The Model BP-2 Packet Modem - Completely redesigned "from the ground up". This enhanced version of our famous BP-1 employs "surface mount" technology, allowing us to pack even more performance and value into this tiny package! The BP-2, when combined with BayCom compatible software, transforms your IBM compatible computer into a full-featured packet station, capable of controlling up to eight simultaneous contacts! Although deceptively simple in appearance, the BayPac supports sophisticated features like digipeating, file transfer and remote terminal access, in addition to routine message handling. Not much bigger than a book of matches, the micropower DSP (Digital Signal Processor) in the BP-2 permits a level of portability never before possible in a packet modem. No batteries or external power required! The BP-2 consumes so little current (only 9mw) that it is able to draw its operating power from the signals it is processing! Connect your BayPac to a "Palm Top" and an HT and you have a "world wide" digital communications system that you can hold in one hand! The BP-2 comes completely assembled and tested. Software and extensive documentation are included. Simply plug the BayPac into your computer's serial port, attach your radio, load the software and you're ready to go!

The Model BP-2M MultiMode Modem - All the features of the BP-2 plus MultiMode capability using a wide range of Shareware, Freeware and Commercial software. Now you can get your "feet wet" in AMTOR, RTTY, CW, WEFAX, SSTV and a host of other modes without "breaking the bank"! Switching from one mode to another is a breeze with our menu driven Mode Control Program (BPMODE). As you scroll past each mode selection, a comprehensive Help Screen appears to guide you. The BayPac even "remembers" your mode choice after you turn it off. So, the next time you "fire it up", it's ready to go instantly! The BP-2M is supplied with a comprehensive list of compatible software, which identifies the modes available, how to set it up, and the best source for download or purchase. Software performance and hardware requirements may vary with the software selected.
