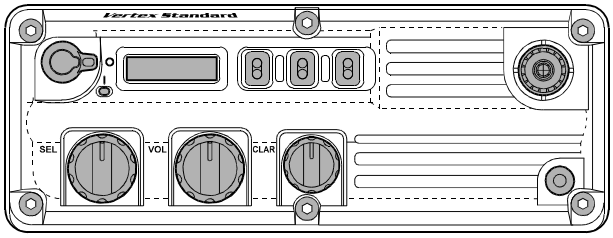
Kwun Tong, Kowloon, Hong Kong



Introduction

This manual provides technical information necessary for servicing the VX-1210 Transceiver.

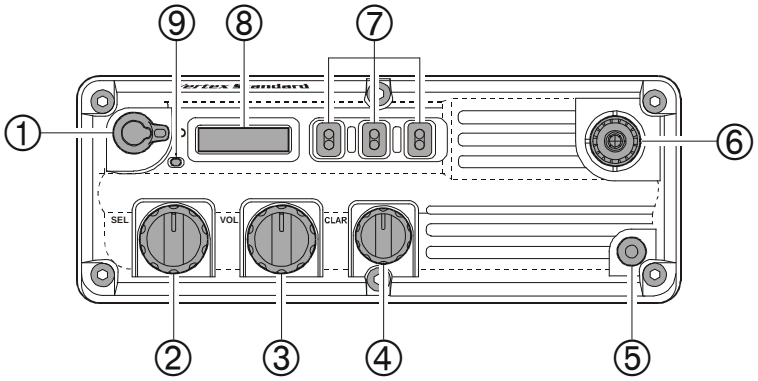
Servicing this equipment requires expertise in handling surface-mount chip components. Attempts by non-qualified persons to service this equipment may result in permanent damage not covered by the warranty, and may be illegal in some countries.

Two PCB layout diagrams are provided for each double-sided circuit board in the transceiver. Each side of thr board is referred to by the type of the majority of components installed on that side (“leaded” or “chip-only”). In most cases one side has only chip components, and the other has either a mixture of both chip and leaded components (trimmers, coils, electrolytic capacitors, ICs, etc.), or leaded components only.

While we believe the technical information in this manual to be correct, VERTEX STANDARD assumes no liability for damage that may occur as a result of typographical or other errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated.

Contents

FRONT PANEL CONTROLS AND SWITCHES



① **POWER** Switch

Turn this knob clockwise to turn the radio on. Counterclockwise rotation will turn the radio off.

② **SEL** Knob

This 12-position detented rotary switch selects the memory channels, and tune the operating frequency, if your transceiver is configured for use of the VFO feature.

③ **VOL** Knob

This control adjusts the audio volume level. Clockwise rotation increases the volume level.

④ **CLAR** ("Clarifier") Knob

This control allows you to offset the receiving frequency by up to 200 Hz in 10 Hz steps (SSB, CW, and DATA modes), or up to 400 Hz in 20 Hz steps (AM mode). This control is helpful in case the incoming signal is drifting.

⑤ **GND** Terminal

If an earth ground connection is available at the operating site, this terminal may be connected to it to provide improved performance and safety.

⑥ **ANT** Jack

This jack accepts a 50Ω antenna. If the optional **ATU-1210** internal antenna tuner is enabled, the optional **YHA-61** whip antenna (or **FHA-27** folding whip antenna with **GN-1210** goose neck) can be connected to this jack directly. Use only a type PL-259 (type **M**) plug.

⑦ **TOGGLE** Switches

These **TOGGLE** switches can be customized, via programming by your Vertex Standard Dealer. The available features for these switches are described on page 6.

⑧ LCD (Liquid Crystal Display)

The current operating channel is displayed here.

⑨ LED Indicator

This LED indicates the current status of the transceiver.

Glowing Green:	Busy Receive Channel (or Squelch off).
Glowing Yellow:	Transmission in progress.
Blinking Yellow:	Antenna mismatching problem (High SWR condition).
Blinking Red:	Battery voltage is nearing depletion. Prepare to replace the battery.
Glowing Red:	Battery voltage is critically low. Replace the battery immediately.

Note

Generally, the **SEL** knob tunes the VFO frequency in 100 Hz steps when you are operating in the VFO mode. If you wish to tune more quickly, using larger tuning steps, press the **SEL** knob downward momentarily, then rotate the **SEL** knob. This allows you to tune the VFO frequency in 5 kHz steps. When the transceiver is in this "fast" tuning step mode, the "**F**" character will appear on the left side of the display.

Pressing the **SEL** knob downward again causes the transceiver to return to its regular tuning steps (100 Hz per step).

MH-50B7A SWITCHES

① **PTT** Switch
Press this switch to transmit, and release it to receive.

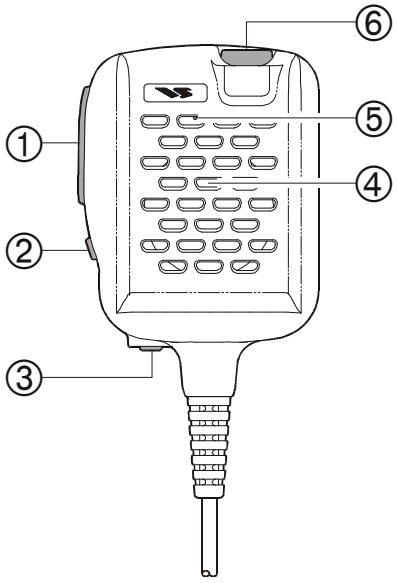
② Dummy Switch
This switch is not activated in this transceiver.

③ **EAR** Jack
You may connect an Earphone to this jack, for improved listening under noisy conditions. Earphone operation requires that the **MH-50B7A**'s loudspeaker be enabled via programming by your Vertex Standard dealer.
When a plug is installed into this jack, the **MH-50B7A**'s internal loudspeaker will be disabled.
Note: The protective rubber cover over the jack must be pulled up to access the jack. Press it back over the jack when does not in use, to protect the inside of the microphone from dust and water.

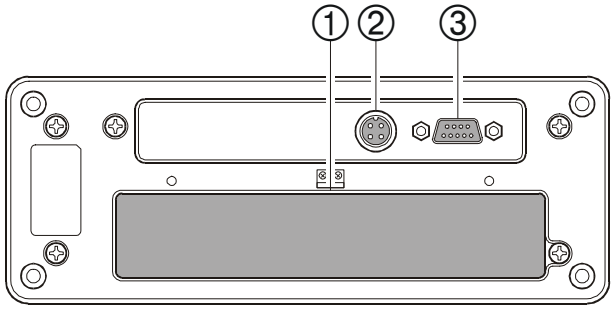
④ Speaker
The loudspeaker for the **MH-50B7A** is located here.

⑤ Microphone
Speak across this opening in a normal voice level while pressing the **PTT** switch.

⑥ Speaker Volume Button
Press this switch to reduce the output level from the **MH-50B7A**'s loudspeaker, if the **MH-50B7A**'s loudspeaker has been enabled (via programming by your Vertex Standard dealer).



REAR PANEL CONNECTORS



① Battery Compartment
This compartment houses allows installation of the **FNB-66LI** Lithium-Ion Battery Pack.

② **CHG** Jack
This 4-pin jack allows connection to the optional **CD-17** Charger.

③ **AUX** Jack (Option)
This optional 9-pin DB-9 jack provides AFSK input/output and CW keying to allow easy interfacing to data communications modem devices.

Note: The protective cover over the **CHG** jack and **AUX** jacks must be removed to access the jacks. Replace it back over the jacks when they are not in use, to protect the inside of the transceiver from dust and water.

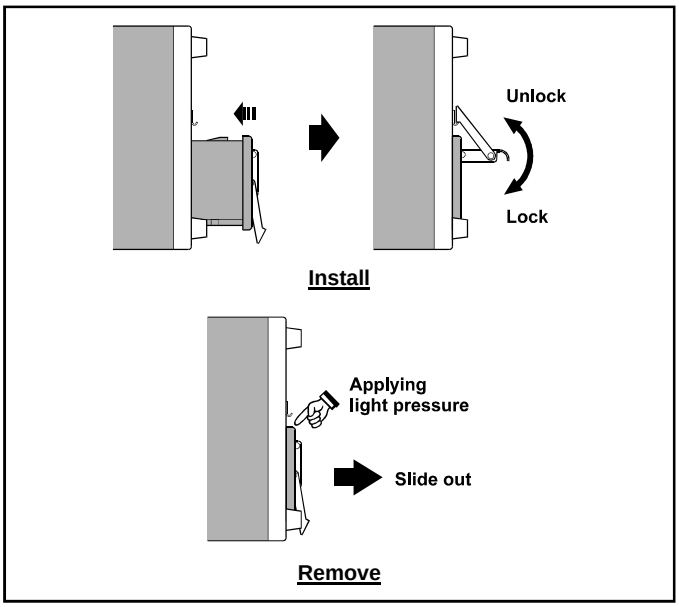
OPERATION

BEFORE YOU BEGIN

Battery Pack Installation and Removal

- ❒ To install the Battery Pack, insert the Battery Pack into the battery compartment on the bottom of the radio, then secure the Battery Pack using the Latch Clip on the Battery Pack.
- ❒ To remove the Battery Pack, turn the radio off and remove any protective cases, then unlatch the clip from the Battery Pack. Place your thumbs on the edge of the Battery pack, then slide out the Battery Pack from the radio while applying light pressure onto it.

Do not attempt to open the Rechargeable Battery Pack, as personal injury or damage to the pack could occur if a cell or cells become accidentally short-circuited.



Battery Charging

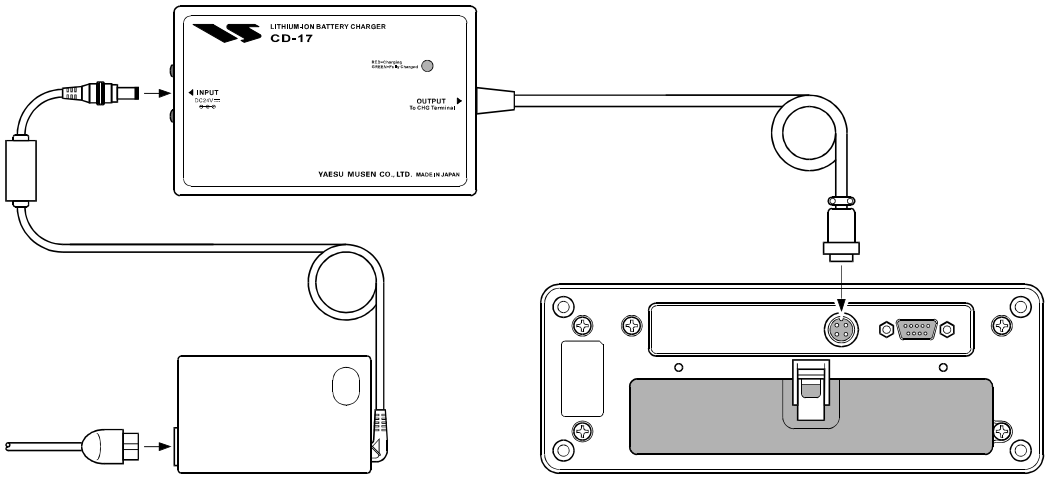
It is necessary to charge the Battery Pack fully before its first use.

1. Install the Battery Pack into the transceiver. Ensure that the transceiver is switched off.
2. Connect the cable plug from the **PA-26** AC Adapter into the **INPUT** jack on the **CD-17** Charger, then insert the cable plug from the **CD-17** Charger into the **CHG** terminal on the bottom of the transceiver.
3. Connect the AC cable into the **AC** jack on the **PA-26** AC Adapter, then plug the **PA-26** AC Adapter into the AC line outlet.
4. The LED indicator on the **CD-17** Charger will glow red (Charging) while the battery is being charged. When charging is completed, the red LED indicator will change to green (Fully Charged). A fully-discharged pack will be charged completely in about five hours.
5. Unplug the cable from the **CHG** terminal, then disconnect the **PA-26** AC Adapter from the AC line outlet.

❒ ***Do not connect an improper Charger into the*** **CHG** ***terminal.***

❒ ***Do not forget to replace the protective cover.***

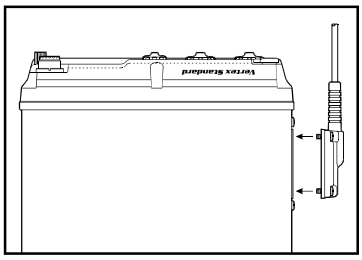
❒ ***In rare instances, the*** **CD-17** ***LED indicator may glow Green (apparently indicating "Fully Charged") immediately when you charge a fully-discharged pack. If this should happen, unplug the cable from the*** **CHG** ***terminal, wait a few seconds, then re-insert the cable plug into the*** **CHG** ***terminal. Normal charging should then begin.***



OPERATION

PRELIMINARY STEPS

1. Install a charged Battery Pack onto the transceiver, as described previously.
2. Connect the **MH-50B7A** Speaker/Microphone onto the transceiver; align the connector of the **MH-50B7A** to the connector on the left side of the transceiver body, then secure the connector using the screws supplied with the **MH-50B7A** Speaker/Microphone.



3. If you use this transceiver with the optional **YA-30** antenna kit, set up the **YA-30** antenna first, then connect the coaxial plug from the **YA-30** to the **ANT** jack of the transceiver.
   ※: When using the **YA-30** dipole antenna, the built-in antenna tuner is not used.
4. If you use this transceiver with the optional whip antenna (**YHA-61** or **FHA-27**w/**GN-1210**), connect the whip antenna onto the **ANT** jack of the transceiver, then connect a good earth ground onto the **GND** terminal of the transceiver using heavy braided cable.

Note: The **VX-1210** can be used either with a Dipole Antenna (like the **YA-30**), or the whip antenna (like the **YHA-61**), depending on the programming of the transceiver by your Vertex Standard dealer. For further details, contact your Vertex Standard dealer.

WHIP ANTENNA SETUP

1. Connect the whip antenna (**YHA-61** or **FHA-27**w/**GN-1210**) and earth ground to the transceiver, as described previously.
2. Press and hold in the **SEL** knob; while holding it in, turn the transceiver on by rotating the **POWER** switch clockwise. "**TU ADJ**" will appear in the display for three seconds, then the display will return to indication of the channel. Once the radio turns on, release the **SEL** knob. The built-in antenna tuner is now engaged.
3. Now, press and hold in the **SEL** knob for 1/2 second to initiate antenna tuning.
4. Repeat step 3 on all operating channels.
5. Turn the transceiver off to save the new settings.

You may set up the whip antenna using the **TOGGLE** switch, if your transceiver's **TOGGLE** switch has been assigned to the Antenna Tuning feature. See page 7 for details regarding Antenna Tuning.

※: Requires Optional **ATU-1210** Built-in Antenna Tuner and **YHA-61** Whip Antenna or **FHA-27** Folding Whip Antenna w/**GN-1210** Goose Neck.

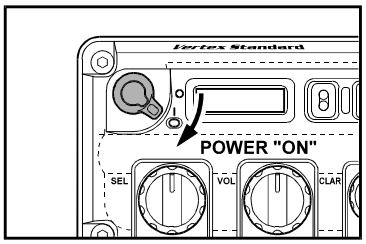
Important Note!

- ❒ If you use the **VX-1210** with the optional whip antenna (**YHA-61** or **FHA-27** w/**GN-1210**), ***MUST BE*** connect a good earth ground onto the **GND** terminal of the **VX-1210** using heavy braided cable to prevent electrical shock and proper performance.
- ❒ The optional whip antenna **YHA-61** is for use only short distance communications. We recommend that using with the optional whip antenna **FHA-27** w/**GN-1210**, optional dipole antenna **YA-30** or other antenna which having the antenna gain, if you wish to communicate with the faraway station.

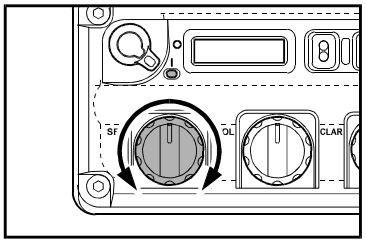
OPERATION

OPERATION QUICK START

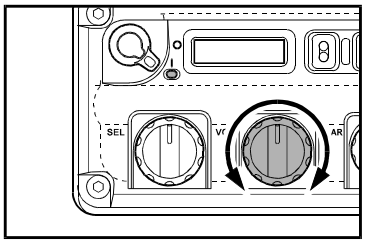
1. Turn the transceiver on by rotating the **POWER** switch clockwise.



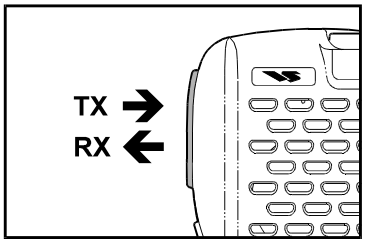
2. Rotate the **SEL** knob to select the desired Memory Channel.



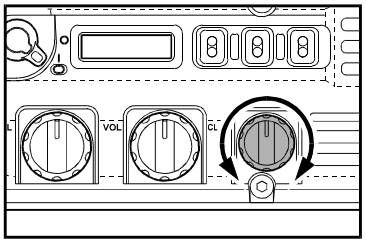
3. Rotate the **VOL** knob to set a comfortable volume level.



4. To transmit, press and hold in the microphone's **PTT** switch, and speak into the microphone in a normal voice level. To return to the receive mode, release the **PTT** switch.



5. If the frequency of the station you are receiving should start to drift, rotate the **CLAR** knob to follow the drifting signal; this does *not* cause your radio's transmitting frequency to move.



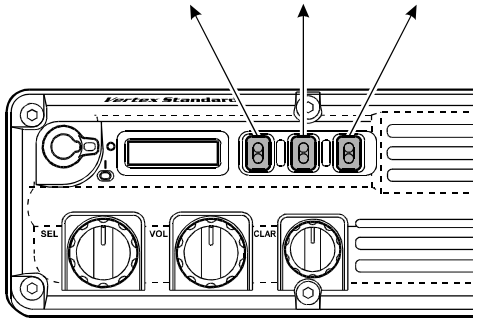
ADVANCED OPERATION

TOGGLE Switch Functions

The **VX-1210**'s **TOGGLE** switch functions can be customized, via programming by the dealer. Some features may require the purchase and installation of optional internal accessories. The possible **TOGGLE** switch programming features are illustrated at the bottom, and their functions are explained on the next page. For further details, contact your Vertex Standard dealer.

For future reference, check the box next to each function that has been assigned to the toggle switch on your particular radio, and keep it handy.

Functions	**A** Switch	**B** Switch	**C** Switch
SELCALL Function	N/A		
High/Low Power Select		N/A	N/A
Noise Blanker on/off		N/A	N/A
Antenna Tuner on/off		N/A	N/A
Antenna Tuning	N/A		
Encryption on/off		N/A	N/A
LAMP on/off			
Display Select (Tag/Frequency)		N/A	N/A
HAIL on/off	N/A		
VFO/Memory Select	N/A		
TELCALL Function	N/A		
Squelch on/off		N/A	N/A
Speaker Select		N/A	N/A
None			



Description of TOGGLE Switch Functions

SELCALL Function

Enables/disables the (optional) Selcall Unit which allow paging and selective calling, if installed. Details for the SELCALL feature are described on next page.

High/Low Power

Selects the transmitter power output level between "High" or "Low."

You will get much longer battery life by switching to Low power operation.

Noise Blanker on/off

Enables/disables the IF Noise Blanker. When the Noise Blanker is activated, it will reduce many different types of manmade impulse noise (but not atmospherics).

Tuner on/off

Enables/disables the Automatic Antenna Tuner.

Antenna Tuning

Press and hold the assigned **TOGGLE** switch into the "ON" position for 1/2 second to initiate antenna tuning. The "**WAIT**" indicator will appear on the display during tuning, and will disappear when a match has been achieved.

If the tuning is successful, the "**TUNE OK**" indication will appear on the display, and the radio will emit a "beep."

Encryption on/off

Enables/disables the (optional) voice encryption unit.

When the voice encryption unit is enabled, the clarifier is disabled.

Remember that disabling the encryption will mean that your transmission are no longer secure. Return to the encrypted mode as soon as possible, and do not discuss any critical or confidential information while in the non-encrypted mode of operation.

LAMP on/off

This feature operates differently, depending on the switch type assigned to this function.

Toggle Switch Type (Switch "**A**")

Move the assigned **TOGGLE** switch into the "ON" position to illuminate the LCD lamp continuously. To disable the LCD lamp, return the assigned **TOGGLE** switch to the "OFF" position.

Momentary Switch Type (Switch "**B**" or "**C**")

Press this switch momentarily, (I) to illuminate the LCD lamp for three seconds, after which the lamp will automatically shut off, or (II) to illuminate the LCD lamp until you press this switch once more (no time limit). These functions are determined via programming by your Vertex Standard Dealer.

LCD Display (Tag/Frequency)

Selects the channel frequency display format between (I) the channel's frequency, or (II) the channel's Alpha/Numeric label (name).

HAIL Function

Turn on the assigned **TOGGLE** switch to activate the "HAIL" feature which emits a loud "Alarm" sound. Use this feature if you want a quick way of alerting other group members as to a dangerous situation.

VFO/MR Select

Selects the frequency control technique between (I) the "VFO" or (II) the "Memory System."

- ❒ Press the assigned **TOGGLE** switch momentarily to toggle frequency control between the VFO and Memory Systems.
- ❒ Press and hold the assigned **TOGGLE** switch in the "ON" position for 1/2 second to copy the memory channel data to the VFO. You may then rotate the **SEL** knob to tune the frequency manually.

TELCALL Function

Enables/disables the TELCALL Function (dialing for Autopatch,) if the optional SELCALL Unit is installed. Details for the TELCALL function are described on page 8.

Squelch on/off

Turn the assigned **TOGGLE** switch to the "upper" position to keep the receiver quiet until a signal is received. Turn the assigned **TOGGLE** switch to the "lower" position to "open" the RF squelch manually, allowing you to listen for very weak signals.

To Adjust the Squelch threshold level:

1. Rotate the **SEL** knob to select a clear channel (where no signals are present).
2. Turn the **TOGGLE** switch (assigned to the "Squelch on/off" feature) to the "upper" position.
3. Press and hold in the **SEL** knob for 5 seconds to enable modification of the squelch threshold level.
4. Rotate the **SEL** knob to the point where the background noise just disappears; this is point of maximum sensitivity to weak signals.
5. Press the **SEL** knob momentarily to save the new setting and exit to normal operation.

Speaker Select

Switches the audio output between the internal speaker or the optional **MH-50B7A** Speaker/Microphone.

ADVANCED OPERATION

SELCALL Operation

The **VX-1210** SELCALL feature allow paging and selective calling using 4-digit codes transmitted as an FSK format. Your receiver remains silent until it receives 4-digit codes that match those stored in a dedicated code memory.

When the SELCALL feature is activated, the clarifier is disabled.

Receiving a SELCALL

When a SELCALL is decoded, an alert ringer sounds for 30 seconds, and appear the ID code of the calling stations (such as "ID1234") will appear in the display. If a private SELCALL is detected, the **VX-1210** send the answer back signal to the calling station automatically before the alert ringer sounds.

Unless you respond, the alert beeper will be heard every three seconds, and the "[**CALL RECEIVED**] ***plus*** the [calling station's ID Code]" will appear in the display until you do respond.

Sending a SELCALL

1. Press the **TOGGLE** switch (assigned to the "SELCALL" feature) momentarily to enable selection of the code memory.
2. Rotate the **SEL** knob to select (display) the code memory of the station you want to SELCALL.
3. Press and hold in the **TOGGLE** switch (assigned to the "SELCALL" feature) for 1/2 second to send the SELCALL.

Manual Sending

If your **VX-1210** has not been programmed with the 4-digit codes for the "SELCALL" feature into the code memory, you can pre-program and send the 4-digit code manually as a temporary measure.

Here is the SELCALL manual sending procedure:

1. Press the **TOGGLE** switch (assigned to the "SELCALL" feature) momentarily.
2. Rotate the **SEL** knob to select (display) "**AUX xxxx**."
3. Press and hold in the **SEL** knob for 1/2 second, then rotate the **SEL** knob to select the first number of the 4-digit code you want to send.
4. Press the **SEL** knob momentarily to step to the next digit's place. Use the **SEL** knob again to select a number and to step to the next entry.
5. After entering all four numbers you want to send, press and hold in the **SEL** knob for 1/2 second to save the 4 digits into the code memory temporarily.
6. Press and hold in the **TOGGLE** switch (assigned to the "SELCALL" feature) for 1/2 second to send the SELCALL.

TELCALL Operation

The **VX-1210** allows easy "TELCALL" Operation for Autopatch dialing.

When the "TELCALL" feature is activated, the clarifier is disabled.

Sending a TELCALL

1. Press the **TOGGLE** switch (assigned to the "SELCALL" feature) momentarily to enable selection of the code memory.
2. Rotate the **SEL** knob to select (display) the code memory of the station you want to SELCALL.
3. Press the **TOGGLE** switch (assigned to the "TELCALL" feature) momentarily to enable to TELCALL feature.
4. Rotate the **SEL** knob to select the Autopatch memory string you wish to send.
5. Press and hold in the **TOGGLE** switch (assigned to the "TELCALL" feature) for 1/2 second to send the TELCALL (corresponding to a telephone number).
6. When the communication is finished, press and hold in the **TOGGLE** switch (assigned to the "TELCALL" feature) for 1/2 second, while holding in the **PTT** switch to send the "Hang-up" signal.

Manual Sending

If your **VX-1210** has not had the telephone number stored into the Autopatch memory, you can pre-program and send the telephone number temporarily.

Here is the manual sending procedure:

1. Call the station that is connected to the telephone system via the SELCALL feature first, as described previously.
2. Press the **TOGGLE** switch (assigned to the "TELCALL" feature) momentarily.
3. Rotate the **SEL** knob to select (display) "**AUX xxxx**."
4. Press and hold in the **SEL** knob for 1/2 second, then rotate the **SEL** knob to select the first digit of the telephone number you want to send.
5. Press the **SEL** knob momentarily to step to the next digit's place. Use the **SEL** knob again to select a number and to step to the next entry.
6. After entering all digits of the telephone number you want to send, press and hold in the **SEL** knob for 1/2 second to save the telephone number into the Autopatch memory temporarily.
7. Press and hold in the **TOGGLE** switch (assigned to the "TELCALL" feature) for 1/2 second to send a TELCALL (corresponding to the telephone number).

ACCESSORIES & OPTIONS

Supplied Accessories

Speaker/Microphone	**MH-50B7A**
Lithium-Ion Battery Pack	**FNB-66LI** (14.4 V, 4800 mAh)
Rapid Charger	**CD-17**
AC Adapter	**PA-26**

Available Options

Internal Antenna Tuner	**ATU-1210**
SELCALL Unit	**SEL-1200**
Whip Antenna	**YHA-61**
Folding Whip Antenna	**FHA-27** (Requires **GN-1210**)
Goose Neck Connector	**GN-1210**
Dipole Antenna (T2FD type)	**YA-30**
Shoulder Bag	**CSC-78**
D-SUB 9-pin Connector Unit	**DSV-1200**
Service Kit	**SVC-1200**

Specifications

General

Frequency Range:	RX: 0.5 ~ 30 MHz, TX: 1.6 ~ 30 MHz
Emission Modes:	A1A (CW), J3E (LSB/USB), H3E (AM), F1B (AFSK)
Synthesizer Steps:	10 Hz
Antenna Impedance:	50 Ω, Unbalanced
Operating Temperature Range:	–30° C to +60° C
Frequency Stability:	±1 ppm
Power Requirements:	DC 14.4V Lithium-ion Battery
Current Consumption:	Receive (Saver off) 0.5 A, Receive (Saver on) 0.1 A, Transmit (20 W) 5 A, Transmit (5 W) 3 A
Case Size:	193 (W) x 74 (H) x 274 (D) mm
Weight (approx.):	3.2 kg with FNB-66LI Lithium-Ion Battery Pack

Transmitter

Power Output:	20 W/5 W (J3E/A1A/F1B), 10 W/2.5 W (H3E) (Selectable)
Modulation Type:	Balanced Modulator (SSB: J3E), Early Stage (Low Level) (AM: H3E)
Spurious Radiation:	56 dB down (Harmonics)
Carrier Suppression:	55 dB
Undesired Sideband Suppression:	55 dB @ 1.5 kHz tone
Audio Response (A3J):	350 to 2650 Hz (–6 dB)
3rd-order IMD:	–31 dB
Microphone Impedance:	2 kΩ, condenser

Receiver

Circuit Type:	Double Conversion Superheterodyne
Intermediate Frequencies:	47.055 MHz & 10.7 MHz
Sensitivity:	0.25 µV (J3E/A1A, 10 dB S/N)
IF Rejection:	80 dB
Image Rejection:	80 dB
Selectivity (–6 dB/–60 dB):	2.4 kHz/5.0 kHz
Audio Output:	At least 1.5 W into 4 Ω @ 10% THD
Clarifier Adjustment Range:	±200 Hz (J3E/A1A/F1B), ±400 Hz (H3E)

Specifications are subject to change without notice or obligation.

SEL-1200 INSTALLATION MANUAL

Installation

- ❒ Make sure that the transceiver is off. Remove the Battery Pack, Microphone, and Antenna from the transceiver.
- ❒ Referring to Figure 1, remove the two screws from the left side of the transceiver.
- ❒ Referring to Figure 2, remove the five screws from the rear panel of the transceiver.
- ❒ Draw off the rear panel and case from the transceiver body.
- ❒ Referring to Figure 3 & 4, connect the supplied connection cable between **J1017** on the **MAIN UNIT** and **J2013** on the **CNTL UNIT**, then route the connection cable as shown in the drawing.
- ❒ Affix the **SEL-1200** SELCALL Unit onto the **MAIN UNIT**, using the supplied double-sided adhesive tape, then connect the 3-pin plug from the **SEL-1200** to **J1013** on the **MAIN UNIT** (Figure 4).
- ❒ Replace the case and rear panel with its seven screws, using care to avoid pinching or damaging the connecting wires and wounding the **MIC** jack.
- ❒ Connect the Battery Pack to the transceiver.

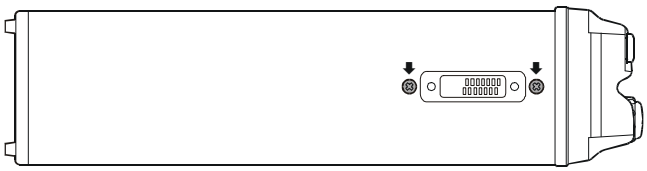


Figure 1

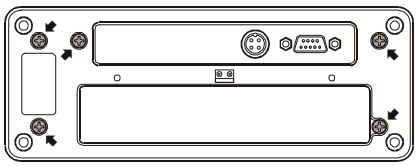

Figure 2

IMPORTANT NOTE!

Do not touch the potentiometer nor the jumper plug of the **SEL-1200**. The **SEL-1200** is carefully aligned at the factory for the specified performance.

Programming

- ❒ Connect the Microphone Box and Programming Cable of the **SVC-1200** Service Kit to the computer's serial port and the transceiver's **MIC** jack.
- ❒ Start the **CE42** Programming Software, then upload the current programming data from the transceiver via the "**Read CH Data**" menu which appears when you press the ([**F4**]: **Transfer**) key.
- ❒ Press the ([**F3**]: **Option**) key to invoke a pop-up window, then select the "**Sel Call Unit**" item, and change its setting to "**on**."
- ❒ Program the SELCALL features (such as the "**Sel Call ID**," "**Sel Call Memory**," etc.), if needed.
- ❒ Press the ([**F3**]: **Option**) key again to close the pop-up window, then turn on the SELCALL feature (on the main screen) on the channel(s) where you wish to operate.
- ❒ Download the revised programming data to the transceiver from the computer via the "**Write CH Data**" menu, which appears when you press the ([**F4**]: **Transfer**) key.
- ❒ Installation and programming are now complete.
- ❒ Disconnect the Programming Cable from the transceiver's **MIC** jack.

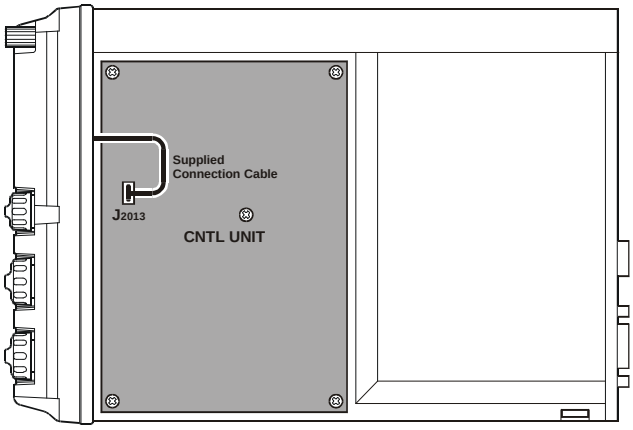

Figure 3

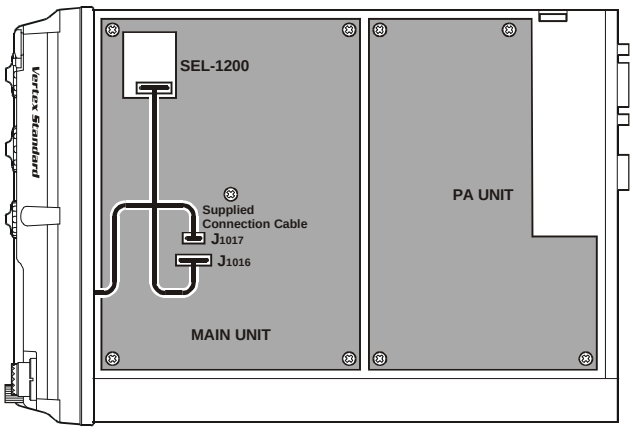

Figure 4

ATU-1210 INSTALLATION MANUAL

Installation

- ❒ Make sure that the transceiver is off. Remove the Battery Pack, Microphone, and Antenna from the transceiver.
- ❒ Referring to Figure 1, remove the two screws from the left side of the transceiver.
- ❒ Referring to Figure 2, remove the five screws from the rear panel of the transceiver.
- ❒ Draw off the rear panel and case from the transceiver body.
- ❒ Referring to Figure 3, disconnect the coaxial cable from **J3005** on the **PA UNIT**.
- ❒ Referring to Figure 4, disconnect the coaxial cable from **J8101** on the **CONNECTION UNIT**, then remove two screws affixing the **CONNECTION UNIT** and detach the **CONNECTION UNIT** from the transceiver.
- ❒ Mount the **ATU-1210** Internal Antenna Tuner to the transceiver using the supplied five screws, then connect the coaxial cable (which was disconnected from **J8101** in the previous step) to **J1001** on the **ATU-1210** (Figure 5).
- ❒ Referring to Figures 5 and 6, route the coaxial cable from **JP1002** on the **ATU-1210** as shown in the drawing, then connect this cable to **J3005** on the **PA UNIT**.
- ❒ Referring to Figures 5, 6, and 7, route the connection cable from **JP1001** on the **ATU-1210** as shown in the drawing, then connect it to **J2010** on the **CNTL UNIT**.
- ❒ Bundle the cables using the two supplied Cable Ties (Figure 6).
- ❒ Replace the case and rear panel with its seven screws, using care to avoid pinching or damaging the connecting wires and wounding the **MIC** jack.
- ❒ Connect the Battery Pack to the transceiver.

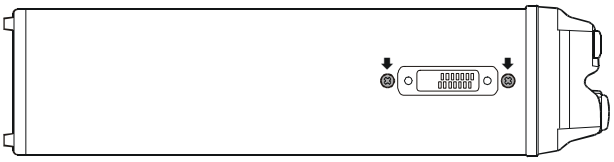

Figure 1

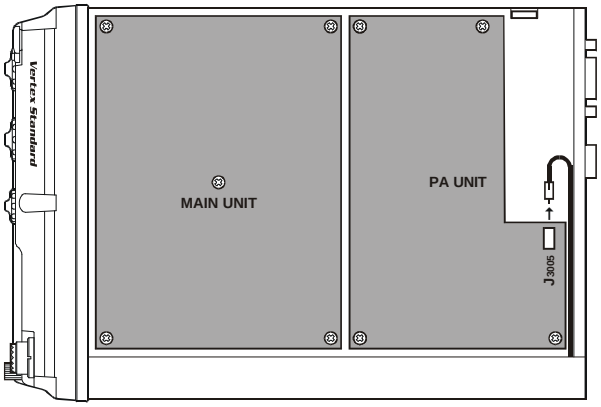

Figure 3

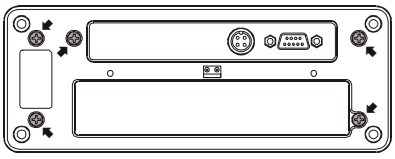

Figure 2

Programming

- ❒ Connect the Microphone Box and Programming Cable of the **SVC-1200** Service Kit to the computer's serial port and the transceiver's **MIC** jack.
- ❒ Start the **CE42** Programming Software, then upload the current programming data from the transceiver via the "**Read CH Data**" menu, which appears when you press the ([**F4**]: **Transfer**) key.
- ❒ Press the ([**F3**]: **Option**) key to invoke a pop-up window, select the "**Tuner Unit**" item, and then change its setting to "**on**."
- ❒ Press the ([**F3**]: **Option**) key again to close the pop-up window, then turn on the "Tune Mode" (on the main screen) on the channel(s) where you wish to operate.
- ❒ Download the revised programming data to the transceiver from the computer via the "**Write CH Data**" menu, which appears when you press the ([**F4**]: **Transfer**) key.
- ❒ Installation and programming are now complete.
- ❒ Disconnect the Programming Cable from the transceiver's **MIC** jack.

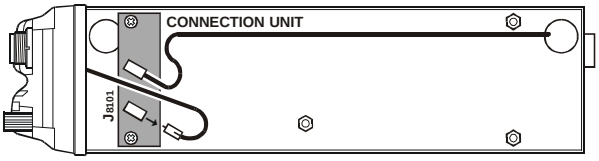

Figure 4

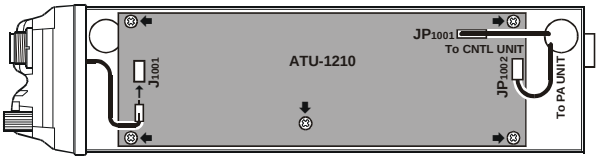

Figure 5

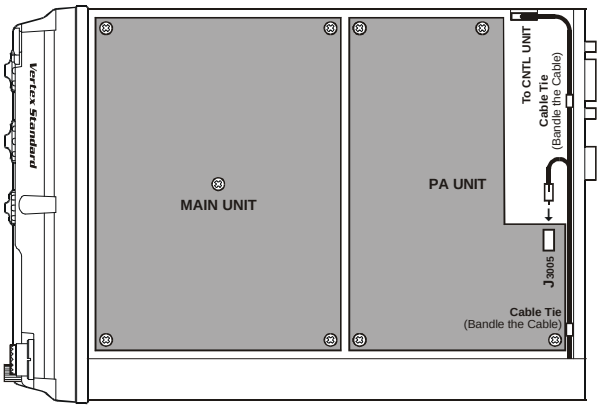

Figure 6

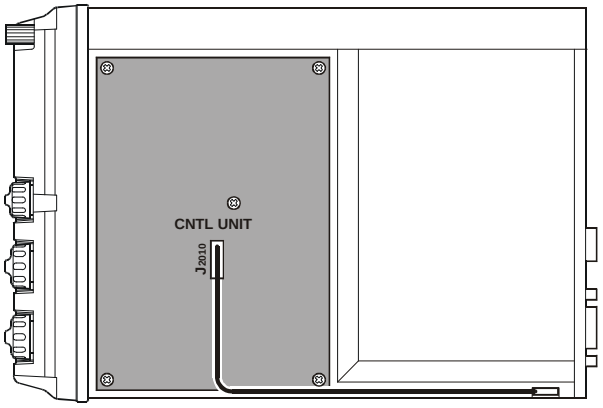

Figure 7

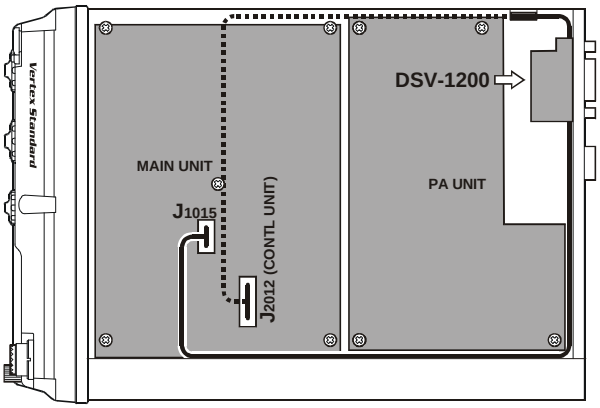
DSV-1200 INSTALLATION MANUAL

Installation

- ❒ Turn the transceiver off, remove the Battery Pack from the transceiver.
- ❒ Disconnect the Microphone from the **MIC** Jack.
- ❒ Remove the five screws affixing the Rear Panel, and remove the Rear Panel.
- ❒ Remove the two screws which located on the **MIC** Jack on the left side of the transceiver.
- ❒ Slide the transceiver cover toward the rear to remove it.
- ❒ Remove the two screws affixing the dummy cover on the rear chassis, and remove the dummy cover.
- ❒ Mount the **DSV-1200** to the rear chassis using the supplied two hex screws.
- ❒ Connect the 3-pin connector from the **DSV-1200** to the **J1015** on the MAIN UNIT, and connect the 7-pin connector from the **DSV-1200** to the **J2012** on the CNTL UNIT.
- ❒ Replace the transceiver cover, ensuring no wires are pinched, then replace the two screws.
- ❒ Replace the rear panel and its five screws.
- ❒ Installation is now complete.



TOP View

Operation

CW Operation

- ❒ Program the operating frequency and CW delay time which you wish to operating on CW mode via the CE36 Channel Editor.
- ❒ Connect the CW key to the pin 3 (Signal) and pin 6 (GND) of the **DSV-1200** (D-SUB 9-pin) Jack on the rear panel.

DATA (AFSK) Operation

- ❒ Program the operating frequency which you wish to operating on DATA mode via the CE42 Channel Editor.
- ❒ Connect the AFSK modem to the follwing pins of the **DSV-1200** (D-SUB 9-pin) Jack on the rear panel.
  - Pin 4: PTT
  - Pin 6: GND
  - Pin 8: DATA IN (50 ~ 100 mV @ 10 kΩ)
  - Pin 9: DATA OUT (approx. 200 mV @ 1 kΩ)

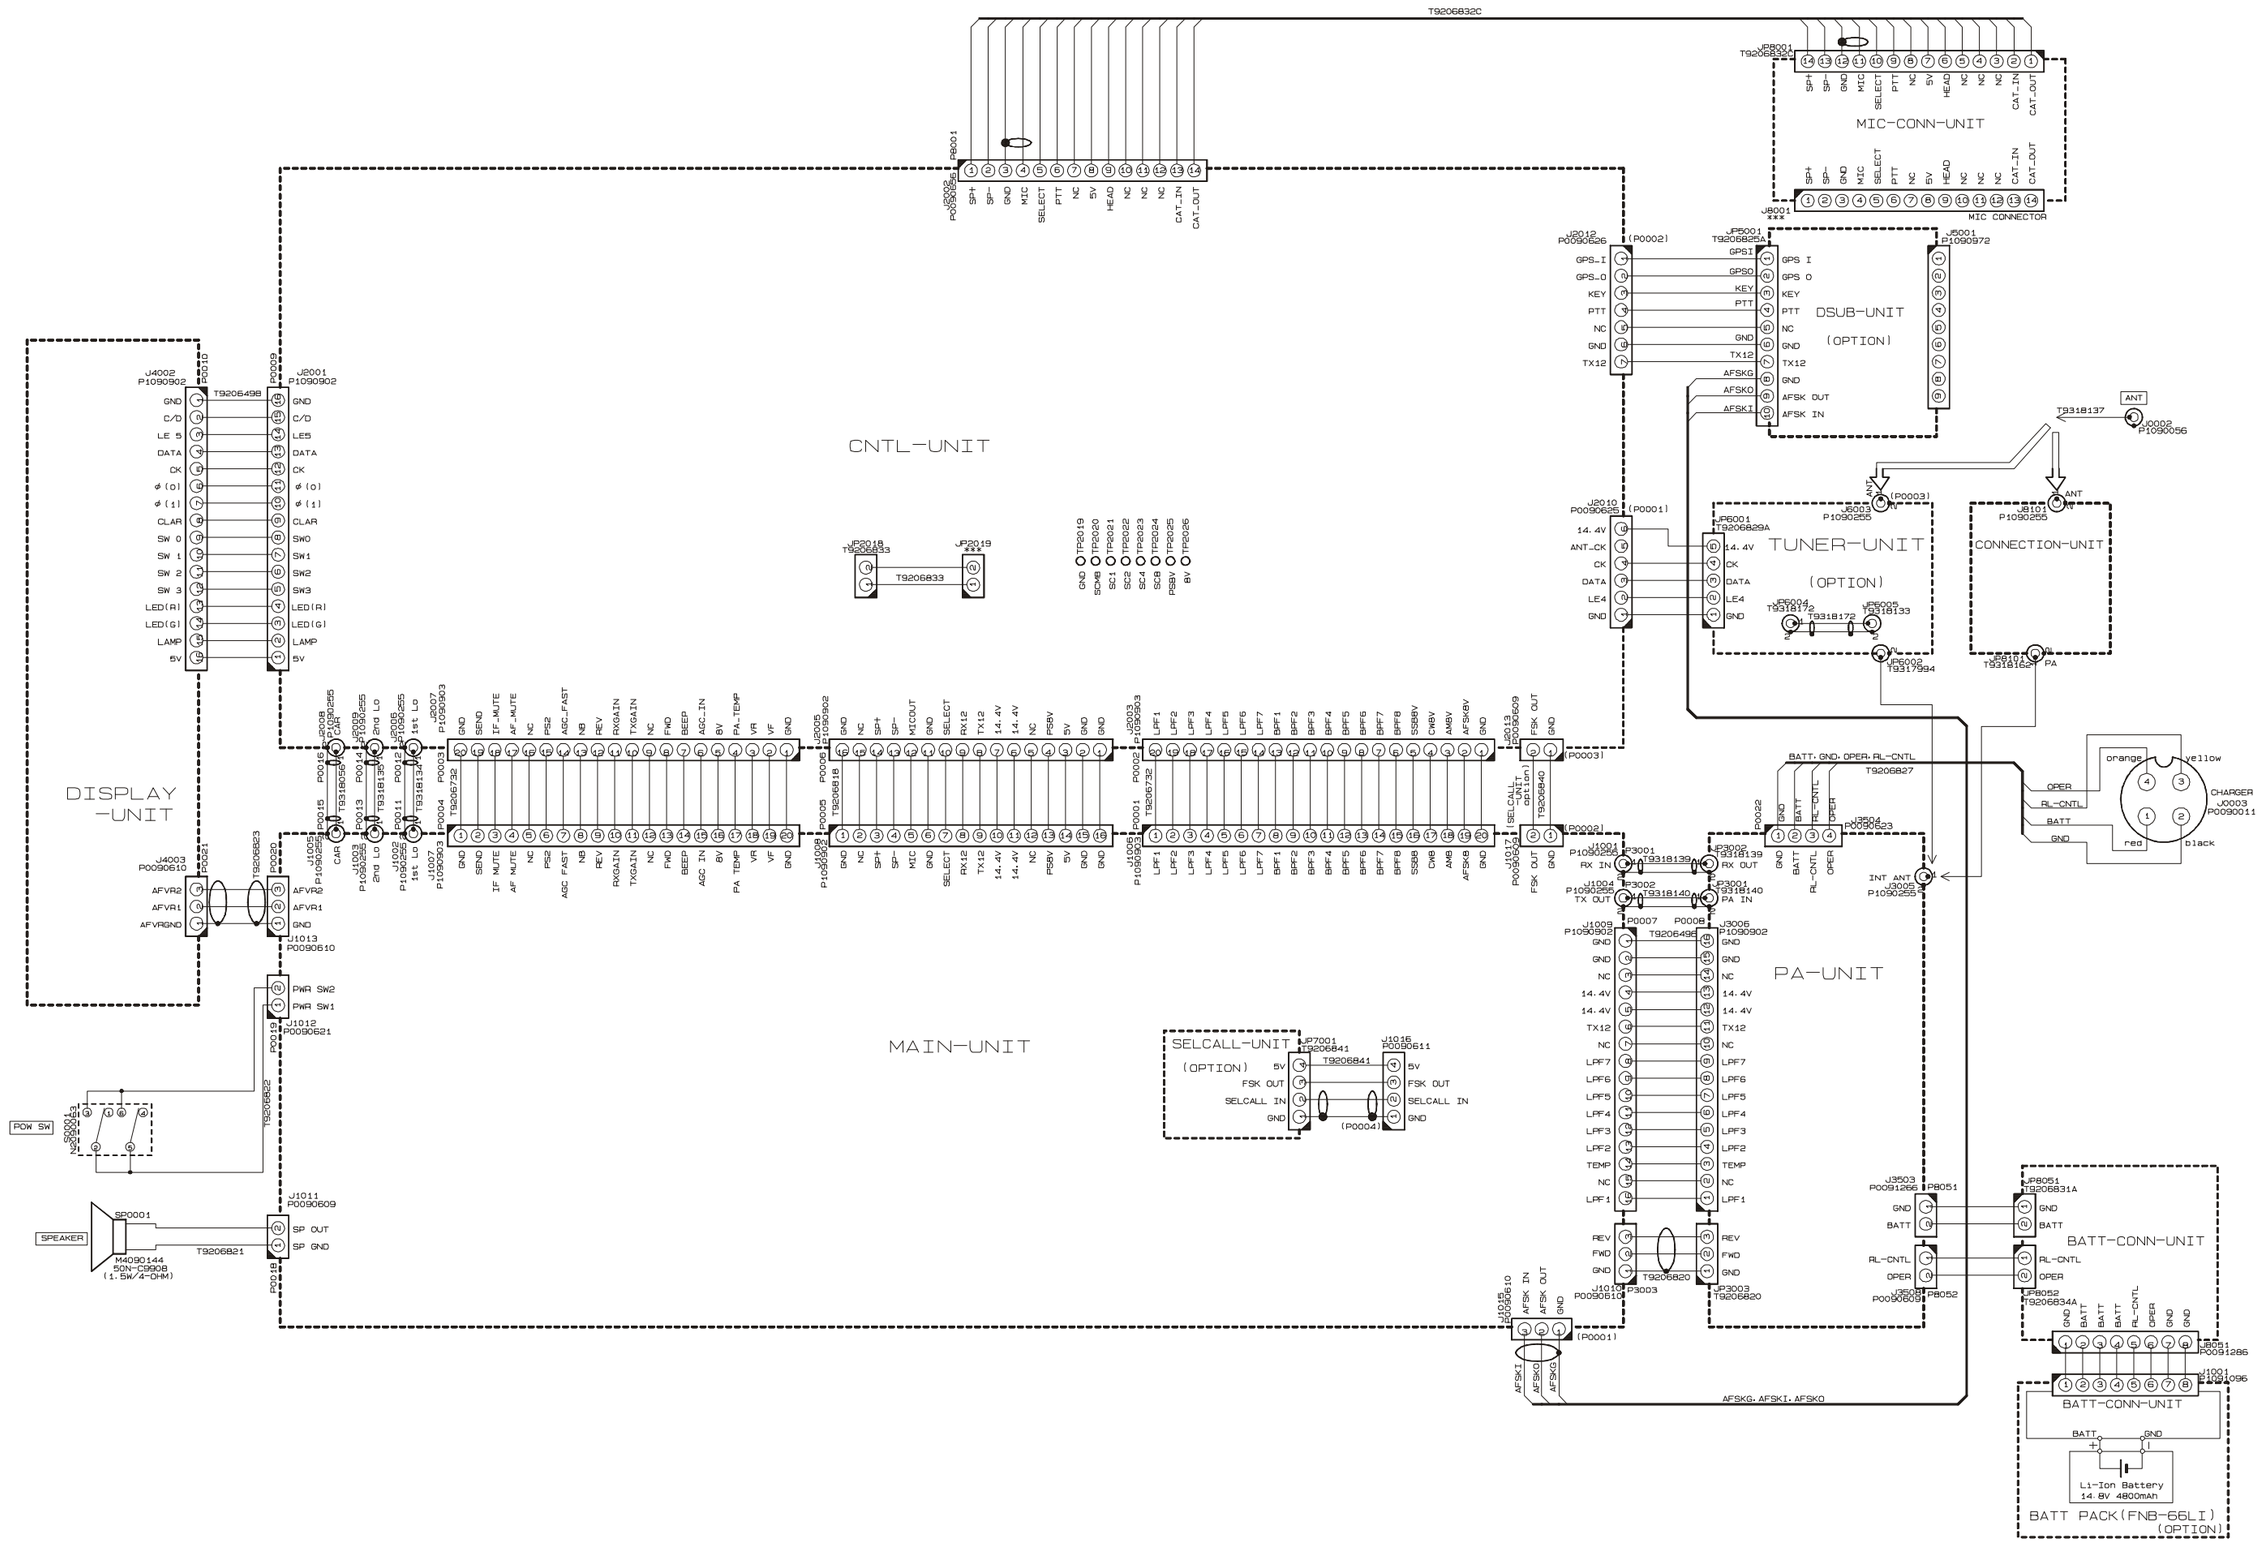
Interconnection Diagram



Receive Signal Path

Incoming RF signal from the ANT jack is delivered to J3005 on the PA Unit, and passes through the TX/RX relay RL3013 to the low-pass filter which consists of the coils L3016 & L3017 and capacitors C3050, C3051, & C3052 which cut-off frequency is 30 MHz.

The RF signal is then applied to J1001 on the MAIN Unit, and passed through the limitter circuit consist of **D1001**, **D1002**, **D1003**, and **D1004** (all **1SS244**) to prevent the distortion from the high RF input and one of eight band-pass filters which strip away unwanted signals to the RF amplifier **Q1001** and **Q1002** (both **2SK520-K41**).

The amplified RF signal is applied to the double balanced mixer **D1009** (**HSB88WS**) where the RF signal is mixed with 1st local signal delivered from buffer **Q1005** (**2SC2954**), resulting in a 47.055 MHz 1st IF signal.

The 47.055 MHz 1st IF signal is fed through the monolithic crystal filter **XF1001** (**47M15AU**) which strip away unwanted mixer products, and then the 1st IF signal is applied to the 2nd mixer **Q1006** (**3SK151GR**), where it is mixed with the 36.355 MHz 2nd local signal delivered from buffer amplifier **Q2038** (**2SC2714Y**) on the Control Unit, resulting in a 10.7 MHz 2nd IF signal.

The 10.7 MHz 2nd IF signal is fed through the Noise Blanker Gate **D1014** & **D1015** (both **1SS302**) and 2nd IF filter **XF1002** (**10M2.4D**) to the 2nd IF amplifier **Q1007**, **Q1008**, & **Q1009** (all **3SK151GR**).

A portion of the 2nd IF signal is amplified by **Q1011** & **Q1012** (both **3SK151GR**), and then detected (with twofold voltage amplitude) by diode **D1016** (**HSM198S**). This detected output controls the gain of above-mentioned FET by an average AGC voltage responsible for AGC amplifier **Q1013** (**2SC2812**). Also, noise pulse contained in the detected output is amplified by the **Q1014** (**2SC2812**) to be utilized for controlling Noise Blanker Gate **D1014** & **D1015**.

In SSB, CW and FSK modes, the amplified 2nd IF signal from **Q1009** is applied to the product detector diode **D1024** & **D1025** (both **HSM198S**).

In AM mode, the amplified 2nd IF signal from **Q1009** is fed through the buffer amplifier **Q1015** (**2SC2812**) and AM detector diodes **D1021** & **D1022** (both **HSM198S**).

The audio signal from the selected detector is amplified by AF preamplifier **Q1023** (**M5218AFP**). The audio signal is then fed through the AF mute gate **Q1025** (**TC4S66F**) and front panel AF potentiometer **VR4001**, then back to audio amplifier **Q1027** (**TDA2822D**) and **Q1058** (**TDA7235**).

A portion of the output of AM detector diodes **D1021** & **D1022** is amplified by AGC amplifier **Q1016** (**2SC2812**). The amplified DC voltage is fed through the buffer amplifier **Q1018** (**2SC2812**) to the RF amplifier **Q1002** and also the amplified DC voltage is fed to the 2nd gates of the IF amplifiers **Q1007**, **Q1008**, & **Q1009**, to reduce their gain when strong signals are present in the receiver passband.

When pulse type noise is received, a sample of the 2nd IF signal from **Q1006** is amplified by **Q1011** & **Q1012** (both **3SK151GR**) before application to pulse detector **D1016** (**HSM198S**). The resulting DC pulse switches noise blanker gate controller **Q1014** (**2SC2812**), which interrupts the 2nd IF signal at noise blanker gate **D1014** & **D1015** during the length of the noise pulse.

The DC voltage from the pulse detector is also amplified by **Q1013** (**2SC2812**) and fed back to 2nd gates of the AGC amplifier **Q1011** & **Q1012** as noise blanker AGC.

Transmit Signal Path

The speech audio from the microphone is delivered to J8001 on the MIC-CONN Unit, then applied to the J2002 on the CNTL Unit.

The speech audio is amplified by **Q2046** (**NJM4558V**) and **Q2050** (**M5218AFP**), then passed though the MIC gain potentiometer VR1001, and further amplified by **Q1043** (**2SC2812**) before application to balanced modulator **D1036** (**HSB88WS**). The modulator also receives 10.7 MHz carrier signal from buffer amplifier **Q1022** (**2SC2812**).

The modulated signal is delivered to the crystal filter **XF1002** where is stripped unwanted sideband. The resulting 10.7 MHz single sideband signal is buffered by **Q1045** (**2SK302GR**) and then applied to single balanced mixer **Q1046** (**3SK151GR**) which receives 36.355 MHz local signal from buffer amplifier **Q2038** on the CNTL Unit. In AM mode, the single balanced mixer **Q1046** also receivers 10.7 MHz carrier signal from buffer amplifier **Q1022** to resulting the double sideband (AM) signal.

The resulting the 47.055 MHz IF signal is fed through the monolithic crystal filter **XF1001** which strip away unwanted mixer products, and then amplified by **Q1048** (**3SK151GR**). The amplified IF signal is delivered to double balanced mixer **D1009**, where it is mixed with the PLL local signal from the buffer amplifier **Q1005** (**2SC2954**).

The resulting the RF signal at the transmit frequency is fed through the TX amplifier **Q1049** (**2SC2714Y**) and buffer amplifier **Q1050** (**2SC3357**), and then filtered by one of eight bandpass filters to suppress out-of-band mixer products. The RF signal is then amplified by **Q1051** (**2SC2954**) and delivered to PA Unit.

On the PA Unit, the low-level RF signal from the Main Unit is amplified by pre-drive **Q3501** (**2SC2166**), push-pull driver **Q3502/Q3503** (both **2SC2166**), and then push-pull final amplifier **Q3504/Q3505** (both **2SC3133**), which provides approximately 20 watts RF output power.

The RF output from the final amplifier is fed through the one of six low-pass filters, sampling directional coupler T3001, and TX/RX relay RL3014 before delivery to the antenna jack.

The sampling directional coupler senses forward and reverse power output, which is rectified by **D3001/D3005** & **D3002/D3006** (all **1SS106**) respectively for return to the ALC and SWR sensing circuitry on the Main Unit. The DC voltages derived from forward and reverse power are applied in combination to

op-amp **Q1053** (**M5218AFP**), the output which is buffered by **Q1055** (**2SC2812**), then fed back to the 2nd gate of the 47.055 MHz IF amplifier **Q1048**, so that transmitter IF gain is regulated by relative power output, thus preventing overdrive or transmission into an excessive impedance mismatch at the antenna.

PLL Circuit

The PLL local signal for the receiver 1st local and the transmitter final local is generated by one of three VCOs: **Q2017**, **Q2018**, & **Q2019** (all **2SK210GR**) in conjunction with varactor diodes **D2008**, **D2009**, & **D2010** (all **HVU359**) on the CNTL Unit. The oscillating frequency is determined primarily by the level of DC voltage applied to the varactor diodes. The VCO output is buffered by **Q2011** (**2SK302Y**), amplified by **Q2025** (**2SC535B**) and bandpass filtered by capacitor C2088, C2091, C2093, C2095, C2096, & C2099 and coils L2012, L2013, L2015, & L2016. The filtered PLL local signal is applied to the J1002 on the Main Unit, then fed through the buffer amplifiers **Q1003** (**2SC2714Y**), **Q1004** (**2SC3356**), and **Q1005** (**2SC2954**) to the TX final mixer/RX 1st mixer **D1009**.

A portion of the output of buffer amplifier **Q2011** is further amplified by **Q2006** (**2SC2714Y**) and delivered to the PLL subsystem IC **Q2001** (**LM7001JUM**), which contains a reference divider, serial-to-parallel data latch, programmable divider, phase comparator and a swallow counter. The sample VCO signal is divided by the programmable divider section of the **Q2001**. Meanwhile, the 36.355 MHz crystal reference oscillator X2002 and **Q2037** (**2SC2714Y**) amplified by **Q2036** & **Q2033** (both **2SC2714Y**) and is divided by the DDS IC **Q2024** (**AD9850BRS**) in accordance with the PLL dividing data from the main CPU **Q2030** (**HD64F2134FA20**), then applied to the low-pass filter which consist of capacitors C2034, C2036, C2037, C2038, C2041, C2046, C2047, C2051, & C2053 and coils L2002, L2003, L2004, & L2006. The divided and filtered reference signal is applied to the reference divider section of the PLL subsystem IC **Q2001**, where divides it by 72 to produce the loop reference.

The divided signal from the programmable divider (derived from the VCO) and that derived from the reference oscillator are applied to the phase detector section of the PLL subsystem IC **Q2001**, which produces a pulsed output with pulse duration depending on the phase difference between the input signals. This pulse train is low-pass filtered by **Q2003** (**2SK208Y**) & **Q2004** (**2SC2812**), then fed back to the VCO varactor diodes **D2008**, **D2009**, & **D2010**.

Changes in the DC voltage applied to the varactor diodes **D2008**, **D2009**, and **D2010** affect the reactance in the tank circuit VCO **Q2017**, **Q2018**, and **Q2019**, changing the oscillating frequency according to the phase difference between the signals derived from the VCO and the crystal reference oscillator. The VCO is thus phase-locked to the reference frequency standard.

A portion of the output of reference signal from **Q2037** is buffered by **Q2038** (**2SC2714Y**), then applied to the low-pass filter which consist of capacitors C2155 ~ C2159 and coils L2024 & L2025. The filtered reference signal delivered to J1003 on the Main Unit, then applied to the 2nd gate of the TX 1st mixer Q1046 and 2nd gate of the RX 2nd mixer **Q1006**.

A portion of the output of reference signal from **Q2033** is applied to further DDS IC **Q2032** (**FQ7928**) where the reference signal is devided to 10.7 MHz carrier signal accordance with the PLL dividing data from the main CPU **Q2030**, then applied to the buffer amplifier **Q2035** (**2SC2812**). The amplifed carrier signal is fed through the low-pass filter consist of capacitors C2117, C2119, & C2122 ~ C2126 and coils L2020 ~ L2022 to J1005 on the Main Unit, then fed through the carrier amplifier **Q1022** (**2SC2812**) to the detector diode **D1024** & **D1025** and balanced modulator **D1036**.

Control Circuit

Major frequency control functions such as memory selecting, display, and PLL divider control are performed by main CPU **Q2030** (**HD64F2132RF**) on the CNTL Unit, at the command of the user via the tuning knob and function switches on the front panel.

The programmable divider data for the PLL from main CPU **Q2030** is applied directly to DDS IC **Q2024** (**AD9850BRS**) & **Q2032** (**FQ7928**) and PLL subsystem IC **Q2001** (**LM7001JUM**).

The MODE selection data from the main CPU **Q2030** is level shifted by **Q2007** ~ **Q2010** (all **FMC3**) to control the various circuit required for the selected mode.

The BAND selection binary data from the main CPU **Q2030** is BCD-to Decimal decoded by **Q2021** (**TC4028BF**). The resulting decimal outputs are level shifted by **Q2015** (**TD62083F**) to select the active band-pass filter on the Main Unit required for the operating frequency. Also, the decimal outputs from **Q2021** are delivered to PA Unit, then level shifted by **Q3001** ~ **Q3006** and **Q3009** (all **FMC5A**) to select the active low-pass filter required for the operating frequency.

TX/RX Control

When press the PTT switch, pin 22 of main CPU **Q2030** (**HD64F2134FA20**) goes low. This signal disable the receiver 12 V bus at **Q2022** (**2SA1179**). At the same time, activate the transmit 12 V bus at **Q2016** (**2SA1365**).

Power Supply & Regulation

The +5 V bus for the main CPU is derived from the 13.5 V bus via regulator **Q2050** (**NJM78L05UA**) on the CNTL Unit.

The +5 V bus is derived the from the 13.5 V bus by switching regulator **Q2043** (**IR3M03A**) and rectified **D2016** (**11EQS04**) and L2028. A portion of the +5 V is switched by **Q2044** (**2SC4047**) & **Q2047** (**2SA1365**) on the CNTL Unit, under control of the main CPU **Q2030** via pin 58.

The +8 V bus is derived from the 13.5 V bus via regulator **Q2048** (**KIA7808API**) on the CNTL Unit.

The VX-1210 is carefully aligned at the factory for the specified performance across the entire operating frequency range. Realignment should therefore not be necessary except in the event of a component failure. All component replacement and service should be performed only by an authorized Vertex Standard representative, or the warranty policy may be void.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts subsequently are placed, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed only by authorized Vertex Standard service technicians who are experienced with the circuitry and fully equipped for repair and alignment. Therefore, if a fault is suspected, contact the dealer from whom the repeater was purchased for instructions regarding repair. Authorized Vertex Standard service technicians realign all circuits and make complete performance checks to ensure compliance with factory specifications after replacing any faulty components.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Vertex Standard reserves the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners.

Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards.

Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Have all test equipment ready before beginning, and follow all of the steps in a section in the order presented.

Required Test Equipment

- ❒ RF Signal Generator with calibrated output level at 30 MHz
- ❒ Spectrum Analyzer
- ❒ In-line Wattmeter with 5 % accuracy at 30 MHz
- ❒ 50 Ω RF Dummy Load with power rating 50W at 30MHz
- ❒ Frequency Counter with 0.02 ppm accuracy at 40 MHz
- ❒ AF Signal Generator
- ❒ AC Voltmeter
- ❒ DC Voltmeter: High input impedance
- ❒ DC Ammeter
- ❒ HF Sampling Coupler
- ❒ IBM PC / compatible Computer with MS-DOS or later operating system
- ❒ Vertex Standard **SVC-1200** Service Set & **CE42** Channel/ Alignment Diskette

Alignment Preparation & Precautions

A 50 Ω RF Dummy Load and in-line wattmeter must be connected to the ANT jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna.

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, in connected) before proceeding.

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 68 °F and 86 °F (20 °C ~ 30 °C). When the transceiver is brought into the shop from hot or cold air, it should be allowed time to come to room temperature before alignment.

Whenever possible, alignments should be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

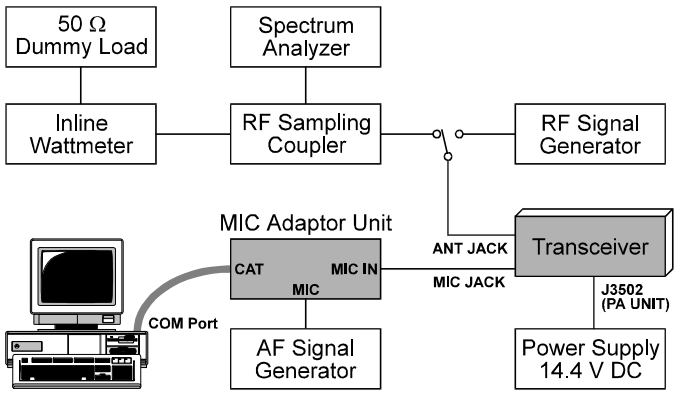
Note: Signal levels in dB referred to in the alignment procedure are based on 0dBµ = 0.5µV (Closed Circuit).

Alignment

Set up the test equipment as shown below, and apply 14.4V DC power to the transceiver.

The VX-1210 must be programmed for use in the intended system before alignment is attempted. The frequency and other parameters are loaded from the file during the alignment process.

In order to facilitate alignment over the complete switching range of the equipment it is recommended that the channel data first be uploaded and then stored to disk. Alignment Channel data should then be downloaded. The original data can be replaced at the end of the alignment process.



VX-1210 Alignment Setup

PLL Alignment

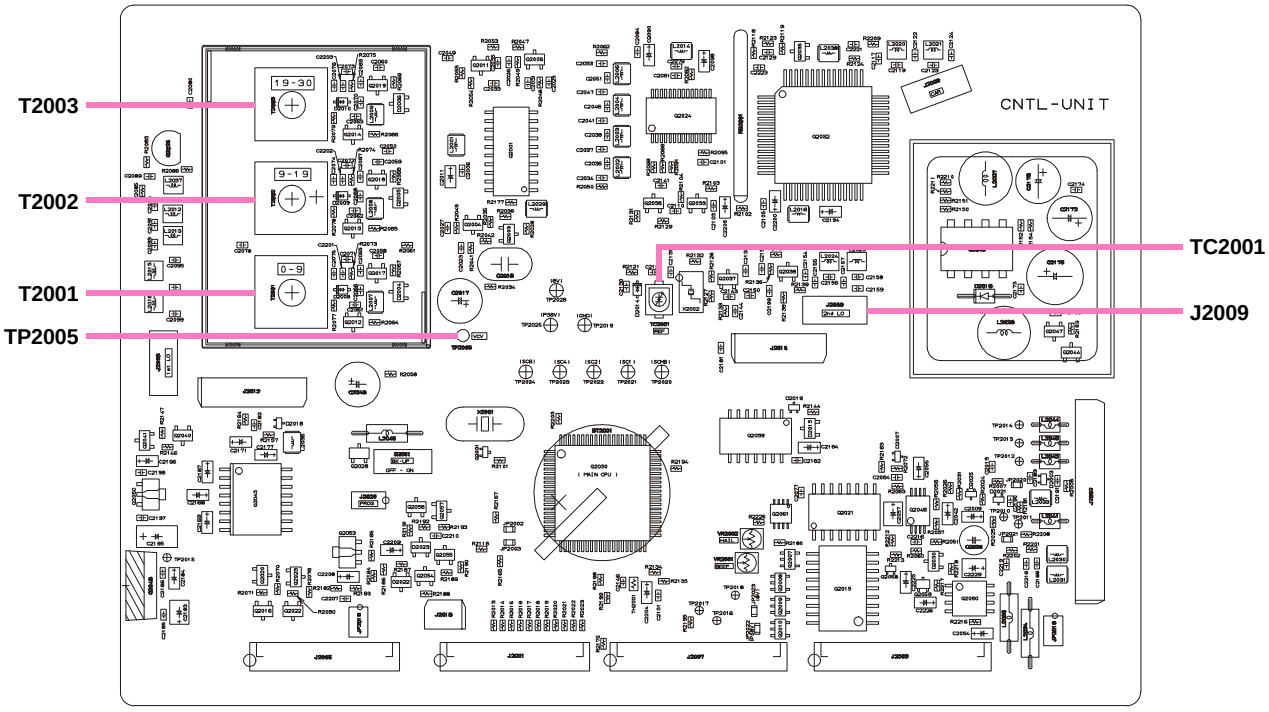
PLL Reference Frequency Alignment

- ❒ Remove the coaxial plug from **J2009** on the CNTL Unit, and connect the Frequency Counter to **J2009**.
- ❒ Adjust **TC2001** on the CNTL Unit for 36.355 MHz ±10 Hz on the frequency Counter.

VCO VCV Alignment

- ❒ Connect the DC voltmeter to **TP2005** on the CNTL Unit, and referring Table below, turn the transceiver to each channel listed. Then adjust the listed component for the required voltage or confirm that the correct voltage is present.

Tune to	Adjust or Confirm	For
"**VCO 1 U**" channel (8.99999 MHz, USB)	**T2001**	6.0 V ± 0.1 V
"**VCO 1 L**" channel (0.50000 MHz, USB)	Confirm	1.3 ~ 2.3 V
"**VCO 2 U**" channel (18.9999 MHz, USB)	**T2002**	6.0 V ± 0.1 V
"**VCO 2 L**" channel (9.00000 MHz, USB)	Confirm	1.0 ~ 2.0 V
"**VCO 3 U**" channel (30.00000 MHz, USB)	**T2003**	6.0 V ± 0.1 V
"**VCO 3 L**" channel (19.00000 MHz, USB)	Confirm	1.0 ~ 2.0 V



CNTL Unit Alignment Points

Receiver Alignment

RX IF Coils Alignment

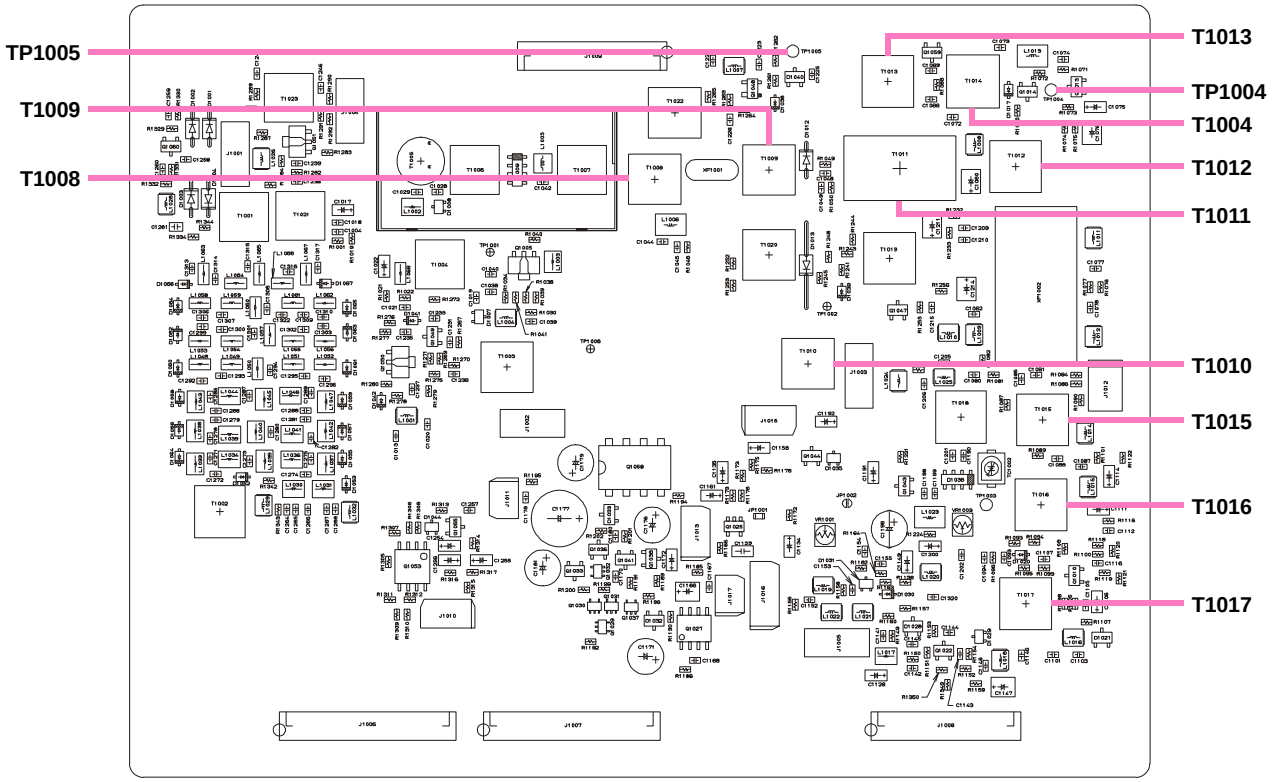
- ❒ Connect the RF Signal Generator to ANT jack, and connect the DC voltmeter to **TP1005** on the MAIN Unit.
- ❒ Select the "**RX IF**" channel (10.15000 MHz, CW).
- ❒ Inject a signal from the RF Signal Generator to 10.15100 MHz, then adjust the RF Signal Generator output level so that the DC voltmeter reading is approximately 3 V.
- ❒ Adjust **T1008**, **T1009**, **T1010**, **T1011**, **T1012**, **T1015**, **T1016**, and **T1017** in succession several times for minimum indication on the DC Voltmeter.

RX Gain Alignment

- ❒ Connect the RF Signal Generator to ANT jack, and connect the DC voltmeter to **TP1005** on the MAIN Unit.
- ❒ Select the "**RX IF**" channel (10.15000 MHz, CW), and recall the [**RX GAIN**] parameter on the computer.
- ❒ Inject a signal from the RF Signal Generator to 10.15100 MHz, then adjust the RF Signal Generator output level for 6 dBμ.
- ❒ Press the [**F10**] key to activate the **SPOT-ADJ** mode, then press the [**SHIFT**] + [▲]/[▼] keys so that the difference of the DC Voltmeter reading is 0.1 V ±0.05 V when the RF Signal Generator on and off.
- ❒ Press the [**F2**] key to save the alignment value to the transceiver.

Noise Blanker Alignment

- ❒ Connect the RF Signal Generator to ANT jack, and connect the DC voltmeter to **TP1004** on the MAIN Unit.
- ❒ Select the "**RX IF**" channel (10.15000 MHz, CW).
- ❒ Inject a signal from the RF Signal Generator to 10.15100 MHz, then adjust the RF Signal Generator output level so that the DC voltmeter reading is approximately 3 V.
- ❒ Adjust **T1013** and **T1014** for minimum indication on the DC Voltmeter.



MAIN Unit Alignment Points [1]

Alignment

Transmitter Alignment

MIC Gain Alignment

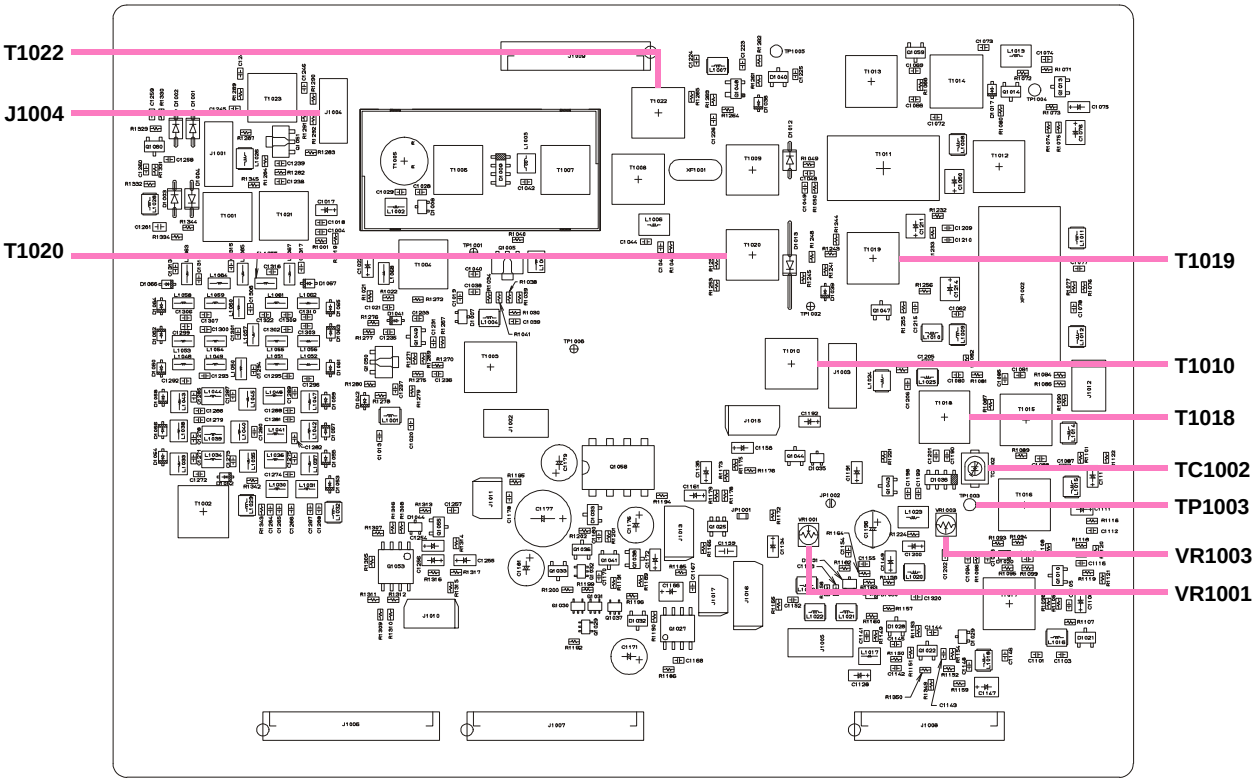
- ❒ Connect the AF millivoltmeter to **TP1003** on the MAIN Unit.
- ❒ Connect the AF Generator to the **MIC IN** jack on the MIC Adapter Unit.
- ❒ Select the "**TX IF**" channel (10.25000 MHz, USB).
- ❒ Inject a signal from the AF Generator to 1500 Hz, then adjust the AF Generator output level for 8 mV.
- ❒ Key the transmitter, adjust **VR1001** on the MAIN Unit for 30 mV ± 3 mV on the AF millivoltmeter.

TX IF Coils Alignment

- ❒ Remove the coaxial plug from **J1004** on the MAIN Unit, then connect the RF millivoltmeter and 50 Ω resistor to **J1004**.
- ❒ Connect the AF Generator to the **MIC IN** jack on the MIC Adapter Unit.
- ❒ Select the "**TX IF**" channel (10.25000 MHz, USB).
- ❒ Inject a signal from the AF Generator to 1500 Hz, then adjust the AF Generator output level so that the RF millivoltmeter reading is approximately 0 dBm.
- ❒ Key the transmitter, adjust **T1010**, **T1018**, **T1019**, **T1020**, and **T1022** on the MAIN Unit in succession several times for maximum indication on the RF millivoltmeter.
- ❒ Disconnect the RF millivoltmeter and 50 Ω resistor, then replace the plug into **J1004**.

Carrier Balance Pre-Alignment

- ❒ Remove the coaxial plug from **J1004** on the MAIN Unit, then connect the RF millivoltmeter and 50 Ω resistor to **J1004**.
- ❒ Select the "**TX IF**" channel (10.25000 MHz, USB).
- ❒ Key the transmitter with no microphone input, adjust **TC1002** and **VR1003** on the MAIN Unit for minimum indication on the RF millivoltmeter.
- ❒ Disconnect the RF millivoltmeter and 50 Ω resistor, then replace the plug into **J1004**.



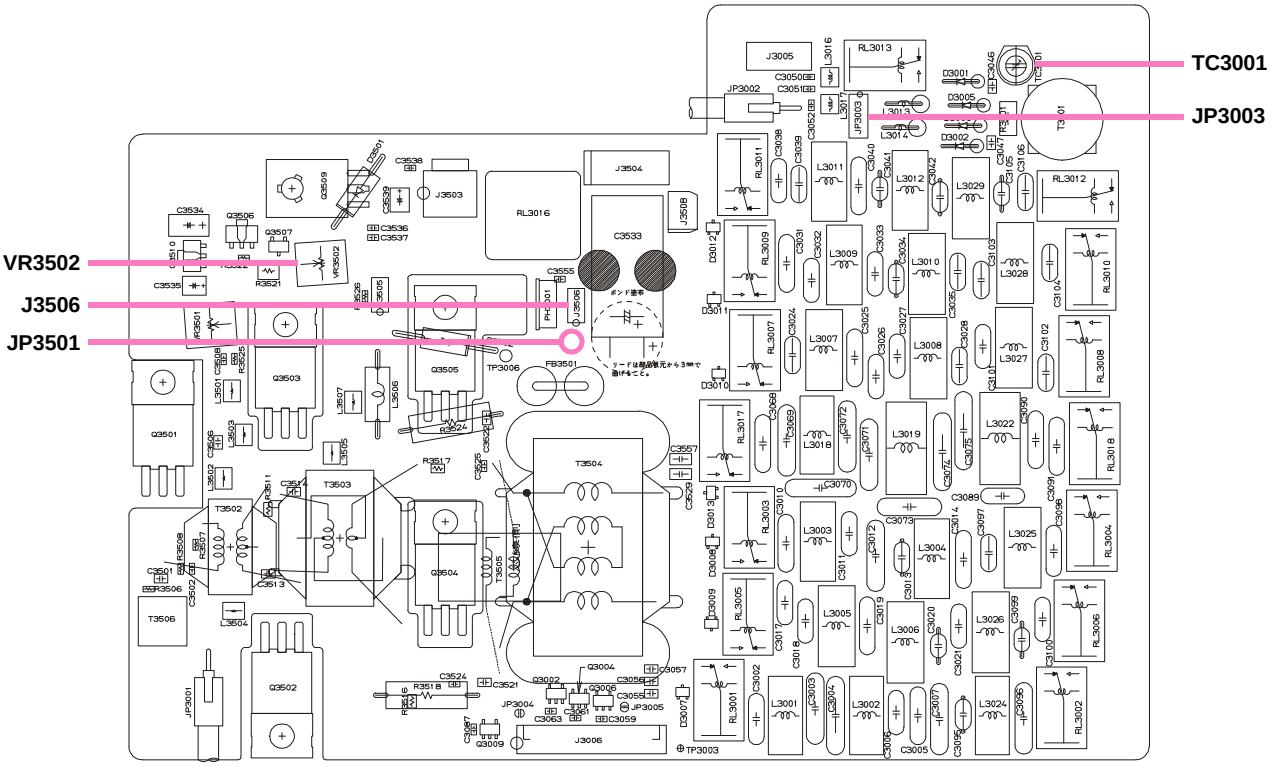
MAIN Unit Alignment Points [1]

Final Section Idling Current Alignment

- ❒ Remove the Solder jumper from **JP3501** on the PA Unit, and connect the DC Ammeter to **J3506** (pin 1: "–" lead, pin 2: "+" lead) on the PA Unit.
- ❒ Select the "**TX IF**" channel (10.25000 MHz, USB).
- ❒ Key the transmitter with no microphone input, adjust **VR3502** on the PA Unit for 100 mA ± 10 mA on the DC Ammeter.
- ❒ Disconnect the DC Ammeter, and connect **JP3501** by solder jumper.

CM Coupler Balance

- ❒ Connect the 50 Ω Dummy Load and Inline Wattmeter to the **ANT** jack, then connect the AF Generator to the **MIC IN** jack on the MIC Adapter Unit, and adjust the AF Generator to 1500 Hz.
- ❒ Connect the DC voltmeter to pin 3 of **JP3003** ("+" lead, "–" lead: GND) on the CNTL Unit.
- ❒ Select the "**CM BAL**" channel (29.9000 MHz, USB).
- ❒ Turn the **HI/LOW** (Transmitter Power) Switch to the "upper" position.
- ❒ Key the transmitter, then adjust the AF Generator output level so that the Inline Wattmeter reading is approximately 20 Watts.
- ❒ Now, adjust **TC3001** for minimum indication on the DC voltmeter.



PA Unit Alignment Points

Alignment

TX Gain Alignment 1 (SSB Hi Power)

- ❒ Connect the 50 Ω Dummy Load and Inline Wattmeter to the ANT jack, then connect the AF Generator to the **MIC IN** jack on the MIC Adapter Unit, and adjust the AF Generator to 1500 Hz, 8 mV.
- ❒ Referring Table below, turn the transceiver to each channel listed, and recall the computer to each parameter listed by pressing the [**F7**] key. Press the [**F10**] key to activate the **SPOT-ADJ** mode, then key the transmitter and press the [**SHIFT**] + [▲]/[▼] keys for the required output.
- ❒ Press the [**F2**] key to save the alignment value to the transceiver.

Tune to	Recall Parameter	For
"**TXG S 1H**" channel (3.50000 MHz, USB)	SSB Tx Ga Hi (00-04)	20 W
"**TXG S 2H**" channel (5.00000 MHz, USB)	SSB Tx Ga Hi (04-06)	20 W
"**TXG S 3H**" channel (7.50000 MHz, USB)	SSB Tx Ga Hi (06-09)	20 W
"**TXG S 4H**" channel (11.00000 MHz, USB)	SSB Tx Ga Hi (09-13)	20 W
"**TXG S 5H**" channel (16.50000 MHz, USB)	SSB Tx Ga Hi (13-20)	20 W
"**TXG S 6H**" channel (25.00000 MHz, USB)	SSB Tx Ga Hi (20-30)	20 W

TX Gain Alignment 2 (SSB Low Power)

- ❒ Connect the 50 Ω Dummy Load and Inline Wattmeter to the ANT jack, then connect the AF Generator to the **MIC IN** jack on the MIC Adapter Unit, and adjust the AF Generator to 1500 Hz, 8 mV.
- ❒ Referring Table below, turn the transceiver to each channel listed, and recall the computer to each parameter listed by pressing the [**F7**] key. Press the [**F10**] key to activate the **SPOT-ADJ** mode, then key the transmitter and enter the alignment values using the numeric keys for the required output.
- ❒ Press the [**F2**] key to save the alignment value to the transceiver.

Tune to	Recall Parameter	For
"**TXG S 1L**" channel (3.50000 MHz, USB)	SSB Tx Ga Lo (00-04)	5 W
"**TXG S 2L**" channel (5.00000 MHz, USB)	SSB Tx Ga Lo (04-06)	5 W
"**TXG S 3L**" channel (7.50000 MHz, USB)	SSB Tx Ga Lo (06-09)	5 W
"**TXG S 4L**" channel (11.00000 MHz, USB)	SSB Tx Ga Lo (09-13)	5 W
"**TXG S 5L**" channel (16.50000 MHz, USB)	SSB Tx Ga Lo (13-20)	5 W
"**TXG S 6L**" channel (25.00000 MHz, USB)	SSB Tx Ga Lo (20-30)	5 W

TX Gain Alignment 1 (AM Hi Power)

- ❒ Connect the 50 Ω Dummy Load and Inline Wattmeter to the ANT jack.
- ❒ Referring Table below, turn the transceiver to each channel listed, and recall the computer to each parameter listed by pressing the [**F7**] key. Press the [**F10**] key to activate the **SPOT-ADJ** mode, then key the transmitter with no microphone input and press the [**SHIFT**] + [▲]/[▼] keys for the required output.
- ❒ Press the [**F2**] key to save the alignment value to the transceiver.

Tune to	Recall Parameter	For
"**TXG A 1H**" channel (3.50000 MHz, AM)	AM Tx Ga Hi (00-04)	20 W
"**TXG A 2H**" channel (5.00000 MHz, AM)	AM Tx Ga Hi (04-06)	20 W
"**TXG A 3H**" channel (7.50000 MHz, AM)	AM Tx Ga Hi (06-09)	20 W
"**TXG A 4H**" channel (11.00000 MHz, AM)	AM Tx Ga Hi (09-13)	20 W
"**TXG A 5H**" channel (16.50000 MHz, AM)	AM Tx Ga Hi (13-20)	20 W
"**TXG S 6H**" channel (25.00000 MHz, AM)	AM Tx Ga Hi (20-30)	20 W

TX Gain Alignment 2 (AM Lo Power)

- ❒ Connect the 50 Ω Dummy Load and Inline Wattmeter to the ANT jack.
- ❒ Referring Table below, turn the transceiver to each channel listed, and recall the computer to each parameter listed by pressing the [**F7**] key. Press the [**F10**] key to activate the **SPOT-ADJ** mode, then key the transmitter with no microphone input and press the [**SHIFT**] + [▲]/[▼] keys for the required output.
- ❒ Press the [**F2**] key to save the alignment value to the transceiver.

Tune to	Recall Parameter	For
"**TXG A 1L**" channel (3.50000 MHz, AM)	AM Tx Ga Lo (00-04)	5 W
"**TXG A 2L**" channel (5.00000 MHz, AM)	AM Tx Ga Lo (04-06)	5 W
"**TXG A 3L**" channel (7.50000 MHz, AM)	AM Tx Ga Lo (06-09)	5 W
"**TXG A 4L**" channel (11.00000 MHz, AM)	AM Tx Ga Lo (09-13)	5 W
"**TXG A 5L**" channel (16.50000 MHz, AM)	AM Tx Ga Lo (13-20)	5 W
"**TXG S 6L**" channel (25.00000 MHz, AM)	AM Tx Ga Lo (20-30)	5 W

Tx Output Power Alignment 1 (SSB/CW Hi Power)

- ❒ Connect the 50 Ω Dummy Load and Inline Wattmeter to the ANT jack.
- ❒ Referring Table below, turn the transceiver to each channel listed, and recall the computer to each parameter listed by pressing the [**F7**] key. Press the [**F10**] key to activate the **SPOT-ADJ** mode, then key the transmitter and press the [**SHIFT**] + [▲]/[▼] keys for the required output.
- ❒ Press the [**F2**] key to save the alignment value to the transceiver.

Tune to	Recall Parameter	For
"**TXP C 1H**" channel (6.50000 MHz, CW)	SSB Po Hi (00-10)	20 W
"**TXP C 2H**" channel (15.00000 MHz, CW)	SSB Po Hi (10-20)	20 W
"**TXP C 3H**" channel (25.00000 MHz, CW)	SSB Po Hi (20-30)	20 W

Tx Output Power Alignment 2 (SSB/CW Low Power)

- ❒ Connect the 50 Ω Dummy Load and Inline Wattmeter to the ANT jack.
- ❒ Referring Table below, turn the transceiver to each channel listed, and recall the computer to each parameter listed by pressing the [**F7**] key. Press the [**F10**] key to activate the **SPOT-ADJ** mode, then key the transmitter and press the [**SHIFT**] + [▲]/[▼] keys for the required output.
- ❒ Press the [**F2**] key to save the alignment value to the transceiver.

Tune to	Recall Parameter	For
"**TXP C 1L**" channel (6.50000 MHz, CW)	SSB Po Lo (00-10)	5 W
"**TXP C 2L**" channel (15.00000 MHz, CW)	SSB Po Lo (10-20)	5 W
"**TXP C 3L**" channel (25.00000 MHz, CW)	SSB Po Lo (20-30)	5 W

Tx Output Power Alignment 3 (AM Hi Power)

- ❒ Connect the 50 Ω Dummy Load and Inline Wattmeter to the ANT jack.
- ❒ Referring Table below, turn the transceiver to each channel listed, and recall the computer to each parameter listed by pressing the [**F7**] key. Press the [**F10**] key to activate the **SPOT-ADJ** mode, then key the transmitter and press the [**SHIFT**] + [▲]/[▼] keys for the required output.
- ❒ Press the [**F2**] key to save the alignment value to the transceiver.

Tune to	Recall Parameter	For
"**TXP A 1H**" channel (6.50000 MHz, AM)	AM Po Hi (00-10)	10 W
"**TXP A 2H**" channel (15.00000 MHz, AM)	AM Po Hi (10-20)	10 W
"**TXP A 3H**" channel (25.00000 MHz, AM)	AM Po Hi (20-30)	10 W

Tx Output Power Alignment 4 (AM Low Power)

- ❒ Connect the 50 Ω Dummy Load and Inline Wattmeter to the ANT jack.
- ❒ Referring Table below, turn the transceiver to each channel listed, and recall the computer to each parameter listed by pressing the [**F7**] key. Press the [**F10**] key to activate the **SPOT-ADJ** mode, then key the transmitter and press the [**SHIFT**] + [▲]/[▼] keys for the required output.
- ❒ Press the [**F2**] key to save the alignment value to the transceiver.

Tune to	Recall Parameter	For
"**TXP A 1L**" channel (6.50000 MHz, AM)	AM Po L0 (00-10)	2.5 W
"**TXP A 2L**" channel (15.00000 MHz, AM)	AM Po Lo (10-20)	2.5 W
"**TXP A 3L**" channel (25.00000 MHz, AM)	AM Po Lo (20-30)	2.5 W

Carrier Balance Alignment

- ❒ With the 50 dB Attenuator (or 50 Ω Dummy Load and Sampling Coupler) and Spectrum Analyzer connected to the ANT jack.
- ❒ Select the "**TX IF**" channel (10.25000 MHz, USB).
- ❒ Key the transmitter with no microphone input, adjust **TC1002** and **VR1003** on the MAIN Unit for minimum indication on the Spectrum Analyzer.

Warning Indicator (Low Voltage) Alignment

- ❒ Reduce the DC power to 13.8 volt.
- ❒ Recall the [**Volt Warning 1**] parameter on the computer.
- ❒ Press the [**F10**] key to activate the **SPOT-ADJ** mode, then press the [**SHIFT**] + [▲]/[▼] keys so that the front panel LED will blink red when the [**F7**] key is pressed.
- ❒ Reduce the DC power to 13.0 volt.
- ❒ Recall the [**Volt Warning 2**] parameter on the computer.
- ❒ Press the [**F10**] key to activate the **SPOT-ADJ** mode, then press the [**SHIFT**] + [▲]/[▼] keys so that the front panel LED will glows red when the [**F7**] key is pressed.
