Note

Introduction and Precautions

The following procedures cover adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts subsequently be replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed by authorized Vertex Standard service technicians, experienced with the circuitry and fully equipped for repair and alignment. If a fault is suspected, contact the selling dealer for instructions regarding repair. Authorized Vertex Standard service technicians have the latest configuration information, and realign all circuits and make complete performance checks to ensure compliance with factory specifications after repairs.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Vertex Standard must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners.

Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and the need for realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Most steps do not require all of the equipment listed, but the interactions of some adjustments may require that more complex adjustments be performed in a sequence. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Rather, have all test equipment ready before beginning, and follow all of the steps in a section in the order they are presented.

Required Test Equipment

- Digital DC Voltmeter (high-Z, 1 M-Ohm/V)
- DC Ammeter
- RF Millivoltmeter
- AC Voltmeter
- RF Standard Signal Generator w/calibrated output and dB scale, 0 dB μ = 0.5 μ V
- Signal Generator with calibrated output
- Spectrum Analyzer good to at least 1 GHz.
- Frequency Counter
- 50-Ohm Dummy Load (500 watts)
- 100-Ohm Dummy Load (500 watts)
- 150-Ohm Dummy Load (500 watts)
- In-Line Wattmeter (500 watts, 50-Ohm)
- Linear Detector
- RF Coupler

Alignment Preparation & Precautions

A 50-ohm RF Dummy load and in-line wattmeter must be connected to the main antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna.

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding.

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 68 °F ~ 86 °F (20 °C ~ 30 °C). When the transceiver is brought into the shop from hot or cold air, it should be allowed time to come to room temperature before alignment.

Whenever possible, alignments should be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

Note: Signal levels in dB referred to in this procedure are based on 0 dB μ = 0.5 μ V (closed circuit).

Alignment

SHIFT/WIDTH Knob Zero (Center) Adjustment

- ❑ Set the (Main & Sub) SHIFT/WIDTH knobs to the 12-o'clock position.
- ❑ Set the (Main & Sub) operating mode to "USB."
- ❑ Press and hold in the [ANT1], [ANT3], and [RX ANT] keys, while turning the radio on, to enter the alignment mode.
- ❑ Rotate the Main Dial knob to select the alignment parameter "02A."
- ❑ Rotate the CLAR/VFO-B knob so that the IF SHIFT frequency of the MAIN Band (VFO-A) is set to ± 0.00 on the TFT (D version) or LCD (MP/Contest versions) display. The center point (± 0.00) is broad (7 points: D/MP versions, 18 points: Contest version). Therefore, set the CLAR/VFO-B knob to the center of this broad range.
- ❑ In the D and MP versions, rotate the Main Dial knob to select the alignment parameter "02b," then rotate the CLAR/VFO-B knob so that the IF SHIFT frequency of the Sub Band (VFO-B) is ± 0.00 on the TFT display. The center point (± 0.00) is broad (7 points). Therefore, set the CLAR/VFO-B knob to the center of this broad range.
- ❑ Rotate the Main Dial knob to select the alignment parameter "02c."
- ❑ Rotate the CLAR/VFO-B knob so that the IF Bandwidth of the MAIN Band (VFO-A) is 2.40 kHz on the TFT (D version) or the LCD display.
- ❑ In the D and MP versions, rotate the Main Dial knob to select the alignment parameter "02d."
- ❑ Rotate the CLAR/VFO-B knob so that the IF Bandwidth of the SUB Band (VFO-B) is 2.40 kHz on the TFT display.
- ❑ Press and hold in the [MNU] key for 2 seconds to exit from the alignment mode.
