TS-711/TS-811 FREQUENCY CONFIGURATION

Fig. 1 represents the frequency configuration. Reception uses a double conversion superheterodyne system, in which the second IF (Intermediate Frequency) differs according to the mode. Here, the signal from the antenna is mixed with the PLL (Phase Locked Loop) local OSC (Oscillator) signal in the first mixer common to the respective modes and is then converted to the first IF at 30.265MHz. At this point, the first IF is separated between SSB/CW and FM modes. In SSB/CW, it is mixed with a 40.96MHz local OSC signal (4 times the TCXO frequency) in the second mixer (Q34) and is converted to the second IF at 10.695MHz. Then, this IF is product detected with a 10.6965MHz carrier. In the FM mode, it is mixed with the 30.72MHz local OSC signal (3 times the TCXO frequency) in the second mixer (Q36) and is converted to the second IF at 455kHz. Then, this IF is detected. In SSB/CW transmission, the SSB/CW signal at 10.695MHz is mixed with the 40.96MHz local OSC signal (4 times the TCXO frequency) in the balanced mixer (Q6/Q7) and is converted to a 30.265MHz signal. It is then mixed with the 113.735–115.725MHz PLL signal to the transmission frequency. In case TS-811, PLL signal (113.015–123.005 MHz) mixed with the 296.720MHz (A), 286.720MHz (B,E) HET signal to the transmission frequency. In the FM mode, a 13.6533MHz X'tal OSC signal, used in place of the 40.96 MHz local OSC signal, is modulated and multiplied by 3 to a 40.96MHz local OSC signal.

RF UNIT
(X44-1620-XX) : TS-711, (X45-1650-XX) : TS-811

- **Reception system**

The signal input from the RA terminal enters the RF amplifier (Q1) through the ATT circuit (−20dB) TS-711 only. The RF amplifier uses GaAs FET : 3SK129. The input uses a 2-pole helical and the output a 3-pole helical, thus obtaining the desired bandwidth and skirt attenuation. The input signal is converted in the receiving mixer, Q2 : C-MOS FET : 3SK122 (in the TS-811, GaAs FET : 3SK129), to the first IF at 30.265MHz. Then, the first IF is convertes to the RIF level signal through the 2-stage MCF (Monolithic Crystal Filter) and is output to the IF unit.

- **Transmission system (TS-711)**

The lower IF signal (30.265MHz) from the IF unit is mixed with the HET signal in the FET balanced mixer (Q3, Q4 : 2SK192A(GR)*N) and converted to the transmission frequency. From this transmission signal, any spurious component is eliminated by the 5-stage VCT (Varactor Tuned) circuit in which the PLL unit CV (Correction Voltage) is used.

Further, the transmission signal is amplified up to the drive output level of for the output transceiver 0.3W for the output transceiver in amplifier Q6. This output is fed to the final module.

- **Transmission system (TS-811)**

The lower IF signal (30.625MHz) from the IF unit is mixed with the HET signal in the Schottky-type DBM (Double Balanced) mixer and is converted to the transmission frequency. From this signal, any spurious component is eliminated by the 2-stage band-pass amplifier with small Hi-Q helical coils. In particular, the second-stage band-pass amplifier has helical coils connected in series, thus providing acute BPF characteristics.

Further, the transmission signal is amplified up to the drive output level of for the output transceiver 0.35W for the output transceiver in amplifier Q4. This output is fed to the final module. VR1 at Q4 controls Q4's idling current The idling current is set to about 15mA for this stage.

Item	Rating

Attenuation bandwidth	±32kHz or less at 40dB
Ripple	1.5dB or less
Loss	3dB or less
Guaranteed attenuation	60dB or more within ±1MHz Spurious level : 40dB or more
Input and output impedance	1.4kΩ ± 10%/1pF ± 10%

Table 4 MCF (L71-0248-05)
(RF unit L4 TS-711, L16 TS-811)

CIRCUIT DESCRIPTION

IF UNIT (X48-1400-XX)

- **Reception system**

The reception system is generally divided into SSB/CW and FM modes.

1) SSB/CW mode

The RIF signal (30.265MHz) from the RF unit (X44-1620-11 : TS-711, X45-1650-XX : TS-811) is mixed with the 40.96MHz output from Q2 at Q34 : 3SK73(Y) and is converted to the 10.695MHz second IF. Then, this signal is amplified via the noise blanker gate circuit and SSB filter L12 by IF amplifiers Q20–22 : 3SK73(GR) (to which AGC is applied), and is then mixed with the carrier OSC signal by product detector (D10–13 : IN60) to obtain a demodulated audio output.

For AGC, the IF output of Q22 is taken through AGC buffer Q24 : 2SC2458(Y). Q23 controls the AGC voltage. Part of the output of AGC buffer Q24 is connected as the SSB squelch release signal with SSB squelch mixer Q40 : 2SC2668(Y,O) via Q39.

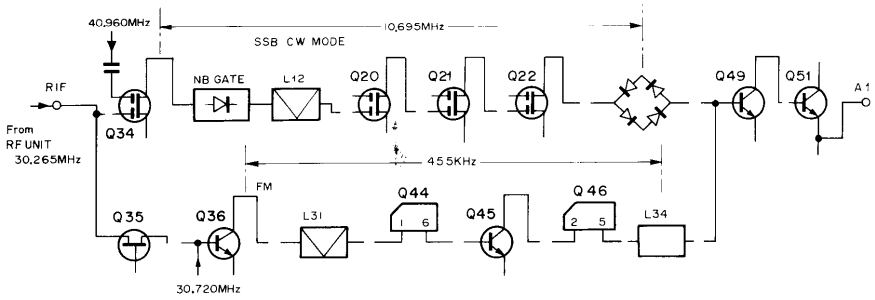
Q25 is the AGC time constant selection circuit. Q26 and Q27 from the S-meter amplifier.

2) FM mode

The RIF is input to mixer Q36 : 2SC2668(Y) via gate-grounded amplifier Q35 : 2SK125. For the local OSC signal, 30.72MHz is obtained by multiplying the PLL 10.24MHz reference by 3-times (Q38). There, the RIF signal is converted to the 455kHz second IF. This output is amplified via ceramic filter L31 in the IF amplifiers, consisting of Q44 : TA7302P, Q45 : 2SC2668(Y) and Q46 : μPC577H, and is then demodulated by ceramic discriminator L34 : CFY455S.

The demodulated signal is filter separated between the AF pre-amplifier Q49 : 2SC2458(Y) and the squelch noise amplifier Q53 : 2SC2458(Y), Q54 : 2SC3113(B). The "busy" lamp is controlled by the squelch circuit and the center detection circuit Q47 : μPC4558C. To supress ignition noise, a "killer" circuit using Q62 is added and is controlled by Q61.

RX SECTION



TX SECTION

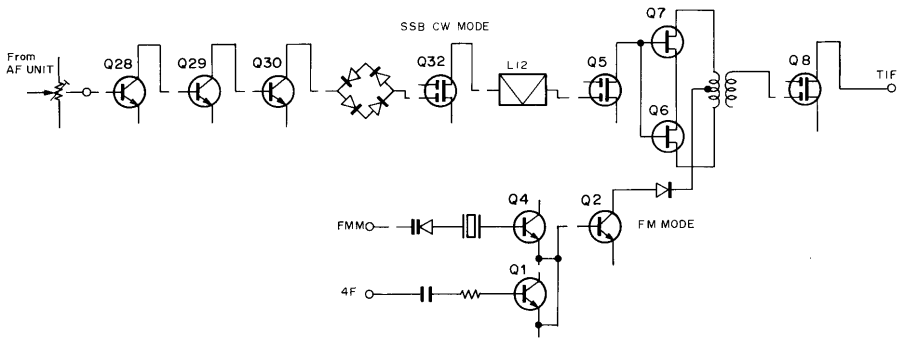


Fig. 2 IF unit block diagram

CIRCUIT DESCRIPTION

3) Noise blanker

Q41 noise amplifier the second IF output, obtained by mixing the 30.265MHz first IF at Q36. It is switched by Q43. Q37 is a switching circuit to blank PLL reset noise which would otherwise occurs every 20kHz.

4) SSB squelch

This acts as a noise squelch. The SSB squelch release signal, taken from AGC buffer Q24, is input to buffer Q39 through squelch sensitivity pot VR6. This output is mixed with 10.24MHz in the SSB squelch mixer Q40 and converted to 455kHz. This signal is then input to the FM IF amplifier. Thereafter, the FM squelch circuit is used to provide SSB squelch.

In the SSB mode, Q56 in the squelch circuit operates to set the attack and slow release time constants.

- **Transmission system**

1) SSB and CW mode

The audio signal from the AF unit is amplified in the microphone amplifier Q28–30 : 2SC2458C and sent to the balanced modulator, D16 : ND487C1-3R. In CW mode, the modulator is unbalanced by DC, and this carrier signal output from the modulator is used. The double sideband output is filtered by SSB X'tal filter L12 amplified by FET Q5 : 3SK73(GR), and mixed with the 40.96MHz output from Q2 in balanced mixer Q6, Q7 : 2SK161(GR) for conversion to the TIF (Transmit IF) signal at 30.265 MHz. Then, the TIF signal is amplified by FET Q8 : 3SK73(GR) and sent to the RF unit. In CW mode, keying controlled by Q32 and Q8 gate biases using –6V and Q13 switching.

2) FM mode

The carrier signal output from the unbalanced SSB modulator is used. Different from the SSB/CW mode is that the local OSC signal used in FM for balanced mixers Q6, Q7 is supplied by X'tal OSC L4 (13.657MHz), which in FM mode operates at 13.6533MHz, pulled by varicap D3. This OSC output is tripled 40.96MHz. In the FM mode, ±5kHz frequency deviation is obtained after tripling the direct modulated X'tal OSC output.

3) Power control

Fig. 3 shows the power control circuit configuration. The final output is detected, and the ALC (Automatic Level Control) voltage is controlled by Q4 in the Display unit (X54-1820-11). The ALC voltage is applied to the second gates of FETs Q5 and Q8, by which the TIF level is adjusted and then APC (Automatic Power Control) is applied. In addition, the power control, in which two pots are used. controls the G2 voltage of generator buffer Q32, to counter excessive ALC at low power.

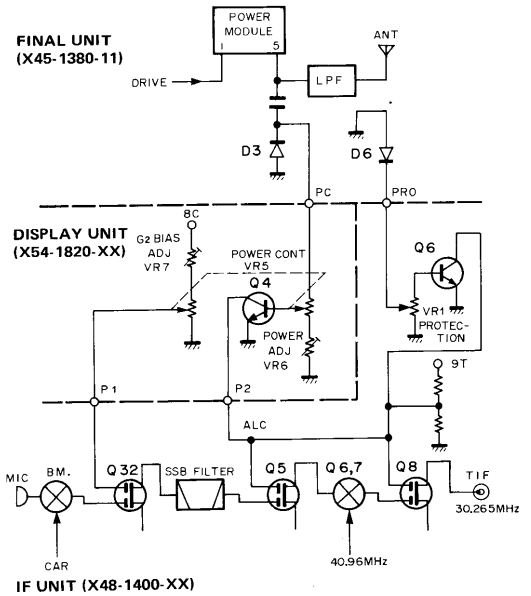

Fig. 3 Power control cinfiguration (TS-711)

Table 5 ND487C1-3R Electric characteristic (IF unit D16)

CIRCUIT DESCRIPTION

AF UNIT (X49-1180-00)

- **Microphone amplifier**

The signal from the microphone is amplified by Q1 : 2SC2459(GR), which is common to both FM and SSB modes. In FM mode, the signal is subject to 6dB/oct pre-emphasis by Q4 (1/2) : NJM4558S and is amplified by OP amplifier Q4 (2/2). Then, it is high-cut by active LPF (Low Pass Filter) Q9 for –24dB/oct via amplitude limiter D8 : MC911 and applied as modulation to the X'tal OSC in the IF unit.

In the SSB mode, the output from amplifier Q1 is impedance-converted by emitter-follower Q3 : 2SC2458(Y) and provided as modulation for the balanced modulator in the IF unit through the microphone gain control on the front panel. The input signal to pin AN1 of accessory terminal ACC2, in the SSB/CW mode is mixed with the output of microphone amplifier Q3 and is then input to the microphone gain control. In the FM mode, it is input to amplifier Q4, but not through the pre-emphassis circuit. Further, Q2 is controlled by the signal input to ACC2 pin MM to turn OFF amplifier Q1 for microphone muting.

- **Processor**

When the processor SW is ON, the processor circuit consisting of Q5, Q6 and Q7 is connected through transistor switch Q8. Q5 is an amplifier circuit with ALC. The NFB (Negative Feedback) signal from Q5 pin 3 is amplified by Q7, detected by D5 and input for ALC at pin 6. Then, the input is controlled by ALC output pin 5.

Q6, an FET switch, adjusts the SSB level to that which has been previously adjusted in the FM mode.

- **Other circuits**

Q11 is the AF PA. Transistor Q10 is an AF amplifier through which the signal is supplied to ACC2. Q12 is the CW side-tone OSC circuit. Q13–Q16 forms the CW semi-break-in circuit

FINAL UNIT (X45-1380-11) : TS-711, (X45-1390-XX) : TS-811

The drive signal from the RF unit is amplified up to 25W by power hybrid Q1 : M57727 (TS-711), Q2 : M57745 (TS-811). It is then supplied to the antenna through the ANT switch and the LPF for removal of harmonic component content.

In addition, ALC detection, RF meter, reflected Power detection and fan temperature detection circuits are provided. The RF meter circuit is a peak holding circuit in which voltage doubler detection is used. The final PA hybrid is protected in two ways. Reflected power (VSWR) is detected from the antenna circuit and lowers the drive voltage by control of the ALC reference voltage to prevent damage to the final PA hybrid for the second protection circuit, thermistor TH1 detects the Final unit temperature to control the fan and prevent abnormal heating in the Final unit PA.

AVR UNIT (X43-1490-11)

The AVR (Automatic Voltage Regulator) unit consists of the rectifier and filter section and the AVR circuit section. The AVR circuit section has 13.8V, 8V and 9V AVR circuits and a temperature protection circuit. There is also a fan drive circuit.

The 13.8V AVR circuit consists of Q1–Q4 and pass transistor, Q5 : 2SD717. Transistor Q1, which controls Q5 emitter, supplies power (pin BB) which is separately rectified and filtered.

The fan is switched by comparator Q10 (1/2) and Q11 after heat detection by thermistor TH1 in the Final unit. The temperature protection circuit functions to stop transmission if the transformer heats abnormally due to excessive continuous transmission, etc. during AC operation. The detection circuit, like the fan, turns OFF the AVR 9T (9V, transmit) output.

PLL UNIT (X50-1990-XX)

The PLL unit has a double loop configuration an ouput in 10Hz steps and uses a 10.24MHz TCXO (Temperature Compensates Crystal Oscillator) (±3ppm) as the reference OSC. 10Hz step operaiton is achieved by dividing the output of the 2kHz comparison PLL (loop B) by a 1/200 divider. Digital tuning in 10Hz steps is obtained by mixing that division signal with the output of the 20kHz comparison PLL (loop A). In addition, the carrier OSC, which is located in the PLL unit, is configures to an IF shift.

Loop B is a mixing type PLL. The VCO output operates from 64–68MHz (Q28 : 2SK192A (GR)*N)) in loop B and, is mixed in Q31 : SN16931P with a 51.2MHz signal This infection signal is derived by multiplying 10.24MHz 5 times in Q32 : 2SC2668(Y,O) via buffer amplifier Q29 : 2SC2668(Y) and then converting to 12.8–16.8MHz.

CIRCUIT DESCRIPTION

Then, the resultant signal is amplified in Q30 : TA7302 and divided at a frequency division coefficient of from 6400–8400 so that a 2kHz output is obtained. Further, 10.24 MHz is also divided by 1/10 at Q36 and again divided by 1/5, and the resultant signal is phase compared with the 2kHz reference signal at Q21 : MC145155P*K.

The PD (Phase Detector) output is converted to a DC Correction Voltage by a 3 transistor stage LPF (Q25–27 2SC2459(BL)) to control the VCO (Q28).

Additionally, part of the 64–68MHz VCO output which passed through buffer amplifier Q29 is subject to 1/2000 division by divider IC Q23 : M5449L for 1/1000 division, and Q22 : SN74LS90N for 1/2 division through buffer Q24 : 2SC260(Y,O). The output of Q22 therefore becomes 320–340kHz at a 10kHz step rate. This output and the output of the carrier OSC are input to mixer Q6 : SN16913P. A 11.025MHz output is taken through a ceramic filter and a buffer Q5 : 2SC2668(Y). Then, this 11.025MHz output is mixed at Q4 : SN16913P with a 20.48MHz signal which is obtained by multiplying 10.24 MHz by two at Q40 : 2SC2668(Y) so that an output of 31.505MHz is obtained. Then this 31.505MHz output is input to mixer Q3 : SN16913P as the loop A local OSC signal. Loop A is a dual modulus type PLL with a 20kHz comparison frequency. Prescaler Q20 : μPB555 operates at either a 1/16 or 1/17 division ratio. The VCO output 113.735–115.735MHz TS-711E, 113.735–117.735MHz TS-711A (Q10 : 2SK129A(GR)* N) in loop A is separated into the HET (Heterodyne) output and the input to mixer Q3 : SN16913P through buffer Q11 : 2SC2668(Y). Mixer Q3 output (80–90MHz) is amplified in a 2 transistor stage amplifier (Q17, Q18 : 2SC2668(Y)) through a 80–95 MHz BPF and is input to prescaler Q20.

The prescaler, connected with PLL IC Q19, forms a swallow counter to divide this input at a frequency division coefficent NA = 4112–4212 (TS-711E), NA = 4112–4312 (TS-711A) to 20kHz. This signal is phasecompared with the 20kHz reference signal obtained by dividing 10.24MHz by two, and 1/256 division of 5.12MHz. The PD output is DC converted by a 3 transistor LPF stage (Q12, 13, 14) to control the VCO (Q10). HET output is obtained by amplifying the VCO output (Q10) by transistor Q1 : 2SC2668(Y).

Comparison frequency derivation :

- **Loop A**

The TCXO 10.24MHz output is amplified by two transistor stages (Q34, 35 : 2SC2458(Y)) via buffers (Q33, 38 : 2SC2458(Y)), is divided by Q36/2 to 5.12MHz, which in turn is input to PLL IC Q19. This input is divided 1/256 by the divider contained inside Q19 to 20kHz, which is the comparison frequency.

- **Loop B**

The 5.12MHz output in loop A is further divided 1/5 by divider Q36/2 to 1.024MHz. This signal is then input to PLL IC Q21 and is divided 1/512 by the divider contained inside Q21 to 2kHz, which is the comparison signal.

For unlock detection, the output of PLL IC Q19 pin 9 in loop A is used. The power supply to buffer Q1 is switched by transistors Q15 and Q16.

The carrier X'tal OSC is switched by diode switches D4 and D5. The bias voltage for D4 is applied from the 8C (8V DC common supply) line, and is independent of the mode. However, in the LSB mode, D4 and D5 can be selected by the ratios of R37/R38 and R40/R39.

Item	Rating
Center frequency of 3dB bandwidth	11.025MHz ± 50kHz
3dB attenuation bandwidth	Within 150 ± 40kHz
20dB attenuation bandwidth	380kHz or less
Insertion loss $20 \cdot \log\left(\frac{E1}{2 \cdot E2}\right)$	8dB or less
Spurious (Within 9–12MHz)	38dB or more
Input and output impedance	330Ω

Table 6 Ceramic filter (L72-0346-05) (PLL unit L8,10)

HET UNIT
(X50-2000-00) : TS-811 M,X,T,W only
(X50-2010-10) : TS-811 K type only

The HET unit gives the HET output by mixing the PLL VCO output and the local OSC signal, which is obtained by a 7 times multiplication of the 40.96MHz local OSC from the PLL unit. 40.96MHz from the PLL unit is amplified up to 0.5V (rms) by amplifier Q4. To remove unwanted harmonic components, it is low pass filtered by amplifier Q7 through a Hi-Q tuning circuit (stage Q6) to become the local OSC signal for HET section.

This signal is mixed with the PLL signal (113.015–123.015 MHz) in the Schottky barrier DBM (Double Balanced) diode mixer : ND-487 and converted to the actual HET signal of from 399.735–409.735MHz (TS-811B/E), 399.735–419.730MHz (TS-811A). After passing a 2-stage bandpass amplifier with small helical coils to obtain the necessary band-width, it is amplified up to the HET signal level by broad band amplifier Q3.

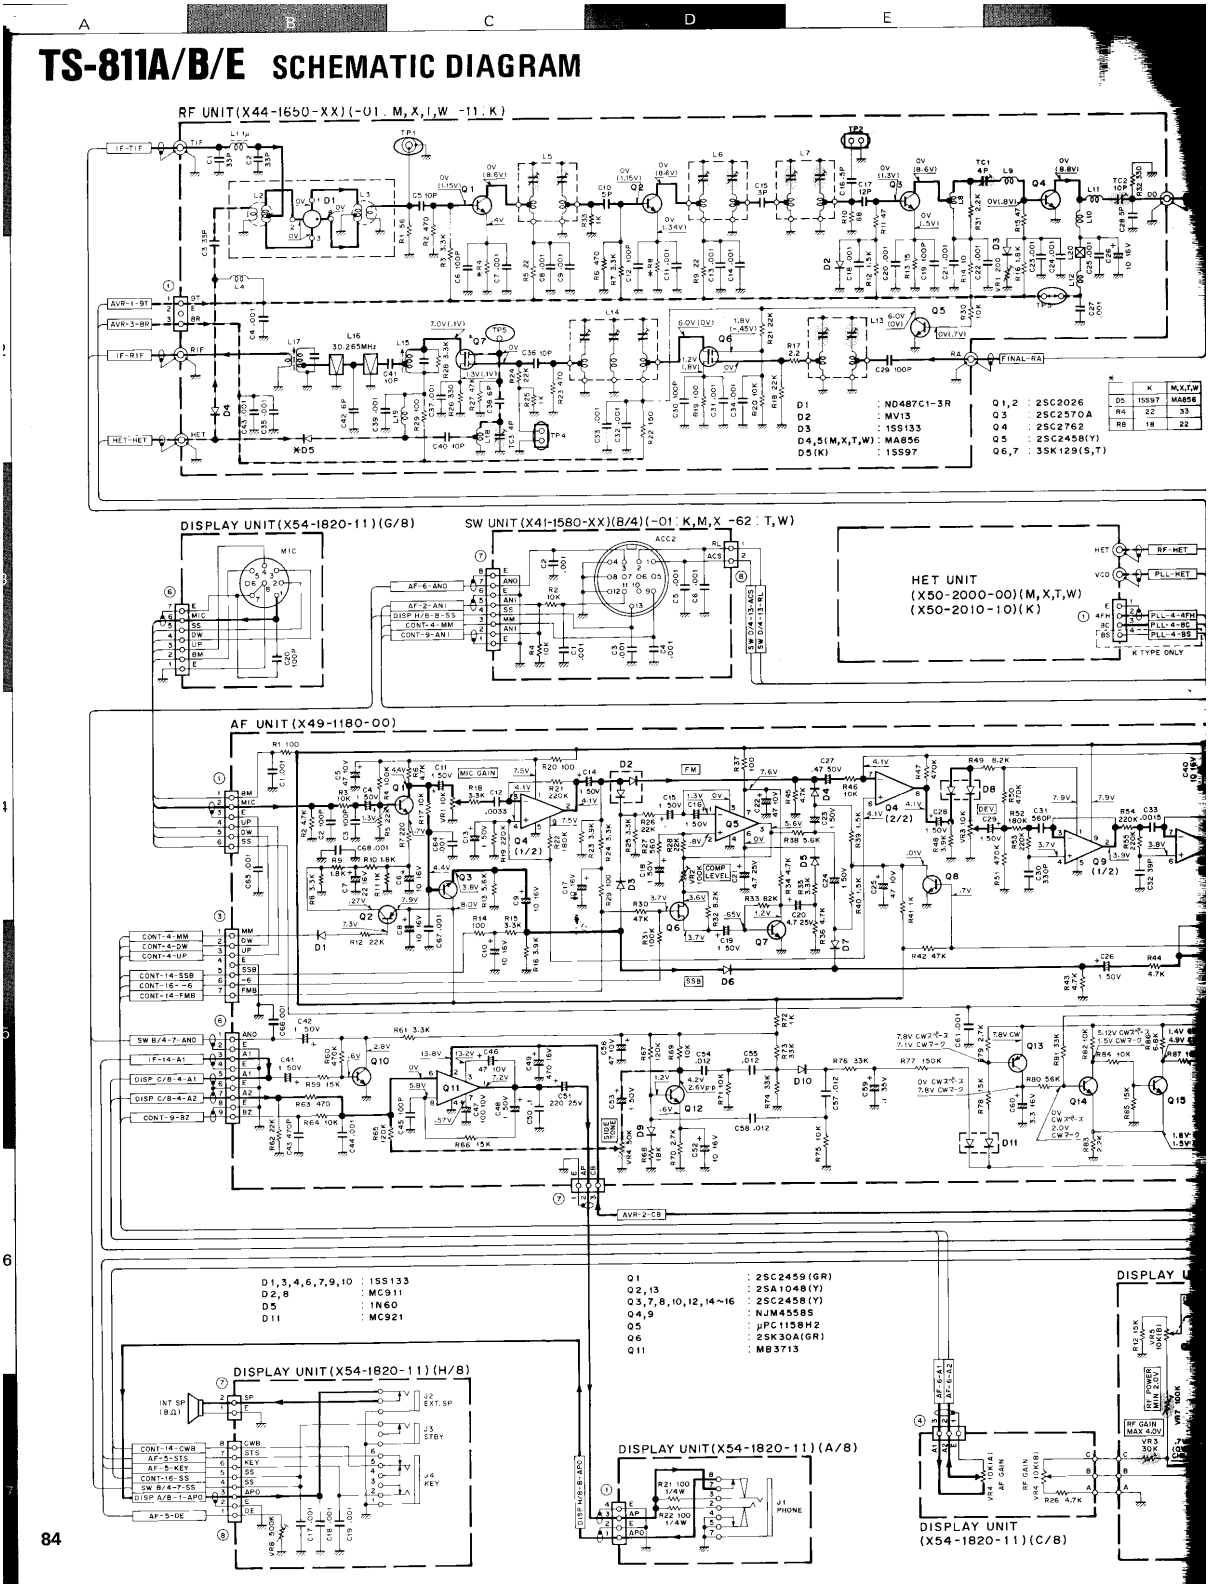
TS-811A/B/E SCHEMATIC DIAGRAM



CIRCUIT DESCRIPTION

CONTROL UNIT (X53-1410-XX)

- **Basic configuration**

Fig. 5 shows the block diagram of the digital control section. The microprocessor, which has an 8-bit (ROM, 6-kbyte) main CPU IC24 : μPD7802G-087-36 (TS-711), μPD7802G-088-36 (TS-811) and a 4-bit (ROM, 2-kbyte) sub CPU IC20 : μPD7507G-575-00, uses a CMOS RAM IC14 : MB847C-20LP-GRA with a capacity of 8 bits x 2kbytes as the external memory IC, the I/O icterface IC IC16 : μPD8255AC-5 for I/O port extension and three 6-bit D-flip-flop ICs IC12, 17, 22 : 74LS174. In addition, it is provided with 24 pin IC socket for the external ROM for optional personal computer interface.

These ICs, connected in parallel with the data bus in the main CPU, exchange data with the main CPU synchronizes by timing signals $\overline{WR}$ or $\overline{RD}$ from the main CPU, or the $\overline{CS}$ signal from IC15. IC15, a 3 to 8 bit line decoder decodes inputs to address lines PE13–15 in the main CPU to generate the chip select signal ($\overline{CS}$). In addition, IC13 takes an OR logic between signals $\overline{CS}$ and $\overline{WR}$ to supply the clock pulse to IC12, IC 17 and IC22, all of which are used as latches.

The main CPU controls the frequency, mode, offset, tone, display, memory, dial click mechanism, DCL system, voice synthesis, etc. and accepts interface with the sub CPU or an external personal computer.

The sub CPU, (common to the TM-211, -411, TR-2600, and TR-3600) interfaces with the main CPU or the MODEM, IC IC19, to handle digital signal code conversion and control tone ON/OFF and other such operation.

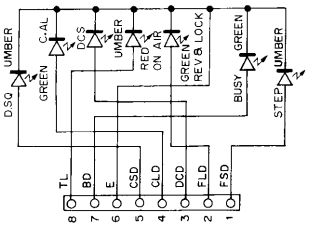
Table 7 Function of μPD8255AC-5 (Control unit IC16)

CIRCUIT DESCRIPTION

• Key switch section

The key switches on the front panel are arranged in a diode matrix (**Fig. 6**) and their signals are input to the main CPU in a key scan system. The switches, LEDs, RIT encoder, etc. on the front panel are electrically connected in the switch unit and sent to the control unit over simple wiring.



LED : LN01201C (RED)
LN01301C (GREEN)
LN01401C (UMBER)

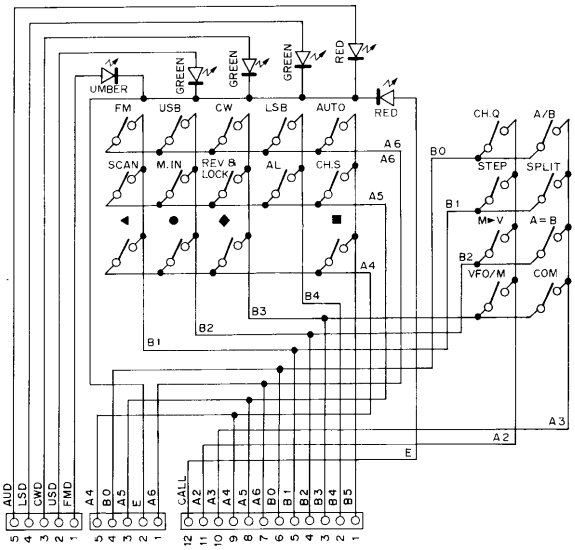


Fig. 6 Keyboard ass'y schematic diagram

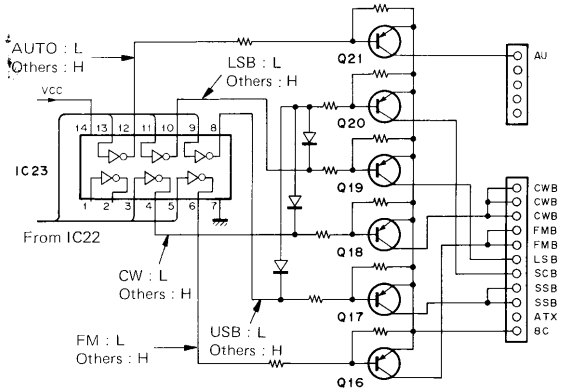
• Display/mode control section

The fluorescent display section, a using custom IC : FIP11FM7, serially transfers the data corresponding to the display contents from the main CPU. The data transferred is 79 bits at power ON and 71 bits whenever the display contents change. The data is output by use of 3 pins SCK (clock), SO (data) and PCO (enable) from the main CPU when pin PCO is "L". After emission of all data bits, pin PCO is made "H". The "CALL", "STEP", "REV & LOCK", "DCL", "CHL", "C" and "SQ" LEDs each light by switching the latch output (active "L") of IC12 : 74LS174 via digital transistors Q1–Q6. Mode LED's light with the voltage for that mode. The voltage for each mode is produced by switching 8V by Q16–21 with the latch output (active "H") of IC22 : 74LS174 configured as an open-collector output by IC23 : 74LS05.



Normally Tr Q16–21 (base) voltage level is "H" and collector voltage level is "L". When MODE switch is turned to FM position, Q16 base is turned low to high level. Then, Tr Q16 is turned ON (collector is high level).

Fig. 7 MODE switching circuit

CIRCUIT DESCRIPTION

• DCS system control section

The processing of the digital control signal used in the DCS system is performed by the sub CPU (IC20 : μPD7507G-575-00), the MODEM process IC (IC19 : MN6127A) and IC18 : μPC4558C.

In transmission, first, the data (digital code, call sign, idle channel) for the control signal is transferred to the sub CPU from the main CPU. In the sub CPU, logic transforms that data to NRZ (None Return to Zero) code, which is then output to IC19. It is subject to MSK (Minimum Shift Keying) modulation at IC19. Subsequently, that output is input to Q4 in the AF unit via pin ANI and is applied as FM modulation. In reception, the signal which was subject to FM detection at discriminator L34 in the IF unit is input to IC18 from pin RT. IC18, an active filter, cuts off the high frequency component of this signal and also amplifies it up to the proper input level for IC19, and it is then output to IC19.

At IC19, it is subject to MSK demodulation to NRZ code and is output to the sub CPU, in which it receives the reverse logic operation to that in transmission and is transferred to the main CPU. For the functions of IC pins used in this transfer, see **Fig. 8** and **Table 8, 9.**

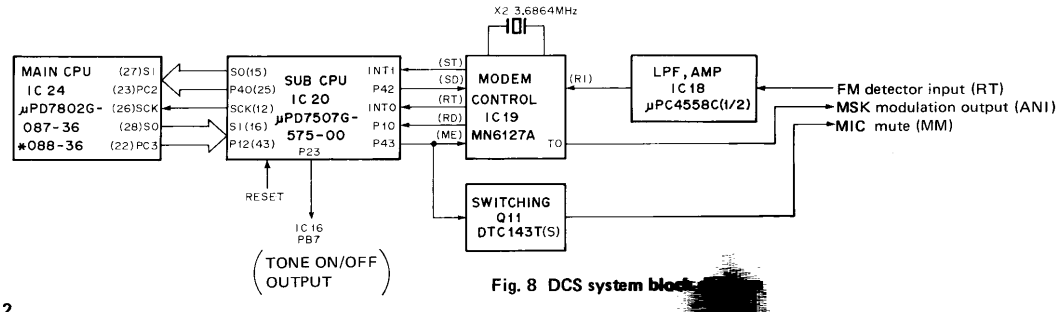

Fig. 8 DCS system block

CIRCUIT DESCRIPTION

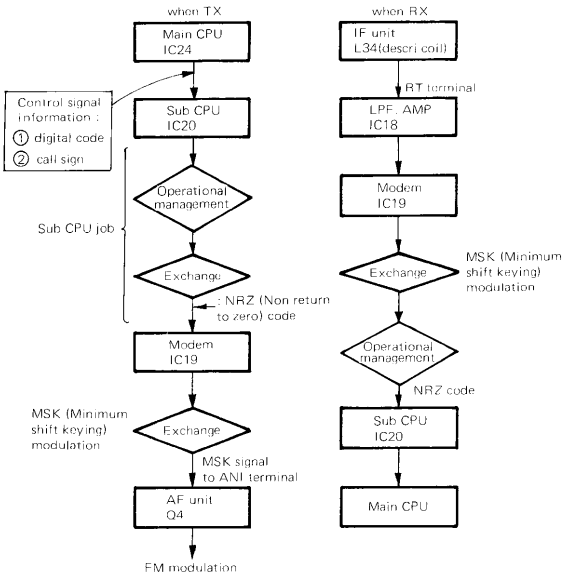

Fig. 9 DCS system flow chart

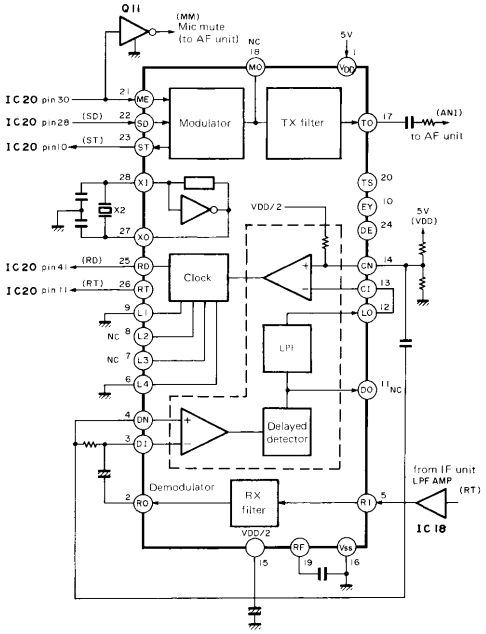

Fig. 10 Modem IC MN6127A block diagram (Control unit IC19)

- **Reset and backup**

A custom IC (IC10 : PST518A) (**Fig. 11**) is used to output the pre-determined reset pulse at power ON or momentary power failure. At IC10, the voltage in the 5V line is detected. When it becomes less than 4.2V, the open-collector output is turned ON. thus, "H" (RESET) and "L" ($\overline{\text{RESET}}$) pulses of about 10msec are generated through a Schmitt trigger when resetting and applied to the reset pin of each IC. At power OFF, when Q8 and Q9 detect the supply line voltage (13.8V) is less than about 9.5V, the CPU returns the transciever to the reception mode to stop all other processes. In addition, when the voltage at the 5V line becomes less than 4.2V, Q7 (normally ON) turns OFF to establish IC14 in the standby (backup) state.

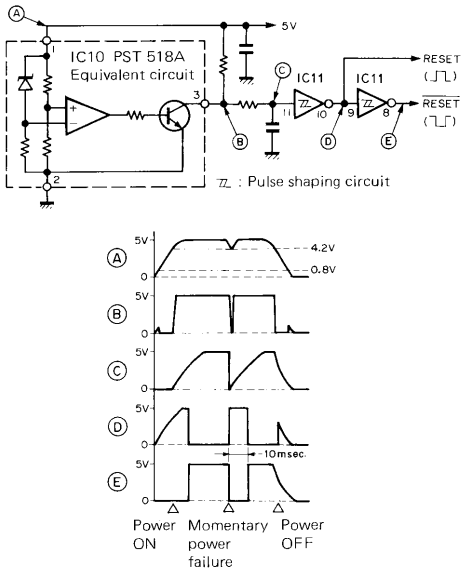

Fig. 11 Reset circuit and waveforms at respective points

CIRCUIT DESCRIPTION

- **"Beep" tone oscillator and voice synthesis control section**

For the "beep" tone output (including Morse Annunciation), its corresponding ON/OFF signal is output from the main CPU PA7 (pin 40) and is generates in oscillation circuit IC11 : MC14584BCP. It is then mixed with the audio output of the voice synthesizer (VS-1) and is input to the AF unit from pin ANO.

The control output (PSO-4, SR) of the voice synthesizer unit (option VS-1) is output from IC17 latch and the control input (BY) is input to IC16 PC3.

- **Encoder section**

Fig. 12 shows the configuration of the encoder section. The control pulse of the main dial "click" detent mechanism is as shown in **Fig.13**. When operating the [CH.Q], [CS], [VFO/M], [M►V], [SELECT], etc., keys, the CPU performs its associated process, judges whether or not the dial is detented, and inputs the status signal of the sensor (pin PS) to IC16 PCO (pin 14). For example, when the dial retent is activates, as when the dial is already detented when pin PS is "H", the process ends. However, when pin PS is "L", a 100msec pulse is emitted from PA3 IC16 pin 17,. thereupon the plunger drive pulse (PN) is emitted through the switching operation of Q12 : DTC143T(S), Q13 : 2SC2459(Y) or Q14 : 2SA1307(Y). After 100msec, the sensor status is checked. If it is "H", the process ends. However, it is found not "H", the process series is repeated. If it does not become "H" after this is repeated 7 times, the CPU stops the process, judging that the plunger ;section has a malfunction.

Out of waveforms EN1, EN2 and EN3 in the encoder, waveforms EN1 and EN2 are connected to four waveforms EN1, EN2, $\overline{EN1}$ and $\overline{EN2}$ in IC1 : MC14069UBCP. These four waveforms are combined with their respective differentiation waveforms and multiplied 4 times in IC5 and IC6 : TC4011. Output $\overline{UP}$/DOWN and a clock pulse are generates in IC8 and IC9 : TC4011 and are entered to the main CPU PC1 (pin 24) and INT1 (pin 12). In the detent mode, the Schmitt trigger differentiation waveform output of EN3 is selected in IC9 and is taked as the clock pulse. RIT encoder waveform chatter is absorbed at Schmitt trigger IC2, and waveforms E1 and E2 are combined with their inversion waveforms and differentiation waveforms. They are then multiplied 4 times at IC4 and IC7, from which signal UP/DOWN and clock pulse outputs are produced and entered to PC7 and INT2 of the main CPU.

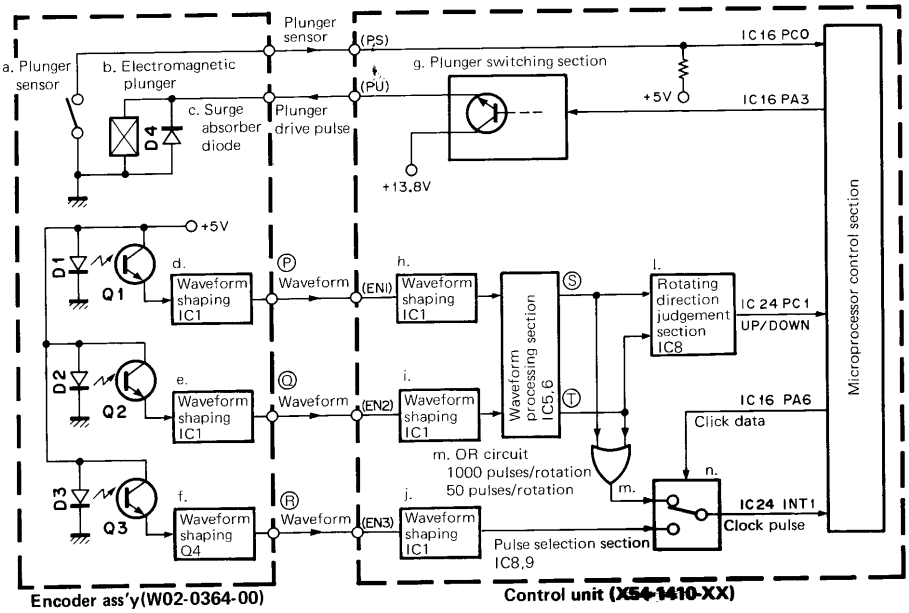

Fig. 12 Configuration of encoder processing section

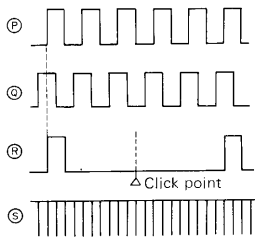
CIRCUIT DESCRIPTION



Ⓟ, Ⓠ . . . . 250 pulses/rotation
Waveforms Ⓟ and Ⓠ have a phase difference of 90° from each other.
At counterclockwise rotation : Ⓠ has a delay of 90° from Ⓟ .
At clockwise rotation : Ⓠ has an advance of 90° from Ⓟ .

Ⓡ . . . . . 50 pulses/rotation
With 50 clicks per rotation, one pulse is equal to one click.

Ⓢ . . . . . At clockwise rotation, 1000 pulses/rotation

Ⓣ . . . . . At counterclockwise rotation, 1000 pulses/rotation

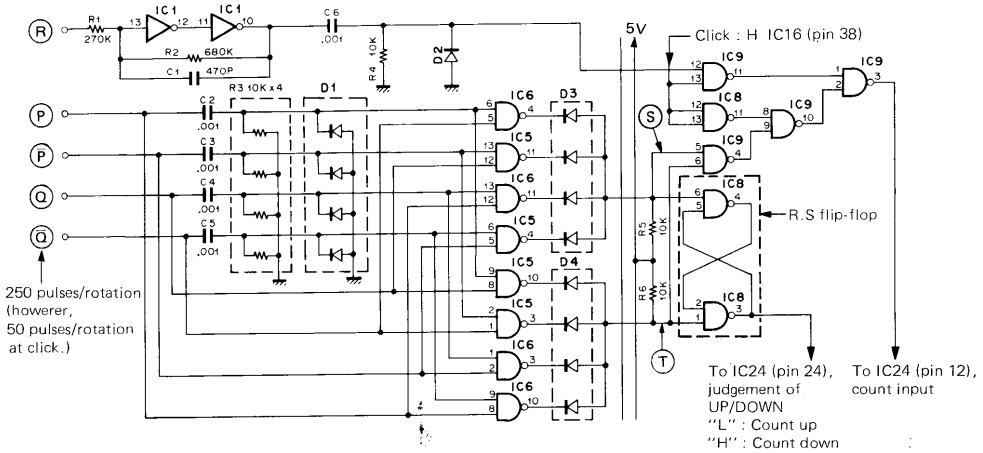


Fig. 13 Output waveform of main encoder

- **Other I/O sections**

a. Standby (ST) output :

The P.T.T. switch ON/OFF signal (ST) from pin SS is taken in PB7 of the main CPU. In transmission, Q10 (open-collector) is thus switched with IC16 PA4 (pin 40) "H".

In auto-transmission in the DCL system, the ON/OFF control for Q10 is also generated in the main CPU to control transmission and reception along with a personal computer.

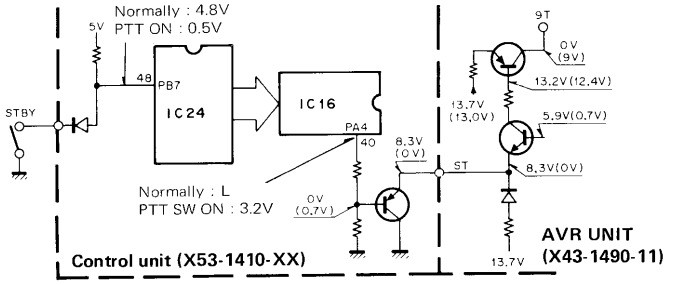

Fig. 14 STBY output circuit

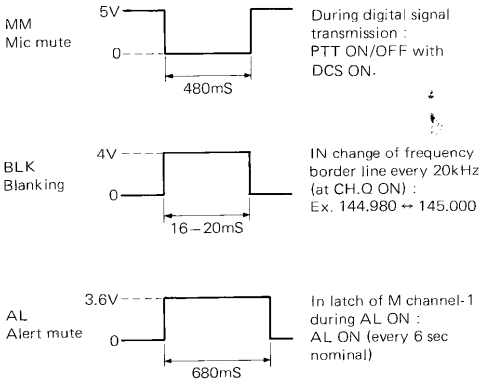
CIRCUIT DESCRIPTION

b. PLL select switching noise blanking output :
When the data in PLL loop A (in 20kHz steps) changes, the timing pulse (BLK) in synchronization with the data output is output from IC16 PA1 (pin 3). Q37 in the IF unit switches to momentarily mute the PLL select switching noise.
c. Busy (SC) input :
In scan mode operation, the SC signal corresponding to busy lamp status is input to IC16 PC4 (pin 13) to select between "open" or "busy".
d. Microphone UP/DOWN switch :
These are input to IC16 PC5 or PC6 after chatter filtering. (The following are for DCL system control.)
e. Microphone mute (MM) output :
This signal cuts off microphone audio during digital signal transmission. This signal, which is output to IC19 from P43 of the sub CPU, controls Q11 (open-collector) to switch Q2 in the AF unit.
f. Audio mute (AL) output :
This mutes the audio output by making IC16 PA0 "H" in code squelch operation, during retrieval of an idle channel or in memory channel check during alert operation.

Connector ④



Connector ⑨

RT . . . . In reception of standard modulation signal (1kHz ± 3kHz deviation, 60dBμ) → 100mVp-p (36mVrms)
ANI . . . In transmission of digital signal, PTT ON/OFF at DCS ON → 80mVp-p.
BZ . . . . In output of beep sound, M.IN pressed → 22mVp-p.
TO . . . . In output of 88.5Hz tone (0.6kHz deviation) → 420mVrms.

Fig. 15 Waveforms at ④ and ⑨ I/O pins (With harness connected)

Encoder ass'y (W02-0364-00)

- **Encoder section**

An IR (Infrared) output is taken through a 250 slit/rotation disk is detected at phototransistors Q1 and Q2. These detection signals are each waveform-shaped at comparator IC1 and emitted to pins EN1 and EN2. Then, they are adjusted by VR1 and VR2 so that they have a precise phase difference of 90° from each other with a precise duty cycle of 50%.
An IR output which is taken through 50 slit/rotation disk is detected at phototransistor Q3. The detection signal is amplified at Q4 and emitted to pin EN3. Signal EN3 is extracted without adjustment. Fig. represents each output waveform.

- **Detent : electromagnetic plunger section**

Whenever the plunger relay is turned ON and then OFF by the Control unit control pulse (pin PN), the detent mode changes to the slew (continuous tuning) mode or vice versa. Normally, the plunger relay is OFF. In addition, the plunger sensor switch is OFF (open) at the detent mode and ON (closed) at the slew mode.

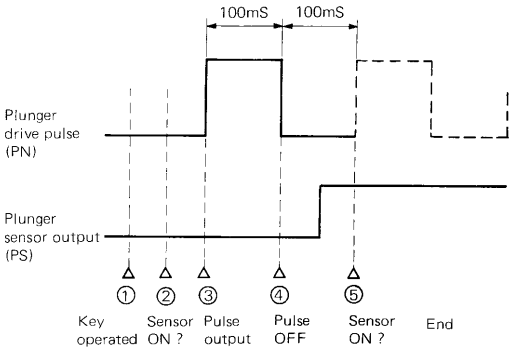


Fig. 16 Relationship between plunger drive pulse and sensor

CIRCUIT DESCRIPTION

DISPLAY UNIT (X54-1820-11)

- **Display section**

When display data is transferred on its 3 lines : DD (data) CD (clock) and ED (enable) from the control unit, they are input to the display control IC Q5 : μPD763C. Q5 outputs both digit signals (T0–T11) and segment signals (Sa–Sg, I0,I1) for dynamic display lighting. (**Table 10**). The digit and segment signals are driven by Q7 and Q8, and by Q6, Q11 and Q12 so display tube (V1) lights. Q7, Q8, Q6 and Q11 switch about –23V and + 5V. Specifically, Q12 switches about –23V and + 11V, as it drives the red character segments. In addition, Q9 and Q10, which are a DC-DC converter oscillator circuit, produce negative voltages for the display tube and AGC circuits.

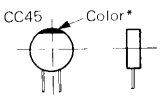
1 = Type ..... ceramic, electrolyic, etc.
2 = Shape .....round, square, etc.
3 = Temp. coefficient
4 = Voltage rating
5 = Value
6 = Tolerance



- **Capacitor value**

0 1 0 = 1pF
1 0 0 = 10pF
1 0 1 = 100pF
1 0 2 = 1000pF = 0.001μF
1 0 3 = 0.01μF
2 2 0 = 22pF
1st number | Multiplier
2nd number

- **Temperature Coefficient**

1st Word	C	L	P	R	S	T	U
Color*	Black	Red	Orange	Yellow	Green	Blue	Violet
ppm/°C	0	−80	−150	−220	−330	−470	−750

2nd Word	G	H	J	K	L
ppm/°C	± 30	± 60	± 120	± 250	± 500

Example CC45TH = −470±60 ppm/°C

- **Tolerance**

Code	C	D	G	J	K	M	X	Z	P	No code
(%)	± 0.25	± 0.5	± 2	± 5	± 10	± 20	+ 40 −20	+ 80 −20	+ 100 −0	More than 10μF −10~ + 50 Less than 4.7μF −10~ + 75

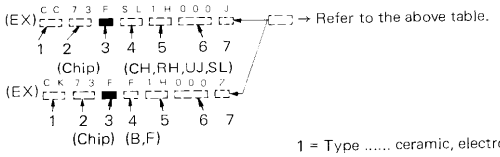
Less than 10 pF

Code	B	C	D	F	G
(pF)	± 0.1	± 0.25	± 0.5	± 1	± 2

- **Rating voltage**

2nd word / 1st word	A	B	C	D	E	F	G	H	J	K	V
0	1.0	1.25	1.6	2.0	2.5	3.15	4.0	5.0	6.3	8.0	—
1	10	12.5	16	20	25	31.5	40	50	63	80	35
2	100	125	160	200	250	315	400	500	630	800	—
3	1000	1250	1600	2000	2500	3150	4000	5000	6300	8000	—

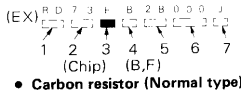
- **Chip capacitors**



→ Refer to the above table.

1 = Type ..... ceramic, electrolytic, etc.
2 = Shape ..... round, square, etc.
3 = Dimension
4 = Temp. coefficient
5 = Voltage rating
6 = Value
7 = Tolerance.

- **Chip resistor (Carbon)**



- **Carbon resistor (Normal type)**

Dimension

Dimension code	L	W	T
Empty	5.6 ± 0.5	5.0 ± 0.5	Less than 2.0
E	3.2 ± 0.2	1.6 ± 0.2	Less than 1.25
F	2.0 ± 0.3	1.25 ± 0.2	Less than 1.25

Dimension

Dimension code	L	W	T	Wattage
E	3.2 ± 0.2	1.6 ± 0.2	0.57	2B
F	2.0 ± 0.3	1.25 ± 0.2	0.45	2A

Rating wattage

Cord	Wattage	Cord	Wattage	Cord	Wattage
2A	1 10W	2E	1 4W	3A	1W
2B	1 8W	2H	1 2W	3D	2W
2C	1 6W

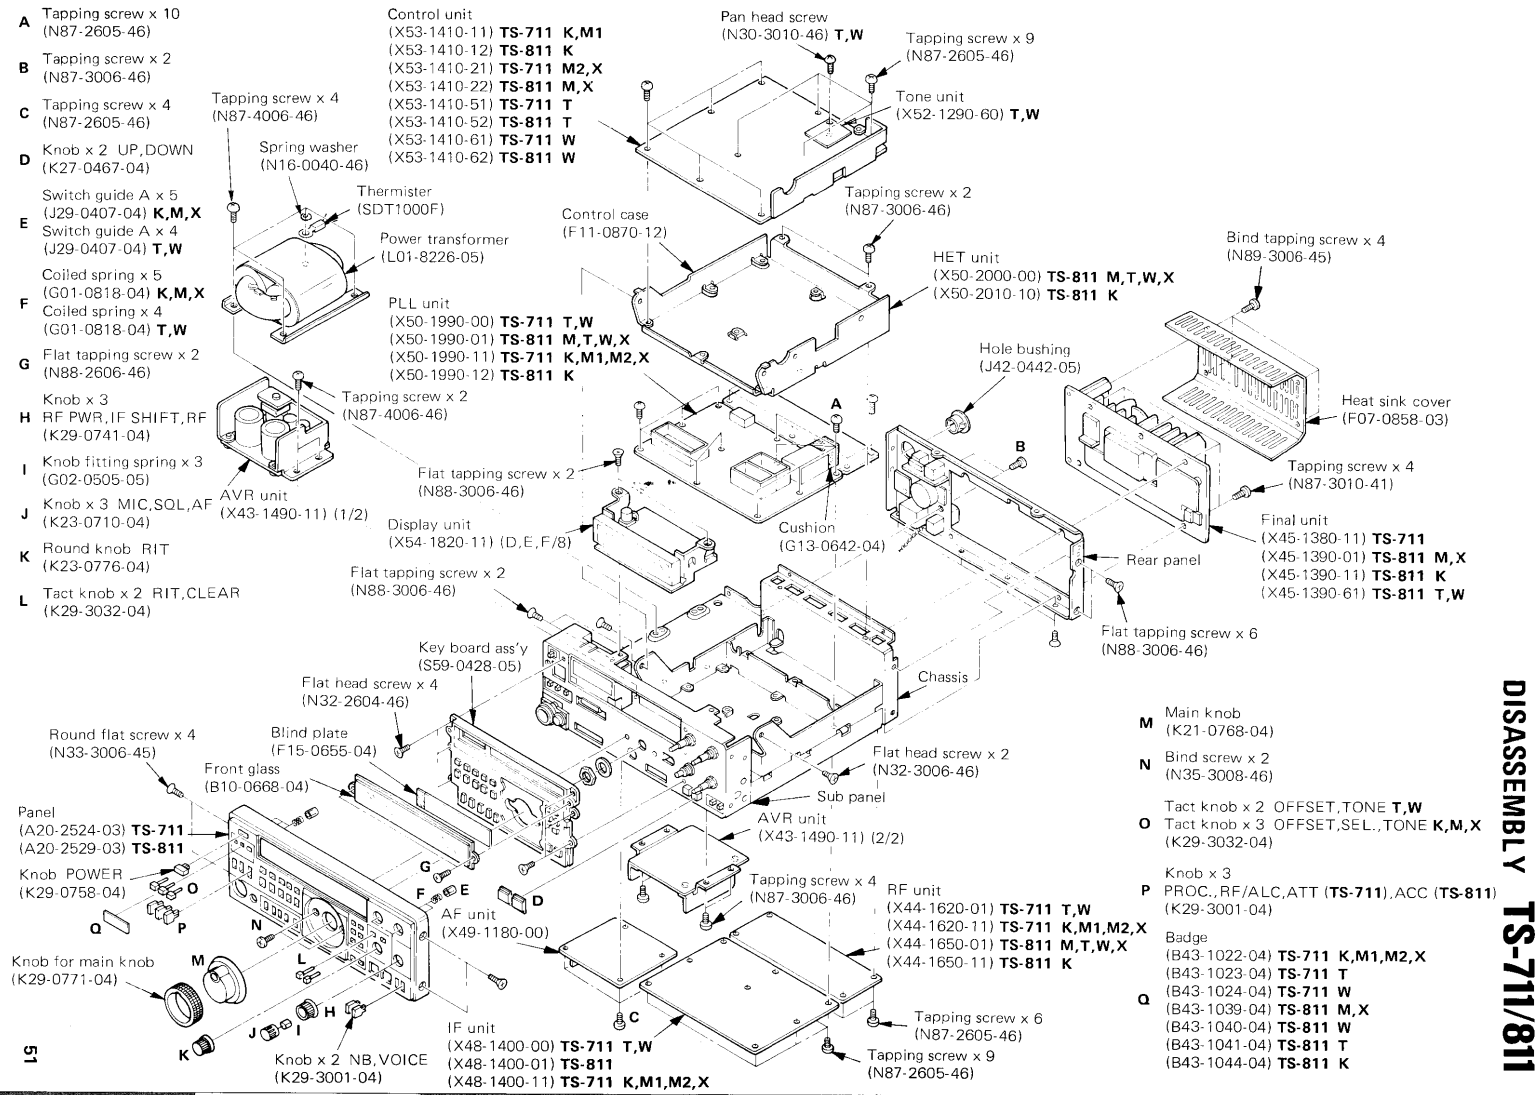
DISASSEMBLY TS-711/811



ADJUSTMENT

REQUIRED TEST EQUIPMENT

1. **DC V.M**
   1) High input impedance
2. **RF VTVM (RF V.M)**
   1) Input impedance : 1MΩ min., 2pF max.
   2) Voltage range : F.S = 10mV ~ 300V
   3) Frequency range : Up to 450MHz
3. **Frequency Counter (f. counter)**
   1) Input sensitivity : Approx. 50mV
   2) Frequency range : Up to 450MHz
4. **DC Power Supply**
   1) Voltage : 10V ~ 17V, variable
   2) Current : 6A min.
5. **Power Meter**
   1) Measurement range Approx. : 30W, 3W, 1W
   2) Input impedance : 50Ω
   3) Frequency range : 450MHz
6. **AF VTVM (AF V.M)**
   1) Input impedance : 1MΩ min.
   2) Voltage range : F.S = 1mV ~ 30V
   3) Frequency range : 50Hz ~ 10kHz
7. **AF Generator (AG)**
   1) Output frquency : 100Hz ~ 10kHz
   2) Output voltage : 0.5mV ~ 1V
8. **Linear Detector**
   1) Frequency range : 450MHz
9. **Field Strength Meter**
   1) Frequency range : 450MHz
10. **Directional Coupler**
11. **Oscilloscope**
    1) High sensitivity oscilloscope with horizontal input terminal
12. **SSG**
    1) Frequency range : 144MHz and 430MHz bands
    2) Modulation : AM and FM MOD.
    3) Output level : −20dB to 100dB
13. **Dummy Load**
    1) 8Ω, 30W (approx.)
14. **Noise Generator**
    1) Must generate ignition-like noise containing harmonics beyond 450MHz.
15. **Sweep Generator**
    1) Sweep range : 1440MHz and 430MHz bands
16. **Tracking generator**

PREPARATION

1) Unless otherwise specified, knobs and switches should be set as follows **Table 11**.

POWER SW	ON	RF POWER	MAX
PROC. SW	OFF	SQUELCH VR	MIN
ALC/RF SW	RF	AF GAIN VR	MIN
ATT SW **TS-711A/E**	OFF	RF GAIN VR	MAX
ACC SW **TS-811A/B/E**	OFF	MIC GAIN VR	MIN
SELECT SW **K,M,X**	OFF	TONE SW	OFF
TONE SW	OFF	MODE SW	FM
IF SHIFT VR	CENTER		

Table 11

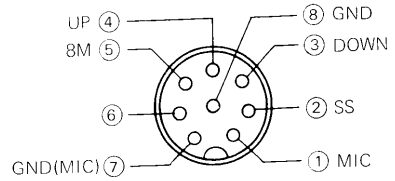


Fig. 17 MIC terminals (view from front panel side)

2) Use an insulated adjusting rod to adjust trimmers and coils.
3) To prevent damaging SSG, never set the stand by switch to SEND while adjusting the receiver section.
4) Be sure to turn the power switch OFF, before connecting the power cable to a power source.
5) SSG output levels are those at the time the output terminal is open.
6) Meter and display section should be set as follows **Fig. 18** or **19**.

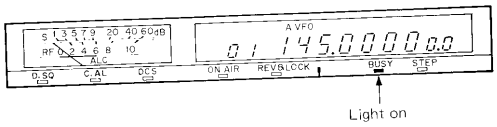

Fig. 18 Meter and display section (TS-711A/E)

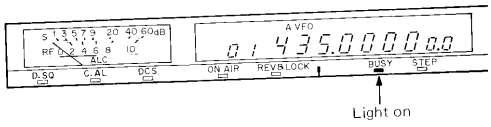

Fig. 19 Meter and display section (TS-811A/B/E)

Microprocessor operation check

Item	Condition	Operation check
1. Reset	1) Set the Power SW ON, while depressing the A=B key. Then release the A=B key.	Display : A VFO 145.000 A VFO 433.000 MODE SW : CW LED light on. The "Beeper" sounds. Encoder is the click position.
2. MODE function (FM, USB, CW LSB, AUTO)	1) Change MODE (ex. : depress CW once) **Note :** If depress same MODE key then same morse code continuously	CW : "C" morse code —·—· Ex. : FM ··——· USB ··—— CW —·—· LSB ·——·· AUTO ·——
3. Encoder	1) MODE SW : FM (push once) Turn the main dial knob to CW and CCW.	STEP LED: OFF — K,M1,M2,X: 5kHz — T,W: 12.5kHz STEP LED: ON — K,M1,M2,X: 5kHz — T,W: 5kHz
4. CH.Q (Channel quick)	1) Push the CH.Q key once.	The plunger sounds. Display : VFO A 144.000.0 → 100Hz order VFO B 434.000.0 ↗ Release click function on VFO knob.
5. A/B	1) Push the A/B key once	The plunger sounds. (Release click function) Display : VFO B 144.000.0 VFO B 430.000.0 MODE SW : CW, AUTO LED light on.
	2) Push the A/B key again.	A VFO 145.000 A VFO 433.000
6. STEP	1) Push the STEP key once.	The "Beeper" sounds. STEP LED (orange) light on
	2) Turn the main dial CW and CCW.	Up and Down each 10kHz step. (VFO A, FM mode)
	3) Push the CH.Q key once. (click off condition)	Display shows 7 digits and become fast step as of STEP off.
	4) Push the STEP key again	STEP LED light off. (STEP function off) The "Beeper" sounds.
7. SPLIT	1) Push the SPLIT key once (VFO A and VFO B frequency works for both TX and RX) Transmitt	The "Beeper" sounds Display : SPLIT light on. Ex. : A VFO 145.000 A VFO SPLIT 144.000.0 A VFO SPLIT 435.000 A VFO SPLIT 434.000.0
	2) Push the SPLIT key again	Display : SPLIT light off. (SPLIT function off)

Item	Condition	Operation check
8. A = B (VFO A and VFO B become same frequency)	1) Push the A=B key once.	The "Beeper" sounds. Ex. VFO A : 145.000 TS-711 VFO B : 144.000.0 TS-811 VFO A : 435.000 VFO B : 434.000.0
	2) Push the A/B key once	The "Beeper" sounds. Display changes to VFO B and shows same frequency as VFO A.
9. COM CH	1) Push the COM key once.	The "Beeper" sounds. COM LED : Light on Display : A 145.000 A 433.000 In case COM CH working, the main dial UP, DOWN, CH.Q, A/B STEP, SPLIT, SCAN and M.IN functions are not work.
10. MHz	1) Push the MHz SW (UP) one by one.	UP MHz order 1MHz each or push. The "Beeper" sounds each push.
	2) Push the MHz SW (UP) continuously.	UP MHz order continuously.
	3) Push the MHz SW (DOWN) one by one.	Down MHz order 1MHz each one push. The "Beeper" sounds each push.
	4) Push the MHz SW (DOWN) continuously.	Down MHz order continuously.
11. SCAN	1) MODE SW : SCAN push once.	The "Beeper" sounds. The dot point light winks. Start SCAN after 6 seconds.

SCAN Step

	Display 5 digit	Display 5 digit STEP : ON	Display 6 digit	Display 6 digit STEP : ON
FM	20kHz step	10kHz step	5kHz step	5kHz step
CW, SSB	5kHz step	1kHz step	1kHz step	1kHz step

	2) STBY : SEND	Stop SCAN
	3) SCAN start : Push SCAN again.	The "Beeper" sounds. (SCAN stop)
12. Memory (Write)	1) Push the M.IN key once. (Desire frequency)	The "Beeper" sounds (Memorized frequency) Frequency has memorized with any mode.
	2) MODE SW : CH.S push once. Turn main dial CW. Ex. Set to	The "Beeper" sounds (Main dial works only on MHz order.) Changes only on M.CH display.
	3) MODE SW : CH. S push again.	The "Beeper" sounds (Main dial works as VFO knob)
	4) Memo in up to 40 channel following 1), 2), 3).	The "Beeper" sounds each M. IN, CH. S push.

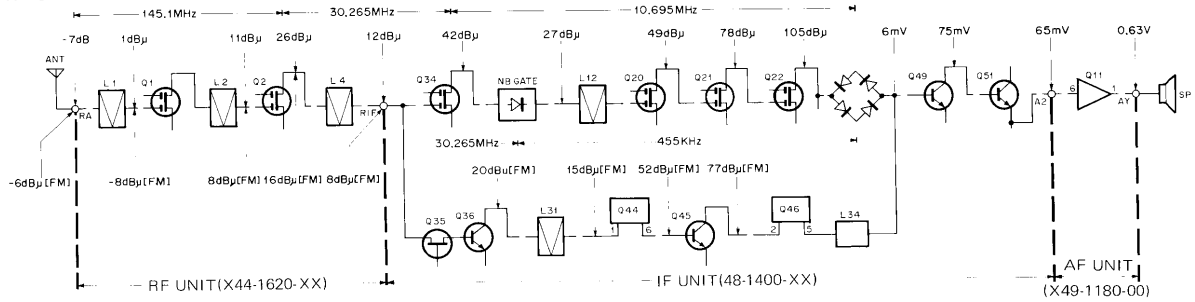
ADJUSTMENT

Item	Condition	Operation check
13. Memory (Recall)	1) Recall memorized frequency at item 12. Push the VFO/M key once.	The "Beeper" sounds. Display : MCH 01 A 144.030 MCH 01 A 433.030 Which is MEMO IN on CH1
	2) Tuning the main dial	Display shows memorized CH and frequency.
	3) Push the VFO/M key again.	The "Beeper" sounds Display shows VFO frequency.
14. M►V	1) Transfer MEMO frequency to VFO. Ex. MEMO frequency : 144.800 : 433.800 VFO A frequency : 144.000 : 434.000 Push the M►V key once.	1 Display MCH 01 A 144.800 MCH 01 A 433.800 The "Beeper" sounds. 2 Display A VFO 144.000 A VFO 434.000 Display has transfer 1 to 2
15. Frequency	1) MODE SW : REV & LOCK push once.	The "Beeper" sounds. REV & LOCK LED light on.
	2) Turn main dial CW and CCW.	Confirm the display does not change.
	3) MODE SW : REV & LOCK push again.	The "Beeper" sounds. REV & LOCK LED light off. (Freq. lock free)
16. Alert (AL)	1) MODE SW : AL push once	The "Beeper" sounds. Display shows AL.
	2) RX : 6 seconds each	Confirm the "Beeper" sounds.
	3) MODE SW : AL push again	The "Beeper" sounds AL sign disapear.

TS-711A/E, TS-811A/B/E DCS (Digital Code Squelch) system operation check

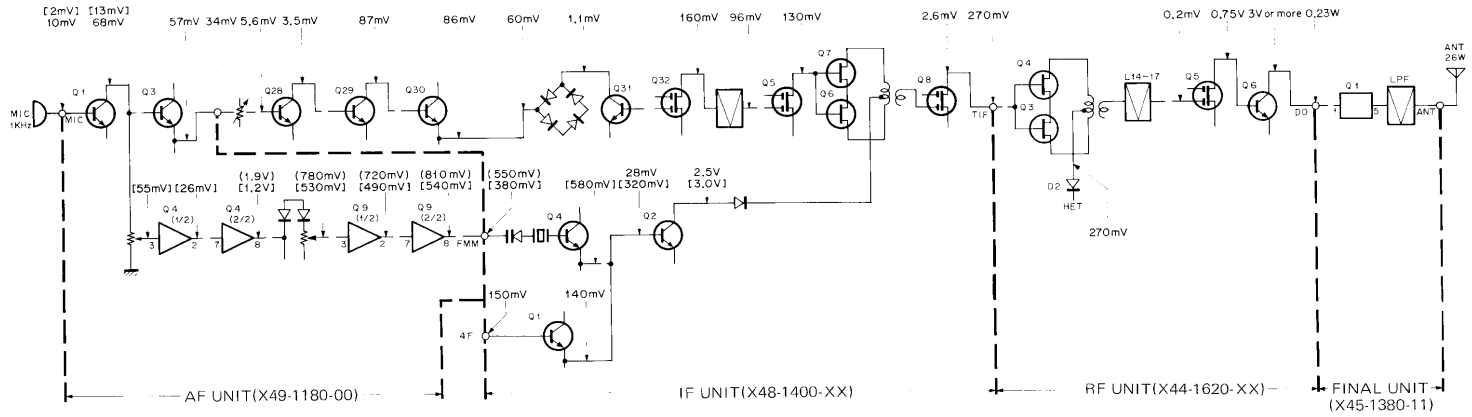
Item	Condition	Operation check
1. Digital code input	1) Display : any Push the CS key once.	The "Beeper" sounds. Display : C0 00000 (Digital code has 5 digits and can input 9 kind)
	2) Digital code input MODE SW : FM–CH.S has dual function as digital code and each key works ; FM : 1–CH.S : 0	1 F M 2 USB 3 C W 4 LSB 5 AUTO 6 SCAN 7 M.IN 8 REVS LOCK 9 A L 0 CH.S Each one input makes "Pi" sound and each 5 digit input makes "Pee" sound.
	3) Turn main dial one click CW, and input digital code following step 2).	Display : C1 00000
	4) Input digital code for C0~C9 turning main dial.	Confirm "Pee" sound at each 5 digit input.
	5) Push the D.SQ key when digital code has displayed.	C0. ←Dot light winks. If push the D.SQ key again, this dot has disapear.
2. Call sign input	1) Push the C.AL key while digital code has displayed. 2) Push the C.AL key again.	The "Beeper" sounds. C- 000000 (1st 2nd 3rd) C= 000000 (4th 5th 6th) Ex. : J A 1 Y K X ↑ ↑ ↑ ↑ ↑ ↑ 74 65 49 89 75 88
3. DCS system	1) Set monitor's radio to condition below. Digital code : 6 7 8 9 0 MODE SW : FM DCS : ON	
	2) MODE SW : FM VFO : 146.0000 Push the DCS key once.	DCS LED light on.
	3) Push the CS key once. Push the 6, 7, 8, 9, 0 key each time. Push the CS key once after checks.	C0 6 7 8 9 0
	4) Push the D.SQ key once. SQL VR : MIN	D.SQ LED light on. Squelch closed.
	5) Push the C.AL key once. Monitor : SEND Push the C.AL key once after check.	C. AL LED light on. Squelch opened. D. SQ LED light off. The "Beeper" sounds. (Monitor's radio : "Beeper" sounds heard during transmit.)
	6) STBY : SEND	"Beeper" sounds heard when TX.

RX SECTION



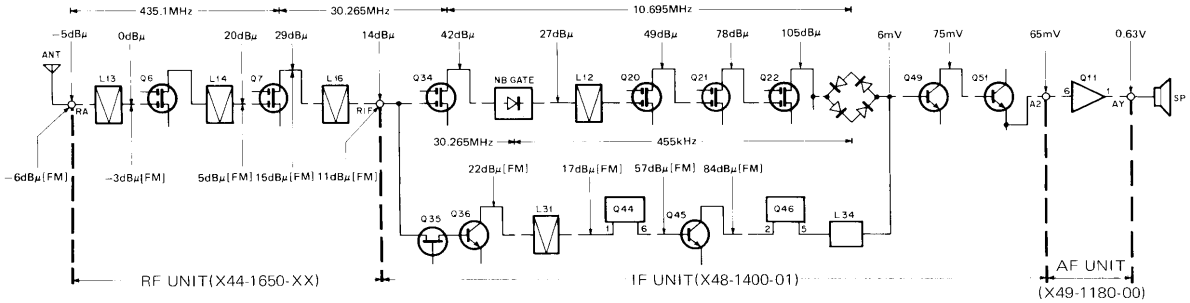
1. First, set the AF gain control for an audio output of 0.63V/8Ω for an SSG input signal at 145.1MHz/−6dBμ, applied to the antenna terminal, the AF gain control is now fixed. Thereafter, only the SSG signal level injected at each point is varied, as required to obtain the same audio output.
2. In the FM mode, the SSG signal level at each point required to obtain the same S/N ratio as that at initial input of the reference −6dBμ is taken.
3. In the stages after the product detector, the AF output level is measured.
4. Level measurement is made with a 0.01μF titanium oxide porcelain capacitor connected to the SSG output.
5. For level measurement at the RA terminal point, the SSG cable connection is changed to this terminal.

TX SECTION



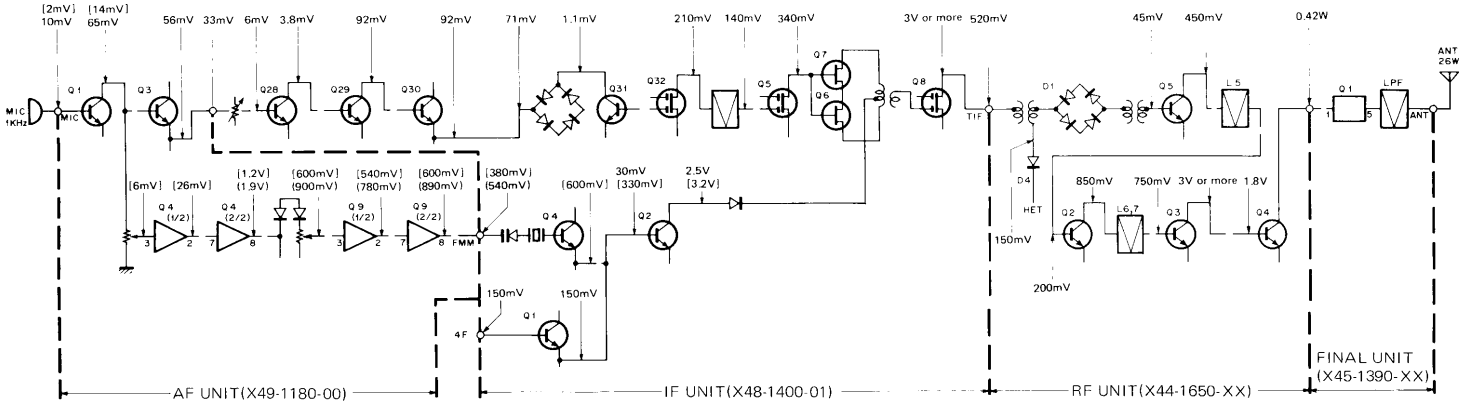
1. Frequency : 145.10MHz
2. For level measurement before pin DO in the RF unit, the coaxial cable connected to pin DO is disconnected.
3. In IF & RF sections, measurements are taken by an RF VTVM in the CW mode. In AF sections, it is taken by an AF VTVM in the USB mode. In this case, the values in [ ] are with the FM mode processor OFF, and those in ( ) are with the FM mode processor ON.
4. The audio input voltage in the USB mode, is a 1kHz signal tone which gives a nearly full-scale reading within the ALC range. In the FM mode, it is that which gives the standard modulation degree (±3kHz deviation).

RX SECTION



1. First, set the AF gain control for an audio output of 0.63V/8Ω for an SSG input signal at 435.1MHz/−6dBμ, applied to the antenna terminal, the AF gain control is now fixed. Thereafter, only the SSG signal level injected at each point is varied, as required to obtain the same audio output.
2. In the FM mode, the SSG signal level at each point required to obtain the same S/N ratio as that at initial input of the reference −6dBμ is taken.
3. In the stages after the product detector, the AF output level is measured.
4. Level measurement is made with a 0.01μF titanium oxide porcelain capacitor connected to the SSG output.
5. For level measurement at the RA terminal point, the SSG cable connection is changed to this terminal.

TX SECTION



1. Frequency : 435.10MHz
2. For level measurement before pin DO in the RF unit, the coaxial cable connected to pin DO is disconnected.
3. In IF & RF sections, measurements are taken by an RF VTVM in the CW mode. In AF sections, it is taken by an AF VTVM in the USB mode.
   In this case, the values in [ ] are with the FM mode processor OFF, and those in ( ) are with the FM mode processor ON.
4. The audio input voltage in the USB mode, is a 1kHz signal tone which gives a nearly full-scale reading within the ALC range. In the FM mode, it is that which gives the standard modulation degree (±3kHz deviation).

TS-711 SPECIFICATION

[General]

Frequency range	144.0 ~ 148.0 MHz..... (TS-711A)
	144.0 ~ 146.0 MHz..... (TS-711E)
Radio wave mode	A3J (SSB), F2, F3 (FM), A1 (CW)
Antenna impedance	50 ohms
Operating temperature	−10°C ~ +50°C
Power voltage	AC120V/240V/220V, 50/60 Hz
	DC 13.8V (12V ~ 16V)
Grounding	Negative
Power consumption	170W, 6.5A (DC13.8V) at maximum transmission
	50W, 1.2A (DC13.8V) in receive mode without receiving signal
Frequency tolerance (−10°C ~ +50°C)	Within ± 3 ppM (SSB/CW)
	Within ± 5 ppM (FM)
Frequency stability	± 300 Hz 1 ~ 60 minutes after power on
	Within 50 Hz/every 30 minutes 60 minutes later (after power on)
Dimensions	W270 x H96 x D260 mm
	(W279 x H108 x D327 mm) – Projected parts measured.
Weight	7.1 kg (15.62 lb)

[Transmitter]

RF output power	25 watts (One minute transmission/three minutes reception)
	RF output variable from approx. 2W to maximum
Modulation	Balanced (SSB), Reactance (FM)
Spurious radiation	Less than −60 dB
Carrier surpression	Less than −40 dB
Side band surpression	Less than −40 dB
Maximum frequency deviation (FM)	± 5 kHz
Modulation distortion (FM60%)	Less than 3% (300 Hz ~ 3 kHz)
MIC impedance	500 ~ 600 Ω

[Receiver]

Circuitry		Double superheterodyne
Intermediate frequency		1st 30.265 MHz
		2nd 10.695 MHz (SSB/CW), 455 kHz (FM)
Receiver sensitivity	**FM**	12 dB SINAD less than 0.22 μV..... (TS-711A)
		12 dB SINAD less than 0.2 μV..... (TS-711E)
		S + N/N more than 50 dB at 1.0 mV input
	SSB/CW	S + N/N 10 dB less than 0.16 μV..... (TS-711A)
		S + N/N 10 dB less than 0.13 μV..... (TS-711E)
Receiver selectivity	**FM**	More than 12 kHz (−6 dB)
		Less than 24 kHz (−60 dB)
	SSB/CW	More than 2.2 kHz (−6 dB)
		Less than 4.8 kHz (−60 dB)
Spurious response		Better than 70 dB
Squelch sensitivity		Less than 0.16 μV (threshold)
Auto scan stop level		Less than 0.2 μV (threshold)
Audio output power		More than 2.0 watts across 8 ohms load (5% dist.)
Audio output impedance		8 ohms

[DCS control]

Code	NRZ equal-length code
Modulation	MSK modulation
Frequency deviation	± 2.5 kHz or more
	± 5 kHz or less
	± 3.5 kHz Standard
Mark frequency and deviation	1200 Hz ± 200PPM
Space frequency and deviation	1800 Hz ± 200 PPM
Code transmission speed and deviation	1200 bits/second ± 200 PPM

Note: Circuit and ratings are subject to change without notice due to developments in technology.

TS-811A/B/E

TS-811 SPECIFICATION

[General]	
Frequency range	430 ~ 440MHz (TS-811B/E)
	430 ~ 450MHz (TS-811A)
Radio wave mode	A3J (SSB), F2, F3 (FM), A1 (CW)
Antenna impedance	50 ohms
Operating temperature	−10°C ~ +50°C
Power voltage	AC120V/220V/240V, 50/60Hz
	DC 13.8V (12V ~ 16V)
Grounding	Negative
Power consumption	220W, 8.0A (DC 13.8V) at maximum transmission (TS-811B/E)
	240W, 8.5A (DC 13.8V) at maximum transmission (TS-811A)
	50W, 1.2A (DC 13.8V) in receive mode without receiving signal
Frequency tolerance (−10°C ~ +50°C)	Within ± 3PPM (SSB, CW ; 430 ~ 440MHz)
	Within ± 5PPM (SSB, CW ; 440 ~ 450MHz)
	Within ± 5PPM (FM)
Frequency stability (430 ~ 440MHz)	± 1200Hz 1 ~ 60 minutes after power on
	Within 50Hz/every 30 minutes 60 minutes later (after power on)
Dimensions	W 270 x H 96 x D 260 mm
	(W 279 x H 108 x D 327 mm) −projected parts measured.
Weight	7.2kg (15.6lb)
[Transmitter]	
RF output power	25 watts (One minute transmission/three minutes reception)
	RF output variable from approx. 2W to maximum
Modulation	Balanced (SSB), Reactance (FM)
Spurious radiation	Less than −60dB
Carrier surpression	Less than −40dB
Side band supression	Less than −40dB
Maximum frequency deviation (FM)	± 5kHz
Modulation distortion (FM 60%)	Less than 3% (300Hz ~ 3kHz)
