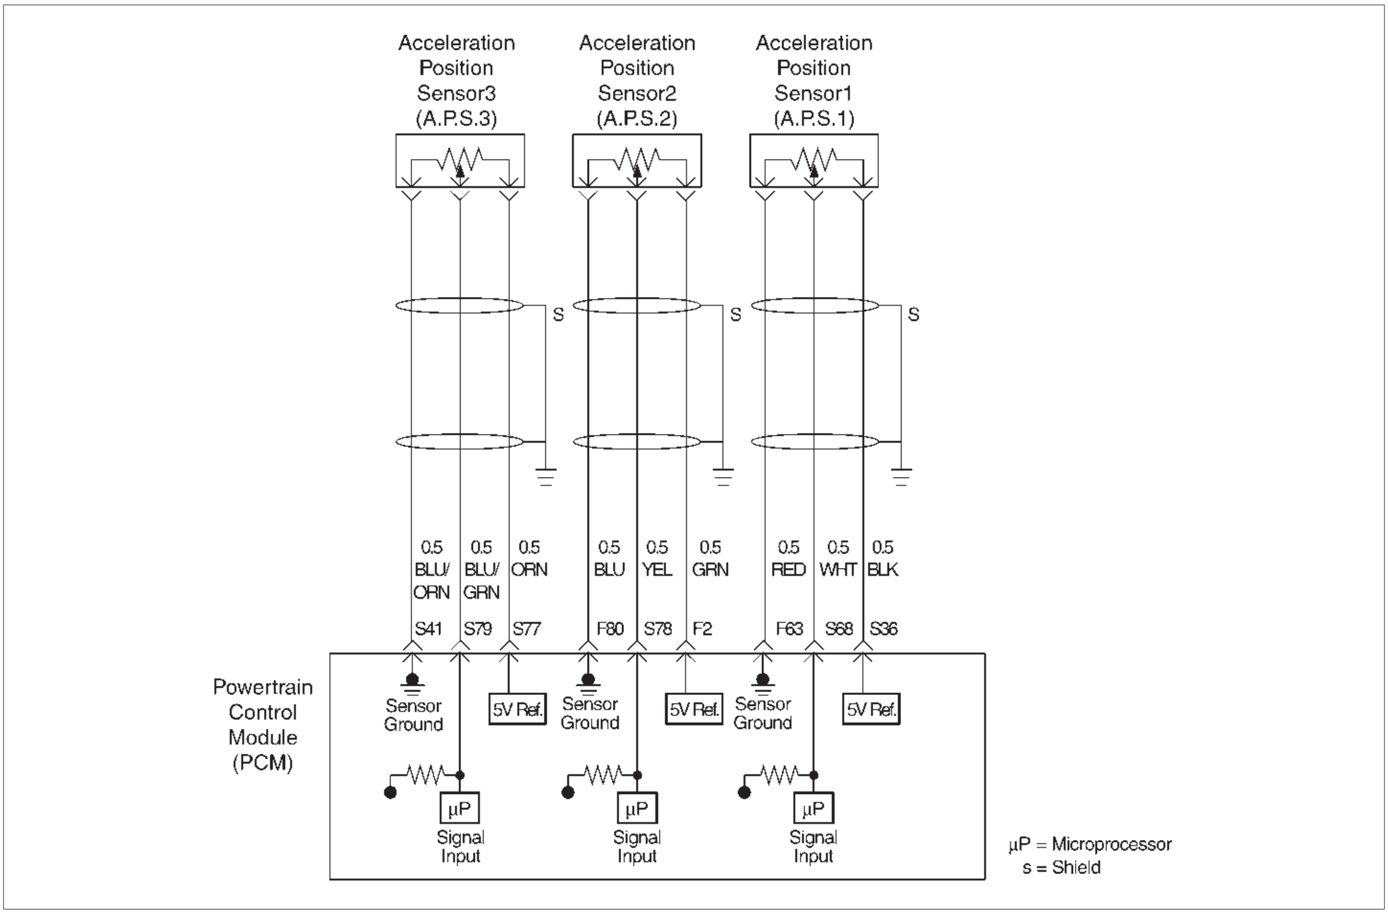
Diagnostic Trouble Code (DTC) P1275 APS 1 Circuit Fault



D06RY00075

Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP1) will vary about 13 % at idle position to about 87 % at wide open throttle (WOT).

  This code detects a continuous short to ground or high in either the cicuit or the sensor.

Conditions for setting the DTC

- The Ignition is “ON”.
- The acceleration pedal angle is less than 2.5 % or more than 97 % for 12 counts within 500 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will store condition which werepresent when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1275 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1275 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK,observe the APP sensor 1 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1275 cannot be duplicated,the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC

P1275 Diagnostic Chart may isolate the cause of the fault.

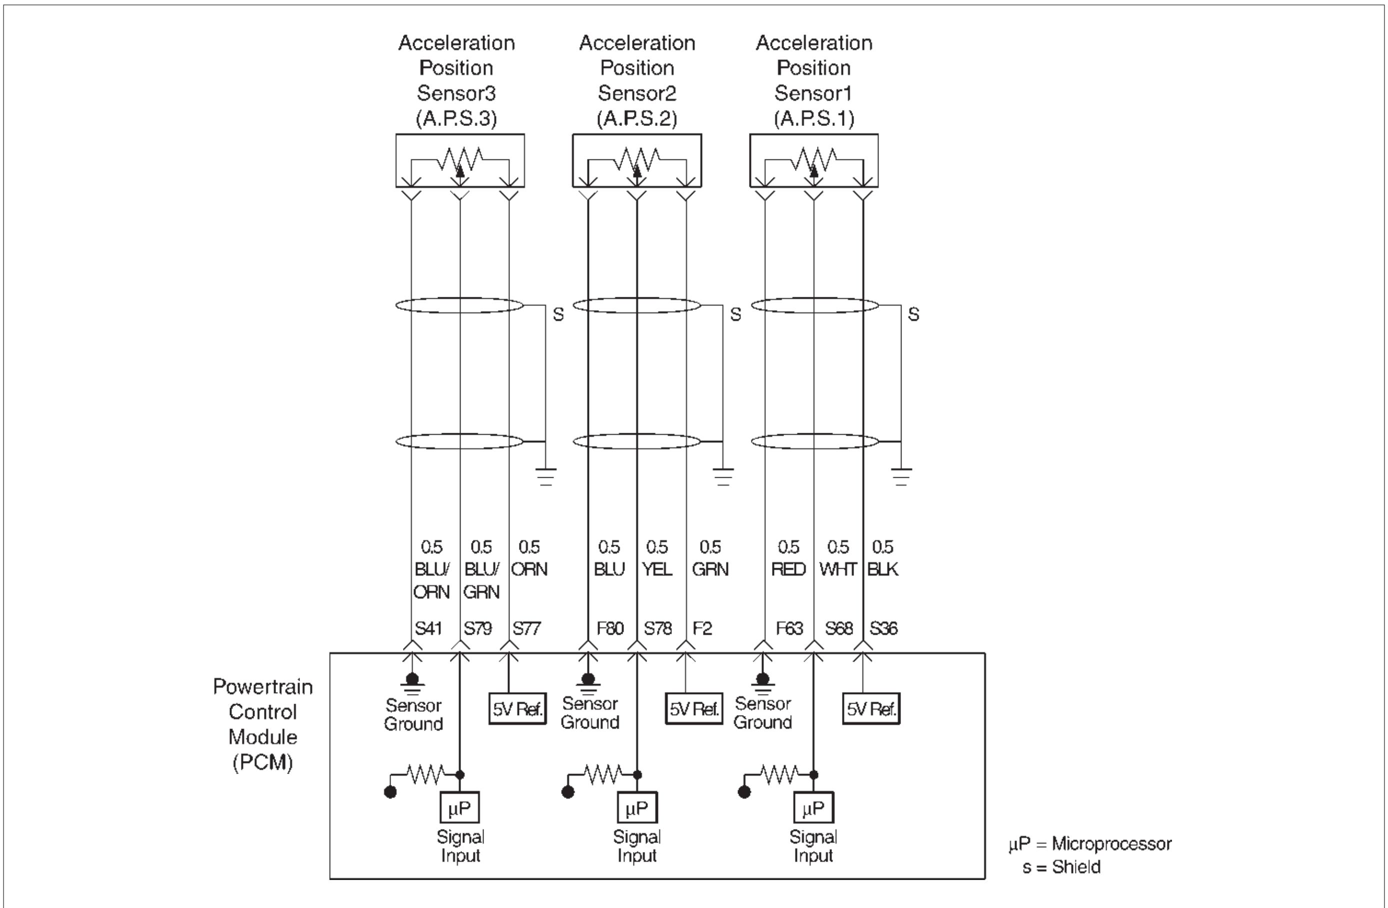
Diagnostic Trouble Code (DTC) P1280 APS 2 Circuit Fault



D06RY00075

Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP2) will vary about 87 % at idle position to about 13 % at wide open throttle(WOT).

  This code detects a continuous short to ground or high in either the cicuit or the sensor.

Conditions for setting the DTC

- The Ignition is “ON”.
- The acceleration pedal angle is less than 2.5 % or more than 97 % for 12 counts within 500 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1280 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1280 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the APP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1280 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC

P1280 Diagnostic Chart may isolate the cause of the fault.

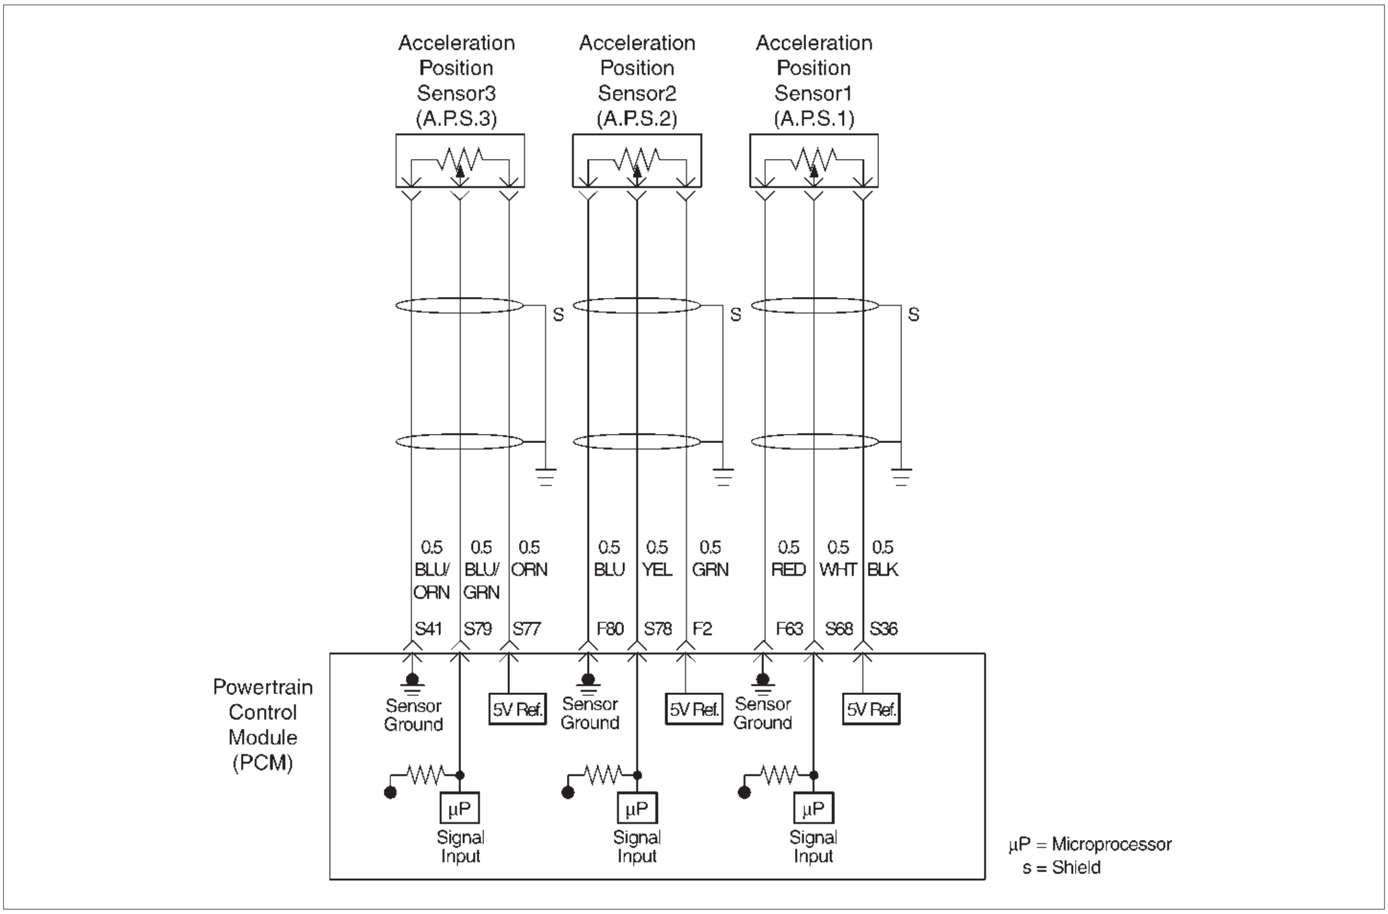
Diagnostic Trouble Code (DTC) P1285 APS 3 Circuit Fault



D06RY00075

Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP3) will vary about 87 % at idle position to about 34 % at wide open throttle(WOT).

  This code detects a continuous short to ground or high in either the circuit or the sensor.

Conditions for setting the DTC

- The Ignition is “ON”.
- The acceleration pedal angle is less than 2.5 % or more than 97 % for 12 counts within 500 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1285 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1285 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the APP sensor 3 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1285 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC

P1285 Diagnostic Chart may isolate the cause of the fault.

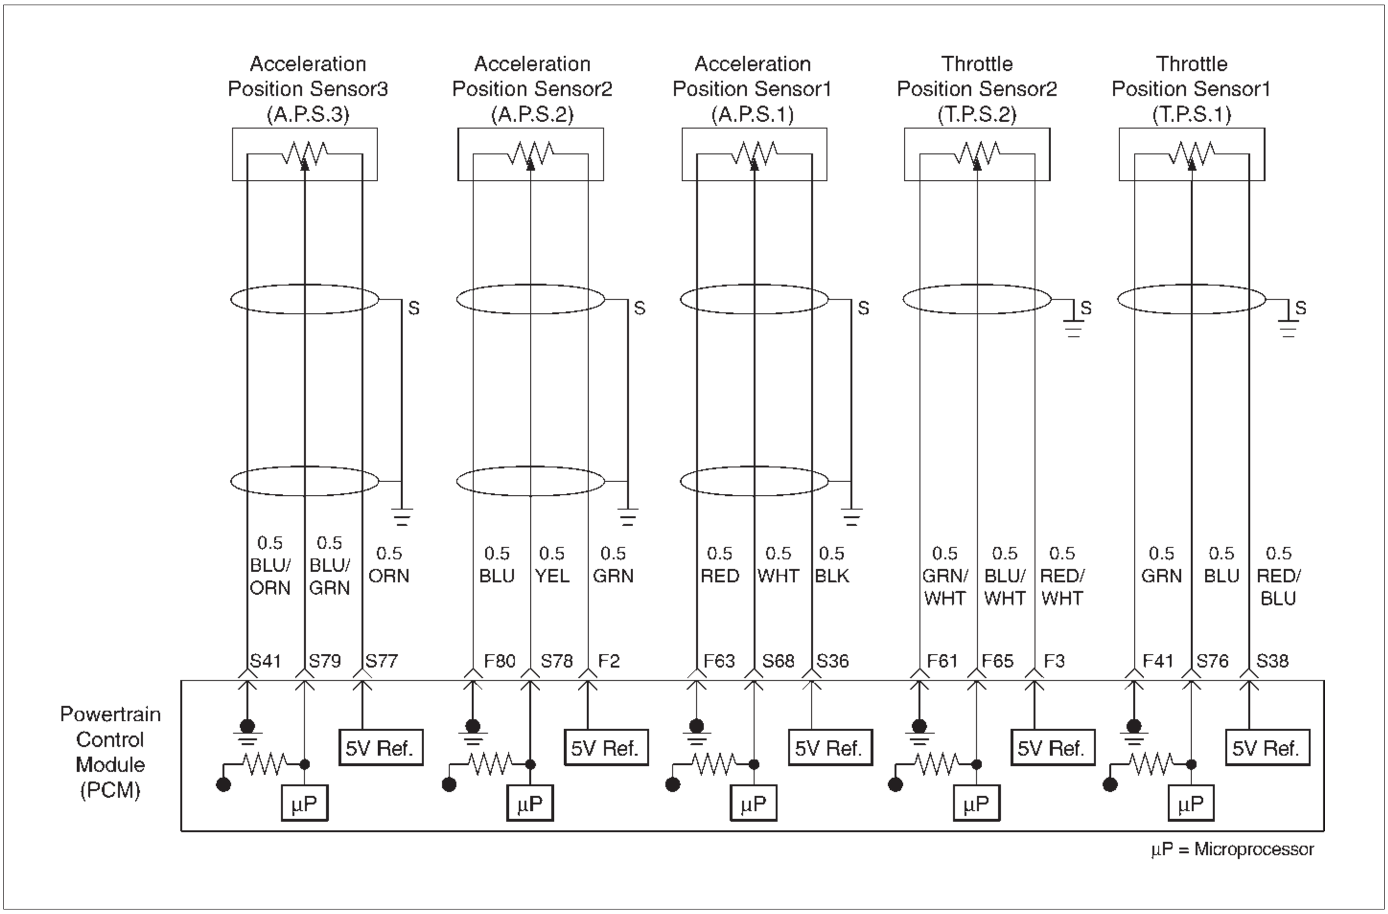
Diagnostic Trouble Code (DTC) P1290 ETC Forced Idle Mode



D06RY00157

Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP1) will vary about 13 % at idle position to about 87 % at wide open throttle (WOT).

  This code detects that if the systm is in Forced Idle Mode. (Fail safe Mode)

Conditions for setting the DTC

- The Ignition is “ON”.
- Forced Idle Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1290 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1290 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the APP sensor 1, APP sensor 2, APP sensor 3 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1290 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC

P1290 Diagnostic Chart may isolate the cause of the fault.

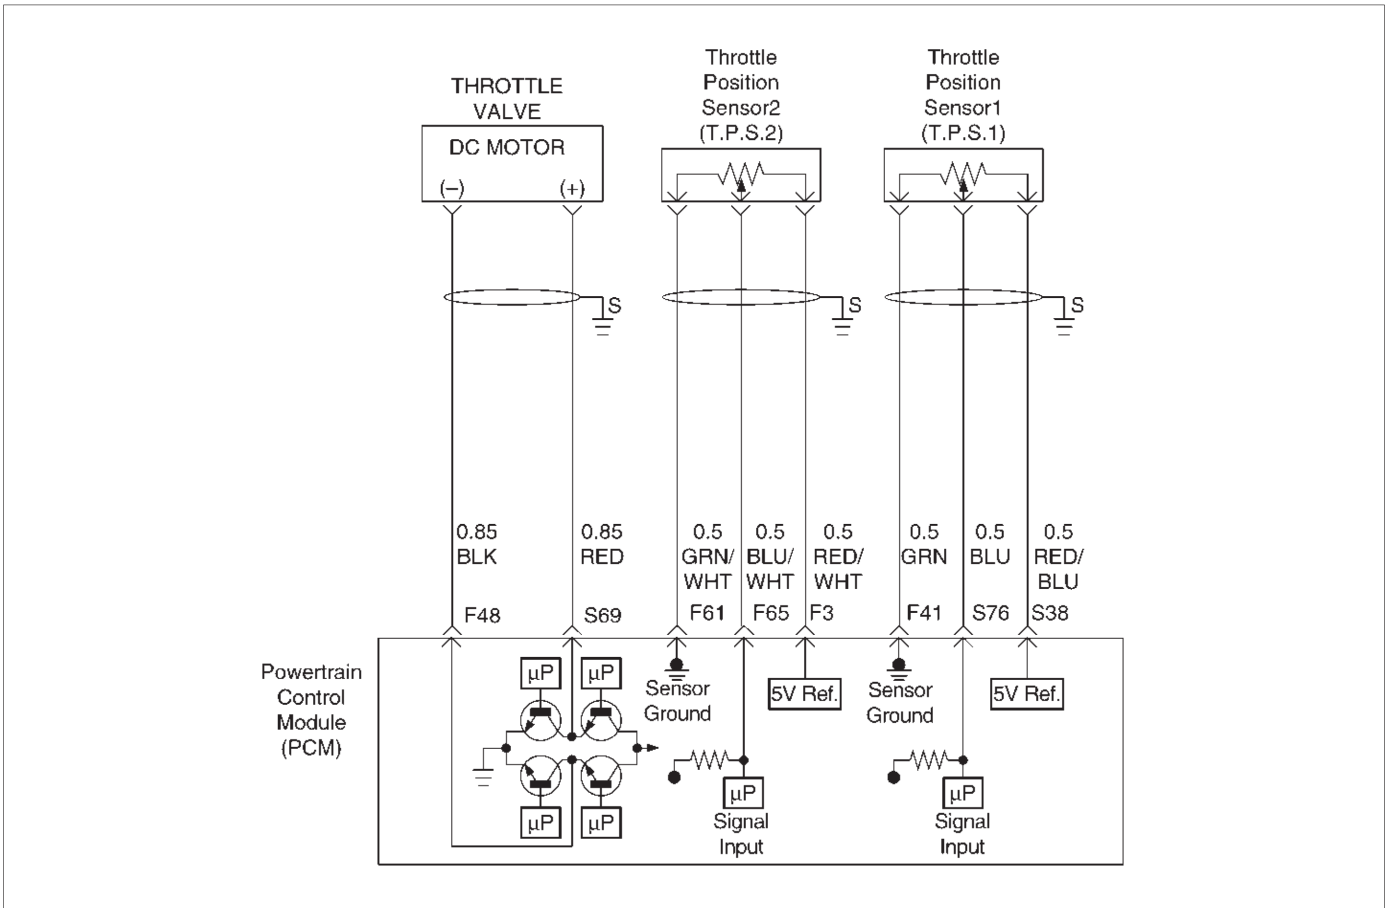
Diagnostic Trouble Code (DTC) P1295 Power Management Mode



D06RY00088

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle).

  The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle (WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain Control Module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations.

  A large quantitiy of air entering the engine indicates an accleration or high load situation, while a small quantity or air indicates deceleration or idle.

  The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7g/s at idle to around 25 to 40g/s at maximum engine load.
- This DTC ditects that if the systm is in PowerManagement Mode.(Fail safe Mode)

Conditions for setting the DTC

- The ignition is “ON”.
- Power Management Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1295 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1295 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken

locks, improperly formed or damaged terminals,and poor terminal to wire connection.

- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault.If DTC P1295 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC P1295 Diagnostic Chart may isolate the cause of the fault.

DTC P1295 - Power Management Mode

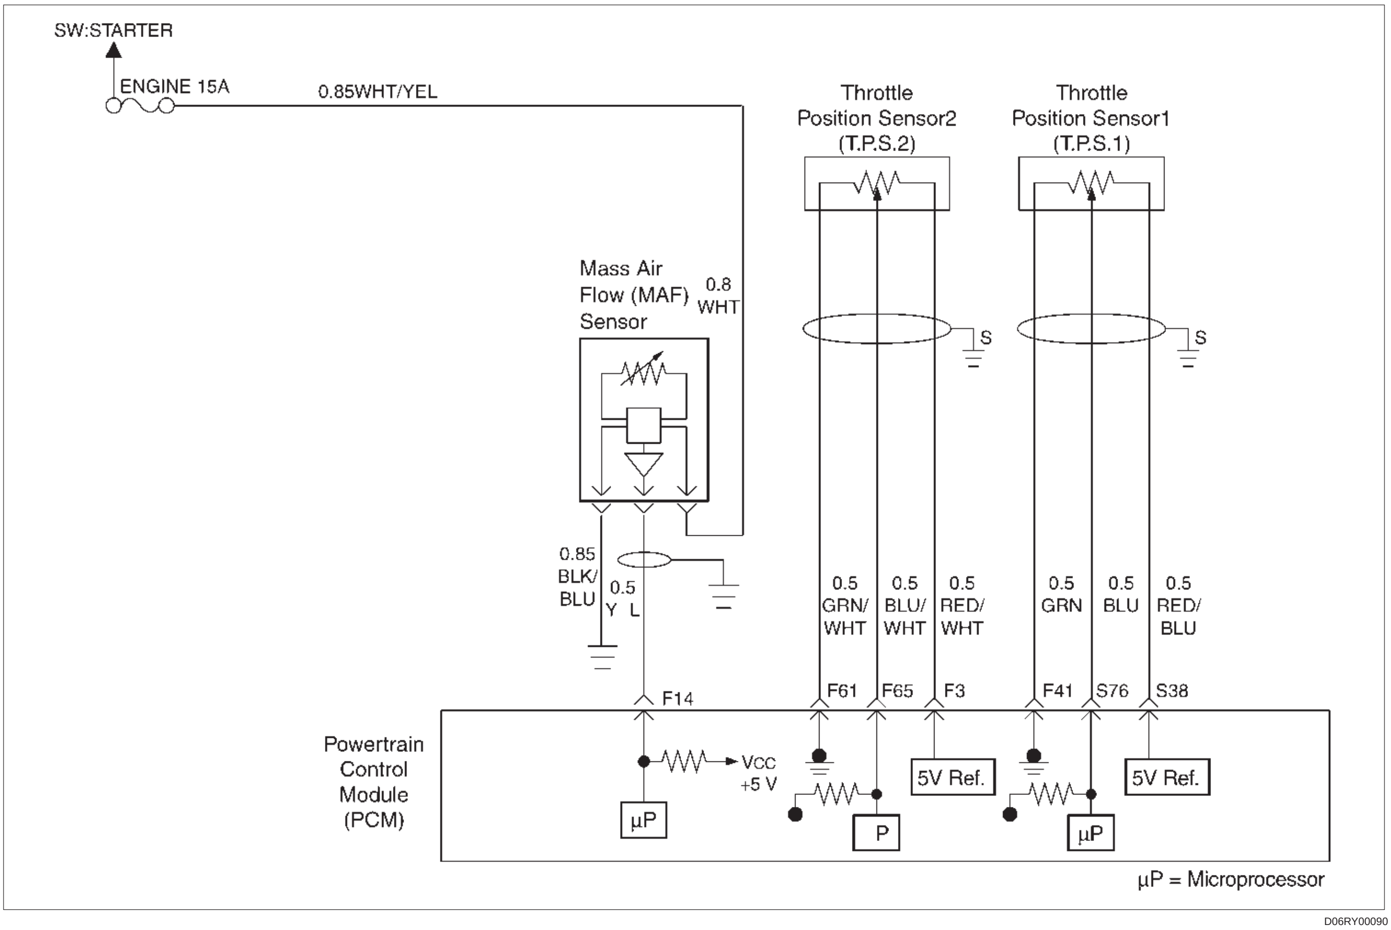
DTC P1295 - Power Management Mode (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Connect a test light between the 5Volt reference "A"circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to *Step 13*	Go to *Step 12*
11	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
12	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
13	Replace the TP sensor. Is the action complete?	—	Verify repair	—
14	1. Start the engine. 2. With the engine idling, monitor "MAF Frequency" display on the Tech 2. Is the "MAF Frequency" below the specified value?	6 ~ 10 g/s	Go to *Step 15*	Go to *Step 18*
15	1. Ignition "OFF." 2. Disconnect the MAF sensor connector. 3. Ignition "ON," engine idling. 4. Using a Tech 2, monitor "MAF Frequency." Does the Tech 2 indicate a "MAF Frequency" at the specified value?	0g/s	Go to *Step 16*	Go to *Step 17*
16	Replace the MAF sensor. Is the action complete?	—	Verify repair	Go to *Step 19*
17	1. Check the MAF harness for incorrect routing near high voltage components (solenoids, relays, motors). 2. If incorrect routing is found, correct the harness routing. Was a problem found?	—	Verify repair	Go to *Step 17*
18	1. With the engine idling, monitor "MAF Frequency." display on the Tech 2. 2. Quickly snap open throttle to wide open throttle while under a road load and record value. Does the Tech 2 indicate a "MAF Frequency" at thespecified value?	6 ~ 10 g/s	Go to *Step 16*	Go to *Step 19*

DTC P1295 - Power Management Mode (Cont'd)

Step	Action	Value(s)	Yes	No
19	1. Ignition "ON",engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65kPa	Go to *Step 20*	Go to *Step 23*
20	1. Disconnect the MAP sensor. 2. Connect a test 5 volt reference circuit and the MAP signal at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value? (If no, start with diagnosis chart forother sensors in the circuit and see if 5V returns.)	—	Go to *Step 22*	Go to *Step 21*
21	1. Check the MAP signal circuit between the PCM and MAP grund circuit. 2. If the MAP signal circuit is open or shoted, repair it as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to *Step 23*
22	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
23	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin.Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1299 ETC Forced Engine Shutdown Mode



Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle).

  The throttle blade angle will vary about 8% at closed throttle to about 92% at wide open throttle(WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain Control Module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations. A laege quantitiy of air entering the engine indicates an accleration or high load situation, while a small quantity or air indicates deceleration or idle.

  The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7g/s at idle to around 25 to 40g/s at maximum engine load.
- This DTC ditects if the system is in ECT Forced Engine Shutdown Mode.(Fail safe Mode)

Conditions for setting the DTC

- The ignition is “ON”.
- ECT Forced Engine Shutdown Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1299 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1299 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech 2 while

moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1299 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1299 Diagnostic Chart may isolate the cause of the fault.

3	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =90 ~ 92 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =8 ~ 10 %	Go to *Step 8*	Go to *Step 4*
4	1. Ignition “OFF.” 2. Disconnect the DC motor. Is the DC motor reading near the specified value?	0.3 ~ 100Ω	Go to *Step 5*	Go to *Step 7*
5	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
6	Check the throttle valve assembly. Was a problem found?		Verify repair	Go to *Step 7*
7	Replace the DC motor. (Replace the Throttle valve assembly) Is the action complete?	—	Verify repair	Go to *Step 8*
8	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0V	Go to *Step 9*	Go to *Step 10*
9	1. Connect a test light between the 5Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. .Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to *Step 12*	Go to *Step 11*

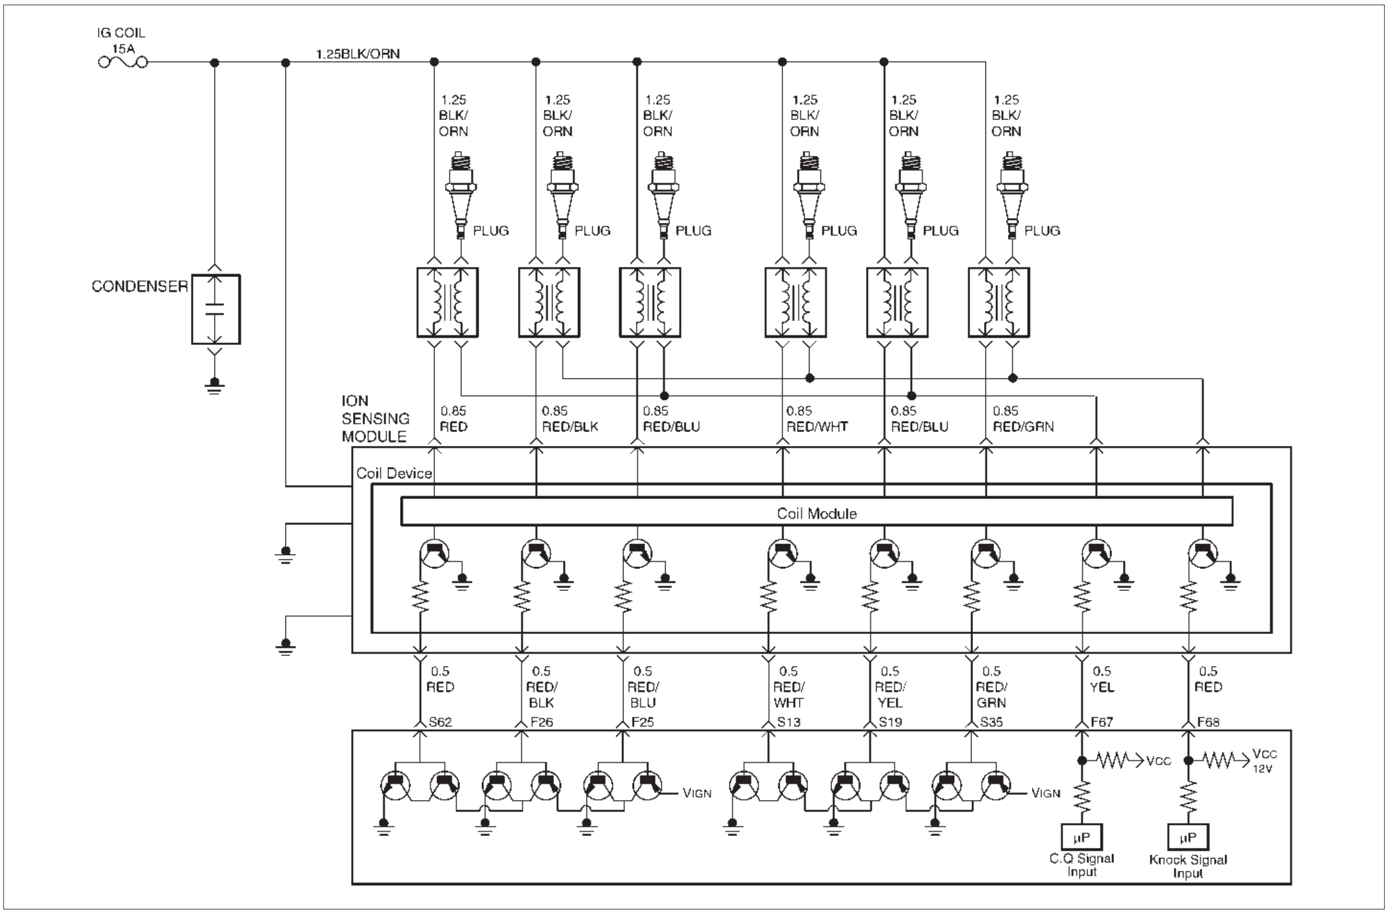
DTC P1299 - ETC Forced Engine Shutdown Mode (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
11	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1and TP2 sensor. 3. If a problem is found,repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
12	Replace the TP sensor. Is the action complete?	—	Verify repair	—
13	1. Start the engine. 2. With the engine idling, monitor "MAF Frequency" display on the Tech 2. Is the "MAF Frequency" below the specified value?	6 ~ 10 g/s	Go to *Step 16*	Go to *Step 17*
14	1. Ignition "OFF." 2. Disconnect the MAF sensor connector. 3. Ignition "ON," engine idling. 4. Using a Tech 2, monitor "MAF Frequency." Does the Tech 2 indicate a "MAF Frequency" at the specified value?	0g/s	Go to *Step 15*	Go to *Step 16*
15	Replace the MAF sensor. Is the action complete?	—	Verify repair	Go to *Step 18*
16	1. Check the MAF harness for incorrect routing near high voltage components (solenoids, relays, motors). 2. If incorrect routing is found, correct the harness routing. Was a problem found?	—	Verify repair	Go to *Step 16*
17	1. With the engine idling, monitor "MAF Frequency." display on the Tech 2. 2. Quickly snap open throttle to wide open throttle while under a road load and record value. Does the Tech 2 indicate a "MAF Frequency" at the specified value?	6 ~ 10 g/s	Go to *Step 15*	Go to *Step 18*
18	1. Ignition "ON",engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65kPa	Go to *Step 19*	Go to *Step 22*

DTC P1299 - ETC Forced Engine Shutdown Mode (Cont'd)

Step	Action	Value(s)	Yes	No
19	1. Disconnect the MAP sensor. 2. Connect a test 5 volt reference "A" circuit and the MAP signal at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?(If no, start with diagnosis chart for other sensors in the circuit and see if 5Vreturns.)	—	Go to *Step 21*	Go to *Step 20*
20	1. Check the MAP signal circuit between the PCM and MAP ground circuit. 2. If the MAP signal circuit is open or shorted ,repair it as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to *Step 22*
21	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
22	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1310 ION Sensing Module Diagnosis



D06RY00067

Circuit Description

The Power Control Module (PCM) checks the validity of the signals used in the ION Sensing module at the following engine operating conditions.

- The Deceleration Fuel Cut Off (DFCO) test is performed to evaluate the Combustion Quality (CQ) signal pulse width if it is below a predetermined value, the value it is expected to be during DFCO conditions. If the CQ signal pilse width is above the predetermined threshold, the fail counter will be incremented. If the failure counter exceeds the calibration, then the test is conplete and a failure will be reported.
- The Power Enrichment (PE) test is performed to evaluate the Combustion Quality (CQ) signal pulse width if it is below a predetermined value, the value it is expected to be during PE conditions.

  If the CQ signal pulse width is above the predetermined threshold, the fail counter will be incremented. If the failure counter exceeds the calibration, then the test is complete and a failure will be reported.
- The Combustion Quality (CQ) test is performed to check if inappropriate (CQ) signal status were detected. If missing CQ pulses or multiple CQ pulses or CQ pulse width calculation errors were detected, the fail counter will be incremented. If the failure counter exceeds the calibration, then the test is complete and a failure will be reported.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- MAP sensor signal is between 26kPa and 100 kPa.
- Fuel level is more than 10%.
- Engine speed is between 650rpm and 6500rpm.
- No Crank DTCs set.
- No System voltage DTCs set.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1310 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1310 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.

- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1310 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1310 Diagnostic Chart may isolate the cause of the fault.

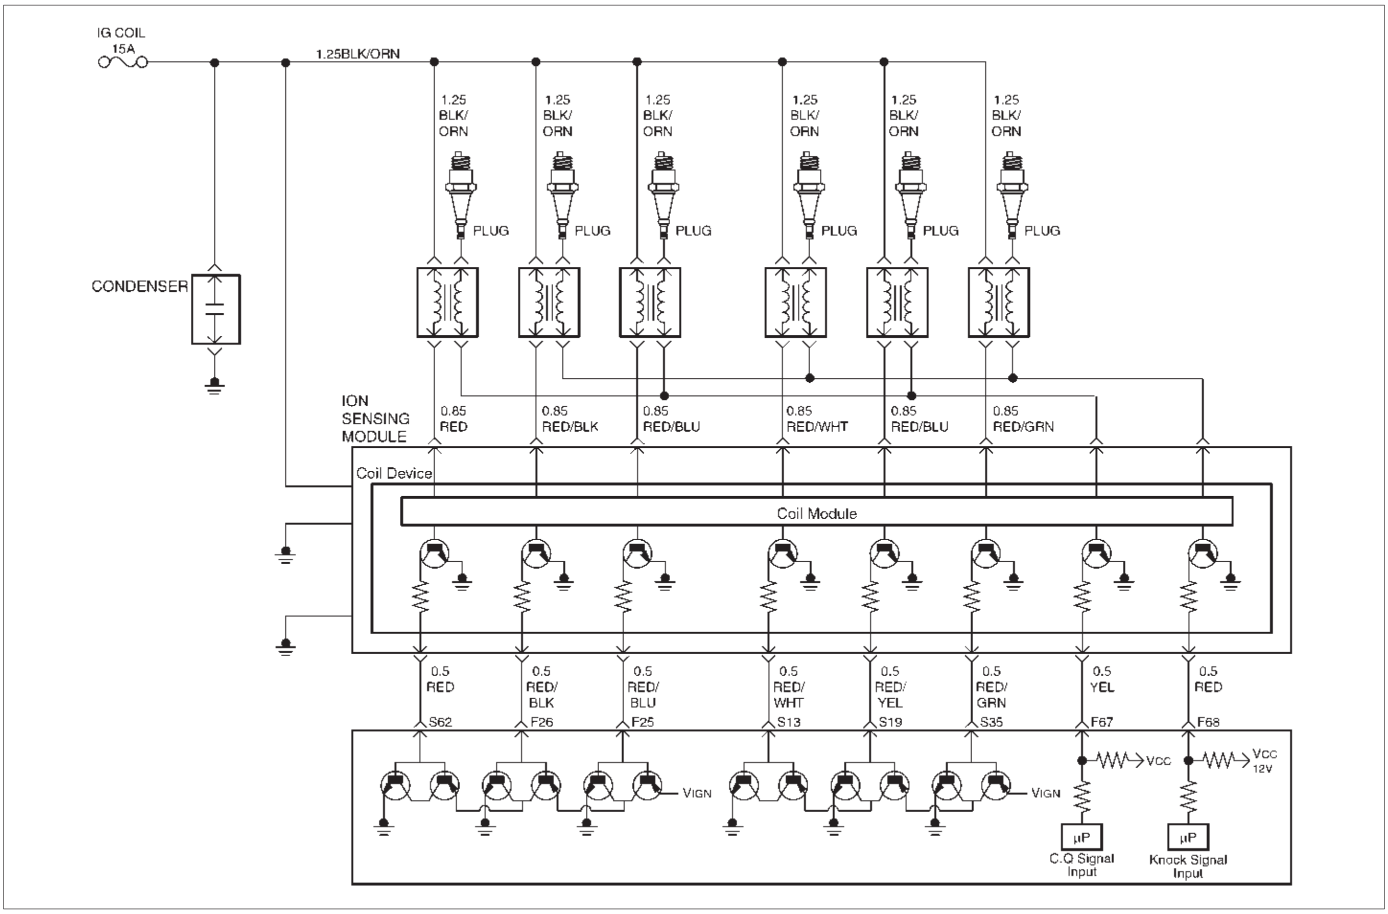
DTC P1310 - ION Sensing Module Diagnostic

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P1310. Does the Tech 2 indicate DTC P1310 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Ignition “OFF.” 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 4*	Go to *Step 3*
4	Check the ION Sensing harness between the PCM and ION Sensing module circuit harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 6*	Go to *Step 5*
6	Check the ION Sensing harness between the ignition coil and ION Sensing module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 9*
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 11*
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to *Step 10*

DTC P1310 - ION Sensing Module Diagnostic (Cont'd)

Step	Action	Value(s)	Yes	No
11	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1311 ION Sensing Module SEC line 1 Circuit Fault



D06RY00067

Circuit Description

- The Power Control Module (PCM) will compara the secondary current reading to a predetermined maximum and minimum thresholds.

  If the secondary current signal pulse width is out of the predetermined renge, the fail counter will be incremented. If the failure counter exceeds the calibration, then the PCM is complete and a failure will be reported. If the sample counter threshold is reached before the failure threshold, then the PCM is complete and pass will be reported.

  This PCM will detect an open/short circuit in the secondary current sense input circuit, misfire on the entire bank for the secondary current sense input circuit, coil failure, and same internal Ignition Current Sense System (ICSS) module faults.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- MAP sensor signal is between 26kPa and 100 kPa.
- Fuel level is more than 10%.
- Engine speed is between 650rpm and 6500rpm.
- ION Sensing Module circuit is open or shorted signals on the SEC 1 line.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1311 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1311 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.
- A change in the display will indicate the location of the fault. If DTC P1311 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.
- If it is determined that the DTC occurs intermittently, performing the DTC P1311 Diagnostic Chart may isolate the cause of the fault.

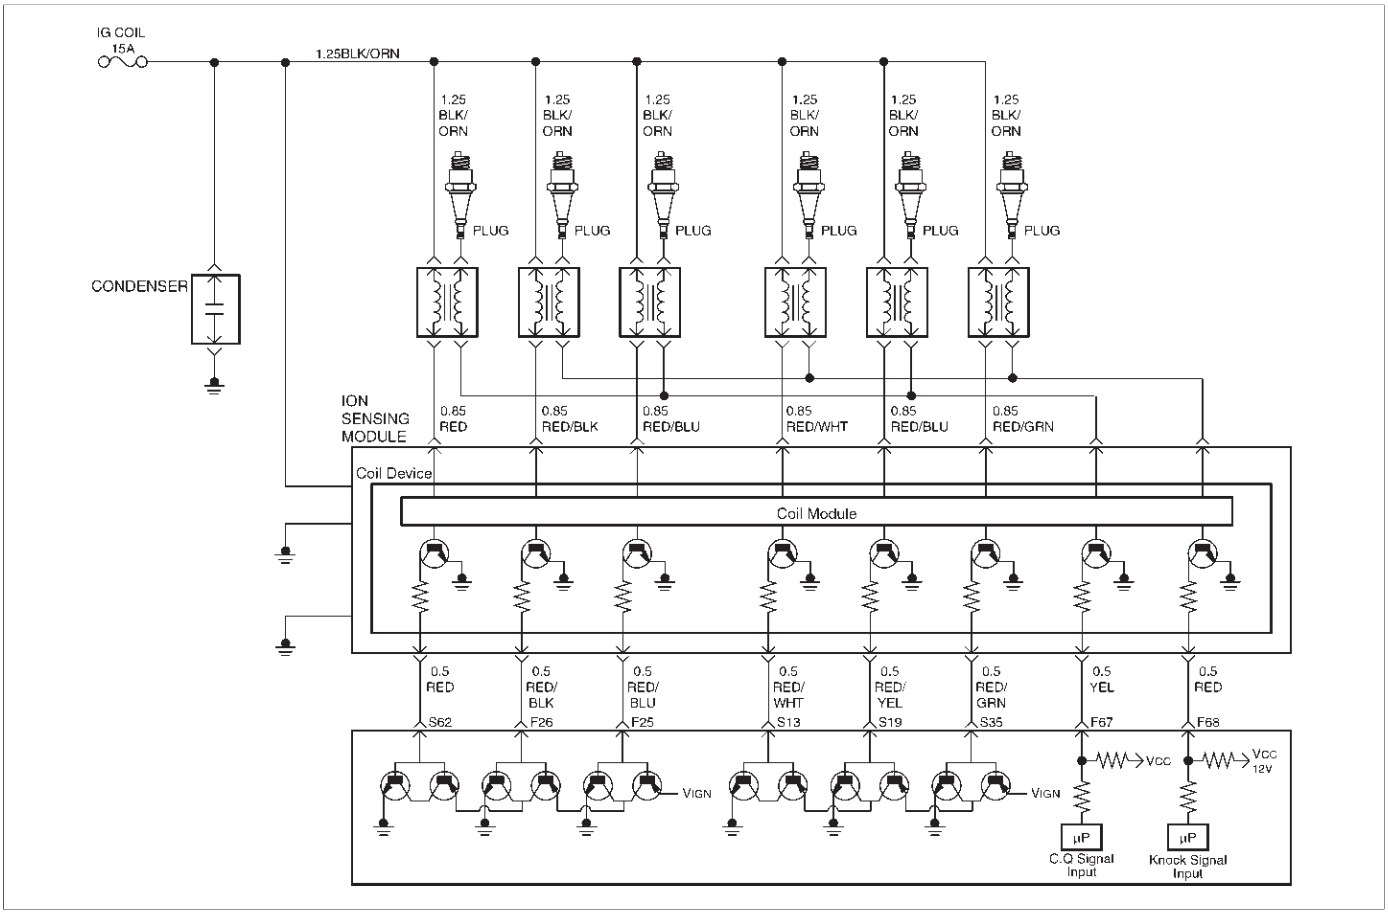
DTC P1311 - ION Sensing Module SEC line 1 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P1311. Does the Tech 2 indicate DTC P1311 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Ignition “OFF.” 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 4*	Go to *Step 3*
4	Check the ION Sensing module harness between the PCM and ION Sensing module circuit at the ION Sensing module harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 6*	Go to *Step 5*
6	Check the ION Sensing module harness between the ignition coil and ION Sensing module circuit at the SEC line 1 harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 9*
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 11*

DTC P1311 - ION Sensing Module SEC line 1 Circuit Fault (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to *Step 10*
11	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1312 ION Sensing Module SEC line 2 Circuit Fault



D06RY00067

Circuit Description

- The Power Control Module (PCM) will compara the secondary current reading to a predetermined maximum and minimum thresholds.

  If the secondary current signal pulse width is out of the predetermined renge, the fail counter will be incremented. If the failure counter exceeds the calibration, then the PCM is complete and a failure will be reported. If the sample counter threshold is reached before the failure threshold, then the PCM is complete and pass will be reported.

  This PCM will detect an open/short circuit in the secondary current sense input circuit, misfire on the entire bank for the secondary current sense input circuit, coil failure, and same internal Ignition Current Sense System (ICSS) module faults.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- MAP sensor signal is between 26kPa and 100 kPa.
- Fuel level is more than 10%.
- Engine speed is between 650rpm and 6500rpm.
- ION Sensing Module circuit is open or shorted signals on the SEC 2 line.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1312 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1312 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1312 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1312 Diagnostic Chart may isolate the cause of the fault.

DTC P1312 - ION Sensing Module SEC line 2 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P1312. Does the Tech 2 indicate DTC P1312 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Ignition "OFF." 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 4*	Go to *Step 3*
4	Check the ION Sensing module harness between the PCM and ICSS module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 6*	Go to *Step 5*
6	Check the ION Sensing module harness between the ignition coil and ION Sensing module circuit at the SEC line 2 harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 9*
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 11*

DTC P1312 - ION Sensing Module SEC line 2 Circuit Fault (Cont'd)

Step	Action	Value(s)	Yes	No

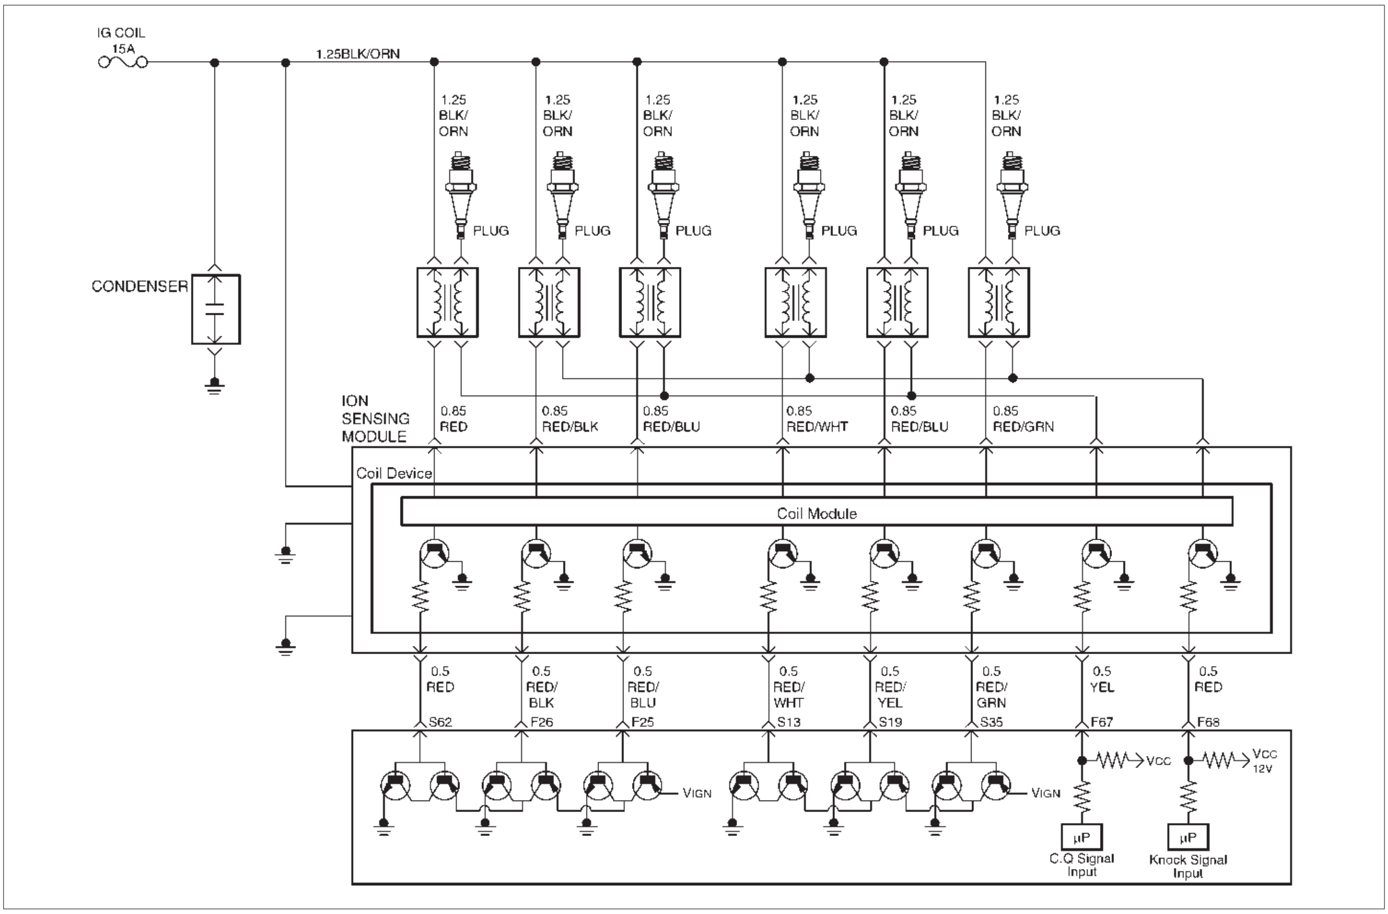
Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1326 ION Sensing Module Combustion Quality Input Circuit Fault



D06RY00067

Circuit Description

The Power Control Module (PCM) checks the validity of the signals used in the ION Sensing module at the following engine operating conditions.

- The test is performed to evauate the Combustion Quality (CQ) signal pulse width if it is within a predetermined range. If the CQ signal puls width is out of the predetermined range, the fail counter will be incremented. If the failure counter exceeds the calibration, then test is complete and a failure will be reported. If the sample counter threshold is reached before the failure threshold, then the test is complete and a pass will be reported. This test will detect an open/short in the QC line circuit, ION Sensing module faults and analog input faults in the PCM.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- No Cramk DTCs set.
- No cylinder ID DTCs set.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1326 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1326 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1326 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1326 Diagnostic Chart may isolate the cause of the fault.

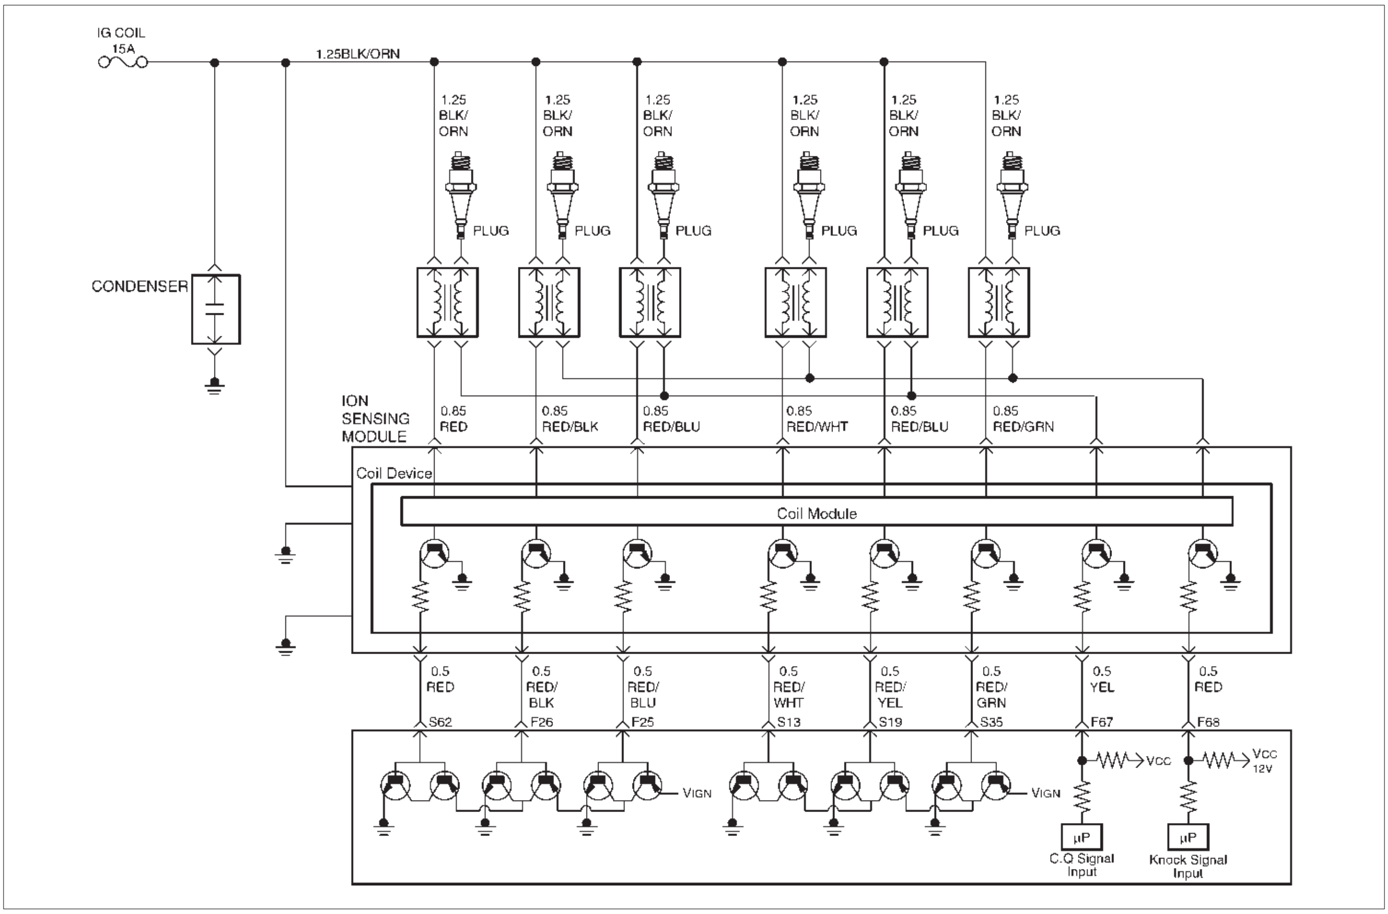
DTC P1326 - ION Sensing Module Combustion

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC”info for DTC P1326. Does the Tech 2 indicate DTC P1326 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Ignition “OFF.” 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 4*	Go to *Step 3*
4	Check the ION Sensing module harness between the PCM and ION Sensing module circuit at the QC line harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 6*	Go to *Step 5*
6	Check the ION Sensing module harness between the ignition coil and ICSS module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 9*
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 11*

DTC P1326 - ION Sensing Module Combustion (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to *Step 10*
11	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin .Check to see if the latest software is released or not. And then Down Load the LATEST PROGRMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1340 ION Sensing Module Cylinder ID Fault (Cylinder Synchronization Fail)



D06RY00067

Circuit Description

The Power Control Module (PCM) checks the validity of the signals used in the ION Sensing module at the following engine opreating conditions.

- This test will return a fault if the cylinder synchronization routine has not been completed after a predetermined number of events after crank. This test will detect fault that will prevent the PCM from synchronaization, such as Knock Signal (KI) - Combustion Quality (CQ) lines being swapped, shorted spark plugs, ION Sensing module faults, an PCM hardware faults.

Conditions for setting the DTC

- Ignition voltage is between 11volt and 16 volts.
- Engine speed is between 650rpm and 6500rpm.
- No ECT DTCs set.
- No injector DTCs set.
- No Fuel Trim DTCs set.
- No Misfire DTCs set.
- No system voltage DTCs set.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1340 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1340 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness–Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1340 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1340 Diagnostic Chart may isolate the cause of the fault.

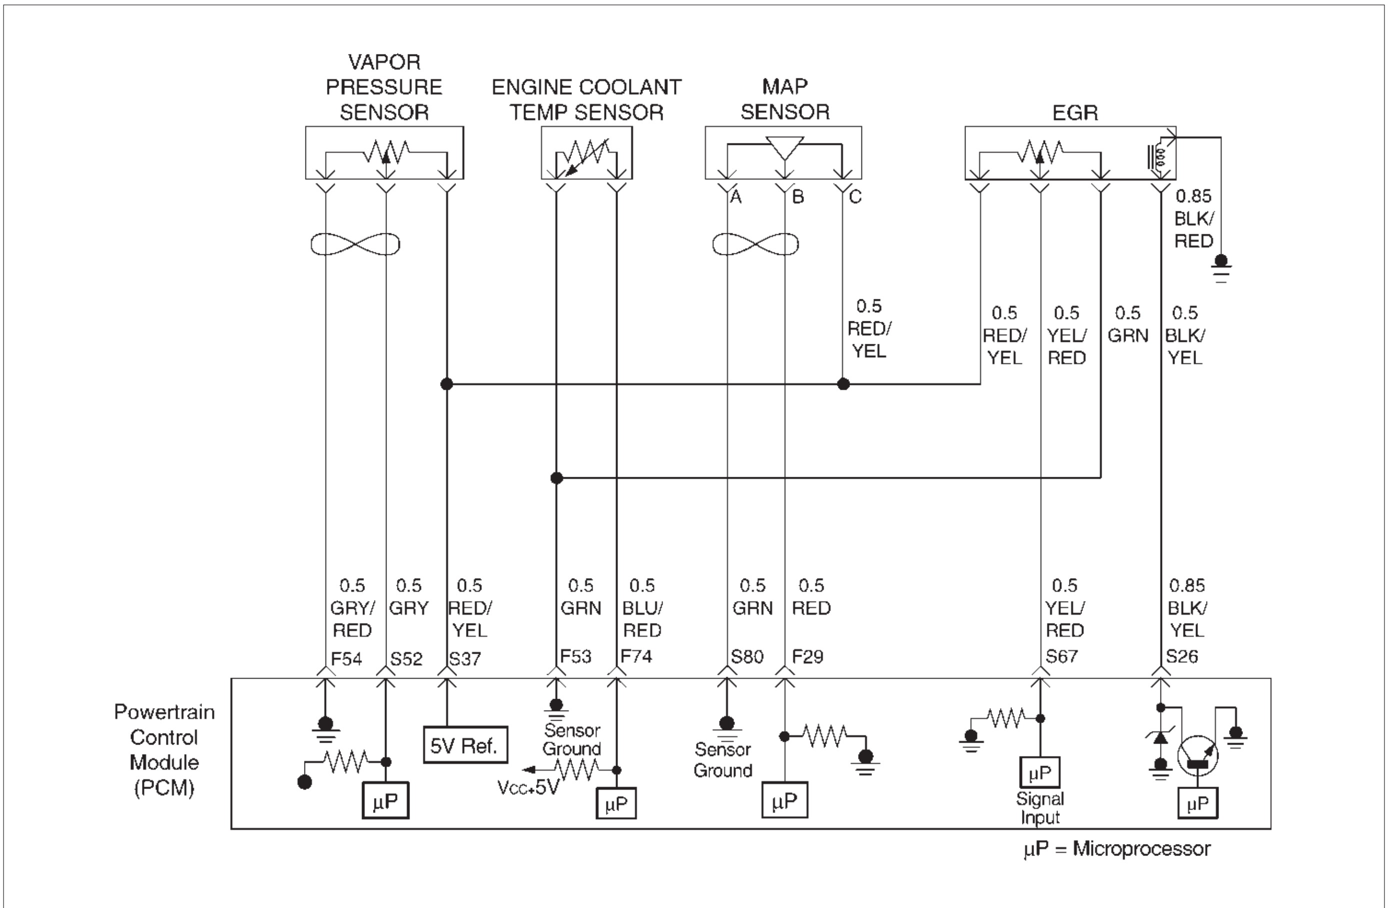
DTC P1340 - ION Sensing Module Cylinder ID Fault (Cylinder Synchronization Fail)

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “ DTC” info for DTC P1340. Does the Tech 2 indicate DTC P1340 failed thisignition?	—	Go to *Step 3*	Refer to *DiagnosticAids*
3	1. Ignition “OFF.” 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 4*	Go to *Step 3*
4	Check the ION Sensing module harness between the PCM and ICSS module circuit at the QC line harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 6*	Go to *Step 5*
6	Check the ION Sensing module harness between the ignition coil and ION Sensing module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 9*
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 11*

DTC P1340 - ION Sensing Module Cylinder ID Fault (Cylinder Synchronization Fail) (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to *Step 10*
11	Replace the PCM. **IMPORTANT:** IMPORTANT; The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin.Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1404 EGR Stuck Closed



D06RY00178

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to commands from the PCM, and to detect a fault if current pintle zero position is different from the learned zero position. If the PCM detects a pintle position signal indicates more than 30 % different between current zero position and the learned zero position for more than 5 seconds, and this condition exists 3 times during trip, then the PCM will set DTC P1404.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- Intake Air temp is more than 3°C.
- Desired EGR position is 0.
- Difference of EGR pintle position between current and the learned zero is more than 30 % for more than 5 seconds, and exists three time to the above condition during a trip the PCM will set DTC 1404. Then it trigger the PCM lights on.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after consecutive 2nd trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1404 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1404 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Excessive carbon deposit on EGR valve shaft and/or foreign material may cause the EGR valve not to fully seated. The carbon deposit may occur by unusual port operation. Remove foreign material and/or excessive carbon deposit on EGR valve shaft and may allow the EGR valve to be fully seated.
- Poor connection or damaged harness – Inspect the wiring harness for damage.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

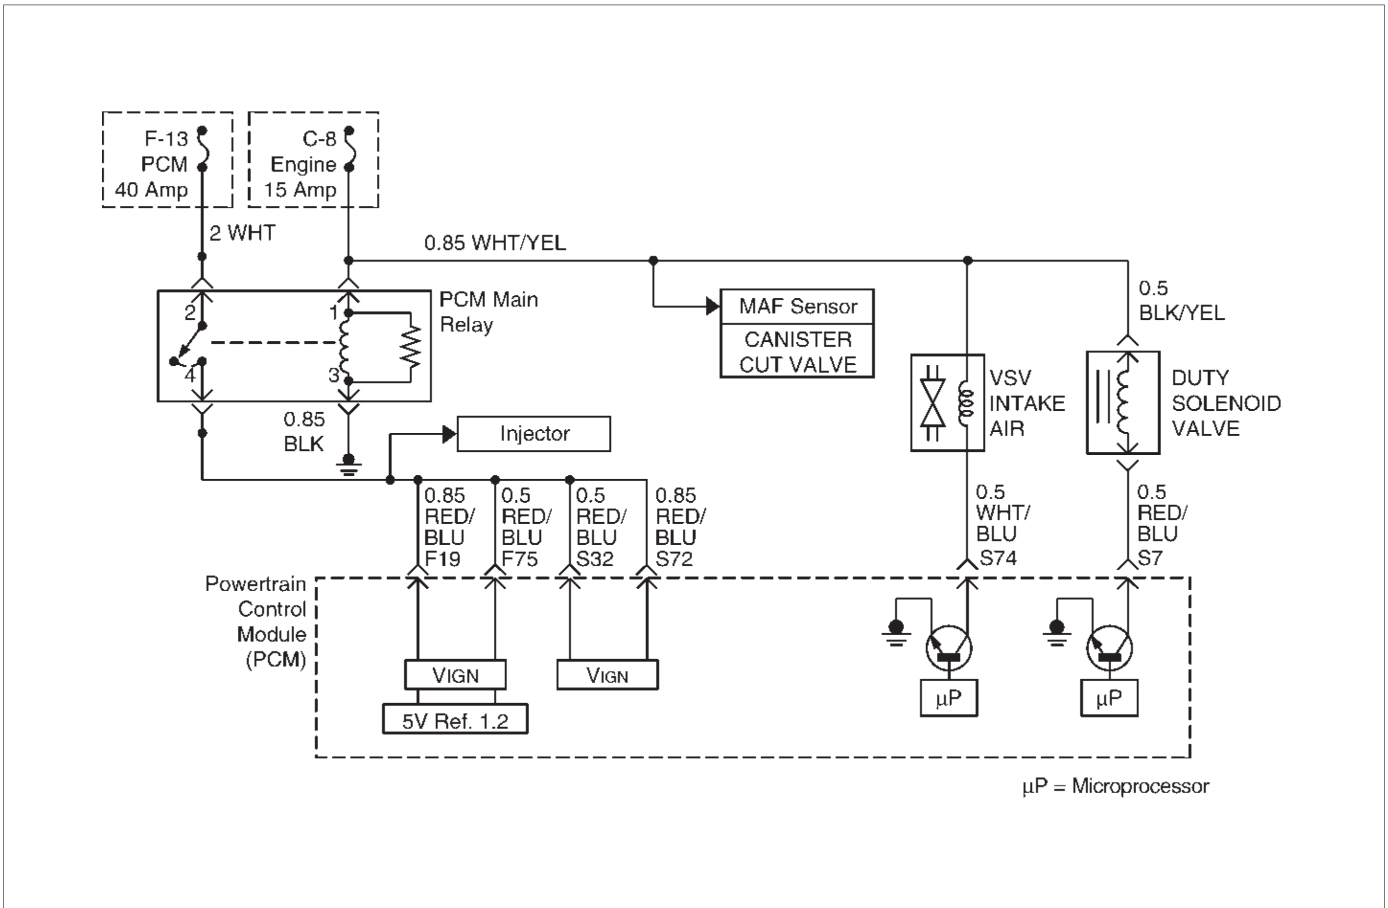
DTC P1404 – EGR Stuck Closed

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition "ON," engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC inf. for DTC P1404 until the DTC P1404 test runs. Note the result. Does the Tech 2 indicates DTC P1404 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to *Step 4*	Go to *Step 5*
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
5	1. Remove EGR valve from Engine. 2. Inspect EGR valve for any excessive carbon deposit on EGR shaft. 3. Inspect for any foreign material inside of EGR valve. Was excessive carbon deposit on EGR valve shaft and/or foreign material in EGR valve ?	—	Go to *Step 6*	Go to *Step 7*
6	1. Clean up EGR valve shaft and inside of EGR valve. 2. Remove foreign material from EGR valve. 3. Visually inspect damage of pintle and seat to see if it is bent. If damaged leakage may occur. Was there any severe damage which affects function?	—	Go to *Step 8*	Verify repair Go to *Step 7*
7	1. Install the EGR valve. 2. Ignition "OFF". 3. Install the Tech 2. 4. Run the engine at idle. 5. On the Tech 2, select EGR Control Test. 6. Use the "UP" arrow to increase the EGR from 0% to 40%. Did EGR work properly?	—	—	Go to *Step 8*
8	1. Reset the learned zero EGR valve position. 2. Repeat step 7. Did EGR work properly?	—	Verify repair	Go to *Step 9*

DTC P1404 – EGR Stuck Closed (Cont'd)

Step	Action	Value(s)	Yes	No
9	Replace the EGR valve. Does DTC P1404 still fail "DTC" test on the Tech 2?	—	Go to *Step 10*	Verify repair
10	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1441 EVAP System Flow During Non-Purge



D06RY00128

Circuit Description

Canister purge is controlled by a solenoid valve that allows manifold vacuum to purge the canister. The powertrain control module (PCM) supplies a ground to energize the solenoid valve (purge “ON”). The EVAP purge solenoid control is pulse-width modulated (PWM) or turned “ON” and “OFF” several times a second. The duty cycle (pulse width) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the PCM and the output is commanded when the appropriate conditions have been met.

The EVAP purge vacuum switch is a normally closed switch positioned in the purge line between the canister and to EVAP purge solenoid. The EVAP purge vacuum switch will open when vacuum increases to greater than 5 inches of water in the purge line. The PCM monitors the EVAP purge vacuum switch signal to determine if the evaporative emission control system is working properly. If the switch is open (purge flow detected) when the PCM is not commanding the EVAP purge solenoid “ON,” DTC P1441 will be set.

Conditions for Setting the DTC

- No active ECT sensor, IAT sensor, MAP sensor, vacuum switch, or TP sensor DTCs set.
- BARO reading is above 85 kPa.
- Engine coolant temperature is below 70°C (158°F).
- Start-up intake air temperature (IAT) and start-up engine coolant temperature (ECT) are both above 5°C (41°F).
- The difference between start-up ECT and start-up IAT is less than 25°C (45°F).
- TP sensor indicates a throttle position above 12%.
- Battery voltage is between 11.5 volts and 16 volts.
- Engine speed is between 800 and 6,000 RPM.
- Canister purge duty cycle is below 3%.
- Canister purge vacuum switch is open, which results in the PCM signal voltage (from the vacuum switch input) being approximately 12 volts.
- All conditions are present for at least 3 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1441 will clear after 40 consecutive warm–up cycles have occurred without a fault.

- DTC P1441 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wring harness for damage. If the harness appears to be OK, observe the EVAP vacuum switch display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. The canister purge vacuum switch is normally closed when no vacuum (purge) is present. With the ignition "ON" and the engine "OFF," there shouldn't be any vacuum (purge) present in the EVAP system.
3. Determines if the PCM is able to control the EVAP purge solenoid valve.
4. Determines if the DTC will set under the conditions present when the DTC was originally stored. If not, the fault is intermittent.
5. Checks for a grounded EVAP purge solenoid driver circuit, a faulty EVAP vacuum switch, or a leaking EVAP purge solenoid valve.

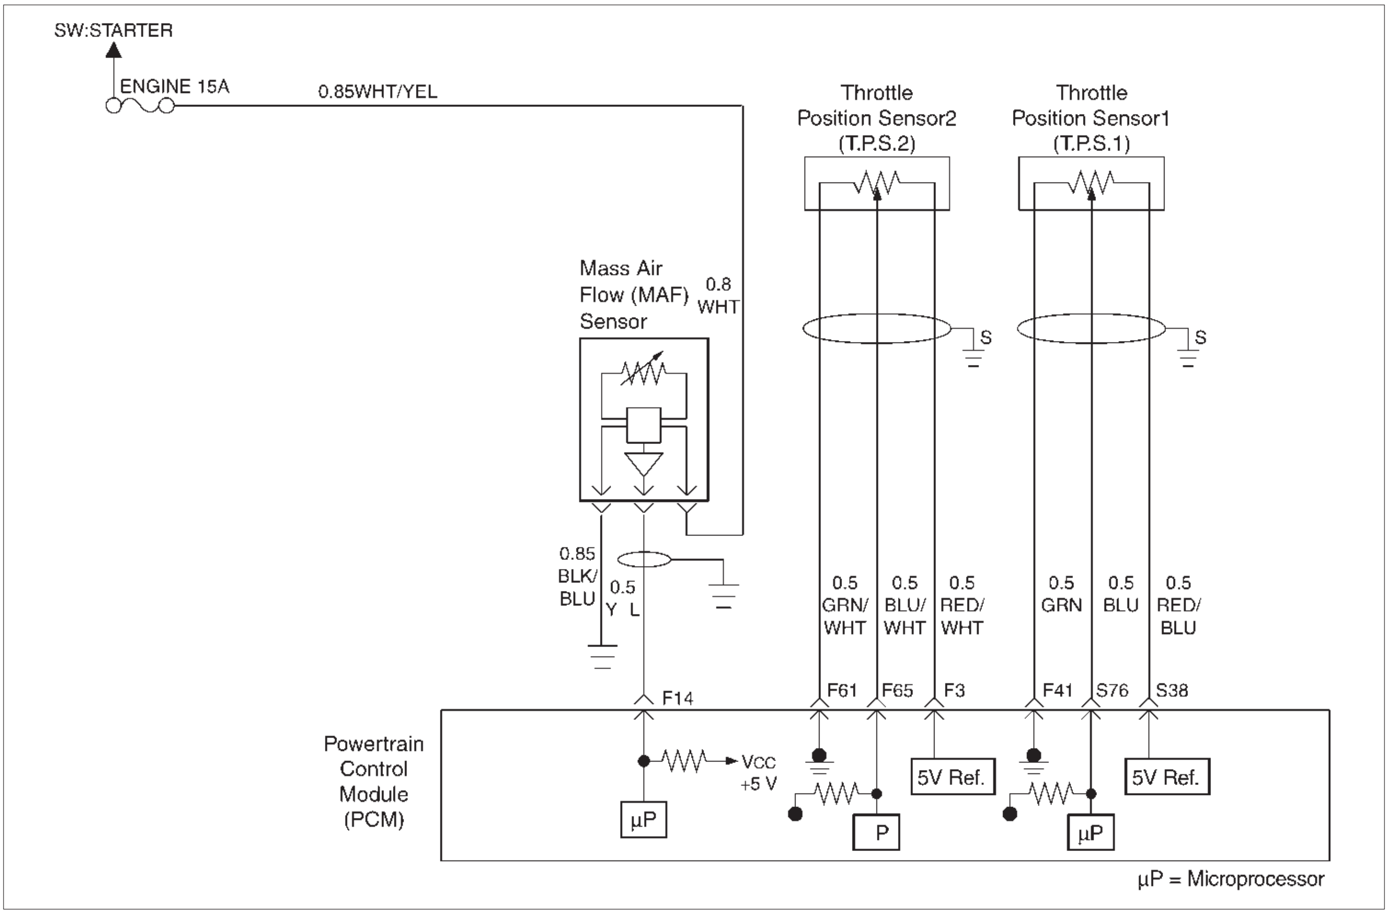
DTC P1441 – EVAP System Flow During Non-Purge

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition "OFF." 2. Remove the fuel filler cap. 3. Ignition "ON." 4. Observe "Fuel Tank Pressure" on the Tech 2. Is "Fuel Tank Pressure" at the specified value?	1.51V	Go to *Step 3*	Go to *DTC P0452 or P0453*
3	1. Re-install the fuel filler cap. 2. Using the Tech 2, command the EVAP Vent Solenoid Valve "ON" (Closed). 3. Disconnect the canister side rubber hose end that hose is connected between the Purge Solenoid Valve and Canister. **IMPORTANT:** Before continuing with the diagnosis, zero the EVAP pressure/purge cart J41413 (refer to the tool operating instructions). And them monitor the fuel tank inner pressure using the Tech 2. Does the fuel tank pressure remain the specified value?	1.52 - 1.60V	Go to *Step 4*	Go to *Step 6*
4	1. Disconnect the EVAP pressure/purge cart J41413, and then plug the hose end. 2. Disconnect the rubber hose end of engine vacuum source side, (the hose connected between Purge Solenoid Valve and engine). 3. Connect the vacuum hand pump to this rubber hose end. 4. Then apply the -15 in H2O vacuum by the vacuum pump. 5. Monitor the fuel tank inner pressure using the Tech 2. Does the fuel tank inner pressure hold the specified value?	1.47 - 1.51V	Go to *Step 6*	Go to *Step 5*

DTC P1441 – EVAP System Flow During Non-Purge (Cont'd)

Step	Action	Value(s)	Yes	No
5	Replace the Purge Solenoid Valve.	—	Verify Repair	—
6	1. Check leaks, kinks or pinched hoses at the EVAP system rubber hose line, and also check if the rubber hoses are correctly connected or not. 2. Check for a leak from Vent Solenoid Valve and EVAP system rubber hoses, and also check for clogged Filter of air separator which is located near the vent solenoid valve. Was a problem found? Using the Vacuum Hose Routing Diagram, repair or re-connect the rubber hoses correctly.	—	Verify Repair	Go to *Step 7*
7	1. Start engine. 2. Remove the Fuel Filler cap. 3. Using the Tech 2, command the EVAP Vent Solenoid Valve "ON" (closed) and Purge Solenoid Valve "OFF" (0%). 4. Replace the Fuel Filler Cap. 5. Run the engine at 2500RPM constant while monitoring "Fuel Tank Vacuum" on the Tech 2. Does the fuel tank vacuum remain at the specified value while the EVAP Vent Solenoid Valve "ON" (closed) and Purge Solenoid Valve "OFF" (0%)?	30 - 40 %	Verify Repair	Go to *Diagnostic Aids*

Diagnostic Trouble Code (DTC) P1514 TPS - MAF Correlation Error



D06RY00090

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle blade angle.

  The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle (WOT).
- The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain Control Module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations.

  A large quantitiy of air entering the engine indicates an accleration or high load situation, while a small quantity or air indicates deceleration or idle.

  The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7g/s at idle to around 25 to 40g/s at maximum engine load.

Conditions for setting the DTC

- The engine is running.
- No MAF sensor DTCs are set.
- Throttle actuation mode is not off.
- MAF reading-ETC estimated air flow is less than 40g/s for 250 failres within test 1000 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1514 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1514 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM - Inspect harness connectors for backed out terminals, improper mating,broken

locks, improperly formed or damaged terminals,and poor terminal to wire connection.

- Damaged harness - Inspect the wiring harness for damage. If the harness appears to be OK, observe the Mass Air Flow, TP sensor 1, TP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.
- Plugged intake air duct or filter element
- A wide - open throttle acceleration from a stop should cause the mass air flow displayed on a Tech 2 to increase from about 3 – 6 g/s at idle to 100 g/s or greater at the time of the 1 – 2 shift. If not, check for a restriction.

A change in the display will indicate the location of the fault. If DTC P1514 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1514 Diagnostic Chart may isolate the cause of the fault.

DTC P1514 - TPS-MAF Correlation Error

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P1514. Does the Tech 2 indicate DTC P1514 failed this ignition?	—	Go to *Step 4*	Refer to *Diagnostic Aids*
4	1. Start the engine. 2. With the engine idling, monitor “MAF Frequency” display on the Tech 2. Is the “MAF Frequency” below the specified value?	6 ~ 10 g/s	Go to *Step 5*	Go to *Step 8*
5	1. Ignition “OFF.” 2. Disconnect the MAF sensor connector. 3. Ignition “ON,” engine idling. 4. Using a Tech 2, monitor “MAF Frequency.” Does the Tech 2 indicate a “MAF Frequency” at the specified value?	0g/s	Go to *Step 6*	Go to *Step 7*
6	Replace the MAF sensor. Is the action complete?	—	Verify repair	Go to *Step 9*
7	1. Check the MAF harness for incorrect routing near high voltage components (solenoids, relays, motors). 2. If incorrect routing is found, correct the harness routing. Was a problem found?	—	Verify repair	Go to *Step 7*
8	1. With the engine idling, monitor “MAF Frequency.” display on the Tech 2. 2. Quickly snap open throttle to wide open throttle while under a road load and record value. Does the Tech 2 indicate a “MAF Frequency” at thespecified value?	6 ~ 10 g/s	Go to *Step 6*	Go to *Step 9*

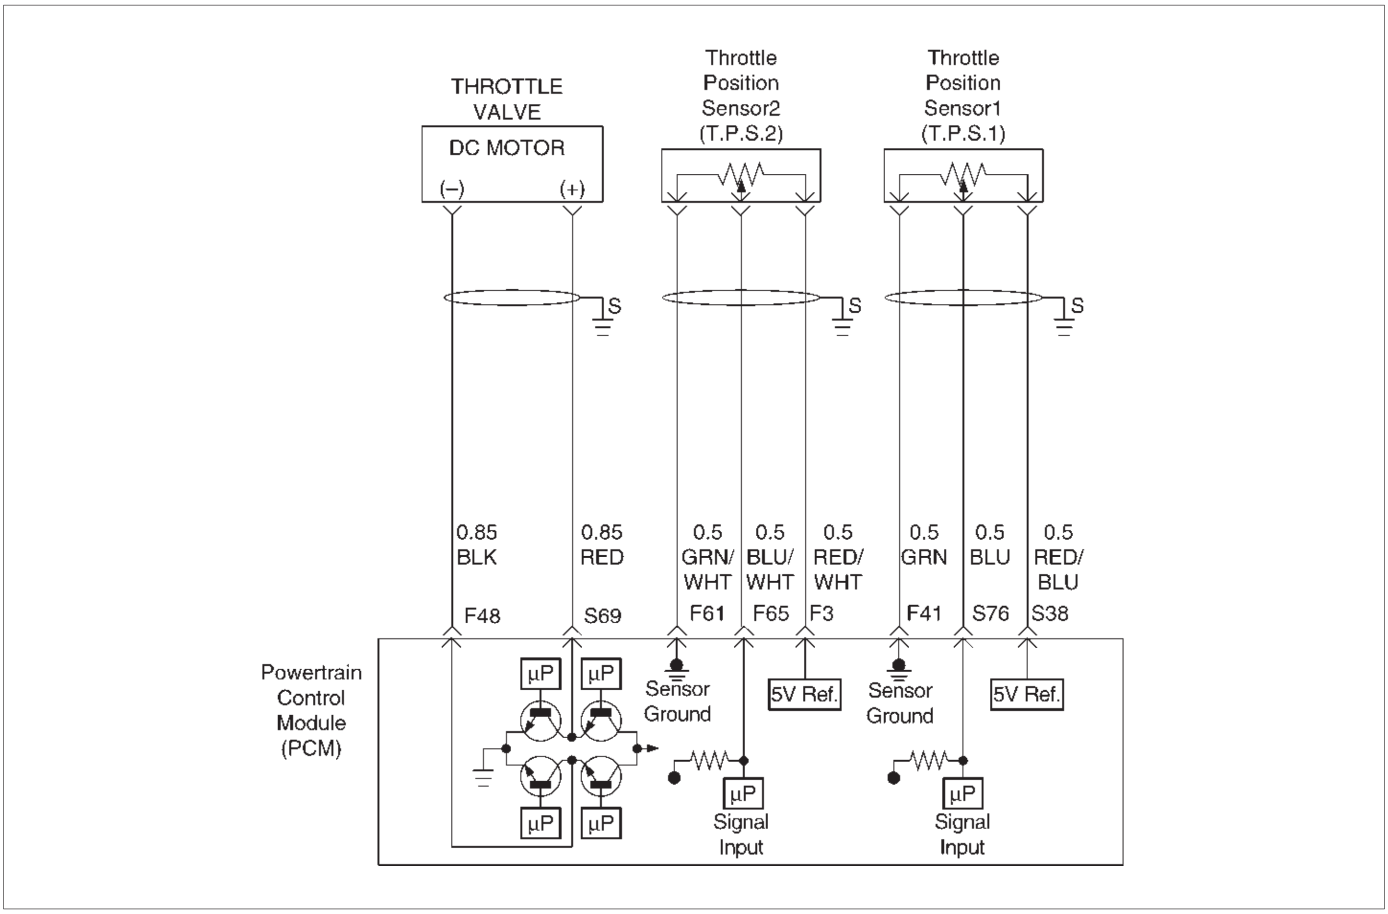
DTC P1514 - TPS-MAF Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Ignition"ON", engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65kPa	Go to *Step 10*	Go to *Step 13*
10	1. Disconnect the MAP sensor. 2. Connect a test 5 volt reference circuit and the MAP signal at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value? (If no, start with diagnosis chart for other sensors in the circuit and see if 5Vreturns.)	—	Go to *Step 12*	Go to *Step 11*
11	1. Check the MAP signal circuit between the PCM and MAP ground circuit. 2. If the MAP signal circuit is open or shoted, repair it as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to *Step 13*
12	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
13	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =90 ~ 92 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =8 ~ 10 %	Refer to *Diagnostic Aids*	Go to *Step 14*
14	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	0V	Go to *Step 15*	Go to *Step 16*
15	1. Connect a test light between the 5Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	5V	Go to *Step 18*	Go to *Step 17*
16	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1 and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 19*

DTC P1514 - TPS-MAF Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
17	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	Replace the TP sensor. Is the action complete?	—	Verify repair	—
19	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin.Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1515 Command - Actual TPS Correlation Error



D06RY00088

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle).

  The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle(WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC ditects the difference between actual throttle position and command throttle position.

Conditions for setting the DTC

- The ignition is “ON”.
- Throttle actuation mode is normal.
- Command Throttle position - Actual Throttle position is more than + 5 % for 100 counts within test 1000 test samples (15.6 m sec) else Actual Throttle position is less than + 40 % and Command Throttle position - Actual Throttle position is more than - 5 % or Command Throttle position - Actual Throttle position is more than - 20 % for 150 failres within test 1000 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1515 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1515 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, mproper mating, locks, improperly formed or damaged terminals, and poor terminal to wire connection.

- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1515 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC P1515 Diagnostic Chart may isolate the cause of the fault.

DTC P1515 - Command - Actual TPS Correlation Error

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “ DTC” info for DTC P1515. Does the Tech 2 indicate DTC P1515 failed thisignition?	—	Go to *Step 4*	Refer to *Diagnostic Aids*
4	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =90 ~ 92 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =8 ~ 10 %	Go to *Step 8*	Go to *Step 5*

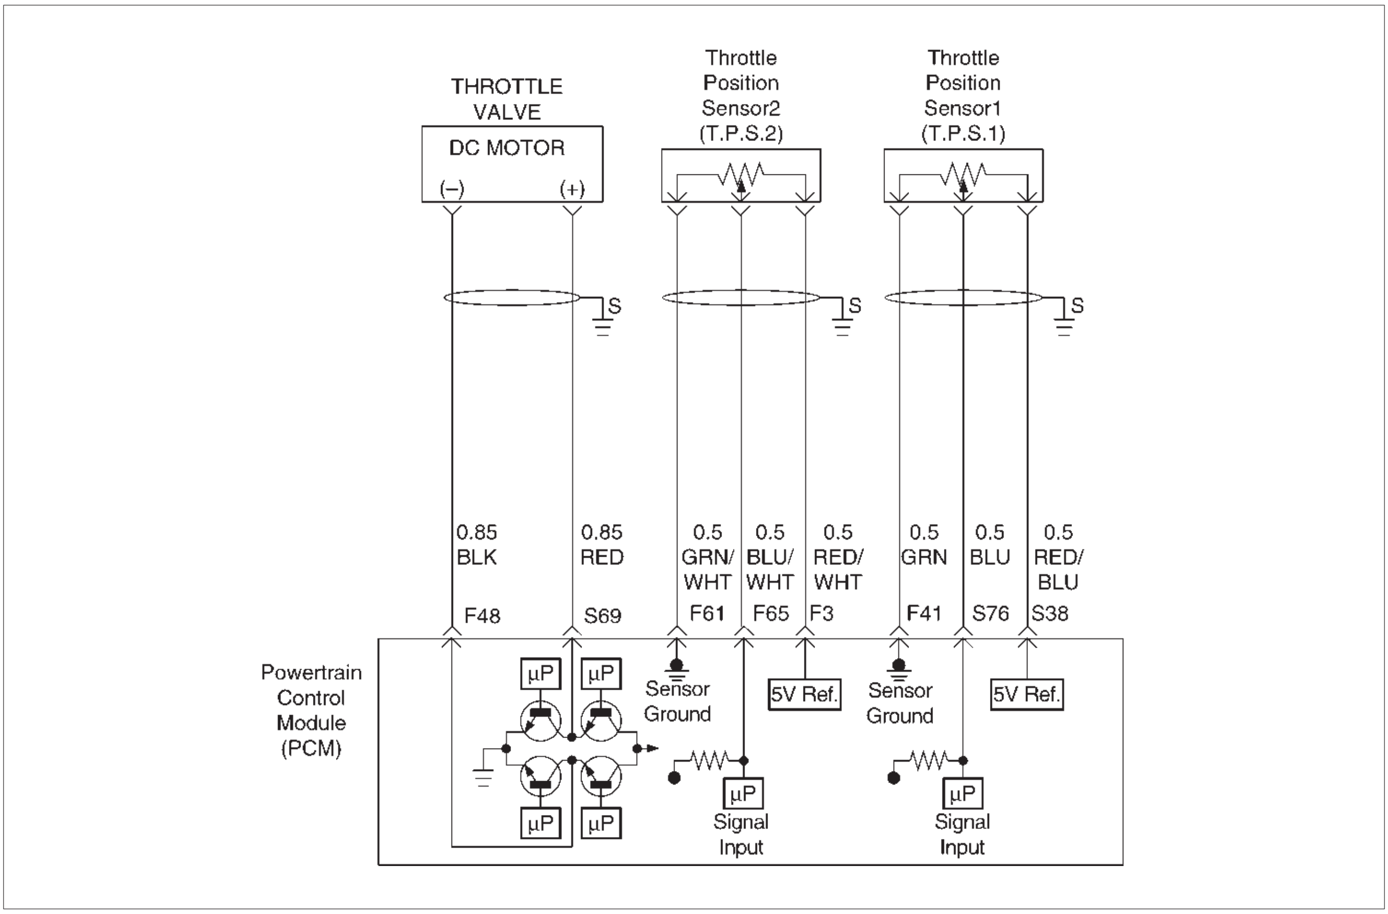
6	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to *Step 8*
7	Replace the DC motor. Is the action complete?	—	Verify repair	Go to *Step 6*
8	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0V	Go to *Step 9*	Go to *Step 10*
9	1. Connect a test light between the 5Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	5V	Go to *Step 12*	Go to *Step 11*

DTC P1515 - Command - Actual TPS Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1and TP2 sensor ground circuit for a poor connection. 4. If a problem is found,repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
11	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
12	Replace the TP sensor. Is the action complete?	—	Verify repair	—
13	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1516 Command - Actual TPS Correlation Error



D06RY00088

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle). The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle (WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC detects the dufference between actual throttle position and command throttle position in steady state.

Conditions for setting the DTC

- The ignition is “ON”.
- Throttle Actuation mode is normal.
- Command Throttle position-Actual Throttle positionis less than 8 % when desird TPS is sutudy wihtin 0.5 %for 30 second within test samples (30 second)

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1516 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1516 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness - Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1516 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1516 Diagnostic Chart may isolate the cause of the fault.

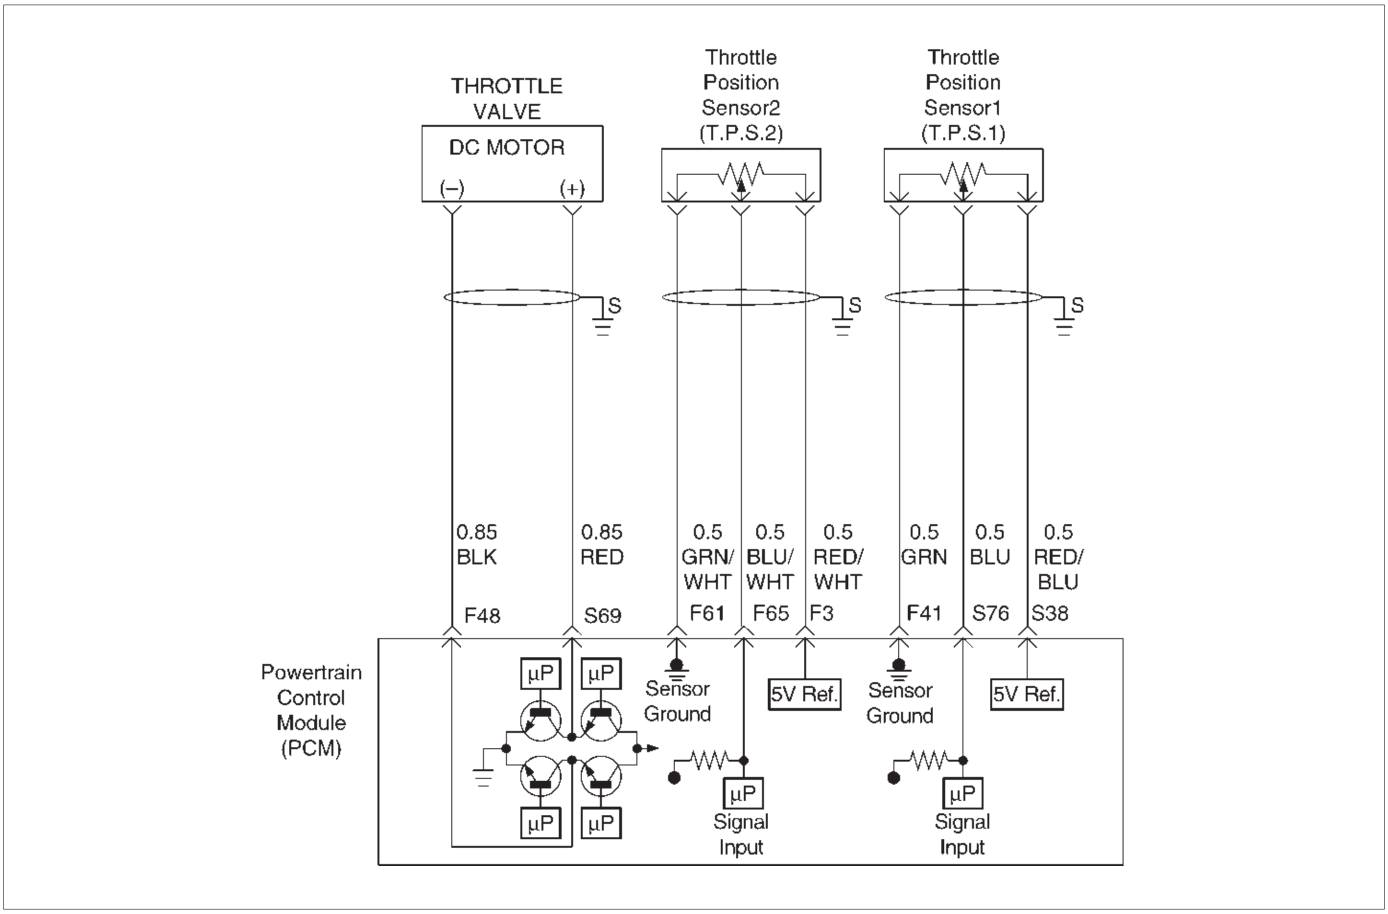
DTC P1516 - Command - Actual TPS Correlation Error

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P1516. Does the Tech 2 indicate DTC P1516 failed this ignition?	—	Go to *Step 4*	Refer to *Diagnostic Aids*
4	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =90 ~ 92 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =8 ~ 10 %	Go to *Step 8*	Go to *Step 5*
5	1. Ignition “OFF.” 2. Disconnect the DC motor. Is the DC motor reading near the specified value?	0.3 ~ 100 Ω	Go to *Step 6*	Go to *Step 7*
6	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to *Step 8*
7	Replace the DC motor. Is the action complete?	—	Verify repair	Go to *Step 6*
8	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	0V	Go to *Step 9*	Go to *Step 10*
9	1. Connect a test light between the 5Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to *Step 12*	Go to *Step 11*

DTC P1516 - Command - Actual TPS Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
11	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1 and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
12	Replace the TP sensor. Is the action complete?	—	Verify repair	—
13	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1523 Actuator Control Return Performance



D06RY00088

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle).

  The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle(WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC ditects if the throttle return to the default position at key on, steady state.

Conditions for setting the DTC

- The ignition is “ON”.
- Normalized TPS is less than 0 % but Normalized TPS is more than 25 %.

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1523 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1523 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1523 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC P1523 Diagnostic Chart may isolate the cause of the fault.

DTC P1523 - Actuator Control Return Performance

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =90 ~ 92 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =8 ~ 10 %	Go to *Step 7*	Go to *Step 4*
4	1. Ignition “OFF.” 2. Disconnect the DC motor. Is the DC motor reading near the specified value?	0.3 ~ 100 Ω	Go to *Step 5*	Go to *Step 6*
5	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
6	Replace the DC motor. Is the action complete?	—	Verify repair	Go to *Step 5*
7	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0V	Go to *Step 8*	Go to *Step 9*
8	1. Connect a test light between the 5Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to *Step 11*	Go to *Step 10*
9	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*

DTC P1523 - Actuator Control Return Performance (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
11	Replace the TP sensor. Is the action complete?	—	Verify repair	—
12	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1625 PCM Unexpected Reset

Circuit Description

The powertrain control module (PCM) monitors unexpected PCM reset. This will not turn on MIL light on, only records code DTC P1625.

Conditions for Setting the DTC

- Clock or COP (Computer Operating Properly) reset.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1625 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1625 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

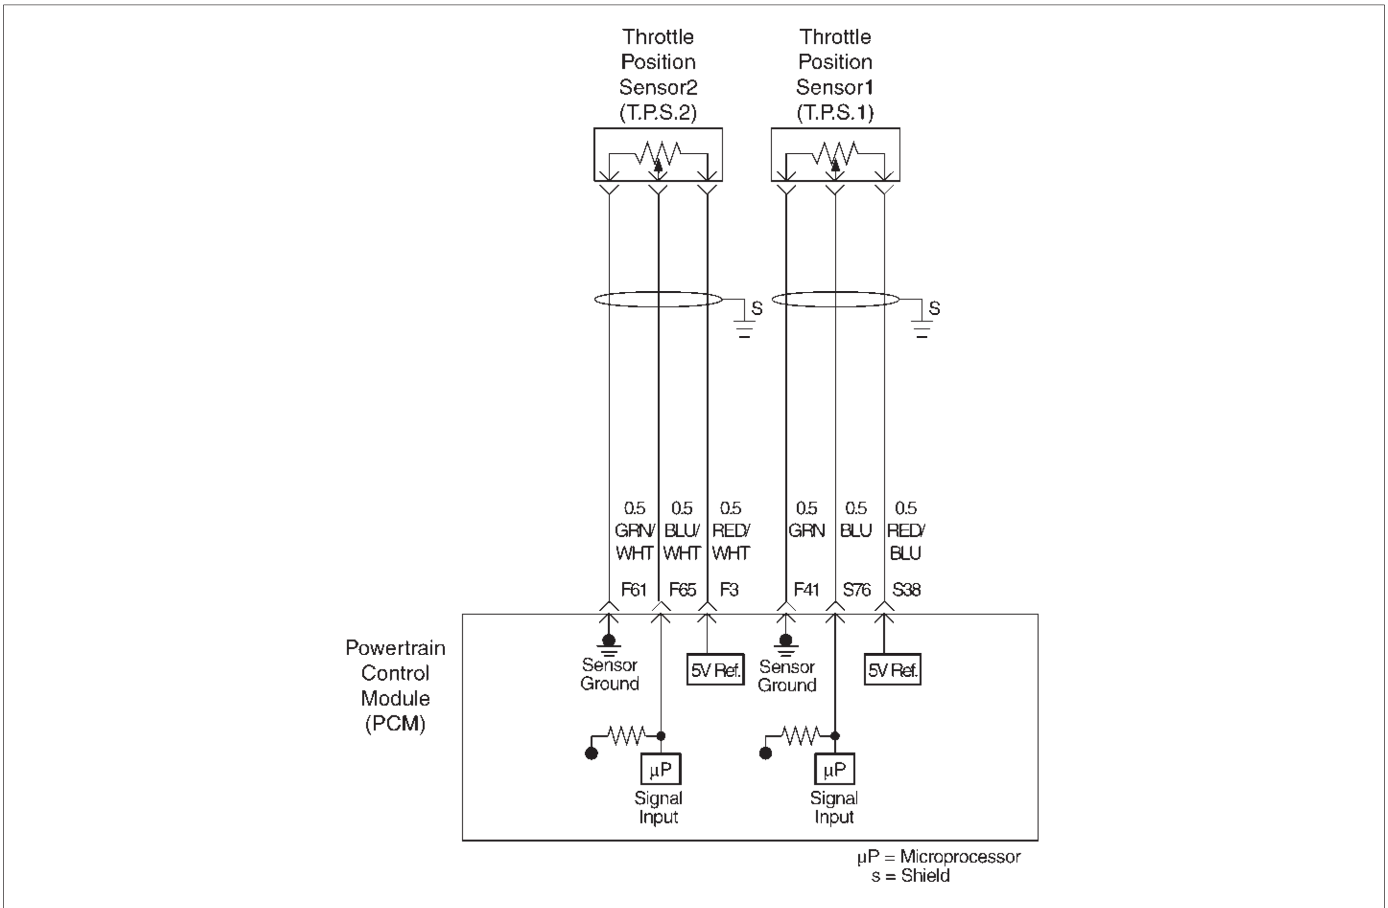
Check for the following conditions:

- P1625 alone stored does not need diagnosis. Clear DTC code.

DTC P1625 – PCM Unexpected Reset

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to *OBD System Check*
2	1. Ignition is “ON”. 2. Install the Tech 2. 3. Start the engine at let it Idle. 4. On the Tech 2, select “DTC info”. Does the Tech 2 indicate DTC P1625 failed?	—	Go to *Step 3*	Go to *Diagnostic Aids*
3	1. Ignition is “ON”. 2. Clear DTC P1625 by using the Tech 2 “Clear Info”. 3. Start the engine at let it Idle. 4. On the Tech 2, select “DTC info”. Does the Tech 2 indicate DTC P1625 failed?	—	Go to *Step 4*	Go to *Diagnostic Aids*
4	1. Check for aftermarket electronics, such as transceiver, stereos, and anti theft devices. They may radiate EMI into the control system if they are improperly installed. (This may cause a false sensor reading and turn on the MIL.) 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1635 Reference Voltage # 1 Circuit Fault



D06RY00077

Circuit Description

The TP sensor # 1 shares a 5 Volt reference with the PCM.

If the PCM detects the 5 Volt reference for the TP sensor # 1 is failure, DTCP1635 will be set.

Conditions for setting the DTC

- The ignition is “ON”.
- The 5 Volt reference voltage for the TP sensor # 1 is less than 4 volts.
- The 5 Volt reference voltage for the TP sensor # 1 is more than 5 volts.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL) .
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

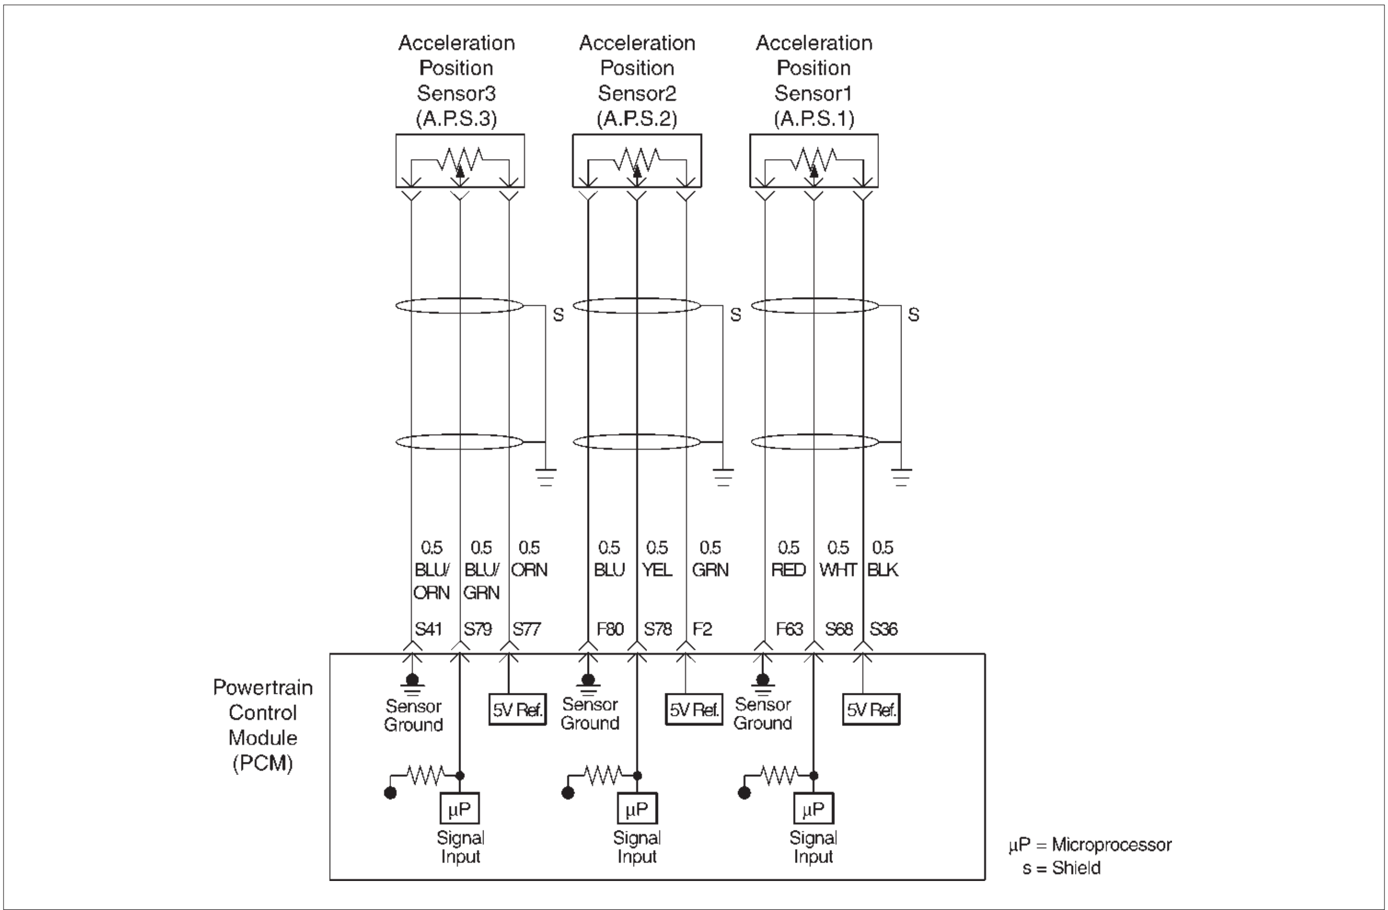
Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1635will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1635 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed. Tech2 “ Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Trouble Code (DTC) P1635 Reference Voltage # 1 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board(OBD)System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal S38 (RED/BLU) pin. Is the voltage in specified range?	4.95 – 5.0V	Go to *ETC System Check*	Go to *Step 3*
3	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal F20 (WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to *Step 4*	Go to *Step 5*
4	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal F57 (WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to *Step 6*	Go to *Step 5*
5	Observe the battery voltage and circuit. If the probrem found, repair it as necessary. Was the probrem found?	—	Verify repair	Go to *Step 6*
6	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1639 Reference Voltage # 2 Circuit Fault



D06RY00075

Circuit Description

The AP sensor # 1shares a 5Volt reference with the PCM. If the PCM detects the 5 Volt reference for the AP sensor # 1 is failure, DTC P1635 will be set.

Conditions for setting the DTC

- The ignition is “ON”.
- The 5 Volt reference voltage for the AP sensor # 1 is less than 4 volts.
- The 5 Volt reference voltage for the AP sensor # 1 is more than 5 volts.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1639 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1639 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed. Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Trouble Code (DTC) P1639 Reference Voltage # 2 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal S36 (BLK) pin. Is the voltage in specified range?	4.95 – 5.0V	Go to *ETC System Check*	Go to *Step 3*
3	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal F20(WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to *Step 4*	Go to *Step 5*
4	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal F57 (WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to *Step 6*	Go to *Step 5*
5	Observe the battery voltage and circuit. If the probrem found, repair it as necessary. Was the probrem found?	—	Verify repair	Go to *Step 6*
6	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin.Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1640 Driver-1-Output Circuit Fault (ODM)

Circuit Description

Output driver modules (ODMs) are used by the powertrain control module (PCM) to turn "ON" many of the current-driven devices that are needed to control various engine and transmission functions. Each ODM is capable of controlling up to 7 separate outputs by applying ground to the device which the PCM is commanding "ON."

Unlike the Quad Driver Modules (QDMs) used in prior model years, ODMs have the capability of diagnosing each output circuit individually. DTC P1640 set indicates an improper voltage level has been detected on an ODM output.

Since A/C is an option, No A/C will cause the air conditioning clutch relay output to always fail. If a fault is seen on the air conditioning clutch relay output, it will not be logged as a fault until the A/C request input interrupts a high voltage, indicating that A/C has been installed.

Conditions for Setting the DTC

- Ignition "ON."
- Engine running.
- No DTC 1618.
- Ignition voltage is above 13.2 volts for 4 seconds.
- Output voltage does not equal ignition voltage when output is "OFF" or output voltage is not less than 1 volt when output is "ON."
- Above conditions occur for at least 1 second.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1640 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P1640 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage, If the harness appears to be OK, disconnect the PCM, turn the ignition "ON" and observe a voltmeter connected to the suspect driver circuit at the PCM harness connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.
- Poor connection at component – Examine for damaged connectors, unplugged connector, or damaged terminals at the following locations: Instrument cluster harness, canister purge solenoid, A/C clutch relay. An open ignition feed circuit at any of these components will cause DTC P1640 to be set.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

4. The Tech 2 Driver Module Status indicates the PCM pin that is affected.

9. The Tech 2 may indicate "short circuit" even when the problem is an open circuit. The cause of an open circuit may be in the component itself-lamp, purge, solenoid, or A/C compressor relay.

11. A short to ground on the ignition side of the component will blow the fuse. Since the fuse was checked in Step 2, a short to ground would be between the affected component and the PCM.

DTC P1640 – Driver-1-Output Circuit Fault (ODM)

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Check the fuse for the driver circuit that was shown as faulty. Was the fuse blown?	—	Go to *Step 3*	Go to *Step 4*
3	1. Check for a short to ground between the fuse and the affected component. 2. Replace the fuse after making any necessary repairs. Is the action complete?	—	Verify repair	—
4	Disconnect the PCM connector for the affected driver circuit. Is there any damage to the PCM pin or connector?	—	Go to *Step 5*	Go to *Step 6*
5	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
6	Were either of the lamp circuits for “Check Engine” or “Check Trans.” indicated as faulty by the Tech 2?	—	Go to *Step 7*	Go to *Step 13*
7	1. Leave the PCM connector for the lamp driver circuit disconnected. 2. Ignition “ON.” 3. Using a DVM, check the voltage at the PCM connector for the affected lamp driver circuit. Was the voltage equal to the specified value?	B+	Go to *Step 15*	Go to *Step 8*
8	1. Ignition “ON.” 2. Check for battery voltage at the fuse for the affected lamp circuit. Was battery voltage available at the fuse?	—	Go to *Step 10*	Go to *Step 9*
9	Repair the open circuit between the ignition switch and the fuse. Is the action complete?	—	Verify repair	—
10	1. Ignition “OFF.” 2. Disconnect the PCM connector for the affected driver terminal. 3. Connect an ohmmeter between a good ground and the PCM connector for the affected driver. Did the ohmmeter indicate continuity?	—	Go to *Step 11*	Go to *Step 12*
11	Repair the short to ground between the affected component and its PCM driver terminal. Is the action complete?	—	Verify repair	—
12	Repair the open circuit between the fuse and the PCM driver terminal for the affected circuit. Is the action complete?	—	Verify repair	—

DTC P1640 – Driver-1-Output Circuit Fault (ODM) (Cont'd)

Step	Action	Value(s)	Yes	No
13	1. Connect the PCM. 2. Start the engine and let it idle. 3. Backprobe the affected terminal at the PCM with a DVM. Was the voltage equal to the specified value?	+B	Go to *Step 15*	Go to *Step 14*
14	1. Run the engine at idle. 2. Check for battery voltage at the fuse for the affected circuit. Was battery voltage available at the fuse?	—	Go to *Step 10*	Go to *Step 9*
15	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1650 Quad Driver Module “A” Fault

Circuit Description

The Quad Driver Module (QDMs) are used by the powertrain control module (PCM) to turn “ON” current–driven devices that are needed to control two engine functions. The PCM monitors open or short circuit of either of Canister Control Purge (CCP) Vent solenoid or Variable Intake Manifold (VIM).

Conditions for Setting the DTC

- Ignition “ON”.
- Engine running.
- Ignition voltage.
- Output voltage does not equal voltage is not less than 1 volt when out put is “ON”.
- Above conditions occur for at least 0.5 second.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1650 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1650 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage, If the harness appears to be OK, disconnect the PCM, turn the ignition “ON” and observe a voltmeter connected to the suspect driver circuit at the PCM harness connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.
- Poor connection at component – Examine for damaged connectors, unplugged connector, or damaged terminals at the following locations: canister purge solenoid, fuel level sensor. An open ignition feed circuit at any of these components will cause DTC P1650 to be set.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

The following PCM pins are controlled by Quad driver modules (QDMs):

- S74 – VIM
- S7 – Canister control purge

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

4. The Tech 2 Driver Module Status indicates the PCM pin that is affected.

9.The Tech 2 may indicate “short circuit” even when the problem is an open circuit. The cause of an open circuit may be in the component itself.

11.A short to ground on the ignition side of the component will blow the fuse. Since the fuse was checked in Step 2, a short to ground would be between the affected component and the PCM.

DTC P1650 – Quad Driver Module (QDM) Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Check the fuse for the driver circuit that was shown as faulty. Was the fuse blown?	—	Go to *Step 5*	Go to *Step 6*
3	1. Check for a short to ground between the fuse and the affected component. 2. Replace the fuse after making any necessary repairs. Is the action complete?	—	Verify repair	—
4	Disconnect the PCM connector for the affected driver circuit. Is there any damage to the PCM pin or connector?	—	Go to *Step 5*	Go to *Step 6*
5	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
6	Were either of the lamp circuits for “Check Engine” or “Check Trans.” indicated as faulty by the Tech 2?	—	Go to *Step 7*	Go to *Step 13*
7	1. Leave the PCM connector for the lamp driver circuit disconnected. 2. Ignition “ON.” 3. Using a DVM, check the voltage at the PCM connector for the affected lamp driver circuit. Was the voltage equal to the specified value?	B+	Go to *Step 15*	Go to *Step 8*
8	1. Ignition “ON.” 2. Check for battery voltage at the fuse for the affected lamp circuit. Was battery voltage available at the fuse?	—	Go to *Step 10*	Go to *Step 9*
9	Repair the open circuit between the ignition switch and the fuse. Is the action complete?	—	Verify repair	—
10	1. Ignition “OFF.” 2. Disconnect the PCM connector for the affected driver terminal. 3. Connect an ohmmeter between a good ground and the PCM connector for the affected driver. Did the ohmmeter indicate continuity?	—	Go to *Step 11*	Go to *Step 12*
11	Repair the short to ground between the affected component and its PCM driver terminal. Is the action complete?	—	Verify repair	—
12	Repair the open circuit between the fuse and the PCM driver terminal for the affected circuit. Is the action complete?	—	Verify repair	—

DTC P1650 – Quad Driver Module (QDM) Fault (Cont'd)

Step	Action	Value(s)	Yes	No
13	1. Connect the PCM. 2. Start the engine and let it idle. 3. Backprobe the affected terminal at the PCM with a DVM. Was the voltage equal to the specified value?	+B	Go to *Step 15*	Go to *Step 14*
14	1. Run the engine at idle. 2. Check for battery voltage at the fuse for the affected circuit. Was battery voltage available at the fuse?	—	Go to *Step 10*	Go to *Step 9*
15	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Symptom Diagnosis

Preliminary Checks

Before using this section, perform the "On-Board Diagnostic (OBD) System Check" and verify all of the following items:

- The powertrain control module (PCM), and malfunction indicator lamp (MIL) (Check Engine lamp) and Reduced Power Lamp (RPL) are operating correctly.
- There are no DTC(s) stored.
- Tech 2 data is within normal operating range. Refer to *Typical Scan Data Values*.
- Verify the customer complaint and locate the correct symptom in the table of contents. Perform the procedure included in the symptom chart.

Visual/Physical Check

Several of the symptom procedures call for a careful visual/physical check. This can lead to correcting a problem without further checks and can save valuable time.

This check should include the following items:

- PCM grounds for cleanliness, tightness and proper location.
- Vacuum hoses for splits, kinks, and proper connections, as shown on the "Vehicle Emission Control Information" label. Check thoroughly for any type of leak or restriction.
- Air intake ducts for collapsed or damaged areas.
- Air leaks at throttle body mounting area, mass air flow (MAF) sensor and intake manifold sealing surfaces.
- Ignition components for cracking, hardness, and carbon tracking.
- Wiring for proper connections, pinches and cuts.

Intermittents

IMPORTANT: An intermittent problem may or may not turn on the malfunction indicator lamp (MIL) or store a DTC. DO NOT use the Diagnostic Trouble Code (DTC) charts for intermittent problems. The fault must be present to locate the problem.

Most intermittent problems are caused by faulty electrical connections or wiring. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector (backed out).
- Improperly formed or damaged terminal.
- All connector terminals in the problem circuit should be carefully checked for proper contact tension.
- Poor terminal-to-wire connection. This requires removing the terminal from the connector body to check.

Road test the vehicle with a J 39200 Digital Multimeter connected to a suspected circuit. An abnormal voltage when the malfunction occurs is a good indication that there is a fault in the circuit being monitored.

Use a Tech 2 to help detect intermittent conditions. The scan tool has several features that can be used to locate an intermittent condition. Use the following feature to find intermittent faults:

- Using a Tech 2's "Freeze Frame" buffer or "Failure Records" buffer can aid in locating an intermittent condition. Review and record the information in the freeze frame or failure record associated with the intermittent DTC being diagnosed. The vehicle can be driven within the conditions that were present when the DTC originally set.

To check for loss of diagnostic code memory, disconnect the MAP sensor and idle the engine until the MIL (Check Engine lamp) comes on. DTC P0107 should be stored and kept in memory when the ignition is turned "OFF." If not, the PCM is faulty. When this test is completed, make sure that you clear the DTC P0107 from memory.

An intermittent MIL (Check Engine lamp) with no stored DTC may be caused by the following:

- Ignition coil shorted to ground and arcing.
- MIL (Check Engine lamp) wire to PCM shorted to ground.
- Poor PCM grounds. Refer to the PCM wiring diagrams.

Check for improper installation of electrical options such as lights, cellular phones, etc. Check all wires from the PCM to the ignition coils for poor connections.

Check for an open diode across the A/C compressor clutch and check for other open diodes (refer to wiring diagrams in *Electrical Diagnosis*).

If problem has not been found, refer to *PCM Connector Symptom* tables.

- Check the "Calibration ID" of the PCM, and compare it with the latest Isuzu service bulletins and/or Isuzu EEPROM reprogramming equipment to determine if an update to the PCM's reprogrammable memory has been released. To check the "Calibration ID", connect the Tech 2, then look for "Powertrain", then select "Calibration ID". This identifies the contents of the reprogrammable software and calibration contained in the PCM. If the "Calibration ID" is not the most current available, it is advisable to reprogram the PCM's EEPROM memory, which may either help identify a hard-to-find problem or may fix the problem.
- Calibration ID (example)

Part number	9377709
Broadcast Code	CYYD
Identifier	801

Hard Start Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Engine cranks, but does not start for a long time. Does eventually run, or may start but immediately stalls. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 4*
4	Was a visual/physical check performed?	—	Go to *Step 5*	Go to *Visual/Physical Check*
5	Check engine coolant temperature (ECT) sensor for shift in value. After 8 hours with the hood up and the engine not running, connect the Tech 2. With the ignition "ON" and the engine not running, compare engine coolant temperature to intake air temperature. Are ECT and IAT within the specified value of each other?	± 5°C (± 9°F)	Go to *Step 10*	Go to *Step 6*
6	1. Using a Tech 2, display the engine coolant temperature and note the value. 2. Check the resistance of the engine coolant temperature sensor. 3. Refer to *Engine Coolant Temperature Sensor Temperature vs. Resistance* chart on *DTC P0118 Diagnostic Support* for resistance specifications. Is the resistance value near the resistance for the temperature noted?	—	Go to *Step 8*	Go to *Step 7*
7	Replace the ECT sensor. Is the action complete?	—	Verify repair	—
8	Locate and repair high resistance or poor connection in the ECT signal circuit or the ECT sensor ground. Is the action complete?	—	Verify repair	—
9	1. Check for a faulty, plugged, or incorrectly installed PCV valve. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
10	1. Check for water- or alcohol-contaminated fuel. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Perform the procedure in *Fuel System Pressure Test*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*

Hard Start Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electric Ignition System* for procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Remove the ignition coils and check the ignition coils for cracks or carbon tracking. 2. If a problem is found, replace affected coil(s) as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Check for the following engine mechanical problems (refer to *Engine Mechanical*): • Low compression • Leaking cylinder head gaskets • Worn or incorrect camshaft • Camshaft drive belt slipped or stripped 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records buffer • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Surges and/or Chuggles Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Engine power variation under steady throttle or cruise. Feels like the vehicle speeds up and slows down with no change in the accelerator pedal. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 4*
4	Was a visual/physical check performed?	—	Go to *Step 5*	Go to *Visual/Physical Check*
5	Be sure that the driver understands transmission torque converter clutch and A/C compressor operation as explained in the owner's manual. Inform the customer how the TCC and the A/C clutch operate. Is the customer experiencing a normal condition?	—	System OK	Go to *Step 6*
6	1. Check the the fuel control heated oxygen sensors (HO2S, B1S1 and B2S1). The fuel control heated oxygen sensors (HO2S) should respond quickly to different throttle positions. If they don't, check them for silicone or other contaminants from fuel or use of improper RTV sealant. The sensors may have a white powdery coating. Silicon contamination causes a high but false HO2S signal voltage (rich exhaust indication). The PCM will then reduce the amount of fuel delivered to the engine, causing a severe driveability problem. For more information, refer to *Powertrain Control Module (PCM) and Sensors*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Check the fuel pressure. Refer to *Fuel System Pressure Test*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Monitor the long term fuel trim on the Tech 2. Is the long term fuel trim significantly in the negative range (rich condition)?	—	Go to *Step 9*	Go to *Step 10*
9	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids* in *DTC P0172 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 11*	Verify repair

Surges and/or Chuggles Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check items that can cause the engine to run lean. Refer to *Diagnostic Aids* in *DTC P0171*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 11*	Verify repair
11	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electric Ignition System* for procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
12	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Check the ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
14	1. Remove the spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Check the injector connections. 2. If any of the injector connectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Check PCM grounds for the cleanliness, tightness and proper locations. Refer to the PCM wiring diagrams in *Electrical Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Check MAF sensor connections. 2. If a problem is found, replace the faulty terminals as necessary. Refer to *Electrical Diagnosis* for wiring repair procedures. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Visually/physically check vacuum hoses for splits, kinks, and proper connections and routing as shown on the "Vehicle Emission Control Information" label. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 19*

Surges and/or Chuggles Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
19	1. Check the exhaust system for possible restriction: • Inspect the exhaust system for damaged or collapsed pipes. • Inspect the muffler for heat distress or possible internal failure. • Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to *Restricted Exhaust System Check*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 20*
20	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records buffer • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Lack of Power, Sluggish or Spongy Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Engine delivers less than expected power. Little or no increase in speed when accelerator pedal is pushed down part-way. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 4*
4	Was a visual/physical check performed?	—	Go to *Step 5*	Go to *Visual/Physical Check*
5	1. Remove and check the air filter element for dirt or restrictions. Refer to *Air Intake System* in *ON-Vehicle Service*. 2. Replace the air filter element if necessary. Was a repair required?	—	Verify repair	Go to *Step 6*
6	1. Check for low fuel pressure. Refer to *Fuel System Pressure Test*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Check for water- or alcohol-contaminated fuel. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	1. Install the Tech 2. 2. Run the engine at idle. 3. On the Tech 2, select F3: Miscellaneous Test, F6: Variable Intake Manifold. 4. Repeat Switch ON or OFF of VIM solenoid valve by using the Tech 2. 5. Check to see if the actuator works normally. 6. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
9	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electronic Ignition System* for procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*

Lack of Power, Sluggish or Spongy Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Remove the spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Check the ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
12	1. Check the PCM grounds for the cleanliness, tightness and proper locations. Refer to the PCM wiring diagrams in *Electrical Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Check the exhaust system for possible restriction: • Inspect the exhaust system for damaged or collapsed pipes. • Inspect the muffler for heat distress or possible internal failure. • Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to *Restricted Exhaust System Check*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	1. Check the torque converter clutch (TCC) for proper operation. Refer to *4L30-E Transmission Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Check for an engine mechanical problem. Check for low compression, incorrect or worn camshaft, loose timing belt, etc. Refer to *Engine Mechanical*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records buffer • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Detonation/Spark Knock Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** A mild to severe ping, usually worse under acceleration. The engine makes sharp metallic knocks that change with throttle opening. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	If Tech 2 readings are normal (refer to *Typical Scan Values*) and there are no engine mechanical faults, fill the fuel tank with a known quality gasoline that has a minimum octane rating of 87 and re-evaluate the vehicle performance. Is detonation present?	—	Go to *Step 5*	Verify repair
5	1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive. 2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to *4L30-E Automatic Transmission Diagnosis*). Was a problem found?	—	Verify repair	Go to *Step 6*
6	1. Check TCC operation. Refer to *4L30-E Transmission Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Check for obvious overheating problems: • Low engine coolant. • Restricted air flow to radiator, or restricted water flow through radiator. • Correct coolant solution should be a 50/50 mix of approved antifreeze/coolant and water. Refer to *Engine Cooling*. • EGR operation. Refer to *DTC P0401*. • ION sensing module fault. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	1. Ignition "OFF." 2. Disconnect the ION sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 9*	—
9	Check the ION sensing harness between the PCM (F68) and ION sensing module circuit (RED Wire) at the Kl line harness connector. Was a problem found?	—	Verify repair	Go to *Step 10*

Detonation/Spark Knock Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 11*	—
11	Check the ION sensing harness between the ignition coil and ION sensing module circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to *Step 12*
12	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 14*
14	Check the following items; 1. ION sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 16*
15	Replace the ION sensing module. Is the action complete?	—	Verify repair	Go to *Step 16*
16	1. Check fuel pressure. Refer to Chart Fuel System Pressure Test. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Check items that can cause an engine to run lean (long term fuel trim significantly in the positive range). For a lean condition, refer to *Diagnostic Aids* in *DTC P0171 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Spark plugs for proper heat range. Refer to *General Information*. 2. If incorrect spark plugs are installed, replace spark plugs as necessary. Did any spark plugs require replacement?	—	Verify repair	Go to *Step 19*
19	1. Remove excessive carbon buildup with a top engine cleaner. Refer to instructions on the top engine cleaner can. 2. Re-evaluate vehicle performance. Is detonation still present?	—	Go to *Step 20*	Verify repair

Detonation/Spark Knock Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
20	1. Check for an engine mechanical problem. Perform a cylinder compression check. Refer to *Engine Mechanical*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 21*
21	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records buffer • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Rough, Unstable, or Incorrect Idle, Stalling Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine. Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Go to *Step 14*	Go to *Step 4*
4	Was a visual/physical check performed?	—	Go to *Step 5*	Go to *Visual/Physical Check*
5	1. Check the PCM grounds for cleanliness, tightness and proper routing. Refer to the PCM wiring diagrams in *Electrical Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 6*
6	Observe the long term fuel trim on the Tech 2. Is the long term fuel trim significantly in the negative range (rich condition)?	—	Go to *Step 7*	Go to *Step 8*
7	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids* in *DTC P0172 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
8	Is the long term fuel trim significantly in the positive range (lean condition)?	—	Go to *Step 9*	Go to *Step 10*
9	1. Check items that can cause the engine to run lean. Refer to *Diagnostic Aids* in *DTC P0171 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
10	1. Check for incorrect idle speed. Ensure that the following conditions are present: • The engine is fully warm. • The accessories are “OFF.” 2. Using a Tech 2, monitor the Engine Speed. Is the Engine Speed within the specified values?	Desired Idle Speed	Go to *Step 12*	Go to *Step 11*

Rough, Unstable, or Incorrect Idle, Stalling Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
11	1. Visually/physically inspect for the following conditions: • Restricted air intake system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. • Large vacuum leak. Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty crankcase ventilation valve or a disconnected brake booster hose. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
12	Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Perform the "Injector Coil/Balance Test" in *Fuel Metering System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	1. Check for fuel in the pressure regulator vacuum hose. 2. If fuel is present, replace the fuel pressure regulator assembly. Refer to *Fuel Metering System*. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electronic Ignition System* for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Check for a loose ignition coil ground and ION Sensing Module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Check ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 19*

Rough, Unstable, or Incorrect Idle, Stalling Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
19	Using a Tech 2, monitor the throttle position 1 and 2 angle with the engine idling. Is the TP angle at the specified value and steady?	8 ~ 10%	Go to *Step 20*	Refer to *DTC* for further diagnosis
20	1. Check the positive crankcase ventilation (PCV) valve for proper operation. Refer to *Crankcase Ventilation System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 21*
21	1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive. 2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to *4L30-E Automatic Transmission Diagnosis*). Was a problem found?	—	Verify repair	Go to *Step 22*
22	1. Check for the following engine mechanical items. Refer to *Engine Mechanical* for diagnosis procedures: • Low compression • Sticking or leaking valves • Worn camshaft lobe(s) • Camshaft drive belt slipped or stripped • Incorrect valve timing • Worn rocker arms • Broken valve springs 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 23*
23	1. Check for faulty motor mounts. Refer to *Engine Mechanical* for inspection of mounts. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 24*
24	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records buffer • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Poor Fuel Economy Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test. (Non-standard tires will cause odometer readings to be incorrect, and that may cause fuel economy to appear poor when it is actually normal.) Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	Check owner's driving habits. • Is the A/C "ON" full time (defroster mode "ON")? • Are tires at the correct pressure? • Are excessively heavy loads being carried? • Is acceleration too much, too often? Was a problem found?	—	Go to *Step 5*	Go to *Step 6*
5	Review the items in Step 4 with the customer and advise as necessary. Is the action complete?	—	System OK	—
6	1. Visually/physically check: Vacuum hoses for splits, kinks, and improper connections and routing as shown on the "Vehicle Emission Control Information" label. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Remove and check the air filter element for dirt or for restrictions. Refer to *Air Intake System*. 2. Replace the air filter element if necessary. Was a repair required?	—	Verify repair	Go to *Step 8*
8	1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Spark Plug Replacement*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
9	1. Check for low engine coolant level. Refer to *Engine Cooling*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*

Poor Fuel Economy Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check for an incorrect or faulty engine thermostat. Refer to *Engine Cooling*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Check for low engine compression. Refer to *Engine Mechanical*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
12	1. Check the TCC operation. Refer to *4L30-E Transmission Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Check the exhaust system for possible restriction: • Inspect the exhaust system for damaged or collapsed pipes. • Inspect the muffler for heat distress or possible internal failure. • Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to *Restricted Exhaust System Check*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	Check for proper calibration of the speedometer. Does the speed indicated on the speedometer closely match the vehicle speed displayed on the Tech 2?	—	Go to *Step 16*	Go to *Step 15*
15	Diagnose and repair an inaccurate speedometer condition as necessary. Refer to *Vehicle Speed Sensor* in *Electrical Diagnosis*. Was a problem found?	—	Verify repair	—
16	1. Check the air intake system and the crankcase for air leaks. Refer to *Air Intake System* and *Crankcase Ventilation System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Review all diagnostic procedures within this table. 2. When all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records buffer • All connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	Perform the procedure in *Fuel System Pressure Test*. Was the fuel pressure normal?	—	Contact Technical Assistance	Verify repair

Excessive Exhaust Emissions or Odors Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Vehicle fails an emission test. Vehicle has excessive "rotten egg" smell. (Excessive odors do not necessarily indicate excessive emissions.) Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Go to *Step 13*	Go to *Step 3*
3	Was a thorough visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	1. Check for vacuum leaks. Check vacuum lines, intake manifold, throttle body, etc. 2. If a problem is found, repair as necessary. Were any vacuum leaks located?	—	Go to *Step 13*	Go to *Step 5*
5	1. Check the fuel cap for proper installation. 2. Secure the fuel cap if necessary. Was the fuel cap installed properly?	—	Go to *Step 6*	Go to *Step 13*
6	1. Check the fuel pressure. Perform the procedure in *Fuel System Pressure Test*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 7*
7	1. Check for a faulty, plugged, or incorrectly installed crankcase ventilation valve; also check the crankcase ventilation system for plugging. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 8*
8	1. Check the injector connections. 2. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 9*
9	1. Perform the "Injector Coil/Balance Test" in *Fuel Metering System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 10*
10	1. Refer to *Engine Cooling* for cooling system diagnosis. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 11*
11	1. Check EVAP canister for fuel loading. Refer to *Evaporative Emission Control System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 12*

Excessive Exhaust Emissions or Odors Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Remove excessive carbon buildup with a top engine cleaner. Refer to the instructions on the top engine cleaner can. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 14*
13	Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 14*
14	Does the exhaust emission test indicate excessive CO and HC levels or is long term fuel trim significantly in the negative range (rich condition)?	—	Go to *Step 15*	Go to *Step 16*
15	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids* in *DTC P0172 Diagnostic Support*. Make any necessary repairs. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 17*
16	1. Check items that can cause the engine to run lean. Refer to *Diagnostic Aids* in *DTC P0171 Diagnostic Support*. Make any necessary repairs. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 17*
17	1. Check the EGR system (refer to *DTC P0401*). 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 18*
18	1. Check for an engine mechanical problem. Perform a cylinder compression check (refer to *Engine Mechanical*). 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 19*
19	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records butter • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Dieseling, Run-On Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Engine continues to run after key is turned "OFF," but runs very rough. If engine runs smooth, check ignition switch and adjustment. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	1. Check for a short between B+ and any of the ignition feed circuits. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 5*
5	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records butter • All electrical connections within a suspected circuit and/or system 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Backfire Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Fuel ignites in the intake manifold, or in the exhaust system, making a loud popping noise. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	1. Check for proper ignition voltage coil output with spark tester J 26792 (ST-125). Refer to *Electric Ignition System* for procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 5*
5	1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to *DTC P0172* to determine the cause of a rich condition or *Engine Mechanical* for an oil fouling condition. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 6*
6	1. Visually/physically inspect the ignition coils for cracks. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Check for an intermittent ignition system malfunction: • Intermittent CKP 58X signal. • Intermittent ignition feed circuit or sensor ground circuit to the crankshaft position sensor. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	1. Check the fuel pressure. Refer to *Fuel System Pressure Test*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*

Backfire Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Check for the following engine mechanical conditions. Refer to *Engine Mechanical* for diagnosis procedures: • Low compression • Sticking or leaking valves • Worn camshaft lobe(s) • Camshaft drive belt slipped or stripped • Incorrect valve timing 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
10	1. Check the intake and exhaust manifold(s) for casting flash. Refer to *Engine Mechanical*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records butter • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Cuts Out, Misses Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Steady pulsation or jerking that follows engine speed; usually more pronounced as engine load increases. Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Go to *Step 14*	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 5*	Go to *ETC System Check*
5	1. Check the PCM grounds for clearness, tightness and proper routing. Refer to the PCM wiring diagrams in *Electrical Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 6*
6	Observe the long term fuel trim on the Tech 2. Is the long term fuel trim significantly in the negative range (rich condition)?	—	Go to *Step 7*	Go to *Step 8*
7	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids* in *DTC P0172 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
8	Is the long term fuel trim significantly in the positive range (lean condition)?	—	Go to *Step 9*	Go to *Step 10*
9	1. Check items that can cause the engine to run lean. Refer to *Diagnostic Aids* in *DTC P0171 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
10	1. Check for incorrect idle speed. Ensure that the following conditions are present: • The engine is fully warm. • The accessories are “off.” 2. Using a Tech 2, monitor the Engine Speed. Is the Engine Speed within the specified values?	Desired Idle Speed	Go to *Step 12*	Go to *Step 11*

Cuts Out, Misses Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
11	1. Visually/physically inspect for the following conditions: • Restricted air intake system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. • Large vacuum leak. Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty PCV valve or brake booster hose disconnected . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
12	Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Perform the "Injector Coil/Balance Test" in *Fuel Metering System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	1. Check for fuel in the pressure regulator vacuum hose. 2. If fuel is present, replace the fuel pressure regulator assembly. Refer to *Fuel Metering System*. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electronic Ignition System* for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Check ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 19*
19	Using a Tech 2, monitor the TP 1, 2 angle with the engine idling. Is the TP angle at the specified value and steady?	8 ~ 10%	Go to *Step 20*	Refer to *DTC P0123* for further diagnosis

Cuts Out, Misses Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
20	1. Check the PCV valve for proper operation. Refer to *Crankcase Ventilation System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 21*
21	1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive. 2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to *4L30-E Automatic Transmission Diagnosis*). Was a problem found?	—	Verify repair	Go to *Step 22*
22	1. Check the following engine mechanical items. Refer to *Engine Mechanical* for diagnosis procedures: • Low compression • Sticking or leaking valves • Worn camshaft lobe(s) • Camshaft drive belt slipped or stripped • Incorrect valve timing • Worn rocker arms • Broken valve springs 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 23*
23	1. Check for faulty motor mounts. Refer to *Engine Mechanical* for inspection of mounts. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 24*
24	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records butter • All electrical connections within a suspected circuit and/or system 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Hesitation, Sag, Stumble Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Momentary lack of response as the accelerator is pushed down. Can occur at any vehicle speed. Usually most pronounced when first trying to make the vehicle move, as from a stop sign. May cause the engine to stall if severe enough. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 4*
4	Was a visual/physical check performed?	—	Go to *Step 5*	Go to *Visual/Physical Check*
5	1. Check the fuel control heated oxygen sensors (HO2S, B1S1 and B2S1). The fuel control heated oxygen sensors (HO2S) should respond quickly to different throttle positions. If they don't, check them for silicon or other contaminants from fuel or use of improper RTV sealant. The sensors may have a white powdery coating. Silicon contamination causes a high but false HO2S signal voltage (rich exhaust indication). The PCM will then reduce the amount of fuel delivered to the engine, causing a severe driveability problem. For more information, refer to *Powertrain Control Module (PCM) and Sensors*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 6*
6	1. Check the fuel pressure. Refer to *Fuel System Pressure Test.* 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Observe the TP 1, 2 angle display on the Tech 2 while slowly increasing throttle pedal. Does the TP angle display steadily increase from 8 ~ 10% at closed throttle to 90 ~ 92% at WOT?	—	Go to *Step 8*	Go to *Step 19*
8	Monitor the long term fuel trim on the Tech 2. Is the long term fuel trim significantly in the negative range (rich condition)?	—	Go to *Step 9*	Go to *Step 10*
9	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids* in *DTC P0172 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*

Hesitation, Sag, Stumble Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check items that can cause the engine to run lean. Refer to *Diagnostic Aids* in *DTC P0171 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electronic Ignition System* for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
12	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Check the ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Check the PCM grounds for clearness, tightness and proper routing. Refer to the PCM wiring diagrams in Electrical Diagnosis. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Check the MAF sensor connections. 2. If a problem is found, replace the faulty terminals as necessary. Refer to *Electrical Diagnosis* for wiring repair procedures. Was a problem found?	—	Verify repair	Go to *Step 17*

Hesitation, Sag, Stumble Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
17	1. Visually/physically check vacuum hoses for splits, kinks, and proper connections and routing as shown on the "Vehicle Emission Control Information" label. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records butter • All electrical connections within a suspected circuit and/or system 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Bank 1 Restricted Exhaust System Check

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Remove the Bank 1 HO2S 2. 2. Install the Exhaust Backpressure Tester (BT-8515-V or equivalent) in place of the Bank 1 HO2S 2. 3. Run the engine at normal operating temperature. 4. Increase the engine speed to 2000 RPM and allow 10 seconds for pressure to build. 5. Observe the exhaust system backpressure reading on the gauge. Does the reading exceed the amount in the value column?	8.62 kPa (1.25 psi)	Go to *Step 3*	Go to *Step 4*
3	Repair the restriction in the exhaust system after the catalytic converter. Possible faults include: • Collapsed pipe • Heat distress • Internal muffler failure Is the action complete?	—	Verify repair	—
4	1. Install the Bank 1 HO2S 2. 2. Install the Exhaust Backpressure Tester in place of Bank 1 HO2S 1. 3. Run the engine at normal operating temperature. 4. Increase the engine speed to 2000 RPM and allow 10 seconds for pressure to build. 5. Observe the exhaust system backpressure reading on the gauge. Does the reading exceed the amount in the value column?	8.62 kPa (1.25 psi)	Go to *Step 5*	No trouble found. If a driveability symptom exists, refer to symptom charts
5	Repair the restriction in the catalytic converter. Is the action complete?	—	Verify repair	—

NOTE: DTCs will be set by running the vehicle to normal operating temperature after a cold start with the O2 sensor disconnected. After performing these tests, use the Tech 2 to erase the DTCs that were set by the lack of O2 sensor activity.

Bank 2 Restricted Exhaust System Check

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Remove the Bank 2 HO2S 2. 2. Install the Exhaust Backpressure Tester (BT-8515-V or equivalent) in place of the Bank 2 HO2S 2. 3. Run the engine at normal operating temperature. 4. Increase the engine speed to 2000 RPM and allow 10 seconds for pressure to build. 5. Observe the exhaust system backpressure reading on the gauge. Does the reading exceed the amount in the value column?	8.62 kPa (1.25 psi)	Go to *Step 3*	Go to *Step 4*
3	Repair the restriction in the exhaust system after the catalytic converter. Possible faults include: • Collapsed pipe • Heat distress • Internal muffler failure Is the action complete?	—	Verify repair	—
4	1. Install the Bank 2 HO2S 2. 2. Install the Exhaust Back pressure Tester in place of Bank 1 HO2S 1. 3. Run the engine at normal operating temperature. 4. Increase the engine speed to 2000 RPM and allow 10 seconds for pressure to build. 5. Observe the exhaust system backpressure reading on the gauge. Does the reading exceed the amount in the value column?	8.62 kPa (1.25 psi)	Go to *Step 5*	No trouble found. If a driveability symptom exists, refer to symptom charts
5	Repair the restriction in the catalytic converter. Is the action complete?	—	Verify repair	—

NOTE: DTCs will be set by running the vehicle to normal operating temperature after a cold start with the O2 sensor disconnected. After performing these tests, use the Tech 2 to erase the DTCs that were set by the lack of O2 sensor activity.

Default Matrix Table

Service Procedure Default Strategy

A referral strategy has been established to assist the technician with additional information when the cause of the failure cannot be determined. If no problem is found after performing diagnostics, then refer to the default matrix table for further diagnostic information.

Default Matrix Table

Strategy Based Diagnostic Charts	Initial Diagnosis	Default Section(s)
On-Board Diagnostic (OBD) System Check	Vehicle does not enter diagnostics.	Chassis Electrical
On-Board Diagnostic (OBD) System Check	Vehicle enters diagnostics and communicates with the Tech 2. MIL is "ON" in diagnostics. Engine does not start and run.	Ignition System Check
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of vibration.	—
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of harsh or soft shift, poor performance, delayed or no engagement into drive or reverse, transmission fluid leak, transmission noise or vibration, or improper TCC operation.	Automatic Transmission
PCM Power and Ground Check	On-Board Diagnostic (OBD) System Check.	Chassis Electrical
PCM Power and Ground Check	On-Board Diagnostic (OBD) System Check. PCM power and ground circuits OK. Data link voltage incorrect.	Chassis Electrical
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of harsh or soft shift, poor performance, delayed or no engagement into drive or reverse, transmission fluid leak, transmission noise or vibration, or improper TCC operation.	Automatic Transmission

Symptoms	Initial Diagnosis	Default Section(s)
Intermittents	1. On-board Diagnostic (OBD) system check. 2. Careful visual/physical inspections.	Chassis Electrical
Hard Starts	1. OBD system check. 2. ETC system check. 3. Sensors (ECT, MAP, MAF, TP) ; MAP output chart. 4. Fuel system electrical test, fuel system diagnosis. 5. Ignition system.	Engine Mechanical, Ignition System Check, Exhaust System Diagnosis

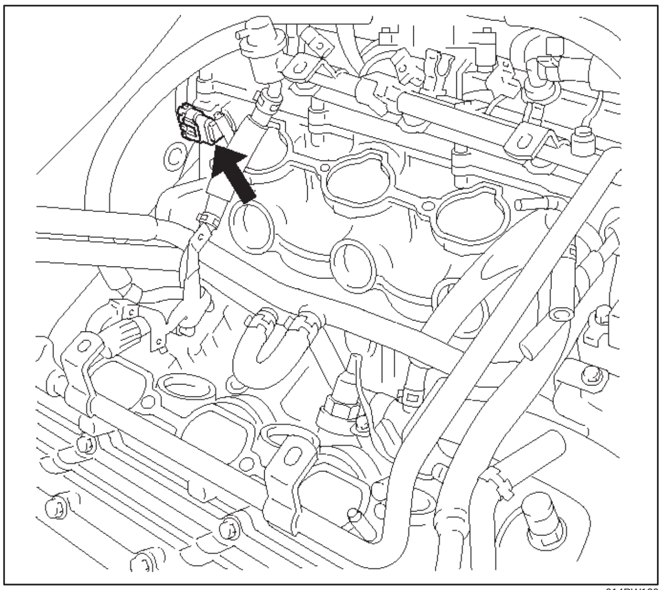
Symptoms	Initial Diagnosis	Default Section(s)
Surges and/or Chuggles	1. OBD system check. 2. ETC system check. 3. Heated oxygen sensors. 4. Fuel system diagnosis. 5. Ignition system.	Calibration ID/Service Bulletins, Ignition System Check, Generator Output, Exhaust System Diagnosis, 4L30-E System Test
Lack of Power, Sluggish or Spongy	1. OBD system check. 2. ETC system check. 3. Fuel system diagnosis. 4. Ignition system. 5. EGR operation. 6. EGR system check.	Refer to *Exhaust System* in *Engine Exhaust*, TCC Operation, Calibration ID/Service Bulletins
Detonation/Spark Knock	1. OBD system check. 2. Transmission range switch. 3. EGR operation. 4. EGR system check. 5. TCC operation. 6. Fuel system diagnosis. 7. Ignition system. 8. ION sensing module check.	TCC operation, Cooling System, Ignition System Check, Calibration ID/Service Bulletins
Rough, Unstable, or Incorrect Idle, Stalling	1. OBD system check. 2. ETC system check. 3. Fuel injector and fuel injector balance test. 4. EVAP emission canister purge valve check. 5. Ignition system. 6. EGR operation.	MAP Output Check, Throttle Linkage, EGR System Check, A/C Clutch Control Circuit Diagnosis, Crankcase Ventilation System, Calibration ID/Service Bulletins, Generator Output Voltage (refer to *Chassis Electrical*), Exhaust Diagnosis
Poor Fuel Economy	1. OBD system check. 2. Careful visual/physical inspection. 3. Ignition system. 4. Cooling system.	TCC Operation, Exhaust System (refer to *Engine Exhaust*)
Hesitation, Sag, Stumble	1. OBD system check. 2. ETC system check. 3. TP. 4. MAP output check. 5. Fuel system diagnosis. 6. Fuel injector and fuel injector balance test. 7. EVAP emission canister purge valve. 8. Ignition system.	EGR Operation, EGR System Check, Generator Output Voltage (refer to *Chassis Electrical*), Calibration ID/Service Bulletins, Ignition System Check
Cuts Out, Misses	1. OBD system check. 2. Cylinder balance test. 3. ETC system check.	Ignition System Check
Engine Cranks But Will Not Run	1. OBD system check.	Fuel System Electrical Diagnosis, Fuel System Diagnosis, Fuel Injector and Fuel Injector Balance Test.

Symptoms	Initial Diagnosis	Default Section(s)
Excessive Exhaust Emissions or Odors	1. OBD system check. 2. Emission test. 3. Cooling system. 4. Fuel system diagnosis. 5. Fuel injector and fuel injector balance test. 6. EVAP emission canister purge valve. 7. Crankcase ventilation system. 8. Ignition system. 9. MAP output check.	EGR System Check, Exhaust Diagnosis, Calibration ID/Service Bulletins
Dieseling, Run-On	1. OBD system check. 2. Careful visual/physical inspection. 3. Fuel system diagnosis.	—
Backfire	1. OBD system check. 2. Ignition system. 3. Fuel system diagnosis. 4. Fuel injector and fuel injector balance test. 5. EGR operation, EGR system check.	Exhaust System Diagnosis, Intake Casting Flash, Ignition System Check
Misfire	1. OBD system check. 2. Ignition system. 3. Fuel system diagnosis. 4. Fuel injector and fuel injector balance test.	Vibrations, Transmission, Driveshaft and Axle
Catalyst Monitor	1. OBD system check. 2. Careful visual/physical inspection. 3. Heated oxygen sensors.	Exhaust System
Fuel Trim	1. OBD system check. 2. Careful visual/physical inspection. 3. Fuel system diagnosis. 4. Heated oxygen sensors, MAF sensors.	Exhaust System Intake Air System
Evaporative Emissions	1. OBD system check. 2. Careful visual/physical inspection. 3. Fuel system diagnosis.	—
Heated Oxygen Sensors	1. OBD system check. 2. Careful visual/physical inspection.	Exhaust System

On-Vehicle ServiceCamshaft Position (CMP) Sensor

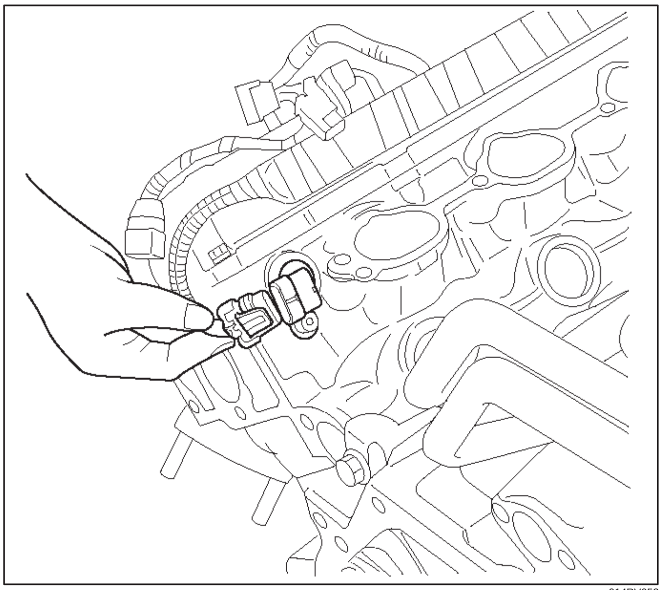
Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the engine cover.
3. Remove the common chamber assembly.
   Refer to Common Chamber in Engine Mechanical section.



014RW120

4. Disconnect the electrical connector to the CMP sensor.



014RV053

5. Remove the CMP retaining bolt from the side of left cylinder head.
6. Remove the CMP sensor from the cylinder head.

Inspection Procedure

1. Inspect the sensor O-ring for cracks or leaks.
2. Replace the O-ring if it is worn or damaged.
3. Lubricate the new O-ring with engine oil.
4. Install the lubricated O-ring.

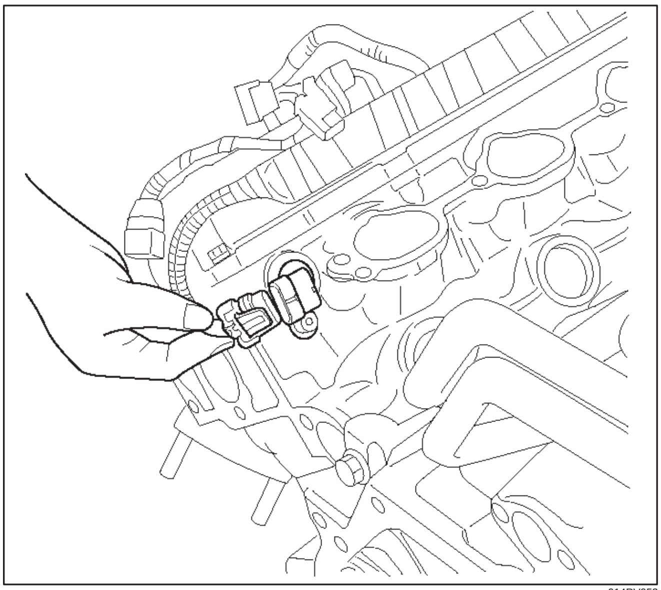
Installation Procedure

1. Install the CMP sensor in the cylinder head.
2. Install the CMP sensor retaining bolt.

Tighten

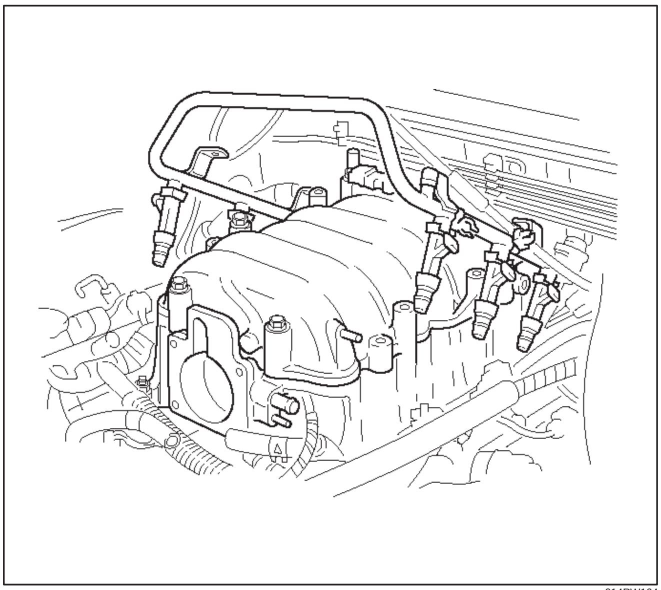
- **Tighten the retaining screw to 9 N·m (78 lb in.).**

3. Connect the electrical connector to the CMP sensor.



014RV053

4. Install the common chamber assembly.
   Refer to Common Chamber in Engine Mechanical section.



014RW164

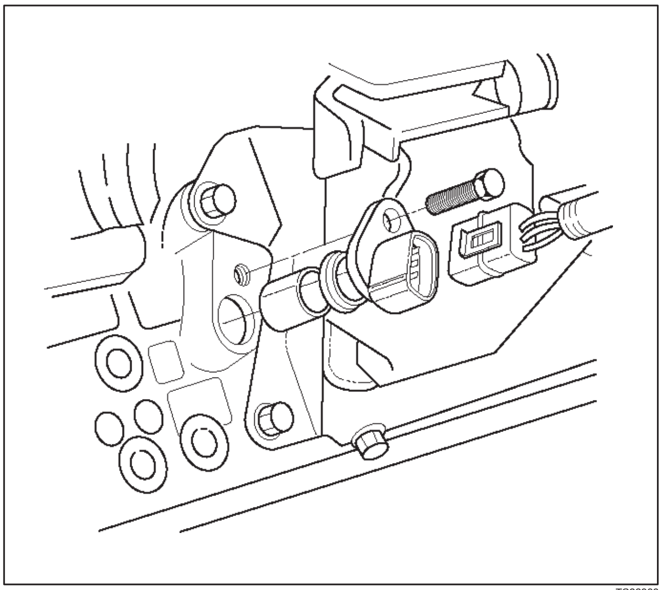
5. Install the engine cover.
6. Connect the negative battery cable.

Crankshaft Position (CKP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector to the CKP sensor.
3. Remove one bolt and the CKP sensor from the right side of the engine block, just behind the mount.

NOTE: Use caution to avoid any hot oil that might drip out.



TS22909

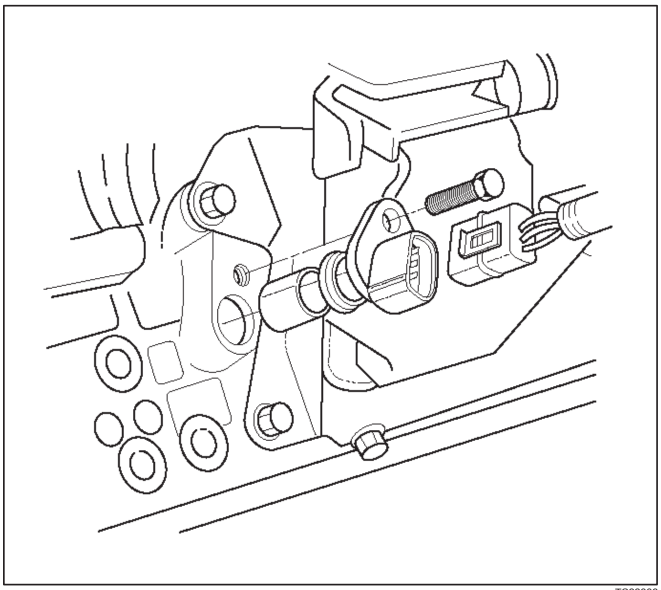
Inspection Procedure

1. Inspect the sensor O-ring for cracks or leaks.
2. Replace the O-ring if it is worn or damaged.
3. Lubricate the new O-ring with engine oil.
4. Install the lubricated O-ring.

Installation Procedure

1. Install the CKP sensor in the engine block.
2. Install the CKP sensor mounting bolt.

Tighten
- **Tighten the mounting bolt to 9 N·m (78 lb in.).**



TS22909

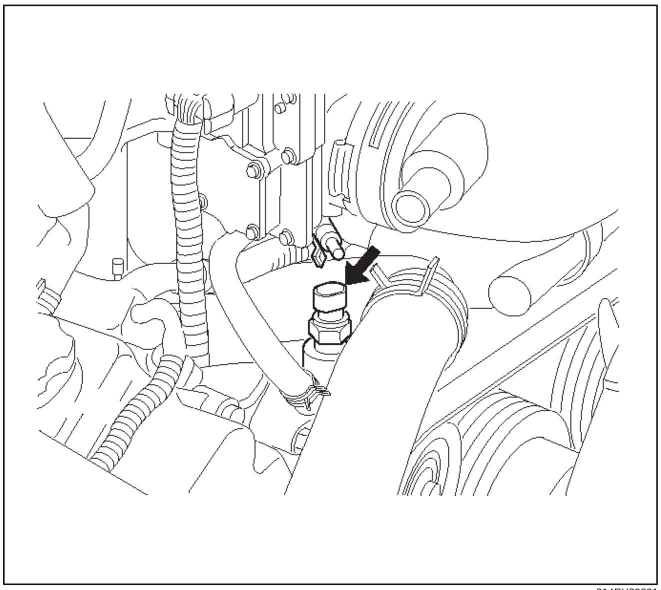
3. Connect the electrical connector to the CKP sensor.
4. Connect the negative battery cable.

Engine Coolant Temperature (ECT) Sensor

Removal Procedure

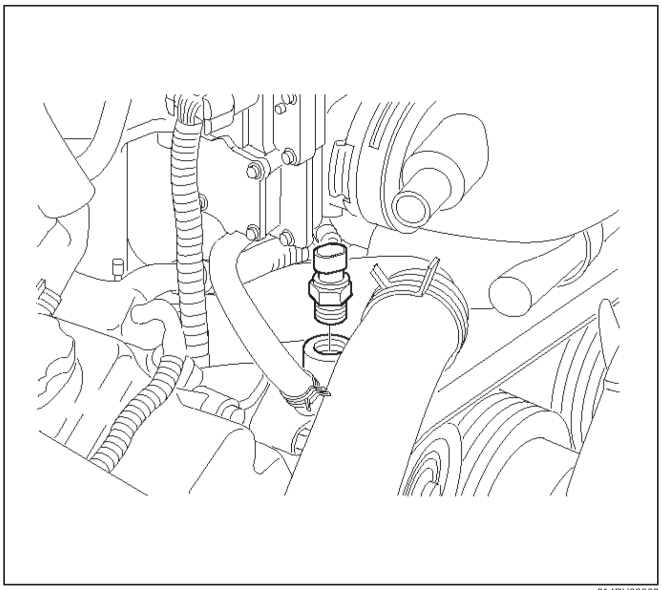
NOTE: Care must be taken when handling the engine coolant temperature (ECT) sensor. Damage to the ECT sensor will affect proper operation of the fuel injection system.

1. Disconnect the negative battery cable.
2. Drain the radiator coolant. Refer to *Draining and Refilling Cooling System* in *Engine Cooling* section.
3. Disconnect the electrical connector.



014RY00001

4. Remove the ECT sensor from the coolant crossover.



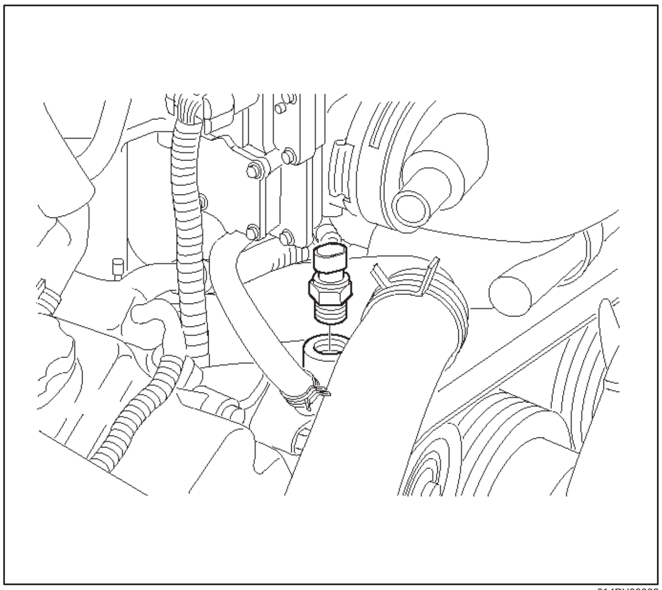
014RY00002

Installation Procedure

1. Apply sealer or the equivalent to the threads of the ECT sensor.
2. Install the ECT sensor in the coolant crossover.

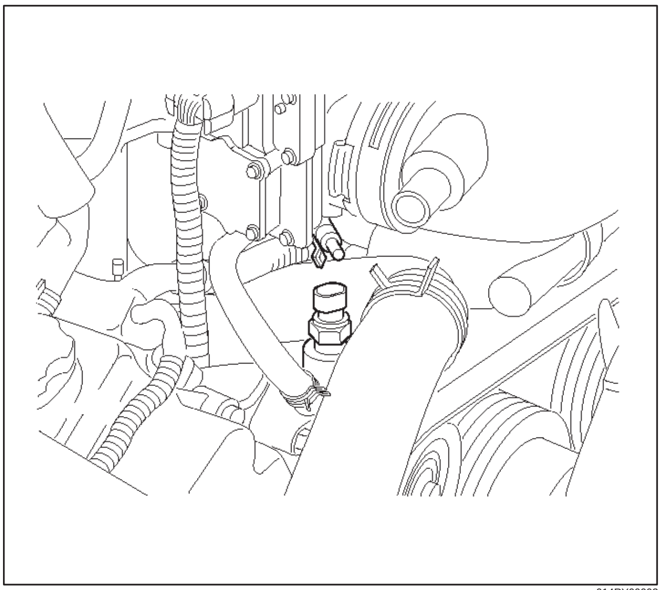
Tighten

- **Tighten the ECT sensor to 30 N·m (22 lb ft.).**



014RY00002

3. Connect the electrical connector.



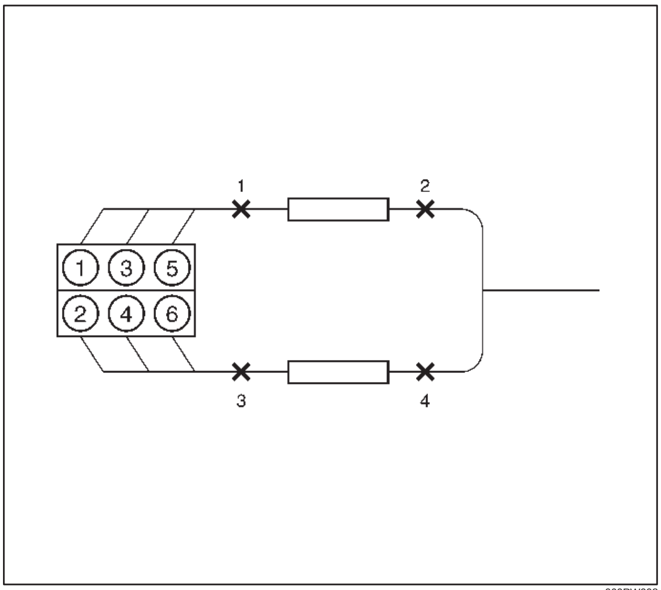
014RY00003

4. Fill the radiator with coolant. Refer to *Draining and Refilling Cooling System* in *Engine Cooling* section.
5. Connect the negative battery cable.

Heated Oxygen Sensor (HO2S)

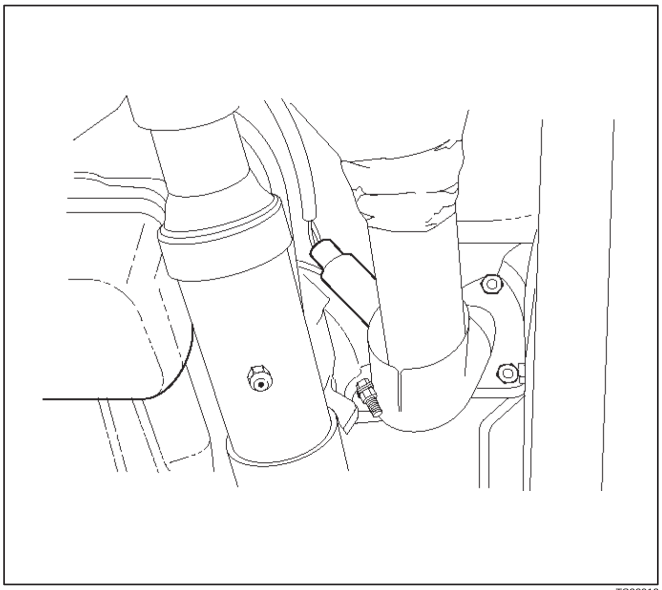
Removal Procedure

1. Disconnect the negative battery cable.
2. Locate the four oxygen sensors.



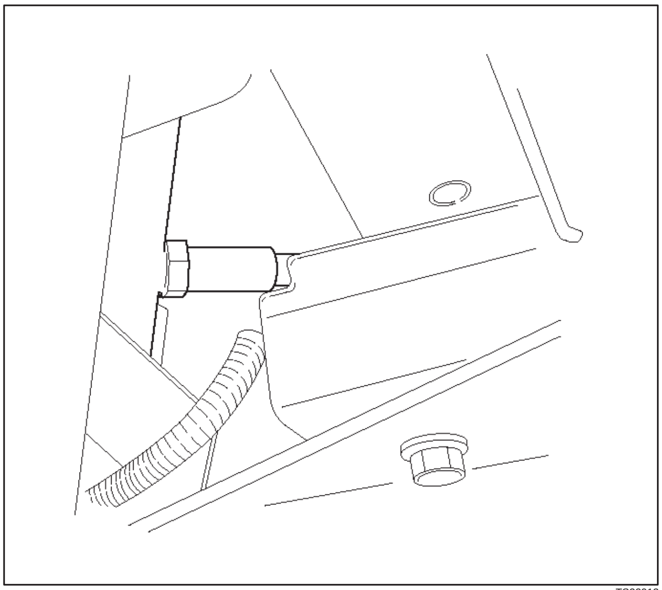
060RW008

- Bank 1 sensor 1 is mounted on the exhaust pipe ahead of the right-hand catalytic converter.



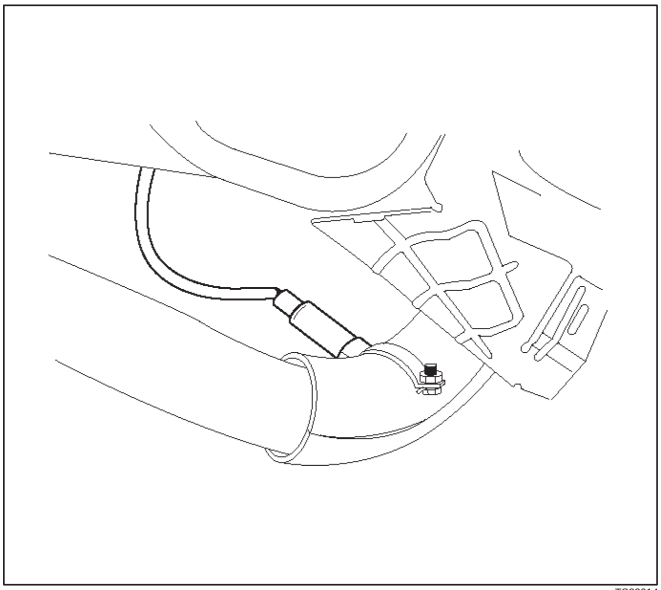
TS22912

- Bank 1 sensor 2 is mounted behind the right-hand catalytic converter.



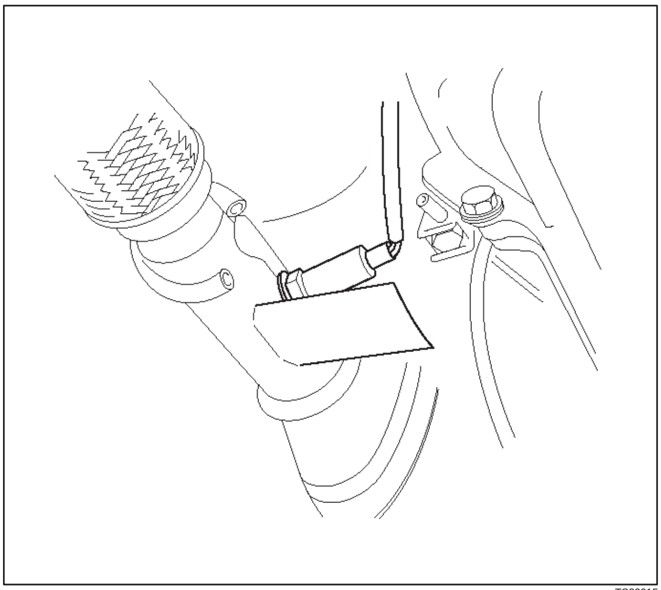
TS22913

- Bank 2 sensor 1 is mounted on the exhaust pipe ahead of the left-hand catalytic converter.



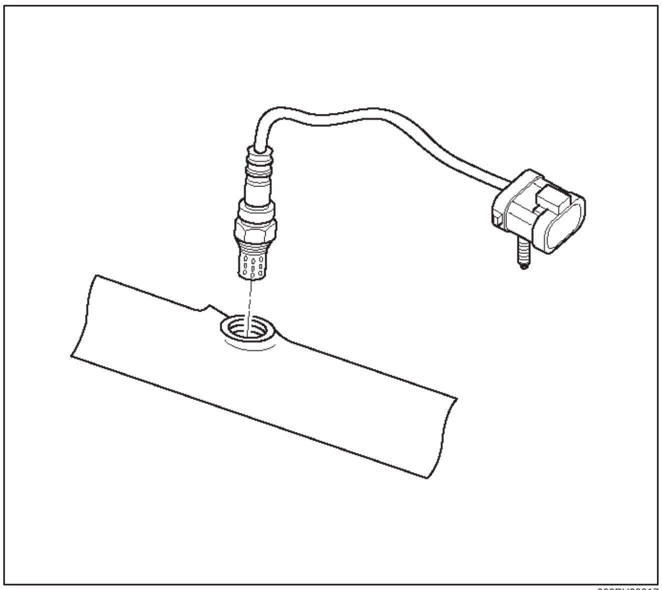
TS22914

- Bank 2 sensor 2 is mounted behind the left-hand catalytic converter.



TS22915

3. Disconnect the pigtail from the wiring harness.

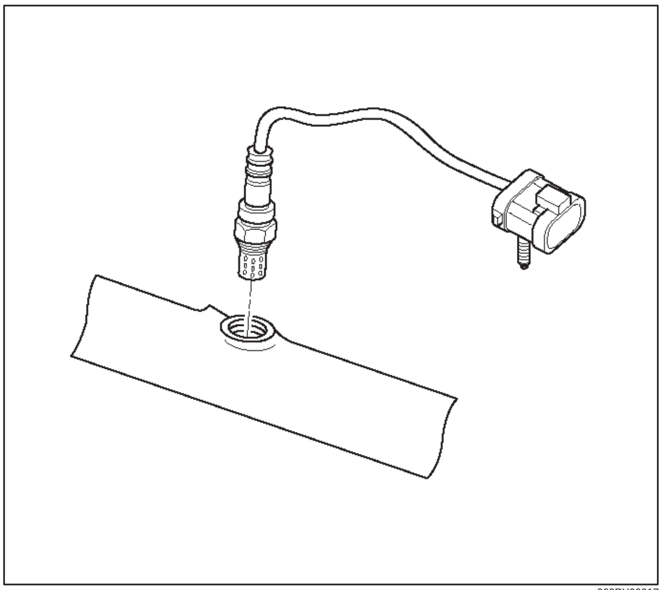


060RY00017

IMPORTANT: The pigtail is permanently attached to the sensor. Be careful not to pull the wires out.

NOTE: Do not use a torch to remove an HO2S unless the sensor is being replaced. Using a torch could damage the sensor.

4. Remove the sensor from the exhaust pipe.
   - Because of the expansion and contraction of the metal in the exhaust system over time, this may be difficult if the engine temperature is below 48°C (120°F).

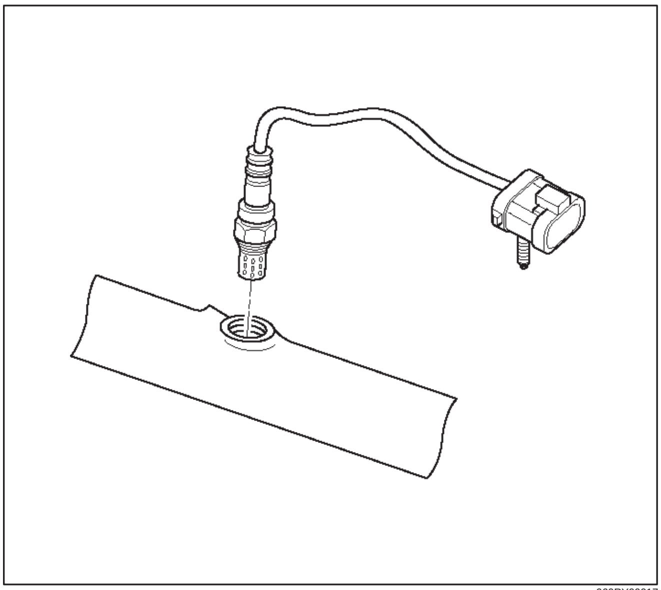


060RY00017

Inspection Procedure

All four sensors are identical. Inspect each in the same way.

1. Inspect the pigtail and the electrical connector for grease, dirt, corrosion, and bare wires or worn insulation.
2. Inspect the louvered end of the sensor for grease, dirt, or other contaminations.



060RY00017

Installation Procedure

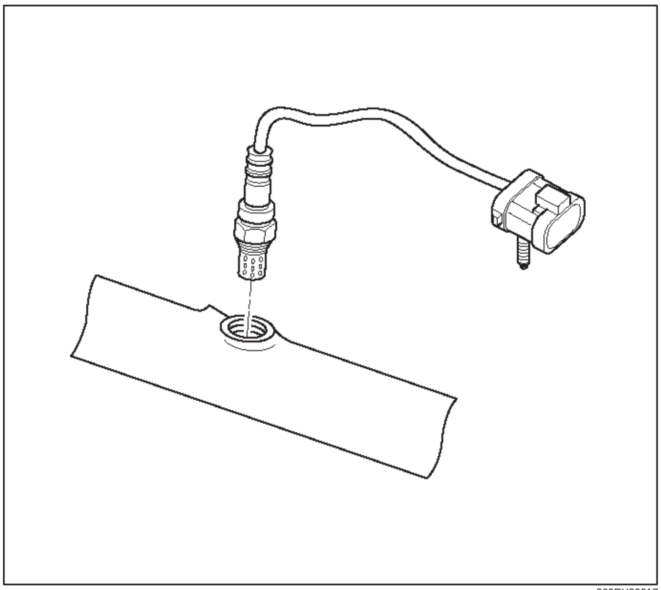
IMPORTANT:

- A special anti-seize compound on the HO2S threads. This compound consists of glass beads suspended in a liquid graphite solution. The graphite burns away with engine heat, but the glass beads will remain, making the sensor easier to remove.
- New or service sensors will already have the compound applied to the threads. If a sensor is removed and is to be reinstalled for any reason, the threads must have anti-seize compound applied.

1. Apply anti-seize compound or the equivalent to the threads of the oxygen sensor, if necessary.
2. Install the oxygen sensor on the exhaust pipe in its original position.

Tighten

- **Tighten the oxygen sensor to 55 N·m (40 lb ft.).**



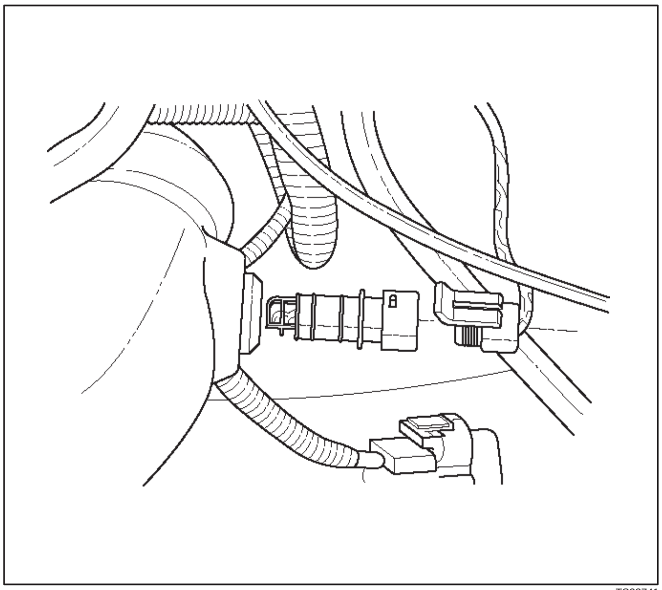
060RY00017

3. Connect the pigtail to the wiring harness.
4. Connect the negative battery cable.

Intake Air Temperature (IAT) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the engine cover
3. The IAT sensor is located in the intake air duct, behind the throttle body.
4. Disconnect the electrical connector from the IAT sensor.

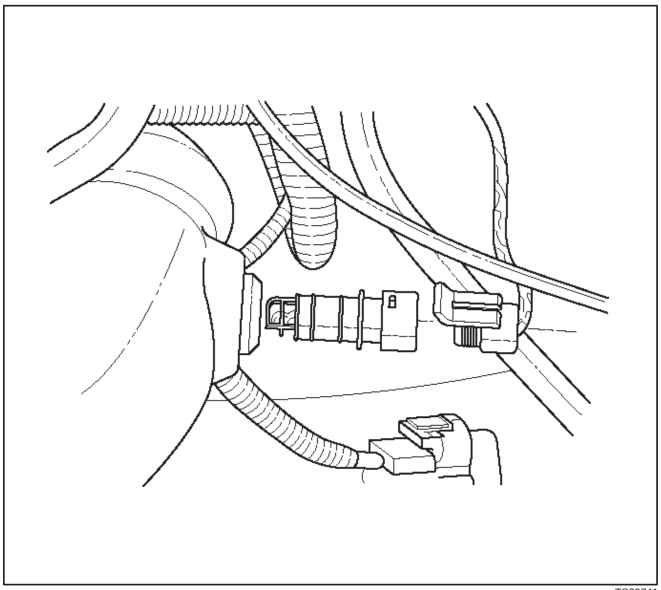


TS23741

5. Remove the IAT sensor from the intake air duct by using a rocking motion while pulling the sensor.

Installation Procedure

1. Install the IAT sensor into the grommet in the intake air duct.
2. Correct the IAT electrical connector.



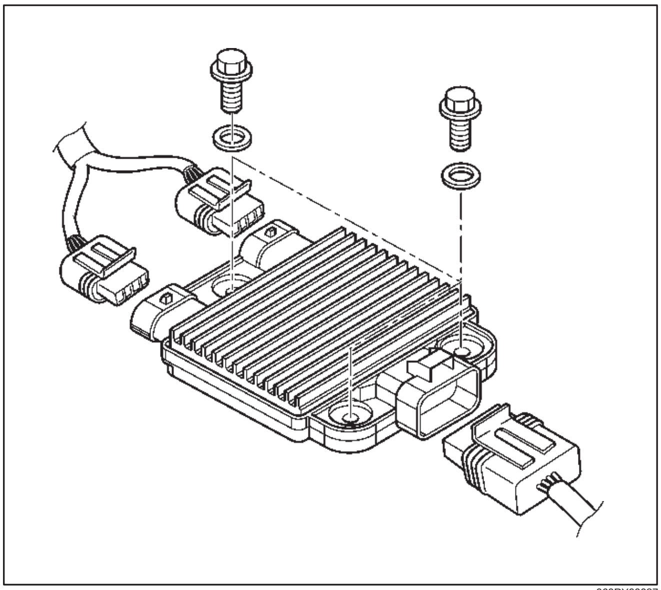
TS23741

3. Install the engine cover.
4. Connect the negative battery cable.

ION Sensing Module

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the ION sensing module connector.
3. Remove the bolts and the ION sensing module from the common chamber.



060RY00087

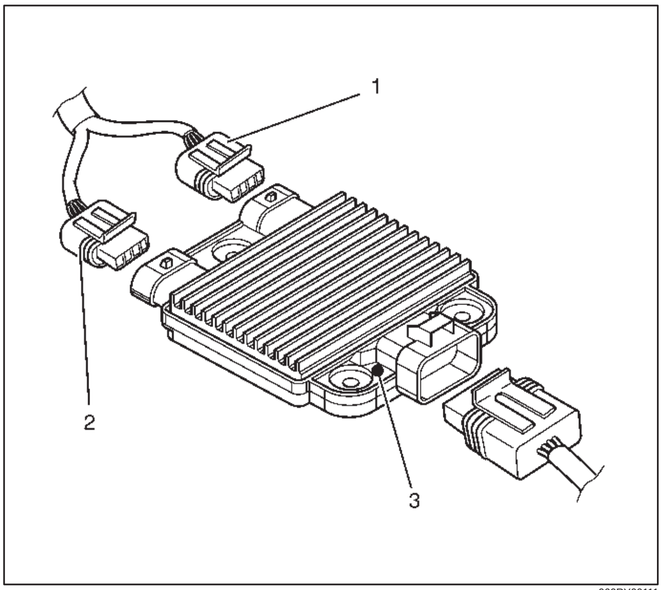
Installation Procedure

1. Install the ION sensing module on the common chamber with the bolts.

Tighten

- **Tighten the ION sensing module to 4 N·m (35 lb in.).**

2. Connect the ION sensing module connectors as shown in the illustration.



060RY00111

Legend

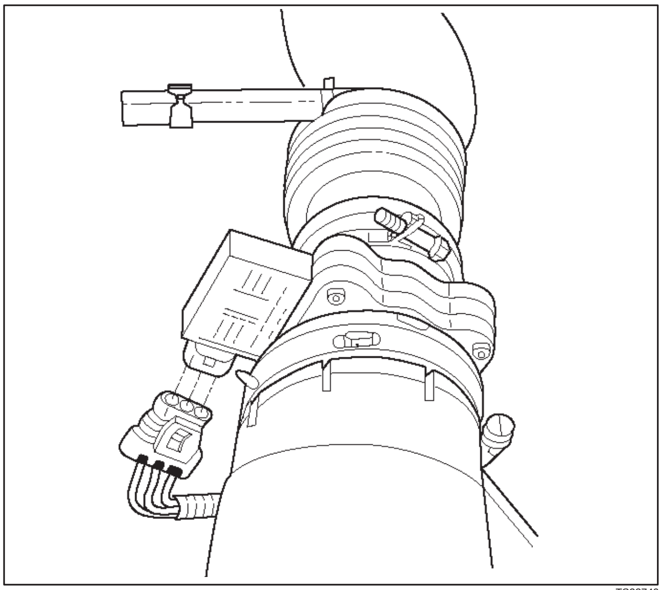
(1) Green Color Connector
(2) Blue Color Connector
(3) Identification Mark (6VE1 Engine Only)

3. Connect the negative battery cable.

Mass Air Flow (MAF) Sensor

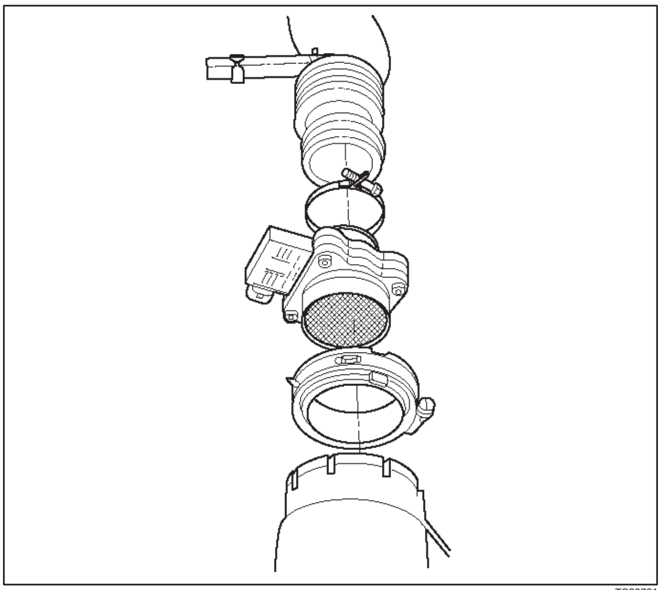
Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the MAF sensor.



TS23740

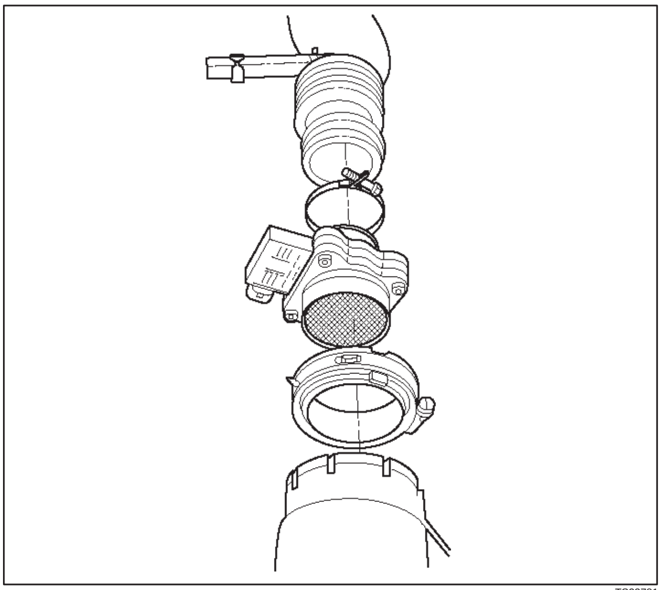
3. Loosen the clamps which secure the intake air duct and the air cleaner to the MAF sensor.
4. Remove the intake air duct from the MAF sensor.
5. Remove the MAF sensor from the air cleaner.



TS23781

Installation Procedure

1. Install the MAF sensor on the air cleaner with the clamp.
2. Install the intake air duct and the clamp on the MAF sensor.



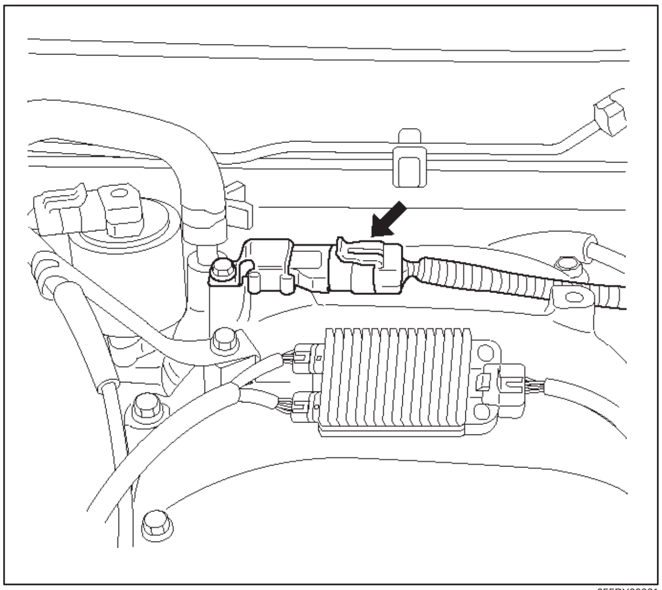
TS23781

3. Tighten the clamps to secure the MAF sensor to the intake air duct and the air cleaner.
4. Connect the MAF electrical connector.
5. Connect the negative battery cable.

Manifold Absolute Pressure (MAP) Sensor

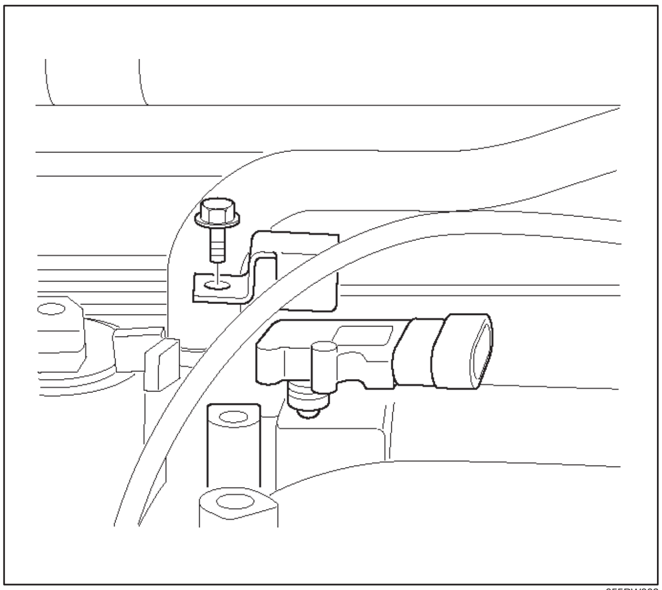
Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the MAP sensor.



055RY00001

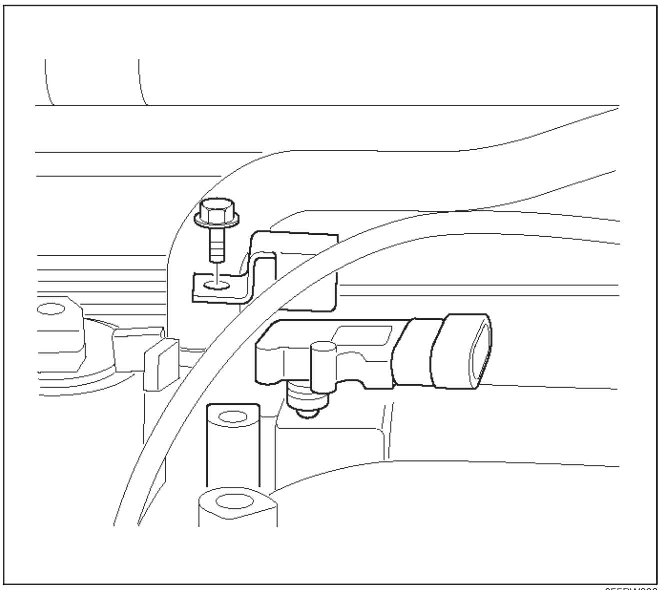
3. Remove the bolt securing the MAP sensor to the mounting bracket on the common chamber.
4. Remove the MAP sensor from the mounting bracket.



055RW002

Installation Procedure

1. Install the MAP sensor in the mounting bracket.



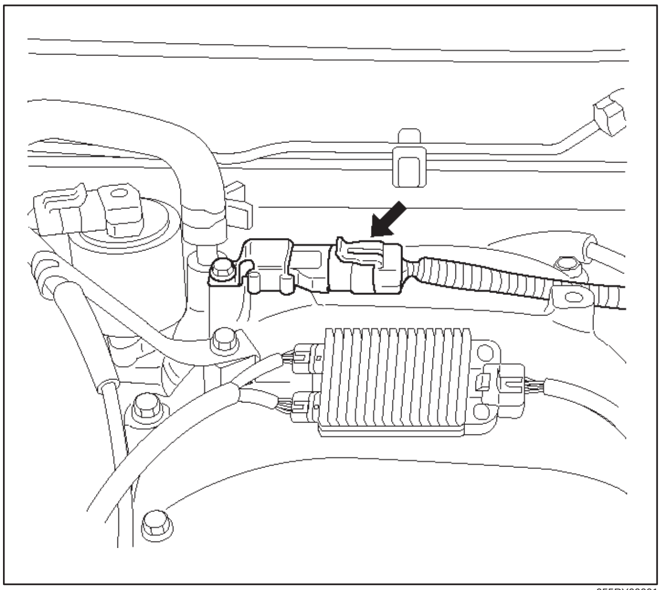
055RW002

2. Install the mounting bracket retaining bolt on the common chamber.

Tighten

- **Tighten the bolt to 20 N·m (12 lb ft.).**

3. Connect the MAP electrical connector.



055RY00001

4. Connect the negative battery cable.

Malfunction Indicator Lamp (MIL)

Removal and Installation Procedure

Refer to Warning light bulb, indicator light valve, illumination light bulb, A/T indicator light bulb in Meter and Gauge.

Reduced Power Lamp

The reduced power lamp (PPL) turns on when the ignition key is moved to the ON position. It should turn off in approximately 3 seconds or immediately after the engine starts.
If the RPL turns on during vehicle operation, a vehicle system failure resulting in reduced engine output is indicated.
If both the reduced RPL and the check engine light turn on, a serious problem affecting vehicle performance is indicated.
Refer to the *OBD system check NO and RPL "ON" steady* in this manual.

Powertrain Control Module (PCM)

Service Precaution

NOTE: To prevent possible electrostatic discharge damage to the PCM, do not touch the connector pins or soldered components on the circuit board.

Electrostatic Discharge (ESD) Damage

Electronic components used in the control systems are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4,000 volts for a person to even feel the zap of a static discharge.
There are several ways for a person to become statically charged. The most common methods of charging are by friction and by induction. An example of charging by friction is a person sliding across a car seat.
Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore, it is important to use care when handling and testing electronic components.

NOTE: To prevent possible Electrostatic Discharge damage, follow these guidelines:

- Do not touch the control module connector pins or soldered components on the control module circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, or while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.

NOTE: To prevent internal PCM damage, the ignition must be in the "OFF" position in order to disconnect or reconnect power to the PCM (for example: battery cable, PCM pigtail, PCM fuse, jumper cables, etc.).

IMPORTANT: When replacing the production PCM with a service PCM, it is important to transfer the broadcast code and production PCM number to the service PCM label. This will allow positive identification of PCM parts throughout the service life of the vehicle. Do not record this information on the metal PCM cover.

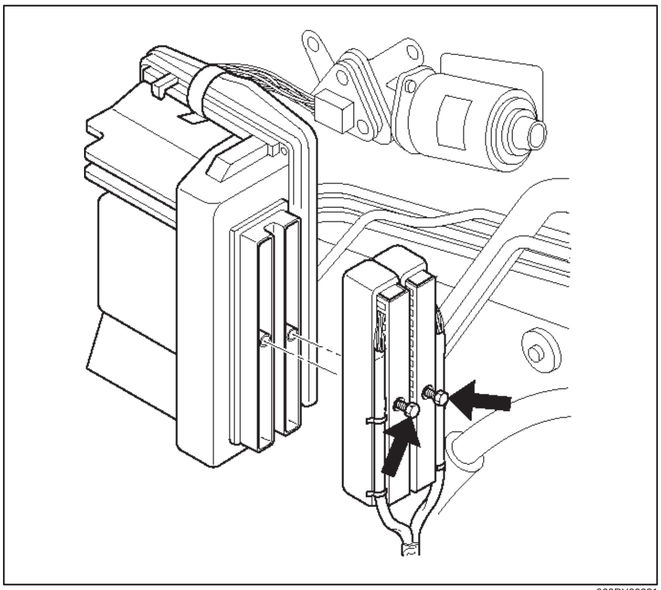
IMPORTANT: The ignition should always be in the "OFF" position in order to install or remove the PCM connectors.

Service of the PCM should normally consist of either replacement of the PCM or EEPROM programming. If the diagnostic procedures call for the PCM to be replaced, the PCM should be checked first to ensure it is the correct part. If it is, remove the faulty PCM and install the new service PCM.

The service PCM EEPROM will not be programmed. DTC P0601 indicates the check sum error.

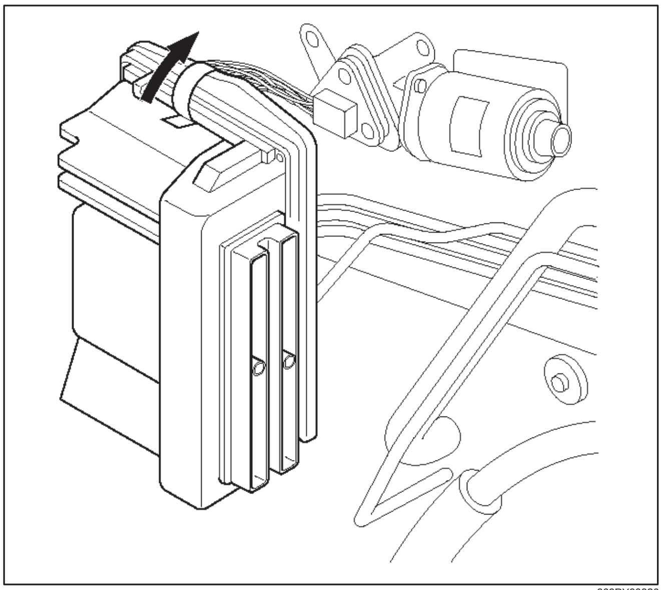
Removal Procedure

1. Disconnect the negative battery cable.
2. Block the wheels.
3. Remove the two screws from the PCM electrical connectors.
4. Disconnect the PCM electrical connectors.



060RY00031

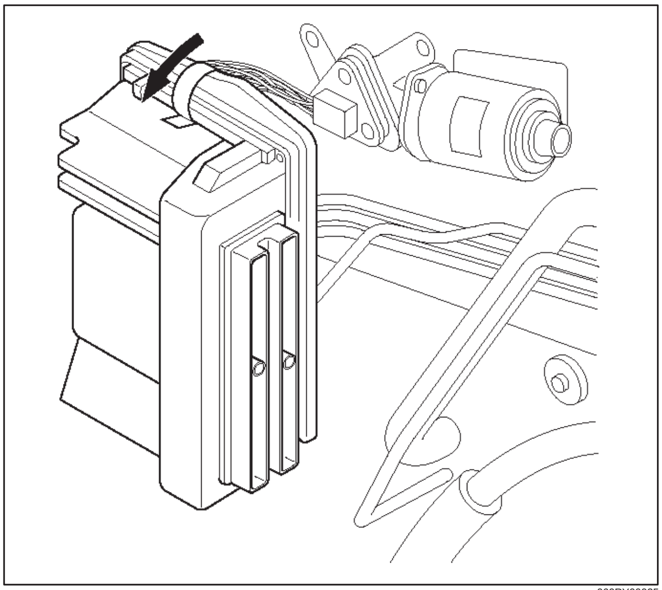
5. After removing the clip which fixes the PCM to the bracket, remove PCM.



060RY00026

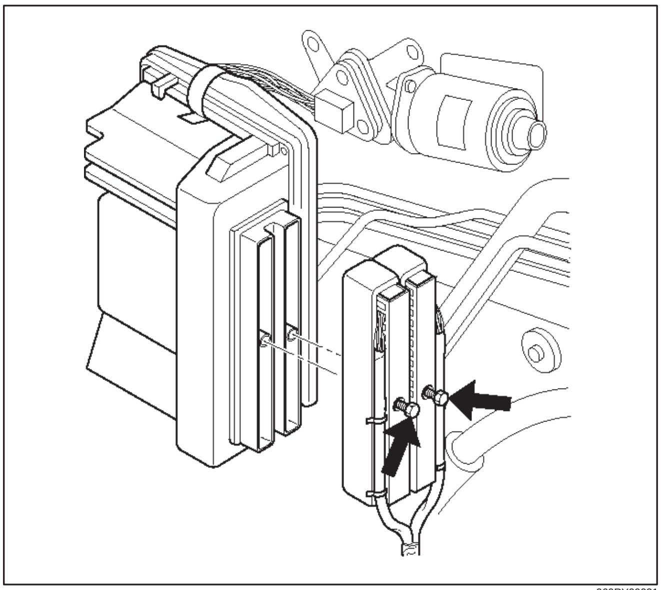
Installation Procedure

1. Install the PCM to bracket and fix with the clip.



060RY00025

2. Connect the PCM electrical connectors.
3. Install the two screws to PCM electrical connectors.



060RY00031

EEPROM

General Description

The Electronically Erasable Programmable Read Only Memory (EEPROM) is a permanent memory that is physically soldered within the PCM. The EEPROM contains program and calibration information that the PCM needs to control powertrain operation.

EEPROM Programming

1. Set-up – Ensure that the following conditions have been met:
   - The battery is fully charged.
   - The ignition is "ON."
   - The Vehicle Interface Module cable connection at the DLC is secure.
2. Program the PCM using the latest software matching the vehicle. Refer to up-to-date Techline equipment user's instructions.
3. If the PCM fails to program, proceed as follows:
   - Ensure that all PCM connections are OK.
   - Check the Techline equipment for the latest software version.
   - Attempt to program the PCM. If the PCM still cannot be programmed properly, replace the PCM. The replacement PCM must be programmed.

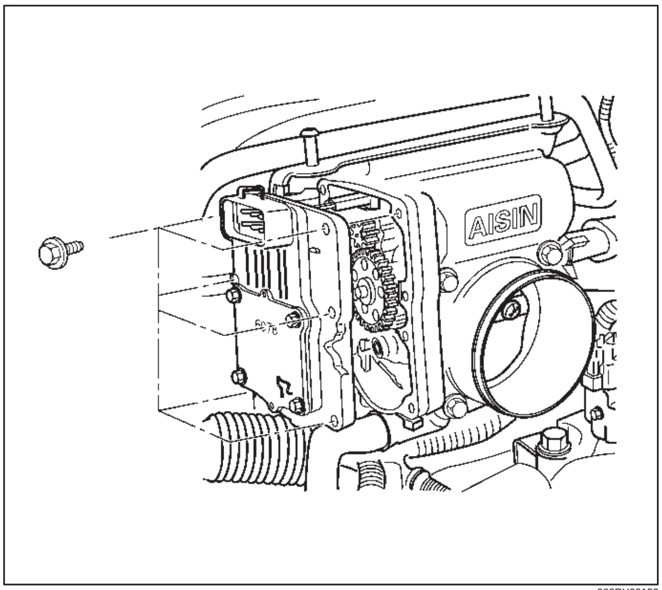
Functional Check

1. Perform the On-Board Diagnostic System Check.
2. Start the engine and run for one minute.
3. Scan for DTCs using the Tech 2.

Throttle Position (TP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the TPS electrical connector.
3. Remove the bolts and the TP sensor from the throttle body.



060RY00159

NOTE: Do not clean the TP sensor by soaking it in solvent. The sensor will be damaged as a result.

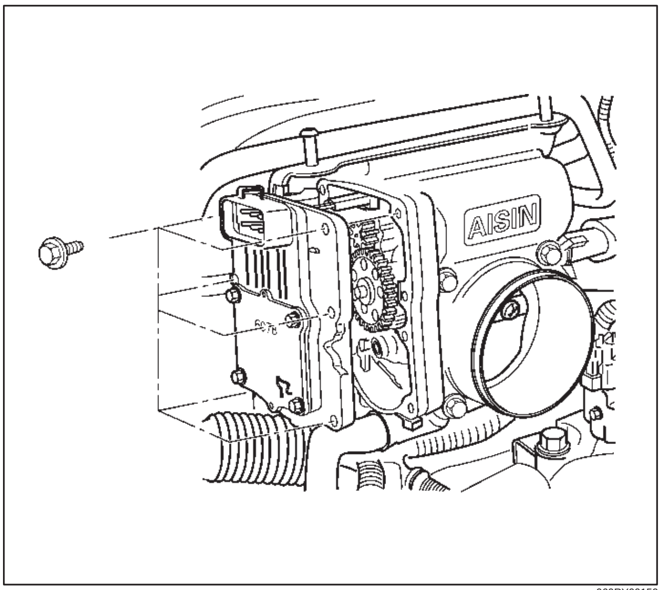
Function Check

Use a Tech 2 to check the TP sensor output voltage at closed throttle.

- The voltage should be under 0.85 volt.
- If the reading is greater than 0.85 volt, check the throttle shaft to see if it is binding.

Installation Procedure

1. Install the TP sensor on the throttle body with the bolts.



060RY00159

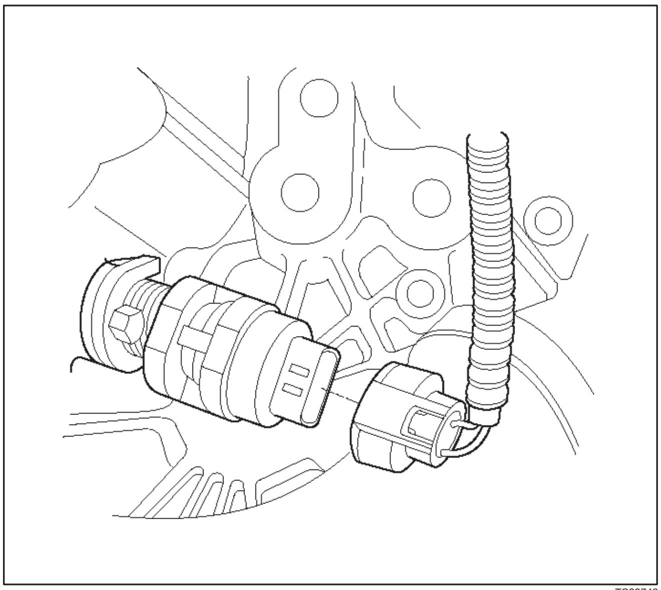
2. Connect the TP electrical connector.
3. Install the negative battery cable.

Vehicle Speed Sensor (VSS)

Removal Procedure

CAUTION: The VSS is located on the right side of the transfer case just ahead of the rear propeller shaft and very close to the exhaust pipes for 4WD and on the extension cover for 2WD. Be sure that the exhaust pipes are cool enough to touch before trying to remove the VSS. If the pipes are hot, you could be burned.

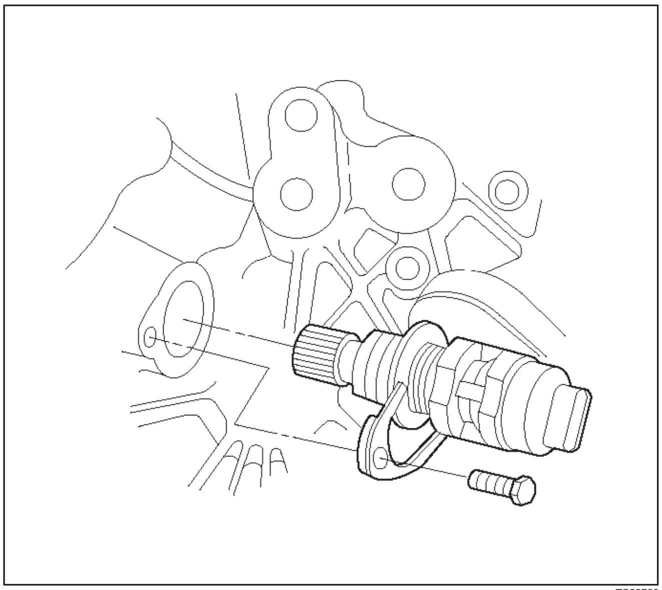
1. Disconnect the negative battery cable.
2. Disconnect the VSS electrical connector.



TS23748

3. Remove the bolt and the clamp securing the VSS in place.

IMPORTANT: Have a container ready to catch any fluid that leaks out when the VSS is removed from the transfer case for 4WD and on the extension cover for 2WD.



TS23780

4. Remove the VSS from the transfer case by wiggling it slightly and pulling it straight out.

Inspection Procedure

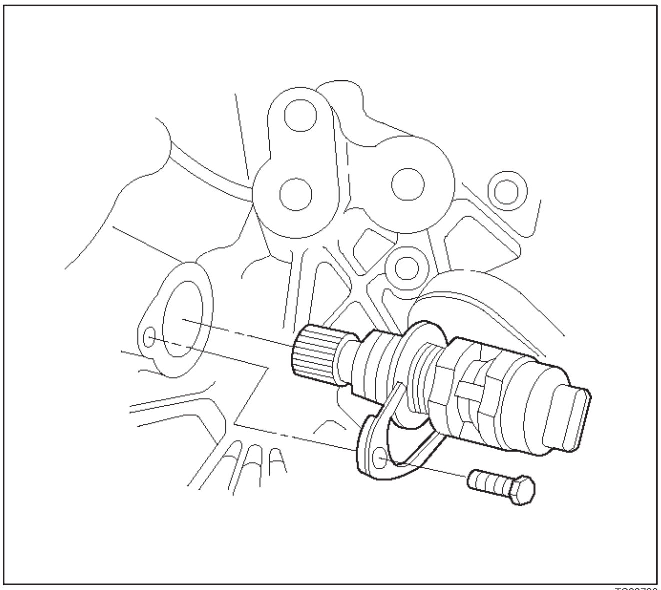
1. Inspect the electrical connector for signs of corrosion or warping. Replace the VSS if the electrical connector is corroded or warped.
2. Inspect the VSS driven gear for chips, breaks, or worn condition. Replace the VSS if the driven gear is chipped, broken or worn.
3. Inspect the O-ring for wear, nicks, tears, or looseness. Replace the O-ring if necessary.

Installation Procedure

1. Install the VSS in the transfer case with the notch for the connector facing the rear.
2. Secure the VSS in place with the clamp and the bolt.

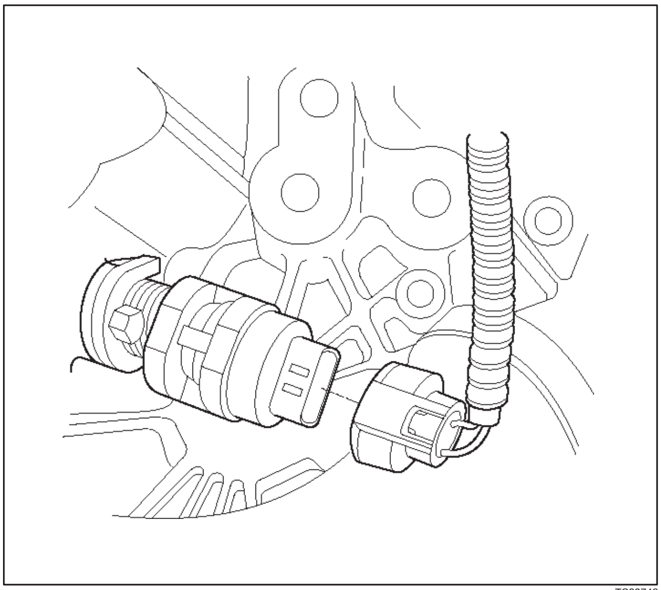
Tighten

- **Tighten the bolt to 16 N·m (12 lb ft.).**



TS23780

3. Connect the VSS electrical connector.



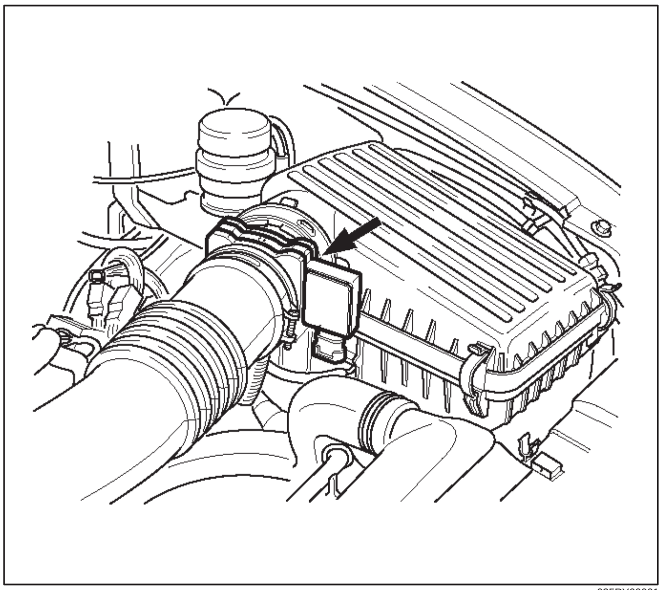
TS23748

4. Check the transfer case oil level. Add fluid if necessary.
5. Connect the negative battery cable.

Air Cleaner/Air Filter

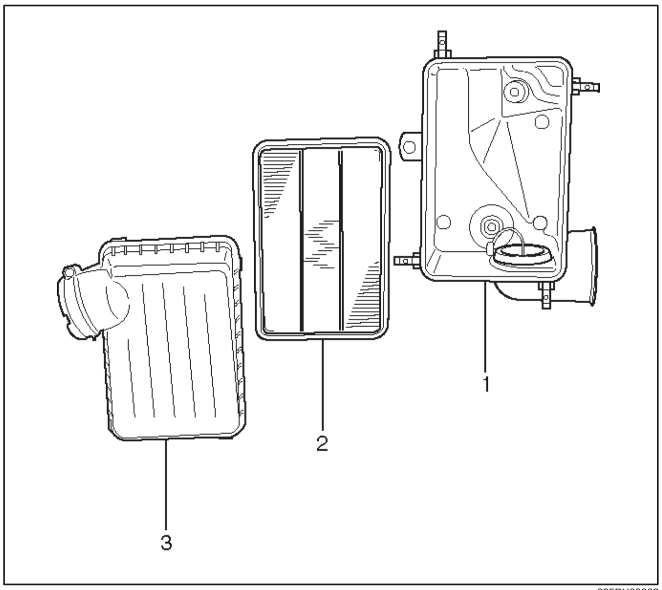
Removal Procedure

1. Loosen the clamp between the air cleaner lid and the mass air flow sensor.



025RY00001

2. Release the four latches securing the lid to the air cleaner housing.
3. Remove the air cleaner lid.
4. Remove the air filter element.
5. Remove the retaining bolts and the air cleaner housing from the vehicle.



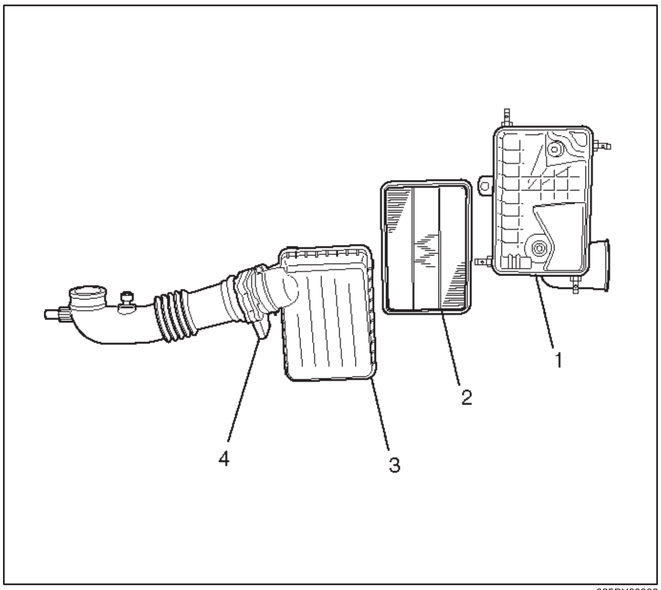
025RY00002

Legend

(1) Air Cleaner Housing
(2) Air Filter Element
(3) Air Cleaner Lid

Installation Procedure

1. Install the air cleaner housing in the vehicle with the retaining bolts.
2. Install the air filter element in the air cleaner housing.
3. Install the air cleaner lid on the MAF sensor and the air cleaner housing.



025RY00003

Legend

(1) Air Cleaner Housing
(2) Air Filter Element
(3) Air Cleaner Lid
(4) Mass Air Flow Sensor

4. Tighten the clamp and secure the four latches between the lid and the air cleaner housing.

Common Chamber

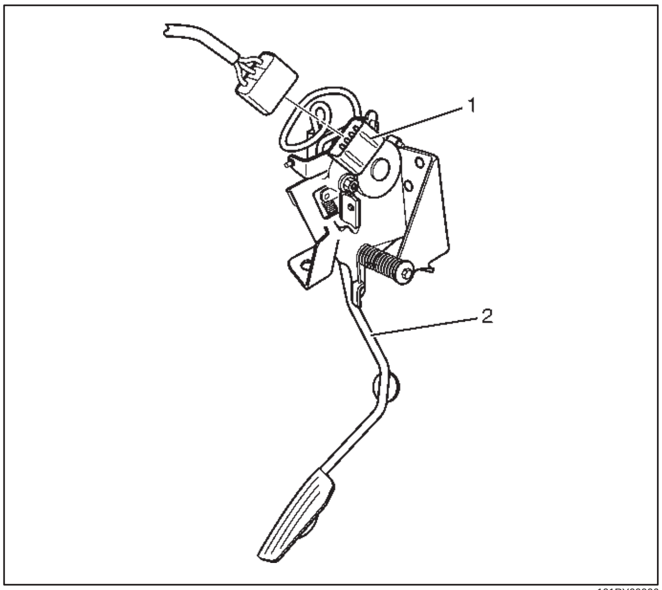
Removal and Installation Procedure

Refer to Common Chamber in Engine Mechanical section.

Accelerator Pedal Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical harness from the accelerator position sensor.

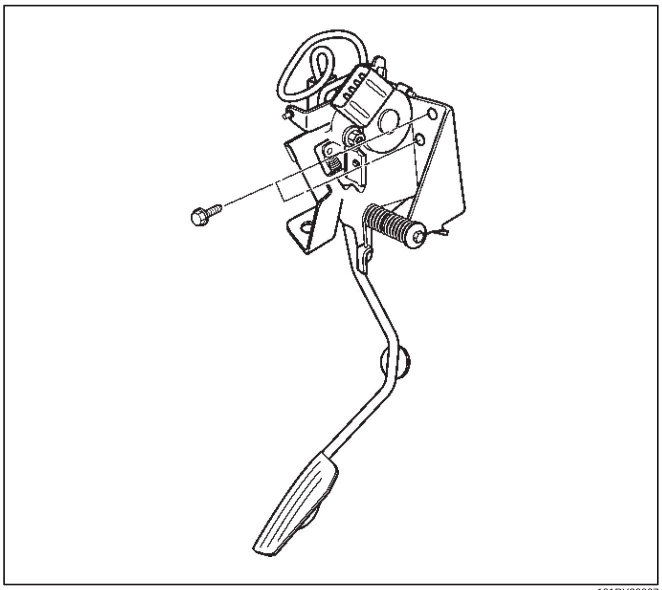


101RY00006

Legend

(1) Accelerator Position Sensor
(2) Accelerator Pedal Assembly

3. Remove the two screws from the accelerator pedal assembly.



101RY00007

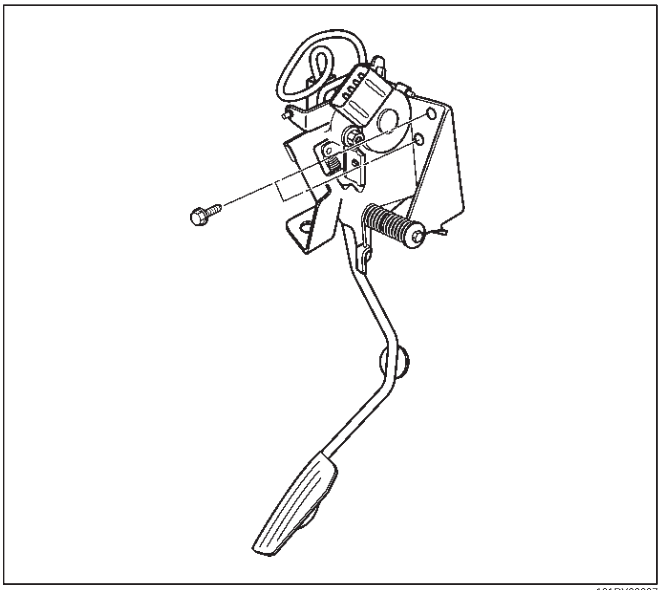
4. Remove the accelerator pedal assembly from the bulkhead.

Installation Procedure

1. Install the accelerator pedal assembly on the bulkhead.
2. Install the two screws to the accelerator pedal assembly.

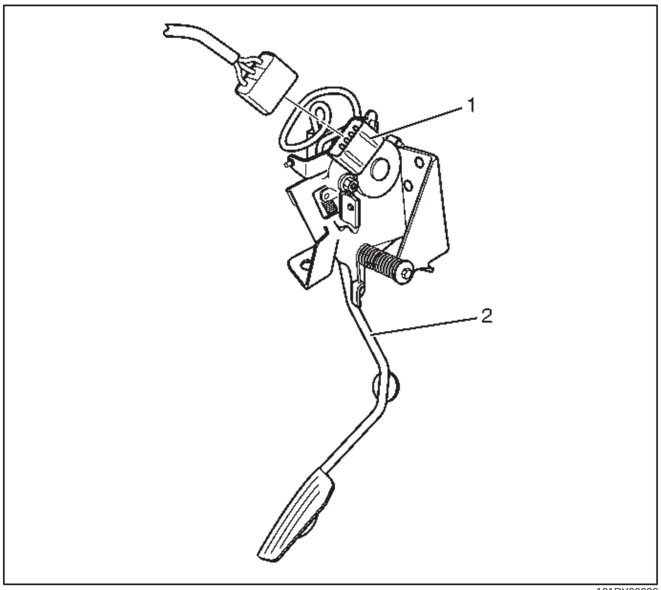
Tighten

- **Tighten the screws to 22 N·m (16 lb ft.).**



101RY00007

3. Connect the electrical harness to the accelerator position sensor.



101RY00006

Legend

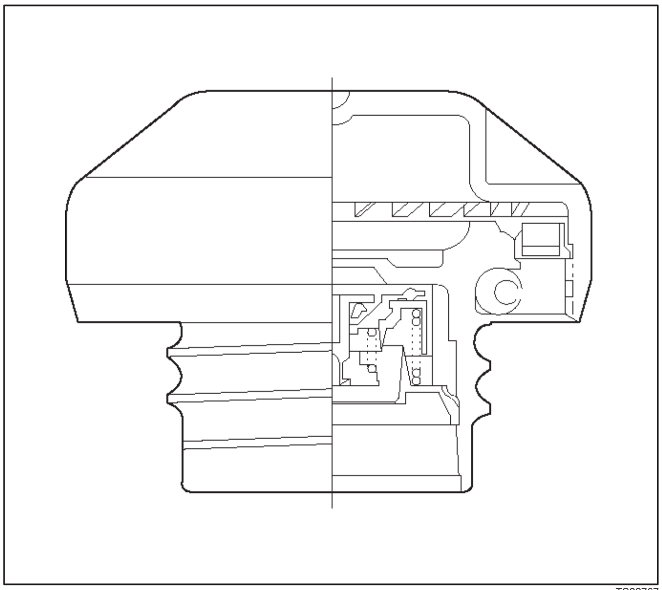
(1) Accelerator Position Sensor
(2) Accelerator Pedal Assembly

4. Install the negative battery cable.

Fuel Filler Cap

General Description

The fuel filler cap includes a vacuum valve and a pressure valve.
If high vacuum or high pressure occurs in the fuel tank, each valve works to adjust the pressure in order to prevent damage of the tank.



TS23767

Inspection Procedure

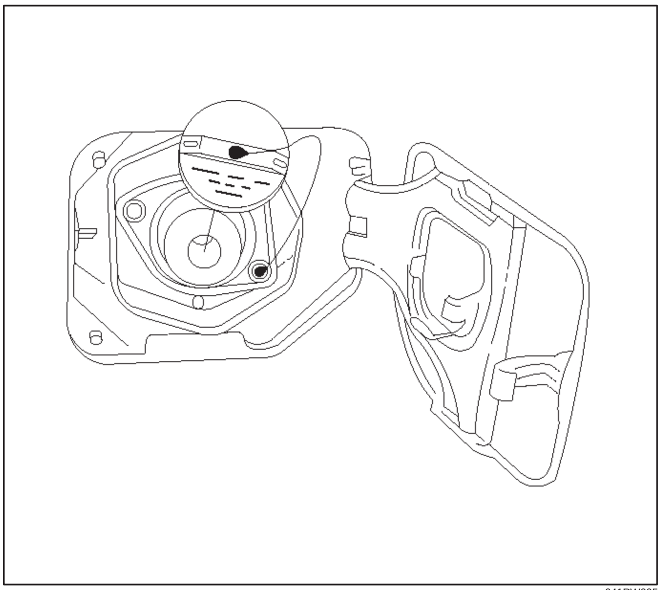
NOTE: Replace the fuel filler cap with the same type of filler cap that was originally installed on the vehicle.

- Check the seal ring in the filler cap for any abnormality and for seal condition.
- Replace the filler cap if any abnormality is found.

Fuel Filter

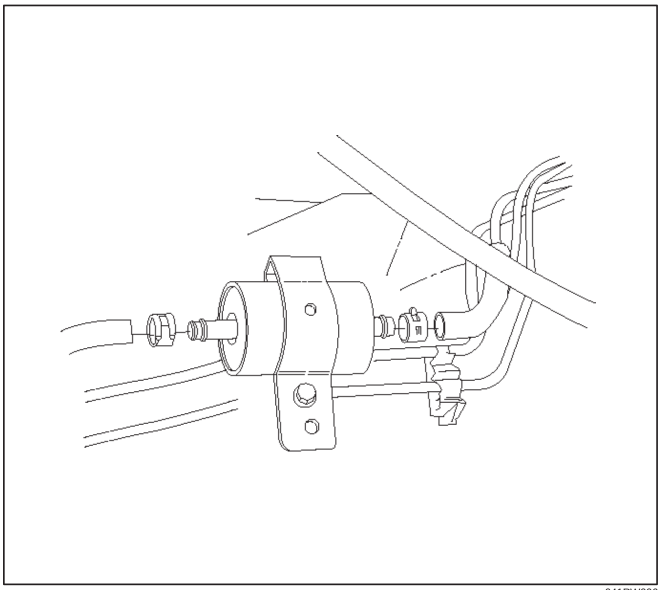
Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the fuel filler cap.



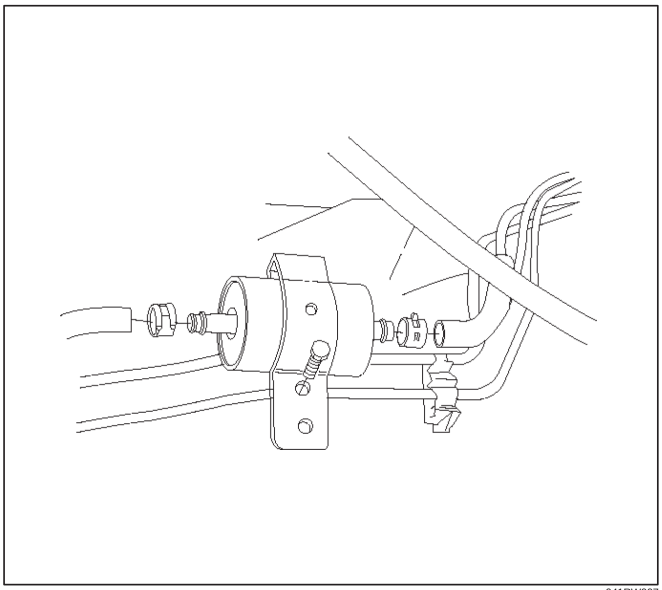
041RW005

3. Disconnect the fuel line from the fuel filter on the engine side.
4. Disconnect the fuel line from the fuel filter on the fuel tank side.



041RW006

5. Remove the bolt on the fuel filter holder.



041RW007

6. Remove the fuel filter.

Inspection Procedure

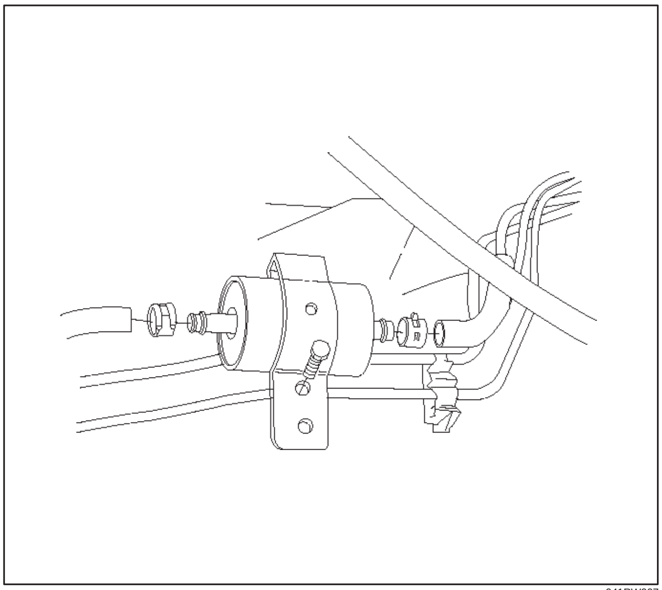
1. Replace the fuel filter when the following occur:
   - Fuel leaks from the fuel filter body.
   - The fuel filter body is damaged.
   - The fuel filter is clogged with dirt or sediment.

Installation Procedure

1. Install the fuel filter in the correct direction.
2. Install the bolt on the fuel filter holder.

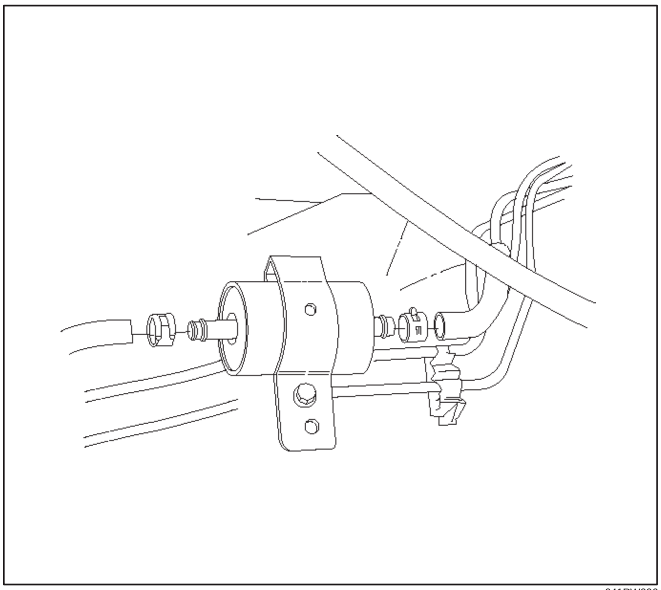
Tighten

- **Tighten the screws to 20 N·m (14 lb ft.).**



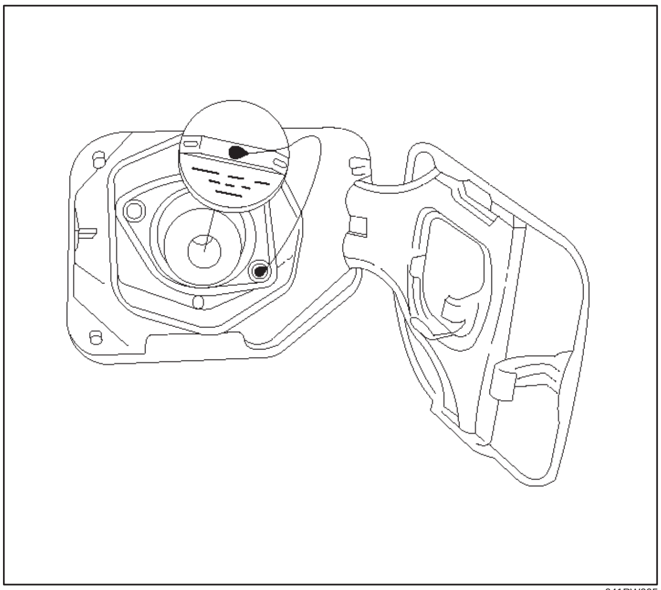
041RW007

3. Connect the fuel line on the engine side.
4. Connect the fuel line on the fuel tank side.



041RW006

5. Install the fuel filler cap.



041RW005

6. Connect the negative battery cable.

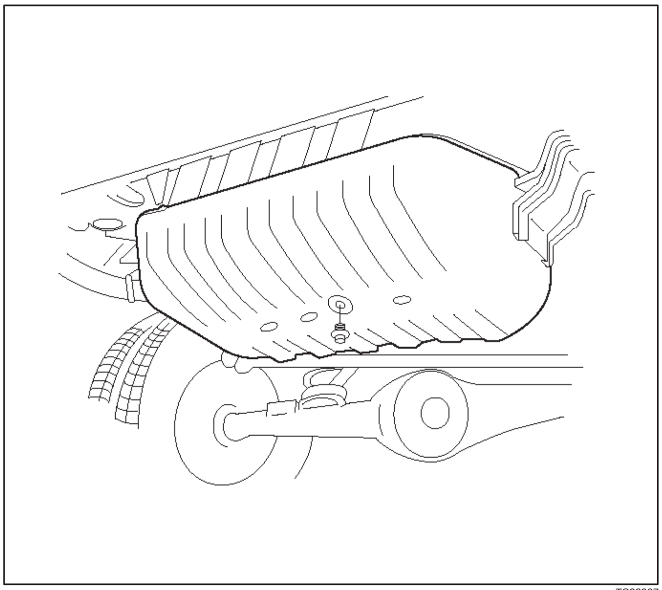
Fuel Gauge Unit

Removal Procedure

1. Disconnect the negative battery cable.
2. Loosen the fuel filler cap.
3. Drain the fuel from the tank.

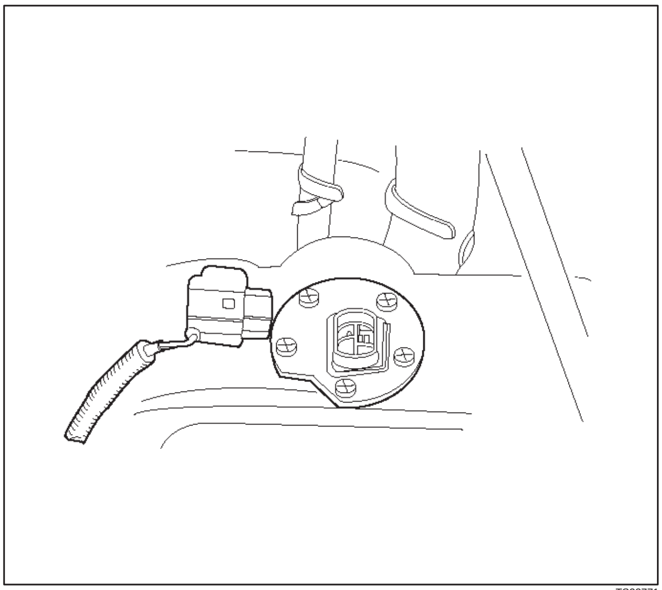
Tighten

- **Tighten the drain plug to 20 N·m (14 lb ft.).**



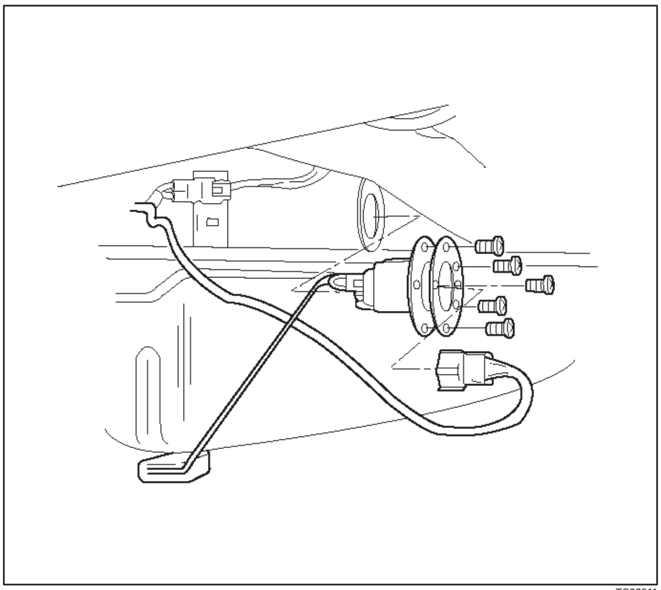
TS22907

4. Disconnect the wiring connector from the fuel gauge unit.



TS23771

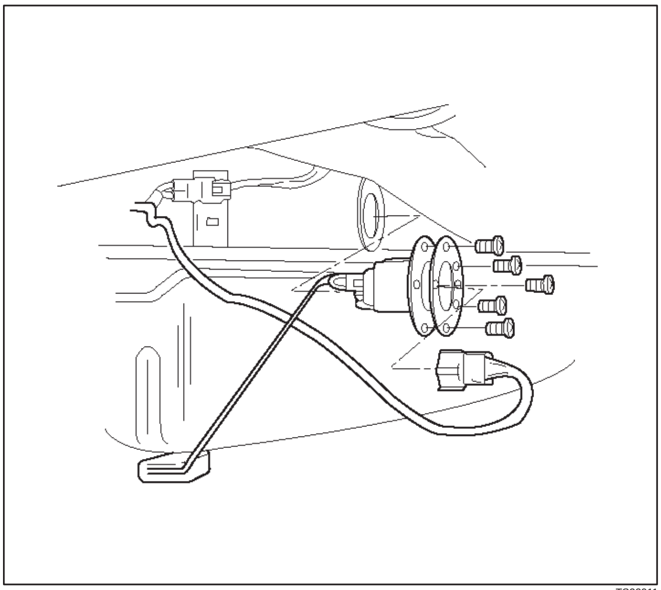
5. Remove the fuel gauge unit retaining screws.
6. Remove the fuel gauge unit.
   - Cover or plug the fuel tank to prevent dust, dirt, or debris from entering the tank.



TS22911

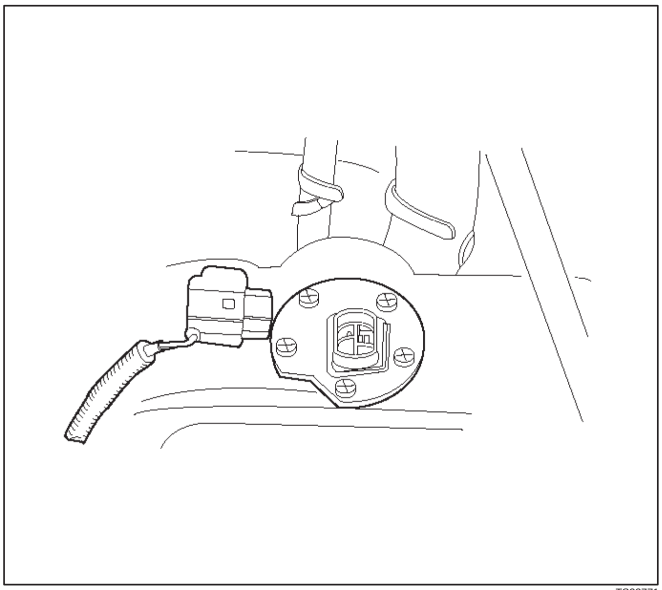
Installation Procedure

1. Install the fuel gauge unit.
2. Install the fuel gauge unit retaining screws.



TS22911

3. Connect the wiring connector to the fuel gauge unit.



TS23771

4. Fill the fuel tank with fuel.
   - Tighten the fuel filler cap.
   - Check for leaks at the fuel gauge unit gasket.
5. Connect the negative battery cable.

Fuel Injectors

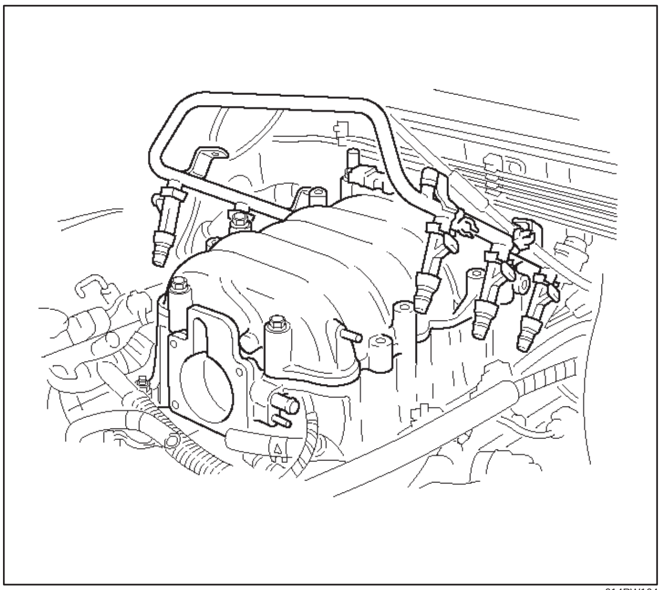
Removal Procedure

NOTE: If the fuel injectors are leaking, the engine oil may be contaminated with fuel. Check the oil for signs of contamination and change the oil and the filter if necessary.

NOTE: Use care in removing the fuel injectors in order to prevent damage to the fuel injector electrical connector pins or the fuel injector nozzles. The fuel injector is an electrical component and should not be immersed in any type of cleaner as this may damage the fuel injector.

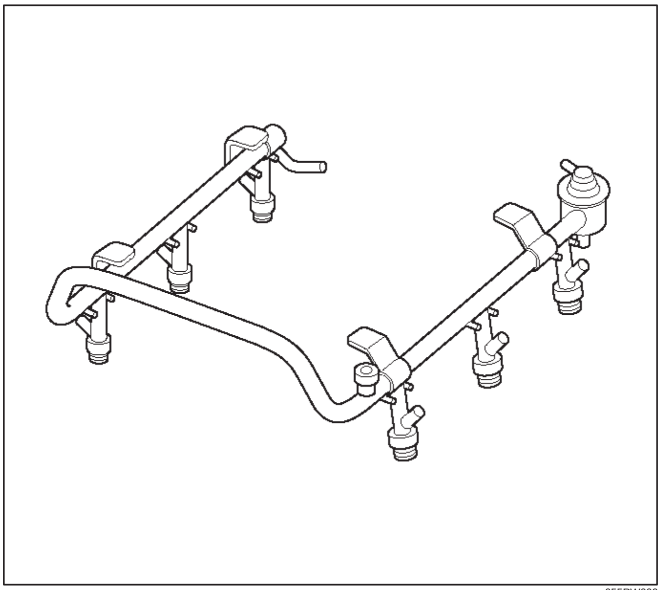
IMPORTANT: Fuel injectors are serviced as a complete assembly only.

1. Disconnect the negative battery cable.
2. Remove the common chamber. Refer to *Common Chamber in Engine Mechanical* section.
3. Remove the fuel rail. Refer to *Fuel Rail* section.



014RW164

4. Remove the injector retainer clip.



055RW009

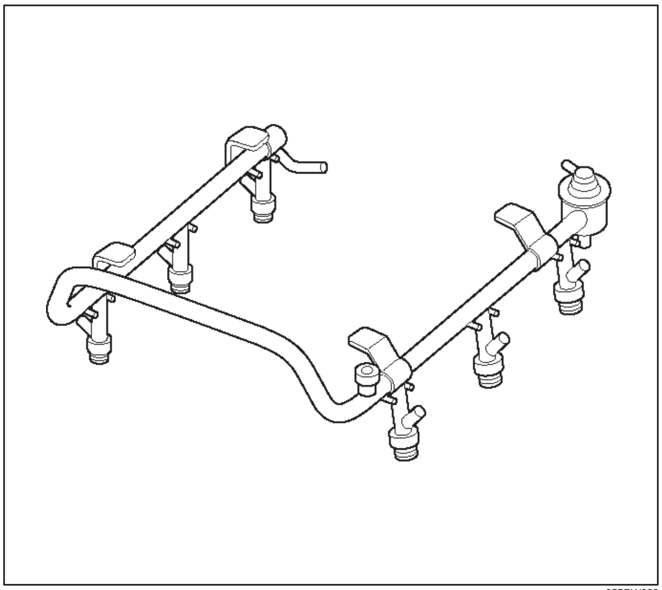
5. Remove the fuel injector assembly.
6. Remove the O-ring from the fuel injector.
7. Remove the O-ring backup from the fuel injector .

Inspection Procedure

1. Inspect the O-rings for cracks or leaks.
2. Replace worn or damaged O-rings.
3. Lubricate the new O-rings with engine oil before installation.

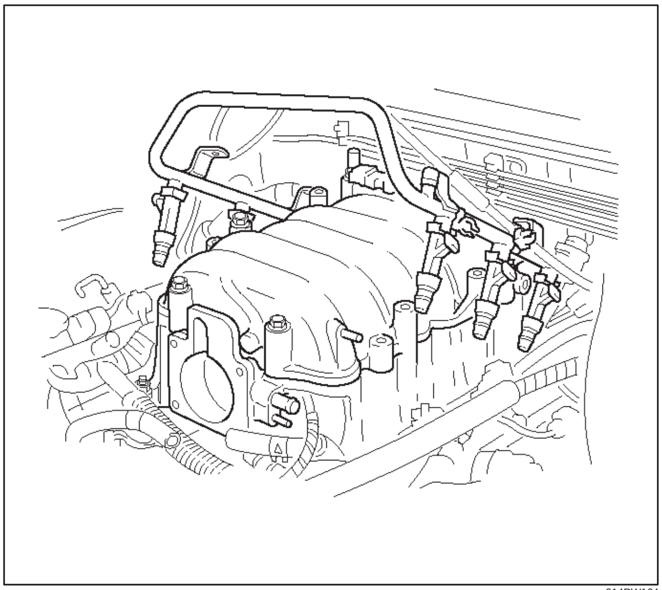
Installation Procedure

1. Install the O-ring backup on the fuel injector.
2. Install the new O-ring on the fuel injector.
3. Install the fuel injector on the fuel rail.



055RW009

4. Use new fuel injector retainer clips to retain the fuel injector to the fuel rail.
5. Coat the end of the fuel injector with gasoline.
6. Install the fuel rail. Refer to *Fuel Rail* section.



014RW164

7. Install the common chamber. Refer to *Common Chamber in Engine Mechanical* section.
8. Install the engine cover.
9. Connect the negative battery cable.

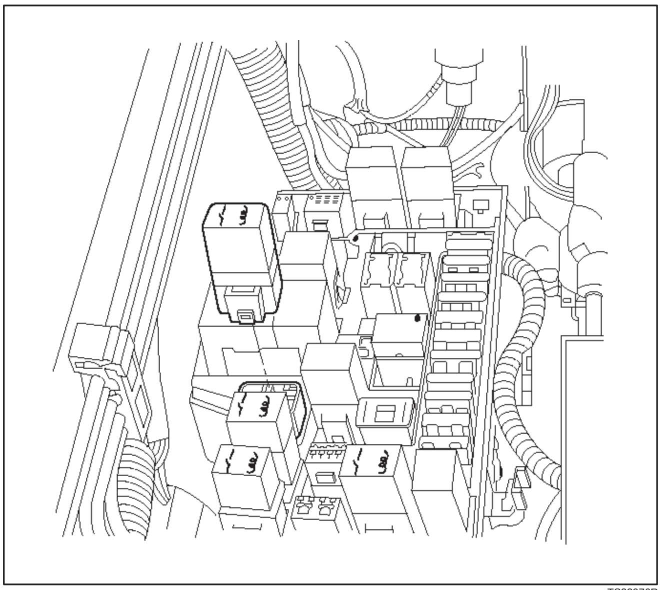
Fuel Metering System

Fuel Pressure Relief Procedure

CAUTION: To reduce the risk of fire and personal injury, there are necessary to relieve the fuel system pressure filler and gauge unit before servicing the fuel system components.

CAUTION: After relieving the system pressure, a small amount of fuel may be released when servicing fuel lines or connections. Reduce the chance of personal injury by covering the fuel line fittings with a shop towel before you disconnect the fittings. The towels will absorb any fuel that may leak out. When the disconnect is completed, place the towel in an approved container.

1. Remove the fuel cap.
2. Remove the fuel pump relay from the underhood relay box. Refer to *Fuel Pump Relay* section.



TS23976R

3. Start the engine and allow it to stall.
4. Crank the engine for 30 seconds.
5. Disconnect the negative battery cable.

Fuel Pump Assembly

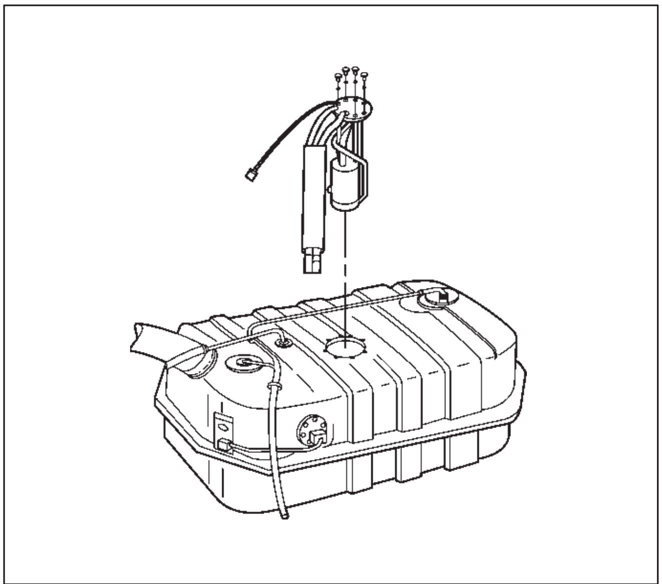
Removal Procedure

1. Disconnect the negative battery cable.
2. Drain all the fuel from the tank.
3. Install and tighten the drain plug.

Tighten

- **Tighten the drain plug to 20 N·m (14 lb ft.).**

4. Remove the fuel tank. Refer to *Fuel Tank* section.
5. Remove the retaining screws from the fuel tank.
6. Remove the fuel pump assembly from the fuel tank.
   - Cover the fuel pump opening in order to prevent dust, dirt, or debris from entering the fuel tank.



TS23795

Inspection Procedure

1. Inspect the fuel pump gasket for tears, cracks, stretching, or rotting. If any of these conditions are found, replace the fuel pump gasket.
2. Inspect the in-tank fuel filter for tears or evidence of dirt, debris, or water in the fuel. If any of these conditions are found, replace the in-tank fuel filter.

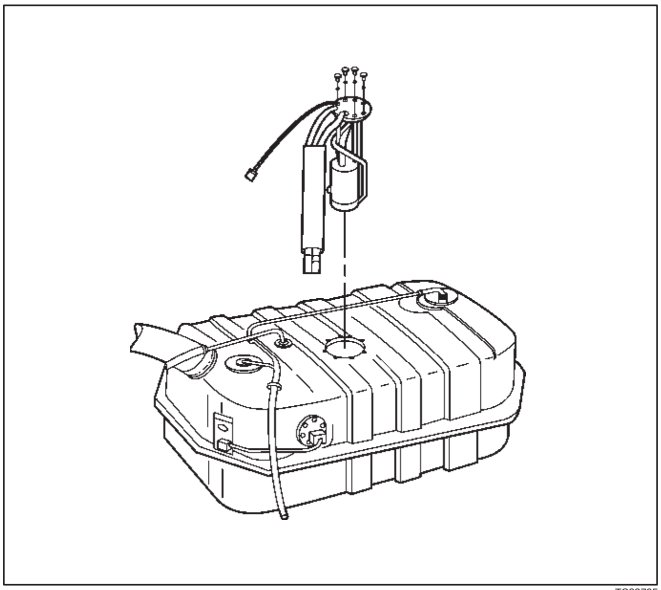
Installation Procedure

1. Install the fuel pump assembly.

Tighten

- **Tighten the fuel pump assembly mounting bolts to 3 N·m (27 lb ft.).**

2. Install the fuel pump assembly retaining screws.
3. Install the fuel tank assembly. Refer to *Fuel Tank* section.
4. Fill the tank with fuel.
5. Tighten the fuel filler cap.
6. Connect the negative battery cable.

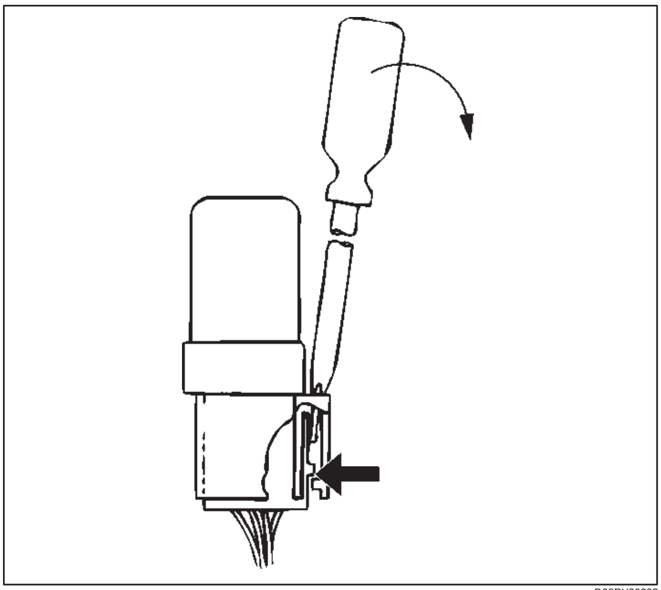


TS23795

Fuel Pump Relay

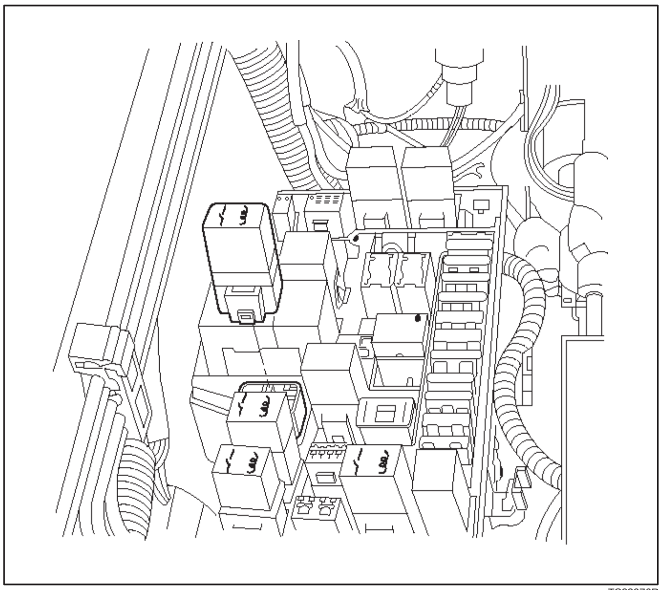
Removal Procedure

1. Remove the fuse and relay box cover from under the hood.
2. Consult the diagram on the cover to determine which is the correct relay.
3. Insert a small screwdriver into the catch slot on the forward side of the fuel pump relay.
   - The screwdriver blade will release the catch inside.



D08RY00292

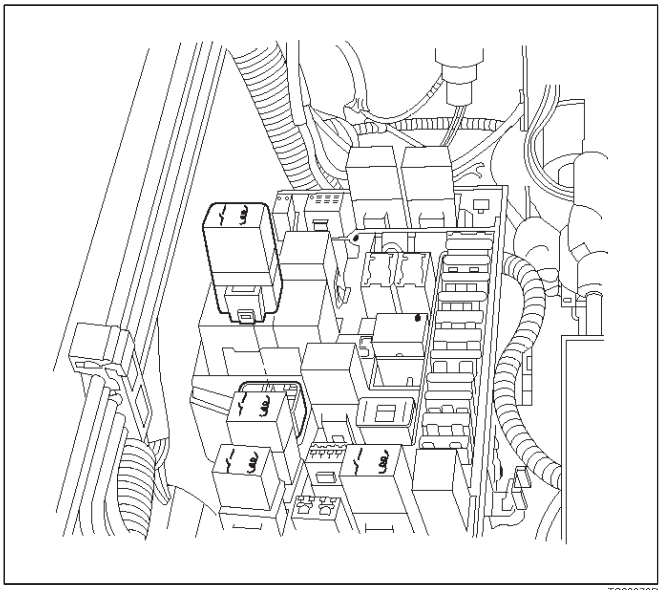
4. Pull the relay straight up and out of the fuse and relay box.



TS23976R

Installation Procedure

1. Insert the relay into the correct place in the fuse and relay box with the catch slot facing forward.
2. Press down until the catch engages.
   - An audible “click” will be heard.



TS23976R

3. Install the fuse and relay box cover.

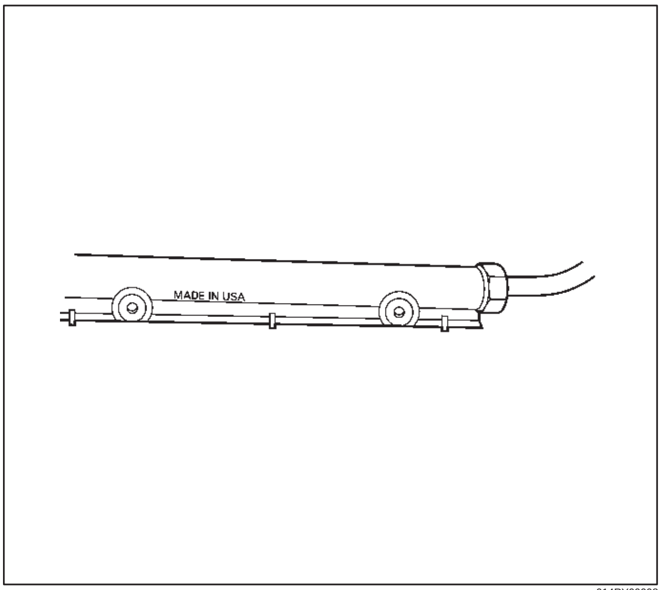
Fuel Rail Assembly

Removal Procedure

NOTE:

- Do not attempt to remove the fuel inlet fitting on the fuel rail. It is staked in place. Removing the fuel inlet fitting will result in damage to the fuel rail or the internal O-ring seal.
- Use care when removing the fuel rail assembly in order to prevent damage to the injector electrical connector terminals and the injector spray tips.
- Fittings should be capped and holes plugged during servicing to prevent dirt and other contaminants from entering open lines and passages.

IMPORTANT: An eight-digit identification number is stamped on the side of the fuel rail. Refer to this number when you service the fuel rail or when a replacement part is required.

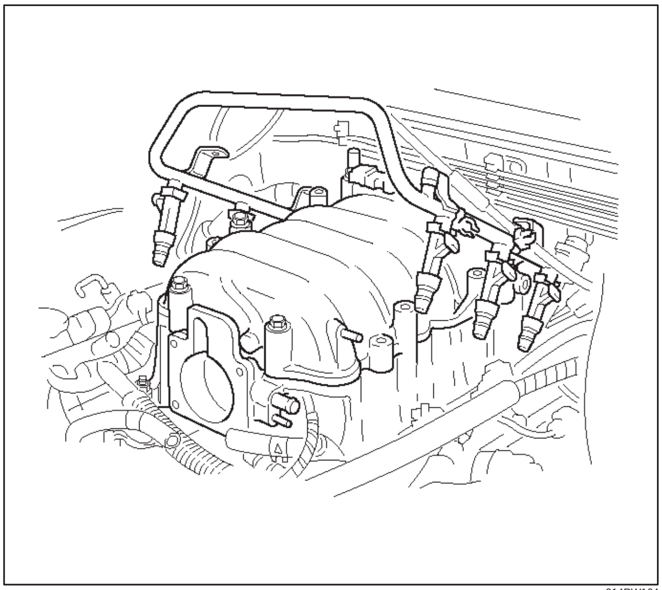


014RY00008

Before removal, the fuel rail assembly may be cleaned with a spray type engine cleaner. Follow the spray package instructions. Do not immerse the fuel rails in liquid cleaning solvent.

1. Depressurize the fuel system. Refer to Fuel Pressure Relief Procedure in this Section.
2. Disconnect the negative battery cable.
3. Remove the engine cover.
4. Disconnect the throttle position sensor electrical connector from throttle body.
5. Disconnect the connectors from manifold absolute pressure sensor, solenoid valve, electric vacuum sensing valve.
6. Disconnect the vacuum hose on canister VSV and positive crankcase ventilation hose.

7. Remove the common chamber. Refer to the common chamber in Engine Mechanical section.
   1. Lift up carefully on the fuel injectors. Do not separate the fuel injectors from the fuel rail.
   2. If an injector becomes separated from the fuel rail, the infector O-ring seals and the retainer clip must be replaced.
   3. Drain residual fuel into an approved container.

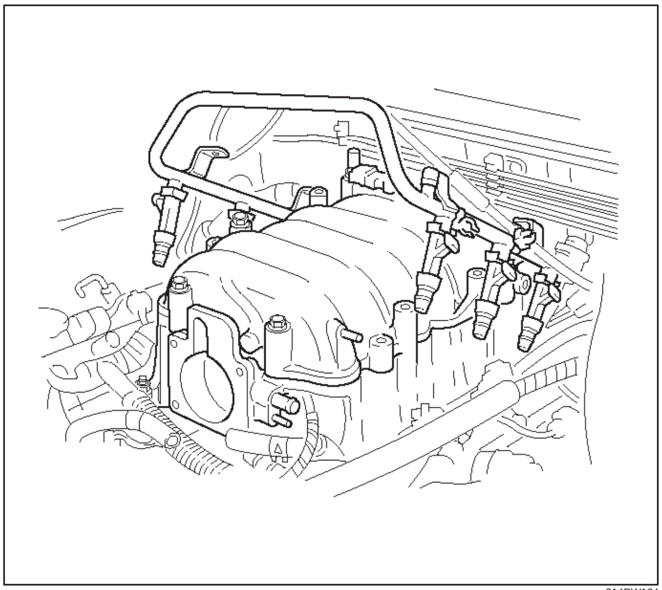


014RW164

8. If removal of the fuel pressure regulator is necessary, refer to *Fuel Pressure Regulator* section.
9. If removal of the fuel injectors is necessary, refer to *Fuel Injectors* section.

Installation Procedure

1. If the fuel injectors were removed, install them. Refer to *Fuel Injectors* section.
2. If the fuel pressure regulator was removed, install it. Refer to *Fuel Pressure Regulator* section.
3. Install the common chamber. Refer to common chamber in engine Mechanical section.



014RW164

4. Connect the vacuum hose on Canister VSV and positive crankcase ventilation hose.
5. Connect the connectors to manifold absolute pressure sensor, solenoid valve, electric vacuum sensing valve.
6. Connect the throttle position sensor electrical connector to throttle body.
7. Install the engine cover.
8. Connect the negative battery cable.
9. Crank the engine until it starts. Cranking the engine may take longer than usual due to trapped air in the fuel rail and in the injectors.

Fuel Tank

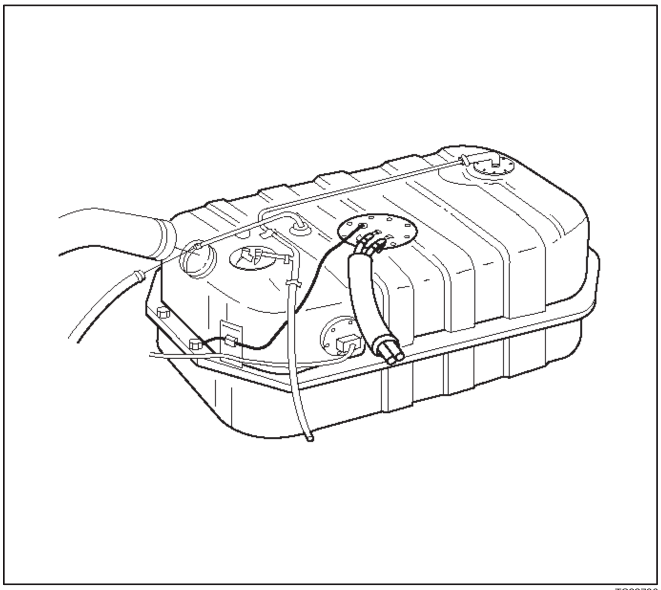
Removal Procedure

1. Disconnect the negative battery cable.
2. Loosen the fuel filler cap.
3. Drain the fuel from the tank into an approved container.
4. Install and tighten the drain plug.

Tighten

- **Tighten the drain plug to 20 N·m (14 lb ft.).**

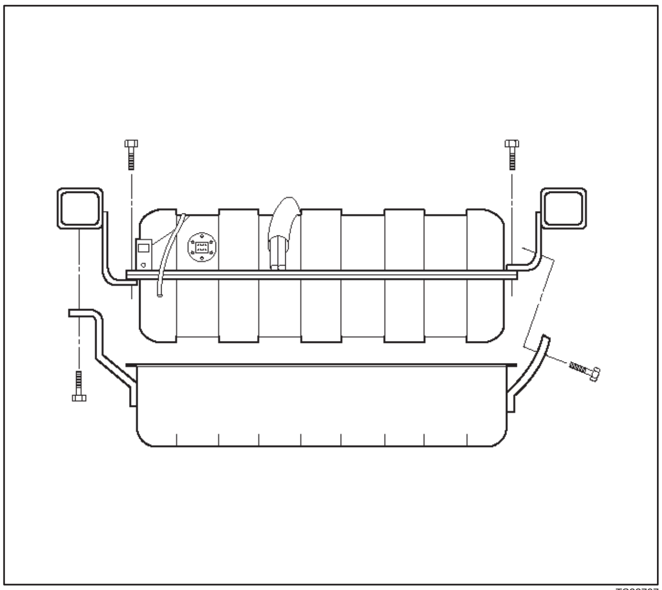
5. Disconnect the fuel filler hose at the fuel tank.
6. Disconnect the air breather hose at the fuel tank.



TS23796

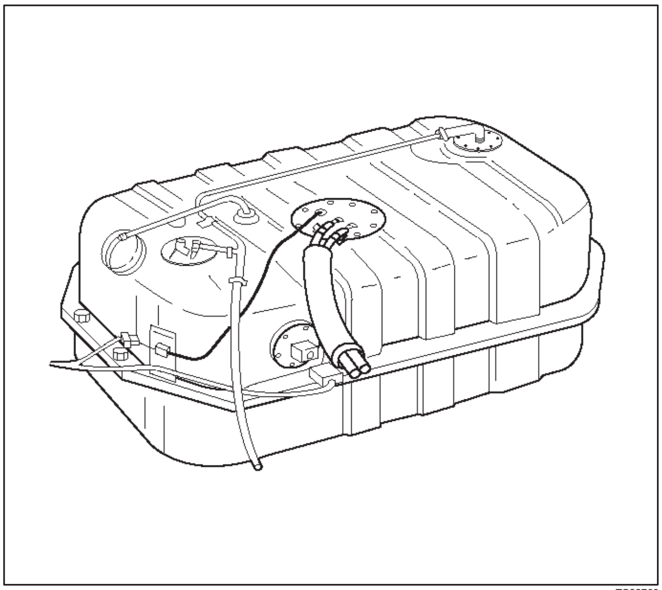
7. Remove the undercover retaining bolts.

8. Remove the undercover.



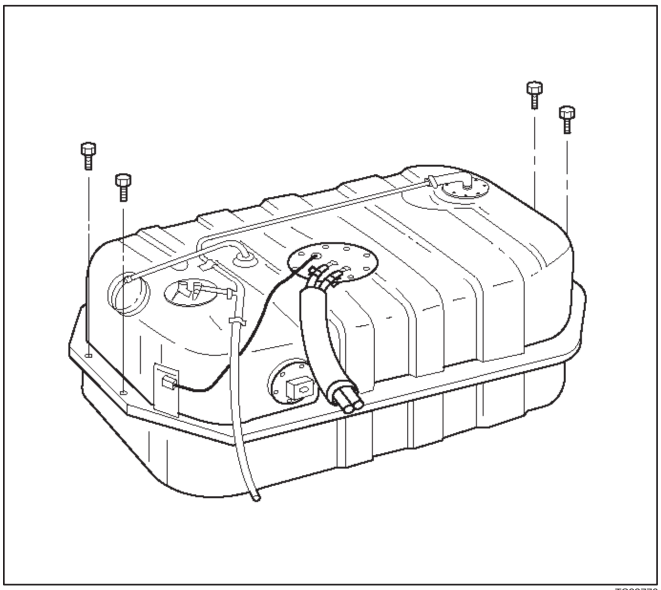
TS23797

9. Disconnect the wiring connector to the fuel pump.
10. Disconnect the wiring connector to the fuel gauge unit.
11. Remove the fuel gauge unit connector from the bracket.
12. Disconnect the EVAP vapor hose.
13. Disconnect the fuel supply hose.
14. Disconnect the fuel return hose.
    - Plug the hoses to prevent dust from entering the hoses.



TS23769

15. Remove the fuel tank retaining bolts on both sides.
16. Remove the fuel tank.



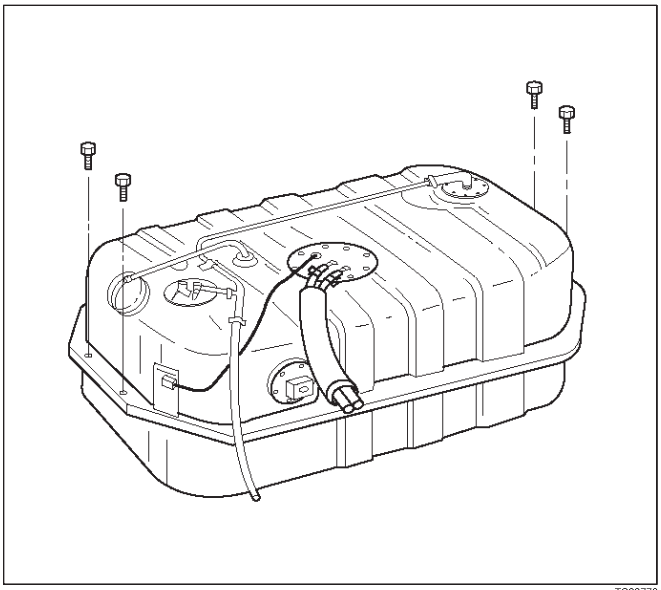
TS23770

Installation Procedure

1. Install the fuel tank.
    - Place the flanges on the left and right side of the tank on the bracket.
2. Install the fuel tank retaining bolts.

Tighten

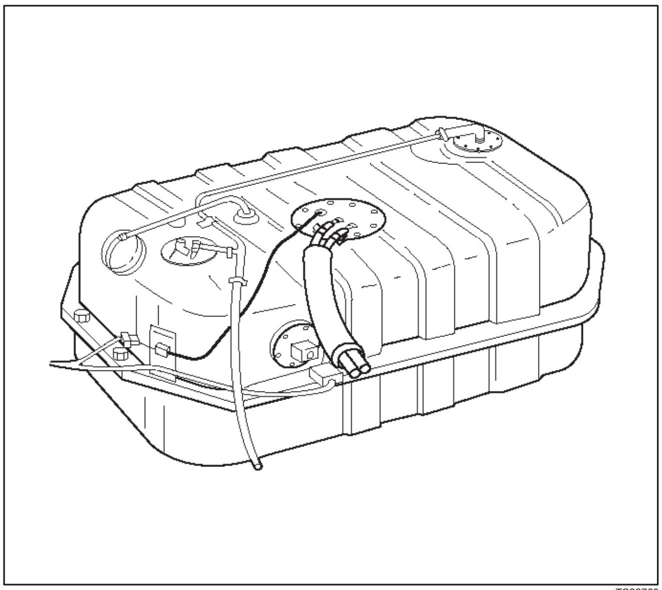
- **Tighten the fuel tank retaining bolts to 36 N·m (27 lb ft.).**



TS23770

3. Connect the fuel return hose.
4. Connect the fuel supply hose.
5. Connect the EVAP vapor hose.
6. Connect the wiring connector for the fuel gauge unit.
7. Connect the fuel gauge wiring connector to the bracket.

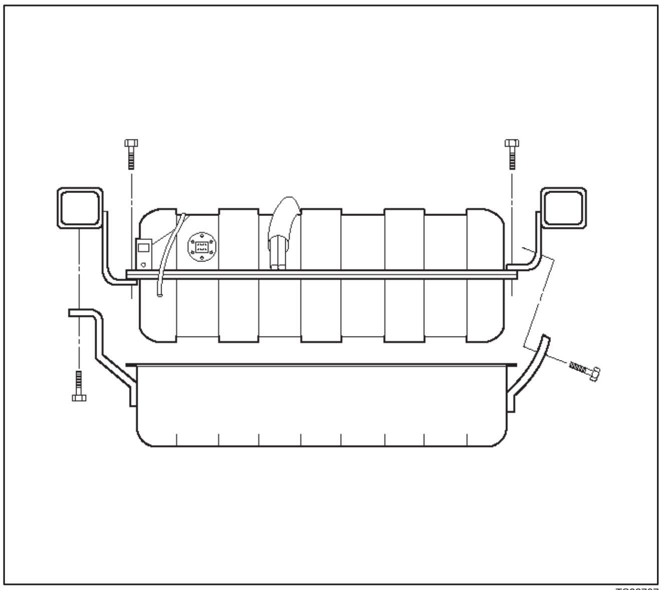
8. Connect the wiring connector for the fuel pump.



TS23769

9. Install the undercover.
10. Secure the undercover with the retaining bolts.

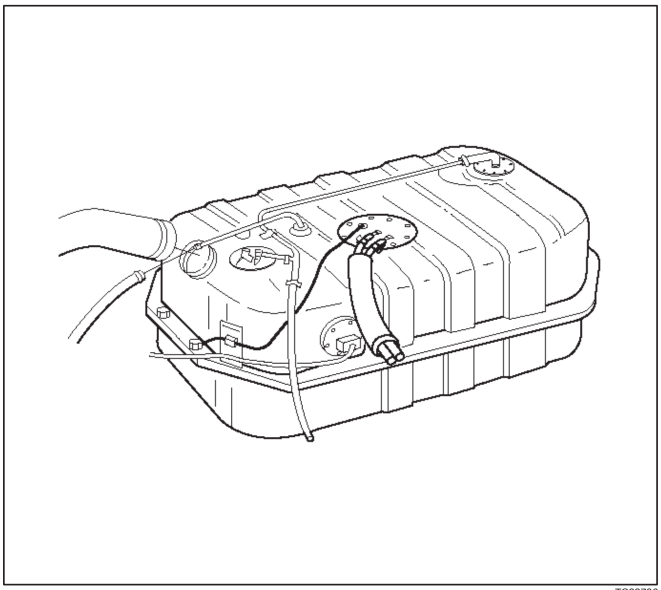
Torque: 36 N·m (26 Ib in)



TS23797

11. Connect the fuel filler fuse at the tank.

12. Connect the air breather hose at the tank.



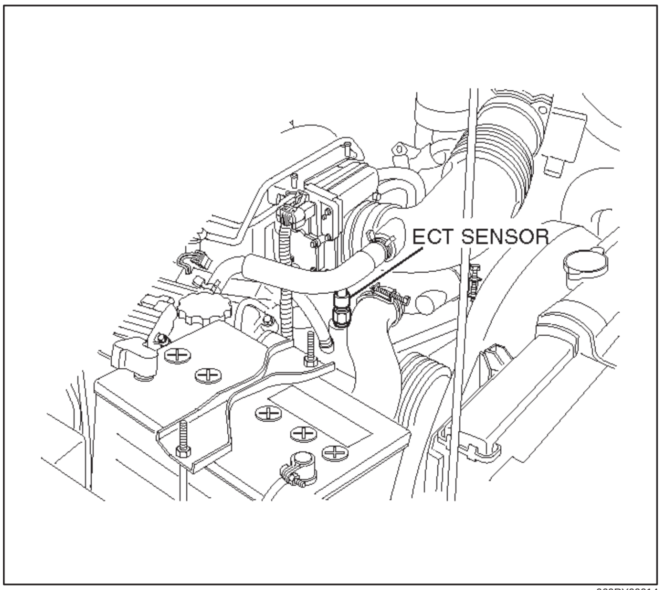
TS23796

13. Fill the fuel tank with fuel.
14. Tighten the fuel filler cap.
15. Connect the negative battery cable.

Throttle Body (TB)

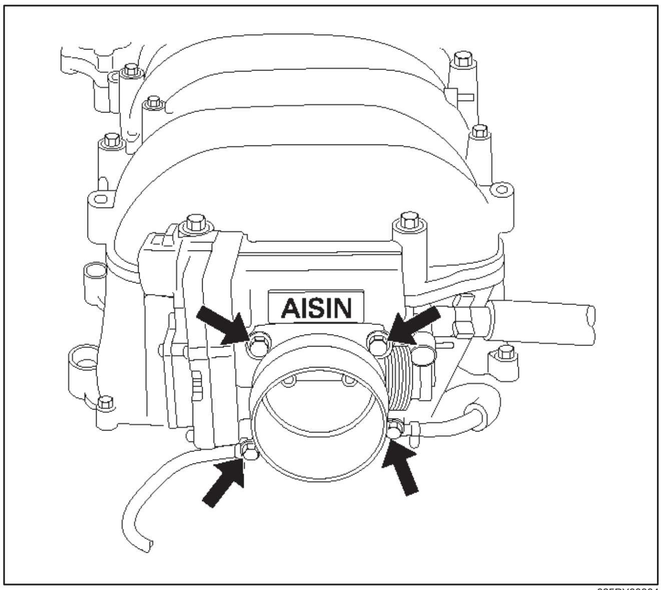
Removal Procedure

1. Disconnect the negative battery cable.
2. Drain the cooling system. Refer to *Cooling System* section.
3. Disconnect the electrical connectors:
   - Throttle position (TP) sensor.
   - Intake air temperature (IAT) sensor. Refer to *Intake Air Temperature Sensor* section.



060RY00014

4. Disconnect the vacuum hose below the air horn.
5. Remove the intake air duct clamp.
6. Disconnect the intake air duct.
7. Disconnect the coolant lines from the throttle body.
8. Remove the bolts from the common chamber.
9. Remove the throttle body from the common chamber.
10. Remove the gasket from the common chamber.



025RY00004

11. Remove the TP sensor. Refer to *Throttle Position (TP) Sensor* section.

Inspection Procedure

NOTE: Do not use solvent of any type when you clean the gasket surfaces on the intake manifold and the throttle body assembly. The gasket surfaces and the throttle body assembly may be damaged as a result.

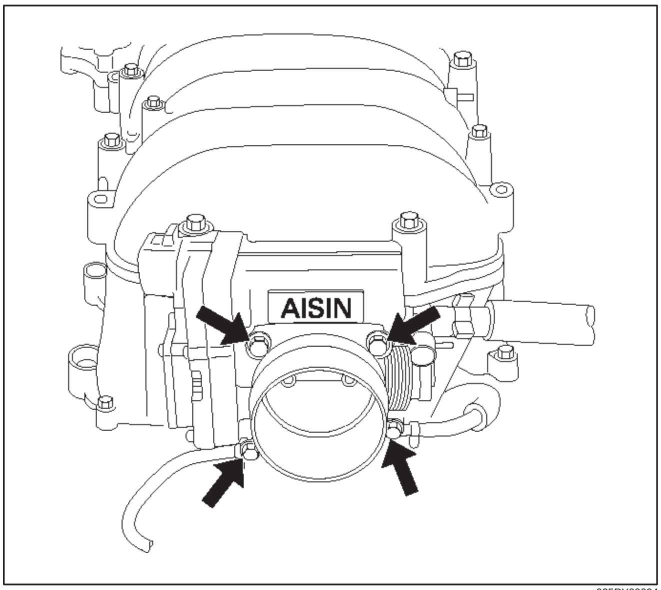
- If the throttle body gasket needs to be replaced, remove any gasket material that may be stuck to the mating surfaces of the manifold.
- Do not leave any scratches in the aluminum casting.

Installation Procedure

1. Install the TP sensor. Refer to *Throttle Position (TP) Sensor* section.
2. Install the gasket on the common chamber.
3. Install the throttle body on the common chamber.
4. Secure the gasket and the throttle body with the four bolts.
   - The vacuum lines must be properly routed under the throttle body before tightening the mounting bolts.

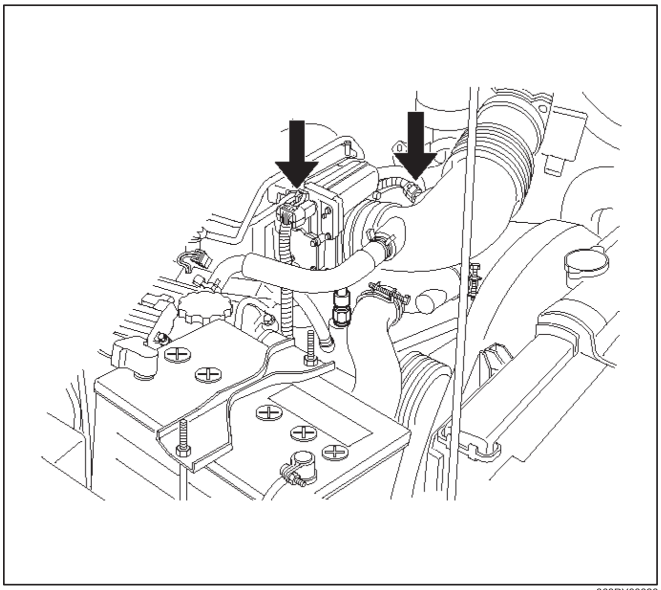
Tighten

- **Tighten the throttle body mounting bolts to 10 N·m (87 lb in).**



025RY00004

5. Install the coolant lines.
6. Connect all the vacuum lines.
7. Install the intake air duct.
8. Tighten the intake air duct clamp.
9. Connect all the electrical connectors:
   - Throttle position (TP) sensor.
   - Intake air temperature (IAT) sensor. Refer to *Intake Air Temperature Sensor* section.



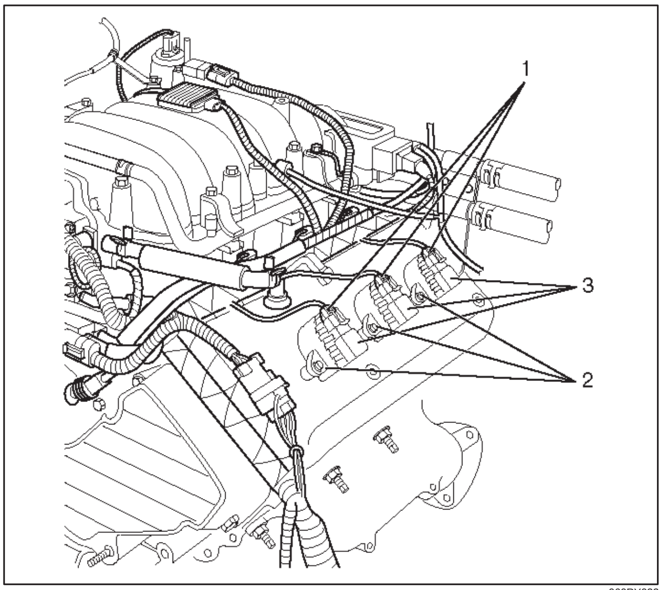
060RY00020

10. Install the accelerator cable assembly. Refer to *Accelerator Cable in Engine Speed Control System* section.
11. Fill the cooling system. Refer to *Cooling System* section.
12. Install the negative battery cable.

Electronic Ignition System

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the ignition coil connector at the ignition coil assemblies.
3. Remove the two screws that secure the ignition coil assemblies to the rocker cover.



060RY022

Legend

(1) Ignition Coil Connectors
(2) Bolts
(3) Ignition Coil Assemblies

4. Remove the ignition coil assemblies and the spark plug boot from the spark plug.
   - Twist the ignition coil assemblies while pulling it straight up.
5. Use the approhiate spark plug socket in order to remove the spark plug from the engine.

Installation Procedure

NOTE: The plug must thread smoothly into the cylinder head and be fully seated. Use a thread chaser if necessary to clean the threads in the cylinder head. Cross-threading or failure to fully seat the spark plug can cause plug overheating, exhaust blow-by gases, or thread damage. Do not overtighten the spark plugs. Over tightening can cause aluminum threads to strip.

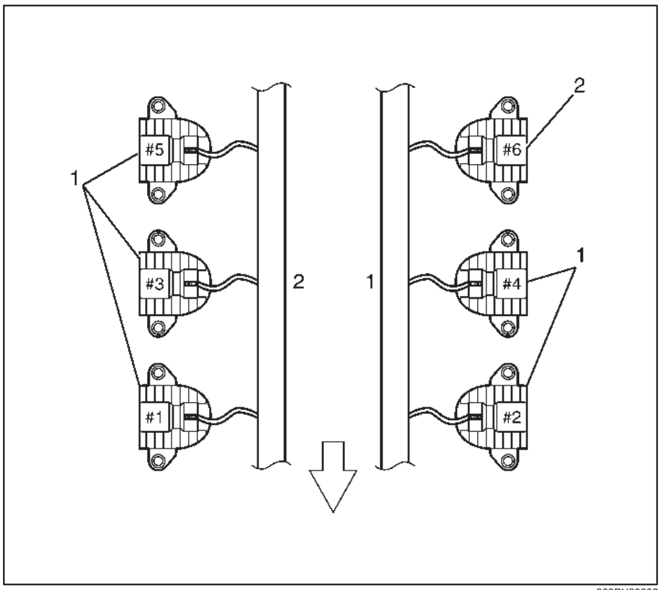
1. Install the spark plug in the engine. Use the appropriate spark plug socket.

Tighten

- **Tighten the spark plug to 18 N·m (13 lb ft.).**

2. Install the ignition coil assemblies and spark plug boot over the spark plug.

CAUTION: Ignition coil assembly #6 is different from ignition coil assembly from #1 to #5. Ignition coil assemblies #6 is short type. So, note it when installing ignition coil assembly of #6.



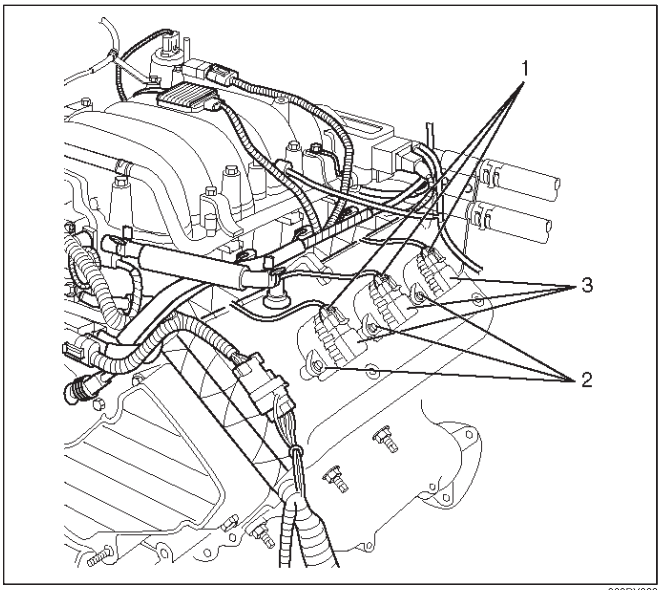
060RY00002

Legend

(1) Long Type Ignition Coil Assemblies (#1 ~ #5)
(2) Short Type Ignition Coil Assembly (#6)

3. Install ignition coil assemblies and tighten the fixing bolts to the specified torque.

Torque: 4 N·m (35.4 lb in)



060RY022

Legend

(1) Ignition Coil Connectors
(2) Bolts
(3) Ignition Coil Assemblies

4. Connect the ignition coil connector at the ignition coil assemblies.
5. Connect the negative battery cable.

Catalytic Converter

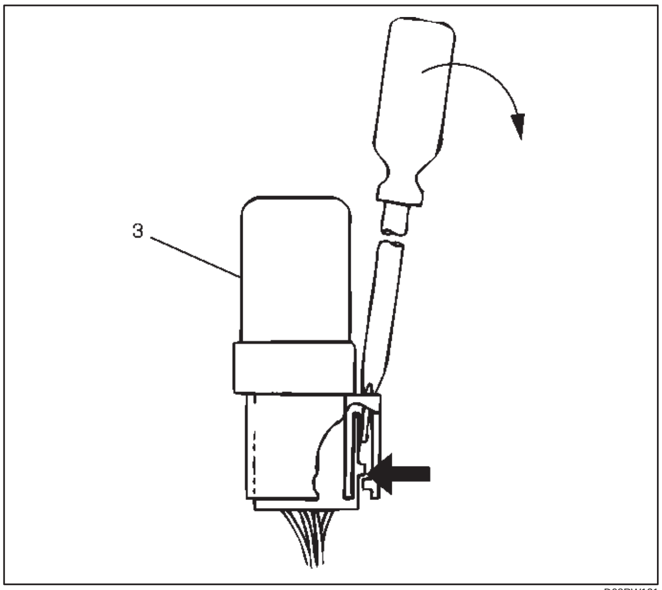
Removal and Installation Procedure

Refer to *Engine Exhaust in Engine* section.

Air Conditioning Thermo Relay

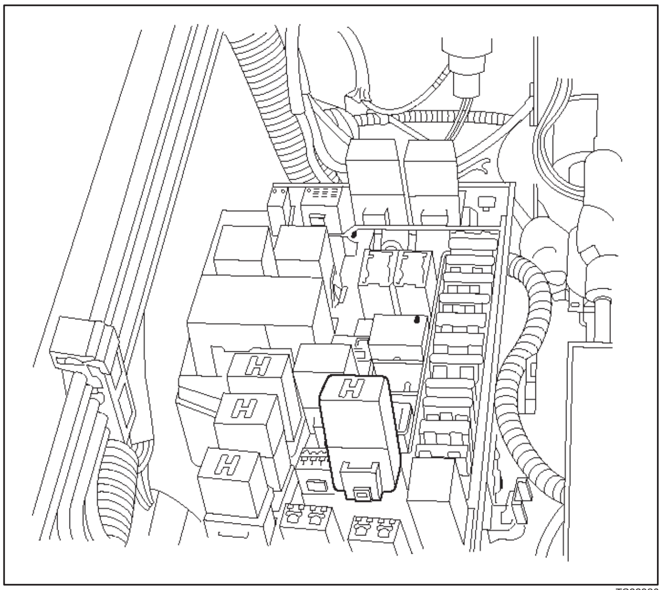
Removal Procedure

1. Remove the fuse and relay box cover from under the hood.
2. Consult the diagram on the cover to determine which is the correct relay.
3. Insert a small screwdriver into the catch slot on the forward side of the fuel pump relay.
   - The screwdriver blade will release the catch inside.



D08RW131

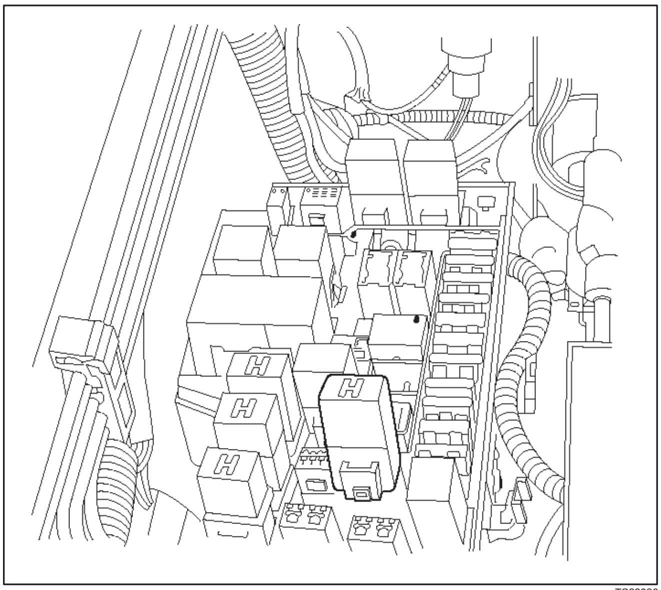
4. Pull the relay straight up and out of the fuse and relay box.



TS23986

Installation Procedure

1. Insert the relay into the correct place in the fuse and relay box with the catch slot facing forward.
2. Press down until the catch engages.
   - An audible “click” will be heard.
3. Install the fuse and relay box cover.



TS23986

EVAP Canister Hoses

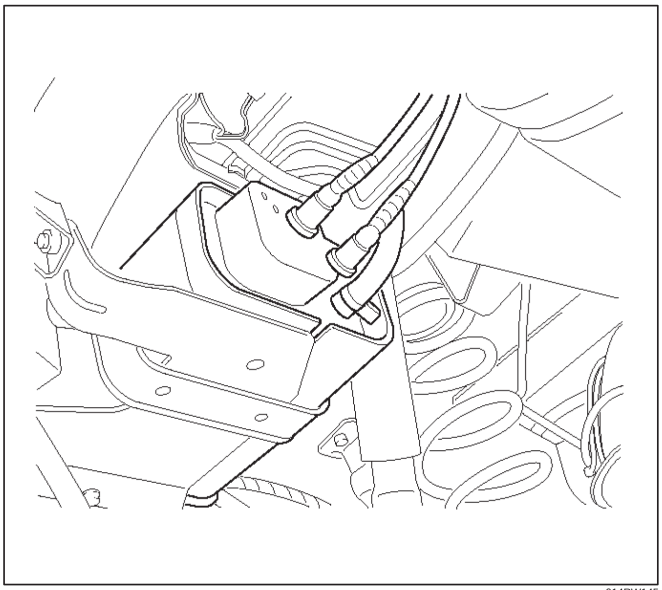
Service Information

To view the routing of the EVAP canister hoses, refer to *Vehicle Emission Control Information* in *Diagnosis* section.

EVAP Canister

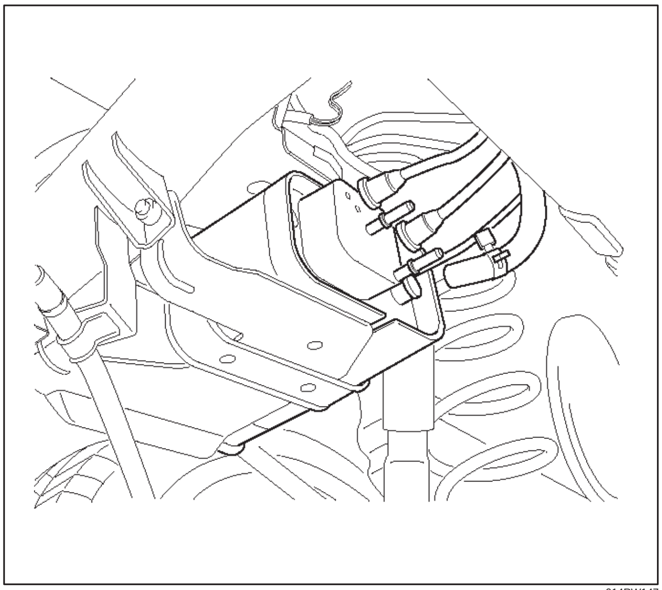
Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the three hoses from the EVAP canister.



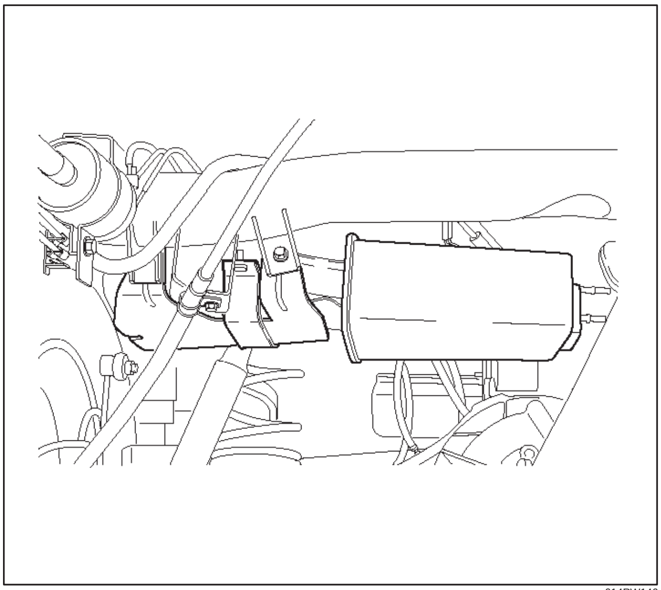
014RW145

3. Disconnect the fuel vapor connector and the purge hose from the EVAP canister vent solenoid.



014RW147

4. Remove the retaining two bolts on the mounting bracket and slide the canister out of mounting bracket.



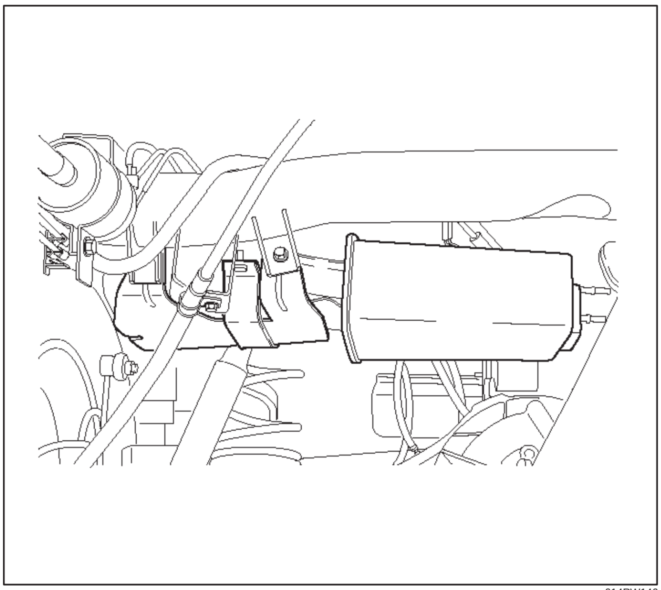
014RW146

Inspection Procedure

1. Inspect the hoses for cracks and leaks.
2. Inspect the canister for a damaged case.

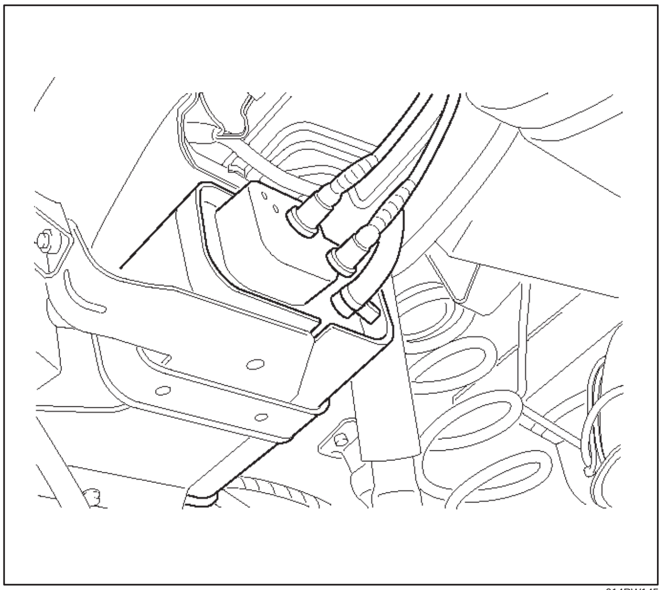
Installation Procedure

1. Slide the canister into mounting bracket and install the mounting bracket two bolts.



014RW146

2. Connect the fuel vapor connector to the EVAP canister vent solenoid.
3. Connect the three hoses to the EVAP canister.



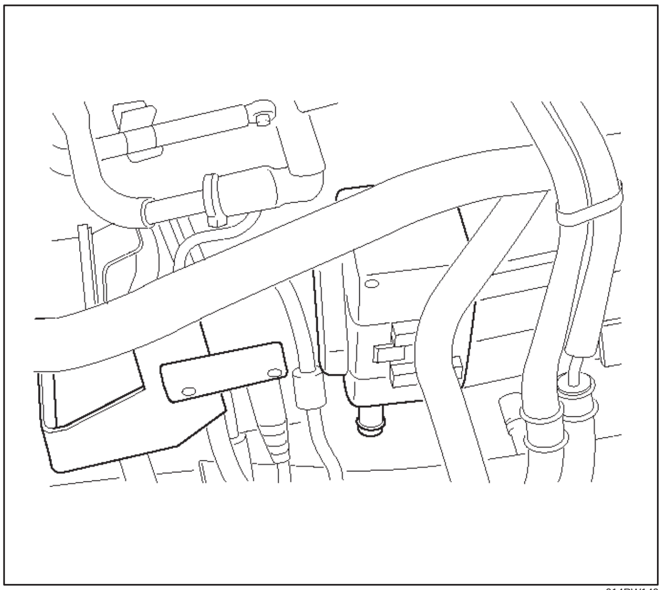
014RW145

4. Disconnect the negative battery cable.

EVAP Canister Vent Solenoid

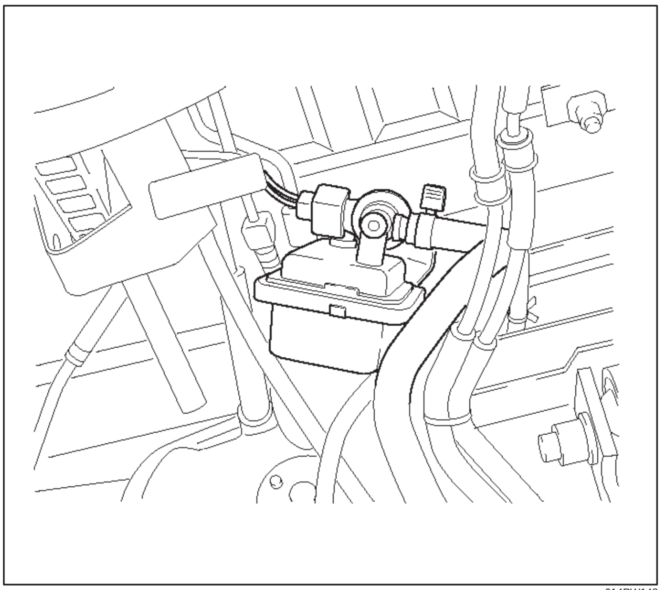
Removal Procedure

1. Disconnect the negative battery cable.
2. Slide out the EVAP canister vent solenoid from mounting bracket.



014RW149

3. Disconnect the connector and hose.



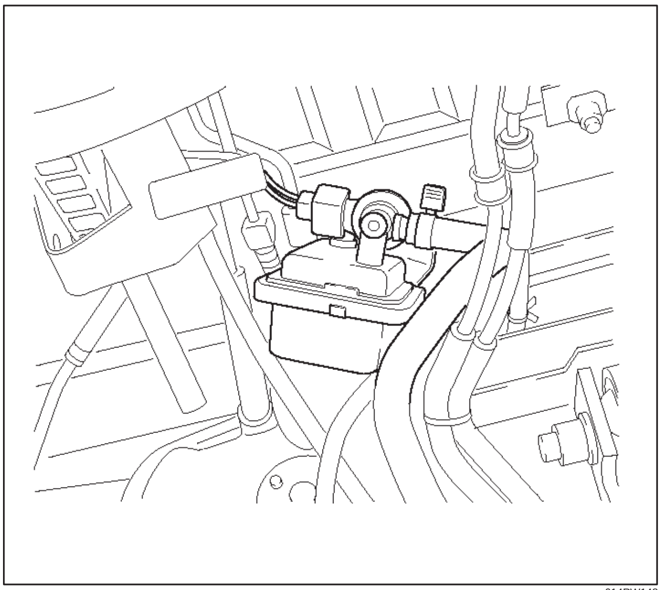
014RW148

Inspection Procedure

1. Check for cracks or leaks.
2. Energize the solenoid and try to blow through it. The solenoid should not allow passage of air when energized. (J 35616 Connector Test Kit can be used to easily attach jumper wires from the battery to the solenoid).

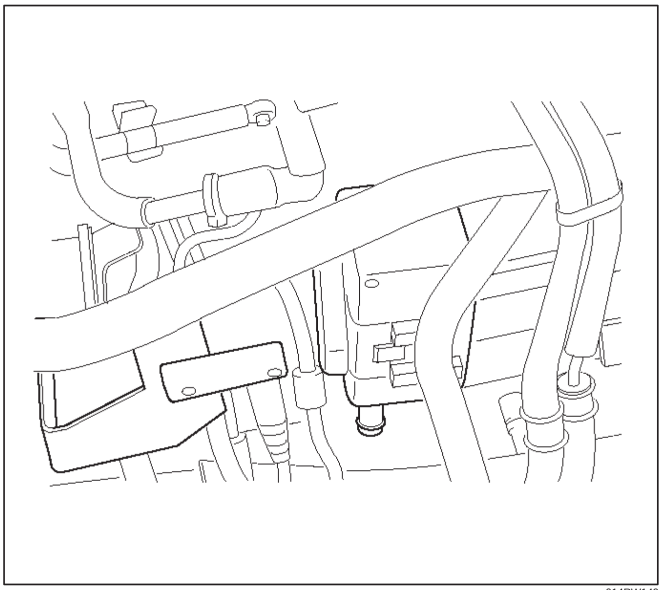
Installation Procedure

1. Connect the connector and hose.



014RW148

2. Slide the EVAP canister vent solenoid into mounting bracket.



014RW149

3. Connect the negative battery cable.

Fuel Tank Pressure Sensor

Removal Procedure

1. Remove the fuel pump assembly. Refer to *Fuel Tank In Fuel Pump* section.
2. Carefully pry the fuel tank pressure sensor out of the top of the fuel pump assembly.

Inspection Procedure

1. Inspect the vapor pressure sensor for cracks in the housing and corrosion on the electrical terminals.
2. Inspect the rubber grommet for tears and signs of rot.

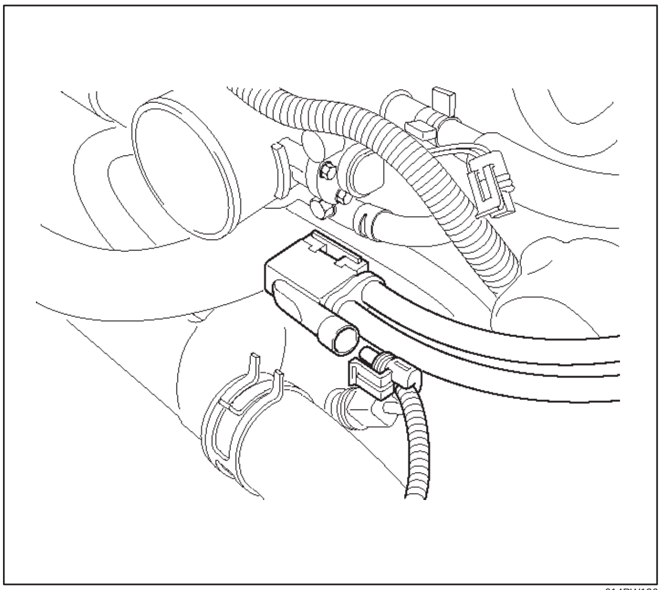
Installation Procedure

1. Install the rubber grommet on the fuel pump assembly.
2. Install the fuel tank vapor pressure sensor on the fuel pump assembly.
   - Insert the sensor nipple firmly into the grommet.
   - Keep twisting and pushing the sensor until the wide portion of the nipple shows on the other side of the grommet.
3. Install the fuel pump assembly on the fuel tank. Refer to *Fuel Tank In Fuel Pump* section.

EVAP Canister Purge Solenoid

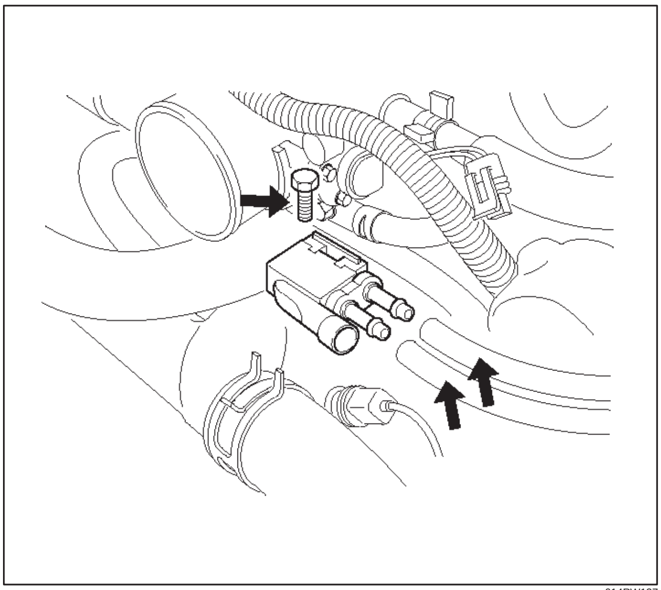
Removal Procedure

1. Disconnect the electrical connector from the EVAP canister purge solenoid.
2. Disconnect the vacuum hoses from the EVAP canister purge solenoid.



014RW136

3. Remove the EVAP canister purge solenoid retaining bolt from the common chamber.
4. Remove the EVAP canister purge solenoid.



014RW137

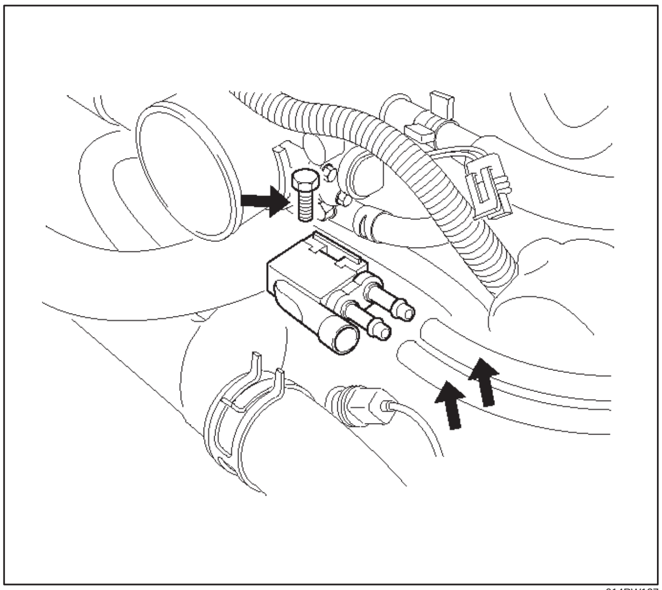
Installation Procedure

1. Install the EVAP canister purge solenoid on the upper intake manifold.
2. Install the EVAP canister purge solenoid retaining bolt.

Tighten

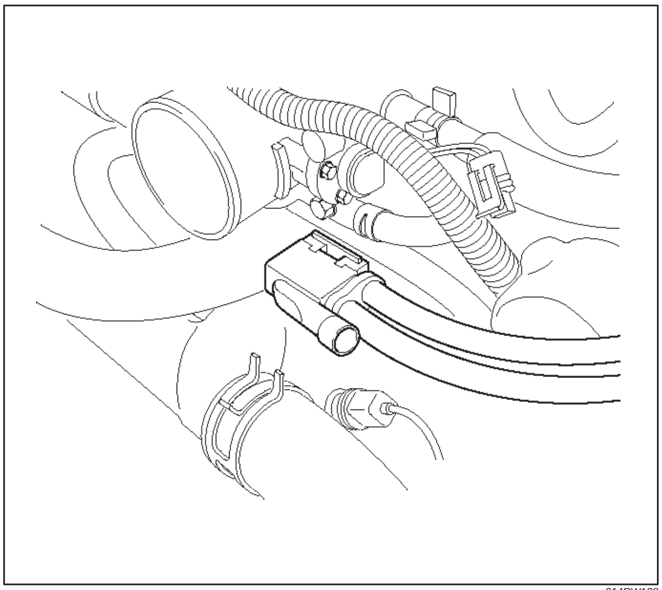
- **Tighten the bolts to 20 N·m (16 lb ft.).**

3. Connect the vacuum hoses to the EVAP canister purge solenoid.



014RW137

4. Connect the electrical connector to the EVAP canister purge solenoid.



014RW138

Fuel Tank Vent Valve

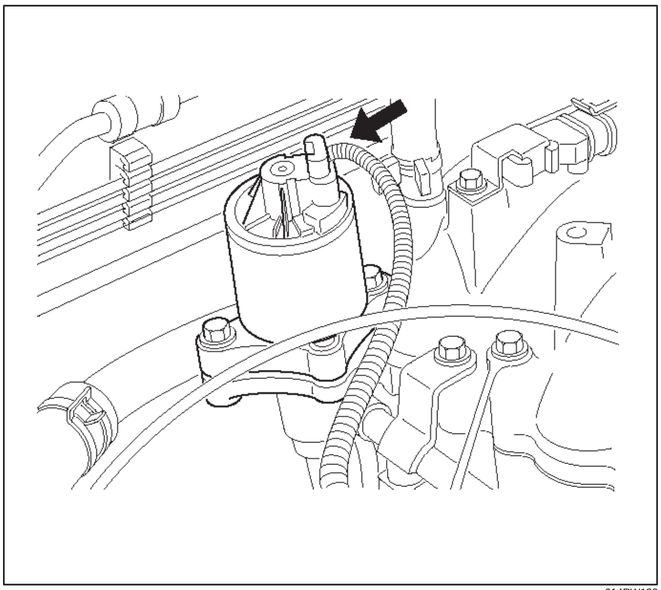
Removal and Installation Procedure

Refer to *Fuel Pump* section.

Linear Exhaust Gas Recirculation (EGR) Valve

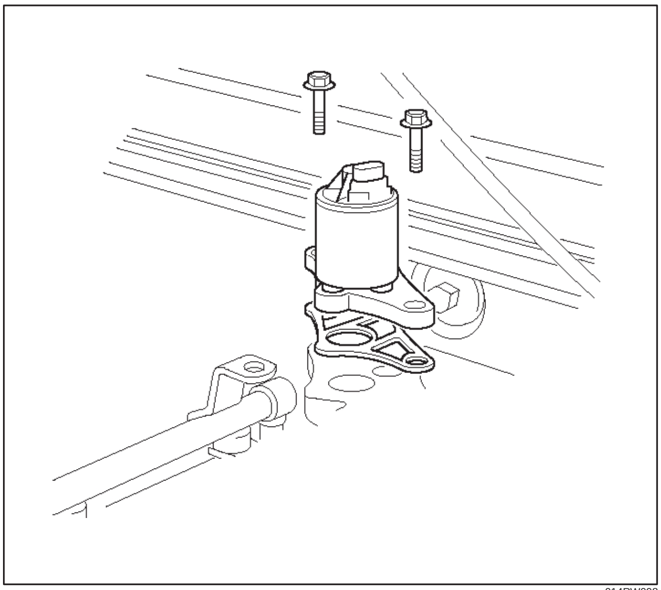
Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector at the EGR valve.



014RW139

3. Remove the bolts from the common chamber.



014RW098

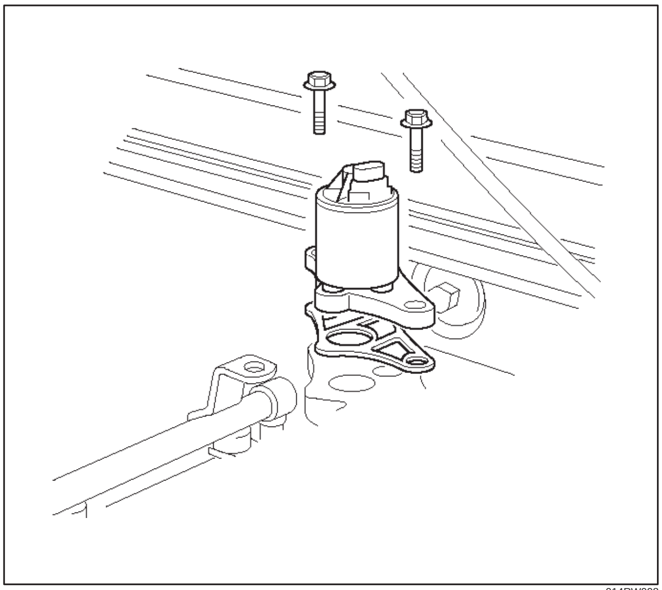
4. Remove the EGR valve from the common chamber manifold.
5. Remove the gasket from the common chamber manifold.

Installation Procedure

1. Install the gasket on the common chamber.
2. Install the EGR valve on the common chamber.
3. Secure the EGR valve and the gasket with the bolts.

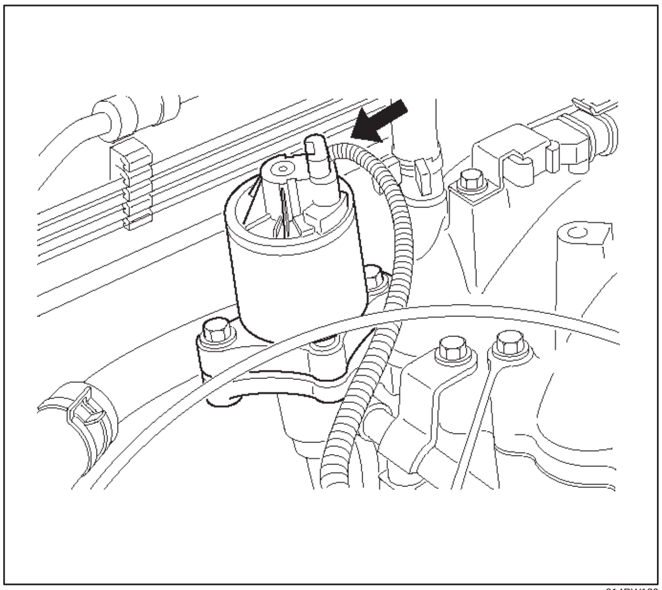
Torque: 25 N·m (18 lb ft)

NOTE: It is possible to install the EGR valve rotated 180° from the correct position. Make sure that the base of the valve is placed so that it aligns with the mounting flange.



014RW098

4. Connect the electrical connector at the EGR valve.



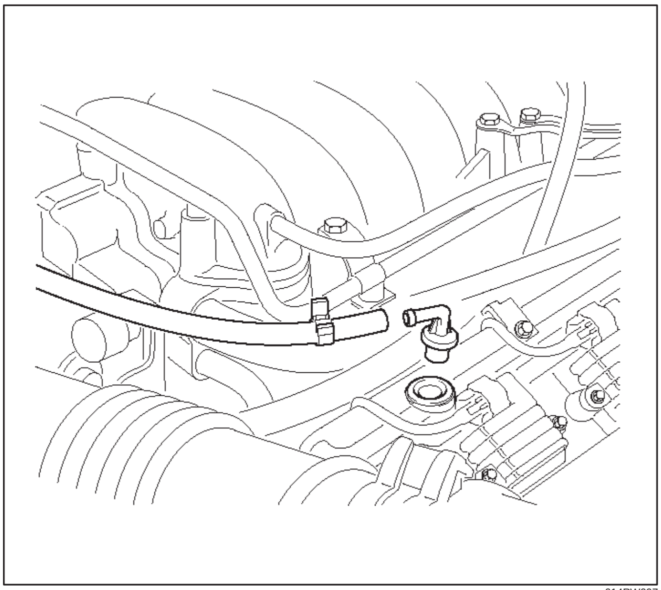
014RW139

5. Connect the negative battery cable.

Positive Crankcase Ventilation (PCV) Valve

Removal Procedure

1. Remove the vacuum hose at the PCV valve.
   - Slide the clamp back to release the hose.
2. Pull the PCV valve from the rubber grommet in the right valve cover.



014RW097

Inspection Procedure

Before inspecting the PCV valve, make sure that the hoses are connected properly and are in good condition. Also check that the oil pan and rocker cover gaskets are sealing properly.

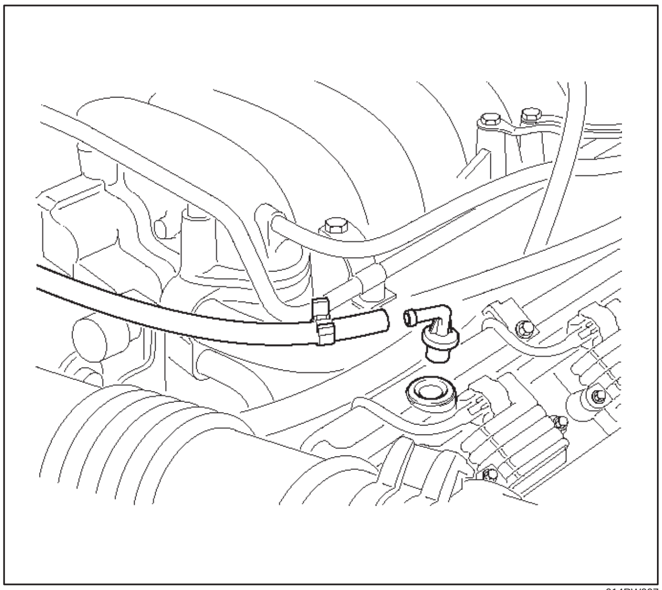
PCV Valve

1. Run the engine at normal operating temperature.
2. Disconnect the valve from the rocker cover.
   RESULT: A hissing noise should be heard from the valve. If no noise is heard, the PCV valve or hose is plugged.
3. Remove the PCV valve from the engine.
   a. Blow air into the rocker cover side of the valve.
   RESULT: Air should pass freely.
   b. Blow air into the air cleaner side of the valve.
   RESULT: Air should not pass through the valve.
4. Re-install the PCV valve and remove the oil filler cap.

RESULT: A small vacuum should be felt at the oil filler hole.

Installation Procedure

1. Push the PCV valve into the rubber grommet in the left valve cover.
2. Install the vacuum hose on the PCV valve and secure the vacuum hose with the clamp.



014RW097

Wiring and Connectors

Wiring Harness Service

The control module harness electrically connects the control module to the various solenoids, switches and sensors in the vehicle engine compartment and passenger compartment.

Replace wire harnesses with the proper part number replacement.

Because of the low amperage and voltage levels utilized in powertrain control systems, it is essential that all wiring in environmentally exposed areas be repaired with crimp and seal splice sleeves.

The following wire harness repair information is intended as a general guideline only. Refer to *Chassis Electrical* section for all wire harness repair procedures.

Connectors and Terminals

Use care when probing a connector and when replacing terminals. It is possible to short between opposite terminals. Damage to components could result. Always use jumper wires between connectors for circuit checking. NEVER probe through Weather-Pack seals.

Use an appropriate connector test adapter kit which contains an assortment of flexible connectors used to probe terminals during diagnosis. Use an appropriate fuse remover and test tool for removing a fuse and to adapt the fuse holder to a meter for diagnosis.

Open circuits are often difficult to locate by sight because oxidation or terminal misalignment are hidden by the connectors. Merely wiggling a connector on a sensor, or in the wiring harness, may temporarily correct the open circuit. Intermittent problems may also be caused by oxidized or loose connections.

Be certain of the type of connector/terminal before making any connector or terminal repair. Weather-Pack and Com-Pack III terminals look similar, but are serviced differently.

PCM Connectors and Terminals

Removal Procedure

1. Remove the connector terminal retainer.
2. Push the wire connected to the affected terminal through the connector face so that the terminal is exposed.
3. Service the terminal as necessary.

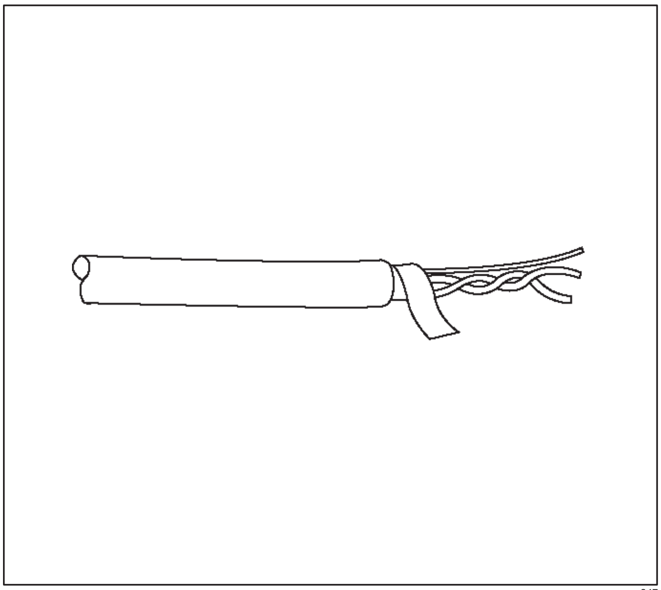
Installation Procedure

1. Bend the tab on the connector to allow the terminal to be pulled into position within the connector.
2. Pull carefully on the wire to install the connector terminal retainer.

Wire Harness Repair: Twisted Shielded Cable

Removal Procedure

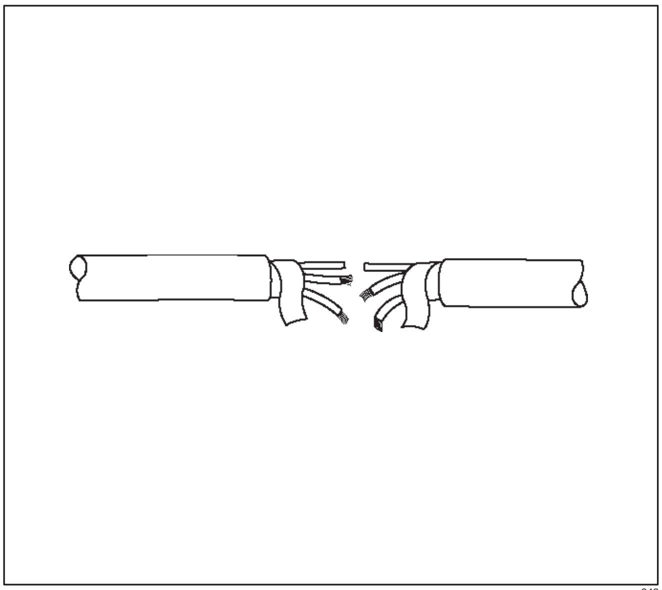
1. Remove the outer jacket.
2. Unwrap the aluminum/mylar tape. Do not remove the mylar.



047

3. Untwist the conductors.

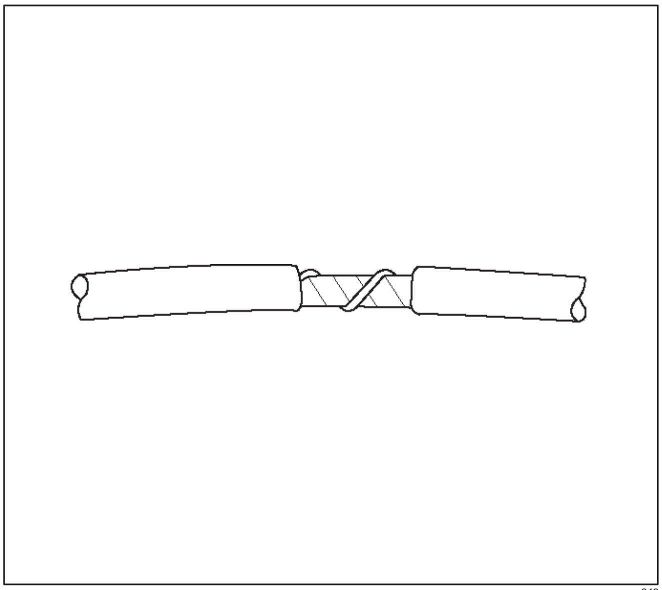
4. Strip the insulation as necessary.



048

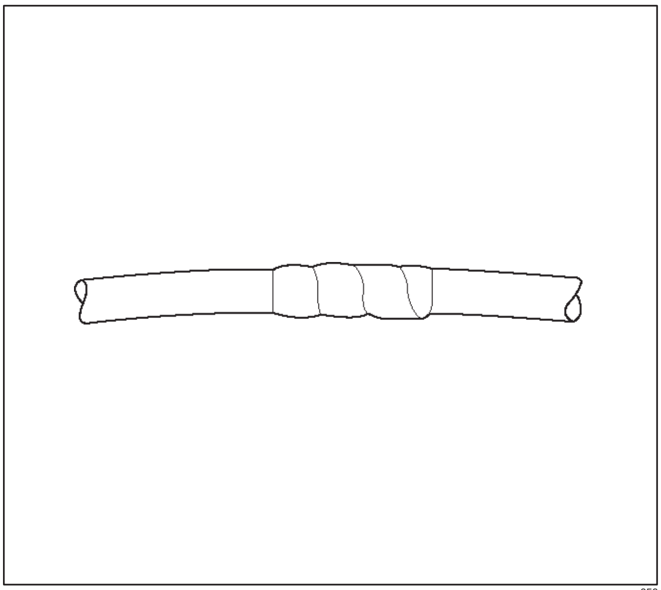
Installation Procedure

1. Splice the wires using splice clips and rosin core solder.
2. Wrap each splice to insulate.
3. Wrap the splice with mylar and with the drain (uninsulated) wire.



049

4. Tape over the whole bundle to secure.

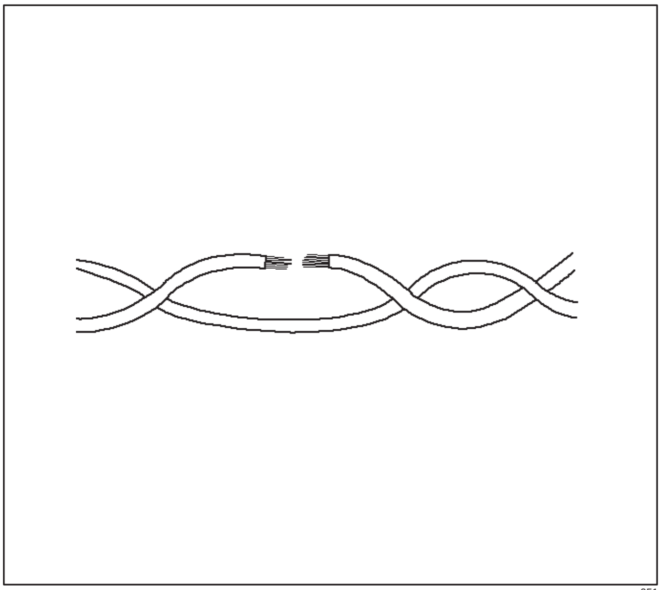


050

Twisted Leads

Removal Procedure

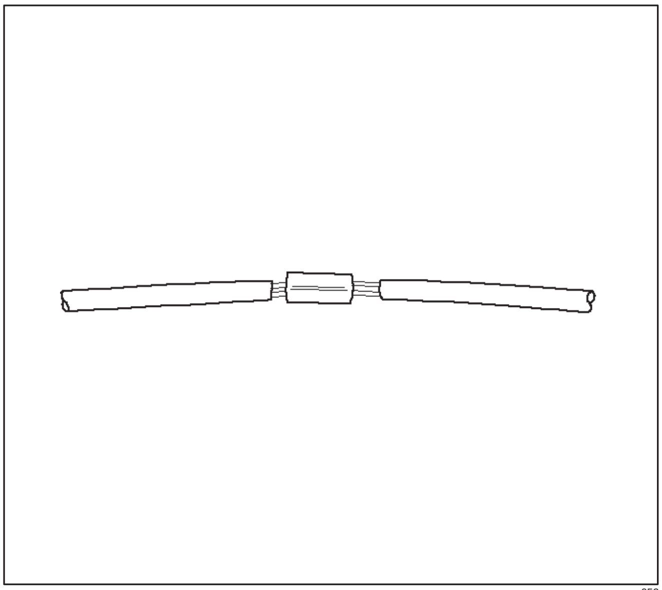
1. Locate the damaged wire.
2. Remove the insulation as required.



051

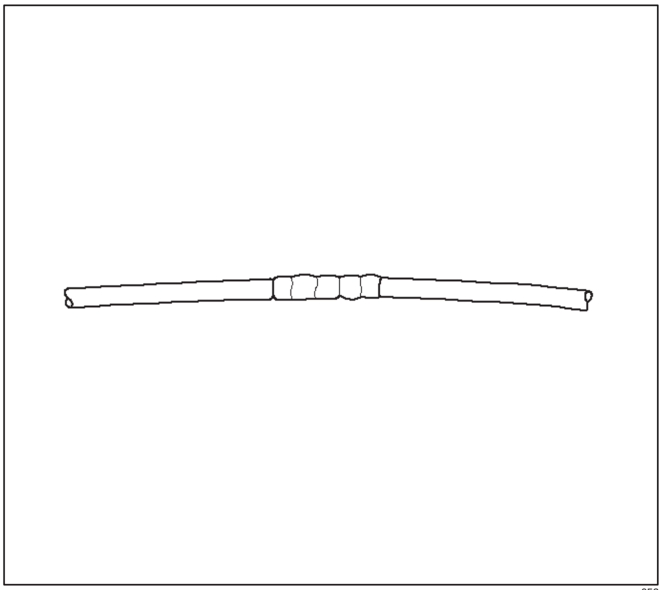
Installation Procedure

1. Use splice clips and rosin core solder in order to splice the two wires together.



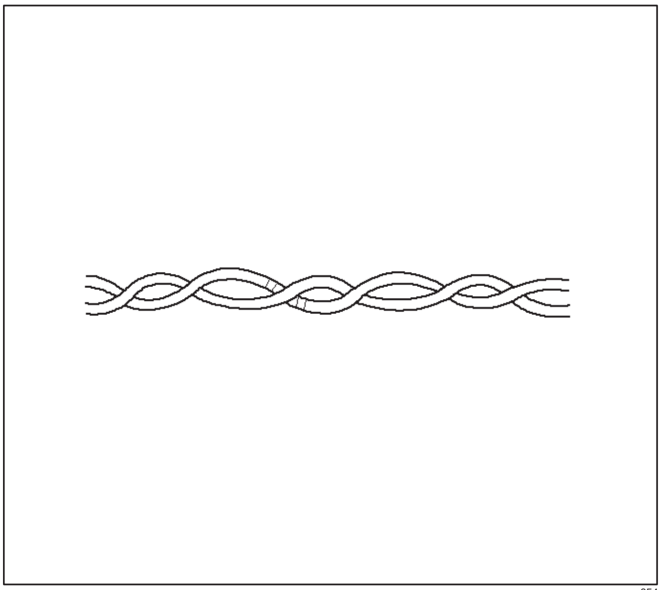
052

2. Cover the splice with tape in order to insulate it from the other wires.



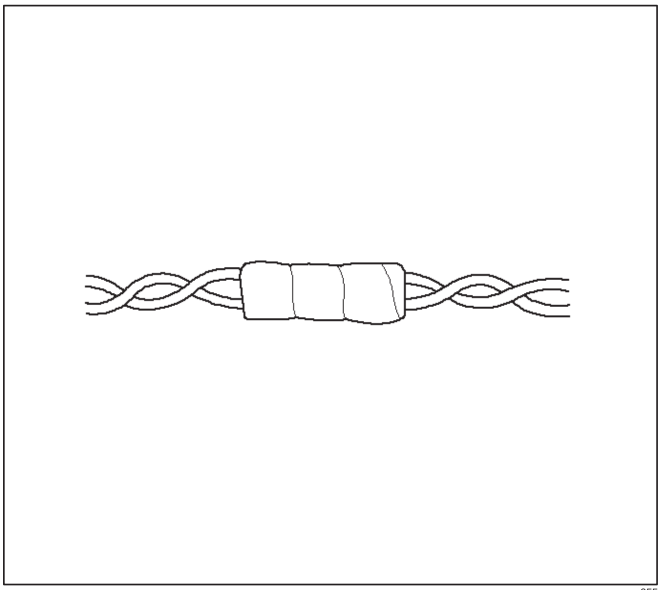
053

3. Twist the wires as they were before starting this procedure.



054

4. Tape the wires with electrical tape. Hold in place.



055

Weather-Pack Connector

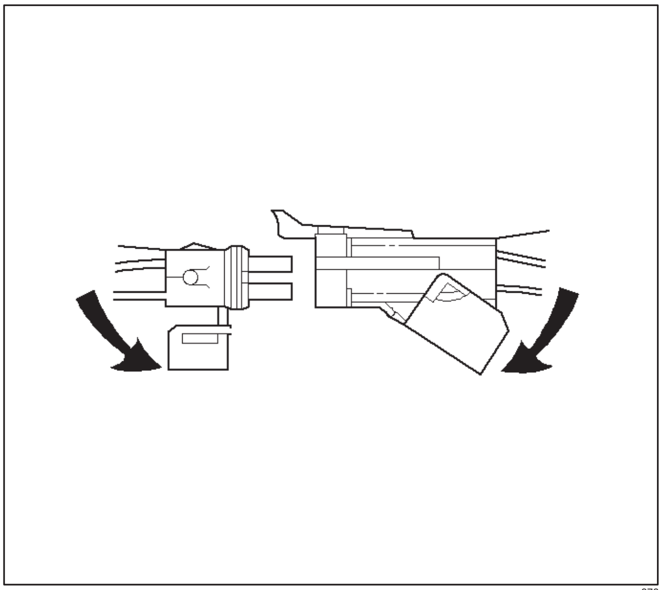
Tools Required

J 28742-A Weather-Pack II Terminal Remover

Removal Procedure

A Weather-Pack connector can be identified by a rubber seal at the rear of the connector. This engine room connector protects against moisture and dirt, which could from oxidation and deposits on the terminals. This protection is important, because of the low voltage and the low amperage found in the electronic systems.

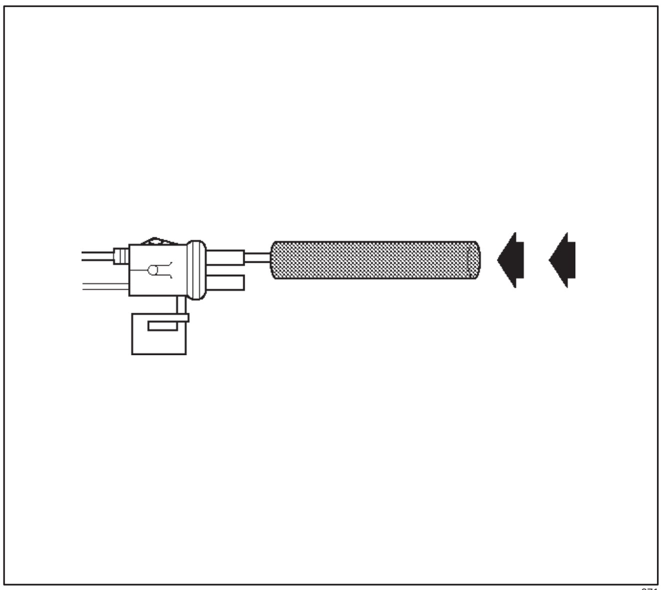
1. Open the secondary lock hinge on the connector.



070

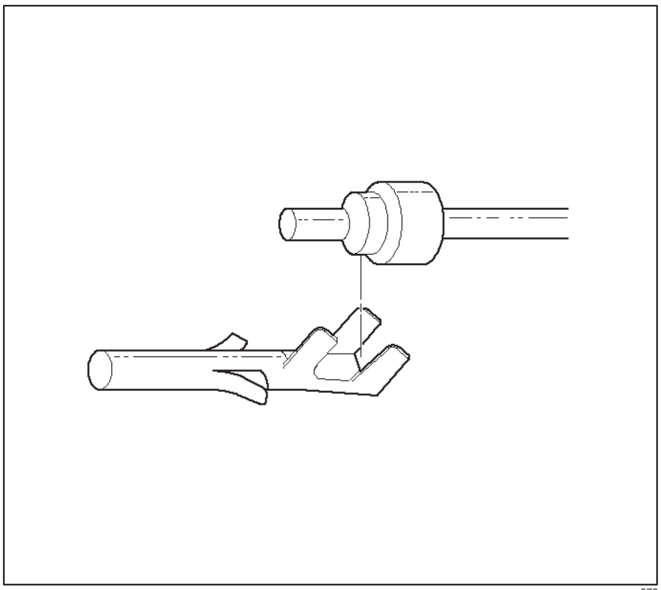
2. Use tool J 28742-A or the equivalent to remove the pin and the sleeve terminals. Push on J 28742-A to release.

NOTE: Do the use an ordinary pick or the terminal may be bent or deformed. Unlike standard blade terminals, these terminals cannot be straightened after they have been improperly bent.



071

3. Cut the wire immediately behind the cable seal.



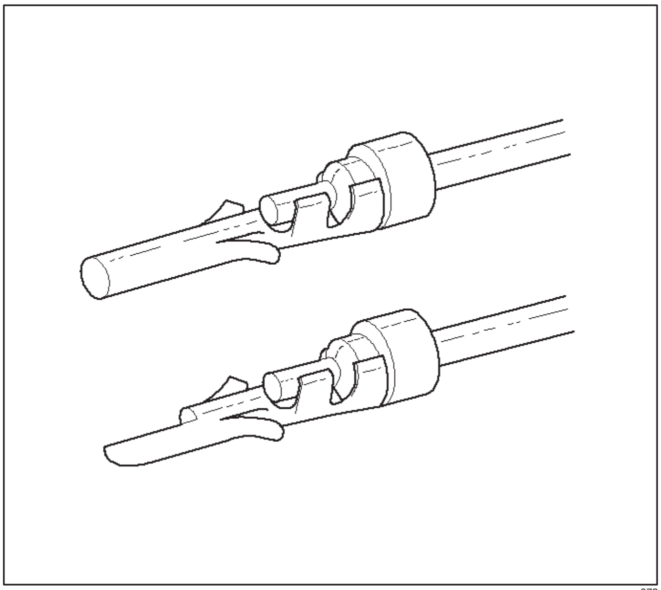
072

Installation Procedure

Make certain the connectors are properly seated and all of the sealing rings are in place when you reconnect the leads. The secondary lock hinge provides a backup locking feature for the connector. The secondary lock hinge is used for added reliability. This flap should retain the terminals even if the small terminal lock tangs are not positioned properly.

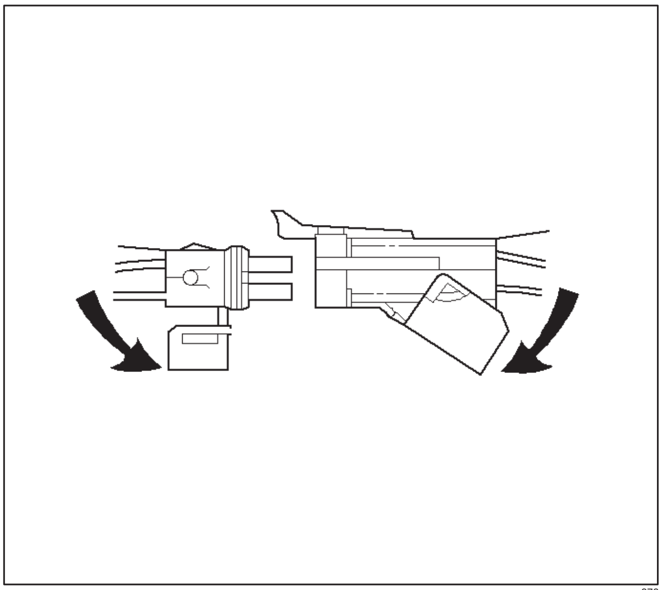
Do not replace the Weather-Pack connections with standard connections. Read the instructions provided with the Weather-Pack connector and terminal packages.

1. Replace the terminal.
2. Slip the new seal onto the wire.
3. Strip 5 mm (0.2”) of insulation from the wire.
4. Crimp the terminal over the wire and the seal.



073

5. Push the terminal and the connector to engage the locking tangs.



070

6. Close the secondary locking hinge.

Com-Pack III

General Information

The Com-Pack III terminal looks similar to some Weather-Pack terminals. This terminal is not sealed and is used where resistance to the environment is not required. Use the standard method when repairing a terminal. Do not use the Weather-Pack terminal tool J 28742-A or equivalent. These will damage the terminals.

Metri-Pack

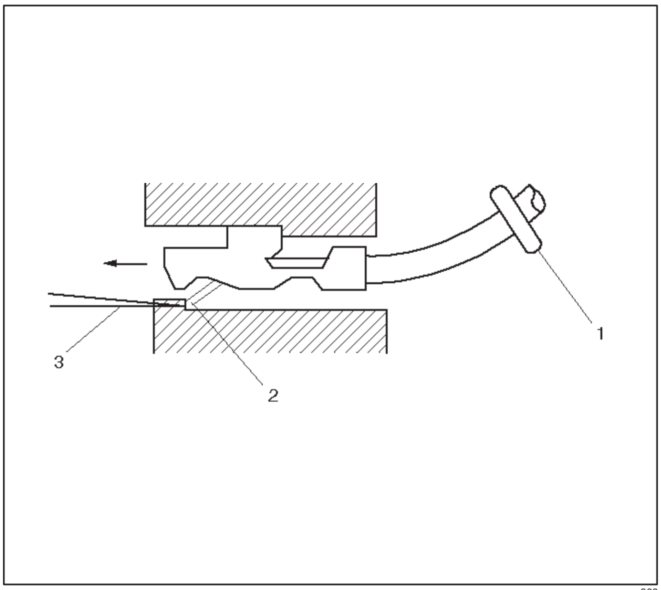
Tools Required

J 35689 Terminal Remover

Removal Procedure

Some connectors use terminals called Metri-Pack Series 150. These may be used at the engine coolant temperature (ECT) sensor.

1. Slide the seal (1) back on the wire.
2. Insert the J 35689 tool or equivalent (3) in order to release the terminal locking tang (2).



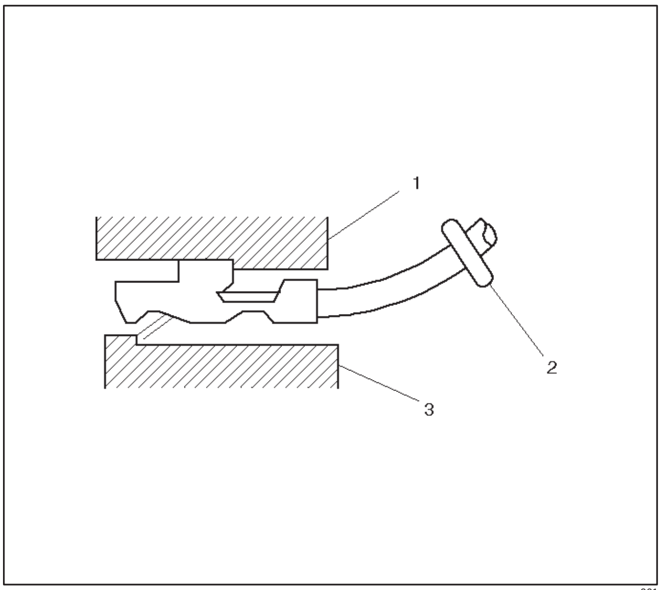
060

3. Push the wire and the terminal out through the connector. If you reuse the terminal, reshape the locking tang.

Installation Procedure

Metri-Pack terminals are also referred to as “pull-to-seat” terminals.

1. In order to install a terminal on a wire, the wire must be inserted through the seal (2) and through the connector (3).
2. The terminal (1) is then crimped onto the wire.



061

3. Then the terminal is pulled back into the connector to seat it in place.

General Description (PCM and Sensors)

58X Reference PCM Input

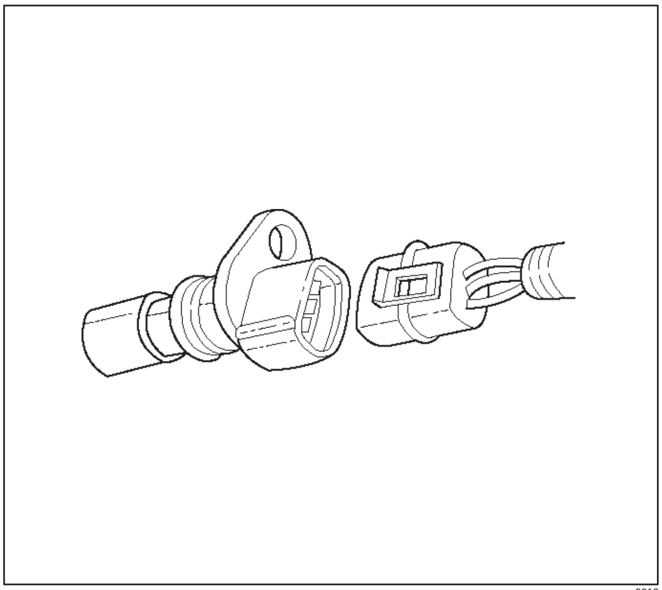
The powertrain control module (PCM) uses this signal from the crankshaft position (CKP) sensor to calculate engine RPM and crankshaft position at all engine speeds. The PCM also uses the pulses on this circuit to initiate injector pulses. If the PCM receives no pulses on this circuit, DTC P0337 will set. The engine will not start and run without using the 58X reference signal.

A/C Request Signal

This signal tells the PCM when the A/C mode is selected at the A/C control head. The PCM uses this to adjust the idle speed before turning "ON" the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the PCM.
Refer to *A/C Clutch Circuit Diagnosis* section for A/C wiring diagrams and diagnosis for the A/C electrical system.

Crankshaft Position (CKP) Sensor

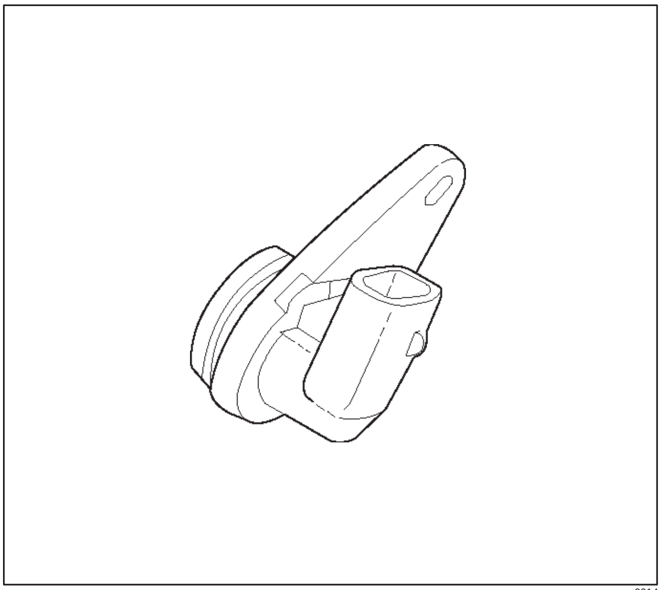
The crankshaft position (CKP) sensor provides a signal used by the powertrain control module (PCM) to calculate the ignition sequence. The CKP sensor initiates the 58X reference pulses which the PCM uses to calculate RPM and crankshaft position.
Refer to *Electronic Ignition System* section for additional information.



0013

Camshaft Position (CMP) Sensor and Signal

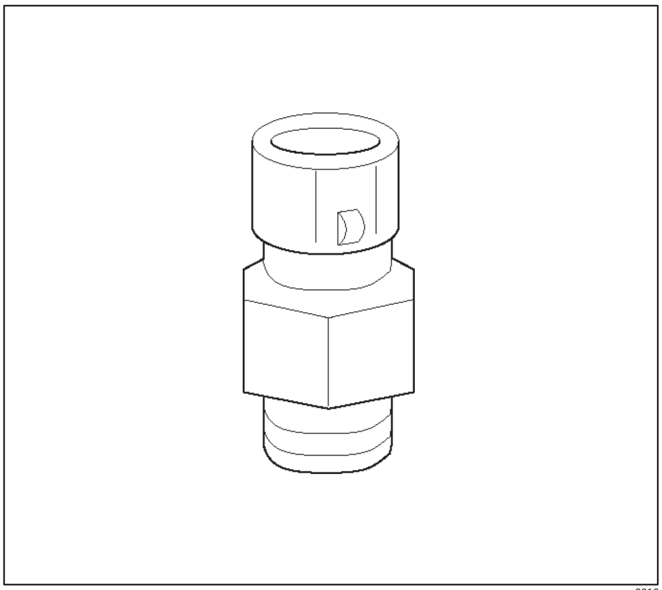
The camshaft position (CMP) sensor sends a CMP signal to the PCM. The PCM uses this signal as a "sync pulse" to trigger the injectors in the proper sequence. The PCM uses the CMP signal to indicate the position of the #1 piston during its power stroke. This allows the PCM to calculate true sequential fuel injection (SFI) mode of operation. If the PCM detects an incorrect CMP signal while the engine is running, DTC P0341 will set. If the CMP signal is lost while the engine is running, the fuel injection system will shift to a calculated sequential fuel injection mode based on the last fuel injection pulse, and the engine will continue to run. As long as the fault is present, the engine can be restarted. It will run in the calculated sequential mode with a 1-in-6 chance of the injector sequence being correct.
Refer to *DTC P0341* for further information.



0014

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor is a thermistor (a resistor which changes value based on temperature) mounted in the engine coolant stream. Low coolant temperature produces a high resistance of 100,000 ohms at –40°C (–40°F). High temperature causes a low resistance of 70 ohms at 130°C (266°F). The PCM supplies a 5-volt signal to the ECT sensor through resistors in the PCM and measures the voltage. The signal voltage will be high when the engine is cold and low when the engine is hot. By measuring the voltage, the PCM calculates the engine coolant temperature. Engine coolant temperature affects most of the systems that the PCM controls.
The Tech 2 displays engine coolant temperature in degrees. After engine start-up, the temperature should rise steadily to about 85°C (185°F). It then stabilizes when the thermostat opens. If the engine has not been run for several hours (overnight), the engine coolant temperature and intake air temperature displays should be close to each other. A hard fault in the engine coolant sensor circuit will set DTC P0177 or DTC P0118. An intermittent fault will set a DTC P1114 or P1115.



0016

Electrically Erasable Programmable Read Only Memory (EEPROM)

The electrically erasable programmable read only memory (EEPROM) is a permanent memory chip that is physically soldered within the PCM. The EEPROM contains the program and the calibration information that the PCM needs to control powertrain operation.

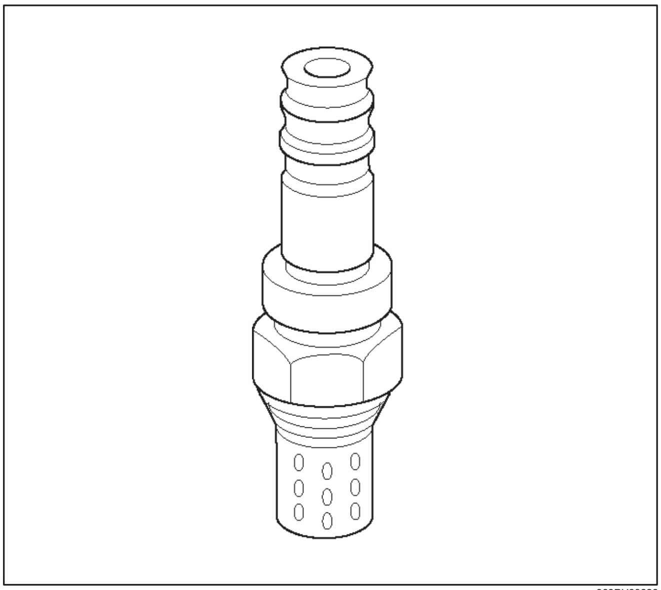
Unlike the PROM used in past applications, the EEPROM is not replaceable. If the PCM is replaced, the new PCM will need to be programmed. Equipment containing the correct program and calibration for the vehicle is required to program the PCM.

Fuel Control Heated Oxygen Sensors

The fuel control heated oxygen sensors (Bank 1 HO2S 1 and Bank 2 HO2S 1) are mounted in the exhaust stream where they can monitor the oxygen content of the exhaust gas. The oxygen present in the exhaust gas reacts with the sensor to produce a voltage output. This voltage should constantly fluctuate from approximately 100 mV to 900 mV. The heated oxygen sensor voltage can be monitored with a Tech 2. By monitoring the voltage output of the oxygen sensor, the PCM calculates the pulse width command for the injectors to produce the proper combustion chamber mixture.

- Low HO2S voltage is a lean mixture which will result in a rich command to compensate.
- High HO2S voltage is a rich mixture which will result in a lean command to compensate.

An open Bank 1 HO2S 1 signal circuit will set a DTC P0134 and the Tech 2 will display a constant voltage between 400-500 mV. A constant voltage below 300 mV in the sensor circuit (circuit grounded) will set DTC P0131. A constant voltage above 800 mV in the circuit will set DTC P0132. Faults in the Bank 2 HO2S 1 signal circuit will cause DTC 0154 (open circuit), DTC P0151 (grounded circuit), or DTC P0152 (signal voltage high) to set. A fault in the Bank 1 HO2S 1 heater circuit will cause DTC P0135 to set. A fault in the Bank 2 HO2S 1 heater circuit will cause DTC P0155 to set. The PCM can also detect HO2S response problems. If the response time of an HO2S is determined to be too slow, the PCM will store a DTC that indicates degraded HO2S performance.



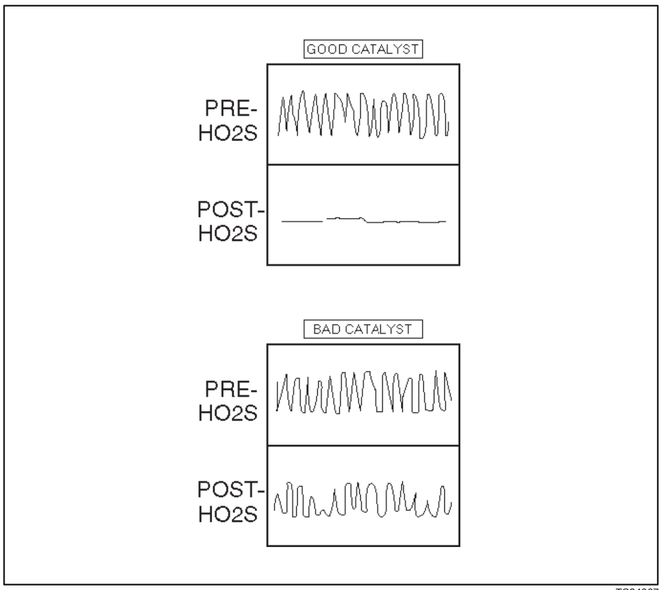
060RY00030

Catalyst Monitor Heated Oxygen Sensors

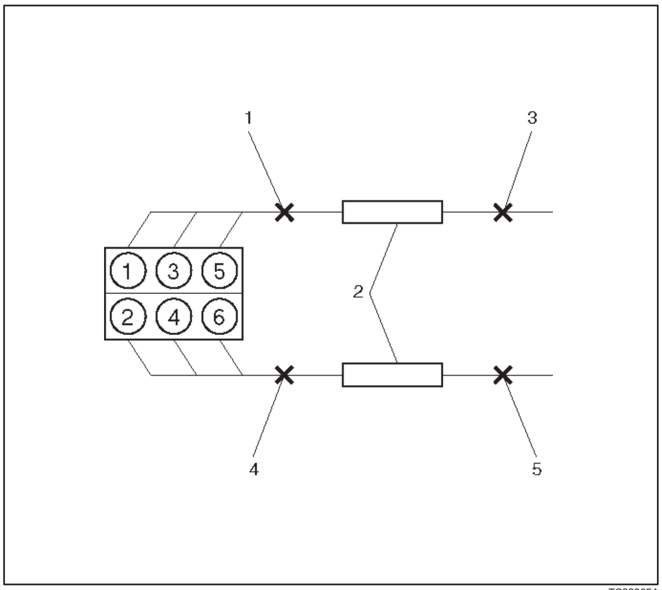
Three-way catalytic converters are used to control emissions of hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx). The catalyst within the converters promotes a chemical reaction. This reaction oxidizes the HC and CO present in the exhaust gas and converts them into harmless water vapor and carbon dioxide. The catalyst also reduces NOx by converting it to nitrogen. The PCM can monitor this process using the Bank 1 HO2S 2 and the Bank 2 HO2S 2 heated oxygen sensors. The Bank 1 HO2S 1 and the Bank 2 HO2S 1 sensors produce an output signal which indicates the amount of oxygen present in the exhaust gas entering the three-way catalytic converter. The Bank 1 HO2S 2 and the Bank 2 HO2S 2 sensors produce an output signal which indicates the oxygen storage capacity of the catalyst. This indicates the catalyst's ability to efficiently convert exhaust gases. If the catalyst is operating efficiently, the Bank 1 HO2S 1 and the Bank 2 HO2S 1 signals will be more active than the signals produced by the Bank 1 HO2S 2 and the Bank 2 HO2S 2 sensors.

The catalyst monitor sensors operate the same as the fuel control sensors. The Bank 1 HO2S 2 and the Bank 2 HO2S 2 sensors' main function is catalyst monitoring, but they also have a limited role in fuel control. If a sensor output indicates a voltage either above or below the 450 mV bias voltage for an extended period of time, the PCM will make a slight adjustment to fuel trim to ensure that fuel delivery is correct for catalyst monitoring.

A problem with the Bank 1 HO2S 2 signal circuit will set DTC P0137, P0138, or P0140, depending on the specific condition. A problem with the Bank 2 HO2S 2 signal circuit will set DTC P0157, P0158, or P0160, depending on the specific condition. A fault in the heated oxygen sensor heater element or its ignition feed or ground will result in lower sensor response. This may cause incorrect catalyst monitor diagnostic results.



TS24067



TS23365A

Legend

(1) Bank 1 Sensor 1 (Fuel Control)
(2) Catalytic Converter
(3) Bank 1 Sensor 2 (Catalyst Monitor)
(4) Bank 2 Sensor 1 (Fuel Control)
(5) Bank 2 Sensor 2 (Catalyst Monitor)

Intake Air Temperature (IAT) Sensor

The intake air temperature (IAT) sensor is a thermistor which changes its resistance based on the temperature of air entering the engine. Low temperature produces a high resistance of 100,000 ohms at –40°C (–40°F). High temperature causes low resistance of 70 ohms at 130°C (266°F) . The PCM supplies a 5-volt signal to the sensor through a resistor in the PCM and monitors the signal voltage. The voltage will be high when the incoming air is cold. The voltage will be low when the incoming air is hot. By measuring the voltage, the PCM calculates the incoming air temperature. The IAT sensor signal is used to adjust spark timing according to the incoming air density.

The Tech 2 displays the temperature of the air entering the engine. The temperature should read close to the ambient air temperature when the engine is cold and rise as underhood temperature increases. If the engine has not been run for several hours (overnight), the IAT sensor temperature and engine coolant temperature should read close to each other. A fault in the IAT sensor circuit will set DTC P0112 or DTC P0113.

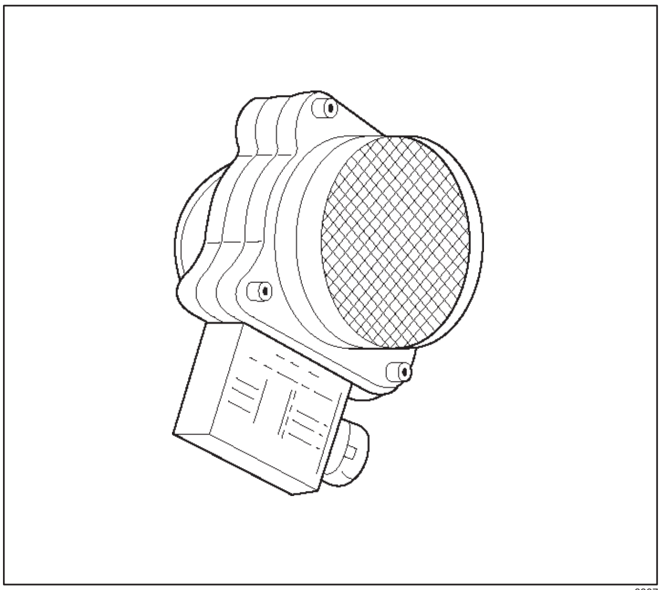
Linear Exhaust Gas Recirculation (EGR) Control

The PCM monitors the exhaust gas recirculation (EGR) actual position and adjusts the pintle position accordingly. The PCM uses information from the following sensors to control the pintle position:

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Mass air flow (MAF) sensor.

Mass Air Flow (MAF) Sensor

The mass air flow (MAF) sensor measures the difference between the volume and the quantity of air that enters the engine. “Volume” means the size of the space to be filled. “Quantity” means the number of air molecules that will fit into the space. This information is important to the PCM because heavier, denser air will hold more fuel than lighter, thinner air. The PCM adjusts the air/fuel ratio as needed depending on the MAF value. The Tech 2 reads the MAF value and displays it in terms of grams per second (gm/s). At idle, the Tech 2 should read between 4-7 gm/s on a fully warmed up engine. Values should change quickly on acceleration. Values should remain stable at any given RPM. A failure in the MAF sensor or circuit will set DTC P0101, DTC P0102, or DTC P0103.



0007

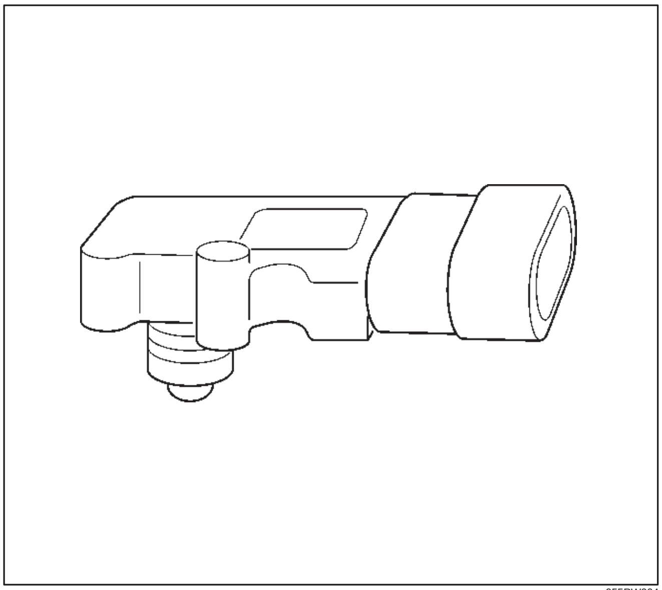
Manifold Absolute Pressure (MAP) Sensor

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the PCM varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine the following:

- Manifold pressure changes while the linear EGR flow test diagnostic is being run. Refer to *DTC P0401*.
- Engine vacuum level for other diagnostics.
- Barometric pressure (BARO).

If the PCM detects a voltage that is lower than the possible range of the MAP sensor, DTC P0107 will be set. A signal voltage higher than the possible range of the sensor will set DTC P0108. An intermittent low or high voltage will set DTC P1107, respectively. The PCM can detect a shifted MAP sensor. The PCM compares the MAP sensor signal to a calculated MAP based on throttle position and various engine load factors. If the PCM detects a MAP signal that varies excessively above or below the calculated value, DTC P0106 will set.



055RW004

Powertrain Control Module (PCM)

The powertrain control module (PCM) is located in the passenger compartment below the center console. The PCM controls the following:

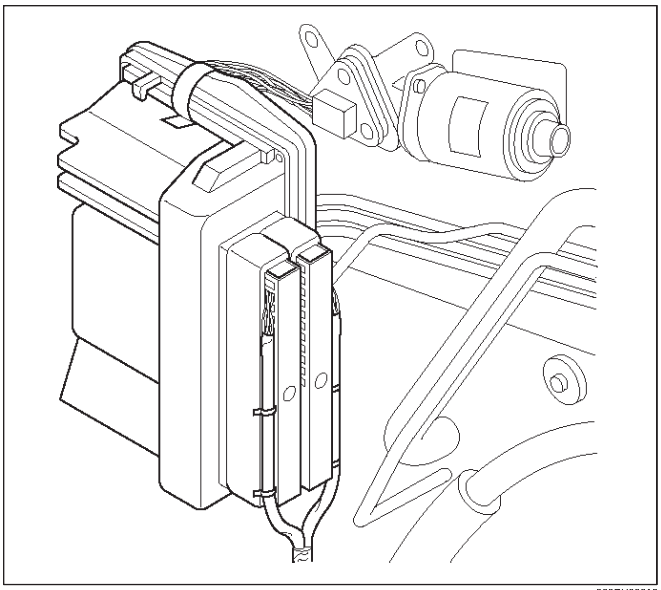
- Fuel metering system.
- Transmission shifting (automatic transmission only).
- Ignition timing.
- On-board diagnostics for powertrain functions.

The PCM constantly observes the information from various sensors. The PCM controls the systems that affect vehicle performance. The PCM performs the diagnostic function of the system. It can recognize operational problems, alert the driver through the MIL (Check Engine lamp), and store diagnostic trouble codes (DTCs). DTCs identify the problem areas to aid the technician in making repairs.

PCM Function

The PCM supplies either 5 or 12 volts to power various sensors or switches. The power is supplied through resistances in the PCM which are so high in value that a test light will not light when connected to the circuit. In some cases, even an ordinary shop voltmeter will not give an accurate reading because its resistance is too low. Therefore, a digital voltmeter with at least 10 megohms input impedance is required to ensure accurate voltage readings. Tool J 39200 meets this requirement. The PCM controls output circuits such as the injectors, fan relays, etc., by controlling the ground or the power feed circuit through transistors or through either of the following two devices:

- Output Driver Module (ODM)
- Quad Driver Module (QDM)



060RY00019

PCM Components

The PCM is designed to maintain exhaust emission levels to government mandated standards while providing excellent driveability and fuel efficiency. The PCM monitors numerous engine and vehicle functions via electronic sensors such as the throttle position (TP) sensor, heated oxygen sensor (HO2S), and vehicle speed sensor (VSS). The PCM also controls certain engine operations through the following:

- Fuel injector control
- Ignition control module
- ION sensing module
- Automatic transmission shift functions
- Cruise control
- Evaporative emission (EVAP) purge
- A/C clutch control

PCM Voltage Description

The PCM supplies a buffered voltage to various switches and sensors. It can do this because resistance in the PCM is so high in value that a test light may not illuminate when connected to the circuit. An ordinary shop voltmeter may not give an accurate reading because the voltmeter input impedance is too low. Use a 10-megohm input impedance digital voltmeter (such as J 39200) to assure accurate voltage readings.

The input/output devices in the PCM include analog-to-digital converters, signal buffers, counters, and special drivers. The PCM controls most components with electronic switches which complete a ground circuit when turned "ON." These switches are arranged in groups of 4 and 7, called either a surface-mounted quad driver module (QDM), which can independently control up to 4 output terminals, or QDMs which can independently control up to 7 outputs. Not all outputs are always used.

PCM Input/Outputs

Inputs – Operating Conditions Read

- Air Conditioning "ON" or "OFF"
- Engine Coolant Temperature
- Crankshaft Position
- Exhaust Oxygen Content
- Electronic Ignition
- Manifold Absolute Pressure
- Battery Voltage
- Throttle Position
- Vehicle Speed
- Fuel Pump Voltage
- Power Steering Pressure
- Intake Air Temperature
- Mass Air Flow
- Engine Knock
- Camshaft Position

Outputs – Systems Controlled

- EVAP Canister Purge
- Exhaust Gas Recirculation (EGR)
- Ignition Control
- Fuel Control
- ION Sensing Module
- Electric Fuel Pump
- Air Conditioning
- Diagnostics
  - Malfunction Indicator Lamp
  - Data Link Connector (DLC)
  - Data Output
- Transmission Control Module

PCM Service Precautions

The PCM is designed to withstand normal current draws associated with vehicle operation. Avoid overloading any circuit. When testing for opens and shorts, do not ground or apply voltage to any of the PCM's circuits unless instructed to do so. These circuits should only be tested using digital voltmeter J 39200. The PCM should remain connected to the PCM or to a recommended breakout box.

Reprogramming The PCM

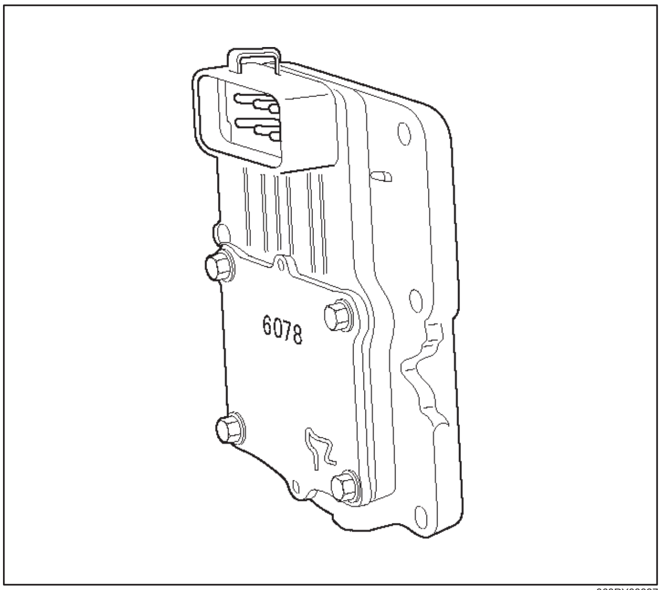
Reprogramming of the PCM is done without removing it from the vehicle . This provides a flexible and cost-effective method of making changes in software calibrations.

Refer to the latest Techline information on reprogramming or flashing procedures.

Throttle Position (TP) Sensor

The throttle position (TP) sensor is a potentiometer connected to the throttle shaft on the throttle body. The PCM monitors the voltage on the signal line and calculates throttle position. As the throttle valve angle is changed (accelerator pedal moved), the TP sensor signal also changes. At a closed throttle position, the output of the TP sensor is low. As the throttle valve opens, the output increases so that at wide open throttle (WOT), the output voltage should be above 4 volts.

The PCM calculates fuel delivery based on throttle valve angle (driver demand). A broken or loose TP sensor may cause intermittent bursts of fuel from an injector and unstable idle because the PCM thinks the throttle is moving.



060RY00027

Transmission Fluid Temperature (TFT) Sensor

The transmission fluid temperature sensor is a thermistor which changes its resistance based on the temperature of the transmission fluid. For a complete description of the TFT sensor, refer to *4L30-E Automatic Transmission Diagnosis* section.

A failure in the TFT sensor or associated wiring will cause DTC P0712 or DTC P0713 to set. In this case, engine coolant temperature will be substituted for the TFT sensor value and the transmission will operate normally.

Transmission Range Switch

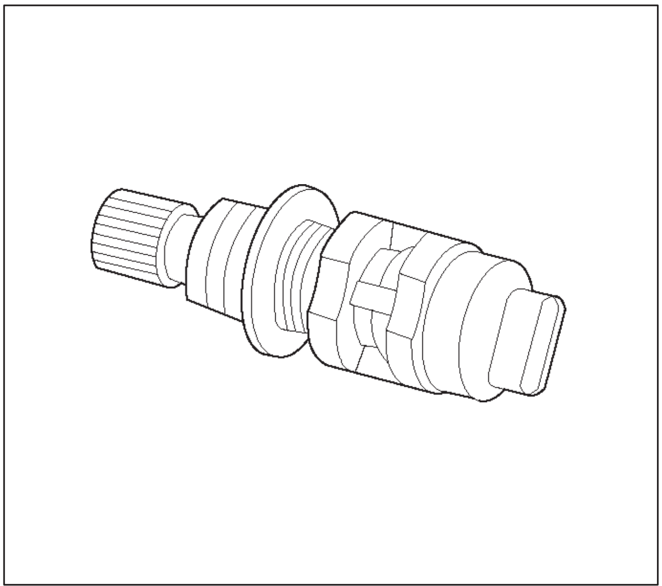
IMPORTANT: The vehicle should not be driven with the transmission range switch disconnected; idle quality will be affected.

The four inputs from the transmission range switch indicate to the PCM which position is selected by the transmission selector lever. This information is used for ignition timing, EVAP canister purge, EGR operation.

For more information on the transmission on the transmission range switch, refer to *4L30-E Automatic Transmission* section.

Vehicle Speed Sensor (VSS)

The PCM determines the speed of the vehicle by converting a plusing voltage signal from the vehicle speed sensor (VSS) into miles per hour. The PCM uses this signal to operate the cruise control, speedometer, and the TCC and shift solenoids in the transmission. For more information on the TCC and shift solenoids, refer to *4L30-E Automatic Transmission* section.



0008

Use of Circuit Testing Tools

Do not use a test light to diagnose the powertrain electrical systems unless specifically instructed by the diagnostic procedures. Use Connector Test Adapter Kit J 35616 whenever diagnostic procedures call for probing connectors.

Aftermarket Electrical and Vacuum Equipment

Aftermarket (add-on) electrical and vacuum equipment is defined as any equipment which connects to the vehicle's electrical or vacuum systems that is installed on a vehicle after it leaves the factory. No allowances have been made in the vehicle design for this type of equipment.

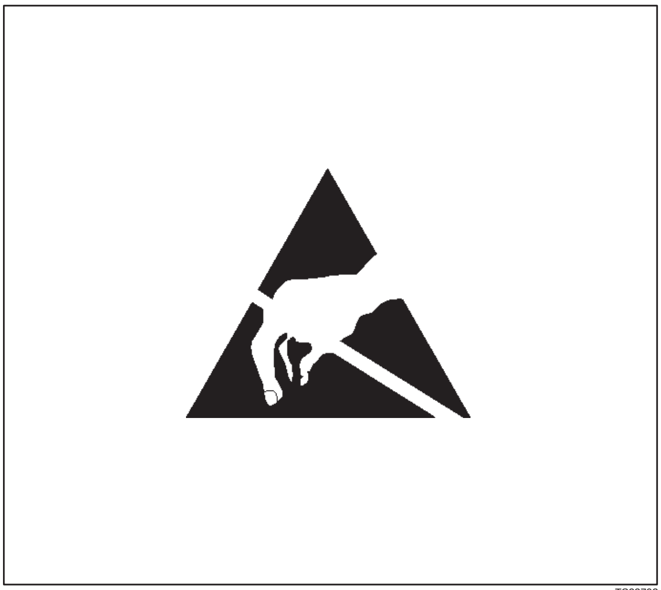
NOTE: No add-on vacuum equipment should be added to this vehicle.

NOTE: Add-on electrical equipment must only be connected to the vehicle's electrical system at the battery (power and ground).

Add-on electrical equipment, even when installed to these guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system such as portable telephones and radios. Therefore, the first step in diagnosing any powertrain problem is to eliminate all aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, it may be diagnosed in the normal manner.

Electrostatic Discharge Damage

Electronic components used in the PCM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4000 volts for a person to feel even the zap of a static discharge.



TS23793

There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

- An example of charging by friction is a person sliding across a vehicle seat.
- Charge by induction occurs when a person with well insulated shoes stands near a highly charged object and momentary touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore it is important to use care when handling and testing electronic components.

NOTE: To prevent possible electrostatic discharge damage, follow these guidelines:

- Do not touch the PCM connector pins or soldered components on the PCM circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.

Upshift Lamp

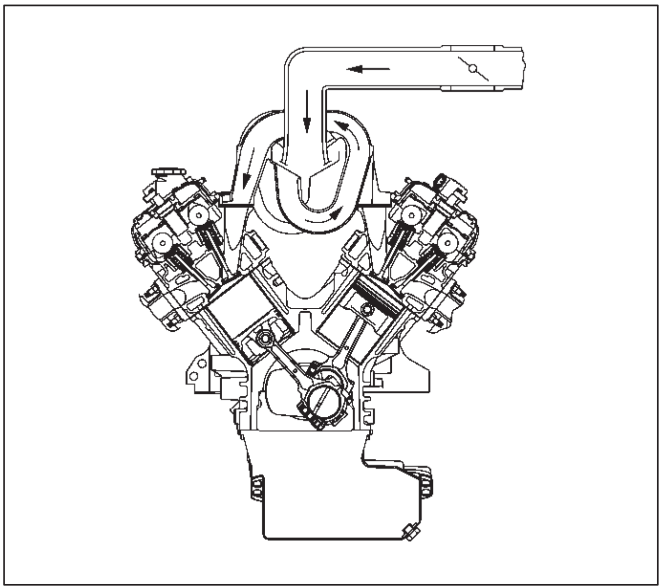
Refer to *Manual Transmission* section.

General Description (Air Induction)

Air Induction System

The air induction system filters contaminants from the outside air, and directs the progress of the air as it is drawn into the engine. A remote-mounted air cleaner prevents dirt and debris in the air from entering the engine. The air duct assembly routes filtered air to the throttle body. Air enters the engine by to following steps:

1. Through the throttle body.
2. Into the common chamber.
3. Through the cylinder head intake ports.
4. Into the cylinders.



055RV010

General Description (Fuel Metering)

Acceleration Mode

The PCM provides extra fuel when it detects a rapid increase in the throttle position and the air flow.

Battery Voltage Correction Mode

When battery voltage is low, the PCM will compensate for the weak spark by increasing the following:

- The amount of fuel delivered.
- The idle RPM.
- Ignition dwell time.

CMP Signal

The PCM uses this signal to determine the position of the number 1 piston during its power stroke, allowing the PCM to calculate true sequential multiport fuel injection (SFI). Loss of this signal will set a DTC P0341. If the CMP signal is lost while the engine is running, the fuel injection system will shift to a calculated sequential fuel injection based on the last fuel injection pulse, and the engine will continue to run. The engine can be restarted and will run in the calculated sequential mode as long as the fault is present, with a 1-in-6 chance of being correct.

Clear Flood Mode

Clear a flooded engine by pushing the accelerator pedal down all the way. The PCM then de-energizes the fuel injectors. The PCM holds the fuel injectors de-energized as long as the throttle remains above 80% and the engine speed is below 800 RPM. If the throttle position becomes less than 80%, the PCM again begins to pulse the injectors "ON" and "OFF," allowing fuel into the cylinders.

Deceleration Mode

The PCM reduces the amount of fuel injected when it detects a decrease in the throttle position and the air flow. When deceleration is very fast, the PCM may cut off fuel completely for short periods.

Engine Speed/Vehicle Speed/Fuel Disable Mode

The PCM monitors engine speed. It turns off the fuel injectors when the engine speed increase above 6400 RPM. The fuel injectors are turned back on when engine speed decreases below 6150 RPM.

Fuel Cutoff Mode

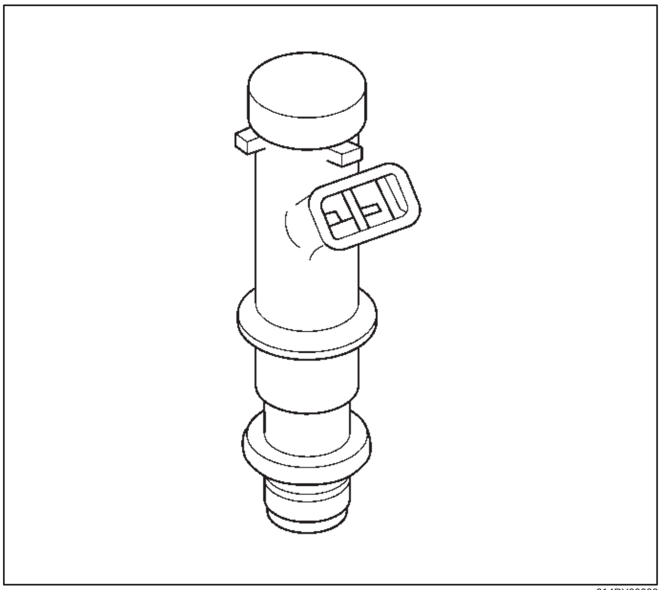
No fuel is delivered by the fuel injectors when the ignition is "OFF." This prevents engine run-on. In addition, the PCM suspends fuel delivery if no reference pulses are detected (engine not running) to prevent engine flooding.

Fuel Injector

The sequential multiport fuel injection (SFI) fuel injector is a solenoid-operated device controlled by the PCM. The PCM energizes the solenoid, which opens a valve to allow fuel delivery.

The fuel is injected under pressure in a conical spray pattern at the opening of the intake valve. Excess fuel not used by the injectors passes through the fuel pressure regulator before being returned to the fuel tank.

A fuel injector which is stuck partly open will cause a loss of fuel pressure after engine shut down, causing long crank times.



014RY00009

Fuel Metering System Components

The fuel metering system is made up of the following parts:

- The fuel injectors.
- The throttle body.
- The fuel rail.

- The fuel pressure regulator.
- The PCM.
- The crankshaft position (CKP) sensor.
- The camshaft position (CMP) sensor.
- The ION sensing module.
- The fuel pump.
- The fuel pump relay.

Basic System Operation

The fuel metering system starts with the fuel in the fuel tank. An electric fuel pump, located in the fuel tank, pumps fuel to the fuel rail through an in-line fuel filter. The pump is designed to provide fuel at a pressure above the pressure needed by the injectors. A fuel pressure regulator in the fuel rail keeps fuel available to the fuel injectors at a constant pressure. A return line delivers unused fuel back to the fuel tank. Refer to *Section 6C* for further information on the fuel tank, line filter, and fuel pipes.

Fuel Metering System Purpose

The basic function of the air/fuel metering system is to control the air/fuel delivery to the engine. Fuel is delivered to the engine by individual fuel injectors mounted in the intake manifold near each intake valve.

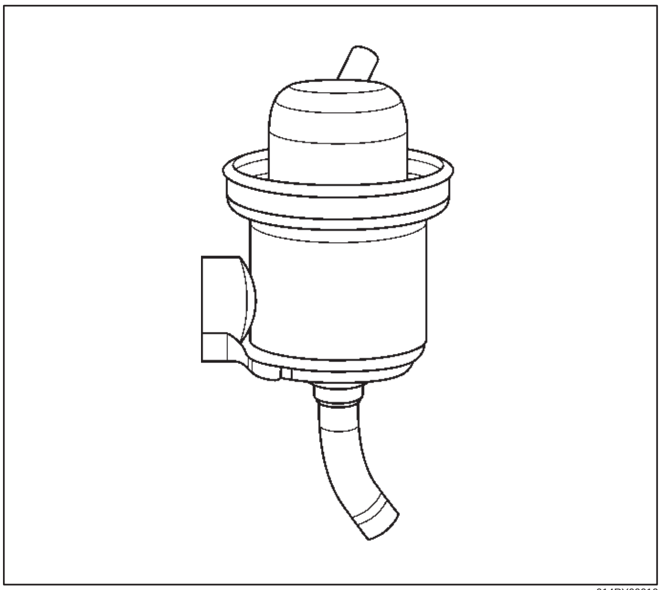
The main control sensor is the heated oxygen sensor (HO2S) located in the exhaust system. The HO2S tells the PCM how much oxygen is in the exhaust gas. The PCM changes the air/fuel ratio to the engine by controlling the amount of time that fuel injector is "ON." The best mixture to minimize exhaust emissions is 14.7 parts of air to 1 part of gasoline by weight, which allows the catalytic converter to operate most efficiently. Because of the constant measuring and adjusting of the air/fuel ratio, the fuel injection system is called a "closed loop" system.

The PCM monitors signals from several sensors in order to determine the fuel needs of the engine. Fuel is delivered under one of several conditions called "modes." All modes are controlled by the PCM.

Fuel Pressure Regulator

The fuel pressure regulator is a diaphragm-operated relief valve mounted on the fuel rail with fuel pump pressure on one side and manifold pressure on the other side. The fuel pressure regulator maintains the fuel pressure available to the injector at three times barometric pressure adjusted for engine load. It may be serviced separate.

If the pressure is too low, poor performance and a DTC P0131, DTC P0151,DTC P0171 or DTC P1171 will be the result. If the pressure is too high, excessive odor and/or a DTC P0132, DTC P0152,DTC P0172 will be the result. Refer to *Fuel System Diagnosis* for information on diagnosing fuel pressure conditions.



014RY00010

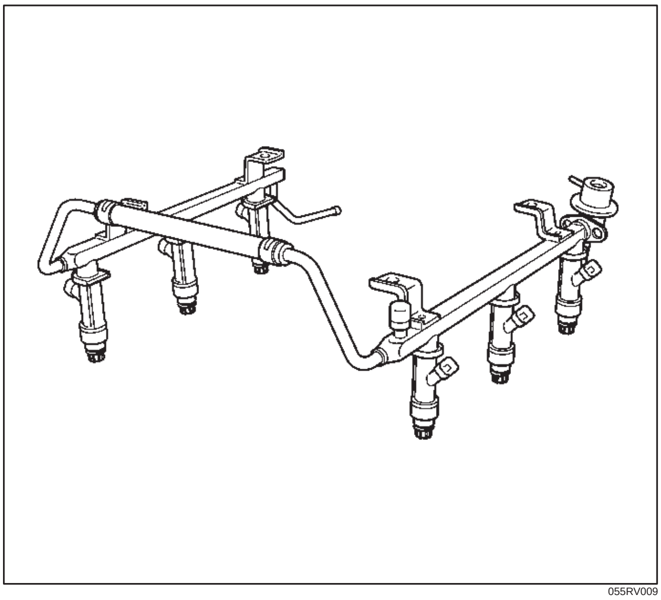
Fuel Pump Electrical Circuit

When the key is first turned "ON," the PCM energizes the fuel pump relay for two seconds to build up the fuel pressure quickly. If the engine is not started within two seconds, the PCM shuts the fuel pump off and waits until the engine is cranked. When the engine is cranked and the 58 X crankshaft position signal has been detected by the PCM, the PCM supplies 12 volts to the fuel pump relay to energize the electric in-tank fuel pump.

An inoperative fuel pump will cause a "no-start" condition. A fuel pump which does not provide enough pressure will result in poor performance.

Fuel Rail

The fuel rail is mounted to the top of the engine and distributes fuel to the individual injectors. Fuel is delivered to the fuel inlet tube of the fuel rail by the fuel lines. The fuel goes through the fuel rail to the fuel pressure regulator. The fuel pressure regulator maintains a constant fuel pressure at the injectors. Remaining fuel is then returned to the fuel tank.



055RV009

Run Mode

The run mode has the following two conditions:

- Open loop
- Closed loop

When the engine is first started the system is in “open loop” operation. In “open loop,” the PCM ignores the signal from the heated oxygen sensor (HO2S). It calculates the air/fuel ratio based on inputs from the TP, ECT, and MAF sensors.

The system remains in “open loop” until the following conditions are met:

- The HO2S has a varying voltage output showing that it is hot enough to operate properly (this depends on temperature).
- The ECT has reached a specified temperature.
- A specific amount of time has elapsed since starting the engine.
- Engine speed has been greater than a specified RPM since start-up.

The specific values for the above conditions vary with different engines and are stored in the programmable read only memory (PROM). When these conditions are met, the system enters “closed loop” operation. In “closed loop,” the PCM calculates the air/fuel ratio (injector on-time) based on the signal from the HO2S. This allows the air/fuel ratio to stay very close to 14.7:1.

Starting Mode

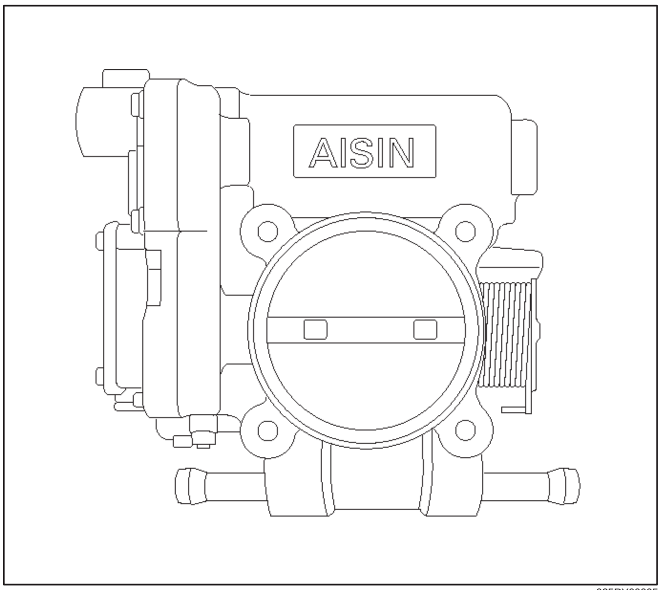
When the ignition is first turned “ON,” the PCM energizes the fuel pump relay for two seconds to allow the fuel pump to build up pressure. The PCM then checks the engine coolant temperature (ECT) sensor and the throttle position (TP) sensor to determine the proper air/fuel ratio for starting.

The PCM controls the amount of fuel delivered in the starting mode by adjusting how long the fuel injectors are energized by pulsing the injectors for very short times.

Throttle Body Unit

The throttle body has a throttle plate to control the amount of air delivered to the engine. The TP sensor are also mounted on the throttle body. Vacuum ports located behind the throttle plate provide the vacuum signals needed by various components.

Engine coolant is directed through a coolant cavity in the throttle body to warm the throttle valve and to prevent icing.

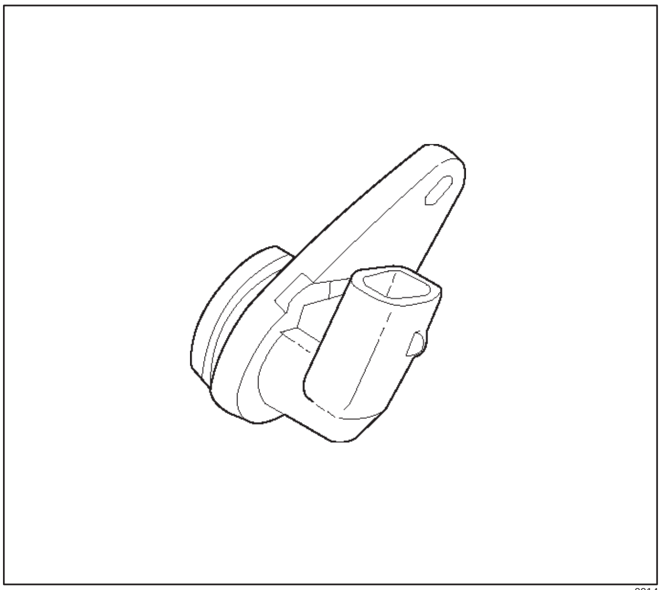


025RY00005

General Description (Electronic Ignition System)

Camshaft Position (CMP) Sensor

CMP is located Left Rear cylinder head. When the Hall-effect switch is activated, it grounds the signal line to the PCM, pulling the camshaft position sensor signal circuit’s applied voltage low. This is a CMP signal. The CMP signals is created as piston #1 is approximately 25° after top dead counter on the power stroke. If the correct CMP signal is not received by the PCM, DTC P0341 will be set.



0014

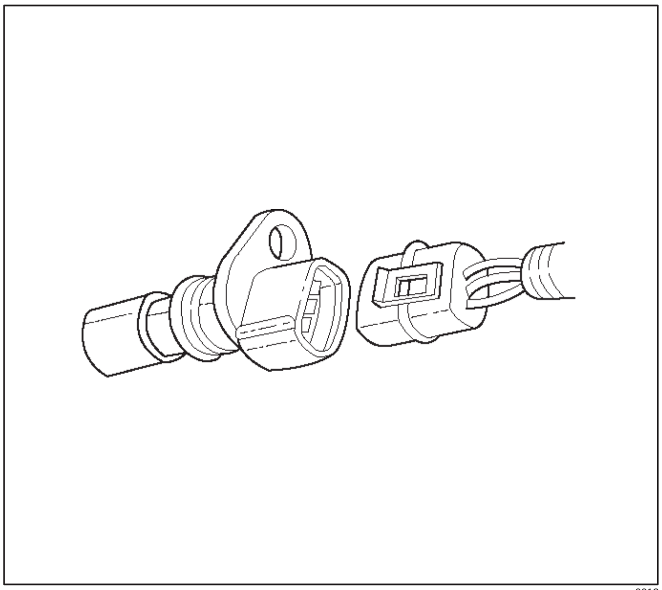
Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor provides a signal used by the powertrain control module (PCM) to calculate the ignition sequence. The sensor initiates the 58X reference pulses which the PCM uses to calculate RPM and crankshaft position. Refer to *Electronic Ignition System* section for additional information.

Electronic Ignition

The electronic ignition system controls fuel combustion by providing a spark to ignite the compressed air/fuel mixture at the correct time. To provide optimum engine performance, fuel economy, and control of exhaust emissions, the PCM controls the spark advance of the ignition system. Electronic ignition has the following advantages over a mechanical distributor system:

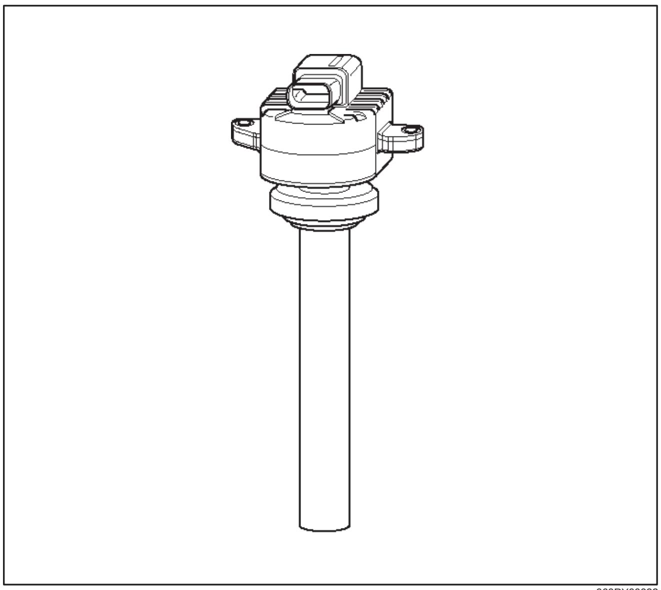
- No moving parts.
- Less maintenance.
- Remote mounting capability.
- No mechanical load on the engine.
- More coil cooldown time between firing events.
- Elimination of mechanical timing adjustments.
- Increased available ignition coil saturation time.



0013

Ignition Coils

A separate coil-at-plug module is located at each spark plug. The coil-at-plug module is attached to the engine with two screws. It is installed directly to the spark plug by an electrical contact inside a rubber boot. A three-way connector provides 12-volt primary supply from the 15-amp ignition fuse, a ground-switching trigger line from the PCM, and a ground.

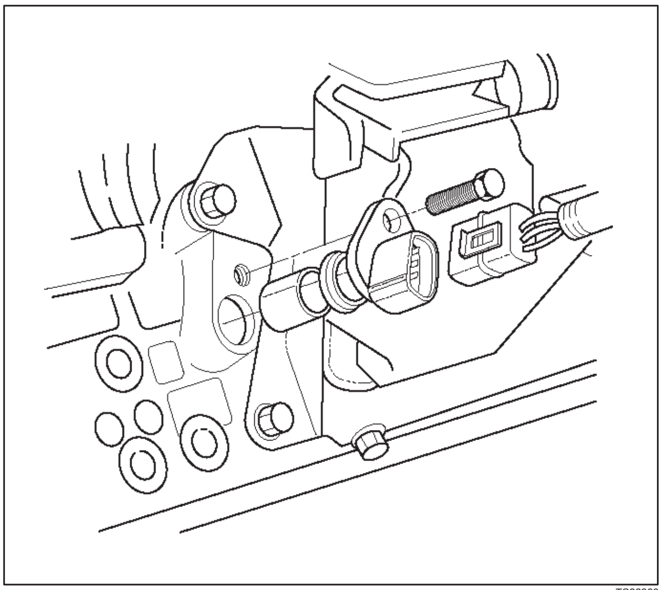


060RY00022

Ignition Control

The ignition control (IC) spark timing is the PCM's method of controlling the spark advance and the ignition dwell. The IC spark advance and the ignition dwell are calculated by the PCM using the following inputs:

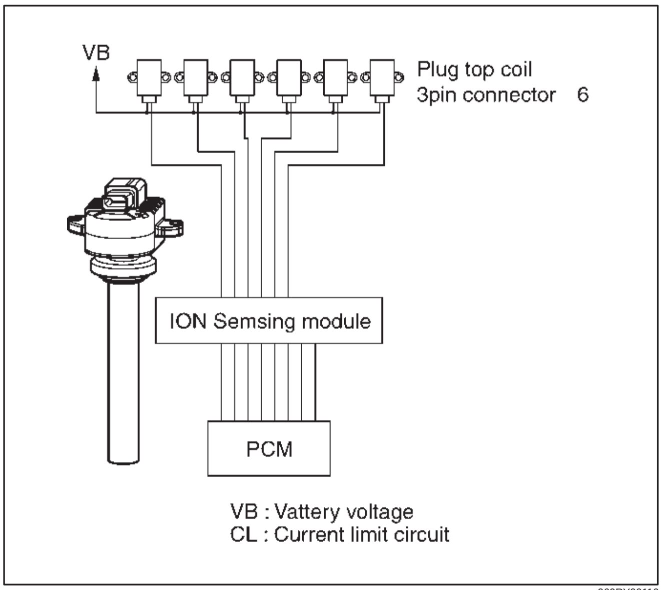
- Engine speed.
- Crankshaft position (58X reference).
- Camshaft position (CMP) sensor.
- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- ION sensing module.
- Park/Neutral position (PRNDL input).
- Vehicle speed (vehicle speed sensor).
- PCM and ignition system supply voltage.
- The crankshaft positron (CKP) sensor sends the PCM a 58X signal related to the exact position of the crankshaft.



TS22909

- The camshaft position (CMP) sensor sends a signal related to the position of the camshaft.

Based on these sensor signals and engine load information, the PCM sends 5V to each ignition coil.



060RY00116

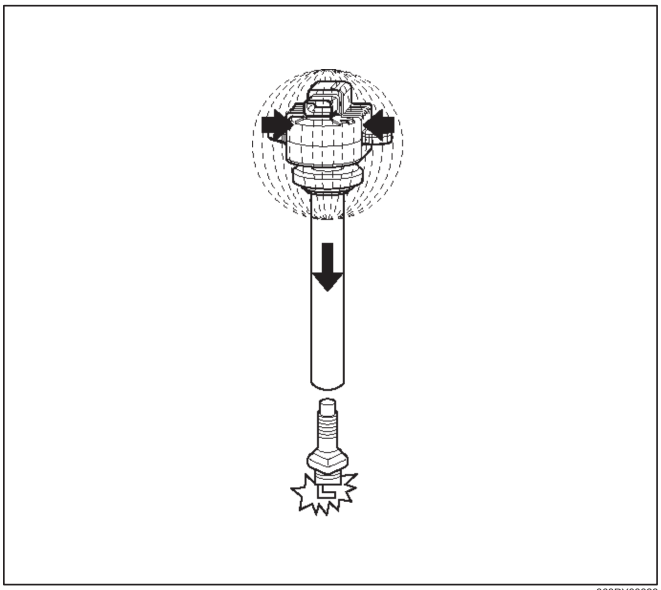
This module has the function to energize and de-energize the primary ignition coil in response to signals from the PCM. The Throttle PCM controls ignition timing and dwell time.

Continuity and out-or-range value check:

This diagnosis detects open circuit or short-circuiting in the Electronic Spark Timing (EST) line by monitoring EST signals. A failure determination is made when the signal voltage remains higher or lower than the threshold for corresponding fault code beyond a predetermined time period.

Diagnosis enabling conditions are as follows:

- RPM is higher than the specified threshold.
- EST line is enabled.



060RY00029

Ignition Control PCM Output

The PCM provides a zero volt (actually about 100 mV to 200 mV) or a 5-volt output signal to the ignition control (IC) module. Each spark plug has its own primary and secondary ignition coil assembly (”coil-at-plug”) located at the spark plug itself. When the ignition coil receives the 5-volt signal from the PCM, it provides a ground path for the B+ supply to the primary side of the coil-at -plug module. When the PCM shuts off the 5-volt signal to the ION sensing module, the ground path for the primary coil is broken. The magnetic field collapses and induces a high voltage secondary impulse which fires the spark plug and ignites the air/fuel mixture.

The circuit between the PCM and the ignition coil is monitored for open circuits, shorts to voltage, and shorts to ground. If the PCM detects one of these events, it will set one of the following DTCs:

- P0351: Ignition coil Fault on Cylinder #1
- P0352: Ignition coil Fault on Cylinder #2
- P0353: Ignition coil Fault on Cylinder #3
- P0354: Ignition coil Fault on Cylinder #4
- P0355: Ignition coil Fault on Cylinder #5
- P0356: Ignition coil Fault on Cylinder #6

Powertrain Control Module (PCM)

The PCM is responsible for maintaining proper spark and fuel injection timing for all driving conditions. To provide optimum driveability and emissions, the PCM monitors the input signals from the following components in order to calculate spark timing:

- Engine coolant temperature (ECT) sensor.
- Intake air temperature (IAT) sensor.
- Mass air flow (MAF) sensor.
- PRNDL input from transmission range switch.
- Throttle position (TP) sensor.
- Vehicle speed sensor (VSS) .
- Crankshaft position (CKP) sensor.

Spark Plug

Although worn or dirty spark plugs may give satisfactory operation at idling speed, they frequency fail at higher engine speeds. Faulty spark plugs may cause poor fuel economy, power loss, loss of speed, hard starting and generally poor engine performance. Follow the scheduled maintenance service recommendations to ensure satisfactory spark plug performance. Refer to *Maintenance and Lubrication* section.

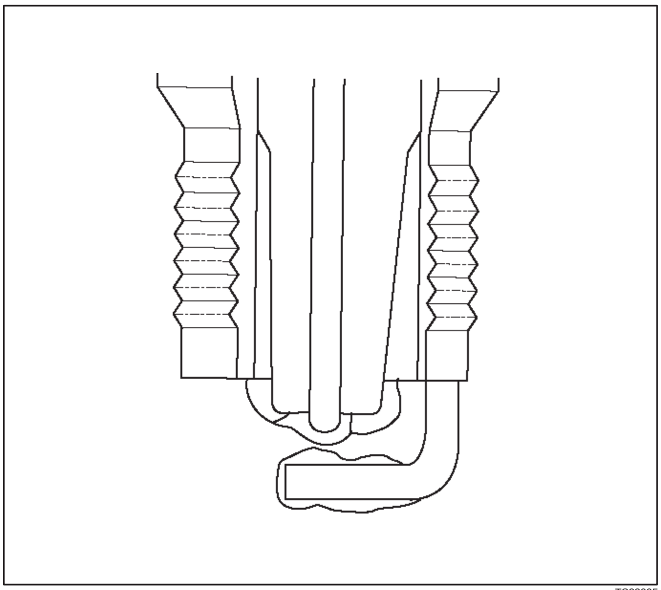
Normal spark plug operation will result in brown to grayish-tan deposits appearing on the insulator portion of the spark plug. A small amount of red-brown, yellow, and white powdery material may also be present on the insulator tip around the center electrode. These deposits are normal combustion by-products of fuels and lubricating oils with additives. Some electrode wear will also occur. Engines which are not running properly are often referred to as “misfiring.” This means the ignition spark is not igniting the air/fuel mixture at the proper time. While other ignition and fuel system causes must also be considered, possible causes include ignition system conditions which allow the spark voltage to reach ground in some other manner than by jumping across the air gap at the tip of the spark plug, leaving the air/fuel mixture unburned. Refer to *DTC P0300*. Misfiring may also occur when the tip of the spark plug becomes overheated and ignites the mixture before the spark jumps. This is referred to as “pre-ignition.”

Spark plugs may also misfire due to fouling, excessive gap, or a cracked or broken insulator. If misfiring occurs before the recommended replacement interval, locate and correct the cause.

Carbon fouling of the spark plug is indicated by dry, black carbon (soot) deposits on the portion of the spark plug in the cylinder. Excessive idling and slow speeds under light engine loads can keep the spark plug temperatures so low that these deposits are not burned off. Very rich fuel mixtures or poor ignition system output may also be the cause. Refer to DTC P0172.

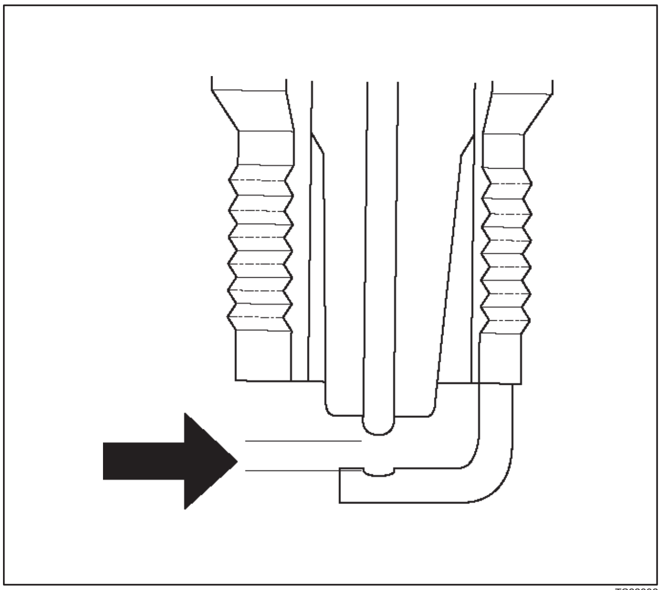
Oil fouling of the spark plug is indicated by wet oily deposits on the portion of the spark plug in the cylinder, usually with little electrode wear. This may be caused by oil during break-in of new or newly overhauled engines.

Deposit fouling of the spark plug occurs when the normal red-brown, yellow or white deposits of combustion by products become sufficient to cause misfiring. In some cases, these deposits may melt and form a shiny glaze on the insulator around the center electrode. If the fouling is found in only one or two cylinders, valve stem clearances or intake valve seals may be allowing excess lubricating oil to enter the cylinder, particularly if the deposits are heavier on the side of the spark plug facing the intake valve.



TS23995

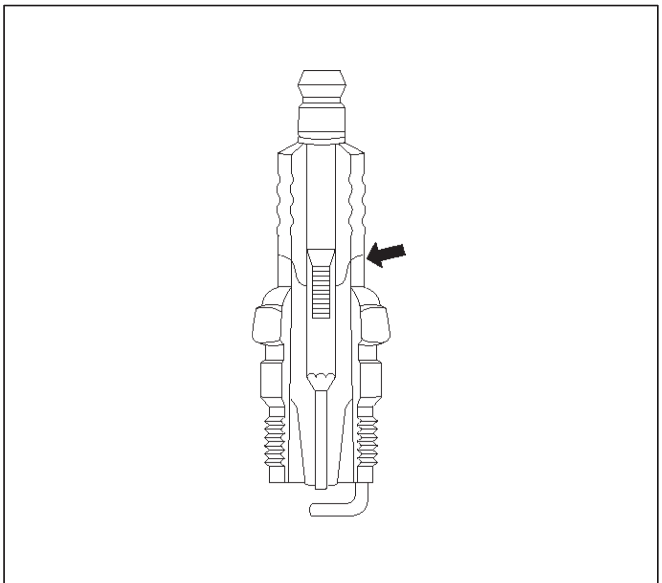
Excessive gap means that the air space between the center and the side electrodes at the bottom of the spark plug is too wide for consistent firing. This may be due to improper gap adjustment or to excessive wear of the electrode during use. A check of the gap size and comparison to the gap specified for the vehicle in *Maintenance and Lubrication* section will tell if the gap is too wide. A spark plug gap that is too small may cause an unstable idle condition. Excessive gap wear can be an indication of continuous operation at high speeds or with engine loads, causing the spark to run too hot. Another possible cause is an excessively lean fuel mixture.



TS23992

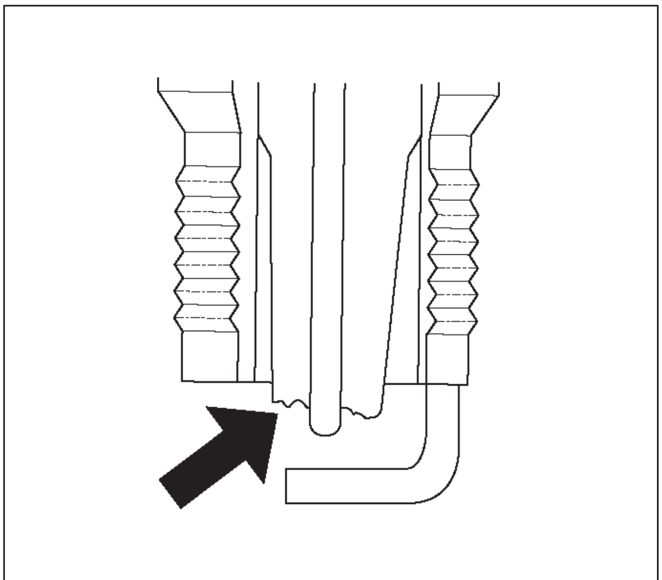
Low or high spark plug installation torque or improper seating can result in the spark plug running too hot and can cause excessive center electrode wear. The plug and the cylinder head seats must be in good contact for proper heat transfer and spark plug cooling. Dirty or damaged threads in the head or on the spark plug can keep it from seating even though the proper torque is applied. Once spark plugs are properly seated, tighten them to the torque shown in the Specifications Table. Low torque may result in poor contact of the seats due to a loose spark plug. Overtightening may cause the spark plug shell to be stretched and will result in poor contact between the seats. In extreme cases, exhaust blow-by and damage beyond simple gap wear may occur.

Cracked or broken insulators may be the result of improper installation, damage during spark plug re-gapping, or heat shock to the insulator material. Upper insulators can be broken when a poorly fitting tool is used during installation or removal, when the spark plug is hit from the outside, or is dropped on a hard surface. Cracks in the upper insulator may be inside the shell and not visible. Also, the breakage may not cause problems until oil or moisture penetrates the crack later.



TS23994

A broken or cracked lower insulator tip (around the center electrode) may result from damage during re-gapping or from “heat shock” (spark plug suddenly operating too hot).



TS23993

- Damage during re-gapping can happen if the gapping tool is pushed against the center electrode or the insulator around it, causing the insulator to crack. When re-gapping a spark plug, make the adjustment by bending only the ground side terminal, keeping the tool clear of other parts.
- ”Heat shock” breakage in the lower insulator tip generally occurs during several engine operating conditions (high speeds or heavy loading) and may be caused by over-advanced timing or low grade fuels. Heat shock refers to a rapid increase in the tip temperature that causes the insulator material to crack.

Spark plugs with less than the recommended amount of service can sometimes be cleaned and re-gapped , then returned to service. However, if there is any doubt about the serviceability of a spark plug, replace it. Spark plugs with cracked or broken insulators should always be replaced.

A/C Clutch Diagnosis

A/C Clutch Circuit Operation

A 12-volt signal is supplied to the A/C request input of the PCM when the A/C is selected through the A/C control switch.

The A/C compressor clutch relay is controlled through the PCM. This allows the PCM to modify the idle air control position prior to the A/C clutch engagement for better idle quality. If the engine operating conditions are within their specified calibrated acceptable ranges, the PCM will enable the A/C compressor relay. This is done by providing a ground path for the A/C relay coil within the PCM. When the A/C compressor relay is enabled, battery voltage is supplied to the compressor clutch coil. The PCM will enable the A/C compressor clutch whenever the engine is running and the A/C has been requested. The PCM will not enable the A/C compressor clutch if any of the following conditions are met:

- The throttle is greater than 90%.
- The engine speed is greater than 6315 RPM.
- The ECT is greater than 119°C (246°F).
- The IAT is less than 5°C (41°F).
- The throttle is more than 80% open.

A/C Clutch Circuit Purpose

The A/C compressor operation is controlled by the powertrain control module (PCM) for the following reasons:

- It improvises idle quality during compressor clutch engagement.
- It improvises wide open throttle (WOT) performance.
- It provides A/C compressor protection from operation with incorrect refrigerant pressures.

The A/C electrical system consists of the following components:

- The A/C control head.
- The A/C refrigerant pressure switches.
- The A/C compressor clutch.
- The A/C compressor clutch relay.
- The PCM.

A/C Request Signal

This signal tells the PCM when the A/C mode is selected at the A/C control head. The PCM uses this to adjust the idle speed before turning on the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the PCM.

Refer to *A/C Clutch Circuit Diagnosis* section for A/C wiring diagrams and diagnosis for A/C electrical system.

General Description (Evaporative (EVAP) Emission System)

EVAP Emission Control System Purpose

The basic evaporative emission (EVAP) control system used on all vehicles is the charcoal canister storage method. Gasoline vapors from the fuel tank flow into the canister through the inlet labeled “TANK.” These vapors are absorbed into the activated carbon (charcoal) storage device (canister) in order to hold the vapors when the vehicle is not operating. The canister is purged by PCM control when the engine coolant temperature is over 60˚C (140˚F), the IAT reading is over 10˚C (50˚F), and the engine has been running. Air is drawn into the canister through the air inlet grid. The air mixes with the vapor and the mixture is drawn into the intake manifold.

EVAP Emission Control System Operation

The EVAP canister purge is controlled by a solenoid valve that allows the manifold vacuum to purge the canister. The powertrain control module (PCM) supplies a ground to energize the solenoid valve (purge on). The EVAP purge solenoid control is pulse-width modulated (PWM) (turned on and off several times a second). The duty cycle (pulse width) is determined by engine operating conditions including load, throttle positron, coolant temperature and ambient temperature. The duty cycle is calculated by the PCM. The output is commanded when the appropriate conditions have been met. These conditions are:

- The engine is fully warmed up.
- The engine has been running for a specified time.
- The IAT reading is above 10˚C (50˚F).

A continuous purge condition with no purge commanded by the PCM will set a DTC P1441.

Poor idle, stalling and poor driveability can be caused by:

- A malfunctioning purge solenoid.
- A damaged canister.
- Hoses that are split, cracked, or not connected properly.

Enhanced Evaporative Emission Control System

The basic purpose of the Enhanced Evaporative Emissions control system is the same as other EVAP systems. A charcoal-filled canister captures and stores gasoline fumes. When the PCM determines that the time is right, it opens a purge valve which allows engine vacuum to draw the fumes into the intake manifold.

The difference between this and other systems is that the PCM monitors the vacuum and/or pressure in the system to determine if there is any leakage. If the PCM determines that the EVAP system is leaking or not functioning properly, it sets a Diagnostic Trouble Code (DTC) in the PCM memory.

The enhanced EVAP system is required to detect evaporative fuel system leaks as small as 0.040 in. (1.0 mm) between the fuel filler cap and purge solenoid. The system can test the evaporative system integrity by applying a vacuum signal (ported or manifold) to the fuel tank to create a small vacuum. The PCM then monitors the ability of the system to maintain the vacuum. If the vacuum remains for a specified period of time, there are no evaporative leaks and a PASS report is sent to the diagnostic executive. If there is a leak, the system either will not achieve a vacuum, or a vacuum cannot be maintained. Usually, a failure can only be detected after a cold start with a trip of sufficient length and driving conditions to run the needed tests. The enhanced EVAP system diagnostic will conduct up to eight specific sub-tests to detect fault conditions. If the diagnostic fails a sub-test, the PCM will store a Diagnostic Trouble Code (DTC) to indicate the type of detected.

(15) 5 Volt Reference "A" Circuit from PCM
(16) Sensor Ground Circuit from PCM
(17) Fuel Level Sensor
(18) Fuel Level Signal to PCM
(19) 5 Volt Return

Electrical Components

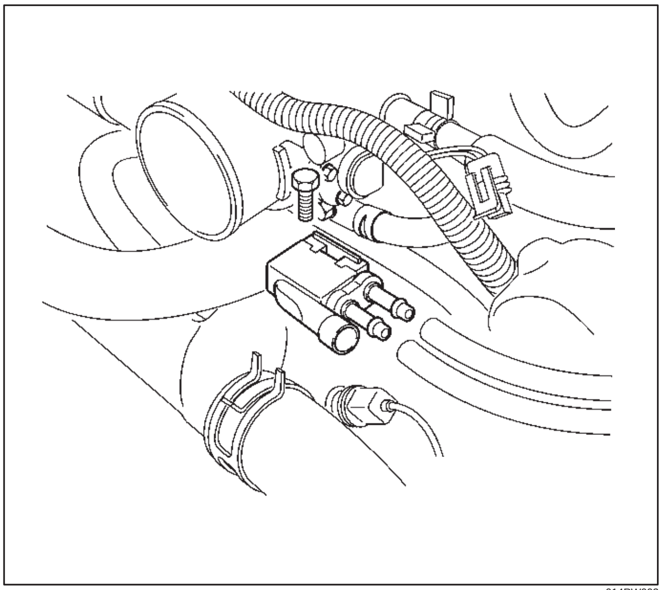
The electrical components that make up the enhanced EVAP system are:

- Fuel Tank Pressure Sensor. The fuel tank pressure sensor is a three-wire strain gauge sensor similar to a common MAP sensor. However, the fuel tank pressure sensor has very different electrical characteristics due to its pressure differential design. The sensor measures the difference between the air pressure (or vacuum) in the fuel tank and the outside air pressure.

The sensor mounts at the top of the fuel pump assembly. A three-wire electrical harness connects it to the PCM. The PCM supplies a five-volt reference voltage and a ground to the sensor. The sensor will return a voltage between 0.1 and 4.9 volts. When the air pressure in the fuel tank is equal to the outside air pressure, such as when the fuel cap is removed, the output voltage of the sensor will be 1.3 to 1.7 volts.

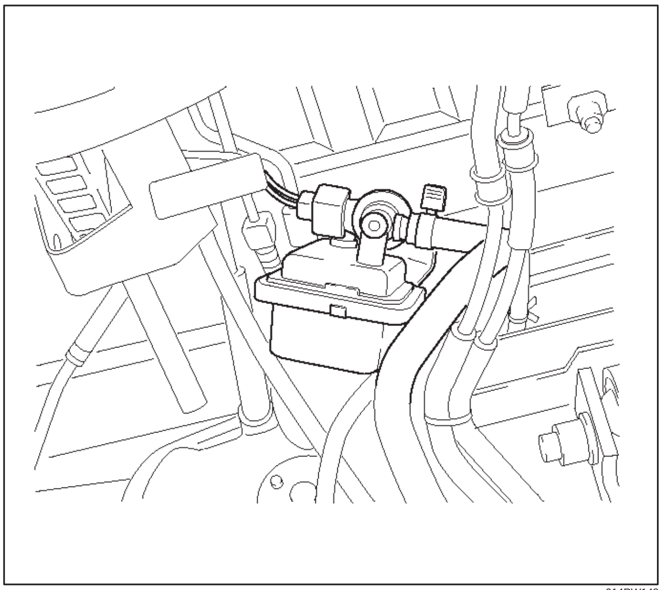
When the air pressure in the fuel tank is 4.5 in. H2O (1.25 kPa), the sensor output voltage will be 0.5 ± 0.2 V. When there is neither vacuum nor pressure in the fuel tank, the sensor voltage will be 1.5 V. At –14 in. H2O (–3.75 kPa), the sensor voltage will be 4.5 ± 0.2 V.

- EVAP Canister Purge Solenoid. Normally closed, the purge solenoid opens upon the PCM's signal to allow engine vacuum to purge gasoline fumes from the canister. Mounted on the water pipe to front of the engine assembly.



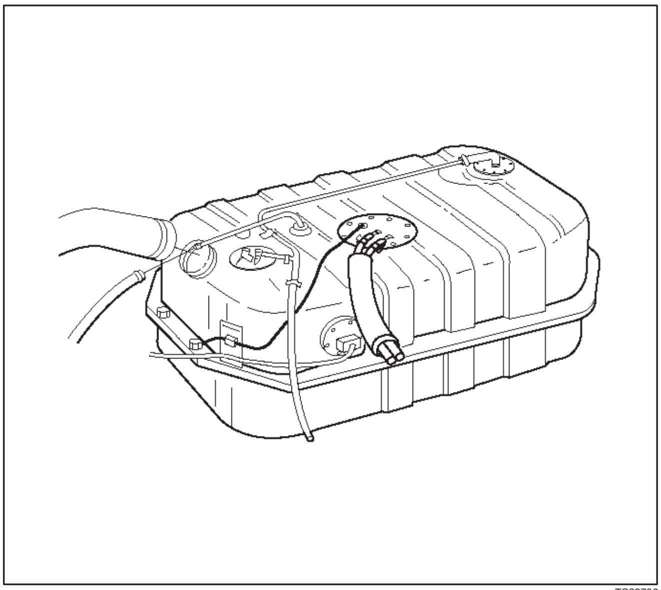
014RW093

- EVAP Canister Vent Solenoid. Located next to the canister, the vent solenoid opens to allow air into the EVAP system. Fresh air is necessary to completely remove gasoline fumes from the canister during purge. The EVAP vent solenoid closes to seal off the evaporative emissions system for leak testing.



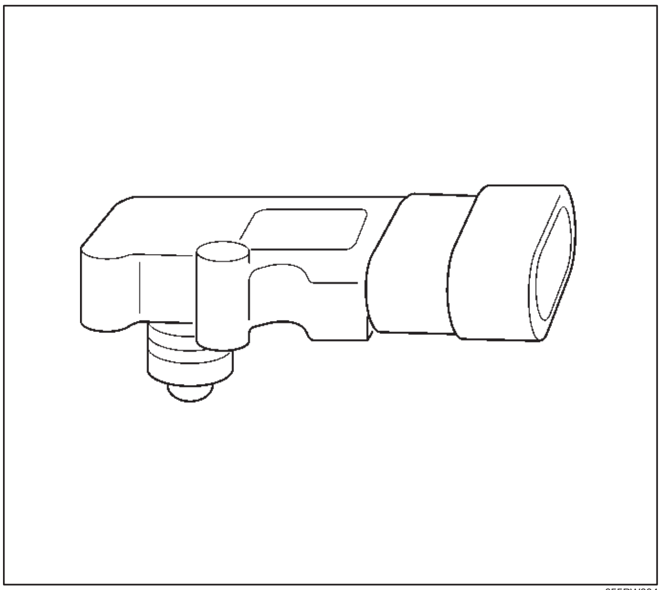
014RW148

- Fuel Level Sensor. The fuel level sensor is an important input to the PCM for the enhanced EVAP system diagnostic. The PCM needs fuel level information to know the volume of fuel in the tank. The fuel level affects the rate of change of air pressure in the EVAP system. Several of the enhanced EVAP system diagnostic sub-tests are dependent upon correct fuel level information. The diagnostic will not run when the tank is less than 15% or more than 85% full. Be sure to diagnose any Fuel Level Sensor DTCs first, as they can cause other DTCs to set.



TS23796

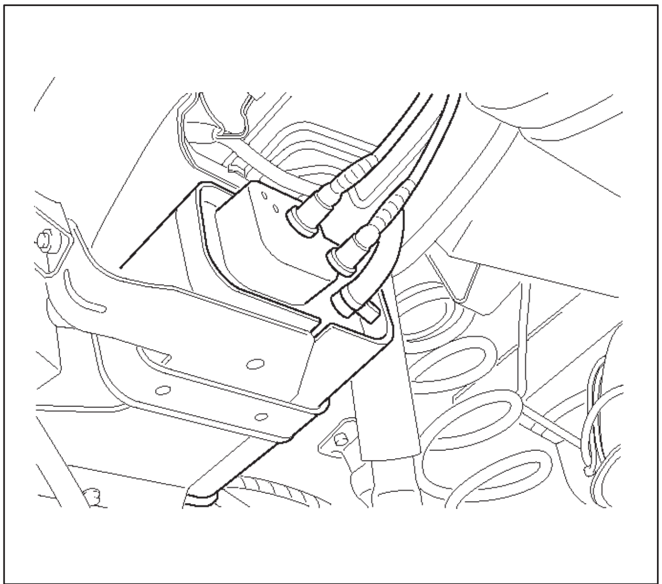
- Manifold Absolute Pressure (MAP) Sensor. The PCM compares the signals from the fuel tank pressure sensor and the MAP sensor to ensure that a relative vacuum is maintained the EVAP system.



055RW004

Non-Electrical Components

- Purge/Vacuum Hoses. Made of rubber compounds, these hoses route the gasoline fumes from their sources to the canister and from the canister to the intake air flow.
- EVAP Canister. Mounted on a bracket ahead of the fuel tank, the canister stores fuel vapors until the PCM determines that engine conditions are right for them to be remove and burned.
- Fuel Tank. The tank has a built-in air space designed for the collection of gasoline fumes.



014RW145

- Vacuum Source. The vacuum source is split between two ports, one on either side of the throttle body.
- Fuel Cap. The fuel cap is designed to be an integral part of the EVAP system.

System Fault Detection

The EVAP leak detection strategy is based on applying vacuum to the EVAP system and monitoring vacuum decay. The PCM monitors vacuum level via the fuel tank pressure sensor. At an appropriate time, the EVAP purge solenoid and the EVAP vent solenoid are turned “ON,” allowing the engine vacuum to draw a small vacuum on the entire evaporative emission system.

After the desired vacuum level has been achieved, the EVAP purge solenoid is turned “OFF,” sealing the system. A leak is detected by monitoring for a decrease in vacuum level over a given time period, all other variables remaining constant. A small leak in the system will cause DTC P0442 to be set.

If the desired vacuum level cannot be achieved in the test described above, a large leak or a faulty EVAP purge solenoid is indicated.

Leaks can be caused by the following conditions:

- Disconnected or faulty fuel tank pressure sensor
- Missing or faulty fuel cap
- Disconnected, damaged, pinched, or blocked EVAP purge line
- Disconnected or damaged EVAP vent hose
- Disconnected, damaged, pinched, or blocked fuel tank vapor line
- Disconnected or faulty EVAP purge solenoid
- Disconnected or faulty EVAP vent solenoid
- Open ignition feed circuit to the EVAP vent or purge solenoid
- Damaged EVAP canister
- Leaking fuel sender assembly O-ring
- Leaking fuel tank or fuel filler neck

A restricted or blocked EVAP vent path is detected by drawing vacuum into the EVAP system, turning “OFF” the EVAP vent solenoid and the EVAP purge solenoid (EVAP vent solenoid “OPEN,” EVAP purge Pulse Width Modulate (PWM) “0%”) and monitoring the fuel tank vacuum sensor input. With the EVAP vent solenoid open, any vacuum in the system should decrease quickly unless the vent path is blocked. A blockage like this will set DTC P0446 and can be caused by the following conditions:

- Faulty EVAP vent solenoid (stuck closed)
- Plugged, kinked or pinched vent hose
- Shorted EVAP vent solenoid driver circuit
- Plugged EVAP canister

The PCM supplies a ground to energize the purge solenoid (purge “ON”). The EVAP purge control is PWM, or turned “ON” and “OFF,” several times a second. The duty cycle (pulse width) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the PCM and the output is commanded when the appropriate conditions have been met.

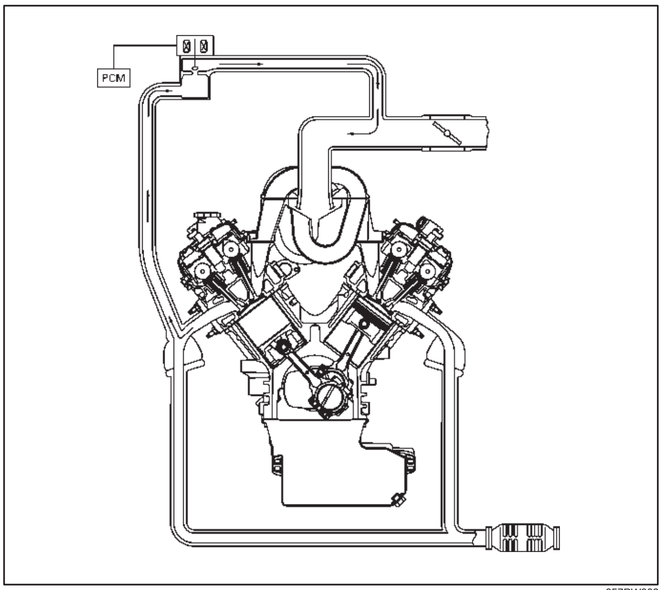
The system checks for conditions that cause the EVAP system to purge continuously by commanding the EVAP vent solenoid “ON” and the EVAP purge solenoid “OFF” (EVAP vent solenoid “CLOSED,” EVAP purge PWM “0%”). If fuel tank vacuum level increases during the test, a continuous purge flow condition is indicated, which will set a DTC P1441. This can be cause by the following conditions:

- EVAP purge solenoid leaking
- EVAP purge and engine vacuum lines switched at the EVAP purge solenoid
- EVAP purge solenoid driver circuit grounded

General Description (Exhaust Gas Recirculation (EGR) System)

EGR Purpose

The exhaust gas recirculation (EGR) system is use to reduce emission levels of oxides of nitrogen (NOx). NOx emission levels are caused by a high combustion temperature. The EGR system lowers the NOx emission levels by decreasing the combustion temperature.



057RW002

Linear EGR Valve

The main element of the system is the linear EGR valve. The EGR valve feeds small amounts of exhaust gas back into the combustion chamber. The fuel/air mixture will be diluted and combustion temperatures reduced.

Linear EGR Control

The PCM monitors the EGR actual positron and adjusts the pintle position accordingly. The uses information from the following sensors to control the pintle position:

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Mass air flow (MAF) sensor.

Linear EGR Valve Operation and Results of Incorrect Operation

The linear EGR valve is designed to accurately supply EGR to the engine independent of intake manifold vacuum. The valve controls EGR flow from the exhaust to the intake manifold through an orifice with a PCM controlled pintle. During operation, the PCM controls pintle position by monitoring the pintle position feedback signal. The feedback signal can be monitored with a Tech 2 as "Actual EGR Pos." "Actual EGR Pos." should always be near the commanded EGR position ("Desired EGR Pos."). If a problem with the EGR system will not allow the PCM to control the pintle position properly, DTC P1406 will set. The PCM also tests for EGR flow. If incorrect flow is detected, DTC P0401 will set. If DTCs P0401 and/or P1406 are set, refer to the DTC charts.

The linear EGR valve is usually activated under the following conditions:

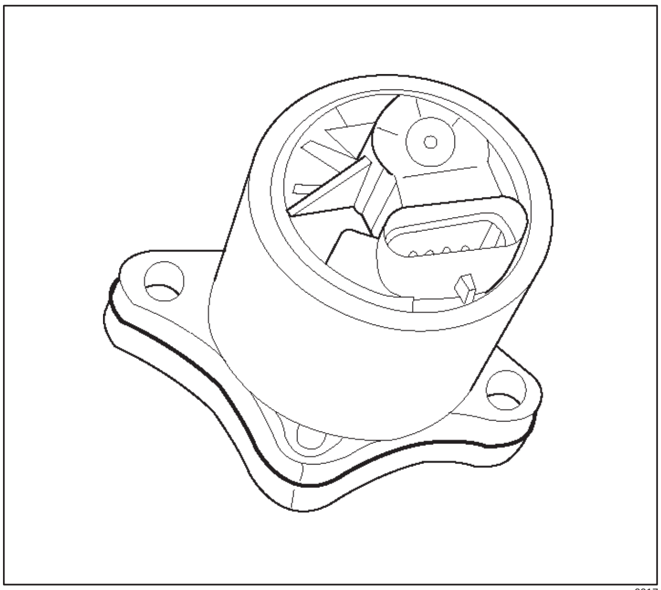
- Warm engine operation.
- Above-idle speed.

Too much EGR flow at idle, cruise or cold operation may cause any of the following conditions to occur:

- Engine stalls after a cold start.
- Engine stalls at idle after deceleration.
- Vehicle surges during cruise.
- Rough idle.
- DTC P0300 (misfire detected).

Too little or no EGR flow may allow combustion temperatures to get too high. This could cause:

- Spark knock (detonation).
- Engine overheating.
- Emission test failure.
- DTC P0401 (EGR flow test).
- Poor fuel economy.



0017

EGR Pintle Position Sensor

The PCM monitors the EGR valve pintle position input to endure that the valve responds properly to commands from the PCM and to detect a fault if the pintle position sensor and control circuits are open or shorted. If the PCM detects a pintle position signal voltage outside the normal range of the pintle position sensor, or a signal voltage that is not within a tolerance considered acceptable for proper EGR system operation, the PCM will set DTC P1406.

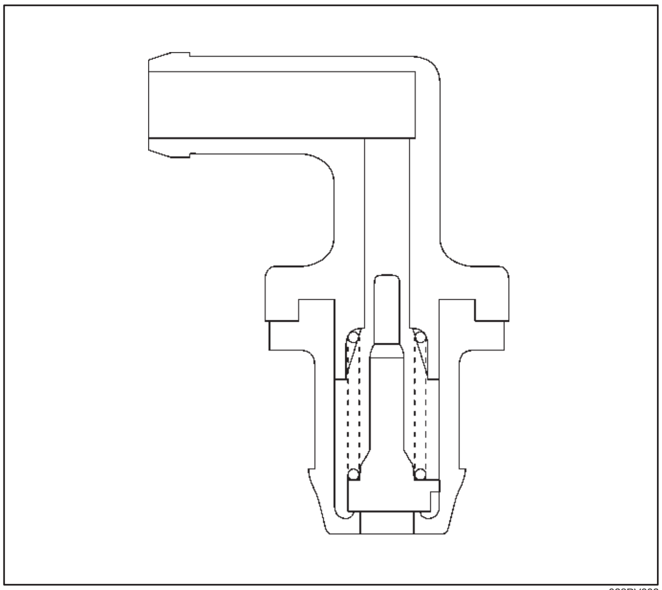
General Description (Positive Crankcase Ventilation (PCV) System)

Crankcase Ventilation System Purpose

The crankcase ventilation system is use to consume crankcase vapors in the combustion process instead of venting them to the atmosphere. Fresh air from the throttle body is supplied to the crankcase and mixed with blow-by gases. This mixture is then passed through the positive crankcase ventilation (PCV) valve into the common chamber.

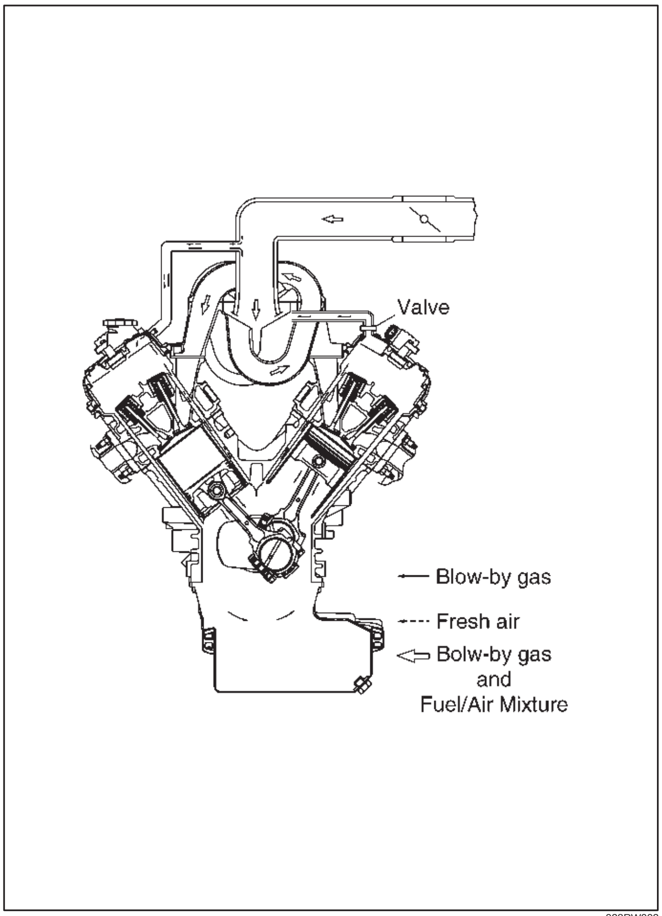
Crankcase Ventilation System Operation

The primary control is through the positive crankcase ventilation (PCV) valve. The PCV valve meters the flow at a rate that depends on the intake vacuum. The PCV valve restricts the flow when the inlet vacuum is highest. In addition, the PCV valve can seal the common chamber off in case of sudden high pressure in the crankcase.



028RV002

While the engine is running, exhaust fuses and small amounts of the fuel/air mixture escape past the piston rings and enter the crankcase. These gases are mixed with clean air entering through a tube from the air intake duct.



028RW002

During normal, part-throttle operation, the system is designed to allow crankcase gases to flow through the PCV valve into the throttle body to be consumed by normal combustion.

A plugged valve or PCV hose may cause the following conditions:

- Rough idle.
- Stalling of slow idle speed.
- Oil leaks.
- Sludge in the engine.

A leaking PCV hose would cause:

- Rough idle.
- Stalling.
- High idle speed.

1. J 41416 Ultrasonic Leak Detector is a microprocessor-based device used to detect leaks in the enhanced evaporative emission control system. The evaporative system is pressurized to 30 inches of water using the J 41413 EVAP Pressure/Purge Diagnostic System. Small leaks in the EVAP system will emit sound at a high frequency undetectable by a human ear but detectable with the J 41416. The technician traces along the evaporative system and can pinpoint leaks due to corroded lines, cracked hoses, or a damaged EVAP component. The detector includes a high quality set of headphones to block out surrounding shop noise and the LED sensitivity meter allows a visual reference for locating leaks in conjunction with the audio output heard through the headphones. Powered by (1) nine volt battery.

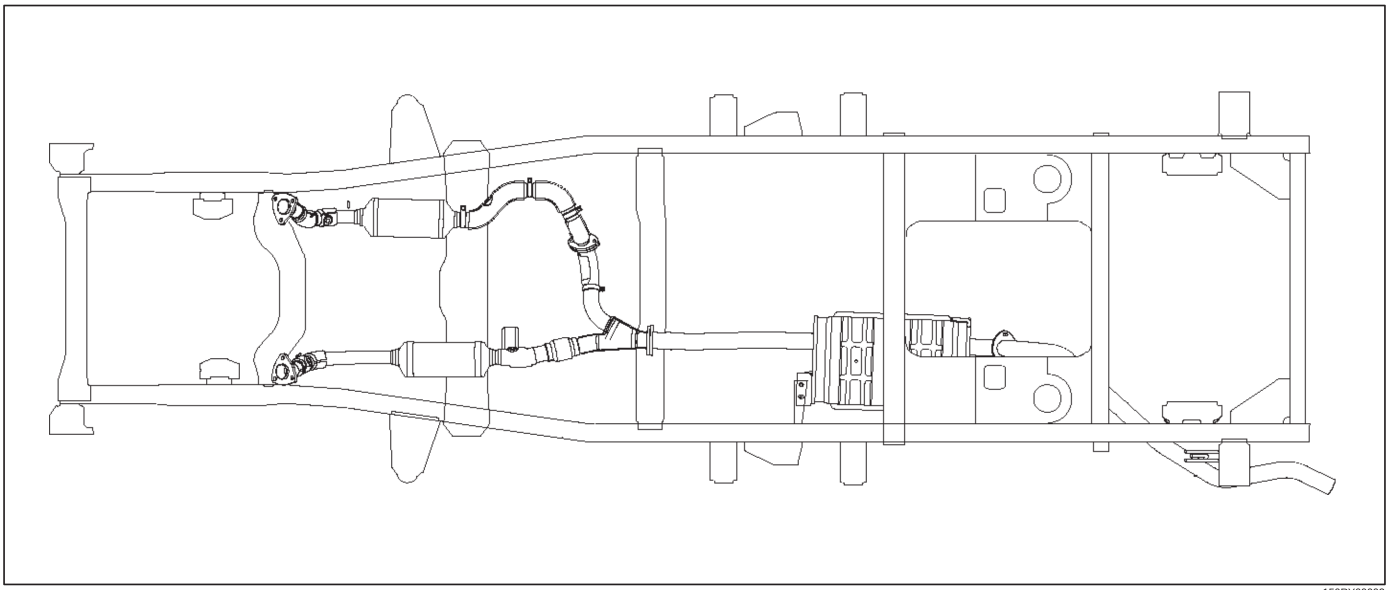
ENGINE

ENGINE EXHAUST

CONTENTS

General Description



150RY00002

When inspecting or replacing exhaust system components, make sure there is adequate clearance from all points on the underbody to prevent overheating the floor pan and possible damage to the passenger compartment insulation and trim materials.

Check complete exhaust system and nearby body areas and rear compartment lid for broken, damaged, missing or mispositioned parts, open seams, holes, loose connections or other deterioration which could permit exhaust fumes to seep into the rear compartment or passenger compartment. Dust or water in the rear compartment may be an indication of a problem in one of these areas. Any faulty areas should be corrected immediately.

Hangers

Various types of hangers are used to support exhaust system(s). These include conventional rubber straps, rubber rings, and rubber blocks.

The installation of exhaust system supports is very important, as improperly installed supports can cause annoying vibrations which can be difficult to diagnose.

Three Way Catalytic Converter

The three way catalytic converter is an emission control device added to the exhaust system to reduce pollutants from the exhaust gas stream.

CAUTION: The catalytic converter requires the use of unleaded fuel only.

Periodic maintenance of the exhaust system is not required. If the vehicle is raised for other service, it is advisable to check the condition of the complete exhaust system.

A dual bed monolith catalytic converter is used in combination with three way catalytic converter.

Catalytic Types:

Three way (Reduction/Oxidation) catalyst

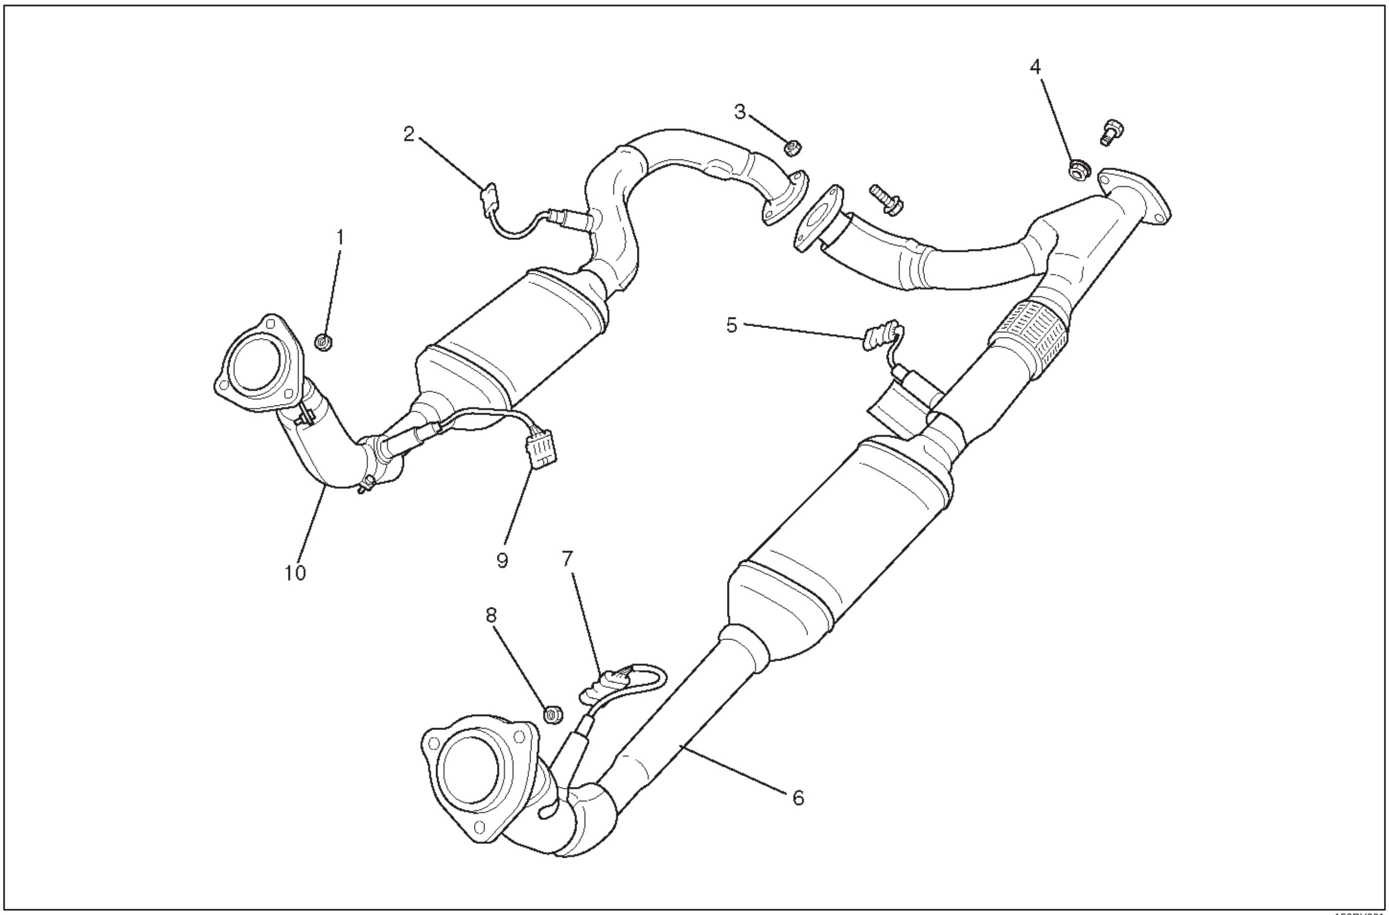
The catalyst coating on the three way (reduction) converter contains platinum and rhodium which lowers the levels of nitrous oxide (NOx) as well as hydrocarbons (HC) and carbon monoxide (Co).

Gasket

The gasket must be replaced whenever a new exhaust pipe, muffler or catalytic converter is installed.

Front Exhaust Pipe

Front Exhaust Pipe and Associated Parts



150RY001

Legend

(1) Front Exhaust Pipe RH Fixing Nuts
(2) O_2 Sensor Terminal Connector
(3) Front Exhaust Pipe RH Fixing Bolts and Nuts
(4) Front Exhaust Pipe Fixing Bolts and Nuts
(5) O_2 Sensor Terminal Connector
(6) Front Exhaust Pipe LH
(7) O_2 Sensor Terminal Connector
(8) Front Exhaust Pipe LH Fixing Nuts
(9) O_2 Sensor Terminal Connector
(10) Front Exhaust Pipe RH

Removal

1. Disconnect battery ground cable.
2. Raise the vehicle and support with suitable safety stands.
3. Disconnect O_2 sensor harness connector (2)(5)(7)(9).
4. Remove front exhaust pipe fixing nuts (3)(4).
5. Remove front exhaust pipe fixing three stud nuts from exhaust manifold (1)(8).
6. Remove front exhaust pipe (6)(10).

Installation

1. Install front exhaust pipe (10)(6) and tighten three stud nuts (1)(8) and two nuts (3)(4) to the specified torque.

   Torque

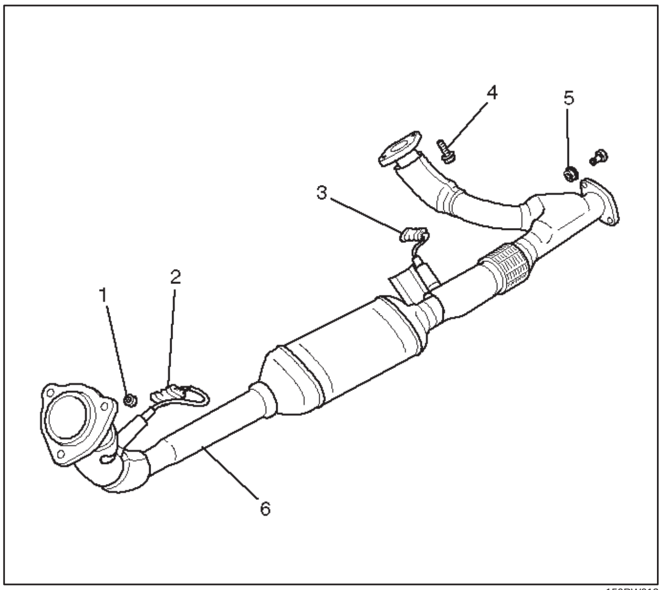
   Stud Nuts : 67 N·m (49 lb ft)

   Nuts : 43 N·m (32 lb ft)
2. Reconnect O_2 sensor harness connector (2)(5)(7)(9).

Three Way Catalytic Converter LH

Removal

1. Disconnect battery ground cable.
2. Raise the vehicle and support with suitable safety stands.
3. Disconnect front O_2 sensor harness connector and rear O_2 sensor harness connector (2)(3).
4. Remove exhaust front pipe fixing three stud nuts (1) from exhaust manifold side and two nuts (4)(5) from rear end of exhaust front pipe (6).



150RW013

Legend

(1) Front Exhaust Pipe Fixing Three Stud Nuts
(2) O_2 Sensor Harness Connector
(3) O_2 Sensor Harness Connector
(4) Front Exhaust Pipe RH Fixing Bolts and Nuts
(5) Front Exhaust Pipe Fixing Bolts and Nuts
(6) Front Exhaust Pipe LH

Installation

1. Install exhaust front pipe (6) and tighten three studs nuts (1) and two nuts (4)(5) to the specified torque.

Torque

Stud nuts : 67 N·m (49 lb ft)

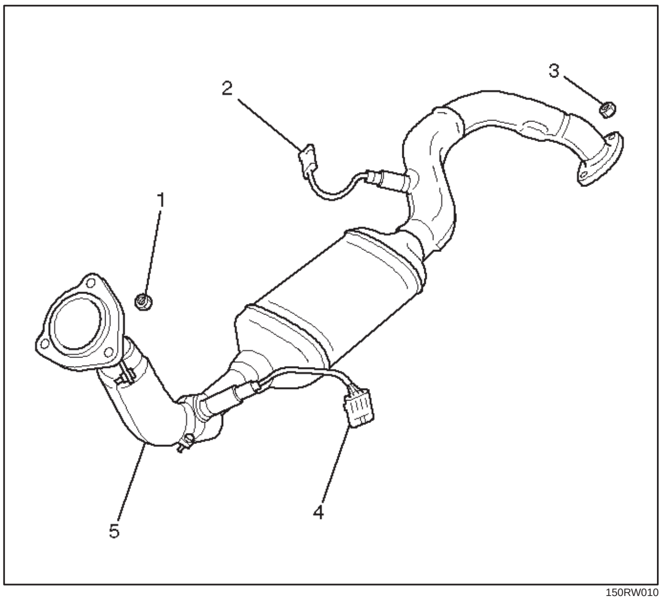
Nuts : 43 N·m (32 lb ft)

2. Reconnect O_2 sensor harness connector (2)(3).

Three Way Catalytic Converter RH

Removal

1. Disconnect battery ground cable.
2. Raise the vehicle and support with suitable safety stands.
3. Remove torsion bar. Refer to removal procedure in Front Suspension section.
4. Disconnect front O_2 sensor harness connector (4) and rear O_2 sensor harness connector (2).
5. Remove front exhaust pipe fixing nuts (3).
6. Remove three stud nuts (1) from exhaust manifold then remove the exhaust front pipe (5).



Legend

(1) Front Exhaust Pipe Fixing Three Stud Nuts
(2) O_2 Sensor Harness Connector
(3) Front Exhaust Pipe Fixing Bolts and Nuts
(4) O_2 Sensor Harness Connector
(5) Front Exhaust Pipe

Installation

1. Install front exhaust pipe (5) and tighten three stud nuts (1) and two nuts (3) to the specified torque.

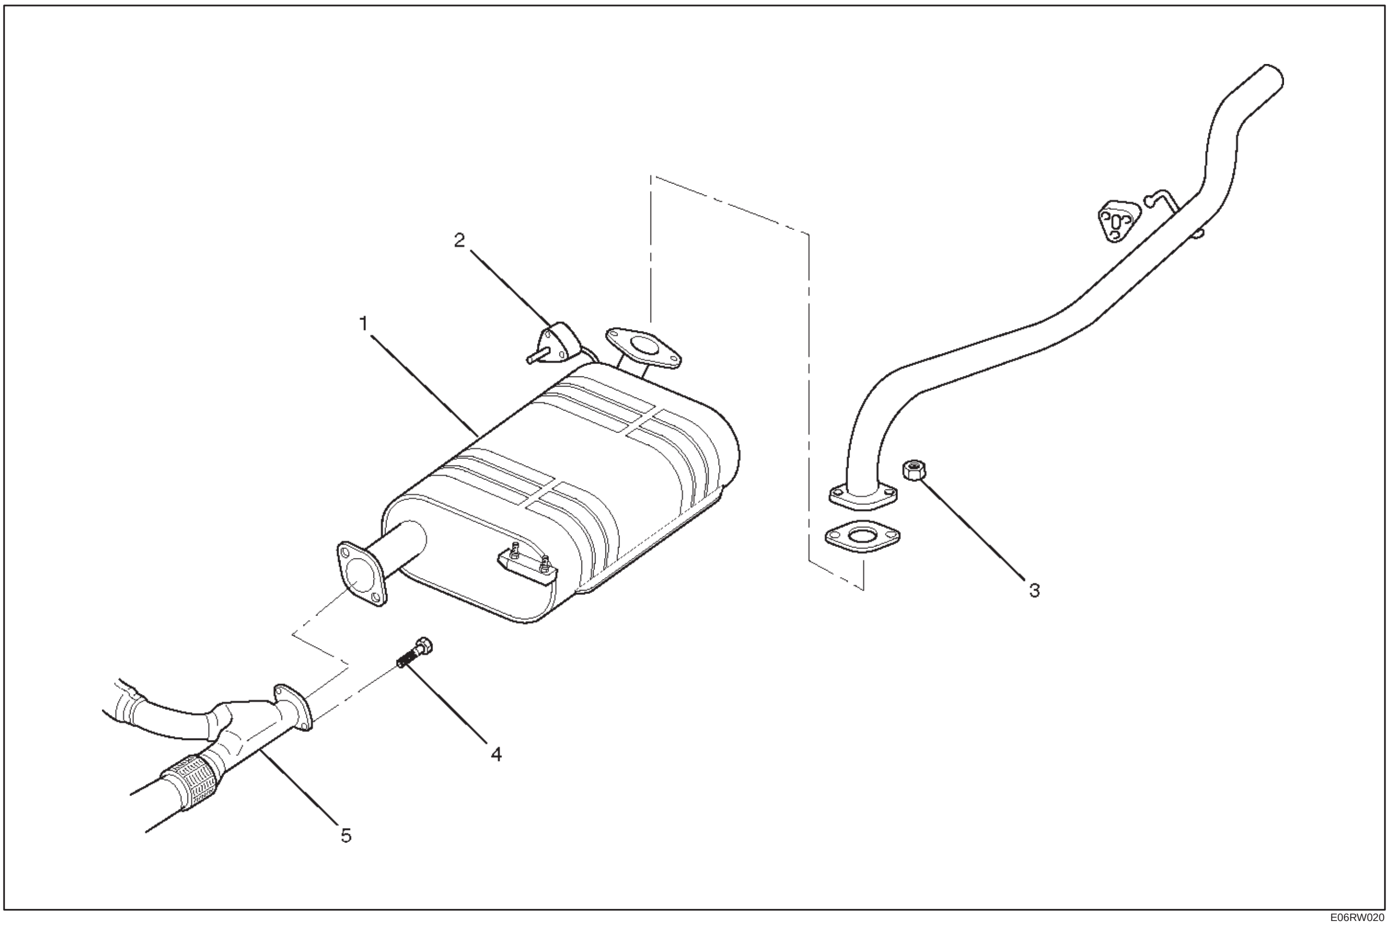
   Torque

   Stud nuts : 67 N·m (49 lb ft)

   Nuts : 43 N·m (32 lb ft)
2. Install the torsion bar and readjust the vehicle height. Refer to the installation and vehicle height adjustment instructions in the Front Suspension Section.

Exhaust Silencer

Exhaust Silencer and Associated Parts



Legend

(1) Exhaust Silencer
(2) Mounting Rubber
(3) Exhaust Silencer Fixing Nuts
(4) Exhaust Silencer Fixing Bolts
(5) Exhaust Front Pipe

Removal

1. Disconnect battery ground cable.
2. Raise the vehicle and support with suitable safety stands.
3. Remove exhaust silencer fixing nuts (3) then disconnect rear exhaust pipe from exhaust silencer.
4. Remove exhaust silencer fixing bolts (4) then disconnect exhaust silencer from front exhaust pipe (5).
5. Remove exhaust silencer mounting nuts from chassis side then remove exhaust silencer (1).

Installation

1. Install the exhaust silencer (1) chassis side and tighten four nuts to the specified torque.

   Nuts: 16 N·m (12 lb ft)

2. Install the exhaust silencer and tighten two bolts (4) on front exhaust pipe to specified torque.

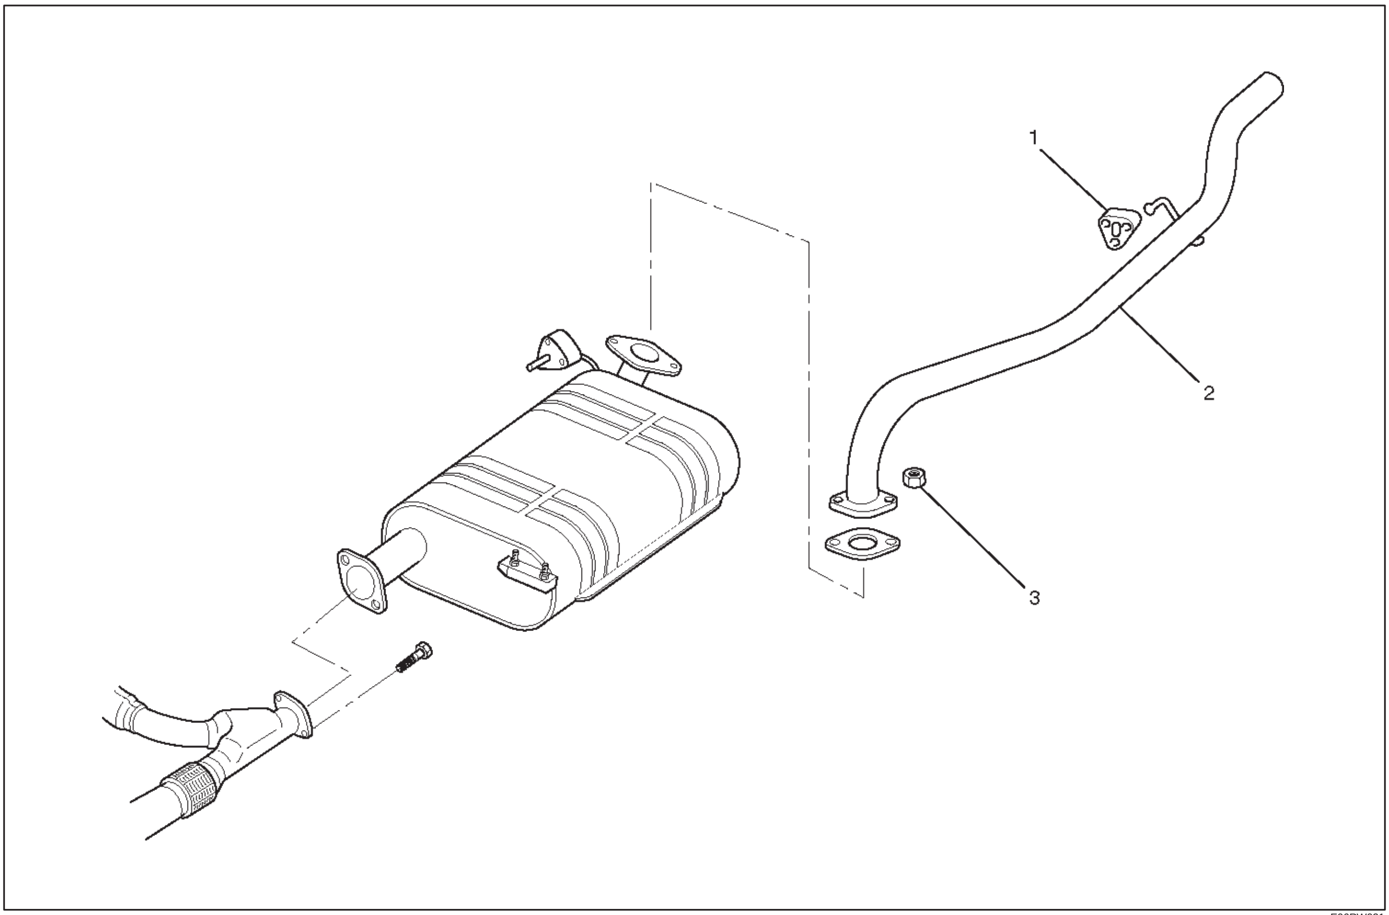
   Bolts: 43 N·m (32 lb ft)

3. Install the rear exhaust pipe and tighten on exhaust silencer to specified torque.

   Nuts: 43 N·m (32 lb ft)

Rear Exhaust pipe

Rear Exhaust pipe and Associated Parts



Legend
(1) Mounting Rubber
(2) Rear Exhaust Pipe
(3) Rear Exhaust Pipe Fixing Nuts

Removal

1. Disconnect battery ground cable.
2. Raise the vehicle and support with suitable safety stands.
3. Remove rear exhaust pipe fixing nuts (3), then disconnect rear exhaust pipe from exhaust silencer.
4. Remove mounting rubber (1).
5. Remove rear exhaust pipe (2).

Installation

1. Install the mounting rubber (1).
2. Install the exhaust pipe (2) and tighten two nuts (3) on exhaust silencer to specified torque.

Nuts: 43 N·m (32 lb ft)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

(8) Relief Valve
(9) Oil Pump Cover
(10) Driven Gear
(11) Drive Gear
(12) Oil Seal
(13) O-ring
(14) Oil Pump Body

Disassembly

1. Remove crankshaft timing pulley.
2. Remove crankcase with oil pan.
3. Remove oil pipe.
4. Remove oil strainer.
5. Remove oil pump assembly.
6. Remove plug.
7. Remove spring.
8. Remove relief valve.
9. Remove oil pump cover.
10. Remove driven gear.

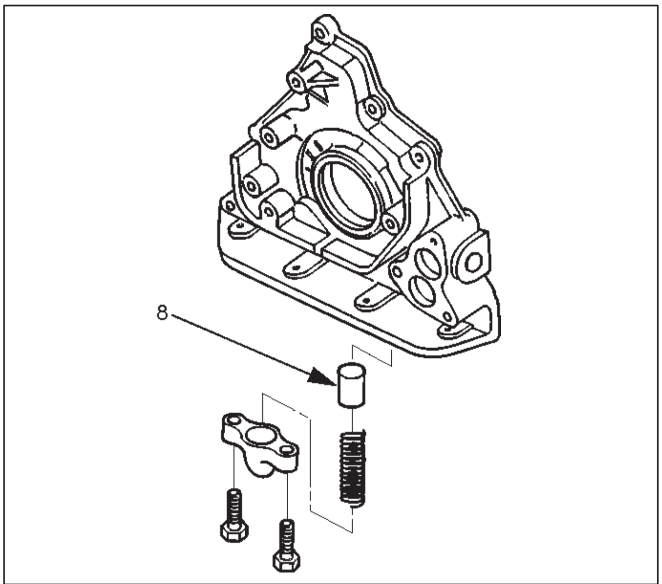
11. Remove drive gear.
12. Remove oil seal.
13. Remove O-ring.

Inspection and Repair

CAUTION: Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found during inspection.

Relief Valve (8)

- Check to see that the relief valve slides freely.
- The oil pump must be replaced if the relief valve does not slide freely.
- Replace the spring and/or the oil pump assembly (5) if the spring is damaged or badly worn.



051RS002

Body (14) and Gears (10, 11)

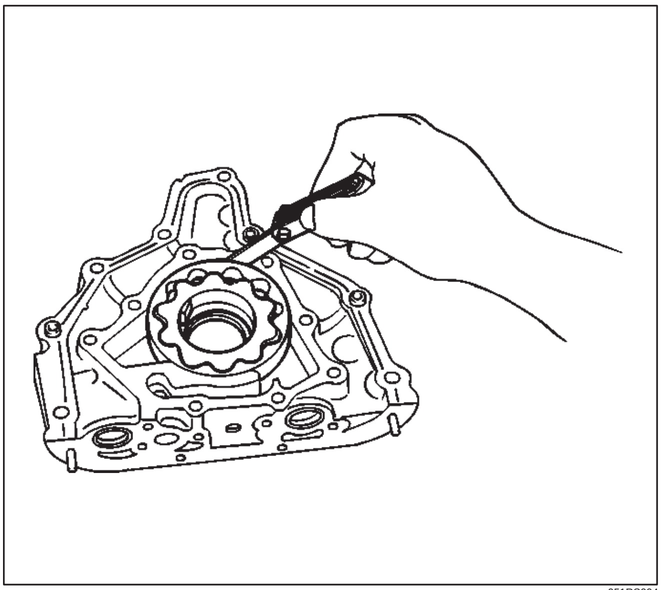
The pump assembly must be replaced if one or more of the conditions below is discovered during inspection.

- Badly worn or damaged driven gear (10).
- Badly worn drive gear (11) driving face.
- Badly scratched or scored body sliding face (14) or driven gear (10).
- Badly worn or damaged gear teeth.

Measure the clearance between the body and the driven gear with a feeler gauge.

Standard : 0.10 mm–0.18 mm (0.0039 in.–0.0070 in)

Limit : 0.20mm (0.0079 in)

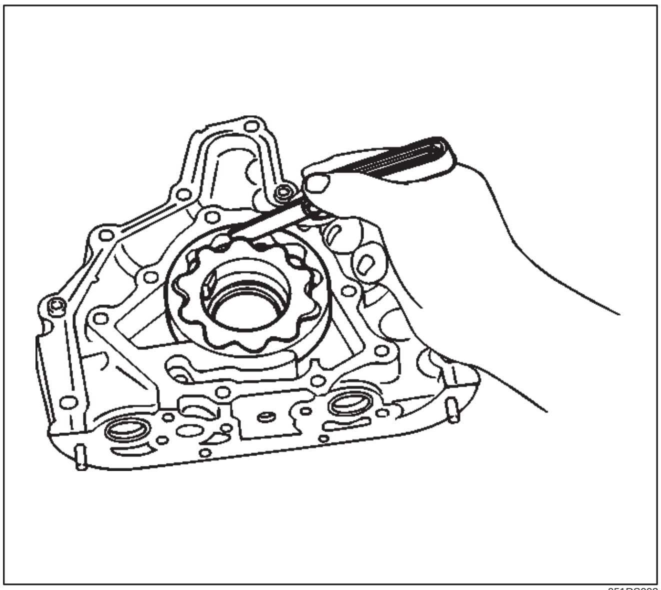


051RS004

- Measure the clearance between the drive gear and driven gear with a feeler gauge.

Standard : 0.11 mm–0.24 mm (0.0043 in–0.0094 in)

Limit : 0.35mm (0.0138 in)



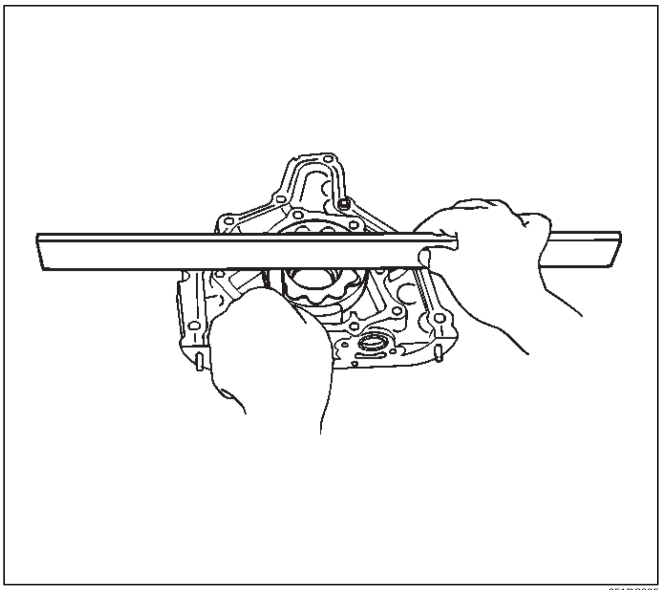
051RS003

- Measure the side clearance with a precision straight edge and a feeler gauge.

Clearance

Standard : 0.03 mm–0.09 mm (0.0011 in–0.0035 in)

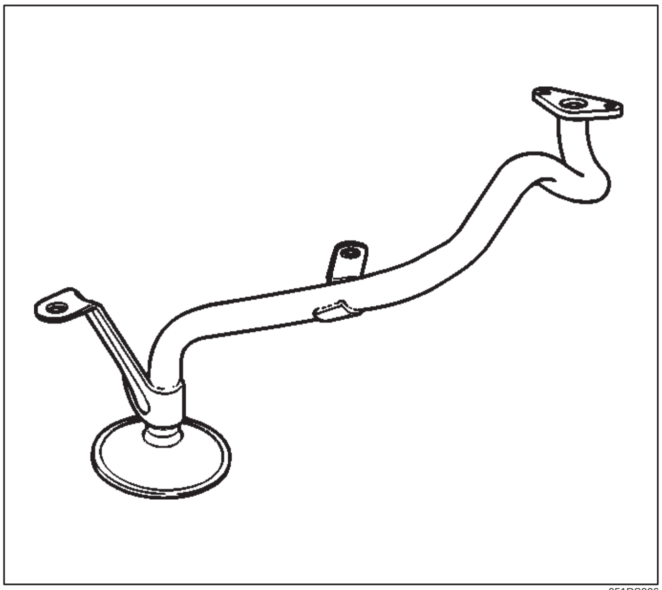
Limit : 0.15mm (0.0059 in)



051RS005

Oil Strainer

Check the oil strainer for cracking and scoring. If cracking and scoring are found, the oil strainer must be replaced.



051RS006

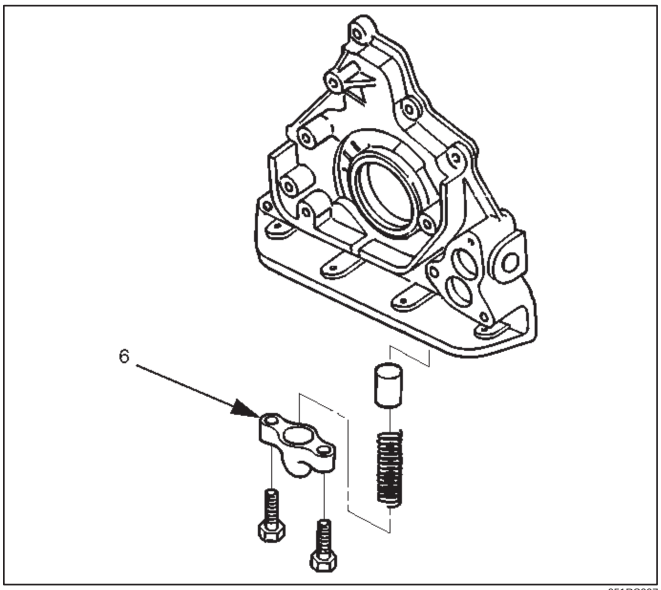
Reassembly

1. Install drive gear (11).
2. Install driven gear (10).
3. Install oil pump cover (9) and first, loosely tighten all of the attaching screws. Next, tighten the attaching screws to the specified torque.

   Torque : 10 N·m (89 lb in)

   After installation, check that the gear rotates smoothly.
4. Install relief valve (8) and apply engine oil to the relief valve and spring (7).
5. Install spring (7).
6. Install the plug (6).

   Torque : 8 N·m (69 lb in)



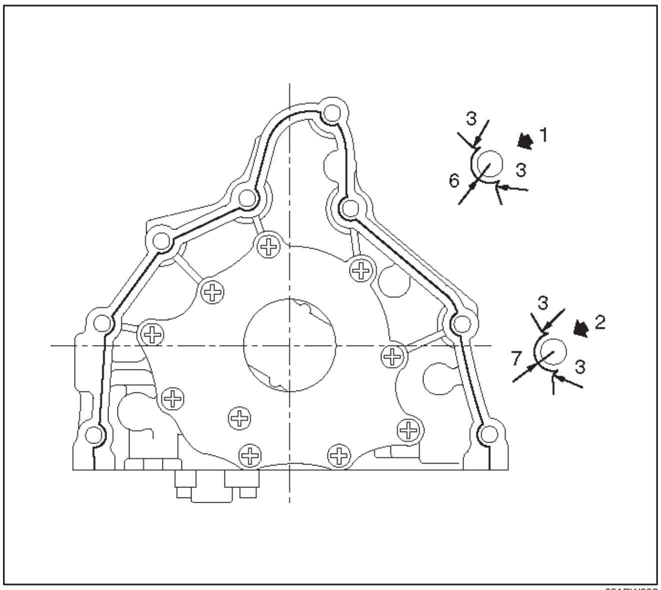
051RS007

7. Install oil pump assembly (5).
   - Carefully remove any oil from the cylinder body and the pump. Apply sealant (TB–1207B or equivalent) to the pump fitting face as shown in illustration. Take care that sealant is not applied to oil port surfaces. The oil pump assembly must be installed within 5 minutes after sealant application before the sealant hardens.

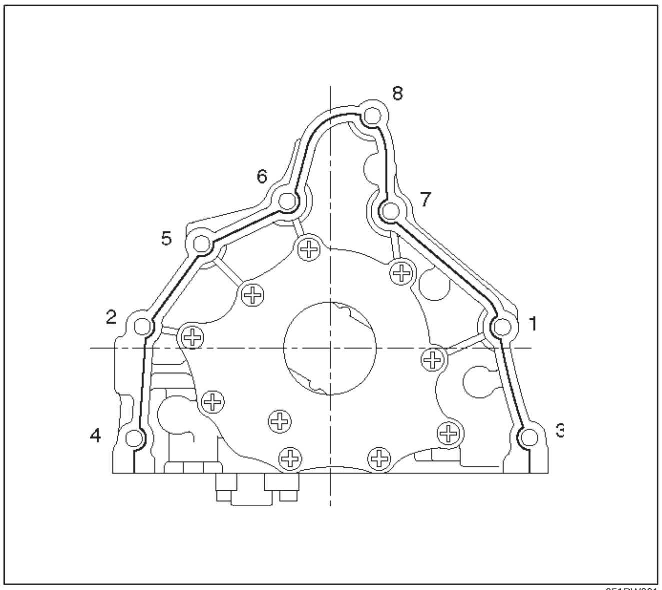
CAUTION: Do not apply an excessive amount of sealant to the contact surface. Applying too much sealant will overflow the contact surfaces. This could cause serious damage to the engine.

- **Attach oil pump assembly to cylinder body.**
- **Tighten the oil pump fixing bolts.**

  Torque : 25 N·m (18 lb·ft)



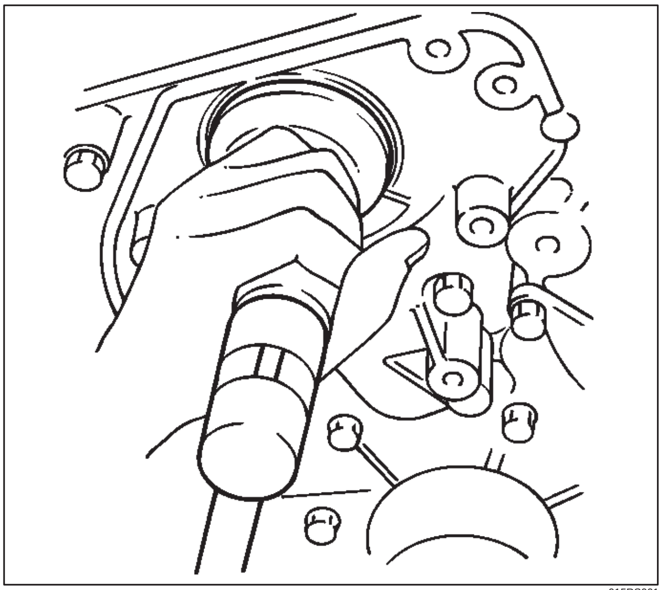
051RW002



051RW001

Legend
(1) Around Bolt Holes
(2) Around Dowel Pin

8. Install the new oil seal (12). Apply engine oil to the oil seal lip before installation then use J–39202 oil seal Installer, install oil seal.



015RS001

9. Install oil strainer (4) with O-ring (13).

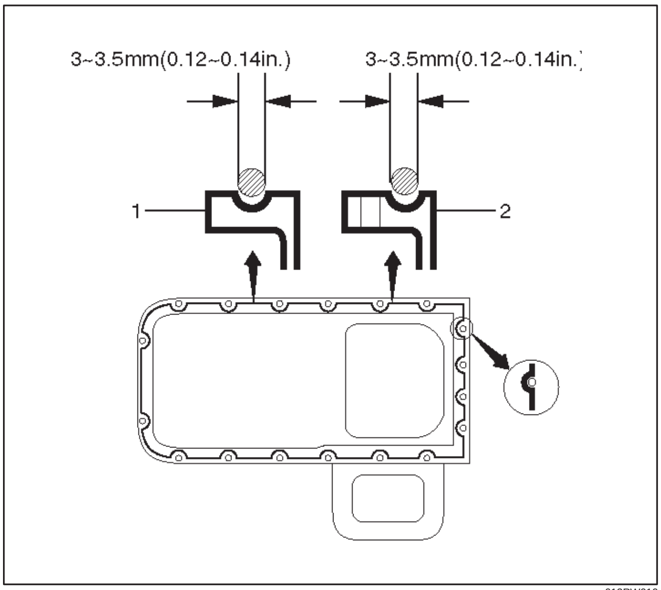
Torque: 25 N·m (18 lb ft)

10. Install oil pipe (3) with O-ring (13).

Torque: 25 N·m (18 lb ft)

11. Install crankcase with oil pan (2).
    - Remove oil on crankcase mounting surface and dry the surface.
    - Apply a proper 4.5 mm (0.7 in) wide bead of sealant (TB1207C or equivalent) to the crankcase mounting surface. The bead must be continuous.
    - The crankcase must be installed within 5 minutes after sealant application before the sealant hardens.
    - Tighten fixing bolts to the specified torque.

Torque : 10 N·m (89 lb in)



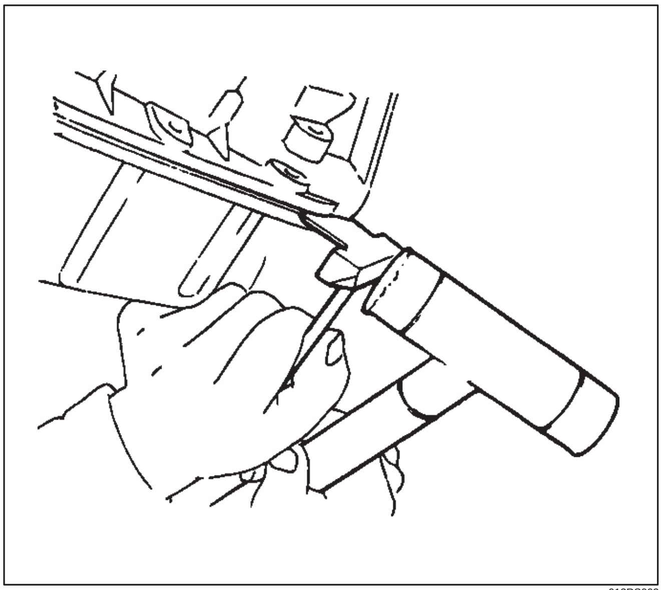
013RW010

12. Install crankshaft timing pulley.

Oil Pan and Crankcase

Removal

1. Disconnect battery ground cable.
2. Lift vehicle by supporting the frame.
3. Remove under cover.
4. Drain engine oil.
5. Remove front wheels.
6. Remove oil level dipstick from level gauge tube.
7. Remove radiator under fan shroud.
8. Remove suspension cross member fixing bolts, 2 pcs each per side and remove suspension cross member.
9. Remove pitman arm and relay lever assembly, using the J-29107 remover, remove pitman arm from the steering unit and remove four fixing bolts for relay lever assembly.
10. Remove axle housing assembly four fixing bolts from housing isolator side and mounting bolts from wheel side. At this time support the axle with a garage jack and remove axle housing assembly. (For 4×4)
11. Remove starter fixing bolts.
12. Remove oil pan fixing bolts.
13. Remove oil pan, using J-37228 sealer cutter, remove oil pan.

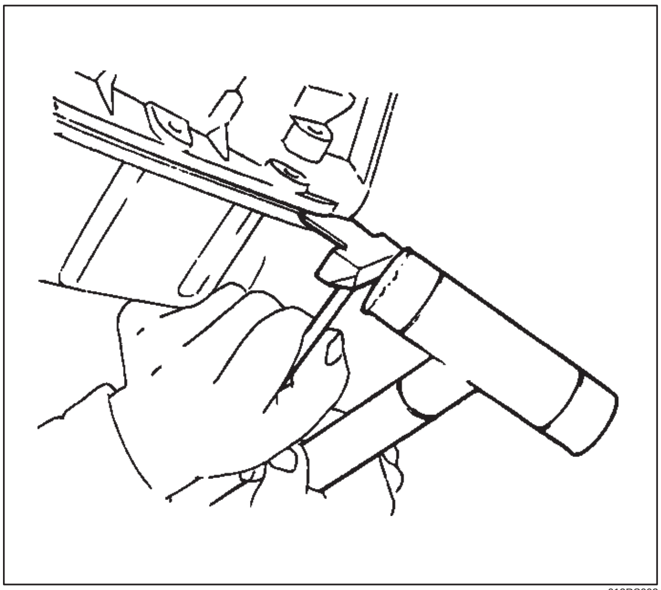


013RS003

14. Remove crankcase fixing bolts.
15. Remove crankcase, using J-37228 sealer cutter, remove crankcase.

NOTE: Do not deform or damage the flange of oil pan and crankcase.

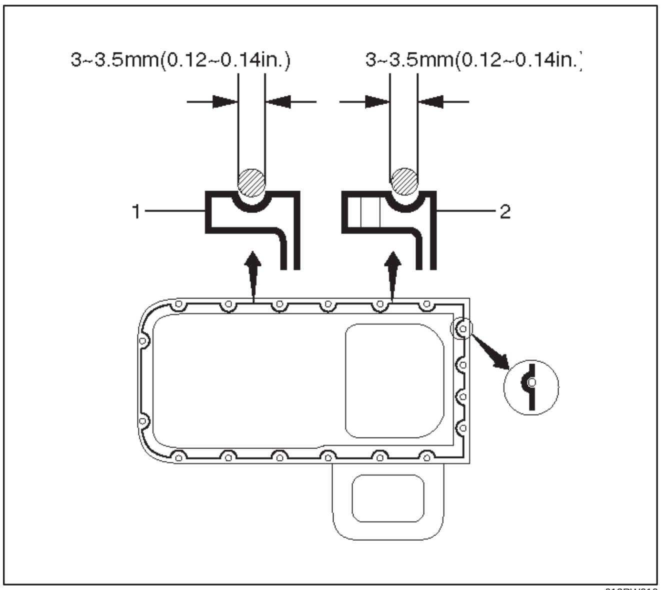
Replace the oil pan and/or crankcase if deformed or damaged.



013RS003

Installation

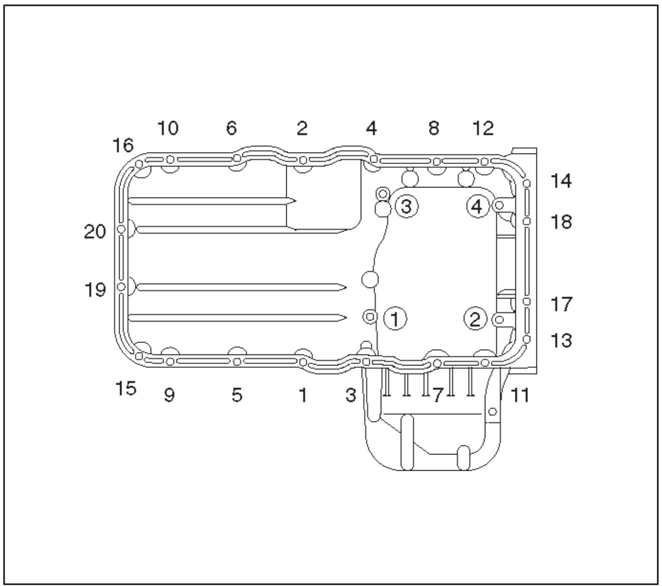
1. Install crankcase.
   A. Remove residual sealant, lubricant and moisture from mounting surface, then dry thoroughly.
   B. Properly apply a 4.5 mm (0.7 in) wide bead of sealant (TB-1207C or equivalent) to mounting surface of crankcase.
   Sealant beat must be continuous.
   - The crankcase must be installed within 5 minutes after sealant application before the sealant hardens.



013RW010

C. Install crankcase, tighten crankcase fixing bolts to the specified torque.

Torque : 10 N·m (89 lb in)

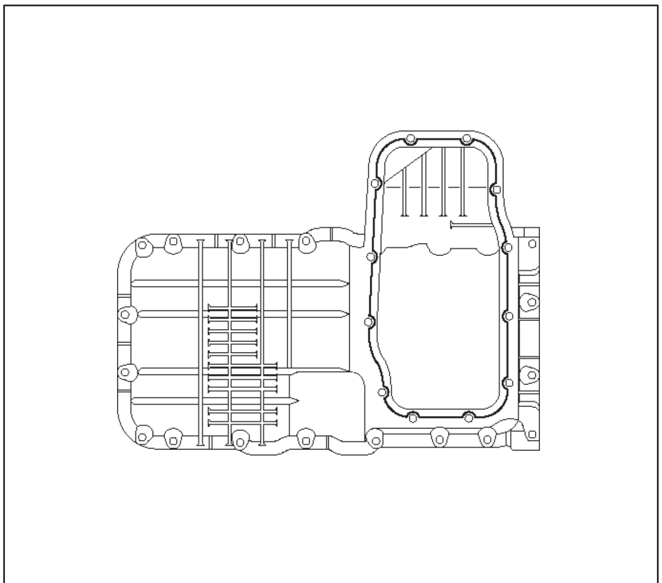


013RW004

2. Install oil pan
   1. Remove residual sealant, lubricant and moisture from mounting surface, then dry thoroughly.
   2. Properly apply a 4.5 mm (07 in) wide bead of sealant (TB-1207C or equivalent) to mounting surface of oil pan.

      Sealant beat must be continuous.

      - The crankcase must be installed within 5 minutes after sealant application befor the sealant hardens.



013RW003

   3. Install oil pan, tighten oil pan fixing bolts to the specified torque.

Torque : 25 N·m (18 lb ft)

3. Install starter and tighten fixing bolts.

Torque: 40 N·m (30 lb ft)

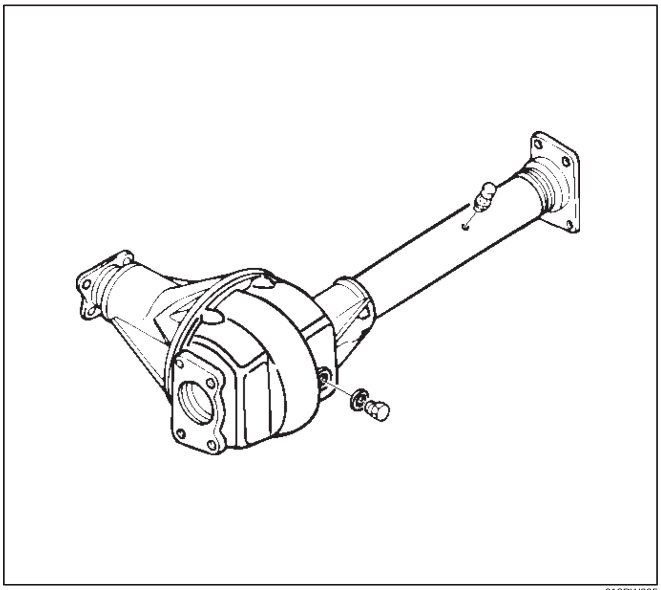
4. Install axle housing assembly and tighten fixing bolts to the specified torque. (For 4×4)

Axle case bolts

Torque : 82 N·m (60 lb ft)

Mounting bolts

Torque : 152 N·m (112 lb ft)



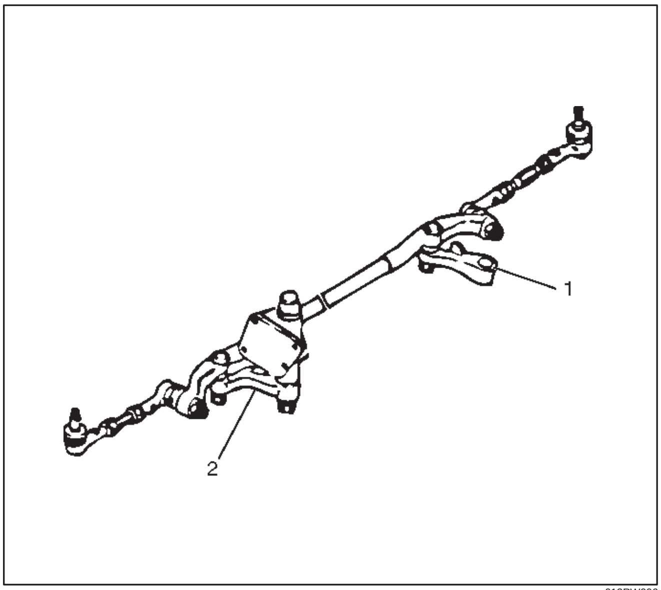
013RW005

5. Install relay lever assembly and tighten fixing bolts.

Torque: 44 N·m (32 lb ft)

6. Engage teeth of pitman arm and steering unit, and tighten nut to the specified torque.

Torque : 216 N·m (159 lb ft)



013RW006

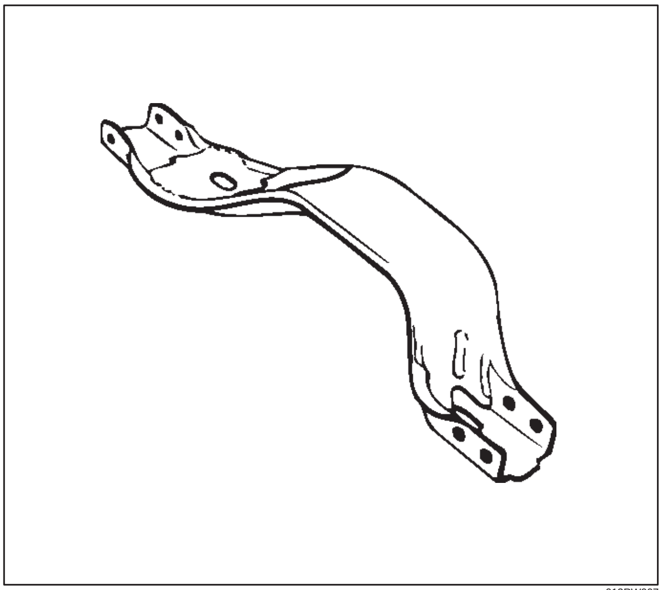
Legend

(1) Pitman Arm

(2) Relay Lever

7. Install suspension cross member and tighten fixing bolts to the specified torque.

Torque : 78 N·m (58 lb ft)



013RW007

8. Install radiator under fan shroud.
9. Install under cover.
10. Install engine oil level dipstick.
11. Fill engine oil until full level on engine oil gauge dipstick.

Oil Pump

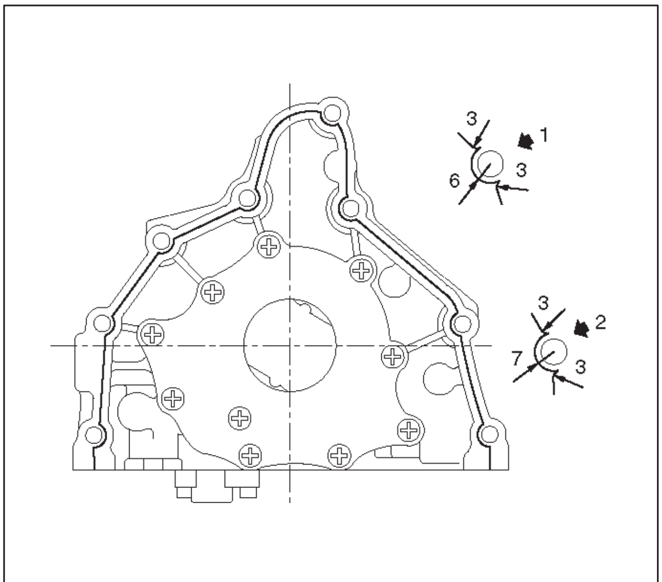
Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove crankcase assembly.
   - Refer to removal procedure for Oil Pan and Crankcase in this manual.
4. Remove crankshaft pulley.
   - Refer to removal procedure for Crankshaft Pulley in this manual.
5. Remove timing belt.
   - Refer to removal procedure for Timing Belt in this manual.
6. Remove timing pulley from crankshaft.
7. Remove four fixing bolts from oil filter assembly.
8. Remove oil strainer fixing bolts, remove oil strainer assembly with O-ring.
9. Remove three bolts from oil pipe and O-ring.
10. Remove eight oil pump fixing bolts, then oil pump assembly.
11. Remove sealant from mounting surface of oil pump assembly, cylinder block and take care not to damage mounting surfaces of oil pump and cylinder block.

Installation

1. Install oil pump assembly
   - Apply sealant (TB-1207B or equivalent) to the oil pump mounting surfaces as shown in the illustration.
   - The oil pump assembly must be installed within 5 minutes after sealant application before the sealant hardens.

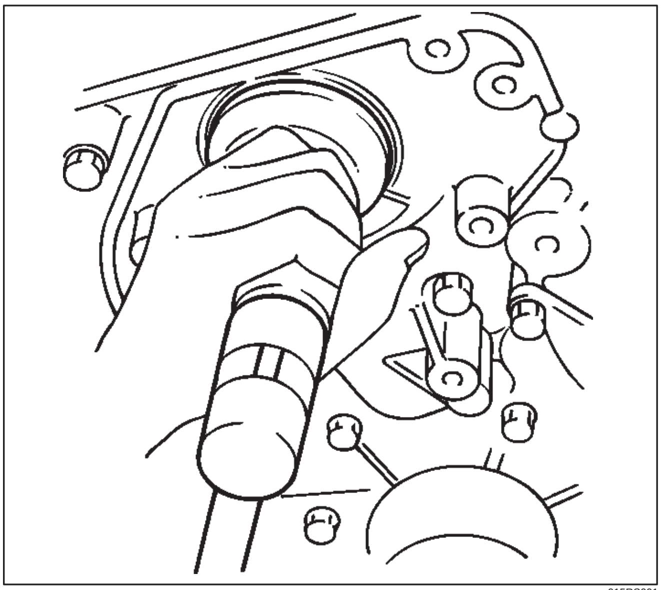
NOTE: Do not apply sealant to the oil ports.



051RW002

   - Use J-39202 installer when installing new oil seal.
   - Apply engine oil to oil seal lip.
   - Install oil pump assembly to the cylinder block.

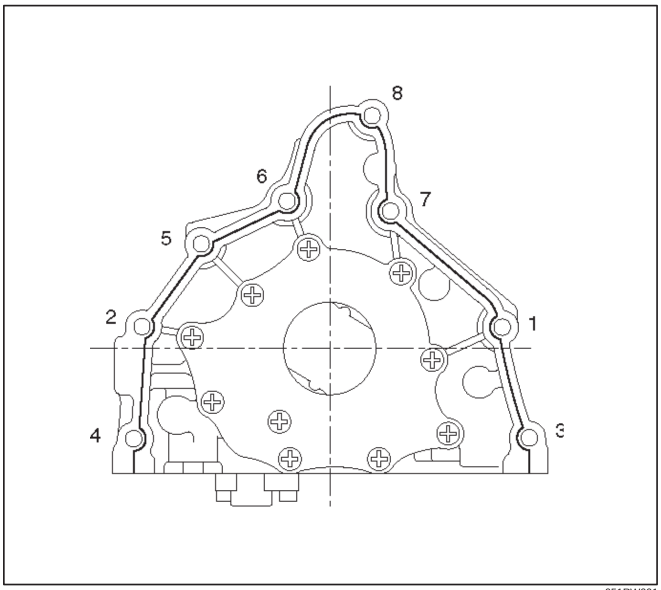
NOTE: Do not damage oil seal during installation of oil pump assembly.



015RS001

   - Tighten fixing bolts to the specified torque.

Torque : 25 N·m (18 lb ft)



051RW001

2. Install oil pipe with O-ring, tighten fixing bolt to the specified torque.

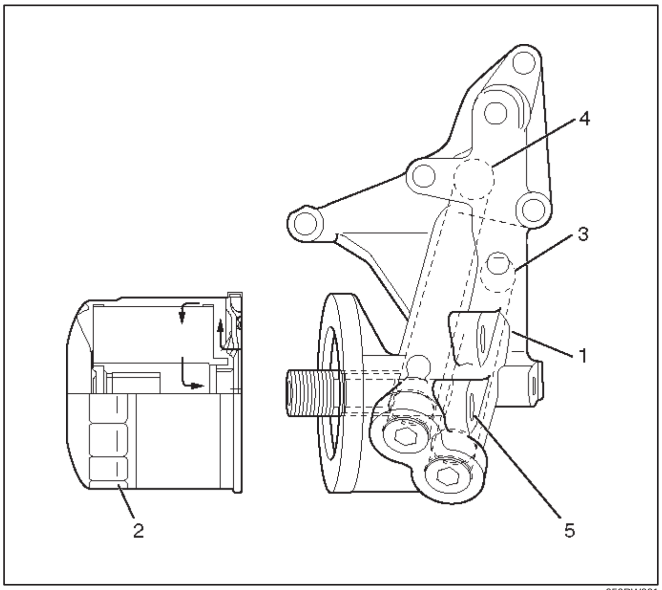
Torque : 10 N·m (89 lb in)

3. Install oil strainer with O-ring, tighten fixing bolt to the specified torque.

Torque : 25 N·m (18 lb ft)

4. Install oil filter assembly and tighten bolts to the specified torque.

Torque : 25 N·m (18 lb ft)



050RW001

Legend

(1) Oil Pump
(2) Oil Filter
(3) Oil Gallery
(4) From Oil Filter
(5) To Oil Filter

5. Install timing pulley on crankshaft.
   Install timing belt.
   - Refer to installation procedure for Timing Belt in this manual.
6. Install crankshaft pulley.
   - Refer to install procedure for Crankshaft Pulley in this manual.
7. Install crankcase assembly.
   - Refer to installation procedure for Oil Pan and Crankcase in this manual.
8. Refill engine oil until full level on engine oil dipstick.

Oil Pump Oil Seal

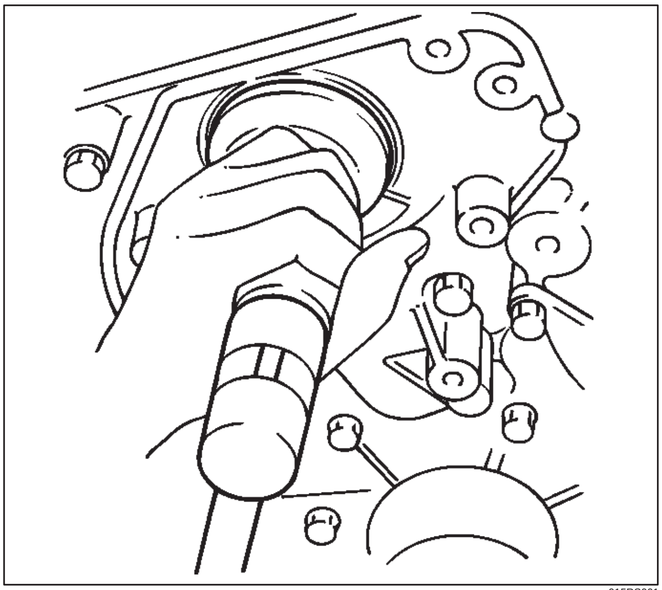
Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove crankshaft pulley.
   - Refer to removal procedure for Crankshaft Pulley in this manual.
4. Remove timing belt.
   - Refer to removal procedure for Timing Belt in this manual.
5. Remove timing pulley from crankshaft.
6. Remove oil pump oil seal using a sealer puller.

NOTE: Take care not to damage sealing surfaces of oil pump and crankshaft when removing oil seal.

Installation

1. Install oil pump oil seal, apply engine oil to oil seal lip, then install oil seal using J-39202 installer.



015RS001

2. Install timing pulley to crankshaft.
3. Install timing belt.
   - Refer to installation procedure for Timing Belt in this manual.
4. Install crankshaft pulley.
   - Refer to installation procedure for Crankshaft Pulley in this manual.
5. Refill engine oil until full level.

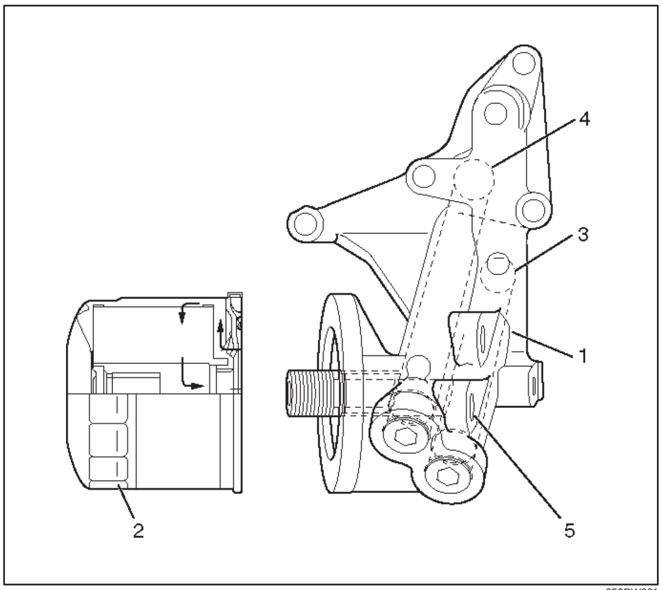
Oil Filter

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove oil filter using J-36390 filter wrench.

Installation

1. Clean filter fitting surface and apply small amount of engine oil to sealing surface.
2. Install oil filter cartridge by hand until it comes in contact with sealing surface then rotate additional 2/3 turn to tighten using J-36390 filter wrench.



050RW001

Legend

(1) Oil Pump
(2) Oil Filter
(3) Oil Gallery

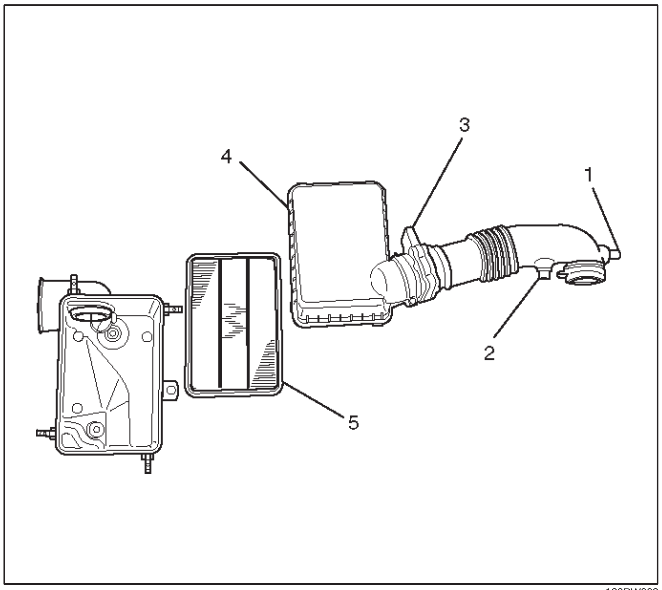
Air Cleaner Element

Removal

1. Remove positive ventilation hose connector(1).
2. Remove intake air temperature sensor(2).
3. Remove air flow sensor(3).
4. Remove air cleaner duct assembly(4).
5. Remove air cleaner element(5).



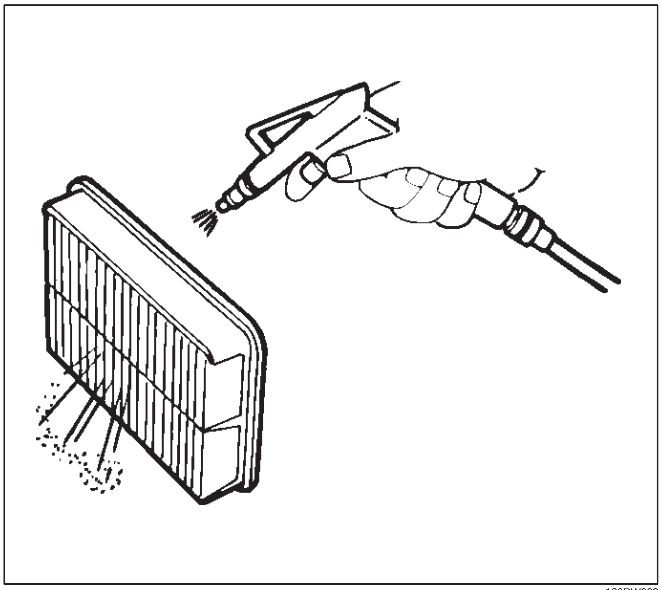
130RW003

Inspection

Check the air cleaner filter for damage or dust clogging. Replace if it is damaged, or clean if it is clogged.

Cleaning Method

Tap the air cleaner filter gently so as not to damage the paper filter, or clean the element by blowing with compressed air of about 490 kPa (71 psi) from the clean side if it is extremely dirty.



130RW002

Installation

1. Install air cleaner element(5).
2. Attach the air cleaner duct cover to the body completely, then clamp it with the clip(4).
3. Install mass air flow sensor(3).
4. Install air temperature sensor(2).
5. Install positive crankcase ventilation hose connector(1).

Torque Converter Clutch (Electronically Controlled Capacity Clutch : ECCC) Application Conditions:

The clutch apply is controlled by moving the converter clutch control valve by commanding Torque Converter Clutch (TCC) solenoid using the PWM signal.
The TCC is normally applied in 2nd, 3rd and 4th gears only when all of the following conditions exist:

— The engine coolant temperature is above 70˚C (158˚F) and ATF temperature is above 18˚C (64.5˚F).

— The brake pedal is released.

— The shift pattern requests TCC apply.

Moreover, TCC is always applied in 2nd, 3rd and 4th gears when the transmission oil temperature is above 135˚C (275˚F).
This mode should be canceled at 125˚C (257˚F).

ATF Warning Lamp

The ATF warning lamp will be constantly on (not flashing) if the transmission oil temperature is above 145˚C (293˚F).
The ATF warning lamp goes off again when the transmission oil temperature is below 125˚C (257˚F).

Reverse Lock Out

With the selector lever in reverse position, the PCM will not close the PWM solenoid until the vehicle is below 11 km/h (6.8 mph), thus preventing reverse engagement above this speed.

Diagnosis

Introduction

The systematic troubleshooting information covered by this Section offers a practical and systematic approach to diagnosing 4L30–E transmission, using information that can be obtained from road tests, electrical diagnosis, oil pressure checks or noise evaluation.
The key to correcting a complaint is to make use of all of the available symptoms and logically letting them direct you to the cause.
When dealing with automatic transmission complaints, it is best to gather as many symptoms as possible before making the decision to remove the transmission from the vehicle.
Frequently, the correction of the complaint does not require removal of the transmission from the vehicle.

Driver Information

To analyze the problem fill out a complete description of the owner's complaint.
Please draw a circle around the right information and complete the following form. (The next page is an example of a completed form). You can draw a circle around many numbers if you are not sure.

A - Today's date :	Month :	Day :	Year : ....

8- TCC Shudder	in Range : All - P - R - N - D - 3 - 2 - L	during a : upshift : 1-2 / 2-3 / 3-4 or downshift : 4-3 / 3-2 / 2-1
9- Noise	in Range : All - P - R - N - D - 3 - 2 - L	during a : upshift : 1-2 / 2-3 / 3-4 or downshift : 4-3 / 3-2 / 2-1
Noise type : 1- Buzz 2- Whine 3- Clunk	4- Rattle 5- Whistle // 6- light	7-medium 8- heavy
10- Other :	in Range : All - P - R - N - D - 3 - 2 - L	during a : upshift : 1-2 / 2-3 / 3-4 or downshift : 4-3 / 3-2 / 2-1

O - Other customer concern and comments :

(This is just an example). Shift shock very harsh overall during a downshift. Not sure if it's the 4-3 or 3-2.

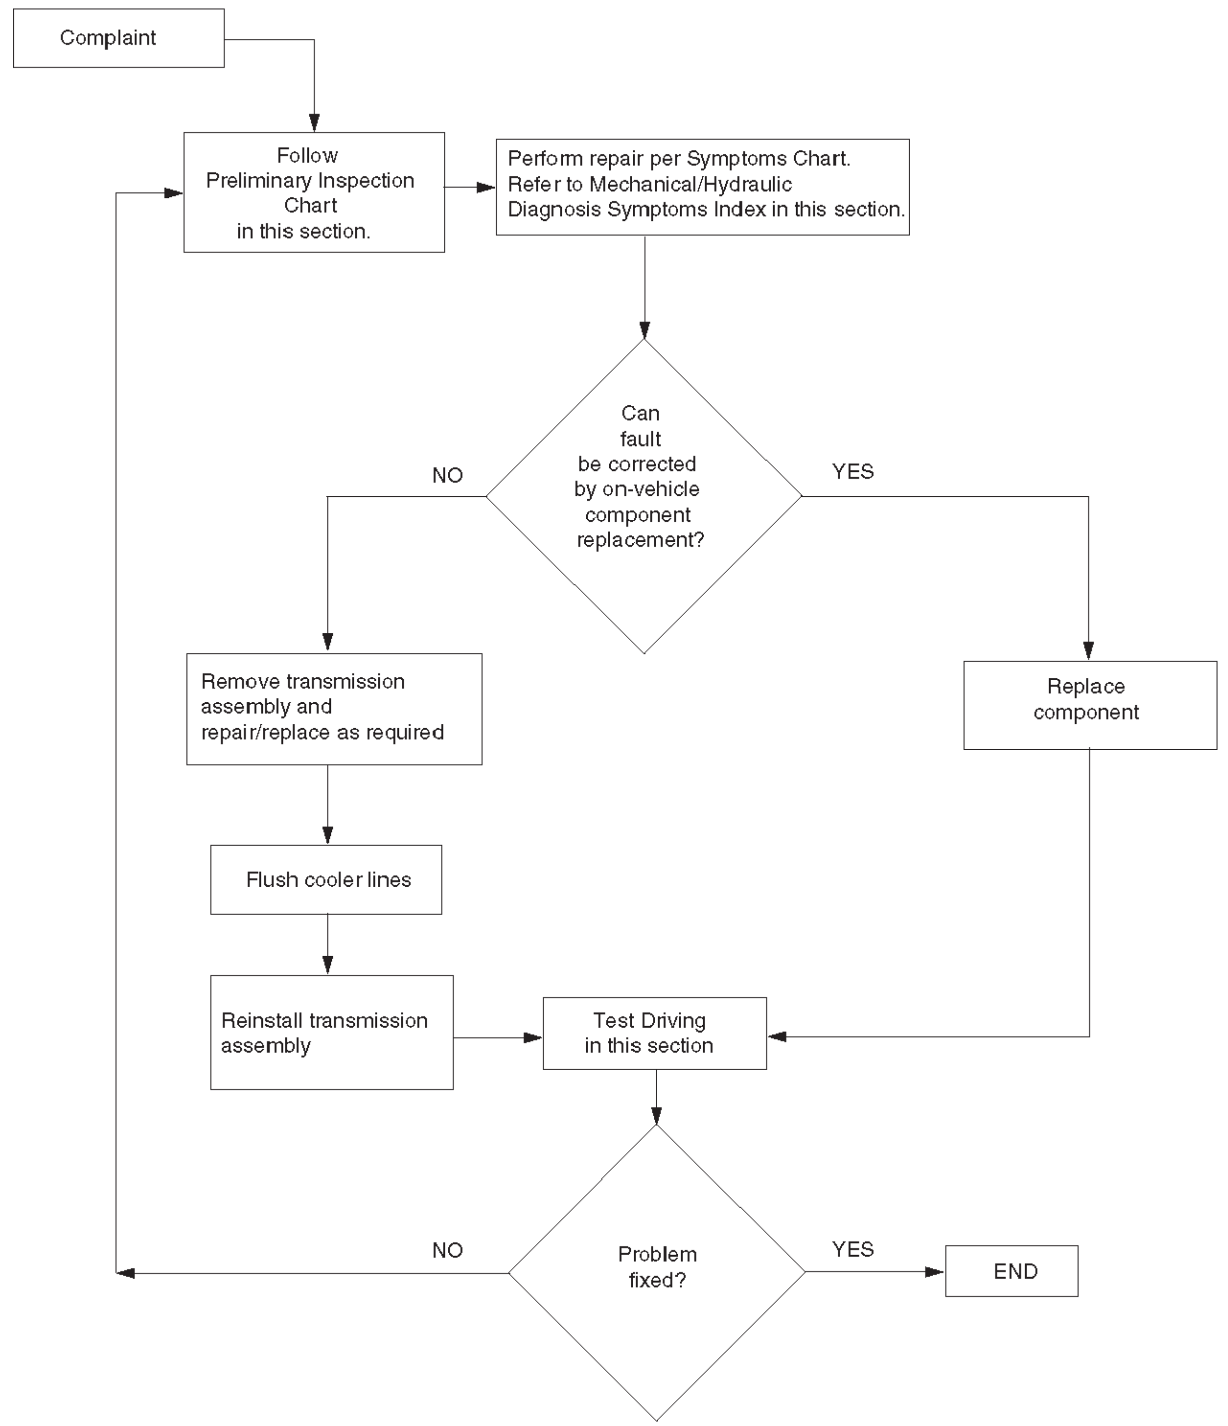
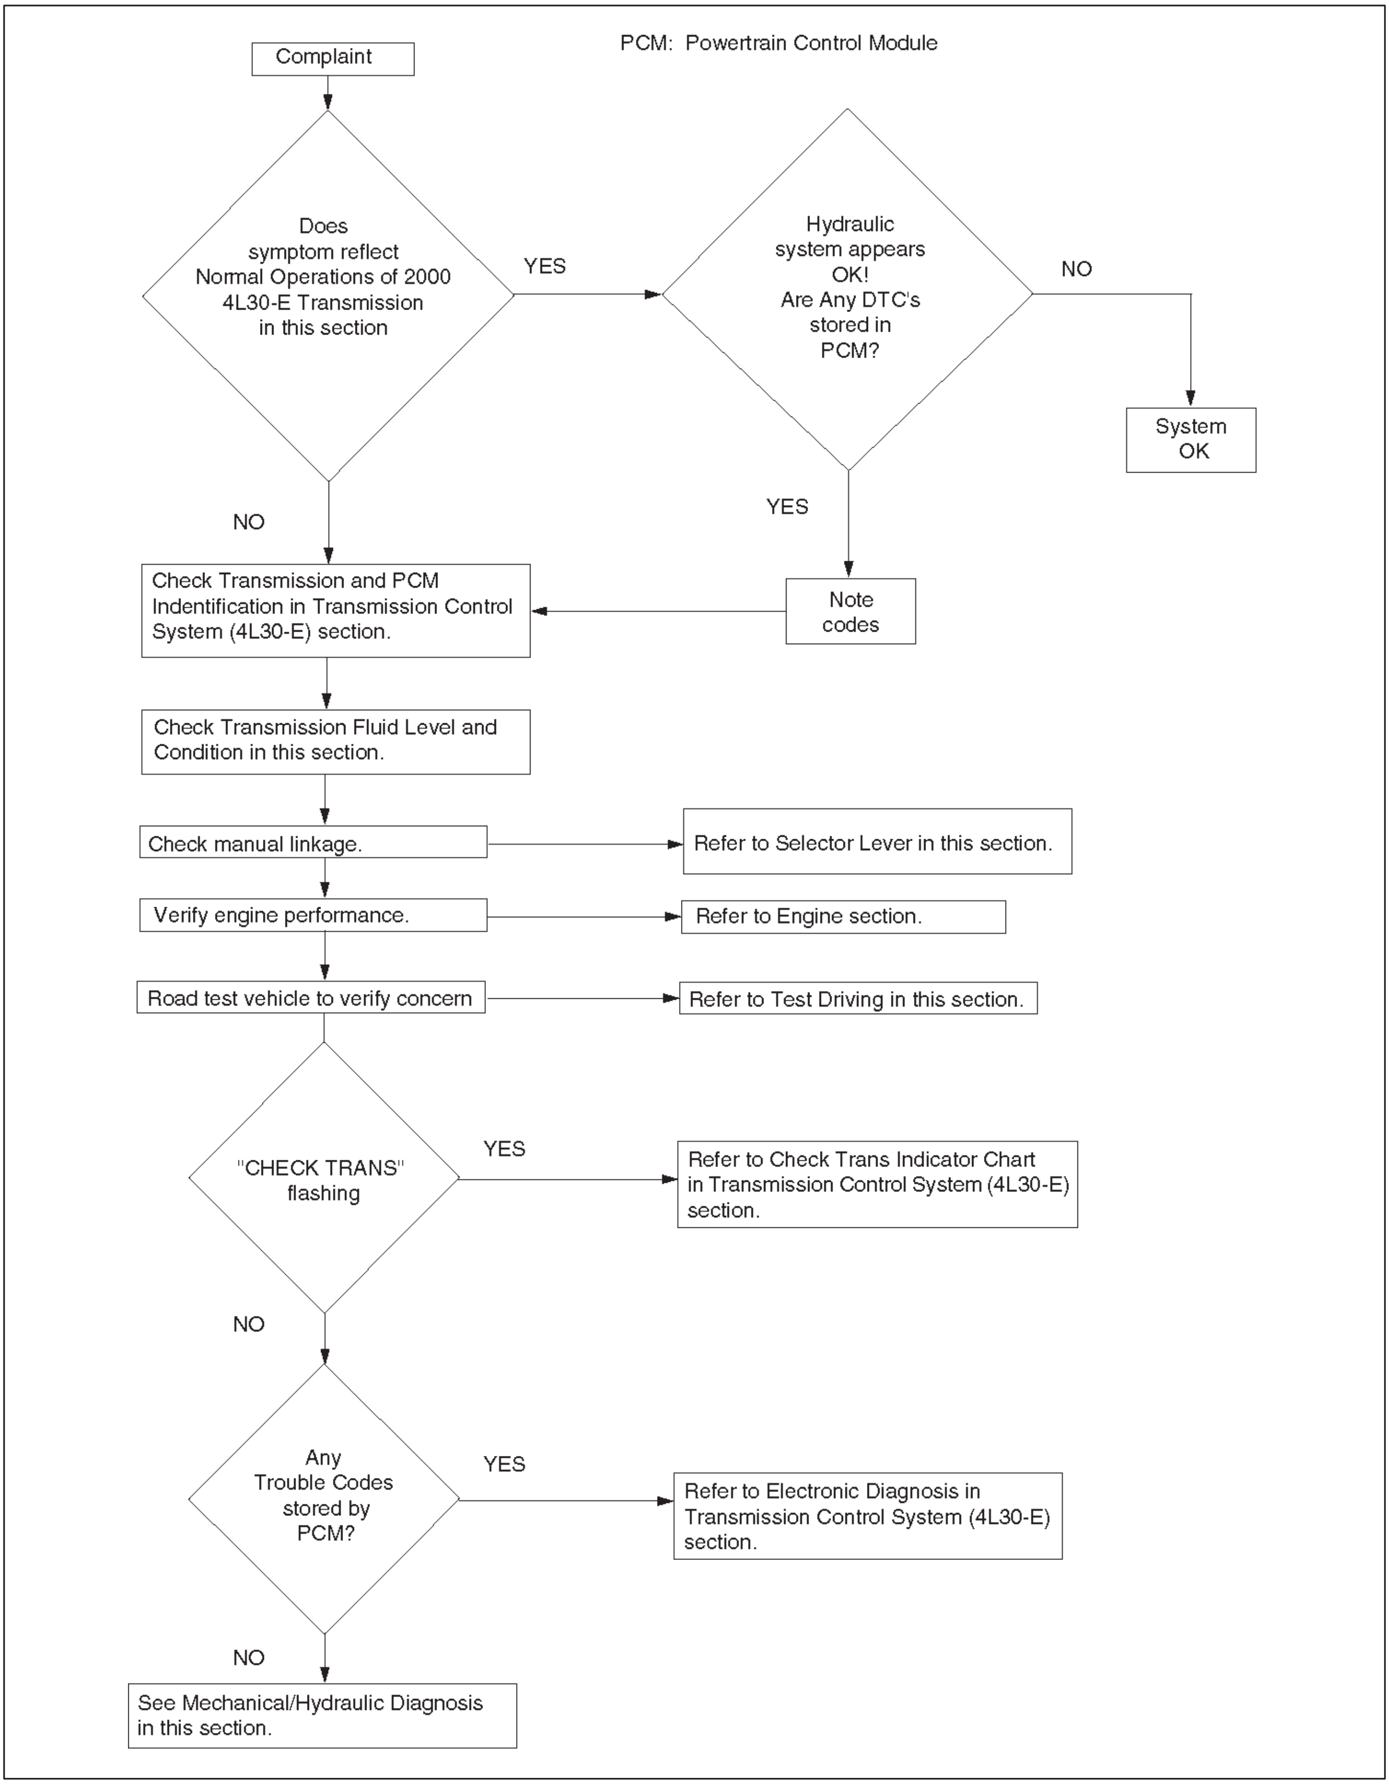
General Diagnosis Procedure



F07RT038

Preliminary Inspection Chart



F07RY00001

Checking Transmission Fluid Level and Condition

Checking fluid level and condition (color and odor) at regular intervals will provide early diagnosis information about the transmission. This information may be used to correct a condition that, if not detected early, could result in major transmission repairs.

IMPORTANT: When new, automatic transmission fluid is red in color. As the vehicle is driven, the transmission fluid will begin to look darker in color. The color may eventually appear light brown.

A dark brown color with burnt odor may indicate excessive fluid deterioration and signal a need for fluid change.

Fluid Level

When adding or changing fluid, use only DEXRON ®–III. Refer to Maintenance and Lubrication in General Information section for maintenance information and servicing interval.

CAUTION: DO NOT OVERFILL.

Overfilling will cause foaming, loss of fluid, abnormal shifting and possible damage to the transmission.

1. Park the vehicle on level ground and apply the parking brake firmly.
2. Check fluid level with engine running at idle.

NOTE: Be sure that transmission fluid temperature is below 30°C (86°F).

3. Move the selector lever through all gear ranges.
4. Move the selector lever to “Park”.
5. Let engine idle for 3 minutes and open the overfill screw (1).
6. Add released transmission fluid until it flows out over the overfill screw opening.
7. Let engine idle until a fluid temperature between 32°C (90°F) and 57°C (135°F) is reached, then close the overfill screw (1).

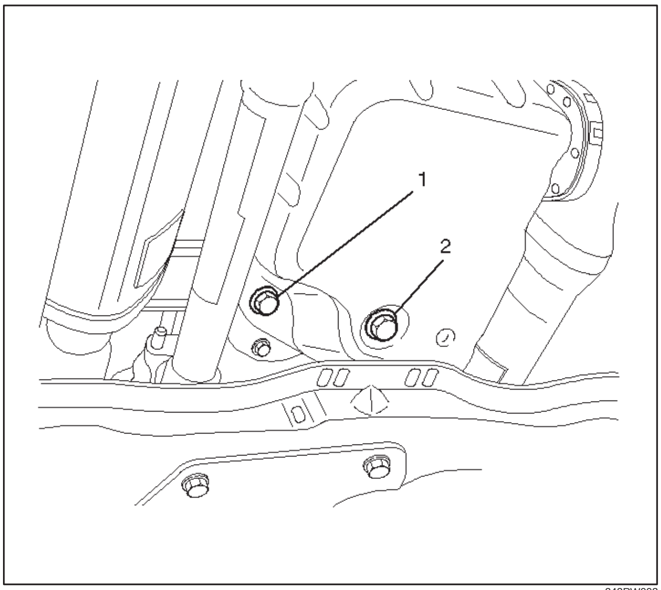
Torque: 38 N•m (28 lb ft)

NOTE: To prevent fluid leaks, the overfill screw and oil drain screws gasket must be replaced each time these screws are removed.

NOTE: Check transmission fluid temperature with scan tool.

Minimum fluid level → 57°C (135°F)

Maximum fluid level → 32°C (90°F)



242RW003

CAUTION: Do not open overfill screw with engine stopped.

CAUTION: DO NOT CHECK FLUID LEVEL UNDER THESE CONDITIONS:

- Immediately after driving at sustained highway speeds.
- In heavy city traffic during hot weather.
- If vehicle is towing a trailer.

If the vehicle has been operated under these conditions, shut the engine off and allow the vehicle to “cool” for thirty (30) minutes. After the cool down period, restart the vehicle and continue from step 2 above.

Fluid Condition

	FLUID CONDITION			
	NORMAL*		CONTAMINATED	
COLOR	RED OR LIGHT BROWN	BROWN	NON–TRANSPARENT / PINK	BROWN
DRAIN REQUIRED?	NO	YES	YES	YES
CONTAMINA–TION	NONE	Very small amount of foreign material in bottom of pan	Contamination by coolant or other source	Large pieces of metal or other foreign material in bottom of pan
CORRECT LEVEL AND CONDITION	1. LOW LEVEL: A. Add fluid to obtain proper level & check for external leaks. B. Correct cause of leak. 2. HIGH LEVEL: – Remove excess fluid	– Remove both pans – Change filter – Flush cooler – Add new fluid – Check level	– Repair/replace radiator cooler – Transmission overhaul required – Check for: ● Damaged plates and seals ● Contaminated solenoids – Flush cooler – Add new fluid – Check level	– Transmission overhaul required – Flush cooler and cooler lines – Add new fluid – Check level

*Fluid should be changed according to maintenance schedule.

Test Driving

Some 4L30–E automatic transmission complaints will require a test drive as a part of the diagnostic procedure. Some codes will not set unless the vehicle is moving. The purpose of the test drive is to duplicate the customer's complaint condition and set a current Powertrain Control Module (PCM) trouble code. Perform this procedure before each 4L30–E automatic transmission repair, and again after repairs are made.

IMPORTANT:

- Duplicate the condition under which the customer's complaint was observed.
- Depending on the complaint, the line pressure gauge and the scan tool may be required during the test drive.
- During the test drive, it is important to record all necessary data from the areas being monitored, for use in diagnosis. Also listen for and note any unusual noises.

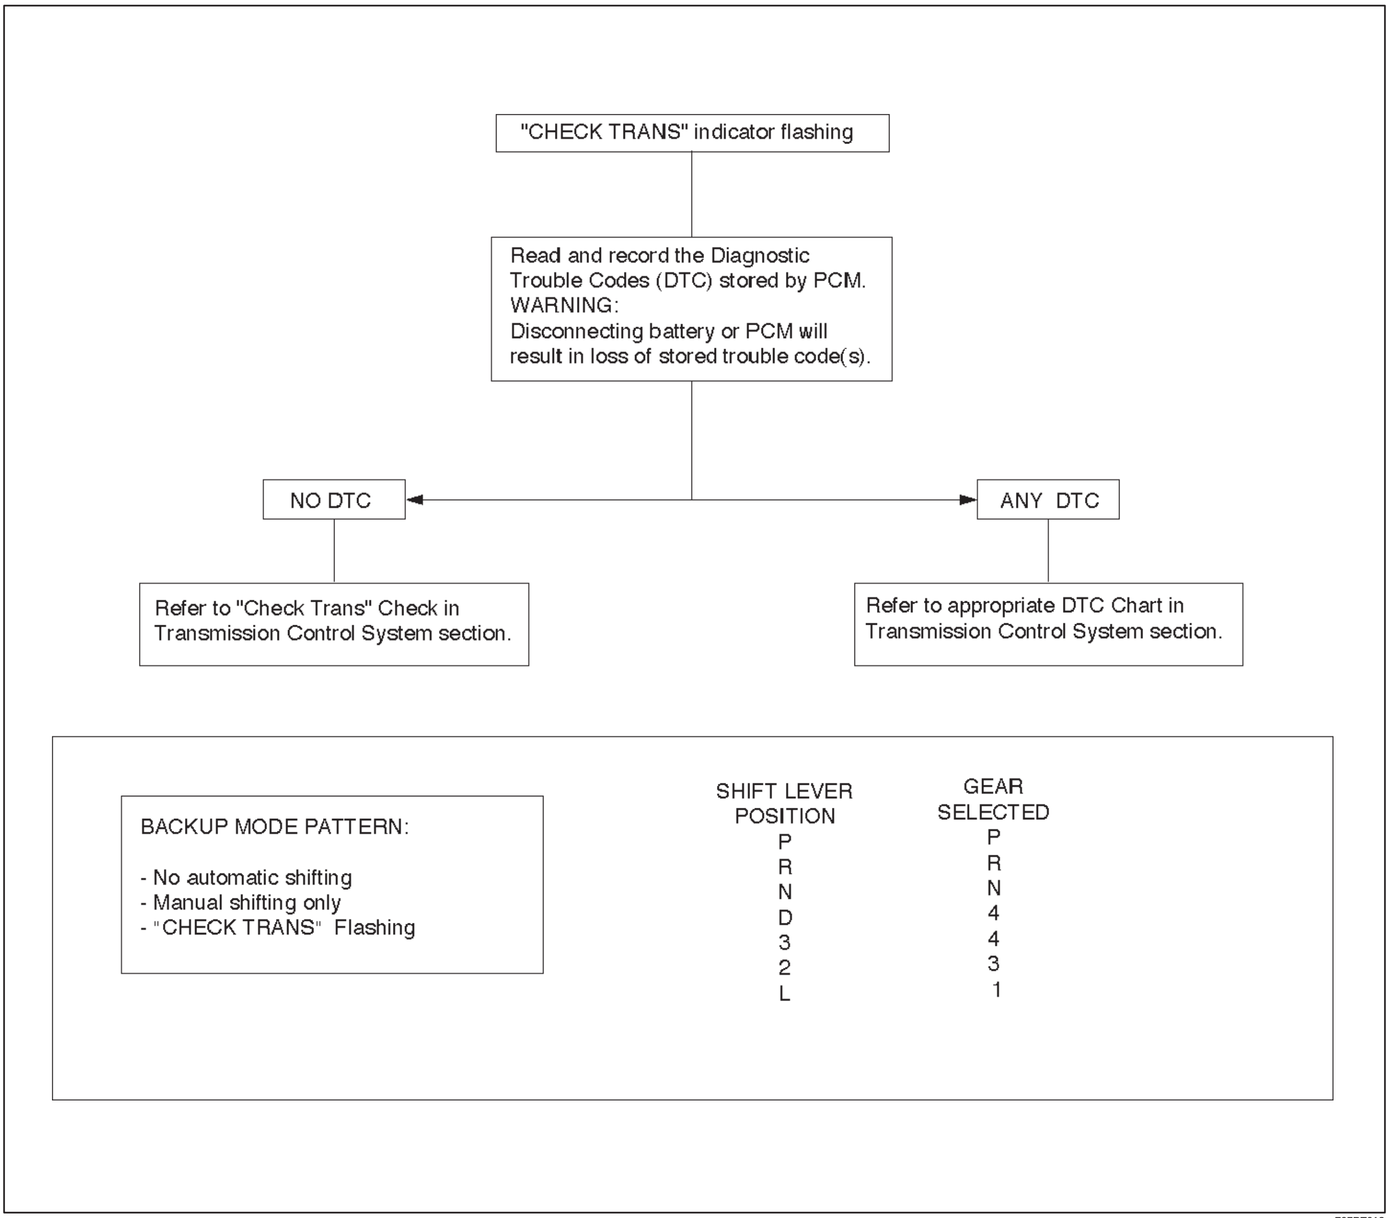
The following procedure should be used to test drive 4L30–E automatic transmission complaint vehicles:

1. Turn the ignition ON without starting the engine. Check that the "CHECK TRANS" lamp comes on for approximately 2 seconds and then goes out and remains out.
   - If the lamp is flashing, GOTO Check Trans Indicator in Transmission Control System (4L30–E) section.
   - If no serial data is present, GOTO OBD System Check. Refer to Driveability and Emissions in Engine section.
   - If the lamp stays ON or stays OFF, GOTO "Check Trans" Check in Transmission Control System (4L30–E) section.
2. Drive the vehicle. During the test drive, be sure that the transmission achieves normal operating temperature (approx. 20 minutes).
   Allow the transmission to go through all of its gear ranges, checking shift timing and firmness. Duplicate the owner's complaint condition as closely as possible during the test drive.
3. If, during the test drive, the "CHECK TRANS" lamp comes on, use the scan tool to check for trouble codes.
4. If, during the test drive, a problem is felt, but the "CHECK TRANS" lamp does not come on and no trouble codes are present, drive the vehicle with the PCM disconnected (manually shifting the vehicle).
   - In Manual L, the vehicle operates in first gear.
   - In Manual 2, the vehicle operates in third gear.
   - In Manual 3 or "D", the vehicle operates in fourth gear.

   If the problem still exists with the PCM disconnected, refer to Mechanical/Hydraulic Diagnosis in this section.
5. If no problem has been found at this point, check all underhood connections that supply power to the PCM and ignition fuses. Physically and visually inspect all the PCM harness connectors for loose or corroded terminals. Inspect the PCM ground points.

Mechanical / Hydraulic Diagnosis Check Trans Indicator Chart

Perform Preliminary Inspection First!



F07RT013

When the “CHECK TRANS” indicator is flashing, it indicates that a problem related to the transmission, the Powertrain Control Module (PCM), or the vehicle harness has occurred.

The system is now operating in a “BACKUP MODE” where the risk of further damaging the transmission has been reduced. The vehicle may be shifted manually.

If the initial problem is intermittent or seldom, switching the engine OFF/ON might allow normal operation again until the problem reoccurs.

Mechanical / Hydraulic Diagnosis Symptoms Index

Perform Preliminary Inspection First!

CHART	SYMPTOMS
1	NO ENGINE START IN NEUTRAL OR PARK
2	NO FORWARD GEARS IN ANY RANGE/NO REVERSE
3	NO ENGINE BRAKE IN ANY RANGE
4	POOR SHIFTING IN ALL GEARS (ALL HARSH OR ALL SOFT)
5a	DELAYS IN DRIVE AND REVERSE
5b	DELAYS IN REVERSE ONLY
6	DIAGNOSTIC TROUBLE CODE (DTC) P0730
7	HARSH 1–2 SHIFT
8	HARSH 3–4 SHIFT
9a	3–2 DOWNSHIFT COMPLAINT
9b	HARSH SHIFT WHEN SHIFTING INTO “D” OR ACCELERATING FROM STOP
9c	COASTDOWN HARSH SHIFT OR CLUNK AT 3–2 DOWNSHIFT
10	INTERMITTENT 4TH TO 2ND GEAR DOWNSHIFT AT STEADY SPEED
11	ENGINE FLARE AT SHIFTING DURING TURNING ONLY (USUALLY WITH WARM ENGINE)
12	ENGINE FLARE DURING 1–2 OR 2–3 SHIFT
13	SHUDDER ONLY DURING TORQUE CONVERTER CLUTCH (TCC) APPLYING
14	POSSIBLE CAUSES OF TRANSMISSION NOISE
15a	POSSIBLE CAUSES OF LOW LINE PRESSURE
15b	POSSIBLE CAUSES OF HIGH LINE PRESSURE
16	POSSIBLE CAUSES OF TRANSMISSION FLUID LEAKS

NOTE: Numbers with parenthesis on the following charts refer to Parts List at end of this section.

Chart 1: No Engine Start In Neutral Or Park

Step	Action	Yes	No
1	Does engine start when shift lever moved from drive to neutral mostly in hot condition?	Go to Step 2	Go to Step 3
2	Does engine start in park at any condition?	Re–test vehicle	Go to Step 4
3	Does engine also not start in neutral when shift lever moved from park to neutral?	Go to Step 4	Go to Step 5
4	Check mode switch (63) setting. Readjust if necessary. Problems fixed?	Re–test vehicle	Go to Step 5
5	Check start circuit of mode switch (63) open in neutral. Was open found?	Locate and repair open(s)	Replace mode switch (63)

Chart 2: No Forward Gears In Any Range/No Reverse

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section
2	1. Check internal linkage: – Manual linkage (58) not moving manual valve (326). 2. Check for internal mechanical damage: – Turbine shaft (506) broken loose. – Overrun roller clutch (516) broken loose. Was the problem found?	Repair or replace	—

Chart 3: No Engine Brake In Any Range

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section
2	1. Check for overrun clutch leaks caused by: – Damaged piston lip (513) – Check ball defective (504) 2. Check for overrun lockout valve (705) stuck by foreign material. 3. Check for leaks at turbine shaft (506) caused by: – Teflon seal rings damaged (508) – Excessive wear of turbine shaft bearing surfaces. Was the problem found?	Repair or replace	—

Chart 4: Poor Shifting In All Gears (All Harsh Or All Soft)

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Go to Step 3
2	1. Check for these conditions which could affect clutch apply time: – Defective band apply solenoid (323). – Defective servo or/and accumulator piston. – Excessive clutch piston travel. 2. Check of possible causes of internal leaks: – Cut or damaged sealing ring(s) – Damaged sealing gasket(s) – Check ball missing or out of location in 2nd and 3rd clutch pistons. 3. Check for causes of burned clutch plates or band. Was the problem found?	Repair or replace	—
3	Was the line pressure high?	Go to Step 4	Use Chart 15a: Possible Causes of Low Line Pressure in this section
4	Does DTC P0705 set?	Diagnose those DTC(s) first	Use Chart 15b: Possible Causes of High Line Pressure in this section

Chart 5a: Delays In Drive And Reverse

NOTE: A short delay (less than 3 seconds) when first engaging drive or reverse after allowing vehicle to sit overnight is normal.

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	More than 3 second delay in drive and reverse with engine off 1 hour or less. Teflon seals (508) on turbine shaft damaged. Repair	Use Chart 15a: Possible Causes of Low Line Pressure in this section.

Chart 5b: Delays In Reverse Only

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	Main case valve body gasket (88) damaged. – Reverse check ball (85) in valve body (84) missing or out of location. – Check for restrictions at valve body transfer plate orifice. Was the problem found?	Repair	—

Chart 6: Diagnostic Trouble Code (DTC) P0730

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section
2	1. 1st and 2nd gear missing or 3rd and 4th gear missing. Check appropriate shift valve. If OK replace solenoid. 2. No engine brake in any range (All ranges in Drive and Reverse are OK). Check for suspected conditions modifying delays to clutch apply: – Overrun clutch seal damaged. – Excessive overrun clutch piston travel. – Defective 3–4 accumulator piston. – Causes of internal leaks. – Causes of burned clutch plates. 3. 1st and 4th gear missing or 2nd and 3rd gear missing. Shift solenoid A stuck. Replace shift solenoid A. 4. DTC P0730 is set in D range 1st gear above 3500 rpm. Go to Step 3. 5. DTC P0730 is set in D range 3rd gear between 55-80 mph. NOTE: Perform this test within safe and legal limits. Check for suspected conditions modifying delays to clutch apply: – 4th clutch seal damaged. – Excessive 4th clutch piston travel. – Defective 3–4 accumulator piston. – Causes of internal leaks. – Causes of burned clutch plates. Was the problem found?	Repair or replace	—
3	Check 3rd gear in “D” in winter mode. Does vehicle move?	Shift solenoid A stuck. Replace shift solenoid A.	Go to Step 4
4	Check for suspected conditions modifying delays to clutch apply: – 2nd clutch seal damaged. – Excessive 2nd clutch piston travel. – Defective accumulator piston. – Causes of internal leaks. – Check ball missing or out of location in 2nd clutch. – Seals cut, damaged or missing. – Gaskets defective. – Causes of burned clutch plates. Was the problem found?	Repair or replace	—

Chart 7: Harsh 1–2 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Check for 1–2 accumulator valve (320) stuck by foreign material in main case valve body.	Use Chart 15b: Possible Causes of High Line Pressure in this section.

Chart 8: Harsh 3–4 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section
2	1. Check for 3–4 accumulator valve (407) stuck in adapter case valve body (401). 2. Check for 3–4 accumulator piston (18) stuck in adapter case (20). Was the problem found?	Repair or replace	—

Chart 9a: 3–2 Downshift Complaint

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section
2	Does DTC P1850 set?	Diagnose P1850 first	Replace band apply solenoid (PWM) (323)

Chart 9b: Harsh Shift When Shifting Into “D” Or Accelerating From Stop

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section
2	Does DTC P1850 set?	Diagnose P1850 first	Replace band apply solenoid (PWM) (323)

Chart 9c: Coastdown Harsh Shift Or Clunk At 3–2 Downshift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section
2	Does DTC P1850 set?	Diagnose P1850 first	Replace band apply solenoid (PWM) (323)

Chart 10: Intermittent 4TH TO 2ND Gear Downshift At Steady Speed

Step	Action	Yes	No
1	Check for consistent speed sensor reading with scan tool. Was the reading correct?	Replace mode switch for intermittent contact.	Go to Step 2
2	1. Check for wiring harness damage or short to ground. If OK, go to (2). 2. Check transmission speed sensor connections. If OK, go to (3). 3. Replace transmission speed sensor. Was the replacement complete?	—	Replace speed sensor.

Chart 11: Engine Flare At Shifting During Turning Only (Usually With Warm Engine)

Step	Action	Yes	No
1	Check for oil leaks at transmission. Was the problem found?	Replace transmission oil filter and gasket	—

Chart 12: Engine Flare During 1–2 Or 2–3 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section
2	1. Check for a stuck 1–2 accumulator valve (320). 2. Check for servo piston (106) leaks. 3. Check for a stuck band apply solenoid (323). Was line pressure normal?	Repair or replace	—

Chart 13: Shudder Only During Torque Converter Clutch (TCC) Applying

Step	Action	Yes	No
1	1. TCC shudder is one of the most commonly misdiagnosed conditions in an automatic transmission. The key to diagnosing TCC shudder is to note when it happens and under what conditions. Once the TCC has been fully applied, it is nearly impossible to make it shudder. TCC shudder (short burst of noise normally less than 1 second) will only occur during clutch applying. It is not a steady state condition. 2. Drive until whole drivetrain is at normal operating temperature. – On 4WD vehicles, the test must be performed with transfer case selector lever in “2H” position. – Shudder is a short burst of noise normally less than 1 second in duration, and can be induced by the following maneuver: 3. From coast condition at 50 mph in “D” range (Normal mode), depress the throttle to 1/4-1/3 throttle. If present, shudder will occur within 5 seconds together with TCC application.(The scan tool may be used to determine the exact time of TCC applying) Was the problem found?	Replace transmission fluid and filter (remove both pans) and flush cooler lines. Replace converter assembly and O-ring on turbine shaft	Perform mechanical inspection of other drivetrain components.

Chart 14: Possible Causes Of Transmission Noise

CAUTION: Before checking transmission for what is believed to be transmission noise, ensure presence and positioning of insulating plugs, pads etc. Also make sure that noise does not come from other drivetrain components.

Condition	Possible cause	Correction
Whine or Buzz	Oil level low	Fill with ATF, check for external leaks.
	Plugged or restricted oil filter	Inspect oil filter. Replace oil filter or ATF as necessary.
	Damaged oil filter gasket	Replace oil filter gasket.
Knocking noise from front of transmission.	Loose bolts (Converter to flex plate)	Tighten to specifications.
	Cracked or broken flex plate	Replace flex plate.
	Converter damaged	Replace converter.
Knocking noise while driving, mostly on acceleration.	Transmission mount loose or broken	Tighten mount bolts or replace transmission mount.
	Cooler line mounts loose or broken	Tighten or replace cooler line mounts.
	Cooler lines touching body or frame	Repair or replace as necessary.
Knocking noise when vehicle is stationary.	Loose flex plate mounting bolts	Tighten to specifications.
	Cracked or broken flex plate	Replace flex plate.
	Damaged converter	Replace converter.

Chart 15a: Possible Causes of Low Line Pressure

Step	Action	Yes	No
1	Check oil level. Was the problem found?	Fill with ATF	Go to Step 2
2	Check for defective throttle position sensor. Was the problem found?	Replace throttle position sensor	Go to Step 3
3	Check for plugged, loose, or damaged oil filter (79). Was the problem found?	Inspect oil filter, tighten bolts or replace oil filter (79)	Go to Step 4
4	Check for a stuck force motor plunger (404). (Adapter case valve body) Was the problem found?	Replace force motor plunger (404)	Go to Step 5
5	Check for a stuck feed limit valve (412). (Adapter case valve body) Was the problem found?	Replace feed limit valve (412)	Go to Step 6
6	Check for loose converter bolts (4 & 5). Was the problem found?	Tighten converter bolts (4 & 5)	Go to Step 7
7	Check for a stuck pressure regulator valve (217). (Oil pump) Was the problem found?	Replace pressure regulator valve (217)	Go to Step 8
8	Check for a stuck boost valve (213).(Oil pump) Was the problem found?	Replace boost valve (213)	Go to Step 9
9	Check for blocked intermediate oil passages to pressure regulator valve. (Oil pump) Was the problem found?	Replace oil pump	Go to Step 10
10	Check for defective oil pump (9, 201, 202 & 228). Was the problem found?	Replace oil pump	Go to Step 11
11	Check for internal leaks. – Check balls missing or out of location in valve bodies – Seals cut or damaged – Gaskets defective, etc. Was the problem found?	Install balls, or correct ball location Replace seals Replace gaskets	—

Chart 15b: Possible Causes Of High Line Pressure

NOTE: If transmission is operating in backup mode, high line pressure will be present.

Step	Action	Yes	No
1	Check for defective throttle position sensor. Was the problem found?	Replace throttle position sensor.	Go to Step 2.
2	Check for a stuck force motor plunger (404). (Open circuit/intermittent) (Adapter case valve body) Was the problem found?	Replace force motor plunger (404)	Go to Step 3
3	Check for a stuck feed limit valve (412). (Adapter case valve body) Was the problem found?	Replace force motor plunger (412)	Go to Step 4
4	Check converter bolts (4 & 5). Was the problem found?	Tighten converter bolts (4 & 5)	Go to Step 5
5	Check for a stuck pressure regulator valve (217). (Oil pump) Was the problem found?	Replace pressure regulator valve (217)	Go to Step 6
6	Check for a stuck boost valve (213). (Oil pump) Was the problem found?	Replace boost valve (213)	Go to Step 7
7	Check for internal leaks. – Check balls missing or out of location in valve bodies – Seals cut or missing – Gaskets defective, etc. Was the problem found?	Install balls, or correct ball location Replace seals Replace gaskets	—

Chart 16: Possible Causes Of Transmission Fluid Leaks

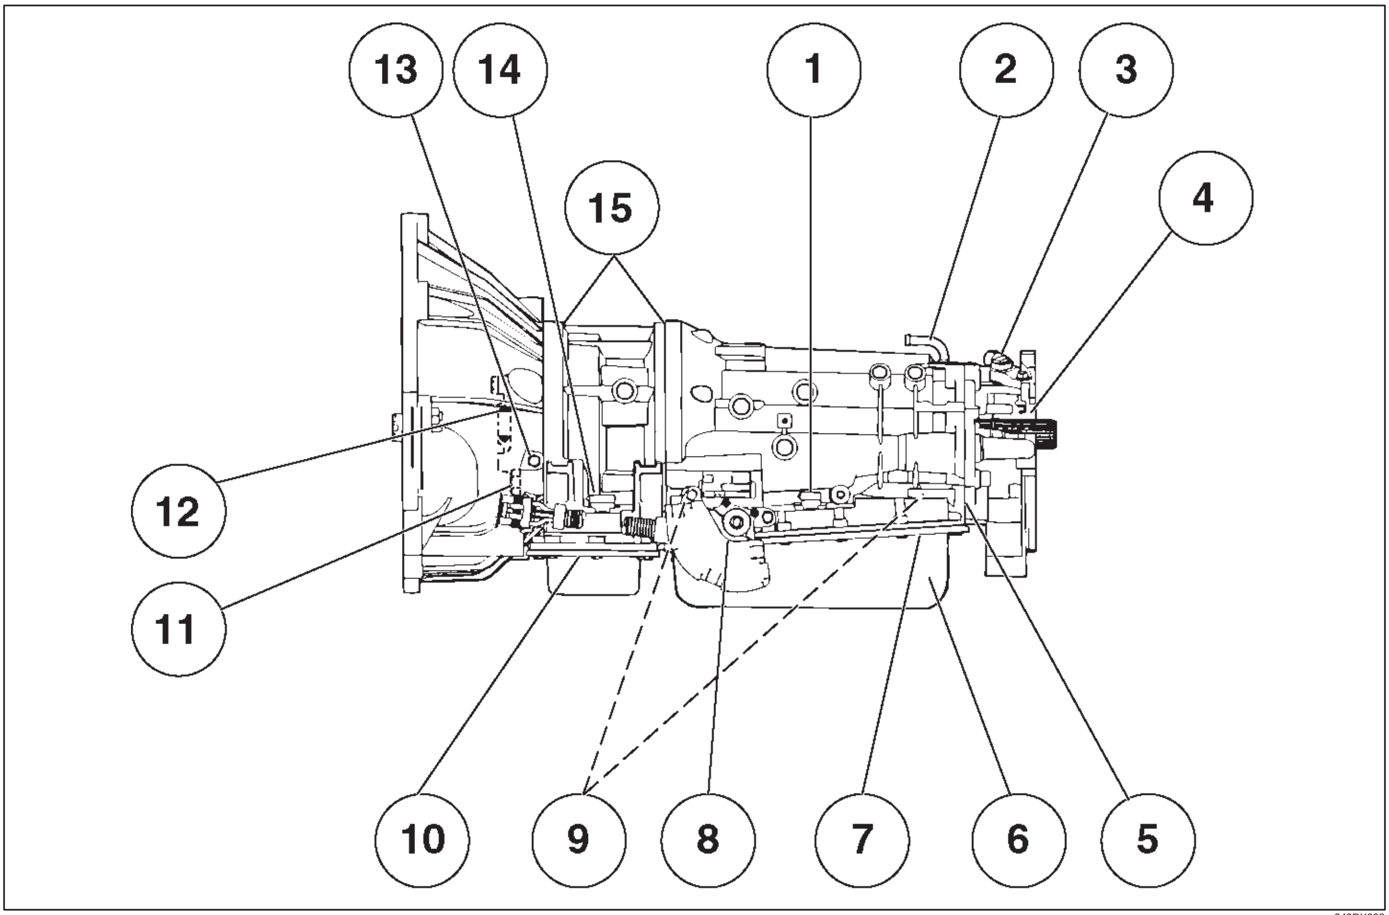
Before attempting to correct an oil leak, the actual source of the leak must be determined. In many cases, the source of the leak may be difficult to determine due to “wind flow” around the engine and transmission.

The suspected area should be wiped clean before inspecting for the source of the leak.

Oil leaks around the engine and transmission are generally carried toward the rear of the vehicle by the air stream. In determining the source of an oil leak, the following two checks should be made:

1. With the engine running, check for external line pressure leaks.
2. With the engine off, check for oil leaks due to the raised oil level caused by drainback of converter oil into the transmission.

Possible Causes Of Fluid Leaks Due To Sealing Malfunction



Legend

(1) Electrical Connector (Main Case) Seal

Stall Test

The stall test allows you to check the transmission for internal abrasion and the one way clutch for slippage. Torque converter performance can also be evaluated.
The stall test results together with the road test results will identify transmission components requiring servicing or adjustment.

Stall Test Procedure:

1. Check the level of the engine coolant, the engine oil, and the automatic transmission fluid. Replenish if necessary.
2. Block the wheels and set the parking brake.
3. Connect a tachometer to the engine.
4. Start the engine and allow it to idle until the engine coolant temperature reaches 70 – 80˚C (158 – 176˚F).
5. Hold the brake pedal down as far as it will go.
6. Place the selector in the "D" range.
7. Gradually push the accelerator pedal to the floor.
   The throttle valve will be fully open.
   Note the engine speed at which the tachometer needle stabilizes.

Stall Speed : 2,100 ±150 rpm

NOTE: Do not continuously run this test longer than 5 seconds.

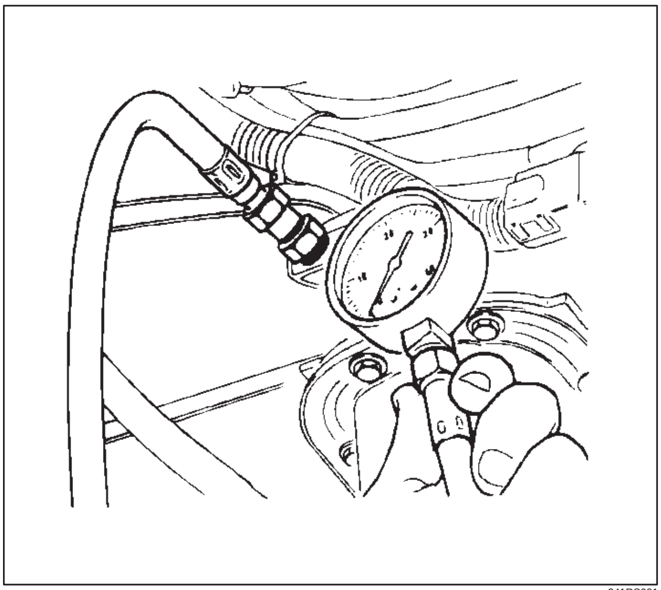
8. Release the accelerator pedal.
9. Place the selector in the "N" range.
10. Run the engine at 1,200 rpm for one minute.
    This will cool the transmission fluid.
11. Repeat Steps 7 – 10 for the "3", "2", "L" and "R" ranges.

Line Pressure Test

The line pressure test checks oil pump and control valve pressure regulator valve function. It will also detect oil leakage.

Line Pressure Test Procedure:

1. Check the level of the engine coolant, the engine oil, and the automatic transmission fluid.
   Replenish if required.
2. Block the wheels and set the parking brake.
3. Remove the pressure detection plug at the left side of the transmission case.
   Set J–29770–A pressure gauge and adapter to the pressure detection plug hole.



241RS001

4. Start the engine and allow it to idle until the engine coolant temperature reaches 70 – 80˚C (158 – 176˚F).
5. Hold the brake pedal down as far as it will go.
6. Place the selector in the "D" range.
7. Note the pressure gauge reading with the engine idling.
8. Gradually push the accelerator pedal to the floor. The throttle valve will be fully open.
   Note the pressure gauge reading with the accelerator pedal fully depressed.

NOTE: Do not continuously run this test longer than 5 seconds.

9. Release the accelerator pedal.
10. Place the selector in the "N" range.
11. Run the engine at 1,200 rpm for one minute.
    This will cool the transmission fluid.
12. Repeat Steps 7 – 11 for the "3", "2", "L", and "R" ranges.
13. Install a pressure detection plug to the transmission case, applying recommended thread locking agent (LOCTITE 242) or its equivalent to thread of plug. Make sure that thread is cleaned before applying locking agents.
14. Tighten the pressure detection plug to the specified torque.

Torque: 9 – 14N·m (7 – 10lb ft)

MODE	LEVER POSITION	ENGINE SPEED	LINE PRESSURE		FORCE MOTOR CURRENT (mA)
			kPa	PSI	
NORMAL/POWER	D,3,2,L	IDLE	590 – 730	86 – 106	680 – 720
WINTER	D	IDLE	300 – 390	44 – 57	1,020 – 1,060

Changing Transmission Fluid

There is no need to change the transmission fluid unless the transmission is used under one or more of the following heavy duty conditions.

A. Repeated short trips
B. Driving on rough roads
C. Driving on dusty roads
D. Towing a trailer

If the vehicle is used under these conditions, change the fluid every 20,000 miles (32,000 km).

1. Place a large drain pan under the oil pan.
2. Remove the transmission oil drain screw (2) and drain fluid.
3. Tighten drain screw (2).

   Torque: 38 N•m (28 lb ft)

4. Remove the transmission overfill screw (1) and fill transmission through overfill screw opening, using DEXRON®–III ATF.

NOTE: Add transmission fluid until it flows out over the overfill screw opening.

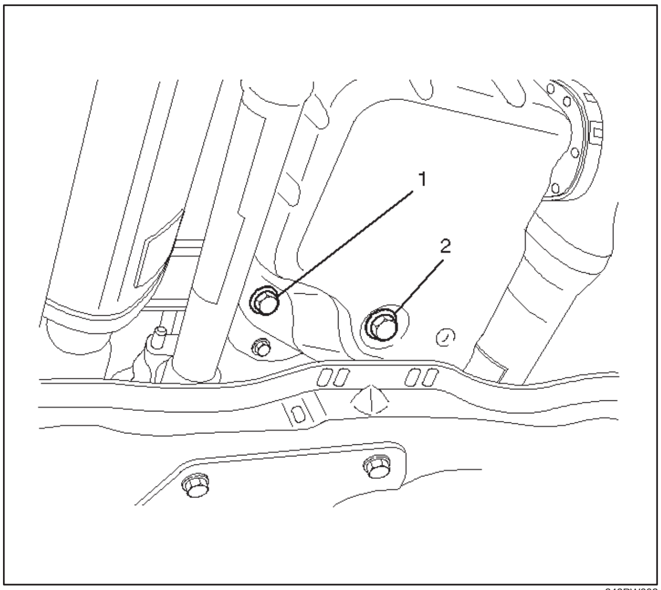
5. Let engine idle until a fluid temperature between 32˚C (90˚F) and 57˚C (135˚F) is reached.
6. Add transmission fluid until it flows out over the overfill screw opening, then close the overfill screw (1).

   Torque: 38 N•m (28 lb ft)

NOTE: To prevent fluid leaks, the overfill screw and oil drain screws gasket must be replaced each time these screws are removed.

NOTE: Check transmission fluid temperature with service scan tool.

7. Reset "Oil Life Monitor" data by using Tech 2.
   Refer to Tech 2 OBD II Connection in Transmission Control System (4L30-E) section.

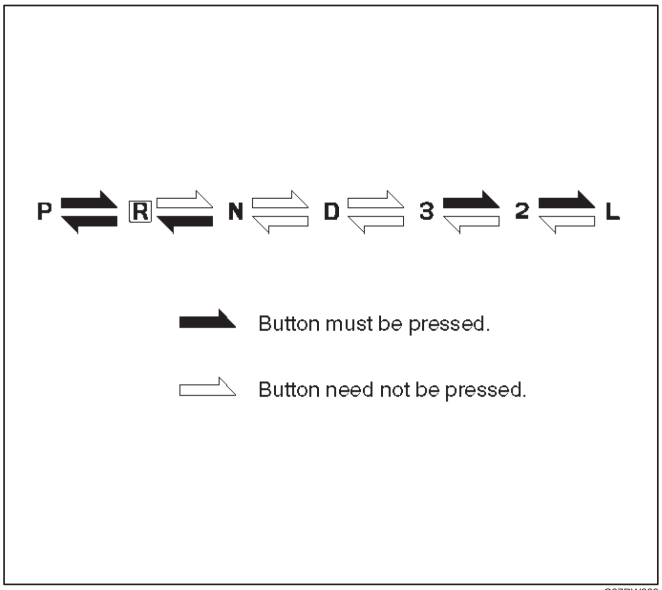


242RW003

Selector Lever

Inspection

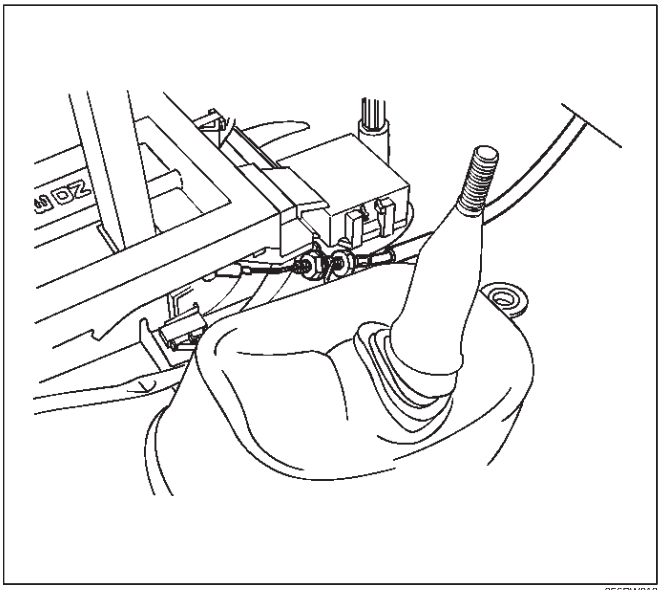
1. Make sure that when the selector lever is shifted from "P" to "L", a "clicking" can be felt at each shift position. Make sure that the gear corresponds to that of the position plate indicator.
2. Check to see if the selector lever can be shifted as shown in illustration.



C07RW009

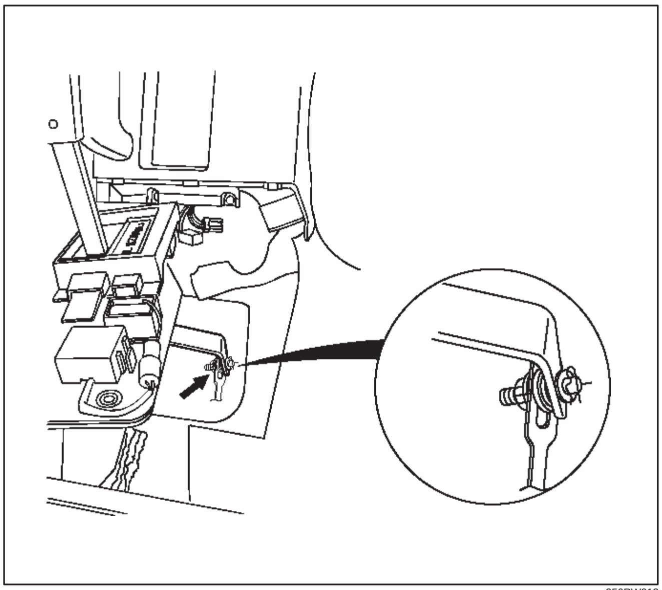
Removal

1. Disconnect battery ground cable.
2. Remove transfer control lever knob (4×4).
3. Remove front console.
   - Disconnect wiring harness connectors from front console.
4. Disconnect shift lock cable (1) from the selector lever assembly side.



256RW012

5. Disconnect shift control rod (2) from the selector lever assembly side.



256RW013

6. Disconnect wiring harness connectors from the selector lever assembly.
7. Remove selector lever assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

Adjustment of select lever and control rod

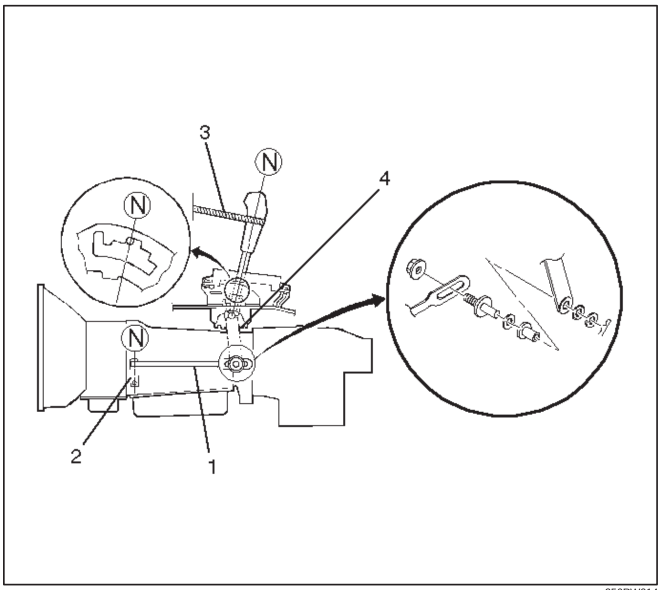
1. Place the vehicle on a level surface.

NOTE: If the vehicle is not on level surface, the shift select cable set positions will vary with the movement of engine. To prevent possible misadjustment of the cable, the vehicle must be placed on a level surface.

2. Install the shift control rod (1) to the transmission select lever (2), and then place the lever in the "N" position.
3. Set select lever in the "N" position.
4. Push select lever forward ("R" position side) and secure it (using a rubber band (3), etc.) so that the pin comes into contact with the wall of the detent plate.
5. Install the shift control rod (1) to the selector lever arm (4).

Torque: 32 N•m (24 lb ft)

NOTE: Do not apply oil to the threaded portions.



256RW014

6. After adjustment, make sure that the selector lever operates normally, and that each selector position is properly indicated. (The red mark shows through the window.)

Adjustment of shift lock cable

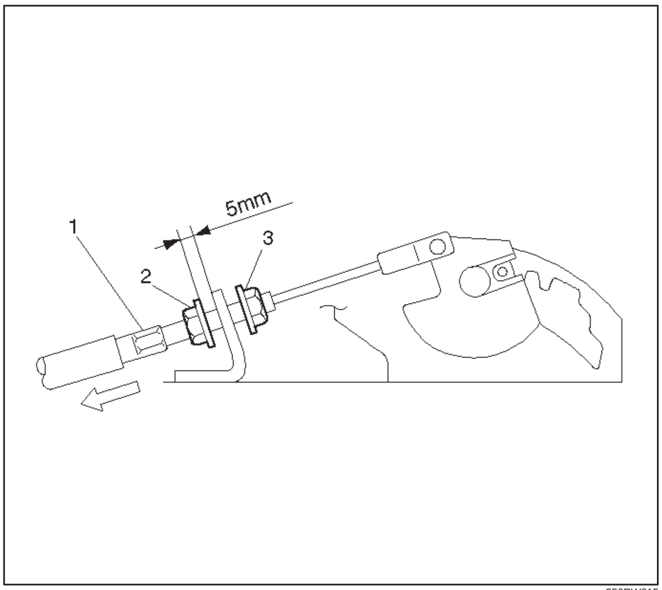
1. Set ignition key in "LOCK" position and selector lever in "P" position.
2. Adjust cable screw cap on selector lever side to provide a gap (slack for cable) of 1 – 2 mm between rod on steering lock side and stopper.

   Adjust cap as follows:

   a. Pull screw cap (1) in arrow direction to remove inner cable slack.
   b. With cable kept as (a), adjust gap between nut (2) and bracket to 5 mm (0.2 in).
   c. Lock inner cable by turning nut (3) while holding nut (2) in place.

Torque : 3.7 N•m (33 lb in)

NOTE: Clean the cable threads, and do not apply oil to them.



256RW015

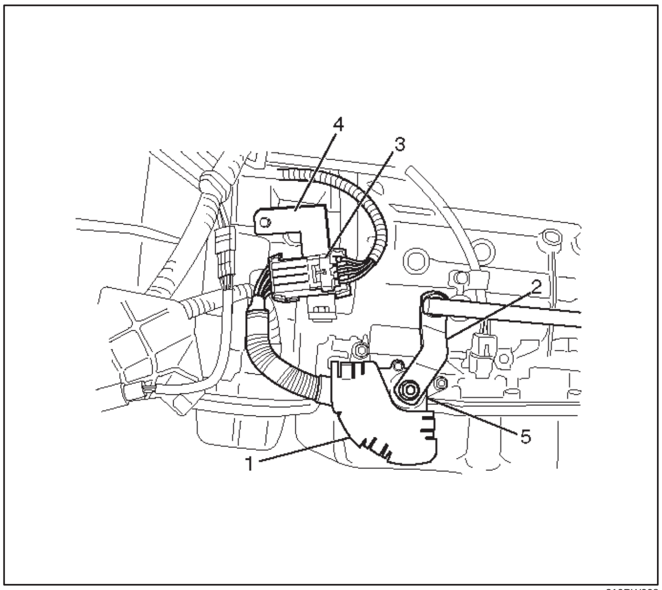
3. Check the shift lock operation:
   a. Selector lever should not move out of “P” position with ignition key in “Lock” position.
   b. Selector lever can be moved out of “P” position with ignition key in “ON” position only when brake pedal is depressed.
   c. Ignition key can be turned to “LOCK” position only when selector lever is in “P” position (key can be pulled out).

   If (a) and (c) fail, readjust cable. If (b) fails, readjust connector wiring and brake pedal switch.

Mode Switch

Removal

1. Place selector lever in neutral.
2. Disconnect battery ground cable.
3. Remove mode switch cover (1).
4. Disconnect selector lever (2) from the mode switch.
5. Disconnect transmission harness from the mode switch connector (3).
6. Remove bracket with mode switch connector from the transmission case.
7. Remove mode switch connector (3) from the bracket (4).
8. Remove two mode switch bolts and nut then remove mode switch (5).



210RW008

Installation

To install, follow the removal steps in the reverse order, noting the following points;

1. Torque

   Mode switch bolt: 13 N•m (113 lb in)

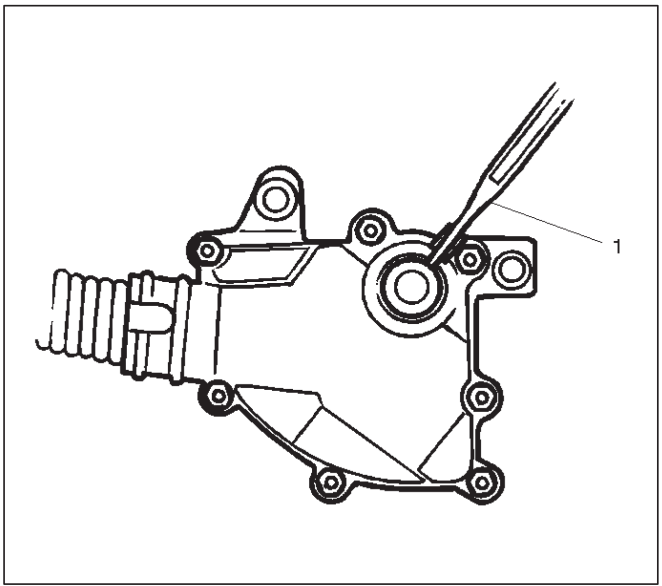
   Selector lever nut: 23 N•m (17 lb ft)

2. Mode switch setting procedure

   Perform either of the following adjustment procedures:

   Procedure 1

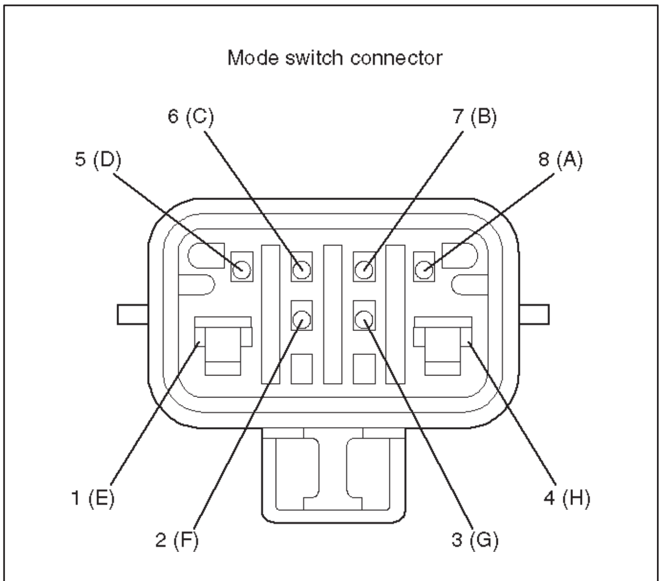
   a. Place selector lever in neutral.
   b. Remove selector lever from the mode switch.
   c. Remove the mode switch cover.
   d. Loosen the two 10 mm screws.
   e. Rotate the mode switch until the slot in the mode switch housing aligns with the selector shaft bushing, and insert a 3/32 in. (2.4 mm) drill bit or punch (1) into the slot.
   f. Tighten the screws to 13 N·m (113 lb in).
   g. After completing adjustment, snap the mode switch cover into place.
   h. Reinstall the selector lever.



249RW001

Procedure 2

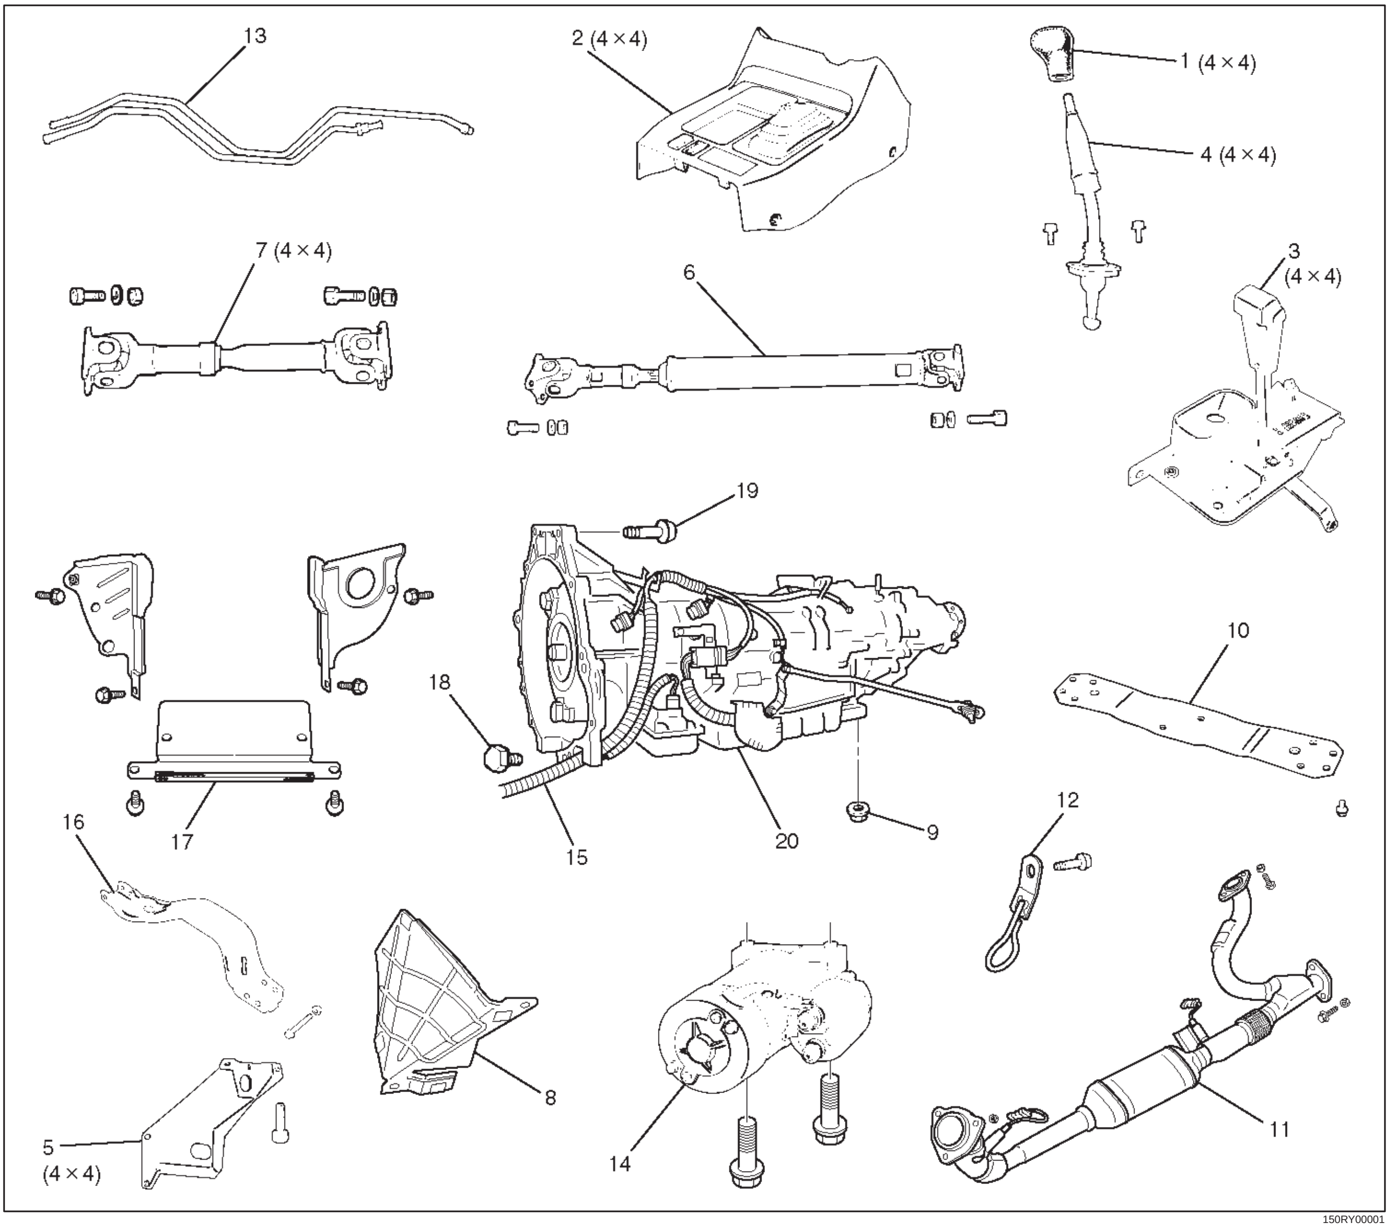
a. Place selector lever in neutral.
b. Disconnect transmission harness connector from mode switch connector.
c. Remove mode switch connector with bracket from the transmission case.
d. Connect multimeter (resistance mode) to terminals 1(E) and 4(H) on mode switch connector.
e. Loosen two mounting screws.
f. Rotate mode switch slightly in both directions to determine the range (approx. 5 degrees) of electrical contact.
g. Position mode switch in middle of contact range.
h. Tighten two mounting screws.
i. Remove multimeter and install mode switch harness connector with bracket to the transmission case.
j. Connect transmission harness connector to mode switch connector.



F07RW003

Transmission (With Transfer Case / Extension Assembly)

Transmission And Associated Parts



Legend

(1) Transfer Control Lever Knob (4×4)
(2) Front Console
(3) Selector Lever Assembly
(4) Transfer Control Lever (4×4)
(5) Transfer Protector (4×4)
(6) Rear Propeller Shaft
(7) Front Propeller Shaft (4×4)

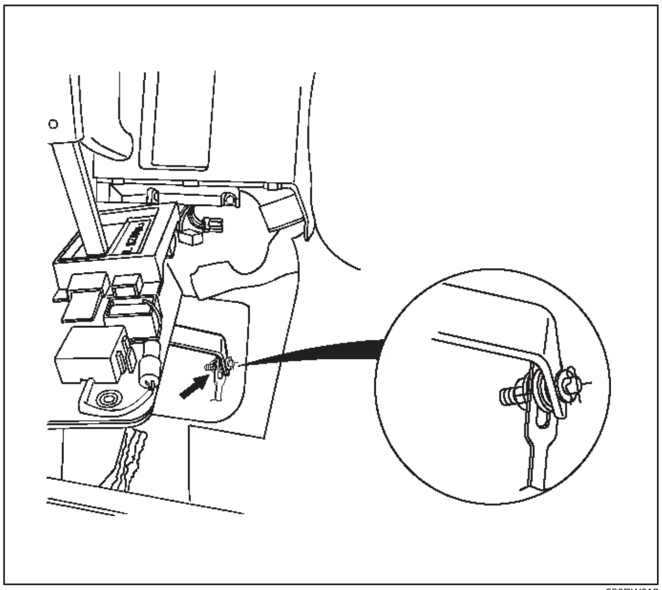
(17) Under Cover
(18) Torque Converter Bolt
(19) Engine Transmission Bolt
(20) Transmission Assembly (With Transfer Case / Extension Assembly)

Removal

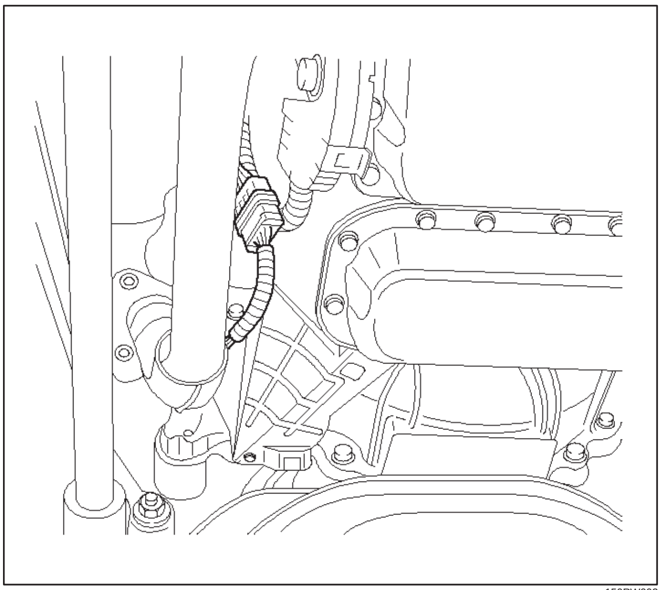
NOTE: Before remove transmission and transfer assembly from vehicle, change the tansfer mode to 2WD using push button on dash panel.

1. Remove engine hood.
2. Disconnect battery ground cable.
3. Remove transfer control lever knob (1) (4×4) and disconnect wiring harness connectors, then remove front console (2).
4. Remove selector lever assembly (3).
5. Remove transfer control lever (4) (4×4).
6. Remove transfer protector (5) (4×4).
7. Disconnect shift control rod from the selector lever assembly side.



256RW013

8. Remove rear propeller shaft (6).
9. Remove front propeller shaft (7) (4×4).
10. Remove harness protector (8).
11. Support transfer case (4×4) or transmission (4×2) with a jack and remove two rear mount nuts (9) from the 3rd crossmember side.
12. Remove eight third crossmember bolts and third crossmember (10).
13. Remove front exhaust silencer mounting nuts.
14. Remove left seat belt tension rod.
15. Disconnect two left side oxygen sensor connectors from the transmission harness.

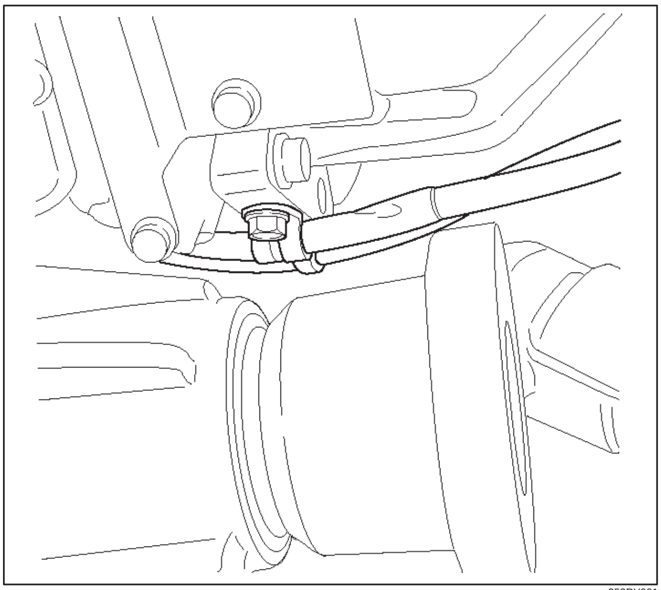


150RW002

16. Remove left catalytic converter assembly (11).
17. Loosen right catalytic converter nuts to exhaust manifold.

NOTE: This will make the next steps easier.

18. Disconnect transmission oil cooler pipe (12) from A/T side.
19. Remove oil pipe clamp from torque converter housing bracket.



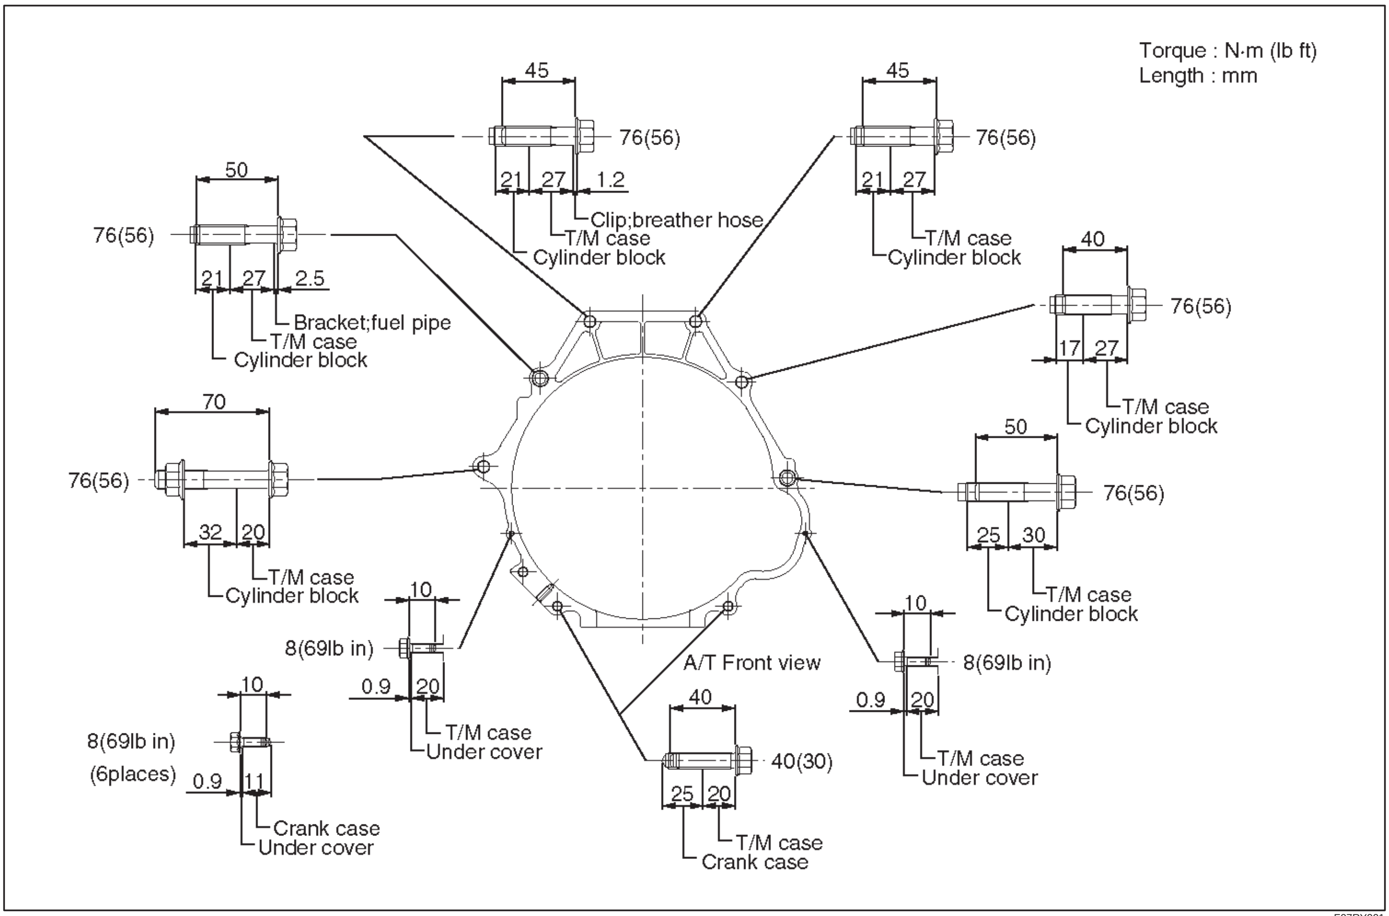
253RY001

20. Loosen oil pipe clamp bolt at the engine mount side.
21. Remove starter (14).
22. Disconnect fuel pipe clamp brackets from transmission side.
23. Disconnect transmission harness connectors (15) from transmission, transfer, and right catalytic converter.
24. Remove front crossmember (16).
25. Remove under covers (3 pieces) (17) from transmission case.
26. Remove flex plate torque converter fixing bolts (6 pieces) (18) by turning crankshaft.

27. Support the transmission with a transmission jack, and hoist engine with a chain block.
28. Remove engine transmission fixing bolts (19).
29. Remove transmission assembly with transfer case (4×4) / extension assembly (4×2) (20).
30. Remove transfer case / extension assembly from the transmission assembly if necessary.

Installation

1. Slowly raise transmission jack until front of the transmission is aligned with rear of the engine, then install transmission assembly.
2. Tighten engine transmission bolts, to the specified torque.

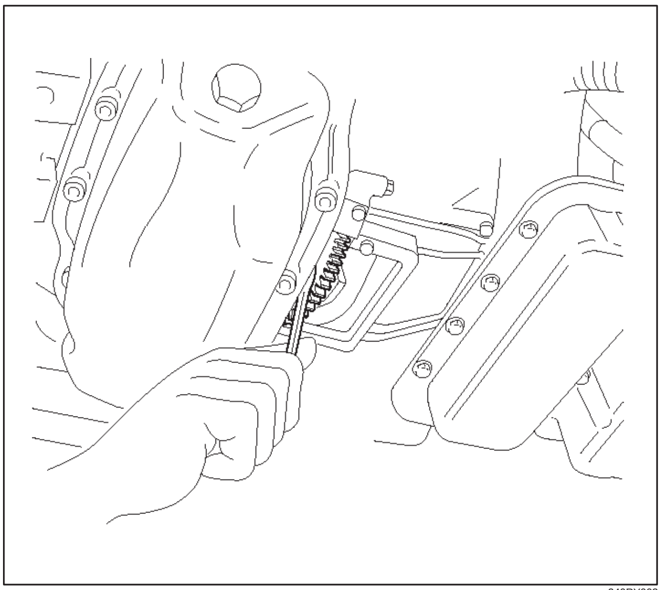


F07RY001

3. Support transfer case with a jack, and remove the transmission jack.
4. Install flex plate torque converter bolts (6 pieces) by turning crankshaft.

Torque: 54 N•m (40 lb ft)

NOTE: Do not reuse the flex plate torque converter bolt.



240RY003

5. Install the under cover (3 pieces), and tighten the bolts to the specified torque.

   Torque: 8 N•m (69 lb in)

6. Install front crossmember.

   Torque: 78 N•m (58 lb ft)

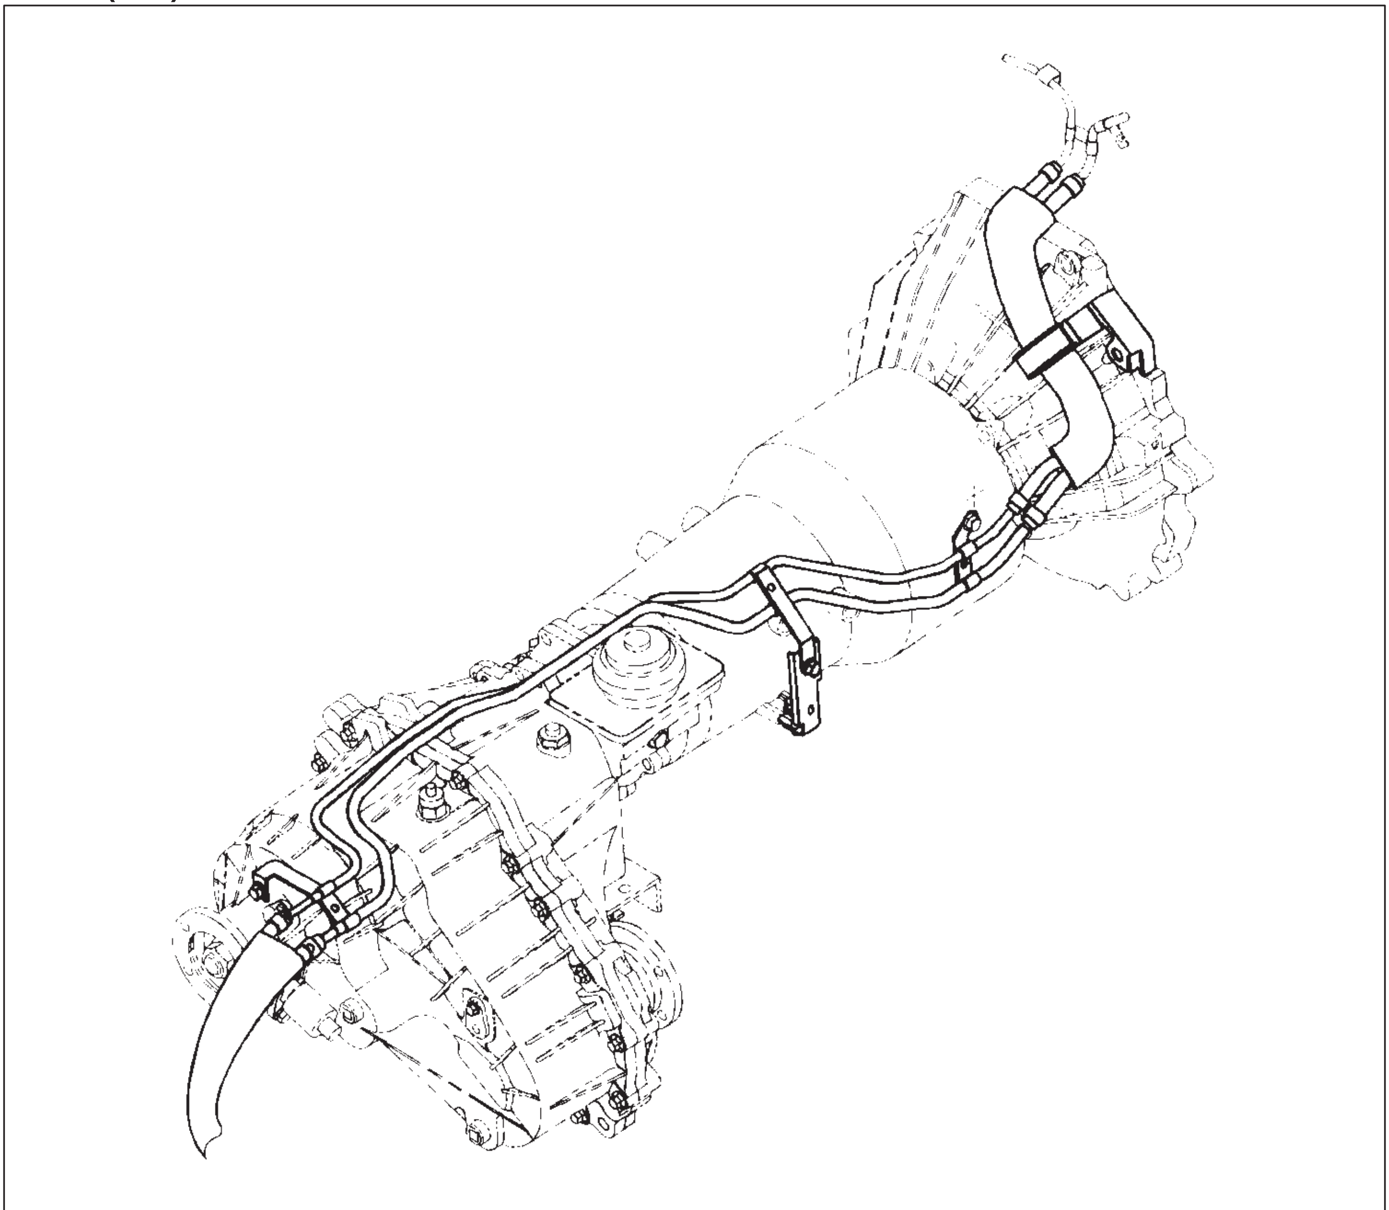
7. Install the starter, and tighten the bolts to the specified torque.

   Torque: 40 N•m (30 lb ft)

8. Connect transmission harness connectors to transmission, transfer, and right catalytic converter.

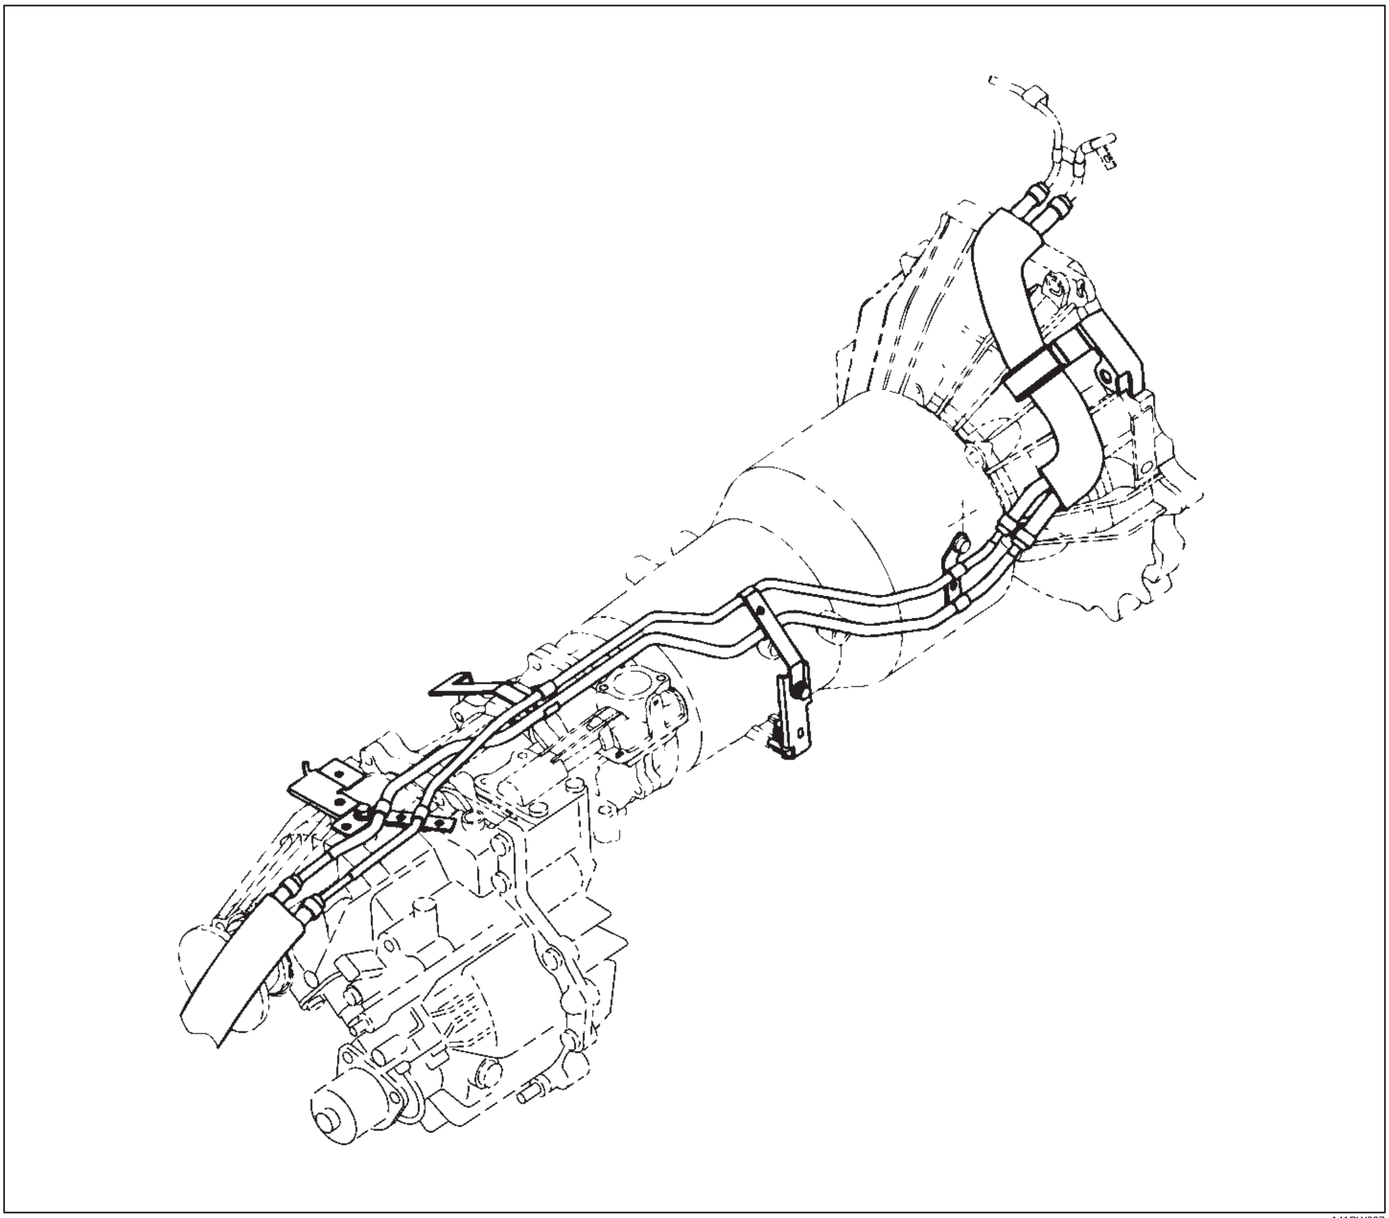
9. Connect fuel pipe brackets to transmission side.

For 4×4 (TOD)



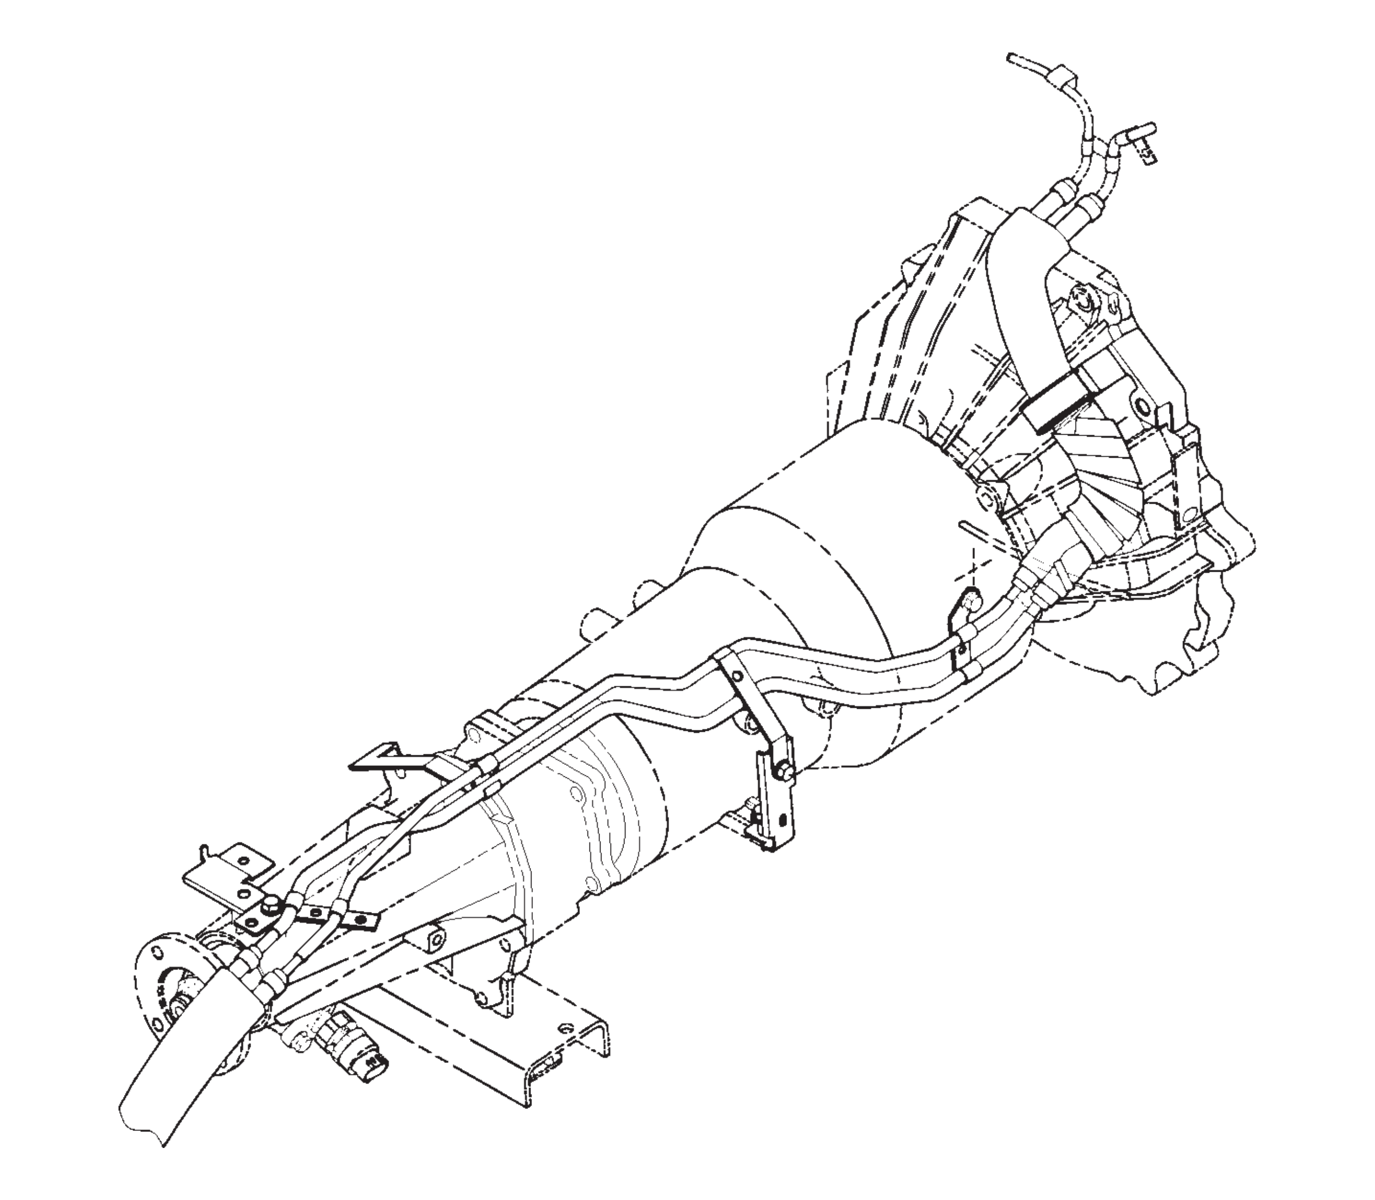
141RW001

For 4×4



141RW027

For 4×2



10. Install transmission oil cooler pipe to transmission.

    Torque: 44 N•m (33 lb ft)

11. Install oil pipe clamp to torque converter housing bracket.
12. Tighten oil pipe clamp bolt at engine mount side.
13. Install right catalytic converter, tighten to the specified torque.

    Torque: 67 N•m (49 lb ft)

14. Install left catalytic converter assembly, and tighten the bolts to the specified torque.

    Exh. pipe to exh. manifold 67 N•m (49 lb ft)

    Exh. pipe flange bolt 43 N•m (32 lb ft)

15. Install left seat belt tension rod.

    Torque: 39 N•m (29 lb ft)

16. Connect two left side oxygen sensor connectors to the transmission harness.
17. Install front exhaust silencer mounting nuts.
18. Install third crossmember, and tighten the bolts to the specified torque.

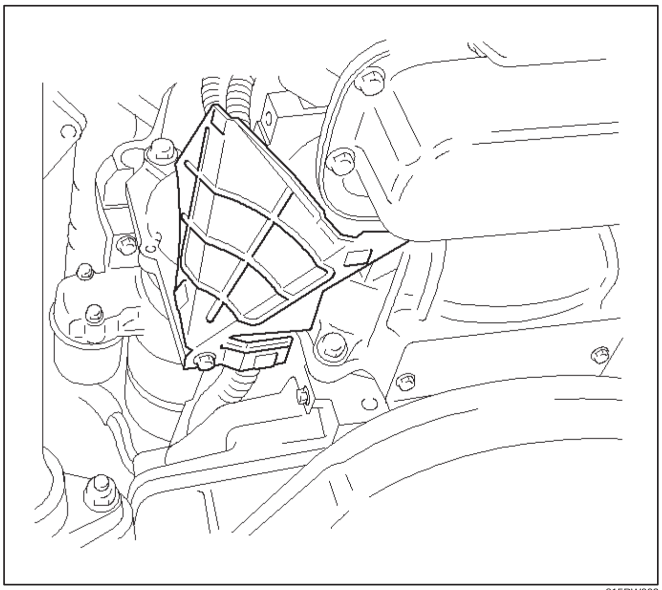
    Torque: 76 N•m (56 lb ft)

19. Install rear mount nuts, and tighten the bolts to the specified torque.

    Torque: 50 N•m (37 lb ft)

20. Remove the jack from the transfer case.

21. Install harness protector.



815RW002

22. Install the front propeller shaft, and tighten the bolts to the specified torque (4×4).

Torque: 63 N•m (46 lb ft)

23. Install the rear propeller shaft, and tighten the bolts to the specified torque.

Torque: 63 N•m (46 lb ft)

24. Connect the shift control rod to selector lever assembly.
25. Install the transfer protectors, and tighten the bolts to the specified torque (4×4).

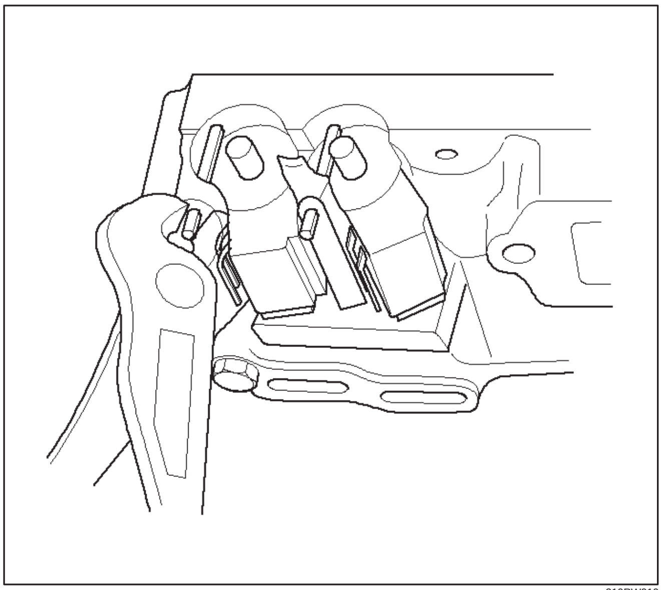
Torque: 37 N•m (27 lb ft)

26. Install the transfer control lever (4×4).
27. Install the selector lever assembly.
28. Connect the wiring harness connectors to front console.
29. Install the front console.
30. Install the transfer control lever knob (4×4).
31. Connect the battery ground cable.
32. Install the engine hood.

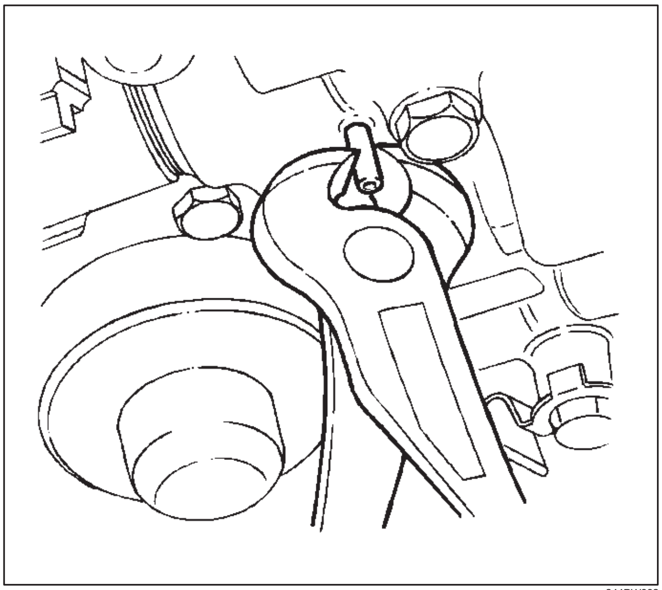
Solenoid (Main Case Valve Body)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Remove transfer protector (4×4).
4. Drain fluid.
5. Support transfer case with a jack and remove third crossmember.
6. Remove sixteen 10 mm screws, main case oil pan, magnet, and gasket.
7. Remove three 13 mm screws, oil filter.
8. Disconnect wiring harness from band control solenoid and shift solenoids. Pull only on connectors, not on wiring harness.
9. Remove spring pin for shift solenoid A, shift solenoid B, and band control solenoid respectively, using suitable pliers taking care not to damage solenoids.



210RW010

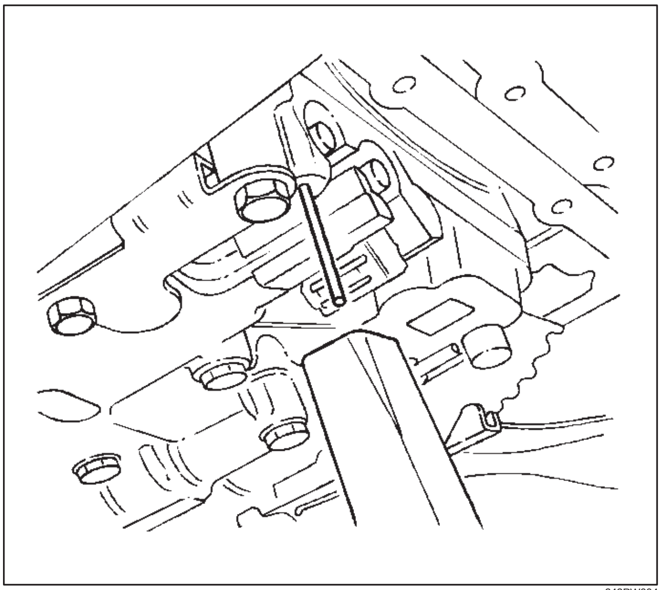


244RW003

10. Remove shift solenoid A, shift solenoid B, band control solenoid, and gaskets from main case valve body. Do not pull on wiring harness. Remove solenoids by grasping the metal tip.

Installation

1. Install shift solenoid A, shift solenoid B, band control solenoid with new gaskets to main case valve body respectively.
2. Carefully install spring pin with hammer to avoid damage to valve body, etc.



243RW004

3. Connect wiring harness to solenoids.
4. Install oil filter with a new gasket and the three 13 mm screws. Tighten the screws to the specified torque.

   Torque: 20 N•m (15 lb ft)

5. Install magnet, main case oil pan with new gasket, sixteen 10 mm screws. Tighten the screws to the specified torque.

   Torque: 11 N•m (96 lb in)

6. Install third crossmember and rear mount nuts. Tighten the nuts and bolts to the specified torque.

   Third crossmember bolt: 76 N•m (56 lb ft)

   Rear mount nut: 50 N•m (37 lb ft)

7. Install the transfer protector. Tighten the bolts to the specified torque (4×4).

   Torque: 37 N•m (27 lb ft)

8. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®–III. Refer to Changing Transmission Fluid in this section.
9. Connect the battery ground cable.

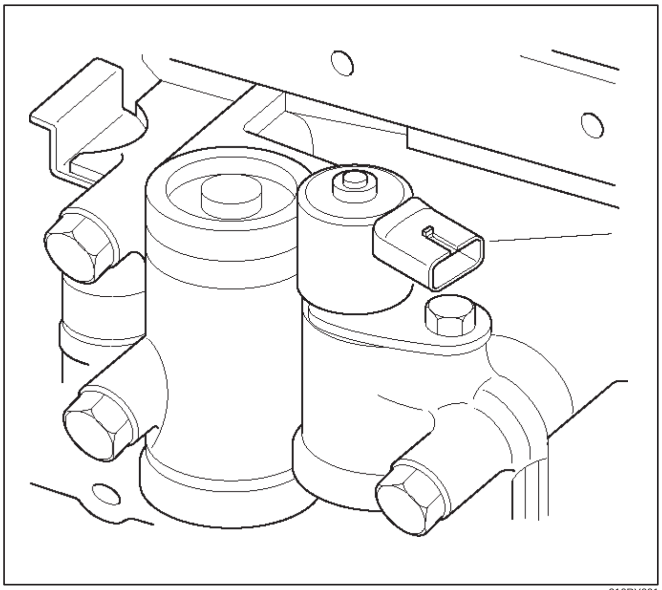
Solenoid (Adapter Case Valve Body)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove adapter case oil pan twelve fixing 10 mm screws, adapter case oil pan, and gasket.

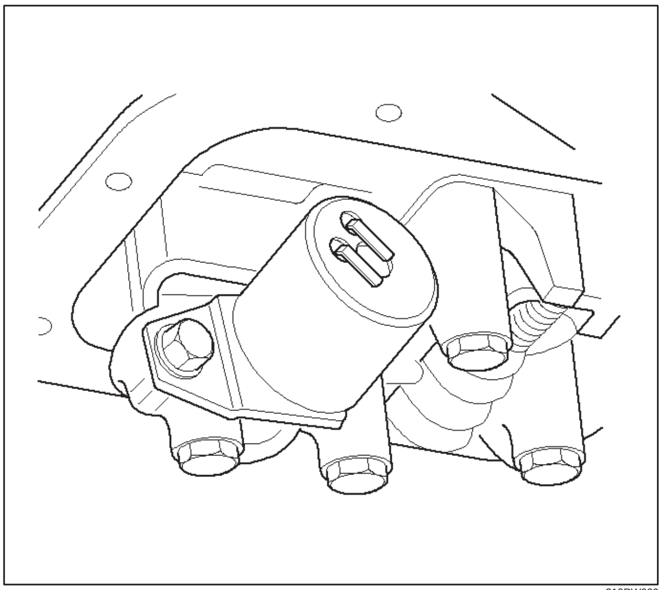
NOTE: Oil pan still contains transmission fluid. Place a large drain container under the oil pan and drain the fluid carefully.

5. Disconnect wiring harness from force motor solenoid and converter clutch PWM solenoid. Pull only on connectors, not on wiring harness.
6. Remove 11 mm bolt, bracket and converter clutch PWM solenoid with two O–rings.



210RY001

7. Remove 11 mm bolt, retainer, and force motor solenoid.



210RW009

Installation

1. Install force motor solenoid, retainer, and 11 mm bolt to adapter case valve body. Tighten the bolt to the specified torque.

Torque: 10 N•m (87 lb in)

2. Install converter clutch PWM solenoid with two O–rings, bracket, and 11 mm bolt to adapter case valve body. Tighten the bolt to the specified torque.

Torque : 10 N•m (87 lb in)

3. Connect wiring harness assembly to solenoids.
4. Install adapter case oil pan, new gasket, and twelve 10 mm screws. Tighten the screws to the specified torque.

Torque : 11 N•m (96 lb in)

5. Fill transmission through overfill screw hole oil pan, using ATF DEXRON®–III. Refer to Changing Transmission Fluid in this section.
6. Connect battery ground cable.

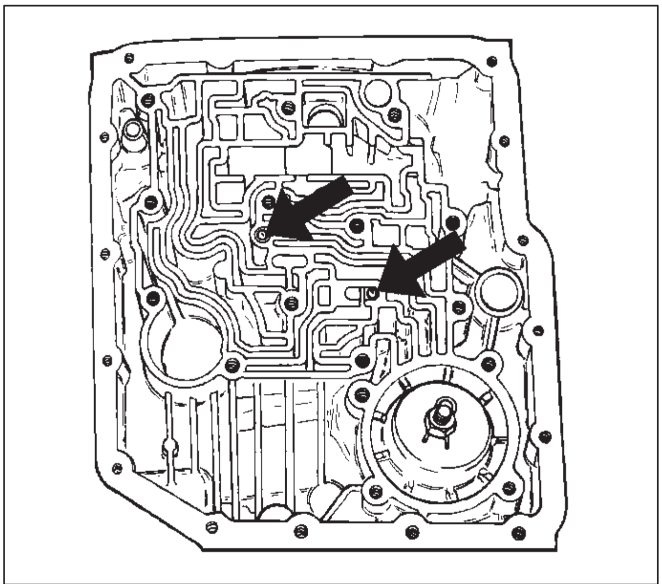
Valve Body Assembly (Main Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Remove transfer protector (4×4).
4. Drain fluid.
5. Support transfer case with a jack and remove third crossmember.
6. Remove sixteen 10 mm screws, main case oil pan, magnet and gasket.
7. Remove three 13 mm oil filter fixing screws, then remove oil filter.
8. Remove two 13 mm manual detent fixing screws, then remove roller and spring assembly.
9. Disconnect wiring harness from band control solenoid and shift solenoids. Pull only on connectors, not on wiring harness.
10. Remove four 13 mm servo cover fixing screws, then remove servo cover and gasket.
11. Remove seven 13 mm valve body fixing screws.
12. Remove main case valve body with manual valve link and transfer plate. Note the position of the link (long end into valve, short end into range selector lever).
13. Remove transfer plate gasket from main case.
14. Remove two check balls from main case.

Installation

1. Install two check balls to main case.



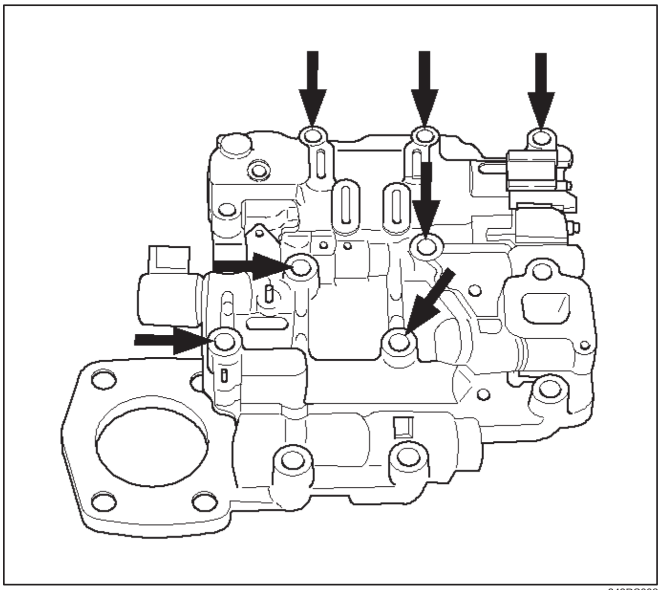
244RW002

2. Inspect electrical 7 way connector and seal of main case. Replace if necessary.
3. Use two J–25025–B guide pin to install main case.
   - Install valve body assembly and manual valve link.

NOTE: Valve must be extended as the short end of manual valve link is connected to the range selector lever. Long end of link goes into valve.

4. Install seven 13 mm screws, and tighten them to the specified torque.

Torque: 20 N•m (15 lb ft)



243RS008

5. Remove two guide pins from main case.
6. Install servo cover gasket, cover, and four 13 mm screws. Tighten the screws to the specified torque.

Torque: 25 N•m (18 lb ft)

7. Connect wiring harness to band control and shift solenoids.
8. Install roller and spring assembly to manual detent.
   - Install two 13 mm screws, and tighten them to the specified torque.

Torque: 20 N•m (15 lb ft)

9. Install oil filter and three 13 mm screws. Tighten the screws to the specified torque.

Torque : 20 N•m (15 lb ft)

10. Install oil pan gasket, magnet, oil pan and sixteen 10 mm screws. Tighten the screws to the specified torque.

Torque: 11 N•m (96 lb in)

11. Install third crossmember and rear mount. Tighten the bolts and nuts to the specified torque.

Torque

Third crossmember bolt: 76 N•m (56 lb ft)

Rear mount nut: 50 N•m (37 lb ft)

12. Install transfer protector. Tighten the bolts to the specified torque (4×4).

Torque: 37 N•m (27 lb ft)

13. Fill transmission through overfill screw hole of oil pan, using ATF DEXRON®–III. Refer to Changing Transmission Fluid in this section.
14. Connect battery ground cable.

Valve Body Assembly (Adapter Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove twelve 10 mm adapter case oil pan fixing screws, adapter case oil pan, and gasket.

NOTE: Oil pan still contains transmission fluid. Place a large drain container under the oil pan.

Drain the fluid carefully.

5. Disconnect wiring harness from force motor solenoid and converter clutch solenoid. Pull only on connectors, not on wiring harness.
6. Remove seven 13 mm screws from adapter case valve body assembly, then remove transfer plate, two gaskets, and adapter case valve body.

Installation

1. Inspect electrical 4 way connector and seal of adapter case. Replace if necessary.
2. Install gasket, transfer plate, and gasket.
3. Install adapter case valve body and seven 13 mm screws. Tighten the screws to the specified torque.

Torque: 20 N•m (15 lb ft)

4. Connect wiring harness assembly to converter clutch solenoid and force motor.
5. Install oil pan gasket, oil pan, and twelve 10 mm screws. Tighten the screws to the specified torque.

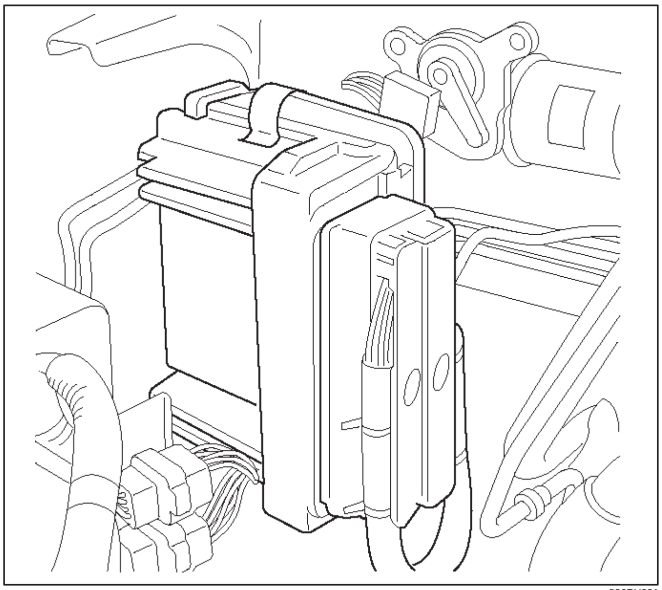
Torque: 11 N•m (96 lb in)

6. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®–III. Refer to Changing Transmission Fluid in this section.
7. Connect battery ground cable.

Powertrain Control Module (PCM)

Removal

1. Disconnect battery ground cable.
2. Disconnect PCM wiring harness connectors from PCM.
3. Remove PCM from bracket.



826RY001

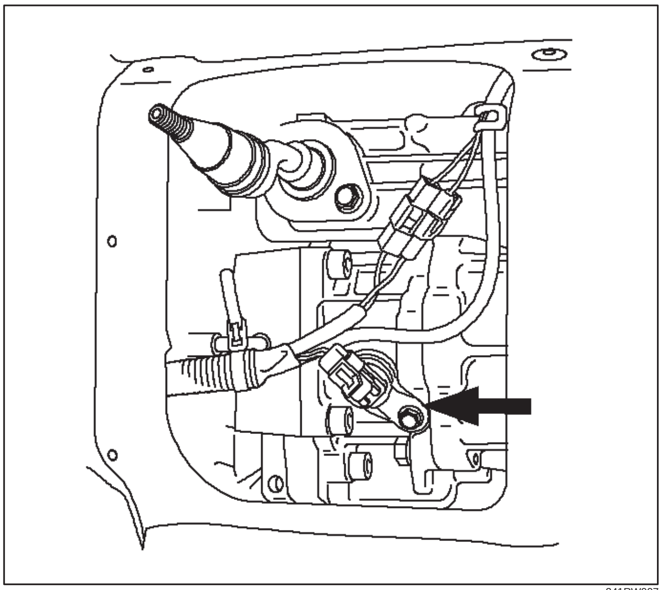
Installation

1. Install PCM to bracket.
2. Connect PCM wiring harness connectors to PCM.
3. Connect battery ground cable.

Speed Sensor (Extension Housing)

Removal

1. Disconnect battery ground cable.
2. Remove front console.
3. Remove selector lever assembly.
4. Disconnect speed sensor harness connector from speed sensor.
5. Remove one 10 mm screw and speed sensor with O–ring.



241RW007

Installation

1. Inspect the speed sensor O–ring, and replace it if necessary.
2. Install speed sensor assembly and 10 mm screw.

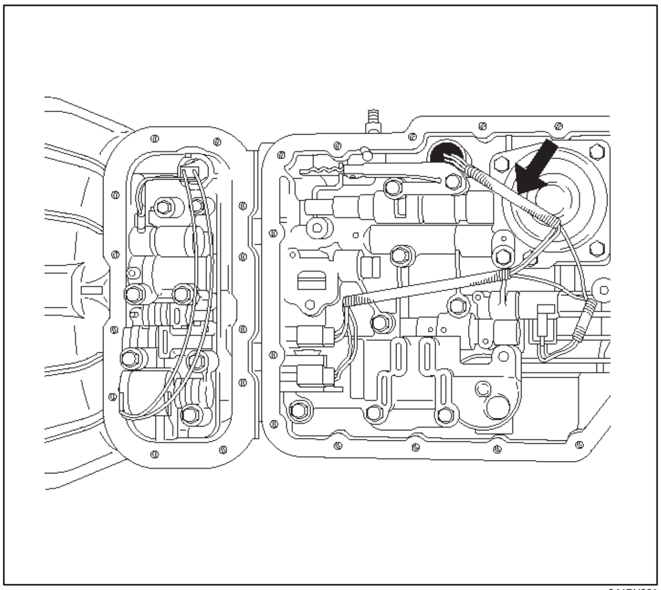
Torque: 9 N•m (78 lb in)

3. Connect speed sensor harness connector to speed sensor.
4. Install selector lever assembly.
   - Adjust shift lock cable. Refer to Selector Lever in this section.
5. Install front console.
6. Connect battery ground cable.

Transmission Oil Temperature Sensor (Main Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove sixteen 10 mm main case oil pan fixing screws, main case oil pan, and gasket.
5. Disconnect wiring harness from shift solenoids, band apply solenoid, and 7 way connector of main case. Pull only on connectors, not on wiring harness.
6. Remove wiring harness assembly with transmission oil temperature sensor.



244RY001

Installation

1. Install wiring harness assembly with transmission oil temperature sensor to band apply solenoid, shift solenoids, and 7 way connector of main case.

2. Install oil pan gasket, oil pan, and sixteen 10 mm fixing screws. Tighten the screws to the specified torque.

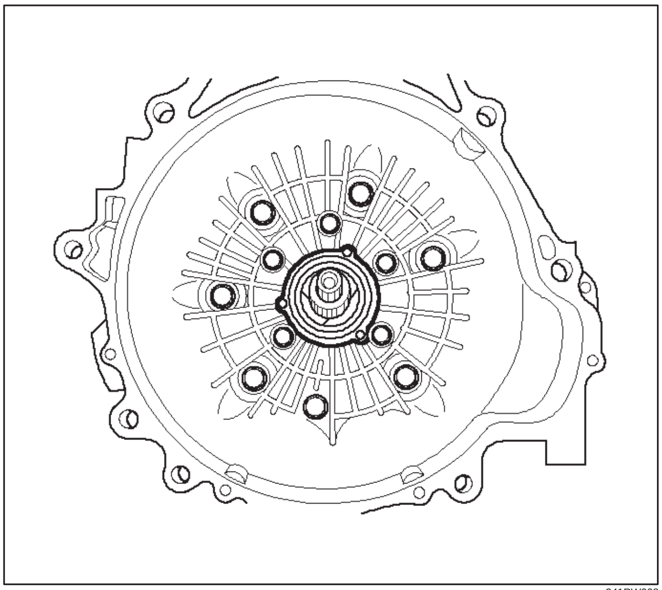
Torque: 11 N•m (96 lb in)

3. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®–III.
   Refer to Changing Transmission Fluid in this section.
4. Connect battery ground cable.

Front Oil Seal (Converter Housing)

Removal

1. Remove transmission assembly with transfer case from the vehicle. Refer to Transmission (With Transfer Case / Extension Assembly) in this section.
2. Remove torque converter from converter housing.
3. Remove three screws and oil seal ring from converter housing.



241RW008

Installation

1. Apply clean ATF to the new oil seal ring lip.
   - Install oil seal ring to converter housing. Tighten the screws to the specified torque.

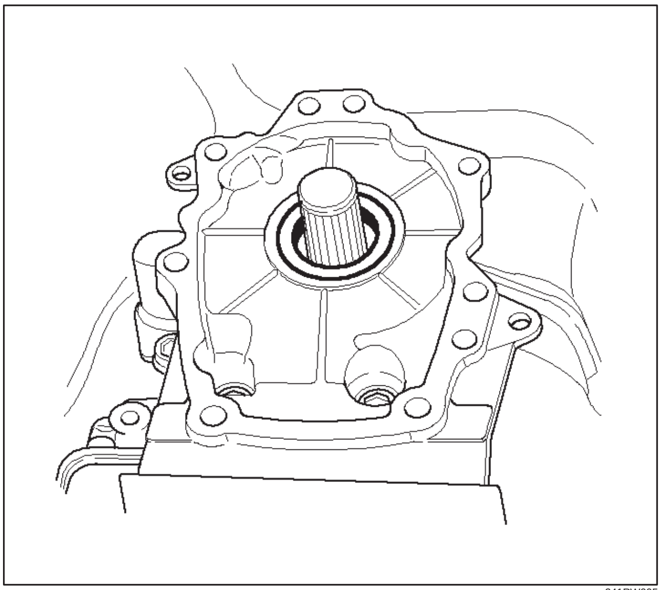
Torque: 3 N•m (26 lb in)

2. Install torque converter to converter housing.
3. Install transmission assembly with transfer case (4×4) / extension assembly (4×2) to the vehicle. Refer to Transmission (With Transfer Case / Extension Assembly) in this section.

Rear Oil Seal (Extension Housing)

Removal

1. Remove transfer case assembly (4×4) or extension assembly (4×2) from the vehicle. Refer to Transfer Case in Drive Line/Axle section.
2. Remove rear oil seal from transmission extension housing.



241RW005

Installation

1. Use J–36797 extension housing oil seal installer, and install the rear oil seal to the transmission extension housing.
2. Install the transfer case assembly (4×4) or extension assembly (4×2) to the vehicle. Refer to Transfer Case in Drive Line/Axle section.

Transmission (4L30–E)

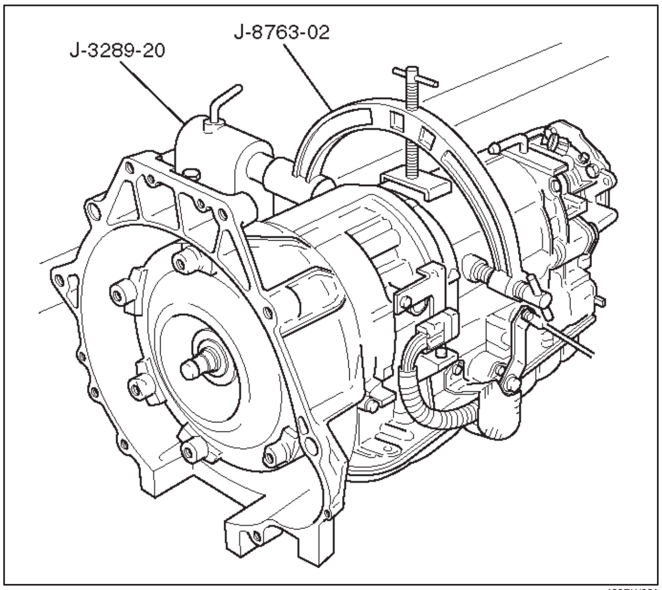
Disassembly

NOTE: During the disassembly and reassembly, perform the following:

- Wash each part thoroughly, and blow air through each oil passage and groove to eliminate blockage.
- Seal rings, roll pins, and gaskets should be replaced.
- When assembling the components, apply DEXRON®–III Automatic Transmission Fluid (ATF) to each seal, rotating part, and sliding part.
- Do not dip part facings, such as clutch or brake drive plates, in cleaner when washing it.
  Also, always coat parts with new ATF two or three times after cleaning with solvent.

1. Remove torque converter (1).
   - Drain fluid from torque converter.
   - Attach J–8763–02 holding fixture to the transmission and set it on J–3289–20 holding fixture base.

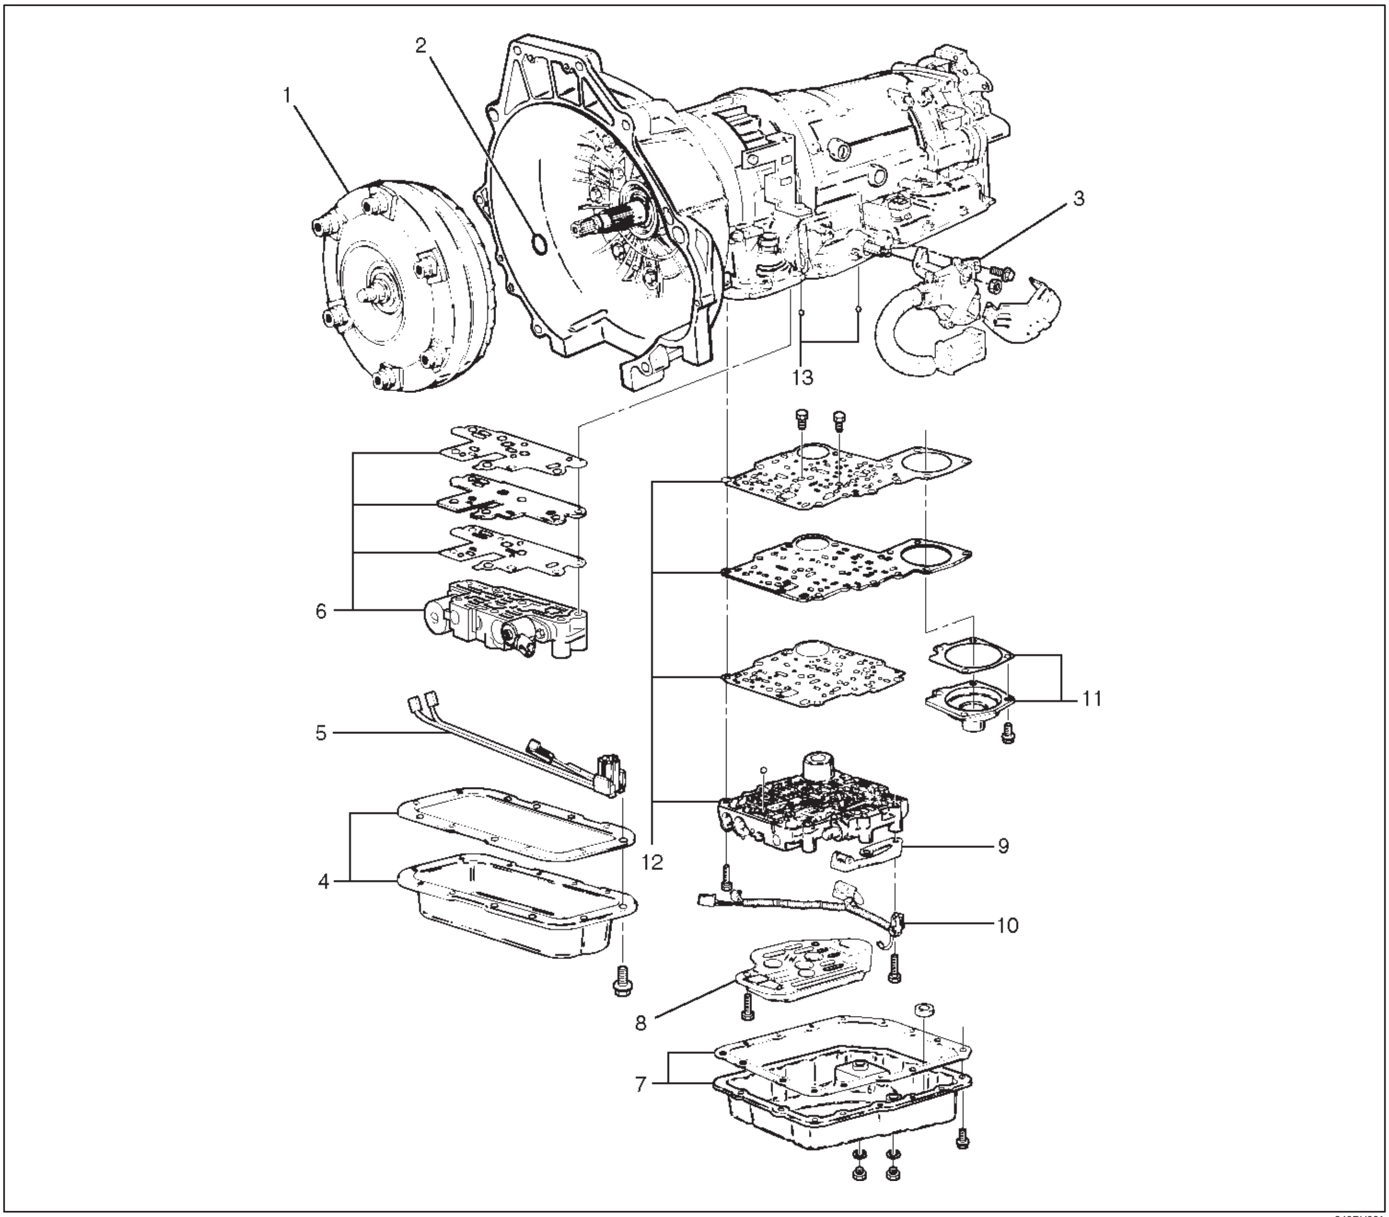
NOTE: Do not overtighten the tool, as case damage may result.



420RW021

2. Remove O–ring (2) from turbine shaft.
3. Remove two 10mm mode switch screws, selector lever nut, cover, and mode switch (3).
4. Remove twelve 10mm adapter case oil pan (4) fixing screws, adapter oil pan, and gasket.
5. Disconnect electrical wiring connections (5) from solenoids and 4 way connector of adapter case. Pull on connectors only, not on wiring harness.
6. Remove seven 13mm adapter case valve body (6) fixing screws, adapter case valve body assembly, transfer plate, and two gaskets.
   - Remove wiring harness and 4 way connector.
7. Remove sixteen 10mm main case oil pan (7) fixing screws, main oil pan, magnet, and gasket.
8. Remove three 13mm oil filter (8) fixing screws and oil filter.
9. Remove two 13mm manual detent (9) fixing screws, roller and spring, and manual detent.
10. Disconnect wiring harness assembly (10) from band apply solenoid, shift solenoids, and main case 7 way connector.
    Pull on connectors only, not on wiring harness.
11. Remove four 13mm servo cover (11) fixing screws, servo cover, and gasket.
12. Remove seven 13mm valve body screws and ground wire from main case.
    - Remove wiring harness assembly (5) from the adapter case side.
    - Remove main valve body assembly (12) with manual valve link and transfer plate. Note the position of the link (long end into valve, short end into range selector lever).
    - Remove 7 way connector.
    - Remove gasket transfer plate from main case.

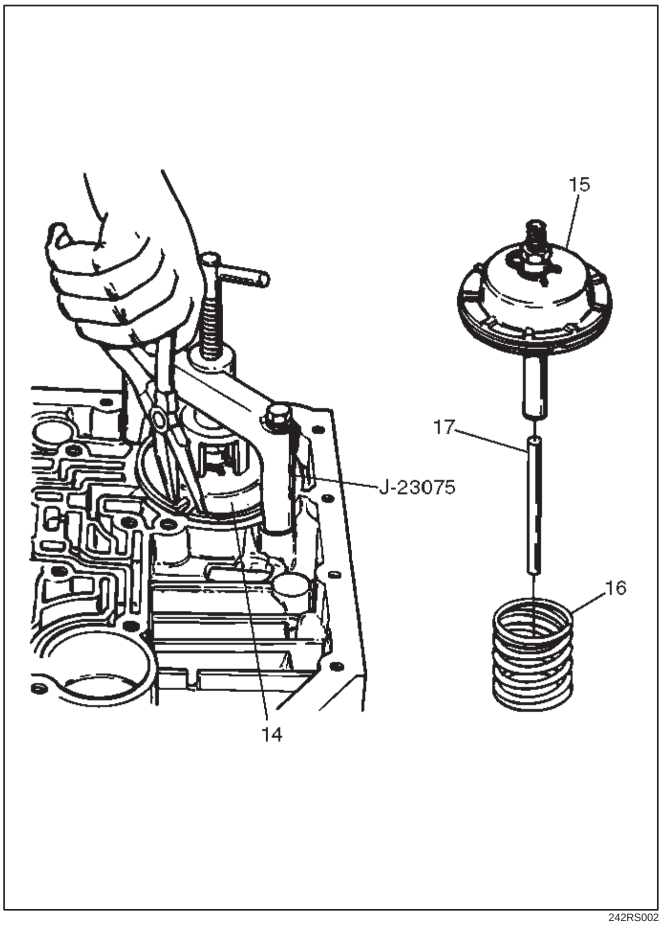
13. Remove two check balls (13) from main case.



240RY001

14. Turn transmission to vertical position to drain fluid. Return back to horizontal position when drained.
    - Install J–23075 servo piston spring compressor with offset to the rear of case.
    - Compress servo piston assembly.
    - Remove servo piston retaining ring (14).
    - Slowly release servo piston assembly (15).
    - Remove tool.

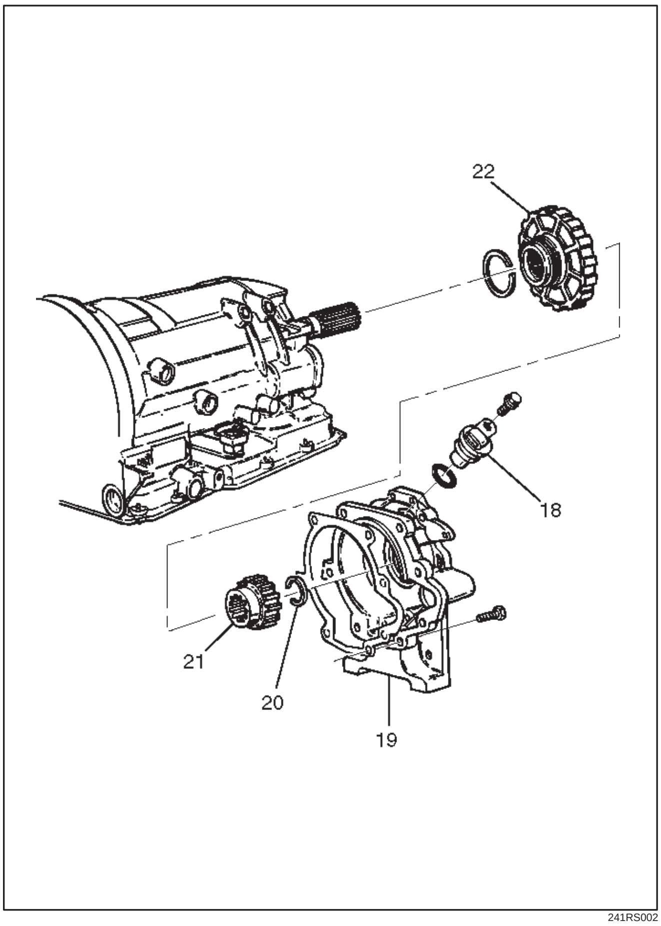
15. Remove servo piston assembly (15), return spring (16), and servo apply rod (17).



16. Rotate transmission to horizontal position, pan side down.
    - Remove one 10mm screw, and speed sensor (18) with “O” ring.
17. Remove seven 8mm extension housing hexagon socket head screws, extension housing assembly (19), and gasket.
18. Remove retaining ring (20).

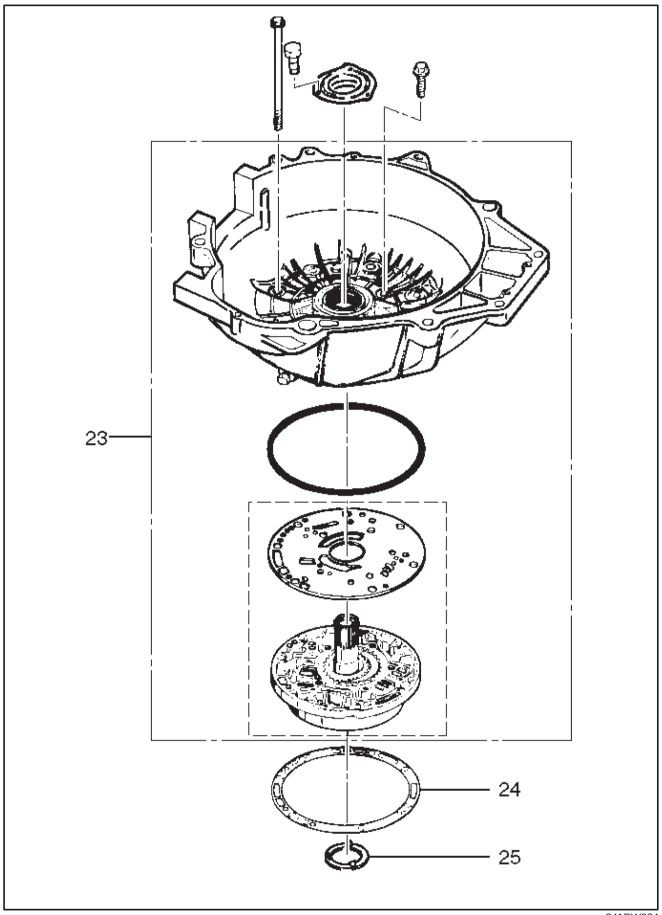
NOTE: Use extra long, needle- nose pliers.

19. Remove speed wheel (21).
20. Remove wheel parking lock (with seal ring) (22).



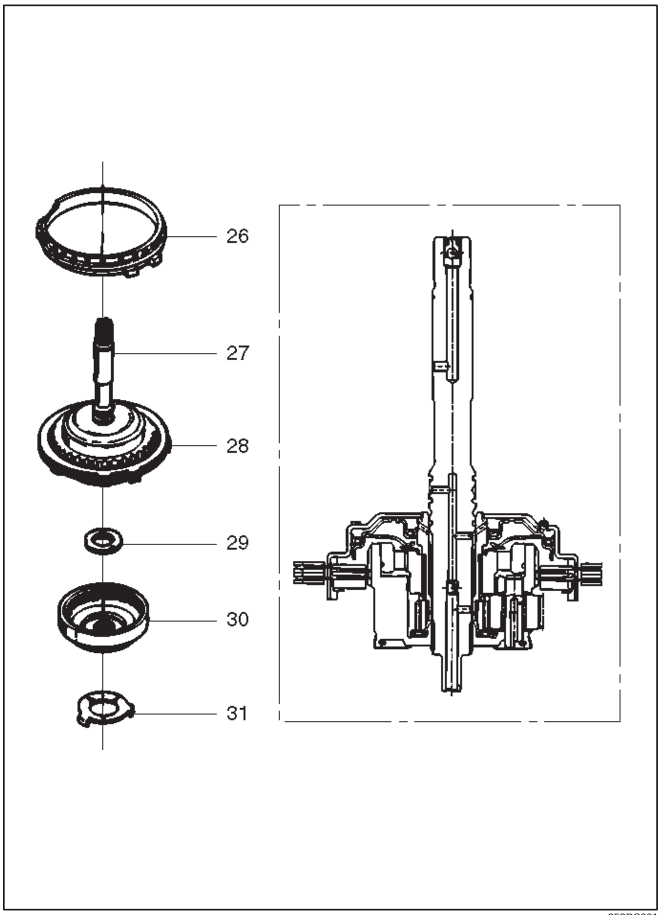
21. Rotate transmission to vertical position, converter housing up.
    - Loosen the converter housing and oil pump assembly fixing screws, but do not remove the five 13 mm inner screws if oil pump disassembly is required.
    - Remove seven outer screws.
    - Remove converter housing and oil pump assembly (23).
22. Remove gasket (24).

23. Remove selective thrust washer (25).



241RW004

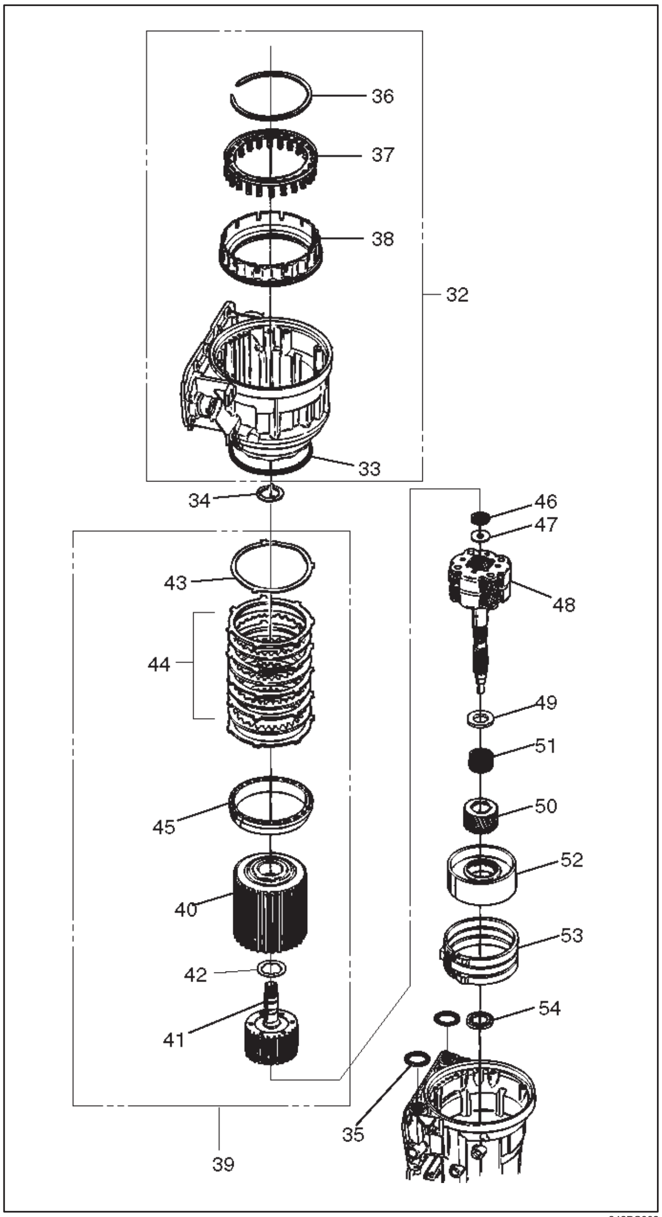
24. Remove fourth clutch retainer (26).
25. Grasp turbine shaft and lift out the overrun clutch housing assembly (27) and fourth clutch plates (28).
26. Remove thrust bearing assembly (29).
27. Remove overdrive internal gear (30).
28. Remove thrust washer (31).



252RS001

29. Remove adapter case and center support assembly (with fourth clutch piston) (32).
30. Remove seal ring (33).
31. Remove selective thrust washer (34) and two O–ring seals (35) from main case.
32. Use J–23327 and J–23327–90 compressor to compress the fourth clutch spring retainer and springs (37).
    - Release snap ring (36) from groove.
    - Remove clutch compressor and snap ring (36).
33. Remove retainer and spring assembly (37).
34. Insert two converter housing/main case screws to hold adapter case while pulling out fourth clutch piston (38).
    - Remove fourth clutch piston assembly (38) from the adapter case.
    - Remove converter housing/main case screws.
35. Grasp intermediate shaft, twist and pull out the second and third clutch drum assemblies with reverse clutch plates while holding onto output shaft (39).

36. Separate second (40) and third clutch (41) assemblies.
37. Remove thrust washer (42).
38. Remove reverse clutch plates (43 and 44) and reverse clutch pressure plate (45).
39. Remove bearing (46) and washer (47).
40. Remove planetary carrier assembly (48).
41. Remove thrust bearing (49).
42. Remove reaction sun gear (50)
43. Remove needle bearing (51).
44. Remove brake drum (52).
45. Remove brake band (53).
46. Remove thrust bearing (54).



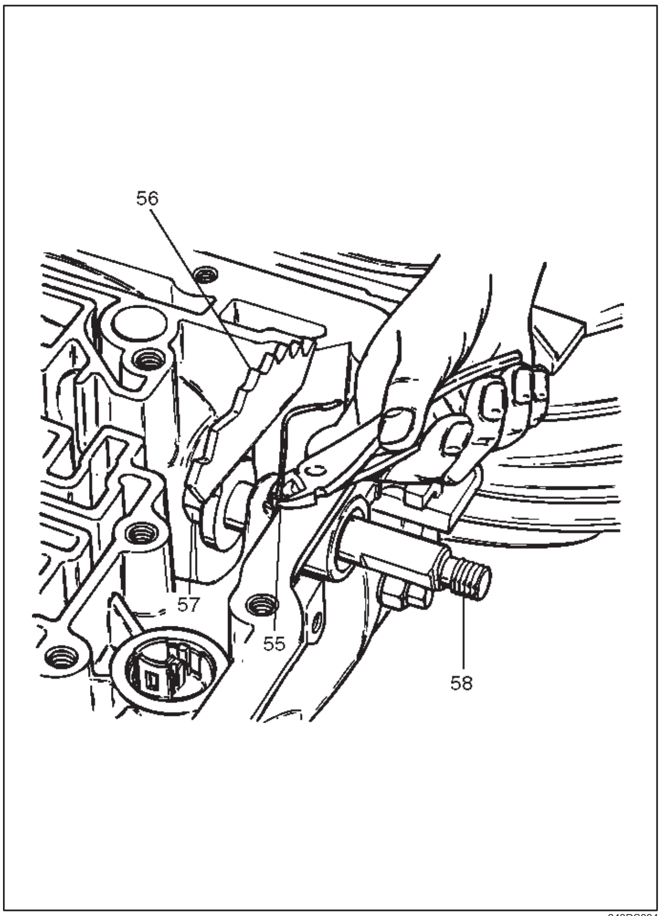
242RS003

47. Rotate case to horizontal position, valve body side facing up.
    - Remove spring pin (55), using cutting pliers, then remove parking lock and selector lever assembly (56).

NOTE: Insert wire in the center of the spring pin to prevent it from collapsing during removal. Be aware of pin height. Protect machined face of main case.

48. Remove parking lock and range selector lever 17 mm nut (57).
49. Remove parking lock and range selector lever (56), and actuator assembly.
50. Remove selector shaft (58).

NOTE: Inspect the shaft for burrs before removing to prevent damaging seal. If necessary, remove burrs by lightly sanding with an oilstone.



249RS004

Reassembly

1. Inspect selector shaft seal, and replace it if necessary.

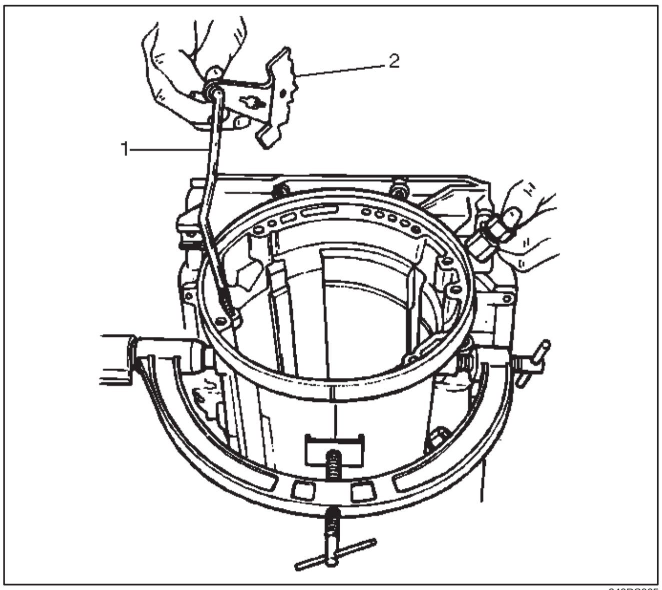
NOTE: Use a seal installer when replacing the seal.

- Install selector shaft.

NOTE: Spring pin groove must be positioned inside the case.

2. Install spring pin. Be sure the selector shaft can move freely. Do not push the pin flush with the case surface. Leave enough height for removal.
3. Install actuator assembly (1).
4. Install parking lock and range selector lever (2) and new 17 mm nut. Tighten the nut to the specified torque.

Torque: 22 N•m (16 lb ft)



249RS005

5. Rotate main case to vertical position, extension end facing down.
   - Install brake band assembly (3).

NOTE: Be sure to align servo pin area with the servo hole.

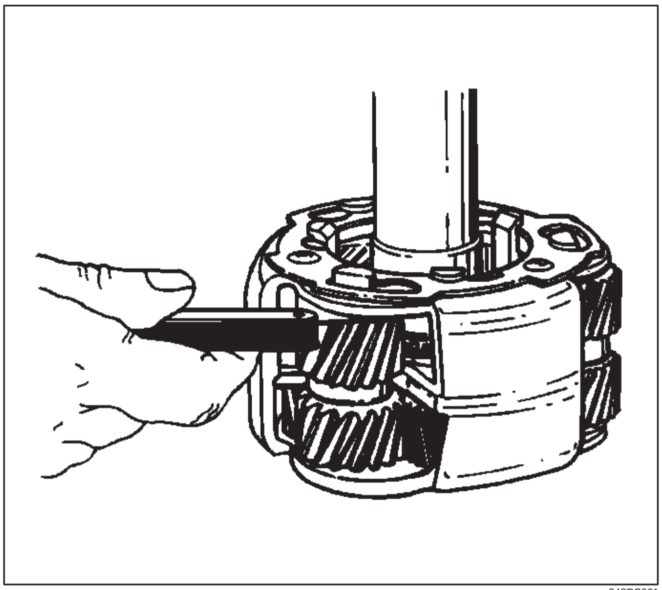
6. Install thrust bearing (4).

NOTE: The case bushing acts as a guide for the thrust bearing.

7. Install brake drum (5).
8. Install reaction sun gear (6).
9. Install needle bearing (7).
10. Inspect planetary carrier assembly (8) for wear and damage. If necessary replace it.
    - Measure pinion end play clearance with a feeler gauge.

Clearance: 0.13mm–0.89mm (0.005 in–0.035 in)

If clearance is outside specified value, replace the planetary carrier assembly.



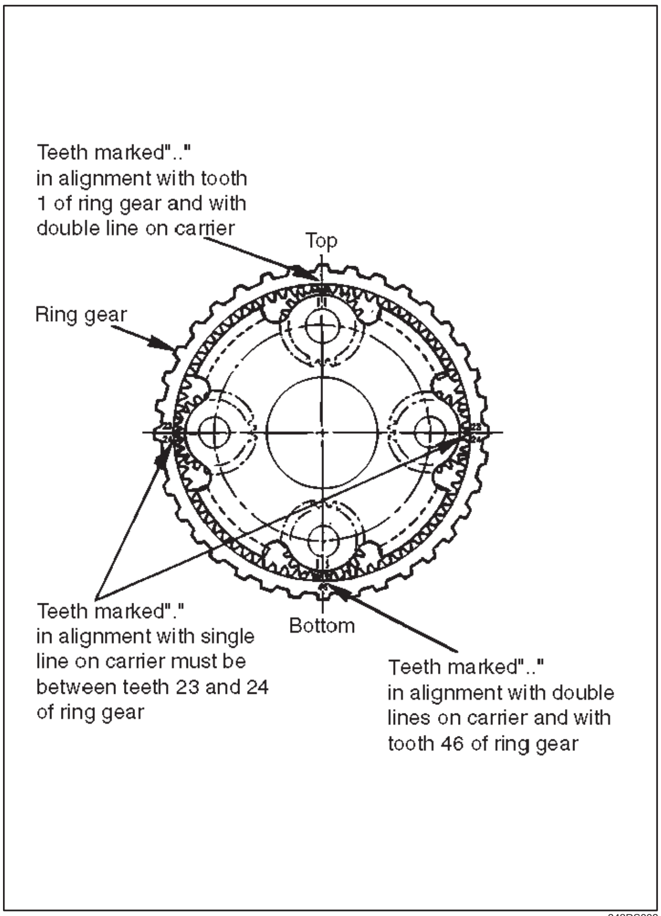
248RS001

11. Install the thrust bearing (9) on the output shaft.

NOTE: Use petroleum jelly to hold the thrust bearing in place.

12. Align planetary pinions. Each pinion is marked with double points to indicate the master tooth space and exactly opposite with a single point to indicate the master tooth. The markings on the planetary carrier consist of double lines which are to be lined up with the double points on two opposite pinions; the single lines are to be lined up with the single points on the other two pinions.
    - After all four pinions are lined up, slide on the third clutch assembly. Rotate third clutch and check mark alignment. Considering that the ring gear tooth between the double points of one planetary pinion is tooth number 1, count the teeth to check that the single points on the two adjacent pinions are between teeth 23 and 24 of the ring gear, and that the ring gear tooth between the double points of the opposite pinion is tooth number 46. If the ring gear and pinions are not lined up, remove, and realign them.
13. Install planetary carrier (8) with third clutch (12).

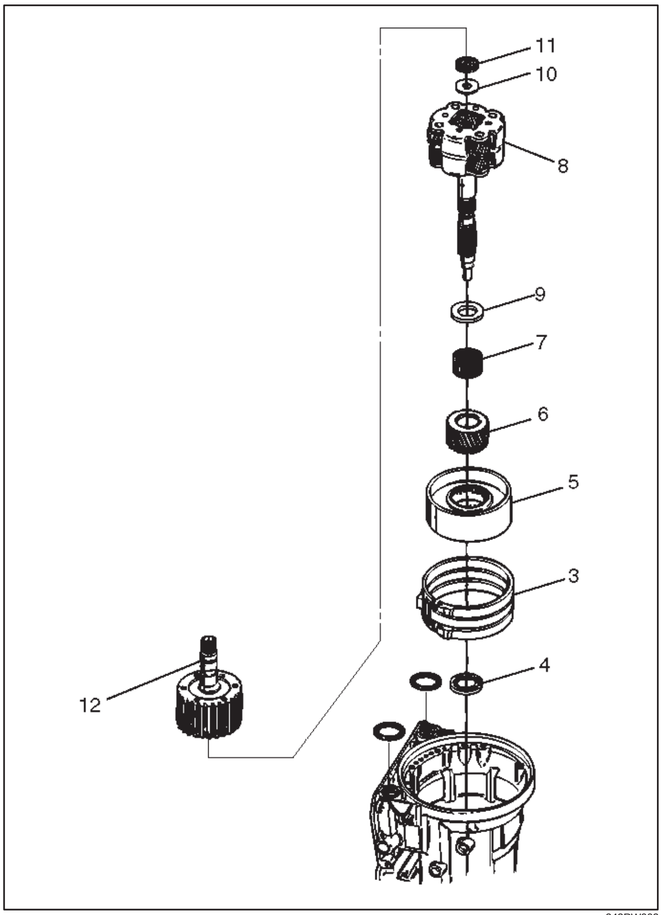
NOTE: Do not force. When properly aligned, the parts will fit together easily.



248RS002

14. Remove the third clutch (12).
15. Install bearing (11) and washer (10).

NOTE: Use petroleum jelly to hold the washer and bearing in place.

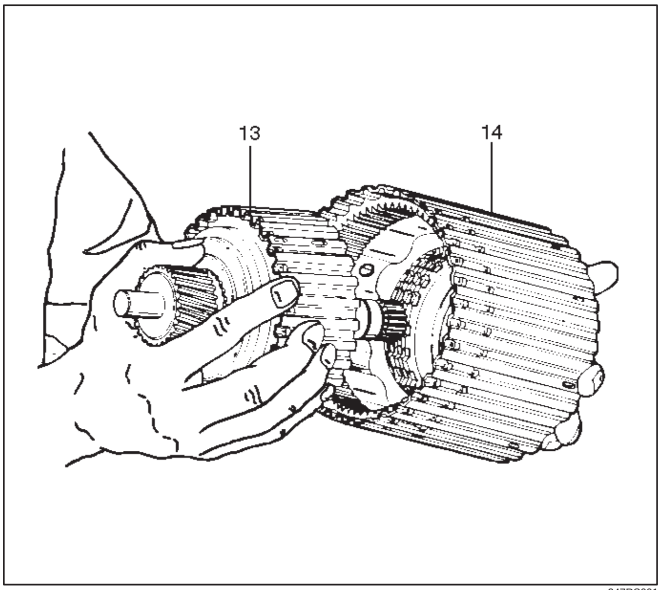


242RW002

16. Carefully align the second clutch plate inner tangs.
    - Install thrust washer, tangs pointing downward, and locating tang positioned in slot on second clutch hub.

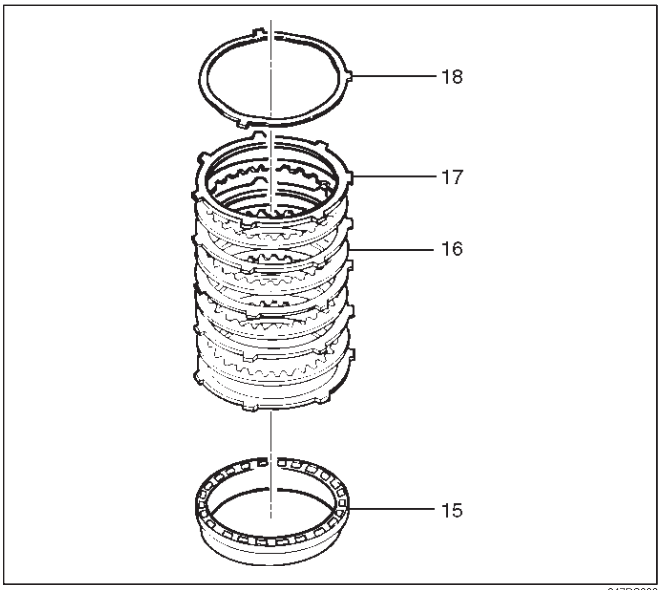
NOTE: Use petroleum jelly to hold thrust washer in place.

17. Install third clutch and intermediate shaft assembly (13) into the second clutch drum (14).
18. Install second and third clutch assemblies into the main case. Twist output shaft and clutch assemblies to ensure proper fit.



247RS001

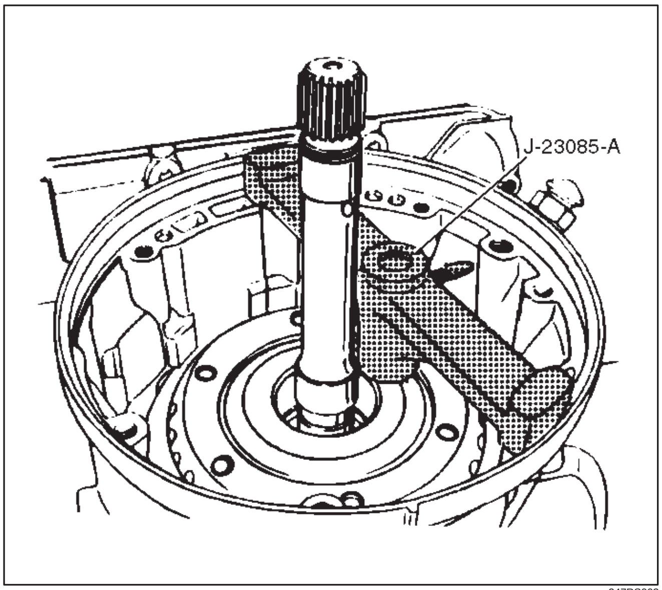
19. Install pressure plate (15) with lip side up, tang facing valve body face.
20. Install reverse clutch plates. Start with a steel plate (17) and alternate with a lined plate (16).
21. Install waved clutch plate (18) with center tang facing valve body side.



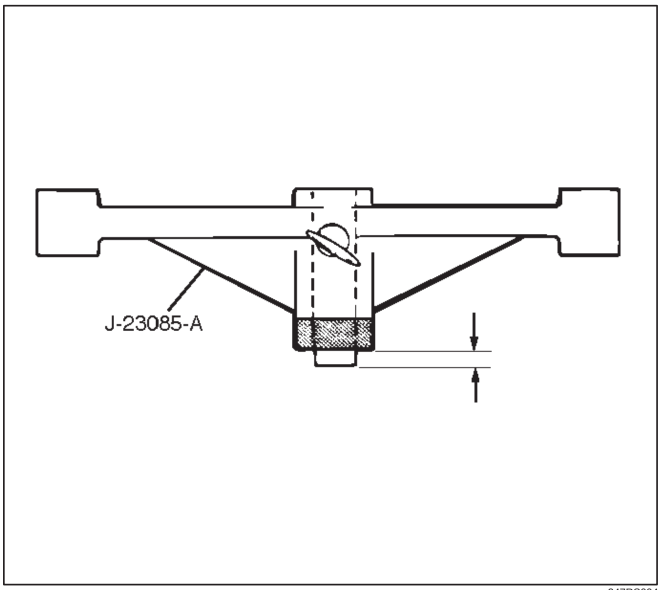
247RS002

22. Second clutch end play measurement
    1. Install the J–23085–A Selective washer gauging tool (with spacer ring) on the case flange and against the intermediate shaft.
    2. Position the inner shaft of the gauging tool against the thrust surface of the second clutch hub.
    3. Tighten thumb screw. Remove the tool.
    4. Fit the spacer ring on the inner shaft of the tool.
    5. Measure the gap, and select the appropriate washer as shown in the chart.

Selective Thrust Washer	
Gap: mm(in)	**Color**
1.53 – 1.63 (0.060 – 0.064)	Yellow
1.72 – 1.82 (0.068 – 0.072)	Red
1.91 – 2.01 (0.075 – 0.079)	Black
2.10 – 2.20 (0.083 – 0.087)	Natural
2.29 – 2.39 (0.090 – 0.094)	Green
2.48 – 2.58 (0.098 – 0.102)	Blue
FOLLOWING THE PROCEDURE SHOULD RESULT IN FINAL END–PLAY FROM 0.36 mm TO 0.79 mm (0.014 in TO 0.031 in)	

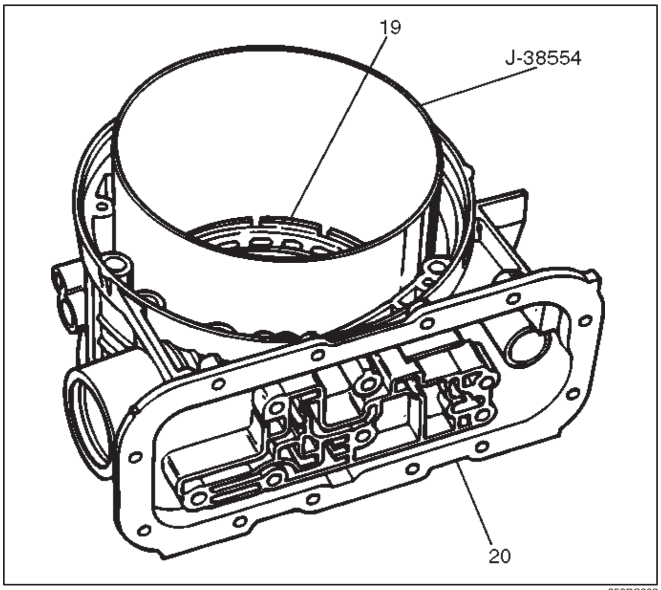


247RS003



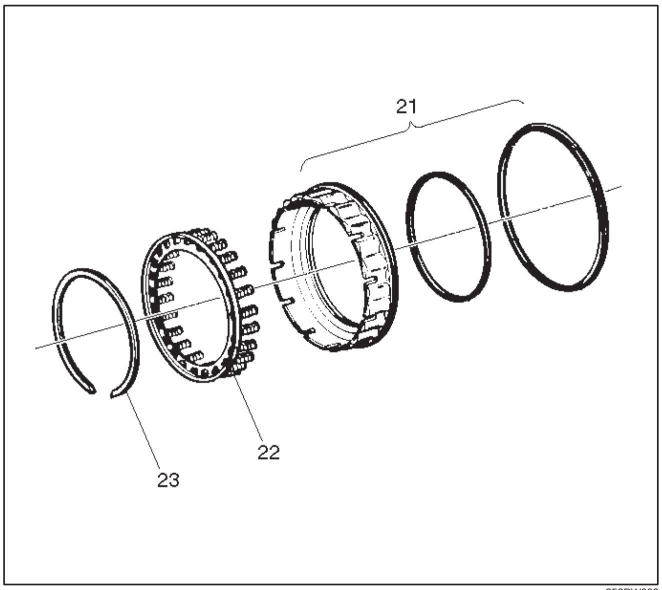
247RS004

23. Inspect fourth clutch piston seals and replace if necessary.
    - Lubricate J–38554 fourth clutch piston fitter and install it on fourth clutch piston (19).
    - Install fourth clutch piston (19) in adapter case (20).
    - Remove fitter.

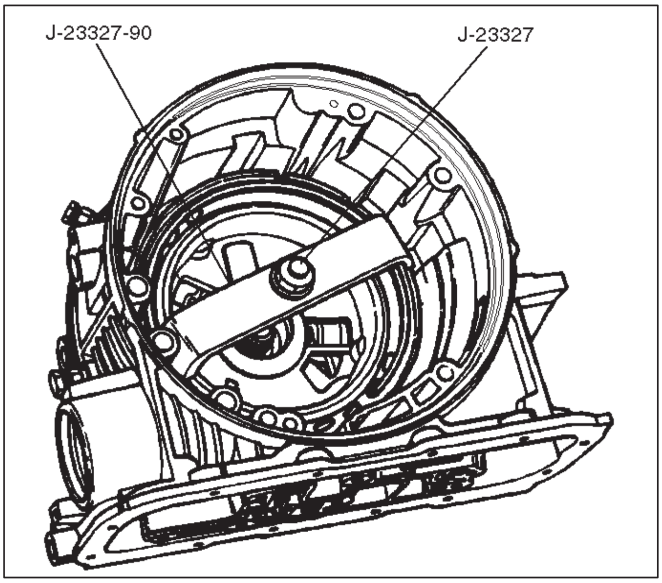


252RS003

24. Install retainer and spring assembly (22) into fourth clutch piston (21).
25. Install snap ring (23) in adapter case.
    - Install J–23327 and J–23327–90 fourth clutch spring compressor.
    - Seat snap ring in groove.
    - Remove compressor.

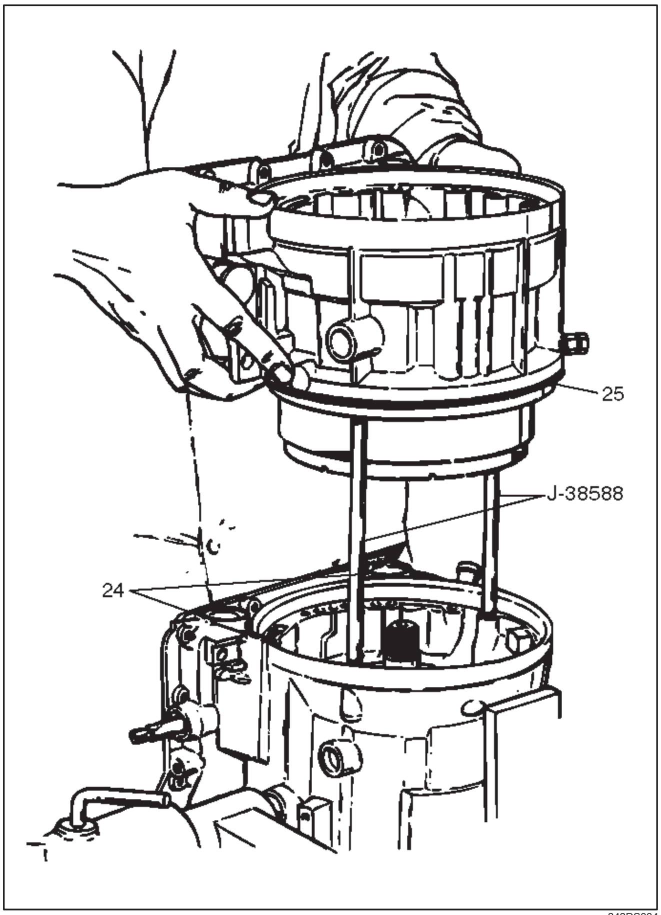


252RW002



252RS004

26. Install selective washer using petroleum jelly.
27. Install two O–ring seals (24) in main case and adapter case/main case seal ring (25).
28. Install J–38588 guide pins.
    - Install adapter case and center support assembly to main case.



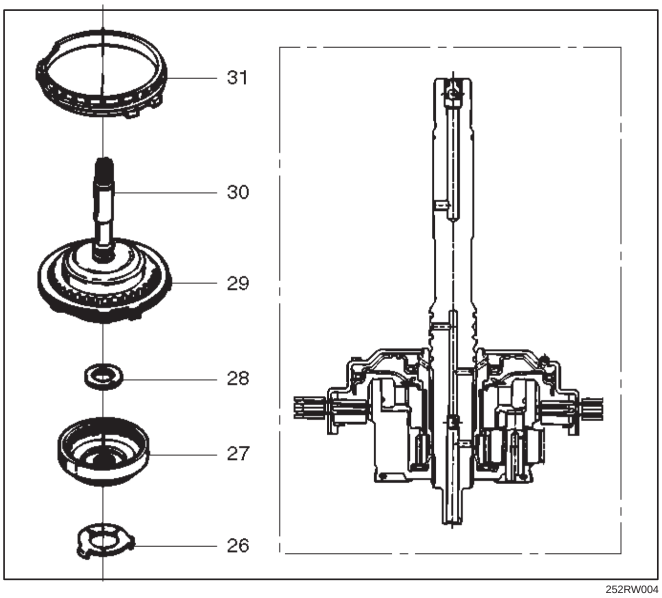
242RS004

29. Install thrust washer (26) into adapter case, with tangs pointing downwards.
30. Preassemble overdrive internal gear (27) and thrust bearing assembly (28) onto the turbine shaft and overrun clutch assembly.

NOTE: Install bearing assembly, black side up. Use petroleum jelly to keep assembly in place.

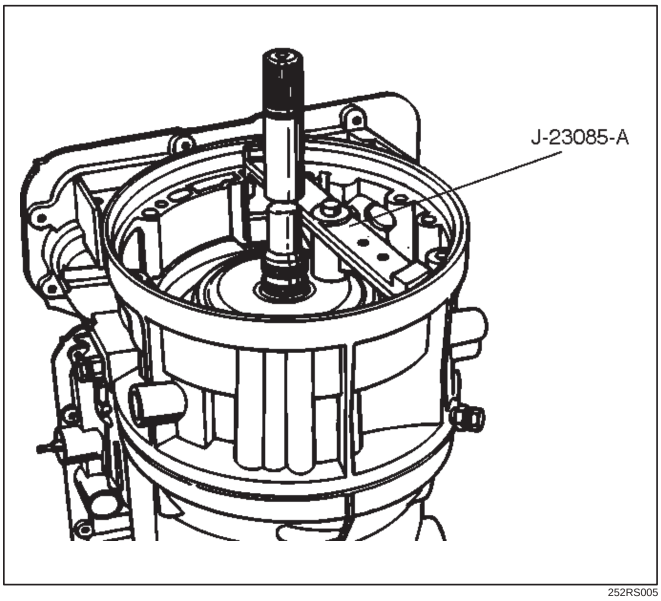
31. Install overdrive carrier (30) and internal gear assembly into adapter case.
32. Install fourth clutch plates (29) in the following order: Steel, Lined, Steel, Steel, Lined, Steel. Steel plates go in with short tang facing towards valve body surface.

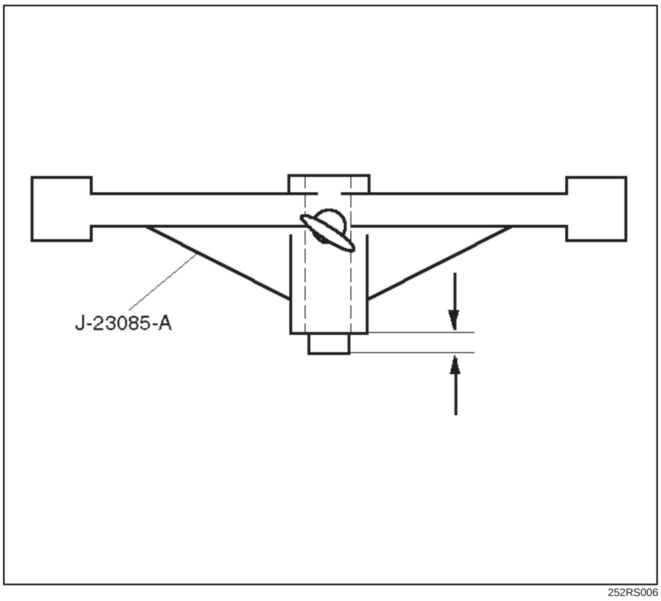
33. Install fourth clutch retainer (31) with the notch facing up and positioned towards valve body surface.



34. Overdrive clutch end play measurement
    1. Install the J–23085–A selective washer gauging tool on the adapter case flange and against the input shaft.
    2. Position the inner shaft of the tool against the thrust surface of the overrun clutch housing.
    3. Tighten thumb screw. Remove the tool.
    4. Measure gap. Select appropriate size washer as shown in the chart.
    5. Set selective thrust washer aside.

Selective Thrust Washer	
Gap: mm(in)	**Color**
1.53 – 1.63 (0.060 – 0.064)	Yellow
1.72 – 1.82 (0.068 – 0.072)	Red
1.91 – 2.01 (0.075 – 0.079)	Black
2.10 – 2.20 (0.083 – 0.087)	Natural
2.29 – 2.39 (0.090 – 0.094)	Green
2.48 – 2.58 (0.098 – 0.102)	Blue
FOLLOWING THE PROCEDURE SHOULD RESULT IN FINAL END–PLAY FROM 0.1 mm TO 0.8 mm (0.004 in TO 0.03 in)	





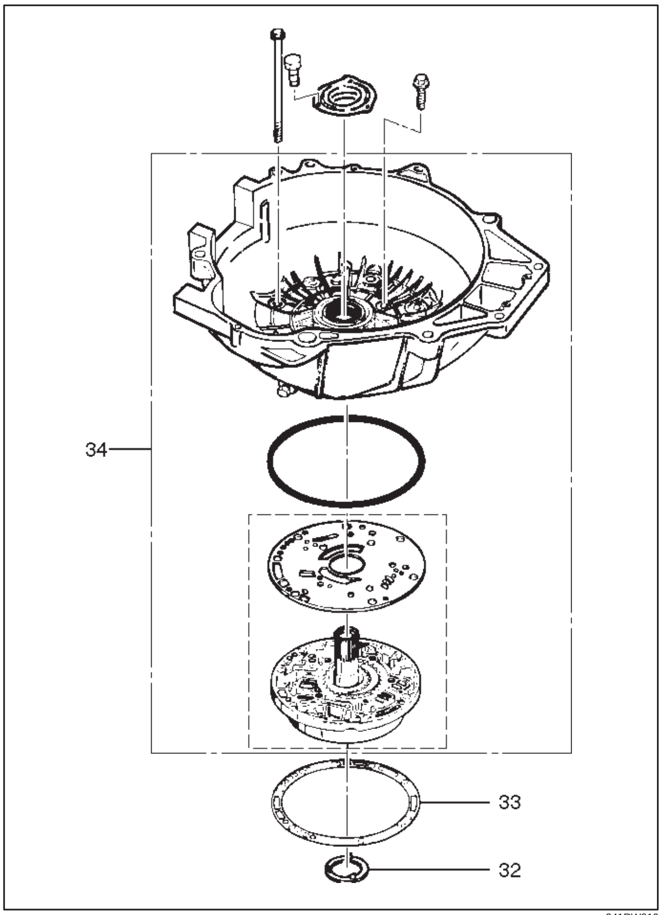
35. Install selective washer (32).

NOTE: Use petroleum jelly to hold selective washer in place.

36. Install gasket (33).
37. Install converter housing and oil pump assembly (34) to adapter case.
    - Fit and tighten seven outer 13 mm screws.

Torque: 39 N•m (29 lb ft)

- Ensure free rotation of pump using J–23082–01 oil pump rotation tool.



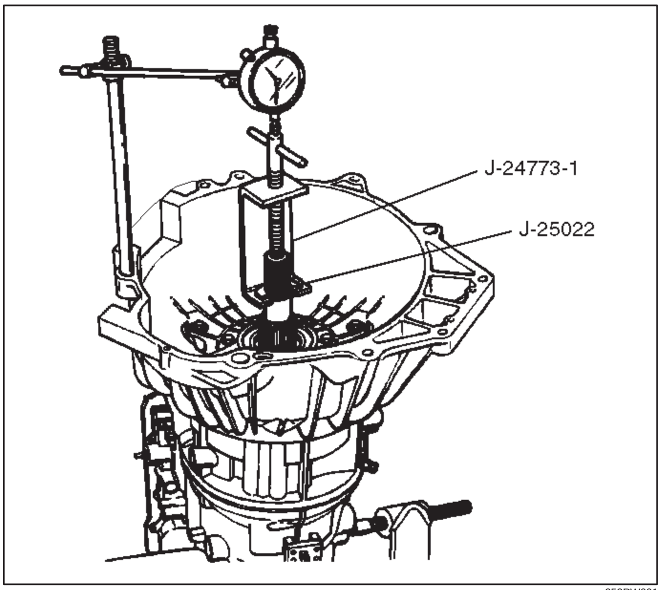
241RW010

38. Overdrive clutch end play measurement
    1. Fit J–25022 and J–24773–1 turbine shaft puller on turbine shaft.
    2. Position axial play checking tool on converter housing mating face.
    3. Pull turbine shaft upwards with puller until first resistance is met. (due to weight of overdrive assembly).
    4. Maintain shaft in this position and set indicator to zero.
    5. Pull turbine shaft further upwards with puller. Read end play shown on indicator.

End play: 0.1mm – 0.8mm (0.004 in – 0.031in)

6. Remove axial play checking tool and puller.

NOTE: If end play is not correct, repeat selective washer selection.



252RW001

39. Inspect extension housing oil seal and replace if necessary, using J–36797 extension housing oil seal installer.
    - Rotate transmission to horizontal position, with valve body side down.
    - Inspect parking wheel seal ring. Replace if necessary.
    - Install wheel parking lock assembly (35).
40. Install speed wheel (36) and snap ring (37).

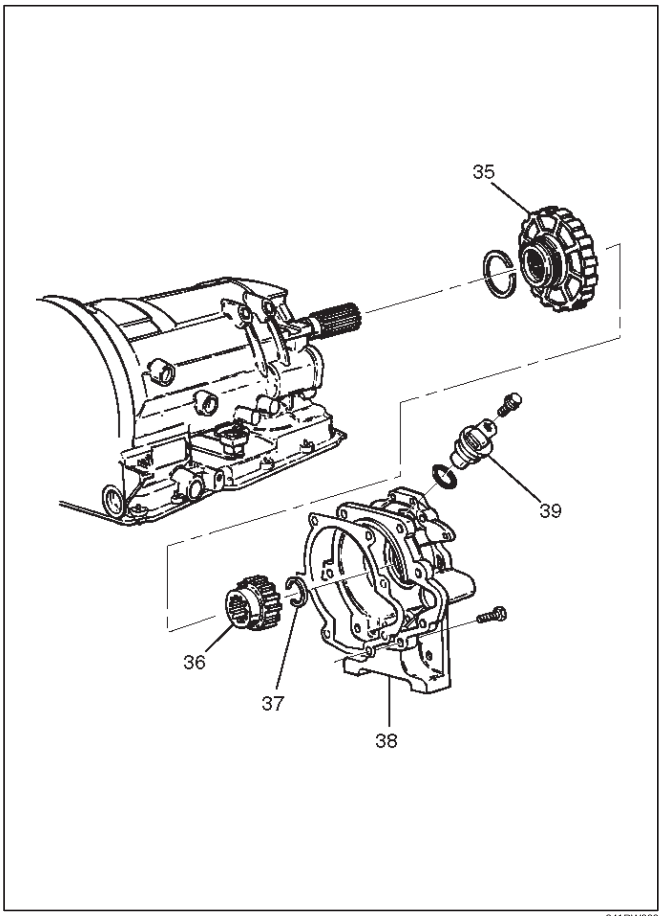
NOTE: Use extra long, needle-nose pliers.

41. Install gasket onto extension assembly with a thin coating of oil.
    - Install extension housing assembly (38), and align parking pawl shaft.
    - Install actuator assembly into extension assembly.
    - Install seven 8 mm hexagon socket head screws.

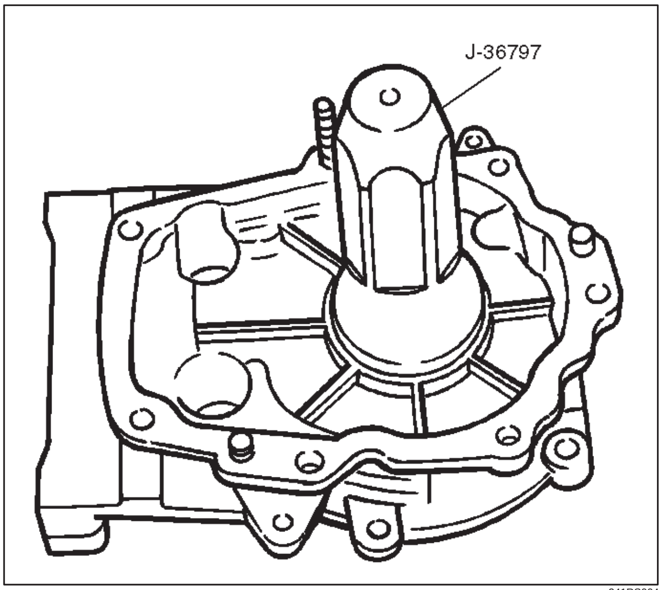
Torque: 32 N•m (24 lb ft)

42. Inspect speed sensor O–ring. Replace if necessary.
    - Install speed sensor assembly (39) and 10 mm screw.

Torque: 9 N•m (78 lb in)



241RW009

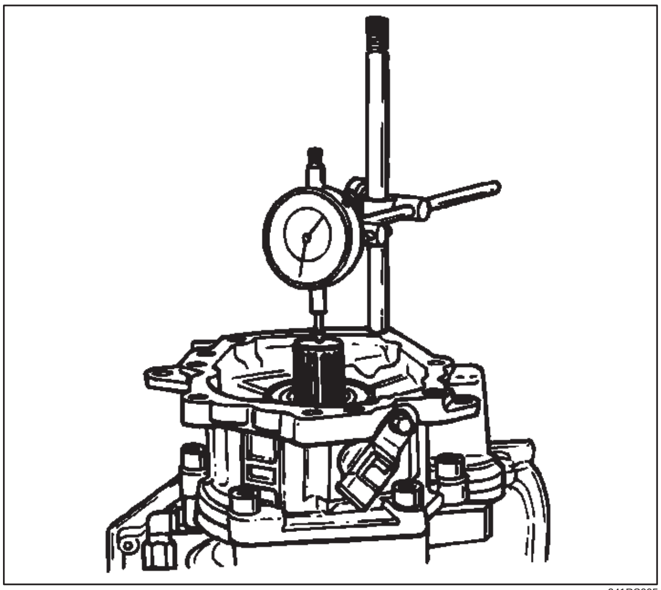


241RS004

43. Main case end play measurement
    1. Attach axial play checking tool on the extension housing and set indicator to zero on output shaft.
    2. Manually push output shaft upwards.

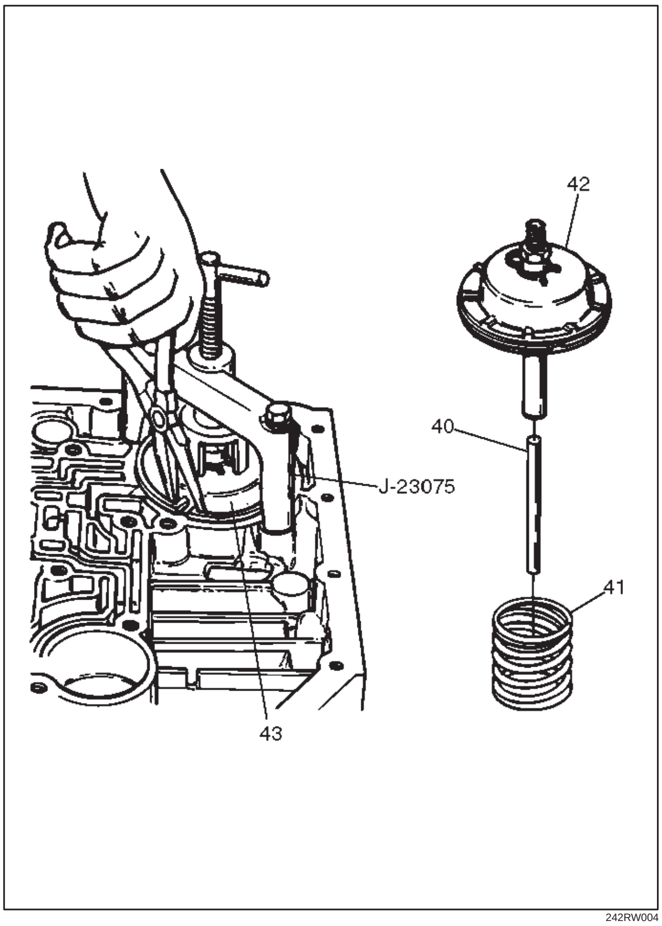
    End play: 0.36mm – 0.80mm (0.014 in – 0.031in)

    3. Remove axial play checking tool.
    4. If end play is not correct, repeat selective washer selection.

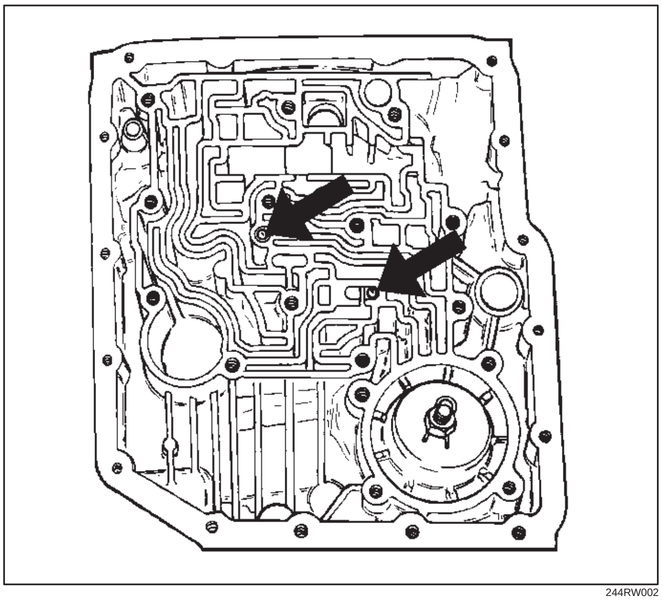


241RS005

44. Inspect servo piston seal ring. Replace if necessary.
    - Ensure brake band is correctly positioned. Rotate output shaft if necessary.
    - Install J–38428 servo piston fitter in servo bore.
    - Install apply rod (40), round end toward band, return spring (41) and piston assembly (42).
45. Install the J–23075 servo spring compressor with offset to rear of case.
    - Compress servo piston seal ring, using fitter while tightening the tool screw.
    - Install servo piston retaining ring (43).
    - Remove tool.
    - Adjust the brake band by tightening the servo adjusting screw to 4.5 N·m torque. Be certain the lock nut is loose, then back–off the screw five turns exactly. Hold piston sleeve with wrench and tighten lock nut to 18.5 N·m torque. Be certain the adjusting screw does not turn.



46. Install two check balls (44).



47. Inspect main case electrical connector and seal, replace if necessary.
   - Install electrical 7 way connector/main case and wiring harness.
48. Install two J–25025–B guide pins into main case.
   - Install main case valve body complete assembly (45) and manual valve link.

NOTE: Valve must be extended as the short end of manual valve link is connected to the range selector lever. Long end of link goes into valve.

   - Install seven 13 mm screws.

Torque: 20 N•m (15 lb ft)

   - Remove two guide pins.
49. Install servo cover gasket, cover (46) and four 13 mm screws.

Torque: 25 N•m (18 lb ft)

50. Connect wiring harness (47) to band control, shift solenoids, and main case 7 way connector.
51. Install manual detent roller and spring assembly (48) with clip.
   - Install two 13 mm screws.

Torque: 20 N•m (15 lb ft)

52. Install oil filter (49), and three 13 mm screws.

Torque: 20 N•m (15 lb ft)

53. Install oil pan gasket, magnet, main oil pan (50), and sixteen 10 mm screws.

Torque: 11 N•m (96 lb in)

54. Inspect adapter case electrical connector and seal. Replace if necessary.
   - Install electrical five pin connector and harness assembly (52) in bottom of adapter case.
55. Install gasket, transfer plate, and gasket.
   - Install adapter case valve body (51) and seven 13 mm screws.

Torque: 20 N•m (15 lb ft)

56. Connect wiring harness harness assembly (52) to converter clutch PWM solenoid, force motor, and 4 way connector.
57. Install oil pan gasket, adapter case oil pan (53), and twelve 10 mm screws.

Torque: 11 N•m (96 lb in)

   - Rotate transmission, with bottom pan facing down.
58. Install mode switch (54), two 10 mm screws, selector lever nut, and cover.

10 mm screw

Torque: 13 N•m (113 lb in)

Nut

Torque: 23 N•m (17 lb ft)

   - Adjust using setting tool, refer to Mode Switch in this section.
59. Install O–ring (55) on turbine shaft.
60. Install torque converter (56).
   The converter assembly must be replaced under any of the following conditions:
   a. Evidence of damage to the pump assembly.
   b. Metal particles are found after flushing the cooler lines.
   c. External leaks in hub weld area.
   d. Converter pilot broken, damaged, or poor fit into crankshaft.

e. Converter hub scored or damaged.

f. Internal failure in stator.

g. Contamination from engine coolant.

h. Excess end play.

- Rotate transmission, bell housing up. Spin converter to insure proper fit.

61. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®–III. Refer to Changing Transmission Fluid in this section.

(6) Oil Seal Ring

Disassembly

1. Remove oil pump assembly from converter housing.
2. Remove outer seal ring.
3. Remove gasket.
4. Remove wear plate.
5. Remove oil seal ring.

Inspection And Repair

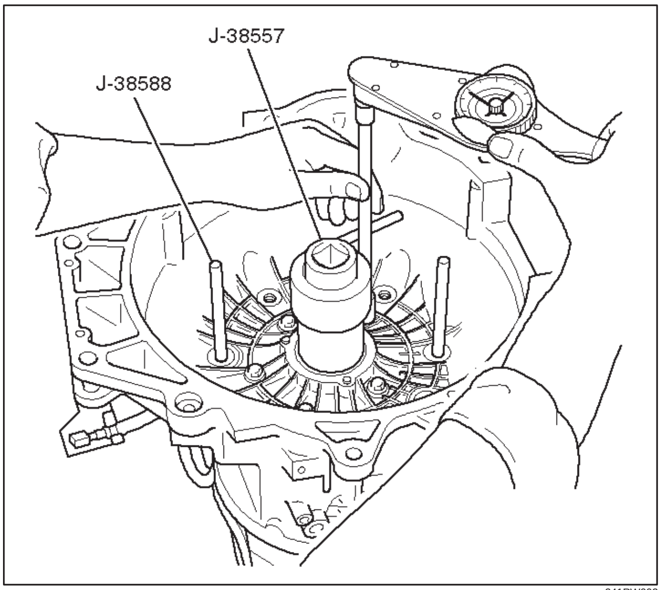
Visual Check:

If any damage, deformation, or local wear is found in a converter housing, outer seal ring, wear plate, or oil seal ring, replace it.

Reassembly

1. Install wear plate onto oil pump assembly.
2. Install converter housing onto complete oil pump assembly. Align with two short J–38588 guide pins on outer bolt holes.
   - Loosely install five 13mm bolts.
   - Center converter housing using J–38557 centering tool.
   - Tighten five inner 13mm bolts in an alternating pattern.

   Torque: 20 N•m (15 lb ft)



241RW002

3. Install oil seal ring (3 screws).

   Torque: 3 N•m (26 lb in)
4. Install gasket.
5. Install outer seal ring.

Oil Pump

(23) Boost Valve Sleeve
(24) Boost Valve
(25) Spring Seat
(26) Pressure Regulator Valve Spring
(27) Spring Seat
(28) Pressure Regulator Valve
(29) Oil Pump Assembly

Disassembly

1. Remove oil pump drive gear (1) and driven gear (2).
2. Remove pin (3) from oil pump assembly (29).
3. Remove plug (4) and seal ring (5), torque converter clutch control valve (6) and spring (7).
4. Remove pin (8) from oil pump assembly (29).
5. Remove torque converter regulator sleeve (9), converter clutch regulator spring (10), converter clutch regulator valve (11), isolator spring (12) and isolator valve (13).
6. Remove pin (14) from oil pump assembly (29).
7. Remove enable valve spring (16), spring guide (15) and enable valve (17).
8. Remove snap ring (18) from oil pump assembly (29).

9. Remove spring seat (19), spring (20) and throttle signal accumulator piston (21).
10. Remove sleeve pin (22) from oil pump assembly (29).
11. Remove boost valve sleeve (23), boost valve (24), spring seat (25), valve spring (26), spring seat (27), and pressure regulator valve (28).

Inspection And Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Lubricate and preinstall pressure regulator spring seat (27) on valve (28), with the flat side against shoulder.
2. Install pressure regulator valve (28) and spring seat (27) assembly, valve spring (26), and spring seat (25) with the flat side away from spring to oil pump assembly (29).
3. Assemble boost valve (24) into sleeve (23).
4. Install boost valve and sleeve assembly, and sleeve pin (22) to oil pump assembly (29).
5. Install throttle signal accumulator piston (21), spring (20), and spring seat (19), with the flat side away from the spring, and snap ring (18) to oil pump assembly (29).
6. Install enable valve (17), spring guide (15), enable valve spring (16) and retainer pin (14) to oil pump assembly (29).
7. Assemble torque converter regulator spring (10) and torque converter regulator valve (11) into sleeve (9).
8. Install isolator valve (13), isolator valve spring (12) and the torque converter regulator sleeve and valve assembly into the oil pump assembly (29).
9. Install torque converter clutch control valve spring (7), torque converter clutch control valve (6), plug (4) and seal ring (5), and retainer pin (3) to oil pump assembly (29).
10. Install oil pump driven gear (2) and drive gear (1).

(23) Spring Pin
(24) Plug
(25) 1–2 Accumulator Valve
(26) 1–2 Accumulator Control Valve
(27) Check Ball
(28) Main Case Valve Body

Disassembly

1. Remove two 11mm bolts from valve body (28), then remove gaskets and transfer plate (1).
2. Remove manual valve (2).
3. Push in band control solenoid (3) to compress waved washer (5), and remove pin (4).
4. Remove band control solenoid (3) and waved washer (5).
5. Remove spring pin (6) with a 3 mm dia punch.
6. Remove solenoid A (7) by grasping the metal tip. Do not grasp the connector housing.
7. Remove retainer (8), 1–2/3–4 shift valve (9), and spring (10).
8. Remove spring pin (11) with a 3 mm dia punch.
9. Remove solenoid B (12) by grasping the metal tip. Do not grasp the connector housing.

10. Remove retainer (13), 2–3 shift valve (14), and spring (15).
11. Remove spring pin (16), plug (17), spring (18), and low pressure control valve (19).
12. Remove spring pin (20), plug (21), and band control screen assembly (22).
13. Remove spring pin (23), plug (24), 1–2 accumulator valve (25), and 1–2 accumulator control valve (26).
14. Remove check ball (27) from valve body (28).

Inspection And Repair

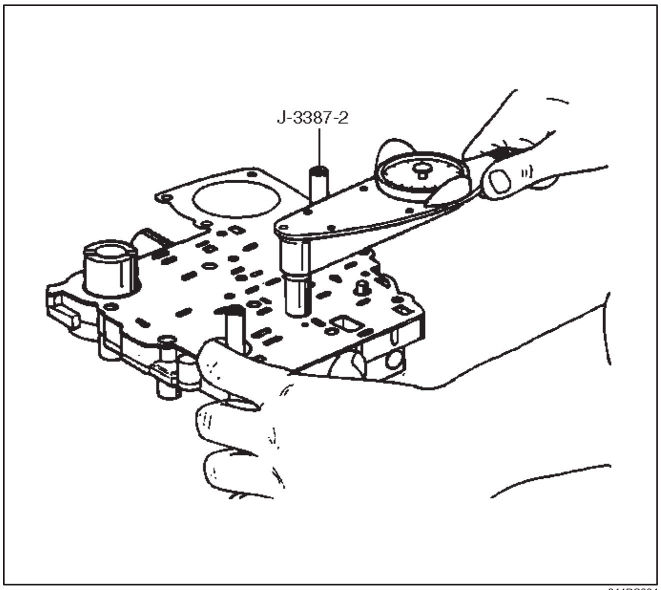
Inspect for the following, and replace any damaged or worn parts:

1. Damage or wear to each valve.
2. Damage in oil passeges.
3. Cracks or damage to valve body.
4. Valve operations.
5. Spring fatigue.

Reassembly

1. Install 1–2 accumulator control valve (26), 1–2 accumulator valve (25), plug (24), and spring pin (23).
2. Install band control screen assembly (22), plug (21), and spring pin (20).
3. Install low pressure control valve (19), spring (18), plug (17), and spring pin (16).
4. Install spring (15), 2–3 shift valve (14), retainer (13), solenoid B (12), and spring pin (11).
5. Install spring (10), 1–2/3–4 shift valve (9), retainer (8), solenoid A (7), and spring pin (6).
6. Install waved washer (5), band control solenoid (3), and pin (4).
7. Install manual valve (2).
8. Install check ball (27) to valve body (28).
9. Install gasket (valve body/transfer plate) and transfer plate using two J–3387–2 guide pins.
   - Install two 11mm bolts.

Torque: 13 N•m (113 lb in)

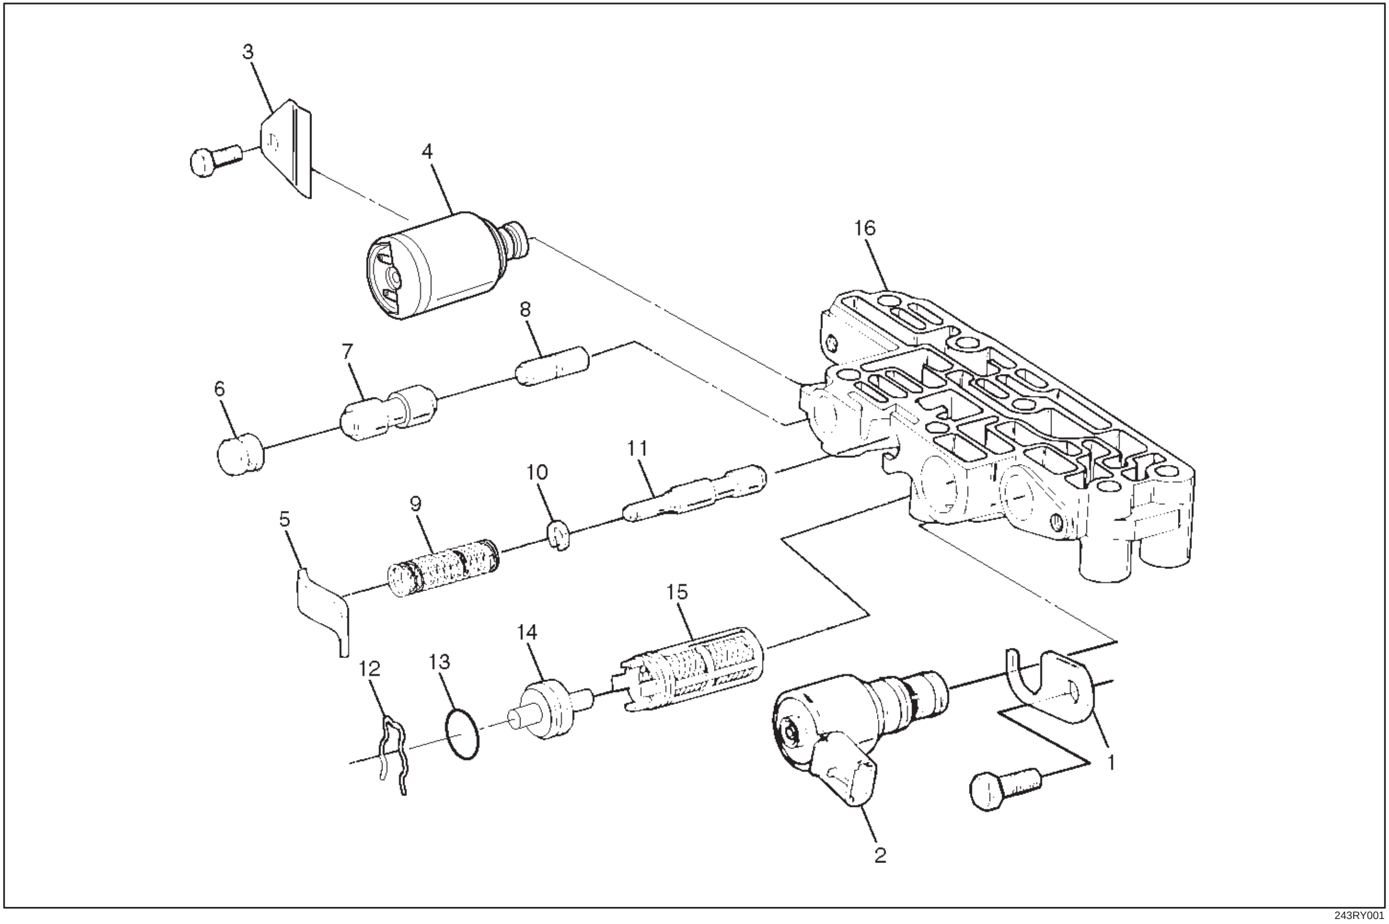


244RS004

- Install gasket (transfer plate/main case).

Adapter Case Valve Body

Disassembled View



Legend

(1) Bracket

(5) Retainer
(6) Plug
(7) 3/4 Accumulator Valve
(8) 3/4 Accumulator Control Valve
(9) Spring
(10) Retaining Ring
(11) Feed Limit Valve
(12) Plug Retainer
(13) O–Ring
(14) Plug
(15) Force Motor Screen Assembly
(16) Adapter Case Valve Body

Disassembly

1. Remove 11mm bolt from valve body.
   - Remove bracket (1) and converter clutch PWM solenoid (2).
2. Remove 11mm bolt and retainer (3) from valve body.
   - Remove force motor solenoid (4).
3. Remove retainer (5), plug (6), 3/4 accumulator valve (7), and 3/4 accumulator control valve (8).
4. Remove spring (9), retaining ring (10), and feed limit valve (11).
5. Remove plug retainer (12), O–ring (13), plug (14), and force motor screen assembly (15).
   - Use 5 mm bolt to pull plug.

Inspection And Repair

Inspect for the following, and replace any damaged or worn parts:

1. Damage or wear to each valve.
2. Damage in oil passeges.
3. Cracks or damage to valve body.
4. Valve operations.
5. Spring fatigue.

Reassembly

1. Install force motor screen assembly (15), plug (14), O–ring (13), and plug retainer (12).

2. Install feed limit valve (11), retaining ring (10), and spring (9).
3. Install 3/4 accumulator control valve (8), 3/4 accumulator valve (7), plug (6), and retainer (5).
4. Install force motor solenoid (4).
   - Place solenoid terminals pointing towards mating face.
   - Install retainer (3) and bolt.

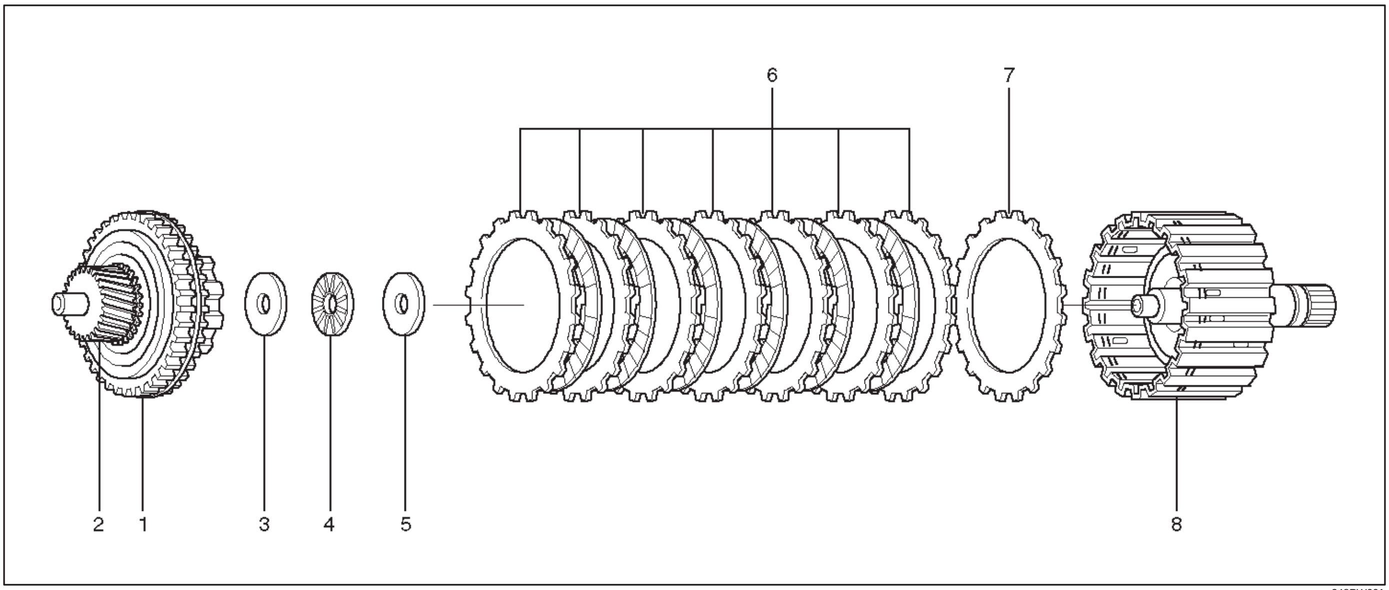
Torque: 10 N•m (87 lb in)

5. Install converter clutch PWM solenoid (2) with two O–rings (2) and bracket (1) to valve body.
   - Install bolt.

Torque: 10 N•m (87 lb in)

Third Clutch And Sprag Unit

Disassembled View



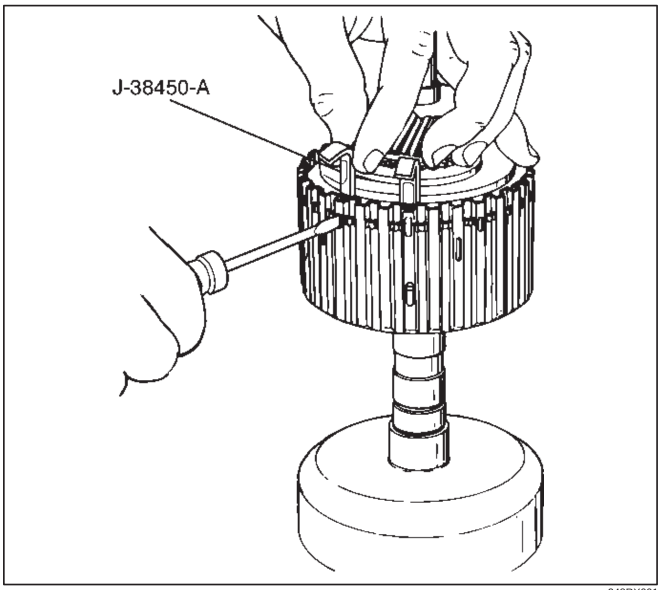
248RW001

Legend

(1) Retaining Ring
(2) Input Sun Gear and Sprag Unit Assembly
(3) Retaining Washer
(4) Bearing
(5) Thrust Washer
(6) Clutch Plates
(7) Third Clutch Spring Cushion Plate
(8) Third Clutch Drum Assembly

Disassembly

1. Place the third clutch drum and intermediate shaft assembly upright, using the overdrive internal gear as a support.
2. Locate the ends of the retaining ring. Depress one end of the ring using a small screwdriver instead of the depressor handle provided with the tool J-38450-A. Slide one blade down between the third clutch drum and the retaining ring.
3. Remove a screwdriver and repeat this step for the other end of retaining ring.
4. Install the remaining four blades approximately (five) notches apart using a screwdriver to depress the retaining ring.
5. Pull up on input sun gear and sprag unit assembly (1 and 2) to release the retaining ring from third clutch drum assembly (8).
6. Remove the tool blades.



248RX001

7. Remove retaining washer (3), bearing (4), thrust washer (5), and clutch plates (6 and 7) from the third clutch drum assembly (8).

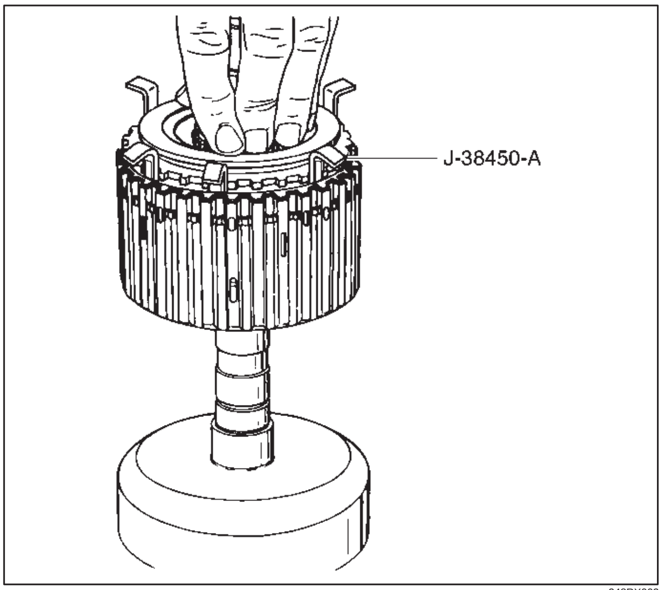
Inspection And Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

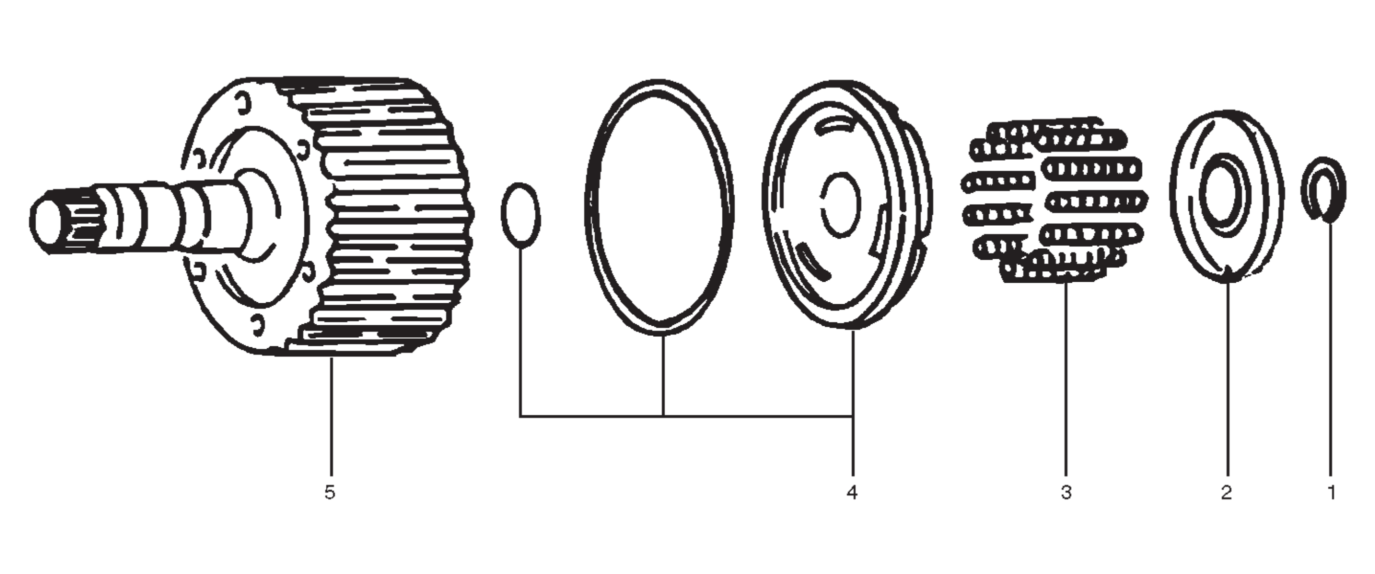
1. Place third clutch drum and intermediate shaft assembly upright, using the overdrive internal gear as a support.
2. Install third clutch spring cushion plate (7), bevel face down.
3. Install third clutch plates (6) into third clutch drum assembly (8). Start with the steel clutch plate and alternate with lined plates.
4. Install thrust washer (5), bearing (4), and retaining washer (3).
5. Fully engage the hub splines of the input sun gear and sprag unit assembly (2) into the third clutch inner tangs.
   - Simultaneously rotate the outer sprag race to engage into the third clutch drum assembly (8).
6. Place J-38450-A blades between the retaining ring and the third clutch drum apporximately (five) notches apart, and one blade at each end of the retaining ring (1). Push down on sprag assembly until the assembly is seated into the third clutch drum assembly (8).
7. Remove the tool blades and engage retaining ring into groove of third clutch drum.



248RX002

Third Clutch

Disassembled View



Legend

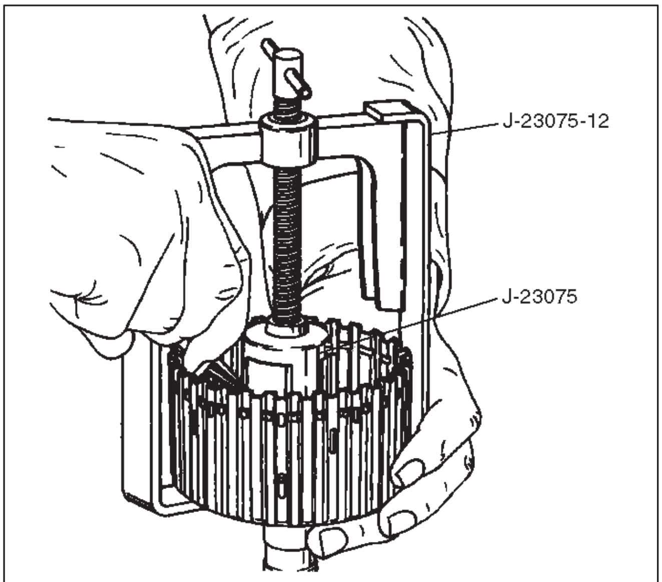
(1) Retaining Ring
(2) Spring Seat
(3) Springs
(4) Piston Assembly
(5) Third Clutch Drum

Disassemble

1. Compress spring seat using the J–23075 spring compressor and J–23075–12 adapter tool.

NOTE: Do not over–stress the springs and seat. This will cause damage to the spring seat.

- Remove the tool.
- Remove retaining ring (1).



2. Release the spring seat (2).

NOTE: Do not let the spring seat catch in the ring groove.

- Remove spring seat (2) and springs (3).

3. Remove piston assembly (4) from third clutch drum (5).

Inspection And Repair

Visual check:

If any damage, deformation or wear is found, replace the damaged part.

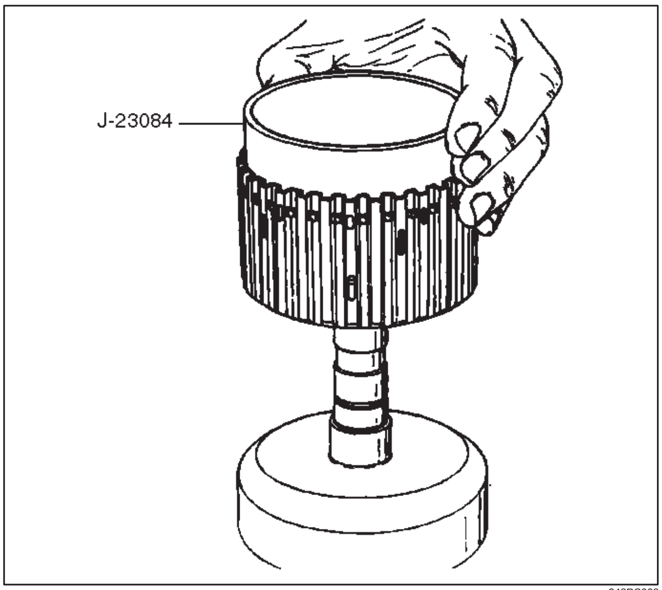
Operation check:

Shake the piston and listen for check ball movement indicates proper check ball operation. Replace the piston if the check ball is missing or falls out.

Reassembly

1. The lip of the piston seal must point toward the front of the transmission. Lubricate the seal lip with transmission fluid.

- Install piston assembly (4) into the third clutch drum (5). Use the J–23084 third clutch piston installer to protect the outer seal during installation.
- Remove the seal installer.



248RS008

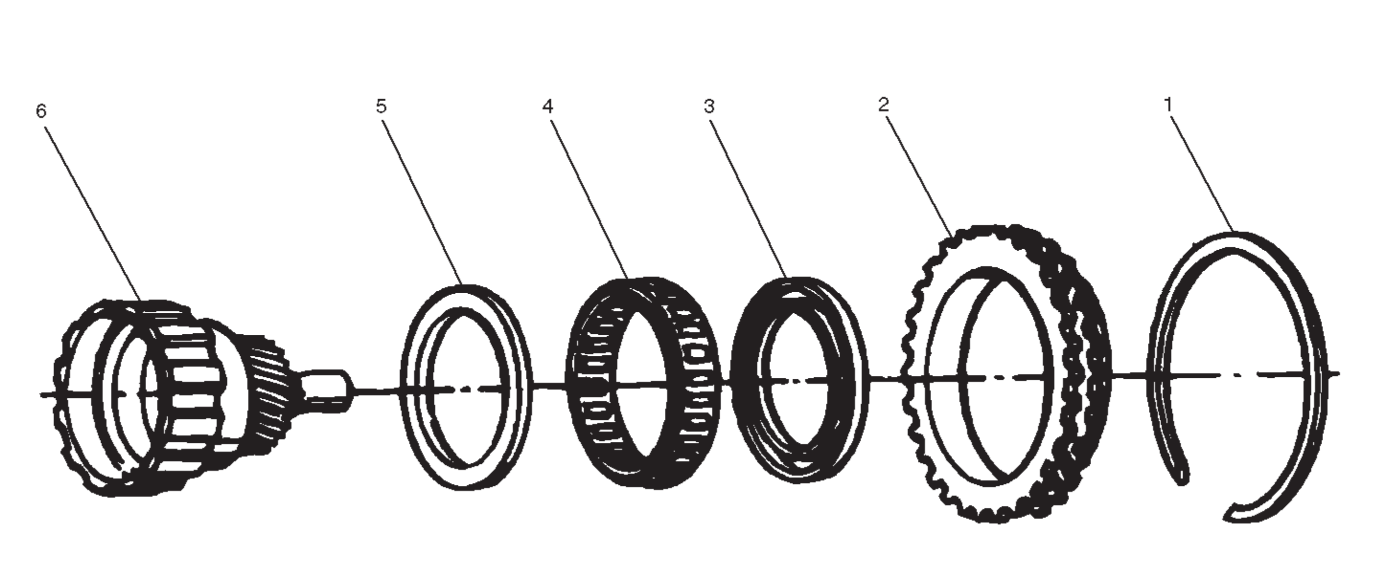
2. Install twelve springs (3) and spring seat (2).
3. Place retaining ring (1) onto spring seat.
   - Compress the piston springs, using the J–23075 piston spring compressor and J–23075–12 adapter.

CAUTION: Do not over stress the springs and seat. Do not let the spring seat catch in the ring groove. This may cause damage to the spring seat.

- Install spring seat retaining ring (1).
- Remove the piston spring compressor and adapter.

Sprag Unit

Disassembled View



248RS009

Legend

(1) Retaining Ring
(2) Sprag Outer Race
(3) Ring
(4) Sprag Assembly
(5) Ring
(6) Third Clutch Hub and Sun Gear Assembly

Disassembly

1. Remove the sprag outer race, retaining ring, and sprag assembly from the third clutch hub and sun gear assembly.
2. Remove the rings and sprag assembly from the sprag outer race.

Inspection And Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

NOTE: Flared shoulder of the sprag cage faces the sun gear. This procedure must be followed exactly to be sure that the sprag assembly is installed properly.

1. Install rings and sprag assembly onto the third clutch hub and sun gear.
2. Install sprag outer race and retaining ring assembly over the sprag cage assembly.
   - Place third clutch hub and sun gear assembly on a flat surface, sun gear facing up. Place sprag outer race and sprag assembly over the sun gear assembly, push down and turn the input sun counterclockwise at the same time.

NOTE: Check correct rotation by holding the sun gear in your left hand and turning the outer race. The outer sprag race should turn freely towards you and should lock turning away from you.

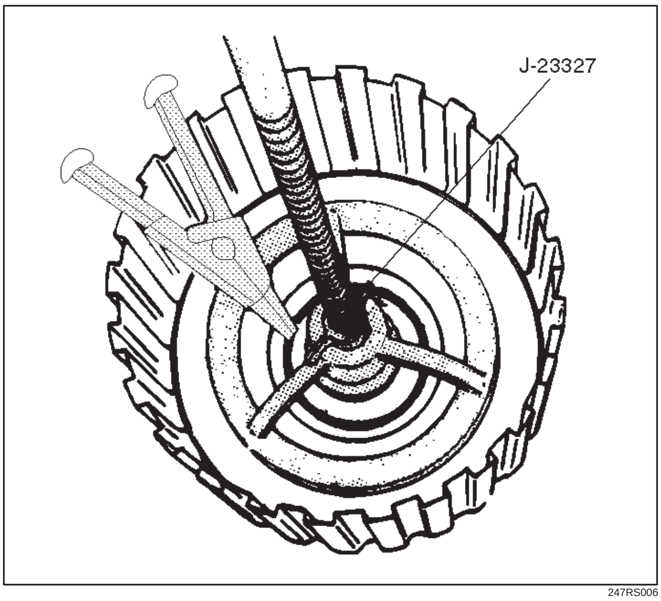
(4) Spacer
(5) Clutch Plates
(6) Waved Washer
(7) Retaining Ring
(8) Spring Seat
(9) Springs
(10) Piston Assembly
(11) Second Clutch Drum

Disassembly

1. Remove retaining ring (1) from second clutch drum (11).
2. Remove ring gear (2), retaining ring (3), and spacer (4).
3. Remove clutch plates (5) and waved washer (6).
4. Remove retaining ring (7) using J–23327 compressor to compress the spring seat (8).
5. Remove spring seat (8), springs (9) and piston assembly (10) from second clutch drum (11).



Inspection And Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Operation Check:

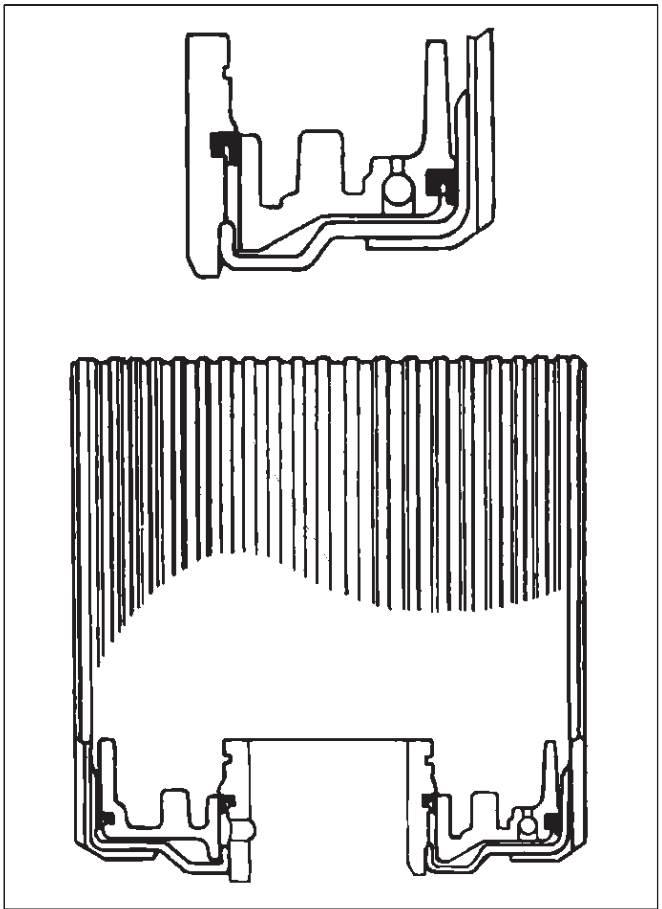
Shake the piston and listen for check ball movement. Movement indicates proper check ball operation. Replace the piston if the check ball is missing or falls out.

Reassembly

1. Install piston assembly (10) into the second clutch drum (11).
   - Lubricate the lip seal with transmission fluid. Use the J–23080–A second clutch piston installer to protect the outer piston lip seal.

NOTE: Lip of the seal should point toward front of transmission.

- Remove the installer.



247RS007

2. Install twenty–two piston springs (9) and spring seat (8) on the second clutch piston (10). Place retaining ring (7) onto spring seat.
   - Use the J–23327 compressor to compress the piston springs.

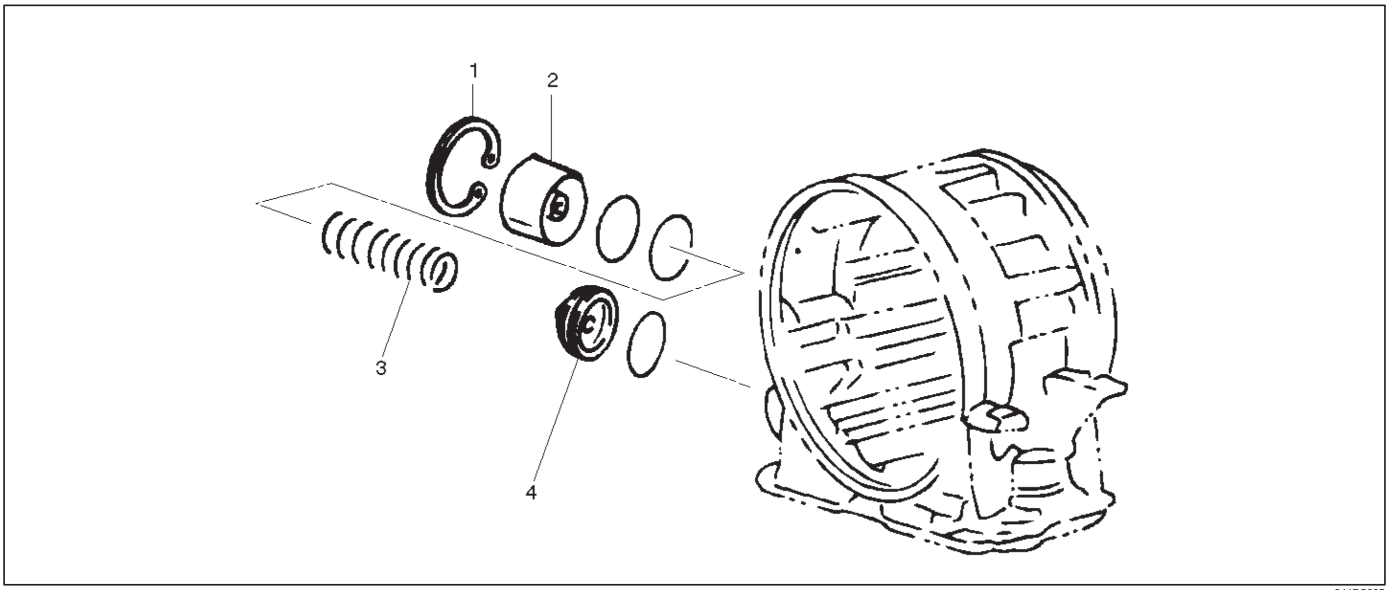
NOTE: Do not let spring seat catch in ring groove.

- Remove the compressor.

3. Install waved plate (6) and clutch plates (5). Start with a steel plate and alternate with lined plates.
   - Align second clutch inner tangs.
4. Install spacer (4), with the fluted end toward clutch plates.
5. Install retaining ring (3), ring gear (2) and retaining ring (1).

3–4 Accumulator Piston

Disassembled View



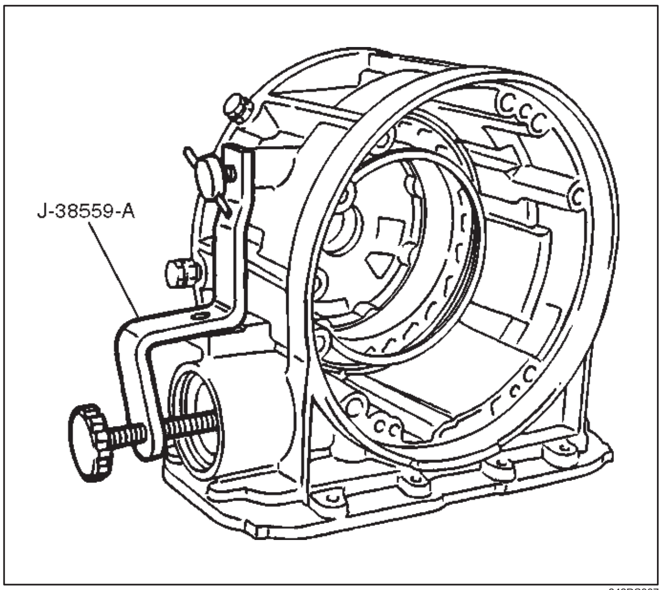
244RS005

Legend

(1) Snap Ring
(2) Cover
(3) Spring
(4) Piston Assembly

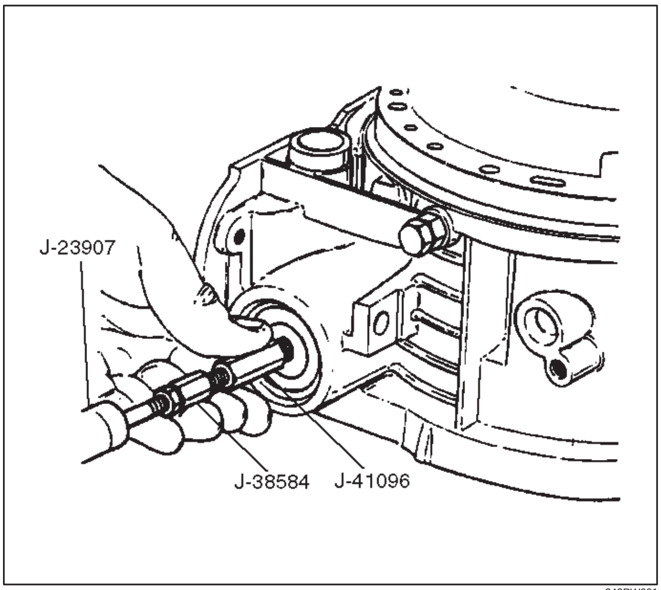
Disassembly

1. Install the J–38559–A cover compressor on adapter case.
   - Compress piston cover then remove snap ring.



242RS007

2. Install the J–41096 cover remover and J–38584 adapter to center hole of cover.
   - Use the J–23907 slide hammer to remove cover.
3. Remove spring and piston assembly.



242RW001

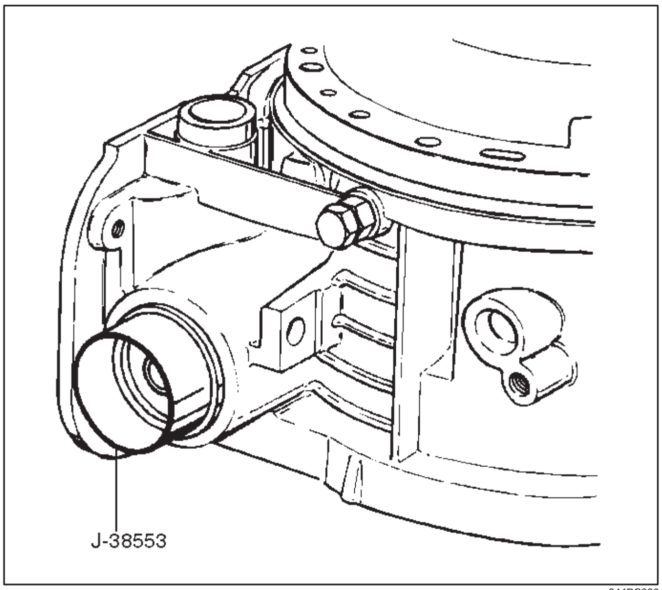
Inspection And Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

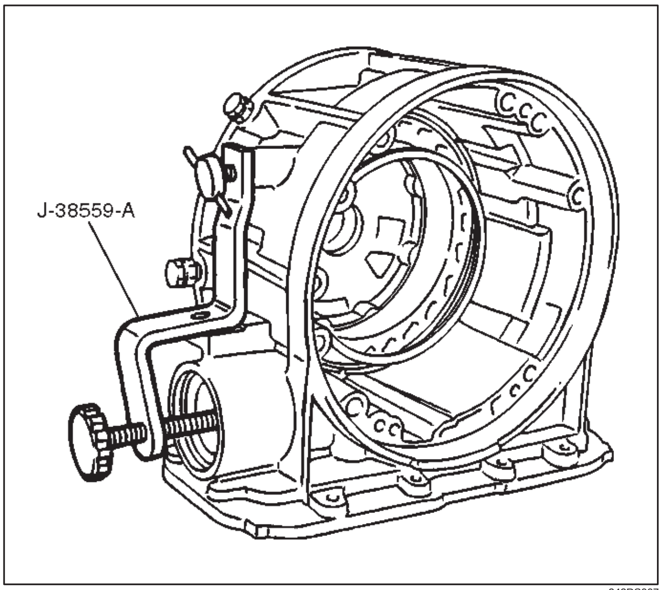
Reassembly

1. Place the J–38553 piston fitter into adaptor case and push the piston into position, using suitable diameter tube.
   - Remove the piston fitter.



244RS006

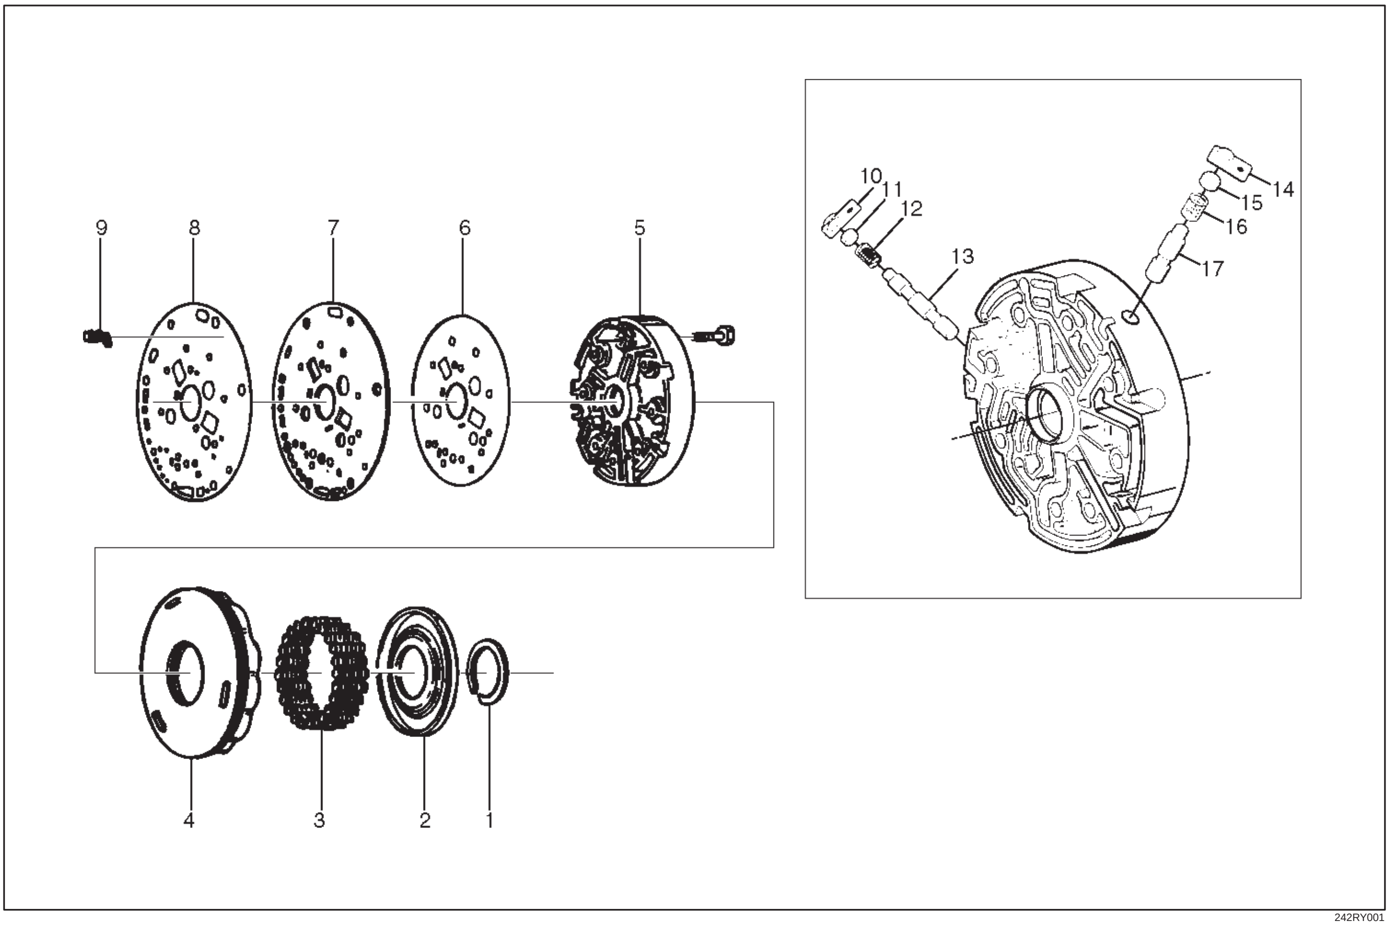
2. Install spring and cover.
3. Install snap ring, using the J–38559–A compressor tool.
   - Install snap ring in groove.
   - Remove the compressor tool.



242RS007

Reverse Clutch Piston And Center Support

Disassembled View



Legend

(1) Retaining Ring
(2) Spring Seat

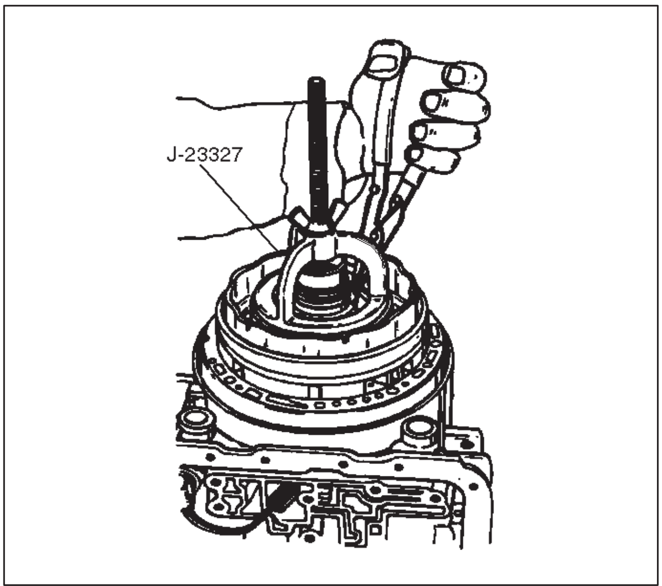
(11) Plug
(12) Spring
(13) Overrun Lock Out Valve
(14) Retainer Plate
(15) Plug
(16) Spring
(17) Reverse Lock Out Control Valve

Disassembly

1. Install the J–23327 compressor tool on spring seat, then compress the spring seat.
   - Remove retaining ring (1).

NOTE: Do not over–stress the springs and seat, as this will cause damage to the spring seat.

   - Remove the compressor tool.



247RS008

2. Remove spring seat (2) and springs (3).
3. Remove piston assembly (4).
4. Remove 8 bolts from center support (5), then remove center support (5) from adapter case.
5. Remove gasket transfer plate/outer support (6), center support transfer plate (7), and gasket transfer plate/adapter case (8).
6. Remove restrictor (9) from adapter case housing.
7. Remove retainer plate (10), plug (11), spring (12), and overrun lock out valve (13) from center support (5).
8. Remove retainer plate (14), plug (15), spring (16) and reverse lock out valve (17) from center support (5).

Inspection And Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

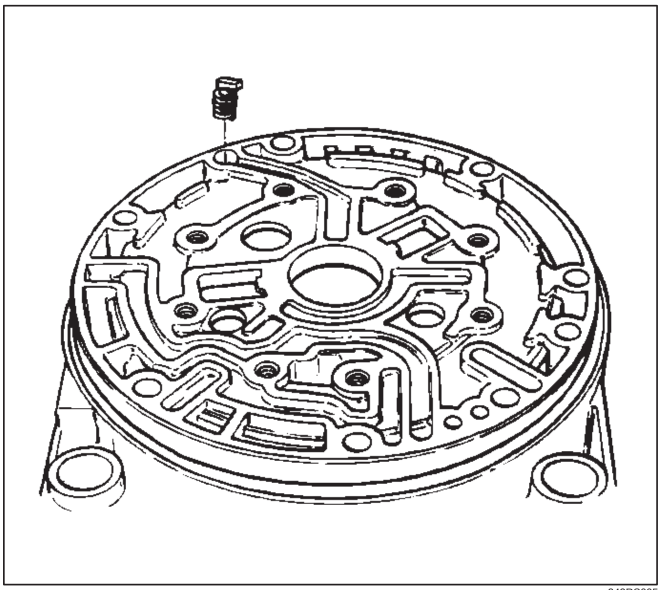
1. Install reverse lock out valve (17) and spring (16) to center support.

NOTE: Ensure correct assembly of valve. The spring should be located over the long small diameter end.

2. Install plug (15) and retainer plate (14).
3. Install overrun lock out valve (13) and spring (12) to center support.

NOTE: Ensure correct assembly of valve. The spring should be located over the long small diameter end.

4. Install plug (11) and retainer plate (10).
5. Place restrictor (9) in the lube overdrive channel in the adapter case housing.



242RS005

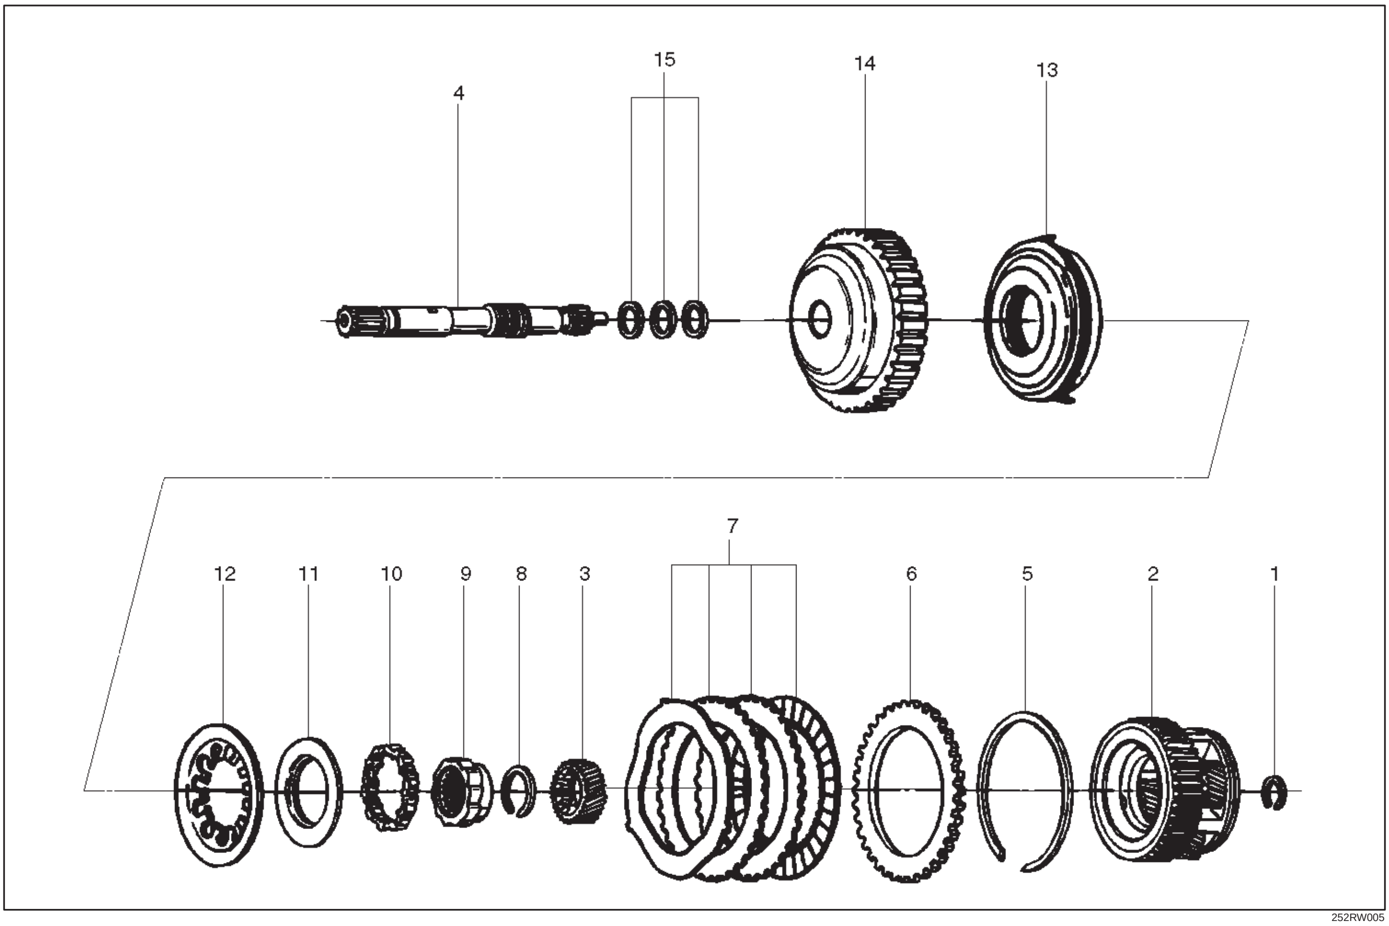
6. Install gasket transfer plate/adapter case (8), center support transfer plate (7), and gasket transfer plate/center support (6).
7. Install center support (5) with 8 bolts.

Torque : 25 N•m (18 lb ft)

8. Install piston assembly (4) into center support (5).
9. Install twenty four springs (3), spring seat (2), and retaining ring (1).
   - Install the J–23327 compressor and compress spring seat (2) and springs (3), then seat snap ring (1) in groove.
   - Remove the tool.

Overrun Clutch And Turbine Shaft

Disassembled View



Legend

(1) Snap Ring
(2) Overdrive Carrier Assembly
(3) Sun Gear
(4) Turbine Shaft
(5) Snap Ring
(6) Backing Plate
(7) Clutch Plates
(8) Snap Ring

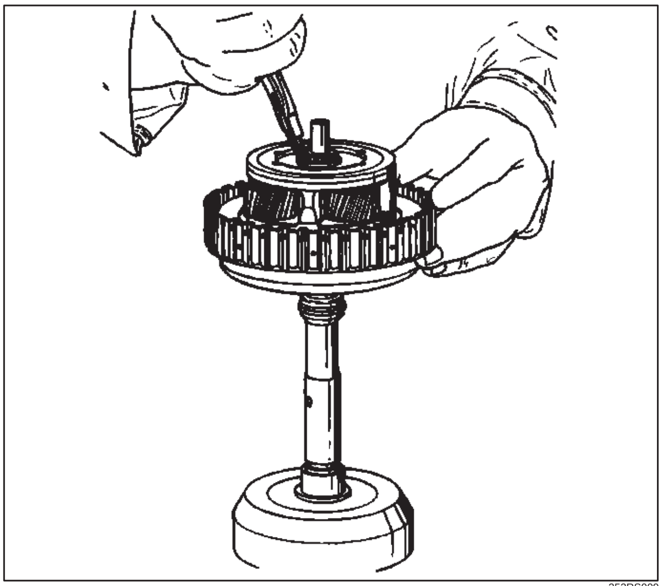
(10) Roller Clutch Assembly
(11) Overrun Clutch Release Spring Retainer
(12) Diaphragm Spring
(13) Piston Assembly
(14) Overrun Clutch Drum
(15) Turbine Shaft Seal Rings

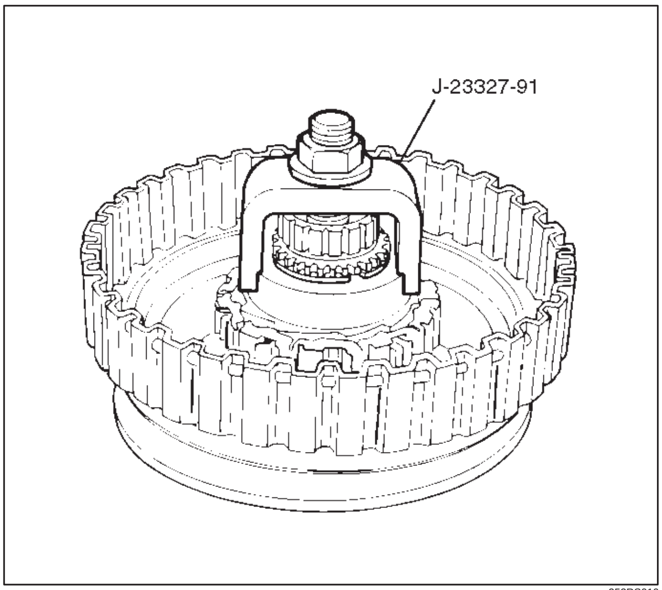
Disassembly

1. Position overrun clutch assembly upright, using the overdrive internal gear as a support.
   - Remove snap ring (1).



252RS009

2. Remove overdrive carrier assembly (2), sun gear (3) and turbine shaft (4).
3. Remove snap ring (5), backing plate (6), and clutch plates (7).
4. Compress diaphragm spring with the J–23327–91 compressor, then remove snap ring (8).



252RS010

5. Remove overrun roller clutch cam (9) and roller clutch assembly (10).
6. Remove overrun clutch release spring retainer (11) and diaphragm spring (12).
7. Remove piston assembly (13) from overrun clutch drum (14).
8. Remove turbine shaft seal rings (15).

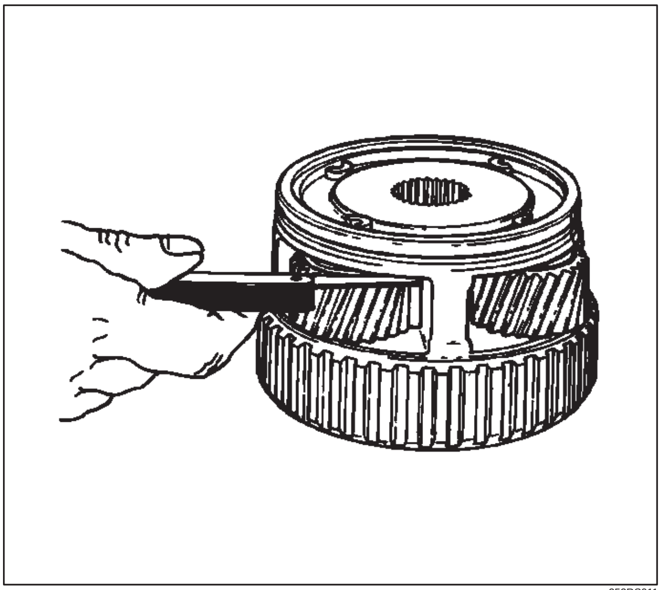
Inspection And Repair

Overdrive Carrier Check

- Check pinion end play with a feeler gauge.

Clearance: 0.24mm–0.64mm (0.0094in–0.025in)

If clearance is outside specified value, replace overdrive carrier assembly.



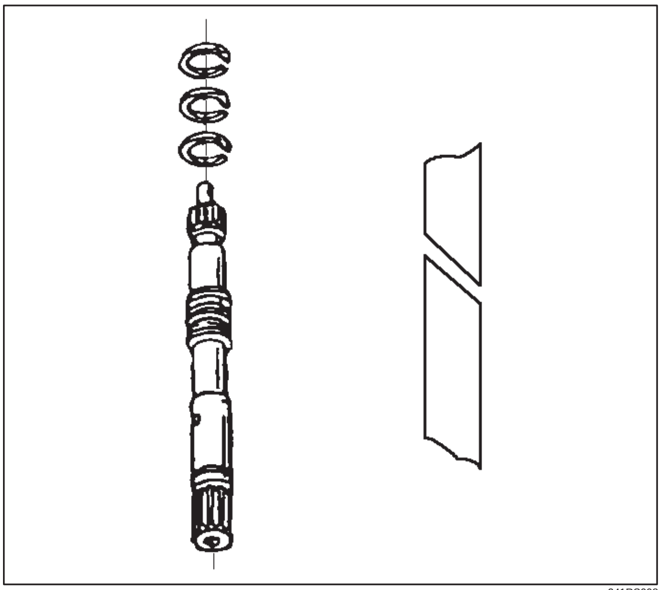
252RS011

Visual Check:

If any damage, deformation or local wear is found, replace the damaged part.

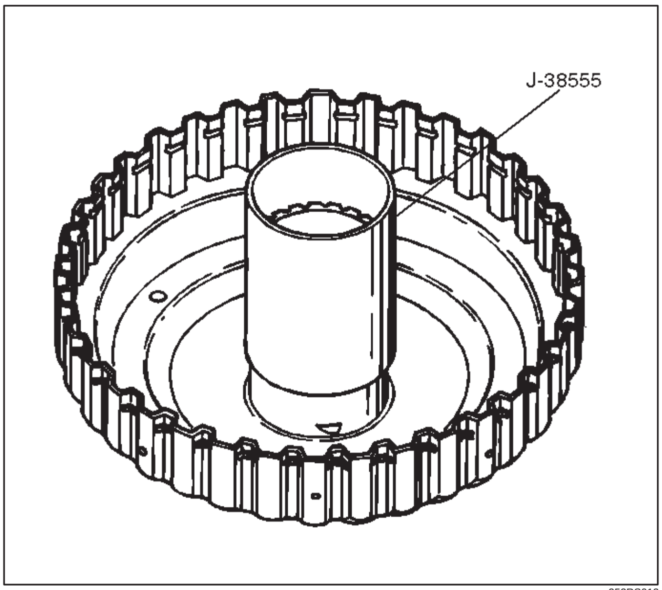
Reassembly

1. Install turbine shaft seal rings (15) with grease (petroleum jelly).

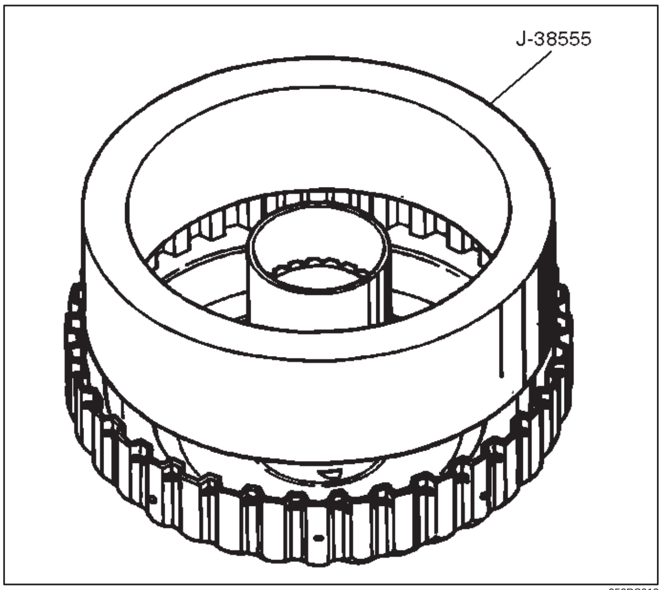


241RS008

2. Install the J–38555 inner installer on the drum (14).
   - Pre–install piston assembly into J–38555 outer installer.
   - Install overrun clutch piston assembly (13). Use the outer installer while pushing piston into drum (14).
   - Remove the installer.



252RS012



252RS013

3. Install diaphragm spring (12).
4. Install overrun clutch release spring retainer (11) (lip faces upwards), overrun roller clutch assembly (10), and cam (9).
5. Place snap ring loosely on spring retainer.
   - Hold the J–23327–91 compressor in a vise and compress piston return spring with compressor.
   - Set snap ring (8) in ring groove.
   - Remove the compressor.
6. Install clutch plates (7), start with steel plate and alternate with lined plates.
7. Install backing plate (6).
8. Install snap ring (5).
9. Install overdrive sun gear with countersink pointing downwards.
10. Install the overdrive carrier assembly (2).

NOTE: Turn the assembly in a counter–clockwise direction only until roller clutch enters the outer race. After installation, rotate the assembly and listen for loose rollers.

11. Install turbine shaft (4) and snap ring (1).

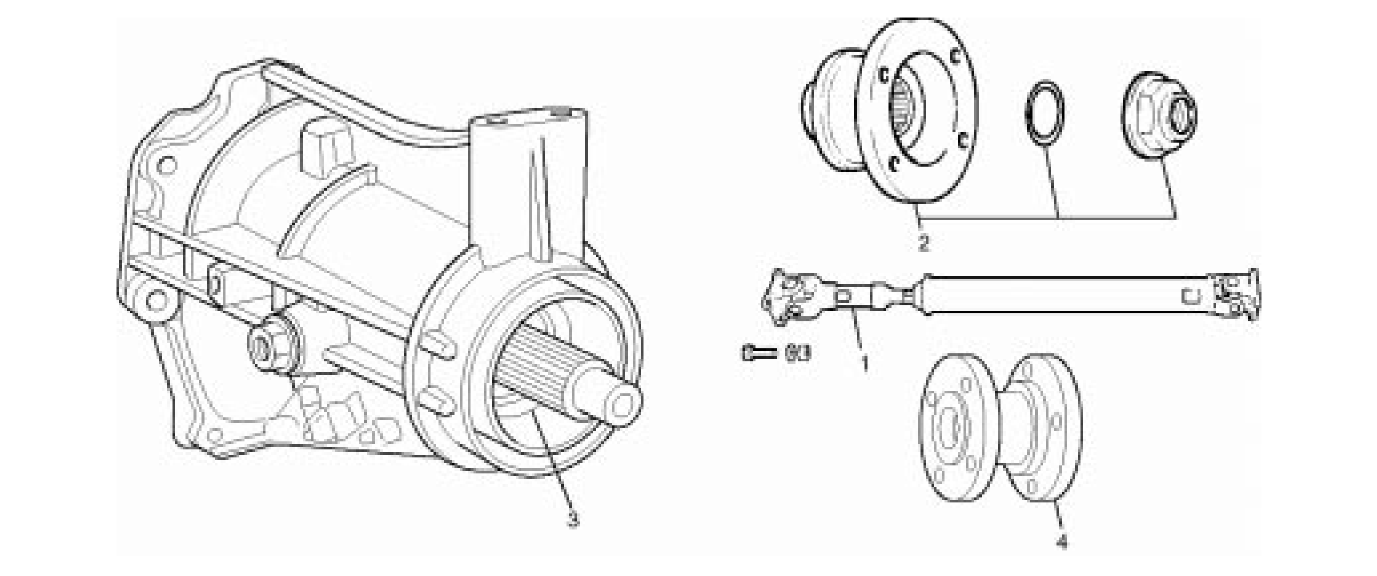
Extension Housing Assembly Oil Seal

Extension Housing Assembly Rear Oil Seal and Associated Parts



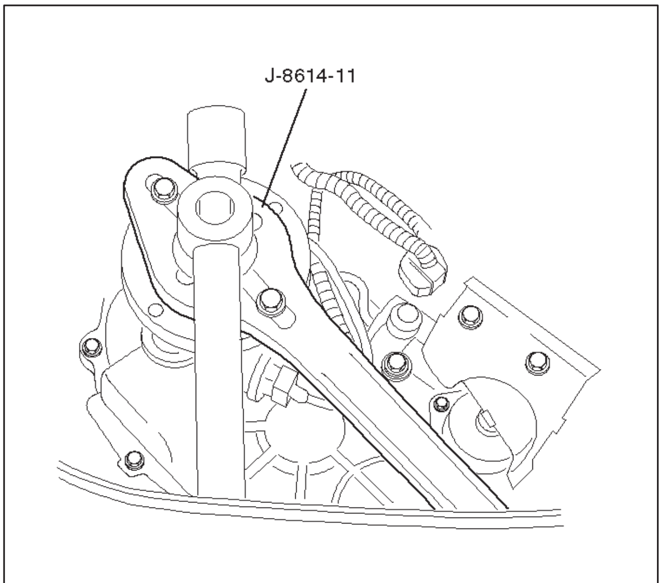
220RY00010

Legend

(1) Propeller Shaft
(2) End Nut and Companion Flange
(3) Oil Seal
(4) Mass

Removal

1. Disconnect the propeller shaft (1) and mass (4) from the extension housing assembly.
2. Remove end nut and companion flange (2), using the companion flange holder J–8614–11.

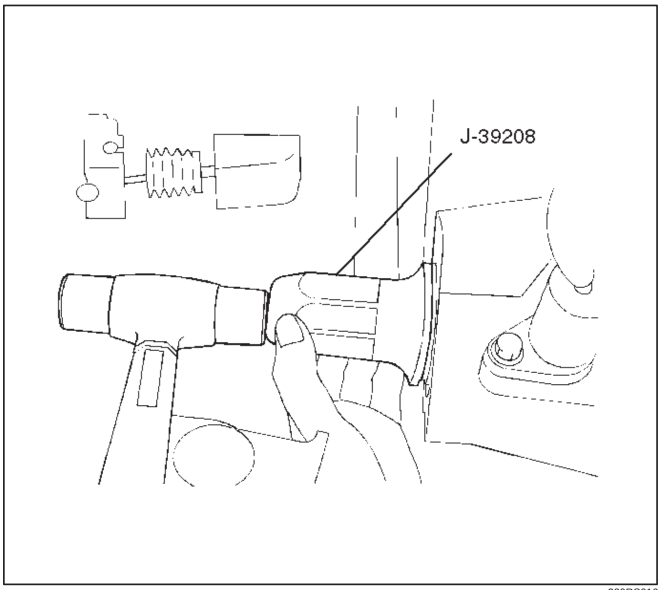


266RW001

3. Use the universal puller to remove the companion flange and O–ring.
4. Remove the oil seal from the extension housing assembly.

Installation

1. Install oil seal and apply engine oil to the oil seal outer surfaces.
2. Apply the recommended grease (BESCO L2) or equivalent to the oil seal lip.
3. Use the oil seal installer J–39208 to install the rear seal (3) to the extension housing assembly.



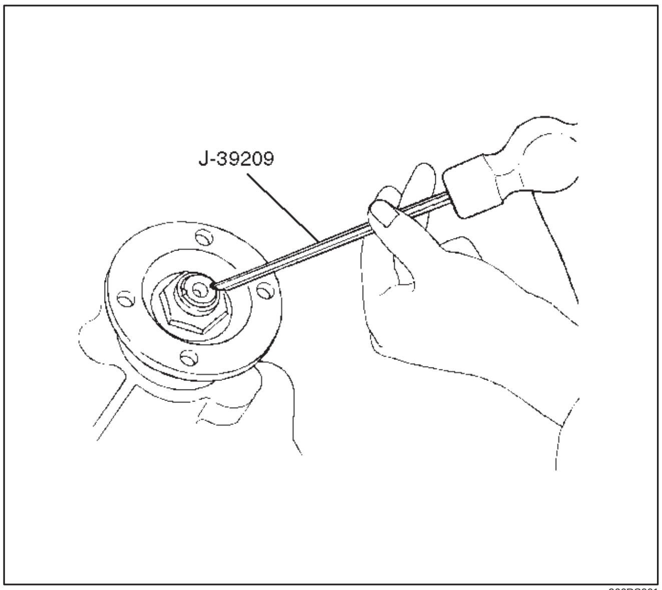
220RS016

4. Install the companion flange (2) and O–ring (2).
5. Use the companion flange holder J–8614–11 to install a new end nut (2) and tighten to the specified torque.

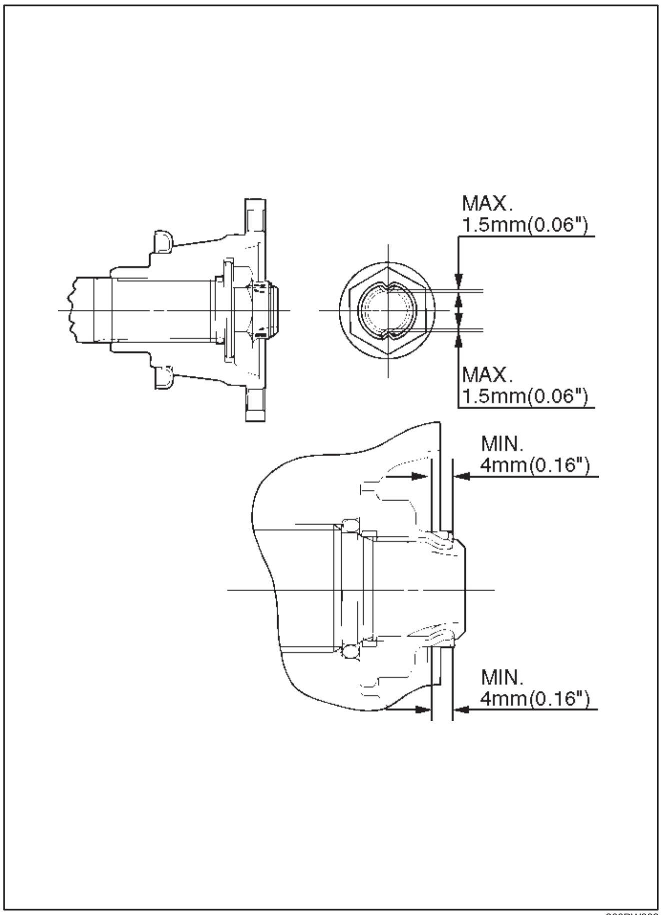
Torque: 167 N·m (123 lb ft)

6. Use the punch J–39209 to stake the end nut at two spots.

NOTE: Be sure to confirm that there is no crack at the staked portion of the end nut (2) after staking.



266RS001



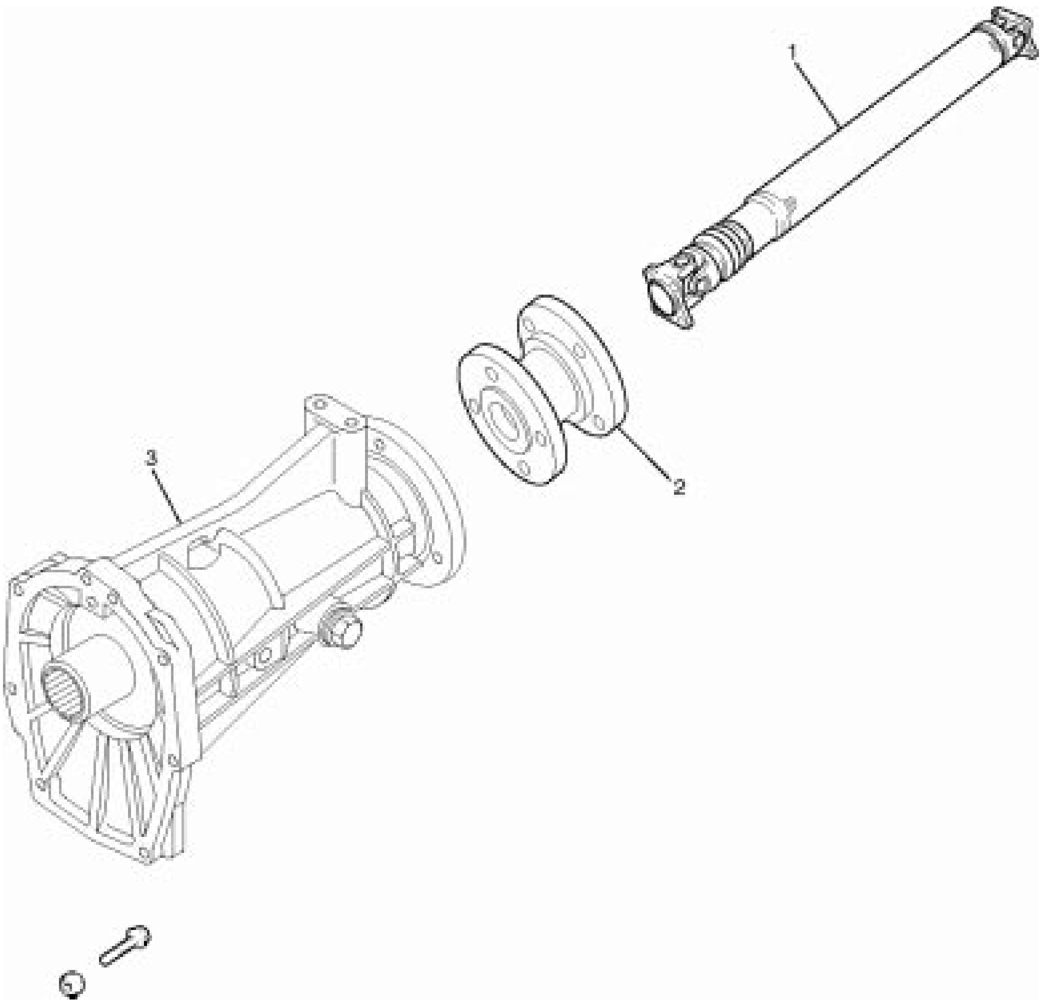
266RW002

7. Connect the mass and propeller shaft to the extension housing assembly and tighten to the specified torque.

Torque: 63 N·m 46 (lb ft)

Extension Housing Assembly

Extension Housing Assembly and Associated Parts



260RY00006

Legend

(1) Propeller Shaft
(2) Mass
(3) Extension Housing Assembly

Removal

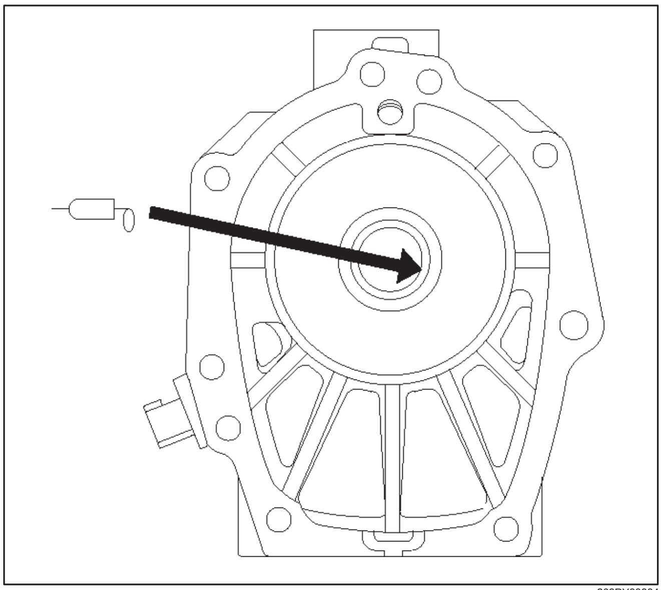
1. Disconnect battery ground cable.
2. Raise and support vehicle with suitable stands.
3. Disconnect harness connectors and fuel pipe fix bolt.
   Connector: speed sensor.
4. Removing the speedometer driven gear bushing and driven gear, drain extension housing assembly fluid.
5. Remove propeller shaft (1) and mass (2).

NOTE: Apply alignment marks on the flange at both front and rear sides.

6. Remove extension housing assembly (3) from the vehicle.

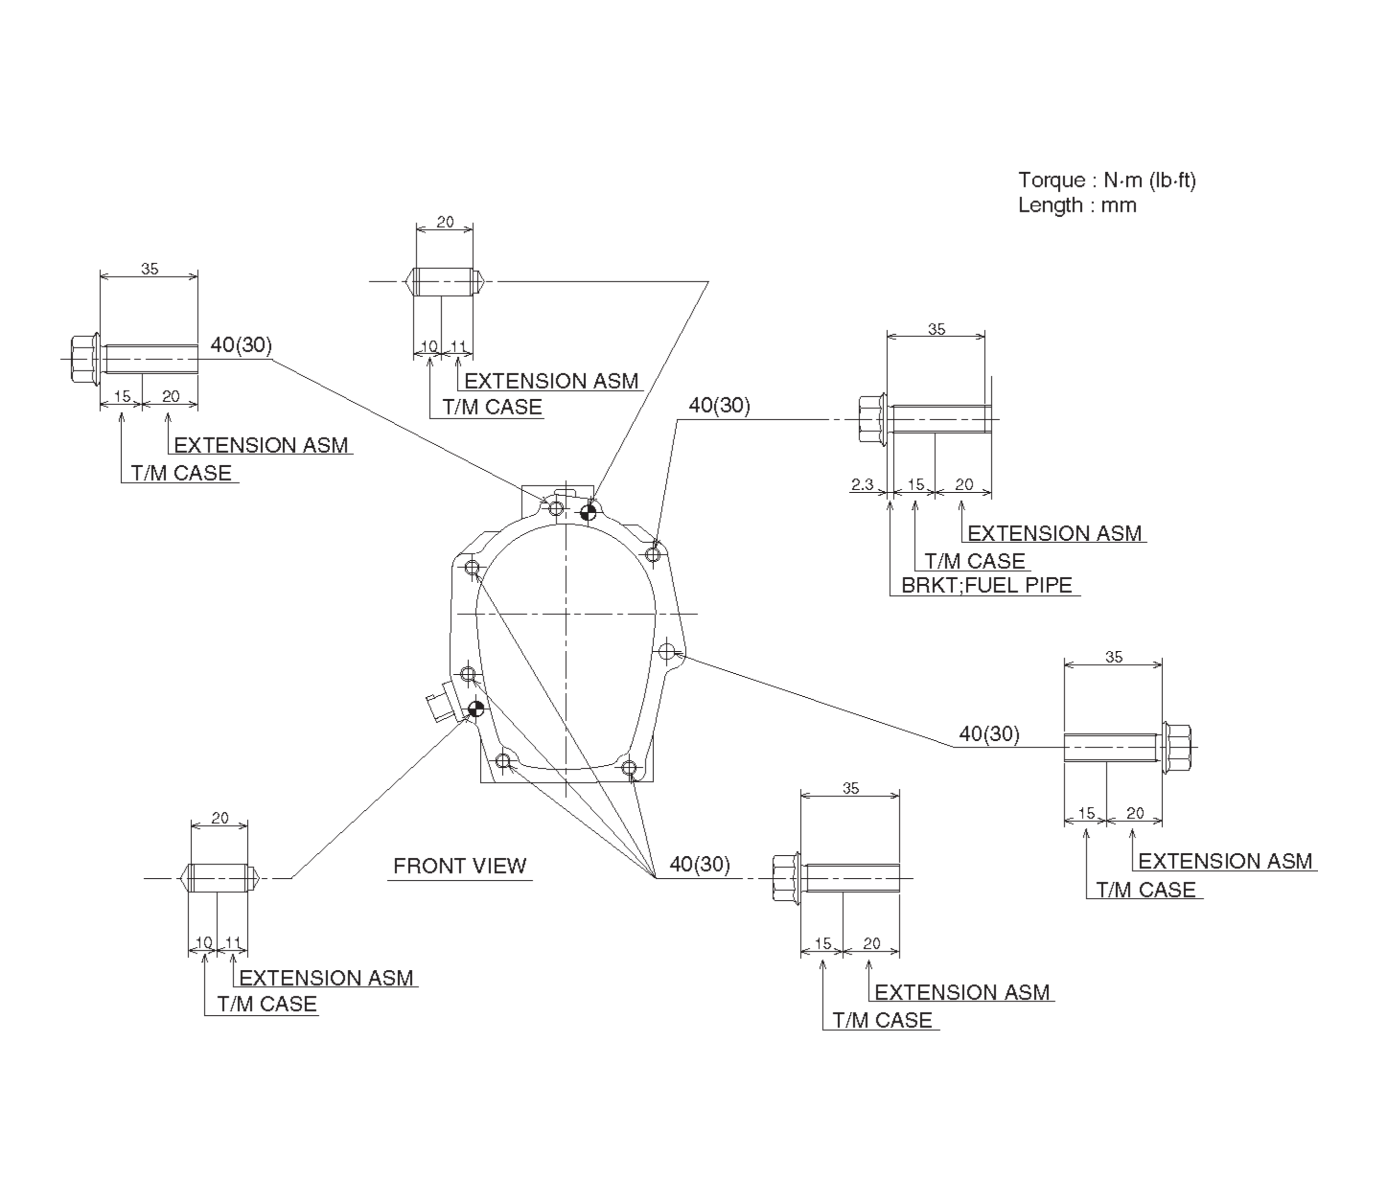
Installation

1. Apply a thin coat of molybdenum disulfide grease to the extension shaft spline as shown in the figure.



260RY00004

2. Install extension housing assembly (3) to the transmission. Tighten extension housing assembly bolts as shown in the figure.



261RY00001

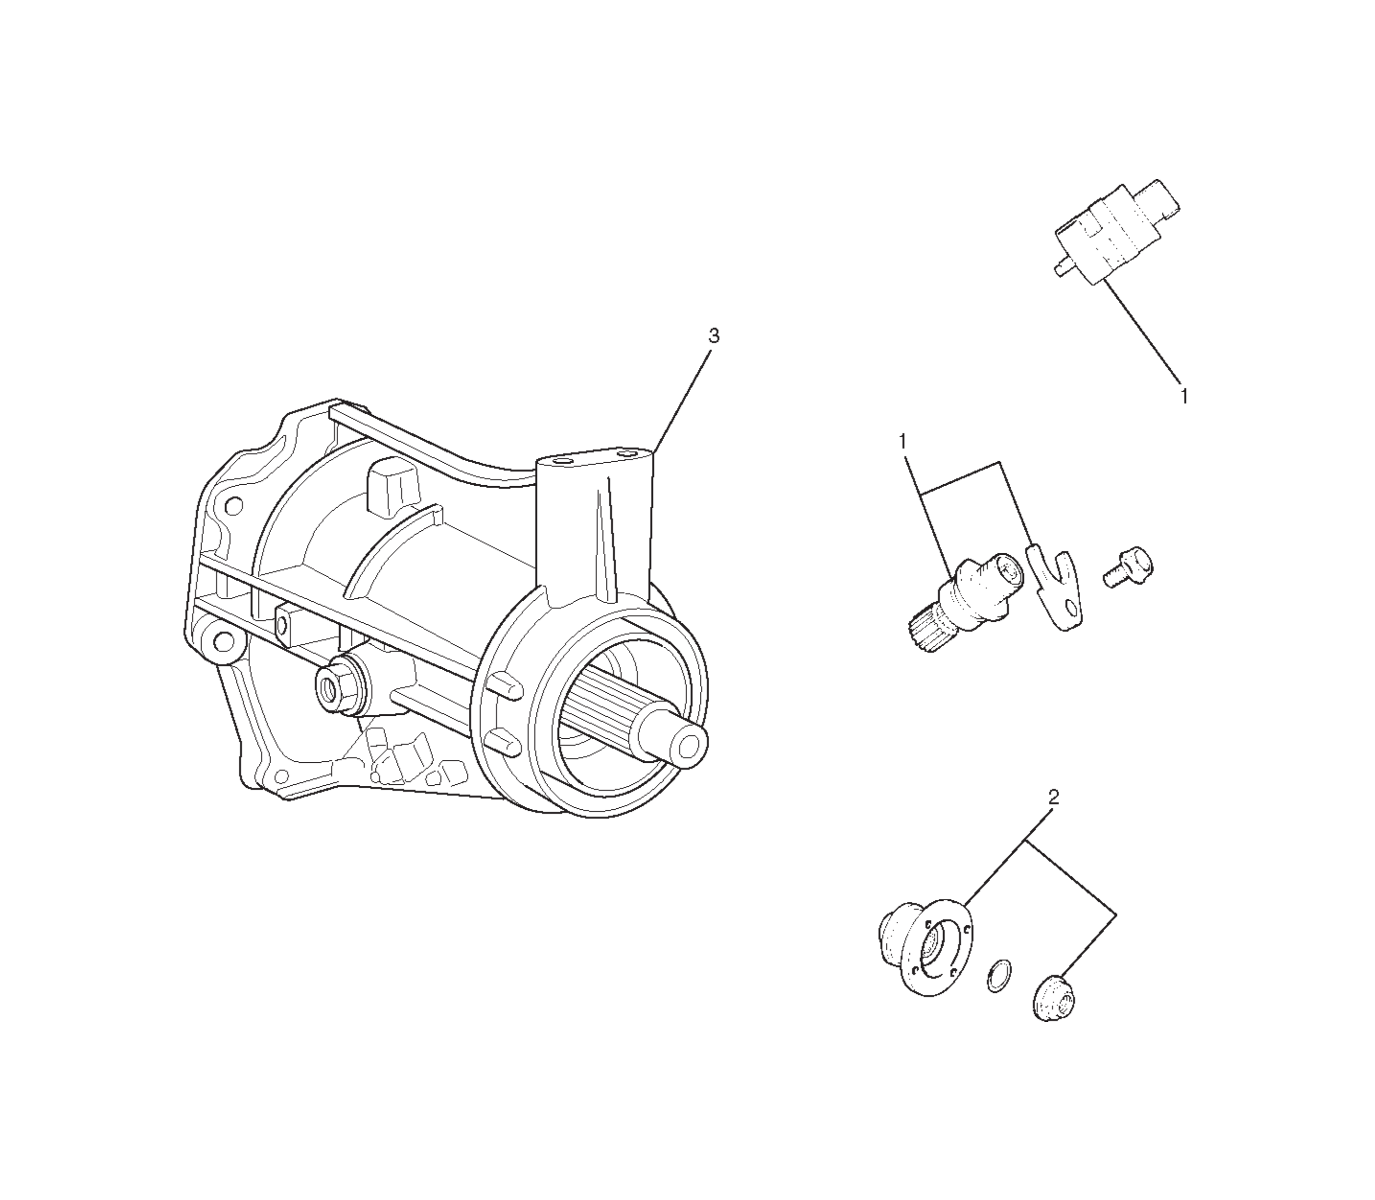
3. Install speedometer driven gear bushing and driver gear.
4. Connect harness connectors and fuel pipe fix bolt. Connector: speed sensor.
5. Install propeller shaft (1) and mass (2).

Torque: 63 N·m (46 lb ft)

6. Fill extension housing assembly fluid.
7. Connect battery ground cable.

Extension Housing Assembly

Extension Housing Assembly and Associated Parts



Legend

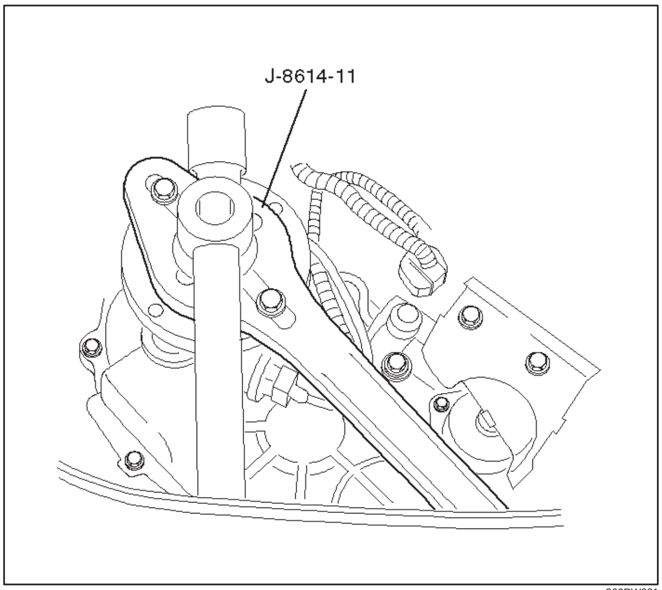
(1) Speedometer Sensor, Speedometer Driven Gear and Plate
(2) Companion Flange
(3) Extension Housing Assembly

Removal

1. Remove the speedometer sensor (1).
2. Remove the plate (1).
3. Remove the speedometer driven gear bushing and driven gear (1).

NOTE: Apply a reference mark to the driven gear bushing before removal.

4. Remove rear companion flange (2), using the flange companion holder J–8614–11 to remove the end nut.



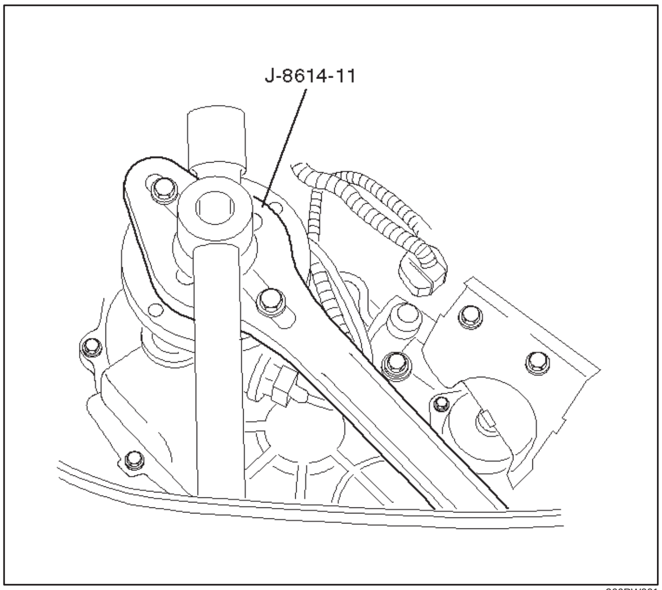
266RW001

5. Remove the rear companion flange.

NOTE: Use the universal puller to remove the rear companion flange.

Installation

1. Install companion flange (2), using the companion flange holder J–8614–11 to tighten the flange nuts to the transfer case.



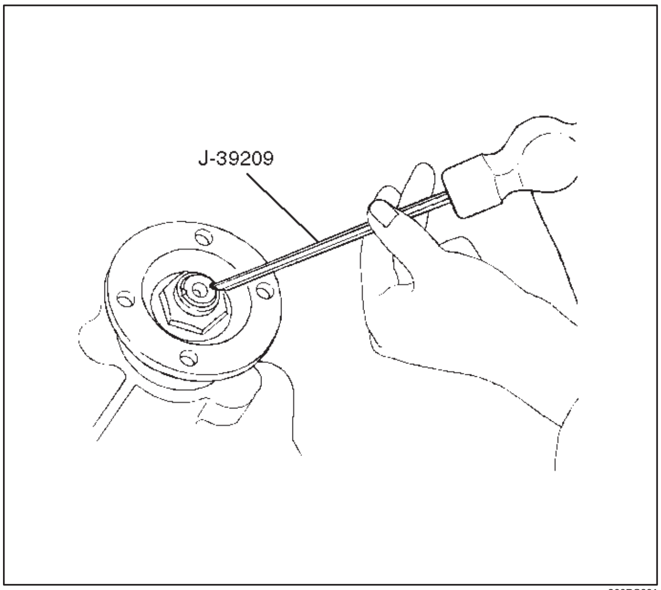
266RW001

2. Tighten the new transfer flange nuts to the specified torque.

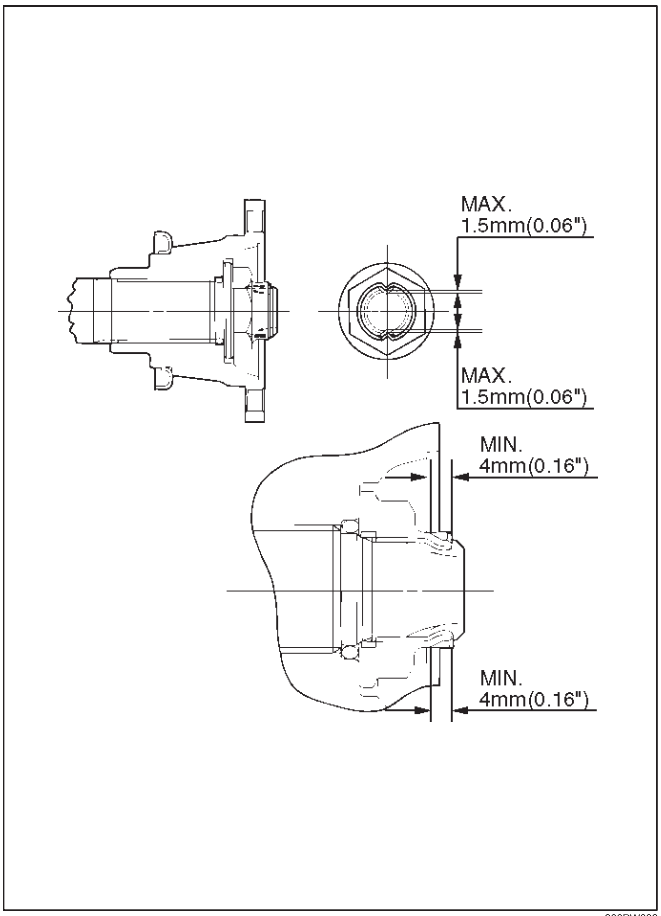
Torque

Companion flange: 167 N·m (123 lb ft)

3. Use the punch J–39209 to stake the companion flange nut (3) at two spots.



266RS001



266RW002

NOTE: Be sure to confirm that there is no crack at the staked portion of the flange nut after staking.

4. Install the O–ring (7) to the speedometer driven gear bushing (6).
5. Install the driven gear to the speedometer driven gear bushing (6).
6. Install the speedometer driven gear assembly to the extension housing assembly.
7. Install the plate (5) to the extension housing assembly and tighten to the specified torque.

Torque: 15 N·m (11 lb ft)

8. Install the speedometer sensor and tighten to the specified torque.

Torque: 27 N·m (20 lb ft)

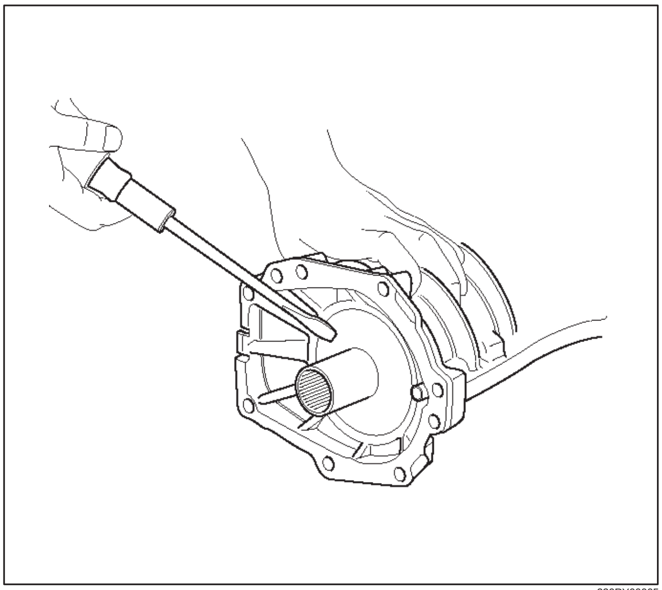
(10) Extension Case

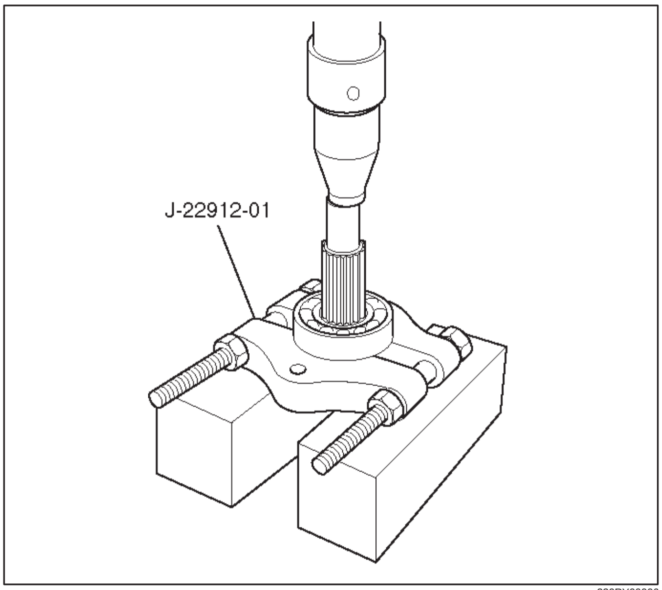
Disassembly

1. Remove front oil seal (5) from the extension housing assembly.



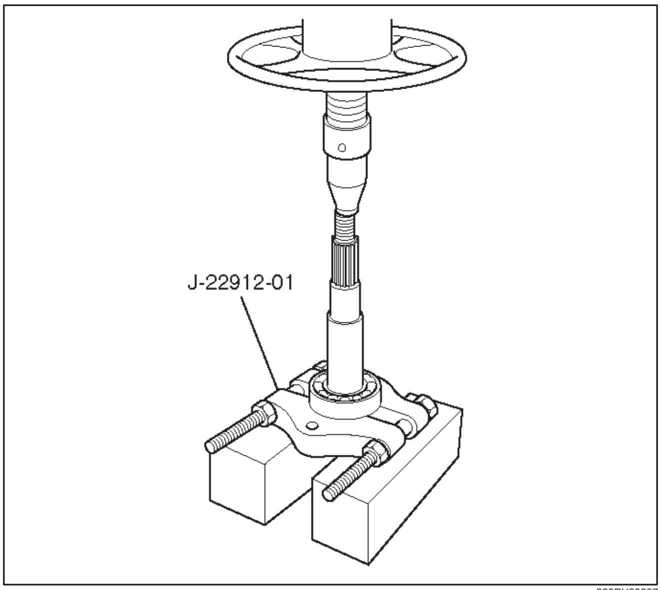
220RY00005

2. Remove front snap ring (4), use a pair of snap ring pliers to remove the snap ring.
3. Remove the extension shaft with ball bearing from the extension case (10).
4. Remove rear ball bearing (8), using a bench press and the bearing remover J–22912–01.



220RY00006

5. Remove speedometer drive gear (7).
6. Remove ball (6).
7. Remove bearing snap ring (1), using a pair of snap ring pliers.
8. Remove extension shaft (3) from the front ball bearing (2), using a bench press and bearing remover J–22912–01.



220RY00007

9. Remove air breather pipe collar (9) from the extension housing assembly.

Reassembly

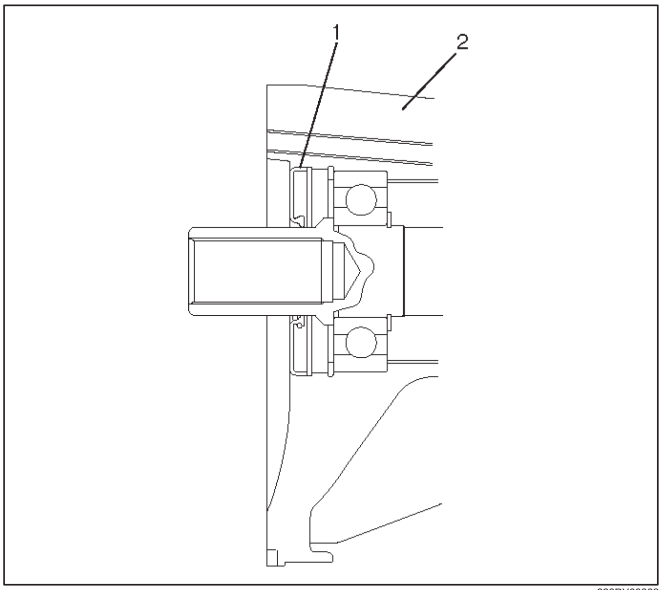
1. Install air breather pipe collar (9) to the extension housing assembly.

CAUTION: PUT THE AIR BREATHER PIPE COLLAR INTO THE EXTENSION CASE AS MATCHING THE PROTRUSION OF THE AIR BREATHER PIPE COLLAR WITH THE DEPRESSION OF THE EXTENSION CASE.

2. Install front ball bearing (2) to the extension shaft (3), using the ball bearing installer J–22912–01.
3. Install bearing snap ring (1), using a pair of snap ring pliers.
4. Install ball (6).
5. Install speedometer drive gear (7).
6. Use the ball bearing installer J–22912–01 to install the rear ball bearing (8).
7. Install the extension shaft with ball bearing to the extension case (10).
8. Install front snap ring (4).

9. Install front oil seal (5).

CAUTION: Hammering the outside of the oil seal equally, install it to the extension case entirely.



220RY00008

Legend

(1) Front Oil Seal
(2) Extension Case

Inspection and Repair

1. Make the necessary repair or parts replacement if wear, damage or any other abnormal conditions are found during inspection.
2. Wash all parts thoroughly in clean solvent. Be sure all old lubricant, metallic particles, dirt, or foreign material are removed from the surfaces of every part. Apply compressed air to each oil feed port and channel in each case half to remove any obstructions or cleaning solvent residue.

Bearings

1. Inspect the condition of all bearings. Wash bearings thoroughly in a cleaning solvent. Apply compressed air to the bearings.

NOTE: Do not allow the bearings to spin. Turn them slowly by hand. Spinning bearings may damage the rollers.

2. Lubricate the bearings with a light oil and check them for roughness by slowly turning the race by hand.

Ball Bearing Play

1. Use a dial indicator to measure the ball bearing play.
2. If the measured value exceeds the specified limit, the ball bearing must be replaced.

Limit : 0.2 mm (0.008 in)

TRANSMISSION CONTROL SYSTEM (4L30–E)

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The 4L30–E is a 4–speed fully automatic transmission. It uses a microcomputer as a control unit to judge running conditions including throttle opening rate and vehicle speed, then it sets the shifting point in the optimum timing so that best driving performance can be achieved.
In addition, the built–in shift mode select function can select three shift modes according to the driver's preference:

- Normal mode –Normal shift pattern.
- Winter mode –Starts in 3rd gear to reduce slippage on ice or snow.
- Power mode has a delayed upshift for when more powerful acceleration is required.

Also, the built–in fail safe function ("backup mode") assures driving performance even if the vehicle speed sensor, throttle signal or any solenoid fails.
Further, the self–diagnostic function conducts diagnosis in a short time when the control system fails, thus improving serviceability.
The major features of 4L30–E are as follows:

- A compact structure consisting of 2 sets of planetary gears and flat torque converter.
- Electronic control selects the optimum shift mode according to the driving conditions.
- Electronic control maintains the optimum hydraulic pressure for clutch, band brake as well as transmission so that shift feeling is improved.
- Two sets of planetary gears reduce friction of power train.

  Also, a lockup mechanism in the torque converter reduces fuel consumption.
- Wide gear ratio and high torque rate of torque converter provide excellent starting performance.

Electronic Control Diagram

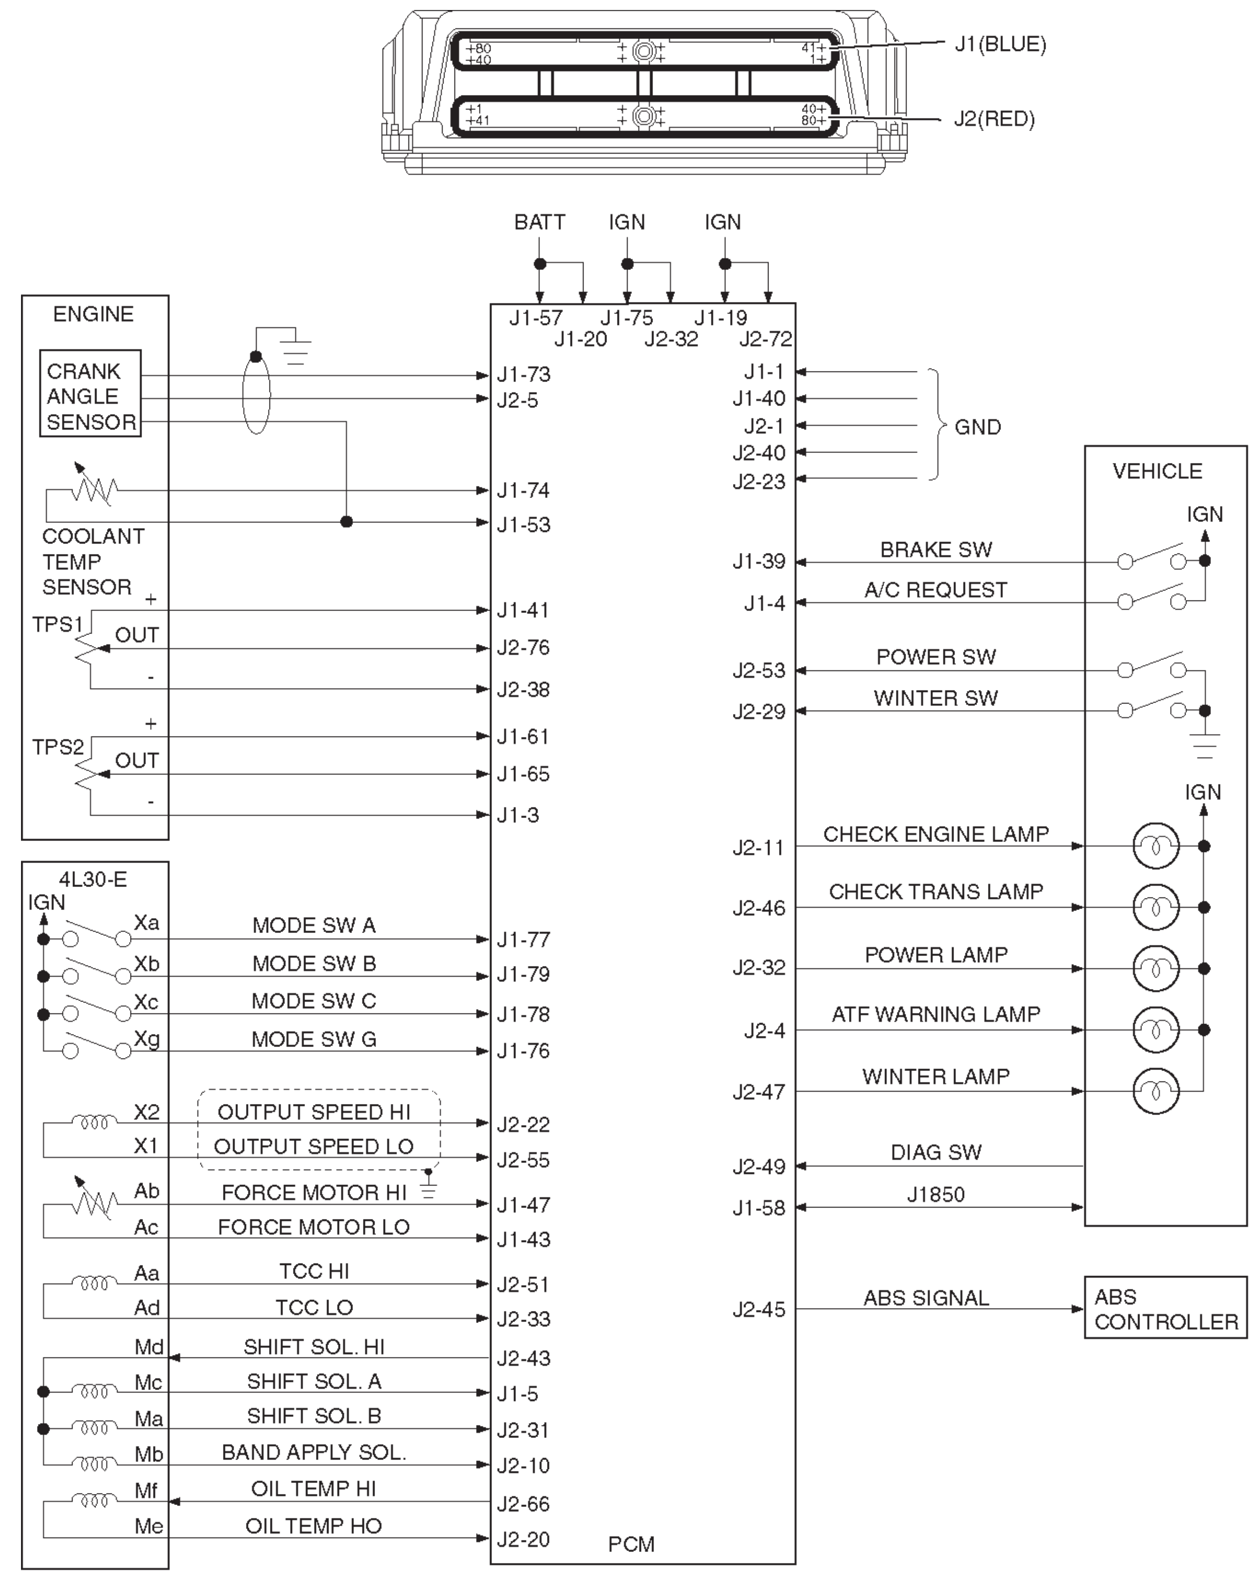
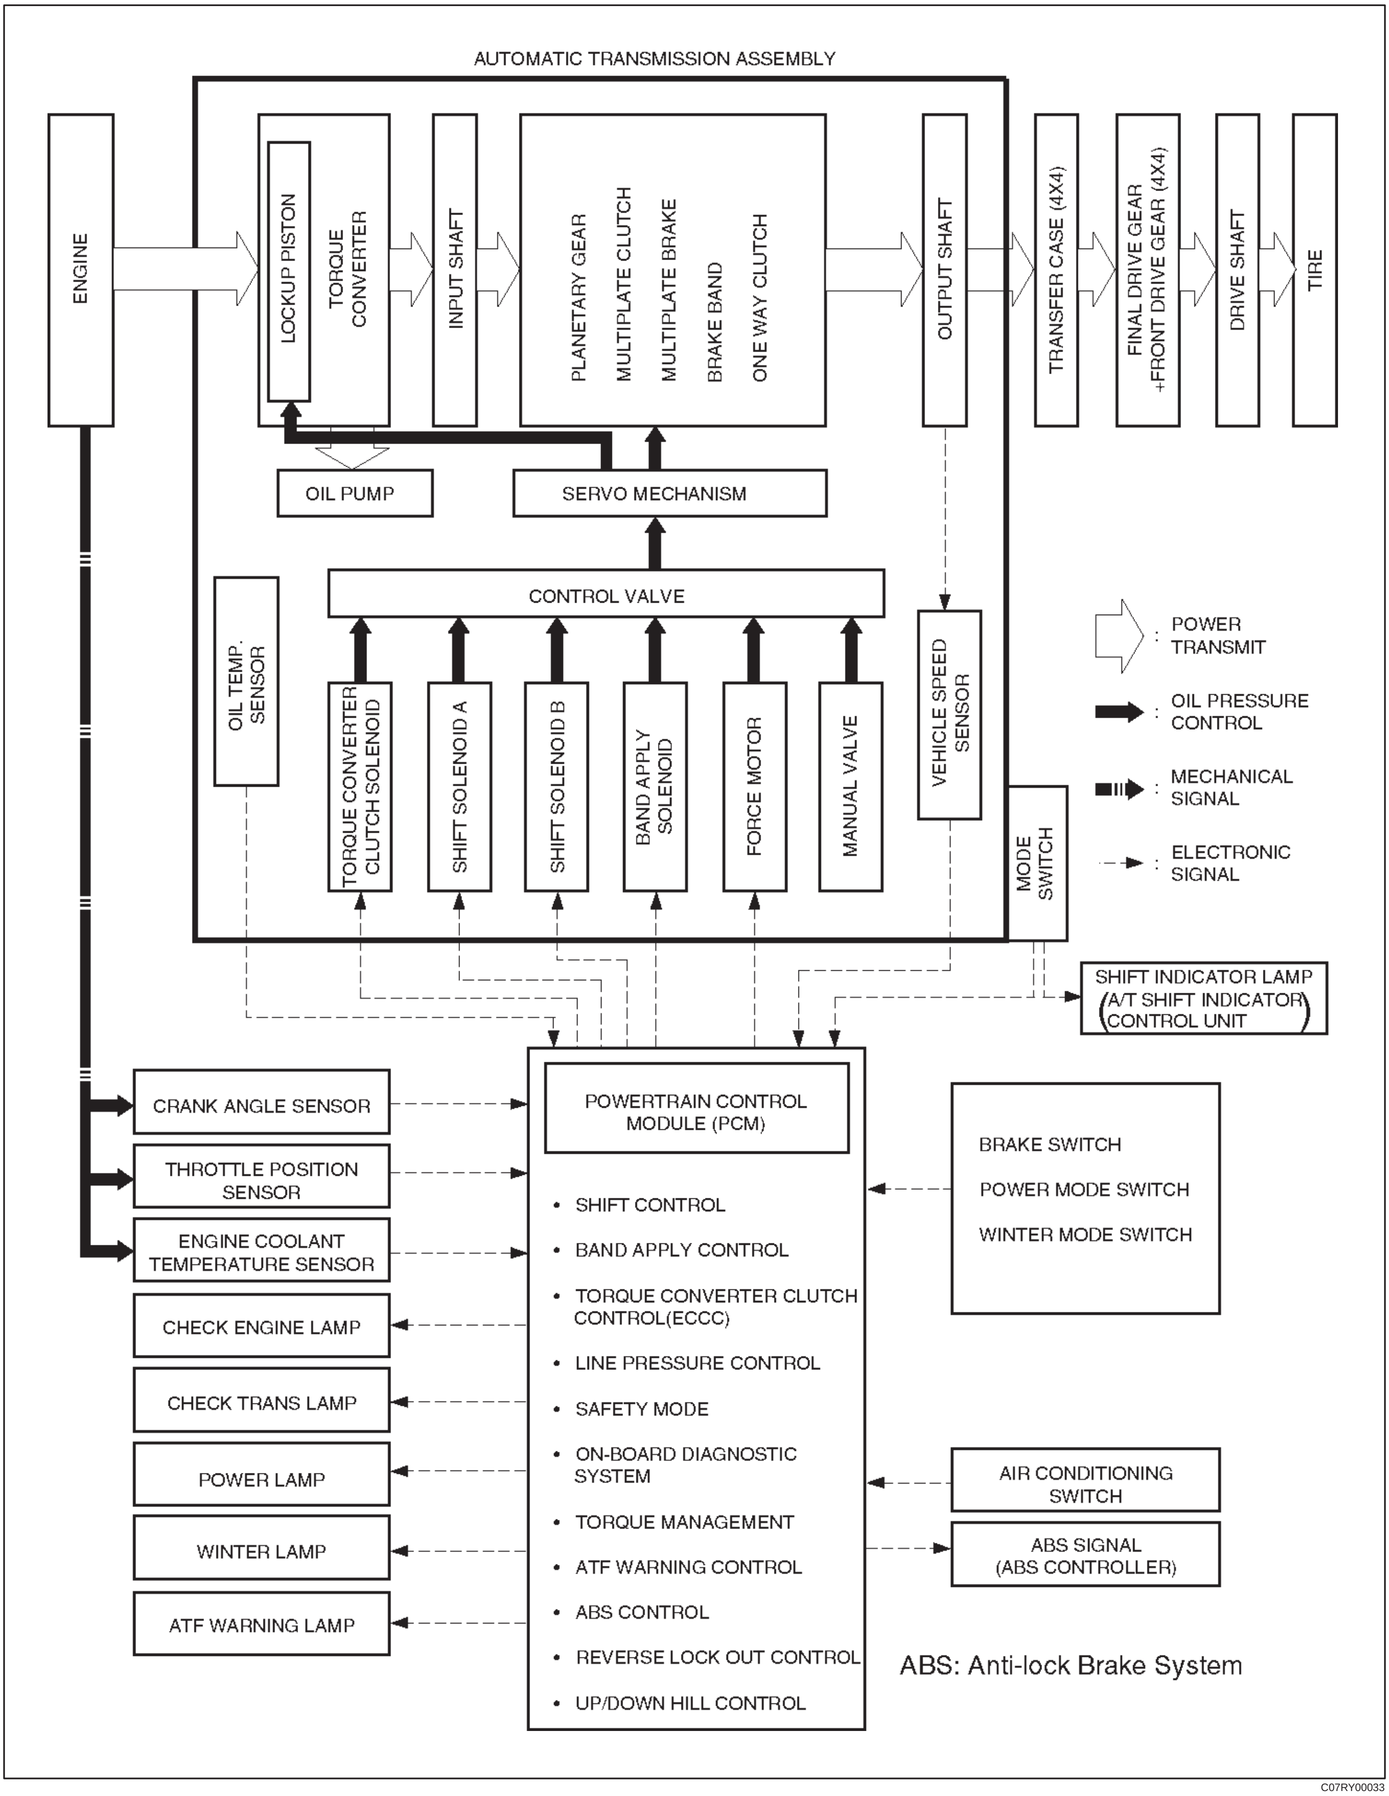
Powertrain Control Module (PCM)



TPS : Throttle Position Sensor
TCC : Torque Converter Clutch
ABS : Anti-Lock Brake System

C07RY002

Control System Diagram



Shift Control

The transmission gear is shifted according to the shift pattern selected by the driver. In shifting gears, the gear ratio is controlled by the ON/ OFF signal using the shift solenoid A and the shift solenoid B.

Band Apply Control

The band apply is controlled when in the 3–2 downshift (engine overrun prevention) and the garage shift (shock control).
The band apply solenoid is controlled by the signal from the Pulse Width Modulation (PWM) to regulate the flow of the oil.

Torque Converter Clutch Control (Electronically Controlled Capacity Clutch = ECCC)

The clutch apply is controlled by moving the converter clutch valve by commanding Torque Converter Clutch (TCC) solenoid using the PWM signal.

Line Pressure Control

The throttle signal allows the current signal to be sent to the force motor. After receiving the current signal, the force motor activates the pressure regulator valve to regulate the line pressure.

On–Board Diagnostic System

Several malfunction displays can be stored in the Powertrain Control Module (PCM) memory, and read out of it afterward.
The serial data lines, which are required for the testing of the final assembly and the coupling to other electronic modules, can be regulated by this function.

Fail Safe Mechanism

If there is a problem in the transmission system, the PCM will go into a “backup” mode.
The vehicle can still be driven, but the driver must use the select lever to shift gears.

Torque Management Control

The transmission control side sends the absolute spark advance signal to the engine control side while the transmission is being shifted. This controls the engine spark timing in compliance with the vehicle running condition to reduce the shocks caused by the change of speed.

ATF Warning Control

The oil temperature sensor detects the ATF oil temperature to control the oil temperature warning, TCC, and the winter mode.

ABS Control

When the select lever is at “L” or “R” range, a signal is sent to the ABS controller as one of the ABS control conditions.

Reverse Lock Out Control

With the selector lever in reverse position, the PCM will not close the PWM solenoid until the vehicle is below 15 km/h (9.3 mph), thus preventing reverse engagement above this speed.

Downhill Control

This mode is automatically activated from “NORMAL” mode only when downhill conditions are recognized.
The shift pattern is identical to “NORMAL” mode except 3-4 and 4-3 shift lines at low throttle modified to get engine braking on a larger speed range.
ECCC lines unchanged compared to “NORMAL” mode.

Uphill Control

When Uphill condition are recognized the 2-3 and 3-4 shift and TCC apply are down only when the engine torque is sufficient in order to avoid shift hunting.

Shift Mode Control

① Mode Type

Mode Type	Select lever position
Normal drive mode (NOR)	Entire range (excluding "R")
Power drive mode (PWR)	Entire range (excluding "R")
Winter drive mode	"D" range only

② Mode selection

	SWITCH (SW)		LAMP	
Mode Type	POW/NOR. SW	WINTER SW	POWER DRIVE LAMP	WINTER DRIVE LAMP
Normal drive mode (NOR)	OFF	OFF	OFF	OFF
Power drive mode (PWR)	ON	OFF	ON	OFF
Winter drive mode	ON/OFF	ON	OFF	ON

However, the winter switch prevails over the PWR/NOR switch.
The mode becomes normal drive mode when the winter switch is operated from ON to OFF.

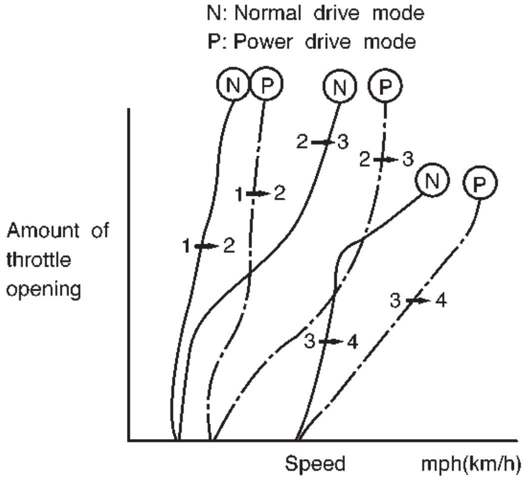
③ Comparison of mode

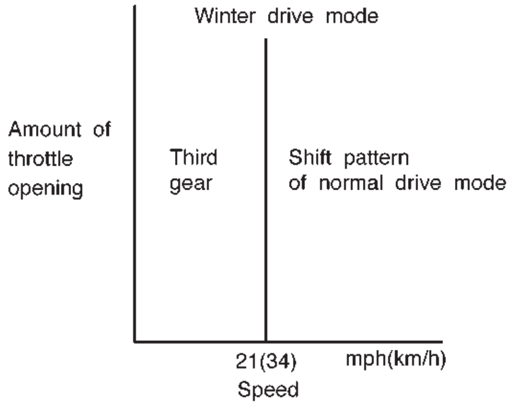
(1) The normal drive mode is set at the normal shift points.

(2) The shift points of the power drive mode are shifted to the higher speed side, compared to the normal drive mode.

(3) The winter drive mode is a special mode used exclusively for starting in third gear.

Shift diagram





F07RX001

Gear Shift Control

1 Shift pattern

SELECT LEVER RANGE	SHIFT PATTERN
D (Drive)	1⇄2TCC ⇄3TCC ⇄4TCC
3 (Third)	1⇄2TCC ⇄3TCC ←4TCC
2 (Second)	1⇄2TCC ←3TCC
L (First)	1←2

TCC = Torque Converter Clutch

2 Gear position

The gear is selected by ON/OFF of two solenoids.

Gear \ SOL	A	B
4 (Fourth)	×	×
3 (Third)	○	×
2 (Second)	○	○
1 (First)	×	○
P (park) R (Reverse) N (Neutral)	×	○

○ = ON

× = OFF

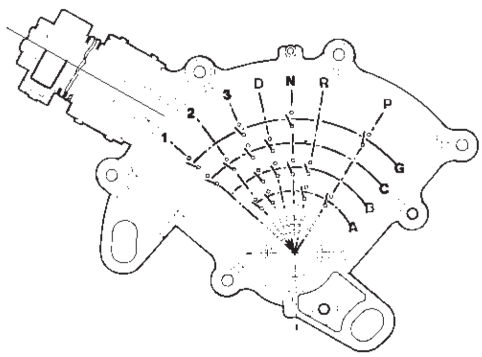
Shift solenoid A (Normally closed) ON → PRESSURE TO SHIFT VALVE

Shift solenoid B (Normally open) OFF → PRESSURE TO SHIFT VALVE

3 Selecting gear pisition

Seven types of positions can be selected according to 5 signals from the mode switch as below.

	MODE SW TERMINALS				
SELECT LEVER RANGE	5(D)	8(A)	7(B)	6(C)	3(G)
P (park)	•	•			•
R (Reverse)	•	•	•		
N (Neutral)	•		•		•
D (Drive)	•		•	•	
3 (Third)	•	•	•	•	•
2 (Second)	•	•		•	
L (First)	•			•	•



• = Continuity

F07RT034

Winter Drive Mode

1. **Operation**
   The winter switch will operate when switched on after all of the following conditions are present:

   Conditions:

   a. The select lever position is "D" range only.
   b. Vehicle speed is 7 mph (11 km/h) or less.
   c. Transmission oil temperature is 130°C (266°F) or less.
   d. Accelerator opening is at 8% or less.
2. **Cancel Release**
   1. Cancellation by driver
      a. Turning off the winter drive mode switch
      b. Shifting select position to "3", "2", or "L" (winter drive mode is not canceled by selecting "D", "N", "R", or "P").
      c. Ignition key is turned off.
   2. Automatic cancellation
      a. When vehicle runs at 21mph (34 km/h) or more for 1 second or more
      b. When transmission oil temperature reaches 130°C (266°F) or above

NOTE: The mode returns to normal drive mode or power drive mode after the winter drive mode is canceled.

Backup Mode

If a major system failure occurs which could affect safety or damage the transmission under normal vehicle operation, the diagnostic system detects the fault and overrides the Powertrain Control Module (PCM).
The "CHECK TRANS" light flashes to alert the driver, and the transmission must be manually shifted as follows:

Select lever position	Gear Ratio Selected
D	4 (Fourth)
Manual 3	4 (Fourth)
Manual 2	3 (Third)
Manual L	1 (First)
R	Reverse

Shifts are firmer to prevent clutch slip and consequent wear. The fault should be corrected as soon as possible.

Functions of Input / Output Components

Components			Function
INPUT SIGNAL		Speed sensor (fixed to transmission)	Senses rotation of output shaft and feeds the data to Powertrain Control Module (PCM).
		Throttle position sensor (TPS) (fixed to engine)	Senses the extent of throttle valve opening and the speed of the throttle valve lever motion to open the valve. Feeds the data to PCM.
		Brake switch (fixed to brake pedal)	Senses whether the driver has pressed the brake pedal or not and feeds the information to PCM.
		Mode switch (fixed to transmission)	Senses the select lever position, and feeds the information to PCM.
		Power drive switch (fixed to front console)	Senses whether the driver has selected the power mode, and feeds the information to PCM.
		T/M oil temperature sensor	Senses the T/M oil temperature and feeds the data to PCM
		Engine coolant tempera-ture sensor	Senses the engine coolant temperature, and feeds the data to PCM.
		Engine speed signal	Feeds the signals monitoring engine speed to PCM from crank angle sensor.
		Air conditioning information	Senses whether the air conditioner has been switched on or not, and feeds the information to PCM.
		Winter switch (fixed to front console)	Senses whether the driver has selected the winter mode, and feeds the information to PCM.
		Cruise controller (Over-drive OFF signal)	Downshift takes place when overdrive OFF signal is received from auto cruise controller integrated in PCM.
OUTPUT SIGNAL	SOLENOID	Shift solenoid A, B	Selects shift point and gear position suited to the vehicle running condition on the basis of PCM output.
		Band apply solenoid	Controls oil flow suited to the vehicle running condition on the basis of PCM output.
		Torque Converter Clutch PWM solenoid	Controls clutch apply suited to the vehicle running condition on the basis of PCM output.
		Force motor (Pressure regulator valve)	Adjusts the oil pump delivery pressure to line pressure suited to the vehicle running condition on the basis of PCM output.
		Power drive mode lamp	Informs the driver whether the vehicle is in power mode or not.
		Winter drive mode lamp	Informs the driver whether the vehicle is in winter mode or not.
		CHECK TRANS lamp	Informs the driver of failure in the system.
		ATF warning lamp	Lights when ATF oil temperature rises.
		ABS signal	When the select lever is at “Reverse” or “L” range, sends a signal to the ABS controller as one of the ABS control conditions.

Diagnosis

Electronic Diagnosis

How To Diagnose The Problem

1. To avoid incorrect diagnostics, this book needs to be followed accurately. Unless stated, do not jump directly to a section that could contain the solution. Some important information may be missed.
2. The sections in CAPITALS and bold are the main sections that can be found in the contents.
3. The GOTO **"SECTION"** means to continue to check going to the "section".
4. The GOTHROUGH **"SECTION"** means to go through the "section" and then to go back to the place the GOTHROUGH was written.
5. BASIC ELECTRIC CIRCUITS:
   You should understand the basic theory of electricity. This includes the meaning of voltage, amps, ohms, and what happens in a circuit with an open or shorted wire. You should also be able to read and understand wiring diagrams.

Check Trans Indicator

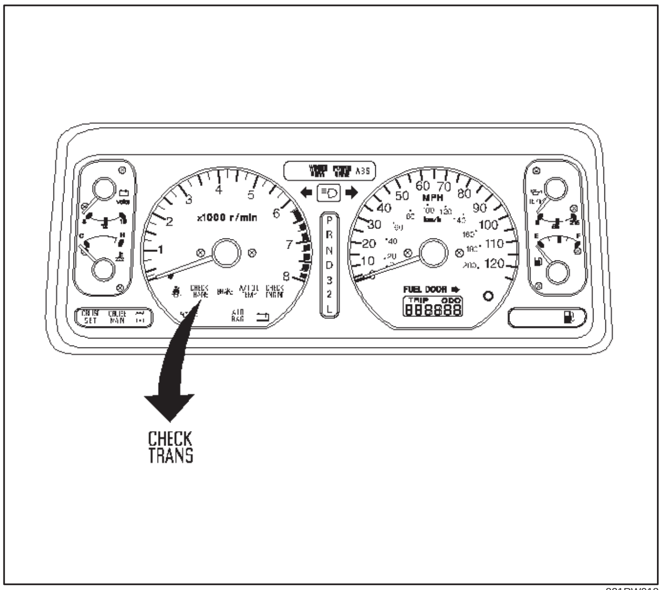
Find CHECK TRANS indicator and verify if it is

A. Flashing: GOTO **DIAGNOSTIC CHECK.**

B. Staying on: GOTHROUGH **CHECK TRANS CHECK**.

C. Is never ON when the ignition key is turned on: GOTHROUGH **CHECK TRANS CHECK**

D. Is ON during 2 seconds at ignition but OFF after: Normal operation. No DTC or malfunction.



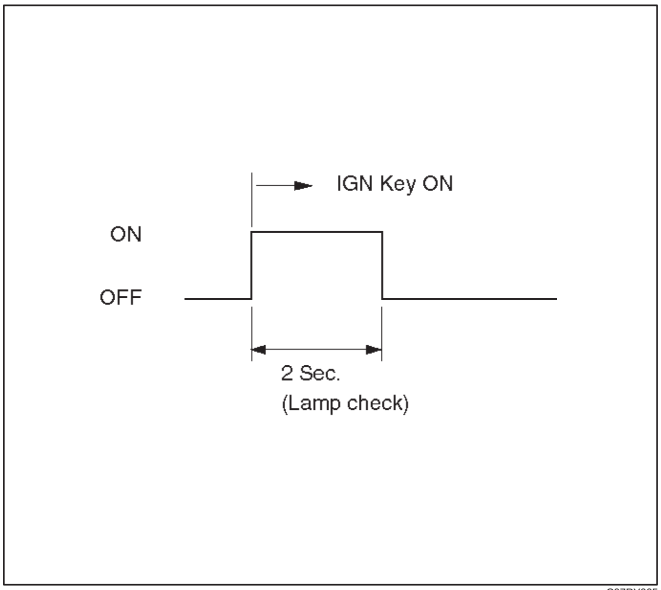
821RW018

Diagnostic Check

This test determines if the transmission or its input or output connections or sensors are failing.

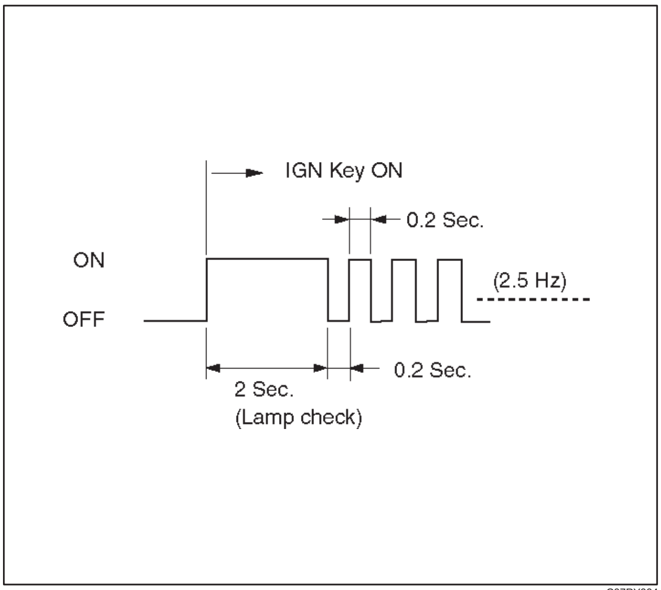
1. Connect the Tech 2: GOTHROUGH **Tech 2 OBD II CONNECTION**.
2. Turn on the ignition but not the engine.
3. Push "F0" on Tech 2 to see the Diagnostic Trouble Code (DTC):
4. Do you have a DTC?
   YES: write down all code numbers and do the **DTC CHECK**
   NO: the DTC can not help you finding the problem.
   1. GOTHROUGH **"CHECK TRANS" CHECK**
   2. IF it is flashing and the flash is 0.2 seconds ON and 0.2 seconds OFF, this means that you should have a DTC stored. Please recheck GOTO **DIAGNOSTIC CHECK** and if you find the same problem, replace the Powertrain Control Module (PCM).

Normal



C07RY005

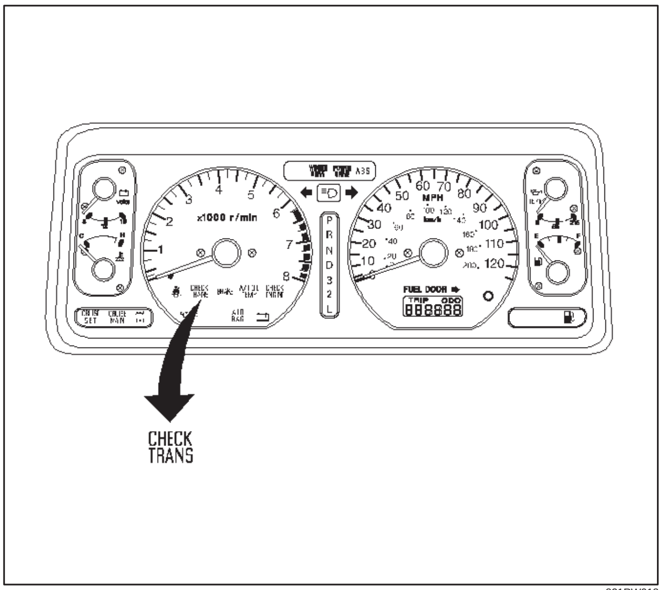
Abnormal



C07RY004

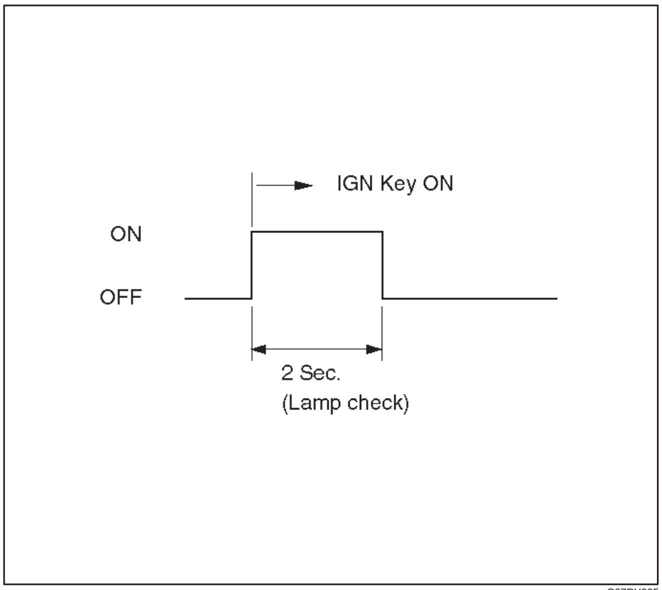
"Check Trans" Check

1. Indicator it is ON during 2 seconds at ignition (or when the engine is cranked) but it is OFF after the engine starts. The indicator is working normally GOTO **DIAGNOSTIC CHECK**.



821RW018

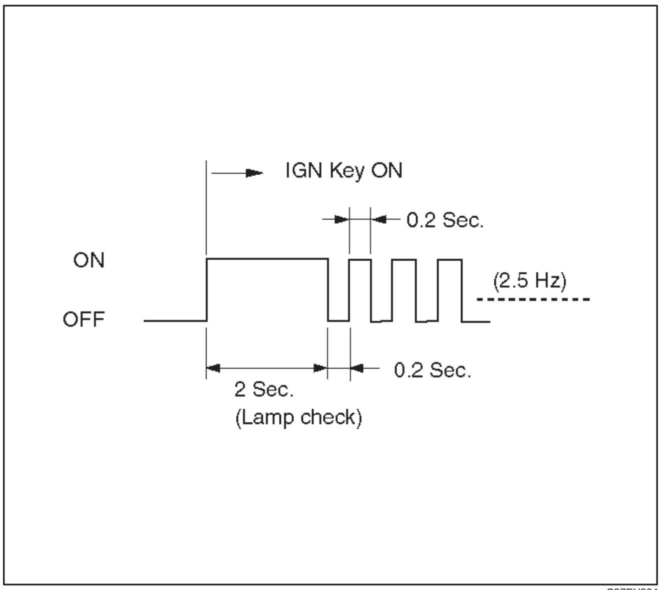
Normal



C07RY005

2. Indicator it is flashing and the flash is 0.2 seconds ON and 0.2 seconds OFF always when ignition is on (engine cranked or not). This means that there is a malfunction. GOTO **DIAGNOSTIC CHECK**.

Abnormal



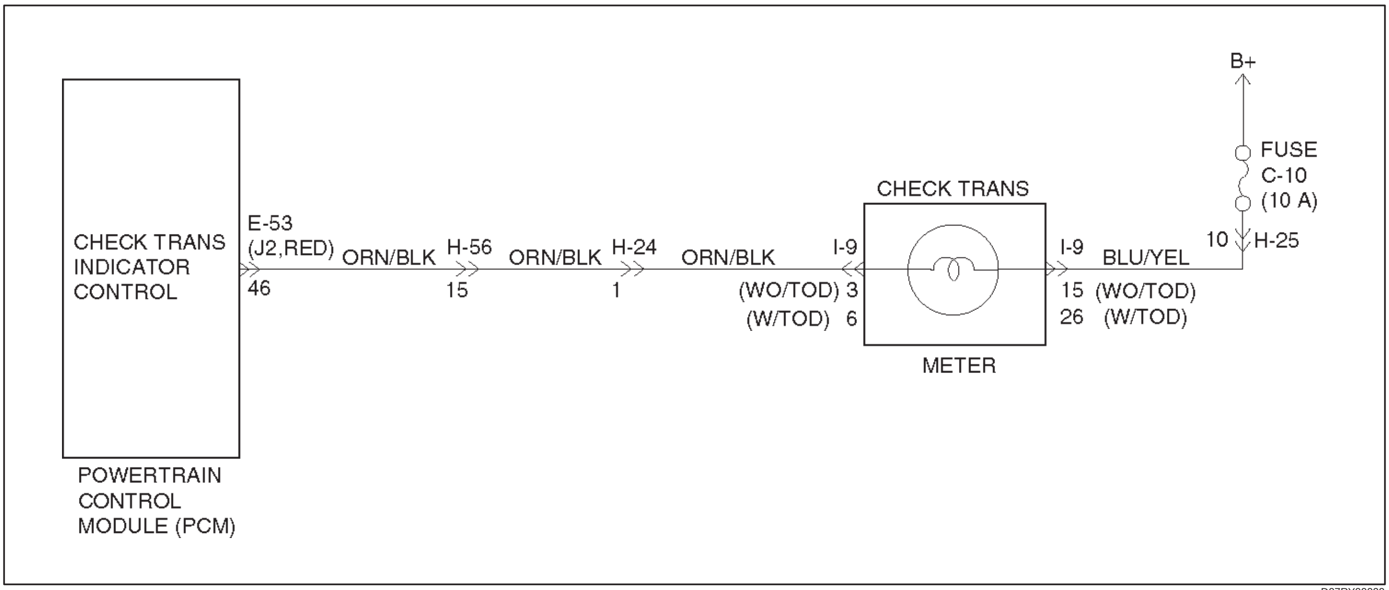
C07RY004

3. Indicator it is staying ON always when Ignition is ON.
   1. This means that connection between the lamp and the PCM is shorted to ground.
   2. Verify if instrument panel terminal 3 (WO/TOD) or 6 (WO/TOD) of connector I–9 is shorted to ground.
   3. Verify if the PCM connector J2 (RED) terminal 46 is shorted to ground.
   4. Verify that the instrument panel terminal 15 (WO/TOD) or 26 (W/TOD) of connector I–9 is connected to battery.
   5. IF problem solved: GOTO **CHECK TRANS INDICATOR**.

   NO:Replace Powertrain Control Module (PCM).
4. Indicator it is staying OFF with the ignition ON (engine OFF).
   1. This means that connection between the lamp and the PCM is shorted to battery or opened.
   2. Verify if instrument panel terminal 3 (WO/TOD) or 6 (WO/TOD) of connector I–9 is shorted to battery or open.
   3. Verify if the PCM connector J2 (RED) terminal 46 is shorted to battery or open.
   4. Verify that the instrument panel terminal 15 (WO/TOD) or 26 (W/TOD) of connector I–9 is connected to battery. If not, check the fuses and the connections (terminal 10 of connector H–25) voltage.

5. IF problem solved: GOTO **CHECK TRANS INDICATOR**.

   NO: Replace Powertrain Control Module (PCM).

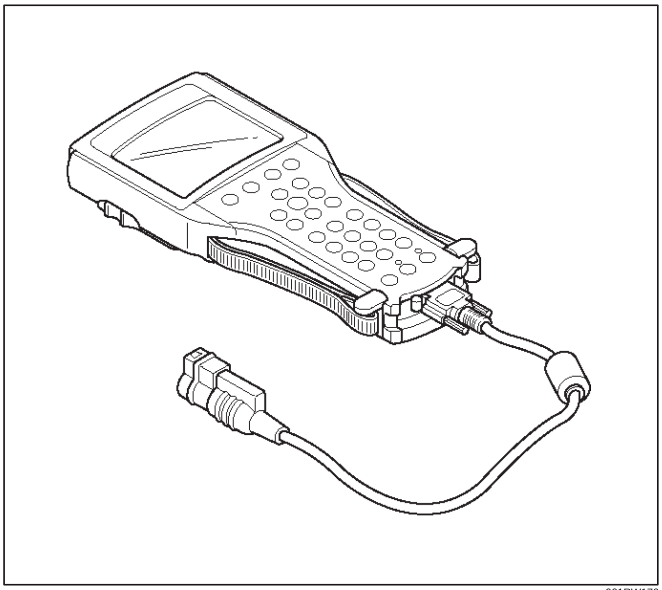


D07RY00009

Tech 2 OBD II Connection

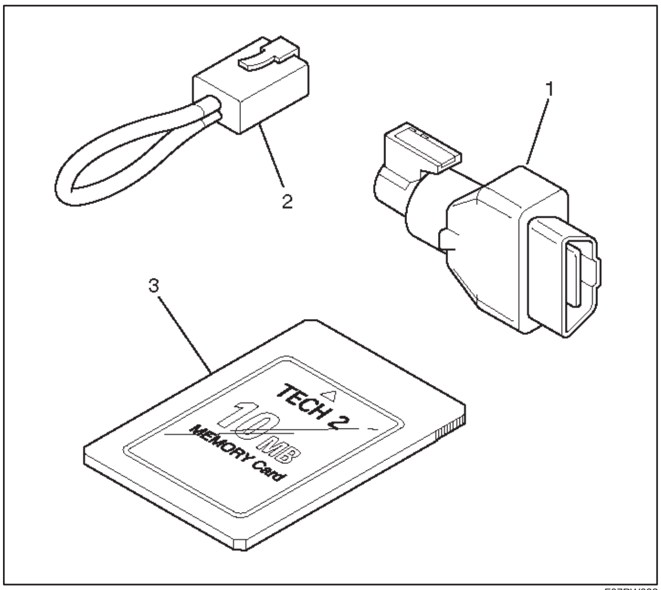
In order to access OBD II Powertrain Control Module (PCM) data, use of the Tech 2 scan tool kit (7000086) is required.

1. The electronic diagnosis equipment is composed of:
   1. Tech 2 hand held scan tool unit (7000057) and DLC cable (3000095).



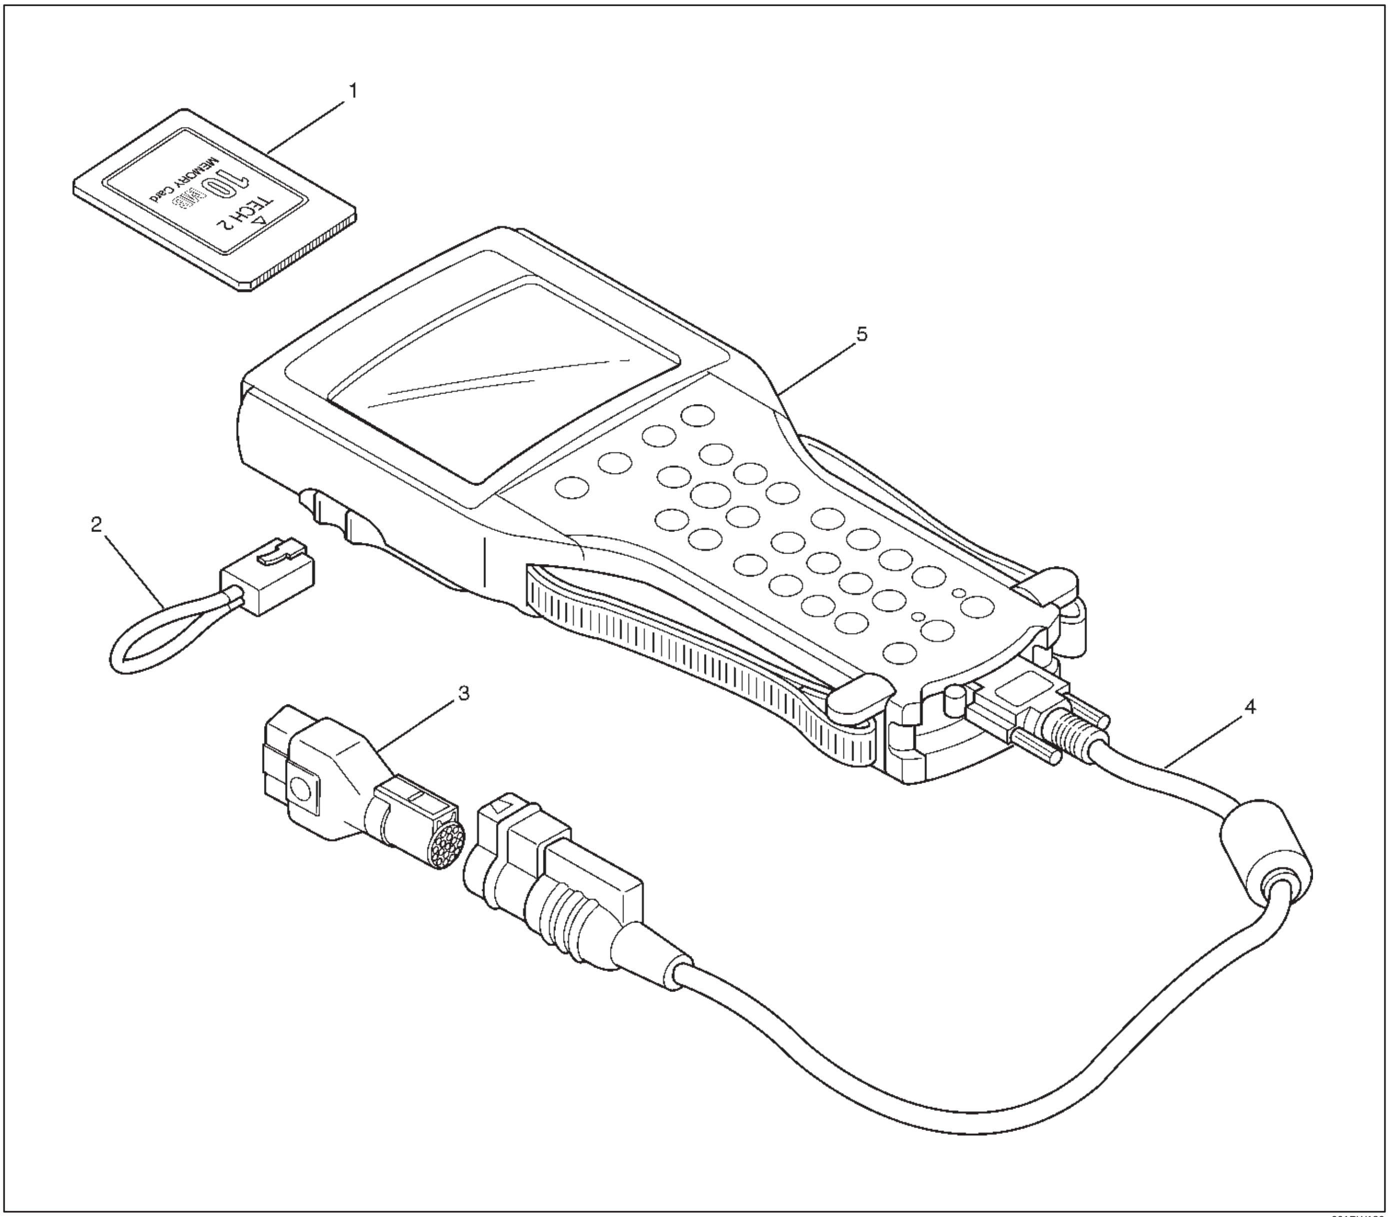
901RW176

   2. SAE 16/19 adaptor (3000098) (1), RS 232 loop back connector (3000112) (2), and PCMCIA card (3000117) (3).



F07RW033

2. Connecting the TECH2



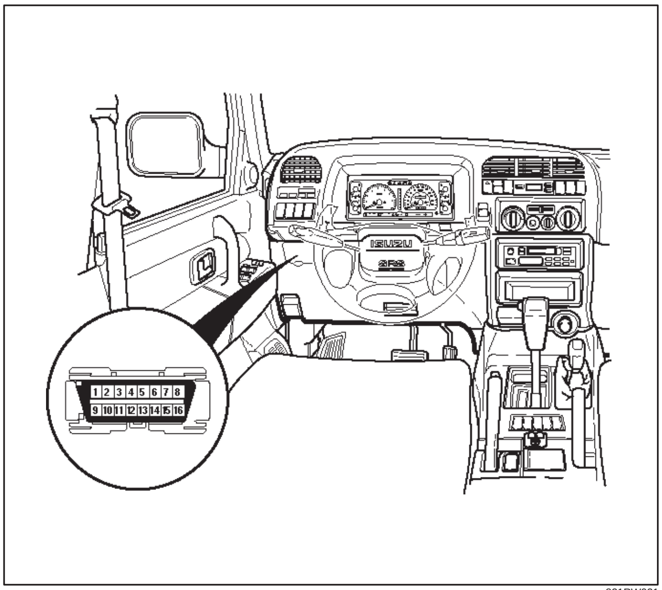
901RW180

Legend
(1) PCMCIA Card
(2) RS 232 Loop Back Connector
(3) SAE 16/19 Adapter
(4) DLC Cable
(5) Tech 2

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:

1. The Isuzu 2000 System PCMCIA card (1) inserts into the Tech 2 (5).
2. Connect the SAE 16/19 adapter (3) to the DLC cable (4).
3. Connect the DLC cable to the Tech 2 (5)
4. Make sure the vehicle ignition is off.

5. Connect the Tech 2 SAE 16/19 adaptor to the vehicle DLC.



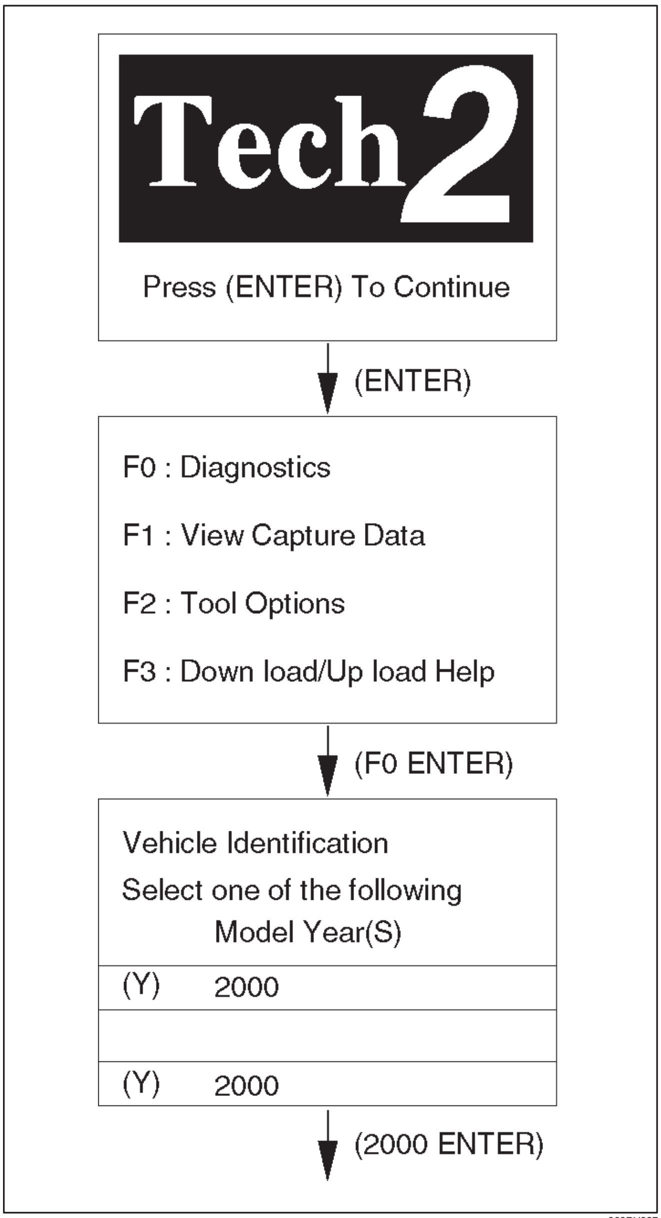
821RW021

6. The vehicle ignition turns on.
7. Verify the Tech 2 power up display.

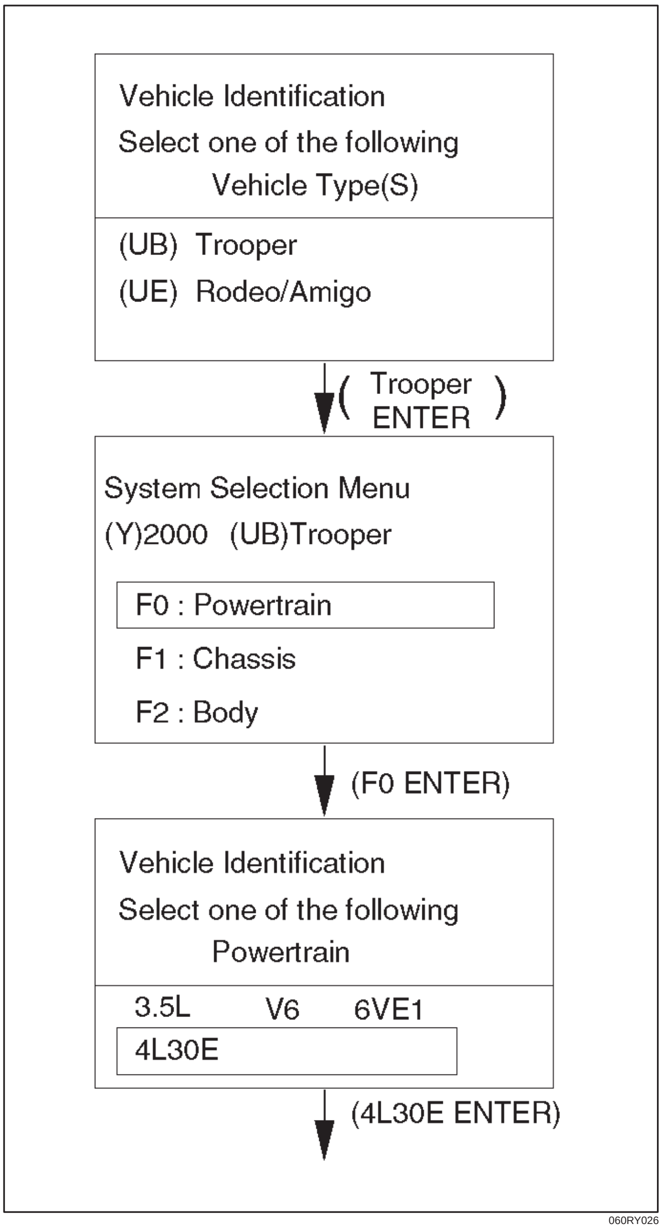
060RW009

NOTE: The RS232 Loop back connector is only to use for diagnosis of Tech 2 and refer to user guide of the Tech 2.

8. The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.



060RY027



Once the test vehicle has been identified an "Application (Powertrain) Menu" screen appears. Please select the appropriate application.

The following table shows, which functions are used for the available equipment versions.

F0: Diagnostic Trouble Codes
F0: Read DTC Info Ordered By Priority
F1: Clear DTC Information
F2: DTC Information
F1: Data Display
F0: Transmission Data
F1: Output Driver Data
F2: Snap Shot
F3: Actuator Tests
F0: Lamps
F0: Check Light
F1: Winter Drive Lamp
F2: Power Drive Lamp
F3: AT Oil Temperature Lamp
F1: Solenoids
F0: Solenoid 1-2/3-4 Test
F1: Solenoid 2-3 Test
F2: TCC Solenoid
F3: Band Apply Solenoid
F4: Pressure Control Solenoid (PCS)
F4: Function Tests
F0: Reset Oil Life Monitor

Diagnostic Trouble Codes

The purpose of the "Diagnostic Trouble Codes" mode is to display stored PCM trouble codes.
When "Diagnostic Trouble Codes" is selected an "Application Menu" screen appears.

Clear DTC Information

The purpose of the "Clear DTC Information" mode is to command the clearing of stored PCM trouble codes.
When "Clear DTC Information" is selected, a "Clear DTC Information", warning screen appears. This screen informs you that by cleaning DTC's, "all stored DTC information in controller will be erased".
Do you want to clear DTC's (Yes/No).
Press either the Yes or No key when answering.
After clearing codes, confirm system operation by test driving the vehicle.
Allow the vehicle to shift through all four forward gears in a manner which attempts to repeat the failure condition.

NOTE: When the trouble has not been repaired and the trouble code cannot be erased, check the vehicle again.

DTC Information

When "DTC Information" is selected, an "Application Menu" appears with a list of DTC information function keys addressing DTC specifics and their origins.
Function key selections may vary for particular vehicle and/or system.

Data Display

The purpose of the "Data Display" mode is to continuously monitor data parameters.
The current actual values of all important sensors and signals in the system are display through F1 mode.
When "Data Display" is selected an "Application Menu" appears. Please select either "Engine" or "Transmission Data Display".
See "Transmission Data" on next page.

Snapshot

When "Snapshot" is selected an "Application Menu" appears.
When "Transmission Snapshot" application is selected from the "Application Menu", a "Snapshot Menu" appears, displaying several options. "Snapshot" options may vary from one system to another.
"Snapshot" allows a recording of all vehicle parameters. There parameters may then be replayed at a future point in time.
This action allows you to focus on making the condition occur, rather than trying to view all of the data in anticipation of the fault. The snapshot will collect parameter information around a trigger point that you select.
When a snapshot is taken. It is recorded onto the PCMCIA memory card. When the Tech 2 is powered down. Snapshots are not lost.

Actuator Tests

The purpose of "Actuator Tests" mode is to check for correct operation of electronic system actuators.

Lamps

You can operate the lamps by pressing the ON and OFF buttons.
Preconditions: none

Solenoid

Solenoid 1-2/3-4, Solenoid 2-3, TCC Solenoid

You can operate the solenoids by pressing the ON and OFF buttons.
Preconditions: P–N position, no vehicle speed, no engine speed

Band Apply Solenoid

You can operate the solenoid by pressing the ON and OFF buttons.
Preconditions: P-N position, idle engine speed, no vehicle speed.

Pressure Control Solenoid (PCS)

You can set desired PCS Current using the UP (+25) and DOWN (–25) button. The PC Solenoid Data informs about PCS Current, Pressure and Duty Cycle.
Preconditions: P–N position, no engine speed, no vehicle speed

Reset Oil Life Monitor

Displays parameter "Oil Life Monitor" and resets to 100% if Yes-button is pressed on Reset-question. "No" leaves test.
Preconditions: no vehicle speed, no engine speed

Transmission Data

Item	Unit	Engine running at idle
Ignition Voltage	V	12.8 ~ 14.1 V
Engine Speed	RPM	750 ~ 900 RPM
Vehicle Speed	km/h, MPH	0 MPH
AT Output Speed (Automatic Transmission)	RPM	0 RPM
AT Input Speed Ratio (Automatic Transmission)		0.0
Throttle Position	%	0 %
AT Oil Temperature (Automatic Transmission)	˚C, ˚F	70 ~ 80˚C (158 ~ 176˚F)
Transmission Temperature	˚C, ˚F	75 ~ 110˚C (167 ~ 230˚F)
AT Oil Temperature Lamp (Automatic Transmission)	Off, On	Off
AT Oil Life Monitor (Automatic Transmission)	%	100 %
AT Oil Life Lamp (Automatic Transmission)	Off, On	Not used

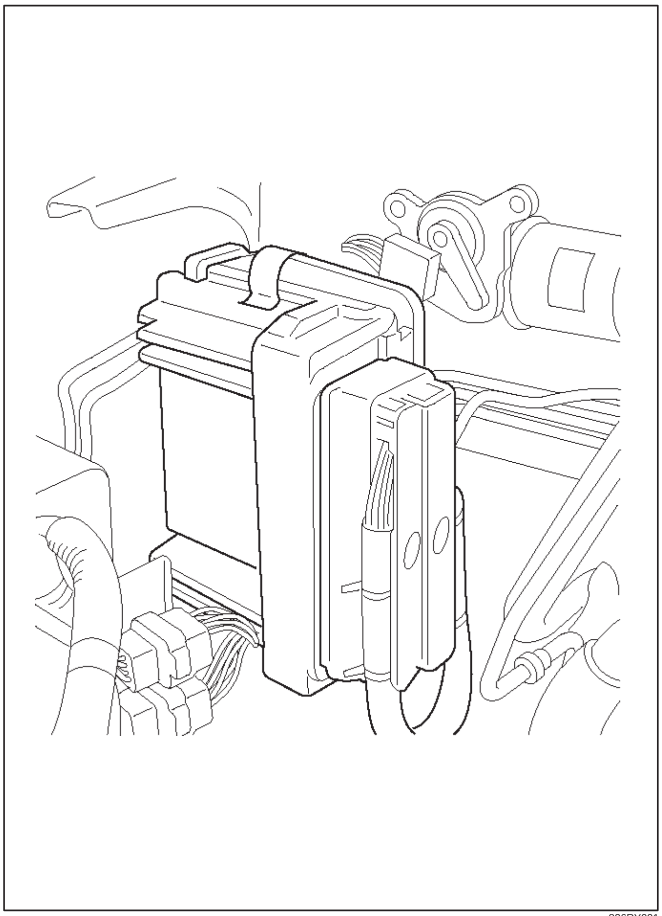
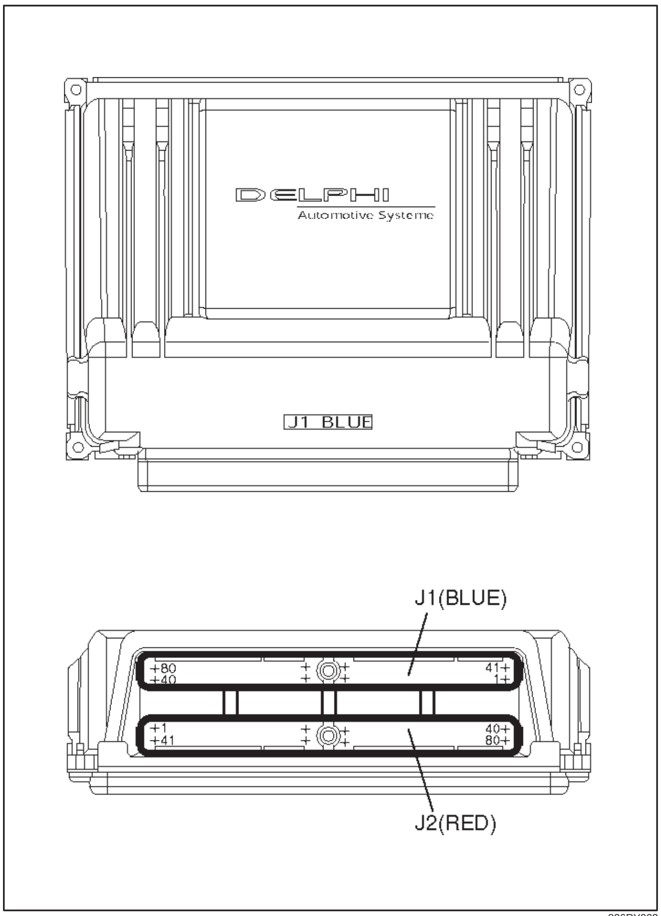
Current Gear		1
Mode Switch A	Inactive, Active	Active
Mode Switch B	Inactive, Active	Inactive
Mode Switch C	Inactive, Active	Inactive
Mode Switch G	Inactive, Active	Active
Selector Position		Park
1–2 Shift Solenoid A	Off, On	Off
2–3 Shift Solenoid B	Off, On	On
Solenoid Brake Band	Off, On	Off
TCC Slip Speed	RPM	750 ~ 900 RPM
TCC Solenoid	Off, On	Off
TCC Duty Cycle	%	0 %
PCS Current (Pressure Control Solenoid)	A	approx. 1.0 A
PCS Duty Cycle (Pressure Control Solenoid)	%	approx. 45 %
Desired PCS Pressure (Pressure Control Solenoid)	kPa	43 ~ 52 kPa
Shift Pressure	kPa	43 ~ 52 kPa
Brake Switch	Off, On	On
Kickdown Switch	On, Off	Not used
Winter Switch	On, Off	Off
Winter Drive Lamp	Off, On	Off
Power Switch	Power Drive Normal	Normal
Power Drive Lamp	Off, On	Off
Emergency Mode	Off, On	Off
ABS Status	On, Off	Off

OBD II Diagnostic Management System

Powertrain Control Module (PCM) Location



826RY001



826RY002

Class 2 Serial Data Bus

OBD II technology requires a much more sophisticated PCM than does OBD I technology. The OBD II PCM diagnostic management system not only monitors systems and components that can impact emissions, but they also run active tests on these systems and components. The decision making functions of OBD II PCMs have also greatly increased. To accommodate this expansion in diagnostic complexity, Isuzu engineers have designed the Class 2 serial data bus, which meets SAE J1850 recommended practice for serial data.

“Serial Data” refers to information which is transferred in a linear fashion – over a single line, one bit at a time. A “Data Bus” is an electronic pathway through which serial data travels.

TROOPER previously used a 5 volt data bus called UART, which is an acronym for “Universal Asynchronous Receive and Transmit”. When neither the vehicle’s control module nor the diagnostic tool, such as a Tech 2, are “talking,” the voltage level of the bus at rest is 5 volts. The two computers talk to each other at a rate of 8,192 bits per second, by toggling or switching the voltage on the data bus from 5 volts to ground.

Class 2 data, which is used on OBD II vehicles, is quite different. Data is transferred at a rate of 10.4 kilobits per second, and the voltage is toggled between zero and 7 volts.

C07RT006

Class 2 data is also pulse width modulated. Each bit of information can have one of two lengths: long or short. On the other hand, UART data bits come in only one length (short). The pulse width modulation of Class 2 data allows better utilization of the data line.

The message carried on Class 2 data streams are also prioritized. This means that if two devices try to communication on the data line at the same time, only the higher priority message will continue. The device with the lower priority message must wait.

NOTE: The Class 2 data wire is always terminal 2 of the new 16–terminal Data Link Connector (DLC).

16 – Terminal Data Link Connector (DLC)

OBD II standardizes Data Link Connector (DLC) configurations. The DLC, formerly referred to as the ALDL, will be a 16–terminal connector found on the lower left side of the driver’s side instrument panel. All manufacturers must conform to this 16–terminal standard.

PIN 13 –	SIR diagnostic enable
PIN 14 –	(Not used)
PIN 15 –	(Not used)
PIN 16 –	Battery power from vehicle unswitched (4 AMP MAX.)

Malfunction Indicator Lamp (MIL)

The Malfunction Indicator Lamp (MIL) looks the same as the MIL you are already familiar with (“CHECK ENGINE” lamp). However, OBD II requires that it illuminate under a strict set of guidelines. Basically, the MIL is turned on when the PCM detects a DTC that will impact the vehicle’s emissions.

The MIL is under the control of the Diagnostic Executive. The MIL will be turned on if a component or system which has an impact on vehicle emissions indicates a malfunction or fails to pass an emissions–related diagnostic test. It will stay on until the system or component passes the same test, for three consecutive trips, with no emissions–related faults.

Types Of Diagnostic Trouble Codes (DTCs)

The Diagnostic Executive classifies Diagnostic Trouble Codes (DTCs) into certain categories. Each type has different requirements to set the code, and the Diagnostic Executive will only illuminate the Malfunction Indicator Lamp (MIL) for emissions related DTCs. DTCs fall into four categories: A, B, C, and D; only types A and B are emission related The following descriptions define these categories:

TYPE A

Will store the DTC and turn on the MIL (“Check Engine” lamp) on the first trip in which an emission related diagnostic test has run and reported a “test failed” to the Diagnostic Executive.

TYPE B

Will store the DTC and turn on the MIL on the second consecutive trip in which an emission related diagnostic test has run and reported a “test failed” to the Diagnostic Executive. After one failure, the type B DTC is “armed,” or prepared to store a history code and turn on the MIL if a second failure occurs. One passed test will disarm a type B DTC. Some special conditions apply to misfire and fuel trim DTCs. For a type B DTC to store and turn on the MIL, two ignition cycles are required.

TYPE C

Will store the DTC and turn on a “SERVICE” lamp (“Check Trans” lamp) on the first trip that a non emission related diagnostic test has run and reported a “test failed” to the Diagnostic Executive. This type of DTC will be used in future applications.

TYPE D

Will store a DTC but will not turn on the MIL on the first trip that a non emission related diagnostic test has run and reported a “test failed” to the Diagnostic Executive. These codes can be very helpful for vehicle service when the driver may comment about a condition, but the MIL did not turn on.

Clear DTC

NOTE: If you clear the DTC (Diagnostic Trouble Codes) you will not be able to read any codes recorded during the last occurrence.

NOTE: To use the DTC again to identify a problem, you will need to reproduce the fault or the problem. This may require a new test drive or just turning the ignition on (this depends on the nature of the fault).

1. IF you have a Tech 2:
   1. Connect the Tech 2 if it is still not connected GOTHROUGH **Tech 2 OBD II CONNECTION.**
   2. Push “F1: Clear DTC Information” in the Application Menu and answer “Yes” to the question “Do you want to clear DTC’s?”
      a. When a malfunction remains as it is the Tech 2 displays “4L30E CODES NOT CLEARED”. This means that the problem is still there or that the recovery was not done. Please **GOTO DTC CHECK.**
      b. When a malfunction has been repaired and the recovery is done. The Tech 2 displays “4L30E CODES CLEARED”.
2. IF you have no Tech 2:
   To clear the DTC, remove Fuse “PCM” (F13, 30A) for at least 10 seconds.

DTC Check

1. Diagnostic Trouble Codes (DTC) have been identified by Tech 2.
2. You have written the list of the DTCs. The order of the malfunctions has no meanings for this PCM. Usually only one or two malfunctions should be set for a given problem.
3. Check directly the DTCs you identified. The DTCs are sorted by number. Refer to Diagnostic Trouble Code (DTC) Identification in this section.

PCM Precaution

The PCM can be damaged by:

1. Electrostatic discharge
2. The short circuit of some terminals to voltage or to ground.

Electrostatic Discharge Damage Description:

1. Electronic components used to control systems are often designed to carry very low voltage, and are very susceptible to damage caused by electrostatic discharge. It is possible for less than 100 volts of static electricity to cause damage to some electronic components. By comparison, it takes as much as 4,000 volts for a person to even feel the zap of a static discharge.
2. There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction. An example of charging by friction is a person sliding across a car seat, in which a charge of as much as 25,000 volts can build up. Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges for the same polarity are drained off, leaving the person highly charged with the opposite polarity. Static charges of either type can cause damage, therefore, it is important to use care when handling and testing electronic components.

NOTICE: **To prevent possible electrostatic discharge damage:**

1. Do not touch the PCM connector pins or soldered components on the PCM circuit board.
2. Be sure to follow the guidelines listed below if servicing any of these electronic components:
3. Do not open the replacement part package until it is time to install the part.
4. Avoid touching electrical terminals of the part.
5. Before removing the part from its package, ground the package to a known good ground on the vehicle.
6. Always touch a known good ground before handling the part. This step should be repeated before installing the part if the part has been handled while sliding across the seat, while sitting down from a standing position or while walking some distance.

Information On PCM

1. The Powertrain Control Module (PCM) is located in the center console and is the control center of the electronic transmission control system.
2. The PCM must be maintained at a temperature below 85° (185°F) at all times. This is most essential if the vehicle is put through a paint baking process. The PCM will become inoperative if its temperature exceeds 85°C (185°F). Therefore, it is recommended that the PCM be removed or that temporary insulation be placed around the PCM during the time the vehicle is in a paint oven or other high temperature process.
3. The PCM is designed to process the various inputs and then respond by sending the appropriate electrical signals to control transmission upshift, downshift, shift feel and torque converter clutch engagement.
4. The PCM constantly interprets information from the various sensors, and controls the systems that affect transmission and vehicle performance. By analyzing operational problems, the PCM is able to perform a diagnostic function by displaying DTC(s) and aid the technician in making repairs.

Intermittent Conditions

If the Tech 2 displays a diagnostic trouble code as intermittent, or if after a test drive a DTC does not reappear though the detection conditions for this DTC are present, the problem is most likely a faulty electrical connection or loose wiring. Terminals and grounds should always be the prime suspect. Intermittents rarely occur inside sophisticated electronic components such as the PCM.

Use the DTC information to understand which wires and sensors are involved.

When an intermittent problem is encountered, check suspect circuits for:

1. Poor terminal to wire connection.
2. Terminals not fully seated in the connector body (backed out).
3. Improperly formed or damaged terminals.
4. Loose, dirty, or corroded ground connections:
   HINT: Any time you have an intermittent in more than one circuit, check whether the circuits share a common ground connection.
5. Pinched or damaged wires.
6. Electro–Magnetic Interference (EMI):
   HINT: Check that all wires are properly routed away from coil, and generator. Also check for improperly installed electrical options, such as lights, 2–way radios, etc.

Use the F2 SNAPSHOT mode of the Tech 2 to help isolate the cause of an intermittent fault. The snapshot mode will record information before and after the problem occurs. Set the snapshot to “trigger” on the suspect DTC. If you notice the reported symptom during the test drive, trigger the snapshot manually.

After the snapshot has been triggered, command the Tech 2 to play back the flow of data recorded from each of the various sensors. Signs of an intermittent fault in a sensor circuit are sudden unexplainable jump in data values out of the normal range.

Transmission And PCM Identification

The chart below contains a list of all important information concerning rear axle ratio, Powertrain Control Module (PCM), and transmission identification.

VEHICLE		Rr axle Ratio	PCM	TRANSMISSION		
Type	Engine		ISUZU Parts No.	Calibration Code	Isuzu Part No.	Model Code
Isuzu / Trooper	3.5L V6	4.300	8–09385–189–0 8–09385–199–0	G26	8–96018–507–0	YA

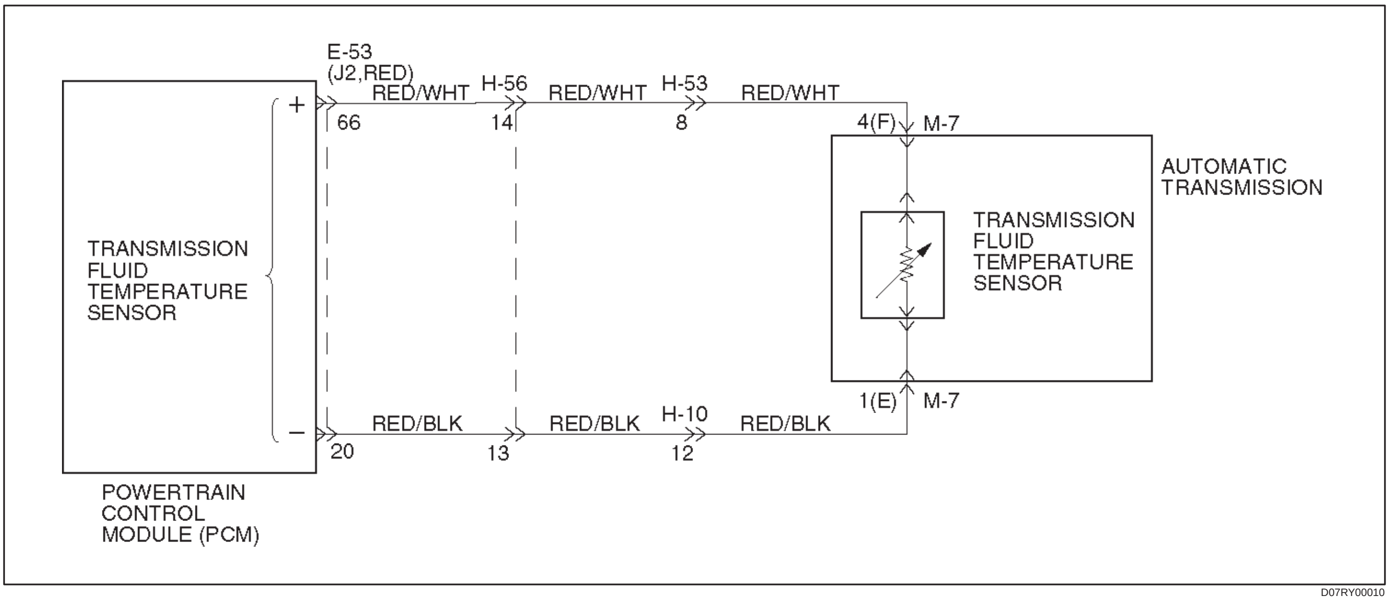
DTC TYPE	DEFINITION
B	Emission related, turn on MIL (Check Engine) and flashing Check Trans after 2 consecutive trips (Removal to confirmed)
C	Non–emission related, flashing Check Trans on 1st failure
D	Non–emission related, no lamps

NOTE: On the following charts, refer to the Powertrain Control Module (PCM) section for the Wiring System, and the Body and Accessories section for circuit diagram details, parts location, and connector configuration.

DTC P0218 Transmission Fluid Over Temperature



Circuit Description

The Transmission Fluid Temperature (TFT) sensor is a thermister that controls the signal voltage to the PCM. The PCM supplies a 5–volt reference to the sensor on circuit RED/WHT. When the transmission fluid is cold, the sensor resistance is high and the PCM will sense high signal voltage. As the fluid temperature warms to a normal transmission operating temperature of 100˚C (212˚F), the sensor resistance becomes less and the voltage decreases to 1.5 to 2.0 volts.
This DTC detects a high transmission temperature for a long period of time. This is a type “D” DTC.

Conditions For Setting The DTC

- No TFT DTCs P0712 or P0713.
- TFT is greater than 135˚C (275˚F).
- All conditions met for 21 seconds.

Action Taken When The DTC Sets

- Hot mode TCC Shift Pattern.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).
- ATF Lamp ON. (TFT is greater than 145˚C (293˚F).)
- Disable E–side TCC OFF request.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm–up cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and at the transmission 16–way connectors. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.

  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check harness routing for a potential short to ground in circuit RED/WHT.
- Scan tool TFT sensor temperature should rise steadily to about 100˚C (212˚F), then stabilize.
- Check for a “skewed” (mis–scaled) sensor by comparing the TFT sensor temperature to the ambient temperature after a vehicle cold soak. A “skewed” sensor can cause delayed garage shifts or TCC complaints.
- Check for a possible torque converter stator problem.
- Verify customer driving habits, trailer towing, etc.

Test Description

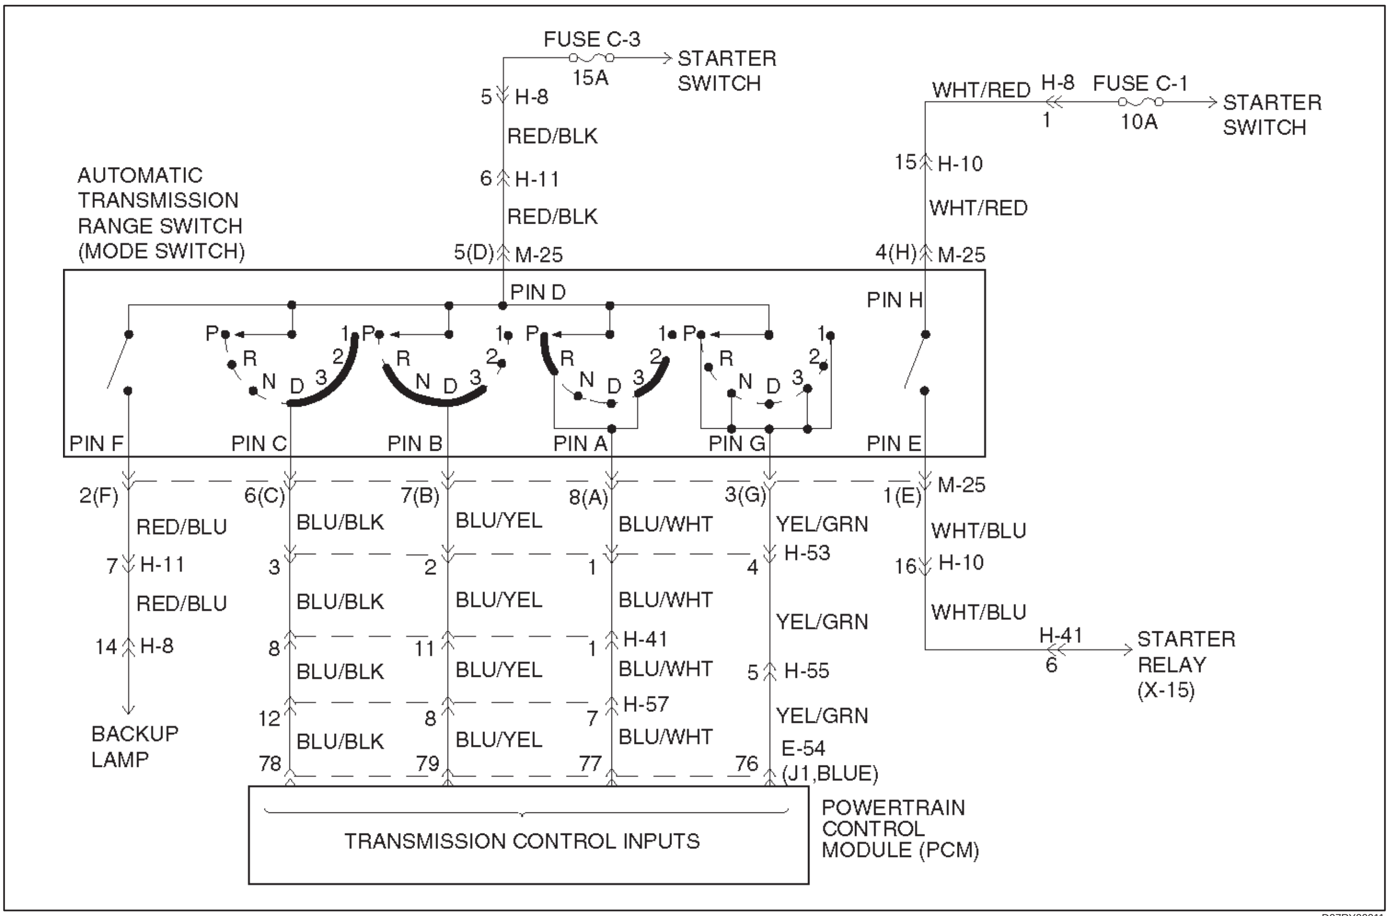
The numbers below refer to the step numbers on the diagnostic chart.

3. This test checks for a “skewed” sensor or shorted circuit.
4. This test simulates a TFT DTC P0713.

DTC P0218 Transmission Fluid Over Temperature

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	Perform the following checks: ● Check for possible engine system problems. ● Transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) Section. Were the checks performed?	Go to Step 3	—
3	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when "Clear Info" function is used. 3. Record the DTC "Failure Records". Is the TFT sensor signal voltage less than 0.33 volts?	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition "off". 2. Disconnect the transmission 16–way connector H–56 (additional DTCs may set). Is the TFT sensor signal voltage greater than 4.92 volts?	Go to Internal Wiring Harness Check.	Go to Step 5
5	Inspect/repair circuit RED/WHT for a short to ground. Was a problem found?	Go to Step 7	Go to Step 6
6	1. Inspect the PCM for poor connections. 2. Replace the PCM if no poor connections were found. Is the replacement complete?	Go to Step 7	—
7	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TFT is less than 125°C (257°F) for at least 10 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0705 Transmission Range Switch (Mode Switch) Illegal Position



D07RY00011

Circuit Description

- The range switch supplies the Powertrain Control Module (PCM) with information regarding the selector lever position: P, R, N, D 3, 2 or L. The selector lever position is indicated by the state of four ON/OFF contacts. The range switch is located on one side of the transmission. It is on the transmission manual shaft and is fixed to the main case.
- The range switch is also used to provide the information P or N to the engine crank wiring. The engine can be cranked only if connector M–25 terminal 4(H) is connected to terminal 1(E) which is connected to ground.
- The range switch is also used to provide the backup lamp power in reverse. This is why the range switch is supplied through a 15A fuse (C–3). This fuse can burn due to a short circuit in the backup lamp.

This DTC detects when a fuse is open or the range switch circuit does not work. This is a type “D” DTC.

Conditions For Setting The DTC

- Range switch illegal positions met for 5 seconds.

Action Taken When The DTC Sets

- Default to D position.
- Inhibit torque management.
- Maximum line pressure.
- Turn force motor OFF.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Refer to accompanying chart for the normal range signals and the illegal combinations.
- Inspect the wiring for poor electrical connections at the PCM and at the transmission 8–way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Refer to the “Range Switch Logic Table” or “Functional Test Procedure” for further information.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks the indicated range signal to the manual valve actually selected.
6. This test checks for continuity between each selected range switch connector terminals.

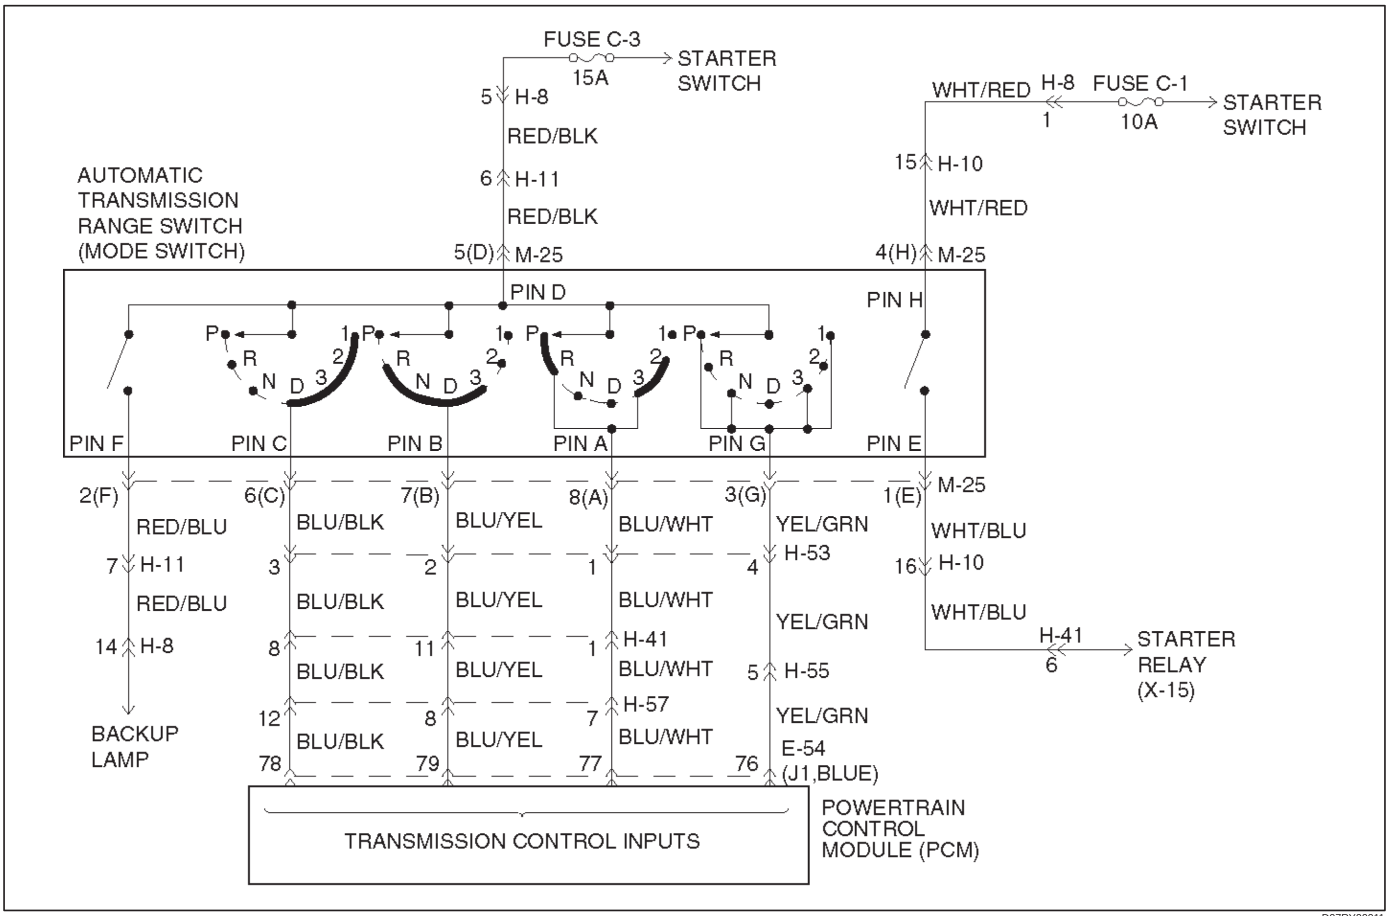
Range Switch Logic Table

Range Position	Range Switch Pin			
	A	B	C	P(G)
Park	ON	OFF	OFF	ON
Reverse	ON	ON	OFF	OFF
Neutral	OFF	ON	OFF	ON
D4	OFF	ON	ON	OFF
D3	ON	ON	ON	ON
2	ON	OFF	ON	OFF
L	OFF	OFF	ON	ON
Illegal	OFF	OFF	OFF	OFF
Illegal	OFF	OFF	OFF	ON

DTC P0705 Transmission Range Switch (Mode Switch) Illegal Position

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	Perform the following checks: ● The transmission linkage from the select lever to the manual valve is adjusted properly. ● Diagnostic circuit check. Were the checks performed?	Go to Step 3	—
3	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Freeze Frame" and "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Freeze Frame" and "Failure Records". 4. Select each transmission range: D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the scan tool "Range Switch" display?	Go to Diagnostic Aids	Go to Step 4
4	Are all range switch pin displays incorrect?	Go to Step 5	Go to Step 6
5	Check fuse and wiring to the 8–way connector terminal 5(D) for opens. Refer to Mode Switch in Automatic Transmission (4L30–E) section. If no problem was found, replace the range switch. Is the replacement complete?	Go to Step 9	—
6	1. Disconnect the 8–way range switch connector. 2. Using ohmmeter, check continuity between terminal 5(D) and respectively terminals 3(G), 6(C), 7(B) and 8(A) of the 8–way range switch connector. 3. Move shift selector lever through all positions and compare results with "Range Switch Logic Table". Is one range switch pin display incorrect?	Go to Step 7	Go to Step 8
7	Check the affected wiring and connector, and repair. Is the repair complete?	Go to Step 9	—
8	Check the Powertrain Control Module (PCM) connectors for poor connection. If no problem was found, replace the PCM. Is the replacement complete?	Go to Step 9	—
9	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and road test the vehicle. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0706 Transmission Range Switch (Mode Switch) Performance



D07RY00011

Circuit Description

- The range switch supplies the Powertrain Control Module (PCM) with information regarding the selector lever position: P, R, N, D, 3, 2 or L. The selector lever position is indicated by the state of four ON/OFF contacts. The range switch is located on one side of the transmission. It is on the transmission manual shaft and is fixed to the main case.
- The range switch is also used to provide the information P or N to the engine crank wiring. The engine can be cranked only if connector M–25 terminal 4(H) is connected to terminal 1(E) which is connected to ground.
- The range switch is also used to provide the backup lamp power in reverse. This is why the mode switch is supplied through a 15A fuse (C–3). This fuse can burn due to a shot circuit in the backup lamp.
- This DTC detects an invalid state of the range switch or the range switch circuit by deciphering the range switch inputs. This is a type “D” DTC.

Conditions For Setting The DTC

This DTC will set if any of the following conditions occurs:

Condition 1 (“R” bad position):

- Engine is running.
- No output speed DTCP0722, P0723.
- Output speed greater than 3,200 RPM.
- Range switch indicates “R”.
- All conditions met for 4 seconds.

Condition 2 (“P” or “N” bad position):

- Engine is running.
- No TPS codes.
- Engine speed is less than 3,000 RPM.
- TP angle is greater than 20%.
- Range switch indicates “P” or “N”.
- All conditions met for 4 seconds.

Action Taken When The DTC Sets

- Default to “D” position.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Refer to the accompanying chart for the normal range signals and the illegal combinations.
- Inspect the wiring for poor electrical connections at the PCM and at the transmission 8–way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Refer to the “Range Switch Logic Table” or “Functional Test Procedure” for further information.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks the indicated range signal to the manual valve actually selected.
6. This test checks for continuity between each selected range switch connector terminals.

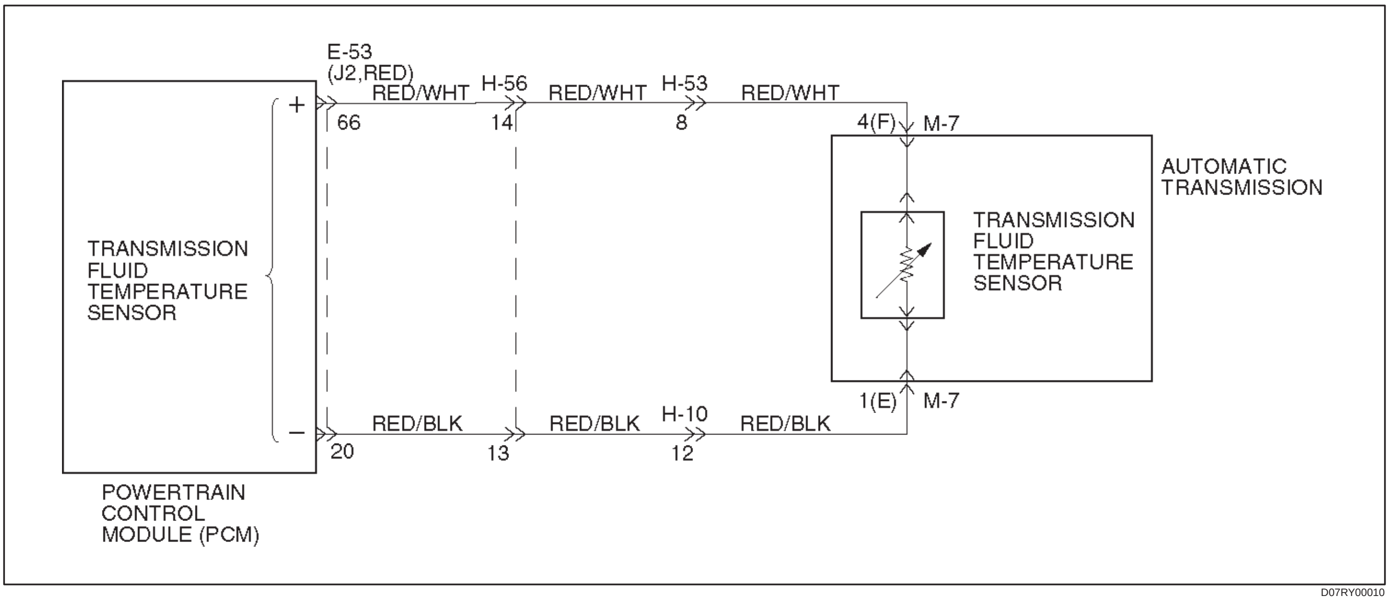
Range Switch Logic Table

Range Position	Range Switch Pin			
	A	B	C	P(G)
Park	ON	OFF	OFF	ON
Reverse	ON	ON	OFF	OFF
Neutral	OFF	ON	OFF	ON
D4	OFF	ON	ON	OFF
D3	ON	ON	ON	ON
2	ON	OFF	ON	OFF
L	OFF	OFF	ON	ON
Illegal	OFF	OFF	OFF	OFF
Illegal	OFF	OFF	OFF	ON

DTC P0706 Transmission Range Switch (Mode Switch) Performance

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	Perform the following checks: ● The transmission linkage from the select lever to the manual valve is adjusted properly. ● Diagnostic circuit check. Were the checks performed?	Go to Step 3	—
3	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. Select each transmission range: D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the scan tool “Range Switch” display?	Go to Diagnostic Aids	Go to Step 4
4	Are all range switch pin displays incorrect?	Go to Step 5	Go to Step 6
5	Check fuse and wiring to the 8–way connector terminal 5(D) for opens. Refer to Mode Switch in Automatic Transmission (4L30–E) section. If no problem was found, replace the range switch. Is the replacement complete?	Go to Step 9	—
6	1. Disconnect the 8–way range switch connector. 2. Using ohmmeter, check continuity between terminal 5(D) and respectively terminals 3(G), 6(C), 7(B) and 8(A) of the 8–way range switch connector. 3. Move shift selector lever through all positions and compare results with “Range Switch Logic Table”. Is one range switch pin display incorrect?	Go to Step 7	Go to Step 8
7	Check the affected wiring and connector, and repair. Is the repair complete?	Go to Step 9	—
8	Check the Powertrain Control Module (PCM) connectors for poor connection. If no problem was found, replace the PCM. Is the replacement complete?	Go to Step 9	—
9	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and road test the vehicle. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0711 Transmission Fluid Temperature (TFT) Sensor Performance



Circuit Description

The TFT sensor is a thermister that controls the signal voltage to the PCM. The PCM supplies a 5–volt reference signal to the sensor on circuit RED/WHT. When the transmission fluid is cold, the sensor resistance is high and the PCM detects high signal voltage. As the transmission fluid temperature increases to normal operating temperature of 100°C (212°F), the sensor resistance becomes less and the voltage decreases to 1.5 to 2 volts.
When the PCM detects a TFT sensor that remains at the startup value, or a sensor that has a change delta of greater than 20°C (36°F) less than 1 second, DTC P0711 sets. DTC P0711 is a type D.

Conditions For Setting The DTC

- No VSS DTCs P0722 or P0723.
- No Transmission Component Slipping DTC P1870.
- Engine is running.
- TFT is between 20 A/D (Analog/Digital) counts and 248 A/D counts.
- TFT is between –40°C (–40°F) and +21°C (69.8°F) at engine startup.
- Engine coolant temperature is greater than 70°C (150°F).
- Engine coolant temperature has changed by greater than 50°C (90°F) since engine startup.
- Vehicle speed has been greater than 5 mph for greater than 410 seconds since engine startup (cumulative timer).
- TCC slip speed has been greater than 120 rpm for greater than 410 seconds since engine startup (cumulative timer).
- Battery voltage is between 10 and 16 volts.

All of the above is true and either of the following occurs:

- If the sensor is stuck, the TFT has not changed for greater than 2 counts (from startup temperature) for greater than 410 seconds.
- If the sensor shows an unrealistic change, the TFT exhibits a change delta of greater than 20°C (36°F), greater than 14 times in 7 seconds.

Action Taken When The DTC Sets

- Transmission default temperature will be:

  80°C (176°F) if engine temperature code is set.

  100°C (212°F) if engine temperature is warm.

  80°C (176°F) if engine run time is greater than 5 minutes.

  21°C (69.8°F) if engine run time is less than 5 minutes.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM. Inspect the wiring for poor electrical connections at the transmission 16–way connectors. Look for the following conditions:
  a. A bent terminal
  b. A backed out terminal
  c. A damaged terminal
  d. Poor terminal tension
  e. A chafed wire
  f. A broken wire inside the insulation

- When diagnosing for an intermittent short or open connection, move the wiring harness while watching the test equipment for a change.
- First diagnose and clear any engine DTCs or TP Sensor codes. Then inspect for any transmission DTCs that may have reset.

Test Description

The number below refers to the step number on the diagnostic chart:

3. This test checks PCM and associated wiring up to the 16–way connectors. If the voltage increases to match chart the problem is isolated to the transmission wiring.

Resistance Chart

˚C	˚F	Resistance (kΩ)
–40	–40	672
0	32	65
20	68	25
80	176	2.5
120	248	0.78
150	304	0.37

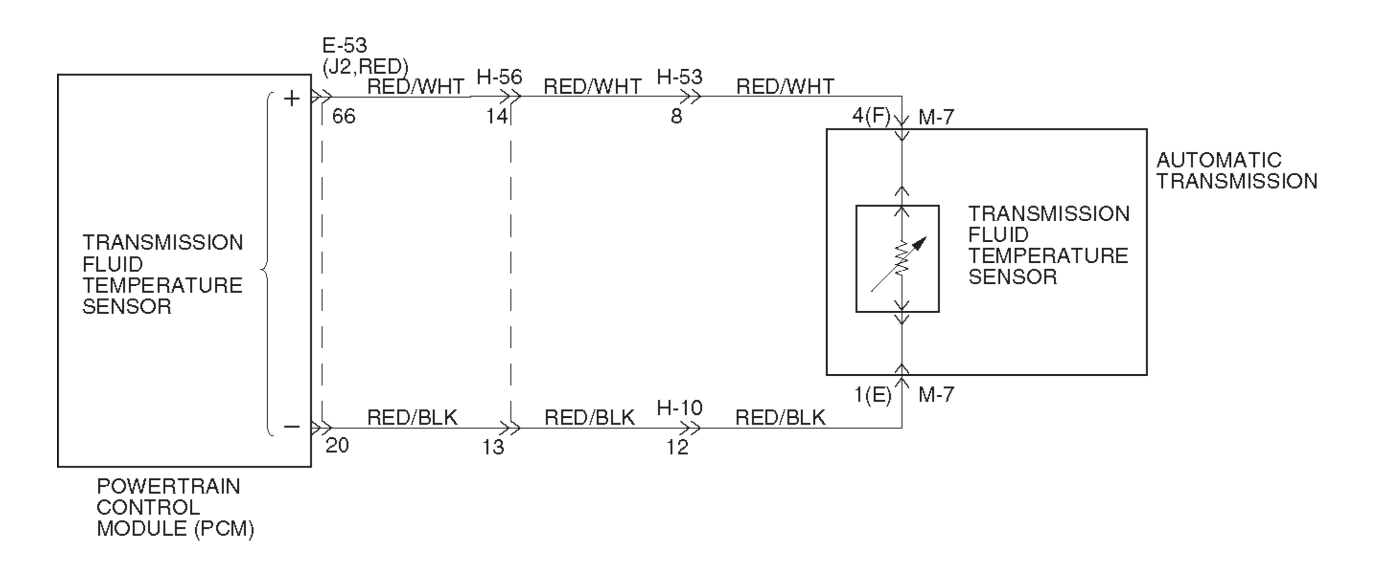
DTC P0711 Transmission Fluid Temperature (TFT) Sensor Performance

Step	Action	Yes	No
1	Was the Powertrain On–Board Diagnostic (OBD) System Check performed?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	Perform the transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section. Did you perform the fluid checking procedure?	Go to Step 3	Go to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section
3	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch to the “on” position. NOTE: Before clearing DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. 4. Select TFT on the scan tool. 5. While observing the scan tool display, move or massage the engine wiring harness from PCM connectors J2–66 and J2–20 to the transmission 16–way connectors. Does the TFT change by more than ±20˚C (36˚F)?	Go to Step 6	Go to Step 4
4	1. Turn the ignition “off”. 2. Disconnect the transmission 16–way connector H–56. 3. Install Jumper Harness on the transmission side of the 16–way connector H–56. 4. Using the J39200 DVOM and J35616 Connector Test Adapter Kit, connect the DVOM leads from terminal M7–4(F) to terminal M7–1(E). 5. Set the DVOM on MIN/MAX to measure resistance. 6. Record the TFT sensor resistance. 7. Move or massage the automatic transmission wiring harness assembly from the 16–way connector H–56 to the TFT sensor connector. Does the DVOM MAX display a resistance greater than the value recorded in Action item 6 of this step?	Go to Step 7	Go to Step 5
5	Does the DVOM MIN display a resistance less than the value recorded in Action item 6 of step 4?	Go to Step 8	—

DTC P0711 Transmission Fluid Temperature (TFT) Sensor Performance (Cont'd)

Step	Action	Yes	No
6	Inspect circuit RED/WHT and RED/BLK of the engine wiring harness for an intermittent open or short condition. Repair the circuits if necessary. Did you find a problem?	Go to Step 12	Go to Step 11
7	Inspect the automatic transmission wiring harness assembly for an intermittent open in circuits RED/WHT and RED/BLK. Did you find a problem?	Go to Step 9	Go to Step 10
8	Inspect the automatic transmission wiring harness assembly for an intermittent shorted condition in circuits RED/WHT and RED/BLK. Did you find a problem?	Go to Step 9	Go to Step 10
9	Replace the automatic transmission wiring harness assembly. Is the replacement complete?	Go to Step 12	—
10	Replace TFT Sensor. Refer to Transmission Oil Temperature Sensor (Main Case) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 12	—
11	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 12	—
12	In order to verify your repair, perform the following procedure. 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle and ensure the following conditions are met: ● The TFT changes by more than 2.25˚C (4.05˚F) for 11 seconds since startup. ● The TFT does not change by more than 20˚C (36˚F) within 0.200 second for a period of at least 11 seconds. 4. Select Specific DTC. 5. Enter DTC P0711. Has the test run and passed?	System OK	Begin the diagnosis again Go to Step 1

DTC P0712 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input



D07RY00010

Circuit Description

The TFT sensor is a thermister that controls the signal voltage to the PCM. The PCM supplies a 5–volt reference signal to the sensor on circuit RED/WHT. When the transmission fluid is cold, the sensor resistance is high. The PCM detects high signal voltage. As the transmission fluid temperature increases to the normal operating temperature of 100°C (212°F), the sensor resistance becomes less and the voltage decreases to 1.5 to 2 volts. With transmission fluid over temperature and DTC P0218 also set, check the transmission cooling system.

This DTC detects a continuous short to ground in the TFT signal circuit or the TFT sensor. This is a type “D” DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is “on”.
- TFT sensor indicating a voltage less than 0.4 volts.
- All conditions met for 20 seconds.

Action Taken When The DTC Sets

- Transmission default temperature will be:

  80°C (176°F) if engine temperature code is set.

  100°C (212°F) if engine temperature is warm.

  80°C (176°F) if engine run time is greater than 5 minutes.

  21°C (69.8°F) if engine run time is less than 5 minutes.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Check harness routing for a potential short to ground in circuit RED/BLK. Scan tool TFT display should rise steadily to about 100°C (212°F), then stabilize.
- Inspect the wiring for poor electrical connection at the PCM and at the transmission 16–way connectors. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- The temperature to resistance value scale may be used to test the TFT sensor at the various temperature levels to evaluate the possibility of a “skewed” (mis–scaled) sensor.

  A “skewed” sensor could result in delayed garage shifts or TCC complaints.
- Verify customer driving habits, trailer towing, etc.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks for a short to ground or a “skewed” sensor.
4. This test checks for an internal fault within the transmission by creating an open.

Resistance Chart

˚C	˚F	Resistance (kΩ)
–40	–40	672
0	32	65
20	68	25
80	176	2.5
120	248	0.78
150	304	0.37

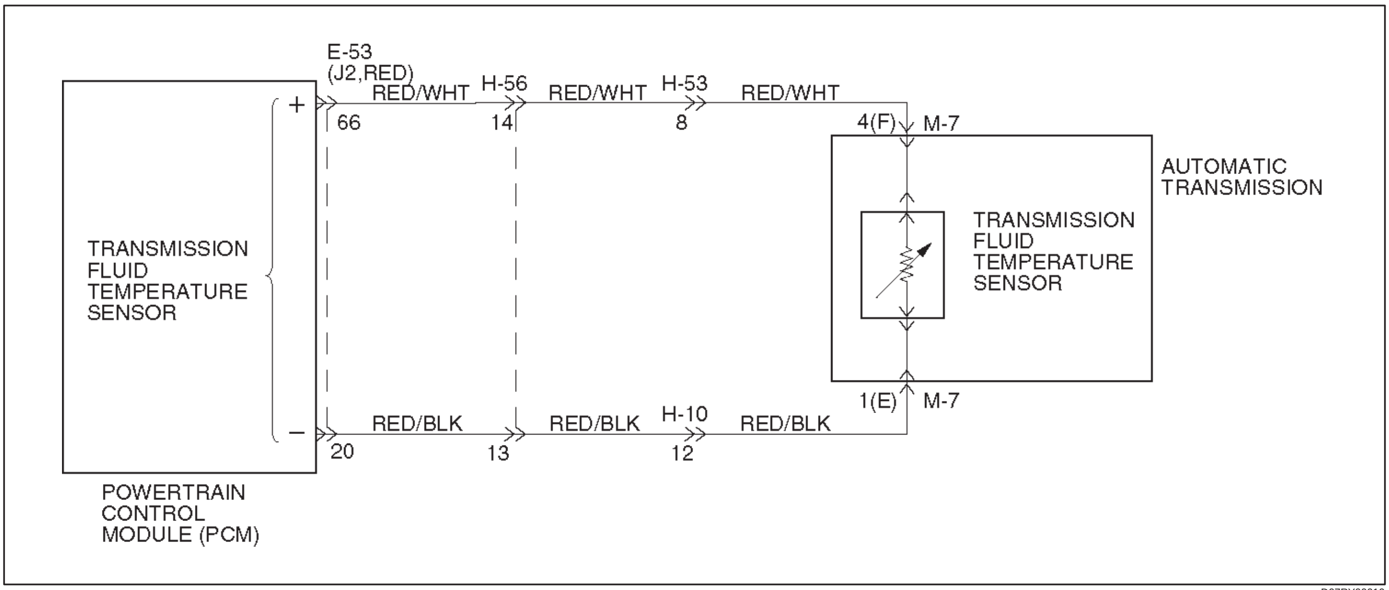
DTC P0712 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	Perform the transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section. Was the fluid checking procedure performed?	Go to Step 3	Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section
3	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Freeze Frame" and "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Freeze Frame" and "Failure Records". Does the scan tool display a TFT sensor signal voltage less than 0.4 volts?	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition "off". 2. Disconnect the transmission 16–way connector H–56. 3. Turn the ignition "on". Does the TFT signal voltage change to match the voltage 4.92 volts?	Go to Step 5	Go to Step 10
5	Using the J39200 DVOM, measure the resistance between terminals M7–4(F) and M7–1(E). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 6
6	1. Disconnect the transmission 7–way connector M–7. 2. Using the J39200 DVOM, measure the resistance between terminals M7–4(F) and M7–1(E). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 7
7	1. Remove the transmission oil pan. Refer to Transmission Oil Temperature Sensor (Main Case) in Automatic Transmission (4L30–E) section. 2. Check the internal wiring harness for a short to ground. Was a problem found?	Go to Step 9	Go to Step 8

DTC P0712 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input (Cont'd)

Step	Action	Yes	No
8	1. Disconnect the internal wiring harness at the TFT sensor. 2. Measure the resistance of the TFT sensor. Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 9
9	Replace the TFT Sensor. Is the replacement complete?	Go to Step 13	—
10	Check circuit RED/WHT for a short to ground. Was a problem found?	Go to Step 13	Go to Step 11
11	Check the PCM for faulty connections. Was a problem found?	Go to Step 13	Go to Step 12
12	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 13	—
13	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TFT sensor indicates a voltage greater than 0.33 volts for 2 seconds. 2. Review the scan tool "DTC info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0713 Transmission Fluid Temperature (TFT) Sensor Circuit High Input



D07RY00010

Circuit Description

The TFT sensor is a thermistor that controls the signal voltage to the PCM. The PCM supplies a 5–volt reference signal to the sensor on circuit RED/WHT. When the transmission fluid is cold, the sensor resistance is high and the PCM will sense high signal voltage. As the transmission fluid temperature warms to the normal operating temperature of 100˚C (212˚F), the sensor resistance becomes less and the voltage decreases to about 1.5 to 2 volts.

This DTC detects a continuous open or short to power in the TFT signal circuit or the TFT sensor. This is a type "D" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is "on".
- TFT sensor indicating a voltage greater than 4.86 volts.
- All conditions met for 20 seconds.

Action Taken When The DTC Sets

- Transmission default temperature will be:

  80˚C (176˚F) if engine temperature code is set.

  100˚C (212˚F) if engine temperature is warm.

  80˚C (176˚F) if engine run time is greater than 5 minutes.

  21˚C (69.8˚F) if engine run time is less than 5 minutes.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 16–way connectors. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Scan tool displays transmission fluid temperature in degrees. After transmission is operating, the temperature should rise steadily to about 100˚C (212˚F), then stabilize.
- The temperature to resistance value scale may be used to check the TFT sensor at the various temperature levels to evaluate the possibility of a "skewed" (mis–scaled) sensor.

  A "skewed" sensor could result in hard shifts or TCC complaints.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This check verifies problem in the TFT sensor circuit.
4. This test simulates a TFT sensor DTC P0712. If the PCM recognizes the low signal voltage (high temperature), and the scan tool displays 146˚C (295˚F) or greater, the PCM and wiring are OK.

5. This test checks the TFT sensor and internal wiring harness.

Resistance Chart

˚C	˚F	Resistance (kΩ)

0	32	65
20	68	25
80	176	2.5
120	248	0.78
150	304	0.37

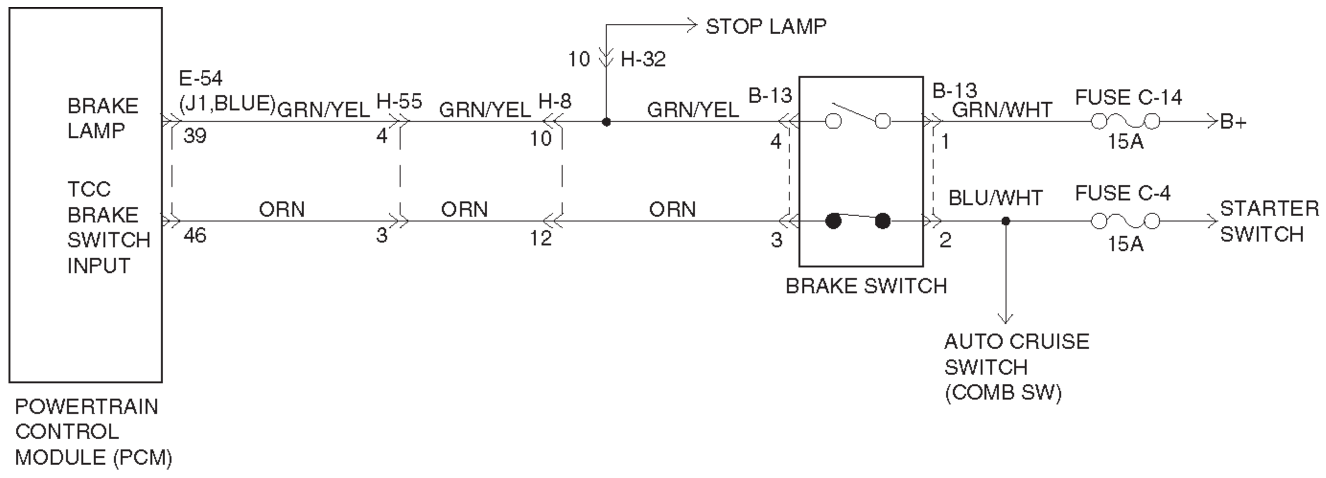
DTC P0713 Transmission Fluid Temperature (TFT) Sensor Circuit High Input

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	Perform the transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section. Was the fluid checking procedure performed?	Go to Step 3	Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section
3	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. Does the scan tool display a TFT sensor signal voltage greater than 4.86 volts?	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition “off”. 2. Disconnect the transmission 16–way connector H–56. 3. Install a fused jumper wire from terminal M7–4(F) and M7–1(E) on the engine harness. 4. Turn the ignition “on”. Does the TFT signal voltage drop to less than 0.4 volts?	Go to Step 5	Go to Step 10
5	1. Turn the ignition “off”. 2. Using the J39200 DVOM, measure the resistance between terminals M7–4(F) and M7–1(E). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 6
6	1. Disconnect the transmission 7–way connector M–7. 2. Using the J39200 DVOM, measure the resistance between terminals M7–4(F) and M7–1(E). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 7

DTC P0713 Transmission Fluid Temperature (TFT) Sensor Circuit High Input (Cont'd)

Step	Action	Yes	No
7	1. Remove the transmission oil pan. 2. Check the internal wiring harness for an open. Refer to Transmission Oil Temperature Sensor (Main Case) in Automatic Transmission (4L30–E) section. Was a problem found and corrected?	Go to Step 14	Go to Step 8
8	1. Disconnect the internal wiring harness at the TFT sensor. 2. Measure the resistance of the TFT sensor. Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 9
9	Replace TFT sensor. Refer to Transmission Oil Temperature Sensor (Main Case) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 14	—
10	Check circuit RED/WHT for an open or short to B+. Was a problem found?	Go to Step 14	Go to Step 11
11	Check circuit RED/BLK for an open. Was a problem found?	Go to Step 14	Go to Step 12
12	Check the PCM for faulty or intermittent connections. Was a problem found?	Go to Step 14	Go to Step 13
13	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 14	—
14	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: 2. TFT sensor indicates a voltage less than 4.92 volts for 2 seconds. 3. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0719 Brake Switch Circuit Low (Stuck On)



D07RY00012

Circuit Description:

The brake switch indicates brake pedal status to the Powertrain Control Module (PCM). The brake switch is a normally–closed switch that supplies battery voltage on circuit ORN to the PCM. Applying the brake pedal opens the switch, interrupting voltage to the PCM. When the brake pedal is released, the PCM receives a constant voltage signal. If the PCM receives a zero voltage signal at the brake switch input, and the Torque Converter Clutch (TCC) is engaged, the PCM de–energizes the Torque Converter Clutch Solenoid Valve (TCC Sol. Valve). The PCM disregards the brake switch input for TCC scheduling if there is a brake switch circuit fault (Refer to Diagnostic Aids).

When the PCM detects an open brake switch circuit (0 volts, low input) during accelerations, then DTC P0719 sets. DTC P0719 is a type D DTC.

Conditions For Setting The DTC

- No OSS Assy. DTCs P0722 or P0723.
- The PCM detects an open brake switch or circuit (0 volts) for 15 minutes without changing for 2 seconds, and the following events occur seven consecutive times:
  - The vehicle speed is less than 8 km/h (5 mph);
  - then the vehicle speed is 8–32 km/h (5–20 mph) for 4 seconds;
  - then the vehicle speed is greater than 32 km/h (20 mph) for 4 seconds.

Action Taken When The DTC Sets

- The PCM does not illuminate the Malfunction Indicator Lamp (MIL).
- DTC P0719 stores in PCM history.

Conditions For Clearing The DTC

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm–up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and brake switch. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check customer driving habits and/or unusual driving conditions (i.e. stop and go, highway).
- Check brake switch for proper mounting and adjustment.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

3. This step isolates the brake switch as a source for setting the DTC.

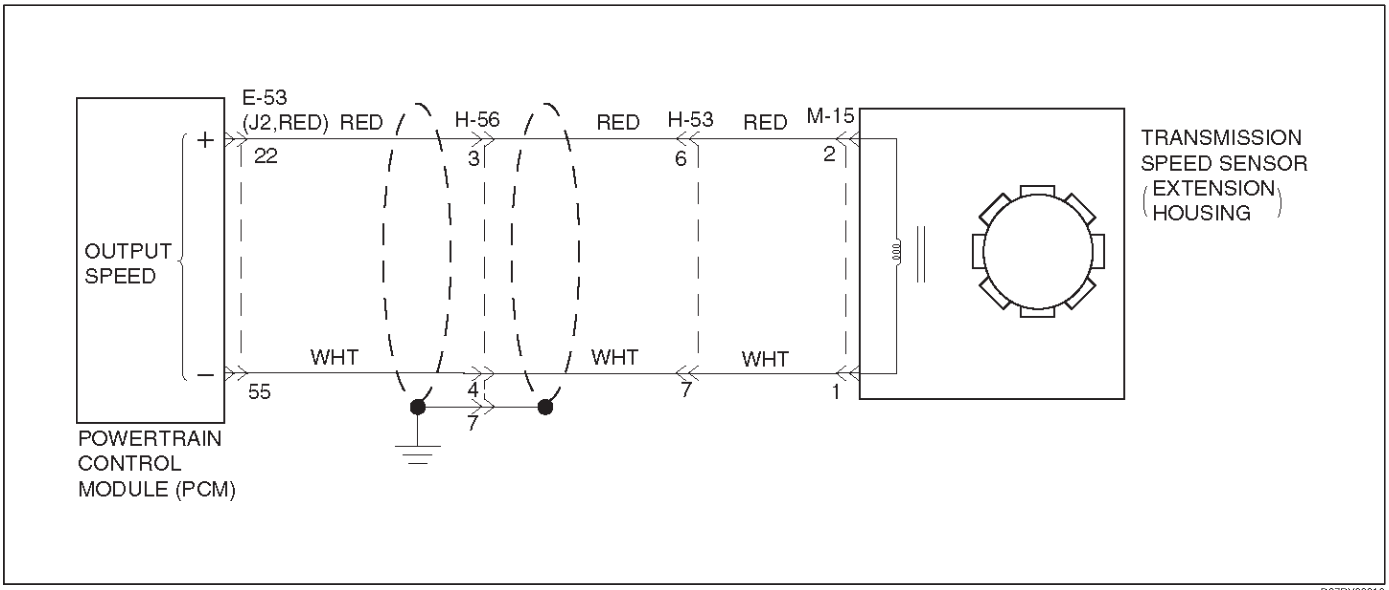
DTC P0719 Brake Switch Circuit Low (Stuck On)

Step	Action	Yes	No
1	Was the Powertrain On–Board Diagnostic (OBD) System Check performed?	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. With the engine “off,” turn the ignition switch to the “on” position. NOTE: Before clearing the DTC(s), use the scan tool in order to record the “Failure Records” for reference. Using the “Clear Info” function will erase the stored “Failure Records” from the PCM. 3. Record the “DTC Failure Records”, then clear the DTC(s). 4. Select “TCC Brake Switch” on the scan tool. 5. Disconnect the brake switch connector from the brake switch. 6. Connect a test lamp from cavity B13–2 of the brake switch connector to a known good ground. Is the test lamp ON?	Go to Step 3	Go to Step 4
3	Install a J 36169–A Fused Jumper Wire from terminal B13–3 to terminal B13–2 of the brake switch connector. Did the TCC Brake Switch status change from Open to Closed?	Go to Step 7	Go to Step 9
4	1. Remove the fuse C–4 (15A). 2. Inspect the fuse for an open. Is the fuse open?	Go to Step 5	Go to Step 8
5	Inspect circuit BLU/WHT for a short to ground condition. Repair the circuit if necessary. Did you find a short to ground condition?	Go to Step 11	Go to Step 6
6	Inspect circuit ORN for a short to ground condition. Repair the circuit if necessary. Did you find a short to ground condition?	Go to Step 11	Go to Step 10
7	Replace the brake switch. Is the replacement complete?	Go to Step 11	—
8	Inspect circuit BLU/WHT for an open condition. Repair the circuit if necessary. Did you find and correct an open condition?	Go to Step 11	—
9	Inspect circuit ORN for an open. Did you find an open condition?	Go to Step 11	Go to Step 10

DTC P0719 Brake Switch Circuit Low (Stuck On) (Cont'd)

Step	Action	Yes	No
10	Replace the PCM. Is the replacement complete?	Go to Step 11	—
11	In order to verify your repair, perform the following procedure: 1. Select DTC. 2. Select Clear Info. 3. With the engine "off," turn the ignition switch to the "on" position. 4. Do not depress the brake pedal. 5. Verify that the TCC Brake Switch status indicates "Closed" (12 volts) for 2 seconds. 6. Select Specific DTC. Enter DTC P0719. Has the test run and passed?	System OK	Begin the diagnosis again. Go to Step 1

DTC P0722 Automatic Transmission Output Speed Sensor (OSS) Low Input



D07RY00016

Circuit Description

Output speed information is provided to the PCM by the OSS, which is a permanent magnet (PM) generator. The PM generator produces a pulsing AC voltage. The AC voltage level and number of pulses increases as the speed of the vehicle increases. The PCM then converts the pulsing voltage to output speed, which is used for calculations. The vehicle speed can be displayed with a scan tool.

This DTC detects a low output speed when there is a high engine speed in a drive gear range. This is a type “B” DTC.

Conditions For Setting The DTC

- No MAP DTCs P0107 or P0108, P0106, P1106, P1107.
- No TPS DTCs P0122 or P0123.
- Not in Park or Neutral.
- TP angle is greater than 10%.
- Engine vacuum is between 0 and 70kPa.
- Engine speed is between 3,000 and 7,000 rpm.
- Transmission output speed is less than 0 rpm.
- All conditions met for 5 seconds.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- For lamp illuminate refer to DTC type definition (type B).

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool. The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- An OSS DTC P0722 will set when no output speed is at detected at start off.
- Inspect the wiring for poor electrical connection at the PCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

4. This test checks the OSS circuit.
5. This test checks the integrity of the OSS.
7. This test checks the 5–volt and ground circuit of the PCM.

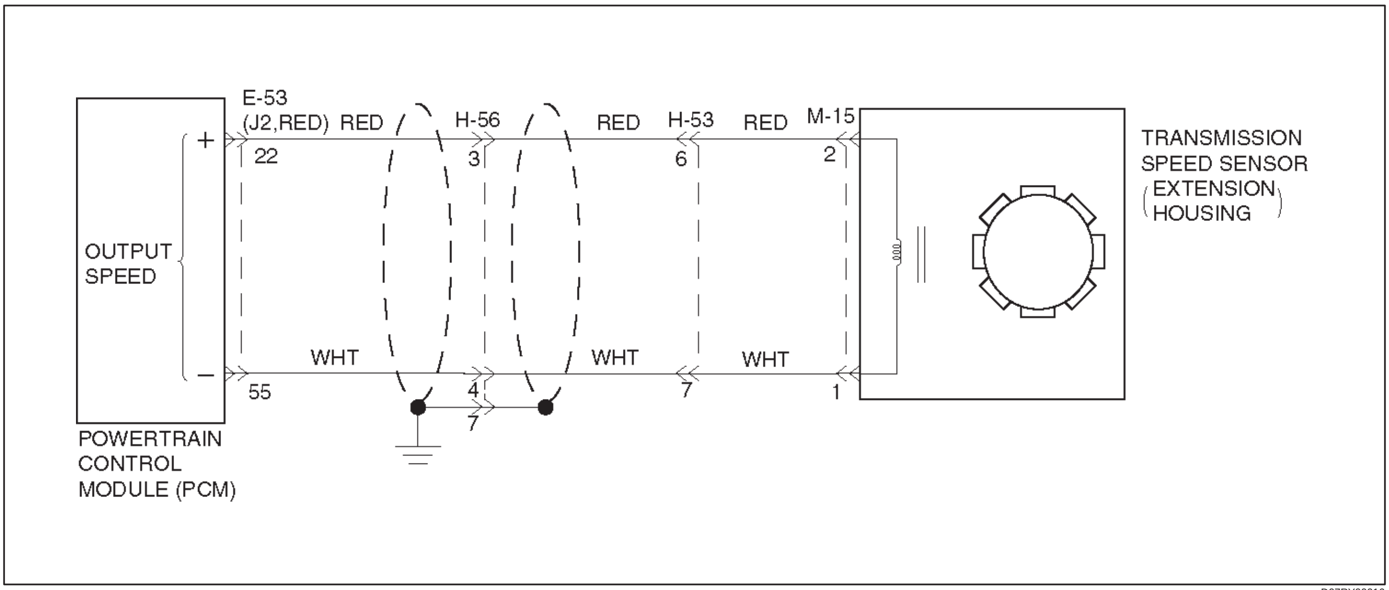
DTC P0722 Automatic Transmission Output Speed Sensor (OSS) Low Input

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. Raise the drive wheels. 5. Start the engine. 6. Place the transmission in any drive range. With the drive wheels rotating, does the “Trans Output Speed” increase with the drive wheel speed?	Go to Diagnostic Aids	Go to Step 3
3	Check for the most current and/or incorrect calibration. Is the calibration current?	Go to Step 16	Go to Step 4
4	1. Turn the ignition “off”. 2. Disconnect the J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between harness connector terminals J2–22 and J2–55. Is the reading 3,000 ohms?	Go to Step 5	Go to Step 6
5	1. Select AC volts. 2. Rotate the rear wheels, ensuring the driveshaft is turning. Is the voltage greater than 0.5 volts?	Go to Step 7	Go to Step 8
6	Inspect circuits RED and WHT for a poor connection or an open circuit. Was a problem found?	Go to Step 17	Go to Step 8
7	1. Reconnect the J2 (RED) PCM connector. 2. Disconnect the OSS harness from the OSS. 3. With the engine “off”, turn the ignition “on”. 4. Using the J 39200 DVOM, measure the voltage at the OSS harness connector terminals M15–2 and M15–1. Is the reading between 4.0 to 5.1 volts?	Go to Step 16	Go to Step 10
8	1. Remove the OSS. 2. Check the output shaft speed sensor rotor for damage or misalignment. Refer to Speed Sensor (Extension Housing) in Automatic Transmission (4L30–E) section. Was a problem found?	Go to Step 17	Go to Step 9
9	Replace the OSS. Is the replacement complete?	Go to Step 17	—
10	Was the reading in step 7 less than 4.0 volts?	Go to Step 12	Go to Step 11
11	Was the reading in Step 7 greater than 5.1 volts?	Go to Step 15	—
12	Using the J 39200 DVOM to chassis ground, measure the voltage on circuit RED. Is the reading between 4.0 to 5.1 volts?	Go to Step 13	Go to Step 14

DTC P0722 Automatic Transmission Output Speed Sensor (OSS) Low Input (Cont'd)

Step	Action	Yes	No
13	Repair the open in circuit WHT. Is the repair complete?	Go to Step 17	—
14	Check circuit RED for a short to ground or open. Was a problem found and corrected?	Go to Step 17	Go to Step 16
15	Repair the short to B+ in circuit RED. Is the repair complete?	Go to Step 17	—
16	Replace the PCM. Refer to Powertrain Control Module (PCM) in automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 17	—
17	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: Transmission output speed is greater than 101 rpm for 3 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0723 Automatic Transmission Output Speed Sensor (OSS) Intermittent



D07RY00016

Circuit Description

Output speed information is provided to the PCM by the OSS, which is a permanent magnet (PM) generator. The PM generator produces a pulsing AC voltage. The AC voltage level and number of pulses increases as the speed of the vehicle increases. The PCM then converts the pulsing voltage to output speed, which is used for calculations. The vehicle speed can be displayed with a scan tool.

This DTC detects a low output speed when there is a high engine speed in a drive gear range. This is a type “B” DTC.

Conditions For Setting The DTC

Drive range

- Engine running time is greater than 5 seconds.
- Output speed is greater than 1300 rpm for 2 seconds.
- NORAW-NORAWLAST < 200 rpm for 2 seconds.

  NORAW Latest raw data of output shaft speed.

  NORAWLAST Filtered pervious data of output speed.
- Transmission negative output speed change is greater than 1300 rpm.
- Conditions met for 3 seconds.

Action During Detection Time

Output speed value is frozen.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- For lamp illumination refer to DTC type definition (type B).

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive trips without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- A OSS DTC P0723 will set when output speed has been detected and is lost.
- Inspect the wiring for poor electrical connection at the PCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

4. This test checks the OSS circuit.
5. This test checks the integrity of the OSS.
7. This test checks the 5–volt and ground circuit of the PCM.

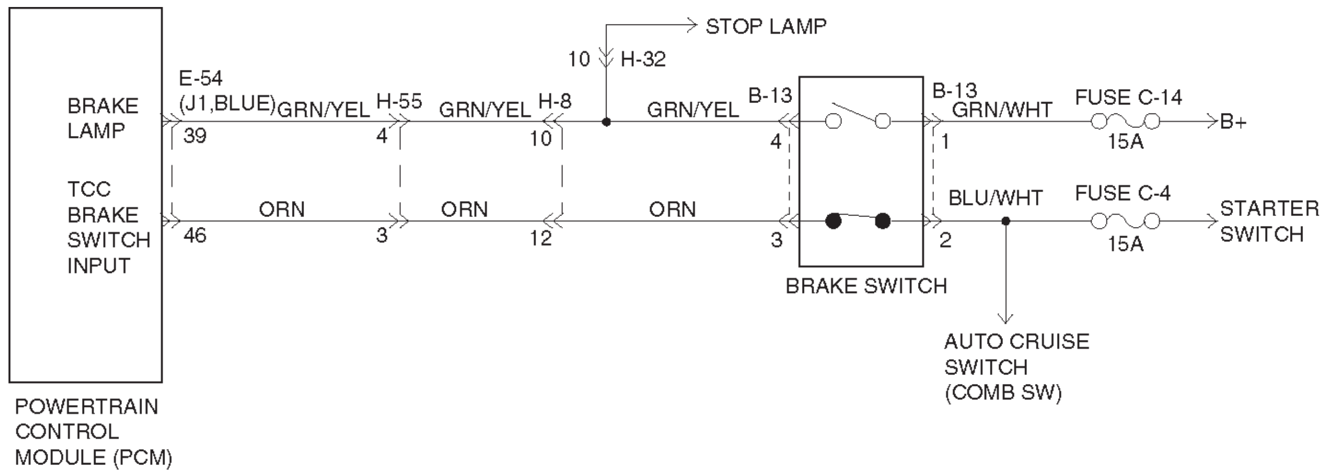
DTC P0723 Automatic Transmission Output Speed Sensor (OSS) Intermittent

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. Raise the drive wheels. 5. Start the engine. 6. Place the transmission in any drive range. With the drive wheels rotating, does the “Trans Output Speed” increase with the drive wheel speed?	Go to Diagnostic Aids	Go to Step 3
3	Check for the most current and/or incorrect calibration. Is the calibration current?	Go to Step 16	Go to Step 4
4	1. Turn the ignition “off”. 2. Disconnect the J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between harness connector terminals J2–22 and J2–55. Is the reading 3,000 ohms?	Go to Step 5	Go to Step 6
5	1. Select AC volts. 2. Rotate the rear wheels, ensuring the driveshaft is turning. Is the voltage greater than 0.5 volts?	Go to Step 7	Go to Step 8
6	Inspect circuits RED and WHT for a poor connection or an open circuit. Was a problem found?	Go to Step 17	Go to Step 8
7	1. Reconnect the J2 (RED) PCM connector. 2. Disconnect the OSS harness from the OSS. 3. With the engine “off”, turn the ignition “on”. 4. Using the J 39200 DVOM, measure the voltage at the OSS harness connector terminals M15–2 and M15–1. Is the reading between 4.0 to 5.1 volts?	Go to Step 16	Go to Step 10
8	1. Remove the OSS. 2. Check the output shaft speed sensor rotor for damage or misalignment. Refer to Speed Sensor (Extension Housing) in Automatic Transmission (4L30–E) section. Was a problem found?	Go to Step 17	Go to Step 9
9	Replace the OSS. Is the replacement complete?	Go to Step 17	—
10	Was the reading in step 7 less than 4.0 volts?	Go to Step 12	Go to Step 11
11	Was the reading in Step 7 greater than 5.1 volts?	Go to Step 15	—
12	Using the J 39200 DVOM to chassis ground, measure the voltage on circuit RED. Is the reading between 4.0 to 5.1 volts?	Go to Step 13	Go to Step 14

DTC P0723 Automatic Transmission Output Speed Sensor (OSS) Intermittent (Cont'd)

Step	Action	Yes	No
13	Repair the open in circuit WHT. Is the repair complete?	Go to Step 17	—
14	Check circuit RED for a short to ground or open. Was a problem found and corrected?	Go to Step 17	Go to Step 16
15	Repair the short to B+ in circuit RED. Is the repair complete?	Go to Step 17	—
16	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 17	—
17	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: Transmission output speed is greater than 101 rpm for 3 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0724 Brake Switch Circuit High (Stuck Off)



D07RY00012

Circuit Description:

The brake switch indicates brake pedal status to the Powertrain Control Module (PCM). The brake switch is a normally–closed switch that supplies battery voltage on circuit ORN to the PCM. Applying the brake pedal opens the switch, interrupting voltage to the PCM. When the brake pedal is released, the PCM receives a constant voltage signal. If the PCM receives a zero voltage signal at the brake switch input, and the Torque Converter Clutch (TCC) is engaged, the PCM de–energizes the Torque Converter Clutch Solenoid Valve (TCC Sol. Valve). The PCM disregards the brake switch input for TCC scheduling if there is a brake switch circuit fault (Refer to Diagnostic Aids).

When the PCM detects a closed brake switch circuit (12 volts, high input) during decelerations, then DTC P0724 sets. DTC P0724 is a type D DTC.

Conditions For Setting The DTC

- No OSS Assy. DTCs P0722 or P0723.
- The PCM detects a closed brake switch circuit (12 volts) without changing and the following events occur seven consecutive times:
  - The vehicle speed is greater than 32 km/h (20 mph) for 4 seconds;
  - then the vehicle speed is between 8–32 km/h (5–20 mph) for 4 seconds;
  - then the vehicle speed is less than 8 km/h (5 mph).

Action Taken When The DTC Sets

- The PCM does not illuminate the Malfunction Indicator Lamp (MIL).
- DTC P0724 stores in PCM history.

Conditions For Clearing The DTC

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm–up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check customer driving habits and/or unusual traffic conditions (i.e. stop and go, expressway).
- Check brake switch for proper mounting and adjustment.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

2. This step isolates the brake switch as a source for setting the DTC.

DTC P0724 Brake Switch Circuit High (Stuck Off)

Step	Action	Yes	No
1	Was the Powertrain On–Board Diagnostic (OBD) System Check performed?	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. With the engine “off,” turn the ignition switch to the “on” position. NOTE: Before clearing the DTC(s), use the scan tool in order to record the “Failure Records” for reference. Using the “Clear Info” function will erase the stored “Failure Records” from the PCM. 3. Record the DTC Failure Records, then clear the DTC(s). 4. Select “TCC Brake Switch” on the scan tool. 5. Disconnect the brake switch connector from the brake switch. Did the TCC brake switch status change from “Closed” to “Open”?	Go to Step 3	Go to Step 4
3	Replace the brake switch. Is the replacement complete?	Go to Step 6	—
4	Inspect circuit ORN for a short to B+ condition. Repair the circuit if necessary. Did you find a short to B+ condition?	Go to Step 6	Go to Step 5
5	Replace the PCM. Is the replacement complete?	Go to Step 6	—
6	In order to verify your repair, perform the following procedure: 1. Select DTC. 2. Select “Clear Info”. 3. With the engine “off” turn the ignition switch to the “on” position. 4. Apply the brake pedal. 5. Verify that the TCC brake switch status indicates “Open” (0 volts) for 2 seconds. 6. Select Specific DTC. Enter DTC P0724. Has the test run and passed?	System OK	Begin the diagnosis again. Go to Step 1

D07RY00055

Circuit Description

- The Powertrain Control Module (PCM) calculates the slippage of the converter and transmission based upon the engine speed, the output speed, and the current gear ratio.
- The slippage of the converter at a high enough engine speed is low. The transmission should not slip more than a given value when there is no shift.
- This DTC detects a slip at each gear. This is a type "C" DTC.

Conditions For Setting The DTC

- No Output Speed Sensor DTC(s) P0722, P0723.
- Not in Park, Neutral, or Reverse.
- Engine speed is greater than 3,500 rpm.
- 3 seconds since upshift.
- No Transmission Range Switch DTC(s) P0705, P0706.
- 3 seconds since downshift.
- 3 seconds since garage shift (N→D).
- And one of the following conditions occur:
  - Slip is greater than 508 rpm in 1st gear.
  - Slip is greater than 468 rpm in 2nd gear.
  - Slip is greater than 449 rpm on 3rd gear.
  - Slip is greater than 440 rpm on 4th gear.
- All conditions met for 5.5 seconds.

Action Taken When The DTC Sets

- Maximum line pressure.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

- The PCM will illuminate the CHECK TRANS Lamp.
- Turn force motor OFF.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn “off” the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from PCM memory by using a scan tool.
- The DTC can also be cleared from memory when the vehicle has made 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC Actions Taken items when the fault conditions no longer exist and the ignition is cycles “off” long enough to power down the PCM.

Diagnostic Aids

- Check for intermittent output speed sensor circuit problems.
- Check for possible incorrect calibration. (PCM part No., tire specification, and rear axle ratio)

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This step checks for possible low fluid level causing slipping resulting in an undefined gear ratio.
4. This step checks for correct gear ratios for commanded gears.
5. This step checks for low line pressure.

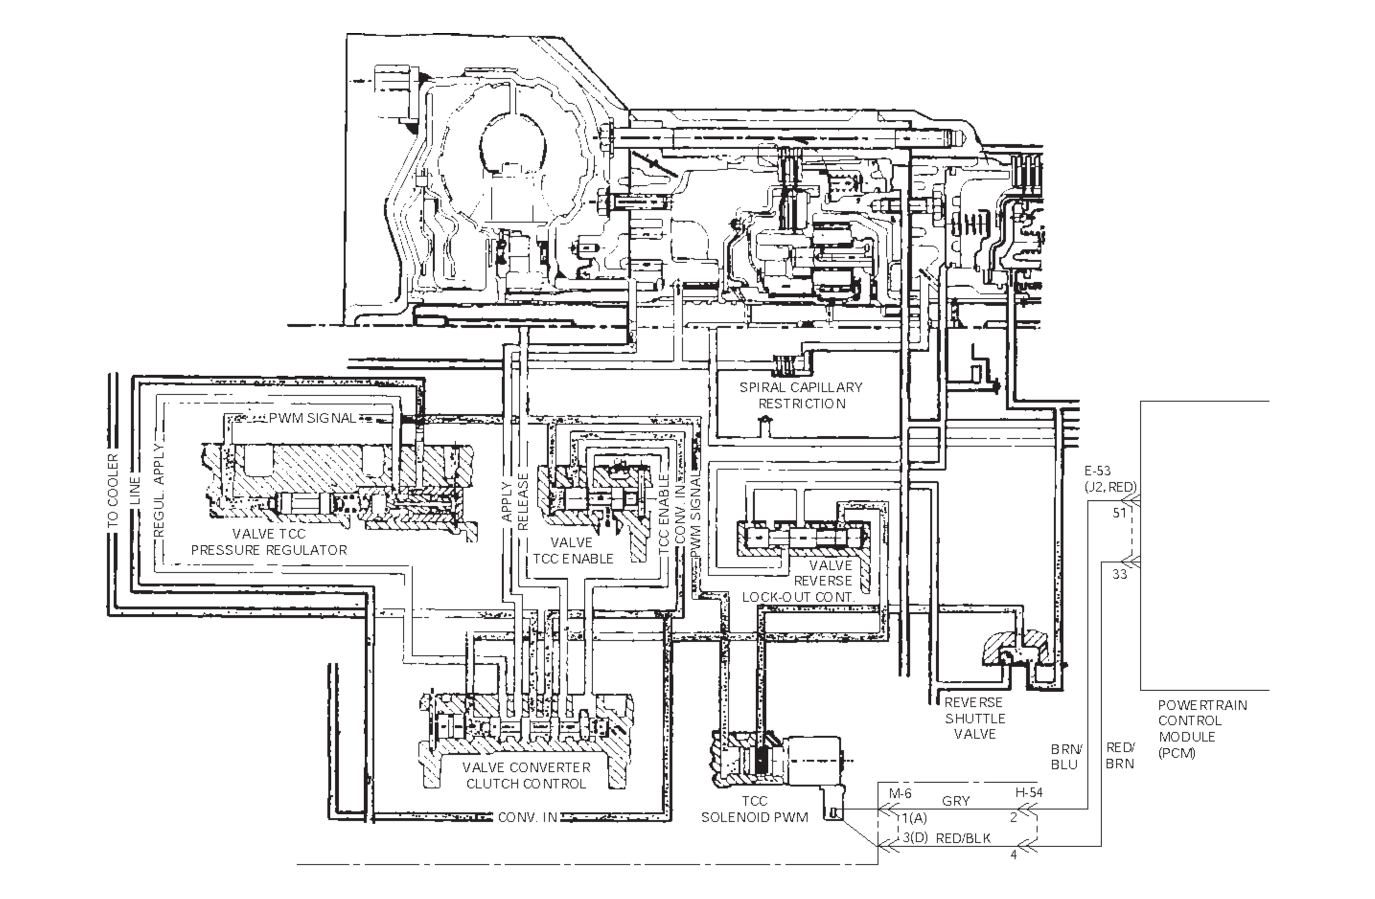
DTC P0730 Gear Error Without Input Speed

Step	Action	Yes	No
1	Were you sent here from the “On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	Visually inspect the transmission cooling system for fluid leaks. ● Refer to Chart 16: Possible Causes of Transmission Fluid Leaks of Mechanical/Hydraulic Diagnosis Symptoms Index in Automatic Transmission (4L30–E) section Was condition found and corrected?	Go to Step 7	Go to Step 3
3	Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section. Has transmission fluid checking procedure been performed?	Go to Step 4	Go to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section
4	1. Install the scan tool. 2. Turn the ignition switch to the “on” position. 3. Engine not running. NOTE: Before clearing DTC(s) use the scan tool to record the “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 4. Record the Failure Record data. 5. Use the scan tool snapshot mode to record transmission gear ratios. 6. Drive vehicle in transmission gear ranges 1, 2, 3, and D with the engine speed is greater than 3,500 rpm for 5.5 seconds. 7. Record each transmission gear. 1st:2.73 – 2.99 2nd:1.54 – 1.71 3rd:0.93 – 1.05 4th:0.66 – 0.78 Does commanded gear ratio match ranges as shown?	Refer to Diagnostic Aids	Go to Step 5

DTC P0730 Gear Error Without Input Speed (Cont'd)

Step	Action	Yes	No
5	Perform line pressure check. ● Refer to Line Pressure Test in Automatic Transmission (4L30–E) section. Was condition found and corrected?	Go to Step 7	Go to Step 6
6	Check for possible clutch slippage. ● Refer to Chart 6: Diagnostic Trouble Code (DTC) P0730 of Mechanical/Hydraulic Diagnosis Symptoms Index in Automatic Transmission (4L30–E) section. Was condition found and corrected?	Go to Step 7	—
7	1. After the repair is complete, use the scan tool to select "DTC", then "Clear info" function. 2. Operate the vehicle under the following conditions: ● Drive the vehicle in D4 with the engine speed greater than 3,500 rpm to obtain anyone of the following gear ratios for seven seconds. 1st 1:2.73 – 1:2.99 2nd 1:1.54 – 1:1.71 3rd 1:0.93 – 1:1.05 4th 1:0.66 – 1:0.78 Has the last test failed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0742 Torque Converter Clutch (TCC) System Stuck On



D07RY002

Circuit Description

The PCM energizes the TCC solenoid by creating an ignition voltage on circuit BRN/BLU. When ignition voltage is energized by the PCM, the TCC solenoid stops converter signal oil from exhausting. This causes converter signal oil pressure to increase and move the TCC valve. The TCC solenoid will deenergize when the PCM no longer provides ignition voltage. When the TCC solenoid is deenergized, it will exhaust fluid and release the TCC.

This DTC detects low torque converter slip when the TCC is commanded “off”. This is a type “B” DTC.

Conditions For Setting The DTC

The following conditions occur once per TCC cycle, three consecutive times:

- No TPS DTCs P0122 or P0123.
- No OSS DTCs P0722 or P0723.
- No TCC solenoid DTC P1860.
- TP angle is greater than 20%.
- Engine speed is greater than 500 rpm and less than 3,000 rpm.
- Engine vacuum is between 0 and 70 kPa.
- Commanded gear is not 1st.
- Gear range is D4.
- TCC is commanded “off”.
- No TCC Stuck off DTC P1870.
- TCC slip speed is between –20 and 40 rpm for 2 seconds.
- Vehicle speed is greater than 25 km/h (15 mph) and less than 120 km/h (75 mph).
- Speed ratio is greater than 0.9 and less than 2.0.

Action Taken When The DTC Sets

- For lamp illuminate refer to DTC type definition (type B).
- Inhibit TCC engagement.

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- If the TCC is mechanically stuck “on” with the parking brake applied and any gear range selected, the TCC fluid will mechanically apply the TCC, possibly causing an engine stall.

Test Description

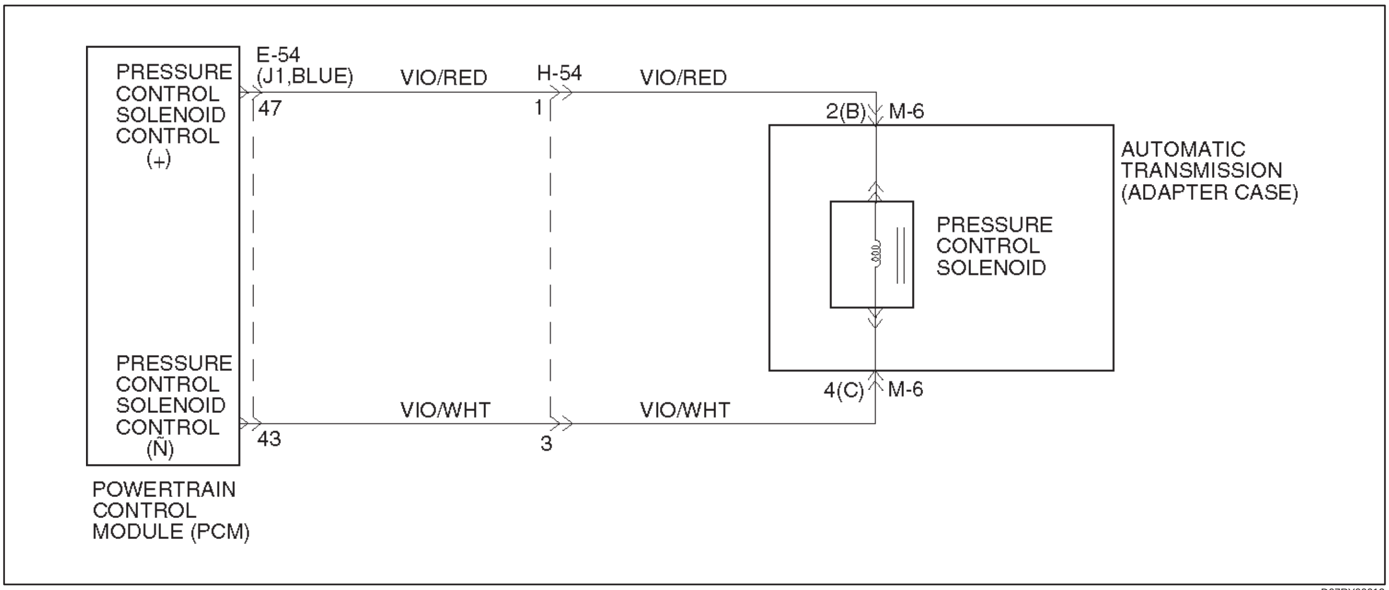
The number below refers to the step number on the diagnostic chart:

3. This test checks the mechanical state of the TCC. (When the PCM commands the TCC solenoid “off”, the slip speed should increase).

DTC P0742 Torque Converter Clutch (TCC) System Stuck On

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. Using the scan tool, verify the “TP Sensor” operation. Are the “TP Sensor” values within 0.6 – 5.0 volts?	Go to Step 3	Go to Diagnostic Aids
3	Drive the vehicle in the D4 drive range in fourth gear under steady acceleration, with a TP angle greater than 20%. Does the scan tool display “TCC Slip Speed” between –30 and +30 rpm, while the displayed TCC solenoid state is “off”?	Go to Step 4	Go to Diagnostic Aids
4	The TCC is mechanically stuck “on”. Check the following items: • Clogged exhaust orifice in the TCC solenoid. • Converter clutch apply valve stuck in the apply position. • Misaligned or damaged valve body gasket. • Restricted release passage. Was a problem found and corrected?	Go to Step 5	—
5	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and ensure the following conditions are met: TCC slip speed must be between 200 and 2,500 rpm for 4 seconds. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0748 Pressure Control Solenoid (PCS) (Force Motor) Circuit Electrical



D07RY00013

Circuit Description

The PCS is a PCM–controlled device used to regulate transmission line pressure. The PCM compares TPS voltage, engine rpm, and other inputs to determine the line pressure appropriate for a given load. The PCM will regulate the pressure by applying a varying amperage to the PCS. The applied amperage can vary from 0.1 to 1 amp, and is monitored by the PCM.

This DTC detects a continuous open or short to ground in the PCS circuit or the PCS. This is a type “C” DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- The PCM detects that the different between commanded and actual current is 200 milliampere (mA) for over 1 second.
- Engine speed is greater than 300 rpm.

Action Taken When the DTC Sets

- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).
- Maximum line pressure.
- The PCM will illuminate the CHECK TRANS Lamp.
- Turn force motor OFF (Durability).

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn “off” the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from PCM history by using a scan tool.
- The DTC will be cleared from memory when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 4–way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

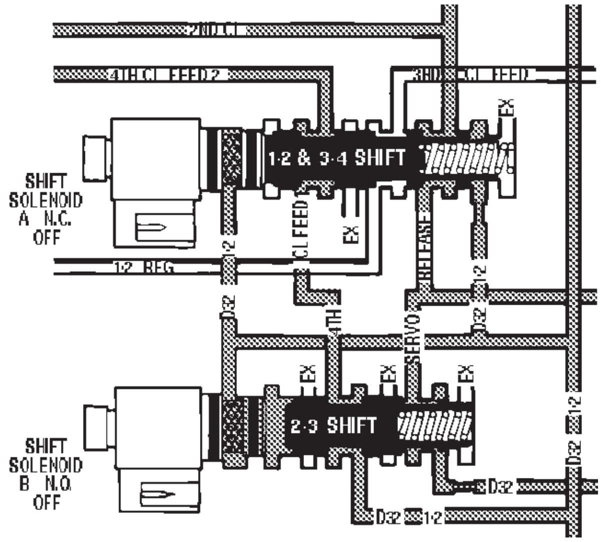
The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the ability of the PCM to command the PCS.
3. This test checks the PCS and internal wiring harness for incorrect resistance.

DTC P0748 Pressure Control Solenoid (PCS) (Force Motor) Circuit Electrical

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". 4. While the engine is operating, put the transmission in Park. 5. Using the scan tool, apply 0.1 amp through 1.0 amp while observing "PC Ref. Current" and "PC Act. Current". Is the "PC Act. Current" reading always within 0.16 amp?	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition "off". 2. Disconnect the transmission 4–way connector M–6. 3. Using the J39200 DVOM, measure the resistance between terminals M6–2(B) and M6–4(C). Is the resistance within 3–7 ohms?	Go to Step 7	Go to Step 4
4	1. Remove the transmission oil pan. Refer to Solenoid (Adapter Case Valve Body) in Automatic Transmission (4L30–E) section. 2. Disconnect the internal wiring harness at the PCS. 3. Measure the resistance of the PCS. Is the resistance within 3–7 ohms?	Go to Step 6	Go to Step 5
5	Replace the PCS. Is the replacement complete?	Go to Step 10	—
6	Repair the internal wiring harness for an open. Is the repair complete?	Go to Step 10	—
7	Inspect/repair circuits J1–47, M6–2(B), J1–43, and M6–4(C). Was a problem found?	Go to Step 10	Go to Step 8
8	Inspect/repair circuits J1–47, M6–2(B), J1–43, and M6–4(C) for a short to ground or poor connections. Was a problem found?	Go to Step 10	Go to Step 9
9	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 10	—
10	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: The PCS duty cycle is not at its electrical high or low limit. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0751 Shift Solenoid A Performance (Stuck OFF)



D07RT011

Circuit Description

The shift solenoid A is used to control fluid flow acting on the 1–2 and 3–4 shift valves. The solenoid is a normally close exhaust valve that is used with the shift solenoid B to allow four different shifting combinations.

The DTC detects when there is only a 1–1–4–4 shift pattern depending on the state of the mechanical failure instead of a 1–2–3–4 shift pattern. This is a type "B" DTC.

Conditions For Setting The DTC

- No ETC DTCs.
- No OSS DTCs P0722 or P0723.
- No TCC solenoid DTC P0742, P1860, P1870.
- No shift solenoid A DTC P0753.
- No shift solenoid B DTC P0758.
- Gear range is D4.
- Output speed is greater than 375 rpm.
- Transmission temperature is between 20° and 130°C (68° and 266°F).
- No range code P0705, P0706.
- No torque code (to be confirmed).
- Engine run for more 0 seconds and not influed cut-off (to be confirmed).

All the above conditions have been met and the combination of conditions 1, 2 occur two consecutive times.

Condition 1:

- 2nd gear is commanded for ≥ 1 sec
- 40 ≤ Engine Torque ≤ 400 N·m
- Throttle positon ≥ 10%
- 800 ≤ TCC slip ≤ 4000 rpm
- Speed ratio ≥ 0.6
- 2.75 ≤ Modeled Ratio ≤ 3.2 for 1 seconds.

Condition 2:

- 3rd Gear is commanded for ≥ 1 sec.
- 40 ≤ Engine Torque ≤ 400 N·m
- Trottle position ≥ 10%
- –8000 ≤ TCC slip ≤ 8000 rpm
- Speed ratio ≥ 0.45
- 0.62 ≤ Modeled Ratio ≤ 0.92 for 3 seconds

Action Taken When the DTC Sets

- Maximum line pressure.
- For lamp illuminate refer to DTC type definition (type B).
- Turn force motor OFF.

Conditions For Clearing The The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Verify that the transmission meets the specifications in the 4L30–E shift speed chart.
- Other internal transmission failures may allow more than one shift to occur.

Test Description

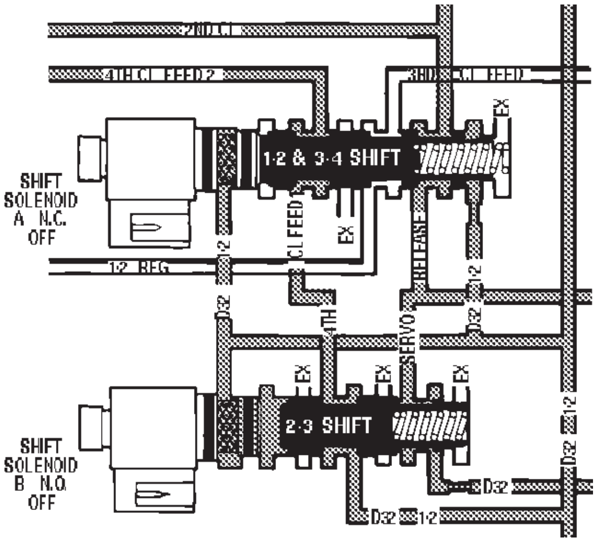
The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the function of the range switch (mode switch).
3. This test checks that the scan tool commanded all shifts, all shifts solenoids responded correctly, but all the shifts did not occur.

DTC P0751 Shift Solenoid A Performance (Stuck OFF)

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. With the engine operating, apply the brake pedal and select each transmission range D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the “TR Switch” on the scan tool?	Go to Step 3	Go to“Range Switch Logic Table”
3	1. While the engine is operating, raise the drive wheels. 2. With the transmission in D4 range, use the scan tool to command 1st, 2nd and 3rd, and 4th gears while accelerating the vehicle. Was a 2–3 or 1–4 only shift pattern detected? (Road testing the vehicle may be necessary).	Go to Step 4	Go to Diagnostic Aids
4	Check the shift solenoid/hydraulic circuit for: ● One or both of the shift solenoids for an internal malfunction. ● Contamination or sediment in one or both of the shift solenoids. ● Damaged seals on one or both of the shift solenoids. Refer to Solenoid (Main Case Valve Body) in Automatic Transmission (4L30–E) section. Was a problem found and corrected?	Go to Step 5	Go to Diagnostic Aids
5	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and road test the vehicle. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0752 Shift Solenoid A Performance (Stuck ON)



D07RT011

Circuit Description

The shift solenoid A is used to control fluid flow acting on the 1–2 and 3–4 shift valves. The solenoid is a normally close exhaust valve that is used with the shift solenoid B to allow four different shifting combinations.

The DTC detects when there is only a 2–2–3–3 shift pattern depending on the state of the mechanical failure instead of a 1–2–3–4 shift pattern. This is a type “B” DTC.

Conditions For Setting The DTC

- No ETC DTCs.
- No OSS DTCs P0722 or P0723.
- No TCC solenoid DTC P0742, P1860, P1870.
- No shift solenoid A DTC P0753.
- No shift solenoid B DTC P0758.
- Gear range is D4.
- Output speed is greater than 375 rpm.
- Transmission temperature is between 20˚ and 130˚C (68˚ and 266˚F).
- No range code P0705, P0706.
- No torque code (to be confirmed).
- Engine run for more 0 seconds and not influed cut-off (to be confirmed).

All the above conditions have been met and the combination of condition 1, 2 occur two consecutive times.

Condition 1:

- 1st gear is commanded for ≥ 1 sec
- 40 ≤ Engine Torque ≤ 400 N·m
- Throttle positon ≥ 10%
- –8000 ≤ TCC slip ≤ 8000 rpm
- Transmission out speed ≥ 375 rpm
- Speed ratio ≥ 0.3
- 1.5 ≤ Modeled Ratio ≤ 2.4 for 0.687 seconds

Condition 2:

- 4th Gear is commanded for ≥ 1 sec.
- 40 ≤ Engine Torque ≤ 400 N·m
- Trottle position ≥ 10%
- –8000 ≤ TCC slip ≤ 8000 rpm
- Speed ratio ≥ 0.6
- 0.92 ≤ Modeled Ratio ≤ 1.5 for 7 seconds

Action Taken When the DTC Sets

- Maximum line pressure.
- For lamp illuminate refer to DTC type definition (type B).
- Turn force motor OFF.

Conditions For Clearing The The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Verify that the transmission meets the specifications in the 4L30–E shift speed chart.
- Other internal transmission failures may cause more than one shift to occur.

Test Description

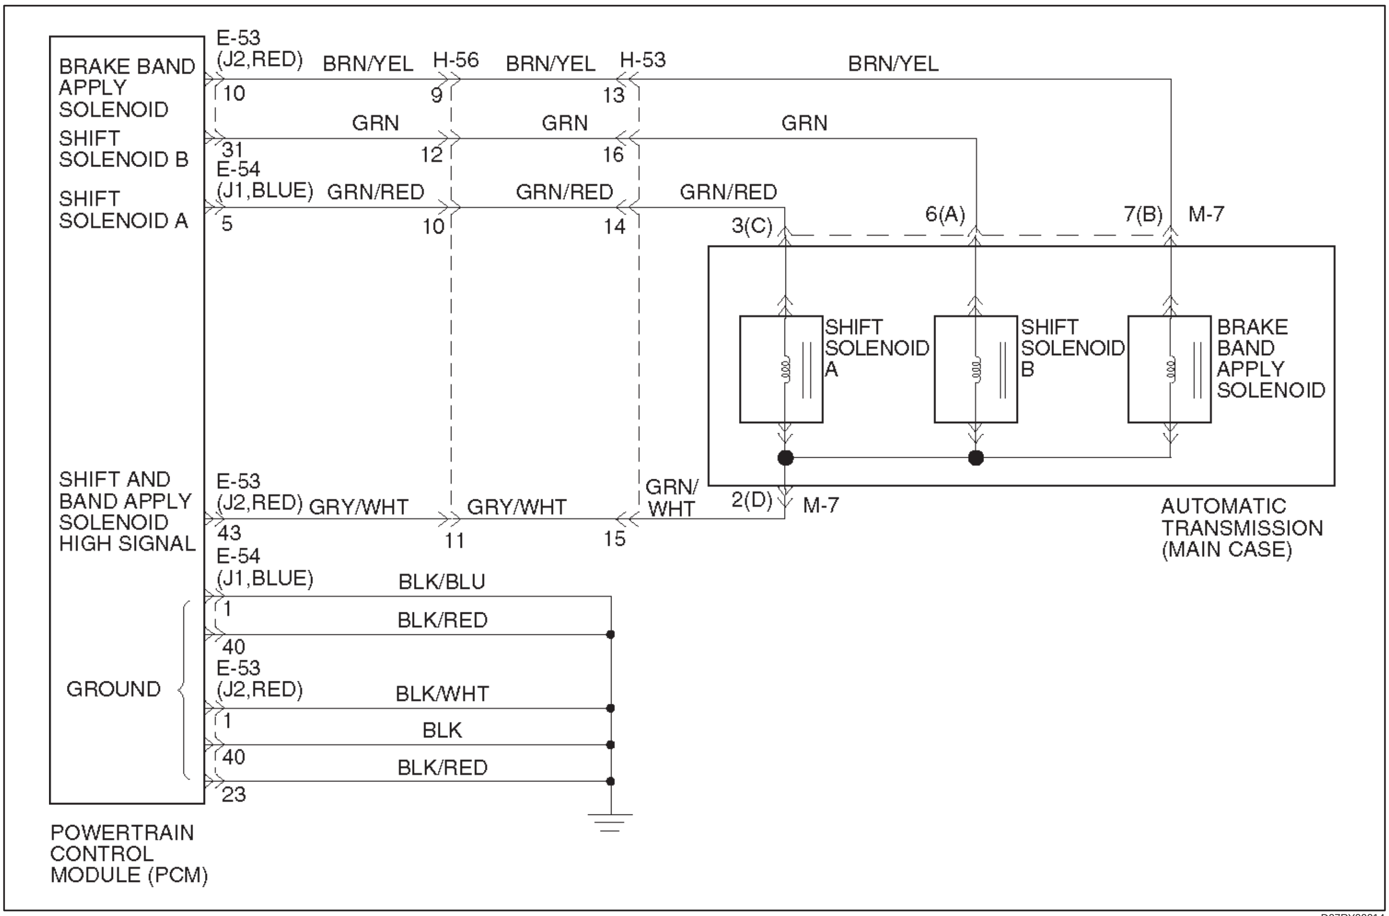
The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the function of the range switch (mode switch).
3. This test checks that the scan tool commanded all shifts, all shifts solenoids responded correctly, but all the shifts did not occur.

DTC P0752 Shift Solenoid A Performance (Stuck ON)

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. With the engine operating, apply the brake pedal and select each transmission range D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the “TR Switch” on the scan tool?	Go to Step 3	Go to“Range Switch Logic Table”
3	1. While the engine is operating, raise the drive wheels. 2. With the transmission in D4 range, use the scan tool to command 1st, 2nd and 3rd, and 4th gears while accelerating the vehicle. Was a 2–3 or 1–4 only shift pattern detected? (Road testing the vehicle may be necessary).	Go to Step 4	Go to Diagnostic Aids
4	Check the shift solenoid/hydraulic circuit for: ● One or both of the shift solenoids for an internal malfunction. ● Contamination or sediment in one or both of the shift solenoids. ● Damaged seals on one or both of the shift solenoids. Refer to Solenoid (Main Case Valve Body) in Automatic Transmission (4L30–E) section. Was a problem found and corrected?	Go to Step 5	Go to Diagnostic Aids
5	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and road test the vehicle. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0753 Shift Solenoid A Electrical



Circuit Description

- The shift solenoid A is a simple on/off solenoid located in the main case valve body. The solenoid is the normally closed type. In second or third gear, the Powertrain Control Module (PCM) energizes the solenoid to open a fluid inlet port. When the port is open, fluid pressure actuates the shift valve.
- The solenoid is activated by current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage, except in BACKUP MODE or when ignition is off the HSD is turned off.

This DTC detects a continuous open or short to ground in the shift solenoid A circuit or the shift solenoid A. This is a type “B” DTC.

Conditions For Setting The DTC

- Ignition is “on”, Engine “run”.
- Battery voltage is between 10 and 16 volts.
- The PCM commands the solenoid “on” and the voltage remains high (B+) or the PCM commands the solenoid “off” and the voltage remains low (zero volts).
- All conditions met for 0.84 ~ 1.0 seconds.

Action Taken When The DTC Sets

- Maximum line pressure.
- Immediate landing to 4th gear.
- Inhibit TCC engagement.
- For lamp illuminate refer to DTC type definition (type B).

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 16–way connectors. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.

- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- An open ignition feed circuit can cause multiple DTCs to set.
- A shift solenoid B DTC P0758 could also set with a shift solenoid A electrical failure.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks for power to the shift solenoid A from the ignition through the PCM.
5. This test measures the resistance of the component.
9. This test checks the function of the shift solenoid A and the transmission internal wiring harness.

Shift Solenoid Status Chart

Gear	Shift solenoid A	Shift solenoid B
1st	OFF	ON
2nd	ON	ON
3rd	ON	OFF
4th	OFF	OFF

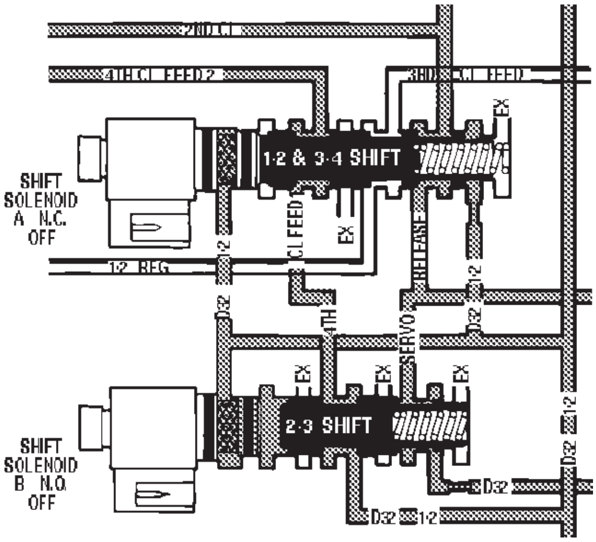
DTC P0753 Shift Solenoid A Electrical

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “on”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. Were DTCs P0753, P0758, P1860 set?	Go to Step 3	Go to Diagnostic Aids
3	1. Turn the ignition “on”. 2. Using the J39200 DVOM, measure the voltage between PCM connector terminals J2–43 and J1–1 (GND). Is the voltage within 10–12 volts?	Go to Step 4	Go to Step 5
4	1. Turn the ignition “off”. 2. Disconnect the J2 (RED) PCM connector. 3. Turn the ignition “on”. 4. Using the J39200 DVOM, measure the voltage between PCM connector terminals J1–5 and ground. Is the voltage within 10 – 12 volts?	Go to Step 11	Go to Step 5
5	1. Turn the ignition “off”. 2. Disconnect the J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–43 and J1–5. Is the resistance within 18 – 20 ohms?	Go to Step 6	Go to Step 7
6	1. Disconnect the J1 (BLUE) and J2 (RED) PCM connectors. 2. Using the J39200 DVOM, check a continuity between PCM terminals J2–43 and ground. Is there a continuity?	Go to Step 12	Go to Step 8
7	1. Disconnect the 16–way harness connector H–56. 2. Using the J39200 DVOM, measure the resistance between terminals H56–11 and H56–10. Is the resistance within 18–20 ohms?	Go to Step 14	Go to Step 9

DTC P0753 Shift Solenoid A Electrical (Cont'd)

Step	Action	Yes	No
8	Using the J39200 DVOM, check a continuity between J2 (RED) PCM terminal 43 and ground. Is there a continuity?	Go to Step 13	Go to Step 10
9	1. Disconnect the transmission main case 7 pin connector M–7. 2. Using the J39200 DVOM, measure the resistance between terminals M7–2(D) and M7–3(C). Is the resistance within 18–20 ohms?	Go to Step 15	Go to Step 16
10	Check every connection at the PCM connector. Was a problem found?	Go to Step 18	Go to Step 17
11	The wiring harness between PCM connector terminals J1–5 and transmission harness terminal M7–3(C) is shorted to voltage. Was a problem found and corrected?	Go to Step 19	—
12	The wiring harness between PCM connector terminal J1–5 and transmission harness terminal M7–3(C) is shorted to ground. Was a problem found and corrected?	Go to Step 19	—
13	The wiring harness between PCM connector terminals J2–43 and transmission harness terminal M7–2(D) is shorted to ground. Was a problem found and corrected?	Go to Step 19	—
14	The wiring harness between PCM connector J1 or J2 and transmission 16–way connector H–56 is open or poor connection. Was a problem found and corrected?	Go to Step 19	—
15	The wiring harness between transmission 16–way connector H–56 and transmission main case connector M–7 is open or has a poor connection. Was a problem found and corrected?	Go to Step 19	—
16	The shift solenoid A is faulty. Replace the shift solenoid A. Refer to Solenoid (Main Case Valve Body) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 19	—
17	The PCM may be faulty. Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 19	—
18	Repair the PCM connector connection. Was a problem found and corrected?	Go to Step 19	—
19	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: ● The shift solenoid A is commanded "on" and voltage drops to zero. ● The shift solenoid A is commanded "off" and voltage increases to B+. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0756 Shift Solenoid B Performance (Stuck OFF)



D07RT011

Circuit Description

The shift solenoid B is used to control fluid flow acting on the 2–3 shift valves. The solenoid is a normally open exhaust valve that is used with the shift solenoid A to allow four different shift combinations.

This DTC detects when there is only a 4–3–3–4 shift pattern depending on the state of the mechanical failure instead of a 1–2–3–4 shift pattren. This is a type “B” DTC.

Conditions For Setting The DTC

- No ETC DTCs.
- No OSS DTCs P0722 or P0723.
- No TCC solenoid DTC P0742, P1860., P1870.
- No shift solenoid A DTC P0753.
- No shift solenoid B DTC P0758.
- Gear range is D4.
- Output speed is greater than 375 rpm.
- Transmission fluid temperature is between 20° and 130°C (68° and 266°F).
- No range code P0705, P0706.
- No torque code (to be confirmed).
- Engine run for more 0 seconds and influed cut-off (to be confirmed).

All the above conditions have been met and the combination of condition 1, 2 occur two consecutive times.

Condition 1:

- 1st gear is commanded for ≥ 1 sec
- 40 ≤ Engine Torque ≤ 400 N·m
- Throttle position ≥ 10%
- –2300 ≤ TCC slip ≤ 200 rpm
- Transmission out speed ≥ 400 rpm
- Speed ratio ≥ 0.3
- 0.60 ≤ Modeled Ratio ≤ 1.49 for 1 seconds

Condition 2:

- 2nd Gear is commanded for ≥ 1 sec.
- 40 ≤ Engine Torque ≤ 400 N·m
- Trottle position ≥ 10%
- –8000 ≤ TCC slip ≤ 8000 rpm
- Speed ratio ≥ 0.6
- 0.92 ≤ Modeled Ratio ≤ 1.5 for 0.687 seconds

Action Taken When the DTC Sets

- Maximum line pressure.
- For lamp illuminate refer to DTC type definition (type B).
- Turn force motor OFF.

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exist and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Verify that the transmission meets the specifications in the 4L30-E shift speed chart.
- Other internal transmission failures may allow more than one shift to occur.

Test Description

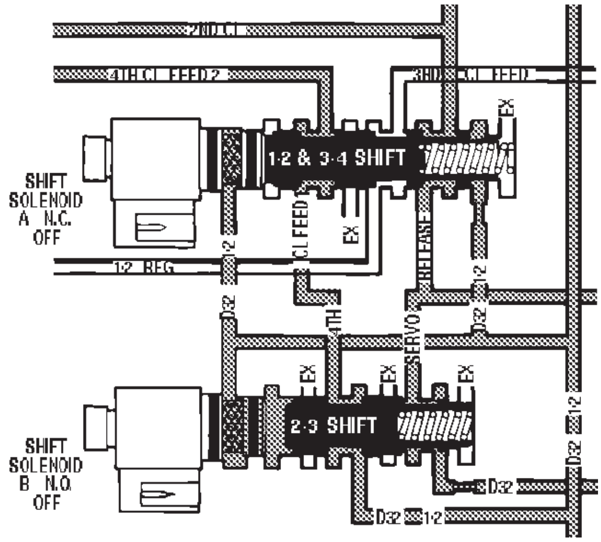
The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the function of the range switch (mode switch).
3. This test checks for selected gear ratio vs. a ratio not obtainable under normal driving conditions.

DTC P0756 Shift Solenoid B Performance (Stuck OFF)

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. With the engine operating, apply the brake pedal and select each transmission range D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the “TR Switch” on the scan tool?	Go to Step 3	Go to “Range Switch Logic Table”
3	1. While the engine is operating, raise the drive wheels. 2. With the transmission in D4 range, use the scan tool to command 1st, 2nd, and 3rd, and 4th gears while accelerating the vehicle. Was 1st gear commanded and not achieved, or 4th gear commanded and other than 4th gear occurred? (Road testing the vehicle may be necessary.)	Go to Step 4	Go to Diagnostic Aids
4	Check the shift solenoid/hydraulic circuit for: • One or both of the shift solenoids for an internal malfunction. • Contamination or sediment in one or both of the shift solenoids. • Damaged seals on the one or both of the shift solenoids. Refer to Solenoid (Main Case Valve Body) in Automatic Transmission (4L30–E) section. Was a problem found and corrected?	Go to Step 5	Go to Diagnostic Aids
5	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and road test the vehicle. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0757 Shift Solenoid B Performance (Stuck ON)



D07RT011

Circuit Description

The shift solenoid B is used to control fluid flow acting on the 2–3 shift valves. The solenoid is a normally open exhaust valve that is used with the shift solenoid A to allow four different shift combinations.

This DTC detects when there is only a 1–2–2–1 shift pattern depending on the state of the mechanical failure instead of a 1–2–3–4 shift pattern. This is a type "B" DTC.

Conditions For Setting The DTC

- No ETC DTCs.
- No OSS DTCs P0722 or P0723.
- No TCC solenoid DTC P0742, P1860, P1870.
- No shift solenoid A DTC P0753.
- No shift solenoid B DTC P0758.
- Gear range is D4.
- Output speed is greater than 375 rpm.
- Transmission fluid temperature is between 20° and 130°C (68° and 266°F).
- No range code P0705, P0706.
- No torque code (to be confirmed).
- Engine run for more 0 seconds and not influed cut-off (to be confirmed).

All the above conditions have been met and the combination of condition 1,2 occur two consecutive times.

Condition 1:

- 3rd gear is commanded for ≥ 1 sec
- 40 ≤ Engine Torque ≤ 400 N·m
- Throttle positon ≥ 10%
- –8000 ≤ TCC slip ≤ 8000 rpm
- Transmission out speed ≥ 375 rpm
- Speed ratio ≥ 0.6
- 1.44 ≤ Modeled Ratio ≤ 2.4 for 4 seconds

Condition 2:

- 4th Gear is commanded for ≥ 1 sec.
- 15 ≤ Engine Torque ≤ 400 N·m
- Trottle position ≥ 10%
- –8000 ≤ TCC slip ≤ 8000 rpm
- Speed ratio ≥ 0.6
- 2.75 ≤ Modeled Ratio ≤ 3.2 for 2 seconds

Action Taken When the DTC Sets

- Maximum line pressure.
- For lamp illuminate refer to DTC type definition (type B).
- Turn force motor OFF.

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Verify that the transmission meets the specifications in the 4L30-E shift speed chart.
- Other internal transmission failures may cause more than one shift to occur.

Test Description

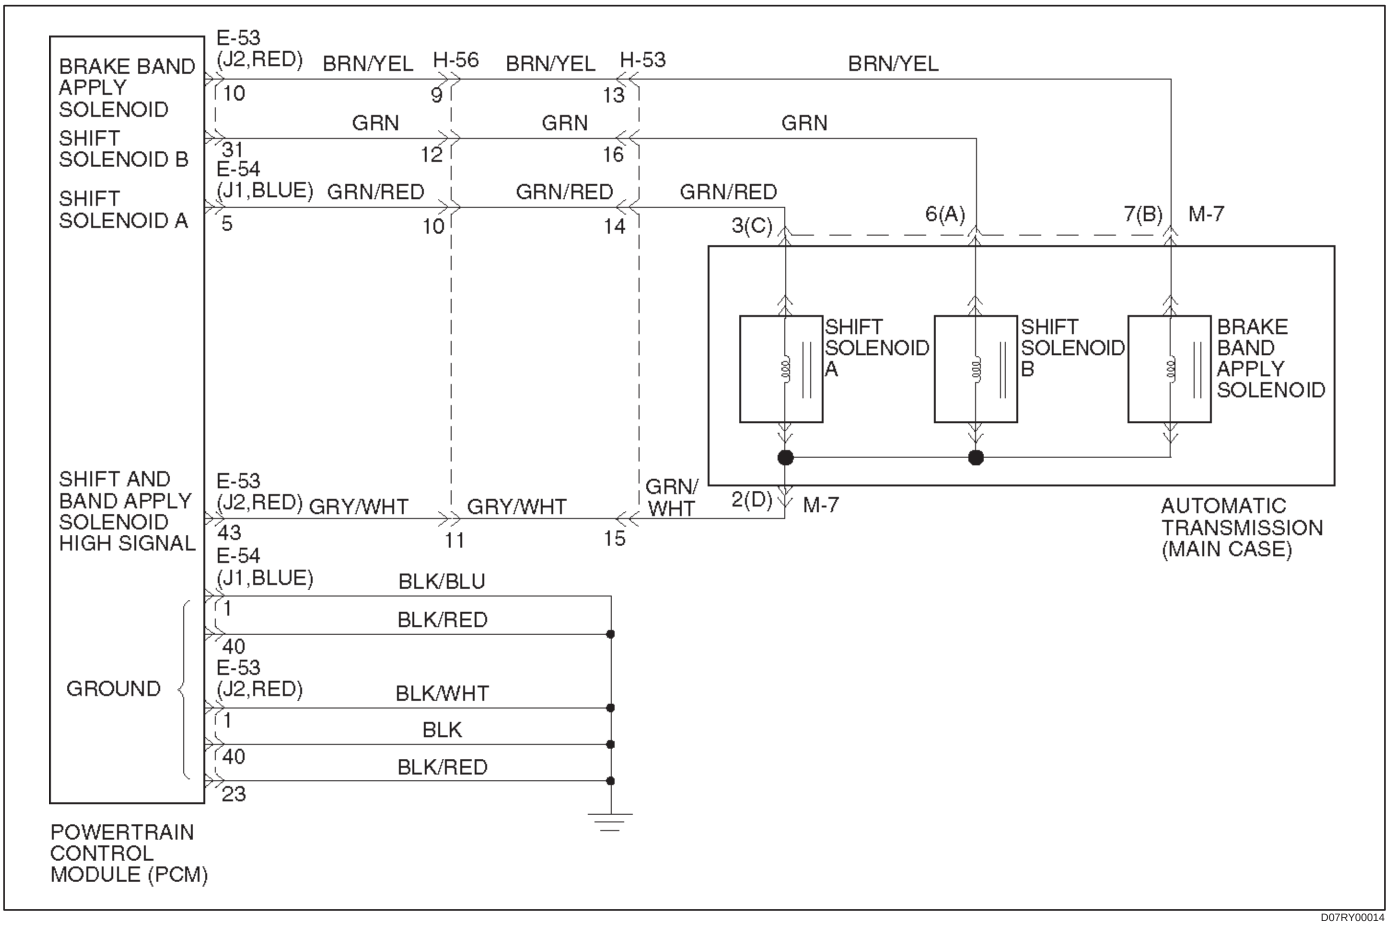
The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the function of the range switch (mode switch).
3. This test checks for selected gear ratio vs. a ratio not obtainable under normal driving conditions.

DTC P0757 Shift Solenoid B Performance (Stuck ON)

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. With the engine operating, apply the brake pedal and select each transmission range D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the “TR Switch” on the scan tool?	Go to Step 3	Go to “Range Switch Logic Table”
3	1. While the engine is operating, raise the drive wheels. 2. With the transmission in D4 range, use the scan tool to command 1st, 2nd, and 3rd, and 4th gears while accelerating the vehicle. Was 1st gear commanded and not achieved, or 4th gear commanded and other than 4th gear occurred? (Road testing the vehicle may be necessary.)	Go to Step 4	Go to Diagnostic Aids
4	Check the shift solenoid/hydraulic circuit for: ● One or both of the shift solenoids for an internal malfunction. ● Contamination or sediment in one or both of the shift solenoids. ● Damaged seals on the one or both of the shift solenoids. Refer to Solenoid (Main Case Valve Body) in Automatic Transmission (4L30–E) section. Was a problem found and corrected?	Go to Step 5	Go to Diagnostic Aids
5	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and road test the vehicle. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0758 Shift Solenoid B Electrical



Circuit Description

- The shift solenoid B is a simple on/off solenoid located in the main case valve body. It is normally open. When the port is open, fluid pressure actuates the shift valve. In first or second gear, the Powertrain Control Module (PCM) energizes the solenoid to close a fluid inlet port.
- The solenoid is activated by current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage. In BACKUP MODE or when the ignition is off, the HSD is turned off.

This DTC detects a continuous open or short to ground in the shift solenoid B circuit or shift solenoid B. This is a type “B” DTC.

Conditions For Setting The DTC

- Ignition is “on”, Engine “run”.
- Battery voltage is between 10 and 16 volts.
- The PCM commands the solenoid “on” and the voltage remains high (B+)or the PCM commands the solenoid “off” and the voltage remains low (zero volts).
- All conditions met for 0.84 ~ 1.0 seconds.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- The PCM will illuminate the Malfunction Indicator Lamp (MIL) and CHECK TRANS Lamp.

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and at the transmission 16–way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.

- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

5. This test measures the resistance of the component.
7. This test checks the function of the shift solenoid B and the transmission internal wiring harness.
11. This test checks for power to the shift solenoid B from the ignition through the PCM.

Shift Solenoid Status Chart

Gear	Shift solenoid A	Shift solenoid B
1st	OFF	ON
2nd	ON	ON
3rd	ON	OFF
4th	OFF	OFF

DTC P0758 Shift Solenoid B Electrical

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “on”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. Were DTCs P0753, P0758, P1860 set?	Go to Step 4	Go to Step 3
3	1. The engine “on”. 2. Apply brake pedal and select transmission range “D”. 3. Press and hold down the winter switch and select transmission mode “winter”. Does the scan tool display DTC P0758 at 3rd gear?	Go to Step 8	Go to Diagnostic Aids
4	1. Turn the ignition “off”. 2. Disconnect the J1 (BLUE) and J2 (RED) PCM connectors. 3. Turn the ignition “on”. 4. Using the J39200 DVOM, measure the voltage between PCM connector terminals J2–31 and J1–1. Is the voltage within 10 – 12 volts?	Go to Step 15	Go to Step 5
5	1. Turn the ignition “off”. 2. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–43 and J2–31. Is the resistance within 18 – 20 ohms?	Go to Step 16	Go to Step 6
6	1. Disconnect the transmission 16–way connector H–56. 2. Using the J39200 DVOM, measure the resistance between terminals H56–11 and H56–12. Is the resistance within 18 – 20 ohms?	Go to Step 17	Go to Step 7
7	1. Disconnect the transmission main case connector M–7. 2. Using the J39200 DVOM, measure the resistance between terminals M7–2(D) and M7–6(A). Is the resistance within 18 – 20 ohms?	Go to Step 18	Go to Step 19

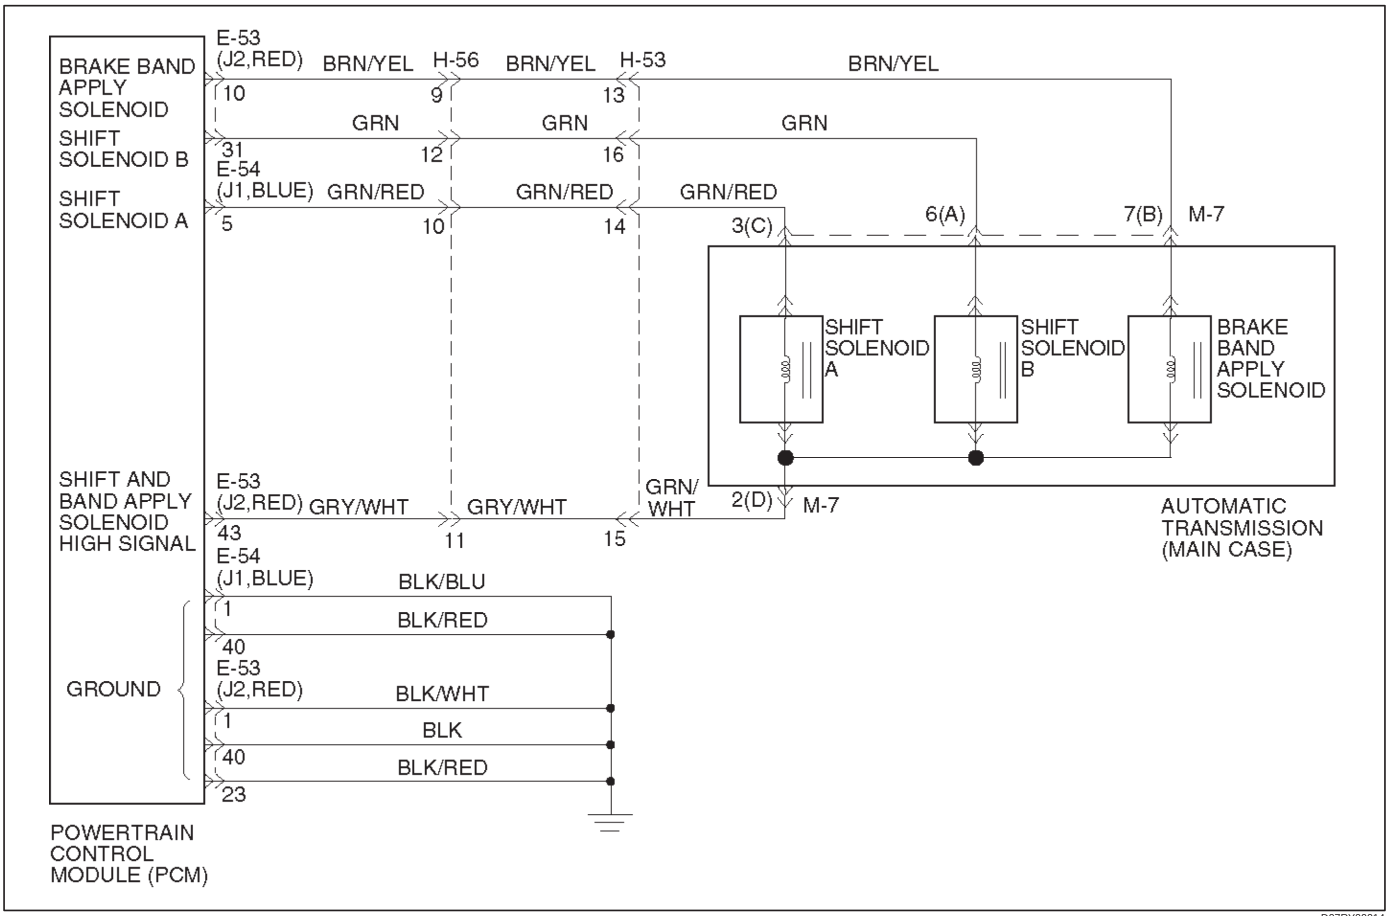
DTC P0758 Shift Solenoid B Electrical (Cont'd)

Step	Action	Yes	No
8	1. Turn the ignition "off". 2. Disconnect the J1 (BLUE) and J2 (RED) PCM connectors. 3. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–43 and J2–31. Is the resistance within 18 – 20 ohms?	Go to Step 9	Go to Step 10
9	Using the J39200 DVOM, check a continuity between PCM connector terminal J2–31 and ground. Is there a continuity?	Go to Step 20	Go to Step 11
10	1. Disconnect the transmission 16–way connector H–56. 2. Using the J39200 DVOM, measure the resistance between terminals H56–11 and H56–12. Is the resistance within 18–20 ohms?	Go to Step 21	Go to Step 12
11	Using the J39200 DVOM, check a continuity between PCM connector terminal J2–43 and ground. Is there a continuity?	Go to Step 22	Go to Step 13
12	1. Disconnect the transmission main case connector M–7. 2. Using the J39200 DVOM, measure the resistance between terminals M7–2(D) and M7–6(A). Is the resistance within 18 – 20 ohms?	Go to Step 23	Go to Step 24
13	Check every connection of the PCM and transmission 16–way connector H–56. Was a problem found and corrected?	Go to Step 26	Go to Step 14
14	1. Connect the J1 (BLUE) and J2 (RED) PCM connectors to the PCM. 2. Turn the ignition "on", the engine "on". 3. Repeat Step 3. Does the scan tool display DTC P0758 at 3rd gear?	Go to Step 25	Go to Diagnostic Aids
15	The wiring harness between PCM connector terminal J2–31 and transmission main case terminal M7–6(A) is shorted to voltage. Was a problem found and corrected?	Go to Step 26	—
16	The PCM internal terminal J2–31 is shorted to voltage. Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 26	—
17	The wiring harness between PCM connector and transmission 16–way connector is shorted. Was a problem found and corrected?	Go to Step 26	—
18	The wiring harness between transmission 16–way connector and transmission main case connector is shorted. Was a problem found and corrected?	Go to Step 26	—
19	The shift solenoid B is faulty, or the internal wiring harness from the shift solenoid B is shorted. Was a problem found and corrected?	Go to Step 26	—
20	The wiring harness between PCM connector terminal J2–31 and transmission main case connector terminal M7–6(A) is shorted to ground. Was a problem found and corrected?	Go to Step 26	—

DTC P0758 Shift Solenoid B Electrical (Cont'd)

Step	Action	Yes	No
21	The wiring harness between PCM connector terminal J2–31 and transmission 16–way connector terminal H56–12, or between PCM connector terminal J2–43 and 16–way connector terminal H56–11 is open. Was a problem found and corrected?	Go to Step 26	—
22	The wiring harness between PCM connector terminal J2–43 and transmission main case connector terminal M7–2(D) is shorted to ground. Was a problem found and corrected?	Go to Step 26	—
23	The wiring harness between transmission 16–way connector terminal H56–12 and transmission main case connector terminal M7–6(A), or between H56–11 and M7–2(D) is open. Was a problem found and corrected?	Go to Step 26	—
24	The internal wiring harness from the shift solenoid B is open, or the shift solenoid B is faulty. Was a problem found and corrected?	Go to Step 26	—
25	Replace the PCM. Is the replacement complete?	Go to Step 26	—
26	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: ● The shift solenoid B is commanded "on" and voltage drop to zero. ● The shift solenoid B is commanded "off" and voltage increases to B+. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P1850 Brake Band Apply Solenoid Malfunction



Circuit Description

- The brake band apply solenoid is a normally open solenoid which controls the flow of fluid for brake band application. The Powertrain Control Module (PCM) uses Pulse Width Modulation (PWM) and changes the duty cycle to control the solenoid. The PCM turns the solenoid on (energized) and off (deenergized) at a constant frequency. The length of time the solenoid is energized during each on/off cycle is called the pulse width. By varying or "modulating" the pulse width, the solenoid output pressure is changed. Since the solenoid is normally open, increasing the pulse width increases the duty cycle and decreases the output pressure. PWM control provides smooth band application without an accumulator. The band is only applied in first and second gears.
- In the event of an electrical failure (open), the solenoid regulates at the maximum oil flow (0% duty cycle).
- The solenoid is activated by current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage. When the ignition is off, the HSD is turned off.

This DTC detects a continuous open or short to ground in the brake band apply solenoid circuit or the brake band apply solenoid. This is a type "D" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is "on", Engine "run".
- The PCM commands the solenoid "on" and the voltage remains high (B+) or the PCM commands the solenoid "off" and the voltage remains low (zero volts).
- All conditions met in 1.34 ~ 1.56 seconds.

Action Taken When The DTC Sets

- Inhibit brake band apply solenoid.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 16–way connectors. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks for power to the brake band apply solenoid from the ignition through the PCM.
4. This test checks the resistance of the transmission internal wiring harness and brake band apply solenoid.
5. This test checks the ability of the PCM and wiring to control the ground circuit.

DTC P1850 Brake Band Apply Solenoid Malfunction

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “on”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. Were DTCs P0753, P0758 set?	Go to Step 3	Go to Step 4
3	Using the J39200 DVOM, back probe between PCM connector terminals J2–43 and J1–1. Is the voltage between 10 to 12 volts?	Go to Step 5	Go to Step 6
4	1. Turn the ignition “off”. 2. Disconnect the J1 (BLUE) and J2 (RED) PCM connectors. 3. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–43 and J2–10. Is the resistance within 10–12 ohms?	Go to Step 12	Go to Step 13
5	Using the J39200 DVOM, back probe between PCM connector terminals J2–10 and J1–1. Is the voltage between 10 to 12 volts?	Go to Step 26	Go to Step 4
6	1. Turn the ignition “off”. 2. Disconnect the J1 (BLUE) and J2 (RED) PCM connectors. 3. Using the J39200 DVOM, check continuity between PCM terminal J2–43 and ground. Is there a continuity?	Go to Step 7	Go to Step 9
7	1. Disconnect the transmission 16–way connector H–56. 2. Using the J39200 DVOM, check continuity between connector H56–9 and ground. Is there a continuity?	Go to Step 8	Go to Step 17
8	1. Disconnect the transmission main case connector M–7. 2. Using the J39200 DVOM, check continuity between the terminal M7–7(B) and ground. Is there a continuity?	Go to Step 18	Go to Step 19

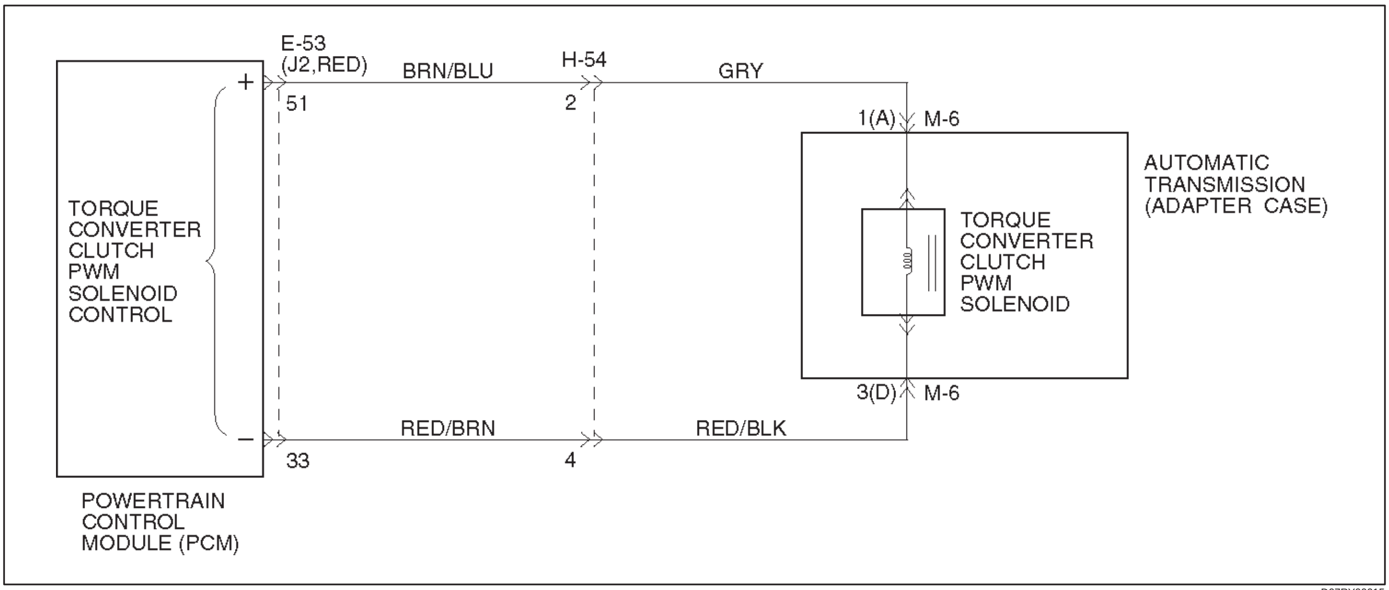
DTC P1850 Brake Band Apply Solenoid Malfunction (Cont'd)

Step	Action	Yes	No
9	1. Disconnect the J1 (BLUE) and J2 (RED) PCM Connector. 2. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–43 and J2–10. Is the resistance within 10–12 ohms?	Go to Step 26	Go to Step 10
10	1. Disconnect the transmission 16–way connector H–56. 2. Using the J39200 DVOM, measure the resistance between terminal H56–11 and H56–9. Is the resistance within 10–12 ohms?	Go to Step 17	Go to Step 11
11	1. Disconnect the transmission main case connector M–7. 2. Using the J39200 DVOM, measure the resistance between terminals M7–2(D) and M7–7(B). Is the resistance within 10–12 ohms?	Go to Step 20	Go to Step 21
12	Using the J39200 DVOM, check continuity between PCM terminal J2–10 and ground. Is there a continuity?	Go to Step 14	Go to Step 26
13	1. Disconnect the transmission 16–way connector H–56. 2. Using the J39200 DVOM, measure the resistance between terminal H56–11 and H56–9. Is the resistance within 10–12 ohms?	Go to Step 24	Go to Step 15
14	1. Disconnect the transmission 16–way connector H–56. 2. Using the J39200 DVOM, check continuity between terminal H56–9 and ground. Is there a continuity?	Go to Step 16	Go to Step 22
15	1. Disconnect the transmission main case connector M–7. 2. Using the J39200 DVOM, measure the resistance between terminals M7–2(D) and M7–7(B). Is the resistance within 10–12 ohms?	Go to Step 25	Go to Step 21
16	1. Disconnect the transmission main case connector M–7. 2. Using the J39200 DVOM, check continuity between the terminal M7–7(B) and ground. Is there a continuity?	Go to Step 18	Go to Step 23
17	The wiring harness between PCM terminal J2–43 and transmission 16–way connector terminal H56–11 is open. Was a problem found and corrected?	Go to Step 27	—
18	The brake band apply solenoid is faulty, or the internal wiring harness from the brake band apply solenoid is shorted to ground. Was a problem found and corrected?	Go to Step 27	—
19	The wiring harness between the transmission 16–way connector terminal H56–11 and the transmission main case connector terminal M7–2(D) is shorted to ground. Was a problem found and corrected?	Go to Step 27	—
20	The wiring harness between the transmission 16–way connector terminal H56–11 and the transmission main case connector terminal M7–2(D) is open. Was a problem found and corrected?	Go to Step 27	—
21	The brake band apply solenoid is faulty, or the internal wiring harness from the brake band apply solenoid is open. Was a problem found and corrected?	Go to Step 27	—

DTC P1850 Brake Band Apply Solenoid Malfunction (Cont'd)

Step	Action	Yes	No
22	The wiring harness between the PCM connector terminal J2–10 and transmission 16–way connector terminal H56–9 is shorted to ground. Was a problem found and corrected?	Go to Step 27	—
23	The wiring harness between the transmission 16–way connector terminal H56–9 and the transmission main case connector terminal M7–7(B) is shorted to ground. Was a problem found and corrected?	Go to Step 27	—
24	The wiring harness between the PCM connector terminal J2–10 and the 16–way connector terminal H56–9 is open. Was a problem found and corrected?	Go to Step 27	—
25	The wiring harness between the transmission 16–way connector terminal H56–9 and the transmission main case connector terminal M7–7(B) is open. Was a problem found and corrected?	Go to Step 27	—
26	Check every connection at the PCM. If OK, replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 27	—
27	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: ● The brake band apply solenoid is commanded "on" and the volts drop to zero. ● The brake band apply solenoid is commanded "off" and the volts increase to B+. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P1860 TCC PWM Solenoid Electrical



D07RY00015

Circuit Description

The PCM allows current to flow through the solenoid coil according to the duty cycle (percentage of “on” and “off” time). This current flow through the solenoid coil creates a magnetic field that magnetizes the solid core. The magnetized core attracts the check ball to seat against spring pressure. This blocks the exhaust for the TCC signal fluid and allows solenoid feed drive fluid to feed to TCC signal circuit. The TCC signal fluid pressure acts on the TCC regulator valve to regulate line pressure and to apply fluid pressure to the torque converter clutch shift control valve. When the TCC control valve is in the apply position, regulated apply fluid pressure is directed through the TCC valve to apply the torque converter clutch. The TCC PWM solenoid is used in conjunction with the TCC reglator valve to regulate fluid to the torque converter. The TCC PWM solenoid is attached to the valve body within the transmission.

This DTC detects a continuous open or short to ground or ignition in the TCC circuit or the TCC PWM solenoid. This is a type “B” DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- No shift solenoid A DTCs P0751 or P0752 or P0753.
- No shift solenoid B DTCs P0756 or P0757 or P0758.
- Ignition is “on”, Engine “run”.
- The PCM commands the solenoid “on” and the voltage remains low (zero volts).
- The PCM commands the solenoid “off” and the voltage remains high (B+).
- All conditions met for 0.875 ~ 1.25 seconds.

Action Taken When The DTC Sets

- Inhibit TCC engagement.
- For lamp illuminate refer to DTC type definition (type B).

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and at the transmission connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks for voltage to the solenoid.
4. This test checks the ability of the PCM and wiring to control the ignition circuit.
9. This test checks the resistance of the TCC solenoid and the internal wiring harness.

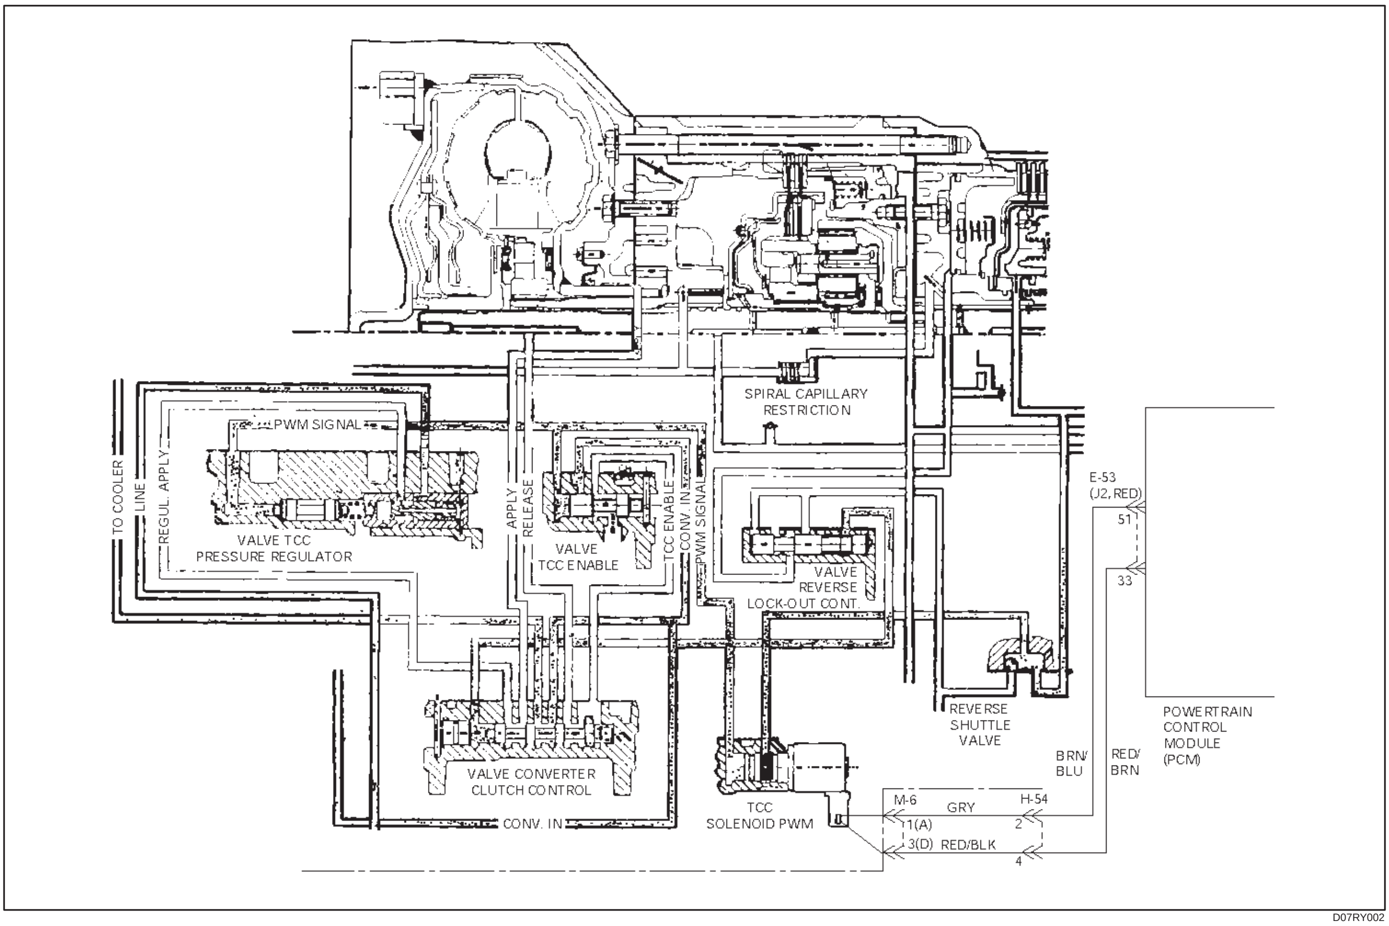
DTC P1860 TCC PWM Solenoid Electrical

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “on”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the“Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”.	Go to Step 3	Go to Step 4
3	Using the J39200 DVOM, back probe between PCM connector terminals J2–51 and J2–33. Is the voltage 0 ?	Go to Step 5	Go to Step 6
4	1. Apply brake pedal and select transmission range “D”. 2. Do a test drive, and increase the vehicle speed to TCC “on” at 4th. Does the scan tool display DTC P1860 at TCC “ON”?	Go to Step 10	Go to Diagnostic Aids
5	1. Turn the ignition “off”. 2. Disconnect the J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–51 and J2–33. Is the resistance within 18 – 20 ohms?	Go to Step 7	Go to Step 8
6	The wiring harness between PCM connector terminal J2–51 and transmission adapter case connector terminal M6–1(A) is shorted to voltage. Was a problem found and corrected?	Go to Step 19	Go to Step 20
7	Intermittent condition. Check the wiring harness and terminals between PCM connector J2 and transmission adapter case connector M–6. Was a problem found and corrected?	Go to Step 19	Go to Step 20
8	1. Disconnect the transmission 4–way connector H–54. 2. Using the J39200 DVOM, measure the resistance between terminal H54–2 and ground. Is the resistance within 18 – 20 ohms?	Go to Step 16	Go to Step 9
9	1. Disconnect the transmission adapter case connector M–6. 2. Using the J39200 DVOM, measure the resistance between terminal M6–1(A) and ground. Is the resistance within 18 – 20 ohms?	Go to Step 17	Go to Step 18
10	1. Turn the ignition “off”. 2. Disconnect the J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between terminals J2–51 and J2–33. Is the resistance within 18 – 20 ohms?	Go to Step 19	Go to Step 11
11	1. Disconnect the transmission 4–way connector H–54. 2. Using the J39200 DVOM, measure the resistance between terminal H54–2 and ground. Is the resistance within 18–20 ohms?	Go to Step 13	Go to Step 12

DTC P1860 TCC PWM Solenoid Electrical (Cont'd)

Step	Action	Yes	No
12	1. Disconnect the transmission adapter case connector M–6. 2. Using the J39200 DVOM, measure the resistance between terminal M6–1(A) and ground. Is the resistance within 18–20 ohms?	Go to Step 14	Go to Step 15
13	The wiring harness between PCM connector terminal J2–51 and transmission 4–way connector terminal H54–2 is shorted to ground. Was a problem found and corrected?	Go to Step 21	—
14	The wiring harness between transmission 4–way connector H–54 and adapter case connector M–6 is shorted to ground. Was a problem found and corrected?	Go to Step 21	—
15	The TCC solenoid is faulty, or the internal wiring harness from the TCC solenoid is shorted to ground. Was a problem found and corrected?	Go to Step 21	—
16	The wiring harness between PCM connector terminal J2–51 and transmission 4–way connector terminal H54–2 is open. Was a problem found and corrected?	Go to Step 21	—
17	The wiring harness between transmission 4–way connector terminal H54–2 and adapter case terminal M6–1(A) is open. Was a problem found and corrected?	Go to Step 21	—
18	The TCC solenoid is faulty, or the internal wiring harness from the TCC solenoid is open. Was a problem found and corrected?	Go to Step 21	—
19	Check every connection at the PCM. If OK, replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 21	—
20	Check the PCM connector terminal J2–51, transmission 4–way connector terminal H54–2 and transmission adapter case connector terminal M6–1(A). Was a problem found and corrected?	Go to Step 21	—
21	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: • The TCC solenoid is commanded "on" and the volts increase to B+. • The TCC solenoid is commanded "off" and the volts drop to zero. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P1870 Transmission Component Slipping (TCC Stuck OFF)



Circuit Description

The PCM monitors the difference in engine speed and transmission output speed. For example in D3 drive range with the ECCC commanded, the engine speed should closely match transmission output speed.
This DTC detects excessive TCC slip when the ECCC is engaged. This is a type “B” DTC.

Conditions For Setting The DTC

The following conditions are met for three TCC cycles with reported excessive TCC slip conditions.

- No OSS DTCs P0722 or P0723.
- No shift solenoid A DTCs P0751 or P0752 or P0753.
- No shift solenoid B DTCs P0756 or P0757 or P0758.
- No TCC solenoid DTCs P0742 or P1860 or P1870.
- Engine speed is between 1,000 and 3,500 rpm for 0.5 seconds.
- Gear range is D4.
- 13% < TPS < 99%
- 50 < Engine Torque < 300 N·m
- TFT is between 20° and 150°C (68° and 302°F).
- TCC slip speed is between 250 rpm and 800 rpm for 3 times 7 seconds.
- Vehicle speed is between 25 km/h (15 mph) and 225 km/h (158 mph).
- Speed ratio is between 0.6 and 0.95.
- ECCC is “ON”.
- Low (0.8) < TCC Capacity < hi (0.99) for 5 seconds

Action Taken When The DTC Sets

- Only stored in memory.
- For lamp illuminate refer to DTC type definition (type B).

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exist and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Range switch malfunction could set a DTC P1870.
- A mechanical failure of the shift solenoids, TCC solenoid, or TCC PWM solenoid could set a DTC P1870.
- Internal transmission failures may set a DTC P1870.
- An intermittent or incorrect engine speed signal may set a DTC P1870.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the indicated range signal to the actual selected range. A faulty switch could set a DTC P1870.
3. This test checks the torque converter for slippage while in a commanded lockup state.

Range Switch Logic Table

Range Position	Range Switch Pin			
	A	B	C	P(G)
Park	ON	OFF	OFF	ON
Reverse	ON	ON	OFF	OFF
Neutral	OFF	ON	OFF	ON
D4	OFF	ON	ON	OFF
D3	ON	ON	ON	ON
2	ON	OFF	ON	OFF
L	OFF	OFF	ON	ON
Illegal	OFF	OFF	OFF	OFF
Illegal	OFF	OFF	OFF	ON

DTC P1870 Transmission Component Slipping (TCC Stuck OFF)

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. Apply the brake pedal. 5. Select each transmission range: D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the scan tool “TR Switch” display?	Go to Step 3	Go to “Range Switch Logic Table”
3	Drive the vehicle in 4th gear while the TCC is engaged. At any time is the “TCC Slip Speed” greater than 130 rpm for 8 seconds while the TCC is engaged?	Go to System Diagnosis Charts	Go to Diagnostic Aids

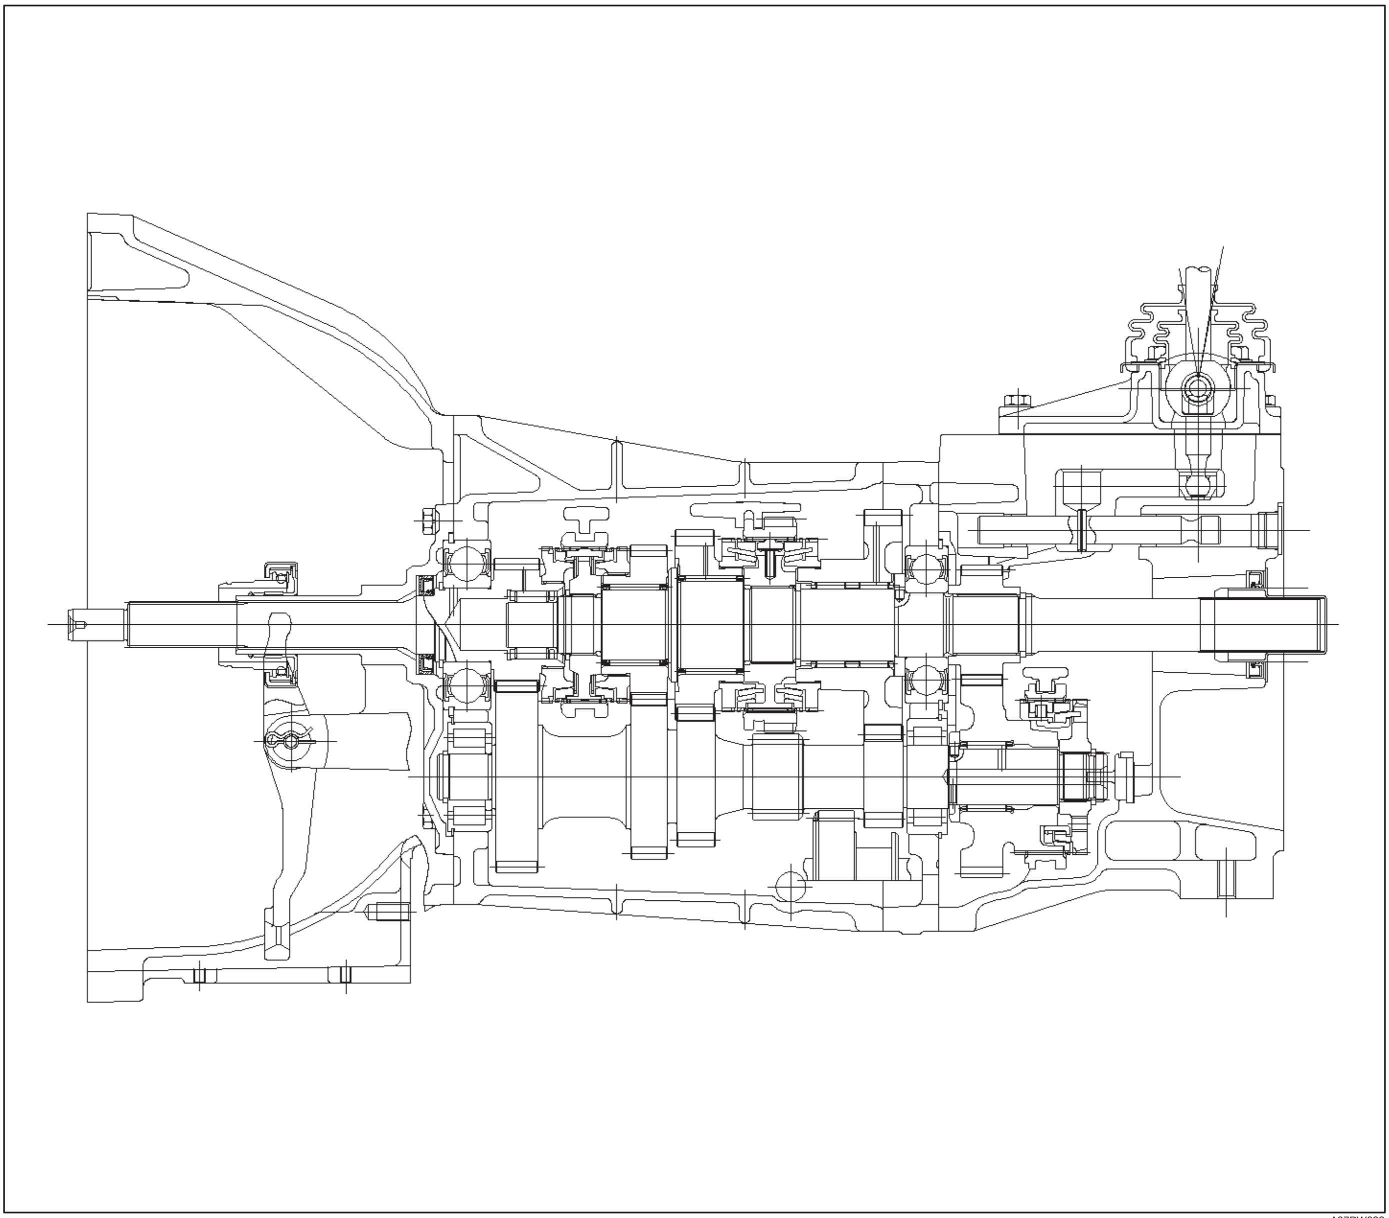
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description



A07RW023

Diagnosis

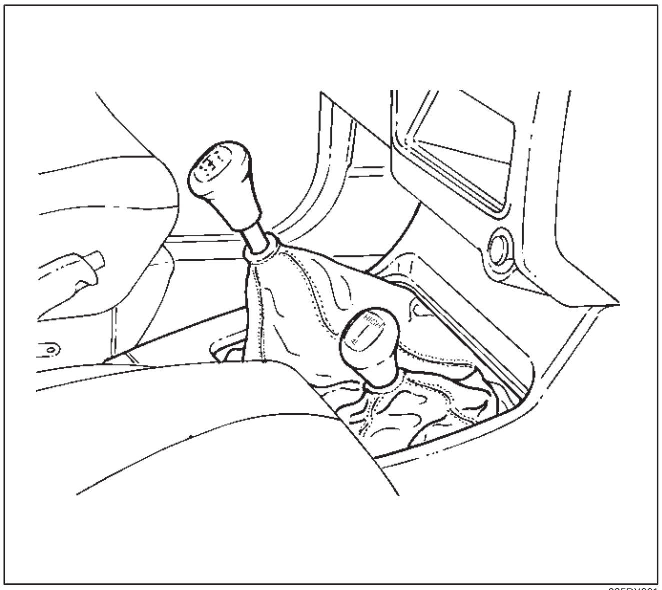
Condition	Possible cause	Correction
Abnormal noise	Flywheel pilot bearing worn	Replace
	Bearings worn or broken (Mainshaft, counter shaft, and transfer shaft)	Replace
	Gear tooth contact surfaces worn or scuffed (Mainshaft, counter shaft, reverse idler gear and transfer gears)	Replace
	Splines worn (Mainshaft, synchronizer clutch hub)	Replace
	Gear or bearing thrust face seized	Replace
	Lack of backlash between meshing gears	Replace
Hard Shifting	Improper clutch pedal free play	Readjust
	Change lever sliding portions worn	Repair or replace Regrease
	Shift block, shift rod and/or control box sliding faces worn	Replace
	Shift arm and synchronizer sleeve groove worn	Replace worn parts
	Thrust washer, collar, and/or gear thrust faces worn (Mainshaft and counter shaft thrust play)	Replace worn parts
	Synchronizer parts worn	Replace
Walking or Jumping out of gear	Detent ball worn	Replace
	Detent spring weakened or broken	Replace
	Shift rod and/or control box sliding faces worn	Replace
	Shift arm and synchronizer sleeve groove worn	Replace worn parts
	Thrust washer, collar, and/or gear thrust faces worn (Mainshaft and counter shaft thrust play)	Replace worn parts
	Bearings worn or broken	Replace
	Splines worn (Mainshaft, synchronizer hub)	Replace
	Synchronizer spring weakened or broken	Replace
Oil leakage	Loose drain plug(s) and/or filler plug(s)	Tighten Replenish oil
	Defective or improperly installed gasket(s)	Replace
	Oil seal worn or scratched	Replace

Manual Transmission Assembly

Removal

NOTE: Before remove the transmission and transfer assembly from the vehicle, change the transfer mode to 2WD using push button on dash panel.

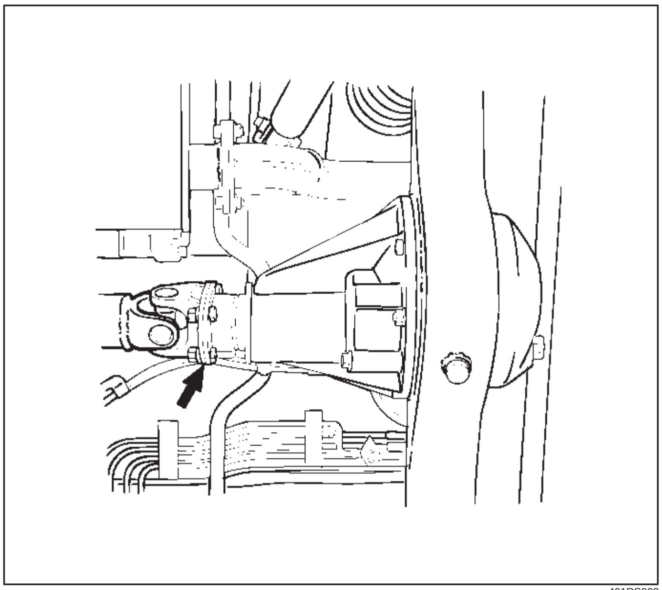
1. Remove engine hood.
2. Disconnect battery ground cable.
3. Remove the gear control lever knob.
4. Remove the front console assembly.
5. Remove the grommet assembly.
6. Remove the transmission control lever and transfer control lever.



235RX001

7. Remove transfer protector.
8. Remove the rear propeller shaft.

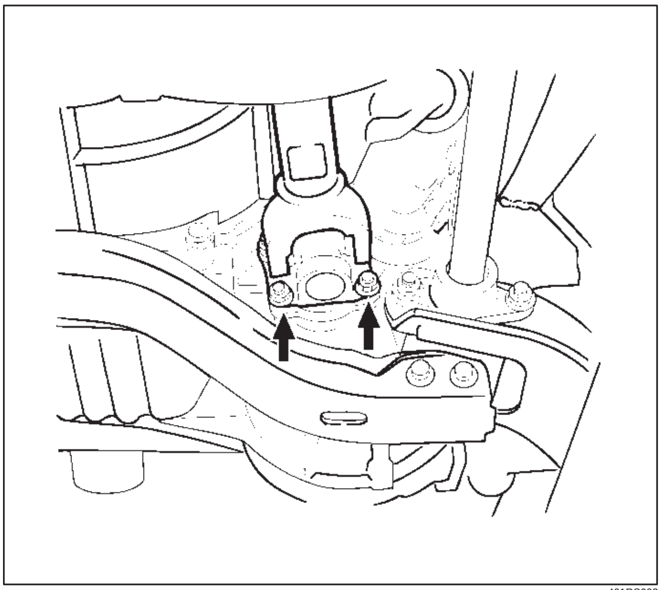
NOTE: Apply alignment marks on the flange at the both front and rear side.



401RS002

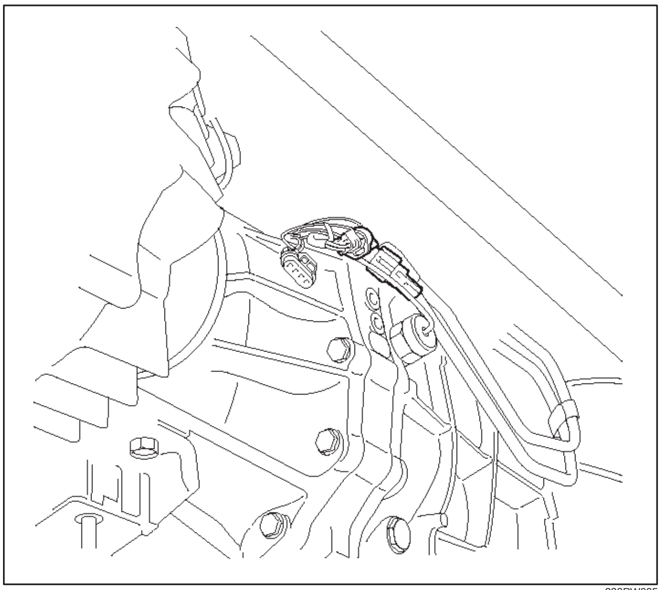
9. Remove the front propeller shaft.

NOTE: Apply alignment marks on the flange at both the front and rear sides.



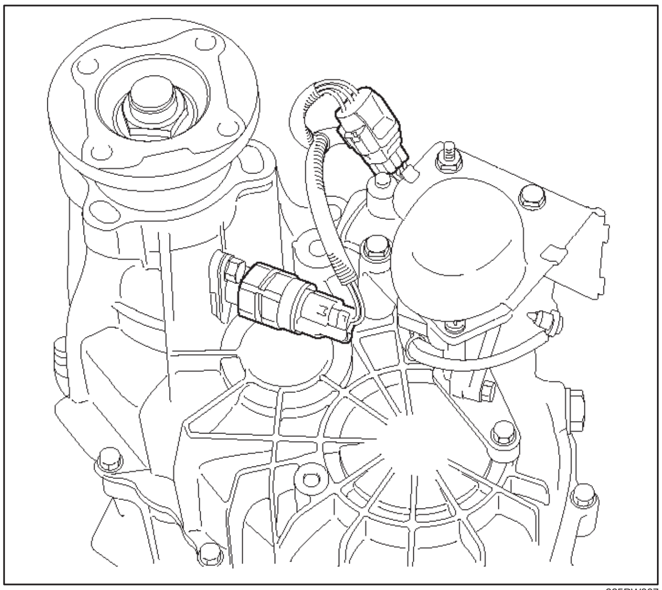
401RS003

10. Disconnect the reverse lamp switch, 4WD indicator switch, and 1-2 indicator switch harness connectors.



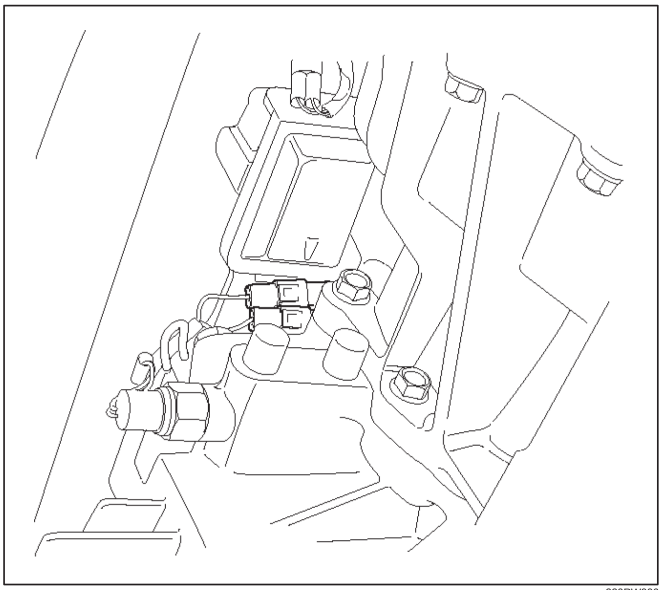
230RW005

11. Disconnect the speed sensor and 2WD-4WD actuator harness connectors.



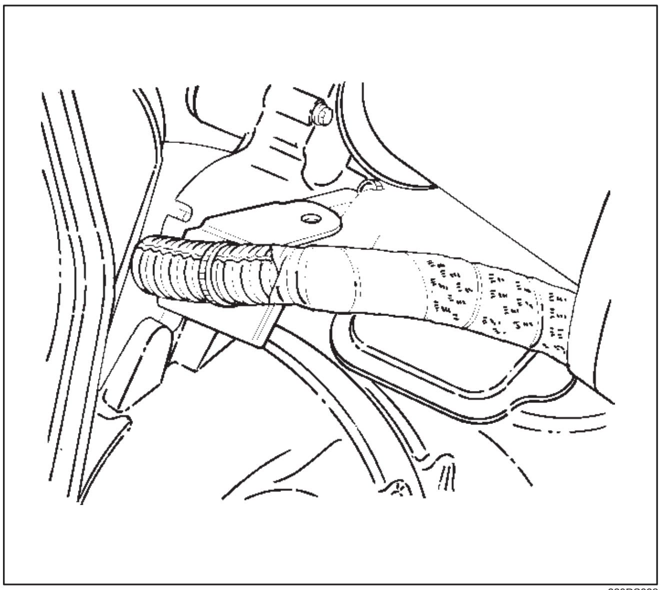
225RW007

12. Disconnect the 4WD indicator harness connector.



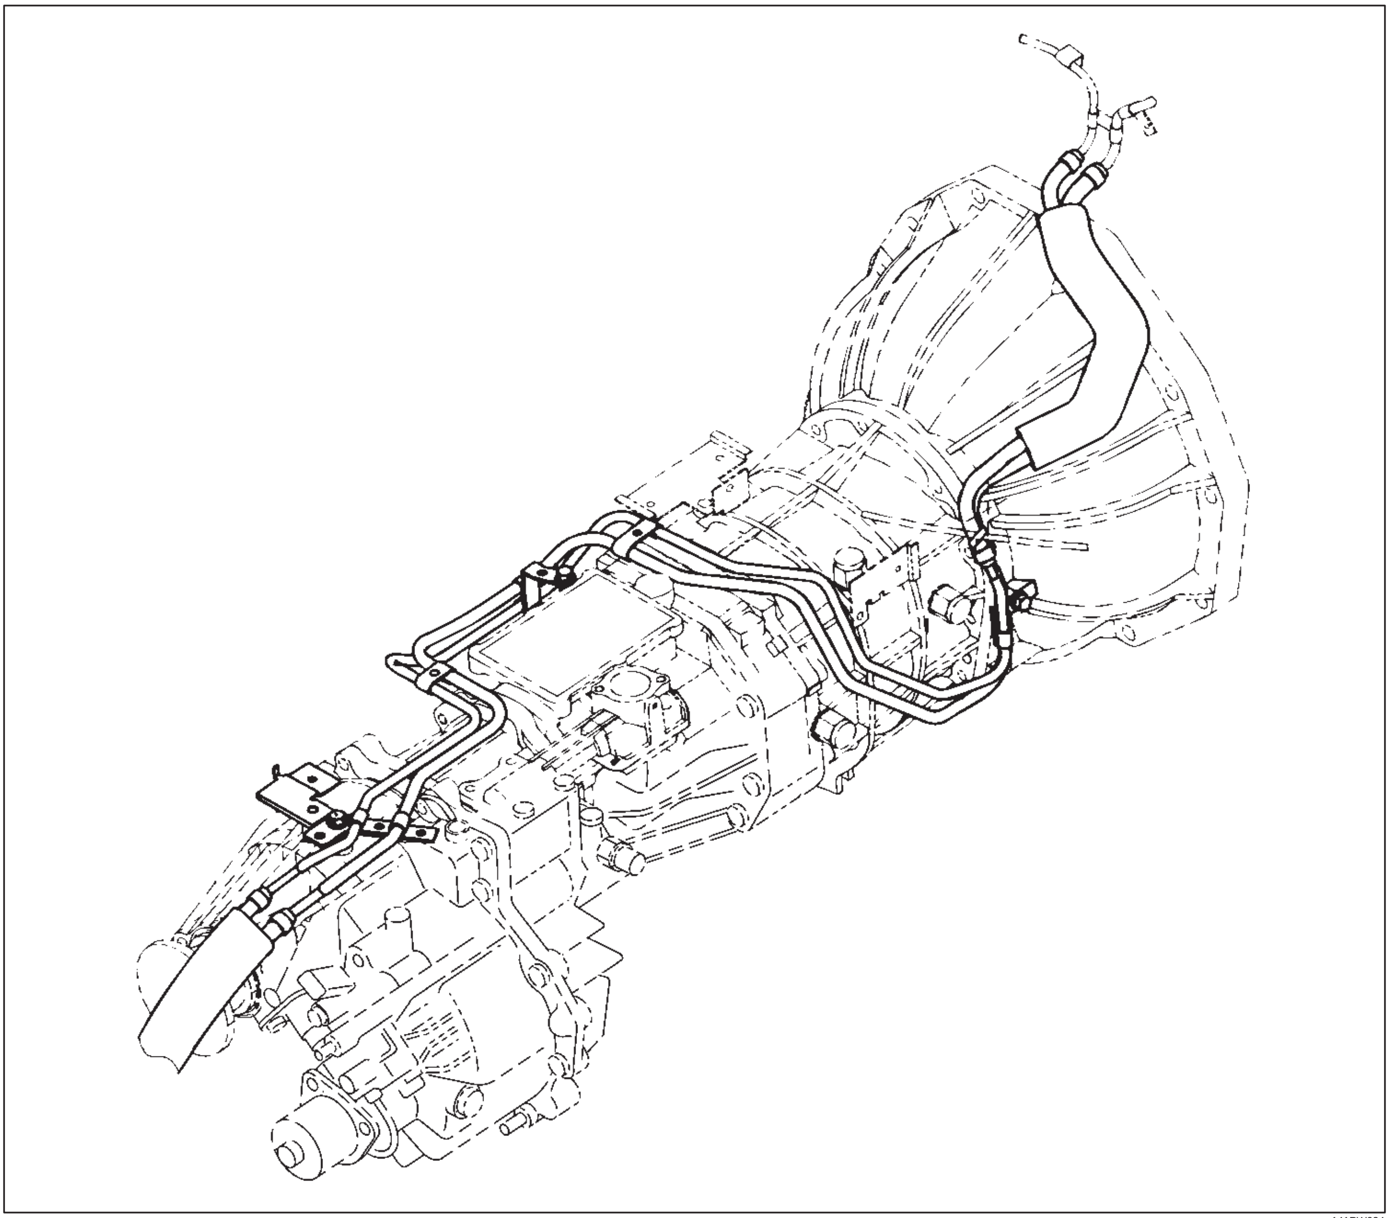
220RW006

13. Remove two transmission harness clamps from the transmission case and bracket .



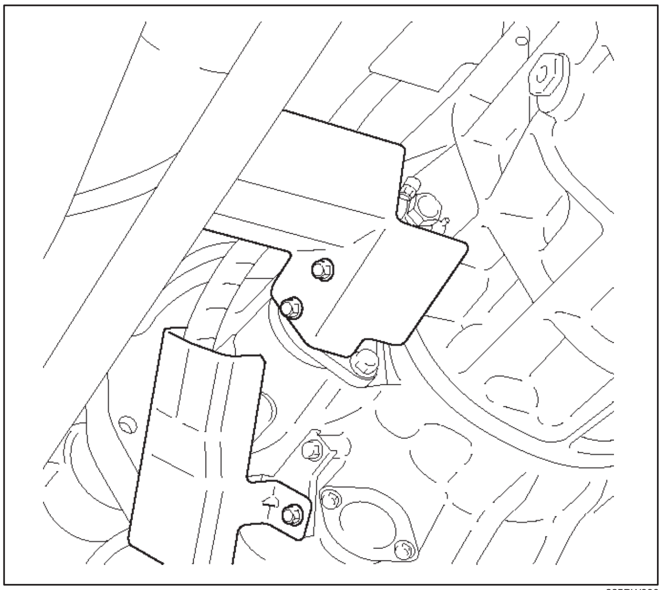
220RS028

14. Remove four fuel pipe bracket.



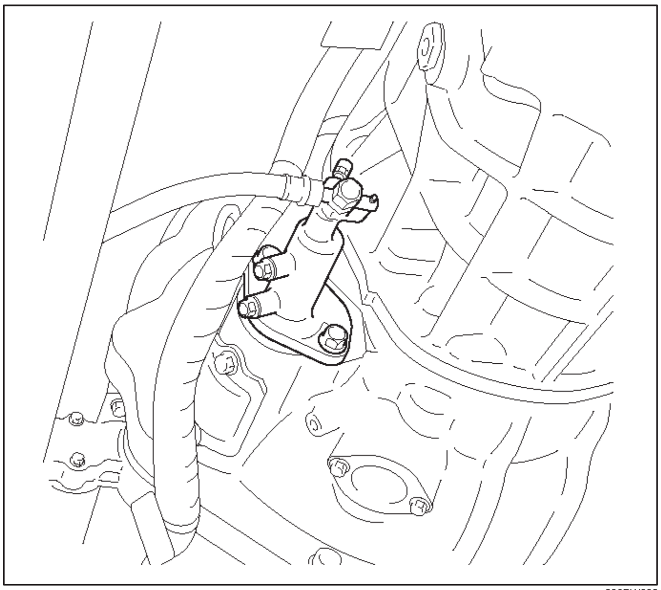
141RW024

15. Remove the heat protector.



225RW006

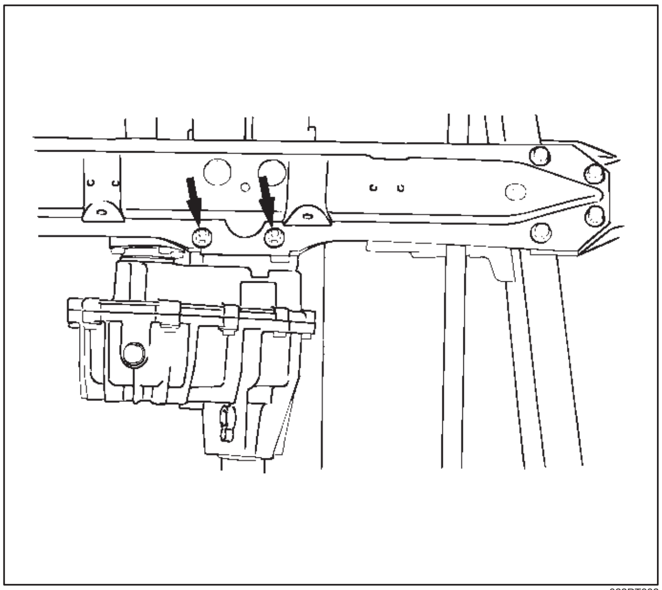
16. Remove the slave cylinder.



206RW002

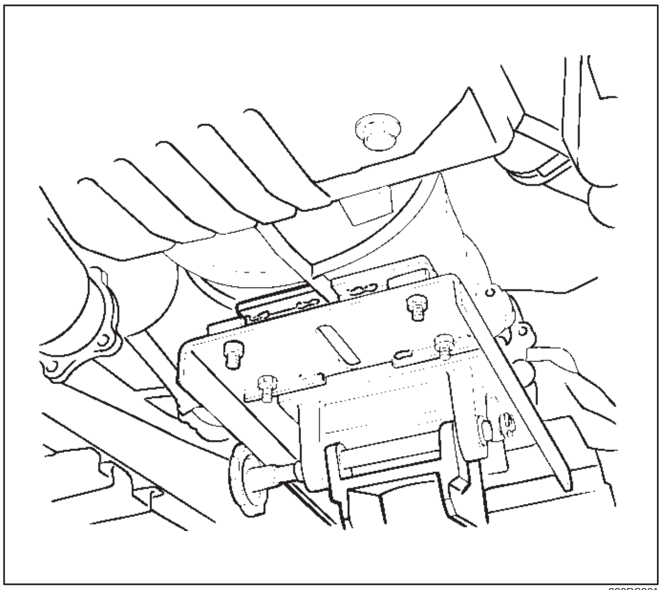
- Remove the dust cover from the clutch housing.

17. Support the transfer case with a jack.
18. Remove two engine rear mount nuts.



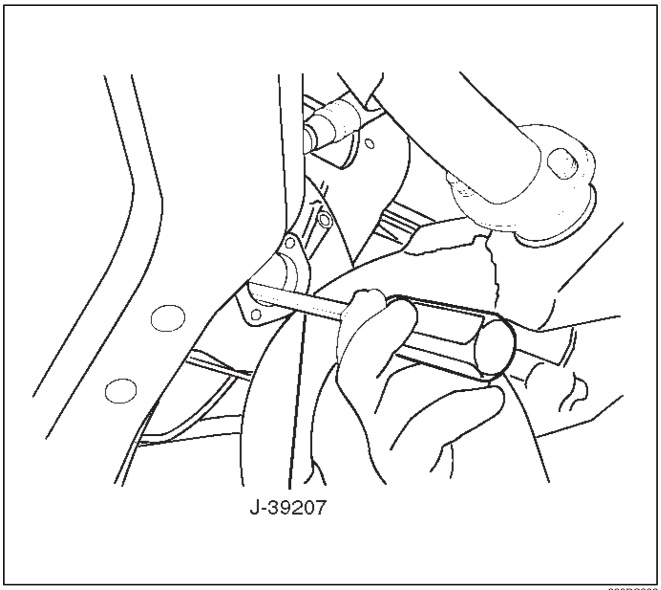
022RT002

19. Remove third crossmember.
20. Disconnect four oxygen sensor connectors from the transmission harness.
21. Remove the right front exhaust pipe and catalytic converter assembly.
22. Remove the harness heat protector.
23. Remove two engine rear mount bolts.
24. Remove the rear mount from the transmission.
25. Remove three flywheel under cover.
26. Support the transmission with a transmission jack and then remove jack from the transfer case side.



220RS001

27. Use the clutch release bearing remover J–39207 to disconnect the clutch release bearing from the clutch pressure plate.

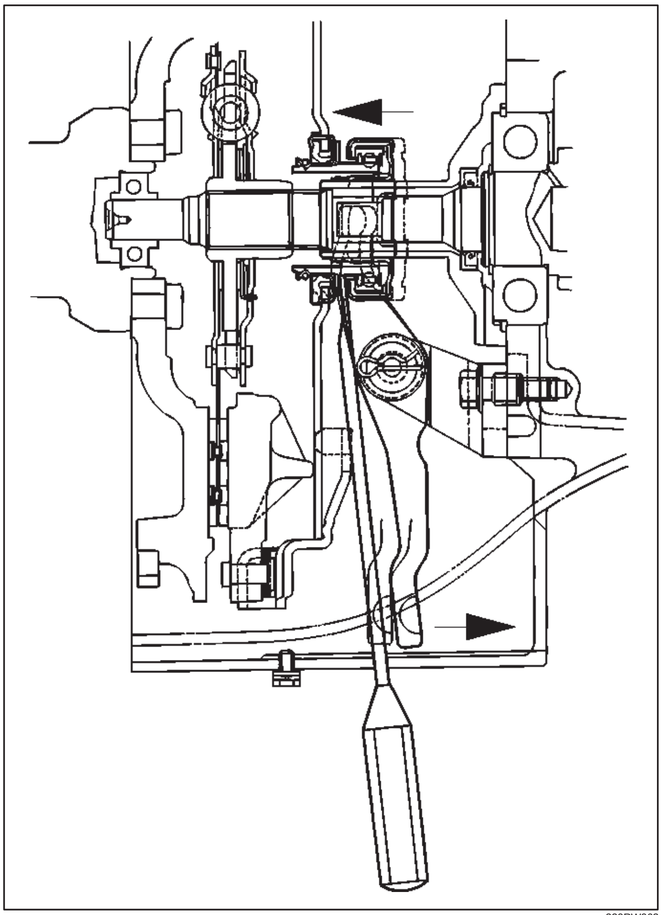


220RS002

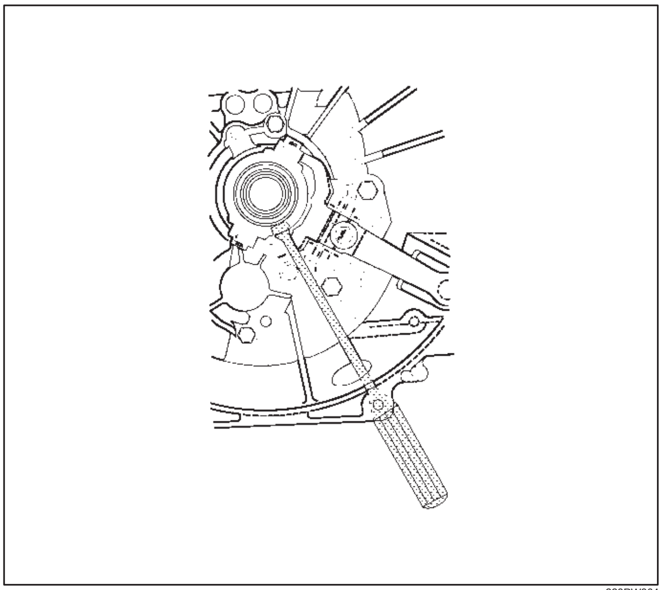
Release bearing disconnection

1. Pull the shift fork toward the transmission to press the clutch release bearing against the clutch.
2. Insert the clutch release bearing remover between the wedge collar and the release bearing.
3. Turn the remover to separate the release bearing.

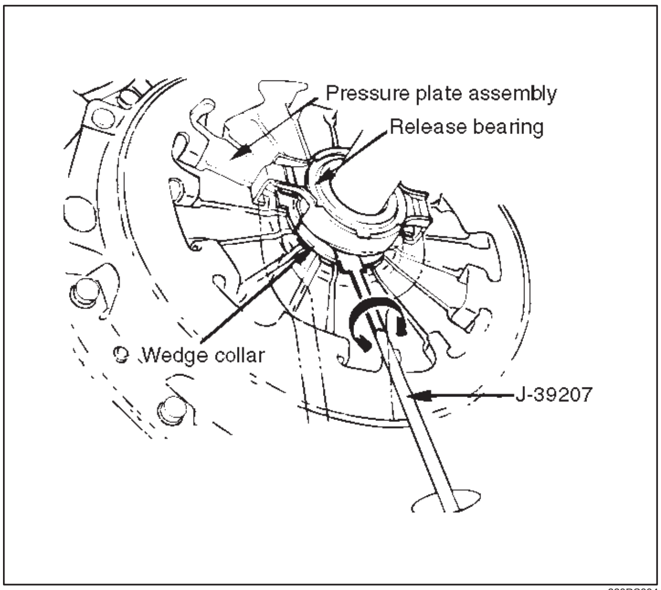
NOTE: Be sure not to insert the remover between the wedge collar and the clutch.



220RW063



220RW064



220RS004

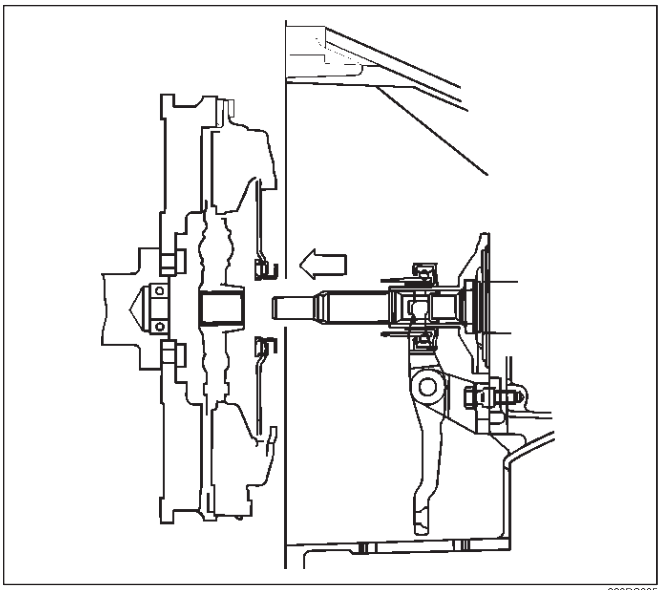
28. Remove the transmission retaining nuts and bolts.
29. Remove the transmission assembly with transfer case from the vehicle.

NOTE: Remove the transfer case from the transmission assembly if the transmission disassembly required.

Refer to Transfer Case in Drive Line/Axle section.

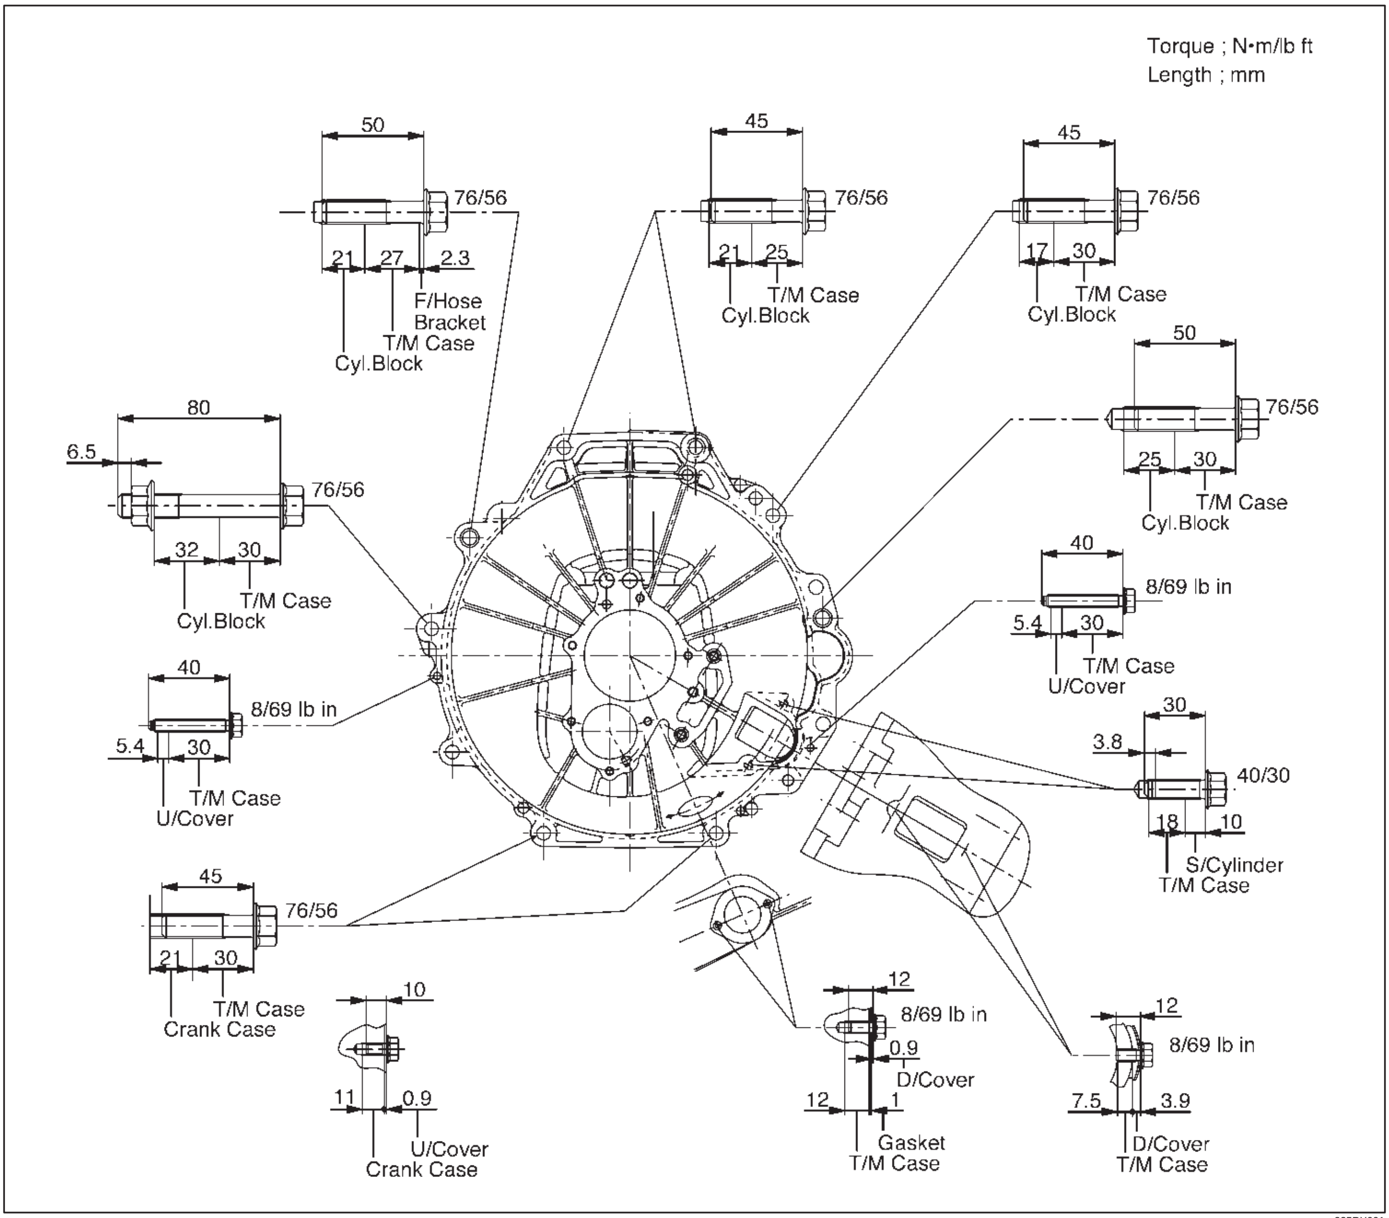
Installation

1. Apply a thin coat of molybdenum disulfide grease to the top gear shaft spline.
2. Slowly operate the transmission jack until the front of transmission is aligned with the rear of the engine.
   The slope of the engine and the transmission must be the same.
3. Align the top gear shaft spline with the clutch driven plate spline.



220RS005

4. Install the transmission to the engine.
   Tighten the transmission retaining nuts and bolts.

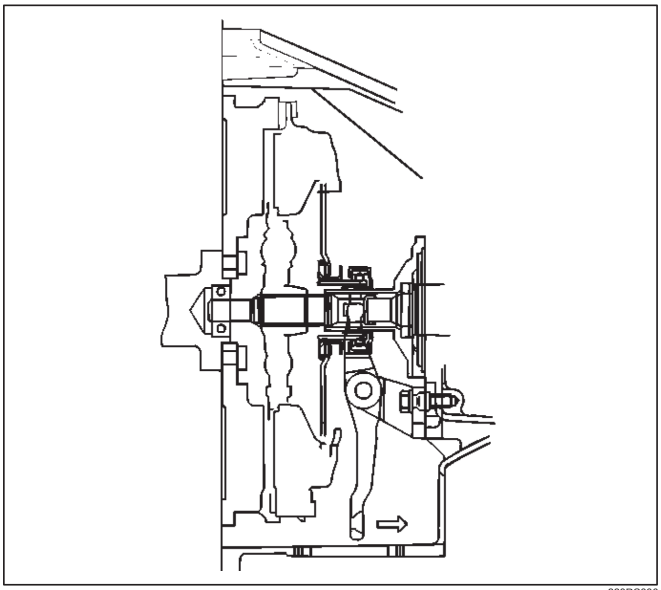


225RX001

5. Apply a force of about 113 N (26 lb) to the tip of the shift fork in the direction of the transmission to engage the clutch pressure plate and release bearing.

NOTE: A clicking sound is heard when the release bearing and the tip of the diaphragm spring engage each other.

Check to see if they are securely engaged by pushing the tip of the shift fork toward the engine while applying a force of about 25 N (5.5 lb). If the shift fork will not move, then they are securely engaged.



220RS006

6. Install three flywheel under cover.

7. Install the engine rear mount to the transmission case and tighten the fixing bolts specified torque.

Torque: 41 N·m (30 lb ft)

8. Install the harness heat protector.
9. Install the right front exhaust pipes and catalytic converter assembly.

Torque

Exh. pipe to exh. manifold: 67 N·m (49 lb ft)

Exh. pipe flange bolt: 43 N·m (32 lb ft)

10. Connect four oxygen sensor connectors to the transmission harness.
11. Install the third crossmember to the frame and tighten the fixing bolts specified torque.

Torque: 50 N·m (37 lb ft)

12. Tighten the engine rear mount nuts specified torque.

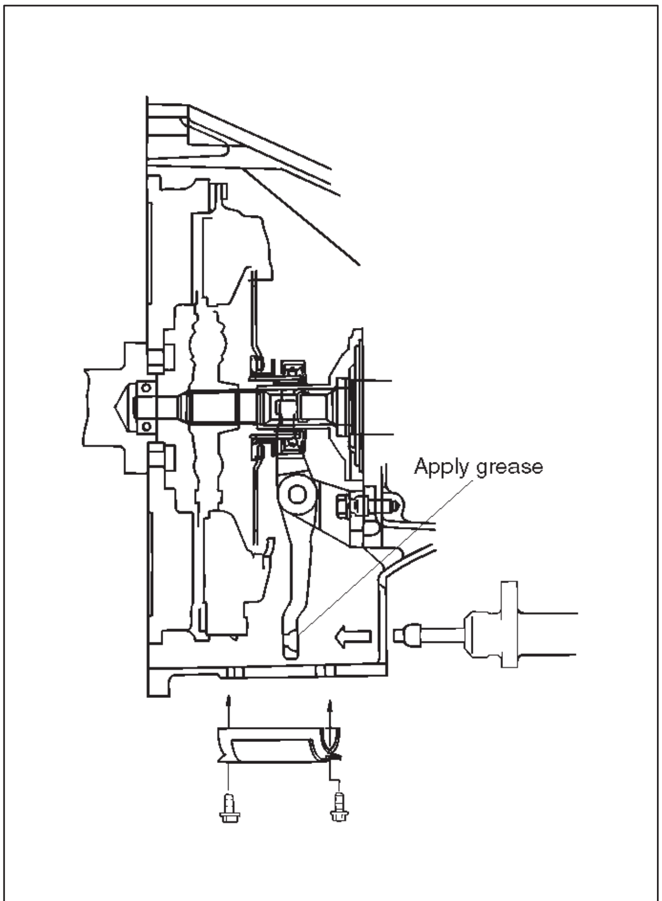
Torque: 50 N·m (37 lb ft)

13. Remove the transmission jack.
14. Apply the grease to top hole portion of the shift fork.
15. Install the slave cylinder and tighten the fixing bolts specified torque.

Torque: 43 N·m (32 lb ft)

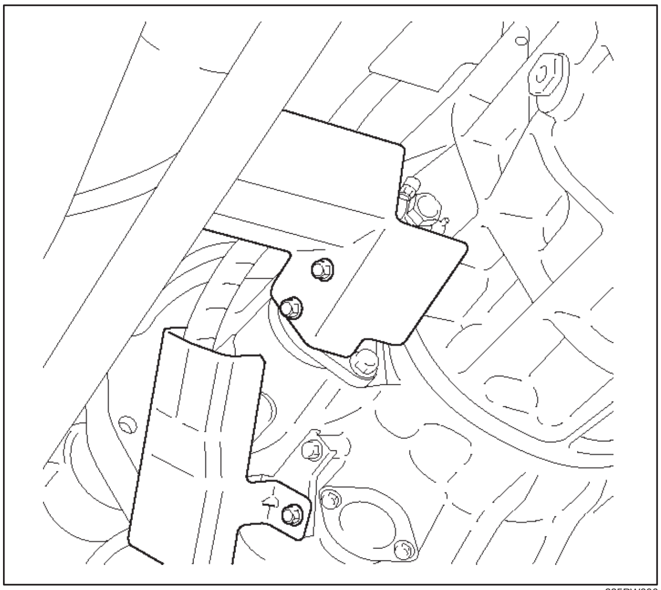
Install the clutch dust cover to the clutch housing and tighten the fixing bolts specified torque.

Torque: 8 N·m (69 lb in)



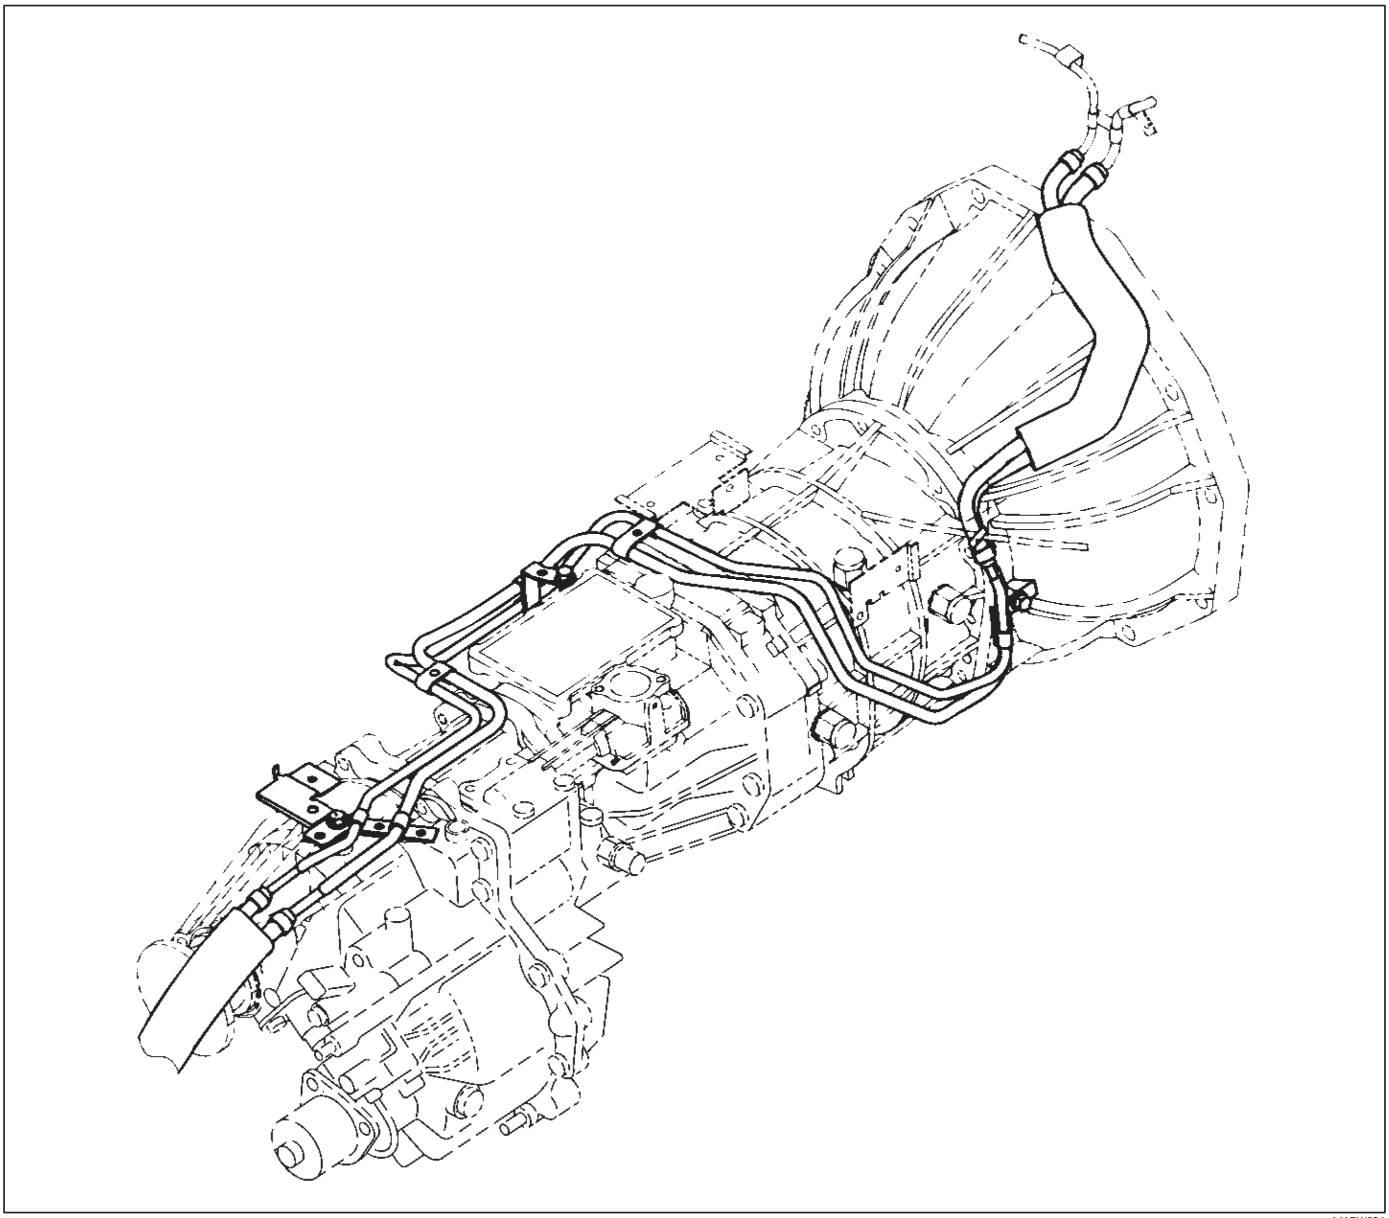
220RS007

16. Install the slave cylinder heat protector to the slave cylinder.
17. Install harness heat protector.



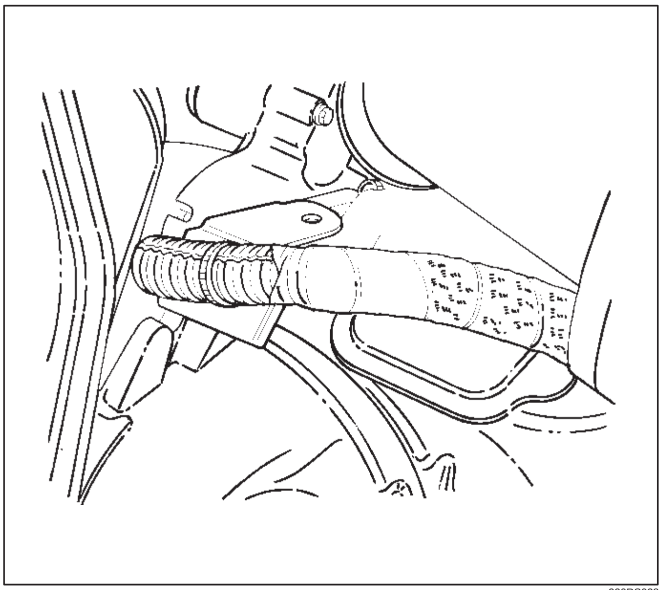
225RW006

18. Install four fuel pipe bracket.



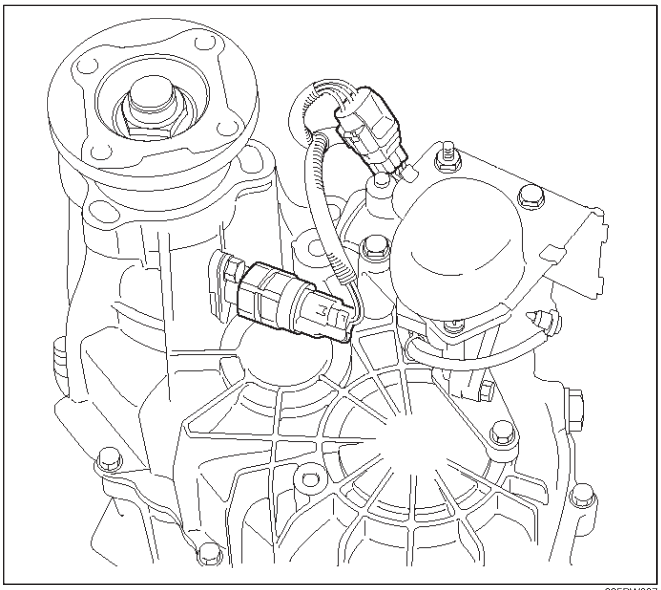
141RW024

19. Install bracket and two transmission harness clamps to the transmission case.



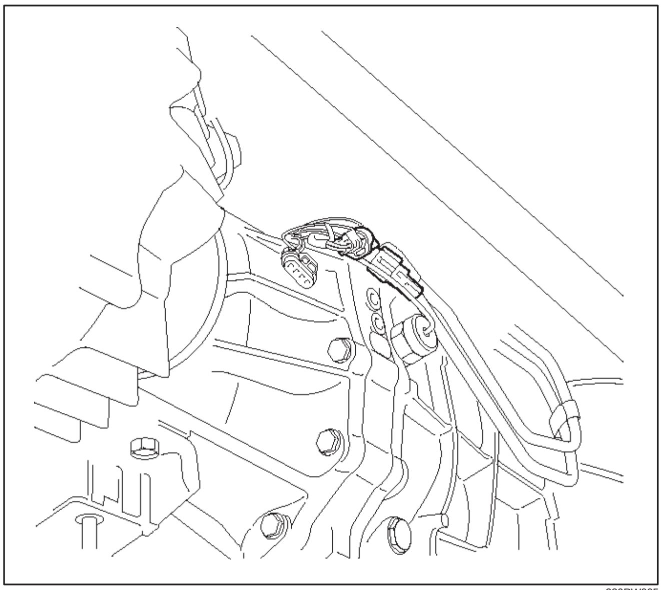
220RS028

20. Connect the speedometer sensor and 2WD–4WD actuator harness connector.



225RW007

21. Connect the backup lamp switch, 4WD indicator switch, and 1-2 indicator switch harness connectors.



230RW005

22. Install the front propeller shaft and tighten the fixing bolts and nuts specified torque.

Torque: 63 N·m (46 lb ft)

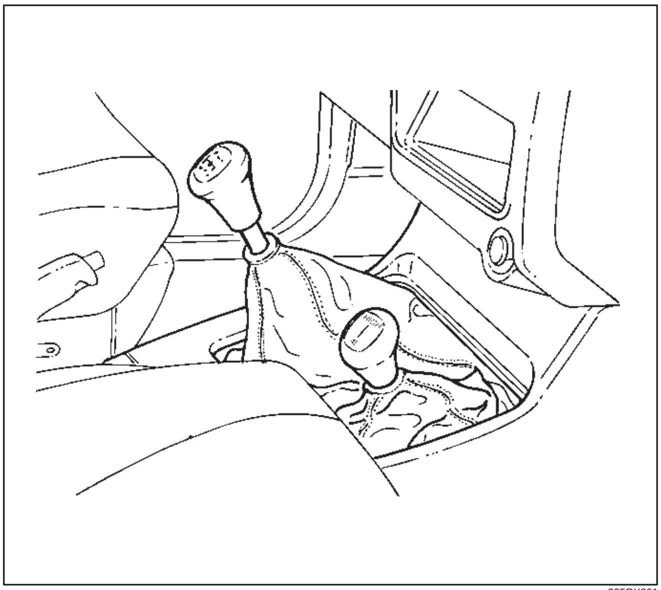
23. Install the rear propeller shaft and tighten the fixing bolts and nuts specified torque.

Torque: 63 N·m (46 lb ft)

24. Install transfer protector and tighten the fixing bolts specified torque.

Torque: 37 N·m (27 lb ft)

25. Install the transmission control lever and transfer control lever.
26. Install the grommet assembly.
27. Install the front console assembly.
28. Install the gear control lever knob.



235RX001

29. Connect battery ground cable.
30. Install engine hood.

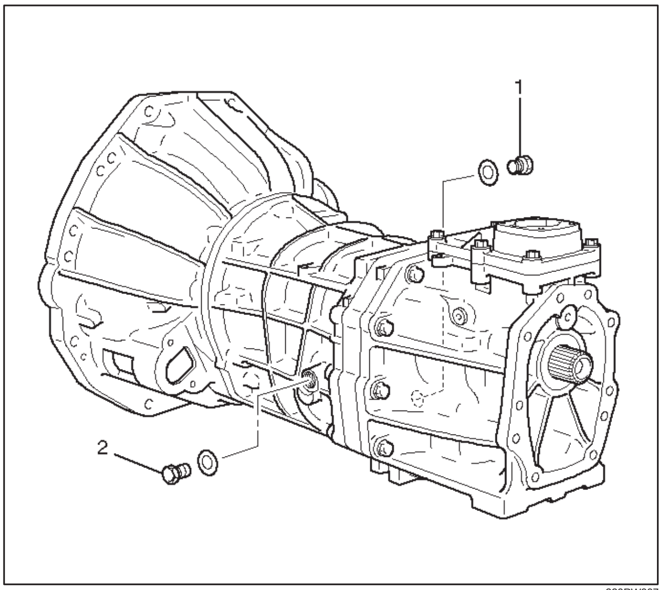
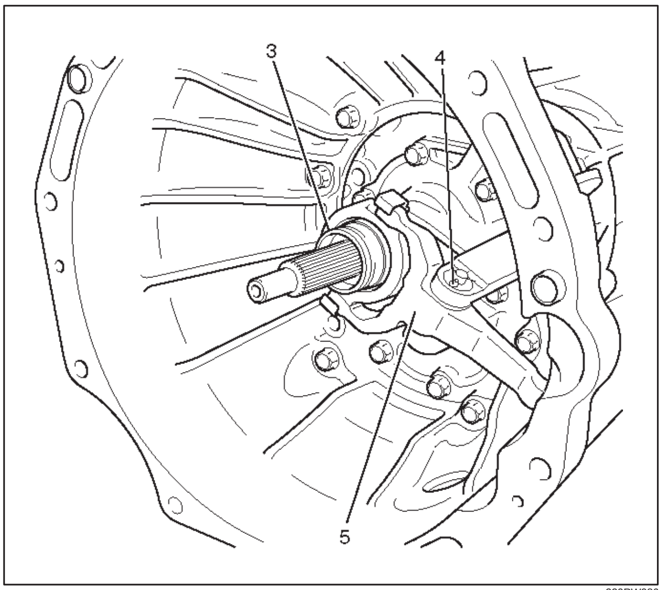
Disassembly

1. Remove the drain plag and filler plug.
   1. Remove the drain plug (1) and gasket.
   2. Remove the filler plug (2) and gasket.



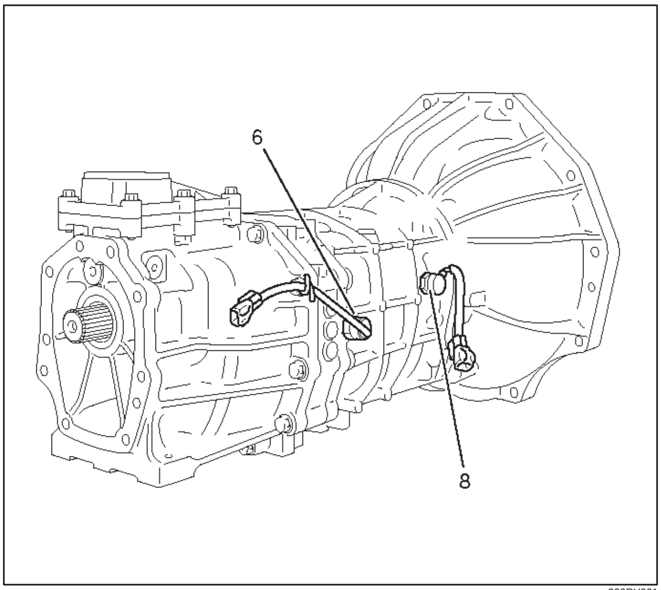
220RW007

2. Remove the clutch release bearing and shift fork.
   1. Remove the clutch release bearing (3) from the front cover.
   2. Remove the split pin (4). Remove the shaft from the under. Remove the shift fork (5).



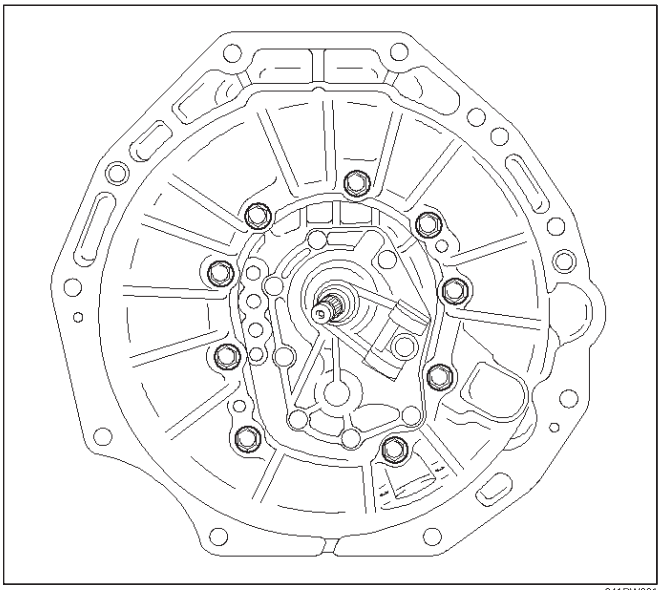
220RW086

3. Remove the switch.
   1. Remove backup light switch (6) and gasket.
   2. Remove 1st and 2nd switch (8) and gasket.



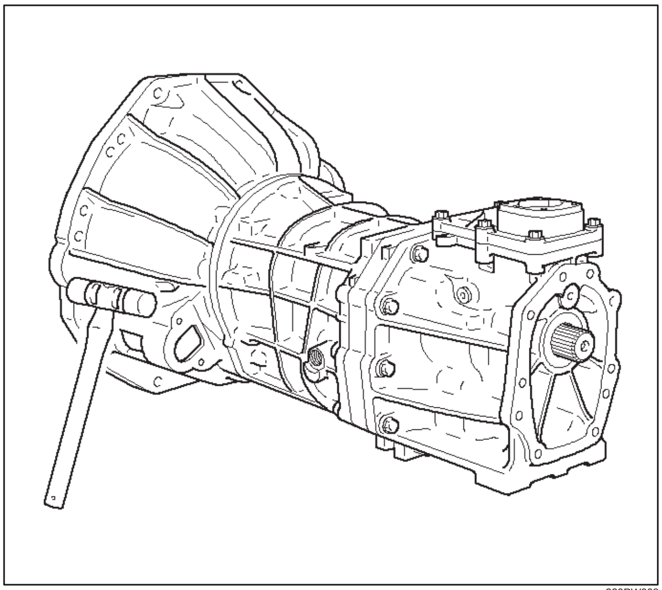
220RY001

4. Remove the clutch housing.
   1. Remove the 9 bolts.



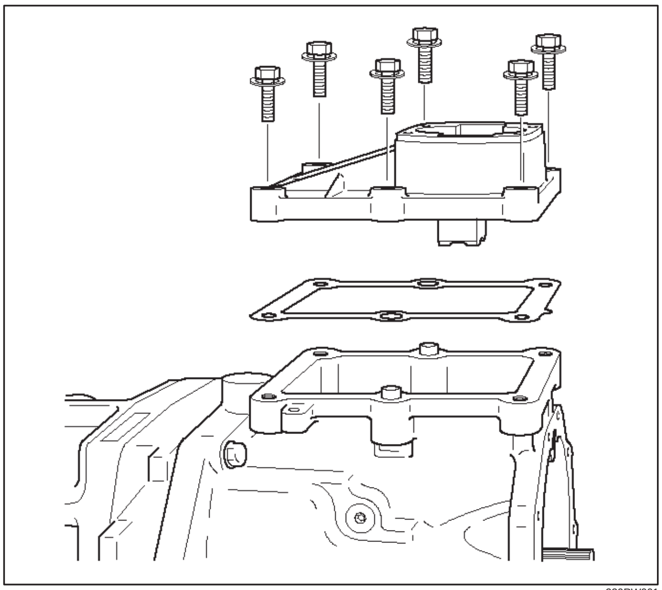
241RW001

2. Using a plastic hammer, carefully tap the clutch housing.



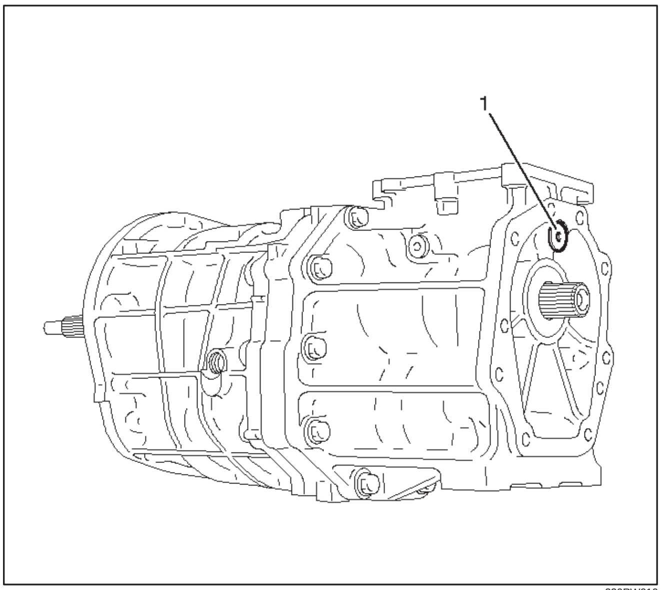
220RW008

5. Remove gear control box and gasket.
   1. Remove the 6 bolts, gear control box and gasket.



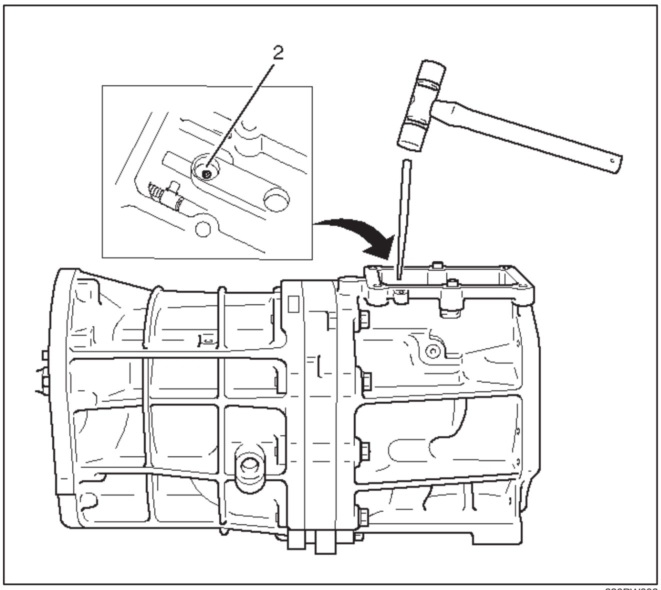
230RW001

6. Remove transfer adapter.
   1. Using a hexagon wrench, remove the plug (1).



220RW010

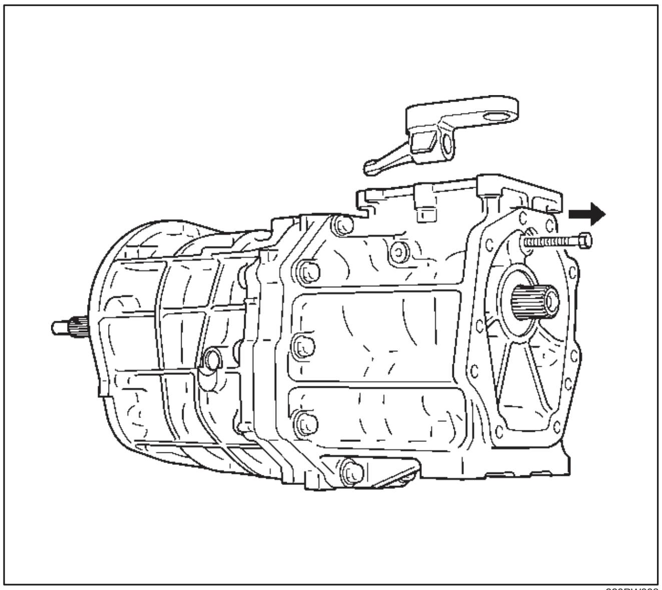
   2. Using a pin punch and hammer, drive out the slotted spring pin (2).



230RW002

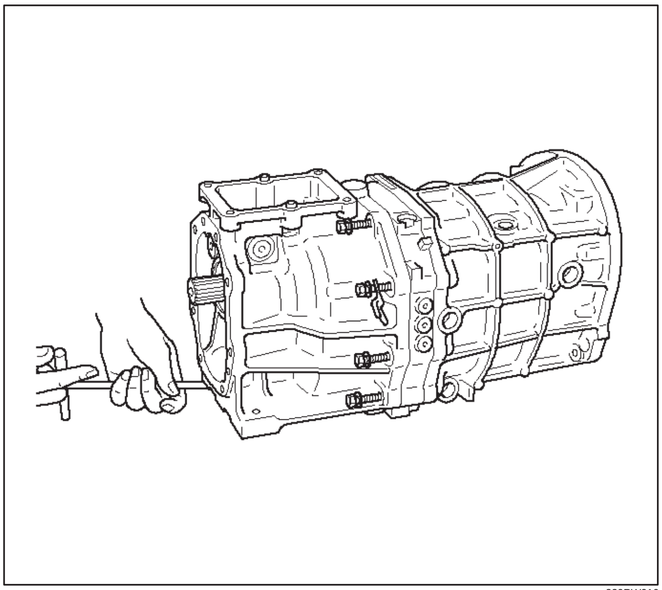
3. Using the M8 × 1.25 bolt, remove the gear control rod and the shift lever housing.

NOTE: Turn the M8 bolt a few times, before remove the gear control rod.



220RW098

4. Remove the 10 bolts and clamp.

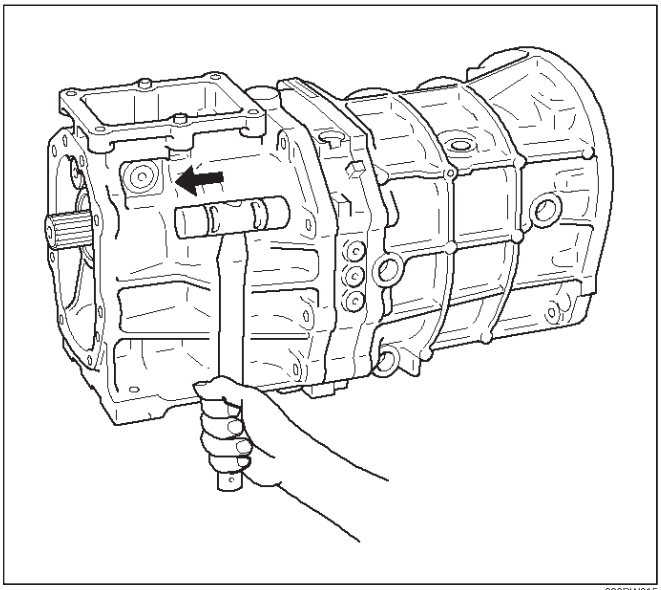


220RW016

5. Using a plastic hammer, tap the transfer adapter.

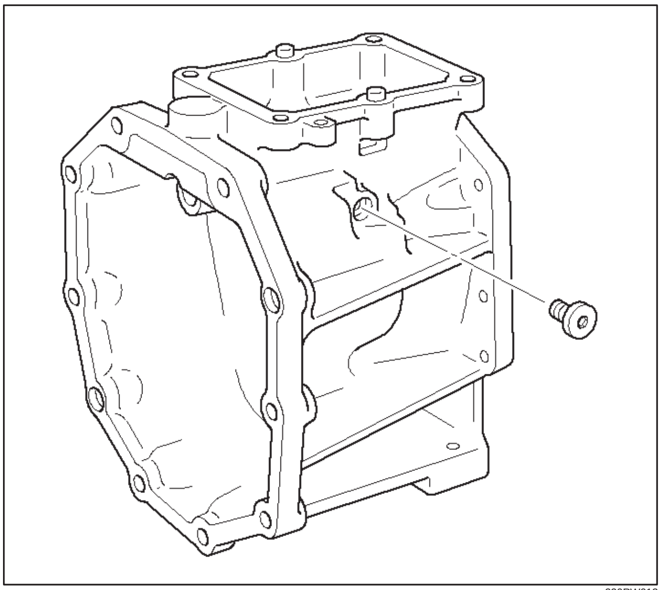
NOTE:

- Be careful not to lose the pin.
- Cover the mainshaft splines with adhesive tape. This will prevent damage to the oil seal lip.



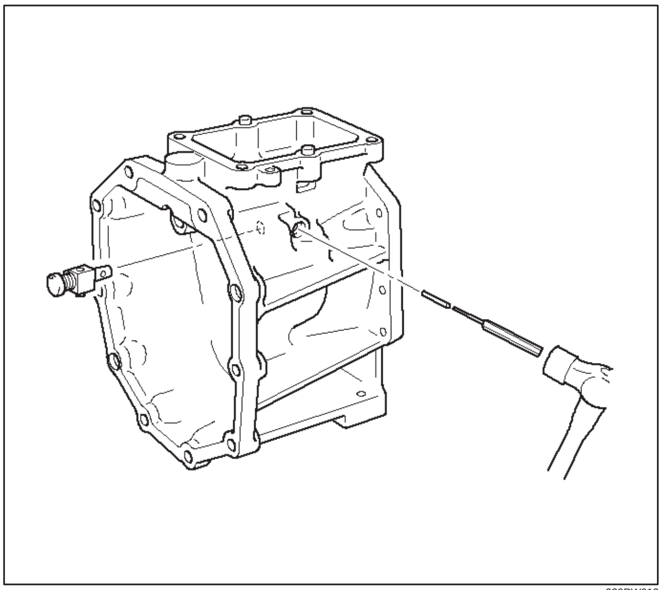
220RW015

7. Disassemble the transfer adapter assembly.
   1. Using a torx socket wrench(T40), remove the plug.



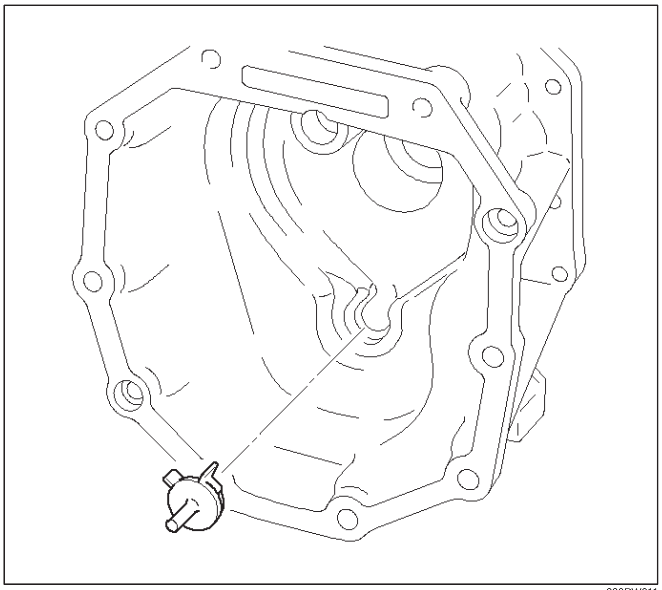
220RW013

2. Using a pin punch and hammer, drive out the slotted spring pin. Remove the reverse restrict pin.



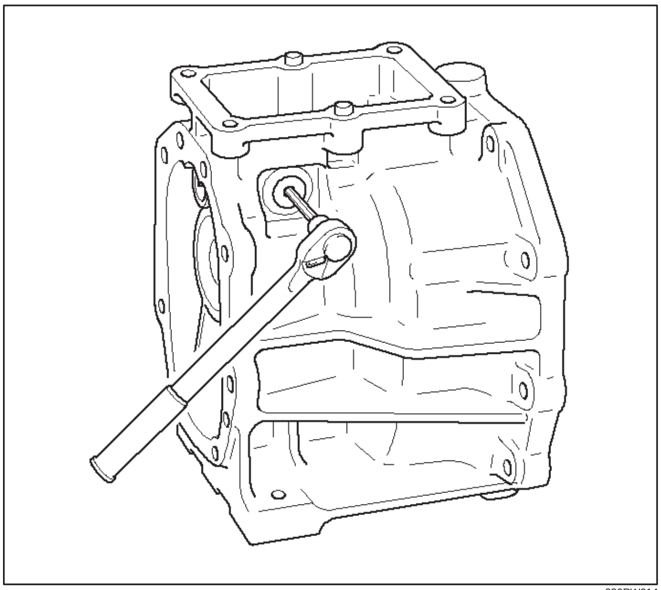
220RW012

3. Remove the oil receiver pipe.



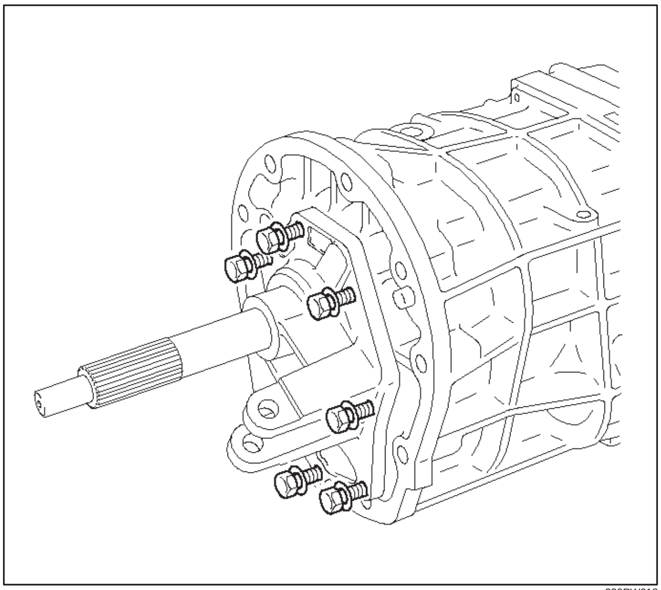
220RW011

4. Remove the oil seal.
5. Using socket hexagon wrench, remove the plug.



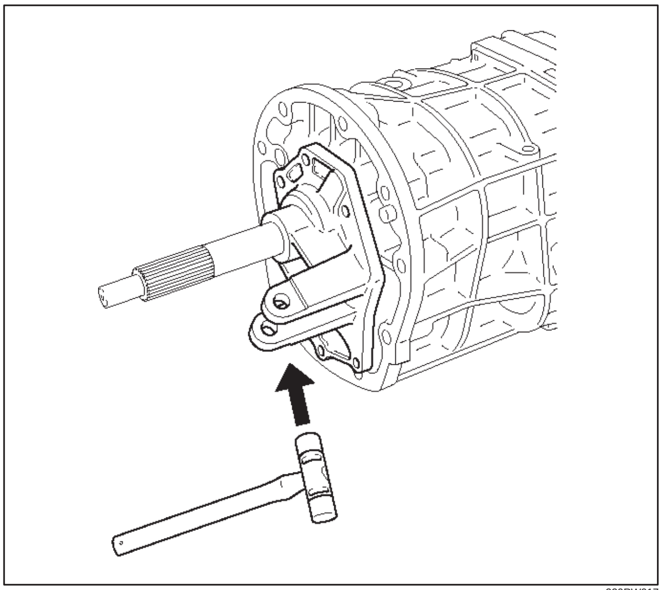
220RW014

8. Remove the front cover.
   1. Remove the 8 bolts.



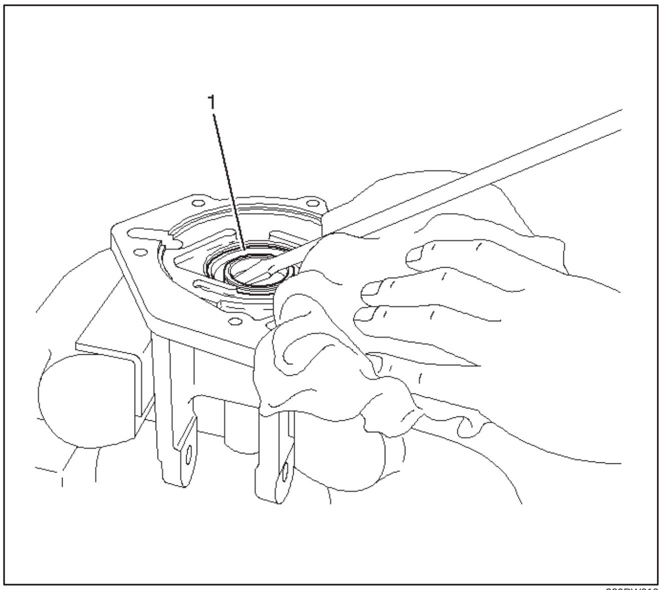
220RW018

2. Using a plastic hammer, carefully tap the front cover.



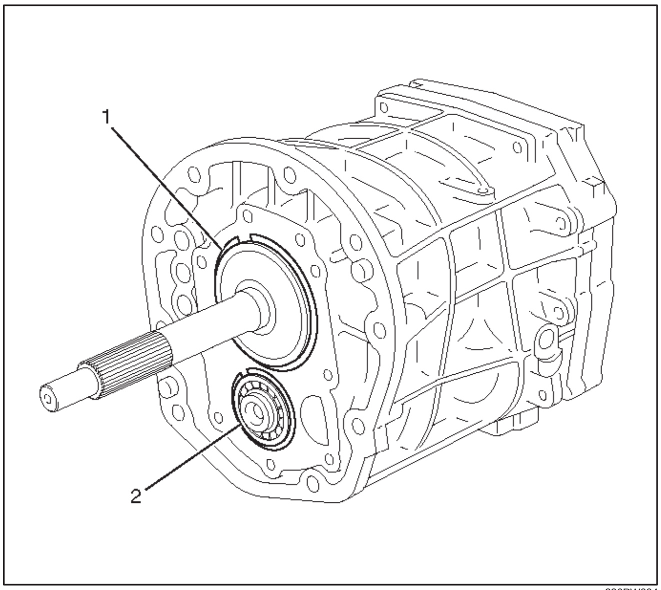
220RW017

9. Remove the front cover oil seal.
   1. Mount the front cover through the aluminum plate in a vise.
   2. Using screwdriver, remove oil seal (1).



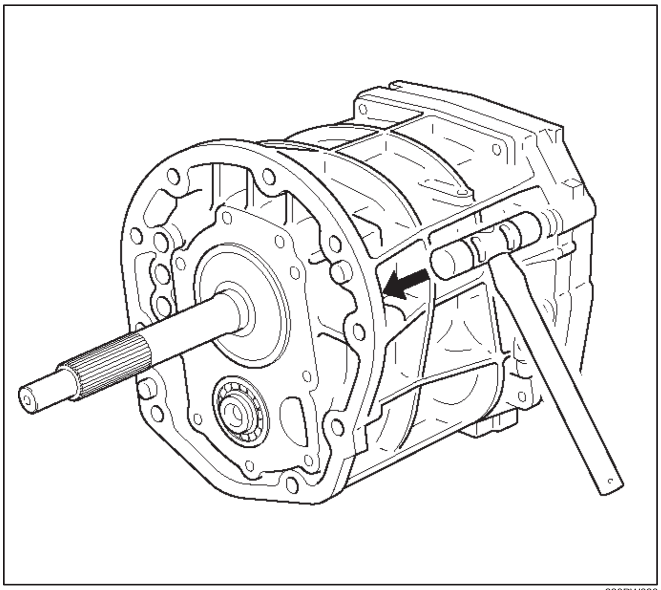
220RW019

10. Remove the transmission case.
    1. Using a snap ring expander, remove the 2 snap rings (1)(2).



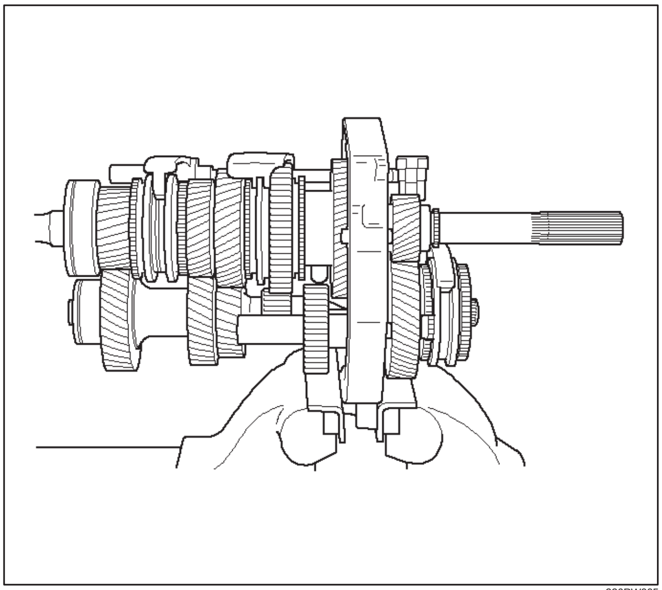
226RW004

   2. Using a plastic hammer, carefully tap the transmission case.



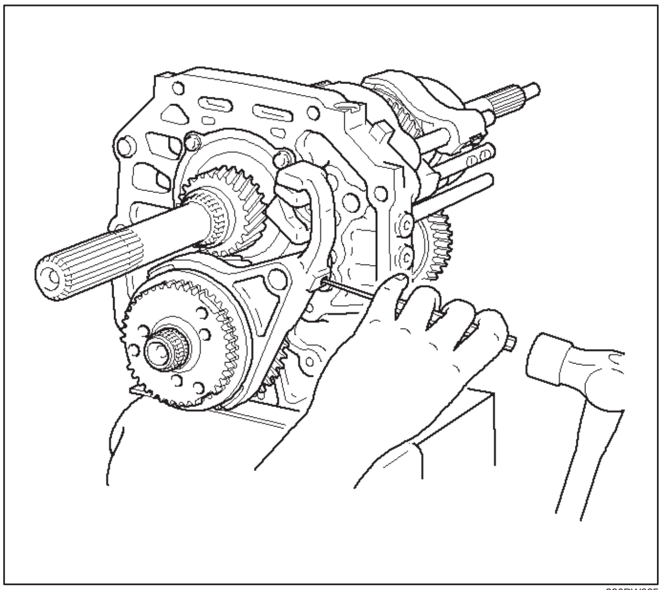
220RW020

11. Mount the intermediate plate.
    1. Mount the intermediate plate through the aluminum plate in a vise.



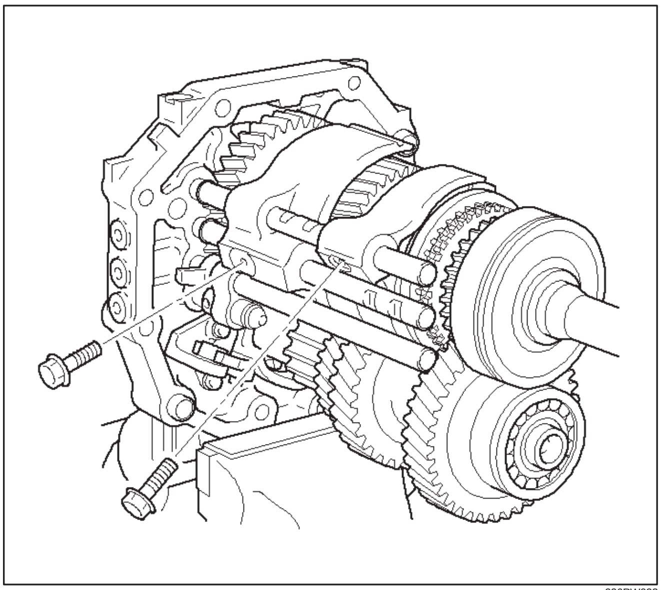
226RW005

12. Remove the slotted spring pin.
    1. Using a pin punch and hammer, drive out the pin from the arm.



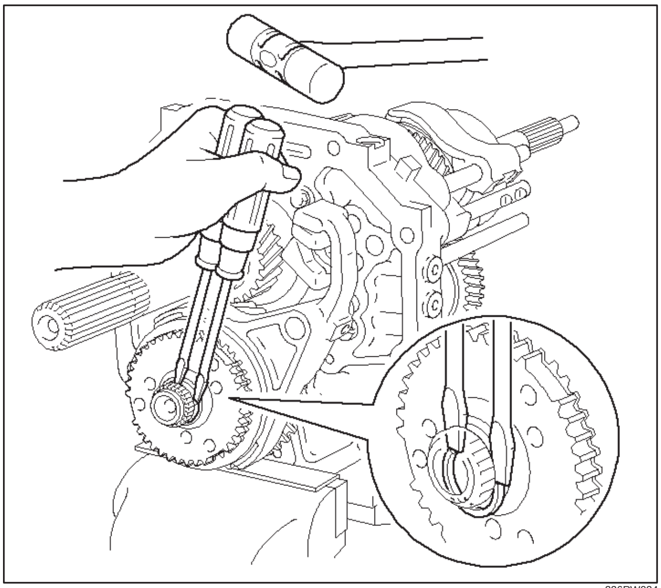
226RW025

13. Remove the shift arm set bolt.
    1. Remove the 2 bolts from the shift arm.



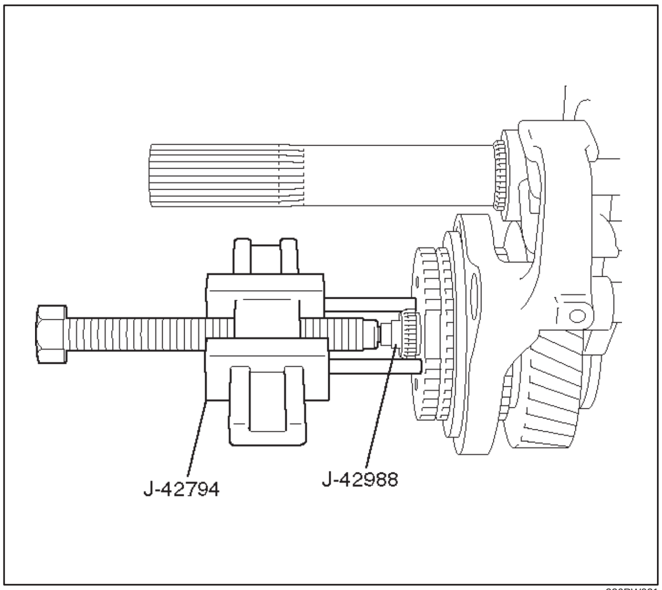
226RW023

14. Remove the counter 5th gear.
    1. Using 2 screwdrivers and hammer, tap out the snap ring.



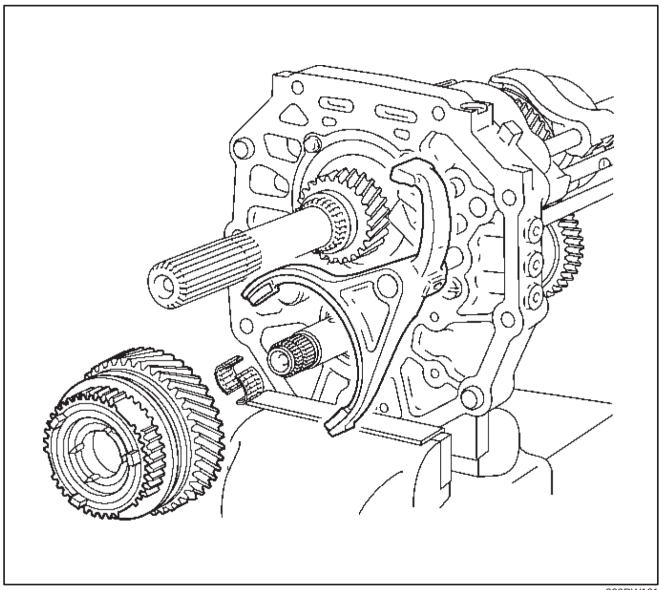
226RW024

2. Using remover J–42794 and attachment J–42988, remove the 5th gear spline piece.



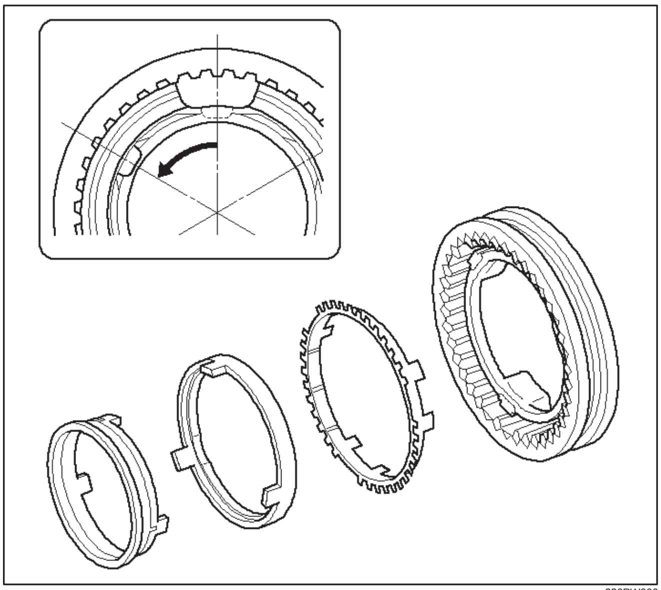
226RW021

3. Remove the hub sleeve No.3, block ring set, counter 5th gear, bearing and 5th shift arm.



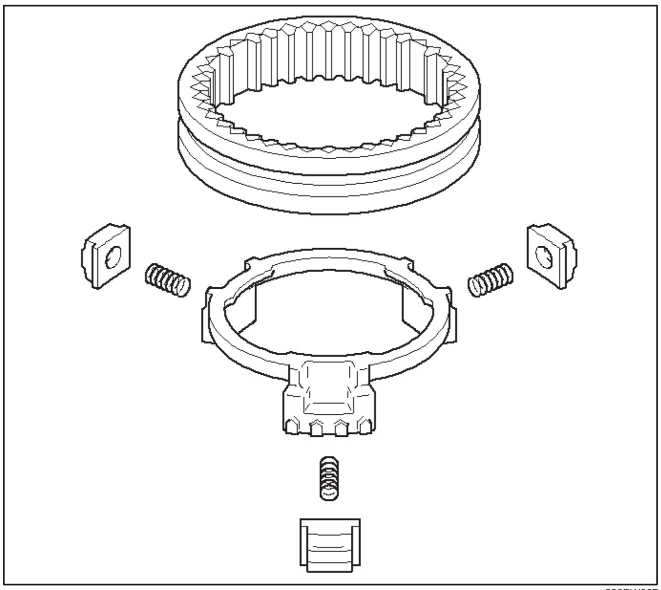
220RW101

4. Remove the synchronizer pull ring, synchronizer cone ring, and synchronizer outer ring from hub sleeve No.3.



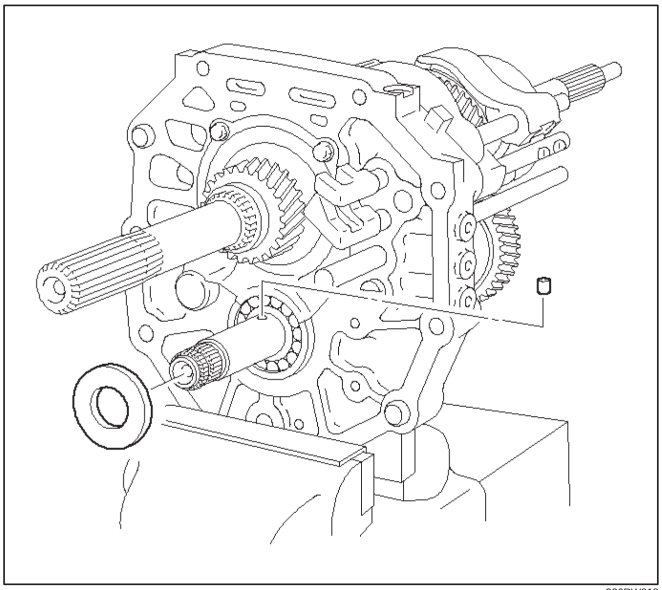
226RW066

5. Remove the reverse block ring from the hub sleeve No.3. Remove the 3 inserts and 3 compression springs.



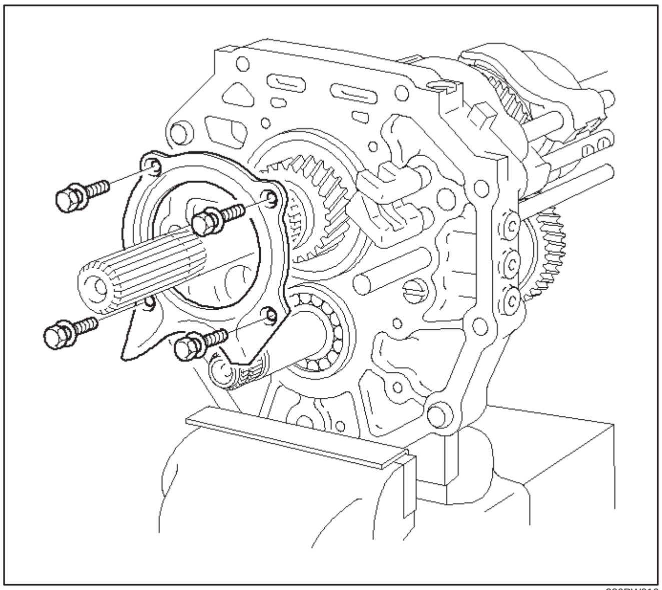
226RW067

15. Remove the thrust washer.
    1. Remove the thrust washer from counter gear shaft.
    2. Remove the thrust washer pin from counter gear shaft.



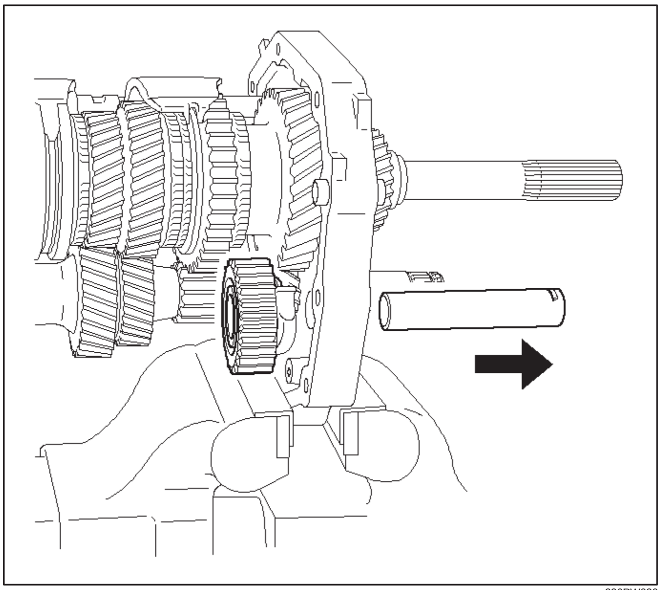
226RW018

16. Remove the bearing plate.
    1. Remove the 4 bolts and bearing retainer.



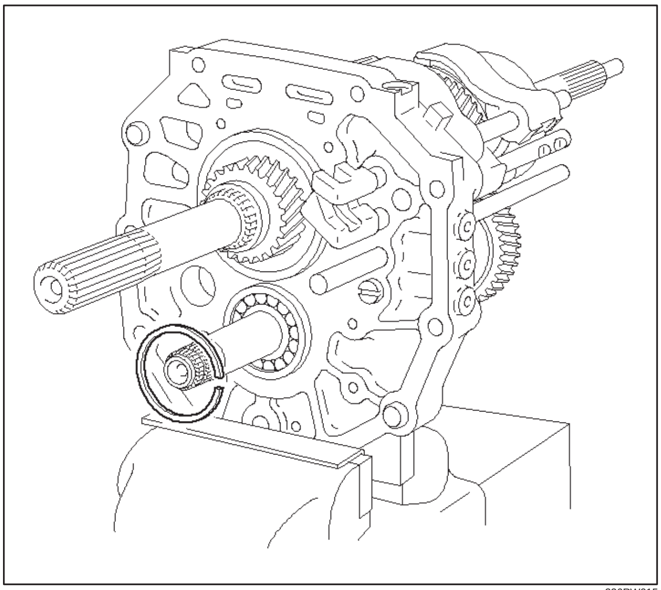
226RW016

17. Remove the reverse idle gear.
    1. Pull out the shaft foward the rear and remove the reverse idle gear.



226RW020

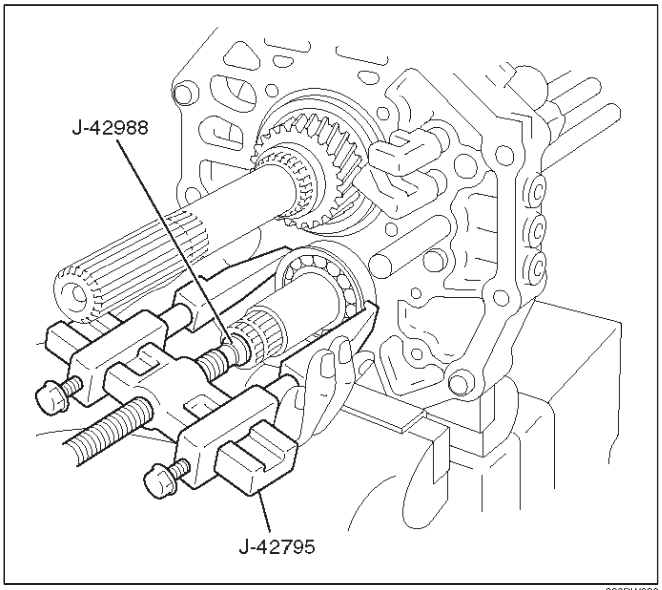
18. Remove the counter gear shaft.
    1. Using snap ring plier, remove counter gear shaft center bearing snap ring.



226RW015

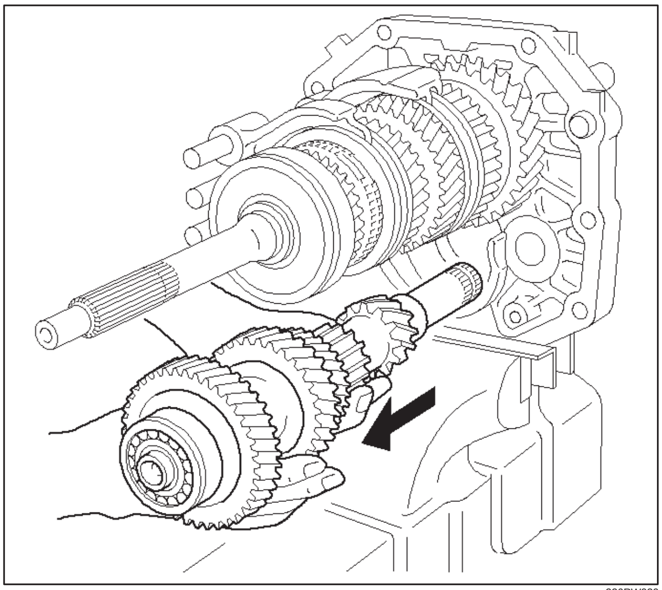
2. Using remover J–42795 and attachment J–42988, remove counter gear shaft center bearing.

NOTE: Be careful not to drop the counter gear, when removing the bearing.



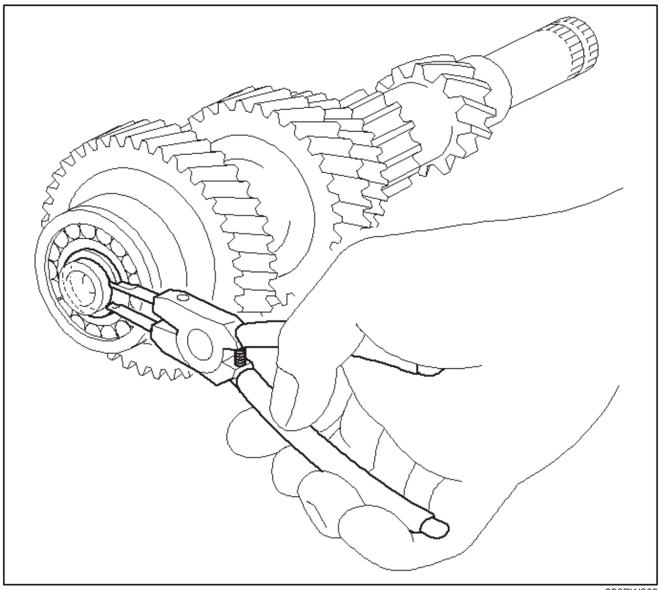
226RW036

3. Remove the counter gear from intermediate plate.



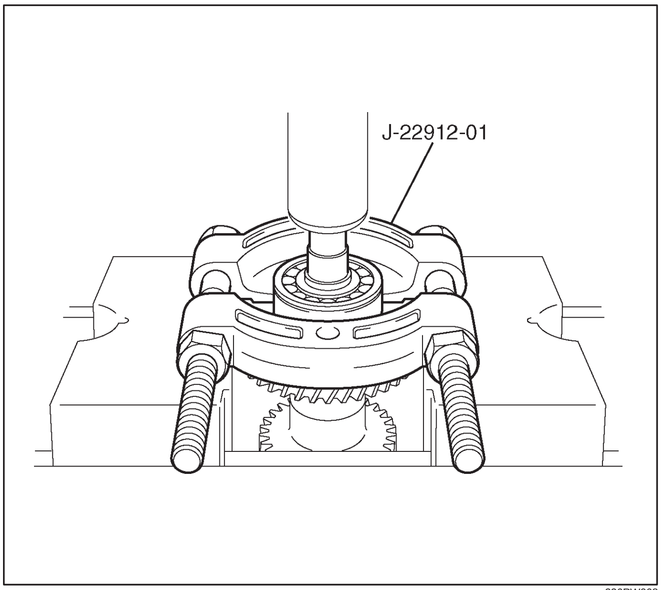
226RW030

19. Disassemble the counter gear shaft assembly.
    1. Using snap ring pliers, remove the counter gear shaft front bearing snap ring.



226RW065

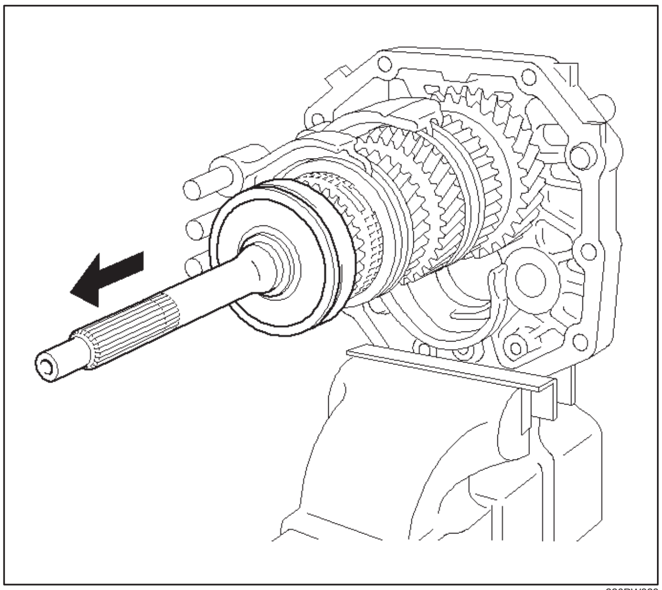
2. Using bearing separator J–22912–01 and a press, remove the bearing.



226RW068

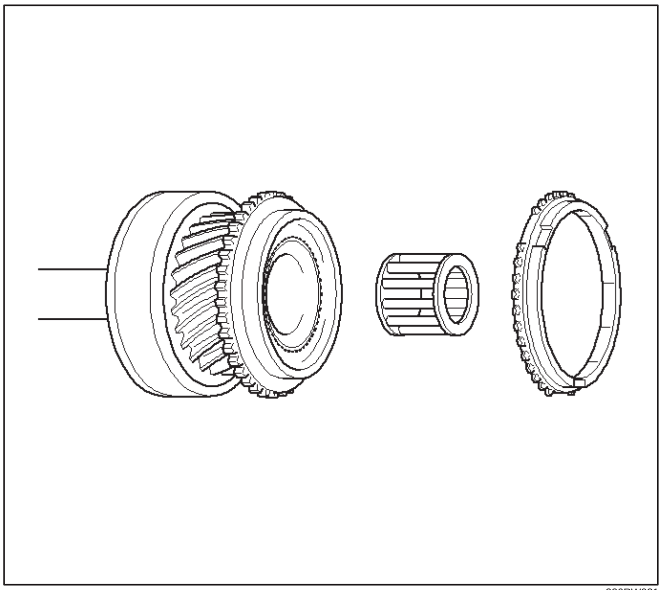
20. Remove the top gear shaft.
    1. Remove the top gear shaft from mainshaft.

NOTE: Don’t fall needle roller bearing.



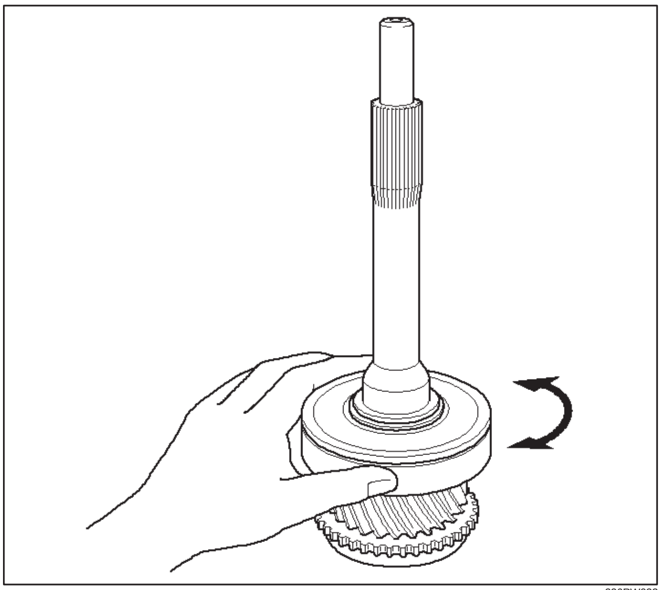
226RW029

    2. Remove the 4th block ring and roller bearing.



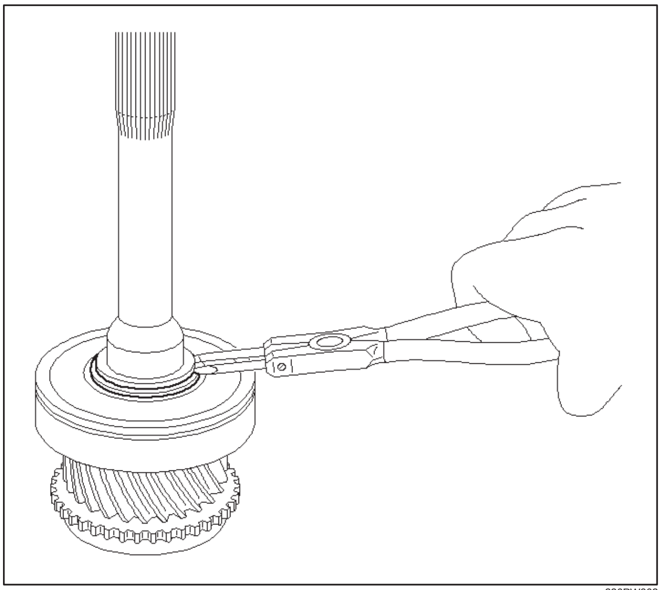
226RW031

21. Disassemble the top gear shaft assembly.
    1. Check for wear or damage.



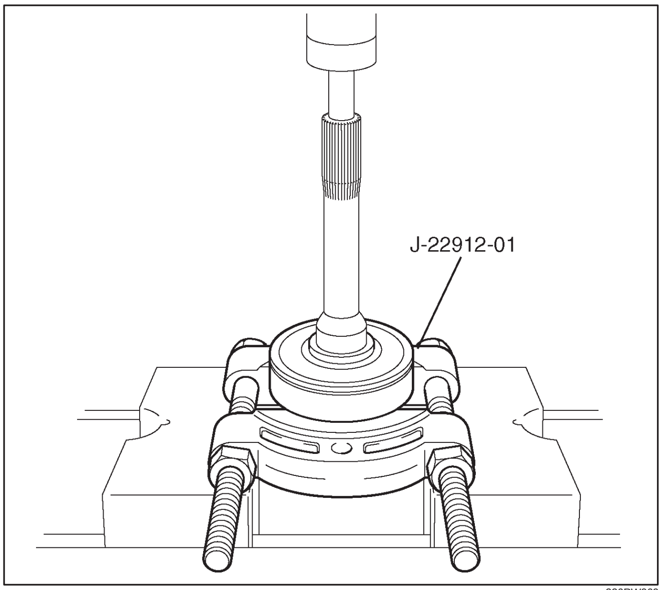
226RW033

    2. Remove the front bearing shaft snap ring.



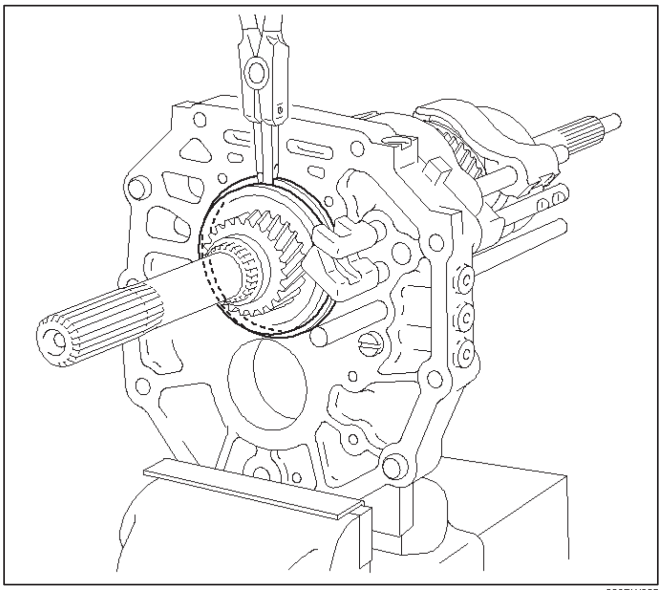
226RW062

3. Using bearing separator J–22912–01 and a press, remove the bearing.



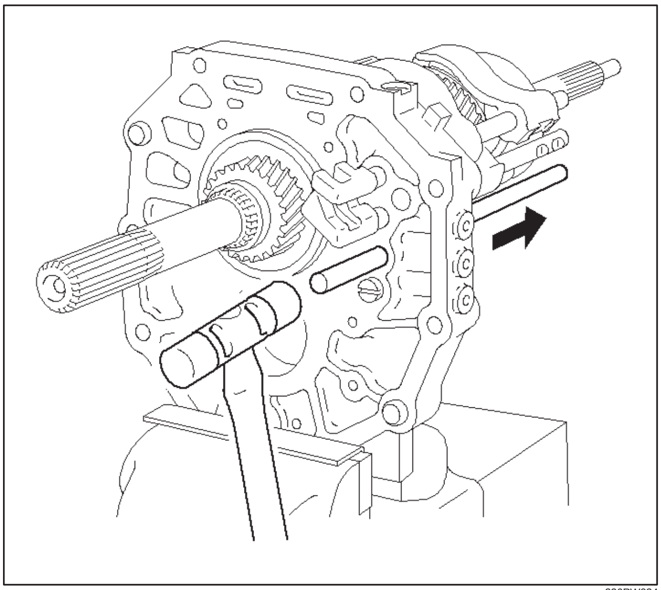
226RW069

22. Remove the mainshaft.
1. Remove mainshaft bearing snap ring.



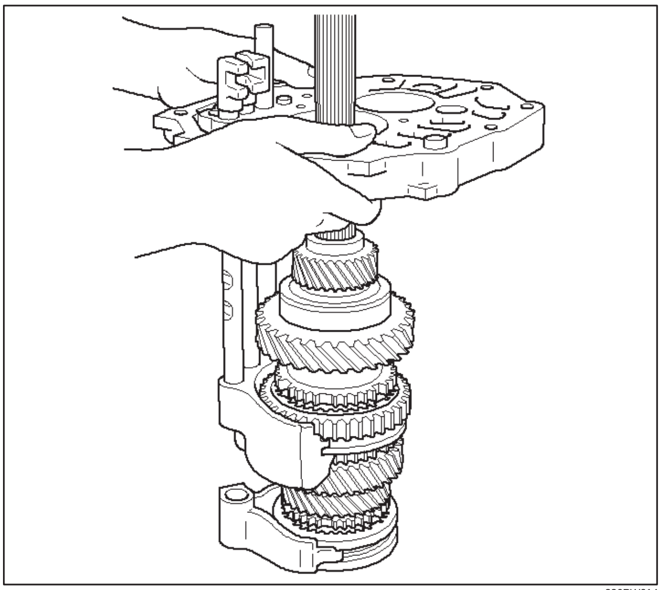
226RW035

2. Using a plastic hammer, tap the 5th-reverse shift rod at the reverse shift side.



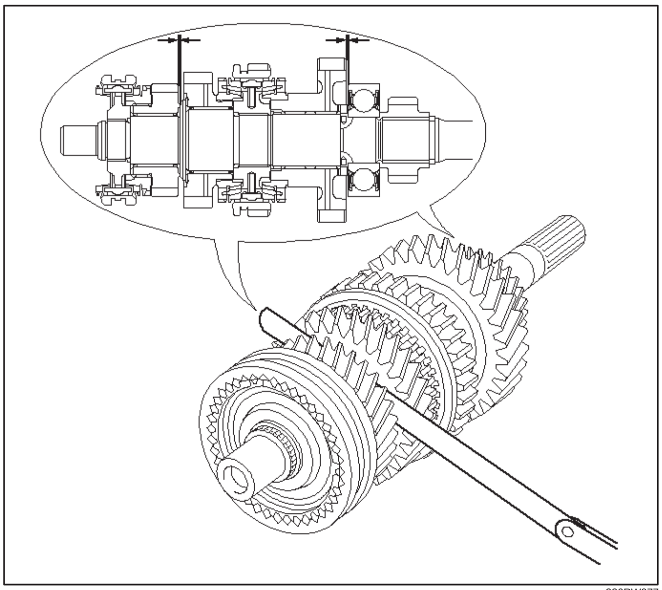
226RW034

3. Remove the intermediate plate from a vise.
4. Remove the mainshaft, 1st-2nd shift arm and 3rd-4th shift arm.



226RW014

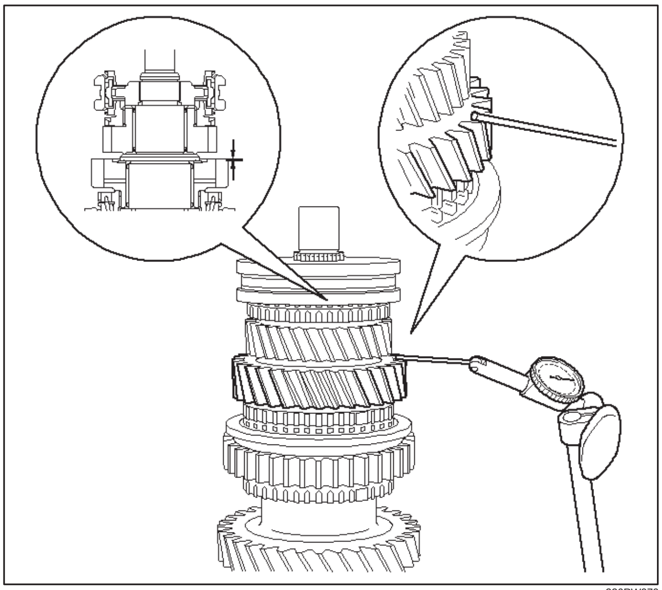
23. Disassemble the main shaft assembly.
    1. Inspect each gear thrust clearance.
        1. Using thickness gauge, inspect thrust clearance (1st gear, 3rd gear).



226RW077

        2. Mount the mainshaft through the aluminum plate in a vise.
        3. Using a dial indicator, measure each gear thrust clearance.

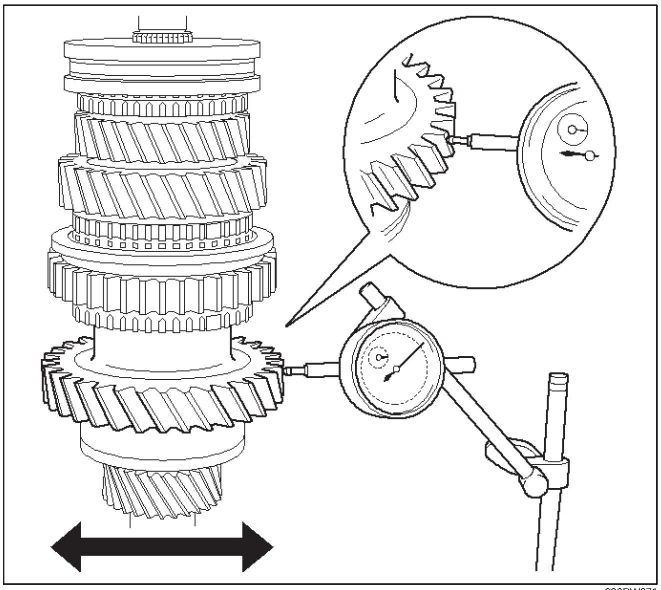
Gear	Standard Clearanse
1st	0.15 – 0.45 mm (0.0059 – 0.0177 in)
2nd	0.10 – 0.25 mm (0.0039 – 0.0098 in)
3rd	0.10 – 0.25 mm (0.0039 – 0.0098 in)



226RW070

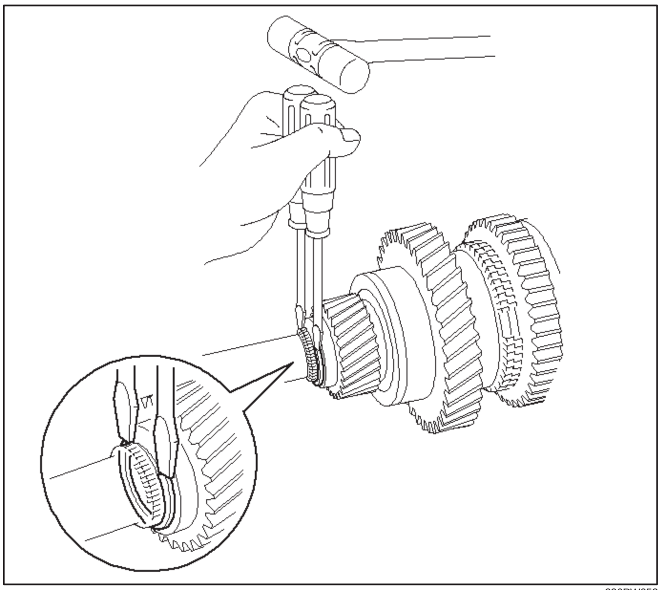
    2. Inspect each gear radial clearance.
        1. Using a dial indicator, measure the radial clearance of each gear.

Gear	Standard Clearanse
1st	0.020 – 0.074 mm (0.00078 – 0.00291 in)
2nd	0.015 – 0.068 mm (0.00059 – 0.00268 in)
3rd	0.015 – 0.068 mm (0.00059 – 0.00268 in)



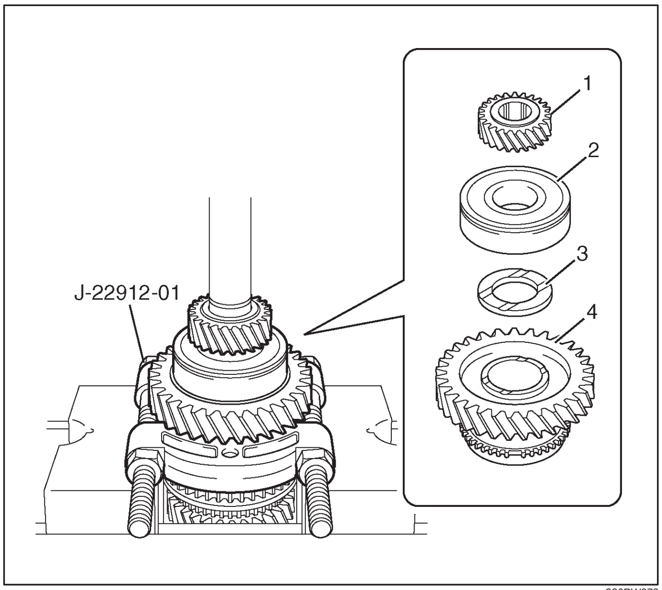
226RW071

    3. Using 2 screwdrivers and hammer, tap out the snap ring.



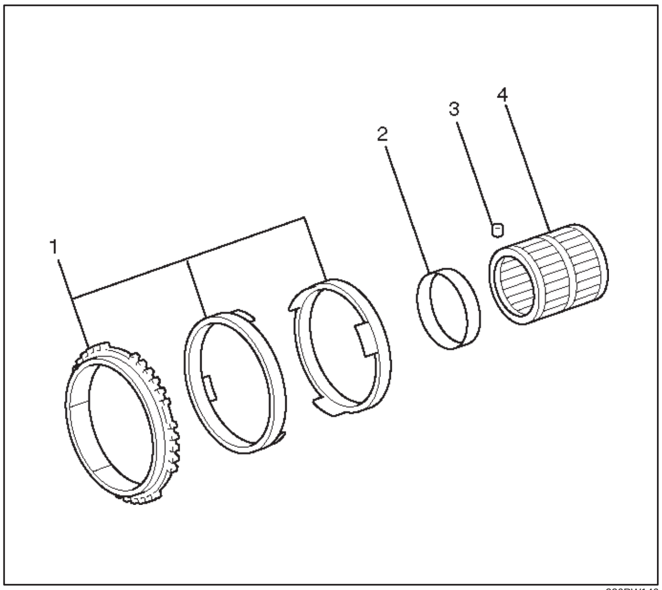
226RW053

4. Using bearing separator J–22912–01 and a press, remove the following parts.
    1. 5th gear (1).
    2. Mainshaft bearing (2).
    3. 1st gear thrust washer (3).
    4. 1st gear (4).



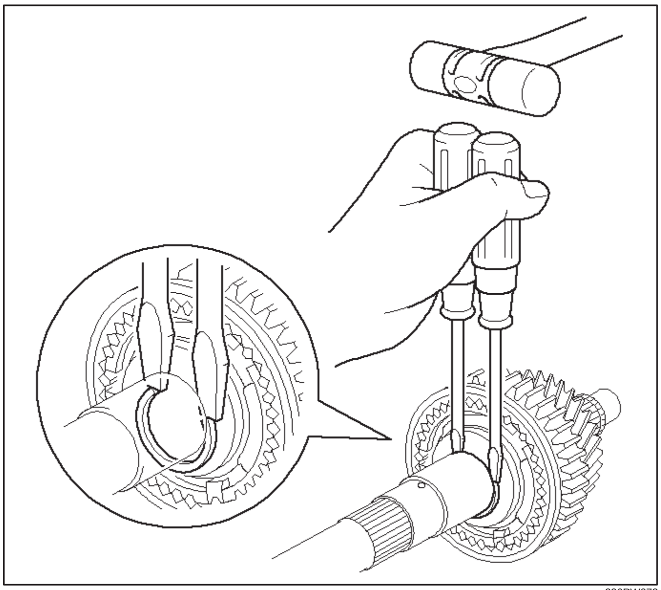
226RW072

5. Remove following parts from mainshaft.
    1. Synchronizer assembly (1).
    2. 1st gear thrust washer pin (3).
    3. 1st gear needle roller bearing (4).
    4. 1st gear bearing spacer (2).



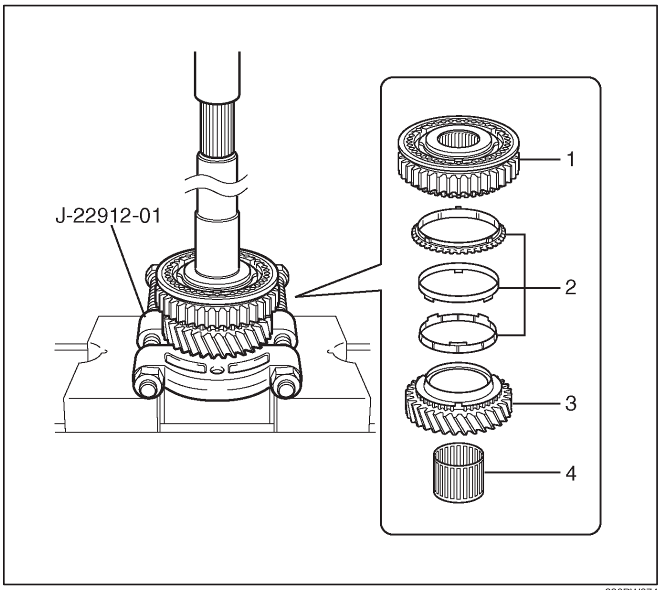
226RW146

6. Using 2 screwdrivers and hammer, tap out snap ring.



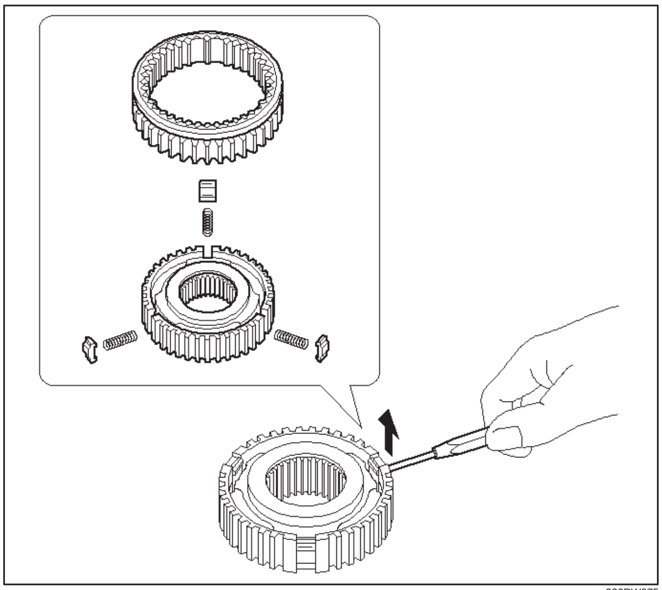
226RW073

7. Using bearing separator J–22912–01 and a press, remove the following parts.
    1. Clutch hub No.1 assembly (1).
    2. Synchronizer assembly (2).
    3. 2nd gear (3).
    4. 2nd gear needle roller bearing (4).



226RW074

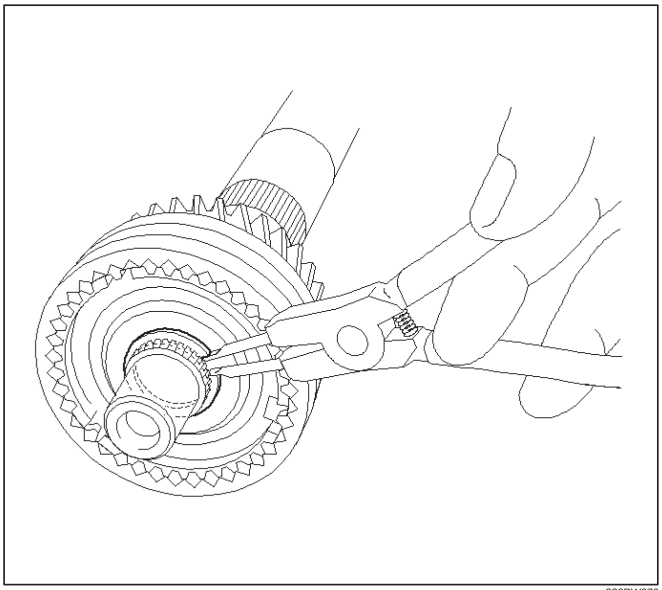
8. Remove the reverse gear from clutch hub No.1.
9. Remove the 3 inserts and 3 compression springs.
   - When removing the inserts, push the insert spring with a screwdriver.



226RW075

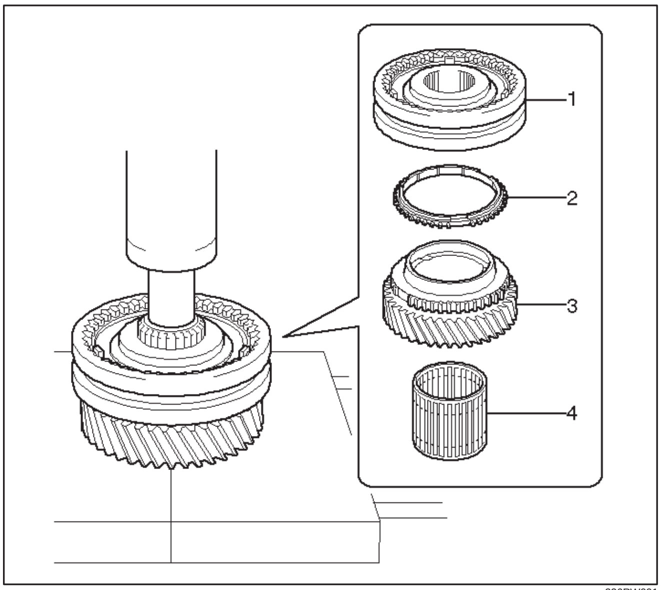
10. Remove the snap ring.

NOTE: Don’t damage the bearing surface.



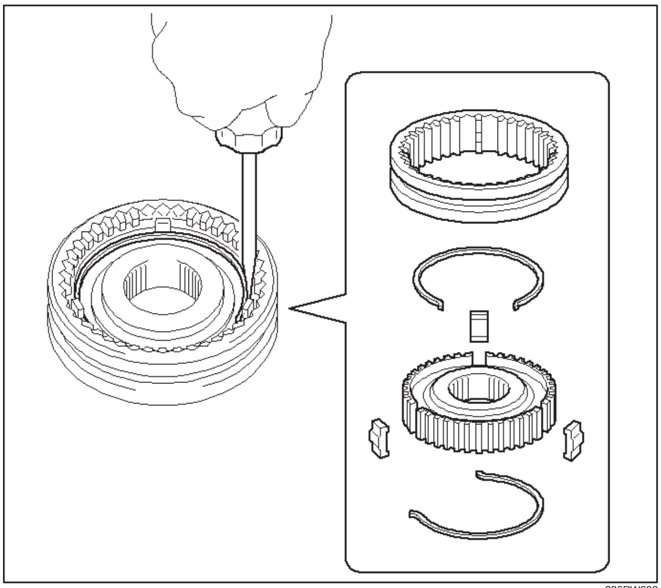
226RW076

11. Using a press, remove following parts.
    1. Clutch hub No.2 assembly (1).
    2. 3rd block ring (2).
    3. 3rd gear (3).
    4. 3rd gear needle roller bearing (4).



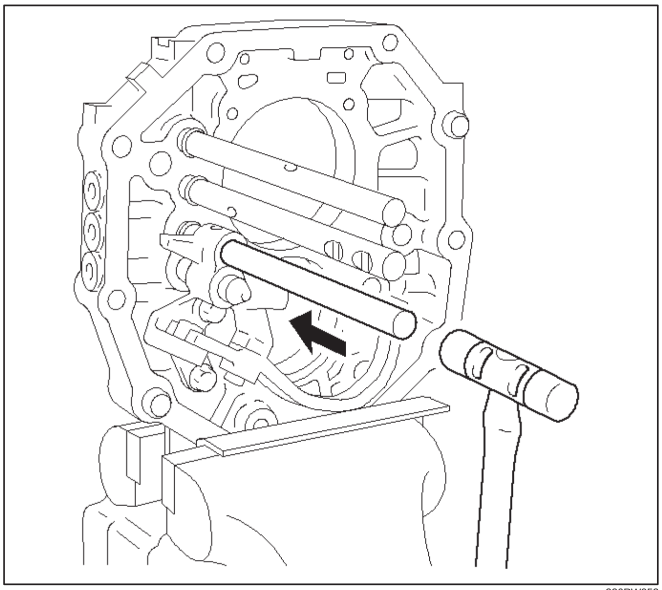
226RW091

12. Using screwdriver, remove the 2 insert springs, hub sleeve No.2, clutch hub No.2 and 3 inserts.



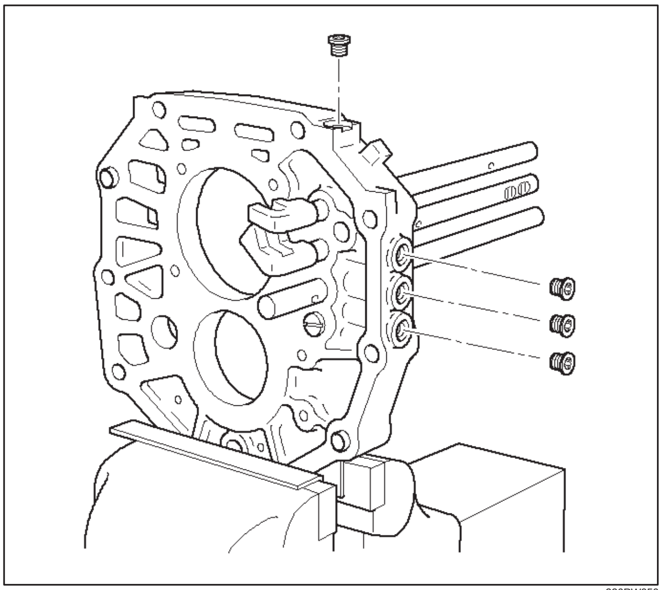
226RW090

24. Remove the shift parts and interlock parts.
    1. Mount the intermediate plate through the aluminum plate in a vise.
    2. Using a plastic hammer, tap the 5th shift rod on the neutral.



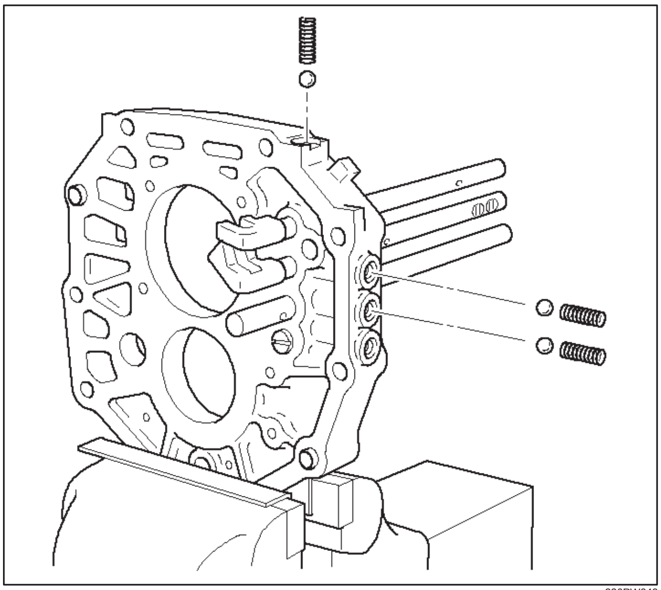
226RW052

    3. Using a torx socket wrench(T40), remove the 4 plugs.



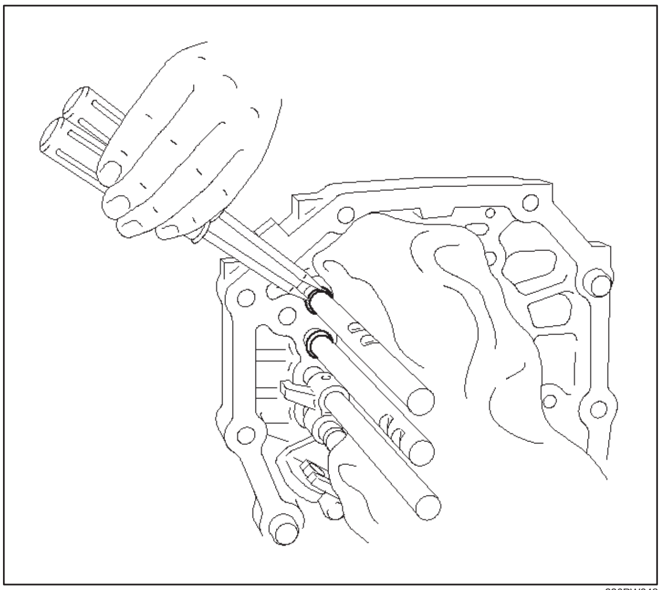
226RW050

    4. Using a magnetic finger, remove 3 springs and balls.



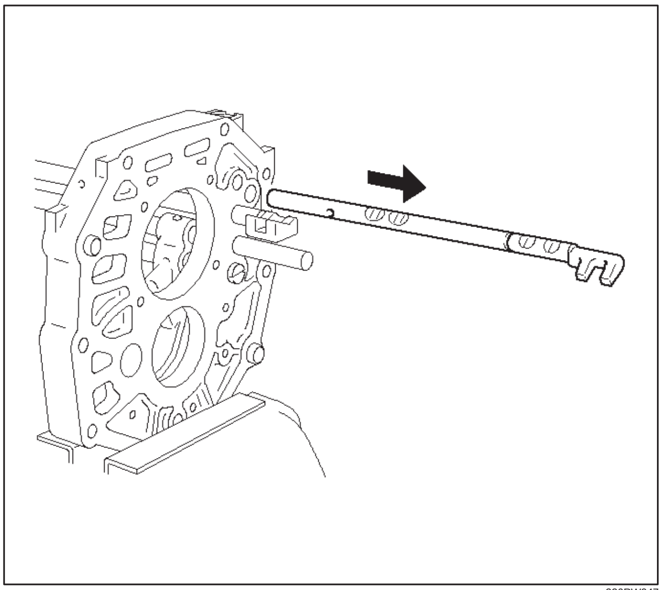
226RW049

    5. Using 2 screwdrivers and a hammer, remove 2 snap rings from each shift fork rod.



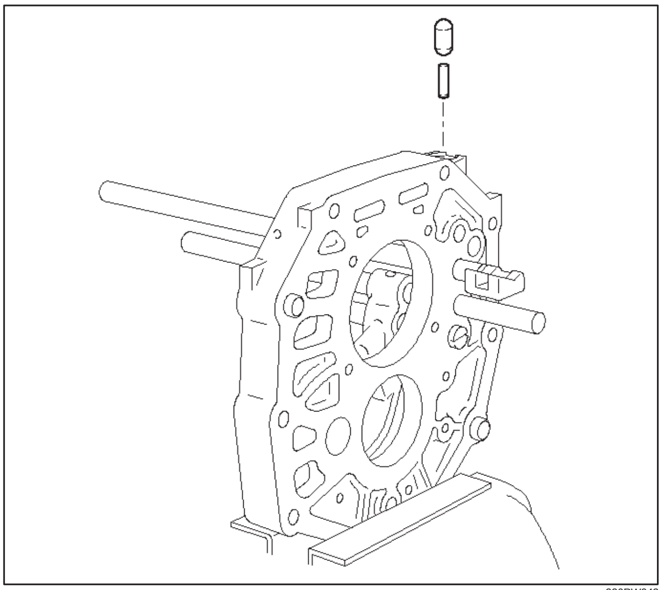
226RW048

6. Pull out the 3rd–4th shift rod at the rear.



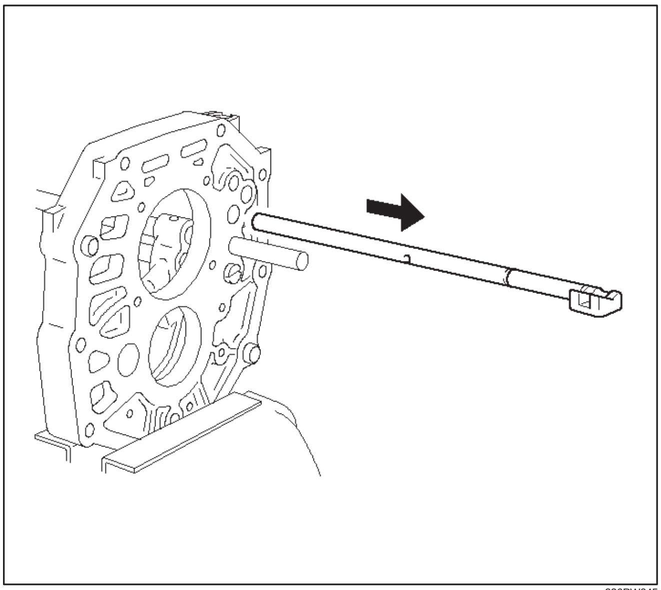
226RW047

7. Using a magnetic finger, remove the interlock pin and straight pin.



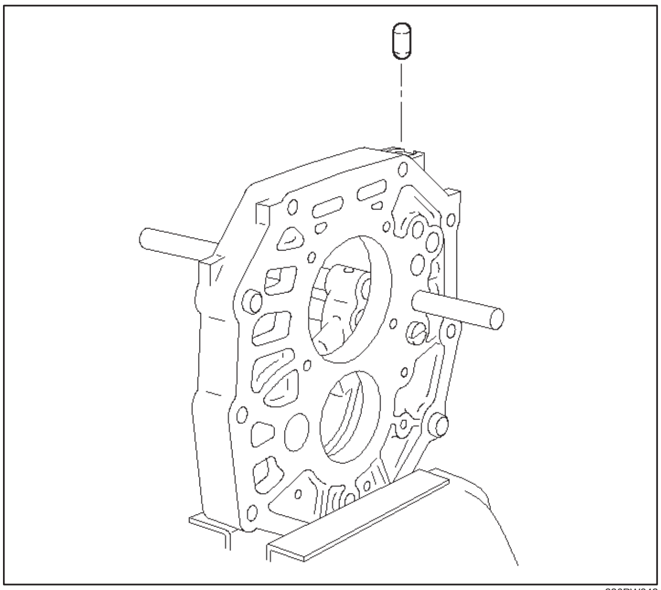
226RW043

8. Pull out the 1st–2nd shift rod at the rear.



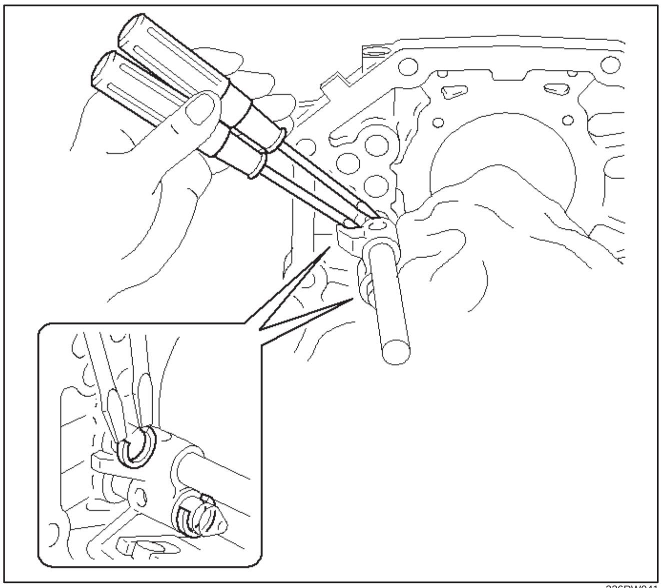
226RW045

9. Using a magnetic finger, remove the interlock pin.



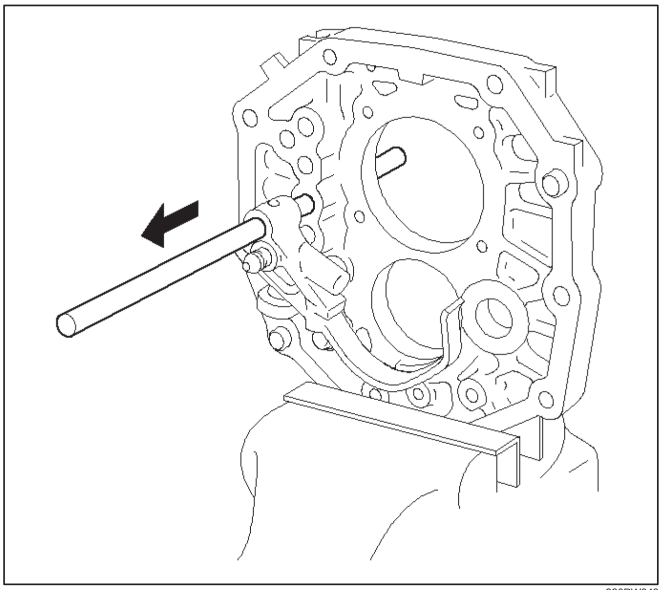
226RW042

10. Using 2 screwdrivers and a hammer, remove 2 snap rings.



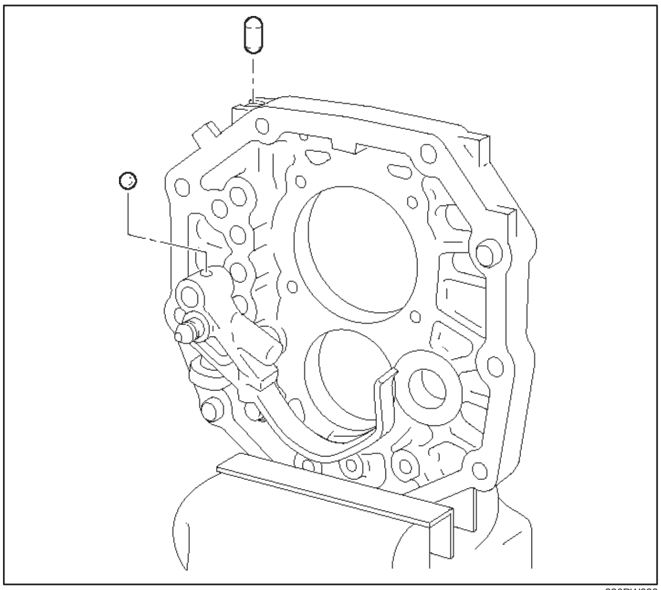
226RW041

11. Pull out the 5th-reverse shift rod at the front.



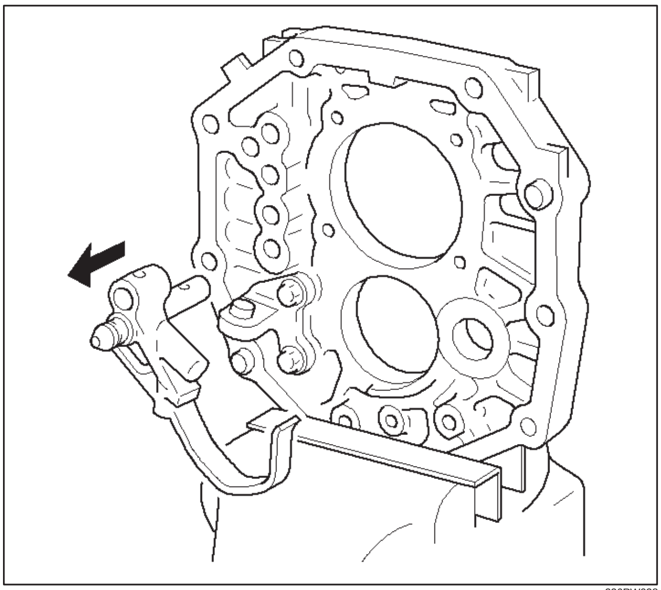
226RW040

12. Using a magnetic finger, remove the interlock pin from the intermediate plate. Remove the ball from the reverse shift arm No.1.



226RW039

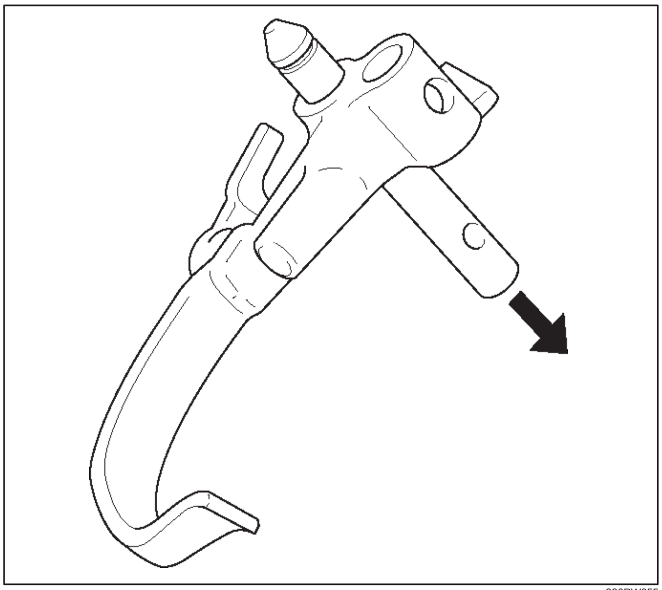
13. Pull out at the rear reverse shift rod, reverse shift arm No.1 and reverse shift arm No.2 at the same time.



226RW038

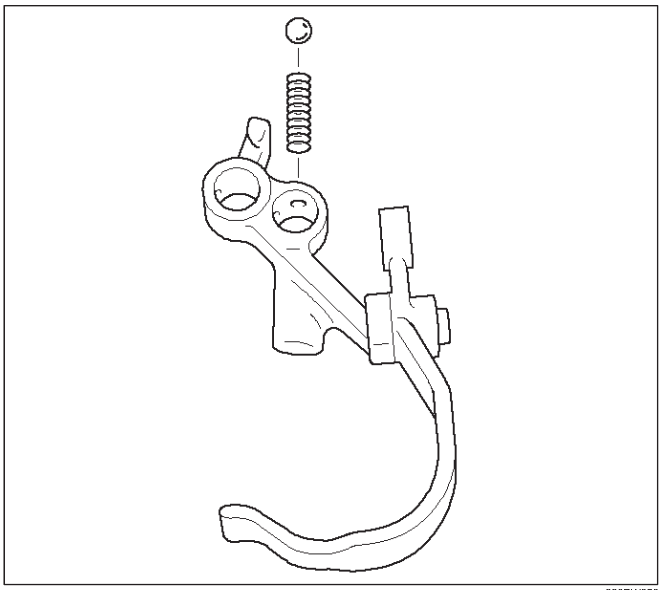
14. Pull out reverse shift rod from reverse shift arm No.1.

NOTE: Be sure remove at the rear.



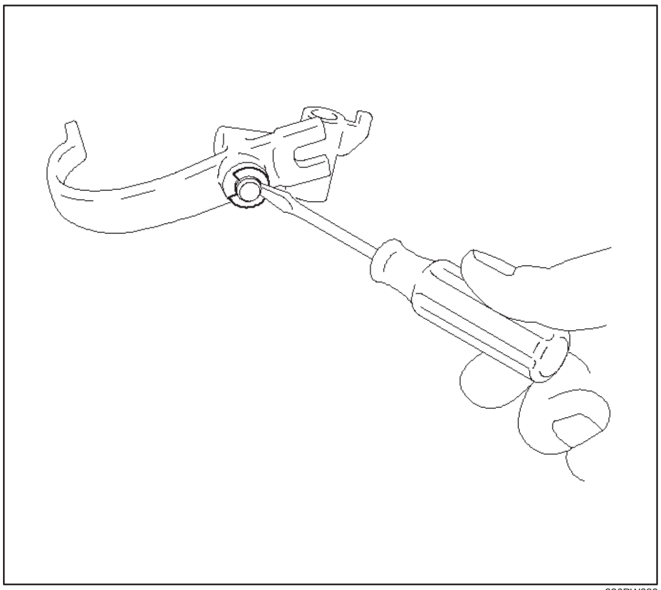
226RW055

15. Using a magnetic finger, remove the ball and spring from reverse shift arm No.1.



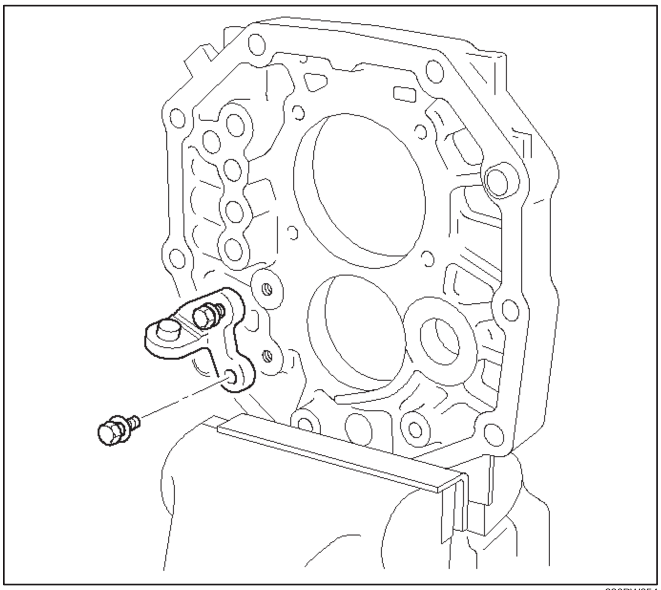
226RW056

16. Remove the reverse shift arm No.2 E–ring. Remove the reverse shift arm No.2 from reverse shift arm No.1.



226RW089

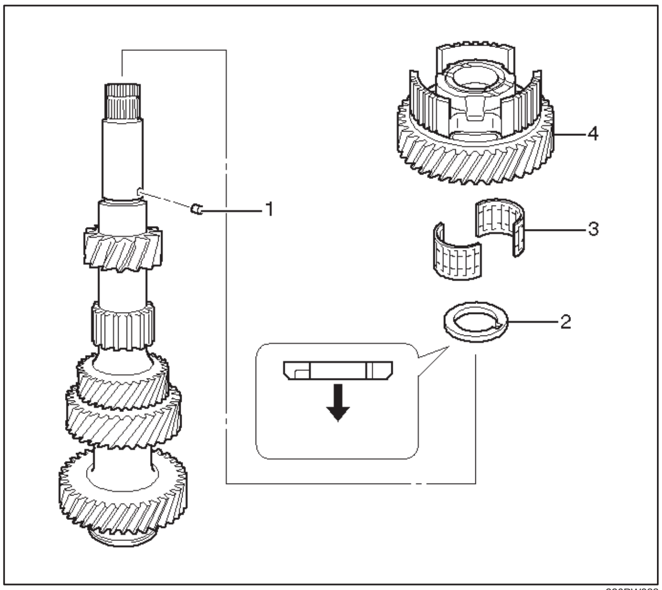
17. Remove the 2 bolts and reverse shift arm bracket.



226RW054

Inspection

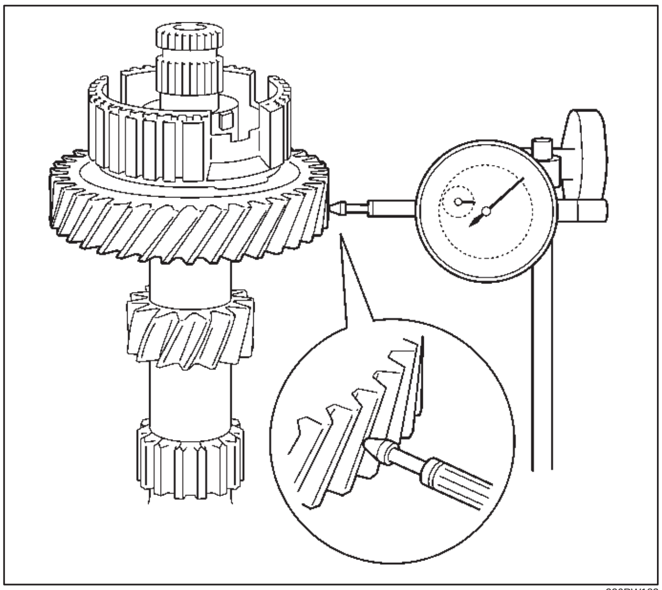
1. Counter 5th gear radial clearance.
   1. Install the following parts to the counter gear shaft.
      1. Counter 5th gear thrust washer pin (1).
      2. Counter 5th gear thrust washer (2).
      3. Counter 5th gear needle bearing(3).
      4. Counter 5th gear (4).



226RW088

   2. Mount the counter gear shaft through the aluminum plate in vise.
   3. Using a dial indicator, measure the counter 5th gear radial clearance.

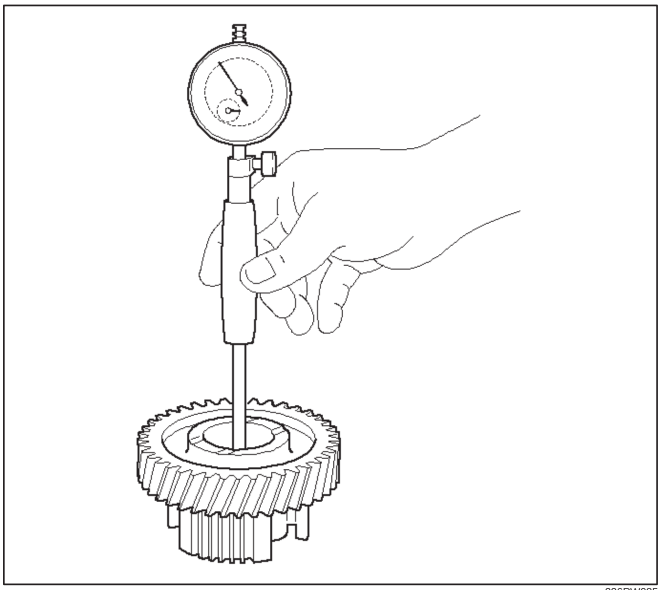
Standard: 0.015 – 0.068 mm (0.00059 – 0.00268 in)



226RW183

   4. Using a inside dial indicator, measure the gear inside diameter.

Standard: 38.015 – 38.040 mm (1.49665 – 1.49763 in)



226RW085

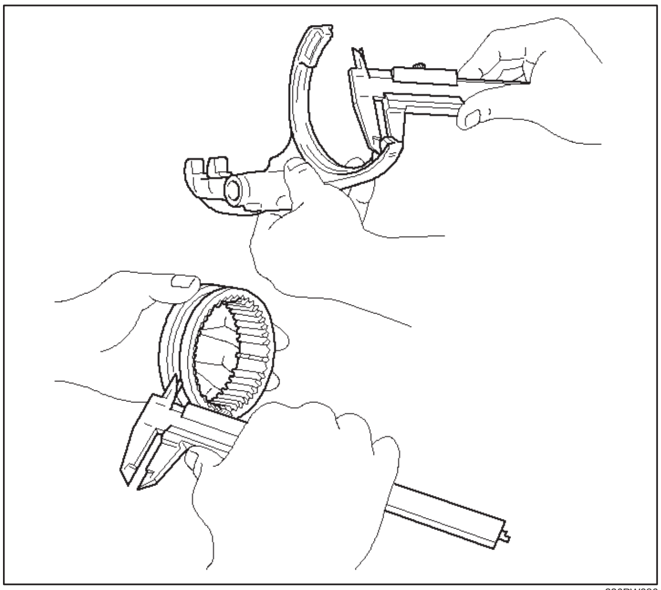
2. 5th-reverse shift arm and hub sleeve No.3 clearance.
   1. Using a vernier caliper, measure the 5th-reverse shift arm thickness.

Reference: 10.2 mm (0.402 in)

   2. Using a vernier caliper, measure the center groove of hub sleeve No.3. Calculate the clearance between the hub sleeve No.3 and shift arm.

Standard: 0.26 – 0.84 mm (0.0102 – 0.0331 in)

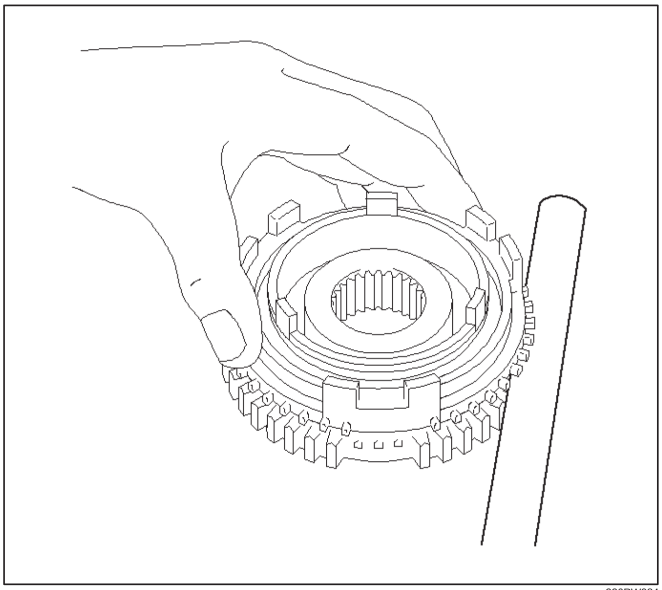
Reference: Center groove dimension 10.5mm (0.413 in)



226RW086

3. Reverse block ring set.
   1. Using a thickness gauge, measure the clearance between the counter 5th gear spline piece and reverse block ring.

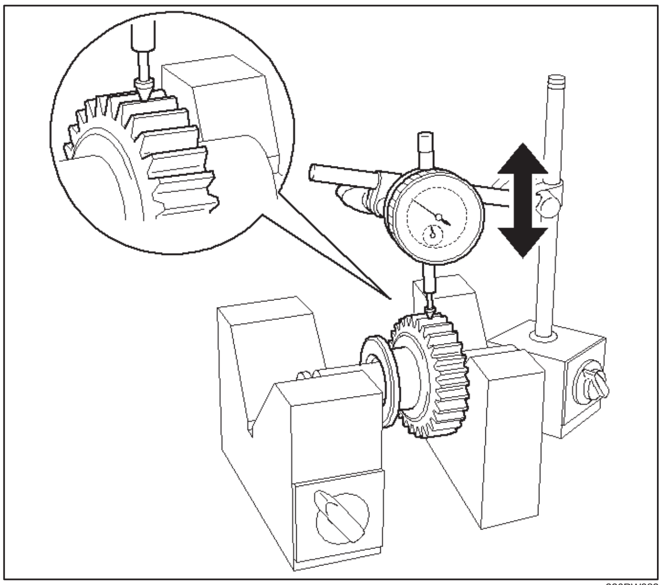
Standard: 0.7 – 1.7 mm (0.028 – 0.067 in)



226RW084

4. Reverse idle gear and reverse idle gear shaft.
   1. Mount the reverse idle gear and reverse idle gear shaft in a vise.
   2. Using a dial indicator, measure the reverse idle gear radial clearance.

Standard: 0.040 – 0.082 mm (0.0016 – 0.0032 in)



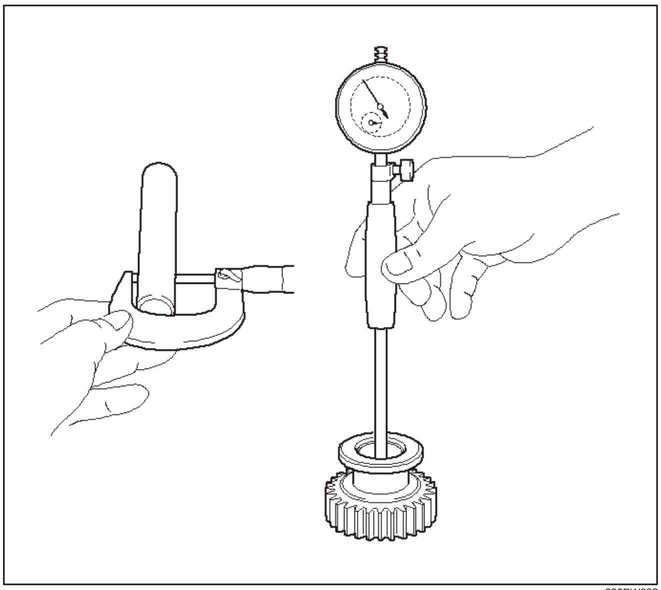
226RW083

   3. If the clearance exceeds the maximum, measure the gear inside diameter and shaft diameter.

Standard

Shaft Diameter: 23.979 – 24.000 mm (0.94405 – 0.94488 in)

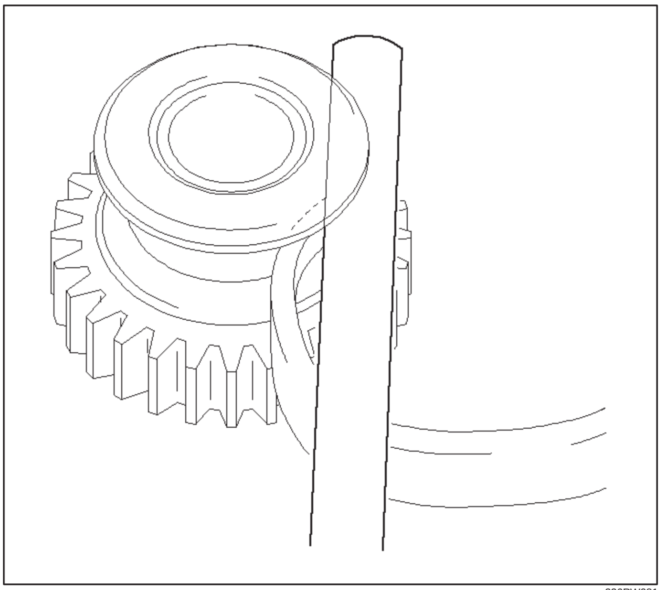
Gear Diameter: 24.040 – 24.061 mm (0.94645 – 0.94728 in)



226RW082

5. Reverse shift arm No.2 thrust clearance.
   1. Using a thickness gauge, measure the clearance between the reverse idle gear and shift arm No.2.

Standard: 0.05 – 0.35 mm (0.002 – 0.014 in)

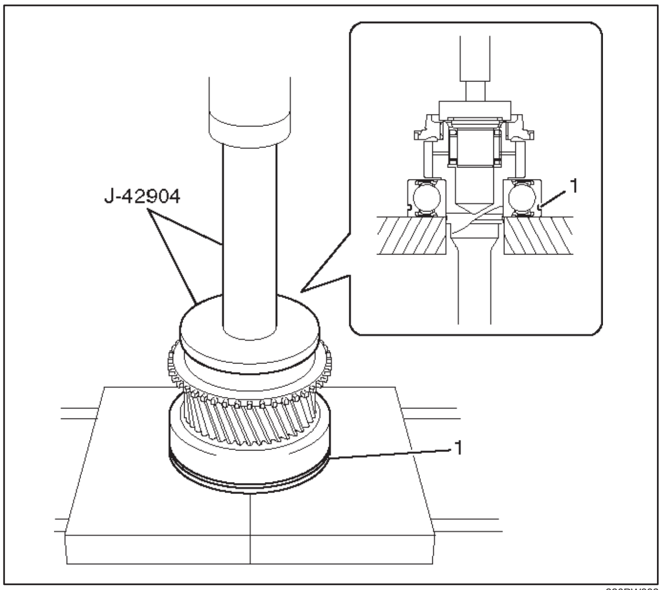


226RW081

Reassembly

1. Install the top gear shaft assembly.
   1. Using installer J–42904 and a press, install a new bearing.

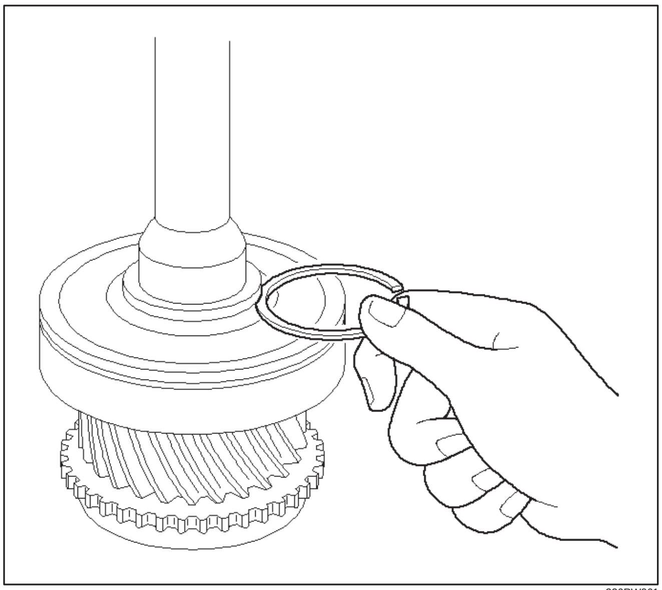
NOTE: Outer race snap ring groove (1) toward front.



226RW092

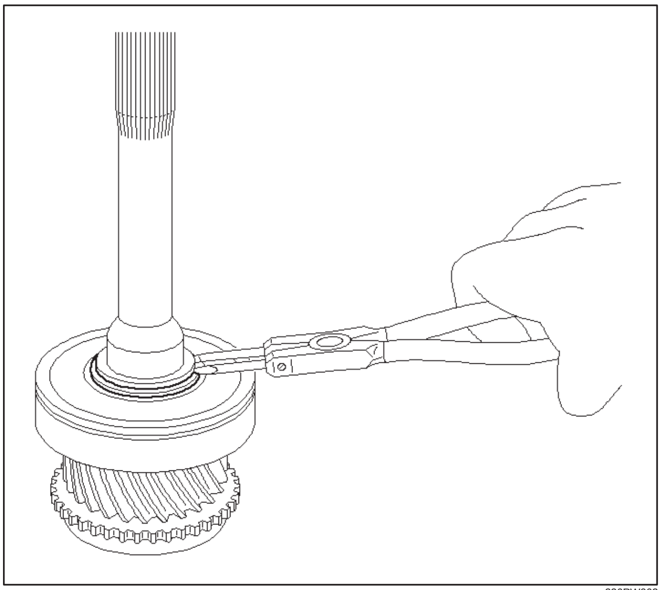
2. Select a snap ring that will allow minimum axial play.

Mark	Thickness
A	2.10 – 2.15 mm (0.083 – 0.085 in)
B	2.15 – 2.20 mm (0.085 – 0.087 in)
C	2.20 – 2.25 mm (0.087 – 0.089 in)
D	2.25 – 2.30 mm (0.089 – 0.091 in)
E	2.30 – 2.35 mm (0.091 – 0.093 in)
F	2.35 – 2.40 mm (0.093 – 0.095 in)
G	2.40 – 2.45 mm (0.095 – 0.097 in)



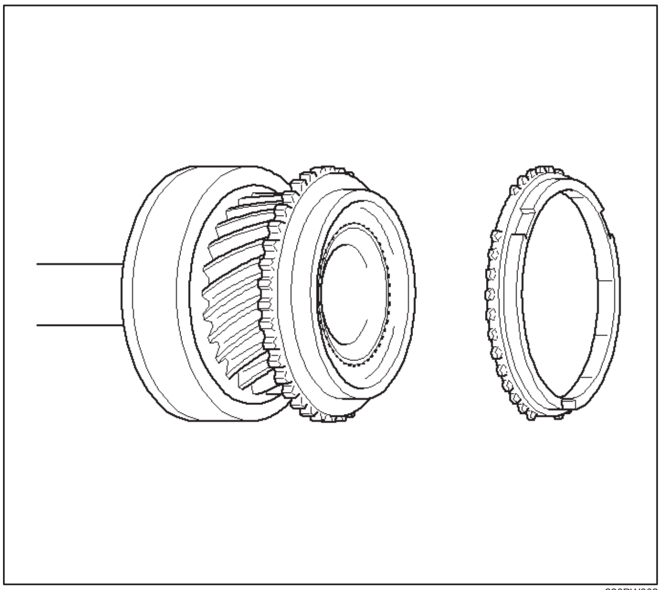
226RW061

3. Using a snap ring expander, install the new snap ring.



226RW062

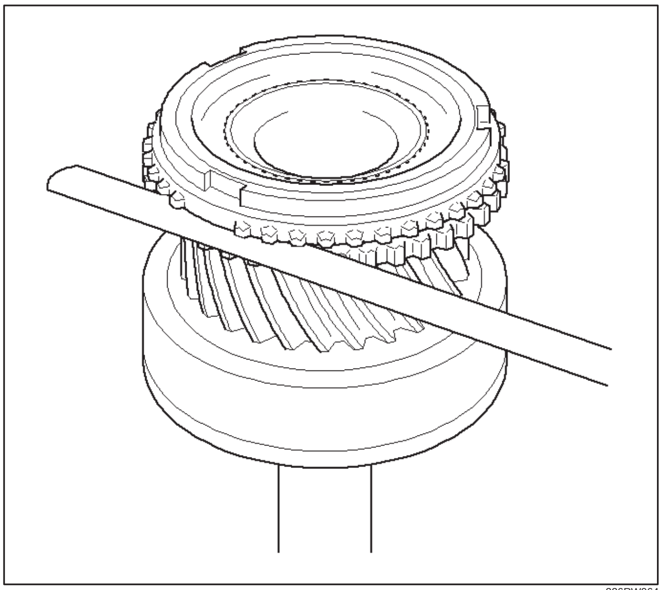
4. Install the 4th block ring.



226RW063

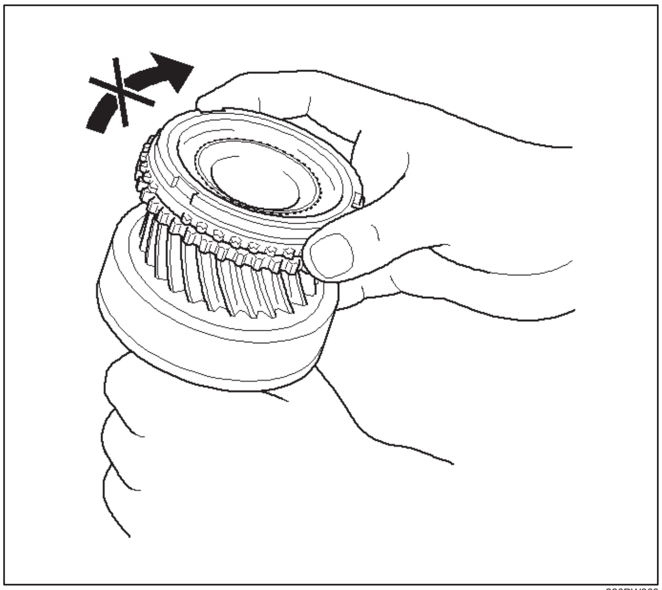
5. Using a thickness gauge, measure the clearance between the 4th block ring back and gear spline end.

Standard: 0.75 – 1.65 mm (0.030 – 0.065 in)



226RW064

6. Check the braking effect of the block ring. Turn the block ring in one direction while pushing it to the gear cone. Check that the ring locks. If it does not lock, replace the block ring.



226RW060

7. Install the needle roller bearing.

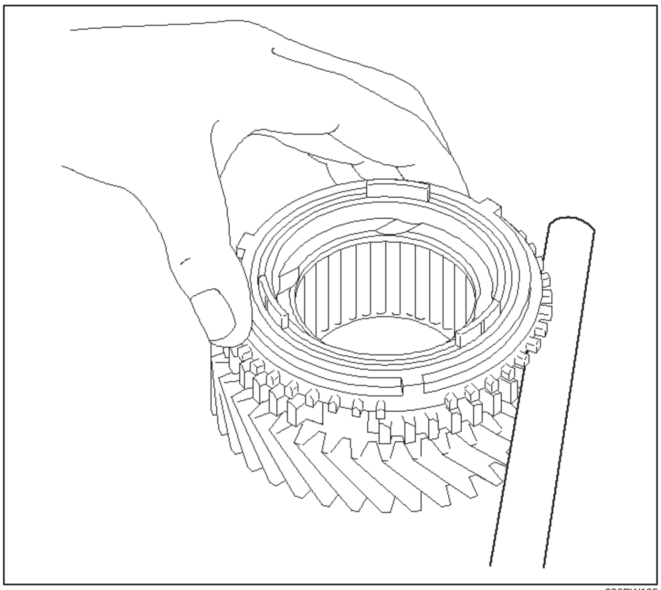
2. Reassemble the mainshaft assembly.

NOTE: Apply all parts with gear oil before installing them.

3. Inspect block ring.

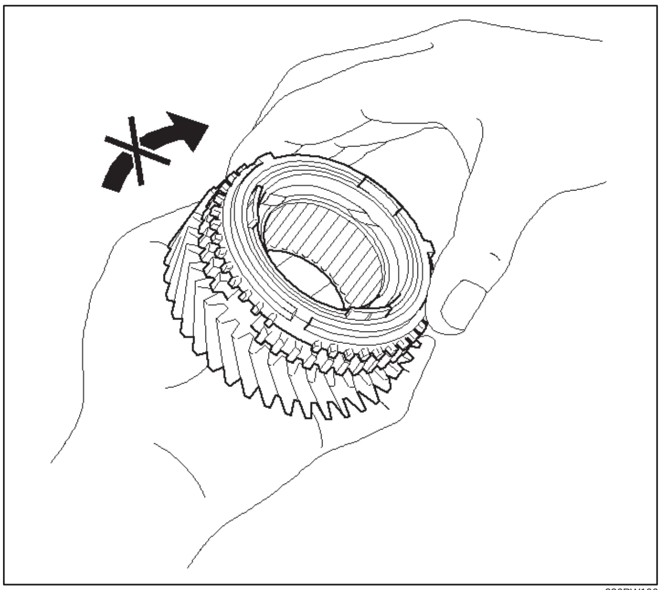
1. Using a thickness gauge, measure the clearance between the synchronizer ring back and gear spline end.

Gear	Standard Clearanse
1st	0.80 – 1.60 mm (0.032 – 0.063 in)
2nd	0.65 – 1.75 mm (0.026 – 0.069 in)
3rd	0.75 – 1.65 mm (0.030 – 0.065 in)



226RW105

2. Turn the synchronizer ring in one direction while pushing it to the gear cone. Check that the ring locks.



226RW106

4. Inspect hub sleeve and shift arm.

1st–2nd shift arm

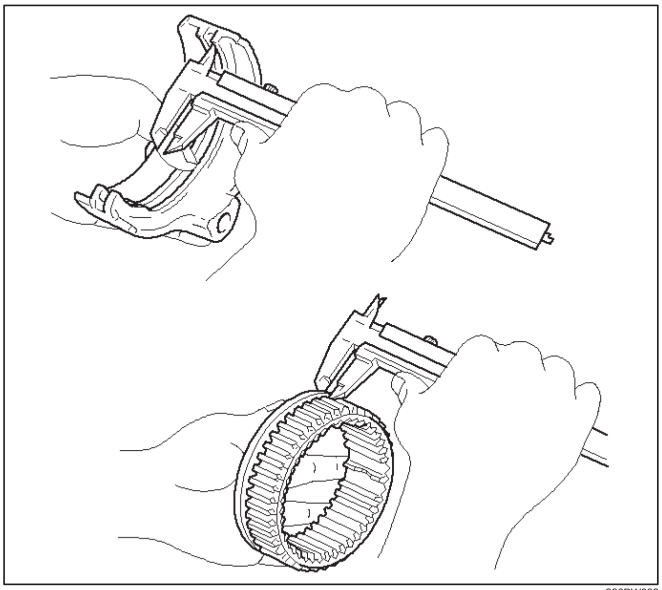
1. Using a vernier caliper, measure center groove of the 1st–2nd shift arm.

Reference: 5.28 mm (0.208 in)

2. Using a vernier caliper, measure flange of the reverse gear. Calculate the clearance between the reverse gear and shift arm.

Reference: Reverse gear flange thickness 5.0 mm (0.197 in)

Standard: 0.15 – 0.41 mm (0.006 – 0.016 in)



226RW093

3rd–4th shift arm

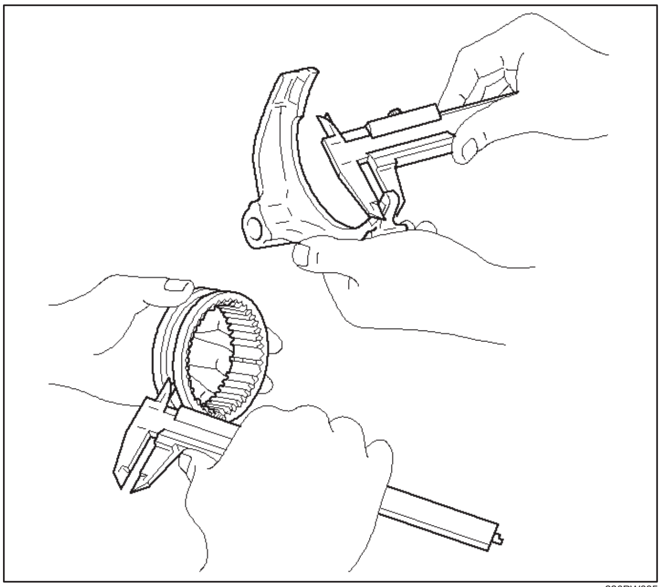
1. Using a vernier caliper, measure tip of the shift arm thickness.

Reference: 10.0mm (0.39 in)

2. Using a vernier caliper, measure center groove of the hub sleeve No.2. Calculate the clearance between the hub sleeve No.2 and shift arm.

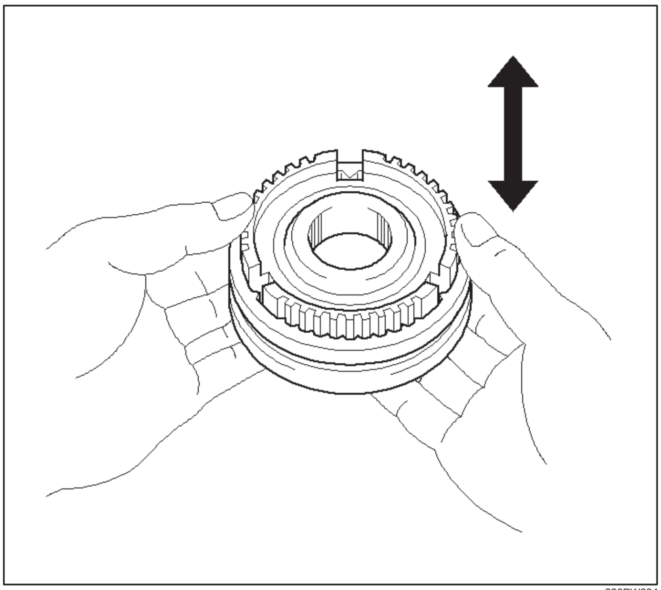
Reference: Center groove dimension 10.2 mm (0.402 in)

Standard: 0.15 – 0.35 mm (0.006 – 0.014 in)



226RW095

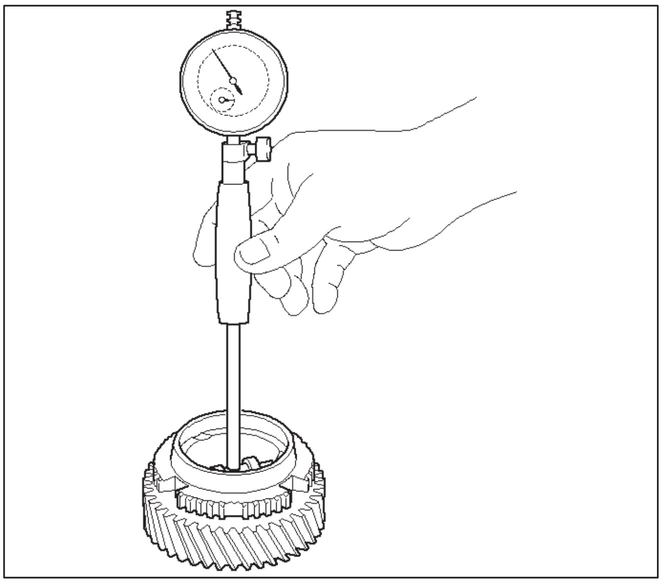
5. Inspect clutch hub and hub sleeve.
   1. Check for wear or damage.
   2. Install the hub sleeve to the clutch hub, and check sliding smoothly.



226RW094

6. Inspect gear inside diameter.
   1. Using a inside dial indicator, measure the gear inside diameter.

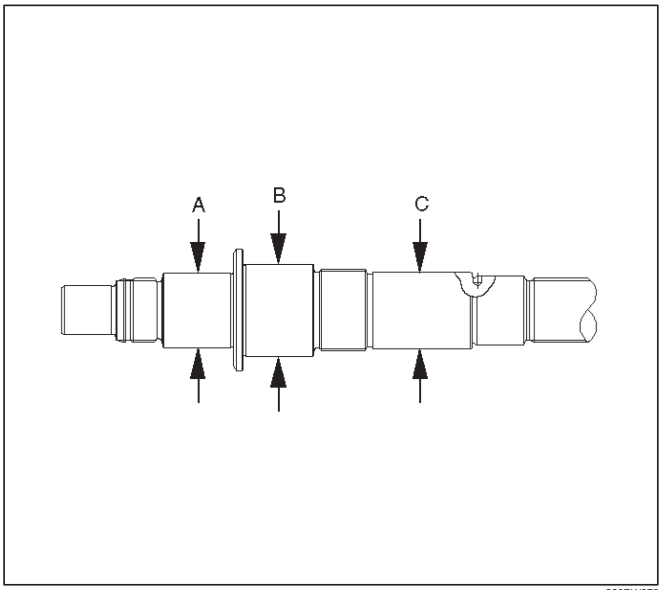
Gear	Standard Diameter
1st	46.015 – 46.040 mm (1.8116 – 1.8126 in)
2nd	53.015 – 53.040 mm (2.0872 – 2.0882 in)
3rd	44.015 – 44.040 mm (1.7329 – 1.7339 in)



226RW096

7. Inspect mainshaft.
   1. Using a micrometer, measure the outer diameter of the mainshaft journal.

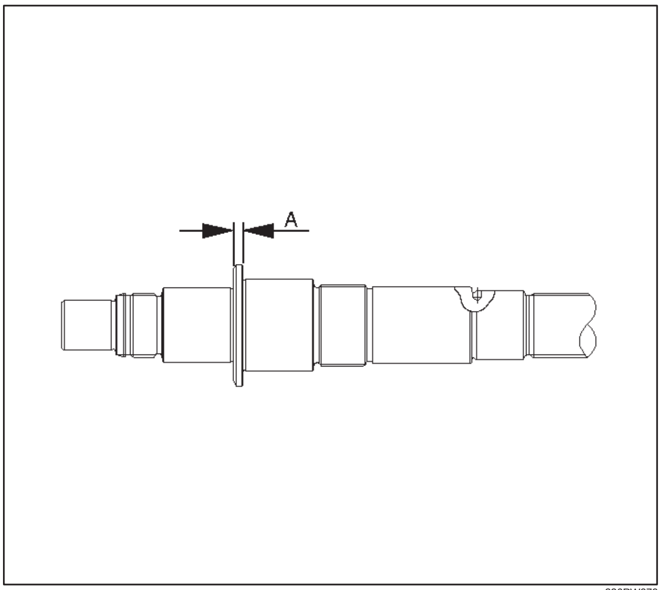
Mea-sure Position	Standard
A	37.984 – 38.000 mm (1.4954 – 1.4961 in)
B	46.984 – 47.000 mm (1.8498 – 1.8504 in)
C	38.979 – 38.995 mm (1.5346 – 1.5352 in)



226RW078

   2. Using a micrometer, measure the mainshaft flange thickness.

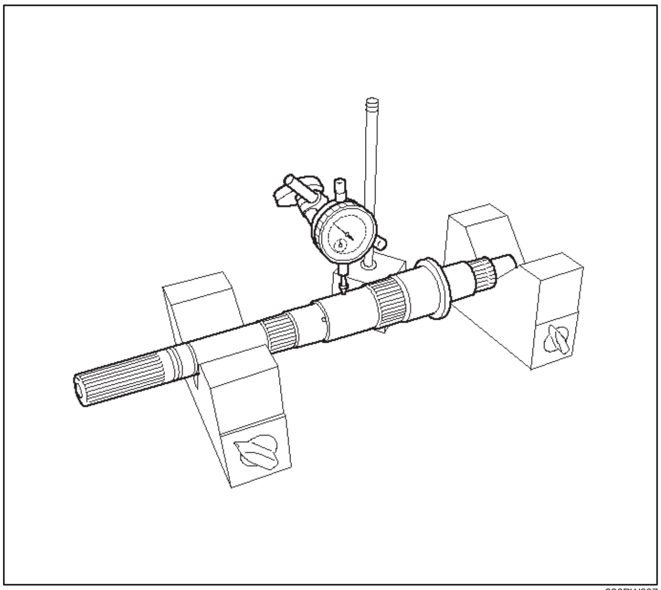
Standard: 5.0 mm (0.197 in)



226RW079

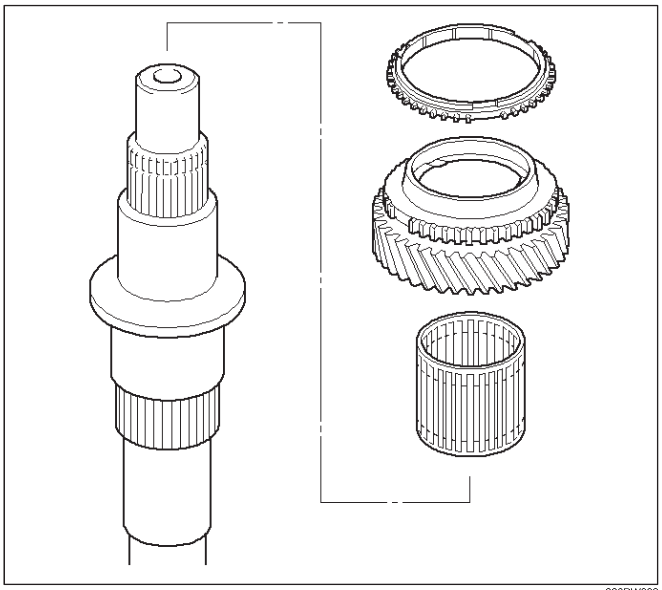
   3. Install the mainshaft to V-blocks.
   4. Use a dial indicator to measure the mainshaft central portion run-out.

Standard: less than 0.015 mm (0.0006 in)



226RW097

8. Install 3rd gear.
   1. Install the 3rd gear needle bearing, 3rd gear and 3rd block ring to the mainshaft.



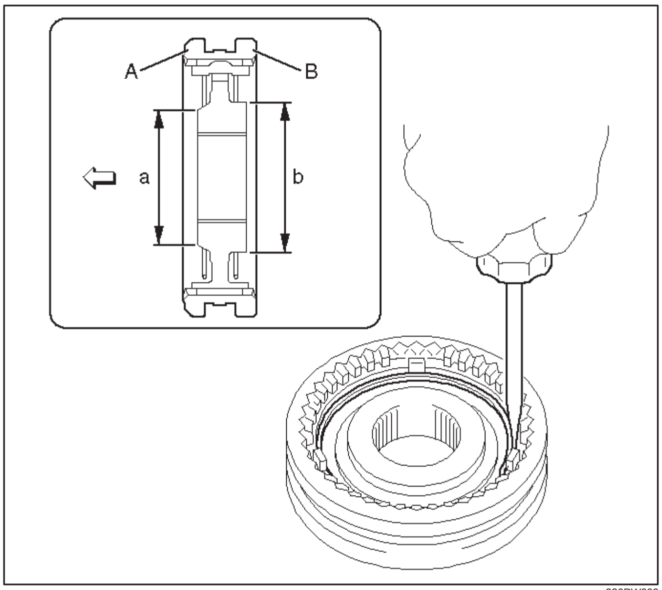
226RW098

9. Install the clutch hub No.2.
   1. Install the clutch hub No.2 and hub sleeve No.2.

NOTE: Be careful the direction of the clutch hub No.2, as shown.

   2. Using a screwdriver, install 3 inserts and 2 springs.

NOTE: Position the insert springs so that their end gaps are not in line.

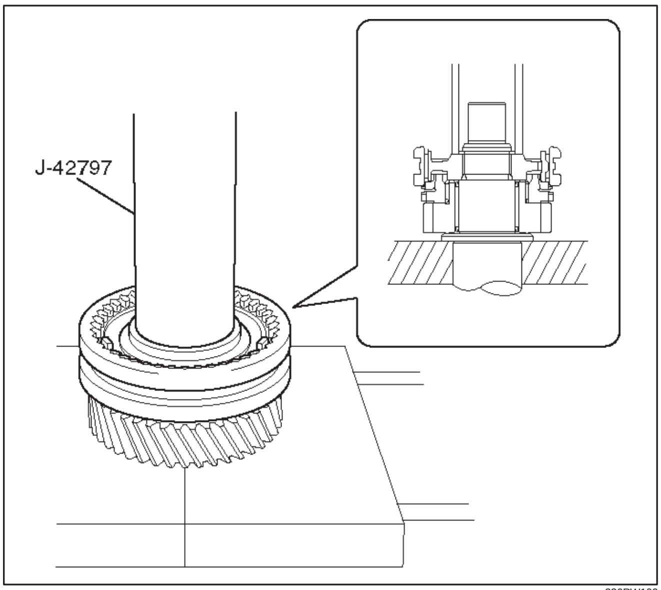


226RW099

   3. Using installer J–42797 and a press, install the clutch hub No.2 and hub sleeve No.2 to the mainshaft.

NOTE:

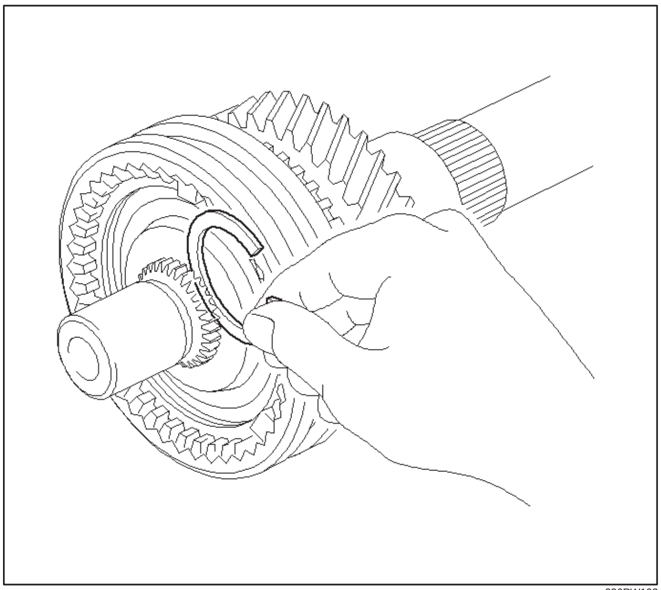
- Align the block ring slots with the inserts.
- Check that the gear rotates smoothly.



226RW100

   4. Select a snap ring that will allow minimum axial play.

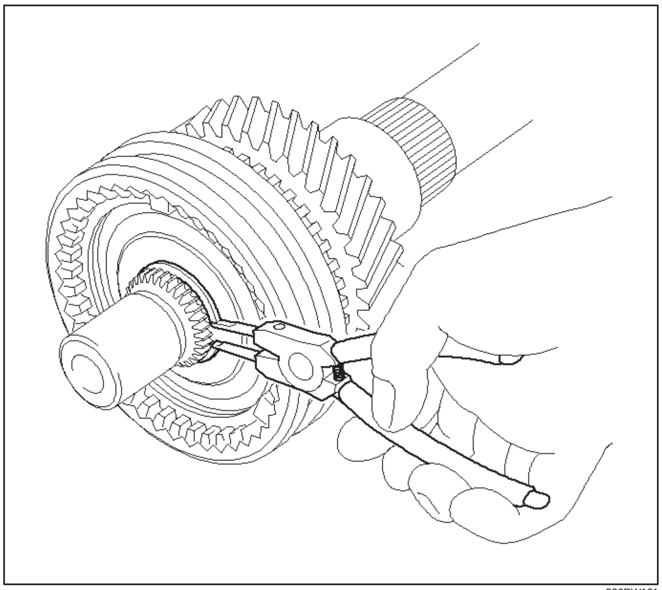
Mark	Thickness
A	1.80 – 1.85 mm (0.071 – 0.073 in)
B	1.85 – 1.90 mm (0.073 – 0.075 in)
C	1.90 – 1.95 mm (0.075 – 0.077 in)
D	1.95 – 2.00 mm (0.077 – 0.079 in)
E	2.00 – 2.05 mm (0.079 – 0.081 in)
F	2.05 – 2.10 mm (0.081 – 0.083 in)
G	2.10 – 2.15 mm (0.083 – 0.085 in)



226RW102

5. Using a snap ring expander, install the new snap ring.

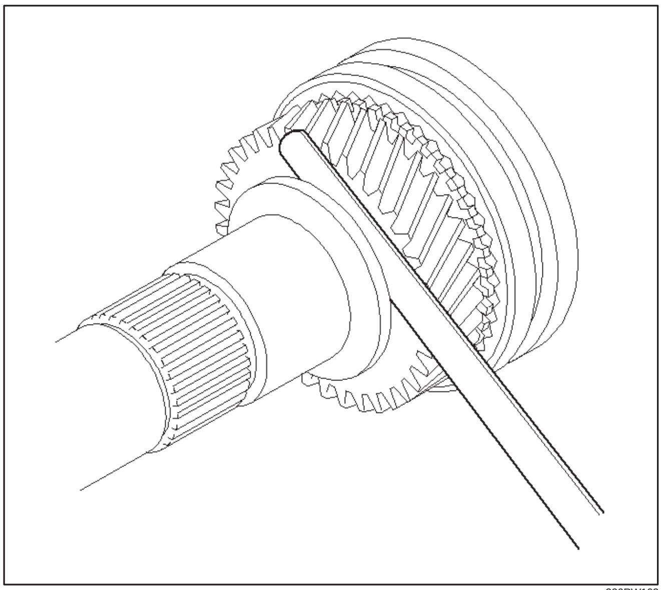
NOTE: Be careful not to damage the bearing surface.



226RW101

6. Using a thickness gauge, inspect the 3rd gear thrust clearance.

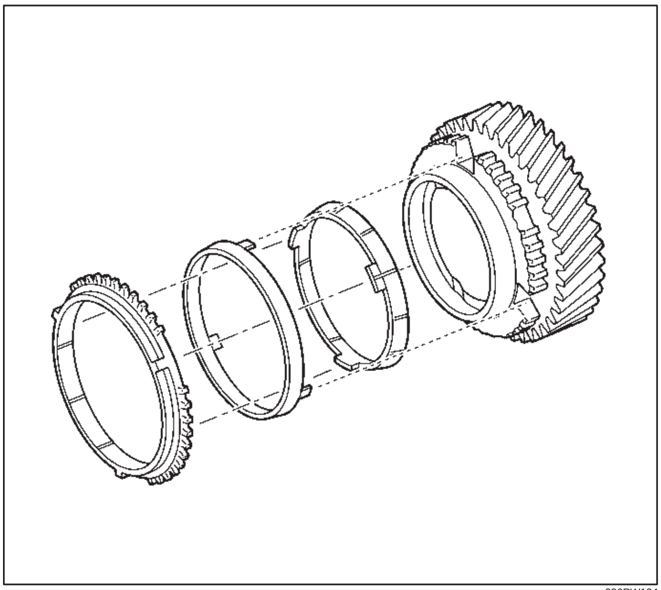
Standard: 0.10 – 0.25mm (0.004 – 0.010 in)



226RW103

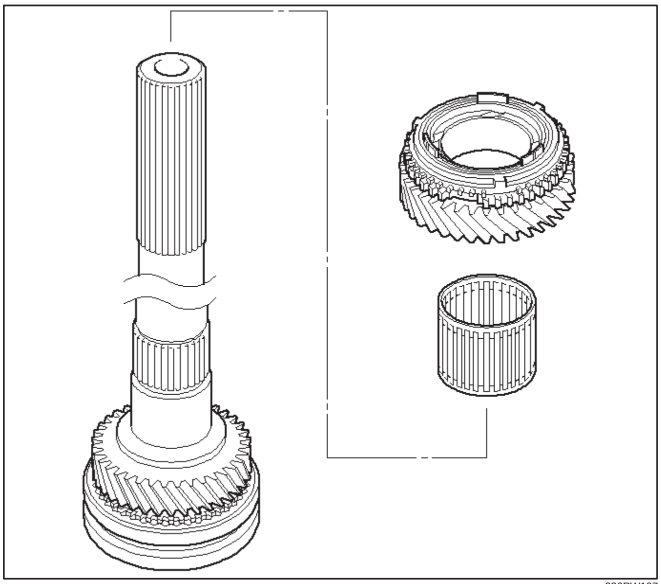
10. Install the 2nd gear.
    1. Install the synchronizer ring set NO.1 to the 2nd gear.

NOTE: Align the nail of middle ring with gear spline slots.



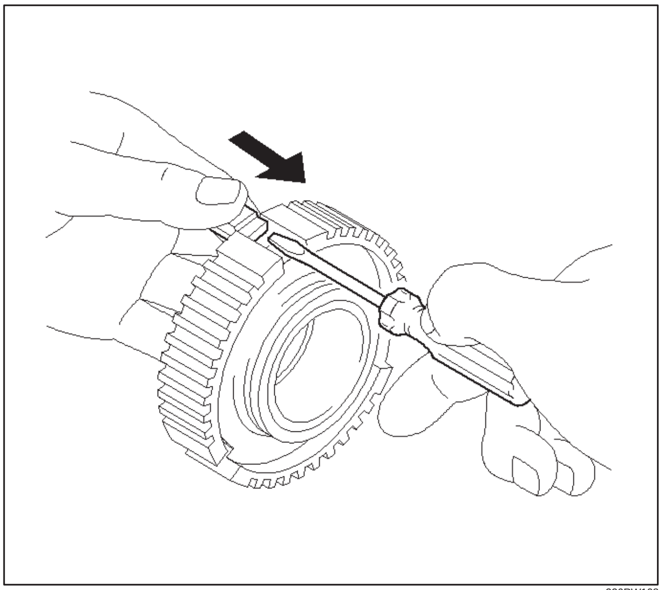
226RW104

2. Install the needle roller bearing, 2nd gear and 2nd gear block ring set to the mainshaft.



226RW107

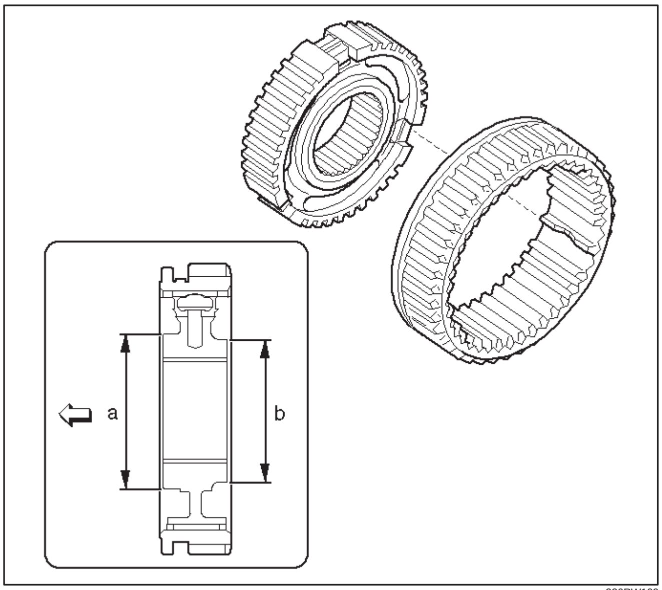
11. Install the clutch hub No.1.
    1. Install the 3 inserts and 3 insert springs to the clutch hub No.1.
       Reference: While pushing the insert spring with a screwdriver, install the inserts.



226RW108

2. Install the clutch hub No.1 to the reverse gear.

NOTE: Check the clutch hub No.1 installing direction, as shown.

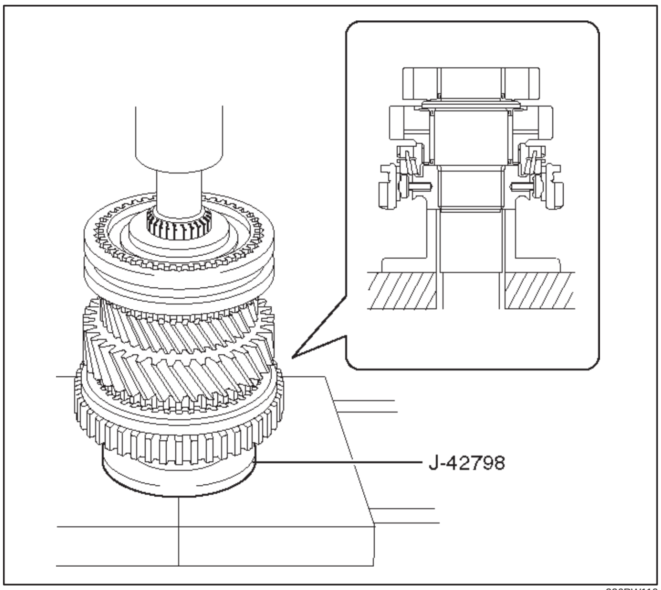


226RW109

3. Using installer J–42798 and a press, install the hub No.1 by retaining the reverse gear.

NOTE:

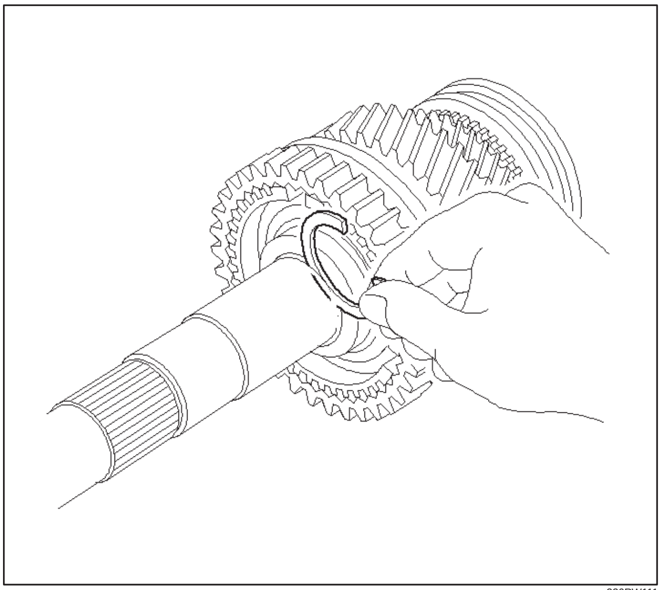
- Align the projection of inner ring with hub No.1 slots.
- Check that the gear rotates smoothly.



226RW110

4. Select a snap ring that will allow minimum axial play.

Mark	Thickness
A	2.30 – 2.35 mm (0.091 – 0.093 in)
B	2.35 – 2.40 mm (0.093 – 0.095 in)
C	2.40 – 2.45 mm (0.095 – 0.097 in)
D	2.45 – 2.50 mm (0.097 – 0.098 in)
E	2.50 – 2.55 mm (0.098 – 0.100 in)
F	2.55 – 2.60 mm (0.100 – 0.102 in)
G	2.60 – 2.65 mm (0.102 – 0.104 in)

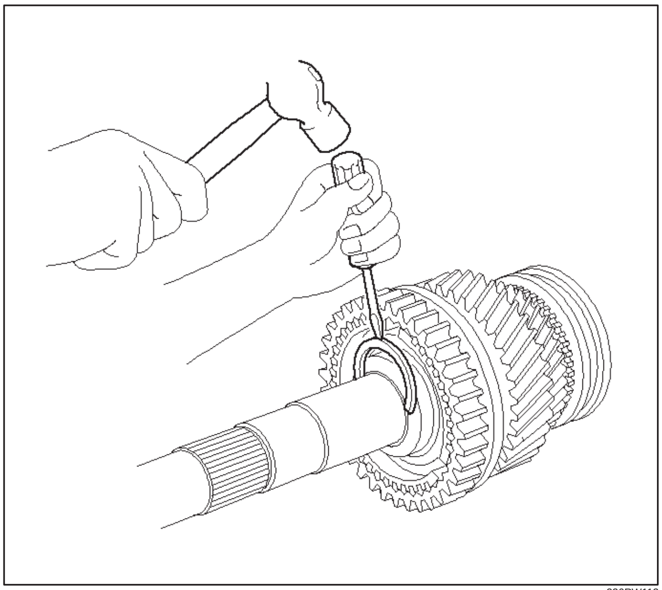


226RW111

5. Using a screwdriver and hammer, install the snap ring.

NOTE: Be careful not to damage the bearing surface.

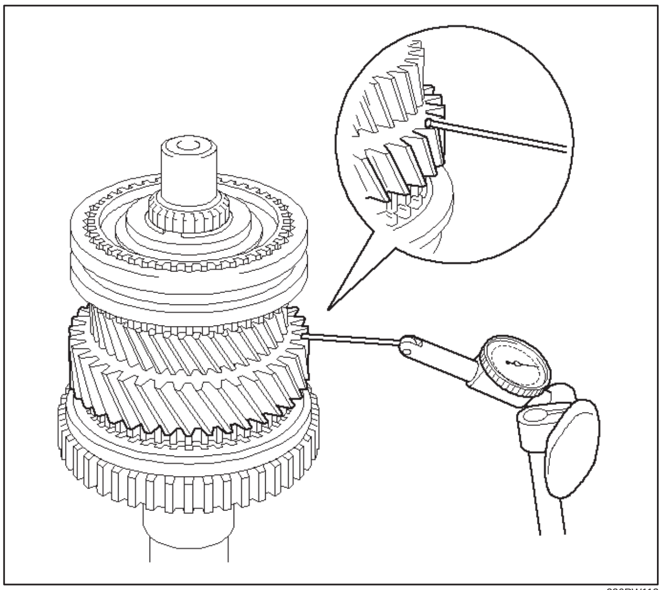
6. Check that the gear rotates smoothly.



226RW112

7. Using a dial indicator, measure the 2nd gear thrust clearance.

Standard: 0.10 – 0.25mm (0.004 – 0.010 in)



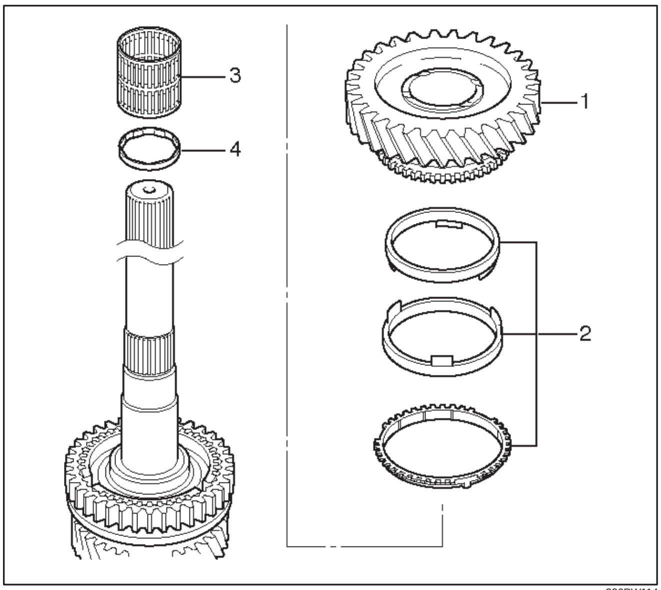
226RW113

12. Install the 1st gear.

1. Install the following parts:
   1. 1st gear bearing spacer (4).
   2. 1st gear needle roller bearing (3).
   3. Synchronizer assembly (2).
   4. 1st gear (1).

NOTE:

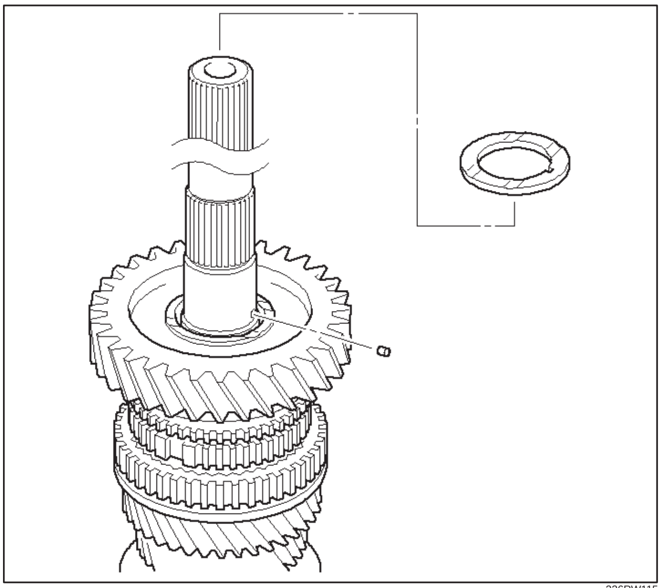
- Align the projection of inner ring with hub No.1 slots.
- Check that the gear rotates smoothly.



226RW114

2. Install the 1st gear thrust washer pin and 1st gear thrust washer to the mainshaft.

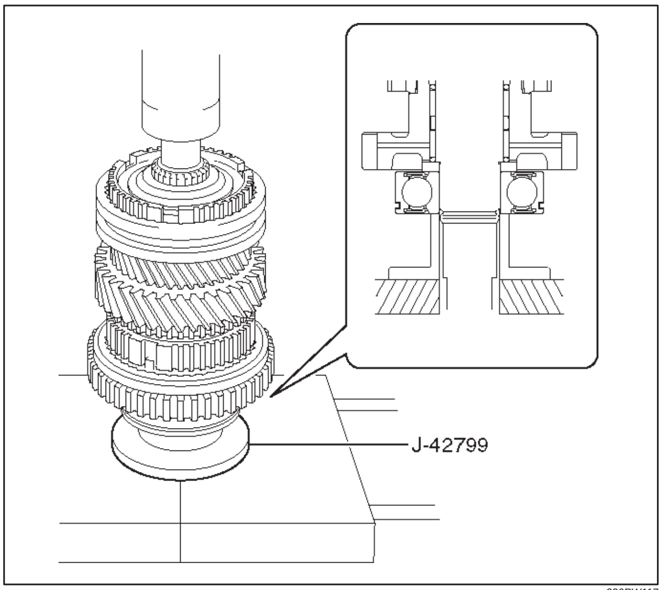
NOTE: Align the straight pin with the thrust washer slot.



226RW115

13. Install the mainshaft center bearing.
    1. Using installer J–42799 and a press, install the mainshaft center bearing.

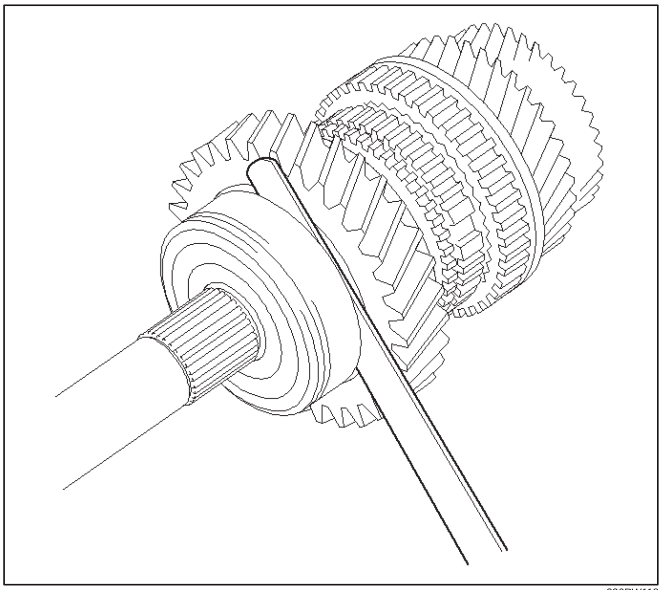
NOTE: Center bearing snap ring groove toward rear.



226RW117

    2. Using a thickness gauge, measure 1st gear thrust clearance.

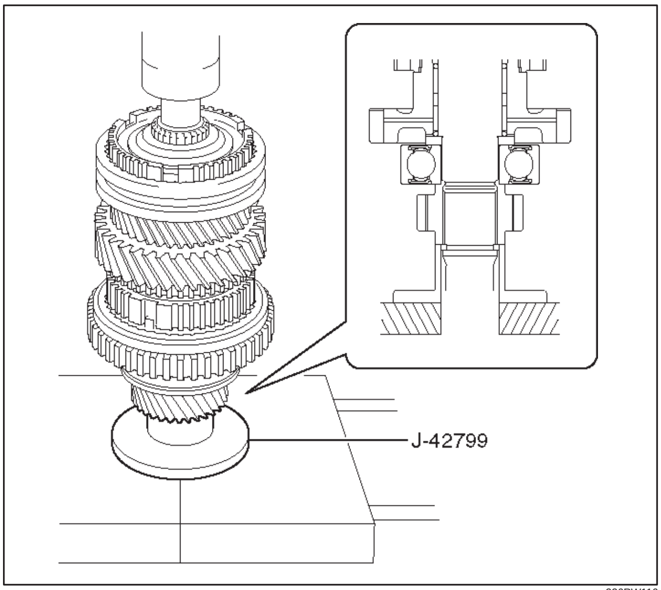
Standard: 0.10 – 0.45mm (0.004 – 0.018 in)



226RW118

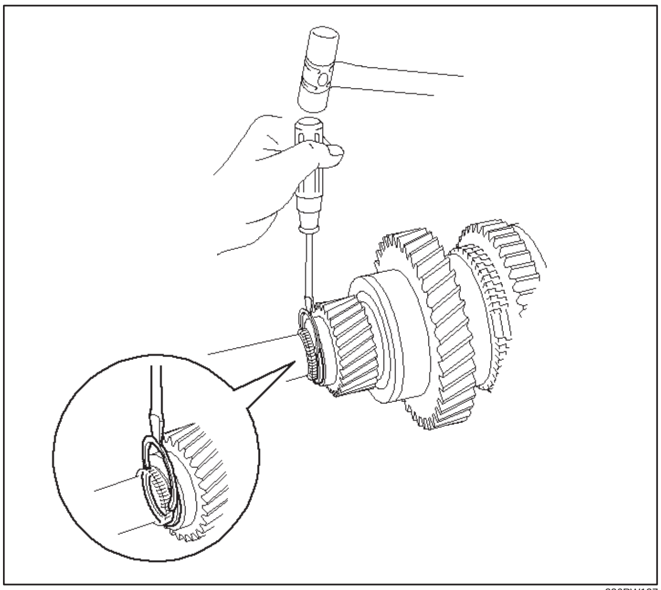
14. Install the 5th gear.
    1. Using installer J–42799 and a press, install the 5th gear.
    2. Select a snap ring that will allow minimum axial play.

Mark	Thickness
C	2.75 – 2.80 mm (0.108 – 0.110 in)
D	2.80 – 2.85 mm (0.110 – 0.112 in)
E	2.85 – 2.90 mm (0.112 – 0.114 in)
F	2.90 – 2.95 mm (0.114 – 0.116 in)
G	2.95 – 3.00 mm (0.116 – 0.118 in)
H	3.00 – 3.05 mm (0.118 – 0.120 in)
J	3.05 – 3.10 mm (0.120 – 0.122 in)
K	3.10 – 3.15 mm (0.122 – 0.124 in)
L	3.15 – 3.20 mm (0.124 – 0.126 in)
M	3.20 – 3.25 mm (0.126 – 0.128 in)
N	3.25 – 3.30 mm (0.128 – 0.130 in)
P	3.30 – 3.35 mm (0.130 – 0.132 in)



226RW116

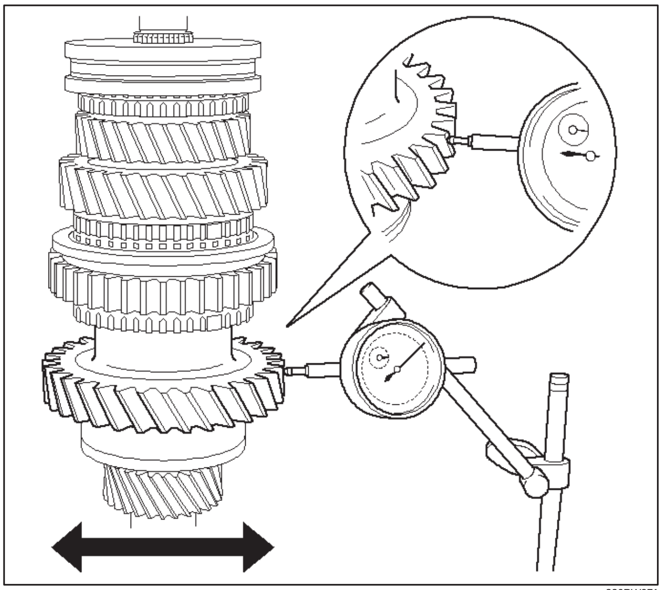
    3. Using a screwdriver and hammer, install the new snap ring.



226RW127

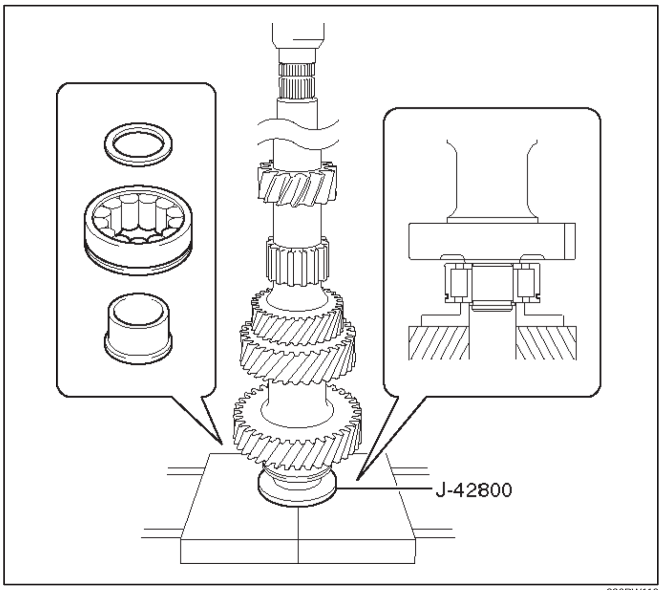
15. Inspect each gear radial clearance.
    1. Mount the mainshaft through the aluminum plate in a vise.
    2. Using a dial indicator, measure the radial clearance of each gear.

Gear	Standard Clearanse
1st	0.020 – 0.073 mm (0.0008 – 0.0029 in)
2nd	0.015 – 0.068 mm (0.0006 – 0.0027 in)
3rd	0.015 – 0.068 mm (0.0006 – 0.0027 in)



226RW071

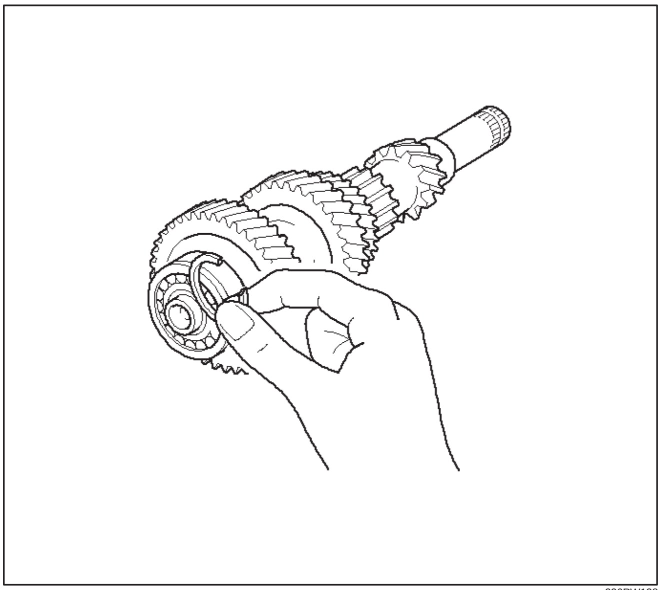
16. Install the counter gear shaft.
    1. Check the new counter front bearing inner race and the side race, as shown.
    2. Using installer J–42800 and a press, install the counter gear shaft front bearing.



226RW119

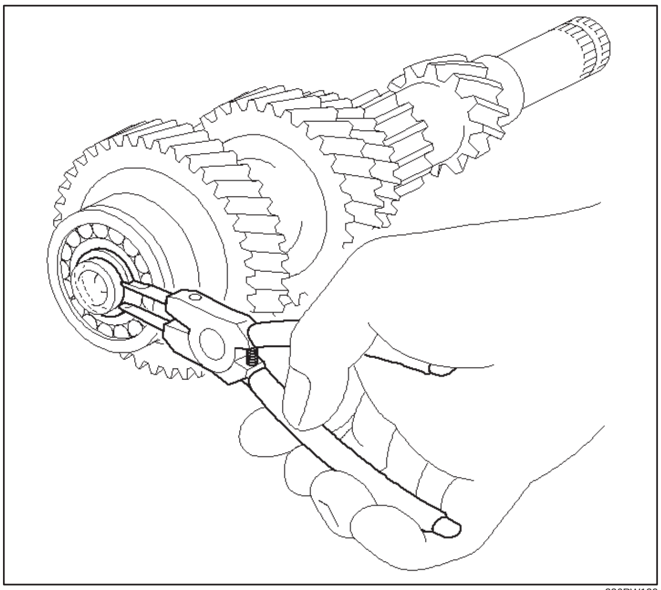
3. Select a snap ring that will allow minimum axial play.

Mark	Thickness
A	2.00 – 2.05 mm (0.079 – 0.081 in)
B	2.05 – 2.10 mm (0.081 – 0.083 in)
C	2.10 – 2.15 mm (0.083 – 0.085 in)
D	2.15 – 2.20 mm (0.085 – 0.087 in)
E	2.20 – 2.25 mm (0.087 – 0.089 in)
F	2.25 – 2.30 mm (0.089 – 0.091 in)



226RW128

4. Using a snap ring expander, install the new snap ring.

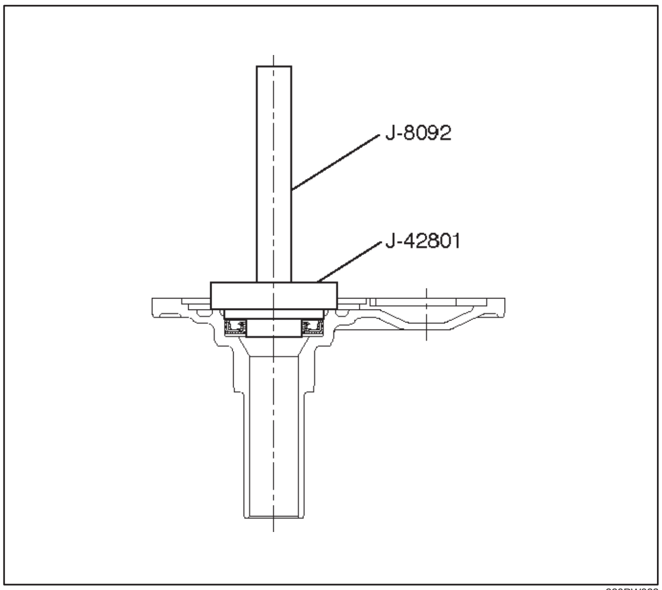


226RW129

17. Install the front cover.
    1. Using installer J–42801, grip J–8092 and a hammer, drive in a new oil seal.

Drive in depth (from cover end): 11.7 ± 0.5 mm (0.46 ± 0.02 in)

    2. Apply grease to the seal lip.

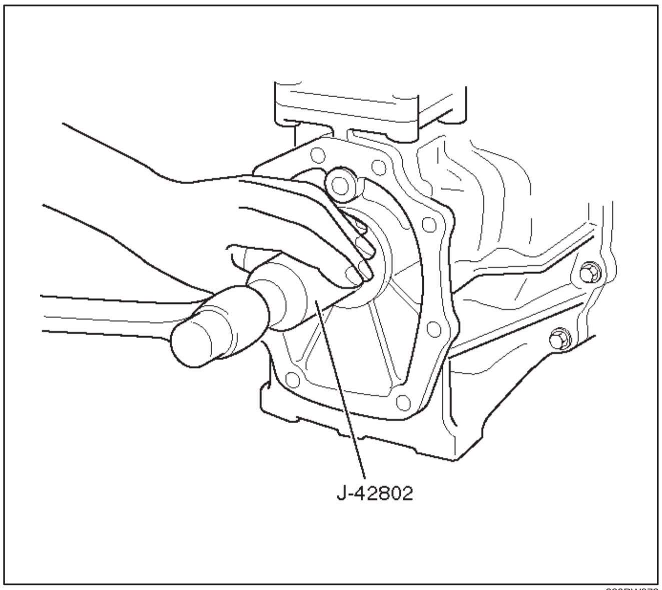


220RW023

18. Install the transfer adapter.
    1. Using installer J –42802, and a hammer drive in a new oil seal.

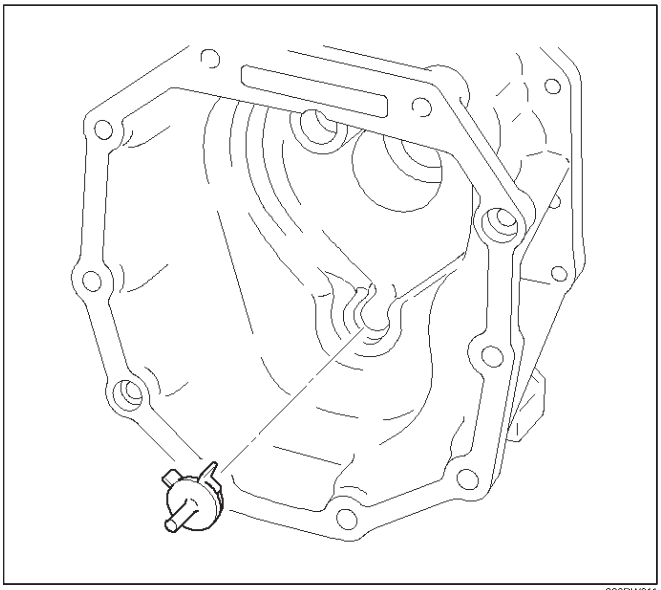
Drive in depth (from transfer adapter): 10.95 ± 0.5 mm (0.431 ± 0.02 in)

    2. Apply grease to the oil seal lip.



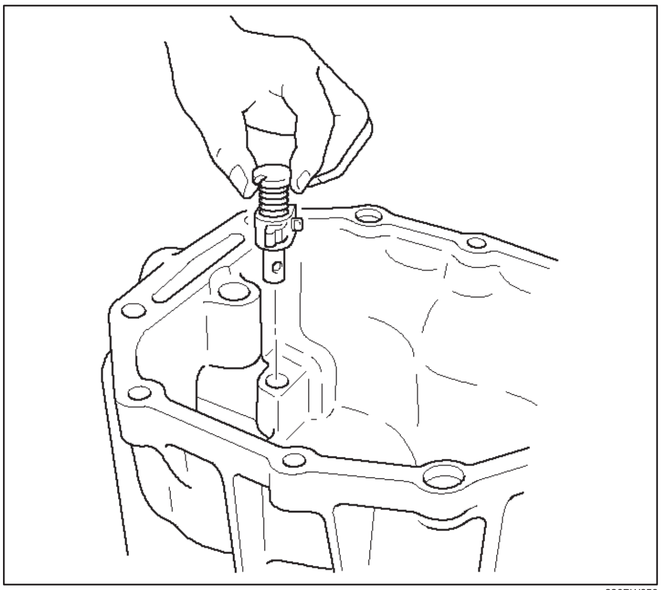
220RW073

3. Install the oil receiver pipe.



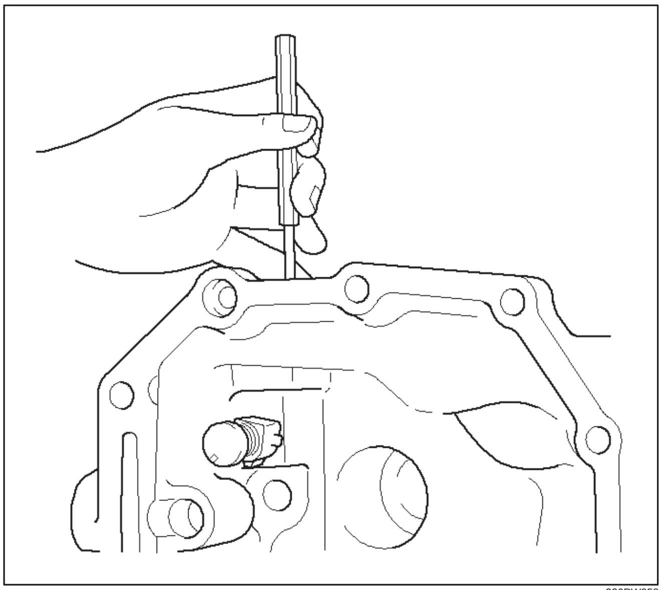
220RW011

4. Install the reverse restrict to the transfer adapter.



226RW059

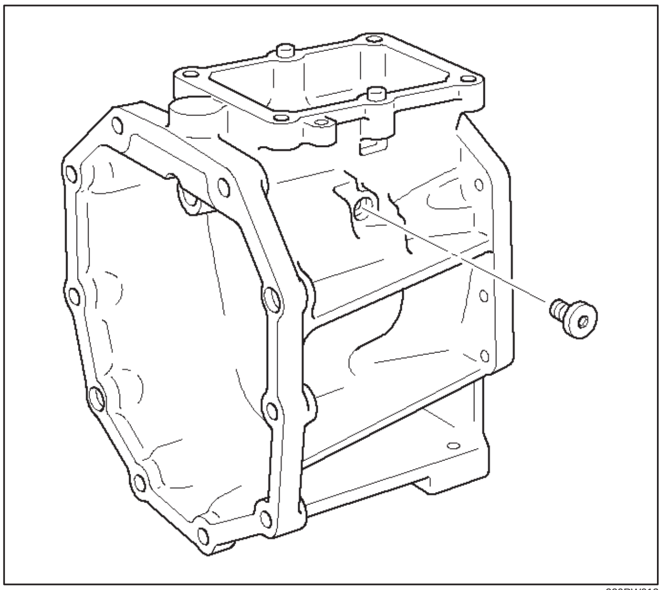
5. Using a pin punch and hammer, drive in the slotted spring pin.



226RW058

6. Clean up the plug and plug hole.
7. Apply sealant to the plug threads. (THREE BOND 1344 or equivalent)
8. Using a torx socket wrench(T40), install and torque the plug.

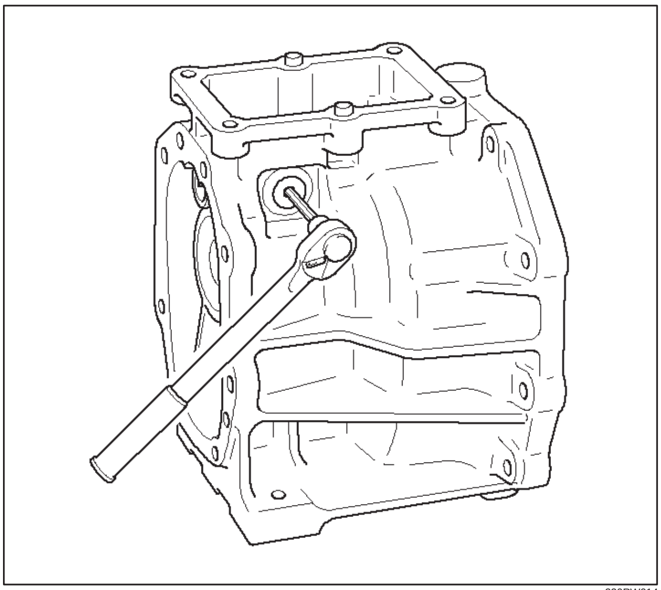
Torque: 18.5 N·m (13.5 lb ft)



220RW013

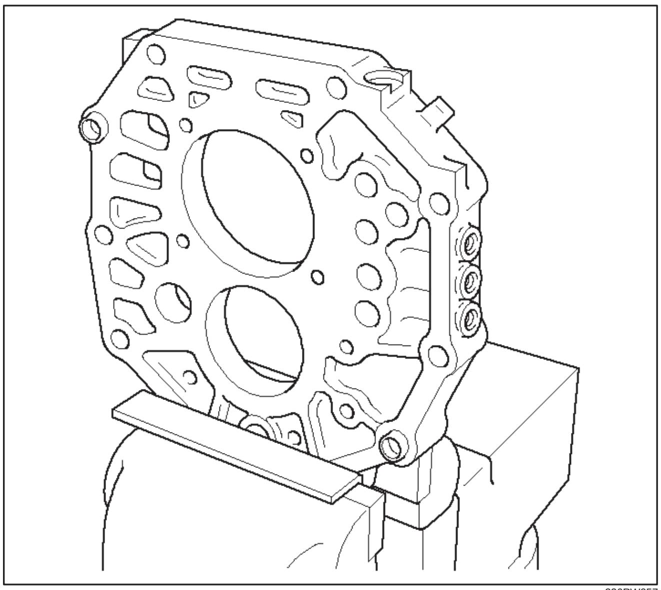
9. Using hexagon wrench, install and torque the plug.

Torque: 37 N·m (27 lb ft)



220RW014

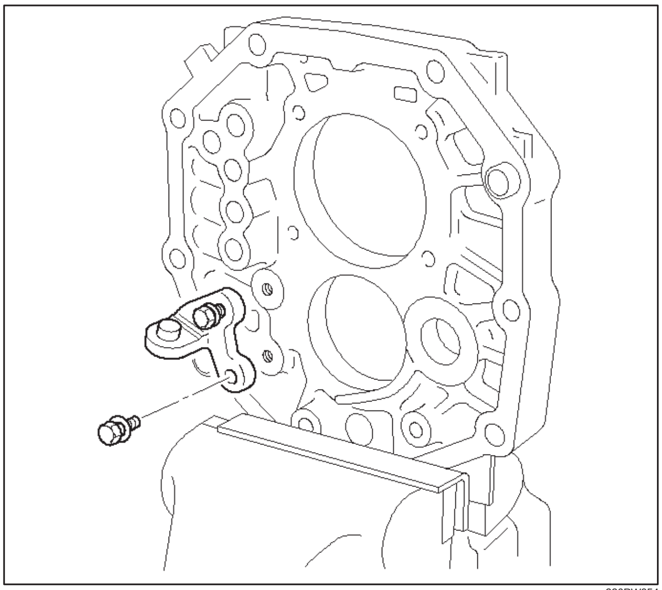
19. Install the reverse shift arm No.1 and reverse shift arm No.2.
    1. Mount the intermediate plate through the aluminum plate in a vise.



226RW057

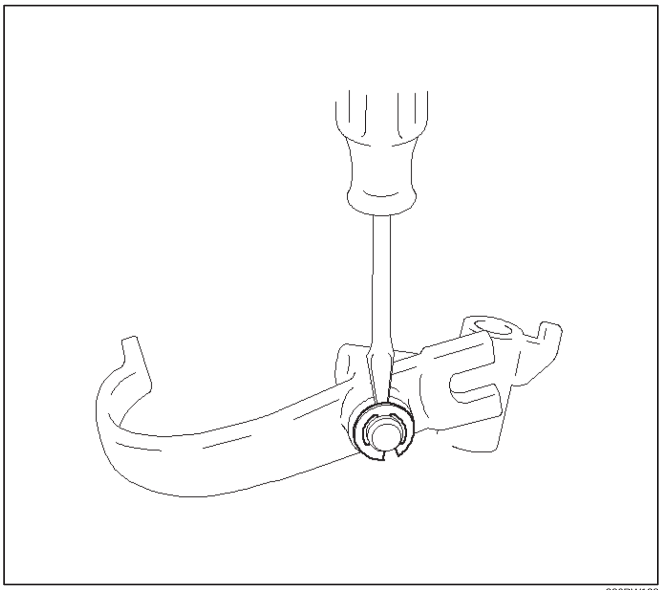
2. Using 2 bolts, install reverse shift arm bracket.

Torque: 18 N·m (13 lb ft)



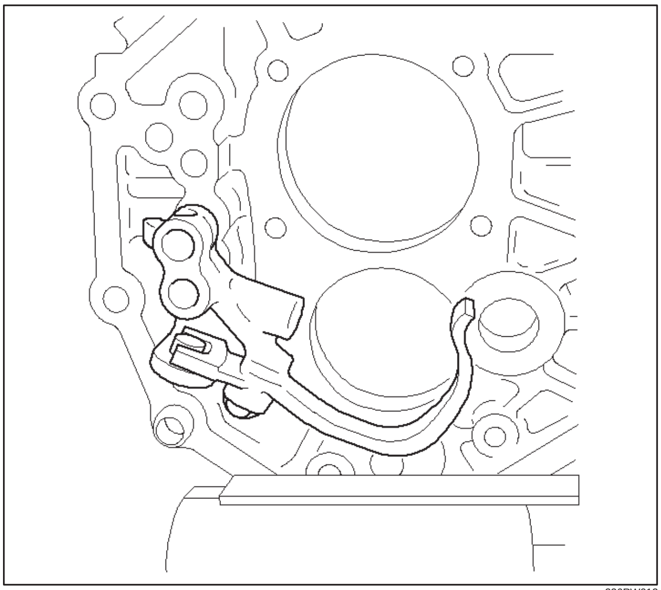
226RW054

3. Install reverse shift arm No.2 to the reverse shift arm No.1. Using screwdriver and a hammer, install the new E-ring.



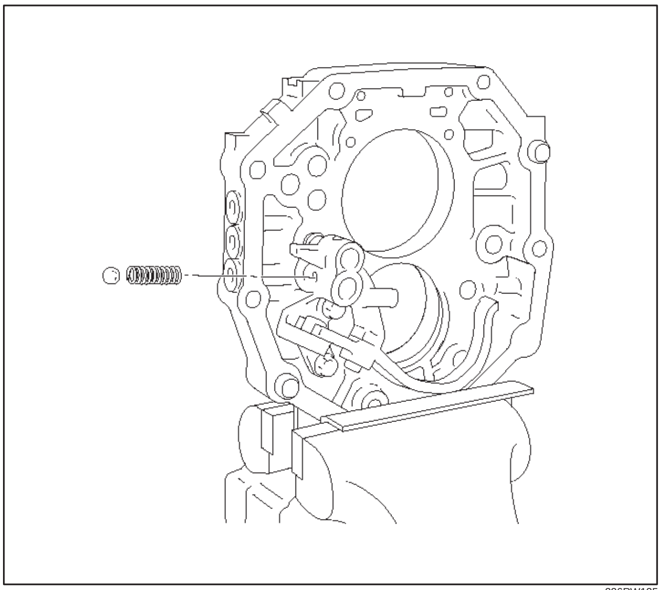
226RW138

4. Install reverse shift arm No.2 to the reverse shift arm bracket.



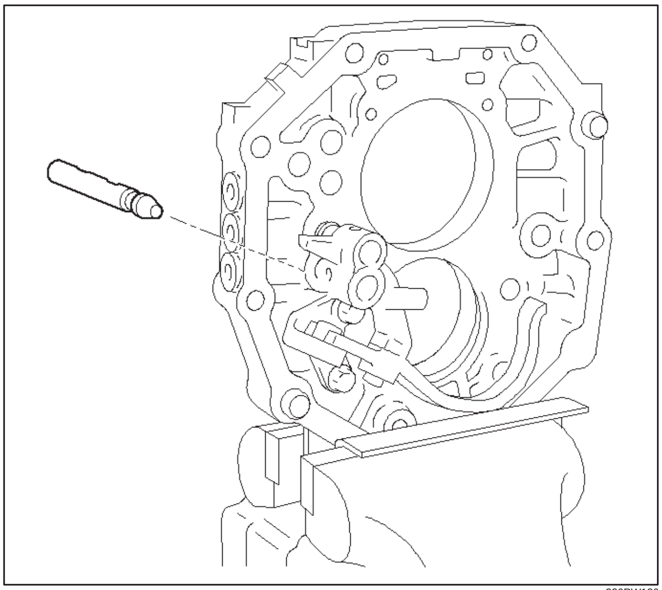
226RW012

20. Install the reverse shift rod.
    1. Install the reverse shift arm No.1 compression spring and ball to the reverse shift arm No.1.



226RW125

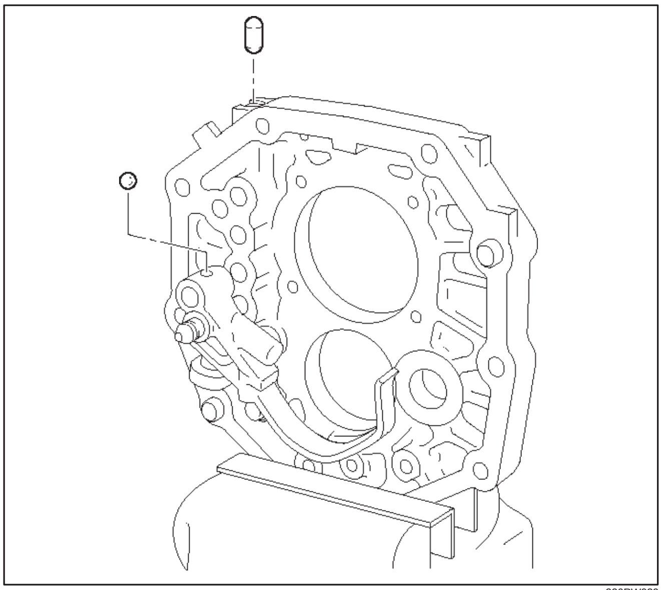
2. Install the reverse shift rod from the rear side by pushing the ball on using a screwdriver.



226RW126

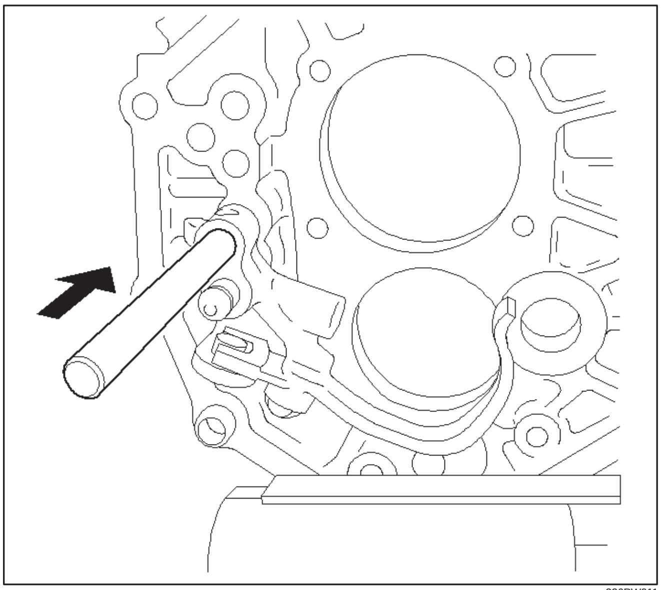
21. Install the reverse-5th shift rod.

1. Install the reverse shift arm No.1 lock ball to the reverse shift arm No.1.
2. Install the interlock pin to the intermediate plate.



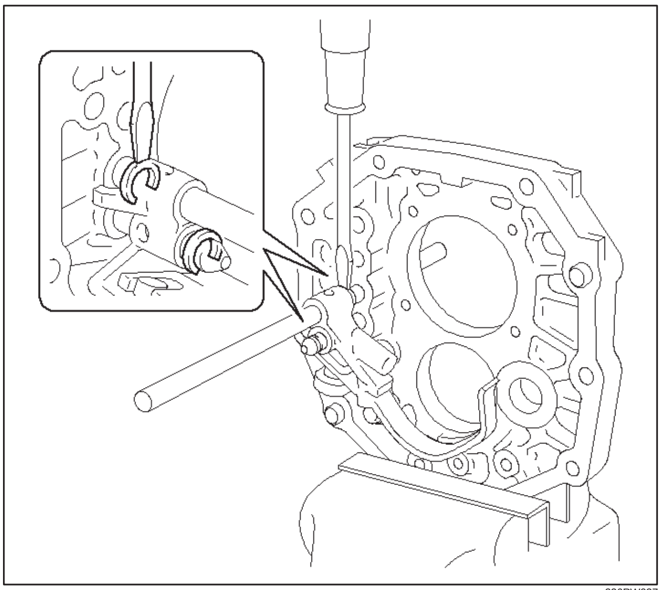
226RW039

3. Put in the reverse-5th shift rod from the front.



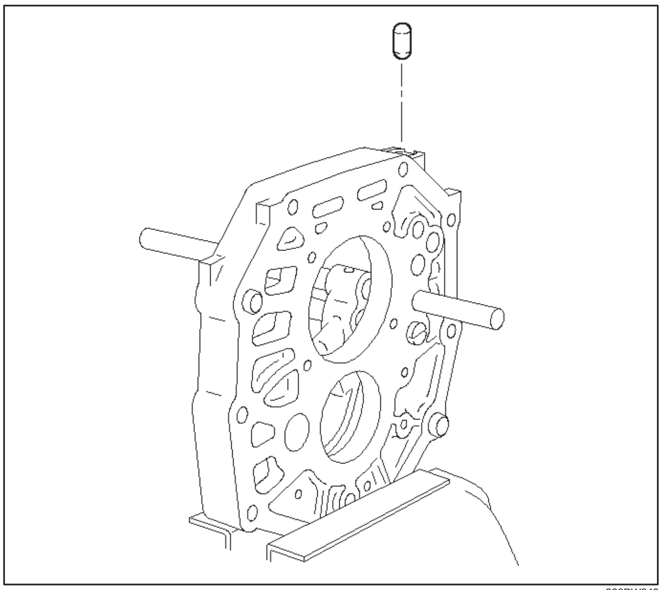
226RW011

4. Using a screwdriver and a hammer, install the 2 new shift rod snap rings to the 5th-reverse shift rod and reverse shift rod.



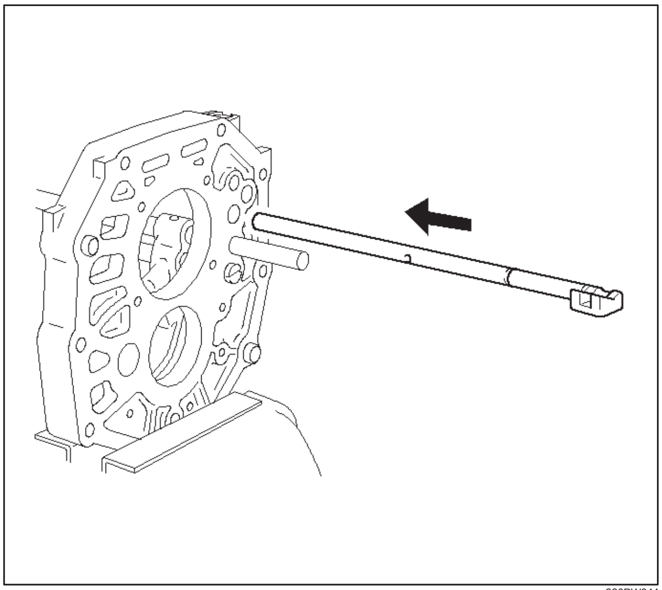
226RW037

22. Install 1st–2nd shift rod.
    1. Install the interlock pin to the intermediate plate.



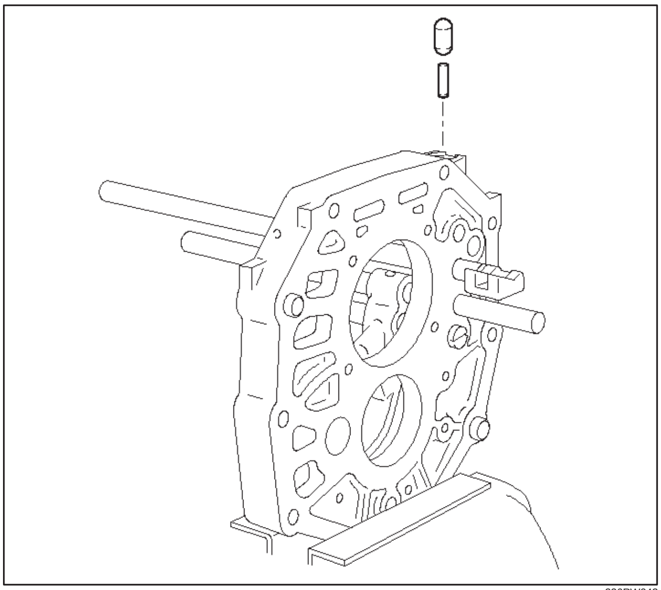
226RW042

    2. Put in the 1st–2nd shift rod from the rear.



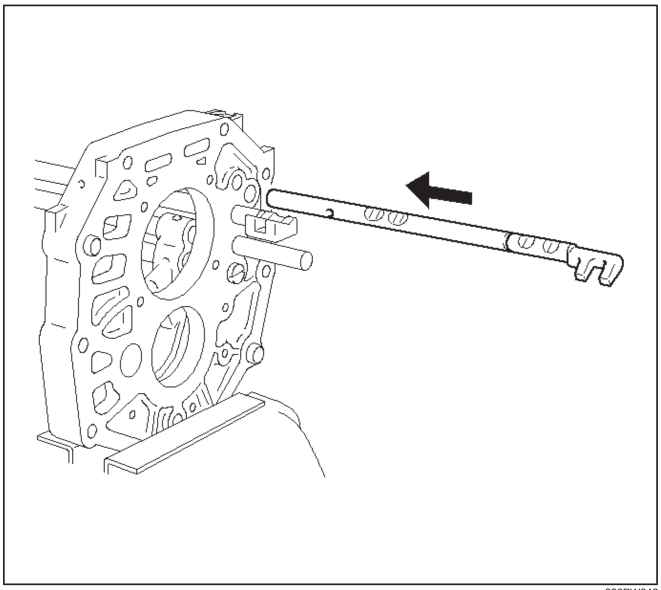
226RW044

23. Install 3rd–4th shift rod.
    1. Install the straight pin and interlock pin to the intermediate plate.



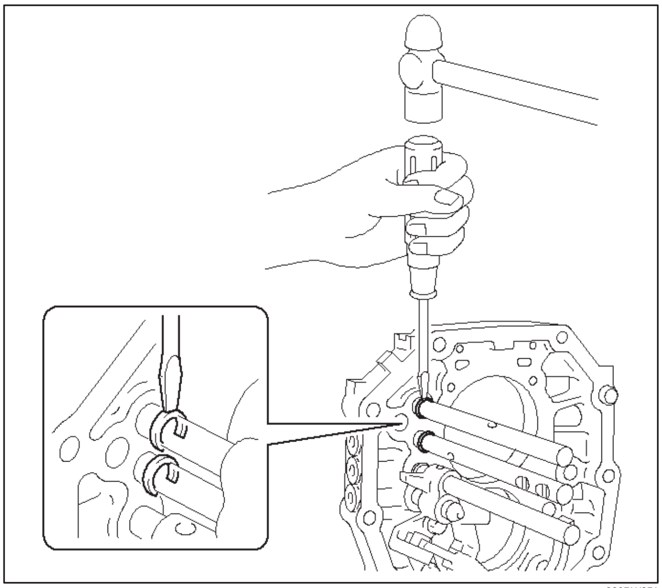
226RW043

    2. Put in the 3rd–4th shift rod from the rear.



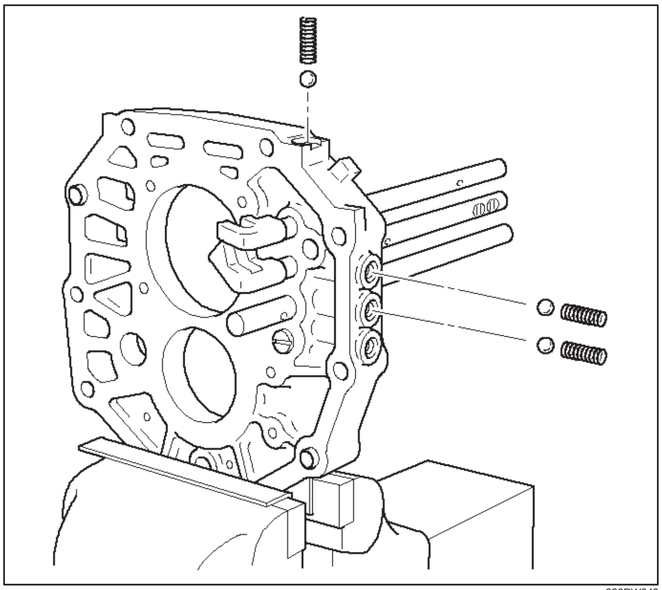
226RW046

24. Install the interlock parts.
    1. Using a screwdriver and hammer, 2 new shift rod snap rings to the 1st–2nd and 3rd–4th shift rod.



226RW051

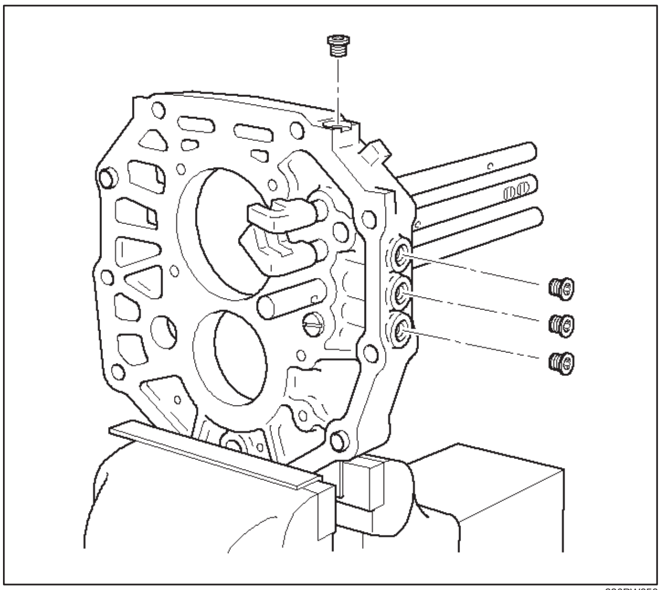
    2. Install the 3 shift detent ball and springs to the intermediate plate.



226RW049

    3. Clean up the plug hole.
    4. Apply sealant to the plug threads.
       sealant: three bond 1344 or equivalent
    5. Using a torx socket wrench(T40) install and torque the 4 plugs.

Torque: 18.5 N·m (13.5 lb ft)

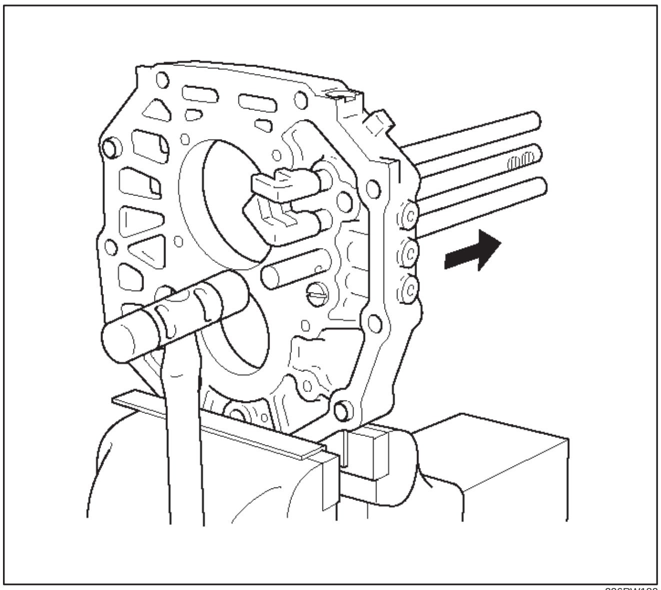


226RW050

25. Install mainshaft assembly.

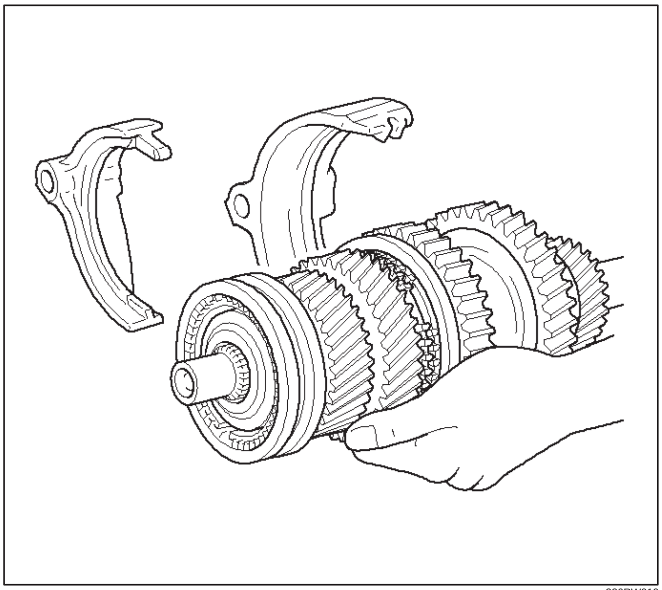
NOTE: Coat all parts with gear oil before installing them.

    1. Using a plastic hammer, tap the 5th-reverse shift rod at the reverse shift.



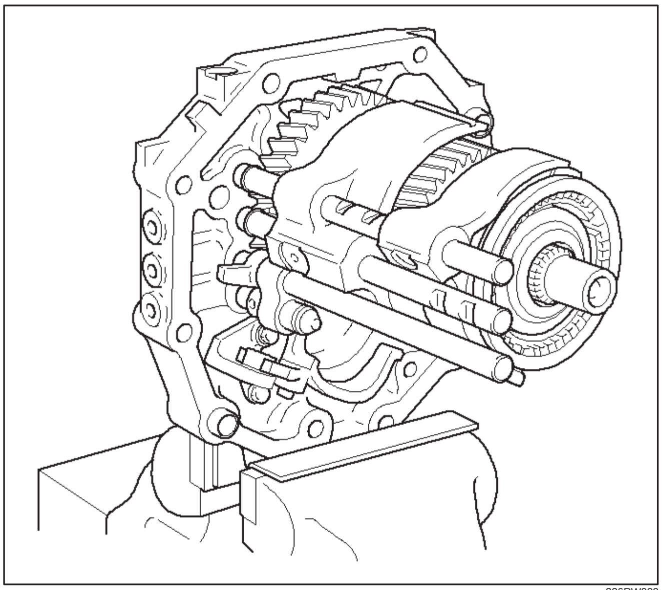
226RW180

2. Install the shift arm No.1 and No.2 to the mainshaft.



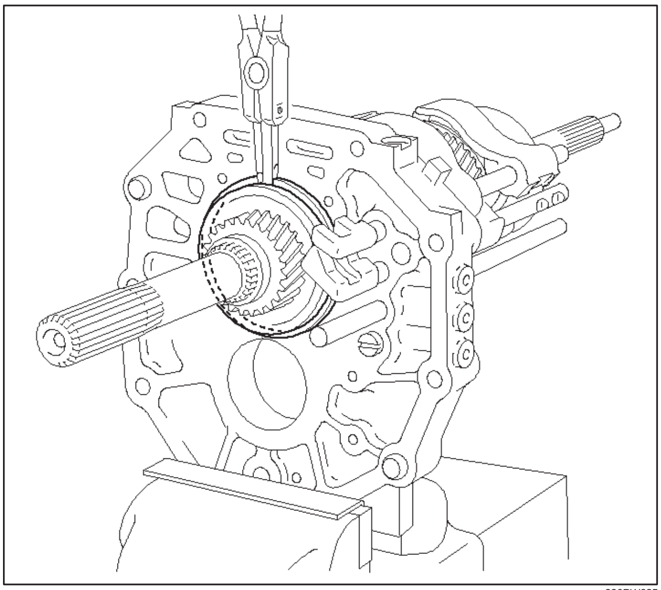
226RW010

3. Using a plastic hammer, tap the intermediate plate and install the mainshaft. Through the shift arm No.1 and No.2 to the shift rod.



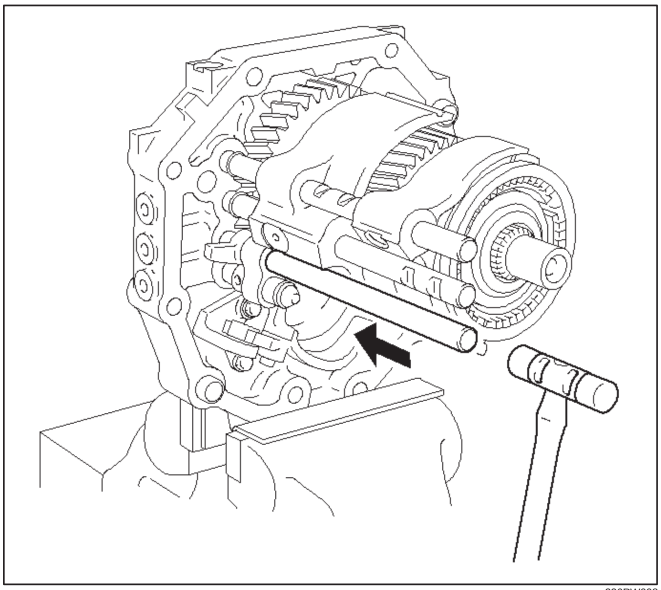
226RW009

4. Using a snap ring expander, install the snap ring.



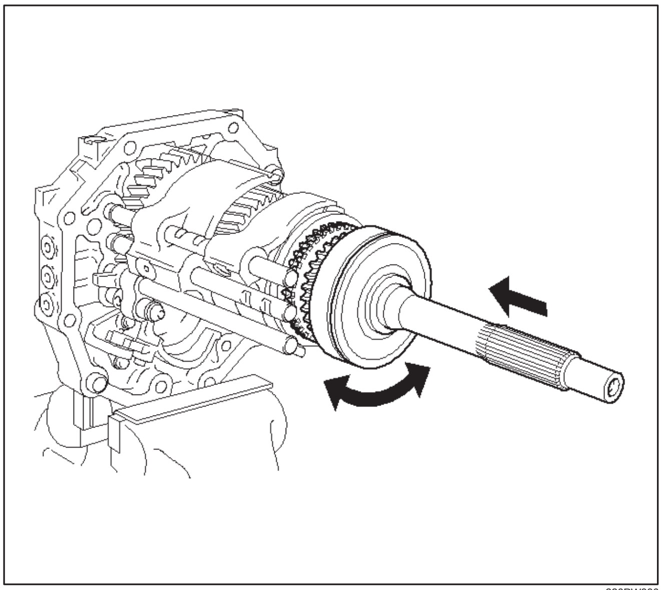
226RW035

5. Using a plastic hammer, tap the 5th-reverse shift rod at the neutral shift.



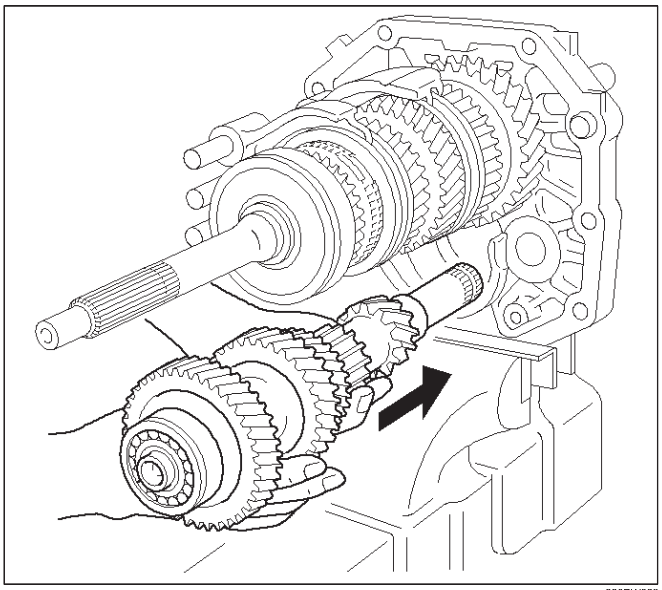
226RW008

26. Install the top gear shaft.
    1. Align the projection of the hub No.2 with the synchronizer ring slots, and install the top gear shaft assembly to the mainshaft.
    2. Check that the gear rotates smoothly.



226RW006

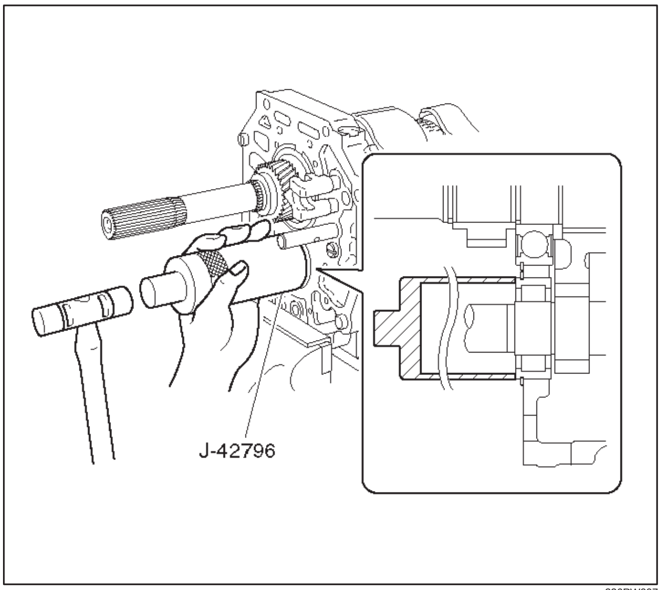
27. Install the counter gear shaft.
    1. Temporarily install the counter gear shaft to the intermediate plate.



226RW028

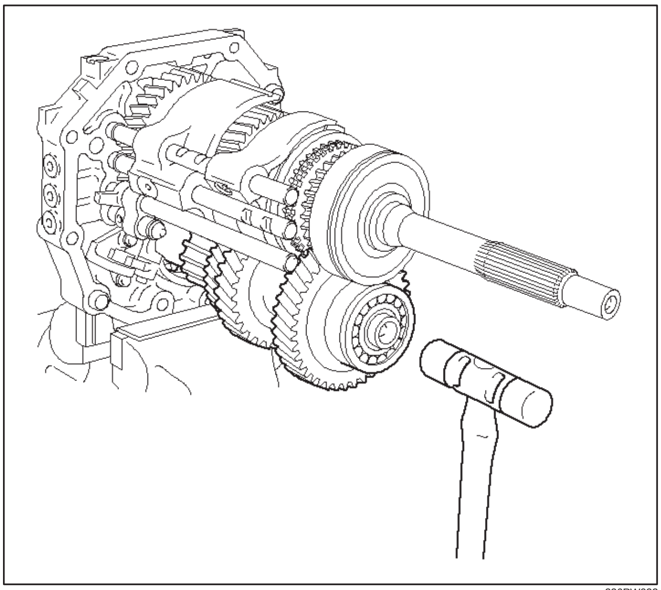
    2. Using installer J–42796 and a hammer, drive in the center bearing as shown.

NOTE: Outer race snap ring groove toward rear.



226RW007

Reference: Drive in the counter rear bearing by tapping on the front end of the counter shaft.

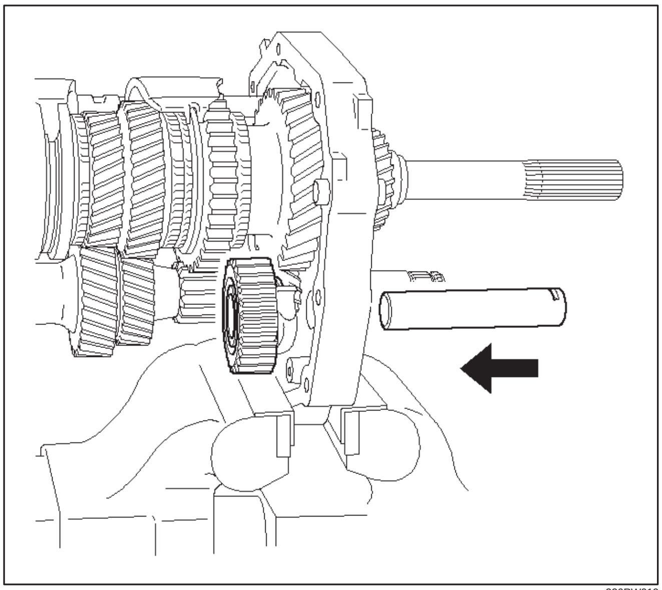


226RW022

28. Install the reverse idle gear.
    1. Install the reverse idle gear and reverse idle gear shaft.

NOTE:

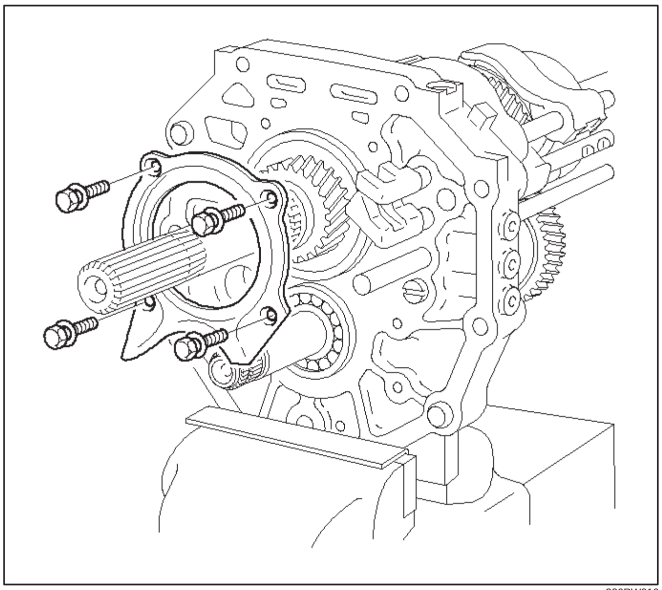
- Insert the reverse idle gear shaft with the slot toward rear.
- Install the reverse idle gear with the reverse shift arm No.2.



226RW019

29. Install the bearing plate.
    1. Align the bearing plate to groove of the reverse idle gear shaft.

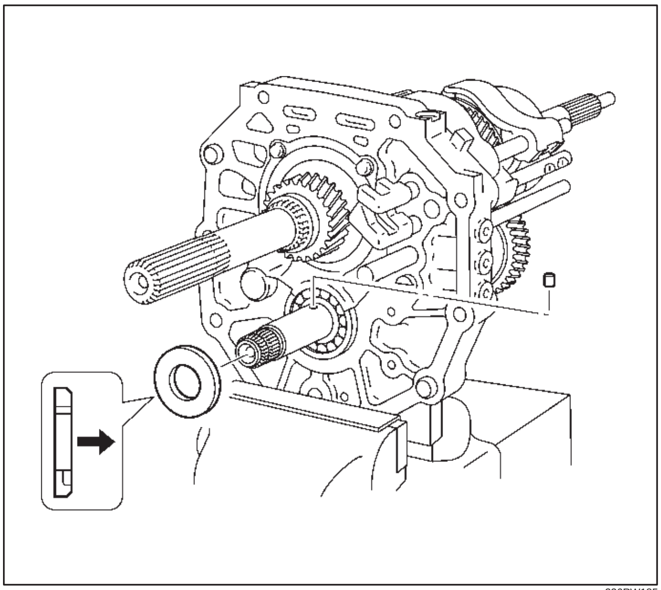
Torque: 12.5 N·m (109 lb in)



226RW016

30. Install the 5th gear thrust washer.
    1. Install the 5th gear thrust washer pin to the counter gear shaft.
    2. Install the 5th gear thrust washer to the counter gear shaft.

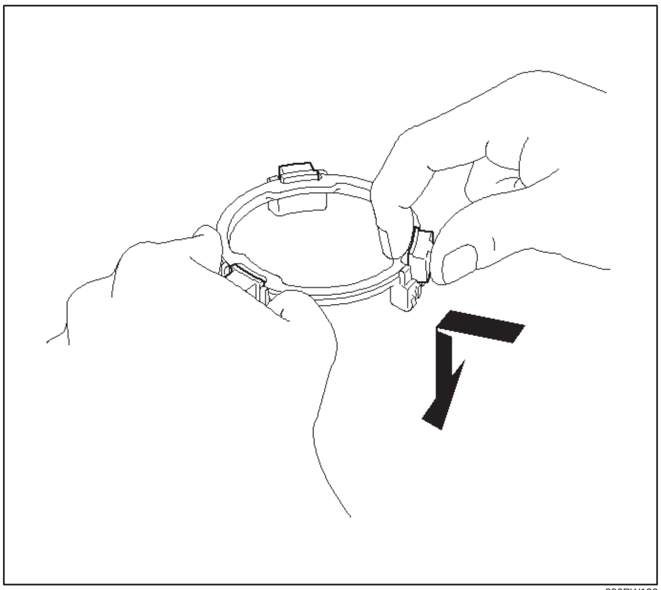
NOTE: Thrust washer must be assembled with the chamfered face of the washer toward the front.



226RW185

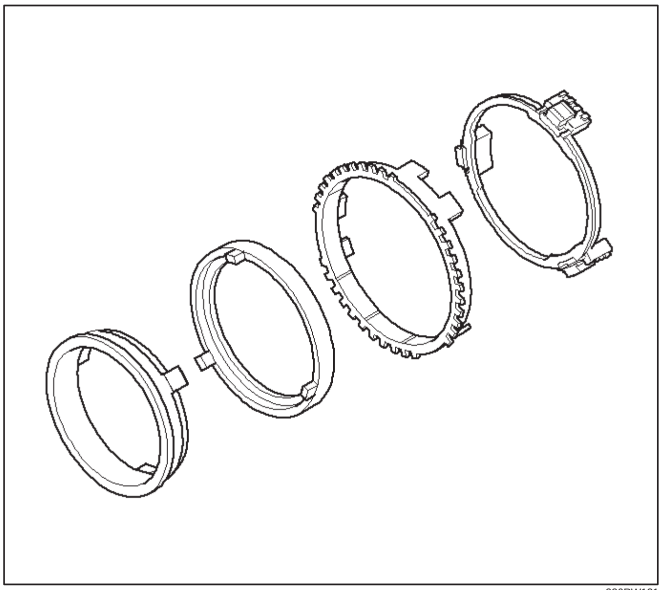
31. Install the counter 5th gear.
    1. Install the 3 inserts and 3 compression springs to the reverse block ring.

    Reference: Push the 3 inserts with the 3 compression springs to the reverse synchronizer ring.



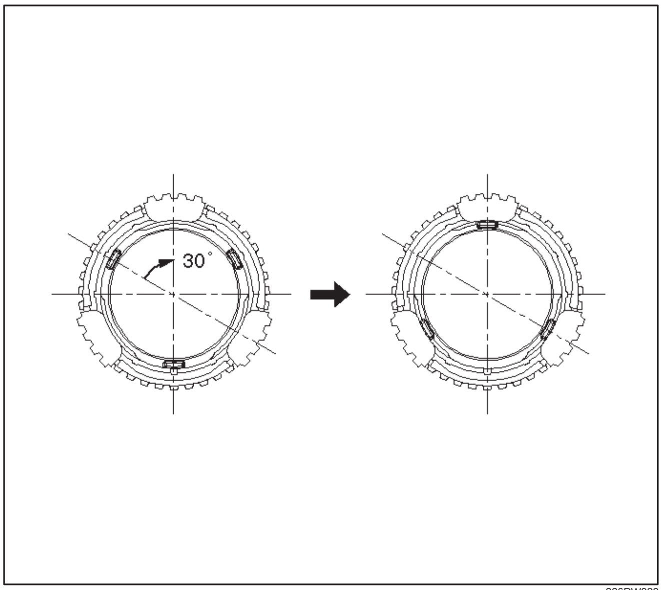
226RW120

2. Install the synchronizer outer ring, synchronizer cone ring, and synchronizer pull ring to the reverse block ring.



226RW121

3. Turn to 30 degree the reverse synchronizer pull ring.

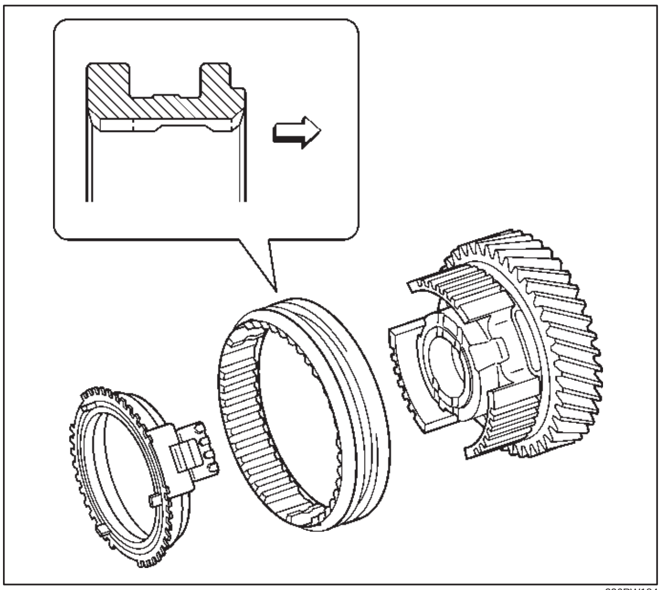


226RW080

4. Install the hub sleeve No.3 and reverse block ring set to the counter 5th gear.

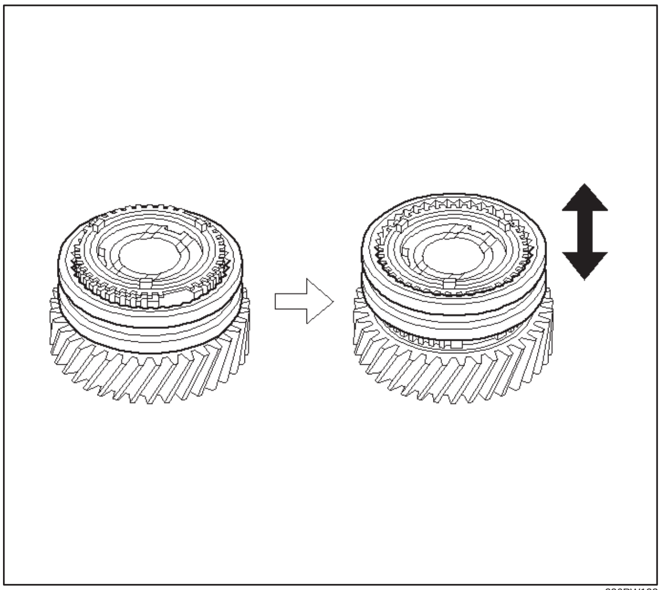
NOTE: Check the hub sleeve No.3 direction, as shown.

Reference: While pushing the 3 inserts, install the synchronizer ring assembly to the hub sleeve No.3.



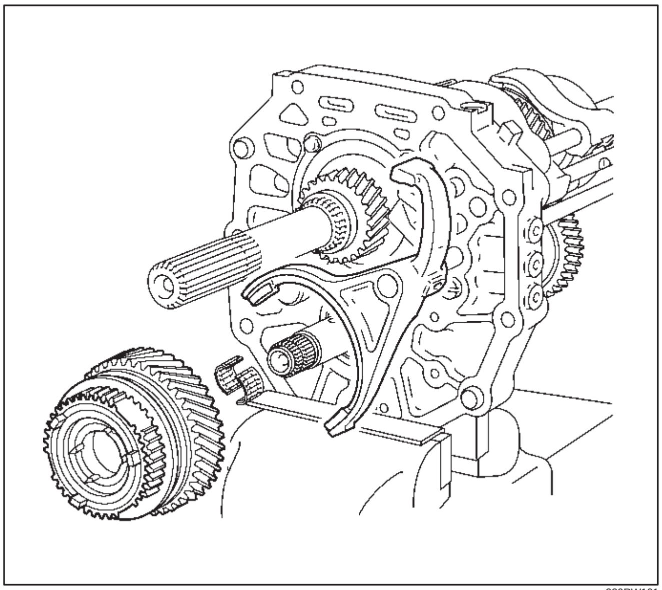
226RW184

5. Slide the hub sleeve No.3.



226RW123

6. Install the counter 5th gear bearing, counter 5th gear and reverse block ring set to the counter gear shaft, through the 5th reverse shift arm to the 5th reverse shift rod.

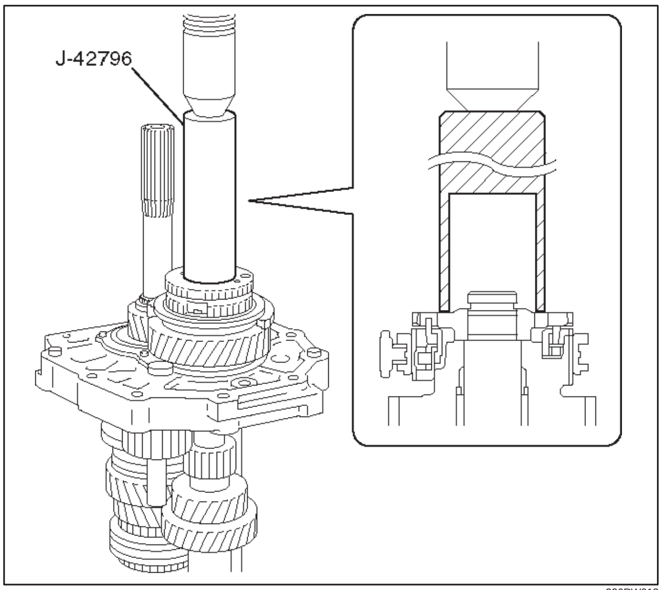


220RW101

7. Using installer J–42796 and a press, install counter 5th gear spline piece.

NOTE:

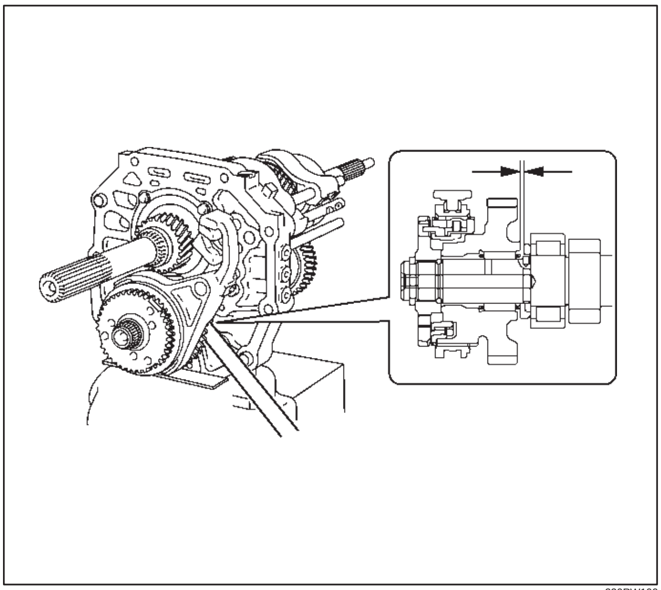
- Align the projection of the cone ring to the holes of the 5th gear spline piece.
- Check that the gear rotates smoothly.



226RW013

8. Using thickness gauge, measure the counter 5th gear thrust clearance.

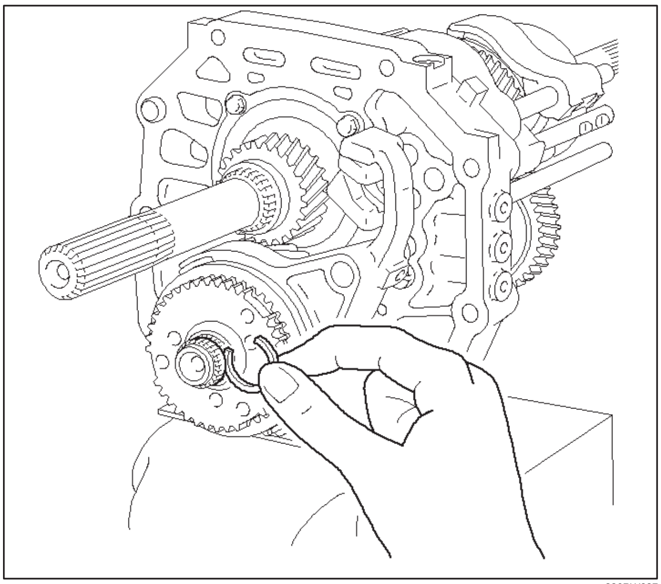
Standard: 0.10 – 0.35mm (0.004 – 0.014 in)



220RW100

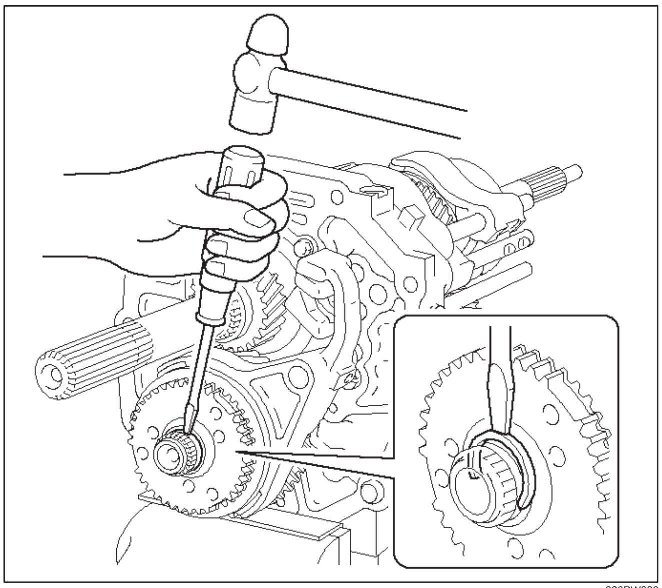
9. Select a snap ring that will allow minimum axial play.

Mark	Thickness
A	2.80 – 2.85 (0.110 – 0.112 in)
B	2.85 – 2.90 (0.112 – 0.114 in)
C	2.90 – 2.95 (0.114 – 0.116 in)
D	2.95 – 3.00 (0.116 – 0.118 in)
E	3.00 – 3.05 (0.118 – 0.120 in)
F	3.05 – 3.10 (0.120 – 0.122 in)
G	3.10 – 3.15 (0.122 – 0.124 in)



226RW027

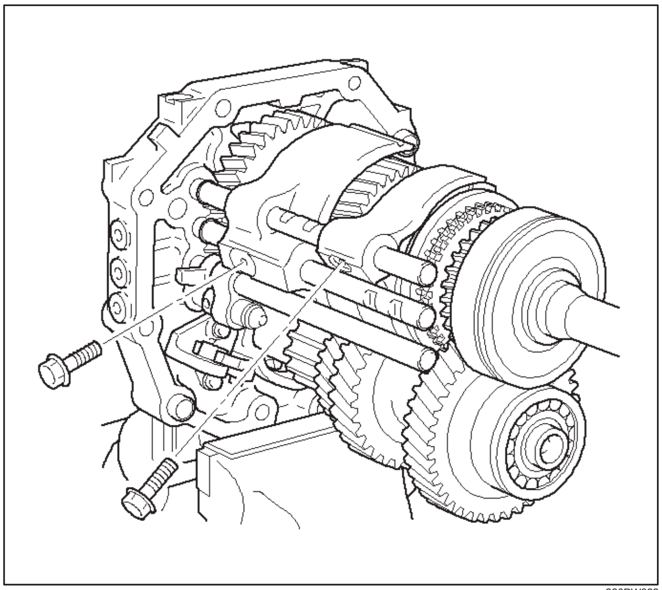
10. Install the new snap ring.



226RW026

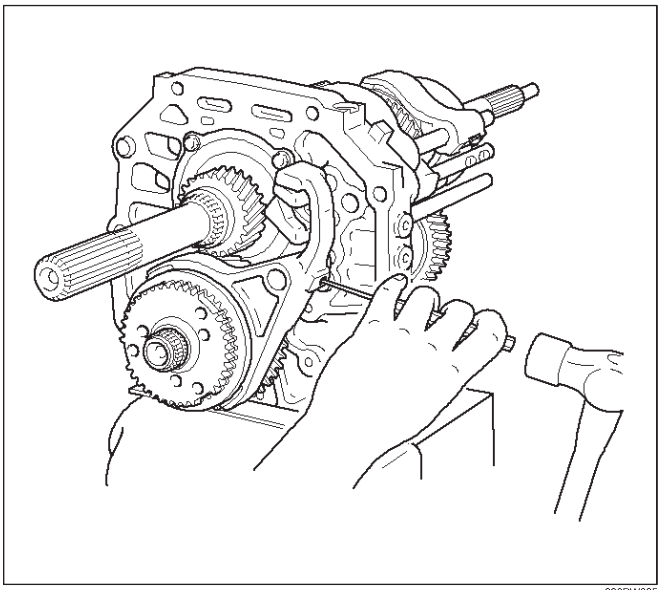
32. Install the shift arm bolts.
    1. Install and torque the 2 shift arm bolts.

Torque: 19.5 N·m (14 lb ft)



226RW023

33. Install the shift arm slotted pin.
    1. Using a pin punch and a hammer, drive in the slotted pin to the shift arm.

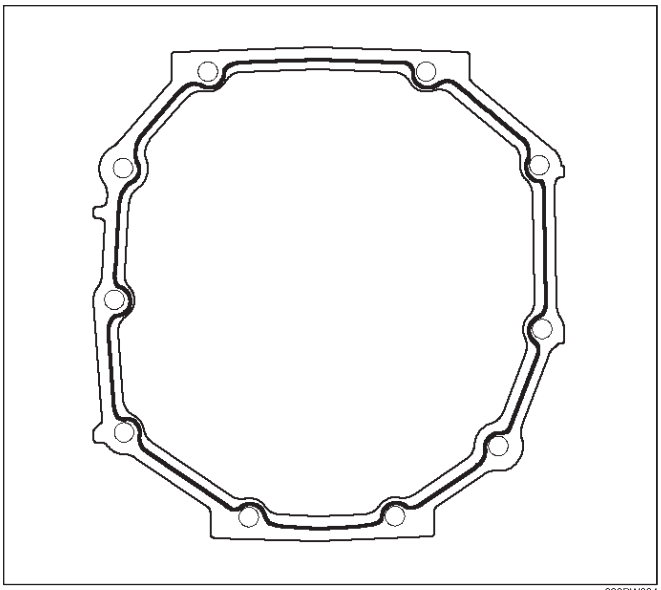


226RW025

34. Install the transmission case.
    1. Clean up the fitting surface.
    2. Apply recommended liquid gasket (THREE BOND 1281 or equivalent), as shown.

NOTE:

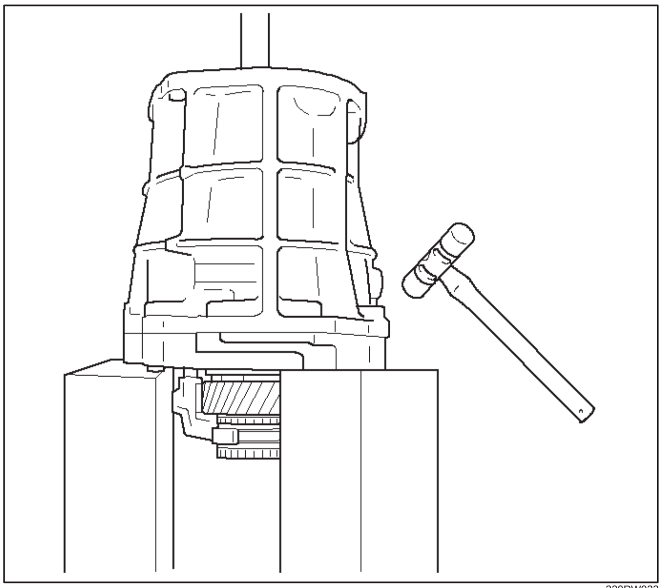
- Don't dry the liquid gasket.



220RW024

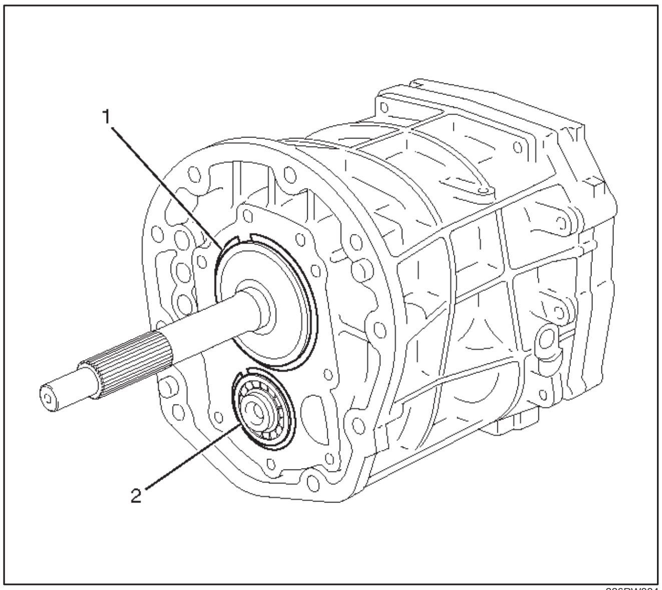
3. Stand the transmission by the wood blocks.
4. Using a plastic hammer, tap the transmission case and attach it to the intermediate plate.

NOTE: Be careful not to add over force to bearing.



220RW022

5. Using a snap ring expander, install the front bearing shaft snap ring (1) and counter gear shaft bearing snap ring (2).

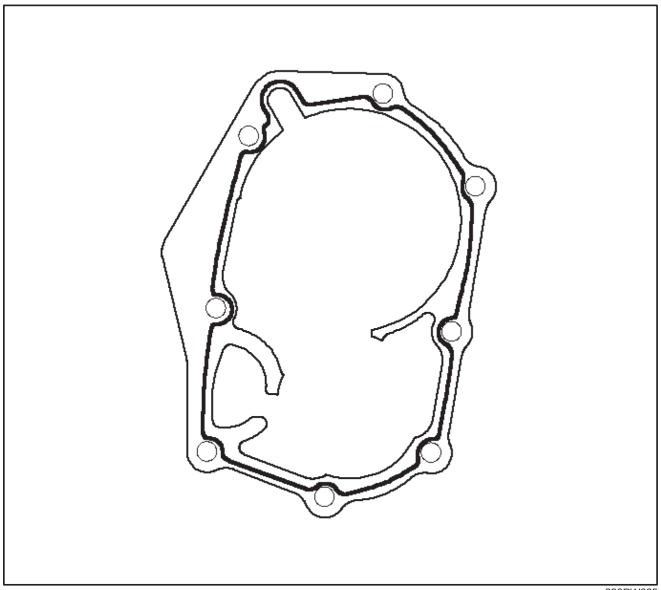


226RW004

6. Turn over the transmission.

35. Install the front cover.
1. Clean up the fitting surface.
2. Apply recommended liquid gasket (THREE BOND 1281 or equivalent), as shown.

NOTE:
- Don’t dry the liquid gasket.

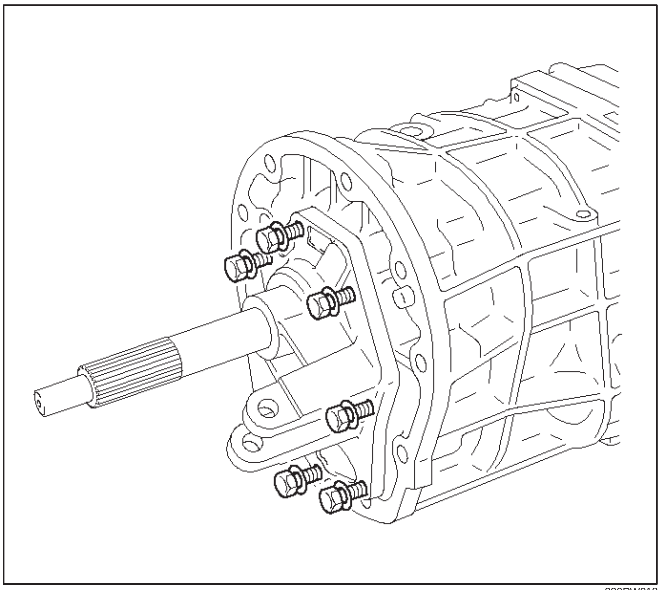


220RW025

3. Clean up and dry the bolts.
4. Apply thread sealant (THREE BOND 1344 or equivalent) to the 8 bolts.
5. Using 8 bolts, install the front cover to the transmission case.

Torque: 16.5 N·m (12 lb ft)

NOTE:
- Tighten the all bolts evenly.
- Be careful not to damage the oil seal.

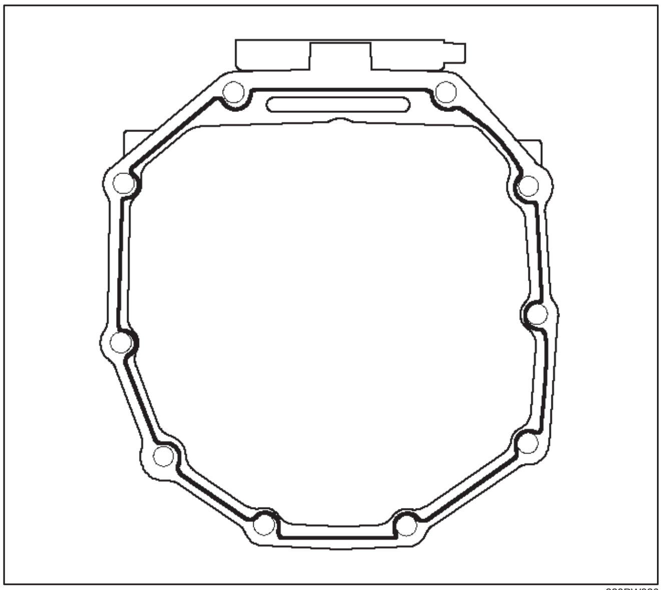


220RW018

6. Check that the top gear shaft and mainshaft rotate.

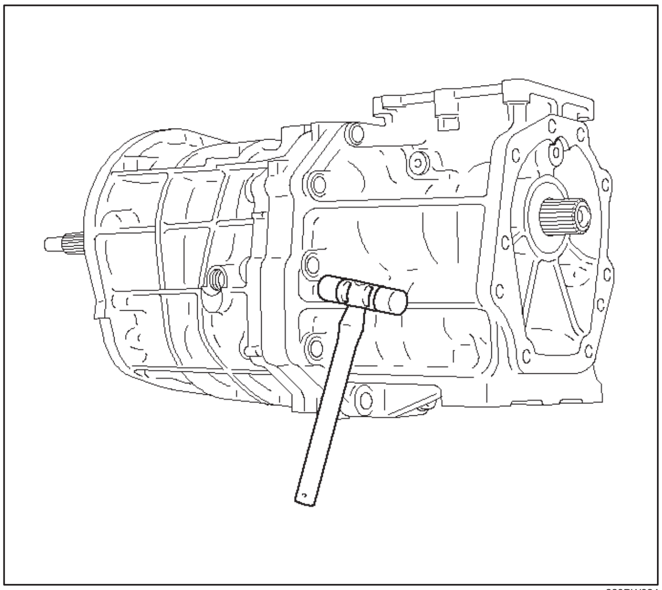
36. Install the transfer adapter.
1. Clean up the fitting surface.
2. Apply recommended liquid gasket (THREE BOND 1281 or equivalent), as shown.

NOTE:
- Don't dry the liquid gasket.



220RW026

3. Using a plastic hammer, tap the transfer adapter and attach it to the intermediate plate.

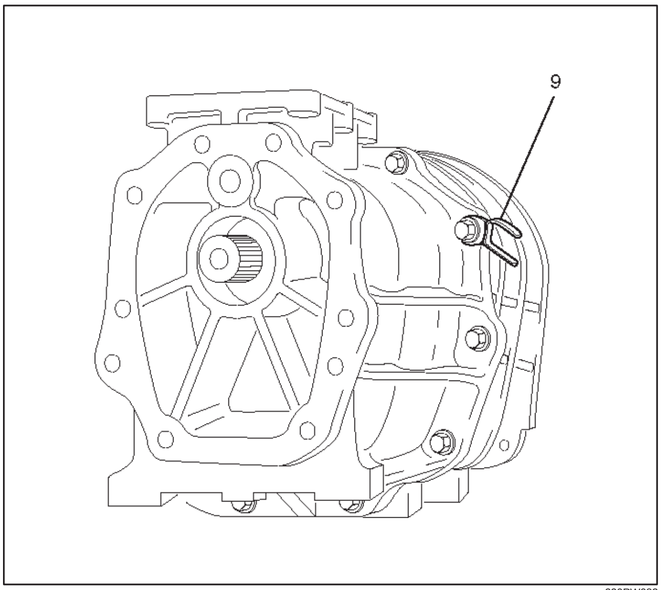


220RW034

4. Using 10 bolts, install the transfer adapter.

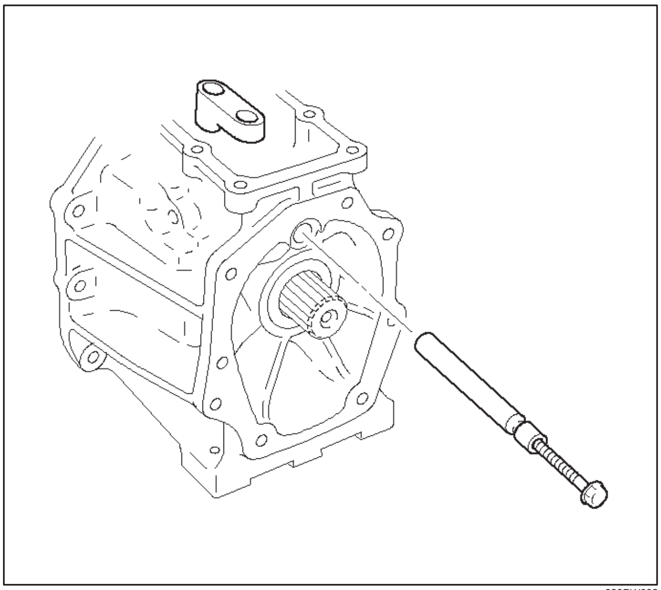
Torque: 37 N·m (27 lb ft)

NOTE:
- Tighten the all bolts evenly.
- Don't damage the lip of the oil seal.
- Install the wire clamp (9) to the transfer adapter.



220RW083

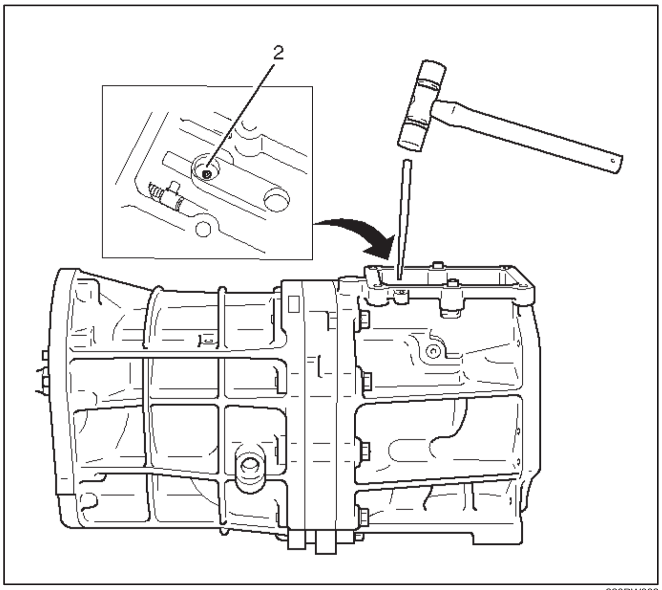
37. Install the gear control box.
1. Align the projection of the shift lever housing to the shift rod groove, and install the gear control rod.



230RW003

2. Using a pin punch and hammer, drive in the slotted spring pin (2) to the shift lever housing.

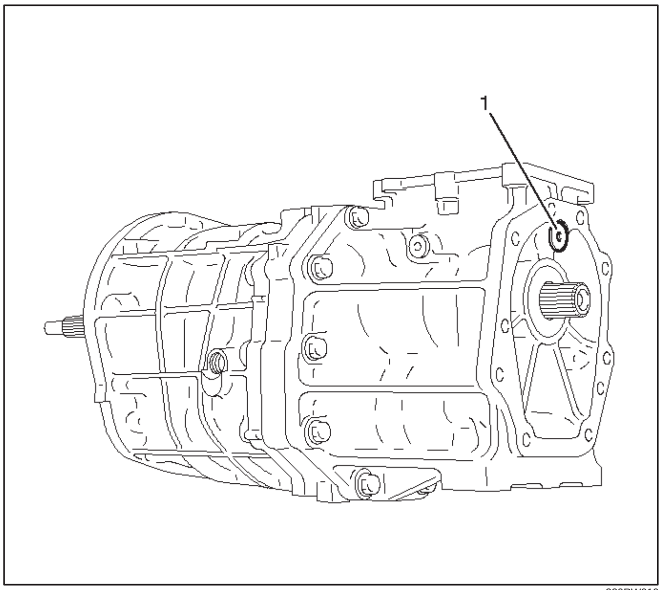
NOTE: Be carefull not to drop the slotted spring pin.



230RW002

3. Apply sealant (THREE BOND 1344 or equivalent) to the plug (1) thread.
4. Using hexagon wrench, install and torque the plug (1).

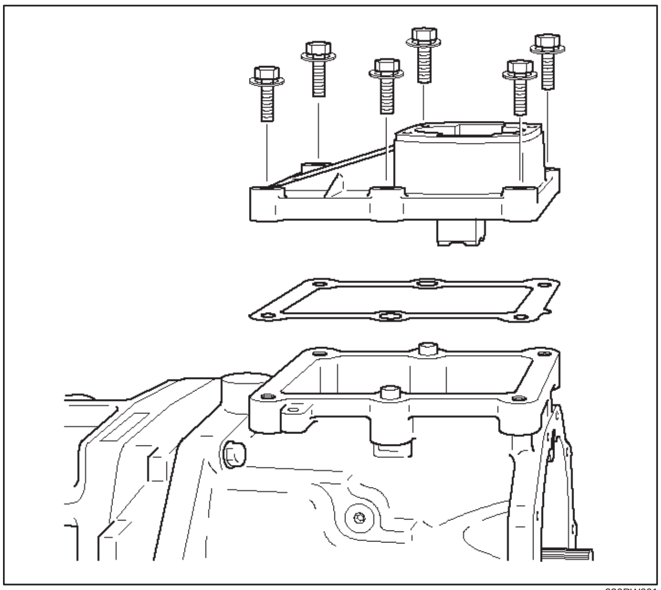
Torque: 18 N·m (13 lb ft)



220RW010

5. Clean up the bolts and bolt hole.
6. Using 6 bolts, install the gear control box through the gasket.

Torque 18 N·m (13 lb ft)

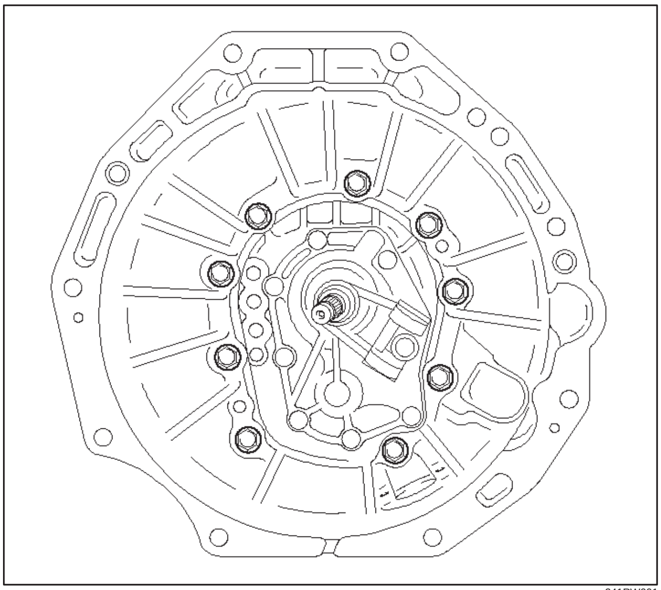


230RW001

38. Install clutch housing.
    1. Install the clutch housing to the transmission case.

Torque: 36 N·m (27 lb ft)

NOTE: Tighten the all bolts evenly.



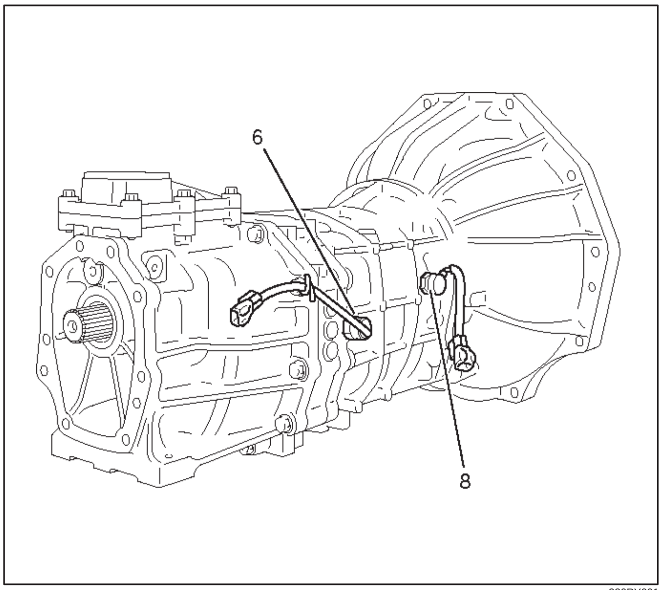
241RW001

39. Install the switches.
    1. Install the new gasket to the 1st and 2nd switch.
    2. Install the 1st and 2nd switch assembly (8).

Torque: 39 N·m (29 lb ft)

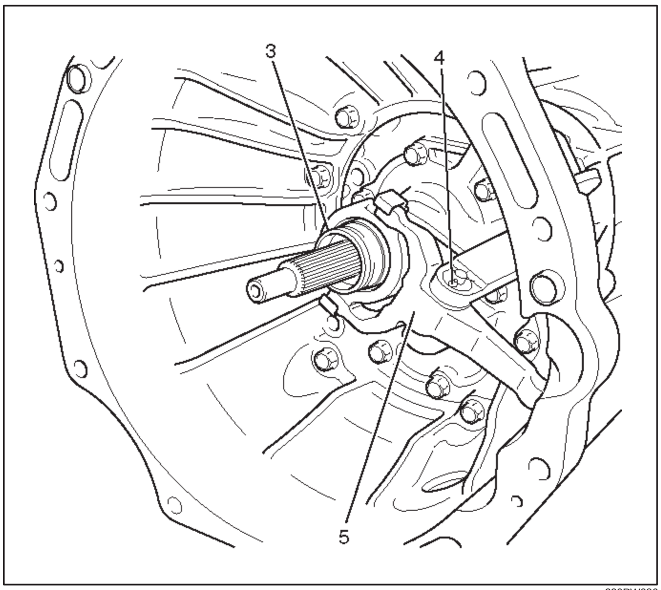
    3. Install the new gasket to the backup light switch.
    4. Install the backup light switch assembly (6).

Torque: 44 N·m (33 lb ft)



220RY001

40. Install the clutch release bearing (3) and clutch shift fork (5).
    1. Apply the clutch release grease.
        1. Fitting surface of the cylinder push rod.
        2. Fitting surface of the release bearing hub.
        3. The hole of the fork split pin (4).
    2. Apply the clutch release grease.
        1. The spline surface of the top gear shaft.
    3. Install the clutch shift fork (5).
    4. Install the snap pin.
    5. Install the clutch release bearing (3) to the clutch shift fork (5).



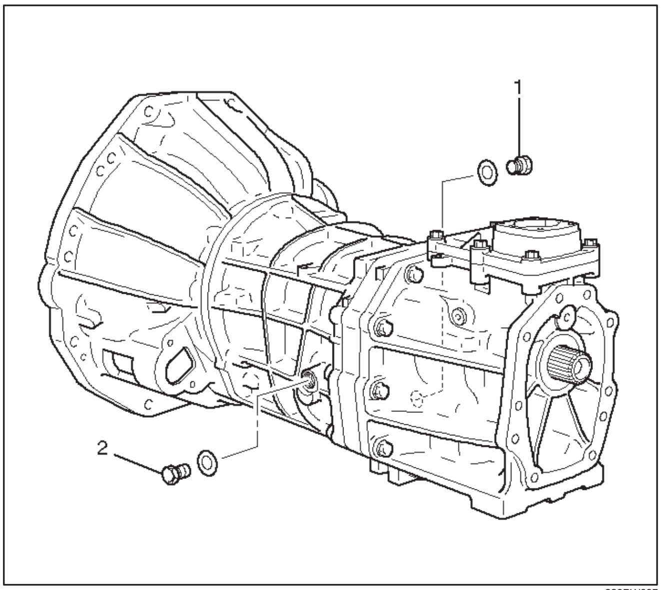
220RW086

41. Install the drain plug and filler plug.
    1. Install the drain plug (1) through the new gasket.

Torque: 37 N·m (27 lb ft)

    2. Install the filler plug (2) through the new gasket.

Reference: Plug after the gear oil fill in.
Torque: 37 N·m (27 lb ft)



220RW007

Main Data and Specifications

General Specifications

Transmission type		Fully synchronized forward and reverse gears
Control method		Direct control with the gear shift lever on the floor
Gear ratio	1st	3.954
	2nd	2.330
	3rd	1.436
	4th	1.000
	5th	0.788
	Rev	3.918
Oil capacity lit (US qt)		2.7 (2.86)
Type of lubricant		Engine oil : Refer to the chart in "SECTION 0"

Torque Specifications

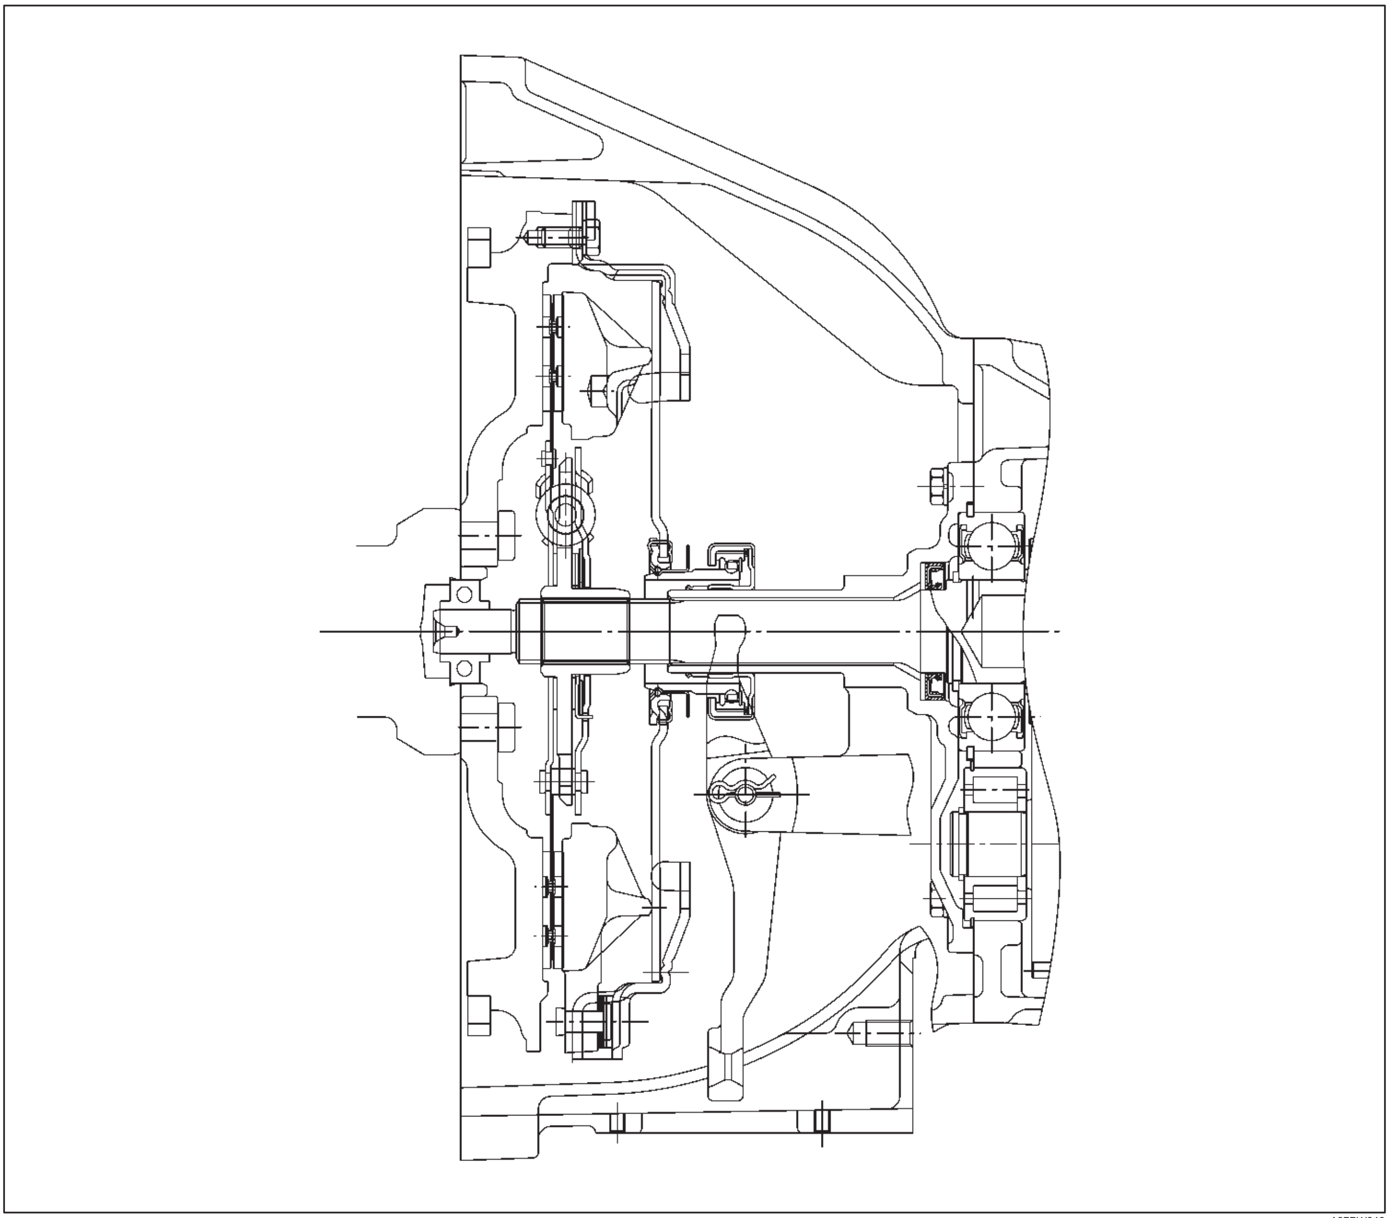
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM(SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFOMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastner in the proper location. When you reolace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that requir a replacement after removal. ISUZU will also call out the fasteners that requir thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED , do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fastners or fastner joint interfaces. Generally,such coatings adversely affect the fastner torque and the joint clamping force, and may damage the fastner. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

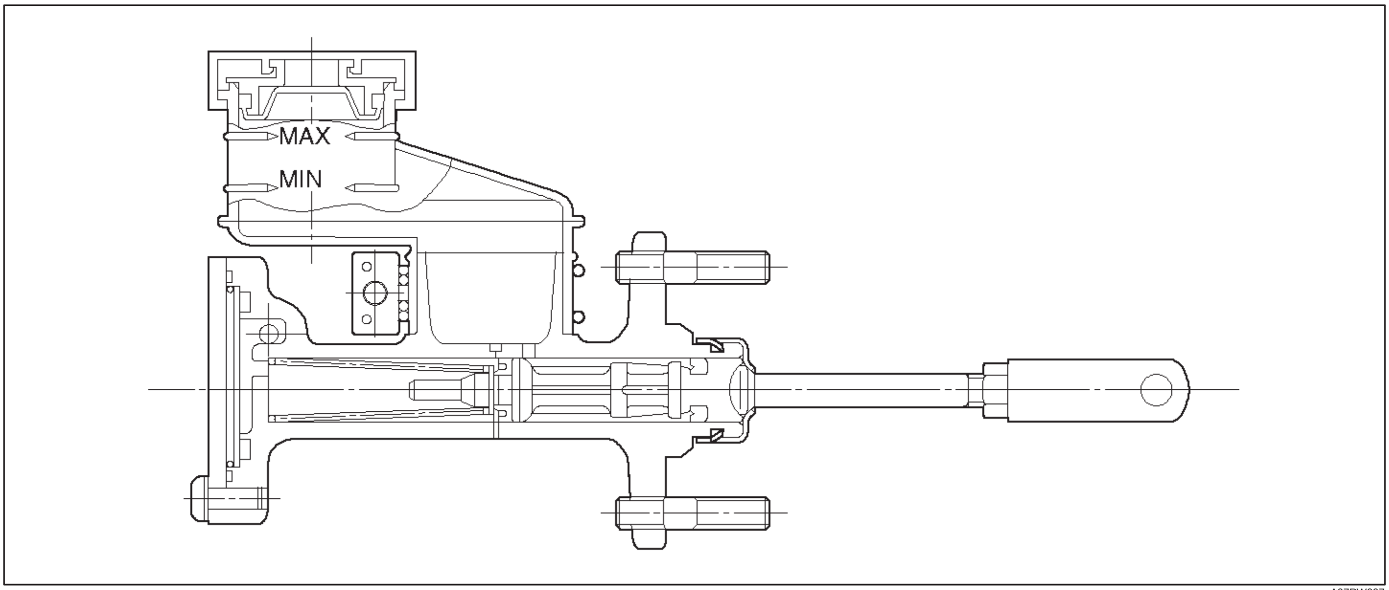
Clutch



A07RW046

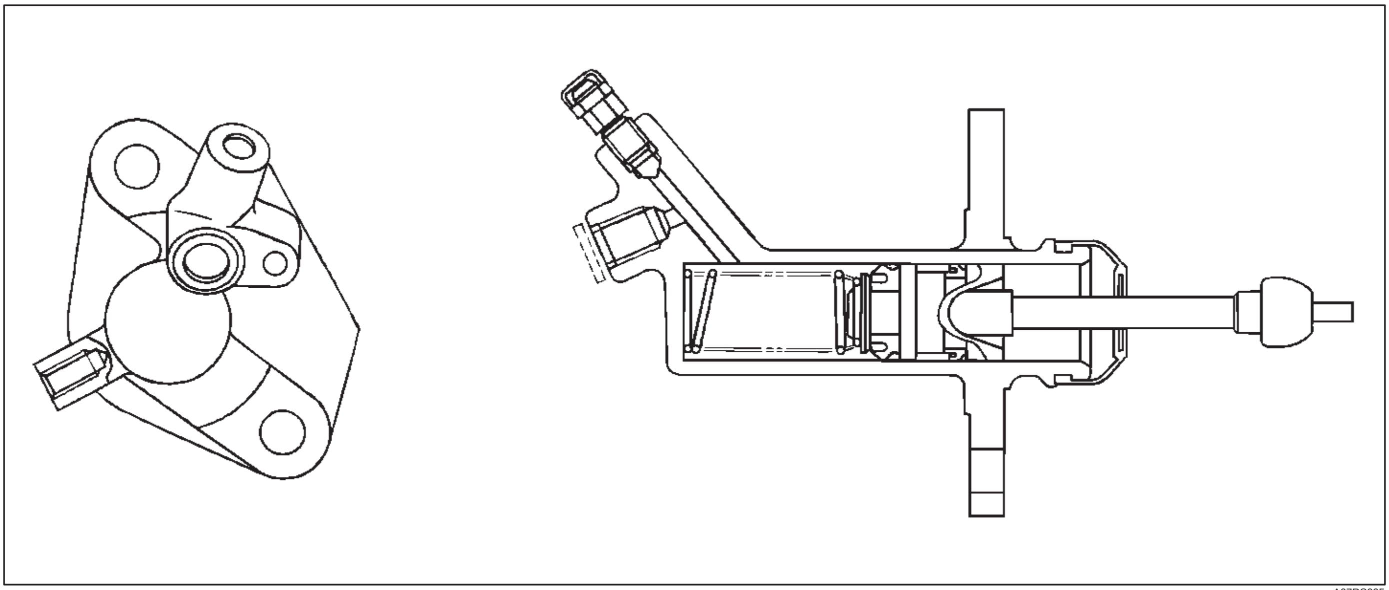
For 6VE1 (3.5L) engine model, the pull-type clutch is employed. The pull-type clutch is disengaged by pulling the release lever (release bearing) to disengage the pressure plate.

Master Cylinder



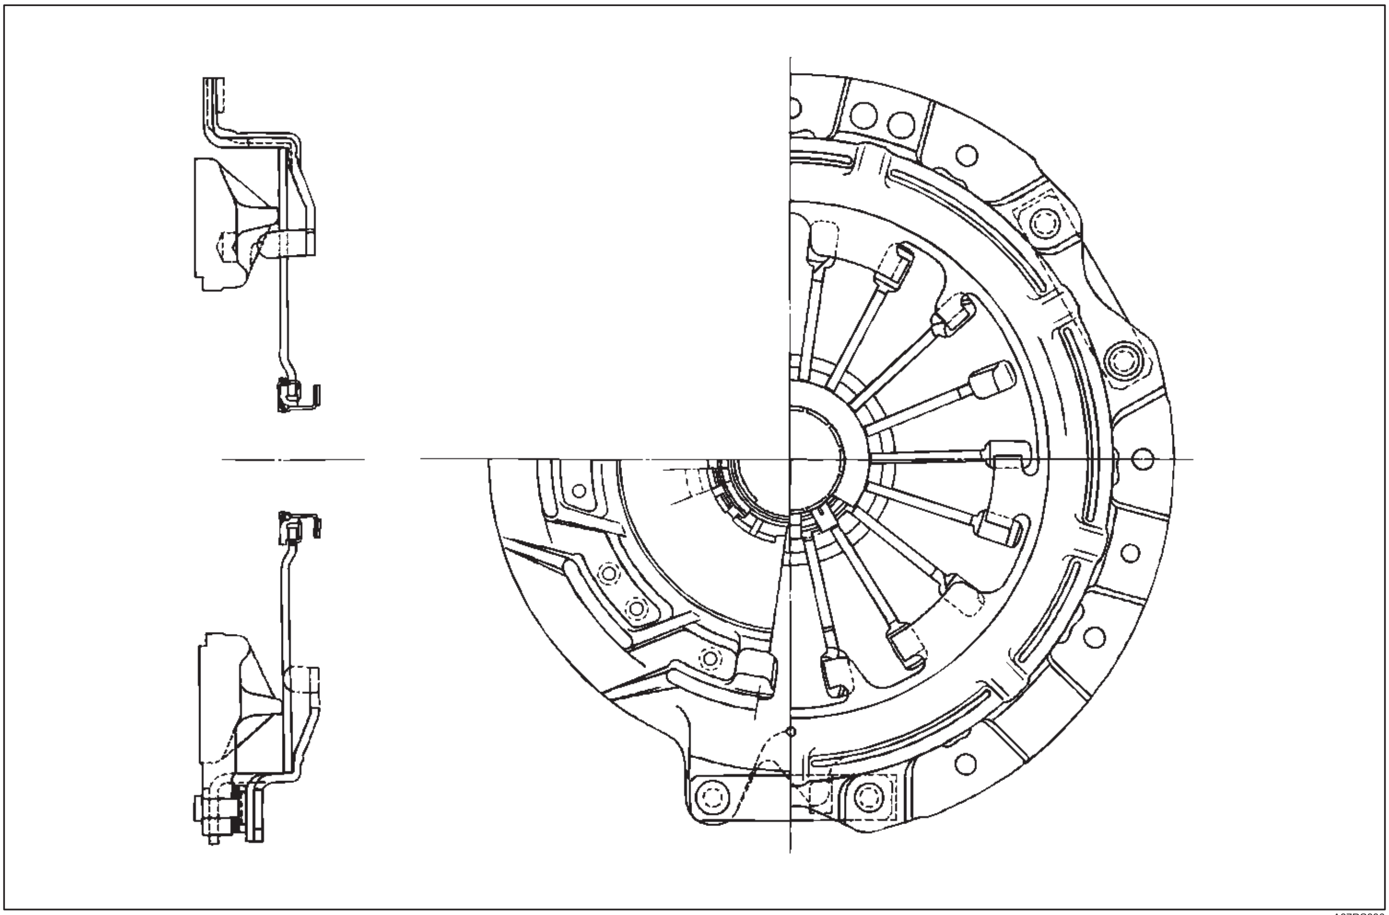
A07RW007

Slave Cylinder



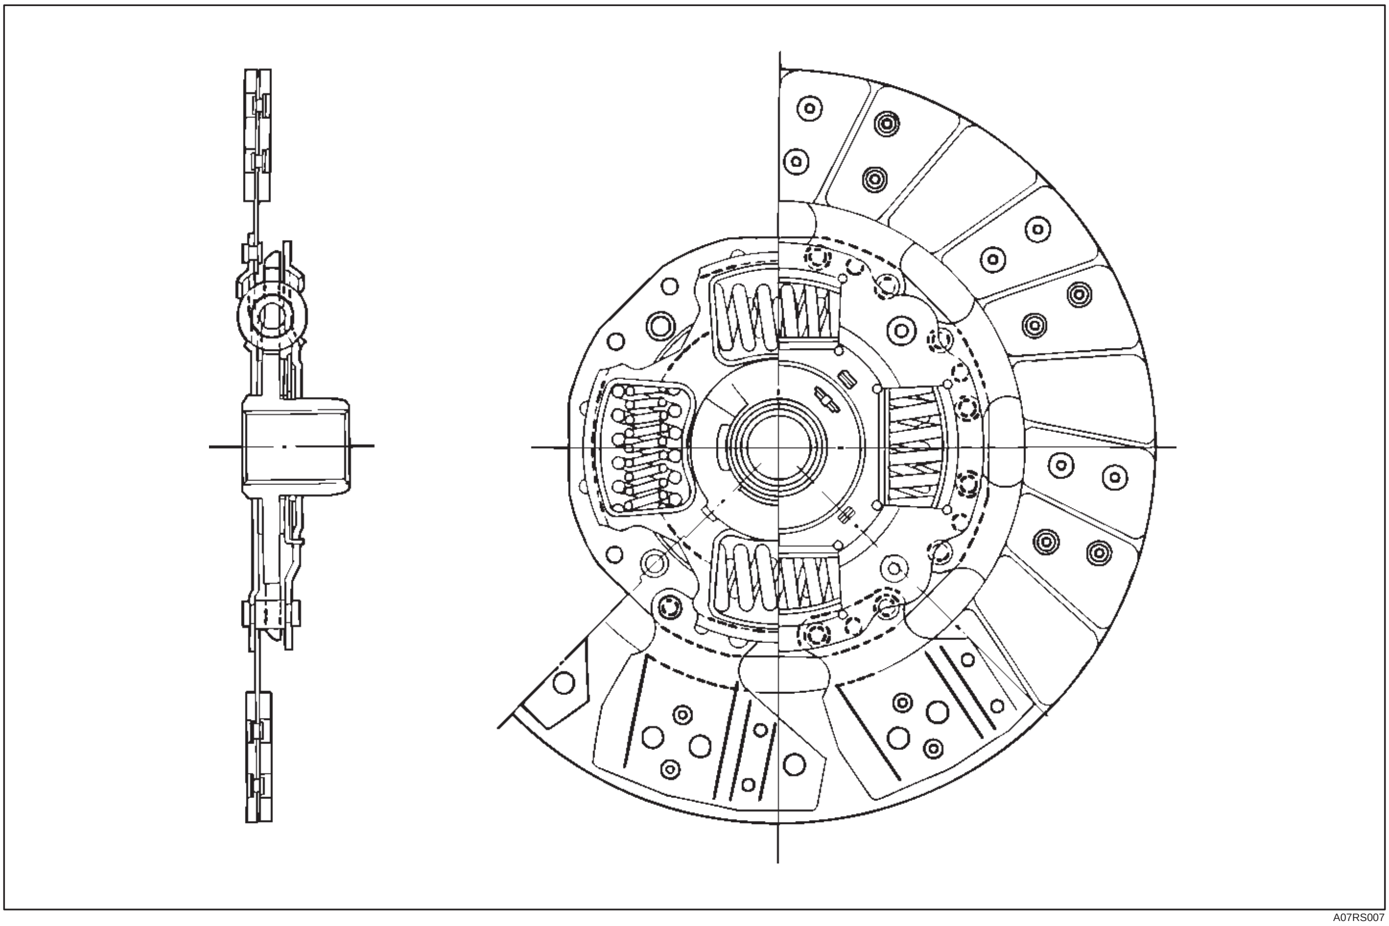
A07RS005

Pressure Plate Assembly



A07RS006

Driven Plate Assembly

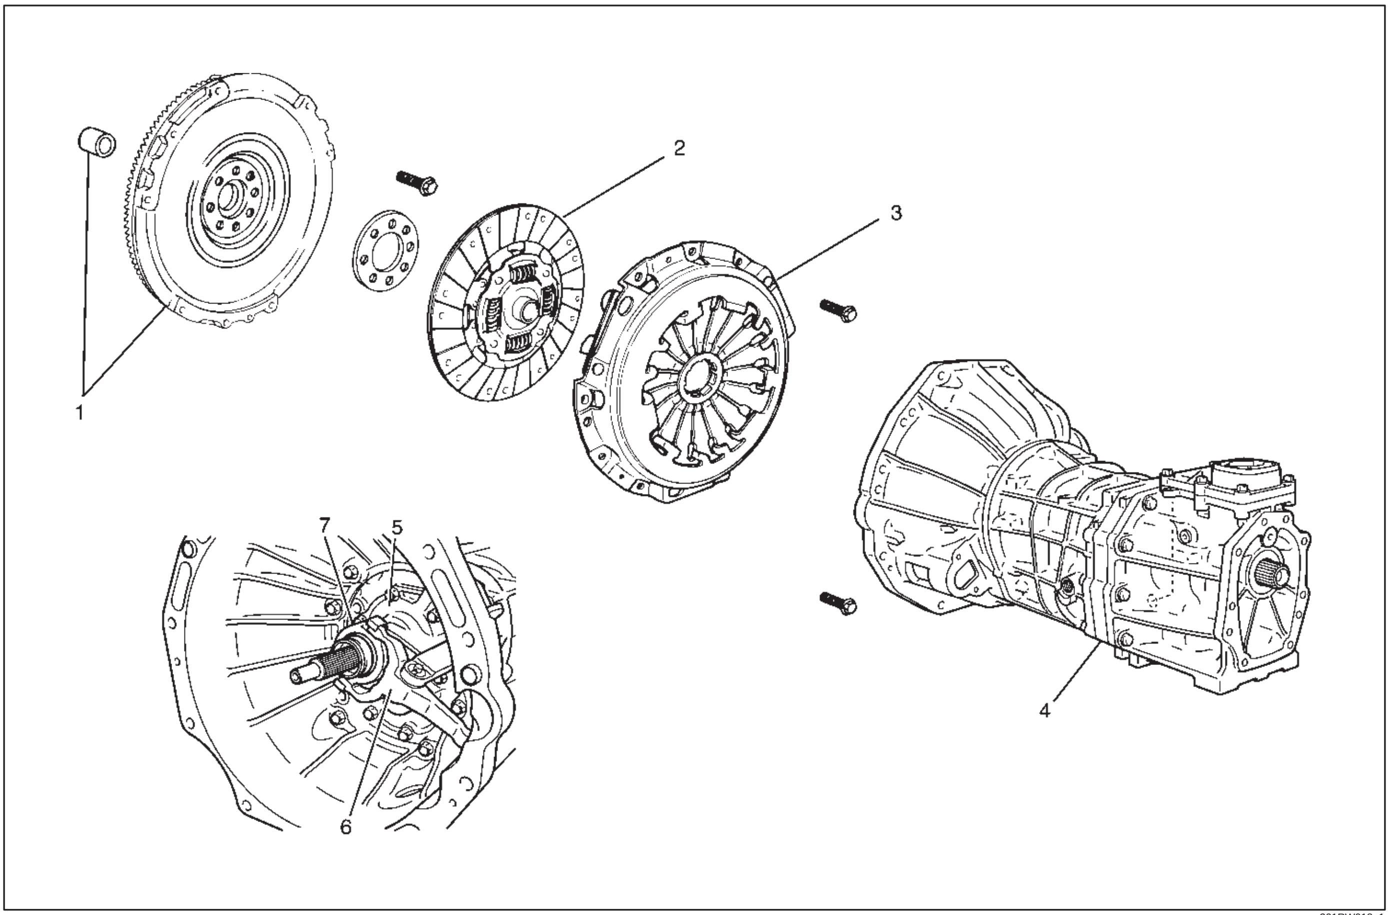


Diagnosis

Condition	Possible cause	Correction
Dragging	Fluid leakage.	Repair
	Air in hydraulic line.	Bleed
	Master cylinder and slave cylinder seals worn.	Replace seals.
	Driven plate warped.	Replace driven plate.
	Diaphragm spring weakened or tip of fingers worn.	Replace pressure plate
	Driven plate sticking on splines.	Lubricate with grease or replace.
	Clutch spline worn.	Repair
	Release bearing worn or damaged.	Replace release bearing.
Slipping	Driven plate facing worn or oil soaked.	Replace driven plate and check for leaks.
	Diaphragm spring weakened.	Replace pressure plate.
	Pressure plate or flywheel warped.	Correct or replace.
	Master cylinder and slave cylinder seals worn.	Replace seals.
Chattering	Engine mounts loose or damaged.	Tighten or replace.
	Driven plate facing warped.	Replace driven plate.
	Surface of facing hardened.	Replace driven plate
	Driven plate facing oil soaked.	Replace driven plate and check for leaks.
	Damper springs weakened or broken.	Replace.
	Pressure plate or flywheel warped.	Correct or replace.
Noisy	Replace bearing binding.	Correct, or replace if damaged, and lubricate.
	Replace bearing worn or damaged.	Replace release bearing.
	Release bearing poorly lubricated.	Lubricate.
	Pilot bearing worn.	Replace pilot bearing.
	Damper springs weakened or broken.	Replace driven plate.
	Rivets of driven plate exposed.	Replace driven plate.
Replace driven plate.	Hydraulic line blocked.	Clean out or replace.
	Master or slave cylinders binding.	Repair or replace as needed.

Clutch Assembly

Clutch Assembly and Associated Parts



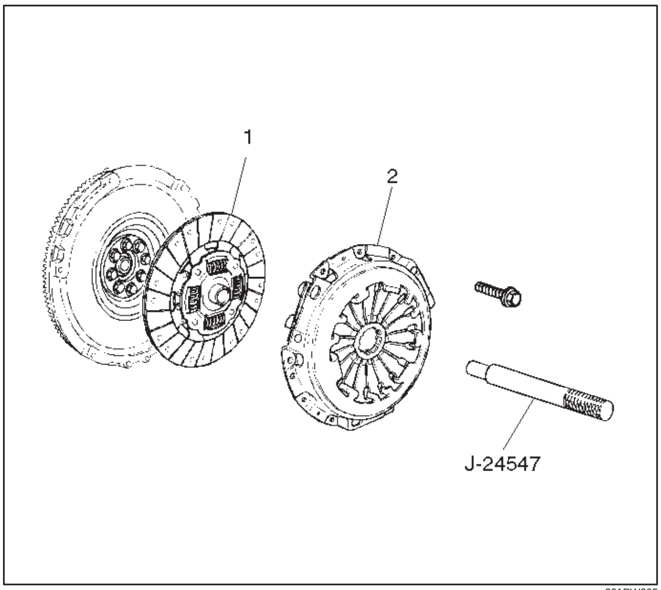
201RW018–1

Legend

(1) Flywheel Assembly and Crankshaft Bearing
(2) Driven Plate Assembly
(3) Pressure Plate Assembly
(4) Transmission Assembly
(5) Front Cover
(6) Shift Fork
(7) Release Bearing

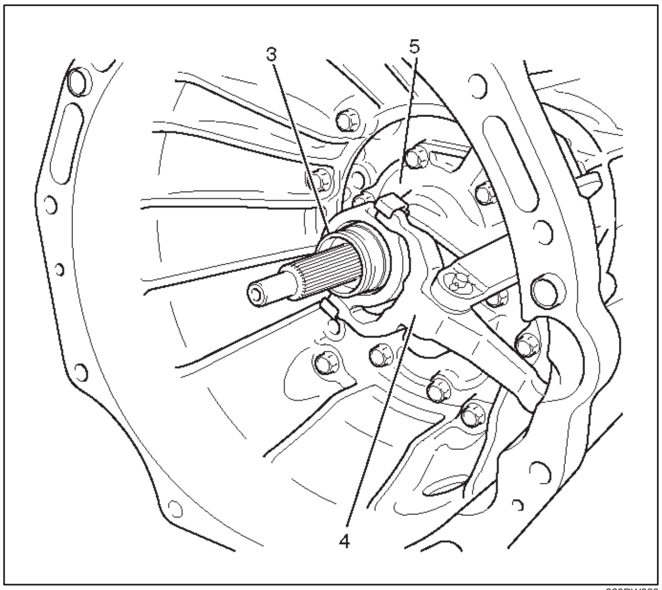
Removal

1. Remove transmission assembly, refer to ”MANUAL TRANSMISSION” of Section 7B for ”Removal AND INSTALLATION” procedure.
2. Remove pressure plate assembly (2).
3. Remove driven plate assembly (1), use the pilot aligner J-24547 to prevent the driven plate assembly (1) from falling free.



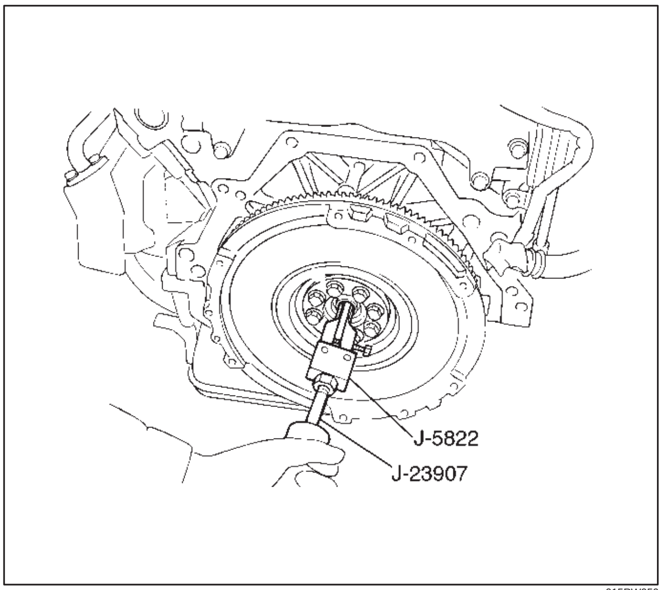
201RW005

4. Mark the flywheel, clutch cover and pressure plate lug for alignment when installing.
5. Remove the release bearing (3) from the transmission case .
6. Remove the shift fork snap pin.
7. Remove the shift fork pin and shift fork (4) from the front cover.
8. Remove the front cover bolts.
9. Remove the front cover (5) from the transmission case.



220RW088

10. Remove flywheel assembly and crankshaft bearing, do not remove except for replacement.
11. Use the remover J–5822 and sliding hammer J–23907 to remove the crankshaft bearing.

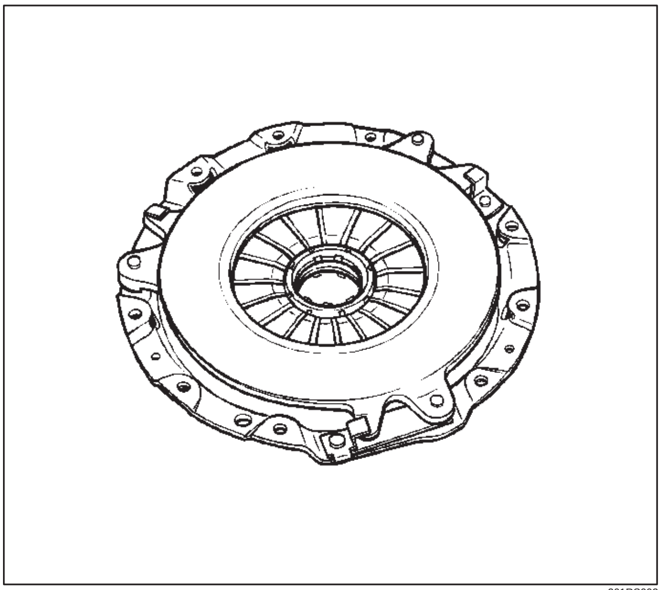


015RW050

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, or any other abnormal condition are found through inspection.

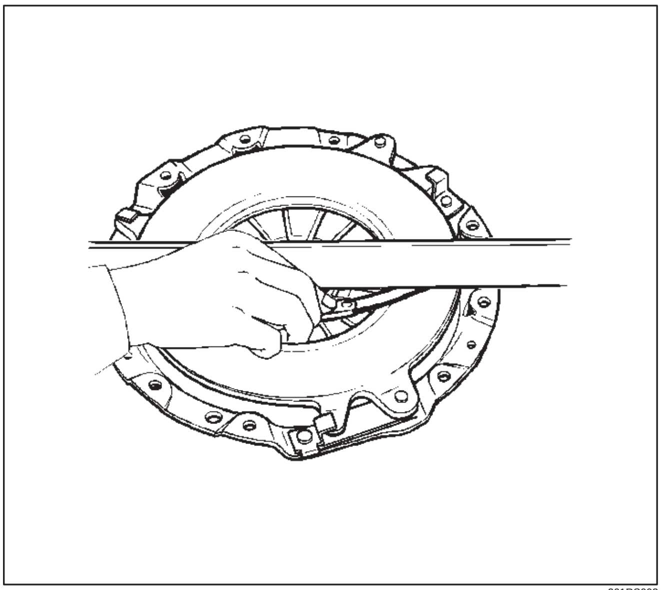
Pressure Plate Assembly



201RS002

1. Visually check the pressure plate friction surface for excessive wear and heat cracks.
2. If excessive wear or deep heat cracks are present, the pressure plate must be replaced.

Pressure Plate Warpage



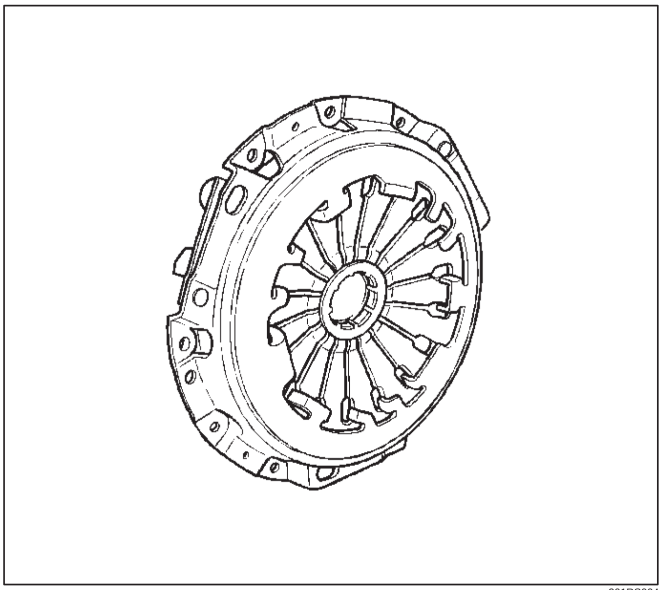
201RS003

1. Use a straight edge and a feeler gauge to measure the pressure plate friction surface flatness in four directions.
2. If any of the measured values exceeds the specified limit, the pressure plate must be replaced.

Pressure Plate Warpage

Limit: 0.3 mm (0.012 in)

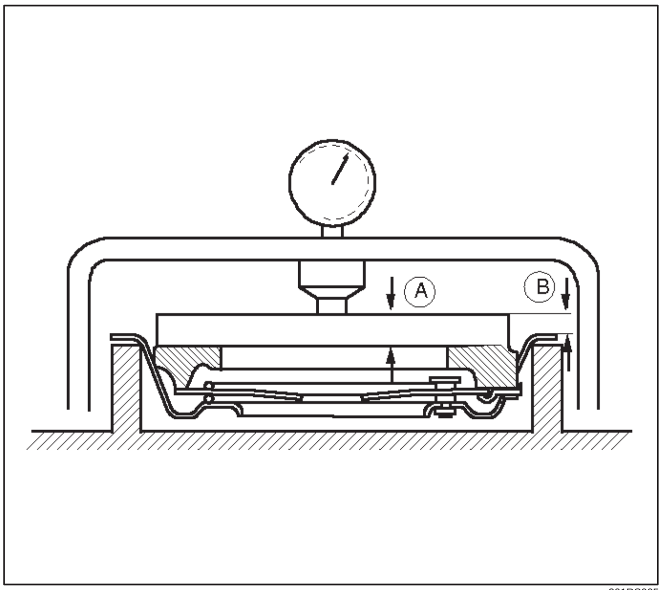
Clutch Cover



201RS004

1. Visually check the entire clutch cover for excessive wear, cracking, and other damage.
2. The clutch cover must be replaced if any of these conditions are present.

Clutch Set Force



201RS005

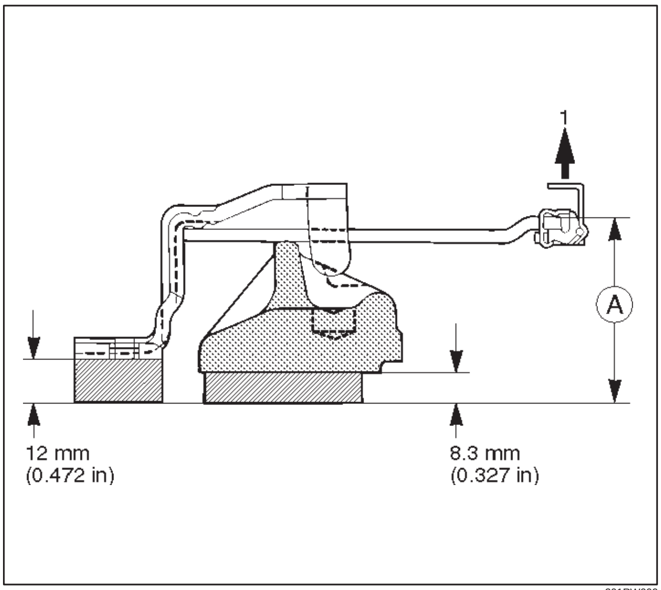
1. Invert the pressure plate assembly.
2. Place a new driven plate over the pressure plate. A metal sheet with A thickness of 8.3 mm (0.327 in) may be used in place of the driven plate.
3. Compress the pressure plate assembly until the distance B becomes 12 mm (0.472 in).
4. Note the pressure gauge reading.
5. If the measured value is less than the specified limit, the pressure plate assembly must be replaced.

Clutch Set Force

Standard: 7208 N (1621 lb)

Limit: 6468 N (1454 lb)

Diaphragm Spring Finger Height



201RW009

Legend

(1) Release Side

1. Place a new driven plate or a 8.3 mm (0.327 in) spacer beneath the pressure plate.
2. Fully compress the pressure plate and diaphragm spring.
3. There are two ways to do this.
4. Use a bench press to press down on the assembly from the top.
5. Tighten the fixing bolts.

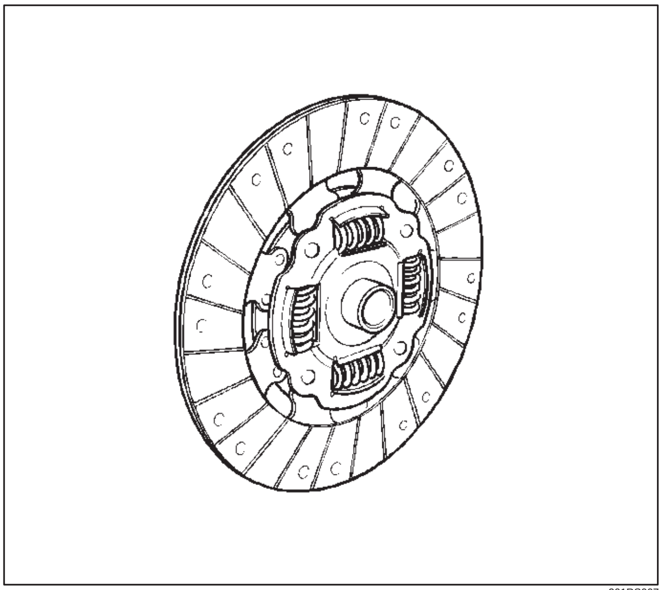
NOTE: Preload on diaphragm spring finger must be 49 – 98 N (11 – 22 lb) in direction of release, when clutch cover assembly is bolted to the flywheel.

6. Measure the spring height from base to spring tip A. If the measured value exceeds the specified limit, the pressure plate assembly must be replaced.

Spring Finger Height

Standard: 49.9 mm – 51.9 mm (1.965 in – 2.043 in)

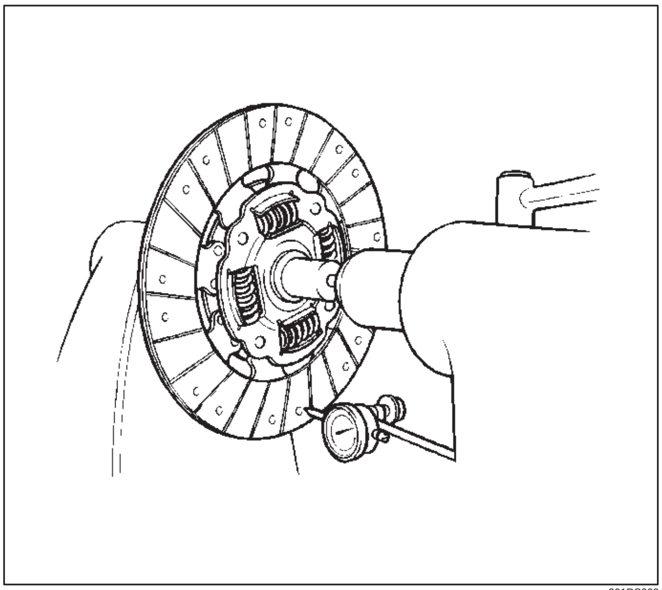
Driven Plate Assembly



201RS007

1. Visually check the torsion spring for looseness, breakage, and weakening.
2. If any of these conditions are discovered, the driven plate assembly must be replaced.
3. Visually check the facing surfaces for cracking and excessive scorching.
4. Visually inspect the facing surfaces for the presence of oil or grease.
5. If any of these conditions are discovered, the facing must be cleaned or replaced.
6. Check that the driven plate moves smoothly on the transmission top gear shaft spline.
7. Minor ridges on the top gear shaft spline may be removed with an oil stone.

Driven Plate Warpage



201RS008

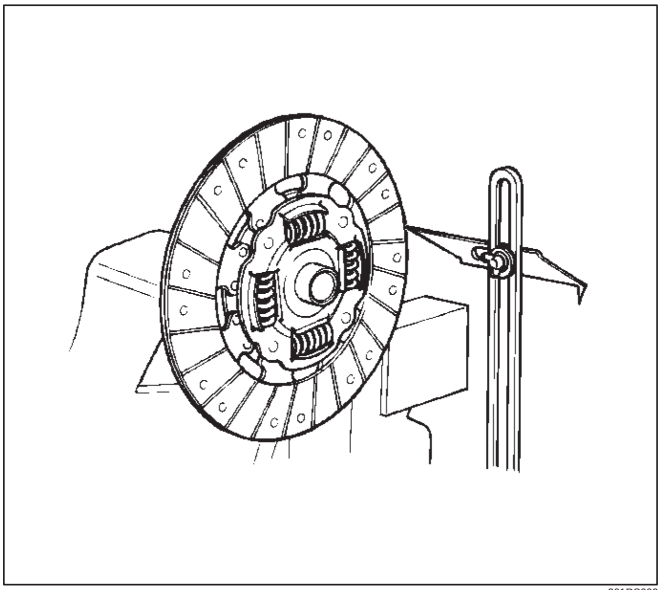
1. Insert the clutch pilot aligner into the driven plate splined hub.
2. The clutch pilot aligner J-24547 must be held perfectly horizontal.
3. Set a dial indicator to the driven plate outside circumference.
4. Slowly turn the driven plate.
5. Read the dial indicator as you turn the driven plate.
6. If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Warpage

Standard: 0.7 mm (0.028 in)

Limit: 1.0 mm (0.039 in)

Driven Plate Splined Hub Spline Wear



201RS009

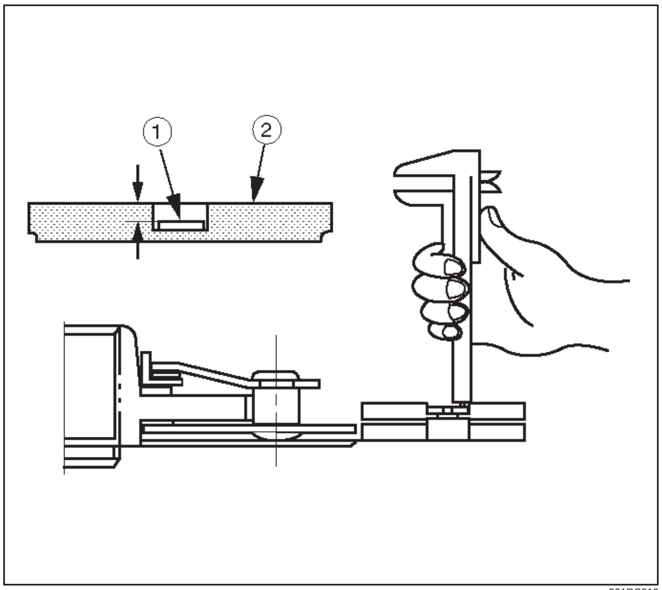
1. Clean the driven plate splined hub.
2. Install the driven plate to the transmission top gear shaft spline.
3. Set a surface gauge to the driven plate outside circumference.
4. Slowly turn the driven plate counterclockwise.
5. Measure the spline rotation play as you turn the driven plate.
6. If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Splined Hub Spline Wear

Standard: 0.5 mm (0.020 in)

Limit: 1.0 mm (0.039 in)

Rivet Head Depression



201RS010

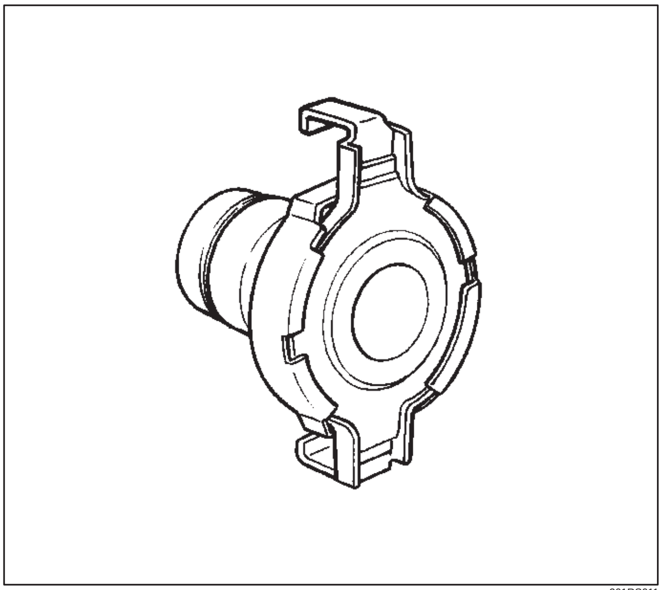
1. Use a depth gauge or a straight edge with steel rule to measure the rivet head depression 1 from the facing surface 2.
2. Be sure to measure the rivet head depression on both sides of the driven plate.
3. If the measured value is less than the specified limit, the driven plate assembly must be replaced.

Rivet Head Depression

Standard: 1.95 mm (0.077 in)

Limit: 0.2 mm (0.008 in)

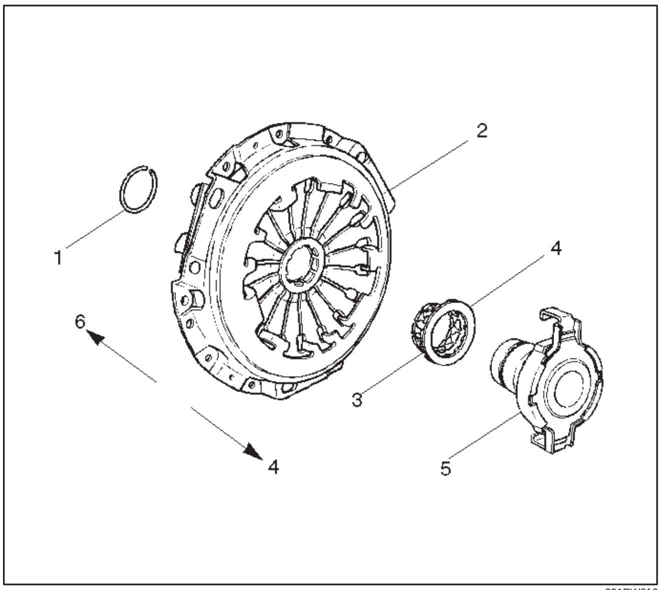
Release Bearing



201RS011

1. Visually check the release bearing for excessive play, noise and breakage.
2. If any of these conditions are discovered, the release bearing must be replaced.

3. When replacing the release bearing, replace both the wedge collar and wire ring at the same time.

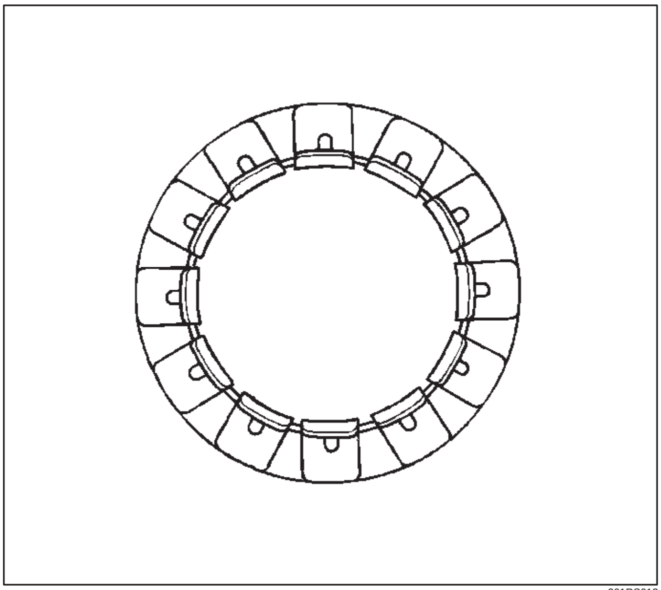


201RW010

Legend

(1) Wire Ring
(2) Pressure Plate Assembly
(3) Wedge Collar
(4) T/M Side
(5) Release Bearing
(6) Engine Side

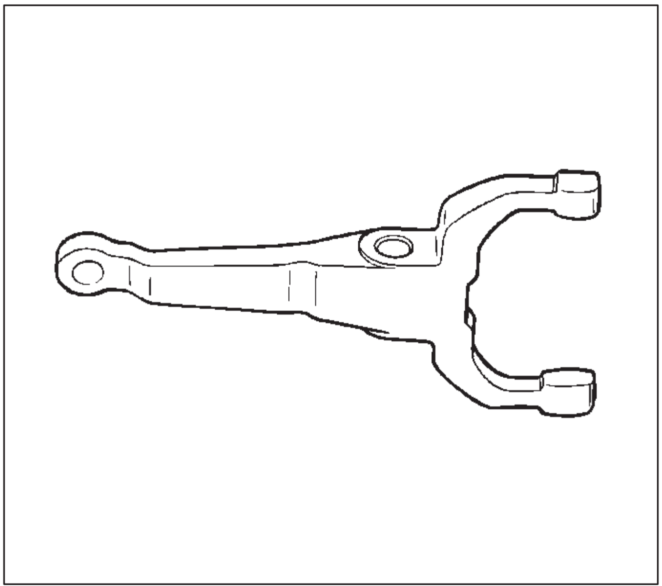
Wedge Collar



201RS013

1. Visually check the surfaces of the wedge collar making contact with the release bearing for excessive wear and damage.
2. Replace any exhibiting excessive wear or damage.

Shift Fork



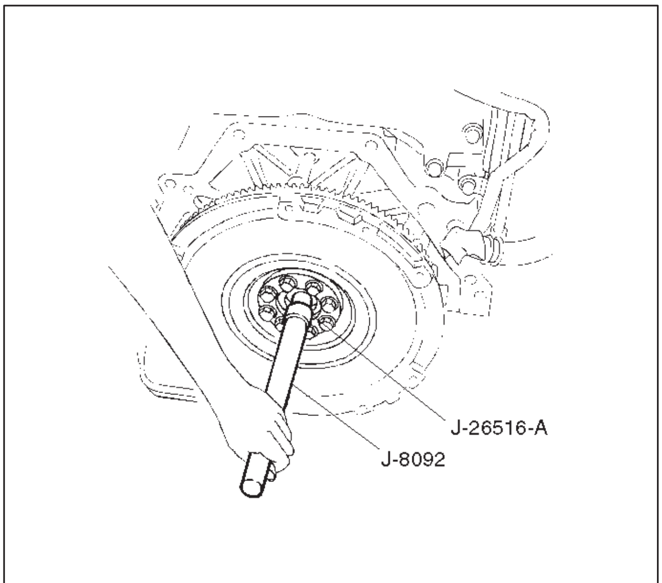
201RS014

1. Visually check the surfaces of the shift fork making contact with the release bearing for excessive wear and damage.
2. Remove any minor stepping or abrasion from shift fork with an oil stone.
3. Replace any exhibiting excessive wear or damage.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Install flywheel assembly and crankshaft bearing, use the installer J-26516-A and driver handle J-8092 to install the crankshaft bearing then clean and lubricate with grease.

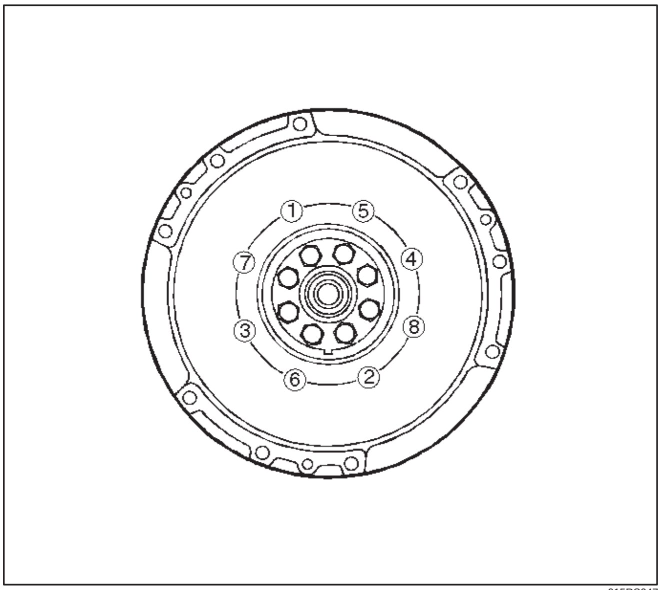


015RS046

2. Install new flywheel fixing bolts in the order illustrated and tighten them to the specified torque.

Torque: 54 N·m (40 lb ft)

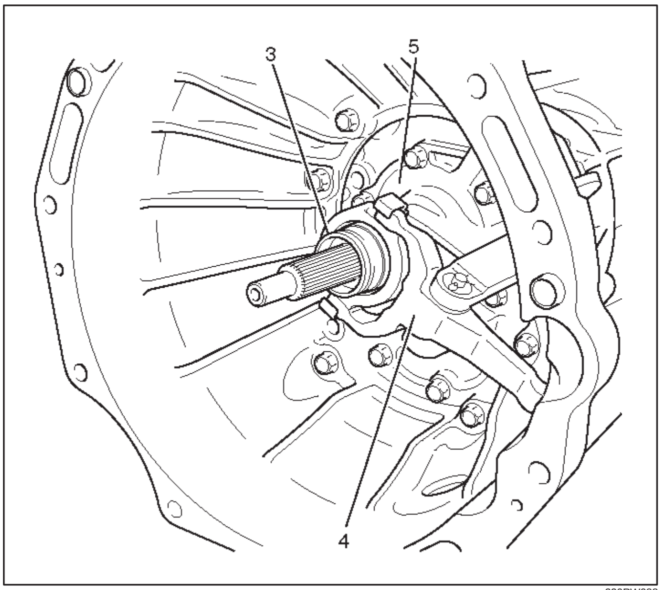
NOTE: Do not reuse the bolt and do not apply oil or thread lock to the bolt.



015RS047

3. Install the front cover (5) to the transmission case.
4. Tighten three fulcrum bridge bolts to the specified torque.

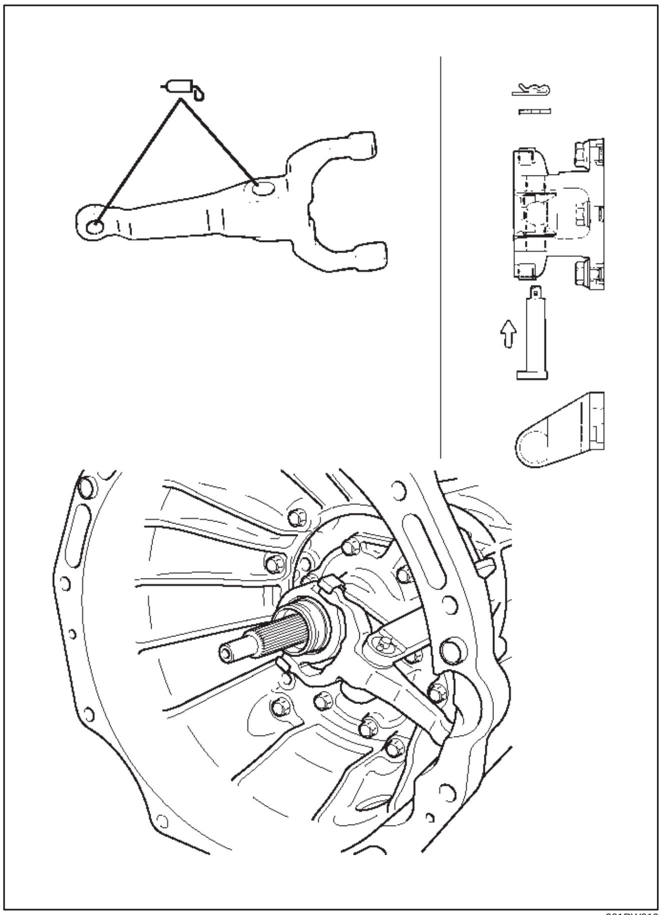
Torque: 16.5 N·m (12 lb ft)



220RW088

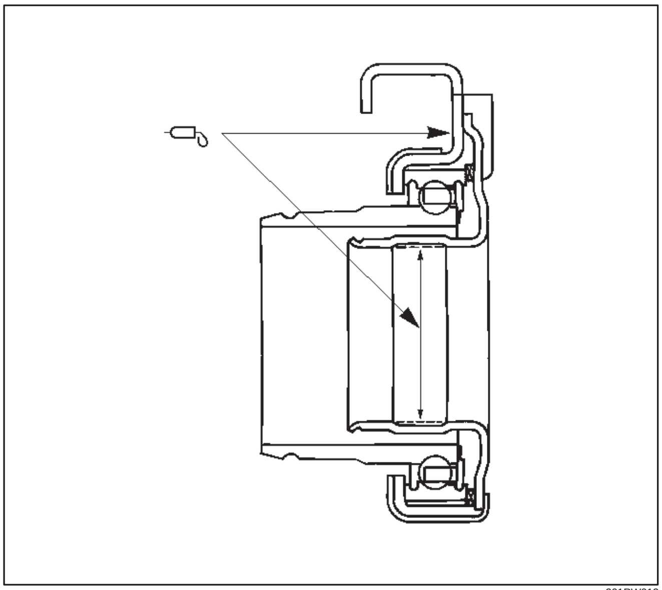
5. Apply molybednum disulfide type grease to the pin hole inner circumferences and thrust surfaces.
6. Attach the shift fork to the front cover and insert the pin from below of the front cover.

7. Install the washer and snap pin.



201RW019

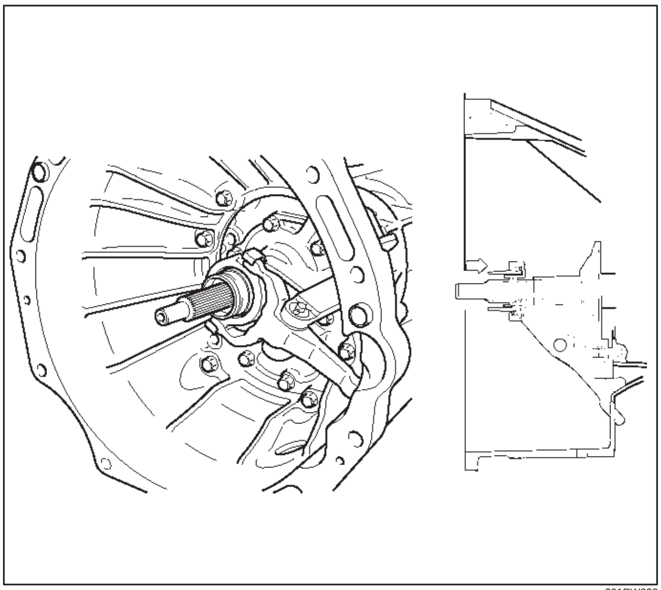
8. Apply molybdenum disulfide type grease to the areas shown in illustration.



201RW012

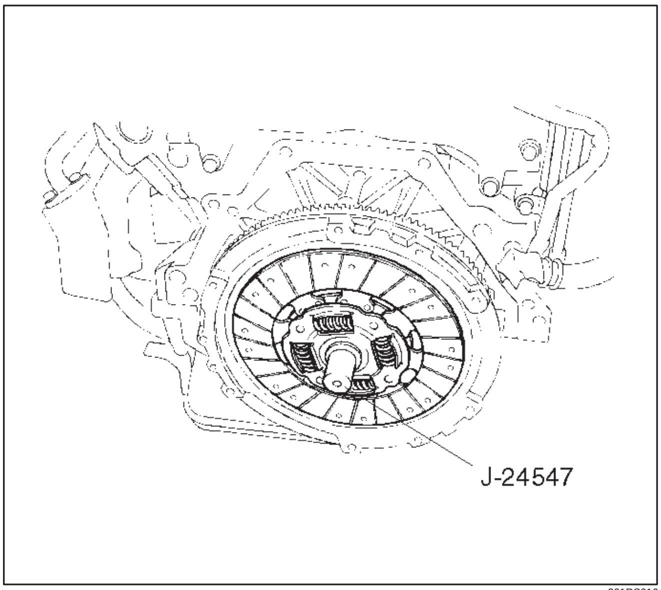
9. Install the release bearing in the proper direction.

NOTE: Ensure release bearing is properly positioned during installation, as shown in illustration.



201RW020

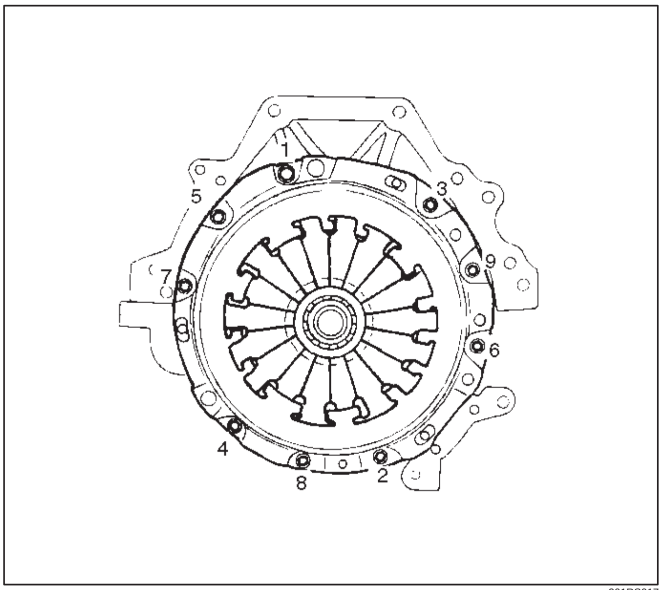
10. Install driven plate assembly, use the pilot aligner J-24547 to install the driven plate assembly.



201RS016

11. Install pressure plate assembly and tighten the bolts holding the pressure plate assembly in the order shown in illustration.

Torque: 18 N·m (13 lb ft)



201RS017

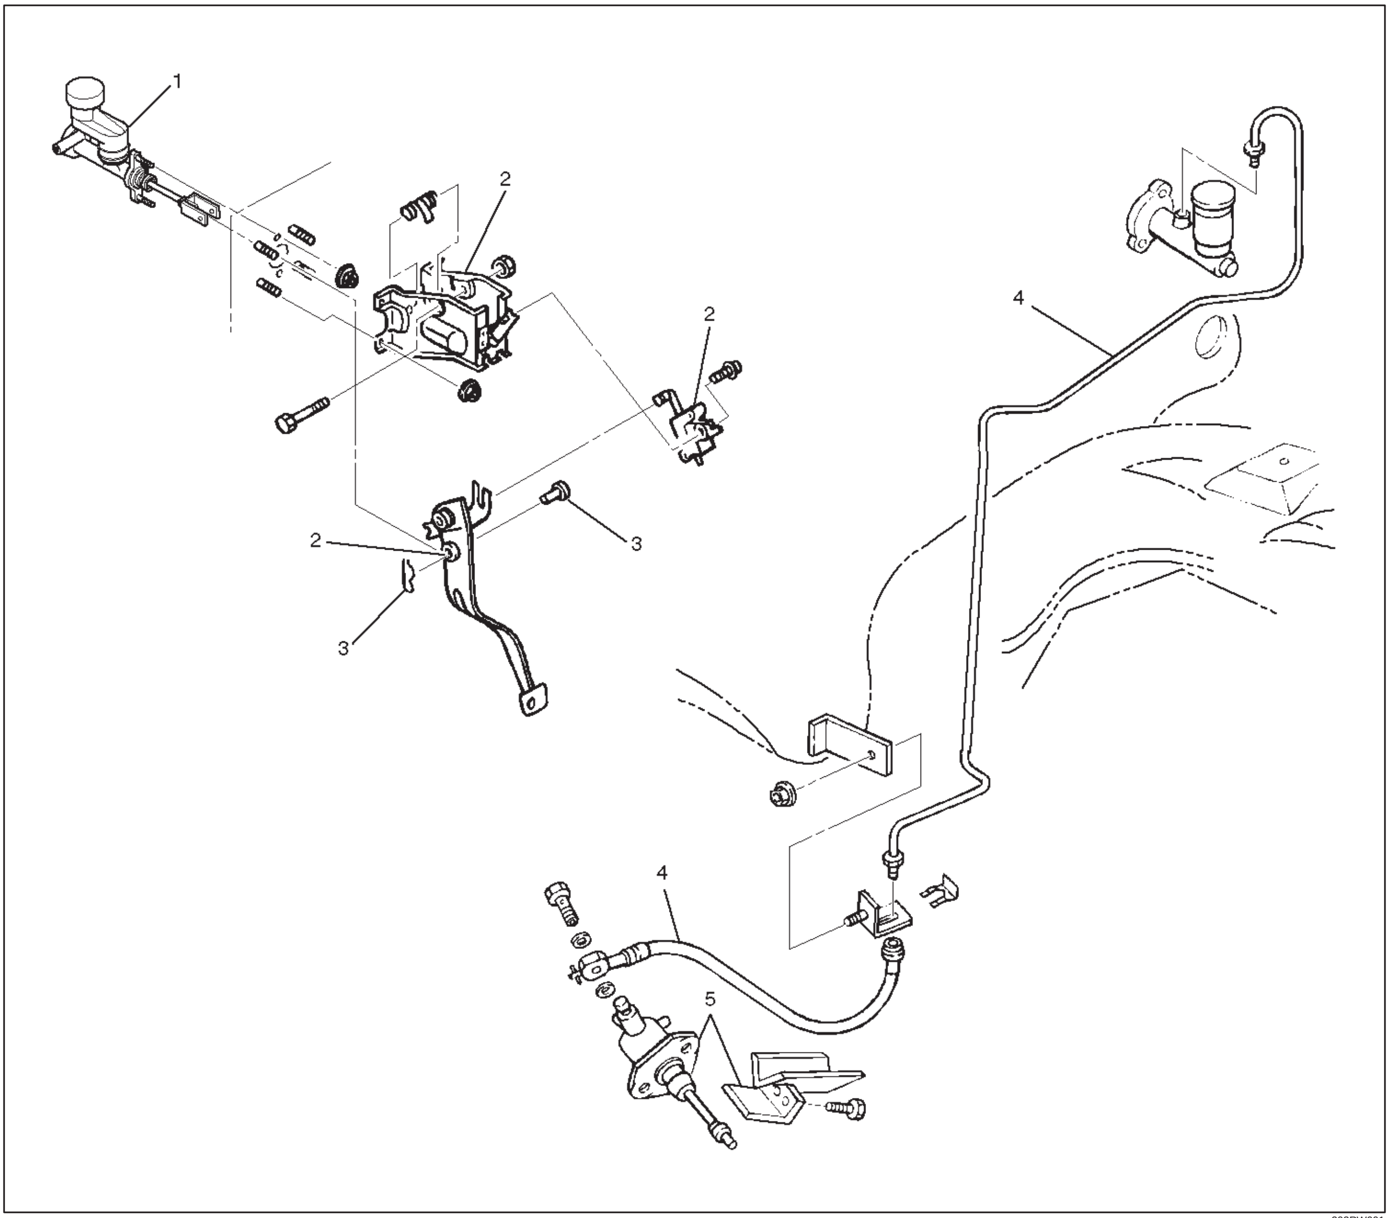
12. Remove the aligner.

NOTE: Do not strike the aligner with a hammer to remove it.

13. Install transmission assembly.

Clutch Control

Clutch Control Parts



Legend

(1) Master Cylinder Assembly
(2) Pedal Assembly and Switch
(3) Pin and Jaw Joint Pin
(4) Oil Line Pipe
(5) Slave Cylinder Assembly and Heat Protector

Removal

1. Remove pin and jaw joint pin.
2. Remove pedal assembly and switch.
3. Remove oil line pipe.
4. Remove slave cylinder assembly and heat protector.
5. Remove master cylinder assembly.
6. Remove damper cylinder assembly.

Inspection and Repair

Make necessary adjustments, repairs, and part replacement if wear, damage or other problems are discovered during inspection.

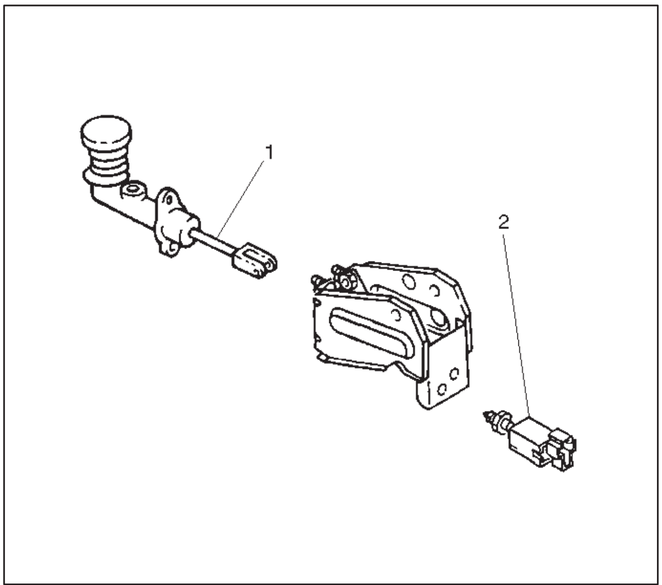
Installation

1. Install damper cylinder assembly.
2. Install master cylinder assembly.
3. Install slave cylinder assembly and heat protector.
4. Install oil line pipe.
5. Install pedal assembly and switch.
6. Install pin and jaw joint pin.

Adjustment

Clutch Pedal Adjustment

1. With clutch switch
   1. Disconnect clutch switch (2) connector.
   2. Loosen lock nut, then turn switch out until there is a gap between the switch plunger and clutch pedal.



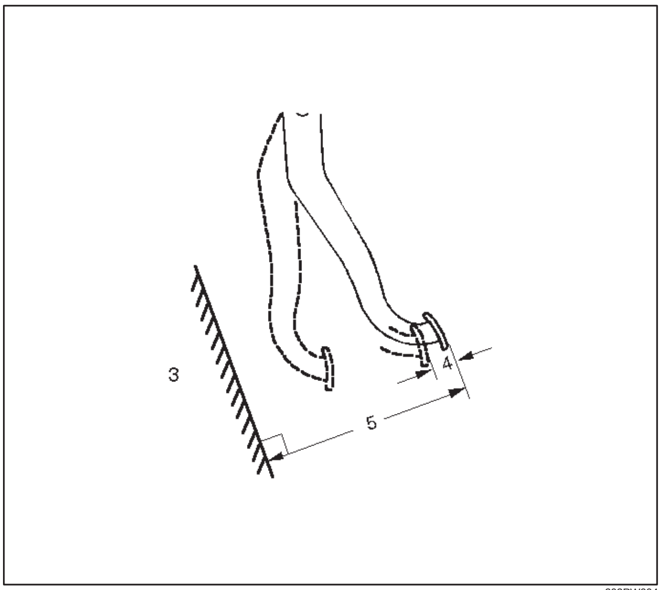
203RW003

Legend

(1) Push Rod
(2) Clutch Switch

2. Loosen clutch master cylinder push rod lock nut. Turn push rod by hand to set clutch pedal height (5) to within specification.

Clutch pedal height (5): 217 mm – 227 mm (8.543 in – 8.937 in)

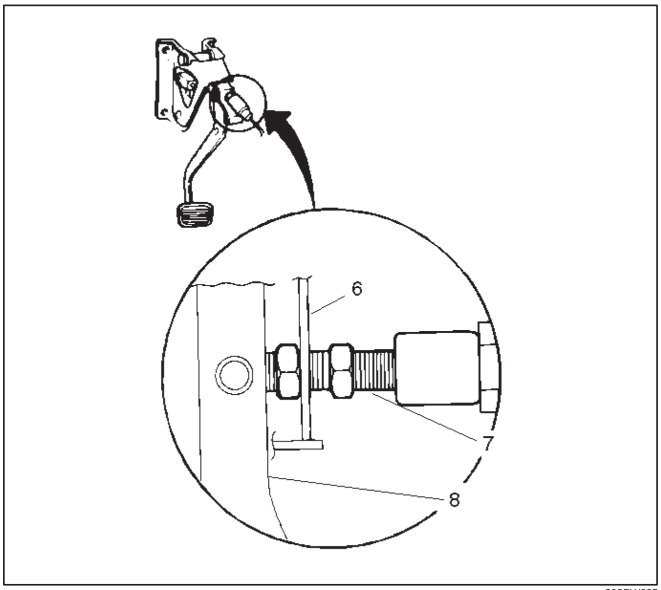


203RW004

Legend

(3) Floor Panel
(4) Pedal Free Play
(5) Clutch Pedal Height

3. Tighten push rod lock nut.
4. With clutch switch
   1. Turn the clutch switch until the switch bolt just touches the clutch pedal arm.

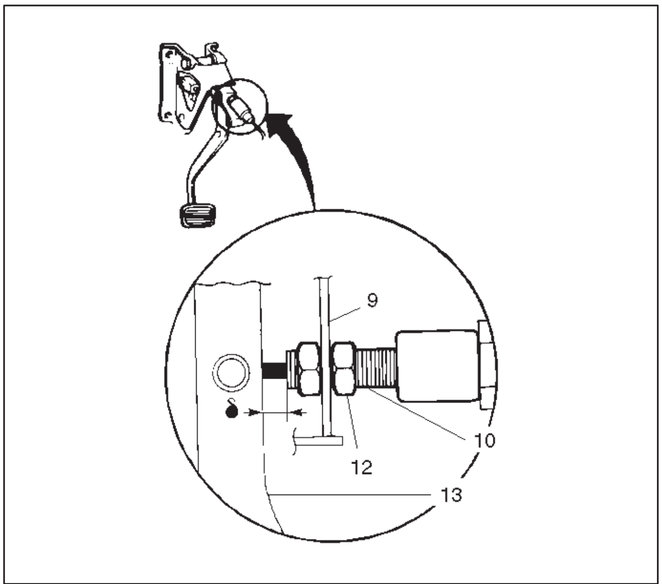


203RW005

Legend

(6) Blacket
(7) Clutch Switch Bolt
(8) Clutch Pedal Arm

2. Adjust clutch switch by backing it out half a turn, and measure the clearance (E) between the clutch pedal arm and the clutch switch.



203RW006

Legend

(9) Back out Switch 1/2 turn
(10) Bracket
(11) Clutch Switch Bolt
(12) Lock Nut
(13) Clutch Pedal Arm

3. Lock the lock nut.
4. Connect clutch switch connector.

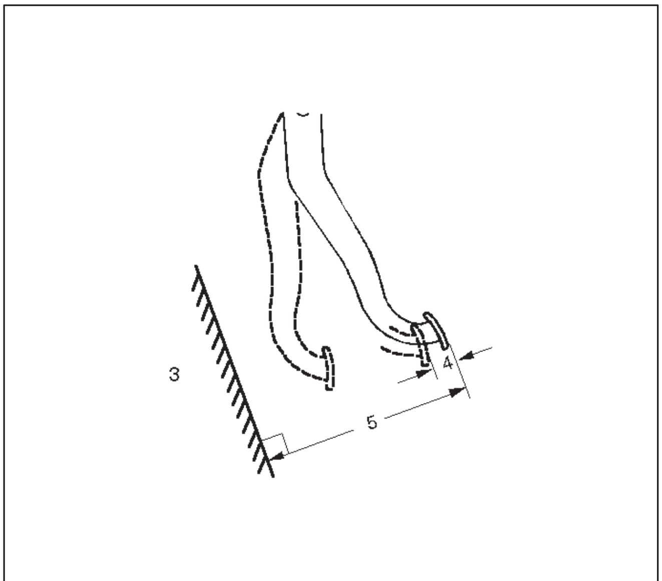
Clutch Switch and Clutch Pedal Clearance (E)

0.5 mm – 1.5 mm (0.020 in – 0.059 in)

5. After adjusting the clutch pedal height, push the clutch pedal by hand rightly to check the clutch pedal free play (4) to within specification.

Pedal Free Play (4)

5 mm – 15 mm (0.20 in – 0.59 in)



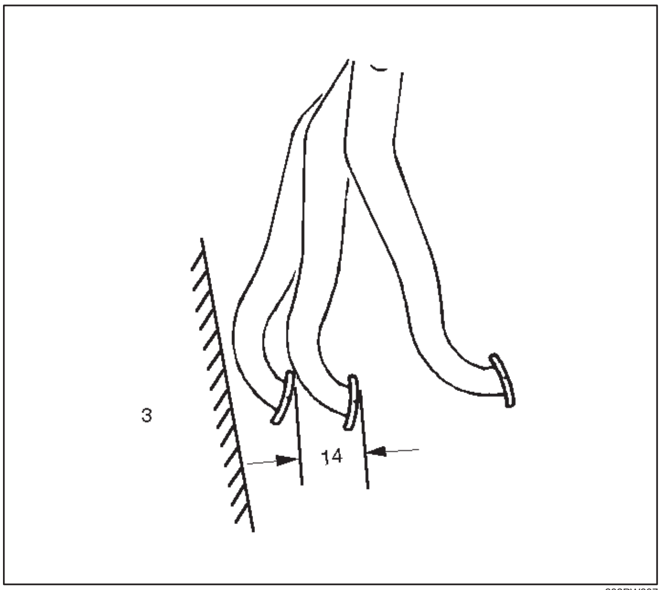
203RW004

6. Clutch pedal engagement height inspection:
   1. Operate the parking brake lever and block the wheels.
   2. Start the engine, fully step on the clutch pedal, and move the shift lever to 1st position.
   3. With the engine idling, release the clutch pedal slowly and measure its stroke just prior to its clutching position.

Clutch Pedal Engagement Height (14)

MIN. 30 mm (1.18 in)

7. If the measured value exceeds the specified limit, check the following points. Repair if necessary:
   - Hydraulic circuit for fluid leakage or air in circuit.
   - Clutch disc warped.
   - Diaphragm spring weakened or tip of fingers worn.
   - Driven plate sticking on sprines.
   - Release bearing worn or damaged.
   - Master cylinder and slave cylinder worn.



203RW007

Legend

(3) Floor Panel
(14) Clutch Pedal Engagement Height

Torque Specifications

- **Master cylinder to dash panel**
  Torque: 16 N·m (12 lb ft)
- **Clutch pedal to dash panel**
  Torque: 21 N·m (15 lb ft)
- **Master cylinder push rod to yoke**
  Torque: 17 N·m (12 lb ft)

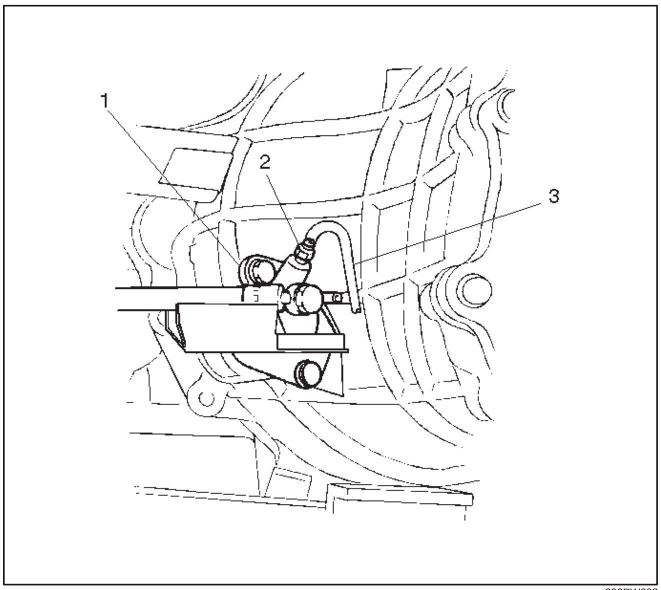
  Torque: 12 N·m (9 lb ft)
- **Clutch pipe to flexible hose**
  Torque: 16 N·m (12 lb ft)
- **Slave cylinder to case**
  Torque: 43 N·m (32 lb ft)
- **Slave cylinder bleeder screw**
  Torque: 8 N·m(69 lb in)
- **Flexible hose to slave cylinder**
  Torque: 20 N·m (14 lb ft)



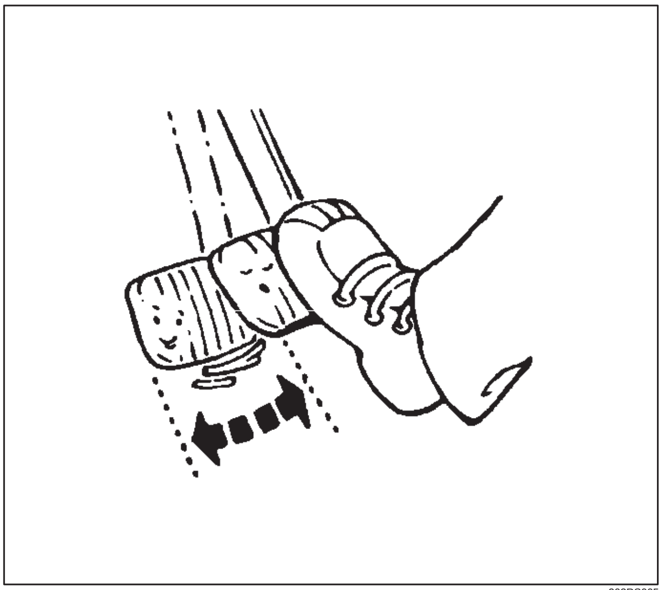
206RW003

Legend

(1) Slave Cylinder
(2) Bleeder Screw
(3) Vinyl Tube

Bleeding

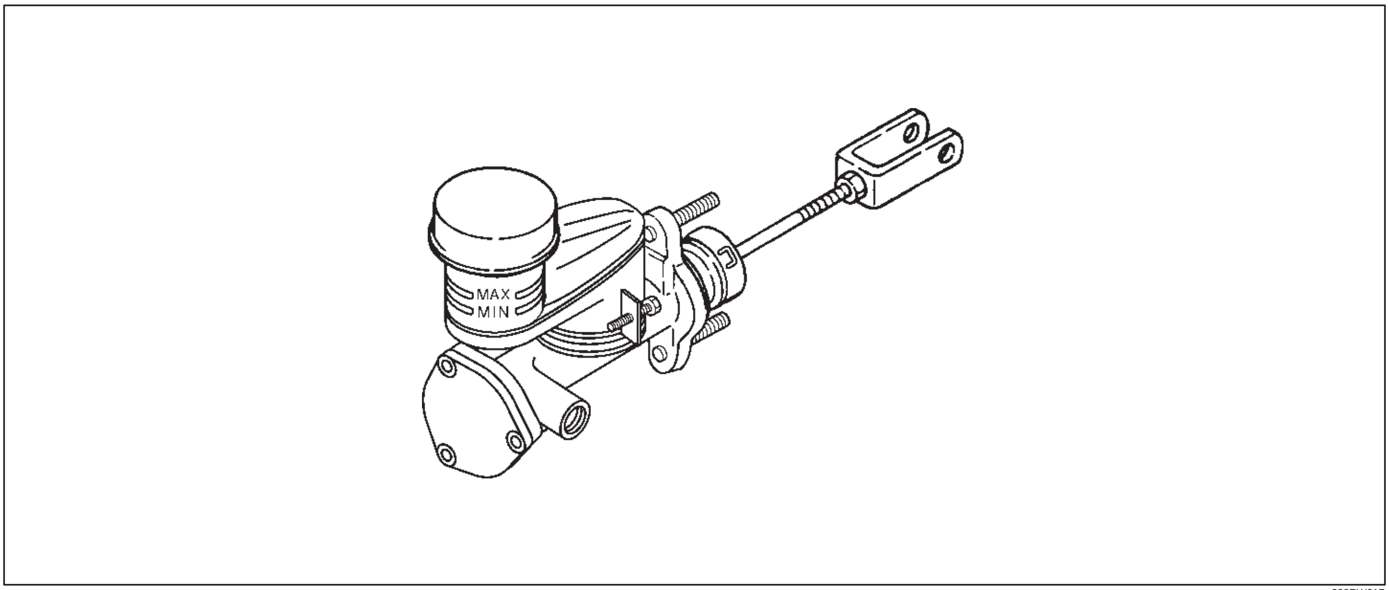
1. Check the level of clutch fluid in the reservoir and replenish if necessary
2. Bleeding the slave cylinder.
   1. Remove the rubber cap from the bleeder screw and wipe clean the bleeder screw. Connect a vinyl tube to the bleeder screw and insert the other end of the vinyl tube into a transparent container.
   2. Pump the clutch pedal repeatedly and hold it depressed.



203RS005

   3. Loosen the bleeder screw to release clutch fluid with air bubbles into the container, then tighten the bleeder screw immediately.
   4. Release the clutch pedal carefully. Repeat the above operation until air bubbles disappear from the clutch fluid being pumped out into the container. During the bleeding operation, keep the clutch fluid reservoir filled to the specified level. Reinstall the rubber cap.

Master Cylinder



208RW017

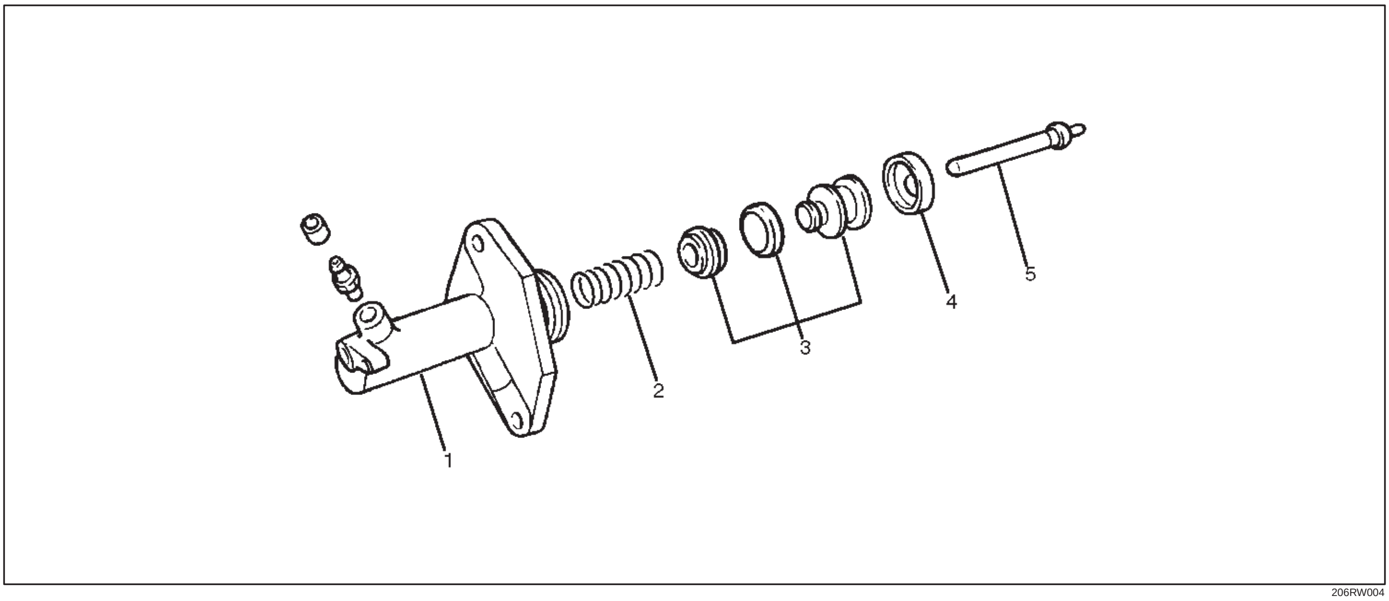
Inspection and Repair

Inspect the removed parts. If there are abnormalities such as wear, oil leak or other damage, replace the master cylinder assembly.

NOTE: The master cylinder assembly cannot be disassembled because of point–staked rod stopper.

Slave Cylinder

Disassembled View



Legend

(1) Cylinder Body
(2) Spring
(3) Piston and Piston Cup
(4) Boot
(5) Push Rod

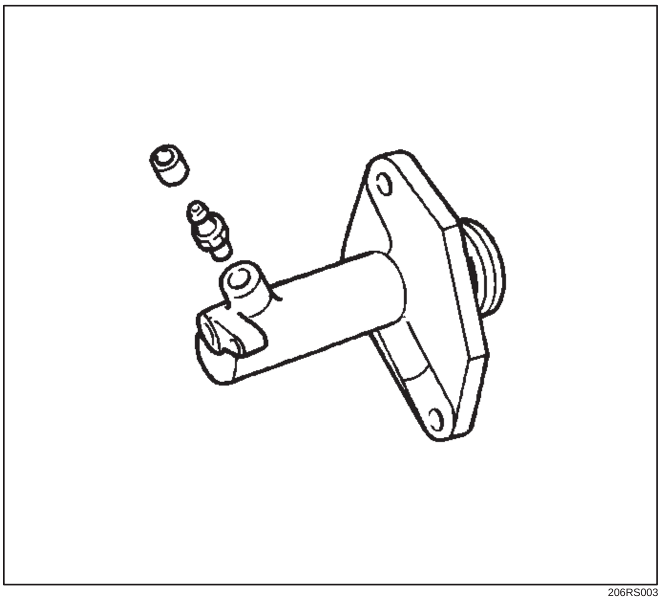
Disassembly

1. Remove boot.
2. Remove push rod.
3. Remove piston and piston cup.
4. Remove spring.
5. Remove cylinder body.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

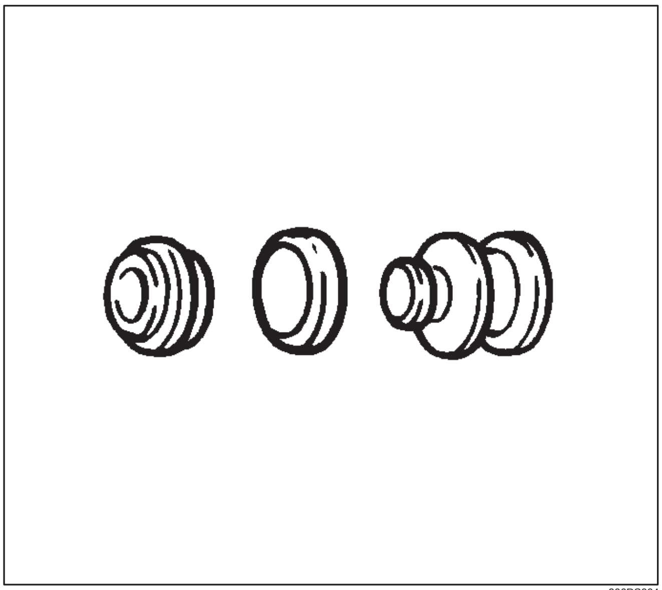
Cylinder Body



1. Clean the cylinder body.
2. Check the fluid return port for restrictions and clean it if necessary.

Piston and Piston Cup

1. Visually inspect the disassembled piston and piston cup for excessive wear and damage.
2. Replace the inner parts with new parts shown in the illustration.

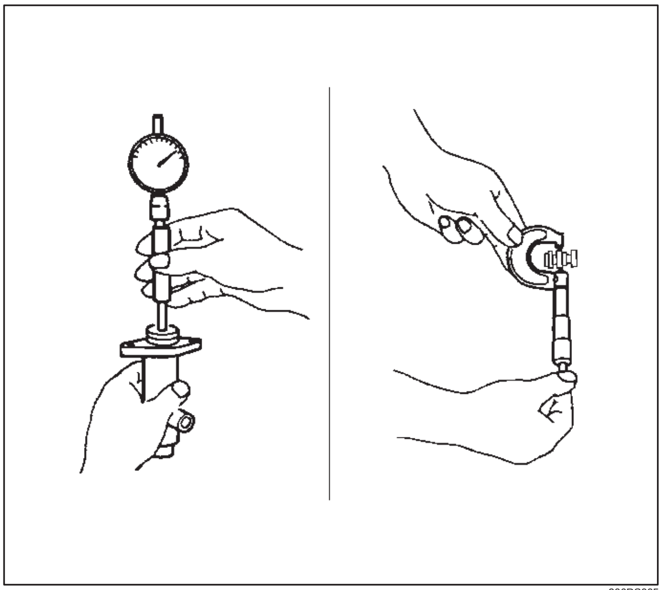


206RS004

3. Measure the clearance between slave cylinder wall and piston.
4. If the measured value exceeds the specified limit, the slave cylinder assembly must be replaced.

Standard: 0.07 mm (0.0028 in)

Limit: 0.15 mm (0.0059 in)

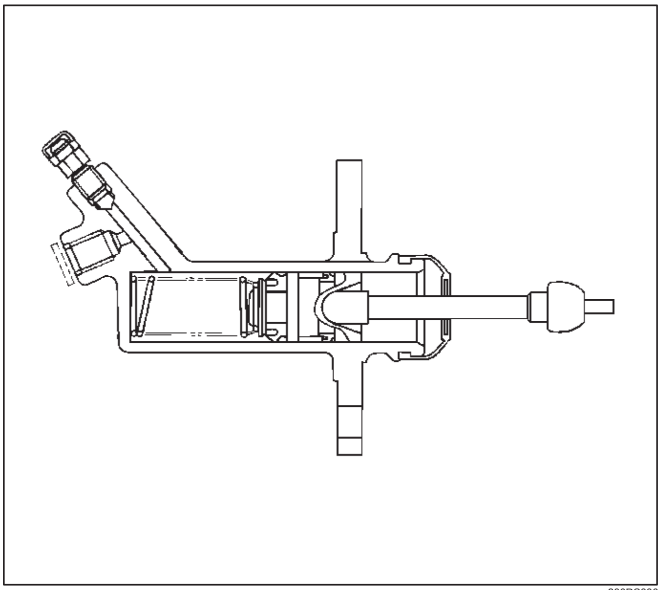


206RS005

Reassembly

To reassemble, follow the disassembly steps in the reverse order, noting the following points:

1. Before installing the parts, apply a thin coat of rubber grease.
2. Install cup in groove in piston with the lip turned to the front of cylinder. Use care so as not to scratch the cylinder.



206RS006

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

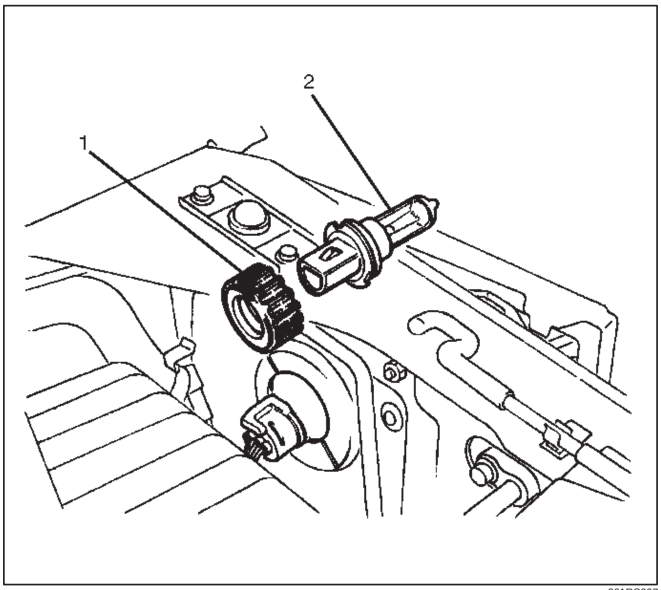
CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Headlight Bulb

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector.
3. Remove the cap(1) while turning it counter clockwise.
4. Pull the bulb(2) out from the headlight body.

CAUTION: The halogen bulb develops a very high temperature. Do not touch the glass portion. If any stain is on the glass surface, It will scorch and the glass will be damaged.



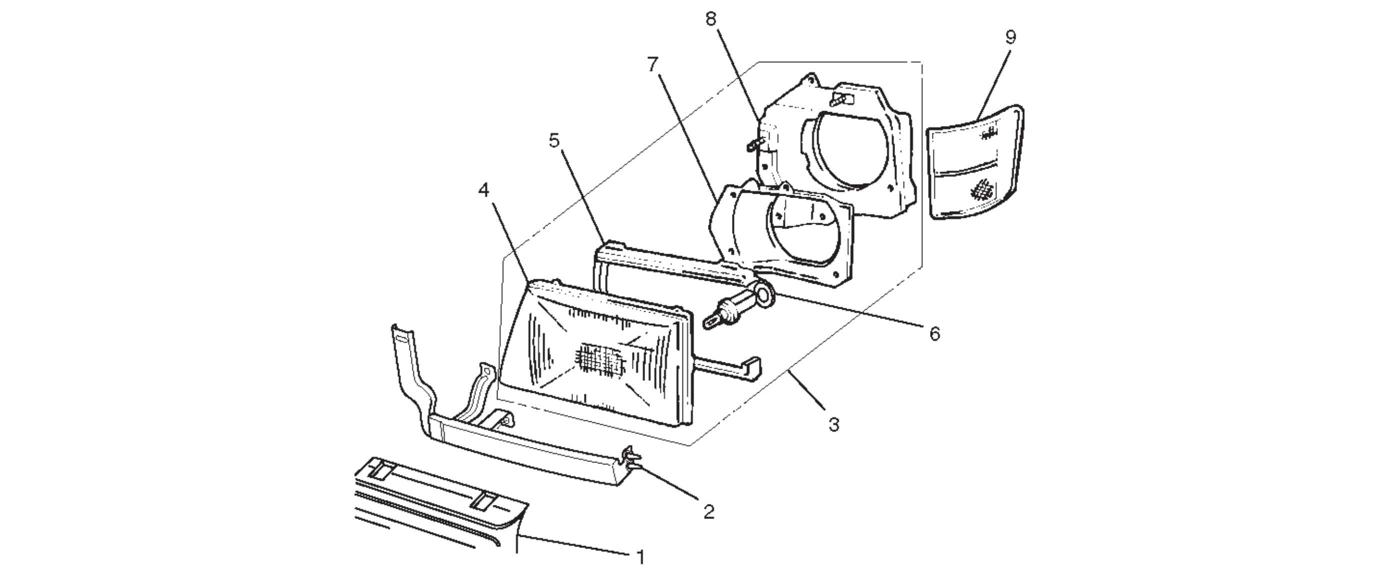
801RS007

Installation

To install, follow the removal steps in the reverse order.

Headlight

Headlight and Associated Parts



801RW003

(1) Radiator Grille
(2) Front End Lower Panel
(3) Headlight Assembly
(4) Headlight
(5) Headlight Rim
(6) Headlight Bulb
(7) Rear Cover
(8) Bracket
(9) Front Combination Light

Removal

1. Disconnect the battery ground cable.
2. Remove the screw and pull out the two projecting portions on the fender to remove the front combination light.
3. Remove five clips and two screws to remove the radiator grille.
4. Remove two screws to remove the front end lower panel(2).
5. Remove two bolts and two nuts to remove the headlight assembly (with bracket).
6. Remove the headlight bulb.
7. Remove two screws, two nuts and the spring for the headlight aim adjustment to remove the bracket.
8. Remove four screws to remove the rear cover.
9. Remove the headlight rim.
10. Remove the headlight.

Installation

To install, follow the removal steps in the reverse order.

CAUTION: After installing the headlight, be sure to adjust the headlight aim.

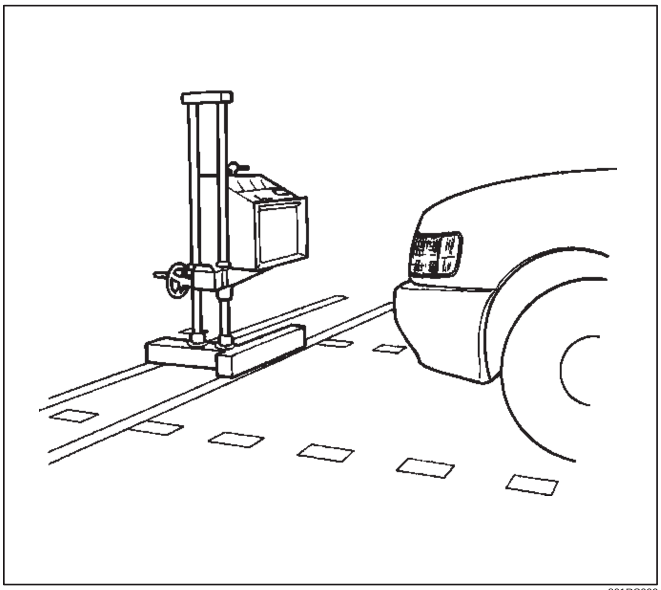
Headlight Adjustment

Preparation

Place the unloaded vehicle on a level surface and check to see if the inflation pressure of the tires is correct, the lenses are clean, and the battery is sufficiently charged.

Adjust the aim with the headlight tester, if necessary.

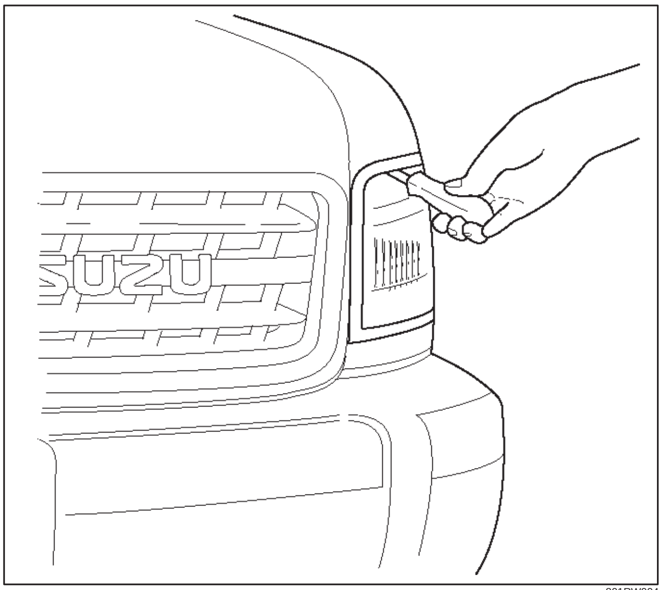
When adjusting, follow the procedure of the tester manufacturer's.



801RS009

Vertical adjustment

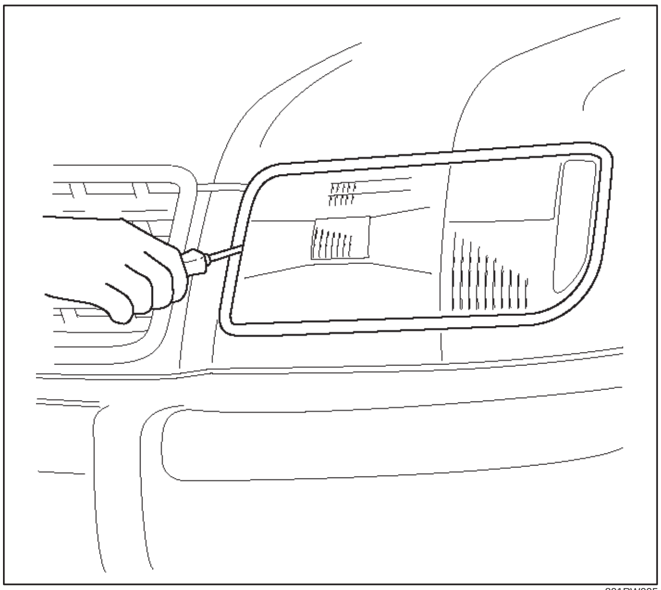
Use a screwdriver for vertical adjustment.



801RW004

Horizontal adjustment

Use a screwdriver for horizontal adjustment.

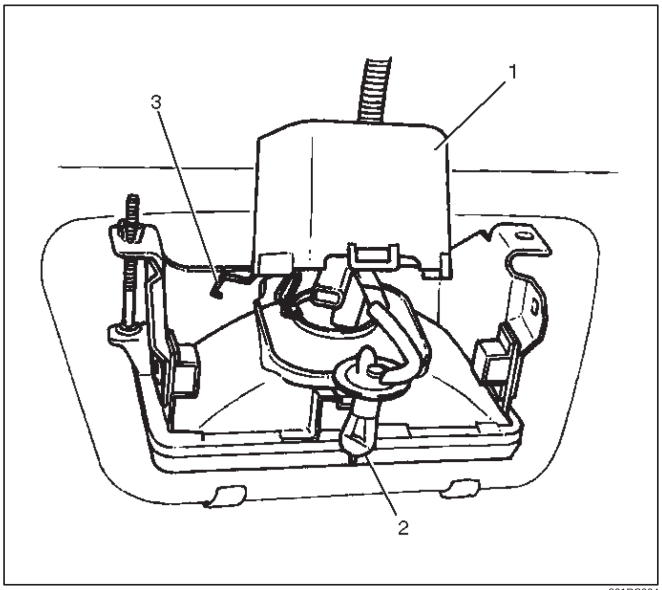


801RW005

Fog Light Bulb

Removal

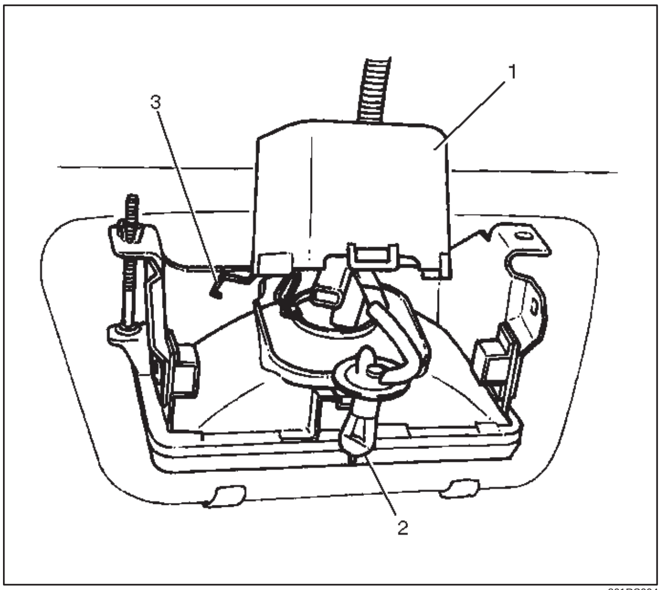
1. Disconnect the battery ground cable.
2. Open the rear cover(1) of the case.
3. Remove the dust cover.
4. Disconnect the bulb connector.
5. Remove the clip(3).
6. Remove the fog light bulb(2).



801RS004

Installation

1. Install the fog light bulb(2).
2. Install the clip(3).
3. Connect the bulb connector.
4. Install the dust cover.
5. Close the rear cover(1) of the case.



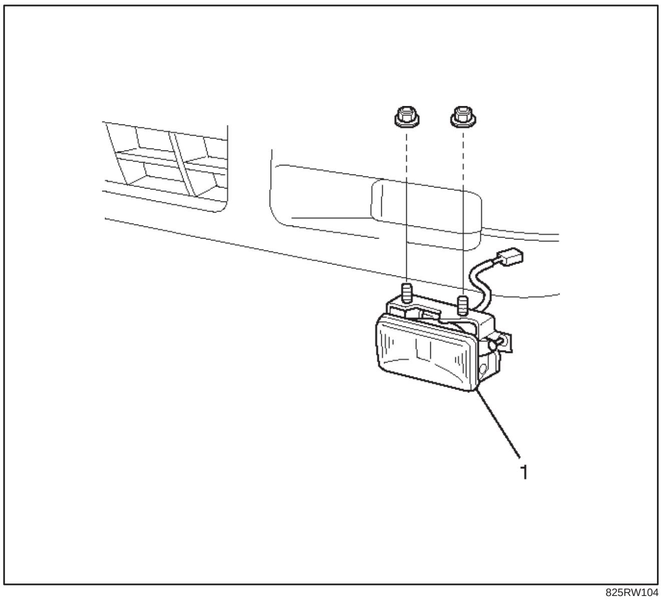
801RS004

6. Connect the battery ground cable.

Fog Light Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove two nuts from the bracket.
3. Disconnect the connector.
4. Remove the fog light assembly(1).



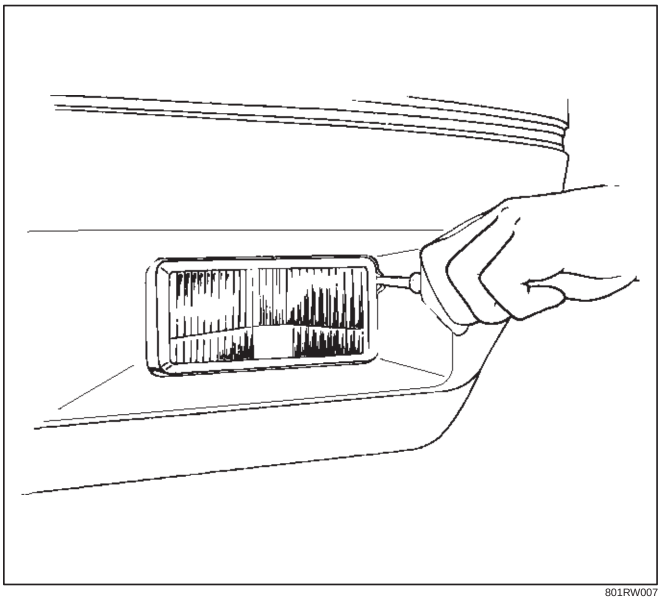
Installation

To install, follow the removal steps in the reverse order.

CAUTION: After installing the fog light, be sure to adjust the fog light aim.

Fog Light Adjustment

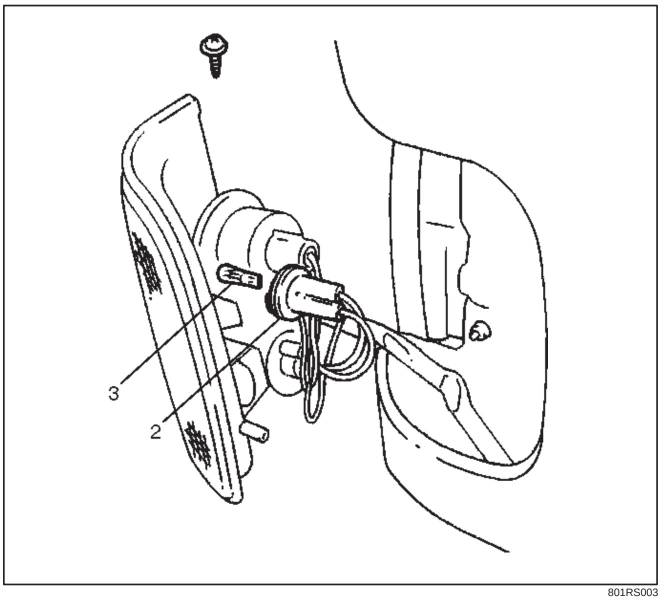
Turn the adjusting screw with a screwdriver to adjust the aim of the fog light vertically.



Front Side Marker Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the screw at the upper portion of the light bracket and then remove the bracket from the fender.
3. Remove the front combination light assembly(1).
4. Remove the front side marker light socket(2) by turning it counterclockwise.
5. Pull out the bulb(3) from the socket.



Installation

To install, follow the removal steps in the reverse order.

Parking Light Bulb

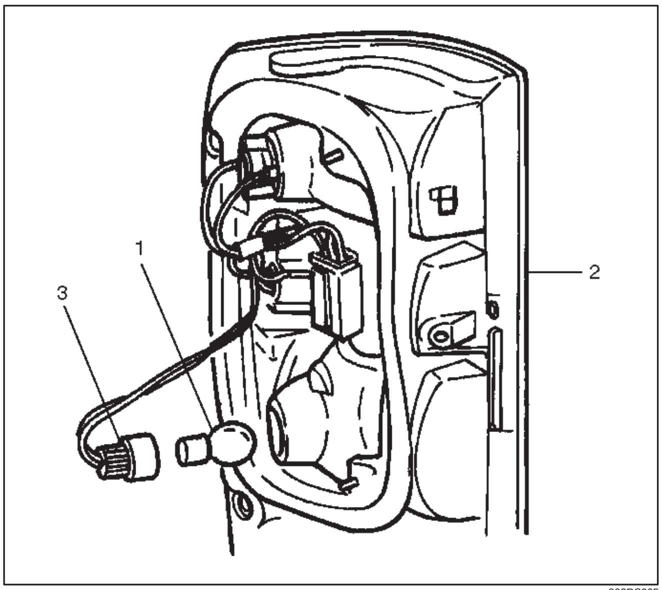
Removal and Installation

Refer to the Front Turn Signal Light Bulb in this section.

Taillight Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove three screws and release locks at two locations to remove the rear combination light assembly(2).
3. Remove the socket(3) by turning it counterclockwise.
4. Turn the bulb(1) counterclockwise while pushing it to remove it from the socket.



803RS005

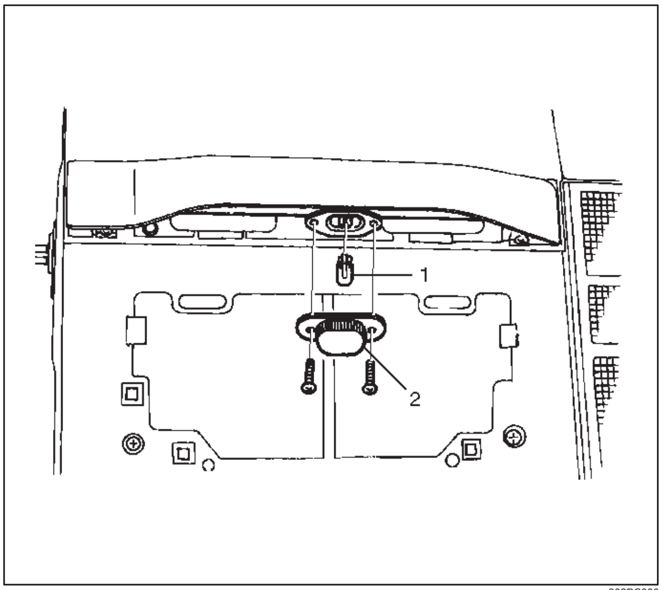
Installation

To install, follow the removal steps in the reverse order.

License Plate Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove two screws to remove the lens(2).
3. Pull out the bulb(1) from the socket.



803RS006

Installation

To install, follow the removal steps in the reverse order.

Stoplight Bulb

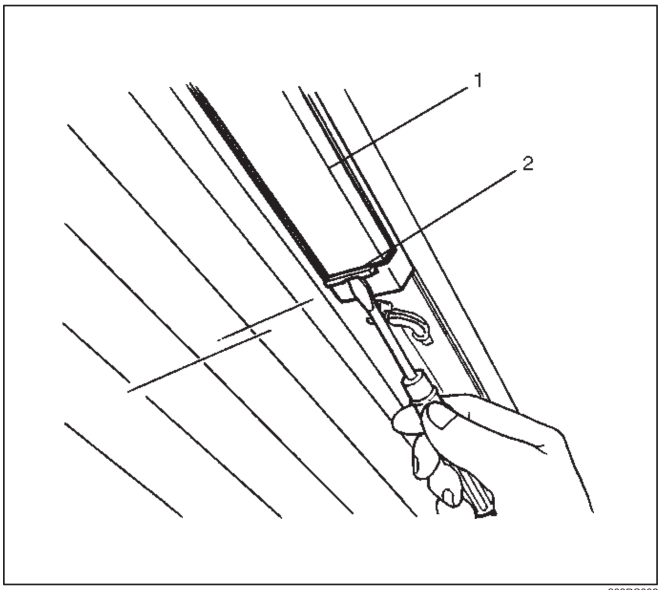
Removal and Installation

Refer to the Taillight Bulb in this section.

High Mount Stoplight

Removal

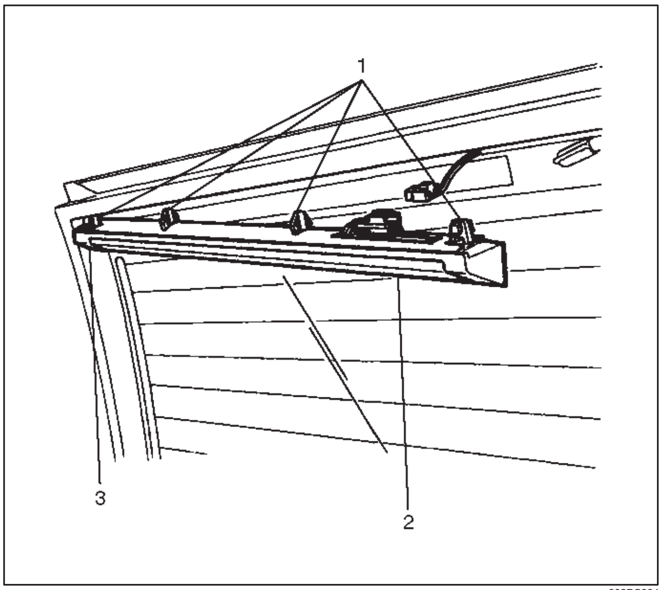
1. Disconnect the battery ground cable.
2. Remove the clips(2).
3. Pull out the high mount stoplight(1).
4. Remove the connector.
5. Remove the high mount stoplight.



803RS003

Installation

1. Insert the clips(1)(3) into the high mount stoplight(2).
2. Reconnect the connector.
3. Install the high mount stoplight.

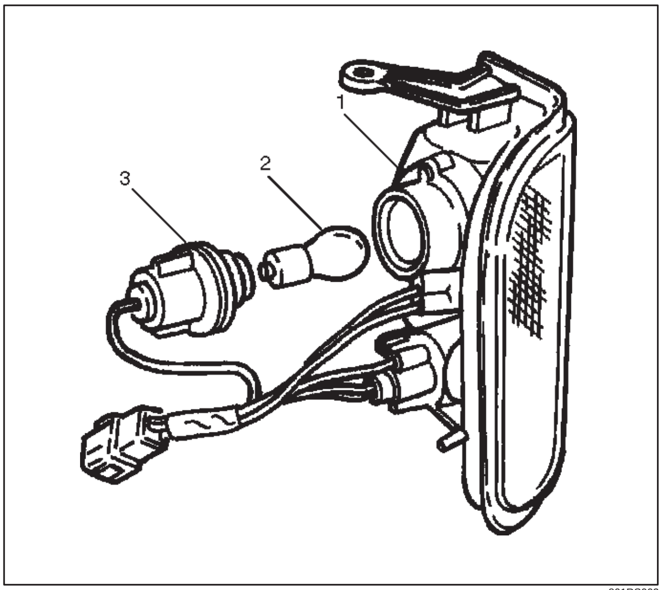


803RS004

Front Turn Signal Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the screw at the upper portion of the light bracket, and remove the bracket from the fender.
3. Remove the front combination light(1).
4. Remove the turn signal light socket(3) by turning it counterclockwise.
5. Remove the bulb(2) by turning it counterclockwise while pushing it at the same time.



801RS002

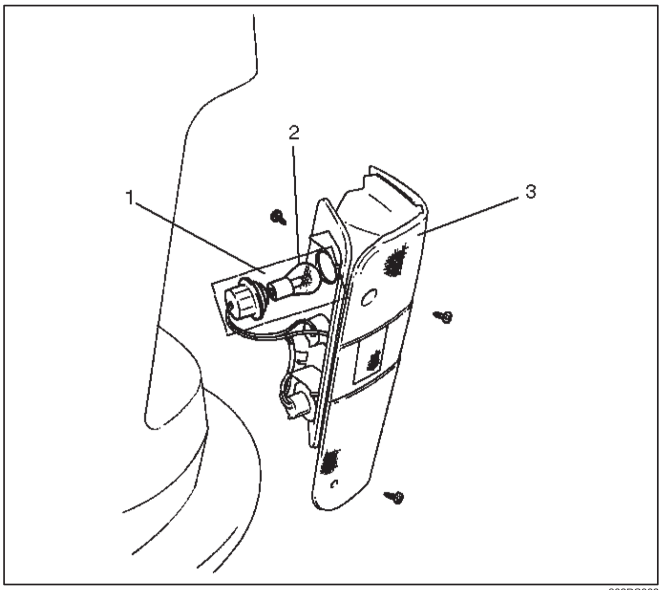
Installation

To install, follow the removal steps in the reverse order.

Rear Turn Signal Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the three screws and release the lock at two positions.
3. Remove the rear combination light(3).
4. Remove the turn signal light socket/bulb(1) by turning it counterclockwise.
5. Remove the bulb(2) by turning it counterclockwise while pushing it at the same time.



803RS002

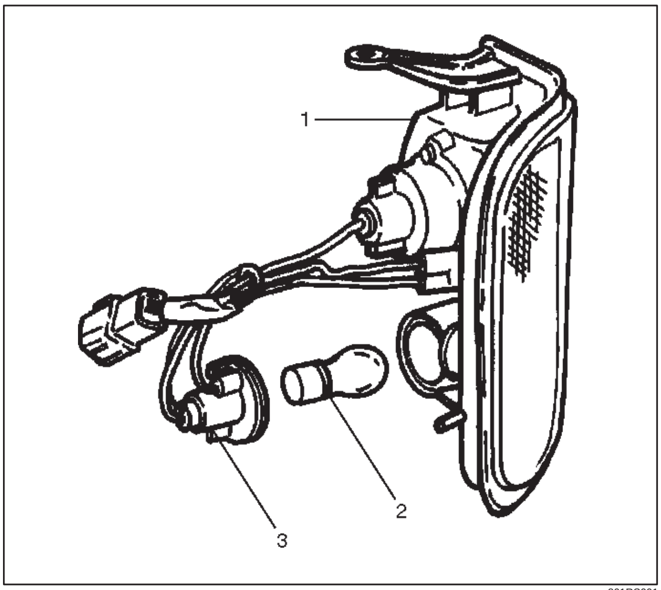
Installation

To install, follow the removal steps in the reverse order.

Cornering Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the screws at the upper portion of the light bracket, and remove the bracket from the fender.
3. Remove the front combination light(1).
4. Remove the cornering light bulb socket(3) by turning it counterclockwise.
5. Remove the bulb(2) by turning it counterclockwise while pushing it at the same time.



801RS001

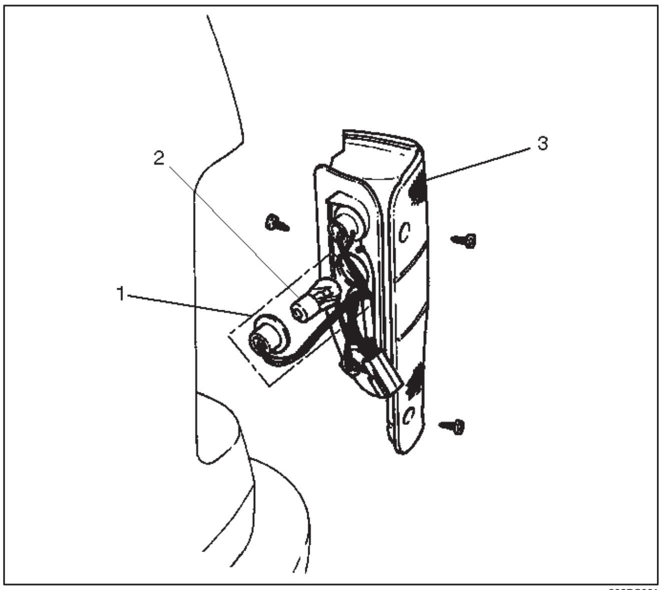
Installation

To install, follow the removal steps in the reverse order.

Backup Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove three screws and release the lock at two positions.
3. Remove the rear combination light(3).
4. Remove the backup light socket/bulb(1) by turning it counterclockwise.
5. Remove the bulb(2) by turning it counterclockwise while pushing it at the same time.



803RS001

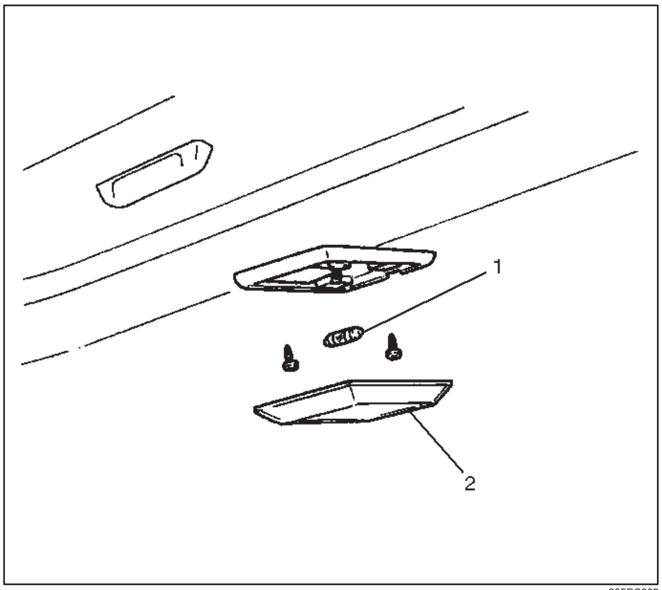
Installation

To install, follow the removal steps in the reverse order.

Dome Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens(2) by releasing the locks at three locations.
3. Remove the bulb(1).



805RS005

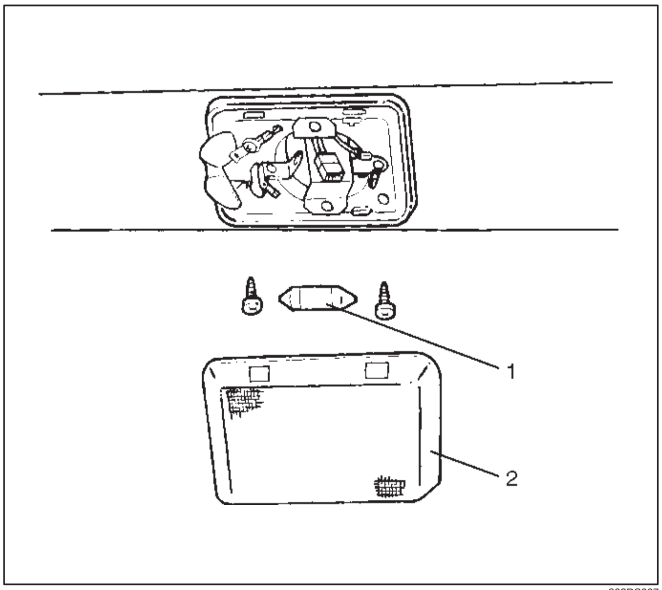
Installation

To install, follow the removal steps in the reverse order.

Luggage Room Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens(2) by releasing the locks at four locations.
3. Remove the bulb(1).



803RS007

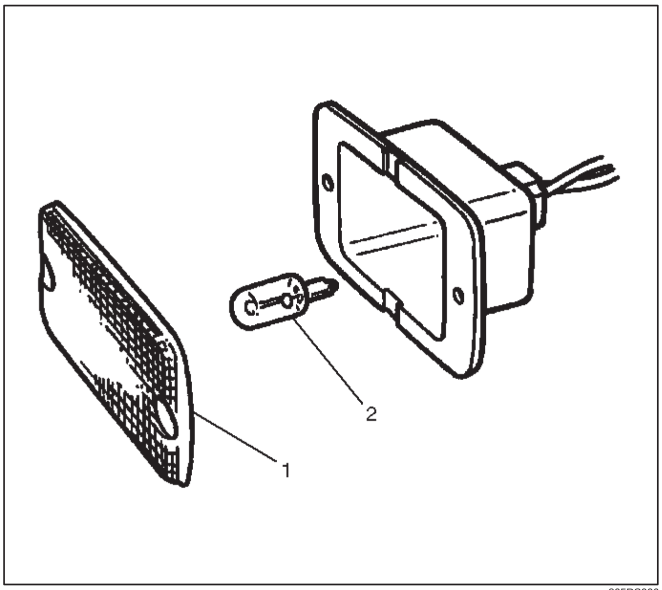
Installation

To install, follow the removal steps in the reverse order.

Courtesy Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove two screws to remove the lens(1).
3. Pull out the bulb(2) from the socket.



805RS006

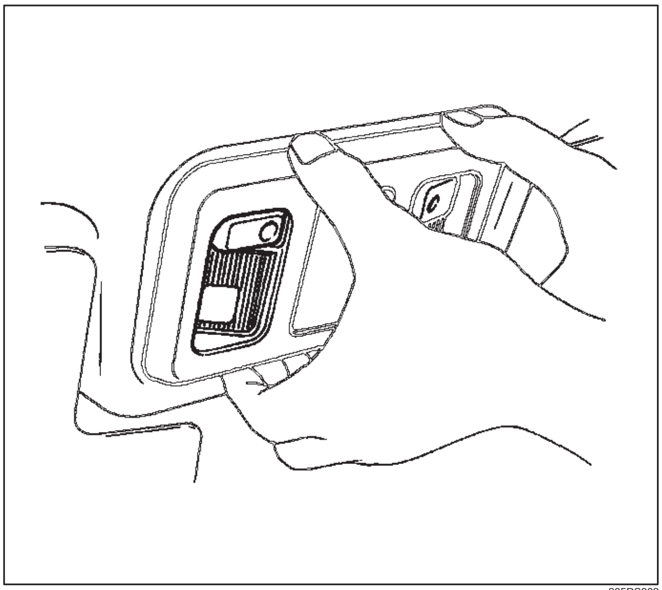
Installation

To install, follow the removal steps in the reverse order.

Map Light Switch/Bulb

Removal

1. Disconnect the battery ground cable.
2. Pull the map light body downward to release the lock.
3. Disconnect the connectors of the map light and the sun roof switch.
4. Remove the map light switch.
5. Turn the socket counterclockwise to remove it.
6. Pull out the bulb from the socket.



805RS008

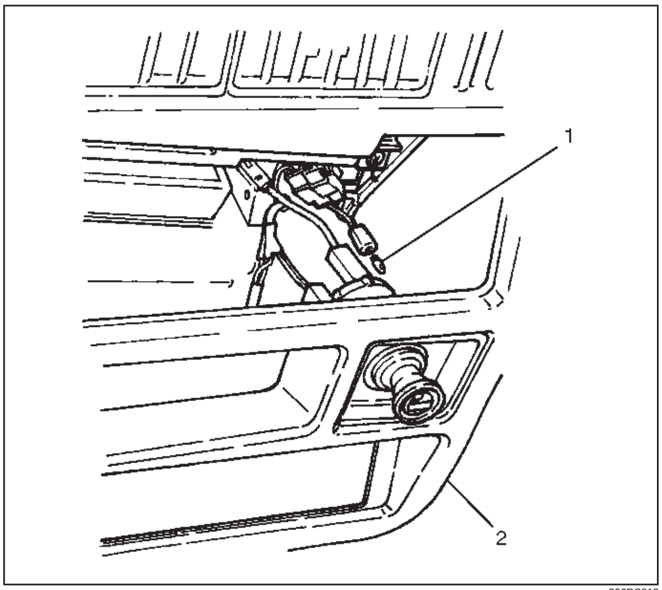
Installation

To install, follow the removal steps in the reverse order.

Cigarette Lighter Illumination Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove eight screws to remove the instrument cluster panel(2).
3. Turn the socket counterclockwise to remove it then pull out the bulb(1).



826RS013

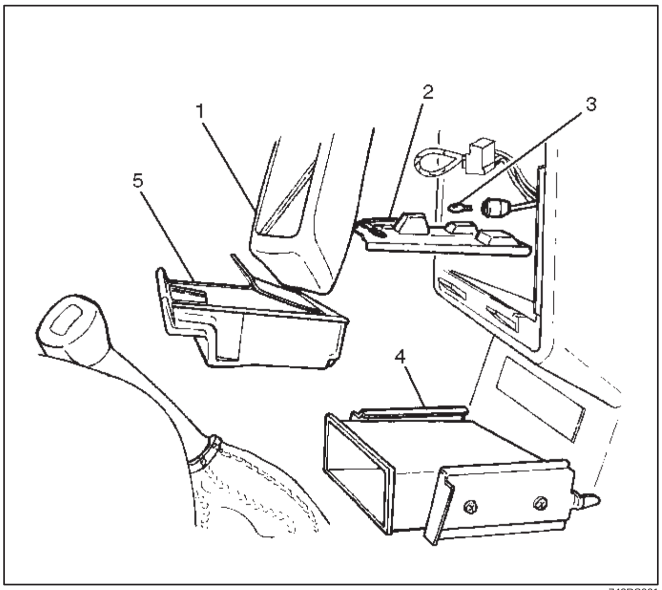
Installation

To install, follow the removal steps in the reverse order.

Ashtray Illumination Bulb

Removal

1. Disconnect the battery ground cable.
2. Removal eight screws to remove the instrument cluster panel(1).
3. Remove the ashtray(5).
4. Remove four screws to remove the audio box(4).
5. Remove two screws to remove the ashtray guide(2).
6. Turn the socket counterclockwise to remove it then pull out the bulb(3).



742RS001

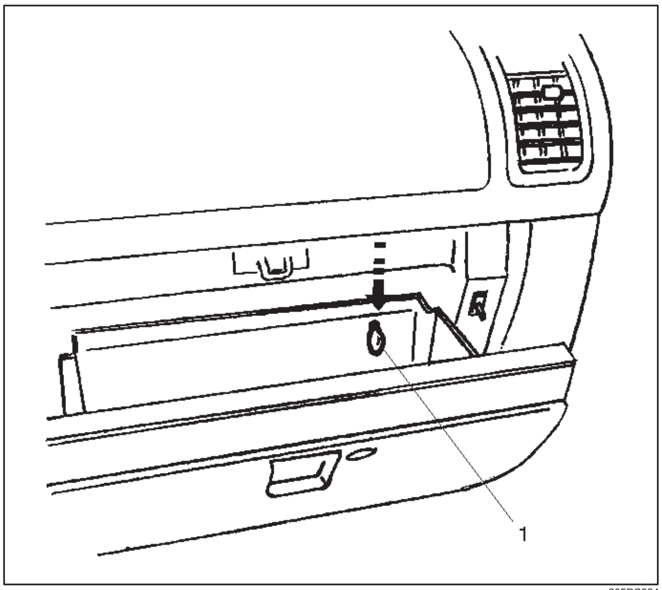
Installation

To install, follow the removal steps in the reverse order.

Glove Box Illumination Bulb

Removal

1. Disconnect the battery ground cable.
2. Open the glove box lid, and then pull out the bulb(1).



805RS004

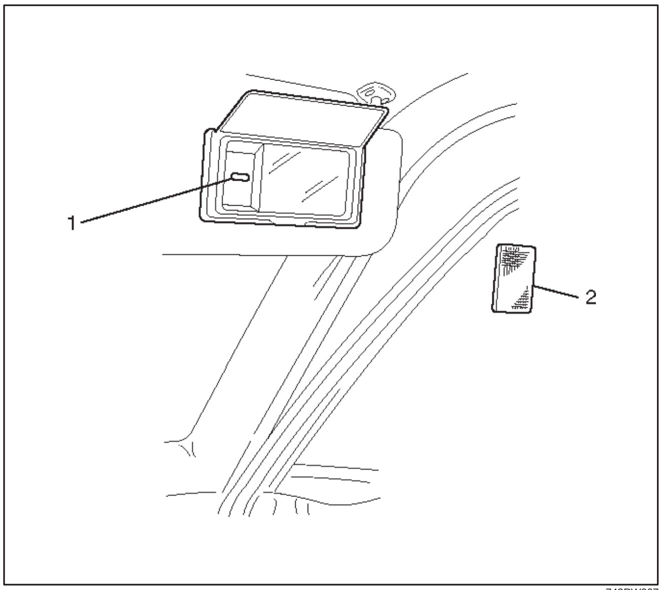
Installation

To install, follow the removal steps in the reverse order.

Vanity Mirror Illumination Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens(2).
3. Remove the bulb(1).



743RW007

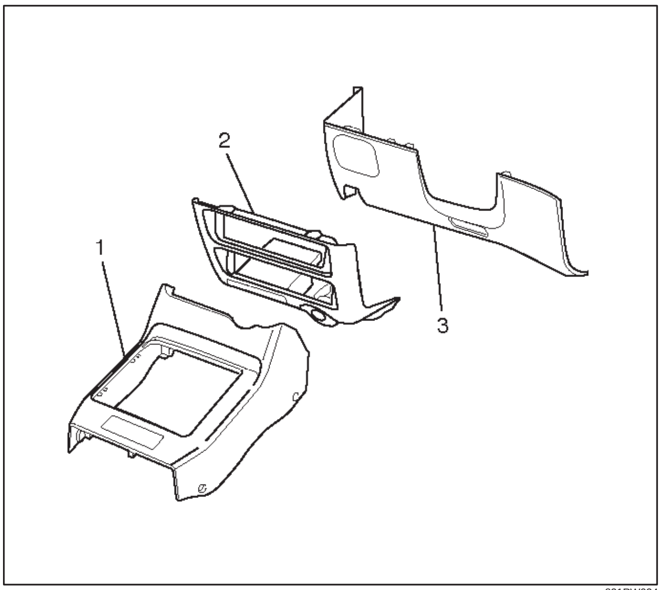
Installation

To install, follow the removal steps in the reverse order.

Starter Switch

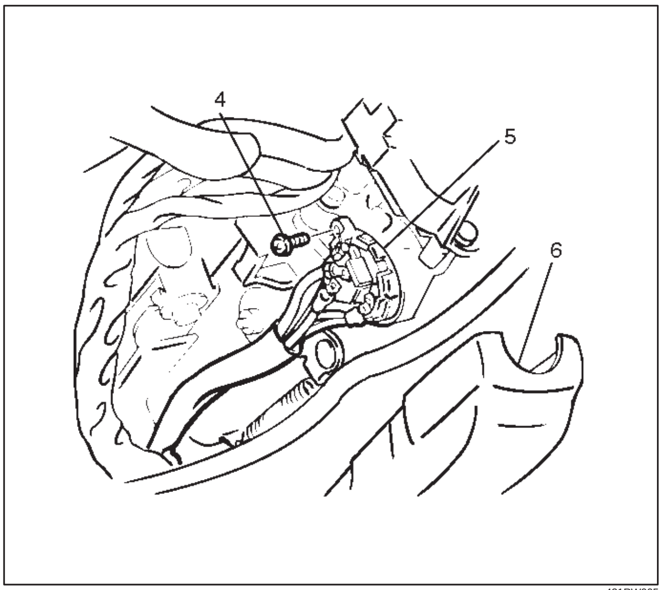
Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly(1).
   Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly(2).
   Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover assembly(3).
   Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove seven screws to remove the steering cowl(6).
6. Disconnect the connector, remove the screw(4) and then remove the starter switch(5).

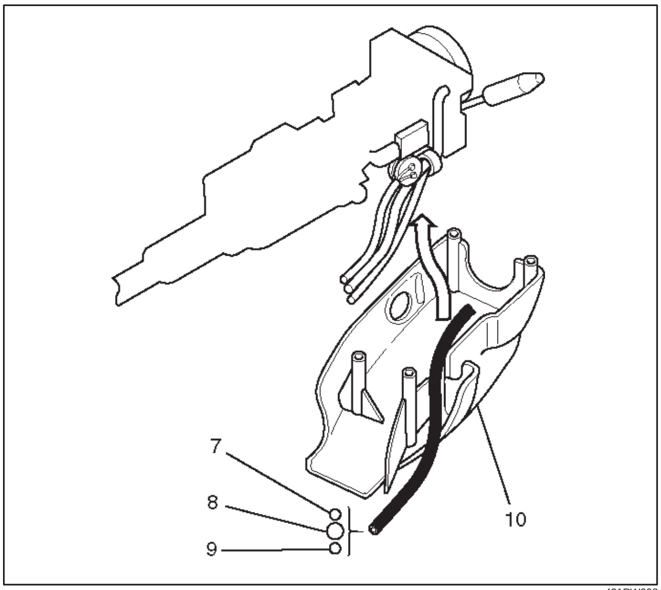


431RW005

Installation

To install, follow the removal steps in the reverse order noting the following point.

1. When installing the steering cowl(10), be sure to pass the harnesses through the route as shown in the figure so that the starter switch harness(7), the combination switch harness(8) and the inflator module harness(9) will not get caught.



431RW008

Lighting Switch (Combination Switch)

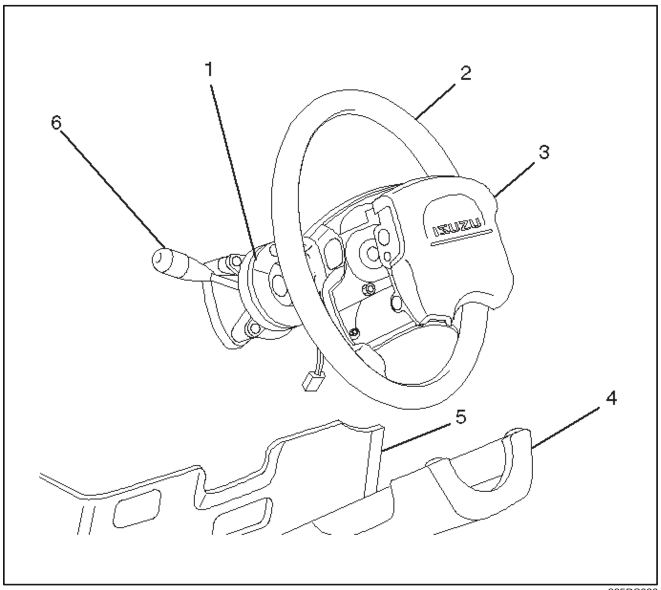
Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel driver lower cover(5).
   Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove seven screws to remove the steering cowl(4).
4. Disconnect the SDM (air bag controller) connector located at lower of the instrument panel driver lower cover.
5. Remove four fixing screws and disconnect the driver inflator module connector to remove the driver inflator module(3).

CAUTION: When carrying a live inflator module, make sure the bag opening is pointed away from you. In case of an accidental deployment, the bag will then deploy with minimal chance of injury. Never carry the inflator module by the wires or connector on the underside of the module.

When placing a live inflator module on a bench or other surface, always face the bag and trim cover up, away from the surface. This is necessary so that a free space is provided to allow the air bag to expand in the unlikely event of accidental deployment.

6. Remove the steering wheel(2).
   Refer to the Steering Wheel in Steering section.
7. Disconnect the SRS coil assembly connector,remove four fixing screws to remove the SRS coil assembly(1).
8. Disconnect the lighting switch connector, remove four fixing screws to remove the lighting switch(6).

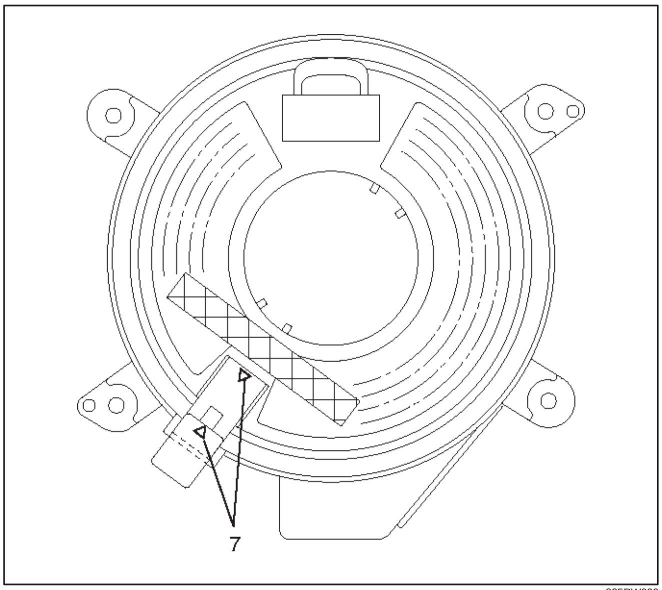


825RS039

Installation

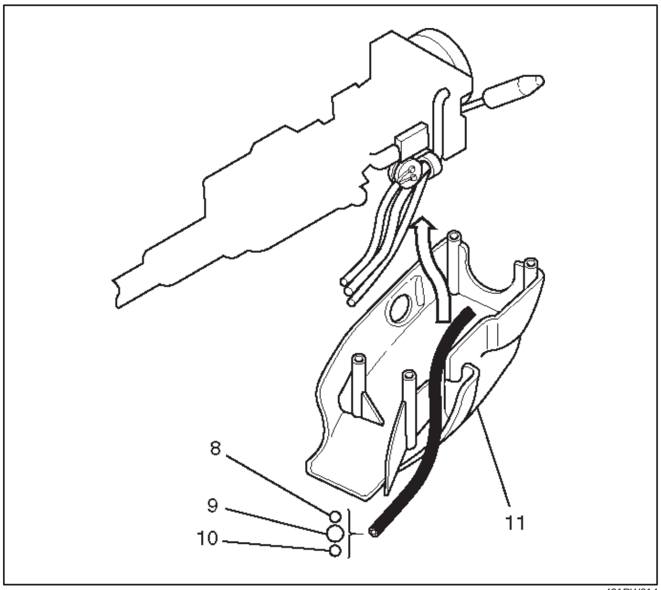
To install, follow the removal steps in the reverse order, noting the following points.

1. Check to see if the vehicle is in the straight driving condition and turn the rotary section of the SRS coil assembly provided to the upper surface of the lighting switch (combination switch) counterclockwise fully until it stops.
   Then from where it stops, turn it back about 3 rotations to set the alignment marks(7) together before installing the steering wheel.



825RW099

2. Tighten the steering shaft nut to the specified torque.
   Torque: 34 N·m (25 lb ft)
3. When connect the double lock type of inflator module connector, insert the connector completely and lock at outside.
   Imperfect locking may cause malfunction of SRS system circuit.
4. When installing the steering cowl(11),be sure to pass the harnesses through the route as shown in the figure so that the starter switch harness(8), the combination switch harness(9) and inflator module harness(10) will not get caught.

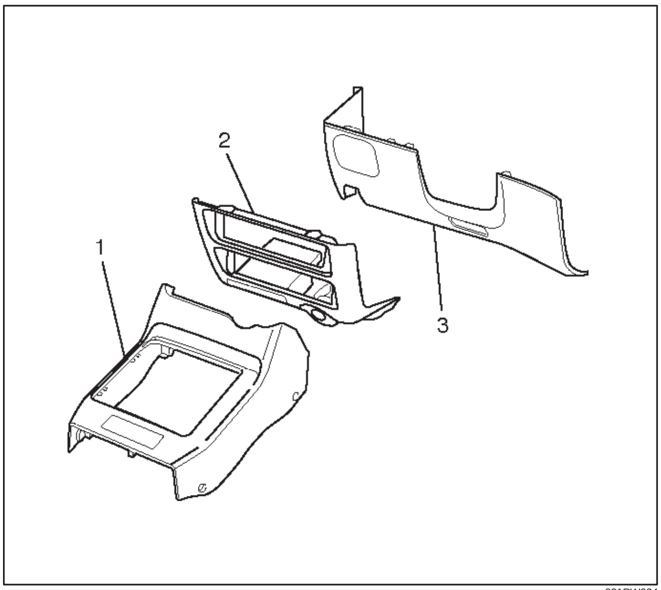


431RW014

Fog Light Switch

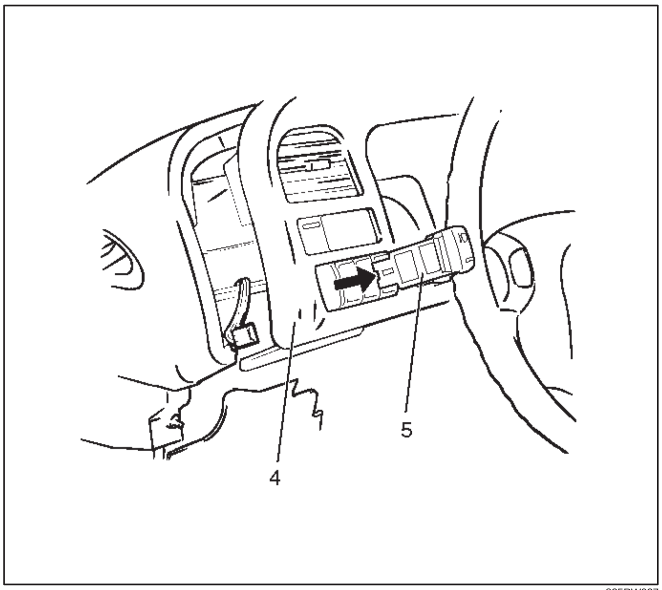
Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly(1).
   Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly(2).
   Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover assembly(3).
   Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove the instrument panel cluster assembly(4). Refer to the Instrument Panel Assembly in Body Structure section.
6. Disconnect the connector and push the lock from the back side of the instrument panel cluster assembly to remove the fog light switch(5).



825RW027

Installation

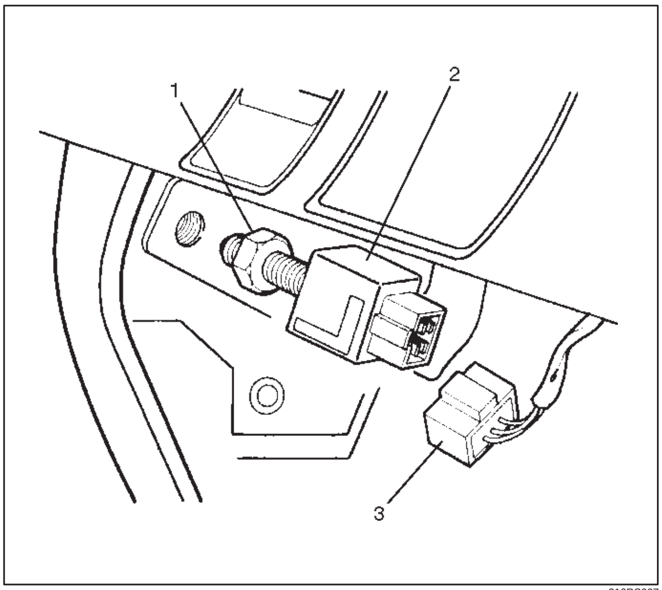
To install, follow the removal steps in the reverse order, noting the following point:

1. Push in the switch with your fingers until the switch is locked securely.

Stoplight Switch (W/O Cruise Control)

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector(3), loosen the lock nut(1) and then remove the stoplight switch(2) by turning it.

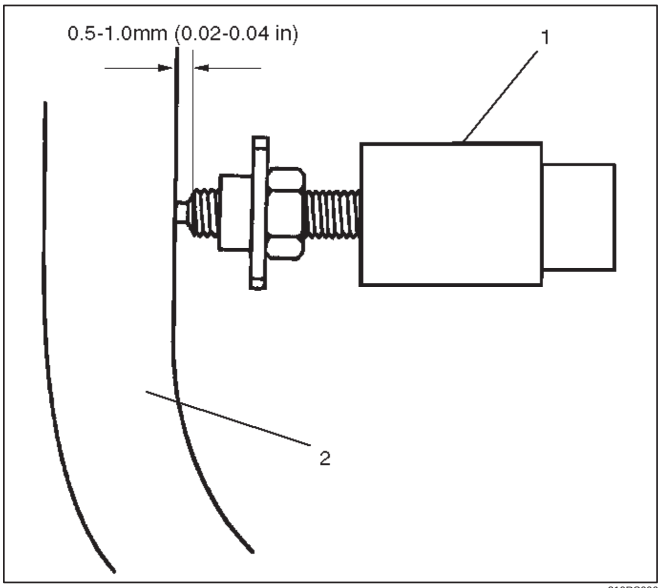


310RS007

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Check to see if the brake pedal has been returned by the return spring to the specified position.
2. Turn the stoplight switch(1) clockwise until the tip of the threaded portion of the switch contacts the pedal arm(2).
3. Turn the switch counterclockwise until the space between the tip of the threaded portion and the pedal arm is 0.5 to 1.0 mm (0.02 – 0.04 in.).

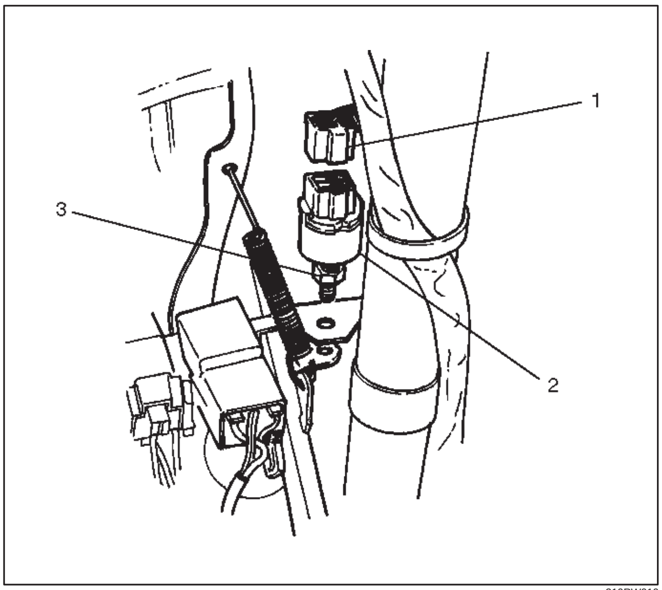


310RS006

Brake Switch (W/Cruise Control)

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector(1), loosen the lock nut(3) and then remove the brake switch(2) by turning it.

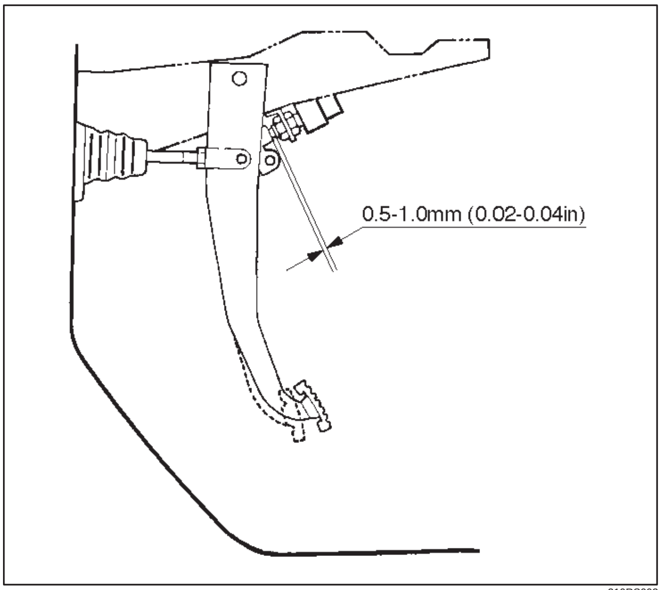


310RW010

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Check to see if the brake pedal has been returned by the return spring to the specified position.
2. Turn the switch clockwise until the tip of the threaded portion of the brake switch contacts the pedal arm.
3. Turn the switch counterclockwise until the space between the tip of the threaded portion and the pedal arm is 0.5 to 1.0 mm (0.02 – 0.04 in.).



310RS003

Turn Signal Switch/Cornering Light Switch (Combination Switch)

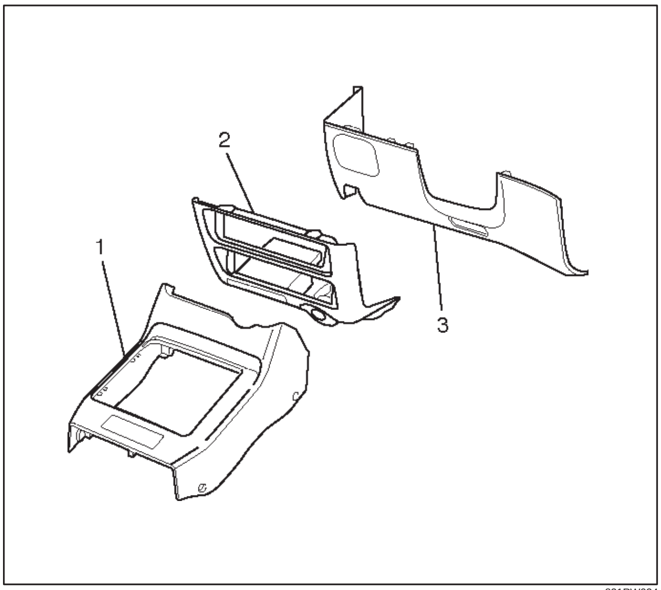
Removal and Installation

Refer to the removal and installation steps of the Lighting Switch (Combination Switch) in this section.

Hazard Warning Switch

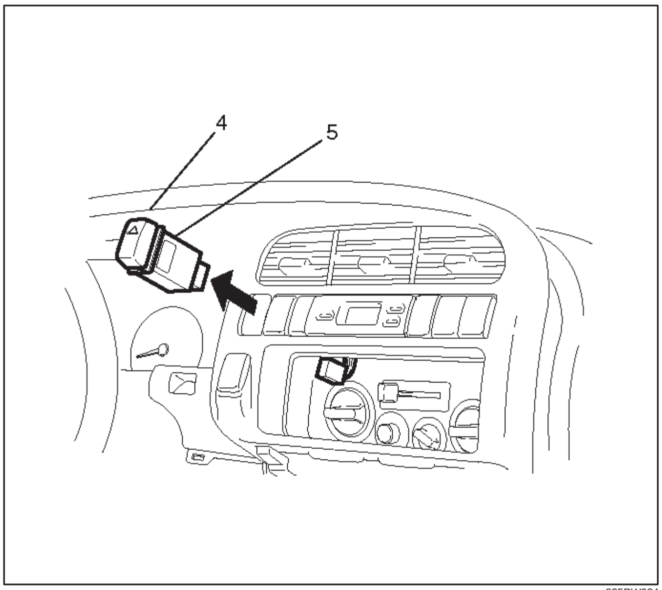
Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly(1).
   Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly(2).
   Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover assembly(3).
   Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove the instrument panel cluster assembly(4).
   Refer to the Instrument Panel Assembly in Body Structure section.
6. Disconnect the connector and push the lock from the back side of the instrument panel cluster assembly to remove the hazard warning switch(5).



825RW024

Installation

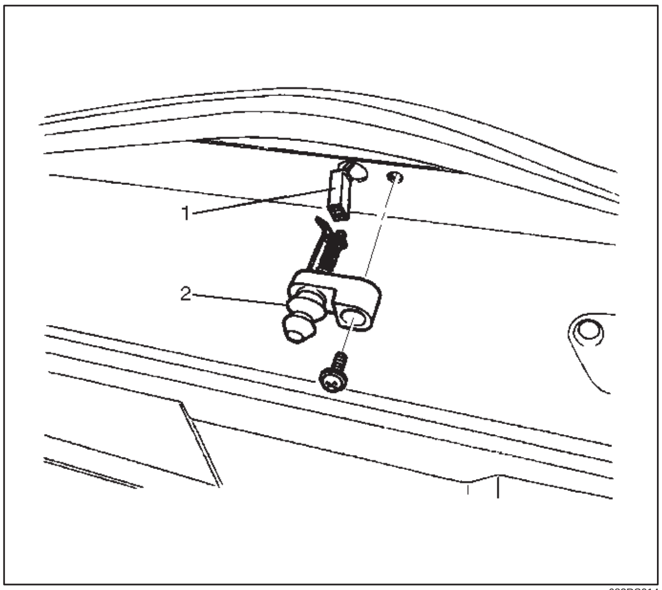
To install, follow the removal steps in the reverse order, noting the following point.

1. Push in the switch with your fingers until it locks securely.

Tailgate Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the screw and disconnect the connector(1) to remove the tailgate switch(2).



683RS014

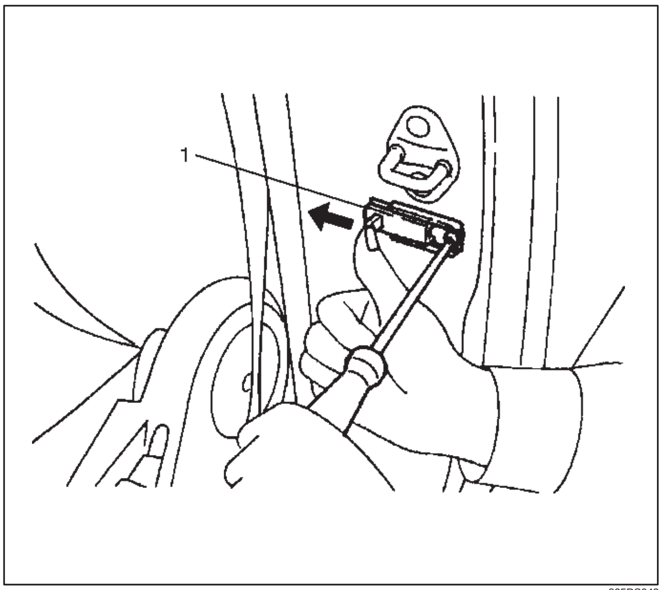
Installation

To install, follow the removal steps in the reverse order.

Door Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the screw and disconnect the connector to remove the door switch(1).



825RS043

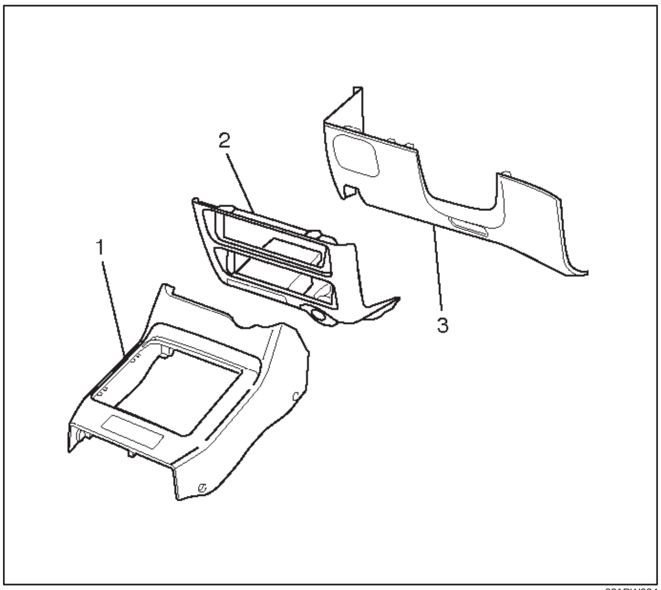
Installation

To install, follow the removal steps in the reverse order.

Rear Defogger Switch

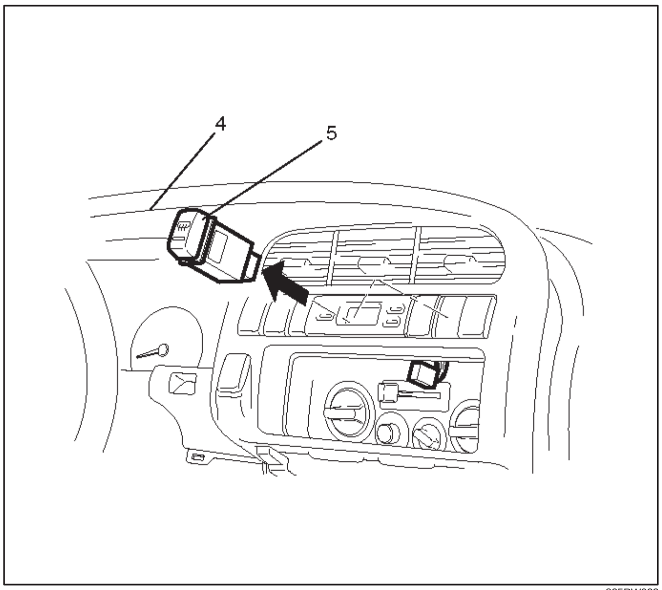
Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly(1).
   Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly(2).
   Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover assembly(3).
   Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove the instrument panel cluster assembly(4).
   Refer to the Instrument Panel Assembly in Body Structure section.
6. Disconnect the connector and push the lock from the back side of the instrument panel cluster assembly to remove the rear defogger switch(5).



825RW023

Installation

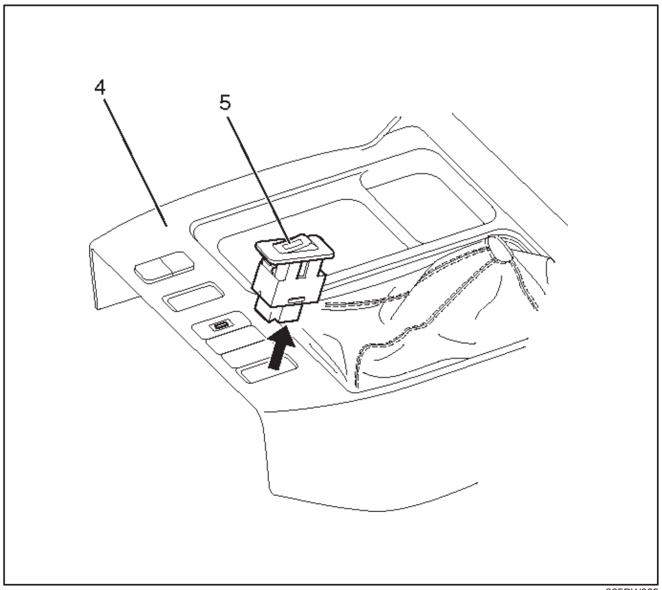
To install, follow the removal steps in the reverse order, noting the following point.

1. Push in the switch with your fingers until it locks securely.

Seat Heater Switch

Removal

1. Disconnect the battery ground cable.
2. Remove four fixing screws and disconnect the switch connectors to remove the front console assembly(4).
3. Push the lock from the back side of the front console assembly to remove the seat heater switch(5).



825RW025

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Push the switch with your fingers until it locks securely.

Key Remind Switch (Starter Switch)

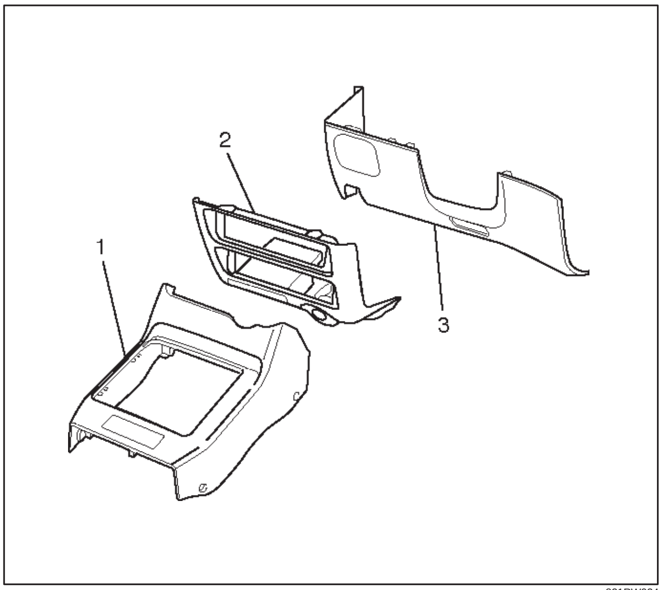
Removal and Installation

Refer to the removal and installation on steps of the Starter Switch in this section.

Illumination Controller

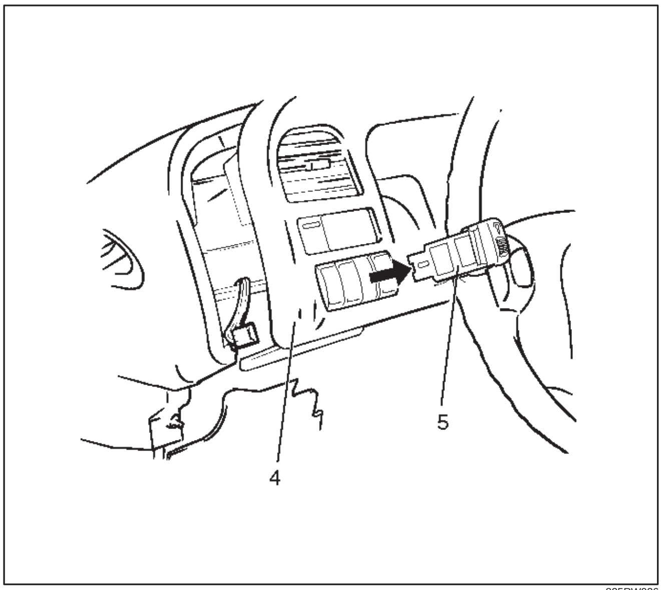
Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly(1).
   Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly(2).
   Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover assembly(3).
   Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove the instrument panel cluster assembly(4).
   Refer to the Instrument Panel Assembly in Body Structure section.
6. Disconnect the connector and push the lock from the back side of the instrument panel cluster assembly to remove the illumination controller(5).



825RW026

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Push in the switch with your fingers until the switch is locked securely.

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Windshield Wiper/Washer System

General Description

The circuit consists of the starter switch, windshield wiper & washer switch, windshield wiper motor, windshield washer motor and windshield intermittent relay.

When the wiper & washer switch is turned on with the starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.
The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The intermittent relay is used to control motion of the wiper.

Windshield Wiper And Washer Switch

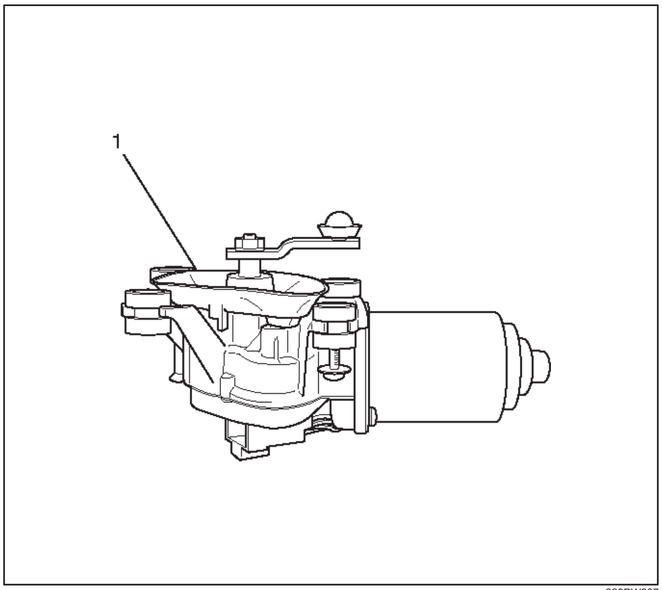
Removal and Installation

Refer to the Lighting Switch (Combination Switch) in Lighting System section.

Windshield Wiper Motor

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector.
3. Remove 4 mounting bolts.
4. Remove the windshield wiper motor(1).



880RW007

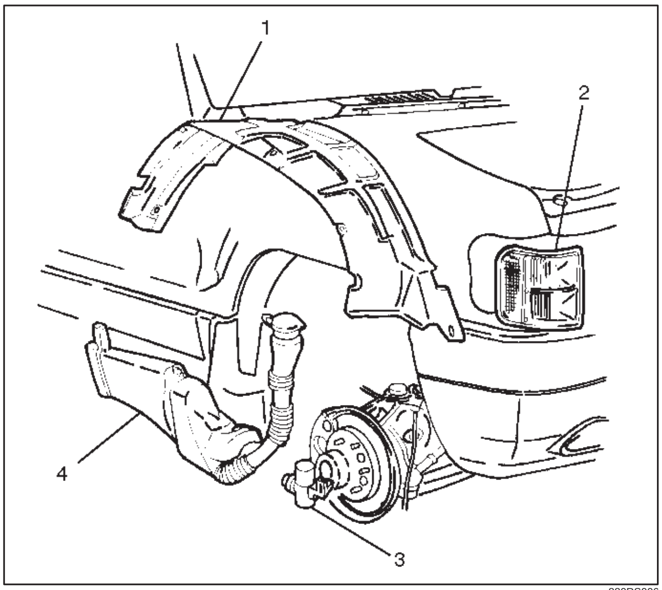
Installation

To install, follow the removal steps in the reverse order.

Windshield Washer Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the fender inner liner (right side) (1).
3. Remove the screws and then remove the front combination light(2).
4. Remove 2 screws, the filler neck and the hose.
5. Disconnect the windshield washer motor connector and remove the washer tank (4).
6. Pull the windshield washer motor(3) from the washer tank(4).



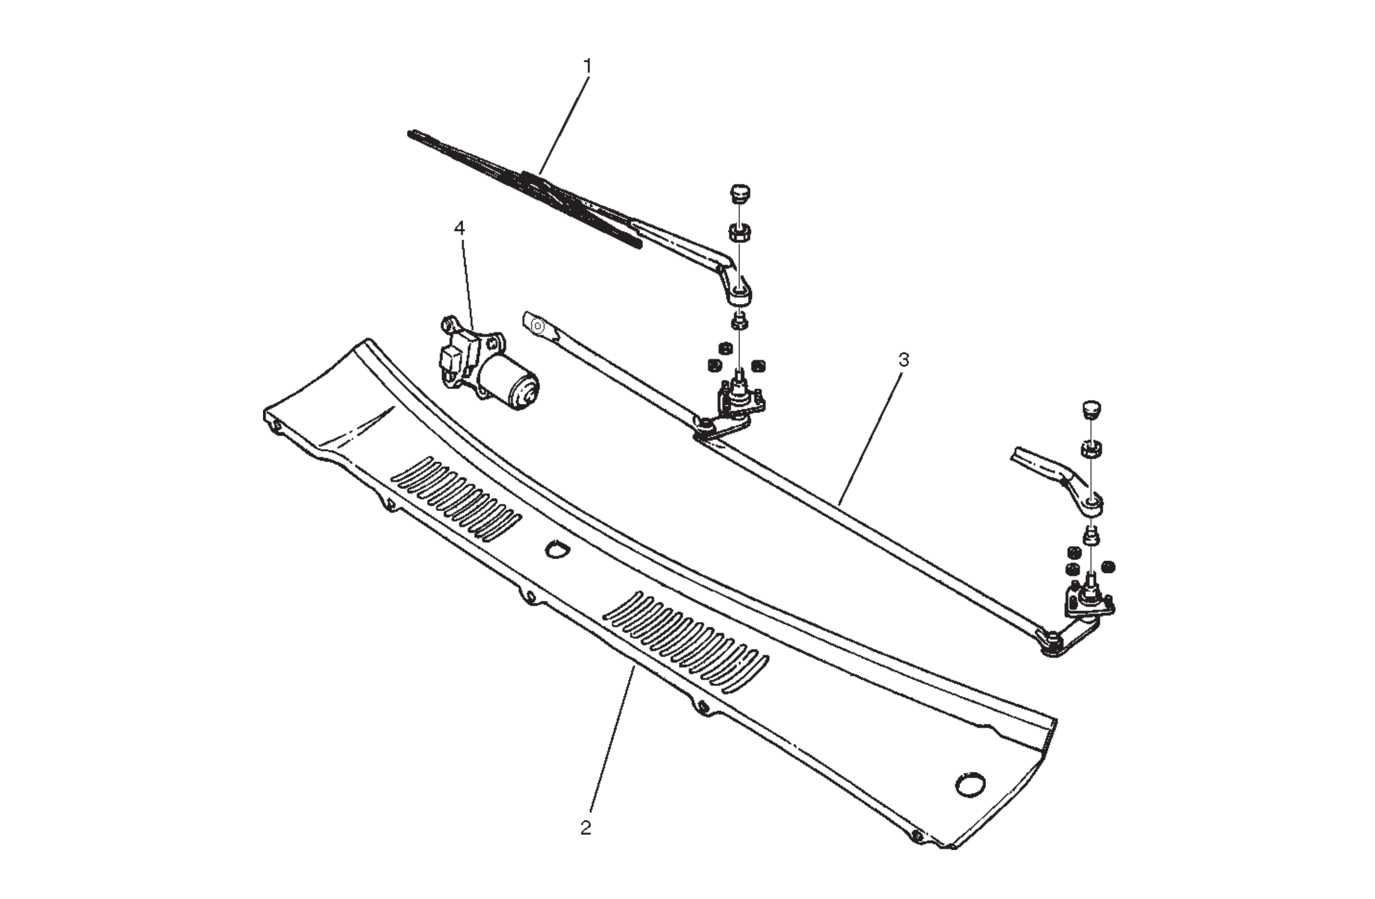
880RS006

Installation

To install, follow the removal steps in the reverse order.

Windshield Wiper Linkage

Windshield Wiper Linkage and Associated Parts



Legend

(1) Windshield Wiper Arm/Blade
(2) Vent Cowl Cover
(3) Windshield Wiper Linkage Assembly
(4) Windshield Wiper Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the windshield wiper arm/blade.
3. Remove the windshield wiper motor.
4. Remove the pivot assembly mounting nuts, fixing screws and then remove the vent cowl cover.
5. Take out the windshield wiper linkage assembly from the opening of the cowl.

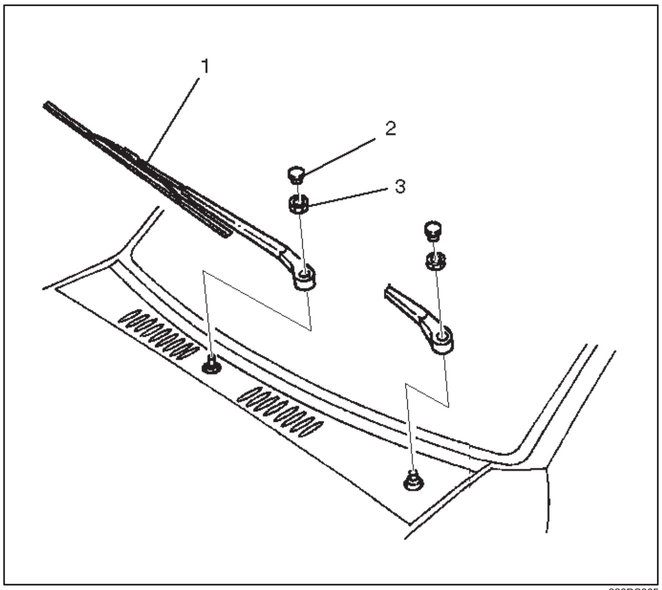
Installation

To install, follow the removal steps in the reverse order.

Windshield Wiper Arm/Blade

Removal

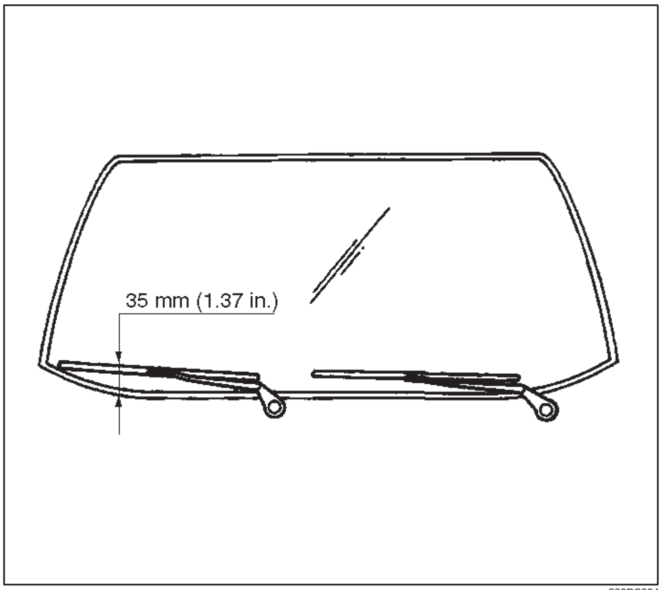
1. Pry the cap(2) off with the tip of a screwdriver.
2. Remove the nut(3).
3. Remove the wiper/blade(1).



880RS005

Installation

To install, follow the removal steps in the reverse order, noting the following points.



880RS004

1. Wiper arm/blade
   - Before installing the wiper arm/blade to the shaft, confirm that the motor stops at the auto-stop position.
   - Set the wiper arm/blade so that the tips of both blades are positioned about 35 mm (1.37 in) from the upper edge of the cowl cover as shown in the figure.
   - Tighten the nuts to the specified torque.

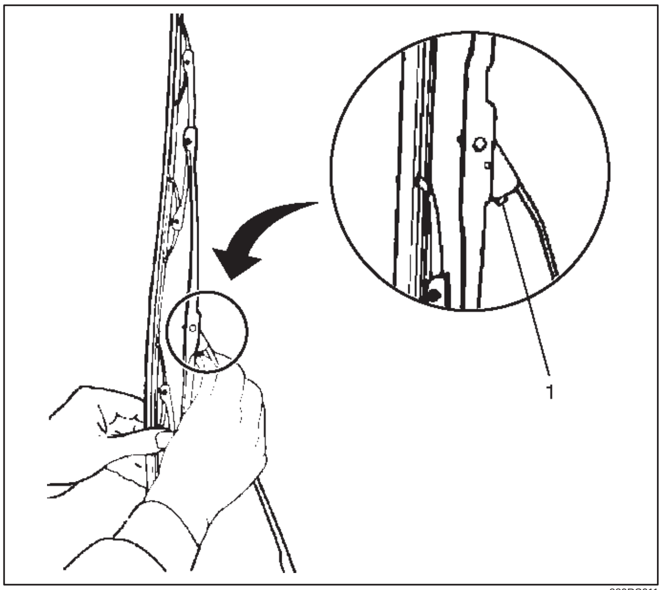
Torque: 31 N·m (23 lb ft)

Windshield Wiper Blade Rubber

Removal

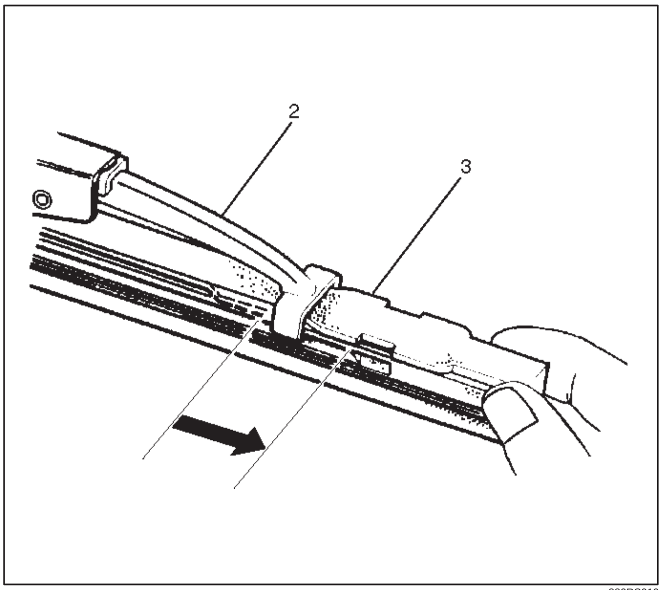
1. Push the wiper blade lock(1) while pulling the wiper blade in the arrow direction as shown in the figure.

CAUTION: When the wiper blade has been removed, wrap the tip of the wiper arm with cloth, to avoid damaging the glass.



880RS011

2. Pull the end of rubber and remove the projection(3) from the click of the blade stay (2).



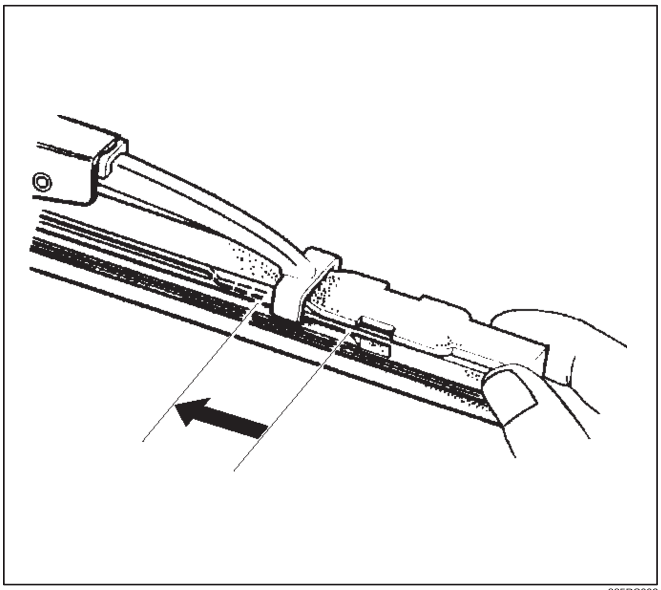
880RS010

3. Pull the rubber out in the same direction.

Installation

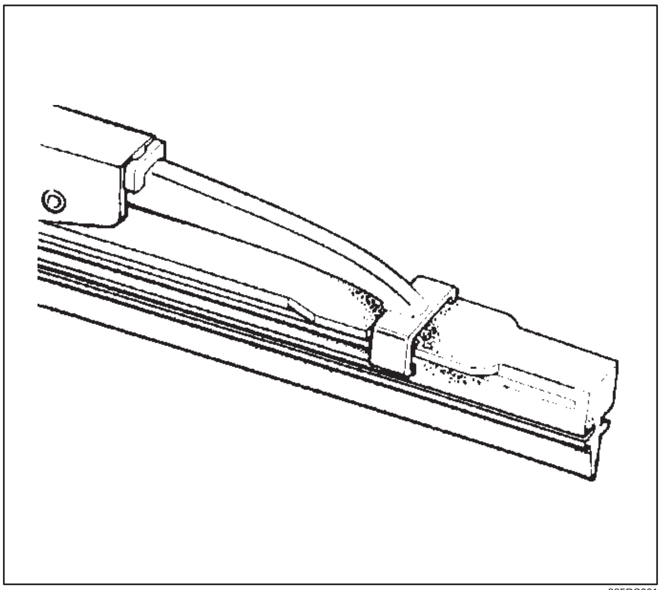
To install, follow the removal steps in the reverse order, noting the following points.

1. Install the click of the blade stay in the groove of the new rubber and slide it in. Complete wiper blade installation by pushing the click.



885RS002

2. Finally, check that the click of the stay has caught in the hole of the rubber.



885RS001

Rear Wiper/Washer System

General Description

The circuit consists of the starter switch, rear wiper & washer switch, rear wiper motor, rear washer motor and rear intermittent relay.

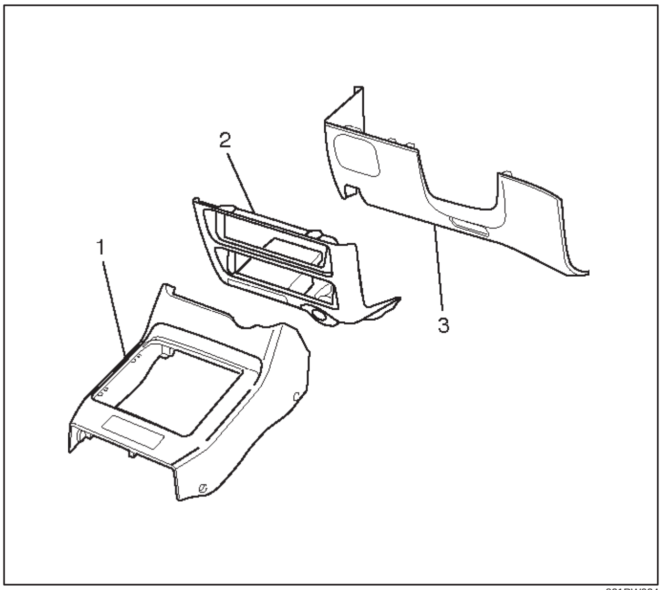
When the wiper & washer switch is turned on with the starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.

The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The intermittent relay is used to control motion of the wiper.

Rear Wiper and Washer Switch

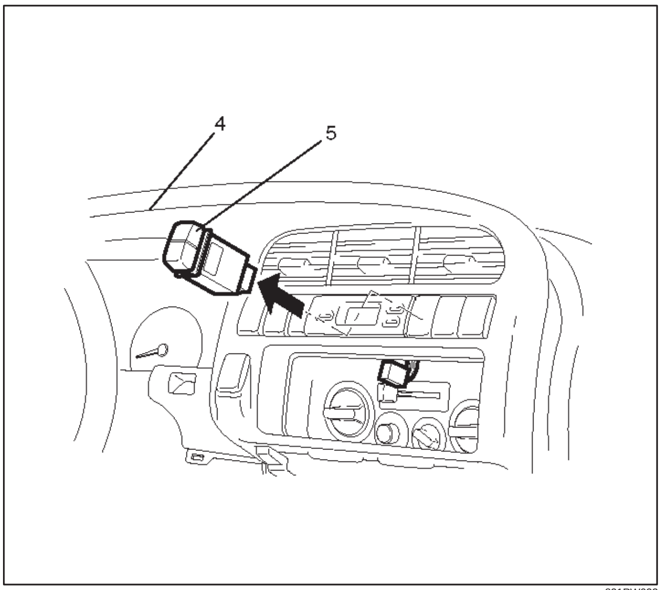
Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly(1).
   Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly(2).
   Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover(3).
   Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove the instrument panel cluster assembly(4).
   Refer to the Instrument Panel Assembly in Body Structure section.
6. Disconnect the connector and push the lock from the back side of the instrument panel cluster assembly to remove the rear wiper & washer switch(5).



821RW023

Installation

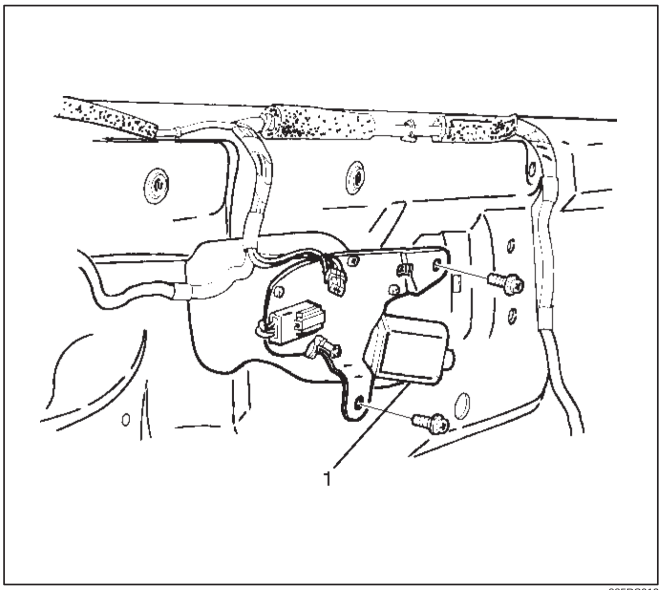
To install, follow the removal steps in the reverse order, noting the following point:

1. Push the switch with your fingers until it locks securely.

Rear Wiper Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim pad.
3. Remove the wiper arm/blade.
   Refer to the removal steps of the Rear Wiper Arm/Blade in this section.
4. Disconnect the connector remove the wiper shaft nut, remove the fixing screws and then remove the rear wiper motor(1).

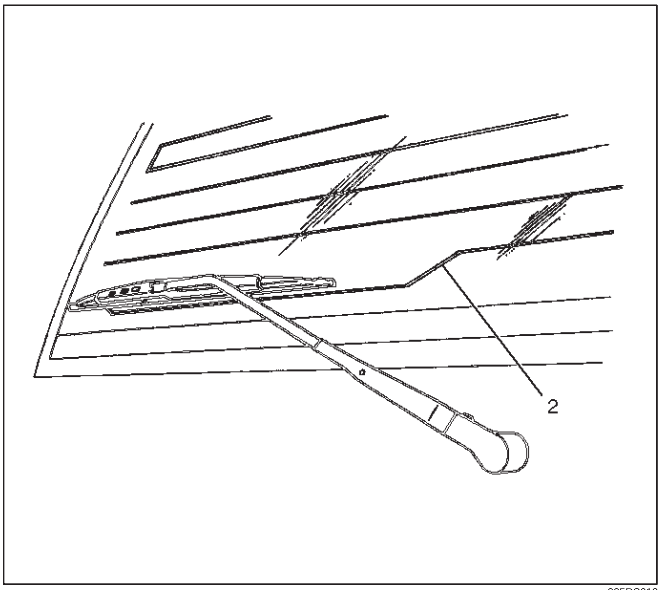


885RS013

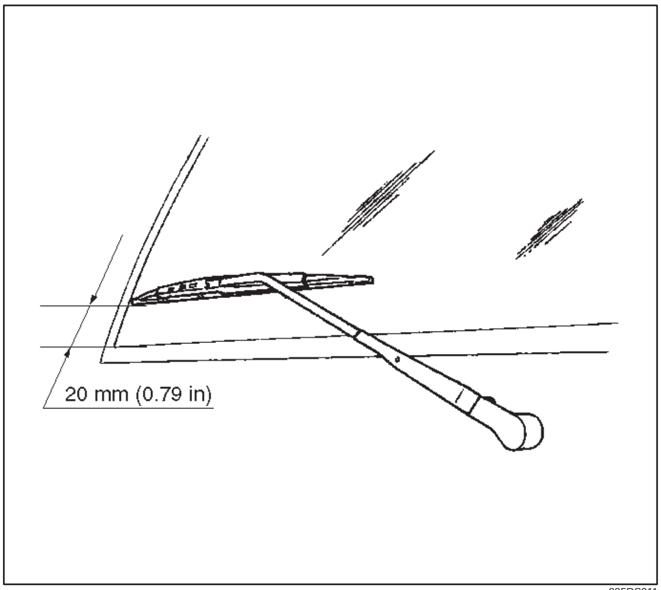
Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Before installing the wiper arm/blade to the motor shaft, confirm that the motor stops at the auto-stop position.
2. Install the wiper arm so that the blade gets parallel to the lowermost heat wire(2) of the rear defogger (w/rear defogger), or position the blade 20 mm (0.79 in) from edge of tailgate glass (W/O rear defogger).



885RS012



885RS011

3. Tighten the motor shaft nut to the specified torque.

   Torque: 6 N·m (52 lb in)

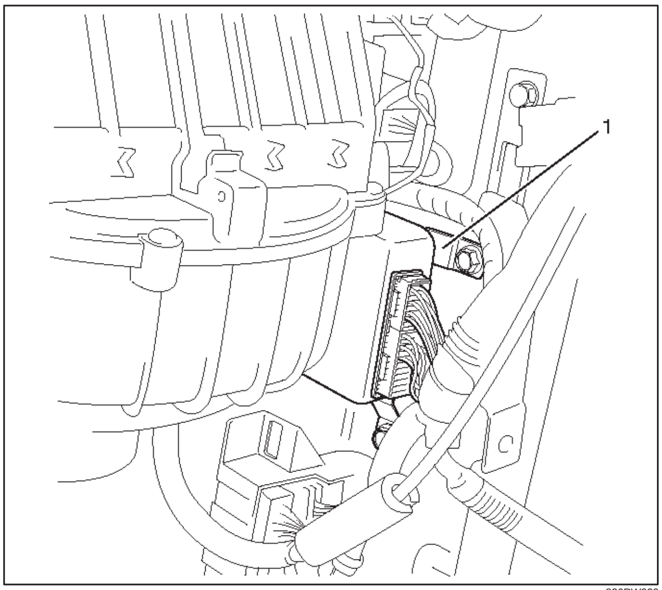
4. Tighten the wiper arm nut to the specified torque.

   Torque: 9 N·m (78 lb in)

Alarm & Relay Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the glove box.
3. Remove the instrument panel passenger lower cover assembly.
4. Remove the passenger Knee bolster reinforcement assembly.
5. Remove the fixing bolts, disconnect the connectors and then remove the alarm & relay control unit (1).



826RW020

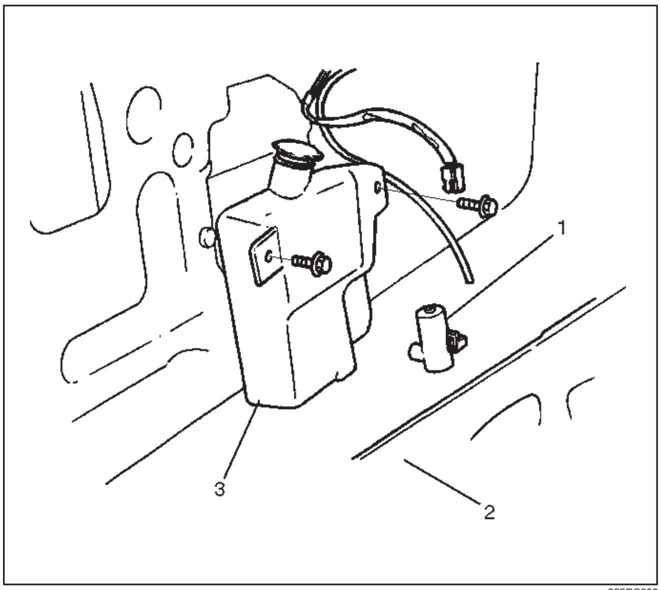
Installation

To install, follow the removal steps in the reverse order.

Rear Washer Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim pad(2).
3. Remove two screws, disconnect the connector, remove the washer hose and then remove the rear washer tank(3).
4. Pull out the rear washer motor(1) from the washer tank.



885RS009

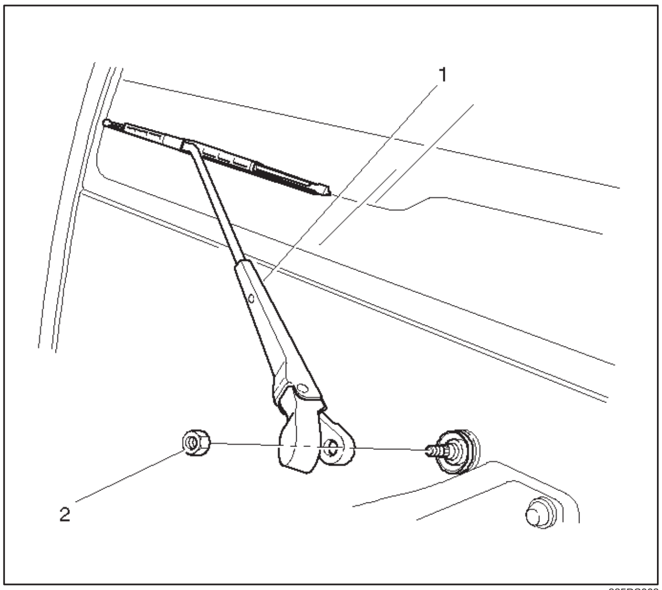
Installation

To install, follow the removal steps in the reverse order.

Rear Wiper Arm/Blade

Removal

1. Remove the arm nut(2).
2. Remove the wiper arm/blade(1).



885RS008

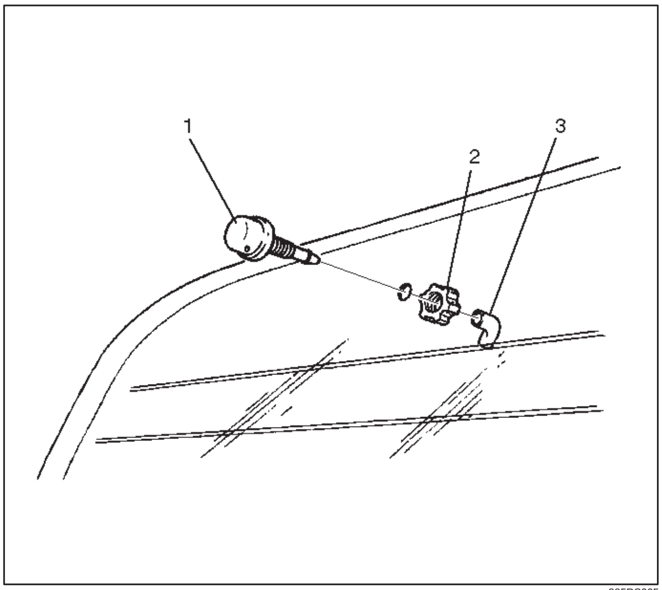
Installation

Refer to the installation steps of the Rear Wiper Motor in Wiper/Washer System section.

Rear Washer Nozzle

Removal

1. Disconnect the hose(3).
2. Remove the lock nut(2), and then remove the washer nozzle(1).



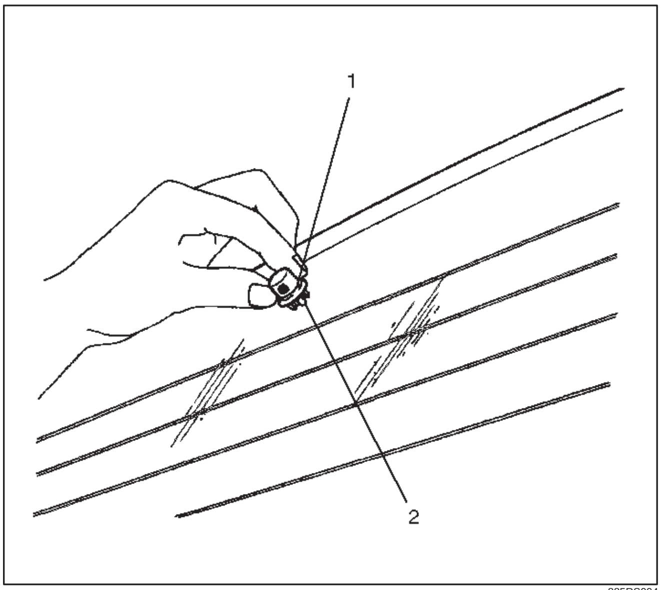
885RS005

Installation

To install, follow the removal steps in the reverse order.

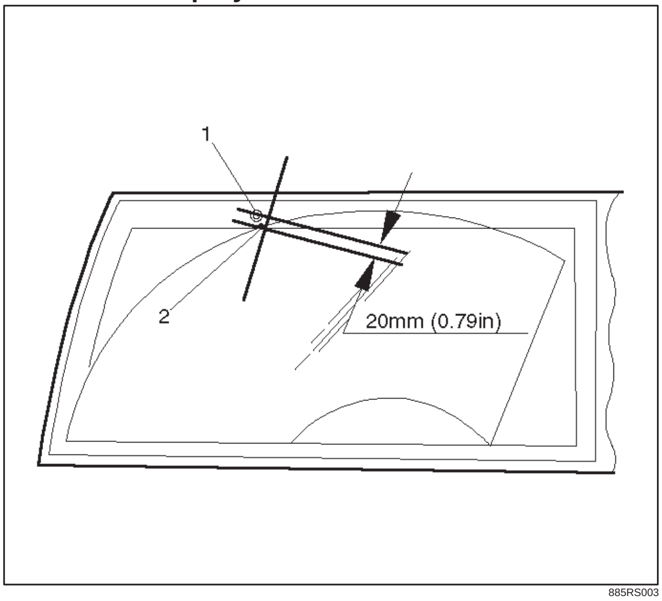
Rear Washer Nozzle Angle Adjustment

Loosen the lock nut(2) of the washer nozzle(1) to adjust the injection angle of the cleaning fluid, and then retighten the lock nut(2).



885RS004

Rear Washer Spray Pattern



Legend
(1) Washer Nozzle
(2) Spray Target

Rear Wiper Blade Rubber

Removal and Installation

Refer to the Windshield Wiper Blade Rubber in this section.

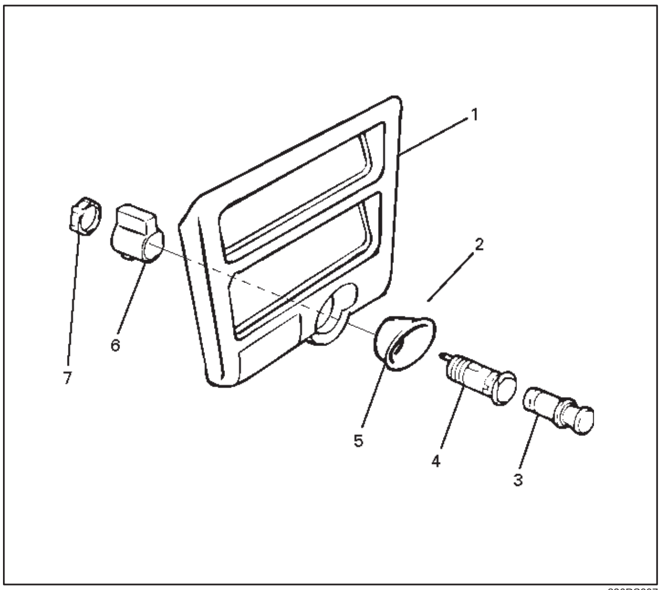
Cigarette Lighter

General Description

When the cigarette lighter is pushed in with the starter switch at either “ACC” or “ON” position, a circuit is formed in the cigarette lighter case to heat the lighter coil.
The cigarette lighter is sprung back to its original position after the lighter coil is heated.

Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly(1).
   Refer to the Instrument Panel Assembly removal steps in Body Structure section.
3. Disconnect the connectors, remove the socket of the illumination light, the retaining ring(7), the outer case(6), the cigarette lighter(3) and socket(4), the bezel(5) and then remove the cigarette lighter assembly(2).



826RS007

Installation

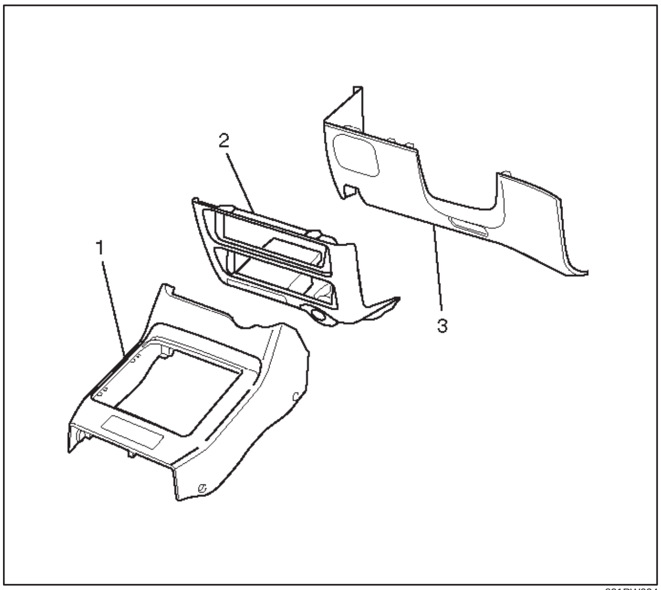
To install, follow the removal steps in the reverse order, noting the following point.

1. When installing the bezel, align the projected portion of the socket with the notch of the bezel.

Digital Clock

Removal

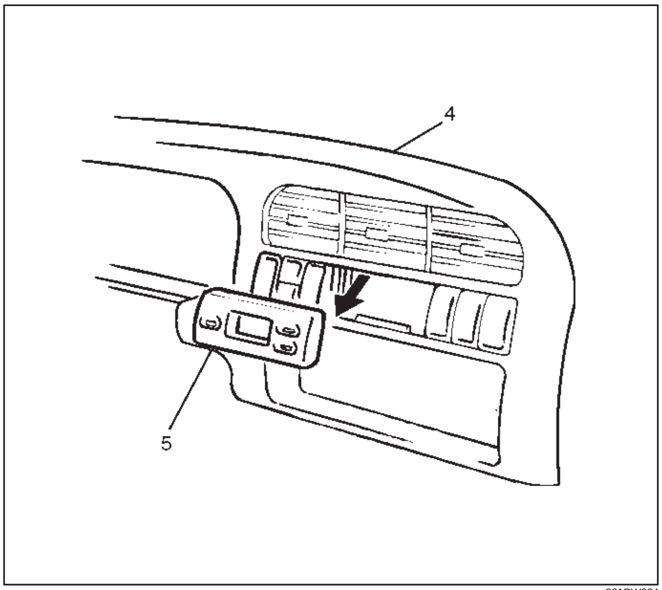
1. Disconnect the battery ground cable.
2. Remove the front console assembly(1).
   Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly(2).
   Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover assembly(3).
   Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove the instrument panel cluster assembly(4).
   Refer to the Instrument Panel Assembly in Body Structure section.

6. Disconnect the connector and push the lock from the back side of the instrument panel cluster assembly to remove the digital clock(5).



821RW034

Installation

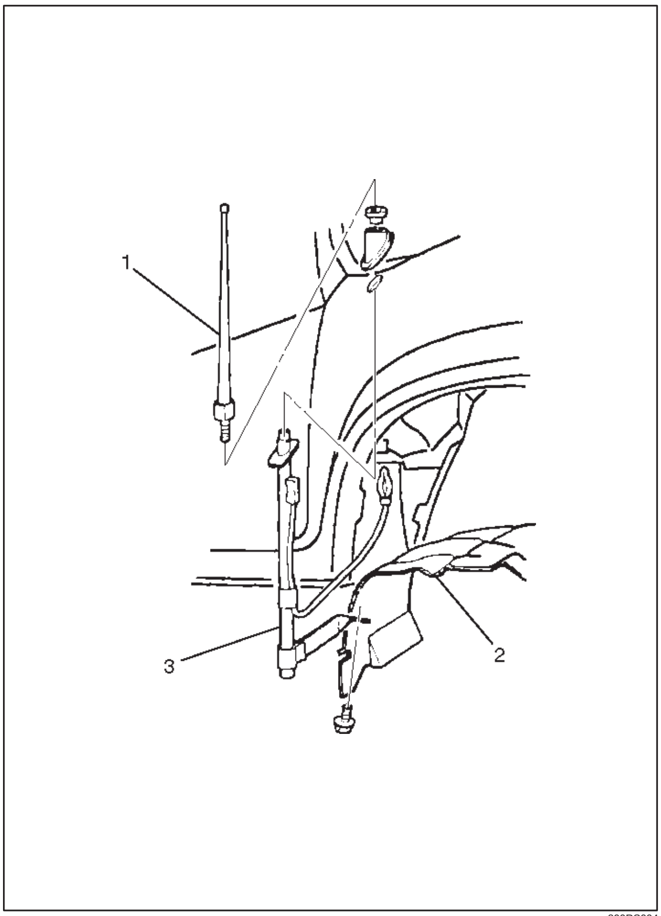
To install, follow the removal steps in the reverse order, noting the following point.

1. Push in the switch with your fingers until it locks securely.

Rod Type Antenna

Removal

1. Disconnect the battery ground cable.
2. Turn the antenna rod(1) counterclockwise to remove it.
3. Remove three screws and nine clips to remove the fender inner liner(2).
4. Disconnect the feeder cable connector at the inside of the vehicle, remove the housing bracket screw, turn the lock nut counterclockwise to remove it together with the base mold and then remove the housing(3).



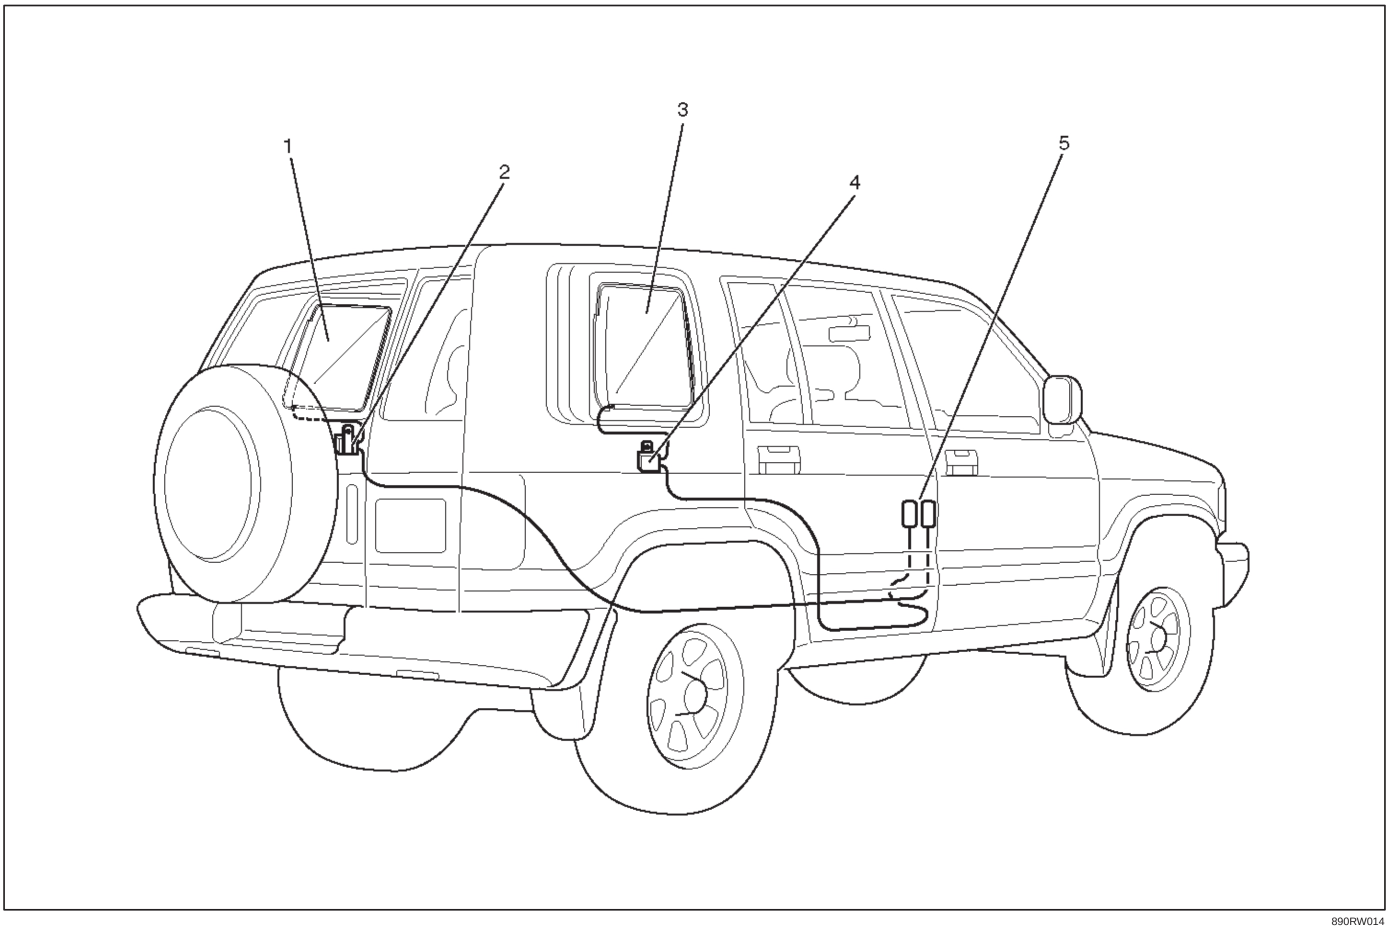
890RS004

Installation

To install, follow the removal steps in the reverse order.

Diversity Glass Antenna

Glass Antenna System Parts Location



Legend

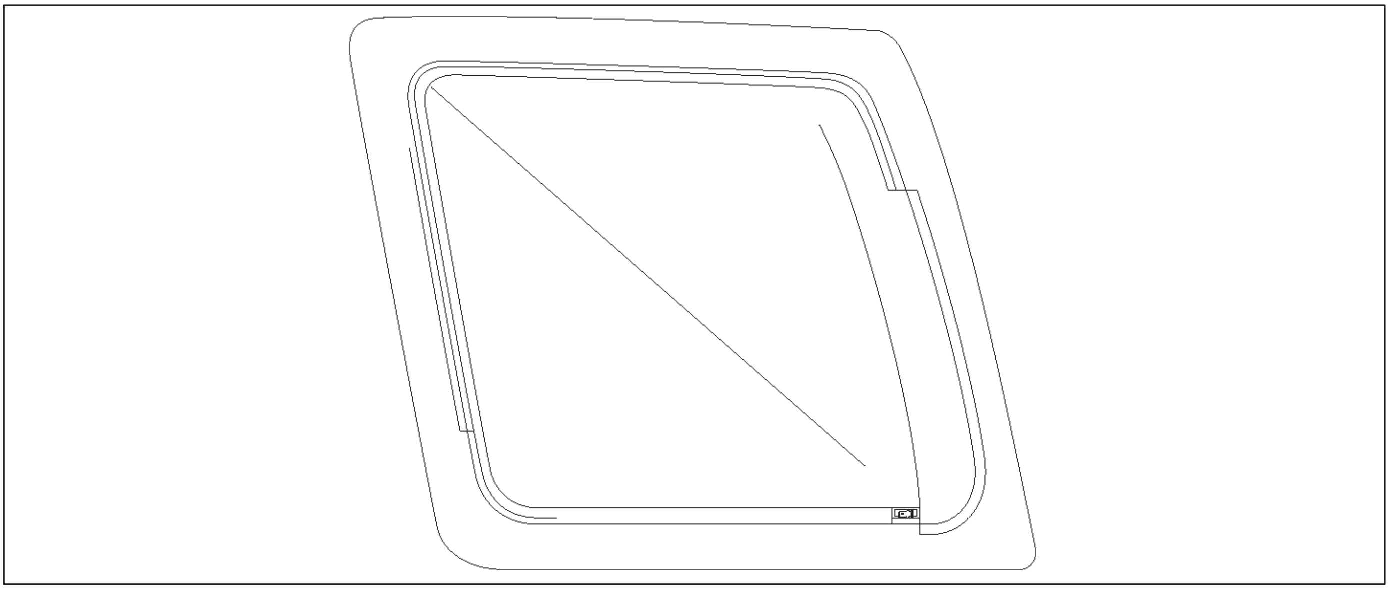
(3) Glass Antenna (RH)
(4) Glass Antenna Amplifier
(5) Connection with the audio side feeder cables at the dash side (RH)

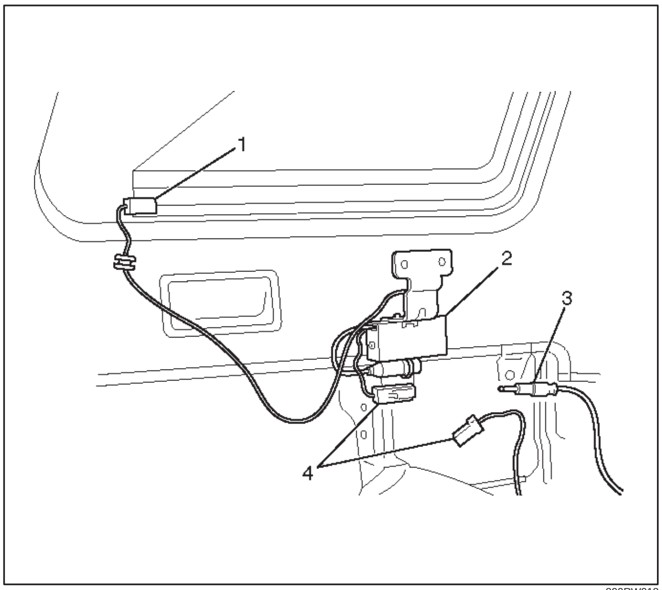
Glass Antenna Pattern



890RW016

Glass Antenna Amplifier Removal

1. Disconnect the battery ground cable.
2. Remove the luggage side trim cover.
   Refer to the Interior Trim Panels removal steps in Exterior/Interior Trim section.
3. Disconnect the connector(1)&(4), feeder cable(3) and remove two screws to remove the glass antenna amplifier(2).



890RW018

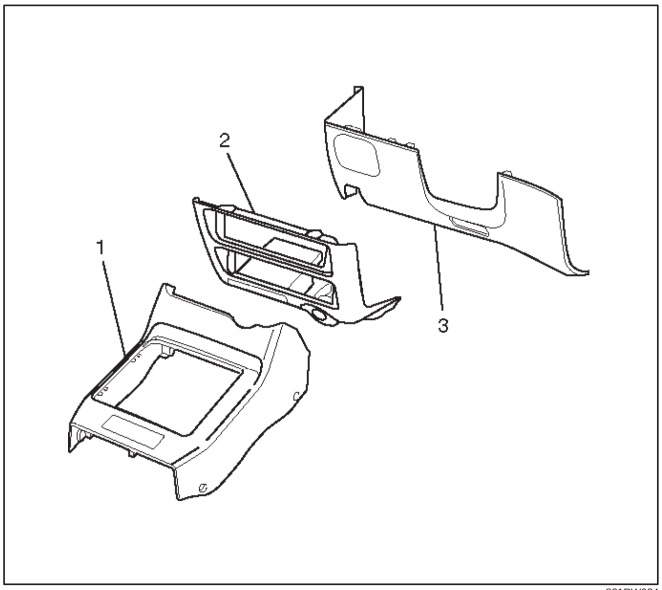
Glass Antenna Amplifier Installation

To install, follow the removal steps in the reverse order.

Radio

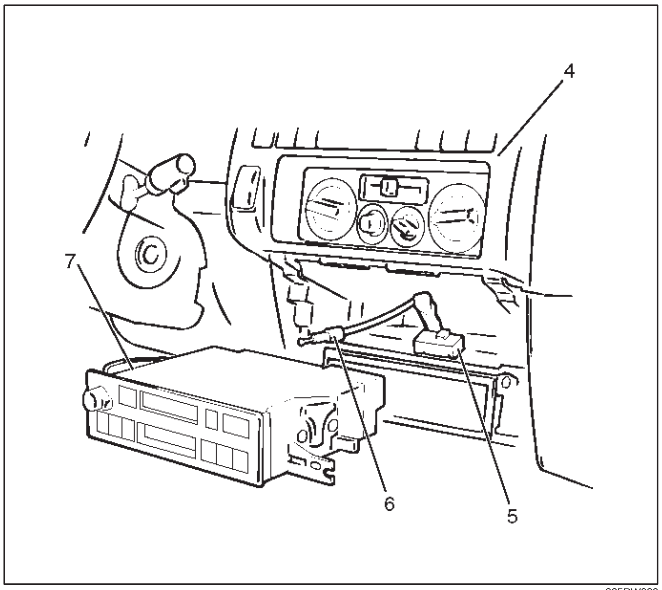
Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly (1).
   Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly (2).
   Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover assembly (3).
   Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove the instrument panel cluster assembly(4).
   Refer to the Instrument Panel Assembly in Body Structure section.
6. Remove two screws and disconnect the radio connector(5) and antenna feeder plug(6) to remove the radio(7).



825RW039

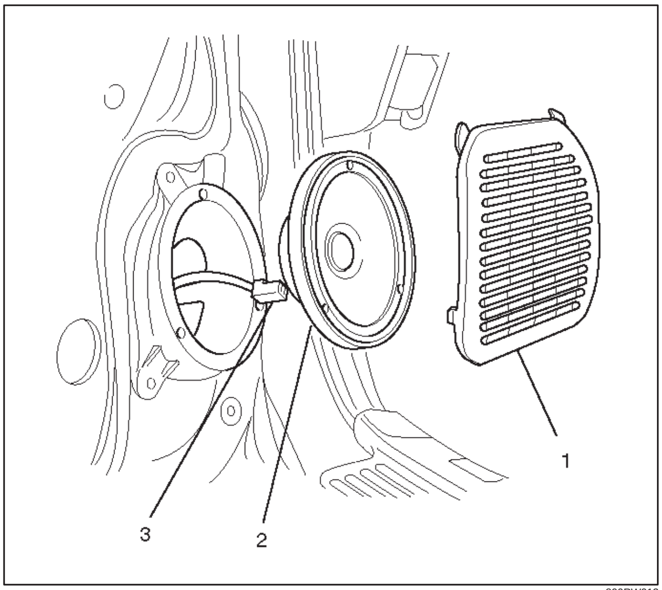
Installation

To install, follow the removal steps in the revers order.

Front Speaker

Removal

1. Disconnect the battery ground cable.
2. Pull the grille(1) to release the locks and then remove it.
3. Remove four screws and disconnect the connector(3) to remove the speaker(2).



890RW013

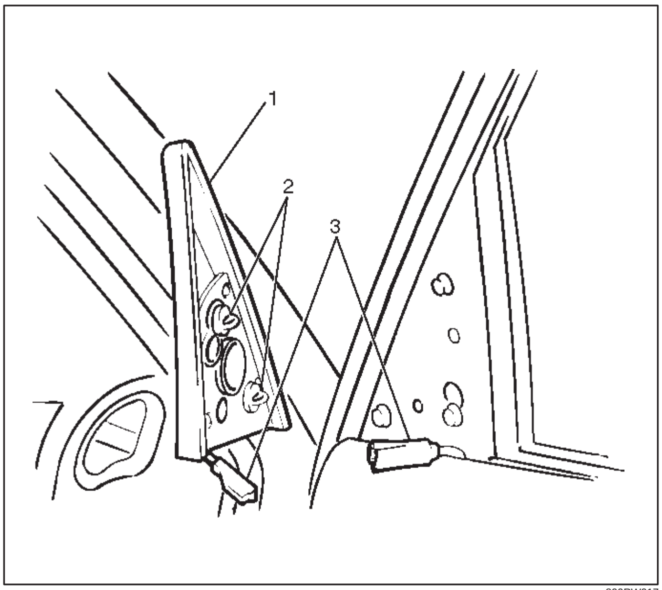
Installation

To install, follow the removal steps in the reverse order.

Tweeter Assembly

Removal

1. Disconnect the battery ground cable.
2. Pull the tweeter, assembly(1) to release the clips(2) and disconnect the connector(3) to remove the tweeter assembly.



890RW017

Installation

To install, follow the removal steps in the reverse order.

Rear Speaker

Removal

1. Disconnect the battery ground cable.
2. Pull the grille(1) to release the locks and then remove it.
3. Remove four screws and disconnect the connector(3) to remove the speaker(2).

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The circuit consists of the starter switch, meter assembly, vehicle speed sensor, transmission switch, lighting switch, turn signal switch, thermo unit, oil pressure unit, Powertrain Control Module (PCM), fuel tank unit, 4WD switch, oil pressure switch, parking brake switch, brake fluid switch, seat belt switch, illumination controller, multi meter and ambient sensor.

Meter Assembly

General Description

The meter assembly has the speedometer, tachometer, engine coolant temperature gauge, fuel gauge and warning/indicator lights.In addition, the meter assembly containing TOD (Torque on Demand) has the TOD indicator light, or the meter assembly not containing TOD has the voltmeter and oil pressure gauge instead of the TOD indicator.

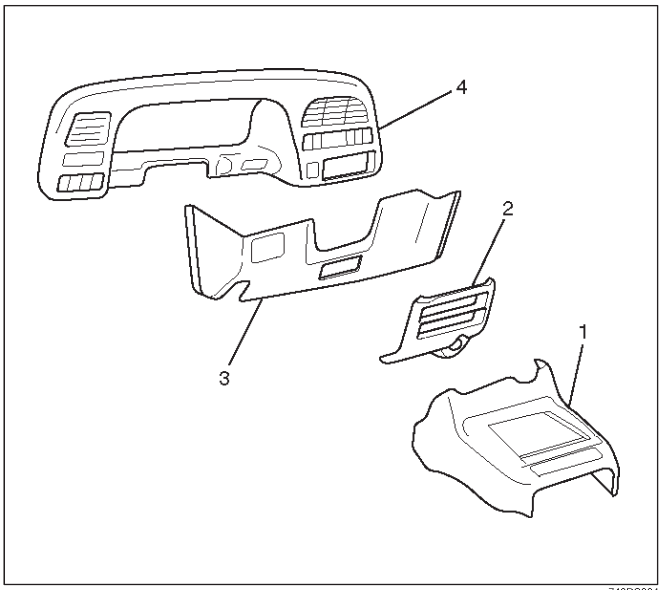
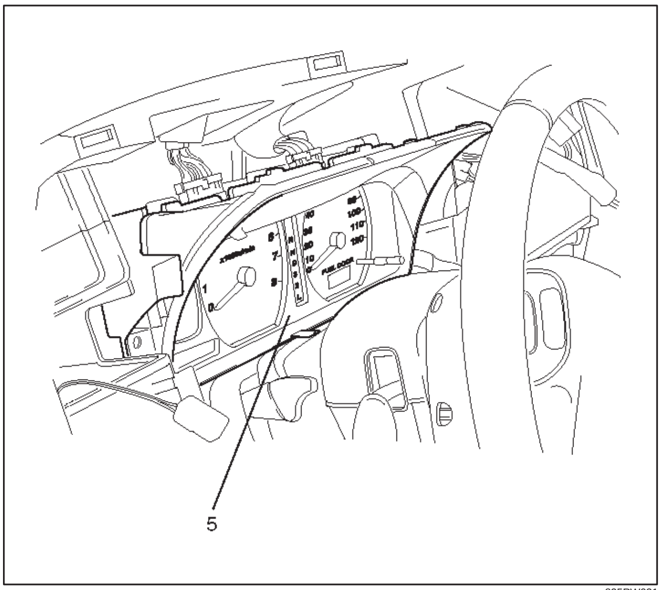
Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly(1).
   Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly(2).
   Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover(3).
   Refer to the Instrument Panel Assembly in Body Structure section.



740RS004

5. Remove four fixing screws and disconnect the meter connectors to remove the meter assembly(5).



825RW031

CAUTION: The removed meter assembly should be placed upright or with its face side up.

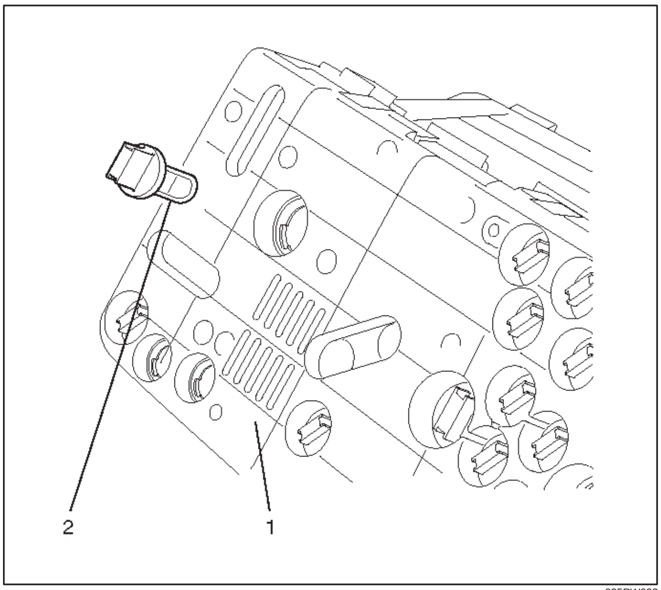
Installation

To install, follow the removal steps in the reverse order.

Warning Light Bulb, Indicator Light Bulb, Illumination Light Bulb, A/T Indicator Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the meter assembly(1).
   Refer to the Meter Assembly removal steps in this section.
3. Hold the bulb socket by hand and rotate it counterclockwise to remove the socket & bulb(2) from the meter body.



825RW032

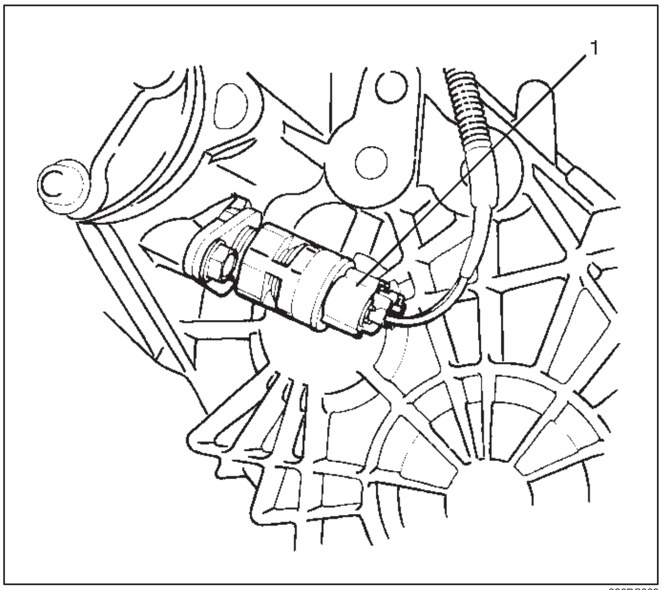
Installation

To install, follow the removal steps in the reverse order.

Vehicle Speed Sensor

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector, remove the vehicle speed sensor body by rotating it and then remove the vehicle speed sensor(1).



826RS009

Installation

To install, follow the removal steps in the reverse order, noting the following point.

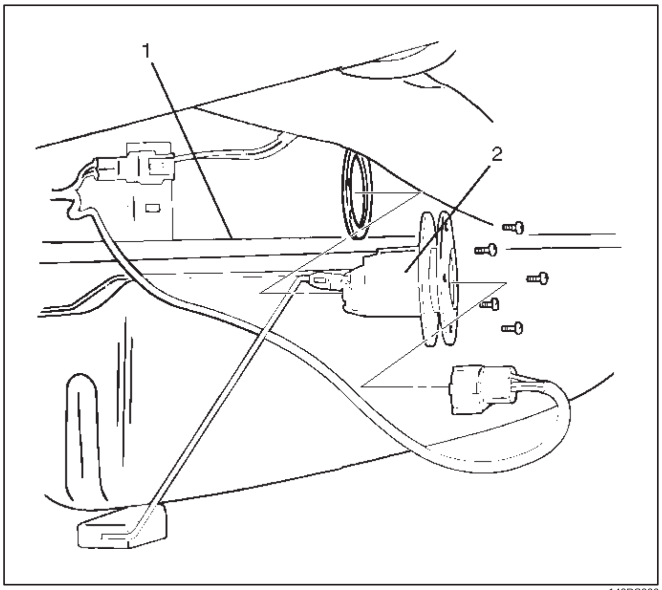
1. Tighten the vehicle speed sensor to the specified torque.

Torque: 27 N·m (20 lb ft)

Fuel Tank Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the fuel tank(1).
   Refer to the Fuel Tank removal steps in Engine section
3. Disconnect the connectors, remove five screws and then remove the fuel tank unit(2).



140RS006

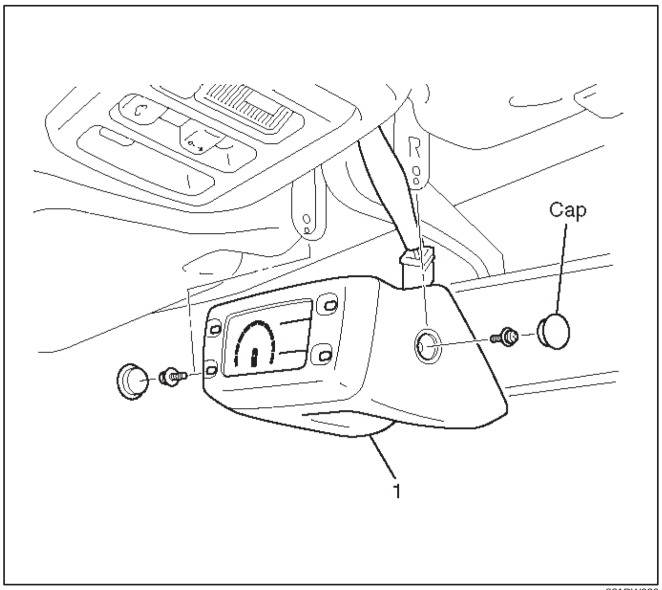
Installation

To install, follow the removal steps in the reverse order.

Multi Meter

Removal

1. Disconnect the battery ground cable.
2. Remove two caps, two screws and disconnect the connector to remove the multi meter(1).



821RW036

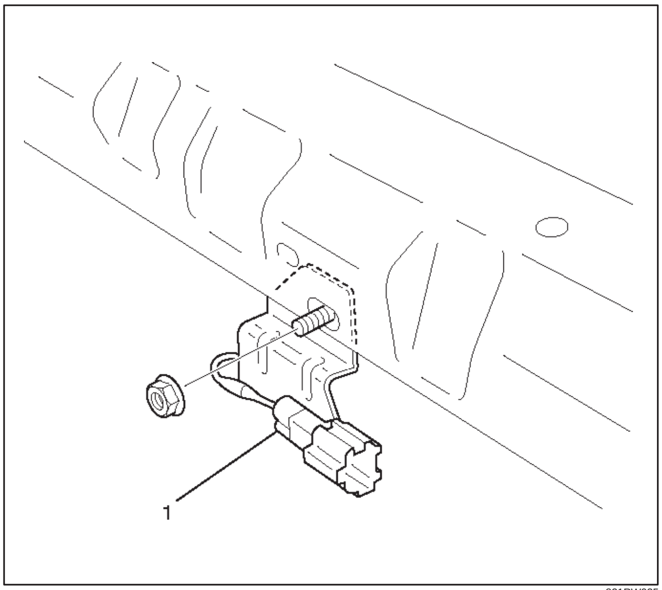
Installation

To install, follow the removal steps in the revers order.

Ambient Sensor

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector and remove the nut to remove the ambient sensor(1).



821RW035

Installation

To install, follow the removal steps in the reverse order.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

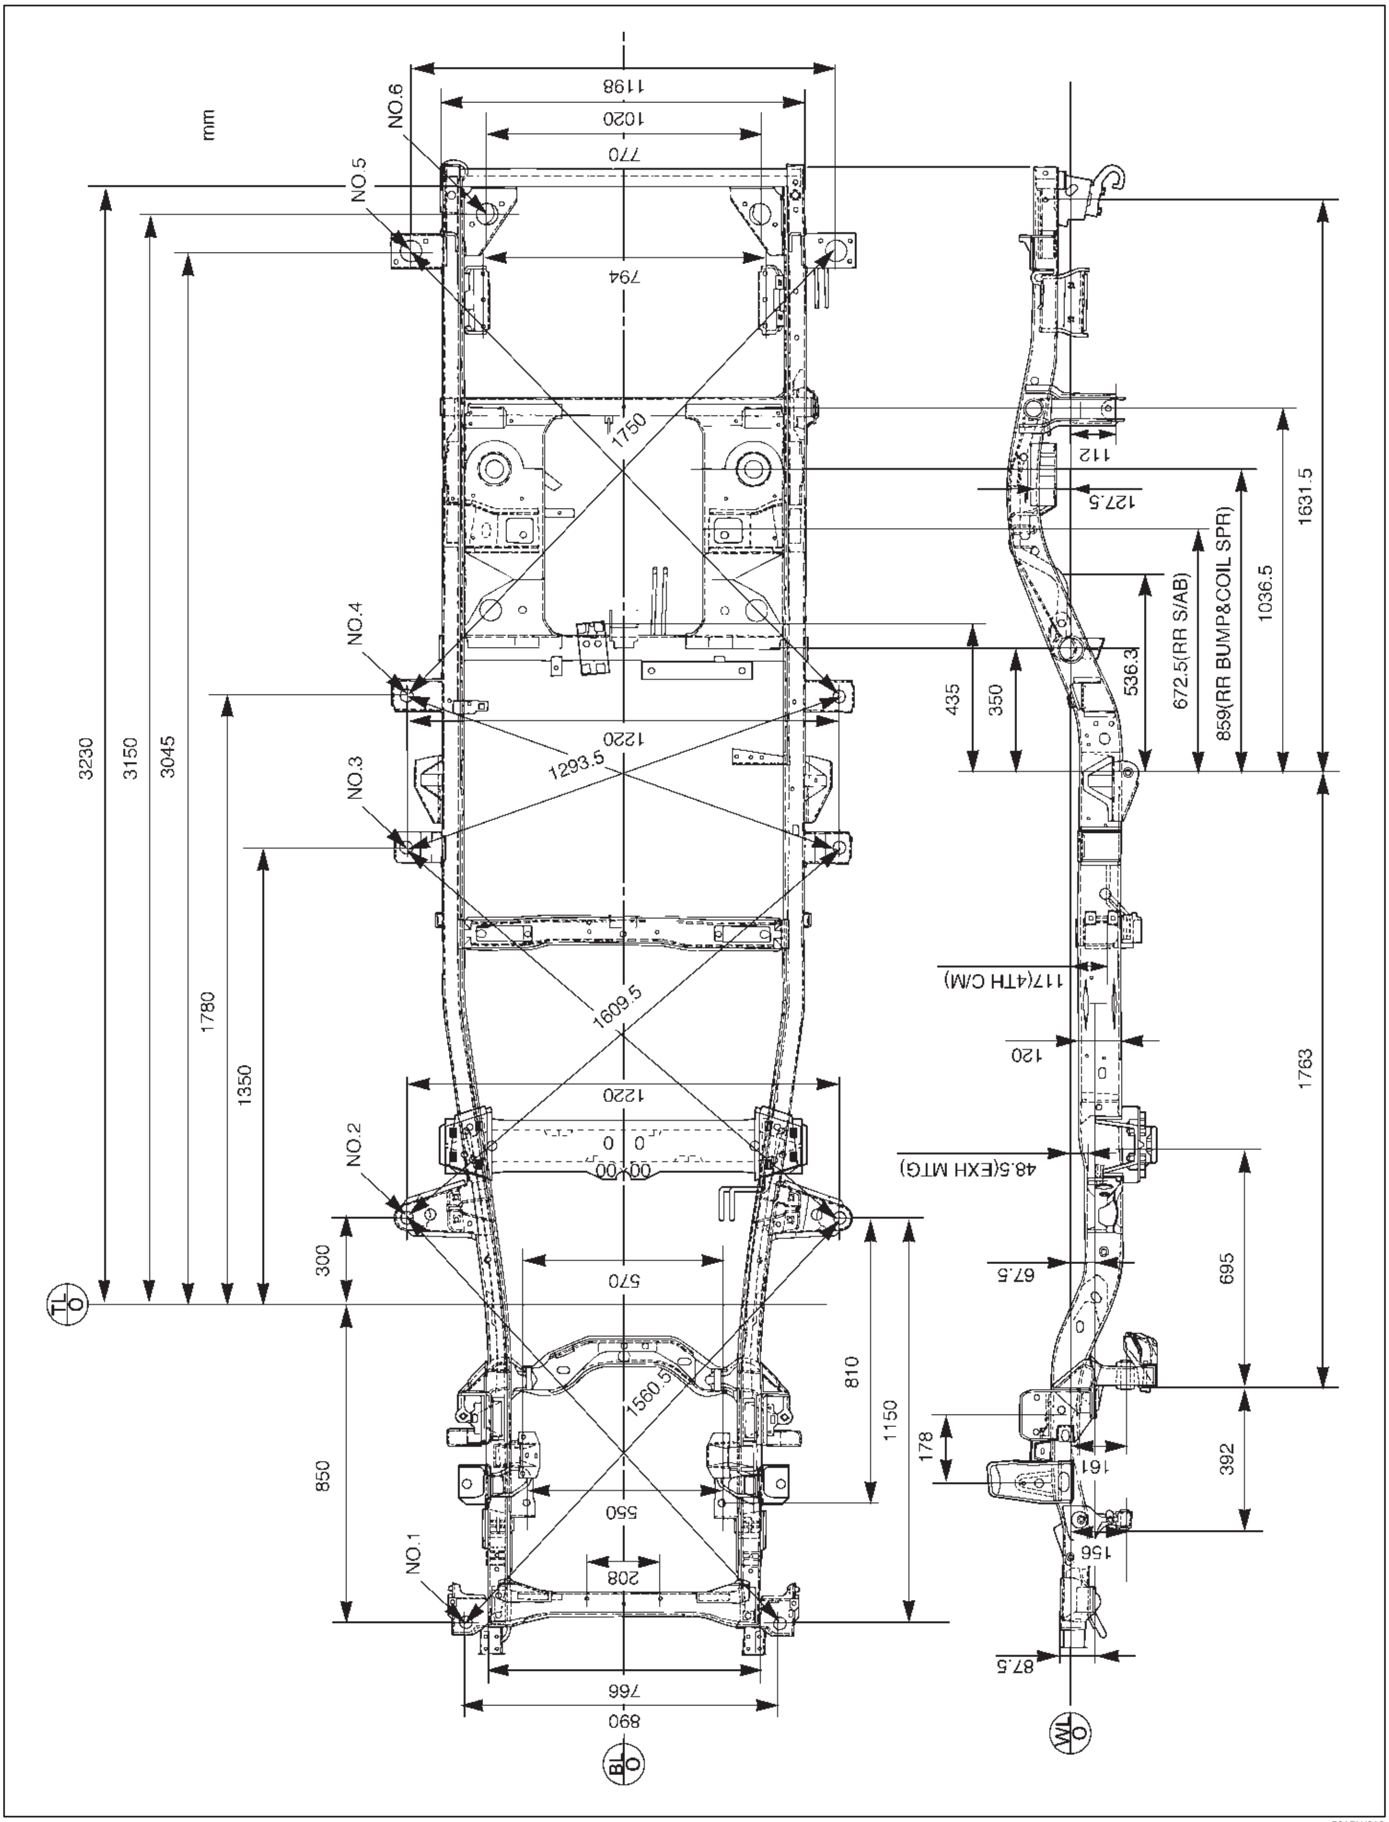
CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Frame

General Description

Proper frame alignment is important to assure normal vehicle life and performance of many other parts of the vehicle. If the vehicle has been involved in a fire, collision or has been overloaded, it is necessary to check the frame alignment.

Frame Dimensions



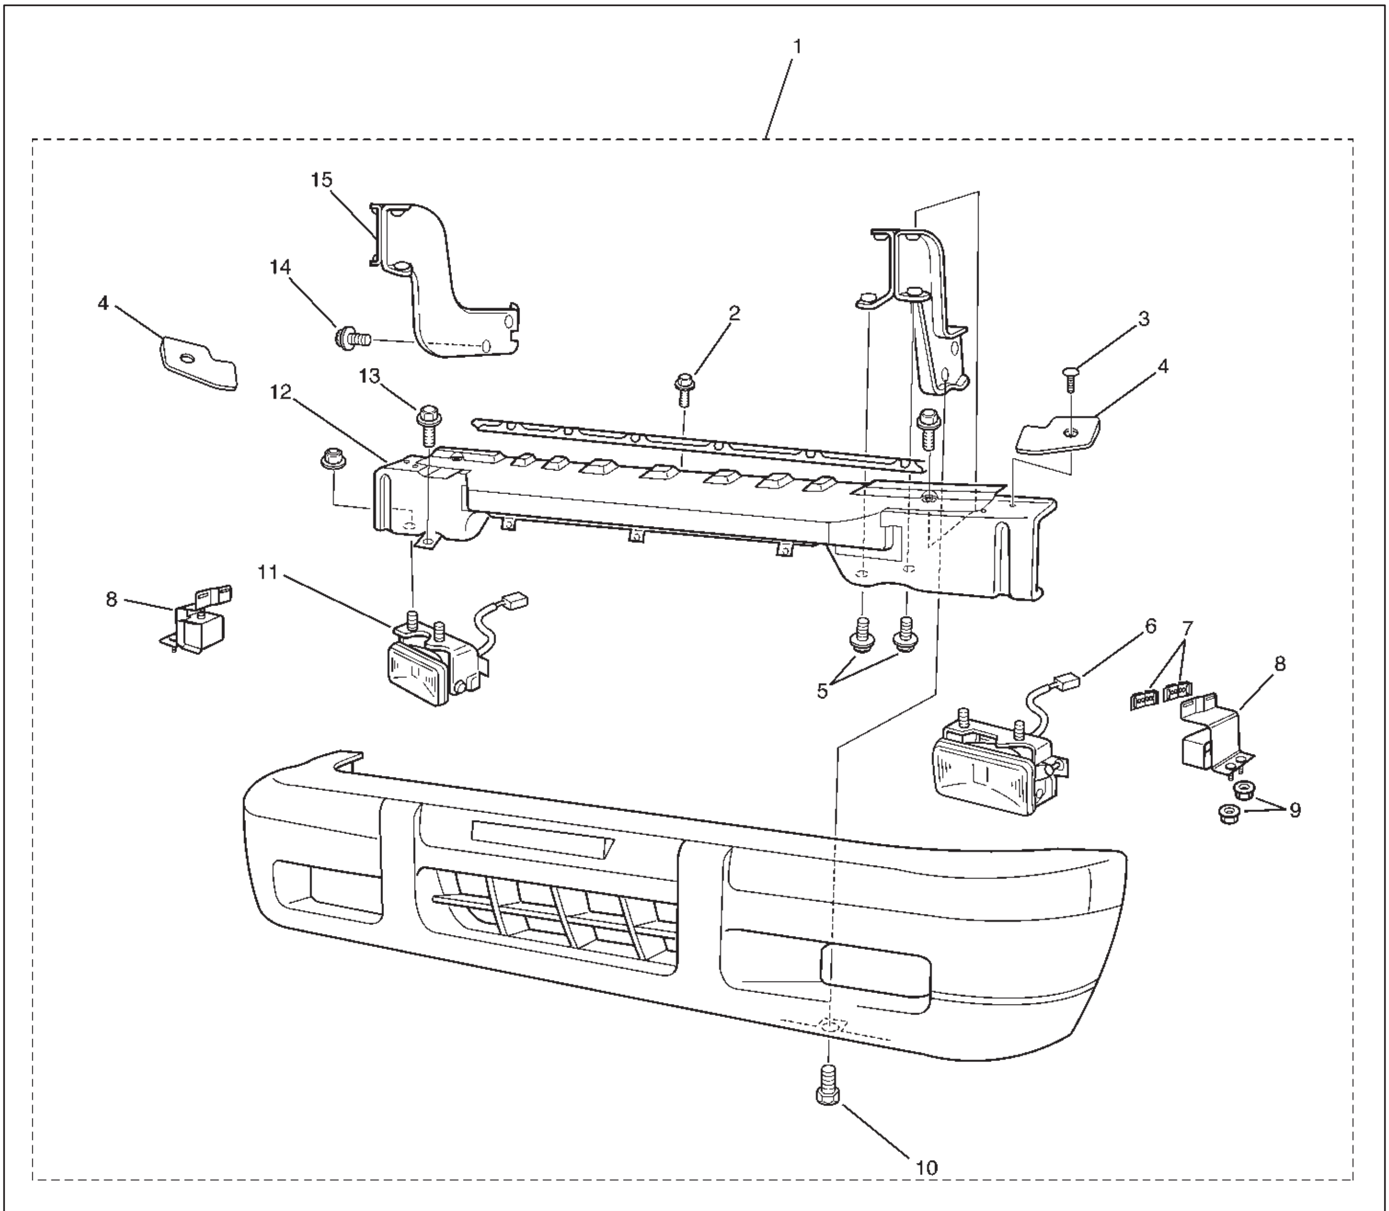
501RW013

General Description

This section describes how to remove and install front and rear bumpers. Each bumper is installed with two fixing bolts used on either side to fasten the backbar to the frame, a slider is used to fasten the bumper fascia to the fender panel. The bumpers can be removed by taking them out forward or backward after removing the two fixing bolts on either side.

Front Bumper

Parts Location



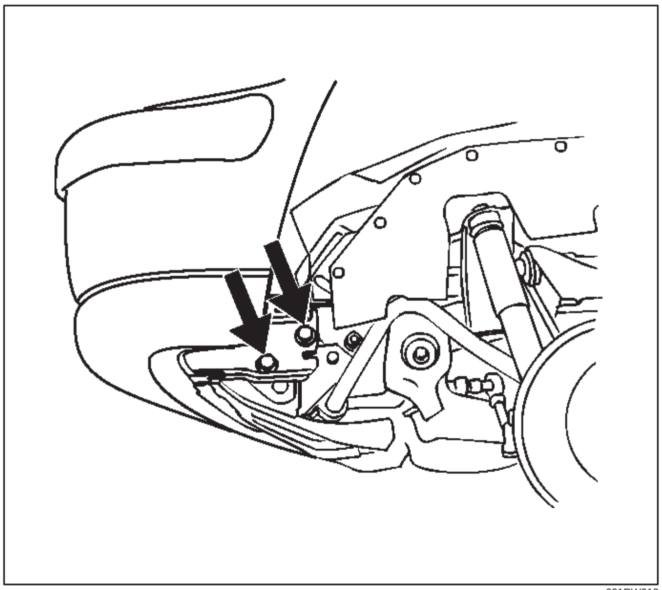
601RX001

Legend

(1) Front Bumper Assembly
(2) Front Bumper Retainer Bolt
(3) Clip
(4) Bumper Spacer Support
(5) Back Bar Fixing Bolt
(6) Front Fog Light Connector
(7) Front Bumper Slider Fixing Clip
(8) Front Bumper Slider
(9) Front Bumper Slider Fixing Nut
(10) Bumper Fascia Lower Bolt
(11) Front Fog Light Assembly
(12) Reinforce Assembly
(13) Reinforce Lower Bolt
(14) Front Bumper Fixing Bolt
(15) Back Bar

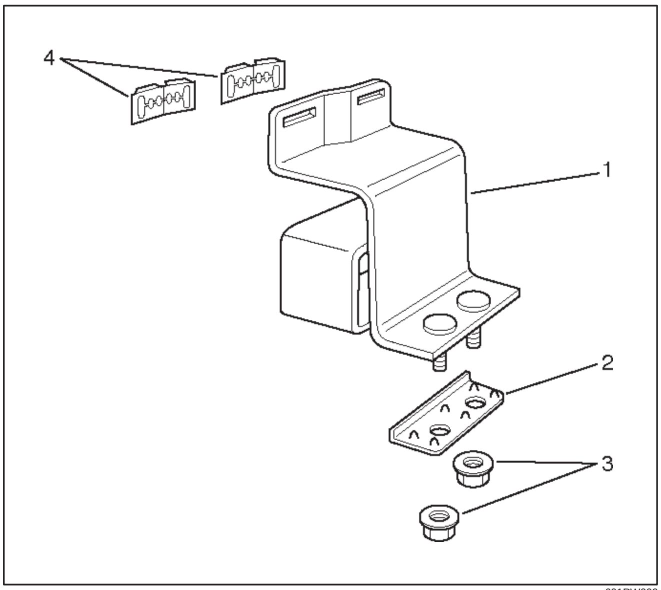
Removal

1. Remove front fog light connector.
2. Remove front bumper assembly fixing bolt.
   - Remove the two bolts from both sides of the front bumper.



601RW010

3. Remove front bumper assembly.
4. Remove bumper fascia lower bolts.
5. Remove front bumper retainer.
6. Remove reinforce lower bolts.
   - Loosen the five bolts and release claws.
7. Remove reinforce assembly.
8. Remove backbar fixing bolts.
   - Remove the four bolts at each backbar.
9. Remove front fog light assembly.
10. Remove the front bumper slider(1).
    - Remove the two clips(4) and the two nuts(3), and release the claw from the washer(2).



601RW009

Installation

To install, follow the removal steps in reverse order noting the following points:

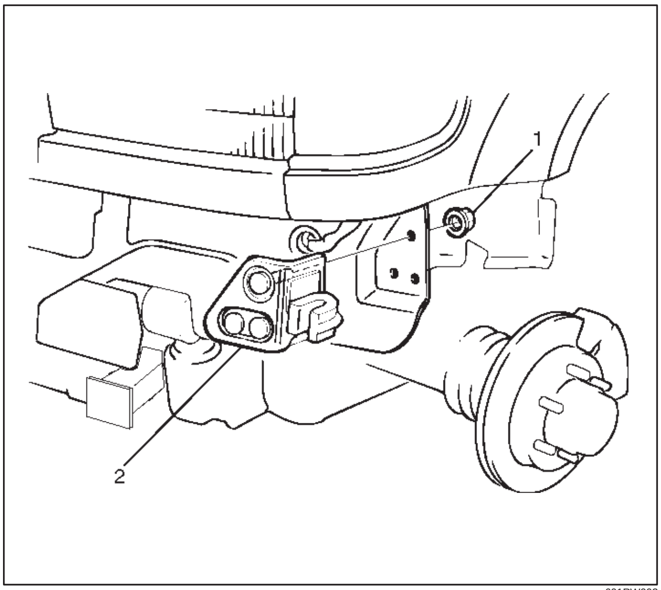
1. Tighten the front bumper assembly fixing bolts to the specified torque.

Torque: 132 N•m (98 lb ft)

Front Bumper Slider Bracket

Removal

1. Remove the Front bumper.
   - Refer to Front Bumper in this section.
2. Remove the three nuts(1) and draw out the slider bracket(2).



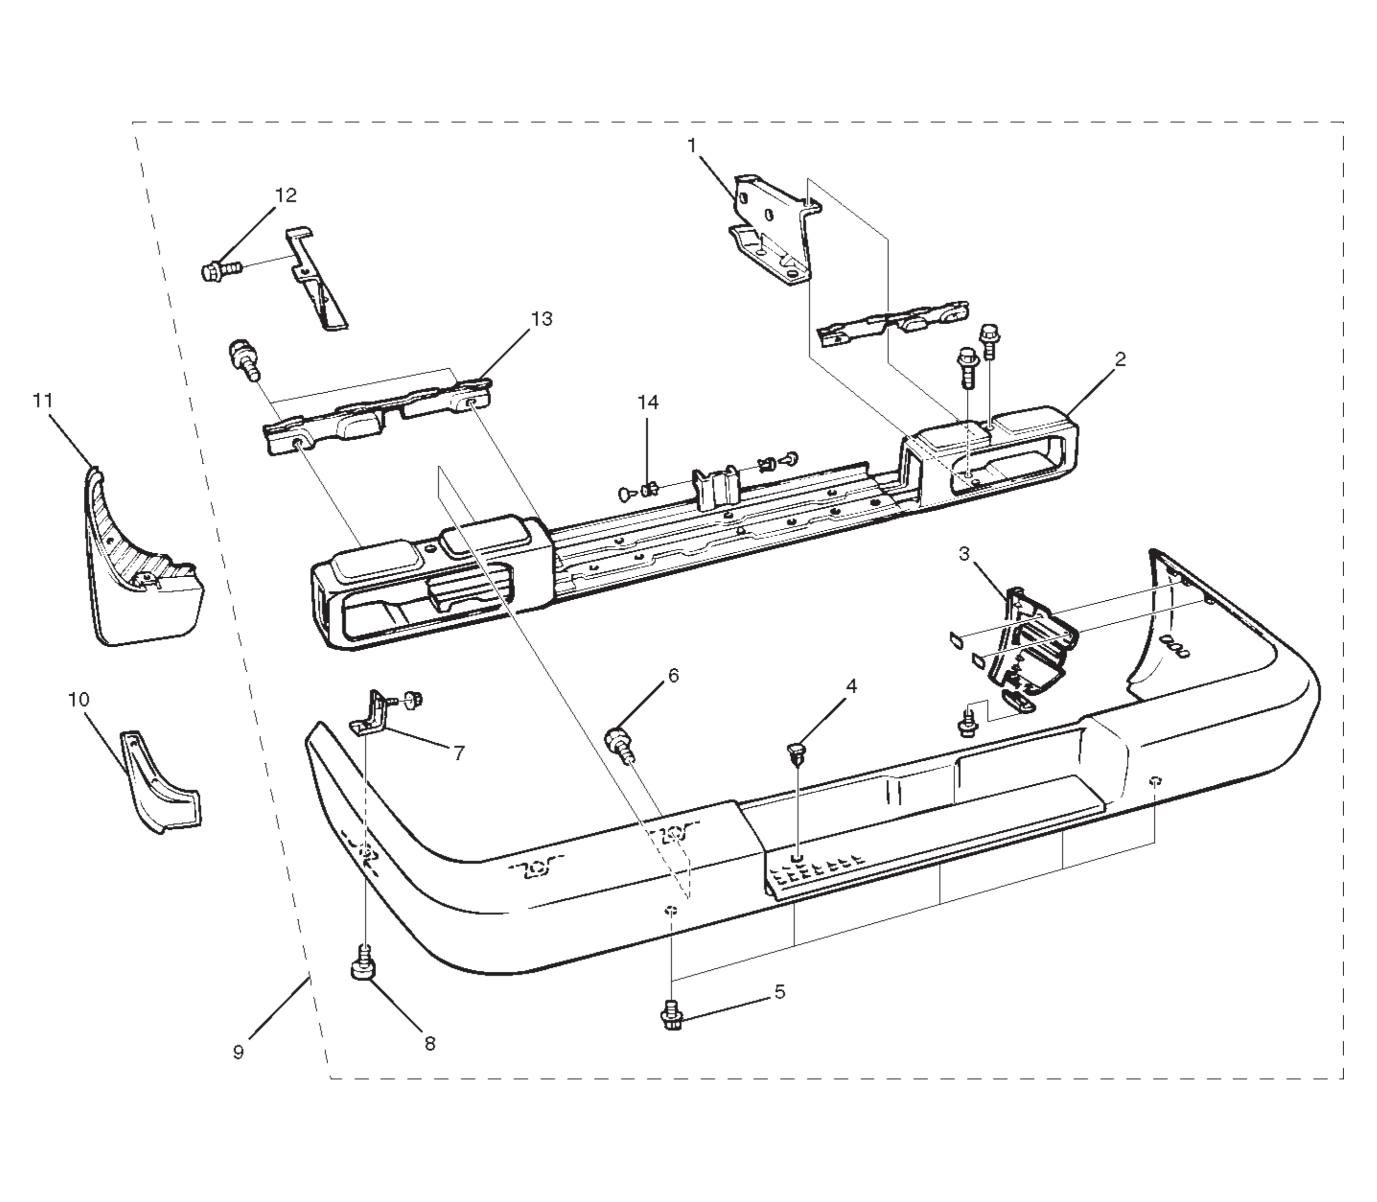
601RW003

Installation

To install, follow the removal steps in reverse order.

Rear Bumper

Parts Location



690RW001

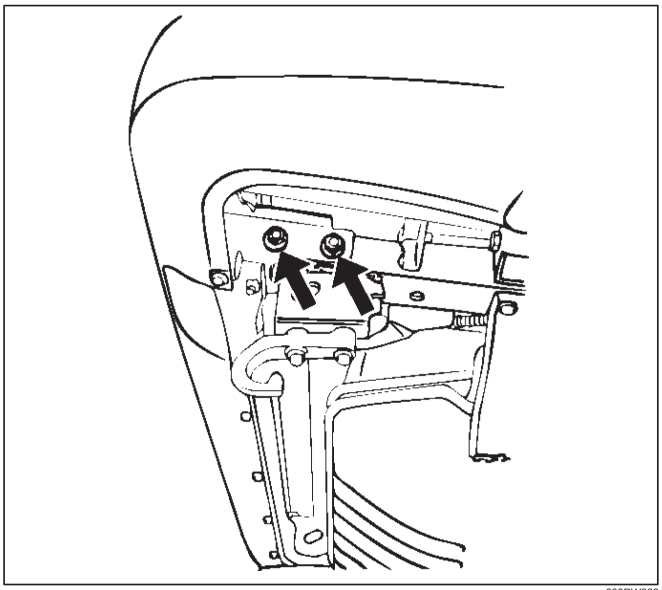
Legend

(1) Back Bars
(2) Reinforce Assembly
(3) Rear Bumper Slider Brackets
(4) Rear Step Clips
(5) Reinforce Lower Bolts
(6) Reinforce Upper Bolts
(7) Rear Bumper Fascia Brackets
(8) Rear Bumper Fascia Bracket Screws
(9) Rear Bumper Assembly
(10) Rear Bumper Side Covers
(11) Mud Flaps
(12) Rear Bumper Assembly Fixing Bolts
(13) Rear Bumper Retainers
(14) Clips

Removal

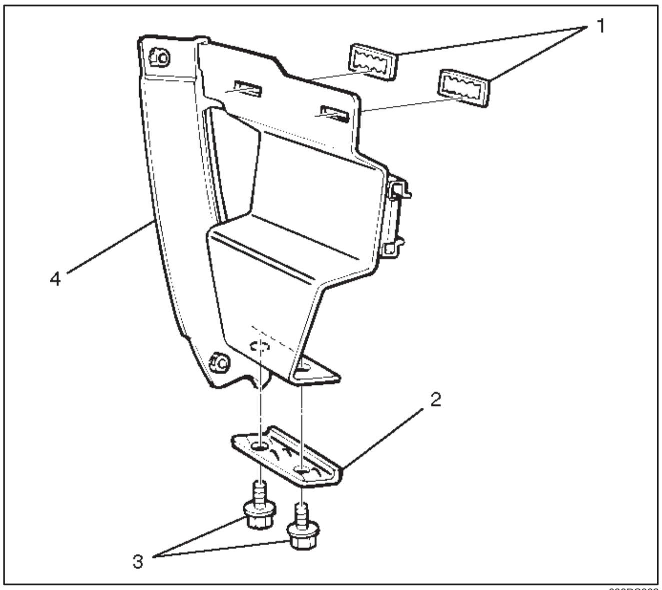
1. Remove rear bumper side covers.
2. Remove mud flaps.
   - Remove three screws.
3. Remove bumper fascia bracket screws.

4. Remove rear bumper assembly fixing bolts.
   - Remove two bolts from each side.



690RW002

5. Remove rear bumper assembly.
6. Remove rear bumper retainers.
7. Remove reinforce upper bolts.
   - Remove the rear bumper retainer from each side, and then remove two upper bolts.
8. Remove reinforce lower screws.
9. Remove clips.
10. Remove rear step clips.
11. Remove reinforce assembly.
    - Pull out both ends of the bumper fascia and take out the reinforce assembly.
12. Remove backbars.
    - Remove the three bolts from each backbar.
13. Remove rear bumper slider brackets(4).
    - Remove the two clips(1) and two screws(3), and then remove claw caught in the washer(2).



690RS003

14. Remove bumper fascia brackets.
    - Remove the fixing nut on the back side of the fender panel.

Installation

To install, follow the removal steps in reverse order noting the following points:

1. Tighten the front bumper assembly fixing bolts to the specified torque.

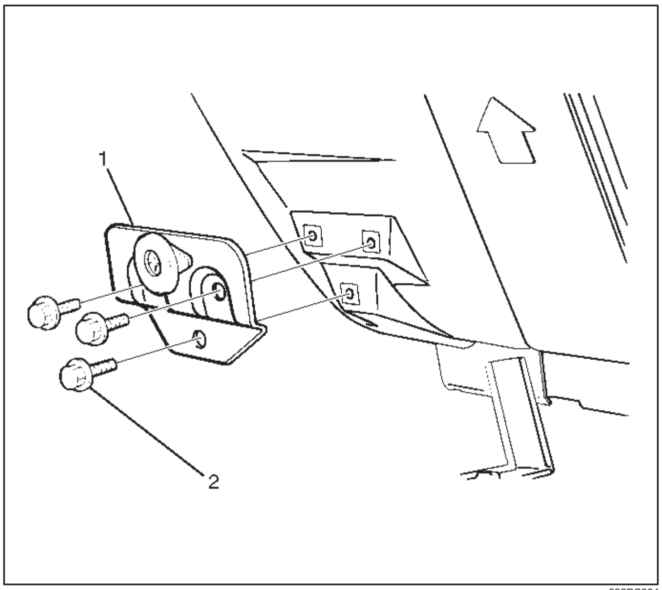
   Torque: 132 N•m (98 lb ft)

2. Apply chassis grease to the slider and the slider bracket moving surface.

Rear Bumper Slider

Removal

1. Remove the rear bumper.
   - Refer to Rear Bumper in this section.
2. Remove the three bolts (2).
3. Remove rear bumper slider (1).



690RS004

Installation

To install, follow the removal steps in reverse order noting the following points:

1. Apply chassis grease to the slider and the slider bracket moving surface.

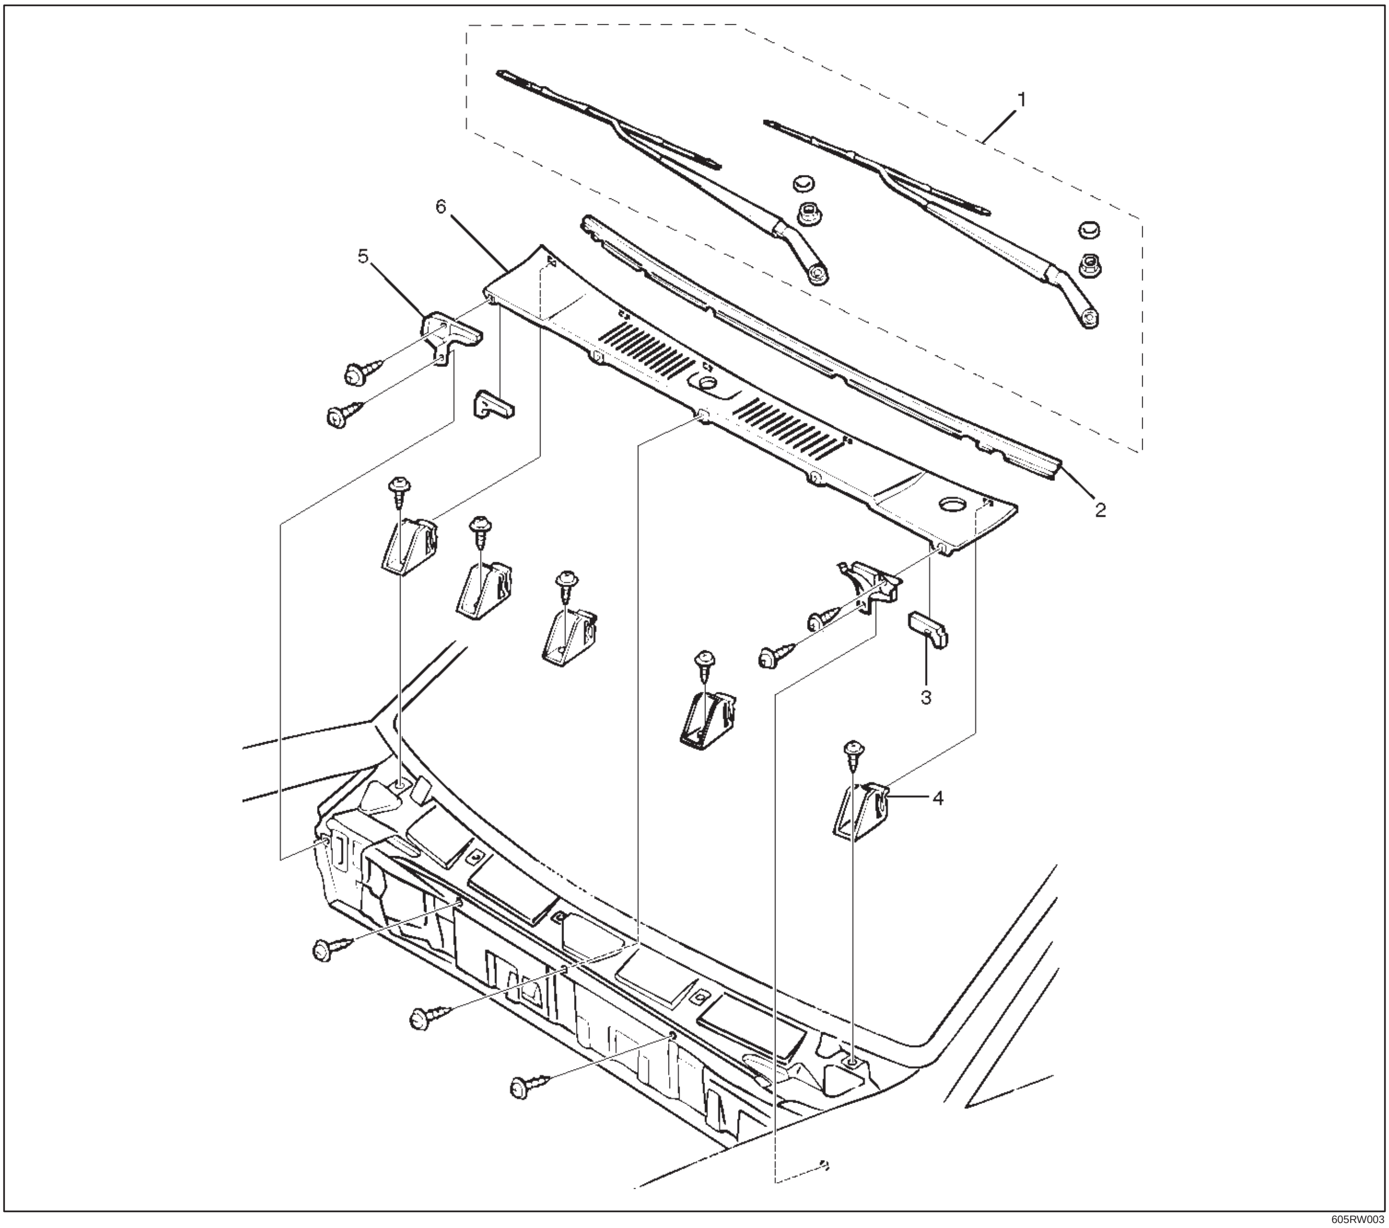
General Description

This section includes items of front end sheet metal that are attached by bolts, screws or clips and related accessory components.

Anti-corrosion materials have been applied to the interior surfaces of some metal panels to provide rust resistance. When servicing these panels, areas on which this material has been disturbed should be properly recoated with service-type anti-corrosion material.

Cowl Cover

Parts Location



Legend

(1) Front Wiper Arms
(2) Front Window Lower Molding
(3) Cowl Cover Seals
(4) Cowl Cover Stoppers
(5) Cowl Cover Brackets
(6) Cowl Cover

Removal

1. Open the hood.
2. Support the hood.
3. Remove front wiper arms.
   - Refer to Windshield Wiper Arm/Blade in Wiper/Washer System section.
4. Remove front window lower molding.

5. Remove cowl cover brackets.
   - Disconnect two screws each side.
6. Remove cowl cover.
   - Disconnect three screws.
7. Remove cowl cover seals.
8. Remove cowl cover stoppers.

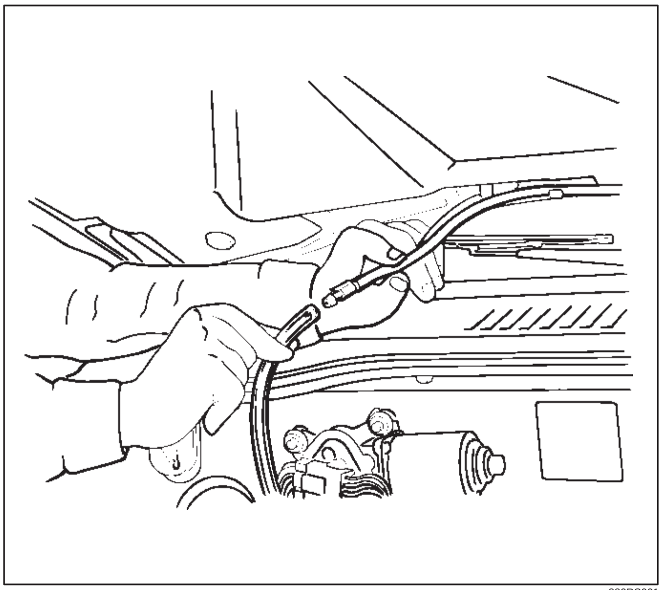
Installation

To install, follow the removal steps in reverse order.

Engine Hood

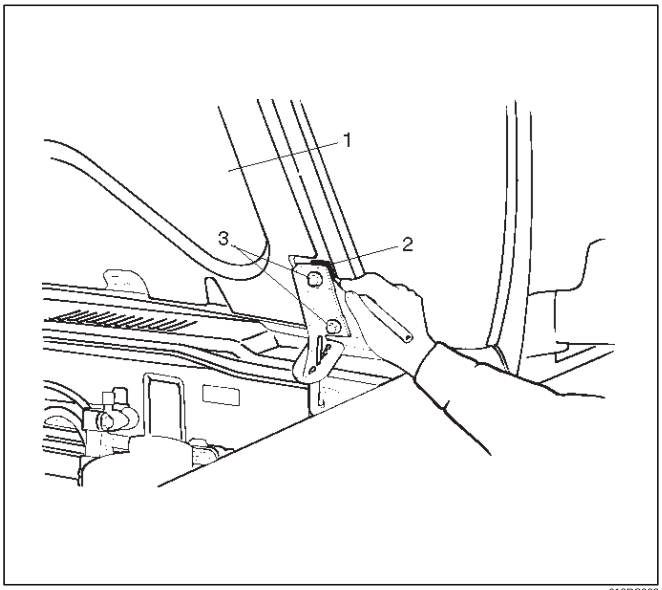
Removal

1. Open the hood.
2. Support the hood.
3. Remove windowshield washer nozzle tube.



880RS001

4. Remove hood hinge bolts (3).
   - Before removing the hinges from the Engine hood (1), scribe a mark (2) showing location of the hinges to facilitate installation in the original position.



610RS003

5. Remove engine hood.

Installation

To install, follow the removal steps in the reverse order noting the following points:

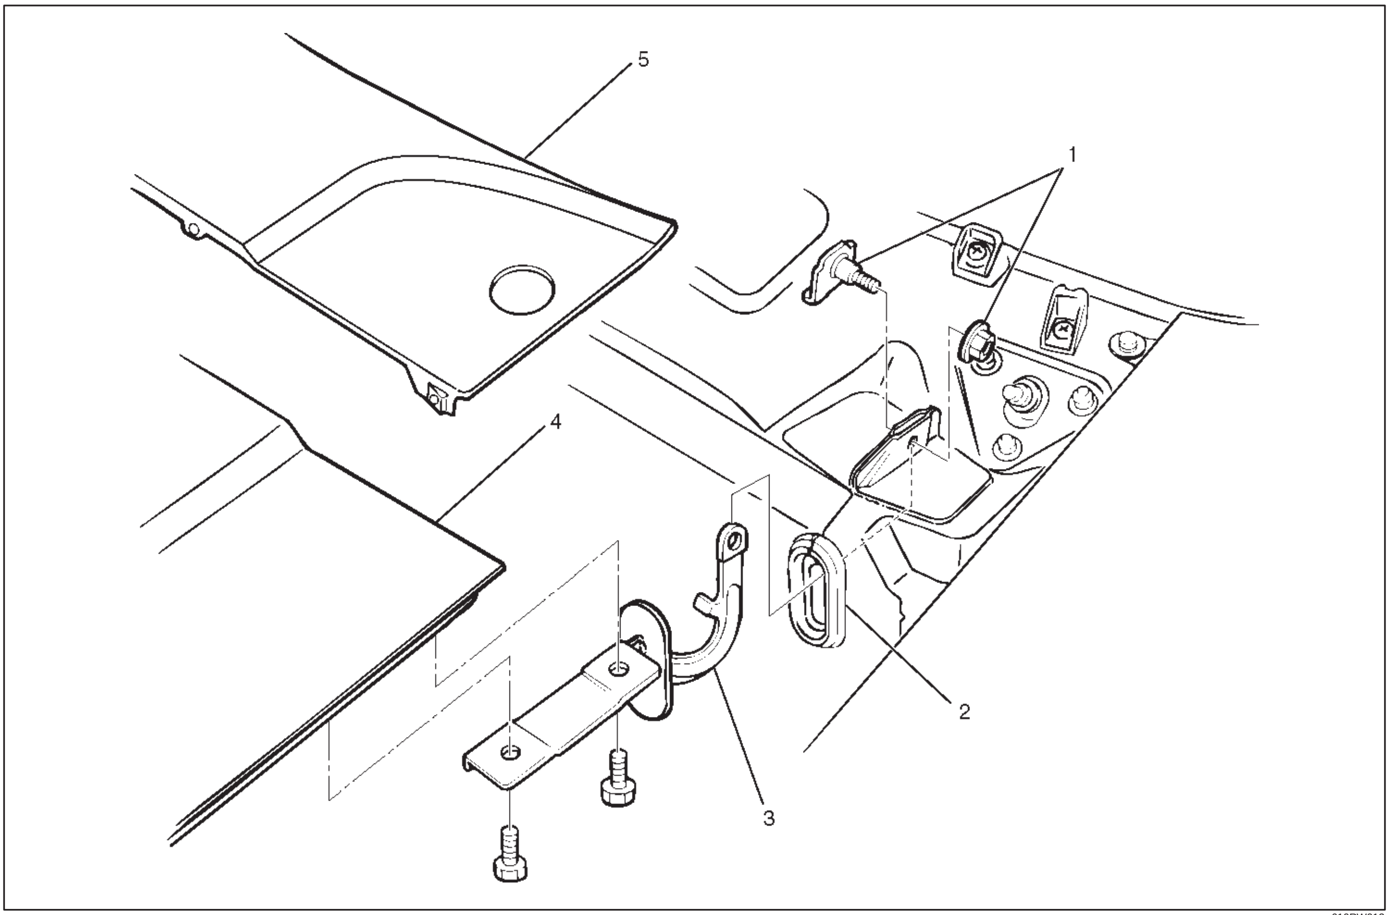
1. Tighten the engine hood fixing bolts to the specified torque.

   Torque: 13 N•m (113 lb in)

2. Adjust the engine hood mounting gap with reference to Body Dimension in this section.
3. Check and see if the engine hood lock operates normally.

Engine Hood Hinge

Parts Location



610RW012

Legend
(1) Hinge Fixing Bolts And Nuts
(2) Hood End Seal
(3) Engine Hood Hinge
(4) Engine Hood
(5) Cowl Cover

Removal

1. Remove cowl cover.
   - Refer to Cowl Cover in this section.
2. Remove engine hood.
   - Refer to Engine Hood in this section.
3. Remove hinge fixing bolt and nut.
4. Remove engine hood hinge.
5. Remove hood end seal.

Installation

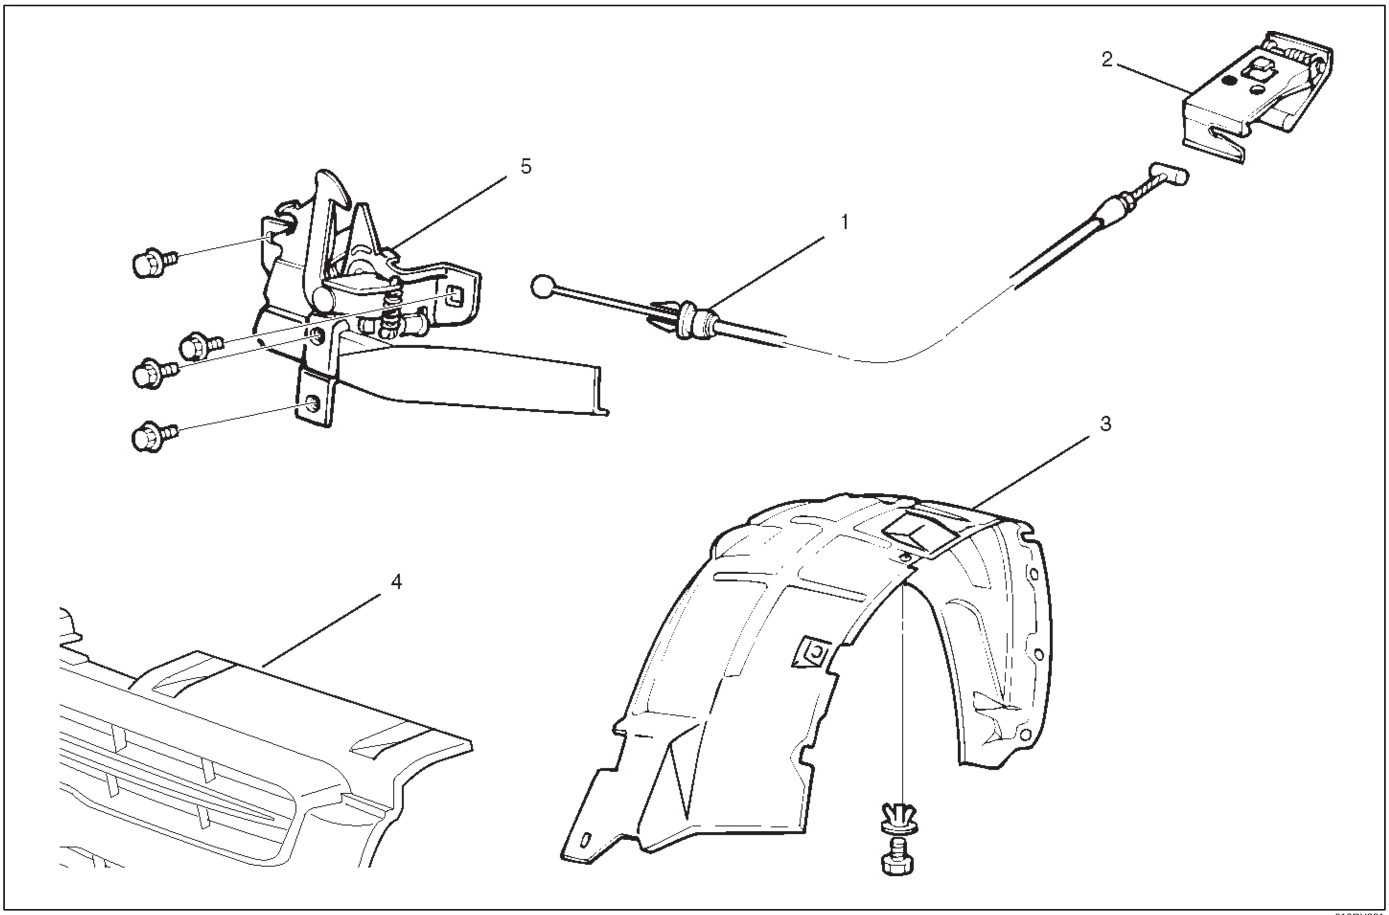
To install, follow the removal steps in reverse order noting the following points:

1. Tighten the hood hinge fixing bolt and nut to the specified torque.

   Torque 13 N•m (113 lb in)

Engine Hood Lock

Parts Location

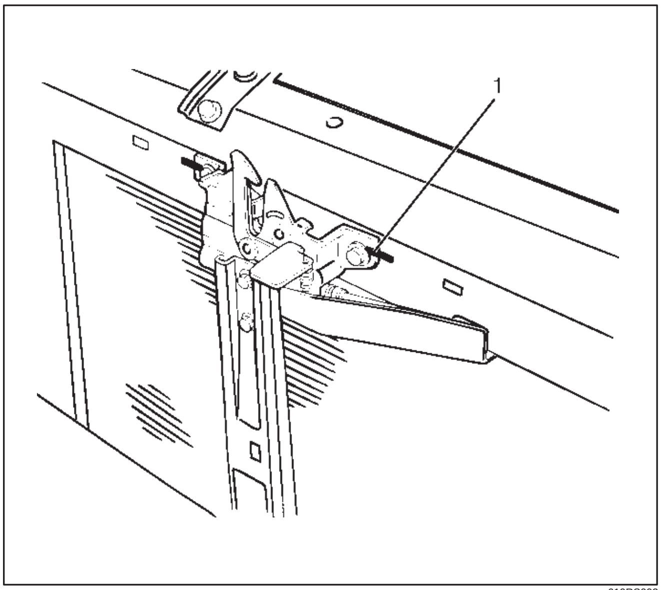


610RY001

Legend
(1) Control Cable
(2) Hood Lock Control Lever
(3) Inner Liner
(4) Radiator Grille
(5) Engine Hood Lock Assembly

Removal

1. Remove hood lock control lever.
2. Remove inner liner.
3. Remove control cable.
   - Remove the cable fixing clips from the body panel.
4. Remove radiator grille.
   - Refer to Radiator Grille And Front End Lower Panel in this section.
5. Remove engine hood lock assembly.
   - Apply setting marks (1) to the hood lock assembly and the body prior to removal.



610RS002

Installation

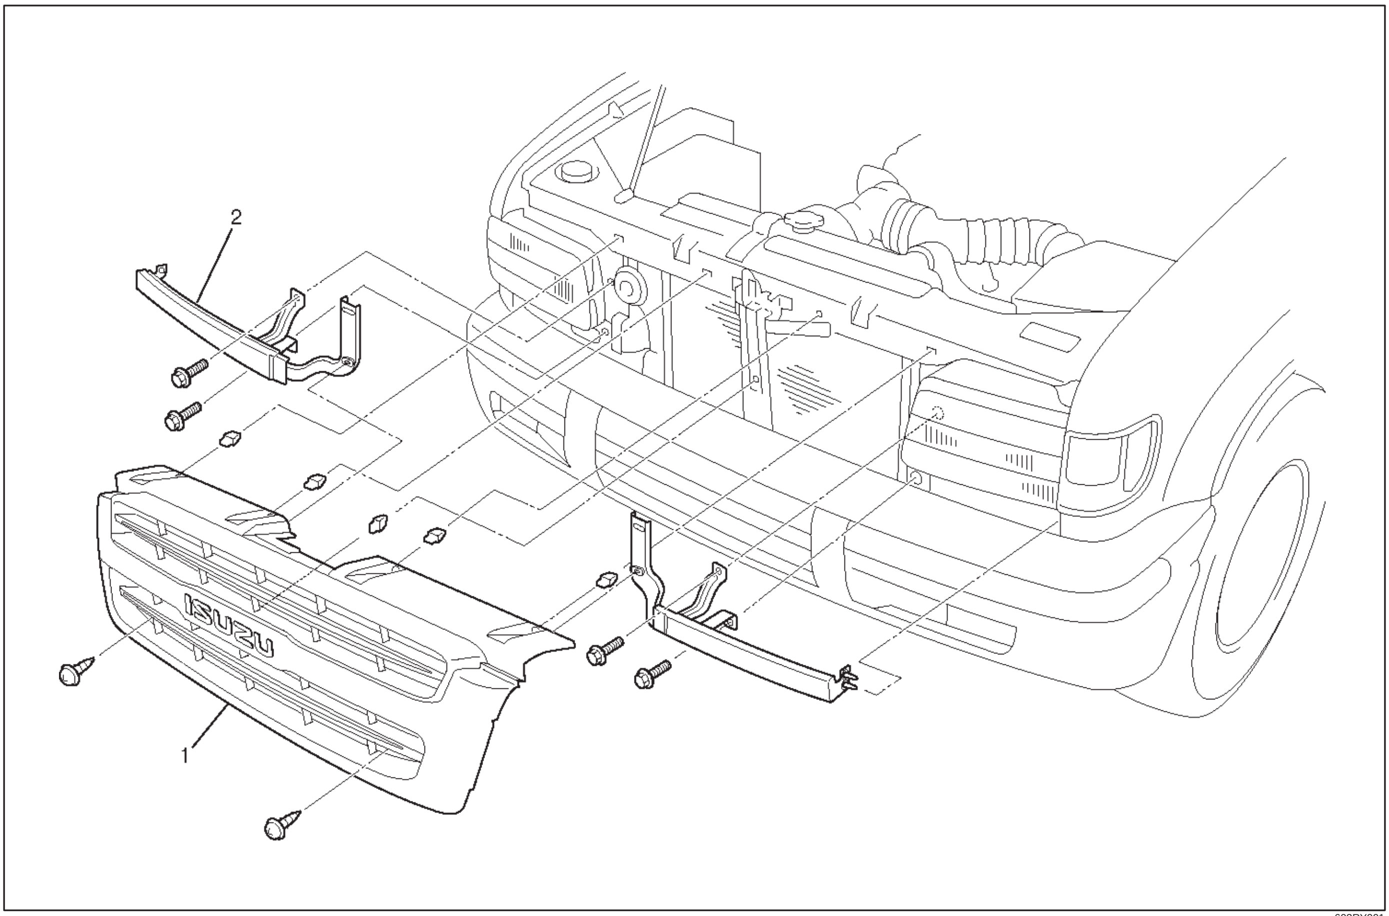
To install, follow the removal steps in reverse order noting the following points:

1. Reroute the control cable to its original position, and check and see if the lock assembly and control lever work normally.
2. Tighten the hood lock assembly fixing bolts to the specified torque.

Torque : 10 N•m (87 lb in)

Radiator Grille And Front End Lower Panel

Parts Location



603RY001

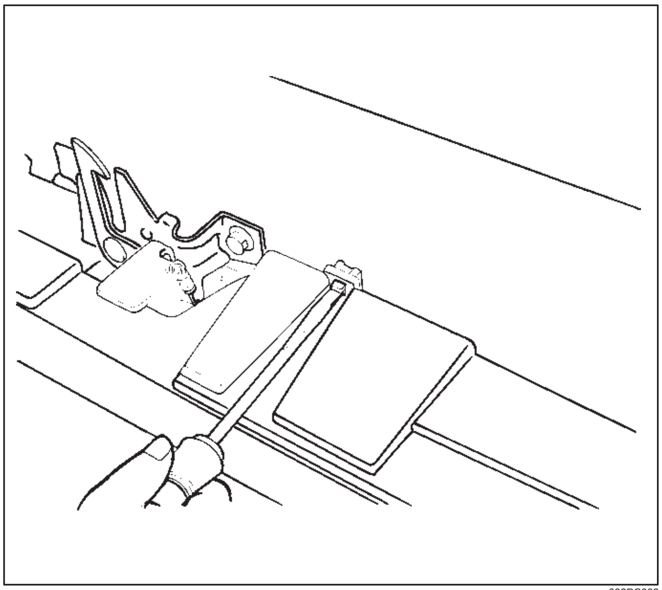
Legend

(1) Radiator Grille
(2) Front End Lower Panel

Removal

1. Open the hood.
2. Support the hood.

3. Remove radiator grille.
   - Raise the five clips on the radiator grille and remove two screws.



603RS002

4. Remove front end lower panel.
   - Remove two fixing bolts and remove the panel from the fender.

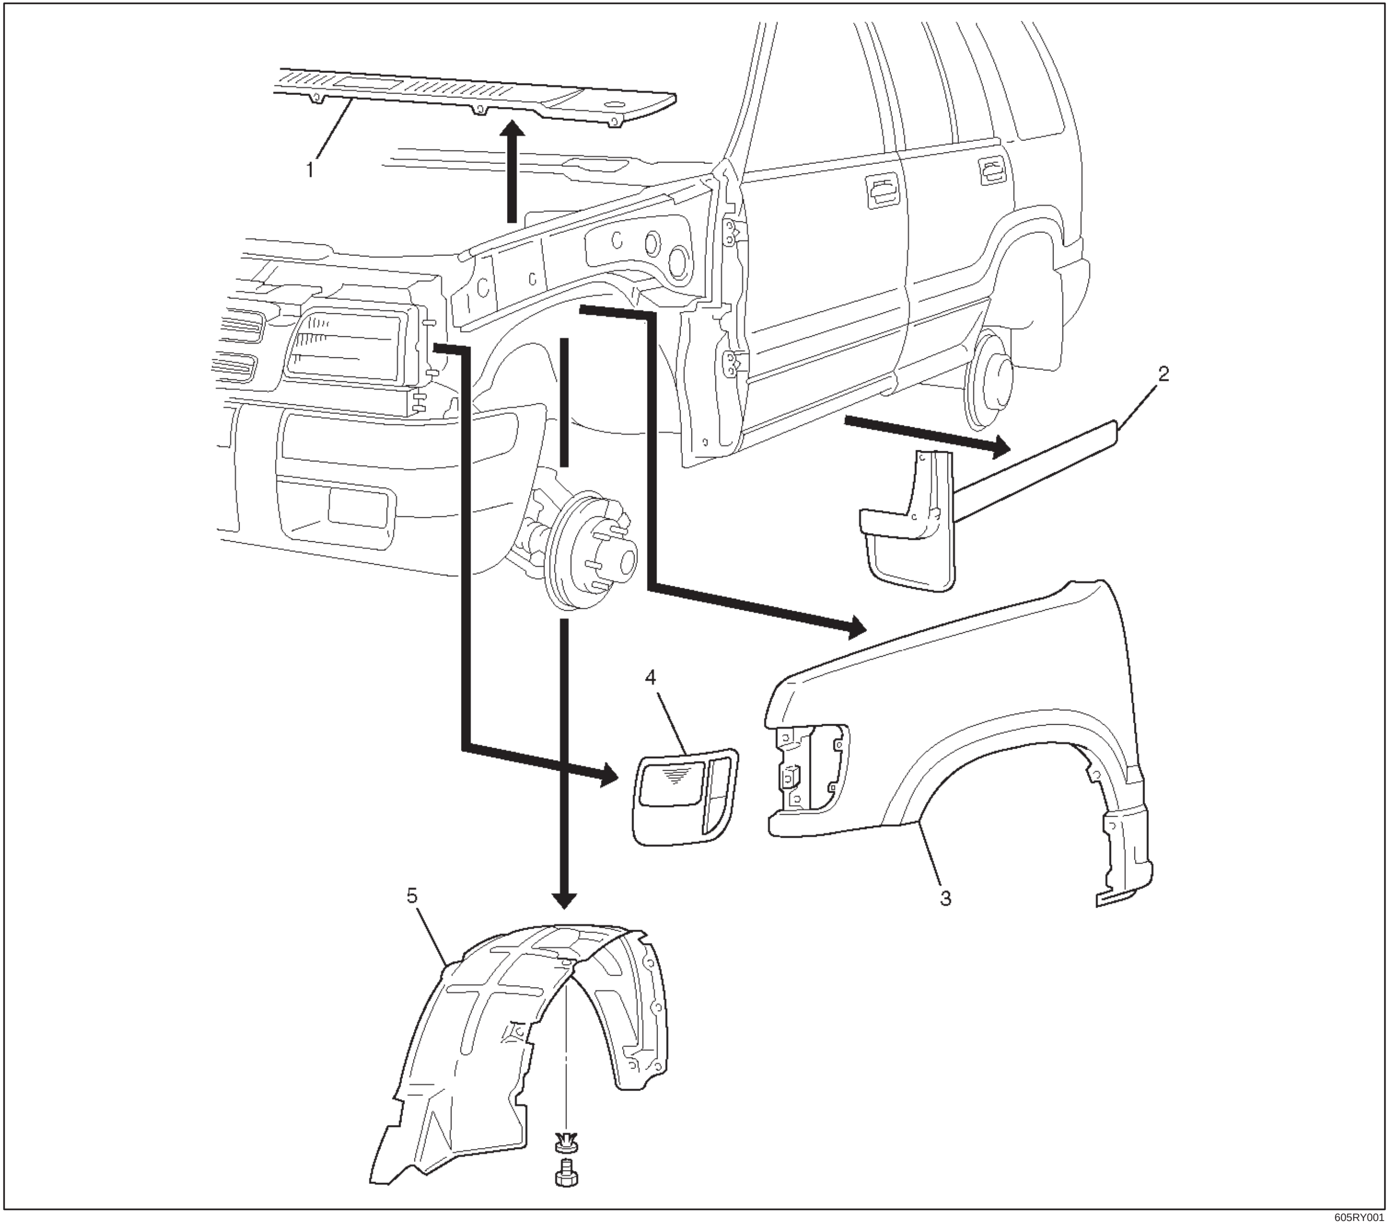
Installation

To install, follow the removal steps in reverse order, noting the following point.

1. Install the radiator grille clips remaining on the body side in the radiator grille, and then install the radiator grille on the body.

Front Fender Panel

Parts Location

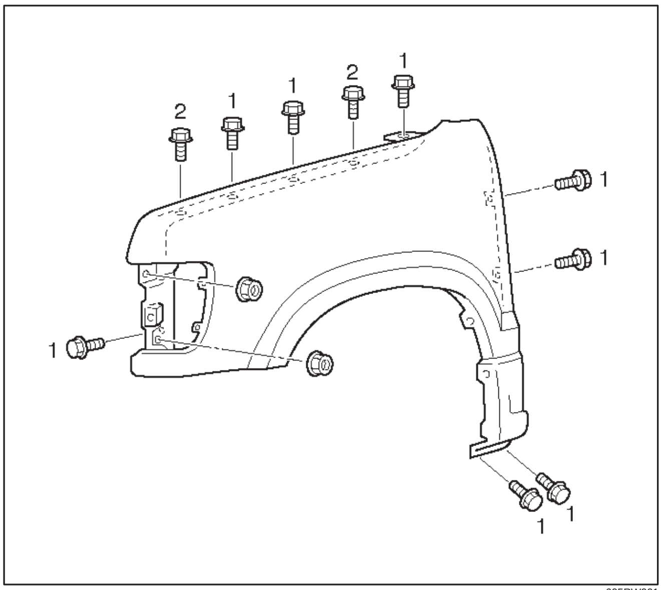


Legend
(1) Cowl Cover
(2) Front Mud Flap
(3) Front Fender Panel
(4) Front Combination Lamp Assembly
(5) Inner Liner

Removal

1. Open the hood.
2. Support the hood.
3. Remove cowl cover.
   - Refer to Cowl Cover in this section.
4. Remove front combination lamp assembly.
   - Disconnect fixing screw and connector.
5. Remove front mud flap.
   - Disconnect three fixing screws and four clips.
6. Remove inner liner.

7. Remove front fender panel.
   - Disconnect ten fixing bolts and two nuts.



605RW001

Installation

To install, follow the removal steps in the reverse order noting the following points:

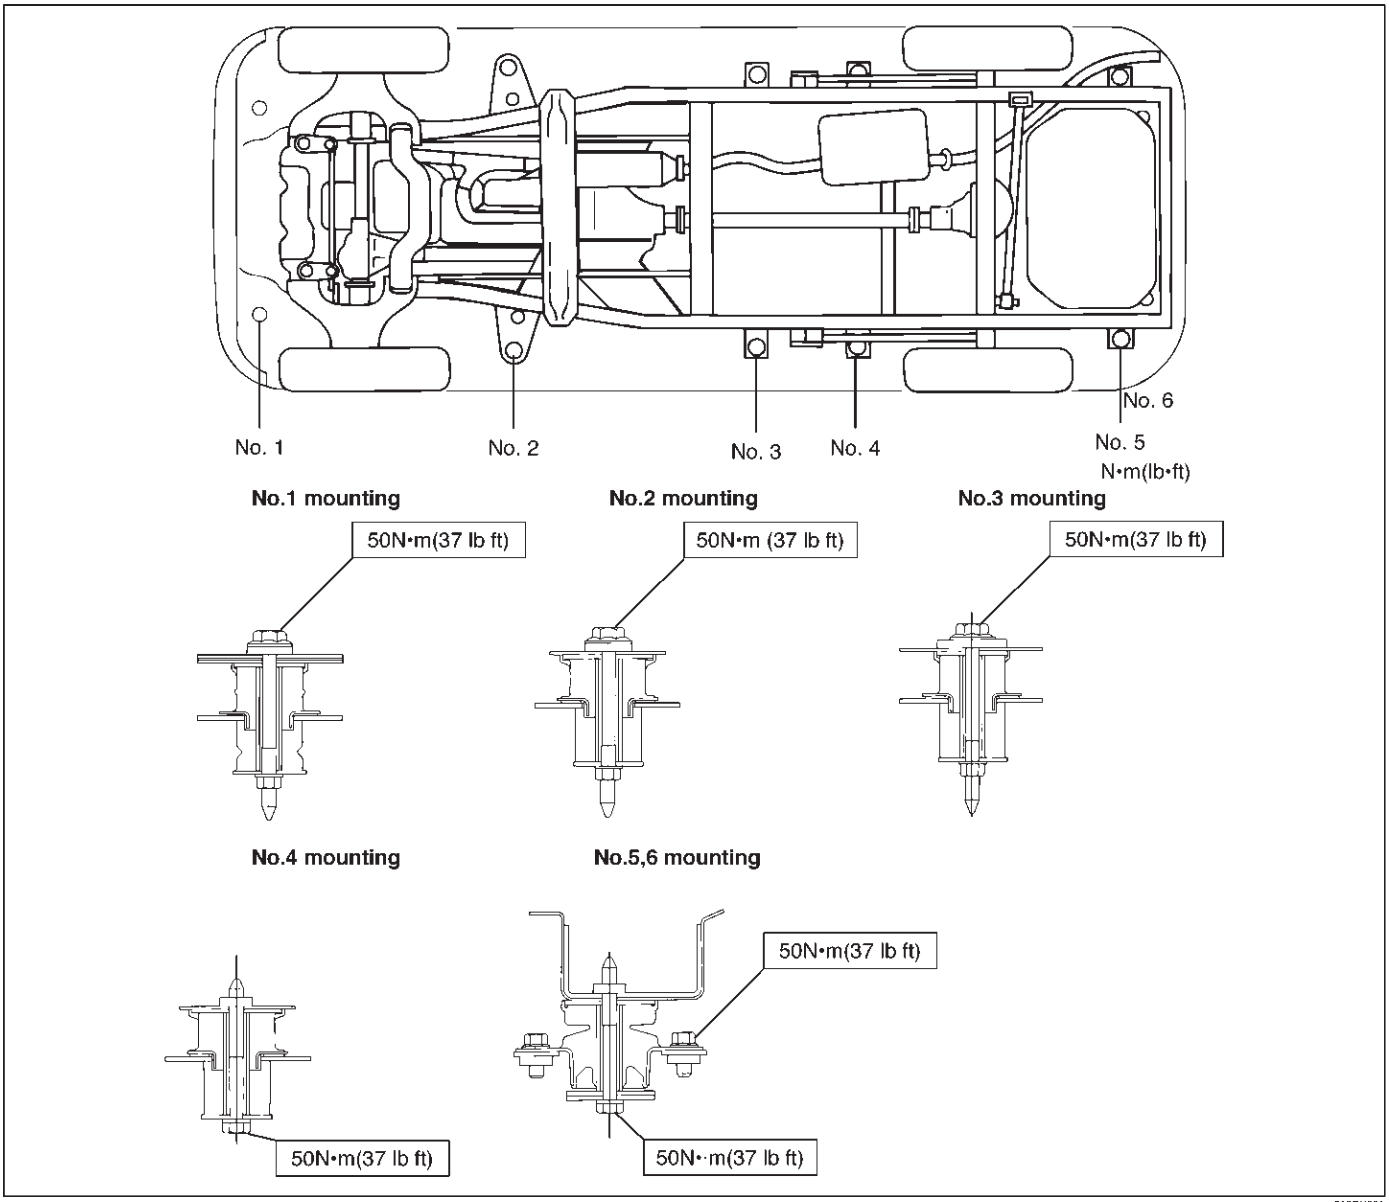
1. Tighten the front fender panel fixing bolts to the specified torque.

   (1) Torque : 9 N•m (78 lb in)

   (2) Torque : 7 N•m (61 lb in)

Body Mounting

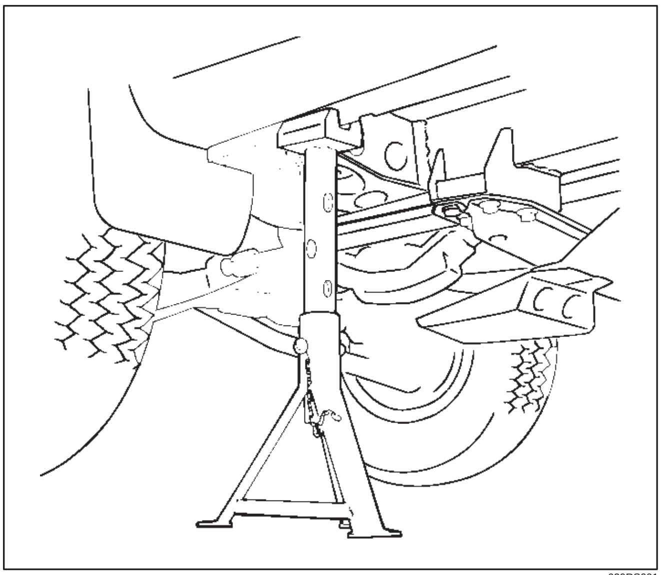
Parts Location



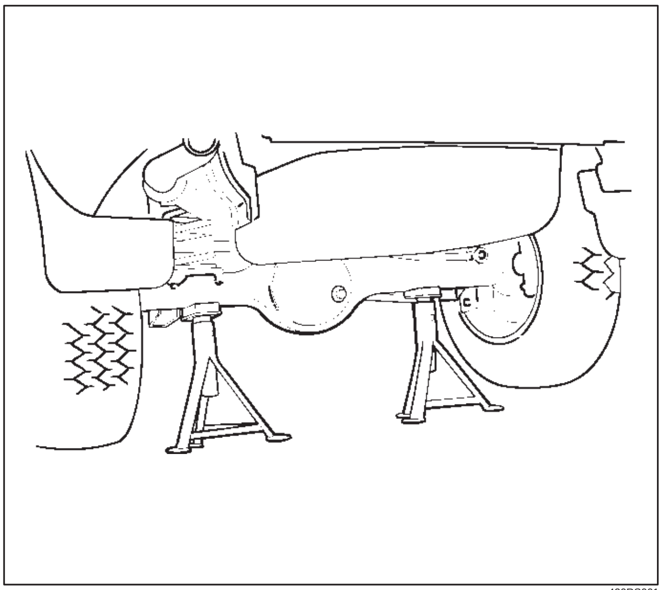
510RX001

Removal (No.1 – No. 2)

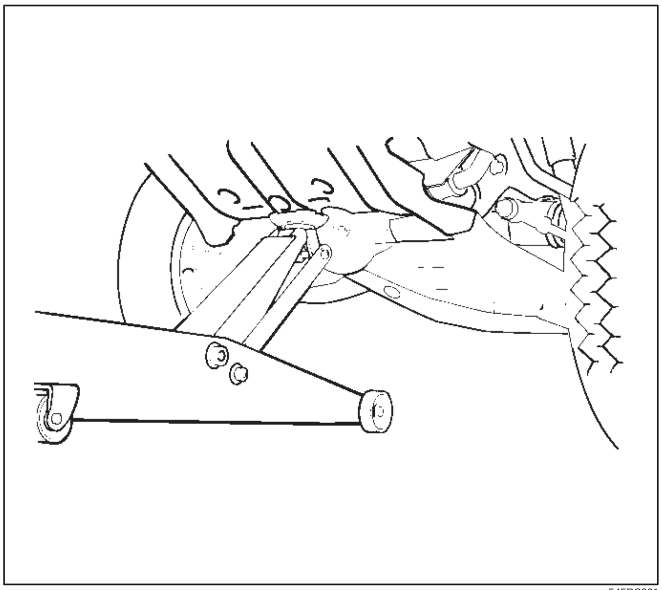
1. Remove the front bumper.
2. Jack up the vehicle by the frame.
3. Support the front side sill and rear axle with stands. Further, support the front jack up point with a jack.



620RS001

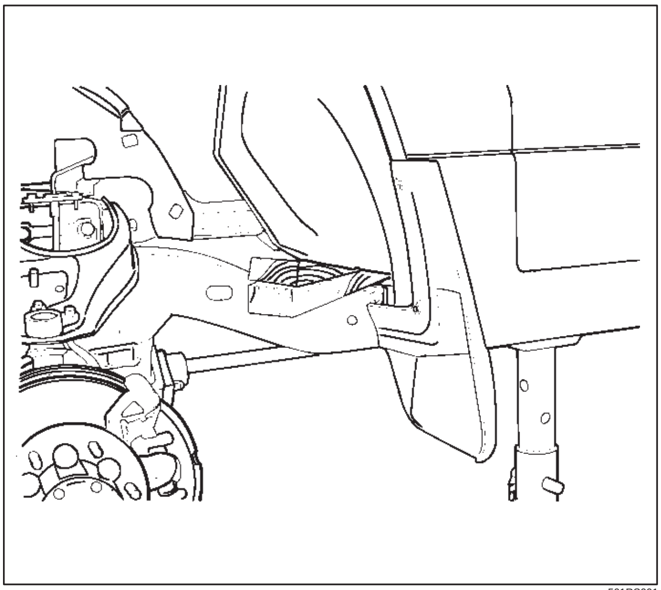


420RS001



545RS001

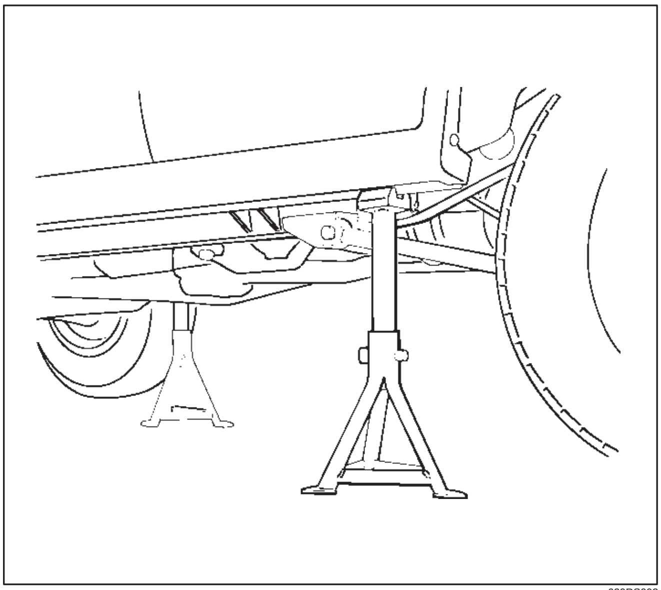
4. Remove the mounting bolts (No. 1-4) on either side.
   - No. 1 – Hold in check not to turn from the inside of the front fender.
   - No. 2 – Remove the front door sill plate and dash side trim panel, turn over the floor carpet and hold the bolt in check not to turn.
   - No. 3 – Remove the rear door sill plate and center pillar lower trim cover, turn over the floor carpet and hold the bolt in check not to turn.
   - No. 4 – Remove the bolt from under the frame.
5. Loosen the mounting bolts (No. 5-6) on either side.
6. Remove the frame side mounting and washer.
7. Gently lower the jack supporting the front axle until the cab side mounting can be removed.
8. Remove the cab side mounting.
   - Be sure to use a splice bar around the mounting to be removed.



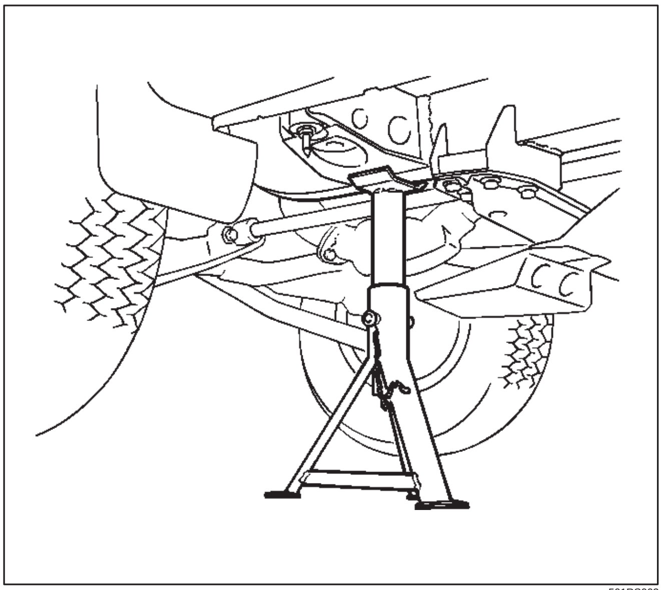
501RS001

Removal (No. 3 — No. 6)

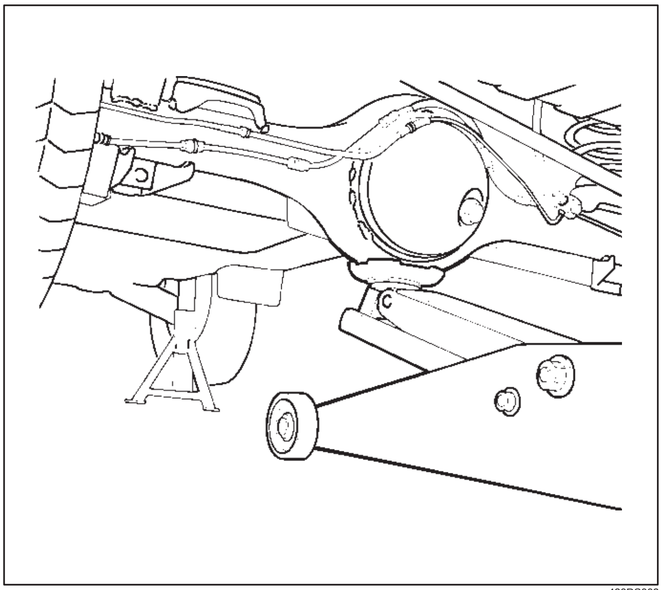
1. Remove the rear bumper.
2. Jack up the vehicle by the frame.
3. Support the rear side sill and frame stands, and support the rear axle with a jack.



620RS002

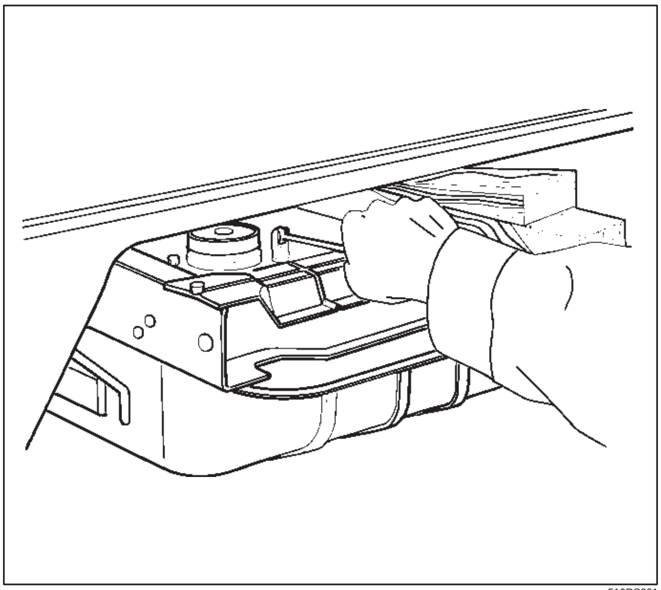


501RS003



420RS002

4. Remove the mounting bolts (No. 3-6) on either side.
   - No. 3 — Remove the rear door sill plate and center pillar lower-trim cover, turn over the floor carpet and hold the bolt in check not to turn.
   - No. 4, 5 and 6 — Remove the bolts from the lower side of the frame.
5. Remove the frame side mounting and washer.
6. Gently lower the jack supporting the rear axle until the cab side mounting can be removed.
7. Remove the cab side mounting.
   - Be sure to use a splice bar around the mounting to be removed.
   - As for No. 5 and 6, remove the frame side bracket fixing bolts after lowering the frame gently.



510RS001

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Tighten each mounting bolt to the specified torque.

   Torque : 50 N•m (37 lb ft)

General Description

This section describes major items of the removal, installation and servicing procedures pertaining to the TROOPER body. Each servicing instruction is applicable to all models of the TROOPER, unless otherwise specifically mentioned. For those differing by specific models from the common procedures, they are detailed for each model.

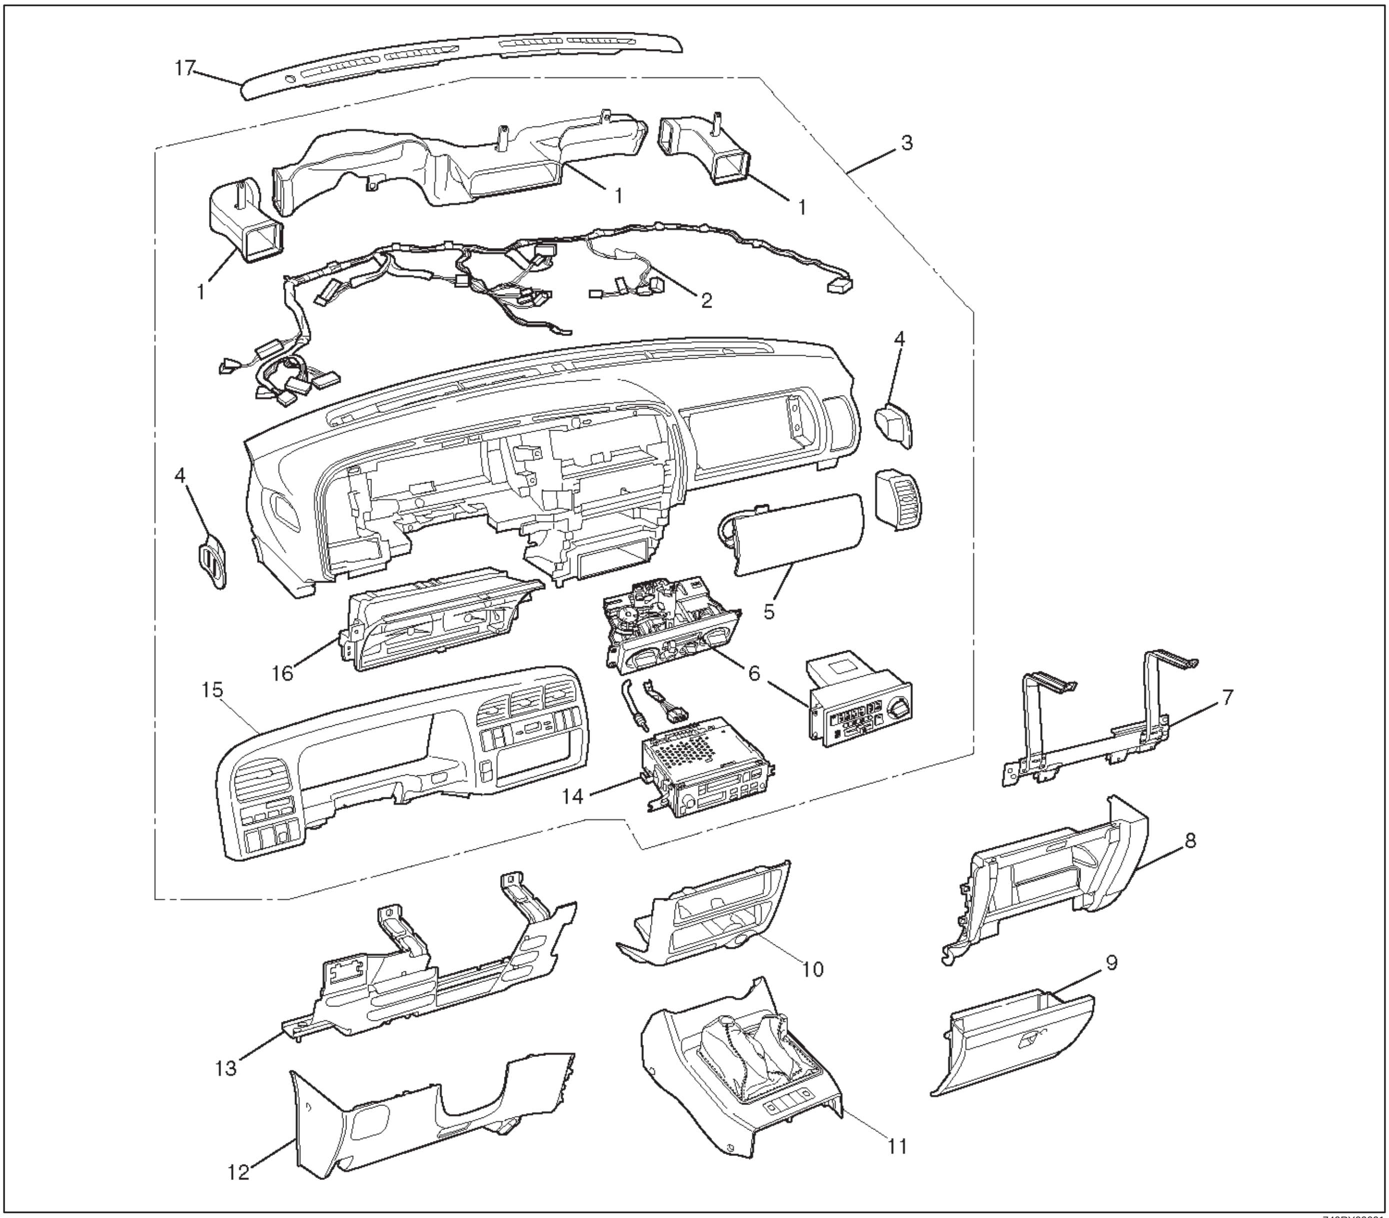
Instrument Panel Assembly

Parts Location



740RY00001

Legend

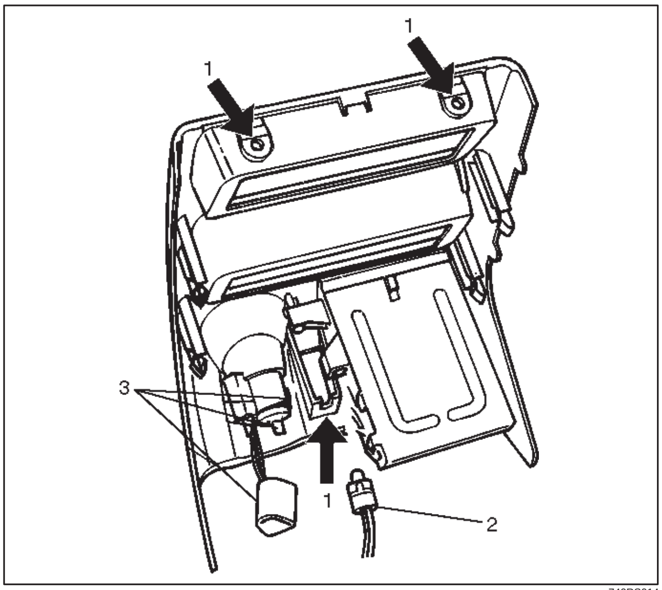
(1) Vent Duct Assembly
(2) Instrument Harness Assembly
(3) Instrument Panel Assembly
(4) Side Defroster Grille
(5) Passenger Inflator Module
(6) Control Lever Assembly / Control Panel Assembly
(7) Passenger Knee Bolster Reinforcement Assembly
(8) Instrument Panel Passenger Lower Cover Assembly
(9) Glove Box
(10) Lower Cluster Assembly
(11) Front Console Assembly
(12) Instrument Panel Driver Lower Cover Assembly
(13) Driver Knee Bolster Assembly
(14) Radio Assembly
(15) Instrument Panel Cluster Assembly
(16) Meter Assembly
(17) Front Defroster Grille

Removal

CAUTION: For precautions on installation or removal of SRS—air bag system, refer to Supplemental Restraint System (SRS) — AIR BAG in Restraint section.

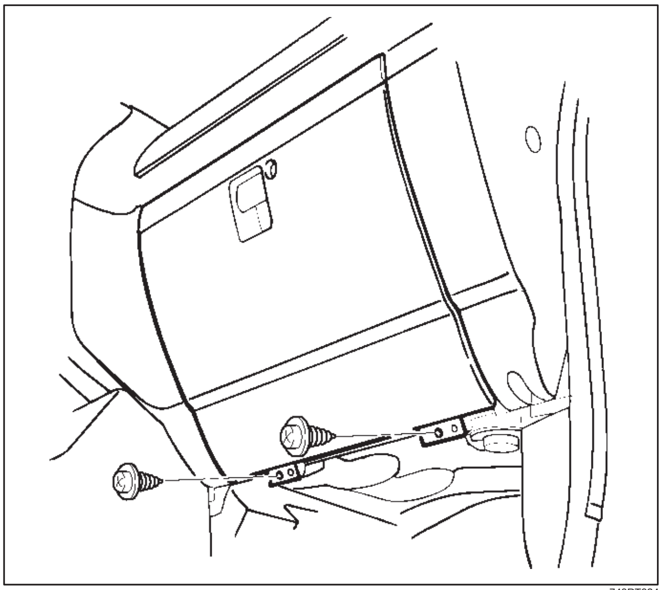
1. Disconnect the battery ground cable.

2. Remove front console assembly.
   - Remove the 4 fixing screws and disconnect the switch connectors.
3. Remove lower cluster assembly.
   - Remove the 3 fixing screws (1) in order to disconnect the cigarette lighter (3) and the illumination (2) connectors.



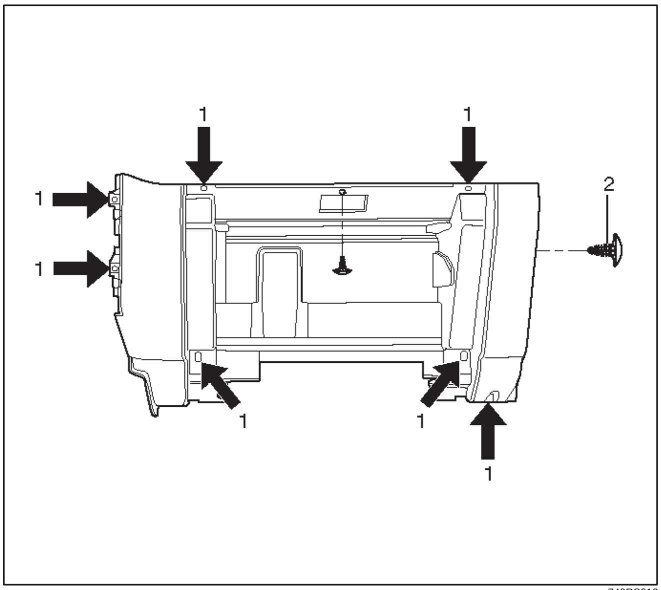
740RS014

4. Remove glove box.
   - Remove the 2 fixing screws.



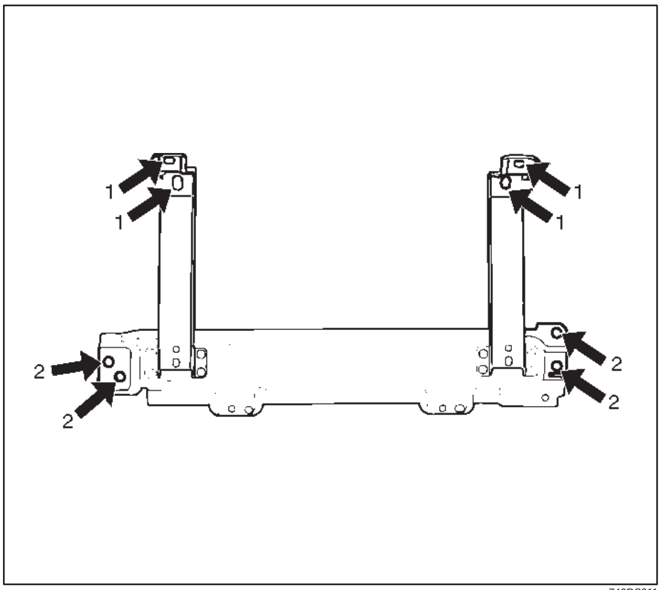
740RT024

5. Remove instrument panel passenger lower cover assembly.
   - Remove the 7 fixing screws (1) and 1 clip (2).



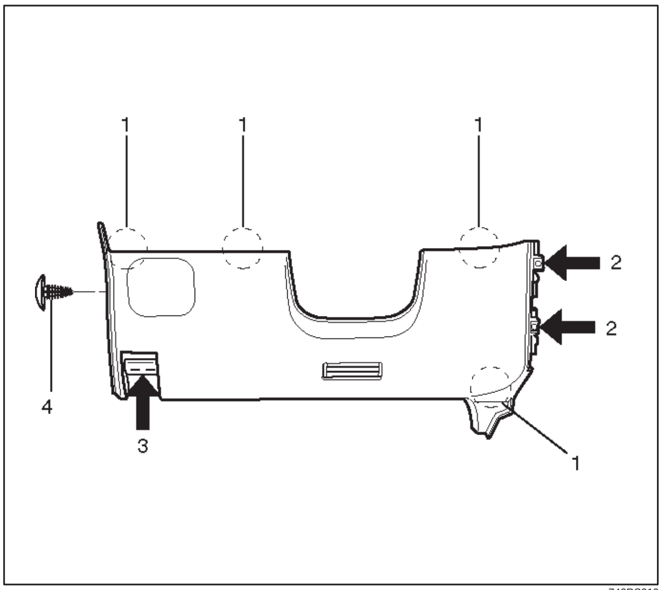
740RS012

6. Remove passenger knee bolster reinforcement assembly.
   - Remove the 4 fixing bolts (2) and 4 nuts (1).



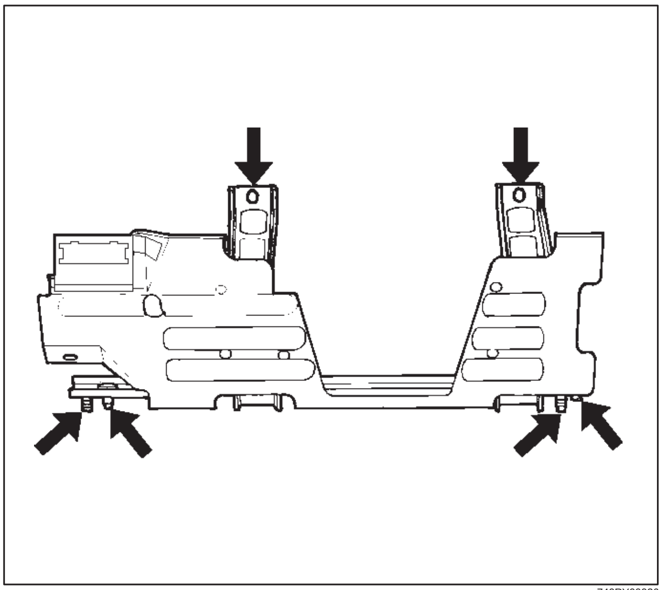
740RS011

7. Remove instrument panel driver lower cover assembly.
   - Remove the engine hood opener fixing screws.
   - Remove the 2 fixing screws (2), 1 fixing bolt (3), and 1 clip (4). Pull out the fasteners at the 4 positions (1).



740RS010

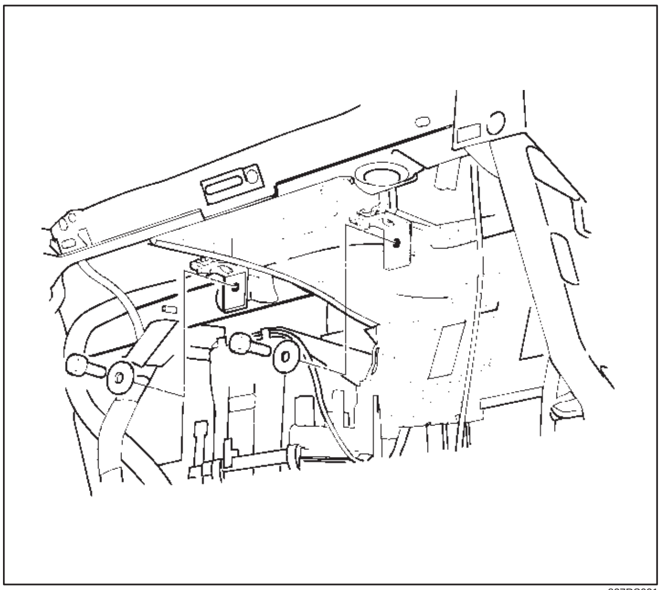
8. Remove driver knee bolster assembly.
   - Remove the 6 fixing nuts.



740RY00026

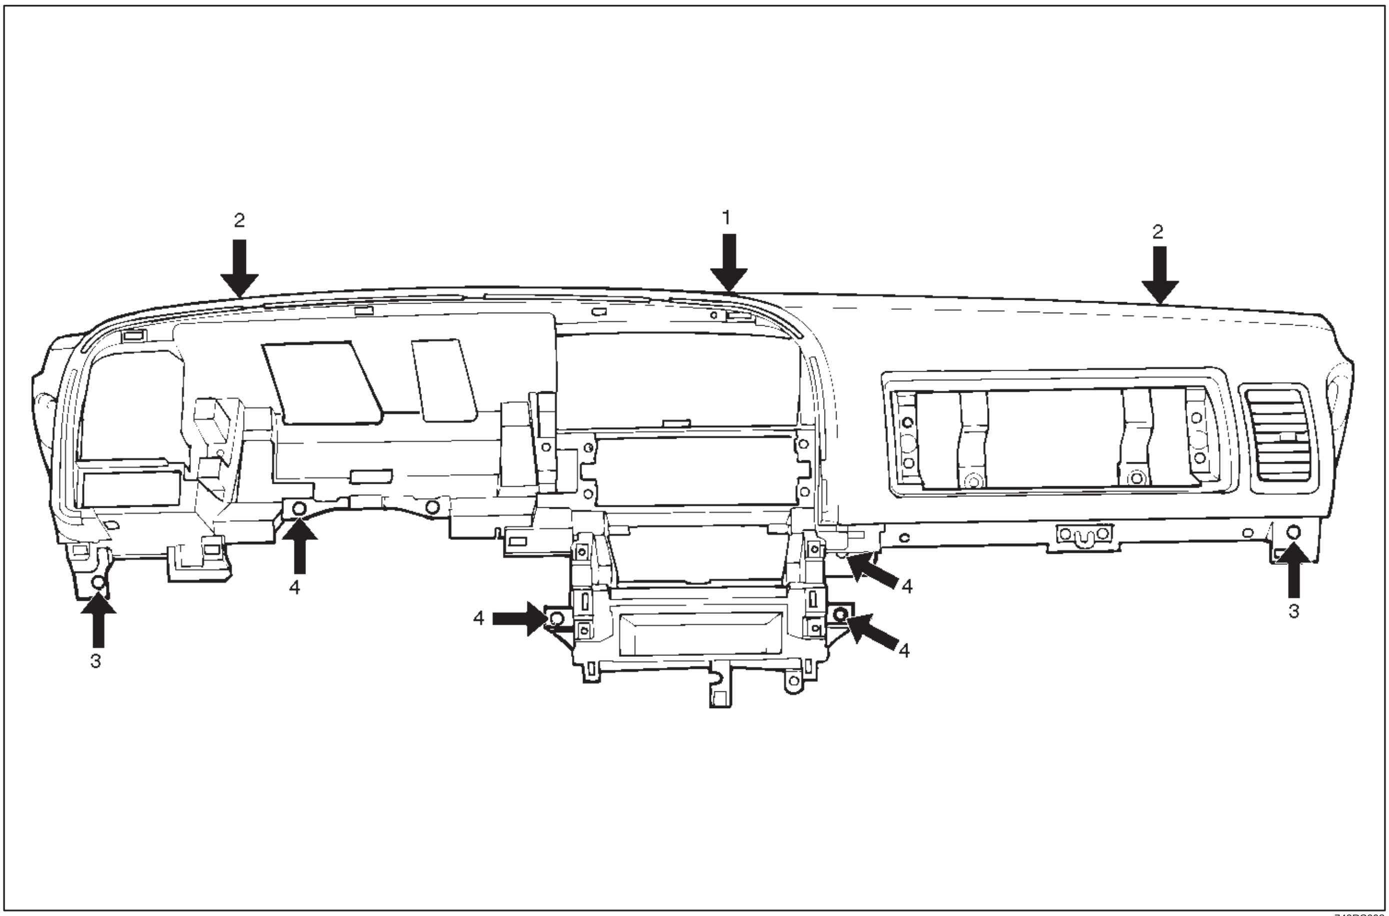
9. Remove front defroster grille.
   - Pry 8 claws on the front side toward you side (room side) and raise the grille upward.
10. Remove instrument panel assembly.
    - Remove the 2 fixing bolts on the SRS adjust bracket and the cross beam under the passenger inflator module.

CAUTION: For precautions on installation or removal of SRS — air bag system, refer to Supplemental RestraintSystem (SRS) — AIR BAG in Restraint section.



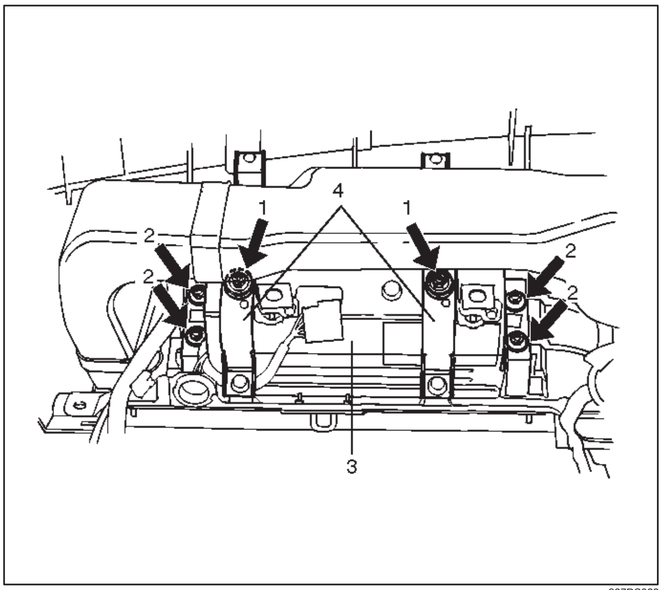
827RS021

- Disconnect the 3 air conditioner control cables on the unit side.
- Remove the instrument harness connectors (5 connectors on the drivers side and 3 connectors on the passenger side), the passenger inflator module connector, the radio antenna cable plug, and the ground cable fixing bolt on the center bracket.
- Remove the 4 bolts (4) and the 2 nuts (3) under the instrument panel assembly, and the upper left and the upper right bolts (2) and the center nut (1).



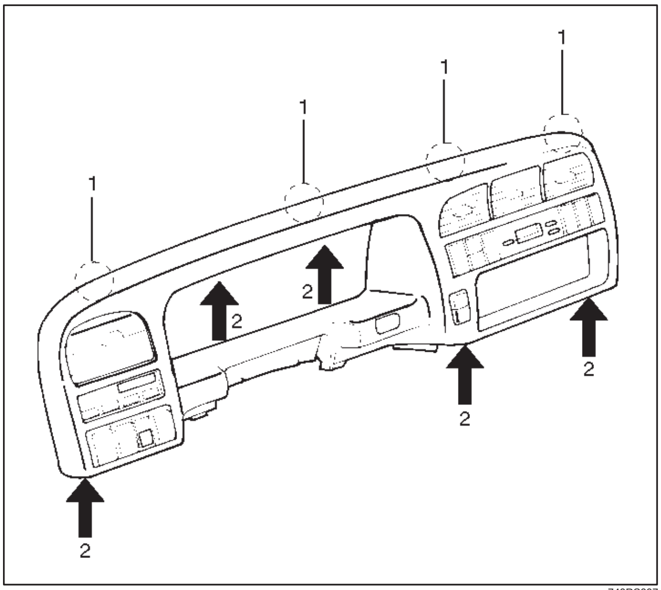
740RS008

11. Remove passenger inflator module.
   - From the back of the instrument panel, remove the 4 fixing nuts (2) on the passenger inflator module (3) and the 2 fixing nuts (1) and washers on the support bracket (4), then disengage the 2 clips in order to remove the passenger inflator module.



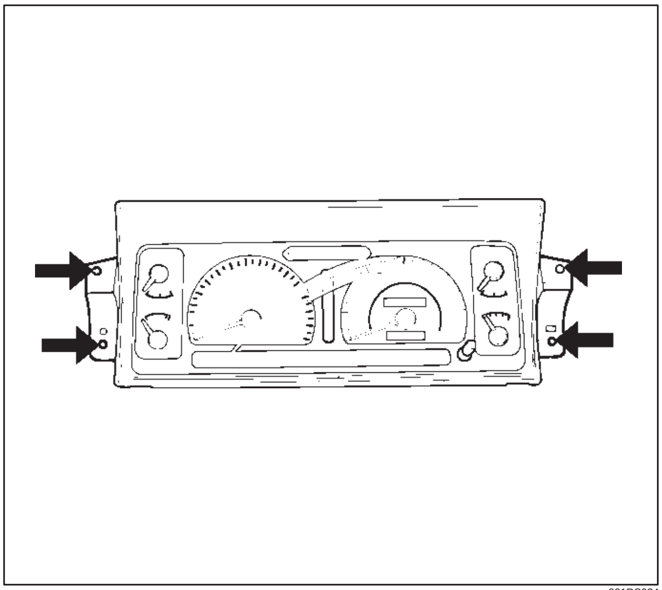
827RS022

12. Remove instrument panel cluster assembly.
   - Remove the 5 fixing screws (2) and pull the main unit toward you and remove the clips at the 4 positions (1). Disconnect the switch connectors.



740RS007

13. Remove meter assembly.
    - Remove the 4 meter assembly fixing screws and disconnect the meter harness connectors.



821RS034

14. Remove control lever assembly / control panel assembly.
    - Refer to Control Lever Assembly and / or Control Cable in HVAC section.
15. Remove radio assembly.
    - Remove 2 fixing screws.
16. Remove vent duct assembly.
    - Remove 5 fixing screws.
17. Remove instrument harness assembly.
    - Remove the 4 fixing screws, fasteners at the 4 positions and the clips at the 7 positions.
18. Remove side defroster grille.
    -

NOTE: For the order of removal steps in which each items contained in the instrument panel assembly are removed individually, refer to the chart.

Installation

To install, follow the removal steps in the reverse order.

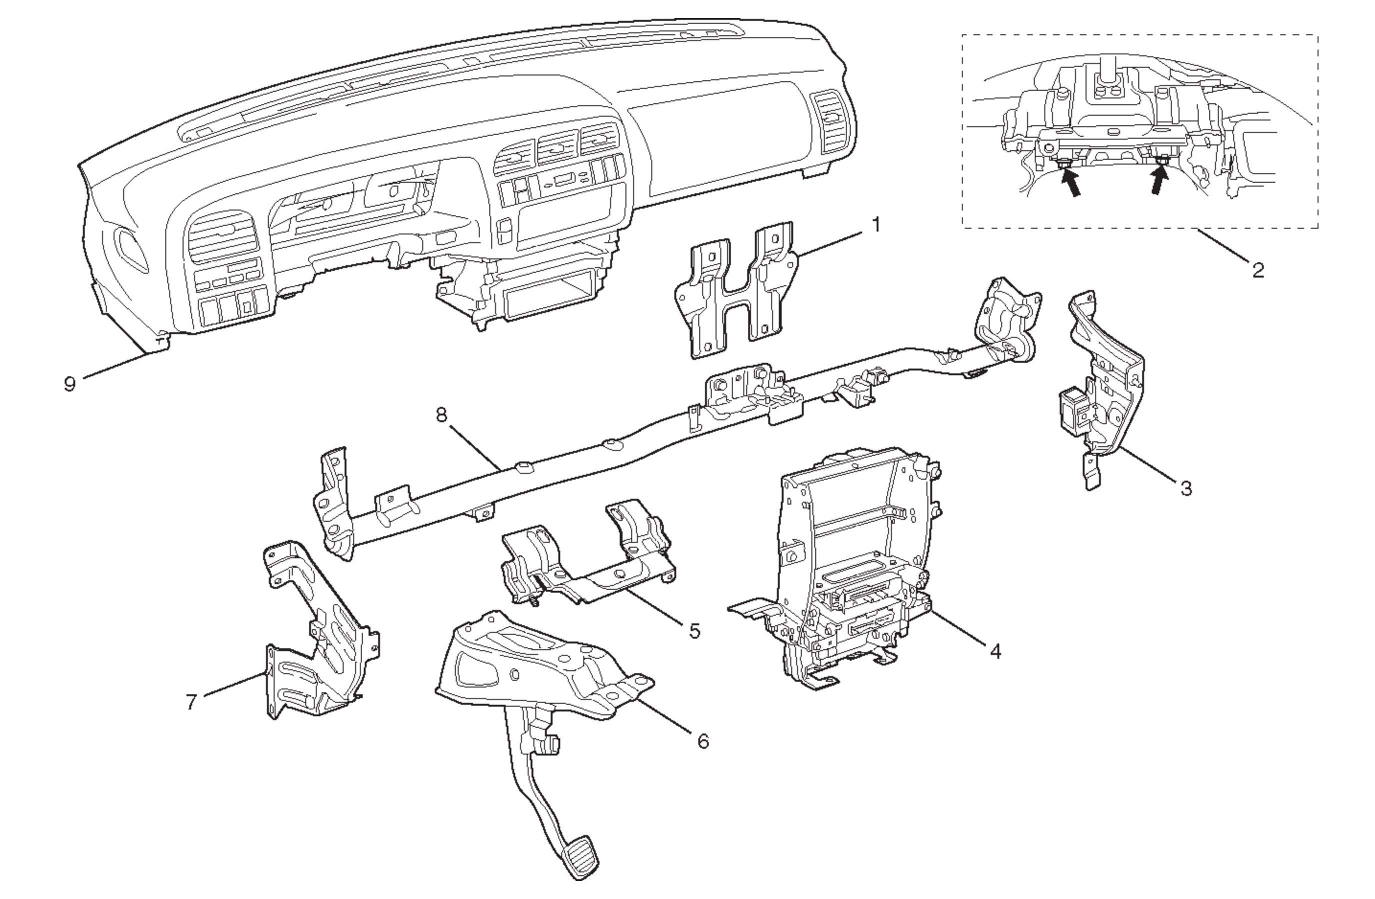
Order Of Removal/Installation Steps For Each Item

Removal Item	Removal Procedure	Removal Step
Front console assembly	Shift knob (M/T), Power & Winter SW (A/T), Transfer knob, Seat heater/Miller SW conn. and 4 screws	1, 2
Lower cluster assembly	3 screws, Ciger lighter conn. and Ashtray illumination conn.	1~3
Glove box	2 screws	4
Instrument panel passenger lower cover	7 screws and 1 clip	1~5
Passenger knee bolster reinforcement	4 nuts and 4 bolts	1~6
Instrument panel driver lower cover	Engine hood opening fixing screw, 2 screws, 1 bolt, 1 clip and fasteners at 4 positions	1~3, 7
Driver knee bolster	6 nuts	1~3, 7, 8
Front defroster grille	Claws at 8 positions	9
Instrument panel assembly	2 bolts (SRS adjust bracket~ cross beam), A/C control cable (Unit side at 3 position), Instrument harness connector (Driver side 5 position, assist side 3 position), SRS module conn., Radio antenna jack, Earth cable, 9 bolts and 3 nuts	1~10
Passenger inflator module	4 nuts (SRS module~Instrument panel), 2 nuts 0 and 2 washers (SRS module~support bracket) and 2 clips	1~6, 11
Instrument panel cluster	5 Screws, fastener at 4 position and each SW conn.	1~3, 7, 12
Meter assembly	4 screws and connectors	1~3, 7, 12, 13
A/C control panel assembly	4 screws and connectors	1~3, 7, 12, 14
Radio assembly	2 screws	1~3, 15
Vent duct assembly	5 screws	1~10, 16
Instrument harness assembly	4 screws, fasteners at 4 position, and clips at 7 position	1~10, 17
Side defroster grille		18

M/T = Manual Transmission
A/T = Automatic Transmission
SRS = Supplemental Restraint System
A/C = Air Conditioning

Cross Beam Assembly

Parts Location



740RT013

Legend

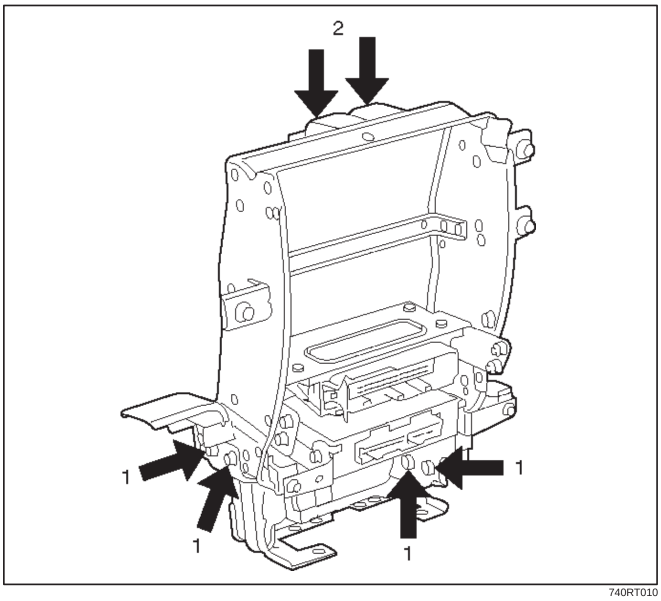
(1) Cross Beam Center Bracket
(2) Steering Column Fixing Bolts
(3) Side Support Bracket Assembly (RH)
(4) Instrument Panel Center Bracket
(5) Steering Support Bracket Assembly
(6) Brake Pedal Mounting Bracket Assembly
(7) Side Support Bracket Assembly (LH)
(8) Cross Beam Assembly
(9) Instrument Panel Assembly

Removal

1. Disconnect battery ground cable.
2. Remove instrument panel assembly.
   - Refer to Instrument Panel Assembly in this section.
3. Remove side support bracket assembly (LH/RH).
   - Remove the 4 fixing bolts on both sides.
4. Remove cross beam center bracket
   - Remove 2 fixing nuts.
5. Remove instrument panel center bracket.
   - Disconnect the PCM and EBCM connector.
   - Remove the DERM (SRS) with 3 fixing nuts.

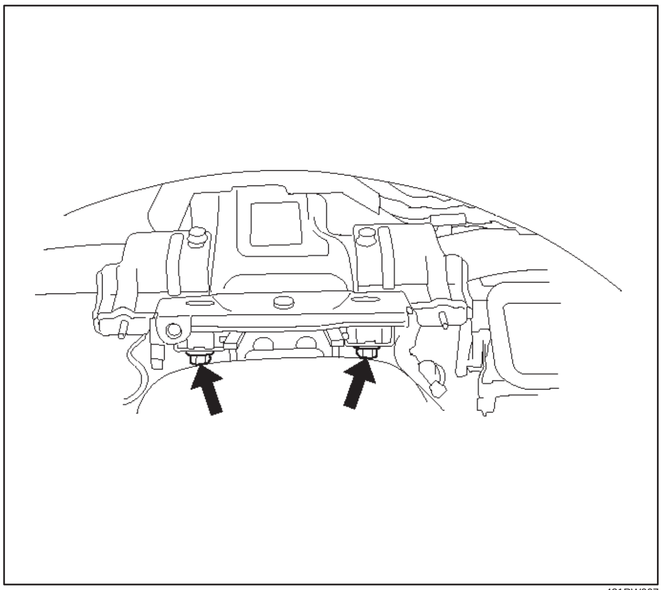
CAUTION: For precautions on installation or removal of SRS — air bag system, refer to Supplemental Restraint System (SRS) — AIR BAG in Restraint section.

- Remove the 2 fixing nuts (upper) and the 4 fixing bolts (lower).



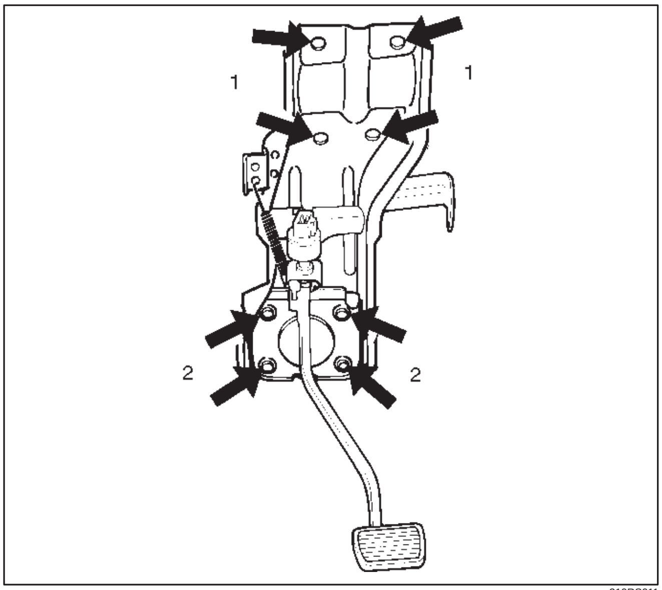
740RT010

6. Remove steering column fixing bolts.
   - Remove 2 fixing bolts.



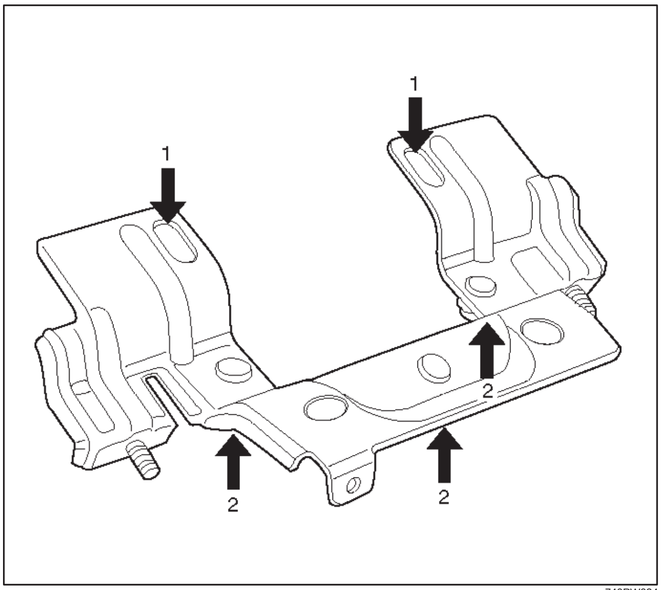
431RW007

7. Remove brake pedal mounting bracket assembly.
   - Disconnect the 2 brake pedal mounting bracket assembly fixing nuts, and remove the antitheft controller.
   - Disconnect the brake pedal link and the brake switch, and remove the 4 fixing bolts and the nuts on the bracket.



310RS011

8. Remove steering support bracket assembly.
   - Remove the 2 fixing bolts (upper side) (1) and the 3 fixing nuts (lower side) (2).



740RW024

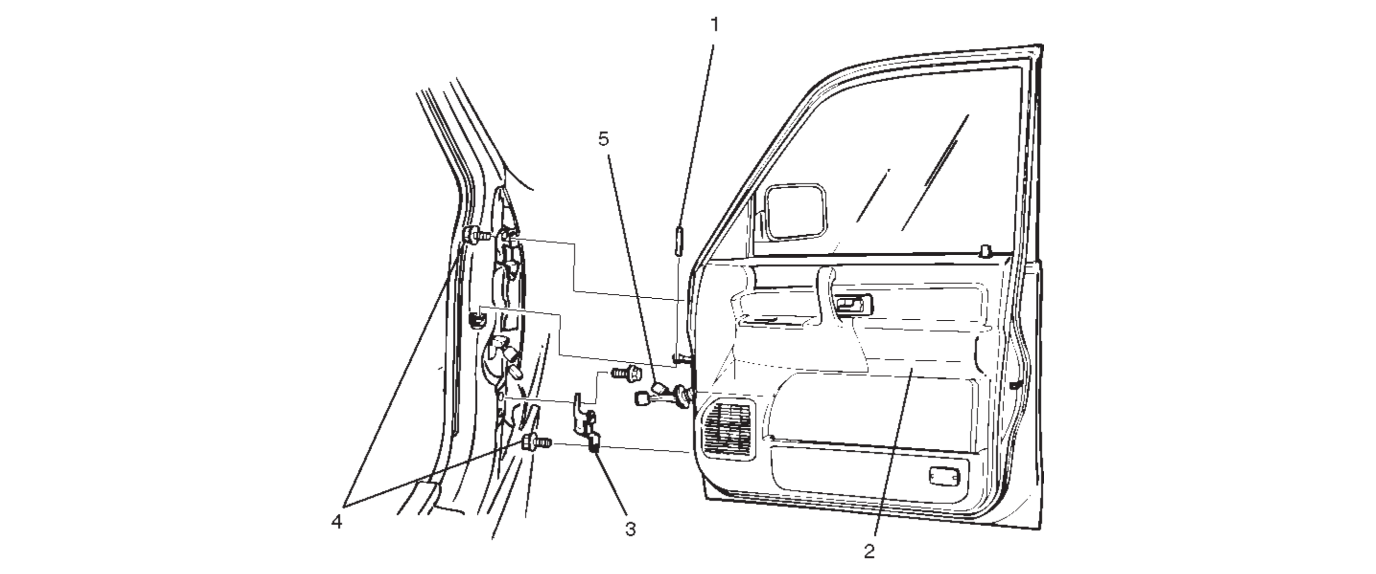
9. Remove cross beam assembly.
   - Disconnect the harness clips from the crossbeam assembly, and remove 2 fixing bolts on both sides and 2 fixing nuts in the center.

Installation

To install, follow the removal steps in the reverse order.

Front Door Assembly

Parts Location



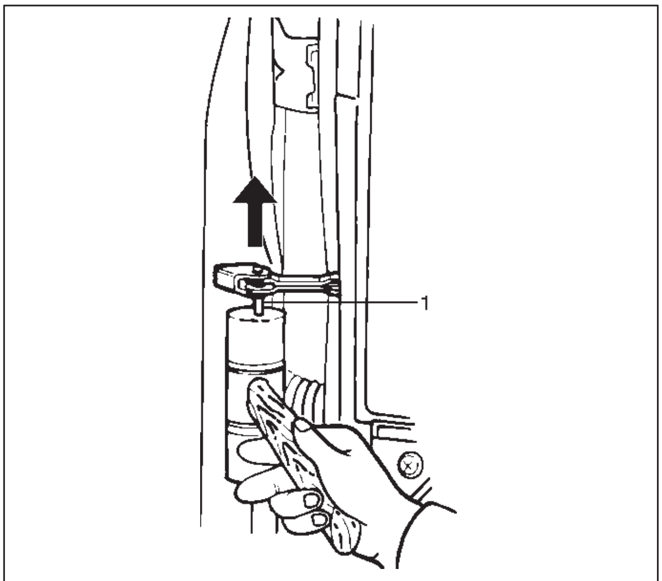
630RS001

Legend

(1) Door Check Arm Pin
(2) Front Door Assembly
(3) Door Hinge Assembly
(4) Hinge Bolt
(5) Door Harness Connection

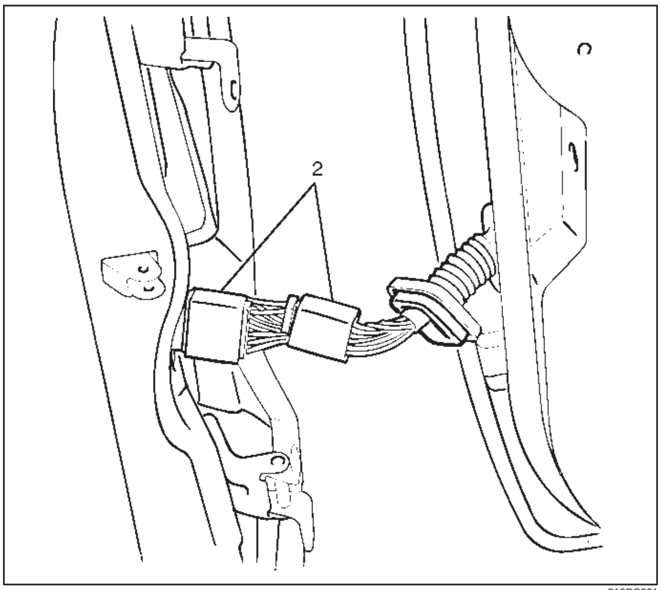
Removal

1. Disconnect the battery ground cable.
2. Remove door check arm pin (1).



630RS002

3. Remove hinge bolt.
   - Align the hinge bolt to the door side hinge and put a marker on it.
4. Remove door harness connection (2).
   - Pull the door harness grommet out in order to disconnect the harness connection.



810RS001

5. Remove front door assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

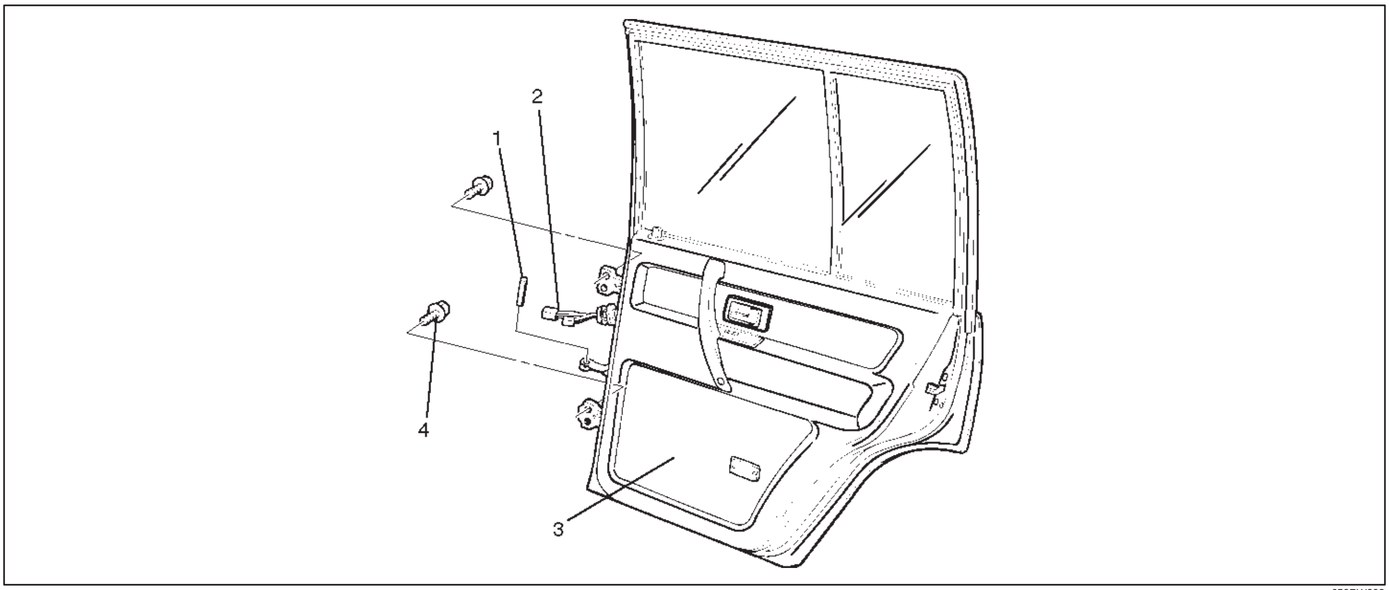
1. Align the door fitting to the body by referring to Body Dimensions in this section.
2. Tighten the door hinge bolts to the specified torque.

   Torque : 34 N•m (25 lb ft)

3. Apply chassis grease to the door check arm pin and the door hinge moving surface.

Rear Door Assembly

Parts Location



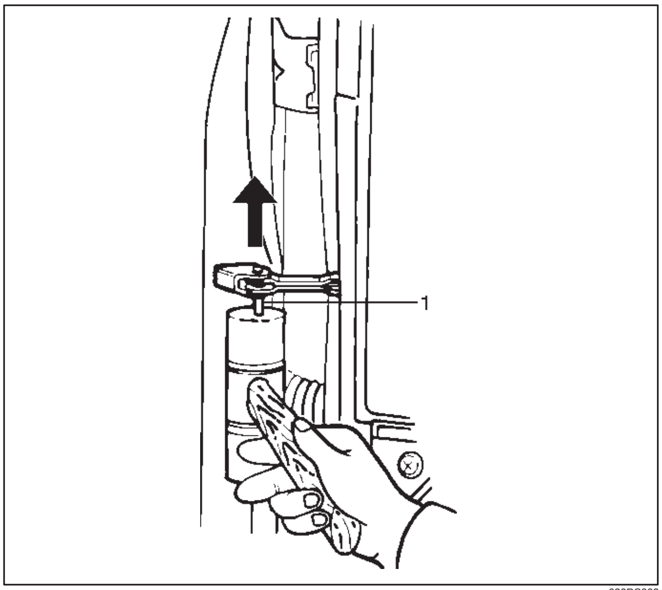
650RW002

Legend

(1) Door Check Arm Pin
(2) Door Harness Connection
(3) Rear Door Assembly
(4) Hinge Bolt

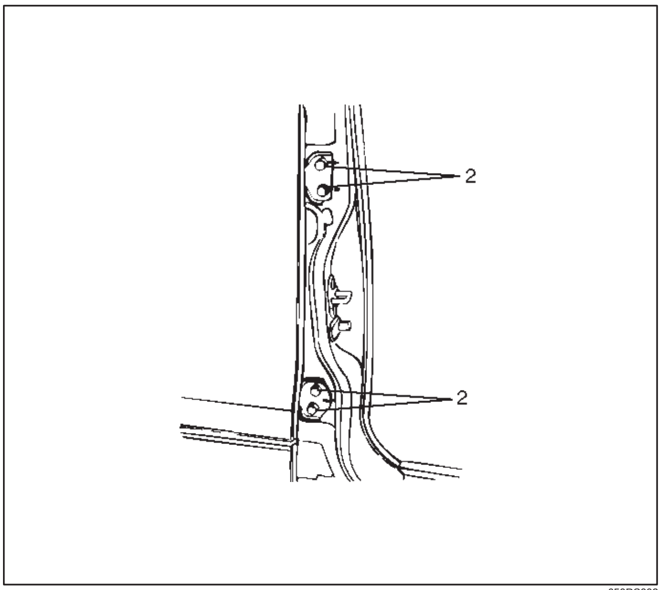
Removal

1. Disconnect the battery ground cable.
2. Apply a setting mark on the body side hinge.
3. Remove door check arm pin (1).



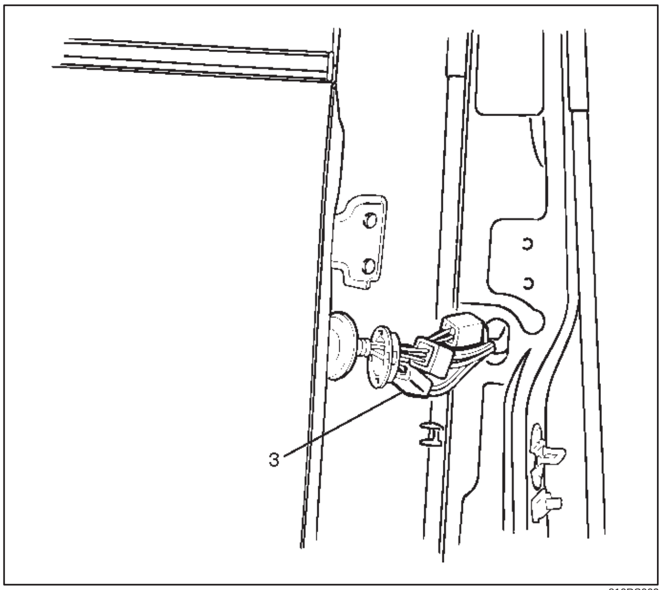
630RS002

4. Remove hinge bolt.
   - Open the front door and remove the body side hinge bolts (2).



650RS002

5. Remove door harness connection (3).
   - Pull the door harness grommet out in order to disconnect the door harness connection.



810RS002

6. Remove door assembly

Installation

To install, follow the removal steps in the reverse order, noting the following points.

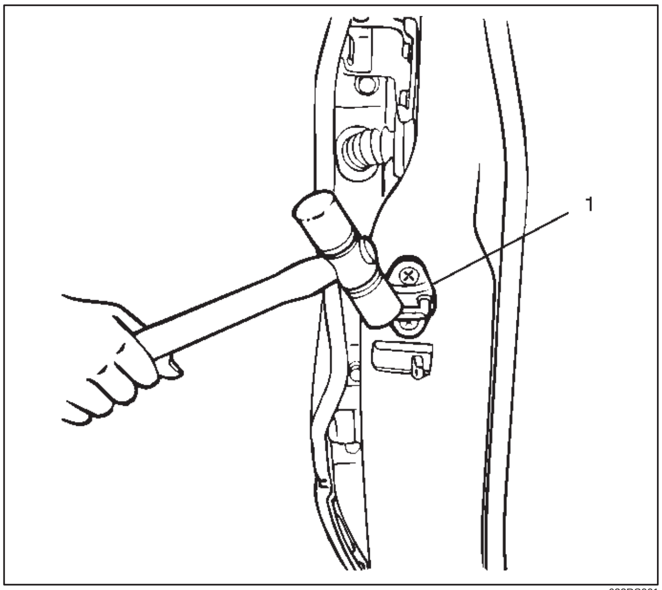
1. Align the door fitting to the body by refer to Body Dimensions in this section.
2. Tighten the door hinge bolts to the specified torque.

   Torque : 34 N•m (25 lb ft)

3. Apply chassis grease to the check arm pin and the door hinge moving surface.

Door Strikers

Adjustment



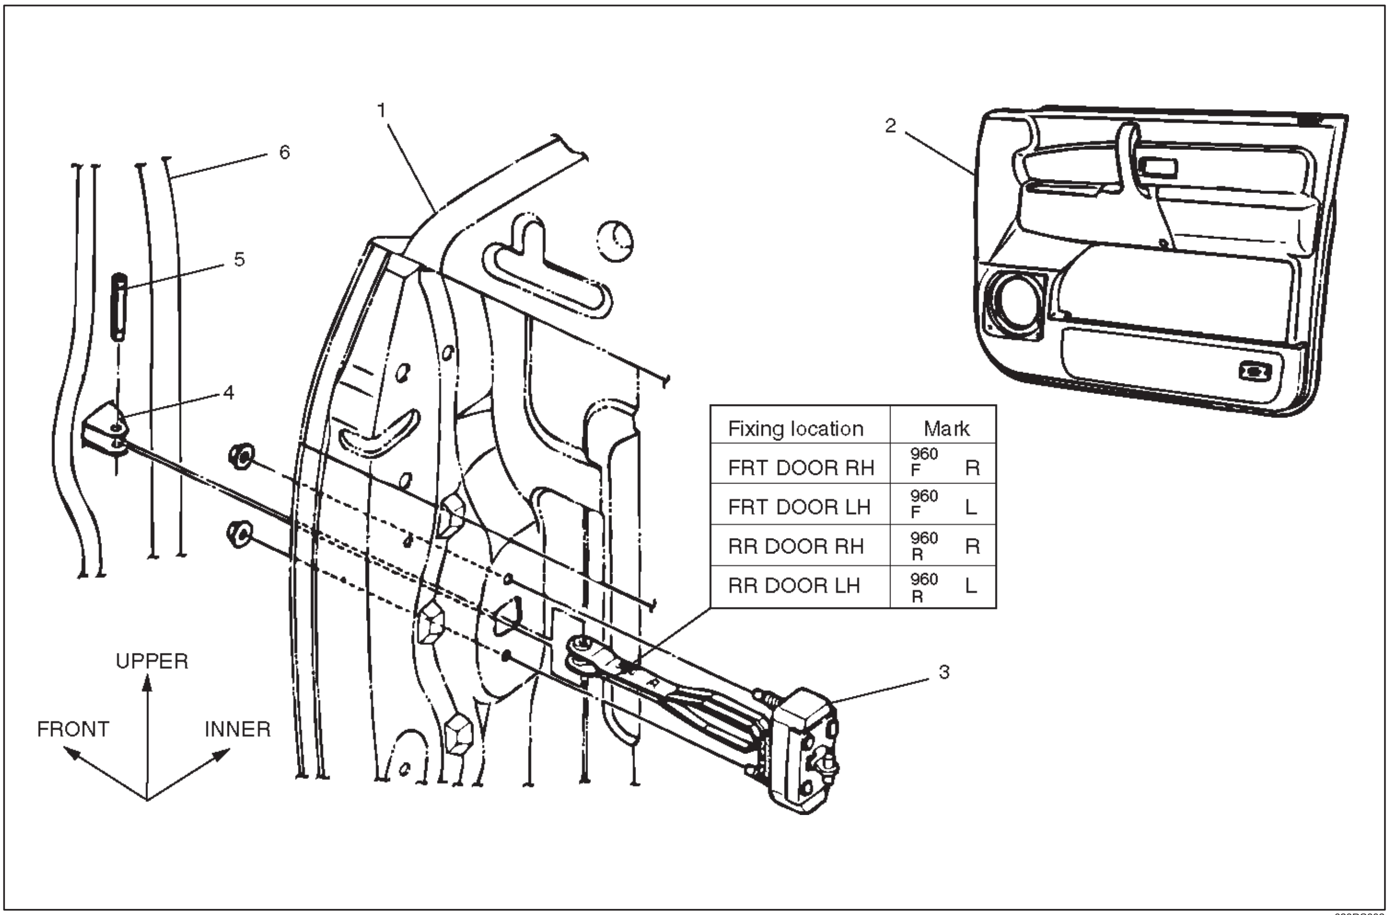
632RS001

1. Loosen the striker (1) screws.
2. Tap with a plastic hammer to align.
3. Tighten the striker screws.

   Torque : 15 N•m (11 lb ft)

Door Check Arm Assembly (Front & Rear)

Parts Location



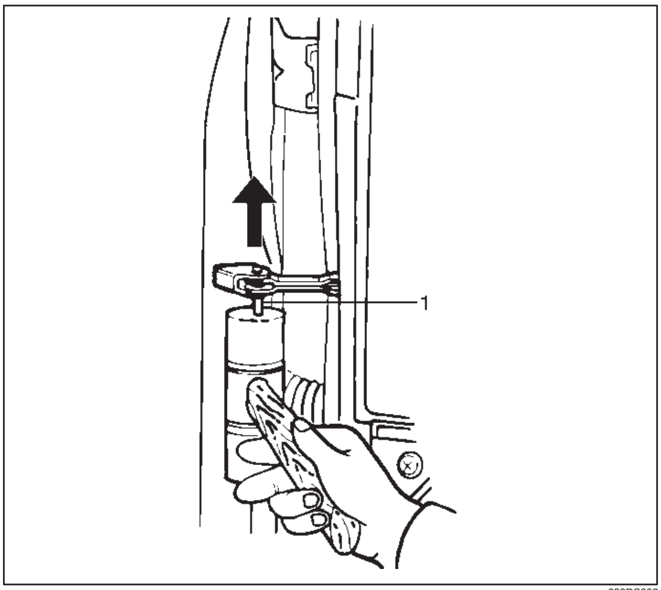
630RS003

Legend

(1) Front or Rear Door
(2) Door Trim Panel
(3) Check Arm Assembly
(4) Check Arm Pin Bracket
(5) Check Arm Pin
(6) Front or Center Pillar

Removal

1. Disconnect the battery ground cable.
2. Remove door trim panel.
   - Refer to Front / Rear Door Trim Panel in Exterior / Interior Trim section.
3. Remove check arm pin (1).



630RS002

4. Remove check arm assembly.
   - Carefully peel off the water proof sheet as much as necessary, for check arm removal.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

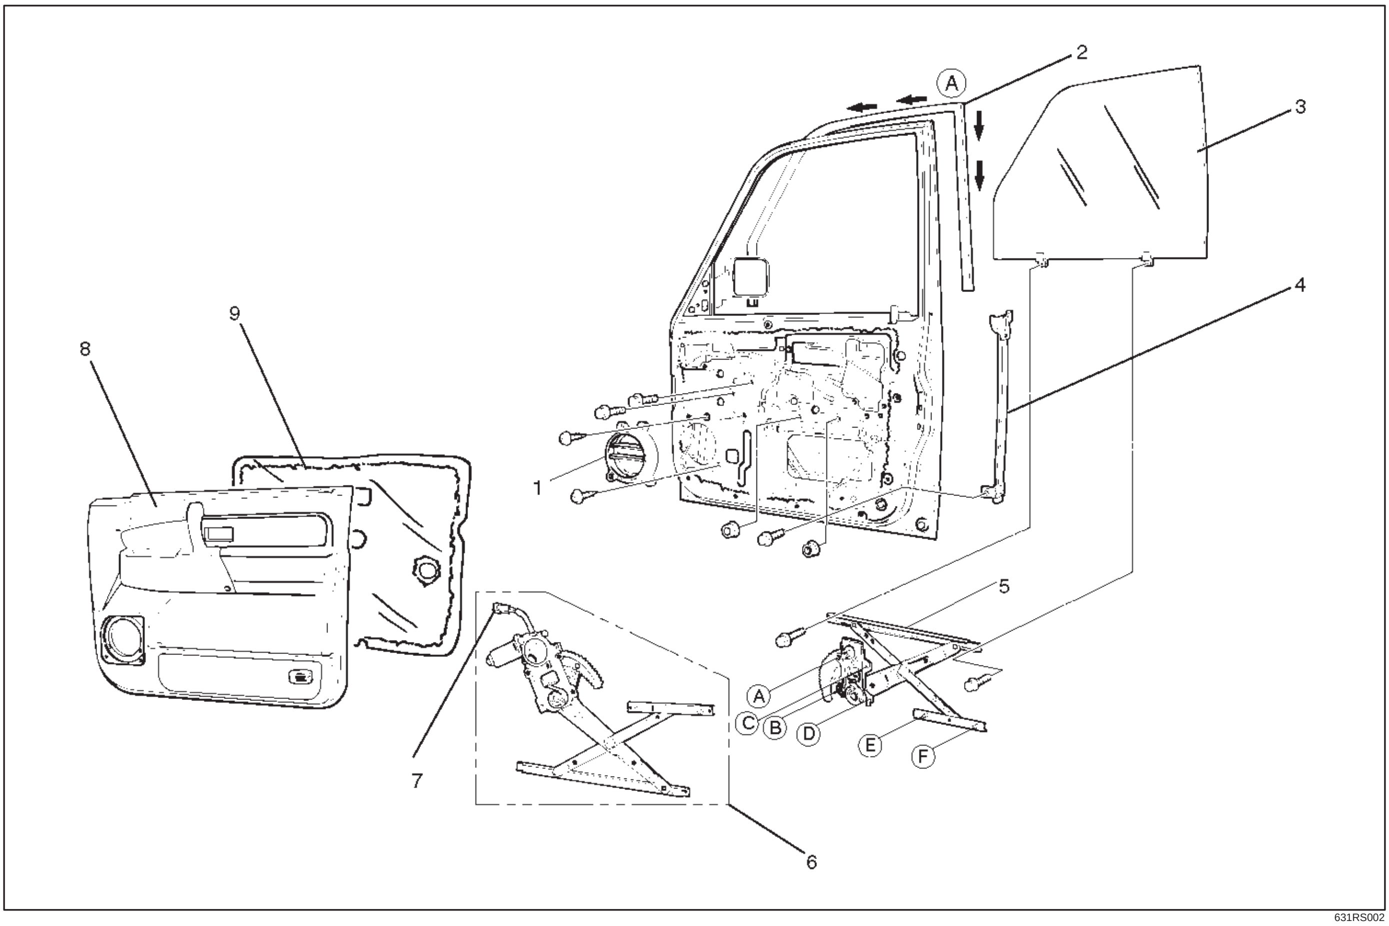
1. When installing the check arm assembly, note its marking to ensure using the appropriate part.
2. Tighten the check arm fixing nuts to the specified torque.

Torque : 13 N•m (113 lb in)

3. Apply chassis grease to the check arm pin moving surface.

Front Window Regulator, Glass And Glass Run

Parts Location



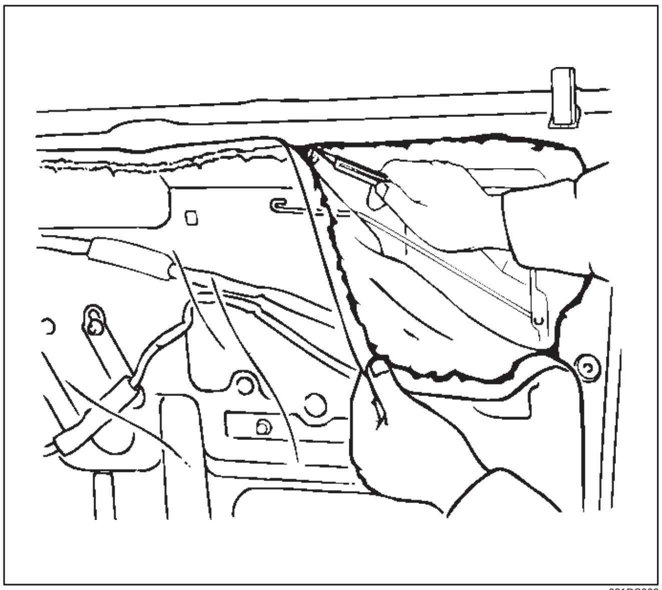
Legend

(1) Speaker Box
(2) Glass Run
(3) Glass
(4) Rear Guide Rail
(5) Window Regulator
(6) Window Regulator with Power Window
(7) Window Regulator Motor Connector
(8) Door Trim Panel
(9) Waterproof Sheet

Removal

1. Disconnect the battery ground cable.
2. Remove door trim panel.
   - Refer to Front Door Trim Panel in Exterior / Interior Trim section.
3. Remove speaker box.

4. Remove waterproof sheet.

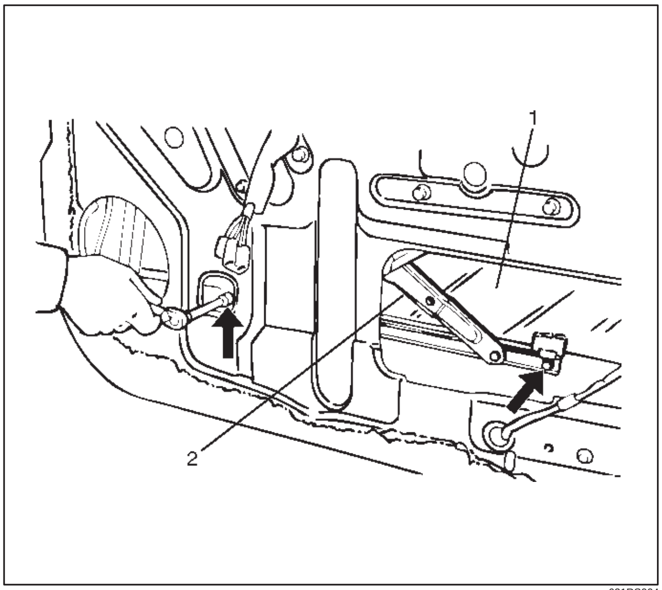


631RS003

- Take notice of the door harness and the grommet, peel the waterproof sheet off the door panel carefully.

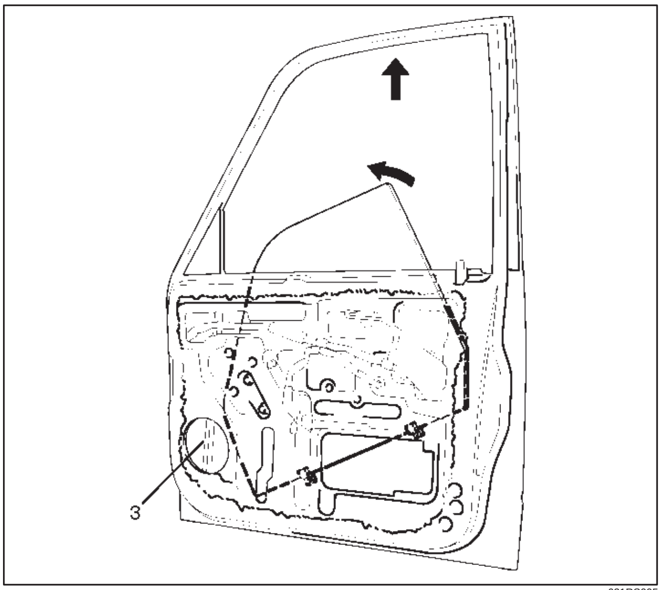
5. Remove glass.

- Bring the glass (1) down to the position where the fixing bolts can be seen.



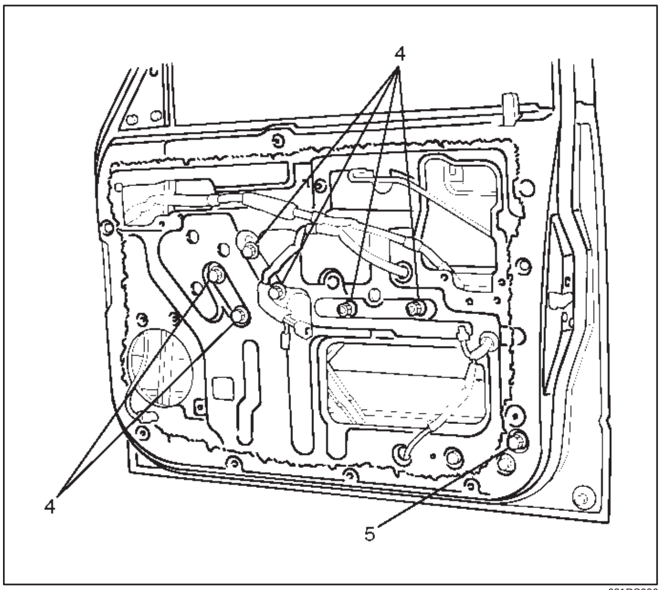
631RS004

- Remove the glass fixing bolts from the window regulator (2) and lower thefront side of the glass.
  When the front side of the glass comes off the glass run (3), turn the glass inside out and pull it up from its rear side.



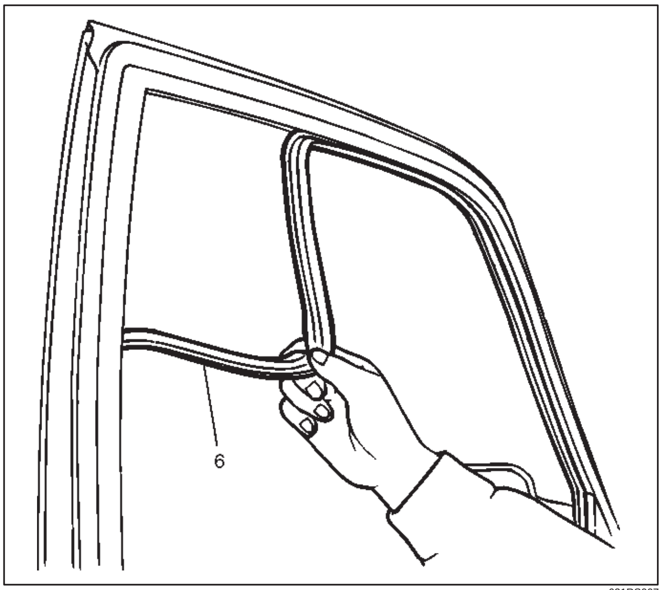
631RS005

6. Remove window regulator.
   - Remove the window regulator fixing bolts (4) and the rear guide rail fixing bolt (5).
   - Disconnect the window regulator motor harness connector, if equipped with power windows.



631RS006

7. Remove glass run.
   - Pull the glass run (6) out from the door frame groove.



631RS007

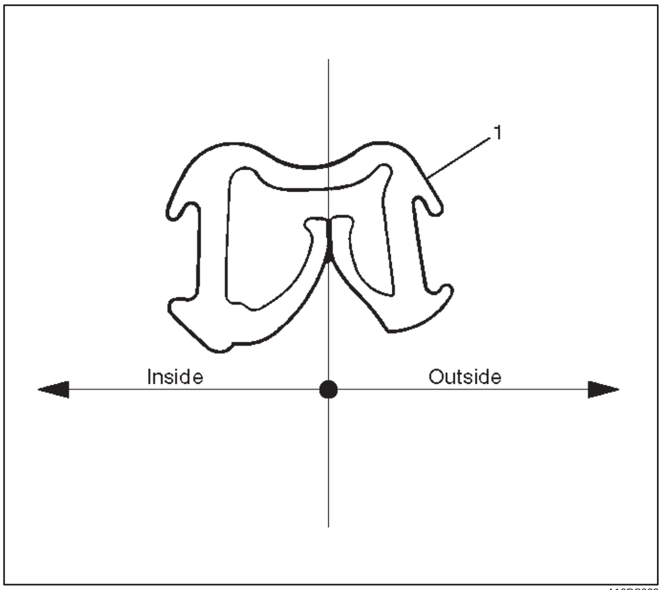
8. Remove rear guide rail.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Apply soap and water to the door frame groove. Insert the glass run (1) to the door frame from the A corner in the arrow–marked directions.

   Install the glass run with its wider end pointed to the inside of the vehicle.



A10RS023

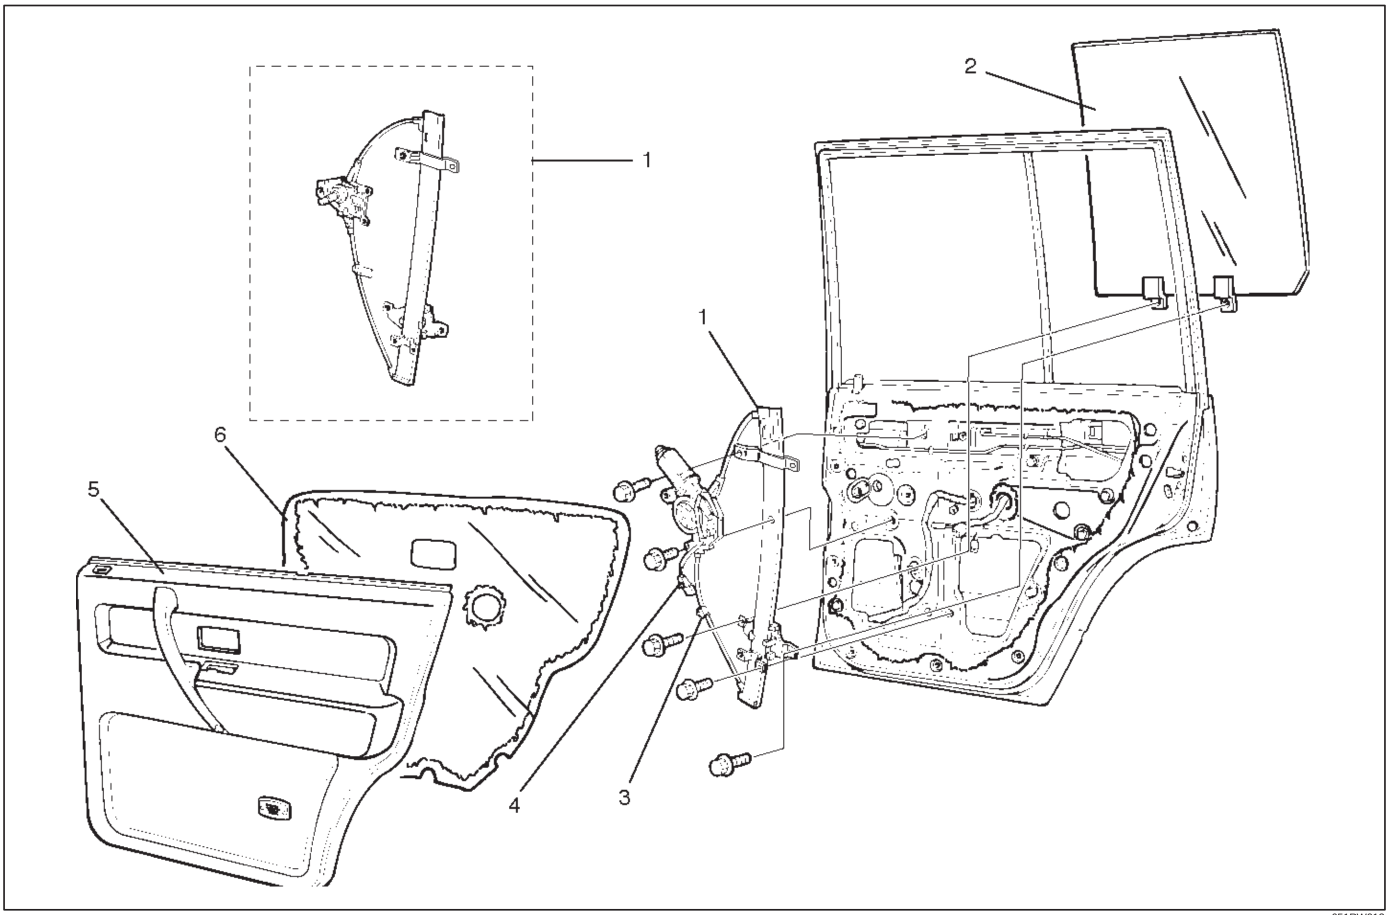
2. Set the glass into the door panel with the front side of the glass lowered and insert the rear side of the glass into the glass run (1). Then insert the front side of the glass into the glass run in order to install the glass to the glass run while raising it up along the glass run.
3. Tighten the window regulator and the glass fixing bolts and nuts to the specified torque.

Torque : 8 N•m (69 lb in)

4. Check to see of the window regulator operates smoothly and the glass opens and closes properly. Install the waterproof sheet with no clearance between the door panel and the waterproof sheet.

Rear Window Regulator And Glass

Parts Location

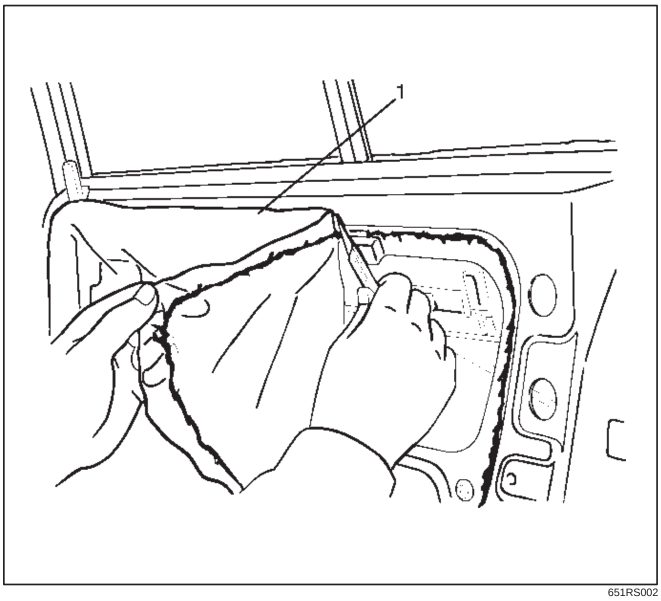


651RW012

Legend
- (1) Window Regulator
- (2) Glass
- (3) Cable Fixing Clip
- (4) Window Regulator Motor Connector
- (5) Door Trim Panel
- (6) Waterproof Sheet

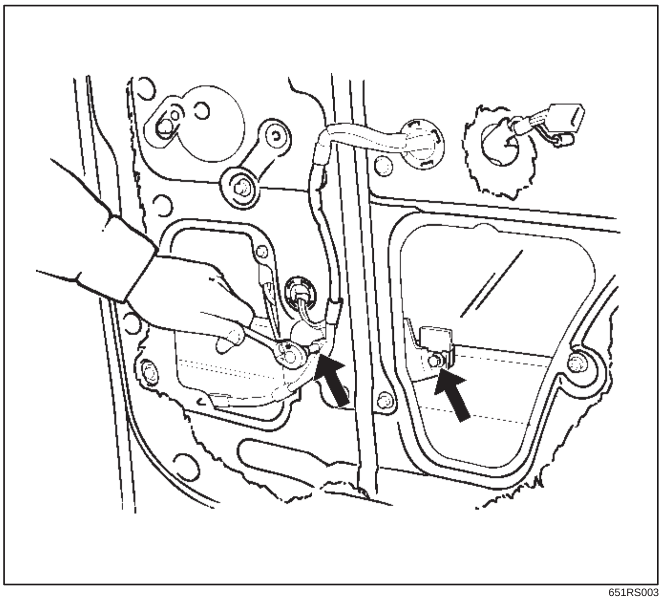
Removal

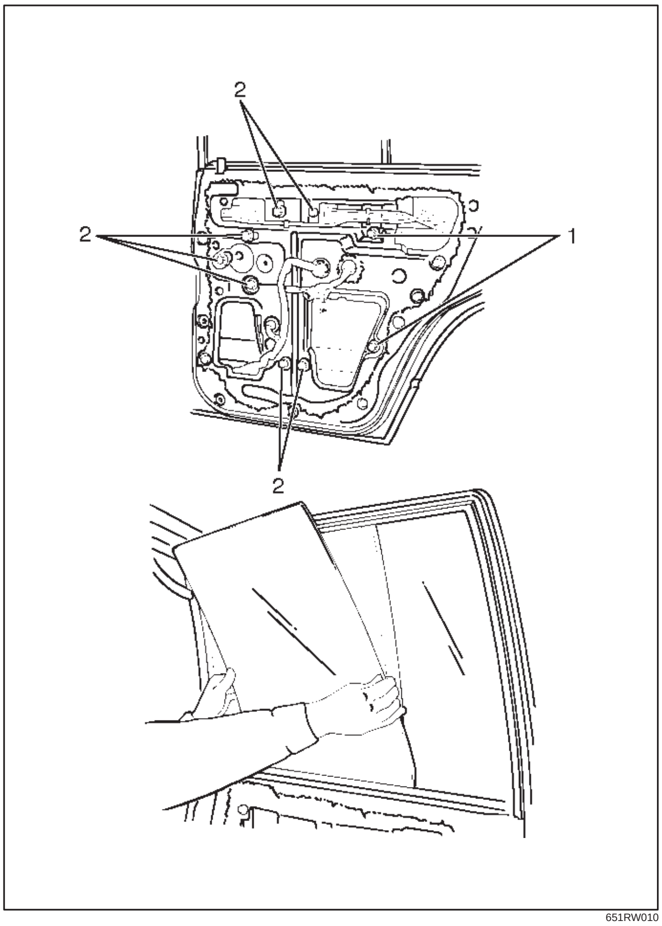
1. Disconnect the battery ground cable.
2. Remove door trim panel.
   - Refer to Rear Door Trim Panel in Exterior / Interior Trim section.
3. Remove waterproof sheet (1).
   - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.



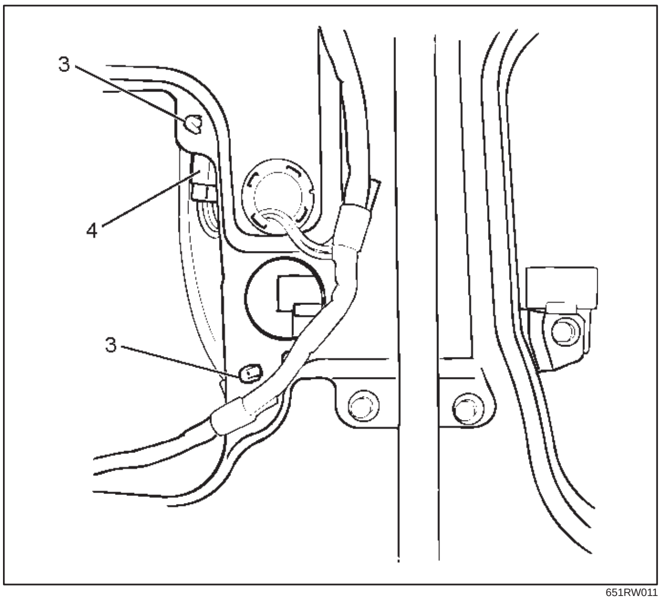
651RS002

4. Remove glass.
   - Bring the glass down to the position where the bolt can be seen.
   - Remove the sash division 2 fixing bolts (1) and then remove the glass fixing bolt to remove the glass upwards.





5. Remove window regulator.
   - Disconnect the regulator motor connector (4) and remove the window regulator cable fixing clip (3) from the door panel, if model is equipped with power windows.
   - Remove the window regulator 7 fixing bolts (2) and pull the regulator out from the lower hole of the door panel.



Installation

To install, follow the removal steps in the reverse order, noting the following points.

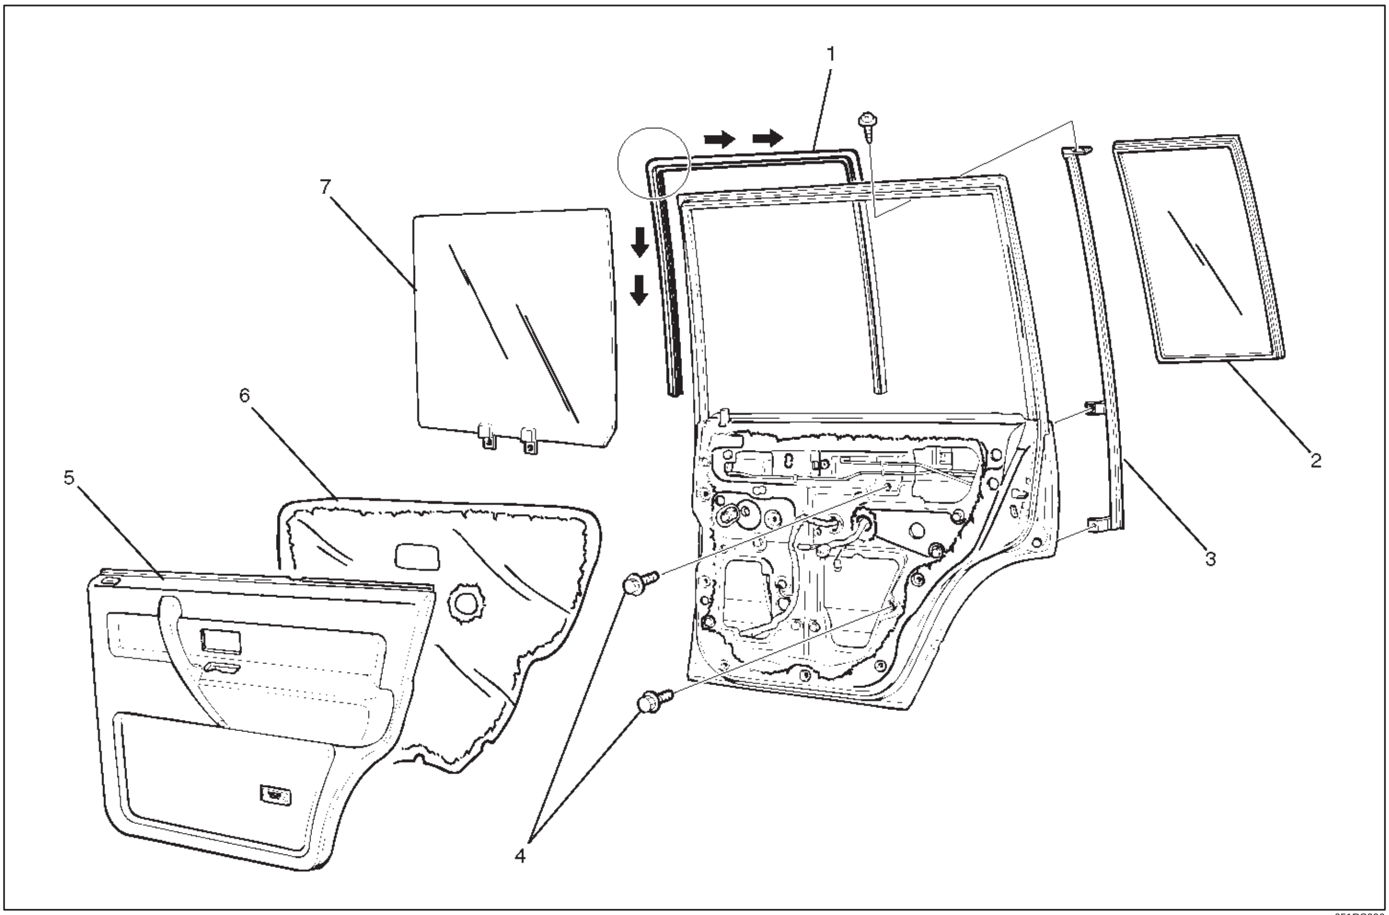
1. Tighten the window regulator and the glass fixing bolts to the specified torque.

   Torque : 8 N•m (69 lb in)

2. Install the waterproof sheet with no clearance between the door panel and the waterproof sheet.

Rear Door Fixed Glass And Glass Run

Parts Location

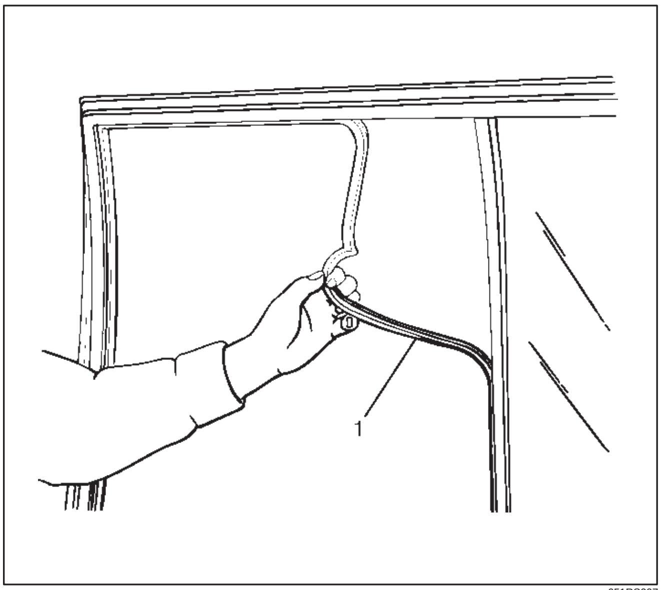


651RS006

Legend
(1) Glass Run
(2) Rear Fixed Glass
(3) Sash Division
(4) Sash Division Fixing Bolts
(5) Door Trim Panel
(6) Waterproof Sheet
(7) Glass

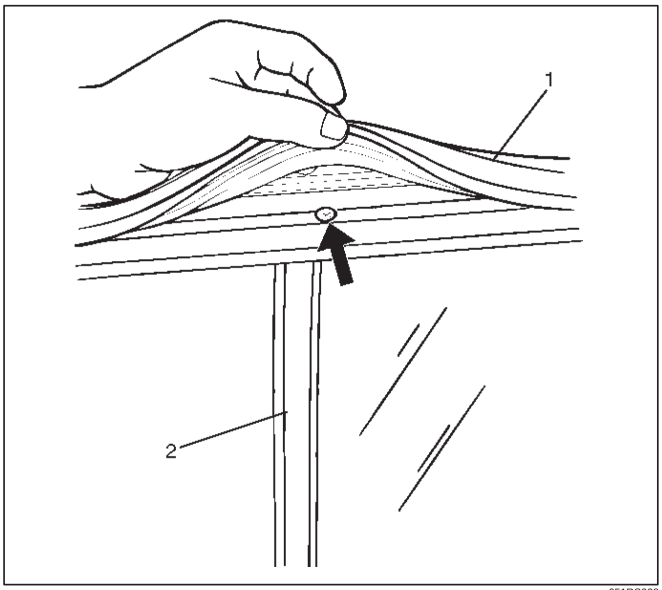
Removal

1. Disconnect the battery ground cable.
2. Remove door trim panel.
3. Remove waterproof sheet.
4. Remove glass.
   - Refer to Rear Window Regulator and Glass in this section.
5. Remove glass run.
   - Pull the glass run (1) out from the door frame.



651RS007

6. Remove sash division (2).



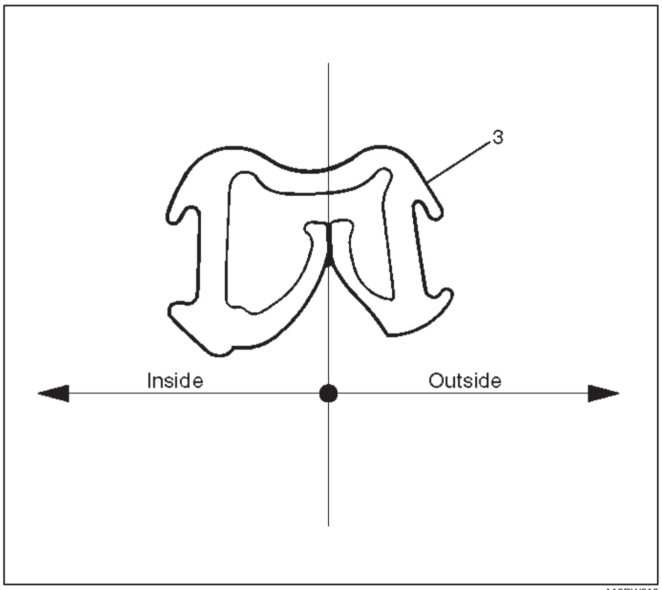
651RS008

7. Remove door fixed glass.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

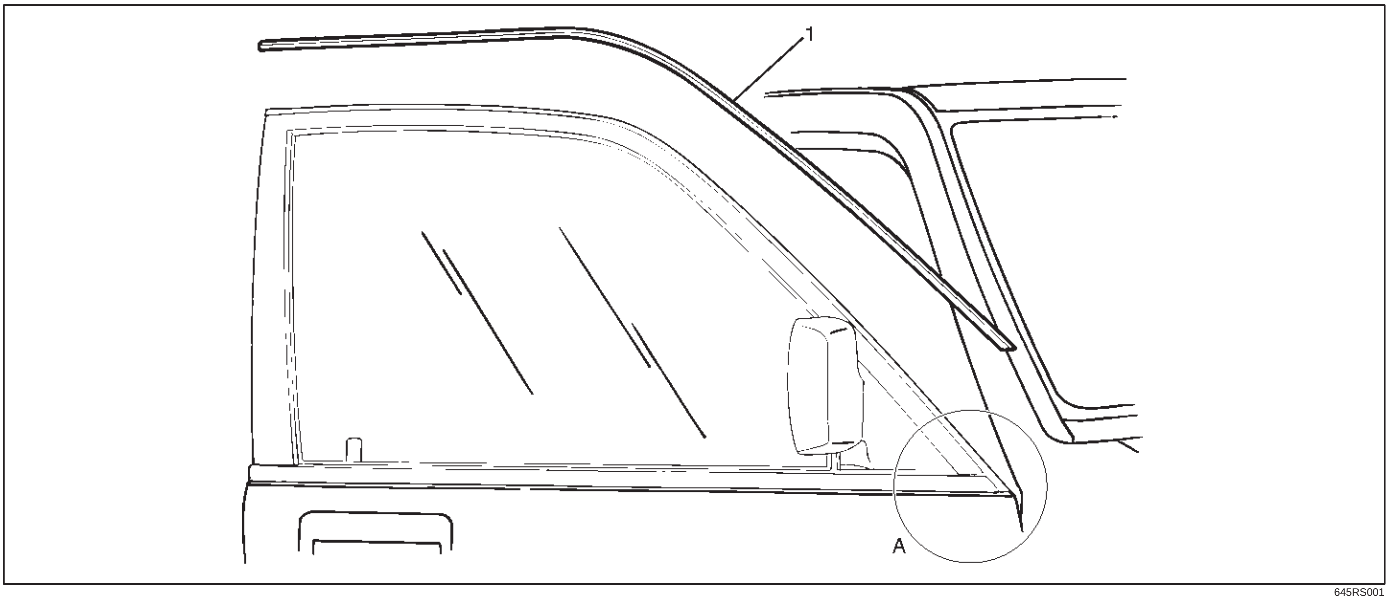
1. Apply soap and water to the fixed glass.
2. Apply soap and water to the door groove and insert the glass run (3) to the frame from the corner in the arrow-marked directions.
3. Be sure to install the glass run with its end pointed to the inside of the vehicle.



A10RW019

Front Door Sash Moulding

Parts Location

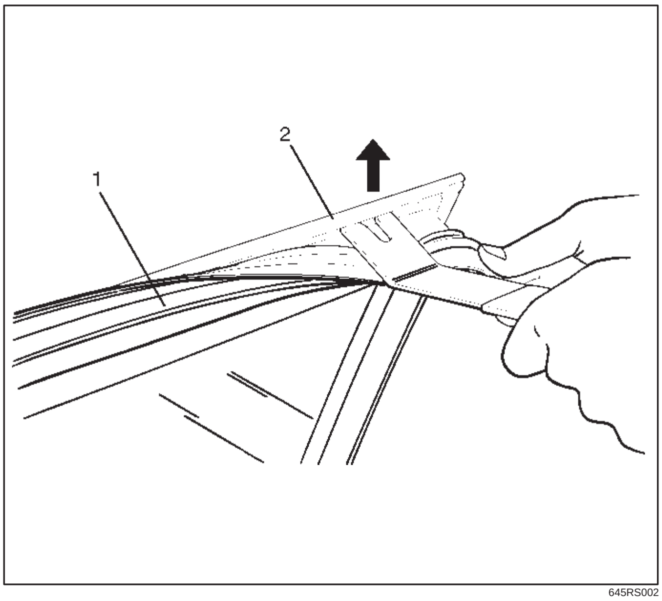


Legend

(1) Front Door Sash Moulding

Removal

1. Remove front door slash moulding.
   - To avoid the weatherstrip (1) and pry the door sash moulding (2) out from the door panel.

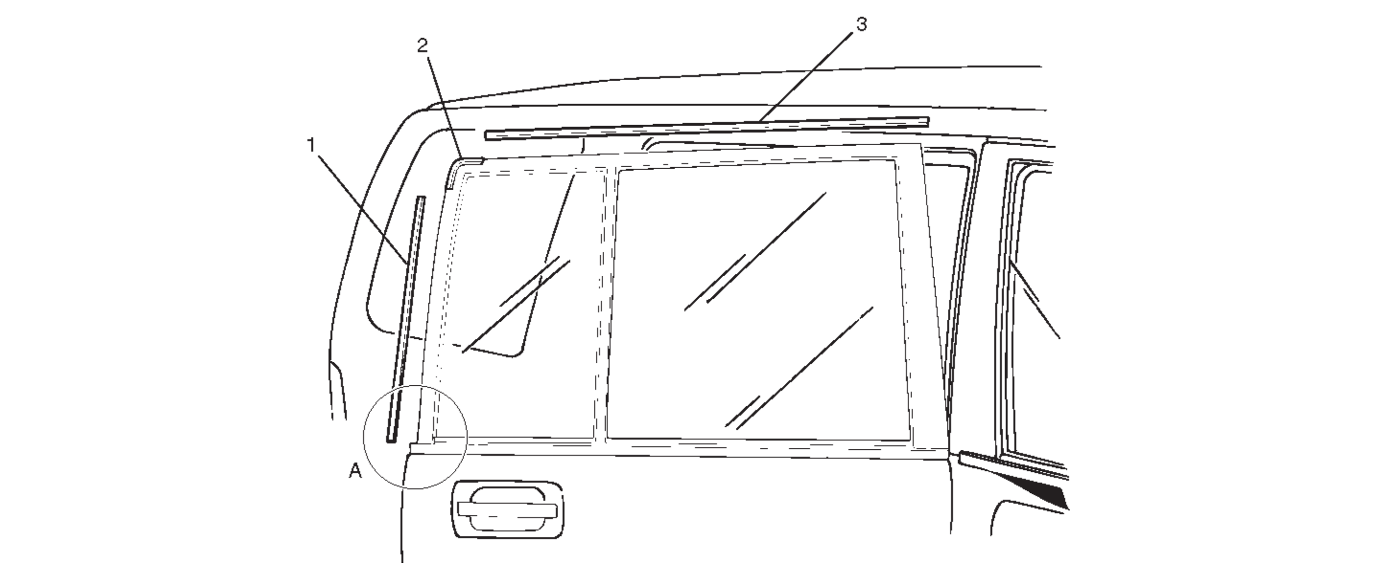


Installation

1. Front door sash moulding.
   - Assemble the edge portion (A portion) of the moulding so that the clearance between the moulding and the waist seal becomes 1 mm (0.04 in).

Rear Door Moulding

Parts Location



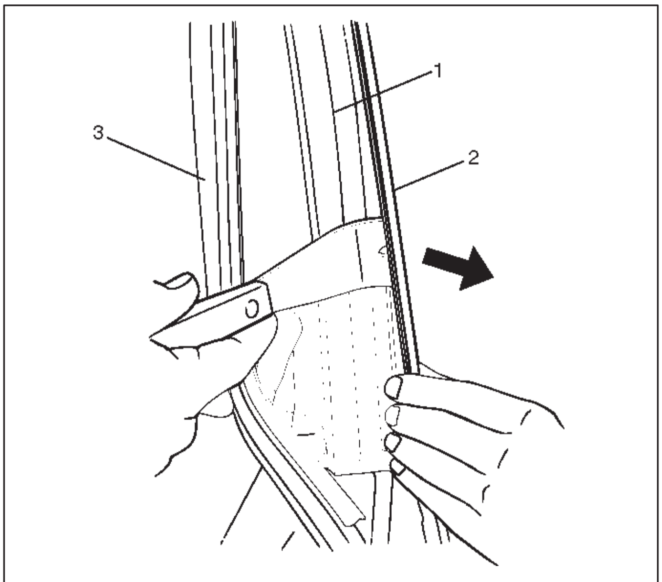
645RS003

Legend

(1) Rear Door Side Moulding
(2) Rear Door Corner Moulding
(3) Rear Door Upper Moulding

Removal

1. Disconnect the battery ground cable.
2. Remove rear door side moulding.
3. Remove rear door upper moulding.
4. Remove rear door corner moulding.
   - Avoiding the weatherstrip (3), pry the moulding (2) out from the door frame (1).



645RS004

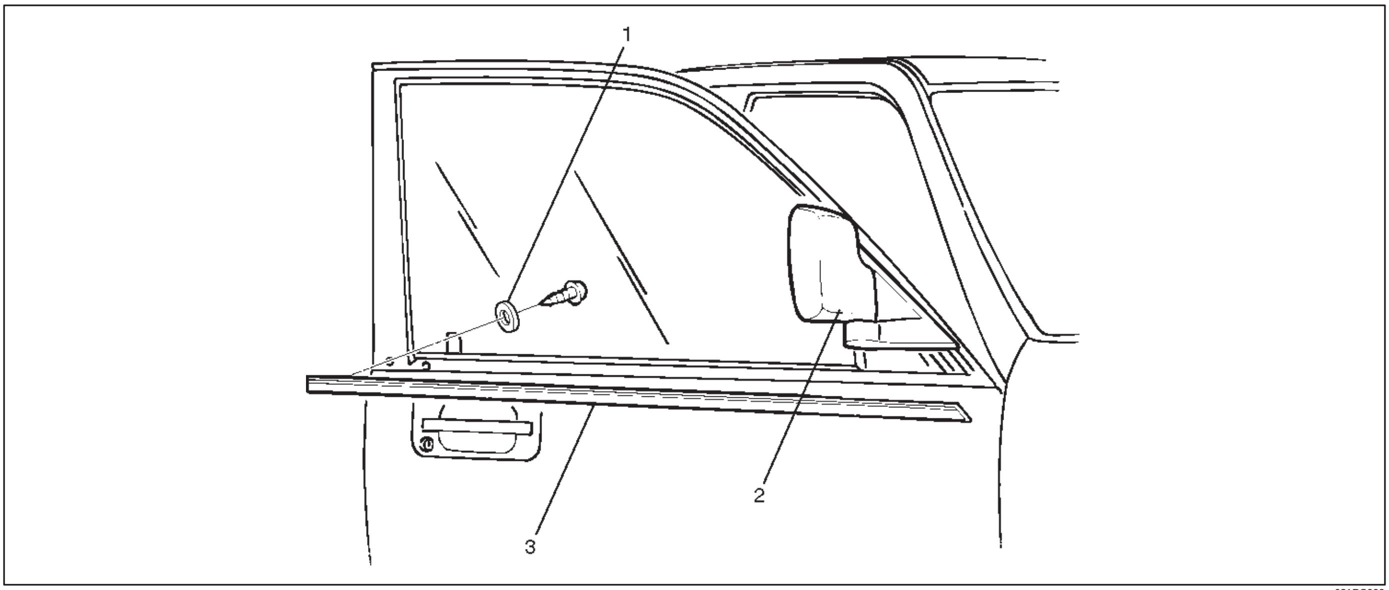
Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Install each moulding with no clearance between each piece of moulding.
2. Assemble the edge portion (A portion) of the moulding so that the clearance between the rear side moulding and the waist seal is 1 mm (0.04 in).

Front Door Waist Seal

Parts Location

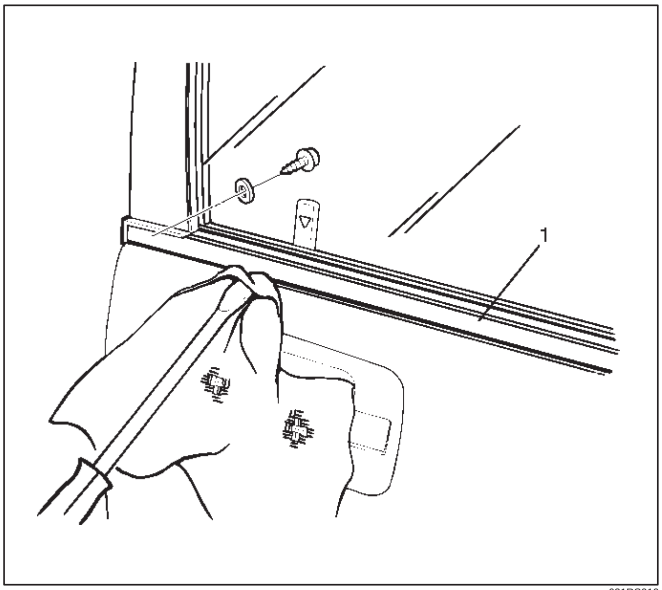


631RS009

Legend
(1) Nylon Washer
(2) Door Mirror
(3) Front Door Waist Seal

Removal

1. Disconnect the battery ground cable.
2. Remove door mirror.
   - Refer to Door Mirror in this section.
3. Remove front door waist seal.
   - Remove the fixing screw and pull out the waist seal (1) from the door frame while prying it up.



631RS010

Installation

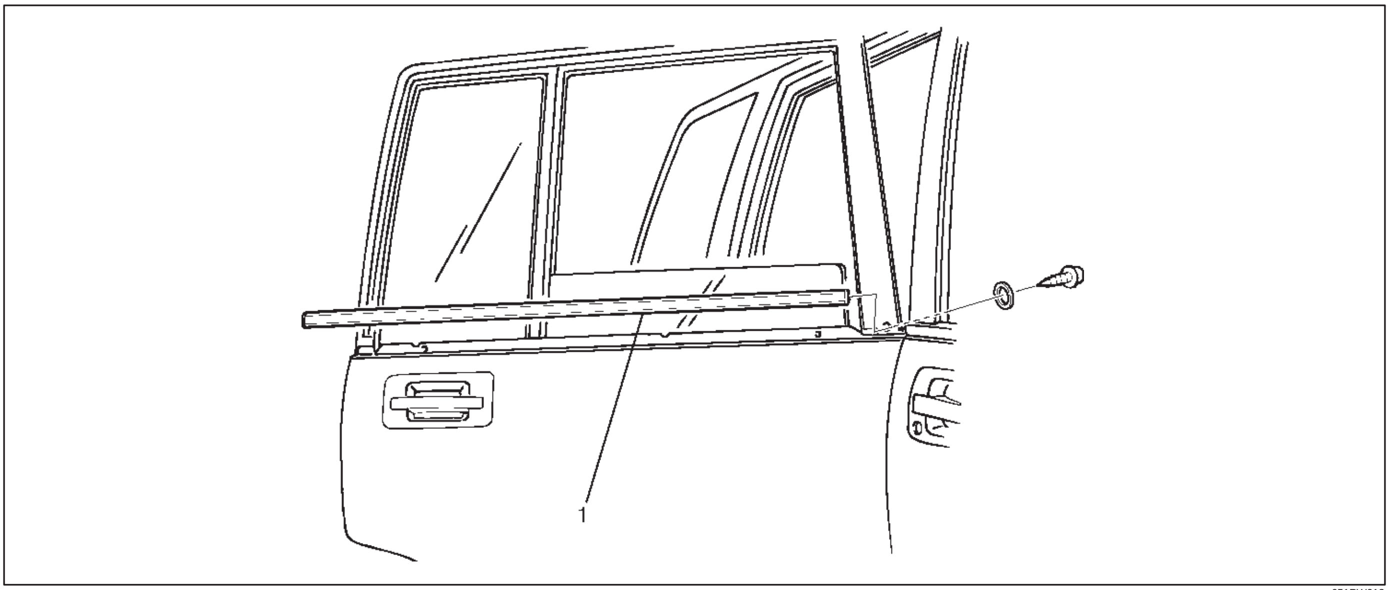
To install, follow the removal steps in the reverse order, noting the following point.

1. Apply soap and water to the inside of the waist seal and align the screw hole of the waist seal to the door panel hole, and gently tap the seal with a rubber hammer.

   Be sure not to tap the seal hard. This may result in deforming the seal.

Rear Door Waist Seal

Parts Location



651RW013

Legend

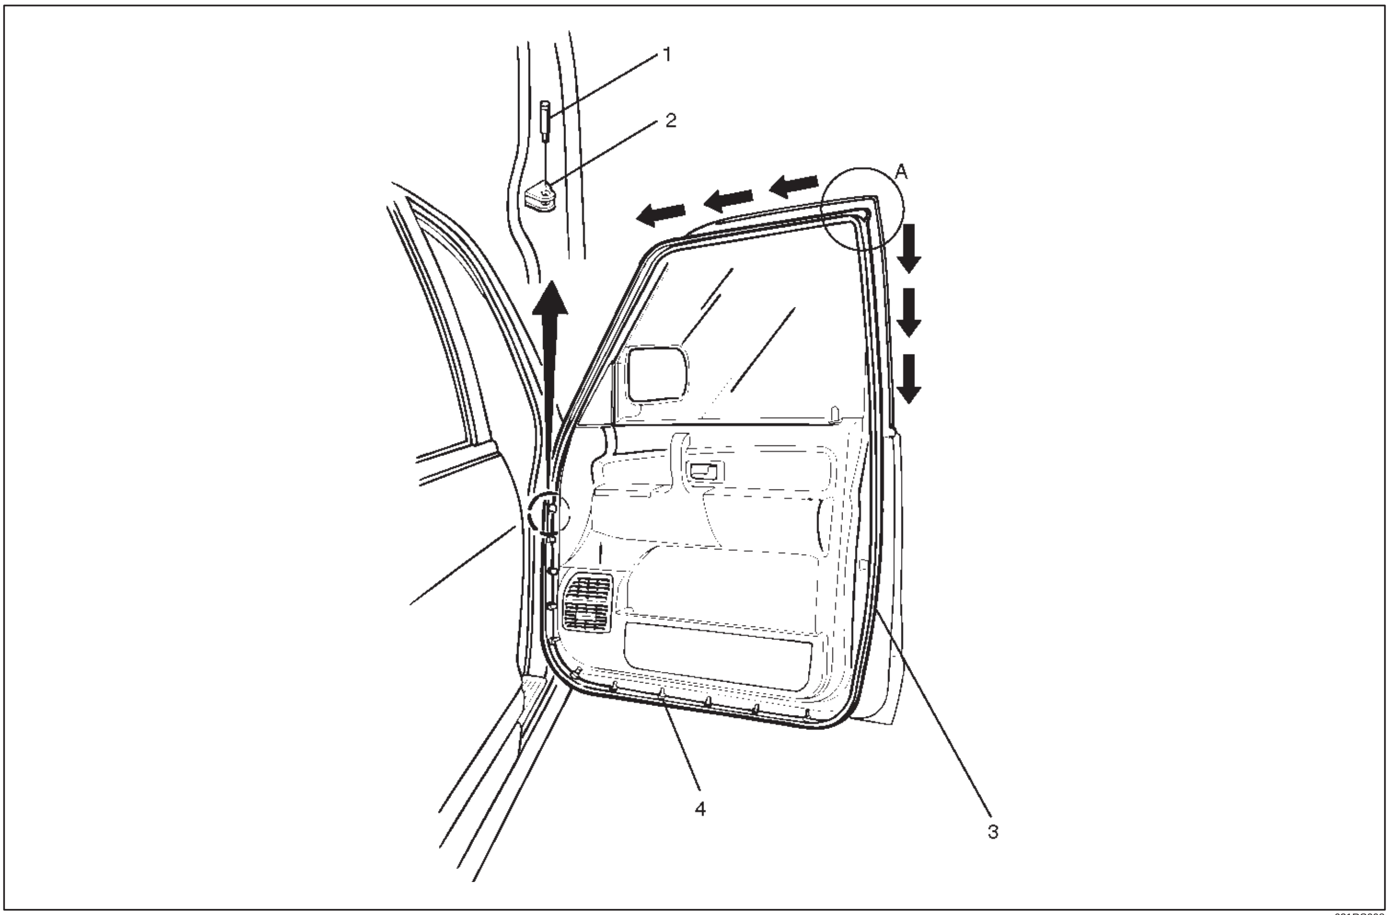
(1) Rear Door Waist Seal

Removal and Installation

Refer to Front Door Waist Seal in this section.

Front Door Weatherstrip

Parts Location



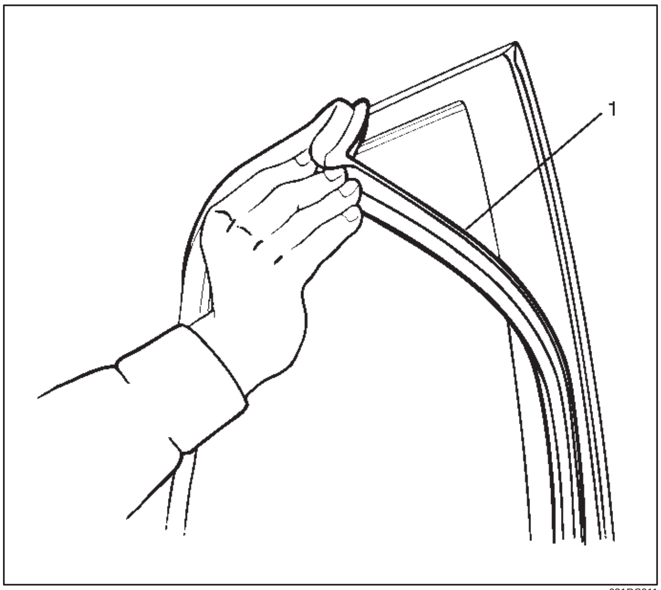
631RS008

Legend

(1) Check Arm Pin
(2) Bracket
(3) Weather Strip
(4) Clip

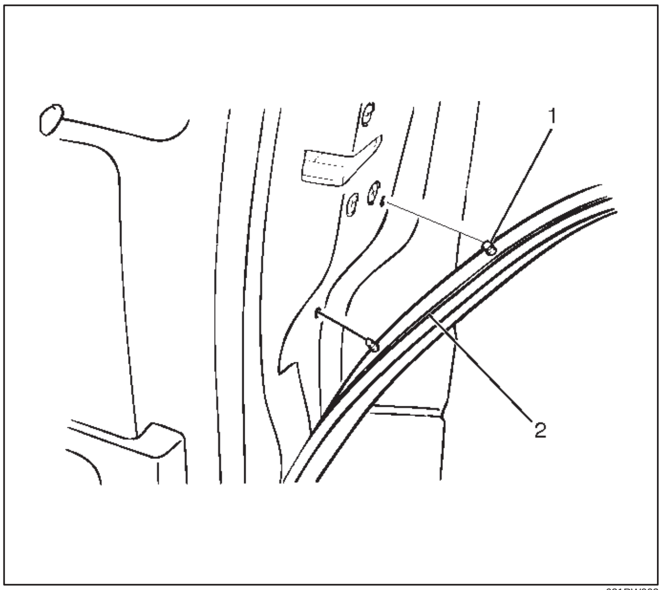
Removal

1. Remove check arm pin.
2. Remove front door weatherstrip.
   - Pull the weatherstrip (1) out from the door frame.



631RS011

- Carefully remove the weatherstrip (2) from the door panel.

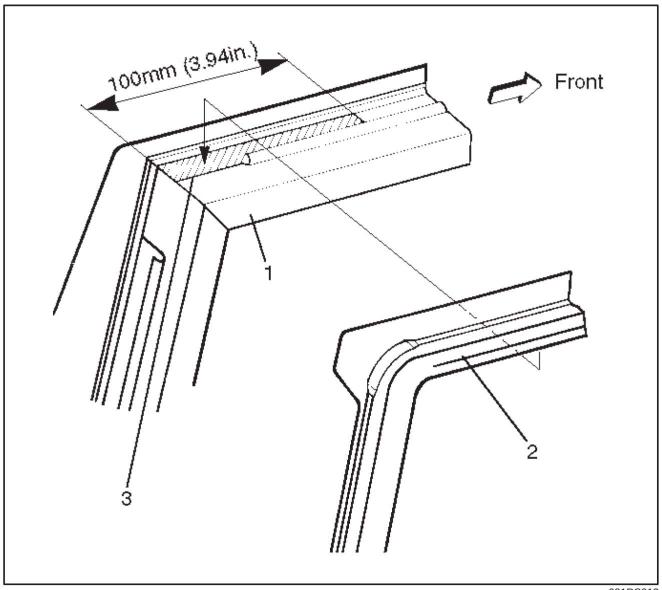


631RW003

Installation

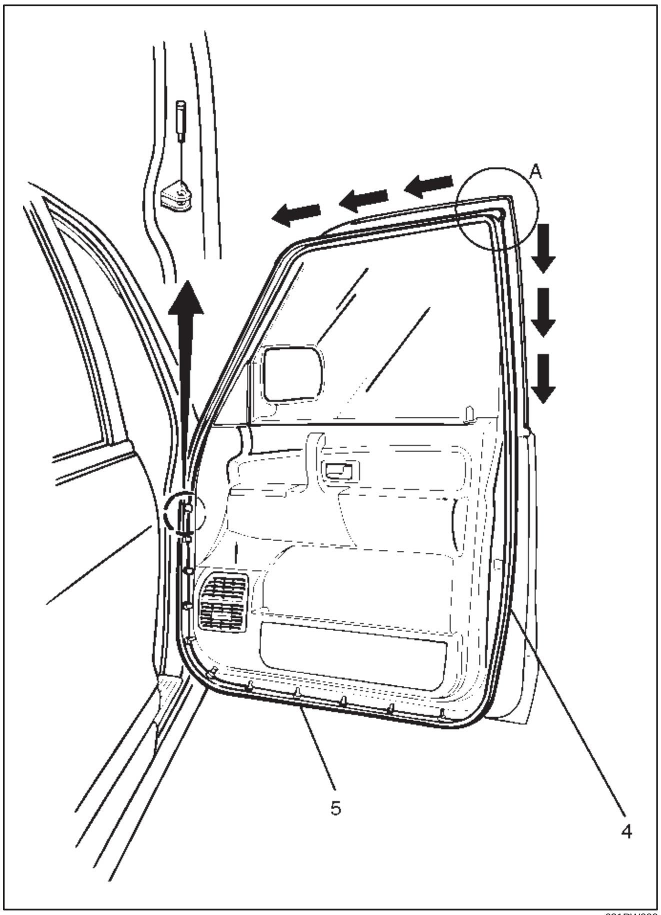
To install, follow the removal steps in the reverse order, noting the following points.

1. Apply soapy water to the door frame groove, when installing the front door weatherstrip (2).
2. Apply the sealing adhesive (3) to the upper A portion of the door frame (1) and press it for installation after assembling the weatherstrip (2).



631RS013

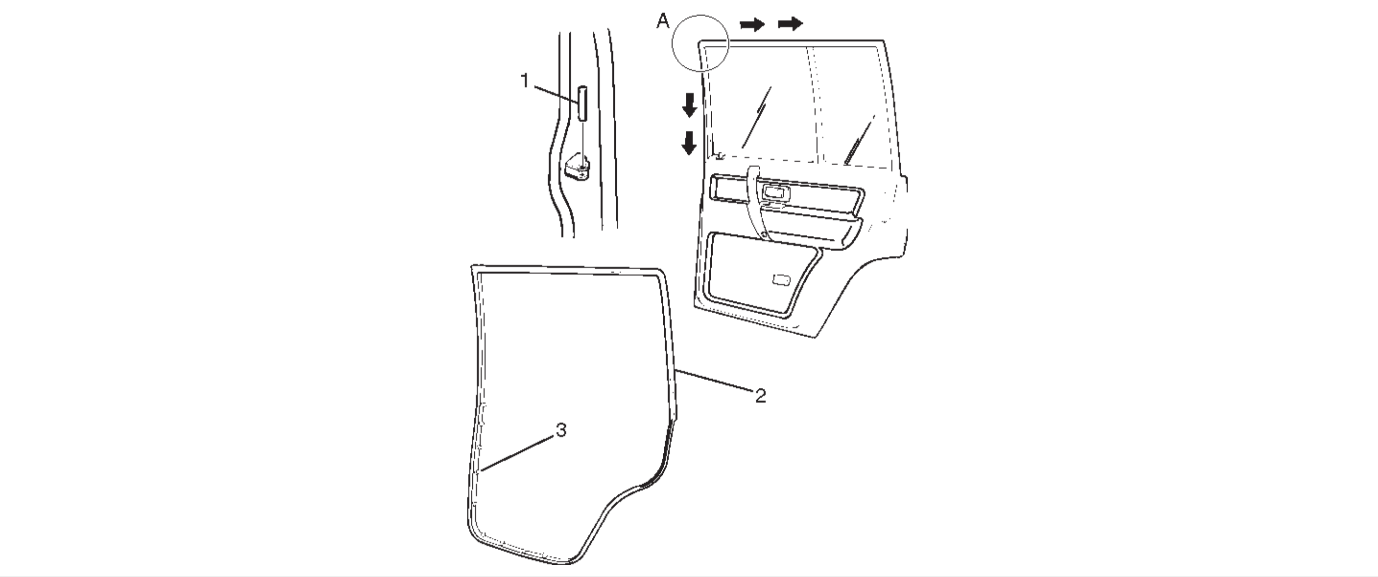
3. After positioning the weatherstrip (4) corner, insert the weatherstrip into the door frame groove from A point in the arrow–marked direction.
4. Insert the weatherstrip clip (5) into the door panel up to its base.



631RW009

Rear Door Weatherstrip

Parts Location



Legend

(1) Check Arm Pin

(2) Rear Door Weather Strip

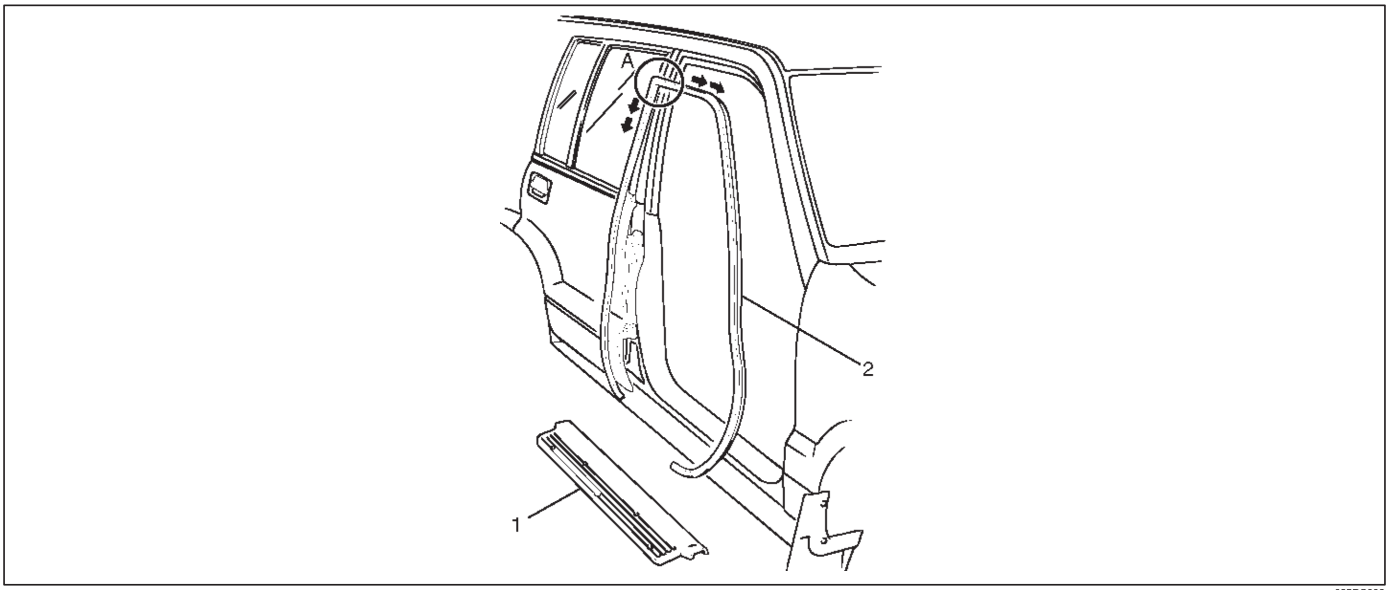
(3) Clip

Removal and Installation

Refer to Front Door Weatherstrip in this section.

Front Door Seal Finisher

Parts Location

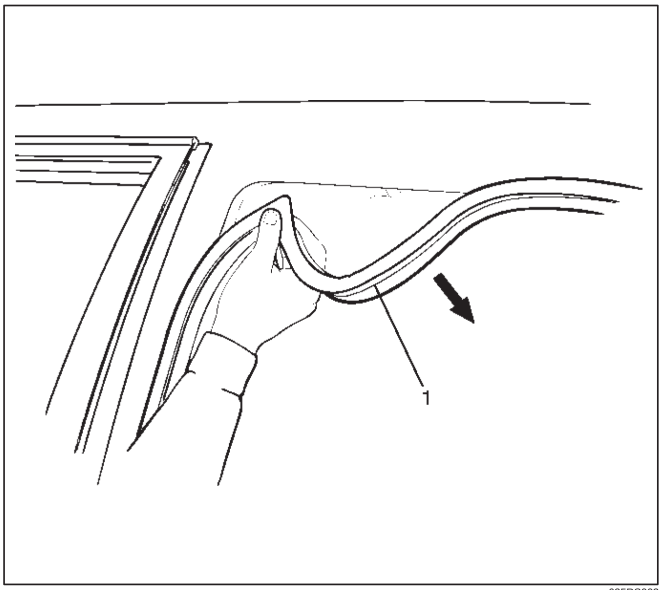


635RS002

Legend
(1) Front Door Sill Plate
(2) Front Door Seal Finisher

Removal

1. Disconnect the battery ground cable.
2. Remove front door sill plate.
3. Remove front door seal finisher (1).
   - Pull the finisher out from the body panel.

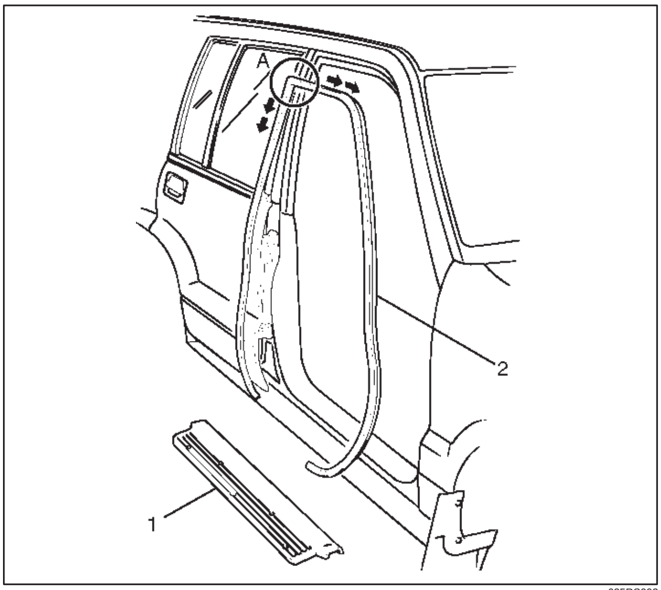


635RS003

Installation

To install, follow the removal steps in the reverse order, noting the following points.

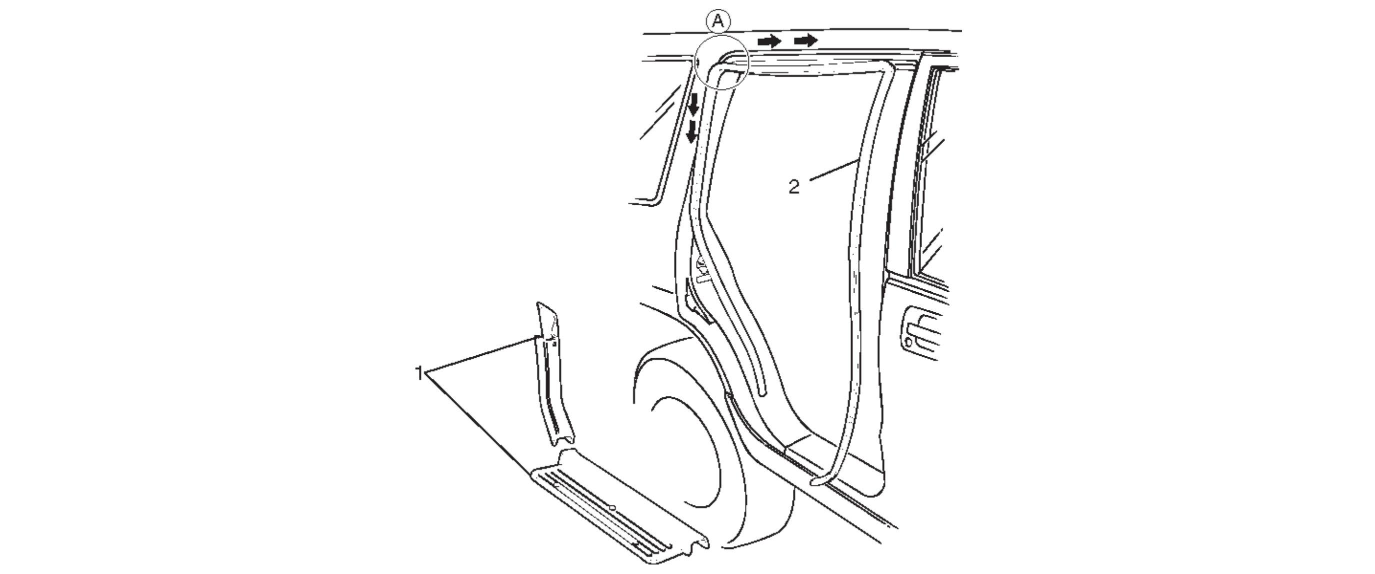
1. Insert the finisher (2) into the A corner and install the finisher in the arrow–marked directions.
2. Take care not to allow the sill plate (1) to distort or twist the finisher.



635RS002

Rear Door Seal Finisher

Parts Location



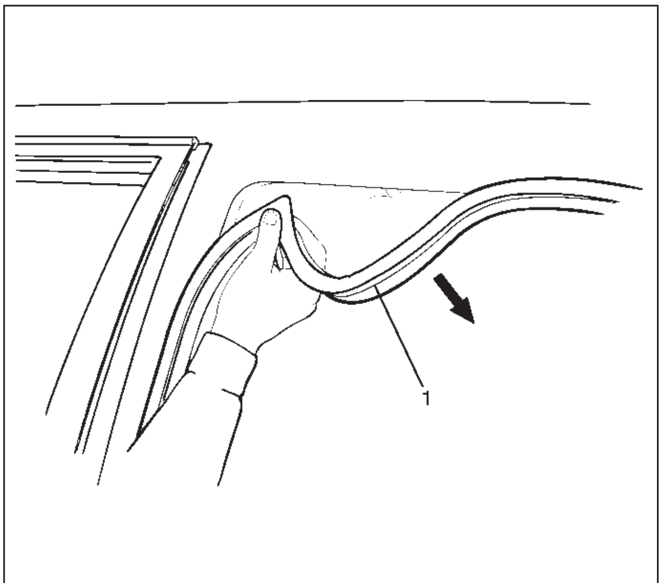
655RS002

Legend

(1) Rear Door Sill Plate and Luggage Side Lower Cover
(2) Rear Door Seal Finisher

Removal

1. Disconnect the battery ground cable.
2. Remove rear door sill plate and the luggage side lower cover.
3. Remove rear door seal finisher (1).
   - Pull the rear door seal finisher (1) out from the body panel.

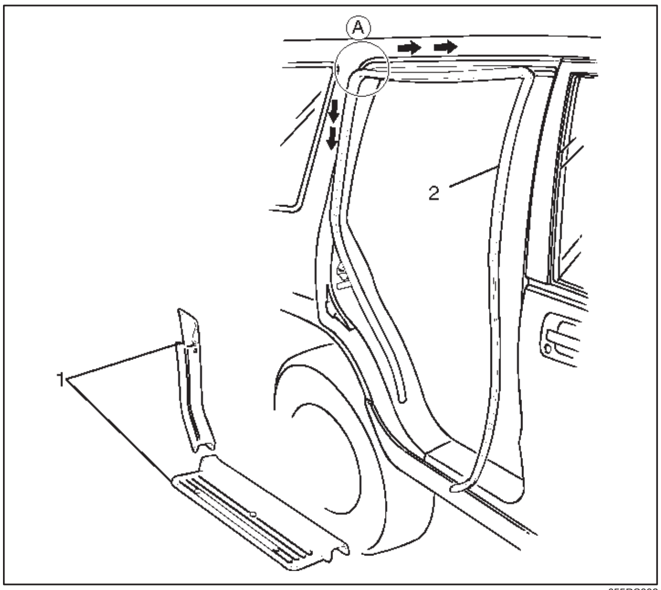


635RS003

Installation

To install, follow the removal steps in the reverse order, noting the following points.

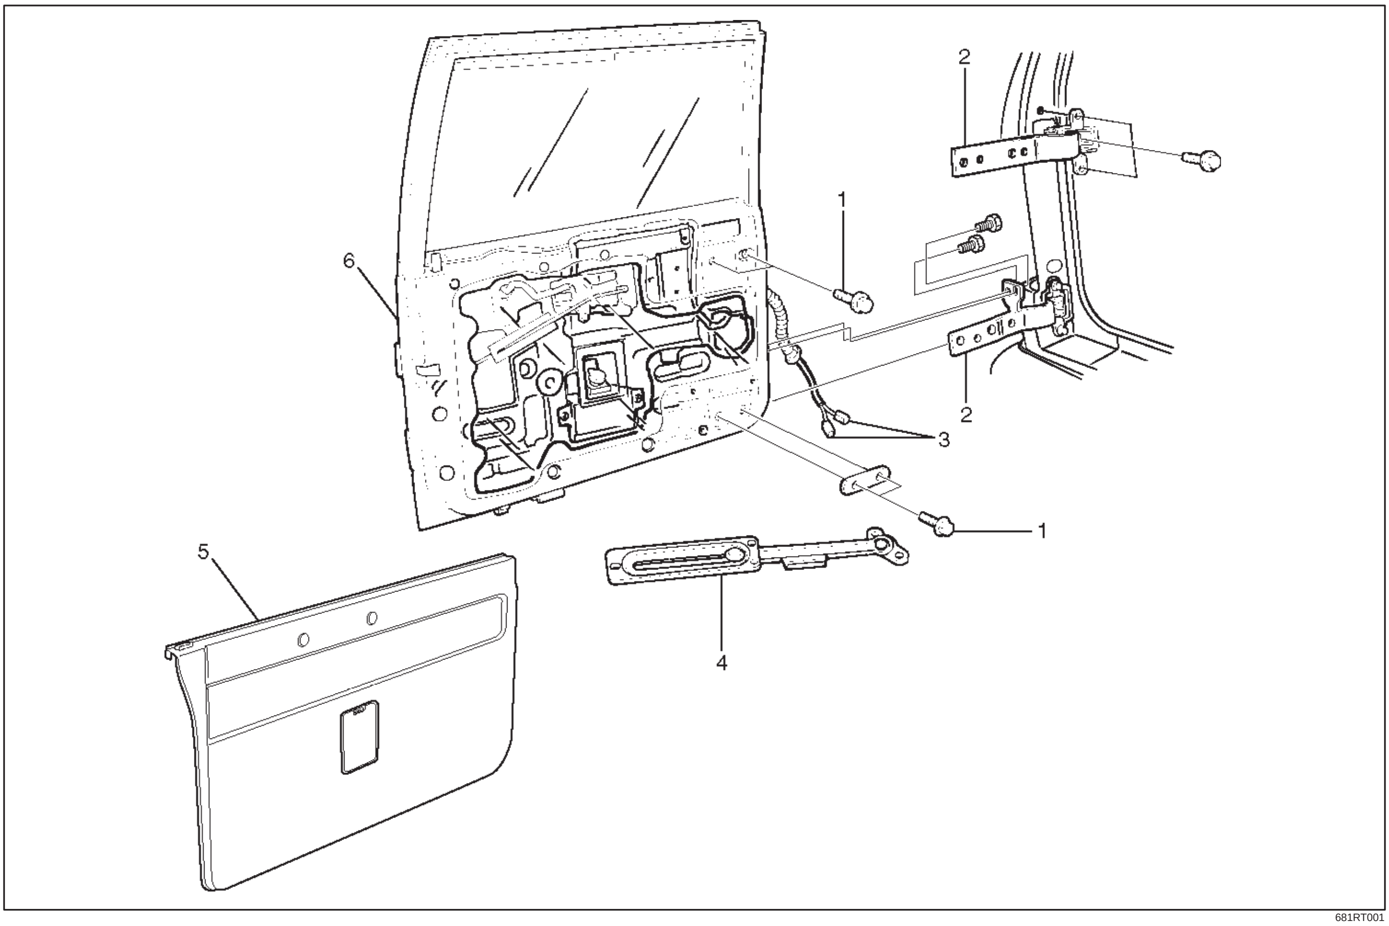
1. Insert the rear door seal finisher (2) into the A corner and install the finisher in the arrow-marked directions.
2. Be careful not to allow the sill plate and cover (1) to distort or twist the finisher.



655RS002

Tailgate Assembly (LH)

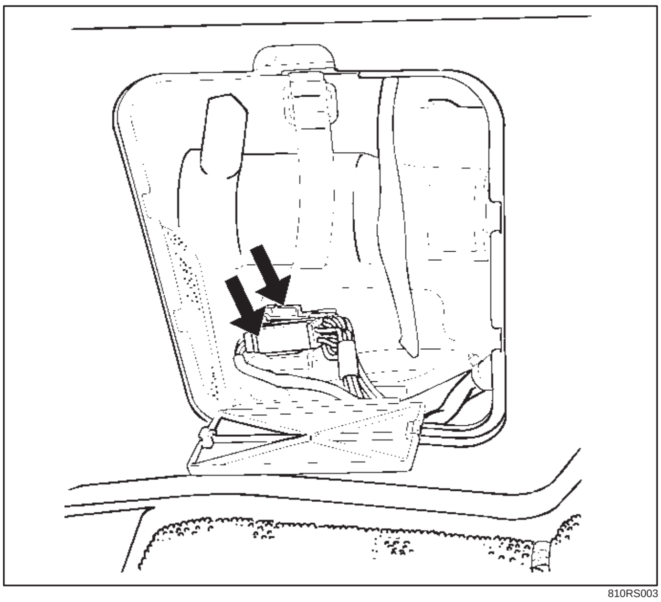
Parts Location



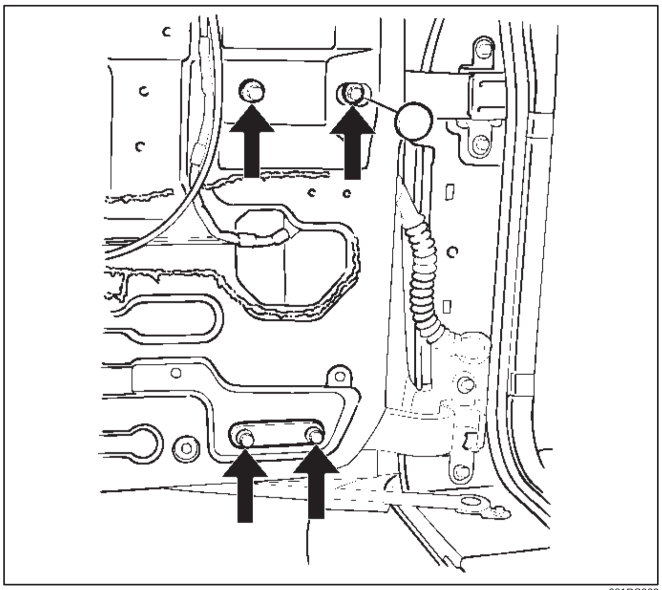
Legend
(1) Tailgate Fixing Bolt
(2) Tailgate Hinge
(3) Tailgate Harness Connection
(4) Tailgate Stopper Assembly
(5) Tailgate Trim Panel (LH)
(6) Tailgate Assembly (LH)

Removal

1. Disconnect the battery ground cable.
2. Remove tailgate time panel (LH).
   - Refer to Tailgate Trim Panel (LH) in Exterior / Interior Trim section.
3. Remove tailgate stopper assembly
4. Remove tailgate harness connection.
   - Open the luggage trim panel lid and disconnect the tailgate harness connection.

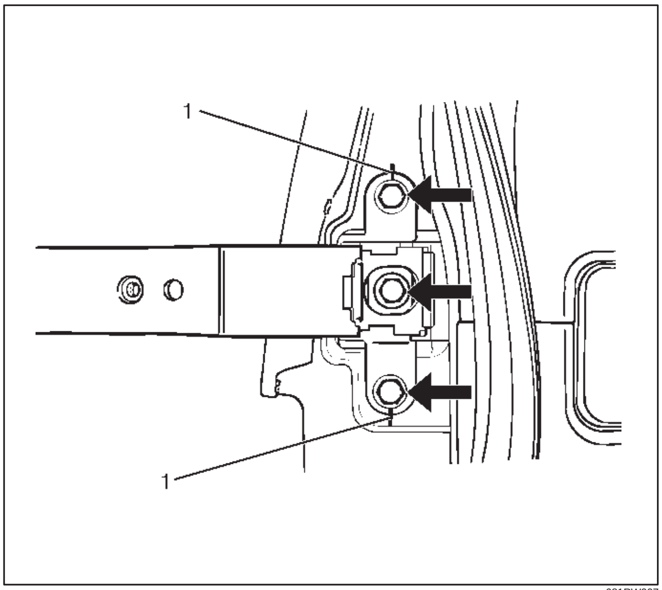


5. Remove tailgate fixing bolts.



681RS002

6. Remove tailgate assembly (LH).
7. Remove tailgate hinge.
   - Apply a setting mark (1) on the body side hinge and remove the hinge fixing bolts.



681RW007

Installation

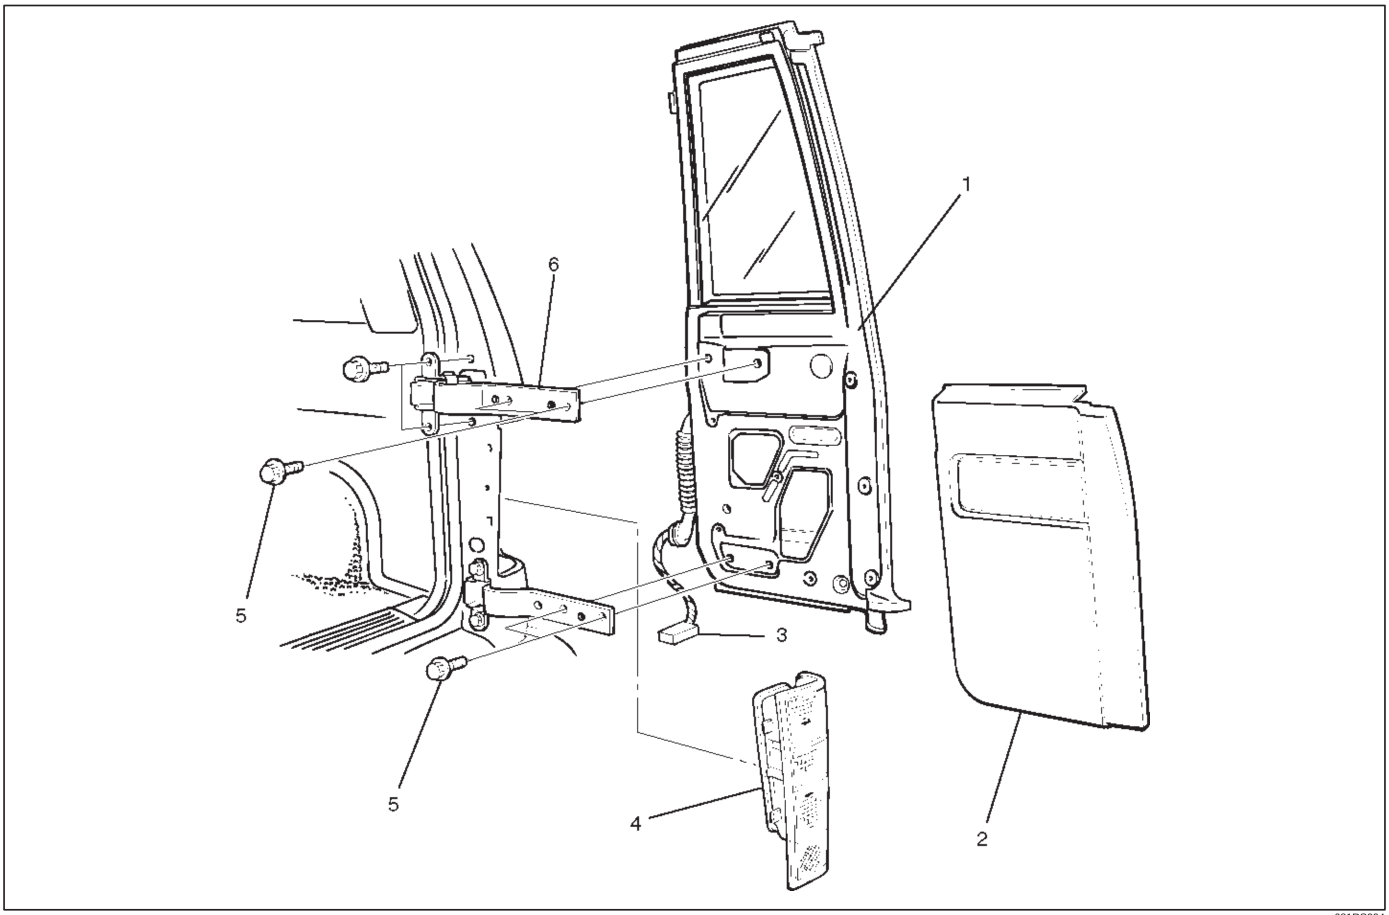
To install, follow the removal steps in the reverse order, noting the following points.

1. Apply chassis grease to the tailgate hinge and the tailgate stopper moving surface.
2. Align the tailgate fitting to the body by referring to Body Dimension in this section.
3. Tighten the hinge bolts to the specified torque.

Torque : 34 N•m (25 lb ft)

Tailgate Assembly (RH)

Parts Location



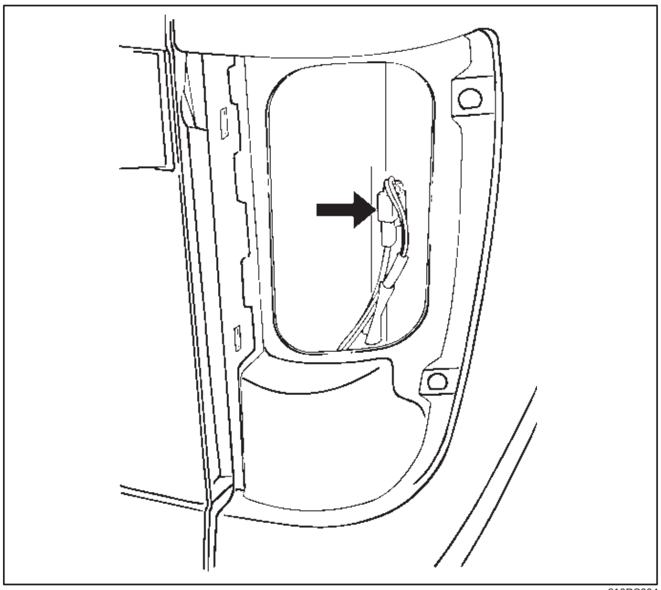
681RS004

Legend

(1) Tailgate Assembly (LH)
(2) Tailgate Trim Panel (RH)
(3) Tailgate Harness Connection
(4) Rear Combination Light (RH)
(5) Tailgate Fixing Bolt
(6) Tailgate Hinge

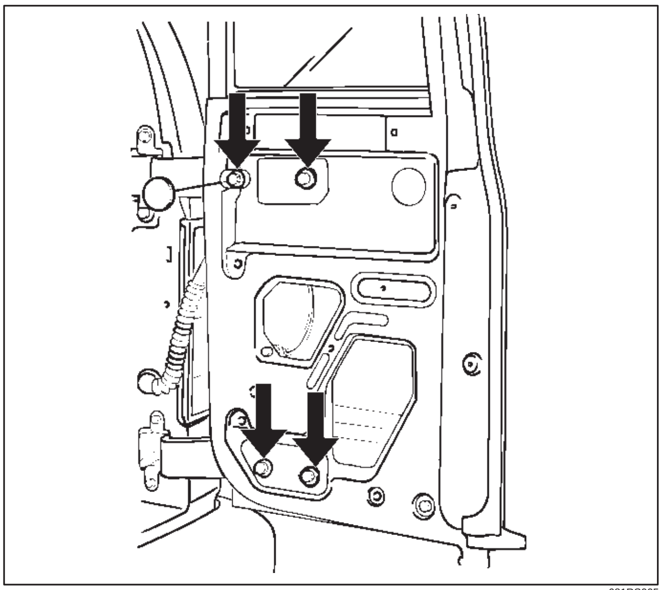
Removal

1. Disconnect the battery ground cable.
2. Remove rear combination light (RH).
3. Remove tailgate trim panel (RH).
   - Refer to Tailgate Trim Panel (RH) in Exterior / Interior Trim section.
4. Remove tailgate harness connection.
   - Disconnect the tailgate harness connection.



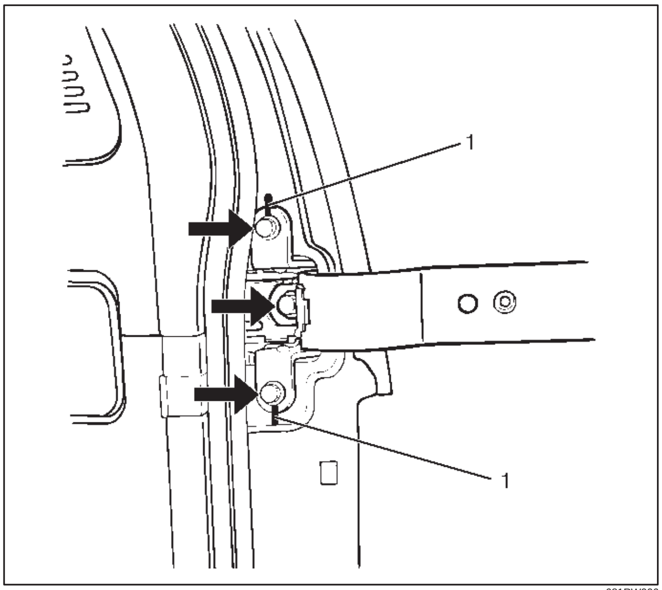
810RS004

5. Remove tailgate fixing bolt.



681RS005

6. Remove tailgate assembly (RH).
7. Remove tailgate hinge.
   - Apply a setting mark (1) on the body side hinge and remove the hinge fixing bolts.



681RW006

Installation

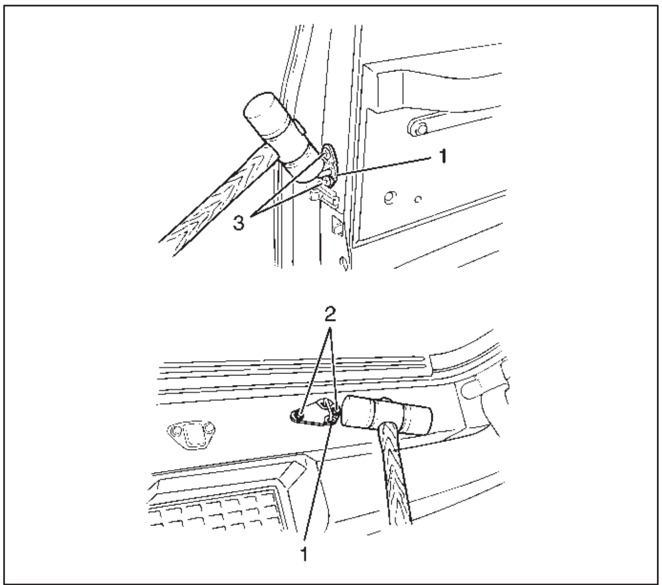
To install, follow the removal steps in the reverse order, noting the following point.

1. Apply chassis grease to the tailgate hinge moving surface.
2. Align the tailgate fitting to the body. Refer to Body Dimension in this section.
3. Tighten the hinge bolts to the specified torque.

Torque : 34 N•m (25 lb ft)

Tailgate Strikers

Adjustment



683RW012

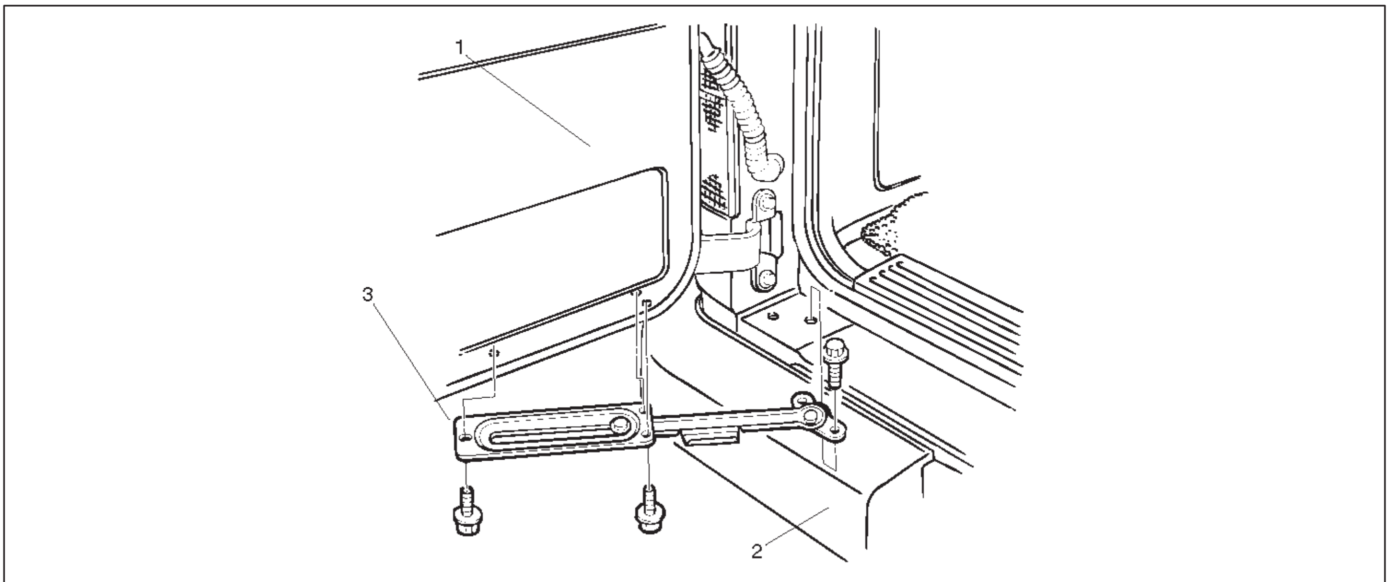
1. Loosen the striker screws (3) (or bolts (2)).
2. Tap the striker (1) with a plastic hammer to align.
3. Tighten the striker screws (3) (or bolts (2)).

Screw Torque : 15 N•m (11 lb ft)

Bolt Torque : 12 N•m (104 lb in)

Tailgate Stopper Assembly

Parts Location



683RS010

Legend

(1) Tailgate

(2) Rear Bumper

(3) Tailgate Stopper Assembly

Removal

1. Remove tailgate stopper assembly.
   - Remove the five bolts.

Installation

To install, follow the removal steps in the reverse order, nothing the following points.

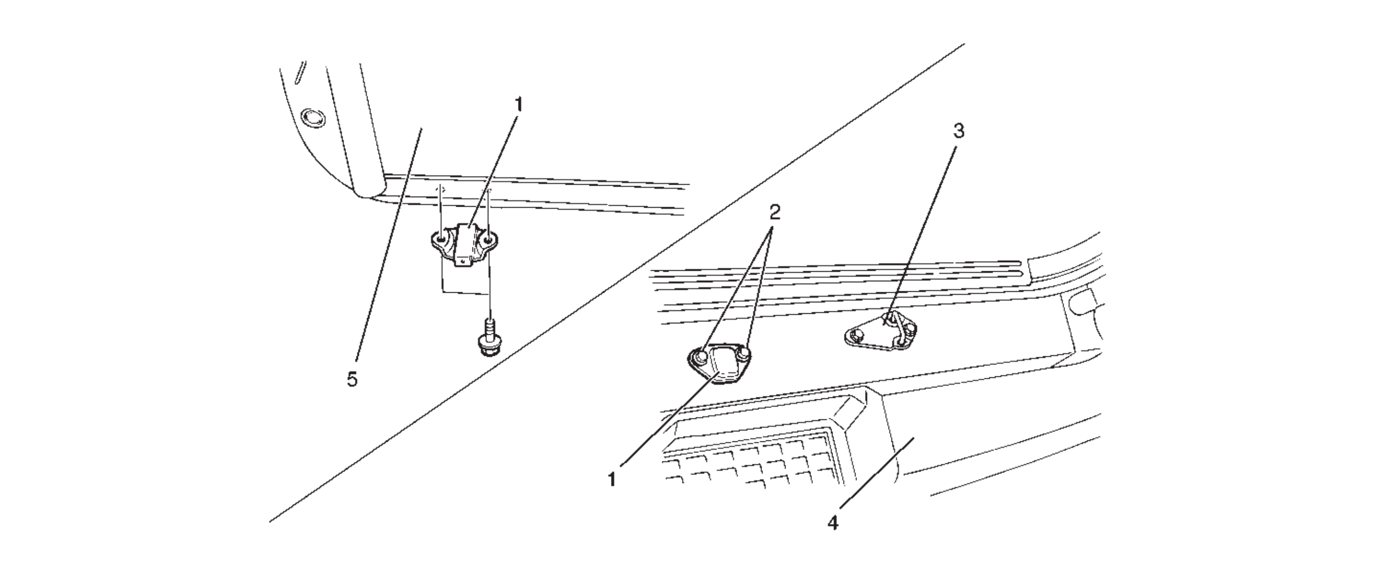
1. Tighten the fixing bolts to the specified torque.

   Torque : 12 N•m (104 lb in)

2. Apply chassis grease to the stopper moving surface.

Tailgate Dove-Tail

Parts Location



683RW011

Legend

(1) Dove-Tail
(2) Fixing Bolt
(3) Tailgate Striker
(4) Rear Bumper
(5) Tailgate (LH)

Removal

1. Remove tailgate dove-tail.
   - Remove the two bolts from each side.

Installation

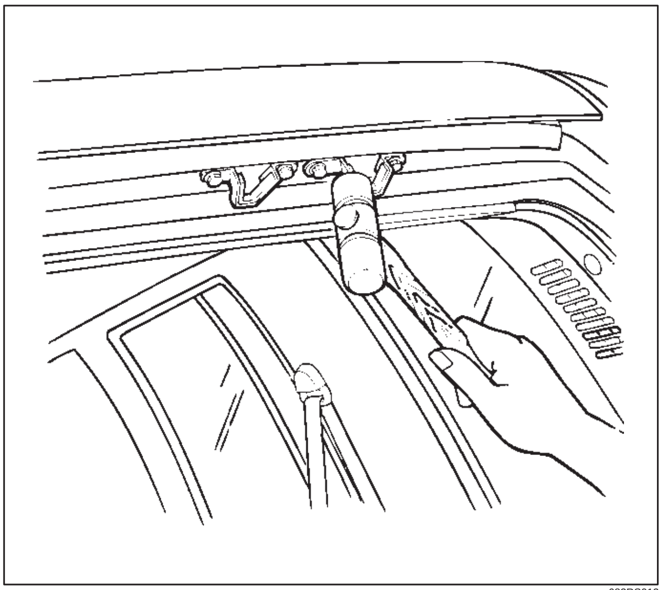
To install, follow the removal steps in the reverse order, nothing the following points.

1. Apply chassis grease to the dove–tail (A) moving surface.
2. Tighten the fixing bolts to the specified torque.

Torque : 12 N•m (104 lb in)

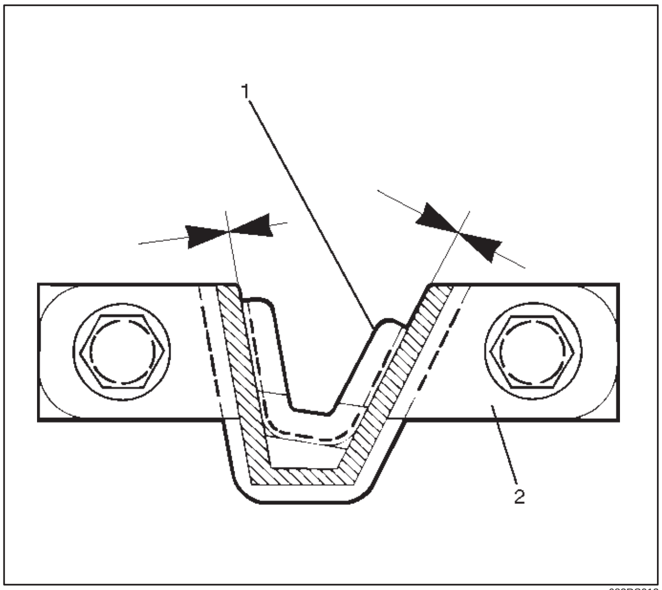
Tailgate Dove-Tail Striker

Adjustment



683RS012

1. Loosen the striker bolts.
2. Tap with a plastic hammer to align.
   - Gaps between Dove–Tail Striker (2) and bracket (1) are 0 mm (No clearance).



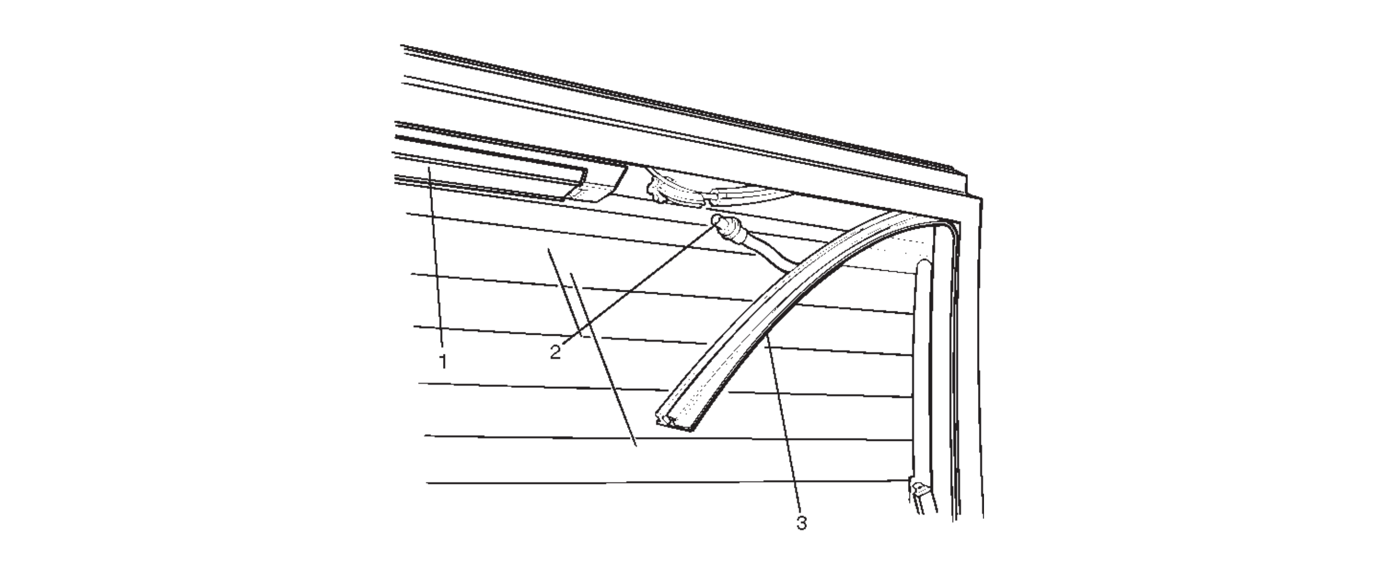
683RS013

3. Tighten striker bolts.

Torque : 12 N•m (104 lb in)

Tailgate Frame Cover (LH)

Parts Location



684RW001

Legend

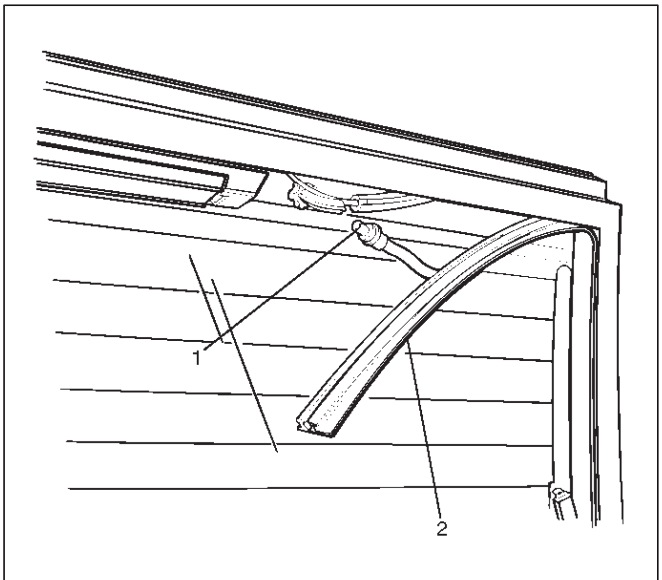
(1) High Mount Stop Light

(2) Washer Tube

(3) Tailgate Frame Cover

Removal

1. Disconnect the battery ground cable.
2. Remove tailgate frame cover.
   - Pull the tailgate frame cover (2) out.
   - Disconnect the washer tube (1) at the nozzle and pull the washer tube out from the frame cover (2).
   - Disconnect the rear defogger and pull the harness from the cover.

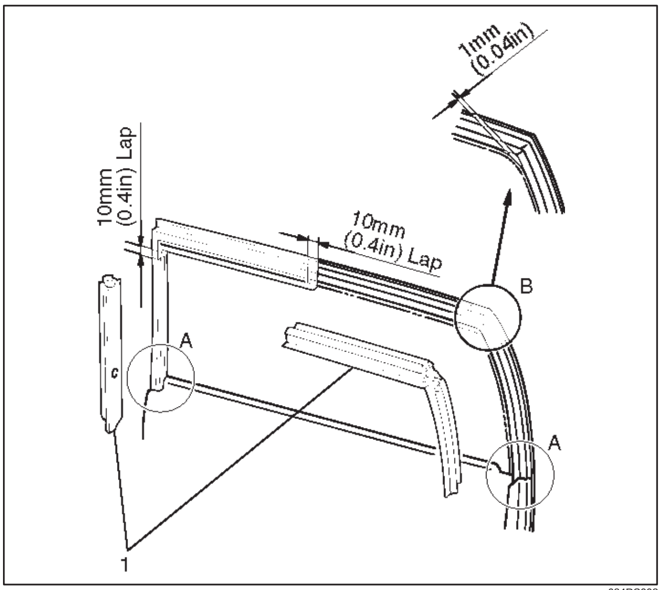


684RW002

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Hit the lower A edge portion of the cover (1) to the tailgate flange.
2. Clearance between the frame cover and the tailgate panel (B portion) is 1 mm (0.04 in).

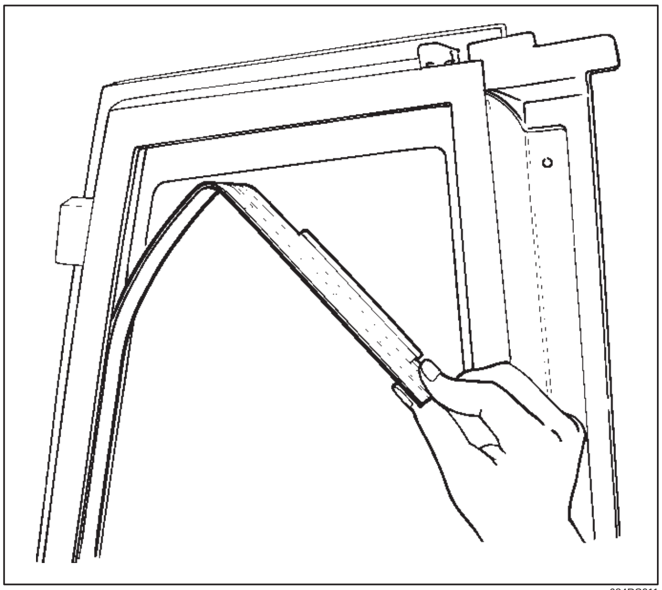


684RS008

Tailgate Frame Cover (RH)

Removal

1. Remove tailgate frame cover (RH).
   - Pull the frame cover out from the tailgate frame.

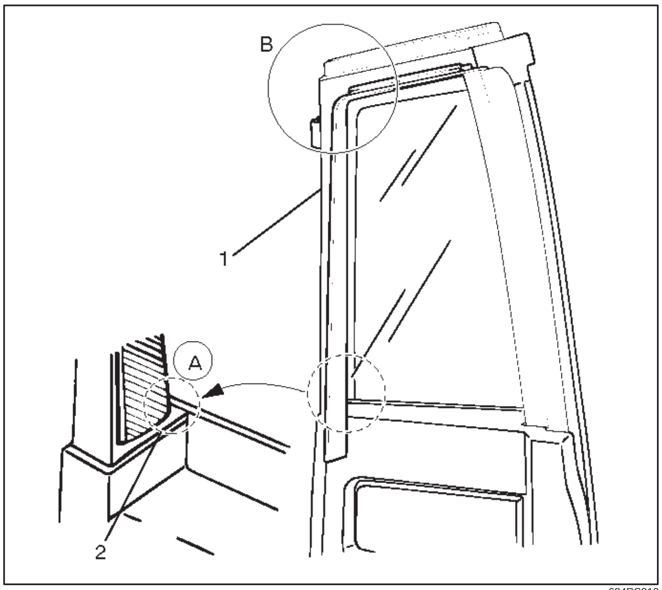


684RS011

Installation

To install, follow the removal steps in the reverse order, noting the following points.

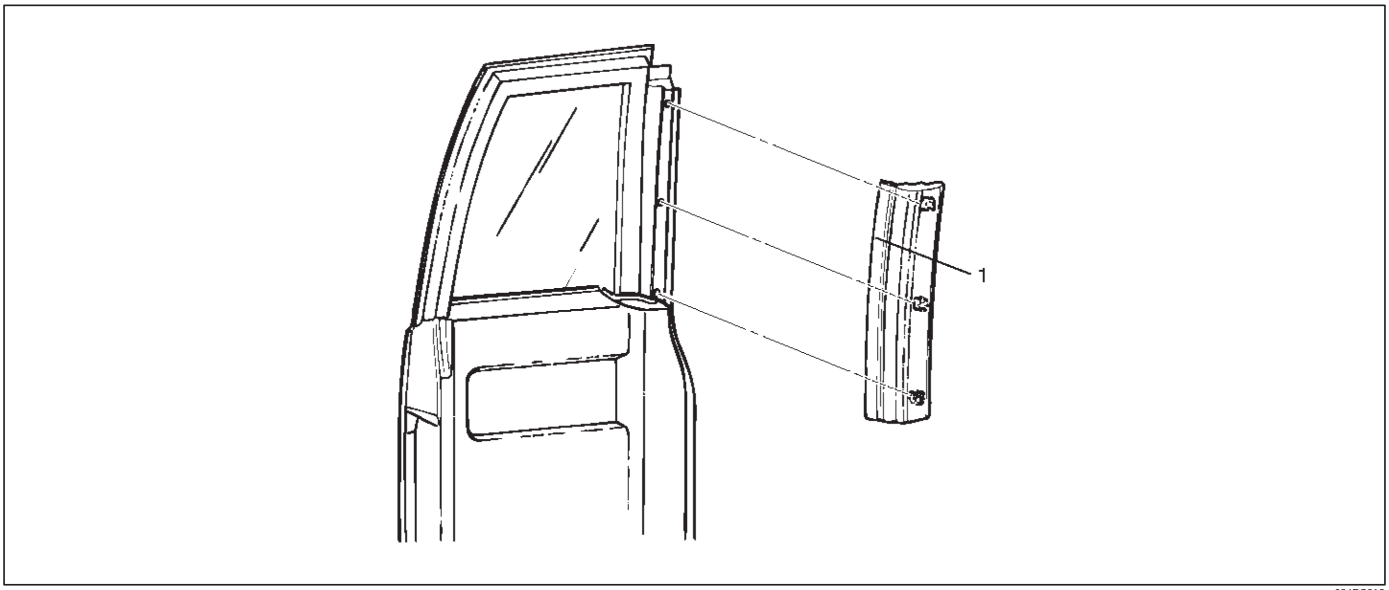
1. Hit the lower A edge portion (2) of the tailgate frame cover (1).
2. Clearance between the frame cover and the tailgate panel (B portion) is 1 mm (0.04 in).



684RS010

Tailgate Sash Trim Cover

Parts Location



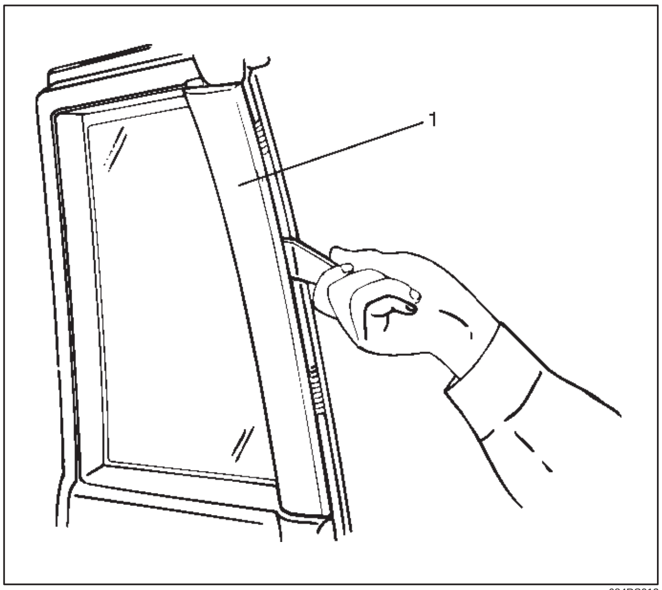
684RS012

Legend

(1) Tailgate Sash Trim Cover

Removal

1. Remove tailgate sash trim cover (1).
   - Pry the tailgate trim cover retainers free from the tailgate panel.



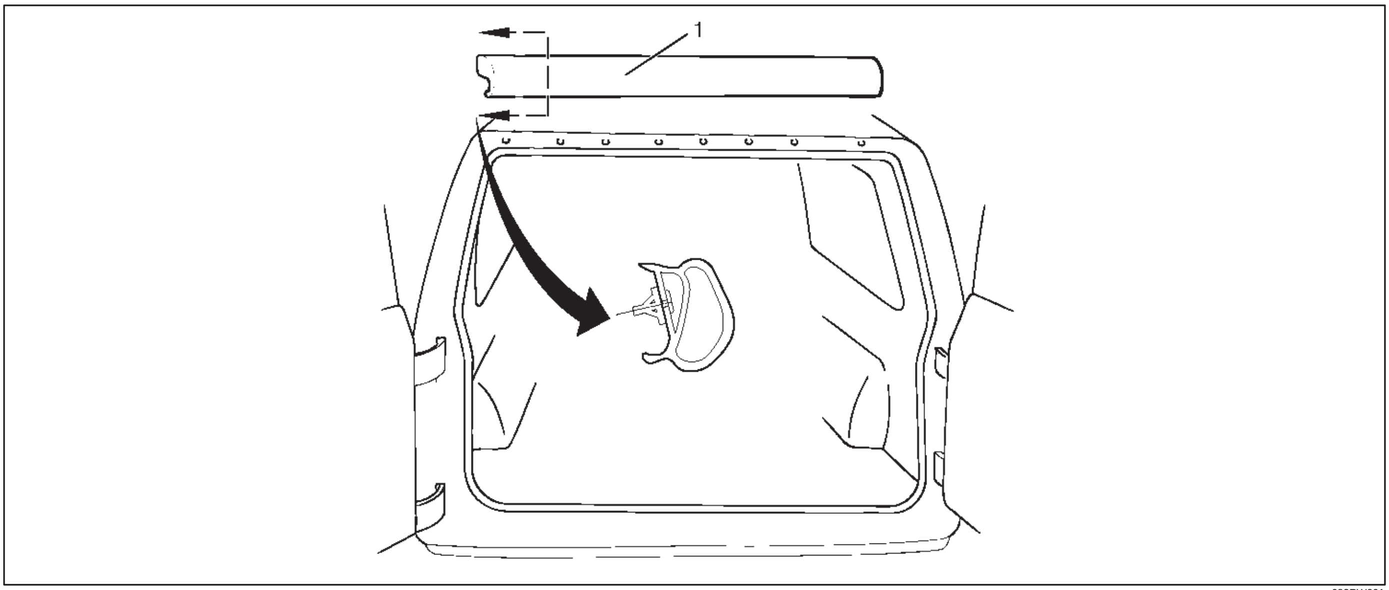
684RS013

Installation

1. Tailgate sash trim cover (1).
   - Insert the trim cover retainers into the tailgate hole securely so that there are no gaps between them.

Tailgate Outer Weatherstrip

Parts Location



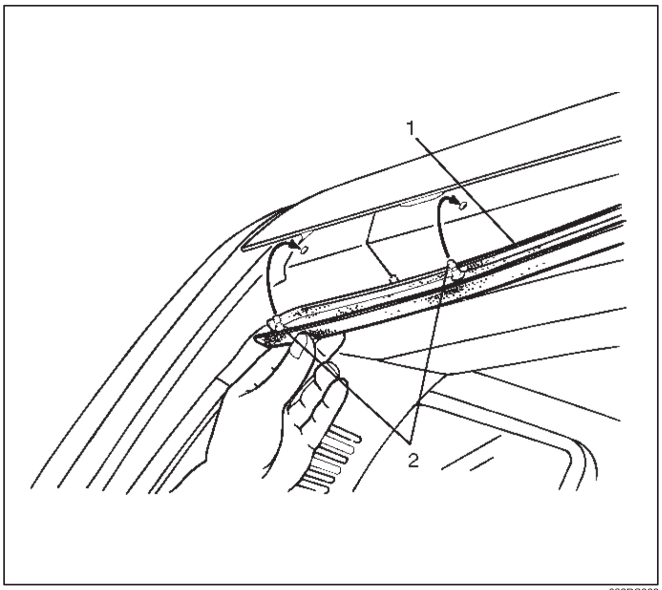
682RW001

Legend

(1) Tailgate Outer Weatherstrip

Removal

1. Disconnect the battery ground cable.
2. Remove tailgate outer weatherstrip (1).
   - Pry the tailgate outer weatherstrip clips (2) free from the body panel.



682RS002

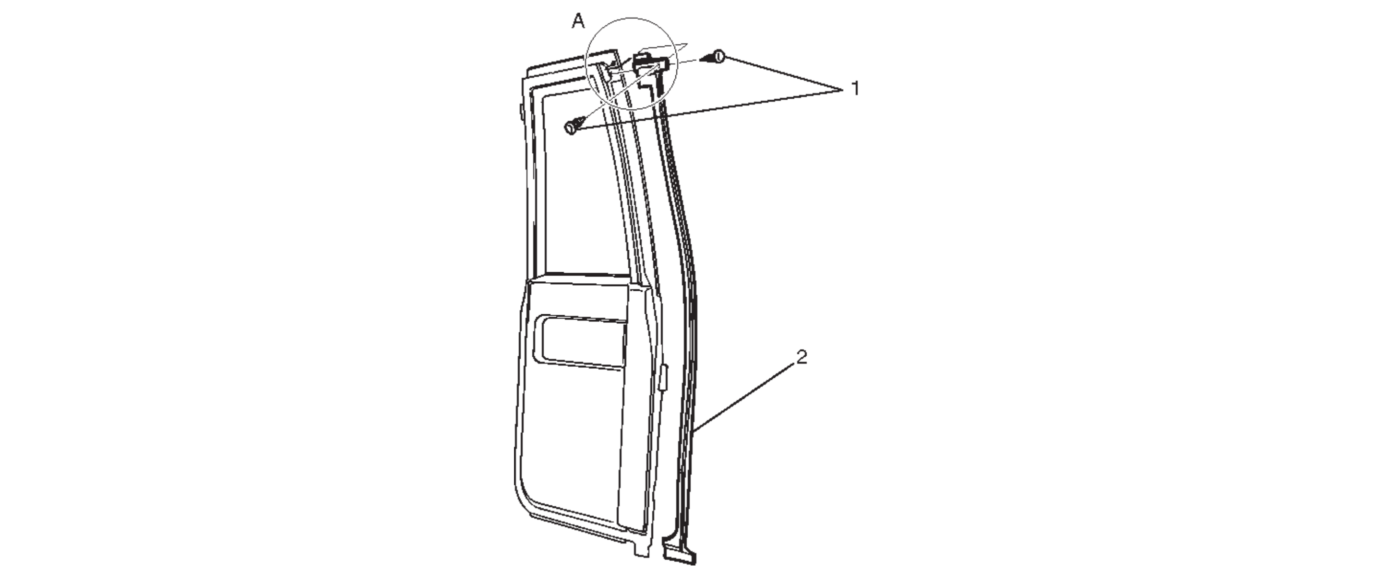
Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Insert the tailgate outer weatherstrip clip into the body panel hole securely in order to install the tailgate outer weatherstrip with the gap between the body panel and the weatherstrip.

Tailgate Center Weatherstrip

Parts Location



682RS003

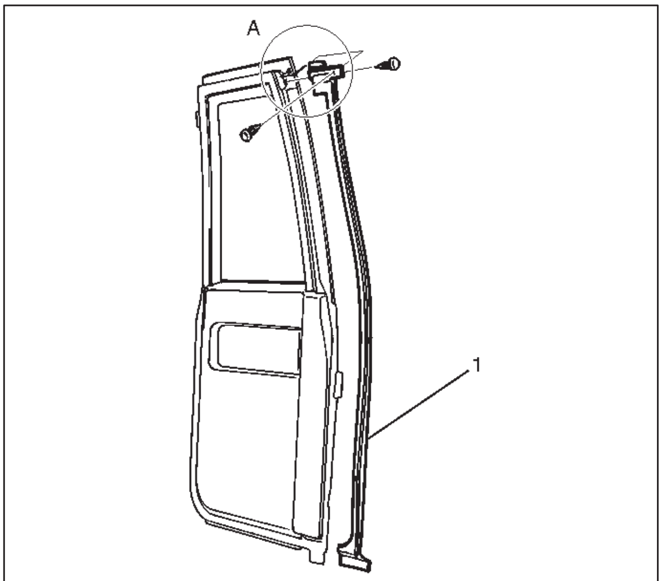
Legend
(1) Clip
(2) Tailgate Center Weatherstrip

Removal

1. Remove tailgate center weatherstrip.
   - Remove the fixing clips in order to pull the tailgate center weatherstrip out from the tailgate panel.

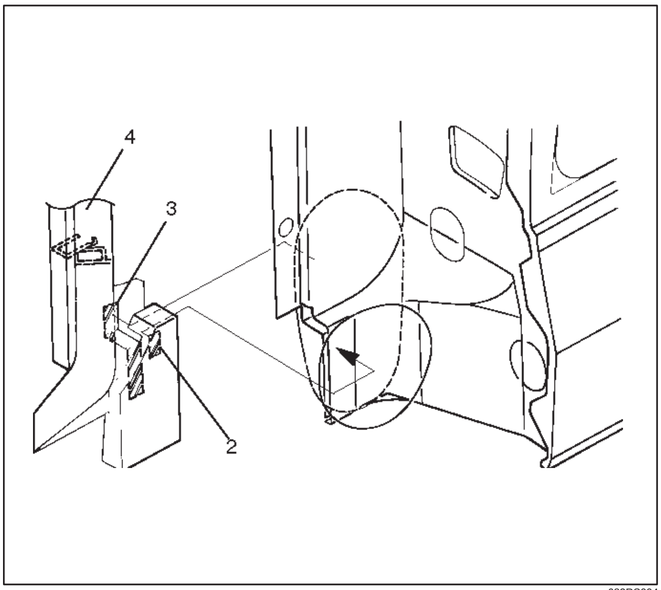
Installation

1. Tailgate center weatherstrip (1).
   - Start assembling at the A portion.



682RW006

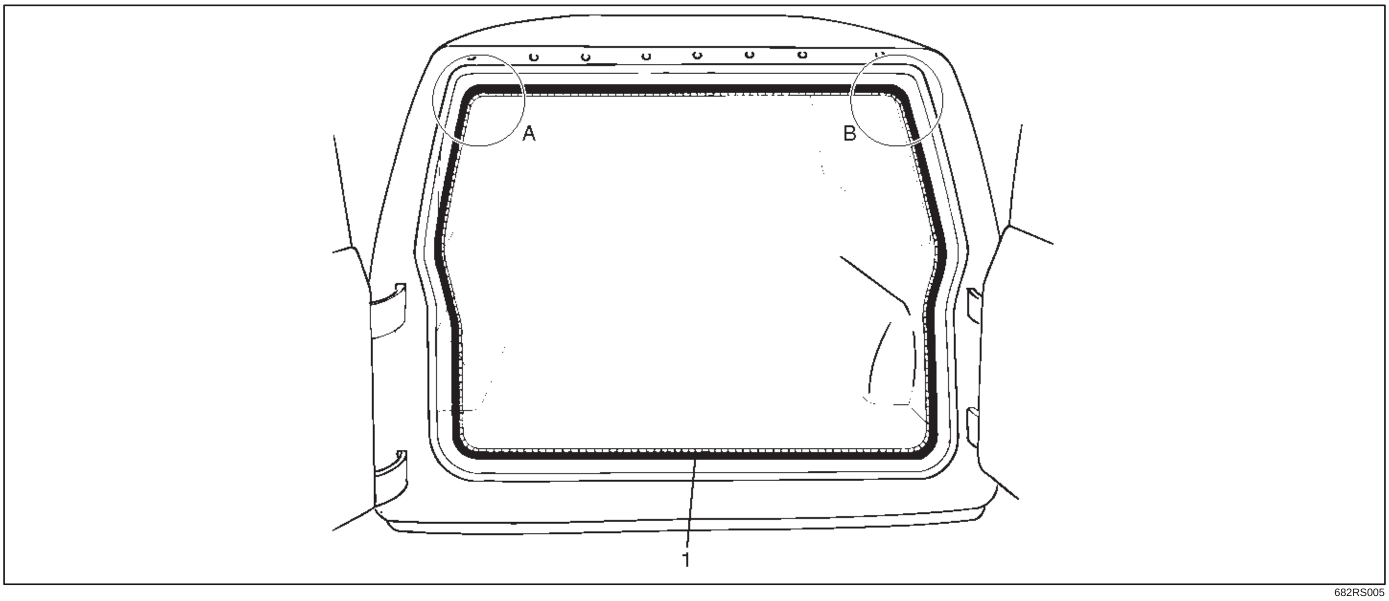
- Clean the tailgate center weatherstrip (4) adhesive tape (2) and the butyl seal (3) fitting position of the tailgate panel.
- Affix new adhesive tape and the butyl seal to the weatherstrip (lower side) in order to install the tailgate center weatherstrip to the tailgate panel with no gap between them.



682RS004

Tailgate Main Weatherstrip

Parts Location



Legend

(1) Tailgate Main Weatherstrip

Removal

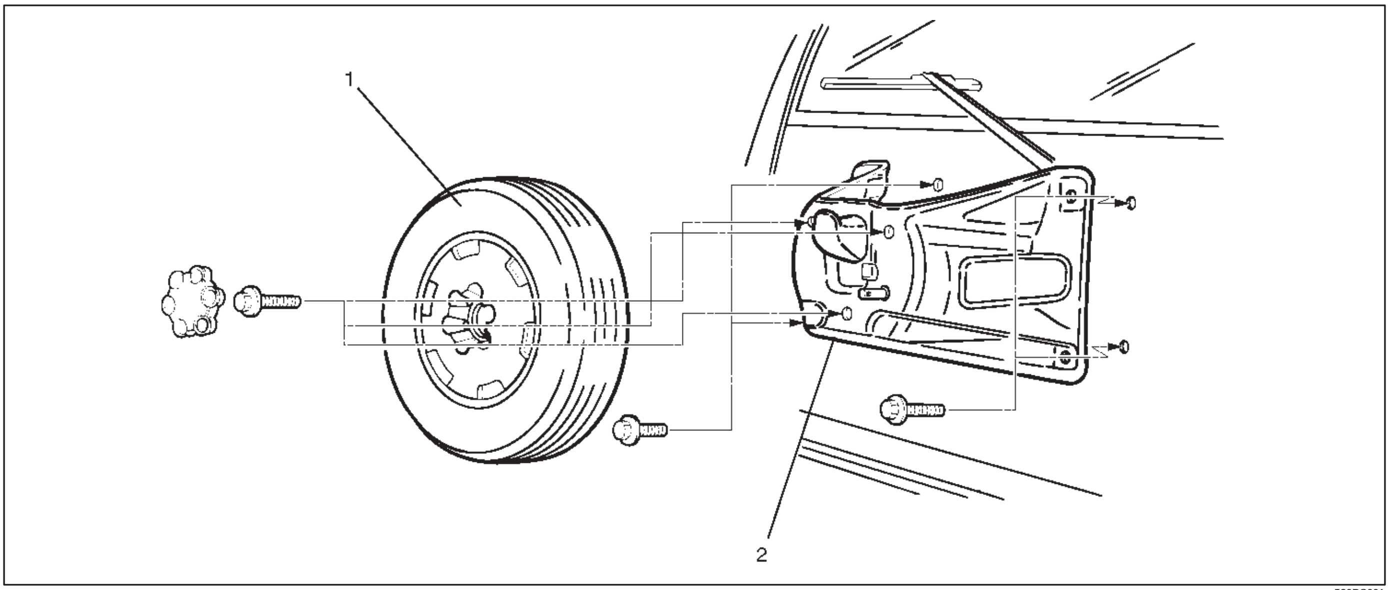
1. Remove tailgate main weatherstrip.
   - Pull the tailgate main weatherstrip out from the body panel.

Installation

1. Tailgate main weatherstrip.
   - Align the A and B positions to the corners of the body panel. Install the tailgate main weatherstrip to the body panel by gently tapping with a plastic hammer. There should be not clearance between the body panel the tailgate main weatherstrip.

Spare Tire Carrier

Parts Location



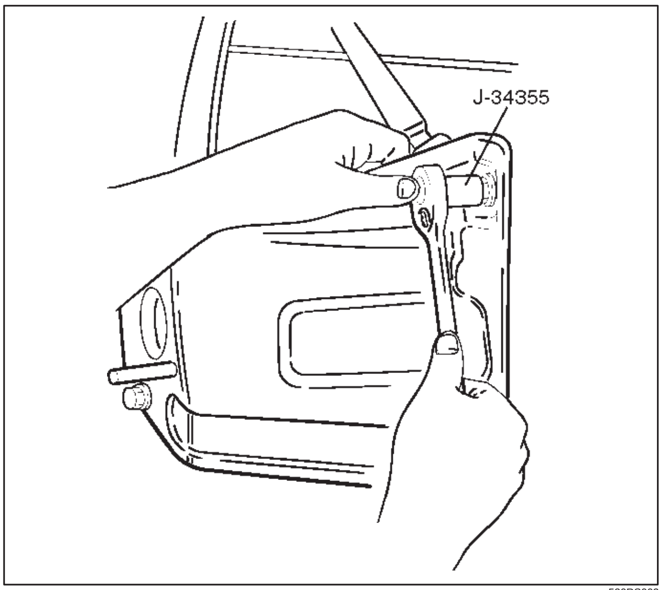
530RS001

Legend

(1) Spare Tire
(2) Spare Tire Carrier

Removal

1. Remove spare tire.
2. Remove spare tire carrier by using spare tire carrier nut wrench J–34355.



530RS002

Installation

1. Install the spare tire carrier.
   - Tighten the carrier fixing bolts to the specified torque.

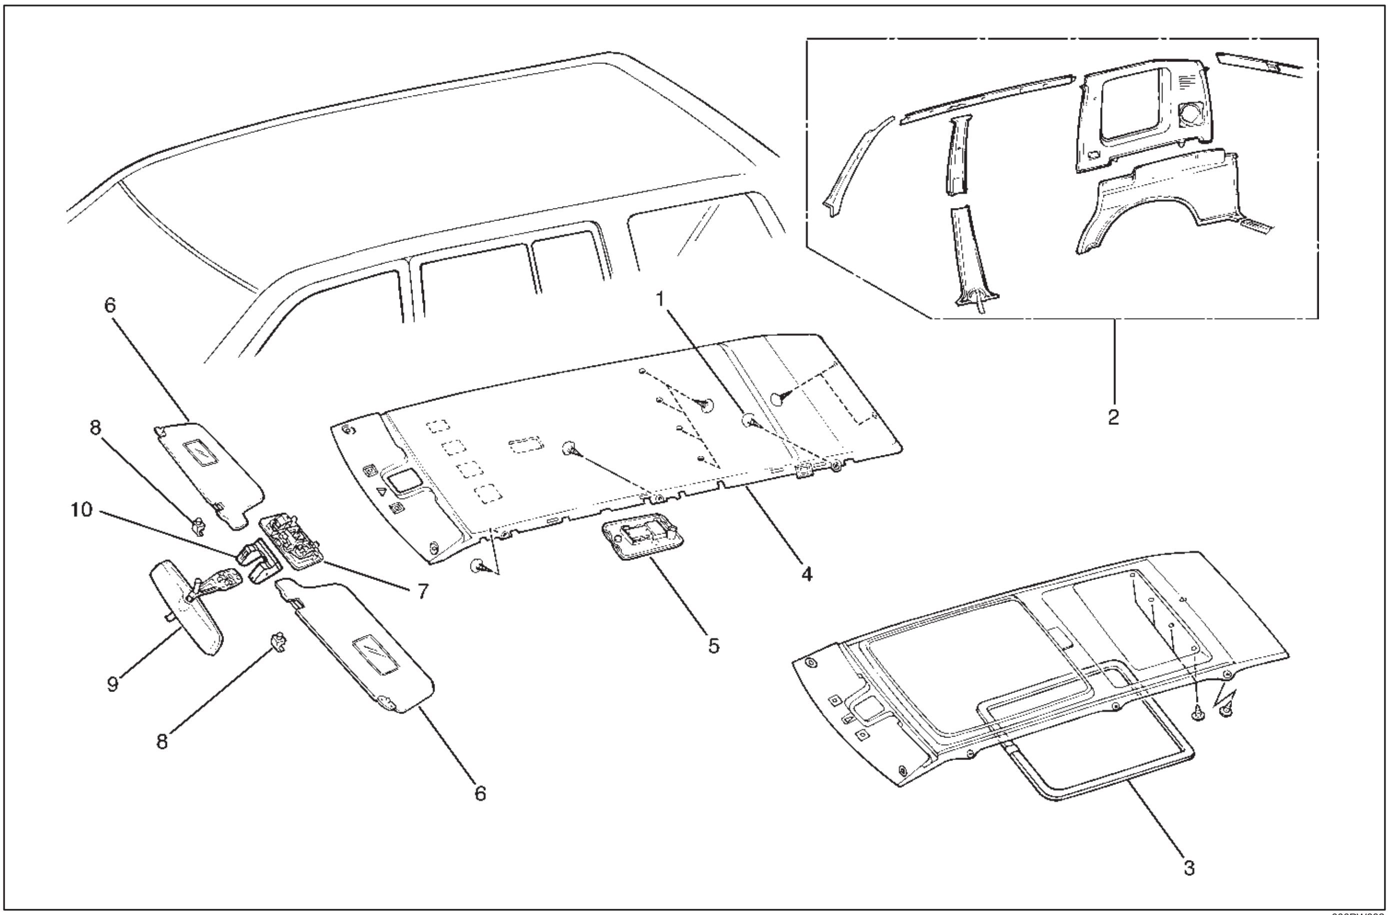
   Torque : 31 N•m (23 lb ft)

2. Install the spare tire.
   - Tighten the spare tire fixing bolts to the specified torque.

   Torque : 118 N•m (87 lb ft)

Headlining

Parts Location



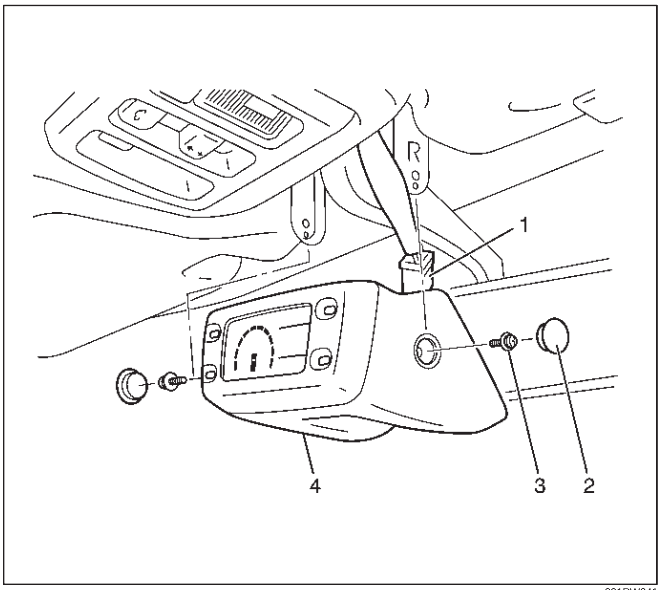
666RW003

Legend

(1) Clip
(2) Interior Trim Panels
(3) Sun Roof Finisher (W/Sun Roof)
(4) Headlining
(5) Dome Light
(6) Sunvisors
(7) Map Light
(8) Sunvisor Holder
(9) Rear View Mirror
(10) Multi Meter

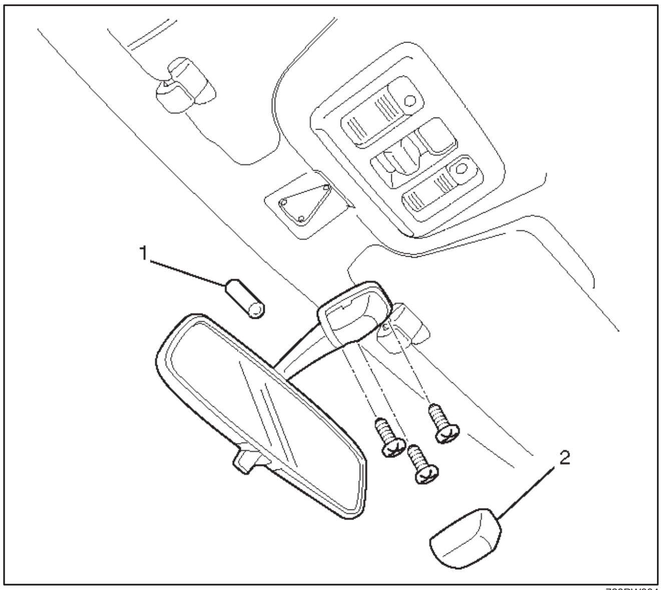
Removal

1. Disconnect the battery ground cable.
2. Remove interior trim panels.
   - Refer to the Exterior / Interior Trim section.
3. Remove dome light.
   - Remove the dome light lens and the fixing screws.
   - Disconnect the dome light connectors.
4. Remove multi meter (4).
   - Remove two caps (2), two screws (3) and disconnect the connector (1).



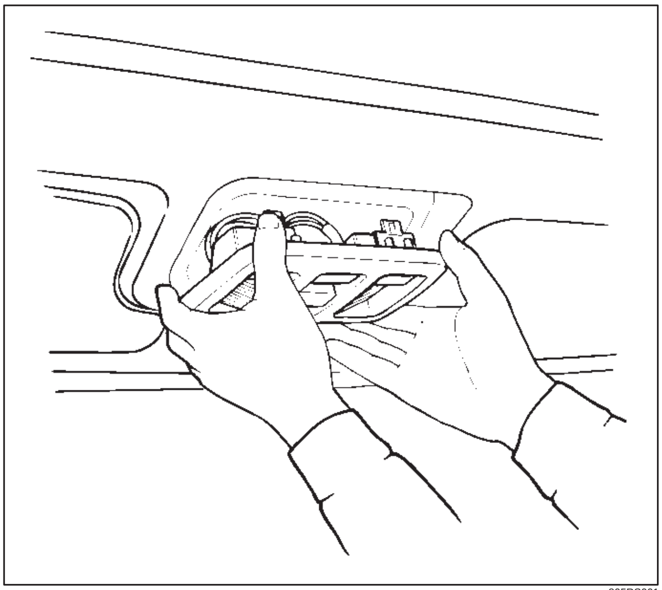
821RW241

5. Remove rear view mirror.
   - Remove the rubber stopper (1).
   - Pry off the mirror stay cover (2) and remove 3 screws.



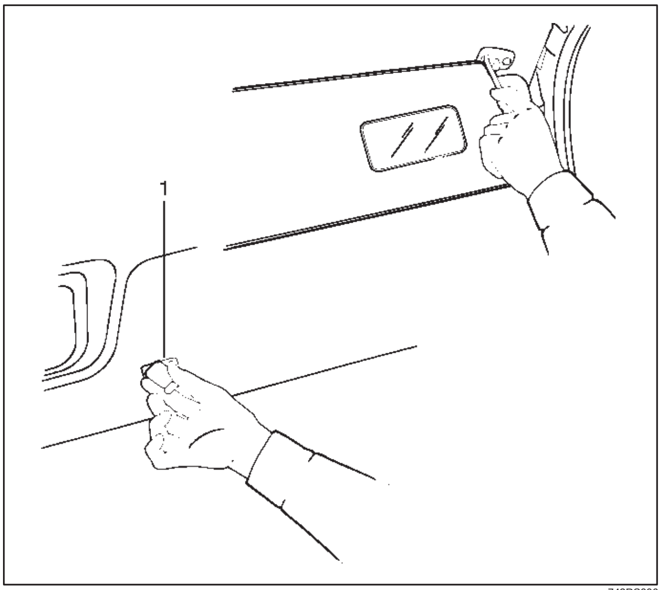
720RW004

6. Remove map light/sun roof switch.
   - Pry the map light clip free from the map light/sun roof switch bracket and disconnect the connector.



805RS001

7. Remove sunvisors.
   - Remove the fixing screw and turn the sunvisor holder (1) to remove it.
   - Disconnect the vanity mirror illumination connector.



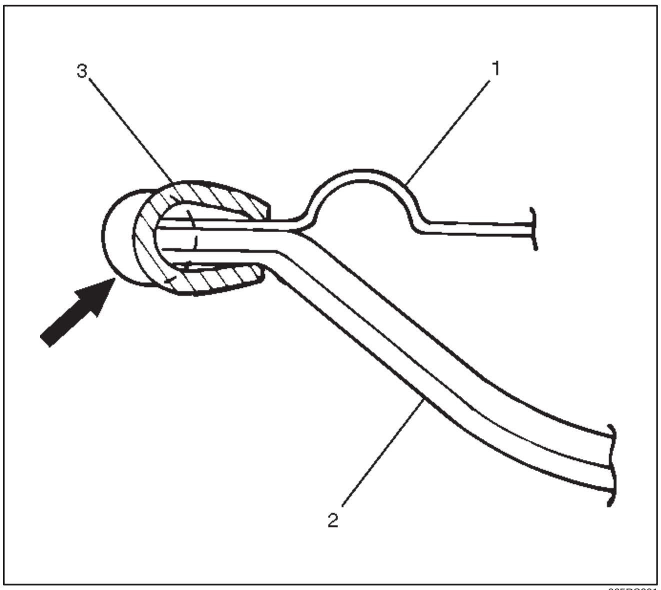
743RS006

8. Remove sun roof finisher (W/Sun roof).
9. Remove headlining.
   - Remove the headlining fixing clips.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

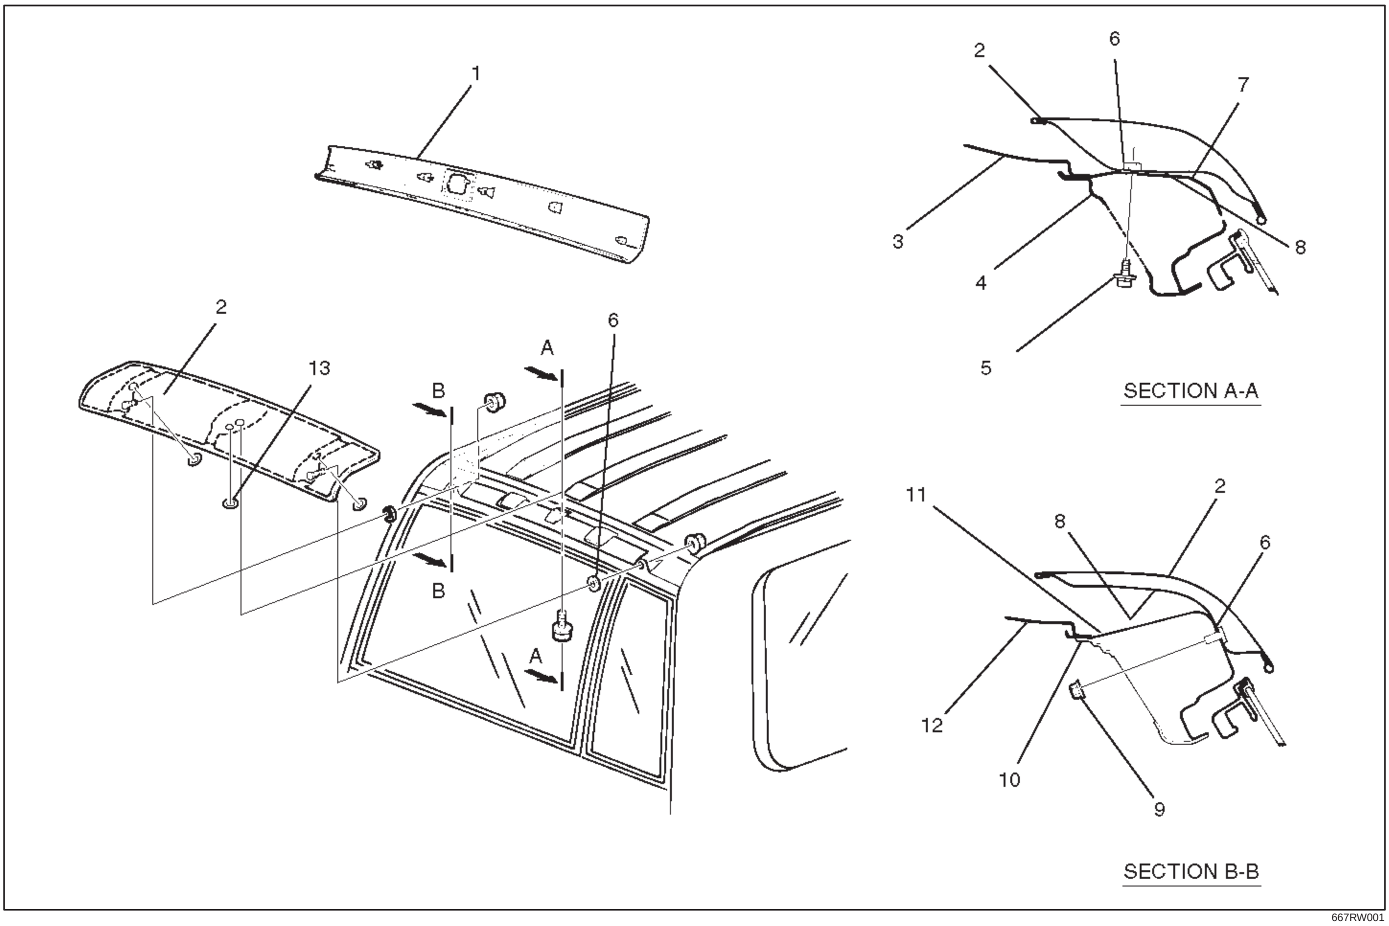
1. Install the headlining so that the fixing clips will not come off.
2. To install the sun roof finisher (3), first fit in at one place with the head lining (2) close to the sun roof frame complete (1), then install the entire finisher tightly by hitting it with a plastic hammer, not allowing it to move up.



665RS001

Rear Air Deflector

Parts Location



Legend

(1) Rear Roof Trim Cover
(2) Rear Air Deflector
(3) Roof Rail
(4) Rear Inner Roof Rail
(5) Fixing Bolt
(6) Nylon Washer
(7) Rear Outer Roof Panel
(8) Seal
(9) Fixing Nut
(10) Rear Pillar Upper Reinforcement
(11) Rear Outer Roof Rail
(12) Roof Panel
(13) Grommet

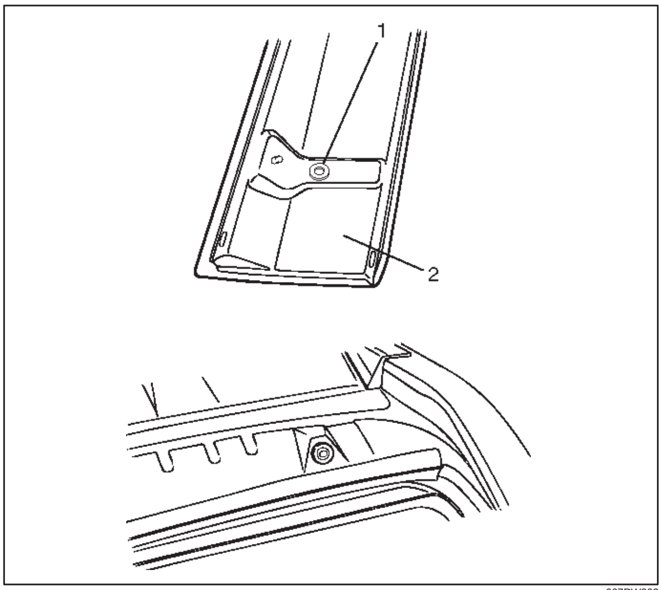
Removal

1. Disconnect the battery ground cable
2. Remove rear roof trim cover.
   - Refer to Luggage Side and Quarter Upper Trim Cover in Exterior / Interior Trim section.
3. Remove rear air deflector.
   - Take notice of the grommet and the nylon washer.

Installation

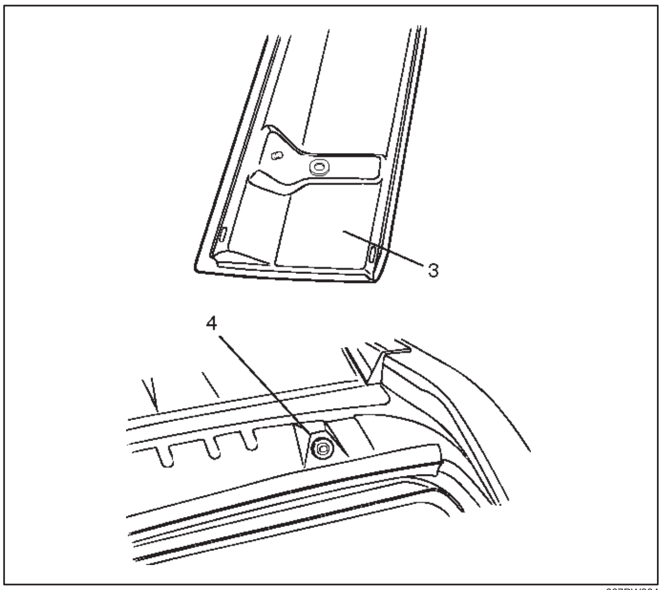
To install, follow the removal steps in the reverse order, noting the following points.

1. Install the grommet (1) to the air deflector (2) drain hole.



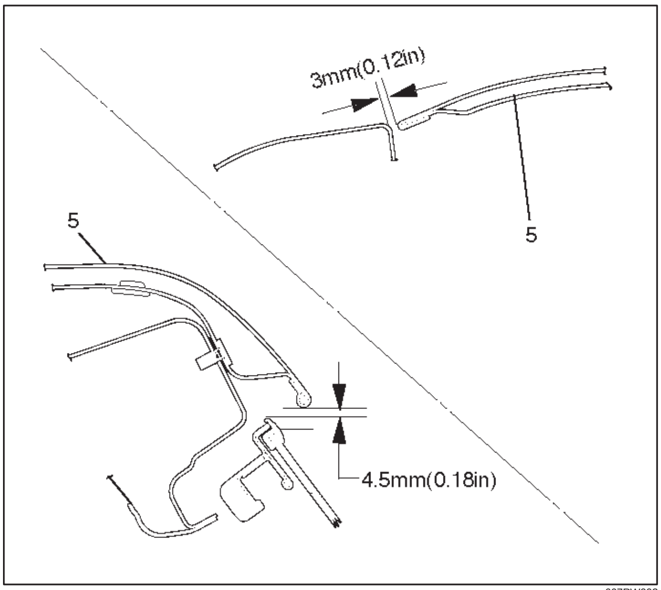
667RW002

2. Use a new nylon washer (4). Peel off the adhesive tape of the washer to install the nylon washer to the air deflector (3).



667RW004

3. Install the air deflector (2) to the roof by referring to the specified values shown in the illustration.



667RW003

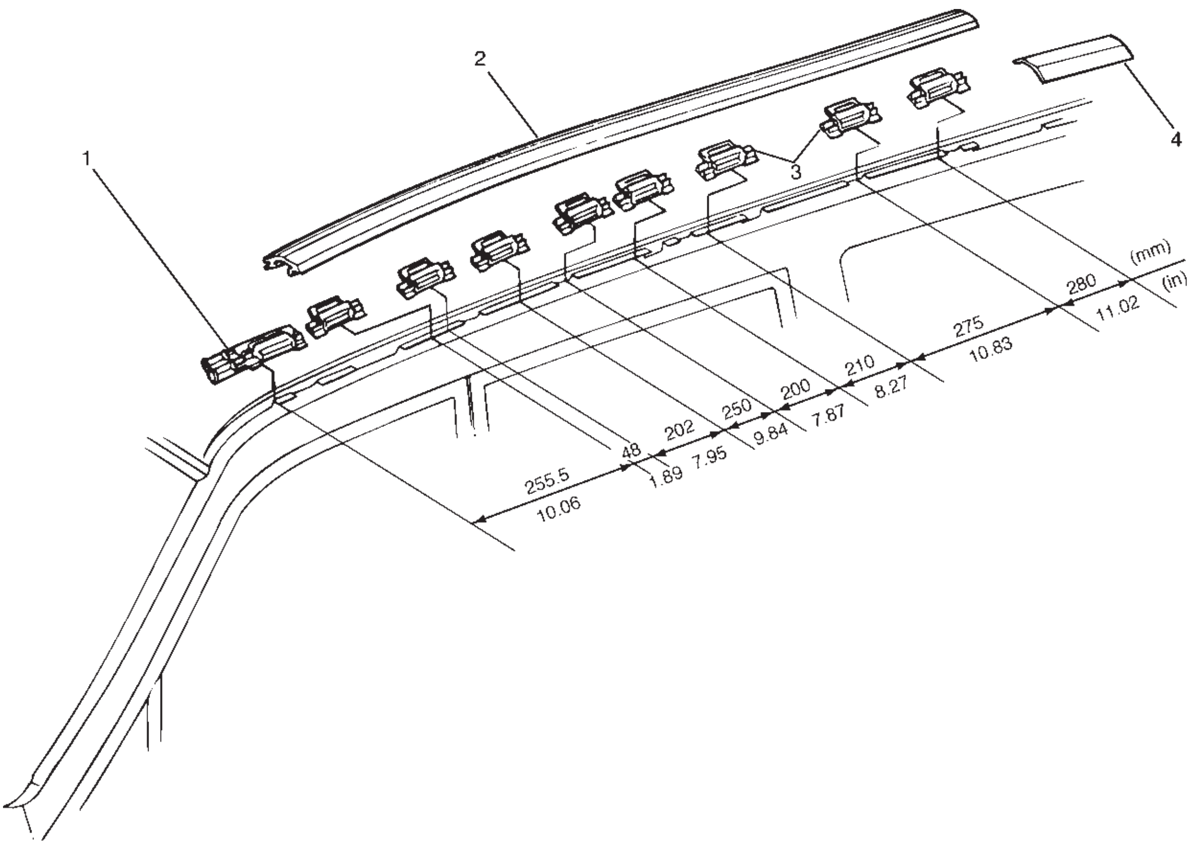
4. Tighten the deflector fixing to the specified torque.

Bolt Torque : 6 N•m (52 lb in)

Nut Torque : 8 N•m (69 lb in)

Roof Moulding

Parts Location



645RX002

Legend

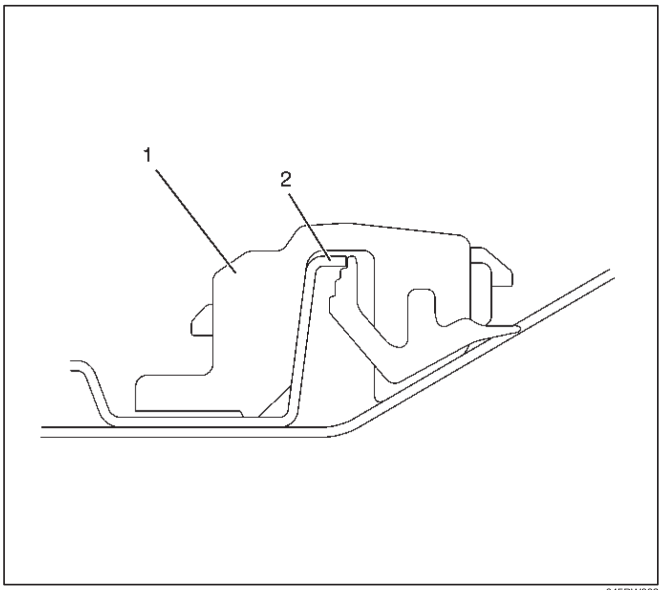
(1) Windshield Side Moulding Upper Clip
(2) Roof Moulding
(3) Roof Moulding Clip
(4) Roof End Moulding

Removal

1. Disconnect the battery ground cable.
2. Remove roof moulding.
3. Remove roof end moulding.
   - Remove the sealing adhesive and the adhesive tape of the roof end moulding from the panel using a knife or scraper while you peel them off.
4. Remove roof moulding clip.
   - Remove the clips.

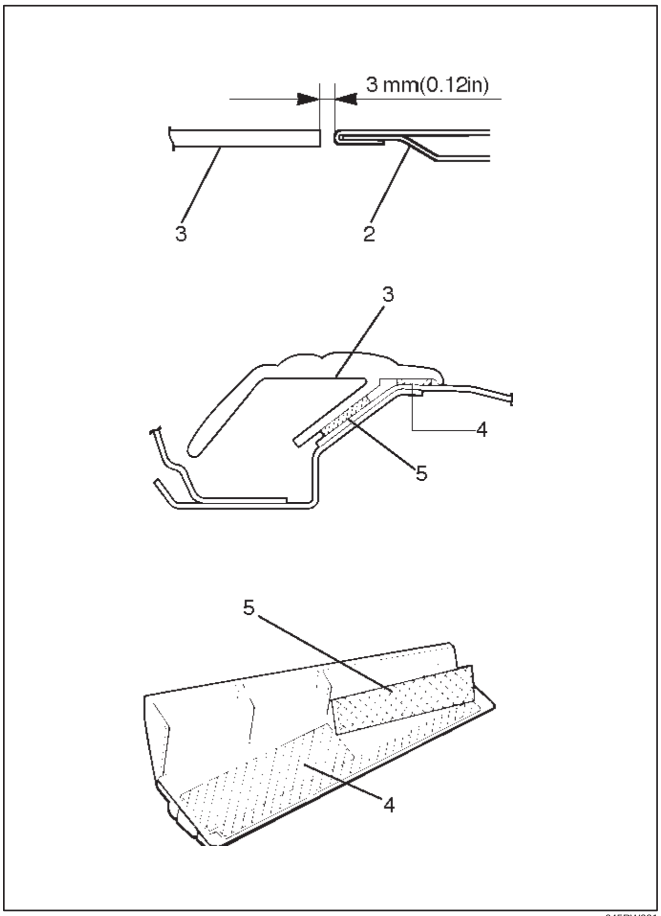
Installation

1. Install the roof moulding clip (1).
   - Install the clips to the specified positions on the roof panel flange (2).



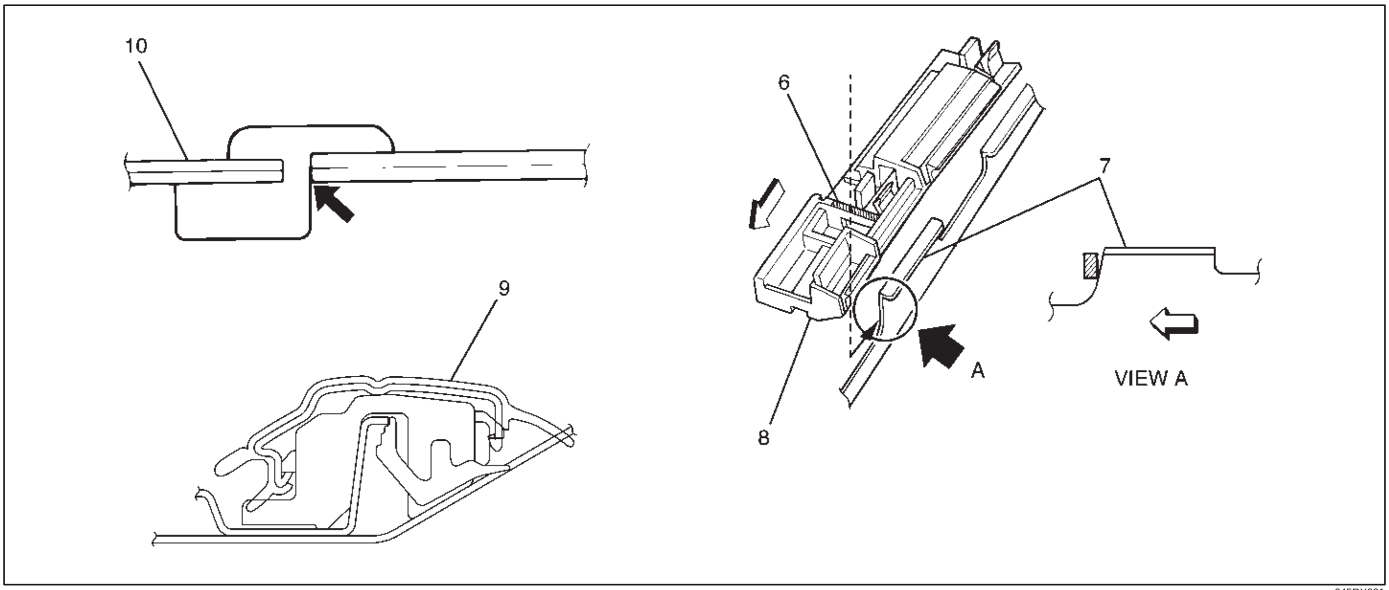
645RW003

2. Install the roof end moulding (3).
   - Clean the body panel where the roof end moulding is installed.
   - Install the roof end moulding and the rear air deflector (2) so that the installation clearance between them is within the specified values. Securely fix it with the adhesive tape (4) and sealing adhesive (5).



645RW001

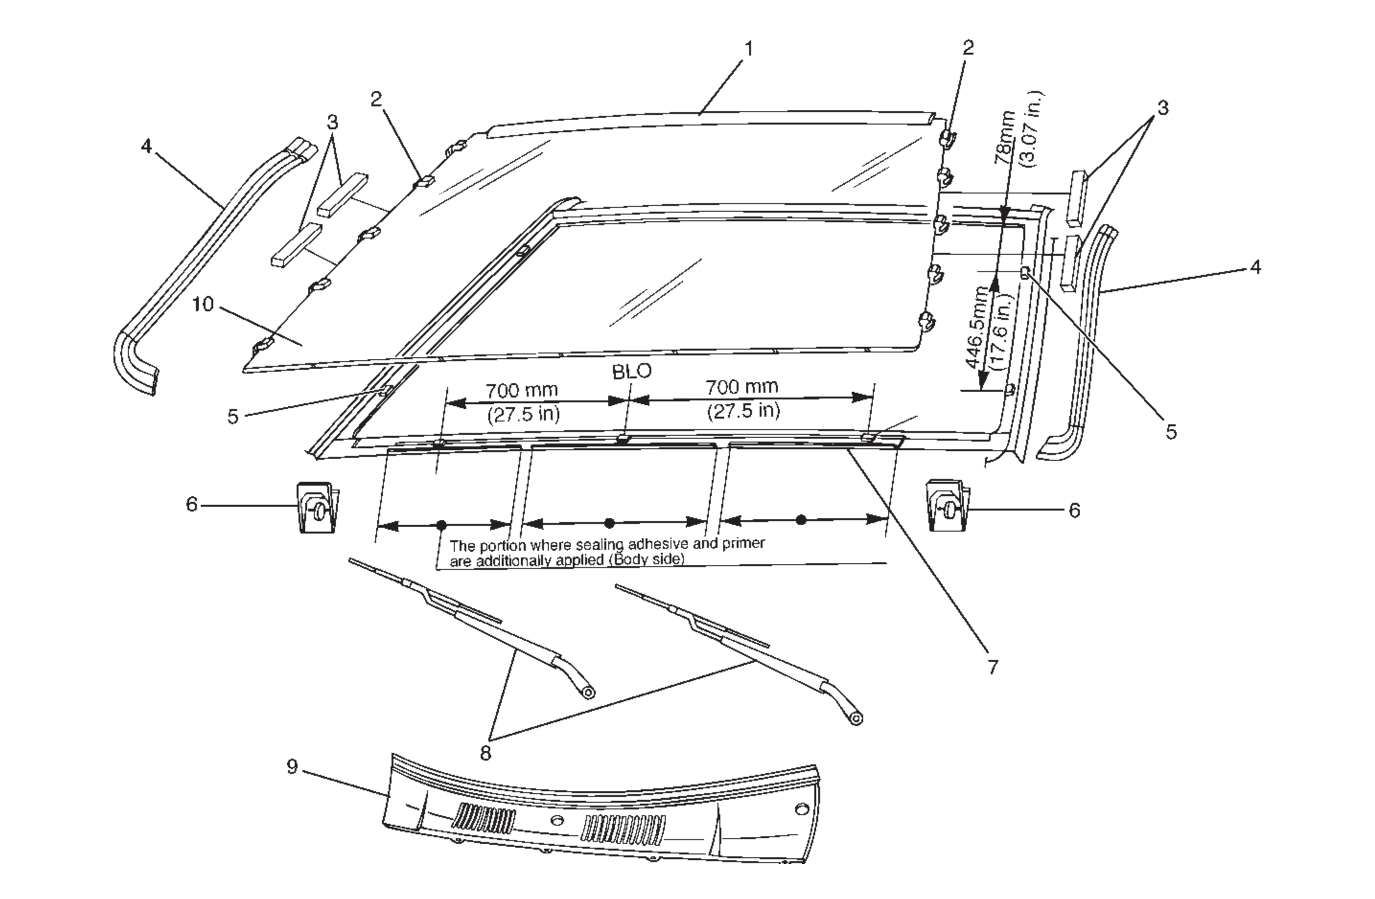
3. Install the roof moulding (9).
   - Assemble the windshield side moulding upper clip (8) to the roof panel with the clip positioning rib (6) (oblique lines portion) attached to the roof panel flange (7). Assemble the roof moulding (9) while you attach the front edge portion of the roof molding to the windshield side moulding (10).



645RX001

Windshield

Parts Location



607RX001

Legend
- (1) Windshield Upper Moulding

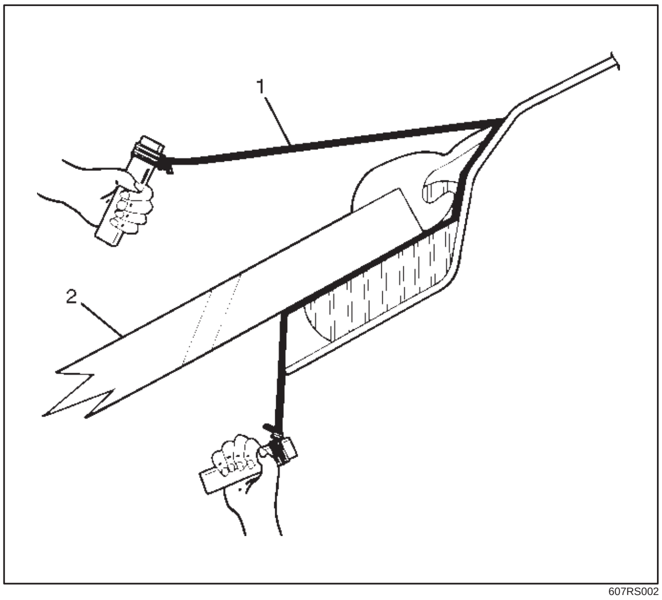
- (5) Spacer
- (6) Windshield Support
- (7) Cowl Upper Rail Flange
- (8) Windshield Wiper
- (9) Front Cowl Cover
- (10) Windshield

Removal

1. Disconnect the battery ground cable.
2. Remove windshield wiper.
   - Refer to Windshield Wipper Arm/Blade in Wiper/Washer System section.
3. Remove front cowl cover.
   - Refer to Cowl Cover in this section.
4. Remove windshield side moulding.
   - Pull the moulding out from the windshield side moulding clip.
5. Remove windshield support.
6. Remove windshield side seal.
7. Remove windshield (2).

- Use a knife or pick to make a hole in part of the adhesive caulking material.

- Secure one end of a piece of steel piano wire (1) (0.02 inches in diameter) to a piece of wood that can serve as a handle.



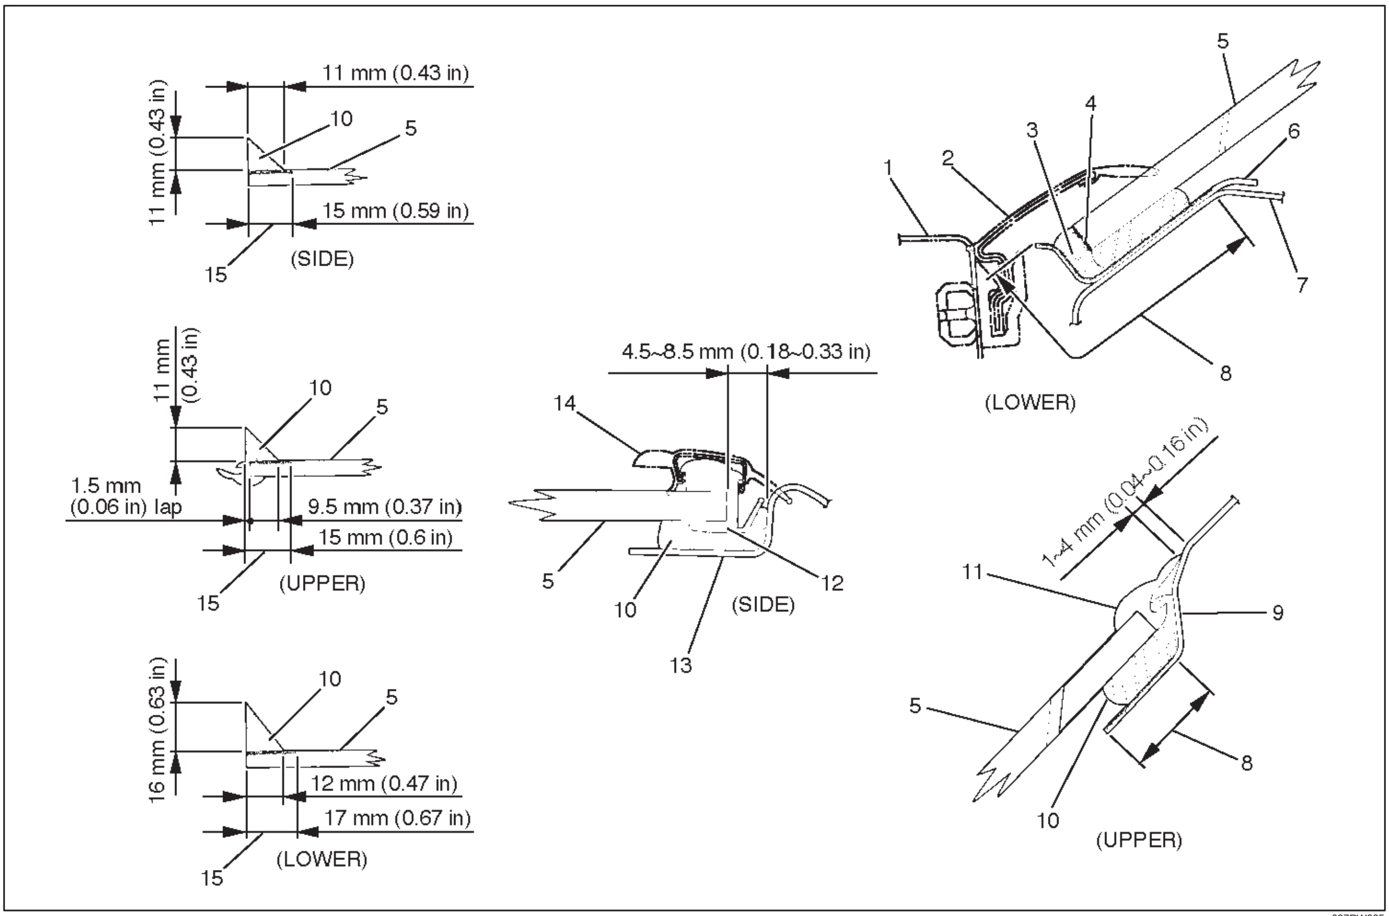
- Use a pair of needle nose pliers to insert the other end of the piano wire through the adhesive caulking material at the edge of the windshield glass.
- Secure the other end of the piano wire to another piece of wood.
- With the aid of an assistant, carefully move the piano wire with a sawing motion to cut through the adhesive caulking material around the entire circumference of the windshield glass.
- Clean the remaining adhesive caulking material from the area of the body which holds the windshield.

8. Remove windshield upper moulding.
   - Taking notice of the adhesive tape, and peel the moulding off the windshield upper portion.
9. Remove moulding clip.
10. Remove spacer.

Installation

1. Install the spacer (1).
   - Clean the bonding surfaces of both the windshield and the body panel.
   - When installing the spacers, align the lower side spacer to the R stop of the body panel and the side spacer to the end of the body panel. Be sure to always use a new spacer.

   - Be absolutely sure to apply glass primer and body primer to the body panel as shown in the illustration.



607RW005

Legend

(13) Front Pillar Outer Panel
(14) Windshield Side Moulding
(15) Sealing Adhesive

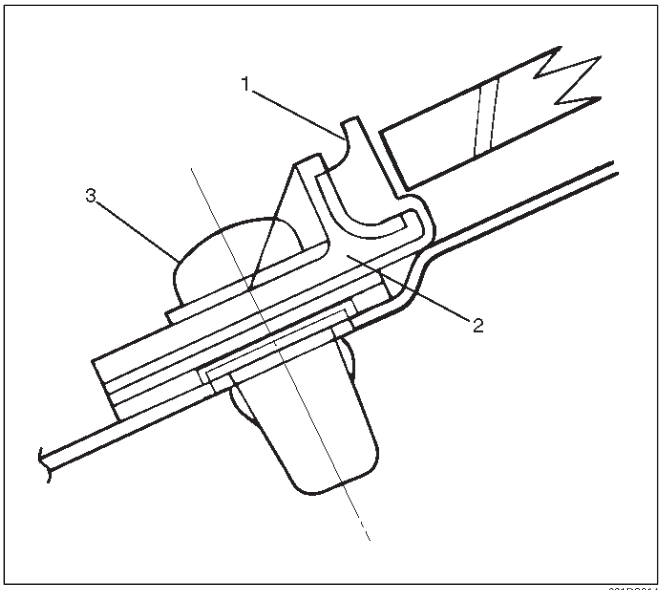
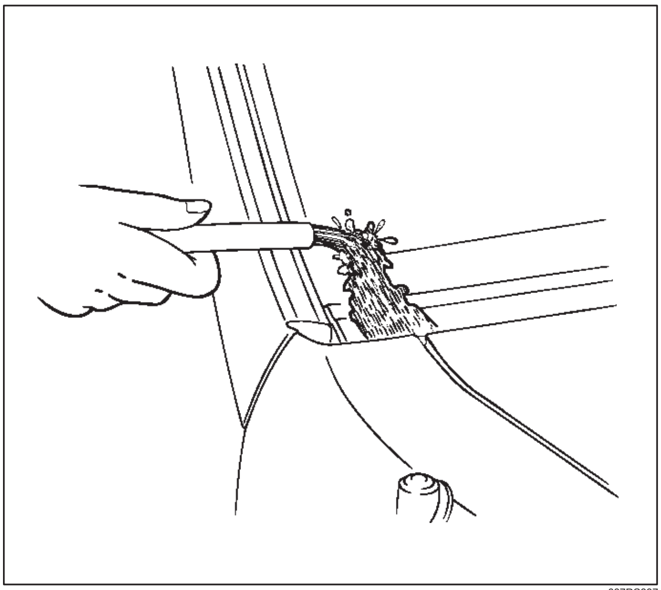
5. Install the windshield side seal.
6. Install the windshield support (2).



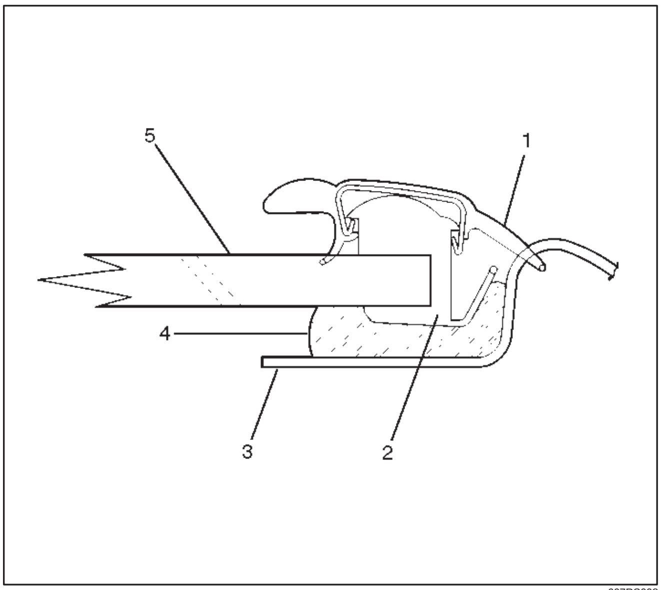
631RS014

- Apply a sealing adhesive (4) to the circumference of the windshield (5).
- Apply the sealing adhesive to the frange portion of the cowl upper rail.
- Adjust the gap clearance of the windshield (5).
- Install the windshield to the body panel by applying pressure to the windshield.
- Cure the adhesive at a temperature of 20~30˚C (68~86˚F) for 24 hours.
- Check that the windshield does not leak water.



607RS007

7. Install the windshield side moulding.
   - Insert the windshield (5) side moulding (1) into the moulding clip (2).



607RS008

   - Take care not to damage the side moulding when you install it.

8. Install the front cowl cover.
9. Install the windshield wiper.

Rear Quarter Side Glass

Legend

(1) Rear Quarter Upper Trim Panel
(2) Fastener
(3) Rear Quarter Side Glass
(4) Valve Assembly
(5) Ventilation Assembly
(6) Side Outer Panel
(7) Ventilation Assembly
(8) Ventilation Fixing Clip
(9) Rear Quarter Side

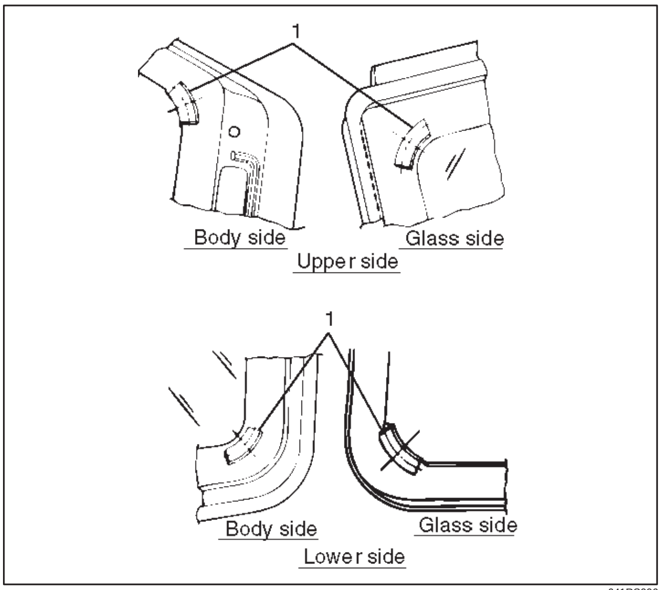
Removal

1. Disconnect the battery ground cable.
2. Remove rear quarter upper trim panel.
   - Refer to Laggage Side and Quarter Upper Trim Cover in Exterior / Interior Trim section.
3. Remove ventilation assembly.
4. Remove valve assembly.
   - Refer to Ventilation Assembly in this section.
5. Remove rear quarter side glass.
   - Refer to windshield in this section.

Installation

1. Install the rear quarter side glass.

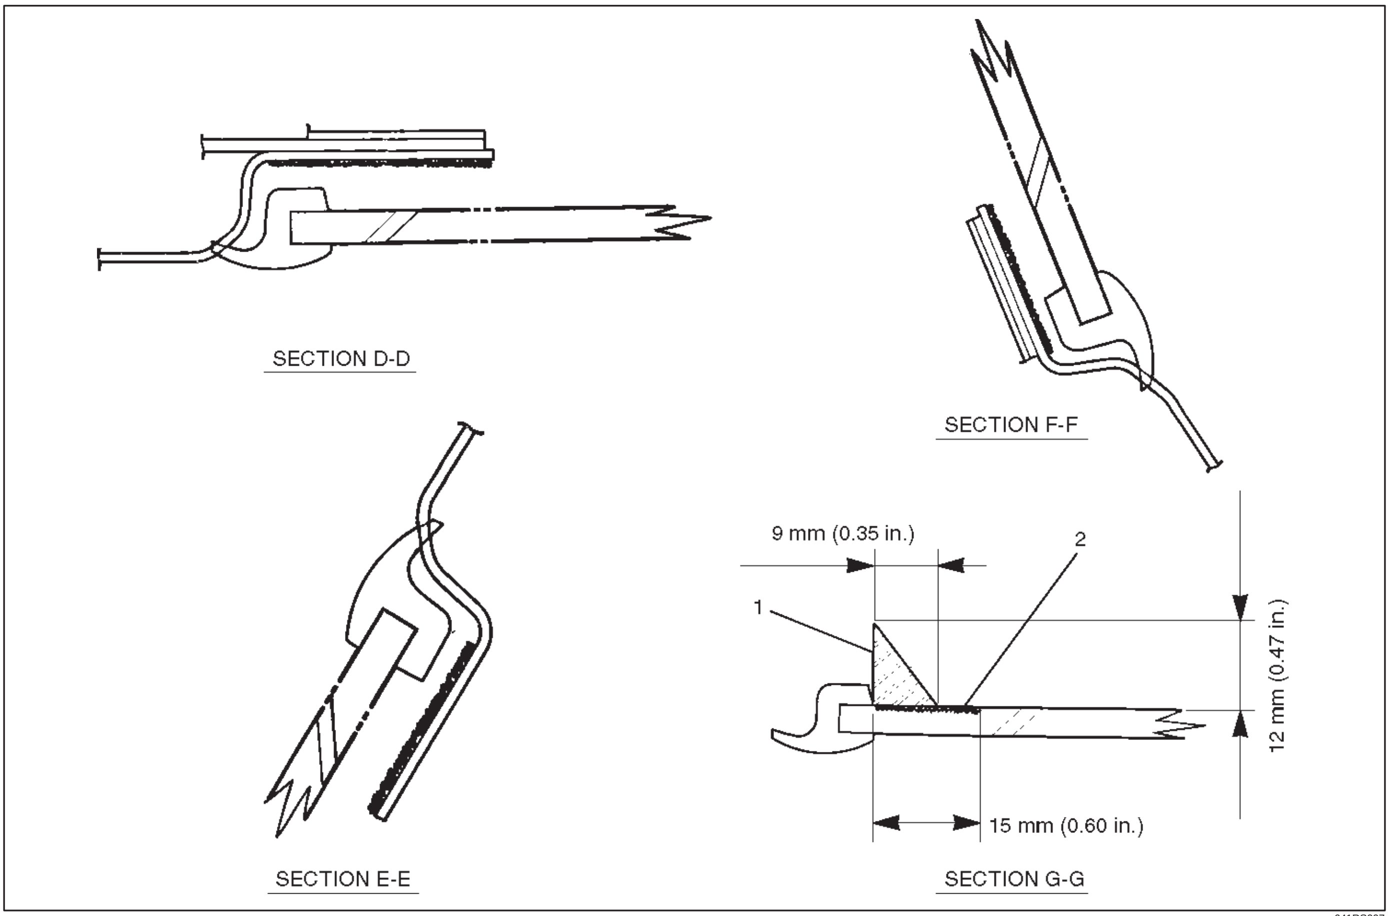
- Clean the bonding surfaces of both the glass and the body panel.
- Install the fasteners (1) to the fixed positions of the glass and the body panel.



641RS006

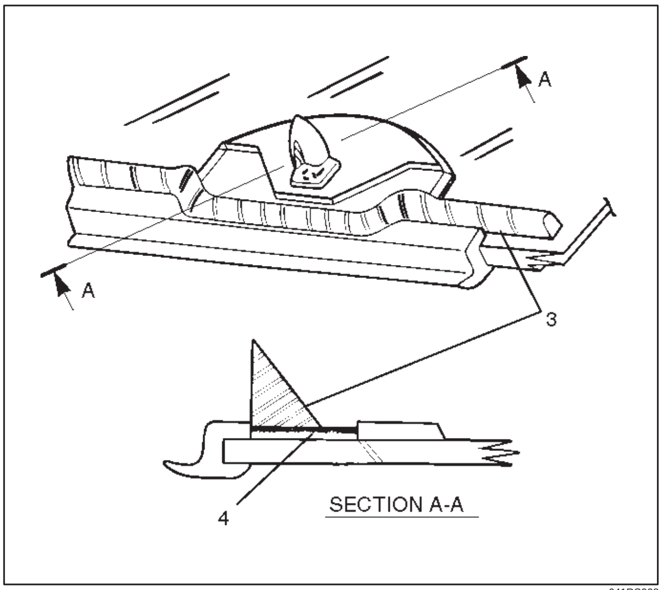
- Always use new fasteners.

- Be absolutely sure to apply glass primer to the side glass.



641RS007

- Apply a sealing adhesive (1) to the glass circumference.



641RS008

- Apply PVC primer (4) to the A clip portion.
- Insert the fixing clip on the side glass into the body panel.
- Push the side glass against the body panel and bond them.
- Cure the adhesive at a temperature of 20~30˚C (68~86˚F) for 24 hours.
- Check that the rear quarter side glass does not leak water.

2. Install the valve assembly.
3. Install the ventilation assembly.
4. Install the rear quarter upper trim panel.

Tailgate Glass

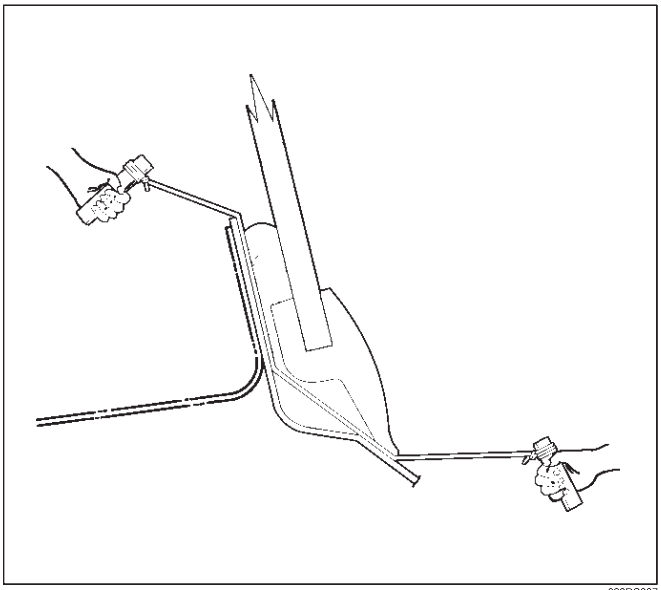
Removal

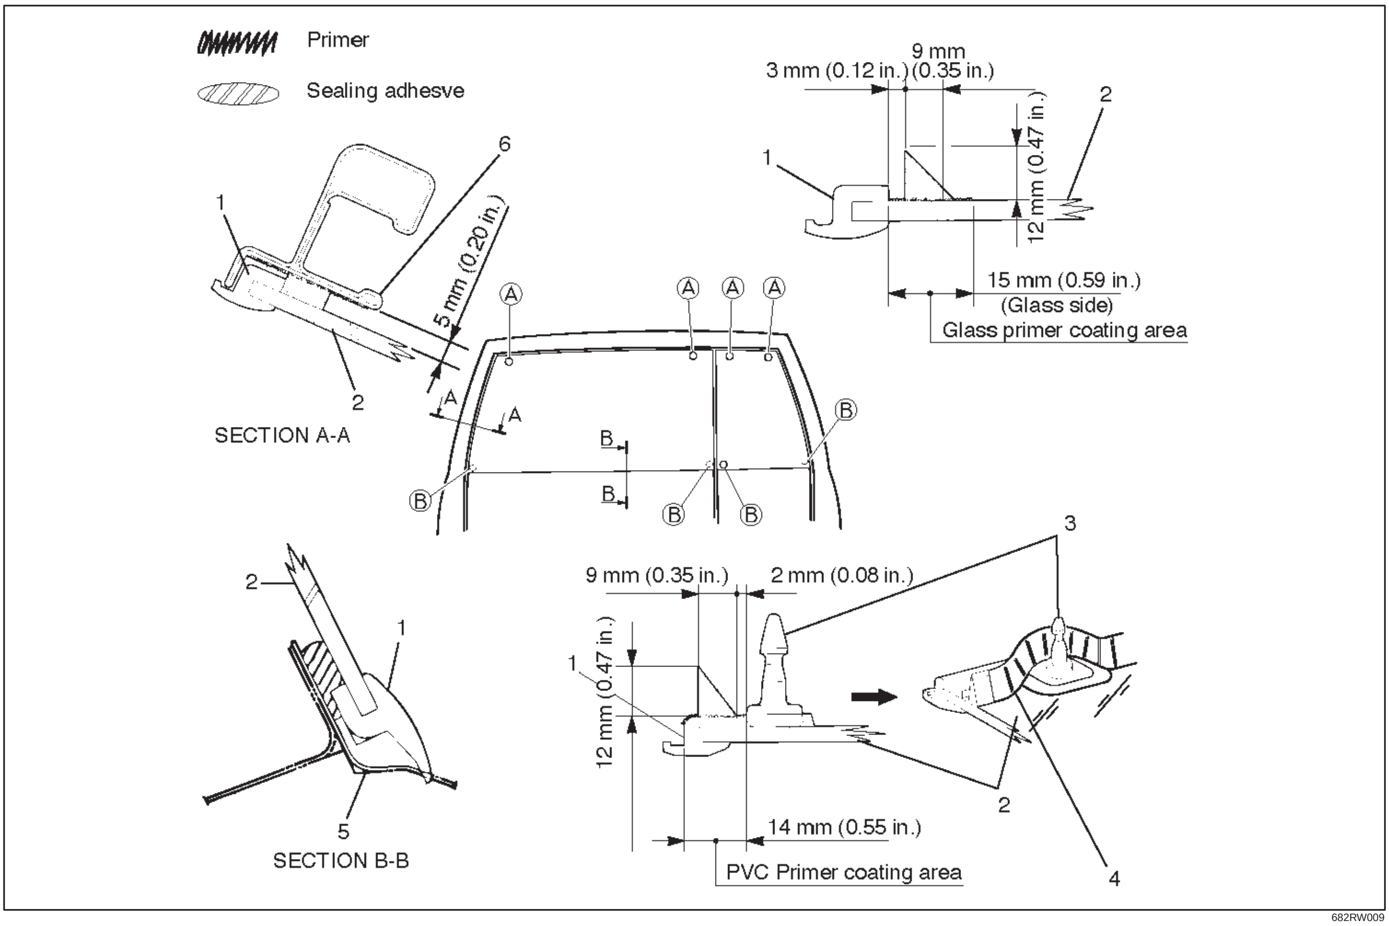
1. Remove battery ground cable.
2. Remove tailgate trim panel.
3. Remove tailgate sash trim cover (RH only).
4. Remove the tailgate frame cover.
   - Refer to Tailgate Frame Cover (RH & LH) in this section
5. Remove tailgate glass.
   - Refer to Windshield in this section.



682RS007

6. Remove tailgate glass clip.

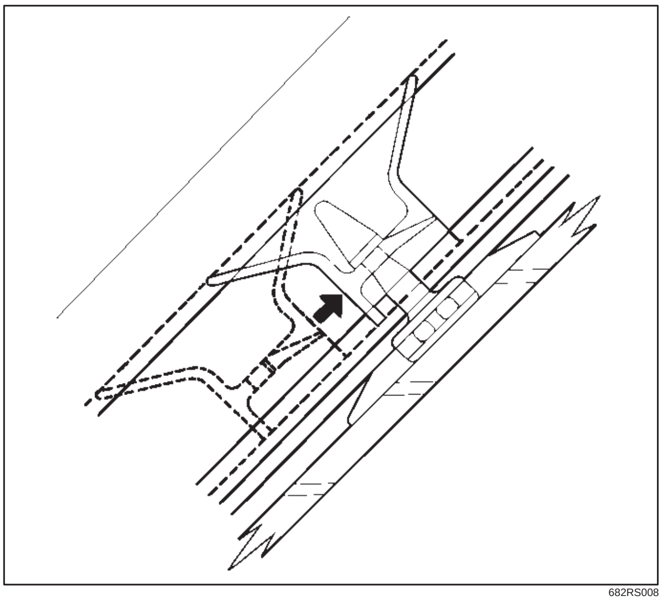
Installation



Legend

(1) Glass Moulding
(2) Tailgate Glass
(3) Clip
(4) Sealing Adhesive
(5) Body Panel
(6) Tailgate Frame

1. Install the tailgate glass clip.



2. Install the tailgate glass (2).
   - Clean the bonding surfaces of both the tailgate glass and the tailgate panel.
   - Be absolutely sure to apply glass primer to the tailgate glass and PCV primer to the glass moulding (1).
   - Apply a sealing adhesive to the circumference of the tailgate glass as shown.
   - Insert the clip of the tailgate glass A portion into the tailgate panel hole to position the glass.
   - Install the new tailgate glass clip to the clip of the tailgate glass B portion while sliding it, and bond the glass to the tailgate panel by applying pressure.

     Always use new tailgate glass clips.
   - Cure the bonding at a temperature of 20~30˚C (68~86˚F) for 24 hours.
   - Check that the tailgate glass does not leak water.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

(5) Door Sill Plate
(6) Riser Cover
(7) Front Cover

Removal

1. Disconnect the battery ground cable.
2. Remove the front cover.
3. Remove the rear cover.
   - Remove the cover fixing screw from the rear inner cover, if this model is equipped with the power seats.
4. Remove the door sill plate.
5. Remove the rear seat foot rest.
   - Refer to the Rear Seat Foot Rest in this section.
6. Remove the riser cover.
7. Remove the seat belt warning connector (Driver's side only).
8. Remove the front seat assembly.
   - Disconnect the power seat connector, if this model is equipped with the power seats.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the front seat assembly fixing bolts to the specified torque.

Torque: 40 N·m (30 lb ft)

2. Install the longest bolt to the rear inner side fixing location, if this model is equipped with power seats.

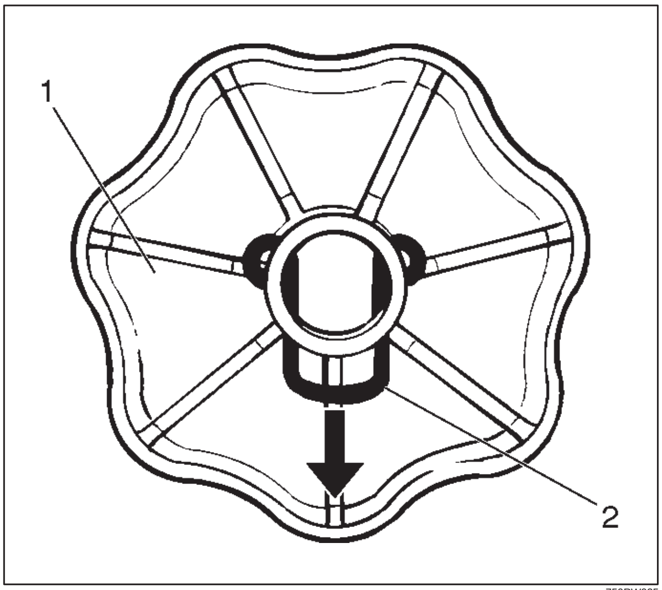
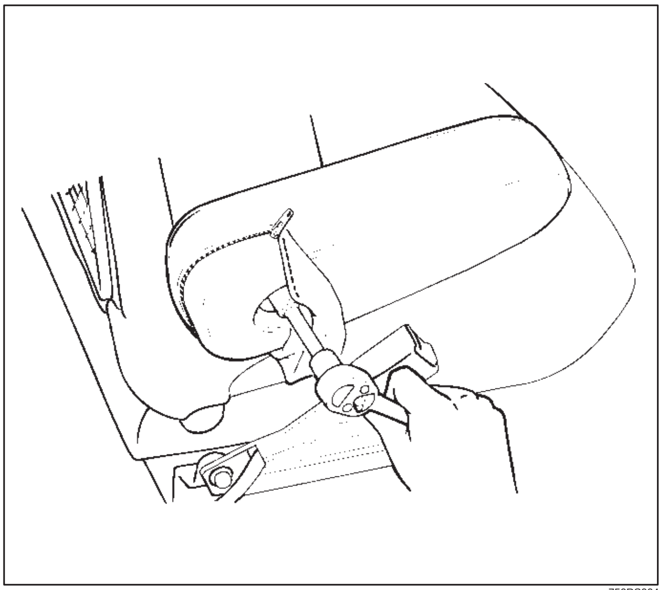
Disassembly

1. Remove the head rest.
2. Remove the reclining knob.
3. Remove the dial(1) (W/height adjuster).
   - Remove the side cover fixing screws and the dial lock spring(2).



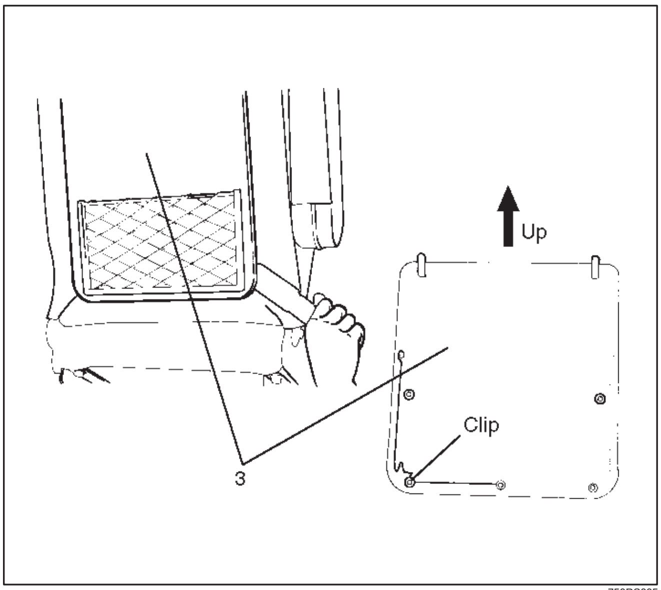
750RW025

4. Remove the side cover.
5. Remove the armrest assembly.
   - Open the armrest fastener and remove the armrest fixing bolt.



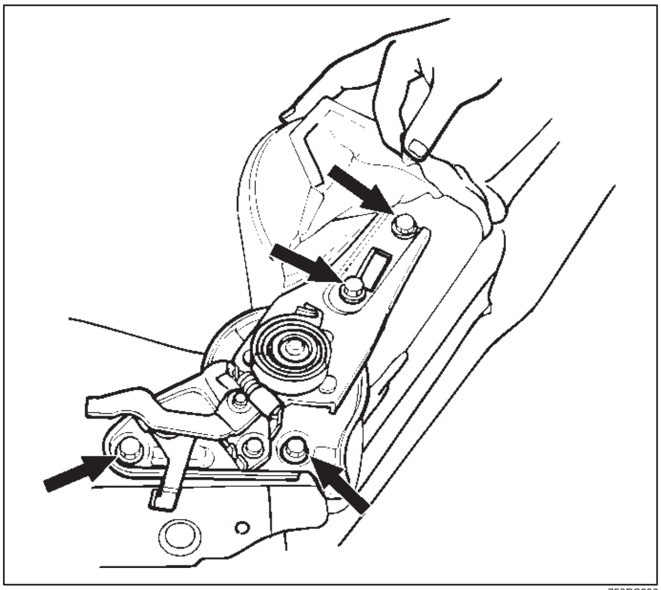
750RS004

6. Remove the trim cover.
7. Remove the pad and frame assembly.
8. Remove the hinge cover.
9. Remove the back board assembly(3).
   - Pull out the back board while prying the clip of the back board free from the seat back assembly.



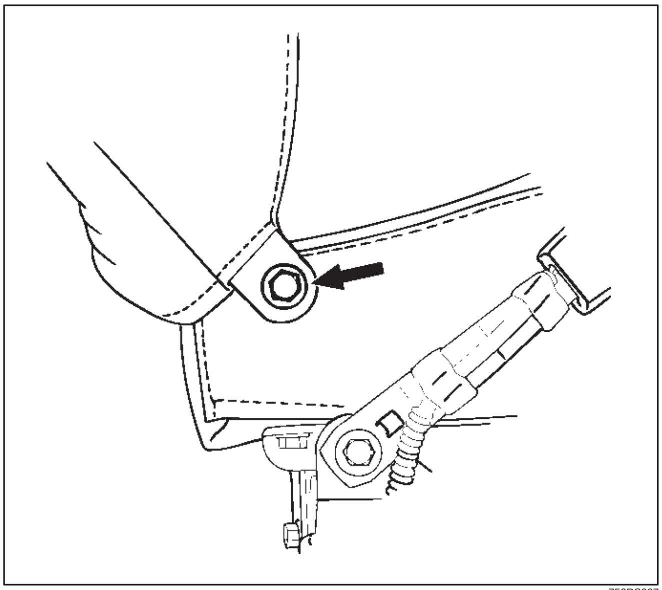
750RS005

10. Remove the reclining device.
    - Turn up the seat back trim cover in order to remove the reclining device fixing bolts.



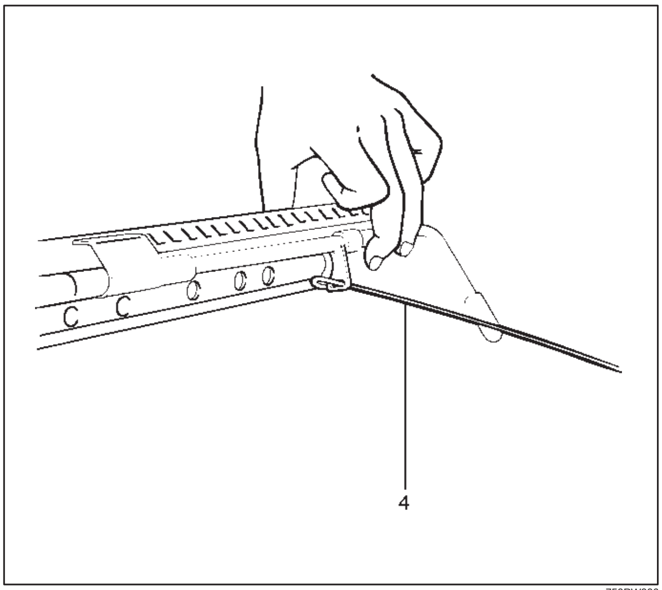
750RS006

11. Remove the seat back assembly.
    - Remove the seat back assembly fixing nut on the opposite side of the reclining device.



750RS007

12. Remove the guide holder.
    - Pull the guide holder out by holding the bottom end of it from the seat back assembly.
13. Remove the trim cover.
    - Remove the trim cover hog rings from the back side of the seat back.
    - With close attention paid to the hog rings and the wire which connect the trim cover and the pad and frame assembly, remove the trim cover while turning it up.
14. Remove the pad and frame assembly.
15. Remove the seat adjuster.
    - Disconnect the release wire(4) and remove the fixing bolts.



750RW006

- Remove the seat belt buckle assembly.

16. Remove the height adjuster.
17. Remove the spacer (W/O height adjuster).
18. Remove the seat cushion assembly.
19. Remove the trim cover.
    - Remove the trim cover hog rings from the back side of the seat cushion assembly.
    - With close attention paid to the hog rings and the wire which connect the trim cover and the pad and frame assembly, remove the trim cover while turning it up.
20. Remove the frame assembly.
21. Remove the pad assembly.

Reassembly

To reassembly, follow the disassembly steps in the reverse order, noting the following points.

1. Tighten the armrest assembly fixing bolts to the specified torque.

   Torque: 18 N·m (13 lb ft)
2. Tighten the reclining device fixing bolts to the specified torque.

   Torque: 47 N·m (35 lb ft)

Power Seat Assembly

General Description

The circuit consists of the power seat switch, front tilt motor (driver's seat only), rear tilt motor (driver's seat only), slide motor and the recliner motor.

The power seat switch has a tilt & slide switch and a recliner switch.

The motor built in the seat can be actuated by operating these switches to move the seat to desired position, independent of the position of the starter switch.

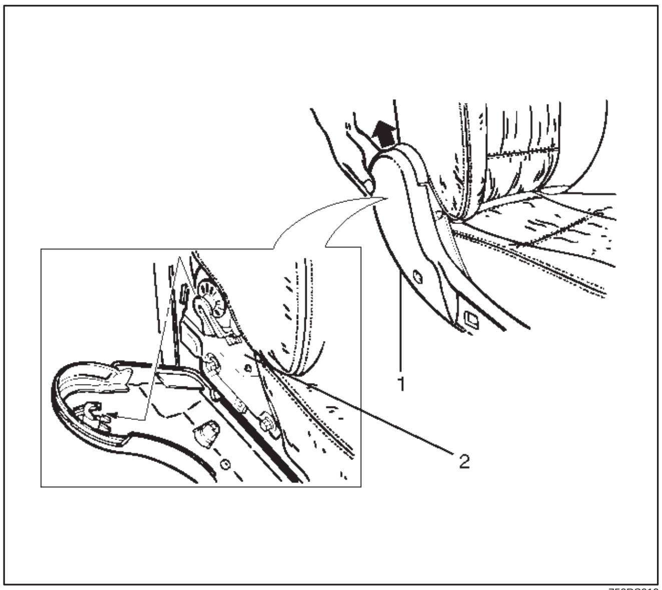
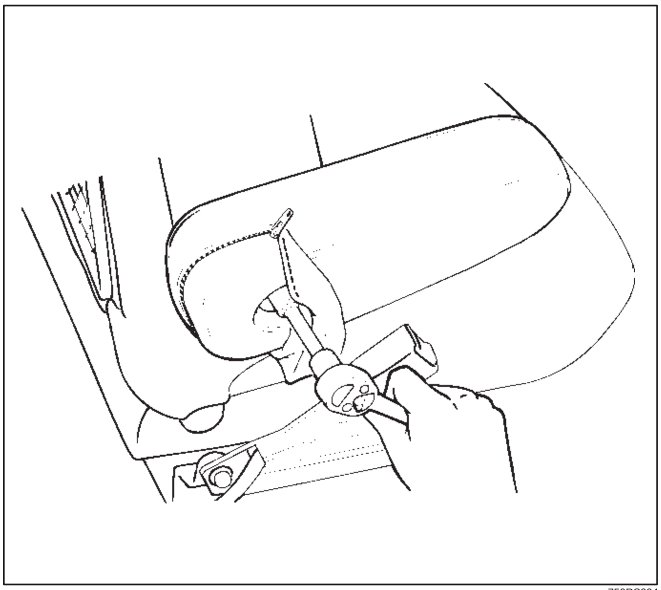
Disassembly

1. Disconnect the battery ground cable.
2. Remove the head rest.
3. Remove the switch knob.
   - Pull the switch knob out.
4. Remove the outer cover cap.
5. Remove the outer cover fixing screws.
   - Pull up the outer cover(1) to remove the cover from the reclining device(2).



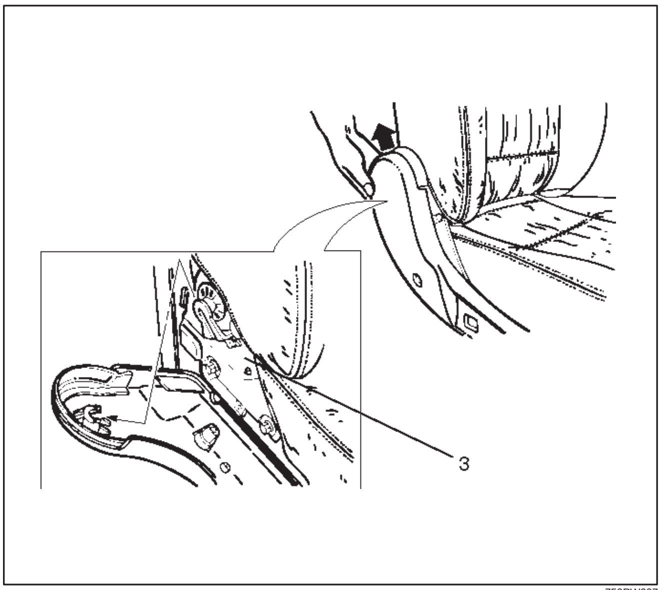
750RS012

6. Remove the front cover.
7. Remove the front lower cover.
8. Remove the rear cover.
9. Remove the outer cover.
   - Disconnect the switch connectors and remove the harness fixing clips.
10. Remove the switch assembly.
    - Remove the switch fixing screws from the outer cover.
11. Remove the armrest assembly.
    - Open the armrest fastener and remove the fixing bolt.



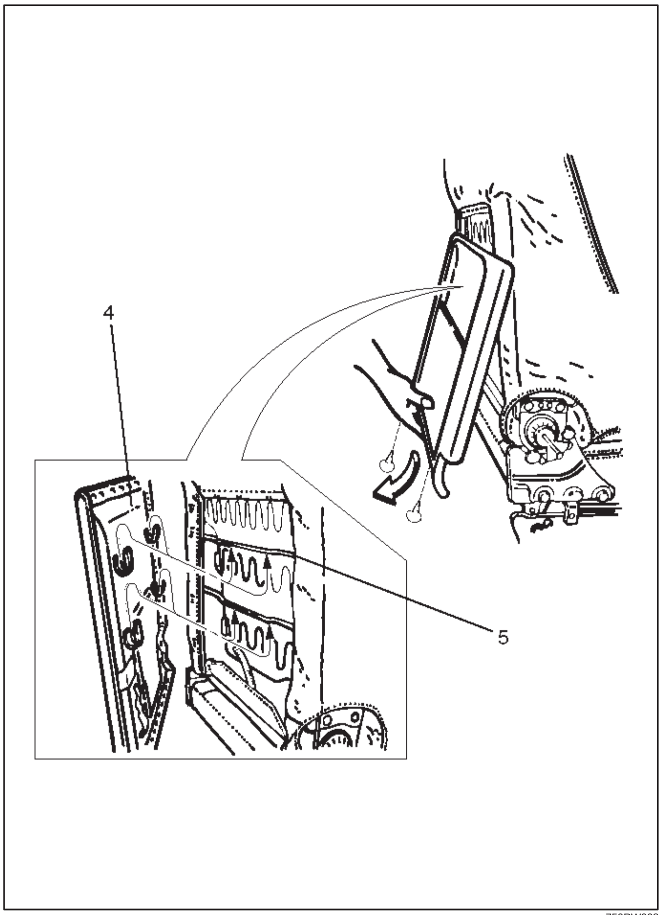
750RS004

12. Remove the trim cover.
13. Remove the pad & frame assembly.
14. Remove the inner cover
    - Remove the cover fixing screw.
    - Pull up the inner cover to remove the cover from the reclining device(3).



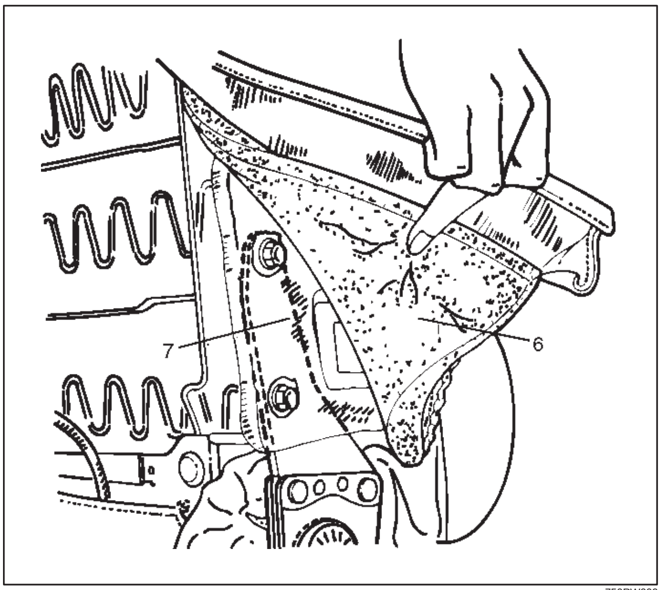
750RW007

15. Remove the back board assembly(4).
    - Remove the board fixing screws.
    - Pull the back board downward and remove the board from the seat back frame(5).



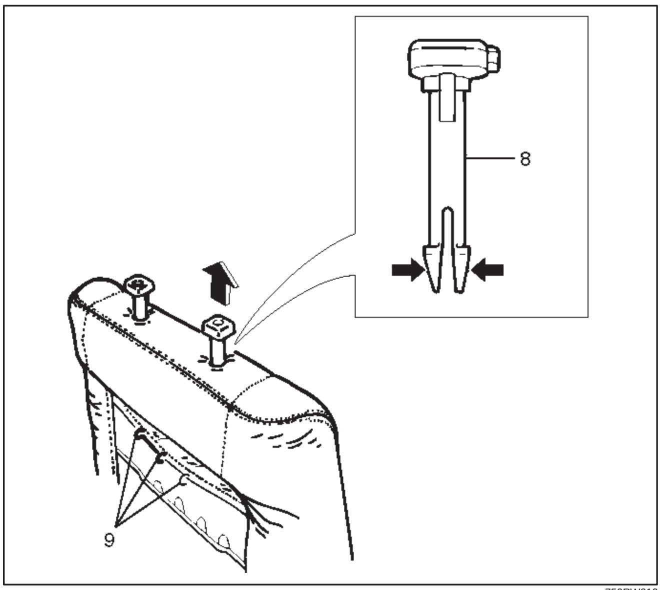
750RW008

16. Remove the reclining device(7).
    - Remove the device lower side fixing bolt in order to separate the seat back from the seat cushion.
    - Disconnect the seat heater connector.
    - Remove the trim cover(6) hog rings from the backside of the seat back assembly.
    - Turn up the seat back trim cover to remove the reclining device upper side fixing bolt.
    - Disconnect the connecting shaft and the reclining device connectors.



750RW009

17. Remove the seat back assembly.
18. Remove the guide holder(8).
    - Remove the trim cover fixing hog rings(9) from the backside of the seat back assembly.
    - Hold the tip end of the guide holder and pull the holder out from the seat back assembly.



750RW010

19. Remove the trim cover.
    - Remove the trim cover hog rings from the backside of the seat back.
    - With close attention paid to the hog rings and the wire which connect the trim cover and pad & frame assembly, remove the trim cover while turning it up.
20. Remove the seat heater.
21. Remove the pad assembly.
22. Remove the frame assembly.
23. Remove the outer lower cover.
24. Remove the inner lower cover.
25. Remove the adjuster assembly.
    - Disconnect the connectors and remove the fixing bolts.

- Remove the power seat harness from the adjuster assembly.

26. Remove the seat cushion assembly.
27. Remove the trim cover.
    - Remove the trim cover hog rings from the backside of the seat cushion assembly.
    - With close attention paid to the hog rings and the wire which connect the trim cover and the pad & frame assembly, remove the trim cover while turning it up.
28. Remove the seat heater.
29. Remove the frame assembly.
30. Remove the pad assembly.

Reassembly

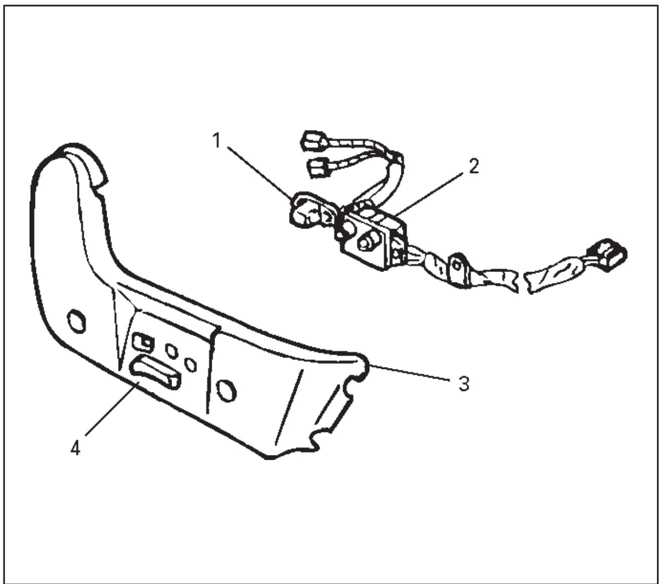
To reassemble, follow the disassembly steps in the reverse order, noting the following point.

1. Tighten the fixing bolts to the specified torque.
    - Refer to the Torque Specifications in this section.

Power Seat Switch

Removal

1. Remove the side cover(3).
    - Refer to the Power Seat Assembly in this section.
2. Remove the tilt & slide switch lever(4).
    - Hold the switch lever with your fingers and pull it toward you.
3. Remove the tilt & slide switch(2).
    - Remove two screws.
4. Remove the recliner switch(1).
    - Remove two screws.



750RS025

Installation

To install, follow the removal steps in the reverse order.

Seat Heater System

General Description

The circuit consists of the starter switch, seat heater switch and the heat unit.
The seat heater is provided in driver's and front passenger seats (as option).
When the seat heater switch is ON, the seat heat built in the seat back and cushion is switched on to warm the seats.
To prevent the seats from being overheated, the circuit is fitted with a thermostat.

Seat Heater Switch Removal and Installation

Refer to the Seat Heater Switch in Lighting System section.

Heat Unit Parts Location

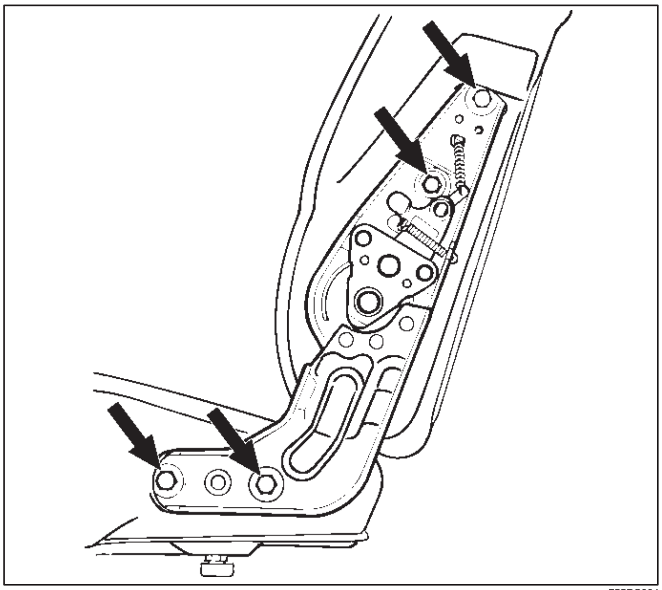
(28) Seat Cushion Assembly
(29) Linkage Bush
(30) Bush

Disassembly (Split Type)

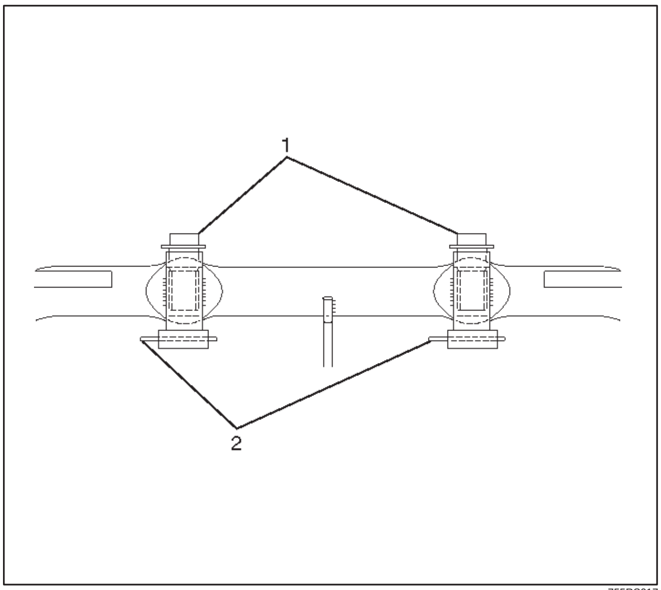
1. Remove the back board.
   - Remove the clips and the back board.
2. Remove the device cover.
3. Remove the release knob.
   - Turn the knob counterclockwise to remove it.
4. Remove the release rod.
   - Disconnect the rod from the linkage bush.
5. Remove the reclining device.



755RS004

6. Remove the connecting shaft.
7. Remove the seat back assembly.
8. Remove the band hook cover.
9. Remove the pillow assembly.
   - Turn up the seat back trim cover and slit the pad from the back around to the place where the lock spring(2) of the guide bush(1) is.

   Then insert a finger through the slit and pull out the pillow while you are pressing down on the lock spring.



755RS017

10. Remove the armrest assembly.
    - Turn up the seat back trim cover and remove the fixing nuts.
11. Remove the armrest set bracket.
12. Remove the armrest board.
13. Remove the trim cover.
    - Remove the trim cover fixing hog rings from the backside of the seat back.
    - With close attention paid to the hog rings and the wire which connect the trim cover and the pad and frame assembly, remove the trim cover while turning it up.
14. Remove the pad & frame assembly.
15. Remove the seat cushion assembly.
16. Remove the seat lock cover.
17. Remove the rear seat belt buckle and lock assembly.
18. Remove the mounting bracket.
19. Remove the return spring.
20. Remove the spring collar.
21. Remove the trim cover.
    - Remove the hog rings and pull the trim cover out from the frame assembly groove.
    - With close attention paid to the hog rings and the wire which connect the trim cover and the pad & frame assembly, remove the trim cover while turning it up.
22. Remove the frame assembly.
23. Remove the pad assembly.
24. Remove the stopper rubber.

Reassembly (Split Type)

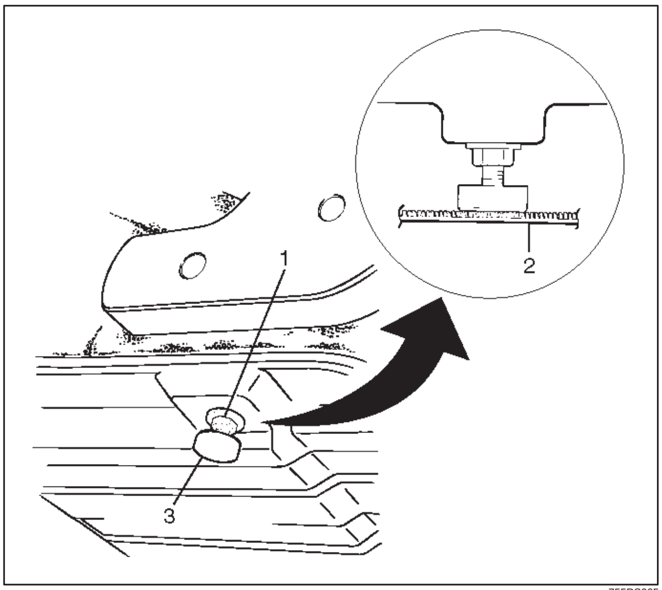
To reassemble, follow the disassembly steps in the reverse order, noting the following points.

1. Tighten the reclining device fixing bolts to the specified torque.

   Torque: 27 N·m (20 lb ft)

2. Loosen the rubber stopper lock nut(1). Adjust the stopper(3) so there is no clearance between the bottom of the stopper and the carpet(2) while you make sure the rear seat is firmly locked.

   Then tighten the lock nut securely.



755RS005

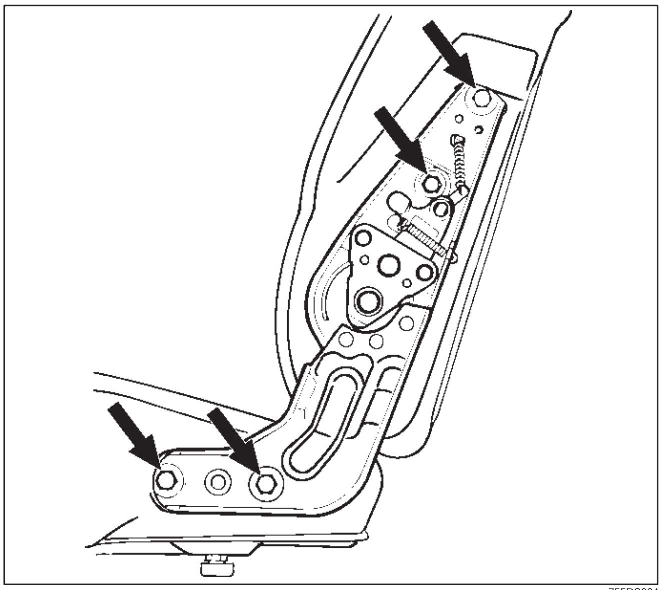
(19) Frame Assembly
(20) Pad Assembly

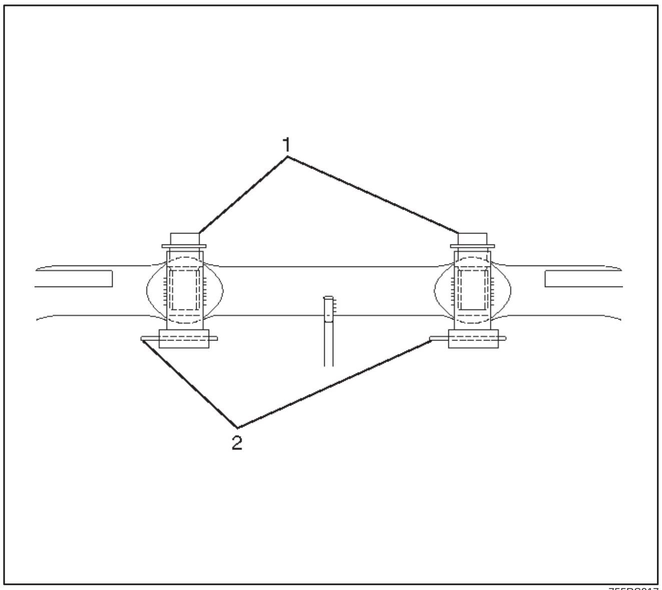
Disassembly (Bench Type)

1. Remove the device cover.
2. Remove the release knob.
   - Turn the knob to the counterclockwise to remove it.
3. Remove the release rod.
   - Disconnect the rod from the linkage bush.
4. Remove the reclining device.



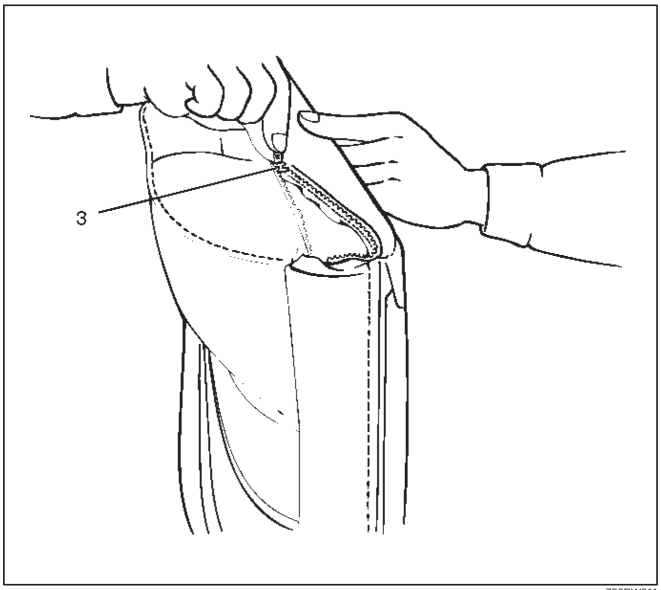
755RS004

5. Remove the connecting shaft.
6. Remove the seat back assembly.
7. Remove the band hook cover.
8. Remove the pillow assembly.
   - Refer to the Disassembly (Split Type) in this section.



755RS017

9. Remove the trim cover.
   - Open the fastener(3), and with close attention paid to the hog rings and wire which connect the trim cover and the pad and frame assembly, remove the trim cover as you turn it up.



750RW011

10. Remove the pad & frame assembly.
11. Remove the seat cushion assembly.
12. Remove the seat lock cover.
13. Remove the rear seat belt buckle and lock assembly.
14. Remove the mounting bracket.
15. Remove the trim cover.
    - Remove the hog rings and pull the trim cover out from the frame assembly groove.
    - With close attention paid to the hog rings and the wire which connect the trim cover and the pad and frame assembly, remove the trim cover while turning it up.
16. Remove the frame assembly.
17. Remove the pad assembly.
18. Remove the stopper rubber.

Reassembly (Bench Type)

To reassemble, follow the disassembly steps in the reverse order, noting the following points.

1. Tighten the reclining device fixing bolts to the specified torque.

   Torque: 27 N·m (20 lb ft)

2. Loosen the rubber stopper lock nut(1) and adjust the stopper rubber(3) so there is no clearance between the bottom of the stopper and the carpet(2), while ensuring the rear seat is firmly locked.

   Tighten the lock nut securely.

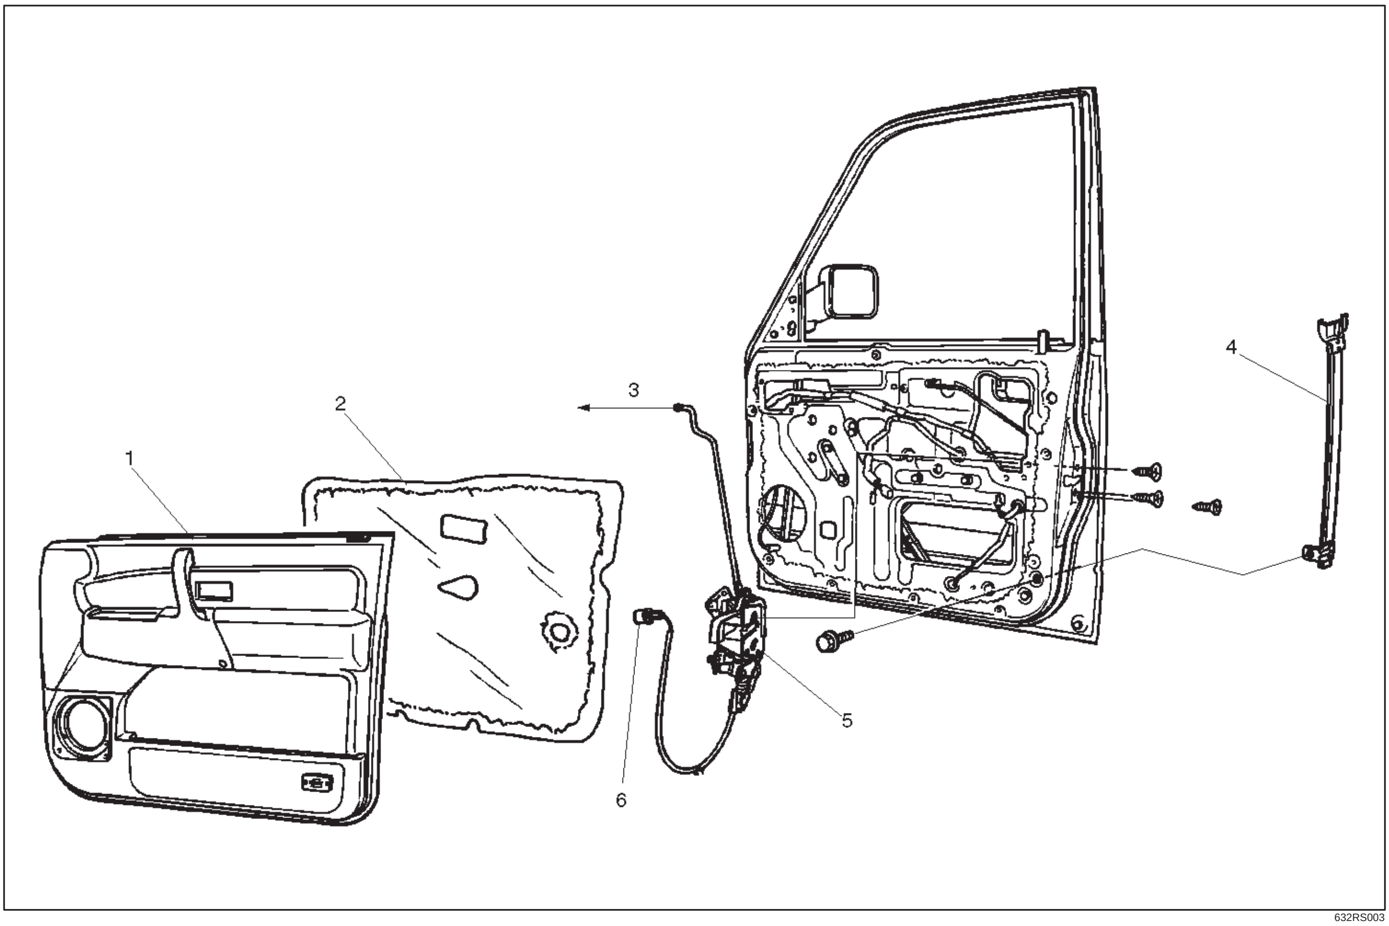
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Door Lock Assembly

Front Door Lock Assembly and Associated Parts

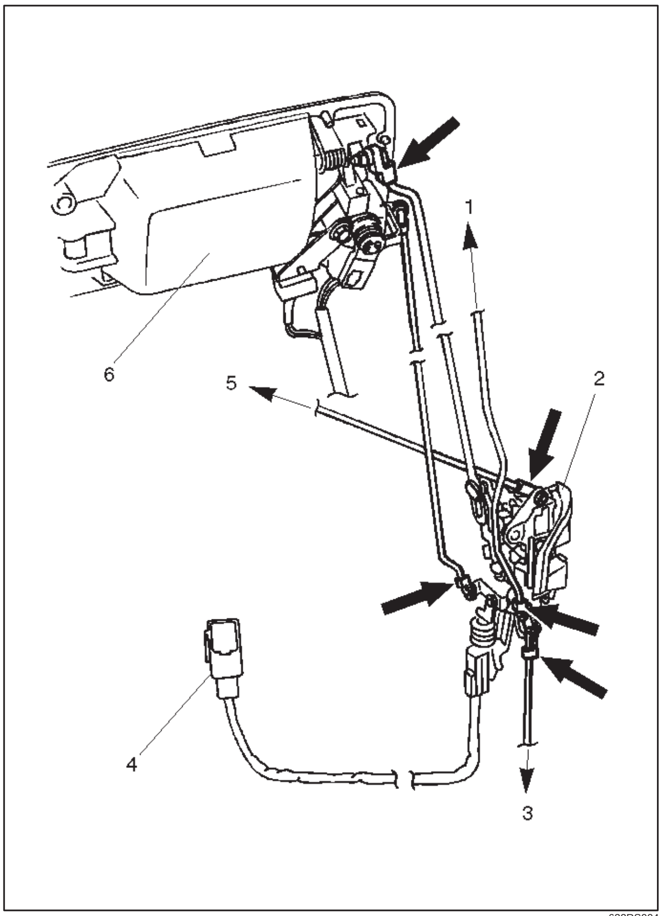


Legend
(1) Door Trim Panel
(2) Waterproof Sheet
(3) To Outside Handle
(4) Rear Guide Rail
(5) Door Lock Assembly
(6) Door Lock Switch Connector (W/Power Door Lock)

Removal

1. Disconnect the battery ground cable.
2. Remove the door trim panel.
3. Remove the waterproof sheet.
   - Refer to the Front Window Regulator, Glass And Glass Run in Body Structure section.

4. Raise the glass up to the uppermost position, and then remove the rear guide rail.
5. Disconnect the door lock switch connector (w/power door lock) and locking links (arrow marks positions), then remove the door lock assembly fixing screws and door lock assembly.



Legend

(1) To Inside Lock Knob
(2) Door Lock Assembly

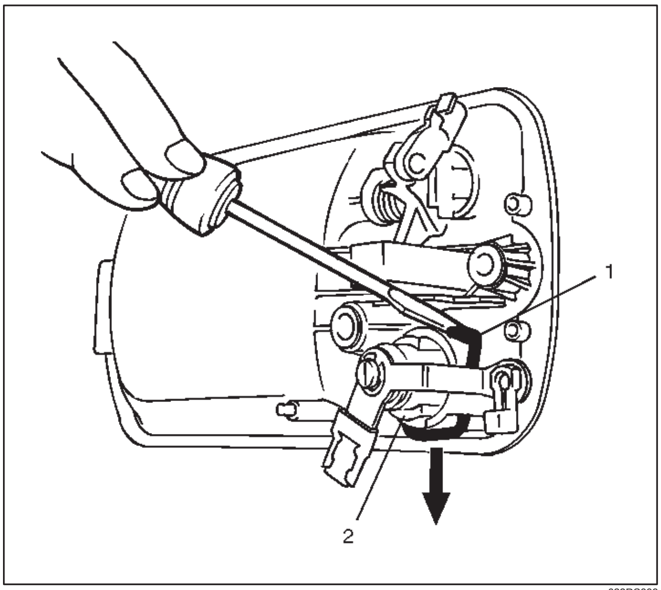
(3) Key Switch

6. Remove the fixing clip(1) to remove the door lock cylinder(2).

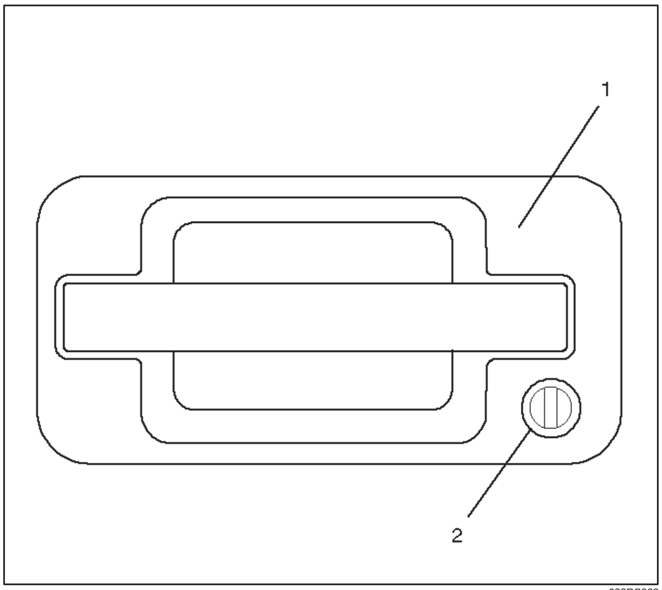


632RS009

Installation

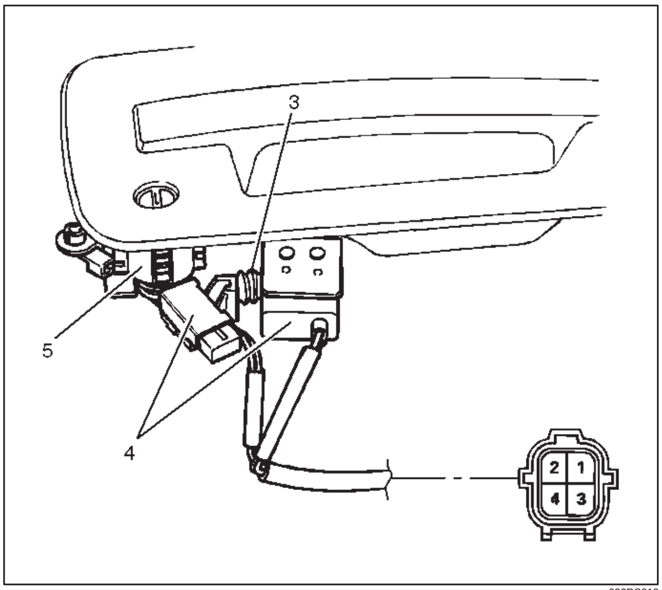
To install, follow the removal steps in the reverse order, noting the following points.

1. Be sure to install the door lock cylinder(2) at a right angle to the outside handle(1).



632RS008

2. For the anti-theft system, be sure to install the push rod(3) of key switch while pressing it to the door lock cylinder(5) so that there is no continuity between the key switch(4) side connector terminal No. D6–2 and D6–4 (No. D16–2 and D16–4: passenger side).



632RS010

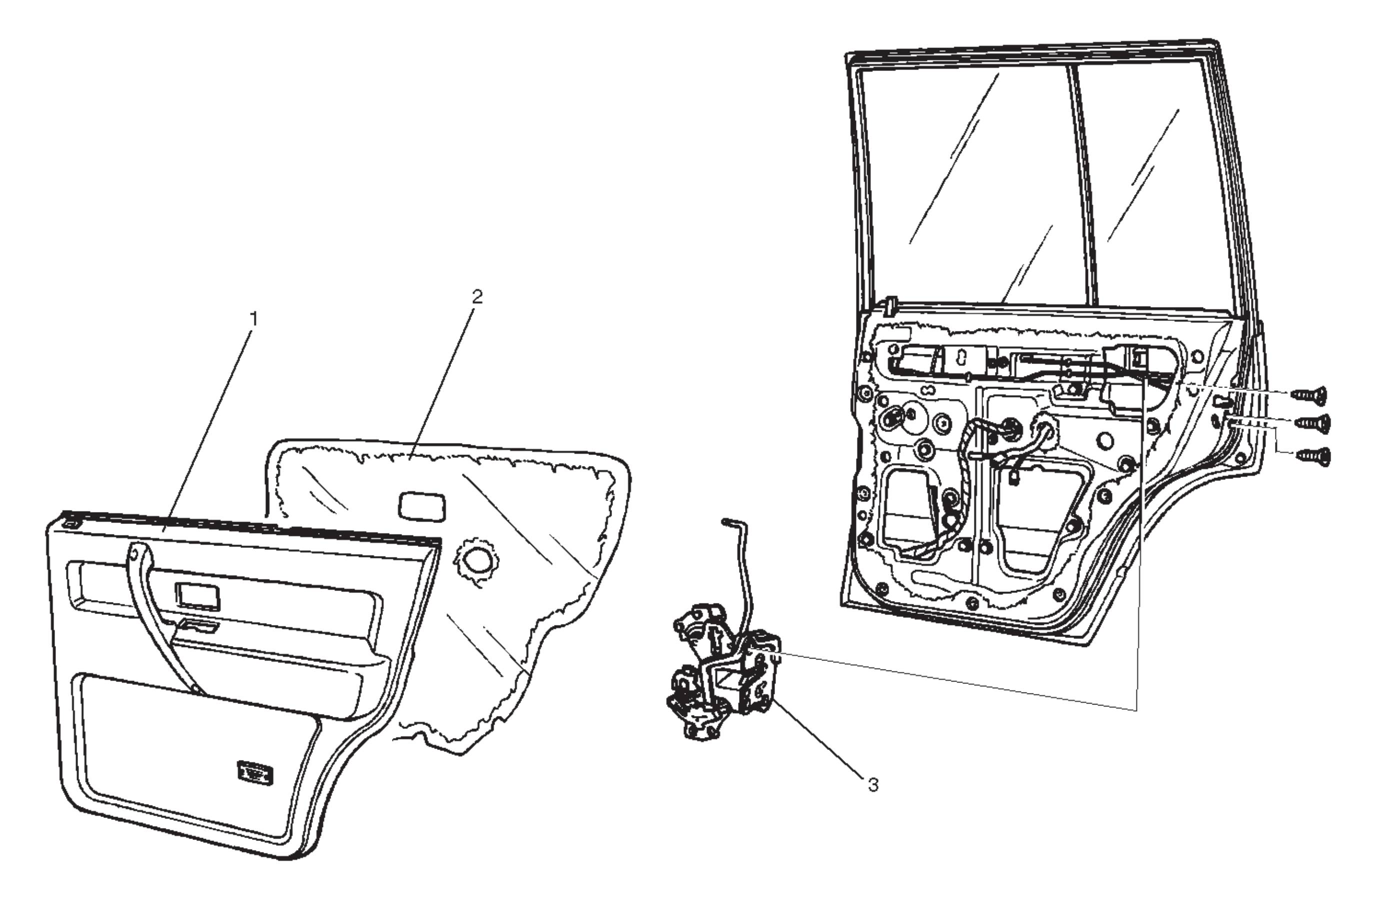
3. Tighten the outside handle and key switch fixing bolts to the specified torque.

Torque: 9 N·m (78 lb in)

4. Check for smooth outside handle and lock cylinder operation.

Rear Door Lock Assembly

Rear Door Lock Assembly and Associated Parts



Legend

(1) Door Trim Panel

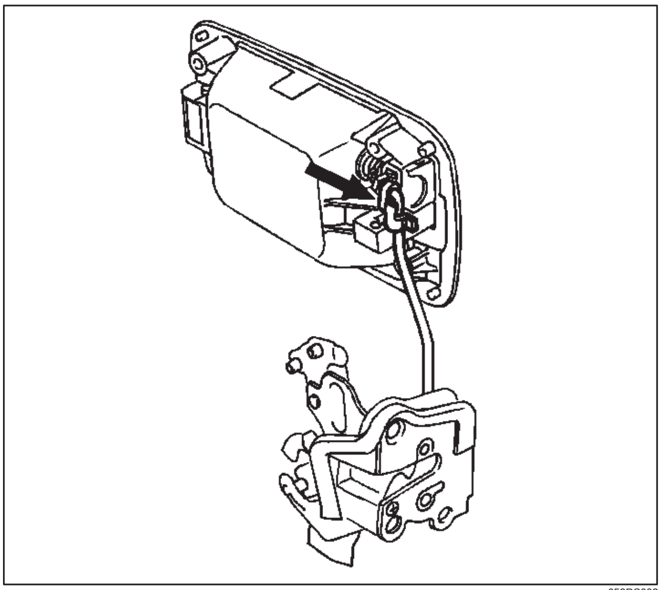
(3) Outside Handle

Removal

1. Disconnect the battery ground cable.
2. Remove the door trim panel.
3. Remove the waterproof sheet.
   - Refer to the Rear Window Regulator And Glass in Body Structure section.
4. Disconnect the locking link (arrow mark position) and remove three fixing bolts to remove the outside handle.



652RS003

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the outside handle fixing bolts to the specified torque.

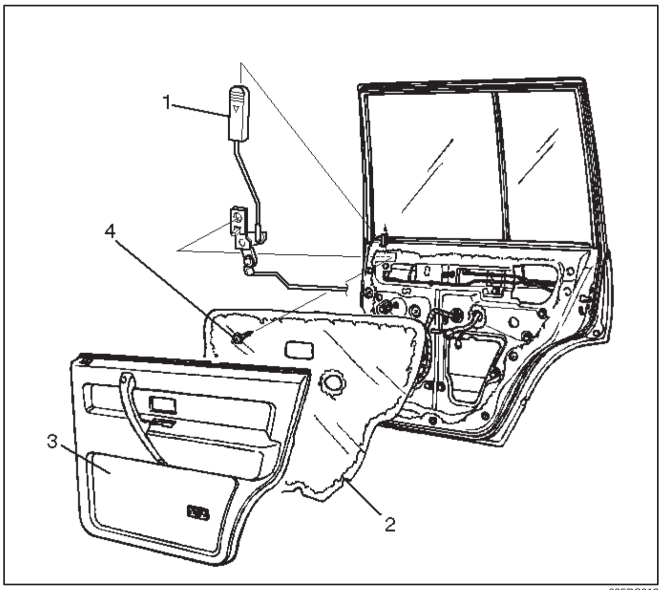
   Torque: 9 N·m (78 lb in)

2. Check that the outside handle operates smoothly.

Rear Door Inside Lock Knob Link

Removal

1. Disconnect the battery ground cable.
2. Remove the door trim panel(3).
3. Remove the waterproof sheet(2).
   - Refer to the Rear Window Regulator And Glass in Body Structure section.
4. Remove the fixing screw(4) and disconnect the locking link at the door lock assembly to remove the rear door inside lock knob link(1).



635RS013

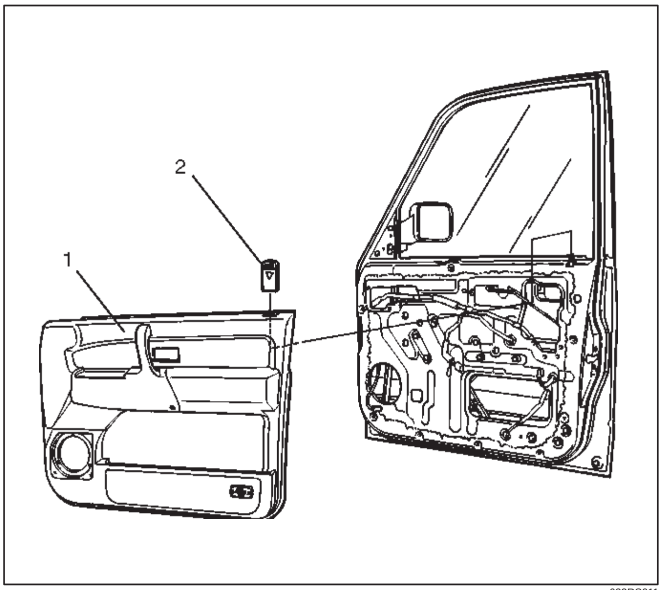
Installation

To install, follow the removal steps in the reverse order.

Door Inside Lock Knob

Removal

1. Disconnect the battery ground cable.
2. Remove the door trim panel(1).
   - Refer to the Front / Rear Door Trim Panel in Exterior/Interior Trim section.
3. Turn the door inside lock knob counterclockwise and then remove the door inside lock knob (2).



632RS011

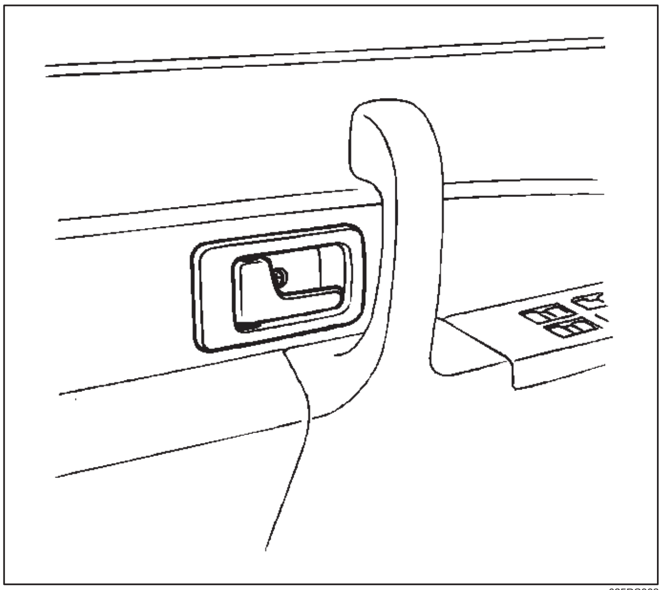
Installation

To install, follow the removal steps in the reverse order.

Door Inside Handle

Removal and Installation

- Refer to the Front/Rear Door Trim Panel in Exterior/Interior Trim section.



635RS008

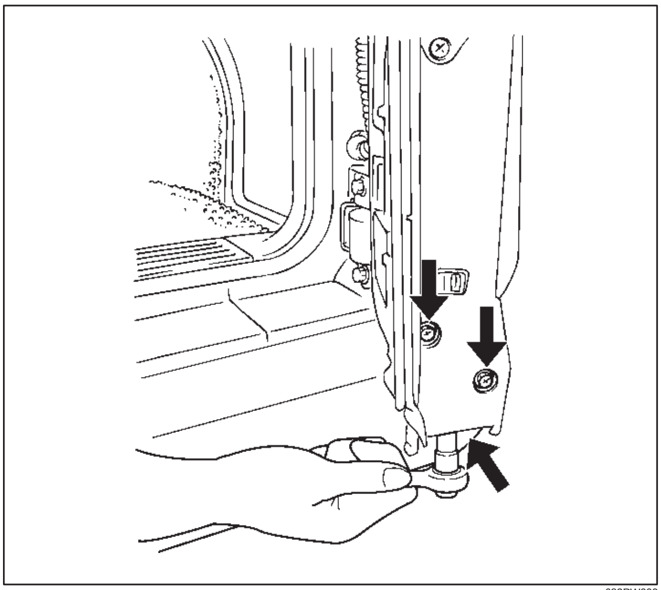
(3) Tailgate Lock Seal
(4) Clip
(5) Screw
(6) Tailgate Lock Assembly (RH)

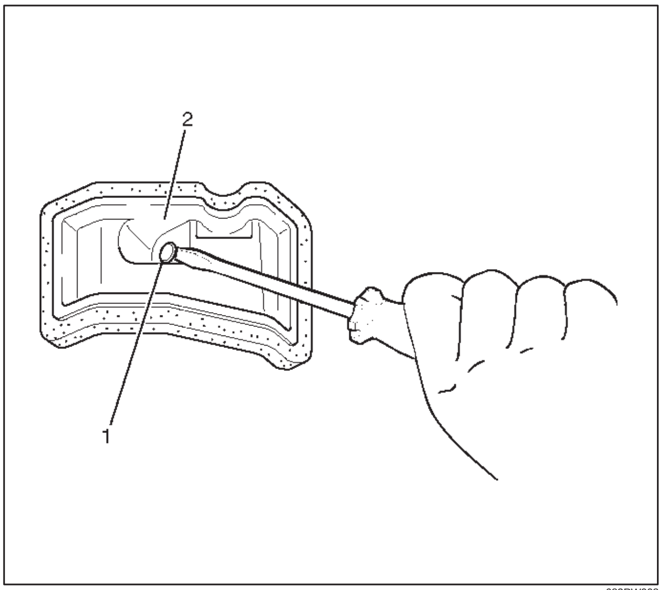
Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim panel (RH).
   - Refer to Tailgate Trim Panel (RH) in Exterior/Interior Trim section.
3. Peel the waterproof sheet off the tailgate panel carefully and then remove the waterproof sheet.
4. Remove three fixing bolts and then remove the tailgate lock assembly (RH).



683RW009

5. Remove the tailgate lock seal fixing clip(1) and then remove the tailgate lock seal(2).



683RW008

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Apply chassis grease to the lock assembly and striker moving surface.
2. Tighten the tailgate lock assembly fixing bolts to the specified torque.

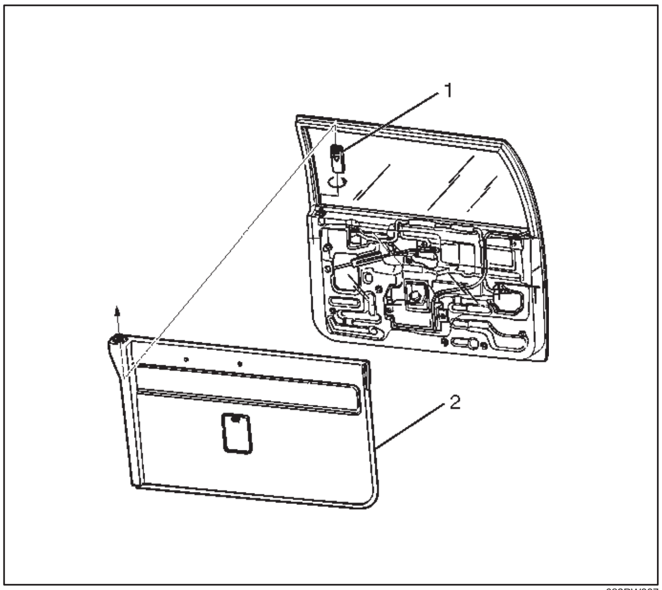
   Torque: 11 N·m (95 lb in)

3. Check that the tailgate lock operates correctly after installing it.

Tailgate Inside Lock Knob

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim panel (LH)(2).
   - Refer to the Tailgate Trim Panel (LH) in Exterior/Interior Trim section.
3. Take care of cushion to turn the lock knob counterclockwise and then remove the tailgate inside lock knob(1).



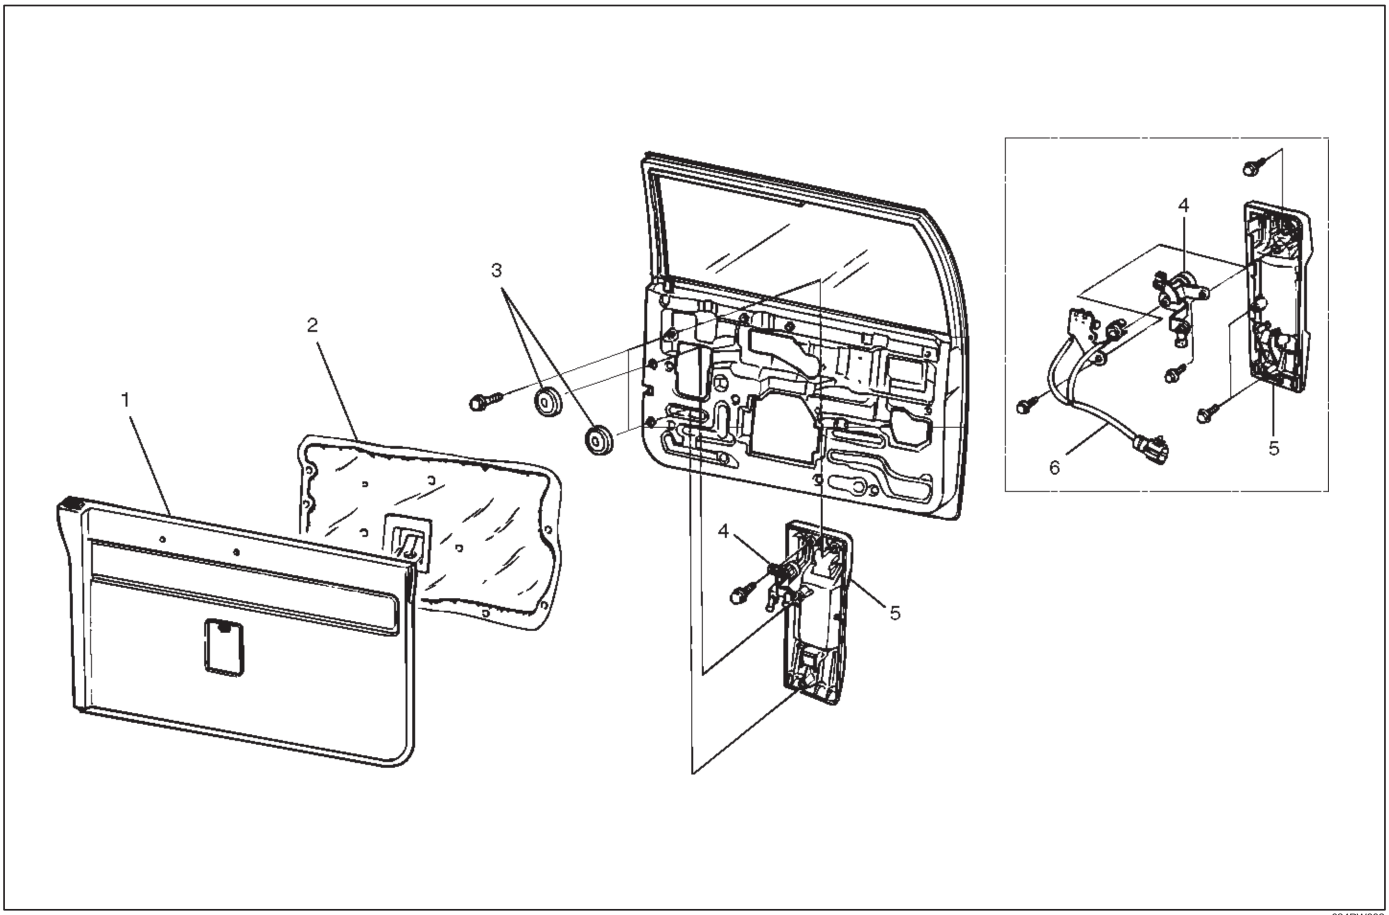
683RW007

Installation

To install, follow the removal steps in the reverse order.

Tailgate Outside Handle and/or Tailgate Lock Cylinder

Tailgate Outside Handle and/or Tailgate Lock Cylinder and Associated Parts

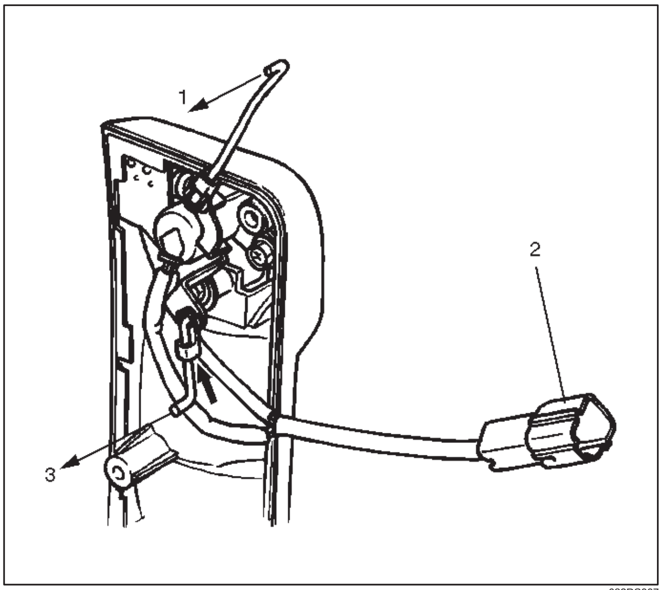


Legend
(1) Tailgate Trim Panel (LH)
(2) Waterproof Sheet
(3) Grommet
(4) Tailgate Lock Cylinder
(5) Tailgate Outside Handle
(6) Key Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim panel.
3. Remove the waterproof sheet.
   - Refer to the Tailgate Lock Assembly (LH) in this section.
4. Remove the grommet.

5. Disconnect the locking links (arrow marks positions), key switch connector (w/anti-theft) and remove three fixing bolts to remove the tailgate outside handle.

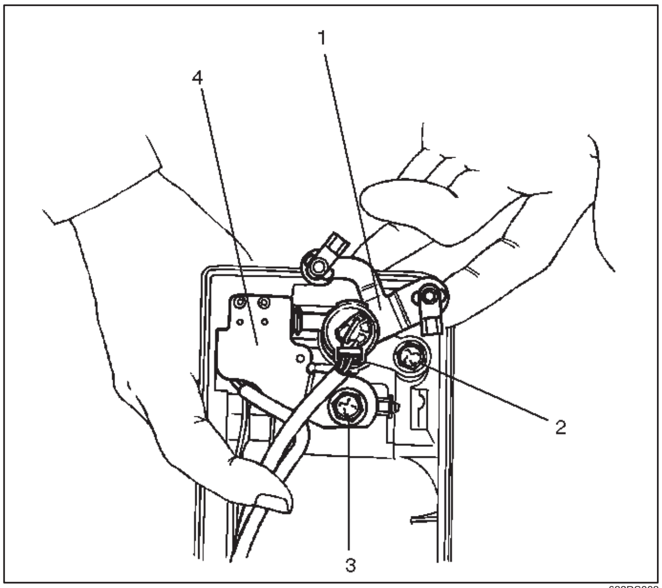


683RS007

Legend
(1) To Actuator
(2) Key Switch Connector
(3) To Lock Assembly

6. Remove the key switch fixing bolt(3) to remove the key switch(4) from the tailgate lock cylinder (w/anti-theft)(1).

   And remove the tailgate lock cylinder fixing bolt(2) to remove the tailgate lock cylinder.

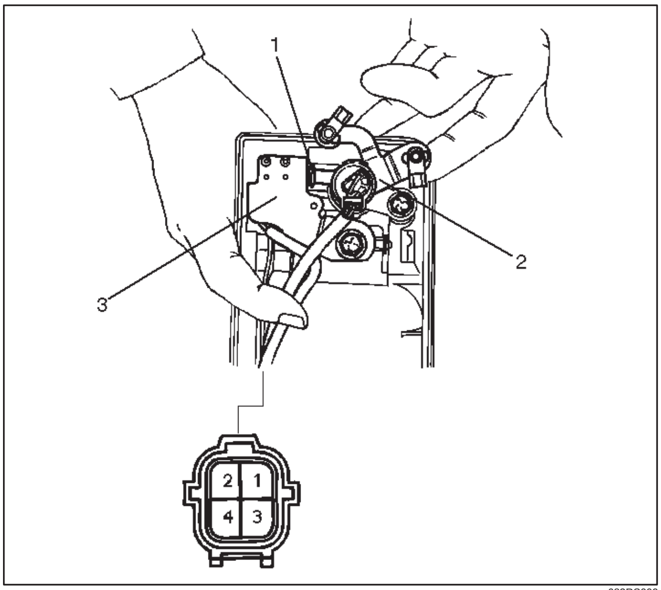


683RS008

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. For the anti-theft system, install the push rod(1) of the key switch(3) to the key cylinder(2) while pressing it so that there is not continuity between the key switch side connector terminals No. G5–2 and G5–4 as shown in the figure.



683RS009

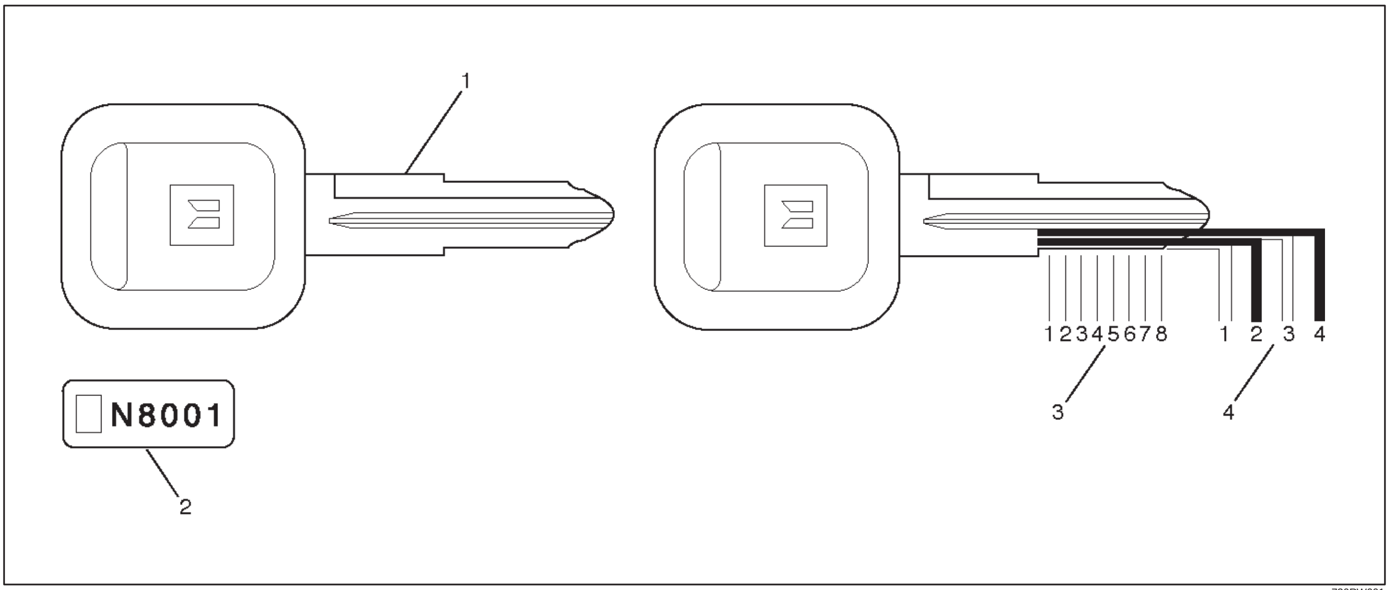
2. Tighten the outside handle and key cylinder fixing bolts to the specified torque.

   Torque: 9 N·m (78 lb in)

3. Check that the outside handle and key cylinder operate correctly after installing them.

Key

Key Coding

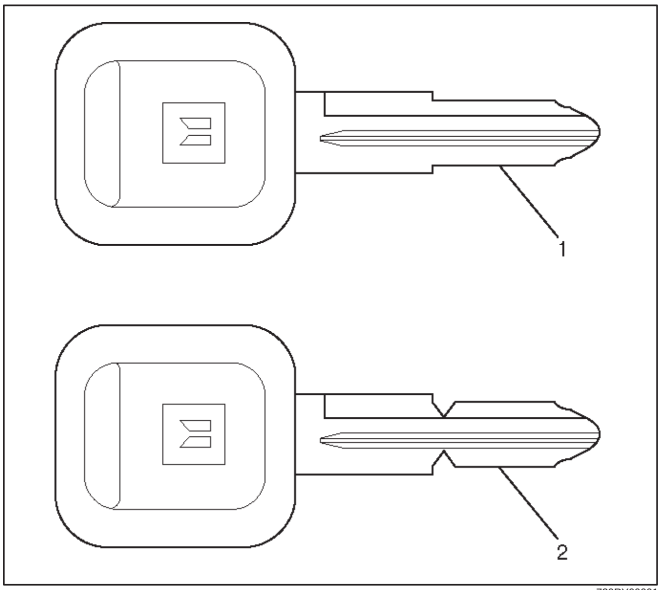


730RW001

Legend
(1) Key(Actual Size)
(2) Key Code Tag
(3) Position
(4) Level

One key is used for the ignition, door, and tailgate lock cylinders. The keys are cut on both edges to make them reversible.
Key identification is obtained from the five character key code stamped on the key code tag. From this key code, the key code cutting combination can be determined from a code list (available to owners of key cutting equipment from suppliers).
If key codes are not available from records or tags, the key code can be obtained from the right hand door lock cylinder (if lock has not been replaced). Lock cylinders supplied by the factory as service parts are unmarked.
If the original key is available, the key code cutting combination can be determined by laying the key on the diagram shown in the figure.

Key Styles



730RY00001

Legend
(1) Blank Key Style “A”
(2) Blank Key Style “B”

The keys come in styles A or B depending on the key code cutting combination. When the first position in the combination is a 1, 2 or 3, Style A is used. When the first position is a 4, Style B (factory pre-cut key) is used.

Power Door Lock System

General Description

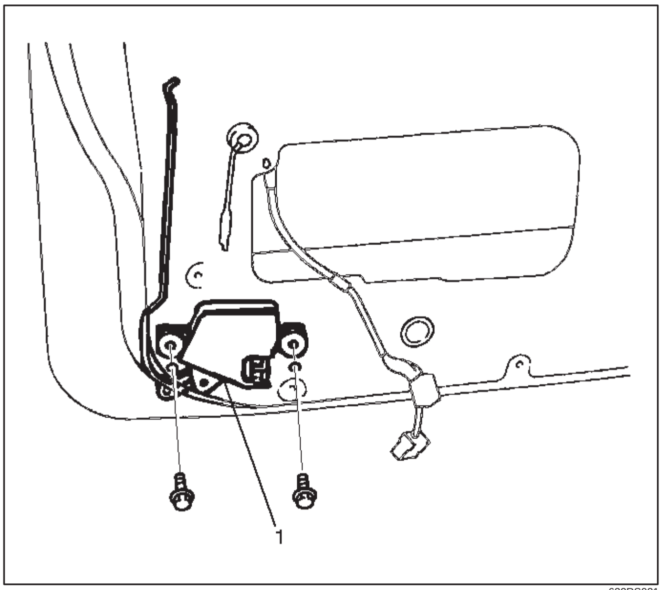
The circuit consists of the door lock (& power window) switch, door lock actuator for the front and rear door, tailgate lock actuator and the door lock key switch. The front door lock switch –LH is always provided with battery voltage.

The key or the inside lock button on the both driver's and the front passenger's door can activate the lock mechanism of all the doors (including the tailgate).

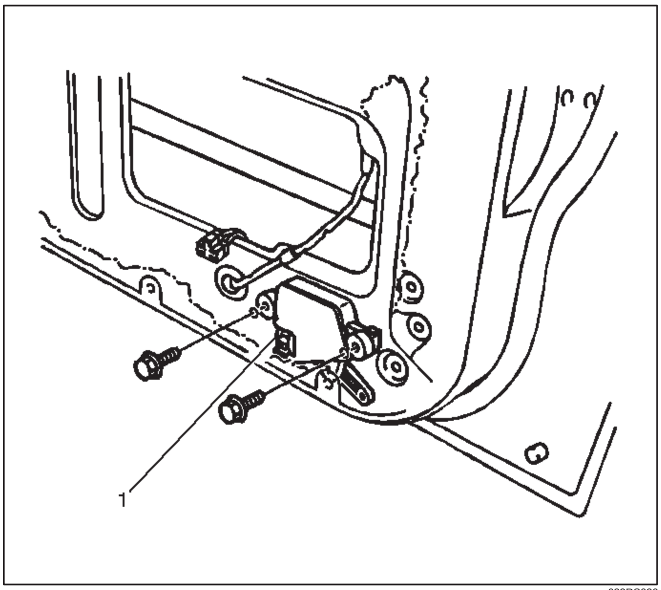
When the driver's door lock switch or the front passenger's door lock switch is turned on, current flows for about one second to the door lock actuator of each door connected in parallel with the front door lock (& power window) switch –LH to activate the actuator to lock and unlock the doors.

Front Door Lock Actuator Removal

1. Refer to the Front Door Lock Assembly removal procedure in this section.
2. Remove the door lock actuator(1).



632RS021



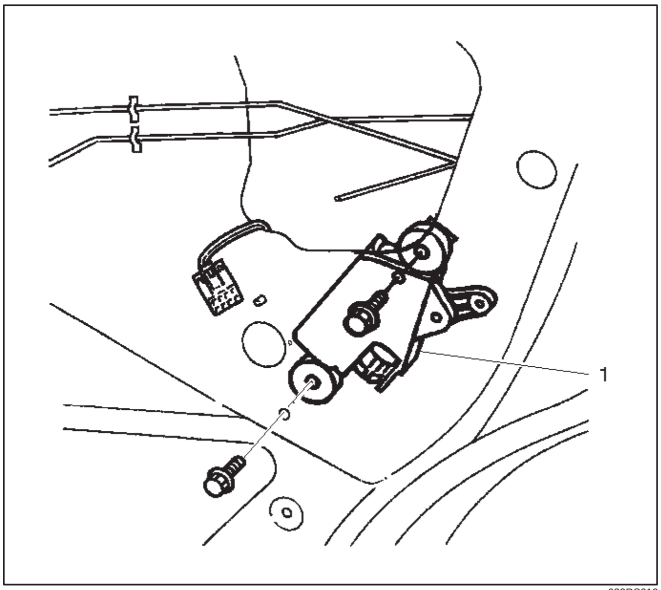
632RS020

Front Door Lock Actuator Installation

To install, follow the removal steps in the reverse order.

Rear Door Lock Actuator Removal

1. Refer to the Rear Door Lock Assembly removal procedure in this section.
2. Removal the door lock actuator(1).



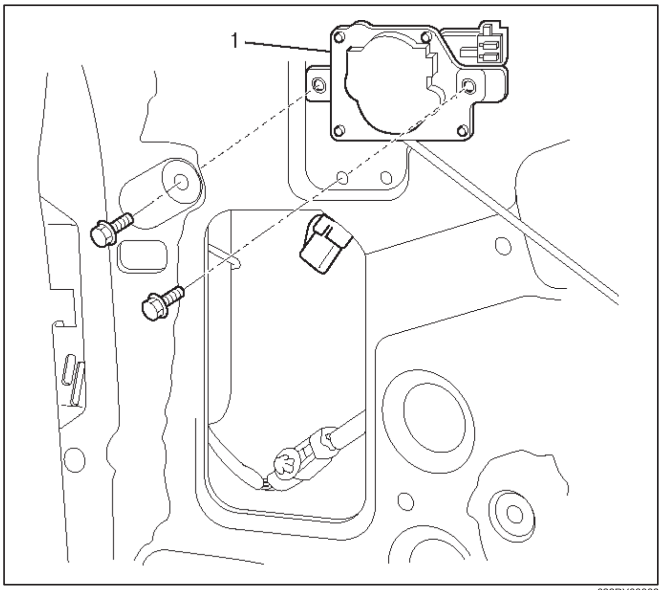
632RS019

Rear Door Lock Actuator Installation

To install, follow the removal steps in the reverse order.

Tailgate Lock Actuator Removal

1. Refer to the Tailgate Lock Assembly removal procedure in this section.
2. Remove the tailgate lock actuator(1).



632RY00002

Tailgate Lock Actuator Installation

To install, follow the removal steps in the reverse order.

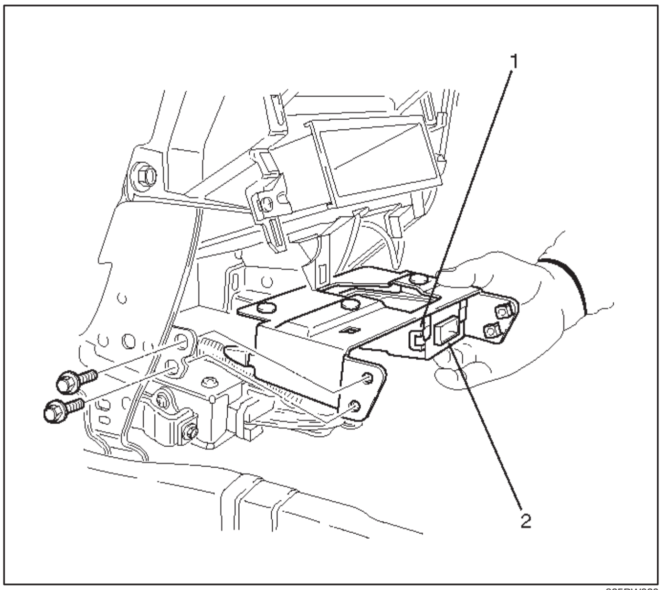
Anti-theft System

General Description

The circuit consists of the starter switch, anti-theft & keyless entry control unit, anti-theft horn, front door and tailgate key switch (detect and tamper switch), door lock (& power window) switch, door lock actuator for each door, engine hood switch, clutch start switch (M/T), ANTI-THEFT indicator light and mode switch (A/T).
The system operates as follows: After locking the starter switch and removing the starter key (this sets the alarm), if the door is unlocked in any way other than with the proper key, the headlights start flashing, the horn sounds, and the starter circuit is disabled. (However, the engine hood and all the doors must be locked and closed.)
Once the system has been placed in the warning or alarm condition, it can be released only when the starter switch is shifted from “OFF” to “ACC” by the starter key, or when the lock of the front door or the tailgate is released (to activate the detect switch) by the starter key.

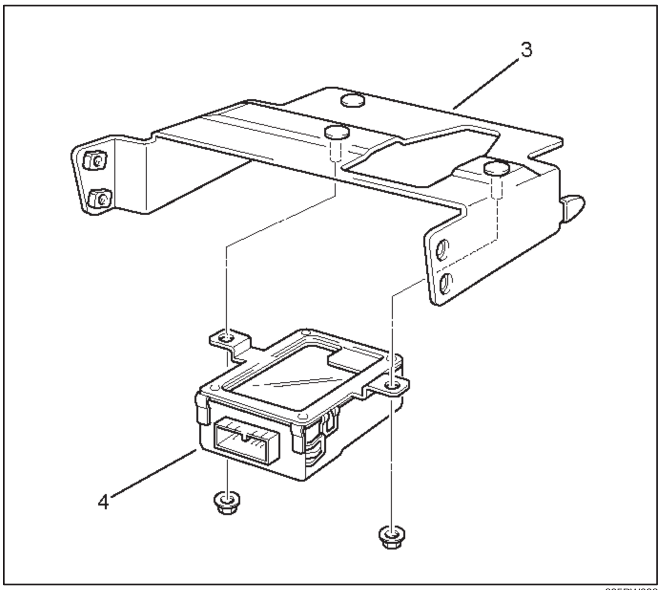
Anti-theft & Keyless Entry Control Unit Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly.
   - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly.
   - Refer to the Instrument Panel Assembly in Body Structure section.
4. Disconnect the connector(2).
5. Remove four screws to remove the anti-theft & keyless entry control unit with bracket(1).



825RW029

6. Remove two nuts from the anti-theft & keyless entry control unit with bracket(3) to remove the anti-theft & keyless entry controller(4).



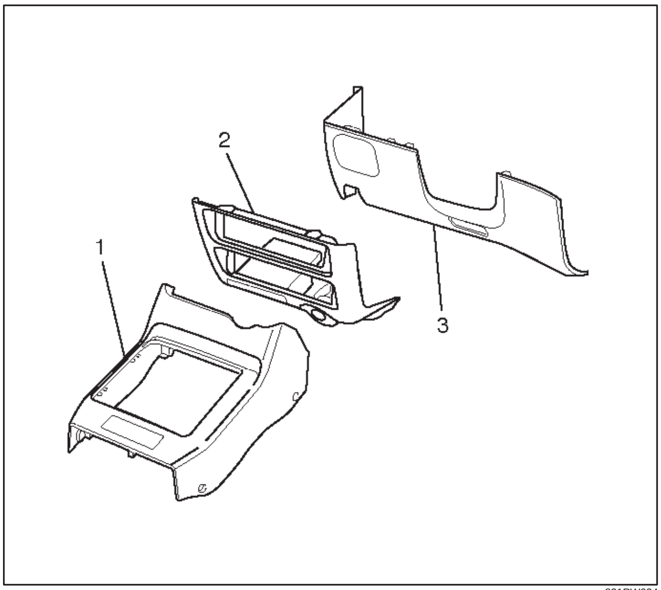
825RW028

Anti-theft & Keyless Entry Control Unit Installation

To install, follow the removal steps in the reverse order.

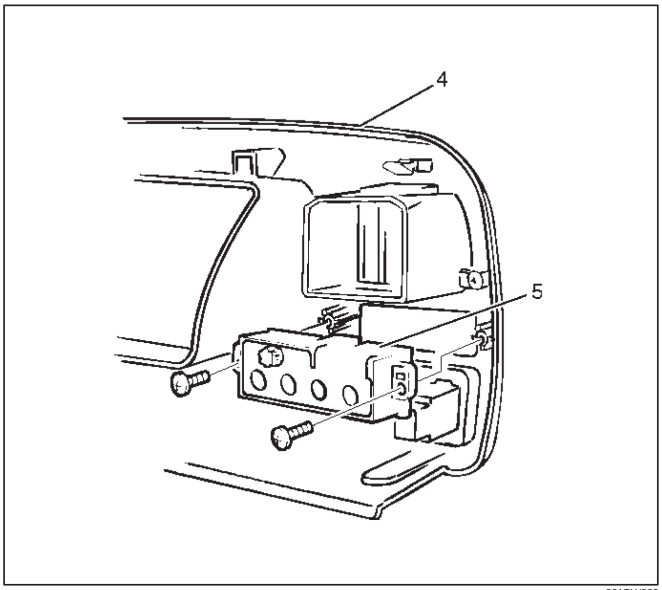
Anti-theft Indicator Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly(1).
   - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly(2).
   - Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover assembly(3).
   - Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove the instrument panel cluster assembly(4).
   - Refer to the Instrument Panel Assembly in Body Structure section.
6. Remove two screws and then remove the anti-theft indicator(5).



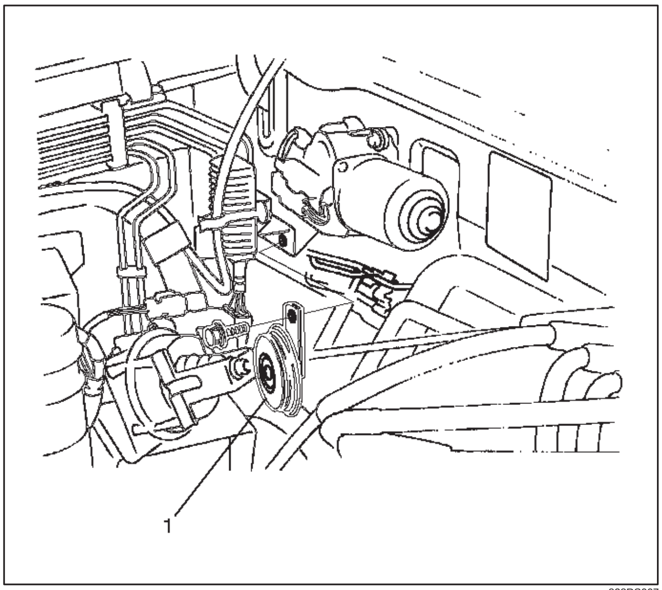
821RW032

Anti-theft Indicator Installation

To install, follow the removal steps in the reverse order.

Anti-theft Horn Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector and remove the fixing bolt to remove the anti-theft horn(1).



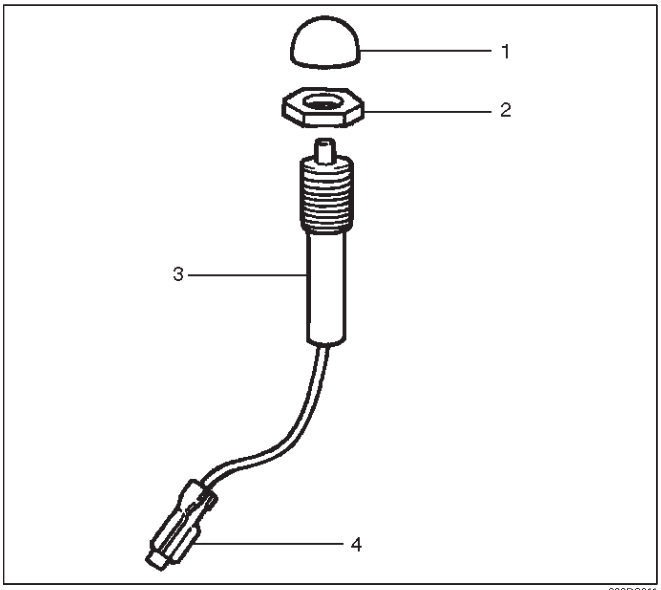
828RS007

Anti-Theft Horn Installation

To install, follow the removal steps in the reverse order.

Engine Hood Switch Removal

1. Disconnect the battery ground cable.
2. Remove the cap(1).
3. Remove the lock nut(2).
4. Disconnect the connector(4).
5. Remove the engine hood switch(3).



828RS011

Engine Hood Switch Installation

To install, follow the removal steps in the reverse order.

Keyless Entry System

ID Code Registration

There are four kinds of ID codes which can be registered, for which these two modes, ID code new registration and ID code additional registration, are available.

ID Code New Registration

This procedure erases all registered ID codes and registers a new received ID code instead.

Step	Action	Yes	No
1	1. Confirm that all the doors are closed and unlocked. 2. Open the driver's side door. 3. Insert the key into the starter switch. Is the action complete?	Go to Step 2	Go to Step 1
2	Turn the starter switch to ACC position and then to OFF position three times. NOTE: This step must be carried out within five seconds after step 1. Is the action complete?	Go to Step 3	Go to Step 1
3	Close the driver's side door and then open it two times. NOTE: This step must be carried out within ten seconds after step 2. Is the action complete?	Go to Step 4	Go to Step 1
4	1. Turn the starter switch to ACC position and then to OFF position five times. 2. Close the driver's side door and then open it. NOTE: This step must be carried out within ten seconds after step 3. Is the action complete?	Go to Step 5	Go to Step 1
5	The control unit locks and unlocks the doors one time. Does the control unit work normally?	Go to Step 6	Go to Step 1
6	Operate the lock or unlock button of the transmitter. NOTE: This step must be carried out within twenty seconds after step 5. Is the action complete?	Go to Step 7	Go to Step 1
7	The control unit locks and unlocks the doors one time. Does the control unit work normally?	Go to Step 8	Go to Step 1

Step	Action	Yes	No
8	Operate the lock or unlock button of the transmitter. NOTE: This step must be carried out within twenty seconds after step 7. Is the action complete?	Go to Step 9	Go to Step 1
9	The control unit compares the two codes sent from the transmitter. If the code succeeds in registration, the control unit locks and unlocks the doors one time. If the two codes are different from each other or fails in registration, the control unit locks and unlocks the doors three times. NOTE: In any case, this procedure is finished.	Go to Step 1	Go to Step 1

ID Code Additional Registration

This procedure additionally registers a new received ID code with holding registered ID codes. When total number of registered ID codes and newly registered ID code exceeds four, they are erased in order of older one.

Step	Action	Yes	No
1	1. Confirm that all the doors are closed and unlocked. 2. Open the driver's side door. 3. Insert the key into the starter switch. Is the action complete?	Go to Step 2	Go to Step 1
2	Turn the starter switch to ACC position and then to OFF position three times. NOTE: This step must be carried out within five seconds after step 1. Is the action complete?	Go to Step 3	Go to Step 1
3	Close the driver's side door and then open it two times. NOTE: This step must be carried out within ten seconds after step 2. Is the action complete?	Go to Step 4	Go to Step 1
4	1. Turn the starter switch to ACC position and then to OFF position three times. 2. Close the driver's side door and then open it. NOTE: This step must be carried out within ten seconds after step 3. Is the action complete?	Go to Step 5	Go to Step 1
5	The control unit locks and unlocks the doors two times. Does the control unit work normally?	Go to Step 6	Go to Step 1
6	Operate the lock or unlock button of the transmitter. NOTE: This step must be carried out within twenty seconds after step 5. Is the action complete?	Go to Step 7	Go to Step 1
7	The control unit locks and unlocks the doors one time. Does the control unit work normally?	Go to Step 8	Go to Step 1

Step	Action	Yes	No
8	Operate the lock or unlock button of the transmitter. NOTE: This step must be carried out within twenty seconds after step 7. Is the action complete?	Go to Step 9	Go to Step 1
9	The control unit compares the two codes sent from the transmitter. If the code succeeds in registration, the control unit locks and unlocks the doors one time. If the two codes are different from each other or fails in registration, the control unit locks and unlocks the doors three times. NOTE: In any case, this procedure is finished.	Go to Step 1	Go to Step 1

Anti–theft & Keyless Entry Control Unit/Transmitter Replacement

Anti–theft & Keyless Entry Control Unit Replacement

1. Remove and install the control unit.
   - Refer to Anti–theft & Keyless Entry Control Unit Removal and Installation in this section.
2. Register ID code.
   - Refer to ID Code Registration in this section.
3. Check that the keyless entry system works normally.

Transmitter Replacement

1. Prepare a new transmitter.
2. Regiter ID code.
   - Refer to ID Code Registration in this section.
3. Check that the keyless entry system works normally.

Transmitter Battery Replacement

1. Remove a screw to remove the cover.
2. Remove the batteries.
3. Set the new batteries into the transmitter.
4. Install the cover to the transmitter.
5. Check that the keyless entry system works normally.

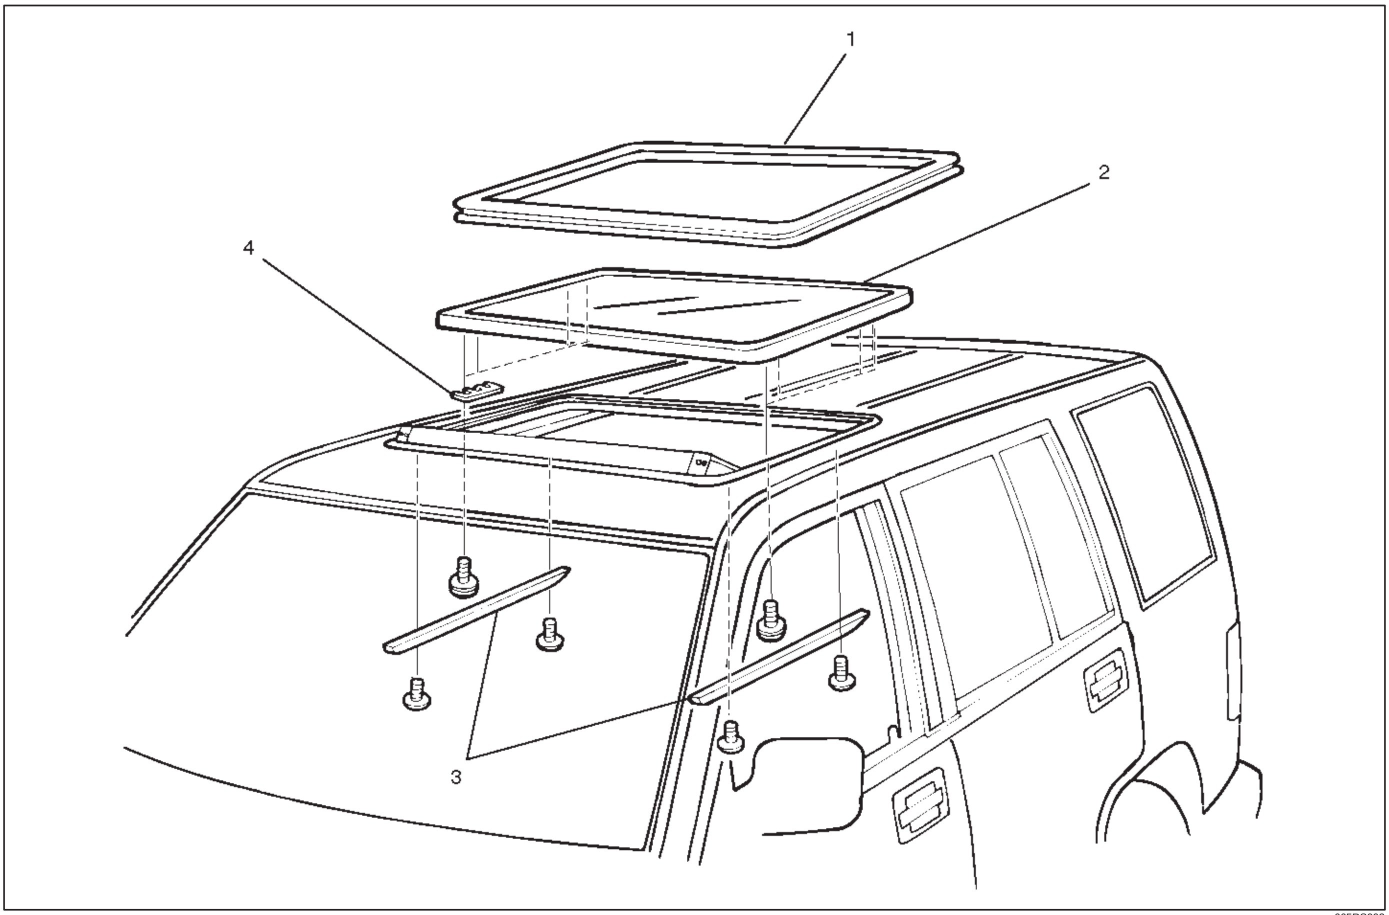
WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Sun Roof Glass

Sun Roof Glass and Associated Parts

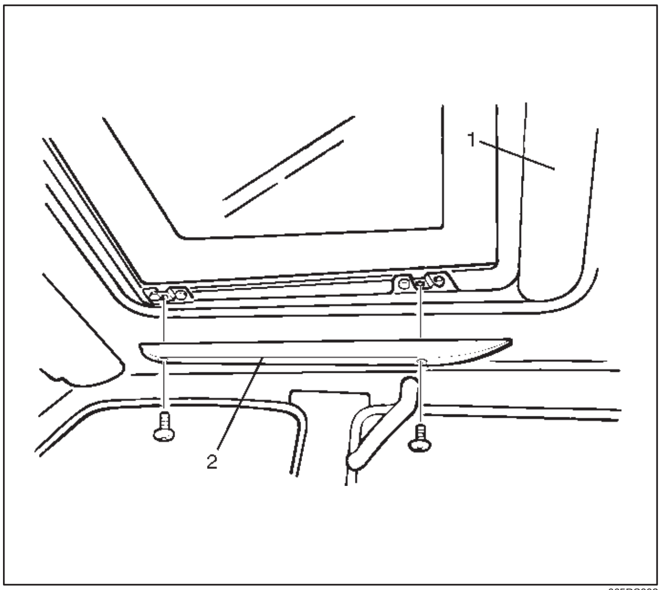


665RS002

Legend
(1) Sun Roof Weatherstrip
(2) Sun Roof Glass
(3) Decoration Cover
(4) Sun Roof Shim

Removal

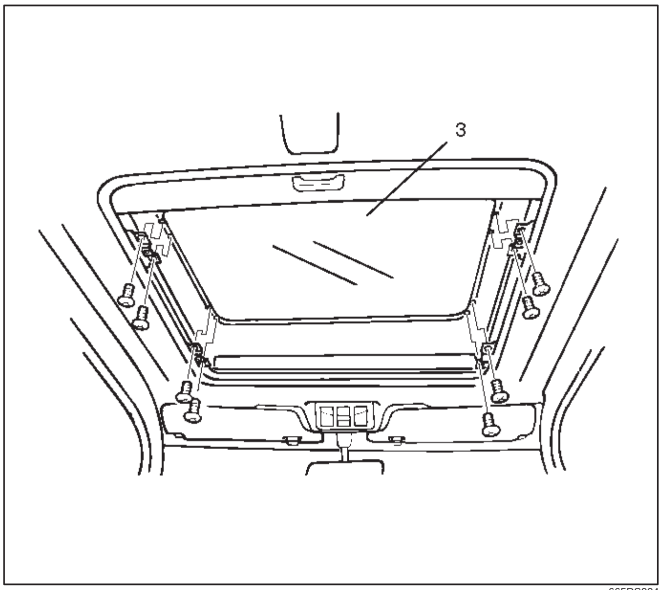
1. Open the sun roof and pull the sun roof weatherstrip out from the roof panel.
2. Disconnect the battery ground cable.
3. Close the sun roof and open the sunshade(1). Then, remove the decoration cover fixing screws and decoration cover(2).



665RS003

4. Remove eight sun roof glass fixing screws to remove the sun roof glass(3).

NOTE: If shims are used between the sun roof set plate and the glass, note the number of shims used.

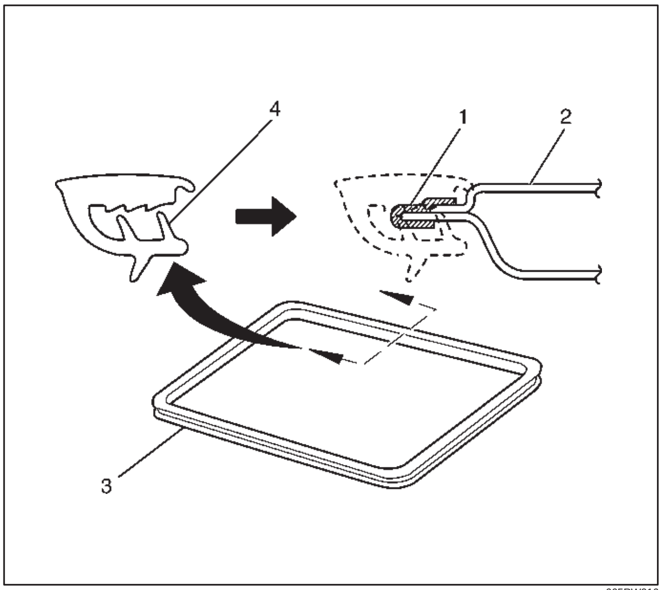


665RS004

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Clean the body panel of the weatherstrip fixing portion.
   - If the protective film(1) of the body panel is peeled, it cannot be reused.
     Install the new protective film around the body panel(2).
2. Install the new weatherstrip(3).
   - Always replace with a new one.
   - Be sure to install the sun roof weatherstrip so that the white marking location(4) of the weatherstrip is on the front side of the vehicle.



665RW016

3. Temporarily install the glass to the sun roof frame.
4. Open and shut the sun roof four to five times to position correctly the sun roof weatherstrip and the glass in the longitudinal and latitudinal setting positions.
5. Insert the original shims between the sun roof set plate and the glass.
6. Tighten the sun roof glass fixing screws to the specified torque.

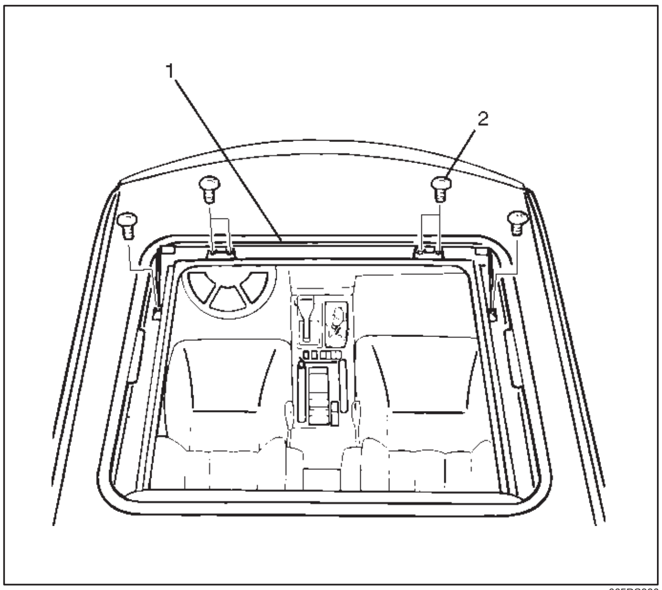
Torque: 10 N·m (87 lb in)

7. After the sun roof glass is installed, check the roof panel and sun roof glass for vertical install position.
   If out of standard, adjust with shim.
   For the installation standard, refer to Body Dimension in Body Structure section.
8. Install the decoration cover.

Sun Roof Deflector

Removal

1. Open the sun roof.
2. Remove the fixing screws(2) to remove the sun roof deflector(1).



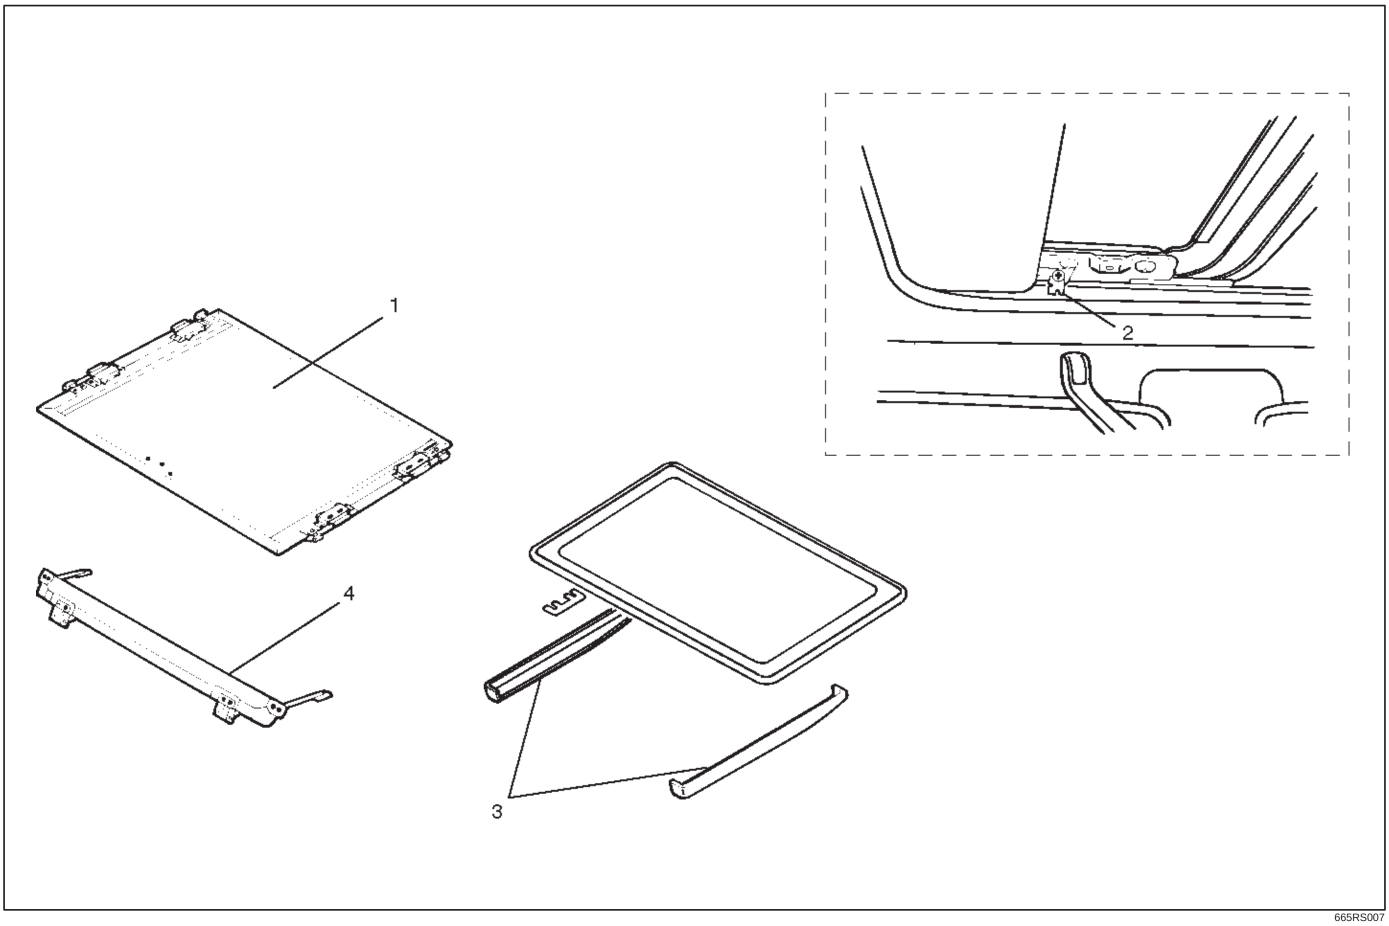
665RS006

Installation

To install, follow the removal steps in the reverse order.

Sunshade

Disassembled View



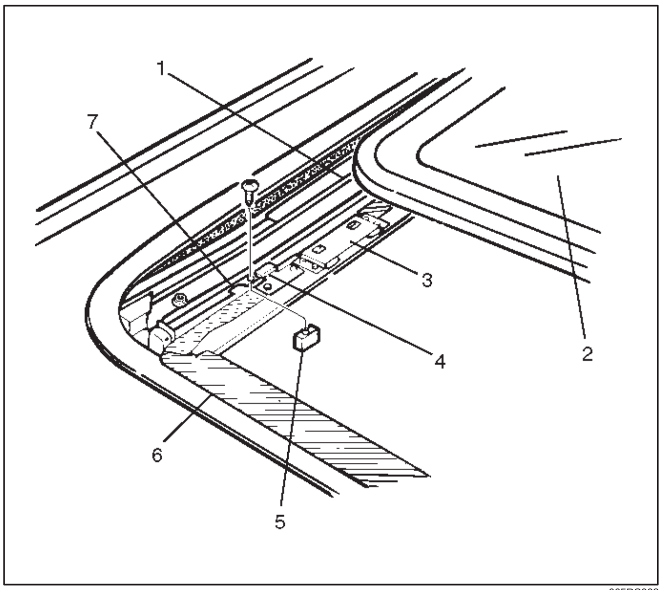
665RS007

Legend

(1) Sunshade
(2) Sunshade Stopper
(3) Decoration Cover
(4) Sun Roof Deflector

Removal

1. Remove the decoration cover.
2. Open the sun roof half position, remove the sunshade stopper screw and pull out the sunshade(6) until its front side protrudes a little from the sun roof glass(2) to remove the sunshade stopper.
3. Remove the sun roof deflector.
   - Refer to the Sun Roof Deflector in this section.
4. Open the sun roof completely.
5. Remove the sunshade guide rail stopper(5), and pull out the sunshade up to the rail edge.
6. Remove the guide pin(4) in the sunshade through the notch(7) of guide rail(1) and then draw the sunshade out of the roof by pushing inward the retaining clips(3) on both sides.



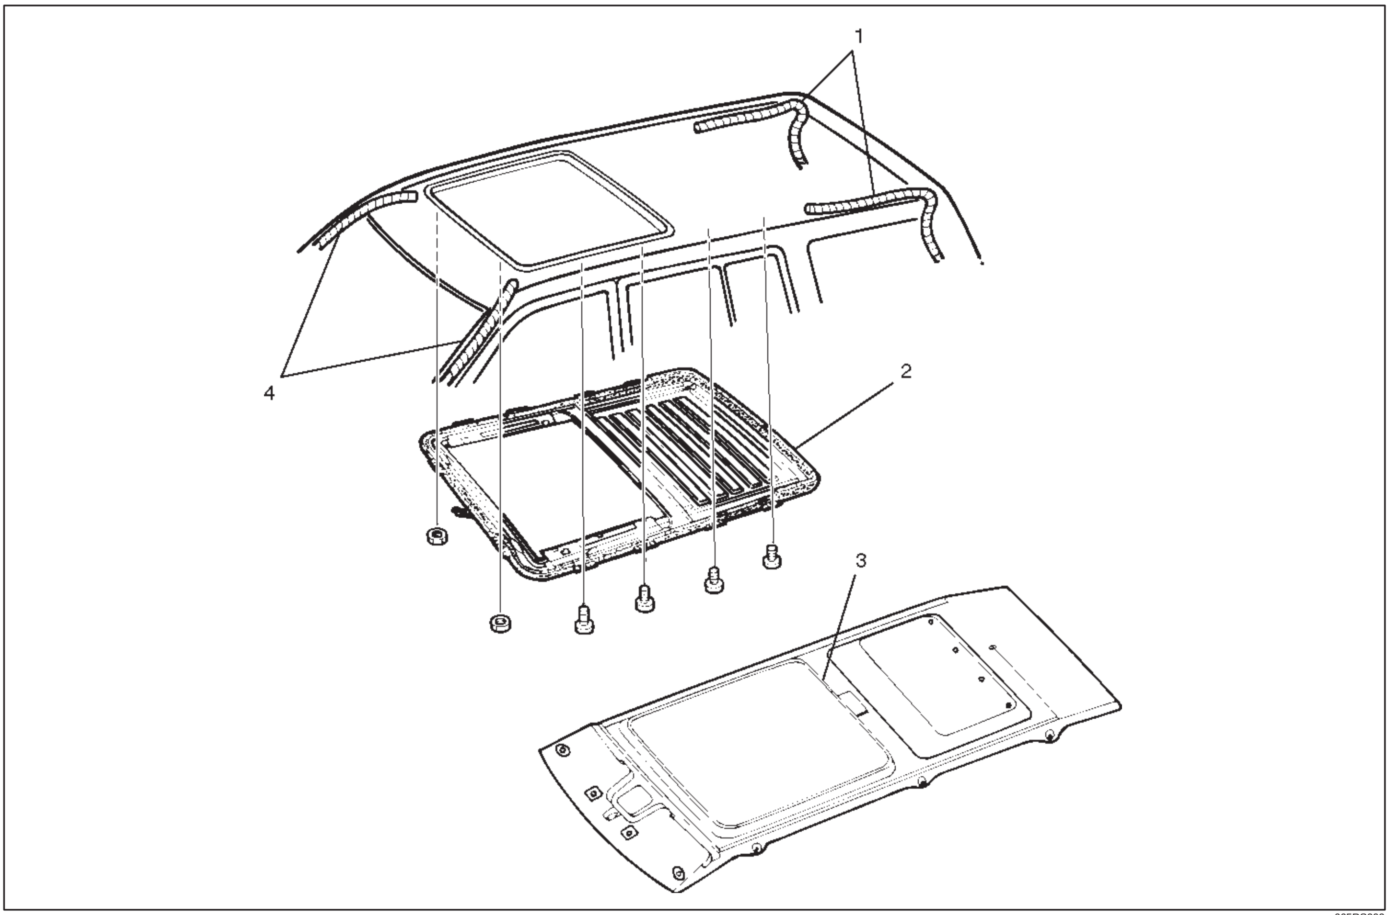
665RS008

Installation

To install, follow the removal steps in the reverse order.

Sun Roof Frame Complete Assembly

Sun Roof Frame Complete Assembly and Associated Parts



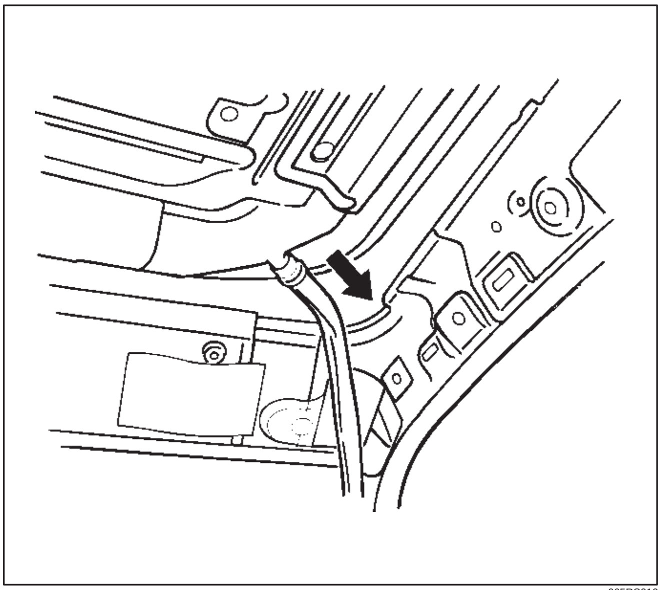
665RS009

Legend

(1) Sun Roof Drain Hose
(2) Sun Roof Frame Complete Assembly
(3) Headlining
(4) Sun Roof Drain Hose

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining.
   - Refer to the Headlining in Body Structure section.
3. Disconnect the sun roof drain hose at the sun roof frame side as shown in the figure.



665RS010

4. Disconnect the sun roof harness connection.

5. Remove two sun roof frame complete assembly fixing nuts (front side) and four fixing bolts (each side) from the frame complete, and then remove the sun roof frame complete assembly.

NOTE: Be sure to remove the frame complete while supporting it.

Installation

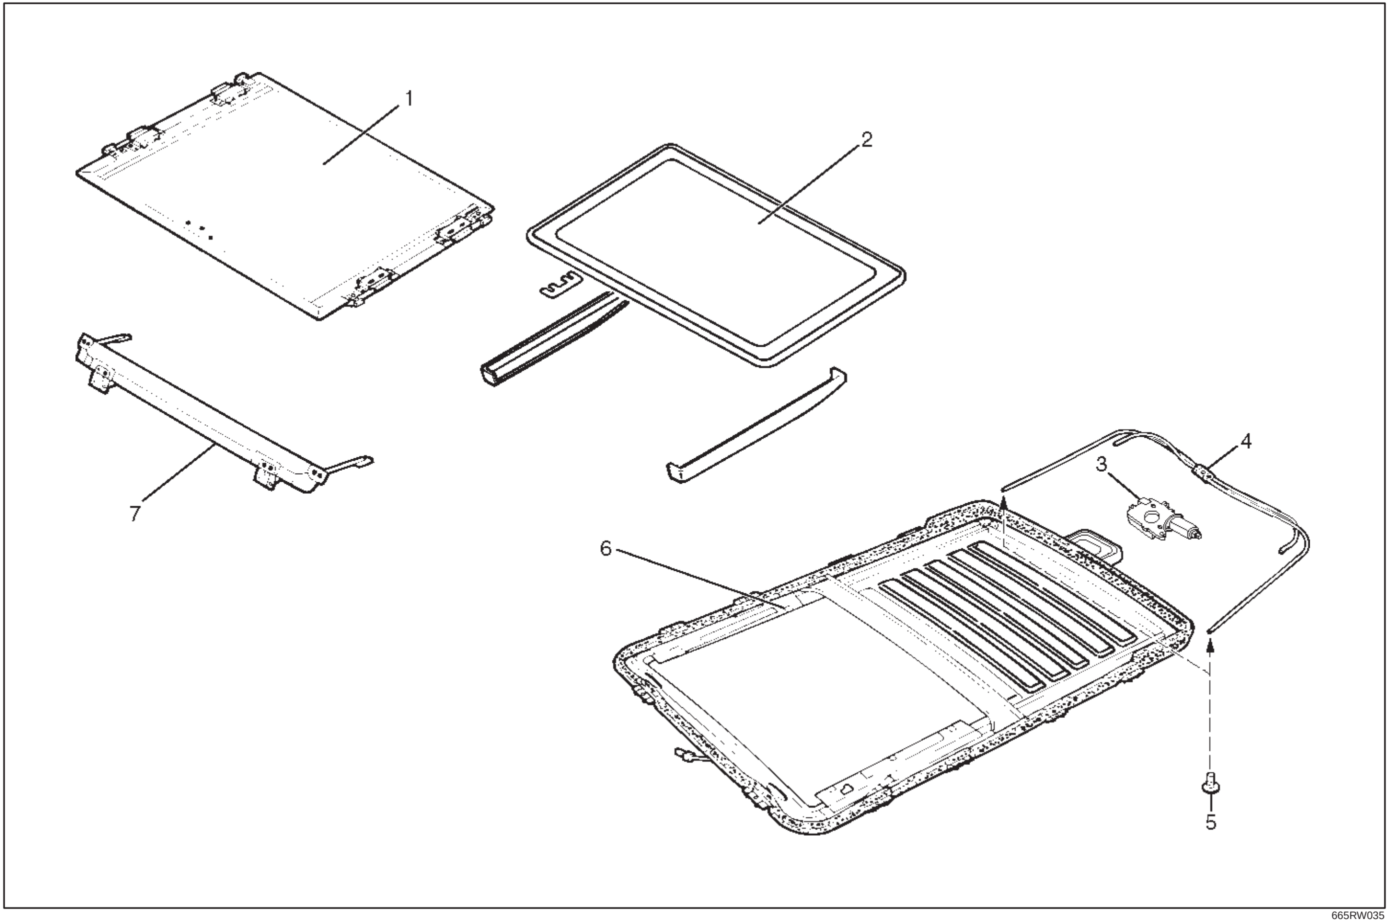
To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the sun roof frame complete assembly fixing bolts and nuts to the specified torque.

Torque: 10 N·m(87 lb in)

2. After installing the frame complete, loosen the sun roof glass fixing nuts and adjust the sun roof glass setting position.
   - Refer to the Sun Roof Glass in this section.

Disassembled View



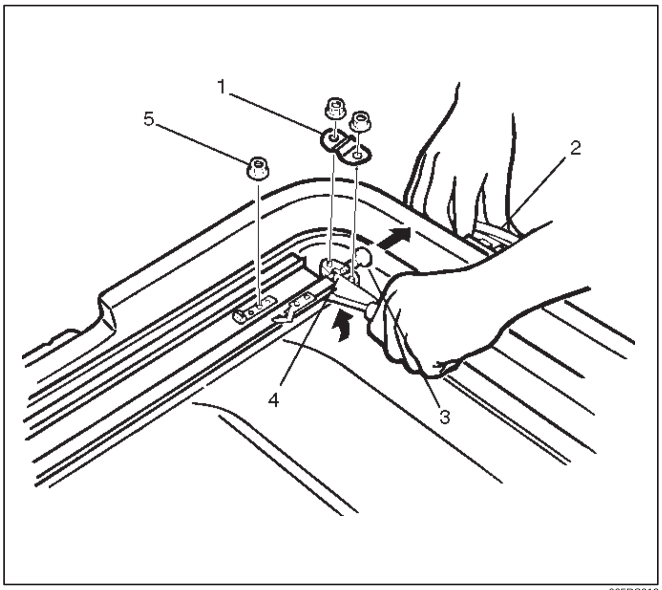
Legend

(1) Sunshade
(2) Sun Roof Glass
(3) Sun Roof Motor
(4) Sun Roof Drive Unit Assembly
(5) Outer Tube Fixing Screw
(6) Sun Roof Frame Assembly
(7) Sun Roof Deflector

Disassembly

1. Open the sun roof.
2. Remove the sun roof deflector fixing screws and then remove the sun roof deflector.
3. Remove the sunshade.
   - Refer to the Sunshade in this section.
4. Close the sun roof, remove the decoration cover and the fixing screws and then remove the sun roof glass.
5. If the shims are used between the sun roof set plate and the glass, note the number of the shims.

6. Disconnect the sun roof motor connector, remove the sun roof fixing nuts and screws, and then remove the sun roof motor.
7. Remove the cable outer tube(2) fixing screws.
8. Remove the cable outer tube fixing clamps(1) and guide rail fixing nuts(5).
9. Prying the guide rail a little with a screwdriver, draw the outer tube out of the grommet(3).
   - At this time, the inner cable(4) remains on the frame assembly.
10. Remove the sun roof frame assembly.

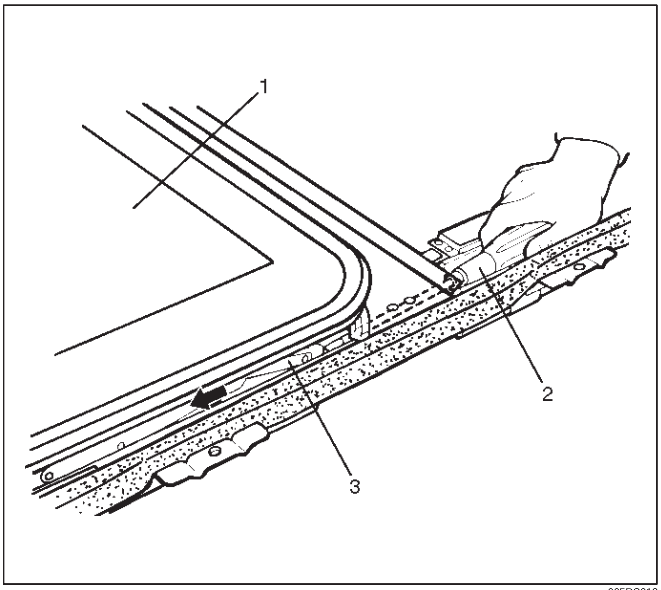


665RS012

Reassembly

To reassembly, follow the disassembly steps in the reverse order, noting the following points.

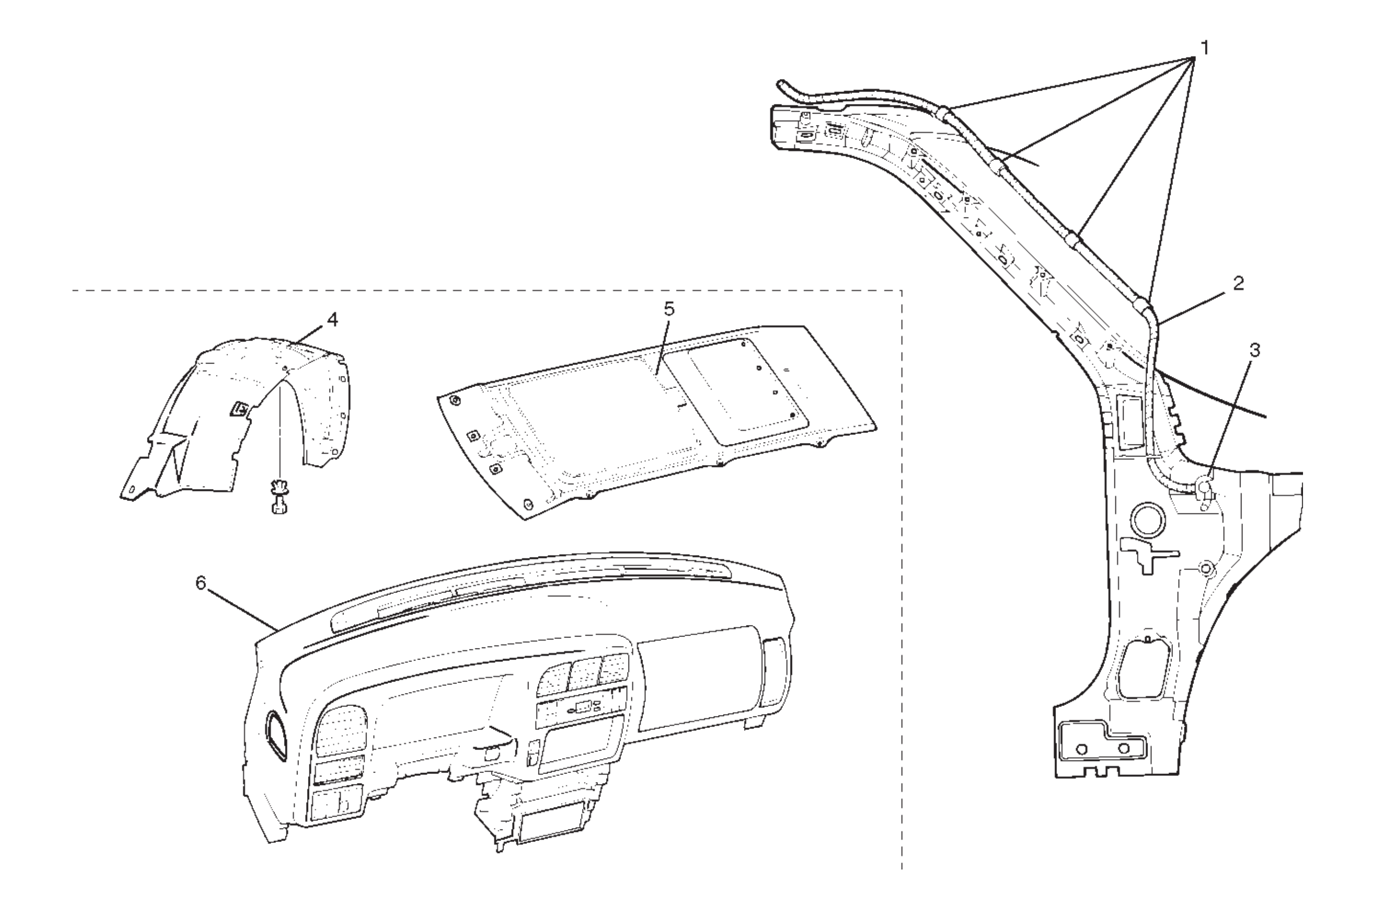
1. When installing the motor or drive unit, set the sun roof set plate in the full closed position by pushing the link(3) portion using the screwdriver(2).
2. When installing the sun roof glass(1) to the sun roof set plate, insert the original shims in the same position before removing the sun roof glass.



665RS013

Sun Roof Drain Hose (Front Side)

Sun Roof Drain Hose (Front Side) and Associated Parts



Legend
(1) Clip
(2) Sun Roof Drain Hose
(3) Grommet
(4) Front Inner Liner
(5) Headlining
(6) Instrument Panel Assembly

Removal

1. Remove the front inner liner.
2. Remove the headlining.
   - Refer to the Headlining in Body Structure section.
3. Remove the instrument panel assembly.
   - Refer to the Instrument Panel Assembly in Body Structure section.
4. Disconnect the drain hose at the frame complete side.
5. Apply the soap and water to the body panel grommet.
6. Pass the string from the sun roof frame side through the drain port side, and remove the drain hose from the hose fixing clips. Taking care not to allow the body panel grommet to be removed together with the hose, pull the drain hose only to the inside of the vehicle. (The string should be kept as it is.)

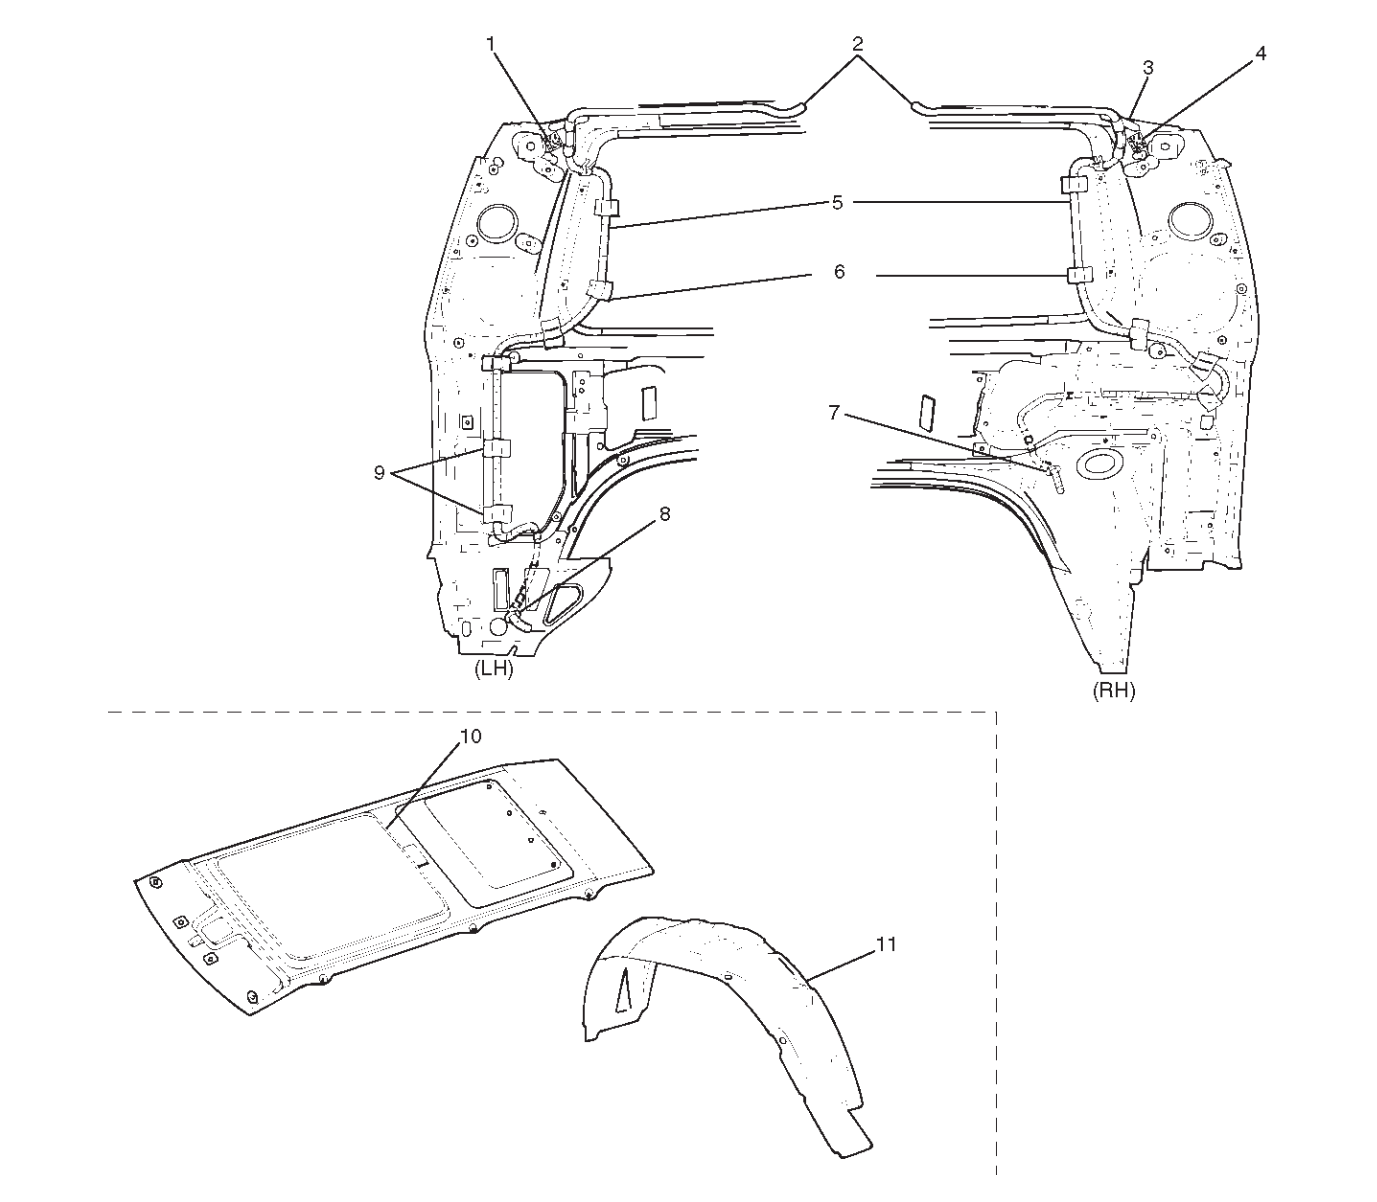
Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Apply the soap and water to the body panel grommet.
2. Install the drain hose from inside of the vehicle by utilizing, as a guide, the string passed during removal step.
3. The body panel grommet must not be twisted or caught in during installation.
4. Complete routing, avoiding extreme bends or curves.
5. After routing, install the trim with care not to allow the drain hose to be caught in.
6. Test the drain condition.
7. The protrusion of drain hose from the body panel must be within 50 mm (2.0 in). If it exceeds 50 mm (2.0 in) after correct routing, cut the leading edge so that the protrusion is within 50 mm (2.0 in).

Sun Roof Drain Hose (Rear Side)

Sun Roof Drain Hose (Rear Side) and Associated Parts



Legend

(1) Soft Tape
(2) Pipe
(3) Clip
(4) Soft Tape
(5) Sun Roof Drain Hose
(6) Tape
(7) Grommet
(8) Grommet
(9) Clip
(10) Headlining
(11) Rear Fender Inner Liner

Removal

1. Disconnect the battery ground cable.
2. Remove the rear fender inner liner.
3. Remove the headlining.
   - Refer to the Headlining in Body Structure section.
4. Disconnect the drive hose at the frame complete side.
5. Remove the hose fixing tapes and clips.
6. Apply the soap and water to the body panel grommet.
7. Pull the drain hose to the inside of the vehicle.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Apply the soap and water to the body panel grommet.
2. Insert the drain hose from inside of vehicle, restore routing, and fix with new soft tape and clip.
   If the grommet is removed during removal of drain hose, insert the grommet into drain hose from outside of the vehicle, and install on the body panel, avoiding any twisting.
3. After installing the drain hose, install the trim while taking care not to crush the drain hose.
   Also, care should be taken not to allow the drain hose connected to the pipe to be caught in.
4. Test the drain condition.
5. The protrusion of the drain hose from the body panel must be within 50 mm (2.0 in). If it exceeds 50 mm (2.0 in) after correct routing, cut the leading edge so that the protrusion is within 50 mm (2.0 in).

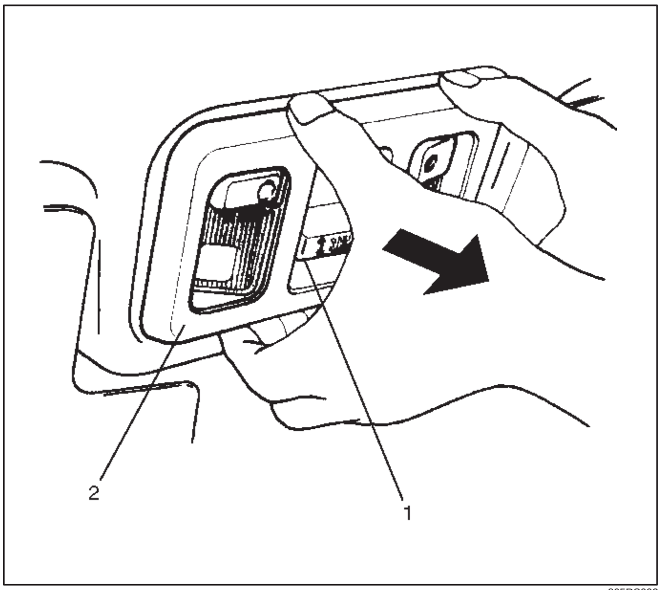
Sun Roof Switch

General Description

Sun roof operation can be controlled by pushing continuously the sun roof switch to activate the sun roof control unit and sun roof motor.
While the switch is being pushed to the “OPEN” side, the sun roof stops about 165 mm (6.5 in) before fully open position. Push the switch again to the “OPEN” side to open it fully. When the switch is being continuously pushed to the “CLOSE” side, the sun roof stops about 180 mm (7.1 in) short of the fully closed position and remains in this state. Push the switch again to the “CLOSE” side to close it completely.

Removal

1. Disconnect the battery ground cable.
2. Pull down the switch housing(2) and disconnect the sun roof switch and map light connectors to remove the sun roof switch(1).



805RS002

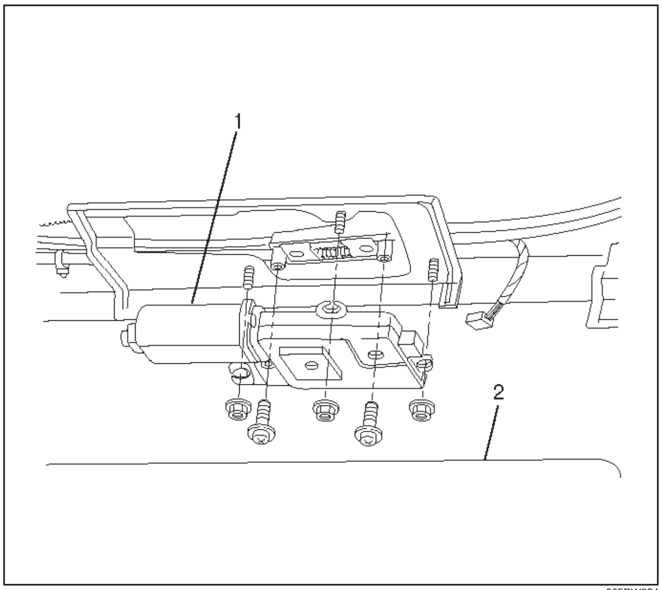
Installation

To install, follow the removal steps in the reverse order.

Sun Roof Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining(2).
   - Refer to the Headlining in Body Structure section.
3. Disconnect the connector, and remove three nuts and two screws to remove the sun roof motor(1).



665RW034

Installation

To install, follow the removal steps in the reverse order.

CONTENTS

Service Precaution

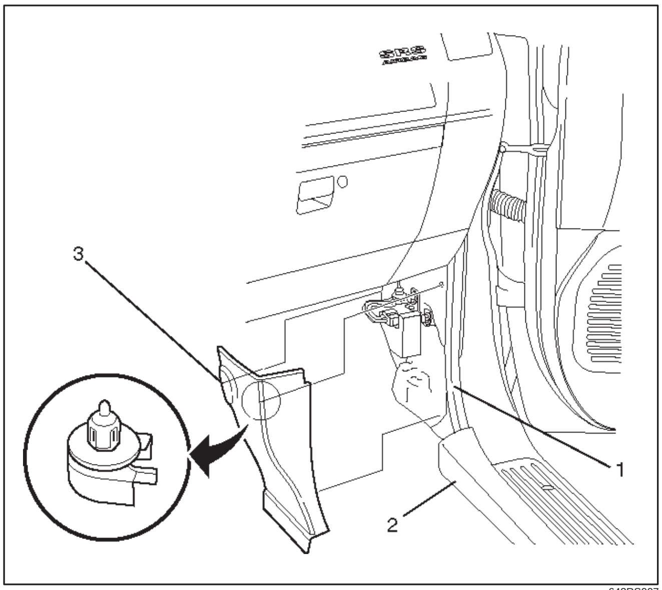
WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Dash Side Trim Panel

Removal

1. Disconnect the battery ground cable.
2. Remove the front door sill plate(2).
3. Remove the dash side trim panel(3).
   - Turn up the door inner seal(1) of the body panel to remove the clips of the trim panel.
   - Take care not to damage the harness and the controller on the back of the trim panel.



643RS007

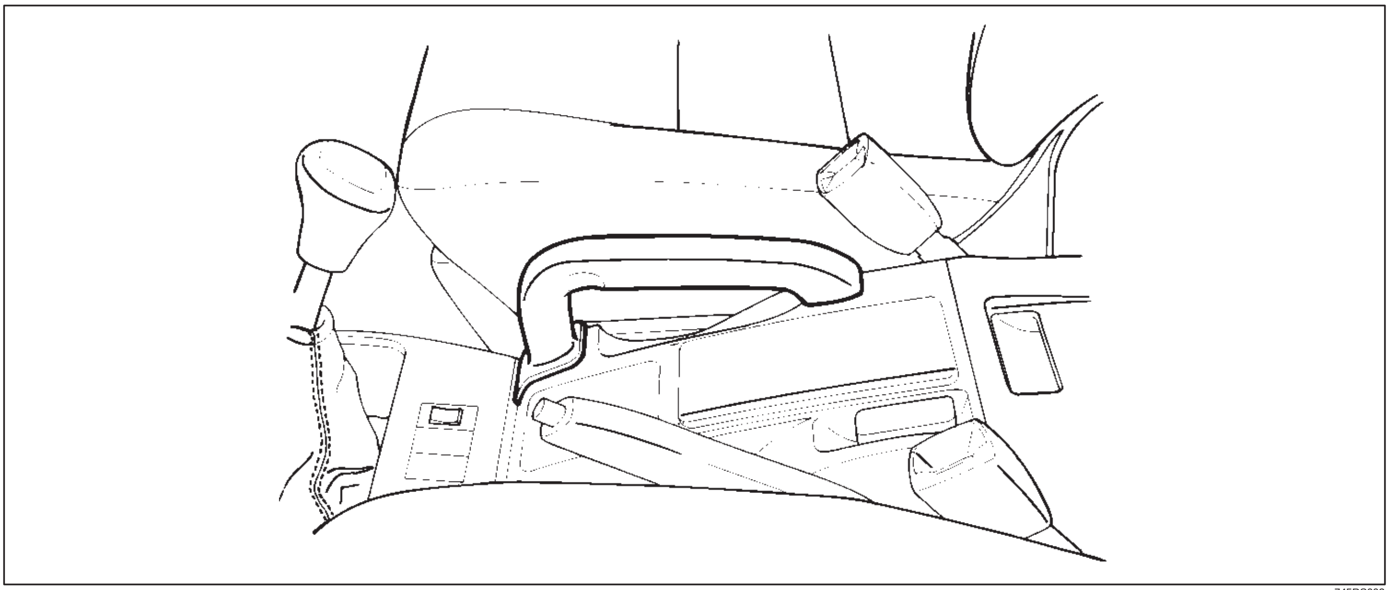
Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Lap the door inner seal over the trim panel to install them securely to the body panel.

Assist Grip

Parts Location



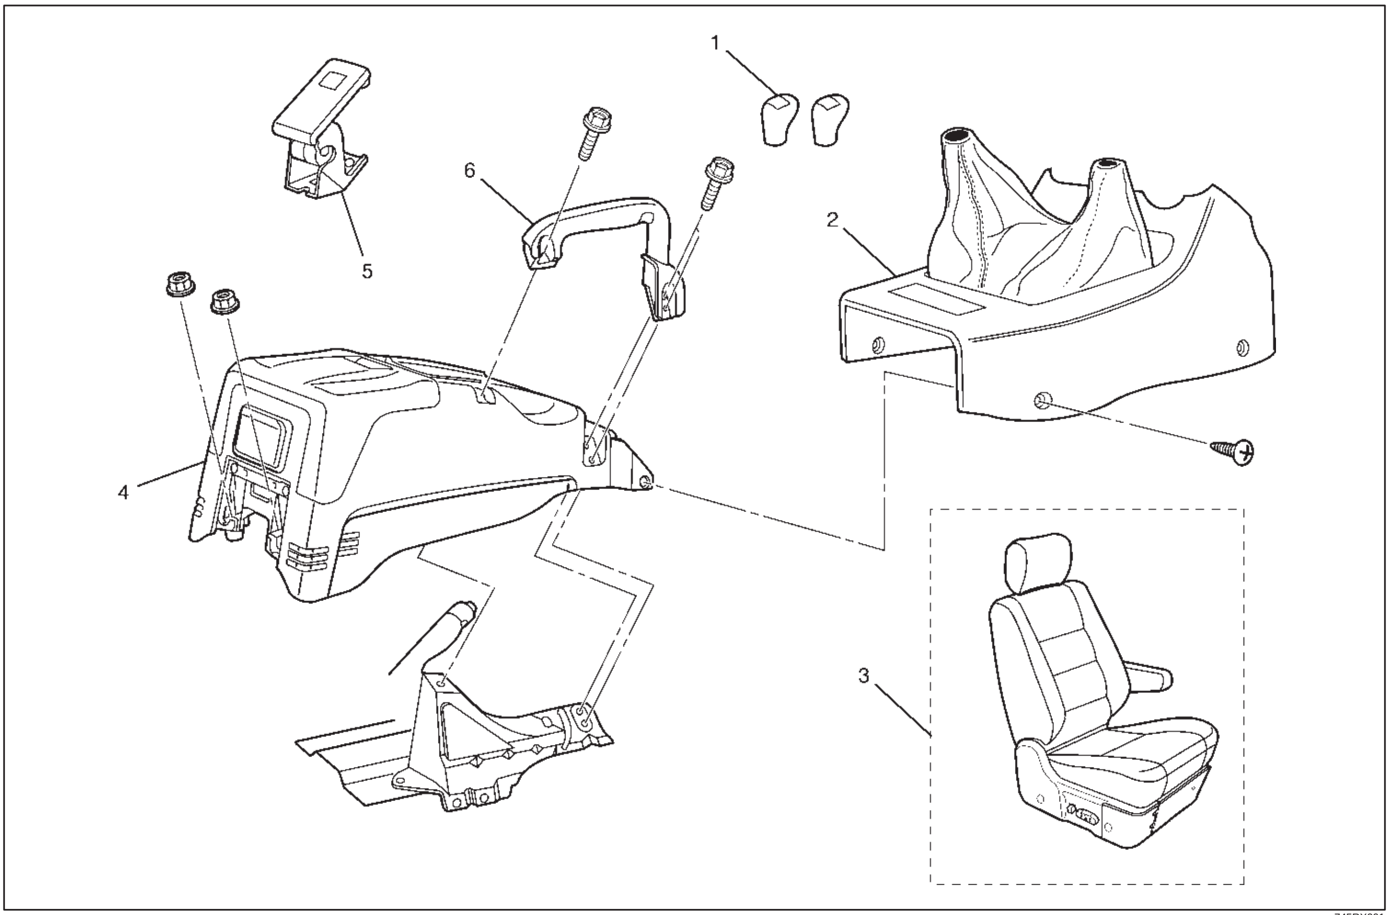
745RS002

Removal and Installation

- Refer to the Consoles removal and installation steps in this section.

Consoles

Consoles and Associated Parts



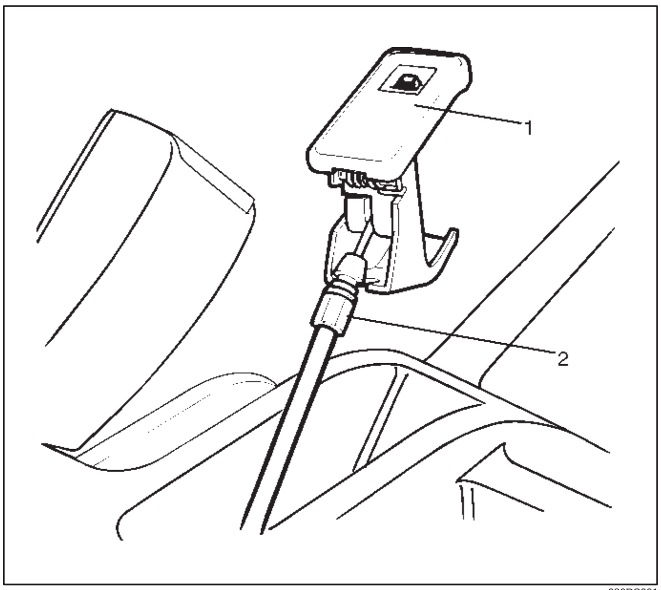
745RX001

Legend

(1) Shift Knob (M/T) / Transfer Knob (A/T)
(2) Front Console Assembly
(3) Front Seat Assembly (RH)
(4) Center Console Assembly
(5) Fuel Filler Lid Opener
(6) Assist Grip

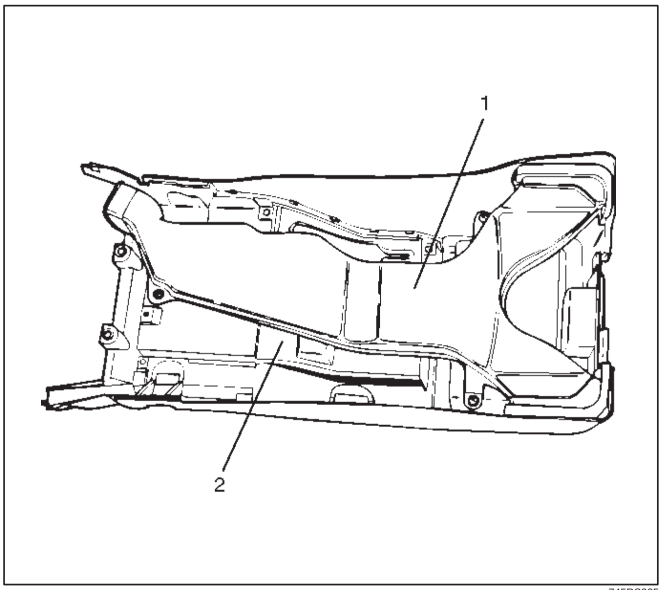
Removal

1. Disconnect the battery ground cable.
2. Remove the shift knob (M/T) / transfer knob (4x4 only).
3. Remove the front console assembly.
   - Remove four fixing screws and disconnect the switch connectors.
4. Remove the front seat assembly(RH).
   - Refer to Front Seat Assembly in Seats section.
5. Remove the assist grip.
   - Remove three bolts.
6. Remove the fuel filler lid opener.
   - Remove the fuel filter lid opener(1) and disconnect the cable(2).



686RS001

7. Remove the center console assembly(2).
   - Remove two fixing screws on the front side.
     Open the rear cover, remove two nuts, then the center console assembly.
   - Remove the rear heater duct(1) from the center console.



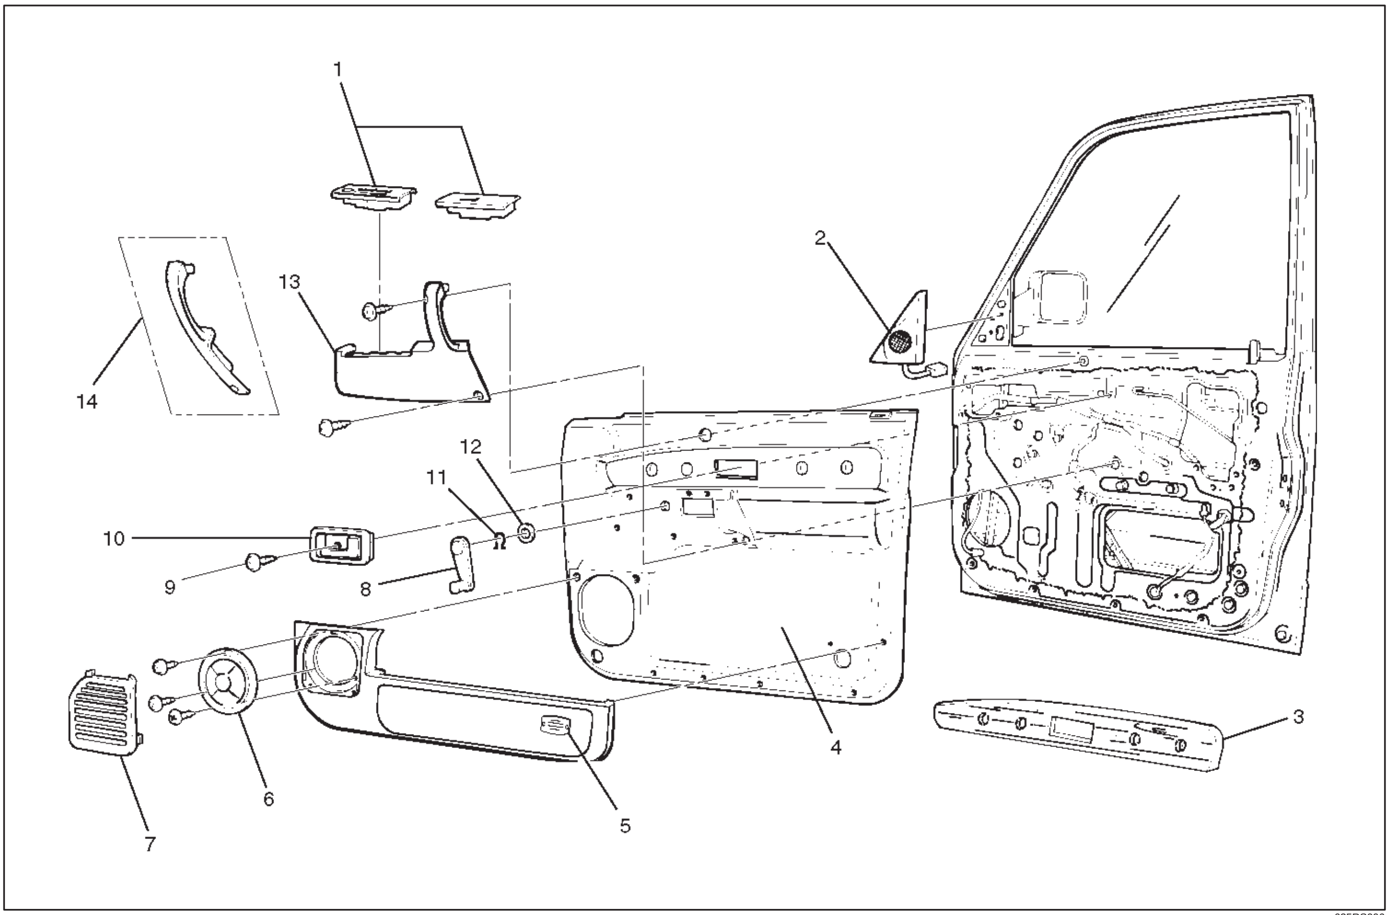
745RS005

Installation

To install, follow the removal steps in the reverse order.

Front Door Trim Panel

Front Door Trim Panel and Associated Parts



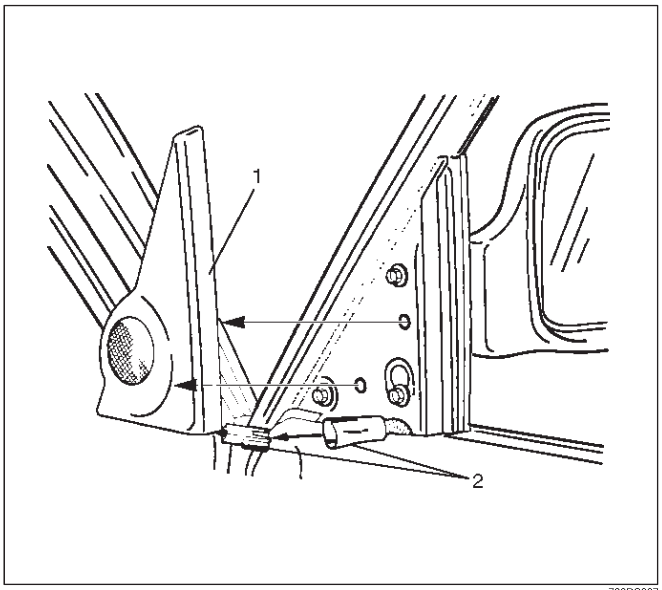
Legend

(1) Power Window Switch
(2) Door Mirror Cover/Tweeter
(3) Door Wood Panel
(4) Door Trim Panel
(5) Courtesy Light
(6) Front Speaker
(7) Speaker Cover
(8) Regulator Handle
(9) Inside Handle Fixing Screw
(10) Inside Handle
(11) Hook
(12) Washer
(13) Inside Pull Handle
(14) Inside Pull Handle (W/O Power Window)

Removal

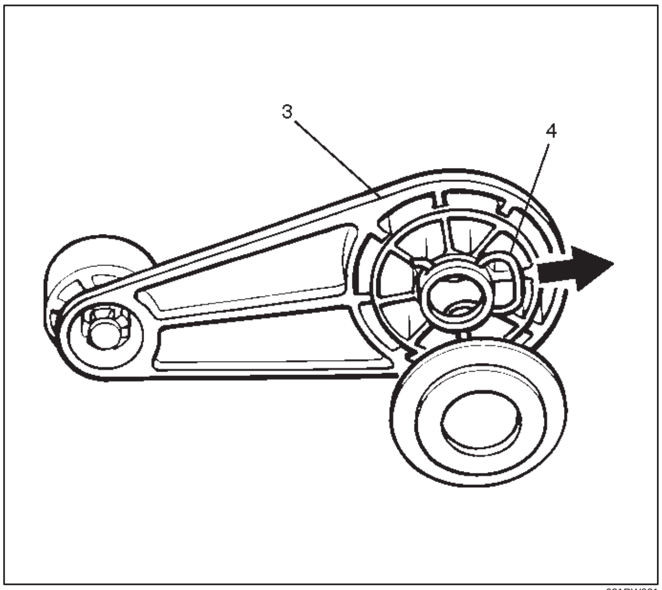
1. Disconnect the battery ground cable.

2. Remove the door mirror cover/tweeter(1).
   - On a model equipped with a tweeter, remove the connector(2).



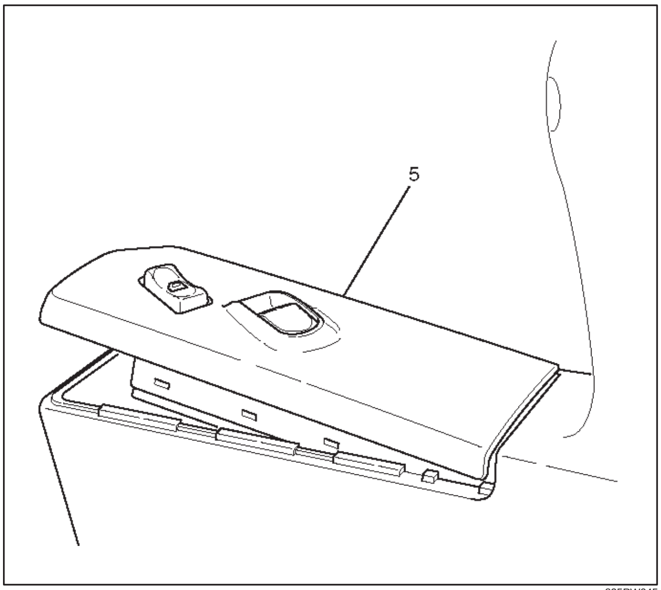
720RS007

3. Remove the regulator handle(3).
   - Pull the hook(4) out and remove the regulator handle.



631RW001

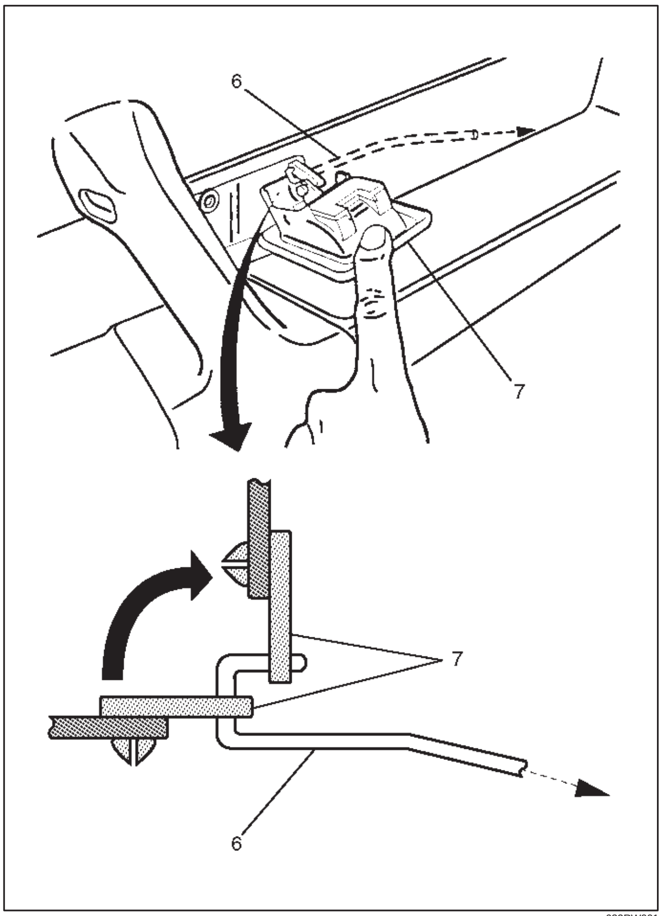
4. Remove the power window switch(5).
   - Pry the power window switch out and disconnect the switch connector.



825RW045

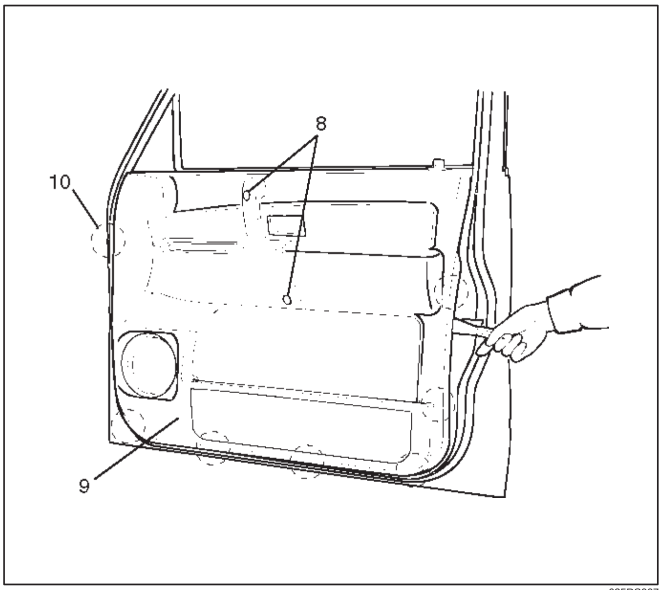
5. Remove the speaker cover.
6. Remove the front speaker.
   - Remove the front speaker fixing screws in order to disconnect the speaker connector.
7. Remove the inside handle fixing screw.
   - Remove the screw that fixes the inside handle(7), slide the inside handle to the position illustrated, and leave it there for the moment.

CAUTION: Take care not to impose excessive force on the inside handle link(6), lest this link is elongated, which could make it impossible to operate the door with the inside handle.



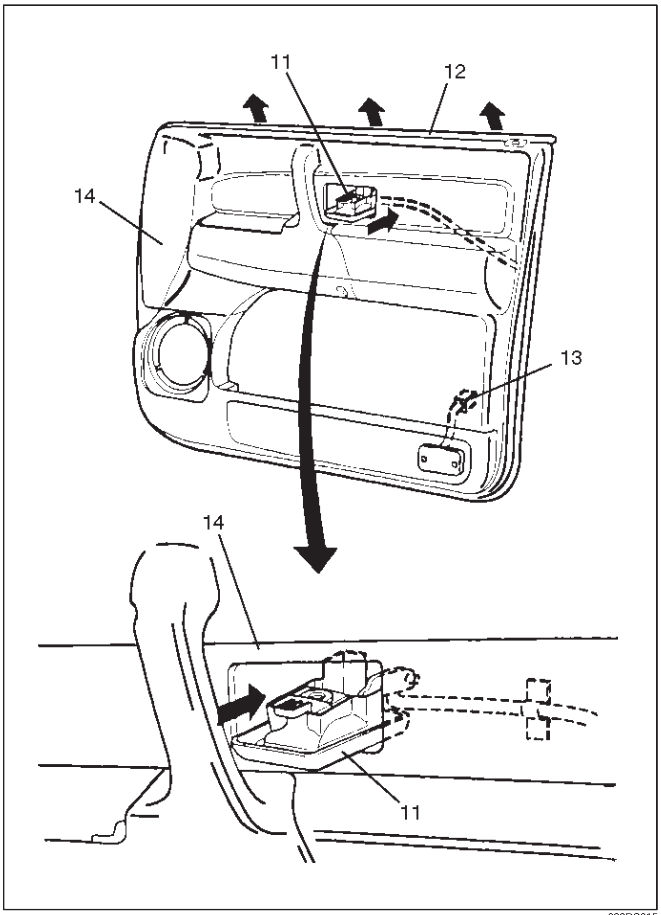
632RW001

8. Remove the door trim panel(9).
   - Remove two fixing screws(8) in order to take off seven clips(10) from the door panel.



635RS007

- Disconnect the courtesy light connector(13) to lift the door trim panel(14) and unlock the engagement of the waist seal(12) section. Then, pass the inside handle(11) through the mounting hole of the trim panel, and detach the trim panel.



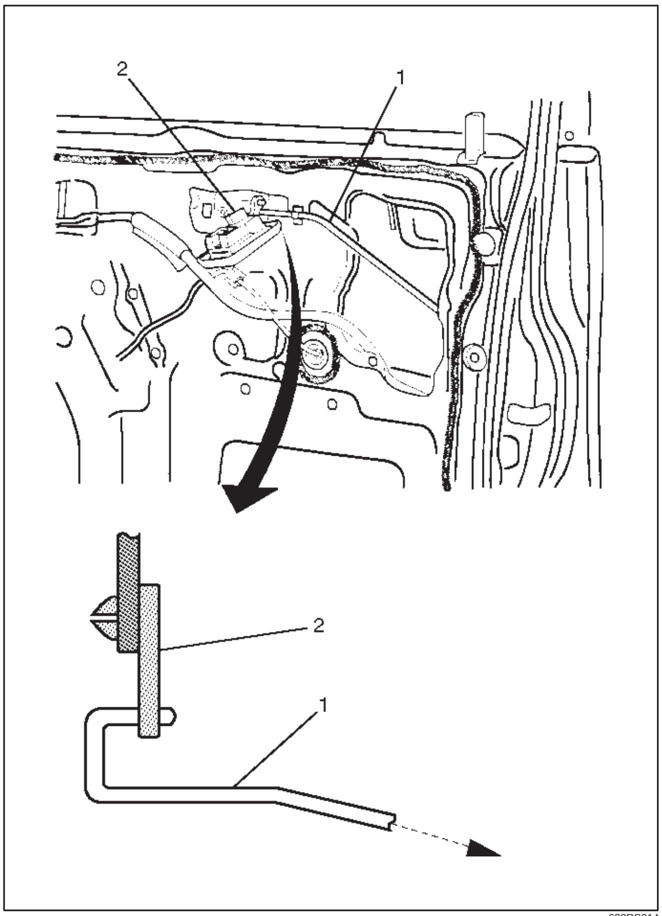
632RS015

9. Remove the inside handle.
10. Remove the door wood panel.
    - Refer to the Door Wood Panel Assembly in this section.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. When installing the inside handle(2), assemble it temporarily to the inside handle link(1).

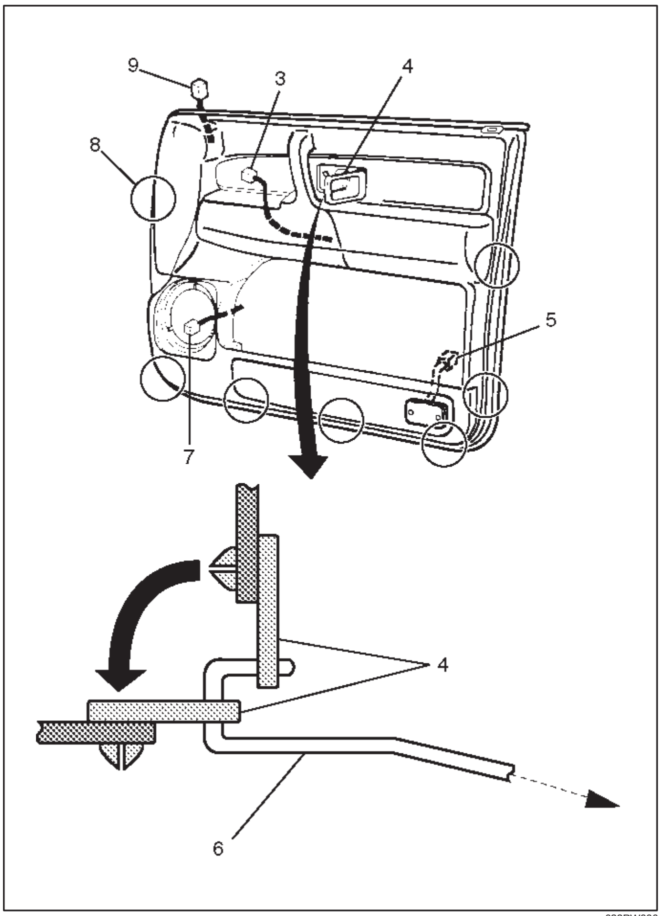


632RS014

2. Pass the inside handle(4) through the mounting hole of the trim panel and assemble the trim panel.

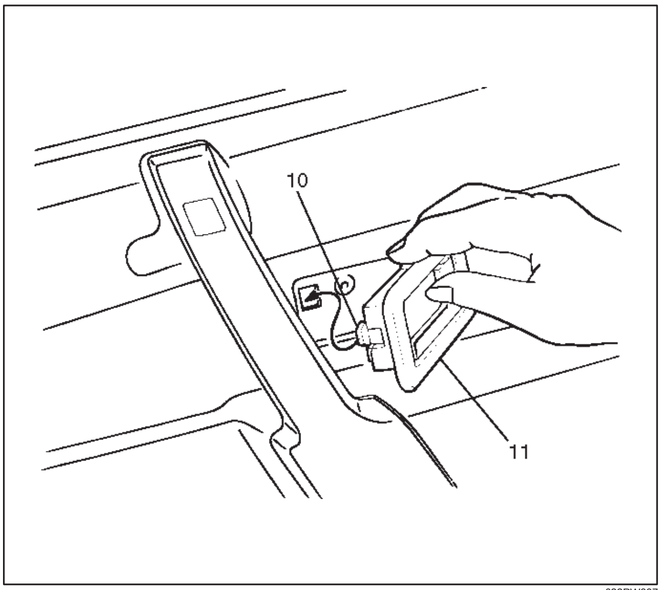
   Engage seven clips(8) into the door panel. Also, connect the courtesy light connector(5) and leave the connectors of the speaker(7), tweeter(9) and power window(3) drawn out to their prescribed positions, so that they will not be caught.

   Then, put the inside handle(4) to the normal position of the inside handle link(6).



632RW006

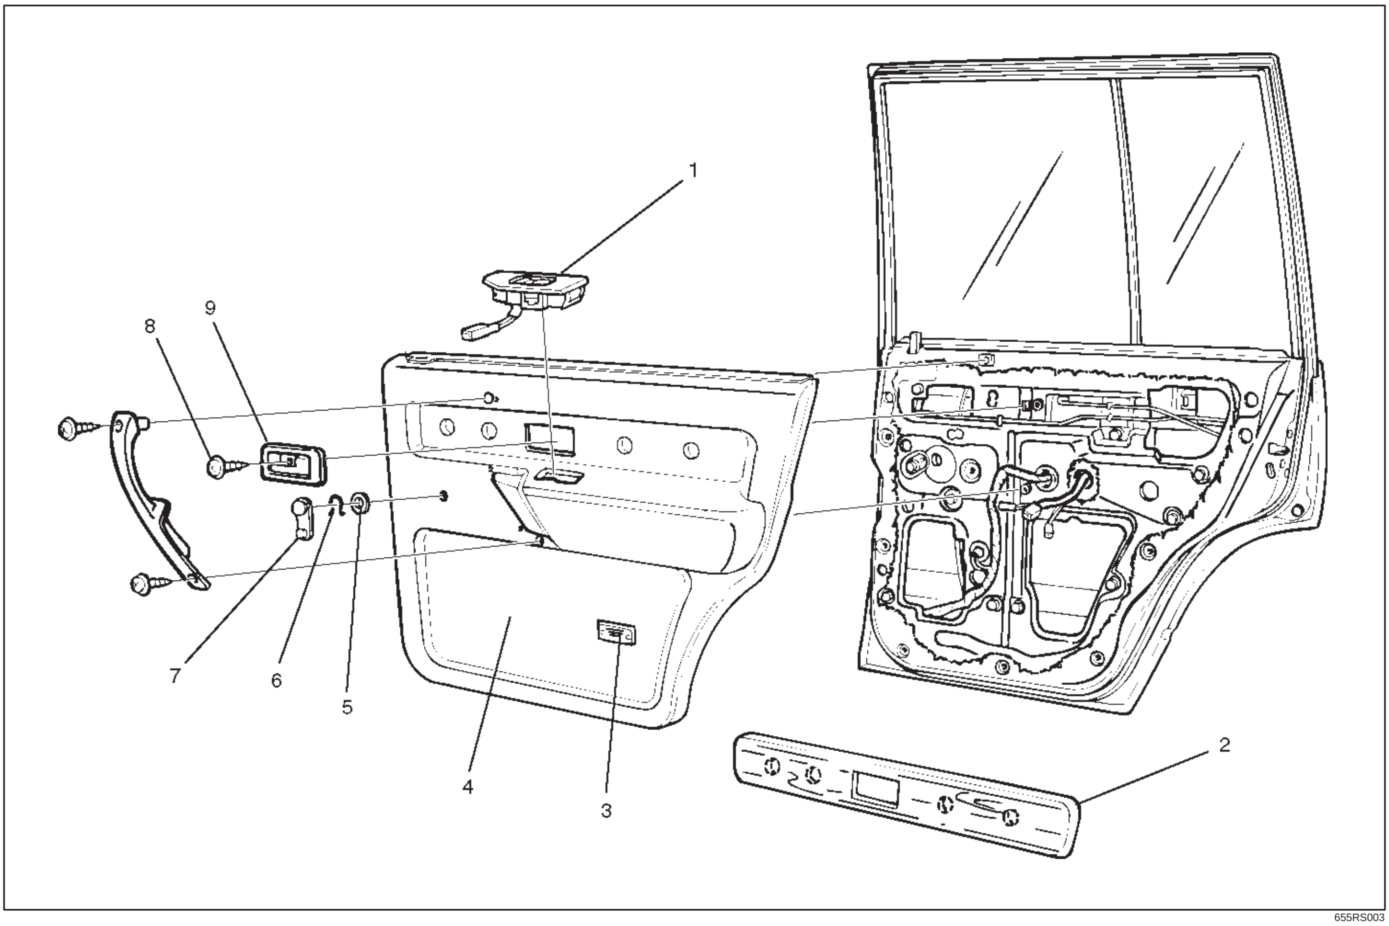
3. Fit the claw(10) of the inside handle(11) securely into the hole of the door panel and fix the inside handle with the screw.



632RW007

Rear Door Trim Panel

Rear Door Trim Panel and Associated Parts

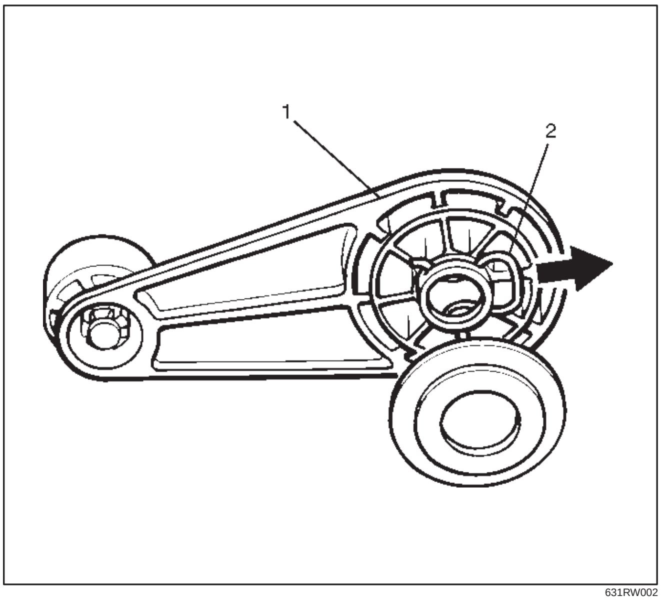


Legend

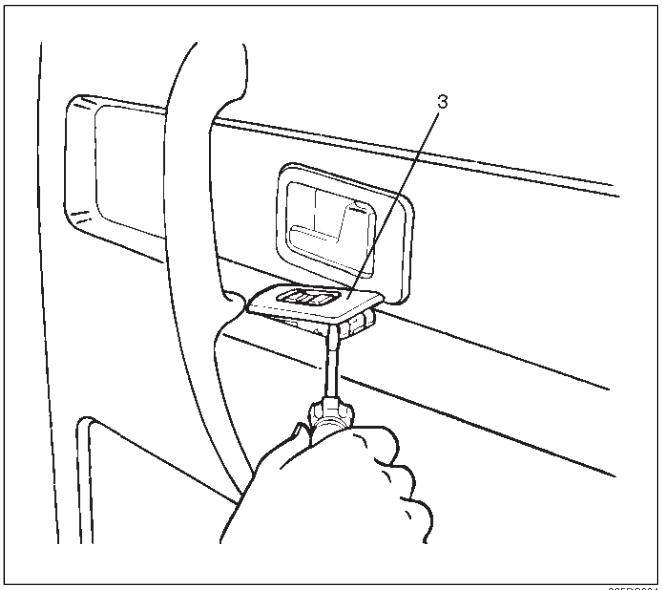
(1) Power Window Switch
(2) Door Wood Panel
(3) Courtesy Light
(4) Door Trim Panel
(5) Washer
(6) Clip
(7) Regulator Handle
(8) Inside Handle Fixing Screw
(9) Inside Handle

Removal

1. Disconnect the battery ground cable.
2. Remove the regulator handle(1).
   - Pull the hook(2) out and remove the regulator handle.



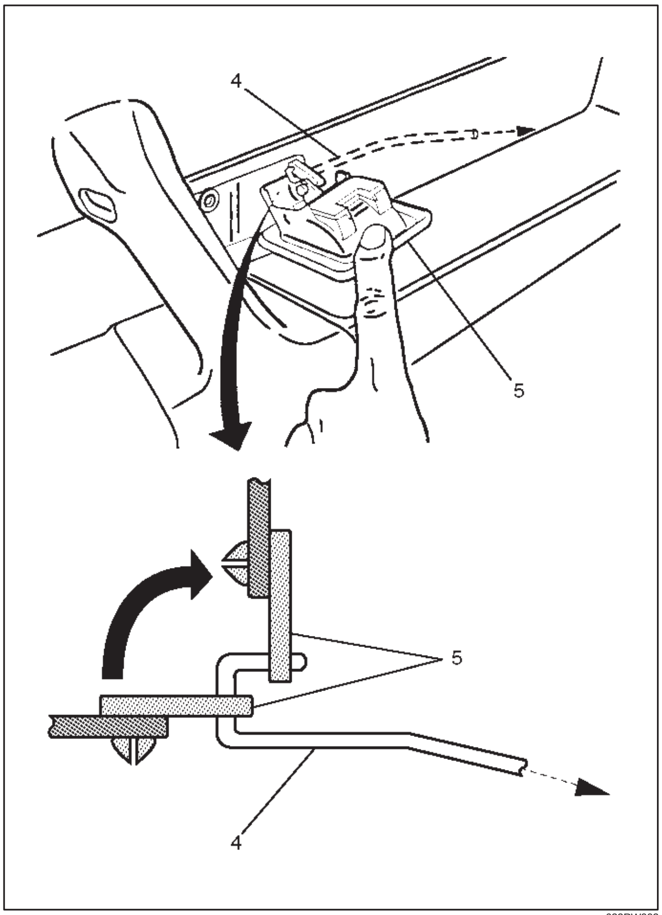
3. Remove the power window switch(3).
   - Pry the power window switch out and disconnect the switch connector.



825RS084

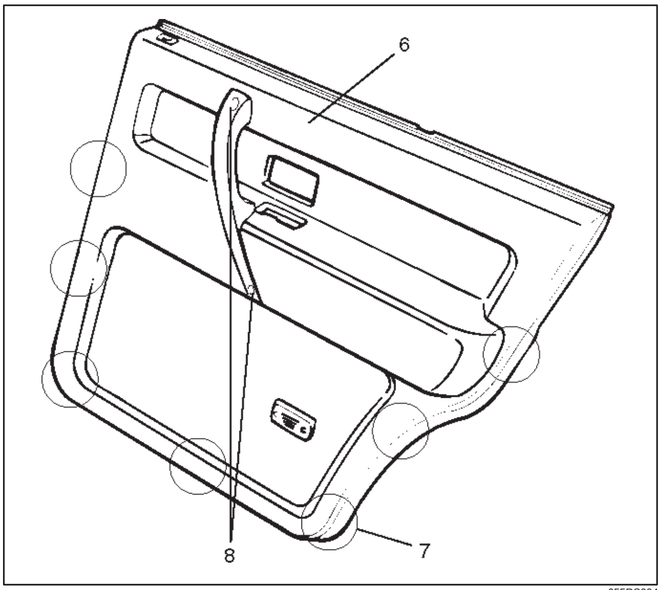
4. Remove the inside handle fixing screw.
   - Remove the screw that fixes the inside handle(5), slide the inside handle to the position illustrated, and leave it there for the moment.

CAUTION: Take care not to impose excessive force on the inside handle link(4), lest this link be elongated, which could make it impossible to operate the door with the inside handle.



632RW002

5. Remove the door trim panel(6).
   - Remove two fixing screws(8) to take off seven clips(7) from the door panel.



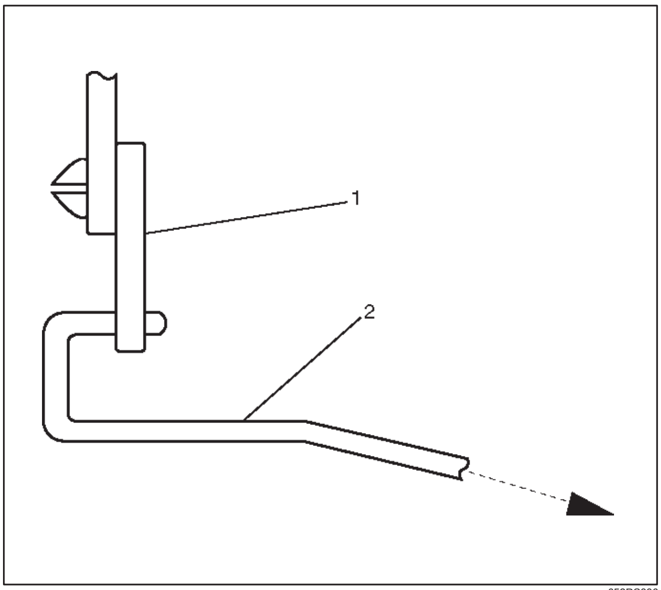
655RS004

   - Unplug the courtesy light connector to lift the trim panel and unlock the engagement of the waist seal section. Then, pass the inside lever through the mounting hole of the trim panel, and detach the trim panel.
6. Remove the inside handle.
7. Remove the door wood panel.
   - Refer to the Door Wood Panel Assembly in this section.

Installation

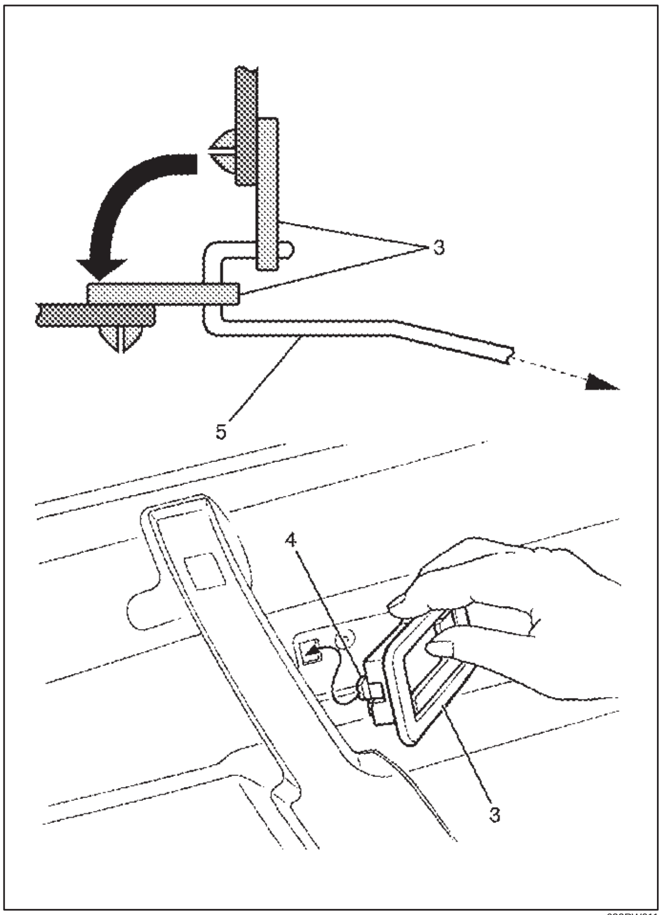
To install, follow the removal steps in the reverse order, noting the following point.

1. When installing the inside handle(1), assemble temporarily to the inside handle link(2).



652RS006

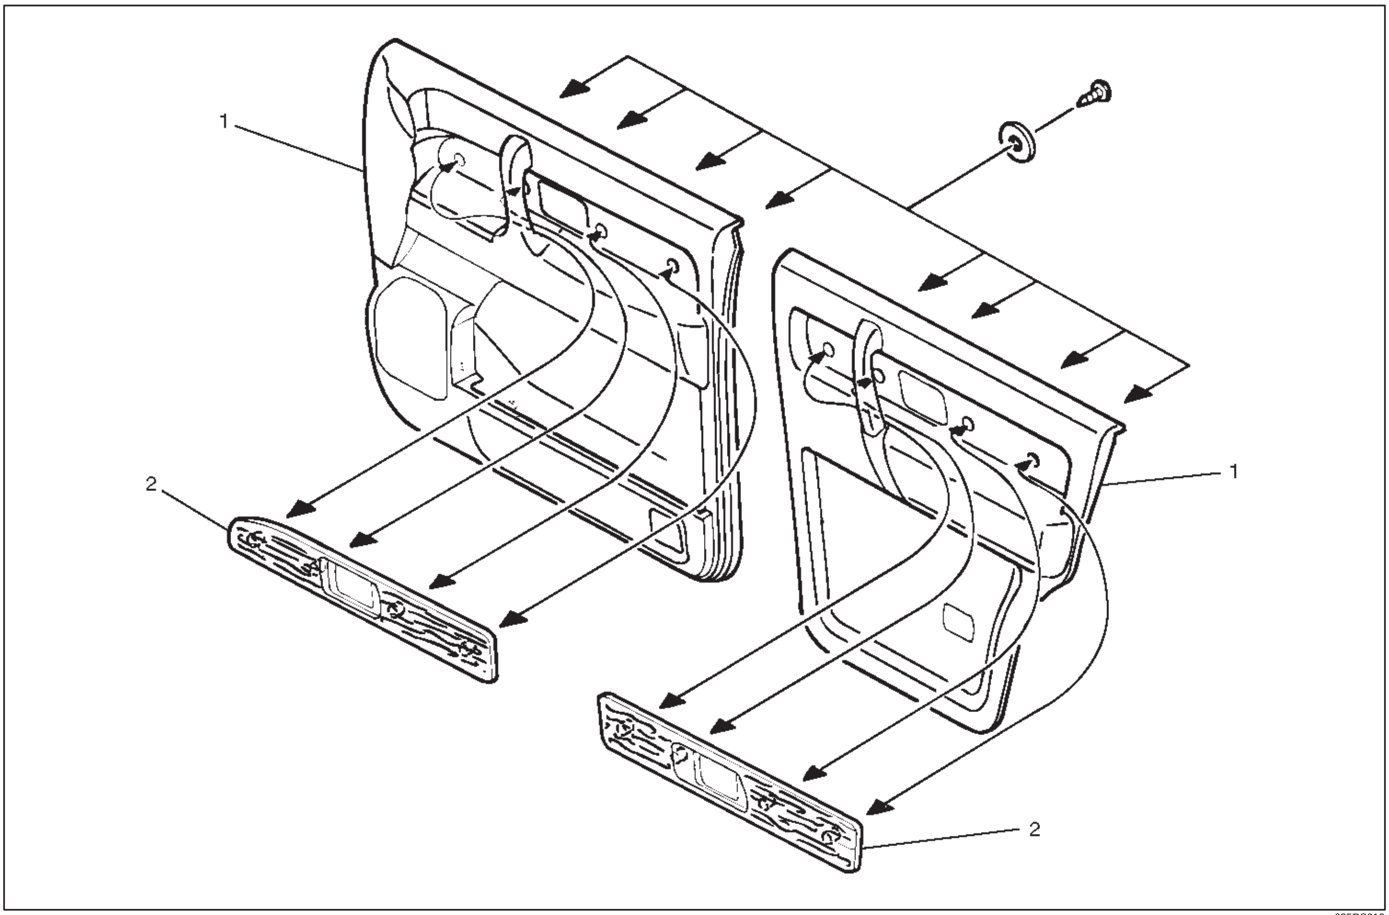
2. Pass the inside handle through the mounting hole of the trim panel. Assemble the trim panel. Engage securely seven clips into the door panel. Also, connect the courtesy light connector. Leave the connector of the power window drawn out to its prescribed position, so that it will not caught.
3. Put back the inside handle(3) to the original position of the link(5). Fit the claw(4) of the inside handle securely into the hole of the door panel. Fix the handle with the screw.



632RW011

Door Wood Panel Assembly

Door Wood Panel Assembly and Associated Parts



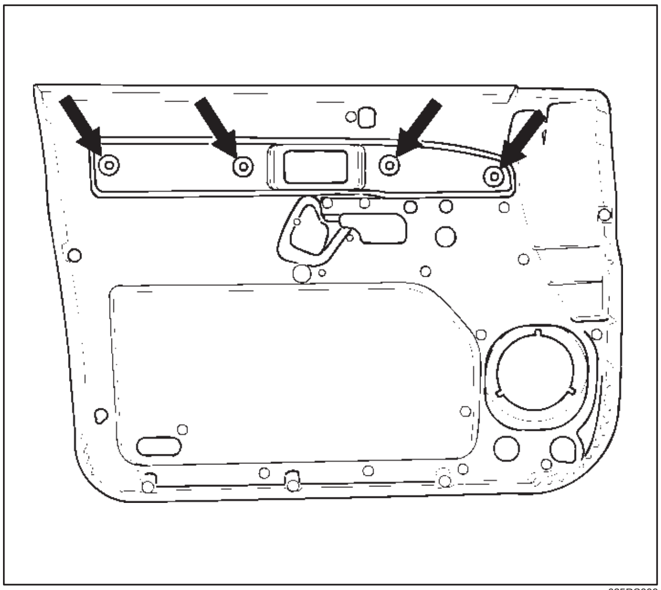
Legend

(1) Door Trim Panel
(2) Door Wood Panel Assembly

Removal

1. Remove the door trim panel(1).
   - Refer to the Front / Rear Door Trim Panel in this section.
2. Remove the door wood panel assembly(2).
   - Remove four door wood panel assembly fixing screws and washers.

NOTE: The removal and installation steps are common to both front and rear doors.

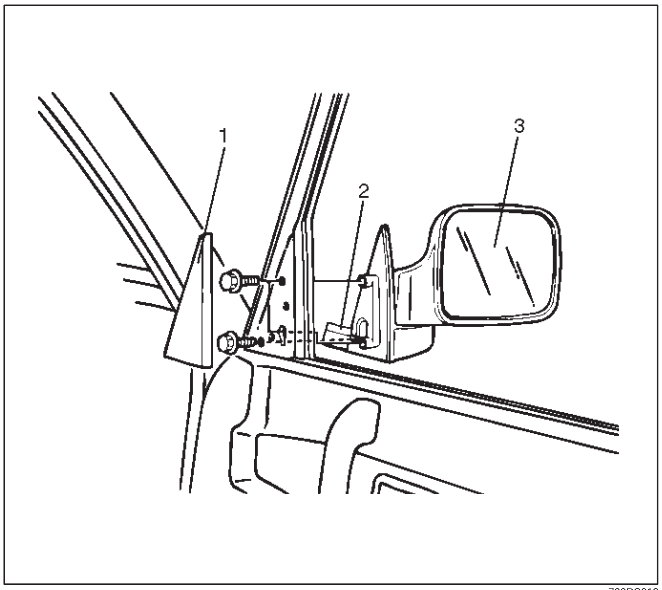


Installation

To install, follow the removal steps in the reverse order.

Door Mirror

Door Mirror and Associated Parts



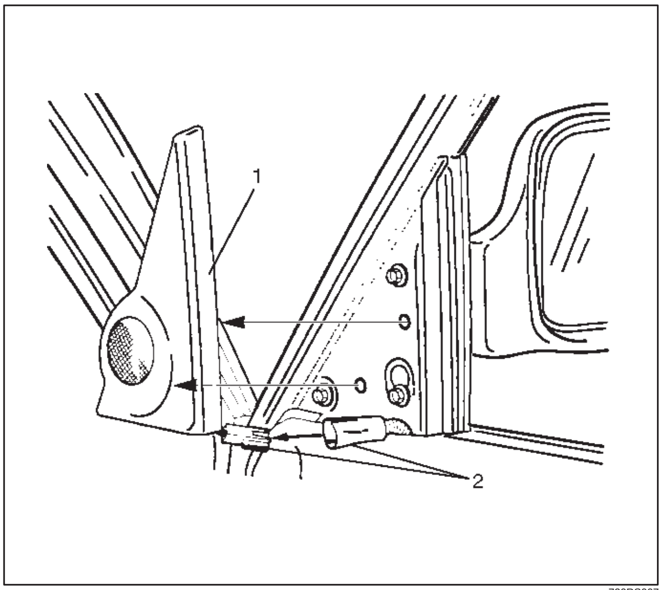
720RS012

Legend

(1) Door Mirror Cover / Tweeter
(2) Door Mirror Connector
(3) Door Mirror

Removal

1. Disconnect the battery ground cable.
2. Remove the door mirror cover(1).
   - Remove the connectors(2) and the door mirror cover, if equipped with a tweeter.



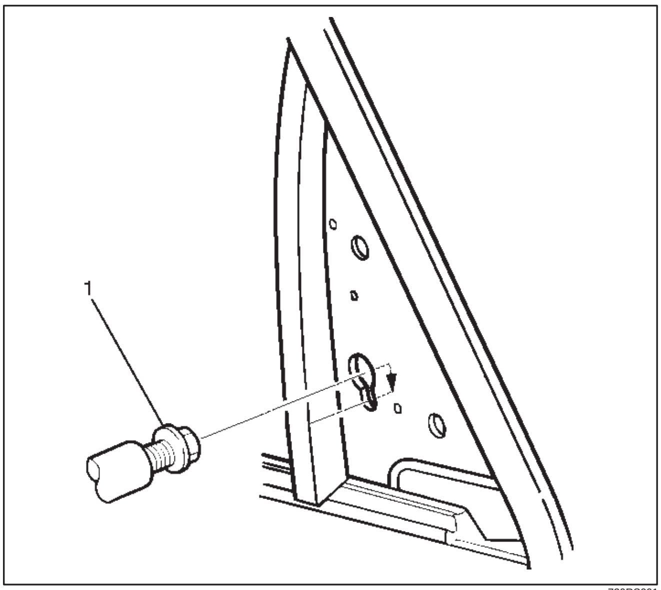
720RS007

3. Remove the door mirror connector.
4. Remove the door mirror.

Installation

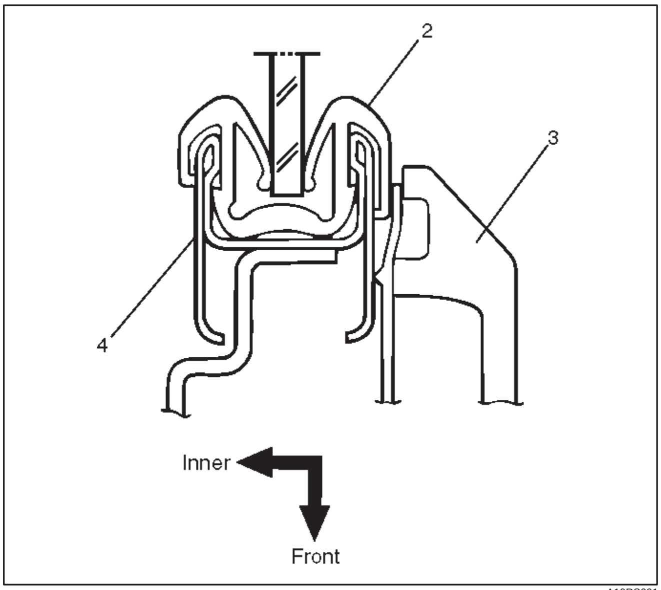
To install, follow the removal steps in the reverse order, noting the following points.

1. When you install the door mirror, install the bolt(1) to the mirror temporarily, hook the bolt to the door side hole and tighten the bolt from the inside.



720RS001

2. When installing the door mirror, hold the glass run lip(2) between the door mirror base(3) and the center sash(4).



A10RS001

3. Tighten the door mirror fixing bolts to the specified torque.

Torque: 8 N·m (69 lb in)

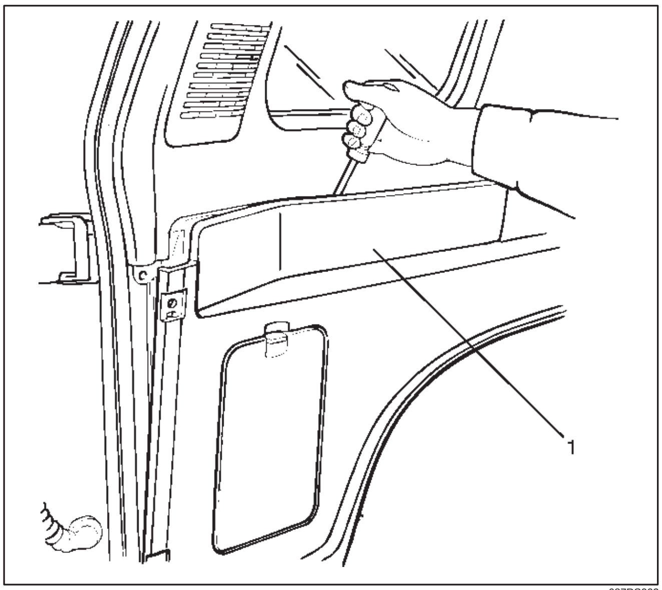
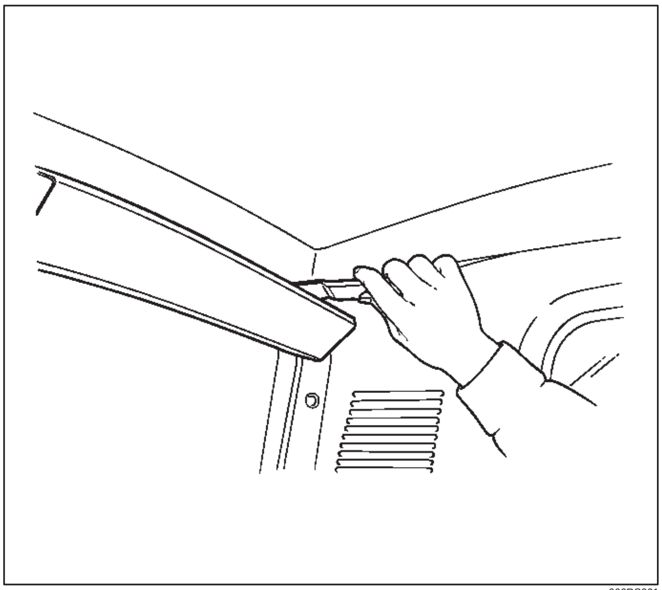
Removal

1. Disconnect the battery ground cable.
2. Remove the rear end floor trim cover.
3. Remove the luggage side cap.
4. Remove the luggage side lower cover.
5. Remove the luggage side trim cover (1).
   - Remove the rear side fixing screws and pry the trim cover retainers free from the body panel and the upper trim cover.



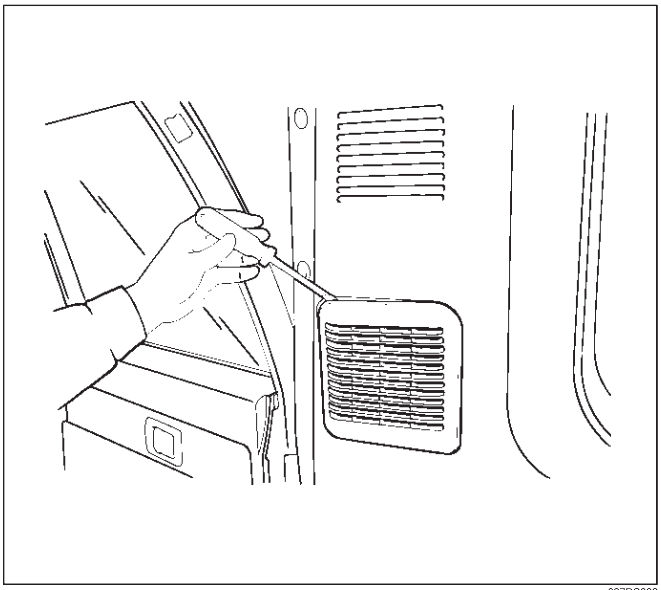
687RS002

6. Remove the luggage room light.
   - Remove the luggage room light lens and the fixing screws.
   - Disconnect the luggage room light connector.
7. Remove the rear roof trim cover.
   - Pry the trim cover retainers free from the body panel.



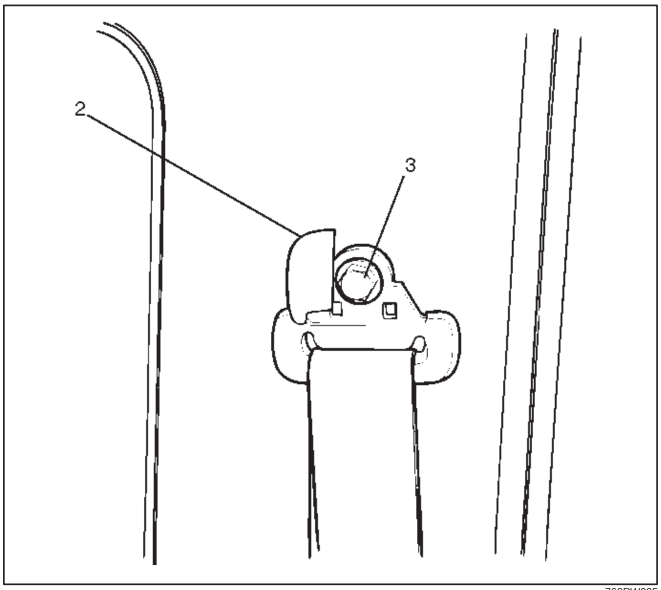
666RS001

8. Remove the speaker grille.



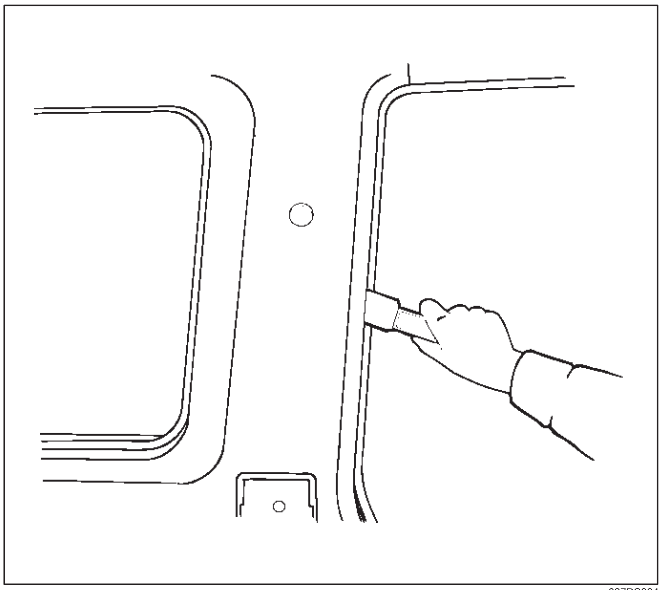
687RS003

9. Remove the rear speaker.
   - Remove the rear speaker fixing screws and disconnect the connector.
10. Remove the rear seat belt anchor bolt cover (2) and the anchor bolt (3).



760RW005

11. Remove the quarter upper trim cover.
    - Remove the rear side clips of the trim cover and pry the quarter upper trim cover retainers free from the body panel.



687RS004

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the seat belt anchor bolt to the specified torque.

Torque: 39 N·m (29 lb ft)

Center Pillar and Roof Side Trim Cover

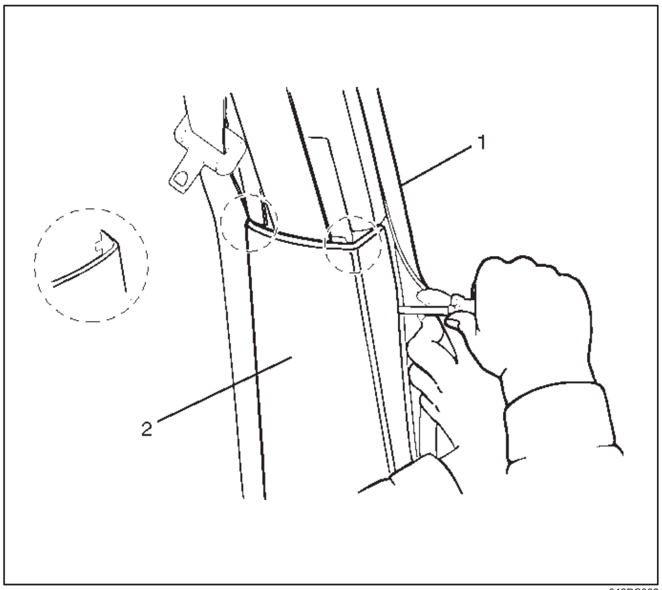
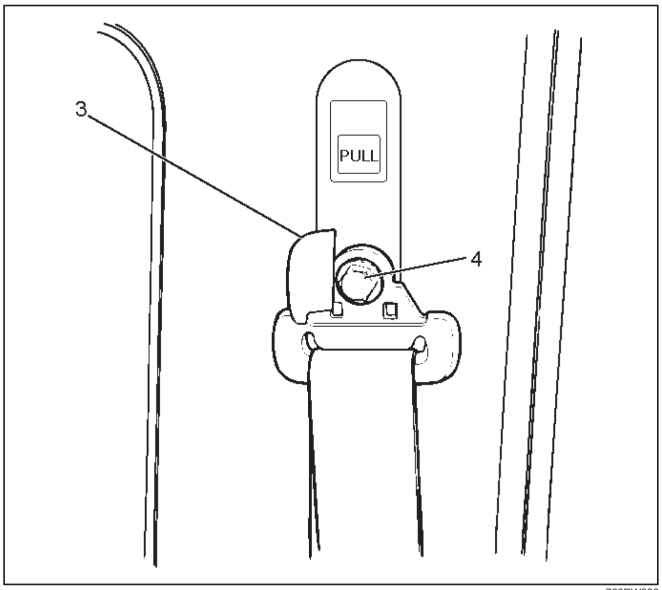
Removal

1. Disconnect the battery ground cable.
2. Remove the door sill plate (front and rear).
3. Remove the center pillar lower trim cover (2).
   - Turn up the finisher (1) and pry the trim cover retainers free from the body panel, then slide the trim cover downward.



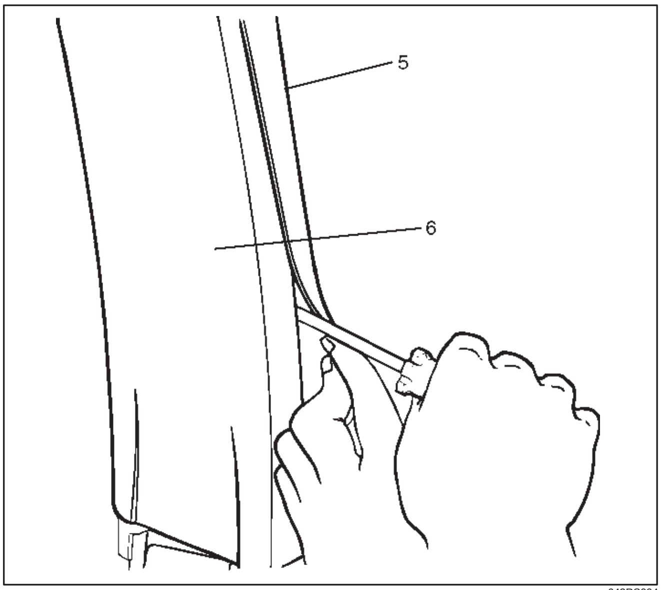
643RS003

4. Remove the front seat belt anchor bolt cover (3) and the anchor bolt (4).



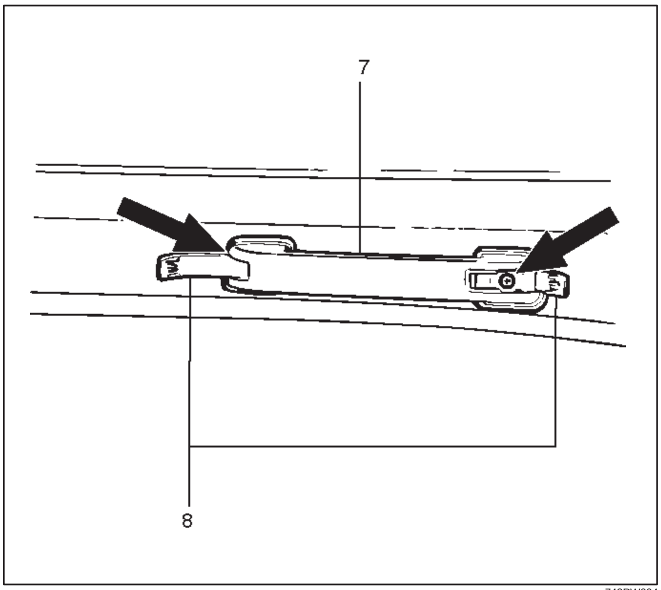
760RW006

5. Remove the center pillar upper trim cover (6).
   - Turn up the finisher (5) and pry the trim cover retainers free from the body panel.



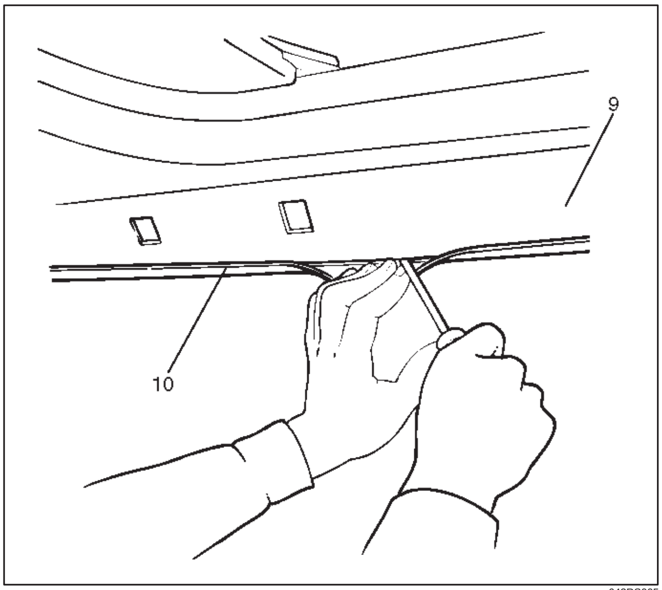
643RS004

6. Remove the center pillar assist grip.
7. Remove the seat belt anchor plate.
8. Remove the assist grip (7).
   - Open the both side of the assist grip cover (8) and remove two fixing screws.



743RW004

9. Remove the roof side trim cover (9).
   - Turn up the finisher (10) and pry the trim cover retainers free from the body panel.



Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Install the seat belt anchor bolts to the specified torque.

Torque: 39 N·m (29 lb ft)

Removal

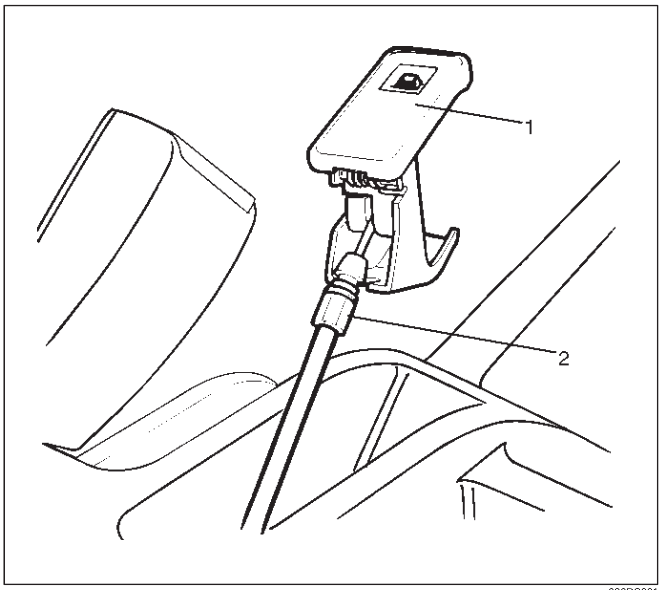
1. Disconnect the battery ground cable.
2. Remove the front seat (RH).
3. Remove the rear door sill plate (RH).
4. Remove the center pillar lower trim cover.
5. Remove the rear end floor trim panel.
6. Remove the luggage side trim panel (RH).
   - Refer to the Luggage Side and Quarter Upper Trim Cover in this section.

7. Remove the fuel filler lid opener(1).
   - Remove two opener fixing screws and disconnect the cable(2).



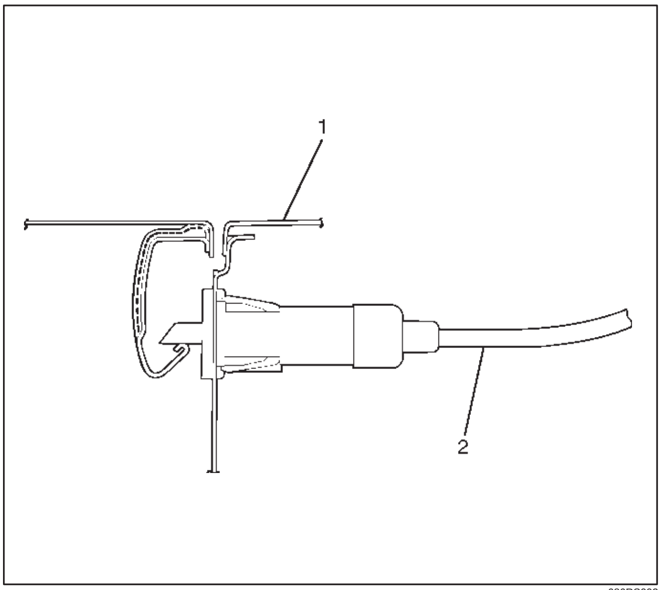
686RS001

8. Remove the center console assembly.
9. Remove the filler lid opener cable.
   - Roll up the floor carpet and remove the clips of the chassis harness and body panel to pull out the cable toward the fuel filter lid.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Insert the opener cable(2) into the body panel(1) securely.



686RS002

2. Install the cable and clips to its original position to the chassis harness and the body panel.
3. Check that the opener operates smoothly.

Removal

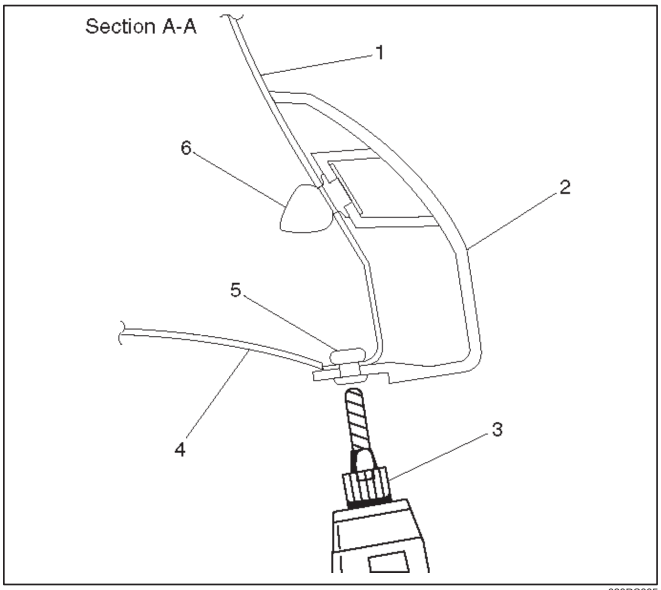
1. Remove the front rocker protector assembly.
   - Loosen and pull clips, and remove the front rocker protector assembly.
2. Remove the rear rocker protector assembly.
   - Loosen and pull three clips, remove a rear screw, and remove the rear rocker protector assembly.
3. Remove the front wheel opening extension(2).
   - Let a 5mm drill(3) go through four blind rivets(5) to disengaged riveted portions.

     Remove two screws and disengage five clips, then remove the front wheel opening extension assembly.



620RS005

4. Remove the rear quarter wheel opening extension assembly.
   - Let a 5mm drill go through six blind rivets to disengage riveted portions.
     Disengage four clips, remove two screws, and remove the rear quarter wheel opening extension assembly.
5. Remove the rear door wheel opening extension assembly.
   - Let a 5mm drill go through a blind rivet to disengage riveted portions.
     Disengage three clips, peel off the bonded portions with two double surface adhesive tape and the rear door wheel opening extension assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Use a new 2–sided adhesive tape whenever installing each wheel opening extension assembly and rocker protector assembly. Using a white gasoline, clean the places in advance where a 2–sided adhesive tape is affixed. Also, install the clips, screws and blind rivets in the order specified as shown in the figure.

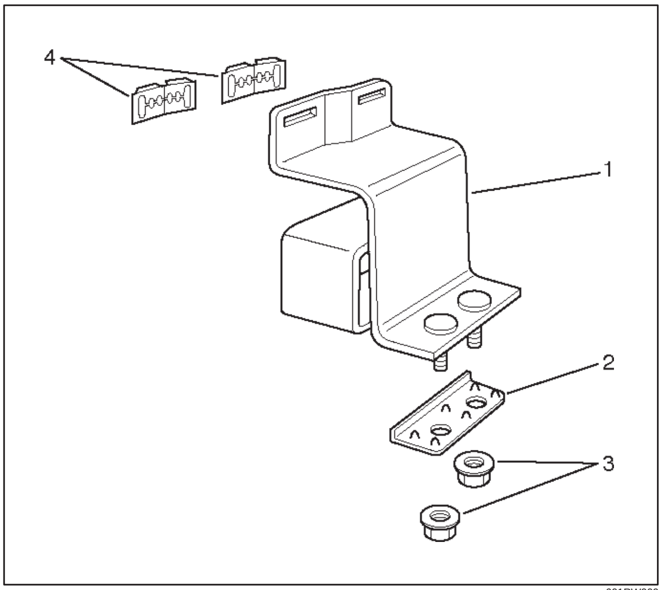
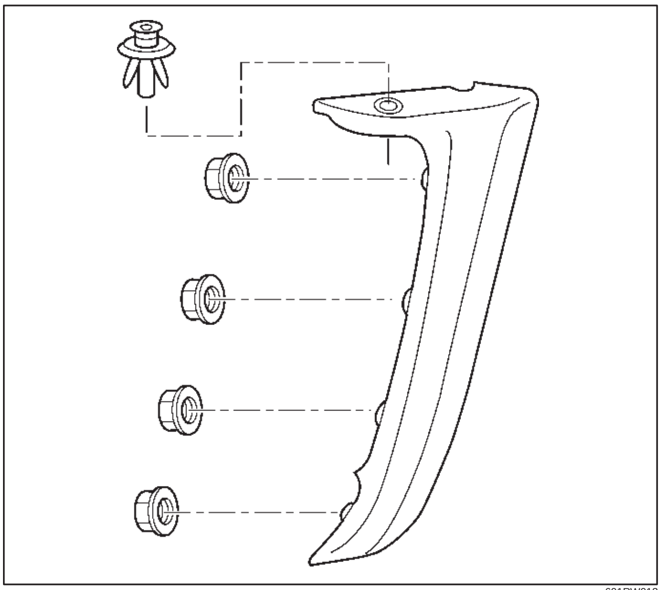
   - Disconnect the front fog light connector and remove two bolts from both sides of the front bumper.
2. Remove the front bumper slider(1).
   - Remove two clips(4) and two nuts(3), release the claw from the washer(2).



601RW009

3. Remove the front mud flap.
   - Remove four nuts and a clip.



601RW013

Rear Side

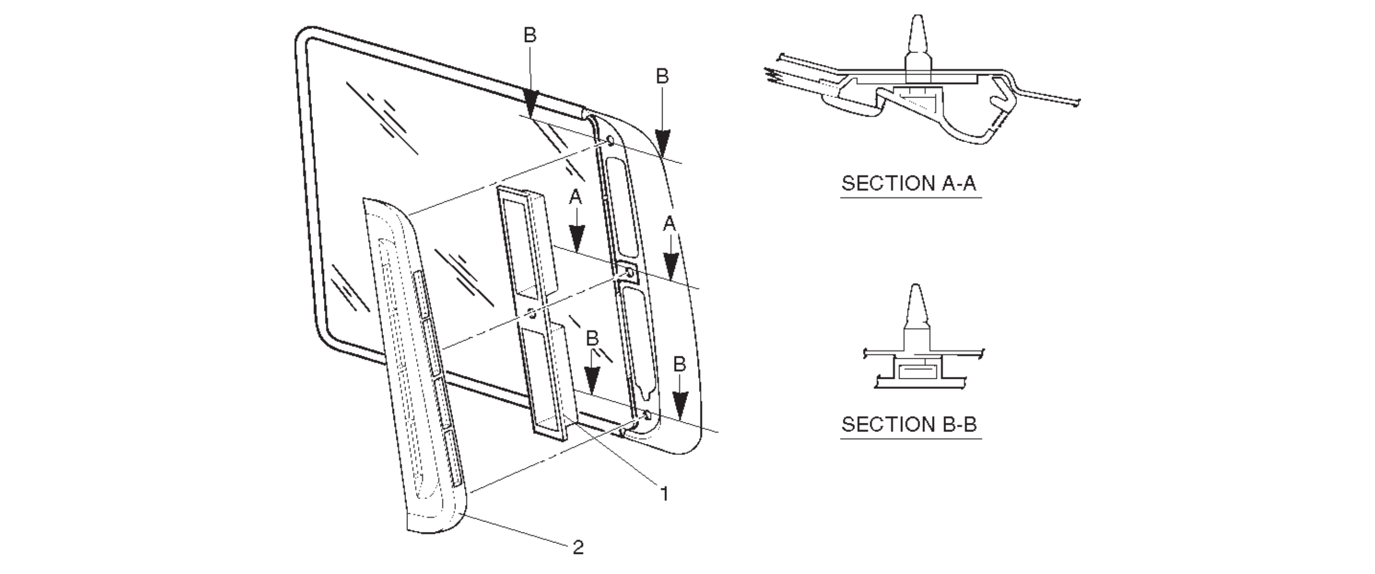
1. Remove the bumper side cover.
2. Remove the rear mud flap.
   - Remove four bolts and two nuts.

Installation

To install, follow the removal steps in the reverse order.

Ventilation Assembly

Ventilation Assembly and Associated Parts



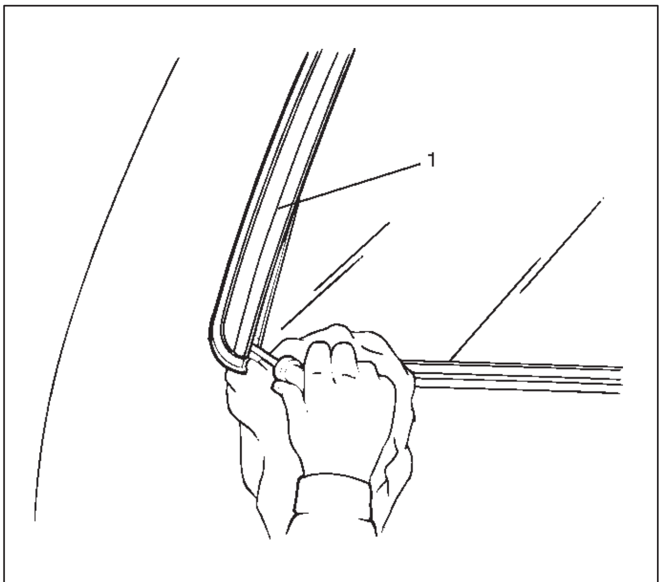
641RS001

Legend

(1) Outlet Valve Assembly
(2) Ventilation Assembly

Removal

1. Remove the ventilation assembly(1).
   - Pry the ventilation assembly retainers free from the body panel.



641RS002

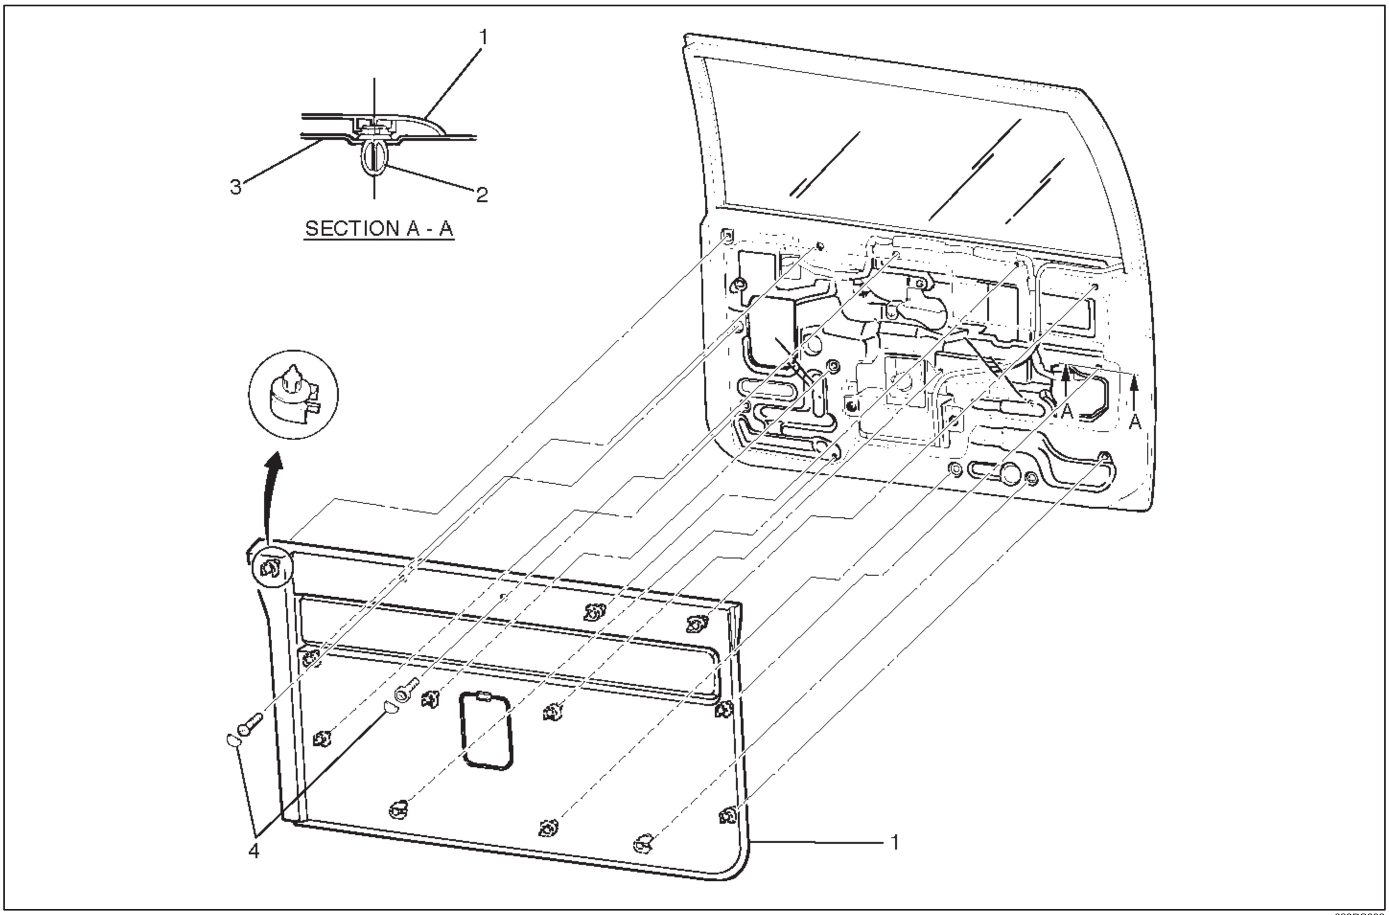
2. Remove the outlet valve assembly.

Installation

1. Install the outlet valve assembly.
   - Insert the upper and lower catches of the outlet valve into the body panel flange and fix them securely.
2. Install the ventilation assembly.
   - Fix the clips to the body panel securely so that the ventilation assembly will not come off the body panel.

Tailgate Trim Panel (LH)

Tailgate Trim Panel (LH) and Associated Parts



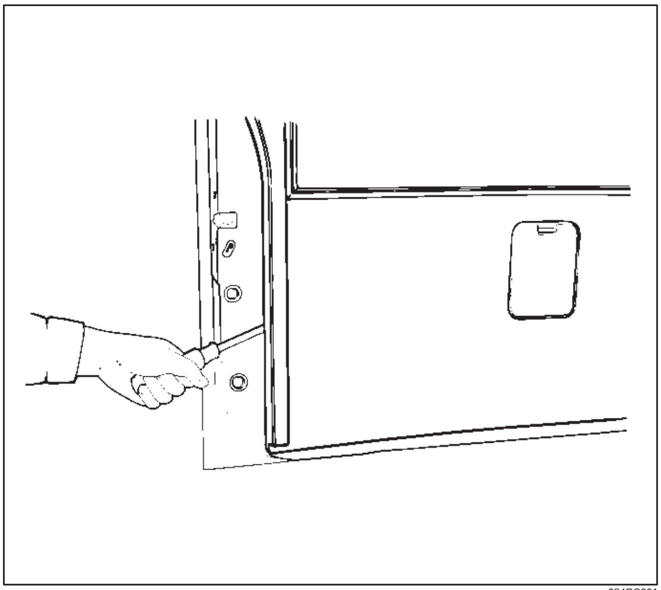
683RS002

Legend

(1) Tailgate Trim Panel (LH)
(2) Clip
(3) Tailgate Panel
(4) Cap and Screw

Removal

1. Disconnect the battery ground cable.
2. Remove the cap and screw.
3. Remove the tailgate trim panel (LH).
   - Pry the trim panel retainers free from the tailgate panel.



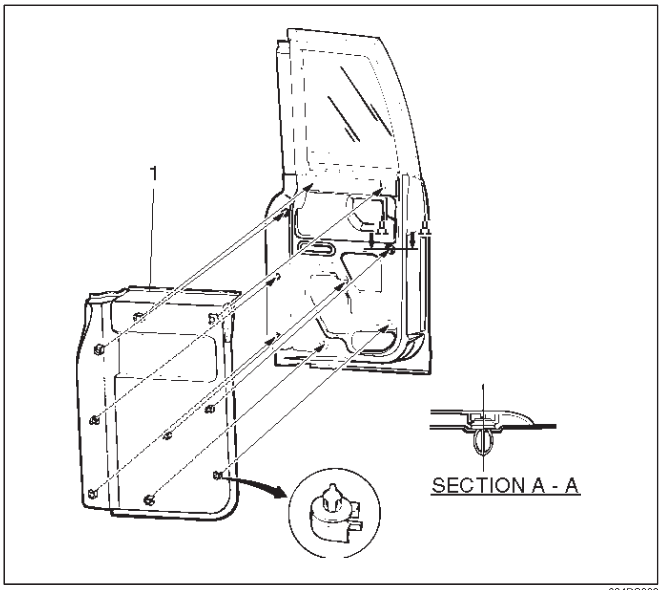
684RS001

Installation

To install, follow the removal steps in the reverse order.

Tailgate Trim Panel (RH)

Parts Location



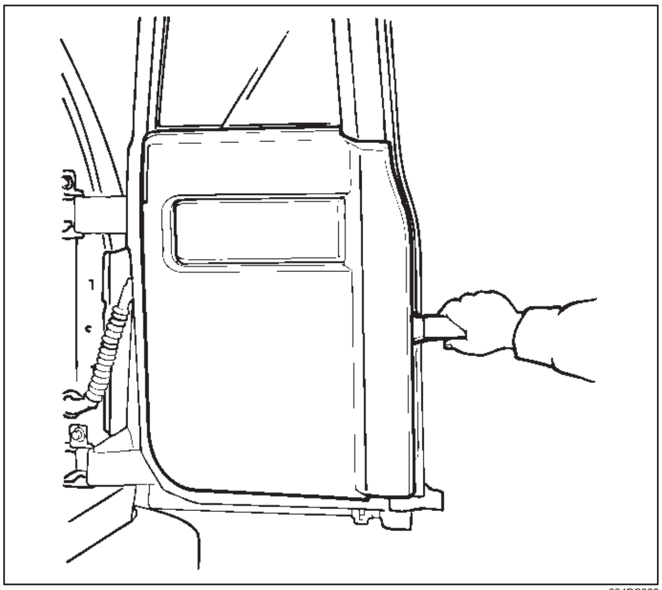
684RS002

Legend

(1) Tailgate Trim Panel

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim panel (RH).
   - Pry trim panel retainer free from the tailgate panel.



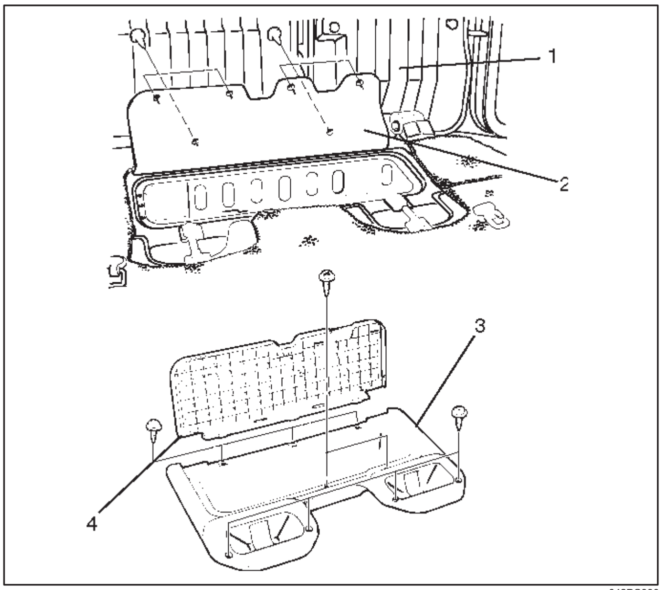
684RS003

Installation

1. Install the trim panel (RH).
   - Insert the retainer of the trim panel into the tailgate panel and fix it securely.

Luggage Floor Box

Luggage Floor Box and Associated Parts



643RS006

Legend

(1) Rear Seat
(2) Floor Carpet
(3) Luggage Floor Box
(4) Luggage Floor Box Cover

Remove

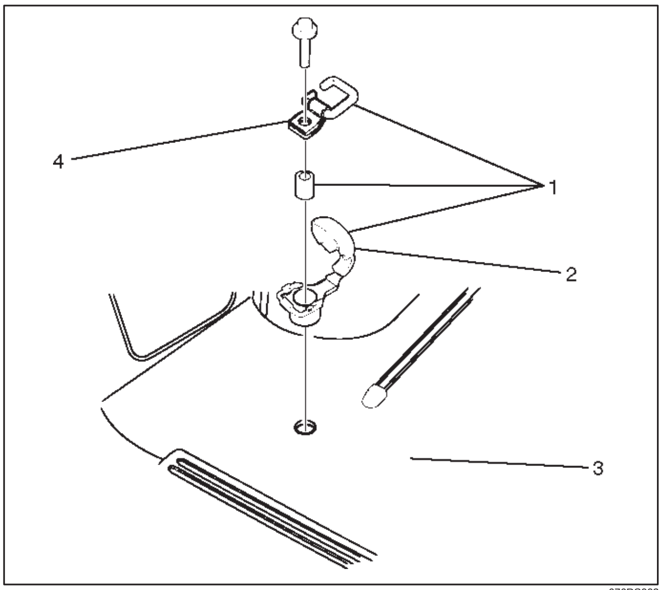
1. Fold the rear seat assembly to the front direction.
2. Remove the luggage floor box cover.
   - Remove the clips which connect the floor carpet and the luggage floor box cover.
3. Remove the luggage floor box.

Installation

To install, follow the removal steps in the reverse order.

Rope Hook Set

Rope Hook Set and Associated Parts



676RS003

Legend

(1) Rope Hook Set
(2) Cover
(3) Luggage Floor Carpet
(4) Hook

Removal

1. Remove the rope hook set.
   - Open the hook cover and hook fixing bolt.

Installation

1. Install the rope hook set.
   - Tighten the hook fixing bolt to the specified torque.

Torque: 13 N·m (113 lb in)

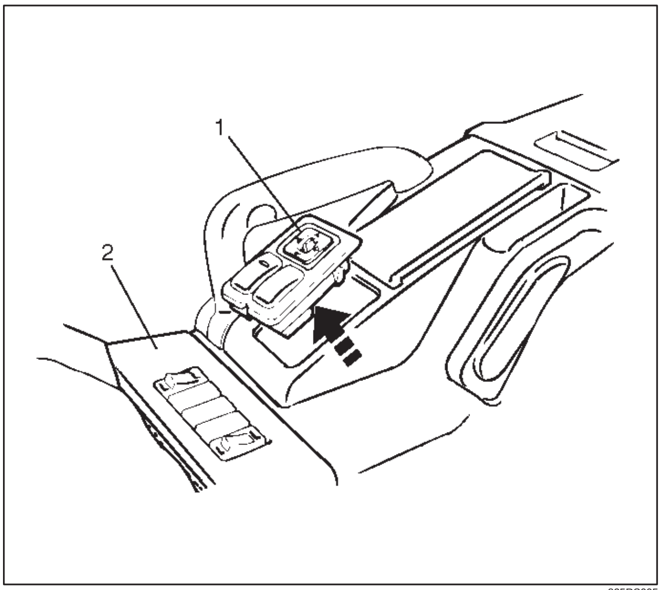
Power Door Mirror System

General Description

The circuit consists of the starter switch, door mirror control switch, folding switch, defogger switch and door mirrors on both sides.
The door mirror switch consists of the control switch, folding switch and defogger switch.
When the control switch is operated with the starter switch at either “ACC” or “ON” position, the motors incorporated in the door mirrors on both sides rotates to allow the horizontal and vertical adjustment of mirror angles.
The folding switch can be used to fold the mirror and return it to its original position.
When turning on the door mirror defogger switch with the starter switch at “ON” position, built-in heater in the mirror is activated to perform the defogger function.

Door Mirror Switch Assembly (Control Switch, Folding Switch and Defogger Switch) Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly(2).
   - Remove four screws.
   - Remove the transmission shift lever knob.
   - Remove the transfer shift lever knob.
   - Disconnect the seat heater switch connectors (if so equipped).
   - Disconnect the door mirror switch connectors.
   - Disconnect the power & winter switch connectors. (A/T only)
3. Remove the door mirror switch assembly(1).
   - Push the lock from the back side of the front console.



825RS005

Installation

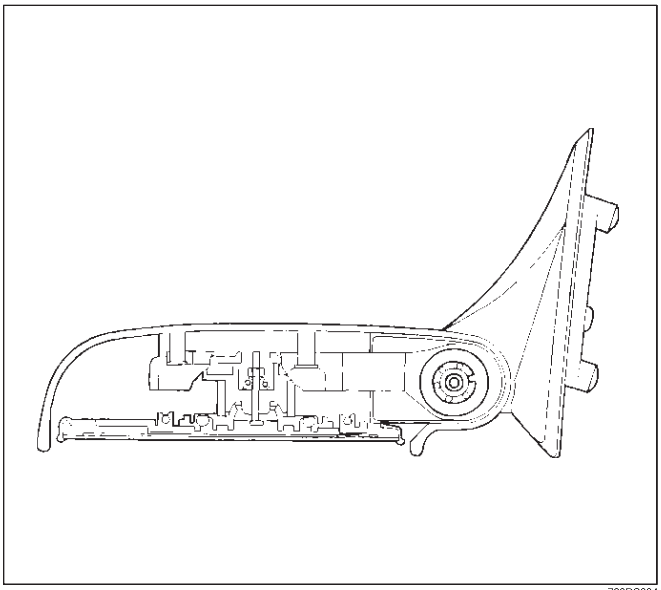
To install, follow the removal steps in the reverse order, noting the following point.

1. Depress the switch with your fingers until it locks securely.

Power Door Mirror

General Description

Mirrors contain two driving motors for the horizontal and vertical movement of the mirror and one motor for folding the mirror.
The movement of the mirror is controlled by the direction of current running through these motors.
The housing portion of the mirror is provided with the auto-stop mechanism which is interlocked with the motor for folding the mirror. When the mirror moves to the stop position (with the mirror folded or returned to its original position), the current to the motor is shut off.
When the mirror cannot operate due to some obstacle and the motor stops its rotation, the resistor prevents current overflow.



720RS004

Removal and Installation

Refer to the Door Mirror removal and installation steps in this section.

Power Window System

General Description

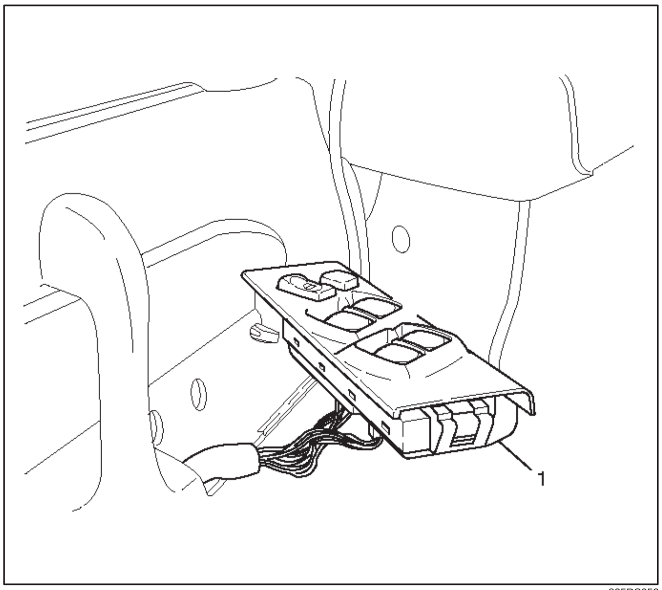
The circuit consists of the starter switch, (door lock &) power window switch for each of the front windows, power window switch for rear windows and power window motors.
When the starter switch is turned on, the battery voltage is applied to each of the power window switches through the circuit breaker and the power window relay on the circuit.
The “Down” switch of the driver’s power window switch has a built-in function which can be operated by just touching it.
Accordingly, the window will roll down automatically by just setting the switch to the “AUTO” position.
When the driver’s power lock switch at the driver side is depressed, the power source to the passenger’s power window switches are shut off. So, even if these switches are operated, the power window motor will not operate.

Power Window Switch Removal and Installation

Driver Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the switch(1).
   - Pull out the switch by pushing the spring with the tip of a screwdriver.
   - Disconnect two connectors.



825RS052

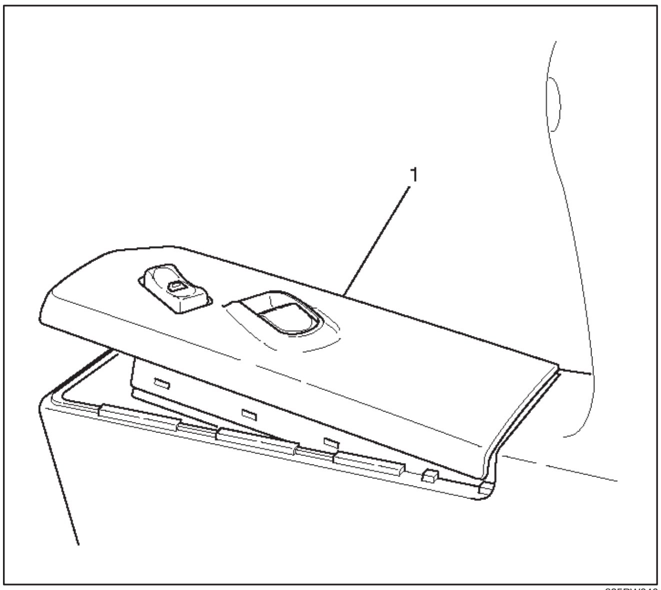
Installation

To install, follow the removal steps in the reverse order.

Front Passenger Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the switch(1).
   - Pull out the switch by pushing the spring with the tip of a screwdriver.
   - Disconnect the connector.



825RW046

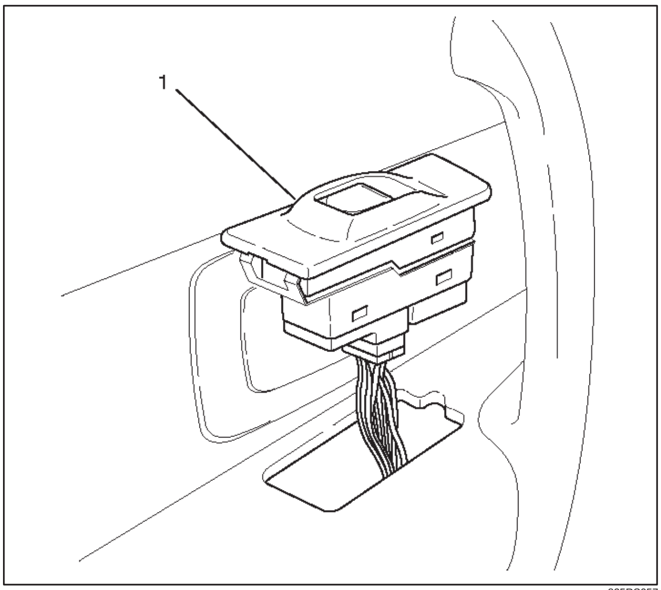
Installation

To install, follow the removal steps in the reverse order.

Rear-Left and Right Sides

Removal

1. Disconnect the battery ground cable.
2. Remove the switch(1).
   - Pull out the switch by pushing the spring with the tip of a screwdriver.
   - Disconnect the connector.



825RS057

Installation

To install, follow the removal steps in the reverse order.

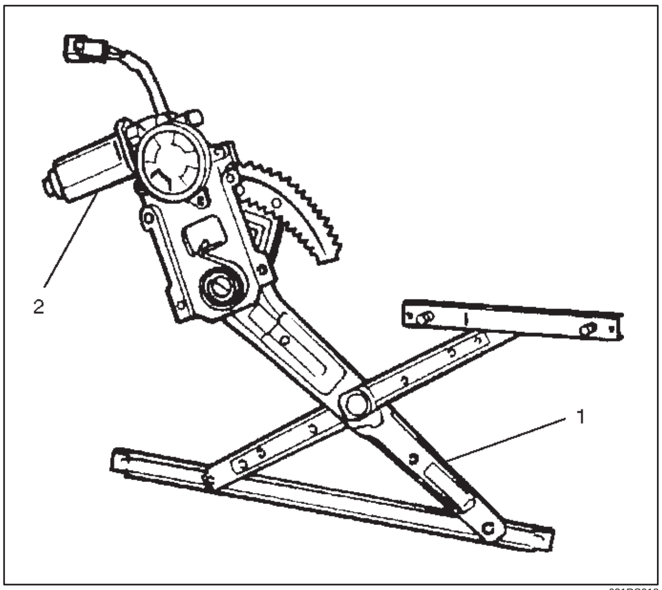
Power Window Motor Removal and Installation

Driver Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the window regulator assembly (1).
   - Refer to Front Window Regulator, Glass and Glass Run in Body Structure section.
3. Remove the power window motor(2).
   - Remove three screws.

CAUTION: When removing the motor from the regulator(1), be careful not to get injured by the strong repellent force of the regulator spring.



631RS018

Installation

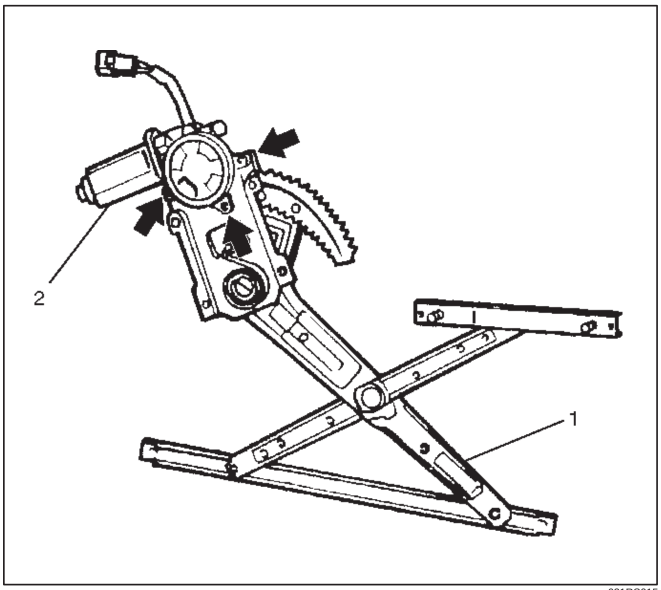
To install, follow the removal steps in the reverse order.

Front Passenger Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the window regulator assembly (1).
   - Refer to Front Window Regulator, Glass and Glass Run in Body Structure section.
3. Remove the power window motor(2).
   - Remove three screws.

CAUTION: When removing the motor from the regulator(1), be careful not to get injured by the strong repellent force of the regulator spring.



631RS015

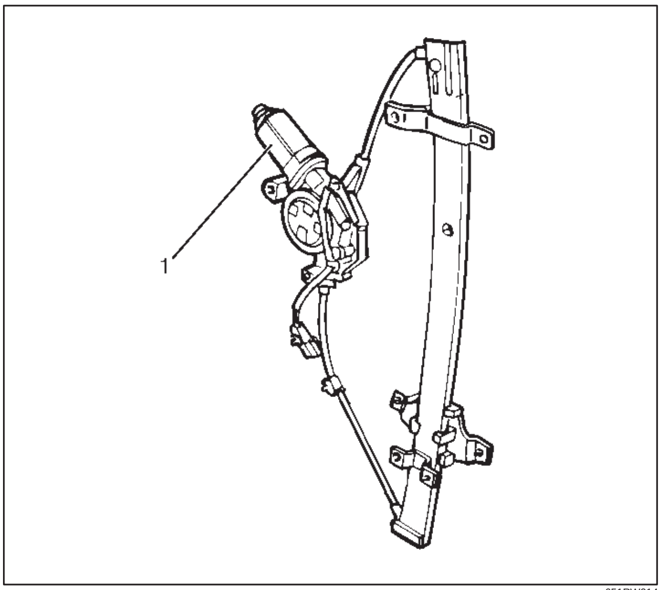
Installation

To install, follow the removal steps in the reverse order.

Rear-Left Side

Removal

1. Disconnect the battery ground cable.
2. Remove the rear window regulator assembly.
   - Refer to Rear Window Regulator and Glass in Body Structure section.
3. Remove the power window motor(1).
   - Remove four screws.



651RW014

Installation

To install, follow the removal steps in the reverse order.

Rear-Right Side

Removal and Installation

Refer to the Rear Power Window Motor-Left Side in this section.

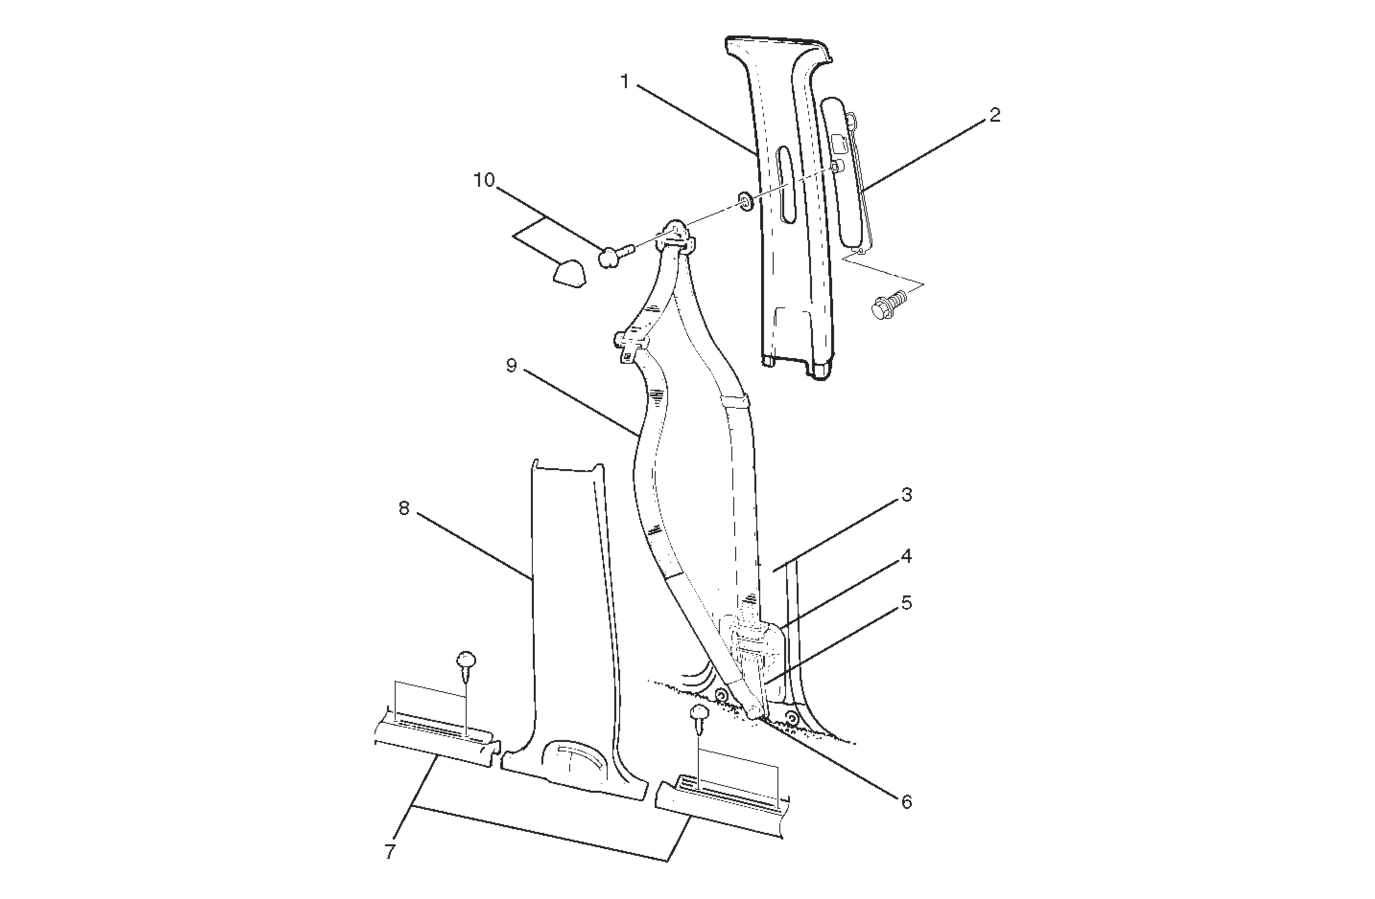
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Seat Belt

Front Seat Belt and Associated Parts



760RW014

Legend
- (1) Center Pillar Upper Trim Cover
- (2) Adjustable Shoulder Anchor Assembly

- (6) Anchor Bolt (Lower)
- (7) Door Sill Plate (Front & Rear)
- (8) Center Pillar Lower Trim Cover
- (9) Front Seat Belt Assembly
- (10) Front Seat Belt Anchor Bolt Cover and Anchor Bolt

Removal

1. Disconnect the battery ground cable.
2. Remove the door sill plate (Front & Rear).
3. Remove the center pillar lower trim cover.
4. Remove the front seat belt anchor bolt cover and anchor bolt (Upper Side).
   - Refer to Center Pillar and Roof Side Trim Cover in Exterior/Interior Trim section.
5. Remove the seat belt lower anchor bolt and screw, and then remove the front seat belt.

Inspection

If any of the following abnormalities is found, replace on an assembly basis:

- Deform and malfunction of adjustable shoulder anchor.
- No smooth move of upper/lower anchors in the circumferential direction.
- Damaged and/or deformed through ring.
- Damaged and/or deformed tongue.
- Damaged and/or frayed of webbing.
- Deformed retractor bracket.
- Seat belt not rewound up.
- Resistance or abnormal sound when seat belt is wound out and rewound.
- Retractor abnormality.

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
   - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
   - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.
3. ALR (Automatic Locking Retractor)/ELR check (Except for driver's seat).
   - When rewound after winding out the seat belt, make sure the seat belt cannot be taken out. After rewinding, make sure it has returned to its normal operation.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following points;

CAUTION: The front seat belt for '99model is differently specified from that for '98model.
When replacing, be sure to replace with the one for '99model after making sure of part No..

1. Pass the seat belt through the lower trim cover hole, and tighten the seat belt anchor bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

2. After installing the trim cover to the body panel securely, close the lower trim cover.

Rear Seat Belt and Associated Parts

(2) Quarter Upper Trim Cover
(3) Rear Seat Belt Assembly
(4) Dust Cover
(5) Retractor
(6) Anchor Bolt (Lower Side)
(7) Luggage Side Trim Cover
(8) Rear End Floor Trim Cover

Removal

1. Disconnect the battery ground cable.
2. Remove the rear end floor trim cover.
3. Remove the luggage side trim cover.
   - Refer to Luggage Side and Quarter Upper Trim Cover in Exterior/Interior Trim section.
4. Remove the rear seat belt anchor bolt cover and anchor bolt (Upper Side).
5. Remove the seat belt lower anchor bolt and remove the retractor from dust cover slit to remove the rear seat belt.

Inspection

If any of the following abnormalities is found, replace on an assembly basis:

- No smooth move of upper/lower anchors in the circumferential direction.
- Damaged and/or deformed through ring.
- Damaged and/or deformed tongue.
- Damaged and/or frayed of webbing.
- Deformed retractor bracket.
- Seat belt not rewound up.
- Resistance or abnormal sound when seat belt is wound out and rewound.
- Retractor abnormality.

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
   - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
   - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.
3. ALR (Automatic Locking Retractor)/ELR check (Except for driver's seat).
   - When rewound after winding out the seat belt, make sure the seat belt cannot be taken out. After rewinding, make sure it has returned to its normal operation.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

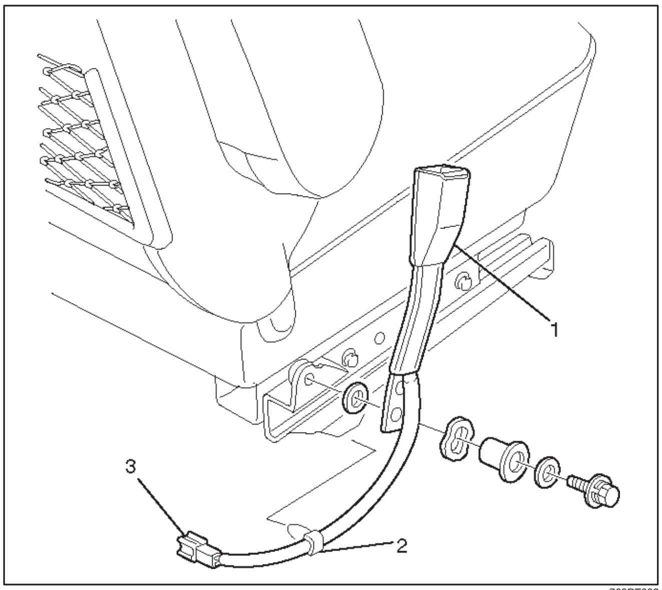
1. Tighten the seat belt anchor bolts to the specified torque.

Torque: 39 N·m (29 lb ft)

Front Seat Buckle Assembly

Removal

1. Disconnect the battery ground cable.
2. Disconnect the seat belt warning connector (driver's side) (3) and remove a clip(2).
3. Remove the front seat buckle assembly(1).

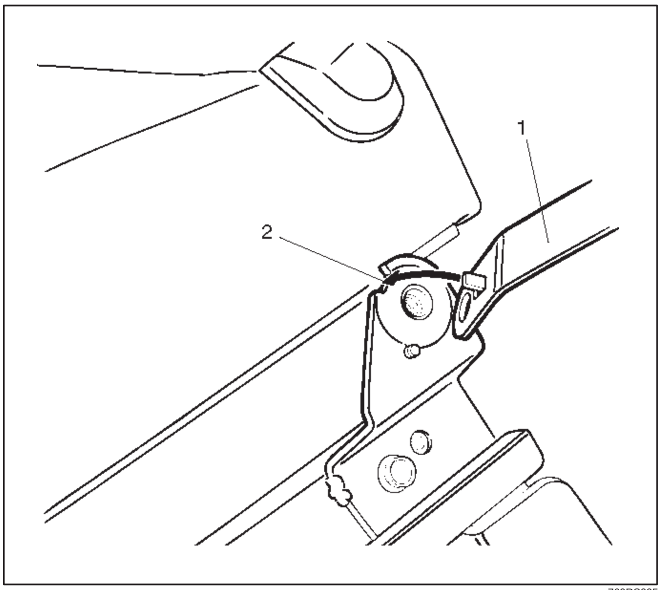


760RT003

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Fix the buckle to the rotation-stop position(2) securely to install the front seat buckle assembly(1).



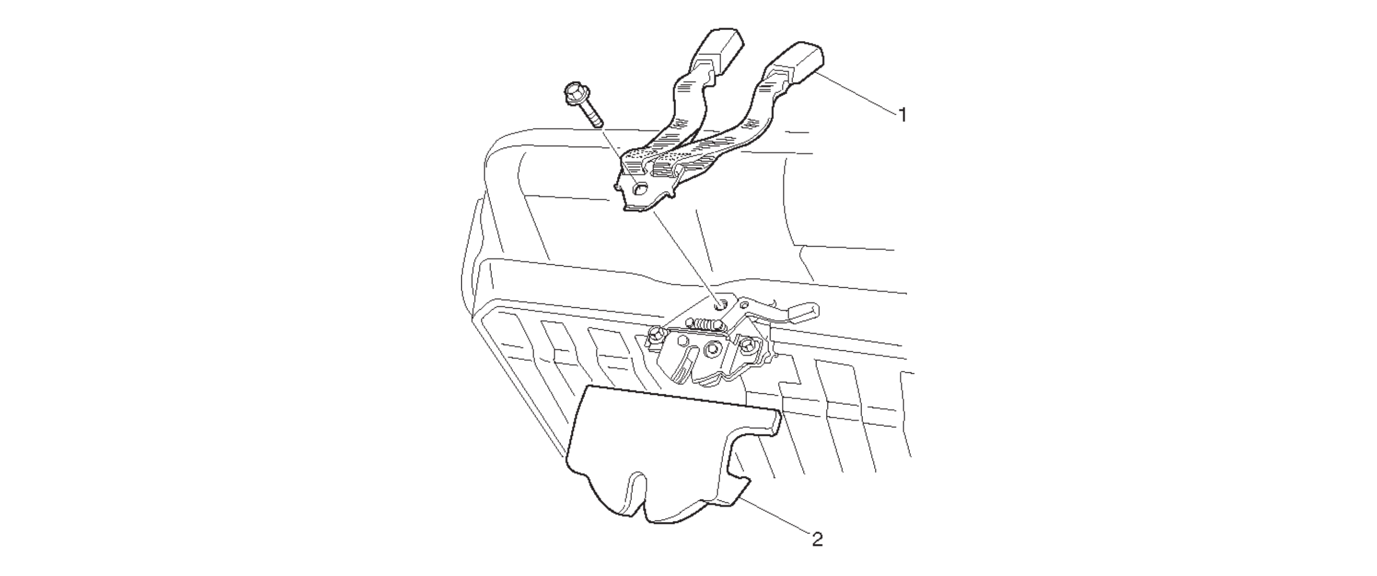
760RS005

2. Tighten the buckle anchor bolt to the specified torque.

Torque: 39 N·m (29 lb ft)

Rear Center Seat Belt / Buckle Assembly

Rear Center Seat Belt / Buckle Assembly and Associated Parts



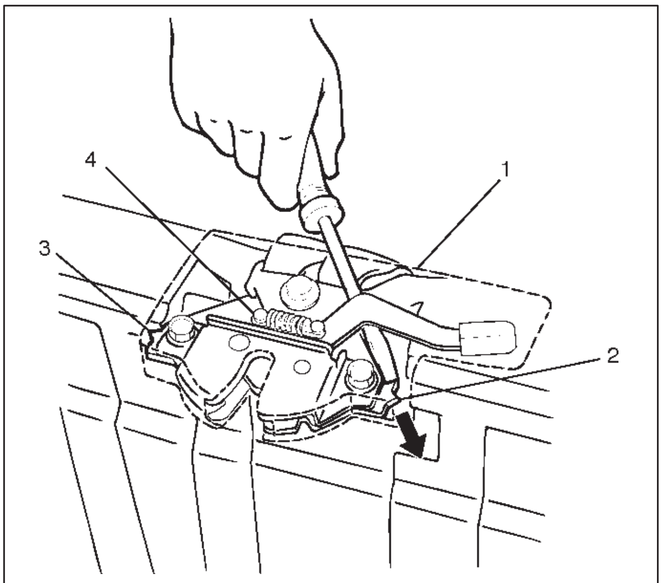
760RW007

Legend

(1) Rear Seat Belt Buckle Assembly
(2) Seat Lock Cover

Removal

1. Remove the catch portions(2) & (3) of the seat lock assembly(4) from the cover, and then remove the seat lock cover(1).



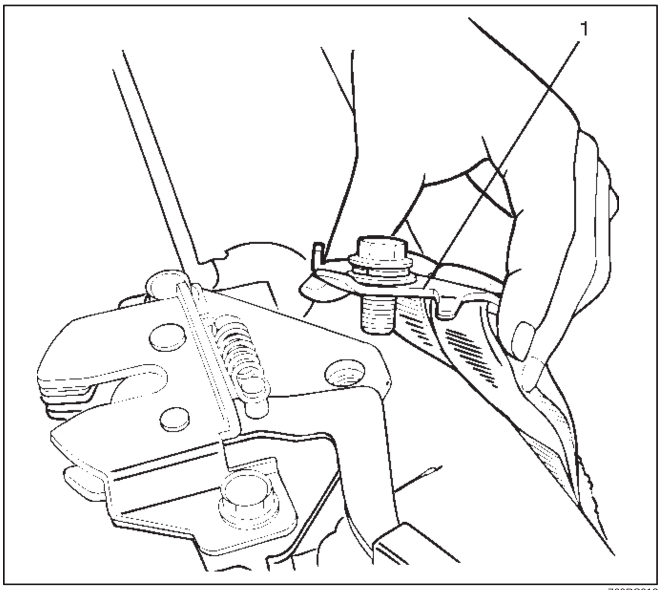
760RW016

2. Remove the rear seat buckle assembly.

Installation

1. Fix the rear seat buckle assembly(1) to the rotation stopper and tighten the anchor bolt to the specified torque.

Torque: 39 N·m (29 lb ft)



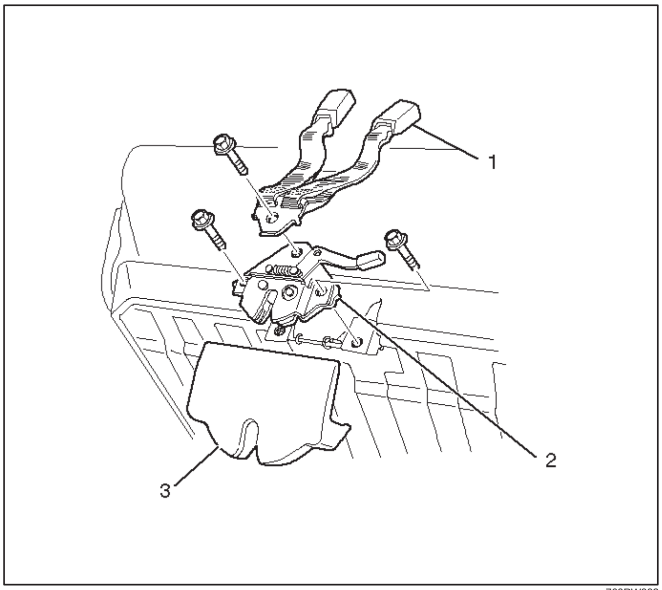
760RS013

2. Install the seat lock cover.

Rear Seat Lock Assembly

Removal

1. Remove the seat lock cover(3).
2. Remove the rear seat belt buckle assembly(1).
3. Remove the rear seat lock assembly(2).



760RW002

Installation

To install, follow the removal steps in the reverse order, noting the following point.

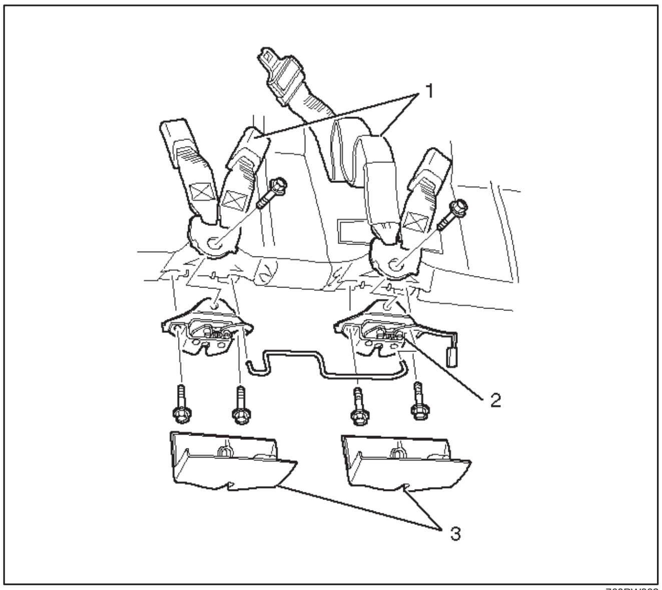
1. Tighten the seat lock fixing bolts to the specified torque.

Torque:42 N·m (31 lb ft)

Rear Seat Lock Assembly (Bench Type)

Removal

1. Remove the seat lock cover(3).
2. Remove the rear seat belt/buckle assembly(1).
3. Disconnect the link connecting the lock assemblies on the both sides, and then remove the rear seat lock assembly(2).



760RW003

Installation

To install, follow the removal steps in the reverse order, noting the following point.

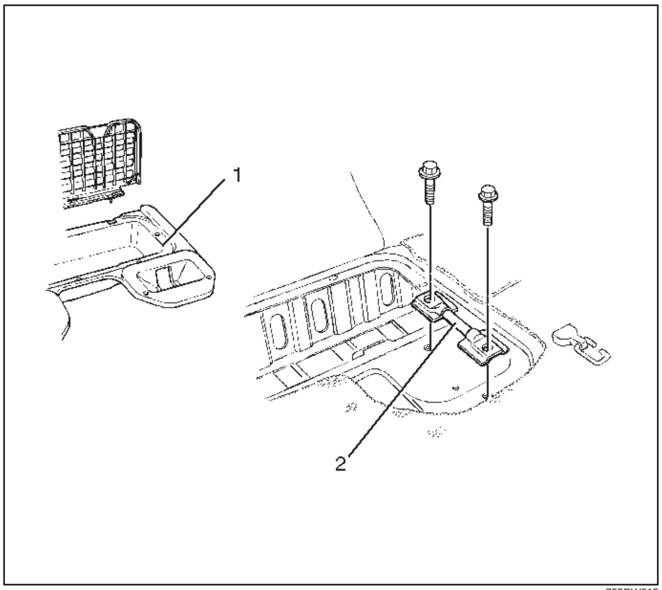
1. Tighten the seat lock fixing bolts to the specified torque.

Torque: 42 N·m (31 lb ft)

Rear Seat Strikers

Removal

1. Fold the rear seat assembly to the front direction.
2. Remove the luggage floor box(1).
3. Remove the rear seat striker(2).



755RW015

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the striker fixing bolts to the specified torque.

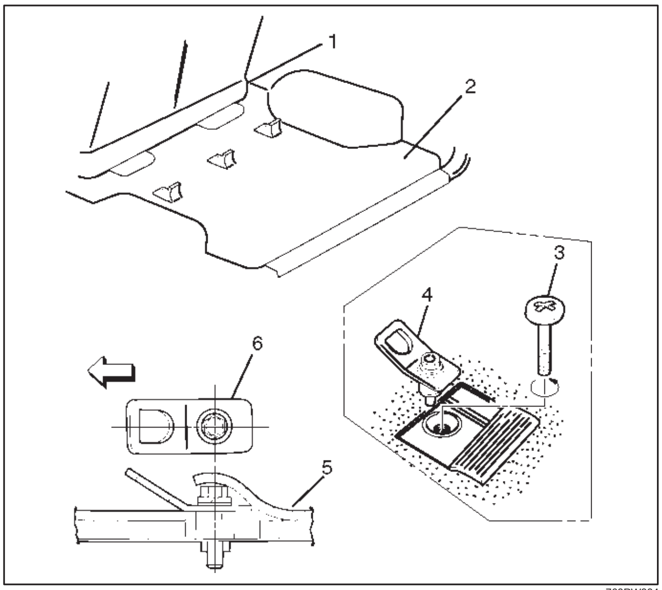
Torque: 40 N·m (30 lb ft)

Child Seat Tether Anchor Bracket (Child Restraint)

General Description

Plastic plug is provided at three places on the luggage floor panel. Remove the center plug from the floor panel. Install the bracket to the hole where the plug is removed. Alternatively, the bracket may be installed in the right-hand or left-hand plug hole.

Child Seat Tether Anchor Bracket and Associated Parts



760RW004

Legend

(1) Rear Seat
(2) Luggage Floor
(3) Plug
(4) Child Seat Tether Anchor Bracket
(5) Floor Carpet
(6) Child Seat Tether Anchor Bracket

Installation

1. Turn the plug counterclockwise to remove it.
2. Install the bracket such that its tether belt hook hole is facing toward the front of the vehicle.
3. Tighten the fixing bolt to the specified torque.

Torque: 20 N·m (14 lb ft)

RESTRAINTS

SUPPLEMENTAL RESTRAINT SYSTEM (SRS)

CONTENTS

Service Precaution

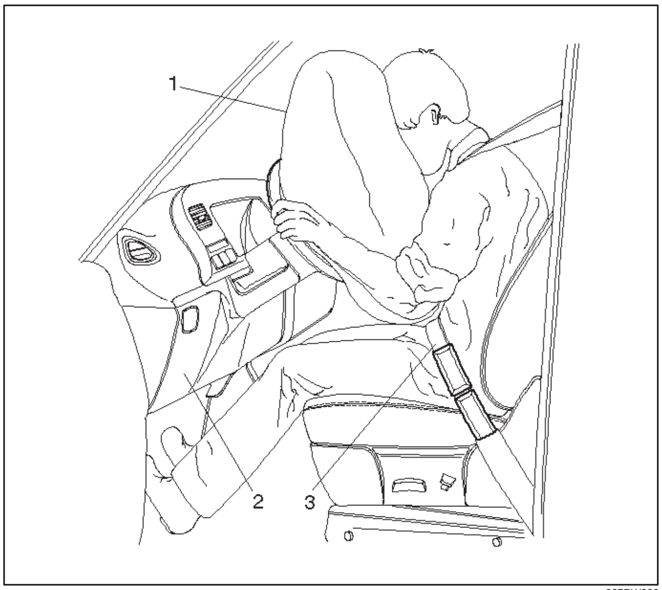
WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

Restraint Devices

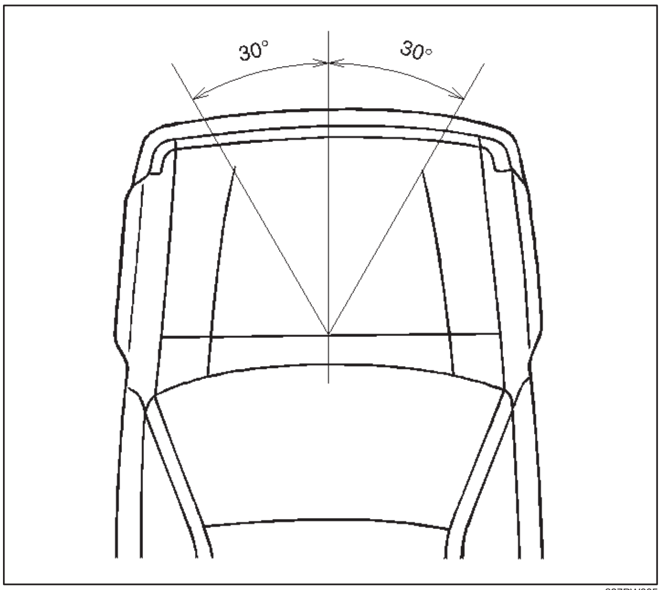


827RW006

Legend
- (1) Deployed Air Bag
- (2) Knee Bolster
- (3) Seat Belt

The Supplemental Restraint System (SRS) helps supplement the protection offered by the driver and front passenger seat belts by deploying an air bag from the center of the steering wheel and from the top of the right side of the instrument panel.

The air bag deploys when the vehicle is involved in a frontal crash of sufficient force up to 30 degrees off the centerline of the vehicle. To further absorb the crash energy there is a knee bolster located beneath the instrument panel for both the driver and passenger, and the steering column is collapsible.



827RW005

System Description

The SRS consists of the Sensing and Diagnostic Module (SDM), the driver air bag assembly, the SRS coil assembly, the passenger air bag assembly and the “AIR BAG” warning lamp in the instrument cluster. The SDM, SRS coil assembly (driver side only), driver air bag assembly, passenger air bag assembly and connector wire make up the deployment loops. The function of the deployment loops is to supply current through air bag assembly, which will cause deployment of the air bags in the event of a frontal crash of sufficient force, up to 30 degrees off the centerline of the vehicle. The air bag assemblies are only supplied enough current to deploy when the SDM detects vehicle velocity changes severe enough to warrant deployment.

The SDM contains a sensing device which converts vehicle velocity change to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags.

Component Description

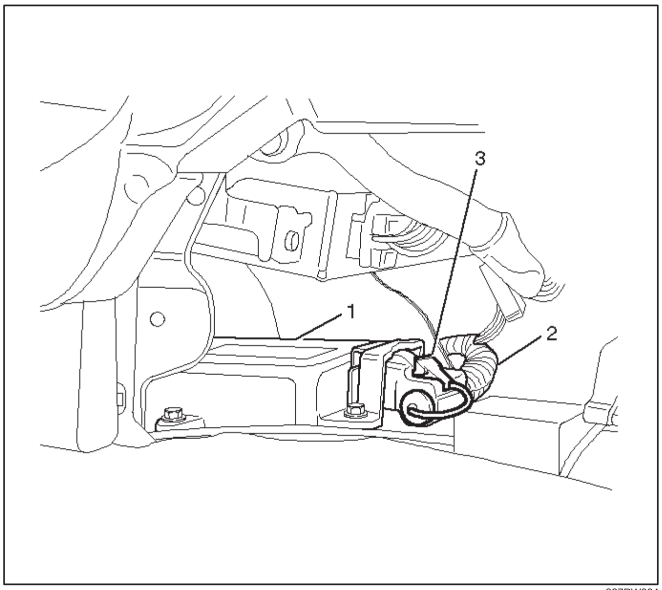
SDM (Sensing and Diagnostic Module)

WARNING: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTED TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

The Sensing and Diagnostic Module (SDM) is designed to perform the following functions in the SRS:

1. Energy Reserve — The SDM maintains 24–Volt Loop Reserve (24VLR) energy supply to provide deployment energy when ignition voltage is lost in a frontal crash.
2. Frontal Crash Detection — The SDM monitors vehicle velocity changes to detect frontal crashes which are severe enough to warrant deployment.
3. Air Bag Deployment — When a frontal crash of sufficient force is detected, the SDM will cause enough current to flow through the air bag assembly to deploy the air bag.
4. Malfunction Detection — The SDM performs diagnostic monitoring of SRS electrical components and sets a diagnostic trouble code when a malfunction is detected.
5. Frontal Crash Recording — The SDM records information regarding SRS status during frontal crash.
6. Malfunction Diagnosis — The SDM displays SRS diagnostic trouble codes and system status information through the use of a scan tool.
7. Driver Notification — The SDM warns the vehicle driver of SRS malfunctions by controlling the “Air Bag” warning lamp.

The SDM is connected to the SRS wiring harness by a 24–pin connector. This harness connector uses a shorting clip across certain terminals in the contact area. This shorting clip connects the “AIR BAG” warning lamp to ground when the SDM harness connector is disconnected or CPA (Connector Position Assurance) is not inserted even if completely connected. This will cause the “AIR BAG” warning lamp to come “ON” steady whenever the ignition switch is at the ON or START positions with the SDM disconnected.



827RW004

Legend

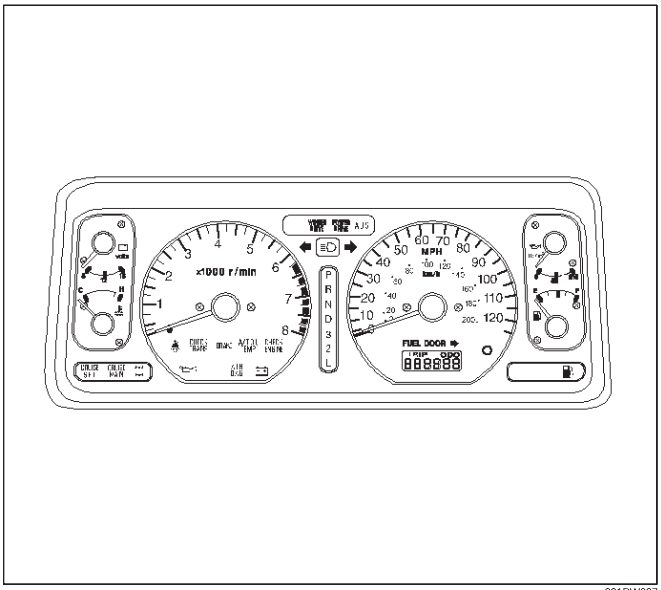
(1) SDM
(2) SRS Harness
(3) Connector Position Assurance

“Air Bag” Warning Lamp

Ignition voltage is applied to the “AIR BAG” warning lamp when the ignition switch is at the ON or START positions. The SDM controls the lamp by providing ground with a lamp driver. The “AIR BAG” warning lamp is used in the SRS to do the following:

1. Verify lamp and SDM operation by flashing SEVEN (7) times when the ignition switch is first turned “ON”.
2. Warn the vehicle driver of SRS electrical system malfunctions which could potentially affect the operation of the SRS. These malfunctions could result in nondeployment in case of a frontal crash or deployment for conditions less severe than intended.

The “AIR BAG ” warning lamp is the key to driver notification of SRS malfunctions. For proper lamp operation, refer to the “SRS Diagnostic System Check” in this section.



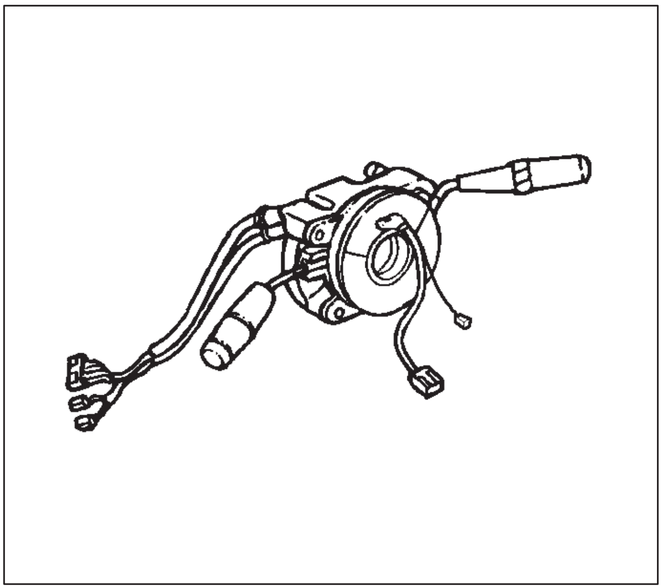
821RW037

SRS Coil Assembly

The SRS coil assembly consists of two current carrying coils. This is attached to the steering column and allow rotation of the steering wheel while maintaining continuous contact of the driver deployment loop to the driver air bag assembly.

There is a shorting clip on the yellow 2–pin connector near the base of steering column which connects the SRS coil to the SRS wiring harness.

The shorting clip shorts to the SRS coil and driver air bag assembly when the yellow 2–pin connector is disconnected. The circuit to the driver air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the steering column or other SRS components.



825RS017

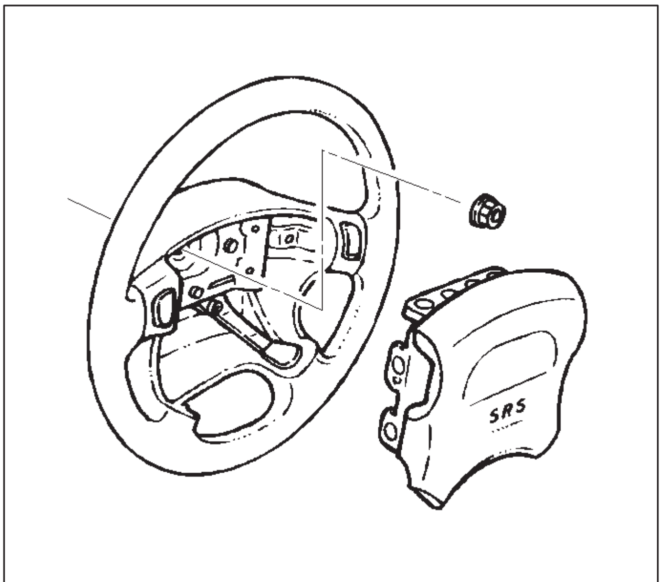
Air Bag Assemblies

The air bag assembly consist of an inflatable air bag assembly and an inflator (a canister of gas–generating material and an initiating device). When the vehicle is in a frontal crash of sufficient force.

The SDM causes current flow through the deployment loops. Current passing through the inflator ignites the material in the air bag assembly. The gas produced from this reaction rapidly inflates the air bag assembly.

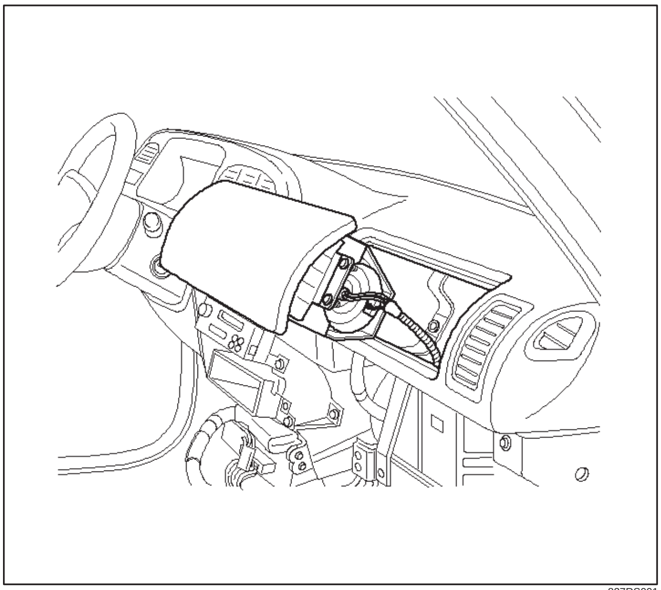
There is a shorting clip on the driver air bag assembly connector which connects the SRS coil assembly. The shorting clip shorts across the driver air bag assembly circuits when driver air bag assembly connector is disconnected.

The circuit to the driver air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the driver air bag assembly, the steering column or other SRS components.



827RS008

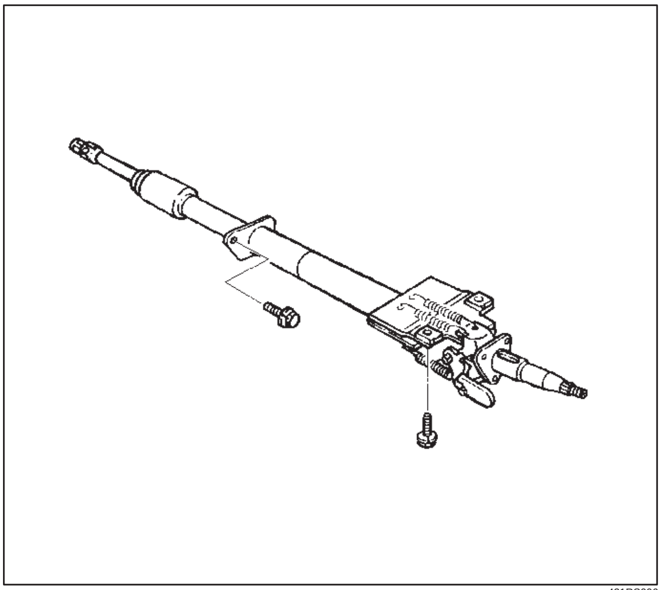
There is a shorting clip on the passenger air bag assembly connector which connects to the SRS harness. The shorting clip shorts across the passenger air bag assembly circuit when the passenger air bag assembly connector is disconnected. The circuit to the passenger air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the passenger air bag assembly, the instrument panel or other SRS components.



827RS001

Steering Column

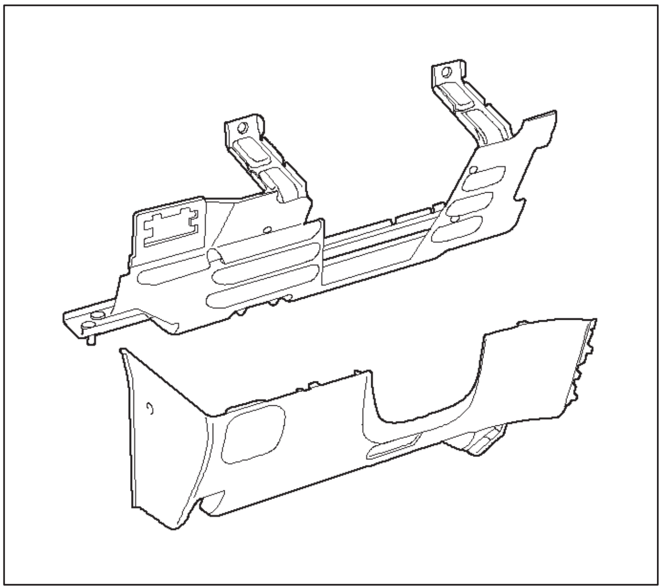
The steering column absorbs energy and is designed to compress in a frontal crash to decrease the chance of injury to the driver.



431RS006

Knee Bolster

The knee bolsters are used to absorb energy to protect knees and control the forward movement of the vehicle's front seat occupants during a frontal crash, by limiting leg movement.



740RT015

Definitions

Air Bag
An inflatable cloth cushion designed to deploy in certain frontal crashes. It supplements the protection offered by the seat belts by distributing the impact load more evenly over the vehicle occupant's head and torso.

Asynchronous
Performed in a nonperiodic fashion, (i.e., no defined time or interval).

B+
Battery voltage, (B+) The voltage available at the battery at the time of the indicated measurement. With the key "ON" and the engine not running, the system voltage will likely be between 12 and 12.5 volts. At idle, the voltage may be 14 to 16 volts. The voltage could be as low as 10 volts during engine cranking.

Bulb Check
The SDM will cause the "AIR BAG" warning lamp to flash seven times and then go "OFF" whenever the ignition switch transitions to the ON position from any other ignition switch position and no malfunctions are detected.

"Continuous Monitoring"
Tests performed by the SDM on the SRS every 100 milliseconds while "Ignition 1" voltage is in the normal operating voltage range at the SDM.

Data Link Connector (DLC)
Formerly "DLC" a connector which allows communication with an external computer, such as a scan tool.

Datum Line
A base line parallel to the plane of the underbody or frame from which all vertical measurements originate.

Deploy
To inflate the air bag.

Deployment Loops
The circuits which supply current to the air bag assemblies to deploy the air bag.

Diagnostic Trouble Code (DTC)
Formerly "Code", a numerical designator used by the SDM to indicate specific SRS malfunctions.

Driver Current Source
An output of the SDM which applies current into the driver air bag assembly circuit during the "Initiator Assembly Resistance Test".

Driver Air Bag Assembly
An assembly located in the steering wheel hub consisting of an inflatable bag, an inflator and an initiator.

EEPROM
Electrically Erasable Programmable Read Only Memory. Memory which retains its contents when power is removed from the SDM.

Ignition Cycle
The voltage at the SDM "Ignition 1" inputs, with ignition switch "ON", is within the normal operating voltage range for at least ten seconds before turning ignition switch "OFF".

Ignition 1
A battery voltage (B+) circuit which is only powered with the ignition switch in the ON, or START positions.

Initiator
The electrical component inside the air bag assembly which, when sufficient current flows, sets off the chemical reaction that inflates the air bag.

"Initiator Assembly Resistance Test"
Tests performed once each ignition cycle when no malfunctions are detected during "Turn–ON" or "Continuous Monitoring". This test checks for the correct SDM configuration for the vehicle, shorts to "Ignition 1" in the deployment loops, high resistance or opens in the "Driver Side High", "Driver Side Low", "Passenger Side High" and "Passenger Side Low" circuits and measures the resistance of the inflator assembly consisting of 1) Initiators, 2) SRS coil assembly (driver side only), 3) Connectors and associated wiring.

Normal Operating Voltage Range
The voltage measured between the SDM "Ignition 1" terminals and "Ground" terminals is between 9 and 16 volts.

Passenger Current Source
An output of the SDM which applies current into the passenger air bag assembly circuit during the "Initiator Assembly Resistance Test".

Passenger Air Bag Assembly
An assembly located in the right side of the instrument panel consisting of an inflatable bag, an inflator and an initiator.

Scan Tool
An external computer used to read diagnostic information from on–board computers via the data link connector.

SDM
Sensing and Diagnostic Module which provides reserve energy to the deployment loops, deploys the air bags when required and performs diagnostic monitoring of all SRS components.

Serial Data
Information representing the status of the SRS.

SRS
Supplemental Restraint System.

SRS Coil Assembly
An assembly of two current–carrying coils in the driver deployment loop that allows the rotation of the steering wheel while maintaining the continuous contact of the driver deployment loop to the driver air bag assembly.

SRS Wiring Harness
The wires and connectors that electrically connect the components in the SRS.

"Turn–ON"
Test which the SDM performs on the SRS once during each ignition cycle immediately after "Ignition 1" voltage is applied to the SDM and before "Continuous Monitoring".

Diagnosis

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NONPOWERED PROBE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

Diagnostic Trouble Codes

The "SRS Diagnostic System Check" must always be the starting point of any SRS diagnosis. The "SRS Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation and checks for SRS diagnostic trouble codes using the scan tool.

1. Current diagnostic trouble codes – Malfunctions that are presently being detected. Current diagnostic trouble codes are stored in RAM (Random Access Memory).
2. History diagnostic trouble codes – All malfunctions detected since the last time the history memory was cleared. History diagnostic trouble codes are stored in EEPROM.

Scan Tool Diagnostics

A scan tool is used to read current and history diagnostic trouble codes and to clear all diagnostic trouble codes after a repair is completed. The scan tool must be updated to communicate with the SRS through a replaceable cartridge before it can be used for SRS diagnostics. To use the scan tool, connect it to the data link connector and turn the ignition switch "ON". The scan tool reads serial data from the SDM "Serial Data" line terminal "24" to the data link connector terminal "9".

Use Of Special Tools

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC, OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON POWERED PROBE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT. YOU SHOULD BE FAMILIAR WITH THE TOOLS LISTED IN THIS SECTION UNDER THE HANDLING SRS SPECIAL TOOLS.

You should be able to measure voltage and resistance. You should be familiar with proper use of a scan tool such as the Tech 2 Diagnostic Computer, SRS Driver/Passenger Load Tool J–41433, Connector Test Adapter Kit J–35616–A, and the DVM (Digital Multimeter) J–39200.

(5) SRS Coil Assembly
(6) DLC Connector

Repairs And Inspections Required After An Accident

NOTE: If any SRS components are damaged, they must be replaced. If SRS component mounting points are damaged, they must be replaced.

- Never use SRS parts from another vehicle. This does not include remanufactured parts purchased from an authorized dealer; they may be used for SRS repairs.
- Do not attempt to service the SDM, the SRS coil assembly, or the air bag assembly. Service of these items is by replacement only.
- Verify the part number of replacement air bag assembly.

CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.

The air bag assembly has identification colors on the bar code label from ’00 model as follows.

Yellow color for driver air bag assembly.

White color for passenger air bag assembly.

Use only new air bag assembly proper to the Trooper which is being repaired.

CAUTION: Proper operation of the sensors and supplemental restraint system (SRS) requires that any repairs to the vehicle structure return it to the original production configuration. Deployment requires, at a minimum, replacement of the SDM, air bag assembly and dimensional inspection of the steering column. Any visible damage to the SDM mounting bracket (s) requires replacement, and the steering column must be dimensionally inspected, whether deployment occurred or not.

Accident With Deployment – Component Replacement And Inspections

Certain SRS components must be replaced or inspected for damage after a frontal crash involving air bag deployment. Those components are:

- Air bag assembly
- SDM

CAUTION: Refer to "SDM Replacement Guidelines" below for important information on SDM replacement in both deployment and non deployment crashes.

- SRS coil assembly — Inspect wiring and connector for any signs of scorching, melting, or damage due to excessive heat. Replace if damaged. Refer to section "SRS Coil Assembly" in this manual.

Accident With or Without Deployment – Component Inspection

Certain SRS system components and rotation parts must be inspected after any crash, whether the air bag deployed or not. Those components are:

- Steering column — Refer to Inspection Required "After an Accident" in this manual.
- Knee bolsters and mounting points — Inspect for any distortion, bending, cracking, or other damage.
- I/P steering column reinforcement plate — Inspect for any distortion, bending, cracking, or other damage.
- I/P braces — Inspect for any distortion, bending, cracking, or other damage.
- Seat belts and mounting points — Refer to "Seat Belts" in Section "Seat Belt" of this workshop manual.

SDM Replacement Guidelines

SDM replacement policy requires replacement of SDM, after crash involving air bag deployment when "SRS Warning Lamp" turn "ON", "SRS Diagnosis" should be done according to Section "Restraint Control System."

Wiring Damage

If any SRS wire harness is damaged, it should be replaced. Don't repair SRS harness. It is replace only.

SRS Connector (Plastic Body And Terminal Metal Pin) Damage

If any connector or terminal in the SRS wire harness (except pigtails) is damaged, it should be replaced.

SRS Wire Pigtail Damage

If the wiring pigtail (a wire or wires attached directly to the device, not by a connector) is damaged, the entire component (with pigtail) must be replaced. Examples of "pigtail" components are the driver air bag assembly, the passenger air bag assembly, and the SRS coil assembly.

On–Vehicle Service

Service Precaution

WARNING: WHEN PERFORMING SERVICE ON OR AROUND SRS COMPONENTS OR SRS WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE SRS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNEEDED SRS REPAIRS.

The SDM in Driver–Passenger SRS can maintain sufficient voltage to cause a deployment for up to 15 seconds after the ignition switch is turned "OFF," the battery is disconnected, or the fuse powering the SDM is removed.

Many of the service procedures require removal of the "C–21" fuse, and disconnection of the air bag assembly from the deployment loop to avoid an accidental deployment. If the air bag assembly is disconnected from the deployment loop as noted in the "Disabling the SRS" procedure that follows, service can begin immediately without waiting for the 15 second time period to expire.

Disabling The SRS

Removal

Turn the ignition switch to "LOCK" and remove key.

1. Remove SRS fuse C–21, from left dash side lower fuse block or disconnect battery.
2. Disconnect yellow 2–pin connector at the base of steering column.
3. Remove glove box assembly, refer to "Passenger Air Bag Assembly Replacement" in this manual.
4. Disconnect yellow 2–pin connector behind the glove box assembly.

CAUTION: With the "C–21" fuse removed and ignition switch "ON", the "AIR BAG" warning lamp will be "ON". This is normal operation and does not indicate an SRS malfunction.

Enabling The SRS

Installation

CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.

The air bag assembly has identification colors on the bar code label from '00 model as follows.

Yellow color for driver air bag assembly.

White color for passenger air bag assembly.

Use only new air bag assembly proper to the Trooper which is being repaired.

Turn ignition switch to "LOCK" and remove key.

1. Connect yellow 2–pin connector passenger air bag assembly.
2. Install glove box assembly. Refer to "Passenger air bag assembly replacement" in this manual.
3. Connect yellow 2–pin connector at the base of steering column.
4. Install "AIR BAG" fuse C–21 to left dash side lower fuse block or connect battery.

Turn ignition switch to "ON" and verify that the "AIR BAG" warning lamp flashes seven times and then turns "OFF." If it does not operate as described, perform the "SRS Diagnostic System Check" in this manual.

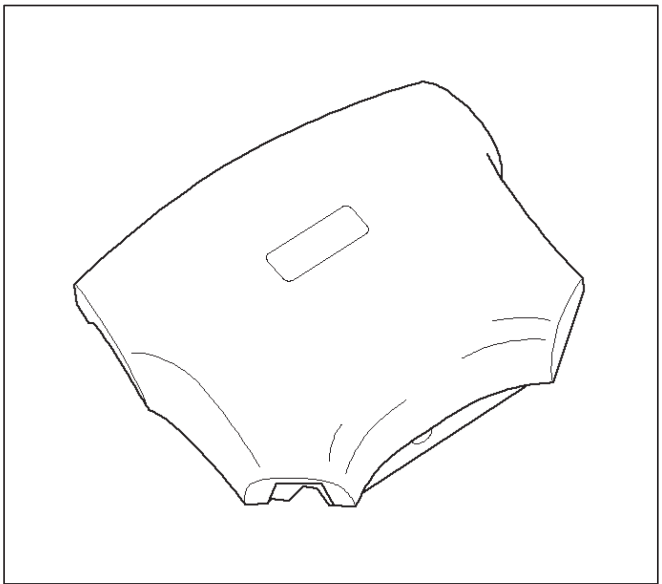
Handling / Installation / Diagnosis

1. Air bag assembly should not be subjected to temperatures above 65˚C (150˚F).
2. Air bag assembly, and SDM should not be used if they have been dropped from a height of 100 centimeters (3.28 feet) or more.
3. When a SDM is replaced, it must be oriented with the arrow on the sensor pointing toward the front of the vehicle. It is very important for the SDM to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the SDM mounting surface is free of any dirt or other foreign material.
4. Do not apply power to the SRS unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
5. The “SRS Diagnostic System Check” must be the starting point of any SRS diagnostics. The “SRS Diagnostic System Check” will verify proper “AIR BAG” warning lamp operation and will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacement.

Air Bag Assembly Handling / Shipping / Scrapping

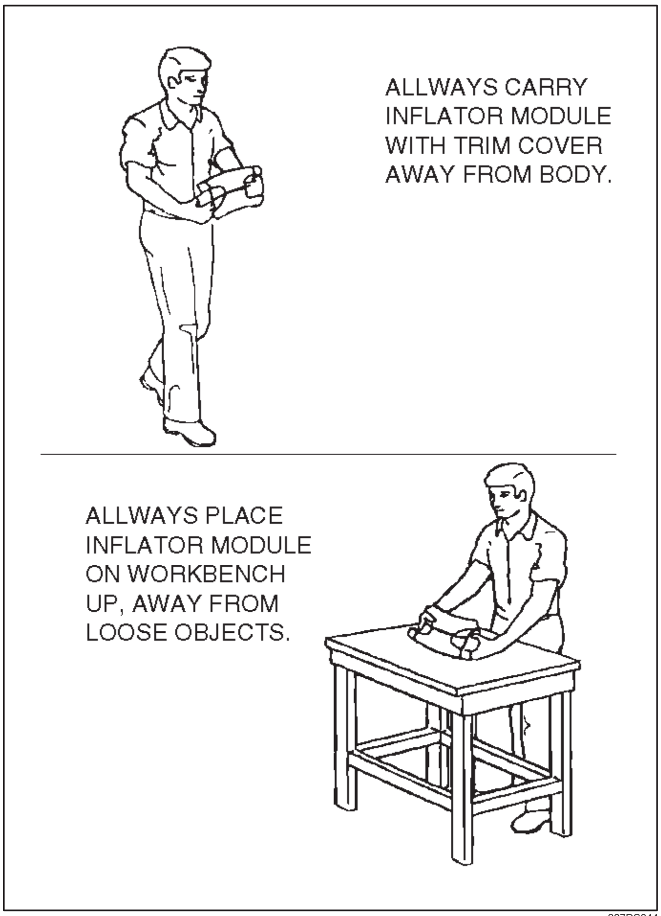
Live (Undeployed) Air Bag Assembly

Special care is necessary when handling and storing a live (undeployed) air bag assembly. The rapid gas generation produced during deployment of the air bag could cause the air bag assembly, or an object in front of the air bag assembly, to be thrown through the air in the unlikely event of an accidental deployment.



827RV004

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG OPENING IS POINTED AWAY FROM YOU. IN CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. NEVER CARRY THE AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF THE MODULE.



827RS044

Air Bag Assembly Shipping Procedure For Live (Undeployed) Air Bag Assemblies

Service personnel should refer to the latest Service Bulletins for proper SRS air bag assembly shipping procedures.

Deployed Air Bag Assembly (Driver Side)

You should wear gloves and safety glasses. After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present.

Air Bag Assembly Scrapping Procedure

During the course of a vehicle’s useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) air bag assembly. This information covers proper procedures for disposing of a live air bag assembly.

Before a live air bag assembly can be disposed of, it must be deployed. A live air bag assembly must not be disposed of through normal refuse channels.

WARNING: FAILURE TO FOLLOW PROPER SUPPLEMENTAL RESTRAINT SYSTEM (SRS) AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. AN UNDPLOYED AIR BAG ASSEMBLY MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE, AND / OR LOCAL LAW.

In situations which require deployment of a live air bag assembly, deployment may be accomplished inside or outside the vehicle. The method employed depends upon the final disposition of the particular vehicle, as noted in “Deployment Outside Vehicle” and “Deployment Inside Vehicle” in this section.

Deployment Outside Vehicle (Driver Air Bag Assembly)

Deployment outside the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which the vehicle will be returned to useful service after a functionally or cosmetically deficient air bag assembly is replaced. Deployment and disposal of a malfunctioning air bag assembly is, of course, subject to any required retention period.

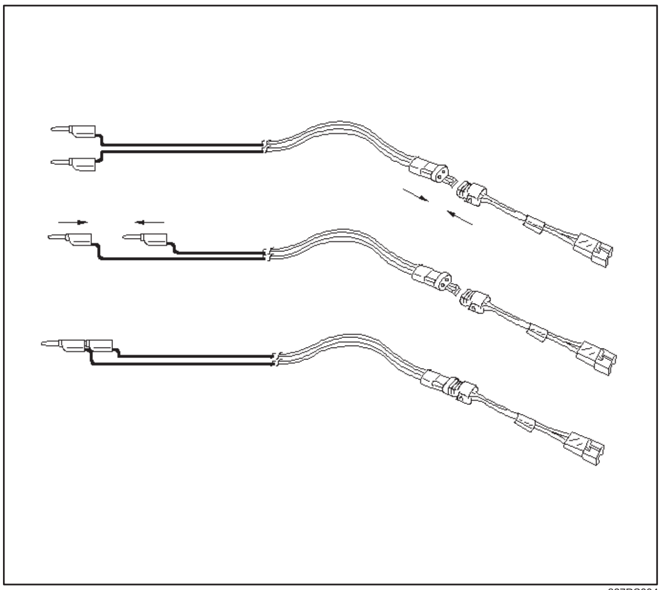
For deployment of a live (undeployed) air bag assembly outside the vehicle, the deployment procedure must be followed exactly. Always wear safety glasses during this deployment procedure until a deployed air bag assembly is scrapped or until an undeployed air bag assembly is shipped. Before performing the procedures you should be familiar with servicing the SRS and with proper handling of the air bag assembly. Procedures should be read fully before they are performed.

The following procedure requires use of J–42986 SRS deployment harness with appropriate pigtail adapter. Do not attempt procedure without J–42986 adapter.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT HARNESS TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT HARNESS TO THE DRIVER AIR BAG ASSEMBLY. DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

NOTE: This information applies only to driver air bag assembly . Refer to “Deployment Outside Vehicle (Passenger Air Bag assembly)” in this section for information on passenger air bag assembly scrapping.

1. Turn ignition switch to “LOCK”, remove key and put on safety glasses.
2. Inspect J–42986 SRS Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail adapter is damaged, discard and obtain a replacement.
3. Short the two SRS deployment harness leads together by fully seating one banana plug into the other. SRS deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed.

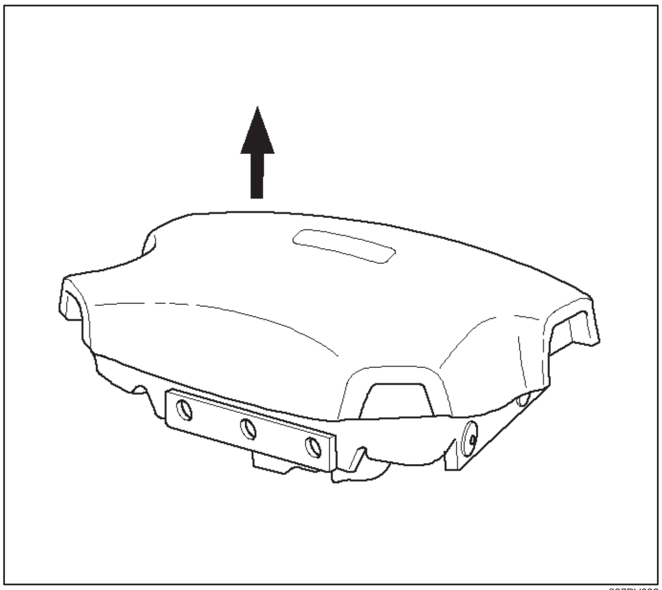


827RS004

4. Connect the appropriate pigtail adapter to the SRS deployment harness.
5. Remove the driver air bag assembly from vehicle. Refer to “Inflator Module Removal” in this manual.

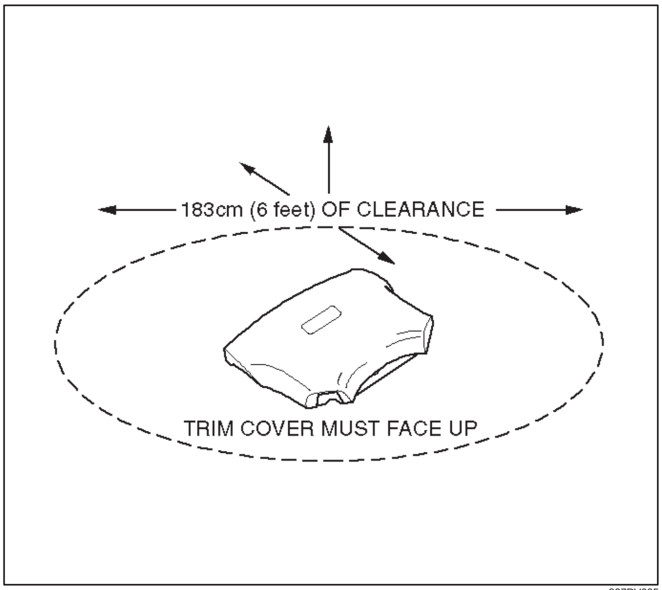
WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE AIR BAG AND TRIM COVER UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

6. Place the driver air bag assembly on a work bench or other surface away from all loose or flammable objects with its trim cover facing up, away from the surface.



827RV003

7. Clear a space on the ground about 183 cm (six feet) in diameter where the driver air bag assembly is to be deployed. A paved, outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where there is no activity and sufficient ventilation is recommended. Ensure no loose or flammable objects are within the deployment area.



827RV005

8. Place the driver air bag assembly, with its trim cover facing up, on the ground in the space just cleared.
9. Stretch the SRS deployment harness and pigtail adapter from the driver air bag assembly to its full length.
10. Place a power source near the shorted end of the SRS deployment harness. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
11. Connect the driver air bag assembly to the pigtail adapter on the SRS deployment harness. Deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The driver air bag assembly will immediately deploy the air bag when a power source is connected to it.

NOTE: Ensure that the pigtail adapter is firmly seated into the driver air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the driver air bag assembly connector functioning (shorted) and may result in nondeployment of the driver air bag assembly.

12. Verify that the area around the driver air bag assembly is clear of all people and loose or flammable objects.
13. Verify that the driver air bag assembly is resting with its trim cover facing up.
14. Notify all people in the immediate area that you intend to deploy the driver air bag. The deployment will be accompanied by a substantial noise which may startle the uninformed.
15. Separate the two banana plugs on the SRS deployment harness.

NOTE: When the air bag deploys, the driver air bag assembly may jump about 30 cm (one foot) vertically. This is a normal reaction of the driver air bag to the force of the rapid gas expansion inside the air bag.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the driver air bag.

WARNING: DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

16. Connect the SRS deployment harness wires to the power source to immediately deploy the driver air bag. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
17. Disconnect the SRS deployment harness from the power source.
18. Short the two SRS deployment harness leads together by fully seating one banana plug into the other.

19. In the unlikely event that the driver air bag assembly did not deploy after following these procedures, proceed immediately with Steps 24 through 26. If the driver air bag assembly did deploy, proceed with Steps 20 through 23.
20. Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed driver air bag assembly. After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This power consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with the atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE INFLATOR MODULE TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED AIR BAG ASSEMBLY NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY.

AFTER A DRIVER AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE DRIVER AIR BAG ASSEMBLY WILL BE VERY HOT. DO NOT TOUCH THE METAL AREAS OF THE DRIVER AIR BAG ASSEMBLY FOR ABOUT TEN MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED DRIVER AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL, WEAR GLOVES AND HANDLE BY THE AIR BAG OR TRIM COVER.

21. Disconnect the pigtail adapter from the driver air bag assembly as soon after deployment as possible. This will prevent damage to the pigtail adapter or SRS deployment harness due to possible contact with the hot driver air bag assembly canister. The pigtail adapter can be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
22. Dispose of the deployed driver air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
23. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the driver air bag assembly did not deploy after following these procedures.

24. Ensure that the SRS deployment harness has been disconnected from the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other.
25. Disconnect the pigtail adapter from the driver air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE INFLATOR MODULE UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

26. Temporarily store the driver air bag assembly with its trim cover facing up, away from the surface upon which it rests.

Deployment Outside Vehicle (Passenger Air Bag Assembly)

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. UNDEPLOYED AIR BAG ASSEMBLIES MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE AND/OR LOCAL LAWS.

Deployment out of the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which a functionally or cosmetically deficient air bag assembly is replaced. Deployment and disposal of an air bag assembly is, of course, subject to any required retention period.

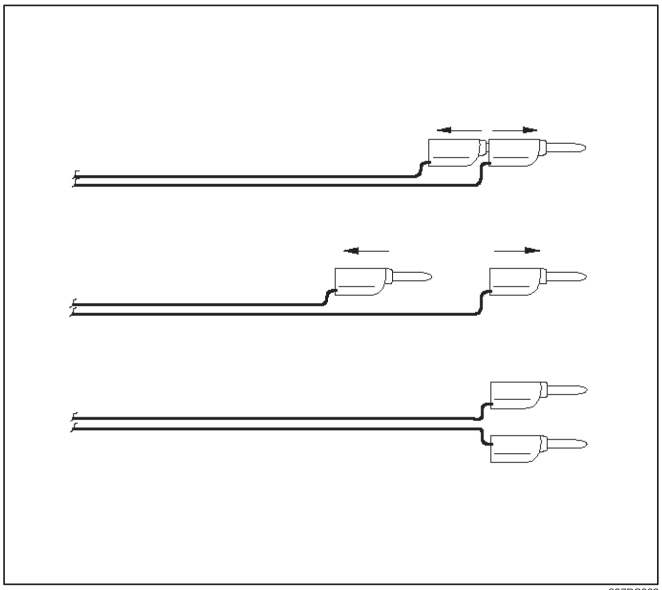
For deployment of a live air bag assembly out of the vehicle, the deployment procedure must be followed exactly. Always wear safety glasses during this deployment procedure until the deployed air bag assembly is scrapped. Before performing the procedures, you should be familiar with servicing the SRS system and with proper handling of the air bag assembly. Procedures should be read fully before they are performed.

The following procedure requires use of J–42986 SRS Deployment Harness with the appropriate pigtail adapter. The procedure also requires the use of J–41497 Passenger Side SRS Module Deployment Fixture. Do not attempt this procedure without J–42986 and adapter, and J–41497.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT HARNESS TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT HARNESS TO THE AIR BAG ASSEMBLY. DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

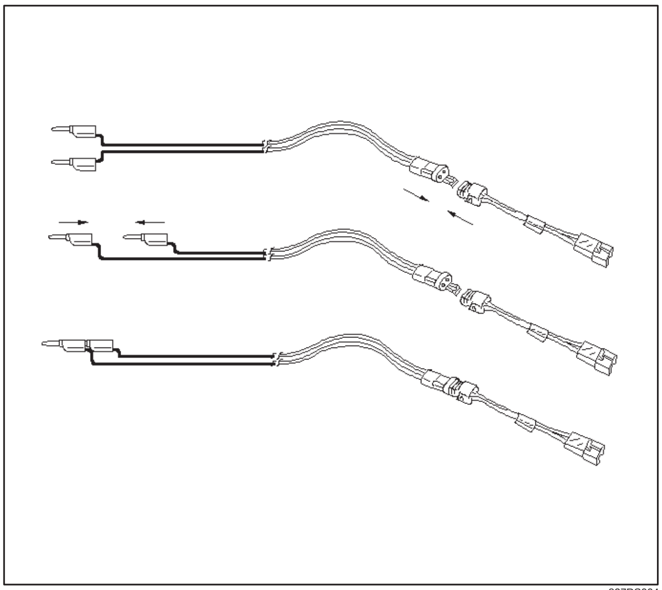
NOTE: This information applies only to passenger air bag assembly. Information for disposing of a live driver air bag assembly can be found in "Deployment Outside Vehicle" (Driver Air Bag Assembly) in this section.

1. Turn ignition switch to "LOCK" remove key, and put on safety glasses.
2. Inspect J–42986 SRS Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail is damaged, discard and obtain a replacement.
3. Short the two SRS Deployment Harness leads together by fully seating one banana plug into the other. The SRS Deployment Harness shall remain shorted and not be connected to a power source until the air bag is to be deployed.



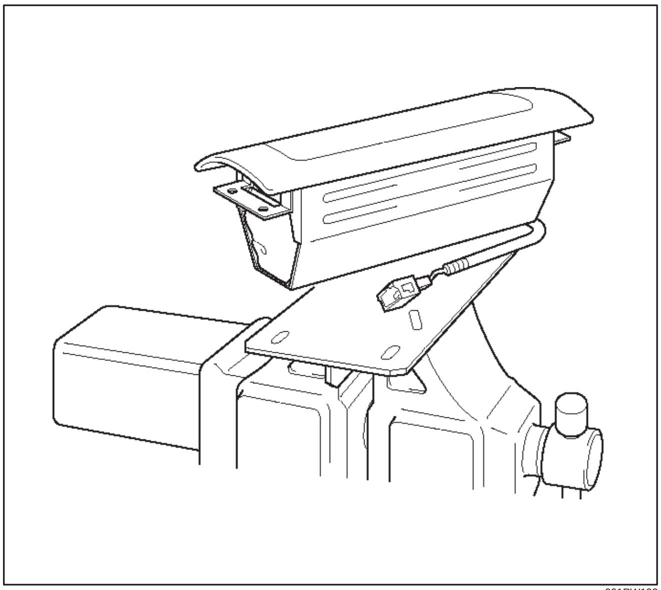
827RS003

4. Connect the appropriate pigtail adapter to the SRS Deployment Harness



827RS004

5. Remove passenger air bag assembly from vehicle. Refer to "Passenger Air Bag Assembly Removal " in this Section 9J–3.
6. Clear a space on the ground approximately 183 cm (six feet) in diameter where the fixture with attached air bag assembly is to be placed for deployment. A paved outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where is no activity and sufficient ventilation is recommended. Ensure that no loose or flammable objects are within the deployment area.
7. Place the J–41497 on the bench vice. This is necessary to provide sufficient stabilization of the fixture during deployment.
8. Attach the passenger air bag assembly in the J–41497. An air bag assembly must be mounted such that the bag will deploy upward. SECURELY HAND–TIGHTEN ALL FASTENERS PRIOR TO DEPLOYMENT.



901RW199

9. Stretch the SRS Deployment Harness and pigtail adapter from the air bag assembly to its full length.
10. Place a power source near the shorted end of the SRS deployment harness. (Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.)
11. Connect the air bag assembly to the pigtail adapter on the SRS deployment harness. The SRS Deployment Harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The air bag assembly will immediately deploy the air bag when a power source is connected to it.

NOTE: Ensure that the pigtail adapter is firmly seated into the air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the air bag assembly connector functioning (shorting the deployment circuit) and may result in nondeployment of the air bag assembly.

12. Verify that the area around the passenger air bag assembly is clear of all people and loose or flammable objects.
13. Verify that the passenger air bag assembly is firmly and properly in J–41497.

14. Notify all people in the immediate area of your intention to deploy the passenger air bag assembly. The deployment will be accompanied by a substantial noise which may startle the uninformed.
15. Separate the two banana plugs on the SRS deployment harness.

NOTE: When air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the air bag assembly.

WARNING: DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

16. Connect the SRS deployment harness wires to the power source to immediately deploy the air bag assembly. Recommended application : 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
17. Disconnect the SRS deployment harness from the power source.
18. Short the two SRS deployment harness leads together by fully seating one banana plug into the other.
19. In the unlikely event that the passenger air bag assembly did not deploy after following these procedures, proceed immediately with Steps 24 through 26. If the passenger air bag assembly deployed as intended, proceed with Steps 20 through 23.
20. The passenger inflator requires no special precaution after deployment. 95% of the particulate emission are potassium ckloride (KLC), which is commonly sold as an edible salt–substitutes. even if water is applied. Post deployment products are relatively pH neutral. Disposing the inflator by burying it in a landfill will not produce any hazardous products. As with any dusty environment, safety goggles, dust mask and gloves should be worn.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED INFLATOR MODULE NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY. AFTER AN AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE AIR BAG ASSEMBLY WILL BE HOT. DO NOT TOUCH THE METAL AREAS OF THE AIR BAG ASSEMBLY FOR ABOUT THIRTY MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL, WEAR GLOVES AND HANDLE BY THE AIR BAG ITSELF.

21. Disconnect the pigtail adapter from the air bag assembly as soon after deployment as possible to avoid damage to the pigtail adapter or SRS deployment harness from contacting the hot air bag assembly canister. The pigtail adapter and SRS deployment harness are designed to be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
22. Dispose of the deployed air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
23. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following the above procedures.

24. Ensure that the SRS deployment harness has been disconnected from the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other.
25. Disconnect the pigtail adapter from the air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

26. Temporarily store the air bag assembly with the bag facing up, away from the surface upon which it rests.

Deployment Inside Vehicle (Vehicle Scrapping Procedure)

Deployment inside vehicle is proper when the vehicle is to be destroyed or salvaged for component parts. This includes, but is not limited to, the following situations:

1. The vehicle has completed its useful life.
2. The vehicle has been damaged beyond repair in a nondeployment type accident.
3. The vehicle has been stripped or damaged beyond repair in a theft.
4. The vehicle will be salvaged for component parts to be used on a vehicle with a different Vehicle Identification Number (VIN) as opposed to being rebuilt as same VIN. Never use SRS components from another vehicle.

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. UNDEPLOYED AIR BAG ASSEMBLIES MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER

IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE AND/OR LOCAL LAWS.

1. Turn ignition switch to “LOCK,” remove key and put on safety glasses.
2. Remove all loose objects from front seats.
3. Disconnect driver air bag assembly, yellow 2–pin connector located at the base of the steering column.
4. Cut the driver air bag assembly yellow 2–pin harness connector from the vehicle leaving at least 15 cm (six inches) of wire at the connector.
5. Strip 13 mm (1/2 inch) of insulation from yellow – green and yellow – black wire lead of the connector.
6. Cut two 900 cm (30 feet) deployment wires from 0.8 mm^2 (18 gauge) or thicker multi–strand wire. These wires will be used to fabricate the driver deployment harness.
7. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.
8. Short the wires by twisting together one end from each. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT WIRES TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT WIRES TO THE AIR BAG ASSEMBLY LEADS. DEPLOYMENT WIRES SHALL REMAIN SHORTED AND BE NOT CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

9. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure.
10. Bend twisted connection made in the previous step flat and wrap tightly with electrical tape to insulate and secure.
11. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire.
12. Connect the deployment harness to the driver air bag assembly, yellow 2–pin connector at the base of the steering column. Route deployment harness out the driver side of the vehicle.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED.

THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT.

CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE.

FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

13. Disconnect passenger air bag assembly, yellow 2–pin connector located behind glove box assembly.
14. Cut the passenger air bag assembly harness connector from the vehicle leaving at least 15 cm (six inches) of wire at the connector.
15. Strip 13 mm (1/2 inch) of insulation from blue–white and pink–blue wire lead of the connector.
16. Cut two 900 cm (30 feet) deployment wires from 0.8 mm^2 (18 gauge) or thicker multi–strand wire. These wires will be used to fabricate the passenger deployment harness.
17. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.
18. Short the wires by twisting together one end from each. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT WIRES TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT WIRES TO THE AIR BAG ASSEMBLY LEADS. DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

19. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure.
20. Bend twisted connection made in the previous step flat and wrap tightly with electrical tape to insulate and secure.
21. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire.
22. Connect the deployment harness to the passenger air bag assembly, yellow 2–pin connector located behind the glove box assembly. Route deployment harness out the passenger side of the vehicle.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

23. Verify that the inside of the vehicle and the area surrounding the vehicle are clear of all people and loose or flammable objects.
24. Stretch the driver and passenger deployment harness to their full length.
25. Completely cover windshield area and front door window openings with a drop cloth, blanket or similar item. This reduces the possibility of injury due to possible fragmentation of the vehicle's glass or interior.
26. Notify all people in the immediate area that you intend to deploy the air bags. The deployment will be accompanied by a substantial noise which may startle the uninformed.
27. Separate the two ends of the driver deployment harness wires.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the air bags.

28. Connect the driver deployment harness wires to a power source to immediately deploy the driver air bag assembly. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
29. Separate the two ends of the passenger deployment harness wires.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

30. Connect the passenger deployment harness wires to a power source to immediately deploy the passenger air bag assembly. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.(Driver air bag assembly) Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly. After an air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.(Passenger air bag assembly) The passenger inflator requires no special precaution after deployment. 95% of the particulate emission are potassium chloride (KLC), which is commonly sold as an edible salt–substitutes. even if water is applied. Post deployment products are relatively pH neutral. Disposing the inflator by burying it in a landfill will not products any hazardous products. As with any dusty environment, safety goggles, dust mask and gloves should be worn.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE HOT DEPLOYED AIR BAG ASSEMBLY NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN FIRE OR PERSONAL INJURY.

After an air bag assembly has been deployed, the metal canister and surrounding areas of the air bag assembly will be very hot. Do not touch the metal areas of the air bag assembly for about 30 minutes after deployment. If the deployed air bag assembly must be moved before it is cool, wear gloves and handle by the air bag or trim cover.

31. Short the driver deployment harness wires by twisting together one end from each. Repeat this procedure for the passenger deployment harness.
32. Carefully remove drop cloth from vehicle and clean off any fragments or discard drop cloth entirely.
33. Disconnect driver deployment harness and passenger deployment harness from vehicle and discard.
34. In the unlikely event that either or both of the air bag assemblies did not deploy after following these procedures, proceed immediately with Steps 36 through 37. If the air bag assembly deployed, proceed to step 35.
35. With both air bags deployed, the vehicle may be scrapped in the same manner as a non–SRS equipped vehicle.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following these procedures.

36. Remove the undeployed air bag assembly (s) from the vehicle. For driver air bag assembly refer to in the "Passenger Air Bag Assembly Removal" in this manual.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN PERSONAL INJURY.

37. Temporarily store the air bag assembly with the air bag opening facing up, away from the surface upon which it rests.

Deployed Air Bag Assembly Handling

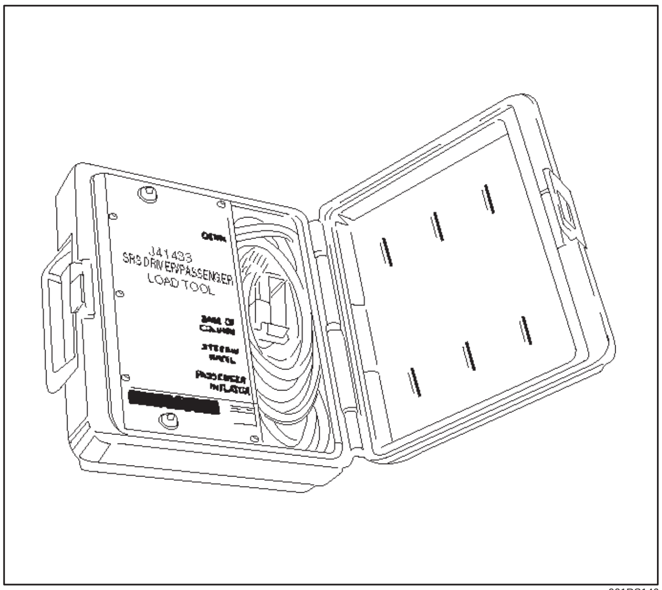
Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly.

After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

Special Tools

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NONPOWERED PROBE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

J–41433 SRS Driver/Passenger Load Tool



901RS146

The SRS Driver/Passenger Load Tool J–41433 is used only when called for in this section. It is used as a diagnostic aid and safety device to prevent inadvertent air bag assembly deployment.

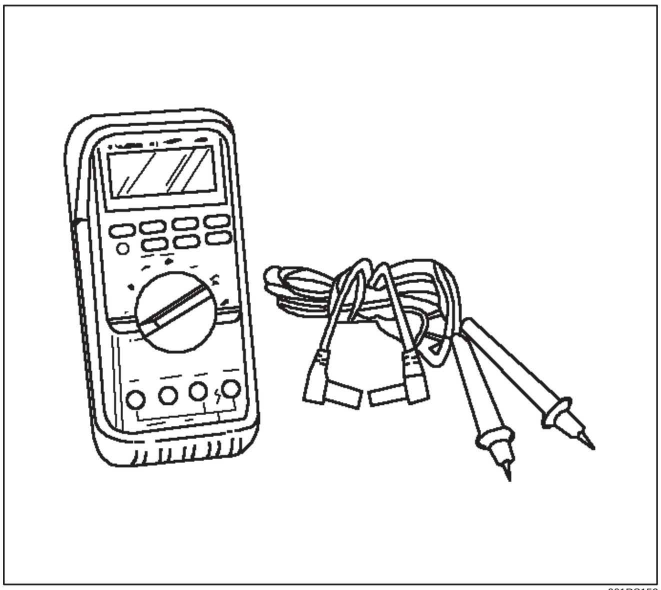
The load tool has three yellow connectors attached to its case.

The three small connectors are electrically functional and serve as resistive load substitutions.

No more than two connectors are used at any time. One of the small connectors is used to substitute for the load of the driver air bag assembly when it is connected at the top of the column to the SRS coil assembly. Another small connector is used to substitute for the load of the driver air bag assembly and the SRS coil assembly when it is connected at the base of the column to the SRS wiring harness. The third small connector is used to substitute for the load of the passenger air bag assembly when connected to the passenger air bag assembly harness connector.

By substituting the resistance of the load tool when called for, a determination can be made as to whether an inflator circuit component is causing system malfunction and which component is causing the malfunction. The load tool should be used only when specifically called for in the diagnostic procedures.

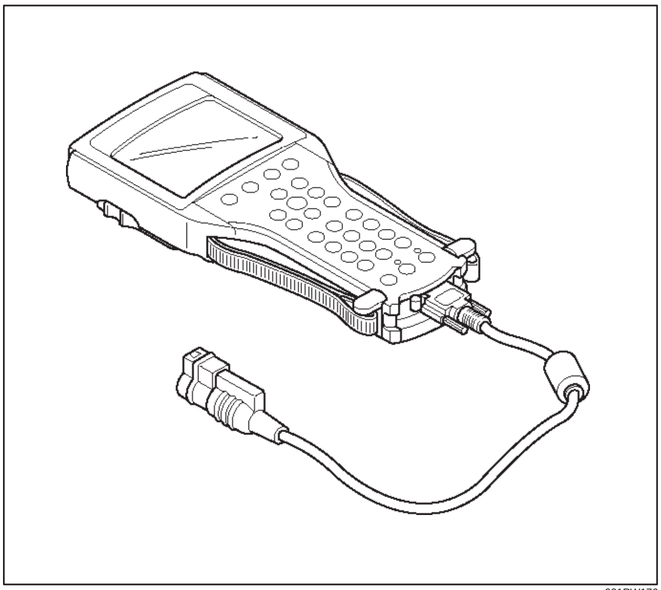
J–39200 DVM



901RS153

The J–39200 DVM is the preferred DVM for use in SRS diagnosis and repair. However, J–34029—A may be used if J–39200 is not available. No other DVMs are approved for SRS diagnosis and repair.

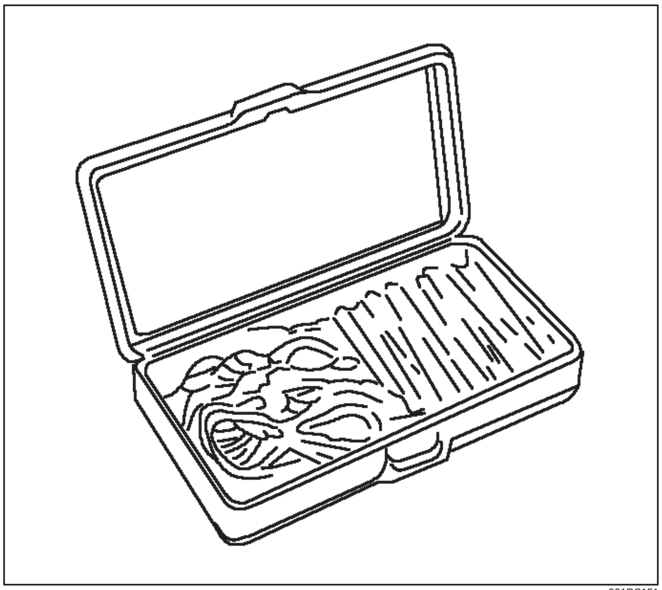
Scan Tool



901RW176

The Tech 2 is used to read and clear SRS Diagnostic Trouble Codes (DTCs). Refer to the Tech 2 Operators, Manual for specific information on how to use the Tech 2.

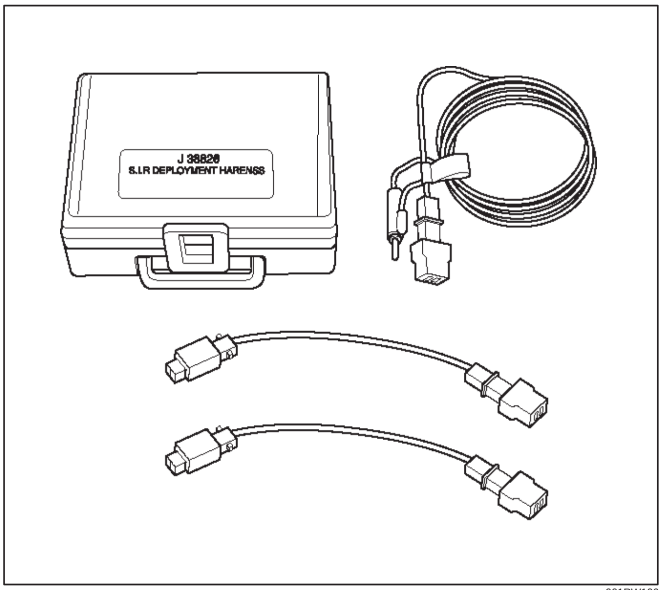
J–35616—A Connector Test Adapter Kit



901RS151

The J–35616–A Connector Test Adapter Kit must be used whenever a diagnostic procedure requests checking or probing a terminal. Using the appropriate adapter will ensure that no damage to the terminal will occur from the DVM prove, such as spreading or bending. The adapter will also give an idea of whether contact tension is sufficient, helping to find an open or intermittent open due to poor terminal contact.

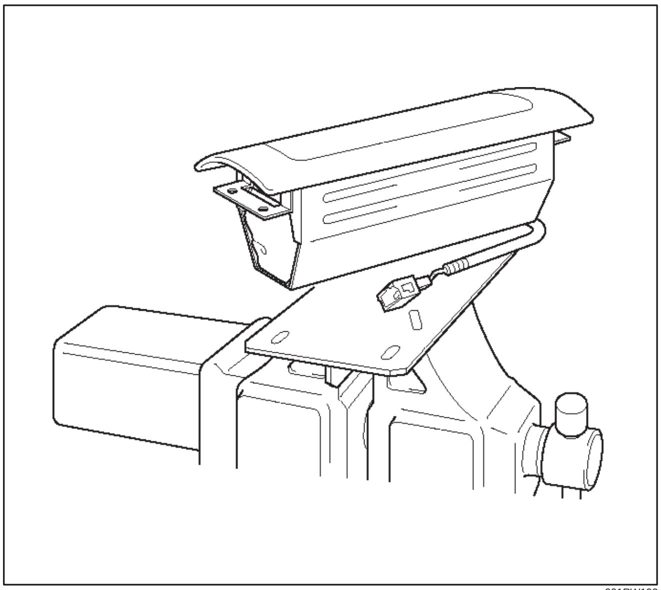
J–42986 SRS Deployment Tool



901RW106

The J–42986 SRS Deployment Tool must be used for deployment of the undeployed air bag.

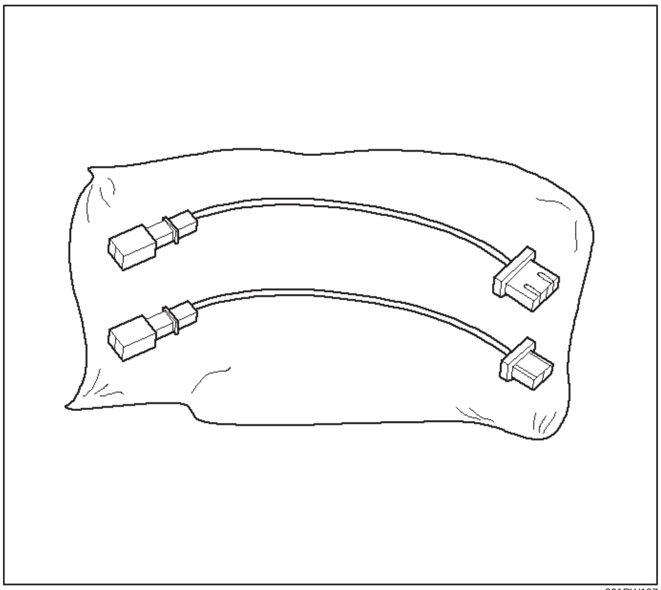
J–41497 SRS Deployment Fixture



901RW199

The J–41497 SRS Deployment Fixture must be used for deployment of the undeployed passenger side air bag.

J–42987 SRS Adapter for Load Tool.

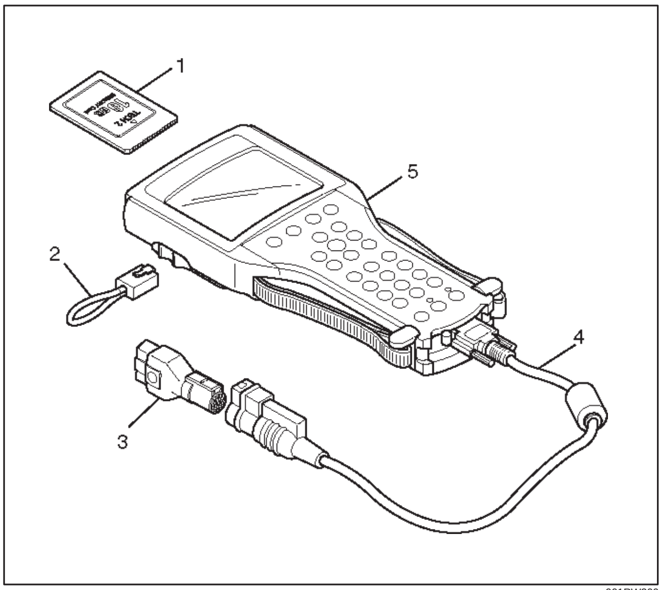


901RW107

The J–42987 SRS Adapter for Load Tool must be used with J–41433 SRS Driver/Passenger Load Tool.

Tech 2 Scan Tool

From 98 MY, Isuzu dealer service departments are recommended to use Tech 2. Please refer to Tech 2 scan tool user guide.



901RW200

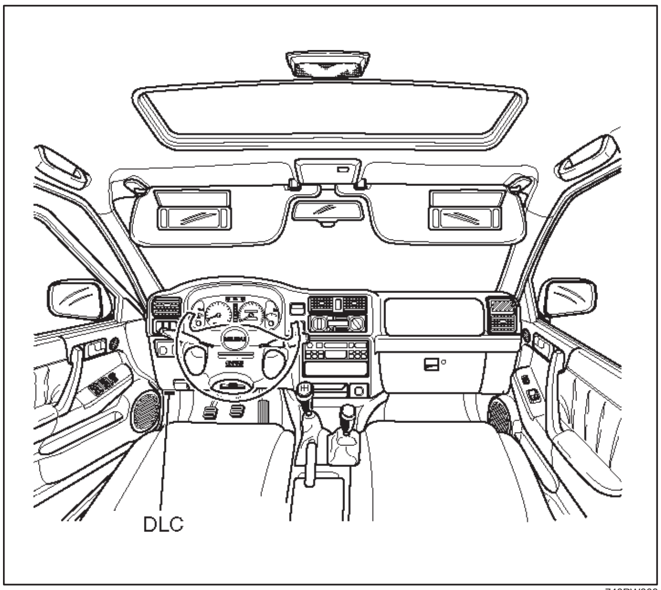
Legend

(1) PCMCIA Card
(2) RS 232 Loop Back Connector
(3) SAE 16/19 Adaptor
(4) DLC Cable
(5) Tech–2

Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:

1. Insert the Isuzu 98 System PCMCIA card (1) into the Tech 2 (5).
2. Connect the SAE 16/19 adapter (3) to the DLC cable (4).
3. Connect the DLC cable to the Tech 2 (5)
4. Make sure of the vehicle ignition is off.
5. Connect the Tech 2 SAE 16/19 adapter to the vehicle ALDL/DLC connector.



740RW060

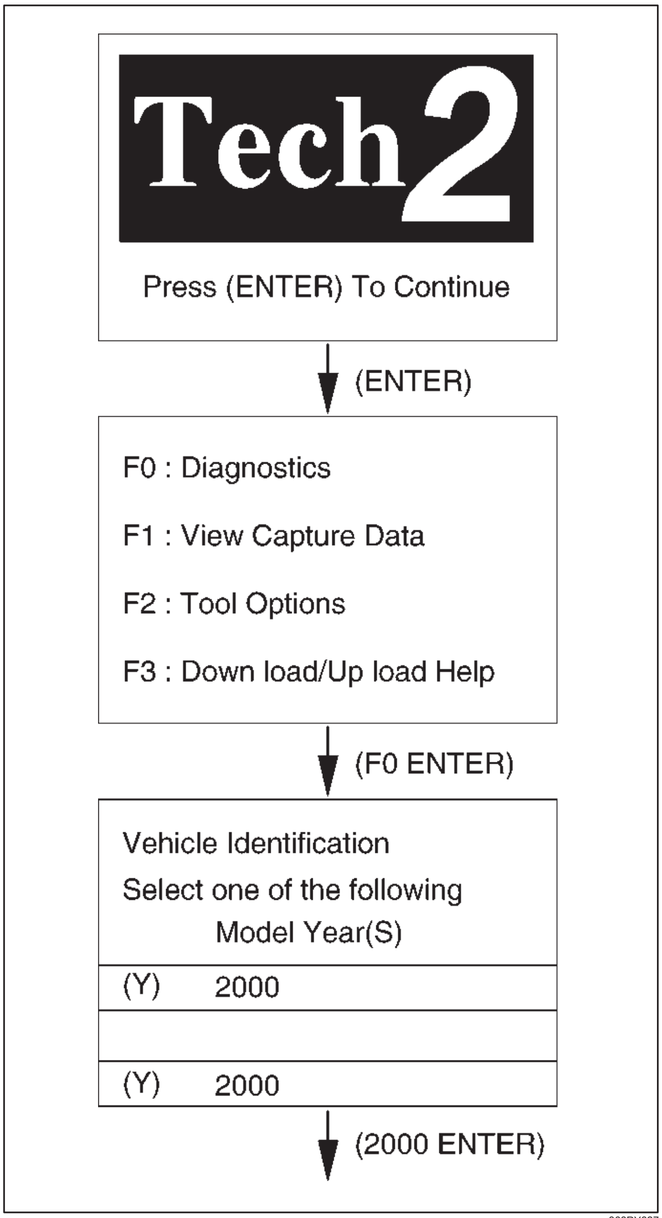
6. Turn on the vehicle ignition switch.
7. Verify the Tech 2 power up display.

060RW009

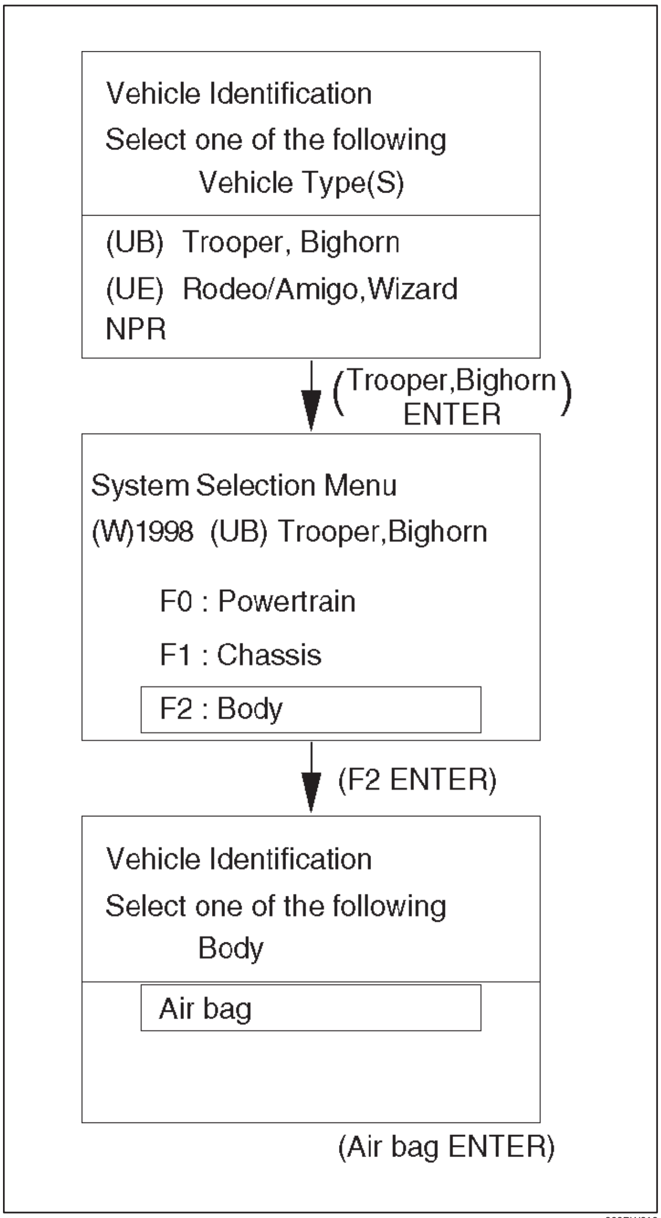
NOTE: The RS232 Loop back connector is only used to diagnosis Tech 2. Refer to user guide of the Tech 2.

Operating Procedure

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.



060RY027



060RW019

Service Precautions for SRS Component Service

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

WARNING: WHEN PERFORMING SERVICE ON OR AROUND SRS COMPONENTS OR SRS WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE SRS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNEEDED SRS REPAIRS.

The SDM in Driver–Passenger SRS can maintain sufficient voltage to cause a deployment for up to 15 seconds after the ignition switch is turned "OFF," the battery is disconnected, or the fuse powering the SDM is removed.

Many of the service procedures require removal of the "C–21" fuse, and disconnection of the air bag assembly from the deployment loop to avoid an accidental deployment. If the air bag assembly is disconnected from the deployment loop as noted in the "Disabling the SRS" procedure that follows, service can begin immediately without waiting for the 15 second time period to expire.

Disabling The SRS

Removal

Turn the ignition switch to "OFF" and turn the steering wheel so that the vehicle's wheels are pointing straight ahead.

1. Remove SRS fuse "C–21" from left dash side lower fuse block or disconnect battery.
2. Disconnect yellow 2–pin connector at the base of steering column.
3. Remove glove box assembly; Refer to "Passenger air bag assembly replacement" in this section.
4. Disconnect passenger air bag assembly yellow 2–pin connector behind the glove box assembly.

CAUTION: With the "C–21" fuse removed and ignition switch "ON," the "AIR BAG" warning lamp will be "ON." This is normal operation and does not indicate an SRS malfunction.

Enabling The SRS

Installation

Turn ignition switch to "LOCK" and remove key.

1. Connect yellow 2–pin connector passenger air bag assembly.
2. Install glove box assembly. Refer to "Passenger Air Bag Assembly Replacement" in this section.
3. Connect yellow 2–pin connector at the base of the steering column.
4. Install "AIR BAG" fuse "C–21" to left dash side lower fuse block or connect battery.

Turn ignition switch to "ON" and verify that the "AIR BAG" warning lamp flashes seven times and then turns "OFF." If it does not operate as described, perform the "SRS Diagnostic System Check" in this section.

Handling / Installation / Diagnosis

1. Air bag assembly should not be subjected to temperatures above 65°C (150°F).
2. Air bag assembly, and SDM should not be used if they have been dropped from a height of 100 centimeters (3.28 feet) or more.
3. When a SDM is replaced, it must be oriented with the arrow on the SDM pointing toward the front of the vehicle. It is very important for the SDM to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the SDM mounting surface is free of any dirt or other foreign material.
4. Do not apply power to the SRS unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
5. The "SRS Diagnostic System Check" must be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" will verify proper "AIR BAG" warning lamp operation and will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacements.

Inspections Required After An Accident

CAUTION: Certain SRS components must be replaced after a frontal crash involving air bag deployment.

In all types of accidents regardless of "Air Bag" deployment, visually inspect all of the following components and replace as required:

— Driver air bag assembly
— Passenger air bag assembly
— Steering wheel
— SRS coil assembly
— Steering column
— Knee bolster and instrument panel mounting attachments
— Driver seat and belt
— Passenger seat and belt
— SDM

SDM always should be checked according to "SDM Replacement Guidelines."

CAUTION: Refer to "SDM Replacement Guidelines" below for important information on SDM replacement in both deployment and non–deployment crashes.

Inspect SRS coil assembly wiring and steering wheel for any sign of scorching, melting, or damage due to excessive heat. If coil assembly wire or steering wheel is

damaged, replace them. The steering column and wheel must be dimensionally checked to determine if they are damaged. Refer to steering wheel of in this manual.
Never use SRS parts from another vehicle. This does not include remanufactured parts purchased from an authorized Isuzu Retailer; they may be used for SRS repairs.
Do not attempt to repair the SDM, the SRS harness, the SRS coil assembly, the air bag assembly, the steering wheel, or the steering column. Service of these items is replacement only. Verify replacement part numbers.

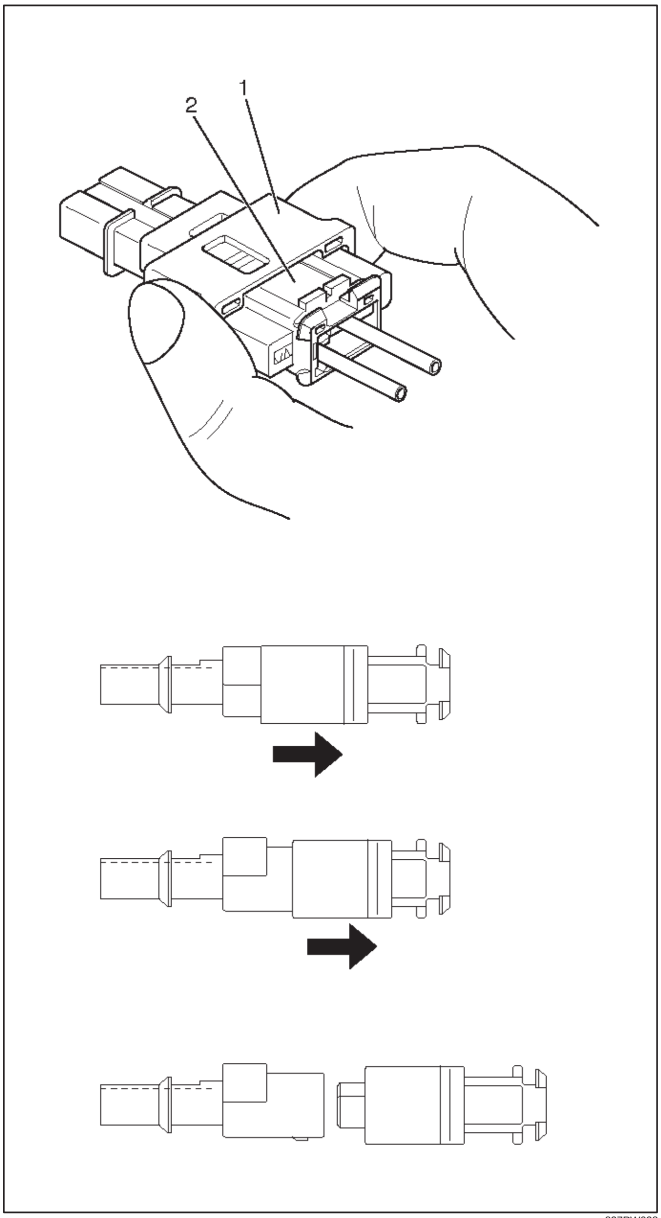
CAUTION: Proper operation of the SDM and supplemental restraint system (SRS) requires that any repairs to the vehicle structure return it to its original production configuration.

SRS Connectors

CAUTION: The special yellow color connectors are used for supplemental restraint system-air bag circuit. When removing the oable harnese, do not pull the cables otherwile, cable disconnection may occur. When connect the SRS connector, insert the connector completely. Imperfect locking may cause malfunction of SRS circuit.

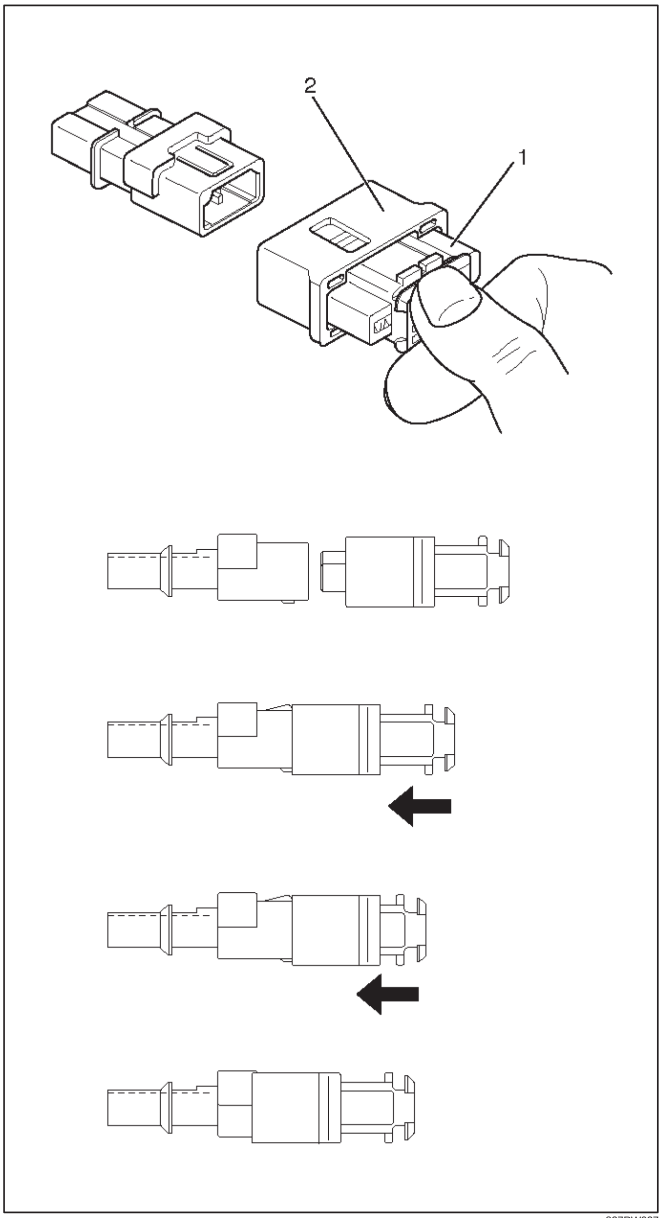
Removal

To remove the connector, hold the cover insulator (1) and pull it. The cover insulator slides and lock will be released. Do not hold the socket insulator (2).



Installation

To install the connector, hold the socket insulator (1) and insert it. The cover insulator slides and connector will be locked. Do not hold the cover insulator (2).



827RW027

Sensing And Diagnostic Module (SDM)

Service Precautions

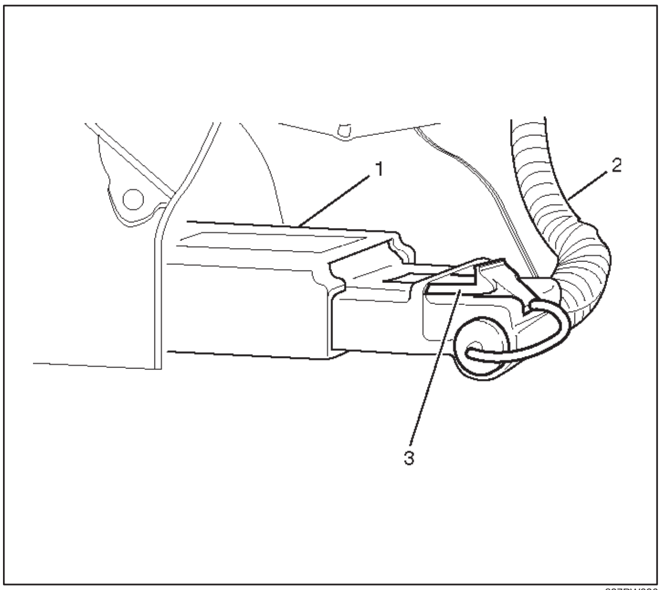
WARNING: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING SDM. NEVER STRIKE OR JAR SDM. UNDER SOME CIRCUMSTANCES, IT COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY OR IMPROPER OPERATION OF THE SUPPLEMENTAL RESTRAINT SYSTEM (SRS) . SDM MOUNTING BRACKET BOLTS MUST BE CAREFULLY TORQUED TO ASSURE PROPER OPERATION. NEVER POWER UP THE SRS WHEN SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

WARNING: PROPER OPERATION OF THE SENSING AND DIAGNOSTIC MODULE (SDM) REQUIRES THE SDM TO BE RIGIDLY ATTACHED TO THE VEHICLE STRUCTURE AND THAT THE ARROW ON THE SENSOR BE POINTING TOWARD THE FRONT OF THE VEHICLE.

SDM is specifically calibrated and is keyed to the SDM location SRS wiring harness. Caution should be used to ensure proper location of the SDM. The keying of the SDM to its location and wiring harness connectors should never be modified in the field.

Removal

1. Disable the SRS (Refer to “Disabling the SRS” in this section).
2. Remove the transmission knob (for M/T) and transfer lever knob.
3. Remove the front console assembly and disconnect wiring harness connector.
4. Pull CPA (Connector Position Assurance) out and push connector lock down to disconnect the SDM harness connector.
5. Remove the three SDM fixing bolts and remove SDM.



827RW026

Legend

(1) SDM
(2) SRS Harness
(3) Connector Position Assurance

Installation

1. Install the SDM on bracket and fixing bolts and tighten the fixing bolts to the specified torque.

   Torque: 10 N·m (87 lb in)
2. Connect the SDM harness connector and after that, put CPA into connector.
3. Install the front console.
4. Install the transmission knob (for M/T) and transfer lever knob.

5. Enable the SRS (Refer to “Enabling the SRS” in this section).

Driver Air Bag Assembly

Service Precautions

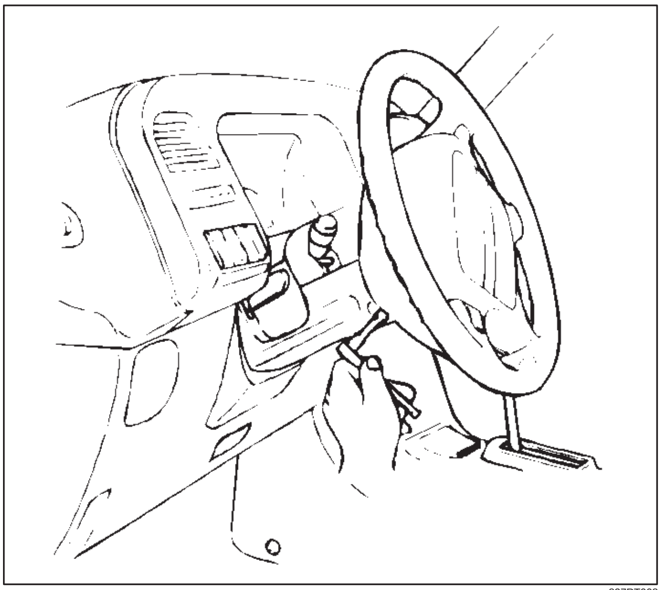
WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING ALIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

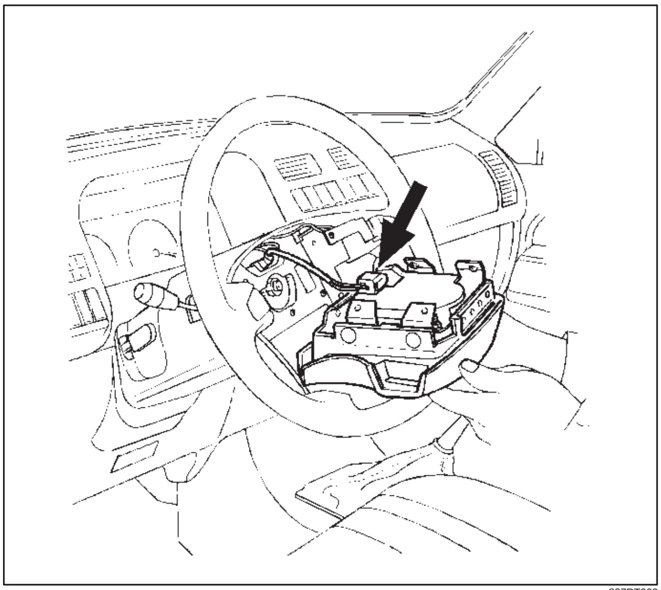
Removal

1. Disable the SRS (Refer to “Disabling the SRS” in this section).
2. Loosen the air bag assembly fixing bolts from behind the steering wheel assembly using a TORX® driver or equivalent until the air bag assembly can be released from steering wheel.



827RT008

3. Disconnect the yellow 2–pin connector located behind the air bag assembly and remove air bag assembly. Refer to “SRS Connectors” in this section for removal and installation.

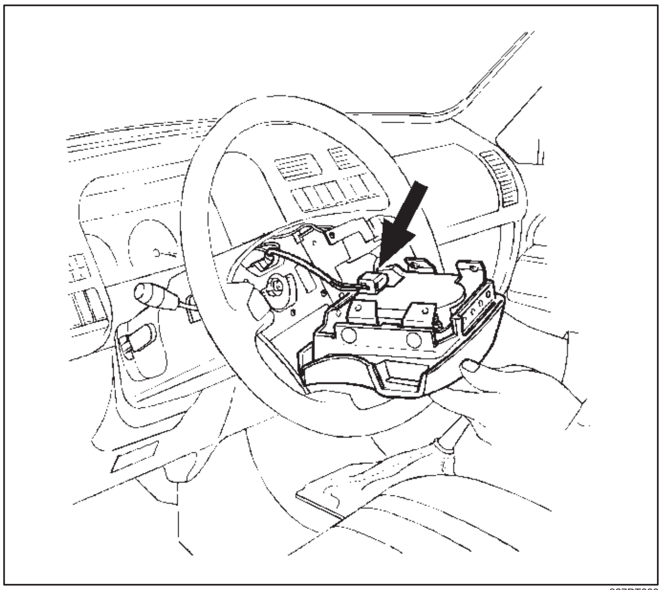


827RT009

Installation

1. Connect air bag to wiring harness connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.



827RT009

2. Install air bag into steering wheel and tighten bolts to specified sequence as shown in figure.

Torque: 8 N·m (69 lb in)

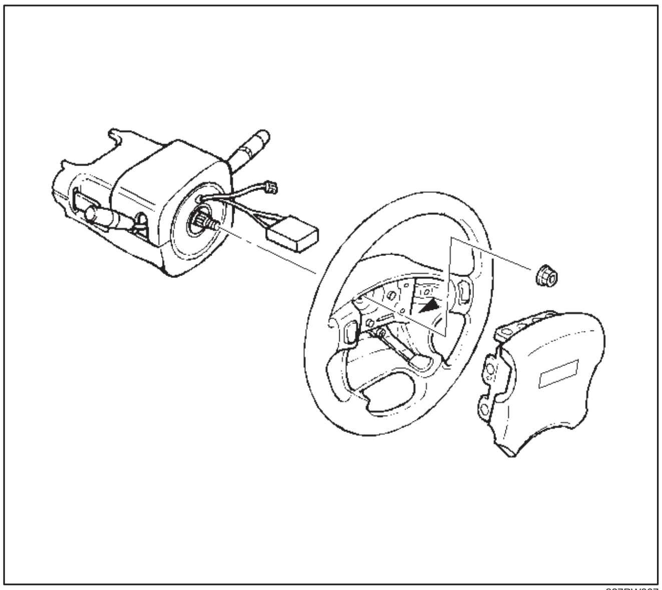
CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.

The air bag assembly has identification colors on the bar code label from '00 model as follows.

Yellow color for driver air bag assembly.

White color for passenger air bag assembly.

Use only new air bag assembly proper to the Trooper which is being repaired.



827RW007

3. Enable the SRS (Refer to "Enabling the SRS" in this section).

Steering Wheel

Service Precautions

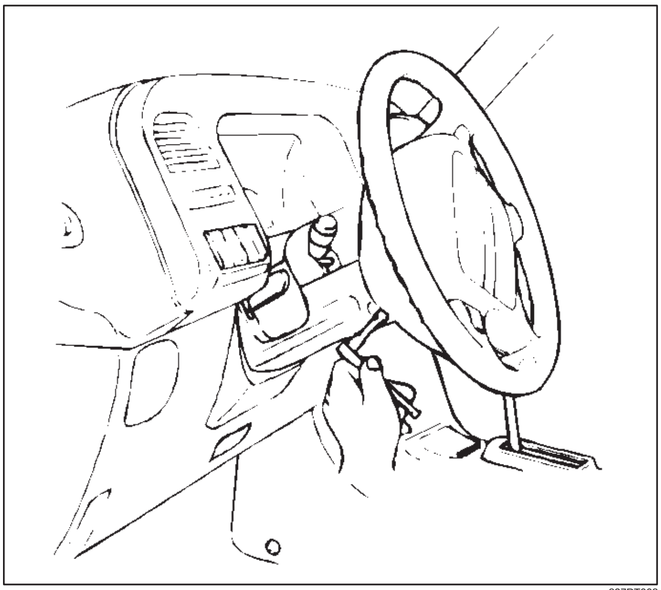
WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING ALIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND RIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

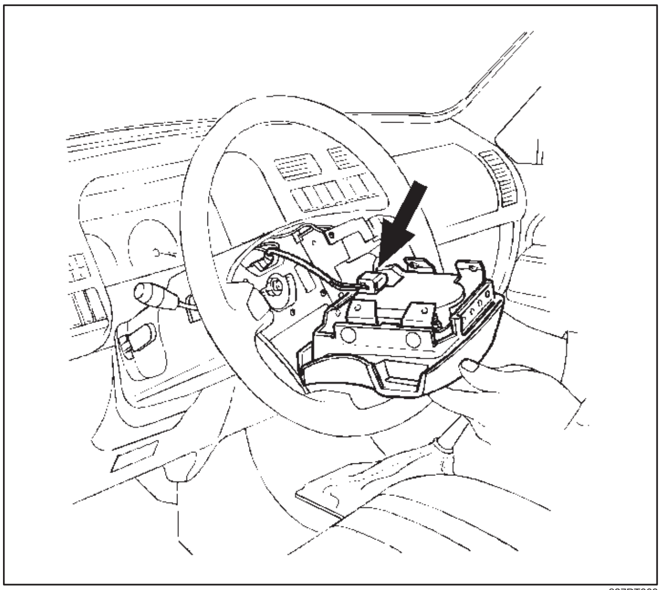
Removal

1. Disable the SRS (Refer to “Disabling the SRS” in this section).
2. Loosen the air bag assembly fixing bolts from behind the steering wheel assembly using a TORX® driver or equivalent until the air bag assembly can be released from steering wheel.



827RT008

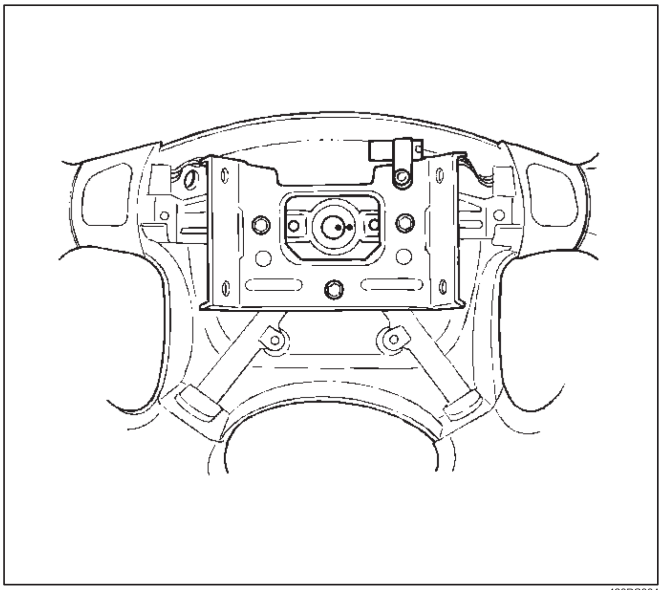
3. Disconnect the yellow 2–pin connector located behind the air bag assembly and remove air bag assembly.Refer to “SRS Connectors” in this section for removal and installation.
4. Disconnect horn lead.



827RT009

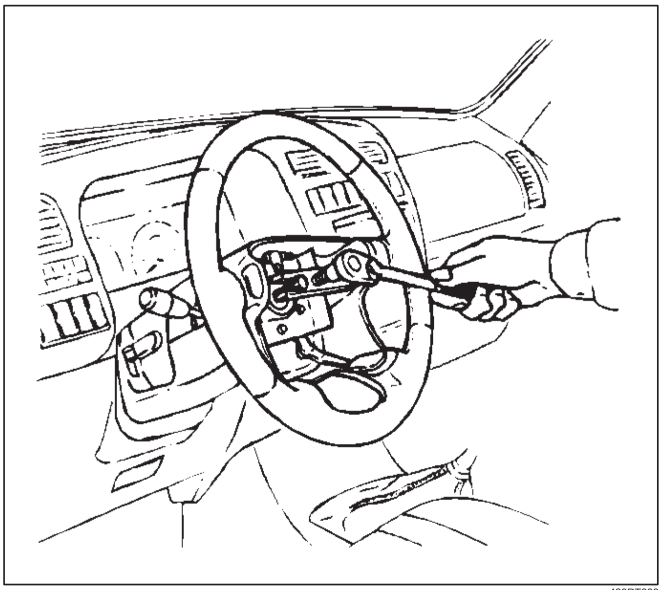
5. Remove steering wheel attachment nut.

6. Apply a setting mark across the steering wheel and shaft so parts can be reassembled in their original position.



430RS004

7. Move the tires to the straight ahead position before removing the steering wheel. Install steering wheel puller onto steering wheel and remove steering wheel with J–29752.



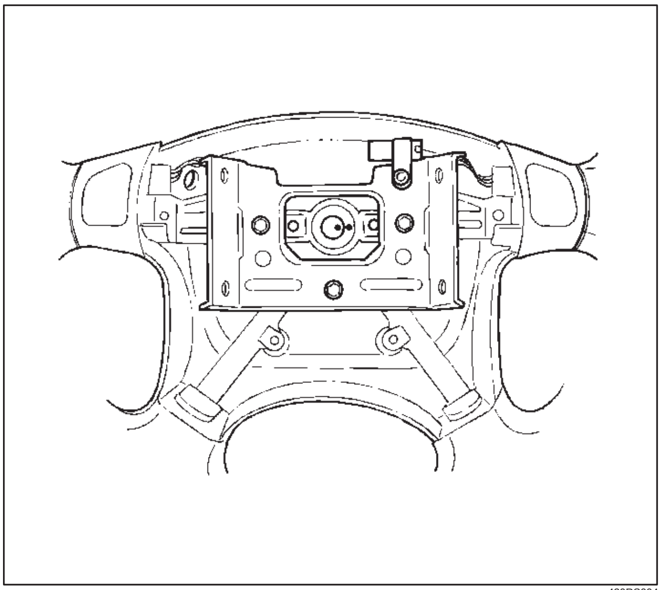
430RT009

8. Feed wiring through the wheel and remove wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

Installation

1. Install the steering wheel and align the setting marks.



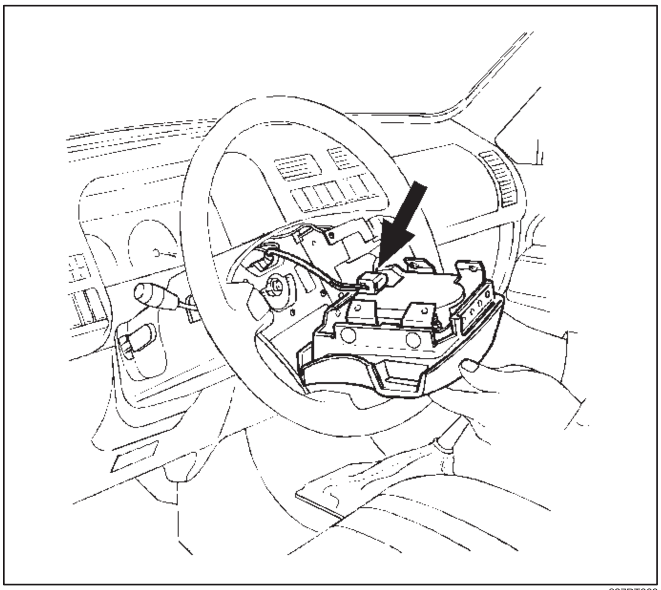
430RS004

2. Tighten the steering wheel fixing nut to the specified torque.

Torque : 34 N · m (25 lb·ft)

3. Connect horn lead.
4. Connect air bag to wiring harness connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.



827RT009

5. Install air bag into steering wheel and tighten bolts to specified sequence as show in figure.

Torque: 8 N·m (69 lb in)

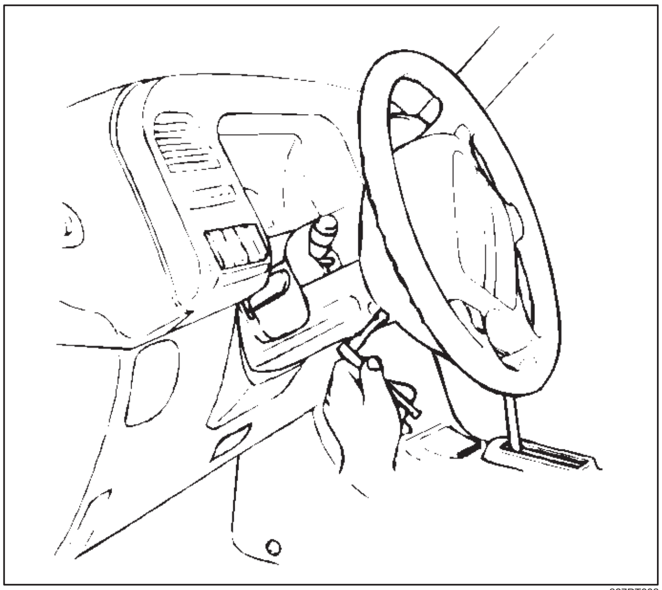
CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.

The air bag assembly has identification colors on the bar code label from '00 model as follows.

Yellow color for driver air bag assembly.

White color for passenger air bag assembly.

Use only new air bag assembly proper to the Trooper which is being repaired.



827RT008

6. Enable the SRS (Refer to "Enabling the SRS" in this section).

SRS Coil Assembly

Service Precautions

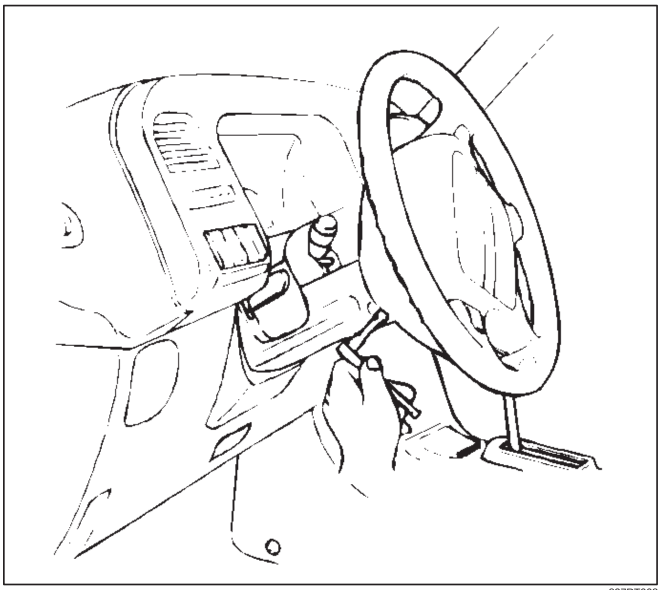
WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING ALIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND RIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

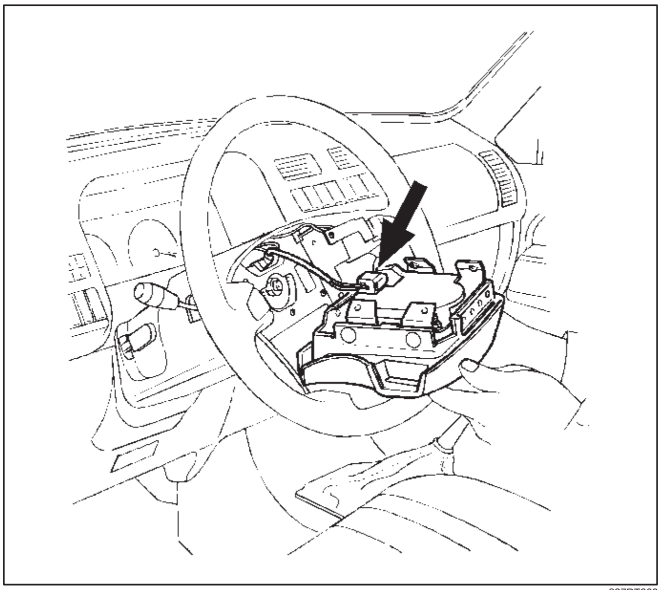
Removal

1. Disable the SRS (Refer to “Disabling the SRS” in this section).
2. Loosen the air bag assembly fixing bolts from behind the steering wheel assembly using a TORX® driver or equivalent until the air bag assembly can be released from steering wheel.



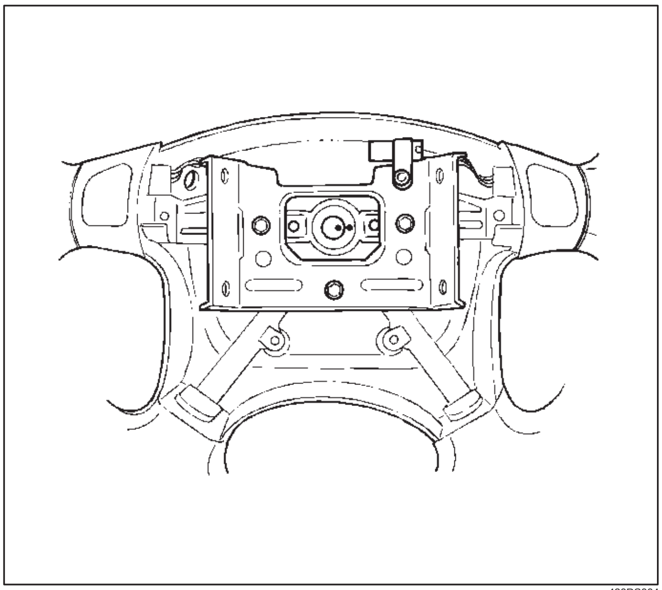
827RT008

3. Disconnect the yellow 2–pin connector located behind the air bag assembly and remove air bag assembly.Refer to “SRS Connectors” in this section for removal and installation.
4. Disconnect horn lead connector.



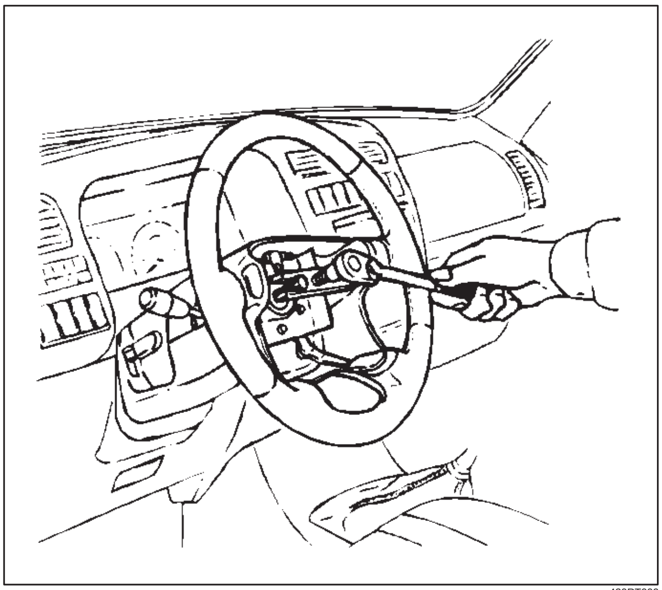
827RT009

5. Remove the steering wheel attachment nut.
6. Apply a setting mark across the steering wheel and shaft so parts can be reassembled in their original position.



430RS004

7. Move the tires to the straight ahead position before removing the steering wheel and remove wheel with J–29752.



430RT009

8. Feed wiring though the wheel and remove wheel.
9. Remove the steering lower cover and engine hood opening lever.
10. Remove the driver knee bolster assembly.
11. Remove the steering column cover.
12. Remove air conditioning lower duct.
13. Disconnect the 2–pin wiring harness connectors located at the base of steering column.

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

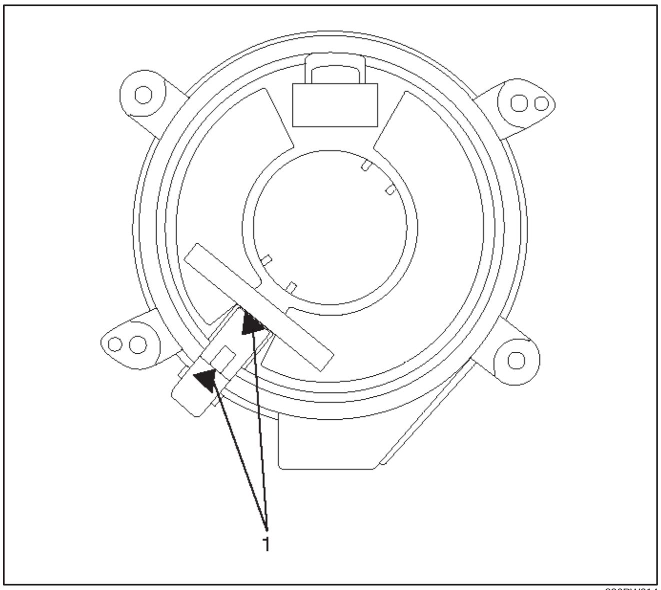
14. Remove the combination switch assembly with SRS coil.

NOTE: SRS coil is a part of combination switch assembly, which cannot be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

Installation

1. Install the combination switch assembly with SRS coil.
2. Turn the SRS coil counterclockwise to full, return about 3 turns and align the neutral mark (1).

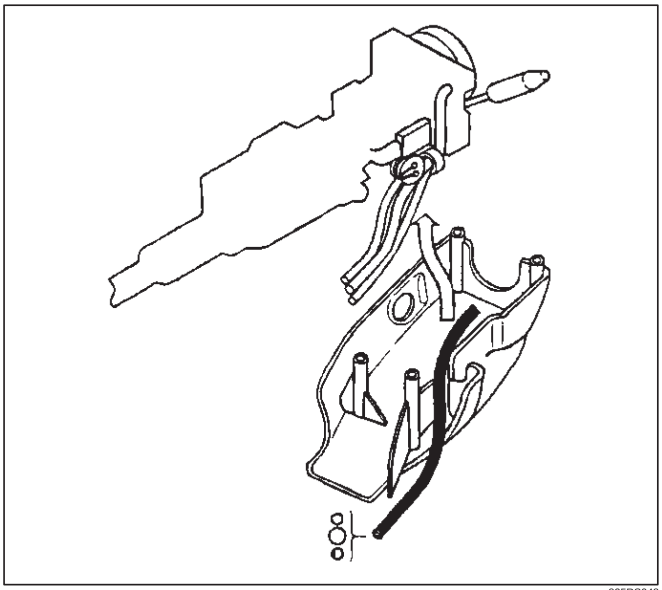
CAUTION: When turning the SRS coil counterclockwise to full, stop turning if resistance is felt. Forced further turning may damage the cable in the SRS coil.



826RW014

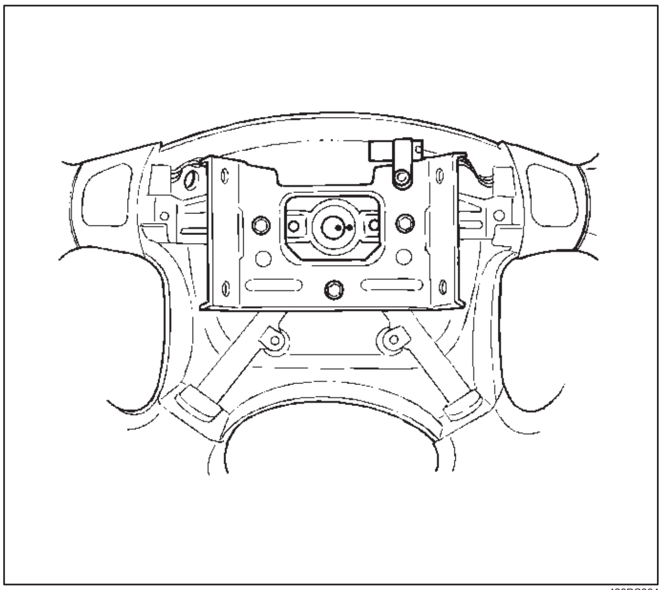
3. Connect the wiring harness connectors located at the base of steering column.
4. Install the air conditioning lower duct.
5. Install the steering column cover.

CAUTION: When installing the steering column cover, be sure to wire (through each harness) as illustrated so that the harness starter switch, combination switch and SRS coil may not catch wiring.



825RS048

6. Install the driver knee bolster assembly.
7. Install the steering lower cover and engine hood opening lever.
8. Install the steering wheel and align the setting marks.



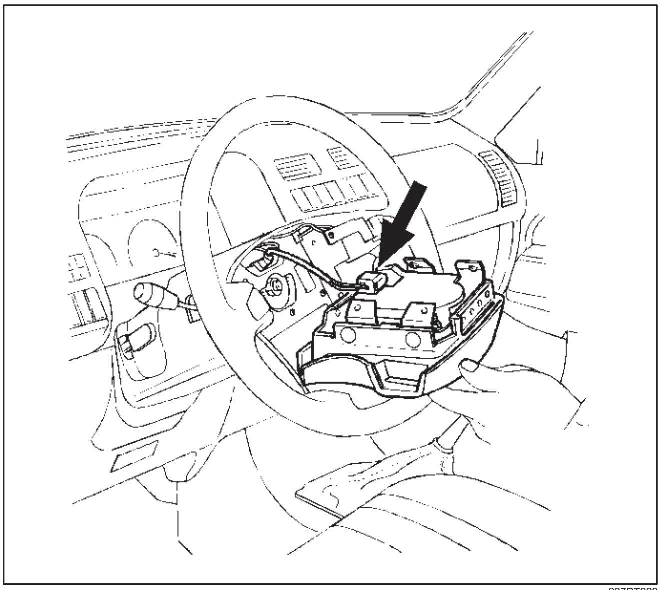
430RS004

9. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34 N·m (25 lb·ft)

10. Connect horn lead.
11. Connect air bag to wiring harness connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air to prevent lead wire from being pinches.

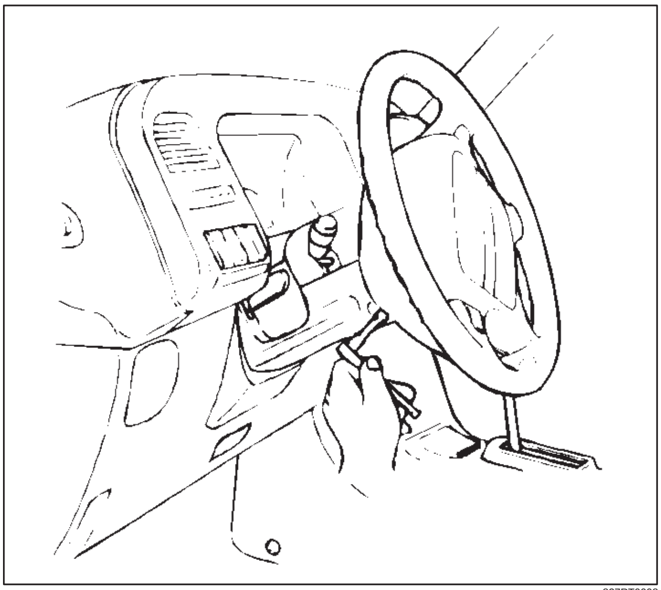


827RT009

12. Install air bag into steering wheel and tighten bolts to specified sequence as shown in figure.

Torque: 8 N·m (69 lb in)

CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.
The air bag assembly has identification colors on the bar code label from ’00 model as follows.
Yellow color for driver air bag assembly.
White color for passenger air bag assembly.
Use only new air bag assembly proper to the Trooper which is being repaired.



827RT0008

13. Enable the SRS (Refer to “Enabling the SRS” in this section).

Steering Column

Service Precautions

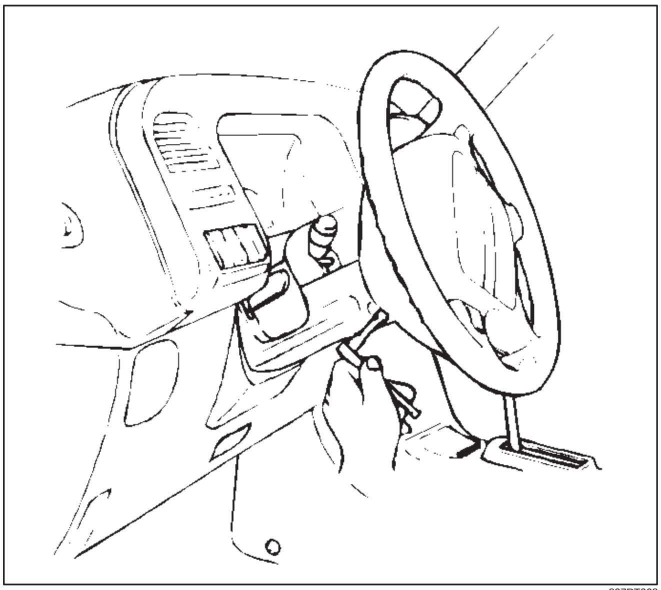
WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING ALIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND RIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

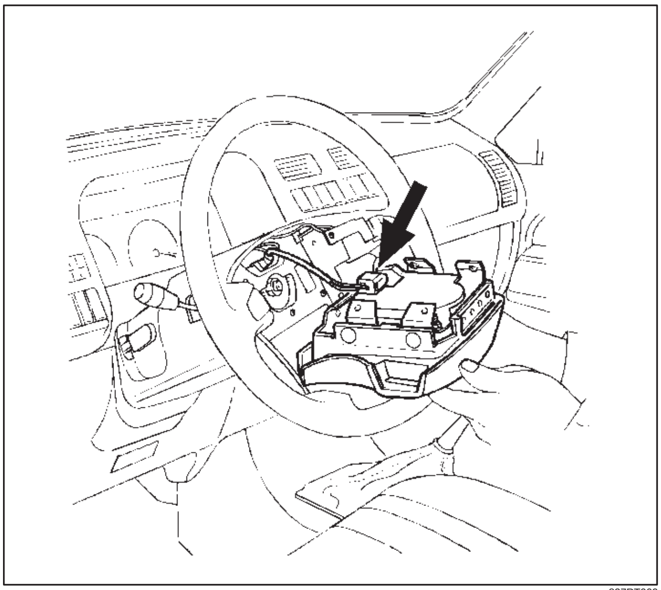
Removal

1. Disable the SRS (Refer to “Disabling the SRS ” in this section).
2. Loosen the air bag assembly fixing bolts from behind the steering wheel assembly using a TORX® driver or equivalent until the air bag assembly can be released from steering wheel.



827RT008

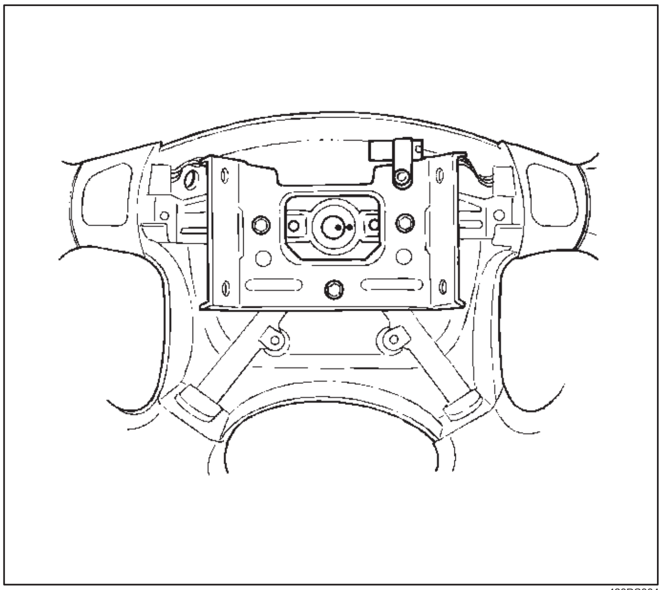
3. Disconnect the yellow 2–pin connector located behind the air bag assembly and remove air bag assembly.Refer to “SRS Connectors” in this section for removal and installation.



827RT009

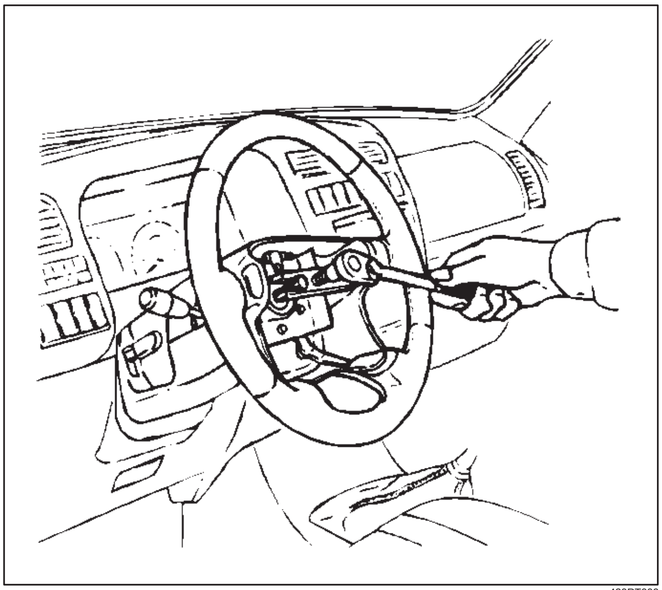
4. Disconnect horn lead connector.
5. Remove the steering wheel attachment nut.

6. Apply a setting mark across the steering wheel and shaft so parts can be reassembled in their original position.



430RS004

7. Move the tires to the straight ahead position before removing the steering wheel and removing wheel with J–29752.

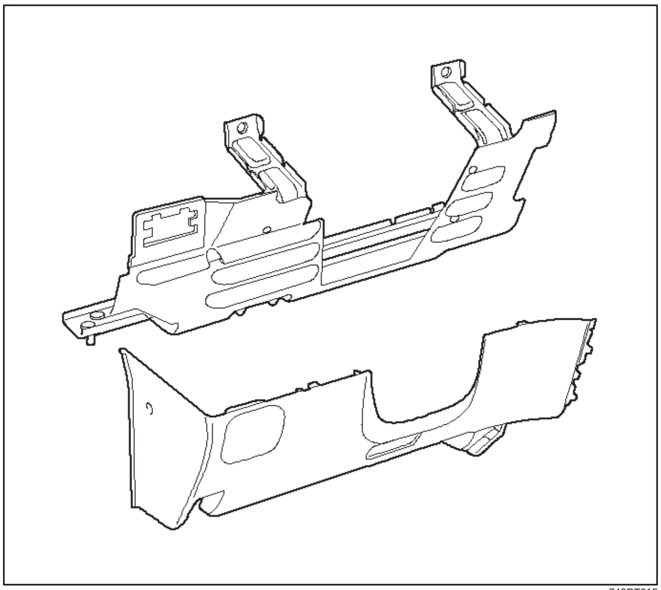


430RT009

8. Feed wiring though the wheel and remove wheel.

9. Remove the steering lower cover and engine hood opening lever.

10. Remove the driver knee bolster assembly.



740RT015

11. Remove the steering column cover.

12. Remove air conditioning lower duct.

13. Disconnect the wiring harness connectors located at the base of steering column.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

14. Remove the combination switch assembly with SRS coil.

NOTE: SRS coil is a part of combination switch assembly, which cannot be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

15. Remove the snap ring.

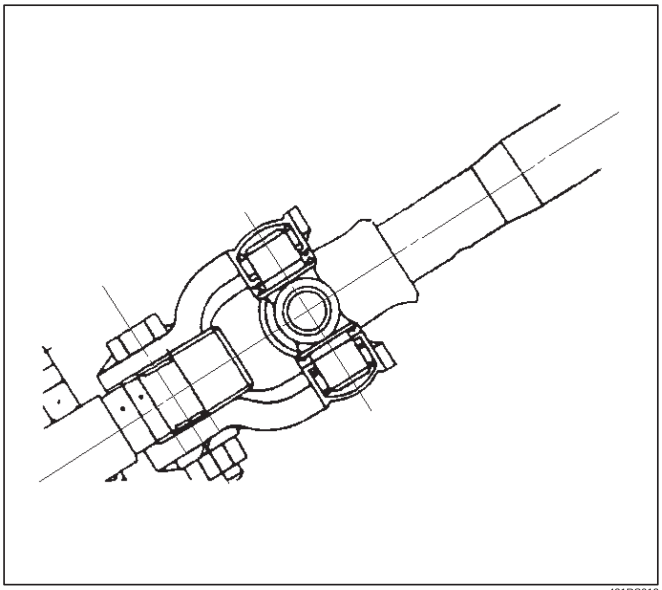
16. Remove the cushion rubber.

17. Disconnect shift lock cable (A/T only).

18. Disconnect the starter switch harness connector located base of steering column.

19. Remove steering lock cylinder assembly.

20. Apply a setting mark across the universal joint and steering shaft to reassemble the parts in their original position.

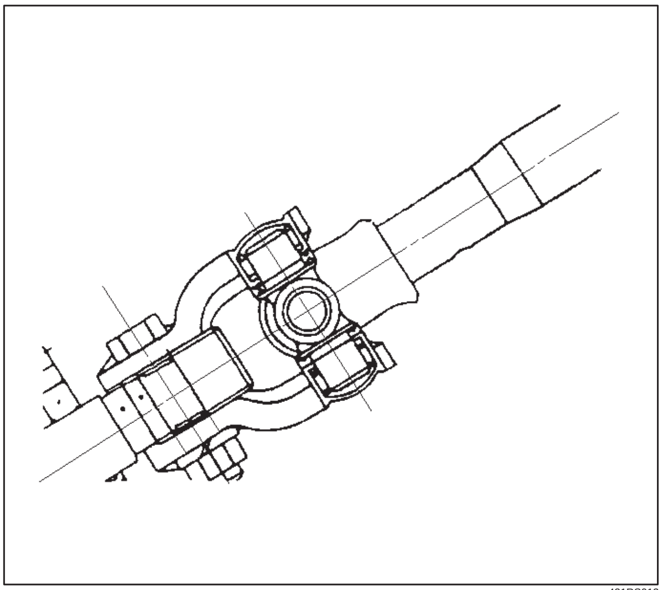


431RS013

21. Remove steering column assembly.

Installation

1. Install the steering column assembly and align the setting marks on the universal joint and steering shaft made during removal.



431RS013

2. Tighten the steering column fixing bolts (dash panel side) to the specified torque.

Torque: 20 N·m (14 lb ft)

3. Tighten the steering column fixing bolts (Pedal bracket) to the specified torque.

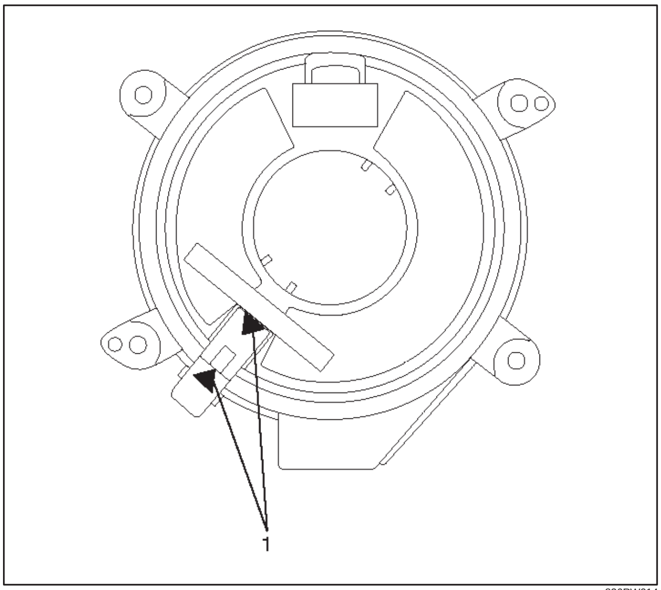
Torque: 20 N·m (14 lb ft)

4. Tighten the universal joint to the specified torque.

Torque: 31 N·m (23 lb ft)

5. Install steering lock cylinder assembly.
6. Connect shift lock cable (For A/T)
7. Install cushion rubber.
8. Install snap ring.
9. Install the combination switch assembly with SRS coil.
10. Connect the wiring harness connector located on the base of steering column.
11. Turn the SRS coil counterclockwise to full, return about 3 turns and align the neutral mark (1).

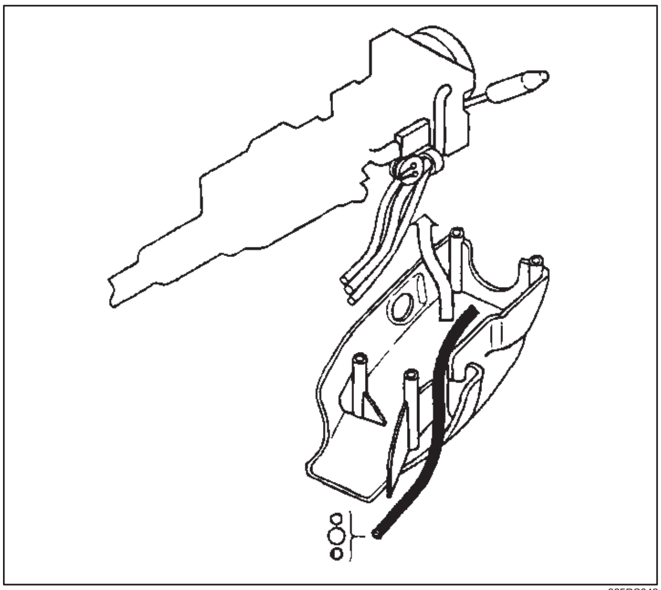
CAUTION: When turning the SRS coil counterclockwise to full, stop turning if resistance is felt. Forced further turning may damage to the cable in the SRS coil.



826RW014

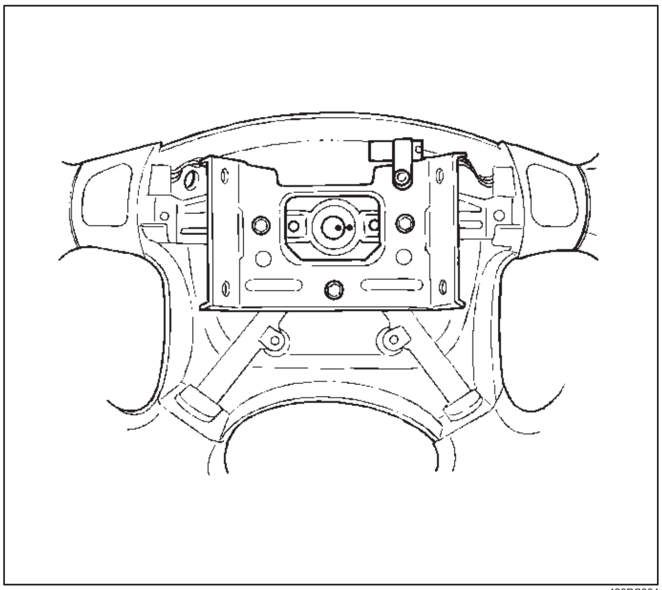
12. Install steering column cover.

CAUTION: When installing the steering column cover, be sure to wire (through each harness) as illustrated so that the harness starter switch, combination switch and SRS coil may not catch wiring.



825RS048

13. Install the steering wheel and align the setting marks.



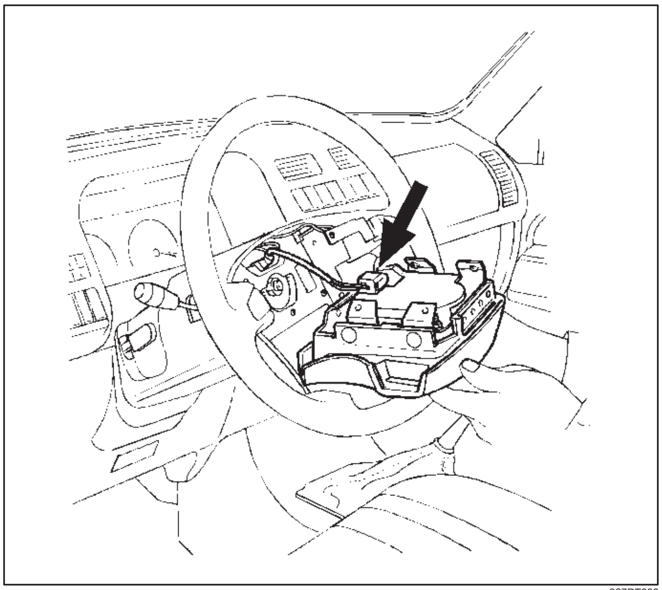
430RS004

14. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34 N·m (25 lb ft)

15. Connect horn lead.
16. Connect air bag wiring harness connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.



827RT009

17. Install air bag into steering wheel and tighten bolts to specified sequence as shown in figure.

Torque: 8.8 N·m (78 lb in)

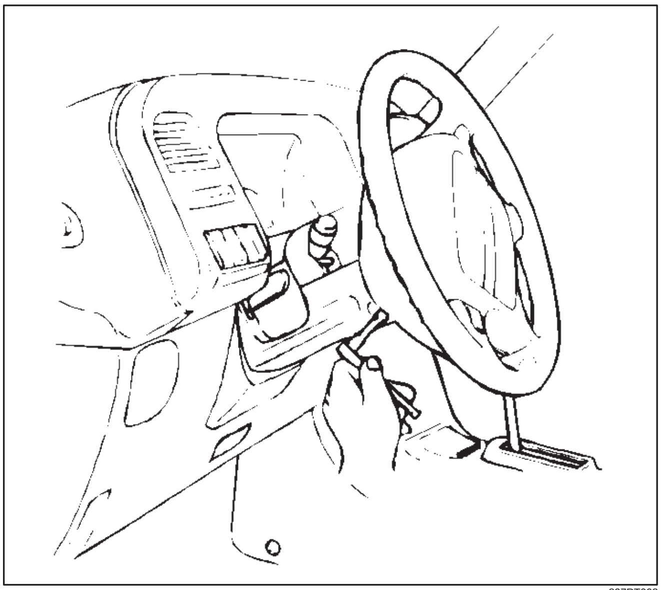
CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.

The air bag assembly has identification colors on the bar code label from '00 model as follows.

Yellow color for driver air bag assembly.

White color for passenger air bag assembly.

Use only new air bag assembly proper to the Trooper which is being repaired.



827RT008

18. Enable the SRS (Refer to "Enabling the SRS" in this section).

Passenger Air Bag Assembly

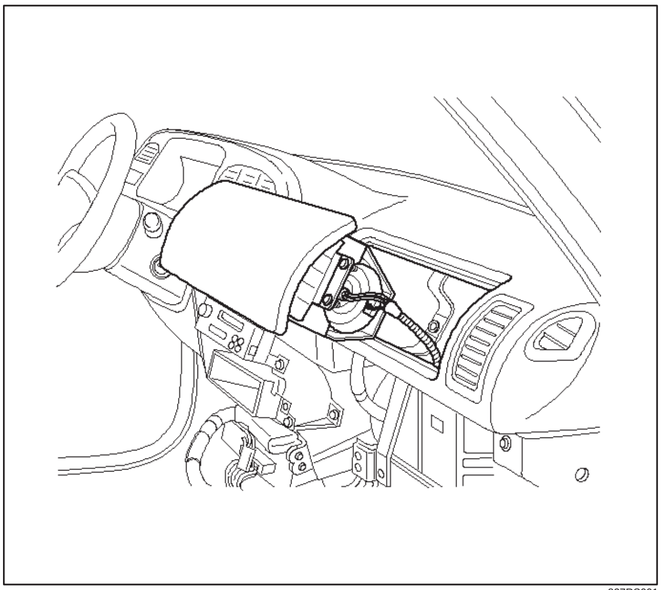
Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING ALIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND RIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: **IN THE EVENT DEPLOYMENT HAS OCCURRED, INSPECT COIL ASSEMBLY WIRE FOR ANY SIGNS OF SCORCHING, MELTING OR ANY OTHER DAMAGE DUE TO EXCESSIVE HEAT. IF THE COIL HAS BEEN DAMAGED, REPLACE IT.**

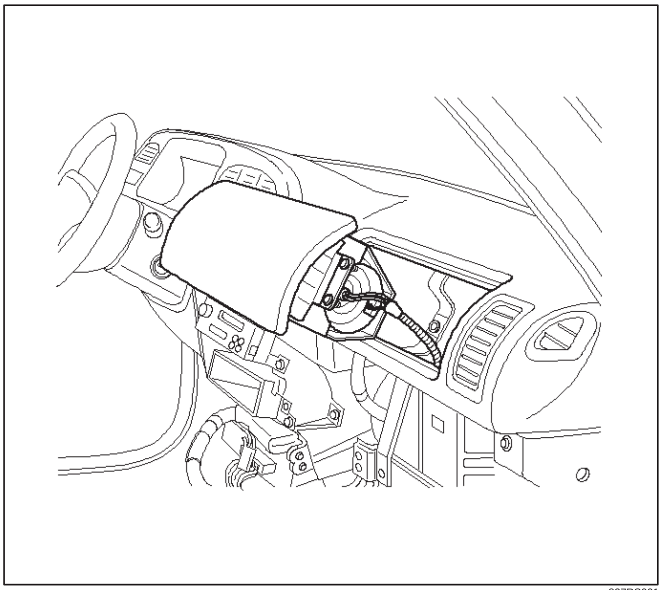
Removal



827RS001

1. Disable the SRS (Refer to “Disabling the SRS ” in this section).
2. Remove gear control knob.
3. Remove front console assembly.
4. Remove rear console assembly and disconnect harness connector.
5. Remove ECM and SDM cover.
6. Remove glove box assembly with lid.
7. Remove glove box cover.
8. Remove instrument panel assist side lower cover.
9. Disconnect engine hood opener lever.
10. Remove instrument panel door side lower cover.
11. Remove lower cluster with ashtray.
12. Remove meter cluster assembly and disconnect harness connector.
13. Remove instrument panel lower center cover.
14. Disconnect passenger air bag assembly harness connector.
15. Remove air bag assembly fixing bolts and nuts.
16. Remove passenger air bag assembly.

Installation



827RS001

1. Install passenger air bag assembly.
2. Install air bag assembly fixing nuts and tighten to specified torque.

Torque: 6 N·m (52 lb in)

3. Connect air bag assembly harness connector.
4. Install instrument panel lower center cover.
5. Install meter cluster assembly and connect harness connector.
6. Install lower cluster with ashtray.
7. Install instrument panel door side lower cover.
8. Connect engine hood opener lever.
9. Install instrument panel assist side lower cover.
10. Install glove box cover.
11. Install glove box assembly with lid.
12. Install ECM and SDM cover.
13. Install rear console assembly and connect harness connector.
14. Install front console assembly.
15. Install gear control knob.
16. Enable the SRS (Refer to “Enabling the SRS” in this section).

Main Data and Specifications

Fastener Tightening Specification

Application	N·m	Lb Ft	Lb In.
SDM	10	—	87
Driver air bag fixing bolt	8.8	—	78
Steering wheel fixing bolt	34	25	—
Steering column (dash panel side fixing bolts)	20	14	—
Steering column (Pedal bracket fixing bolt)	20	14	—
Steering column (Universal joint fixing bolt)	31	23	—
Passenger Air Bag fixing nuts	6	—	52

Trooper

RESTRAINTS

RESTRAINT CONTROL SYSTEM

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnostic Information

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. if a fastener needs to be replaced, use the correct part number fastener for that application. if the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. fasteners that are not reused, and those requiring thread locking compound will be called out. the correct torque value must be used when installing fasteners that require it. if the above conditions are not followed, parts or system damage could result.

Diagnostic Procedures

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON POWERED, PROBE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

The diagnostic procedures used in this section are designed to aid in finding and repairing SRS problems. Outlined below are the steps to find and repair SRS problems quickly and effectively. Failure to carefully follow these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.

1. **Perform The “SRS Diagnostic System Check”.**
   The “SRS Diagnostic System Check” should always be the starting point of any SRS diagnostics. The “SRS Diagnostic System Check” checks for proper “AIR BAG” warning lamp operation and checks for SRS trouble codes using both “Flash Code” and “Scan Tool” Methods.
2. **Refer To The Proper Diagnostic Chart As Directed By The “SRS Diagnostic System Check”.**
   The “SRS Diagnostic System Check” will lead you to the correct chart to diagnose any SRS problems. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.
3. **Repeat The “SRS Diagnostic System Check” After Any Repair Or Diagnostic Procedures Have Been Performed.**
   Preforming the “SRS Diagnostic System Check” after all repair or diagnostic procedures will assure that the repair has been made correctly and that no other conditions exist.

Diagnostic Codes

The Sensing and Diagnostic Module (SDM) maintains a history record of all diagnostic codes that have been detected since the SRS codes were last cleared during service.

1. Active Codes — Faults that are presently detected this ignition cycle. Active codes are stored in RAM (Random Access Memory).
2. History Codes — All faults detected since the last time the history fault memory was cleared. History codes are stored in EEPROM. (Electronically Erasable Programmable Read only Memory)

How To Read Trouble Codes

All codes (Active and history) can be read (or cleared) by using a scan tool or equivalent.
If a PDT is not available, have the vehicle serviced by ISUZU dealer.

How To Clear Trouble Codes

Trouble codes can only be cleared by using a Scan Tool. If a “scan tool” is not available then inform the owner of the stored codes and suggest that the codes are cleared upon the next visit to an Isuzu dealership.

Scan Tool Diagnostics

A scan tool can be used to read current and history codes and to clear all history codes after a repair is complete. The scan tool must be updated to communicate with the SRS through a replaceable cartridge or a manufacturer’s update before it can be used for SRS diagnostics. To use the scan tool, connect it to the DLC connector and turn the ignition switch “ON”. Then follow the manufacturer’s directions for communication with the SRS. The scan tool reads serial data from the SDM “Serial Data” output (terminal 24) to the DLC connector (terminal 9).

Basic Knowledge Required

Before using this section of the Service Manual, there is some basic knowledge which will be required. Without this knowledge, you will have trouble using the diagnostic procedures in this section. Use care to prevent harm or unwanted deployment. Read all cautions in the service manual and on warning labels attached to SRS components.

Basic Electrical Circuits

You should understand the basic theory of electricity including series and parallel circuits, and understand the voltage drops across series resistors. You should know the meaning of voltage (volts), current (amps), and resistance (ohms). You should understand what happens in a circuit with an open or a shorted wire. You should be able to read and understand a wiring diagram.

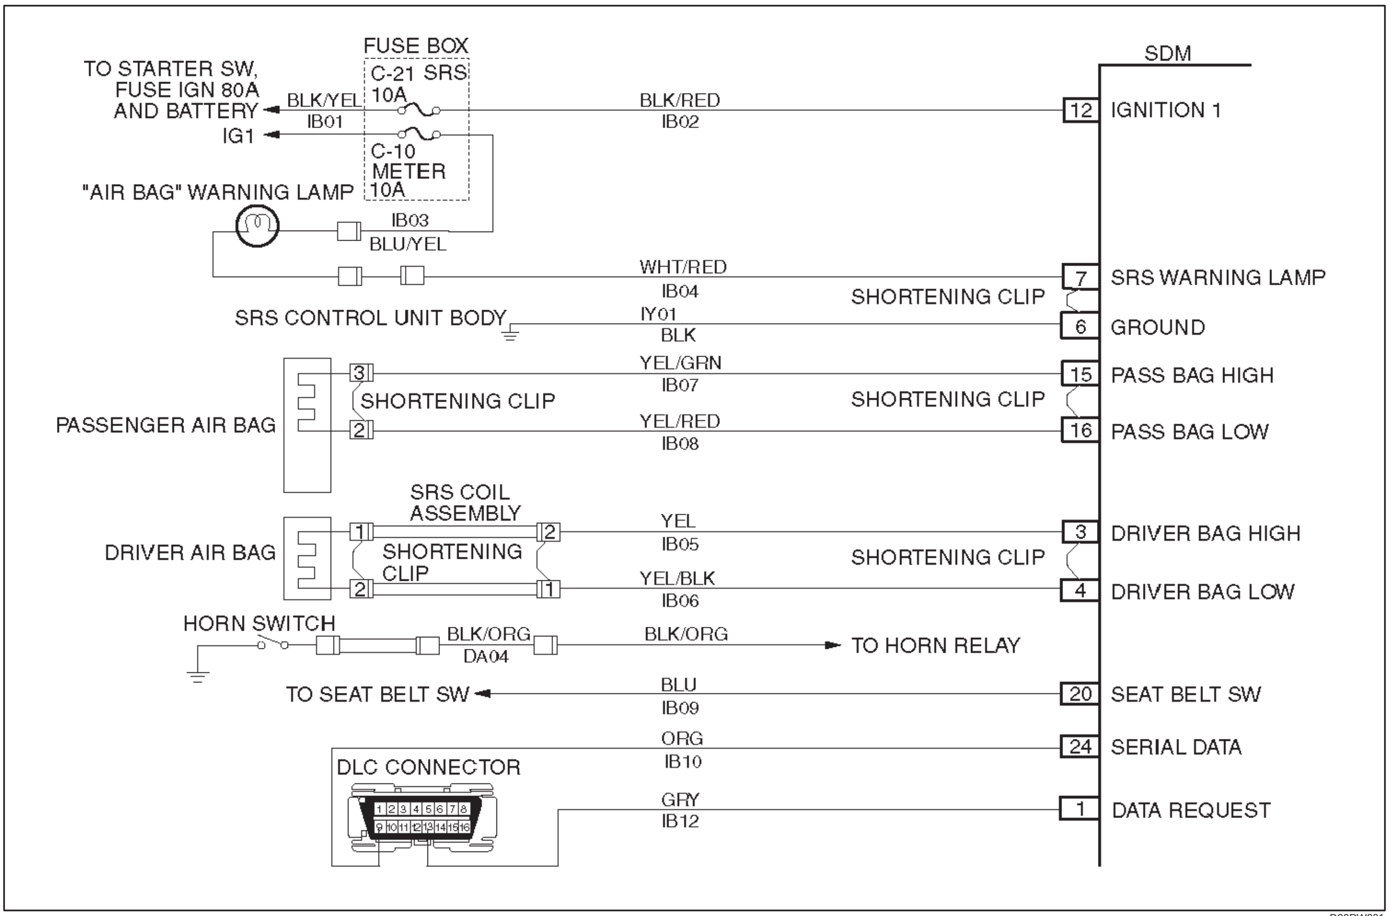
“Flash Code” Diagnostics

Flash code diagnostics can be used to read active codes and to determine if history codes are present but cannot be used to clear codes or read history codes. Flash code diagnostics is enabled by grounding by terminal 4 shorting to terminal 13 of the DLC connector with the ignition switch “ON”. Grounding terminal 4 of the DLC connector pulls the “Diagnostics Request” input (Terminal 1) of the SDM low and signals the SDM to enter the flash code diagnostic display mode.

The SDM displays the trouble codes by flashing the warning lamp. Each code that is displayed will consist of a number of flashes which represents the tens digit, a 1.2 second pause, following by a number of flashes which represents the ones digit of the code. Each code is displayed one time before moving on to the next code. After all of the codes have been displayed, the entire code sequence will continually by repeated until ground is removed from terminal 4 of the DLC connector.

Two special codes exist when reading in the flash code mode (Flash Code 12 and Flash Code 13). “Flash Code 12“ will always be the first code displayed when the flash code mode is enable Code 12 is not an indication of a SRS problem but an indication that the flash code mode has been enabled. If there are no active or history codes present, the SDM will display code 12 until ground is removed from the DLC connector at terminal 4. “flash Code 13” will be displayed if history codes are present. To read the history codes a scan tool must be used.

System Schematic



D09RW001

SRS Diagnostic System Check

The diagnostic procedures used in this section are designed to find and repair SRS malfunctions. To get the best results, it is important to use the diagnostic charts and follow the sequence listed below:

A. Perform the "SRS Diagnostic System Check."

The "SRS Diagnostic System Check" must be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation, the ability of the SDM to communicate through the "Serial Data" line and whether SRS diagnostic trouble codes exist.

B. Refer to the proper diagnostic chart as directed by the "SRS Diagnostic System Check."

The "SRS Diagnostic System Check" will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.

C. Repeat the "SRS Diagnostic System Check" after any repair or diagnostic procedures have been preformed.

Performing the "SRS Diagnostic System Check" after all repair or diagnostic procedures will ensure that the repair has been made correctly and that no other malfunctions exist

Circuit Description

When the ignition switch is first turned "ON", "Ignition 1" voltage is applied from the "C–21" fuse to the SDM at the "Ignition 1" input terminals "12". The SDM responds by flashing the "AIR BAG" warning lamp seven times, while performing tests on the SRS.

Notes On System Check Chart:

1. The "AIR BAG" warning lamp should flash seven times after ignition is first turned "ON".
2. After the "AIR BAG" warning lamp flashes seven times, it should turn "OFF"
3. This test checks for the proper operation of the "Serial Data" line. This test will also determine whether history diagnostic trouble codes are stored and, if so, identify them.
4. Improper operation of the "AIR BAG" warning lamp is indicated. This test differentiates a warning lamp stays "ON" condition from a warning lamp does not come "ON" condition.
5. This test checks for proper operation of the "Serial Data" line. This test will also identify the stored diagnostic trouble codes and whether they are current or history.

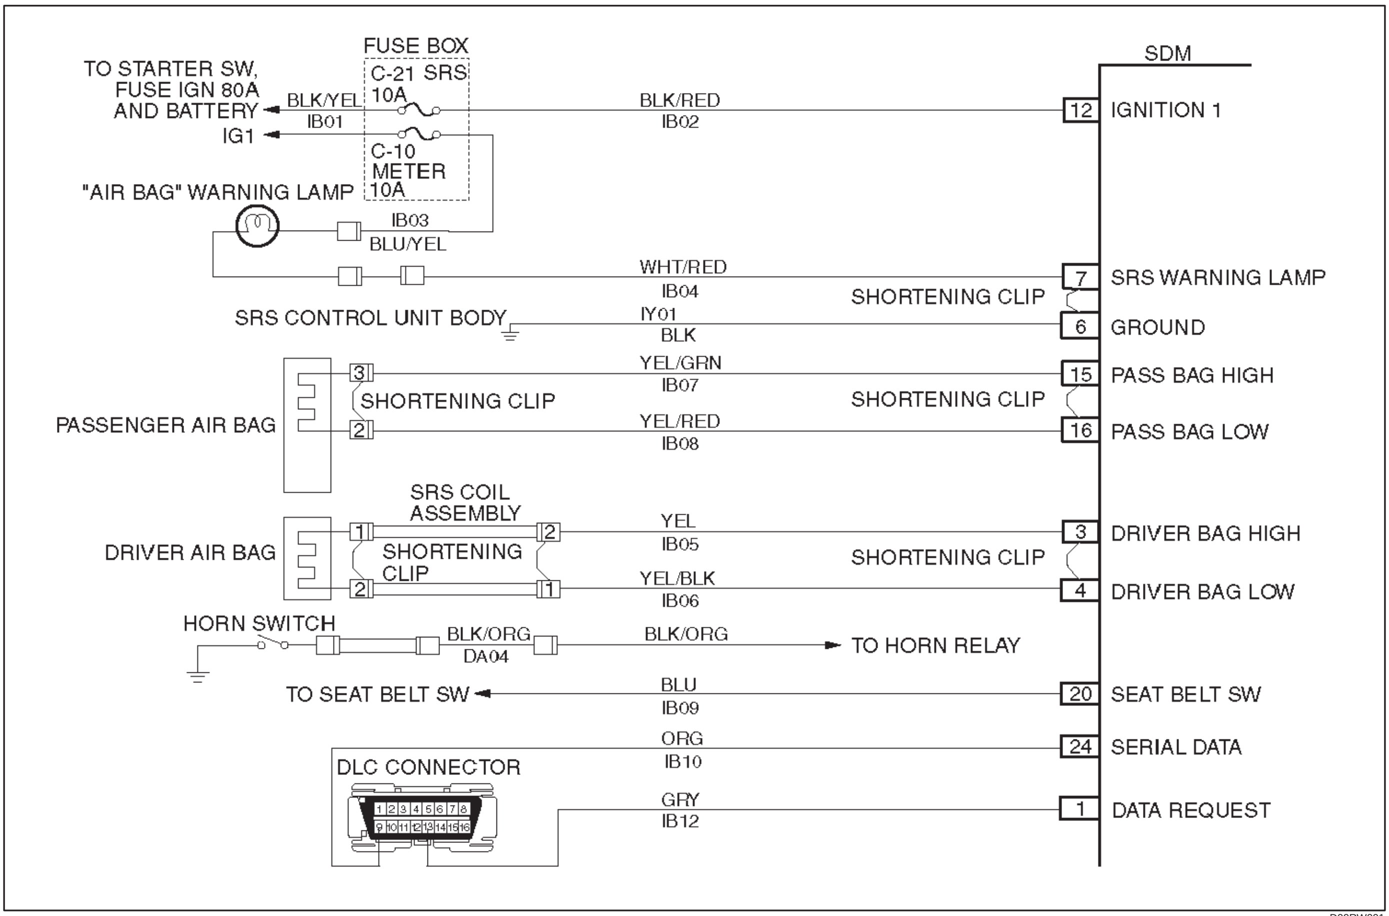
Diagnostic Aids:

The order in which diagnostic trouble codes are diagnosed is very important. Failure to diagnose the diagnostic trouble codes in the order specified may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.

SRS Diagnostic System Check

Step	Action	Yes	No
1	Note the "Air Bag" warning lamp as ignition switch is turned "ON." Does the "AIR BAG" warning lamp flash seven (7) times?	Go to Step 2	Go to Step 3
2	Note the "AIR BAG" warning lamp after it flashed 7 times. Does the "AIR BAG" warning lamp go "OFF"?	Go to Step 4	Go to Step 5
3	Note the "AIR BAG" warning lamp as ignition switch is turned "ON". Does the "AIR BAG" warning lamp come "ON" steady?	Go to Chart B	Go to Chart C
4	1. Note the "AIR BAG" warning lamp as that ignition switch is turned "ON." Ignition switch "OFF." 2. Connect a scan tool to data link connector. 3. Follow direction given in the scan tool instruction manual. Ignition switch "ON." 4. Request the SRS diagnostic trouble code display, recode all history diagnostic trouble code(s). specify as such, on repair order Is (are) diagnostic trouble code(s) displayed?	Ignition switch "OFF" When DTC 71 is set, go to DTC 71 Chart For all other history codes refer to "Diagnostic Aids" For that specific DTC A history DTC indicates the malfunction has been repaired or is intermittent	SRS is functional and free of malfuncitons, no further diagnosis is required If scan tool indicated "NO DATA RECEIVED," refer to chassis electrical section8
5	1. Ignition switch "OFF." 2. Connect a scan tool to data link connector. 3. Follow directions as given in the scan tool instruction manual. 4. Ignition switch "ON." 5. Request the SRS diagnostic trouble code display, Recode all diagnostic trouble code(s), specifying as current or history on repair order. Is (are) diagnostic trouble code (s) displayed?	Ignition switch "OFF" When DTC 53 is set, go to DTC 53 chart When DTC 51 is set, go to DTC 51 chart When DTC 19 is set, go to DTC 19 chart When DTC 25 is set, go to DTC 25 chart Diagnose remaining current DTCs from lowest to highest. When only history DTCs exist, refer to "Diagnostics Aids" for that specific DTC A history DTC indicates the malfunction has been repaired or is intermittent	If scan tool indicates "No Data Received," refer to chassis electrical section8

Chart A SDM Integrity Check



D09RW001

Circuit Description:

When the SDM recognizes “Ignition 1” voltage, applied to terminals “12”, is greater than 9 volts, the “AIR BAG” warning lamp is flashed 7 times to verify operation. At this time the SDM performs “Turn–ON” tests followed by “Continuous Monitoring” tests. When a malfunction is detected, the SDM sets a current diagnostic trouble code and illuminates the “AIR BAG” warning lamp. The SDM will clear current diagnostic trouble codes and move them to a history file when the malfunction is no longer detected and/or the ignition switch is cycled, except for DTCs 19, 25, 51, 53 and 71. DTC 71 can only be cleared using a scan tool “Clear Codes” command. If DTCs 51, 53 are not indicated then DTC 71 is not existing. DTCs 51, 53 and 71 can not be cleared after a “Clear Codes” command is issued.

Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

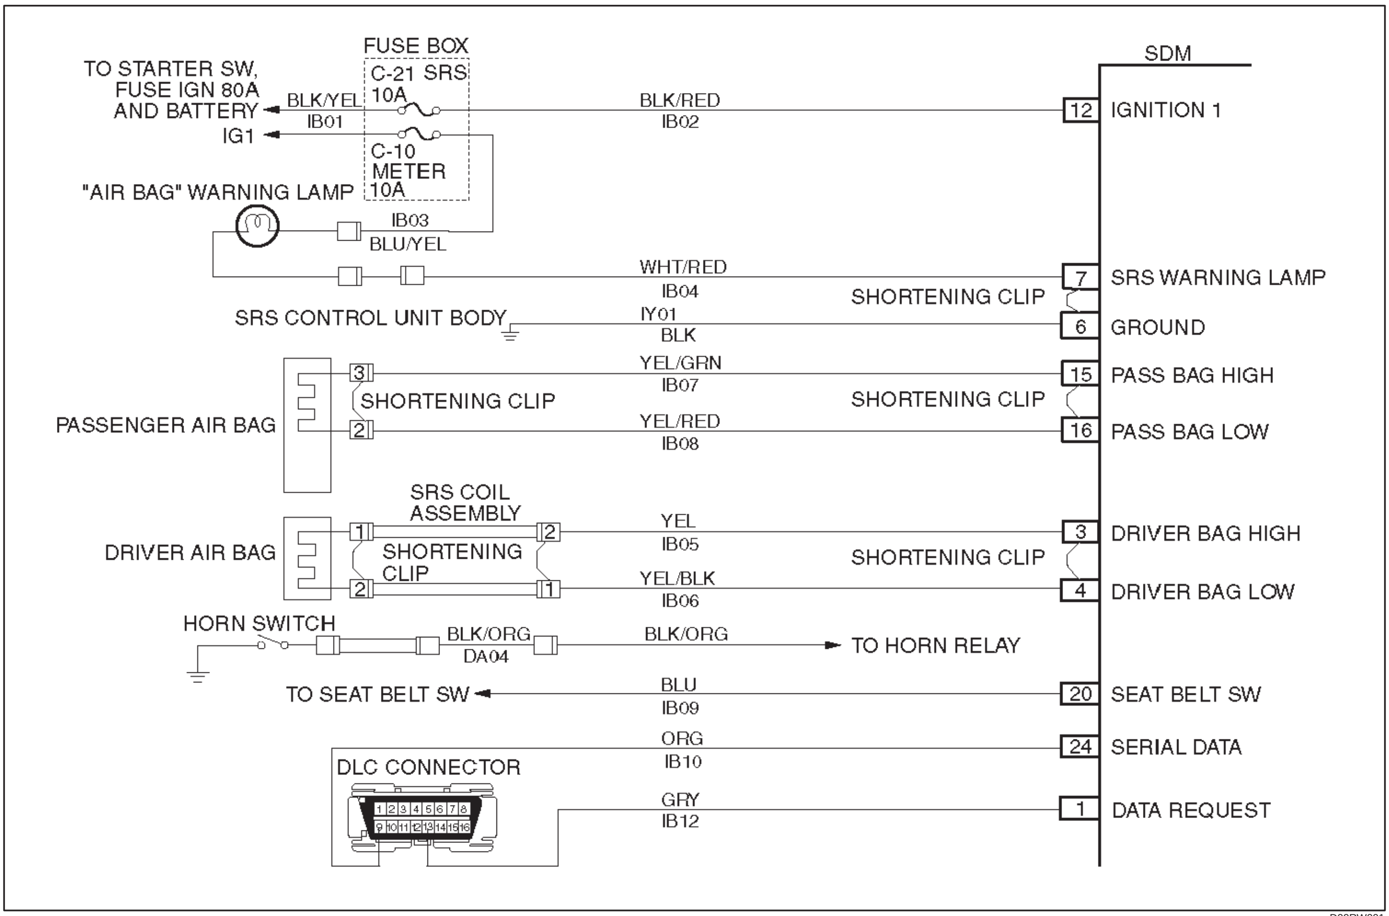
1. This test confirms a current malfunction. If no current malfunction is occurring (history DTC set) the “Diagnostic Aids” for the appropriate diagnostic trouble code should be referenced. The SDM should not be replaced for a history diagnostic trouble code.
2. This test checks for a malfunction introduced into the SRS during the diagnostic process. It is extremely unlikely that a malfunctioning SDM would cause a new malfunction to occur during the diagnostic process.
3. When all circuitry outside the SDM has been found to operate properly, as indicated by the appropriate diagnostic chart, then and only then should the SDM be replaced.

Chart A SDM Integrity Check

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	1. This chart assumes that the “SRS Diagnostic System Check” and either a symptom chart or a diagnostic trouble code chart diagnosis have been performed. When all circuitry outside the SDM has been found to operate properly, as indicated by the appropriate diagnostic chart, and the symptom or DTC remains current, the following 2. Diagnostic procedures must be performed to verify the need for SDM replacement. 3. Ignition switch “OFF”. 4. Reconnect all SRS components, ensure all components are properly mounted. 5. Ensure the ignition switch has been “OFF” for at least 15 seconds. 6. Note “AIR BAG” warning lamp as ignition switch is turned “ON.” Does warning lamp flash 7 times then go “OFF”?	The symptom or DTC is no longer occurring Clear SRS diagnostic trouble codes Repeat “SRS Diagnostic System Check”	Go to Step 2
2	Using a scan tool request diagnostic trouble code display. Is the same symptom or DTC occurring as was when the “SRS Diagnostic System Check ” was first performed?	Go to Step 3	Ignition switch “OFF” Go to the appropriate chart for the indicated malfunction
3	1. Clear “SRS Diagnostic Trouble Codes”. 2. Ignition switch “OFF” for at least two minutes. 3. Note “AIR BAG” warning lamp as ignition switch is turned “ON.” Does warning lamp flash 7 times then go “OFF”?	SRS is functional and free of malfunctions No further diagnosis is required Go to Step 4	Ignition switch “OFF” Replace SDM Go to Step 4
4	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the “SRS Diagnostic System Check”	Go to Step 4

Chart B “AIR BAG” Warning Lamp Comes “ON” Steady



D09RW001

Circuit Description:

When the ignition switch is first turned “ON”, “Ignition 1” voltage is applied from the “C–10” fuse to “AIR BAG”, warning lamp which is connected to “SRS Warning Lamp”, terminal “7”. The “C–21” fuses apply system voltage to the “Ignition 1” inputs, terminals “12”. The SDM responds by flashing the “AIR BAG” warning lamp 7 times. If “Ignition 1” is less than 9 volts, the “AIR BAG” warning lamp will come “ON” solid with no DTCs set.

Chart Test Description:

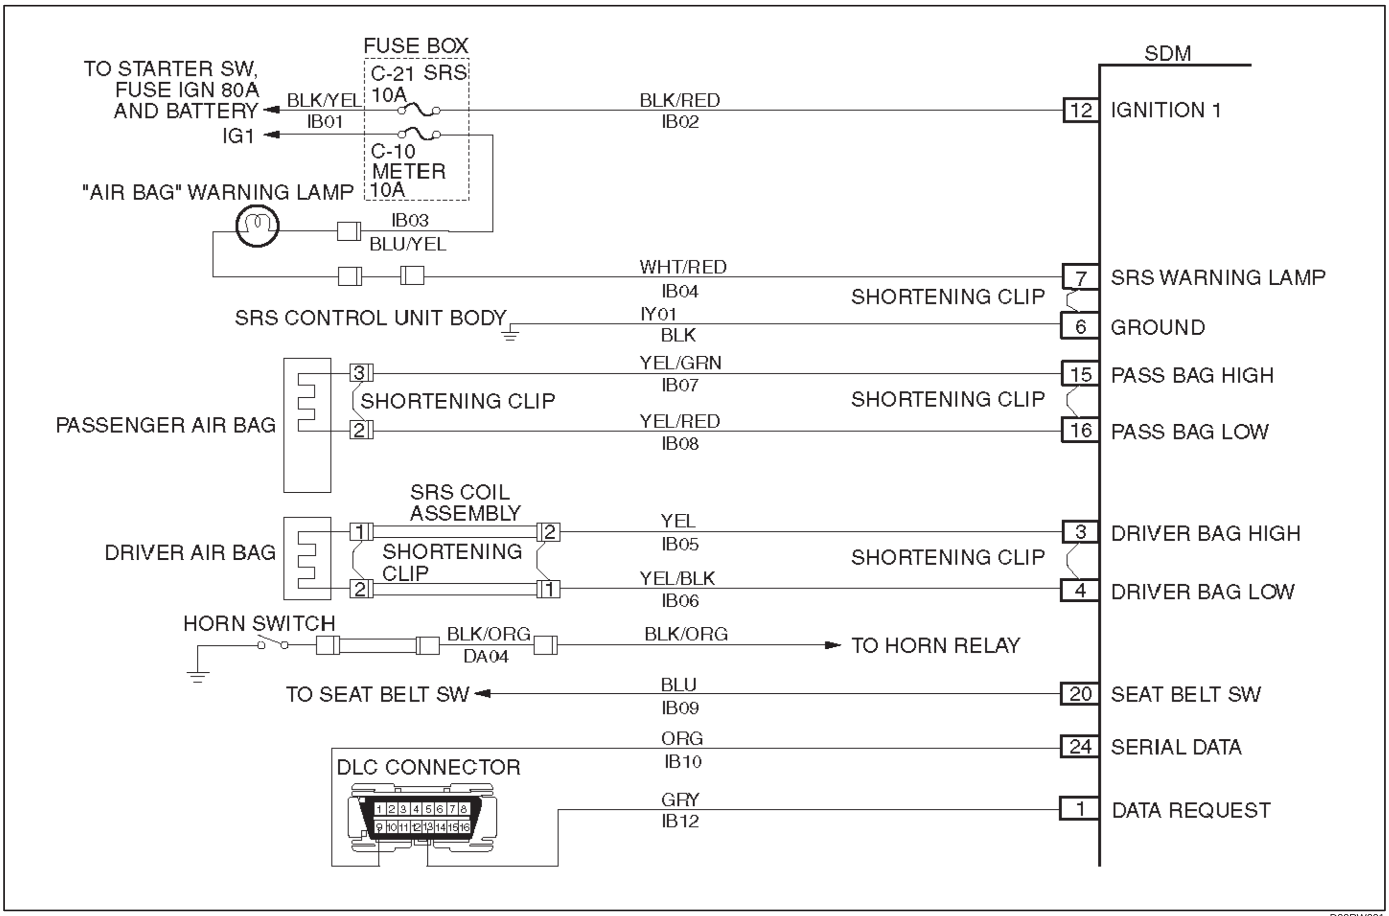
Number(s) below refer to step number(s) on the diagnostic chart.

2. This test checks for an open in the “Ignition 1” circuit to the SDM.
3. This test checks for the voltage of “IGNITION 1”.
4. This test determines whether the malfunction is a short to ground in CKT IB04–WHT/RED.

Chart B “AIR BAG” warning lamp comes “ON” Steady

Step	Action	Yes	No
1	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Ignition switch “OFF.” 3. Connect scan tool to data link connector, follow directions as given in the scan tool instruction MANUAL. 4. Ignition switch “ON.” 5. Request SRS diagnostic trouble code display. Dose scan tool indicate “No Data Received”?	Go to Step 2	Go to Step 3
2	1. Ignition switch “OFF”. 2. Inspect SDM harness connector connection to SDM. Is it securely connected to the SDM?	Ignition switch “OFF” Replace SDM Go to Step 5	Connect SDM securely to de–activate shorting clip in SDM harness connector Go to Step 5
3	Using scan tool, request SRS data list. Is “ignition” more than 9 volts?	Go to Step 4	Ignition switch “OFF” Replace SDM Go to Step 5
4	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag assemblies. yellow 2–pin connector located at base of steering column and behind the glove box assembly. Disconnect SDM. 3. Disconnect the connector of “SRS Warning Lamp” of instrument cluster. 4. Measure resistance from SDM harness connector terminal “6” to ground. Does J–39200 display “OL” (Infinite)?	Go to Chart A	Replace SRS harness Go to Step 5
5	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the “SRS Diagnostic System Check”	Go to Step 5

Chart C "AIR BAG" Warning Lamp Does Not Come "ON" Steady (1/2)



Circuit Description:

When the ignition switch is first turned "ON", "Ignition 1" voltage is applied from the "C–10" fuse to the "AIR BAG" warning lamp which is connected to "SRS Warning Lamp", terminal "7". The "C–21" fuse apply system voltage to the "Ignition 1" inputs, terminals "12". The SDM responds by flashing the "AIR BAG" warning lamp seven times. If "Ignition 1" is more than 16 volts, the "AIR BAG" warning lamp will be still "OFF" solid with no DTCs set.

Chart Test description:

Number(s) below refer to step number(s) on the diagnostic chart:

1. This test decides whether power is available to SDM warning lamp power feed circuit.
2. This test determines whether the voltage is present in the warning lamp circuit.
3. This test determines if the malfunction is in the instrument cluster.
4. This test checks for open in the warning lamp circuitry.
5. This test isolates the IB04–WHT/RED circuit and checks for a short in the IB04–WHT/RED circuit to B+.
8. This test checks for a short from the SDM warning lamp power feed circuit to ground.
9. This test determines whether the short to ground is due to a short in the wiring.

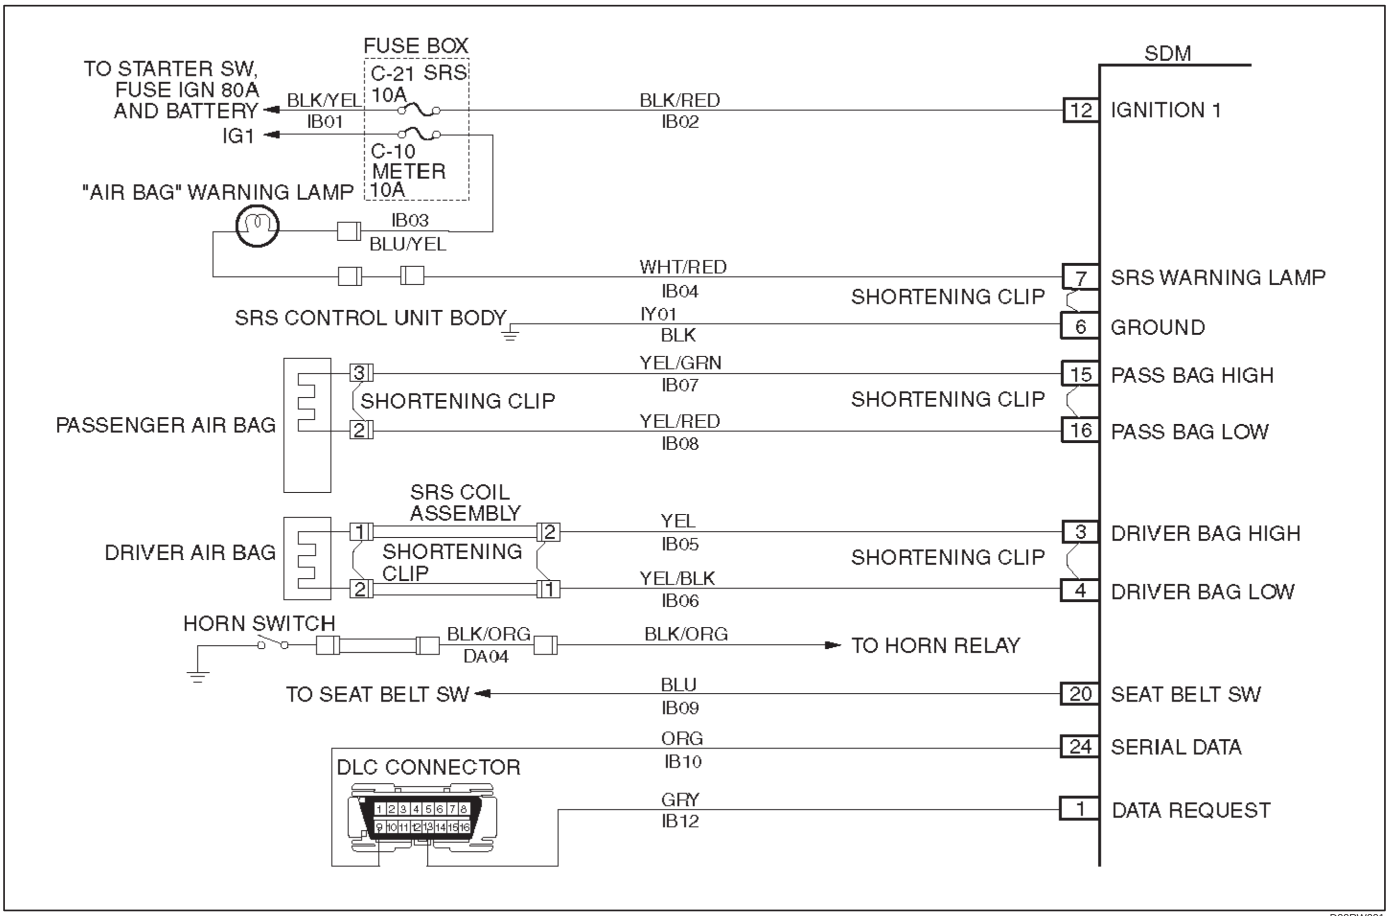
Chart C “AIR BAG” Warning Lamp Does Not Come “ON” Steady

Step	Action	Yes	No
1	1. When measurements are requested in this chart,use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Ignition switch “OFF.” 3. Remove and inspect “C–10” fuse to the “AIR BAG” warning lamp. Is fuse good?	Go to Step 2	Go to Step 7
2	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag assemblies. Yellow 2–pin connector located at base of steering column and behind the glove box assembly. 3. Disconnect SDM. 4. Ignition switch “ON.” 5. Measure voltage on SDM harness connector from terminal “7” to terminal “6” (ground). Is system voltage present on terminal “7”?	Go to Step 4	Go to Step 3
3	1. Ignition switch “OFF.” 2. Remove instrument meter cluster. 3. Check for proper connection to instrument cluster at IB04–WHT/RED terminal. 4. If ok, then remove and inspect “AIR BAG” bulb. Is bulb good?	Go to Step 5	Replace bulb Go to Step 6
4	1. Ignition switch “OFF.” 2. Disconnect instrument meter cluster harness connector. 3. Ignition switch “ON.” 4. Measure voltage on SDM harness connector from terminal “7” to terminal “6” (GROUND). Is voltage 1 volt or less?	Go to Chart A	Replace SRS harness Go to Step 6
5	1. Install bulb. 2. Measure resistance from instrument meter cluster harness connector IB04–WHT/RED terminal to SDM harness connector terminal “7”. Is resistance 5.0 ohms or less?	Service instrument meter cluster Install instrument meter cluster Go to Step 6	Replace SRS harness Go to Step 6
6	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the “SRS Diagnostic System Check”	Go to Step 6
7	Perform chart C. Was this step finished?	Go to Step 8	Go to Step 1
8	1. Replace “C–10” fuse. 2. Ignition switch “ON” wait 10 Seconds then ignition switch “Off.” 3. Remove and inspect “C–10” fuse. Is fuse good?	Install “C–10” fuse Go to Step 10	Go to Step 9

Chart C “AIR BAG” Warning Lamp Does Not Come “ON” Steady (Cont’d)

Step	Action	Yes	No
9	1. Disconnect SRS coil and passenger air bag assemblies. Yellow 2–pin connector located at base of steering column and behind the glove box assembly. 2. Disconnect SDM. 3. Replace “C–10” fuse. 4. Ignition switch “ON” wait 10 seconds. 5. Ignition switch “OFF”. 6. Remove and inspection “C–10” fuse. Is fuse good?	Install“C–10” fuse Go to Chart A	Replace SRS harness Replace “C–10” fuse Go to Step 10
10	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the “SRS Diagnostic System Check”	Go to Step 10

DTC 15 Passenger Deployment Loop Resistance High



Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the “Resistance Measurement Test”. “Passenger Bag Low” terminal “16” is grounded through a resister and the passenger current source connected to “Passenger Bag High” terminal “15” allows a known amount of current to flow. By monitoring the voltage difference between “Passenger Bag High” and “Passenger Bag Low” the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YEL/GRN and IB08–YEL/RED connector terminal contact.

DTC Will Set When:

The combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YEL/GRN and IB08–YEL/RED, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the “Resistance Measurement Test” when:

1. No “higher priority faults” are detected during “Turn–ON”,
2. “Ignition 1” voltage is in the specified value.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned “OFF.”

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test verifies proper connection of the yellow 2–pin connector.
4. This test checks for proper contact and/or corrosion of the yellow 2–pin connector terminals.
5. The test checks for a malfunctioning passenger air bag assembly.
6. This test determines whether the malfunction is due to high resistance in the wiring.

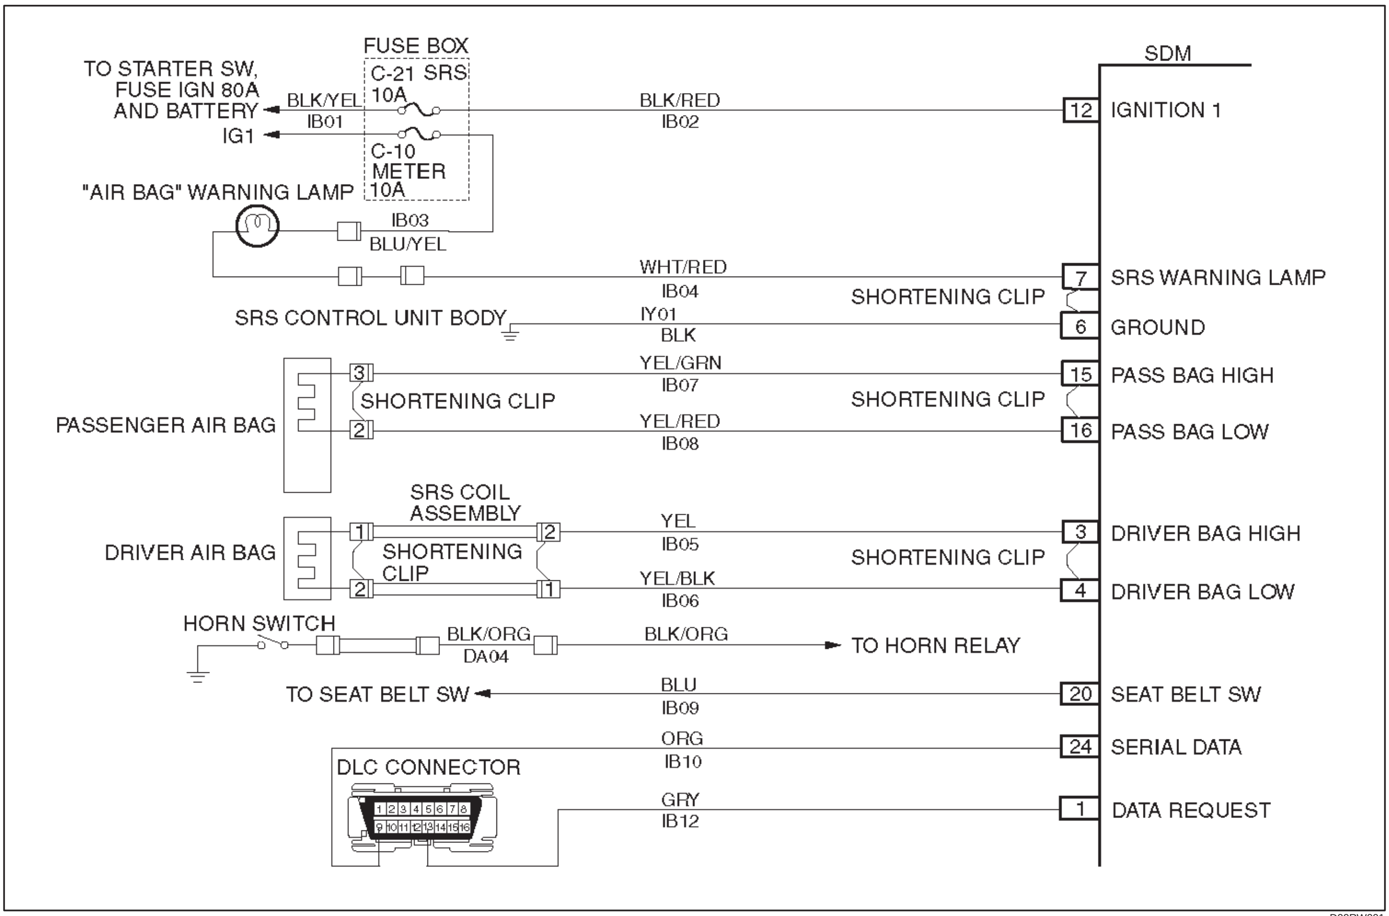
Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the passenger air bag assembly harness connector terminals “1” and “2”, SDM terminal “15” and “16”, or a poor wire to terminal connection in CKTs IB07–YEL/GRN and IB08–YEL/RED. This test for this diagnostic trouble code is only run while the “AIR BAG” warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 15 Passenger Deployment loop Resistance High

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” Performed?	Go to Step 2	Go to The “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Use scan tool data list function, read and record the passenger deployment loop resistance. Is passenger resist. more than 2.9 ohms?	Go to Step 3	Go to Chart A
3	1. Ignition switch “Off.” 2. Make sure the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly is seated properly. Is the yellow 2–pin connector connected properly?	Go to Step 4	Seat passenger Air Bag assembly yellow 2–pin connector properly Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly. 2. If ok, reconnect the passenger air bag assembly 2–pin connector. 3. Ignition switch “ON.” Is DTC 15 current?	Go to Step 5	Go to Step 7
5	1. Ignition switch “Off.” 2. Disconnect SRS coil and passenger air bag assembly, yellow 2–pin connector located at the base of the steering column and behind the glove box assembly. 3. Connect J–41433 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 15 Current?	Go to Step 6	Ignition switch “Off” Replace the passenger air bag assembly Go to Step 7
6	1. Ignition switch “Off.” 2. There has been an increase in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTS IB07–YEL/GRN and IB08–YEL/RED, and SDM connector terminal “15” and “16” to locate the root cause. Was a fault found?	Replace SRS harness Go to Step 7	Go to Chart A
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was This step finished?	Repeat the “SRS Diagnostic System Check”	Go to Chart 7

DTC 16 Passenger Deployment loop Resistance Low



D09RW001

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the “Resistance Measurement Test”. “Passenger Bag Low” terminal “16” is grounded through a resistor and the passenger current source connected to “Passenger Bag High” terminal “15” allows a known amount of current to flow. By monitoring the voltage difference between “Passenger Bag High” and “Passenger Bag Low”, the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YEL/GRN and IB08–YEL/RED connector terminal contact.

DTC Will Set When:

The combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YEL/GRN and IB08–YEL/RED, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the “Resistance Measurement Test” when:

1. No “higher priority faults” are detected during “Turn–ON”,
2. “Ignition 1” voltage is in the specified value.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned “OFF.”

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test verifies connection of the yellow 2–pin connector.
4. This test cheeks for proper operation of the shorting clip in the yellow 2–pin connector.
5. The test checks for a malfunction passenger air bag assembly.
6. This test determines whether the malfunctioning is due to shortening in the wiring.

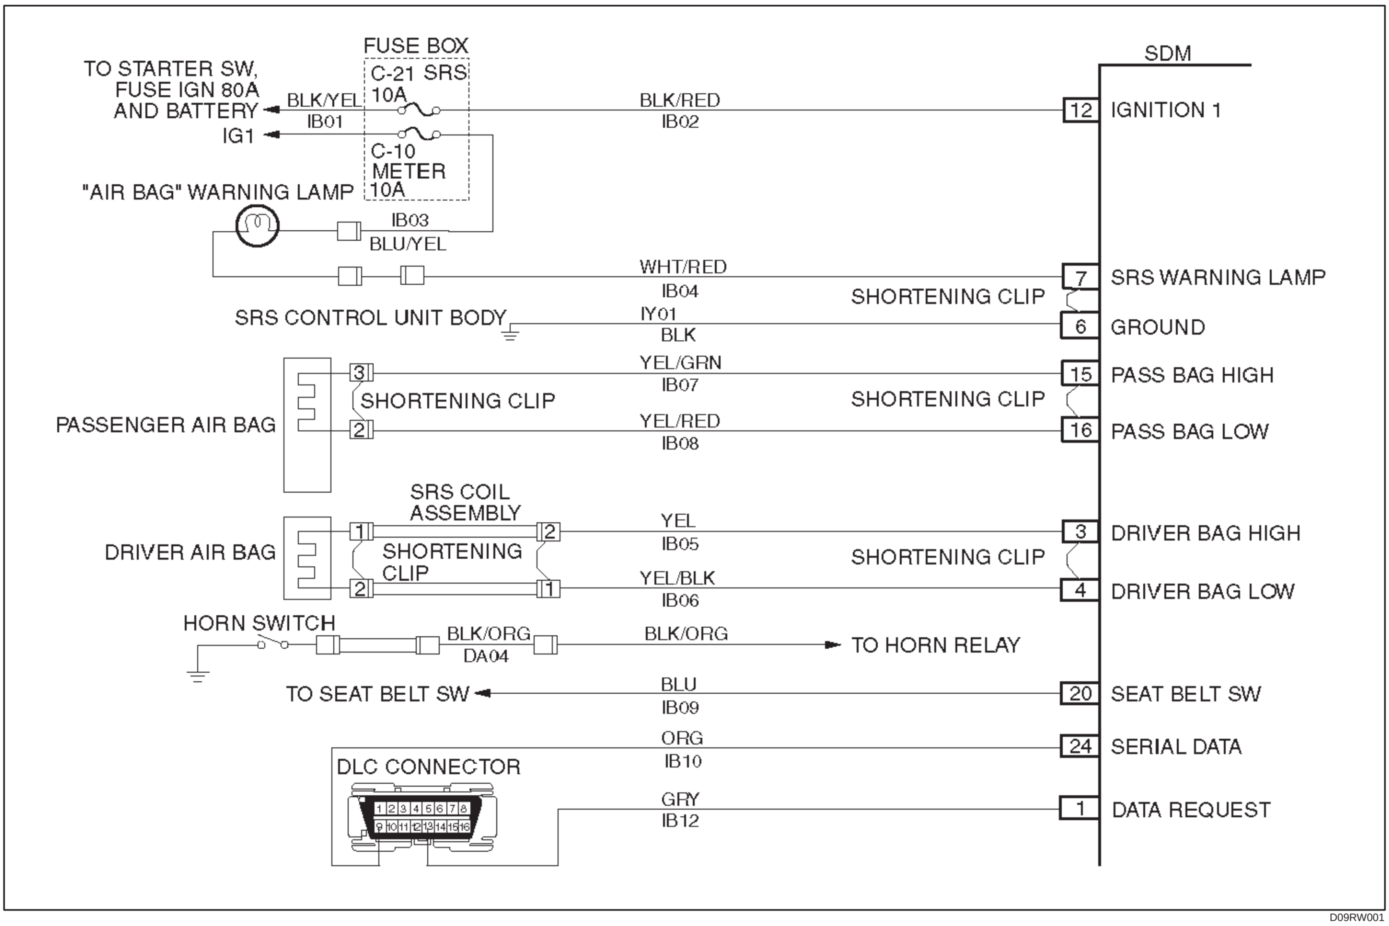
Diagnostic Aids:

An intermittent condition is likely to be caused by a short between CKTs IB07–YEL/GRN and IB08–YEL/RED, or a malfunctioning shorting clip on the passenger air bag assembly which would require replacement of the air bag assembly. The test for this diagnostic trouble code is only run while “AIR BAG” warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 16 Passenger Deployment loop Resistance Low

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Repeat the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Using scan tool data list function, read and record the passenger deployment loop resistance. Is passenger resist. less than 1.4 ohms?	Go to Step 3	Go to Chart A
3	1. Ignition switch “Off.” 2. Make sure the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly is seated properly. Is the yellow 2–pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2–pin connector properly Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly. 2. If ok, reconnect the passenger air bag assembly 2–pin connector. 3. Ignition switch “ON.” Is DTC 16 Current?	Go to Step 5	Go to Step 7
5	1. Ignition switch “Off.” 2. Disconnect SRS coil and passenger air bag assembly, yellow 2–pin connector located at the base of the steering column and behind the glove box assembly. 3. Connect J–41433 SRS driver/passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 16 current?	Go to Step 6	Ignition switch “Off” Replace the passenger air bag assembly Go to Step 7
6	1. Ignition switch “Off.” 2. There has been a decrease in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTS IB07–YEL/GRN and IB08–YEL/RED, and SDM connector terminal “15” and “16” to locate the root cause. Was a fault found?	Replace SRS harness Go to Step 7	Go to Chart A
7	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the “SRS Diagnostic System Check”	Go to Step 7

DTC 17 Passenger Deployment Loop Open



Circuit Description:

When the ignition switch is turned "ON", the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "Ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. During "Continuous Monitoring" diagnostics, a fixed amount of current is flowing in the deployment loop. This produces proportional voltage drops in the loop. By monitoring the voltage difference between "Passenger Bag High" and "Passenger Bag Low", the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YEL/GRN AND IB08–YEL/RED, and connector terminal contact.

DTC Will Set When:

The voltage difference between "Passenger Bag High" terminal "15" and "Passenger Bag Low" terminal "16" is above or equal to a specified value for 500 milliseconds during "Continuous Monitoring".

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage difference between "Passenger Bag High" terminal "15" and "Passenger Bag Low" terminal "16" is below a specified value for 500 milliseconds during "Continuous Monitoring".

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test verifies proper connection of the yellow 2–pin connector.
4. This test cheeks for proper contact and/or corrosion of the shorting clip in the yellow 2–pin connector terminals.
5. The test checks for a malfunctioning passenger air bag assembly.
6. This test determines whether the open in the wiring.

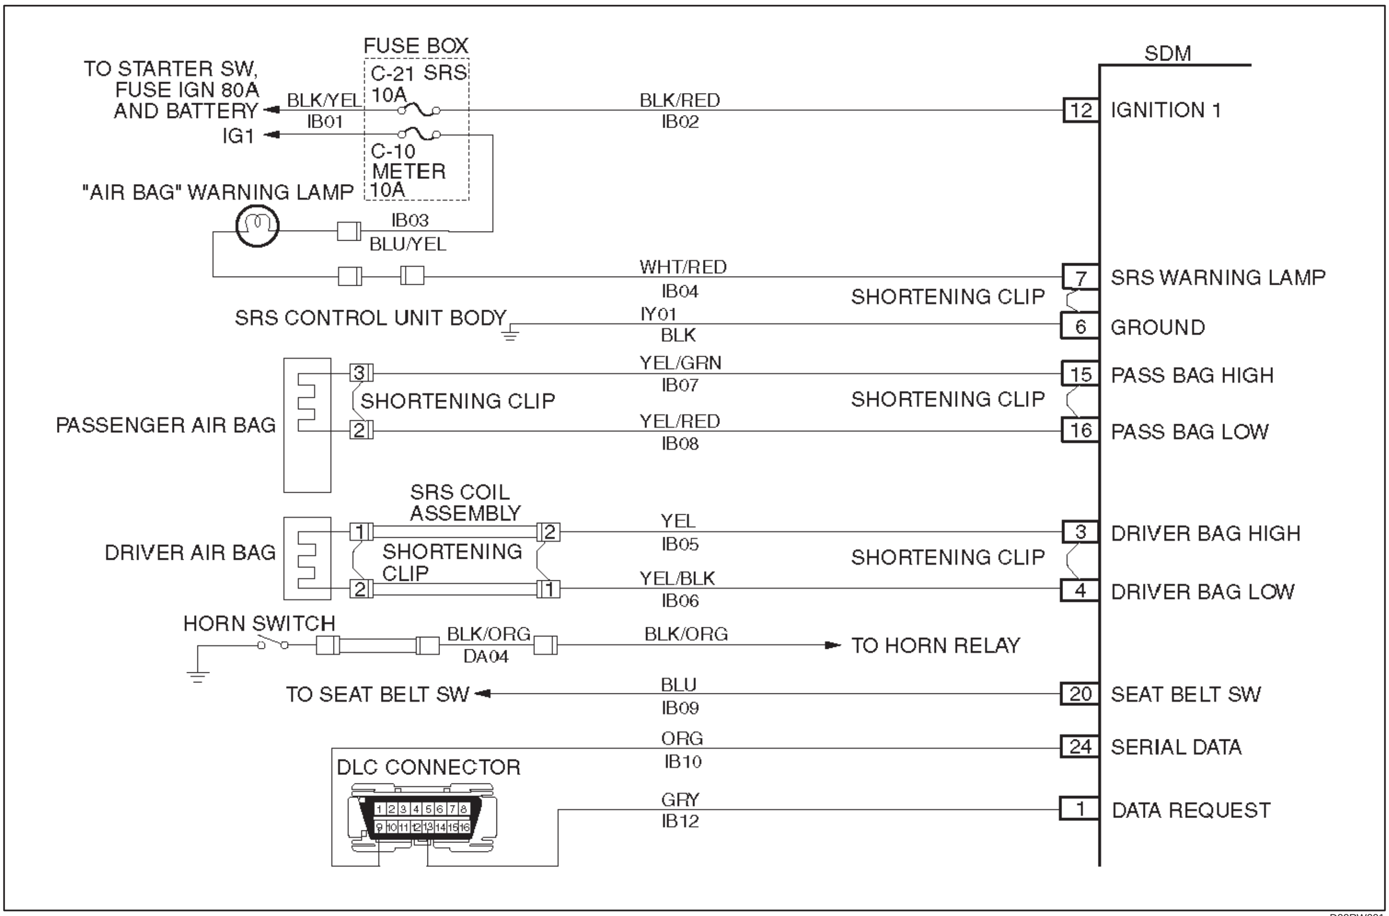
Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the passenger air bag assembly harness connector terminals"1" and "2", SDM terminals "15" and "16", or an open in CKT IB07–YEL/GRN and IB08–YEL/RED.

DTC 17 Passenger Deployment Loop Open

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Using scan tool data list function, read and record the passenger differential voltage. Is passenger VDIF. 0.4 volts or more?	Go to Step 3	Go to Chart A
3	1. Ignition switch “OFF”. 2. Make sure the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly is seated properly. Is the yellow 2–pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2–pin connector properly Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly. 2. If ok, reconnect the passenger air bag assembly 2–pin connector. 3. Ignition switch “ON”. Is DTC 17 current?	Go to Step 5	Go to Step 7
5	1. Ignition switch “Off.” 2. Disconnect SRS coil and passenger air bag assembly, yellow 2–pin connector located at the base of the steering column and behind the glove box assembly. 3. Connect J–41433 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 17 current?	Go to Step 6	Ignition switch “Off” Replace the passenger air bag assembly Go to Step 7
6	1. Ignition switch “Off.” 2. There has been an open circuit resistance in the passenger deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTS IB07–YEL/GRN and IB08–YEL/RED, and SDM connector terminal “15” and “16” to locate the root cause. Was a fault found?	Replace SRS harness Go to Step 7	Go to Chart A
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Go to the “SRS Diagnostic System Check”	Go to Step 7

DTC 18 Passenger Deployment Loop Short To Ground



Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltages at “Driver Bag Low” terminal “4” and “Passenger Bag Low” terminal “16” to detect short to ground in the air bag assembly circuits.

DTC Will Set When:

Neither of the two air bag assemblies is open.

“Ignition 1” is within the normal operating voltage range. Once these conditions are met and the voltage at “Passenger Bag Low” is below a specified value, DTC 18 will set. This test is run once each ignition cycle and “Continuous Monitoring”.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

This malfunction is no longer occurring and the ignition switch is turned “OFF”.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

2. This test determines whether the SDM is malfunctioning.
3. This test isolates the malfunction to one side of the passenger air bag assembly yellow 2–pin connector behind glove box compartment.
4. This test determines whether the malfunction is in CKT IB07–YEL/GRN.
5. This test determines whether the malfunction is in CKT IB08–YEL/RED.

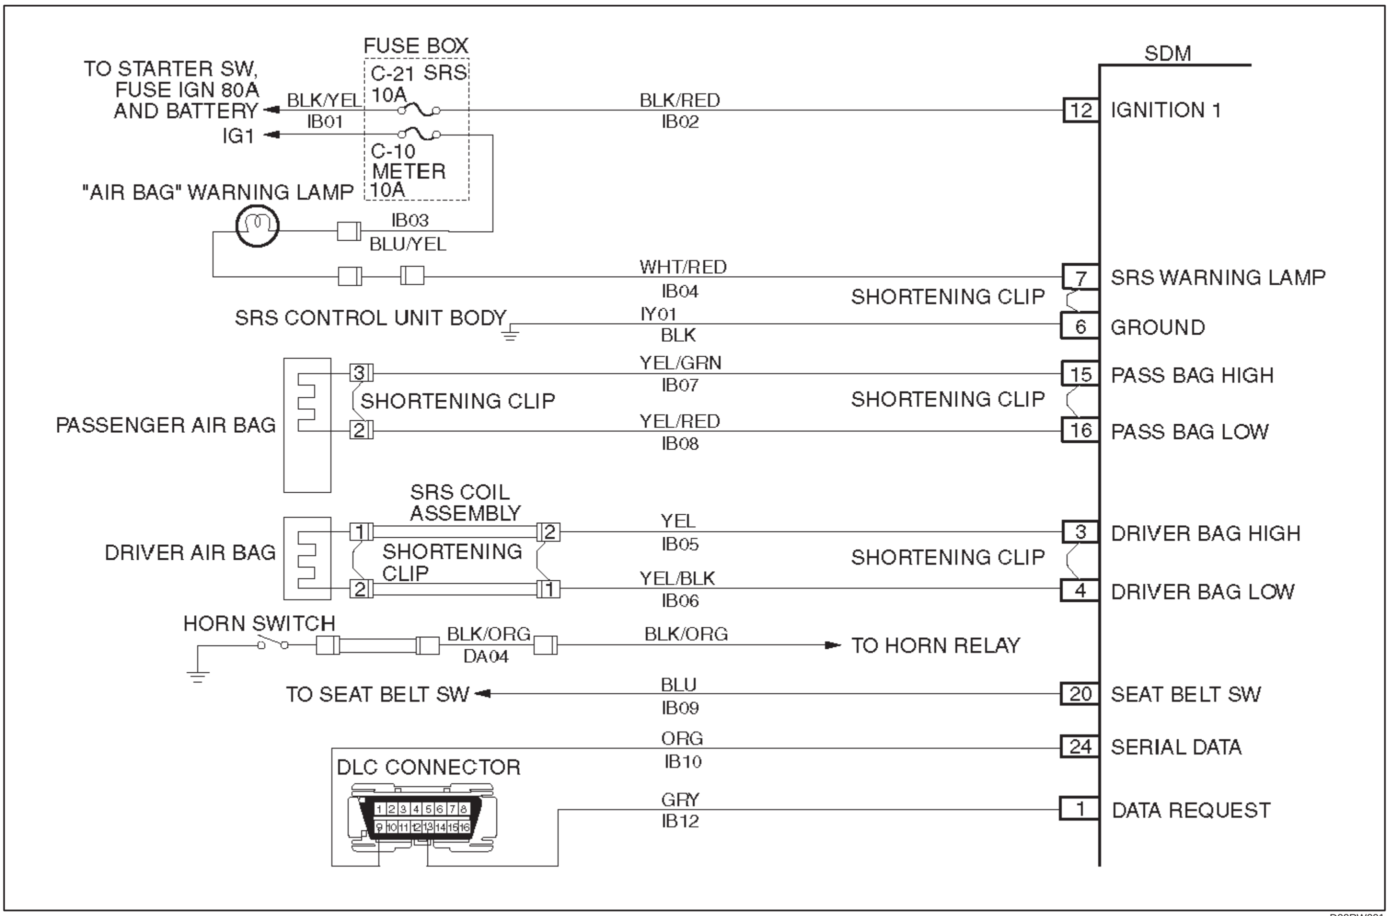
Diagnostic Aids:

An intermittent condition is likely to be caused by a short to ground in the passenger air bag assembly circuit. Inspect CKTs IB07–YEL/GRN and IB08–YEL/RED carefully for cutting or chafing. If the wiring pigtail of the passenger air bag assembly is damaged, the component must be replaced.

DTC 18 Passenger Deployment Loop Short To Ground

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Ignition switch “OFF.” 3. Connect scan tool data link connector. follow directions as given in the scan tool operator’s MANUAL. 4. Ignition switch “ON.” 5. Read passenger sense LO. Is passenger sense LO less than 1.5 volts?	Go to Step 3	Go to Chart A
3	1. Ignition switch “OFF.” 2. Disconnect passenger air bag assembly yellow 2–pin connector behind the glove box assembly. 3. Leave driver air bag assembly connected. 4. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to passenger air bag assembly harness connector. 5. Ignition switch “ON.” Is DTC 18 current?	Go to Step 4	Ignition switch “OFF” Replace passenger air bag assembly Go to Step 6
4	1. Ignition switch “OFF”. 2. Disconnect SRS driver / passenger load tool 3. Measure resistance on SDM harness connector from terminal “15” to terminal “16” (ground). Does J–39200 display “OL” (Infinite)?	Go to Step 5	Replace SRS Harness Go to Step 6
5	Measure resistance on SDM harness connector from terminal “16” to terminal “6” (ground). Does J–39200 display “OL” (Infinite)?	Go to Chart A	Replace SRS Harness Go to Step 6
6	1. Reconnect all components and ensure all component are Properly Mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Go to the “SRS Diagnostic system check”	Go to Step 6

DTC 19 Passenger Deployment Loop Short To Voltage



D09RW001

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltages at “Driver Bag Low” terminal “4” and “Passenger Bag Low” terminal “16” to detect short to B+ in the air bag assembly circuits.

DTC Will Set When:

“Ignition 1” is within the normal operating voltage range. Once these conditions are met and the voltage at “Passenger Bag Low” is above a specified value, DTC 19 will set. This test is run once each ignition cycle and “Continuous Monitoring”.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets DTC 19 and also DTC 71.

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test isolates the malfunction to one side of the passenger air bag assembly yellow 2–pin connector behind glove box assembly.
4. This test determines whether the malfunction is in CKT IB07–YEL/GRN.
5. This test determines whether the malfunction is in CKT IB08–YEL/RED.

Diagnostic Aids:

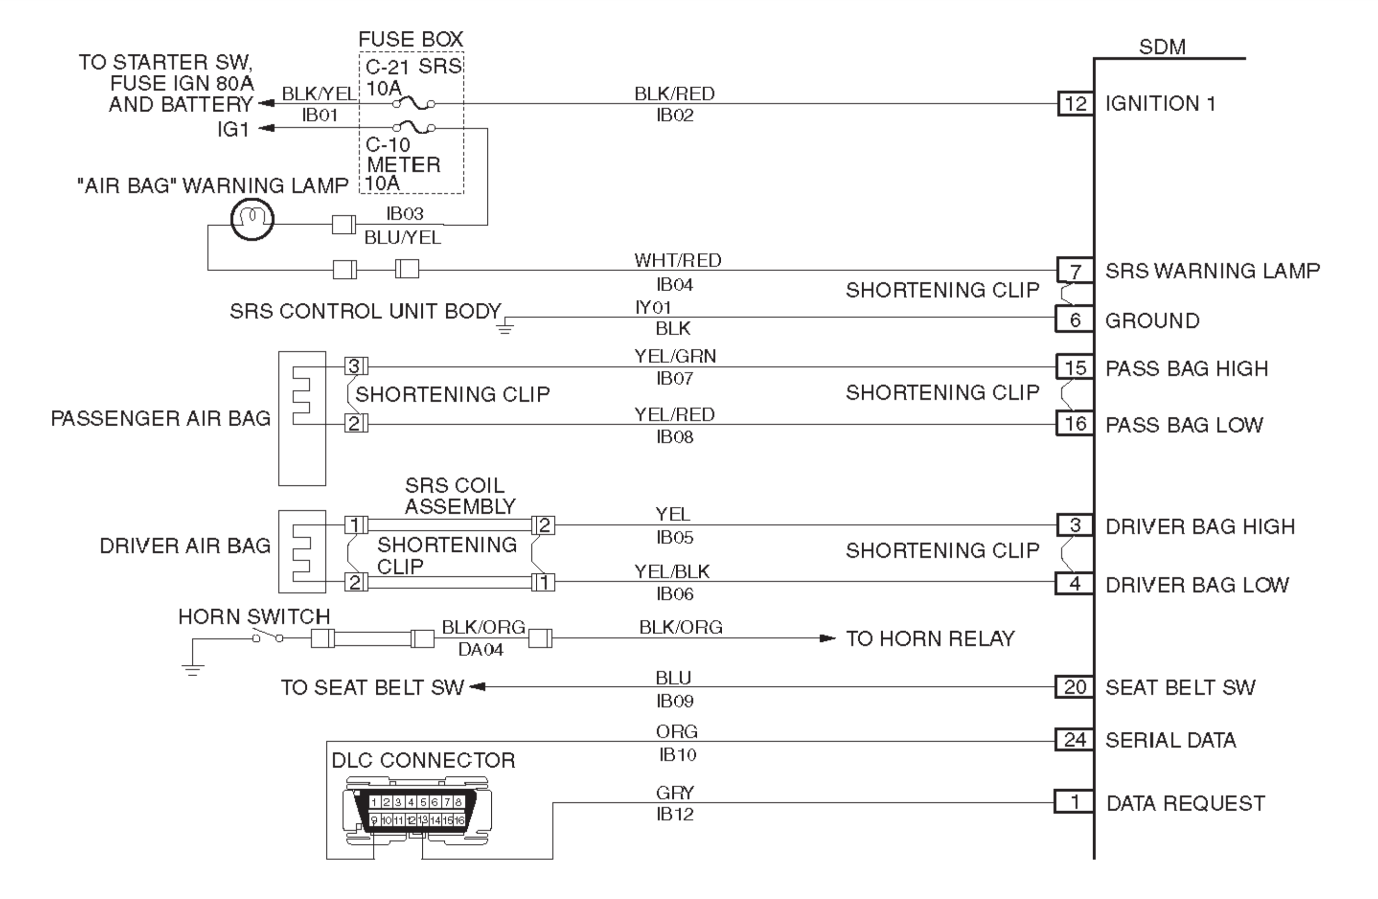
An intermittent condition is likely to be caused by a short to B+ in the passenger air bag assembly circuit. Inspect CKTs IB07–YEL/GRN and IB08–YEL/RED carefully for cutting or chafing. If the wiring pigtail of the passenger air bag assembly is damaged, the component must be replaced. A careful inspection of CKT IB07–YEL/GRN and IB08–YEL/RED, including the passenger air bag assembly pigtail is essential to ensure that the replacement SDM will not be damaged.

DTC 19 Passenger Deployment Loop Short To Voltage

CAUTION: When DTC 19 has been set, it is necessary to replace the SDM. Setting DTC 19 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is no longer present, DTC 71 will remain current. Ensure that the short to voltage condition is repaired prior to installing a replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Perform the "SRS Diagnostic System Check." Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Repeat the "SRS Diagnostic System Check"
2	1. When measurements are requested in this chart use J–39200 DVM With correct terminal adapter from J–35616–A. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. follow directions as given in the scan tool operator's manual. 4. Ignition switch "ON." 5. Read passenger sense LO. Is passenger sense LO more than 3.5 volts?	Go to Step 3	Go to chart A
3	1. Ignition switch "OFF". 2. Disconnect passenger air bag assembly yellow 2–pin connector behind the glove box assembly. 3. Leave driver air bag assembly connected. 4. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to passenger air bag assembly harness connector. 5. Ignition switch "ON." Is passenger sense LO more than 3.5 volts?	Go to Step 4	Ignition switch "OFF" Replace passenger air bag assembly Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SDM. 3. Disconnect SRS driver / passenger load tool. 4. Measure resistance on SDM harness connector from terminal "15" to terminal "12" (ignition). Does J–39200 display "OL" (infinite)?	Go to Step 5	Replace SRS harness Go to Step
5	Measure resistance on SDM harness connector from terminal "16" and terminal "12" (ignition). Does J–39200 display "OL" (infinite)?	Go to Chart A	replace SRS harness Go to Step 6
6	1. Reconnect all components ensure all component are properly mounted. 2. Ignition switch "ON". Is passenger senslo less than 3.5 volts?	Ignition switch "OFF" Replace SDM Go to Step 7	Go to Chart A
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check"	Go to Step 7

DTC 21 Driver Deployment Loop Resistance High



D09RW001

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM then proceeds with the “Resistance Measurement Test” “Driver Bag Low” terminal “4” is grounded through a current sink and the driver current source connected to “Driver Bag High” terminal “3” allows a known amount of current to flow. By monitoring the voltage difference between “Driver Bag High” and “Driver Bag Low”, the SDM calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring CKTs IB05–YEL and IB06–YEL/BLK, and connector terminal contact.

DTC Will Set When:

The combined resistance of the driver air bag assembly, SRS Coil assembly, harness wiring CKTs IB05–YEL and IB06–YEL/BLK, and connector terminal contact is above a specified value. This test run once each ignition cycle during the “Resistance Measurement Test” when:

1. No “higher priority faults” are detected during “Turn–ON”
2. “Ignition 1” voltage is in the specified value.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets DTC 21.

DTC Will Clear When:

The ignition switch is turned “OFF”.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test verifies proper connection of the yellow 2–pin connector at the base of the steering column.
4. This test checks for proper contact and/or corrosion of the 2–pin connector terminals at the base of steering column.
5. This test isolate the malfunction to one side of the SRS coil assembly yellow 2–pin connector located at the base of the steering column.
6. This test determines whether the malfunction is due to high resistance in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at terminals “1” and “2” of the SRS coil 2–pin connector at the base of the steering column, terminal “1” and “2” of the driver air bag assembly 2–pin connector at the top of the steering column, SDM terminals “3” and “4” or a poor wire to terminal connection in CKT IB05–YEL or IB06–YEL/BLK. The test for this diagnostic trouble code is only run while the “AIR BAG” warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

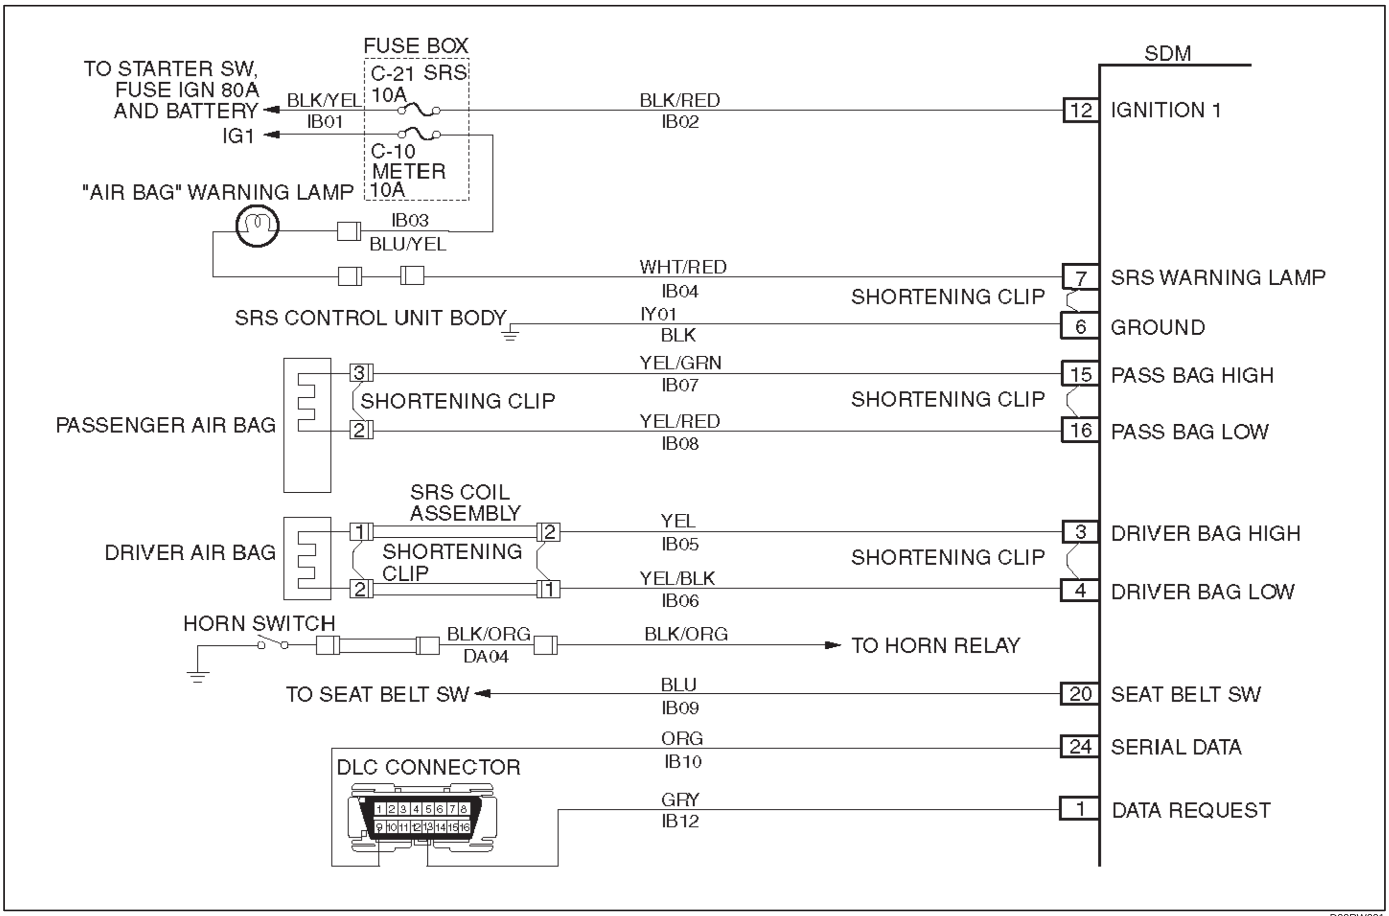
DTC 21 Driver Deployment Loop Resistance High

Step	Action	Yes	No
1	Perform the “SRS Diagnostic System Check”. Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Repeat the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Use scan tool data list function, read and record the driver deployment loop resistance. Is driver resistance more than 3.7 ohms?	Go to Step 3	Go to Chart A
3	1. Ignition switch “OFF.” 2. Disconnect SRS coil assembly yellow 2–pin connector located at base of steering column is seated properly. Is the 2–pin connector connected properly?	Go to Step 4	Seat SRS coil assembly 2–pin connector properly Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2–pin connector located base of steering column. 2. If ok, reconnect the SRS coil assembly yellow 2–Pin connector. 3. Ignition switch “ON.” Is DTC 21 current?	Go to Step 5	Go to Step 8
5	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag assembly, yellow 2–pin connector located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 21 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch “Off.” 2. There has been a increase in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTS IB05–YEL and IB06–YEL/BLK, and SDM connector terminal “3” and “4” to locate the root cause. Was a fault found?	Replace SRS harness Go to Step 8	Go to Chart A

DTC 21 Driver Deployment Loop Resistance High (Cont'd)

Step	Action	Yes	No
7	1. Ignition switch "OFF." 2. Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. 3. Connect SRS driver / passenger load tool J–41433 on the top of steering column. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch "ON." Is DTC 21 current?	Ignition switch "OFF" Replace SRS coil assembly Go to Step 8	Ignition switch "OFF" Replace driver air bag assembly Go to Step 8
8	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check"	Go to Step 8

DTC 22 Driver Deployment Loop Resistance Low



D09RW001

Circuit Description:

When the ignition switch is turned "ON", the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM then proceeds with the "Resistance Measurement Test" "Driver Bag Low" terminal "4" is grounded through a current sink and the driver current source connected to "Driver Bag High" terminal "3" allows a known amount of current to flow. By monitoring the voltage difference between "Driver Bag High" and "Driver Bag Low" the SDM calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring CKTs IB05–YEL and IB06–YEL/BLK and connector terminal contact.

DTC Will Set When:

The combined resistance of the driver air bag assembly, SRS Coil assembly, harness wiring CKTs IB05–YEL and IB06–YEL/BLK and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn–ON"
2. "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets DTC 22.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test verifies proper connection of the yellow 2–pin connector at the base of the steering column.
4. This test checks for proper operation of the shorting clip in the yellow 2–pin connector.
5. This test isolate the malfunction to one side of the SRS coil assembly yellow 2–pin connector located at the base of steering column.
6. This test determines whether the malfunction is due to shortening in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

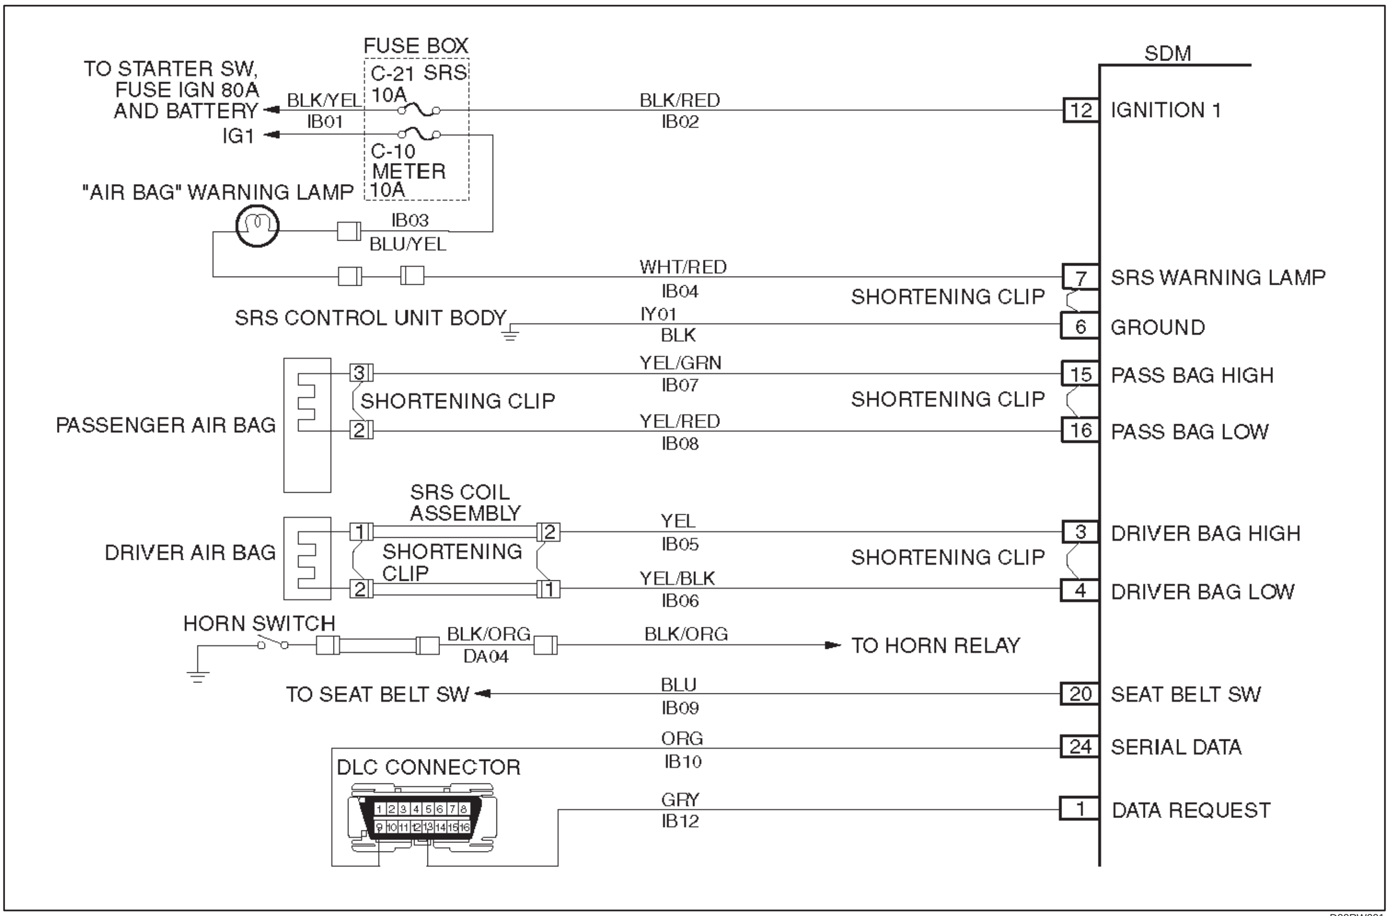
Diagnostic Aids:

An intermittent condition is likely to be caused by a short between CKT IB05–YEL or IB06–YEL/BLK or a malfunctioning shorting clip on the driver air bag assembly or SRS coil assembly which would require replacement of the component. The test for this diagnostic trouble code is only run while the “AIR BAG” warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 22 Driver Deployment Loop Resistance Low

Step	Action	Yes	No
1	Perform the “SRS Diagnostic System Check.” WAS THE “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Use scan tool data list function, read and record the driver deployment loop resistance. Is driver deployment loop resistance less than 1.7 ohms?	Go to Step 3	Go to Chart A
3	1. Ignition switch “OFF.” 2. Make sure the SRS coil assembly yellow 2–pin connector located at the base of steering column is seated properly. Is the 2–pin connector connected properly?	Go to Step 4	Seat driver air bag assembly 2–pin connector properly Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2–pin connector located base of steering column. 2. If ok, reconnect the SRS coil assembly yellow 2–pin connector. 3. Ignition switch “ON.” Is DTC 22 current?	Go to Step 5	Go to Step 8
5	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag assembly, yellow 2–pin connector located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 22 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch “OFF.” 2. There has been a decrease in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTS IB05–YEL and IB06–YEL/BLK, and SDM connector terminal “3” and “4” to locate the root cause. Was a fault found?	Replace SRS harness Go to Step 8	Go to Chart A
7	1. Ignition switch “OFF.” 2. Disconnect SRS driver / passenger load tool from driver air bag assembly harness connector. 3. Connect SRS driver / passenger load tool J–41433 to the top of steering column 2–pin connector. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch “ON.” Is DTC 22 current?	Ignition switch “OFF” Replace SRS coil assembly Go to Step 8	Ignition switch “OFF” Replace driver air bag assembly Go to Step 8
8	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Go to the “SRS Diagnostic System Check”	Go to Step 8

DTC 24 Driver Deployment Loop Short To Ground



D09RW001

Circuit Description:

When the ignition switch is turned "ON", the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "Ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.
The SDM monitors the voltage at "Driver Bag Low" terminal "4" and "passenger Bag Low" terminal "16" to detect shorts to ground in the air bag assembly circuits.

DTC Will Set When:

Neither of the two air bag assemblies is open.
"Ignition 1" is within the normal operating voltage range.
This test is run once each ignition cycle and "Continuous Monitoring". Once these conditions are met and the voltage at "Driver Bag Low" is below a specified value, DTC 24 will set.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The malfunction is no longer occurring and the ignition is turned "OFF".

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the SDM is malfunctioning
3. This test isolates the malfunction to one side of the SRS coil assembly yellow 2–pin connector at the base of the steering column.
4. This test determines whether the malfunction is in CKT IB05–YEL.
5. This test determines whether the malfunction is in CKT IB06–YEL/BLK.
6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

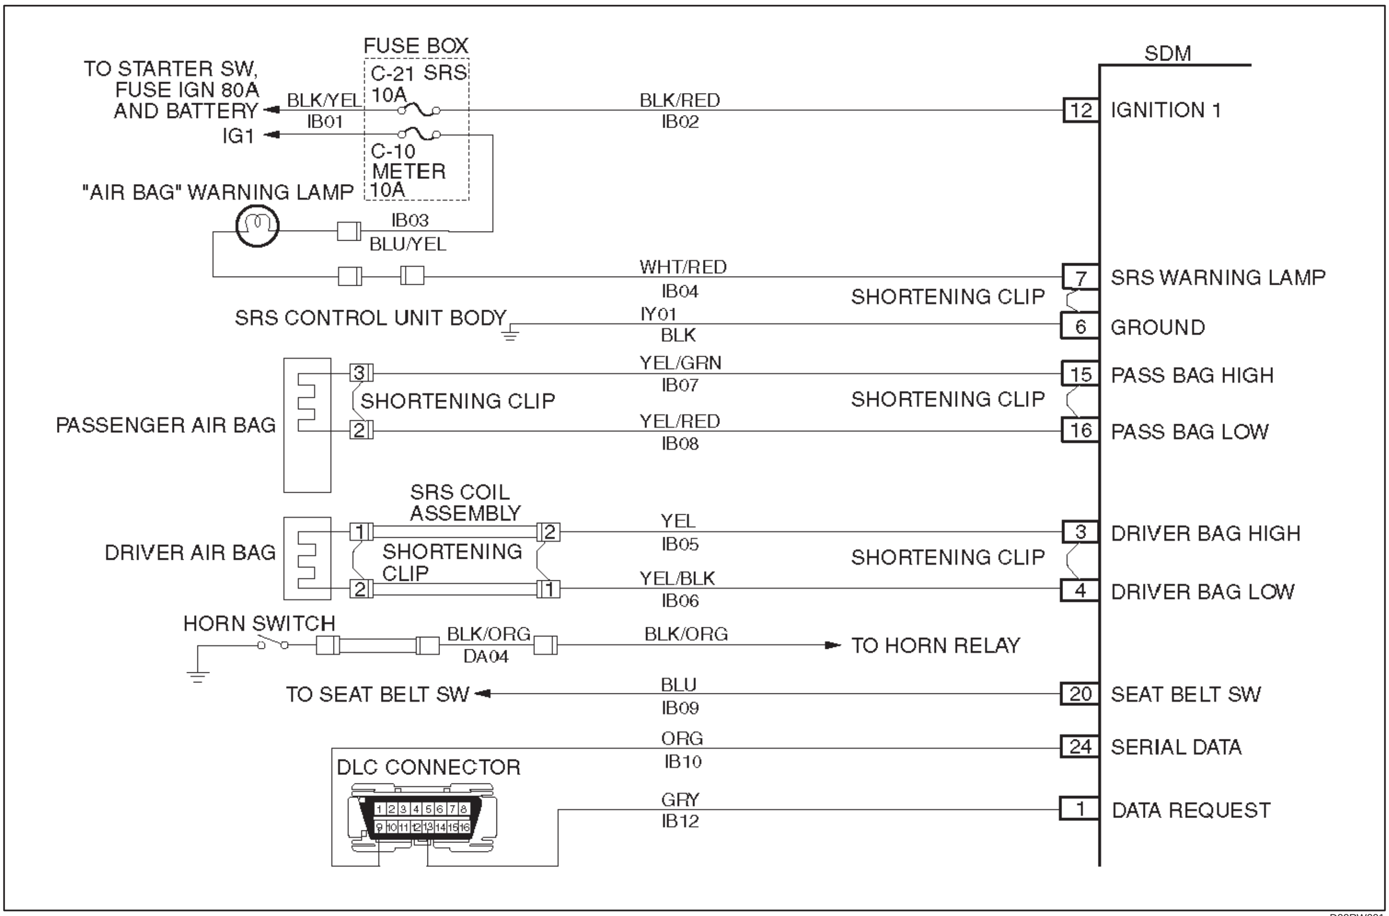
Diagnostic Aids:

An intermittent condition is likely to be caused by a short to ground in the driver air bag assembly circuit. Inspect CKTs IB05–YEL and IB06–YEL/BLK carefully for cutting or chafing.

DTC 24 Driver Deployment Loop Short To Ground

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Ignition switch “OFF.” 3. Connect scan tool data link connector. follow directions as given in the scan tool operator’s manual. 4. Ignition switch “ON.” 5. Read driver sense LO. Is driver sense LO less than 1.5 volts?	Go to Step 3	Go to Chart A
3	1. Ignition switch “OFF.” 2. Disconnect SRS coil assembly yellow 2–pin connector located at base of the steering column. leave passenger air bag assembly connected. 3. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to SRS coil assembly harness connector. 4. ignition switch “ON.” Is DTC 24 current?	Go to Step 4	Go to Step 6
4	1. Ignition switch “OFF.” 2. Disconnect SDM. 3. Disconnect SRS driver / passenger load tool. 4. Measure resistance on SDM harness connector “3” to terminal “6” (ground). Does J–39200 display “OL” (infinite)?	Go to Step 5	Replace SRS harness Go to Step 7
5	measure resistance on SDM harness connector from terminal “4” to terminal “6” (ground). Does J–39200 display “OL” (infinite)?	Go to Chart A	Replace SRS harness Go to Step 7
6	1. Ignition switch “OFF.” 2. Disconnect SRS driver / passenger load tool J–41433 from SRS coil assembly harness connector. 3. connect SRS driver / passenger load tool J–41433 and appropriate adapter J–35616–A to driver air bag assembly harness connector. located top of the steering column 2–pin connector. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch “ON.” Is DTC 24 current?	Ignition switch “OFF” Replace SRS coil assembly Go to Step 7	Ignition switch “OFF” Replace driver air bag assembly Go to Step 7
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Go to the “SRS Diagnostic System Check”	Go to Step 7

DTC 25 Driver Deployment Loop Short To Voltage



D09RW001

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.
The SDM monitors the voltage at “Driver Bag Low” terminal “4” and “Passenger Bag Low” terminal “16” to detect shorts to B+ in the air bag assembly circuits.

DTC Will Set When:

“Ignition 1” is in the normal operating voltage range. This test is run once each ignition cycle and “Continuous monitoring”. Once these conditions are met and the voltage at “Driver Bag Low” is above a specified value, DTC 25 will set.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets DTC 25 and also DTC 71

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the SDM is malfunctioning.
3. This test isolates the malfunction to one side of the driver air bag assembly yellow 2–pin connector at the base of steering column.
4. This test determines whether the malfunction is in CKT IB05–YEL.
5. This test determines whether the malfunction is in CKT IB06–YEL/BLK.
6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids:

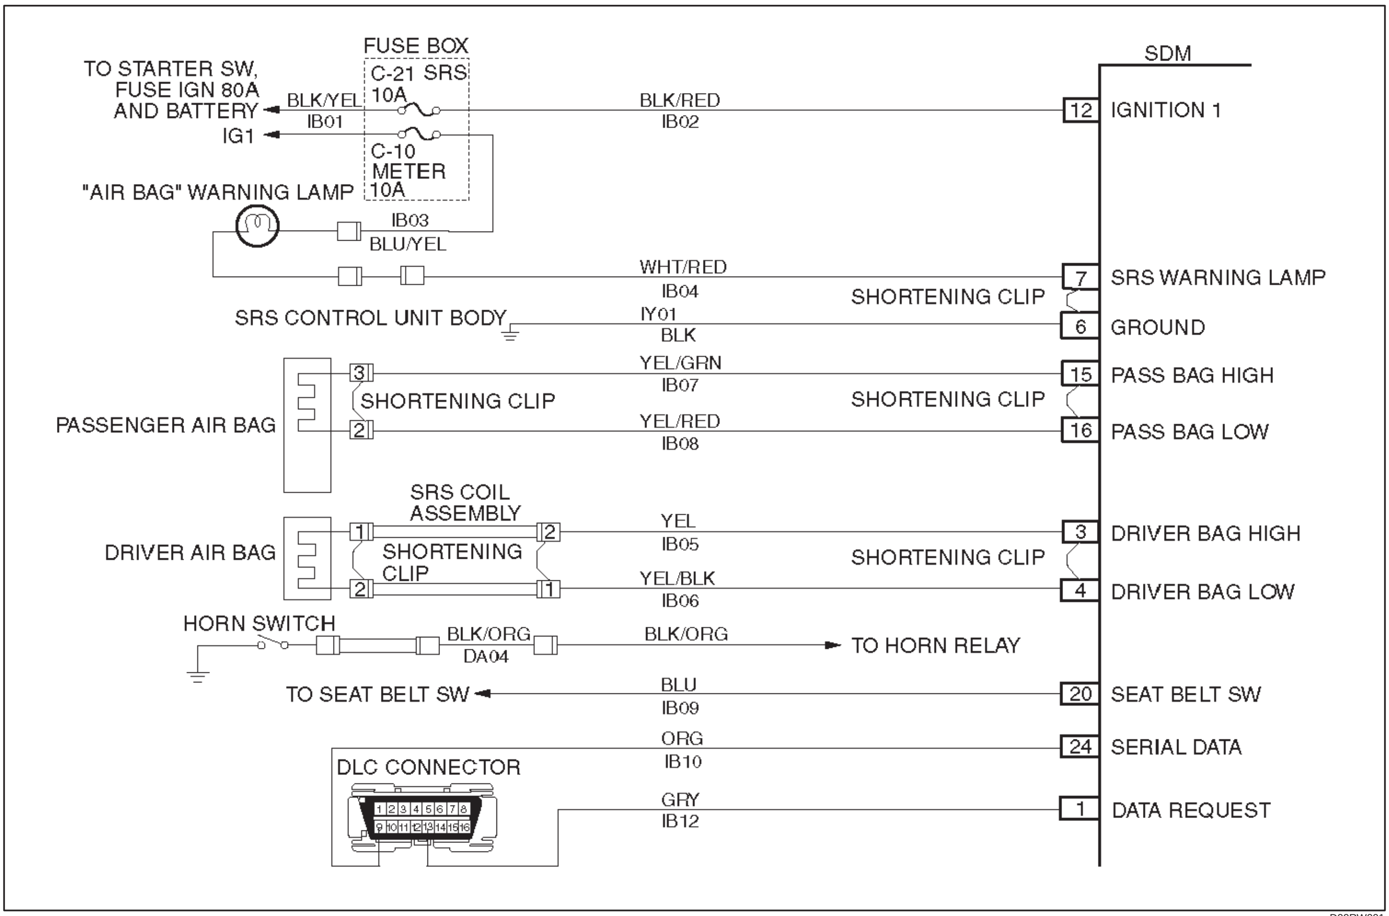
An intermittent condition is likely to be caused by a short to B+ in the driver air bag assembly circuit. Inspect CKTs IB05–YEL and IB06–YEL/BLK carefully for cutting or chafing. If the wiring pigtail of the driver air bag assembly and SRS coil assembly is damaged, the components must be replaced. A careful inspection of CKT IB05–YEL and IB06–YEL/BLK, including the SRS coil assembly and driver air bag assembly is essential to ensure that the replacement SDM will not be damaged.

DTC 25 Driver Deployment Loop Short To Ignition

CAUTION: When DTC 25 has been set, it is necessary to replace the SDM. Setting DTC 25 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is no longer present, DTC 71 will remain current. Ensure that the short to voltage condition is repaired prior to installing a replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check"
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. Ignition switch "OFF." Connect scan tool data link connector. follow directions as given in the scan tool operator's manual. 2. Ignition switch "ON." 3. Read driver sense LO . Is driver sense LO more than 3.5 volts?	Go to Step 3	Go to Chart A
3	1. Ignition switch "OFF." 2. Disconnect SRS coil assembly yellow 2–pin connector at the base of the steering column. leave passenger air bag assembly connected. 3. Connect SRS driver /passenger load tool J–41433 and appropriate adapter to SRS coil assembly harness connector. 4. Ignition switch "ON." Is driver sense LO more than 3.5 volts?	Go to Step 4	Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SDM. 3. Disconnect SRS driver /passenger load tool. 4. Measure resistance on SDM harness connector "3" to terminal "12" (ignition). Does J–39200 display "OL" (infinite)?	Go to Step 5	Replace SRS harness Go to Step 7
5	Measure resistance on SDM harness connector from terminal "4" to terminal "12" (ignition). Does J–39200 display "OL" (infinite)?	Go to Chart A	Replace SRS harness Go to Step 7
6	1. Ignition switch "OFF." 2. Disconnect SRS driver / passenger load tool J–41433 and appropriate adapter J–35616–A to driver air bag assembly harness 2-pin connector located at top of the steering column. 3. Reconnect SRS coil assembly harness connector as the base of steering column. 4. Ignition switch "ON." Is driver sense LO more than 3.5 volts?	Ignition switch "OFF" Replace SRS coil assembly Go to Step 7	Ignition switch "OFF" Replace driver air bag assembly Go to Step 7
7	1. Reconnect all components, ensure all component are properly mounted. 2. Ignition switch "ON." Is passenger senslo less than 3.5 volts?	Ignition switch "OFF" Replace SDM Go to Step 8	Go to Chart A
8	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Go to the "SRS Diagnostic System Check"	Go to Step 8

DTC 26 Driver Deployment Loop Open



D09RW001

Circuit Description:

When the ignition switch is turned "ON", the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "Ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

During "Continuous Monitoring" diagnostics, a fixed amount of current is following in the deployment loop. This produces proportional voltage drops in the loop. By monitoring the voltage difference between "Driver Bag High" and "Driver Bag Low", the SDM calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring CKTs IB05–YEL and IB06–YEL/BLK, and connector terminal contact.

DTC Will Set When:

The voltage difference between "Driver Bag High" terminal "3" and "Driver Bag Low" terminal "4" is above or equal to a specified value for 500 milliseconds during "Continuous Monitoring".

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage difference between "Driver Bag High" terminal "3" and "Driver Bag Low" terminal "4" is below a specified value for 500 milliseconds during "Continuous Monitoring".

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test verifies proper connection of the yellow 2–pin connector at the base of the steering column.
4. This test checks for proper contact and/or corrosion of the yellow 2–pin connector at the base of the steering column.
5. This test isolates the malfunction to one side of the SRS coil assembly yellow 2–pin connector located at the base of steering column.
6. This test determines whether the open is in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

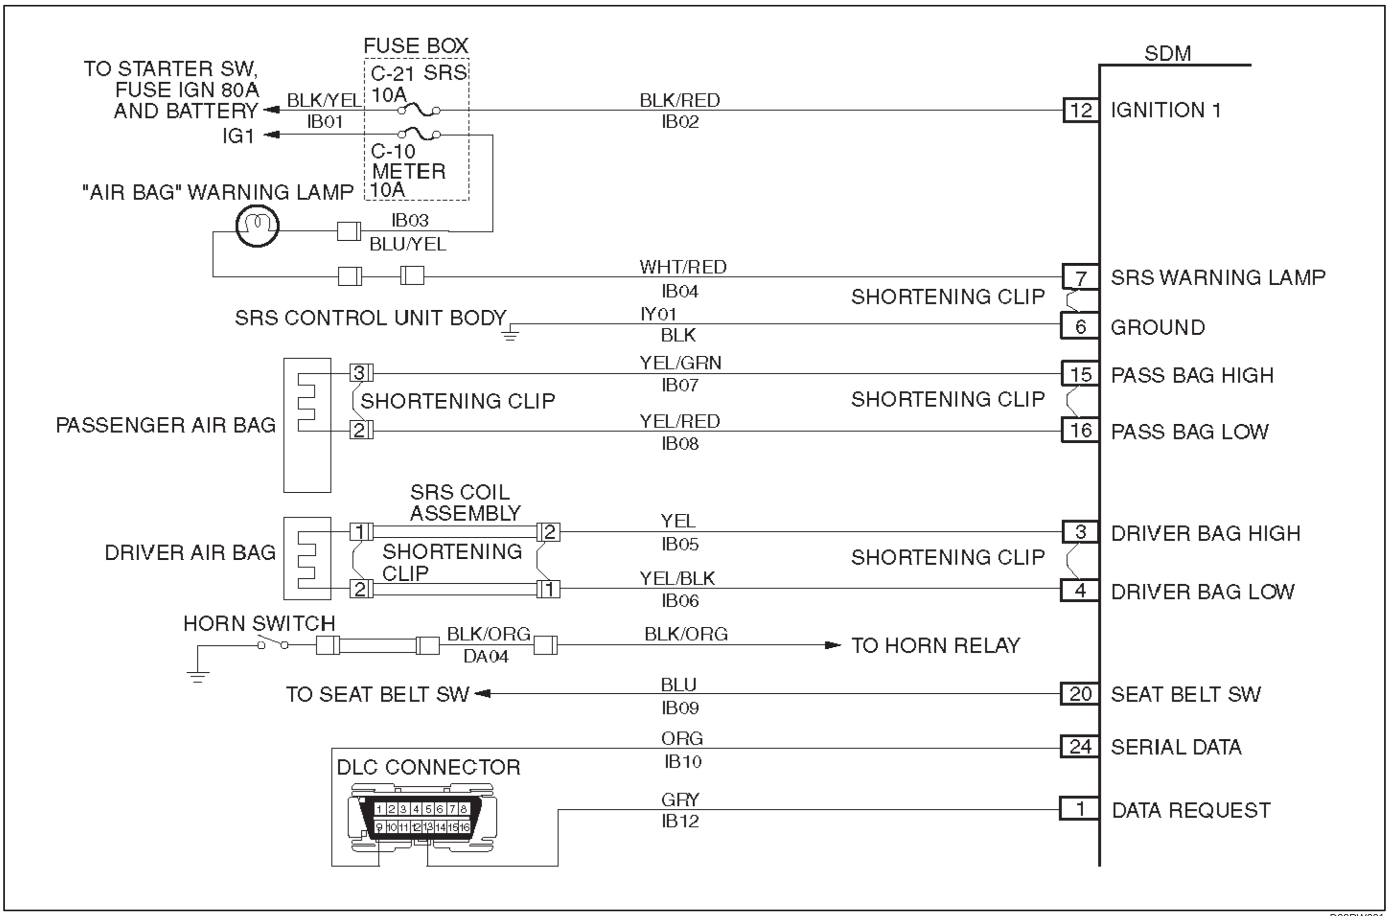
Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the driver air bag assembly harness 2–pin connector terminals "1" and "2" at the top of the steering column, SRS coil assembly harness 2–pin connection terminals "1" and "2", SDM terminals "3" and "4", or an open in CKTs IB05–YEL and IB06–YEL/BLK.

DTC 26 Driver Deployment Loop Open

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use J-39200 DVM with correct terminal adapter from J–35616–A. 2. use scan tool data list function, read and record the driver differential voltage. Is driver VDIF more than 4 volts?	Go to Step 3	Go to Chart A
3	1. Ignition switch “OFF.” 2. Make sure the SRS coil assembly yellow 2–pin connector located at the base of steering column is seated properly. Is the yellow 2–pin connector connected properly?	Go to Step 4	Seat driver air bag assembly 2–pin connector Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2–pin connector located base of steering column. 2. If ok, reconnect the SRS coil assembly yellow 2–pin connector. 3. Ignition switch “ON.” Is DTC 26 current?	Go to Step 5	Go to Step 8
5	1. Ignition switch “OFF”. 2. Disconnect SRS coil and passenger air bag assembly, yellow 2–pin connector located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver/passenger load tool J–41433 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 26 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch “OFF.” 2. there has been an open circuit in the driver inflator deployment loop. 3. use the high resolution ohmmeter mode of the DVM while checking CKTS IB05–YEL and IB06–YEL/BLK, and SDM connector terminal “3” and “4” to locate the root cause. Was a fault found?	Replace SRS harness Go to Step 8	Go to Chart A
7	1. Ignition switch “OFF.” 2. Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. 3. connect SRS driver / passenger load tool J–41433 on steering column 2–pin connector. 4. Reconnect SRS coil assembly harness connector at the base of steering column. 5. Ignition switch “ON.” IS DTC 26 CURRENT?	Ignition switch “OFF” Replace SRS coil assembly Go to Step 8	Ignition switch “OFF” Replace driver air bag assembly Go to Step 8
8	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the “SRS Diagnostic System Check”	Go to Step 8

DTC 51 Deployment Event Commanded



D09RW001

Circuit Description:

The SDM contains a sensing device which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags and causing DTC 51 to set.

DTC Will Set When:

The SDM detects a frontal crash, up to 30 degrees off the centerline of the vehicle, of sufficient force to warrant deployment of the air bags.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp records “Crash Data”, and sets a diagnostic trouble code.

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

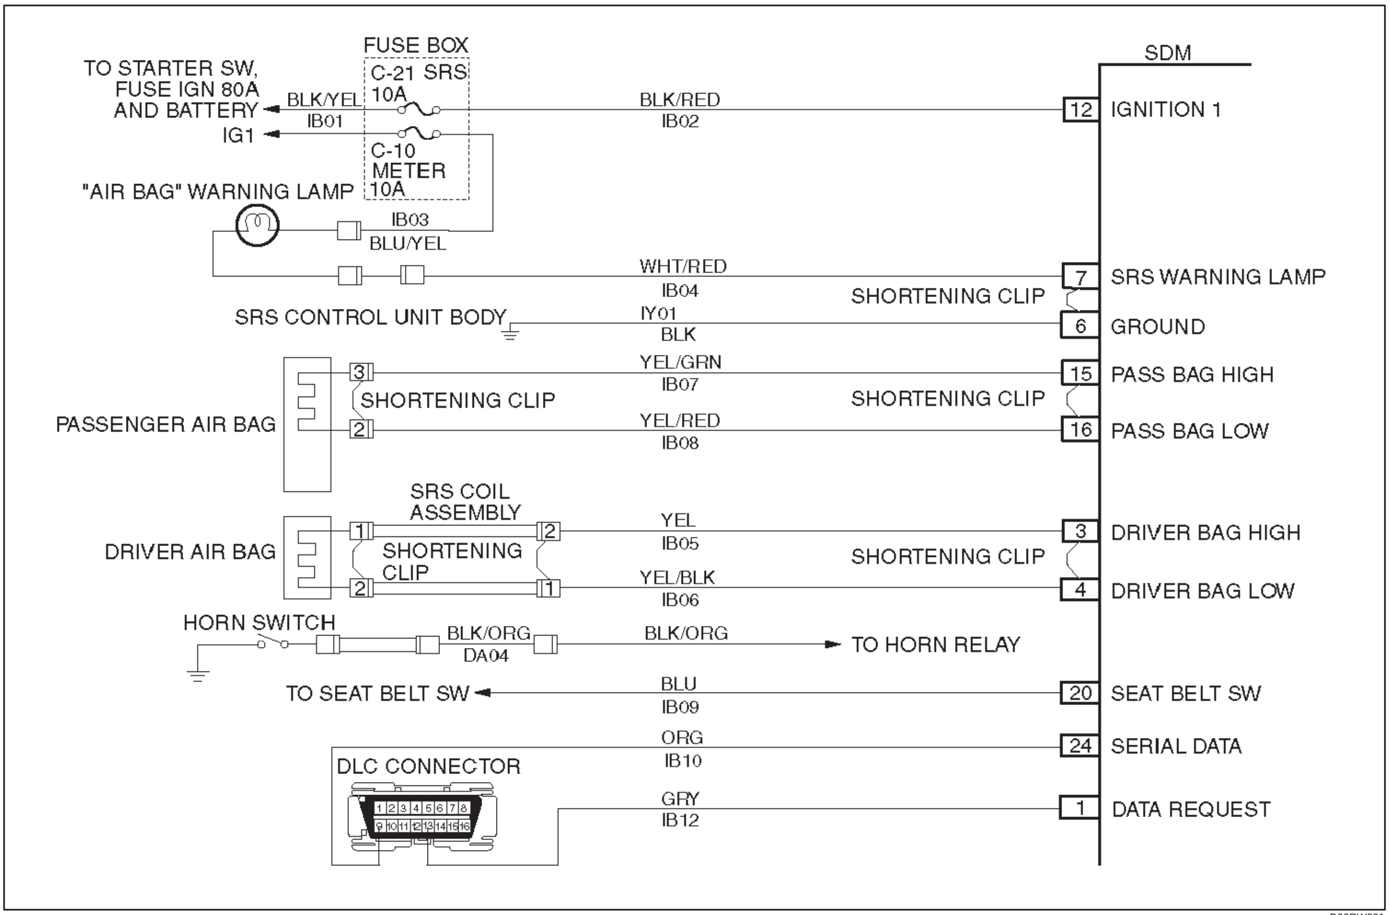
2. If air bag assembly (s) has not deployed, DTC 51 may have falsely set.
3. If DTC 51 has set with no signs of frontal impact, the diagnostic trouble code has falsely set.

DTC 51 Deployment Event Commanded

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	Ignition switch “OFF.” Have air bag assemblies deployed?	Replace components and perform inspections as directed in “repairs and inspections required after an accident” in this section clear diagnostic trouble codes Repeat “SRS Diagnostic System Check”	Go to Step 3
3	Inspect front of vehicle and undercarriage for sings of impact. Were signs of impact found?	Replace components and perform inspections as directed in “Repairs and Inspections Required After An Accident” in this section Clear diagnostic trouble codes Repeat “SRS Diagnostic System Check”	Ignition switch “OFF” Replace SDM Reconnect all SRS system components, ensure all components are properly mounted Repeat “SRS Diagnostic System Check”

DTC 53 Deployment Commanded With Deployment Loop Fault Or Energy Reserves Out Of Range



D09RW001

Circuit Description:

The SDM contains a sensing drive which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags. DTC 53 is set accompanying with DTC 51 when a deployment occurs while an air bag assembly circuit fault is present that could possible result in a no deployment situation in one or both air bag assemblies.

DTC Will Set When:

The SDM detects a frontal crash, up to 30 degrees off the centerline of the vehicle, of sufficient force to warrant deployment of the air bags and an inflator circuit fault is present..

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp records “Crash Data”, and sets a diagnostic trouble code.

DTC Will Clear When:

The SDM is replaced. If DTC 53 is set, one or more DTCs will be set in addition to DTC 53. Malfunction(s) setting DTC(s) (other than DTC 71) must be repaired so that DTC(s) will not be set when a new SDM is installed.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

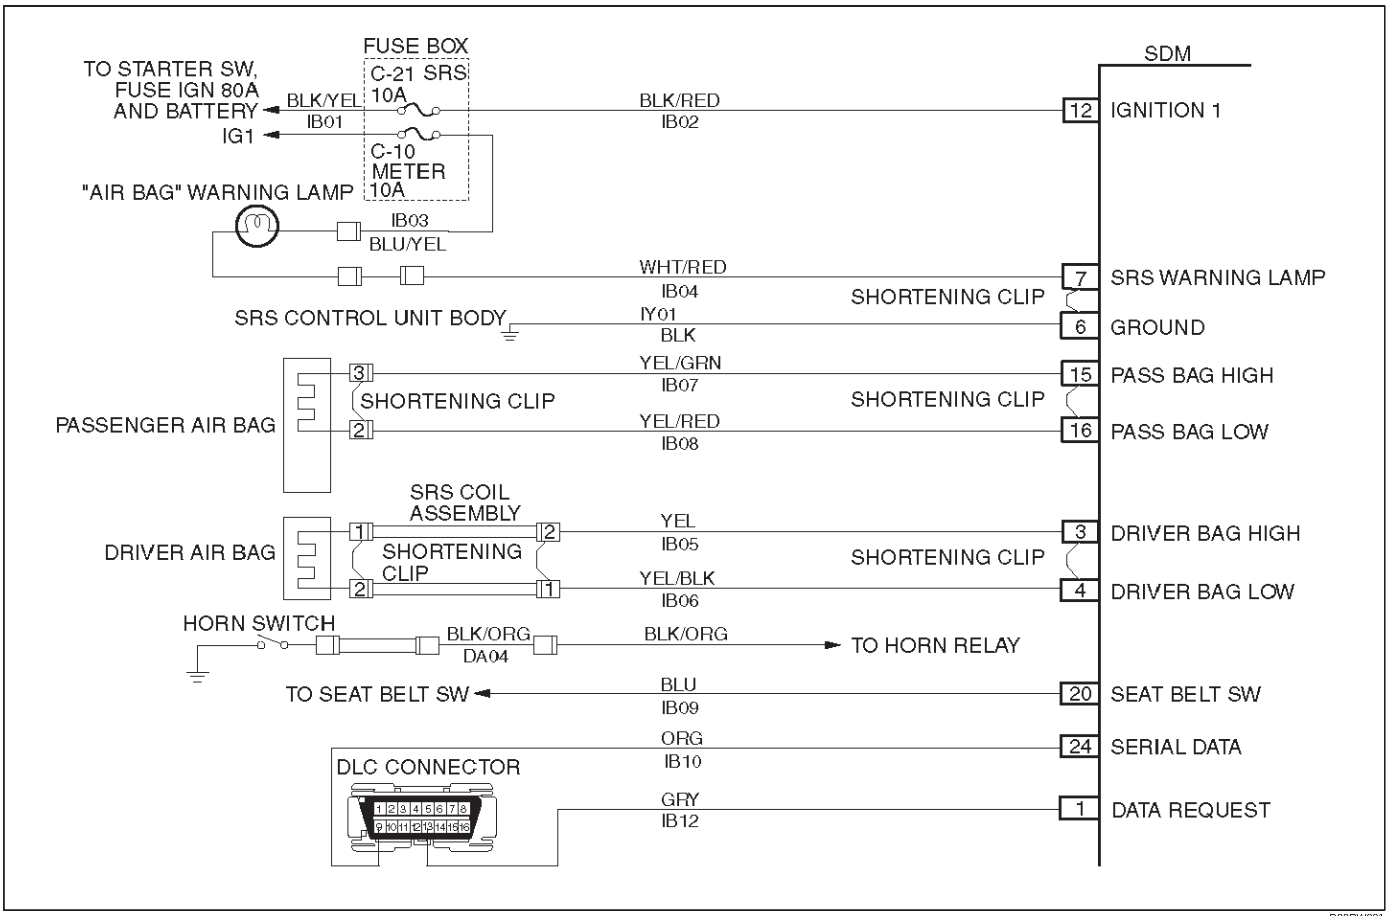
2. If air bag assembly have not deployed, DTC 53 may have falsely set.
3. If DTC 53 has set with no signs of frontal impact, the diagnostic trouble code has falsely set.

DTC 53 Deployment Commanded WITH Deployment Loop Fault Or Energy Reserves Out Of Range

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	Ignition switch “OFF.” Have air bag assembles deployed?	Replace components and perform inspections as directed in “Repairs And Inspections Required After An Accident” in this section Clear diagnostic trouble codes Repeat the “SRS Diagnostic System Check”	Go to Step 3
3	Inspect front of vehicle and undercarriage for signs of impact. Were signs of impact found?	Replace components and perform inspections as directed in “Repairs And Inspections Required After An Accident” in this section Clear diagnostic trouble codes Repeat “SRS Diagnostic System Check”	Ignition switch “OFF” Replace SDM Reconnect all SRS system components, ensure all components are properly mounted Repeat the “SRS Diagnostic System Check”

DTC 61 Warning Lamp Circuit Failure



D09RW001

Circuit Description:

When the ignition switch is turned “ON”, battery voltage is applied to the “AIR BAG” warning lamp and to the “Ignition 1” input terminal “12”. The SDM responds by flashing the “AIR BAG” warning lamp seven times. The SDM monitors the lamp driver output by comparing the output state at “SRS Warning Lamp” terminal “7” to the microprocessor commanded state. When “Ignition 1” is in the specified value, and the output state does not match the commanded state of the lamp driver for 500 milliseconds, DTC 61 is set.

DTC Will Set When:

“Ignition 1” voltage is in the specified value and the output state at the “SRS Warning Lamp” terminal does not match the commanded state of the lamp driver for 500 milliseconds. This test is run every 100 milliseconds during “Continuous Monitoring” tests and once per each ignition cycle at the beginning.

Action Taken:

SDM attempts to turn “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned “OFF.”

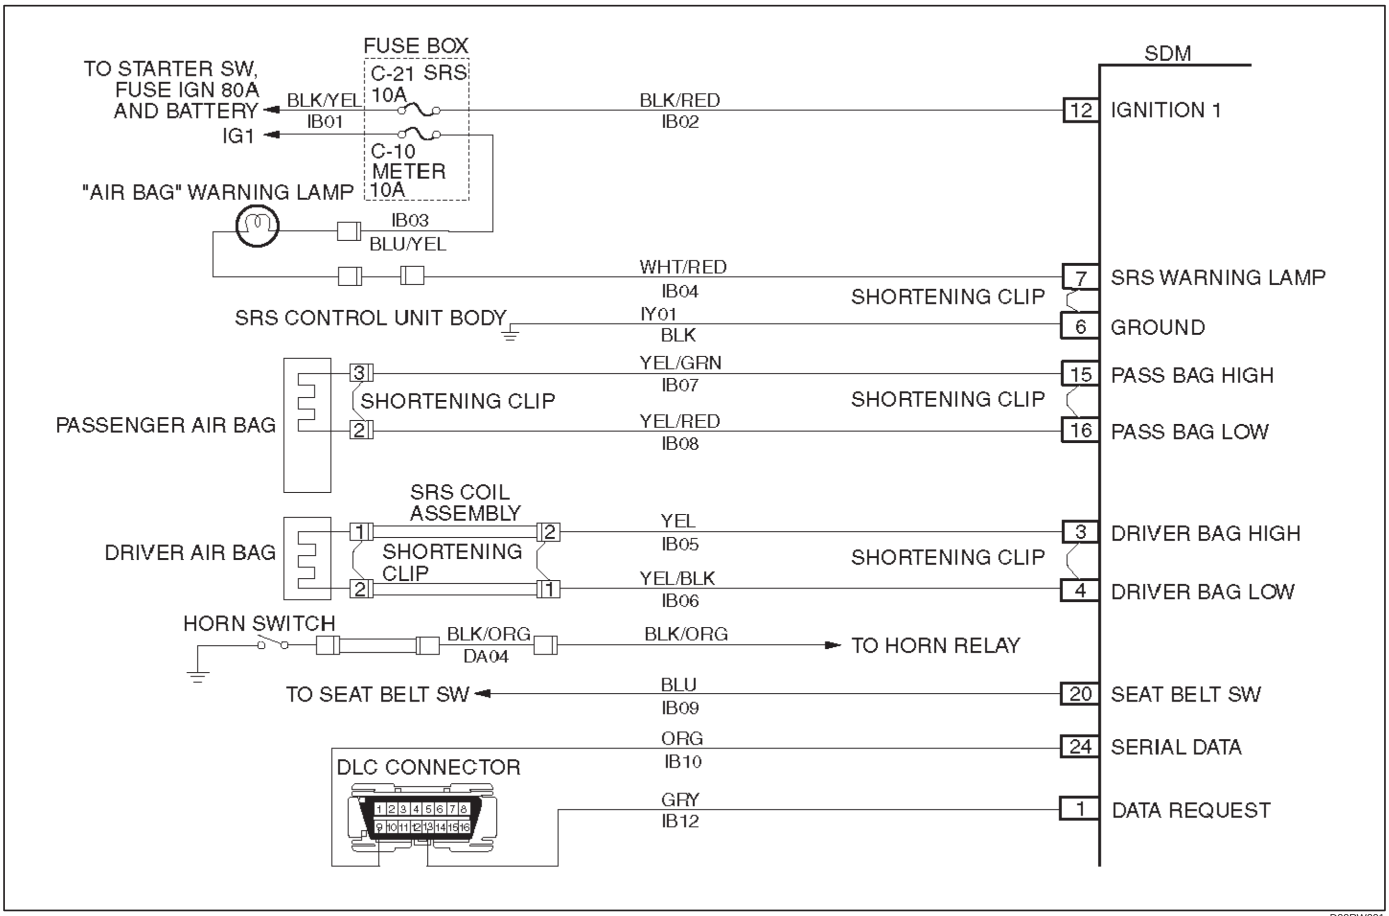
Diagnostic Aids:

Refer to Charts B and C to diagnose warning lamp circuit malfunctions.

DTC 61 Warning Lamp Circuit Failure

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	1. Malfunctions within the “AIR BAG” warning lamp circuitry will set this diagnostic trouble code. 2. These malfunctions are addressed in the “SRS Diagnostic System Check” via Chart B and Chart C. 3. Failure to properly perform the “SRS Diagnostic System Check” may result in misdiagnosis. 4. Ignition switch “ON.” 5. Clear SRS diagnostic trouble codes. IS DTC 61 set?	Ignition switch “OFF.” Go to Chart A.	Repeat the “SRS Diagnostic System Check.”

DTC 71 Internal SDM Fault



D09RW001

Circuit Description:

DTC 71 is an indication of a potential internal SDM malfunction and will set if any of the following conditions are detected:

1) Deployment or microprocessor energy reserve failure.
2) EEPROM failure.
3) ROM failure.
4) RAM failure.
5) Calibration check sum failure.
6) Deployment switch faults.
7) Accelerometer fault.
8) Arming sensor fault.
9) Diagnostic current faults.
10) DTC 19
11) DTC 25
12) DTC 51
13) DTC 53

DTC Will Set When:

Any of the above indicated malfunctions are detected by the SDM. The malfunctions described above are tested mainly during “Continuous Monitoring” and some ones run each ignition cycle.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

A scan tool “Clear Codes” commanded is received by the SDM. Some of the indicated malfunctions will only allow the “AIR BAG” warning lamp to go out.
But when DTC 19, 25, 51, 53 are also set, SDM is replaced.

DTC 71 Internal SDM Fault

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

CAUTION: When DTC 19 or 25 has been set, it is necessary to replace the SDM. Setting DTC 19 and 25 or 51 or 53 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is no longer present, DTC 51 or 53 and DTC 71 will remain current. Ensure that the short to voltage condition DTC 19, 25 is repaired prior to installing a replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check"
2	Note SRS "Diagnostic System Check." Is DTC 19 or 25 or 51 or 53 also set (CURRENT OR HISTORY)? (refeer to notice above.)	Go to DTC 19 if DTC 19 is set Go to DTC 25 if DTC 25 is set Go to DTC 51 if DTC 51 is set Go to DTC 53 if DTC 53 is set	Ignition switch "OFF" Replace SDM Repeat the "SRS Diagnostic System Check"

TROOPER

CONTROL SYSTEM

CRUISE CONTROL SYSTEM

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The cruise control keeps the vehicle running at a fixed speed until a signal canceling this fixed speed is received . When the main switch “AUTO CRUISE” is turned on with the vehicle in the running mode, the battery voltage is applied to the control unit. When a signal from the control switch is input to the PCM while the vehicle is in this state, the cruise control system is activated. Also, while the system is operating, the “AUTO CRUISE” indicator light in the meter assembly lights up.

1. SET/COAST Switch Function

1. **Set Function:** When the SET/COAST switch is pressed and released with the main switch on, the speed at which the vehicle is running at that moment is stored in the memory, and the vehicle automatically runs at the stored speed.
2. **Coast-down Function:** When the SET/COAST switch is kept on while the vehicle in running, the vehicle decelerates during that time. The speed at which vehicle is running when the control switch is turned off is stored in the memory, and the vehicle automatically returns to the stored speed.
3. **Tap-down Function:** When the SET/COAST switch is turned on and off instantaneously while the vehicle is running, the vehicle decelerates a mile for each on/off operation. The vehicle speed at which the vehicle was running when the SET/COAST was turned off last is stored in the memory, and the vehicle automatically returns to this stored speed.

2. RESUME/ACCEL Switch Function

1. **Resume Function:** When the RESUME/ACCEL switch is turned on/off after the system is temporarily deactivated by pressing the brake or clutch pedal while the vehicle is running, the vehicle resumes the speed stored before the system was released, and the vehicle automatically runs at the stored speed .
2. **Accelerate Function:** When the RESUME/ACCEL switch is kept on after the system is released completely, the vehicle accelerates its speed during that time. The vehicle speed at which the vehicle was running when the switch was turned off is stored in the memory, and the vehicle automatically returns to this speed.
3. **Tap-up Function:** When the RESUME/ACCEL switch is turned on and off instantaneously while the vehicle is running, the vehicle accelerates a mile for each on/off operation. The vehicle speed at which the vehicle was running when the switch was turned off last is stored in the memory, and the vehicle automatically returns to this stored speed.

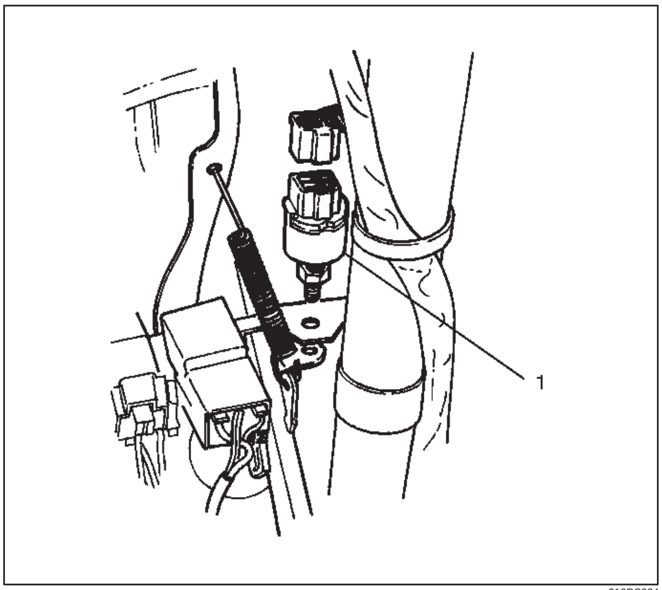
3. CANCEL Function

1. **Temporary Cancellation:**
   - When the cancel switch is turned on.
   - When the brake pedal is pressed.
   - When the clutch pedal is pressed. (M/T)
   - When the select lever is shifted to any position other than “D”, “3”, “2” or “L”. (A/T)
   - When the cancel switch is operated.
   - When the vehicle speed exceeds about 12.5mph over the vehicle speed stored in the memory.
   - Turning the RESUME/ACCEL switch will return the vehicle to the speed stored in the cruise control memory.
   - When the vehicle speed gets lower than 20 mph (32 km/h).
2. **Complete Cancellation:**
   - When the starter switch or the main switch is turned off.
   - When the fail-safe function is activated.
   - When the vehicle speed is about 24 mph.

Brake Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the brake switch (1).
   - Disconnect the connector.
   - Loosen the lock nuts of the switch.
   - Remove the switch by turning it.

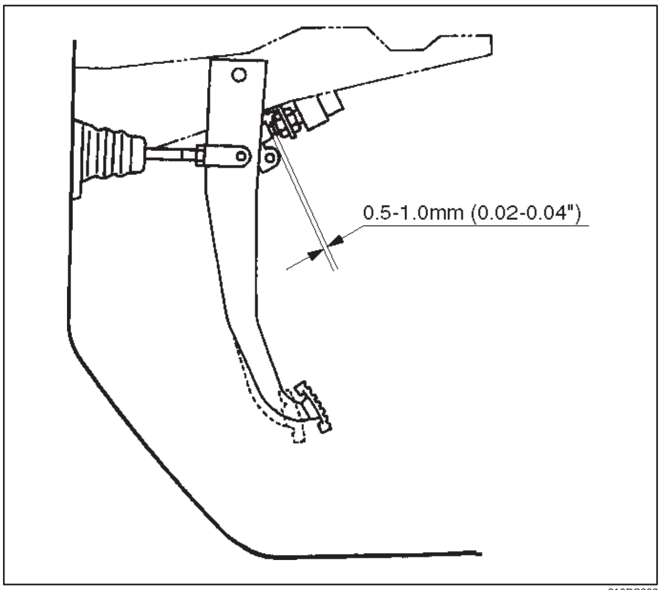


310RS004

Installation

To install, follow the removal steps in the reverse order, noting the following points.

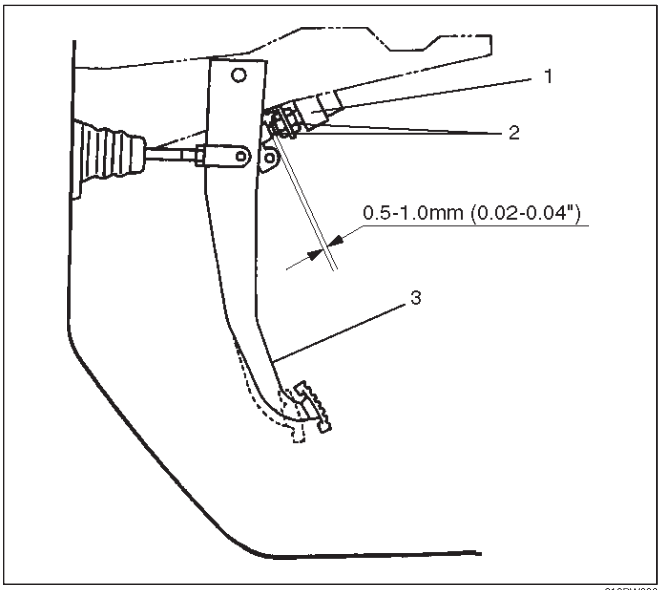
1. Check to see if the brake pedal has been returned by the return spring to the specified position.
2. Turn the switch clockwise until the tip of the threaded portion of the brake switch contacts the pedal arm.
3. Turn the switch counterclockwise until the space between the tip of the threaded portion and the pedal arm is 0.5 to 1.0 mm (0.02-0.04 in.) as shown in the figure.



310RS003

Adjustment

1. Check to be sure that the brake pedal (3) has been completely returned by the return spring.
2. Disconnect the switch connector.
3. Loosen the lock nut (1) of the switch (2).
4. Turn the switch clockwise until the tip of screw portion of the brake pedal hits the pedal arm.
5. Turn the switch counterclockwise until the clearance between the tip of the screw portion and the pedal arm becomes 0.5 to 1.0 mm (0.02-0.04 in).
6. Tighten the lock nut.
7. Connect the switch connector.



310RW006

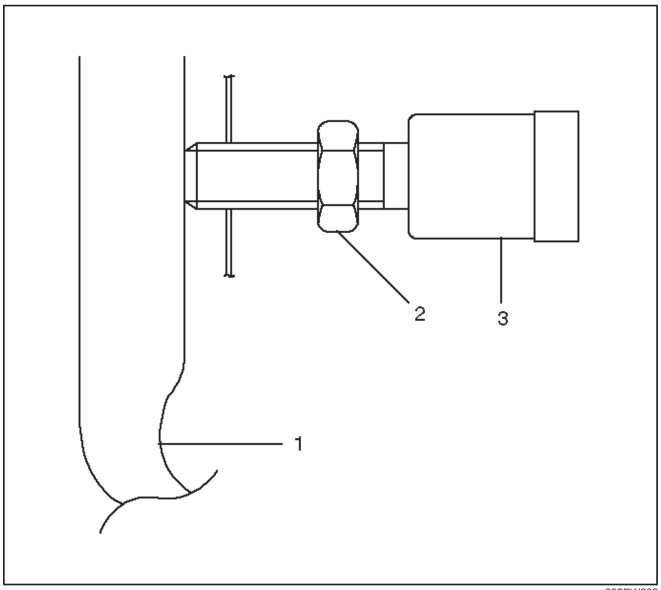
Clutch Switch

Removal and Installation

Refer to the Clutch Control removal and installation steps in Clutch section.

Adjustment

1. Check to be sure that the clutch pedal (1) has been completely returned by the return spring.
2. Disconnect the switch connector.
3. Loosen the lock nut (2) of the switch (3).
4. Push the switch by hand until the push rod cannot be seen from the tip portion of the switch.
5. Give the switch one reverse rotation.
6. Tighten the lock nut.
7. Connect the switch connector.

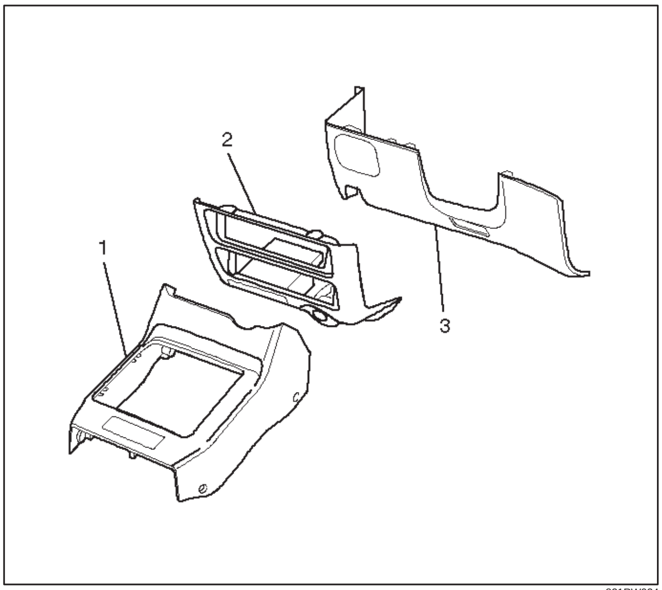


203RW002

Starter Switch

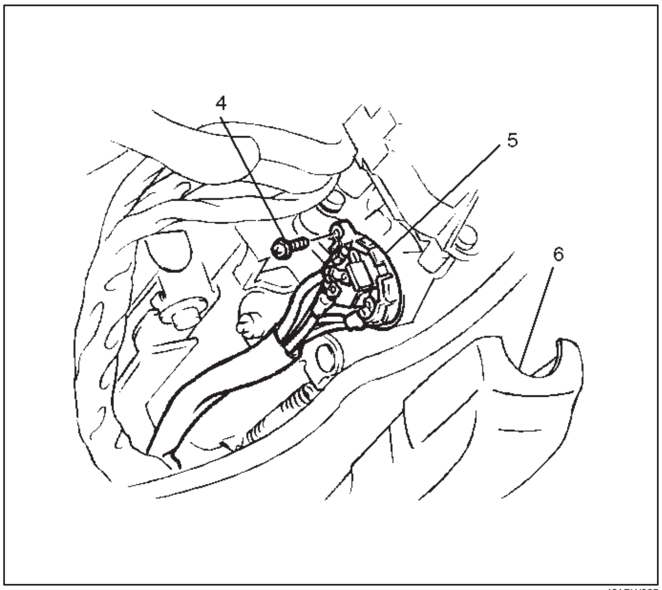
Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly (1). Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly (2). Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover assembly (3). Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove seven screws to remove the steering cowl (6).
6. Disconnect the connector, remove the screw (4) and then remove the starter switch (5).

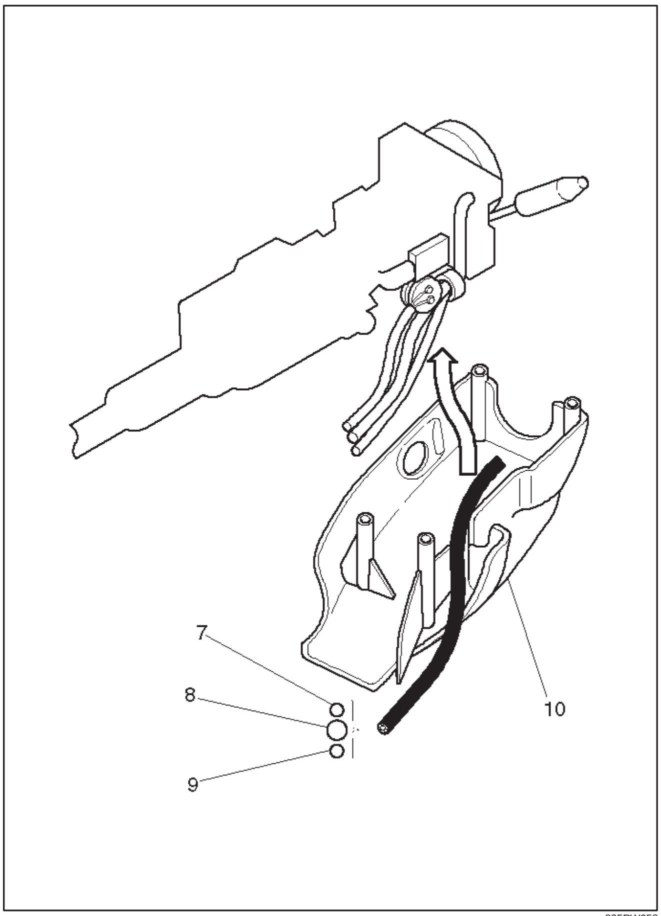


431RW005

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. When installing the steering cowl (10), be sure to pass the harnesses through the route as shown in the figure so that the starter switch harness (7), the combination switch harness (8) and the inflator module harness (9) will not catch.

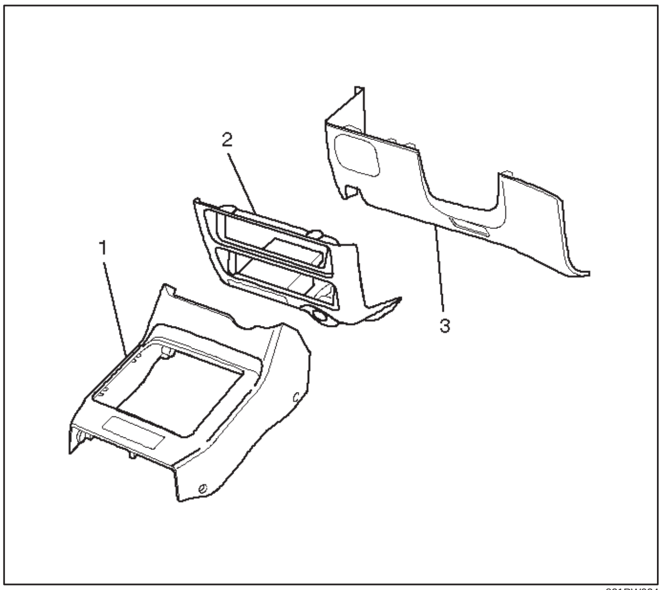


825RW058

Cruise Control Main Switch

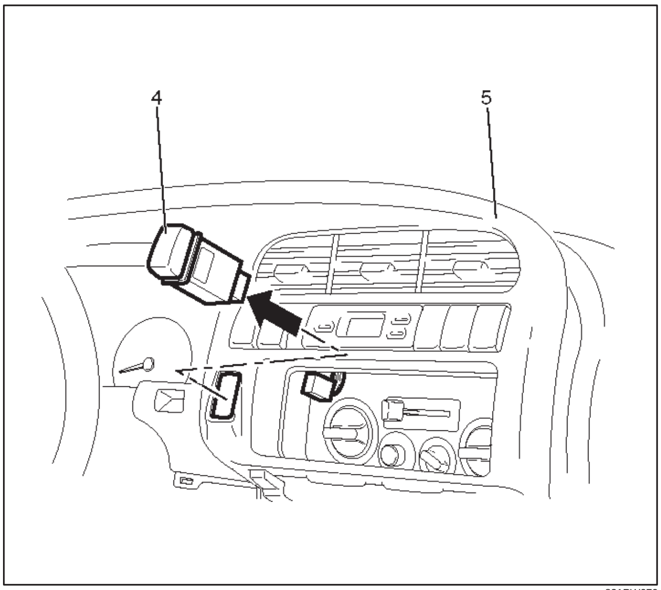
Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly (1). Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the lower cluster assembly (2). Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the instrument panel driver lower cover assembly (3). Refer to the Instrument Panel Assembly in Body Structure section.



821RW024

5. Remove the instrument panel cluster assembly (5). Refer to the Instrument Panel Assembly in Body Structure section.
6. Disconnect the and push the lock from the side of the instrument panel cluster assembly to remove the cruise control main switch (4).



821RW079

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Push in the switch with your fingers until the switch is locked securely.

Cruise Control Switch (Combination Switch)

Removal and Installation

Refer to the Lighting Switch (Combination Switch) removal and installation steps of Lighting System in Body and Accessories section.

Powertrain Control Module (PCM)

Removal and Installation

Refer to Powertrain Control Module (PCM) in Engine section.

Mode Switch

Removal and Installation

Refer to the Mode Switch removal and installation steps in Automatic Transmission section.

Diagnosis

Cruise control system is controlled by the PCM as well as 6VE1 engine and automatic transmission. DTC codes are stored in the PCM if troubles occur in the circuit. DTC codes categorized “type D” are shown only by the Tech 2 scan tool. The following chart only shows some typical DTCs for cruise control system. Refer to PCM Diagnostic Trouble Codes in Driveability and Emissions for entire DTC diagnosis.

DTC	TROUBLE PART	DTC TYPE	MAJOR CONDITION OF TROUBLE	DIAGNOSIS PERIOD
P0565	CRUISE MAIN CIRCUIT	D	• THE SWITCH CONTACT REMAINS ON FOR 15 SECONDS OR MORE. • NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 60 TIMES WITHIN 1 SECOND.	DIAGNOSIS IS ENABLED IN 130 SECONDS AFTER THE SWITCH OPERATED.
P0566	CRUISE CANCEL CIRCUIT	D	• THE SWITCH CONTACT REMAINS ON FOR 40 SECONDS OR MORE. • NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 100 TIMES WITHIN 1.6 SECONDS.	DIAGNOSIS IS ENABLED IN 120 SECONDS AFTER THE SWITCH OPERATED.
P0567	CRUISE RESUME CIRCUIT	D	• THE SWITCH CONTACT REMAINS ON FOR 50 SECONDS OR MORE. • NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 100 TIMES WITHIN 1.6 SECONDS.	DIAGNOSIS IS ENABLED IN 110 SECONDS AFTER THE SWITCH OPERATED.
P0568	CRUISE SET CIRCUIT	D	• THE SWITCH CONTACT REMAINS ON FOR 120 SECONDS OR MORE. • NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 100 TIMES WITHIN 1.6 SECONDS.	DIAGNOSIS IS ENABLED IN 125 SECONDS AFTER THE SWITCH OPERATED.

DTC: Diagnostic Trouble Code

NOTE: The DTCs are detected while the engine is running

General Information

CONTENTS

General Repair Instruction

1. If a floor jack is used, the following precautions are recommended.
   Park vehicle on level ground, "block" front or rear wheels, set jack against the recommended lifting points (see "Lifting Instructions" in this section), raise vehicle and support with chassis stands and then perform the service operations.
2. Before performing service operations, disconnect ground cable from the battery to reduce the chance of cable damage and burning due to short circuiting.
3. Use a cover on body, seats and floor to protect them against damage and contamination.
4. Brake fluid and anti–freeze solution must be handled with reasonable care, as they can cause paint damage.
5. The use of proper tools and recommended essential and available tools, where specified, is important for efficient and reliable performance of service repairs.
6. Use genuine Isuzu parts.
7. Used cotter pins, plastic clips, gaskets, O–rings, oil seals, lock washers and self–locking nuts should be discarded and new ones should be installed, as normal function of the parts cannot be maintained if these parts are reused.
8. To facilitate proper and smooth reassembly operation, keep disassembled parts neatly in groups. Keeping fixing bolts and nuts separate is very important, as they vary in hardness and design depending on position of installation.
9. Clean the parts before inspection or reassembly. Also clean oil ports, etc. using compressed air, and make certain they are free from restrictions.
10. Lubricate rotating and sliding faces of the parts with oil or grease before installation.
11. When necessary, use a sealer on gaskets to prevent leakage.
12. Carefully observe all specifications for bolt and nut torques.
13. When removing or replacing parts that require refrigerant to be discharged from the air conditioning system, be sure to use the Vehicle Refrigerant Recovery and Recycling Equipment (VRRRE) to recover and recycle Refrigerant–134a.
14. When a service operation is completed, make a final check to be sure the service has been done properly and the problem has been corrected.
15. SUPPLEMENTAL RESTRAINT SYSTEM
    The vehicle is equipped with a Supplemental Restraint System (SRS) – Air Bags. This system is not to be serviced without consulting the appropriate service information. Consult Section 9J "SRS System" if work is to be done on the front of the vehicle such as bumper, sheet metal, seats, wiring, steering wheel or column. Also review SRS system information if any arc welding is to be done on the vehicle. The SRS system equipped vehicle can be identified by:
    1. "AIR BAG" warning light on the instrument cluster.
    2. A Code "K" or "M" for fifth digit of Vehicle Identification Number.

Illustration Arrows

Arrows are designed for specific purposes to aid your understanding of technical illustrations.

Arrow Type	Application
	Front of vehicle
	Up Side
	Task Related
	View Detail

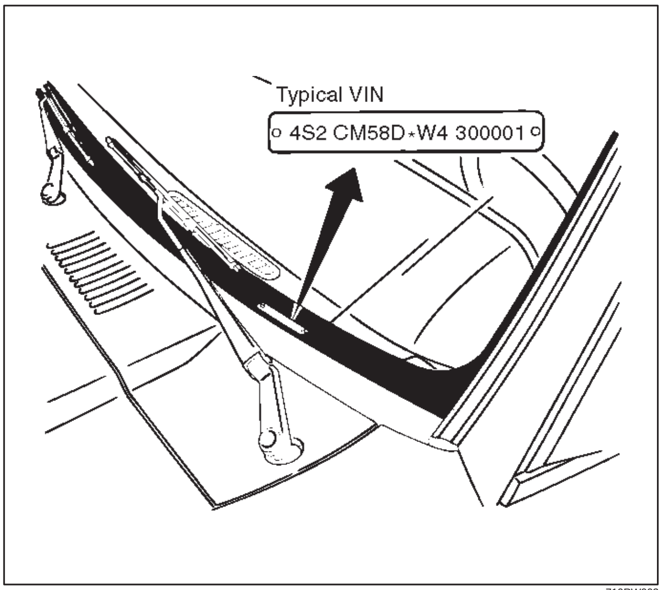
	Sectioning (1:3)

Arrow Type	Application
	• Ambient/Clean air flow • Cool air flow
	• Gas other than ambient air • Hot air flow
	• Ambient air mixed with another gas • Can indicate temperature change
	Motion or direction
	Lubrication point oil or fluid
	Lubrication point grease
	Lubrication point jelly

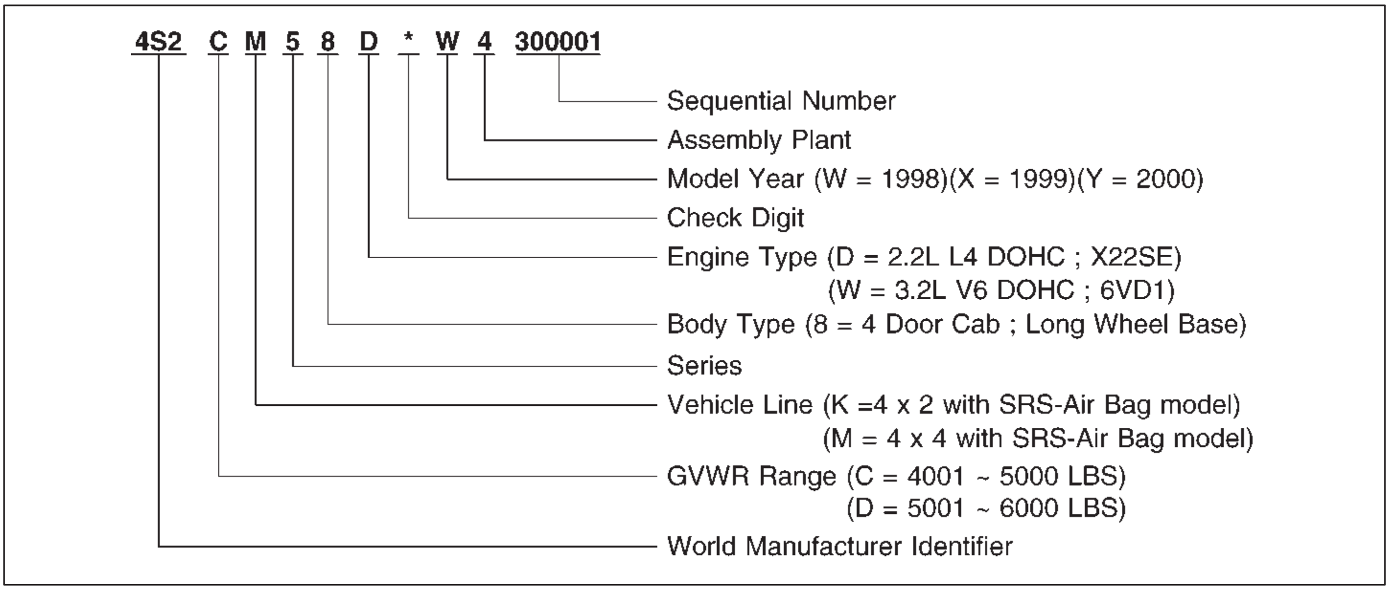
Identification

Vehicle Identification Number (VIN)

This is the legal identification of the vehicle. it is located on the left bottom of the windshield. It can be easily seen through the windshield from outside the vehicle.



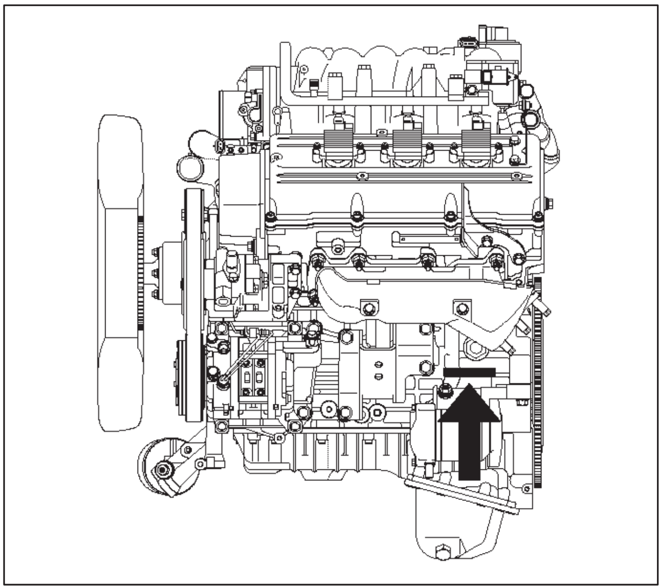
710RW003



Engine Serial Number

- **6VD1 Engine**

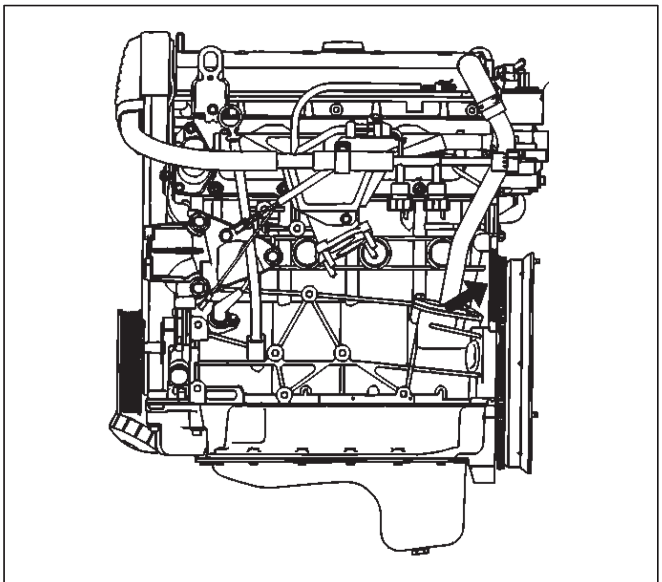
The gasoline engine serial number is stamped on the left rear lower area of the cylinder block above the starter.



F06RW001

- **X22SE Engine**

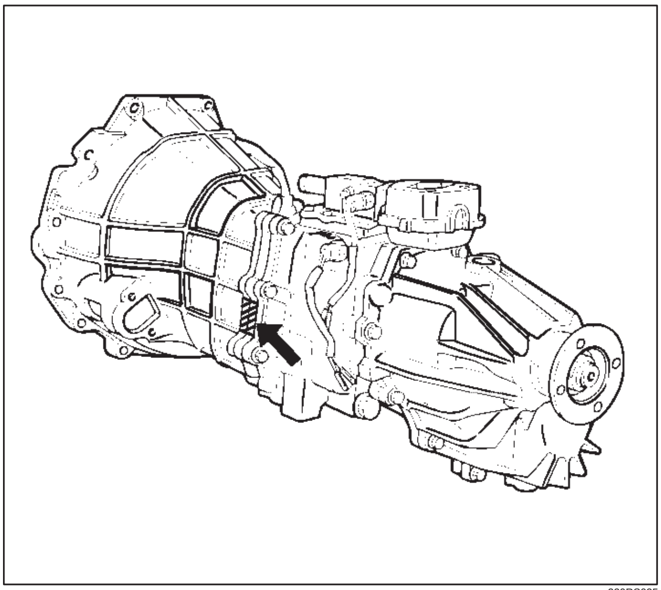
The gasoline engine serial number is stamped on the rear end raised area of the cylinder block left side.



035RW022

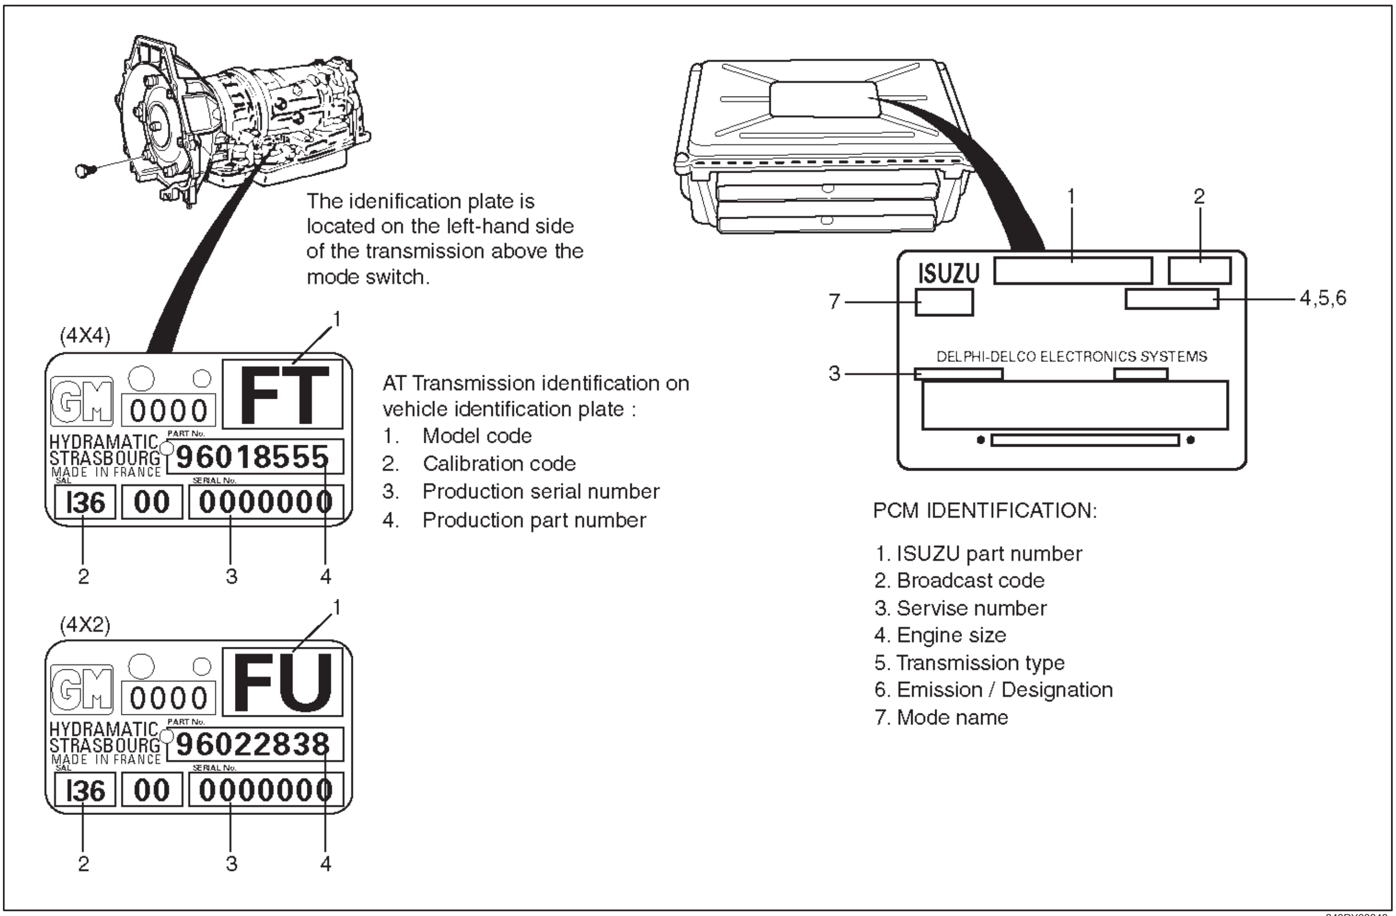
Transmission Serial Number

Manual : Stamped on the left side of the transmission intermediate plate.



220RS025

Automatic : Stamped on the identification plate, located on the left side of the transmission above the mode switch.



240RY00040

Theft Prevention Standard

The 11 major components listed below will be marked with 17 digit VIN at the stage of production. In addition its service parts will be marked with manufacturer's trade mark, "R" mark and "DOT" mark.

Reference Figure No.	COMPONENT		INDICATION	
			PRODUCTION	SERVICE PARTS
0A-10	ENGINE	1– 6VD1 – X22SE	VIN plate	"R DOT" Mark stamping
0A-11	TRANSMISSION	2– Manual transmission – Automatic transmission	VIN plate	"R DOT" Mark stamping
0A-11	BODY	3– Engine hood 4– Front door 5– Rear door 6– Fender 7– Rear Quarter panel 8– Front bumper 9– Back door left side 10– Back door right side 11– Rear bumper	VIN label	"R DOT" Mark label

Anti Theft Stamping/Plate/Label

SERVICE PARTS	R DOT	R DOT

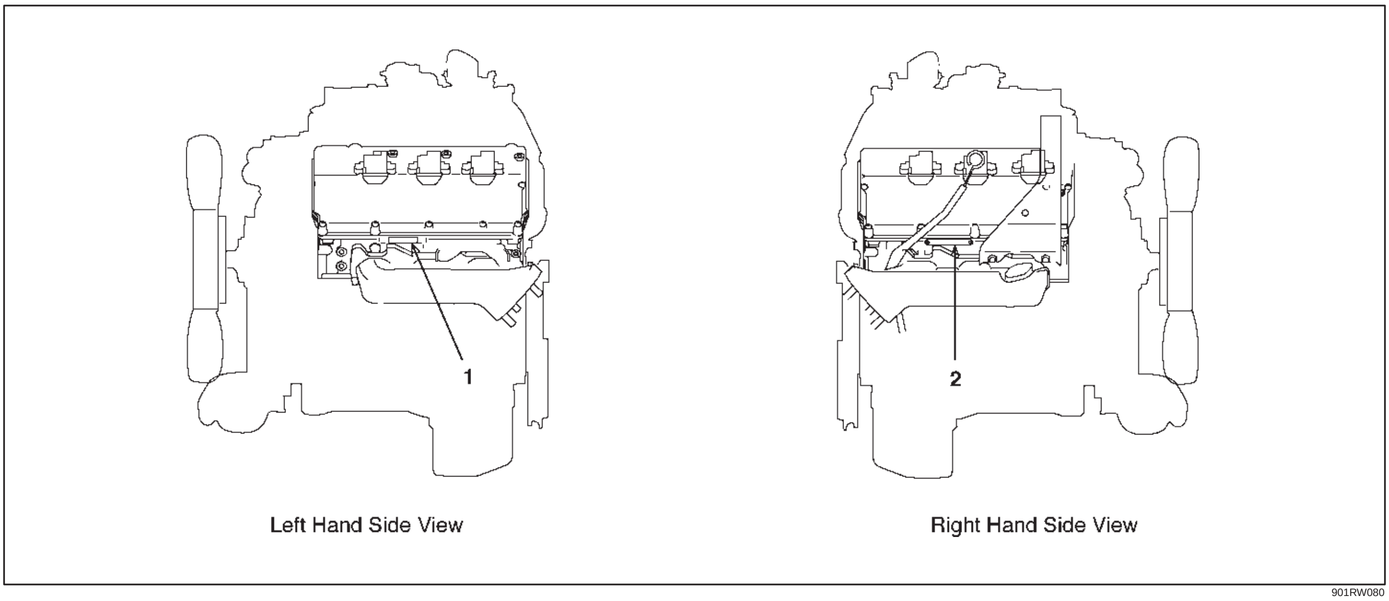
Anti Theft Stamping/Label/Plate Location

The stamping, label and plate locations are indicated by arrows in the illustration below.

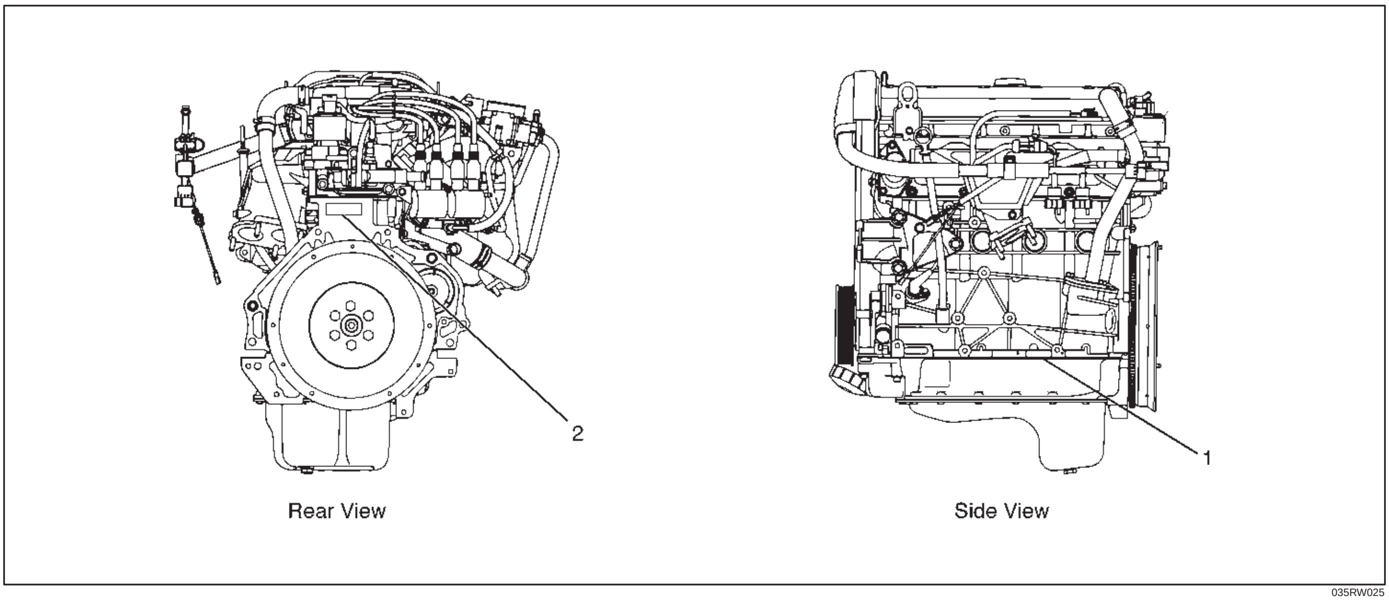
NOTE:

1. VIN plate locations for production.
2. Stamping locations for service parts.

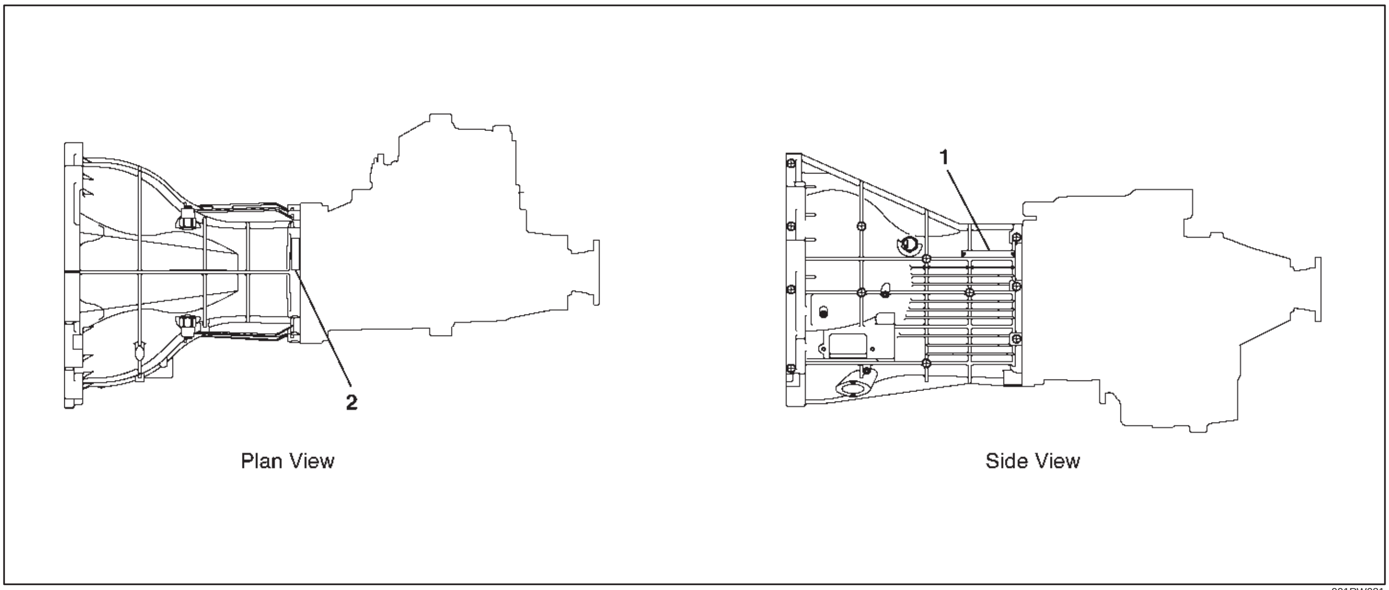
Engine (6VD1)



Engine (X22SE)

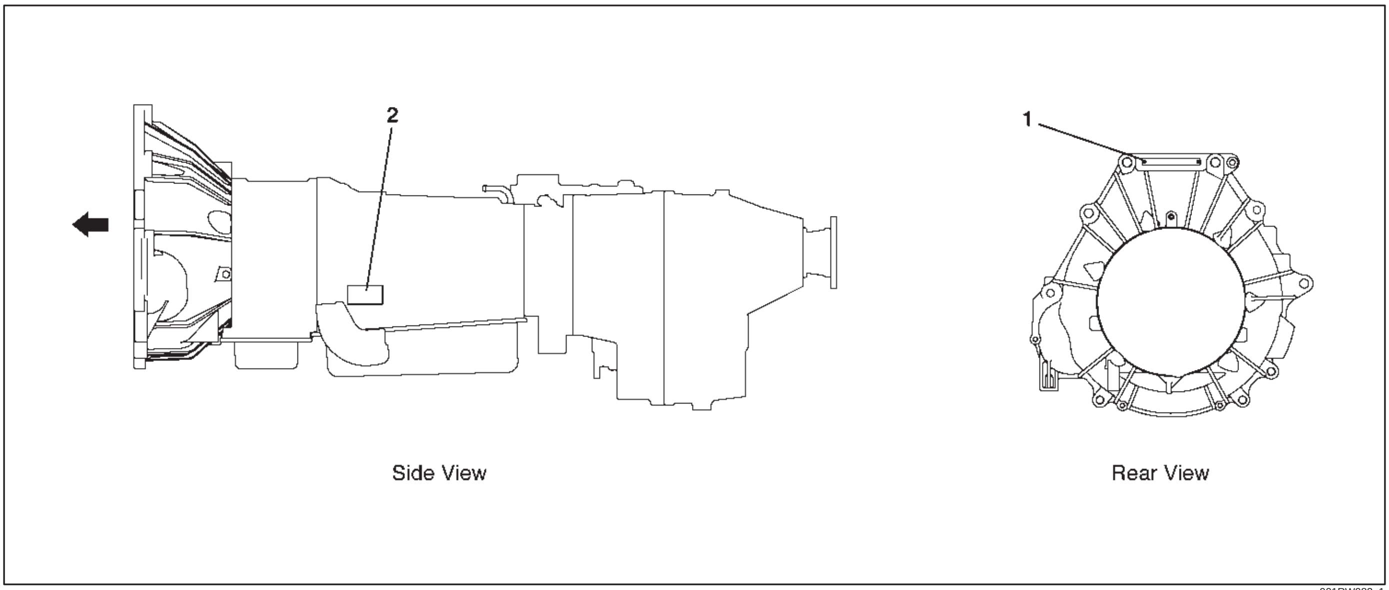


Manual Transmission (MUA)



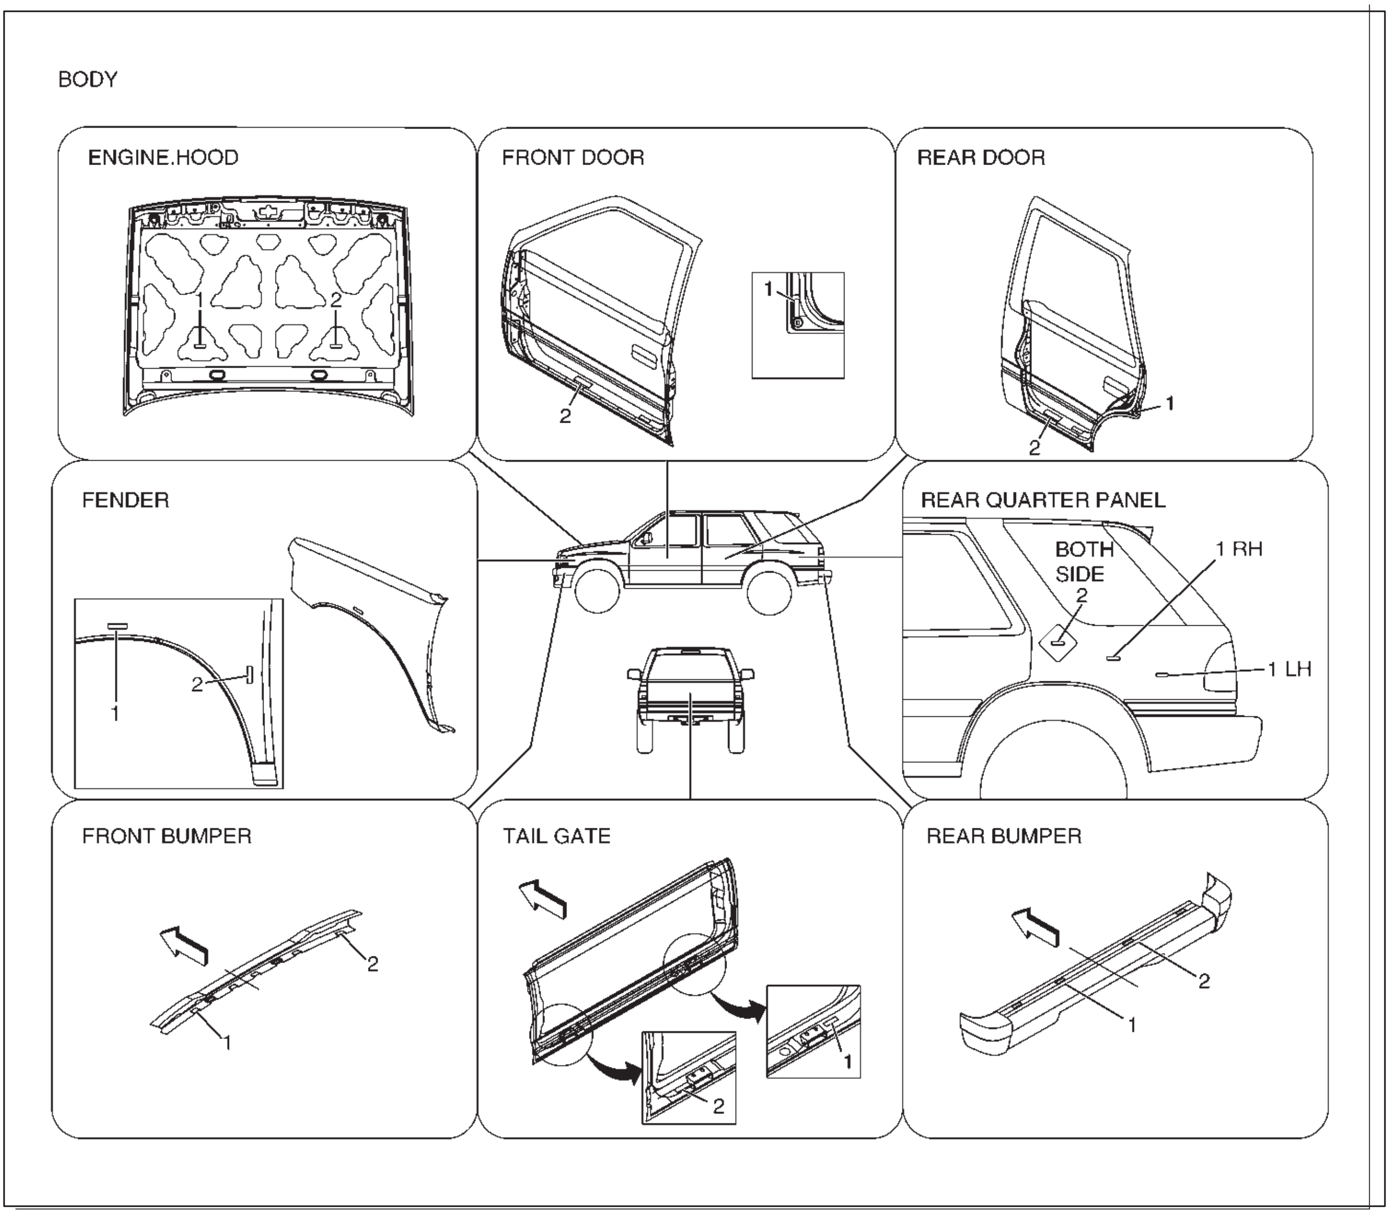
901RW081

Automatic Transmission (THM)



901RW082–1

Body



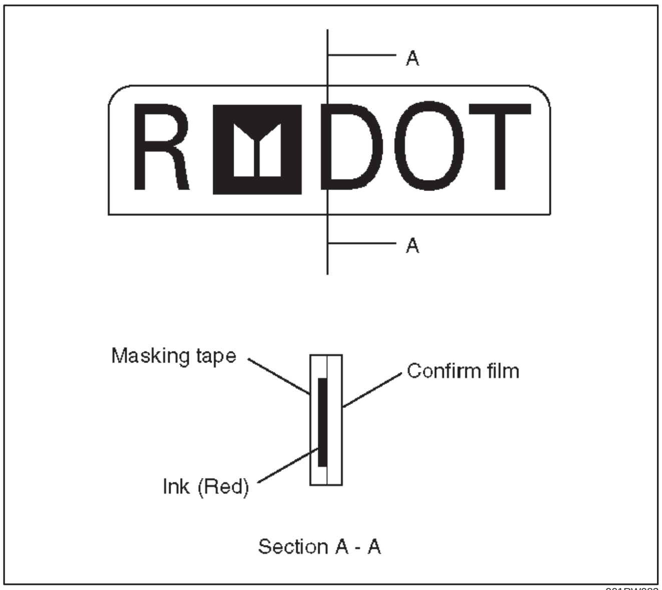
604RW023

Body Label Instructions

Do not peel off the masking tape until completion of paint work when replacing these parts, as the tape is affixed on the label attached to service parts for body of the anti–theft component.

NOTE: Be sure to pull off the masking tape after paint work has been completed.

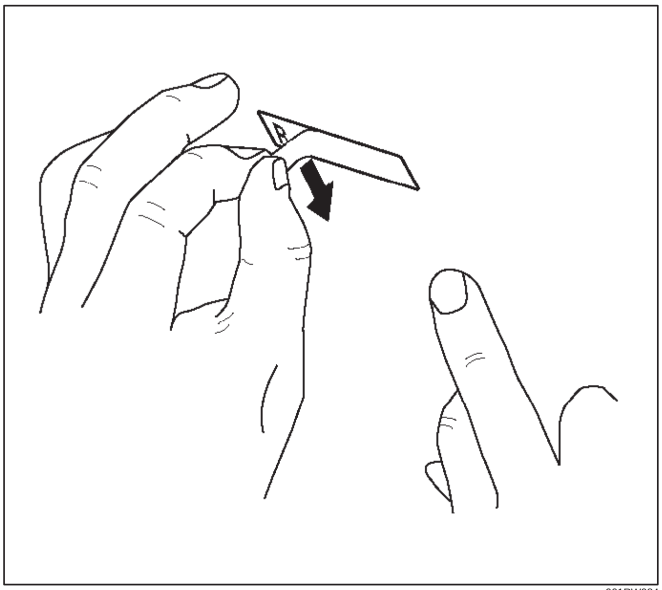
Do not attempt to remove this label for any reason.



901RW083

Precautions in pulling off the masking tape

1. Use only your finger nail or a similar blunt instrument to peel off the masking tape. Use of a sharp object will damage the underlying anti–theft label.
2. Be careful not to damage the paint around the label.



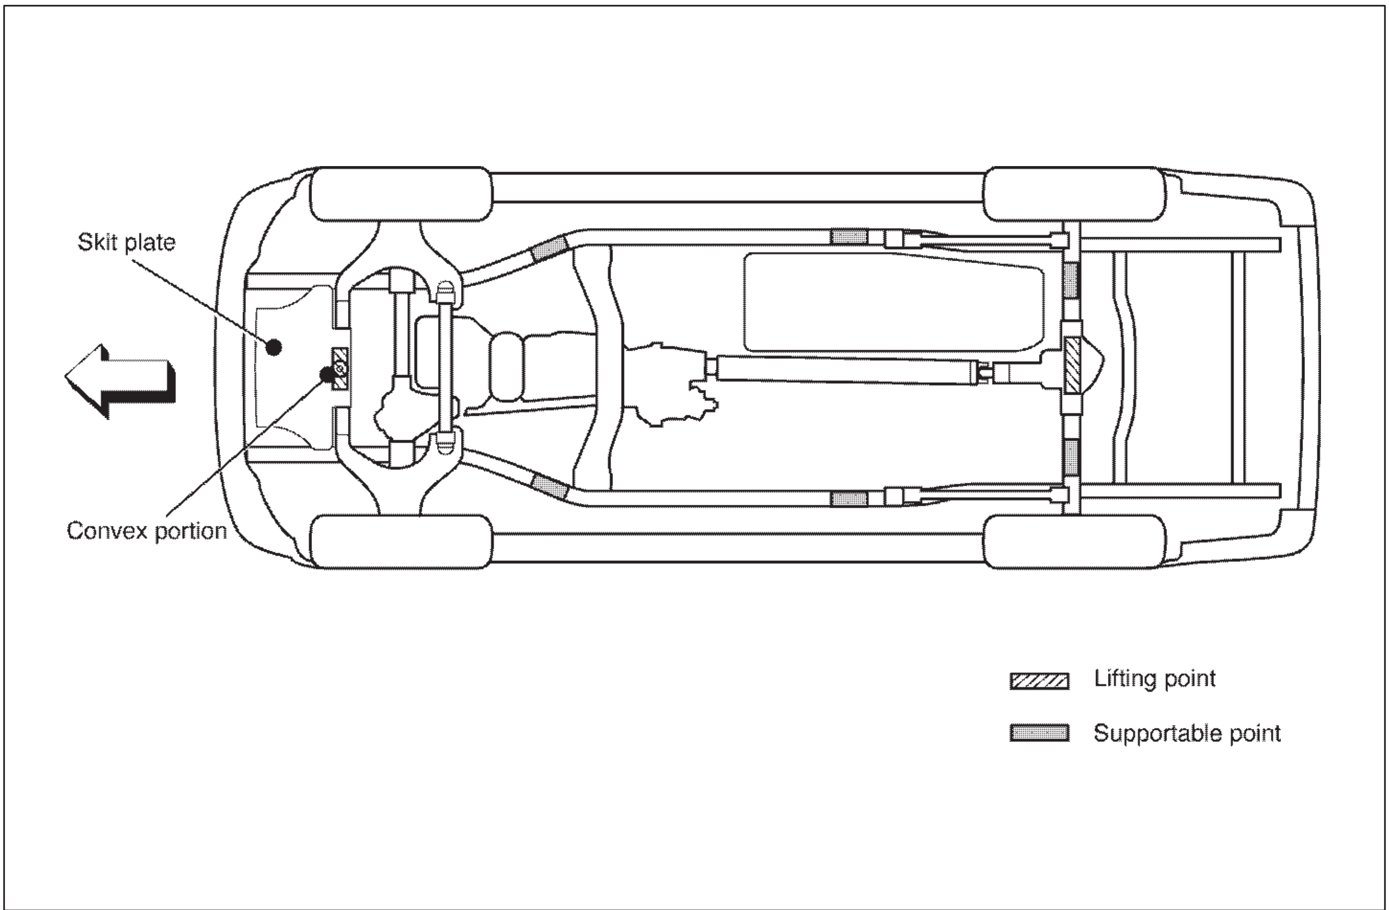
901RW084

Lifting Instructions

CAUTION:

- **If a lifting device other than the original jack is used, it is most important that the device be applied only to the correct lifting points. Raising the vehicle from any other point may result in serious damage.**
- **When jacking or lifting a vehicle at the frame side rail or other prescribed lift points, be certain that lift pads do not contact the catalytic converter, brake pipes or cables, or fuel lines. Such contact may result in damage or unsatisfactory vehicle performance.**

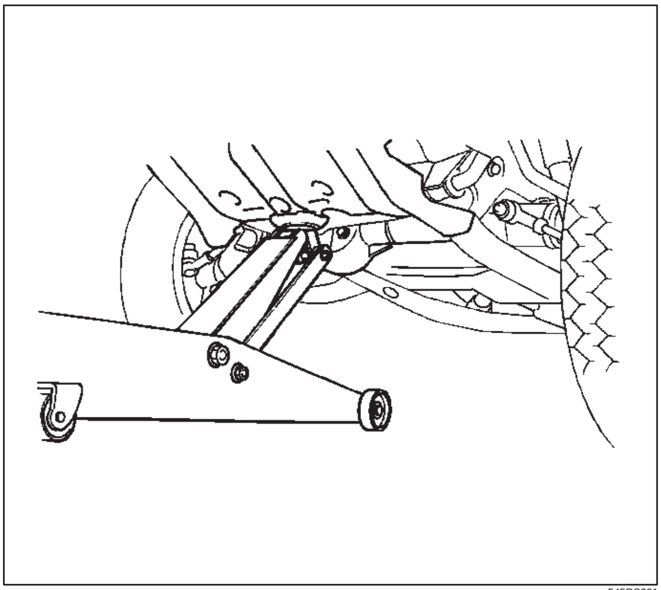
Lifting Points and Supportable Point Locations



C00RX002

Lifting Point: Front

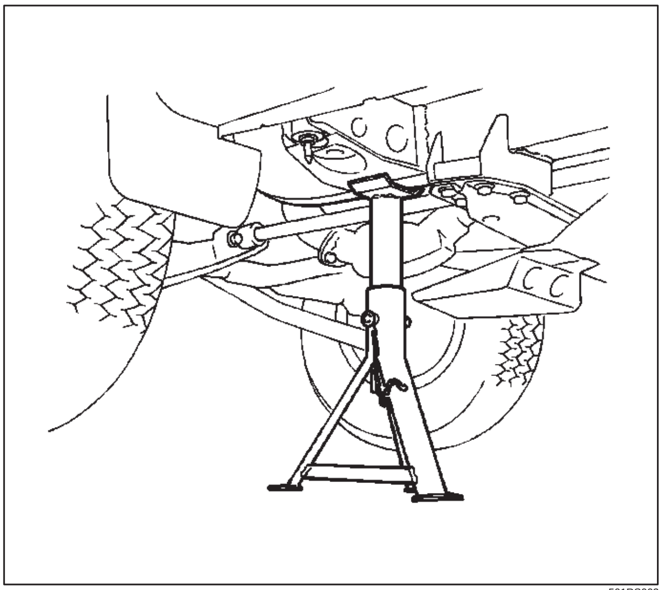
- When using a floor jack, lift on the Convex portion of the skid plate.



545RS001

Supportable Point: Front

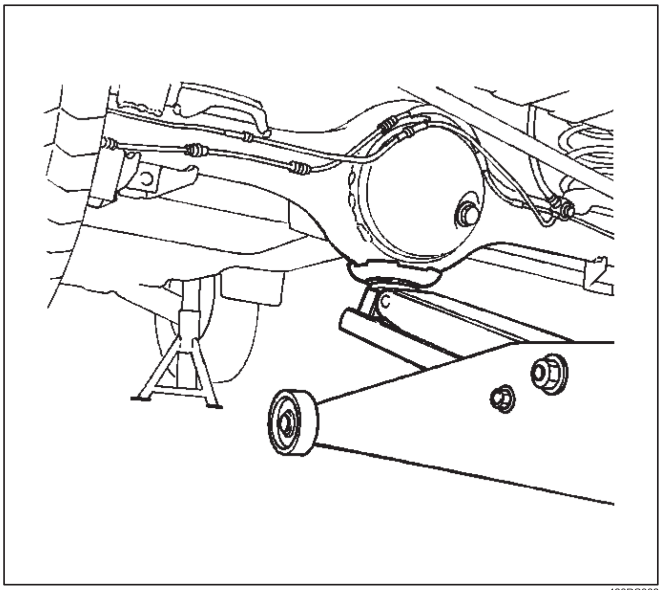
- Position the chassis stands at the bottom of the frame sidemember, behind the front wheel.



501RS003

Lifting Point: Rear

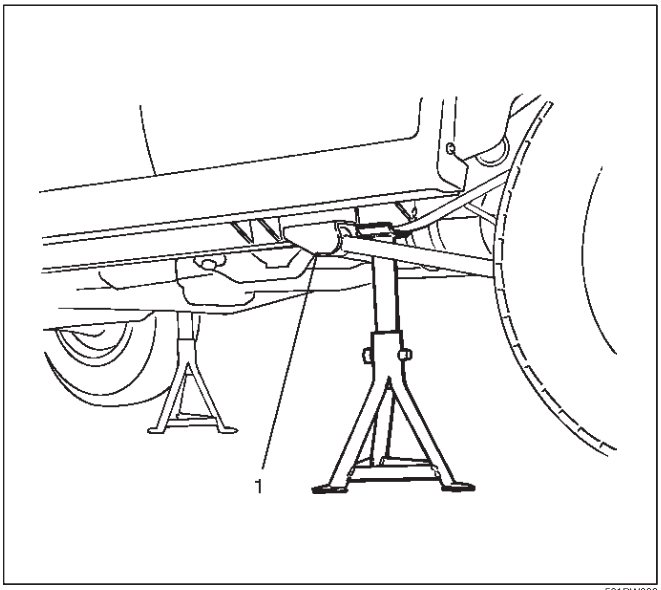
- Position the floor jack at the center of the rear axle case when lifting the vehicle.



420RS002

Supportable Point: Rear

- Position the chassis stands at the bottom of the frame sidemember, just behind the trailing link bracket.



501RW002

Legend

(1) Trailing Link Bracket

Supportable Point: Rear

- Position the chassis stands at the bottom of the rear axle case.

A — Ampere(s)
ABS — Antilock Brake System
AC — Alternating Current
A/C — Air Conditioning
ACCEL — Accelerator
ACC — Accessory
ACL — Air Cleaner
Adj — Adjust
A/F — Air Fuel Ratio
AIR — Secondary Air Injection System
Alt — Altitude
AMP — Ampere(s)
ANT — Antenna
ASM — Assembly
A/T — Automatic Transmission/Transaxle
ATDC — After Top Dead Center
ATF — Automatic Transmission Fluid
Auth — Authority
Auto — Automatic
BARO — Barometric Pressure
Bat — Battery
B+ — Battery Positive Voltage
Bbl — Barrel
BHP — Brake Horsepower
BPT — Backpressure Transducer
BTDC — Before Top Dead Center
° C — Degrees Celsius
CAC — Charge Air Cooler
Calif — California
cc — Cubic Centimeter
CID — Cubic Inch Displacement
CKP — Crankshaft Position
CL — Closed Loop
CLCC — Closed Loop Carburetor Control
CMP — Camshaft Position
CO — Carbon Monoxide
Coax — Coaxial
Conn — Connector
Conv — Converter
Crank — Crankshaft
Cu. In. — Cubic Inch
CV — Constant Velocity
Cyl — Cylinder(s)
DI — Distributor Ignition
Diff — Differential
Dist — Distributor
DLC — Data Link Connector
DOHC — Double Overhead Camshaft
DTC — Diagnostic Trouble Code
DTM — Diagnostic Test Mode
DTT — Diagnostic Test Terminal
DVM — Digital Voltmeter (10 meg.)
DVOM — Digital Volt Ohmmeter
EBCM — Electronic Brake Control Module
ECM — Engine Control Module
ECT — Engine Coolant Temperature
EEPROM — Electronically Erasable Programmable Read Only Memory
EGR — Exhaust Gas Recirculation
EI — Electronic Ignition
ETR — Electronically Tuned Receiver
EVAP — Evaporation Emission
Exh — Exhaust
° F — Degrees Fahrenheit
Fed — Federal (All States Except Calif.)
FF — Front Drive Front Engine
FL — Fusible Link
FLW — Fusible Link Wire
FP — Fuel Pump
FRT — Front
ft — Foot
FWD — Front Wheel Drive
4WD — Four Wheel Drive
4 x 4 — Four Wheel Drive
4 A/T — Four Speed Automatic Transmission/Transaxle
Gal — Gallon
GEN — Generator
GND — Ground
Gov — Governor
g — Gram
Harn — Harness
HC — Hydrocarbons
HD — Heavy Duty
Hg — Hydrargyrum (Mercury)
HiAlt — High Altitude
HO2S — Heated Oxygen Sensor
HVAC — Heater–Vent–Air–Conditioning
IAC — Idle Air Control
IAT — Intake Air Temperature
IC — Integrated Circuit / Ignition Control
ID — Identification / Inside Diameter
IGN — Ignition
INJ — Injection
IP — Instrument Panel
IPC — Instrument Panel Cluster
Int — Intake
ISC — Idle Speed Control
J/B — Junction Block
kg — Kilograms
km — Kilometers
km/h — Kilometer per Hour
kPa — Kilopascals
kV — Kilovolts (thousands of volts)
kW — Kilowatts
KS — Knock Sensor
L — Liter
lb ft — Foot Pounds
lb in — Inch Pounds
LF — Left Front
LH — Left Hand
LR —Left Rear
LS — Left Side
LWB — Long Wheel Base
L–4 — In–Line Four Cylinder Engine
MAF — Mass Air Flow
MAN — Manual
MAP — Manifold Absolute Pressure
Max — Maximum
MC — Mixture Control
MFI — Multiport Fuel Injection
MIL — Malfunction Indicator Lamp
Min — Minimum
mm — Millimeter
MPG — Miles Per Gallon
MPH — Miles Per Hour
M/T — Manual Transmission/Transaxle
MV — Millivolt

N — Newtons
NA — Natural Aspirated
NC — Normally Closed
N·M — Newton Meters
NO — Normally Open
NOX — Nitrogen, Oxides of
OBD — On-Board Diagnostic
OD — Outside Diameter
O/D — Over Drive
OHC — Overhead Camshaft
OL — Open Loop
O2 — Oxygen
O2S — Oxygen Sensor
PAIR — Pulsed Secondary Air Injection System
P/B — Power Brakes
PCM — Powertrain Control Module
PCV — Positive Crankcase Ventilation
PRESS — Pressure
PROM — Programmable Read Only Memory
PNP — Park/Neutral Position
P/S — Power Steering
PSI — Pounds per Square Inch
PSP — Power Steering Pressure
Pt. — Pint
Pri — Primary
PWM — Pulse Width Modulate
Qt. — Quart
REF — Reference
RF — Right Front
RFI — Radio Frequency Interference
RH — Right Hand
RPM — Revolutions Per Minute
RPM Sensor — Engine Speed Sensor
RPO — Regular Production Option
RR — Right Rear
RS — Right Side
RTV — Room Temperature Vulcanizing
RWAL — Rear Wheel Antilock Brake
RWD — Rear Wheel Drive
SAE — Society of Automotive Engineers
Sec — Secondary
SFI — Sequential Multiport Fuel Injection
SI — System International
SIR — Supplemental Inflatable Restraint System
SOHC — Single Overhead Camshaft
Sol — Solenoid
SPEC — Specification
Speedo — Speedometer
SRS — Supplemental Restraint System
ST — Start / Scan Tool
Sw — Switch
SWB — Short Wheel Base
SYN — Synchronize
Tach — Tachometer
TB — Throttle Body
TBI — Throttle Body Fuel Injection
TCC — Torque Converter Clutch
TCM — Transmission Control Module
TDC — Top Dead Center
Term — Terminal
TEMP — Temperature
TOD— Torque On Demand
TP — Throttle Position
TRANS — Transmission/Transaxle
TURBO — Turbocharger
TVRS — Television & Radio Suppression
TVV — Thermal Vacuum Valve
TWC — Three Way Catalytic Converter
3 A/T — Three Speed Automatic Transmission/Transaxle
2WD — Two Wheel Drive
4 x 2 — Two Wheel Drive
U–joint — Universal Joint
V — Volt(s)
VAC — Vacuum
VIN — Vehicle Identification Number
VRRRE — Vehicle Refrigerant Recovery and Recycling Equipment
V–ref — ECM Reference Voltage
VSS — Vehicle Speed Sensor
VSV — Vacuum Switch Valve
V–6 — Six Cylinder “V” Engine
V–8 — Eight Cylinder ”V” Engine
W — Watt(s)
w/ — With
w/b — Wheel Base
w/o — Without
WOT — Wide Open Throttle

Service Parts Identification Plate

The Vehicle Information Plate (Service Parts ID plate) is provided on all vehicle models.
It is located on the center dash wall inside the engine compartment. The plate lists the VIN (Vehicle Identification Number), paint information and all production options and special equipment on the vehicle when it was shipped from the factory.

RODEO

GENERAL INFORMATION

Maintenance and Lubrication

CONTENTS

Maintenance Schedule List

Normal Vehicle Use

The maintenance instructions in this Maintenance Schedule are based on the assumption that the vehicle will be used as designed:

- to carry passengers and cargo within the limitations specified on the tire placard located on the inside of the glove compartment door;
- to be driven on reasonable road surfaces within legal operating limits;
- to be driven on a daily basis, as a general rule, for at least several miles/kilometers;
- to be driven on unleaded fuel

Unusual or severe operating conditions will require more frequent vehicle maintenance, as specified in the following sections.

Severe Driving Conditions

If the vehicle is usually operated under any of the severe driving conditions listed below, it is recommended that the applicable maintenance services be performed at the specified interval shown in the chart below.

Severe driving conditions:

- Towing a trailer, using a camper or car top carrier.
- Repeated short trips of less than 8 Km (5 miles) with outside temperature remaining below freezing.
- Extensive idling and/or low speed driving for long distances, such as police, taxi or door–to–door delivery use.
- Operating on dusty, rough, muddy or salt spread roads.

ITEMS	INTERVAL
CHANGE ENGINE OIL AND OIL FILTER	Every 3,000 miles (4,800 km) or 3 months
CHANGE AUTOMATIC TRANSMISSION FLUID	Every 20,000 miles (32,000 km)
CHANGE REAR AXLE OIL	Every 15,000 miles (24,000 km)
REPLACE TIMING BELT	Every 75,000 miles (120,000 km)
REPLACE AIR CLEANER FILTER	See explanation of service, page 0B–5
CHANGE POWER STEERING FLUID	Every 30,000 miles (48,000 km)

Mileage Only Items

MILEAGE ONLY ITEMS

IN THOUSANDS OF MILES (USE ODOMETER READING) (x 1000 miles)

	MILEAGE ONLY ITEMS	7.5	15	22.5	30	37.5	45	52.5	60	67.5	75	82.5	90	97.5	105	112.5	120	DESCRIPTION
1	*(1) CHANGE FRONT AND *(1) REAR AXLE OIL																	
2	CHANGE MANUAL TRANSMISSION (M/T model) AND TRANSFER CASE OIL(4WD model)																	
3	*(1) CHECK AND ADJUST OR CHANGE AUTOMATIC TRANSMISSION FLUID (IF NECESSARY)																	
4	CHECK AUTOMATIC TRANSMSSION FLUID LEAKAGE																	
5	CHECK AND ADJUST VALVE CLEARANCE(V6-3.2L engine)	If noisy																
6	REPLACE AIR CLEANER ELEMENT																	
7	REPLACE SPARK PLUGS	Every 100,000 miles.																
8	CHANGE ENGINE COOLANT																	
9	*(2) REPLACE TIMING BELT	Every 100,000 miles.																
10	ROTATE TIRES																	
11	REPACK FRONT WHEEL BEARINGS GREASE																	
12	CLEAN RADIATOR CORE AND A/C CONDENSER																	
13	CHECK SPARK PLUG WIRES (I4- 2.2L engine)																	

*(1) : Under sever driving conditions, additional maintenance is required.
Refer to "Severe driving conditions".

*(2) : Replacement of the timing belt is recommended at every 100,000 miles (160,000km)

SHADED AREA INDICATES SERVICE TO BE PERFORMED.

UEROM4

Explanation of Complete Vehicle Maintenance Schedule

Brief explanations of the services listed in the preceding Maintenance Schedule are presented below.
Replace all questionable parts and note any necessary repairs as you perform these maintenance procedures.

Front and Rear Axle Lubricant Replacement

Check the lubricant level after every 7,500 miles (12,000 km) of operation and add lubricant to level of filler hole if necessary.
Replace the front and rear axle lubricant at 15,000 miles (24,000 km) and 30,000 miles (48,000 km) and after every 30,000 miles (48,000 km) of operation thereafter.

Manual Transmission Lubricant Replacement

Check the lubricant level after every 7,500 miles (12,000 km) of operation and add lubricant to level of filler hole if necessary.
Replace the transmission lubricant at 15,000 miles (24,000 km) and 30,000 miles (48,000 km) and after every 30,000 miles (48,000 km) of operation thereafter.

Transfer Case Lubricant Replacement

Check the lubricant level after every 7,500 miles (12,000 km) of operation and add lubricant to level of filler hole if necessary.
Replace the transfer case lubricant at 15,000 miles (24,000 km) and 30,000 miles (48,000 km) and after every 30,000 miles (48,000 km) of operation thereafter.

Air Cleaner Element Replacement

Replace the air cleaner under normal operating conditions every 30,000 miles (48,000 km).
Operation of the vehicle in dusty areas will necessitate more frequent replacement.

Spark Plug Replacement

Replace the plugs at 100,000 miles (160,000 km) intervals with the type specified at the end of this section.

Cooling System Service

Drain, flush and refill system with new engine coolant. Refer to “Recommended Fluids and Lubricants” in this section, or ENGINE COOLING (SEC.6B).

Timing Belt Replacement

Replacement of the timing belt is recommended at every 100,000 miles (160,000 km).
Failure to replace the timing belt may result in serious damage to the engine.

Valve Clearance Adjustment (V6, 3.2L ENG)

Incorrect valve clearance will result in increased engine noise and reduced engine output.
Retorque the camshaft bracket bolts before checking and adjusting the valve clearance.
Check and adjust the valve clearance every if noise occurs.

Tire Rotation

Rotate tires every 7,500 miles (12,000 km).

Spark Plug Wire Inspection

Check the spark plug wires at 60,000 mile (96,000 km) intervals.

Front Wheel Bearings Lubricant Replacement

Clean and repack the front wheel bearings at 30,000 miles (48,000 km) intervals.
Refer to DRIVE SHAFT SYSTEM (SEC. 4C).

Radiator Core and Air Conditioning Condenser Cleaning

Clean the front of the radiator core and air conditioning condenser, at 60,000 miles (96,000 km) intervals.

Fluid Level Check

A fluid loss in any system (except windshield washer) may indicate a problem. Repair the system at once.

Engine oil level

Check level and add if necessary. The best time to check the engine oil level is when the oil is warm. After stopping the engine with the vehicle on a level surface, wait a few minutes for the oil to drain back to the oil pan. Pull out the oil level indicator (dipstick). Wipe it clean and push the oil level indicator back down all the way. Pull out the oil level indicator, keeping the tip down, and look at the oil level on it.

Add oil, if needed, to keep the oil level above the “ADD” mark and between the “ADD” and “FULL” marks in the operating range area. Avoid overfilling the engine since this may cause engine damage. Push the oil level indicator back down all the way after taking the reading. If you check the oil level when the oil is cold, do not run the engine first. The cold oil will not drain back to the pan fast enough to give a true oil level.

Engine coolant level and condition

Check engine coolant level in the coolant reservoir and add engine coolant if necessary. Inspect the engine coolant and replace it if dirty or rusty.

Windshield washer fluid level

Check washer fluid level in the reservoir and add if necessary.

Power steering system reservoir level

Check and keep at the proper level.

Brake master cylinder reservoir level

Check fluid. Keep fluid at proper level. A low fluid level can indicate worn disc brake pads which may need to be serviced.

Hydraulic clutch system

Check fluid level in the reservoir. Add fluid as required.

Battery fluid level

Check fluid level in the battery.

Fluid Leak Check

Check for fuel, water, oil or other fluid leaks by looking at the surface beneath the vehicle after it has been parked for a while. Water dripping from the air conditioning system after use is normal. If you notice gasoline fumes or fluid at any time, locate the source and correct it at once.

Engine Oil and Oil Filter Replacement

Always use API SE, SF, SG, SH or ILSAC GF–1 quality oils of the proper viscosity.

When choosing an oil, consider the range of temperatures the car will be operated in before the next oil change. Then, select the recommended oil viscosity from the chart.

Always change the oil and the oil filter as soon as possible after driving in a dust storm.

Engine Cooling System Inspection

Inspect the coolant/anti–freeze. If the coolant is dirty or rusty, drain, flush and refill with new coolant. Keep coolant at the proper mixture for proper freeze protection, corrosion inhibitor level and best engine operating temperature. Inspect hoses and replace if cracked, swollen or deteriorated. Tighten the hose clamps if equipped with screw–type clamps. Clean outside of radiator and air conditioning condenser. Wash filler cap and neck. To help ensure proper operation, a pressure test of both the cooling system and the cap is also recommended.

Exhaust System Inspection

Visually inspect the exhaust pipes, muffler, heat shields and hangers for cracks, deterioration, or damage.

Be alert to any changes in the sound of the exhaust system or any smell of fumes. These are signs the system may be leaking or overheating. Repair the system at once, if these conditions exist. (See also “Engine Exhaust Gas Safety” and “Three Way Catalytic Converter” in the Owner’s manual.)

Fuel Cap, Fuel Lines, and Fuel Tank Inspection

Inspect the fuel tank, the fuel cap and the fuel lines every 60,000 miles (96,000 km) for damage which could cause leakage.

Inspect the fuel cap and the gasket for correct sealing and physical damage. Replace any damaged parts.

Drive Belt Inspection

Check the serpentine belt driving for cracks, fraying, wear, and correct tension every 30,000 miles (48,000 km). Replace as necessary.

Wheel Alignment, Balance and Tires Operation

Uneven or abnormal tire wear, or a pull right or left on a straight and level road may show the need for a wheel alignment. A vibration of the steering wheel or seat at normal highway speeds means a wheel balancing is needed. Check tire pressure when the tires are “cold” (include the spare).

Maintain pressure as shown in the tire placard, which is located on the driver’s door lock pillar.

Steering System Operation

Be alert for any changes in steering action. An inspection or service is needed when the steering wheel is harder to turn or has too much free play, or if there are unusual sounds when turning or parking.

Brake Systems Operation

Watch for the “BRAKE” light coming on. Other signs of possible brake trouble are such things as repeated pulling to one side when braking, unusual sounds when braking or between brake applications, or increased brake pedal travel. If you note one of these conditions, repair the system at once.

For convenience, the following should be done when wheels are removed for rotation: Inspect lines and hoses for proper hookup, bindings, leaks, crack, chafing etc. Inspect disc brake pads for wear and rotors for surface condition.

Inspect other brake parts, including parking brake drums, linings etc., at the same time. Check parking brake adjustment.

Inspect the brakes more often if habit or conditions result in frequent braking.

Parking Brake and Transmission Park Mechanism Operation

Park on a fairly steep hill and hold the vehicle with the parking brake only. This checks holding ability. On automatic transmission vehicles, shifting from “P” position to the other positions cannot be made unless the brake pedal is depressed when the key switch is in the “ON” position or the engine is running.

WARNING: BEFORE CHECKING THE STARTER SAFETY SWITCH OPERATION BELOW, BE SURE TO HAVE ENOUGH ROOM AROUND THE VEHICLE. THEN FIRMLY APPLY BOTH THE PARKING BRAKE AND THE REGULAR BRAKE. DO NOT USE THE ACCELERATOR PEDAL. IF THE ENGINE STARTS, BE READY TO TURN OFF THE KEY PROMPTLY. TAKE THESE PRECAUTIONS BECAUSE THE VEHICLE COULD MOVE WITHOUT WARNING AND POSSIBLY CAUSE PERSONAL INJURY OR PROPERTY DAMAGE.

Starter Safety Switch Operation (Automatic Transmission)

Check by trying to start the engine in each gear while setting the parking brake and the foot brake. The starter should crank only in “P” (Park) or “N” (Neutral).

Starter Safety Switch Operation (Manual Transmission)

To check, place the shift lever in “Neutral”, push the clutch pedal halfway and try to start. The starter should not crank. The starter should crank only when the clutch pedal is fully depressed.

Accelerator Linkage Lubrication

Lubricate the accelerator pedal fulcrum pin with chassis grease.

Steering and Suspension Inspection

Inspect the front and rear suspension and steering system for damaged, loose or missing parts or signs of wear. Inspect power steering lines and hoses for proper hookup, binding, leaks, cracks, chafing, etc.

Body and Chassis Lubrication

Lubricate the key lock cylinders, the hood latch, the hood and door hinges, the door check link, the parking cable guides, the underbody contact points, and the linkage.

Propeller Shaft Inspection and Lubrication

Check the propeller shaft flange–to–pinion bolts for proper torque to 63 N•m (46 lb ft) for front and rear propeller shaft.

Automatic Transmission Fluid Replacement

Under harsh operating conditions, such as constant driving in heavy city traffic during hot weather, or in hilly or mountainous terrain, change the transmission fluid and service the sump filter after every 20,000 miles (32,000 km) of operation.
More over, the remaining life percentage of ATF can be estimated by using TECH–II as an auxiliary tool to judge the right time for ATF replacement.
The remaining life percentage is calculated from ATF'S heat history. When it is close to 0%, ATF replacement is recommended.

Auto Cruise Control Inspection

Check to see if the clearance between cruise link and accelerator link is normal. Also check that the connected properly.

Clutch Lines and Hoses Inspection

Check lines and hoses for proper attachment, binding, leaks, cracks, chafing, deterioration, etc. Any questionable parts should be replaced or repaired at once. When abrasion or wear is evident on lines or hoses, the cause must be corrected.

Clutch Control Lubrication

Lubricate the clutch pedal bushing, the clevis pin, and pedal spring every 15,000 miles (24,000 km) or 6 months. If a squeaking noise arises from around the bushing or the clevis pin at the clutch pedal arm when the clutch pedal is depressed, lubricate them.

Clutch Pedal Free Play Inspection

Note the clutch pedal free play. It should be 5 – 15 mm (0.2 – 0.6 in). Adjust clutch control when there is little or no free play.

Accelerator Linkage Inspection

Inspect for interference, binding, and damaged or missing parts. Check accelerator pedal for smooth operation and even pedal effort. Replace parts as needed.

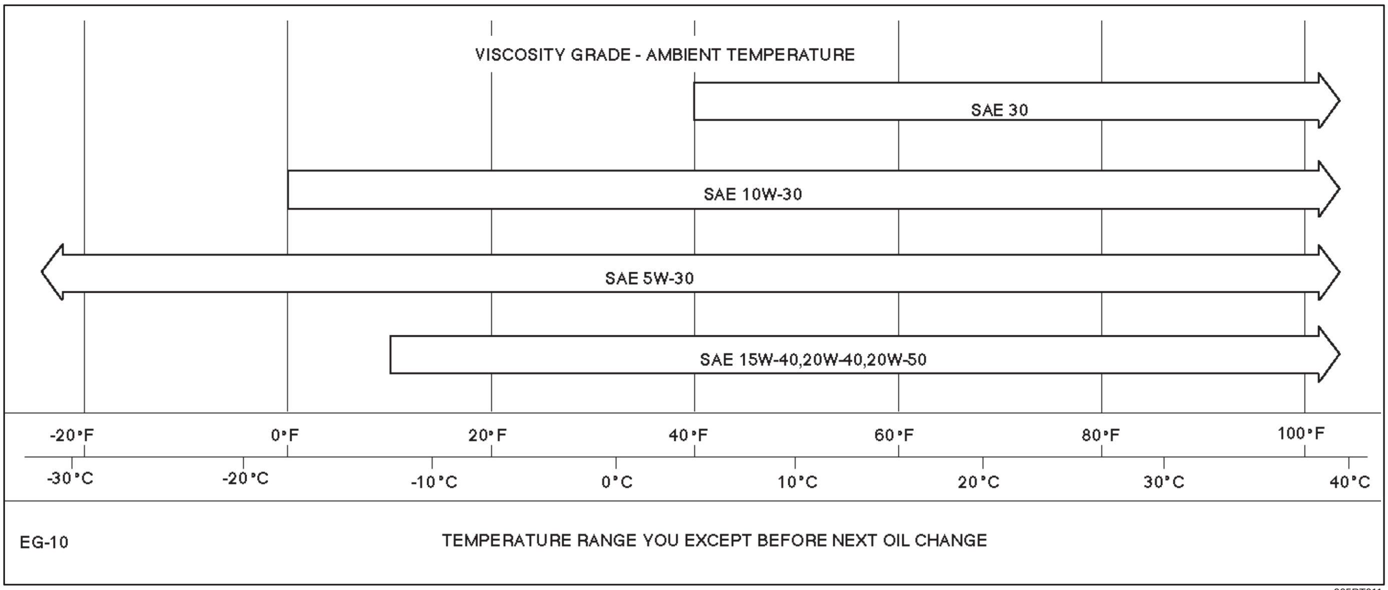
Recommended Fluids and Lubricants

USAGE	FLUID/LUBRICANT
Engine	API SE, SF, SG, SH or ILSAC GF-1 Engine oil (See oil chart on the following page for proper viscosity)
Engine coolant	Mixture of water and good quality ethylene glycol base type antifreeze.
Brake system	DOT-3 hydraulic brake fluid.
Power steering system	DEXRON® -III Automatic transmission fluid.
Automatic transmission	DEXRON® -III Automatic transmission fluid.
MUA Type Manual transmission & Transfer case	Engine oil (See oil chart on following page for proper viscosity)
Rear axle and front axle	GL-5 gear lubricant (Standard differential) GL-5 Limited slip differential gear lubricant together with limited slip differential lubricant additive (Part No. 8-01052-358-0) or equivalent (If equipped with optional limited slip differential) (See oil chart in this section for proper viscosity)
Clutch system a. Pivot points b. Clutch fork joint c. Master cylinder	 Chassis grease Chassis grease DOT-3 hydraulic brake fluid
Hood latch assembly a. Pivots and spring anchor b. Release pawl	 Engine oil Chassis grease
Hood and door hinges	Engine oil
Chassis lubrication	Chassis grease
Parking brake cables	Chassis grease
Front wheel bearings	Multipurpose grease
Shift on the fly system	GL-5 gear lubricant (SAE 75W-90)
Body door hinge pins and linkage, fuel door hinge, rear compartment lid hinges	Engine oil
Windshield washer solvent	Washer fluid
Key lock cylinder	Synthetic light weight engine oil (SAE 5W-30)
Accelerator linkage	Chassis grease

Lubricant Viscosity Chart

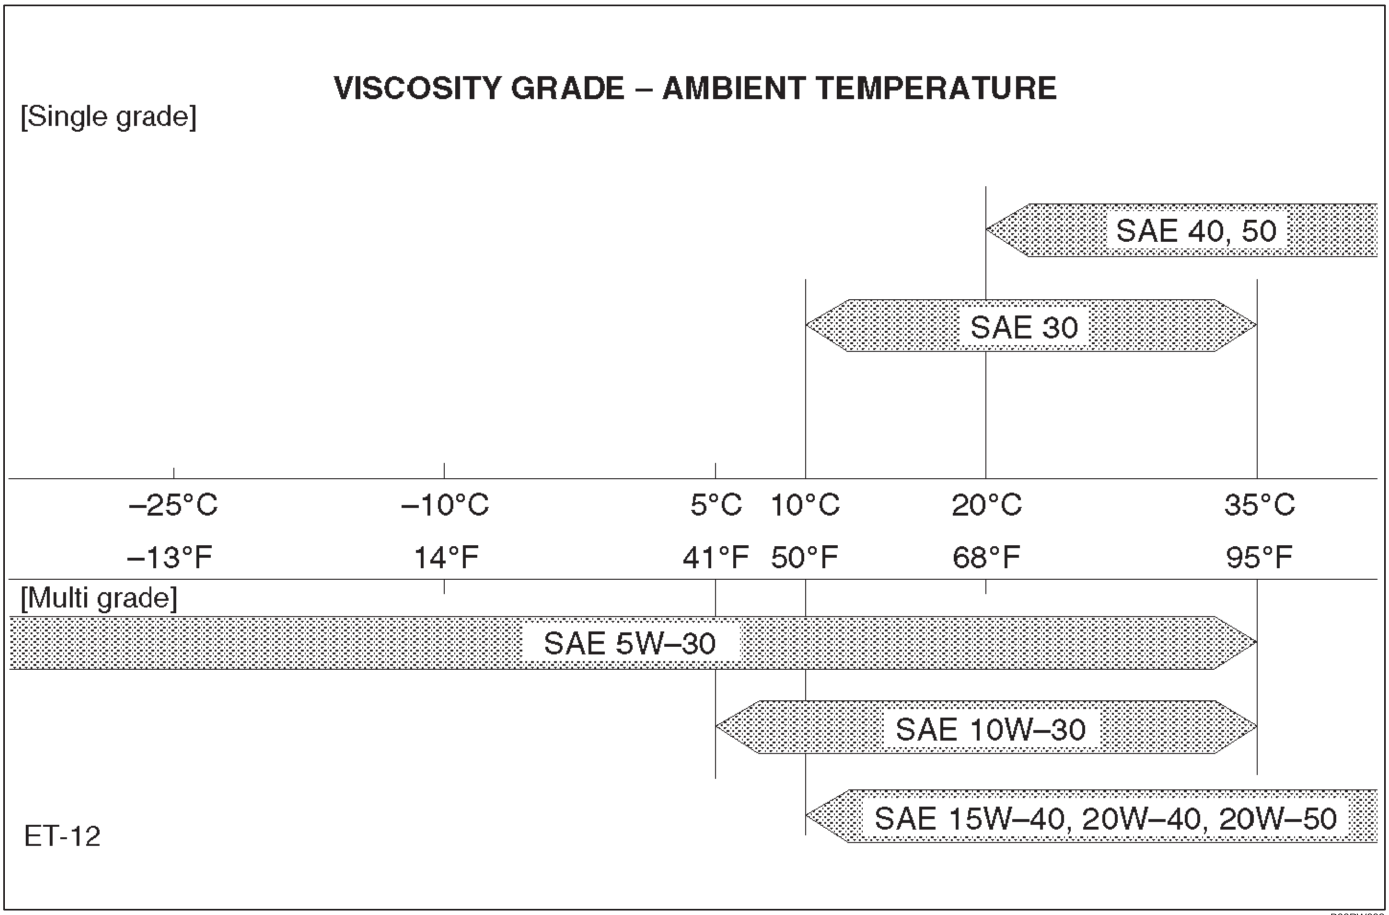
Lubricants should be carefully selected according to the lubrication chart. It is also important to select viscosity of lubricants according to the ambient temperature by referring to the following table.

Oil Viscosity Chart for Gasoline Engine



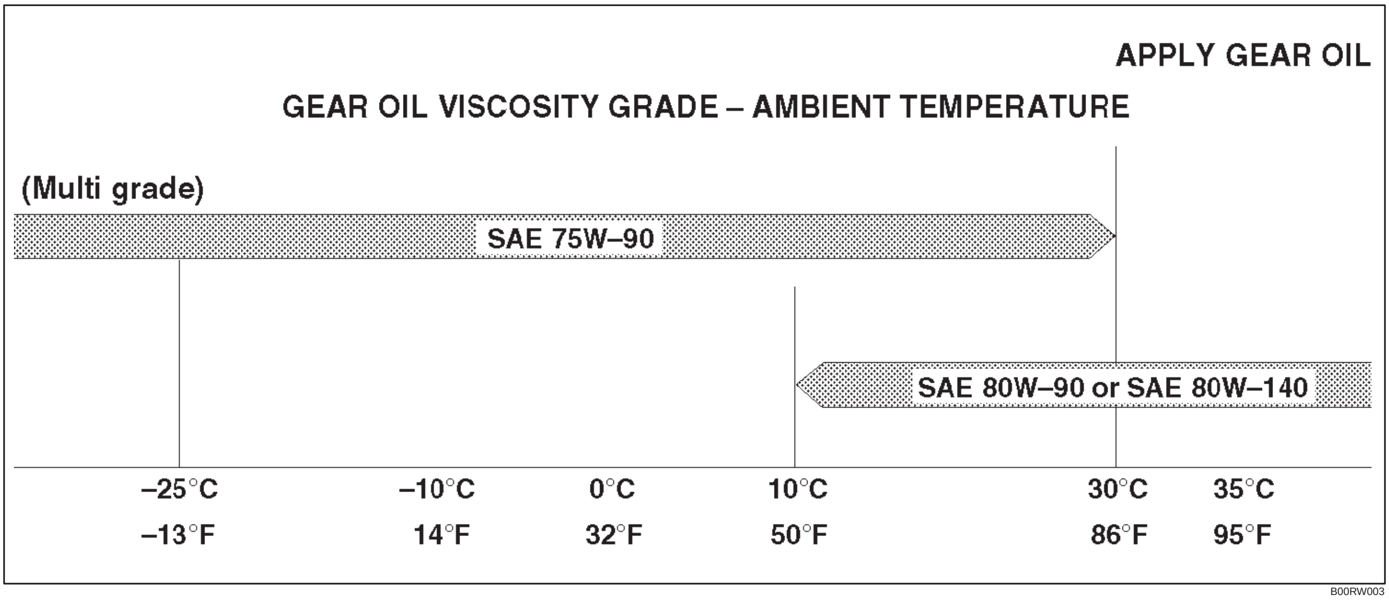
905RT011

Oil Viscosity Chart for Manual Transmission and Transfer Case

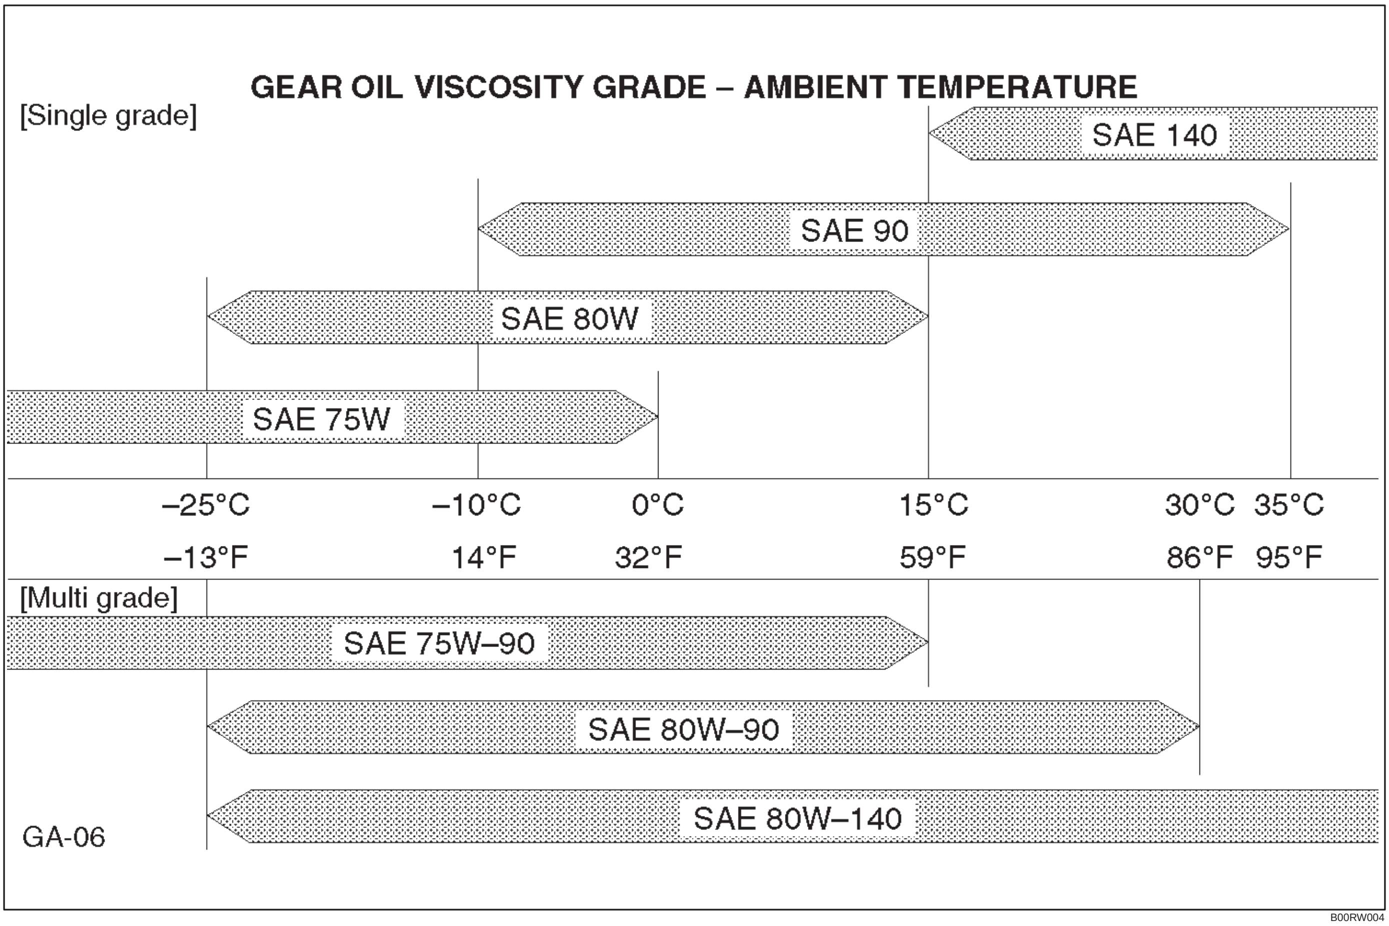


B00RW002

Oil Viscosity Chart for Front Axle



Oil Viscosty Chart for Rear Axle



Recommended Liquid Gasket

Type	Brand Name	Manufacturer	Remarks
RTV* Silicon Base	Three Bond 1207B Three Bond 1207C Three Bond 1215 Three Bond 1280 Three Bond 1281	Three Bond Three Bond Three Bond Three Bond Three Bond	For Engine Repairs For Axle Case Repairs T/M Repairs T/M
Water Base	Three Bond 1141E	Three Bond	For Engine Repairs
Solvent	Three Bond 1104 Belco Bond 4 Belco Bond 401 Belco Bond 402	Three Bond Isuzu Isuzu Isuzu	For Engine Repairs
Anaerobic	LOCTITE 515 LOCTITE 518 LOCTITE 17430	Loctite Loctite Loctite	All

* RTV: Room Temperature Vulcanizer

NOTE:

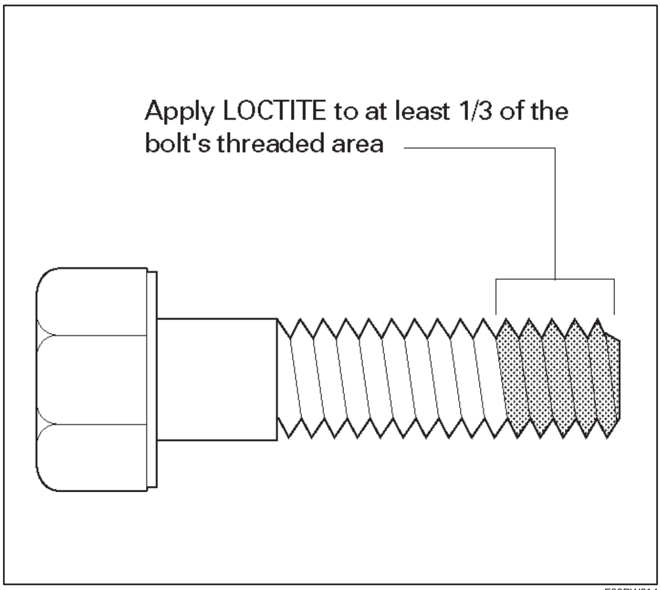
1. It is very important that the liquid gaskets listed above or their exact equivalent be used on the vehicle.
2. Be careful to use the specified amount of liquid gasket.
   Follow the manufacturer's instructions at all times.
3. Be absolutely sure to remove all lubricants and moisture from the connecting surfaces before applying the liquid gasket.
   The connecting surfaces must be perfectly dry.
4. Do not apply LOCTITE 17430, LOCTITE 515 and LOCTITE 518 between two metal surfaces having a clearance of greater than 0.25 mm (0.01 in). Poor adhesion will result.

Recommended Thread Locking Agents

LOCTITE Type	LOCTITE Color
LOCTITE 242	Blue
LOCTITE 262	Red
LOCTITE 271	Red

Application Steps

1. Completely remove all lubricant and moisture from the bolts and the female-threaded surfaces of the parts to be joined.
   The surfaces must be perfectly dry.
2. Apply LOCTITE to the bolts.



F00RW014

3. Tighten the bolts to the specified torque.
   After tightening, be sure to keep the bolts free from vibration and torque for at least an hour until LOCTITE hardens.

NOTE: When the application procedures are specified in this manual, follow them.

Maintenance Service Data

Service Data and Specifications

ENGINE	Valve clearance (cold): only V6–3.2L ENG	Intake 0.28±0.05 mm (0.011±0.002 in) Exhaust 0.3±0.05 mm (0.012±0.002 in)

HVAC SYSTEMS

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Heating and Ventilation System

General Description

Heater

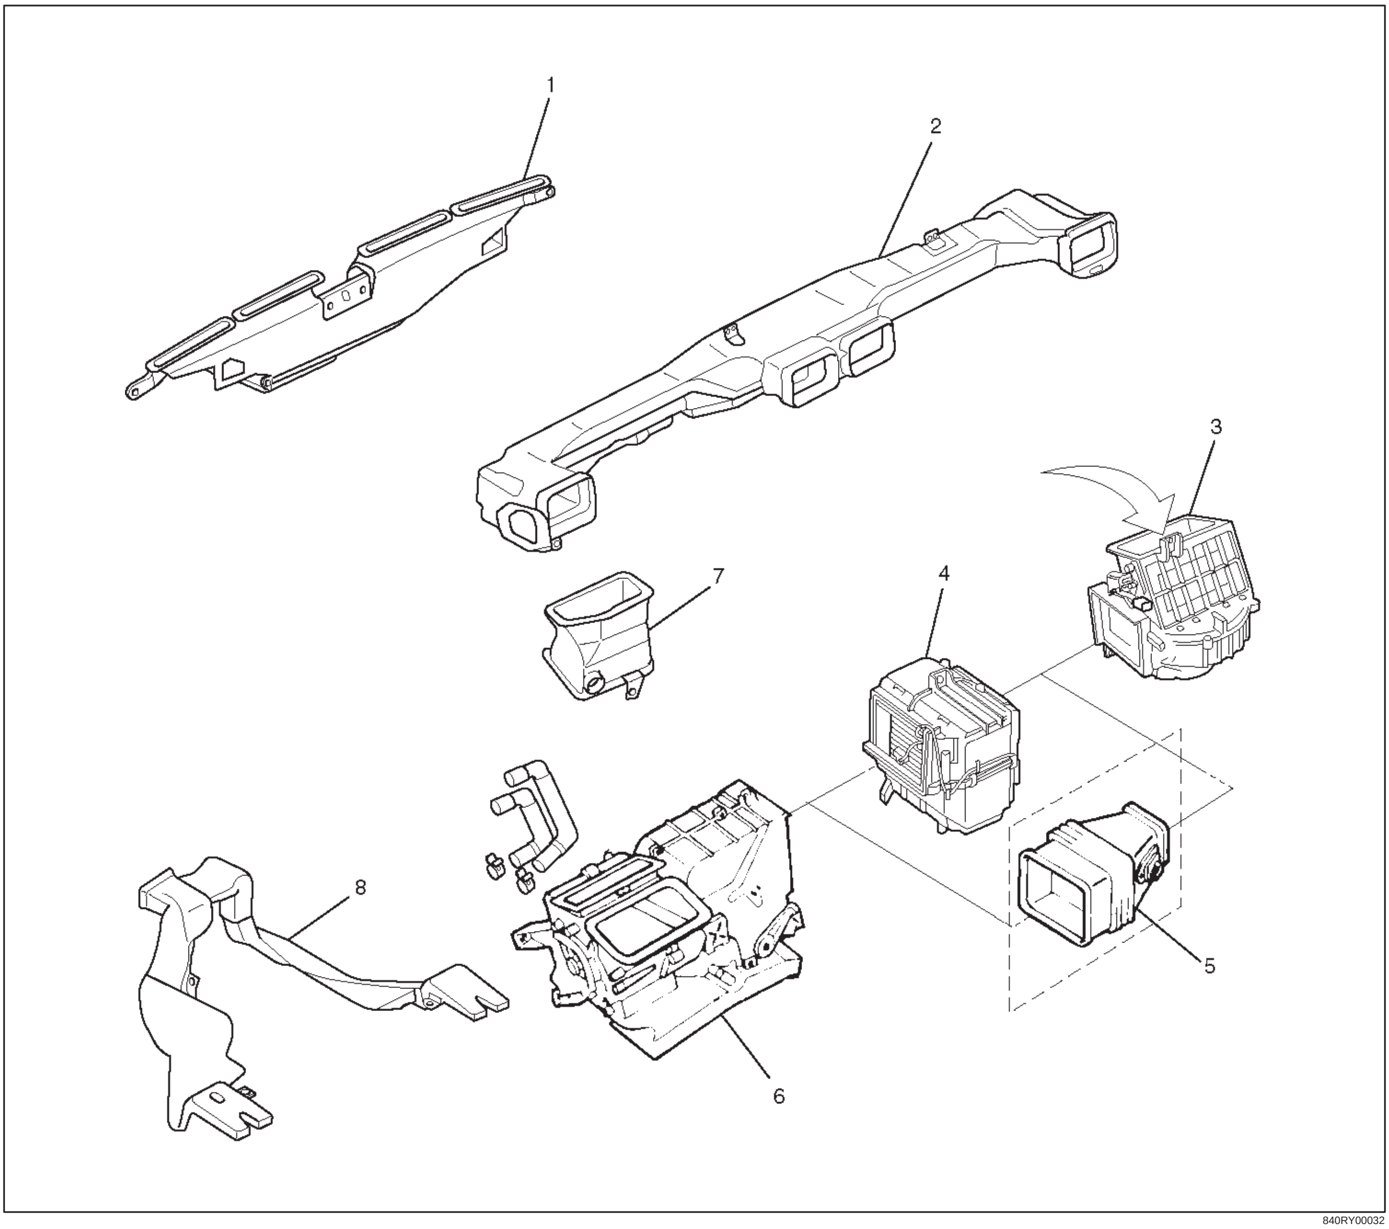
When the engine is warming up, the warmed engine coolant is sent out into the heater core. The heater system supplies warm air into the passenger compartment to warm it up.

Outside air is circulated through the heater core of the heater unit and then back into the passenger compartment. By controlling the mixture of outside air and heater core air, the most comfortable passenger compartment temperature can be selected and maintained.

The temperature of warm air sent to the passenger compartment is controlled by the temperature control knob. This knob acts to open and close the air mix door, thus controlling the amount of air passed through the heater core.

The air selector knob, with its different modes, also allows you to select and maintain the most comfortable passenger compartment temperature.

The air source select lever is used to select either “FRESH” for the introduction of the outside air, or “CIRC” for the circulation of the inside air. When the lever is set to “FRESH”, the outside air is always taken into the passenger compartment. When setting the lever to “CIRC” position, the circulation of air is restricted only to the inside air with no introduction of the outside air and the air in the passenger compartment gets warm quickly. However, the lever is normally set to “FRESH” to prevent the windshield from clouding.



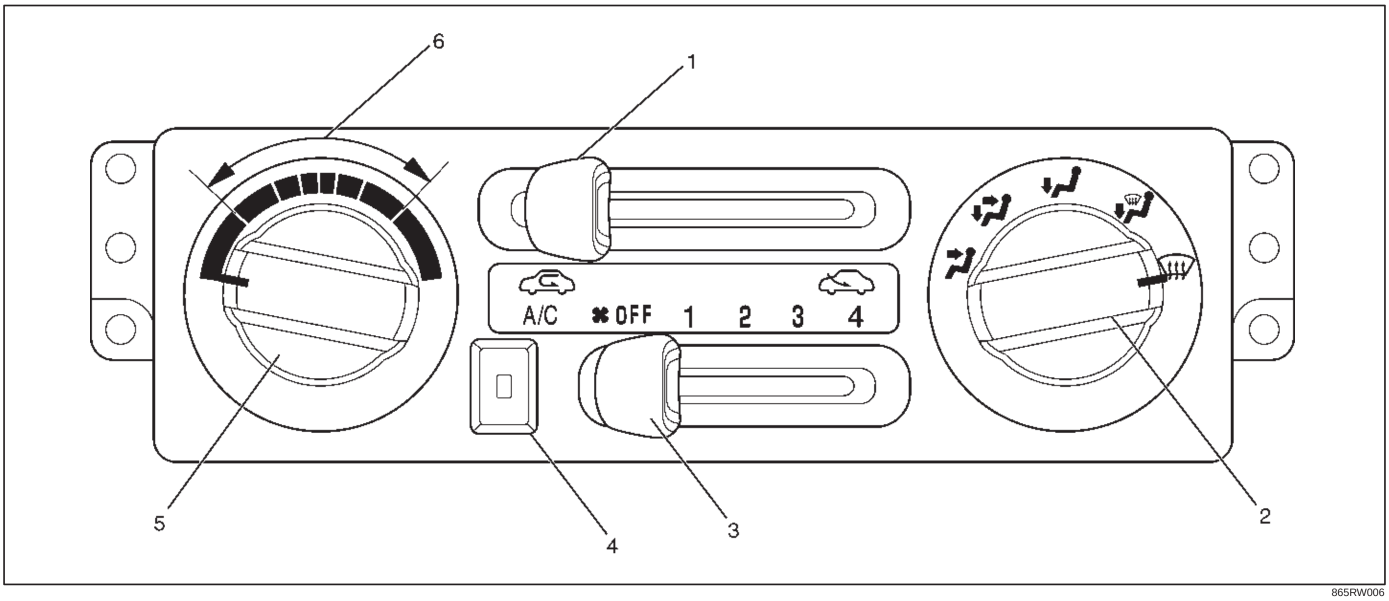
Legend

(1) Defroster Nozzle
(2) Ventilation Duct
(3) Blower Assembly
(4) Evaporator Assembly (With A/C)
(5) Duct (W/O A/C)
(6) Heater Unit
(7) Ventilation Lower Duct
(8) Rear Heater Duct

Control Lever Assembly

The control lever assembly has some cables to control the mode and temperature of the heater unit and the mode door for the air source of the blower assembly.

The fan control is used to control the amount of air sent out by the resistor at four levels from “LOW” to “HIGH”.



Legend

(1) Air Source Select Lever
(2) Air Select Knob
(3) Fan Control Lever (Fan Switch)
(4) Air Conditioning (A/C) Switch (W/ A/C)
(5) Temperature Control Knob
(6) Middle Position

Ventilation

Setting the air source select lever to “FRESH” position allows the heating system to work with sending the fresh air from outside.

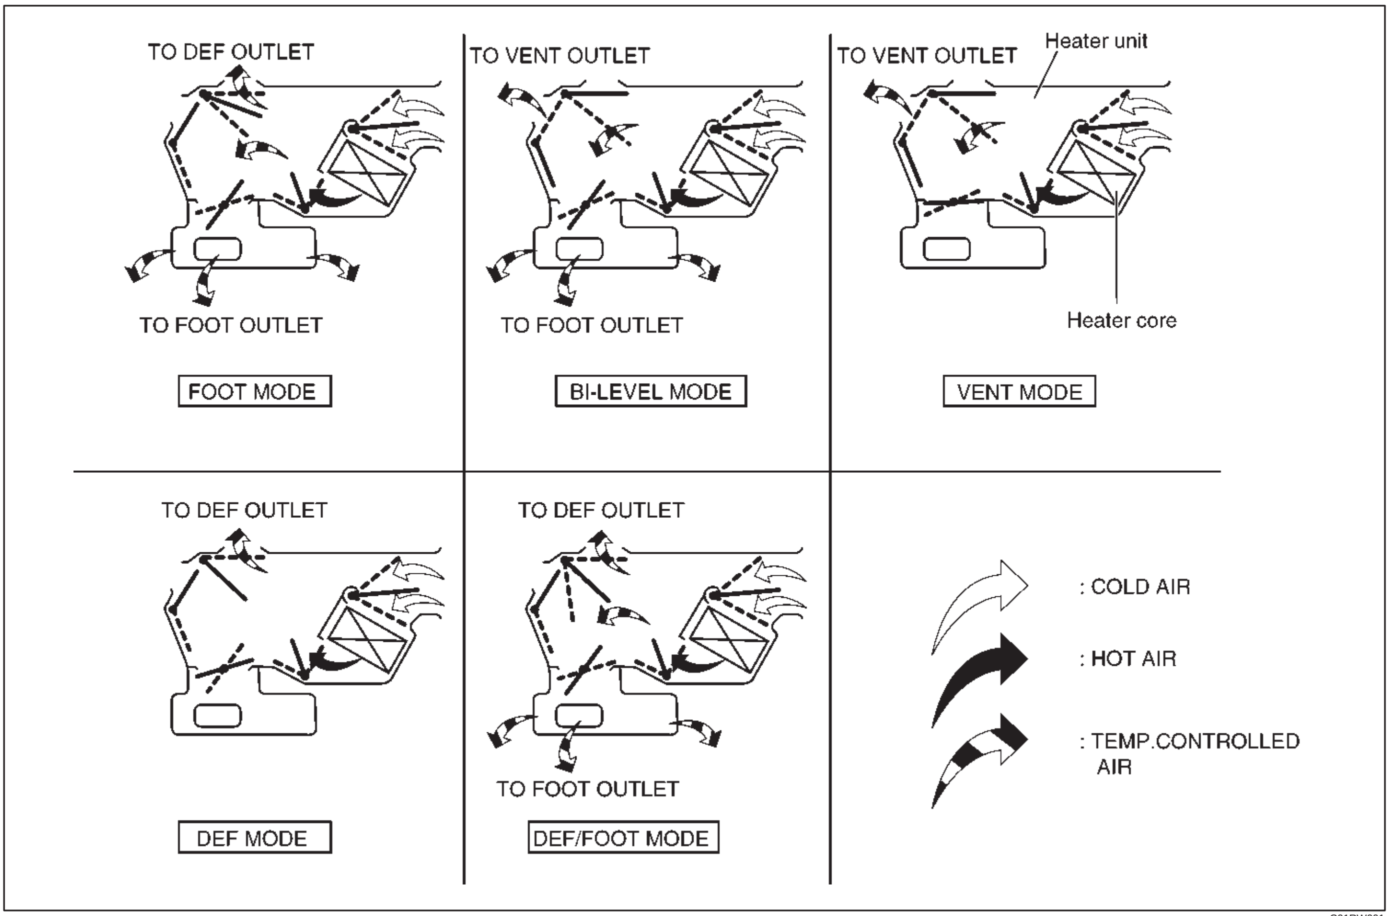
The blower fan also serves to deliver fresh outside air to the passenger compartment to assure adequate ventilation.

Air Select Knob

The air select knob allows you to direct heated air into the passenger compartment through different outlets.

1. **Vent** – In this position, air is discharged from the upper air outlet. Air quantity is controlled by the fan control lever.
2. **Bi-Level** – In this position, air flow is divided between the upper air outlets and the floor air outlets, with warmer air delivered to the floor outlets than the air delivered to the upper air outlets when the temp lever is in middle position.
3. **Foot** – In this position, air flow is delivered to the foot, while sending a small amount of air to the windshield.
4. **Def/Foot** – In this position, air flow is delivered to the foot, while sending approx. 40% of total amount of air to the windshield.
   Selecting this mode allows air conditioning system to work while the fan switch is turned to on position, even if the A/C switch is off.
   Also the fresh air can be delivered even when the circ position is selected.
5. **Defrost** – In this position, most of the air is delivered to the windshield and a small amount is delivered to the side windows.
   Selecting this mode allows air conditioning system to work while the fan switch is turned to on position, even if the A/C switch is off.
   Also the fresh air can be delivered even when the circ position is selected.

Moving the air source select lever to the “CIRC” position provides quickest heat delivery by closing the blower assembly mode door. In this position, outside air is not delivered to the passenger compartment.



C01RW001

Air Source Select Lever

The intake of outside air and the circulation of inside air are controlled by sliding this lever left or right.
And even though the circ position is selected, the fresh air can be delivered while the DEF or DEF/FOOT position is selected.

Fan Control Lever

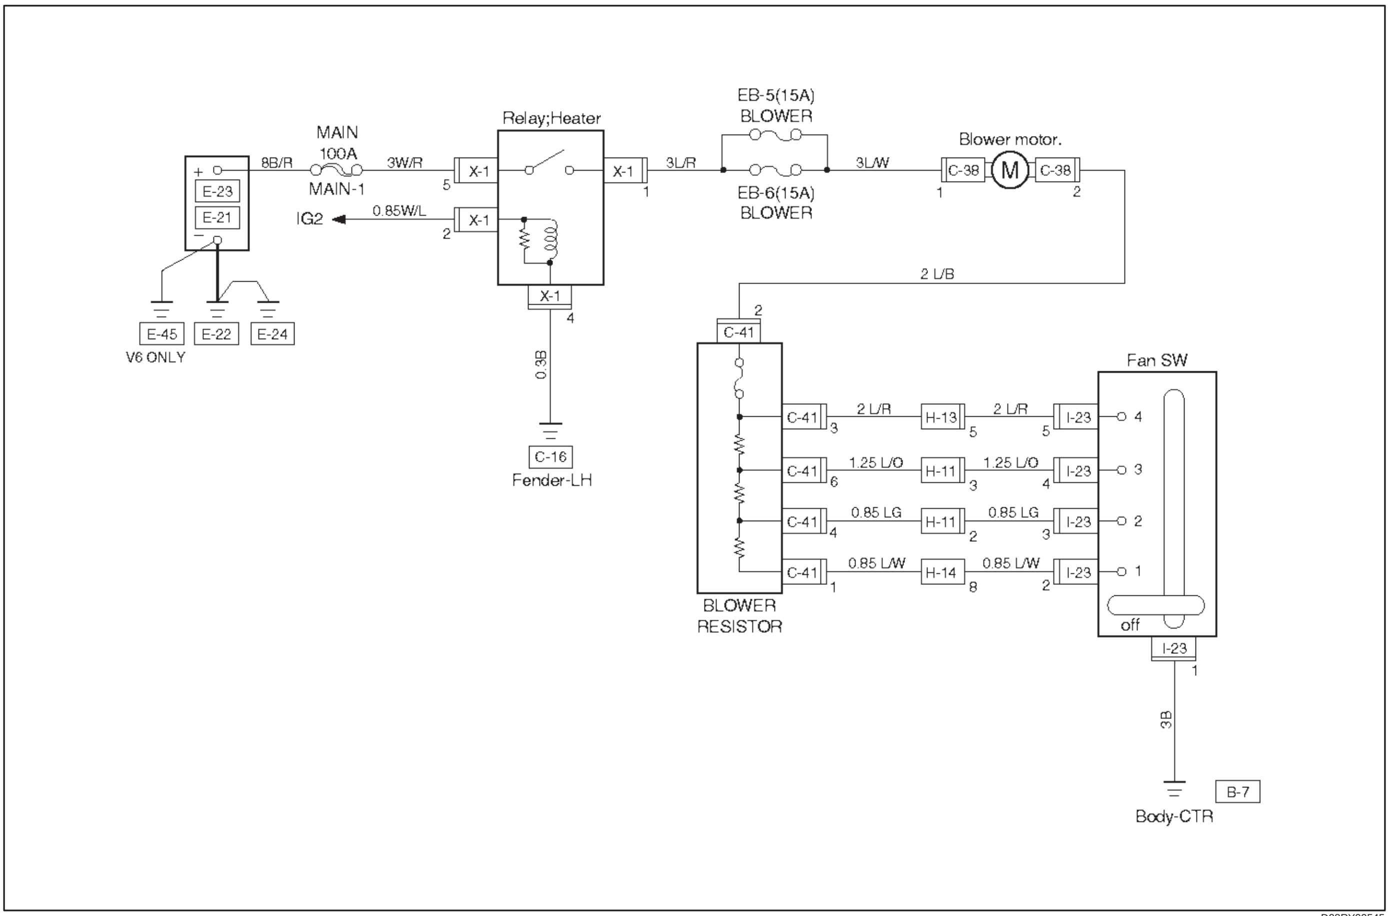
This lever controls the blower motor speed to regulate the amount of air delivered to the defrost, foot, and ventilation ducts:

1. Low
2. Medium Low
3. Medium High
4. High

Temperature Control Knob

When the temperature control knob is in the “COLD” position, the air mix door closes to block the flow air to the heater core.
When the temperature control knob is in the “HOT” position, the air mix door opens to allow air to pass through the heater core and heat the passenger compartment.
Placing the knob in a intermediate position will cause a lesser or greater amount air to reach the heater core. In this mode the passenger compartment temperature can be regulated.

Wiring Diagram



D08RY00545

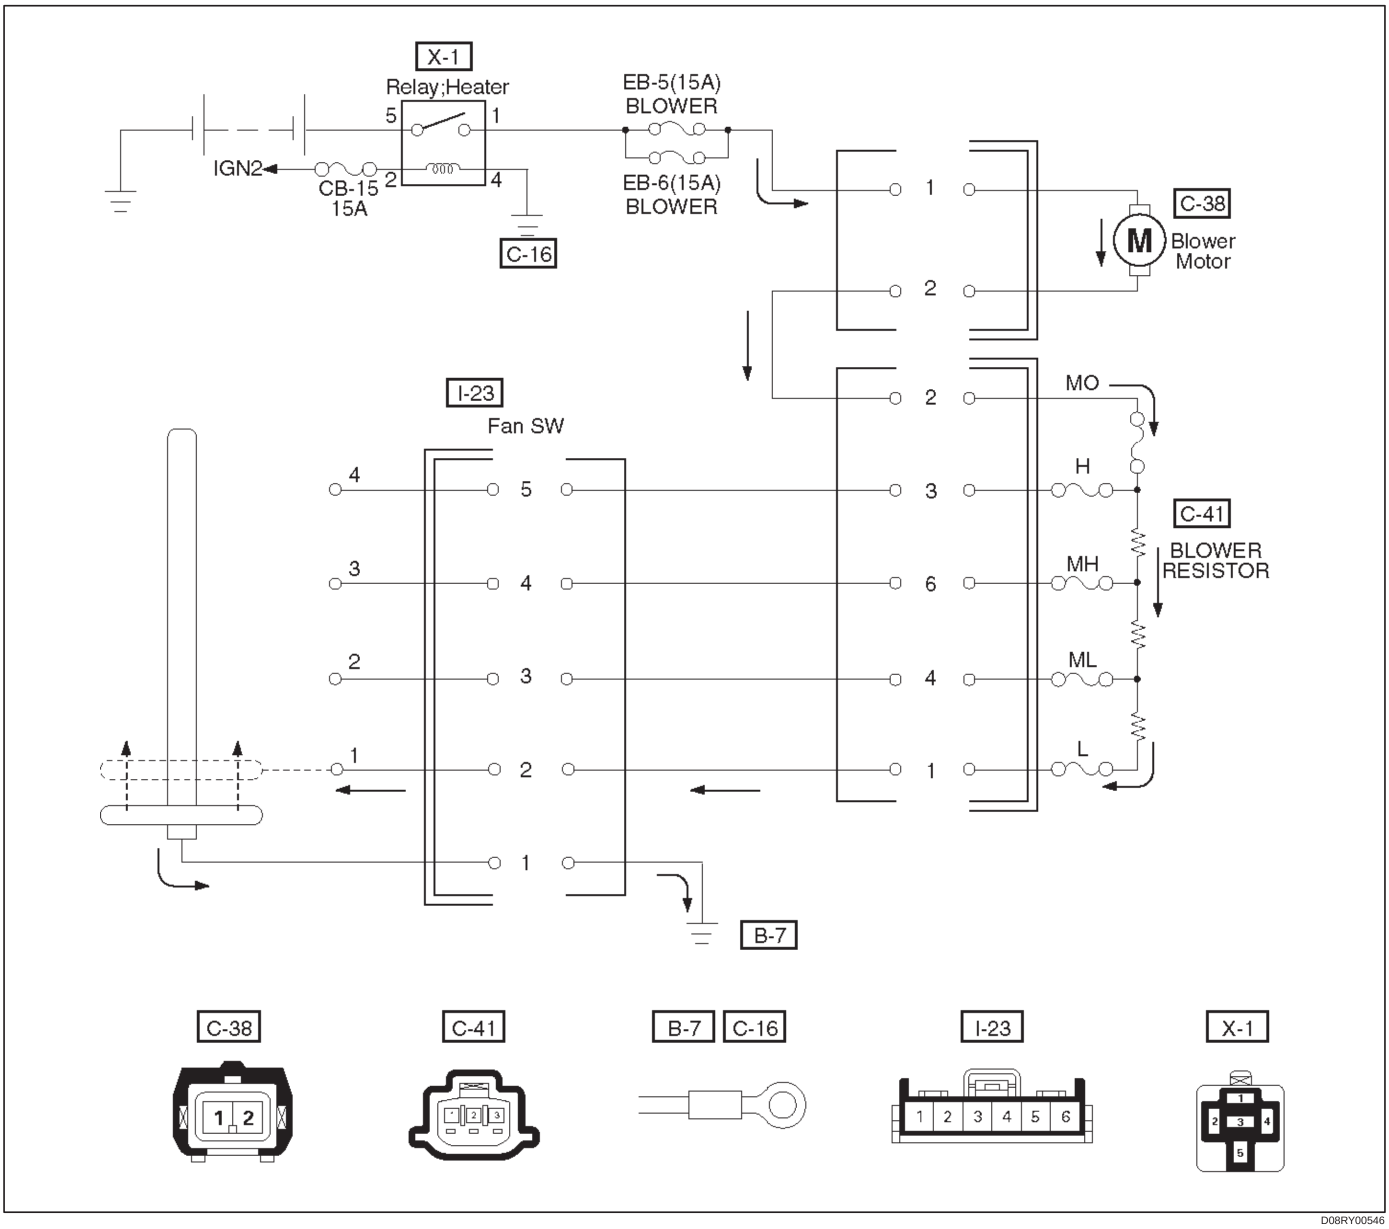
Diagnosis

Heating Cycle diagnosis

Condition	Possible cause	Correction
No heating or insufficient heating.	Blower motor does not run or runs improperly.	Refer to “FAN CONTROL LEVER (FAN SWITCH) DIAGNOSIS”.
	Engine coolant temperature is low.	Check the engine coolant temperature after warming up the engine and check the thermostat. Replace as necessary.
	Insufficient engine coolant.	Add engine coolant as required.
	Circulation volume of engine coolant is insufficient.	Check if the water hose to the heater core is clogged, collapsed or twisted. Repair or replace as necessary.
	Heater core clogged or collapsed.	Clean or replace as necessary.
	The heater cores is not provided with air sent from the blower motor.	Repair the temperature control link unit or mode doors.
	Duct connections defective or unsealing.	Repair or replace as necessary.
Control lever moves but mode door does not operate.	Cable attaching clip is not correct.	Repair
	Link unit of heater or blower assembly defective.	Repair
	The intake actuator is inoperative.	Refer to “AIR SOURCE SELECT LEVER DIAGNOSIS”
The mode door cannot be set to the mode selected.	Link unit of heater unit.	Repair.
	Control cable is not adjusted.	Adjust.

Fan Control Lever (Fan Switch) Diagnosis

Current flows to the blower motor through the heater relay (X-1) to activate the rotation of the blower motor by turning “ON” the fan control knob (fan switch). Blower motor speed is controlled in stages by the resistor, by operating the switch from “LOW” to “HIGH”.
For the inspection of the relays, switches and units in each table, refer to “INDIVIDUAL INSPECTION” in this section.



Condition	Possible cause	Correction
Blower motor does not run.	—	Refer to Chart A
Blower motor does not run in certain position (s).	—	Refer to Chart B, C, D and E
Blower motor does not stop at “OFF” position.	—	Refer to Chart F

Chart "A" Blower Motor Does Not Run

Step	Action	Yes	No
1	Is relay (X-1) OK?	Go to Step 2	Replace
2	Is fuse EB-5 (15A) OK?	Go to Step 3	Replace
3	Is fuse EB-6 (15A) OK?	Go to Step 4	Replace
4	Is resistor OK?	Go to Step 5	Replace
5	Is fan control lever OK?	Go to Step 6	Replace control lever assembly.
6	Is blower motor OK?	Go to Step 7	Replace
7	1. Turn the ignition switch "ON". 2. Turn fan control lever "ON". 3. Check to see if battery voltage is present at chassis side connector terminal No. C38-1 Is there a battery voltage?	Poor ground or open circuit either between chassis side connector terminal No. C38-2 and No. C41-2 or No. I23-1 and body ground (No. B-7).	Open circuit between No. EB-5 (15A) / EB-6 (15A) fuse and No. C38-1.

Chart "B" Blower Motor Does Not Run At Low Position

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between chassis side connector terminal No. C41-1 and No.I23-2.	Replace control lever assembly.

Chart "C" Blower Motor Does Not Run At Medium Low Position

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between the chassis side connector terminal No. C41-4 and No. I23-3.	Replace control lever assembly.

Chart “D” Blower Motor Does Not Run At Medium High Position

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between chassis side connector terminal No. C41-6 and No. I23-4.	Replace control lever assembly.

Chart “E” Blower Motor Does Not Run At High Position

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between Chassis side connector terminal No. C41-3 and No. I23-5.	Replace control lever assembly.

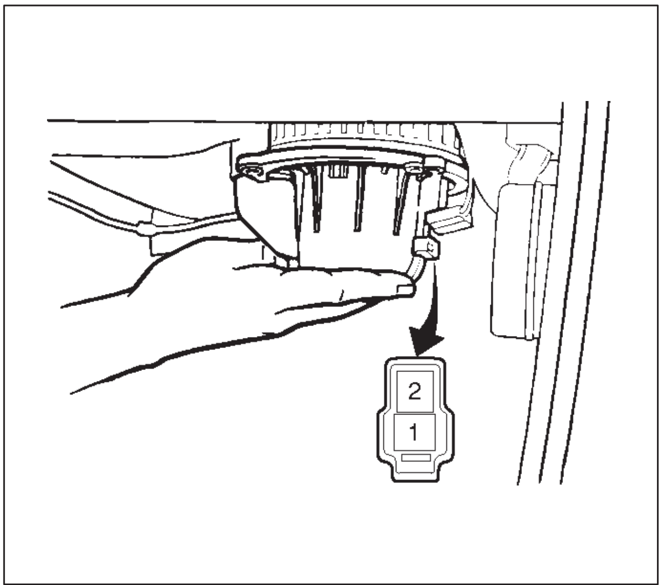
Chart “F” Blower Motor Does Not Stop In The “OFF” Position

Step	Action	Yes	No
1	Is the fan control lever (Fan Switch) OK?	Short circuit between chassis side connector terminal No. C38-2 and No. C41-2, No. C41-3 and No. I23-5, No. C41-6 and No. I23-4, No. C41-4 and No. I23-3 or No. C41-1 and No. I23-2	Replace control lever assembly.

Individual Inspection

Blower Motor

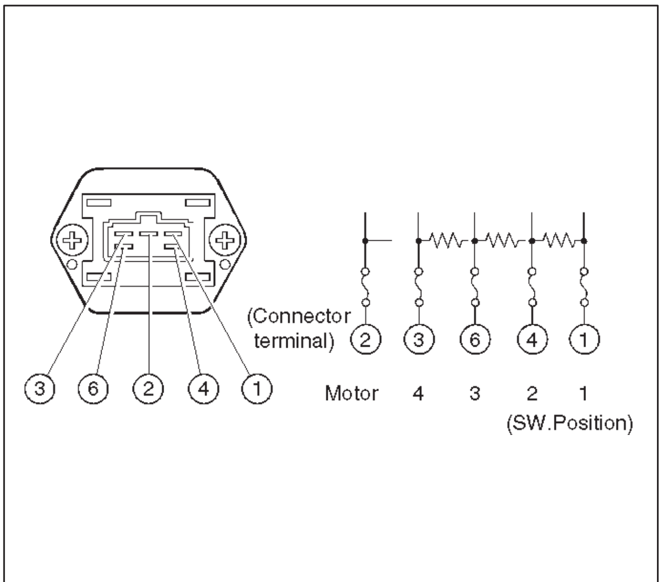
1. Disconnect the blower motor (C-38) connector from the blower motor.
2. Connect the battery positive terminal to the No. 1 terminal of the blower motor and the negative to the No. 2.
3. Be sure to check to see if the blower motor operates correctly.



873RS005

Resistor

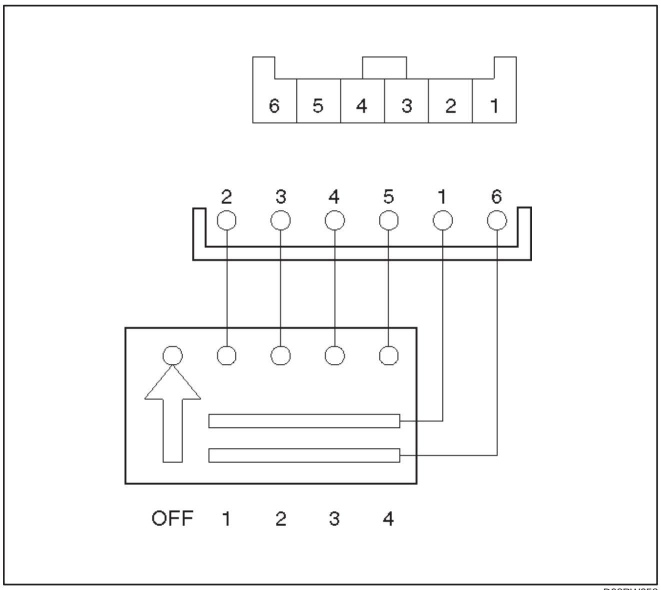
1. Disconnect the resistor (C-41) connector.
2. Check for continuity and resistance between the terminals of the resistor.



840RS001

Fan Control Lever (Fan Switch)

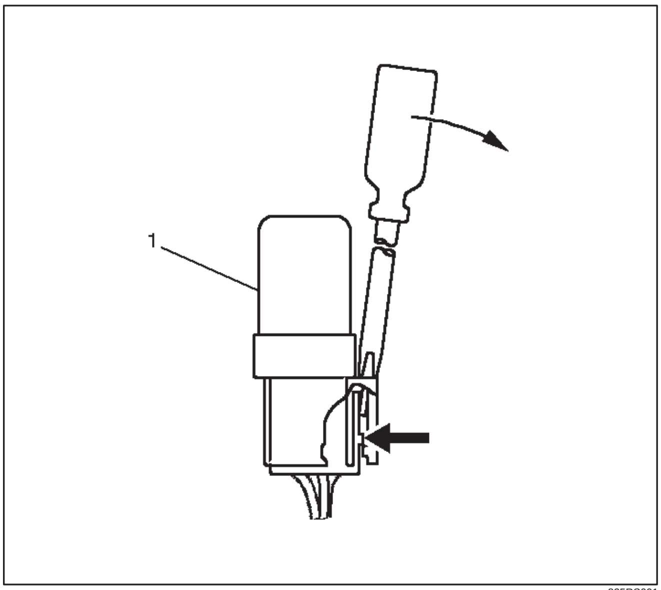
1. Check for continuity between the terminals of the fan switch.



D08RW058

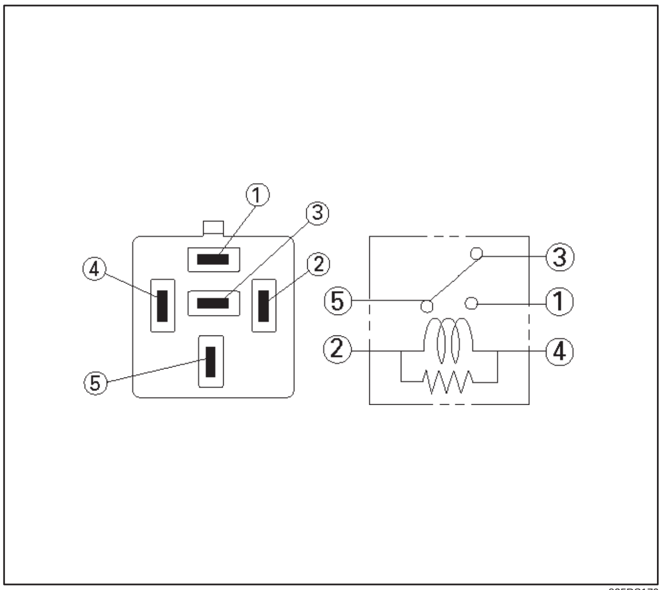
Heater Relay

1. Disconnect the heater relay (X-1).
   - When removing the connector for relay, unfasten the tank lock of the connector by using a screwdriver, then pull the relay (1) out.



825RS001

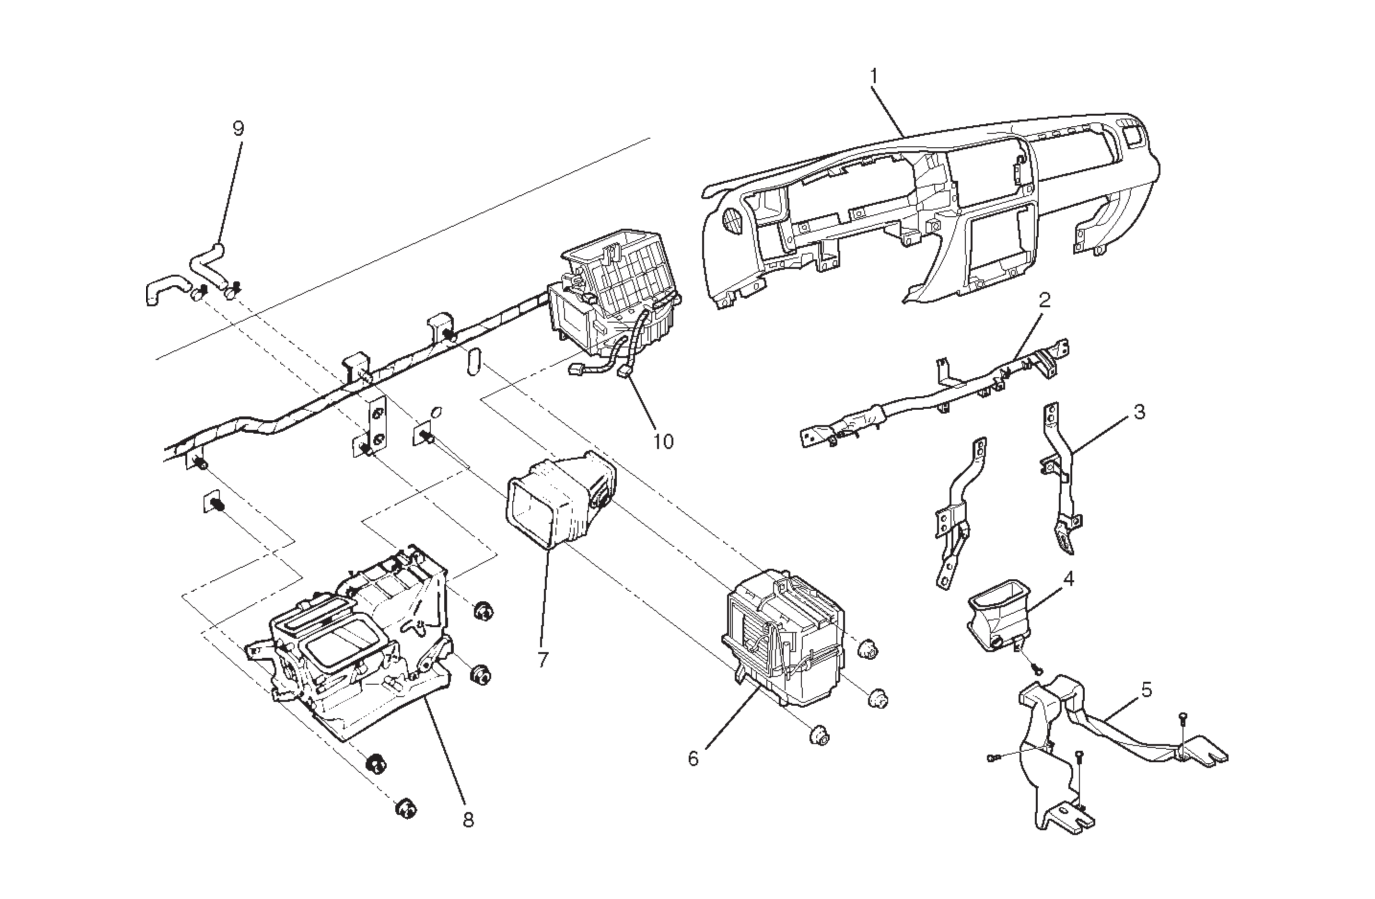
2. Check for continuity between the heater relay (X-1) terminals.



825RS179

Heater Unit

Heater Unit and Associated Parts



Legend

(4) Ventilation Lower Duct
(5) Rear Heater Duct
(6) Evaporator Assembly (A/C only)
(7) Duct
(8) Heater Unit Assembly
(9) Heater Hose
(10) Resistor Connector

Removal

1. Disconnect the battery ground cable.
2. Drain the engine coolant.
3. Discharge and recover refrigerant (with air conditioning).
   - Refer to Refrigerant Recovery in this section.
4. Remove the Instrument panel assembly.
   - Refer to Instrument Panel Assembly in Body and Accessories section.
5. Remove instrument panel bracket.
   - Refer to Cross Beam Assembly in Body and Accessories section.
6. Cross Beam Assembly.
   - Refer to Cross Beam Assembly in Body and Accessories section.
7. Disconnect resistor connector.
8. Remove duct.
9. Remove evaporator assembly (A/C only).
   - Refer to Evaporator Assembly in this section.
10. Remove ventilation lower duct.
11. Remove rear heater duct.
    - Remove foot rest, carpet and 3 clips.
12. Remove heater unit assembly.
    - Disconnect heater hoses at heater unit.

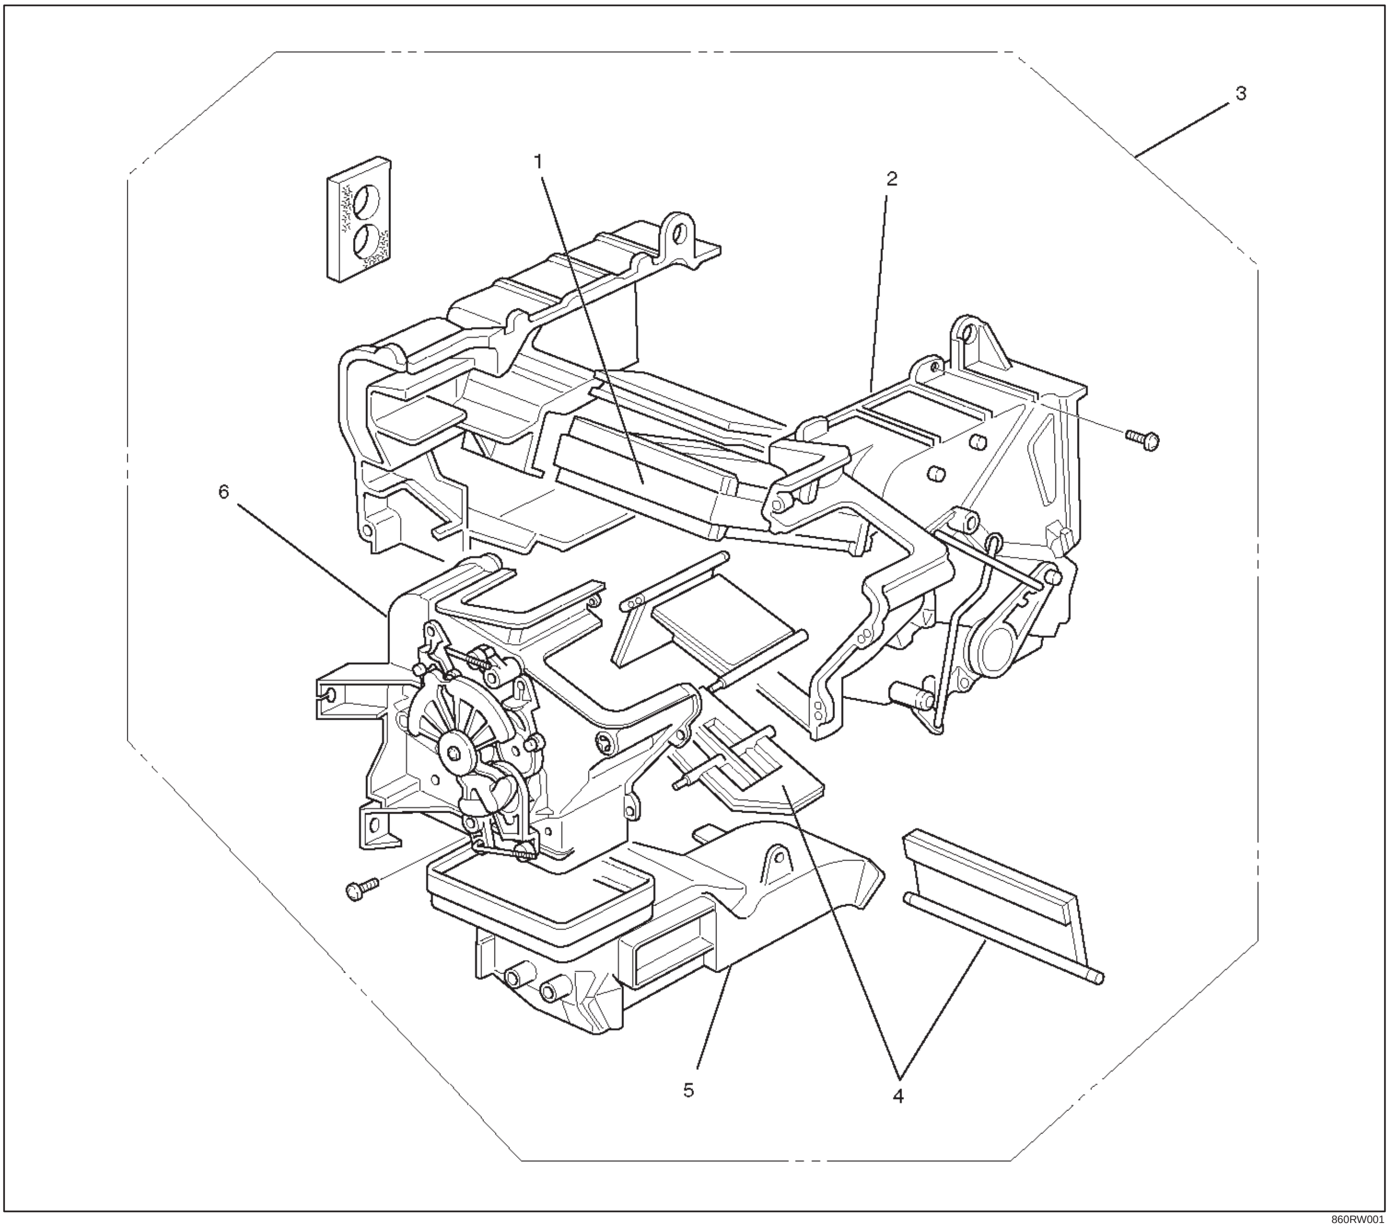
Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. When handling the PCM and the control unit, be careful not to make any improper connection of the connectors.
2. Adjust the control cables.
   - Refer to Control Lever Assembly in this section.
3. When installing the heater unit, defroster nozzle and center vent duct, be sure that the proper seal is made, without any gap between them.

Heater Core and / or Mode Door

Disassembled View



Legend

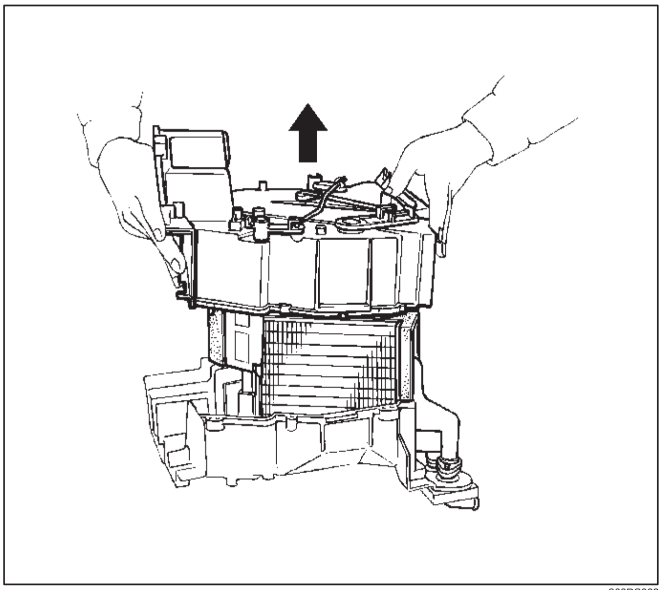
(3) Heater Unit
(4) Mode Door
(5) Duct
(6) Case (Mode Control)

Removal

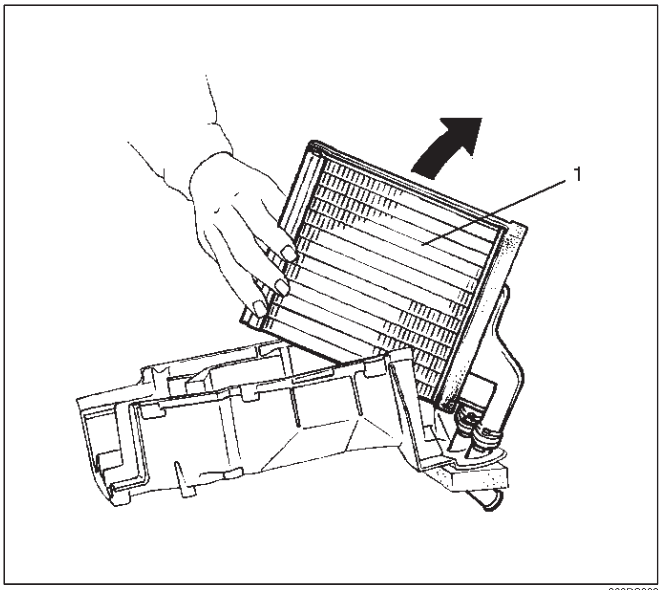
1. Disconnect the battery ground cable.
2. Drain the engine coolant.
3. Discharge and recover refrigerant (with air conditioning).
   - Refer to Refrigerant Recovery in this section.

4. Remove heater unit.
   - Refer to Heater Unit in this section.
5. Remove duct.
6. Remove case (Mode control) and do not remove link unit at this step.
7. Remove case (Temperature control) separate two halves of core case.



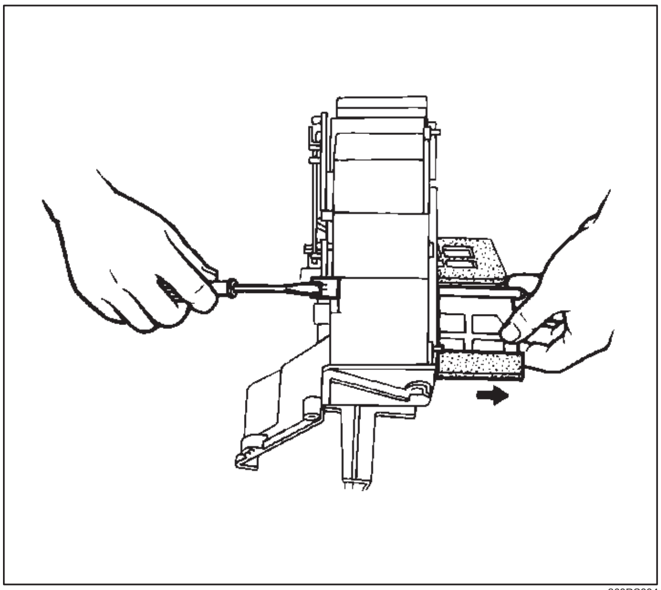
860RS002

8. Remove heater core (1).



860RS003

9. Pull out the mode door while raising up the catch of the door lever.



860RS004

Inspection

Check for foreign matter in the heater core, stain or the core fin defacement.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Check that each mode door operates properly.

Heater Mode Control Link Unit

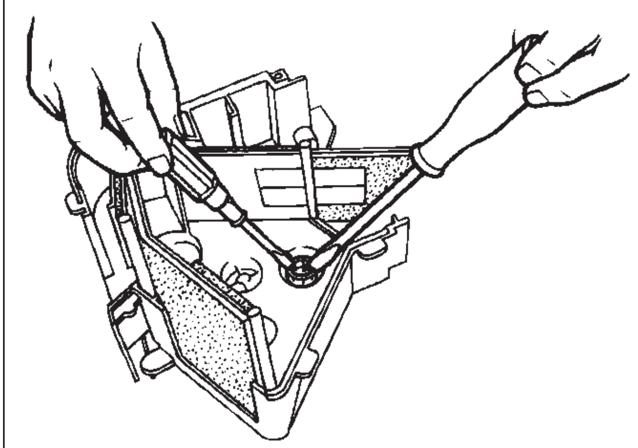
Removal

1. Disconnect the battery ground cable.
2. Drain engine coolant.
3. Discharge and recover refrigerant (with air conditioning)
   - Refer to Refrigerant Recovery in this section.
4. Remove heater unit.
   - Refer to Heater Unit in this section.
5. Remove the case (Mode control) from heater unit.
6. Remove washer and the mode main lever.
7. Remove rod.
8. Press the tab of the sub-lever inward, and take out the sub-lever.



860RS006

9. Pull out the door lever while raising up the catch of the door lever.
10. Remove clip.

Installation

To install, follow the remove steps in the reverse order, noting the following points:

1. Apply grease to the mode sub-lever and to the abrasive surface of the heater unit.
2. After installing the link unit, check to see if the link unit operates correctly.

Heater Temperature Control Link Unit

Disassembled View

Removal

1. Disconnect the battery ground cable.
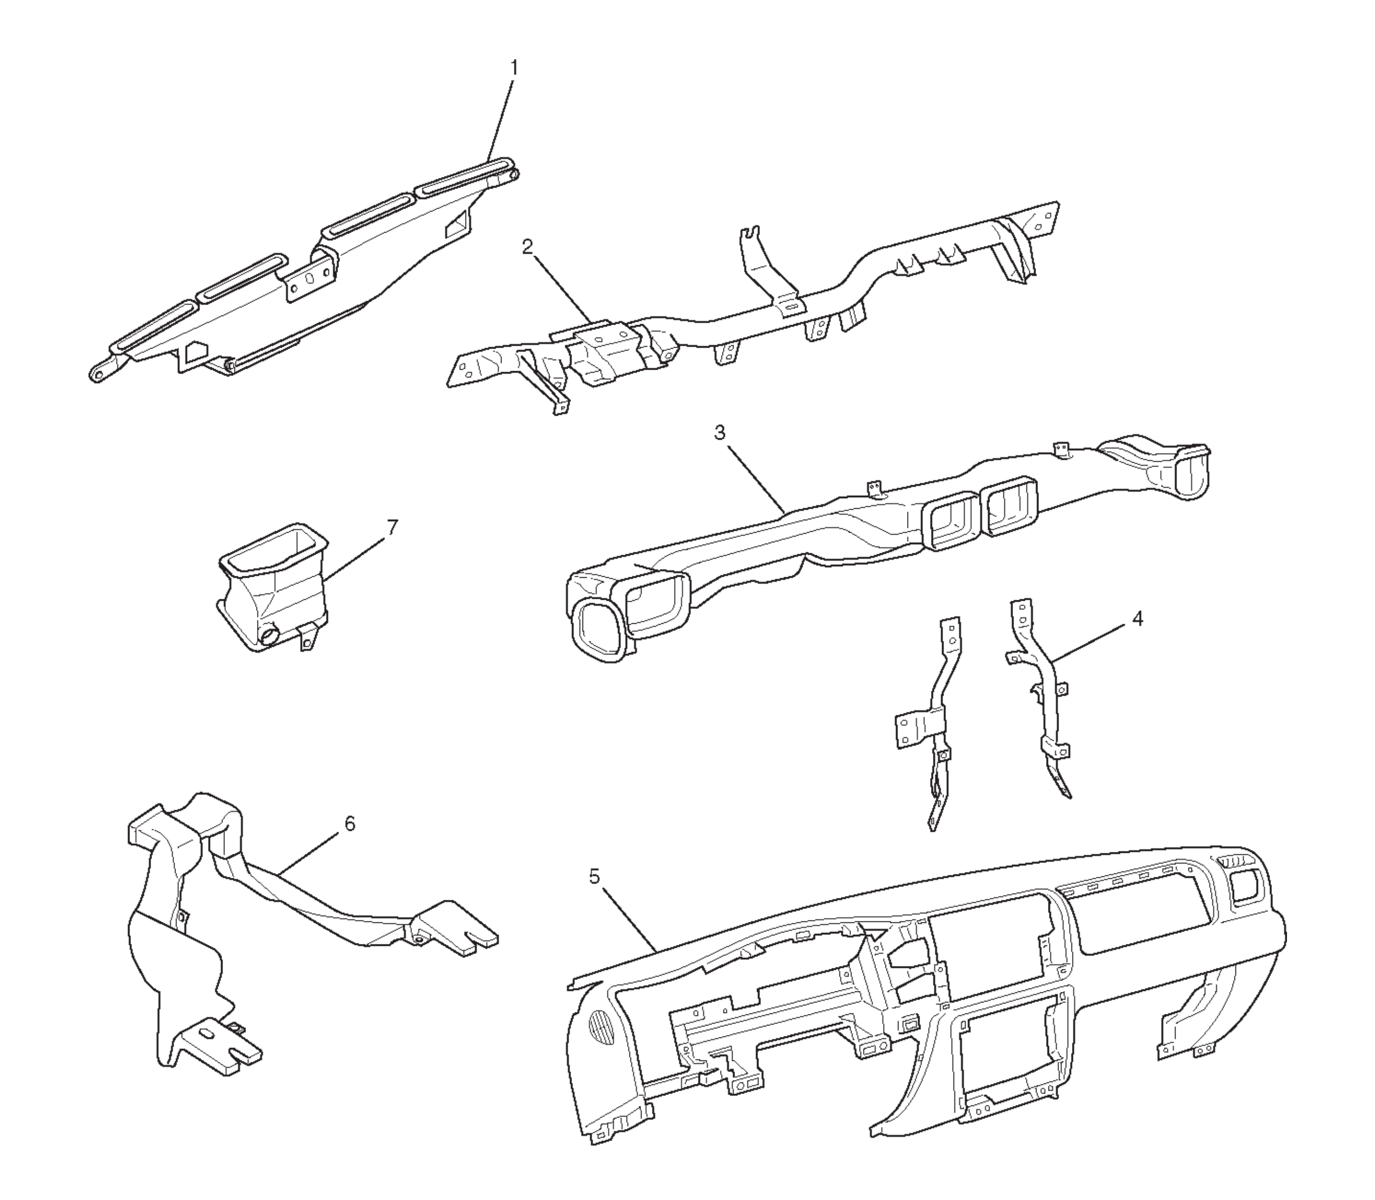
2. Remove blower motor connector.
3. Remove attaching screw.
4. Remove blower motor assembly.
5. Remove clip.
6. Remove fan.
7. Remove blower motor.

Installation

To install, follow the removal steps in the reverse order.

Rear Heater Duct, Defroster Nozzle and Ventilation Duct

Rear Heater Duct, Defroster Nozzle, Ventilation Duct and Associated Parts



Legend

(1) Defroster Nozzle
(2) Cross Beam Assembly
(3) Center Ventilation Duct and Side Defroster Duct
(4) Instrument Panel Bracket
(5) Instrument Panel Assembly
(6) Rear Heater Duct
(7) Ventilation Lower Duct

Removal

1. Disconnect the battery ground cable.
2. Remove instrument panel assembly.
   - Refer to Instrument Panel Assembly in Body and Accessories section.
3. Remove center ventilation duct and side defroster duct.
   - Remove 5 screws.
4. Remove instrument panel brackets.
   - Refer to Cross Beam Assembly in Body and Accessories section.
5. Remove cross beam assembly.
   - Refer to Cross Beam Assembly in Body and Accessories section.
6. Remove ventilation lower duct.
7. Remove rear heater duct.
   - Remove foot rest carpet and 3 clips.

8. Remove defroster nozzle.

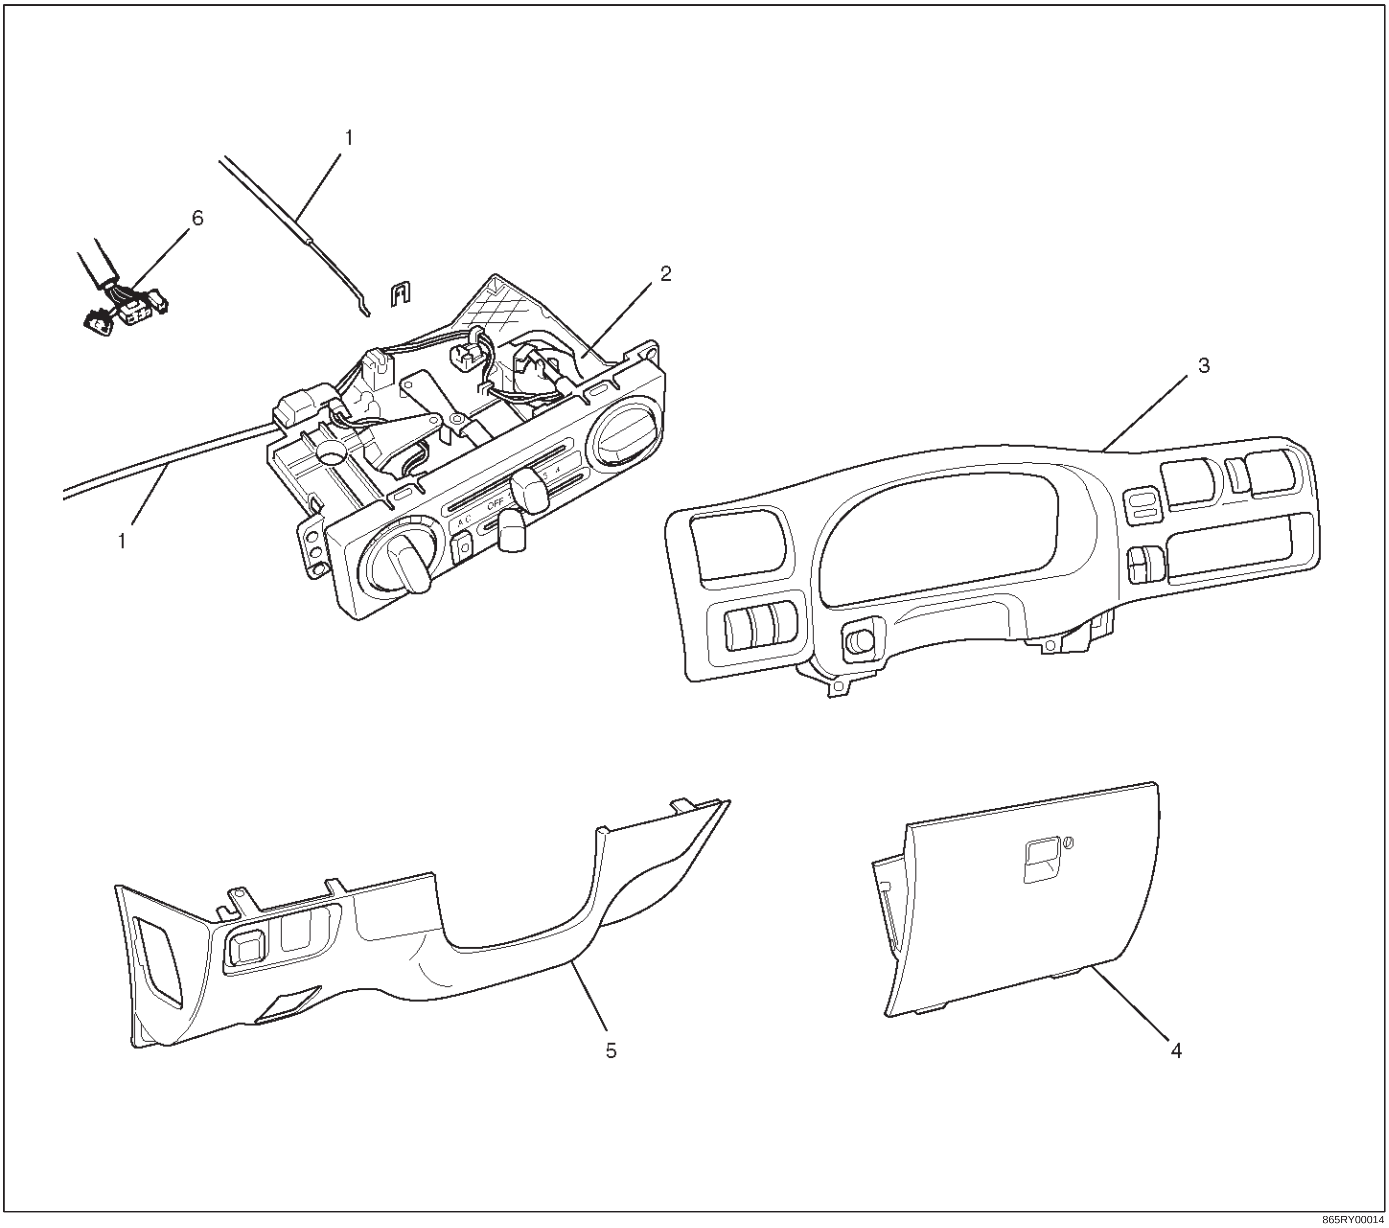
Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Connect each duct and nozzle securely leaving no clearance between them and making no improper matching.

Control Lever Assembly and / or Control Cable

Control Lever Assembly, Control Cable and Associated Parts



Legend

(1) Control Cable

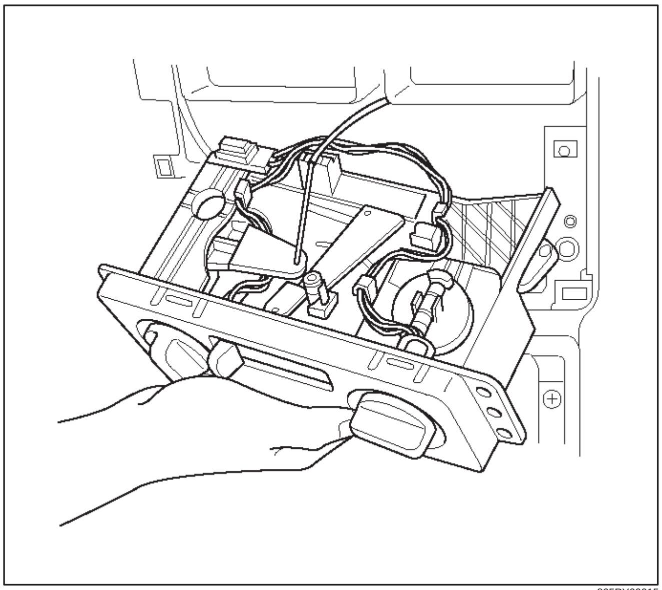
(4) Glove Box
(5) Instrument Panel Driver Lower Cover Assembly
(6) Fan Switch Air Conditioning Switch Connector

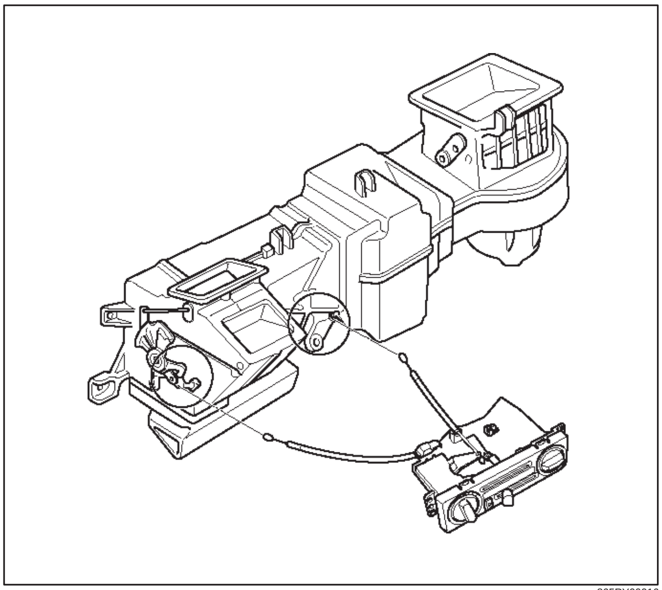
Removal

1. Disconnect the battery ground cable.
2. Remove instrument panel driver lower cover assembly.
3. Remove meter cluster assembly.
   - Refer to Instrument Panel Assembly in Body and Accessories section.
4. Remove glove box.
5. Remove the control lever attaching screws.
6. Pull the control lever assembly out and disconnect the fan switch and air conditioning switch connectors.



865RY00015

7. Remove control level assembly.
8. Disconnect control cables at each unit side.

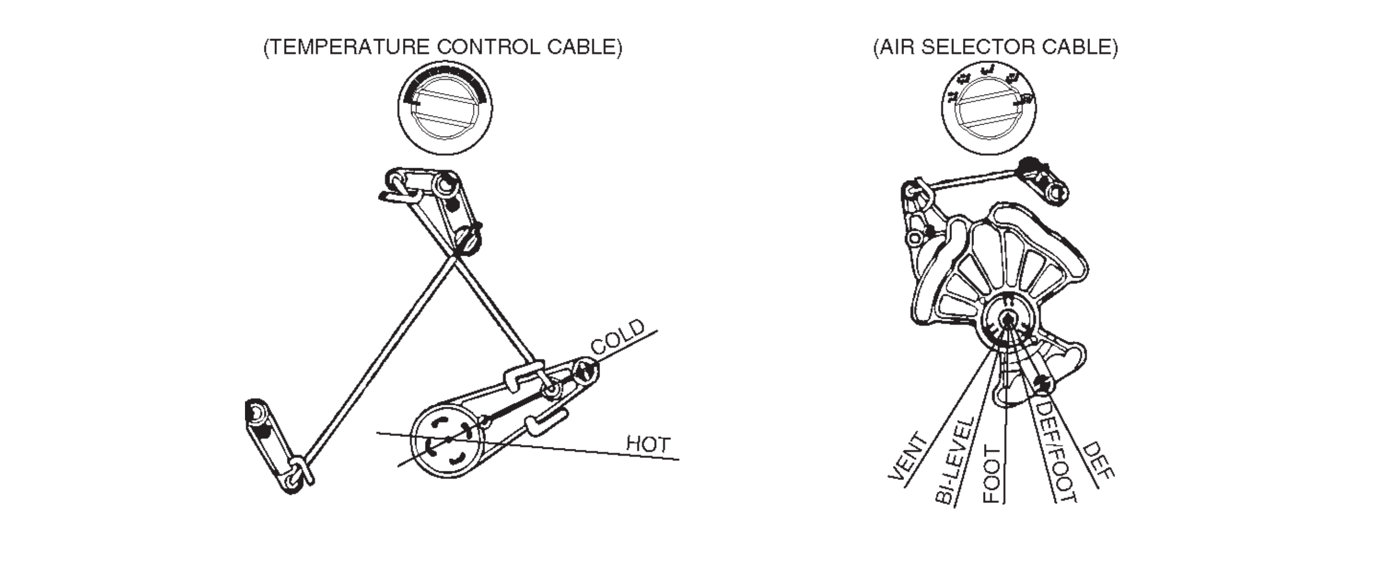


865RY00016

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Adjust the control cable.



865RY00017

- Temperature control cable.
  1. Turn the control knob to the left (“MAX COLD” position).
  2. Connect the control cable at the “COLD” position of the temperature control link of the heater unit and secure it with the clip.
- Air select control cable
  1. Turn the control knob to the right (“DEFROST” position).
  2. Connect the control cable at the “DEFROST” position of the mode control link of the heater unit and secure it with the clip.

2. Check the control cable operation.

Control Panel Illumination Bulb

Control Panel Illumination Bulb and Associated Parts

(17) Mode (DEF) Control Door

The refrigeration cycle includes the following four processes as the refrigerant changes repeatedly from liquid to gas and back to liquid while circulating.

Evaporation

The refrigerant is changed from a liquid to a gas inside the evaporator. The refrigerant mist that enters the

evaporator vaporizes readily. The liquid refrigerant removes the required quantity of heat (latent heat of vaporization) from the air around the evaporator core cooling fins and rapidly vaporizes. Removing the heat cools the air, which is then radiated from the fins and lowers the temperature of the air inside the vehicle.
The refrigerant liquid sent from the expansion valve and the vaporized refrigerant gas are both present inside the evaporator as the liquid is converted to gas.
With this change from liquid to gas, the pressure inside the evaporator must be kept low enough for vaporization to occur at a lower temperature. Because of that, the vaporized refrigerant is sucked into the compressor.

Compression

The refrigerant is compressed by the compressor until it is easily liquefied at normal temperature.
The vaporized refrigerant in the evaporator is sucked into the compressor. This action maintains the refrigerant inside the evaporator at a low pressure so that it can easily vaporize, even at low temperatures close to 0˚C (32˚F).
Also, the refrigerant sucked into the compressor is compressed inside the cylinder to increase the pressure and temperature to values such that the refrigerant can easily liquefy at normal ambient temperatures.

Condensation

The refrigerant inside the condenser is cooled by the outside air and changes from gas to liquid.
The high temperature, high pressure gas coming from the compressor is cooled and liquefied by the condenser with outside air and accumulated in the receiver/drier. The heat radiated to the outside air by the high temperature, high pressure gas in the compressor is called heat of condensation. This is the total quantity of heat (heat of vaporization) the refrigerant removes from the vehicle interior via the evaporator and the work (calculated as the quantity of heat) performed for compression.

Expansion

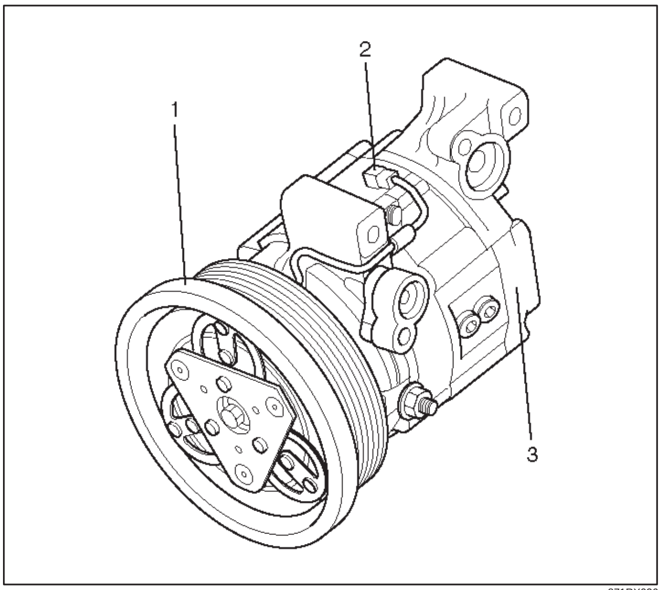
The expansion valve lowers the pressure of the refrigerant liquid so that it can easily vaporize.
The process of lowering the pressure to encourage vaporization before the liquefied refrigerant is sent to the evaporator is called expansion. In addition, the expansion valve controls the flow rate of the refrigerant liquid while decreasing the pressure.
That is, the quantity of refrigerant liquid vaporized inside the evaporator is determined by the quantity of heat which must be removed at a prescribed vaporization temperature. It is important that the quantity of refrigerant be controlled to exactly the right value.

Compressor

The compressor performs two main functions:
It compresses low-pressure and low-temperature refrigerant vapor from the evaporator into high-pressure and high-temperature refrigerant vapor to the condenser.
It pumps refrigerant and refrigerant oil through the air conditioning system.
This vehicle is equipped with a five-vane rotary compressor.
The specified amount of the compressor oil is 150cc (5.0 fl. oz.).
The oil used in the HFC-134a system compressor differs from that used in R-12 systems.
Also, compressor oil to be used varies according to the compressor model. Be sure to avoid mixing two or more different types of oil.
If the wrong oil is used, lubrication will be poor and the compressor will seize or malfunction.
The magnetic clutch connector is a waterproof type.

Magnetic Clutch

The compressor is driven by the drive belt from the crank pulley of the engine. If the compressor is activated each time the engine is started, this causes too much load to the engine. The magnetic clutch transmits the power from the engine to the compressor and activates it when the air conditioning is ON. Also, it cuts off the power from the engine to the compressor when the air conditioning is OFF. Refer to Compressor in this section for magnetic clutch repair procedure.



871RX026

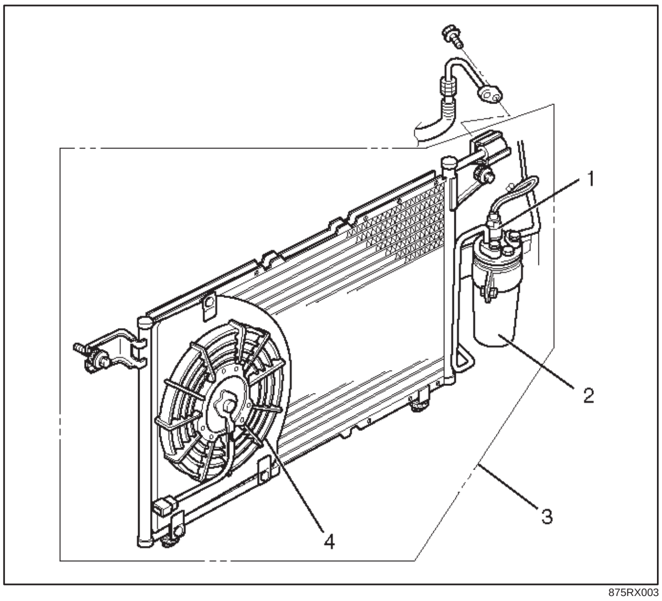
Legend

(1) Magnetic Clutch
(2) Magnetic Clutch Connector
(3) Compressor

Condenser

The condenser assembly is located in front of the radiator. It provides rapid heat transfer from the refrigerant to the cooling fins.
Also, it functions to cool and liquefy the high-pressure and high-temperature vapor sent from the compressor by the radiator fan or outside air.
A condenser may malfunction in two ways: it may leak, or it may be restricted. A condenser restriction will result in excessive compressor discharge pressure. If a partial restriction is present, the refrigerant expands after passing through the restriction.

Thus, ice or frost may form immediately after the restriction. If air flow through the condenser or radiator is blocked, high discharge pressures will result. During normal condenser operation, the refrigerant outlet line will be slightly cooler than the inlet line.
The vehicle is equipped with the parallel flow type condenser. A larger thermal transmission area on the inner surface of the tube allows the radiant heat to increase and the ventilation resistance to decrease.
The refrigerant line connection has a bolt at the block joint, for easy servicing.



Legend
(1) Pressure Switch
(2) Receiver Drier
(3) Condenser & Receiver Tank Assembly
(4) Condenser Fan (6VD1 A/T)

Receiver / Drier

The receiver/drier performs four functions:

- As the quantity of refrigerant circulated varies depending on the refrigeration cycle conditions, sufficient refrigerant is stored for the refrigeration cycle to operate smoothly in accordance with fluctuations in the quantity circulated.
- The liquefied refrigerant from the condenser is mixed with refrigerant gas containing air bubbles. If refrigerant containing air bubbles. If refrigerant containing air bubbles is sent to the expansion valve, the cooling capacity will decrease considerably. Therefore, the liquid and air bubbles are separated and only the liquid is sent to the expansion valve.
- The receiver/drier utilizes a filter and drier to remove the dirt and water mixed in the cycling refrigerant.
- The sight glass, installed atop the receiver/drier, show the state of the refrigerant.

A receiver/drier may fail due to a restriction inside the body of the unit. A restriction at the inlet to the receiver/drier will cause high pressure.
Outlet restrictions will be indicated by low pressure and little or no cooling. An excessively cold receiver/drier outlet may indicate a restriction.
The receiver/drier of this vehicle is made of aluminum with a smaller tank. It has a 300cc refrigerant capacity.
The refrigerant line connection has a bolt at the block joint, for easy servicing.

Dual Pressure Switch (V6,M/T)

The pressure switch (Dual pressure switch) is installed on the upper part of the receiver/drier, to detect excessively high pressure (high pressure switch) and prevent compressor seizure due to the refrigerant leaking (low pressure switch), so that the compressor is able to be turned “ON” or “OFF”.

Compressor	ON (kPa/psi)	OFF (kPa/psi)
Low-pressure control	205.9±29.4 (29.9±4.3)	176.5±19.6 (25.6±2.8)
High-pressure control	2059.4±196.1 (341.3±28.4)	2942.0±196.1 (426.6±28.4)

Triple Pressure Switch (V6, A/T)

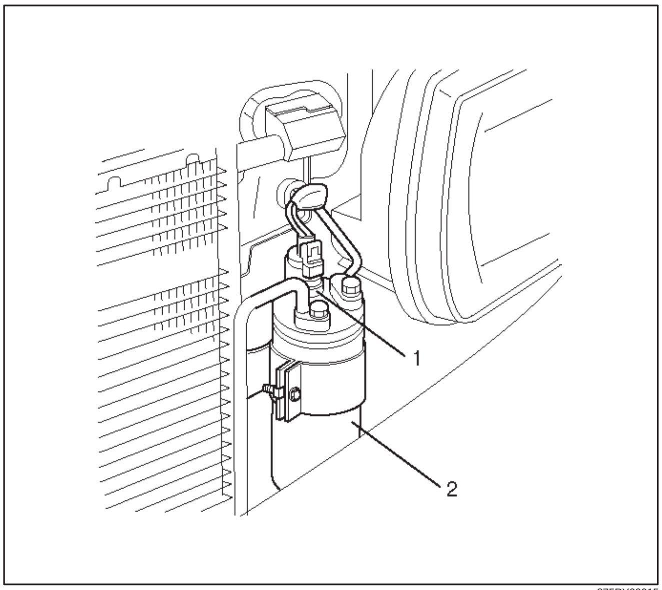
Triple pressure switch is installed on the upper part of the receiver/drier. This switch is constructed with a unitized type of two switches. One of them is a low and high pressure switch (Dual pressure switch) to switch “ON” or “OFF” the magnetic clutch as a result of irregularly high–pressure or low pressure of the refrigerant. The other one is a medium pressure switch (Cycling switch) to switch “ON” or “OFF” the condenser fan sensing the condenser high side pressure.

Compressor	ON (kPa/psi)	OFF (kPa/psi)
Low-pressure control	186.3±29.4 (27.0±4.3)	176.5±24.5 (25.6±3.6)
High-pressure control	2353.6±196.1 (341.3±28.4)	2942.0±196.1 (426.6±28.4)

Condenser fan	ON (kPa/psi)	OFF (kPa/psi)
Medium-pressure control	1471.0±98.1 (213.3±14.2)	1078.7±117.7 (156.4±17.1)

Pressure Sensor

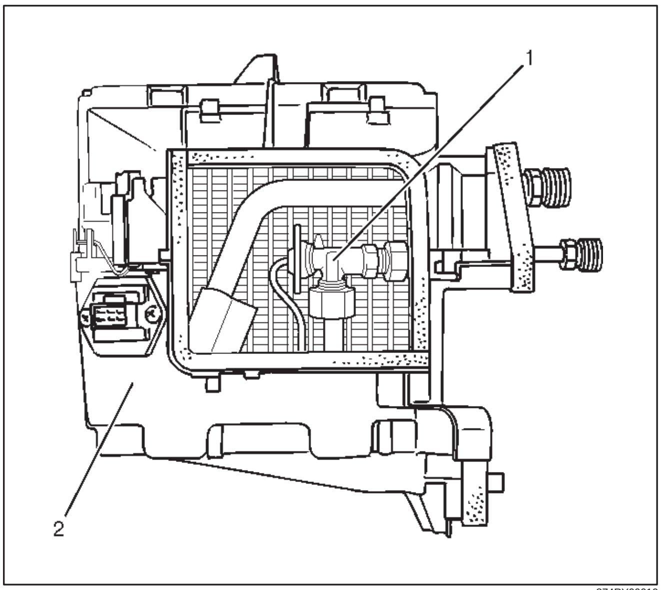
The pressure sensor is installed on the upper part of the receiver/drier. This sensor converts high pressure detection of refrigerant to an electrical voltage signal and supplies it to the ECM. The ECM controls switching compressor idle speed and cooling fan operation by the electrical voltage signal.



875RY00015

Legend

(1) Pressure Switch
(2) Receiver Drier



874RY00019

Legend

(1) Expansion Valve
(2) Evaporator Assembly

Expansion Valve

This expansion valve is an external pressure type and it is installed at the evaporator intake port.

The expansion valve converts the high pressure liquid refrigerant sent from the receiver/drier to a low pressure liquid refrigerant by forcing it through a tiny port before sending it to the evaporator.

This type of expansion valve consists of a temperature sensor, diaphragm, ball valve, ball seat, spring adjustment screw, etc.

The temperature sensor contacts the evaporator outlet pipe, and converts changes in temperature to pressure. It then transmits these to the top chamber of the diaphragm.

The refrigerant pressure is transmitted to the diaphragm's bottom chamber through the external equalizing pressure tube.

The ball valve is connected to the diaphragm. The opening angle of the expansion valve is determined by the force acting on the diaphragm and the spring pressure.

The expansion valve regulates the flow rate of the refrigerant. Accordingly, when a malfunction occurs to this expansion valve, both discharge and suction pressure get low, resulting in insufficient cooling capacity of the evaporator.

The calibration has been changed to match the characteristics of HFC-134a.

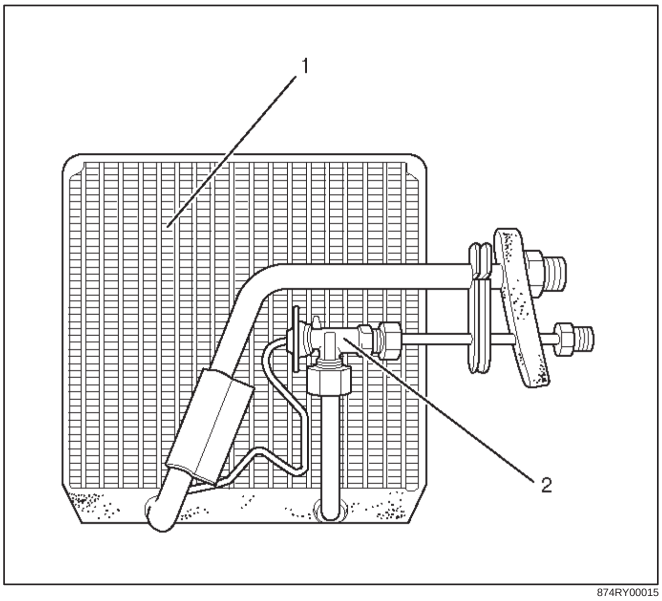
Evaporator

The evaporator cools and dehumidifies the air before the air enters the passenger compartment. High-pressure liquid refrigerant flows through the expansion valve into the low-pressure area of the evaporator. The heat in the air passing through the evaporator core is lost to the cooler surface of the core, thereby cooling the air.

As heat is lost between the air and the evaporator core surface, moisture in the vehicle condenses on the outside surface of the evaporator core and is drained off as water.

When the evaporator malfunctions, the trouble will show up as an inadequate supply of cool air. The cause is typically a partially plugged core due to dirt, or a malfunctioning blower motor.

The evaporator core with a laminate louver fin is a single-sided tank type where only one tank is provided under the core.



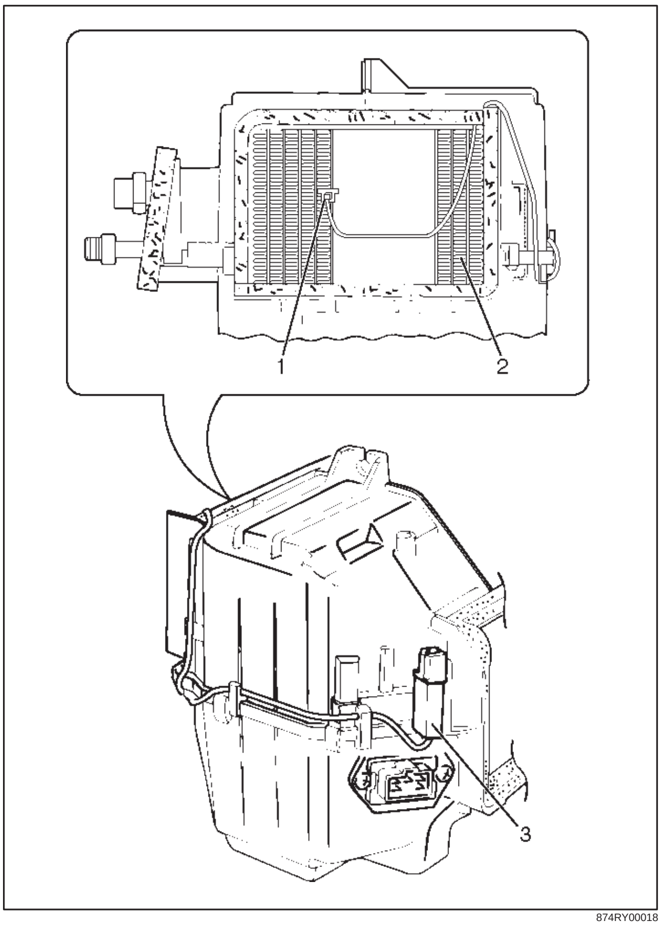
Legend

(1) Evaporator Core
(2) Expansion Valve

Electronic Thermostat

The thermostat consists of the duct sensor and thermostat unit which functions electrically to reduce the noises being generated while the system is in operation. The electronic duct sensor is mounted at the evaporator core outlet and senses the surface temperature of the evaporator core. Temperature signals are input to the thermostat unit. This information is compared by the thermo unit and results in the output to operate the A/C thermostat relay and turn the magnetic clutch ON or OFF to prevent evaporator freeze-up.

A characteristic of the sensor is that the resistance decreases as the temperature increases and the resistance increases as the temperature decreases.



Legend

(1) Duct Sensor
(2) Evaporator Core
(3) Thermostat Unit

Refrigerant Line

Restriction in the refrigerant line will be indicated by:

1. Suction line — A restricted suction line will cause low suction pressure at the compressor, low discharge pressure and little or no cooling.
2. Discharge line — A restriction in the discharge line generally will cause the discharge line to leak.
3. Liquid line — A liquid line restriction will be evidenced by low discharge and suction pressure and insufficient cooling.

Refrigerant flexible hoses that have a low permeability to refrigerant and moisture are used. These low permeability hoses have a special nylon layer on the inside.

Diagnosis

Air Conditioning Cycle Diagnosis

Condition	Possible cause	Correction
No cooling or insufficient cooling.	Magnetic clutch does not run.	Refer to “Magnetic Clutch Diagnosis” in this section.
	Compressor is not rotating properly. Drive belt is loosened or broken.	Adjust the drive belt to the specified tension or replace the drive belt.
	Compressor is not rotating properly. Magnetic clutch face is not clean and slips.	Clean the magnetic clutch face or replace.
	Compressor is not rotating properly. Incorrect clearance between magnetic drive plate and pulley.	Adjust the clearance. Refer to Compressor in this section.
	Compressor is not rotating properly. Compressor oil leaks from the shaft seal or shell.	Replace the compressor
	Compressor is not rotating properly. Compressor is seized.	Replace the compressor
	Insufficient or excessive charge of refrigerant.	Discharge and recover the refrigerant. Recharge to the specified amount.
	Leaks in the refrigerant system.	Check the refrigerant system for leaks and repair as necessary. Discharge and recover the refrigerant. Recharge to the specified amount.
	Condenser is clogged or insufficient radiation.	Clean the condenser or replace as necessary.
	Temperature control link unit of the heat unit is defective.	Repair the link unit.
	Unsteady operation due to a foreign substance in the expansion valve.	Replace the expansion valve.
	Poor operation of the electronic thermostat.	Check the electronic thermostat and replace as necessary.
Insufficient velocity of cooling air.	Evaporator clogged or frosted.	Check the evaporator core and replace or clean the core.
	Air leaking from the cooling unit or air duct.	Check the evaporator and duct connection, then repair as necessary.
	Blower motor does not rotate properly.	Refer to Fan Control Lever (Fan Switch) Diagnosis in this section.

*For the execution of the charging and discharging operation in the table above, refer to Recovery, Recycling, Evacuating and Charging in this section.

Checking The Refrigerant System With Manifold Gauge

Since Refrigerant-134a (HFC-134a) is used in the air conditioning system in this vehicle, be sure to use manifold gauges, charging hoses and other air conditioning service tools for HFC-134a when checking the refrigerant system.

Conditions:

- Run the engine at Idling
- Air conditioning switch is “ON”
- Run the blower motor at “HIGH” position
- Temperature control lever set to “MAX COLD”
- Air source selector lever at “CIRC”
- Open the engine hood
- Close all the doors

Normal Pressure:

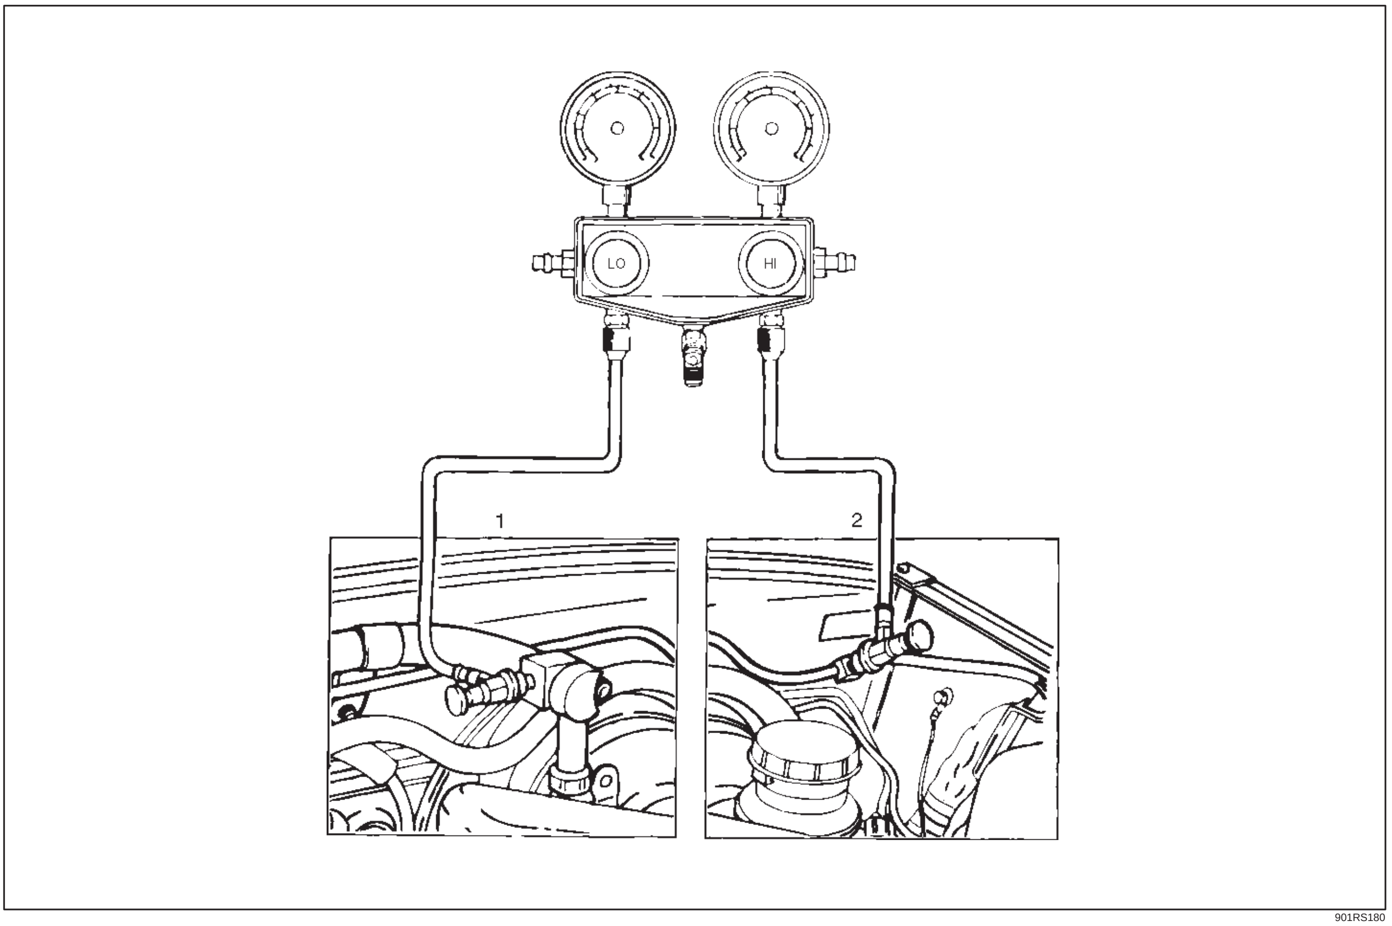
- At ambient temperature: approx. 25–30˚C (77–86˚F).
- At low-pressure side: approx. 147.1–294.2 kPa (21.3–42.7 psi).
- At high-pressure side: approx. 1372.9–1863.3 kPa (199.1–270.2 psi).

Refer to the table on the refrigerant pressure-temperature relationship.

HFC-134a Pressure-Temperature Relationship			
Pressure		Temperature	
(kPa)	(psi)	(˚C)	(˚F)
36	5.3	–20	–4.4
67	9.7	–15	5
104	15	–10	14
147	21	–5	23
196	28	0	32
255	37	5	41
314	45	10	50
392	57	15	59
471	68	20	68
569	82	25	77
677	98	30	86
785	114	35	95
912	132	40	104
1059	154	45	113
1216	176	50	122

Connect The Manifold Gauge

Low-pressure hose (LOW) — Suction side
High pressure hose (HI) — Discharge side



901RS180

Legend

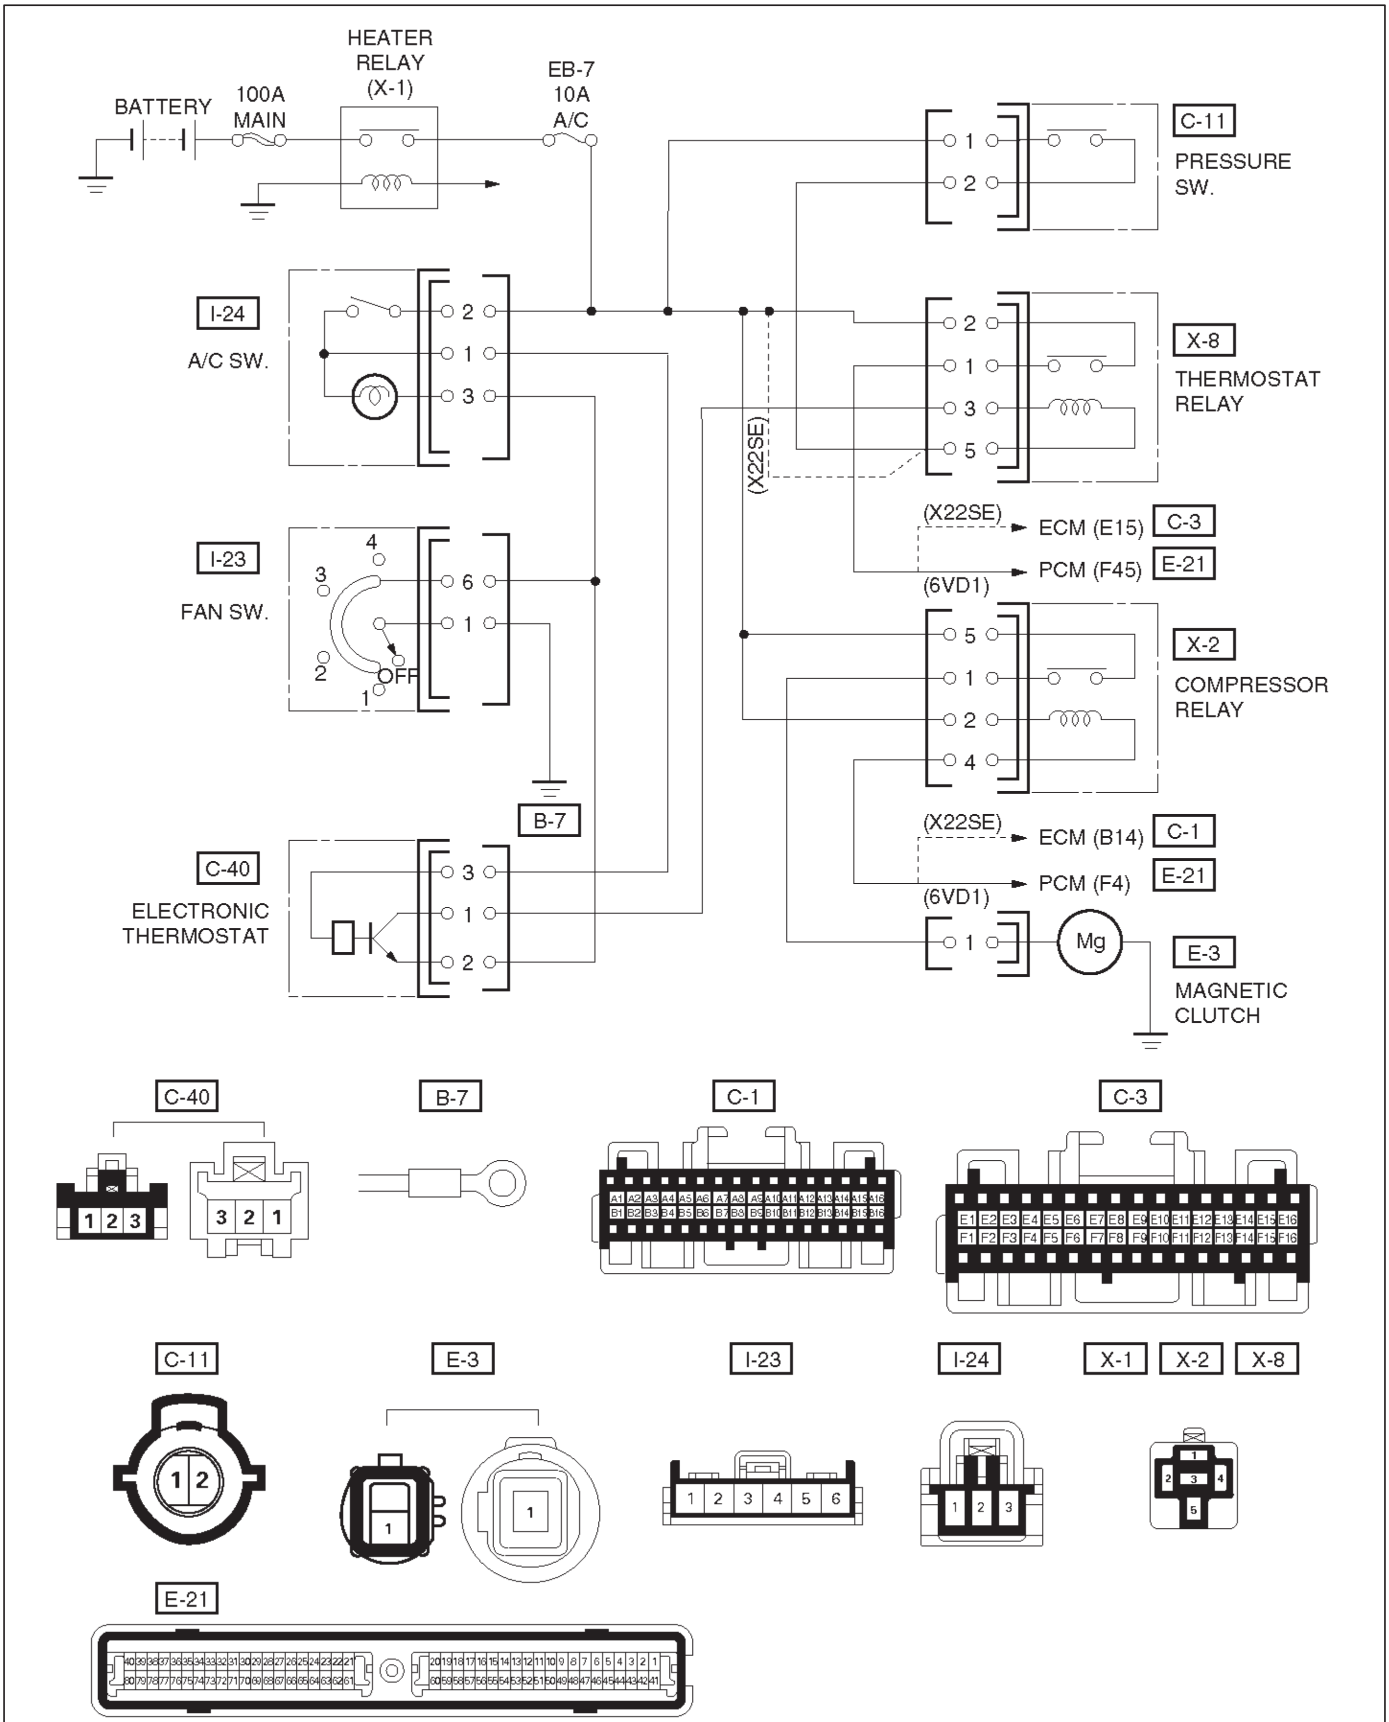
(1) Low Side
(2) High Side

Condition	Possible cause	Correction
Discharge (High Gauge) Pressure Abnormally High	Condenser clogged or dirty.	Clean the condenser fins
	Cooling fan does not operate properly.	Check the cooling fan operation.
Discharge (High Gauge) Pressure Abnormally High. Insufficient cooling.	Excessive refrigerant in system.	Discharge and recover refrigerant. Recharge to specified amount.
Discharge (High Gauge) Pressure Abnormally High. High pressure gauge drop. (After stopping A/C, the pressure drops approx. 196 kPa (28 psi) quickly)	Air in system.	Evacuate and charge refrigerant system.
Discharge (High Gauge) Pressure Abnormally Low. Insufficient cooling	Insufficient refrigerant in system.	Check for leaks. Discharge and recover the refrigerant. Recharge to the specified amount.
Discharge (High Gauge) Pressure Abnormally Low. Low pressure gauge indicates vacuum.	Clogged or defective expansion valve.	Replace the expansion valve.
Discharge (High Gauge) Pressure Abnormally Low. Frost or dew on refrigerant line before and after the receiver/drier or expansion valve, and low pressure gauge indicates vacuum.	Restriction caused by debris or moisture in the receiver/drier.	Check system for restriction and replace the receiver/drier.
Discharge (High Gauge) Pressure Abnormally Low. High and low pressure gauge balanced quickly. (After turned off A/C)	Compressor seal defective	Repair or replace the compressor.
	Poor compression due to a defective compressor gasket.	Repair or replace the compressor.
Suction (Low Gauge) Pressure Abnormally High. Low pressure gauge (Low pressure gauge is lowered after condenser is cooled by water.)	Excessive refrigerant in system.	Discharge and recover refrigerant Recharge to specified amount.
Suction (Low Gauge) Pressure Abnormally High. Low pressure hose temperature. (Low pressure hose temperature around the compressor refrigerant line connector is lower than around evaporator.)	Unsatisfactory valve operation due to defective temperature sensor of expansion valve.	Replace the expansion valve.
	Expansion valve opens too long.	Replace the expansion valve.
Suction (Low Gauge) Pressure Abnormally High. High and low pressure gauge balanced quickly. (After turned off A/C)	Compressor gasket is defective.	Repair or replace the compressor.
Suction (Low Gauge) Pressure Abnormally Low. Insufficient cooling.	Insufficient refrigerant in system.	Check for leaks. Discharge and recover the refrigerant. Recharge to specified amount.
Suction (Low Gauge) Pressure Abnormally Low. Frost on the expansion valve inlet line	Expansion valve clogged.	Replace the expansion valve.

Condition	Possible cause	Correction
Suction (Low Gauge) Pressure Abnormally Low Receiver/drier inlet and outlet refrigerant line temperature. (A distinct difference in temperature develops.)	Receiver/Drier clogged.	Replace the receiver/drier.
Suction (Low Gauge) Pressure Abnormally Low. Expansion valve outlet refrigerant line. (Not cold and low pressure gauge indicates vacuum.)	Expansion valve temperature sensor is defective.	Replace the expansion valve.
Suction (Low Gauge) Pressure Abnormally Low. When the refrigerant line is clogged or blocked, the low pressure gauge reading will decrease, or a vacuum reading may be shown.	Clogged or blocked refrigerant line.	Replace refrigerant line.
Suction (Low Gauge) Pressure Abnormally Low. Evaporator core is frozen.	Thermo switch defective.	Replace thermo switch.
Suction (Low Gauge) and Discharge (High Gauge) Pressure Abnormally High. Insufficient cooling.	Excessive refrigerant in system.	Discharge and recover the refrigerant, the Recharge to the specified amount.
	Condenser clogged or dirty.	Clean the condenser fin.
Suction (Low Gauge) and Discharge (High Gauge) Pressure Abnormally High. Suction (Low) pressure hose (Not cold).	Air in system.	Evacuate and charge refrigerant.
Suction (Low Gauge) and Discharge (High Gauge) Pressure Abnormally Low. Insufficient cooling	Insufficient refrigerant in system.	Check for leaks. Discharge and recover refrigerant. Recharge to specified amount.

A/C — Air Conditioning

Magnetic Clutch Diagnosis



PCM- Powertrain Control Module, A/C-S Air Conditioning

D08RY00547

When the air conditioning switch and the fan control knob (fan switch) are turned on with the engine running, current flows through the thermostat and the compressor relay to activate the magnetic clutch.
The air conditioning can be stopped by turning of the air conditioning switch or the fan control knob (fan switch). However, even when the air conditioning is in operation, the electronic thermostat, the pressure switch or the Powertrain Control Module (PCM;V6-3.2L)/ Engine Control Module (ECM;L4-2.2L) is used to stop the air conditioning temporarily by turning off the magnetic clutch in the prearranged conditions to reduce the engine load which is being caused by the rise in the engine coolant temperature, and the acceleration of the vehicle, etc.
For the inspection of the relays, switches and units in the table, refer to “Individual Inspection” in this section.

Magnetic Clutch Does Not Run

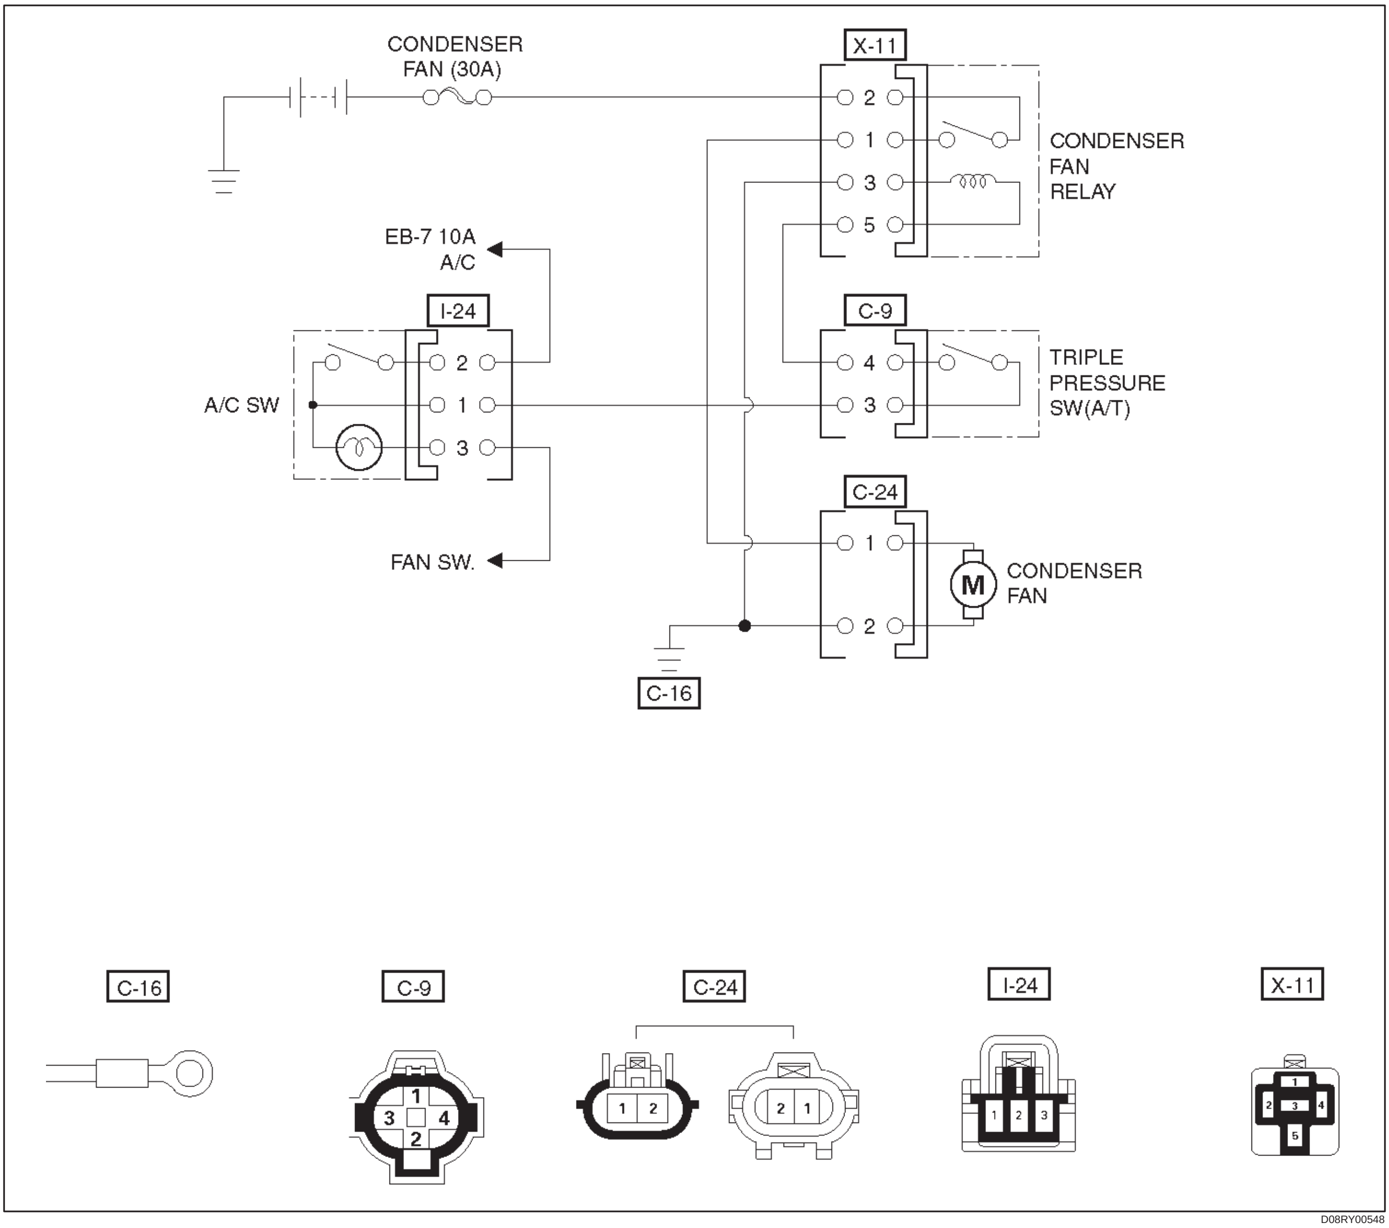
Step	Action	Yes	No
1	Are No. EB-7 (10A) fuse and No. EB-5 (15A) / EB-6 (15A) fuse OK?	Go to Step 2	Replace
2	Are heater (X-1), thermostat (X-8), and compressor (X-2) relays OK?	Go to Step 3	Replace
3	Is pressure switch OK?	Go to Step 4	Switch defective or insufficient refrigerant.
4	Are air conditioning switch and fan control lever (Fan Switch) OK?	Go to Step 5	Replace
5	1. Turn the ignition switch “ON” (Engine is running). 2. Air conditioning switch and fan control lever (Fan Switch) “ON”. 3. Check to see if battery voltage is present at chassis side connector terminal No. E3-1. Is there a battery voltage?	Go to Step 6	Go to Step 7
6	Check to see if continuity between compressor side connector terminal No. E3-1 and the magnetic clutch side connector terminal. Is there a continuity?	Magnetic clutch defective.	Compressor defective.
7	Check to see it battery voltage is present at chassis side connector terminal No.I24-2. Is there a battery voltage?	Go to Step 8	Open circuit between No.EB-7 (10A) fuse and No. I24-2.
8	Check to see if battery voltage is present at chassis side connector terminal No. C11-1 Is there a battery voltage?	Go to Step 9	Open circuit between No.I24-1 and No. C11-1.
9	1. Disconnect thermostat relay (X-8). 2. Check to see if battery voltage is present at the chassis side relay terminal NO. X8-2 Is there a battery voltage?	Go to Step 10	Open circuit between No. EB-7 and C11-2 (10A) fuse and No.X8-2.
10	Check to see if voltage (approx. 10V) is present between chassis side relay terminal No. X8-5 and No. X8-3. Is there a battery voltage?	Go to Step 11	Go to Step 17
11	1. Reconnect thermostat relay and disconnect compressor relay (X-2). 2. Check to see if battery voltage is present at the chassis side relay terminal No. X2-5. Is there a battery voltage?	Go to Step 12	Open circuit between No. EB-7 (10A) fuse and No. X2-5.
12	Check to see if continuity between chassis side relay terminal No. X2-1 and the chassis side connector terminal No. E3-1. Is there a continuity?	Go to Step 13	Open circuit.

Magnetic Clutch Does Not Run (Cont'd)

Step	Action	Yes	No
13	Check to see if battery voltage is present between chassis side relay terminal No. X2-2 and No. X2-4. Is there a battery voltage?	Go to Step 14	Go to Step 15
14	Check to see if battery voltage is present at chassis side relay terminal No. X2-2. Is there a battery voltage?	Go to Step 16	Open circuit between No. EB-7 (10A) fuse and No. X2-2.
15	Check to see if battery voltage is present at chassis side connector terminal No. E21-F4 / C1-B14. Is there a battery voltage?	Power train control module (PCM) defective. Refer to Driveability and Emissions in Engine section.	Open circuit between No. X2-4 and No. E21-F4 / C1-B14.
16	Check to see if continuity between chassis side relay terminal No. X8-1 and chassis side connector terminal No. E21-F45 / C3-E15. Is there a continuity?	Power train control module (PCM) defective. Refer to Driveability and Emissions in Engine section.	Open circuit
17	Check to see if battery voltage is present at chassis side relay terminal No.X8-5. Is there a battery voltage?	Go to Step 18	Open circuit between No.X8-5 and C11-2.
18	1. Reconnect thermostat relay. 2. Check to see if battery voltage is present at chassis side connector terminal No.C40-3. Is there a battery voltage?	Go to Step 19	Open circuit between No.I24-1 and No.C40-3.
19	Check to see if battery voltage (appox 10V) is present at chassis side connector terminal No. C40-1. Is there a battery voltage?	Go to Step 20	Open circuit between No. X8-3 and No. C40-1.
20	Check to see if continuity between chassis side connector terminal No. C40-2 and No.I23-6. Is there a continuity?	Electronic thermostat defective.	Open circuit between No. C40-2 and No.I23-6 or poor ground (Fan Switch Ground Circuit).

Condenser Fan Diagnosis

While the air conditioning is ON, the cycling switch in the triple pressure switch senses the refrigerant pressure, and activates the condenser fan to improve the cooling capacity of the condenser when the refrigerant pressure exceeds a set pressure value. The condenser fan stops when the air conditioning is turned “OFF” or when the pressure goes down below the set pressure value.



Condition	Possible cause	Correction
Condenser fan does not run.	–	Refer to “Chart A”.
	–	Refer to “Chart B”.

Chart “A” Condenser Fan Does Not Run

Step	Action	Yes	No
1	Are 30A fuse OK?	Go to Step 2	Replace
2	Is relay (X-11) OK?	Go to Step 3	Replace
3	Is pressure switch OK?	Go to Step 4	Switch defective or insufficient refrigerant.
4	Is air conditioning switch OK?	Go to Step 5	Replace
5	Is fan motor OK?	Go to Step 6	Replace
6	1. Disconnect condenser fan relay (X-11). 2. Check to see if battery voltage is present at the chassis side relay terminal NO. X11-2 Is there a battery voltage?	Go to Step 7	Open circuit between Condenser Fan fuse (30A) and No.X11-2.
7	1. Reconnect condenser fan relay (X-11). 2. Air conditioning switch “ON”. 3. Check to see if battery voltage is present at chassis side connector terminal No.C9-3. Is there a battery voltage?	Go to Step 8	Open circuit between I-24-1 and C9-3.
8	1. Air conditioning switch “OFF”. 2. Check to see if continuity between chassis side relay terminal No.X11-5 and the chassis side connector terminal No.C9-4. Is there a continuity?	Go to Step 9	Open circuit.
9	Check to see if continuity between chassis side connector terminal No. C24-1 and chassis side relay terminal No.X11-1. Is there a continuity?	Poor ground or open circuit between chassis side connector terminal No.X11-3 (or No.C24-2) and body ground (No.C16).	Open circuit.

Chart “B” Condenser Fan Does Not Stop

Step	Action	Yes	No
1	1. Air conditioning switch “OFF”. Does condenser fan stop?	Triple pressure switch defective.	Condenser fan relay (X11) defective.

Air Source Select Lever Diagnosis

Chart "A": FRESH Mode Inoperative

Step	Action	Value(s)	Yes	No
1	Is the fuse EB-7 normal?	—	Go to Step 2	Replace the fuse
2	Is C-16 grounded securely?	—	Go to Step 3	Ground it securely
3	Remove the intake actuator relay. Is the relay normal?	—	Go to Step 4	Replace the relay
4	Is there continuity between the intake actuator relay harness side connector C-42 terminal 4/5 and the ground C-16?	—	Go to Step 5	Repair an open circuit
5	1. Set the HVAC control bezel to DEF/FOOT or DEF position. 2. Turn the starter switch on and keep the engine running. Is the battery voltage applied between the intake actuator harness side connector C-42 terminal 2 and the ground?	Approx. 12V	Go to Step 10	Go to Step 6
6	Disconnect the HVAC control bezel. Is the battery voltage applied between the bezel harness side connector I-33 terminal 6 and the ground?	Approx. 12V	Go to Step 8	Go to Step 7
7	Repair an open circuit between the fuse EB-7 and the connector I-33 terminal 6. Is the action complete?	—	Go to Step 6	—
8	Is there continuity between the HVAC control bezel side connector terminal 5 and 6?	—	Go to Step 9	Repair or replace the bezel
9	Is there continuity between the harness side connector I-33 terminal 5 and C-42 terminal 2?	—	Go to Step 10	Repair an open circuit
10	Disconnect the intake actuator connector C-39. Is the battery voltage applied between the harness side connector C-39 terminal 3 and the ground?	Approx. 12V	Go to Step 11	Repair an open circuit
11	Is there continuity between the harness side connector C-39 terminal 2 and C-42 terminal 1	Approx. 12V	Go to Step 12	Repair an open circuit
12	Is there continuity between the harness side connector C–39 terminal 4 and 5?	—	Go to Step 13	Repair an open circuit
13	Replace the intake actuator. Is the action complete?	—	Verify repair	—

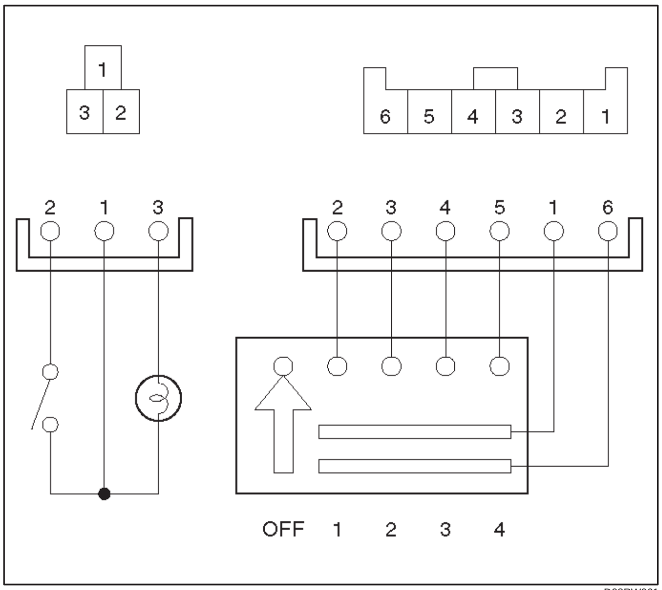
Chart “B”: RECIRC Mode Inoperative

Step	Action	Value(s)	Yes	No
1	Is the fuse EB-7 normal?	—	Go to Step 2	Replace the fuse
2	Is C-16 grounded securely?	—	Go to Step 3	Ground it securely
3	Is the Intake actuator relay normal?	—	Go to Step 4	Replace the relay
4	1. Disconnect the Intake actuator connector C-39 2. Connect the battery positive terminal to the Intake actuator side connector terminal No.3 and the battery negative terminal to terminal No.6. 3. Connect the switch side connector terminal No.4 and No.5. Does the actuator work normally?	—	Go to Step 5	Replace the actuator
5	Turn the Starter switch on. Is the battery voltage applied to the harness side connector C-39 terminal 3?	Approx.12V	Go to Step 6	Repair an open circuit
6	Is there continuity between harness side connector C–42 terminal No.5 and the ground?	—	Go to Step 7	Repair an open circuit
7	1. Remove the HVAC control bezel. 2. Move the air source select lever to REC position. Is there continuity between the control bezel side terminal No.3 and 8?	—	Go to Step 8	Repair or replace the control bezel
8	Is there continuity between harness side connector C-39 terminal 6 and connector I-33 terminal 3?	—	Go to Step 9	Repair an open circuit
9	Repair an open circuit between connector I-33 terminal 8 and connector C-42 terminal 3. Is the action complete?	—	Verify repair	—

Individual Inspection

Fan Control Knob (Fan Switch) And Air Conditioning (A/C) Switch

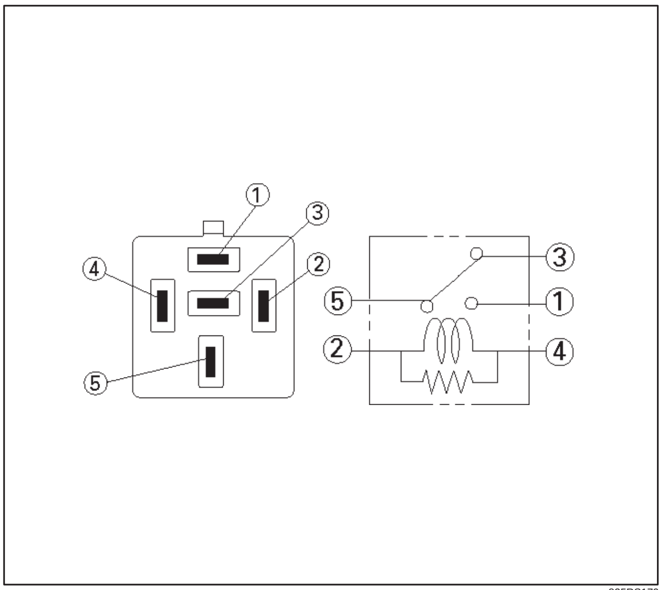
1. Check for continuity between the fan switch and the A/C switch side connector terminals.



D08RW061

Heater (X-1), Thermostat (X-8), Condenser Fan (X-11) And Compressor (X-2) Relay

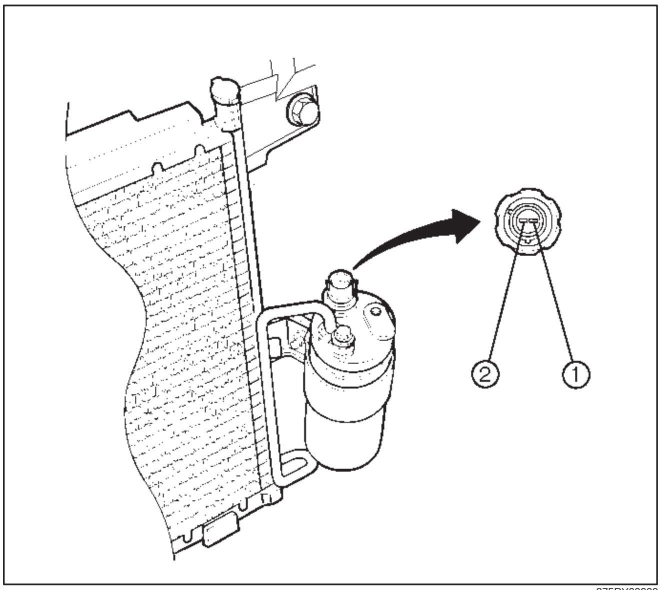
1. Disconnect relays and check for continuity and resistance between relay terminals.
   - For handling of these relays, refer to Heater Relay in this section.



825RS179

Pressure Switch

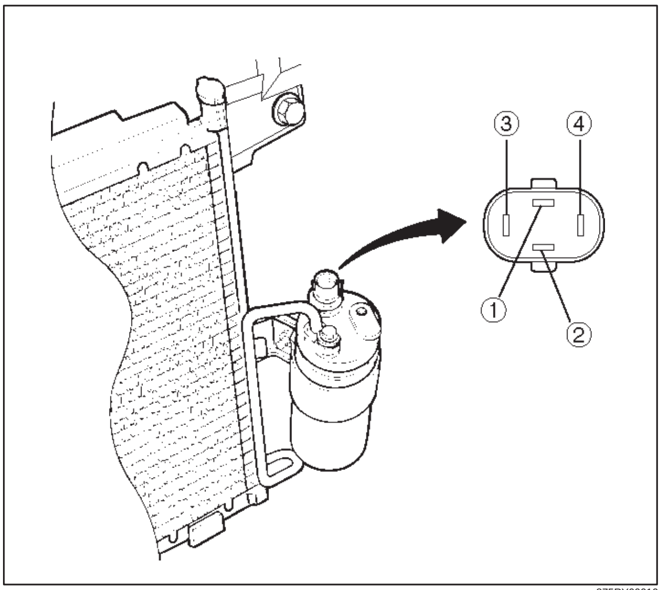
1. Disconnect pressure switch connector and check for continuity between pressure switch side connector terminals (1) and (2).



875RY00009

Triple Pressure Switch (V6, A/T)

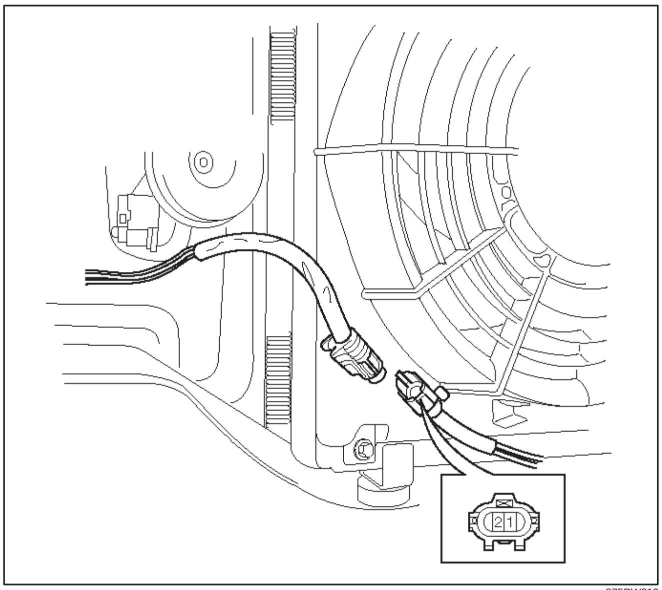
1. Disconnect the connector and check for continuity between pressure switch side connector terminals (1) and (2).
2. Reconnect the connector to activate the A/C switch, and check to see if there is continuity between the chassis side connector terminals (3) and (4) and the fan operates.



875RY00010

Condenser Fan

1. Disconnect the condenser fan connector.
2. Connect the battery positive terminal to the condenser fan side connector terminal No.C-24-1 and negative to the No.C-24-2.
3. Check that condenser fan is rotating correctly.



875RW010

General Repair Procedure

Precautions For Replacement or Repair of Air Conditioning Parts

There are certain procedures, practices and precautions that should be followed when servicing air conditioning systems:

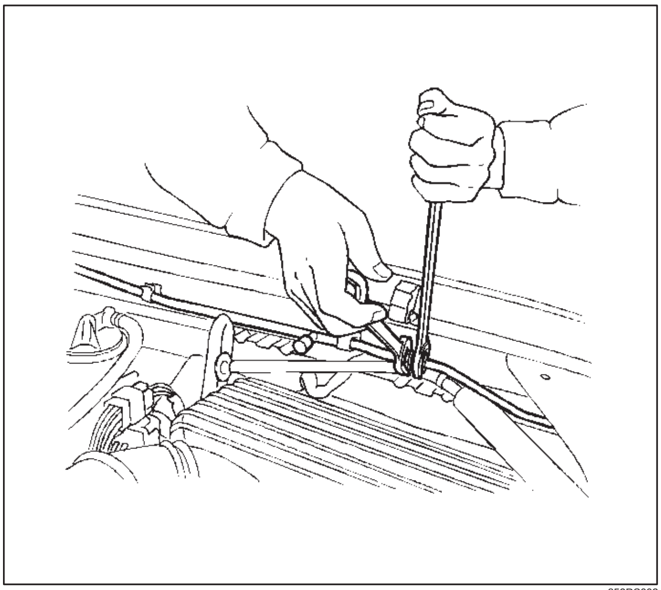
- Keep your work area clean.
- Always wear safety goggle and protective gloves when working on refrigerant systems.
- Beware of the danger of carbon monoxide fumes caused by running the engine.
- Beware of discharged refrigerant in enclosed or improperly ventilated garages.
- Always disconnect the negative battery cable and discharge and recover the refrigerant whenever repairing the air conditioning system.
- When discharging and recovering the refrigerant, do not allow refrigerant to discharge too fast; it will draw compressor oil out of the system.
- Keep moisture and contaminants out of the system. When disconnecting or removing any lines or parts, use plugs or caps to close the fittings immediately.
  Never remove the caps or plugs until the lines or parts are reconnected or installed.
- When disconnecting or reconnecting the lines, use two wrenches to support the line fitting, to prevent from twisting or other damage.
- Always install new O-rings whenever a connection is disassembled.
- Before connecting any hoses or lines, apply new specified compressor oil to the O-rings.
- When removing and replacing any parts which require discharging the refrigerant circuit, the operations described in this section must be performed in the following sequence:

1. Use the J-39500 (ACR4: HFC-134a Refrigerant Recovery / Recycling / Recharging / System) or equivalent to thoroughly discharge and recover the refrigerant.
2. Remove and replace the defective part.
3. After evacuation, charge the air conditioning system and check for leaks.

Repair Of Refrigerant Leaks

Refrigerant Line Connections

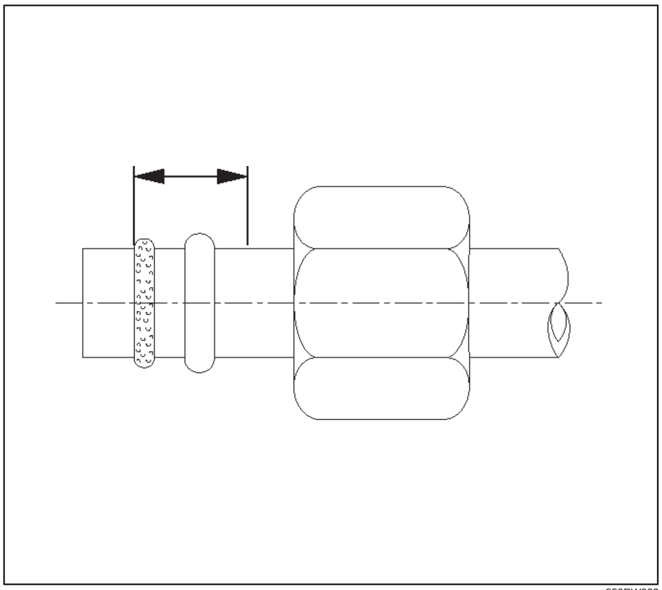
Install new O-rings, if required. When disconnecting or connecting lines, use two wrenches to prevent the connecting portion from twisting or becoming damaged.



852RS003

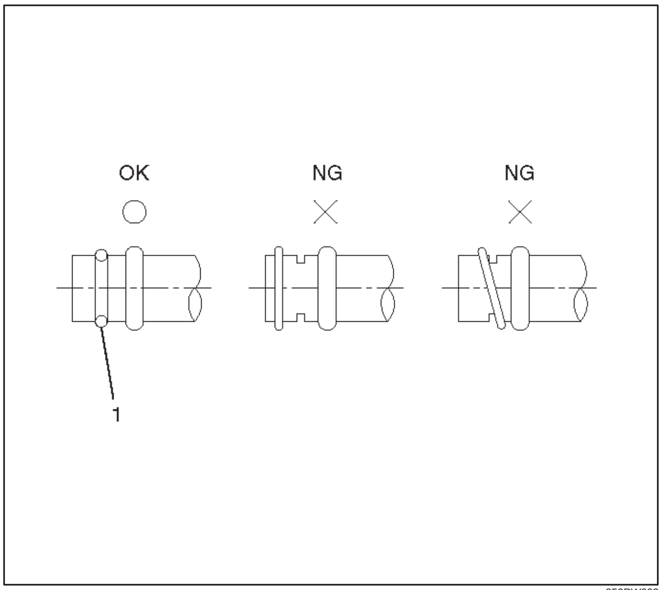
When connecting the refrigerant line at a block joint, securely insert the projecting portion of the joint portion into the connecting hole on the unit side and secure with a bolt. Apply the specified compressor oil to the O-rings prior to connecting.

CAUTION: Compressor (PAG) oil to be used varies according to the compressor model. Be sure to apply oil specified for the model of compressor.



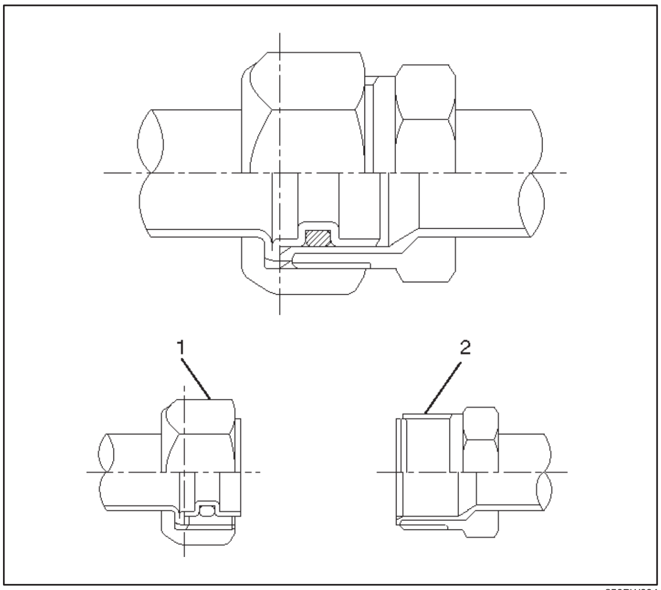
850RW002

O-rings (2) must be fitted in the groove (1) of refrigerant line.



850RW003

Insert the nut into the union.
First, tighten the nut by hand as much as possible, then tighten the nut to the specified torque.



850RW004

Leak Check

Inspection of refrigerant leak

Refrigerant leak may cause an adverse effect not only on the performance and durability of each component of the air–conditioner, but also on the global atmosphere. Therefore, it is most important to repair refrigerant leak when there is any leak found.

Inspection flow of refrigerant leak

Step	Action	Yes	No
1	1. Evacuate the refrigerant system. 2. Charge the refrigerant. Is there any refrigerant leak?	Repair refrigerant system.	Go to Step 2.
2	1. Operate the compressor for more than 5 minutes to raise the pressure on the high pressure side. Is there any refrigerant leak at high pressure components?	Repair refrigerant system.	Compressor operation to be confirmed.

Inspection Steps

Check the components of air–conditioner to see if there occurs any refrigerant leak along the flow of refrigerant.

NOTE:

- To avoid an error in the detection of refrigerant leak, make sure of there being no refrigerant vapor or cigarette smoke around the vehicle before conducting the inspection. Also, select a location where the refrigerant vapor will not get blown off with wind.
- Inspection should be conducted chiefly on the pipe connections and sections where a marked oil contamination is found. When refrigerant is leaking, oil inside is also leaking at the same time.
- It is possible to visually check the leak from inside the cooling unit. Follow the method below when checking. Remove the drain hose or resistor of the cooling unit, and insert a leak detector to see if there occurs any leak.

High Pressure Side

1. Discharger section of compressor.
2. Inlet/outlet section of condenser.
3. Inlet/outlet section of receiver driver.
4. Inlet section of cooling unit.

Low Pressure Side

1. Outlet section of cooling unit.
2. Intake section of compressor.

Major Checking Points of Refrigerant Leak

Compressor

- Pipe connection
- Sealing section of shaft
- Mating section or cylinder

Condenser

- Pipe connection
- Welds of condenser body

Receiver driver

- Pipe connection
- Attaching section of pressure switch
- Section around the sight glass

Evaporator unit (cooling unit)

- Pipe connections
- Connections of expansion valve
- Brazed sections of evaporator

NOTE:

- The evaporator and expansion valve are contained in the case. Remove the drain hose or the resistor of the cooling unit and insert a leak detector when checking for any leak.

Flexible hose

- Pipe connection
- Caulking section of the hose
- Hose (cracks, pinholes, flaws)

Pipe

- Pipe connection
- Pipe (cracks, flaws)

Charge valve

NOTE:

- The charge valve, which is used to connect the gauge manifold, is normally provided with a resin cap. When the valve inside gets deteriorated, refrigerant will leak out.

Leak at Refrigerant Line Connections

1. Check the torque on the refrigerant line fitting and, if too loose, tighten to the specified torque.
   - Use two wrenches to prevent twisting and damage to the line.
   - Do not over tighten.

2. Perform a leak test on the refrigerant line fitting.
3. If the leak is still present, discharge and recover the refrigerant from the system.
4. Replace the O-rings.
   - O-rings cannot be reused. Always replace with new ones.
   - Be sure to apply the specified compressor oil to the new O-rings.
5. Retighten the refrigerant line fitting to the specified torque.
   - Use two wrenches to prevent twisting and damage to the line.
6. Evacuate, charge and retest the system.

Leaks In The Hose

If the compressor inlet or outlet hose is leaking, the entire hose must be replaced. The refrigerant hose must not be cut or spliced for repair.

1. Locate the leak.
2. Discharge and recover the refrigerant.
3. Remove the hose assembly.
   - Cap the open connections at once.
4. Connect the new hose assembly.
   - Use two wrenches to prevent twisting or damage to the hose fitting.
   - Tighten the hose fitting to the specified torque.
5. Evacuate, charge and test the system.

Compressor Leaks

If leaks are located around the compressor shaft seal or shell, replace or repair the compressor.

Recovery, Recycling, Evacuation and Charging of HFC-134a

Air conditioning systems contain HFC-134a. This is a chemical mixture which requires special handling procedures to avoid personal injury.

- Always wear safety goggles and protective gloves.
- Always work in a well-ventilated area. Do not weld or steam clean on or near any vehicle-installed air conditioning lines or components.
- If HFC-134a should come in contact with any part of the body, flush the exposed area with cold water and immediately seek medical help.
- If it is necessary to transport or carry any container of HFC-134a in a vehicle, do not carry it in the passenger compartment.
- If it is necessary to fill a small HFC-134a container from a large one, never fill the container completely. Space should always be allowed above the liquid for expansion.
- HFC-134a and R-12 should never be mixed as their compositions are not the same.
- HFC-134a PAG oil tends to absorb moisture more quickly than R-12 mineral oil and, therefore, should be handled more carefully.
- Keep HFC-134a containers stored below 40°C (104°F).

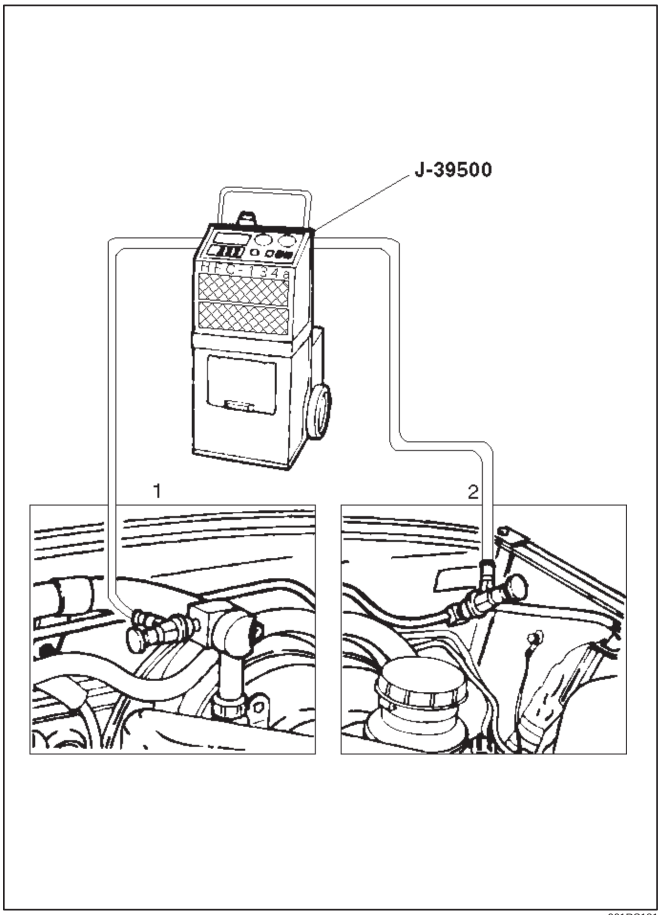
WARNING:

- **SHOULD HFC-134A CONTACT YOUR EYE(S), CONSULT A DOCTOR IMMEDIATELY.**
- **DO NOT RUB THE AFFECTED EYE(S). INSTEAD, SPLASH QUANTITIES OF FRESH COLD WATER OVER THE AFFECTED AREA TO GRADUALLY RAISE THE TEMPERATURE OF THE REFRIGERANT ABOVE THE FREEZING POINT.**
- **OBTAIN PROPER MEDICAL TREATMENT AS SOON AS POSSIBLE. SHOULD THE HFC-134A TOUCH THE SKIN, THE INJURY MUST BE TREATED THE SAME AS SKIN WHICH HAS BEEN FROSTBITTEN OR FROZEN.**

Refrigerant Recovery

The refrigerant must be discharged and recovered by using the J-39500 (ACR4:HFC-134a Refrigerant Recovery/Recycling/Recharging/System) or equivalent before removing or mounting air conditioning parts.

1. Connect the high and low charging hoses of the ACR4(or equivalent) as shown below.



901RS181

Legend

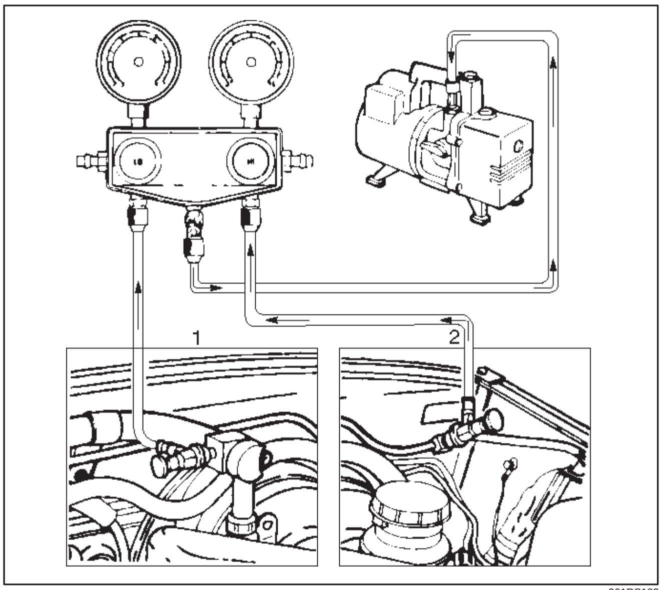
(1) Low Side
(2) High Side

2. Recover the refrigerant by following the Manufacturer's Instructions.
3. When a part is removed, put a cap or a plug on the connecting portion so that dust, dirt or moisture cannot get into it.

Refrigerant Recycling

Recycle the refrigerant recovered by J-39500 (ACR4:HFC-134a Refrigerant Recovery / Recycling / Recharging / System) or equivalent.
For the details of the actual operation, follow the steps in the ACR4(or equivalent) Manufacturer's Instructions.

Evacuation of The Refrigerant System



901RS182

Legend

(1) Low Side
(2) High Side

NOTE: Explained below is a method using a vacuum pump. Refer to the ACR4(or equivalent) manufacturer's instructions when evacuating the system with a ACR4(or equivalent).

Air and moisture in the refrigerant will cause problems in the air conditioning system. Therefore, before charging the refrigerant, be sure to evacuate air and moisture thoroughly from the system.

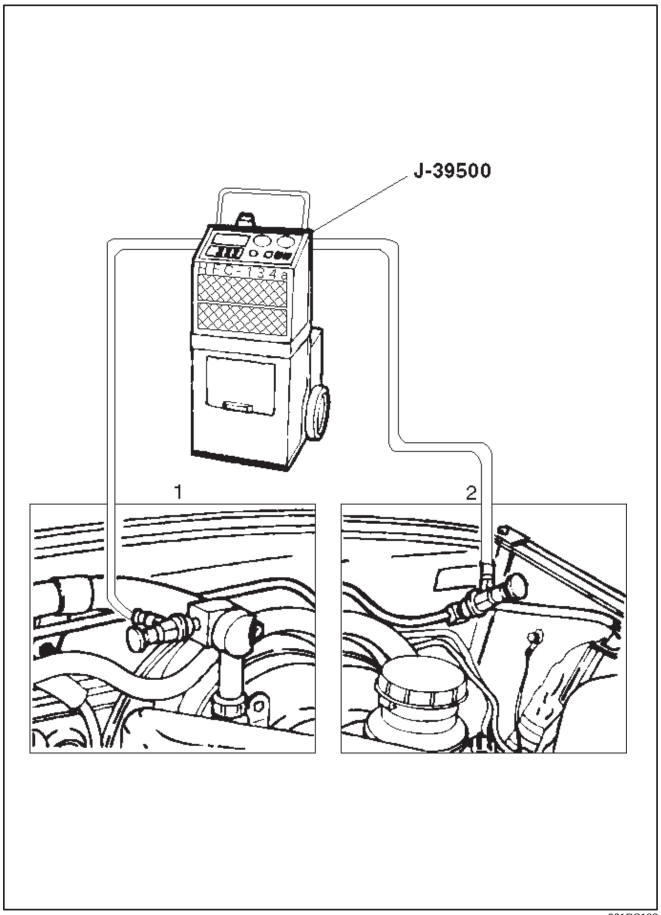
1. Connect the gauge manifold.
   - High-pressure valve (HI) — Discharge-side.
   - Low-pressure valve (LOW) — Suction-side.
2. Discharge and recover the refrigerant.
3. Connect the center hose of the gauge manifold set to the vacuum pump inlet.
4. Operate the vacuum pump, open shutoff valve and then open both hand valves.
5. When the low-pressure gauge indicates approximately 750 mmHg (30 inHg), continue the evacuation for 5 minutes or more.
6. Close both hand valves and stop the vacuum pump.
7. Check to ensure that the pressure does not change after 10 minutes or more.
   - If the pressure changes, check the system for leaks.
   - If leaks occur, retighten the refrigerant line connections and repeat the evacuation steps.
8. If no leaks are found, again operate the vacuum pump for 20 minutes or more. After confirming that the gauge manifold pressure is at 750 mmHg (30 inHg), close both hand valves.
9. Close positive shutoff valve. Stop the vacuum pump and disconnect the center hose from the vacuum pump.

Charging The Refrigerant System

There are various methods of charging refrigerant into the air conditioning system.
These include using J-39500 (ACR4:HFC-134a Refrigerant Recovery/Recycling/Recharging/System) or equivalent and direct charging with a weight scale charging station.

Charging Procedure

- **ACR4(or equivalent) Method**
  For the charging of refrigerant recovered by ACR4(or equivalent), follow the manufacturer's instruction.



901RS183

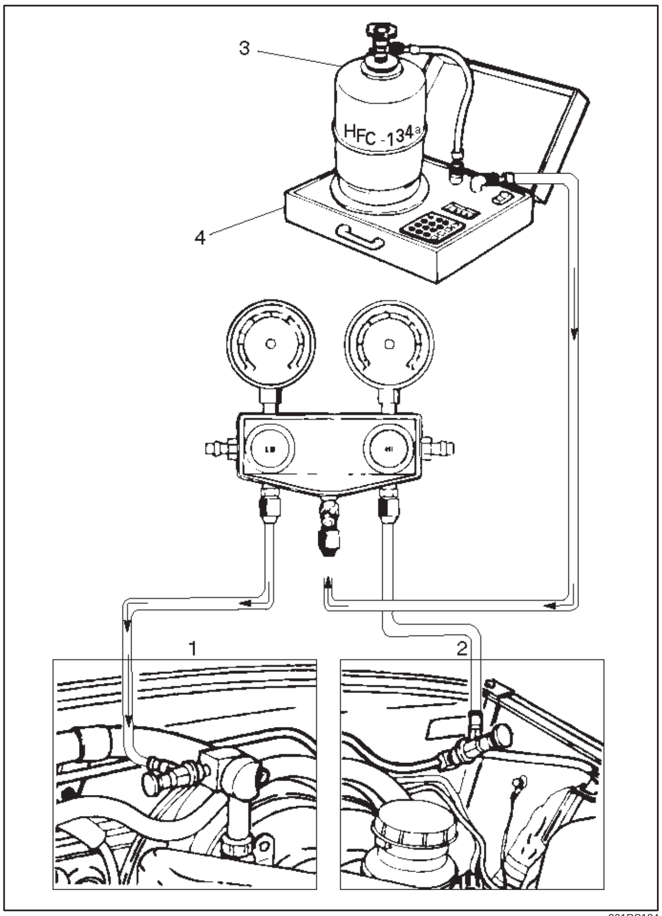
Legend

(1) Low Side
(2) High Side

- **Direct charging with a weight scale charging station method**

1. Make sure the evacuation process is correctly completed.
2. Connect the center hose of the manifold gauge to the weight scale.

3. Connect the low pressure charging hose of the manifold gauge to the low pressure side service valve of the vehicle.
4. Connect the high pressure charging hose of the manifold gauge to the high pressure side service valve of the vehicle.

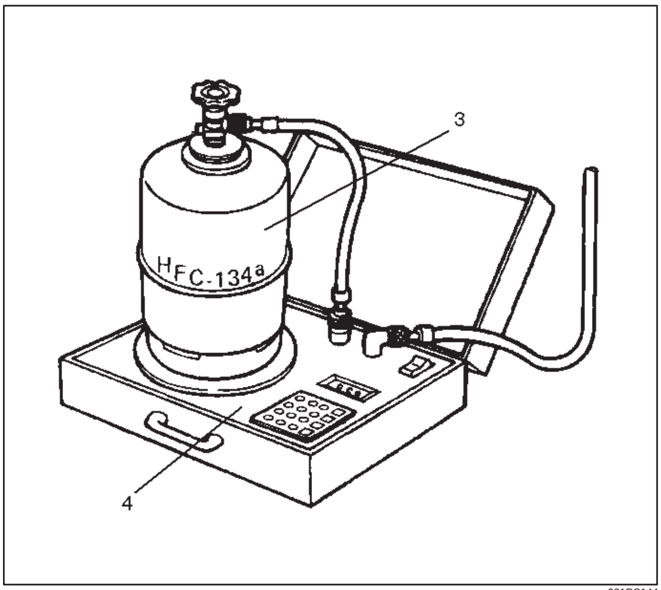


901RS184

Legend

(1) Low Side
(2) High Side
(3) Refrigerant Container
(4) Weight Scale

5. Place the refrigerant container(3) up right on a weight scale(4).
   Note the total weight before charging the refrigerant.
   a. Open the refrigerant container valve.
   b. Open the low side vale on the manifold gauge set. Refer to the manufacturer's instructions for a weight scale charging station.



901RS144

6. Perform a system leak test:
   - Charge the system with approximately 200 g (0.44 lbs) of HFC-134a.
   - Make sure the high pressure valve of the manifold gauge is closed.
   - Check to ensure that the degree of pressure does not change.
   - Check for refrigerant leaks by using a HFC-134a leak detector.
   - If a leak occurs, recover the refrigerant. Repair the leak and start all over again from the first step of evacuation.
7. If no leaks are found, continue charging refrigerant to the air conditioning system.
   - Charge the refrigerant until the scale reading decreases by the amount of the charge specified.

Specified amount: 650 g (1.43 lbs)

- If charging the system becomes difficult:

1. Run the engine at idle and close all the vehicle doors.
2. Turn A/C switch “ON”.
3. Set the fan switch to its highest position.
4. Set the air source selector lever to “CIRC”.
5. Slowly open the low side valve on the manifold gauge set.

WARNING: BE ABSOLUTELY SURE NOT TO OPEN THE HIGH PRESSURE VALVE OF THE MANIFOLD GAUGE. SHOULD THE HIGH PRESSURE VALVE BE OPENED, THE HIGH PRESSURE REFRIGERANT WOULD FLOW BACKWARD, AND THIS MAY CAUSE THE REFRIGERANT CONTAINER TO BURST.

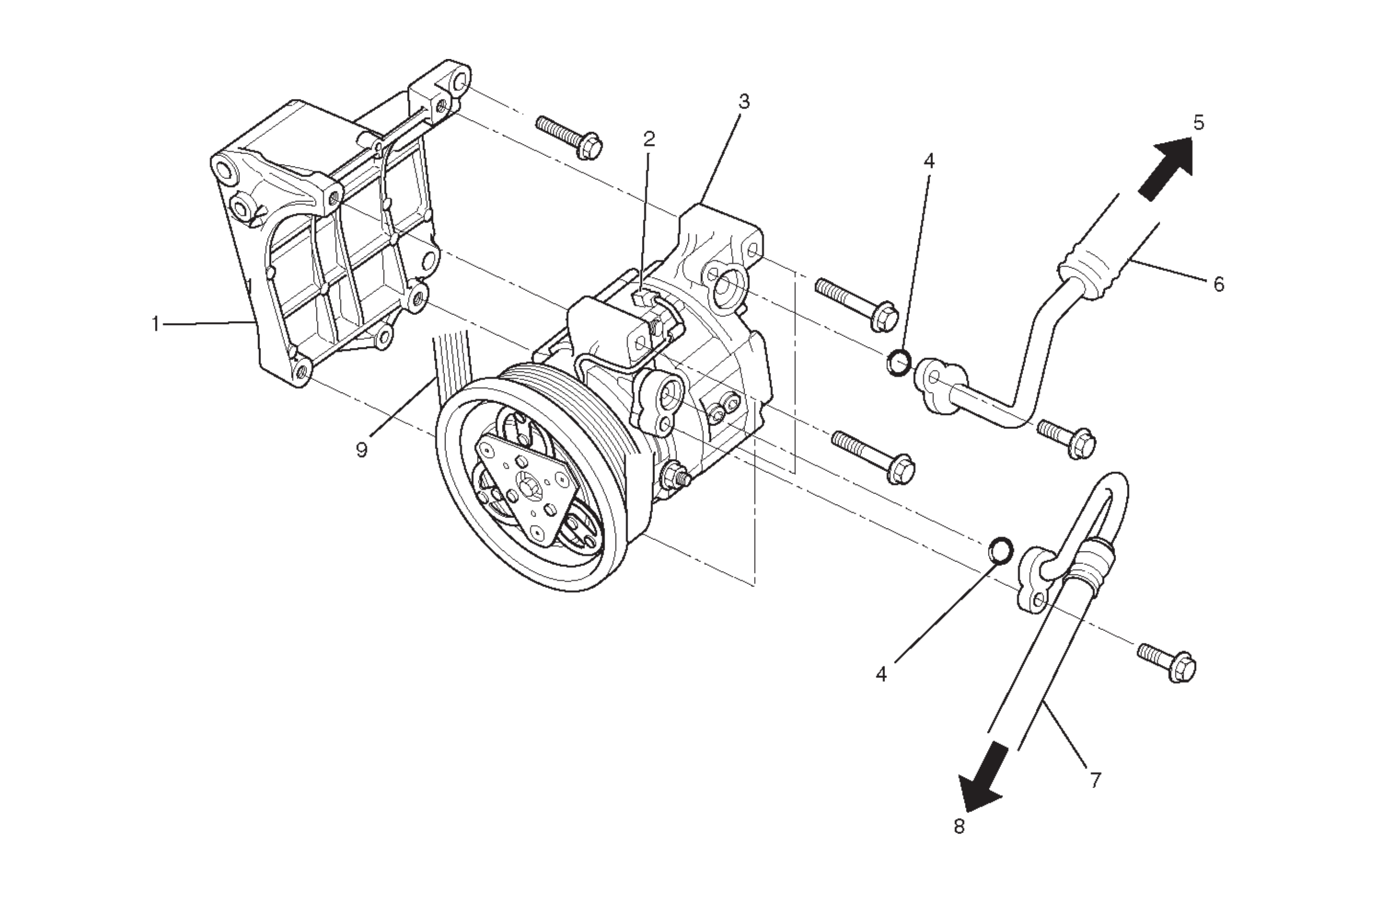
8. When finished with the refrigerant charging, close the low pressure valve of the manifold gauge and container valve.
9. Check for refrigerant leaks.

Checking The A/C System

1. Run the engine and close all the vehicle doors.
2. Turn A/C switch “ON”, set the fan switch to its highest position.
3. Set the air source lever to “CIRC”, set the temperature lever to the full cool position.
4. Check the high and low pressure of the manifold gauge.
   - Immediately after charging refrigerant, both high and low pressures might be slightly high, but they settle down to the pressure guidelines shown below:
   - The ambient temperature should be between 25–30°C (77–86°F).
   - The pressure guideline for the high-pressure side is approximately 1372.9–1863.3 kPa (199.1–270.2 psi).
   - The pressure guideline for the low-pressure side is approximately 147.1–294.2 kPa (21.3–42.7 psi).
   - If an abnormal pressure is found, refer to Checking The Refrigerant System With Manifold Gauge in this section.
5. Put your hand in front of the air outlet and move the temperature control lever of the control panel to different positions. Check if the outlet temperature changes as selected by the control knob.

Compressor Assembly

Compressor Assembly and Associated Parts



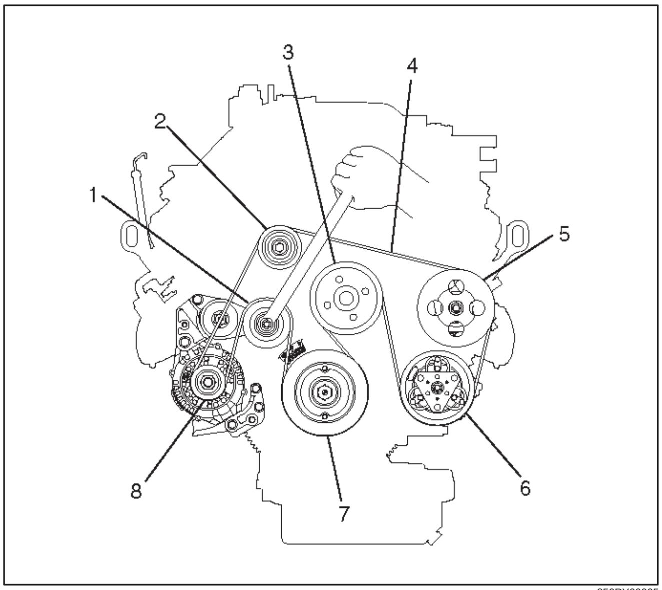
Legend

(1) Compressor Bracket
(2) Magnetic Clutch Harness Connector
(3) Compressor
(4) O-ring
(5) To Evaporator
(6) Suction Line (Low-Pressure Hose)
(7) Discharge Line (High-Pressure Hose)
(8) To Condenser
(9) Serpentine Belt

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant
   - Refer to Refrigerant Recovery in this section.
3. Disconnect magnetic clutch harness connector.

4. Remove serpentine belt.
   - Move serpentine belt tensioner to loose side using wrench then remove serpentine belt.



850RY00005

Legend

(1) Auto Tensioner
(2) Idle Pulley
(3) Cooling Fan Pulley
(4) Serpentine Belt
(5) Power Steering Oil Pump
(6) Air Conditioner Compressor
(7) Crankshaft Pulley
(8) Generator

5. Disconnect refrigerant line connector.
   - When removing the line connector, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
6. Remove compressor.

Installation

1. Install compressor.
   - Tighten the compressor fixing bolts to the specified torque.

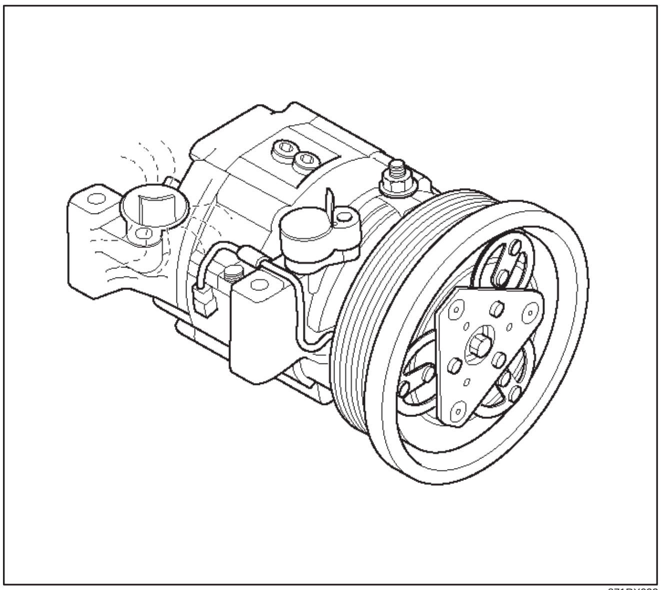
   Torque: 19 N•m (14 lb•ft)
2. Connect refrigerant line connector.
   - Tighten the refrigerant line connector fixing bolts to the specified torque.

   Torque: 15 N•m (11 lb•ft)
   - O-rings cannot be reused. Always replace with new ones.
   - Be sure to apply new compressor oil to the O-rings when connecting refrigerant lines.
3. Install serpentine belt.
   - Move serpentine belt tensioner to loose side using wrench, then install serpentine belt to normal position.
4. Connect magnetic clutch harness connector.

New Compressor Installation

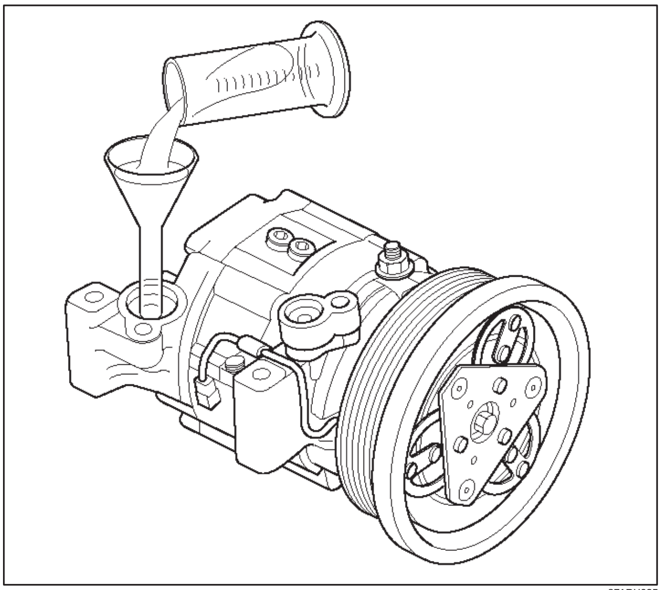
The new compressor is filled with 150cc (5.0fl.oz.)of compressor oil and nitrogen gas. When mounting the compressor on the vehicle, perform the following steps;

1. Gently release nitrogen gas from the new compressor.
   - Take care not to let the compressor oil flow out.
   - Inspect O-rings and replace if necessary.



871RX033

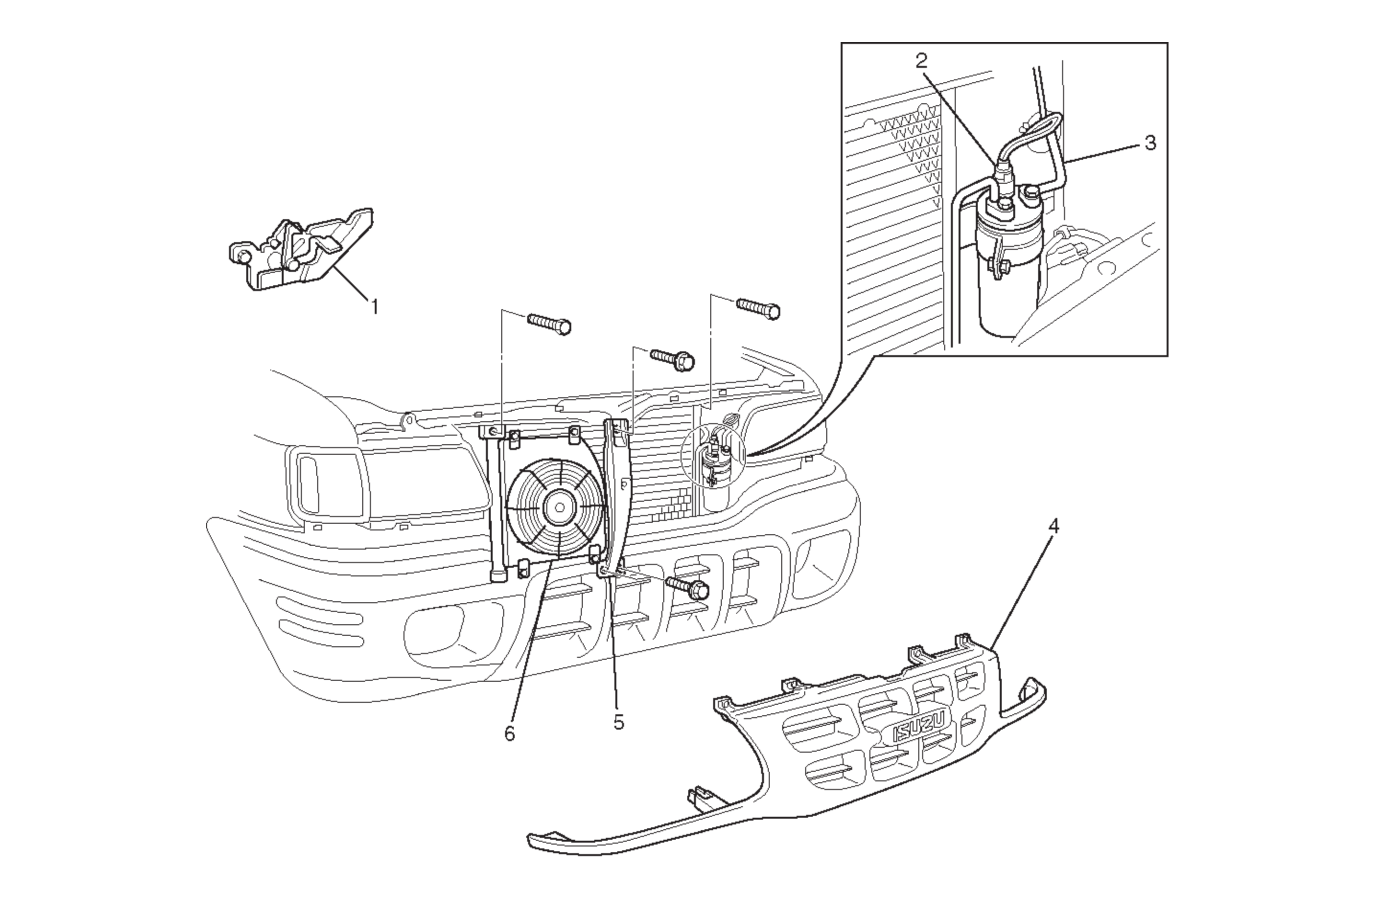
2. Turn the compressor several times by hand and release the compressor oil in the rotor.
3. When installing on a new system, the compressor should installed as it is. When installing on a used system, the compressor should be installed after adjusting the amount of compressor oil. (Refer to Compressor in this section)



871RX035

Condenser Assembly

Condenser Assembly and Associated Parts



Legend

(1) Engine Hood Lock
(2) Pressure Switch Connector
(3) Refrigerant Line
(4) Radiator Grille
(5) Engine Hood Front End Stay
(6) Condenser Assembly

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
   - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Remove engine hood front end stay.
5. Remove engine hood lock.
   - Apply setting mark to the engine hood lock fixing position before removing it.
6. Disconnect pressure switch connector.
7. Disconnect refrigerant line.
   - When removing the line connector, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
8. Remove condenser assembly.
   - Handle with care to prevent damaging the condenser or radiator fin.

Installation

1. Install condenser assembly.
   - If installing a new condenser, be sure to add 30cc (1.0 fl. oz.) of new compressor oil to a new one.
   - Tighten the condenser fixing bolts to the specified torque.

   Torque: 6 N•m (52 lb in)
2. Connect refrigerant line.
   - Tighten the inlet line connector fixing bolt to the specified torque.

   Torque: 15 N•m (11 lb ft)
   - Tighten the outlet line connector fixing bolt to the specified torque.

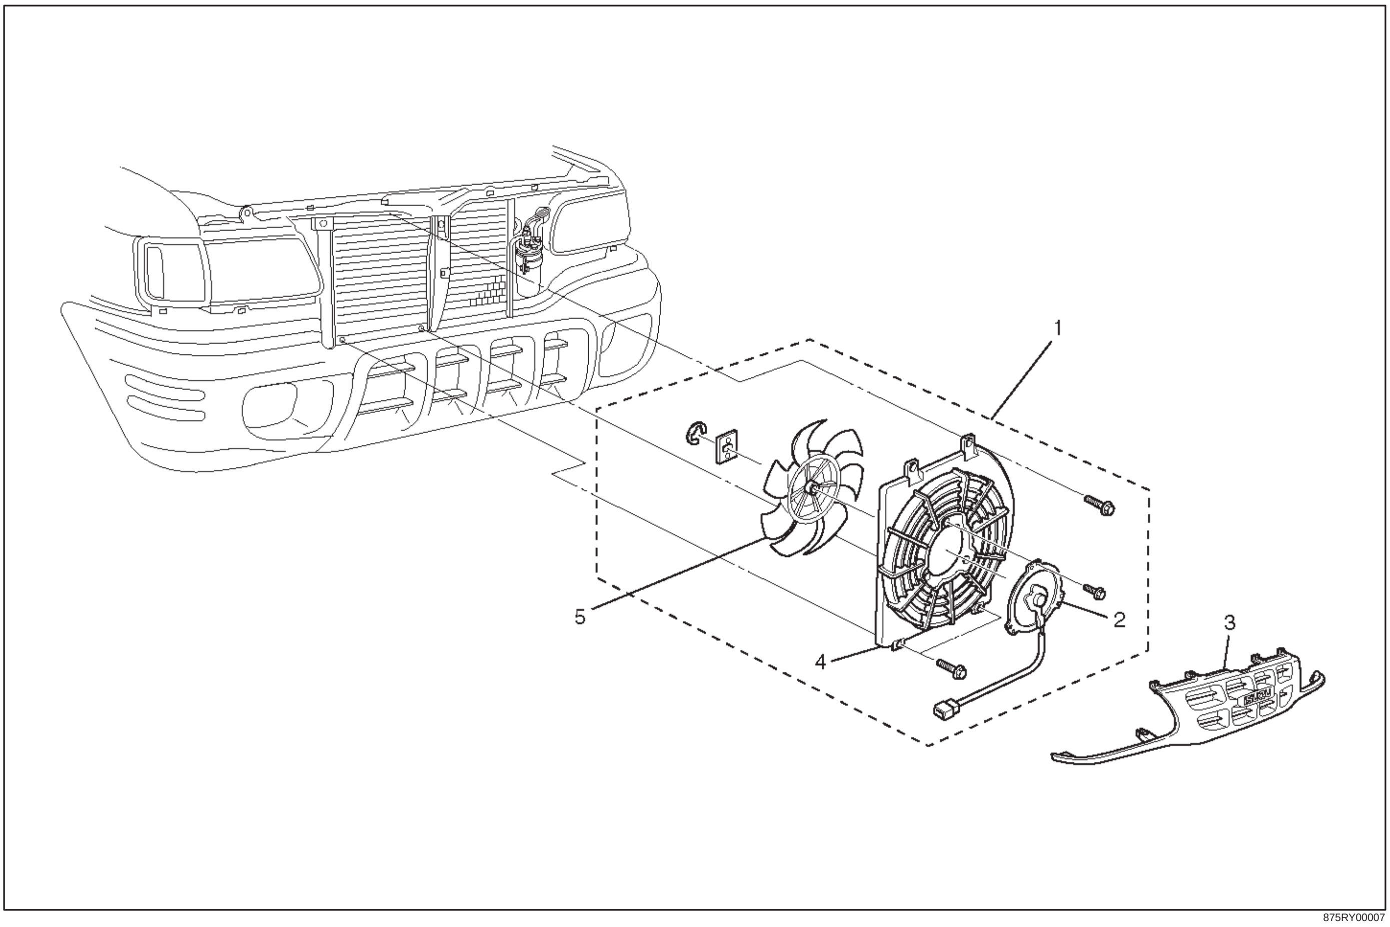
   Torque: 6 N•m (52 lb in)
   - O-rings cannot be reused. Always replace with new ones.

- Be sure to apply new compressor oil to the O-rings when connecting the refrigerant line.

3. Connect pressure switch connector.
4. Install engine hood lock.
5. Install engine hood front end stay.
6. Install radiator grille.

Condenser Fan Motor

Condenser Fan Motor and Associated Parts



Legend

(1) Condenser Fan Assembly
(2) Condenser Fan Motor
(3) Radiator Grille
(4) Shroud
(5) Fan

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
   - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Remove condenser fan assembly.
   - Disconnect the fan motor connector and remove the 4 fixing bolts.
5. Remove shroud.
   - Remove the 3 fixing nuts.
   - Loosen the condenser fixing nut and disconnect the fan motor connector from bracket.
6. Remove fan.
   - Remove the fan fixing C-ring and plate.
7. Remove condenser fan motor.

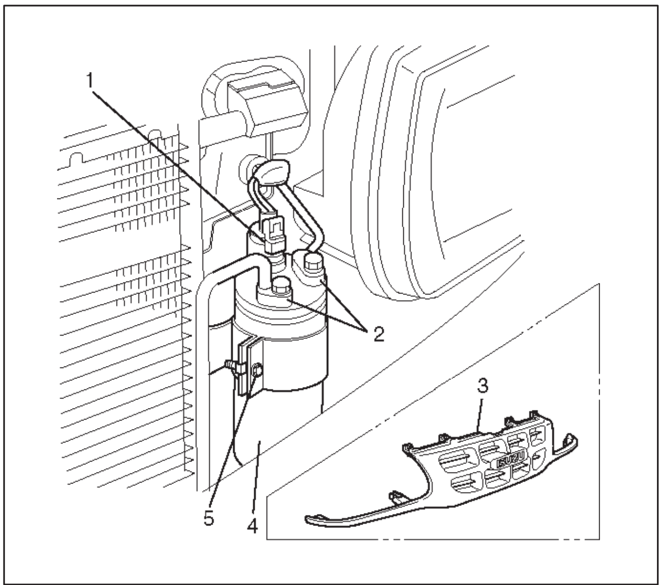
Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Route the fan motor harness in its previous position, and fix it securely with clip and bracket.

Receiver / Drier

Receiver / Drier and Associated Parts



875RY00012

Legend

(1) Pressure Switch Connector
(2) Refrigerant Line
(3) Radiator Grille
(4) Receiver / Drier
(5) Bracket Bolt

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
   - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Disconnect pressure switch connector.
5. Disconnect refrigerant line.
   - When removing the line connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
6. Remove bracket bolt.
7. Remove receiver/drier.
   - Loosen the bolt, then, using care not to touch or bend the refrigerant line, carefully pull out the receiver/drier.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

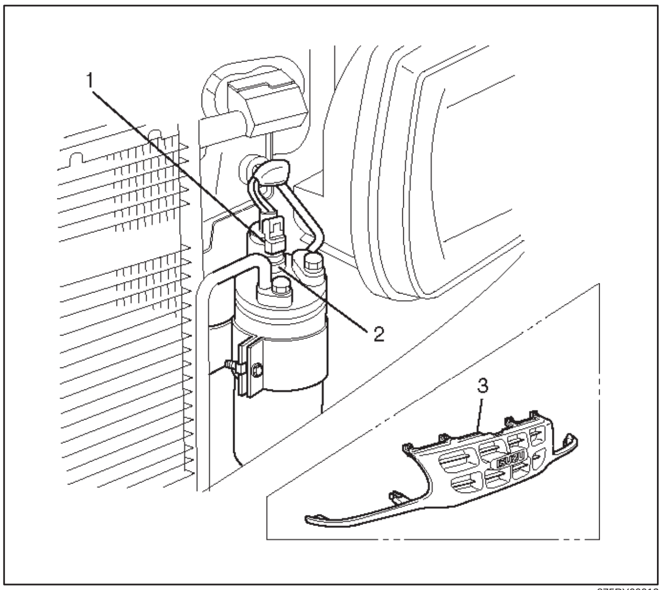
1. If installing a new receiver/drier, be sure to add 30cc (1.0 fl. oz.) of new compressor oil to a new one.
2. Put the receiver/drier in the bracket and connect with the refrigerant line. Check that no excessive force is imposed on the line. Fasten the bracket bolt to the receiver/drier.
3. Tighten the refrigerant line to the specified torque.

Torque: 6 N•m (52 lb in)

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new compressor oil to the O-rings when connecting the refrigerant line.

Pressure Switch

Pressure Switch and Associated Parts



875RY00013

Legend

(1) Pressure Switch Connector
(2) Pressure Switch
(3) Radiator Grille

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
   - Refer to “Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Disconnect pressure switch connector.
5. Disconnect pressure switch.
   - When removing the switch connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.

Installation

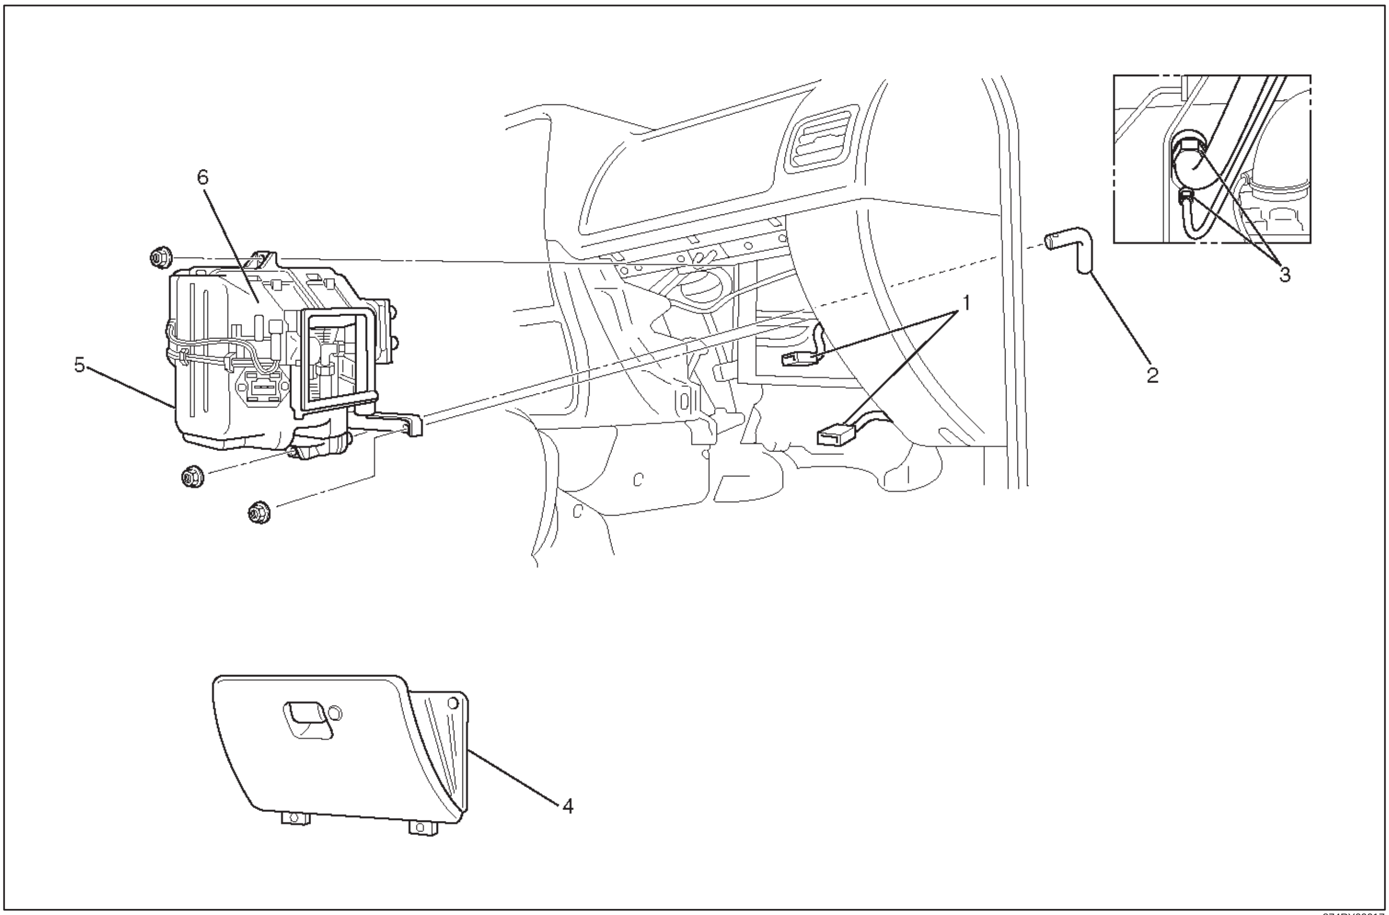
To install, follow the removal steps in the reverse order, noting the following point:

1. O-ring cannot be reused. Always replace with a new one.
2. Be sure to apply new compressor oil to the O-ring when connecting pressure switch.
3. Tighten the pressure switch to the specified torque.

   Torque: 13 N•m (113 lb in)

Evaporator Assembly

Evaporator Assembly and Associated Parts



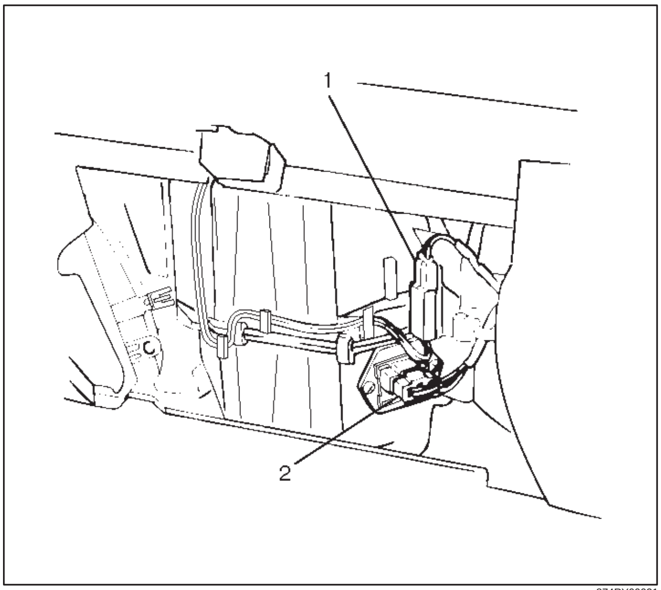
874RY00017

Legend

(1) Resistor and Electronic Thermostat Connector
(2) Drain Hose
(3) Refrigerant Line
(4) Glove Box
(5) Evaporator Assembly

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
   - Refer to Refrigerant Recovery in this section.
3. Remove glove box.
4. Disconnect resistor (2) and electronic thermostat connector (1).



874RY00021

5. Disconnect drain hose.
6. Disconnect refrigerant line.
   - Use a back-up wrench when disconnecting and reconnecting the refrigerant lines.
   - When removing the refrigerant line connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
7. Remove evaporator assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. To install a new evaporator assembly, add 50cc (1.7 fl. oz.) of new compressor oil to the new core.
2. Tighten the refrigerant outlet line to the specified torque.

Torque: 25 N•m (18 lb ft)

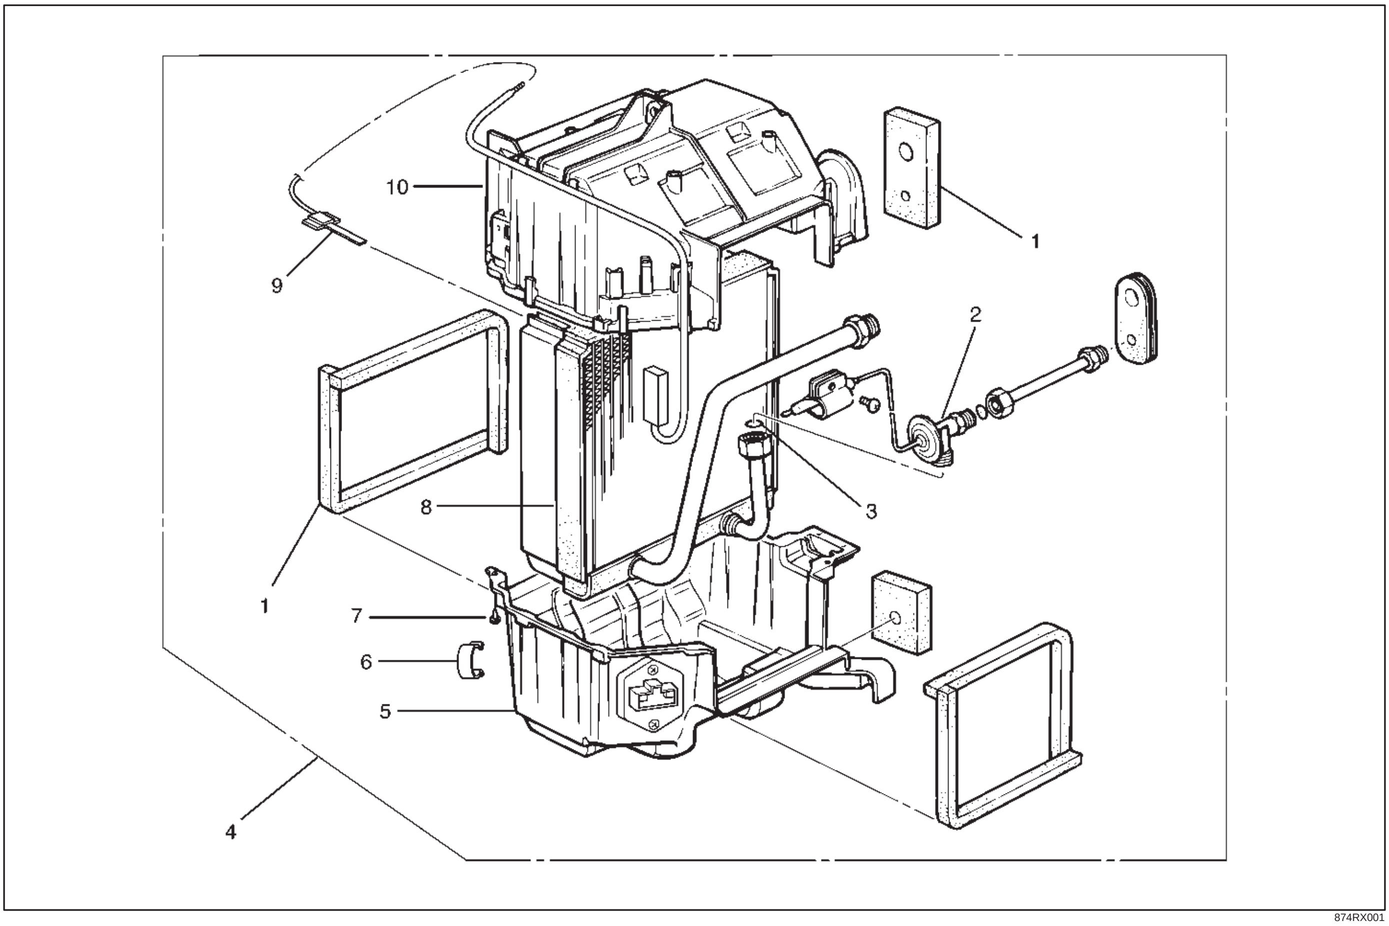
3. Tighten the refrigerant inlet line to the specified torque.

Torque: 15 N•m (11 lb ft)

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new compressor oil to the O-rings when connecting lines.

Electronic Thermostat, Evaporator Core and/or Expansion Valve

Disassembled View

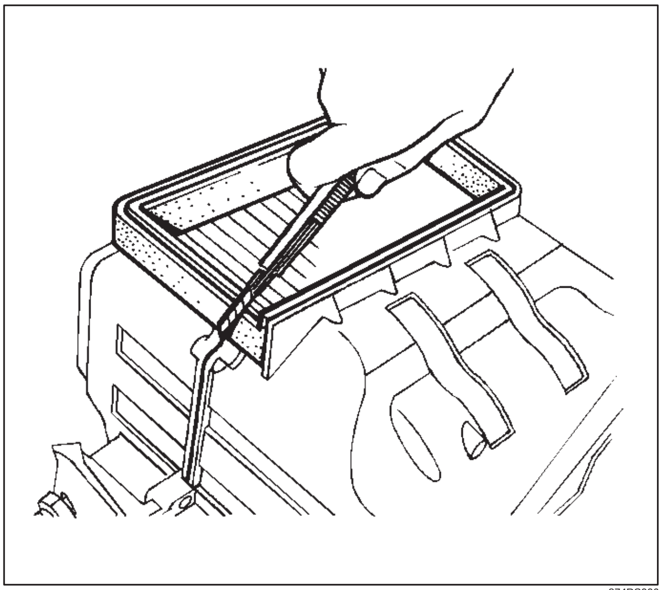


Legend

(1) Lining
(2) Expansion Valve
(3) O-ring
(4) Evaporator Assembly
(5) Lower Case
(6) Clip
(7) Attaching Screw
(8) Evaporator Core
(9) Electronic Thermostat
(10) Upper Case

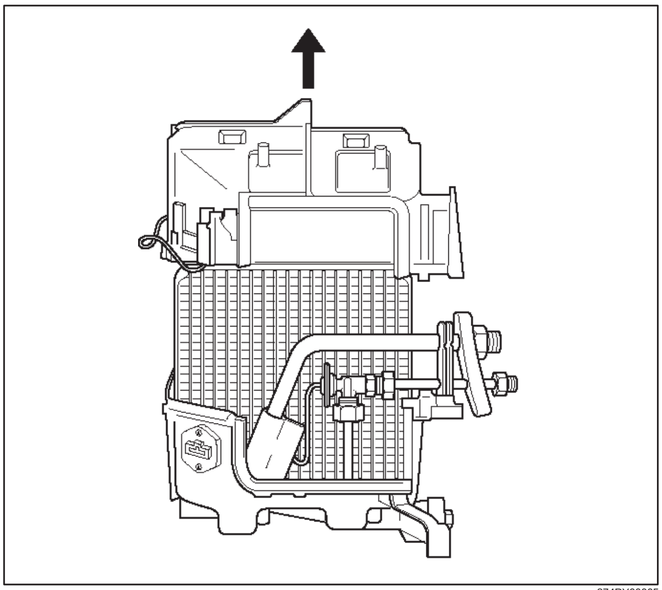
Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
   - Refer to Refrigerant Recovery in this section.
3. Remove evaporator assembly.
   - Refer to Evaporator Assembly in this section.
4. Remove the electronic thermostat sensor fixing clip. Pull the sensor from the evaporator assembly.
5. Remove clip.
6. Remove attaching screw.
7. Remove upper case.
8. Remove lower case.
   - Slit the case parting face with a knife since the lining is separated when removing the evaporator.



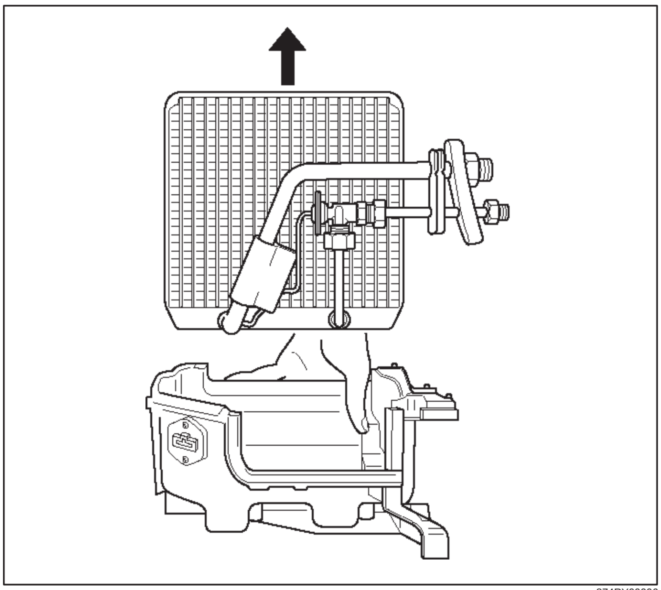
874RS006

   - Lift to remove the upper case.



874RY00005

9. Remove evaporator core.



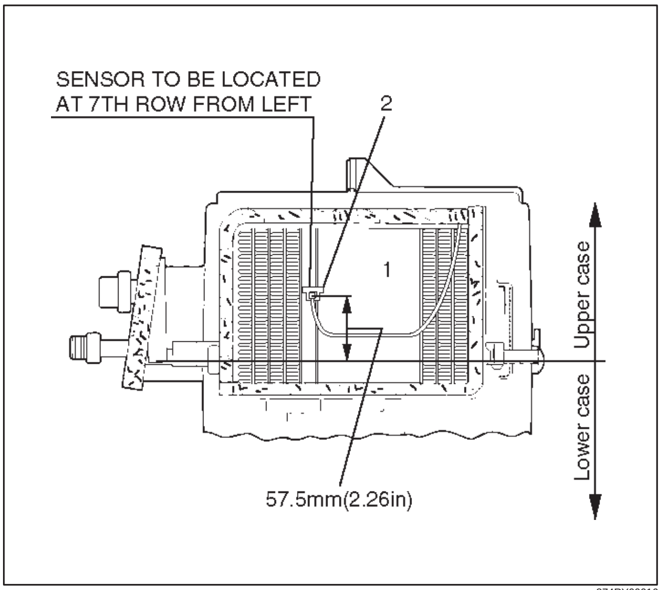
874RY00006

10. Remove expansion valve.
    - Tear off the insulator carefully.
    - Remove the sensor fixing clip.
    - Use a back-up wrench when disconnecting all refrigerant pipes.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. The sensor is installed on the core with the clip.
2. The sensor must not interfere with the evaporator core.
3. When installing the new evaporator core, install the duct sensor (2) to the evaporator core (1) specified position with the clip in the illustration.

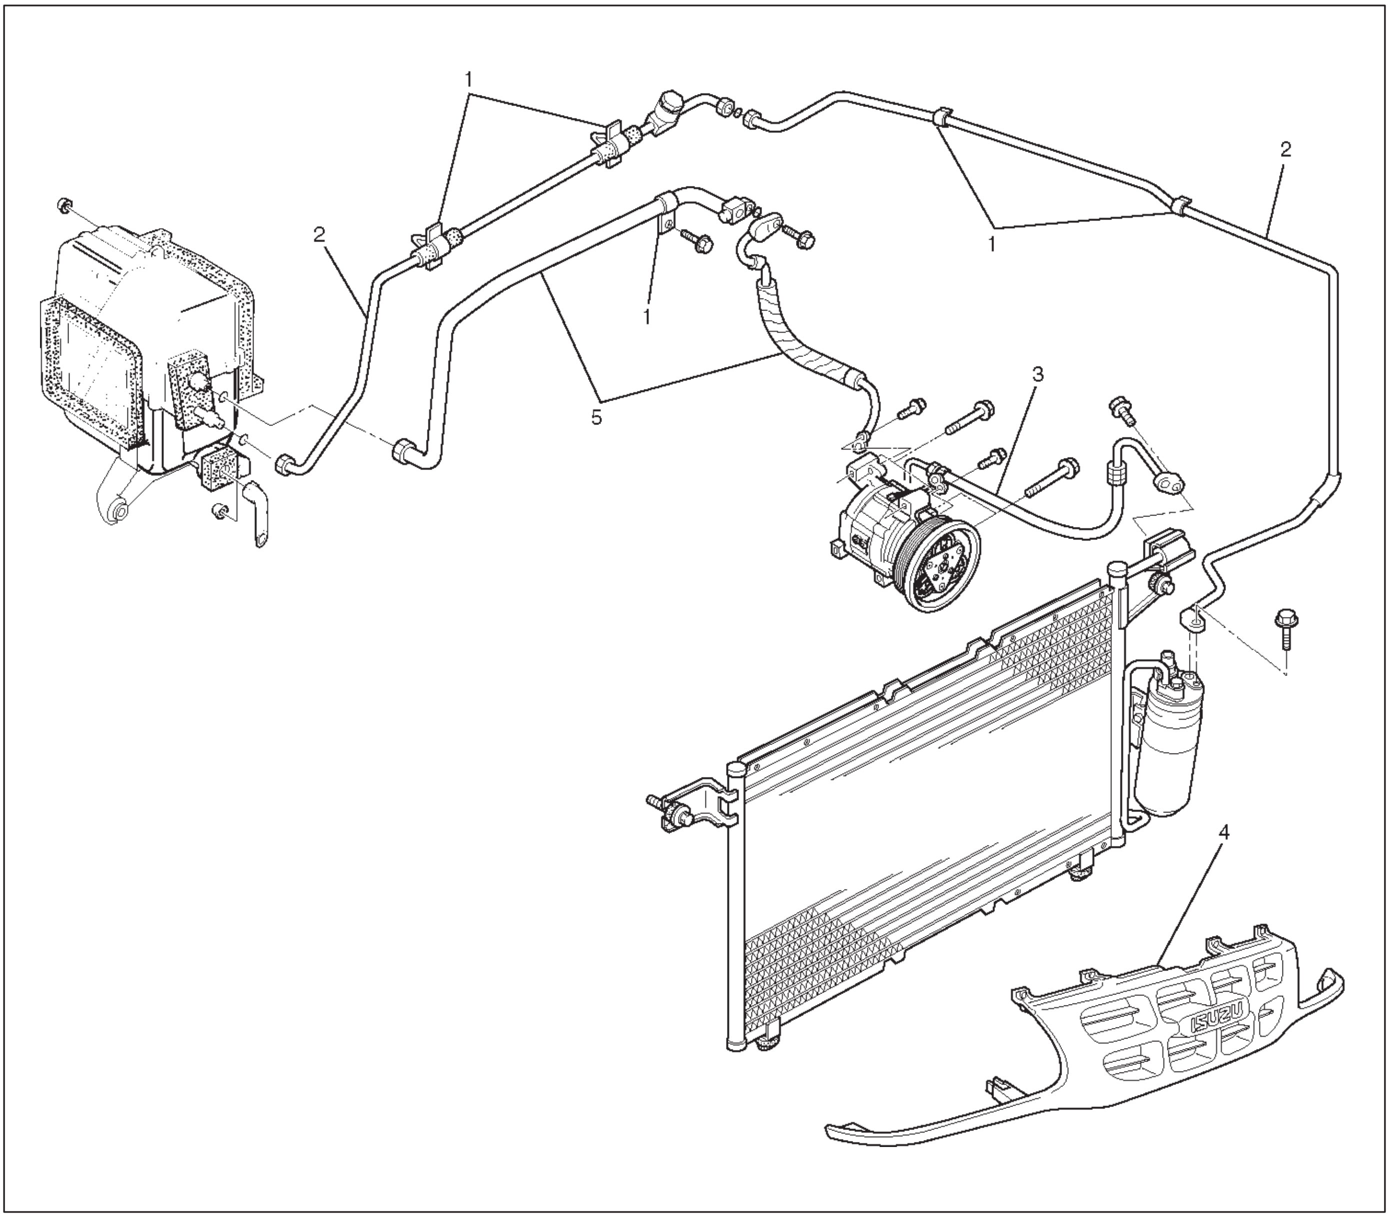


874RY00016

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new compressor oil to the O-rings when connecting lines.
6. Be sure to install the sensor and the insulator on the place where they were before.
7. To install a new evaporator core, add 50cc (1.7 fl. oz.) of new compressor oil to the new core.
8. Tighten the refrigerant lines to the specified torque. Refer to Main Data and Specifications for Torque Specifications in this section.
9. Apply an adhesive to the parting face of the lining when assembling the evaporator assembly.

Refrigerant Line

Refrigerant Line and Associated Parts



Legend

(1) Clip and Clamp
(2) Liquid Line (High-Pressure Pipe)
(3) Discharge Line (High-Pressure Hose)
(4) Radiator Grille
(5) Suction Line (Low-Pressure Pipe)

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
   - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Remove clip and clamp.
5. Disconnect liquid line (High-pressure pipe).
6. Disconnect suction line (Low-pressure pipe) using a back-up wrench.
7. Disconnect suction line (Low-pressure hose) using a back-up wrench.
8. Disconnect discharge line (High-pressure hose) using a back-up wrench.
   - Use a backup wrench when disconnecting and reconnecting the refrigerant lines.
   - When removing the refrigerant line connecting part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. O-rings cannot be reused. Always replace with new ones.
2. Be sure to apply new compressor oil to the O-rings when connecting lines.
3. Tighten the refrigerant line to the specified torque.
   Refer to Main Data and Specifications for Torque Specifications in this section.

Main Data And Specifications

General Specifications

Heater Unit	
Temperature control	Reheat air mix system
Capacity	4.3 kw (3700 Kcal./hr.)
Air flow	280 m^3/h
HEATER CORE	
Type	Fin and tube type
Element dimension	167 mm (6.6 in.) × 151 mm (5.9 in.) × 35 mm (1.4 in.)
Radiating area	Approx. 2.4 m^2
EVAPORATOR ASSEMBLY	
Capacity	4.8 kw (4100 Kcal./hr.)
Air flow	430 m^3/hr
EVAPORATOR CORE	
Type	Al-laminate louver fin type
Element dimension	235 mm (9.3 in.) × 224 mm (8.8 in.) × 60 mm (2.4 in.)
EXPANSION VALVE	
Type	External pressure equalizer type
THERMOSTAT SWITCH	
Type	Electronic thermostat OFF: Below 1.0 ± 0.5 °C (33.8 ± 0.9 °F) ON: Above 3.5 ± 0.3 °C (38.3 ± 0.9 °F)
CONDENSER	
Type	Parallel flow type
Radiation performance	12.9 kw (11,100 Kcal./hr.)
RECEIVER/DRIER	
Type	Assembly includes sight glass with dual (triple) pressure switch (V6) or pressure sensor (L4)
Internal volume	300 cc (10 fl.oz.)

PRESSURE SWITCH	
Type	Dual pressure switch
	Low pressure control ON: 205.9±29.4 kPa (29.9±4.3 psi) OFF: 176.5±24.5 kPa (25.6±3.6 psi)
	High pressure control ON: 2353.6±196.1 kPa (341.3±28.4 psi) OFF: 2942.0±196.1 kPa (426.6±28.4 psi)
	Triple pressure switch (V6, A/T)
	Low pressure control ON: 196.3±29.4 kPa (27.0±4.3 psi) OFF: 176.5±19.6 kPa (25.6±2.8 psi)
	Medium pressure control ON: 1471.0±98.1 kPa (213.3±14.2 psi) OFF: 1078.7±117.7 kPa (156.4±17.7 psi)
	High pressure control ON: 2353.6±196.1 kPa (341.3±28.4 psi) OFF: 2942.0±196.1 kPa (426.6±28.4 psi)
REFRIGERANT	
Type	HFC-134a
Specified amount	650 g (1.43 lbs.)

Compressor

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS ON-VEHICLE SERVICE INFORMATION. FAILURE TO FOLLOW CAUTIONS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

When servicing the compressor, keep dirt or foreign material from getting on or into the compressor parts and system. Clean tools and a clean work area are important for proper service. The compressor connections and the outside of the compressor should be cleaned before any ”On–Vehicle” repair, or before removal of the compressor. The parts must be kept clean at all times and any parts to be reassembled should be cleaned with Trichloroethane, naphtha, kerosene, or equivalent solvent, and dried with dry air. Use only lint free cloths to wipe parts.

The operations described below are based on bench overhaul with compressor removed from the vehicle, except as noted. They have been prepared in order of accessibility of the components. When the compressor is removed from the vehicle for servicing, the oil remaining in the compressor should be discarded and new compressor oil added to the compressor.

Compressor malfunction will appear in one of four ways: noise, seizure, leakage or low discharge pressure. Resonant compressor noises are not cause for alarm; however, irregular noise or rattles may indicate broken parts or excessive clearances due to wear. To check seizure, de–energize the magnetic clutch and check to see if the drive plate can be rotated. If rotation is impossible, the compressor is seized. Low discharge pressure may be due to a faulty internal seal of the compressor, or a restriction in the compressor. Low discharge pressure may also be due to an insufficient refrigerant charge or a restriction elsewhere in the system. These possibilities should be checked prior to servicing the compressor. If the compressor is inoperative, but is not seized, check to see if current is being supplied to the magnetic clutch coil terminals.

The compressor oil used in the HFC–134a system compressor differs from that used in R–12 systems.

Also, compressor oil to be used varies according to the compressor model. Be sure to avoid mixing two or more different types of oil.

If the wrong oil is used, lubrication will be poor and the compressor will seize or malfunction.

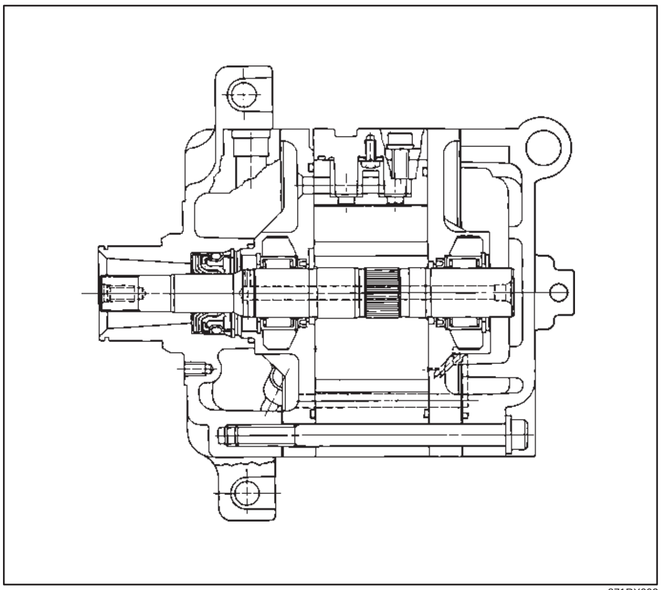
DKV-14G Type Compressor

DKV–14G is equipped with five–vane rotary compressor. These vanes are built into a rotor which is mounted on a shaft.

When the shaft rotates, the vanes built into the cylinder block assembly are operated by centrifugal force.

This changes the volume of the spare formed by the rotor and cylinder, resulting in the intake and compression of the refrigerant gas. The discharge valve and the valve stopper, which protects the discharge valve, are built into the cylinder block assembly. There is no suction valve but a shaft seal is installed between the shaft and head; a trigger valve, which applies back pressure to the vanes, is installed in the cylinder block and a refrigerant gas temperature sensor is installed in the front head.

The specified quantity of compressor oil is contained in the compressor to lubricate the various parts using the refrigerant gas discharge pressure.



871RX002

Diagnosis

Condition	Possible cause	Correction
Noise from compression	Defective rotor/piston	Replace compressor/cylinder and shaft assembly
	Defective shaft	Replace compressor/cylinder and shaft assembly
Noise from magnetic clutch	Defective bearing	Replace magnetic clutch
	Defective clutch	Replace magnetic clutch
	Clearance between drive plate and pulley not standard	Adjust the clearance or replace magnetic clutch
Insufficient cooling	Defective gasket	Replace compressor/gasket
	Defective rotor/reed valve	Replace compressor/valve plate
	Defective trigger valve/suction valve	Replace compressor/suction valve
Not rotating	Defective rotor/piston	Replace compressor/cylinder and shaft assembly
	Defective shaft	Replace compressor/cylinder and shaft assembly
	Rotating parts seized due to insufficient oil	Replace compressor
Oil and/or gas leakage	Defective seal	Replace compressor/shaft seal
	Defective O-ring	Replace

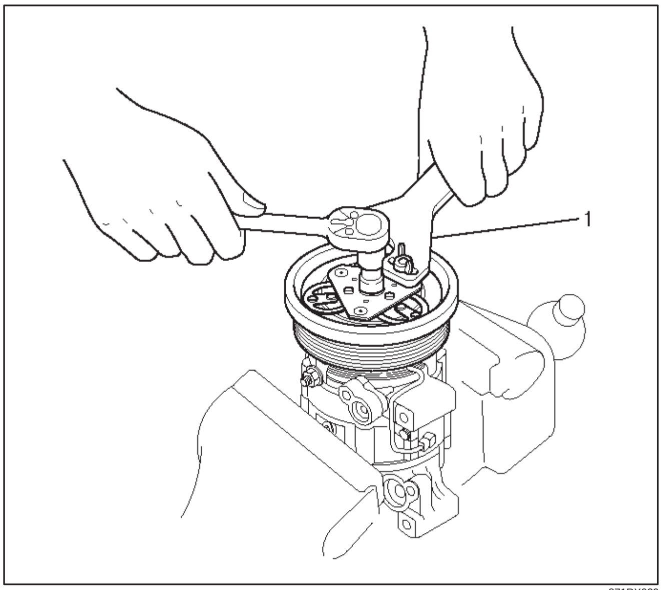
Legend

(1) Drive Plate bolt
(2) Drive Plate
(3) Snap Ring
(4) Pulley Assembly
(5) Field Coil
(6) Shim (s)
(7) Lead Wire

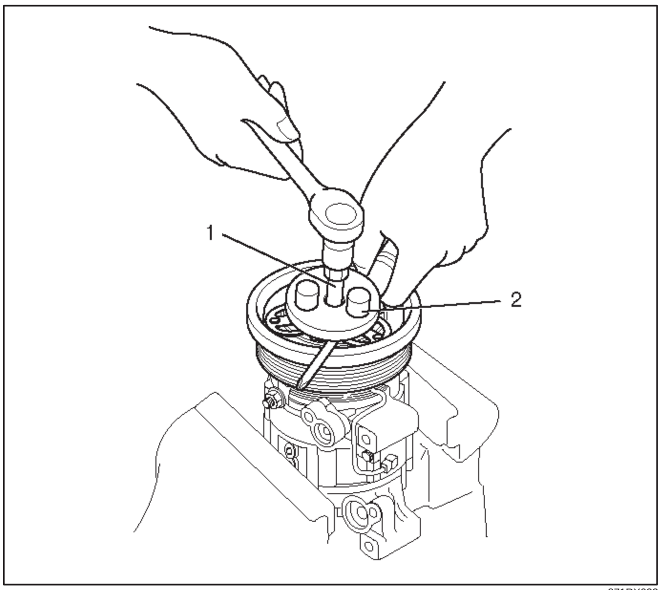
Removal

1. Using drive plate holder J-33939 (1) to prevent the drive plate from rotating, then remove the drive plate bolt.



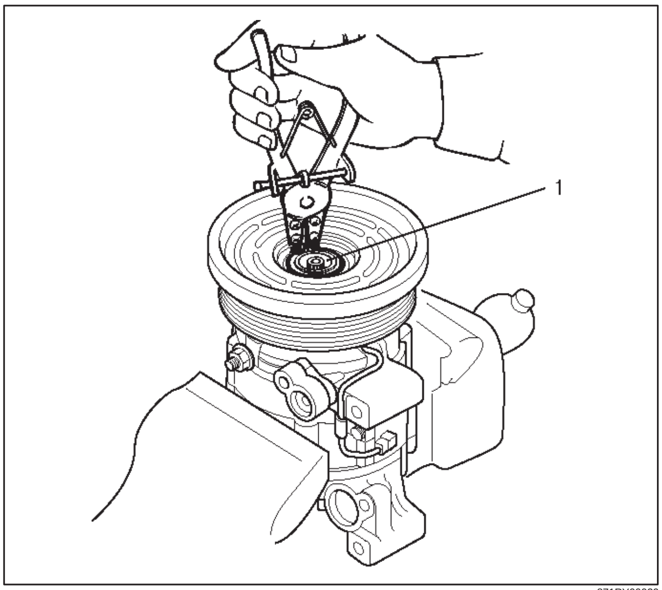
871RX029

2. Remove drive plate by using drive plate puller J-33944-A (2) and forcing screw J-33944-4 (1).



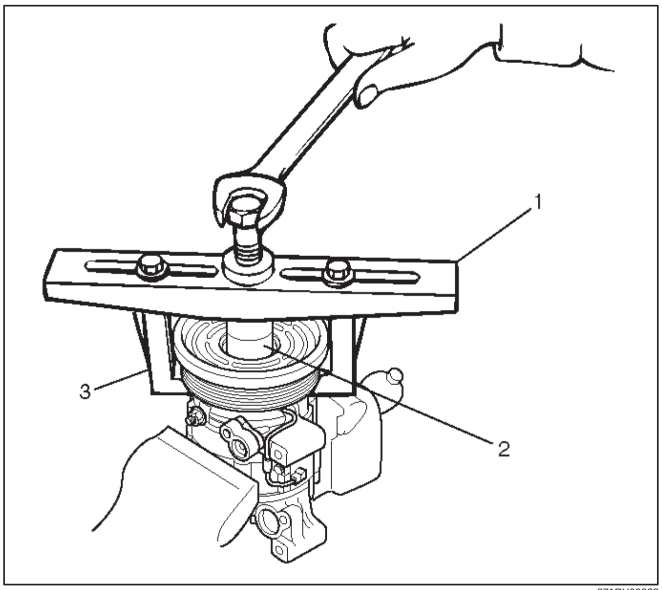
871RX023

3. Remove shim (s).
4. Remove snap ring (1) by using snap ring pliers.



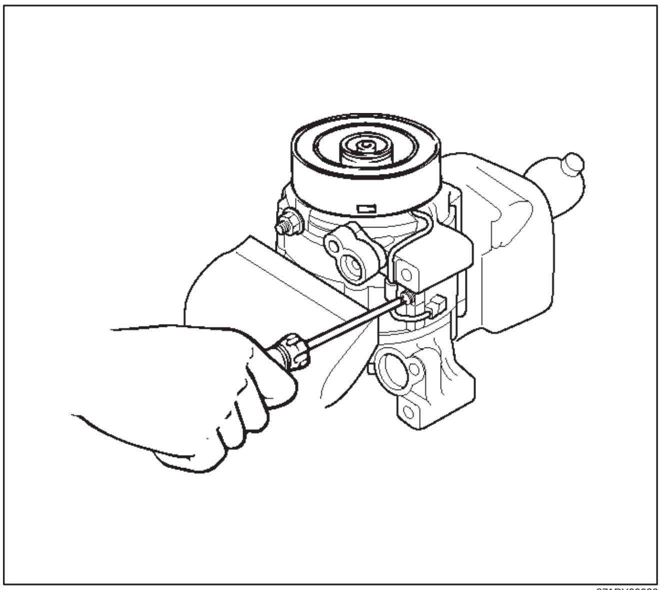
871RY00029

5. Remove pulley assembly by using pulley puller pilot J-38424 (2), pulley puller J-8433 (1) and pulley puller leg J-24092-2 (3).



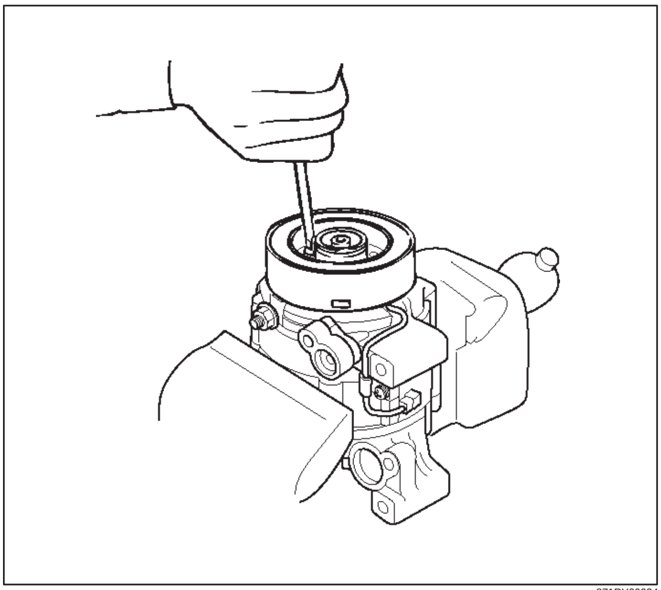
871RY00033

6. Loosen screw and disconnect the field coil wire connector.



871RY00030

7. Loosen three screws and remove the field coil.



871RY00034

Inspection and Repair

Drive Plate

If the frictional surface shows signs of damage due to excessive heat, the drive plate and pulley should be replaced.

Pulley Assembly

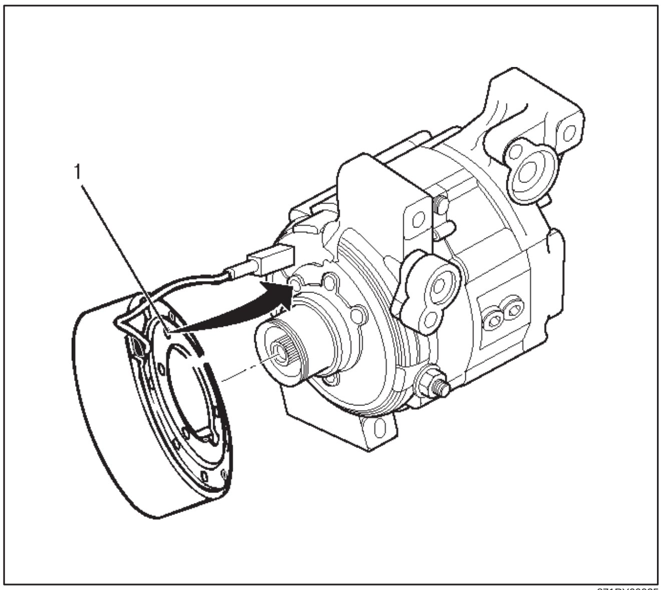
Check the appearance of the pulley assembly. If the frictional surface of the pulley shows signs of excessive grooving due to slippage, both the pulley and drive plate should be replaced. The frictional surfaces of the pulley assembly should be cleaned with a suitable solvent before reinstallation.

Coil

Check coil for loose connector or cracked insulation.

Installation

1. Install field coil.
   - Align the located portion (1) of the field coil and compressor.

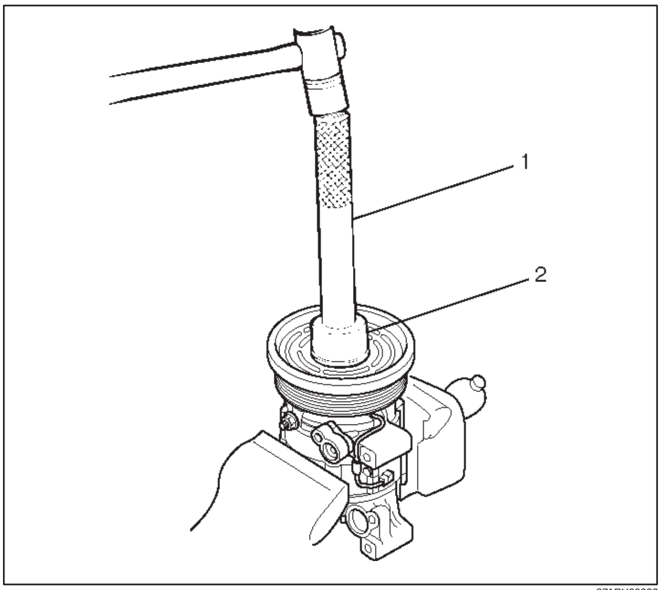


871RY00035

   - Tighten the mounting screw to the specified torque.

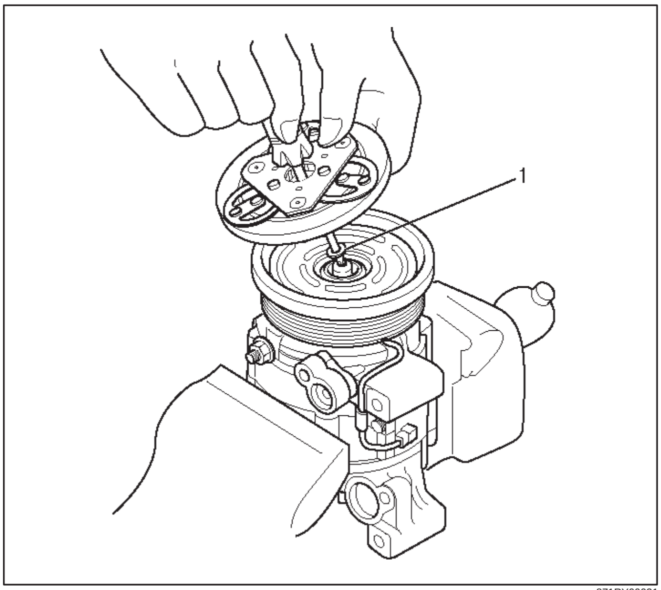
   Torque: 5N·m (44 lb in)

2. Connect the lead wire connector with the rubber hold and tighten the screw.
3. Install pulley assembly by using pulley installer J-33940-A (2) and drive handle J-8092 (1).



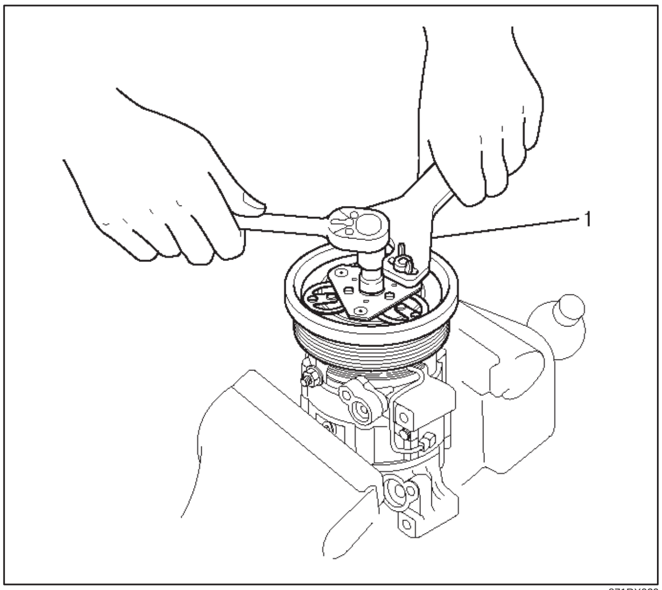
871RY00032

4. Install snap ring.
5. Install shim (s).
6. Install the drive plate to the compressor drive shaft together with the original shim(s)(1). Press the drive plate by hand.



871RY00031

7. Install drive plate bolt by using drive plate holder J-33939 (1) to prevent the drive plate from rotating.

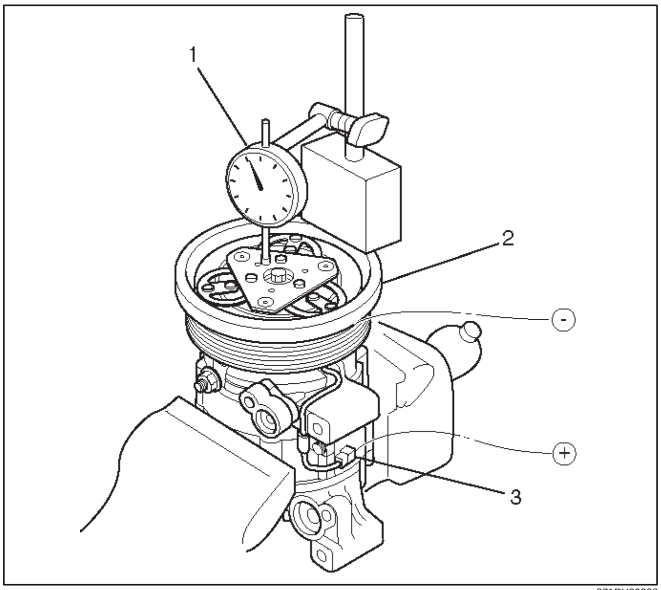


- Tighten the drive plate bolt to the specified torque.

Torque: 13 N·m (113 lb in)

- After tightening the drive plate bolt, check to be sure the pulley rotates smoothly.

- Check to be sure that the clutch clearance is between 0.3-0.6 mm (0.01-0.02 in.)



Legend

(1) Dial Gauge
(2) Pulley Assembly
(3) Field Coil Wire Connector

- If necessary, install adjusting shim(s).
- Adjusting shims are available in the following thickness.

Thickness

- **0.1 mm (0.0039 in.)**
- **0.3 mm (0.0118 in.)**
- **0.5 mm (0.0197 in.)**

Compressor Oil

Oil Specification

- The HFC-134a system requires a synthetic (PAG) compressor oil whereas the R-12 system requires a mineral compressor oil. The two oils must never be mixed.
- Compressor (PAG) oil varies according to compressor model. Be sure to use oil specified for the model of compressor.
- **Always use HFC-134a Vane Rotary Type Compressor Oil (AIPDN Part No.2-90188-301-0)**

Handling of Oil

- The oil should be free from moisture, dust, metal powder, etc.
- Do not mix with other oil.
- The water content in the oil increases when exposed to the air. After use, seal oil from air immediately. (HFC-134a Vane Rotary Compressor Oil absorbs moisture very easily.)
- The compressor oil must be stored in steel containers, not in plastic containers.

Compressor Oil Check

The oil used to lubricate the compressor is circulating with the refrigerant.
Whenever replacing any component of the system or a large amount of gas leakage occurs, add oil to maintain the original amount of oil.

Oil Capacity

Capacity total in system: 150cc (5.0 fl.oz)

Compressor (Service parts) charging amount: 150 cc (5.0 fl.oz)

Checking and Adjusting Oil Quantity for Used Compressor

1. Perform oil return operation. Refer to Oil Return Operation in this section.
2. Discharge and recover refrigerant and remove the compressor.
3. Drain the compressor oil and measure the extracted oil with a measuring cylinder.
4. If the amount of oil drained is much less than 90 cc (3.0 fl. oz.), some refrigerant may have leaked out. Conduct a leak tests on the connections of each system, and if necessary, repair or replace faulty parts.
5. Check the compressor oil contamination. (Refer to Contamination of Compressor Oil in this section.)
6. Adjust the oil level following the next procedure below.

(Charging Amount)	(Collected Amount)
more than 90cc (3.0 fl.oz)	same as collected amount
less than 90 cc (3.0 fl.oz)	90cc (3.0 fl.oz)

7. Install the compressor, then evacuate, charge and perform the oil return operation.
8. Check system operation.

When it is impossible to preform oil return operation, the compressor oil should be checked in the following order:

1. Discharge and recover refrigerant and remove the compressor.
2. Drain the compressor oil and measure the extracted oil with a measuring cylinder.
3. Check the oil for contamination.
4. If more than 90 cc (3.0 fl. oz.) of oil is extracted from the compressor, supply the same amount of oil to the compressor to be installed.
5. If the amount of oil extracted is less than 90 cc (3.0 fl. oz.), recheck the compressor oil in the following order.
6. Supply 90 cc (3.0 fl. oz.) of oil to the compressor and install it onto the vehicle.
7. Evacuate and recharge with the proper amount of refrigerant.
8. Perform the oil return operation.
9. Remove the compressor and recheck the amount of oil.
10. Adjust the compressor oil, if necessary.

(Collected Amount)	(Charging Amount)
more than 90 cc (3.0 fl.oz)	same as collected amount
less than 90 cc (3.0 fl.oz)	90 cc (3.0 fl.oz)

Checking and Adjusting for Compressor Replacement

150 cc (5.0 fl.oz.) of oil is charged in compressor (service parts). So it is necessary to drain the proper amount of oil from the new compressor.

1. Perform oil return operation.
2. Discharge and recover the refrigerant and remove the compressor.
3. Drain the compressor oil and measure the extracted oil.
4. Check the compressor oil for contamination.
5. Adjust the oil level as required.

(Amount of oil drained from used compressor)	(Draining amount of oil from new compressor)
less than 90 cc (3.0 fl.oz)	Same as drained amount
more than 90 cc (3.0 fl.oz)	90 cc (3.0 fl.oz)

6. Evacuate, charge and perform the oil return operation.
7. Check the system operation.

Contamination of Compressor Oil

Unlike engine oil, no cleaning agent is added to the compressor oil. Even if the compressor runs for a long period of time (approximately one season), the oil never becomes contaminated as long as there is nothing wrong with the compressor or its method of use.

Inspect the extracted oil for any of the following conditions:

- The capacity of the oil has increased.
- The oil has changed to red.
- Foreign substances, metal powder, etc., are present in the oil.

If any of these conditions exists, the compressor oil is contaminated. Whenever contaminated compressor oil is discovered, the receiver/drier must be replaced.

Oil Return Operation

There is close affinity between the oil and the refrigerant. During normal operation, part of the oil recirculates with the refrigerant in the system. When checking the amount of oil in the system, or replacing any component of the system, the compressor must be run in advance for oil return operation. The procedure is as follows:

1. Open all the doors and the engine hood.
2. Start the engine and air conditioning switch to “ON” and set the fan control knob at its highest position.
3. Run the compressor for more than 20 minutes between 800 and 1,000 rpm in order to operate the system.
4. Stop the engine.

Replacement of Component Parts

When replacing the system component parts, supply the following amount of oil to the component parts to be installed.

(Component parts to be installed)	(Amount of Oil)
Evaporator	50 cc (1.7 fl. oz.)
Condenser	30 cc (1.0 fl. oz.)
Receiver/dryer	30 cc (1.0 fl. oz.)
Refrigerant line (one piece)	10 cc (0.3 fl. oz.)

Main Data and Specifications

General Specifications

COMPRESSOR	
Model	DKV-14G
Type	Vane rotary type
Number of vanes	5
Rotor diameter	64 mm (2.52 in.)
Stroke	8.75 mm (0.34 in.)
Displacement	140 cc (47.3 fl.oz.)
Maximum speed	7,000 rpm (up to 8,400 rpm)
Direction of rotation	Clockwise (Front-side view)
Lubrication system	Pressure differential type
Lubricant	R-134a Vane Rotary Type Compressor Oil (AIPDN Part No.2-90188-301-0) 150 cc (5.0 fl.oz.)
Refrigerant	Refrigerant-134a (R-134a), 650 g (1.43 lbs.)
Shaft seal	Lip type
Weight	3.5 kg
MAGNETIC CLUTCH	
Type	Electromagnetic single-plate dry clutch
Rated voltage	12 Volts D.C.
Current consumption	3.7 A
Starting torque	49 N·m (36 lb·ft)
Direction of rotation	Clockwise (Front-side view)
Weight	3.0 kg (6.6 lbs.)

STEERING

POWER-ASSISTED STEERING SYSTEM

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnosis

Since the problems in steering, suspension, wheels and tires involve several systems, they must all be considered when diagnosing a complaint. To identify the symptom, always road test the vehicle first. Proceed with the following preliminary inspections and correct any defects which are found.

1. Inspect tires for proper pressure and uneven wear.
2. Raise vehicle on a hoist, then inspect front and rear suspension and steering linkage for loose or damaged parts.
3. Spin the front wheels. Inspect for out-of-round tires, out-of-balance tires, loose and/or rough wheel bearings.

General Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
	Tires not adequately inflated.	Adjust the pressure.

Condition	Possible cause	Correction
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel run–out.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial run–out of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
	Parts in power steering valve defective.	Replace power steering unit.
Hard Steering	Bind in steering linkage ball studs, upper or lower end ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to “Power steering system diagnosis”
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower end ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.

Condition	Possible cause	Correction
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.

Power Steering System

There is some noise in all power steering systems. One of the most common is a hissing sound when the steering wheel is fully turned and the car is not moving. This noise will be most evident when the steering wheel is operated while the brakes are applied. There is no relationship between this noise and steering performance. Do not replace the valve unless the “hissing” noise is extremely objectionable. A replacement valve will also have a slight noise, and is not always a cure for the condition.

Condition	Possible cause	Correction
Rattle or Chucking Noise	Pressure hose touching other parts of vehicle.	Adjust hose position. Do not bend tubing by hand.
	Tie rod ends loose.	Tighten or replace tie rod end.
	Loose steering unit mounting.	Tighten steering unit mounting.
Poor Return of Steering Wheel to Center	Improper front wheel alignment.	Adjust front wheel alignment.
	Wheel bearing worn.	Replace front wheel bearing.
	Tie rod end binding.	Replace tie rod end.
	Ball joint binding.	Replace ball joint.
	Tight or frozen steering shaft bearing.	Replace steering assembly.
	Sticky or plugged steering unit valve.	Flush or replace steering unit.
	Entry of air in the power steering system.	Bleed the system.
Momentary Increase In Effort When Turning Wheel Fast To Right or Left	High internal leakage.	Repair steering gear.
	Power steering fluid level low.	Replenish fluid.
Steering Wheel Surges or Jerks When Turning Especially During Parking	Insufficient pump pressure.	Repair pump assembly.
	Sticky steering unit valve.	Flush or replace steering unit.
	Power steering fluid level low.	Replenish fluid.
Excessive Wheel Kick Back or Loose Steering	Air in system.	Bleed hydraulic system.
	Tie rod end loose.	Tighten tie rod end.
	Wheel bearing worn.	Replace wheel bearing.
Hard Steering or Lack or Power Assist	Sticky steering unit valve.	Flush or replace steering unit.
	Insufficient pump pressure.	Repair pump assembly.
	Excessive internal pump leakage.	Repair pump assembly.
	Excessive internal steering gear leakage.	Repair steering gear.
	Power steering fluid level low.	Replenish fluid.
Unstable Engine Idling or Stalling When Turning	Pressure switch of the power steering pump or its harness is faulty.	Repair or replace.

Power Steering Pump

Foaming milky power steering fluid, low fluid level, and possible low pressure can be caused by air in the fluid, or loss of fluid due to internal pump leakage. Check for leak and correct. Bleed the system. Extremely cold temperatures will cause air bubbles in the system if the fluid level is low. If the fluid level is correct and the pump still foams, remove the pump from the vehicle and check housing for cracks. If the housing is cracked, replace the pump housing.

Condition	Possible cause	Correction
Low Pressure Due to Steering Pump	Relief valve sticking or inoperative.	Replace relief valve.
	Side plate not flat against cam ring.	Replace side plate.
	Extreme wear of cam ring.	Replace cam ring.
	Scored side plate or rotor.	Replace side plate or rotor.
	Vanes sticking in rotor slots.	Repair or replace vanes and rotor.
	Cracked or broken side plate.	Replace side plate.
	High internal leakage.	Repair internal leakage.
Low Pressure Due to Steering Gear	Scored housing bore.	Replace housing.
Growling Noise In Steering Pump	Excessive back pressure in hoses or steering unit caused by restriction.	Repair steering unit or pump.
	Scored side plate or rotor.	Replace side plate or rotor.
	Worn cam ring.	Replace cam ring.
Groaning Noise In Steering Pump	Air in the fluid.	Bleed hydraulic system.
	Low fluid level.	Replenish fluid.
	Pump mounting loose.	Tighten mounting bolt.
Rattling Noise In Steering Pump	Vanes sticking in rotor slots.	Repair or replace vanes and rotor.
	Vane improperly installed.	Repair rotor and vane.
Swishing Noise In Steering Pump	Damaged relief valve.	Replace relief valve.
Whining Noise In Steering Pump	Scored side plate and vanes.	Replace side plate and vanes.

Steering Column Lock System

Condition	Possible cause	Correction
Will Not Unlock	Damaged lock cylinder.	Replace lock cylinder.
	Damaged park lock cable.	Replace park lock cable.
Will Not Lock	Lock spring broken or worn.	Replace lock cylinder.
	Damaged lock cylinder.	Replace lock cylinder.
	Ignition switch stuck.	Repair or replace ignition switch.
	Park lock cable damaged.	Replace park lock cable.
Key Cannot be Removed in “OFF-LOCK”	Ignition switch is not set correctly.	Correct ignition switch.
	Damaged lock cylinder.	Replace lock cylinder.
	Faulty shift lock mechanism.	Repair or replace the shift lock mechanism.

Column

Condition	Possible cause	Correction
Noise in Column	Universal joint loose.	Tighten joint.
	Shaft lock snap ring not seated.	Place snap ring in proper position.

Turn Signal Switch

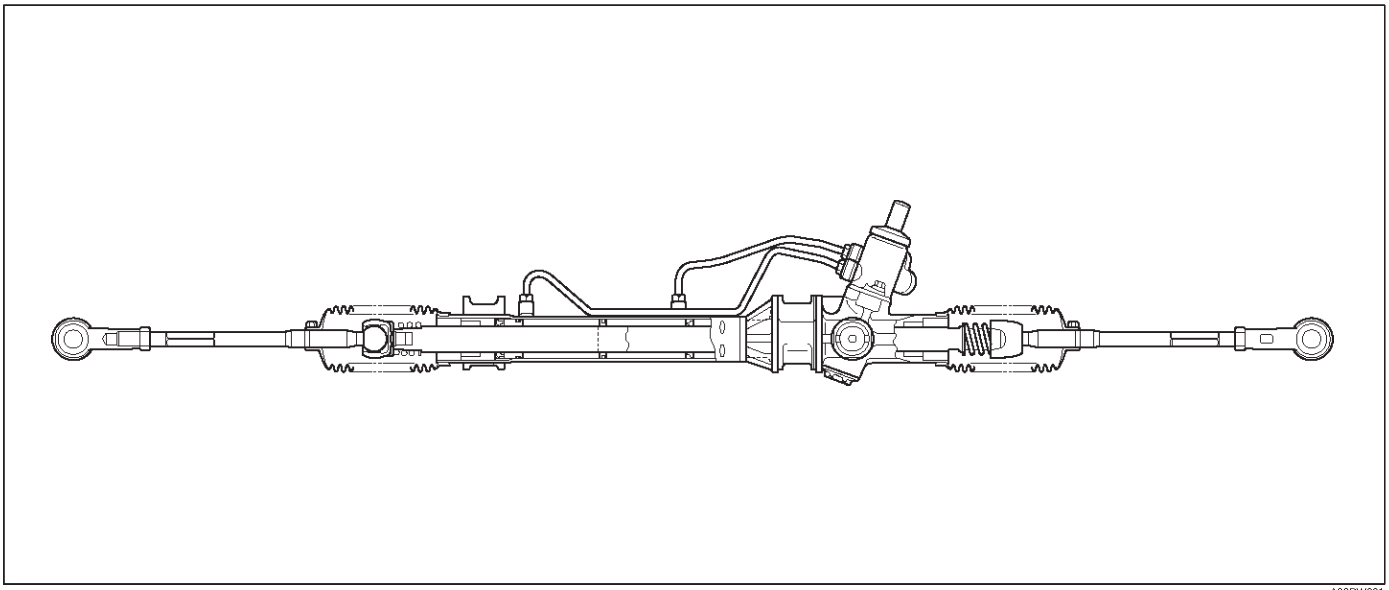
This diagnosis covers mechanical problems only. Refer to Turn Signal Switch in Electrical section for electrical diagnosis.

Condition	Possible cause	Correction
Turn Signal Will Not Stay In Turn Position	Foreign material or loose parts preventing movement of yoke.	Repair or replace signal switch.
	Broken or missing detent or canceling spring.	Replace signal switch.
Turn Signal Will Not Cancel	Loose switch mounting screws.	Tighten mounting screws.
	Switch or anchor bosses broken.	Replace turn signal switch.
	Broken, missing or out of position detent, return or canceling spring.	Replace turn signal switch.
	Worn canceling cam.	Replace turn signal switch.
Turn Signal Difficult To Operate	Turn signal switch arm loose.	Tighten arm screw.
	Broken or distorted yoke.	Replace turn signal switch.
	Loose or misplaced springs.	Replace turn signal switch.
	Foreign parts and/or material.	Repair turn signal switch.
	Loose turn signal switch mounting screws.	Tighten mounting screws.
Turn Signal Will Not Indicate Lane Change	Broken lane change pressure pad or spring hanger.	Replace turn signal switch.
	Broken, missing or misplaced lane change spring.	Replace turn signal switch.
	Base of wire damaged.	Replace turn signal switch.
Hazard Switch Cannot Be Turned Off	Foreign material between hazard switch to turn signal switch body.	Repair or replace hazard switch.
No Turn Signal Lights	Electrical failure in chassis harness.	Refer to Electrical section.
	Inoperative turn signal flasher unit.	Replace flasher unit.
	Loose chassis harness connector.	Repair loose connector.
Front or Rear Turn Signal Lights Not Flashing	Burned-out or damaged turn signal bulb.	Replace bulb.
	High resistance connection to ground at bulb socket.	Repair bulb socket.
	Loose chassis harness connector.	Repair loose connector.

General Description

The hydraulic power steering system consists of a pump, an oil reservoir, a steering unit, a pressure hose and a return hose.

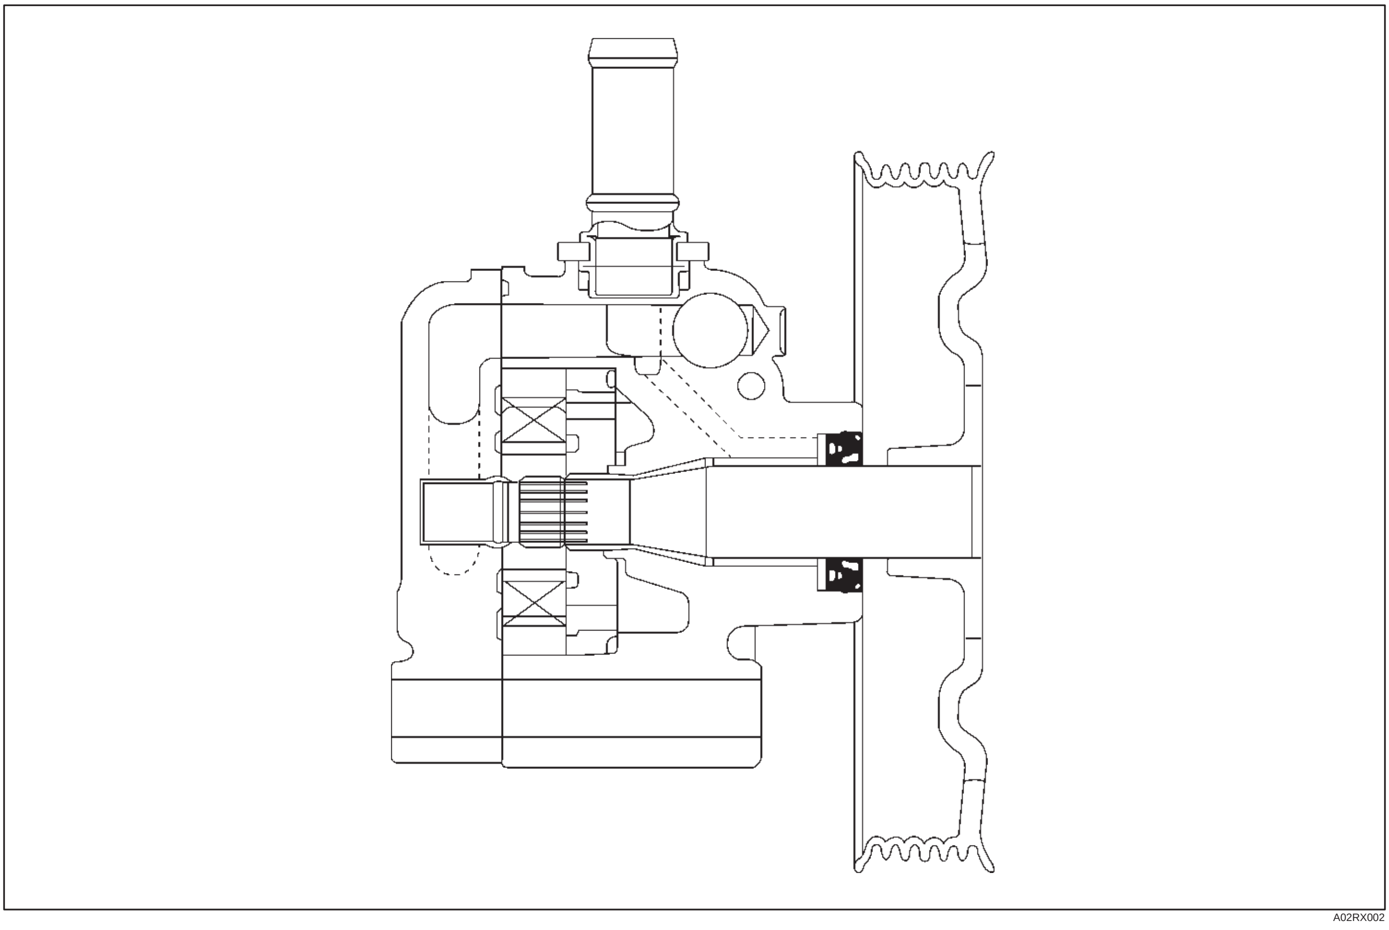
Power Steering Unit



A02RW001

The power steering unit is rack and pinion type.
The toe–in angle can be adjusted by turning the rod on each side.
The steering housing cannot be disassembled.

Hydraulic Pump



A02RX002

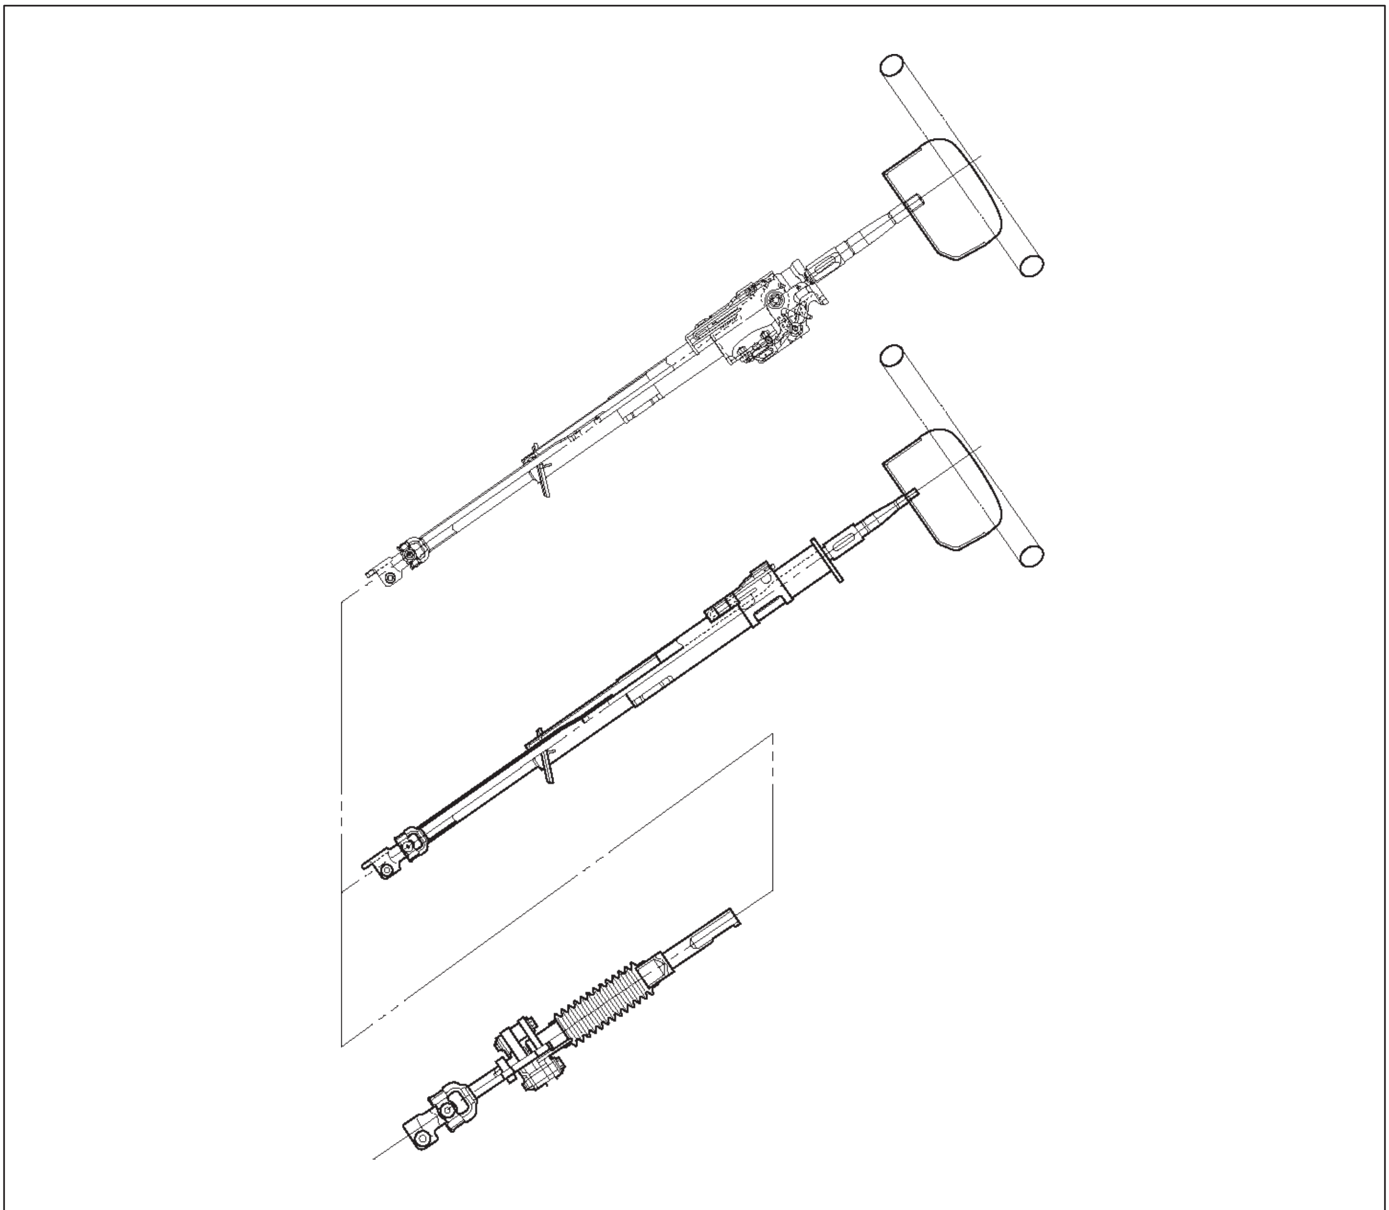
The hydraulic pump is vane-type design. The submerged pump has housing and internal parts that are inside the reservoir and operate submerged in oil. There are two bore openings at the rear of the pump housing. The larger opening contains the cam ring, pressure plate, thrust plate, rotor and vane assembly, and end plate. The smaller opening contains the pressure line union, flow control valve and spring.

The flow control orifice is part of the pressure line union. The pressure relief valve inside the flow control valve limits the pump pressure.

Pressure Switch

When hydraulic pressure reaches 3430 kPa (500 psi), the pressure switch of the power steering pump closes causing the Engine Control Module (ECM) to actuate the idle air control valve, which increases the engine rpm to prevent the overload-induced engine speed slow down. The switch opens when hydraulic pressure drops to 2940 kPa (430 psi).

Steering Column



431RY00004

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLE-SHOOTING THE SRS SYSTEM, DO NOT USE ELECTRICAL TEST EQUIPMENT, SUCH AS BATTERY-POWERED OR A/C-POWERED VOLT-METER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER.

INSTRUCTION IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

When servicing a vehicle equipped with Supplemental Restraint System, pay close attention to all WARNINGS and CAUTIONS.

For detailed explanation about SRS, refer to Restraints section.

The steering column has three important features in addition to the steering function:

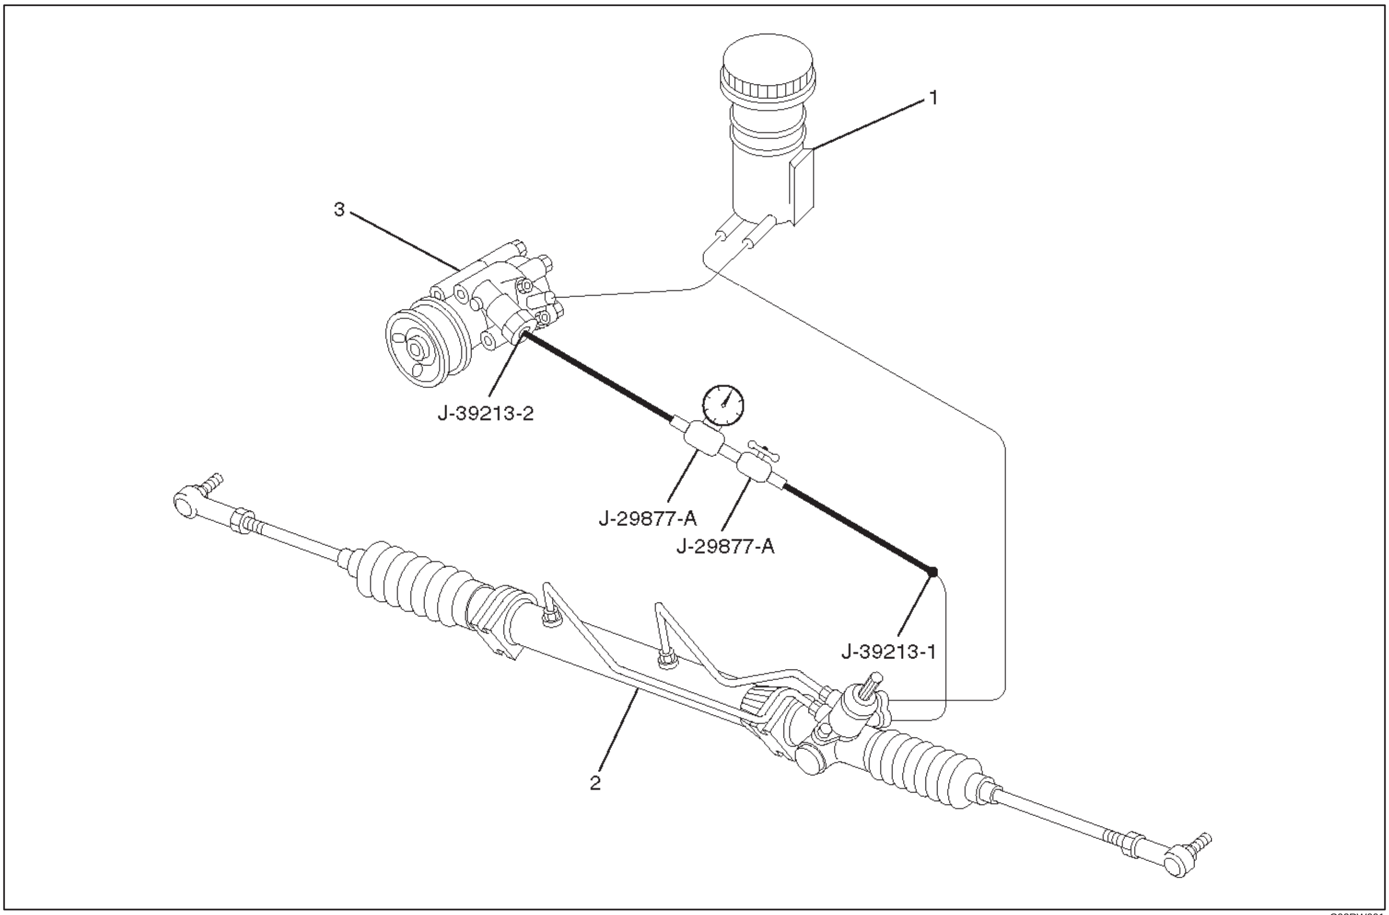
1. The column is energy absorbing, designed to compress in a front-end collision to minimize the possibility of injury to the driver of the vehicle.
2. The ignition switch and lock are mounted conveniently on the column.
3. With the column mounted lock, the ignition and steering operation can be locked to prevent theft of the vehicle.

The column can be disassembled and reassembled. However, to insure the energy absorbing action, use only the specified screws, bolts and nuts as designated, and tighten them to the specified torque.

Handle the column with care when it is removed from the vehicle. A sharp blow on the end of steering shaft or shift lever, or dropping the assembly could shear or loosen the fasteners that maintain column rigidity.

Power Steering System Test

Test Procedure



Legend

(1) Fluid Reservoir
(2) Power Steering Unit
(3) Power Steering Pump

Test of fluid pressure in the power steering system is performed to determine whether or not the oil pump and power steering unit are functioning normally.

The power steering system test is used to identify and isolate hydraulic circuit difficulties. Prior to performing this test, the following inspections and corrections, if necessary, must be made.

- Inspect pump reservoir for proper fluid level.
- Inspect pump belt for proper tension.
- Inspect pump driver pulley condition.

1. Place a container under the pump to catch the fluid when disconnecting or connecting the hoses.
2. With the engine NOT running, disconnect the pressure hose at the power steering pump and install power steering tester J-29877-A. The gage must be between the shutoff valve and pump. Open the shutoff valve.
3. Check the fluid level. Fill the reservoir with power steering fluid, to the “Full” mark. Start the engine, then turn the steering wheel and momentarily hold it against a stop (right or left). Turn the engine off and check the connections at tester for leakage.

4. Bleed the system. Refer to Bleeding the Power Steering System in this section.
5. Start the engine and check the fluid level. Add power steering fluid if required. When the engine is at normal operating temperature, increase engine speed to 1500 rpm.

CAUTION: Do not leave shutoff valve fully closed for more than 5 seconds, as the pump could become damaged internally.

6. Fully close the shutoff valve. Record the highest pressures.
   - If the pressure recorded is within 9300–9800 kPa (1350–1420 psi), the pump is functioning within its specifications.
   - If the pressure recorded is higher than 9800 kPa (1420 psi), the valve in the pump is defective.
   - If the pressure recorded is lower than 9300 kPa (1350 psi), the valve or the rotating group in the pump is defective.
7. If the pump pressures are within specifications, leave the valve open and turn (or have someone else turn) the steering wheel fully in both directions. Record the highest pressures and compare with the maximum pump pressure recorded in step 6. If this pressure cannot be built in either side of the power steering unit, the power steering unit is leaking internally and must be replaced.
8. Shut the engine off, remove the testing gauge.
9. Reconnect the pressure hose, check the fluid level and make the needed repairs.
10. If the problem still exists, the steering and front suspension must be thoroughly examined.

Maintenance

The hydraulic system should be kept clean and fluid level in the reservoir should be checked at regular intervals and fluid added when required. Refer to Recommended Fluids and Lubricants in General Information section for the type of fluid to be used and the intervals for filling.

If the system contains some dirt, flush it as described in this section. If it is exceptionally dirty, the pump must be completely disassembled before further usage. (The steering unit cannot be disassembled.)

All tubes, hoses, and fittings should be inspected for leakage at regular intervals. Fittings must be tight. Make sure the clips, clamps and supporting tubes and hoses are in place and properly secured.

Power steering hoses and lines must not be twisted, kinked or tightly bent. Air in the system will cause spongy action and noisy operation. When a hose is disconnected or when fluid is lost, for any reason, the system must be bled after refilling. Refer to Bleeding the Power Steering System in this section.

- Inspect belt for tightness.
- Inspect pulley for looseness or damage. The pulley should not wobble with the engine running.
- Inspect hoses so they are not touching any other parts of the vehicle.
- Inspect fluid level and fill to the proper level.

Fluid Level

1. Run the engine until the power steering fluid reaches normal operating temperature, about 55˚C (130˚F), then shut the engine off.
2. Check the level of fluid in the reservoir.
3. If the fluid level is low, add power steering fluid as specified in General Information to the proper level and install the receiver cap.
4. When checking the fluid level after the steering system has been serviced, air must be bled from the system. Refer to Bleeding the Power Steering System in this section.

Bleeding The Power Steering System

When a power steering pump or unit has been installed, or an oil line has been disconnected, the air that has entered the system must be bled out before the vehicle is operated. If air is allowed to remain in the power steering fluid system, noisy and unsatisfactory operation of the system may result.

Bleeding Procedure

When bleeding the system, and any time fluid is added to the power steering system, be sure to use only power steering fluid as specified in General Information.

1. Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
2. Start the engine and let it run for a few seconds. Do not turn the steering wheel. Then turn the engine off.
3. Add fluid if necessary.
4. Repeat the above procedure until the fluid level remains constant after running the engine.
5. Raise and support the front end of the vehicle so that the wheels are off the ground.
6. Start the engine. Slowly turn the steering wheel right and left, lightly contacting the wheel stops.
7. Add power steering fluid if necessary.
8. Lower the vehicle, set the steering wheel at the straight forward position after turning it to its full steer positions 2 or 3 times, and stop the engine.
9. Check the fluid level and refill as required.
10. If the fluid is extremely foamy, allow the vehicle to set a few minutes, then repeat the above procedure.

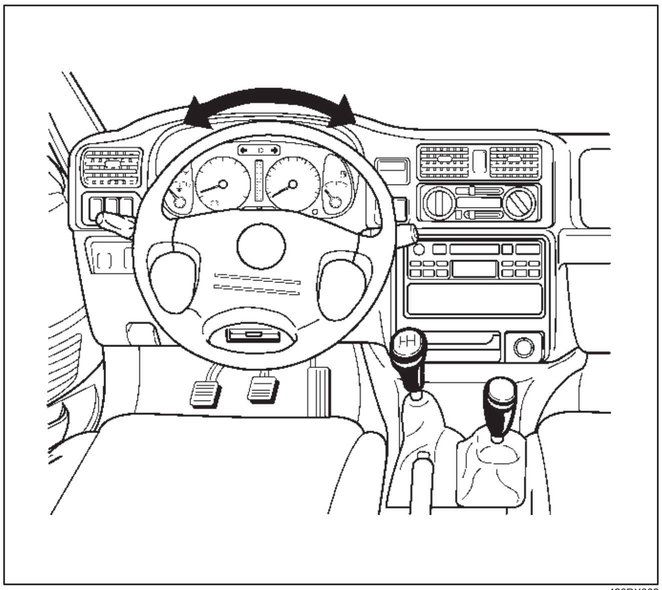
Flushing The Power Steering System

1. Raise and support the front end of the vehicle off the ground until the wheels are free to turn.
2. Remove the fluid return line at the pump inlet connector and plug the connector port on the pump. Position the line toward a large container to catch the draining fluid.
3. While running the engine at idle, fill the reservoir with new power steering fluid. Turn the steering wheel in both directions. Do not contact or hold the steering wheel to the wheel stops. This will cause the pump to go to pressure relief mode, which may cause a sudden fluid overflow at the reservoir.

4. Install all the lines and hoses. Fill the system with new power steering fluid and bleed the system as described in Bleeding The Power Steering System. Operate the engine for about 15 minutes.

   Remove the pump return line at the pump inlet and plug the connection on the pump. While refilling the reservoir, check the draining fluid for contamination. If foreign material is still evident, replace all lines, disassemble and clean or replace the power steering system components. Do not re-use any drained power steering fluid.

Steering Wheel Free Play Inspection



430RX003

1. With the tires in the straight-ahead position, check the amount of steering wheel play by turning the wheel in both directions until the tires begin to move.

NOTE: The wheel free play should be checked with the engine running.

Free play: 0 – 30 mm (0 – 1.18 in)

2. Also check the steering wheel for play and looseness in the mount by moving it back and forth and sideways. When test driving, check for hard steering, steering shimmy and tendency to pull to one side.

Front End Alignment Inspection and Adjustment

General Description

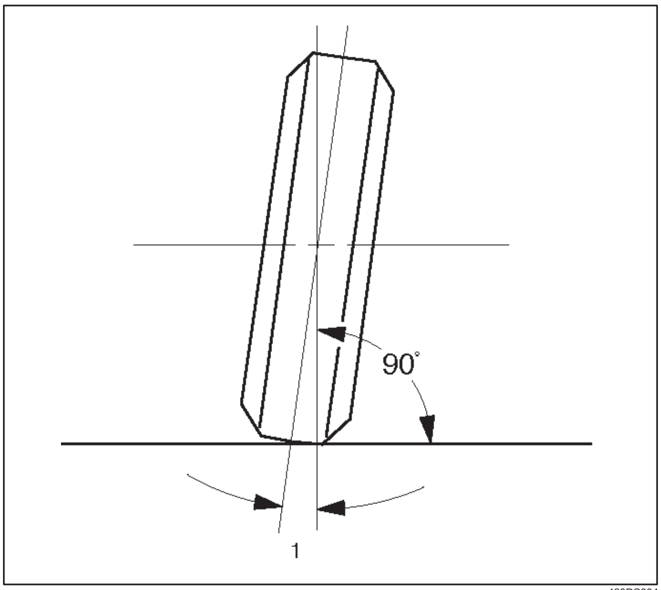
“Front End Alignment” refers to the angular relationship between the front wheels, the front suspension attaching parts and the ground.

Proper front end alignment must be maintained in order to insure efficient steering, good directional stability and to prevent abnormal tire wear.

The most important factors of front end alignment are wheel toe-in, wheel camber and axle caster.

Camber:

This illustration shows view from the front of the vehicle.

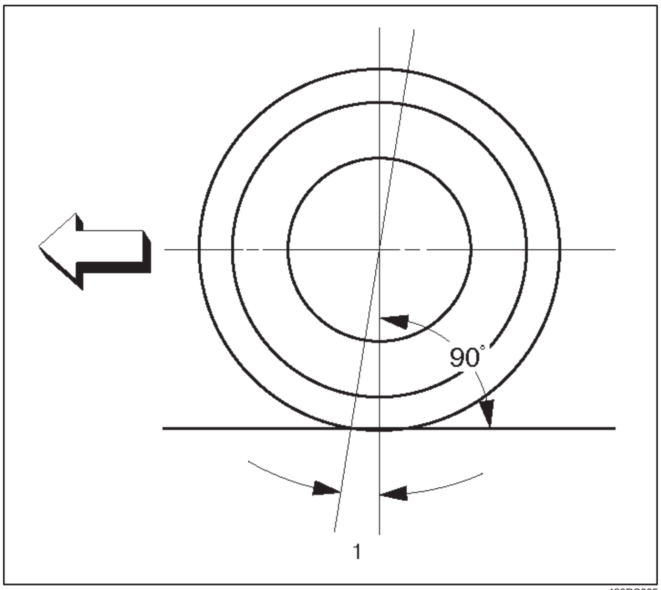


480RS004

Camber is the vertical tilting inward or outward of the front wheels. When the wheels tilt outward at the top, the camber is positive (+). When the wheels tilt inward at the top, the camber is negative (-). The amount of tilt measured in degrees from the vertical is called the camber angle (1). If camber is extreme or unequal between the wheels, improper steering and excessive tire wear will result. Negative camber causes wear on the inside of the tire, while positive camber causes wear to the outside.

Caster:

This illustration shows view from the side of the vehicle.

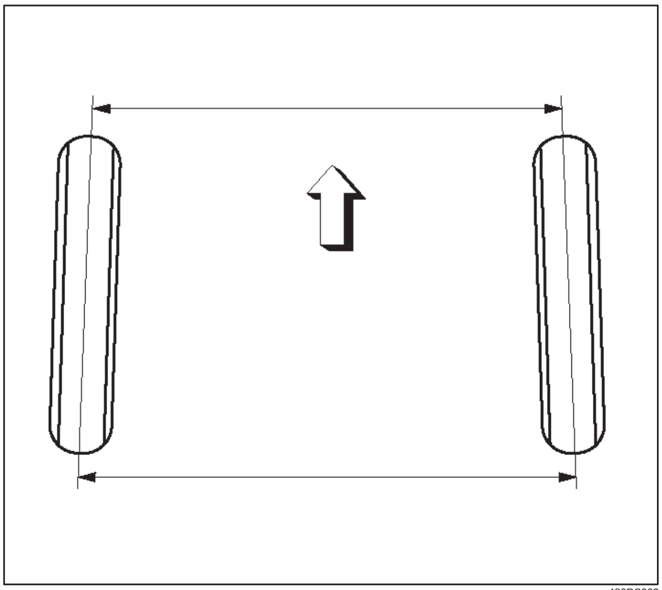


480RS005

Caster (1) is the vertical tilting of the wheel axis either forward or backward (when viewed from the side of the vehicle). A backward tilt is positive (+) and a forward tilt is negative (-). On the short and long arm type suspension you cannot see a caster angle without a special instrument, but if you look straight down from the top of the upper control arm to the ground, the ball joints do not line up (fore and aft) when a caster angle other than 0 degree is present. With a positive angle, the lower ball joint would be slightly ahead (toward the front of the vehicle) of the upper ball joint center line.

Toe-in:

This illustration shows view from the top of the vehicle.



480RS003

Toe-in is the measured amount the front wheels are turn in. The actual amount of toe-in is normally a fraction of a degree. Toe-in is measured from the center of the tire treads or from the inside of the tires. The purpose of toe-in is to insure parallel rolling of the front wheels and to offset any small deflections of the wheel support system which occurs when the vehicle is rolling forward. Incorrect toe-in results in excessive toe-in and unstable steering. Toe-in is the last alignment to be set in the front end alignment procedure.

Inspection

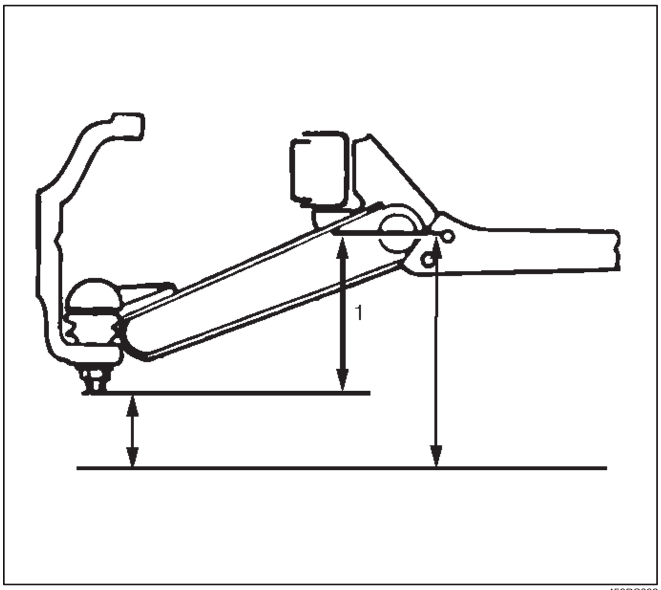
Before making any adjustments affecting caster, camber or toe-in, the following front end inspection should be made.

1. Inspect the tires for proper inflation pressure. Refer to Main Data and Specifications in Wheel and Tire System section.
2. Make sure that the vehicle is unladen condition (With no passenger or loading).
3. Make sure that the spare tire is installed at the normal position.
4. Inspect the front wheel bearings for proper adjustment. Refer to Front Hub and Disc Overhaul in Suspension section.
5. Inspect the ball joints and tie rod ends. If excessive looseness is noted, correct before adjusting. Refer to Steering Linkage in this section.
6. Inspect the wheel and tires for run-out. Refer to Wheel Replacement in Wheel and Tire System section.
7. Inspect the trim height. If not within specifications, the correction must be made before adjusting caster.
8. Inspect the steering unit for looseness at the frame.
9. Inspect shock absorbers for leaks or any noticeable noise. Refer to Shock Absorber in Suspension section.
10. Inspect the control arms or stabilizer bar attachment for looseness. Refer to Suspension section .
11. Inspect the front end alignment using alignment equipment. Follow the manufacturer’s instructions.
12. Park the vehicle must be on a level surface.

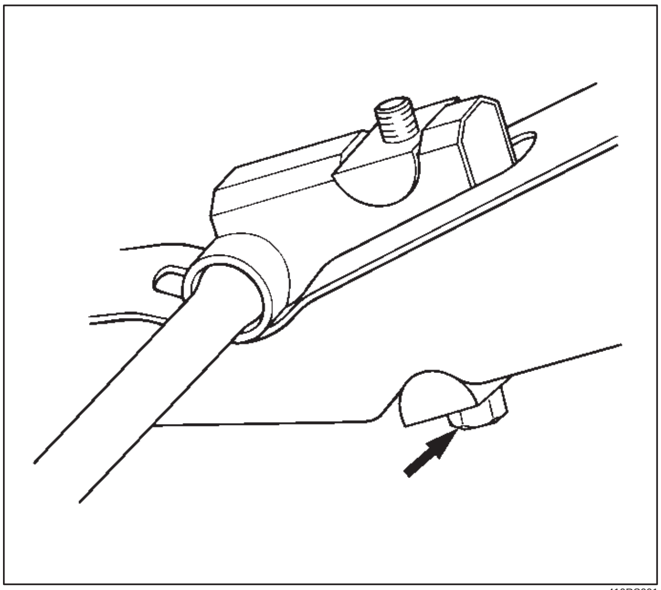
Trim Height Adjustment

Adjust the trim height (1) by means of the adjusting bolt on the height control arms.

CAUTION: When adjusting front end alignment, be sure to begin with trim height first, as it may change other adjusted alignments.



450RS003



410RS001

1. Check and adjust the tire inflation pressures.
2. Park the vehicle on a level ground and move the front of the vehicle up and down several times to settle the suspension.
3. Make necessary adjustment with the adjusting bolt on the height control arms.

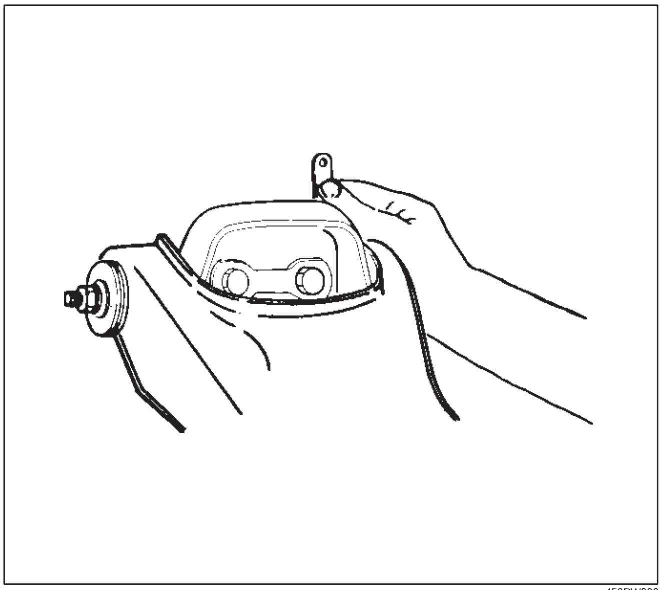
Trim height: 119 ± 5 mm (4.69 ± 0.2 in)

Caster Adjustment

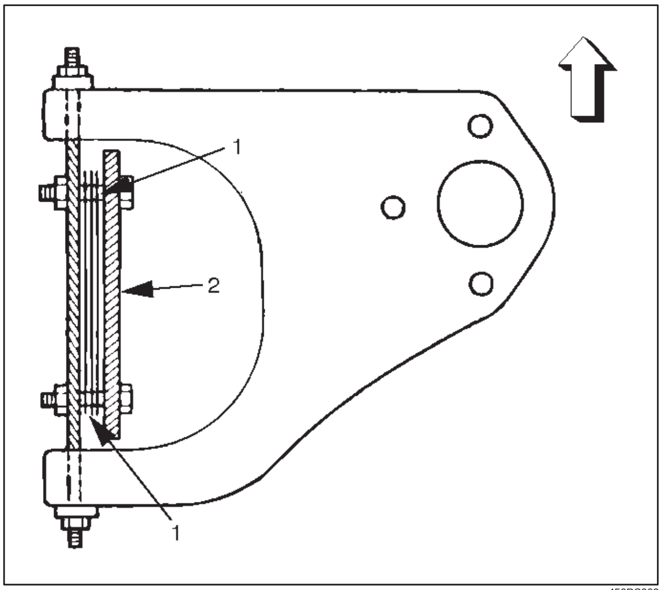
The caster angle can be adjusted by means of the caster shims (1) installed between the chassis frame (2) and fulcrum pins.

Caster angle: 2°30' ± 1°

CAUTION: Left and right side must be equal within 30'.



450RW006



450RS002

NOTE: Difference of the caster shim front/rear thickness should be 3.6 mm (0.142 in) or less. Overall thickness of caster shim and camber shim should be 10.8 mm (0.425 in) or less.

Tighten the fulcrum pin bolt to the specified torque.

Torque: 152 N·m 112 (lb ft)

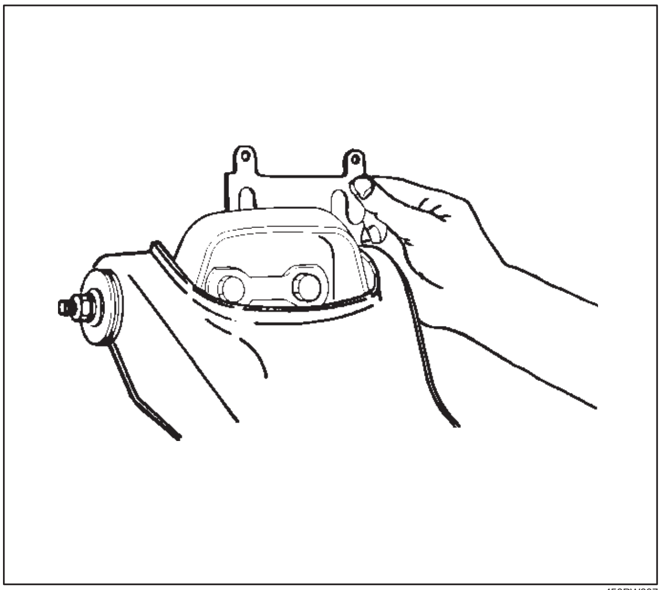
Camber Adjustment

The camber angle can be adjusted by means of the camber shims (2) installed in position between the chassis frame (1) and fulcrum pins

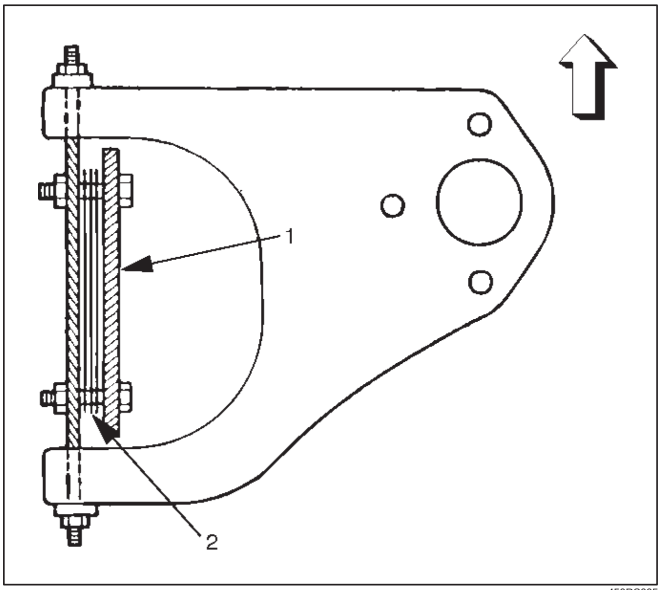
Camber angle: 0° ± 30'

King pin inclination: 12°30' ± 30'

CAUTION: Left and right side must be equal within 30'.



450RW007



450RS005

NOTE: Overall thickness of caster shim and camber shim should be 10.8 mm (0.425 in) or less.

Tighten the fulcrum pin bolt to the specified torque.

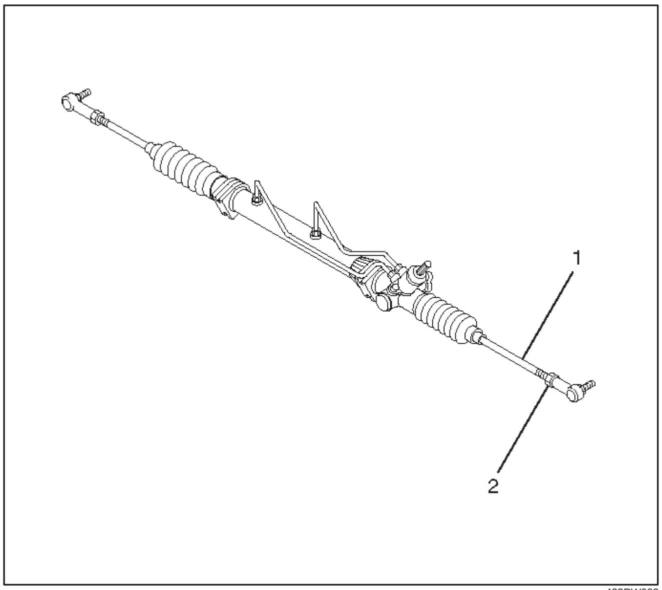
Torque: 152 N·m (112 lb ft)

	Position of shims		Camber angle	Caster angle
	Front side	Rear side		
Caster shim	When added	When removed	Decreases	Decreases
	When removed	When added	Increases	Increases
	—	When removed	Unchanged	Decreases
	—	When added	Unchanged	Increases
Camber shim	When added		Decreases	Unchanged
	When removed		Increases	Unchanged

Toe-in Adjustment

1. To adjust the toe-in angle, loosen the lock nuts (2) on the tie rod (1) and turn the tie rod. Turn both rods the same amount, to keep the steering wheel centered .

Toe-in: 0 ± 2 mm (0 ± 0.08 in)



433RW003

2. Tighten the lock nut to the specified torque.

Torque: 98 N·m (72 lb ft)

Main Data and Specifications

General Specification

Caster		2°30’ ± 1°
Camber		0° ± 30’
King pin inclination		12°30’ ± 30’

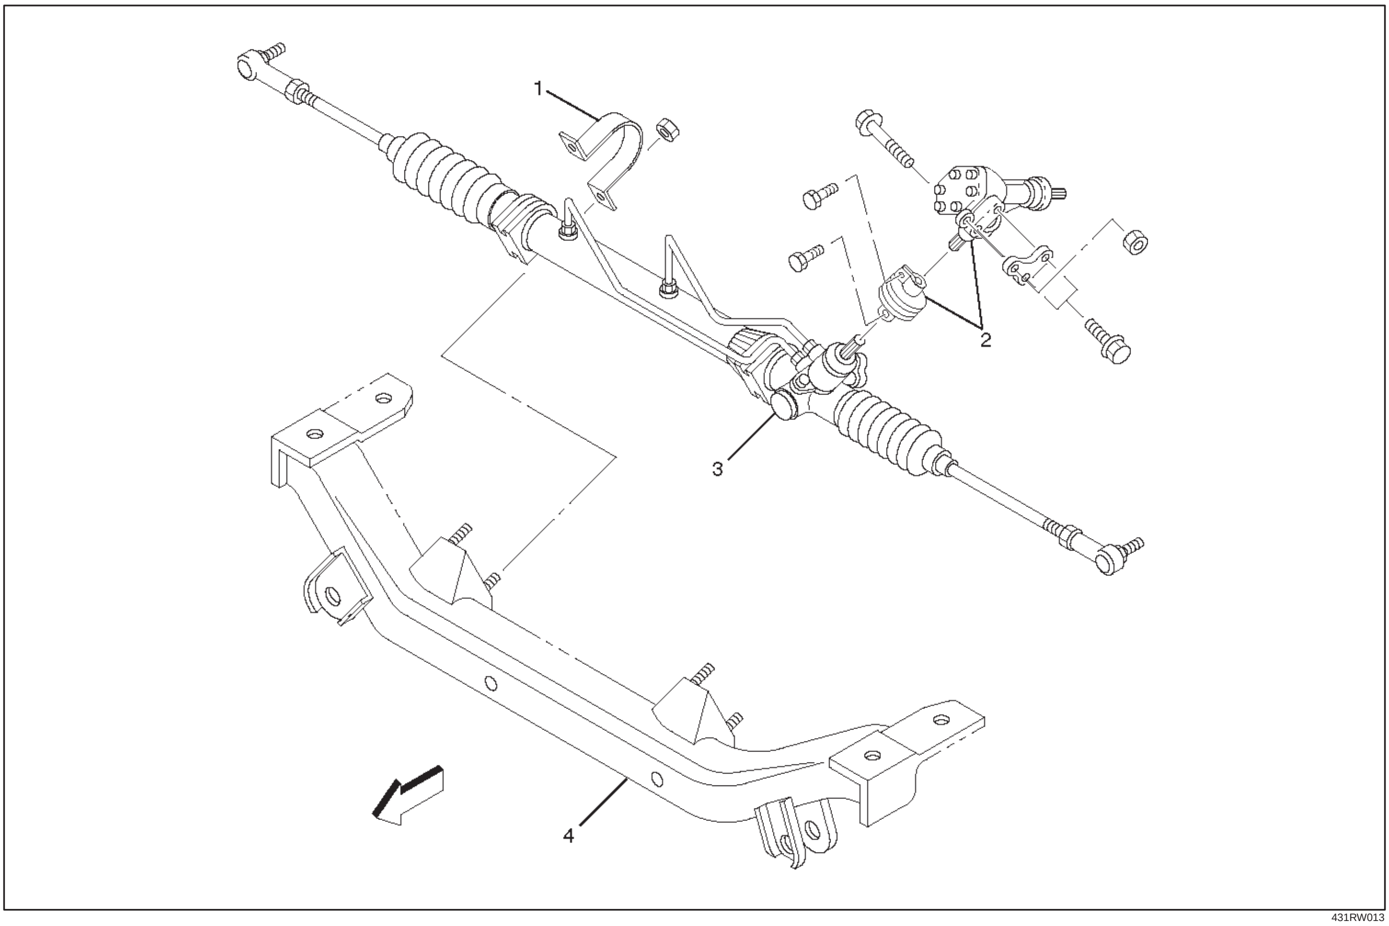
Power Steering Unit

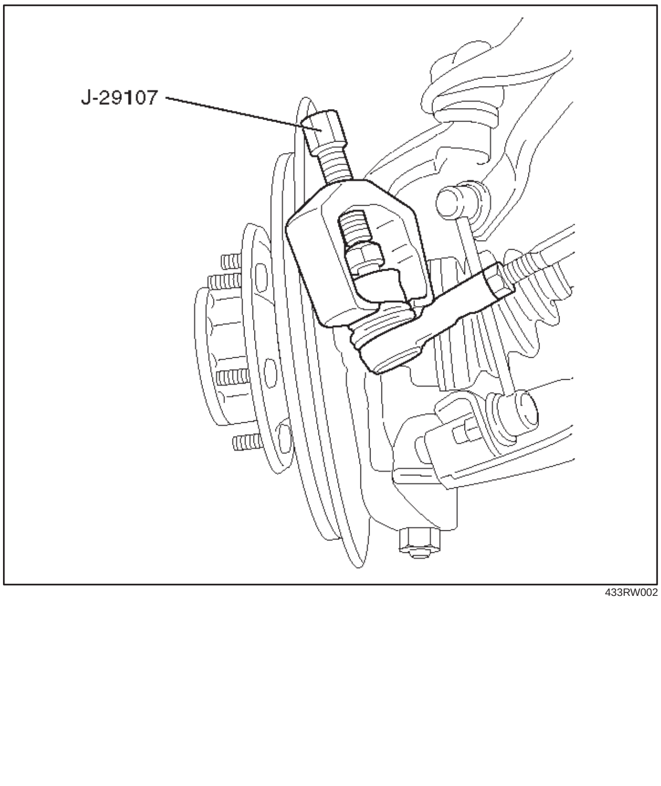
Power Steering Unit and Associated Parts



Legend
(1) Bracket
(2) Transfer Gear Assembly
(3) Power Steering Unit Assembly
(4) Crossmember

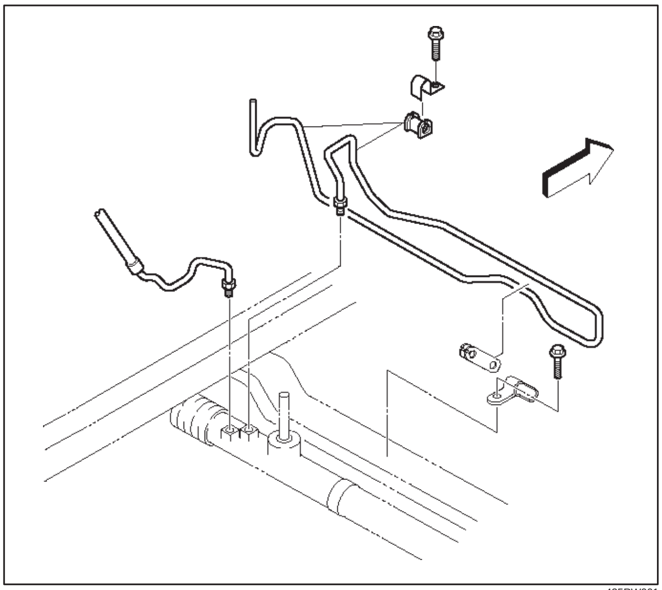
Removal

1. Remove the stone guard.
2. Remove the transfer gear assembly.
   Make a setting mark across the coupling flange and steering unit to ensure reassembly of the parts in the original position.
3. Drain power steering fluid.
4. Remove the tie rod end assembly from knuckle.
   Use tie rod end remover J–29107.



5. Disconnect the feed line and return line from steering unit.
   Remove the clips on the crossmember and frame.
   Wire the power steering line to frame.

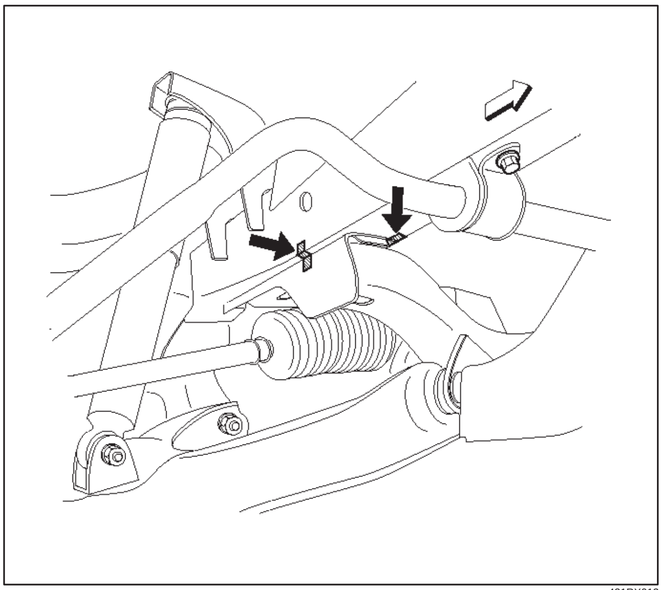
NOTE: Take care to prevent foreign matter from entry when disconnect the power steering line.



435RW001

4×4 model:

1. Remove the torsion bar. Refer to Front Suspension in Suspension section.
2. Remove the lower control arm bolt (Frame side).
   Refer to Front Suspension in Suspension section.
3. Apply a setting mark across the crossmember and frame so parts can be reassembled in their original position.



431RX013

4. Remove the crossmember fixing bolt.
5. Remove the power steering unit with the crossmember.
6. Remove the power steering unit.

4×2 model:

1. Remove the power steering unit from the crossmember.

Installation (4×2 Model)

1. Install power steering unit to crossmember.
   Tighten fixing bolt to specified torque.

   Torque: 116 N·m (85 lb ft)
2. Connect the feed line and return line.

   Torque: 25 N·m (18 lb ft)
3. Install tie–rod end assembly to knuckle.

   Torque: 118 N·m (87 lb ft)
4. Install transfer gear assembly.
   Align the setting marks made at removal.

   Torque: 31 N·m (23 lb ft)
5. Install the stone guard.
6. Bleed the system.
   Refer to Bleeding the Power Steering System in this section.

Installation (4×4 Model)

1. Install power steering unit to crossmember.
   Tighten fixing bolt to specified torque.

   Torque: 116 N·m (85 lb ft)
2. Install power steering unit with crossmember to frame by aligning the setting marks made when removing.
   Tighten crossmember mounting bolt to specified torque.

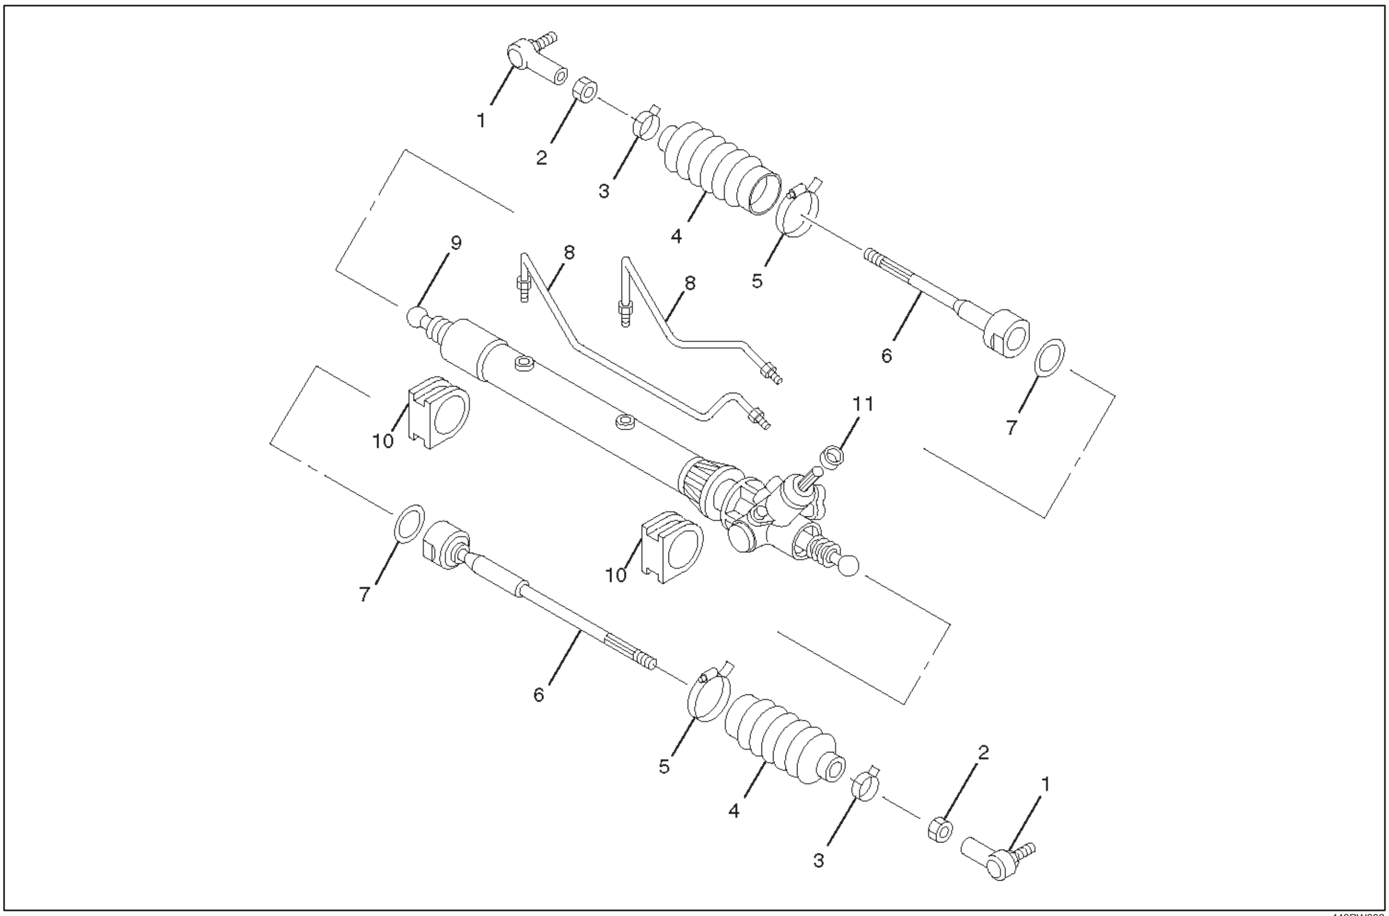
   Torque: 190 N·m (140 lb ft)
3. Install lower control arm bolt.
   Refer to Front Suspension in Suspension section.
4. Install torsion bar.
   Refer to Front Suspension in Suspension section.
5. Connect the feed line and return line.

   Torque: 25 N·m (18 lb ft)
6. Install tie–rod end assembly to knuckle.

   Torque: 118 N·m (87 lb ft)
7. Install transfer gear assembly.
   Align the setting marks made at removal.

   Torque: 31 N·m (23 lb ft)
8. Install the stone guard.
9. Bleed the system.
   Refer to Bleeding the Power Steering System in this section.

Power Steering Unit Disassembled View



Legend

(1) Tie-rod End
(2) Lock Nut
(3) Clip
(4) Bellows
(5) Band
(6) Tie-rod Assembly
(7) Tab Washer
(8) Oil Line
(9) Valve Housing Assembly
(10) Mounting Rubber
(11) Dust Cover

Disassembly

NOTE: The valve housing is made of aluminum and care should be exercised when clamping in a vise, etc. to prevent distortion or damage.

1. Loosen lock nut and remove tie–rod end.
2. Remove clip and band, then remove bellows.
3. Remove tie-rod assembly.
   To remove, move the boot toward the tie-rod end, then remove tab washer.
4. Remove oil line, mounting rubber and dust cover.

Inspection and Repair

Inspect the following parts for wear, damage or any abnormal conditions.

Tie-rod End

If looseness or play is found when checked by moving the end of ball joint at tie-rod end, replace tie-rod end.

Tie-rod Assembly

If the resistance is insufficient or play is felt when checked by moving the ball on the tie-rod, replace the tie-rod assembly.

Rubber Parts

If wear or damage is found through inspection, replace with new ones.

Reassembly

1. Install mounting rubber and dust cover (If removed).
2. Install oil line.

   Torque: 13 N· m (113 lb in)
3. Install tie-rod assembly with tab washer.
   Apply grease to ball joint, install tie-rod and tab washer, then tighten to specified torque.

   Torque: 83 N·m (61 lb ft)

   After tightening, bend tab washer against width across flat of inner ball joint.

4. Apply a thin coat of grease to the shaft for smooth installation. Then install bellows.
5. Install band and clip.
6. Install tie-rod end and tighten lock nut.

Torque: 98 N·m (72 lb ft)

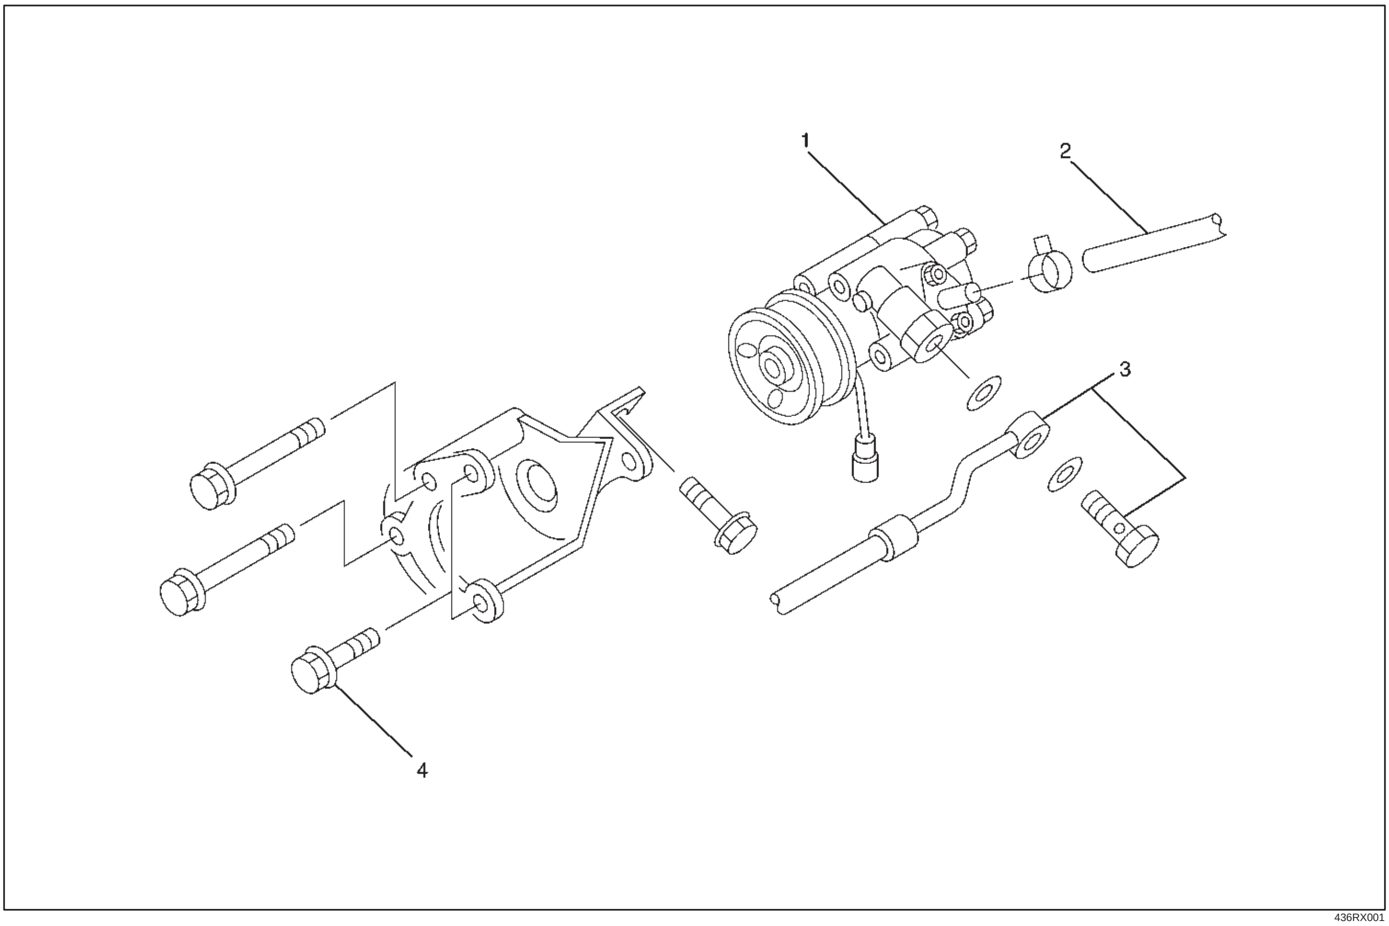
Power Steering Pump

Power Steering Pump and Associated Parts



Legend
(1) Pump Assembly
(2) Hose, Suction
(3) Hose, Flexible
(4) Bolt

Removal

1. Remove the drive belt.
2. Place a drain pan below the pump.
3. Disconnect the suction hose.
4. Disconnect the flexible hose.
5. Remove the power steering fixing bolt and remove the pump assembly.

Installation

1. Install the pump assembly to the pump braket, tighten the fixing bolt to the specified torque.

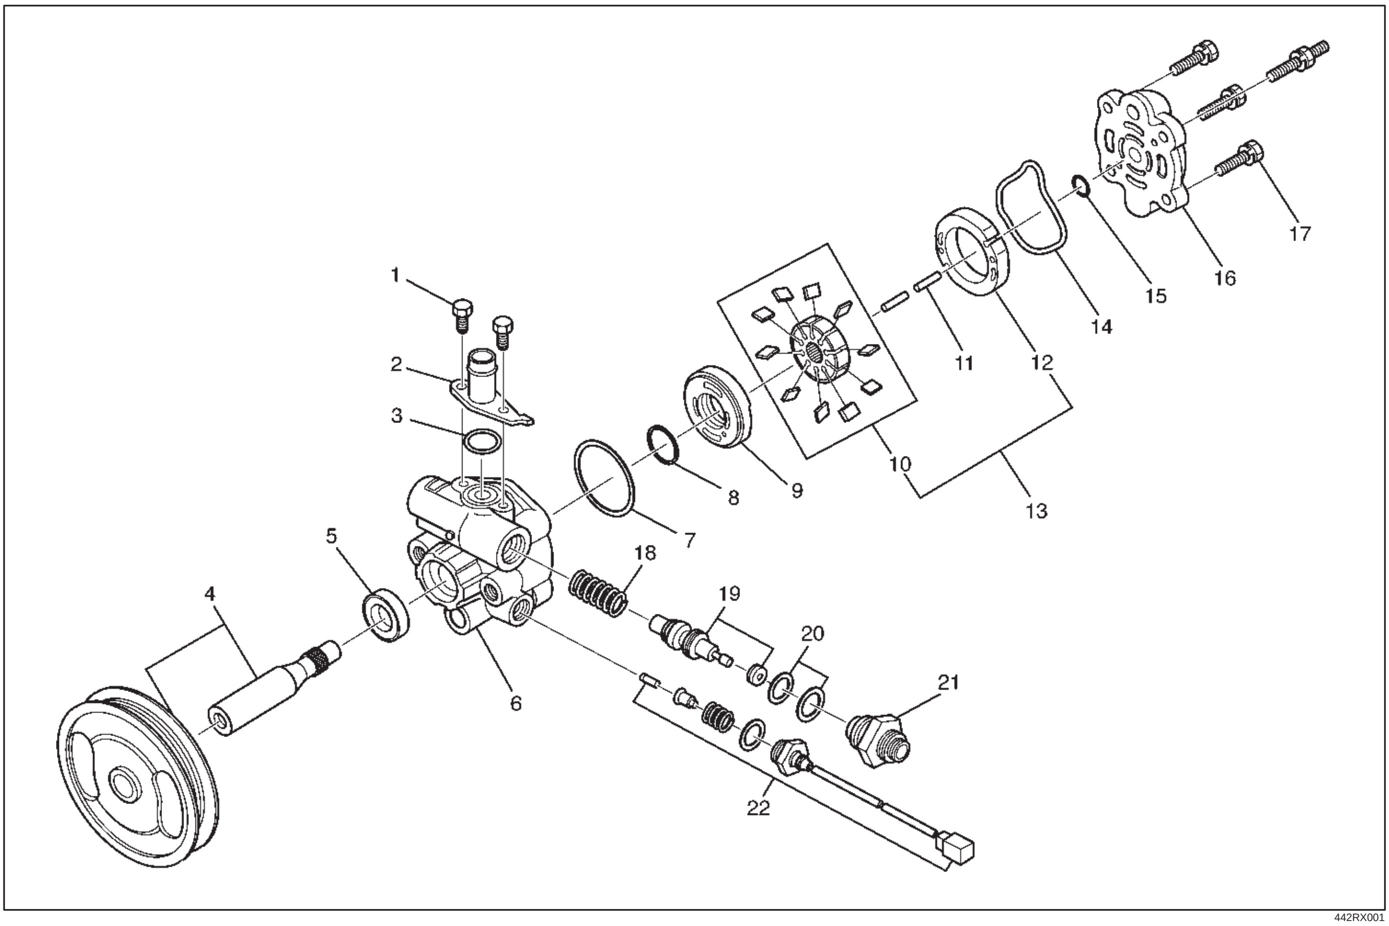
   Torque: 46 N·m (34 lb ft)

2. Install the flexible hose.
   Tighten the eye bolt to specified torque.

   Torque: 54 N·m (40 lb ft)

3. Install the drive belt.
4. Connect the suction hose, then fill and bleed system.
   Refer to Bleeding the Power Steering System in this section.

Power Steering Pump Disassembled View



Legend
- (1) Bolt
- (2) Suction Pipe
- (3) O-ring

- (17) Bolt
- (18) Spring
- (19) Relief Valve
- (20) O-ring
- (21) Connector
- (22) Pressure Switch Assembly

Disassembly

1. Clean the oil pump with solvent (plug the discharge and suction ports to prevent the entry of solvent).
   Be careful not to expose the oil seal of shaft assembly to solvent.
2. Remove the bolt, suction pipe and O-ring.
3. Remove the connector, O-ring, relief valve and spring.
4. Remove the pressure switch assembly.
5. Remove the bolt, rear housing and O-ring.
6. Remove the snap ring.
7. Remove the shaft assembly.
8. Remove the oil seal.

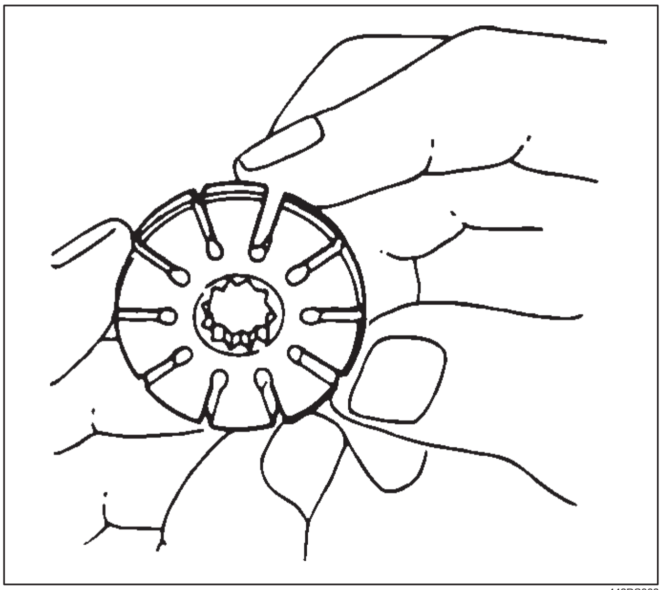
CAUTION: When removing the oil seal, be careful not to damage the housing.

9. Remove the pump cartridge assembly from the front housing.
10. Remove two O-rings.

Inspection and Repair

Make all necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspection.

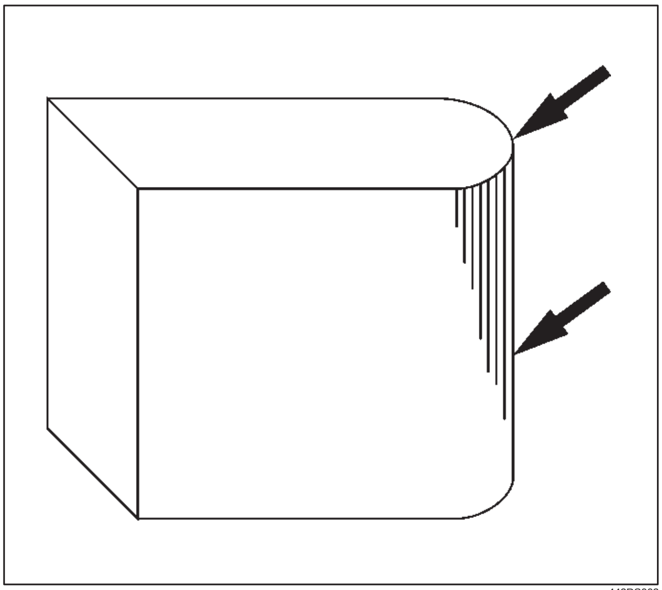
Rotor



442RS002

Check that the groove in the vane is free from excessive wear and that the vane slides smoothly. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Vane



442RS003

Sliding faces of the vane should be free from wear. (Particularly the curved face at the tip that contact with the cam should be free from wear and distortion). When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Cam

The inner face of the arm should have a uniform contact pattern without a sign of step wear. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Side Plate

The sliding faces of parts must be free from step wear (more than 0.01 mm), which can be felt by the finger nail. The parts with minor scores may be reused after lapping the face.

Relief Valve

The sliding face of the valve must be free from burrs and damage. The parts with minor scores may be reused after smoothing with emery cloth (#800 or finer).

Shaft

Oil seal sliding faces must be free from a step wear which can be felt by the finger nail. Bushing fitting face must be free from damage and wear.

O-ring, Oil Seal, Snap Ring

Be sure to discard used parts, and always use new parts for installation. Prior to installation, lubricate all seals and rings with power steering fluid.

Pressure Switch

Check the switch operation as follows:
With engine idling and A/C on, turn the steering wheel fully to the left; compressor should interrupt and engine idle speed will increase. Shut off A/C and again turn steering fully to the left; engine idle will increase. If system fails to function properly, disconnect connector at the pressure switch and repeat system check while testing continuity across disconnected SW connector.

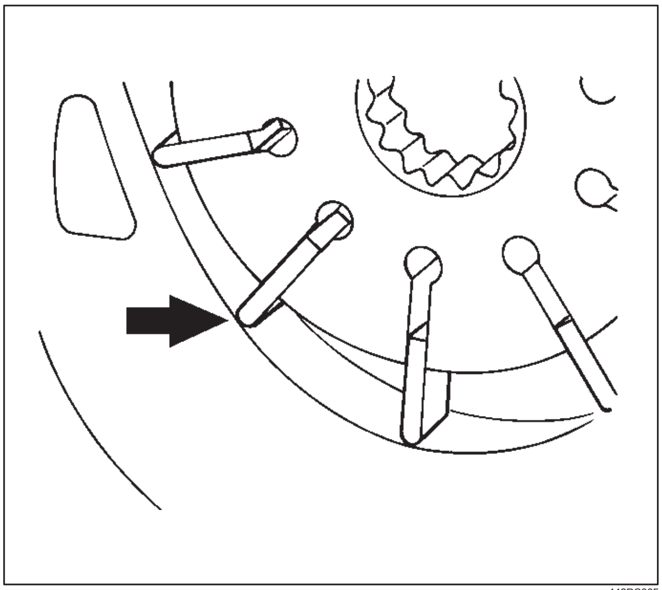
Reassembly

1. Install oil seal to front housing. Be sure to discard used oil seal, and always use new parts for installation.

CAUTION: When installing the oil seal, be careful not to damage the oil seal contacting surface of the housing.

2. Install shaft assembly.

3. Install the vanes to roter with curved face in contact with the inner wall of cam.



442RS005

4. Install roter and vanes to cam.
5. Install pin to front housing.
6. Install two new O-rings to front housing. Be sure to discard used O-ring.
7. Install side plate.

CAUTION: When installing side plate, be careful not to damage its inner surface. Damaged side plate may cause poor pump performance, pump seizure or oil leakage.

8. Install pump cartridge assembly to front housing.
9. Install snap ring to shaft end.
10. Install rear housing with a new O-ring. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.

    Torque: 24 N·m (17 lb ft)

11. Install suction pipe with a new O-ring. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.

    Torque: 10 N·m (87 lb in)

12. Install relief valve and spring.
13. Install connector with a new O-ring. Be sure to discard used O-ring. Tighten the connector to specified torque.

    Torque: 59 N·m (43 lb ft)

14. Install pressure switch assembly and tighten it to specified torque.

    Torque: 18 N·m (13 lb ft)

Removal

1. Remove universal joint bolt (steering shaft side).
2. Remove universal joint bolt (steering unit side).
3. Loosen fixing bolt and nut and remove transfer gear assembly with shim.

Inspection and Repair

The transfer gear assembly cannot be disassembled. If damage or abnormal condition are found, replace to new ones.

Installation

1. Install transfer gear assembly with shim and tighten bolt and nut to the specified torque.

   Torque: 54 N·m (40 lb ft)

2. Connect universal joint (both side) and tighten the bolt to the specified torque.

   Torque: 31 N·m (23 lb ft)

Supplemental Restraint System Steering Wheel & Column

Service Precaution

This steering wheel and column repair section covers the Supplemental Restraint System (SRS) steering column. The following repair procedures are specific to SRS components. When servicing a vehicle equipped with Supplemental Restraint System, pay close attention to all WARNINGS and CAUTIONS.

For detailed explanation about SRS, refer to Restraints section.

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

SAFE HANDLING OF INFLATOR MODULES REQUIRES FOLLOWING THE PROCEDURES DESCRIBED BELOW FOR BOTH LIVE AND DEPLOYED MODULES.

SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY (AIR BAG). AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY (AIR BAG) SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY (AIR BAG) IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AN AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE.

NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS SYSTEM, DO NOT USE ELECTRICAL TEST EQUIPMENT, SUCH AS BATTERY-POWERED OR A/C-POWERED VOLT-METER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER.

INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

SRS Connectors

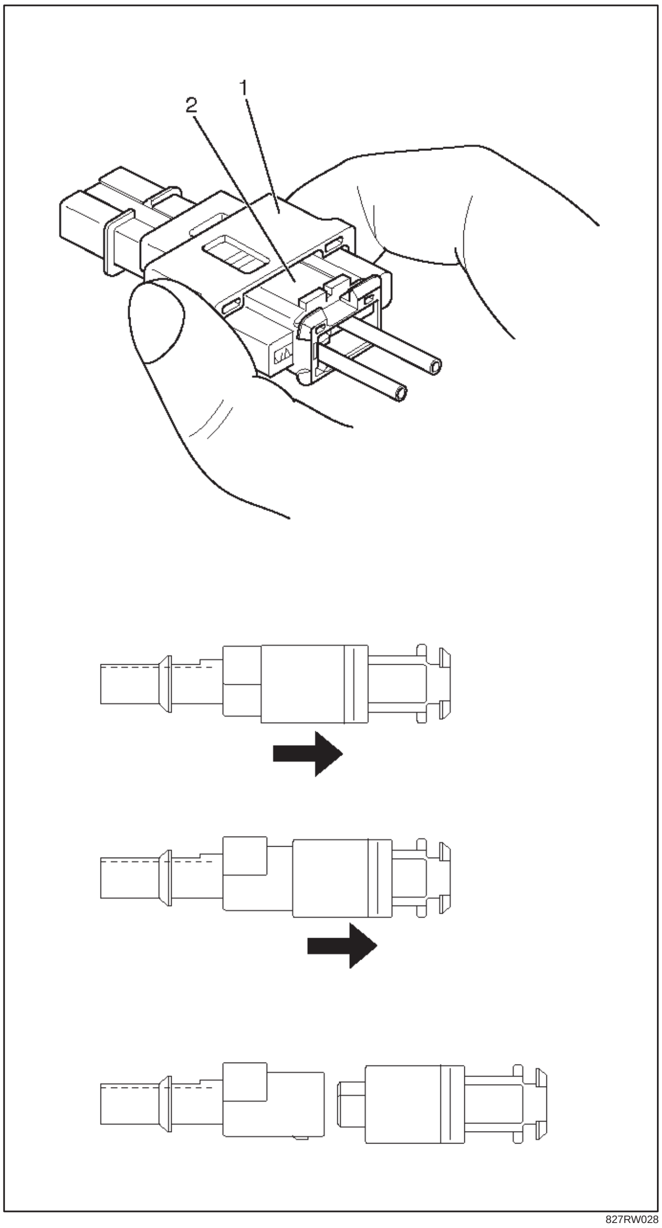
CAUTION: The special yellow color connectors are used for supplemental restraint system-air bag circuit.

When removing the cable harness, do not pull the cables. Otherwise, cable disconnection may occur.

When connect the SRS connector, insert the connector completely. Imperfect locking may cause malfunction of SRS circuit.

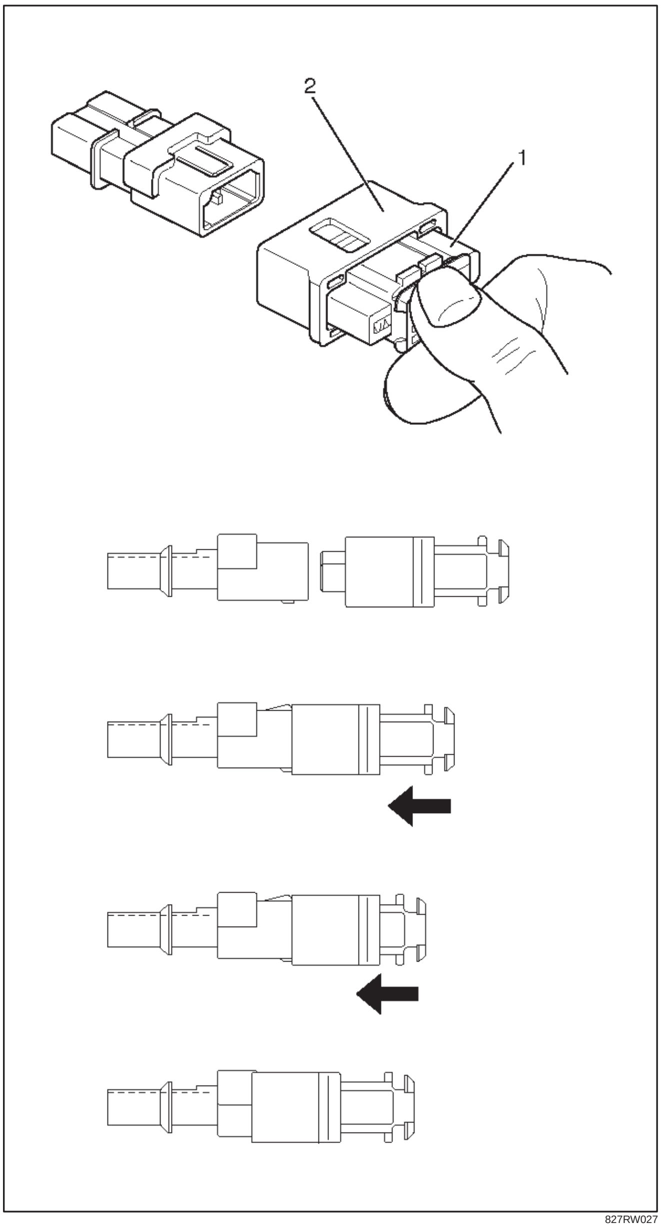
Removal

To remove the connector, hold the cover insulator(1) and pull it. The cover insulator slides and lock will be released. Do not hold the socket insulator(2).



Installation

To install the connector, hold the soket insulator(1) and insert it. The cover insulator slides and connector will be locked.
Do not hold the cover insulator(2).



Inflator Module

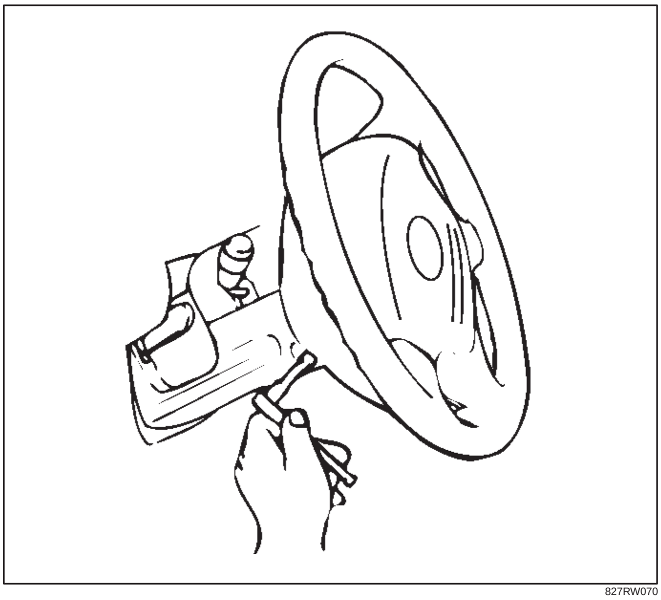
(1) Horn Lead
(2) SRS Connector
(3) Fixing Bolt
(4) Inflator Module

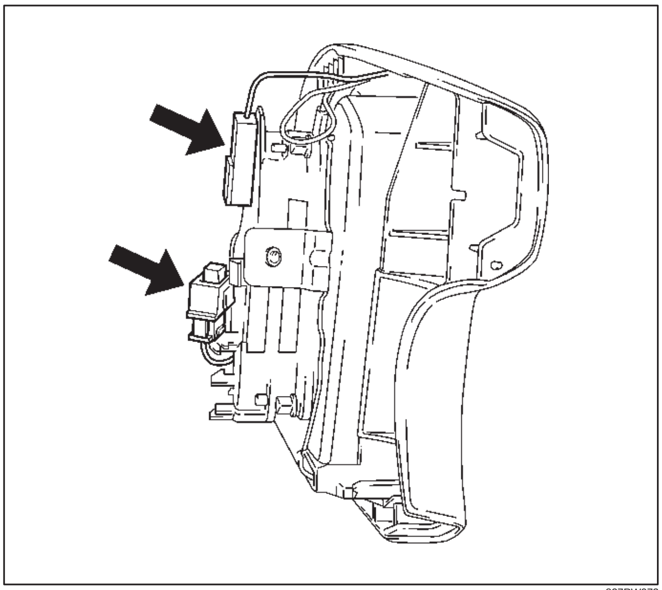
Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.
5. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly .



827RW070

6. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module.

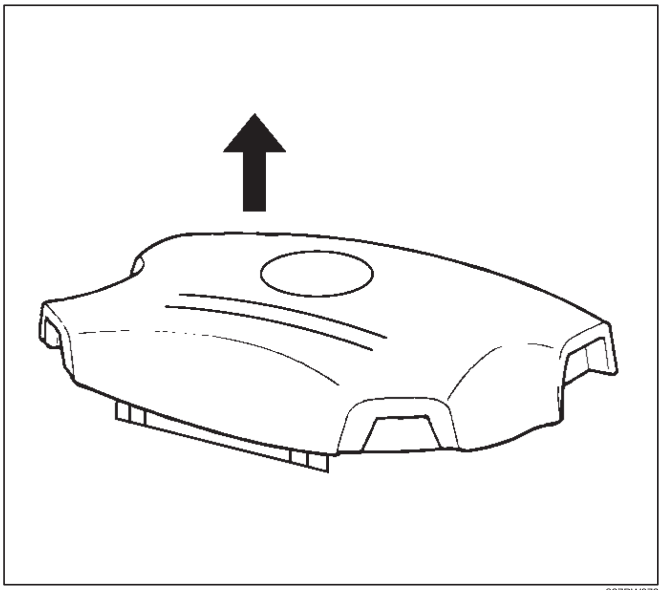


827RW073

7. Remove inflator module.

Inspection and Repair

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE TRIM COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT .



827RW072

The inflator module consists of a cover, air bag, inflator, and retainer. Inspect the inflator module mainly for the following:

- Check for holes, cracks, severe blemishes and deformation on the cover.
- Check that the retainer is not deformed.
- Check for defects such as damage and breakage in the lead wire for the igniter.

If an abnormality is found as the result of the inspection, replace the inflator module with a new one.

Installation

1. Install inflator module.
2. Support the module and carefully connect the module connector and horn lead.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

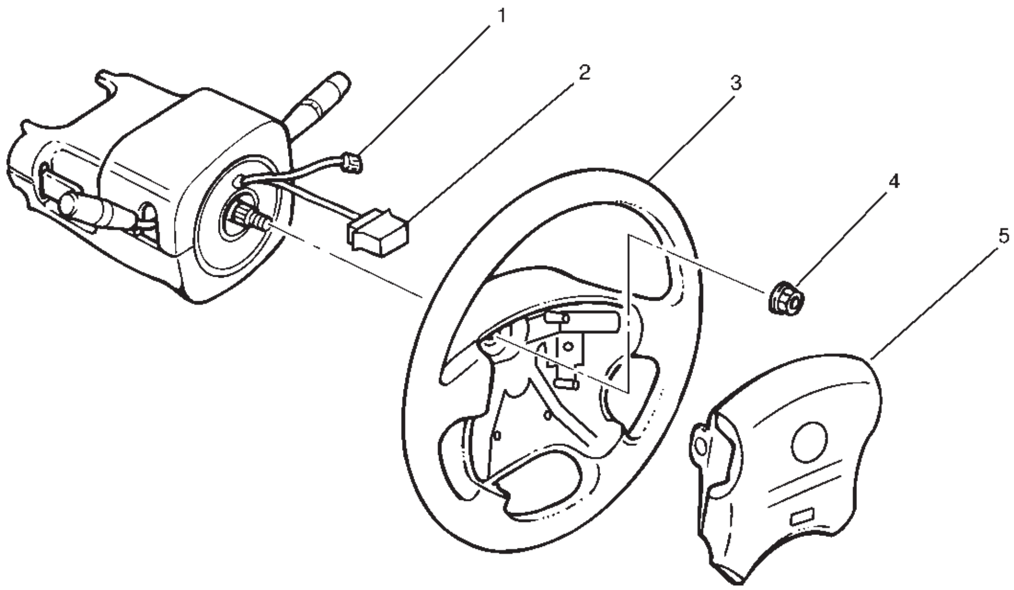
3. Tighten bolts to specified torque.

Torque: 9 N·m (78 lb in)

4. Connect the yellow 2-way SRS connector located under the steering column.
5. Connect the battery "–" terminal cable.
6. Set ignition to "ON" while watching warning light. Light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Steering Wheel

Steering Wheel and Associated Parts



827RW069

Legend

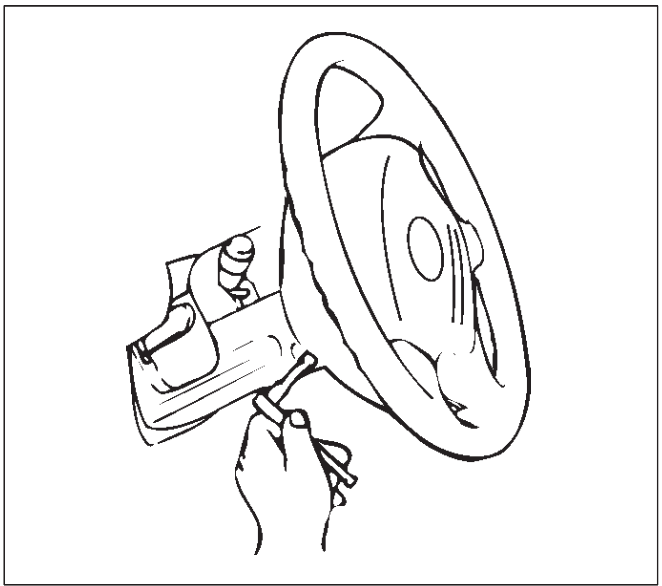
(1) Horn Lead
(2) SRS Connector
(3) Steering Wheel
(4) Steering Wheel Fixing Nut
(5) Inflator Module

CAUTION: Once the steering column is removed from the vehicle, the column is extremely susceptible to damage. Dropping the column assembly on its end could collapse the steering shaft or loosen the slide block which maintains column rigidity. Leaning on the column assembly could cause the jacket to bend or deform. Any of the above damage could impair the column's collapsible design. If it is necessary to remove the steering wheel, use only the specified steering wheel puller. Under no conditions should the end of the shaft be hammered upon, as hammering could loosen slide block which maintains column rigidity.

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

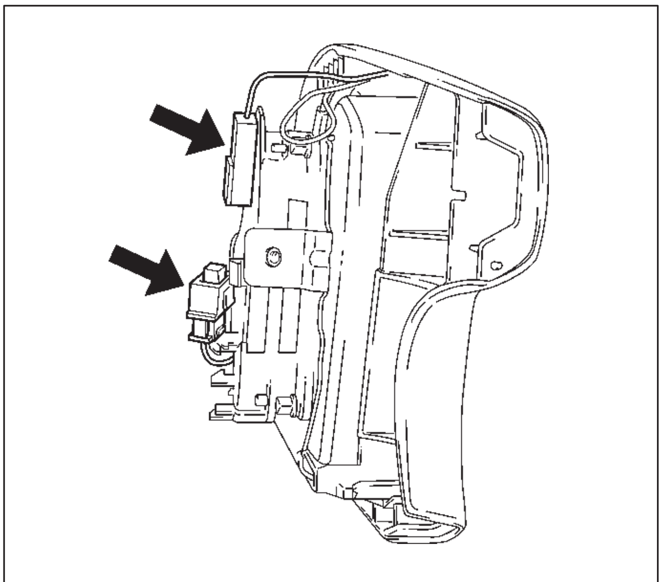
5. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.



827RW070

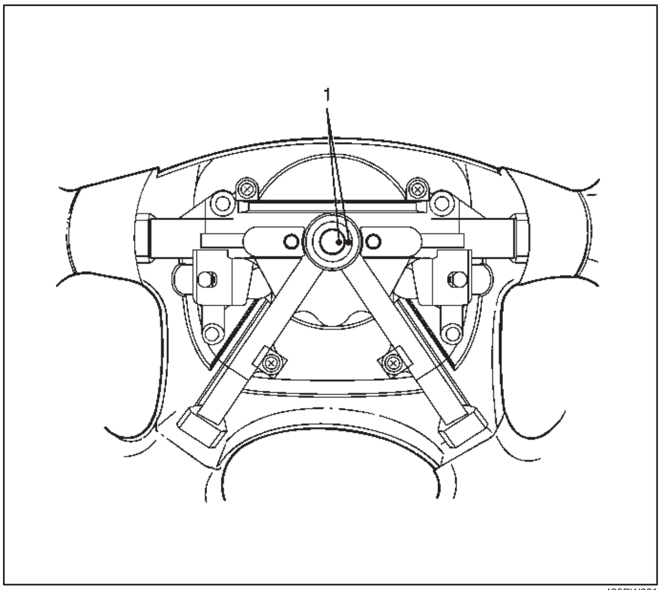
6. Disconnect the yellow 2-way SRS connector located behind the inflator module.

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE TRIM COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.



827RW073

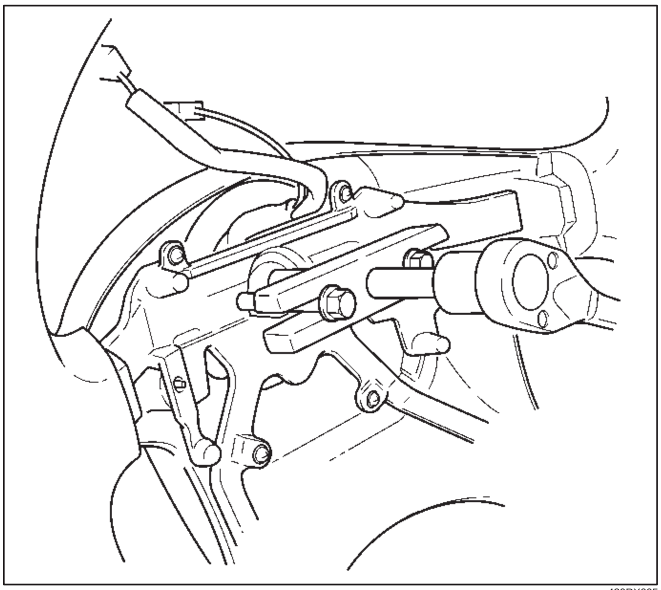
7. Disconnect horn lead.
8. Remove steering wheel fixing nut.
9. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position, then remove steering wheel.



430RW021

10. Move the front wheels to the straight ahead position, then use steering wheel remover J–29752 to remove the steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.



430RX005

Installation

1. Install steering wheel by aligning the setting marks made when removing.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

2. Tighten the steering wheel fixing nut to the specified torque.

   Torque: 34 N·m (25 lb ft)

3. Connect horn lead.
4. Support the module and carefully connect the SRS connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinches.

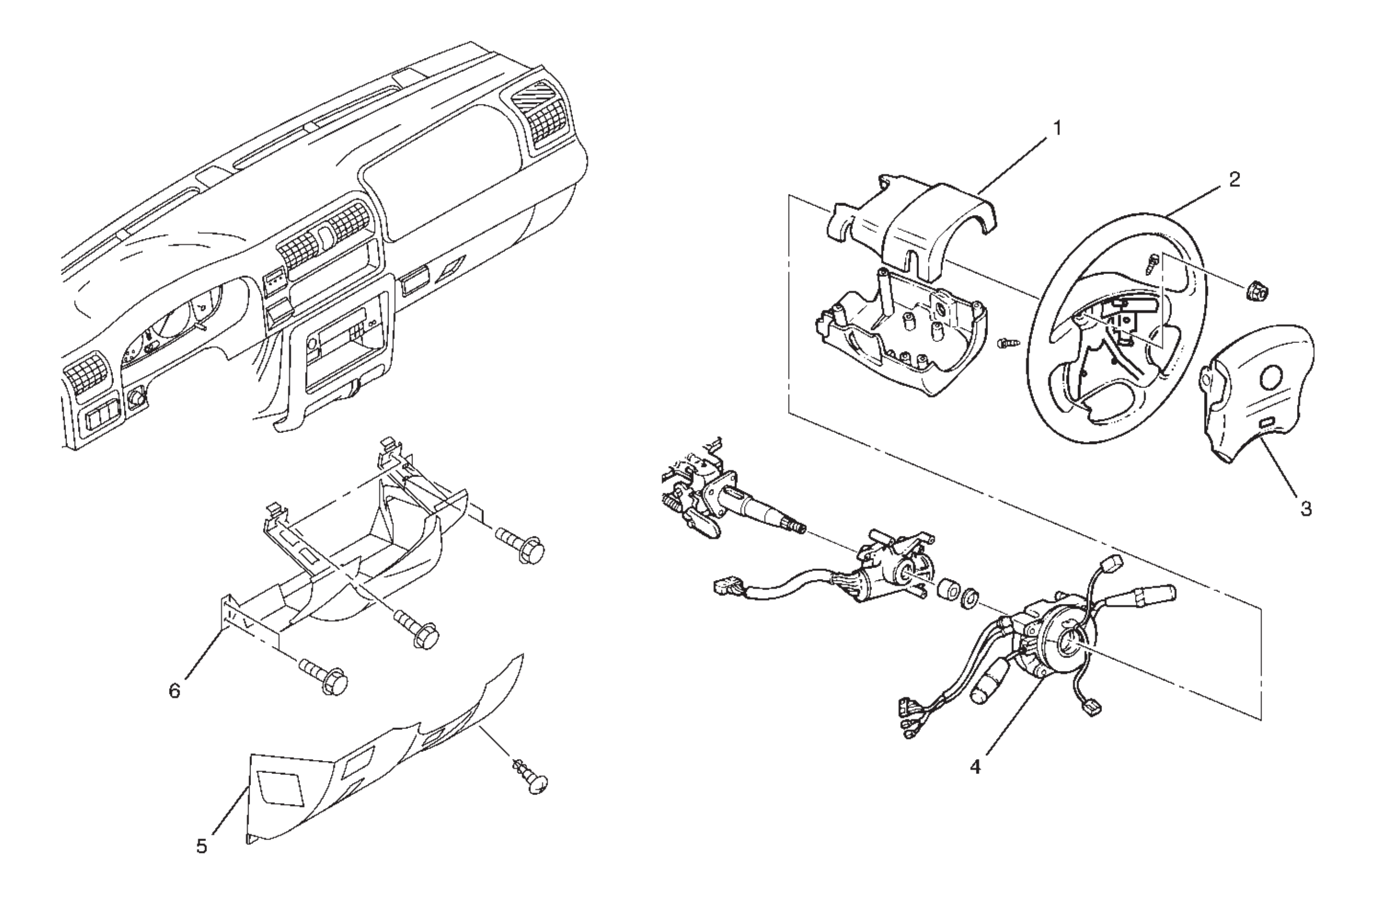
5. Tighten bolts to specified torque.

   Torque: 9 N·m (78 lb in)

6. Connect the yellow 2-way SRS connector located under the steering column.
7. Connect the battery "–" terminal cable.
8. Turn the ignition switch to "ON" while watching warning light. Light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Combination Switch

Combination Switch and Associated Parts



Legend
- (1) Steering Column Cover
- (2) Steering Wheel
- (3) Inflator Module
- (4) Combination Switch and SRS Coil Assembly
- (5) Instrument Panel Lower Cover
- (6) Driver Knee Bolster (reinforcement)

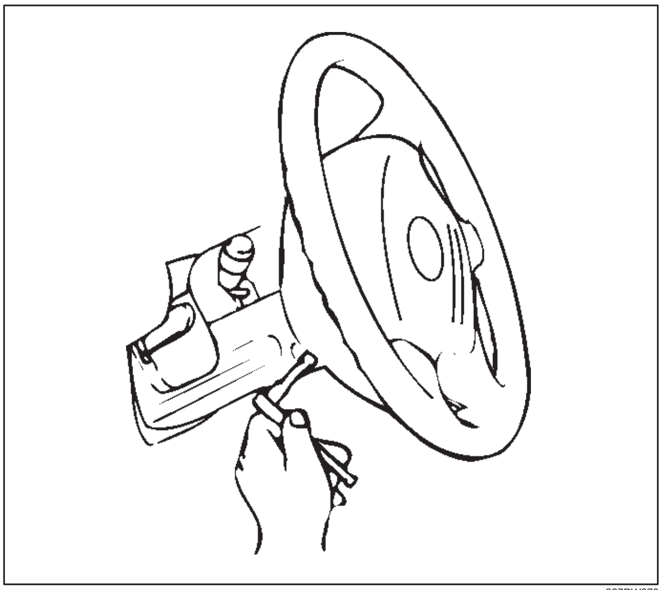
Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

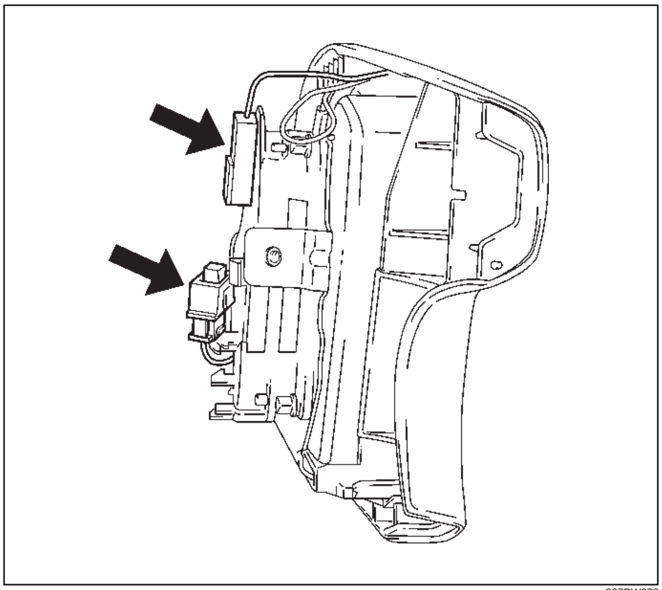
CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to become uncentered which will cause damage to the coil assembly.

5. Remove the engine hood opening lever, then remove instrument panel lower cover.
6. Remove the driver knee bolster (reinforcement).

7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module, then remove inflator module.

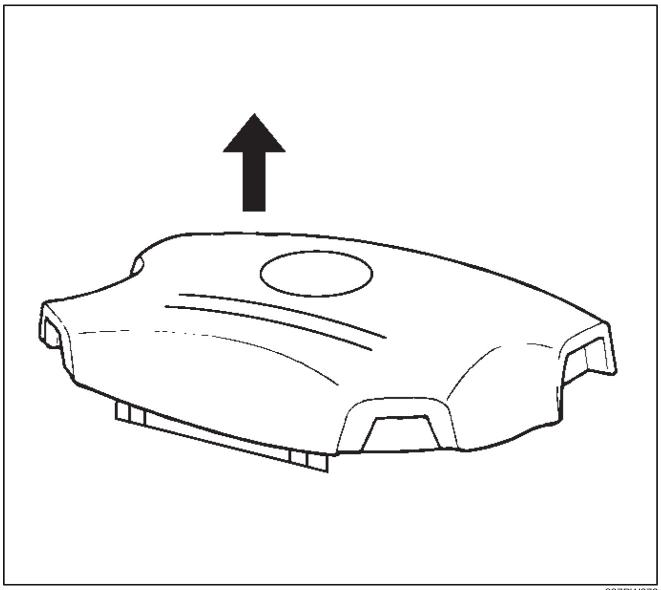


827RW070



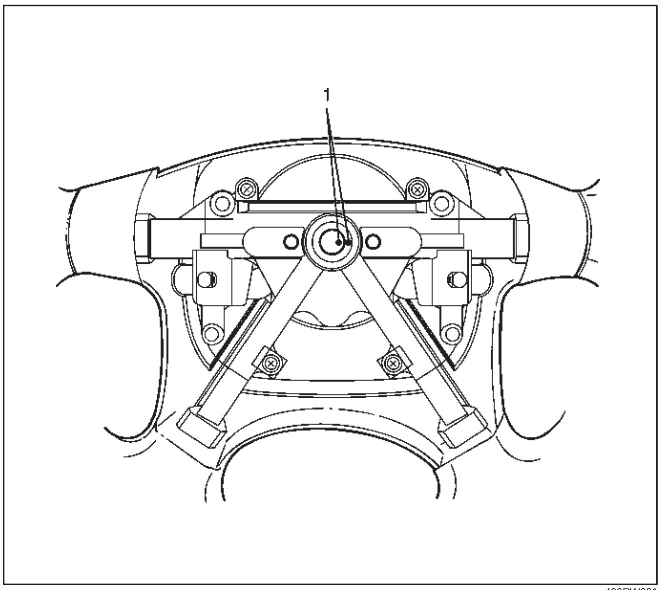
827RW073

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE TRIM COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.



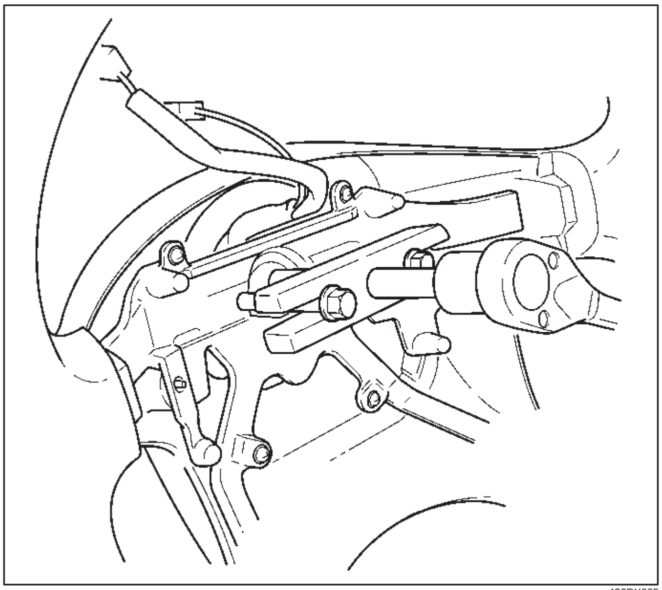
827RW072

8. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover J–29752 to remove the steering wheel.



430RW021

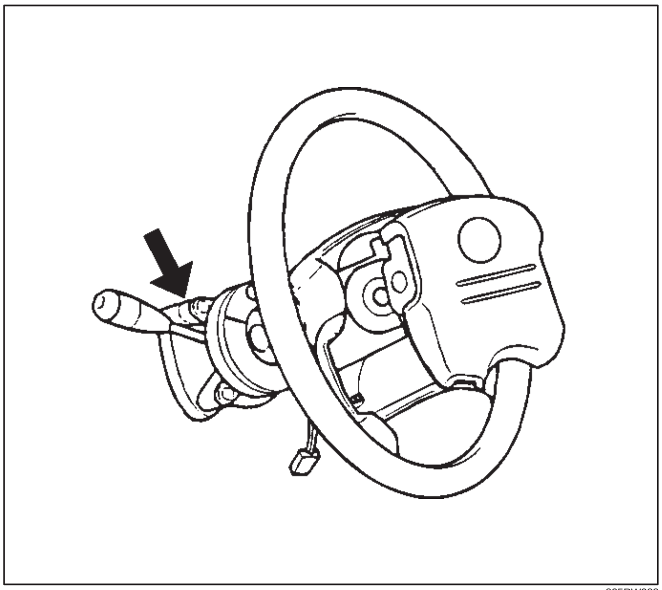
CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.



430RX005

9. Remove steering column cover.
10. Disconnect the wiring harness connectors located under the steering column then remove combination switch and SRS coil assembly.

NOTE: The SRS coil is a part of the combination switch assembly, which can not be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

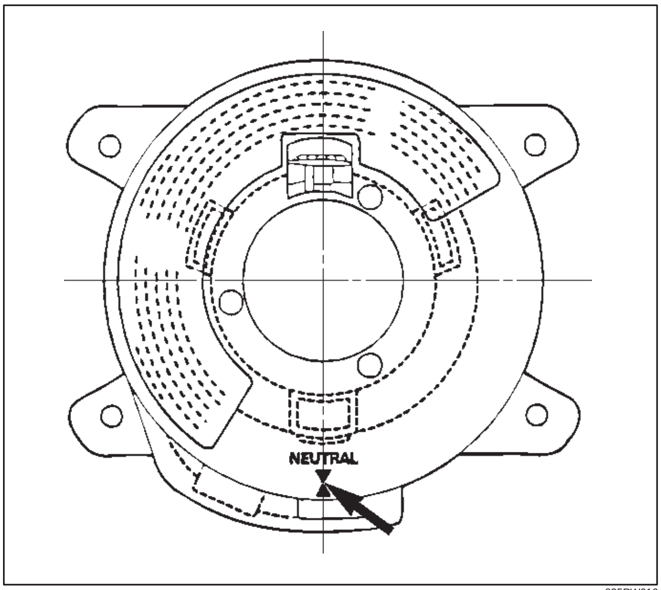


825RW288

Installation

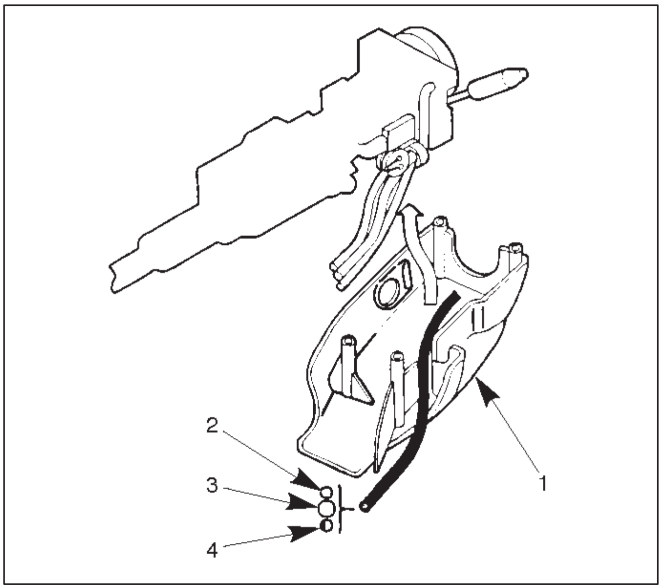
1. Install combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column. Then turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage to the cable in the SRS coil.



825RW016

2. When installing the steering column cover, be sure to route each wire harness as illustrated so that the harnesses do not catch on any moving parts.



825RW017

Legend

(1) Steering Column Cover
(2) Starter Switch Harness
(3) Combination Switch Harness
(4) Inflator Module Harness

3. Align the setting marks made when removing then install steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

4. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34 N·m (25 lb ft)

5. Support the inflator module and carefully connect the SRS connector and horn lead.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

6. Tighten bolts to specified torque.

Torque: 9 N·m (78 lb in)

7. Install driver knee bolster (reinforcement).
8. Install instrument panel lower cover then Install the engine hood opening lever.
9. Connect the SRS connector.
10. Connect the battery “-” terminal cable.
11. Turn the ignition switch to “ON” while watching warning light and check the light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Lock Cylinder

Lock Cylinder and Associated Parts

(9) Driver Knee Bolster (reinforcement)
(10) Shift Lock Cable (for A/T)

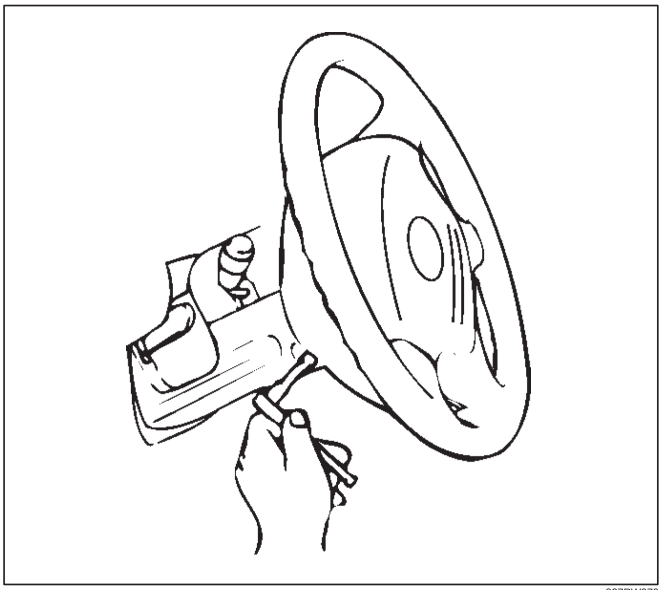
Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to become uncentered which will cause damage to the coil assembly.

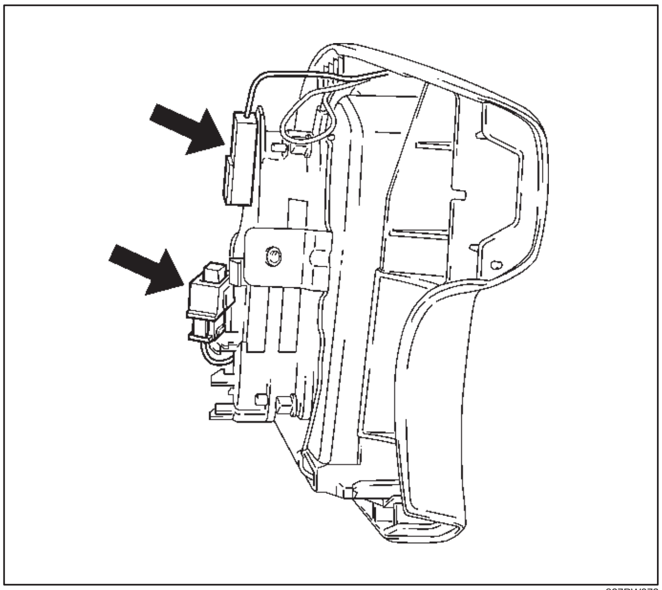
5. Remove the engine hood opening lever and steering lower cover.
6. Remove driver knee bolster (reinforcement).

7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.



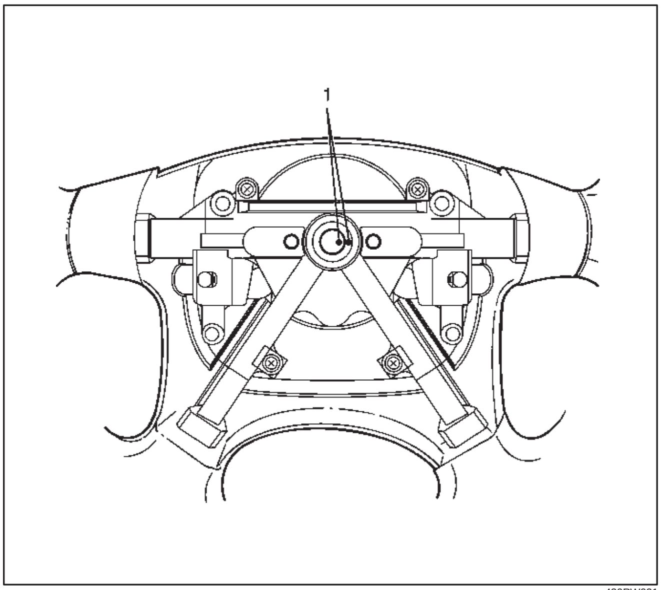
827RW070

8. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module.



827RW073

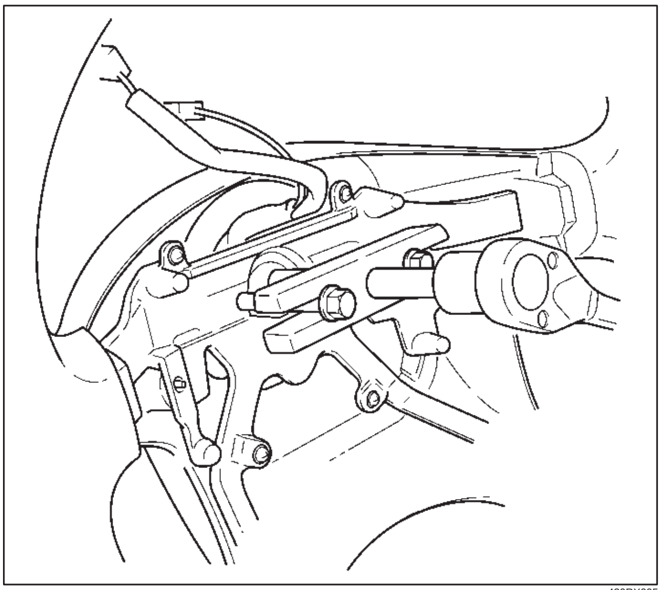
9. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position.



430RW021

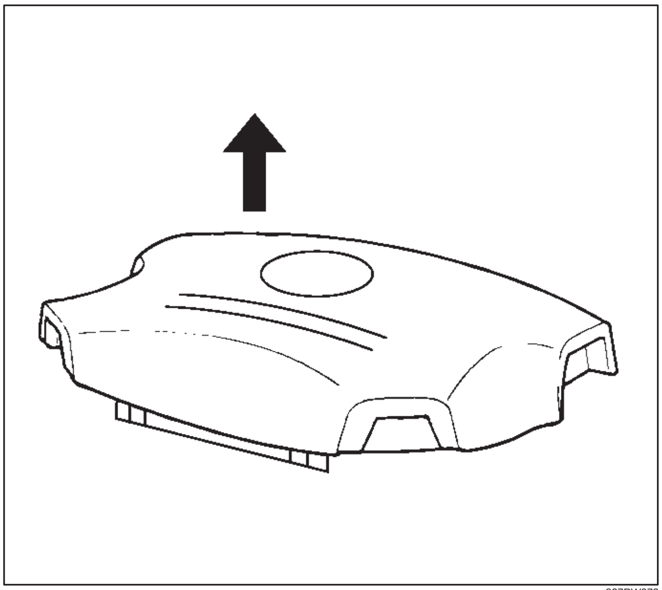
10. Move the front wheels to the straight ahead position, then use steering wheel remover J–29752 to remove the steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.



430RX005

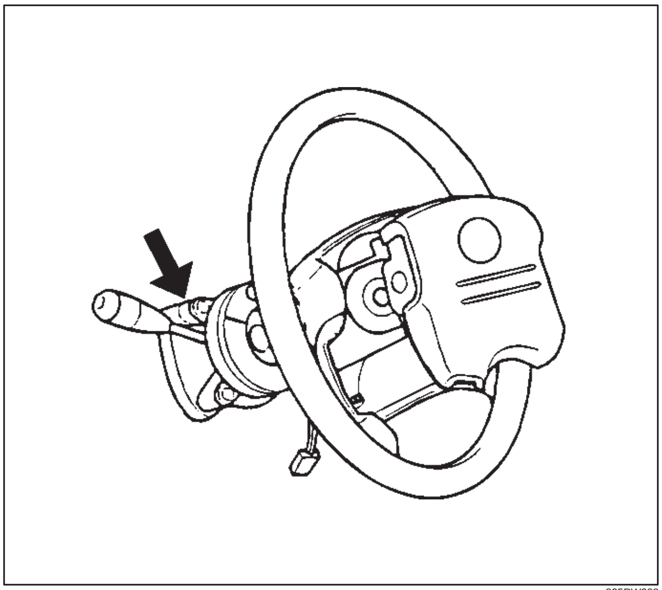
WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE TRIM COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.



827RW072

11. Remove steering column cover.
12. Disconnect the wiring harness connectors located under the steering column.
13. Remove the combination switch assembly with SRS coil.

NOTE: The SRS coil is a part of the combination switch assembly, which can not be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.



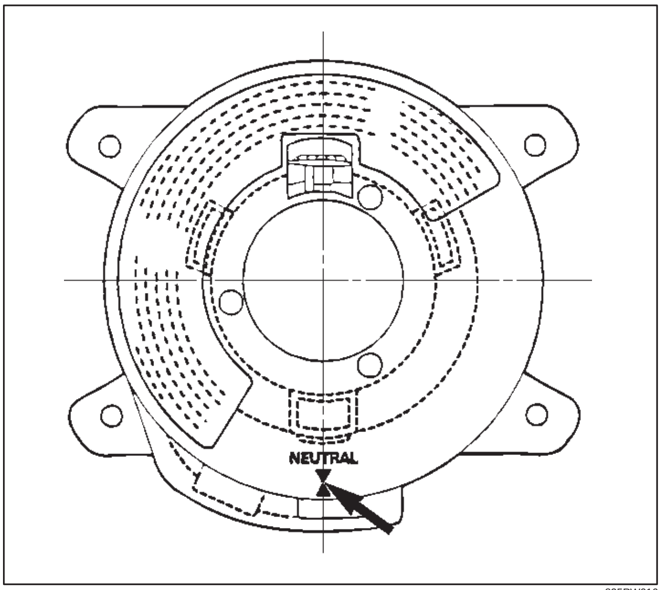
825RW288

14. Remove snap ring.
15. Remove cushion rubber.
16. Remove shift lock cable (for A/T).
17. Disconnect the starter switch harness connector located under the steering column then remove lock cylinder assembly.

Installation

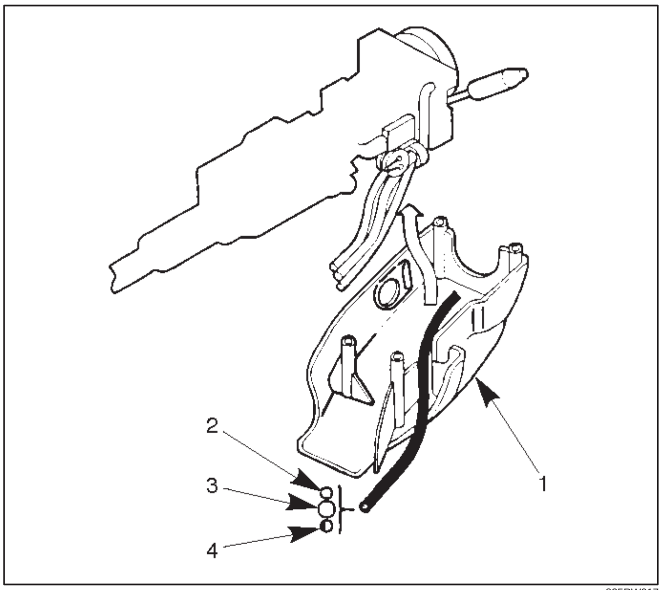
1. Install lock cylinder assembly.
2. Install shift lock cable (for A/T).
3. Install cushion rubber.
4. Install snap ring.
5. Install Combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column.
6. Turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage the cable in the SRS coil.



825RW016

7. When installing the steering column cover, be sure to wire (through each harness) as illustrated so that the harnesses starter switch, combination switch and SRS coil may not catch wiring.



825RW017

Legend

(1) Steering Column Cover
(2) Starter Switch Harness
(3) Combination Switch Harness
(4) Inflator Module Harness

8. Install steering wheel by aligning the setting marks made during removal.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

9. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34 N·m (25 lb ft)

10. Support inflator module and carefully connect the SRS connector and horn lead, then install inflator module.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

11. Tighten fixing bolts to specified torque.

Torque: 9 N·m (78 lb in)

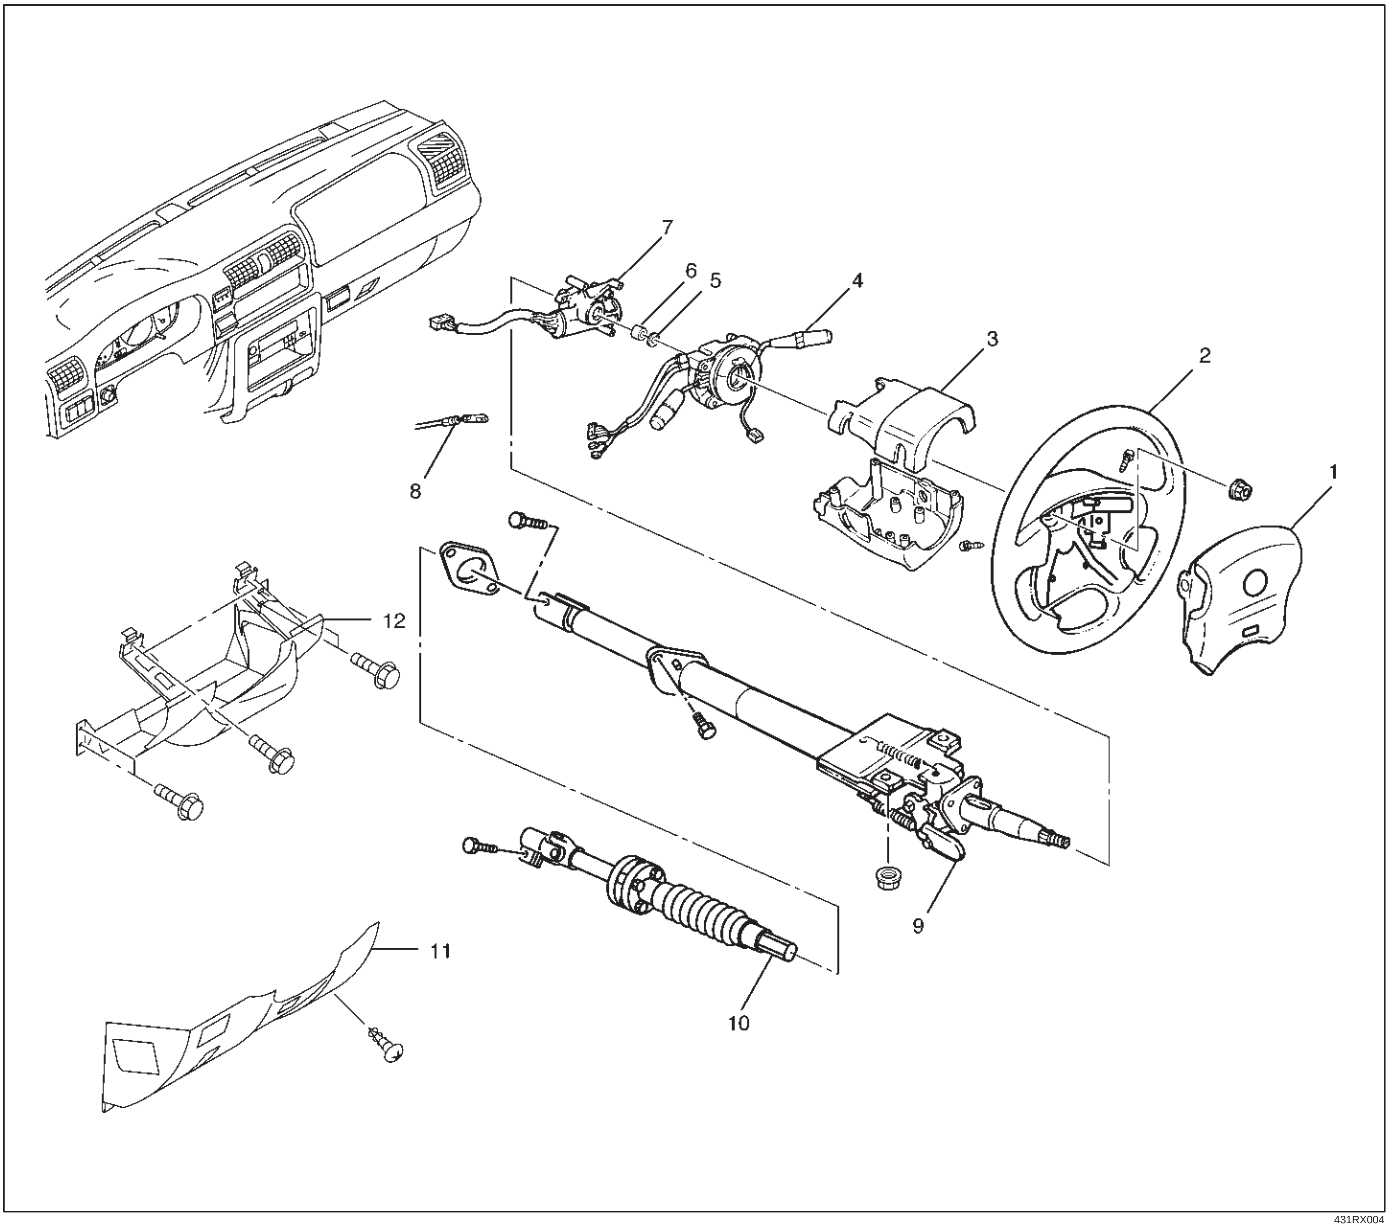
12. Install driver knee bolster (reinforcement).
13. Install instrument panel lower cover, then install the engine hood opening lever.
14. Connect the yellow 2-way SRS connector located under the steering column.
15. Connect the battery "–" terminal cable.

System Inspection

Turn the ignition switch to "ON" while watching warning light.
The light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Steering Column

Steering Column and Associated Parts



Legend

(1) Inflator Module

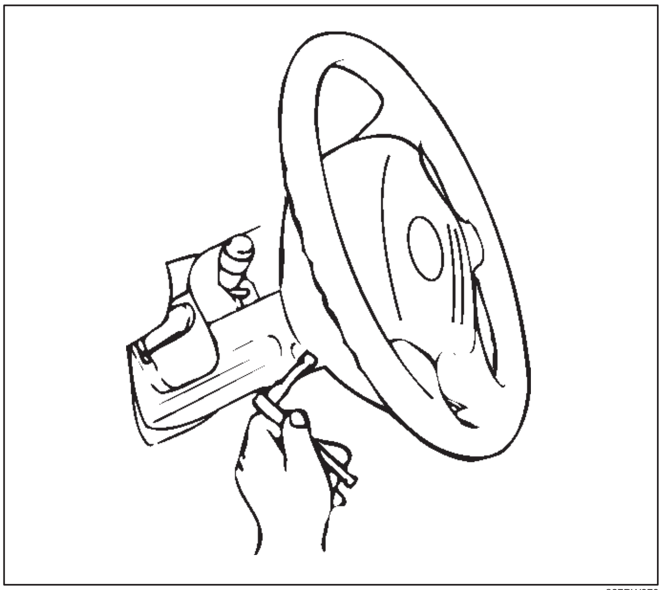
(7) Lock Cylinder Assembly
(8) Shift Lock Cable (For A/T)
(9) Steering Column Assembly
(10) Second Steering Shaft
(11) Instrument Panel Lower Cover
(12) Driver Knee Bolster (reinforcement)

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

CAUTION: The wheel of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering column from the steering gear. Failure to do so will cause the SRS coil assembly to become uncentered which will cause damage to the SRS coil assembly.

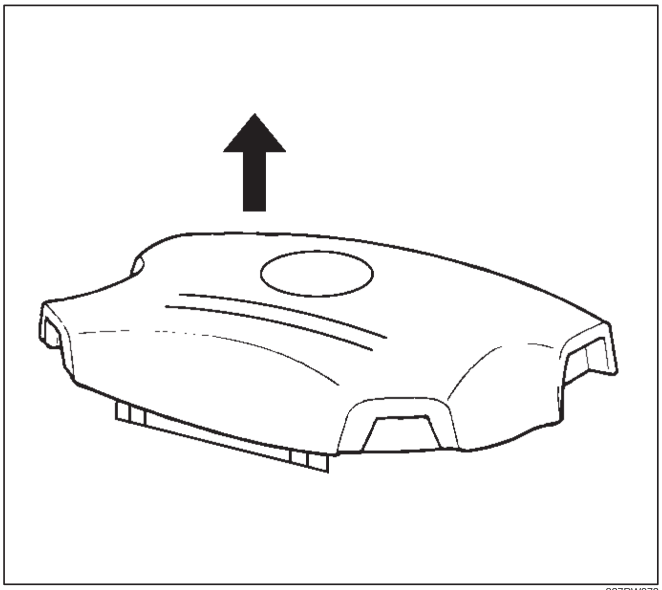
5. Remove the engine hood opening lever, then remove instrument panel lower cover.
6. Remove driver knee bolster (reinforcement).
7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.



827RW070

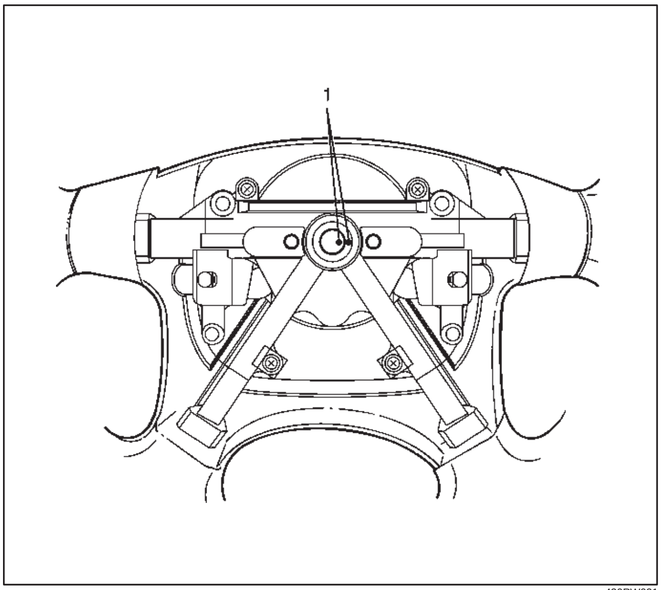
8. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module.
9. Remove inflator module.

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE TRIM COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.

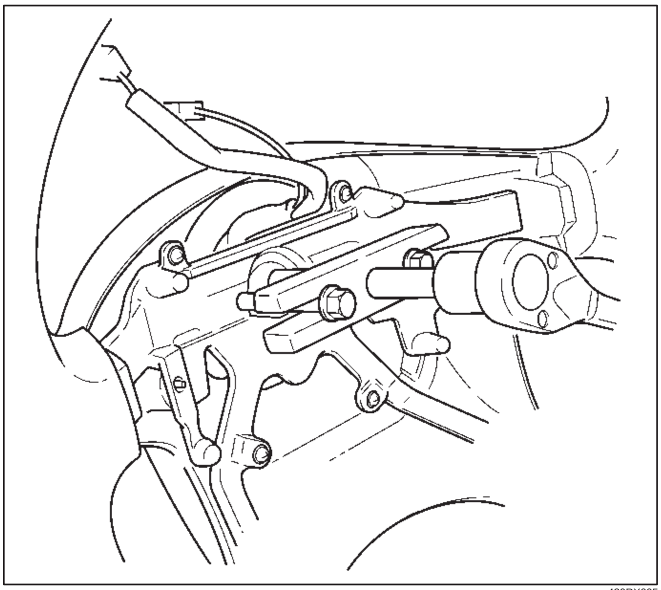


827RW072

10. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover J–29752 to remove the steering wheel.



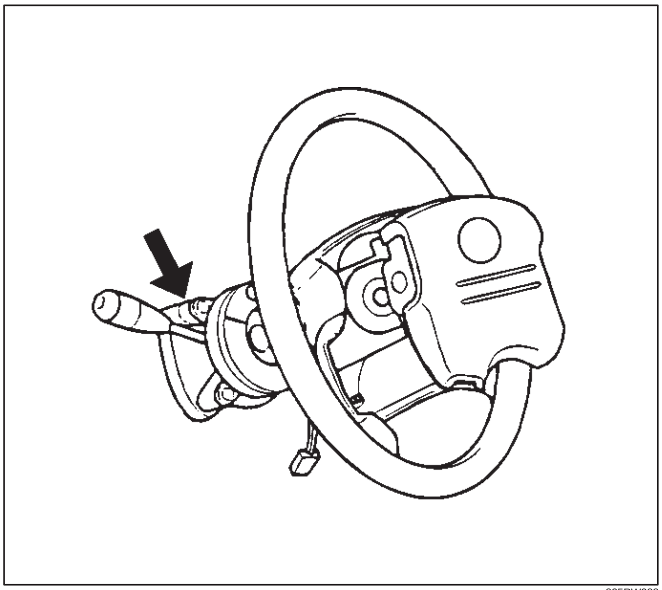
430RW021



430RX005

11. Remove steering column cover.
12. Disconnect the wiring harness connectors located under the steering column.
13. Remove the combination switch assembly with SRS coil.

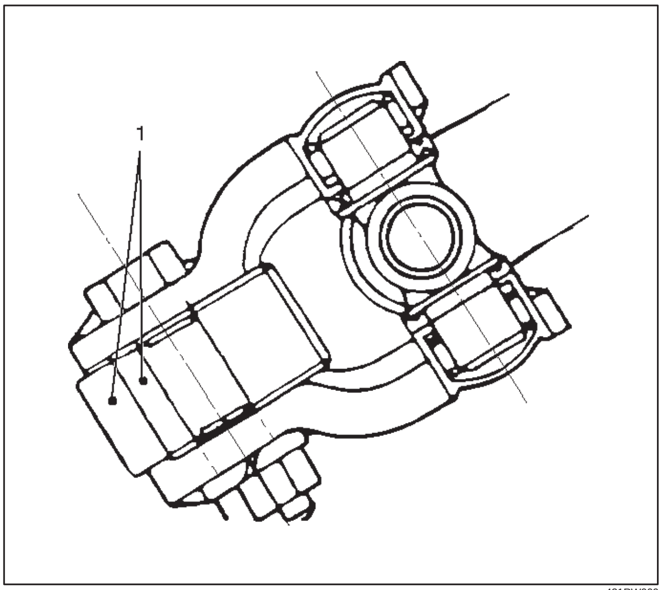
NOTE: SRS coil is a part of combination switch assembly, which can not be replaced singly. Therefore, be sure not to remove the SRS coil from the combination switch assembly.



825RW288

14. Remove snap ring.
15. Remove cushion rubber.
16. Remove shift lock cable (For A/T).
17. Disconnect the starter switch harness connector located under the steering column, then remove lock cylinder assembly.
18. Apply a setting mark (1) across the universal joint and second steering shaft to reassemble the parts in their original position, then remove steering column assembly and second shaft.

NOTE: A setting mark can be easily made if the shaft is withdrawn a little by loosening the steering shaft universal joint.



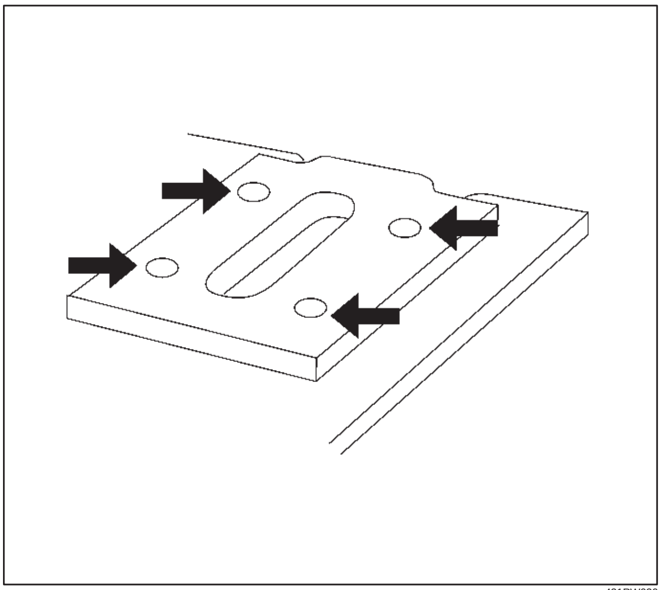
431RW009

Insepction

If the abnormal conditions are found through inspection, replace the steering column assembly.

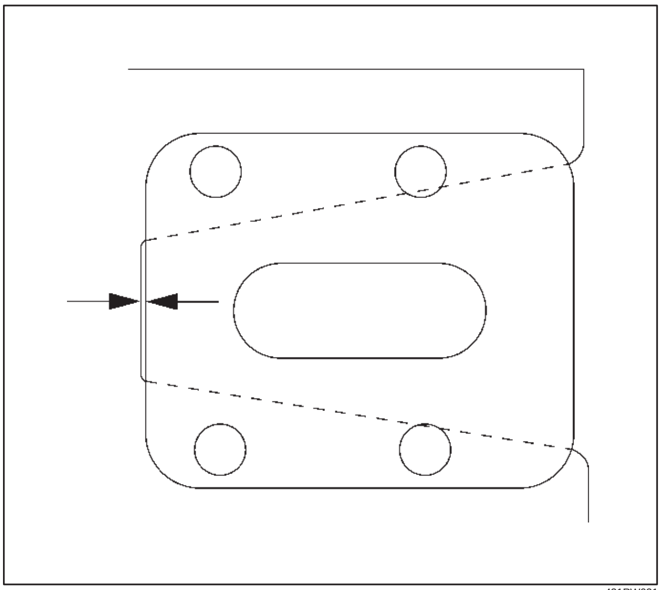
Column Capsule

Check capsules on steering column bracket assembly; all must be securely seated in bracket slots and checked for any loose conditions when pushed or pulled by hand.



431RW030

Check clearance between capsule and bracket. If must be within 1mm (0.039 in).

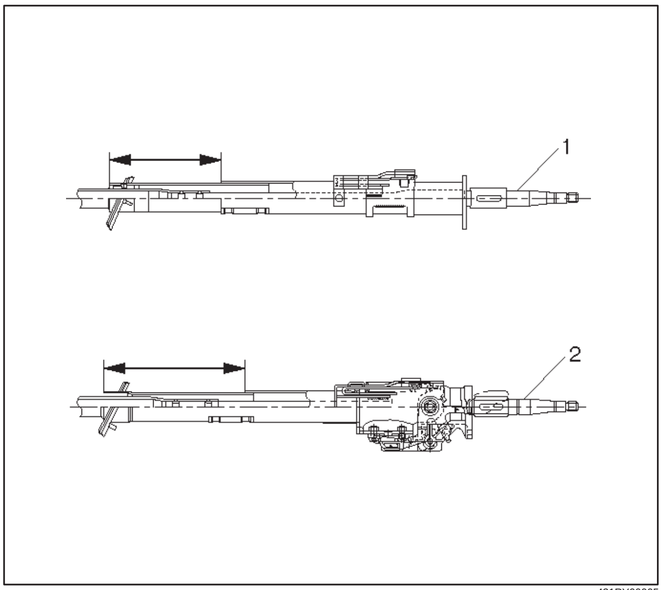


431RW031

Column Tube

Check for collapes by measuring the distance as shown in the figure.

Standard distance: 162.2-165.8 mm (6.386-6.528 in)



431RY00005

Legend

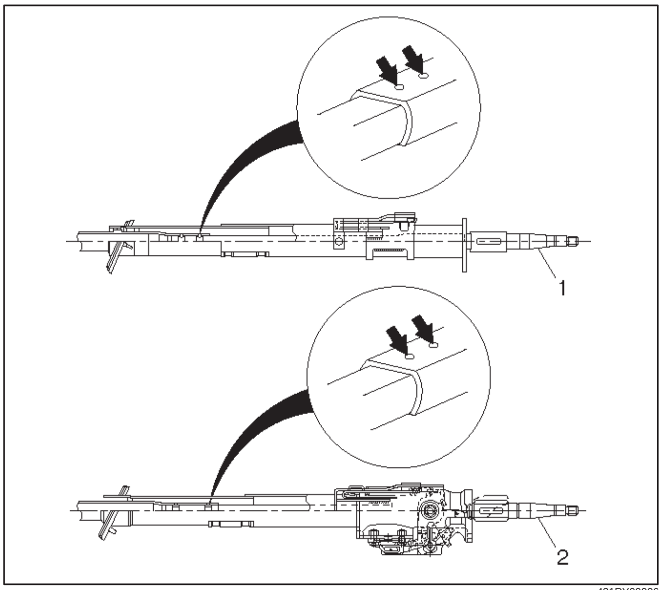
(1) NON TILT TYPE
(2) TILT TYPE

Column Universal Joint for Tilt Mechanism

If the resistance is felt when checked by rotate the joint, replace the steering column assembly.

Sheared Injected Plastic Pin

Check the sheared injected plastic pins for any loose conditions or damage.



431RY00006

Legend

(1) NON TILT TYPE
(2) TILT TYPE

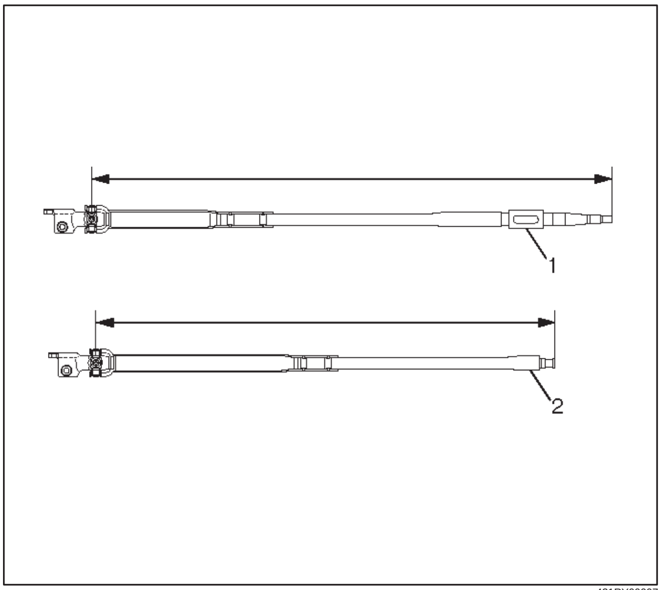
Shaft Length

Check the shaft length from the upper end of the slide joint to the end of the shaft. If column length is not in specifications, steering column should be replaced.

Standard length:

NON TILT TYPE: 912.4 – 914.4 mm (35.921 – 36.000 in)

TILT TYPE: 664.2 – 666.2 mm (26.149 – 26.228 in)



431RY00007

Legend

(1) NON TILT TYPE
(2) TILT TYPE

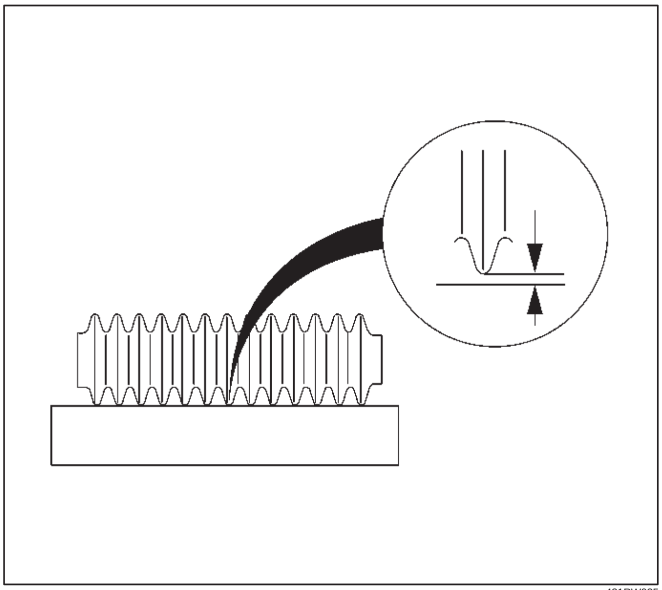
Shaft Universal Joint (Lower End)

If the resistance is felt when checked by rotate the joint, replace the steering column assembly.

Shaft Bellows Pipe

Check the shaft bellows pipe for bend by using straight edge. Measure the clearance between the bellows pipe and the straight edge (at center of the bellows pipe).

Standard: Less than 1mm (0.039 in)



431RW035

Tilt Mechanism

Tilt mechanism should moves smoothly.
While locked the tilt mechanism, be sure the steering column latch securely by pushing the steering wheel upward and downward.

Installation

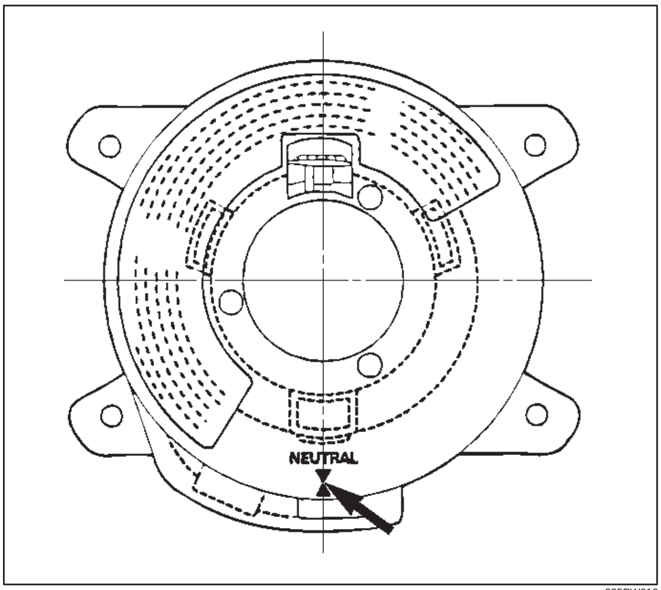
1. Install steering column assembly and second steering shaft.
2. Align the setting marks on the universal joint and second steering shaft made during removal.
3. Tighten the steering column fixing bolt (dash panel) to the specified torque.

   Torque: 20 N·m (14 lb ft)
4. Tighten the steering column fixing nuts (cross beam) to the specified torque.

   Torque: 17 N·m (12 lb ft)
5. Tighten the universal joint to the specified torque.

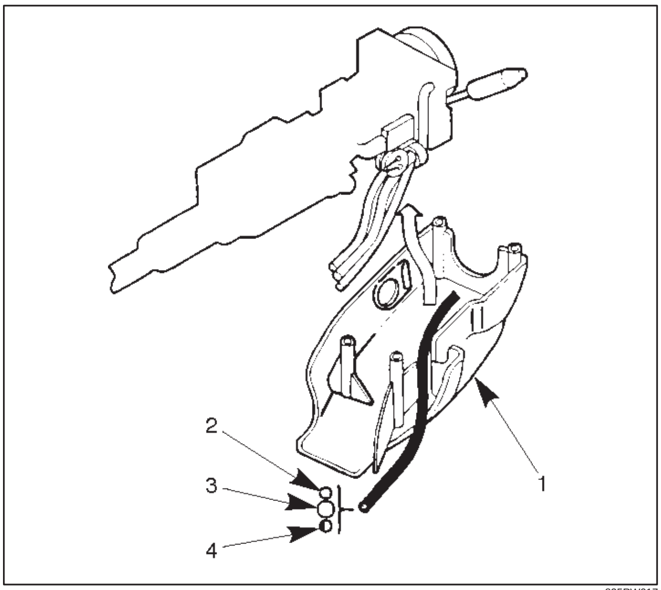
   Torque: 31 N·m (23 lb ft)
6. Install lock cylinder assembly.
7. Install shift lock cable (For A/T).
8. Install cushion rubber.
9. Install snap ring.
10. Install combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column.
11. Turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage to the cable in the SRS coil.



825RW016

12. When installing the steering column cover, be sure to route each wire harness as illustrated so that the harnesses do not catch any moving parts.



825RW017

Legend

(1) Steering Column Cover
(2) Starter Switch Harness
(3) Combination Switch Harness
(4) Inflator Module Harness

13. Install steering wheel and align the setting marks made when removing.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

14. Tighten the steering wheel fixing nut to the specified torque.

    Torque: 34 N·m (25 lb ft)

15. Support the module and carefully connect the module connector and horn lead, then install inflator module.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

16. Tighten bolts to specified torque.

    Torque: 9 N·m (78 lb in)

17. Install driver knee bolster (reinforcement).
18. Install instrument panel lower cover.
19. Install the engine hood opening lever.
20. Connect the yellow 2-way SRS connector and horn lead located under the steering column.
21. Connect the battery “–” terminal cable.

System Inspection

Turn the ignition switch to “ON” while watching warning light.
The light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The front suspension is designed to allow each wheel to compensate for changes in the road surface level without greatly affecting the opposite wheel. Each wheel is independently connected to the frame by a steering knuckle, ball joint assemblies, and upper and lower control arms. The front wheels are held in proper relationship to each other by two tie-rods which are connected to steering arms on the knuckles, and to a steering unit.

All models have a front suspension system consisting of control arms, stabilizer bar, shock absorber and a torsion bar. The front end of the torsion bar is attached to the lower control arm. The rear of the torsion bar is mounted into a height control arm at the crossmember. Vehicle trim height is controlled by adjusting this arm.

Shock absorbers are mounted between the brackets on the frame and the lower control arms. The lower portion of each shock absorber is attached to the lower control arm. The upper portion of each shock absorber extends through a frame bracket and is secured with two rubber bushings, two retainers and a nut.

Ball joint assemblies are bolted to the outer end of the upper and lower control arm and are attached to the steering knuckle.

The inner ends of the upper control arm have pressed in bushings. Bolts, passing through the bushing, attach the control arm to the frame. The inner ends of the lower control arm are attached to the frame by bolts passing through the bushings.

Side roll of the front suspension is controlled by a spring steel stabilizer bar. It is mounted in rubber bushings, which are held to the frame by brackets. The ends of the stabilizer bar are connected to the lower control arms by links.

Diagnosis

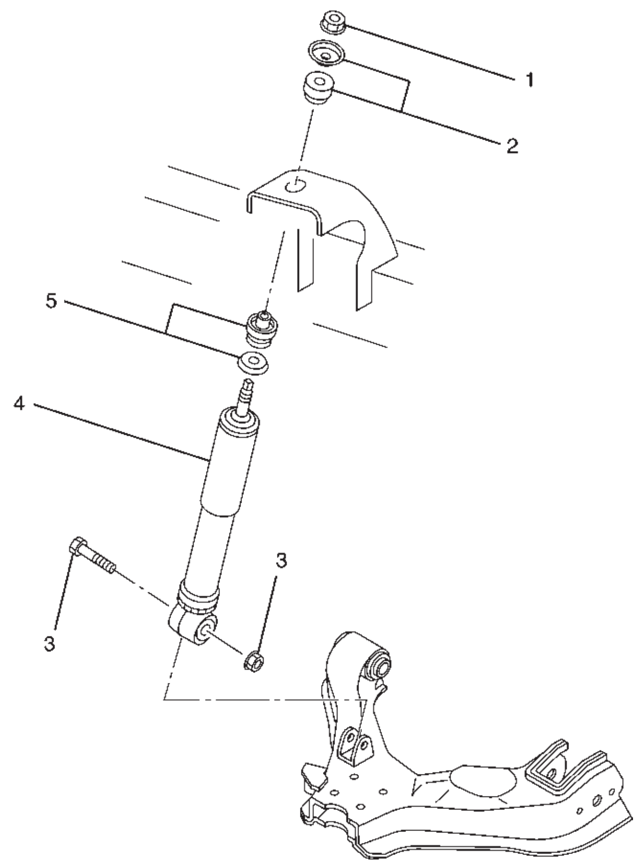
Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
	Tires not adequately inflated.	Adjust the pressure.
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.

Condition	Possible cause	Correction
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
	Parts in power steering valve defective.	Replace power steering unit.
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.

Condition	Possible cause	Correction
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Shock Absorber

Shock Absorber and Associated Parts



450RW009

Legend
(1) Nut
(2) Rubber Bushing and Washer
(3) Bolt and Nut
(4) Shock Absorber
(5) Rubber Bushing and Washer

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
3. Remove bolt and nut.
4. Remove nut.
5. Remove rubber bushing and washer.
6. Remove shock absorber.
7. Remove rubber bushing and washer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts :

- Shock absorber
- Rubber bushing

Installation

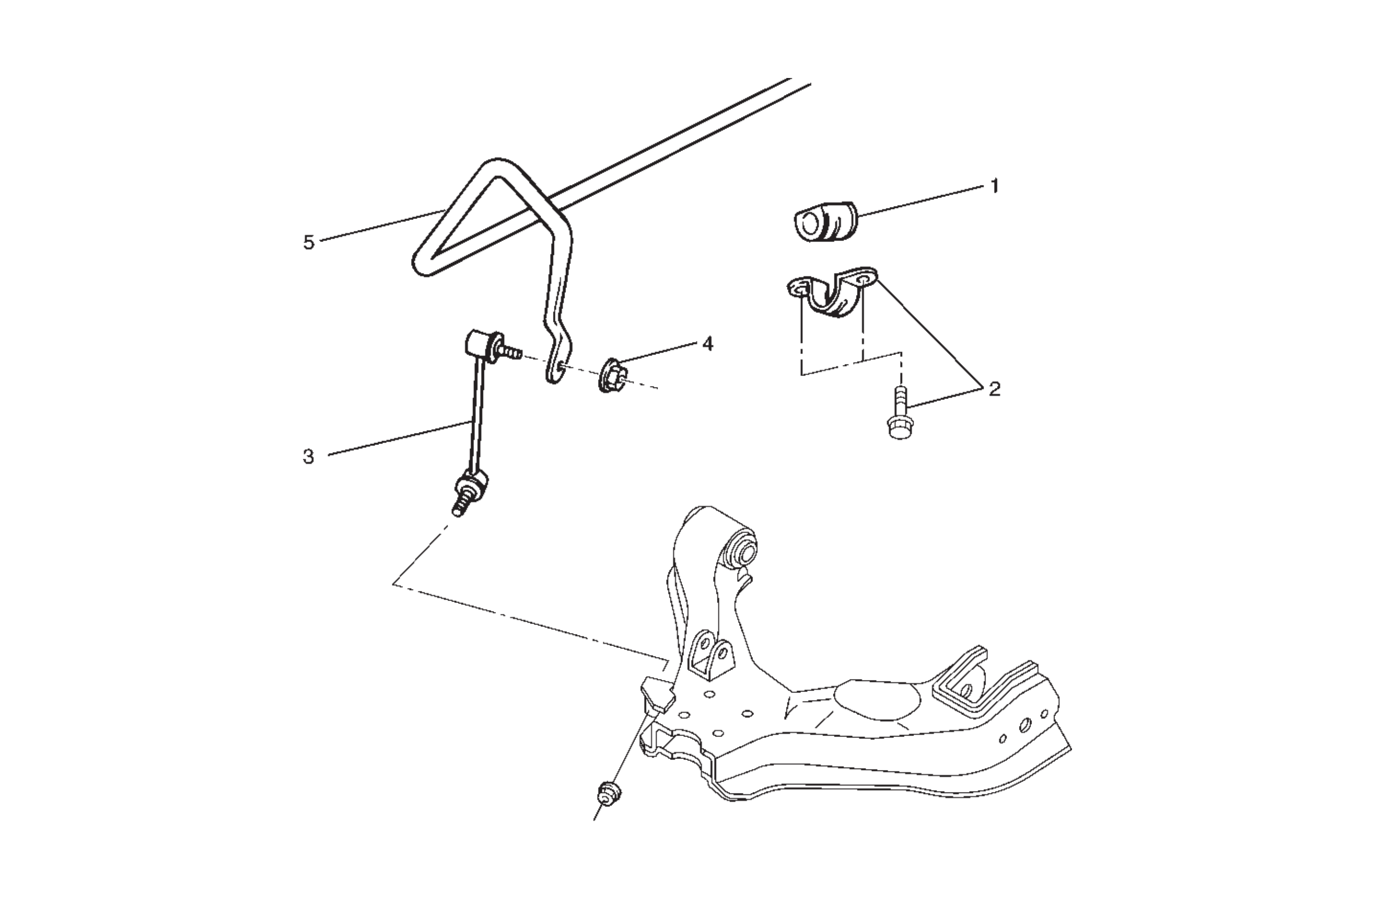
1. Install rubber bushing and washer.
2. Install shock absorber.
3. Install rubber bushing and washer.
4. Install nut, then tighten it to the specified torque.

   Torque: 20 N·m (14 lb ft)
5. Install bolt and nut, then tighten to the specified torque.

   Torque: 93 N·m (69 lb ft)

Stabilizer Bar

Stabilizer Bar and Associated Parts



Legend

(1) Rubber Bushing
(2) Bracket
(3) Link
(4) Nut
(5) Stabilizer Bar

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove the stone guard.
3. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
4. Remove nut.

CAUTION: Be careful not to break the ball joint boot.

5. Remove link.
6. Remove bracket.
7. Remove stabilizer bar.
8. Remove rubber bushing.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts :

- Stabilizer bar
- Rubber bushing
- Link ball joint

Installation

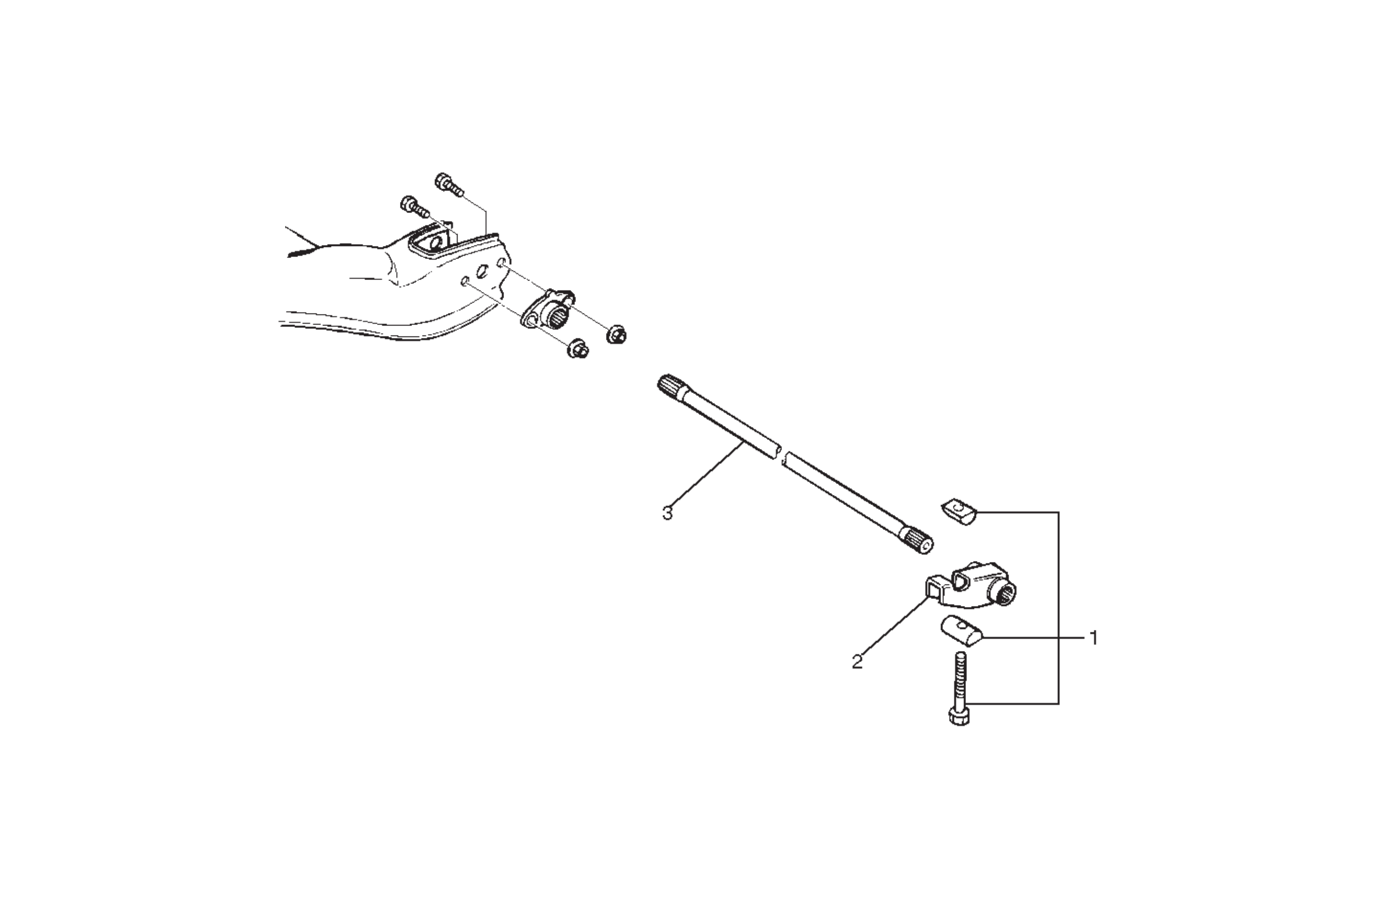
1. Install rubber bushing.
2. Install stabilizer bar.
3. Install bracket, then tighten it to the specified torque.

   Torque: 25 N·m (18 lb ft)
4. Install link.
5. Install nut, then tighten it to the specified torque.

   Torque: 50 N·m (37 lb ft)

Torsion Bar

Torsion Bar and Associated Parts



410RS003

Legend

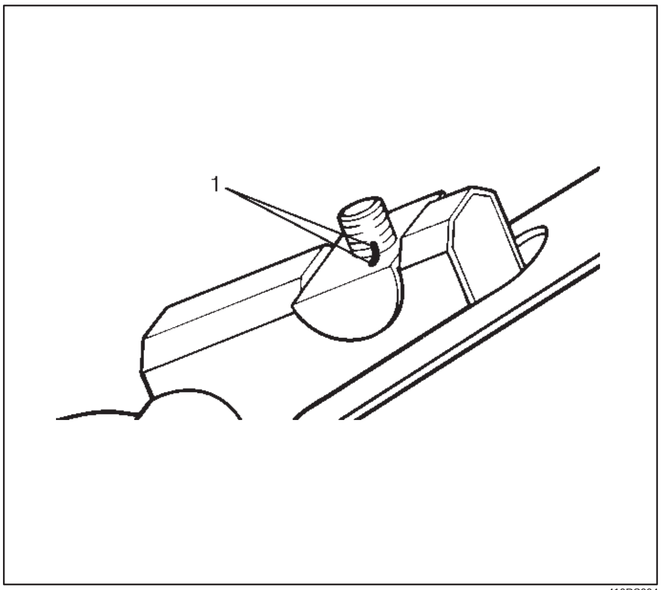
(1) Adjust Bolt, End Piece and Seat

(2) Height Control Arm

(3) Torsion Bar

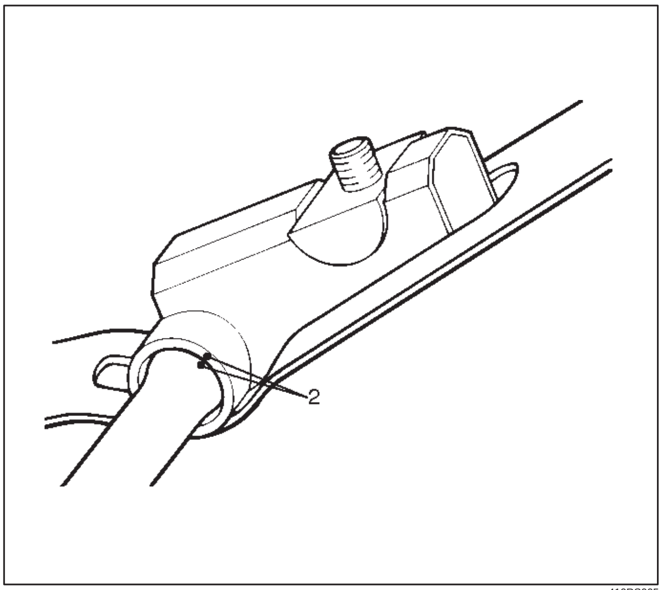
Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Apply the setting marks(1) to the adjust bolt and end piece, then remove adjust bolt, end piece and seat.



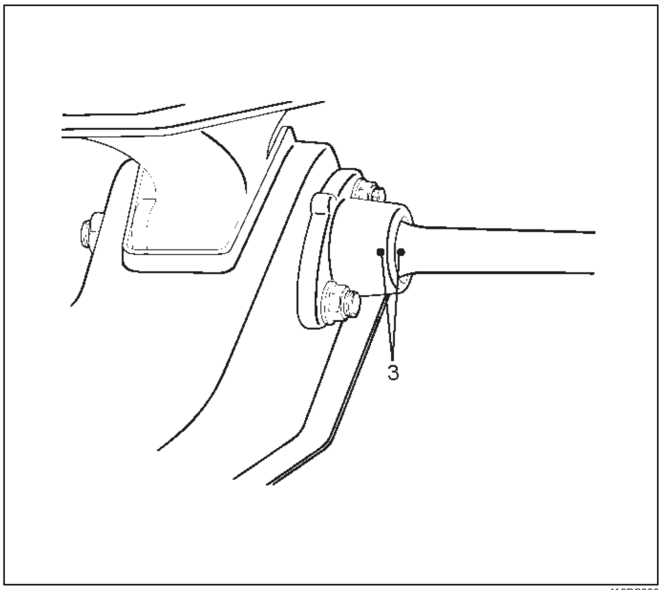
410RS004

3. Apply the setting marks(2) to the height control arm and torsion bar, then remove height control arm.



410RS005

4. Apply the setting marks(3) to the torsion bar and lower control arm, then remove torsion bar.



410RS006

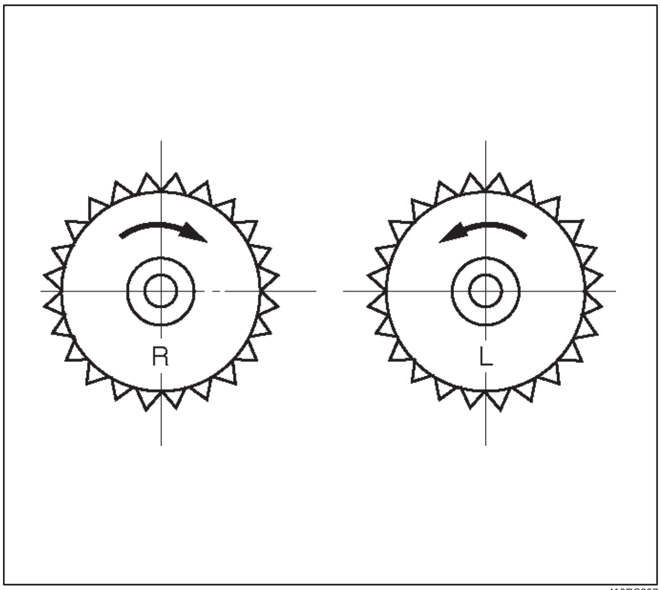
Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

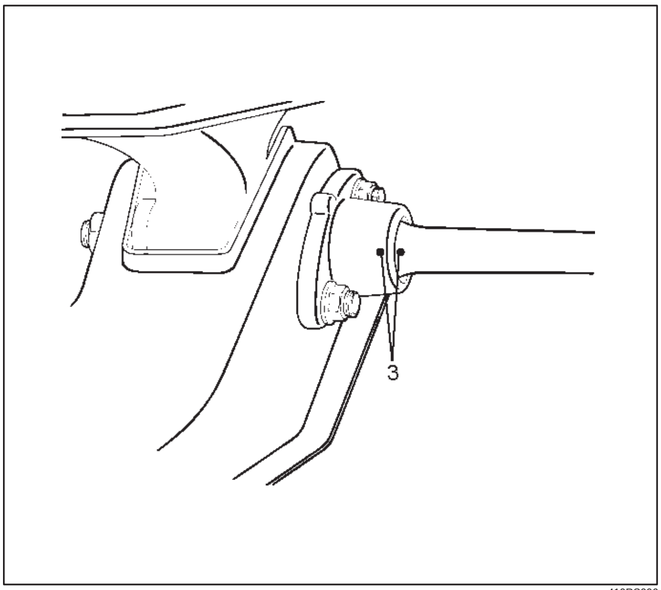
- Torsion bar
- Height control arm
- Adjust bolt
- Rubber seat

Installation

1. Apply grease to the serrated portions, then install torsion bar. Make sure the bars are on their correct respective sides and align the setting marks(3).

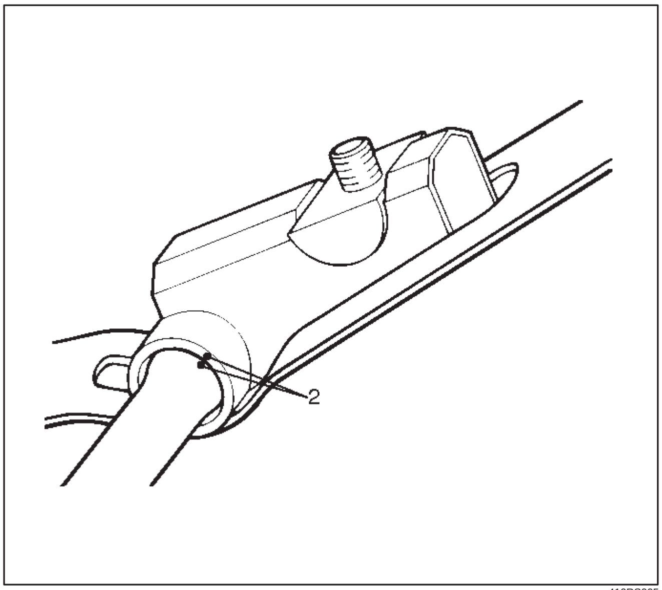


410RS007



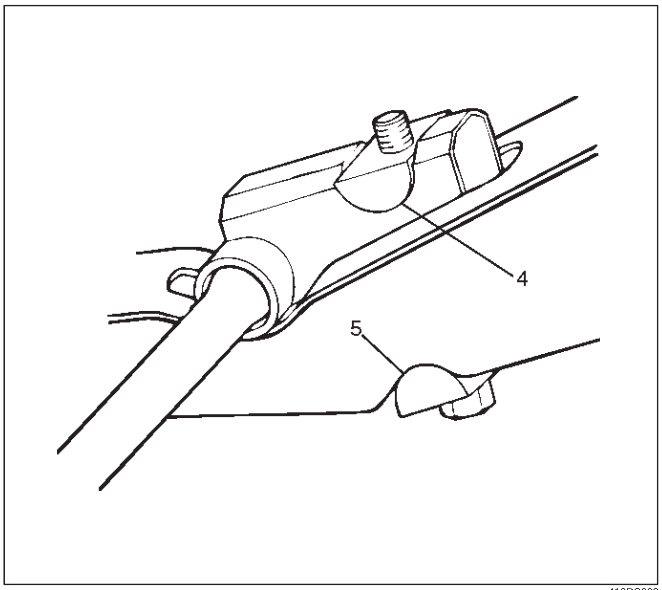
410RS006

2. Apply grease to the portion that fits into the bracket then install height control arm and align the setting marks(2).



410RS005

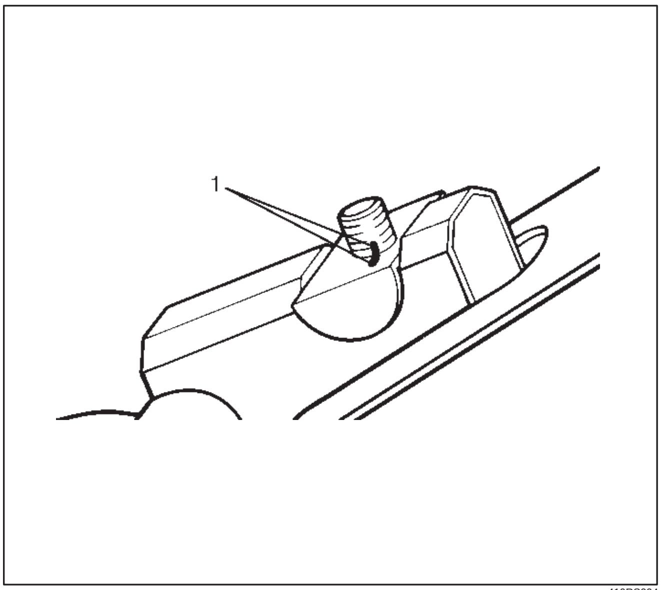
3. Apply grease to the bolt portion of the end piece(4). Apply grease to the portion of the seat(5) that fits into the bracket.



410RS008

4. Apply grease to the serrated portions.
5. Install adjust bolt and seat, then turn the adjust bolt to the setting mark(1) applied during disassembly.

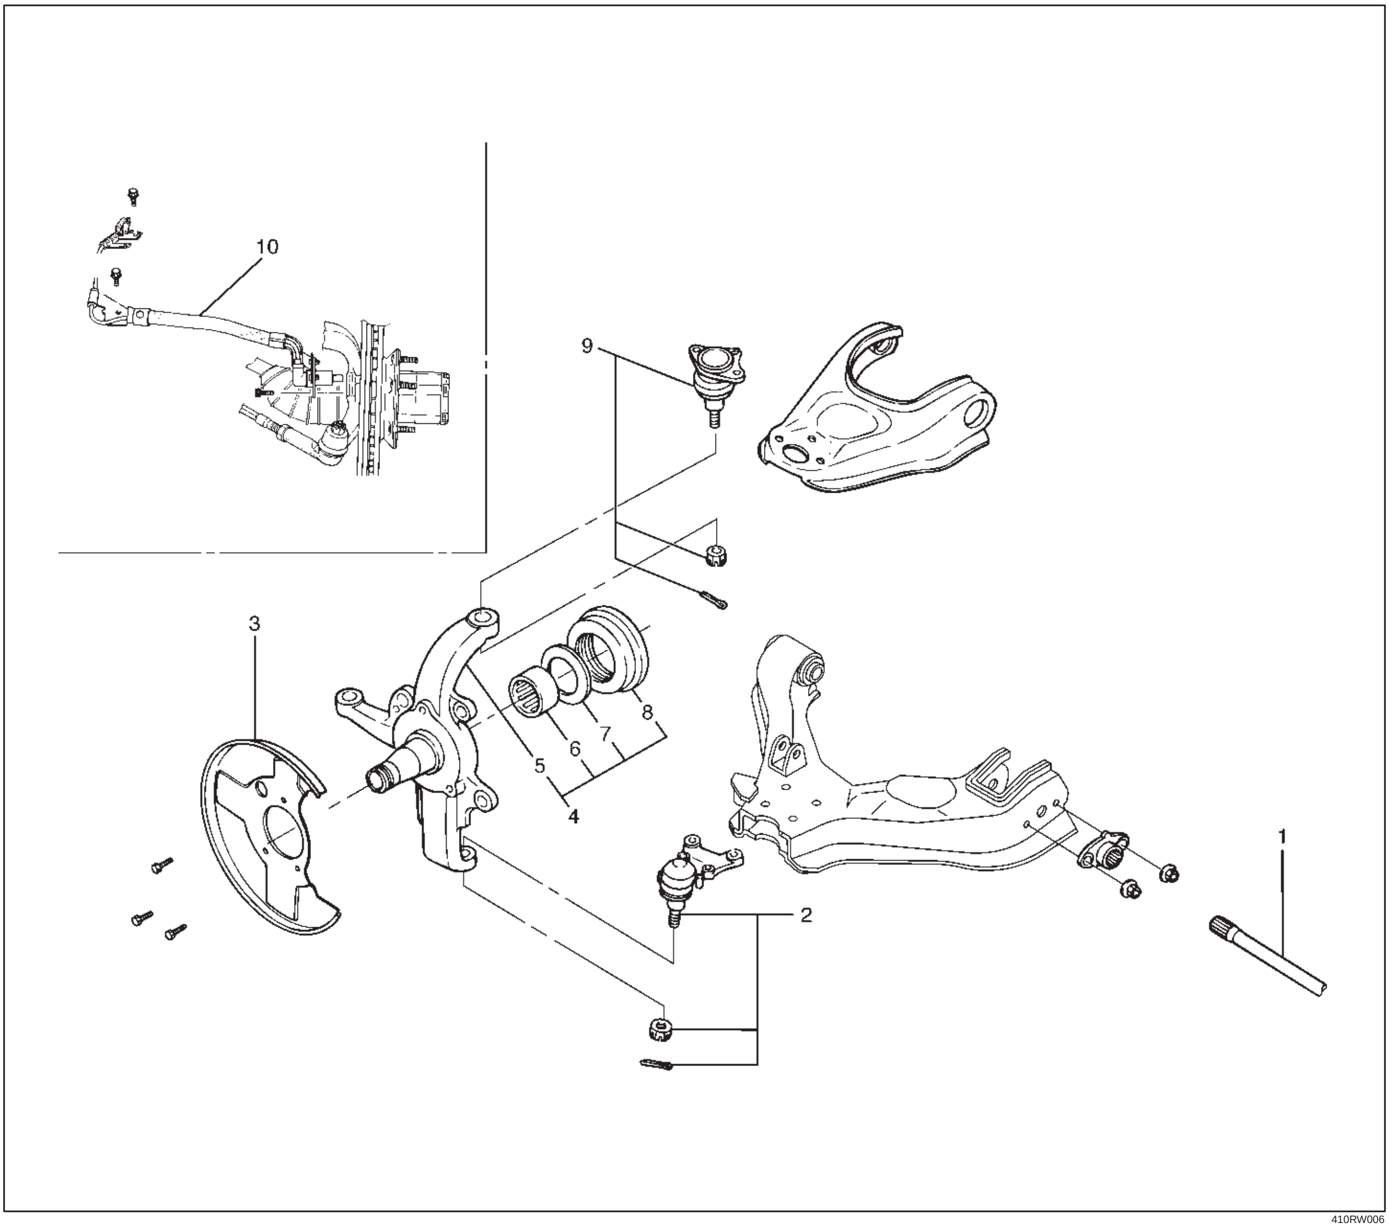
NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering section.



410RS004

Knuckle

Knuckle and Associated Parts



Legend

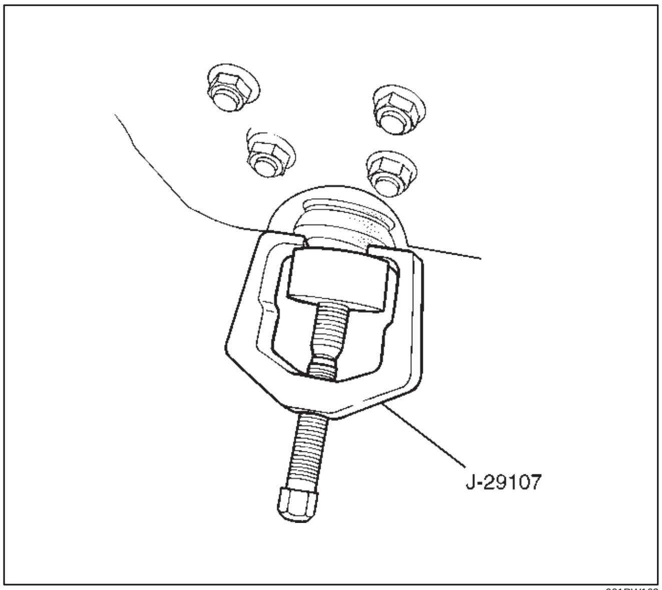
(1) Torsion Bar
(2) Lower Ball Joint
(3) Back Plate
(4) Knuckle Assembly
(5) Knuckle
(6) Needle Bearing
(7) Thrust Washer
(8) Oil Seal
(9) Upper Ball Joint
(10) Wheel Speed Sensor

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper. Refer to Disc Brakes in Brake section.
4. Remove the hub assembly. Refer to Front Hub and Disk in this section.
5. Remove tie–rod end from the knuckle. Refer to Power Steering Unit in Steering section.
6. Remove the speed sensor from the knuckle.
7. Loosen torsion bar by height control arm adjust bolt, then remove torsion bar. Refer to Torsion Bar in this section.
8. Remove wheel speed sensor.

9. Remove back plate.
10. Remove lower ball joint by using remover J–29107.

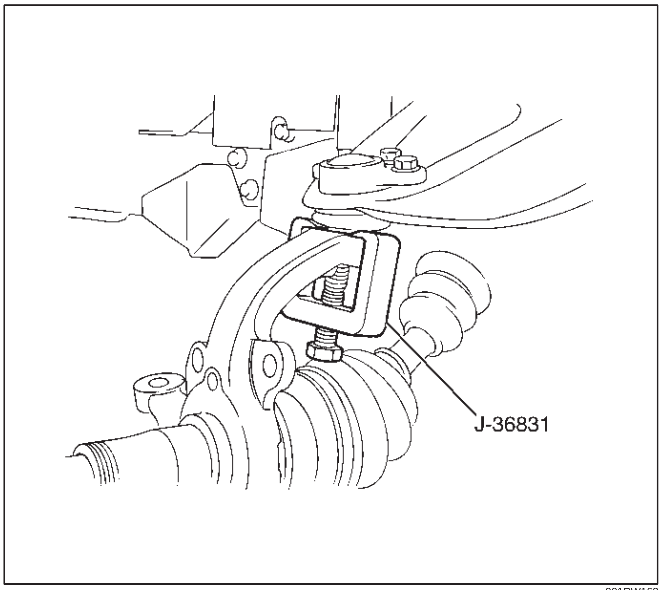
CAUTION: Be careful not to damage the ball joint boot.



901RW163

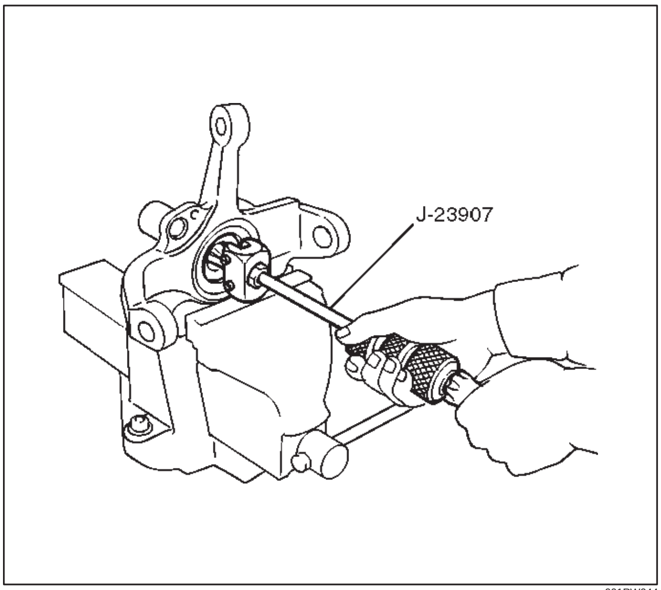
11. Remove upper ball joint by using remover J–36831.

CAUTION: Be careful not to damage the ball joint boot.



901RW162

12. Remove knuckle assembly.
13. Remove oil seal (Except 2WD model).
14. Remove washer (Except 2WD model).
15. Remove needle bearing by using remover J–23907 (Except 2WD model).



901RW044

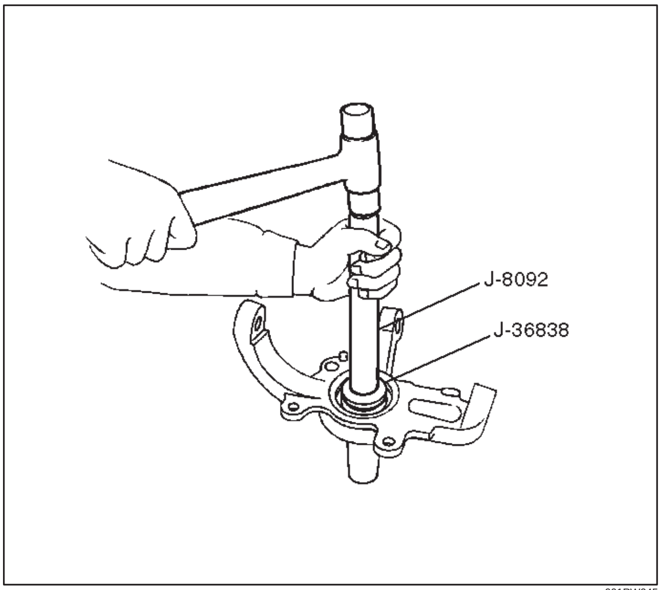
Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

- Knuckle
- Knuckle arm
- Needle bearing
- Thrust washer

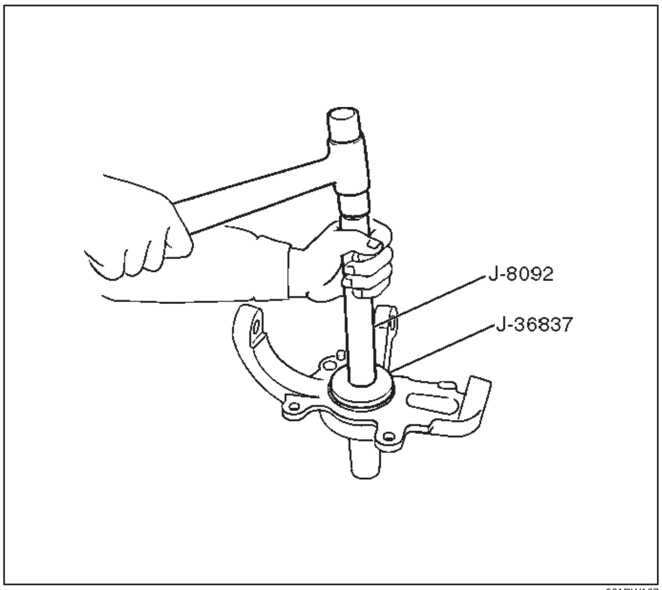
Installation

1. Apply appropriate amount of multipurpose type grease to the new bearing (Approx. 5 g) and install needle bearing by using installer J–36838 and J–8092 (Except 2WD model).



901RW045

2. Apply multipurpose type grease to the thrust washer, and install washer with chamfered side facing knuckle (Except 2WD model).
3. Use a new oil seal, and apply multipurpose type grease to the area surrounded by the lip (approx. 2 g). Then use installer J–36837 and J–8092 to install oil seal. After fitting the oil seal to the installer, drive it to the knuckle using a hammer or bench press until the tool front face contacts with the thrust washer (Except 2WD model).



901RW167

4. Install knuckle assembly.
5. Install upper ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98 N·m (72 lb ft)

6. Install lower ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

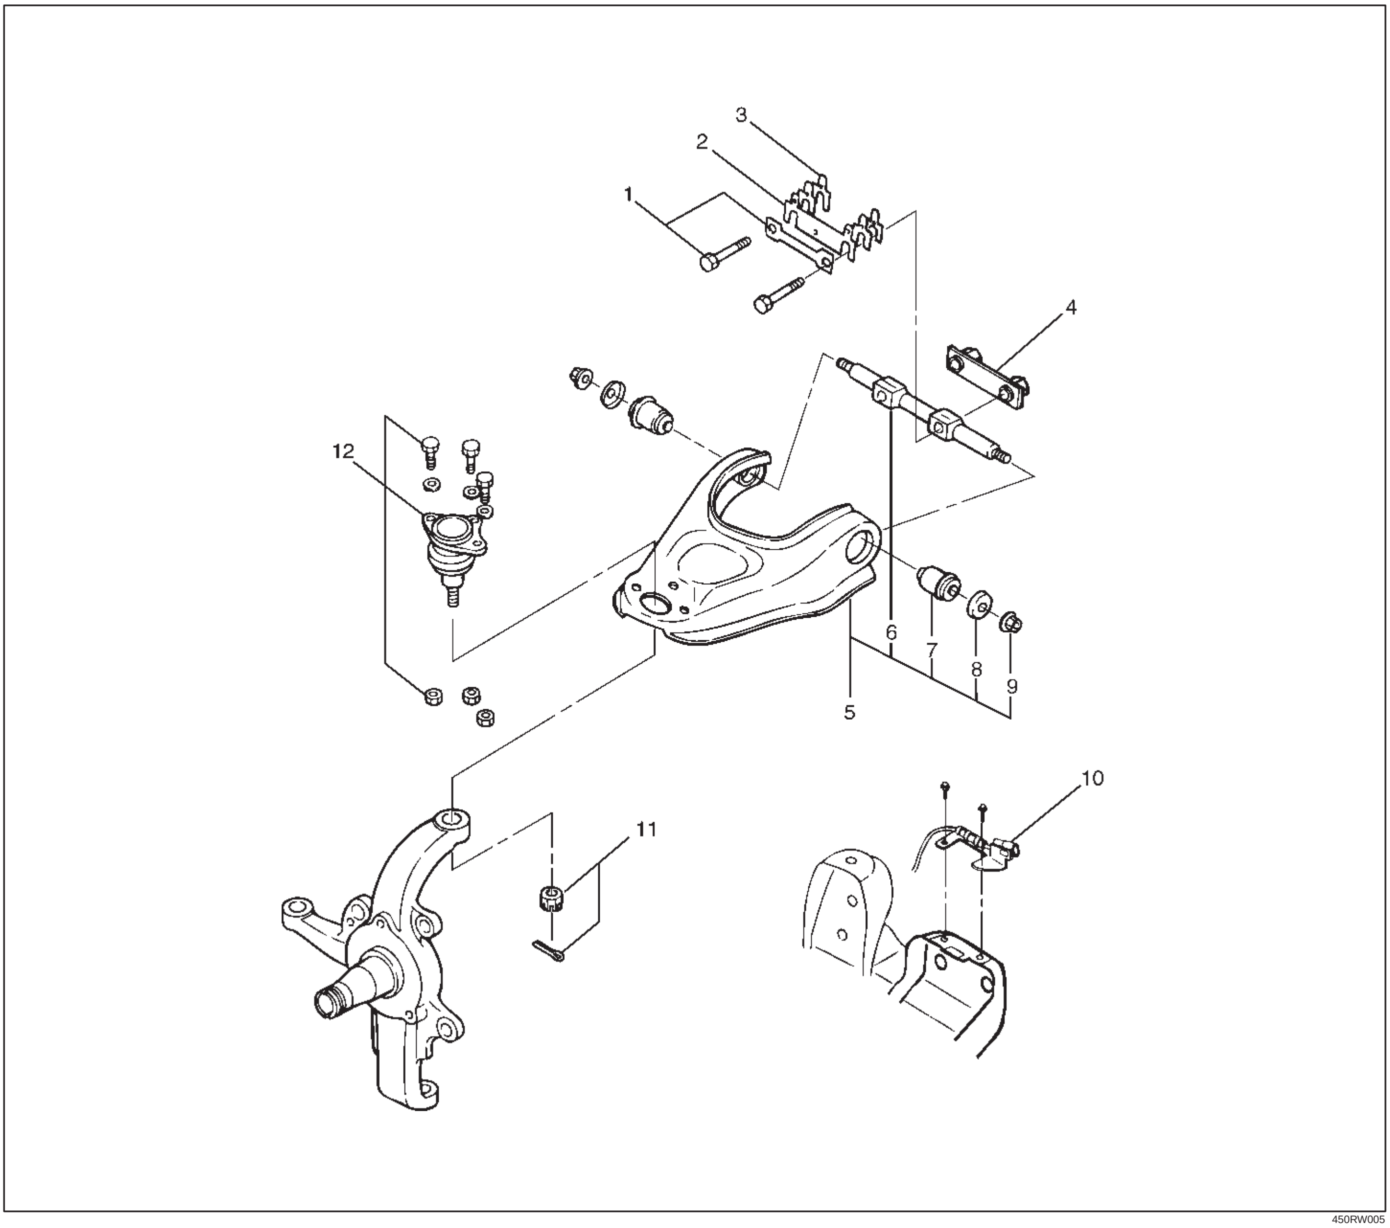
Torque: 147 N·m (108 lb ft)

7. Install back plate.
8. Install wheel speed sensor.
9. Install torsion bar, refer to Torsion Bar in this section.

NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering.

Upper Control Arm

Upper Control Arm and Associated Parts

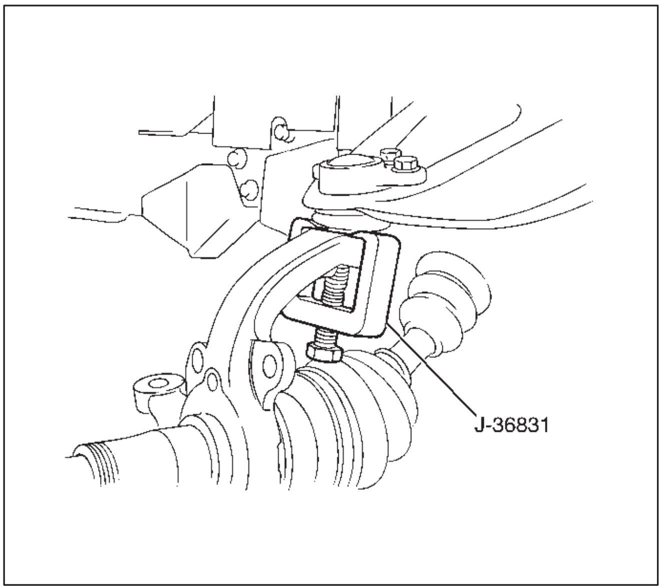


Legend
(1) Bolt and Plate
(2) Camber Shims
(3) Caster Shims
(4) Nut Assembly
(5) Upper Control Arm Assembly
(6) Fulcrum Pin
(7) Bushing
(8) Plate
(9) Nut
(10) Speed Sensor Cable
(11) Nut and Cotter Pin
(12) Upper Ball Joint

Removal

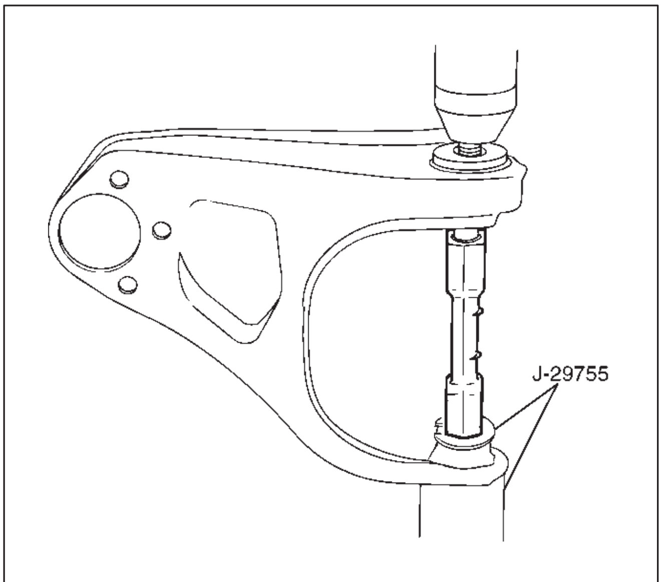
1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper and disconnect brake pipe. Refer to Disc Brakes in Brake section.
4. Support lower control arm with a jack.
5. Remove speed sensor cable.
6. Remove nut and cotter pin then use remover J–36831.

CAUTION: Be careful not to damage the ball joint boot.

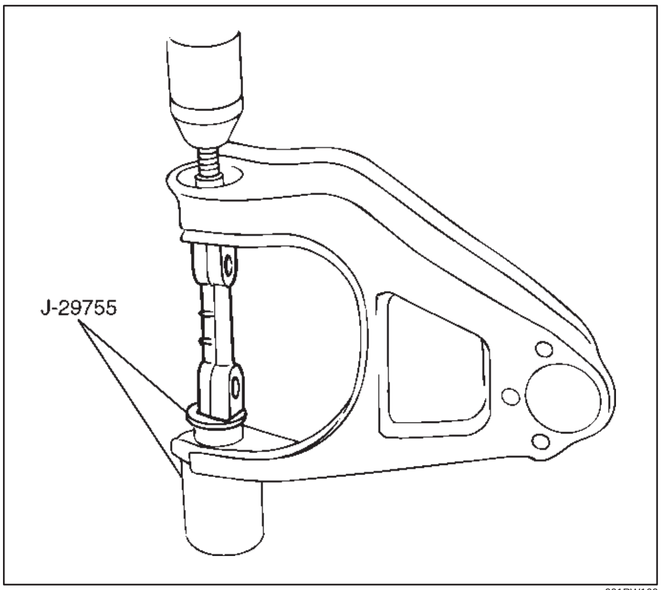


901RW162

7. Remove upper ball joint.
8. Remove bolt and plate.
9. Remove nut assembly.
10. Remove camber shims and note the positions and number of shims.
11. Remove caster shims and note the positions and number of shims.
12. Remove upper control arm assembly.
13. Remove nut.
14. Remove plate.
15. Remove bushing by using remover J–29755.



901RW161



901RW160

16. Remove fulcrum pin.

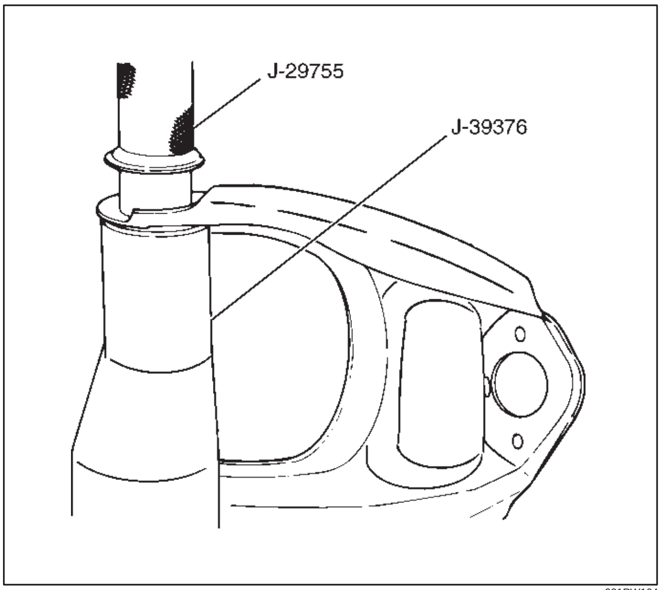
Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.
Check the following parts:

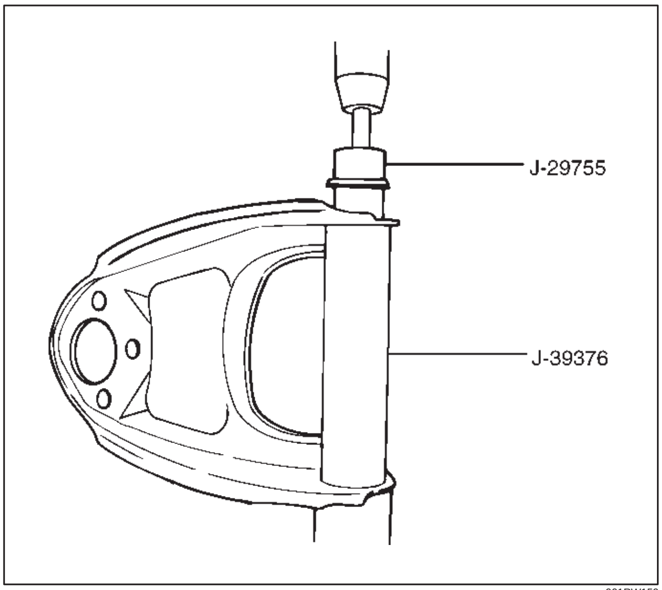
- Upper control arm
- Bushing
- Fulcrum pin

Installation

1. Install fulcrum pin.
2. Install bushing by using installer J–29755 and J–39376.



901RW164



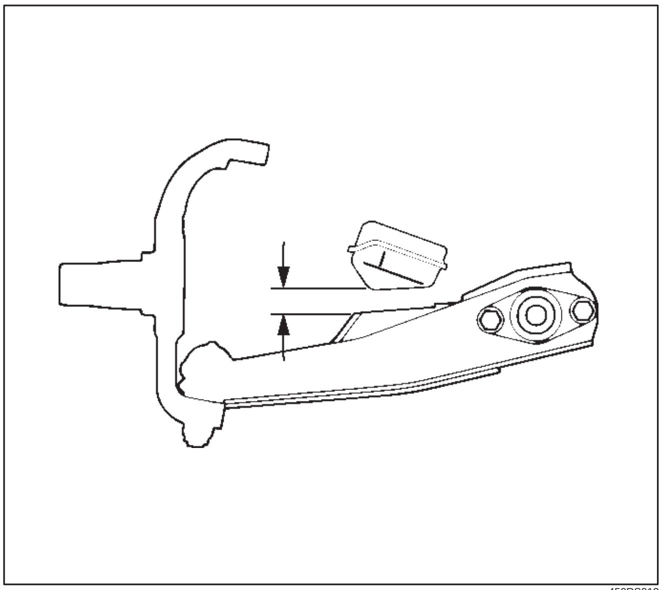
901RW159

3. Install plate.
4. Install nut and tighten fulcrum pin nut finger–tight.

NOTE: Torque fulcrum pin nut after adjusting buffer clearance.

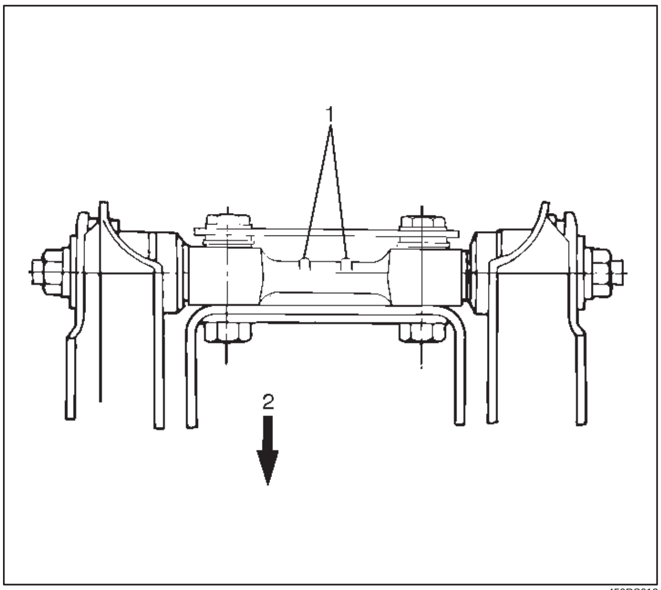
Buffer clearance: 22 mm (0.87 in)

Torque: 108 N·m (80 lb ft)



450RS012

5. Install upper control arm assembly with the fulcrum pin projections turned inward.

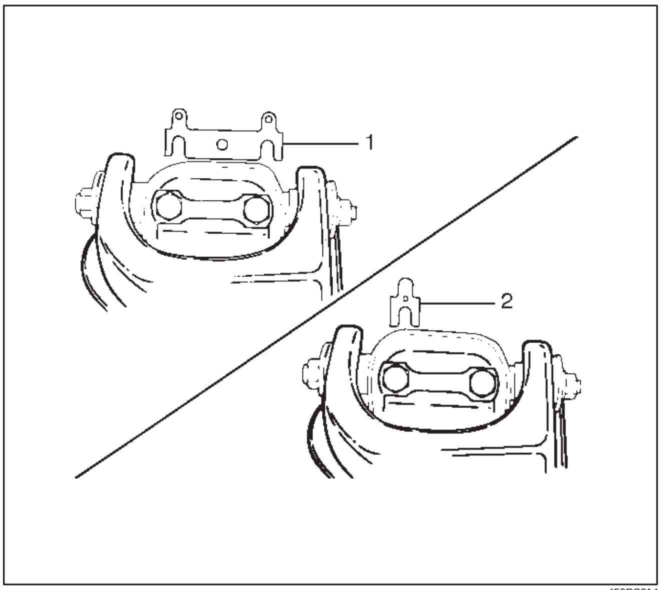


450RS013

Legend

(1) Projection
(2) Outward

6. Install the caster shims(2) between the chassis frame and fulcrum pin.
7. Install the camber shims(1) between the chassis frame and fulcrum pin.



450RS014

8. Install nut assembly.
9. Install bolt and plate, then tighten the bolt to the specified torque.

Torque: 152 N·m (112 lb ft)

10. Install upper ball joint and tighten it to the specified torque.

Torque: 57 N·m (42 lb ft)

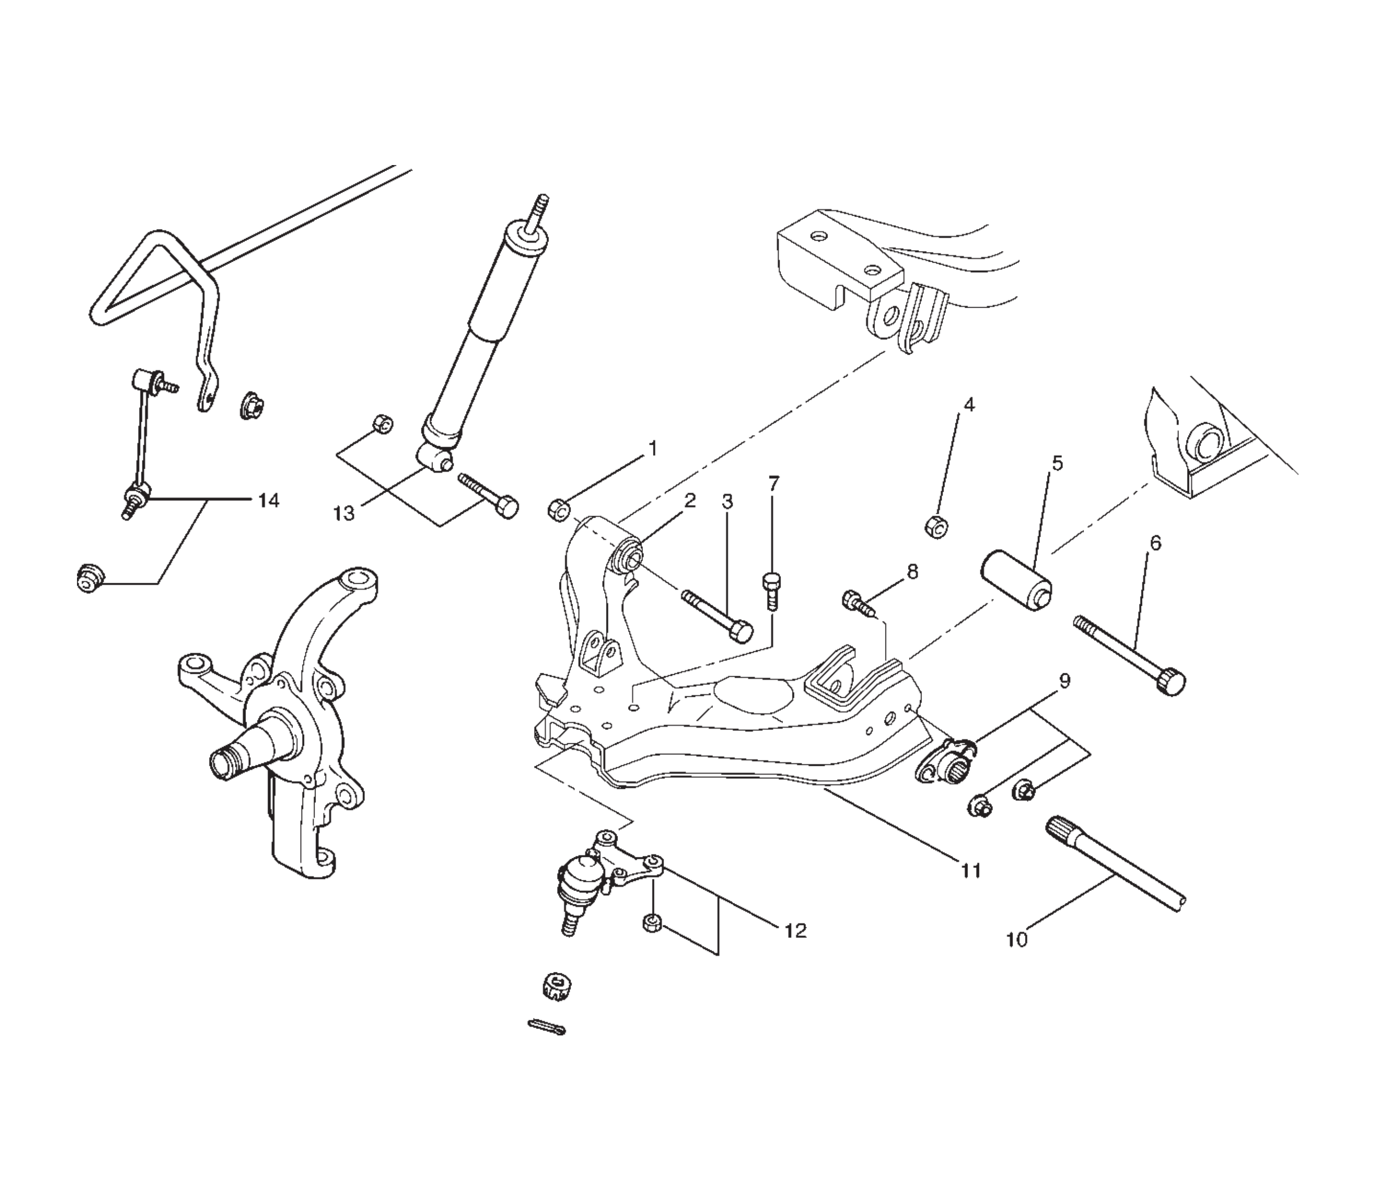
11. Install nut and cotter pin then tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98 N·m (72 lb ft)

12. Install speed sensor cable.

Lower Control Arm

Lower Control Arm and Associated Parts



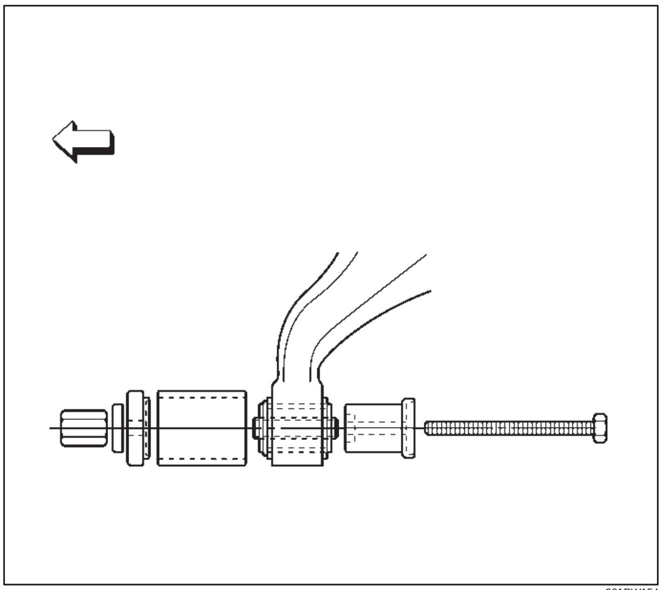
Legend

(1) Nut, Front
(2) Bush, Front
(3) Bolt, Front
(4) Nut, Rear
(5) Bush, Rear
(6) Bolt, Rear
(7) Bolt, Lower Ball Joint
(8) Bolt, Torsion Bar Arm
(9) Torsion Bar Arm Bracket
(10) Torsion Bar
(11) Lower Control Arm
(12) Lower Ball Joint
(13) Shock Absorber
(14) Stabilizer Link

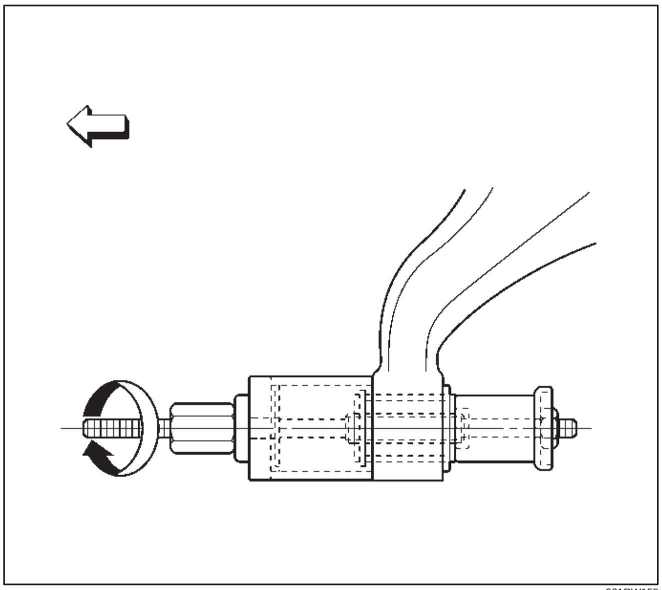
Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
4. Remove the retaining ring from the front axle driving shaft to release the shaft from hub(Except 2WD model). Refer to Front Hub and Disc in Driveline/Axle section.
5. Support lower control arm with a jack.

6. Remove front nut.
7. Remove rear nut.
8. Remove torsion bar, refer to Torsion Bar in this section.
9. Remove torsion bar arm bracket.
10. Disconnect the stabilizer link at the lower control arm.
11. Remove the shock absorber lower end from the lower control arm.
12. Remove the lower ball joint from the lower control arm.
13. Remove front bolt.
14. Remove rear bolt.
15. Remove lower control arm.
16. Remove torsion bar arm bolt.
17. Remove lower ball joint bolt.
18. Remove front bushing by using remover J–36833.

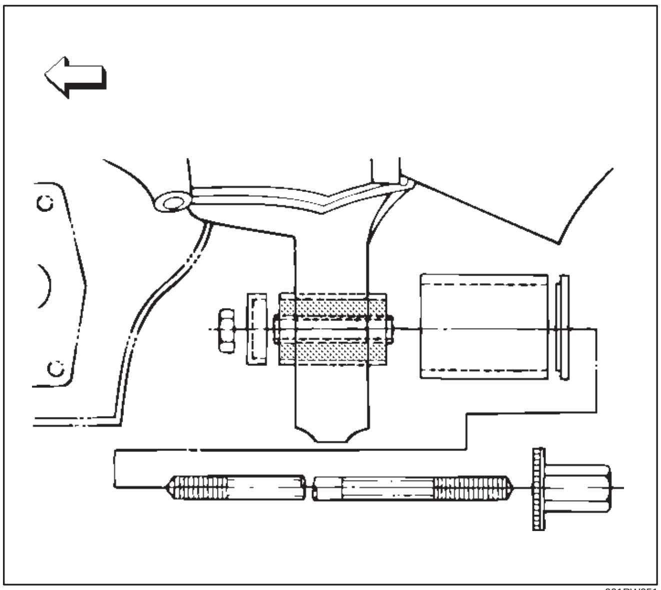


901RW154

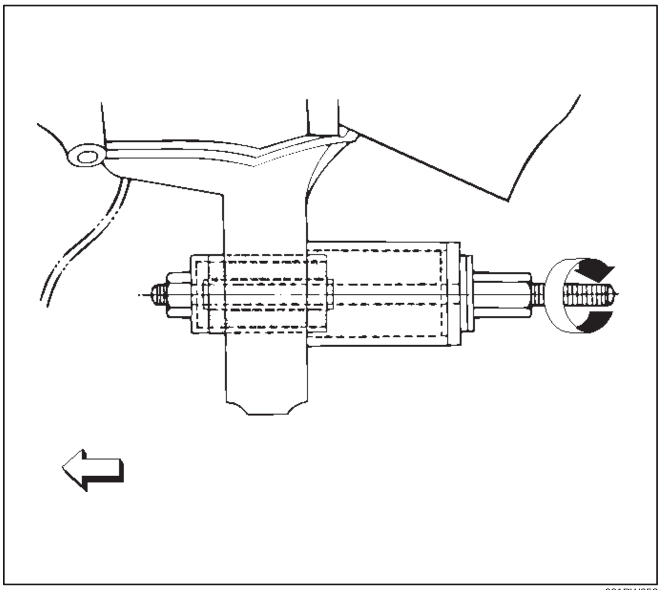


901RW155

19. Remove rear bushing by using remover J–36834.



901RW051



901RW052

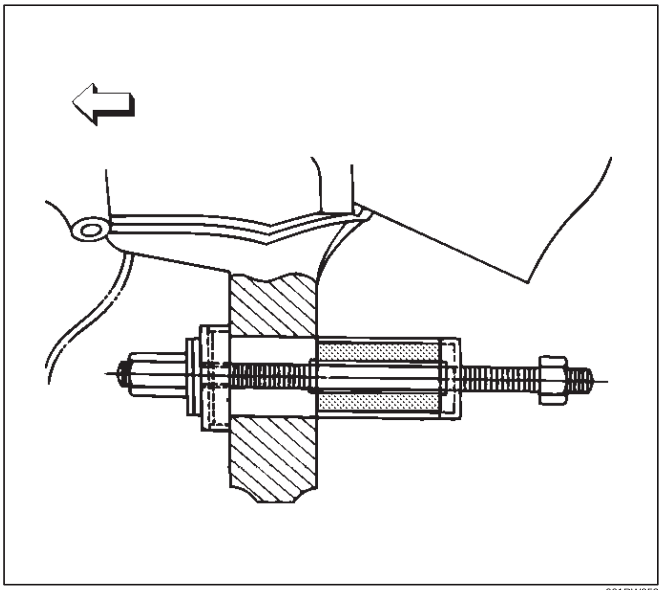
Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

- Lower control arm
- Bushing

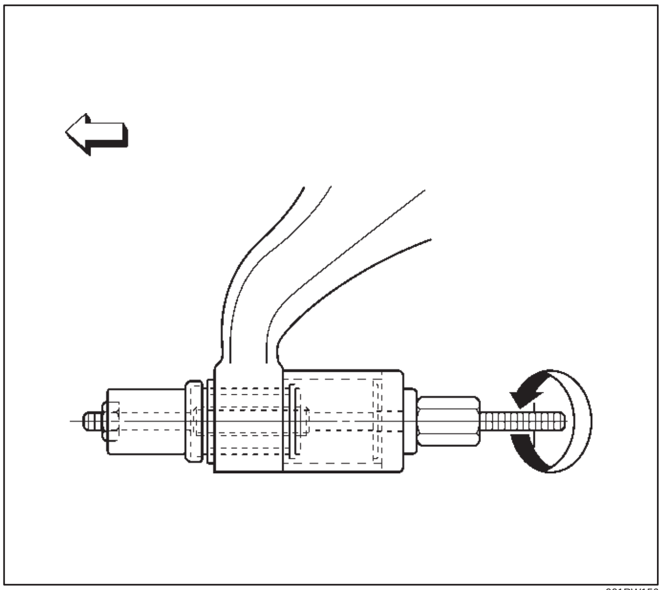
Installation

1. Install rear bushing by using installer J–36834.



901RW053

2. Install front bushing by using installer J–36833.



901RW156

3. Install lower ball joint bolt.
4. Install torsion bar arm bolt.
5. Install lower control arm.
6. Install rear bolt.
7. Install front bolt.
8. Install lower ball joint and tighten it to the specified torque.

   Torque: 116 N·m (85 lb ft)

9. Install shock absorber and tighten it to the specified torque.

   Torque: 93 N·m (69 lb ft)

10. Install stabilizer link and tighten it to the specified torque.

    Torque: 50 N·m (37 lb ft)

11. Install torsion bar arm bracket and tighten it to the specified torque.

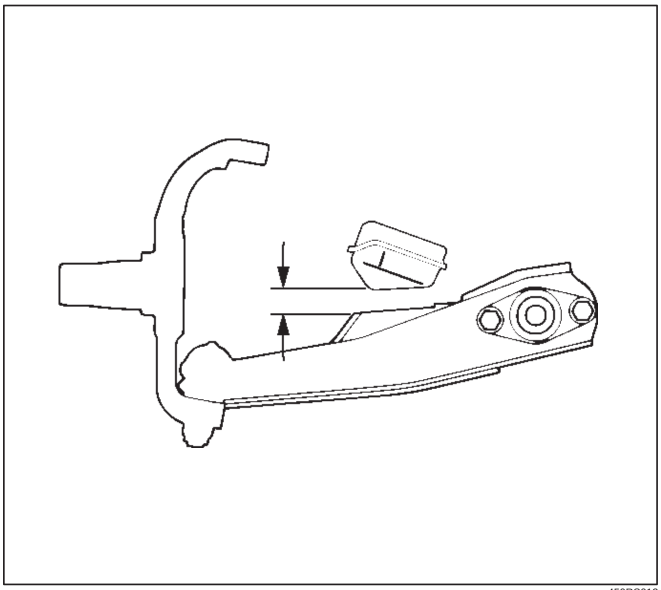
    Torque: 116 N·m (85 lb ft)

12. Install Torsion bar, refer to Torsion Bar in this section.
13. Install rear nut and tighten lower link nut finger–tight.

NOTE: Torque lower control arm nut after adjusting buffer clearance.

Buffer clearance: 22 mm (0.87 in)

Torque: 235 N·m (174 lb ft)



450RS012

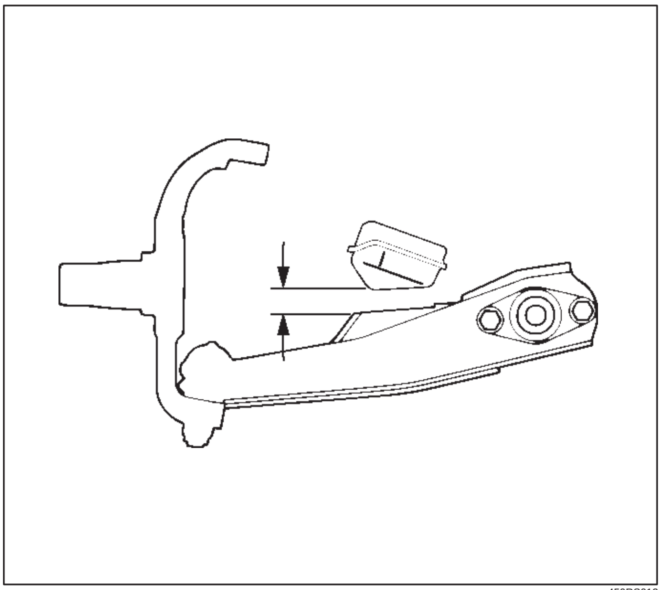
14. Install front nut then tighten lower link nut finger-tight.

NOTE: Torque lower control arm nut after adjusting buffer clearance .

Buffer clearance: 22 mm (0.87 in)

Torque: 190 N·m (140 lb ft)

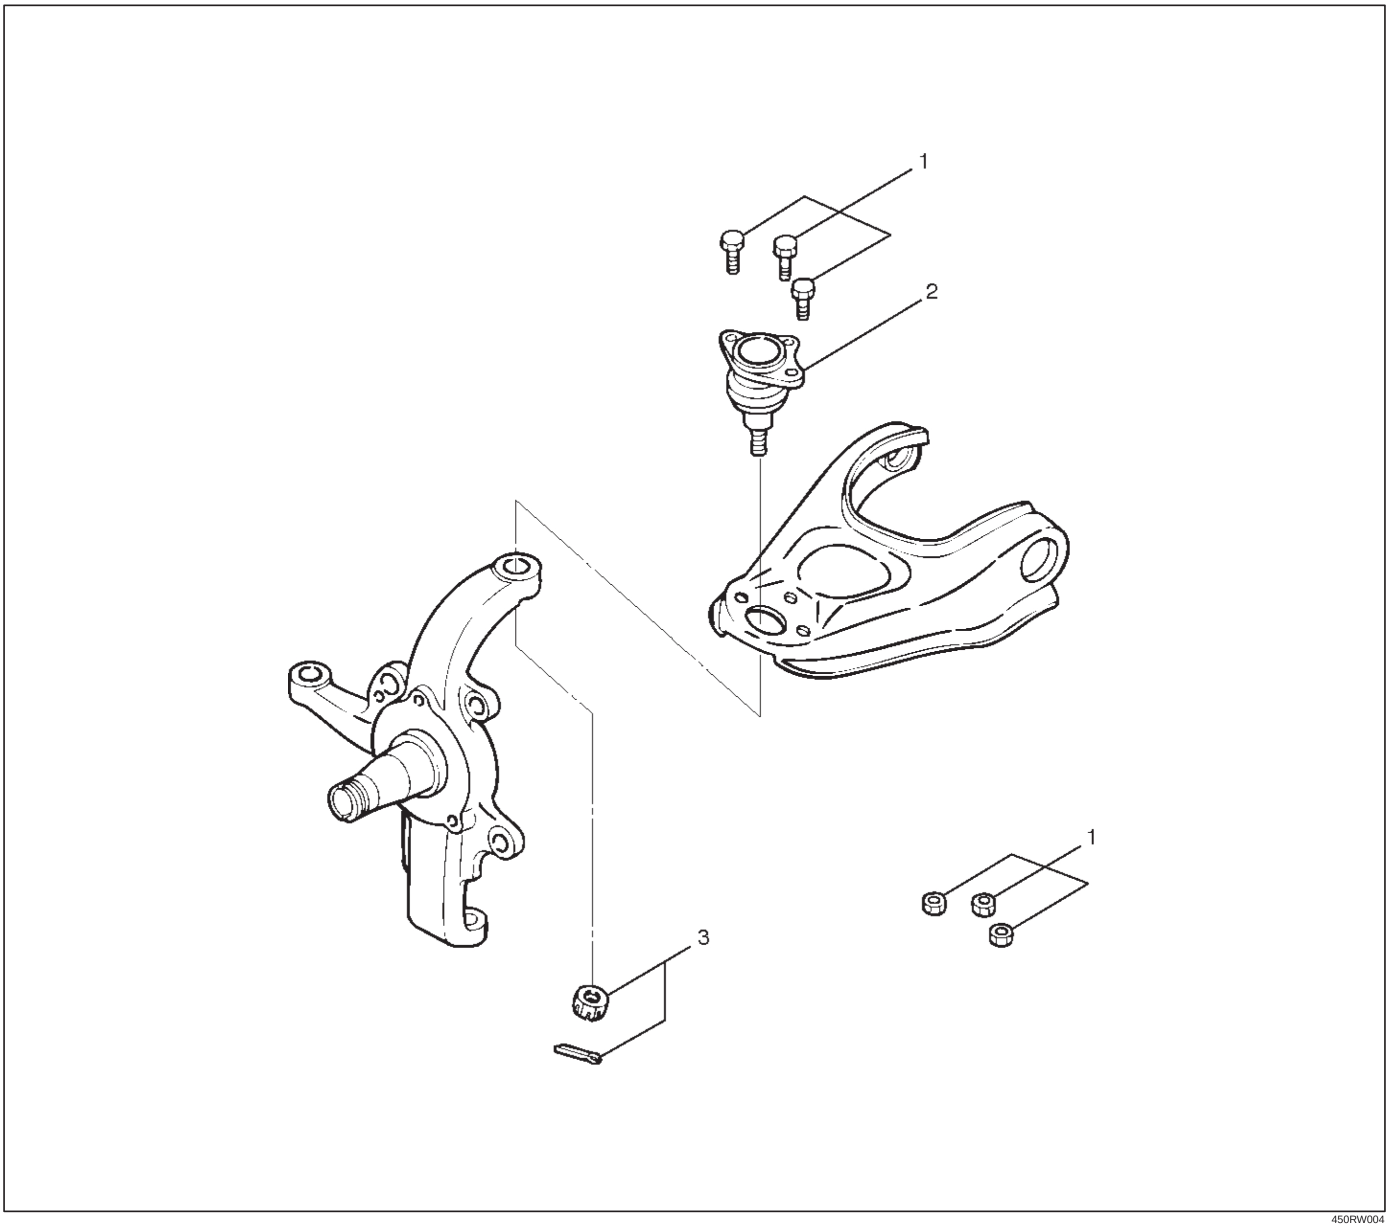
NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering section.



450RS012

Upper Ball Joint

Upper Ball Joint and Associated Parts



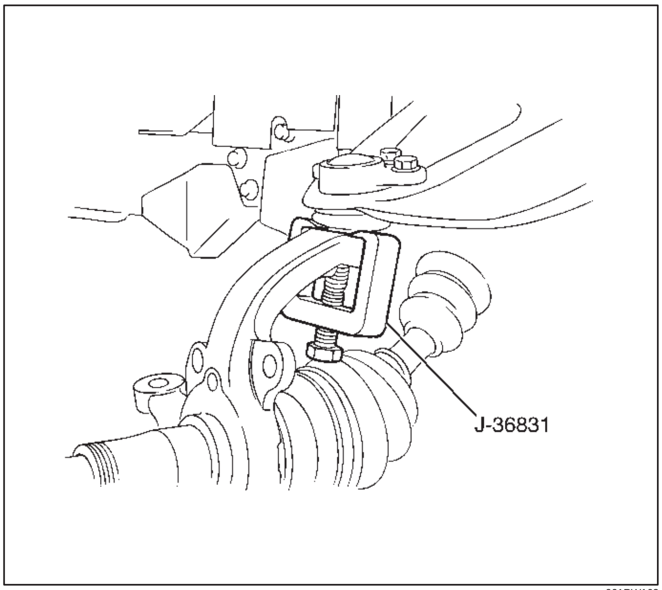
Legend
(1) Bolt and Nut
(2) Upper Ball Joint
(3) Nut and Cotter Pin

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove the speed sensor from the knuckle.

3. Remove upper ball joint nut and cotter pin, then use remover J–36831 to remove the upper ball joint from the knuckle.

CAUTION: Be careful not to damage the ball joint boot.



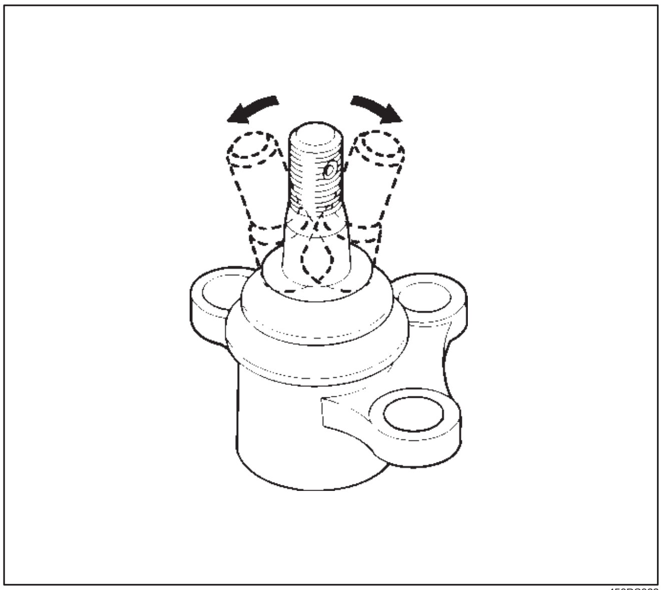
901RW162

4. Remove bolt and nut.
5. Remove upper ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.

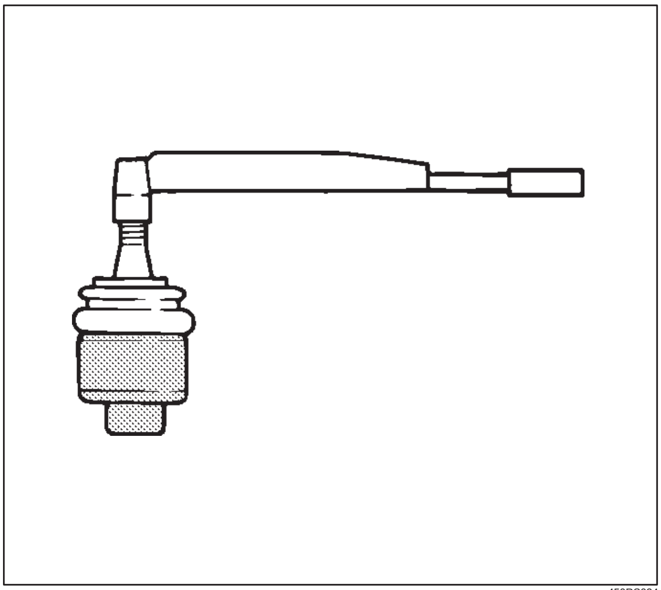
- Inspect the lower end boot for damage or grease leak. Move the ball joint as shown in the figure to confirm its normal movement.
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.



450RS023

- After moving the ball joint 4 or 5 times, attach nut then measure the preload.

Starting torque: 0.5 –3.2 N·m (0.4–2.4 lb ft)



450RS024

If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install upper ball joint.
2. Install bolt and nut, then tighten them to the specified torque.

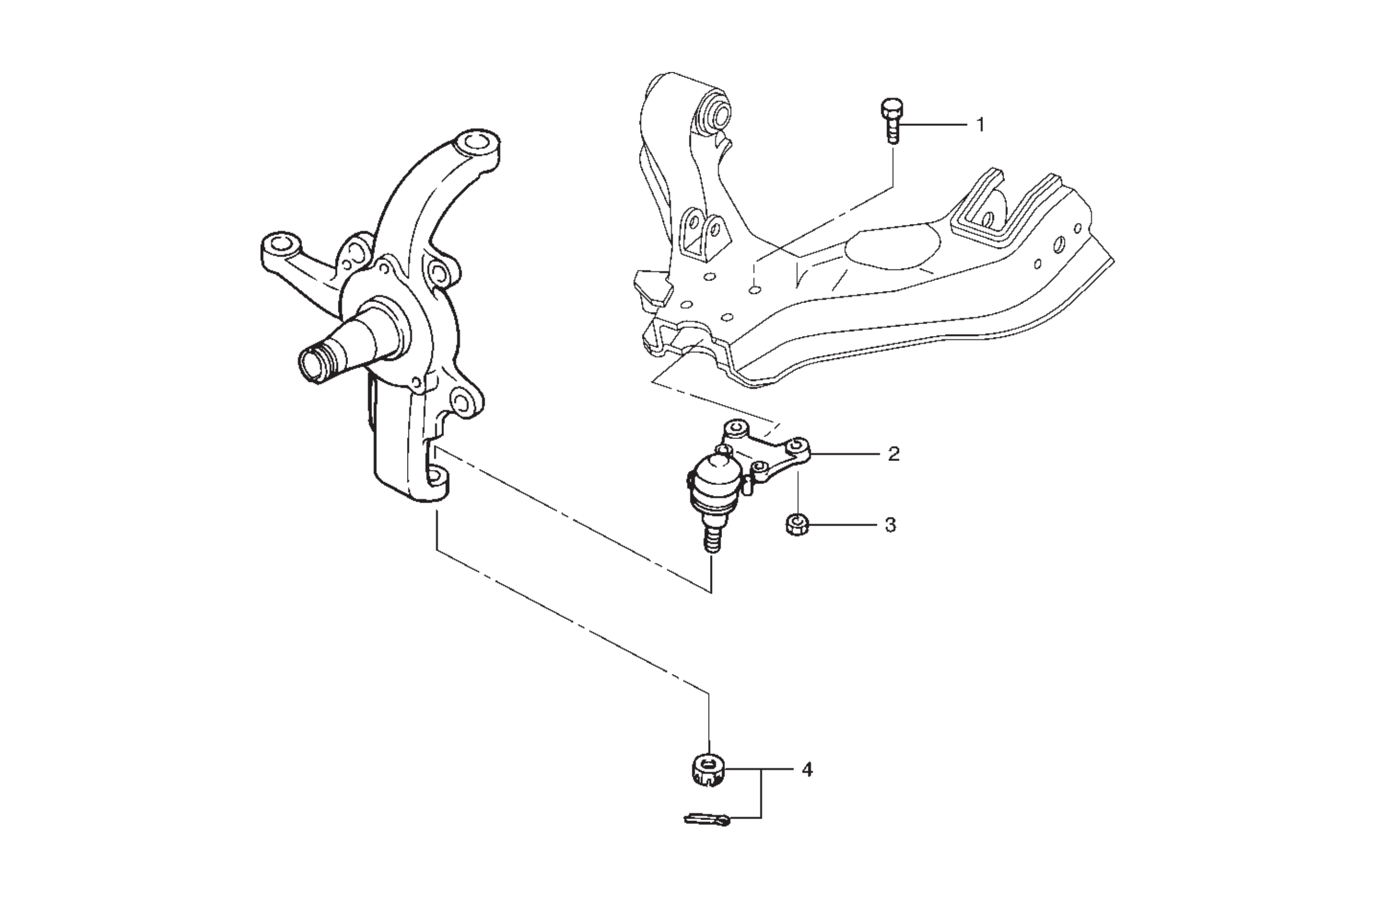
Torque: 57 N·m (42 lb ft)

3. Install nut and cotter pin, then tighten the nut to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98 N·m (72 lb ft)

Lower Ball Joint

Lower Ball Joint and Associated Parts



450RW011

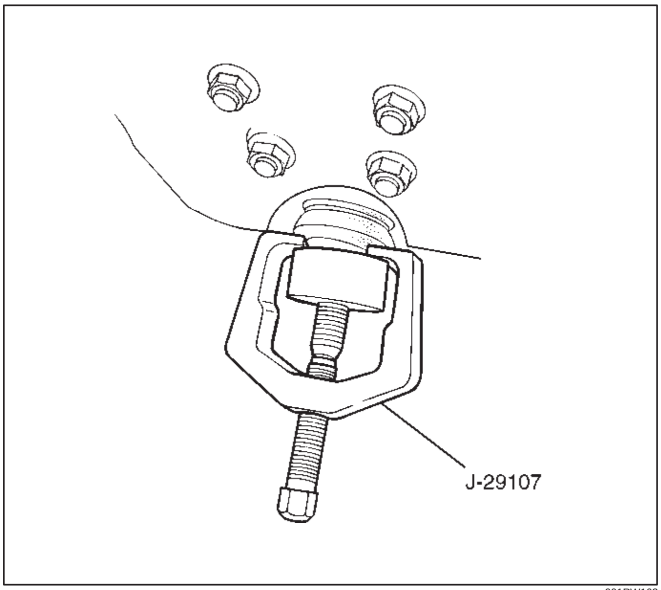
Legend

(1) Bolt
(2) Lower Ball Joint
(3) Nut
(4) Nut and Cotter Pin

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
4. Remove the retaining ring from the front axle driving shaft to release the shaft from hub(Except 2WD model). Refer to Front Hub and Disc in Driveline/Axle section.
5. Support lower control arm with a jack.
6. Remove lower ball joint nut and cotter pin, then use remover J–29107 to remove the lower ball joint from the knuckle.

CAUTION: Be careful not to damage the ball joint boot.



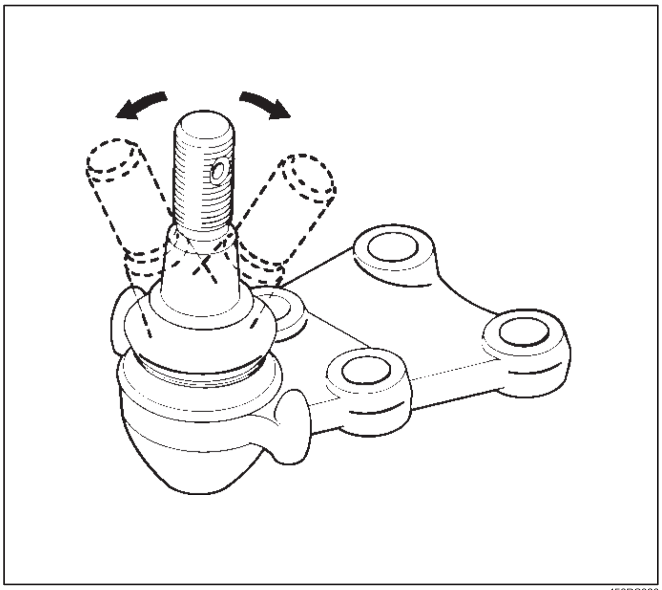
901RW163

7. Remove nut.
8. Remove bolt.
9. Remove lower ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

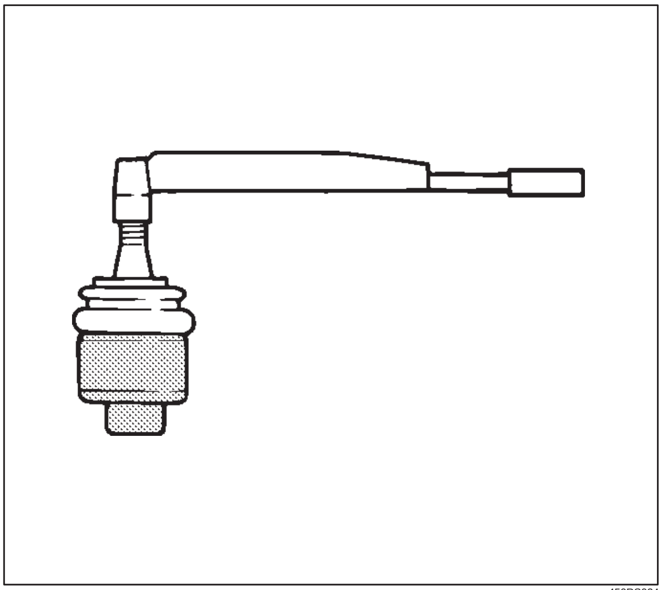
- Inspect the lower end boot for damage or grease leak. Move the ball joint as shown in the figure to confirm its normal movement .
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.



450RS026

- After moving the ball joint 4 or 5 times, attach nut the measure the preload.

Starting torque: 0.5–6.4 N·m (0.4–4.7 lb ft)



450RS024

- If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install lower ball joint.
2. Install bolt.
3. Install nut and tighten it to the specified torque.

Torque: 116 N·m (85 lb ft)

4. Install ball joint nut, then tighten it to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147 N·m (108 lb ft)

Main Data and Specifications

General Specifications

Front suspension	Type	Independent wishbone arms, torsion bar spring with stabilizer bar.
Torsion bar spring	Length	1142 mm (45.0 in)
	Diameter	28.0 mm (1.10 in)
Front shock absorber	Type	Hydraulic, double acting, telescopic
	Piston diameter	30.0 mm (1.18 in)
	Stroke	125.0 mm (4.92 in)
	Compressed length	255.0 mm (10.04 in)
	Extended length	380.0 mm (14.96 in)
Stabilizer bar	Diameter	24.0 mm (0.94 in)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The rear suspension is a 5-link, coil spring type suspension with a stabilizer bar, consisting of two trailing links, two upper links, lateral rod, shock absorber, and stabilizer. In this suspension, the links are specially arranged to enable the rear axle to move freely, thereby expanding suspension stroke, reducing friction, and improving lateral rigidity and roll control. All these result in improved stability, riding comfort, and rough road maneuverability.
Each link connects the axle housing with the frame through a runner bushing. The axle housing is supported by the trailing links and upper links longitudinally and by the lateral rod latitudinally.

Diagnosis

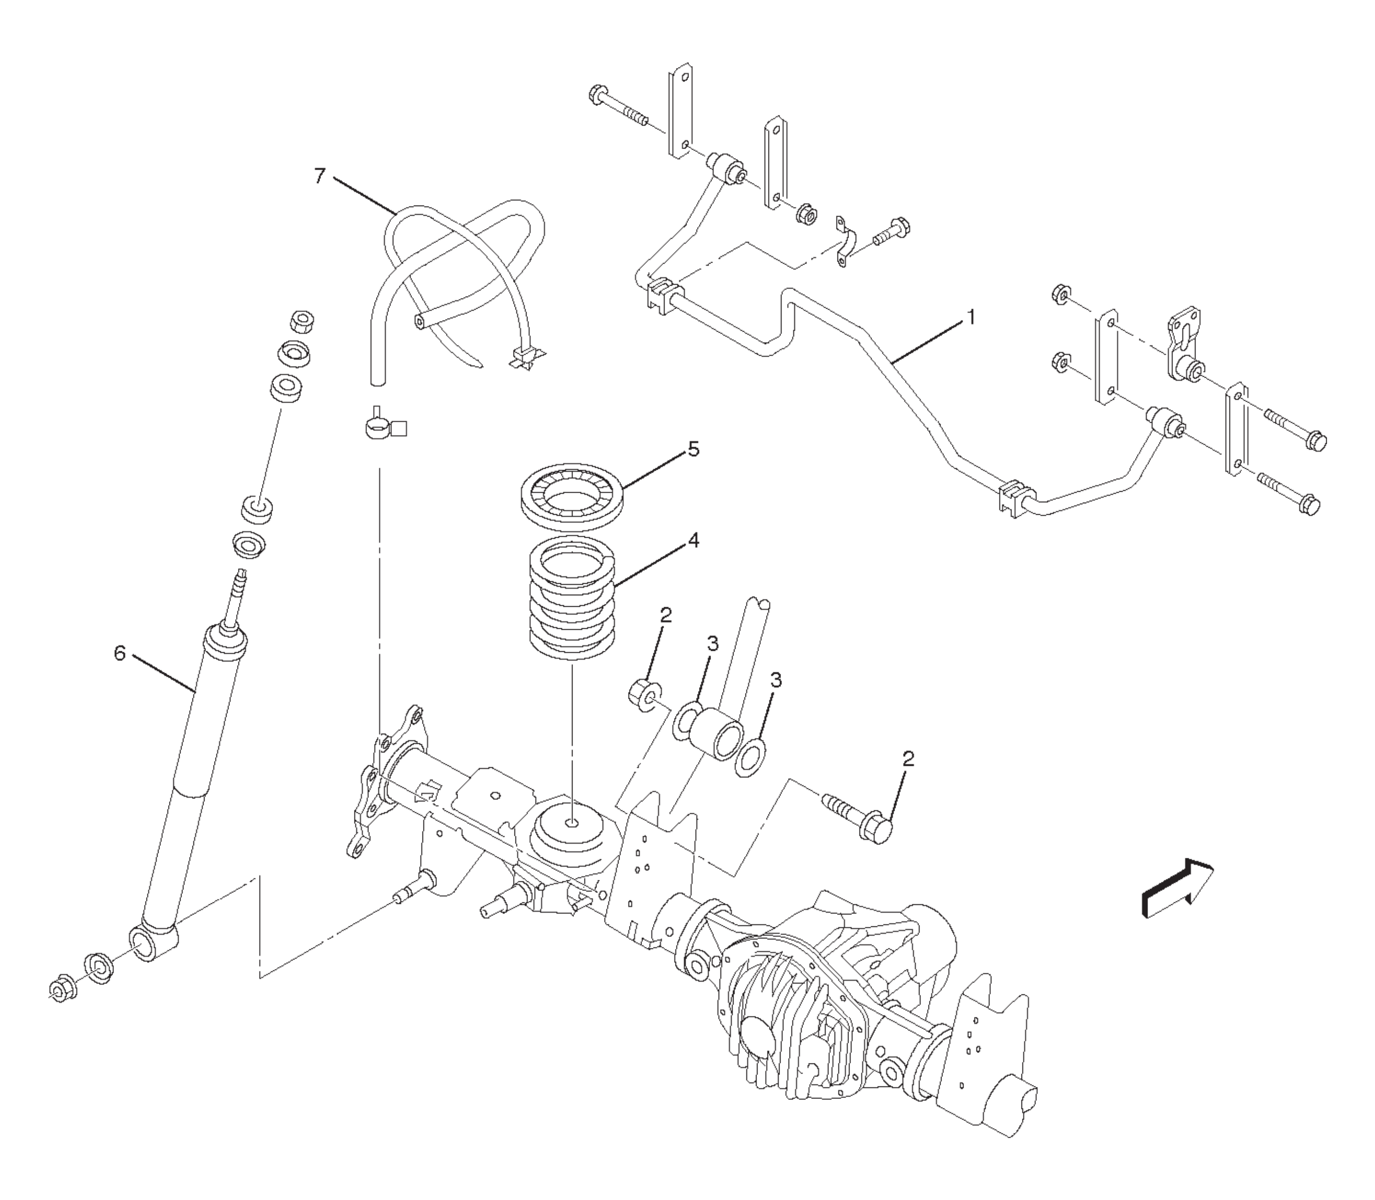
Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
	Tires not adequately inflated.	Adjust the pressure.
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
	Parts in power steering valve defective.	Replace power steering unit.

Condition	Possible cause	Correction
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.

Condition	Possible cause	Correction
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Coil Spring

Coil Spring and Associated Parts



Legend
- (1) Stabilizer Bar
- (2) Upper Link Fixing Bolt and Nut
- (3) Rubber Plate
- (4) Coil Spring
- (5) Insulator
- (6) Shock Absorbar
- (7) Breather Hose

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Support the rear axle case with a jack.
3. Disconnect brake hose at the crossmember.
4. Remove breather hose.
5. Remove upper link fixing bolt, nut and rubber plate on the rear axle case (left-side only).
6. Disconnect the stabilizer bar at the stabilizer link.
7. Remove the shock absorber from the axle case.
8. Remove spring insulator.
9. Remove the insulator and coil spring while lowering the rear axle case.

CAUTION: Be sure not to let the brake hose, parking brake cable, and breather hose extend to their full length.

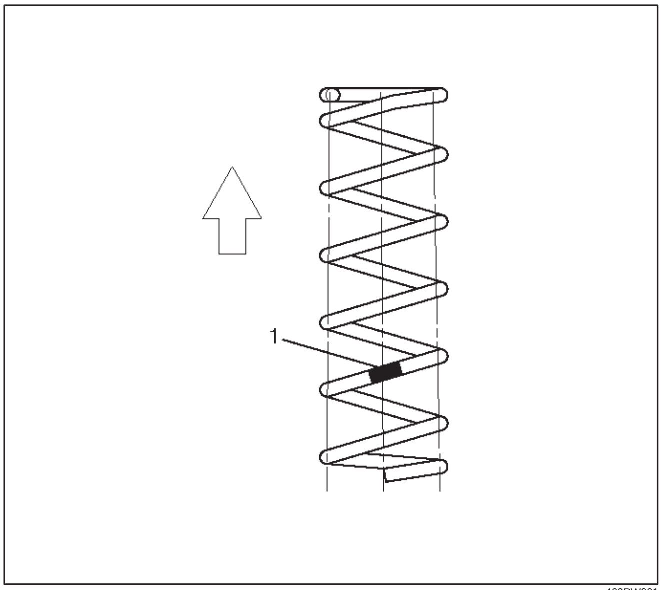
Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

- Coil spring
- Insulator

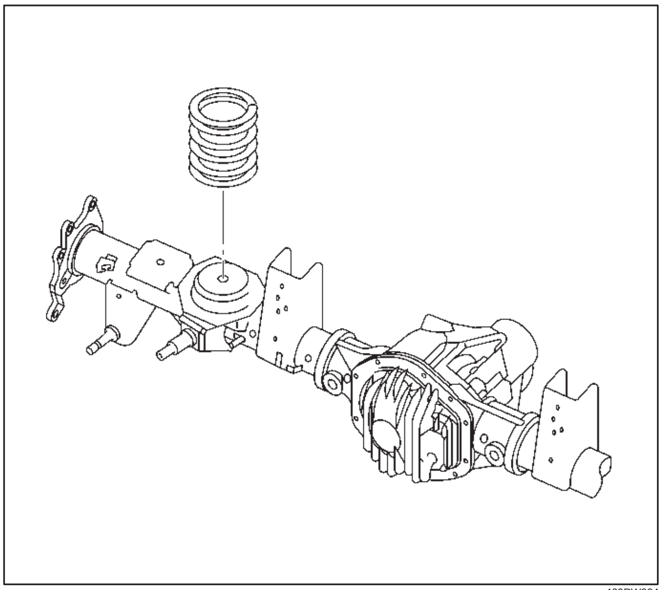
Installation

1. Install coil spring and make sure that the coil spring is installed in the proper position. Paint mark(1) should be downward.



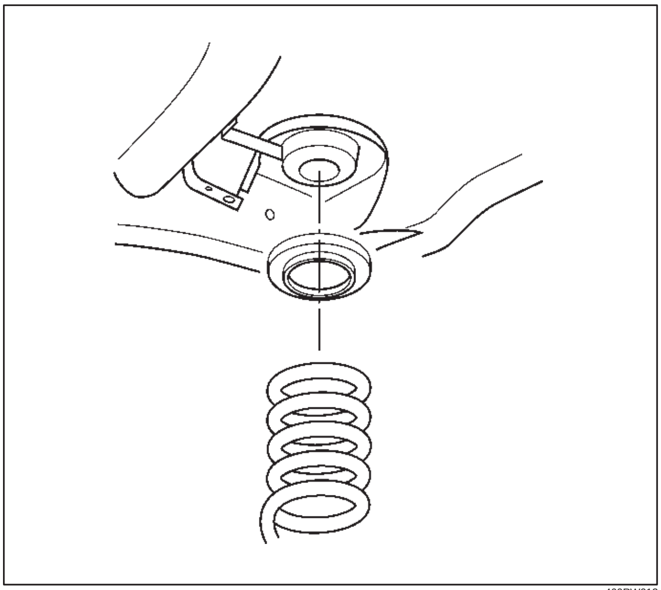
460RW001

2. Fit the end of the coil spring to the coil spring seat and mount the coil spring on the rear axle case.



460RW004

3. Install the insulator on the coil spring. Jack up the axle case gently with the top of the coil spring set to the spring seat on the frame side.



460RW013

4. Install shock absorber and tighten the nut lightly, then retighten it to the specified torque after the vehicle is at curb height.

NOTE: When mounting shock absorber, be sure not to use grease on bushings or any other nearby part.

Torque: 78 N·m (58 lb ft)

5. Install stabilizer bar.

Torque: 31 N·m (23 lb ft)

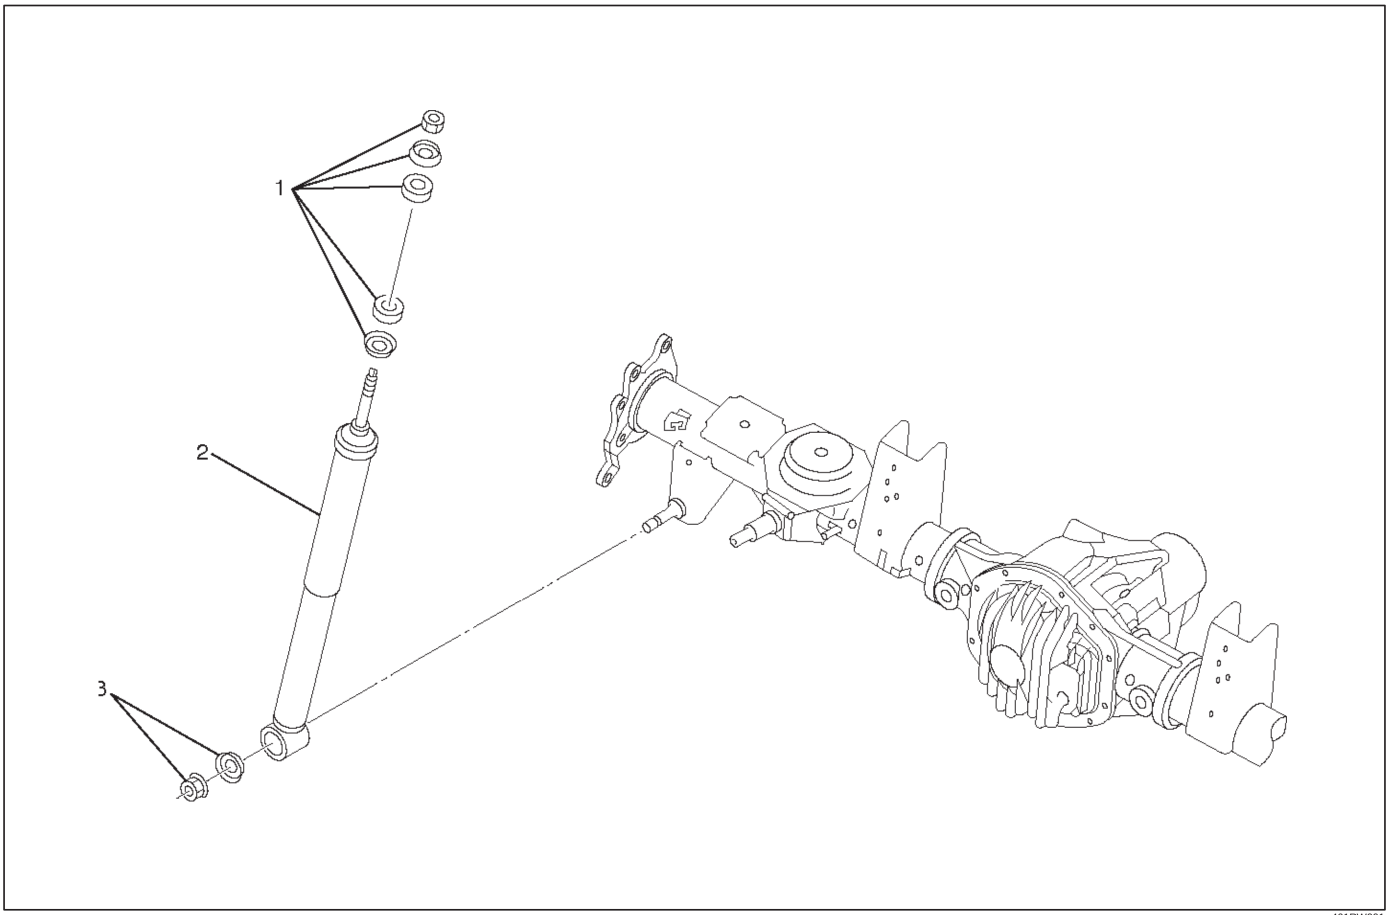
6. Install upper link with rubber plate and tighten fixing bolt.

Torque: 137 N·m (101 lb ft)

7. Install breather hose.
8. Connect brake hose and bleed the brake system.
   Refer to Bleeding the Brake Hydraulic System in Brake section.

Shock Absorber

Shock Absorber and Associated Parts



461RW001

Legend

(1) Nut, Bush and Washer
(2) Shock Absorber
(3) Nut and Washer

Removal

1. Remove shock absorber fixing nut, bush and washer (upper side).
2. Remove shock absorber fixing nut and washer (lower side).
3. Remove shock absorber.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

- Shock absorber
- Rubber bushing

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

Installation

1. Install shock absorber. When mounting shock absorber, be sure not to use grease on bushings or any other nearby part.
2. Install nut and washer (lower side), then tighten the nut lightly. Retighten to the bolt and nut specified torque after the vehicle is at curb height.

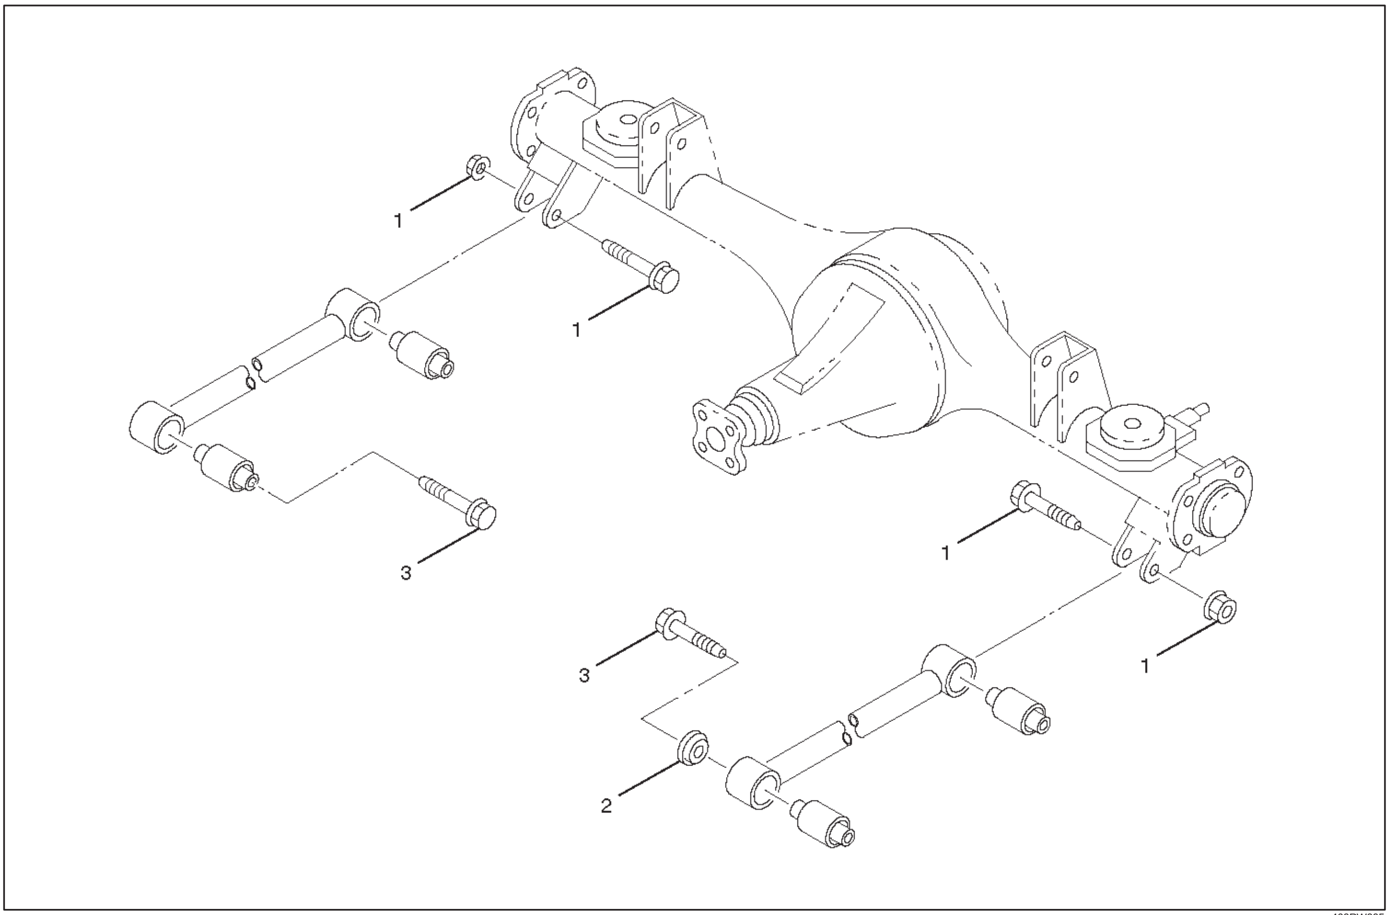
   Torque: 78 N·m (58 lb ft)

3. Install nut, bush and washer (upper side), then tighten the nut lightly. Retighten to the nut specified torque after the vehicle is at curb height.

   Torque: 20 N·m (14 lb ft)

Trailing Link

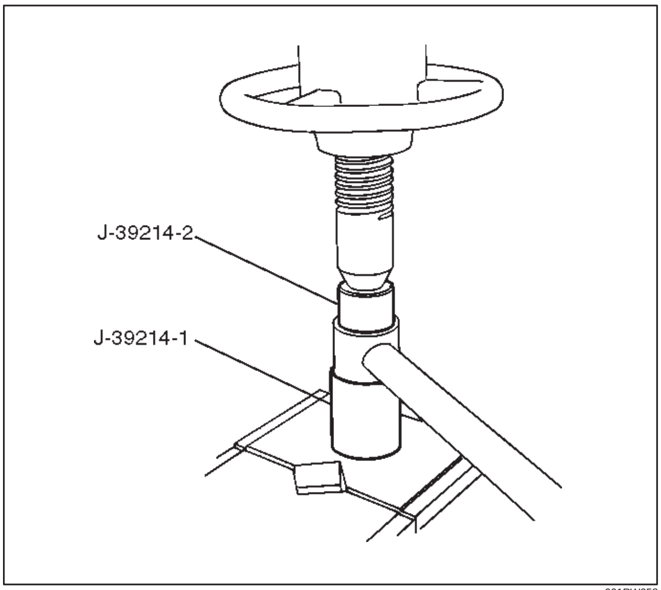
Trailing Link and Associated Parts



Legend
(1) Bolt and Nut (Axle side)
(2) Protector (Left side only)
(3) Bolt (Frame side)

Removal

1. Remove the parking brake cable from the trailing link.
2. Remove the trailing link fixing bolt, nut and protector.
3. Remove trailing link.



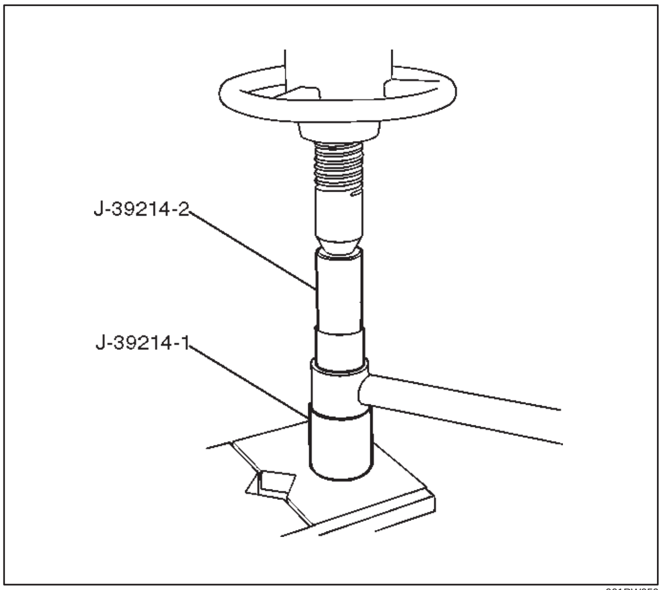
Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

1. Trailing link
2. Rubber bushing
   - Remove the rubber bushing by using remover J–39214.

- Install the rubber bushing by using installer J–39214.

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

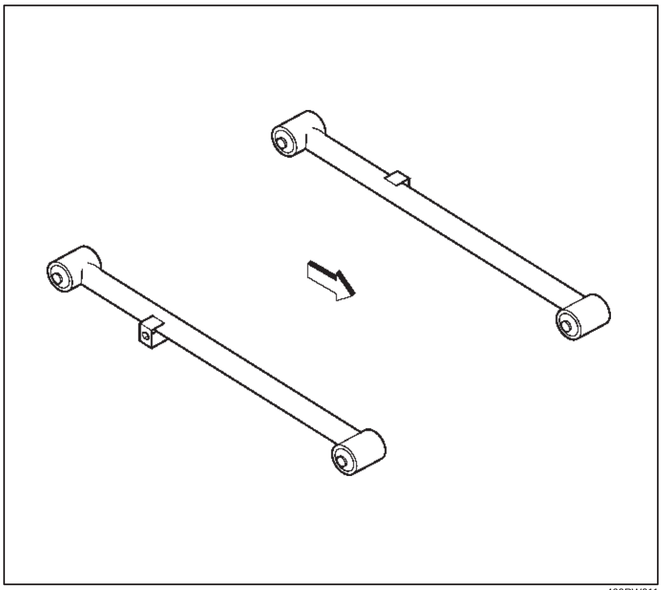


901RW059

Installation

1. Install trailing link. Make sure that the trailing link is in its correct position.

NOTE: When mounting trailing link, be sure not to use grease on bushings or any other nearby part.



460RW011

2. Install bolt, nut and protector. Tighten the bolts and nuts lightly, then retighten them to the specified torque after the vehicle is at curb height.

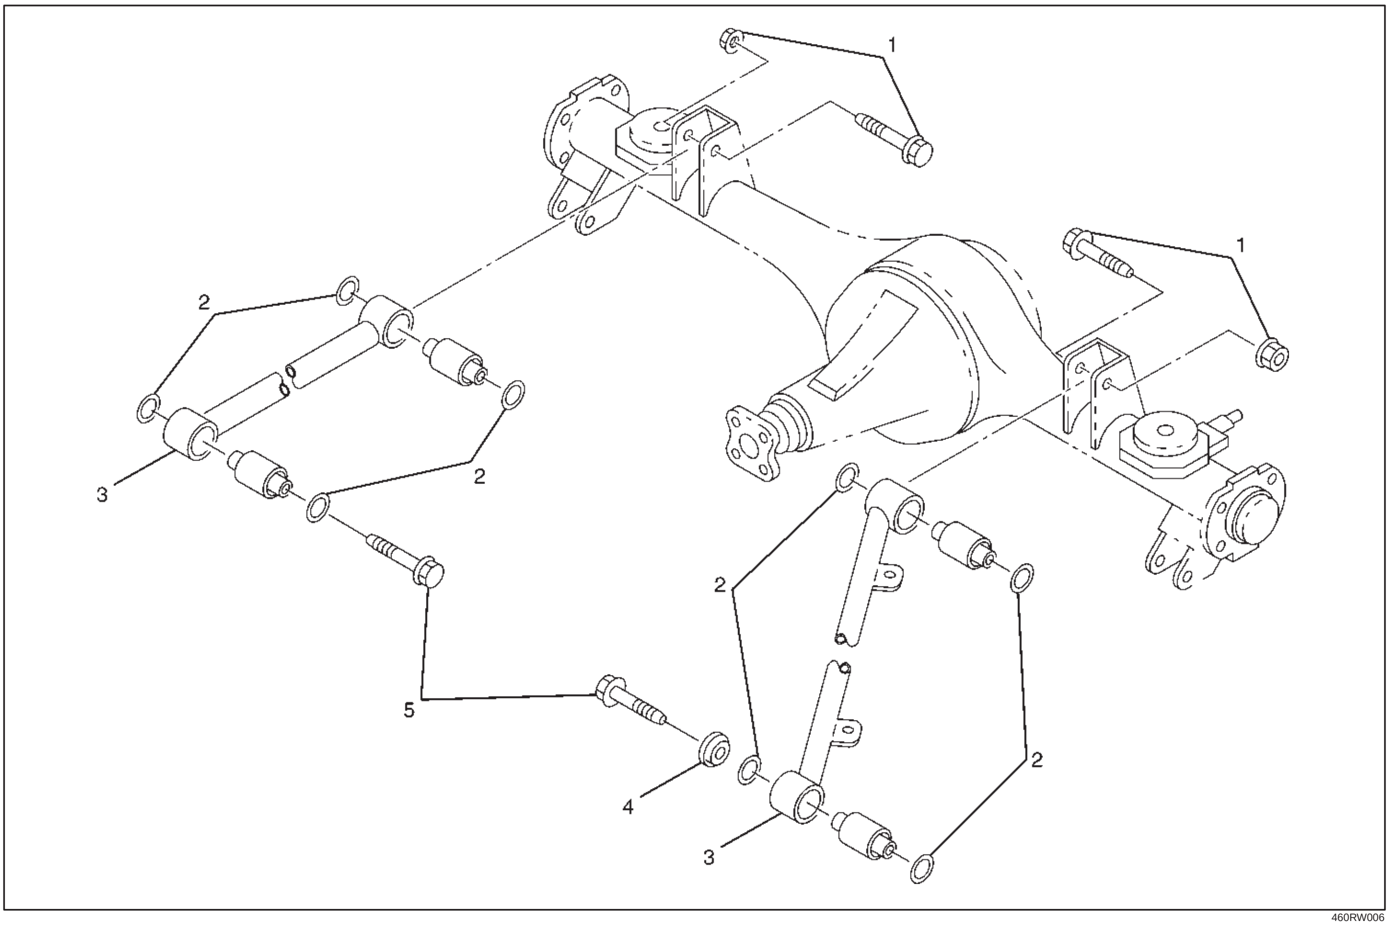
   Torque: 137 N·m (101 lb ft)

3. Install parking brake cable.

CAUTION: The parking brake cable should not be overstrained or slackened.

Upper Link

Upper Link and Associated Parts



Legend

(1) Bolt and Nut (Axle side)
(2) Rubber Plate
(3) Upper Link
(4) Protector (Left side only)
(5) Bolt (Frame side)

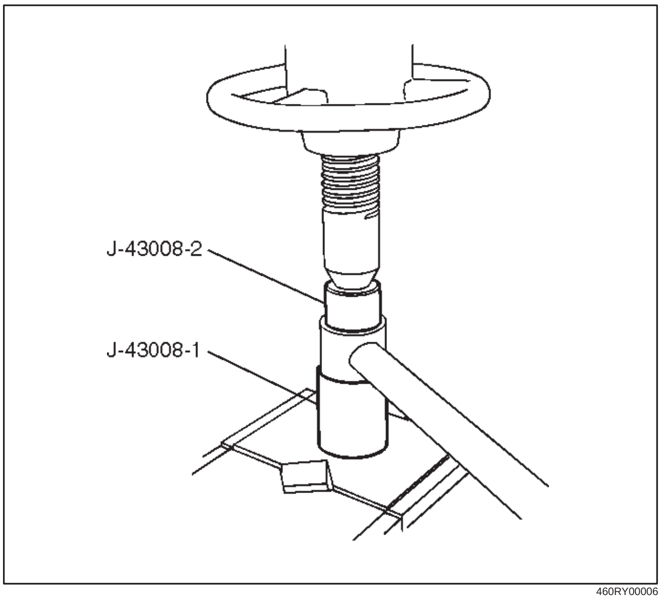
Removal

1. Remove fuel tank. Refer to Engine Fuel in Engine section.
2. Remove the speed sensor cable from the upper link.
3. Remove bolt, nut, rubber plate and protector.
4. Remove upper link.

Inspection and Repair

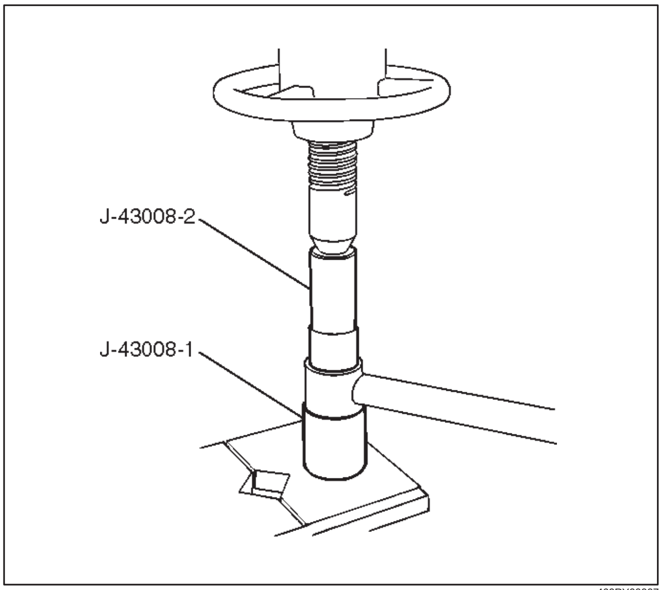
Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

1. Upper link
2. Rubber bushing
   - Remove the rubber bushing by using remover J–43008.



- Install the rubber bushing by using to installer J–43008.

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

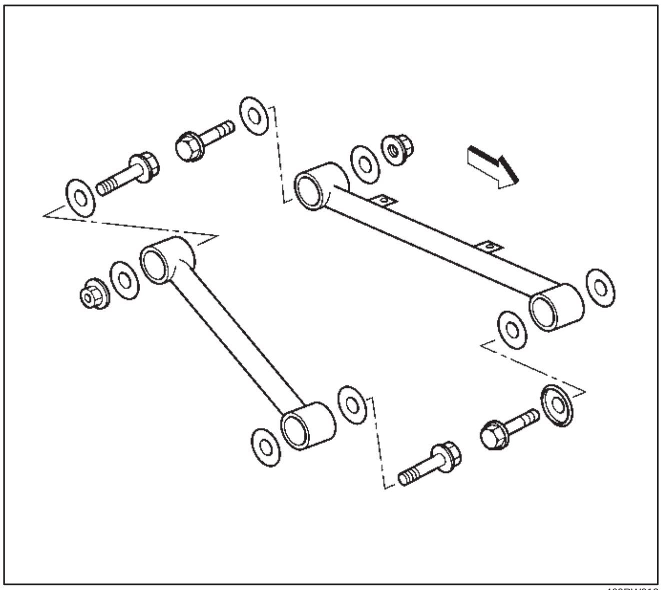


460RY00007

Installation

1. Install upper link. Make sure that the upper link is in its correct position.

NOTE: When mounting upper link, be sure not to use grease bushings or any other nearby part.



460RW012

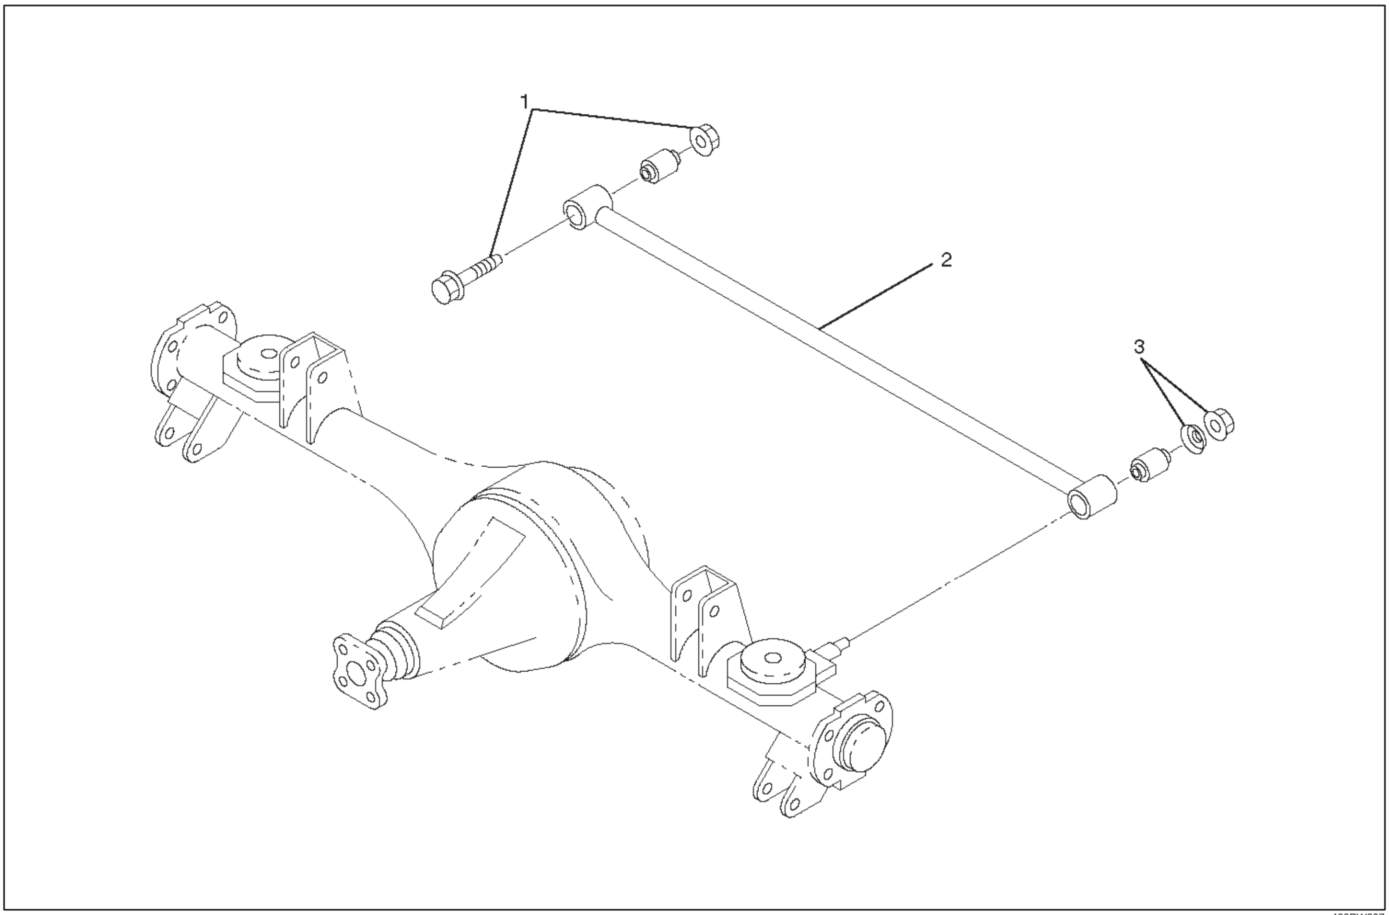
2. Install bolt, nut, rubber plate and protector. Tighten the bolts and nuts lightly, then retighten them to the specified torque after the vehicle is at curb height.

   Torque: 137 N·m (101 lb ft)

3. Install speed sensor cable.
4. Install fuel tank.

Lateral Rod

Lateral Rod and Associated Parts



460RW007

Legend

(1) Bolt and Nut (Frame side)

(2) Lateral Rod

(3) Nut and Washer (Axle side)

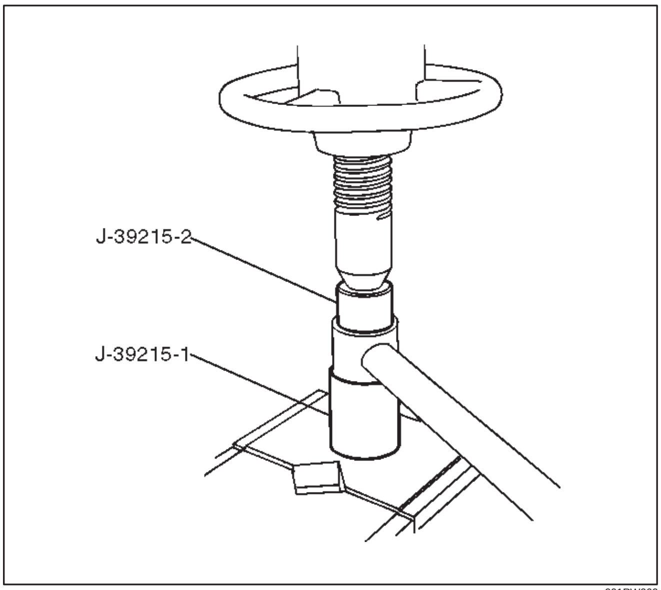
Removal

1. Remove nut and washer.
2. Remove bolt and nut.
3. Remove lateral rod.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

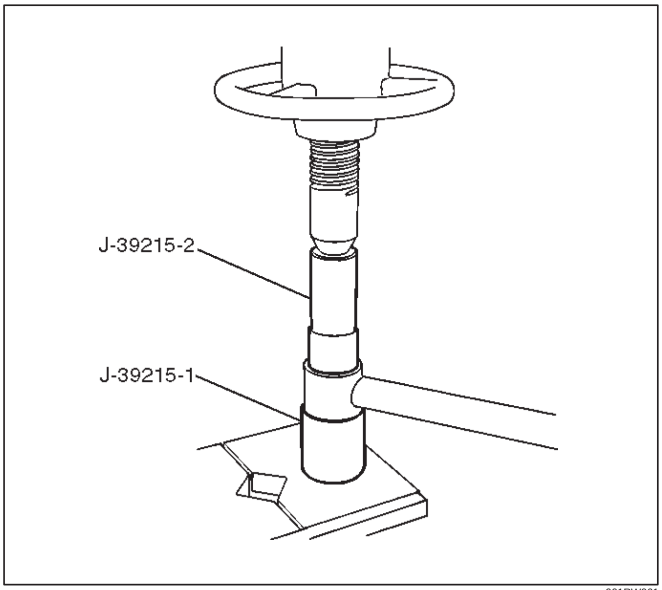
1. Lateral rod
2. Rubber bushing (Frame side)
   - Remove the rubber bushing (Frame side) by using remover J–39214.



901RW060

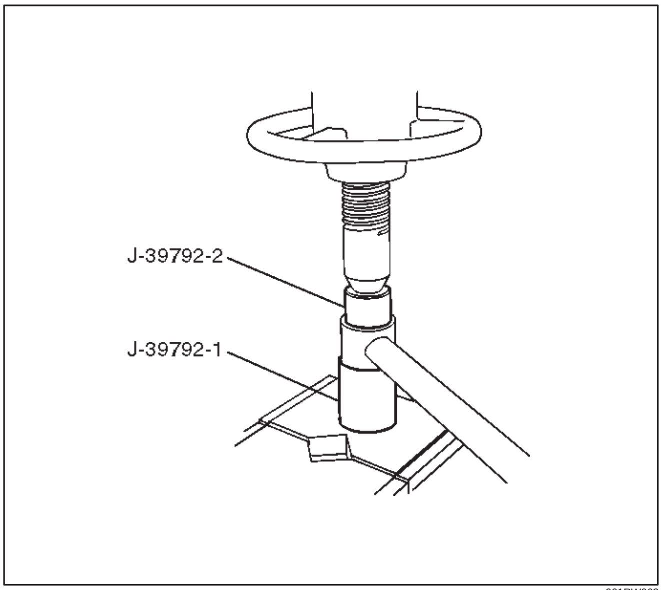
- Install the rubber bushing (Frame side) by using Installer J–39215.

NOTE: When mounting rubber bushings, do not use grease on bushings or any other nearby parts.



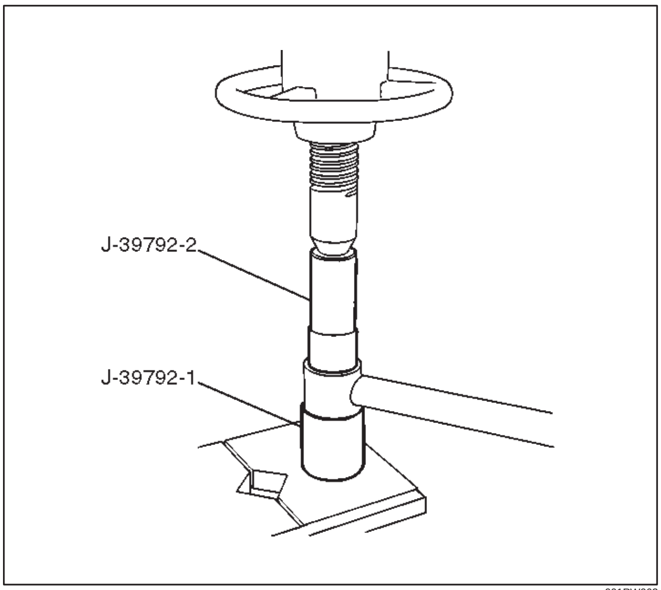
901RW061

3. Rubber bushing (Axle side)
   - Remove the rubber bushing (Axle side) by using remover J–39792.



901RW062

- Install the rubber bushing (Axle side) by using installer J–39792.

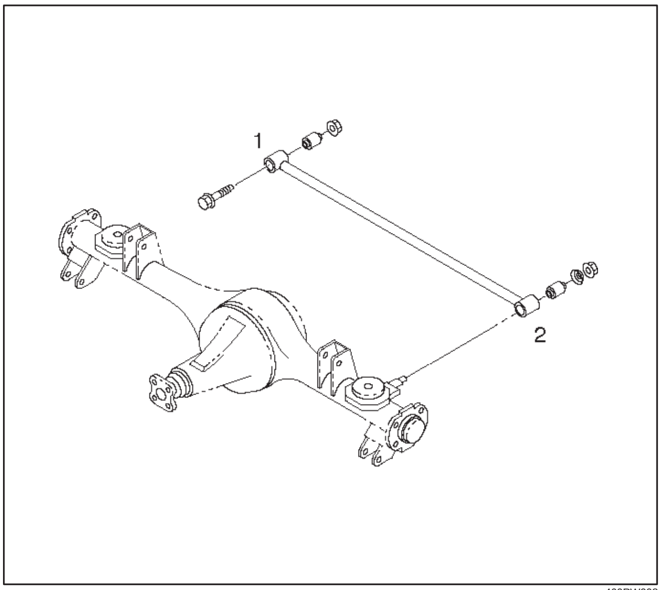


901RW063

Installation

1. Install lateral rod and make sure that the lateral rod is in its correct position.

NOTE: When mounting lateral rod, be sure not to use grease on bushings or any other nearby part.



460RW008

Legend

(1) Frame Side
(2) Axle Side

2. Install bolt and nut. Tighten the bolt and nut lightly, then retighten them to the specified torque after the vehicle is at curb height.

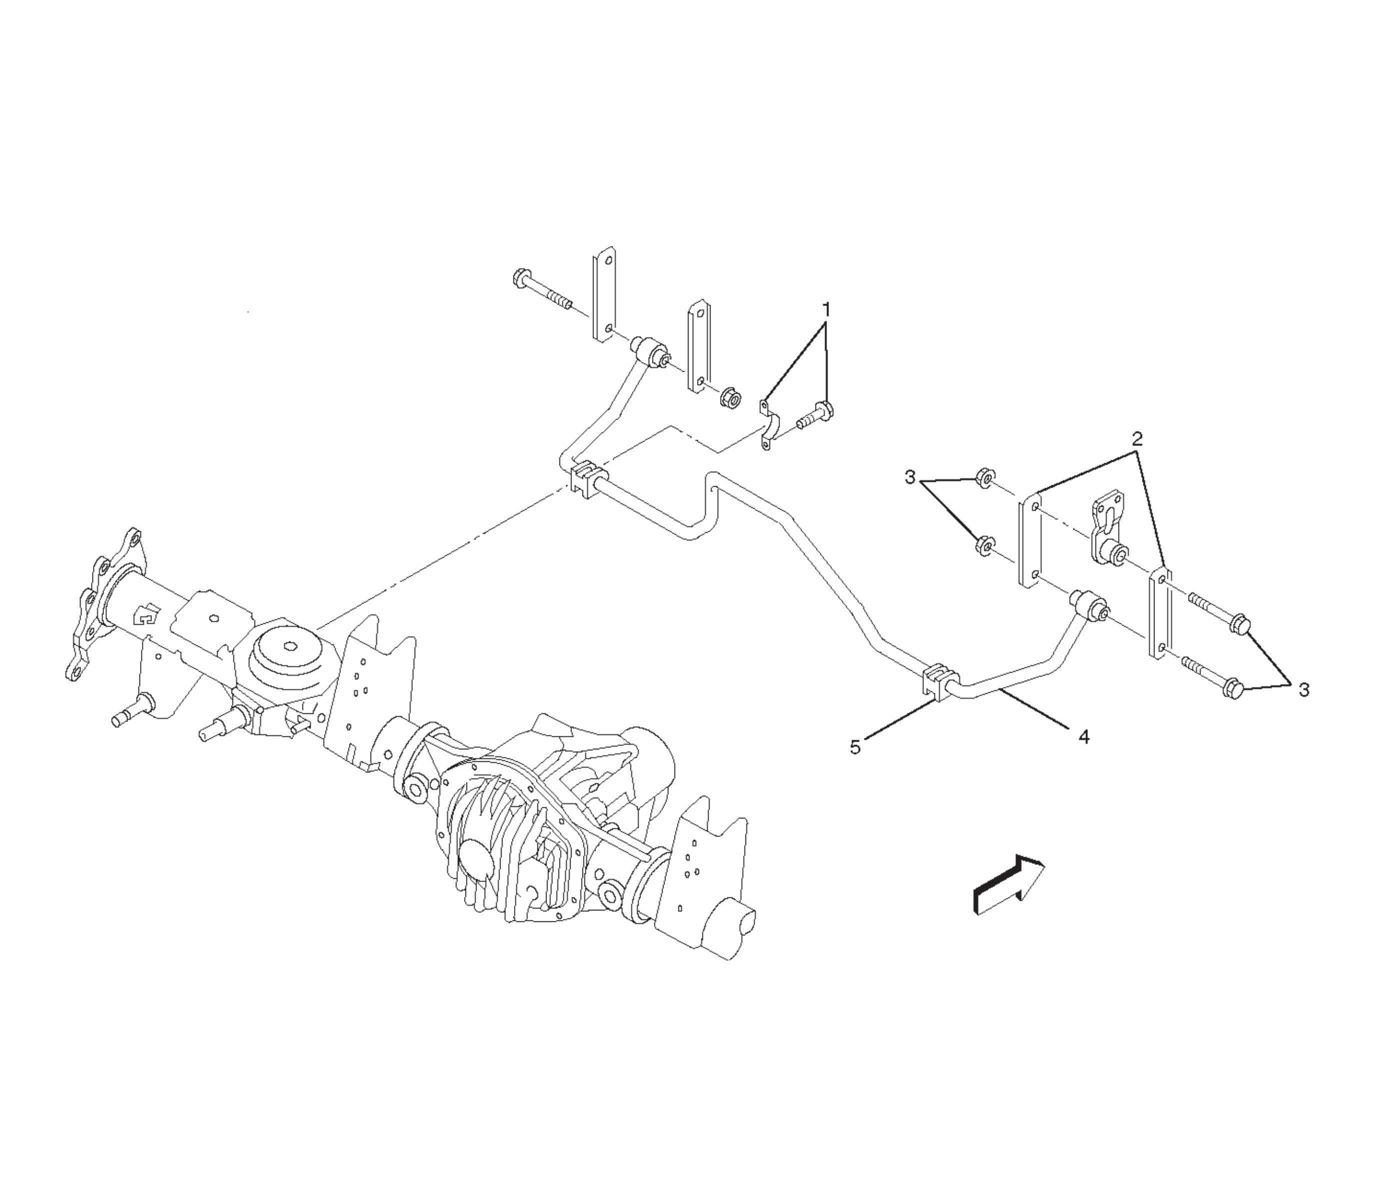
   Torque: 137 N·m (101 lb ft)

3. Install nut and washer. Tighten the nut lightly, then retighten the nut to the specified torque after the vehicle is at curb height.

   Torque: 78 N·m (58 lb ft)

Stabilizer Bar

Stabilizer Bar and Associated Parts



Legend

(1) Bracket
(2) Link
(3) Bolt and Nut
(4) Stabilizer Bar
(5) Rubber Bushing

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove bolt and nut.
4. Remove link.

CAUTION: Be careful not to damage the ball joint boot.

5. Remove bracket.
6. Remove rubber bushing.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

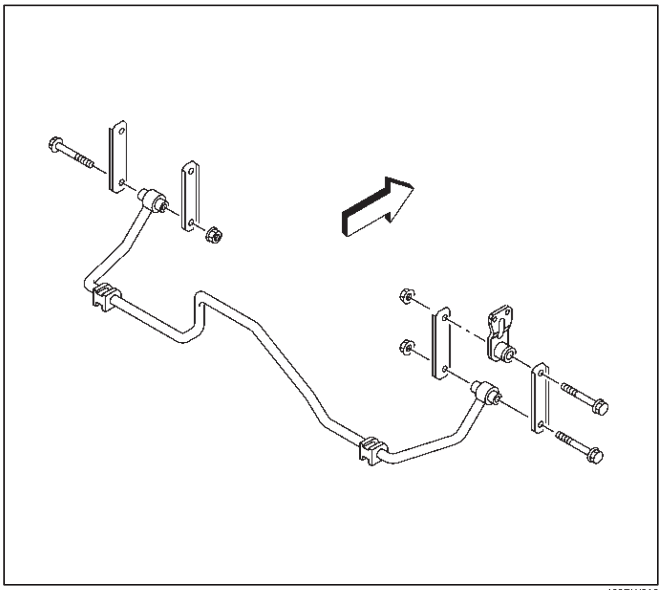
- Stabilizer bar
- Rubber bushing
- Link

Installation

1. Install rubber bushing.
2. Install bracket to axle housing and tighten to the specified torque.

   Torque: 25 N·m (19 lb ft)
3. Install link.
4. Install bolt and nut, then tighten the nut to the specified torque.

   Torque: 31 N·m (27 lb ft)



460RW010

Main Data and Specifications

General Specifications

Rear suspension	Type	5–Link, coil spring type with stabilizer bar.
Coil spring	Free length	389.5mm (15.33in)

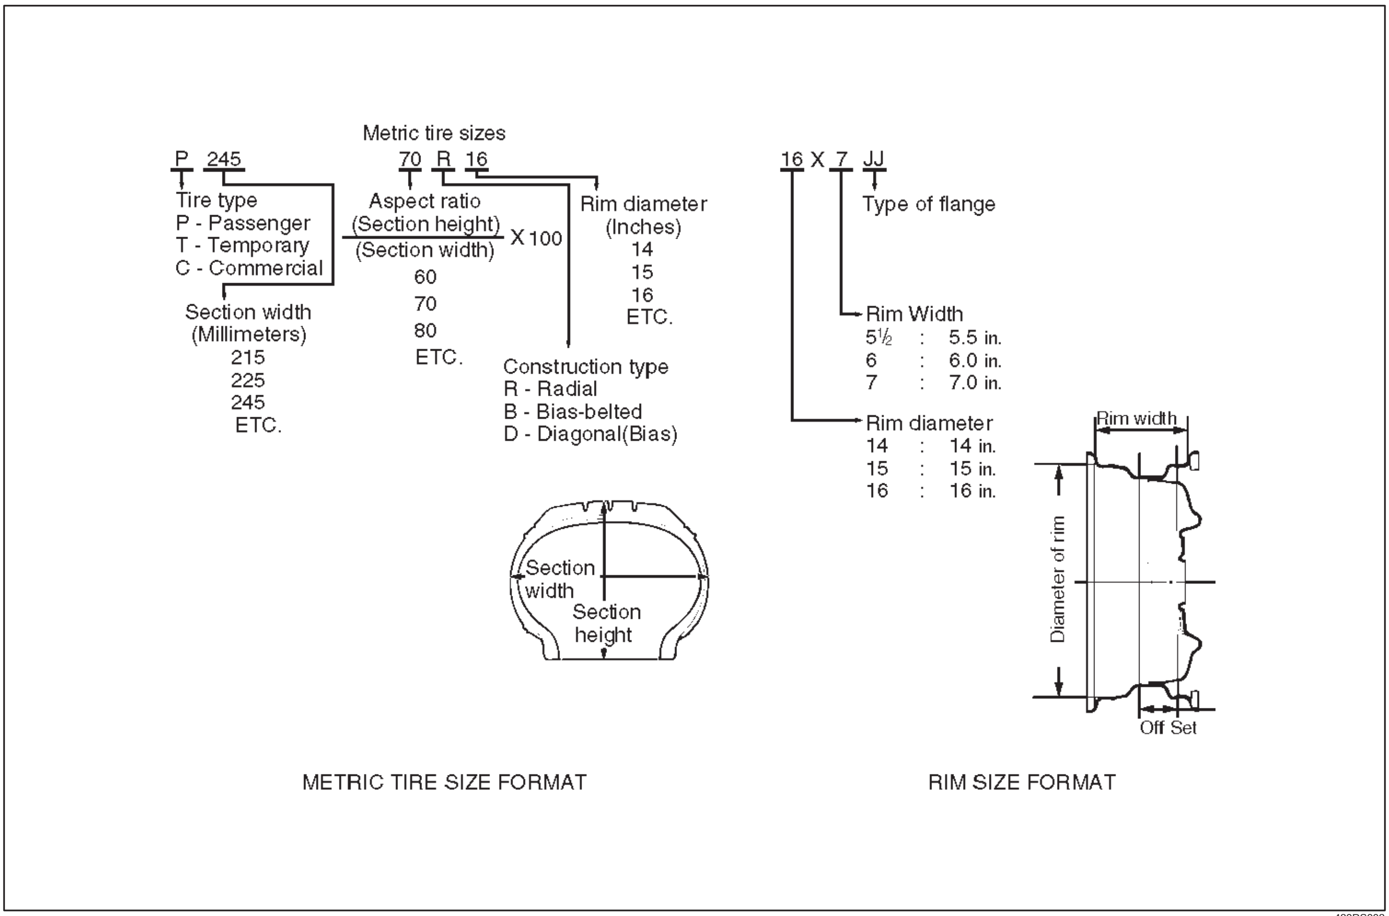
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description



480RS008

Replacement wheels or tires must be equivalent to the originals in load capacity, specified dimension and mounting configuration. Improper size or type may affect bearing life, brake performance, speedometer/odometer calibration, vehicle ground clearance and tire clearance to the body and chassis. All model are equipped with metric sized tubeless steel belted radial tires. Correct tire pressures and driving habits have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase premature and uneven wear.

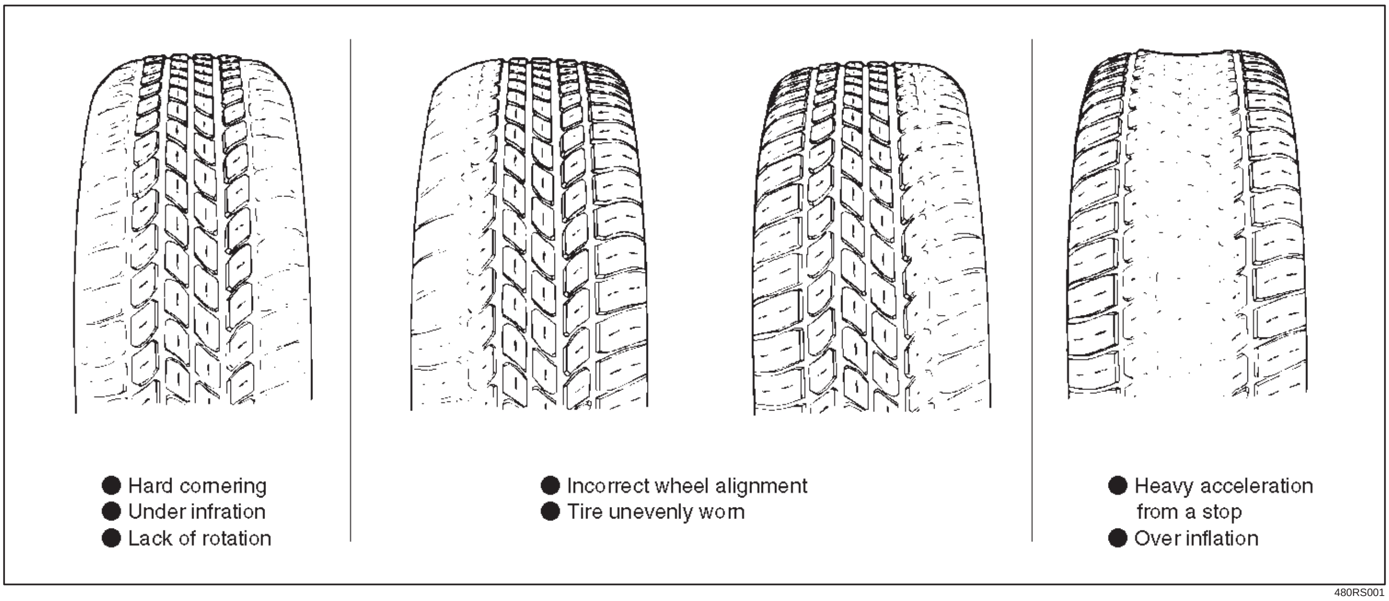
Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
	Tires not adequately inflated.	Adjust the pressure.
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
	Parts in power steering valve defective.	Replace power steering unit.

Condition	Possible cause	Correction
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.

Condition	Possible cause	Correction
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Irregular and Premature Wear

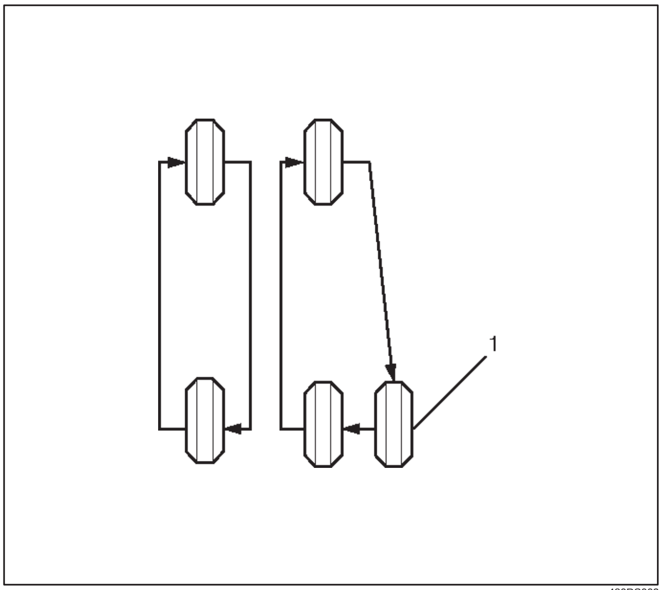


Irregular and/or premature wear has many causes. Some of them are incorrect inflation pressures, lack of tire rotation, poor driving habits or improper wheel alignment. Incorrect inflation is common cause of tire premature wear.

NOTE: Due to their design, radial tires tend to wear faster in the shoulder area, particularly on the front tires. This makes regular rotation especially necessary. After rotation, be sure to check wheel nut torque, and set tire pressures.

Tire Rotation

Tire rotation is recommended to equalize wear for longer tire life.



Legend

(1) Spare Tire

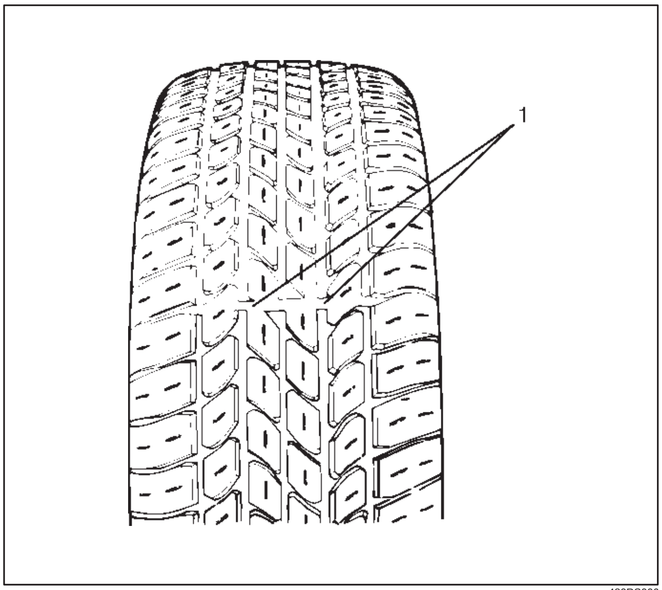
If the following conditions are noted, rotate the tires:

- Front tire wear is different from rear.
- Uneven wear exists across the tread of any tire.
- Left and right front tire wear is unequal.
- Left and right rear tire wear is unequal.

Check wheel alignment if the following conditions are noted:

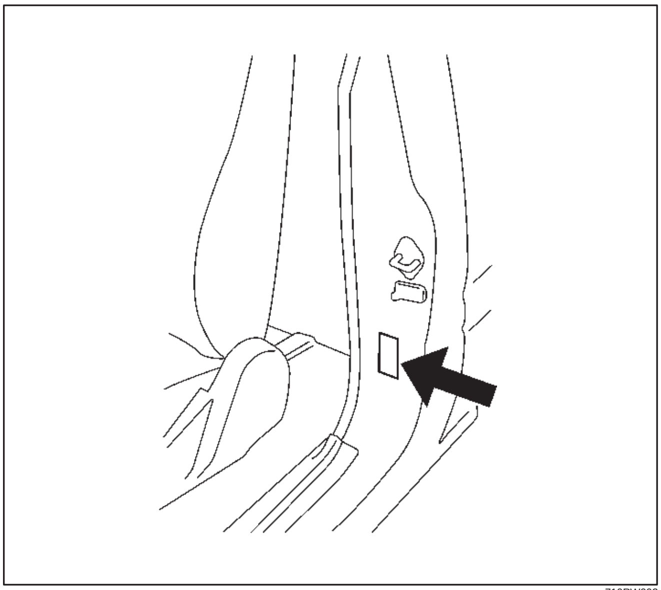
- Left and right front tire wear is unequal.
- Wear is uneven across the tread of any front tire.
- Front tire treads have a scuffed appearance with "feather" edges on one side of the tread ribs or blocks.

Tread Wear Indicators



The original equipment tires have built-in tread wear indicators(1) to show when tires need replacement. These indicators may appear as wide bands. When the indicators appear in two or more grooves at three locations, tire replacement is recommended.

Inflation of Tires



Tire pressure, in cold condition (after vehicle has set for three hours or more, and driven less than one mile), should be checked monthly or before any extended trip. Tire pressure increases approximately 15% when the tires become hot during driving. Tire pressure specification is shown on the label located on the left door lock pillar.

NOTE: Check the tire pressure whenever irregular wear is found. Tire inflation greatly affects tire wear. If the alignment check does not reveal any alignment problems, check the condition of the shock absorbers and wheel/tire balance.

Diagnosis List

If the following conditions are noted, rotation is required.

1. Front tire wear is different from rear.
2. Uneven wear exists across the tread of any tire.
3. Left and right front tire wear is unequal.
4. Left and right rear tire wear is unequal.

If the following conditions are noted, check the wheel alignment.

1. Left and right front tire wear is unequal.
2. Uneven wear exists across the tread of any tire.
3. Front tire treads have scuffed appearance with "feather" edges on one side of tread ribs or blocks.
4. There is cupping, flat spotting etc.

Higher than recommended pressure can cause:

1. Hard ride.
2. Poor steering stability.
3. Rapid and uneven wear at center of the tread.

Lower than recommended pressure can cause:

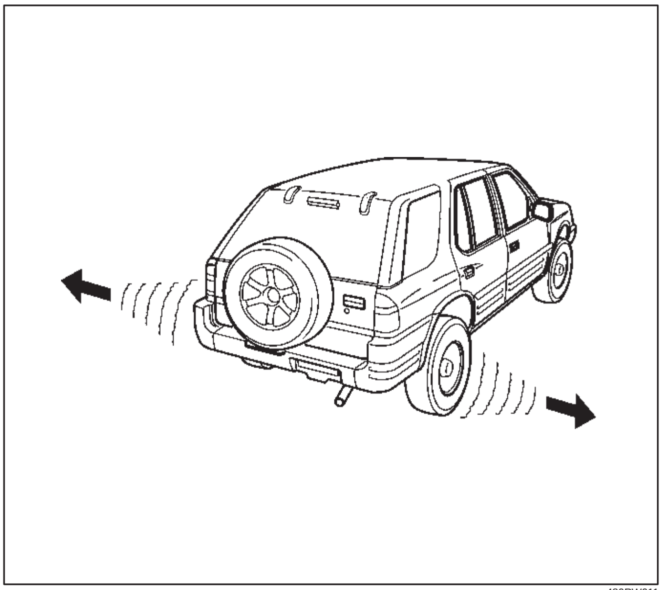
1. Tire squeal on turns.
2. Hard steering.
3. Rapid and uneven wear on the edges of the tread.
4. Tire rim bruises and rupture.

5. Tire cord breakage.
6. High tire temperatures.
7. Reduced handling.
8. Reduced fuel economy.

Unequal pressure on same axle can cause:

1. Uneven braking.
2. Steering lead.
3. Reduced handling.
4. Swerve on acceleration.

Radial Tire Waddle



480RW011

Waddle is side-to-side movement at the front and/or rear of the car. It can be caused by the steel belt not being straight within the tire, or by excessive lateral runout of the tire or wheel. It is most noticeable at low speed, about 8 to 48 km/h (5 to 30 mph). It may also cause rough ride at 80 to 113 km/h (50 to 70 mph).

The car can be road tested to see which end of the car has the faulty tire. If the tire causing the waddle is on the rear, the rear end of the car will "waddle". From the driver's seat, it feels as if someone is pushing on the side of the car.

If the faulty tire is on the front, the waddle is more easily seen. The front sheet metal appears to be moving back and forth. It feels as if the driver's seat is the pivot point in the car.

Another more time-consuming method of determining the faulty tire is substituting tire and wheel assemblies that are known to be good. Follow these steps:

1. Drive the car to determine if the waddle is coming from the front or rear.
2. Install tire and wheel assemblies known to be good (from a similar car) in place of those on the end of the car which is waddling. If the waddle cannot be isolated to front or rear, start with the rear tires.
3. Road test again. If improvement is noted, install the original tire and wheel assemblies one at a time until the faulty tire is found. If no improvement is noted, install tires known to be good in place of all four. Then, install the originals one at a time until the faulty tire is found.

Radial Tire Lead/Pull

"Lead/Pull" is vehicle deviation from a straight path, on a level road with no pressure on the steering wheel.

Lead is usually caused by:

1. Poorly manufactured radial tires.
2. Uneven brake adjustment.
3. Wheel alignment.

The way in which a tire is built can produce lead in a car. An example of this is placement of the belt. Off-center belts on radial tires can cause the tire to develop a side force while rolling straight down the road and the tire will tend to roll like a cone.

The "Radial Tire Lead/Pull Correction" chart should be used to make sure that front wheel alignment is not mistaken for tire lead.

Rear tires will not cause lead/pull.

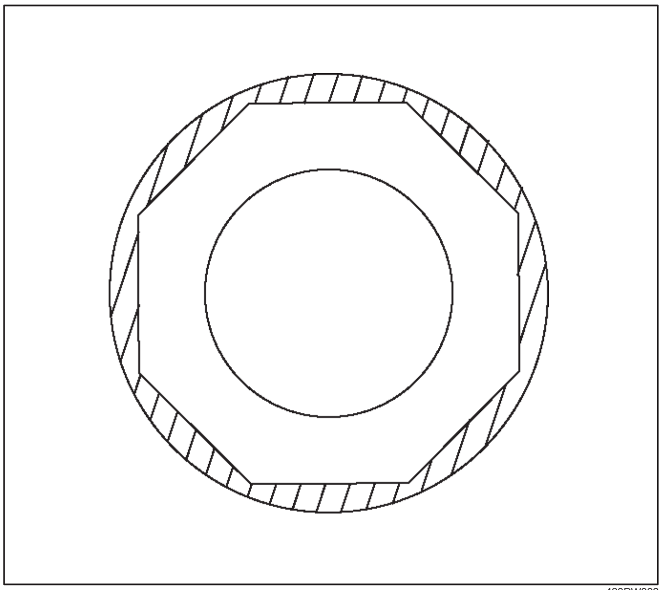
Radial Tire Lead/Pull Correction Chart

Step	Action	Yes	No
1	1. Inflate tires to recommended pressure. 2. Road test vehicle on level uncrowned road. Was a problem corrected?	End.	Go to Step 2
2	Switch front tires side to side and road test again. Was a problem corrected?	If roughness results,replace tires.	Go to Step 3
3	Did the vehicle lead in same direction?	Go to Step 4	Go to Step 5
4	Put tires back in original position and check alignment. Was a problem corrected?	End.	Go to Step 5
5	Install known good tire on one front side. Was a problem corrected?	Replace tire.	Install a known good tire in place of other front tire. If lead corrected, replace tire.

Typical examples of abnormal tire ahead wear and major causes:

CAUTION: Similar wear patterns can be caused by worn suspension parts, misalignment of wheels and tires, and other suspension related problems.

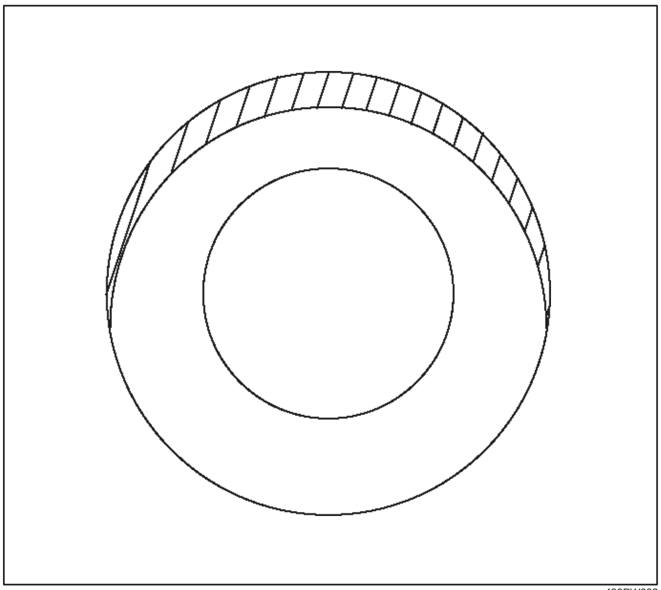
Spotty wear – wear localized on shoulder sections, and in an extreme cases, the tire becomes polygonal in shape.



480RW002

1. Tire or wheel out of round or distorted.
2. Hub or knuckle out of round or distorted.
3. Play in hub bearings or ball joint.
4. Rotating parts out of balance.

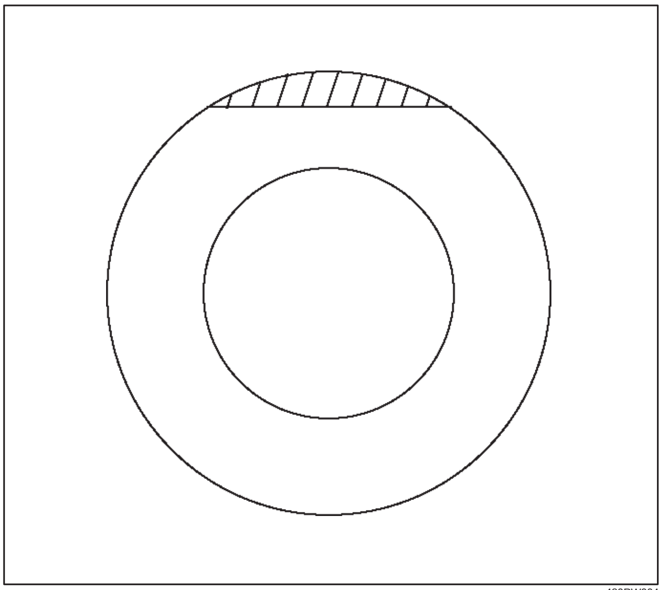
Tread wear one-sided.



480RW003

1. Rotating parts out of balance.
2. Tire or wheel out of round.
3. Hub or knuckle out of round or distorted.

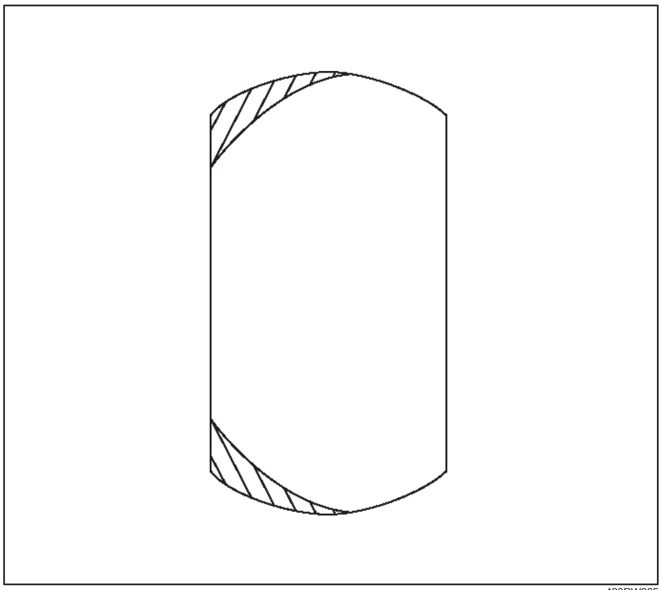
Localized tread wear.



480RW004

1. Once spotty wear develops in tread due to hard braking or abrupt starting, localized wear tends to be promoted.

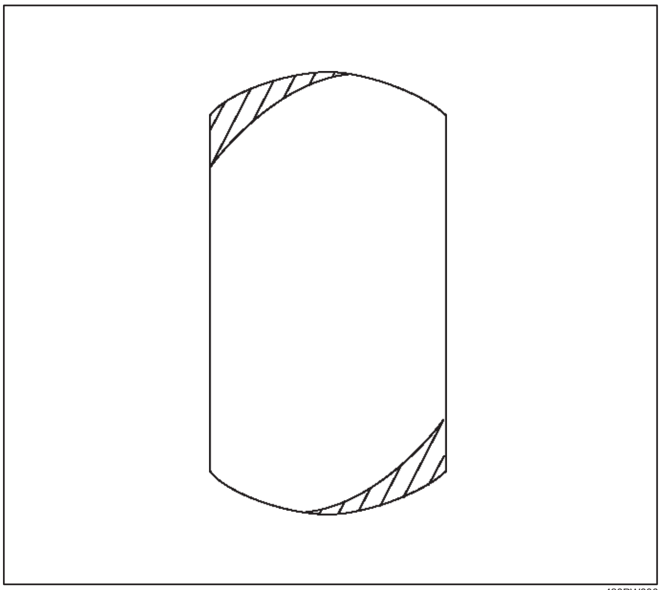
Shoulder wear (generally wear develops in outer shoulder):



480RW005

1. Camber or toe-in incorrect.
2. Shoulder wear caused by repeated hard-cornering.

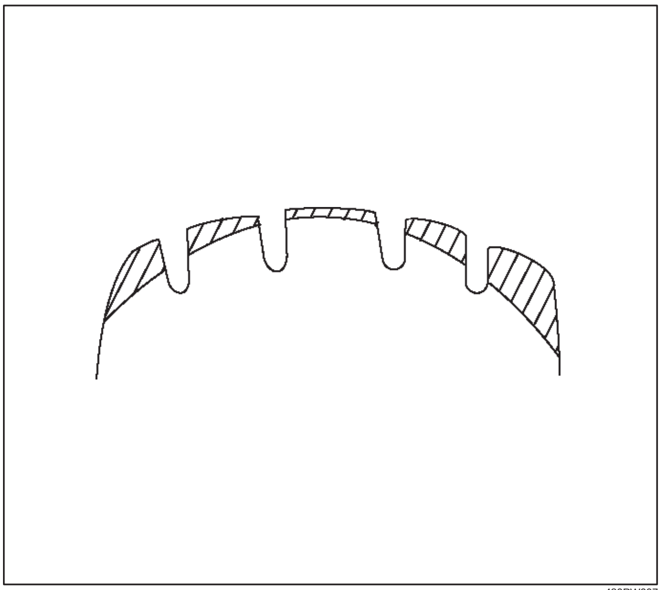
Wear in shoulders at points opposed to each other.



480RW006

1. Tire or wheel out of round or distorted.
2. Play in bearings or ball joint.

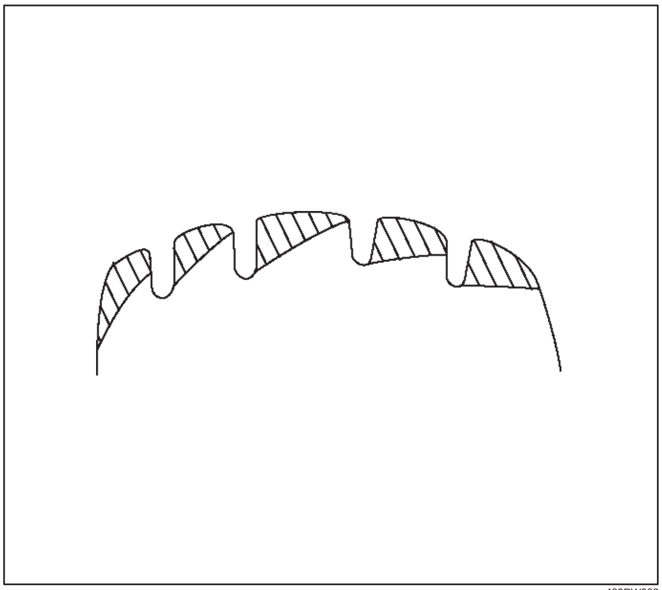
Premature wear in shoulders.



480RW007

1. Flexing of tire excessive due to under-inflation.

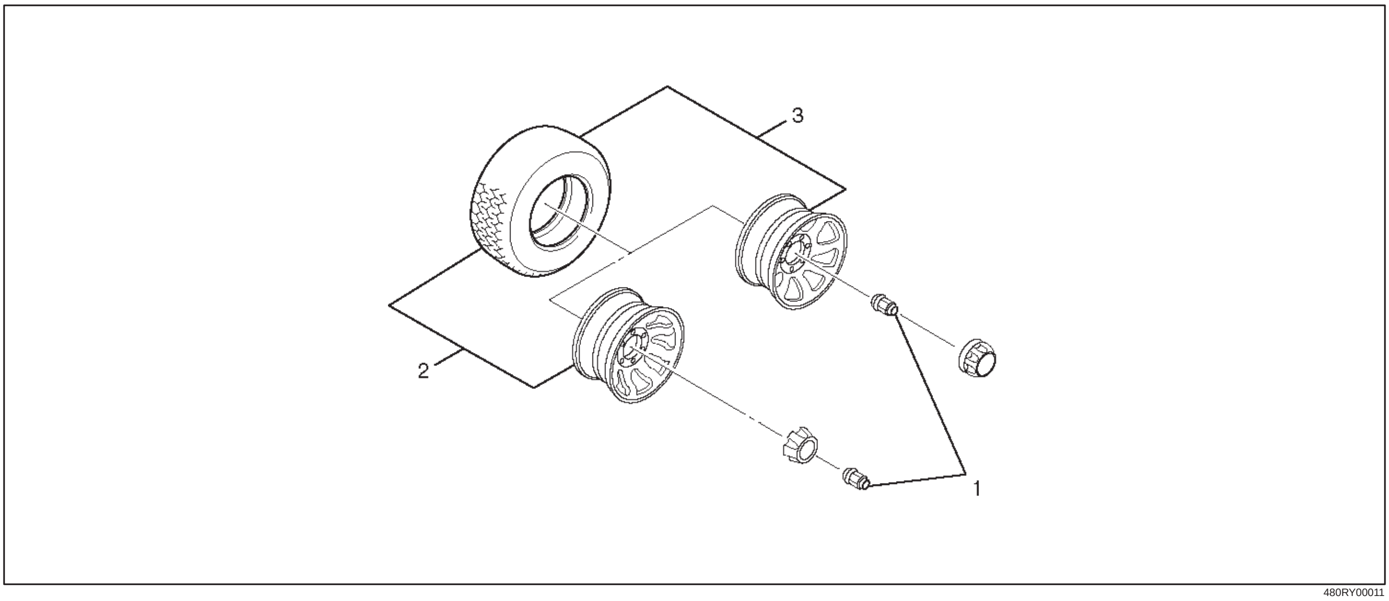
One sided feather edging.



1. Wear caused by repeated hard cornering.
2. Camber or toe-in incorrect.

Wheel

Wheel and Associated Parts



Legend

(1) Wheel Lug Nut

(2) Alumi Wheel and Tire

(3) Steel Wheel and Tire

Removal

1. Loosen wheel lug nut by approximately 180 g (half a rotation), then raise the vehicle and remove the nuts.
2. Remove wheel and tire.

NOTE: Never use heat to loosen a tight wheel lug nut. The application of heat to the hub can shorten the life of the wheel and may cause damage to wheel bearings.

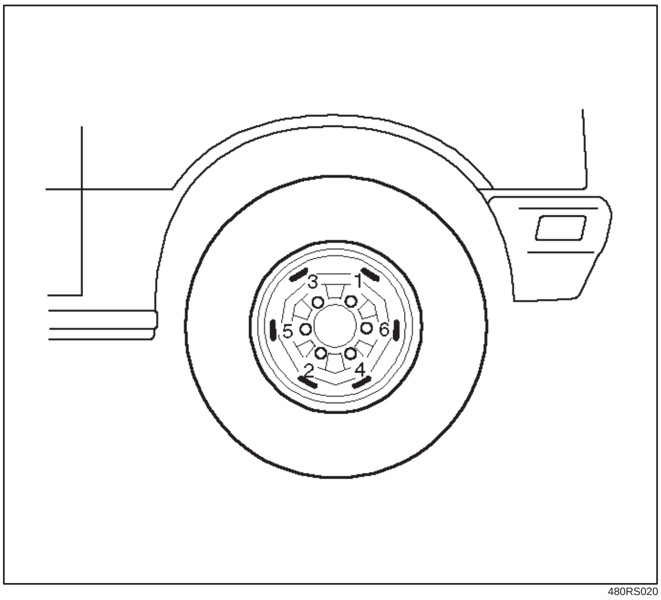
Installation

1. Install wheel and tire.
2. Install wheel lug nut, and lower the vehicle. Tighten the wheel lug nuts to the specified torque in numerical order.

   Torque: 118 N·m (87 lb ft)

CAUTION: Before installing wheels, remove any build-up of corrosion on the wheel mounting surface and brake disc mounting surface by scraping and wire brushing. Installing wheels without good metal-to-metal contact at mounting surfaces can cause wheel nuts to loosen, which can later allow a wheel to come off while the vehicle is moving.

NOTE: Valve caps should be on the valve stems to keep dust and water out.



Tire

Tire Replacement

When replacement is necessary, the original metric the size should be used. Most metric tire sizes do not have exact corresponding alphanumeric tire sizes. It is recommended that new tires be installed in pairs on the same axle. If necessary to replace only one tire, it should be paired with tire having the most tread, to equalize braking traction.

CAUTION: Do not mix different types of tires such as radial, bias and bias-belted tires except in emergencies, because vehicle handling may be seriously affected and may result in loss of control.

Tire Dismounting

Remove valve cap on valve step and deflate the tire. Then use a tire changing machine to mount or dismount tires. Follow the equipment manufacturer's instruction. Do not use hand tools or tire lever alone to change tires as they may damage the tire beads or wheel rim.

Tire Mounting

Rim bead seats should be cleaned with a wire brush or coarse steel wool to remove lubricants, and light rust. Before mounting a tire, the bead area should be well lubricated with an approved tire lubricant.
After mounting, inflate the tire to 196kPa (28 psi) so that beads are completely seated. Inflate the air to specified pressure and install valve cap to the stem.

WARNING: NEVER STAND OVER TIRE WHEN INFLATING. BEAD MAY BREAK WHEN BEAD SNAPS OVER RIM'S SAFETY HUMP AND CAUSE SERIOUS PERSONAL INJURY.

NEVER EXCEED 240 KPA (35 PSI) PRESSURE WHEN INFLATING. IF 240 KPA (35 PSI) PRESSURE WILL NOT SEAT BEADS, DEFLATE, RE-LUBRICATE AND RE-INFLATE. OVER INFLATION MAY CAUSE THE BEAD TO BREAK AND CAUSE SERIOUS PERSONAL INJURY.

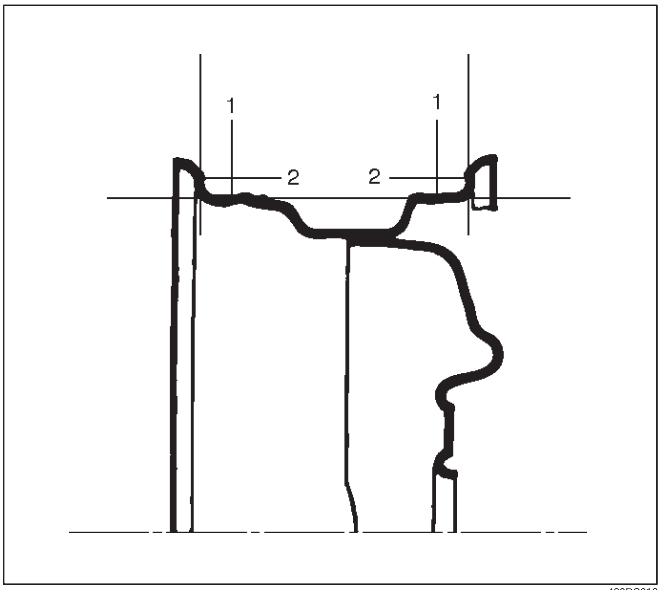
Tire Repair

There are many different materials on the market used to repair tires.
Manufacturers have published detailed instructions on how and when to repair tires. These instructions can be obtained from the tire manufacturer if they are not included with the repair kit.

Wheel Inspection

Damaged wheels and wheels with excessive run-out must be replaced.
Wheel run out at rim (Base on hub Bore):

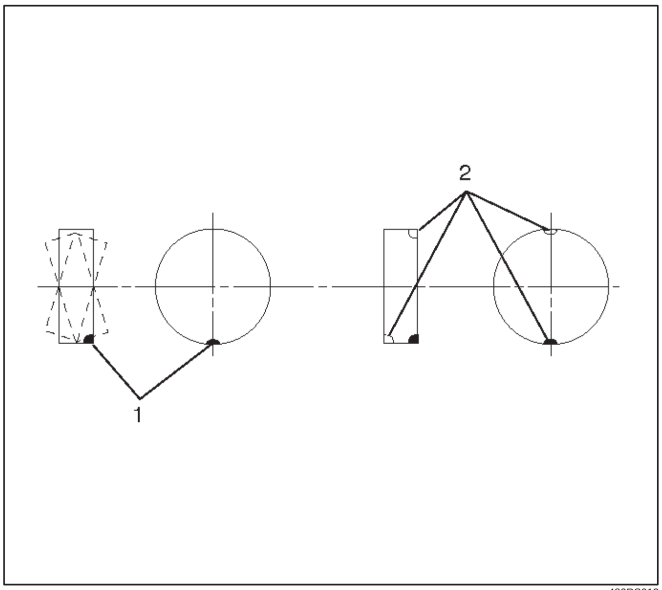
Steel	Aluminum
1– Vertical play: Less than 1.5 mm (0.059 in)	1– Vertical play: Less than 0.7 mm (0.028 in)
2– Horizontal play: Less than 1.5 mm (0.059 in)	2– Horizontal play: Less than 0.7 mm (0.028 in)



480RS012

General Balance Procedure

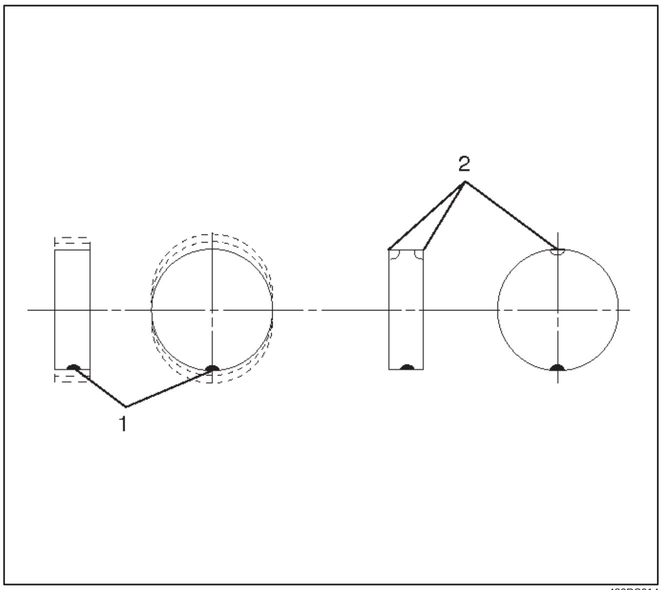
Deposits of mud, etc. must be cleaned from the inside of the rim.
The tire should be inspected for the following: match mount paint marks, bent rims, bulges, irregular tire wear, proper wheel size and inflation pressure. Then balance according to the equipment manufacturer's recommendations.
There are two types of wheel and tire balance.
Static balance is the equal distribution of weight around the wheel.
Assemblies that are statically unbalanced cause a bouncing action called tramp. This condition will eventually cause uneven tire wear.



480RS013

Legend
(1) Heavy Spot Wheel Shimmy
(2) Add Balance Weights Here

Dynamic balance is the equal distribution of weight on each side of the wheel center-line so that when the tire spins there is no tendency for the assembly to move from side to side. Assemblies that are dynamically unbalanced may cause shimmy.



480RS014

Legend
(1) Heavy Spot Wheel Hop
(2) Add Balance Weights Here

WARNING: STONES SHOULD BE REMOVED FROM THE TREAD TO AVOID OPERATOR INJURY DURING SPIN BALANCING AND TO OBTAIN A GOOD BALANCE.

Balancing Wheel and Tire

On-vehicle Balancing

On-Vehicle balancing methods vary with equipment and tool manufacturers. Be sure to follow each manufacturer's instructions during balancing operation.

Off-vehicle Balancing

Most electronic off-vehicle balancers are more accurate than the on-vehicle spin balancers. They are easy to use and give a dynamic balance. Although they do not correct for drum or disc unbalance (as on- vehicle spin balancing does), they are very accurate.

Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Intellignet suspension system uses a microcomputer as a control unit to judge running conditions including engine revolution from Powertrain Control Module, vehicle speed from vehicle speed sensor, a brake switch signal, and vertical and horizontal G-sensor signal, then sets optimum damping force so that best running stability can be achieved.

System Components

Control Unit, 3 Vertical G-sensors, Horizontal G-sensor, 4 Actuators, 4 Adjustable Damping Force Shock Absorbers, and Warning Lamp.

Control Unit

The Control Unit consists of Adjustable Damping Force Shock Absorber control circuits, fault detector, and a fail-safe. It drives the actuator according to the signal from each sensor.
The Control Unit has a self-diagnosing function which can indicate faulty circuits during diagnosis.
The Control Unit is mounted in the center of the instrument panel.

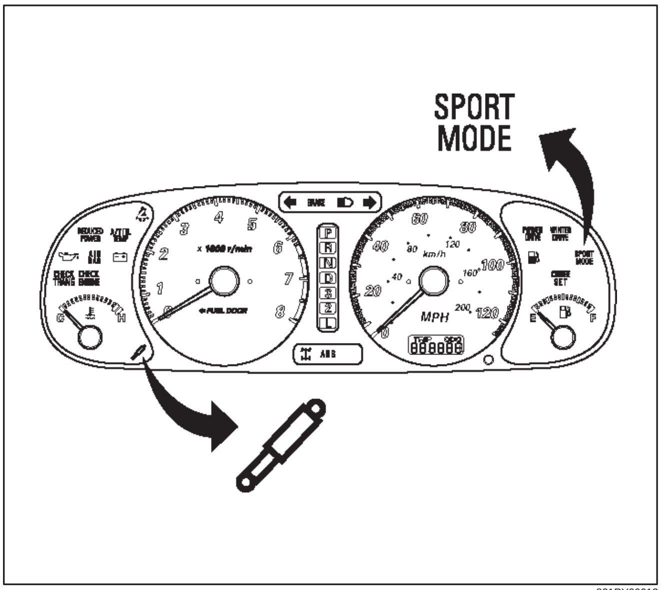
Actuator

Front actuators installed on front shock absorbers and rear actuator installed inside rear shock absorbers control damping force of shock absorber by the Control Unit signal.

Adjustable Damping Force Shock Absorber

This type shock absorber is used in front and rear intelligent suspension. According to running condition the Control Unit changes shock absorber damping force and obtains good running stability.

Warning Lamp



821RY00013

Vehicles equipped with the Intelligent Suspension have an amber warning lamp in the instrument panel. The warning lamp will illuminate if a malfunction in the Intelligent Suspension System is detected by the Control Unit. In case of an important electronic malfunction, the Control Unit will turn“ON” the warning lamp.

Vertical G-Sensor

Front G-sensors installed inside front actuators and the rear G-sensor installed on the rear left frame side detect the vehicle vertical gravity and send a signal to the Control Unit.

Horizontal G-Sensor

The G-sensor installed inside the Control Unit detects the vehicle turning speed and sends a signal to the Control Unit.

General Diagnosis

General Information

Intelligent Suspension System troubles can be classified into two types, those which can be detected by the warning lamp and those which can be detected as a vehicle abnormality by the driver.
In either case, locate the fault in accordance with the“BASIC DIAGNOSTIC FLOWCHART” and repair.
Please refer to Section 3 for the diagnosis of mechanical troubles such as abnormal noise, vehicle pulls, excessive tire wear, wheel hop and shimmy, shake or vibration.

Service Precautions

Required Tools and Items:

- Box Wrench
- Special Tool

Some diagnosis procedures in this section require the installation of a special tool.

J-39200 High Impedance Multimeter

When circuit measurements are requested, use a circuit tester with high impedance.

Computer System Service Precautions

The Intelligent Suspension System interfaces directly with the Control Unit which is a control computer that is similar in some regards to the Powertrain Control Module. These modules are designed to withstand normal current draws associated with vehicle operation. However care must be taken to avoid overloading any of the Control Unit circuits. In testing for opens or shorts, do not ground or apply voltage to any of the circuits unless instructed to do so by the appropriate diagnostic procedure. These circuits should only be tested with a high impedance multimeter (J-39200) or special tools as described in this section. Power should never be removed or applied to any control module with the ignition in the “ON” position.Before removing or connecting battery cables, fuses or connectors, always turn the ignition switch to the“OFF” position.

General Service Precautions

The following are general precautions which should be observed when servicing and diagnosing the Intelligent Suspension System and/or other vehicle systems. Failure to observe these precautions may result in Intelligent Suspension System damage.

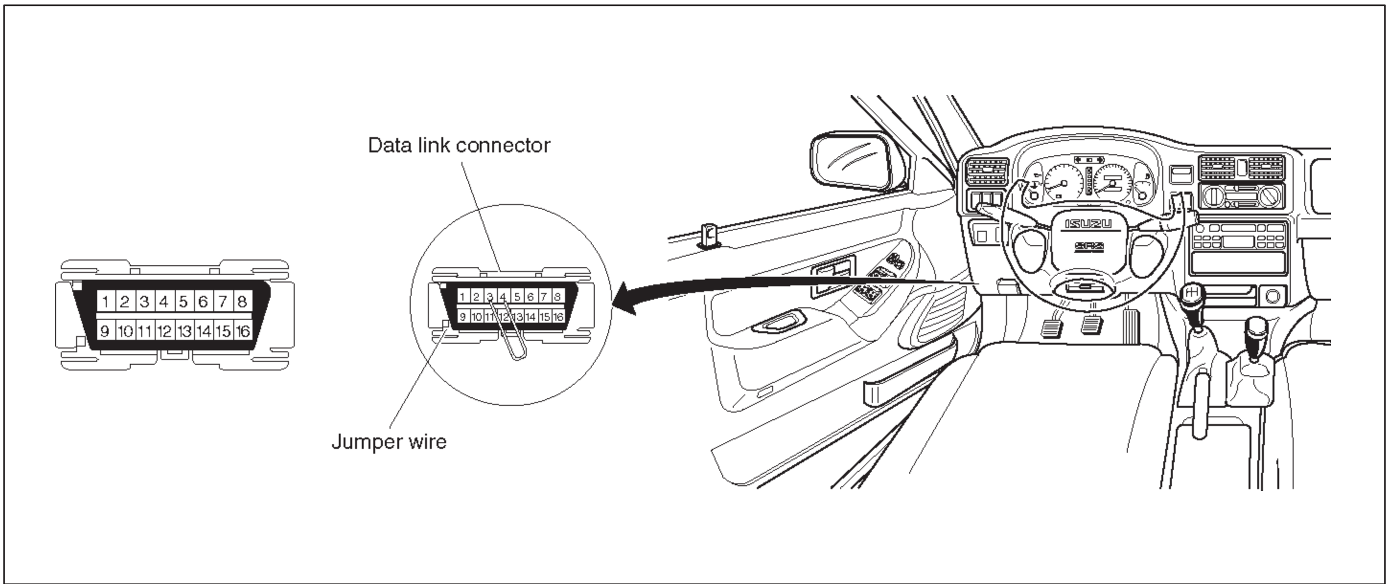
- If welding work is to be performed on the vehicle using an electric arc welder, the Control Unit connectors should be disconnected before the welding operation begins.
- The Control Unit connectors should never be connected or disconnected with the ignition“ON”.

Parts Handling

Be careful when handling the actuator, control unit, or G-sensor. They should not be dropped or thrown, because the semi-conductor G-sensor tip damage may result.

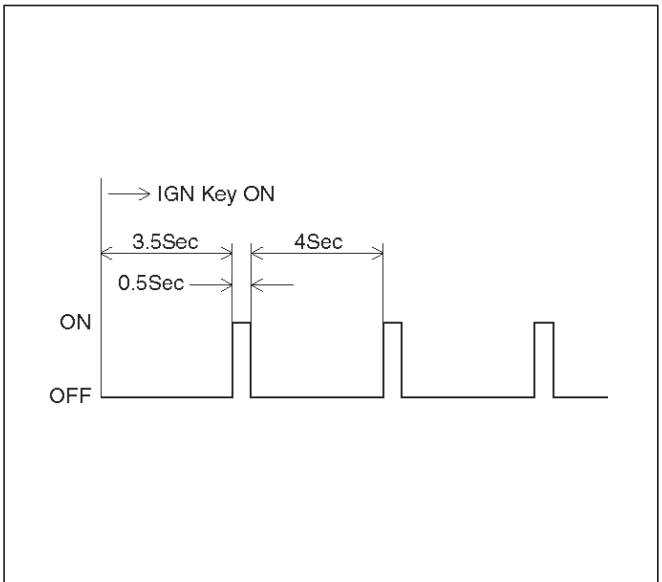
FLASHING CODES

1. ON BOARD DIAGNOSIS (SELF-DIAGNOSIS)
   1. The Control Unit conducts a self-test of most of the wiring and components in the system each time the key is turned ON. If a fault is detected the Control Unit will store a Diagnostic Trouble Code (DTC) in memory. It's a number that corresponds to a specific problem.
   2. When the problem detected is important: the warning lamp turns on until the fault is repaired and the Control Unit memory is cleared.
2. DIAGNOSTIC TROUBLE CODES (DTC)
   1. DTC can be displayed by the Control Unit by shorting together terminals 3 and 4 or 5 of the Diagnosis Connector (C-34) located left side of instrument panel.



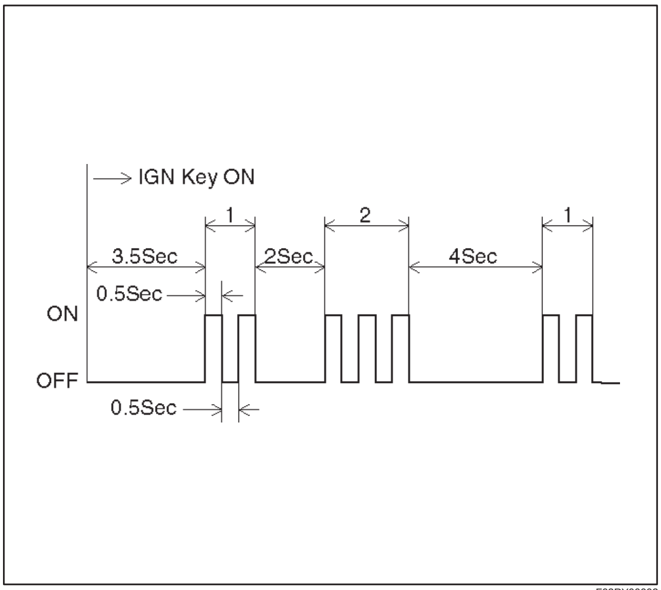
350RY00004

Normal



F03RY00001

Abnormal

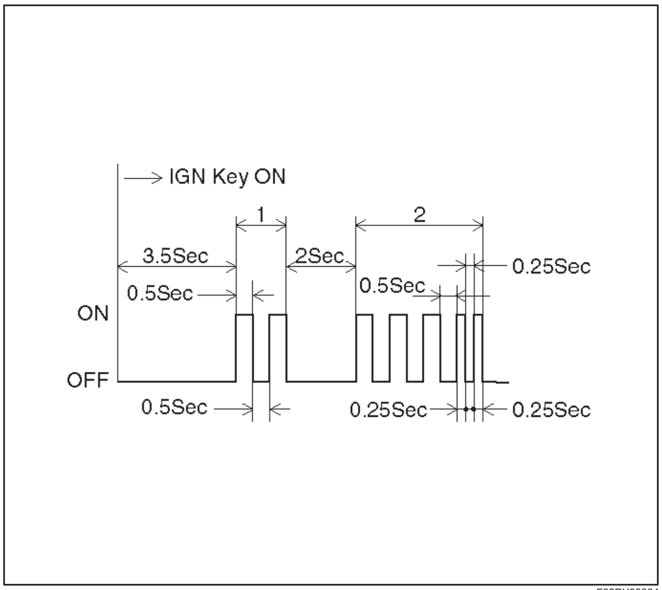


F03RY00002

Legend

(1) Diagnostic Trouble Code 2
(2) Diagnostic Trouble Code 3

It depends below in the case that the code that also, shows a malfunction place is added.



F03RY00004

Legend

1. Diagnostic Trouble Code 2
2. Diagnostic Trouble Code 3 + Position Code 2 Position Code

1: Actuator Front RH, G-sensor Front RH

2: Actuator Front LH, G-sensor Front LH

3: Actuator Rear RH, G-sensor Rear

4: Actuator Rear LH, Lateral G-sensor

3. After this, the warning lamp will be OFF for 3.5 seconds and then will flash each DTC.
   1. When there are more than 9 flashes this means that the indicator is constantly flashing, OFF for 4 seconds ON for 0.5 seconds. In this case there is no DTC stored in memory.
   2. When there are less than 9 flashes you will see DTC of a digit and when all codes have been displayed they are displayed again beginning from the first one.
   3. The DTCs are displayed in lower number order.

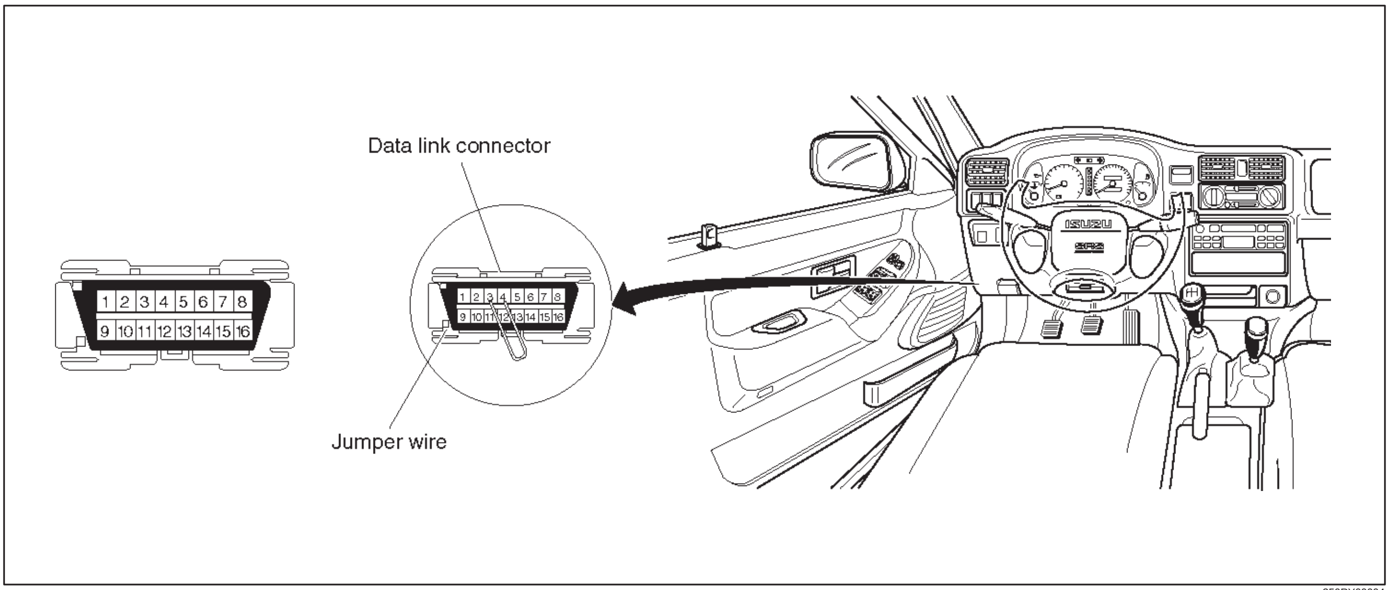
CLEAR DTC

Remark: If you clear the DTC (Diagnosis Trouble Codes) you will not be able to read any codes recorded during the last Trouble.

Remark: To be able to use the DTC again to identify a problem you will need to reproduce the fault or the problem. This may require a new test drive or just turning the ignition on (this depends on the nature of the fault).

1. Short the Diagnosis Connector C-34 terminal 3 to terminal 4 or 5 (ground).

- IF it is flashing and the flash is 0.5 seconds ON and 4 seconds OFF without interruption, this means that there is no DTC. The DTCs are already cleared.



350RY00004

2. IF a code is flashed, wait until the lamp is flashing.
3. Conduct brake switch ON/OFF 6 or more times on condition that one operation is within 2 seconds.

INTERMITTENT CONDITIONS

If the Warning Lamp flashes a diagnostic trouble code as intermittent, or if after a test drive a DTC does not reappear though the detection conditions for this DTC are present: the problem is most likely a faulty electrical connection or loose wiring. Terminals and grounds should always be the prime suspect. Intermittents rarely occur inside sophisticated electronic components such as the Control Unit.

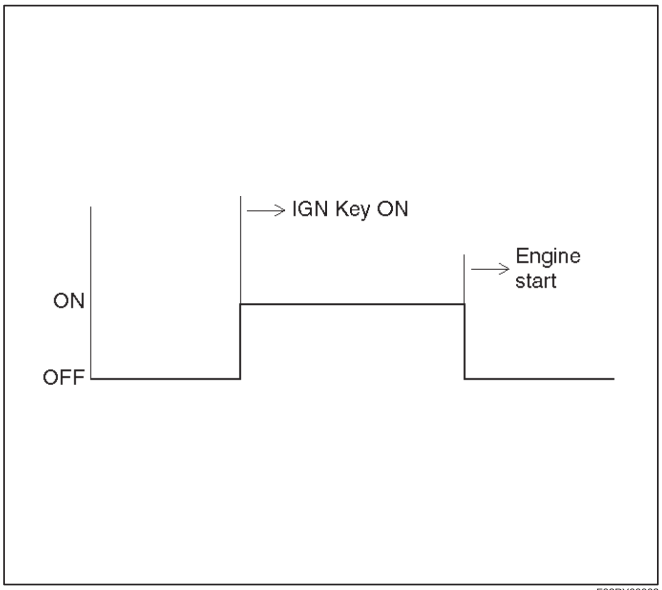
Use the DTC information to understand which wires and sensors are involved.

When an intermittent problem is encountered, check suspect circuits for:

1. Poor terminal to wire connection.
2. Terminals not fully seated in the connector body (backed out).
3. Improperly formed or damaged terminals.
4. Loose, dirty, or corroded ground connections:
   HINT: Any time you have an intermittent in more than one circuit, check whether the circuits share a common ground connection.
5. Pinched or damaged wires.
6. Electro-Magnetic Interference (EMI):
   HINT: Check that all wires are properly routed away from spark plug wires, distributor wires, coil, and generator. Also check for improperly installed electrical options, such as lights, 2-way radios, etc.

BULB CHECK

When the starter switch is turned on in the normal state, the Control Unit turns on the Warning Lamp to check the bulb. After the engine starts, the Warning Lamp turns off.



F03RY00003

DTC CHECK

1. Diagnosis Trouble Codes (DTC) have been identified by FLASHING CODES.
2. You have written the list of the DTC. The order of the malfunctions has no meanings for this Control Unit. Usually only one or two malfunctions should be set for a given problem.
3. Check directly the DTCs you identified. The DTC are sorted by number:
   DIAGNOSTIC TROUBLE CODES.

Diagnostic Trouble Code (DTC) Identification

DTC No.	DTC NAME	CODE MEMORY	WARNING LAMP	NOTE
2	Actuator Coil Over Current	Yes	OFF	Stop drive circuit.
3	Actuator Coil/Position Sensor Open Circuit or Short	Yes	ON	Control stop in condition that actuator position fixed on R.
4	G–Sensor Open Circuit or Short	Yes	ON	Control stop in condition that actuator position fixed on R.
5	Vehicle Speed Sensor Open Circuit or Short	Yes	OFF	Control gain fixed on K3.
6	Stop Lamp Switch Open Circuit, Short or Contact Point Trouble	Yes	OFF	Drive control stop.
7	Engine Speed Signal Open Circuit or Short	Yes	OFF	Normal control.
9	Control Unit Abnormality	Yes	OFF	Control stop or normal drive circuit fixed on R mode.

DTC2 Actuator Coil Over Current

Circuit Description

The A, B, C, and D are the actuator motor coil terminals. DC 12V driving voltage is applied between terminals A and C and terminals B and D so that the shock absorber oil valves are rotated at every 7.5˚ step feed.

Diagnostic Aids

- Inspect the wiring for poor electrical connections between the control unit 24 way connector and the actuator connectors. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.
  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

DTC2 Actuator Coil Over Current

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the actuator connectors C–45, C–44, F–7, and F–6. 3. Measure the resistance between the actuator side connector C–44 terminals 1 and 2. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 2*	Go to *Step 3*
2	1. Measure the resistance between the actuator side connector C–44 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 4*	Go to *Step 3*
3	Replace the actuator FR.	—	Go to *Step 4*	—
4	1. Measure the resistance between the actuator side connector C–45 terminals 1 and 2. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 5*	Go to *Step 6*
5	1. Measure the resistance between the actuator side connector C–45 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 7*	Go to *Step 6*
6	Replace the actuator FL.	—	Go to *Step 7*	—
7	1. Measure the resistance between the shock absorber side connector F–6 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 8*	Go to *Step 9*
8	1. Measure the resistance between the shock absorber side connector F–6 terminals 7 and 8. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 10*	Go to *Step 9*
9	Replace the rear shock absorber RR.	—	Go to *Step 10*	—

DTC2 Actuator Coil Over Current (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Measure the resistance between the shock absorber side connector F–7 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 11*	Go to *Step 12*
11	1. Measure the resistance between the shock absorber side connector F–7 terminals 7 and 8. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 13*	Go to *Step 12*
12	Replace the rear shock absorber RL.	—	Go to *Step 16*	—
13	If all steps are correct, check the continuity between the control unit connector C–50 terminal 1 and connector terminal C50–4, C50–17, C50–5, C50–18, C50–6, C50–19, C50–7, C50–20, C50–8, C50–21, C50–9, C50–22, C50–10, C50–23, C50–11, and C50–24. Is there continuity?	—	Go to *Step 15*	Go to *Step 16*
14	Repair the circuit.	—	Go to *Step 16*	—
15	Replace the control unit.	—	Go to *Step 16*	—
16	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *"Basic Diagnosis Flow".*	Go to *Step 16*

DTC3 Actuator Coil/Position Sensor Open Circuit or Short

Circuit Description

The A, B, C, and D are the actuator motor coil terminals. DC 12V driving voltage is applied between terminals A and C and terminals B and D so that the shock absorber oil valves are rotated at every 7.5° step feed.
The PSW is actuator position signal and detects relative angles between the piston–rod and the control-rod. The actuator outputs the PSW to the control unit.

Diagnostic Aids

- Inspect the wiring for poor electrical connections between the control unit 16 way connector and the actuator connectors. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.
  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

DTC3 Actuator Coil/Position Sensor Open Circuit or Short

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the actuator connectors C–50, C–45, C–44, F–7, and F–6. Is the continuity between the connector C–44 terminals 1 and 2?	—	Go to *Step 2*	Go to *Step 3*
2	Is the continuity between the connector C–44 terminals 3 and 4?	—	Go to *Step 4*	Go to *Step 3*
3	Replace the actuator FR.	—	Go to *Step 4*	—
4	Is the continuity between the connector C–45 terminals 1 and 2?	—	Go to *Step 5*	Go to *Step 6*
5	Is the continuity between the connector C–45 terminals 3 and 4?	—	Go to *Step 7*	Go to *Step 6*
6	Replace the actuator FL.	—	Go to *Step 7*	—
7	Is the continuity between the connector F–6 terminals 3 and 4?	—	Go to *Step 8*	Go to *Step 9*
8	Is the continuity between the connector F–6 terminals 7 and 8?	—	Go to *Step 10*	Go to *Step 9*
9	Replace the rear shock absorber RR.	—	Go to *Step 10*	—
10	Is the continuity between the connector F–7 terminals 3 and 4?	—	Go to *Step 11*	Go to *Step 12*
11	Is the continuity between the connector F–7 terminals 7 and 8?	—	Go to *Step 13*	—
12	Replace the rear shock absorber RL.	—	Go to *Step 13*	—
13	Is the continuity between the connector C–44 terminal 1 and connector C–50 terminal 4?	—	Go to *Step 14*	Go to *Step 15*
14	Is the continuity between the connector C–44 terminal 3 and connector C–50 terminal 17?	—	Go to *Step 16*	Go to *Step 15*
15	Repair the circuit.	—	Go to *Step 16*	—
16	Is the continuity between the connector C–44 terminal 2 and connector C–50 terminal 5?	—	Go to *Step 17*	Go to *Step 18*

DTC3 Actuator Coil/Position Sensor Open Circuit or Short (Cont'd)

Step	Action	Value(s)	Yes	No
17	Is the continuity between the connector C–44 terminals 4 and connector C–50 terminal 18?	—	Go to *Step 19*	Go to *Step 18*
18	Repair the circuit.	—	Go to *Step 19*	—
19	Is the continuity between the connector C–45 terminal 1 and connector C–50 terminal 6?	—	Go to *Step 20*	Go to *Step 21*
20	Is the continuity between the connector C–45 terminal 3 and connector C–50 terminal 19?	—	Go to *Step 22*	Go to *Step 21*
21	Repair the circuit.	—	Go to *Step 22*	—
22	Is the continuity between the connector C–45 terminal 2 and connector C–50 terminal 7?	—	Go to *Step 23*	Go to *Step 24*
23	Is the continuity between the connector C–45 terminal 4 and connector C–50 terminal 20?	—	Go to *Step 25*	Go to *Step 24*
24	Repair the circuit.	—	Go to *Step 25*	—
25	Is the continuity between the connector F–6 terminal 4 and connector C–50 terminal 8?	—	Go to *Step 26*	Go to *Step 27*
26	Is the continuity between the connector F–6 terminal 8 and connector C–50 terminal 21?	—	Go to *Step 28*	Go to *Step 27*
27	Repair the circuit.	—	Go to *Step 28*	—
28	Is the continuity between the connector F–6 terminal 3 and connector C–50 terminal 9?	—	Go to *Step 29*	Go to *Step 30*
29	Is the continuity between the connector F–6 terminal 7 and connector C–50 terminal 22?	—	Go to *Step 31*	Go to *Step 30*
30	Repair the circuit.	—	Go to *Step 31*	—
31	Is the continuity between the connector F–7 terminal 4 and connector C–50 terminal 10?	—	Go to *Step 32*	Go to *Step 33*
32	Is the continuity between the connector F–7 terminal 8 and connector C–50 terminal 23?	—	Go to *Step 34*	Go to *Step 33*
33	Repair the circuit.	—	Go to *Step 34*	—
34	Is the continuity between the connector F–7 terminal 3 and connector C–50 terminal 11?	—	Go to *Step 35*	Go to *Step 36*
35	Is the continuity between the connector F–7 terminal 7 and connector C–50 terminal 24?	—	Go to *Step 37*	Go to *Step 36*
36	Repair the circuit.	—	Go to *Step 37*	—
37	1. Disconnect the terminals C–51, C–43, C–46, F–6, and F–7. Is the continuity between the connector–terminal C51–29 and C43–6, C51–37 and C46–6, C51–33 and F6–2, C51–41 and F7–2?	—	Go to *Step 38*	Go to *Step 41*

DTC3 Actuator Coil/Position Sensor Open Circuit or Short (Cont'd)

Step	Action	Value(s)	Yes	No
38	Is the continuity between the connector C–50 terminal 1 (GND) and the connector C–51 terminals 29, 33, 37, and 41?	—	Go to *Step 41*	Go to *Step 39*
39	Is there the continuity between connector-terminal C51–27 and C51–35, C51–31 and C51–39, C51–32 and C51–40, and C51–34 and C51–42?	—	Go to *Step 41*	Go to *Step 40*
40	Is there the continuity between connector C–50 terminal 1 and connector C–51 terminals 27, 31, 32, and 34?	—	Go to *Step 41*	Go to *Step 42*
41	Repair the circuit.	—	Go to *Step 44*	—
42	1. If all steps are correct, replace following units one by one in the following order. Give a test drive and if normal, reinstall it. 1) actuator FR, 2) actuator FL, rear shock absorber, 3) RR and 4) RL. Does the DTC3 remain?	—	Go to *Step 43*	Go to *Step 44*
43	Replace the control unit.	—	Go to *Step 44*	—
44	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *"Basic Diagnosis Flow".*	Go to *Step 44*

DTC4 G-Sensor Open Circuit or Short

Circuit Description

The G-sensor sends the voltage (Vout) corresponding to the vehicle vertical gravity to the control unit.
The control unit supplies DC 5V power (Vcc) to each G-sensor.
The control unit watches the G-sensor operation through Vcc signal.

Diagnostic Aids

- Inspect the wiring for poor electrical connections between the control unit connectors and the actuator connectors. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.
  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

DTC4 G-Sensor Open Circuit or Short

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the connectors C–51, C–52, C–43, C–46, and F–5. Is there the continuity between the connector-terminal C51–28 and C43–5, C51–30 and C46–5, and C52–45 and F5–1?	—	Go to *Step 2*	Go to *Step 5*
2	Is the continuity between the connector-terminal C51–27 and C43–1, C51–31 and C46–1, and C52–44 and F5–2?	—	Go to *Step 3*	Go to *Step 5*
3	Is there the continuity between the connector-terminal C51–36 and C43–2, C51–38 and C46–2, and C52–56 and F5–3?	—	Go to *Step 4*	Go to *Step 5*
4	1. Disconnect the connectors C–50, C–51, and C–52. Is there the continuity between the connector-terminal C51–28 and C51–35, C51–30 and C51–39, C52–45 and C52–55, C51–27 and C51–35, C51–31 and C51–39, C52–44 and C52–55, C51–32 and C51–40, C51–34 and C51–42, C51–36 and C51–35, C51–38 and C51–39, and C52–56 and C52–55?	—	Go to *Step 5*	Go to *Step 7*
5	Repair the circuit.	—	Go to *Step 6*	—
6	Replace following units one by one in the following order. Give a test drive and if normal, reinstall it. 1) G3-sensor 2) Actuator FL 3) Actuator FR 4) Control Unit	—	Go to *Step 7*	—
7	1. Reconnect all components, ensure all components are properly mounted. 2. Clear th DTC. Was this step finished?	—	Go to *“Basic Diagnosis Flow.”*	Go to *Step 7*

DTC5 Vehicle Speed Sensor Open Circuit or Short

Circuit Description

Output speed information is provided to the control unit by the vehicle speed sensor. The vehicle speed sensor produces a pulsing AC voltage. The AC voltage level and number of pulses increases as the speed of the vehicle increases. The control unit then converts the pulsing voltage to vehicle speed.

Diagnostic Aids

- Inspect the wiring for poor electrical connections between the control unit 22 way connector and the speed sensor connectors. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.

  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

DTC5 Vehicle Speed Sensor Open Circuit or Short

Step	Action	Value(s)	Yes	No
1	1. Jack up and support the rear axle on the stand. 2. Change the transfer mode to 2WD, using the 4WD push button switch on instrument panel. 3. Shift the transmission lever in a forward position and rotate the rear wheels. Does the speedo-meter operate?	—	Go to *Step 2*	Go to *Step 3*
2	1. Open the throttle and rev up engine speed. 2. Using a volt meter, measure the voltage between the meter B connector I–2 terminals 7 and 16 (GND). Does the voltage change alternately at the specified values?	0V and 12V	Go to *Step 7*	Go to *Step 5*
3	1. Turn off the starter switch and disconnect the control connectors C–50 and C–52. 2. Check the continuity between the vehicle speed sensor connector terminal 3 and meter B connector I–2 terminal 7. Is there continuity?	—	Go to *Step 4*	Go to *Step 6*
4	1. Check the continuity between the control unit connector C–50 terminal 1 and control unit connector C–52 terminal 48. Is there continuity?	—	Go to *Step 5*	Go to *Step 6*
5	Repair or replace the vehicle speed sensor.	—	Go to *Step 8*	—
6	Repair the circuit between the vehicle speed sensor connector terminal 3 and the meter B connector I–2 terminal 7 or the circuit between the control unit connector C–52 terminal 48 and the speed sensor connector terminal 3.	—	Go to *Step 8*	—
7	Repair the circuit between the connector H–6 terminal 16 and the control unit connector C–52 terminal 48 or replace the control unit.	—	Go to *Step 8*	—
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear th DTC. Was this step finished?	—	Go to *“Basic Diagnosis Flow.”*	Go to *Step 8*

DTC6 Stop Lamp Switch Open Circuit or Short

Circuit Description

The brake switch is used to indicate brake pedal status. The normally opened brake switch signal voltage circuit is opened.

Brake switch supplies a B+ signal on circuit RED to the control unit when the brakes are applied. The control unit uses this signal to work dive control when the brakes are applied.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the control unit and brake switch. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check customer driving habits and/or unusual driving conditions (i.e. stop and go, highway).
- Check brake switch for proper mounting and adjustment.

DTC6 Stop Lamp Switch Open Circuit or Short

Step	Action	Value(s)	Yes	No
1	1. With the engine “off”, turn the ignition switch “on”. If ABS code is set, check applicable fuse. 2. Apply then release the brake pedal. Is the brake lamp turned on with the brake pedal applied, and then turned off when the brake pedal is released?	—	Go to *Diagnostic Aids*	Go to *Step 2*
2	1. Connect the test light to ground. 2. Back probe ignition feed circuit terminal I18–1 at the brake switch. Is the test light “on”?	—	Go to *Step 3*	Go to *Step 4*
3	1. Connect the test light to ground. 2. Back probe circuit terminal I18–4 at the brake switch. Is the test light “off”?	—	Go to *Step 7*	Go to *Step 5*
4	Repair the open in battery feed circuit terminal I18–1 to the brake switch. If fuse is open, check circuit terminal I18–4 for a short to ground. Is the test light “off”?	—	Go to *Step 13*	—
5	Disconnect brake switch connector I–18 and ignition switch “on”.	—	Go to *Step 8*	Go to *Step 6*
6	Check the brake switch short (I18–1 and I18–4).	—	Go to *Step 9*	Go to *Step 10*
7	Check circuit terminal I18–4 for a short to voltage. Ignition switch “on”.	—	Go to *Step 8*	Go to *Step 10*
8	1. Disconnect the control unit connector C–52. 2. Check circuit terminal I18–4 for a short to voltage. Was a problem found?	—	Go to *Step 13*	Go to *Step 10*

DTC6 Stop Lamp Switch Open Circuit or Short (Cont'd)

Step	Action	Value(s)	Yes	No
9	Replace the brake switch. Is the replacement complete?	—	Go to *Step 13*	—
10	1. Turn the ignition "off". 2. Reconnect the control unit connector C–52 Turn the ignition "on". Is the brake lamp turned on with the brake applied, then turned off with the brake pedal released?	—	Go to *Diagnostic Aids*	Go to *Step 11*
11	Check the control unit for faulty or intermittent connections. Was a problem found and corrected?	—	Go to *Step 13*	Go to *Step 12*
12	Replace the control unit. Is the replacement complete?	—	Go to *Step 13*	—
13	1. After the repair is complete, clear the DTC. The switch signal must indicate 0 volts for 1 seconds with the brake pedal applied. 2. Conduct a test drive. 3. Review the DTC. Has the last test failed or is the current DTC displayed?	—	Begin diagnosis again Go to *Step 1*	Go to *Repair verified*

DTC7 Engine Speed Signal Open Circuit or Short

Circuit Description

PCM (Powertrain Control Module) converts signals from the crankshaft position sensor into the engine speed signals (pulse) and sends these to the control unit and tachometer.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the control unit connector. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.
  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check harness routing for a potential short to ground in circuit BLK/RED.

DTC7 Engine Speed Signal Open Circuit or Short

Step	Action	Value(s)	Yes	No
1	NOTE: Confirm that DTC P0336 or P0337 does not exist. If either exists, warning lamps, “CHECK ENGINE” and “CHECK TRANS” are turned on. Repair the engine, referring to Section 6E “Driveability and Emission”. 1. Turn on the starter switch. 2. Start the engine. 3. Open the throttle and rev up engine speed. Does the tachometer operate according to engine speed?	—	Go to *Step 3*	Go to *Step 2*
2	Repair the tachometer, referring to Section 8D Wiring System in Body and Accessories.	—	Go to *Step 6*	—
3	1. Turn off the starter switch. 2. Check continuity between the control unit connector C–52 terminal 59 and PCM connector E–21 terminal F7. Is there continuity ?	—	Go to *Step 4*	Go to *Step 5*
4	Replace the control unit.	—	Go to *Step 6*	—
5	Repair the circuit.	—	Go to *Step 6*	—
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. 3. Conduct a test drive. Has the last test failed or does the current DTC exist?	—	Begin diagnosis again Go to *Step 1*	Repair verified

DTC9 Control Unit Abnormality

Replace the control unit.

DTC9–1 Control Unit Blown Fuse for FR Actuator

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the actuator connector C–44. 3. Measure the resistance between the actuator side connector C–44 terminals 1 and 2. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 2*	Go to *Step 3*
2	1. Measure the resistance between the actuator side connector C–44 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 4*	Go to *Step 3*
3	Replace the actuator FR.	—	Go to *Step 7*	—
4	1. If all steps are correct, check the continuity between the control unit connector C–50 terminal 1 and connector-terminal C50–4, C50–17, C50–5, C50–18. Is there continuity?	—	Go to *Step 5*	Go to *Step 6*
5	Repair the circuit.	—	Go to *Step 7*	—
6	Replace the control unit.	—	Go to *Step 7*	—
7	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *“Basic Diagnosis FLow”.*	Go to *Step 7*

DTC9–2 Control Unit Blown Fuse for FL Actuator

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the actuator connector C–45. 3. Measure the resistance between the actuator side connector C–45 terminals 1 and 2. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 2*	Go to *Step 3*
2	1. Measure the resistance between the actuator side connector C–45 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 4*	Go to *Step 3*
3	Replace the actuator FL.	—	Go to *Step 7*	—
4	1. If all steps are correct, check the continuity between the control unit connector C–50 terminal 1 and connector-terminal C50–6, C50–19, C50–7, C50–20. Is there continuity?	—	Begin diagnosis again Go to *Step 5*	Go to *Step 6*
5	Repair the circuit.	—	Go to *Step 7*	—
6	Replace the control unit.	—	Go to *Step 7*	—
7	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *“Basic Diagnosis FLow”.*	Go to *Step 7*

DTC9–3 Control Unit Blown Fuse for RR Shock Absorber

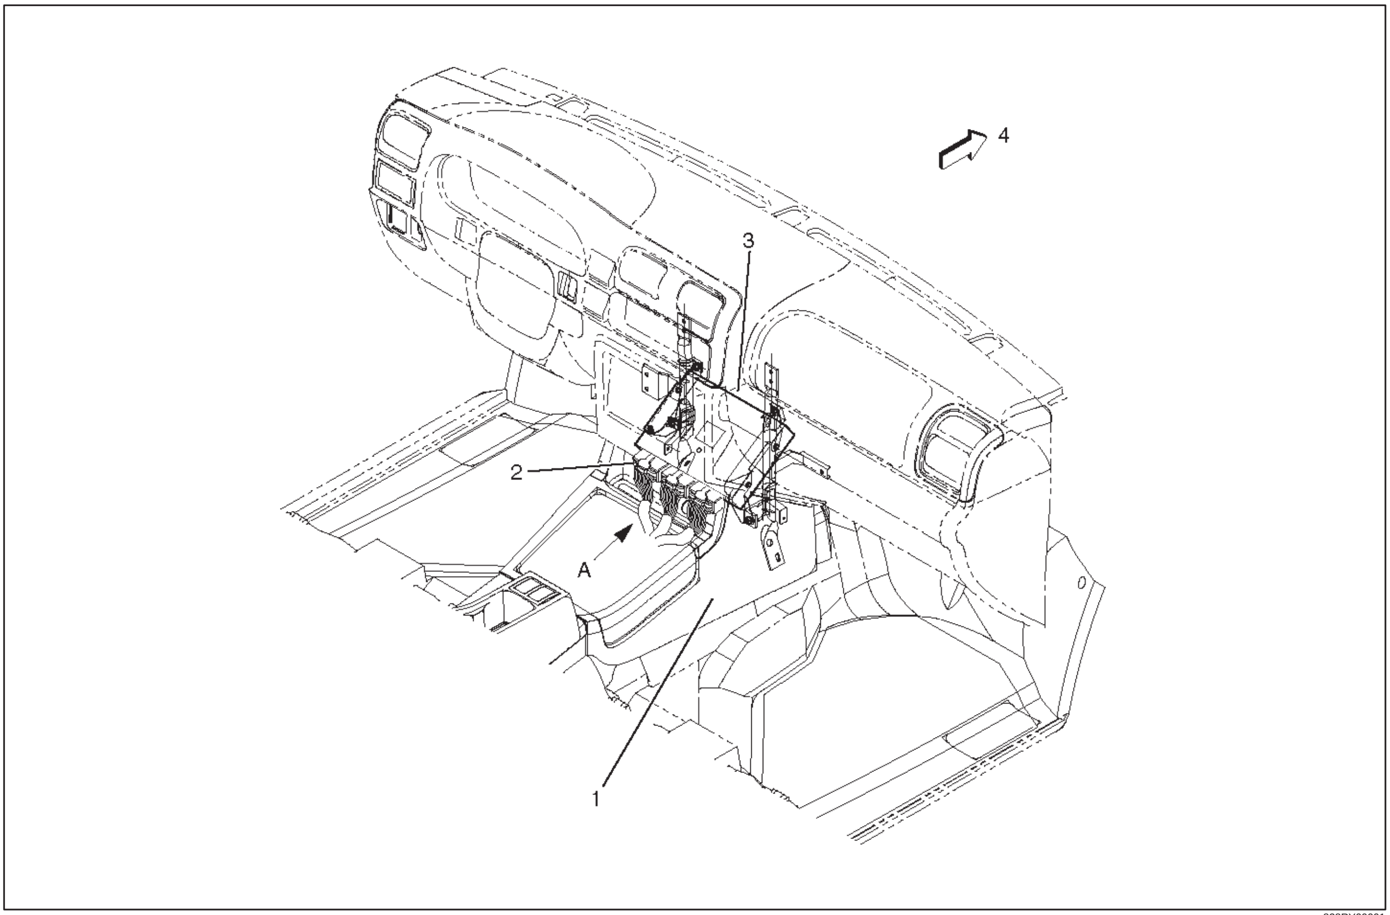
Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the shock absorber connector F–6. 3. Measure the resistance between the shock absorber side connector F–6 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 2*	Go to *Step 3*
2	1. Measure the resistance between the shock absorber side connector F–6 terminals 7 and 8. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 4*	Go to *Step 3*
3	Replace the shock absorber RR.	—	Go to *Step 7*	—
4	1. If all steps are correct, check the continuity between the control unit connector C–50 terminal 1 and connector-terminal C50–8, C50–21, C50–9, C50–22. Is there continuity?	—	Begin diagnosis again Go to *Step 5*	Go to *Step 6*
5	Repair the circuit.	—	Go to *Step 7*	—
6	Replace the control unit.	—	Go to *Step 7*	—
7	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *“Basic Diagnosis FLow”.*	Go to *Step 7*

DTC9–4 Control Unit Blown Fuse for RL Shock Absorber

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the shock absorber connector F–7. 3. Measure the resistance between the shock absorber side connector F–7 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 2*	Go to *Step 3*
2	1. Measure the resistance between the shock absorber side connector F–7 terminals 7 and 8. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 4*	Go to *Step 3*
3	Replace the shock absorber RL.	—	Go to *Step 7*	—
4	1. If all steps are correct, check the continuity between the control unit connector C–50 terminal 1 and connector-terminal C50–10, C50–23, C50–11, C50–24. Is there continuity?	—	Begin diagnosis again Go to *Step 5*	Go to *Step 6*
5	Repair the circuit.	—	Go to *Step 7*	—
6	Replace the control unit.	—	Go to *Step 7*	—
7	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *“Basic Diagnosis FLow”.*	Go to *Step 7*

Control Unit

Control Unit and Associated Parts



828RY00001

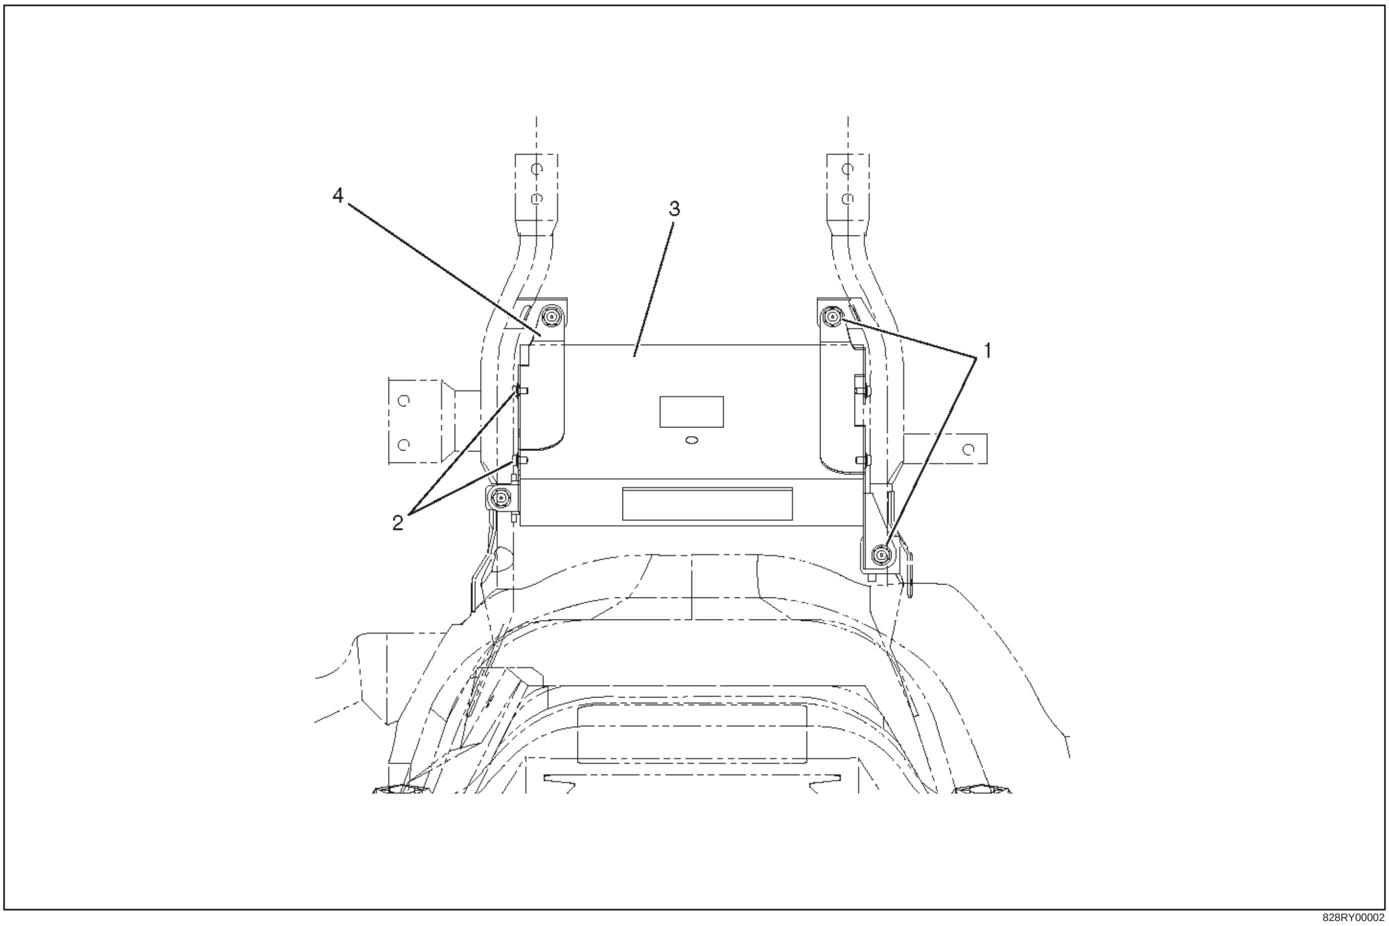
Legend

(1) Front Console
(2) Connector
(3) Control Unit
(4) Front

Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly.
   Refer to *Consoles in Body and Accessories section.*
3. Disconnect the connector from the control unit.

View A



Legend

(1) Nut
(2) Screw
(3) Control Unit
(4) Bracket

4. Remove 4 nuts.
5. Disconnect the control unit with brackets.
6. Remove 4 screws.
7. Disconnect the control unit from brackets.

Installation

To install, follow the removal steps in the reverse order, noting the following points.
Torque:
Nut (1) 8N·m (69 lb in)

Front Actuator

Front Actuator and Associated Parts

(7) Shock Absorber

1. Removal 2 screws.
2. Disconnect the actuator.
3. Remove the nut.
4. Disconnect bracket.
5. Remove the nut.
6. Disconnect the washer.
7. Remove the shock absorber.
   Refer to *Shock Absorber in this section.*

Inspection and Repair

Refer to *shock Abosorber in this section.*

Installation

1. Install the shock absorber.
   Refer to *Shock Absorber in this section.*
2. Install the washer and nut (5), then tighten it to the specified torque.
   Torque: 37 N· m (27 lbft)
3. Install the bracket and nut (3), then tighten it to the specified torque.
   Torque: 37 N· m (27 lbft)
4. Fit the top of the shock absorber rod in the connection part of the actuator.

NOTE:

The mating section is width fitting across flats.

If these normally fit, the distance between the actuator lower face and the bracket upper face is about 1 mm.

5. Install 2 screws then tighten it to the specified torque.
   3 N· m (26 lbft)
6. Connect the connector to the harness and insert the connector to the bracket.
7. Connect the actuator harness with the clip.
8. Connect the battery ground cable.

Rear Shock Absorber

Rear Shock Absorber and Associated Parts

(8) Upper
(9) Right
(10) Connector
(11) Gusset

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector (1) from the harness and remove the connector (1) from the bracket.
3. Remove the clip.
4. Remove the rear shock absorber.
   Refer to *Shock Absorber in this section.*
5. Disconnect the connector (10) from the harness and remove the connector (10) from the gusset.
6. Remove the nut and washer.
7. Disconnect the G-sensor.

Inspection and Repair

Refer to Shock Absorber in this section.

Installation

1. Set the G-sensor on the gusset.
2. Install the washer and nut, then tighten it to the specified torque.
   Torque: 41 N· m (30 lbin)
3. Connect the connector (10) to the harness and insert the connector (10) to the gusset.
4. Install the rear shock absorber.
   Refer to *Shock Absorber in this section.*
5. Connect the connector (1) to the harness and insert the connector (1) to the bracket.
6. Insert the clip to the bracket.
7. Connect the battery ground cable.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM(SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE REFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFOMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED , do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally,such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specification. Following these instructions can help you avoid damage to parts and systems.

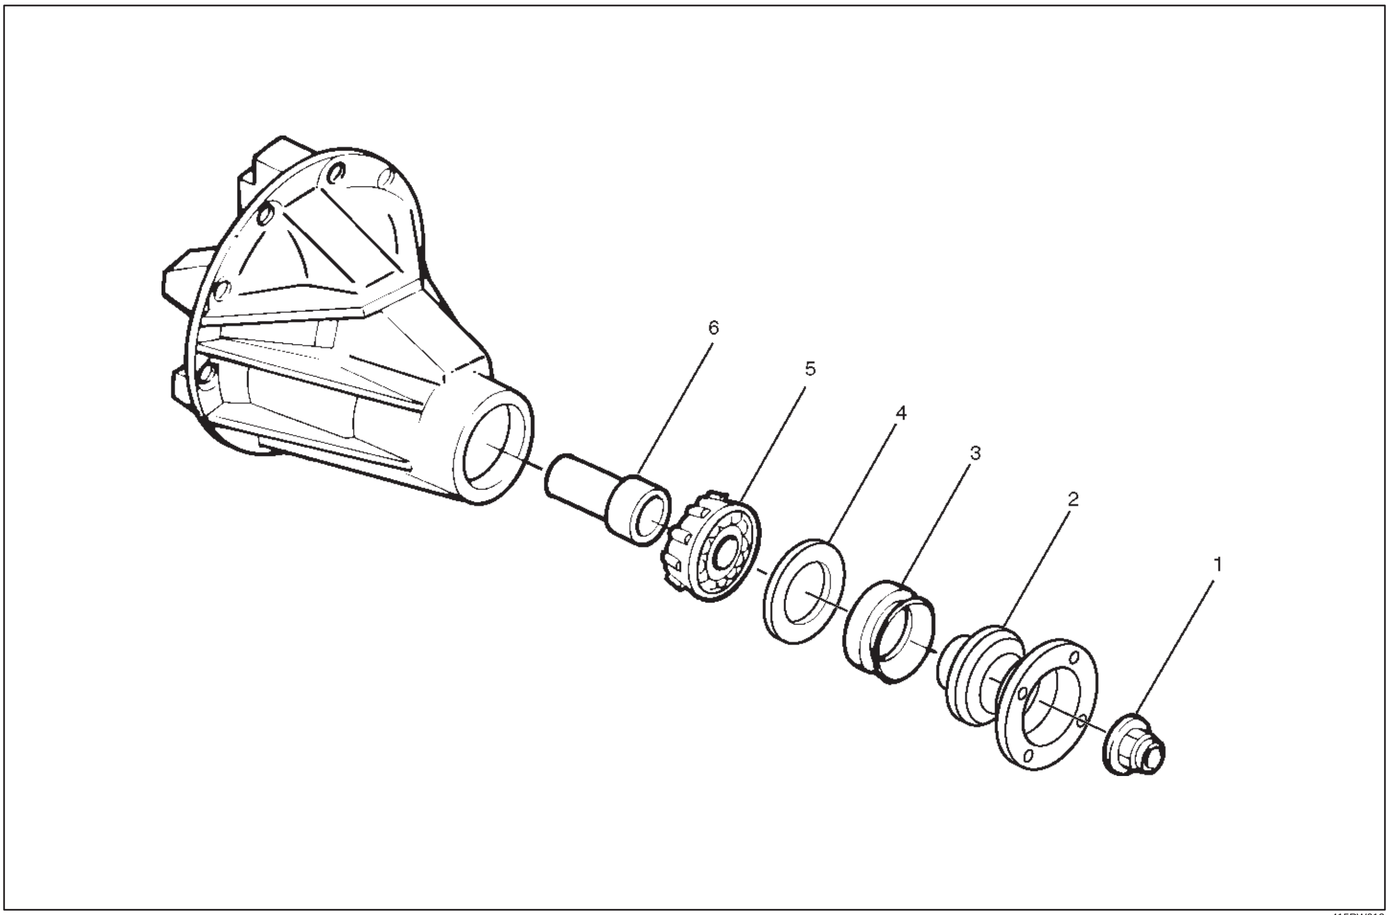
Front Drive Axle

Diagnosis

Condition	Possible cause	Correction
Oil Leak At Front Axle	Worn or defective oil seal.	Replace the oil seal.
	Front axle housing cracked.	Repair or replace.
Oil Leak At Pinion Shaft	Too much gear oil.	Correct the oil level.
	Oil seal worn or defective.	Replace the oil seal.
	Pinion flange loose or damaged.	Tighten or replace.
Noises In Front Axle Drive Shaft Joint	Broken or worn drive shaft joints and bellows (BJ and DOJ).	Replace the drive shaft joints and bellows.
“Clank” When Accelerating From “Coast”	Loose drive shaft joint to output shaft bolts.	Tighten.
	Damaged inner drive shaft joint.	Replace.
Shudder or Vibration During Acceleration	Excessive drive shaft joint angle.	Repair.
	Worn or damaged drive shaft joints.	Replace.
	Sticking spider assembly (inner drive shaft joint).	Lubricate or replace.
	Sticking joint assembly (outer drive shaft joint).	Lubricate or replace.
Vibration At Highway Speeds	Out of balance or out of round tires.	Balance or replace.
	Front end out of alignment.	Align.
Noises in Front Axle	Insufficient gear oil.	Replenish the gear oil.
	Wrong or poor grade gear oil.	Replace the gear oil.
	Drive pinion to ring gear backlash incorrect.	Adjust the backlash.
	Worn or chipped ring gear, pinion gear or side gear.	Replace the ring gear, pinion gear or side gear.
	Pinion shaft bearing worn.	Replace the pinion shaft bearing.
	Wheel bearing worn.	Replace the wheel bearing.
	Differential bearing loose or worn.	Tighten or replace.
Wanders and Pulls	Wheel bearing preload too tight.	Adjust the wheel bearing preload.
	Incorrect front alignment.	Adjust the front alignment.
	Steering unit loose or worn.	Tighten or replace.
	Tire worn or improperly inflated.	Adjust the inflation or replace.
	Front or rear suspension parts loose or broken.	Tighten or replace.
Front Wheel Shimmy	Wheel bearing worn or improperly adjusted.	Adjust or replace.
	Incorrect front alignment.	Adjust the front alignment.
	Worn ball joint or bush.	Replace the ball joint or bush.
	Steering unit loose or worn.	Tighten or replace.
	Tire worn or improperly inflated.	Replace or adjust the inflation.
	Shock absorber worn.	Replace the shock absorber.

Pinion Shaft Oil Seal

Pinion Shaft Oil Seal and Associated Parts



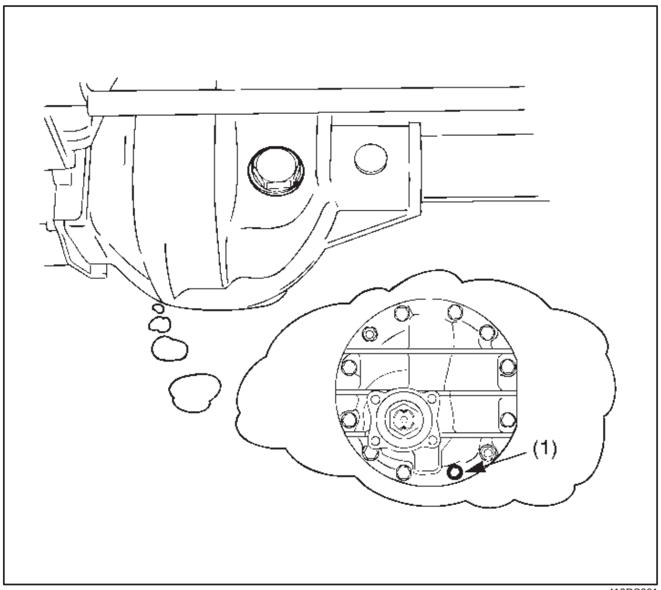
415RW012

Legend

(1) Flange Nut
(2) Flange
(3) Oil Seal
(4) Oil Seal Slinger
(5) Outer Bearing
(6) Collapsible Spacer

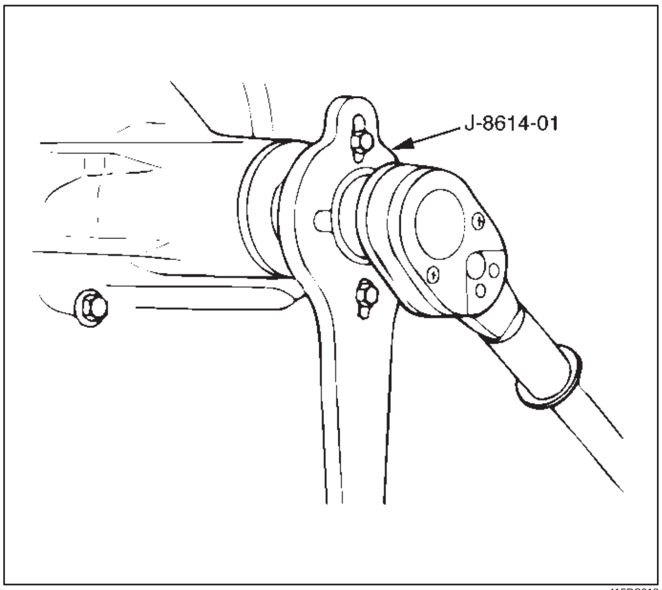
Removal

1. Raise the vehicle and support it at the frame.
   The hoist must remain under the front axle housing.
2. Drain the front axle oil by loosening the drain plug(1).



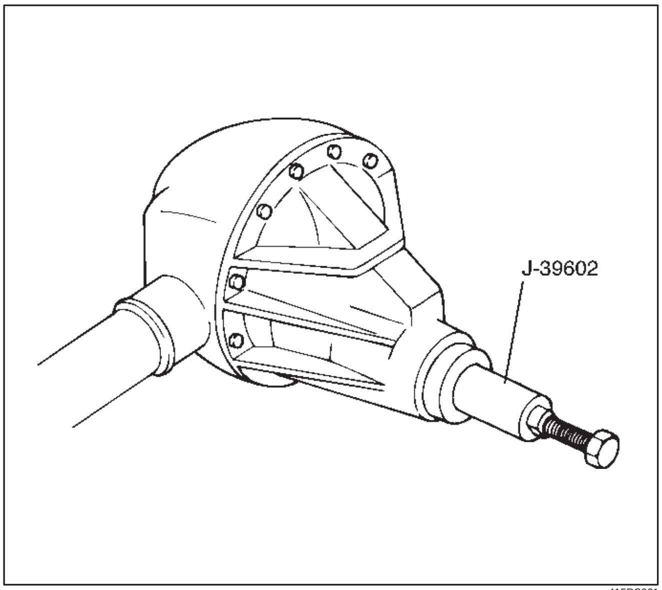
412RS001

3. Remove the front propeller shaft. Refer to Front Propeller Shaft in this section.
4. Remove flange nut by using pinion flange holder J–8614–01.



415RS018

5. Remove flange.
6. Remove oil seal.
7. Remove outer bearing by using remover J–39602.



415RS001

8. Remove collapsible spacer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts.

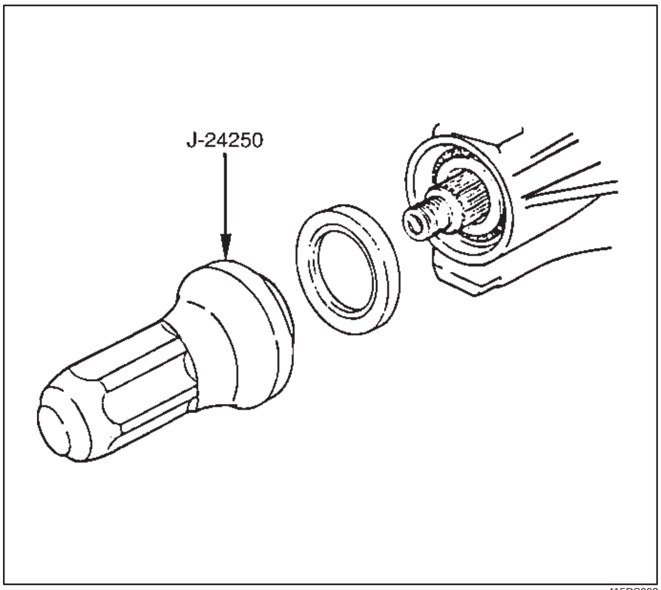
1. Seal surface of the pinion.
2. Cage bore for burns.

Installation

1. Install collapsible spacer. Discard the used collapsible spacer and install a new one.
2. Install outer bearing.

NOTE: Do not drive in, but just temporarily set in the outer bearing by hand, which should be indirectly pressed in finally by tightening the flange nut.

3. Install oil seal, use oil seal installer J–24250 to install a new oil seal that has grease on seal lip.



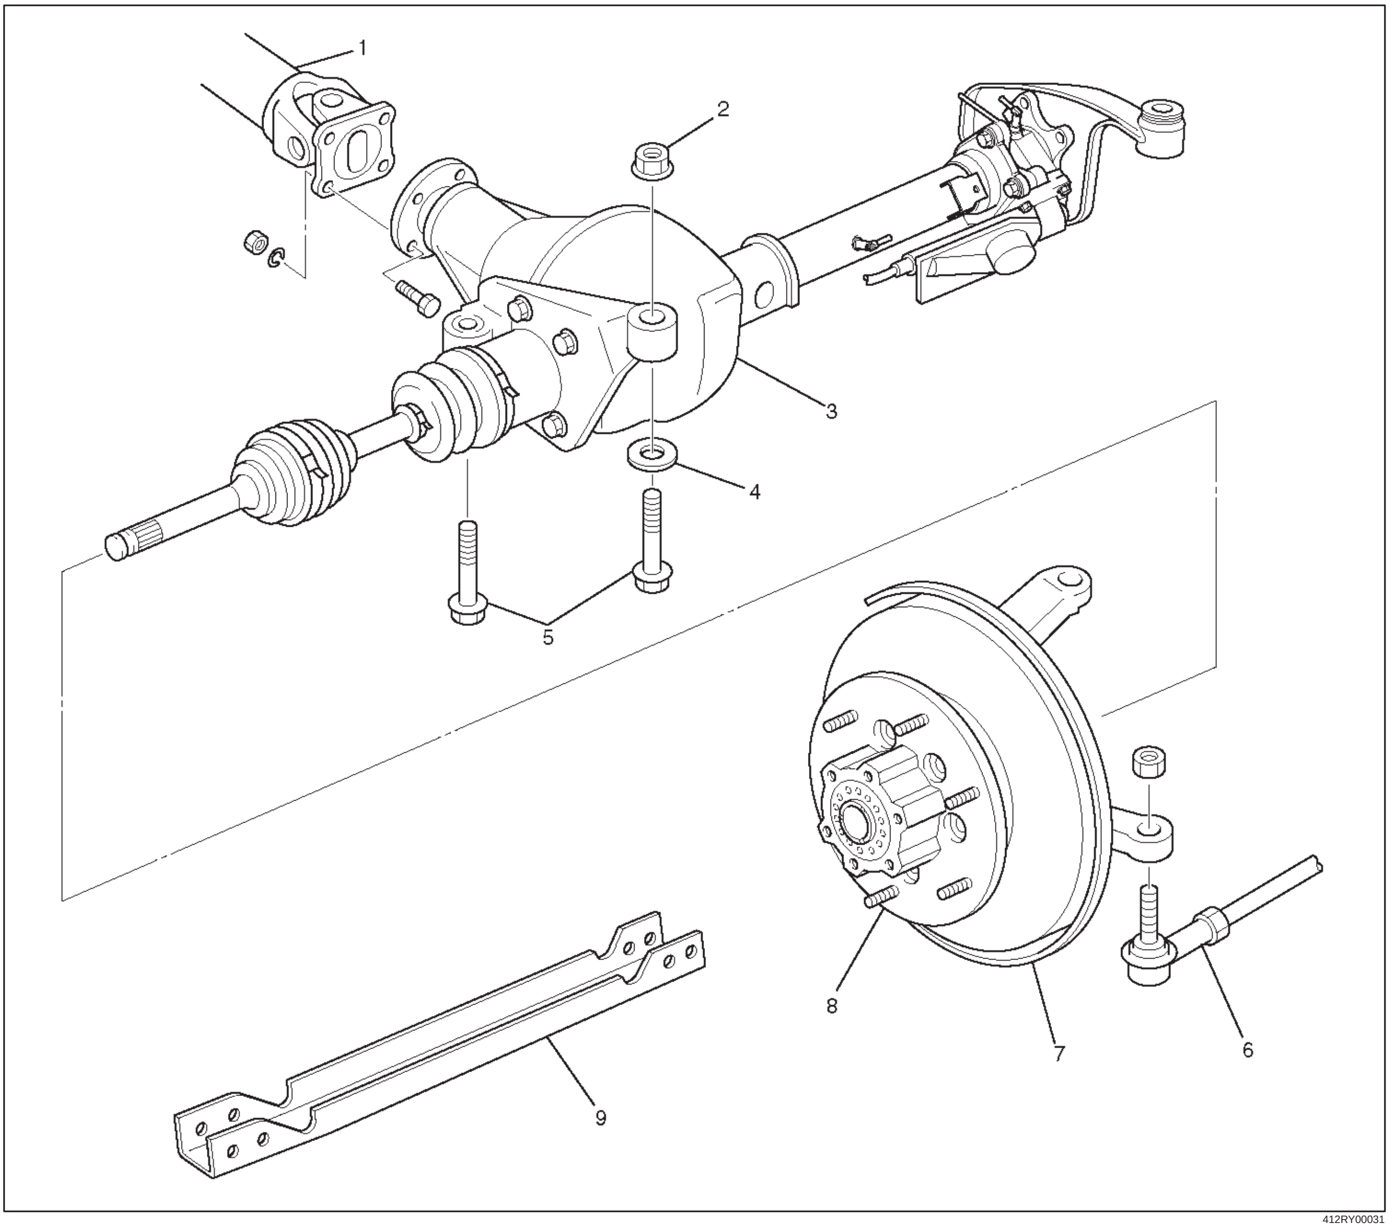
415RS002

4. Install flange.
5. Install flange nut, refer to Differential Assembly Overhaul for flange nut reassembly in this section.

NOTE: Discard the used nut and install a new one.

Front Drive Axle Assembly

Front Drive Axle Assembly and Associated Parts

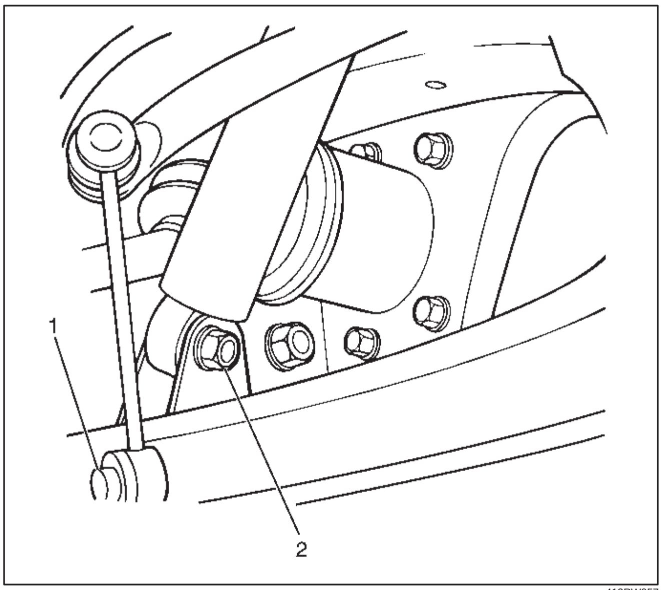


Legend

(1) Propeller Shaft
(2) Mounting Nut
(3) Front Axle Case Assembly and Front Drive Shaft Assembly
(4) Washer
(5) Mounting Bolt
(6) Tie–rod End; Power Steering Unit
(7) Knuckle and Back Plate
(8) Hub and Disc Assembly
(9) Suspension Crossmember

Removal

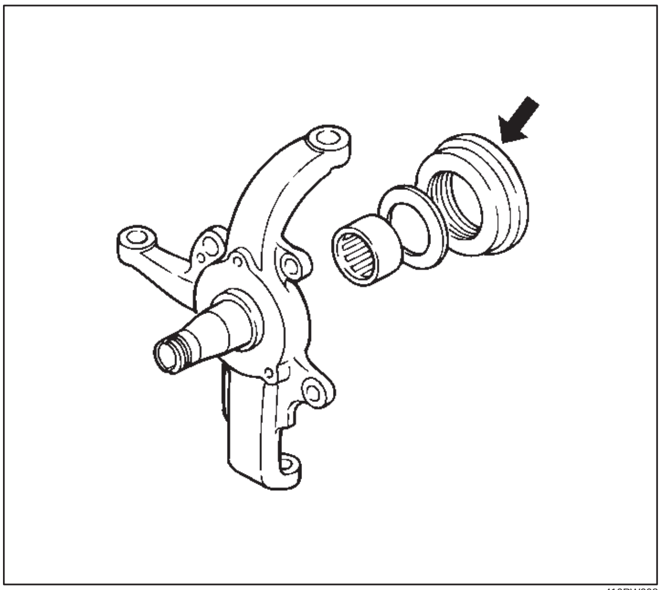
1. Jack up the vehicle and support it using jack stand.
2. Remove the tire and wheel.
3. Remove the stone guard.
4. Remove the brake caliper fixing bolt and hang the caliper. Refer to Disc Brakes in Brake section.
5. Remove the antilock brake system speed sensor. Refer to Front Wheel Speed Sensor in Brake section.
6. Remove the hub and disc assembly. Refer to Front Hub and Disc in this section.
7. Remove the propeller shaft, refer to Front Propeller Shaft in this section.
8. Loosen the height control arm of the torsion bar, then remove the torsion bar from lower control arm. refer to Torsion Bar in Suspension section.
9. Remove the suspension crossmember.
10. Remove the lower nut (1) of the stabilizer link.
11. Remove the lower bolt and nut (2) of the shock absorber.



412RW057

12. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering Section.
13. Disconnect the hose of the shift on the fly.
14. Disconnect the actuator connector.
15. Remove the bolts and nuts of the lower control arm (Frame side), then disconnect the lower control arm from frame.
16. Disconnect between the right side upper control arm and the knuckle, then remove the knuckle with lower control arm.

CAUTION: When removing the knuckle, be careful not to damage the oil seal inside of the knuckle.



410RW008

17. Support the differential case by the jack.
18. Remove the front axle mounting bolts and nuts, lower the jack slowly. Remove the left side drive shaft end from the knuckle, then lower the axle assembly from the vehicle.

CAUTION:

1. **During the work, be sure that the axle assembly is supported securly.**
2. **Be careful not to damage the bellows of the power steering unit by interference.**
3. **Be careful not to damage the hose bracket of the shift on the fly by interference.**

Installation

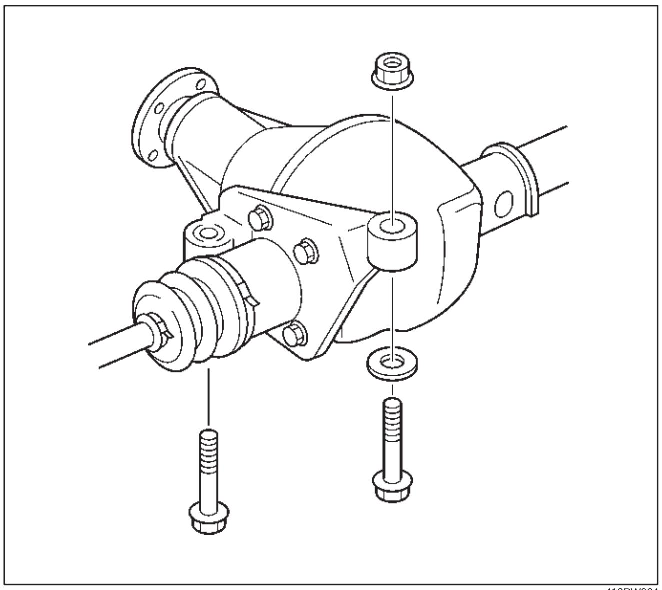
1. Support the differential case by the jack.
2. Jack up the front drive axle assembly, install the left side drive shaft to the knuckle, then install the mount bolts and nuts.

CAUTION:

1. **Be careful not to damage the bellows of the power steering unit by interference.**
2. **Be careful not to damage the hose bracket of the shift on the fly by interference.**
3. **When installing the drive shaft to the knuckle, be careful not to damage the oil seal inside of the knuckle.**

3. Tighten the mounting bolts and nuts to the specified torque.

Torque: 168 N·m (124 lb ft)



412RW064

4. Install the right side knuckle with lower control arm to the upper control arm.
   Refer to Knuckle in Suspension section.

CAUTION: When insert the drive shaft to the knuckle, be careful not to damage the oil seal inside of the knuckle.

5. Align the bolt hole of the lower control arm, install the bolts and nuts.

NOTE: Adjust the buffer clearance before tighten the bolts and nuts of the lower control arm.

6. Install the hose of the shift on the fly.
7. Install the actuator connector of the shift on the fly.
8. Install the tie-rod end of the power steering unit to the knuckle, tighten the nut to the specified torque.

Torque: 118 N·m (87 lb ft)

9. Install lower bolts and nuts of the shock absorber, tighten it to the specified torque.

Torque: 93 N·m (69 lb ft)

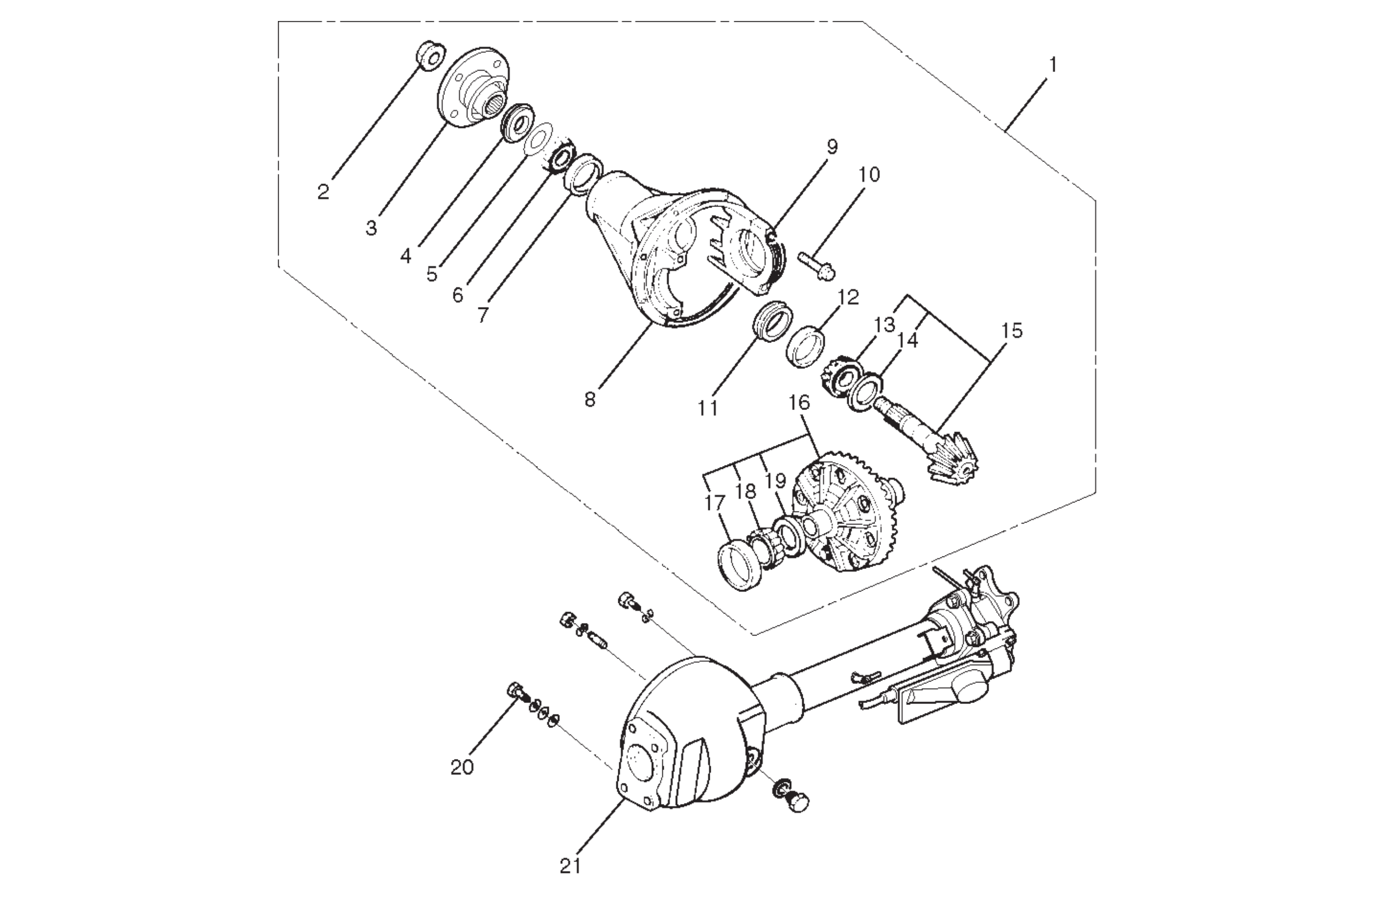
10. Install lower nuts of the stabilizer link, tighten it to the specified torque.
11. Install the suspension crossmember.
12. Install the torsion bar.
    Refer to Torsion Bar in Suspension section.
13. Install the front propeller shaft.
    Refer to Front Propeller Shaft in this section.
14. Install the hub and disc assembly and adjust the bearing preload.
    Refer to Front Hub and Disc in this section.
15. Install the wheel speed sensor of the antilock brake system.
16. Install the brake caliper. Tighten the bolt of the caliper bracket to the specified torque.

Torque: 50 N·m (37 lb ft)

17. Install the stone guard.
18. Install the tire and wheel.
19. Lower the vehicle, adjust the trim height.
    Refer to Trim Height Adjustment in Steering section.
20. Tighten the bolts and nuts of the lower control arm to the specified torque.
    Refer to Lower Control Arm in Suspension section.

Differential Assembly

Disassembled View



415RY00008

Legend

(1) Differential Assembly
(2) Flange Nut

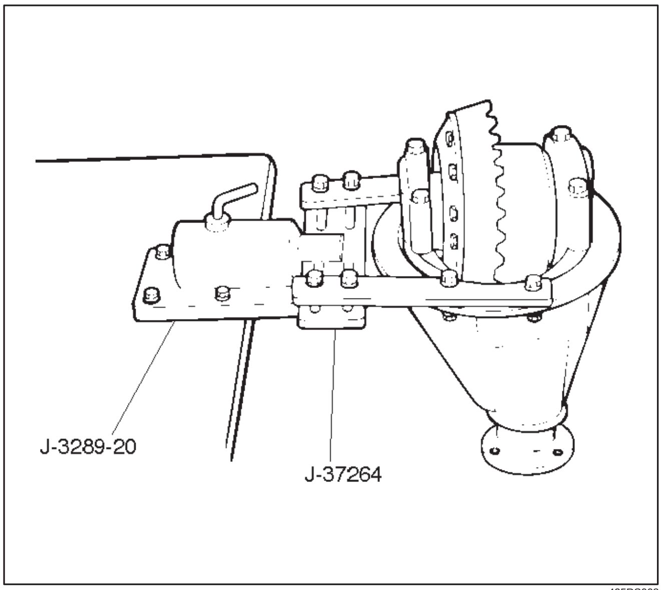
(15) Pinion Gear
(16) Diff Cage Assembly
(17) Side Bearing Outer Race
(18) Side Bearing
(19) Adjust Shim
(20) Bolt
(21) Axle Case

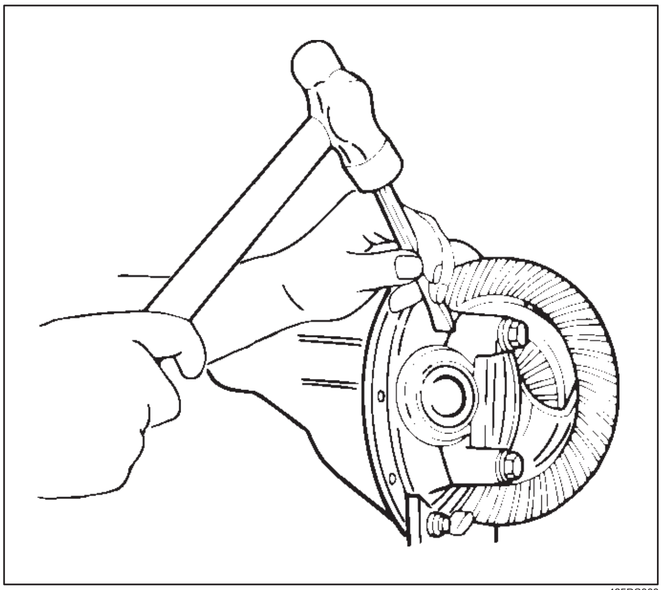
Disassembly

1. Remove differential carrier fixing bolt.
2. Remove differential assembly.
3. Using holding fixture J–37264 and holding fixture base J–3289–20, fix the differential assembly to the bench.



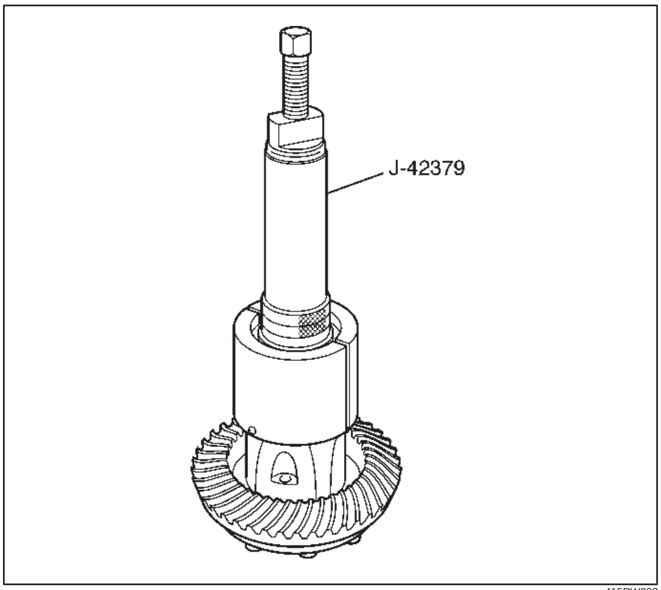
425RS008

4. Remove bearing cap bolt.
5. Apply a setting mark to the side bearing cap and the differential carrier then remove bearing cap.



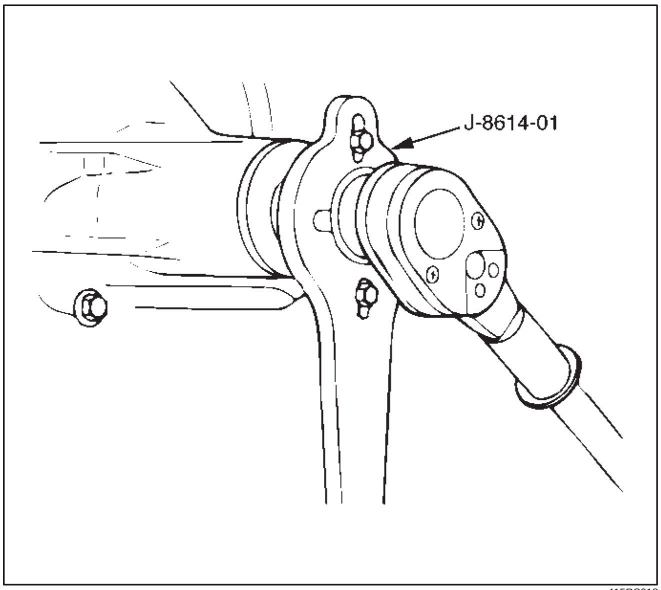
425RS009

6. Remove differential cage assembly.
7. Remove side bearing outer race, after removal, keep the right and left hand side bearing assemblies separate to maintain inner and outer race combinations.
8. Remove side bearing, using remover J–42379 and adapter J–8107–2.
   - Select insert; 303173 and collet halves; 44801 in remover kit J–42379.



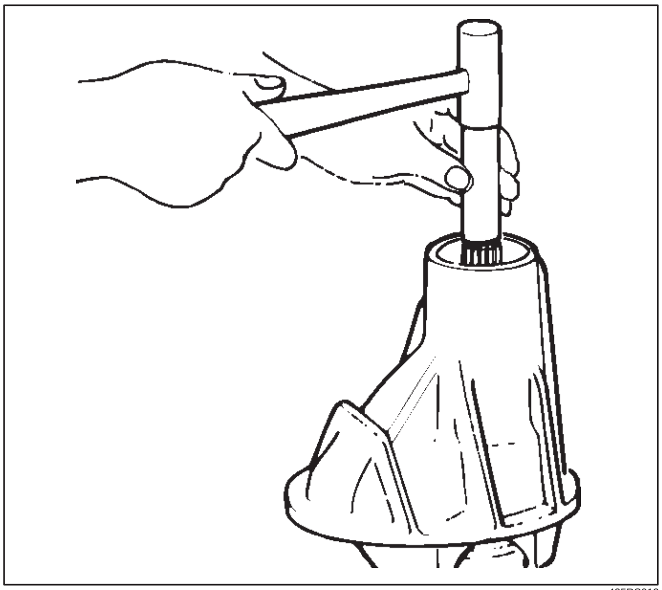
415RW003

9. Remove adjust shim, note the thickness and position of the shims removed.
10. Remove the flange nut using holding wrench J–8614–01.



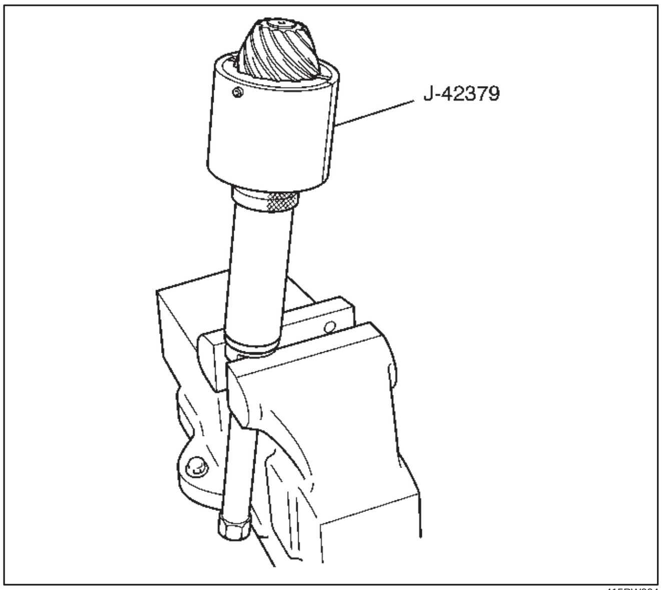
415RS018

11. Remove flange using an universal puller.
12. Remove the drive pinion assembly using a soft metal rod and a hammer.



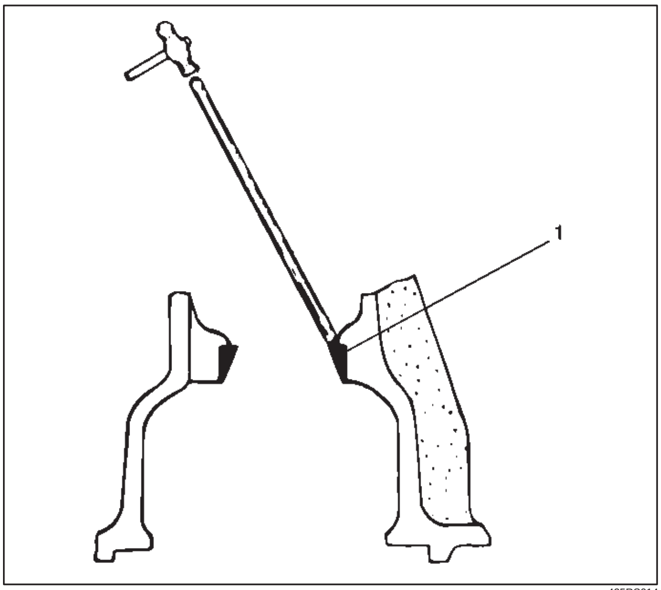
425RS012

13. Remove collapsible spacer.
14. Remove the inner bearing using remover J–42379.
    - Select insert; 303173 and collet halves; 44801 in remover kit J–42379.

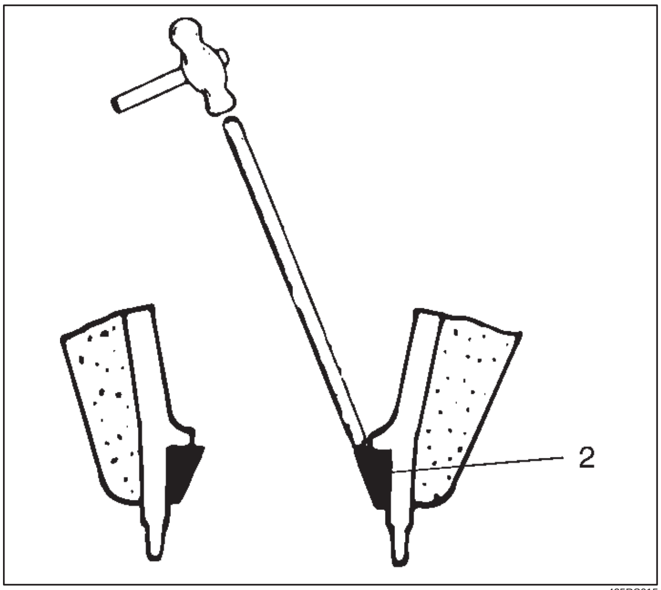


415RW004

15. Remove adjust shim.
16. Remove oil seal.
17. Remove oil seal slinger.
18. Remove outer bearing.
19. Remove the inner bearing outer race (1) and the outer bearing outer race (2) by using a brass bar and a hammer.



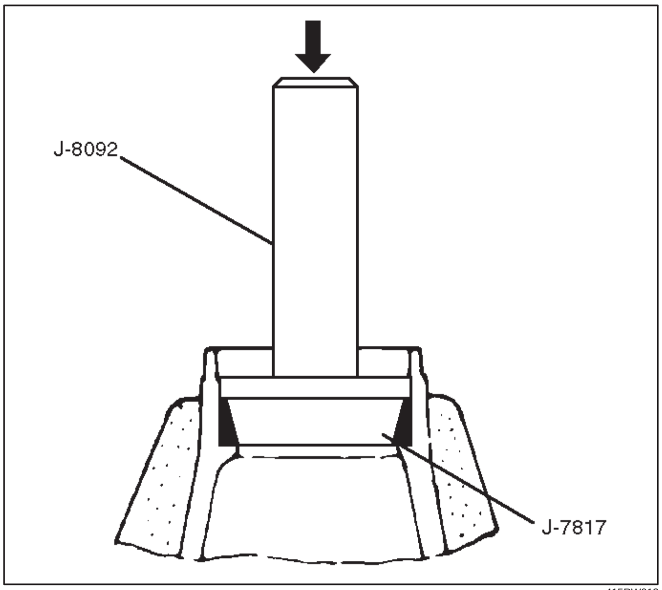
425RS014



425RS015

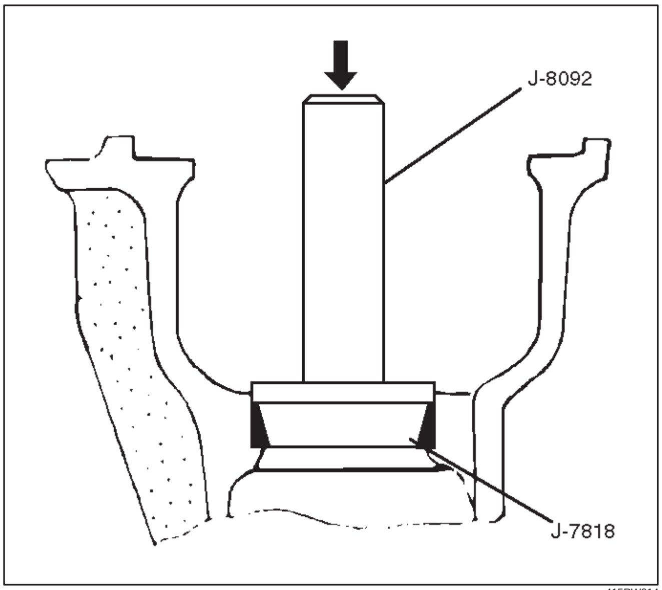
Reassembly

1. Using installer J–7817 and grip J–8092, install outer bearing outer race.



415RW013

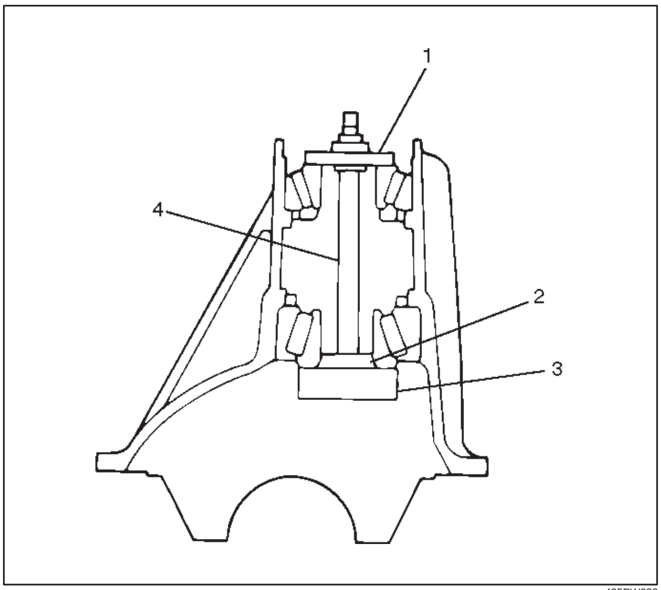
2. Using installer J–7818 and grip J–8092, install Inner bearing outer race.



415RW014

3. Install adjust shim and adjust drive pinion mounting distance:
   1. Apply gear oil to the inner and outer drive pinion bearing.
      Clean the pinion setting gauge set.
      Then install the gauge set together with the inner and outer bearings.
   2. Tighten the nut to the specified torque.

Torque: 2.3 N·m (20 lb in)

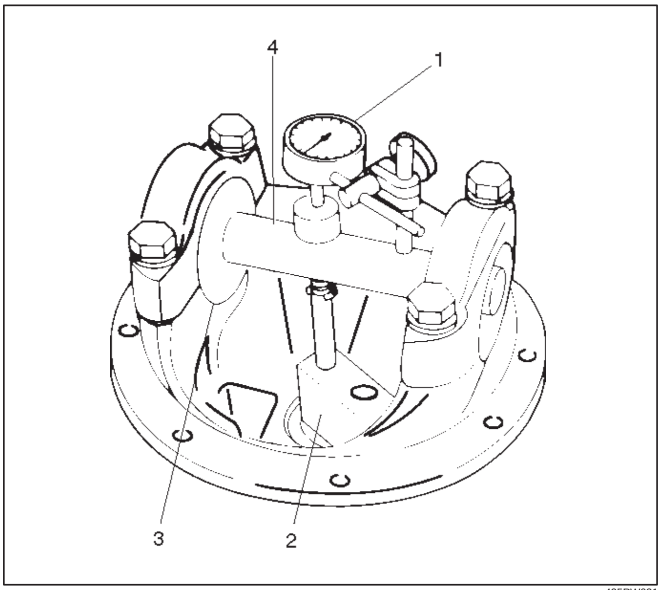


425RW030

Legend
(1) Pilot : J–21777–42
(2) Pilot : J–42479–2
(3) Gauge Plate : J–42479–1
(4) Nut and Stud : J–21777–43

3. Clean the side bearing bores. Install the dial indicator with the discs and arbor. Install and tighten the bearing caps to the specified torque.

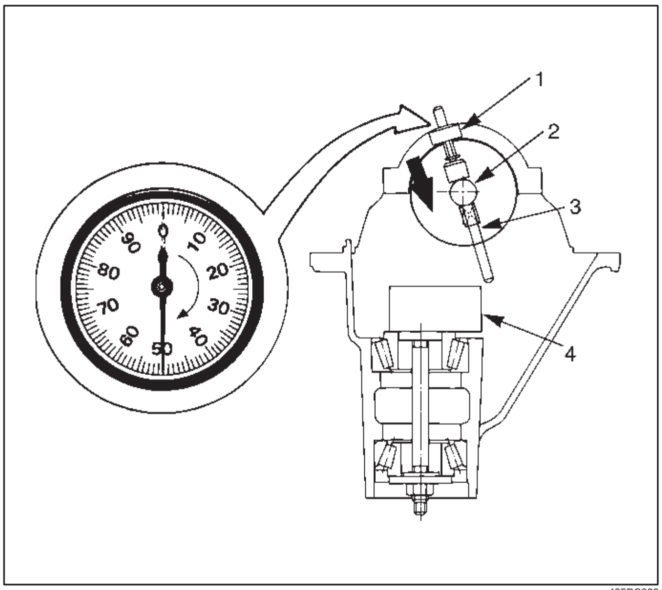
Torque: 97 N·m (72 lb ft)



425RW031

Legend
(1) Dial Indicator: J–8001
(2) Gauge Plate: J–42479–1
(3) Disc (2 pcs.): J–23597–8
(4) Arbor: J–23597–1

4. Set the dial indicator to “0”. Place it on the mounting post of the gauging arbor with the contact button touching the indicator pad. Force the dial indicator downward until the needle has made a half turn clockwise. Tighten down the dial indicator in this position.



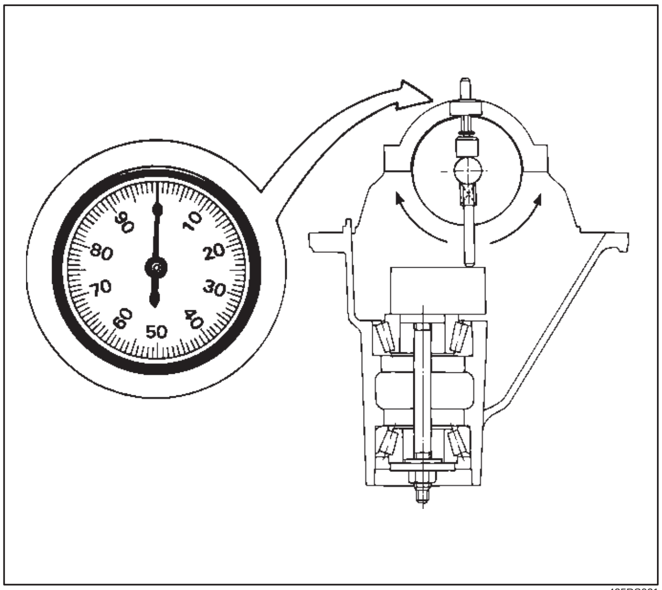
425RS020

Legend

(1) Dial Indicator
(2) Ganging Arbor
(3) Plunger
(4) Gauge Plate

5. Position the plunger on the gauge plate. Move the gauging arbor slowly back and forth and locate the position at which the dial indicator shows the greatest defection. At this point, once again set the dial indicator to “0”.

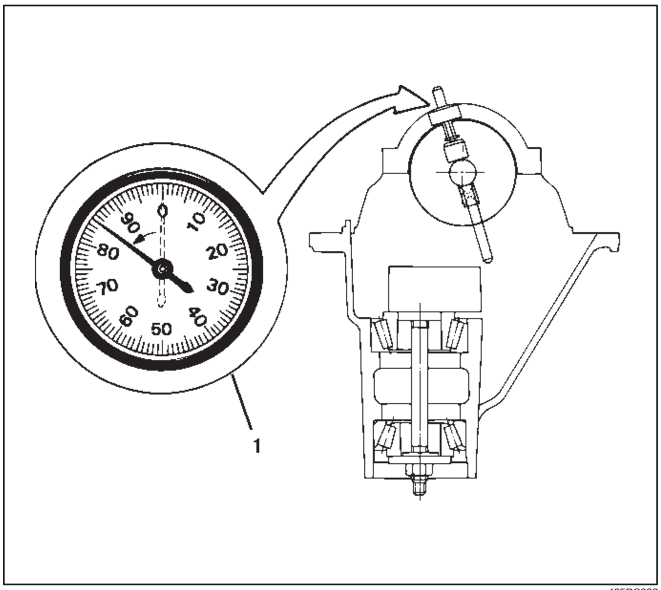
   Repeat the procedure to verify the “0” setting.



425RS021

6. After the ZERO setting is obtained, rotate the gauging arbor until the dial indicator rod does not touch the gauging plate.

   Record the number the dial indicator needle points to.



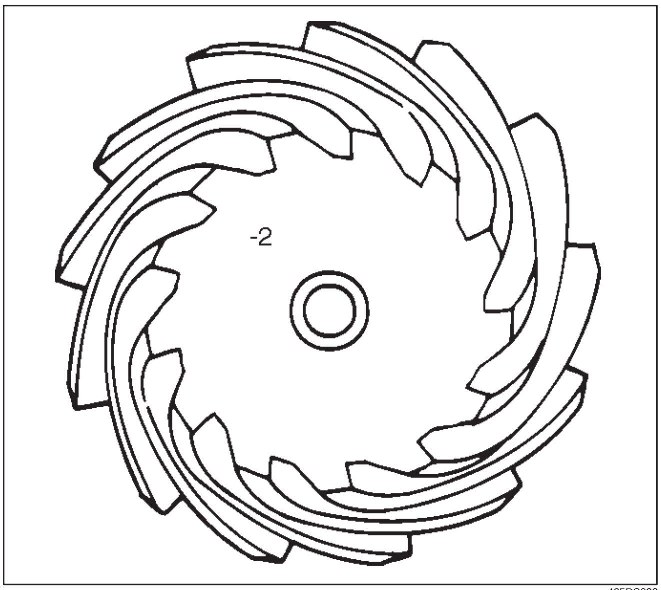
425RS022

Legend

(1) Example=Dial indicator reading of 0.085

7. Record the pinion depth code on the head of the drive pinion.

   The number indicates a necessary change in the pinion mounting distance. A plus number indicates the need for a greater mounting distance (which can be achieved by decreasing the shim thickness). A minus number indicates the need for a smaller mounting distance (which can be achieved by increasing the shim thickness). If examination reveals pinion depth code “0”, the pinion is “nominal”.



425RS023

8. Select the shim using chart;

Pinion marking / Dial indicator reading (Inches)	+7	+6	+5	+4	+3	+2	+1	0	–1	–2	–3	–4	–5	–6	–7
0.023															0.030
0.024														0.030	0.030
0.025													0.030	0.030	0.032

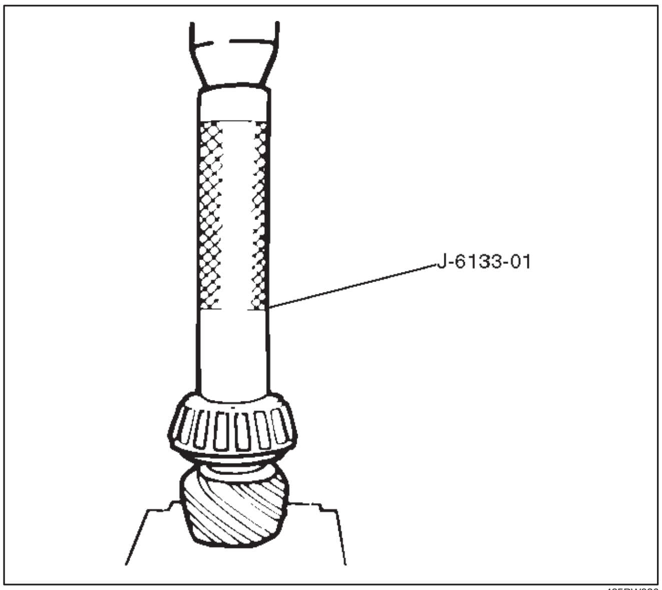
4. Place the shim on the drive pinion. Install the inner bearing onto the pinion using an installer J–6133–01 and a press.

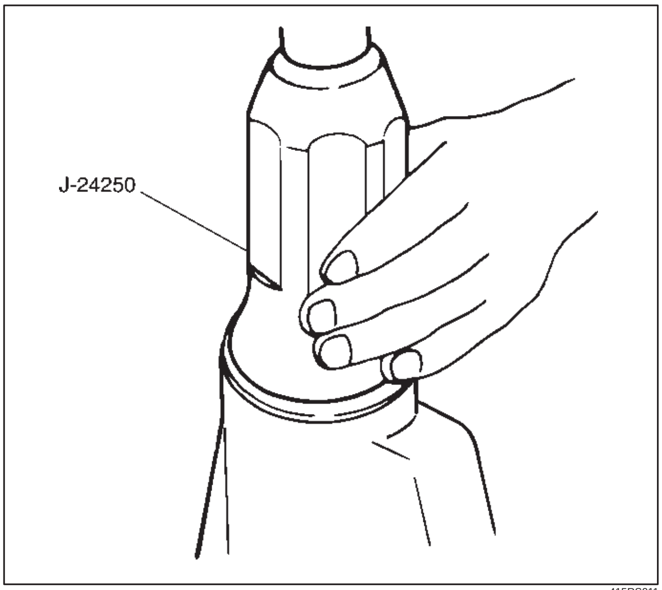
NOTE: Do not apply pressure to the roller cage and apply pressure only to the inner race.



425RW036

5. Discard the used collapsible spacer and install a new one.
6. Install pinion gear.
7. Install outer bearing.
8. Install oil seal slinger.
9. Use oil seal installer J–24250 to install a new oil seal that has been soaked in front axle lubricant.

NOTE: Take care to use a front differential oil seal, NOT the rear differential oil seal.

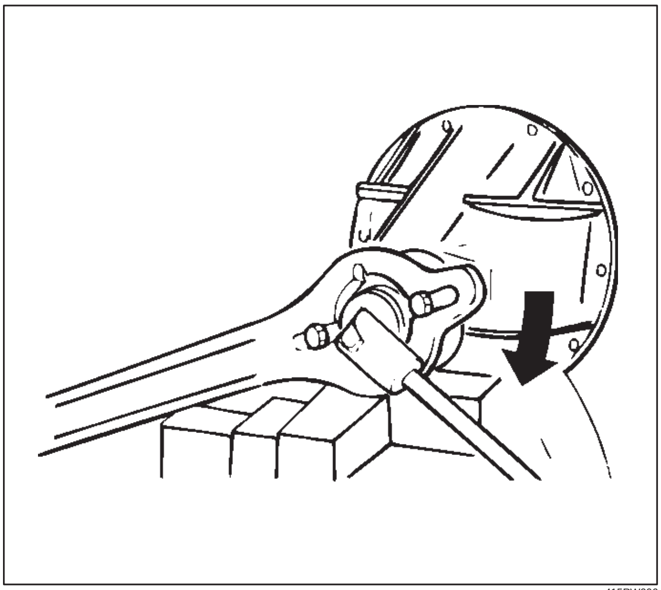


415RS011

10. Install flange.
11. Install flange nut.
    1. Apply lubricant to the pinion threads.
    2. Tighten the nut to the specified torque using the pinion flange holder J–8614–01.

Torque: 217N·m (160 lb ft)

NOTE: Discard used flange nut and install new one and do not over tighten the flange nut.

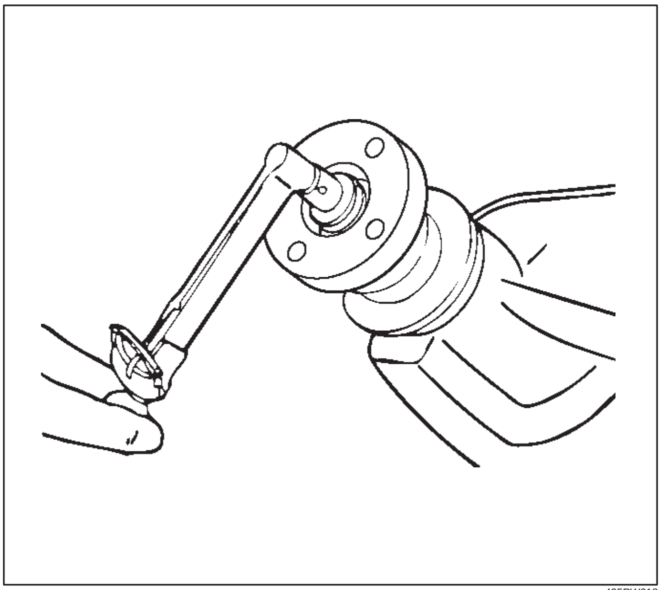


415RW006

    3. Adjust pinion bearing preload.
        a. Measure the bearing preload by using a torque meter. Note the scale reading required to rotate the flange.
        b. Continue tightening flange nut until the specified starting torque is obtained.

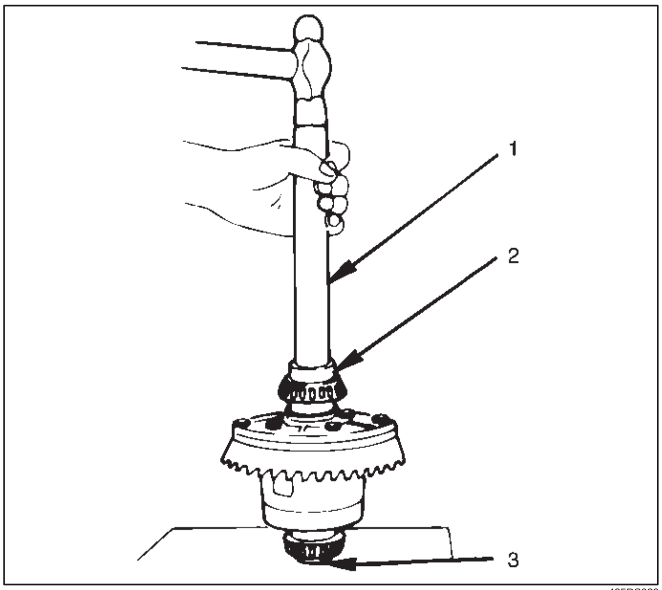
Starting torque: 0.6–1.1 N·m(5.6–10.0 lb in)

NOTE: Do not tighten the flange nut more than 678 N·m(500 lb ft).



425RW018

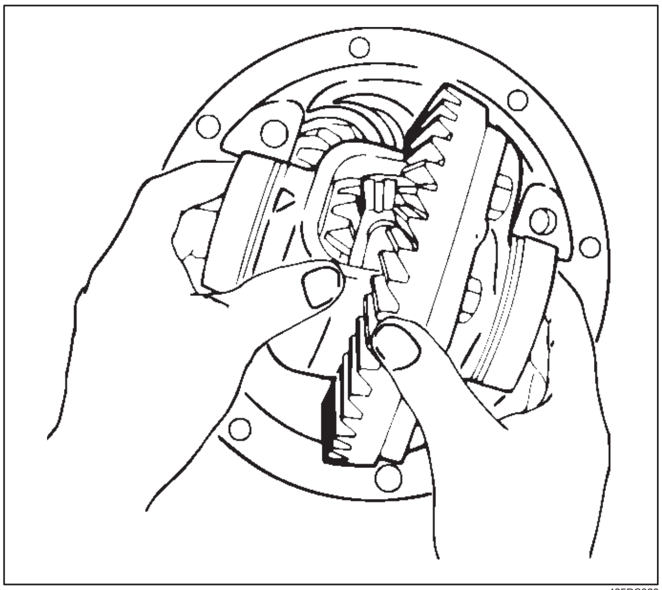
12. Install adjust shim.
    1. Attach the side bearing to the differential assembly without shims. Support the opposite side using a pilot to prevent bearing damage.



425RS029

Legend
(1) Drive handle:J–8092
(2) Installer:J–24244
(3) Pilot:J–8107–2

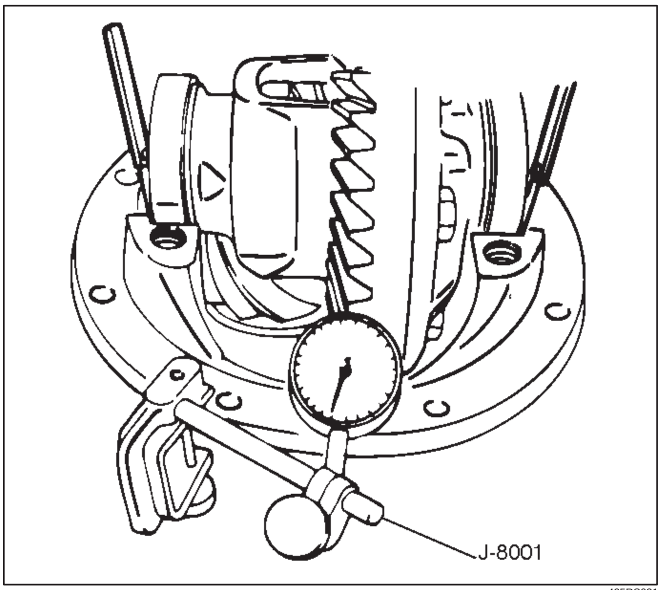
2. Insert the differential cage assembly with bearing outer races into the side bearing bores of the carrier.



425RS030

3. Using two sets of feeler gauges, insert a feeler stock of sufficient thickness between each bearing outer race and the carrier to remove all end play. Make certain the feeler stock is pushed to the bottom of the bearing bores.

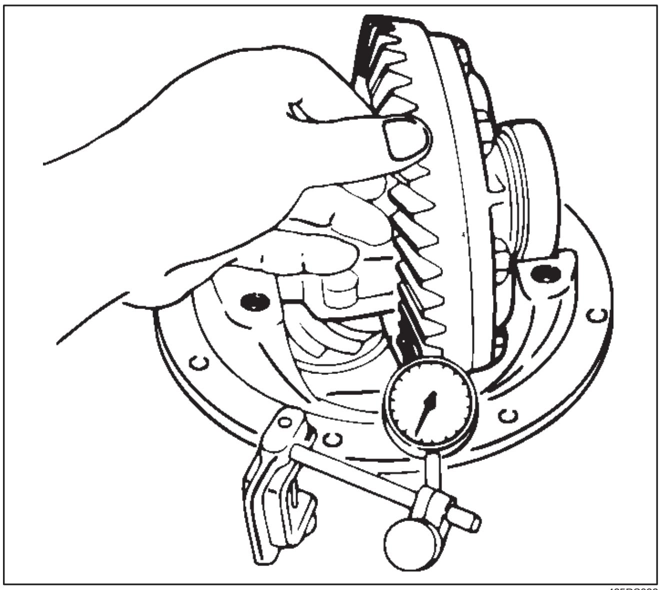
   Mount the dial indicator J–8001 on the carrier so that the indicator stem is at right angles to a tooth on the ring gear.



425RS031

4. Adjust feeler gauge thickness from side to side until ring gear backlash is in the specified range.

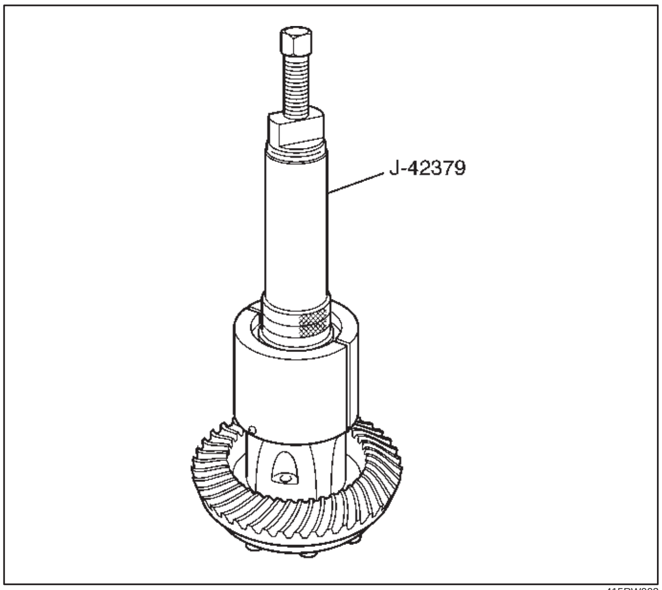
Backlash: 0.13–0.20 mm(0.005 –0.008 in)



425RS032

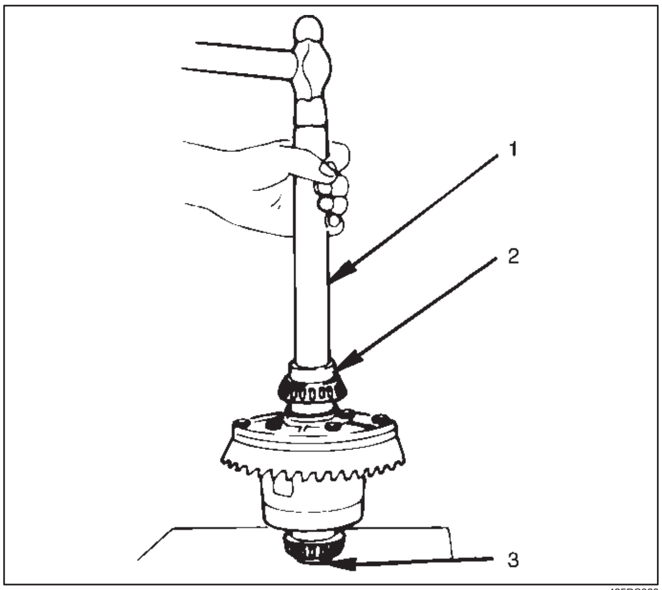
With zero end play and correct backlash established, remove the feeler gauge packs, determine the thickness of the shims required and add 0.025 mm (0.001 in) to each shim pack to provide side bearing preload. Always use new shims.

5. Use bearing remover J–42379 and pilot J–8107–2 to remove side bearing.
   - Select insert; 303173 and collet halves;44801 in remover kit J–42379.



415RW003

13. Install the side bearings together with the selected shims.

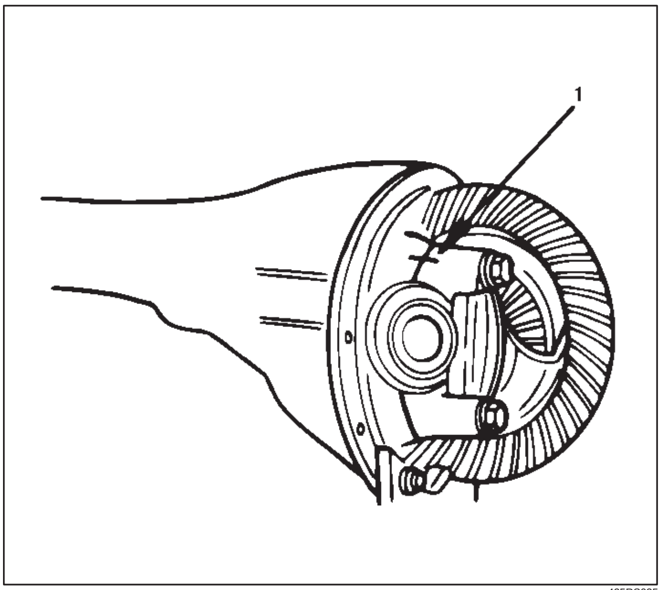


425RS029

Legend

(1) Drive Handle:J–8092
(2) Installer: J–24244
(3) Pilot: J–8107–2

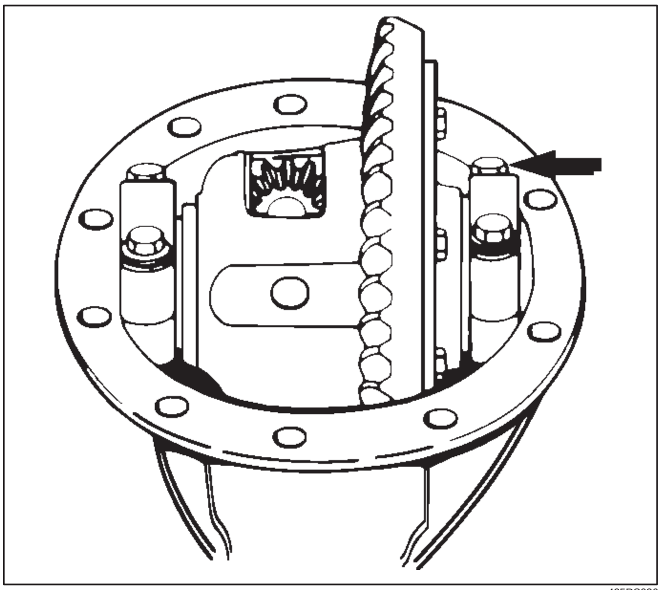
14. Install side bearing outer race.
15. Install differential cage assembly.
16. Install bearing cap then align the setting marks(1) applied at disassembly.



425RS035

17. Tighten the cap bolt to the specified torque.

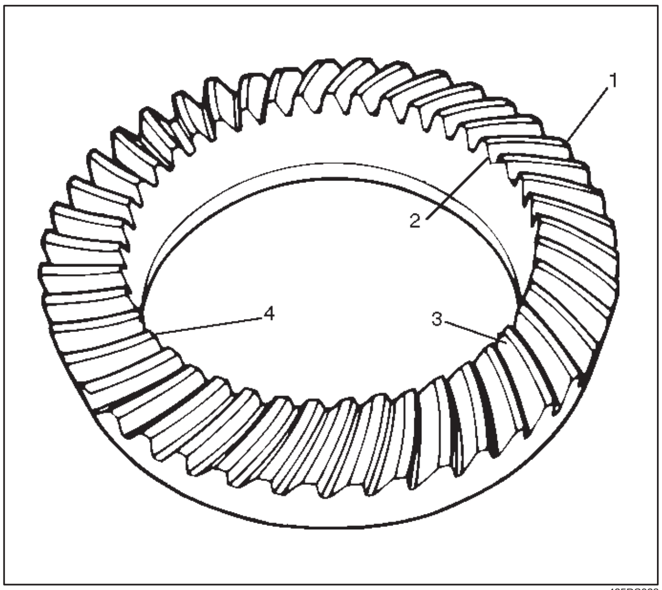
Torque: 97 N·m (72 lb ft)



425RS036

Gear Tooth Contact Pattern Check and Adjustment

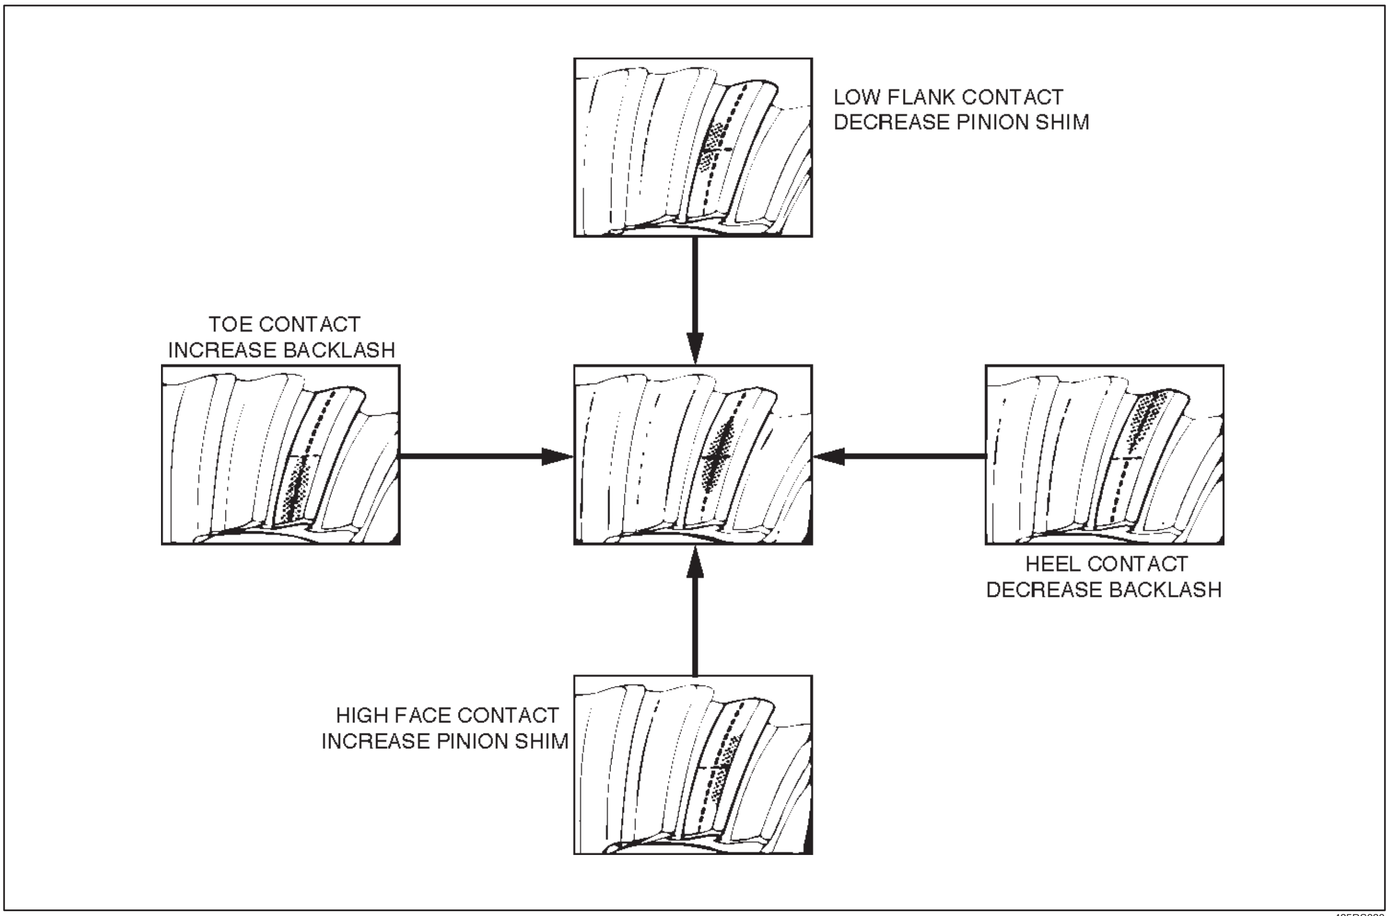
1. Apply a thin coat of prussian blue or equivalent to the faces of the 7–8 teeth of the ring gear. Check the impression of contact on the ring gear teeth and make necessary adjustment as described in illustration if the contact is abnormal.



425RS038

Legend

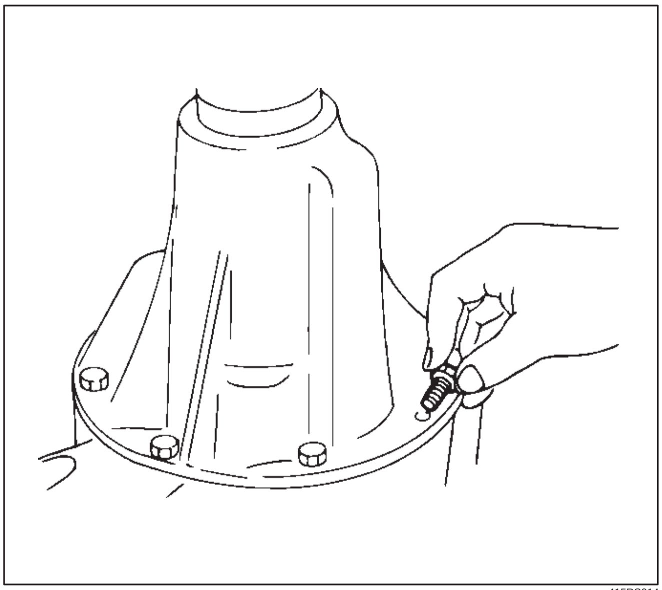
(1) Heel
(2) Toe
(3) Concave Side(Coast)
(4) Convex Side(Drive)



425RS039

18. Install differential assembly.
    1. Clean the faces of the front axle case and differential carrier.
       Apply Three Bond TB1215 or equivalent to the sealing side of the axle case and the carrier.
    2. Attach the differential case and the carrier assembly to the front axle case and tighten the nuts and bolts.

Torque: 25 N·m (19 lb ft)



415RS014

    3. Fill the axle case with hypoid gear lubricant, to just below the filler hole.

Lubricant capacity: 1.4 liter(1.48 US qt)

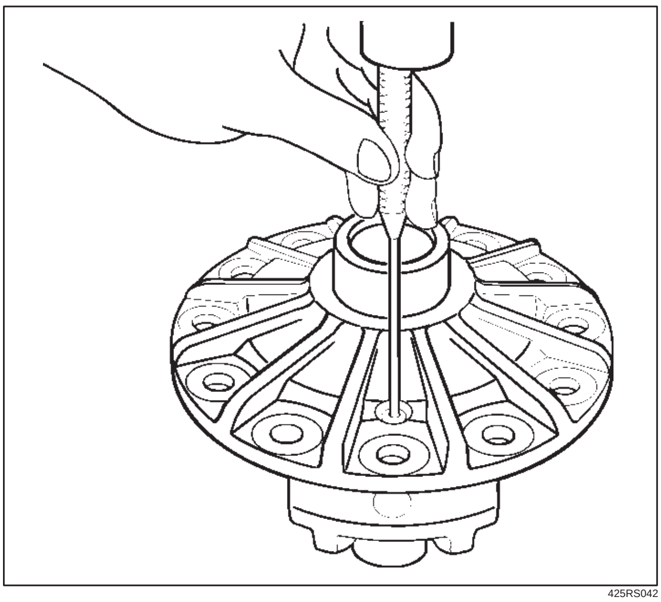
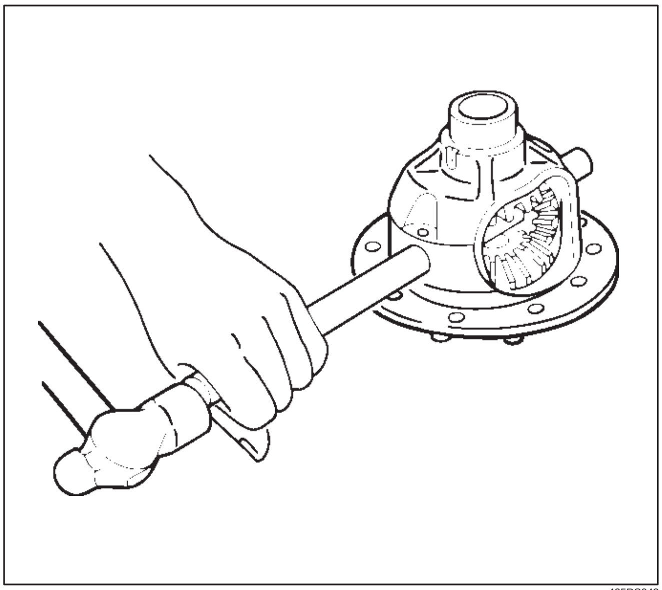
(6) Ring Gear
(7) Bolt
(8) Differential Cage
(9) Lock Pin

Disassembly

1. Remove bolt.
2. Remove ring gear.
3. Remove lock pin.



4. Remove the cross pin, using a soft metal rod and a hammer.



425RS043

5. Remove pinion gear and thrust washer.
6. Remove side gear.
7. Remove thrust washer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts.

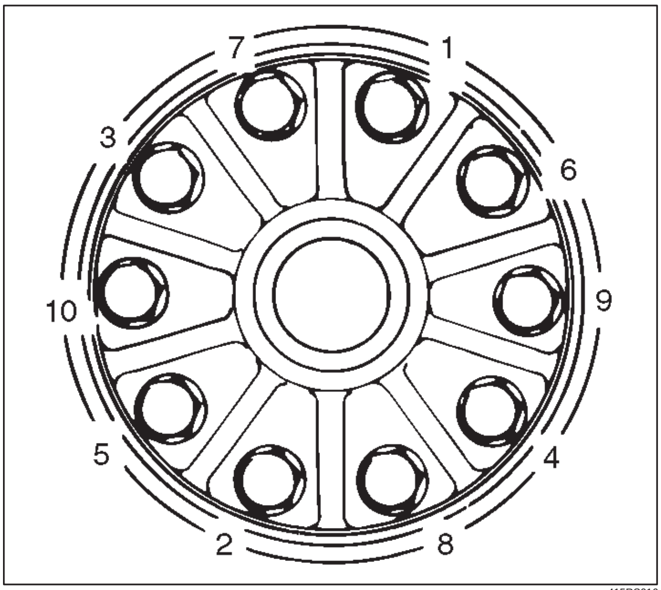
1. Ring gear, pinion gear
2. Bearing
3. Side gear, pinion gear, cross pin
4. Differential cage, carrier
5. Thrust washer
6. Oil seal

Ring gear replacement:

1. The ring gear should always be replaced with the drive pinion as a set.
2. Discard used bolts and install new ones.

Torque: 108 N·m (80 lb ft)

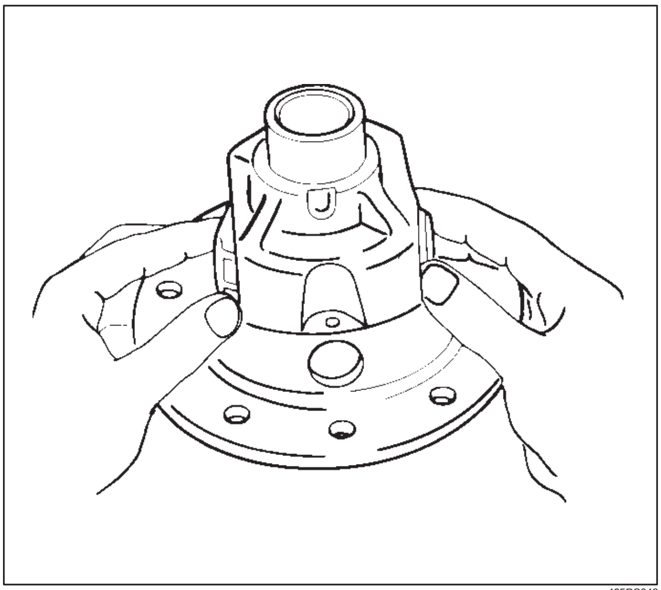
3. Tighten the fixing bolts in a diagonal sequence as illustrated.



415RS016

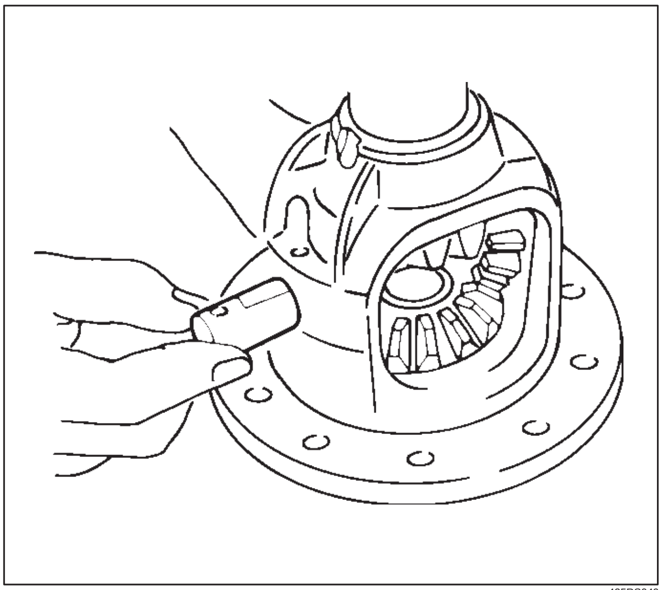
Reassembly

1. Install thrust washer.
2. Install side gear.
3. Install the pinion gear with thrust washer by engaging it with the side gears while turning both pinion gears simultaneously in the same direction.



425RS048

4. Install cross pin.
   - Be sure to install the cross pin so that it is in alignment with the lock pin hole in the differential cage.

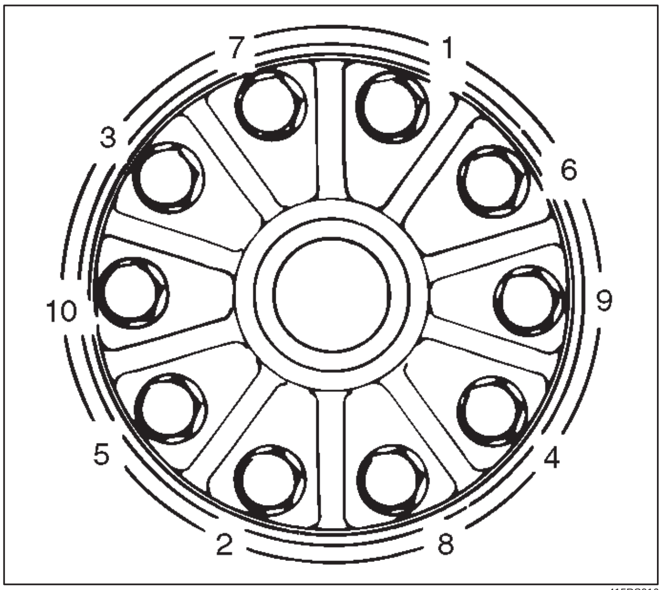


425RS049

5. Install lock pin. After lock pin installation, stake the cage to secure the lock pin.
6. Install ring gear and tighten the bolts in diagonal sequence as illustrated.

Torque: 108 N·m (80 lb ft)

NOTE: Discard used bolts and install new ones.



415RS016

Main Data and Specifications

General Specifications

Axle tube Type		It consists of the duct, a cast iron housing and the axle tube.
Gear type		Hypoid
Gear ratio	(to 1)	4.100 (6VD1 with A/T) 4.300 (6VD1 with M/T)
Differential type		Two pinion
Oil capacity	liter (US qt)	1.25 (1.32) (Differential) 0.12 (0.13) (Actuator Housing: Shift on the fly)
Type of lubricant		GL–5 (75W–90)
Axle shaft type		Constant velocity joint (Birfield joint type and double offset joint)
Hub locking Type		Rigid

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM(SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE REFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFOMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED , do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally,such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specification. Following these instructions can help you avoid damage to parts and systems.

General Description

The rear axle assembly is of the semi–floating type in which the vehicle weight is carried on the axle housing . The center line of the pinion gear is below the center line of the ring gear (hypoid drive).

All parts necessary to transmit power from the propeller shaft to the rear wheels are enclosed in a salisbury type axle housing (a carrier casting with tubes pressed and welded into the carrier). A removable aluminum cover at the rear of the axle housing permits rear axle service without removal of the entire assembly from the vehicle.

The 8.9 inch ring gear rear axle uses a conventional ring and pinion gear set to transmit the driving force of the engine to the rear wheels. This gear set transfers this driving force at a 90 degree angle from the propeller shaft to the drive shafts.

The axle shafts are supported at the wheel end of the shaft by a roller bearing.

The pinion gear is supported by two tapered roller bearings. The pinion depth is set by a shim pack located between the gear end of the pinion and the roller bearing that is pressed onto the pinion. The pinion bearing preload is set by crushing a collapsible spacer between the bearings in the axle housing.

The ring gear is bolted onto the differential case with 10 bolts.

The differential case is supported in the axle housing by two tapered roller bearings. The differential and ring gear are located in relationship to the pinion by using selective shims and spacers between the bearing and the differential case. To move the ring gear, shims are deleted from one side and an equal amount are added to the other side. These shims are also used to preload the bearings which are pressed onto the differential case. Two bearing caps are used to hold the differential into the rear axle housing.

The differential is used to allow the wheels to turn at different rates of speed while the rear axle continues to transmit the driving force. This prevents tire scuffing when going around corners and prevents premature wear on internal axle parts.

The rear axle is sealed with a pinion seal, a seal at each axle shaft end, and by a liquid gasket between the rear cover and the axle housing.

Limited Slip Differential (LSD)

The axle assembly may be equipped with an limited slip differential (LSD). It is similar to the standard differential except that part of the torque from the ring gear is transmitted through clutch packs between the side gears and differential case.

The LSD construction permits differential action when required for turning corners and transmits equal torque to both wheels when driving straight ahead. However, when one wheel tries to spin due to a patch of ice, etc., the clutch packs automatically provide more torque to the wheel which is not trying to spin.

In diagnosing customer complaints, it is important to recognize two things:

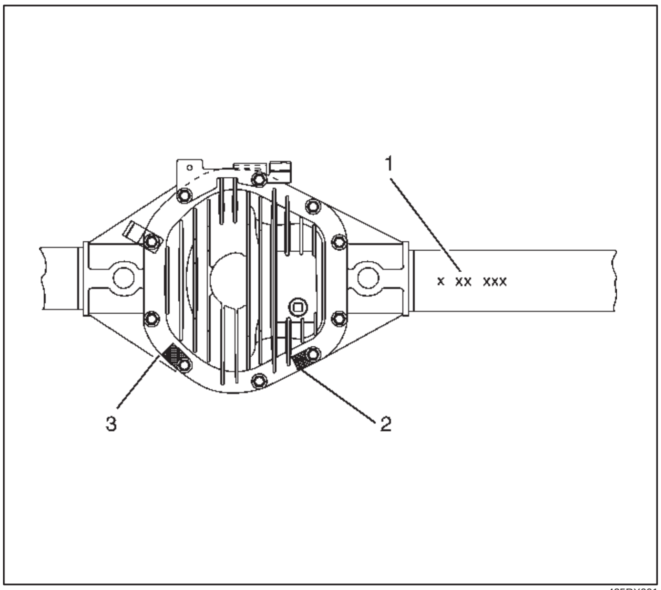
1. If, both wheels slip, with unequal traction, the LSD has done all it can possibly do.
2. In extreame cases of differences in traction, the wheel with the least traction may spin after the LSD has transferred as much torque as possible to the non-slipping wheel.

Limited Slip Differntials impose additional requirements on lubricants, and require a special lubricant or lubricant additive. Use 80W90 GL–5 LSD lubricant.

Rear Axle Identification

The Bill of Material and build date information(1) is stamped on the right axle tube on the rearward side.

The axle ratio is identified by a tag(3) which is secured by a cover bolt. If the axle has limited-slip differntial, it also will be identified with a tag(2) secured by a cover bolt.



425RX001

Diagnosis

Many noises that seem to come from the rear axle actually originate from other sources such as tires, road surface, wheel bearings, engine, transmission, muffler, or body drumming. Investigate to find the source of the noise before disassembling the rear axle. Rear axles, like any other mechanical device, are not absolutely quiet but should be considered quiet unless some abnormal noise is present.

To make a systematic check for axle noise, observe the following:

1. Select a level asphalt road to reduce tire noise and body drumming.
2. Check rear axle lubricant level to assure correct level, and then drive the vehicle far enough to thoroughly warm up the rear axle lubricant.
3. Note the speed at which noise occurs. Stop the vehicle and put the transmission in neutral. Run the engine speed slowly up and down to determine if the noise is caused by exhaust, muffler noise, or other engine conditions.
4. Tire noise changes with different road surfaces; axle noises do not. Temporarily inflate all tires to 344 kPa (50 psi) (for test purposes only). This will change noise caused by tires but will not affect noise caused by the rear axle.

   Rear axle nose usually stops when coasting at speeds under 48 km/h (30 mph); however, tire noise continues with a lower tone. Rear axle noise usually changes when comparing pull and coast, but tire noise stays about the same.

   Distinguish between tire noise and rear axle noise by noting if the noise changes with various speeds or sudden acceleration and deceleration. Exhaust and axle noise vary under these conditions, while tire noise remains constant and is more pronounced at speeds of 32 to 48 km/h (20 to 30 mph). Further check for tire noise by driving the vehicle over smooth pavements or dirt roads (not gravel) with the tires at normal pressure. If the noise is caused by tires, it will change noticeably with changes in road surface.
5. Loose or rough front wheel bearings will cause noise which may be confused with rear axle noise; however, front wheel bearing noise does not change when comparing drive and coast. Light application of the brake while holding vehicle speed steady will often cause wheel bearing noise to diminish. Front wheel bearings may be checked for noise by jacking up the wheels and spinning them or by shaking the wheels to determine if bearings are loose.
6. Rear suspension rubber bushings and spring insulators dampen out rear axle noise when correctly installed. Check to see that there is no link or rod loosened or metal–to–metal contact.
7. Make sure that there is no metal–to–metal contact between the floor and the frame.

After the noise has been determined to be in the axle, the type of axle noise should be determined, in order to make any necessary repairs.

Gear Noise

Gear noise (whine) is audible from 32 to 89 km/h (20 to 55 mph) under four driving conditions.

1. In drive under acceleration or heavy pull.
2. Driving under load or under constant speed.
3. When using enough throttle to keep the vehicle from driving the engine while the vehicle slows down gradually (engine still pulls slightly).
4. When coasting with the vehicle in gear and the throttle closed. The gear noise is usually more noticeable between 48 and 64 km/h (30 and 40 mph) and 80 and 89 km/h (50 and 55 mph).

Bearing Noise

Bad bearings generally produce a rough growl or grating sound, rather than the whine typical of gear noise. Bearing noise frequently “wow–wows” at bearing rpm, indicating a bad pinion or rear axle side bearing. This noise can be confused with rear wheel bearing noise.

Rear Wheel Bearing Noise

Rear wheel bearing noise continues to be heard while coasting at low speed with transmission in the neutral. Noise may diminish by gentle braking. Jack up the rear wheels, spin them by hand and listen for noise at the hubs. Replace any faulty wheel bearings.

Knock At Low Speeds

Low speed knock can be caused by worn universal joints or a side gear hub counter bore in the cage that is worn oversize. Inspect and replace universal joints or cage and side gears as required.

Backlash Clunk

Excessive clunk on acceleration and deceleration can be caused by a worn rear axle pinion shaft, a worn cage, excessive clearance between the axle and the side gear splines, excessive clearance between the side gear hub and the counterbore in the cage, worn pinion and side gear teeth, worn thrust washers, or excessive drive pinion and ring gear backlash. Remove worn parts and replace as required. Select close–fitting parts when possible. Adjust pinion and ring gear backlash.

Rear Axle Noise

Condition	Possible cause	Correction
Noise in Drive	Excessive pinion to ring gear backlash.	Adjust.
	Worn pinion and ring gear.	Replace
	Worn pinion .bearings.	Replace.
	Loose pinion bearings.	Adjust.
	Excessive pinion end play.	Adjust.
	Worn side bearings.	Replace.
	Loose side bearings.	Adjust.
	Excessive ring gear run-out.	Replace.
	Low oil level.	Replenish.
	Wrong or poor grade oil.	Replace.
	Bent axle housing.	Replace.
Noisy when coasting	Axle noise heard when driving will usually be heard also on coasting, although not as loud.	Adjust or replace.
	Pinion and ring gear too tight (audible when slowing down and disappears when driving).	Adjust.
Intermittent noise	Warped bevel ring.	Replace.
	Loose differential case bolts.	Tighten.
Constant noise	Flat spot on pinion or ring gear teeth.	Replace.
	Flat spot on bearing.	Replace.
	Worn pinion splines.	Replace.
	Worn axle shaft dowel holes.	Replace.
	Worn hub studs.	Replace.
	Bent axle shaft.	Replace.
Noisy on turns	Worn differential side gears and pinions.	Replace.
	Worn differential shaft.	Replace.
	Worn axle shaft splines.	Replace.

Limited Slip Differential

Condition	Possible cause	Correction
Does not lock	Broken clutch plates.	Replace the clutch plates.
Chatters in turns	Lubricant contaminated.	Drain lube when hot. Wipe carrier clean. Refill with lube specified in Main Data and Specifications at the end of this section.
	Clutch plates dateriorated.	Replace clutch plates.
Noise (in addition to normal clutch engagement)	Broken clutch plates.	Replace clutch plates.
	Damaged case.	Replace unit.
	Broken differential gears.	Replace gears.

Axle Housing

Axle Housing and Associated Parts

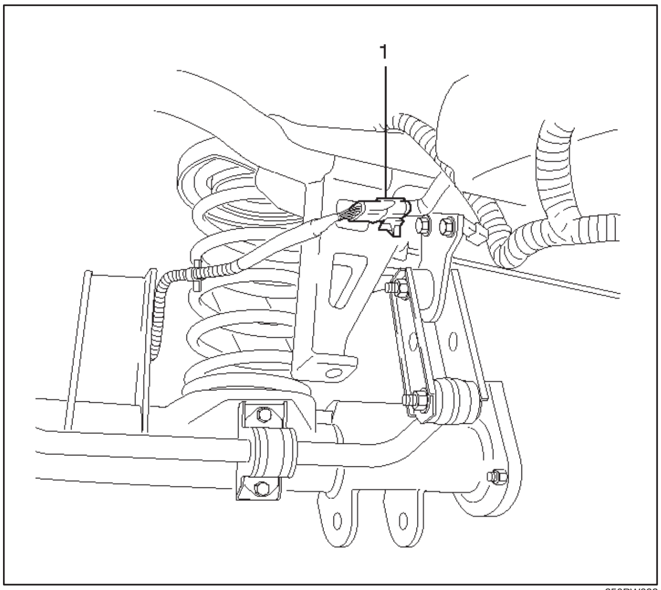
(10) Axle Assembly

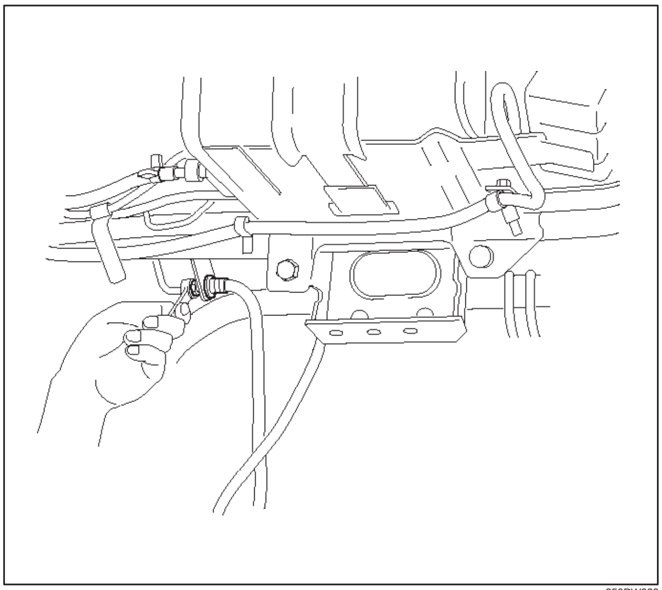
Removal

1. Raise the vehicle and support it with suitable safety stands.
   The hoist must remain under the rear axle housing.
2. Take out brake fluid. Refer to Hydraulic Brakes in Brake section.
3. Remove rear wheels and tires. Refer to Wheel Replacement in Suspension section.
4. Remove propeller shaft. Refer to Rear Propeller Shaft in this section.
5. Drain the rear axle oil into a proper container.
6. Remove parking brake cable, release the connection between the cable fixing clip equalizer. Refer to Parking Brakes in Brake section.
7. Move the clip aside and pull out the breather hose.
8. Disconnect the ABS connectors (1) and remove the brackets attached to the frame and center link.



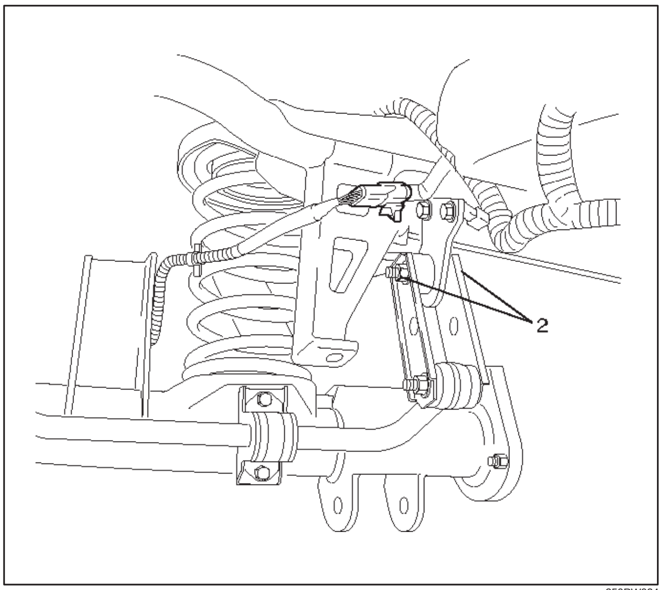
350RW023

9. Loosen the brake tube flare nut, remove the clip and take out the brake tube.



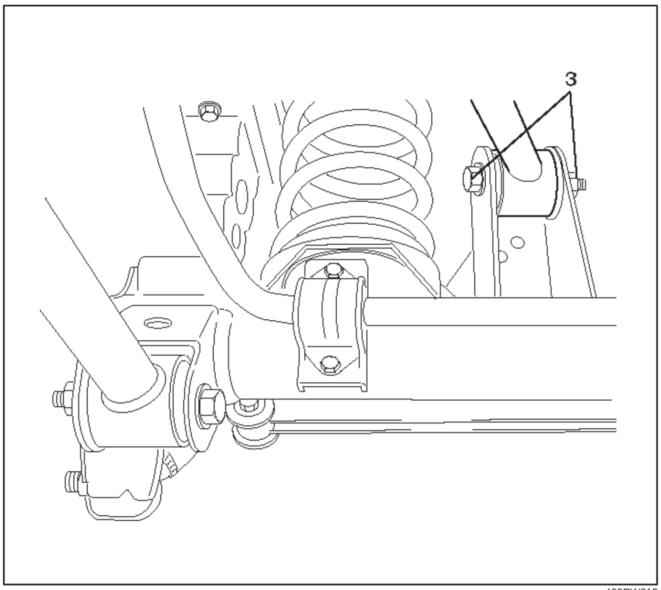
350RW020

10. Remove the shock absorber.
11. Remove the stabilizer linkage mounting bolts and nuts (2) from the frame side.



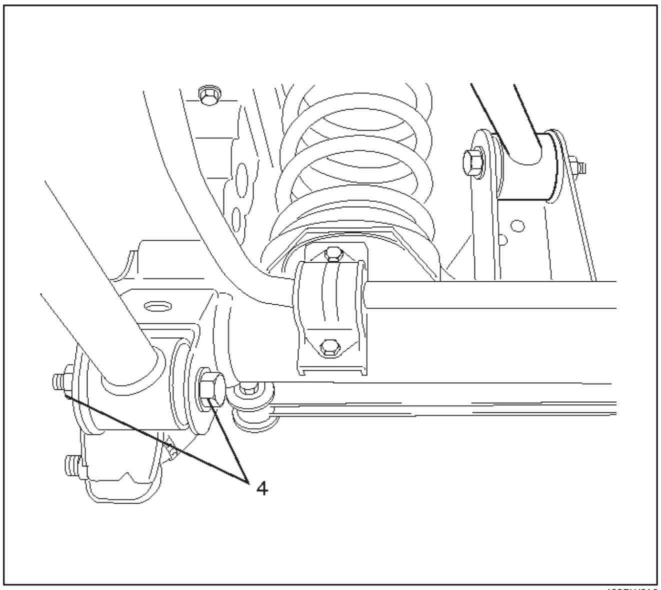
350RW024

12. Remove the lateral rod fixing bolt and nut from the frame.
13. Remove the upper link mounting bolt and nut (3) from the axle housing.



460RW015

14. Remove the lower link fixing bolt and nut (4) from the axle housing.



460RW016

15. Jack down and remove the coil spring and insulator.
16. Axle housing assembly can be separated from the vehicle on completion of steps 1 – 15.
17. Remove the brake caliper fixing bolt, loosen the flare nut, release the clip and take out the brake caliper together with the flexible hose.
18. Remove brake disc.
19. Remove antilock brake system speed sensor fixing bolt and the clip and bracket on the axle housing.
20. Remove the brake pipe clip and fixing bolt on the axle housing and take out the brake pipe.

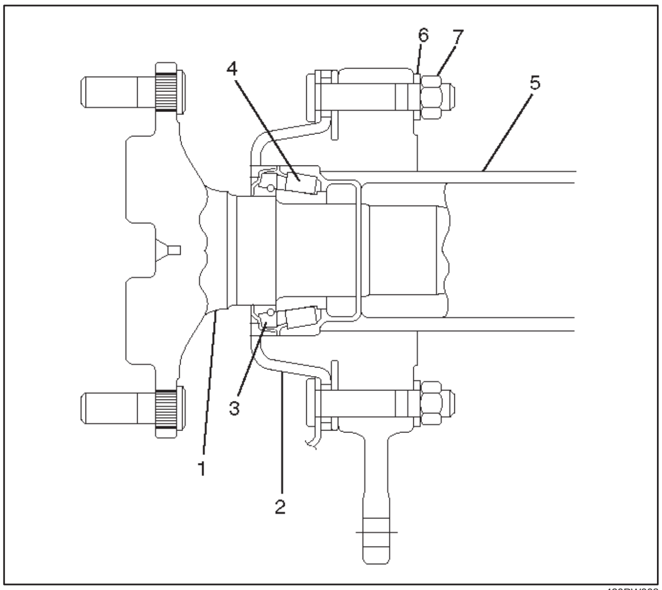
Installation

1. Install brake pipe.
2. Connect Antilock brake system (ABS) speed sensor and harness, refer to 4–Wheel Anti–Lock Brake System (ABS) in Brake section.
3. Install brake disc.
4. Install brake caliper. Refer to Disk Brakes in Brake section.
5. Install axle housing assembly.
6. Install coil spring and insulator.
7. Install the lower link fixing bolt and nut to the axle housing. For the procedures in items 7–11, refer to Suspension section.
8. Install the upper link bolt and nut to the axle housing.
9. Install the lateral rod fixing nut and bolt to the frame side.
10. Install the stabilizer linkage mounting nut and bolt to the frame side.
11. Install the shock absorber.
12. Install brake tube flare nut, Refer to Disk Brakes in Brake section.
13. Install ABS connector and bracket.
14. Connect breather hose.
15. Install parking brake cable, Refer to Parking Brakes in Brake section.
16. Bleed brakes. Refer to Hydraulic Brakes in Brake section.

Axle Shaft, Oil Seal and Bearing

Axle Shaft and Associated Parts

Disc Brake Model

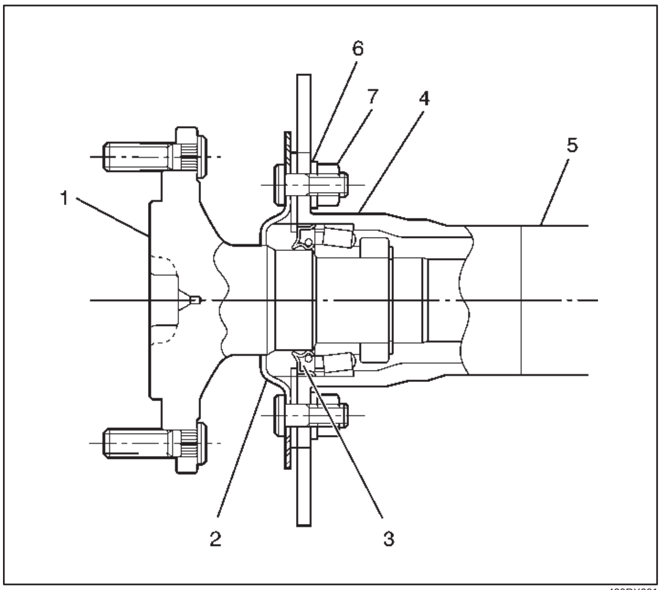


420RW008

Legend

(1) Axle Shaft
(2) Backing Plate
(3) Oil Seal
(4) Bearing
(5) Axle Housing
(6) Lock Washer
(7) Nut

Drum Brake Model



420RX001

Legend

(1) Axle Shaft

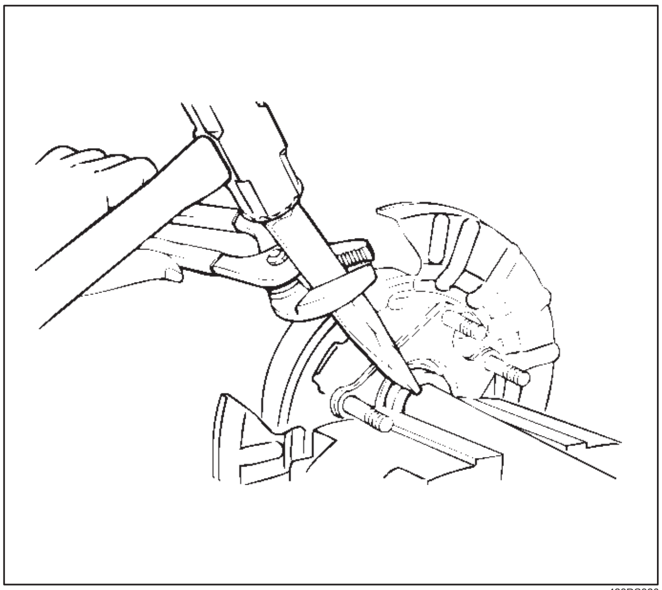
(3) Oil Seal
(4) Bearing
(5) Axle Housing
(6) Lock Washer
(7) Nut

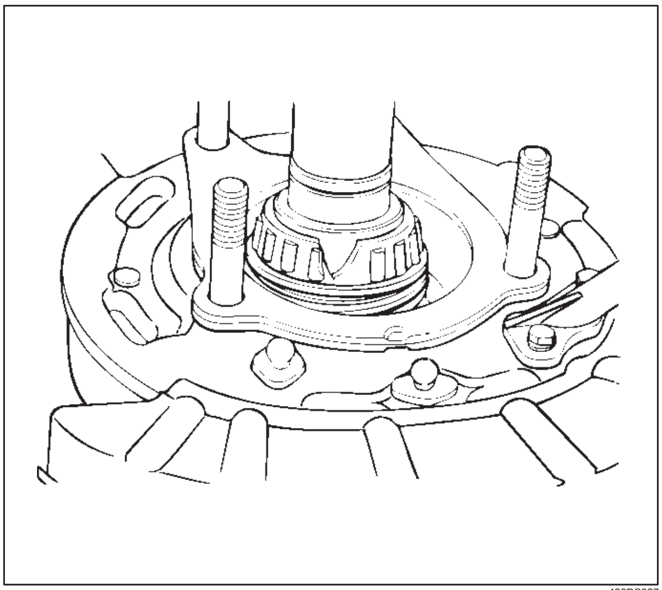
Removal

1. Raise the vehicle.
2. Remove rear wheels and brake calipers or drums. Do not let calipers hang from the vehicle by the brake line or hose. Wire them to frame of vehicle to prevent damage.
3. Remove four nuts and lockwashers.
4. Remove shaft assembly from the axle housing.
5. Remove snap ring and bearing cup.
6. Break retainer ring with hammer and chisel.



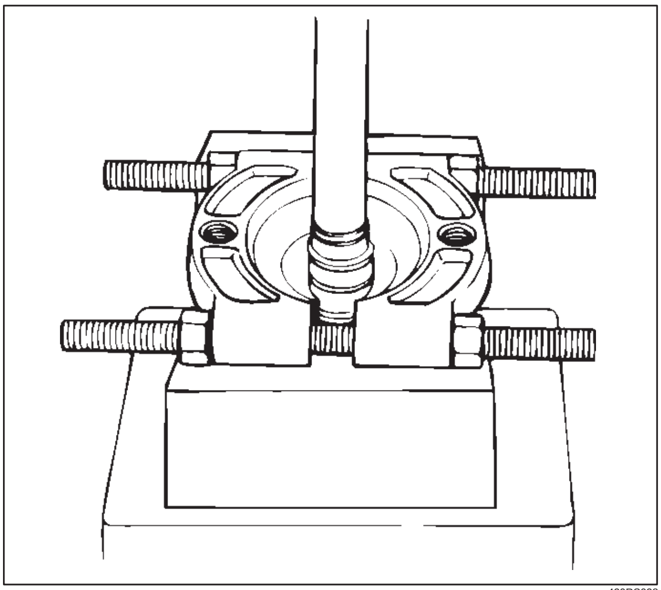
420RS026

7. Break bearing cage with hammer and chisel.



420RS027

8. Remove oil seal, retainer, and emergency brake assembly.
9. Remove inner race from shaft with OTC–1126 bearing splitter and press.



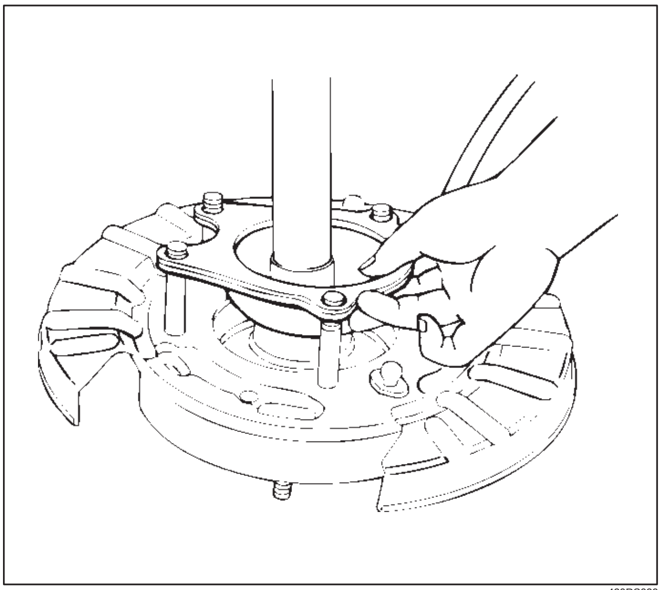
420RS028

Inspection

- Shaft for spalling or grooves from seal wear.
- Retainer – bent or damaged.
- Replace items if required.

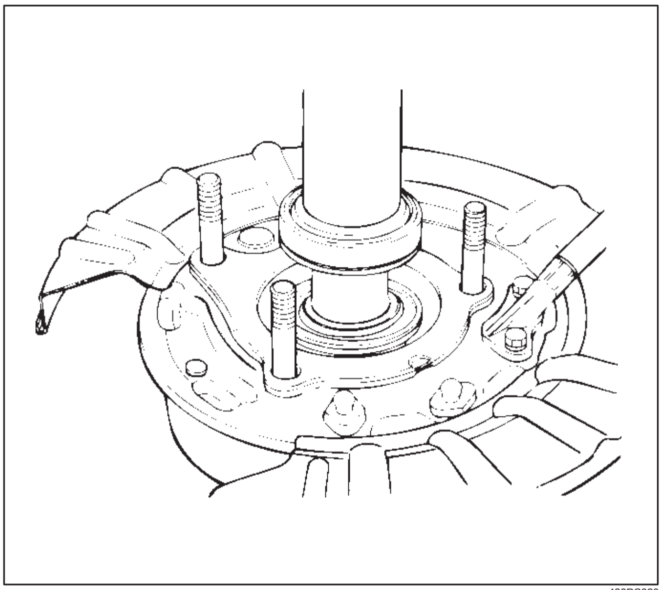
Installation

1. Emergency brake assembly.
2. Install retainer. Note direction – do not install backwards.



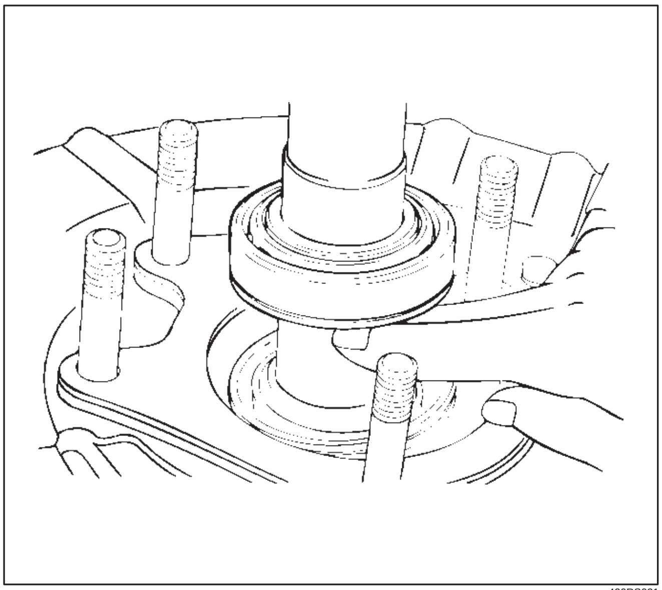
420RS029

3. Install oil seal. Note direction.
4. Install bearing assembly, using installer and press.



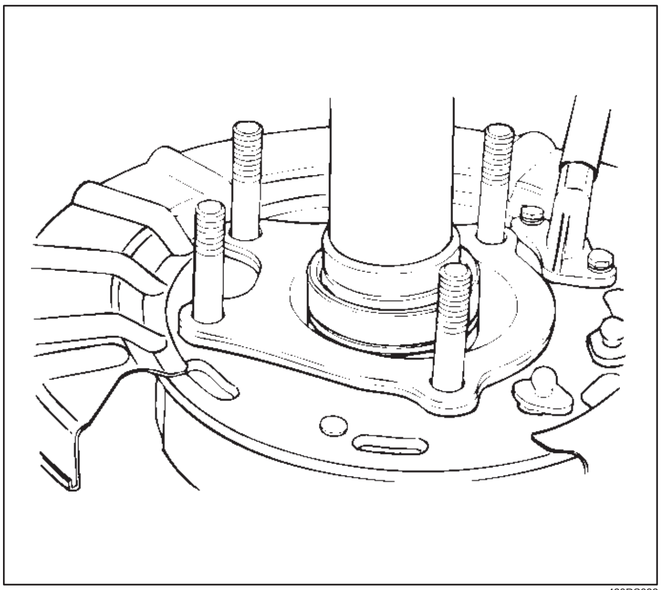
420RS030

NOTE: Install bearing with cup towards inboard side.



420RS031

5. Install retainer ring, using installer and press.



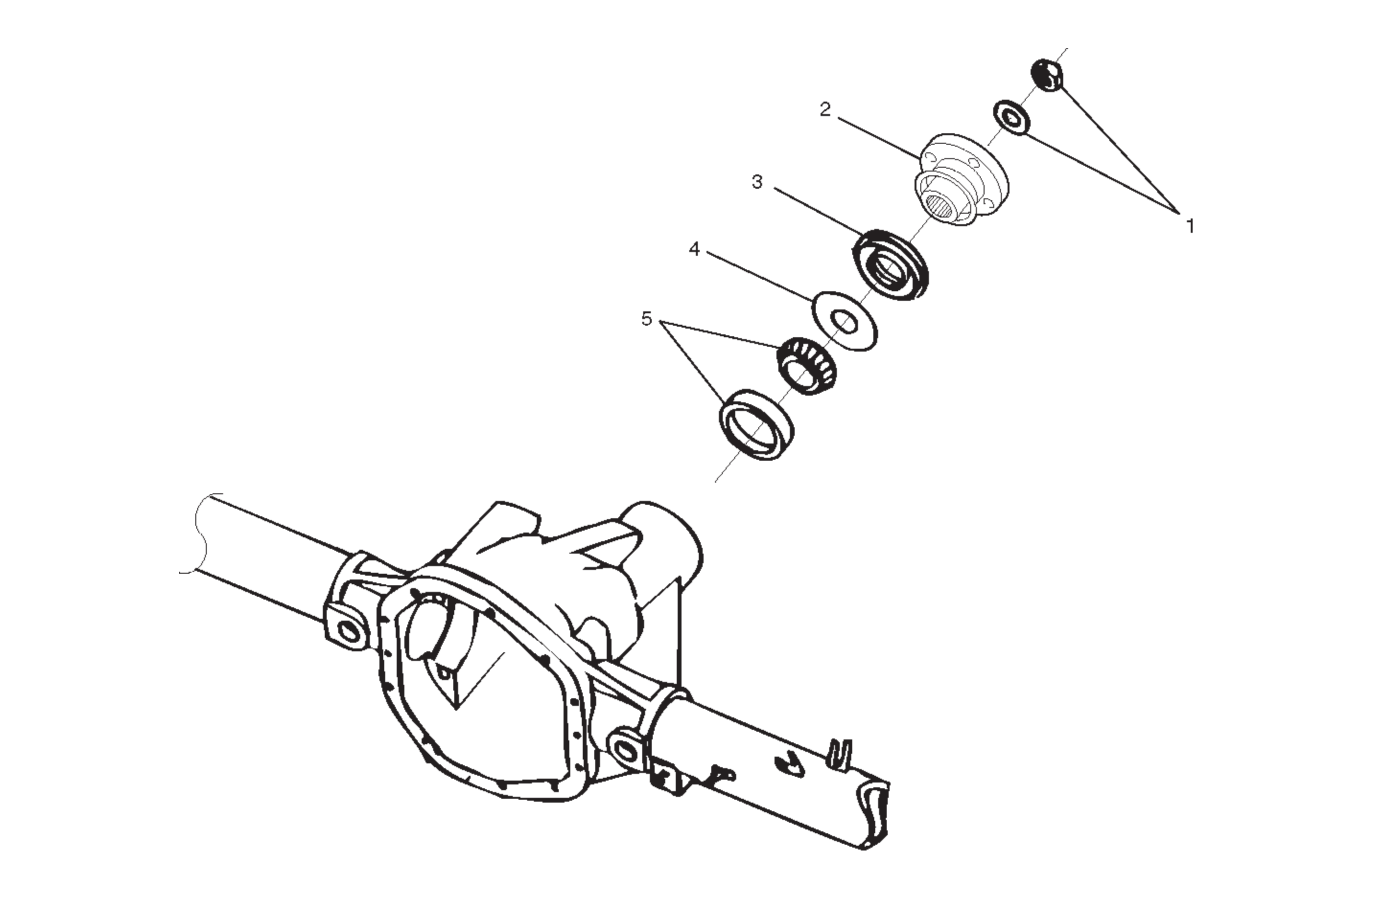
420RS033

6. Install snap ring.
7. Install axle shaft assembly into housing.
8. Install bolts, lockwashers, and nuts.
   Tighten the retainer nuts to the specified torque.

Torque : 75 N·m (55 lb ft)

Pinion Oil Seal

Pinion Oil Seal and Associated Parts

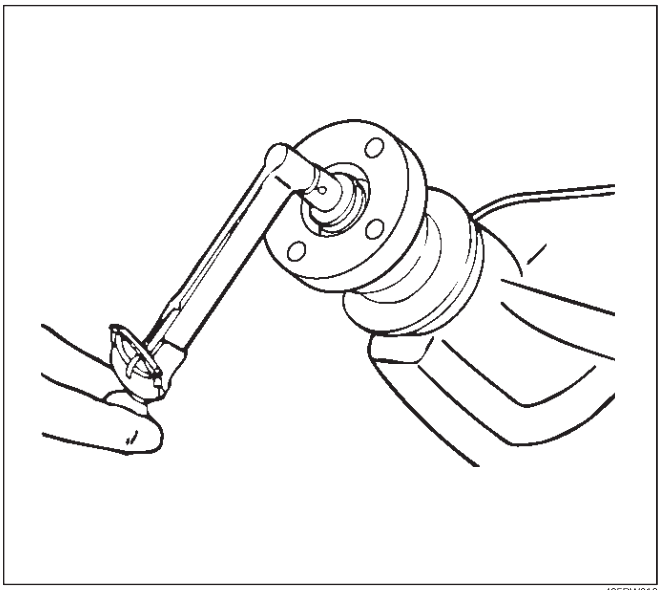


420RW013

Legend
(1) Flange Nut and Washer
(2) Flange
(3) Oil Seal
(4) Outer Oil Seal Slinger
(5) Outer Pinion Bearing (Cup and Cone)

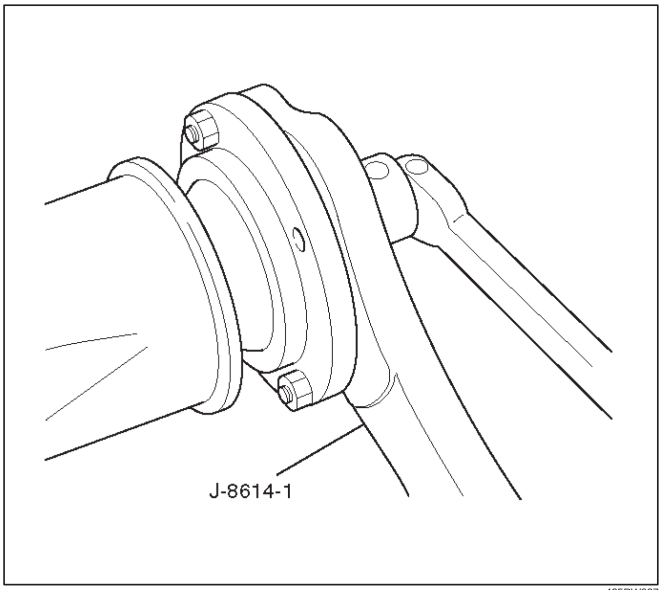
Removal

1. Remove the rear propeller shaft. Refer to Rear Propeller Shaft in this section.
2. Drain the rear axle oil.
3. Check and record preload with an inch pound torque wrench. This will give combined pinion bearing, seal, carrier bearing, axle bearing and seal preload.



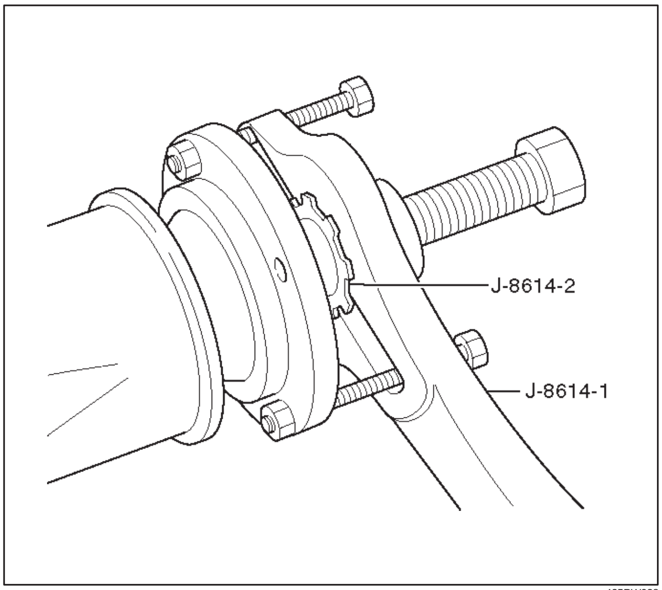
425RW018

4. Remove flange nut and washer by using pinion flange holder J–8614–01 after raising up its staked parts completely.



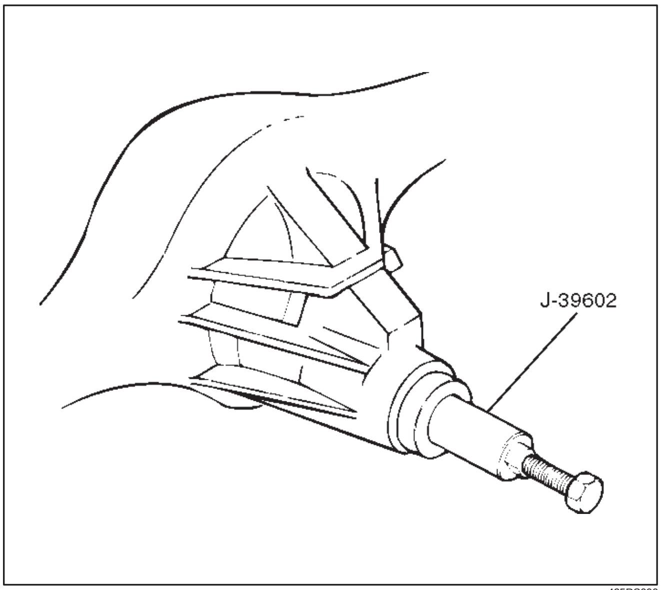
425RW037

5. Remove flange by using SST J–8614–1 ~ 3.
   - Have a suitable container in place to catch lubricant.



425RW038

6. Remove oil seal.
7. Remove pinion oil seal slinger.
8. Remove outer bearing by using remover J–39602.



425RS090

9. Remove collapsible spacer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts.

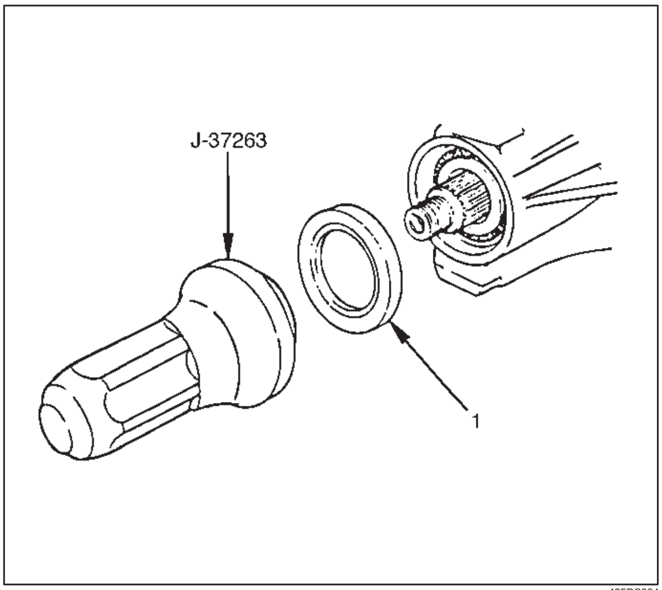
1. Seal surface of the flange.
2. Cage bore for burns.

Installation

1. Install collapsible spacer, discard the used collapsible spacer and install a new one.
2. Install outer bearing.

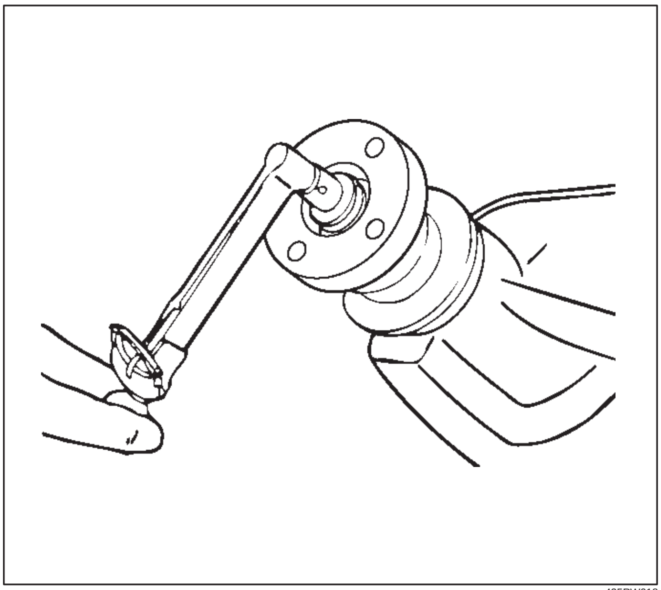
NOTE: Do not drive in, but just temporarily set in the outer bearing by hand, which should be indirectly pressed in finally by tightening the flange nut.

3. By using the seal installer J–37263, install a new oil seal (1) that has grease on seal lip.



425RS004

4. Install flange.
5. The pinion washer and a new nut while holding the pinion flange with J–8614–01.
   - Tighten the nut until the pinion end play is just taken up. Rotate the pinion while tightening the nut to seat the bearings. Once there is not end play in the pinion, the preload torque should be checked.
   - Remove J–8614–01. Using an inch-pound torque wrench, check to make sure the pinion preload is equal to or slightly over the reading recorded during removal.



425RW018

6. Install propeller shaft to the frange.
7. Install bolt and nut. Tighten the bolt and nut to the specified torque.

Torque: 63 N·m (46 lb ft)

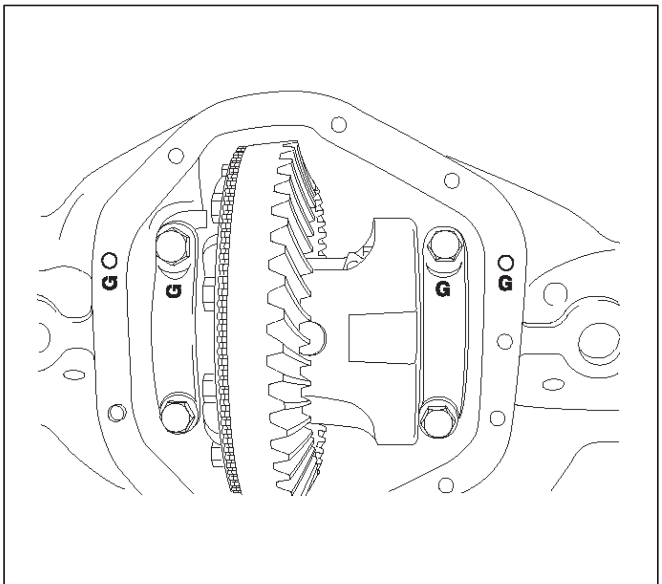
Inspecting the Axle Before Disassembly

1. Remove the axle cover from the rear axle and drain the axle lubricant into a suitable container.
2. Check ring gear backlash. Refer to "BACKLASH ADJUSTMENT" in this section. This information can be used to determine the cause of the axle problem. It will also help when setting up the shim packs for locating and preloading the differential cage.
3. Check case for metal chips and shavings. Determine where these ships and shavings come from, such as a broken gear or bearing cage.
   - If possible, determine the cause of the axle problem before disassembly.

Disassembly

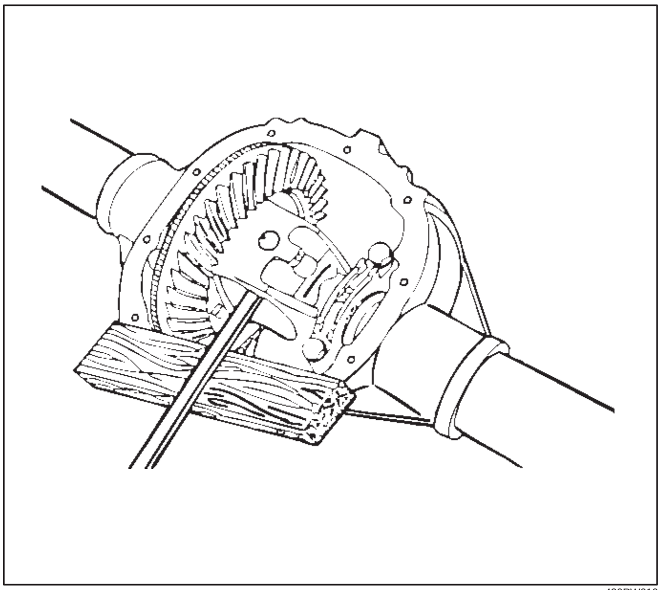
1. Remove axle shafts.
   - Refer to axle shaft replacement in this section.
2. Remove ABS sensor.
3. Remove bearing caps and bolts.
   - Mark the caps and the housing as left and right.

CAUTION: Bearing caps are machined with the housing and must be assembled in the same position as removed. Note the matched letter stamped on the caps and carrier. When assembled, the letters on the caps must agree in both the hosizontal and vertical position with the letters on the carrier.



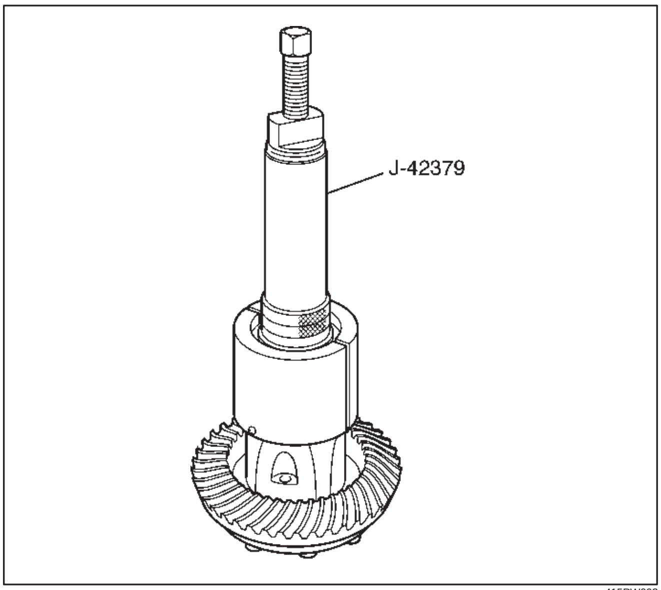
420RW003

4. Remove Differential case.
   - Pry the case from the axle housing at the differential "window".



420RW010

5. Remove side bearing outer races and shims.
   - Mark the races and shims as left and right, and place them with the bearing cups.
6. Remove differential side bearings using remover J–42379 and plug J–39830.
   - Select insert ; 303174 and collet halves ; 44801 in remover kit J–42379.

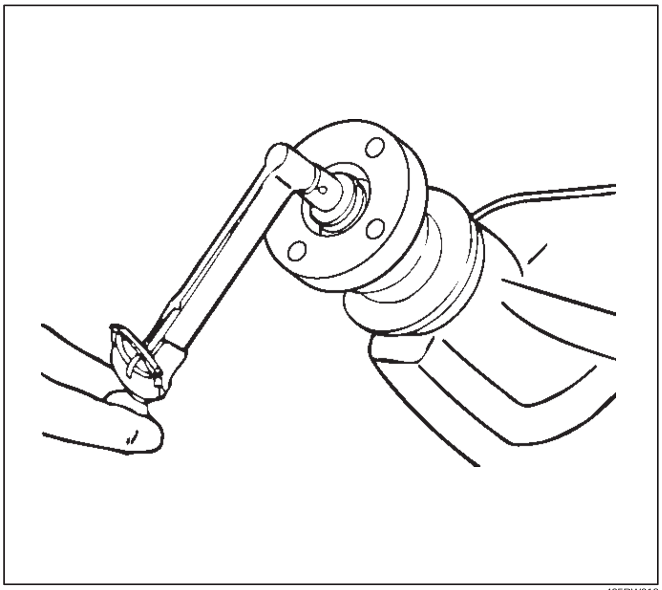


415RW003

7. Remove ring gear bolts.
   - Ring gear bolts use right handed threads.

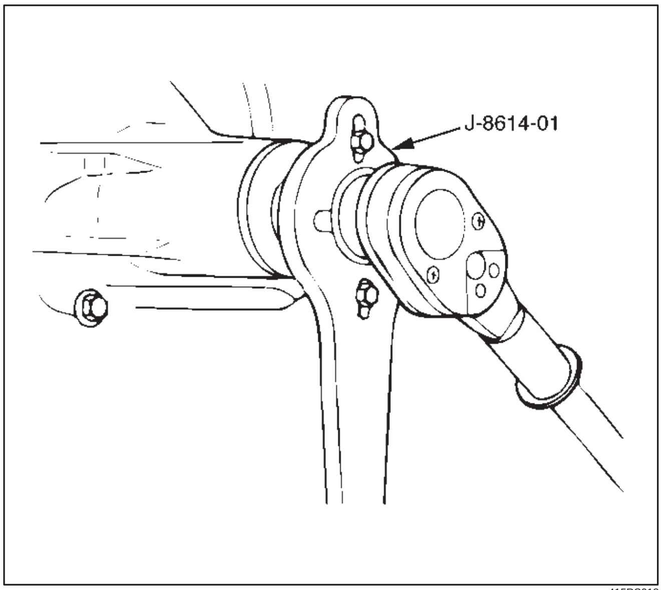
CAUTION: DO not pry the ring gear from the case. This will damage the ring and the differential case.

8. Remove ring gear from the differential.
   - Drive the ring gear off with a brass drift if necessary.
   - Check drive pinion bearing preload.



425RW018

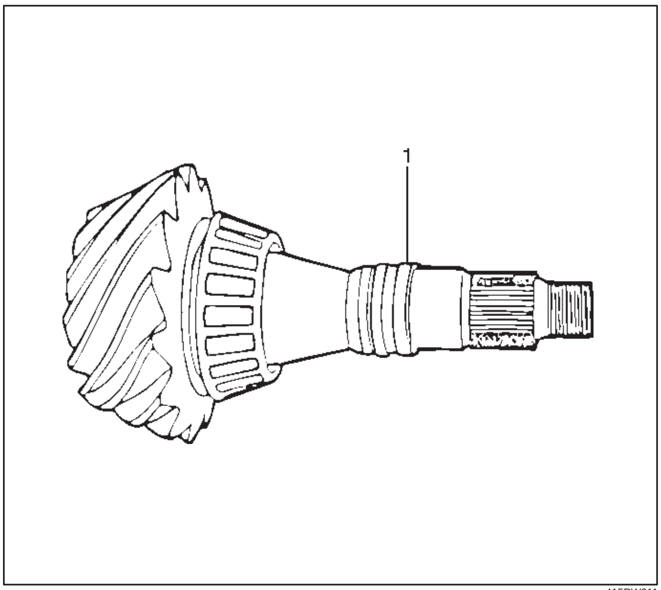
   - Check the pinion assembly for looseness by moving it back and forth. (Looseness indicates excessive bearing wear.)
9. Remove pinion flange nut and washer.
   - Use flange holder J–8614–01 to hold the pinion flange.
10. Remove pinion flange.
   - Use flange holder J–8614–01 to remove the pinion flange.



415RS018

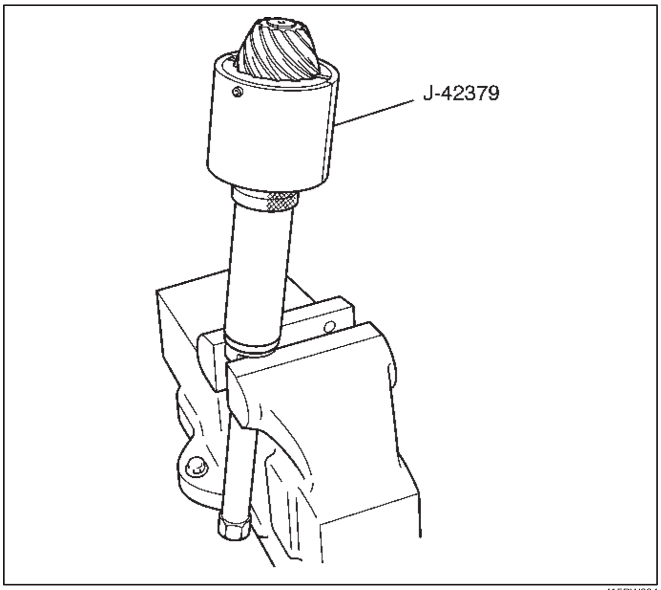
11. Remove pinion from the axle housing.
   - Thread the pinion nut halfway onto the pinion.
   - Drive the pinion out of the housing with a hammer and a soft drift.
   - Remove the nut and then remove the pinion.

12. Remove collapsible spacer(1).



415RW011

13. Remove outer seal, outer oil slinger and outer pinion bearing.
14. Remove inner bearing, inner oil slinger and shim from the pinion.
   - Press the bearing off the pinion using remover J–42379.

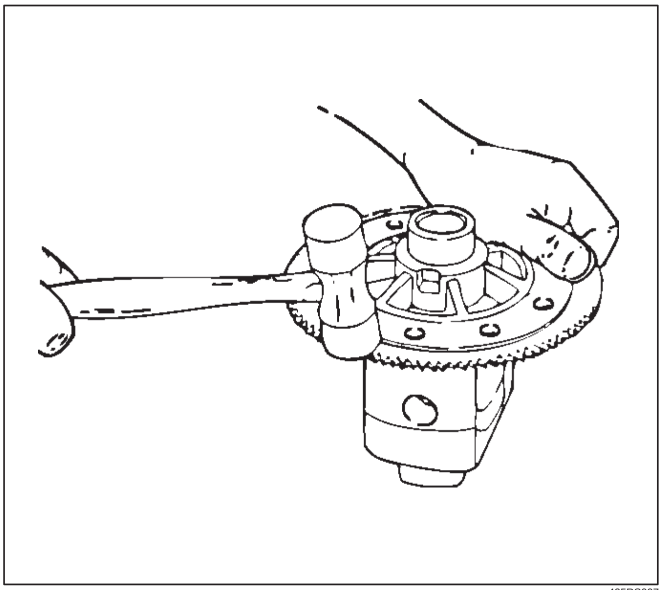


415RW004

   - Select insert ; 303174 and collet halves ; 44801 in remover kit J–42379.
   - Remove the shim.
15. Remove bearing cups and baffle plate from the axle housing using a hammer and a punch.
   - Work the cups out of the housing evenly, moving the punch back and forth between one side of the cup and the other.
   - The baffle plate will be destroyed and should be replaced with a new one.

16. Remove exciter ring.
    - Remove the exciter ring from the differential using a mallet or a brass hammer if it is required.

NOTE: Discard the exciter ring after removal.



Cleaning

Do not steam clean drive parts which have ground and polished surfaces such as gears, bearings, and shafts. These parts should be cleaned in a suitable solvent. All parts should be disassembled before cleaning.
Parts should be thoroughly dried immediately after cleaning. Use soft, clean, lintless rags. Parts may be dried with cimpressed air. Do not allow the bearings to spin while drying them with compressed air.

Inspection and Repair

It is very important to carefully and thoroughly inspect all drive unit parts before reassembly.
Thorough inspection of the drive parts for wear or stress and subsequent replacement of worn parts will eliminate costly drive component repair after reassembly.

Axle Housing

- The carrier bore for nicks or burrs that would prevent the outer diameter of the pinion seal from sealing, Remove any burrs that are found.
- The bearing cap bores for nicks or burrs.
  Remove any burrs that are found.
- The housing for cracks. Replace the housing if any cracks are found.
- The housing for foreign material such as metal chips, dirt, or rust.

Pinion and Ring Gear

- Pinion and ring gear teeth for cracking, chipping, scoring, or excessive wear.
- Pinion splines for wear.
- Pinion flange splines for wear.
- The sealing surface of the pinion flange for nicks, burrs, or rough tool marks which would cause damage to the seal's inside diameter and result in an oil leak.
- Replace all worn or broken parts.
- Ring and pinion gears are matched sets and are both replaced anytime a replacement of either is necessary.

Bearings

- Bearings visually and by feel.
- The bearings should feel smooth when oiled and rotated while applying as much hand pressure as possible.
  The large end of the bearing rollers for wear.
  This is where tapered roller bearing wear is most evident.
- Bearing cups for wear, cracks, brinelling and scoring.
- Bearing and cups are only replaced as sets.
- If the rear axle was operated for an extended period of time with very loose bearings, the ring gear and drive pinion will also require replacement.
- Low mileage bearings may have minute scratches and pits on the rollers and the bearing cups from the initial pre-load. Do not replace a bearing for this reason.
- Bearing cups for cracks or chips.

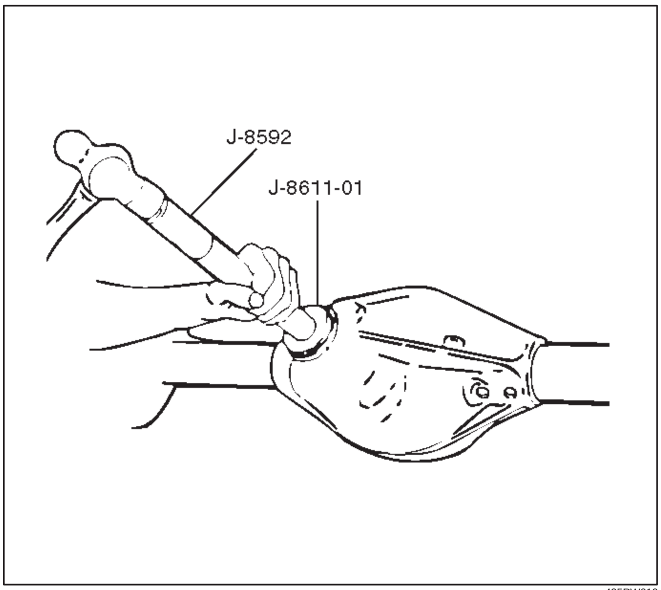
Shims

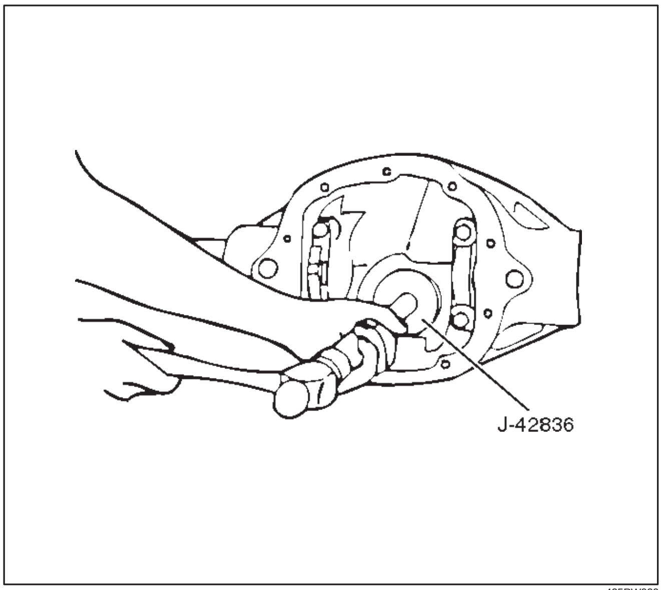
- Shims for cracks and chips. Damaged shims should be replaced with an equally sized service shim.

Reassembly

1. Install pinion bearing races and baffle plate using outer bearing race installer J–8611–01 / inner bearing race installer J–42836 and drive handle J–8592.

NOTE: Baffle plate must be installed, when install the inner pinion bearing race.



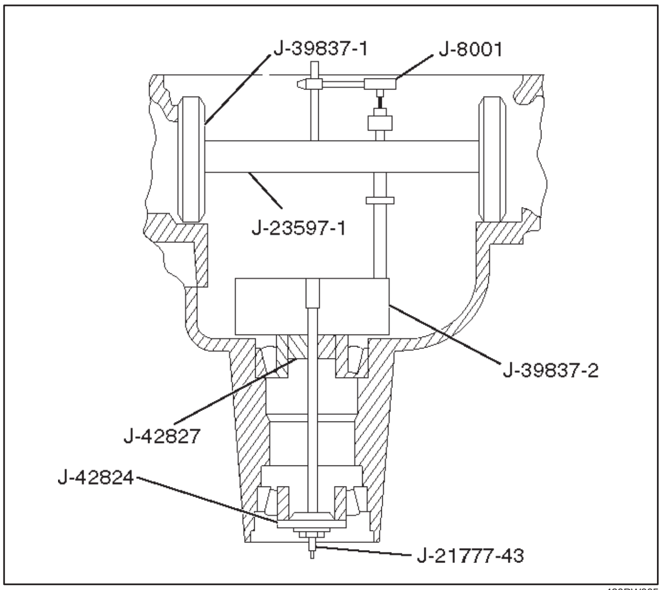


425RW020

2. Clean all the gauge parts.
3. Lubricate the outer and inner bearings with axle lubricant.
4. Place the bearings into the pinion bearing races.
5. Place the inner oil slinger onto the inner pinion bearing.

NOTE: The inner oil slinger must be placed between gauge plate and inner pinion bearing when measuring the pinion depth.

6. Install gauge plate J–39837–2, inner J–42827 stud and nut J–21777–43 and outer pilot J–42824 to the pinion bore.



420RW005

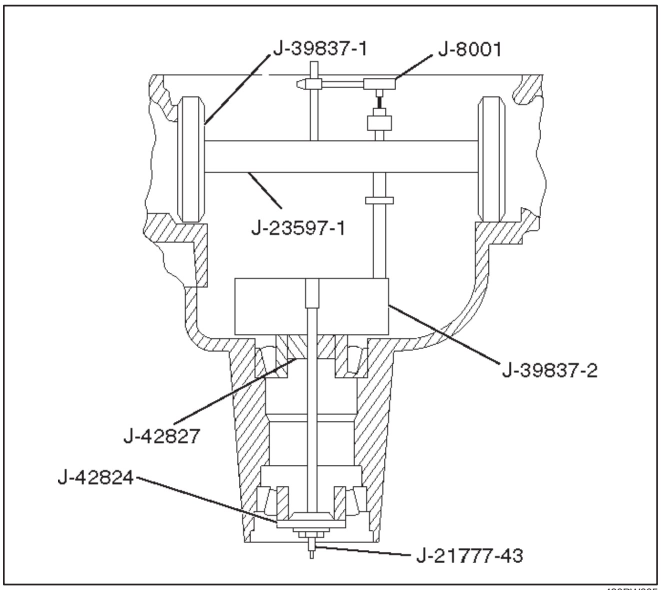
7. Hold the stud stationary at the flats of the stud (and).

Tighten the stud nut

Torque: 2.2 N·m (1.6 lb ft)

8. Rotate the gauge plate and bearings several complete revolutions to seat the bearings.
9. Tighten the stud nut until a torque of 1.6 to 2.2 N·m (1.2 to 1.6 lb ft.) is required to keep the gauge plate in rotation.
10. Assemble discs J–39837–1, arbor J–23597–1 and dial indicator J–8001 to the side bearing bores.

NOTE: The bearing bores must be clean and burr-free.



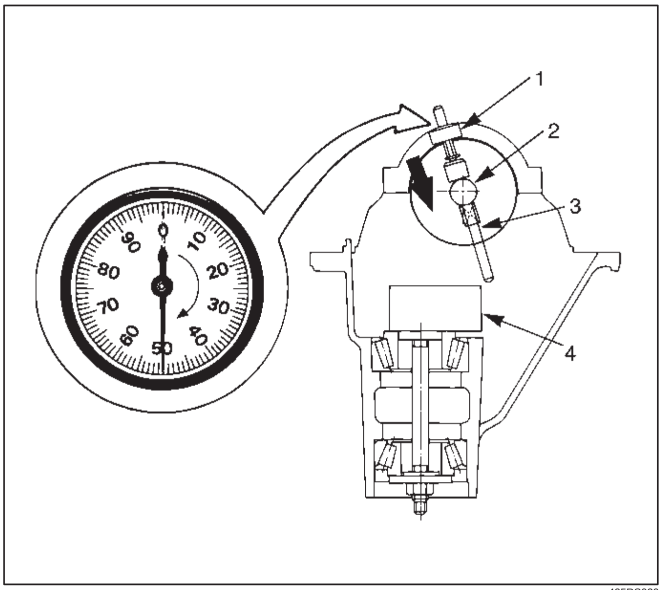
420RW005

11. Install the side bearing caps and tighten the bolts to the specified torque.

Torque: 108 N·m (80 lb ft)

12. Rotate the gauge plate until the gauging area is parallel with the discs.
13. Position the arbor assembly in the carrier so that the plunger is centered on the gauge area of the gauge plate.

14. Set the dial indicator to “0”. Place it on the mounting post of the gauging arbor with the contact button touching the indicator pad.
    Force the dial indicator downward until the needle has made a half turn clockwise. Tighten down the dial indicator in this position.

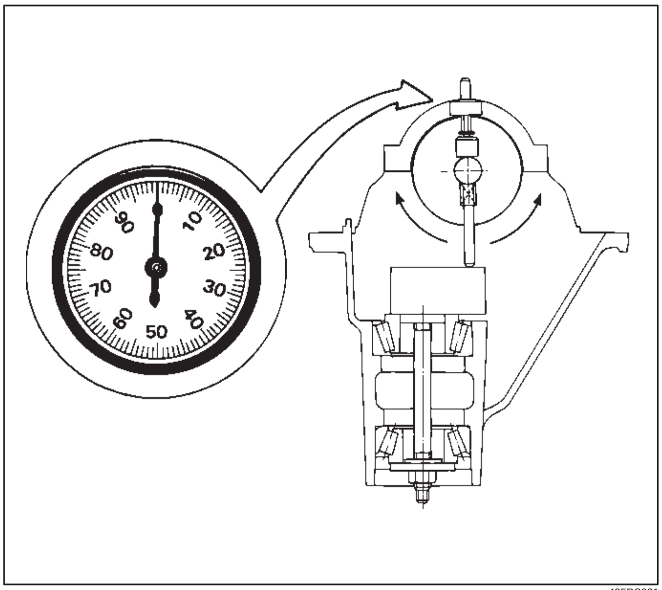


425RS020

Legend

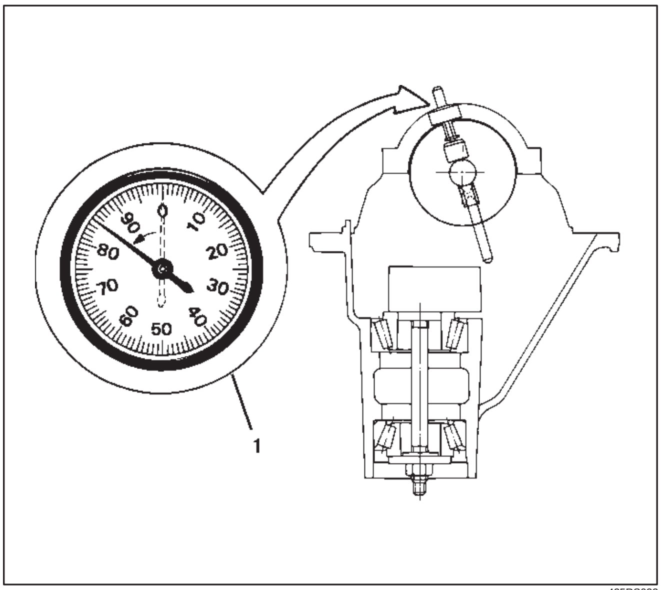
(1) Dial Indicator
(2) Ganging Arbor
(3) Plunger
(4) Gaug Plate

15. Position the plunger on the gauge plate. Move the gauging arbor slowly back and forth and locate the position at which the dial indicator shows the greatest defection. At this point, once again set the dial indicator to “0”.
    Repeat the procedure to verify the “0” setting.



425RS021

16. After the ZERO setting is obtained, rotate the gauging arbor until the dial indicator rod does not touch the gauging plate.
    Record the number the dial indicator needle points to.

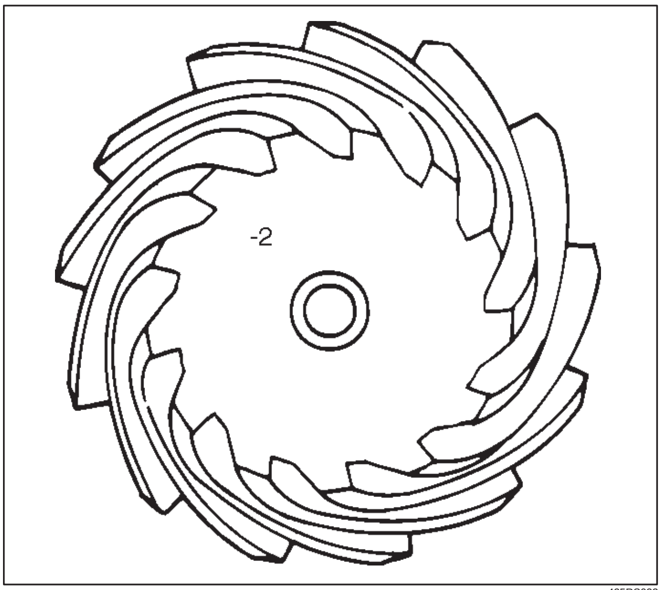


425RS022

Legend

(1) Example=Dial indicator reading of 0.085

17. Record the pinion depth code on the head of the drive pinion.
    The number indicates a necessary change in the pinion mounting distance. A plus number indicates the need for a greater mounting distance (which can be achieved by decreasing the shim thickness). A minus number indicates the need for a smaller mounting distance (which can be achieved by increasing the shim thickness). If examination reveals pinion depth code “0”, the pinion is “nominal”.



425RS023

18. Select the shim using the chart;

Dial Indicator Reading (inches)	Marking (inches)						
	+3	**+2**	**+1**	**0**	**–1**	**–2**	**–3**

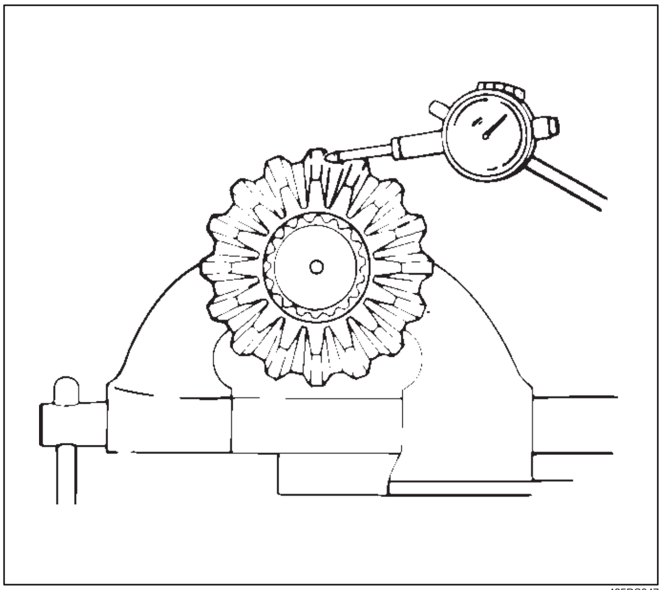
0.055	0.052	0.053					
0.056	0.053						

19. Remove bearing caps and depth gauging tools.
20. Install the correct pinion shim and inner oil slinger onto pinion.

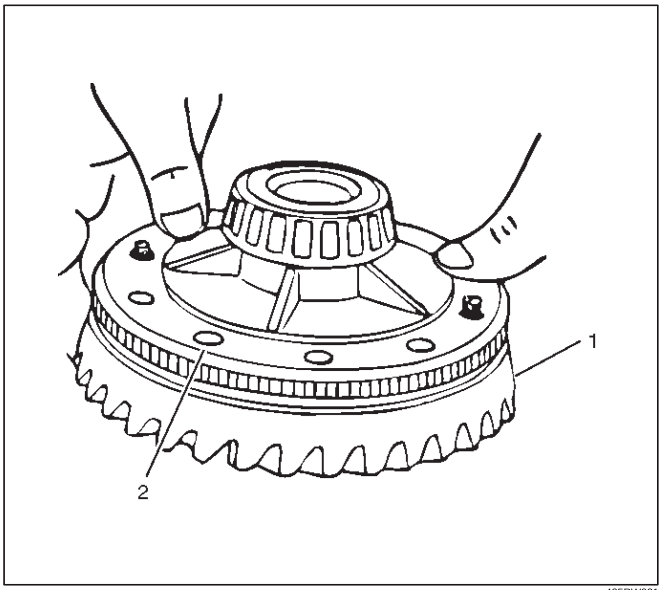
NOTE: Do not install pinion gear into housing at this time.

21. If the exciter ring was removed, install the new exciter ring onto the differential case by pressing using the ring gear as a pilot.



425RS047

22. Install ring gear(1) to the differential case(2)

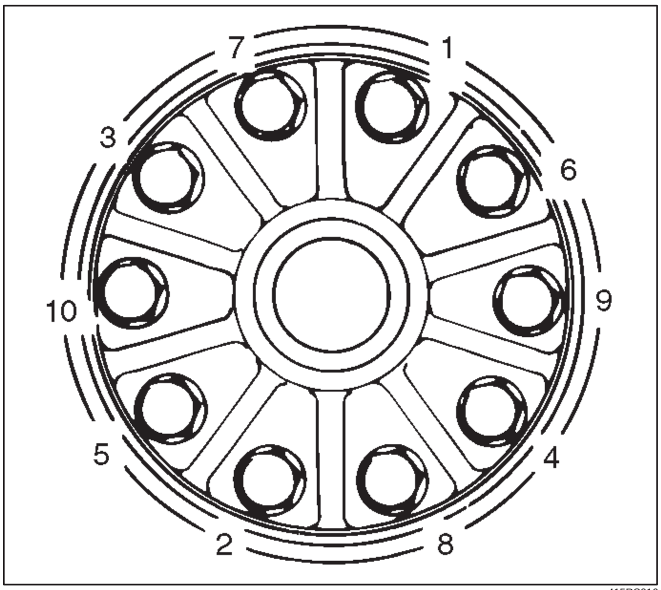


425RW021

23. Install new ring gear bolts.
    - Tighten the ring gear bolts alternately in stages, gradually pulling the ring gear onto the differential case.

Tighten the ring gear bolts in sequence
Torque: 108 N·m (80 lb ft)

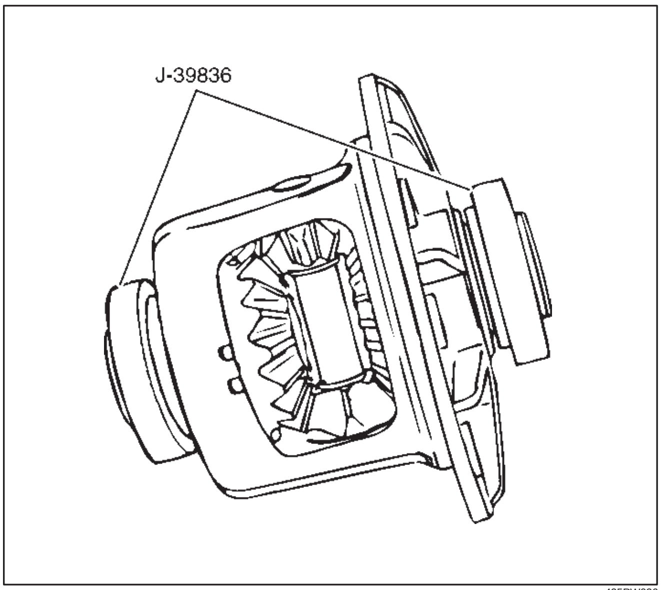
NOTE: Discard used bolts and install new ones.



415RS016

Side Bearing Preload Adjustment

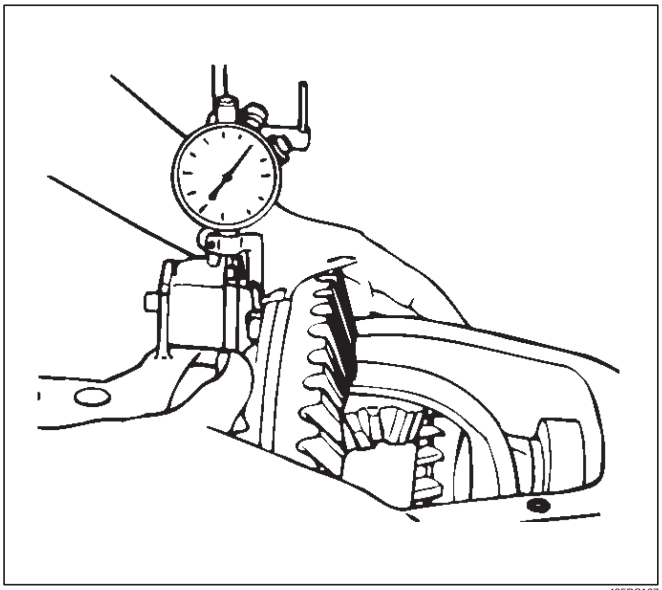
1. The side bearing preload adjustment must be made before installing the pinion.
2. The side bearing preload is adjusted by changing the thickness of both hte left and right shims equally. This maintain the original backlash.
3. Install master side bearings J–39836 onto the case. Remove all nicks, burrs, dirt etc., from the hubs to allow the master bearings to rotate freely.



425RW026

4. Assemble the differential case into the housing (less pinion). Install bearing caps and finger tight bolts. Mount a dial indicator with a magnetic base to the housing and indicate on the flange or head of screw.
   Force the differential assembly as far as possible in the dirction towards the indicator.
   With force still applied, set indicator at zero(0).

NOTE: Dial indicator set should be capable of a minimum travel of 5.08 mm (0.2 in).



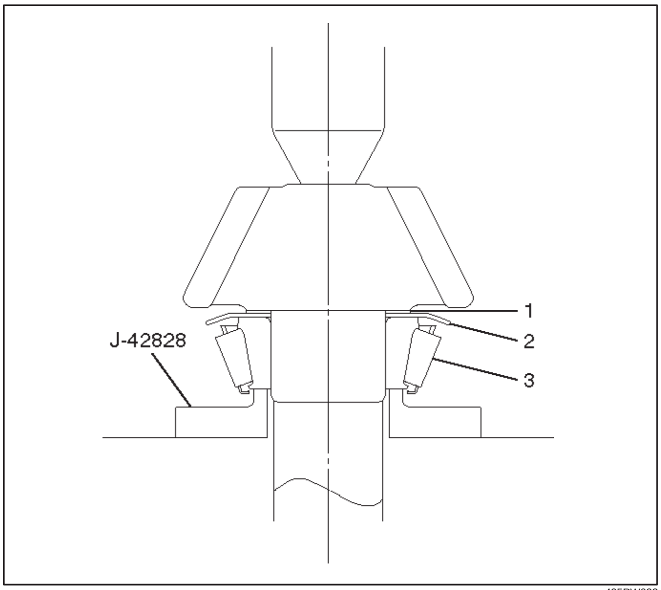
425RS107

5. Force the differetial assembly as far as it will go in the opposite direction. Repeat these steps until the same reading is obtained.
6. RECORD THE READING OF THE INDICATOR.
   This amount, in shims, will be included in the final assembly shim stack to establish side bearing preload and ring gear and pinion backlash.
7. After marking sure the readings are correct, remove the indicator and differetial assembly from the housing.

Pinion Installation

- The bearing cups should have been installed in Pinion Depth Adjustment in this section.

1. Place the shim(1) and inner oil slinger(2) on the pinion gear, then install the pinion inner bearing(3) using installer J–42828.



425RW023

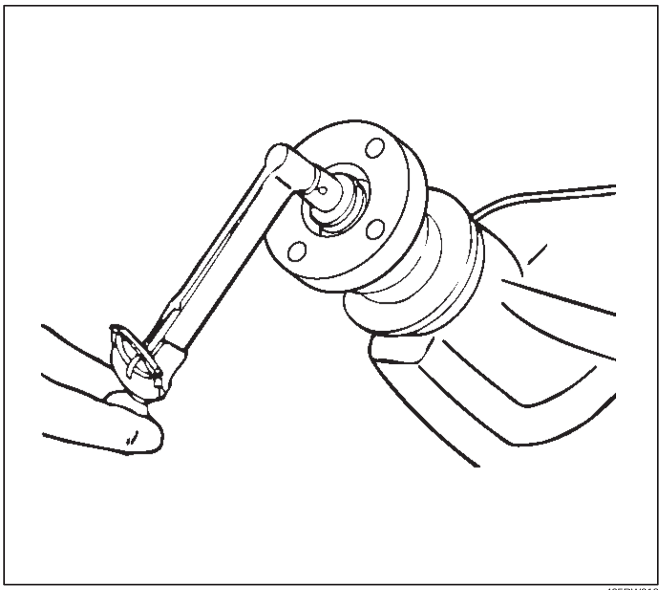
- Drive the bearing until the bearing cone seats on the pinion shims.

2. Install a new collpsible spacer.
   - Lubracate the pinion bearings with axle lublicant.
3. Install pinion to the axle housing.
4. Install outer pinion bearing onto the pinion.
   - Hold the pinion forward from inside the case while driving the bearing onto the pinion.
5. Install oil seal slinger.
6. Install pinion oil seal using installer J–37263.
7. Install the pinion flange to the pinion by tapping it with a rawhide hammer until a few threads show through the pinion flange.
8. Install pinion washer and a new nut while holding the pinion flange with flange holder J–8614–01.
   - Tighten the nut until the pinion end play is just taken up. Rotate the pinion while tightening the nut to seat the bearings.

Torque:217-678 N·m (160-500 lb ft)

Once there is no end play in the pinion, the preload torque should be checked.

- Remove flange holder J–8614–01. Using an inch-pound torque wrench, check the pinion preload by rotating the pinion with the wrench.



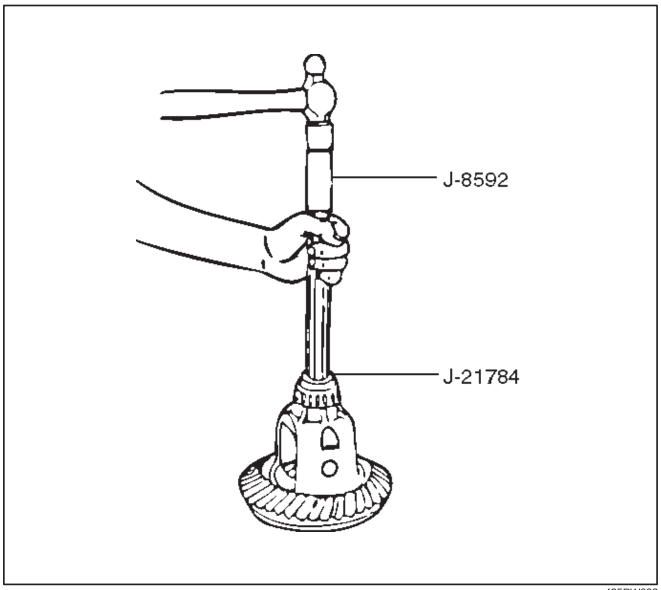
425RW018

Preload should be at 1.0 to 1.6 N·m (8 to 14 in lbs.) on new bearings, or 0.46 to 0.69 N·m (4 to 6 in lbs.) for used bearings.

- If the preload torque is below the preloads given above, continue torquing the nut in small increments. Check the preload after each tightening. Each tightening increases the bearing preload by several pounds. If the bearing preload is exceeded, the pinion will have to be removed, and a new collapsible spacer installed.
- Once a preload of 1.0 to 1.4 N·m (8 to 12 in lbs.) has been obtained, rotate the pinion several times to assure that the bearings have seated. Recheck the preload, and adjust if necessary.

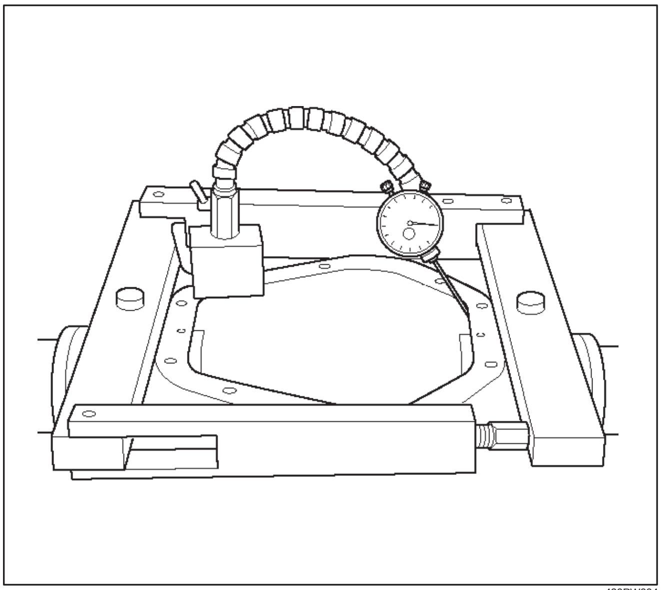
Determination of Backlash & Preload Shims

1. Install master side bearings onto the case.
2. Install differential assembly into the carrier.
3. Install the bearing cap and finger tight bolts.
4. Set up the dial indicator.
5. Force the differential assembly away from the pinion gear until it is completely seated against the cross bore face of the carrier.
6. With force still applied to the differential case, place the tip of dial indicator on a machined surface of the differential case, if available, or on the head of a ring gear screw, and set the indicator at zero(0).
7. Force the ring gear to mesh with the pinion gear. Rock the ring gear slightly to make sure the gear teeth are meshed. Repeat this procedure several times until the same reading is obtained each time. Be sure the indicator reads zero(0) each time the ring gear is forced back into contact with the cross bore face. This reading will be the necessary amount of thims to be placed between the differential case and side bearing cone on the ring gear side.
8. The remaining amount of shims, which is the difference between the overall found in step 6 of Side Bearing Pre-load Adjustment and step(7) above, should be placed on the other side of the differential case, plus additional 0.38 mm (0.015 in) for obtaining preload and backlash.
9. Place the required amount of shims on each hub as determined in the previous steps and assemble side bearing cone by using installer J–21784 and handle J–8592.



425RW022

10. Total torque to rotate — Increase of pinion torque to rotate due to differential case assembly shall not exceed 3.4 N·m (30 in lbs.) divided by the gear ratio.
11. Assembly the spreader J–24385–B and indicator to the carrier as shown in figure. Spread the carrier 0.5 mm (0.02 in) for differential installation.



420RW004

CAUTION: Do not spread the carrier over 0.5 mm (0.02 in).

12. Remove the indicator.

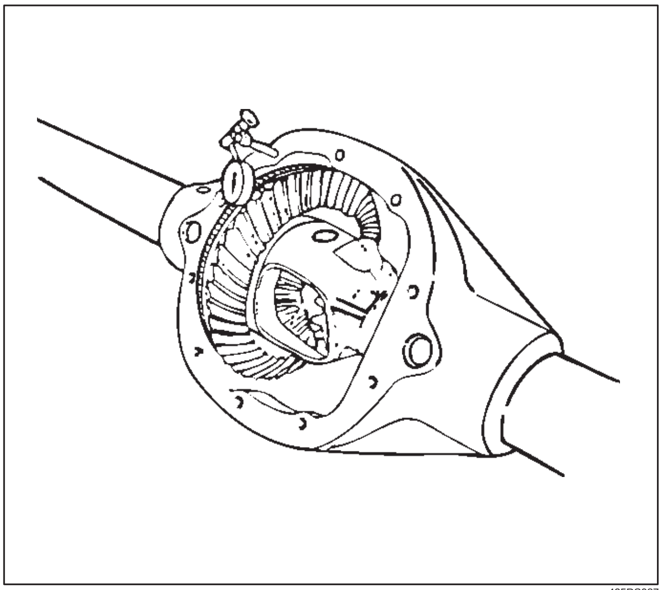
Backlash Adjustment

1. Install the differential case assembly and bearing caps.
2. Rotate the case several times to seat the bearings.
3. Remove the spreader.
4. Install the side bearing cap bolts.

Tighten side bearing cap bolts

Torque: 108 N·m (80 lb ft)

5. Install a dial indicator to the case using a magnetic base.
6. Place the indicator stem at the heel end of a tooth.
   - Set the dial indicator so that the stem is in line with the gear rotation and perpendicular to the tooth angle.



425RS087

7. Check and record the backlash at three points around the ring gear.
   - The pinion must be held stationary when checking backlash.
   - The backlash should be the same at each point within 0.07 mm (0.003 in). If the backlash varies more than 0.07 mm (0.003 in), check for burrs, a distorted case flange, or uneven bolting conditions.
8. Backlash at the minimum lash point measured should be between 0.13 and 0.20 mm (0.005 and 0.008 in) for all new gear sets.
9. If the backlash is not within specifications, move the ring gear in or out from the pinion by increasing the thickness of one shims, and decreasing the thickness of the other shim by the same amount.

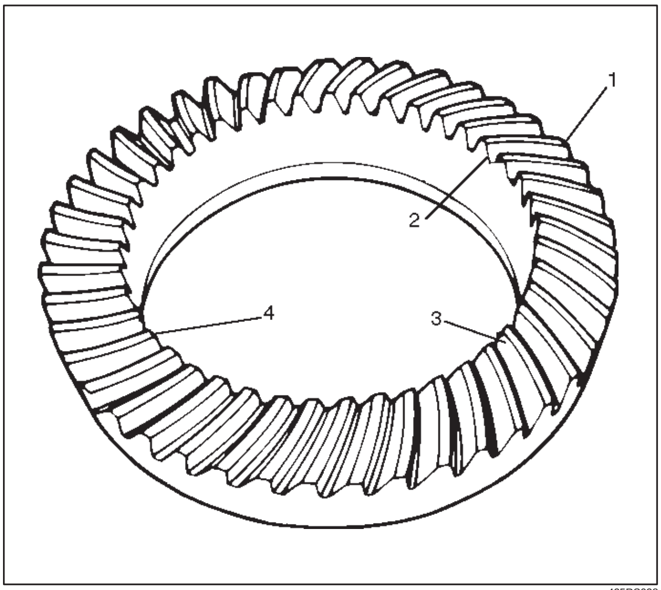
   This will maintain the correct rear axls side bearing preload.
   - Moving 0.05 mm (0.002 in) worth of shim from one side of the differential to the other will change the backlash adjustment by 0.03 mm (0.001 in).
10. After obtaining correct tooth contact described in later, install ABS speed sensor.
11. Install the cover with sealant.

Torque: 40 N·m (30 lb ft)

12. Fill the axle lubricant.

Gear Tooth Pattern Check

Checking the ring gear to pinion tooth pattern is to be done only after setting up the axle according to the methods in this section. The pattern check is NEVER to be used as an initial check, or instead of checking pinion depth and backlash adjustments.
This check is only to be verify the correct adjustment of the gear set after set up.

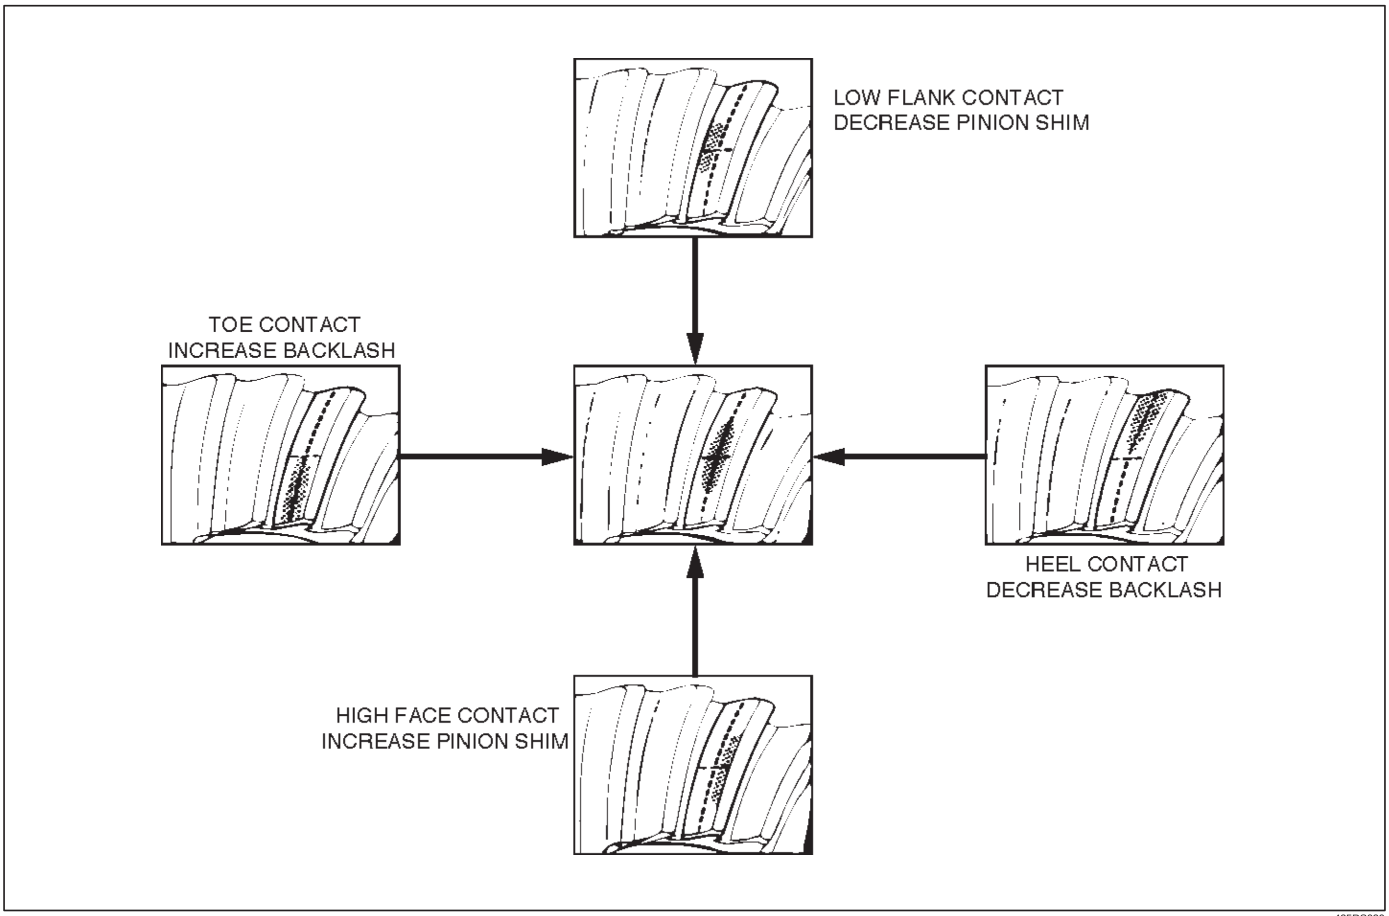


425RS038

Legend

(1) Heel
(2) Toe
(3) Concave Side (Coast)
(4) Convex Side (Drive)

1. Wipe all oil out of the carrier, and carefully clean each tooth of the ring gear.
2. Use gear marking compound 1052351 or equivalent and apply this mixture sparingly to all ring gear teeth, using a medium-stiff brush. When properly used, the area of pinion tooth contact will be visible when hand load is applied.
3. Tighten the bearing cap bolts to the specified torque.
4. Expand the brake shoes until a torque of 54 to 68 N·m (40 to 50 lb ft.) is required to turn the pinion. A test made without loading the gears will not give a satisfactory pattern. Turn the pinion flange with a wrench so that the ring gear rotates one full revolution, then reverse the rotation so that the ring gear rotates one revolution in the opposite direction.
5. Observe the pattern on the ring gear teeth and compare this with figure.



Adjustments Affecting Tooth Contact

Two adjustments can be made which will affect tooth contact pattern: backlash, and the position of the drive pinion in the case. The effects of bearing preloads are not readily apparent on head loaded tooth contact pattern tests; however, these adjustments shuld be within specifications before proceeding with backlash and drive pinion adjustments.

The position of the drive pinion is adjusted by increasing or decreasing the distance between the pinion head and the centerline of the ring gear.

Decreasing the distance will move the pinion closer to the centerline of the ring gear. Increasing the distance will move the pinion farther away from the centerline of the ring gear.

Backlash is adjusted by means of the side bearing adjusting shims which move the entire case and ring gear assembly closer to, or farther from, the drive pinion. (The adjusting shims are also used to set side bearing preload.)

If the thickness of the right shim is increased (along with decreasing the left shim thickness), backlash will increase.

The backlash will decrease if the left shim thickness is increased (along with a decrease in right shim thickness).

Differential Case Assembly

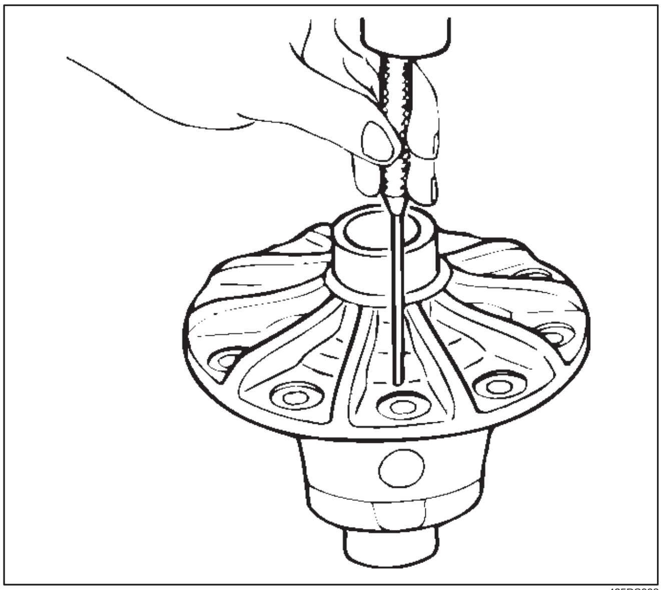
(8) Differential Case

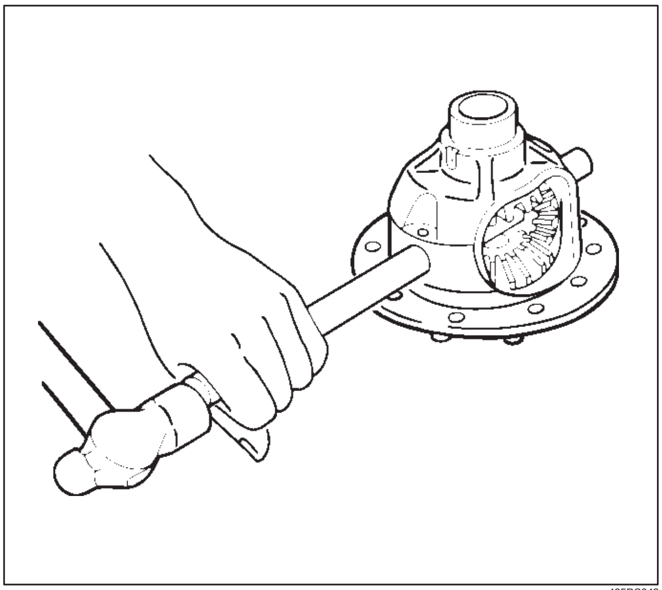
Disassembly

1. Remove lock pin using a small drift.



425RS098

2. Remove the differential shaft by using a soft metal rod and a hammer.



425RS043

3. Remove pinion mate gear and thrust washer.
4. Remove side gear and thrust washer.

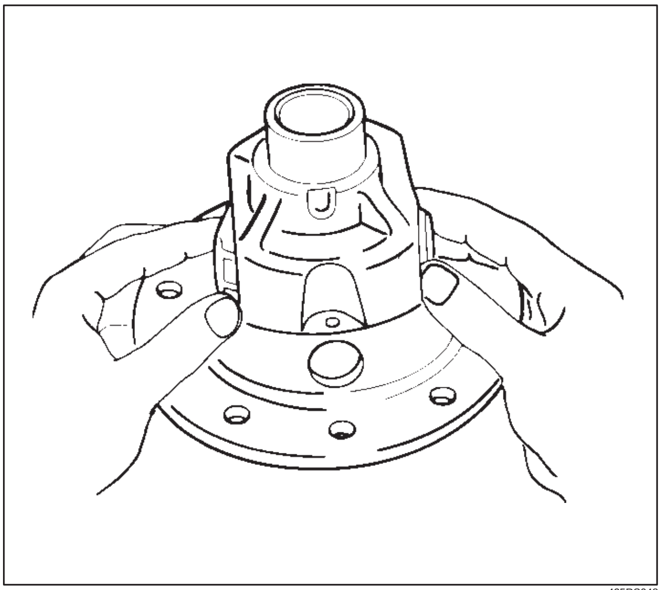
Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts.

- Ring gear, pinion gear
- Bearing
- Side gear, pinion mate gear, differential shaft
- Differential case, carrier
- Thrust washer
- Oil seal

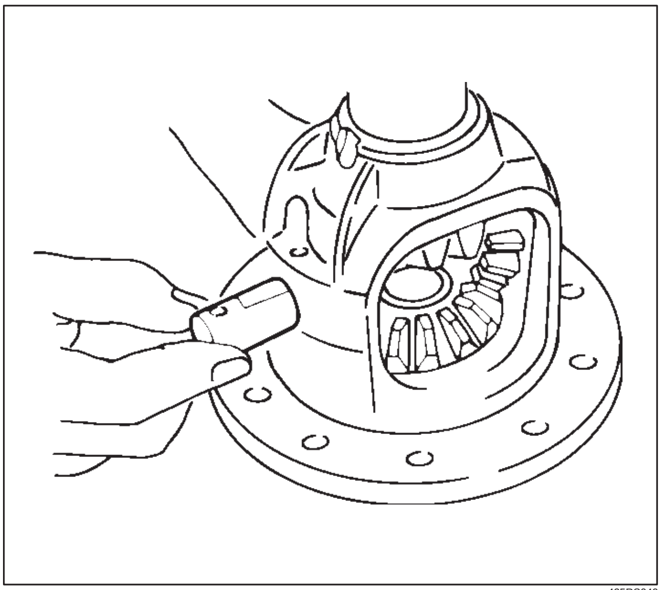
Reassembly

1. Install side gear with thrust washer.
2. Install the pinion mate gear with thrust washer by engaging it with the side gears while turning both pinion mate gears simultaneously in the same direction.



425RS048

3. Install differential shaft.
   1. Be sure to install the differential shaft so that it is in alignment with the lock pin hole in the differential case.

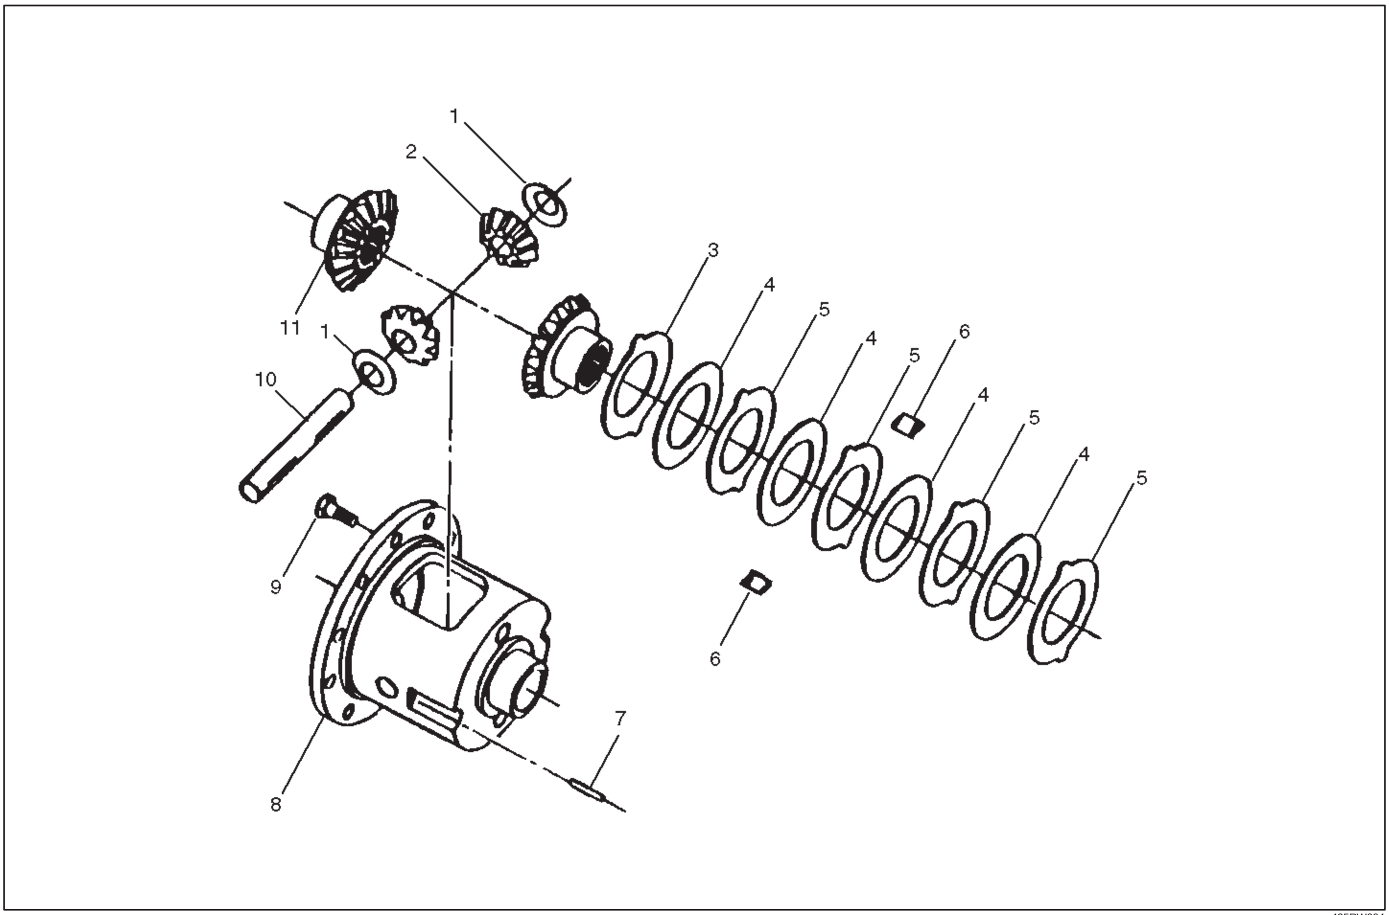


425RS049

4. Install lock pin.
   After lock pin installation, stake the case to secure the lock pin.

Limited Slip Differential Assembly

Disassembled View



425RW004

Legend

(1) Thrust Washer–Differential Pinion Mate Gear

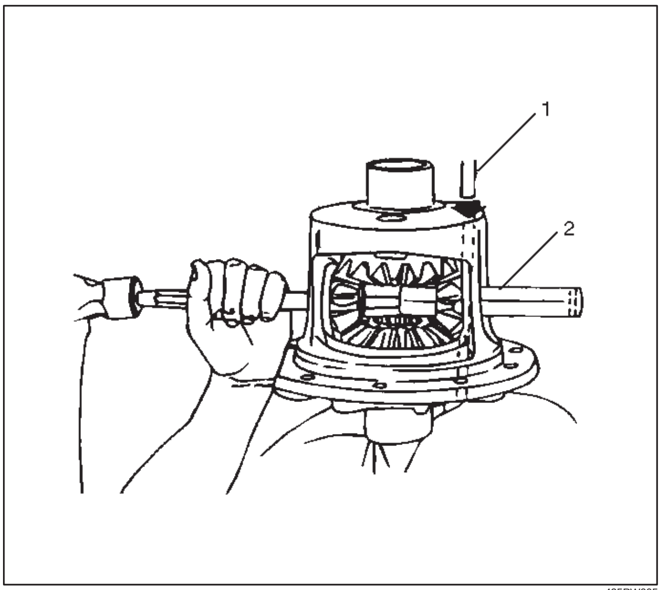
(4) Disc
(5) Plate
(6) Differential Plate Retainer
(7) Lock Pin
(8) Differential Case
(9) Ring Gear Bolts
(10) Differential Shaft
(11) Differential Side Gear

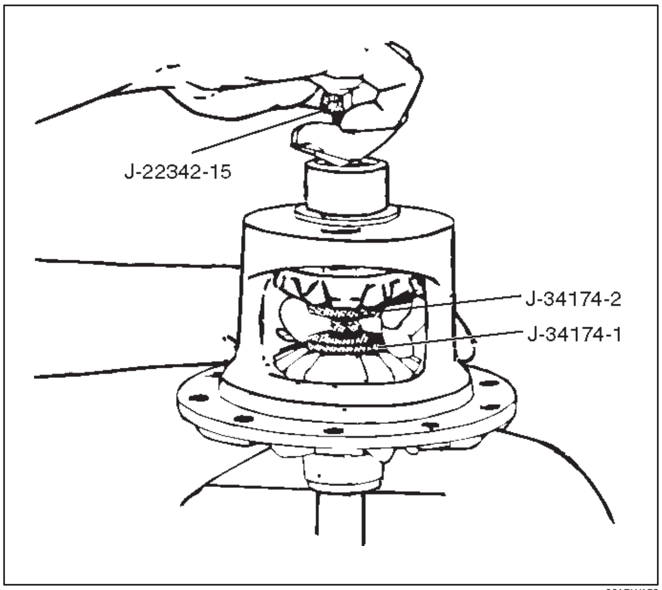
Disassembly

1. Place the holder J–39824 into a vise.
   Position the differential on the holder with the ring gear side down.
2. Remove Lock pin (1) from differential shaft using a punch.
3. Remove Differential shaft (2) using hammer and punch.
   Place shop towel behind case to prevent differential shaft from dropping out of case.



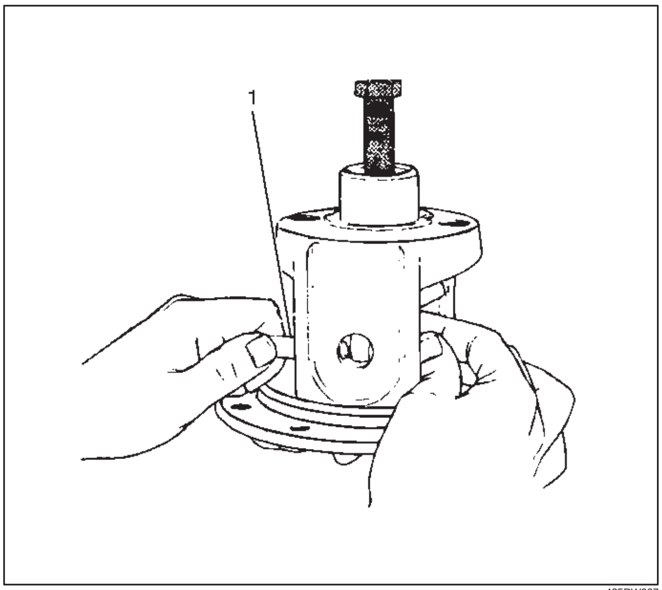
425RW005

4. Assemble clutch pack unloading tool .
   a. Install cap J–34174–1 to the bottom differential side gear.
   b. Install threaded screw cap J–34174–2 to top differential side gear. Thread forcing screws J–22342–15 into threaded screw cap until it becomes centered into the bottom cap.



901RW153

   c. Tighten forcing screw until tight enough to collapse dished spacers and and allow looseness between side and pinion mate gears.
5. Both pinion mate gear thrust washers using a shim stock (1) of 0.51 mm (0.020 in.) or equivalent tool to push out washers.



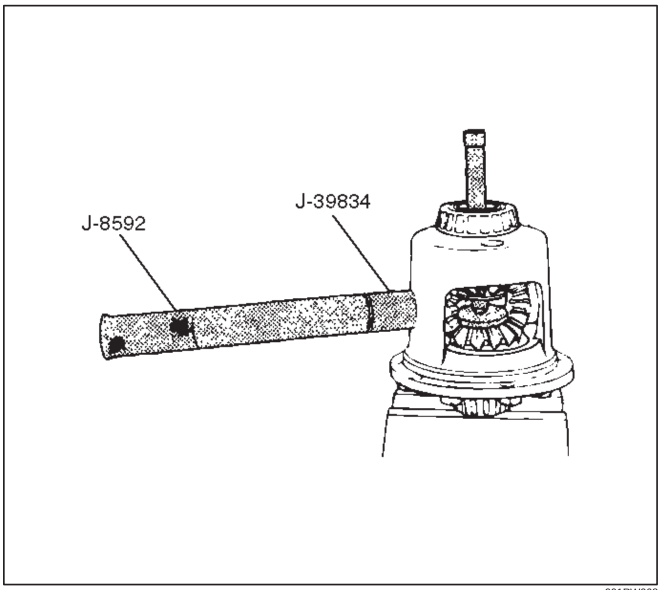
425RW007

6. Relieve tension of dished spacers by loosening forcing screw.

NOTE:

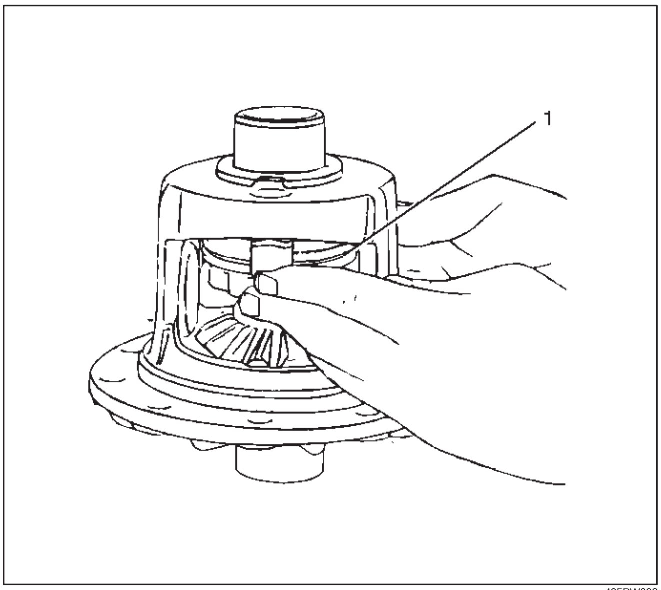
- You may have to adjust the forcing screw slightly to allow the case to rotate.

7. Assemble LSD service adapter J–39834 onto long drive handle J–8592.Insert it into differential shaft hole of case. Pull on handle and rotate case until pinion mate gears can be removed.



901RW068

8. Remove pinion mate gears.
9. Hold side gear top clutch pack (1) with one hand and remove positraction unloading tools.



425RW008

10. Remove top side gear and clutch pack.

NOTE:

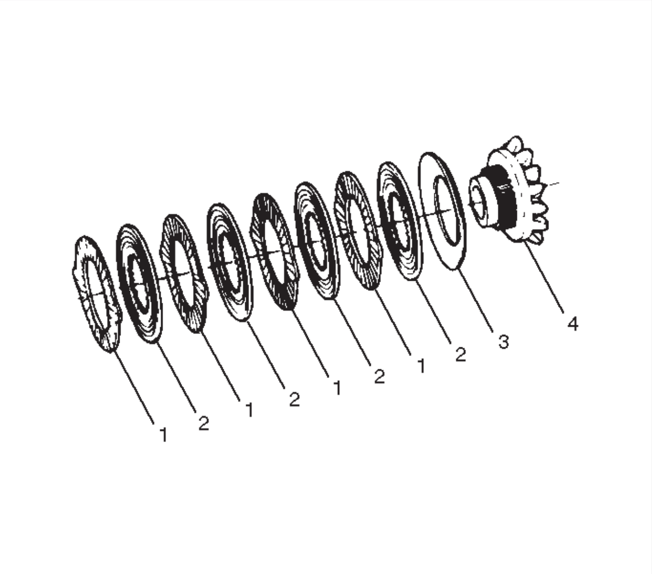
- Keep the stack of plates and discs intact and in exactly the same position while they are being removed.

11. Remove case from holder. Turn case with flange or ring gear side up to allow side gear and clutch pack to be removed from case.

12. Remove differential plate retainer from both clutch packs to allow separation of the plates and discs.

NOTE:

- Keep the discs and plates in the same order as they were removed.



425RW009

Legend

(1) Differential Plate
(2) Differential Disc
(3) Dished Spacer
(4) Side Gear

Inspection and Repair

Cleaning

- All parts with solvent.

Visual Inspection

- Clean all parts with solvent.
- Plates and Discs. If any one disc or plate in either stack shows evidence of excessive wear or scoring, the complete stack is to be replaced on both sides.
- Side Gears and Pinion Mate Gears. The gear teeth of these parts should be checked for extreme wear and possible cracks. The external teeth of the side gear, which retain the concentric groove discs, should also be checked for wear or cracks.
- If replacement of one gear is required due to wear, etc., then both side gears, pinion mate gears, and thrust washers are to be replaced.
- Differential Shaft. If excessive wear is evident, the differential shaft should be replaced.
- Differential Plate Retainers. If wear is evident on any one of the differential plate retainers, all four retainers must be replaced.
- Differential Case. If scoring, wear or metal pickup is evident on the machined surfaces, replacement of the case is necessary.

Reassembly

1. Lubricate thrust face of side gears, plates and discs with the proper limited slip rear axle lubricant.
2. Assemble plates and discs in exactly in the same position as they were removed, regardless of whether they are new or original.
3. Install differential plate retainer to ears of plates.

NOTE:

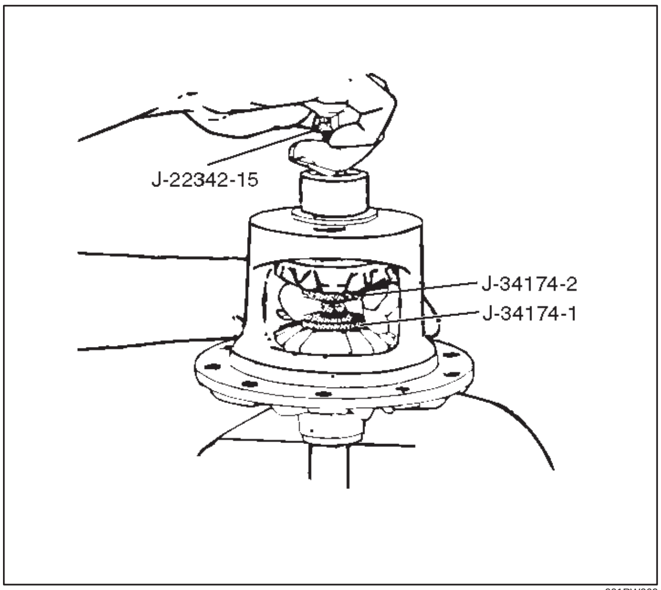
- Make sure both retainers are Completely seated on ears of plates.

4. Install clutch pack and side gear into bottom side gear bore. Make sure clutch pack stays assembled to side gear splines, and that retainers are completely seated into pockets of case.

NOTE:

- To prevent clutch pack from falling out of case, hold clutch pack in place by hand while repositioning case on bench.

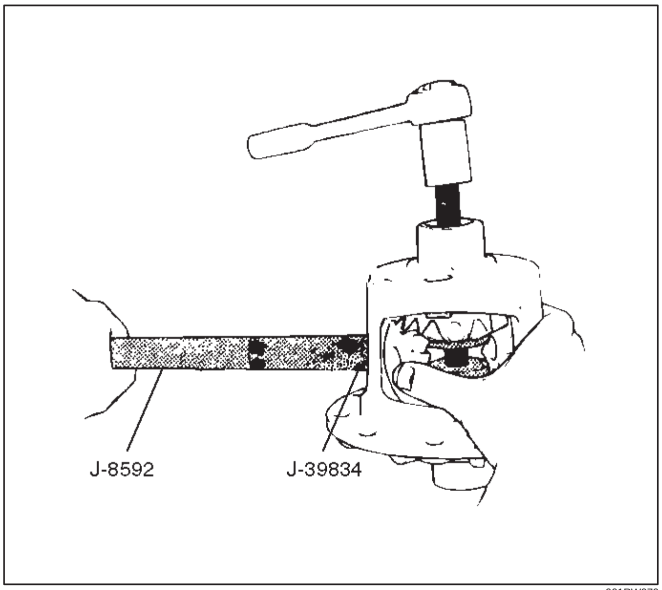
5. Install other side gear and clutch pack. Make sure clutch pack stays assembled to side gear splines, and retainers are completely seated into pockets of case.
6. Hold clutch pack in position and assemble screw cap J–34174–2, cap J–34174–1 and forcing screw J–22342–15. Tighten forcing screw into bottom cap to hold both clutch packs in position.
7. With tools assembled to case, position case on holder J–39824 by aligning splines of side gear with those of shaft. Tighten forcing screw to compress clutch packs in order to provide clearance for pinion mate gears.



901RW069

8. Install pinion mate gears.
   - Place the pinion mate gears into the differential 180 degrees apart.

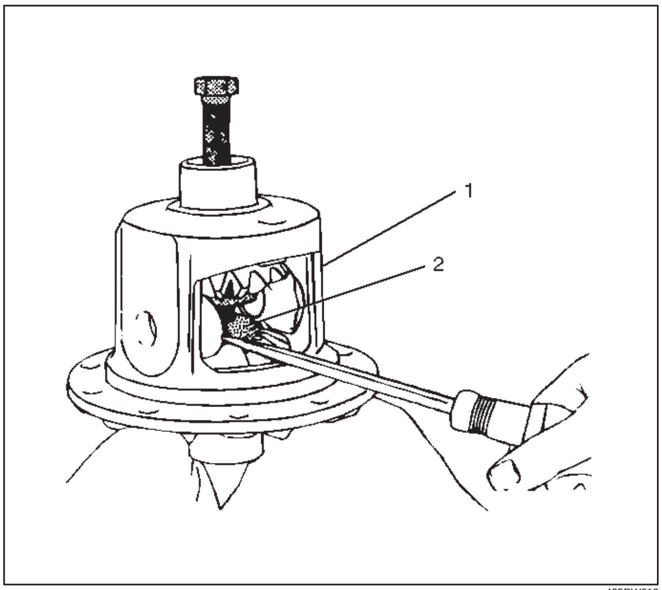
9. While holding gears in place, insert LSD service adapter J–39834 with long drive handle J–8592 in differential shaft hole of case. Pull on long drive handle J–8592 and rotate case, allowing gears to turn. Make sure that holes in pinion mate gears align with holes in case.



901RW070

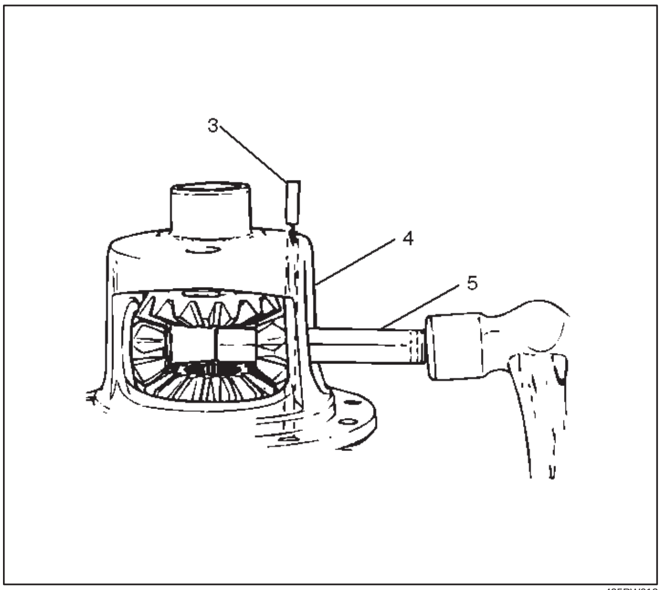
- It may be necessary to adjust tension on forcing screw to rotate case.

10. Tighten forcing screw to compress the clutch packs, to allow installation of spherical thrust washers.
11. Lubricate spherical thrust washers (2), and assemble into case (1). Use a small screw driver to push washers into place. Remove tools.



425RW012

12. Position differential shaft in case and drive in with hammer. Be sure lock pin hole of differential shaft (5) is properly aligned to allow installation of lock pin (3). Be sure that thrust washers and differential pinion mate gears are aligned with the differential case (4). Install new lock pin to proper depth using a punch.
    Stake metal of case over pin in two places, 180 degrees apart.



425RW013

Main Data And Specifications

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Shift On The Fly System

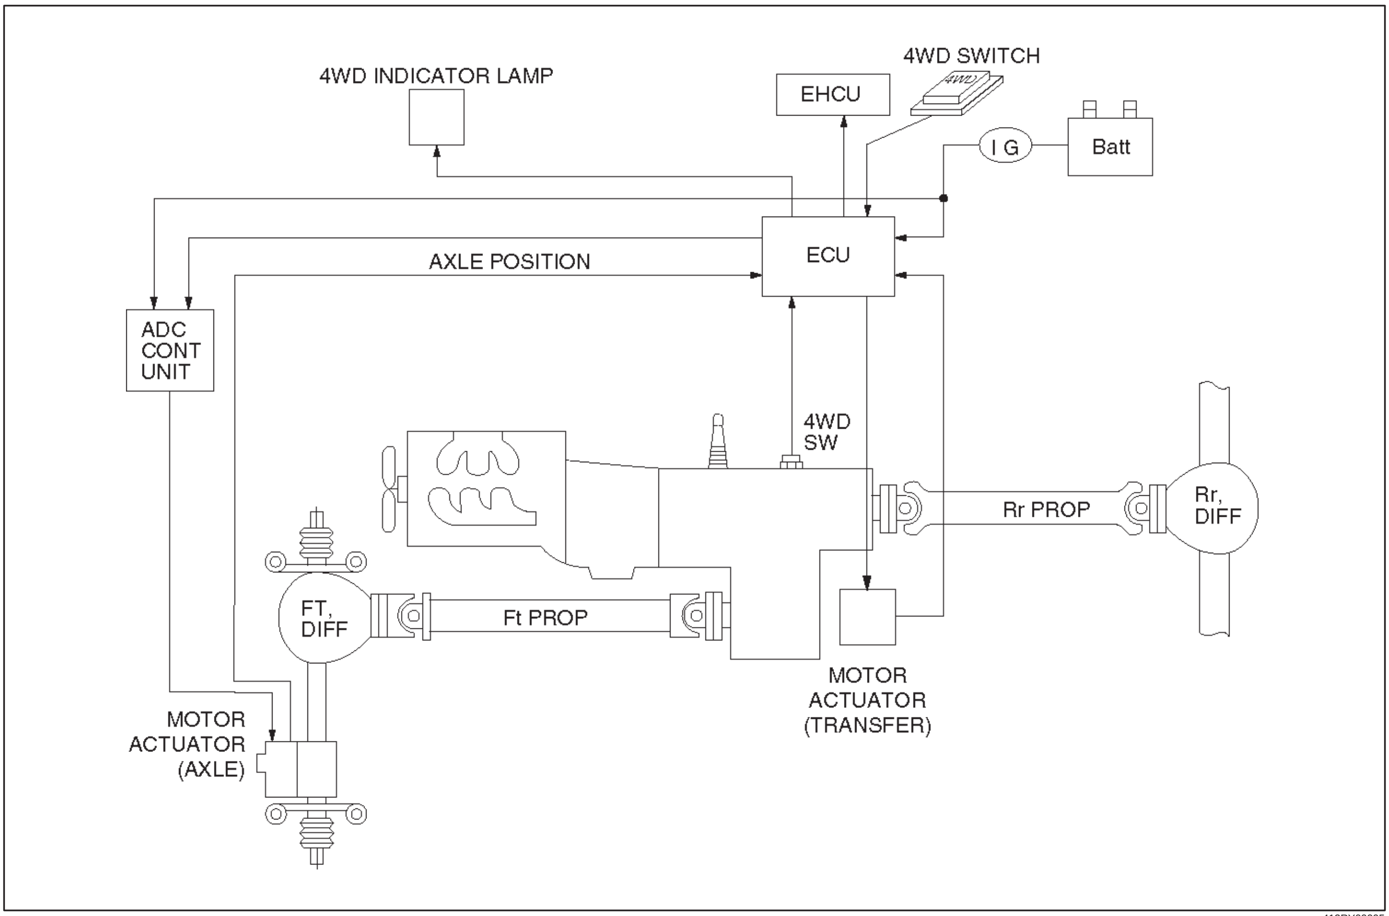
Outline of Shift on The Fly System

The shift on the fly system switches between 2 wheel drive (2WD) and 4 wheel drive (4WD) electrically by driver's pressing the 4WD switch (push button type) on instrument panel.

This system controls below operations. (Shifting between "4H" and "4L" must be performed by transfer control lever on the floor.)

1. Shifting the transfer front output gear (Connecting to, and disconnecting from, front propeller shaft by motor actuator).
2. Retrial of shifting the transfer front output gear.
3. Connecting front wheels to, and disconnecting them from, the front axles by axle motor actuator.
4. Indicator on instrument panel.
5. 4WD out signal to other Electronic Hydraulic Control Unit.

System Diagrams

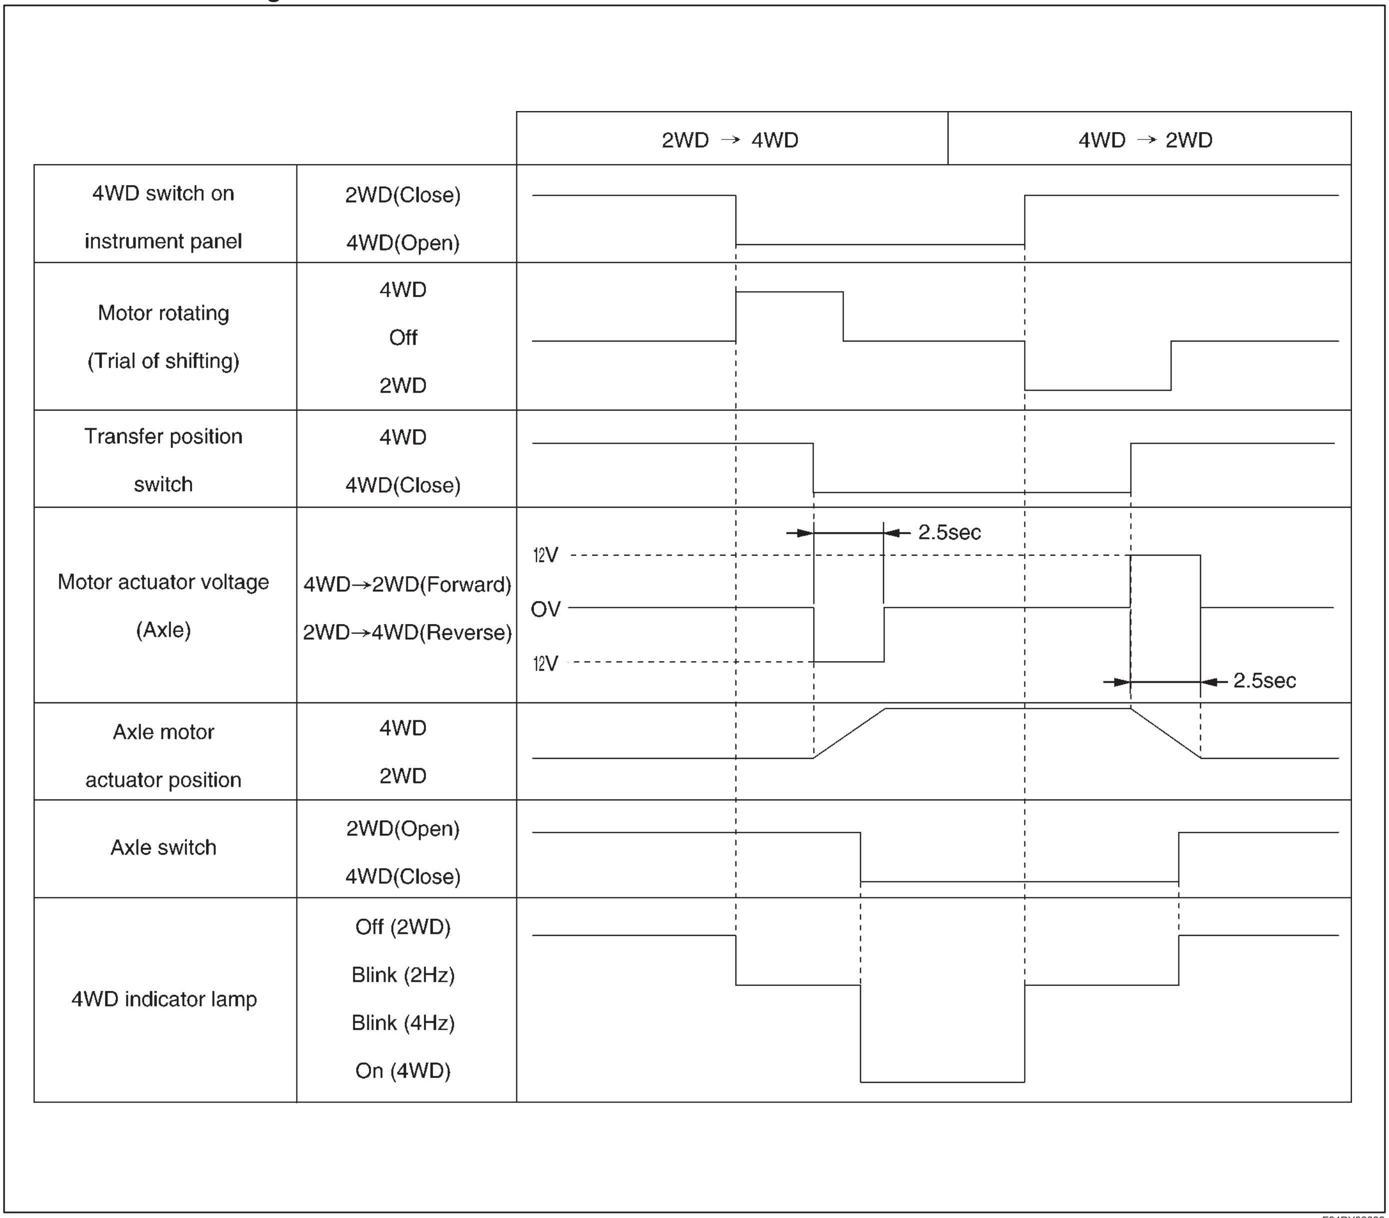


412RY00005

Normal Operation

The motor actuator mounted on transfer rear case is driven by signal from 4WD switch on instrument panel. After complete the connecting transfer front output gear to, or disconnecting it from, front propeller shaft, condition of the transfer position switch changes. The axle disconnect controller is driven by the signal from transfer position switch and axle the motor actuator connects front wheels to, or disconnect them from, front axles.

Time Chart of Shifting Under Normal Condition

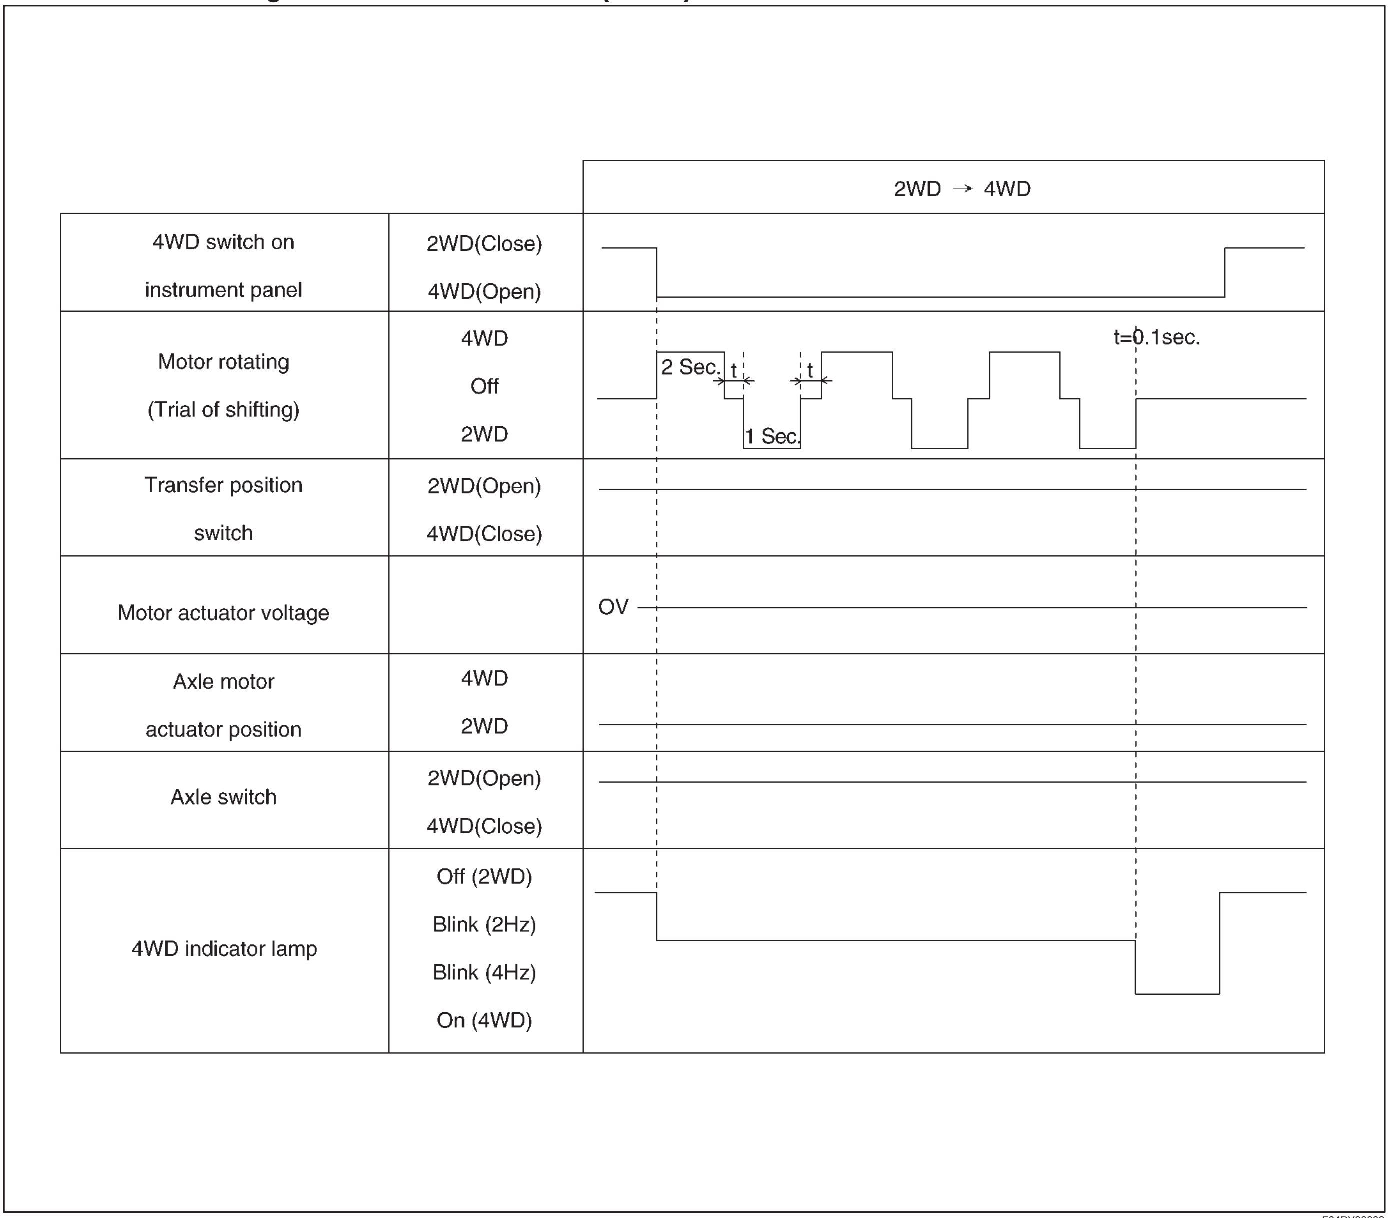


F04RY00002

Retrial

The transfer motor actuator starts transfer gear shifting after signal from 4WD switch on instrument panel has been received. But the shifting may be impossible in cold weather or under high speed condition. When 2 seconds have passed since transfer gear shifting started and the transfer position switch dose not turn on (the gear engagement is not completed), the motor reverses its rotation for 1.2 seconds and tries again to shift transfer gear. This procedure is repeated 3 times in maximum. While this procedure, 4WD indicator lamp blinks by 2 Hz. If the transfer position switch does not turn on after aforementioned procedure has been repeated 3 times, the gear shifting is stopped and 4WD indicator lamp's blinking changes from 2Hz to 4Hz to notify driver that the gear shifting is stopped. This blinking of indicator lamp continues until 4WD switch is returned from 4WD to 2WD.

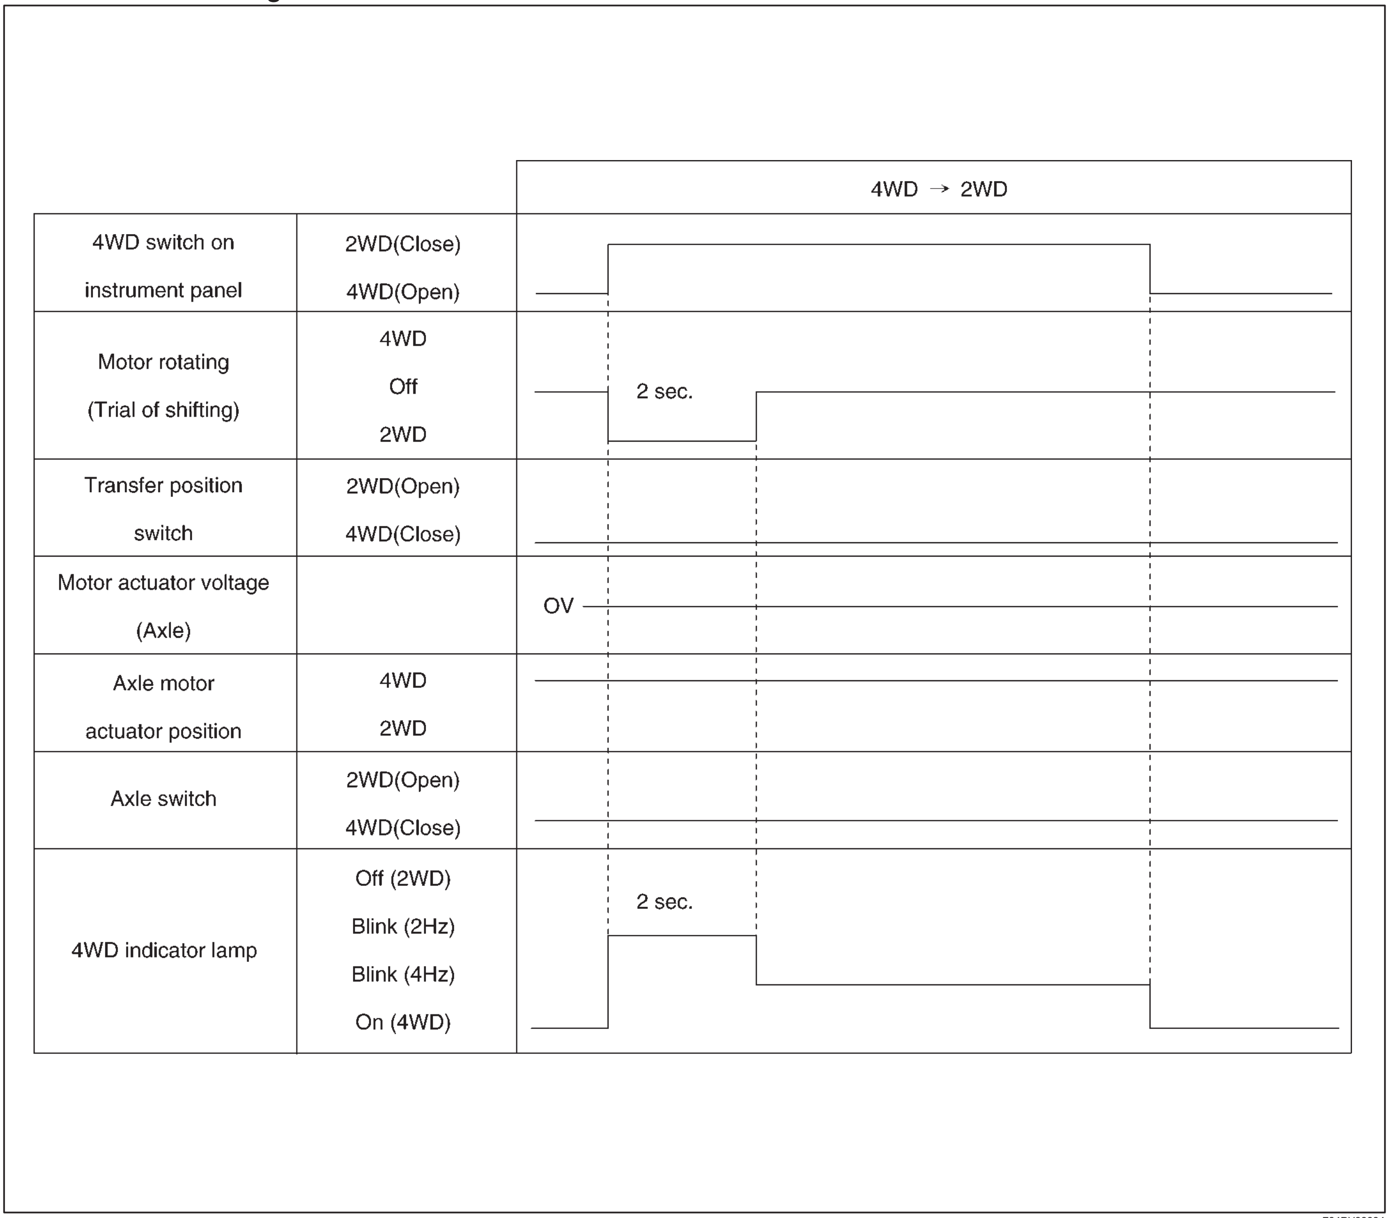
Time Chart of Shifting Under Severe Condition (retrial)



F04RY00003

Warning at “4L” position : In view of the shifting mechanism of transfer, the gear shifting from 4WD to 2WD at “4L” condition is impossible. Therefore, the transfer position switch can not be turned off by 4WD switch when vehicle is in “4L” condition. In the case this condition continues for 2 seconds, the shifting to 2WD is stopped and the indicator lamp’s blinking changes from 2Hz to 4Hz to notify driver of wrong operation.

Time Chart of Shifting from 4WD to 2WD at “4L” Condition



F04RY00004

4WD out signal to other Electronic Hydraulic Control Unit : ECU of shift on the fly sends 4WD out signal to other Electronic Hydraulic Control Unit as below.

4WD out signal (Period)	Vehicle Condition	Transfer position switch	Front axle switch
120 ms	2WD	2WD (Open)	2WD (Open)
240 ms	4WD	4WD (Close)	4WD (Close)

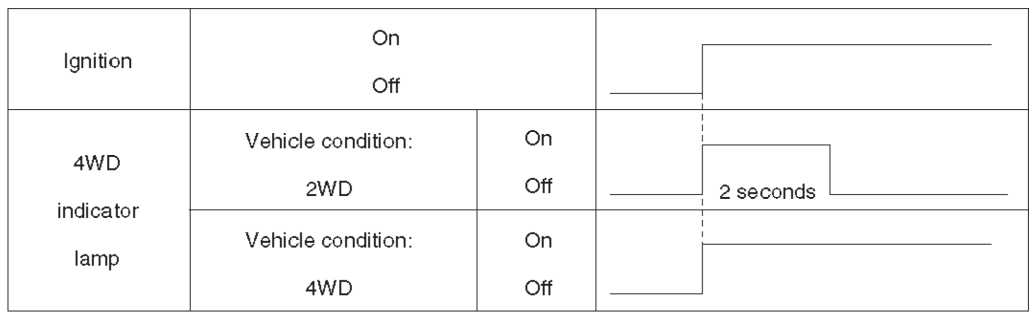
Functions of Indicator Lamp

Indication of vehicle condition : Indicator lamp is controlled by transfer ECU of shift on the fly and shows vehicle conditions as below.

Indicator	Vehicle condition	4WD switch	Transfer position switch	Front axle switch
Off	2WD	Off (Close)	2WD (Open)	2WD (Open)
On	4WD	On (Open)	4WD (Close)	4WD (Close)
Blink (2Hz)	Operating	On (Open)	4WD (Close)	2WD (Open)
		Off (Close)	2WD (Open)	4WD (Close)
Blink (4Hz)	Stop operating	On (Open)	2WD (Open)	2WD (Open)
		Off (Close)	4WD (Close)	4WD (Close)

Bulb check : The bulb of indicator lamp is checked for 2 seconds when ignition key is turned on.

Time Chart of Bulb Checking



F04RW004

Retrials from 2WD to 4WD : In cold weather or under high speed condition, the gear shifting (engagement) sometimes dose not complete by 3 trials. In such case, the indicator lamp informs driver of this incident as aforementioned chart (shown at Retrial in Outline of shift on the fly system.)

Diagnosis

Before Judging That Troubles Occur (Unfaulty mode)

When Switching from 2WD to 4WD

1. **In case that blinking frequency of the 4WD indicator changes from 2Hz to 4Hz.**

   When heavy synchronization load is needed, the motor actuator tries the shifting transfer gear three times. While the motor actuator tries shifting, the indicator blinks by 2Hz. If the third shifting fails, the indicator's blinking changes from 2Hz to 4Hz at the same time that the motor actuator shifted back to 2WD.

   Heavy synchronization load occurs by

   - extremely lower temperature.
   - higher speed rotation difference of wheels during cornering.

   Solution 1: Operate again after stop the vehicle or slow down.

2. **In case that the 4WD indicator continues blinking by 2Hz for more than 11.5 seconds.**

   When there is rotation difference of wheels or there is phase difference between front wheels and axles, it is difficult to connect front wheels to front axles. The blinking by 2Hz shows that shifting the transfer gear or connecting the front wheels is in the middle of operating. In above case, the indicator's blinking by 2Hz shows that connecting the front wheels is not completed (because the indicator's blinking changes to 4Hz when the shifting transfer gear is impossible.). And removal of rotation or phase difference makes connecting the front wheels possible.

   Solution 2: When vehicle is running, drive straight ahead while accelerating and decelerating. When vehicle is at a stop, move the vehicle forward and backward from 2 to 3 meters.

When Switching from 4WD to 2WD

1. **In case that the 4WD indicator continues blinking by 2Hz .**

   The 4WD indicator continues blinking by 2Hz until both shifting the transfer gear and disconnecting the front wheels are completed when switching 4WD to 2WD. When drive line is loaded with torsional torque, the shifting transfer gear and disconnecting front wheels are impossible. In this case, removal of torsional torque on drive line makes the shifting transfer gear and disconnecting front wheels possible.

   Solution 3: When vehicle is running, drive straight ahead while accelerating and decelerating. When vehicle is at a stop, move the vehicle forward and backward from 2 to 3 meters.

2. **In case that the 4WD indicator's blinking changes from 2Hz to 4Hz.**

   Check the position of transfer lever. Is it at "4L" position? In view of the shifting mechanism of transfer, the gear shifting from 4WD to 2WD at "4L" condition is impossible.

   Solution 4: Push the 4WD switch to 4WD, shift the transfer lever to "High" position and re–operate the 4WD switch to 2WD.

Diagnosis of The Faults Based on the Status of 4WD Indicator Lamp, 4WD Switch and T/F Change Lever

Diagnosis charts are shown on below. If troubles can not be solved after every chart was traced, troubles may occur in the ECU. In this case, replace the ECU and trace every chart again.

Fault on Switching from 2WD to 4WD

1. **In case that 4WD indicator's blinking changes from 2Hz to 4Hz after Solution 1 is carried out.**

   Faults occur in the motor actuator or the transfer case assembly. Remove the motor actuator and check function. If problem was found and it was repaired, try **Solution 1** again. After that, disassemble the transfer case assembly for check and repair or replace. If incident is not improved after above mentioned actions were taken, replace the ECU.

2. **In case that 4WD indicator dose not blink nor light, when switching from 2WD to 4WD.**

Step	Action	Yes	No
1	Is ignition turned on?	Go to Step 2	Turn on the ignition and trace this chart from start.
2	Dose the indicator light during two seconds initialization after ignition is turned on?	Go to Step 3	Burning out of indicator lamp or disconnection of harness wire. Trace this chart from the start after repair or replace.
3	Is the 4WD switch turned from 2WD to 4WD?	Short-circuit (body short) on harness of the 4WD switch. Fault of the 4WD switch (holding the closed condition). Trace this chart from the start after repair or replace.	Push the 4WD switch to 4WD.

3. **Case that the indicator keeps blinking by 2Hz after aforementioned Solution 2 is carried out.**

Step	Action	Yes	No
1	Check the air pressure and wear of all tires. Were problems found?	Try **Solution 2** after adjust the air pressure and replace worn tires.	Go to Step 2
2	Can the transfer lever be operated from High to 4L or vice versa?	Go to Step 3	Disconnection of the motor actuator harness wiring. Trace this chart from the start after repair or replace. Faults on the motor actuator. Trace this chart from the start after replace. Internal faults of transfer case. Disassemble the transfer case for check. Trace this chart from the start after repair or replace.
3	Confirm that transfer switch is normal. If abnormal, replace it.	Go to Step 4	—
4	1. Disconnect the connector C–47. 2. Turn on the starter switch 3. Measure voltage between the connector C–47 terminals 4 and 3, when 4WD switch on instrument panel is switched on 2WD and 4WD position. Is the motor actuator voltage on the axle as “Time Chart of Shifting Under Normal Condition” aforementioned?	Go to Step 8	Go to Step 5
5	1. Inspect the wiring for poor electrical connections, open or short to ground between the connector-terminal E56–1 and B19–7, E57–1 and ground, C47–1 and B19–6, C47–2 and ground, H18–1 and B19–12, B19–8 and C49–3, H17–19 and C49–3, C49–1 and C47–4, C49–2 and C47–3, and C49–6 and ground. 2. Repair the circuit. Is the motor actuator voltage on the axle as “Time Chart of Shifting Under Normal Condition” aforementioned?	Go to Step 8	Go to Step 6
6	Check the axle switch continuity between the connector C–47 terminals 1 and 2. Is the axle switch open or close as “Time Chart of Shifting Under Normal Condition” aforementioned?	Go to Step 8	Go to Step 7
7	Replace the axle motor actuator.	Go to Step 8	—
8	Reconnect all components, ensure all components are properly mounted. Was this step finished	Trace this chart from the start.	Go to Step 8

Fault on Switching from 4WD to 2WD

1. **Case that indicator dose not blink nor turn out.**

Step	Action	Yes	No
1	Dose the indicator turn out by ignition off?	Go to Step 2	Short circuit of the indicator harness.
2	Is the 4WD switch on 2WD position?	Disconnection on the 4WD switch harness or breakdown of the 4WD switch in open state. Trace this chart from the start after repair or replace.	Turn the 4WD switch to 2WD position. Trace this chart from the start.

2. **Case that indicator keeps 2Hz blinking after aforementioned Solution 3 is carried out.**

Step	Action	Yes	No
1	Check the air pressure and wear of all tires. Were problems found?	Try **Solution 3** after adjust the air pressure and replace worn tires.	Go to Step 2
2	Can the transfer lever be operated from High to 4L or vice versa?	Faults on the harness wiring of motor actuator. Trace this chart from the start after repair or replace. Internal faults on transfer case. Disassemble the transfer case for check. Trace this chart from the start after repair or replace. Faults on the motor actuator. Trace this chart from the start after or replace.	Go to Step 3
3	1. Disconnect the connector C–47. 2. Turn on the starter switch 3. Measure voltage between the connector C–47 terminals 4 and 3, when 4WD switch on instrument panel is switched on 2WD and 4WD position. Is the motor actuator voltage on the axle as “Time Chart of Shifting Under Normal Condition” aforementioned?	Go to Step 7	Go to Step 4
4	1. Inspect the wiring for poor electrical connections, open or short to ground between the connector-terminal C47–1 and B19–6, C47–2 and ground, H18–1 and B19–12, B19–8 and C49–3, H17–19 and C49–3, C49–1 and C47–4, C49–2 and C47–3, and C49–6 and ground. 2. Repair the circuit. Is the motor actuator voltage on the axle as “Time Chart of Shifting Under Normal Condition” aforementioned?	Go to Step 7	Go to Step 5
5	Check the axle switch continuity between the connector C–47 terminals 1 and 2. Is the axle switch open or close as “Time Chart of Shifting Under Normal Condition” aforementioned?	Go to Step 7	Go to Step 6
6	Replace the axle motor actuator.	Go to Step 7	—
7	Reconnect all components, ensure all components are properly mounted. Was this step finished	Trace this chart from the start.	Go to Step 7

3. **Case that indicator's blinking changes to 4Hz after aforementioned Solution 4 is carried out.**

Step	Action	Yes	No
1	Can the transfer lever be operated from High to 4L or vice versa?	Faults on the harness wiring of motor actuator. Trace this chart from the start after repair or replace. Faults on the motor actuator. Trace this chart from the start after replace. Internal faults on transfer case. Disassemble the transfer case for check. Trace this chart from the start after repair or replace.	Faults on the ECU. Trace this chart from the start after replace.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM(SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED , do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

This publication contains essential removal, installation, adjustment and maintenance procedures.
The front axle utilizes a central disconnect type front axle/transfer case system.

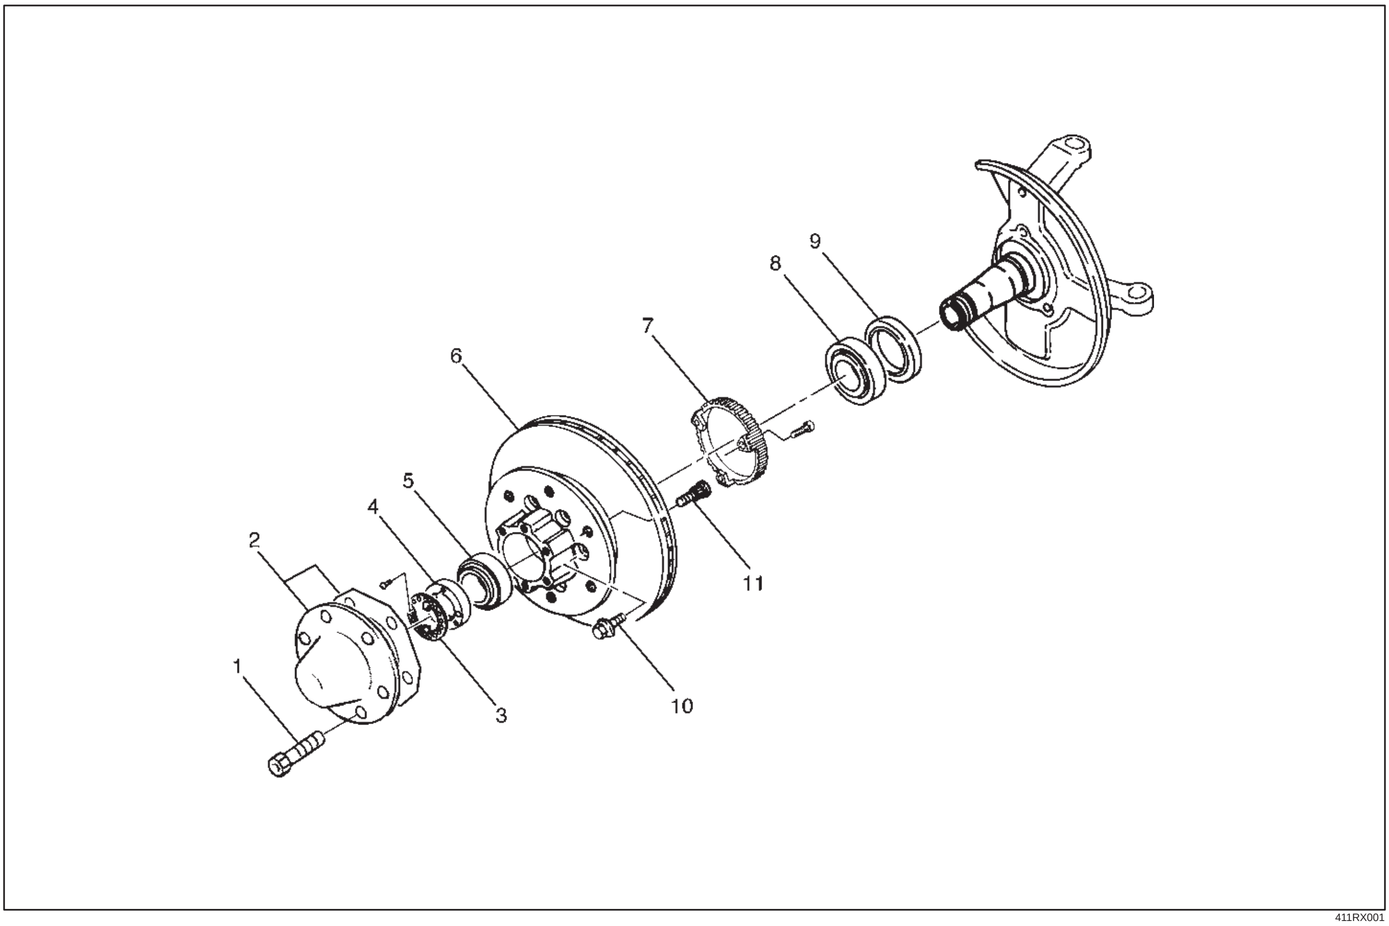
The drive axles are completely flexible assemblies, consisting of inner and outer constant velocity (CV) drive shaft joints connected by an axle shaft.
For description of front propeller shaft and universal joint, refer to Front Propeller Shaft in this section.

Diagnosis

Condition	Possible cause	Correction
Oil Leak At Front Axle	Worn or defective oil seal.	Replace the oil seal.
	Front axle housing cracked.	Repair or replace.
Oil Leak At Pinion Shaft	Too much gear oil.	Correct the oil level.
	Oil seal worn or defective.	Replace the oil seal.
	Pinion flange loose or damaged.	Tighten or replace.
Noises In Front Axle Drive Shaft Joint	Broken or worn drive shaft joints and bellows (BJ and DOJ).	Replace the drive shaft joints and bellows.
“Clank” When Accelerating From “Coast”	Loose drive shaft joint to output shaft bolts.	Tighten.
	Damaged inner drive shaft joint.	Replace.
Shudder or Vibration During Acceleration	Excessive drive shaft joint angle.	Repair.
	Worn or damaged drive shaft joints.	Replace.
	Sticking spider assembly (inner drive shaft joint).	Lubricate or replace.
	Sticking joint assembly (outer drive shaft joint).	Lubricate or replace.
Vibration At Highway Speeds	Out of balance or out of round tires.	Balance or replace.
	Front end out of alignment.	Align.
Noises in Front Axle	Insufficient gear oil.	Replenish the gear oil.
	Wrong or poor grade gear oil.	Replace the gear oil.
	Drive pinion to ring gear backlash incorrect.	Adjust the backlash.
	Worn or chipped ring gear, pinion gear or side gear.	Replace the ring gear, pinion gear or side gear.
	Pinion shaft bearing worn.	Replace the pinion shaft bearing.
	Wheel bearing worn.	Replace the wheel bearing.
	Differential bearing loose or worn.	Tighten or replace.
Wanders and Pulls	Wheel bearing preload too tight.	Adjust the wheel bearing preload.
	Incorrect front alignment.	Adjust the front alignment.
	Steering unit loose or worn.	Tighten or replace.
	Tire worn or improperly inflated.	Adjust the inflation or replace.
	Front or rear suspension parts loose or broken.	Tighten or replace.
Front Wheel Shimmy	Wheel bearing worn or improperly adjusted.	Adjust or replace.
	Incorrect front alignment.	Adjust the front alignment.
	Worn ball joint or bush.	Replace the ball joint or bush.
	Steering unit loose or worn.	Tighten or replace.
	Tire worn or improperly inflated.	Replace or adjust the inflation.
	Shock absorber worn.	Replace the shock absorber.

Front Hub and Disc (2WD Model)

Disassembled View

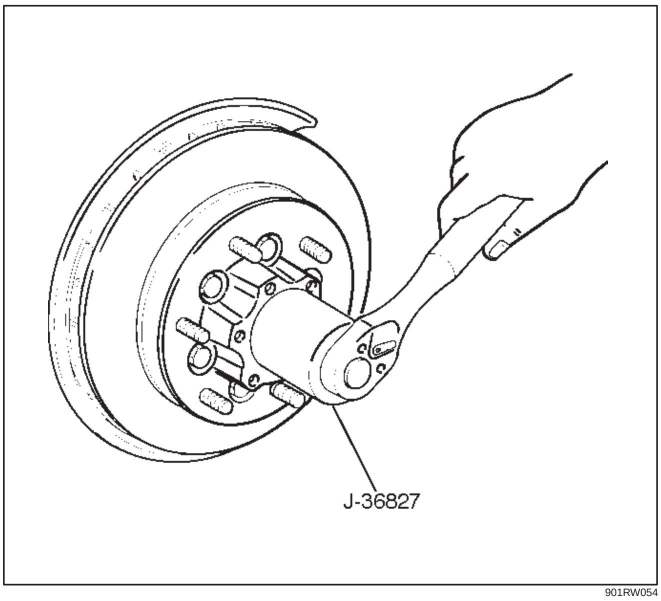


Legend

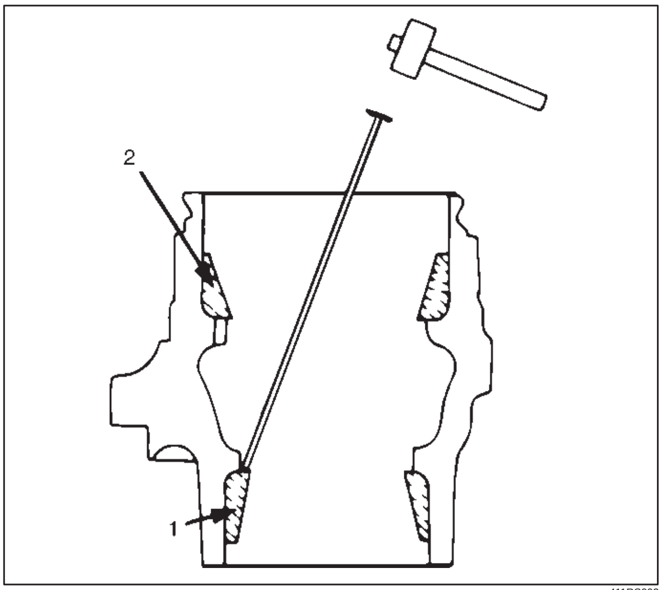
(1) Bolt
(2) Cover and Gasket
(3) Lock Washer
(4) Hub Nut
(5) Outer Bearing
(6) Hub and Disc Assembly
(7) ABS Sensor Ring
(8) Inner Bearing
(9) Oil Seal
(10) Bolt
(11) Wheel Pin

Disassembly

1. Before disassembly, jack up the front of vehicle and support frame with jack stands.
2. Remove the two bolts from the rear side of the knuckle arm, then remove the brake caliper, with the brake hose attached.
   Use a wire to attach the brake caliper to the upper link. Refer to Disk Brakes in Brake section.
3. Remove cover bolt.
4. Remove cover and gasket.
5. Remove lock washer.
6. Remove hub nut, using front hub nut wrench J–36827.

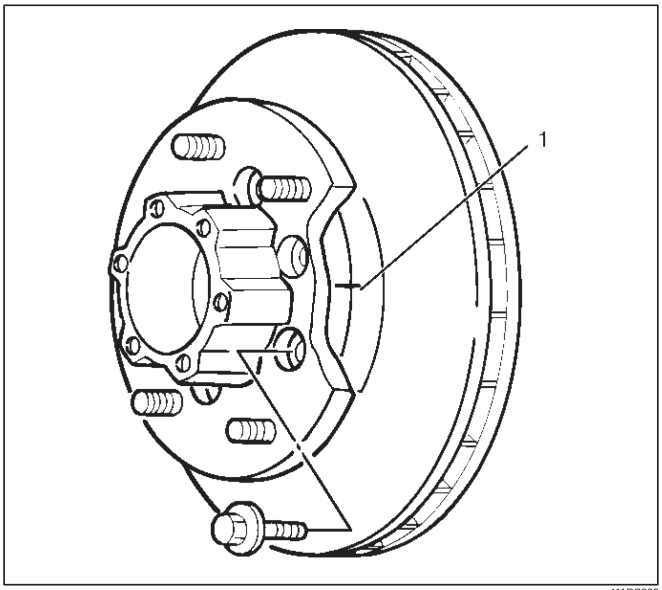


7. Remove outer bearing.
8. Remove oil seal.
9. Remove inner bearing.
10. Use a brass bar to remove the outer bearing outer race(1), oil seal, inner bearing and inner bearing outer race(2) from the hub.



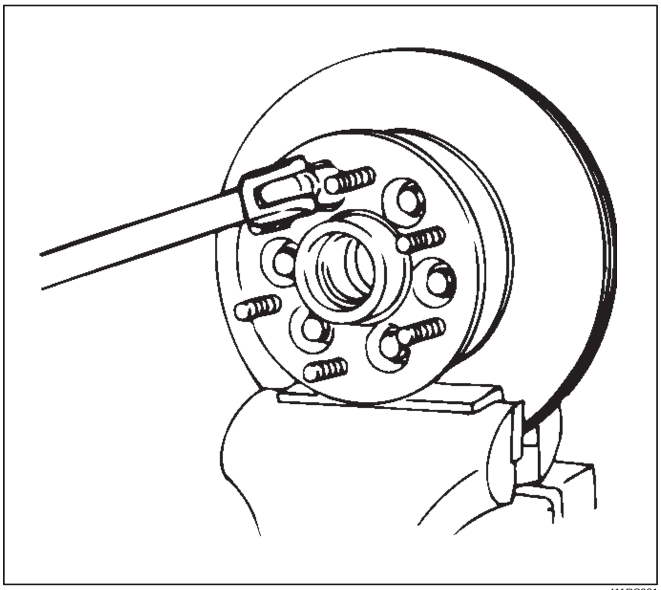
411RS002

11. Remove bolt.
12. If necessary, replace the wheel pin in the following manner.
    - Scribe mark(1) on hub to disc before disassembly to insure proper assembly.



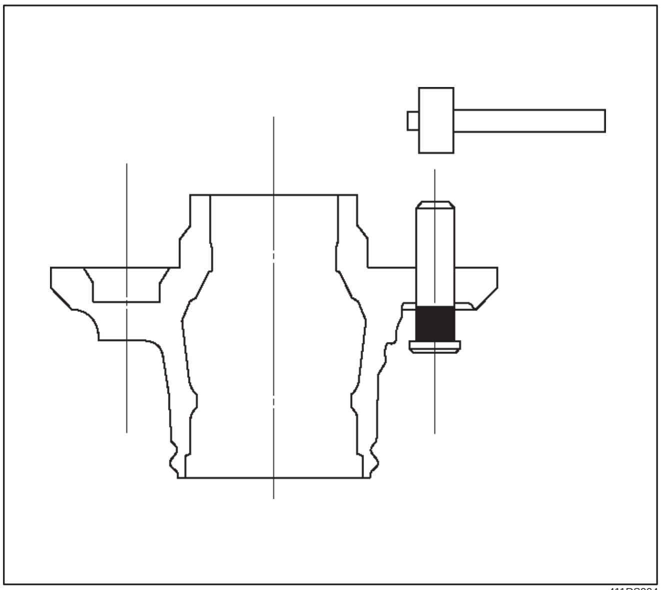
411RS003

- Clamp hub and disc assembly in vise, using protective pads. Remove six(6) disc-to-hub retaining bolts.



411RS021

- Place hub on a suitable work surface and remove wheel studs, as required, using a hammer.



411RS004

Inspection and Repair

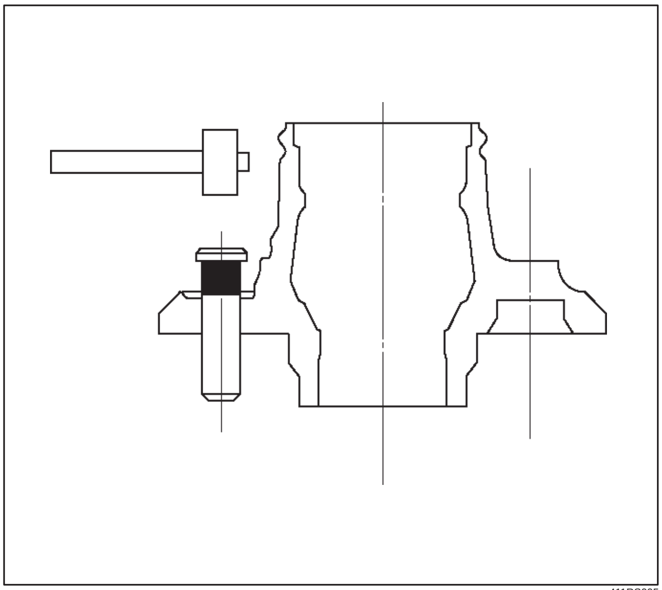
Check the following parts for wear, damage or other abnormal conditions.

- Hub
- Hub bearing
- Bearing outer race
- Disc
- Oil seal

Reassembly

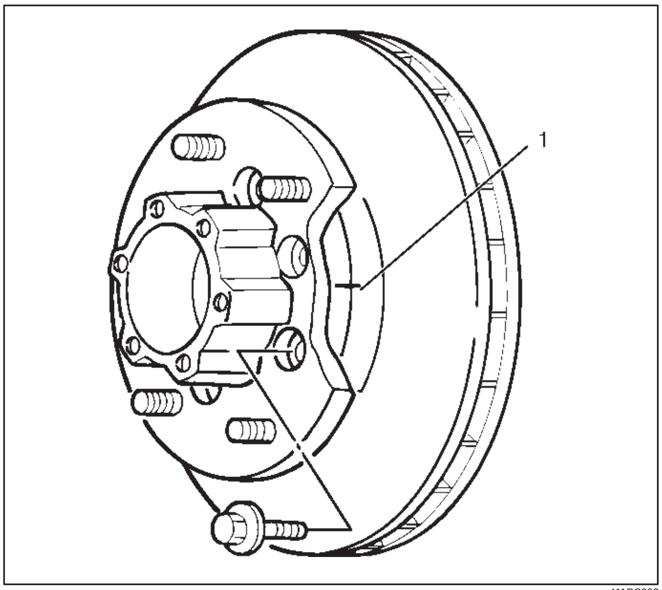
1. Install wheel pin.
   - Place hub on a wood workbench or a block of wood approx. 6” by 6” to protect the wheel stud ends and threads.
   - Install wheel stud, using a hammer.

NOTE: Be sure wheel stud is started squarely and seats completely.



411RS005

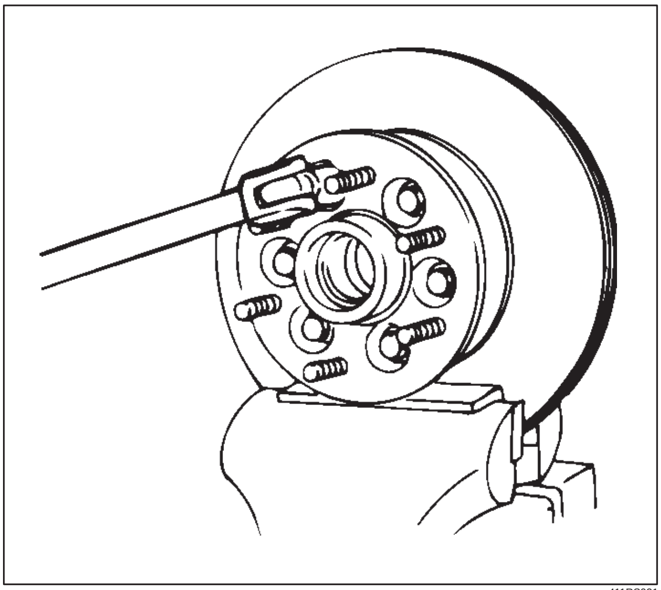
2. Align index marks(1) and install hub to disc.



411RS003

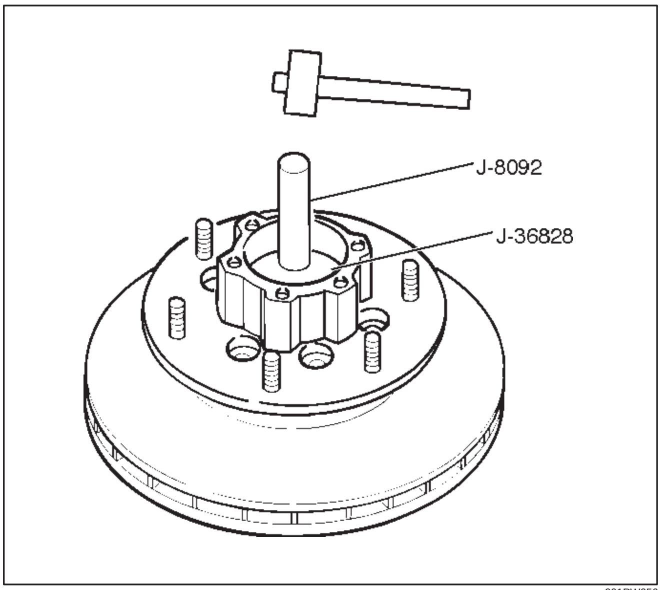
3. Install bolt.
   Tighten the bolts to the specified torque.

Torque: 103 N·m (76 lb ft)



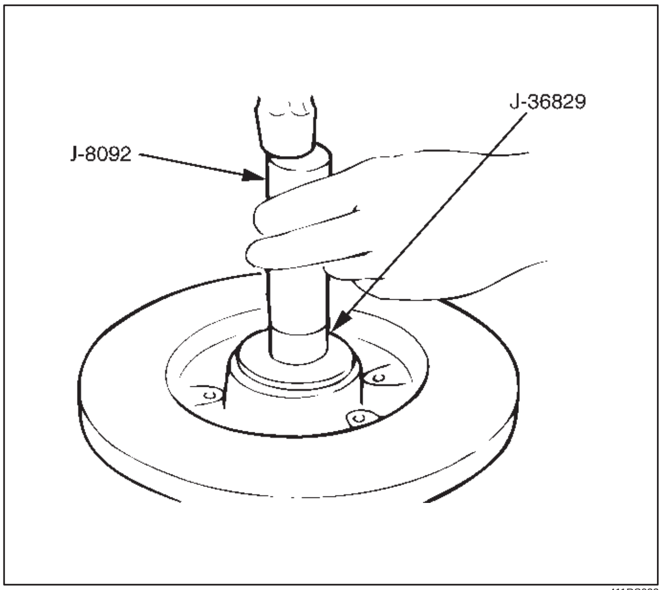
411RS021

4. Install outer bearing.
   Install the outer race by driving it into the hub by using installer J–36828 and grip J-8092.



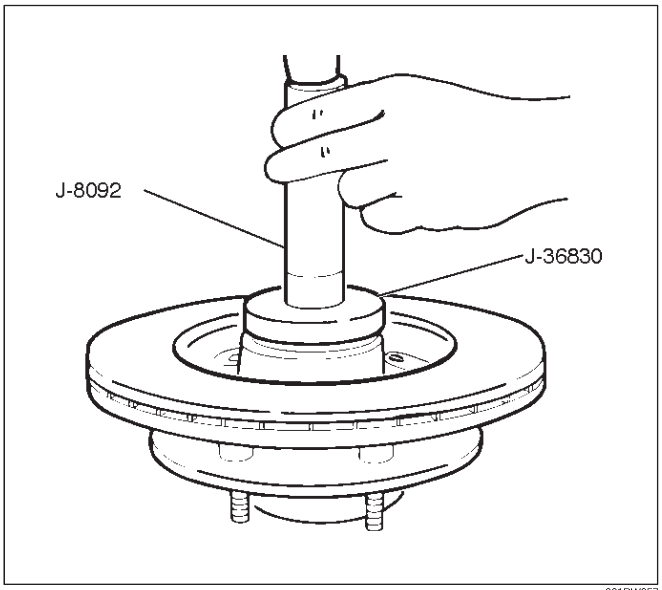
901RW056

5. Install inner bearing.
   Install the outer race by driving it into the hub by using installer J–36829 and grip J–8092.



411RS023

6. Install oil seal by using installer J–36830 and grip J–8092.
   Apply Multipurpose grease NLGI No. 2 or equivalent to the lip portion.

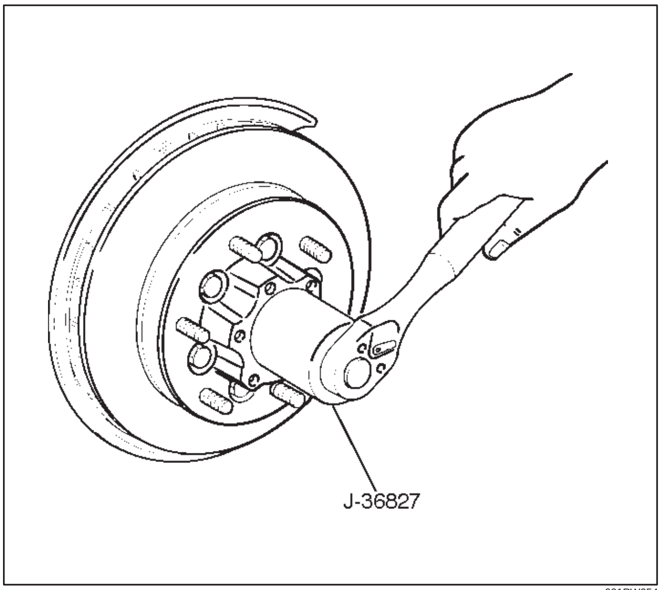


901RW057

7. Apply Multipurpose grease NLGI No.2 in the hub and bearing.

Hub	35 g (1.23 oz)
Outer bearing	10 g (0.35 oz)
Inner bearing	15 g (0.53 oz)

8. Install hub nut by using wrench J–36827.
   Turn the place where there is a chamfer in the tapped hole to the outer side, and attach the nut.



901RW054

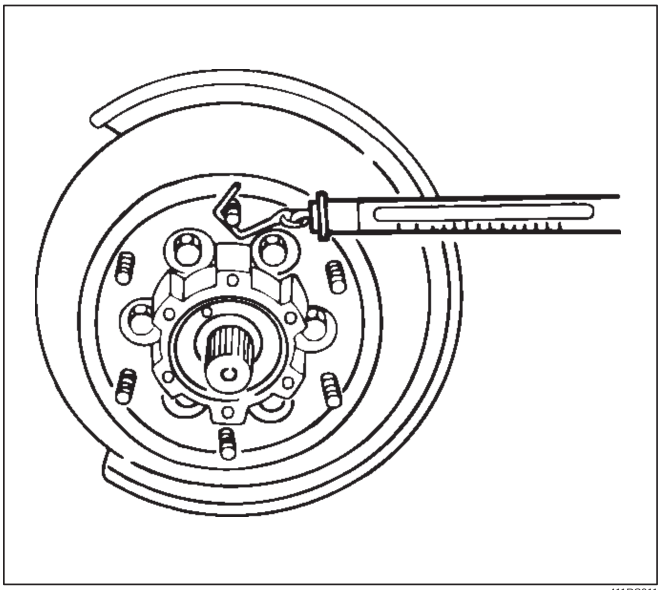
Preload Adjustment

1. Tighten the hub nut to 29.4 N·m (21.7 lb ft), then loosen the nut to the full.
2. Tighten the hub nut to the value given below, using a spring scale on the wheel pin.

Bearing Preload

New bearing and New oil seal	19.6 – 24.5 N (4.4 – 5.5 lb)
Used bearing and New oil seal	11.8 – 17.7 N (2.6 – 4.0 lb)

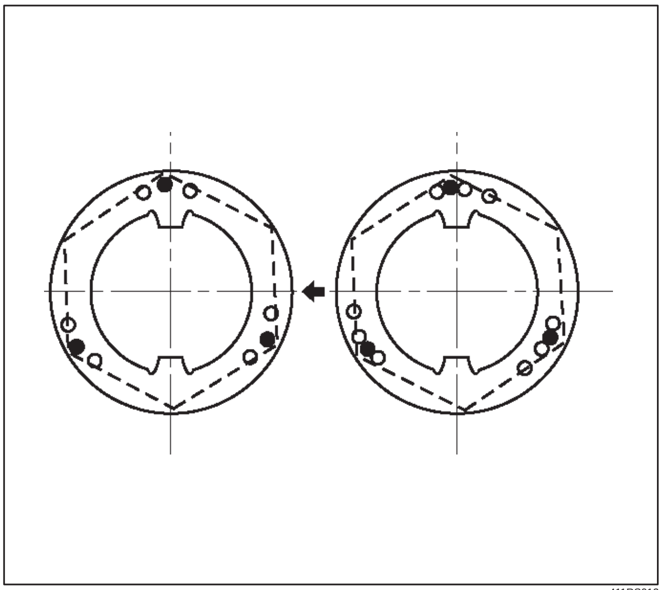
If the measured bearing preload is outside the specifications, adjust it by loosening or tightening the bearing nut.



411RS011

9. Install lock washer.
   - Turn the side with larger diameter of the tapered bore to the vehicle outer side, then attach the washer.

     If the bolt holes in the lock plate are not aligned with the corresponding holes in the nut, reverse the lock plate. If the bolt holes are still out of alignment, turn in the nut just enough to obtain alignment. Screw is to be fastened tightly so its head may come lower than the surface of the washer.

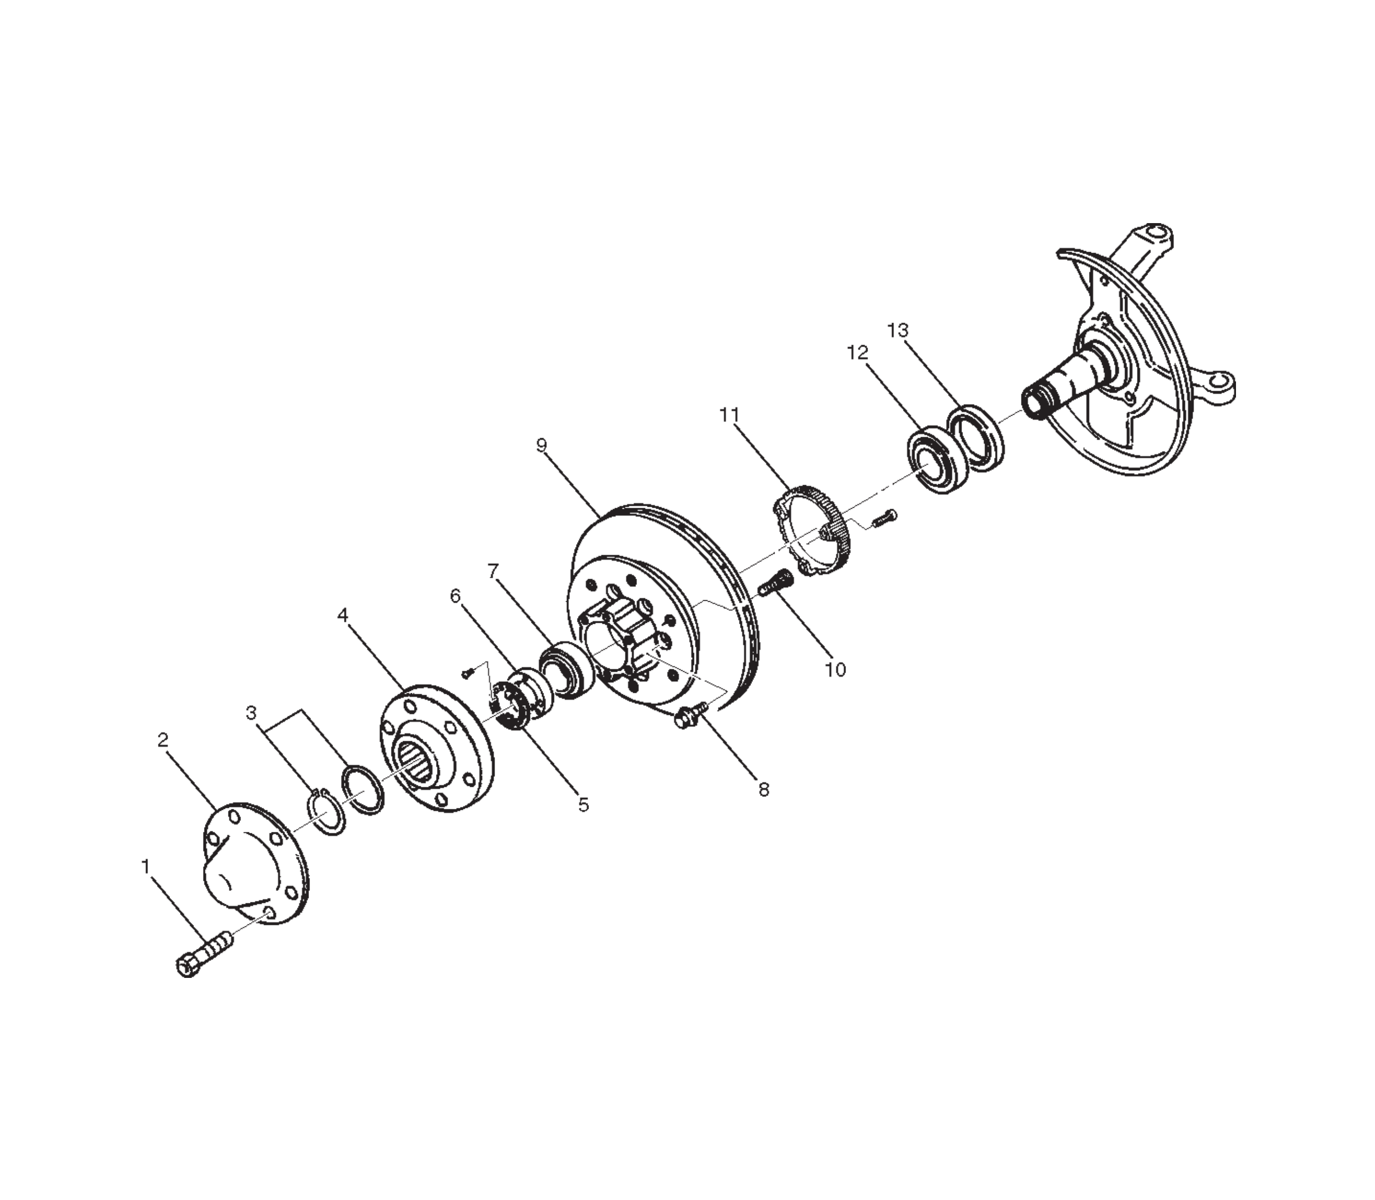


411RS012

10. Install cover and tighten the cover bolt.
11. Install brake caliper and tighten fixing bolt.

Front Hub and Disc (4WD Model)

Disassembled View



411RW001

Legend

(1) Bolt
(2) Cap
(3) Snap Ring and Shim

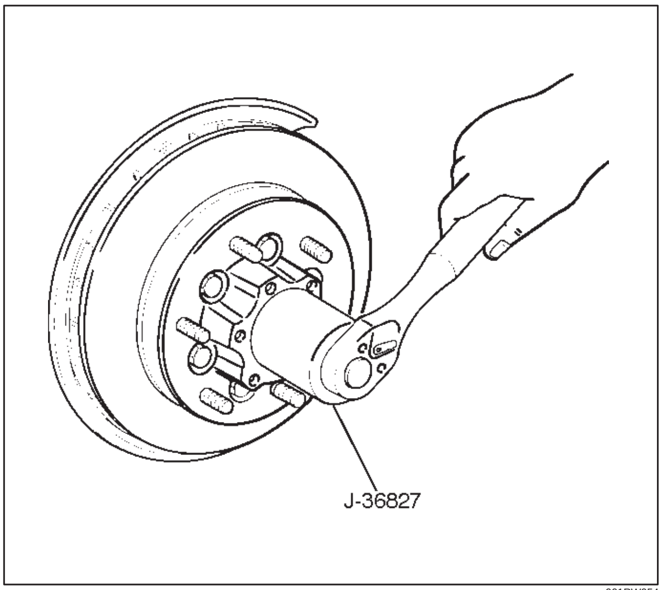
(8) Bolt
(9) Hub and Disc Assembly
(10) Wheel Pin
(11) ABS Sensor Ring
(12) Inner Bearing
(13) Oil Seal

Disassembly

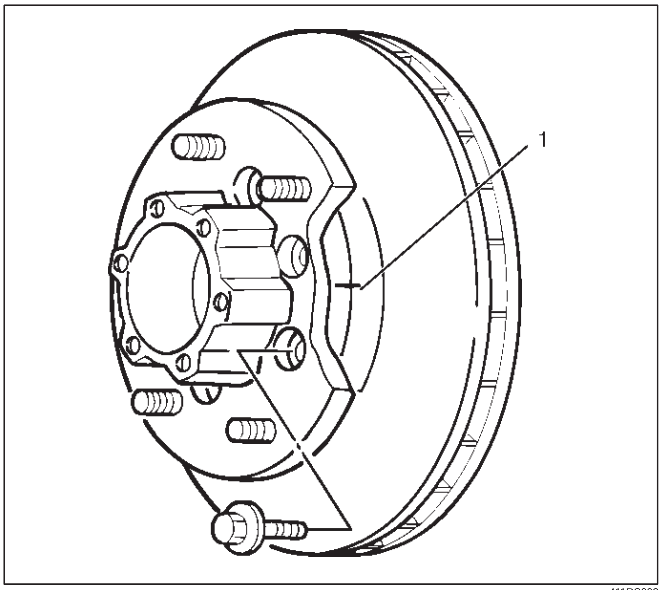
1. Before disassembly, select the 2WD position with the 4WD switch.
2. Jack up the front of vehicle and support frame with jack stands.
3. Remove the disc brake caliper assembly and hang it on the frame with wires. Refer to Disk Brakes in Brake section.
4. Remove Bolt.
5. Remove cap.
6. Remove snap ring and shim.
7. Remove hub flange.

8. Remove lock washer and lock screw.
9. Use wrench J–36827, remove hub nut.



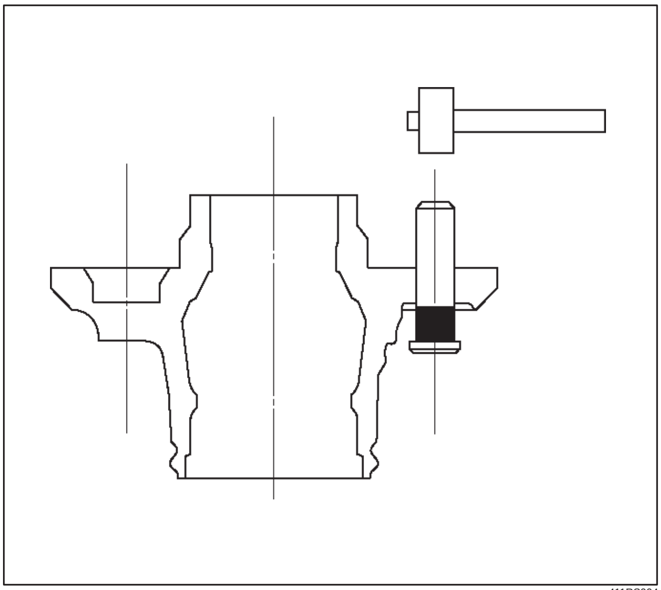
901RW054

10. Remove hub and disc assembly.
11. Remove ABS sensor ring.
12. Remove outer bearing.
13. Remove oil seal.
14. Remove inner bearing.
15. Remove bolt , if necessary, replace the wheel pin in the following manner.
    - Apply a scribe mark(1) to disc to hub.
    - Clamp the hub and disc assembly in a vise, using protective pads. Remove the 6 disc–to–hub retaining bolts.



411RS003

- Place hub on a suitable work surface and remove the studs by using a hammer.



411RS004

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts.

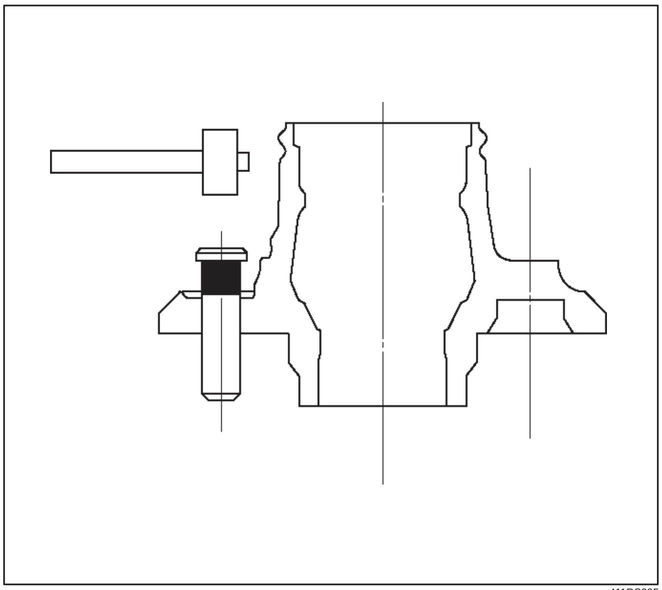
- Hub
- Hub bearing oil seal
- Knuckle spindle
- Disc
- Caliper
- Shift on the fly system parts (Cap, Hub flange, Shim, Snap ring)
- ABS sensor ring

For inspection and servicing of disc caliper and related parts, refer to Disc Brakes in Brake section.

Reassembly

1. Install wheel pin.
   - Place the hub on a wood workbench or a block of wood approx. 6” by 6” to protect the wheel stud ends and threads.
   - Insert a wheel stud using a hammer.

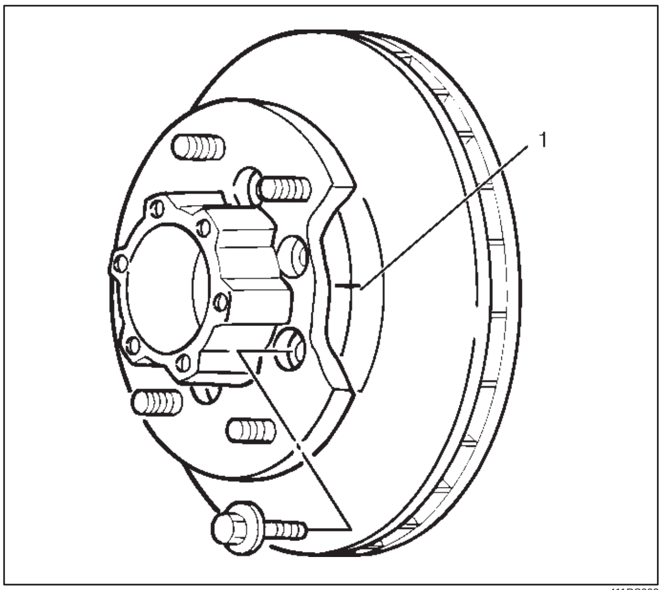
     Be sure the wheel stud is started squarely and seats completely.



411RS005

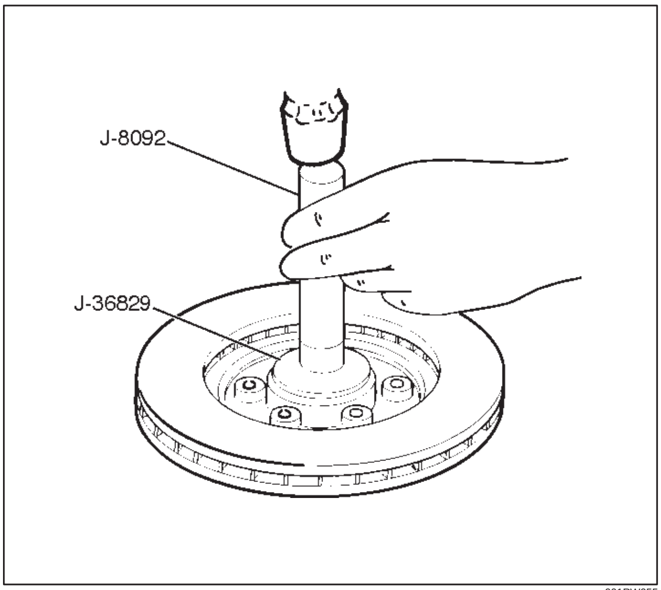
2. Align scribe marks(1) and attach the hub to the disc, then tighten the bolts to the specified torque.

Torque: 103 N·m (76 lb ft)



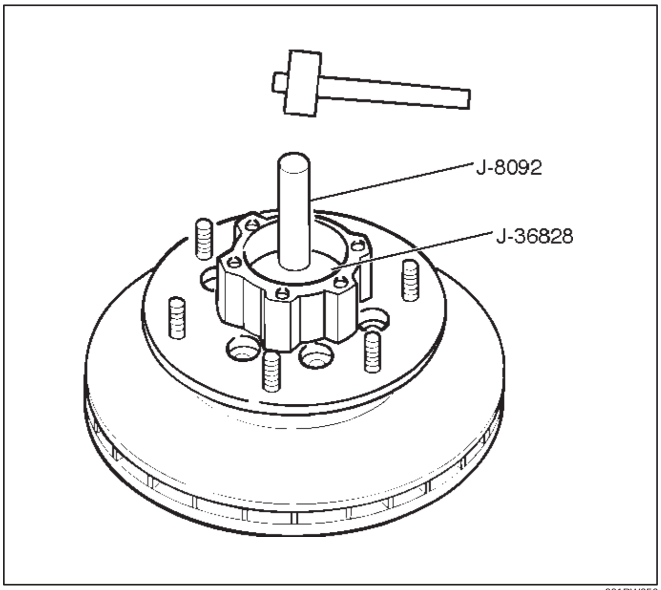
411RS003

3. Use installer J–36829 and grip J–8092, then install the inner bearing by driving it into the hub.



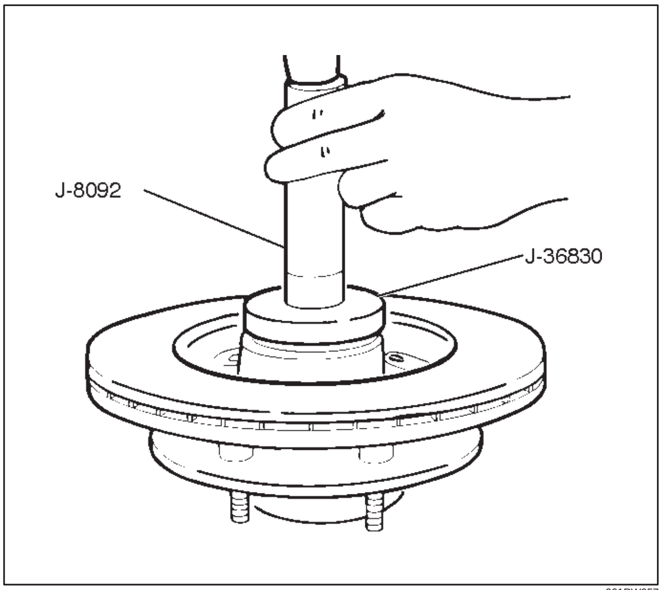
901RW055

4. Use installer J–36828 and grip J–8092 then install the outer bearing by driving it into the hub.



901RW056

5. Apply grease (NLGI No.2 or equivalent) to the lip portion, then install oil seal by using installer J–36830 and grip J–8092.

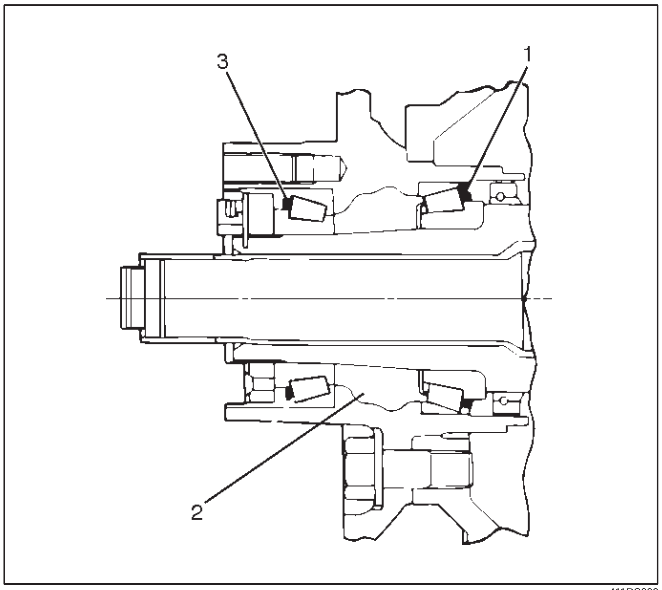


6. Install ABS sensor ring, then tighten the bolts to the specified torque.

Torque: 18 N·m (13 lb ft)

7. Install hub and disc assembly.
   - Apply grease in the hub.
   - Apply wheel bearing type grease NLGI No. 2 or equivalent to the outer and inner bearing.

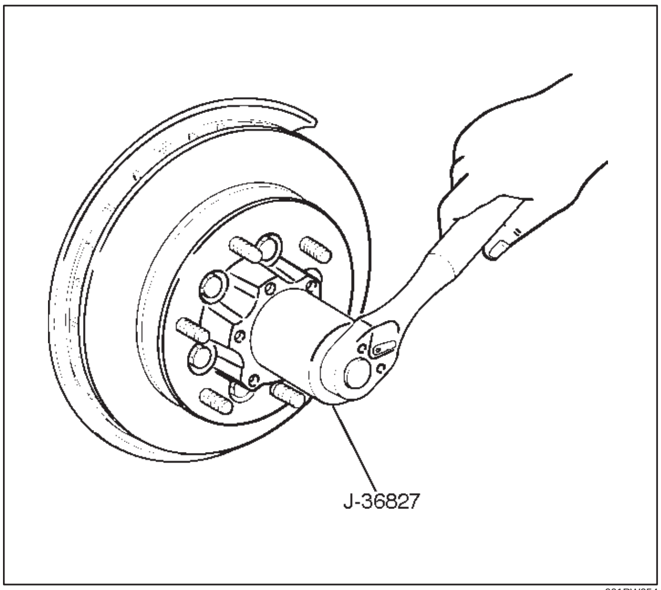
Grease Amount
- **Hub: 35 g (1.23 oz)**
- **Outer bearing: 10 g (0.35 oz)**
- **Inner bearing: 15 g (0.53 oz)**



Legend
- (1) Inner Bearing
- (2) Hub
- (3) Outer Bearing

8. Install hub nut.

   Turn to the place where there is a chamfer in the tapped hole to the outer side, then attach the nut by using front hub nut wrench J–36827.



Preload Adjustment

1. Tighten the hub nut to 29 N·m (22 lb ft), then fully loosen the nut.
2. Tighten the hub nut to the value given below, using a spring scale on the wheel pin.

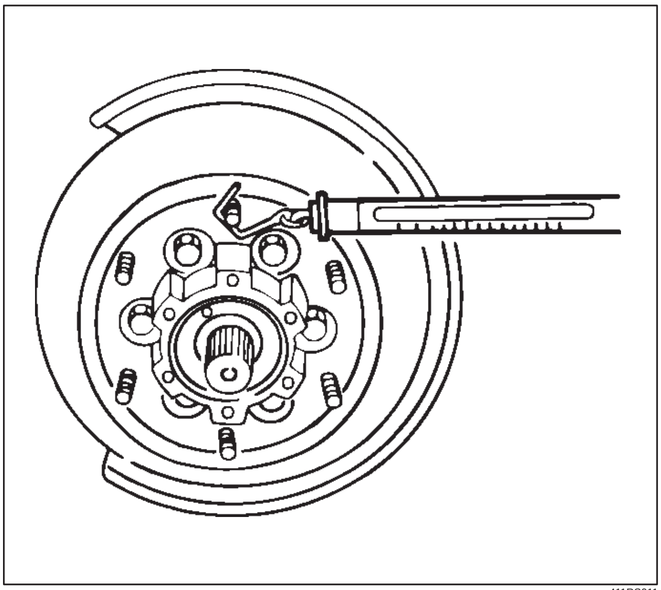
New bearing and New oil seal

Bearing Preload: 20 N – 25 N (4.4 lb – 5.5 lb)

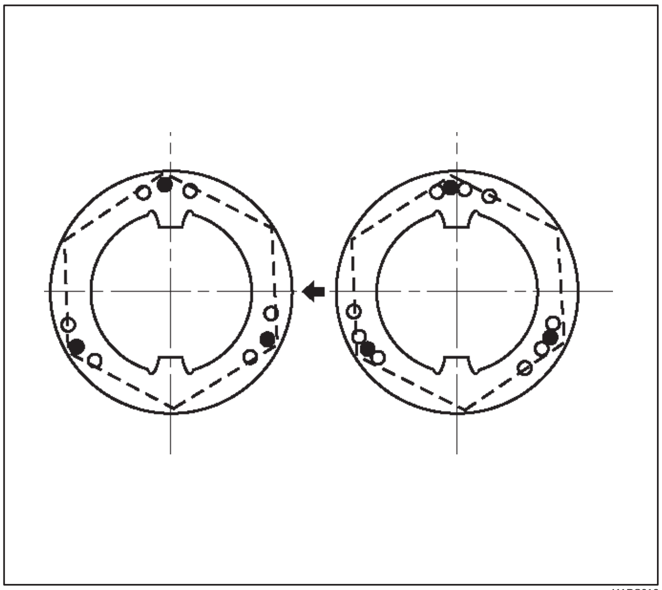
Used bearing and New oil seal

Bearing Preload: 12 N – 18 N (2.6 lb – 4.0 lb)

If the measured bearing preload is outside the specifications, adjust it by loosening or tightening the bearing nut.



9. Install lock washer and lock screw in the following manner.
   - Turn the side with larger diameter of the tapered bore to the vehicle outer side, then attach the washer.
   - If the bolt holes in the lock plate are not aligned with the corresponding holes in the nut, reverse the lock plate.
   - If the bolt holes are still out of alignment, turn in the nut just enough to obtain alignment.
   - Screw is to be fastened tightly so its head may come lower than the surface of the washer.

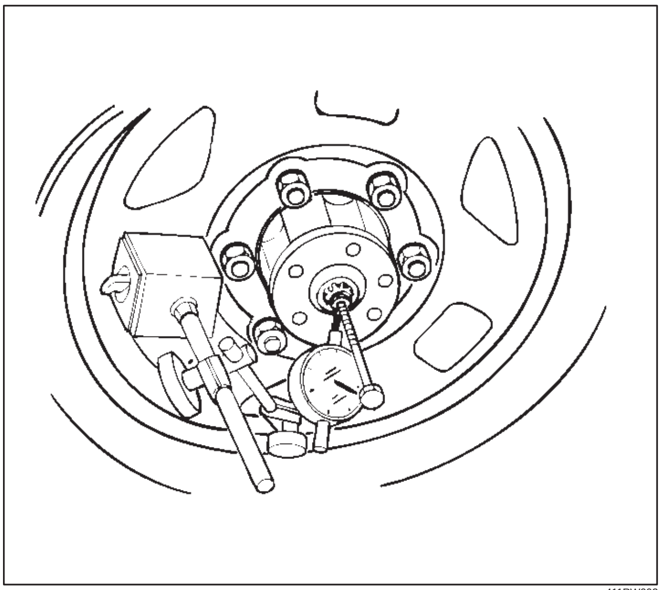


411RS012

10. Apply adhesive (LOCTITE 515 or equivalent) to both joining flange faces then install hub flange.
11. Install snap ring and shim.
    - Adjust the clearance between the free wheeling hub body and the snap ring.

Clearance: 0 mm–0.3 mm (0 in–0.012 in)

Shims Available: 0.2 mm, 0.3 mm, 0.5 mm, 1.0 mm (0.008 in, 0.012 in, 0.020 in, 0.039 in)



411RW002

12. Install hub cap.
13. Tighten the bolts to the specified torque.

Torque: 59 N·m (43 lb ft)

Front Drive Shaft Joint

Front Drive Shaft Joints Replacement

- Refer to Front Drive Axle Assembly Replacement in this section, and refer to Front Hub and Disc Overhaul in Suspension section.

Front Hub Bearing Preload Check

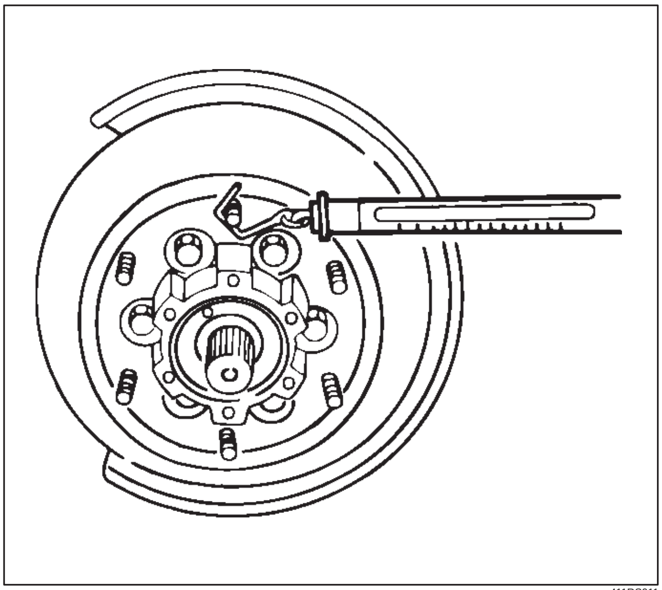
Check the hub bearing preload at the wheel pin.

New bearing and New oil seal:

24.5 N (4.4 – 5.5 lb)

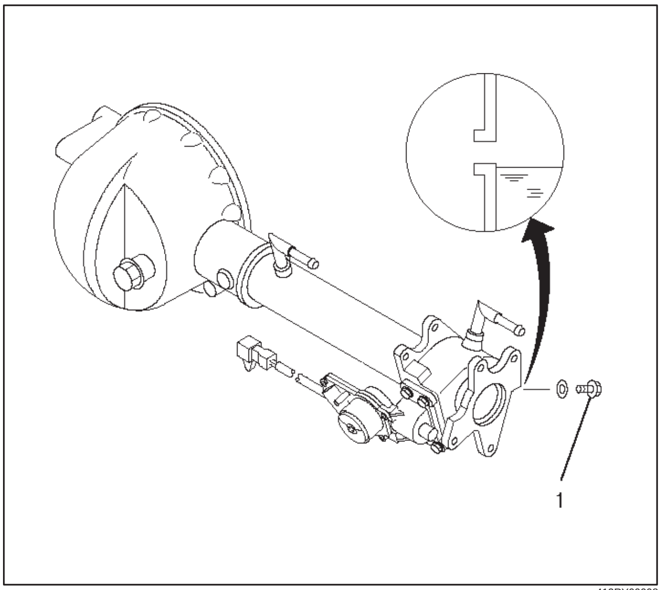
Used bearing and New oil seal:

11.8– 17.7 N(2.6 – 4.0 lb)



411RS011

Inspection Of Shift On The Fly System Gear Oil



412RY00008

1. Open filler plug and make sure that the oil up to the plug port.
   If the oil is short, replenish with gear oil GL–5 grade.
2. Tighten the filler plug to specified torque.

Torque: 78 N·m (58 lb in)

Front Axle Drive Shaft

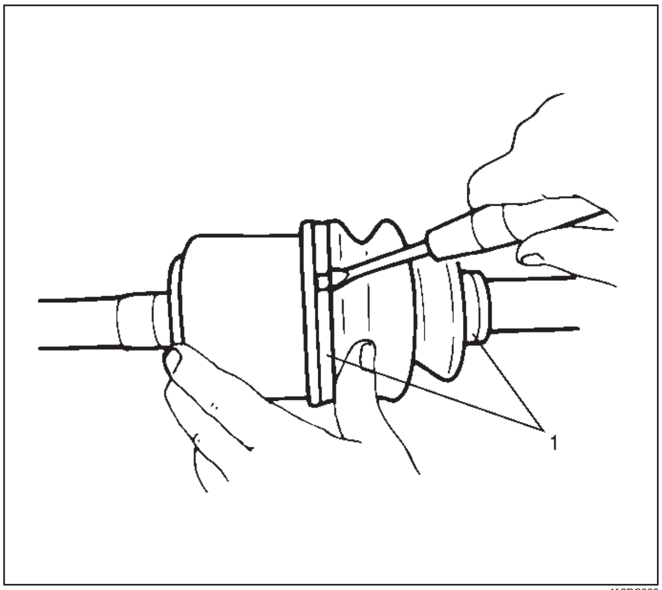
(17) Band
(18) Band
(19) Bellows
(20) Band
(21) BJ Shaft
(22) Dust Seal

Disassembly

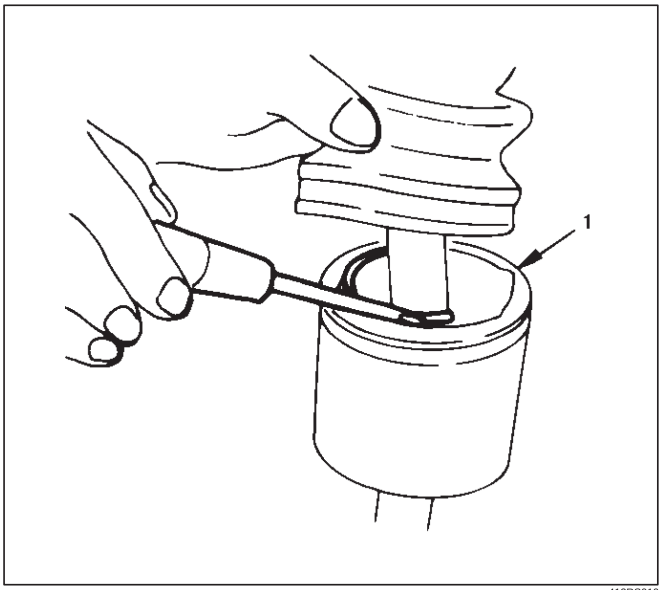
NOTE: For the left side, follow the same steps as right side.

1. Raise the hooked end of the band with a screwdriver or equivalent.



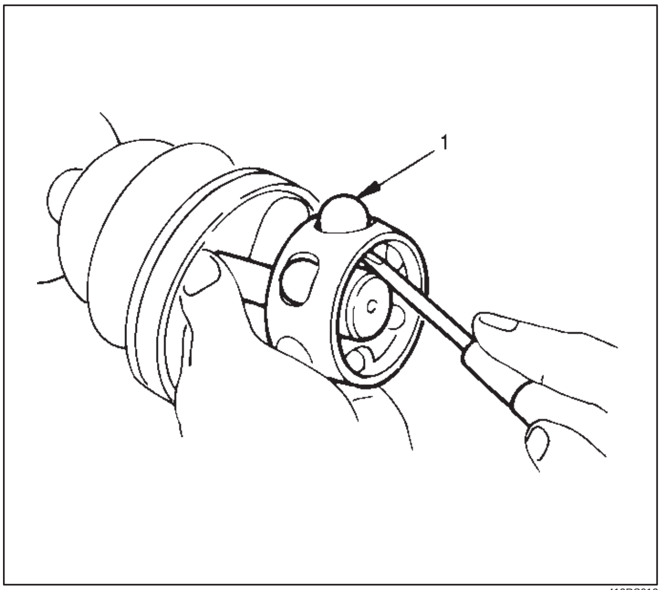
412RS009

2. Remove band(1).
3. Pry off circlip (1) with a screwdriver or equivalent.



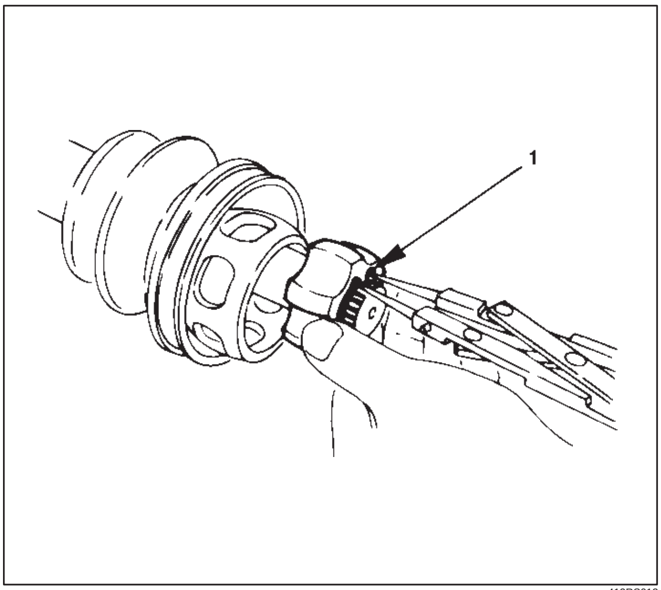
412RS010

4. Remove drive shaft joint assembly.
5. Remove the six balls (1) with a screwdriver or equivalent.



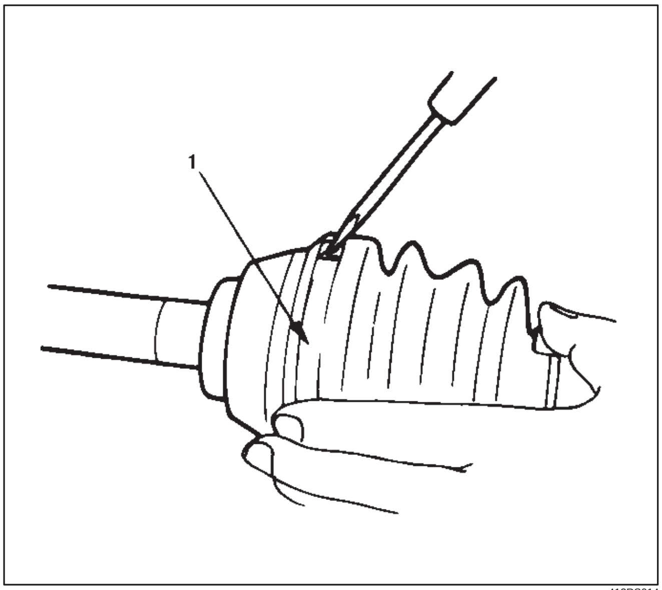
412RS012

6. Using snap ring pliers, remove the snap ring (1) fastening the ball retainer to the center shaft.



412RS013

7. Remove ball retainer, ball guide and bellows.
8. Raise the hooked end of the band with a screwdriver or equivalent.



412RS014

9. Remove band(1).
10. Remove bellows.
11. Remove dust seal.
12. Remove BJ shaft assembly.
13. Remove the mounting bracket fixing bolts, and then remove DOJ case assembly from the axle case.
14. Remove snap ring and bearing.
15. Remove snap ring and oil seal.
16. Remove bracket.

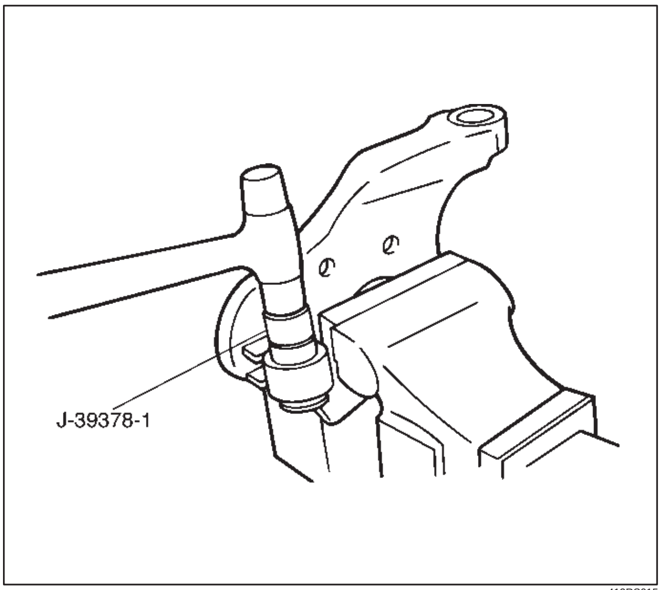
Inspection And Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts.

1. Drive shaft joint assembly
2. DOJ case, ball, ball guide, ball retainer
3. Bellows
4. Bearing
5. Dust seal, oil seal

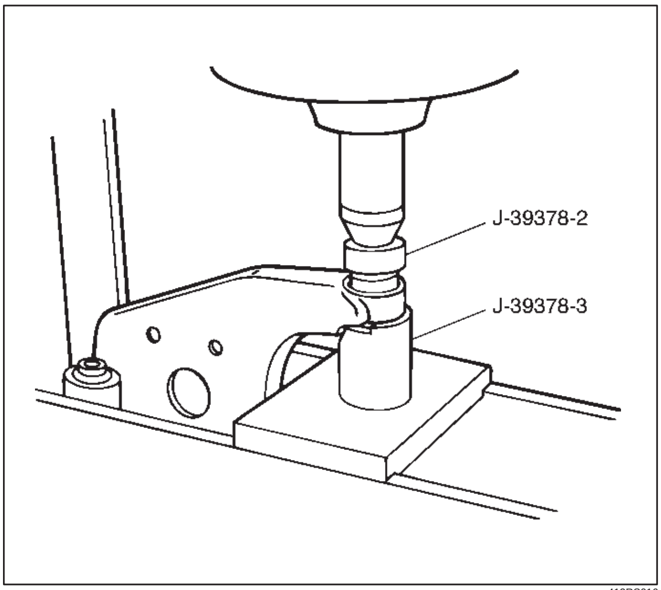
Bushing Replacement

- Remove the bushings using a remover J–39378–1 and hammer.



412RS015

- By using installer J–39378–2 and base J–39378–3, press fit the bushings into the bracket.



412RS016

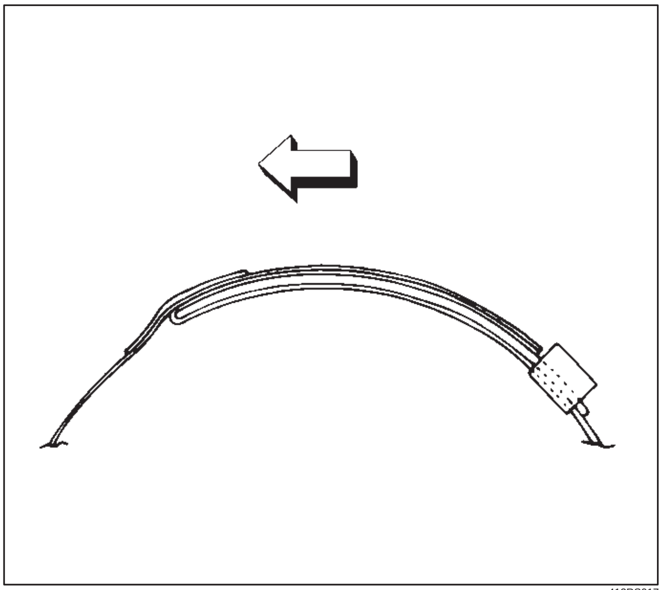
Reassembly

1. Install DOJ case to bracket.
2. Install oil seal and fix snap ring.
3. Install bearing and fix snap ring.
4. Install bracket to axle case. Tighten the bracket bolt to the specified torque.

Torque: 116 N·m (85 lb ft)

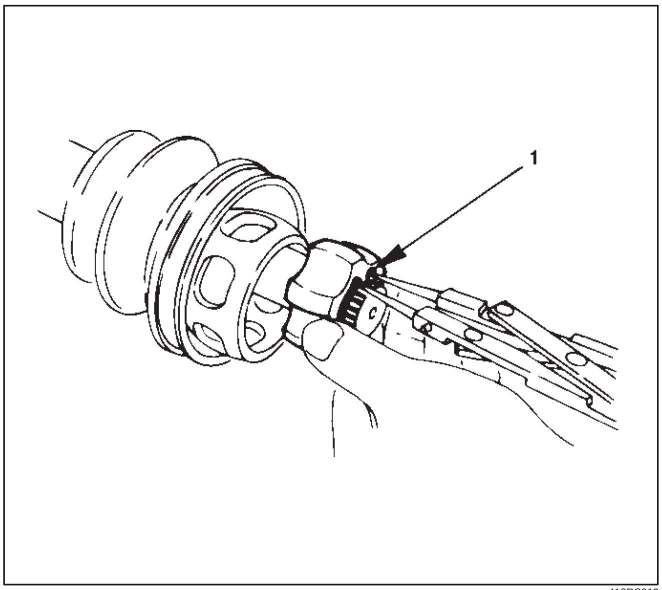
5. Apply 150g of the specified grease in BJ.
6. Install dust seal.
7. Apply a thin coat of grease to the shaft for smooth installation then install bellows.

8. Install band. Note the setting direction. After installation, check that the bellows is free from distortion.



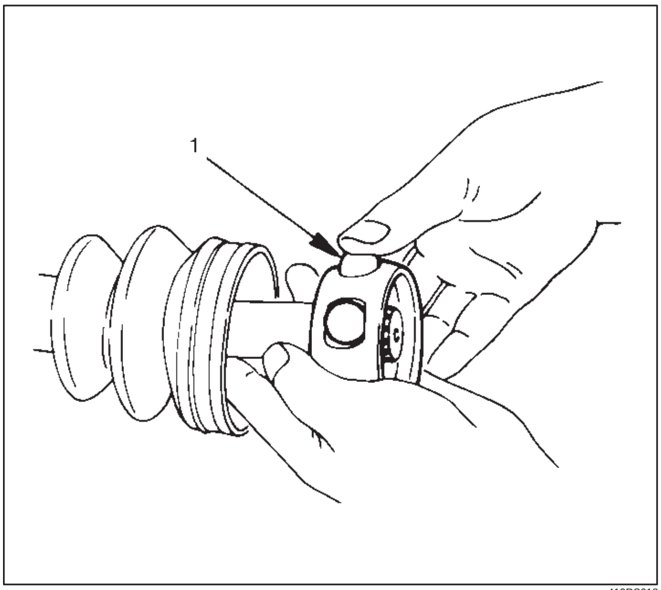
412RS017

9. Install another bellows and fix band.
10. Install the ball guide with the smaller diameter side ahead onto the shaft.
11. Install ball retainer.
12. Using snap ring pliers, install the snap ring (1) securing the ball retainer to the shaft.



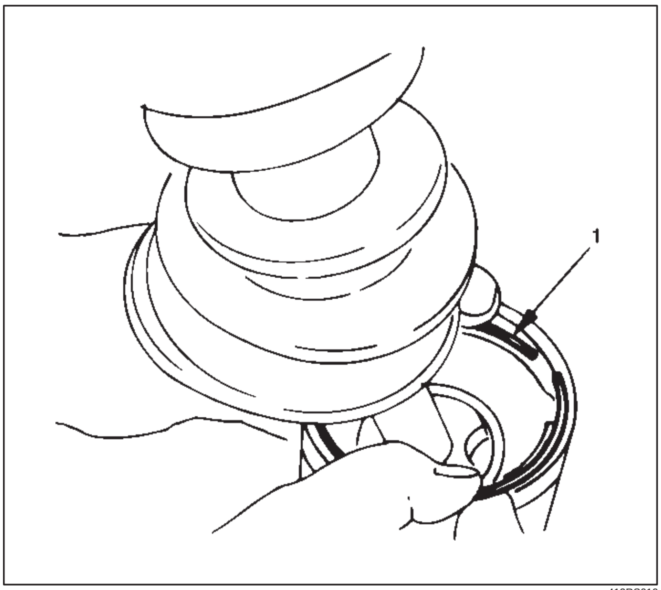
412RS013

13. Align the track on the ball (1) retainer with the window in the cage, and install the six balls into position.

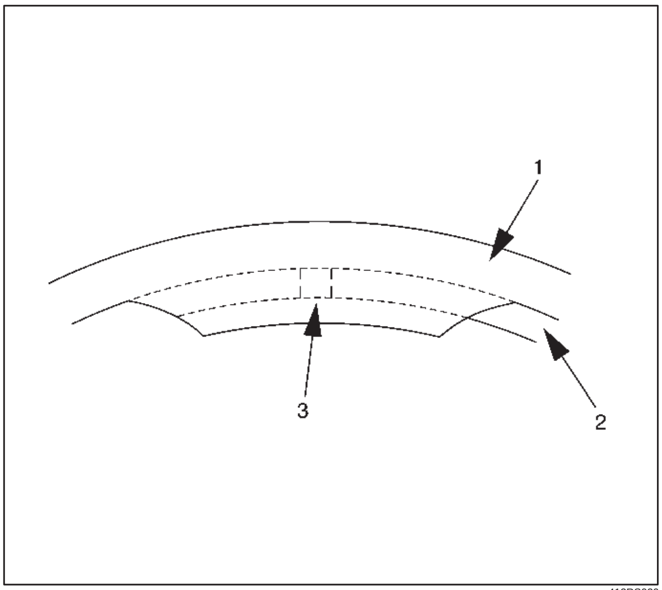


412RS018

14. Pack 150g of the specified grease in DOJ case, then install drive shaft joint assembly. After reassembly, move the DOJ longitudinally several times to get to fit.
15. Install the circlip (1) so that open ends are positioned away from the ball groove.



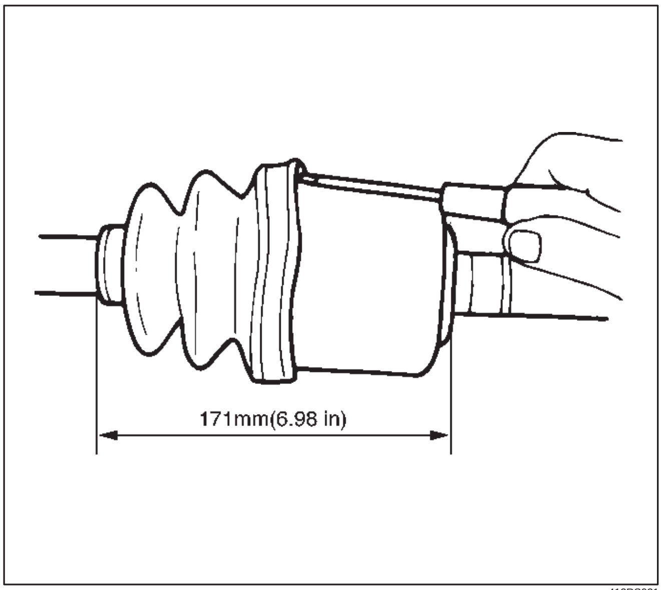
412RS019



Legend

(1) Outer Case
(2) Circlip
(3) Open Ends

16. Install bellows. Adjust the air pressure within the bellows by inserting a screwdriver or equivalent, so that it equals atmospheric pressure.



17. Install band. After installation, check that the bellows is free from distortion.

Shift On The Fly System

Shift On The Fly System and Associated Parts

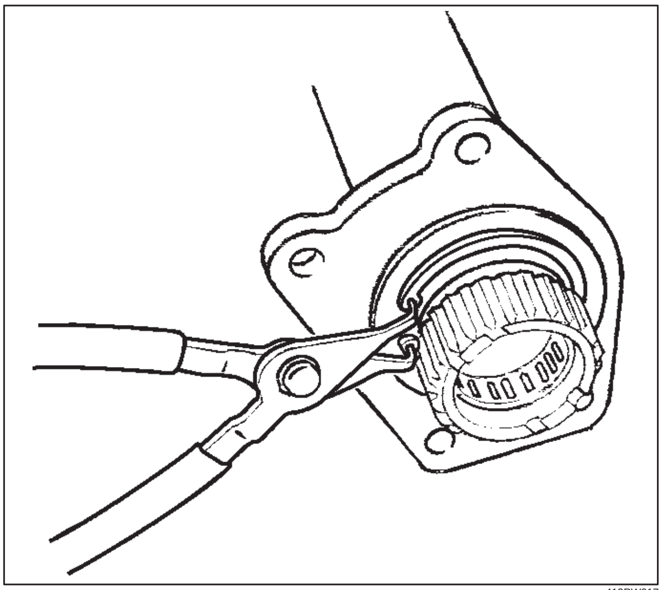
(9) Clutch Gear
(10) Sleeve
(11) Housing
(12) Front Axle Drive Shaft(LH side) with Bracket
(13) Bolt
(14) Actuator Assembly
(15) Bolt

Disassembly

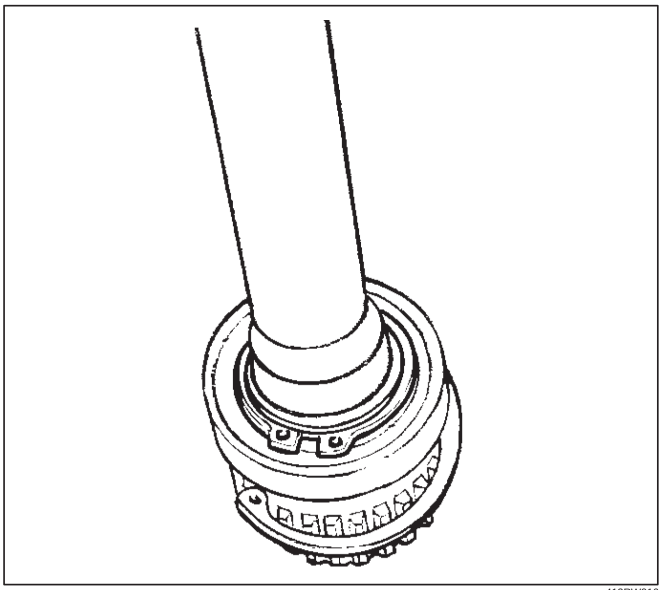
1. Remove filler plug and gasket, drain oil.
2. Loosen mounting bracket fitting bolts and remove front axle drive shaft from front axle case.
3. Remove actuator assembly and draw out actuator ASM.
4. Remove housing.
5. Remove sleeve.
6. Remove clutch gear.

7. Remove snap ring from front axle case by using snap ring pliers.



412RW017

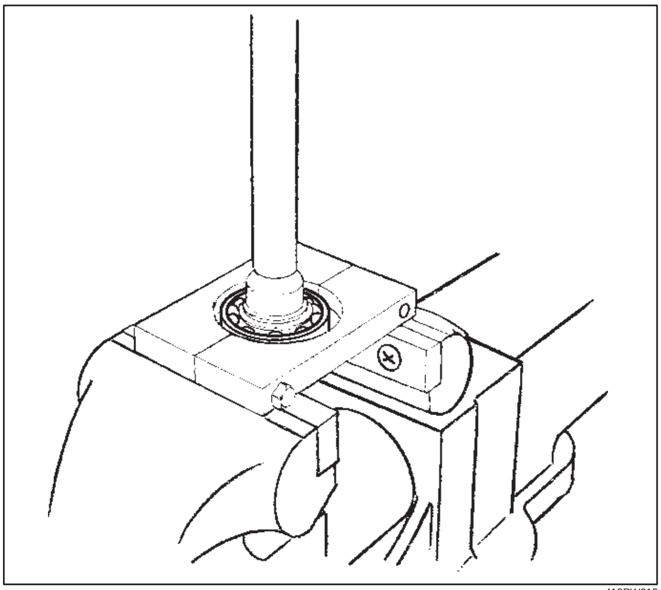
8. Take out inner shaft from front axle case.
9. Remove snap ring from inner shaft by using snap ring pliers.



412RW016

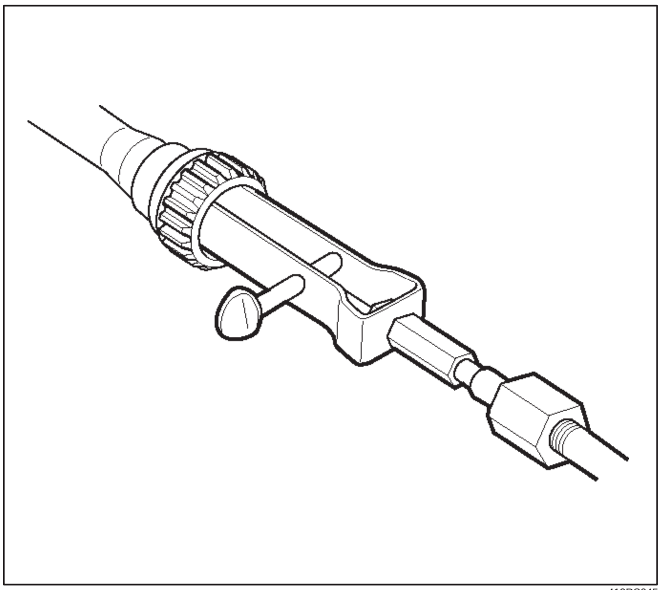
10. Remove inner shaft bearing.

NOTE: Be careful not to damage the shaft.



412RW015

11. Remove needle bearing from inner shaft by using a remover J–26941 and sliding hammer J–2619–01.



412RS045

12. Remove oil seal from front axle case.

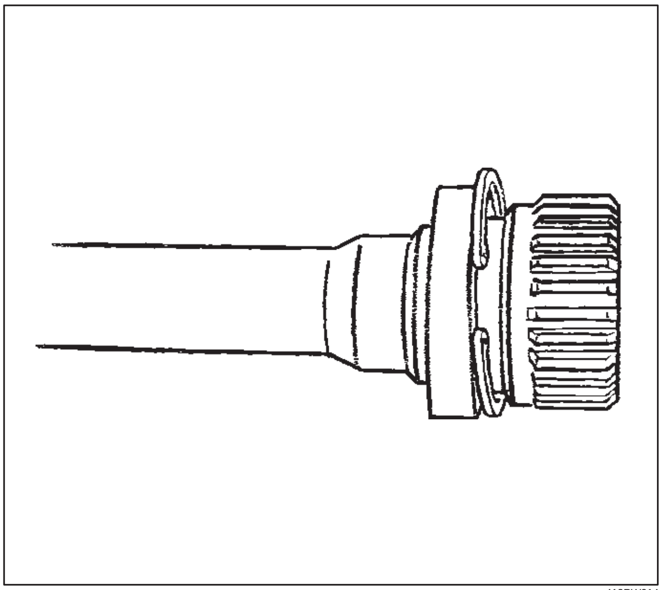
NOTE: Be careful not to damage the front axle case.

Inspection And Repair

Inspect the removed parts. If there are abnormalities such as wear and damage, take corrective action or replace.

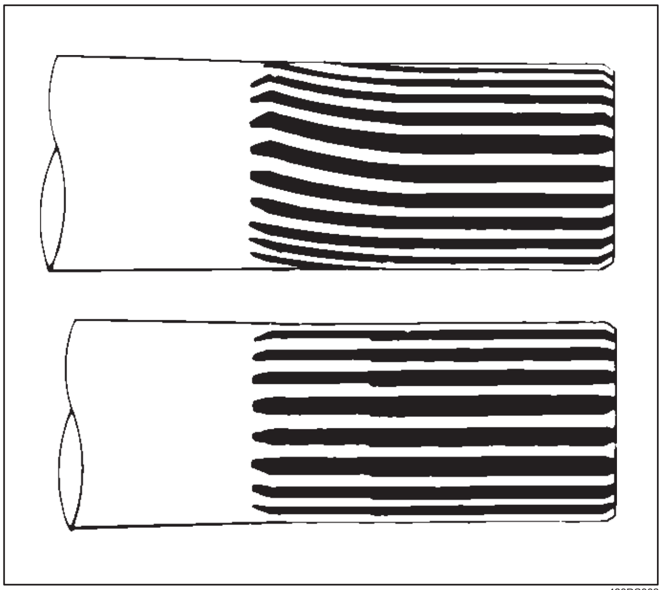
Visual Check

1. Check and see if the inner shaft has such abnormalities as wear and damage.



412RW014

2. When inspecting the inner shaft, be sure to check and see if its splined part is twisted, worn, or cracked. If so, replace with a new shaft. In case such an abnormality in its gear part (a slide with sleeve), replace the shaft.



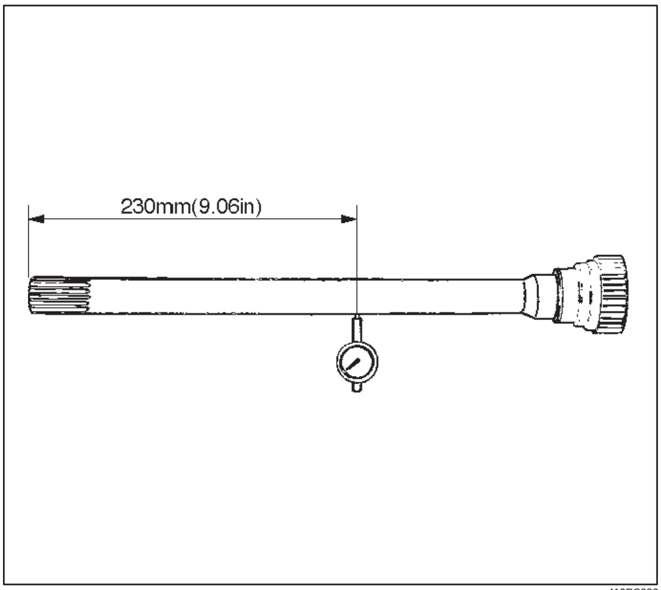
420RS008

Inner Shaft Run–Out

With both end centers supported, rotate the shaft slowly and measure deflection with a dial gauge.

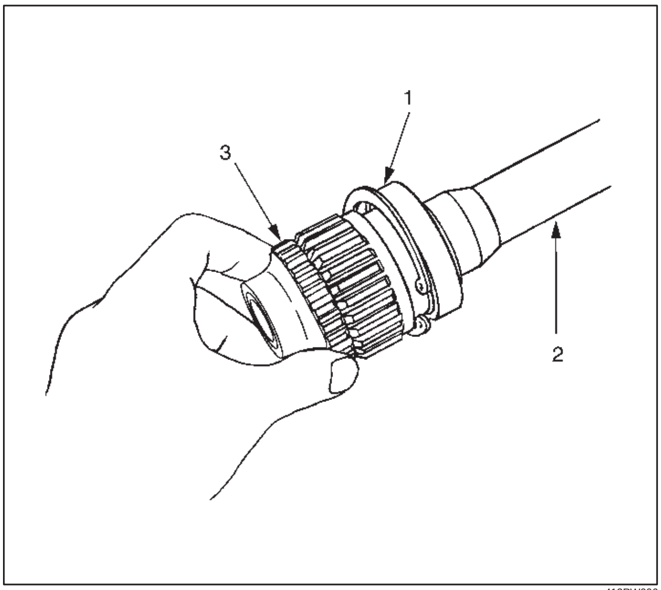
Limit: 0.5 mm (0.02 in)

NOTE: Do not heat the shaft to correct its bend.



412RS026

Inner Shaft Bearing



412RW006

Legend

(1) Inner Shaft Bearing
(2) Inner Shaft
(3) Clutch Gear

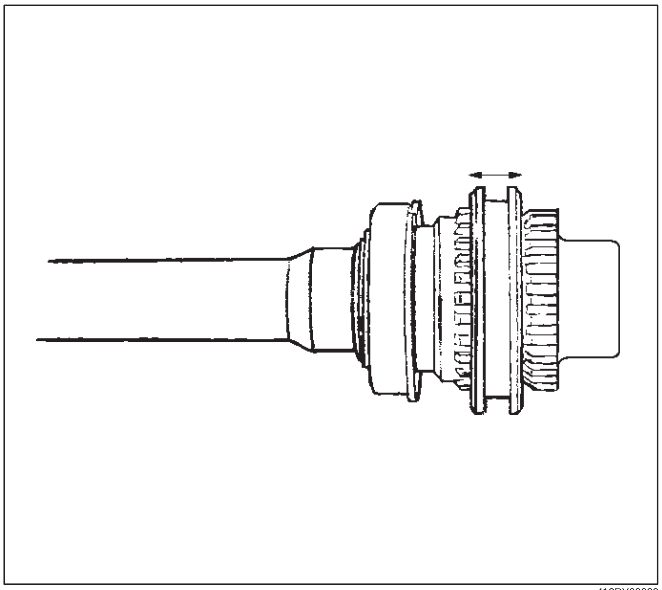
1. Inspect the state of inner shaft bearing. If any abnormality such as smoothlessness is found, replace with a new inner shaft bearing.
2. Insert a clutch gear and check the state of needle bearing.
3. If there is an abnormality such as smoothlessness, replace the needle bearing.

Sleeve Condition

Check and see that there is not wear damage, or cracking in the sleeve.

NOTE: Close inspection of the groove and inner gear are required because those are important parts.

Sleeve Function



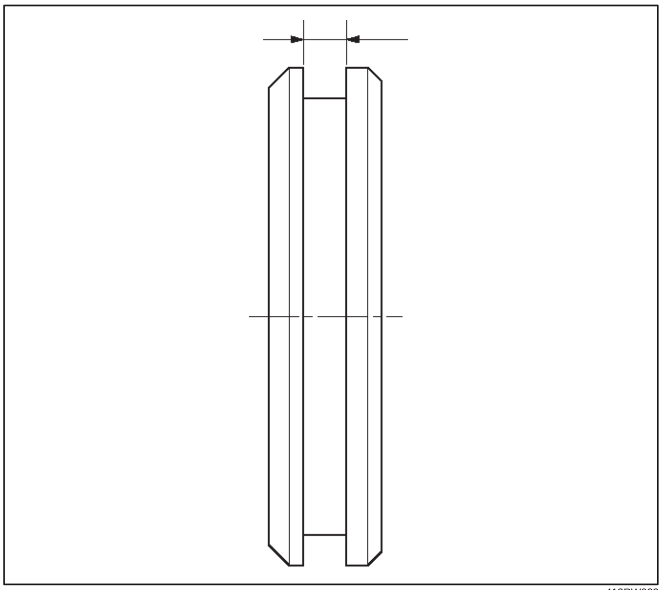
412RY00039

Operate the sleeve with the inner shaft combined with the clutch gear and if smoothlessness is felt, replace the sleeve.

NOTE: Gear oil should be applied to the contact surface of gear.

Check the width of sleeve center groove.

Limit: 7.1 mm (1.28 in)

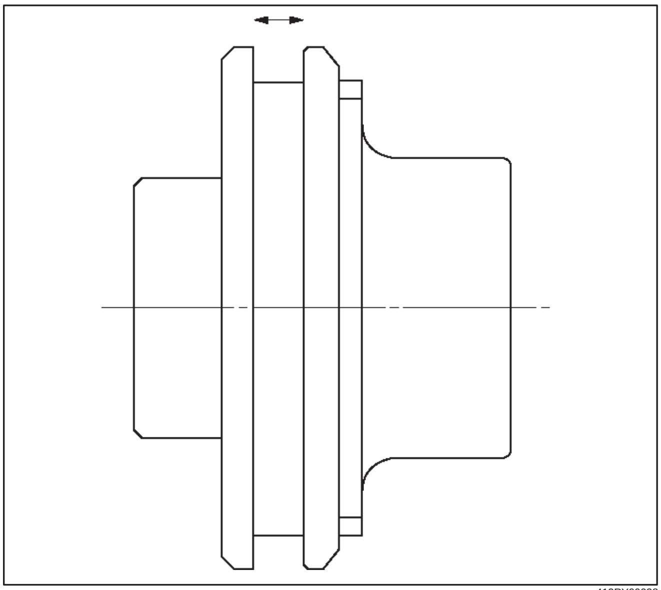


412RW022

Clutch Gear Condition

Check and see that there is not wear, damage, crack, or any other abnormality in the clutch gear.

Clutch Gear Function



412RY00038

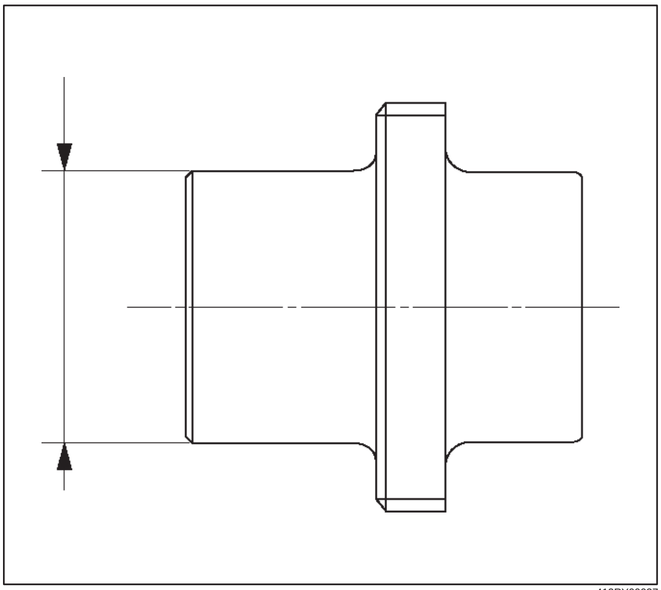
If there is an abnormality such as roughness when operated in combination with sleeve, replace the clutch gear.

NOTE: When inspecting, gear oil should be applied to the contact surface of gear.

Clutch Gear Journal Diameter

Make sure of the size illustrated.

Limit: 36.98 mm (1.456 in)

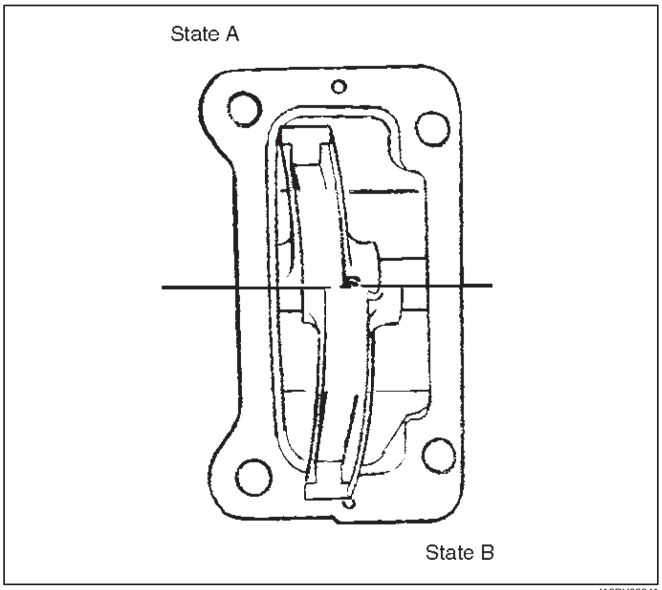


412RY00037

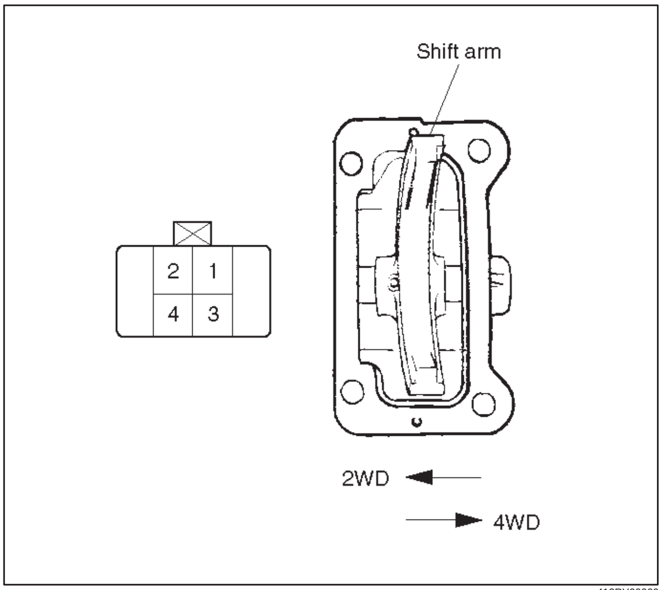
Actuator

Check and see that there is no damage, cracking, or other abnormality.

Functional Check



412RY00041



412RY00009

Wake sure of function with boltage (12V) applied to terminal 3, 4 and set the tester to terminal 1, 2 in accordance with the table below.

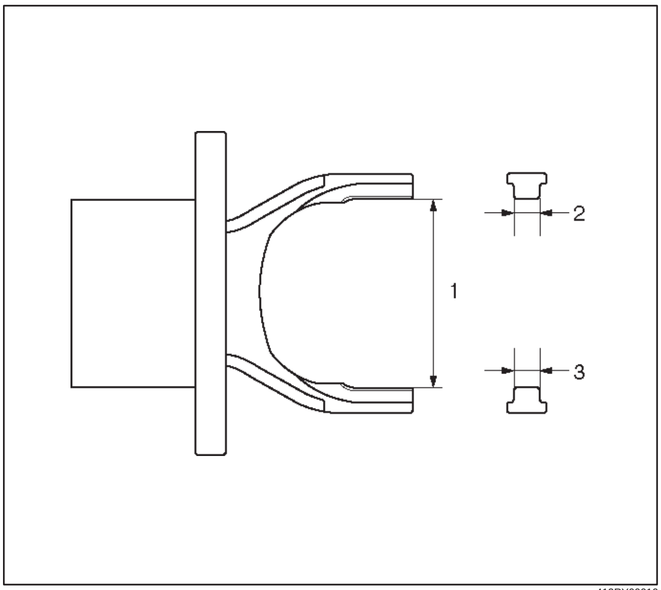
State	Trminal 3	Trminal 4	Electric circuit between terminal 1 & 2	Function
A	+12V	Ground	OK	2WD
B	Ground	+12V	NONE	4WD

If there is an abnormality, replace the actuator as an assembly.

NOTE: Be careful not to permit the entry of water or dust into of the actuator.

Dimentional Check

Measure illustrated sizes 1, 2, and 3.



412RY00010

Limit

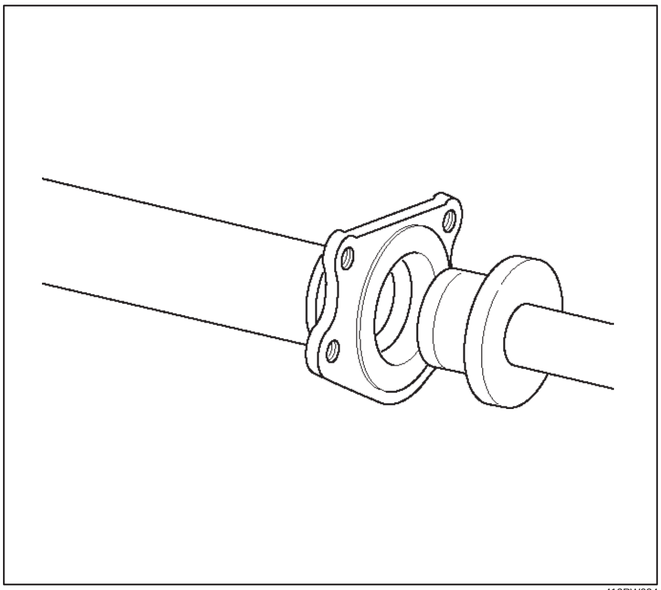
1=64.1 mm (2.52 in)

2=6.7 mm (0.26 in)

3=6.7 mm (0.26 in)

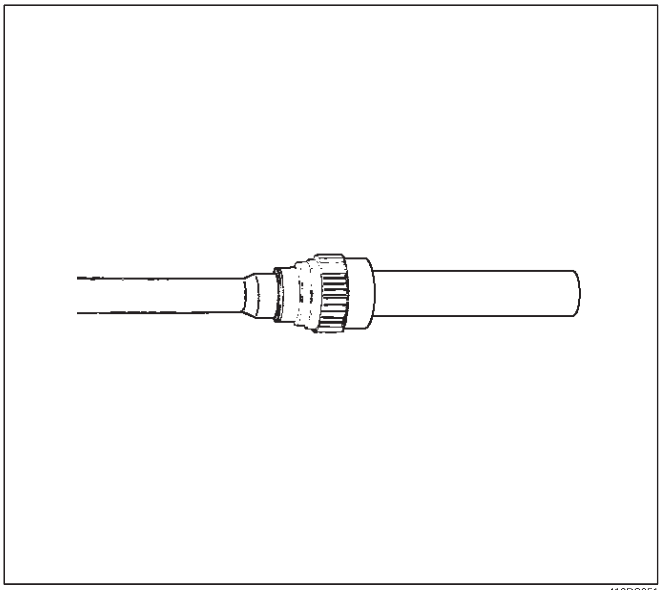
Reassembly

1. Install the new oil seal which has been immersed in differential gear oil, by using an oil seal installer J–41693 and grip J–8092.



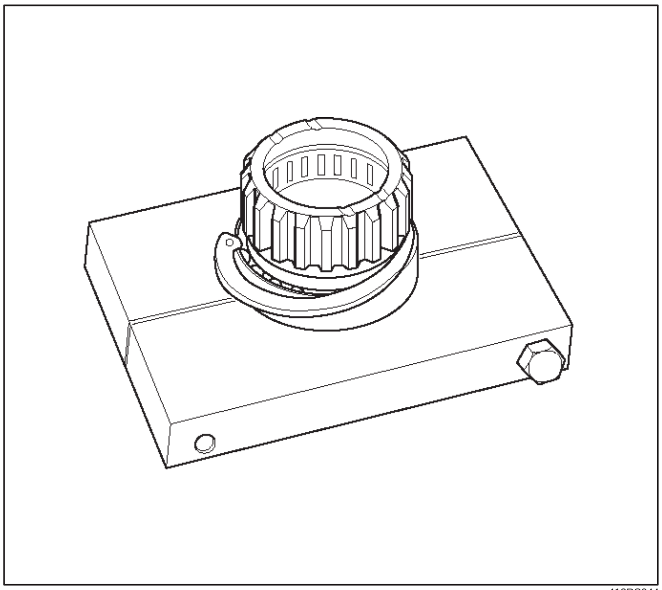
412RW034

2. Force a new needle bearing into inner shaft by using a Installer J–41694 and grip J–8092.



412RS051

3. Place a new snap ring(internal) in inner shaft.
   Force a new inner shaft bearing into the inner shaft.



412RS044

4. Install snap ring(external).

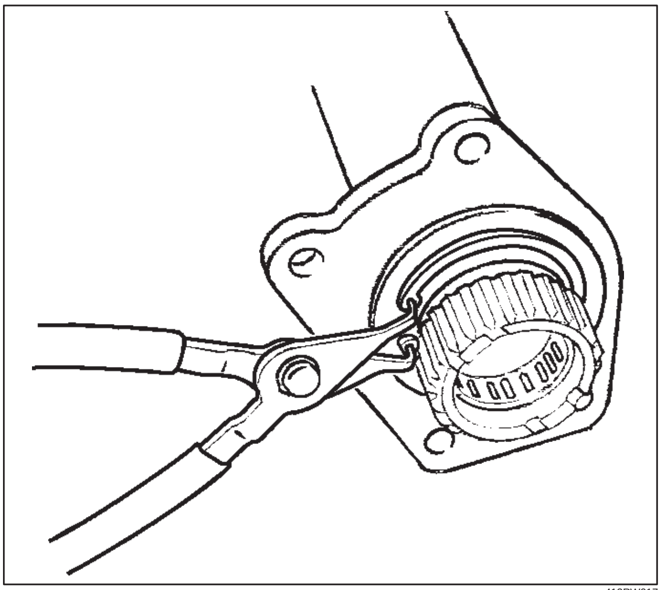
NOTE: Be careful not to damage the inner shaft.

5. Clean the housing contact surface of the front axle case and insert inner shaft assembly into the front axle case.

NOTE: Be careful not to damage seal.

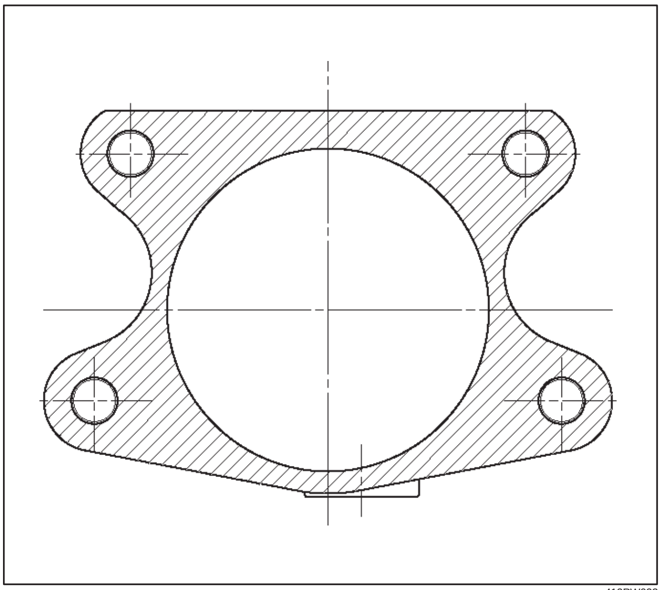
6. Install snap ring internal in the groove of front axle case.

NOTE: Be sure to install the snap ring properly.



412RW017

7. Apply differential gear oil to clutch gear, then install clutch gear.
8. Apply differential gear oil to sleeve, then install sleeve.
9. Clean contact surface with the front axle and actuator mounting surface. Apply liquid gasket to the contact surface on the front axle case, then install in the housing.



412RW023

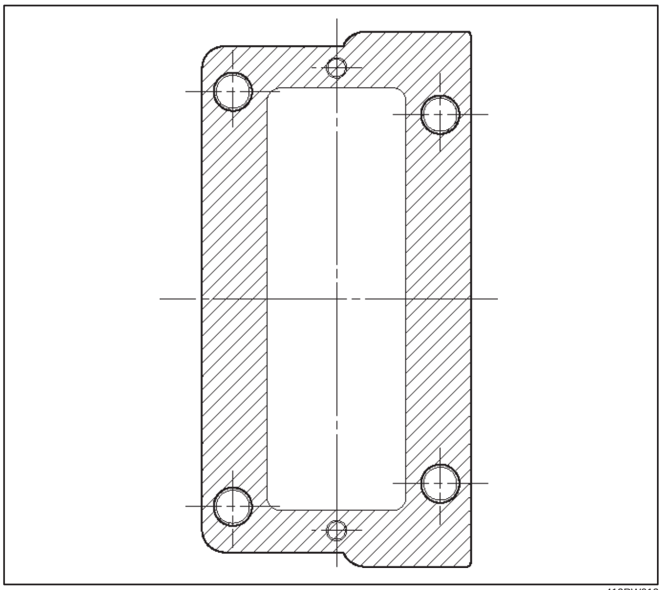
10. Tighten bolts to specified torque.

    Torque: 75N·m(55 lb ft)

11. Clean the actuator contact surface with the housing then Install and tighten shift position switch to specified torque.

    Torque: 39N·m (29 lb ft)

12. Apply liquid gasket to the contact surface on the actuator side.



412RW012

13. Align shift arm with the groove of sleeve and install the actuator.
14. Tighten bolts to specified torque.

    Torque: 9N·m(78 lb in)

15. Install front axle drive shaft and mounting bracket. Tighten fitting bolts to specified torque.

    Torque: 116N·m (85 lb ft)

16. Pour specified amount of differential gear oil to filler plug.

    Front Differential

    Oil Capacity: 1.4lit (1.48US qt)

    Actuator Housing

    Oil Capacity: 0.12lit(0.13US qt)

17. Install filler plug through gasket and tighten to specified torque.

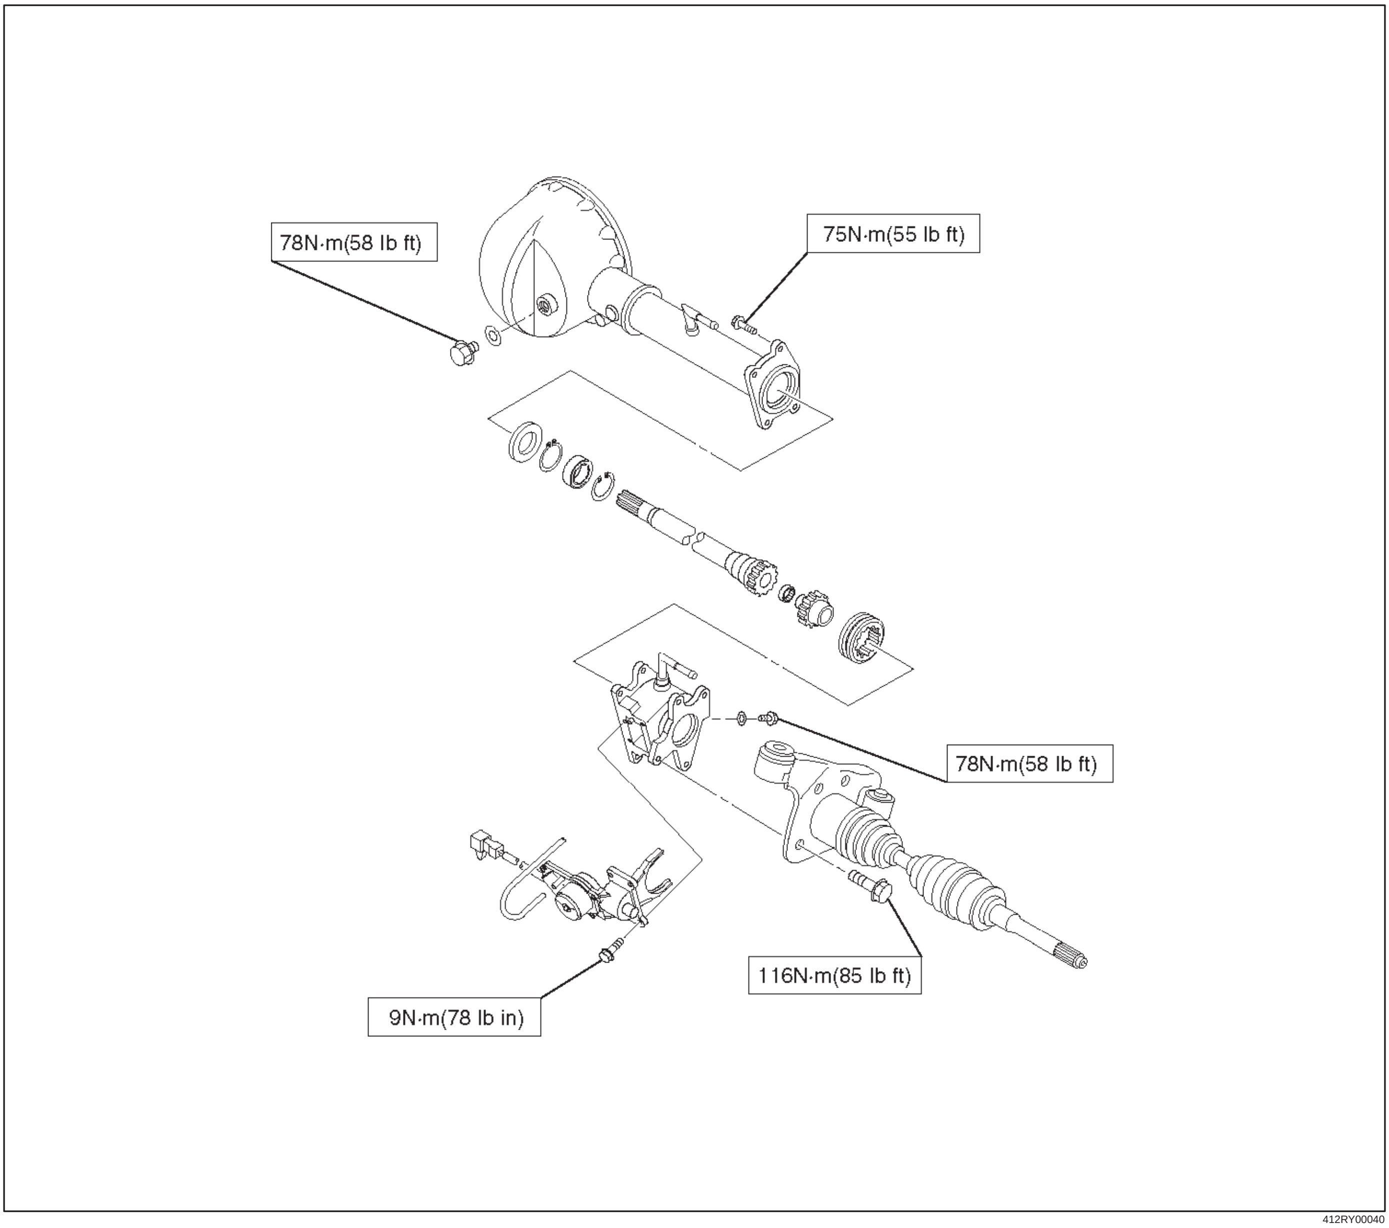
    Torque: 78N·m (58lb ft)

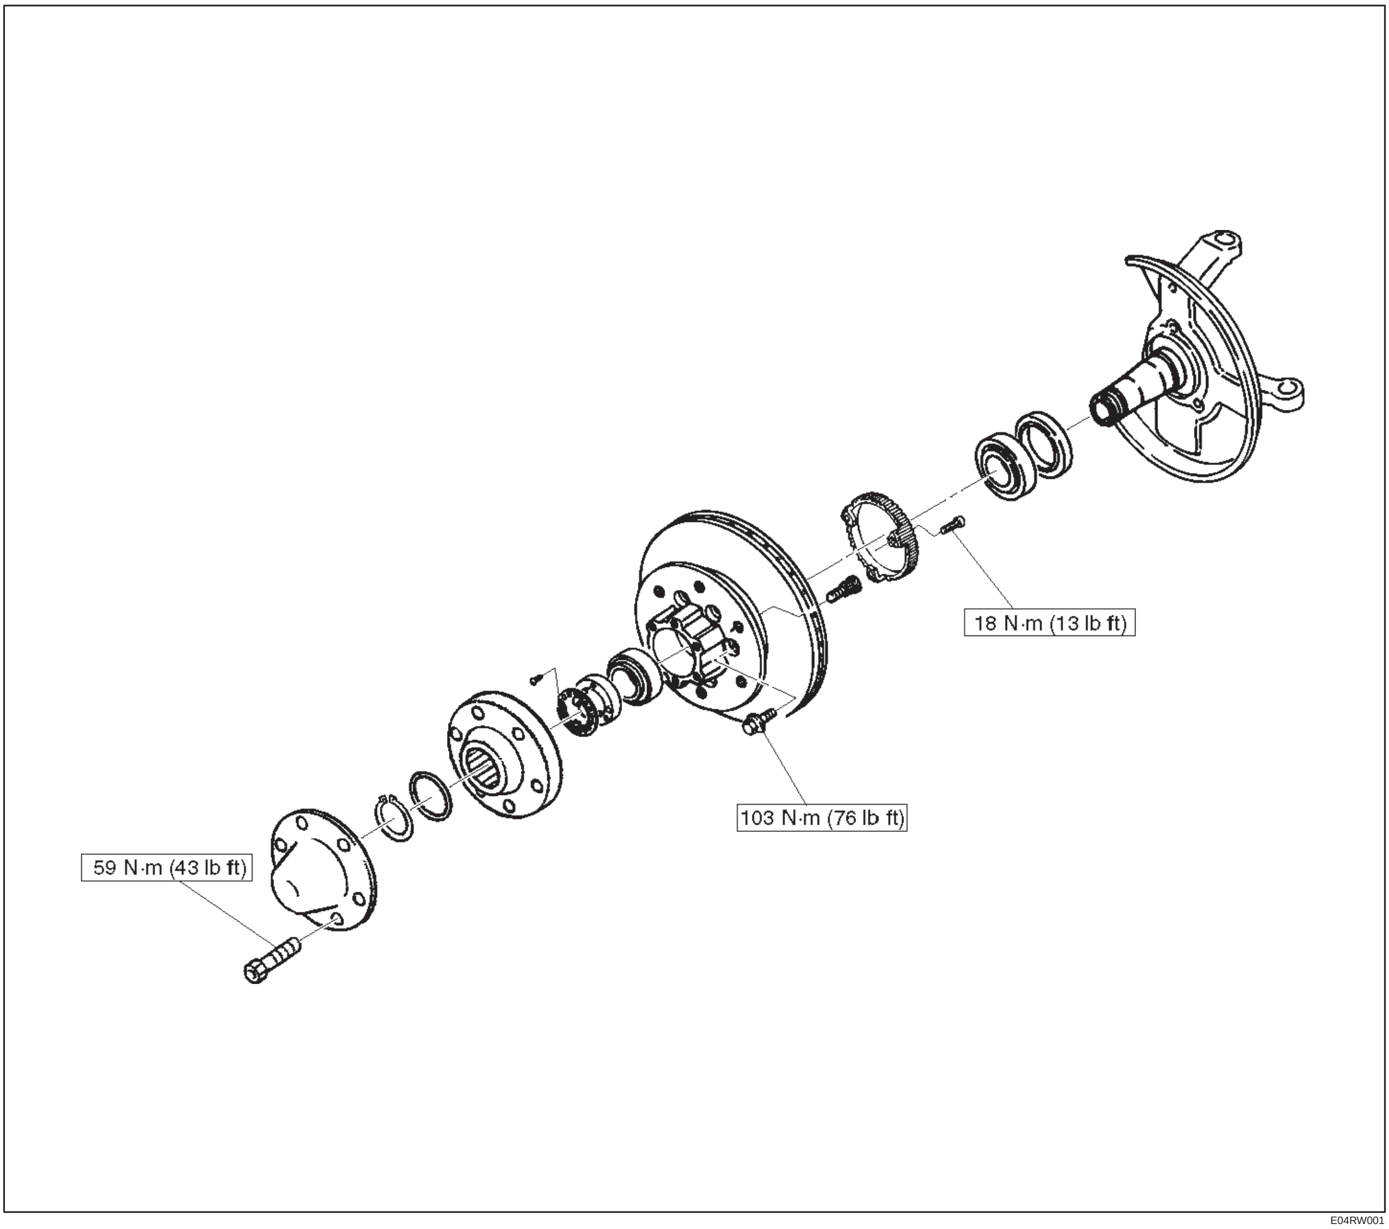
Main Data and Specifications

General Specifications

Front drive axle oil capacity	1.25 liter (1.32 US qt)(Differential)
	0.12 liter (0.13 US qt)(Actuator Housing:Shift on the fly)
Type of lubricant	GL–5 (75W–90) Refer to chart in General Information
Axle shaft type	Constant velocity joint(Birfield joint type and double offset joint)

Torque Specifications





18 N·m (13 lb ft)
103 N·m (76 lb ft)
59 N·m (43 lb ft)

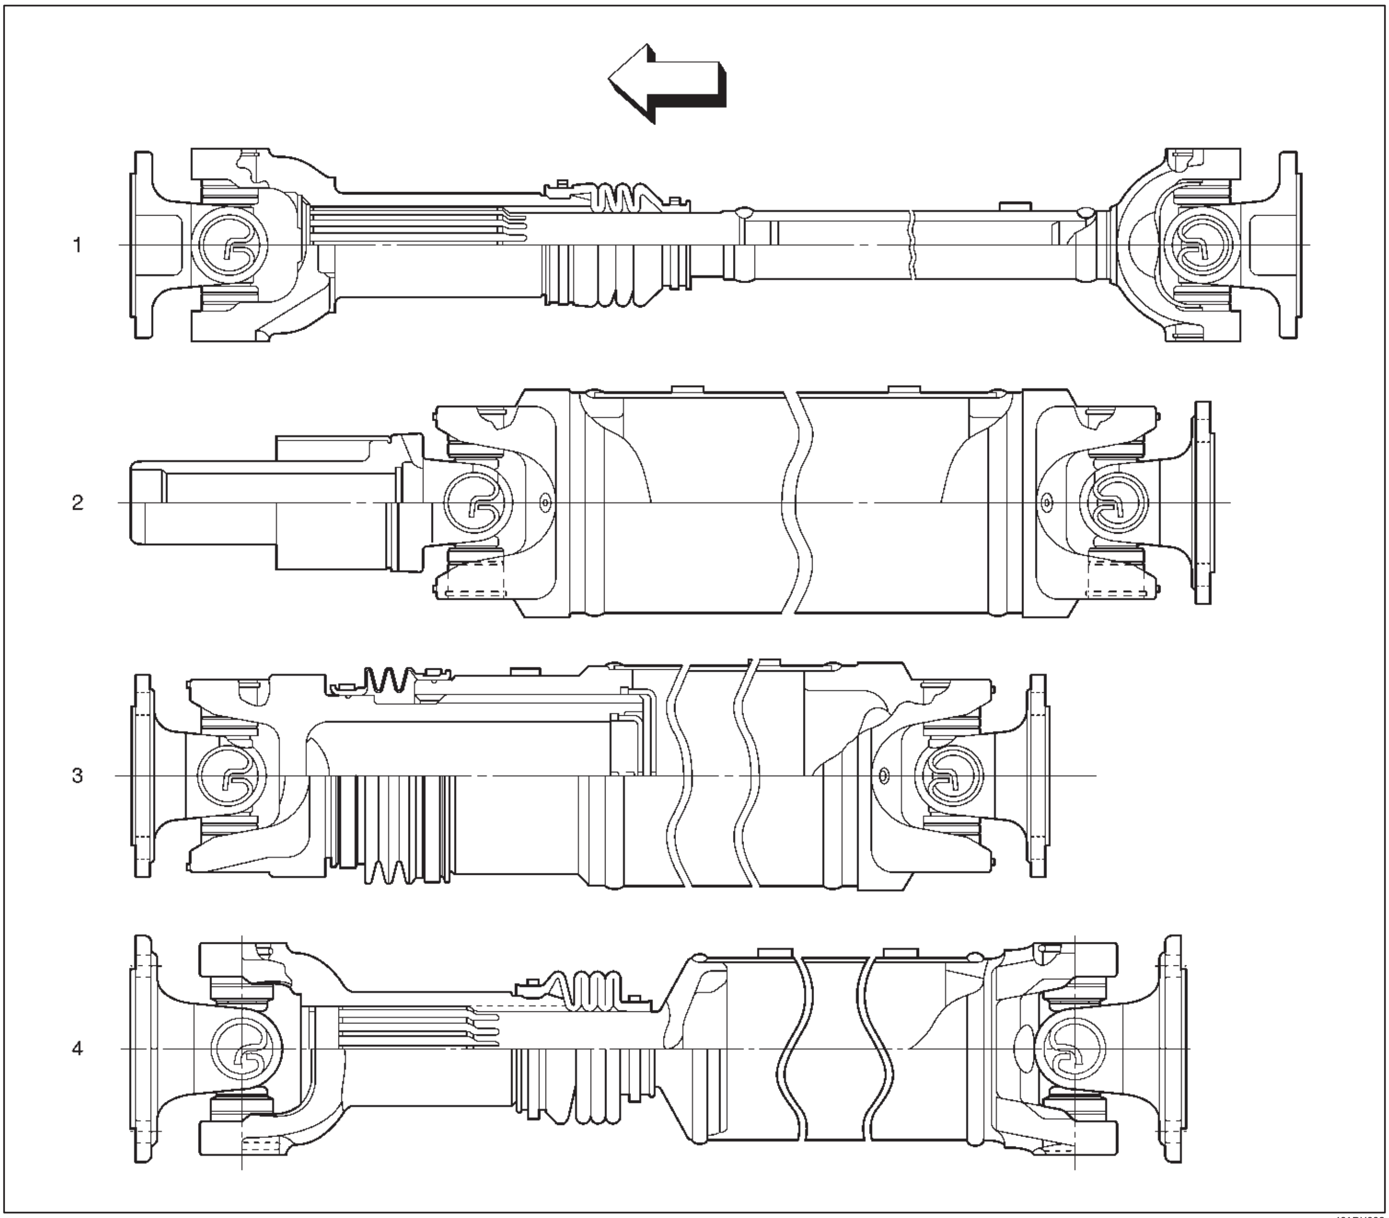
Propeller Shaft

General Description



Legend

(1) Front Propeller Shaft
(2) Rear Propeller Shaft;
Aluminum Tube with Spline Yoke Type
(3) Rear Propeller Shaft;
Aluminum Tube with Flange Yoke Type
(4) Rear Propeller Shaft;
Steel Tube Type (for 4×4, 6VD1, A/T model)

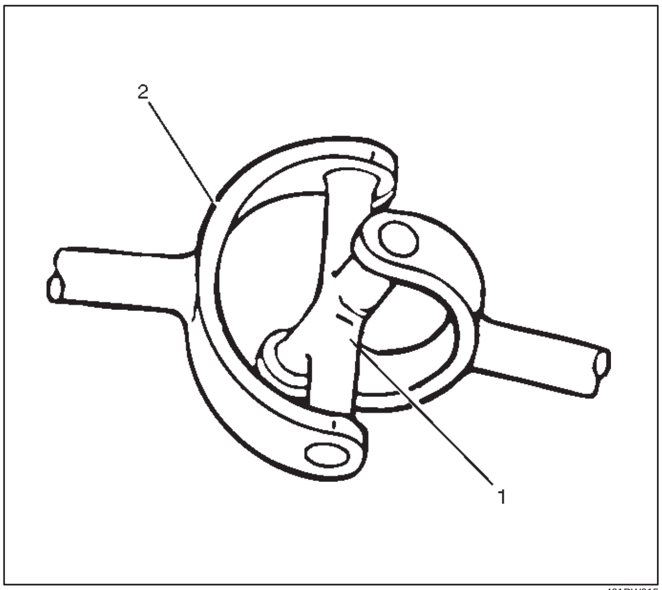
Torque is transmitted from the transmission to the axle through propeller shaft and universal joint assembles. All propeller shafts are the balanced tubular type. A splined slip joint is provided in some drivelines.

- Since the propeller shaft is total balanced carefully, welding or any other modification are not permitted.
- Alignment marks should be applied to each propeller shaft before removal.
- Be sure vehicle is stopped, engine is not running, brake is secured and vehicle is secured to prevent injury.
- Be careful not to grip the propeller shaft tube too tightly in the bise as this will be cause deformation.

Phasing

The propeller shaft is designed and built with the yoke lugs (ears) in line with each other. This design produces the smoothest running shaft possible, called phasing.Vibration can be caused by an out–of–phase propeller shaft.The propeller shaft will absorb vibrations from speeding up and slowing down each time the universal joint goes around.This vibration would be the same as a person snapping rope and watching the ”wave” reaction flow to the end.A propeller shaft working in phase would be similar to two persons snapping a rope at the same time, and watching the ”waves” meet and cancel each other out.In comparison, this would be the same as the universal joints on a propeller shaft.A total cancellation of vibration produces a smooth flow of power in the driveline.It is very important to apply a reference mark to the propeller shaft before removal, to assure installation alignment.

Universal Joint



401RW015

Legend

(1) Spider
(2) Yoke

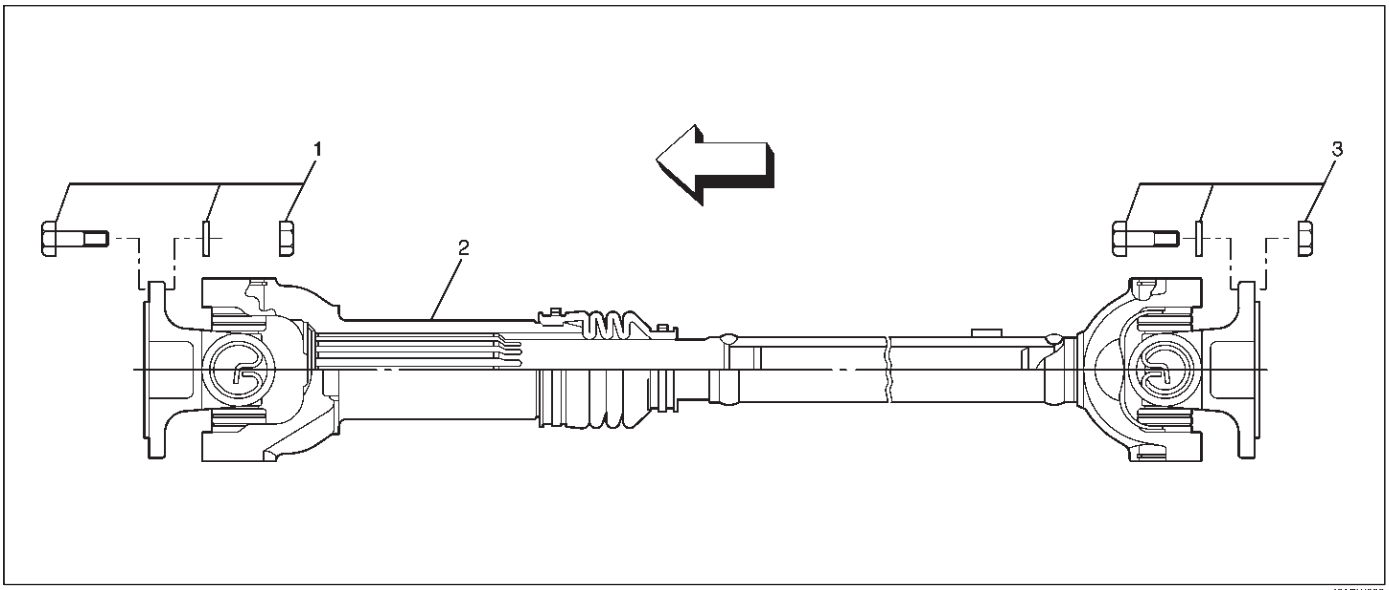
A universal joint consists of two Y-shaped yokes connected by a crossmember called a spider.
The spider is shaped like a cross. Universal joints are designed to handle the effects of various loadings and front or rear axle windup during acceleration. Within the designed angle variations, the universal joint will operate efficiently and safely. When the design angle is changed or exceeded the operationallife of the joint may decrease.
The bearings used in universal joints are of the needle roller type. The needle rollers are held in place on the trunnions by round bearing cups. The bearing cups are held in the yokes by snap rings.

Diagnosis of Propeller Shaft and Universal Joint

Condition	Possible cause	Correction
Universal Joint Noise.	Worn universal joint bearings.	Replace.
	Improper lubrication.	Lubricate as directed.
	Loose flange bolts.	Tighten to specifications.
Ping, Snap, or Click in Drive Line (Usually Heard on Initial Load after the Transmission is in Forward or Reverse Gear)	Loose bushing bolts on the rear springs or upper and lower control arms.	Tighten the bolts to specified torque.
	Loose or out-of-phase end yoke.	Remove end yoke, turn 180 degrees from its original position, lubricate the splines and reinstall. Tighten the bolts and pinion nut to specified torque.
Knocking or Clanking Noise in the Driveline when in High or Neutral Gear at 16km/h(10mph)	Worn or damaged universal joint	Replace the universal joint.
Squeak	Lack of lubricant.	Lubricate joints and splines. Also check for worn or brinelled parts.
Shudder on Acceleration (Low Speed)	Loose or missing bolts at the flanges.	Replace or tighten bolts to specified torque.
	Incorrectly set front joint angle.	Install shim under the transmission support mount to change the front joint angle.
	Worn universal joint.	Replace.
Vibration	Incorrect shaft runout.	Replace.
	Shaft out of balance.	Adjust.
	Transmission rear housing bushing, transfer case housing bushing worn.	Replace.
	Yoke spline jammed.	Replace.
Excessive Leak at the Front Spline Yoke of Rear Propeller Shaft	Rough surface on splined yoke; burred nicked or worn.	Replace the seal. Minor burrs can be Smoothed by careful use of crocus cloth or fine stone honing. Replace the yoke if badly burred.
	Defective transmission rear oil seal.	Replace the transmission rear oil seal and replenish the transmission oil.

Front Propeller Shaft

Front Propeller Shaft and Associated Parts



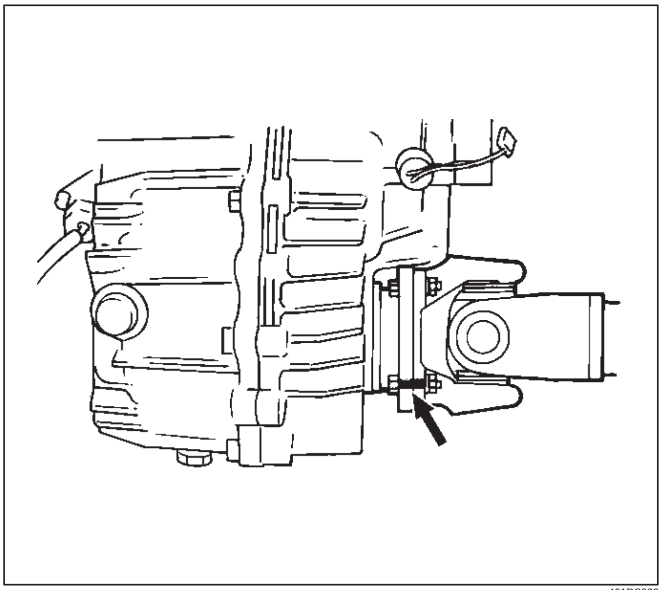
401RW093

Legend
(1) Bolt, Nut and Washer (Front Axle Side)
(2) Front Propeller Shaft
(3) Bolt, Nut and Washer (Transfer Side)

Removal

1. Raise the vehicle on a hoist.

NOTE: Apply alignment marks on the flange at the front propeller shaft both front and rear side.



401RS020

2. Remove bolt, nut and washer (Front axle side).
3. Remove bolt, nut and washer (Transfer side).
4. Remove front propeller shaft.

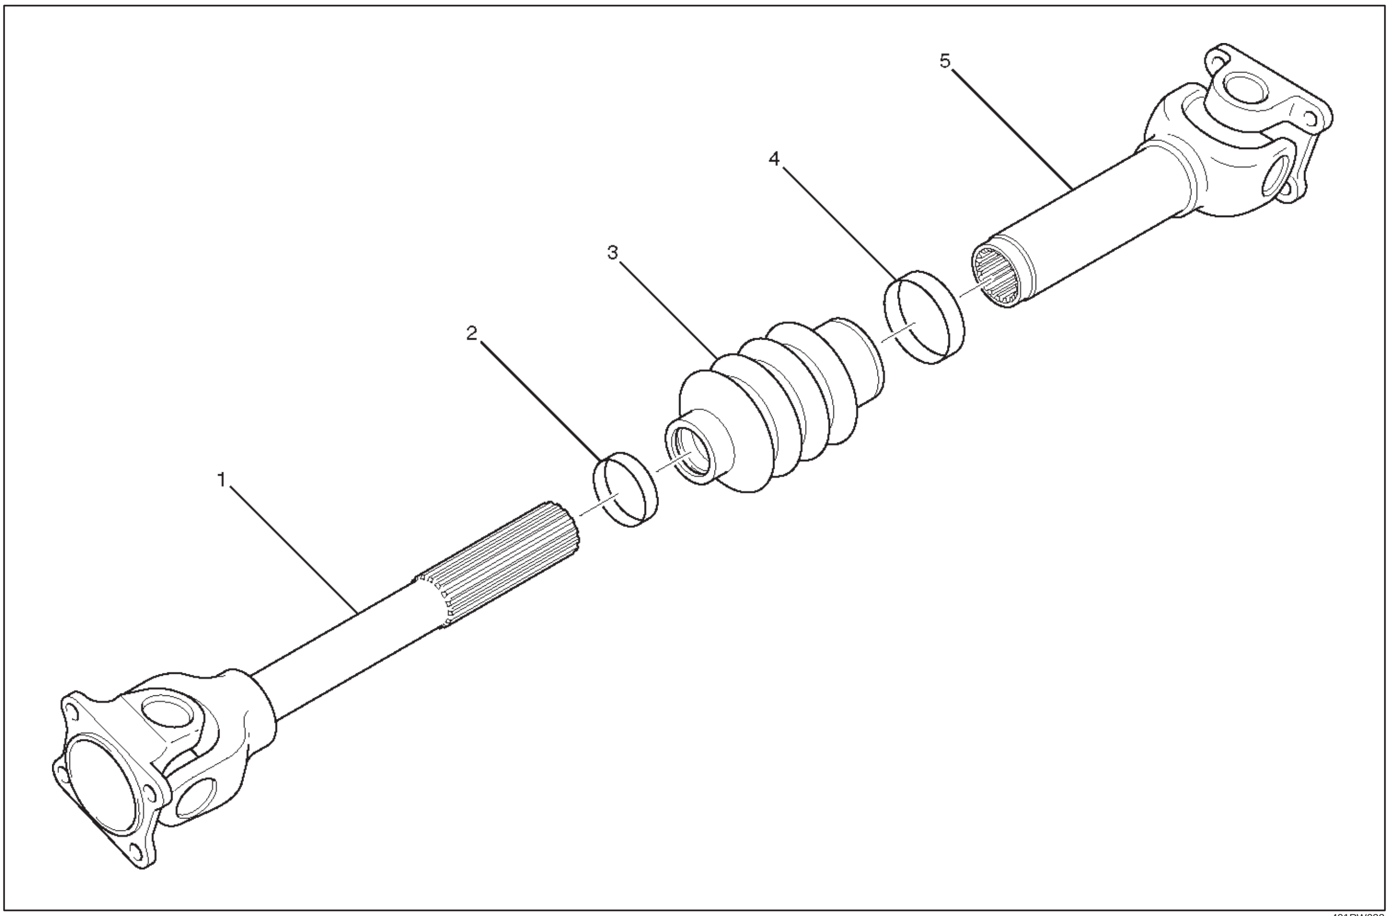
Installation

NOTE: Never install the shaft assembly backwards. Never insert bar between yoke lugs when tightening or removing bolts. Completely remove the black paint from the connecting surface of flange coupling on each end of propeller shaft. Clean so that no foreign matter will be caught in between.

1. Align the mark which is applied at removal. Install front propeller shaft and tighten the bolts to the specified torque.

   Torque: 63 N·m (46 lb ft)

Disassembly

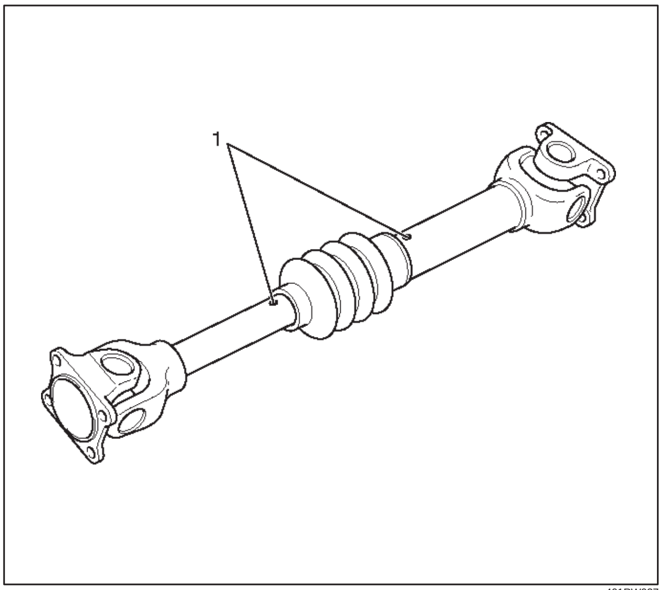


401RW032

Legend

(1) Sleeve Yoke
(2) Clamp
(3) Boot
(4) Clamp
(5) Tube Assembly

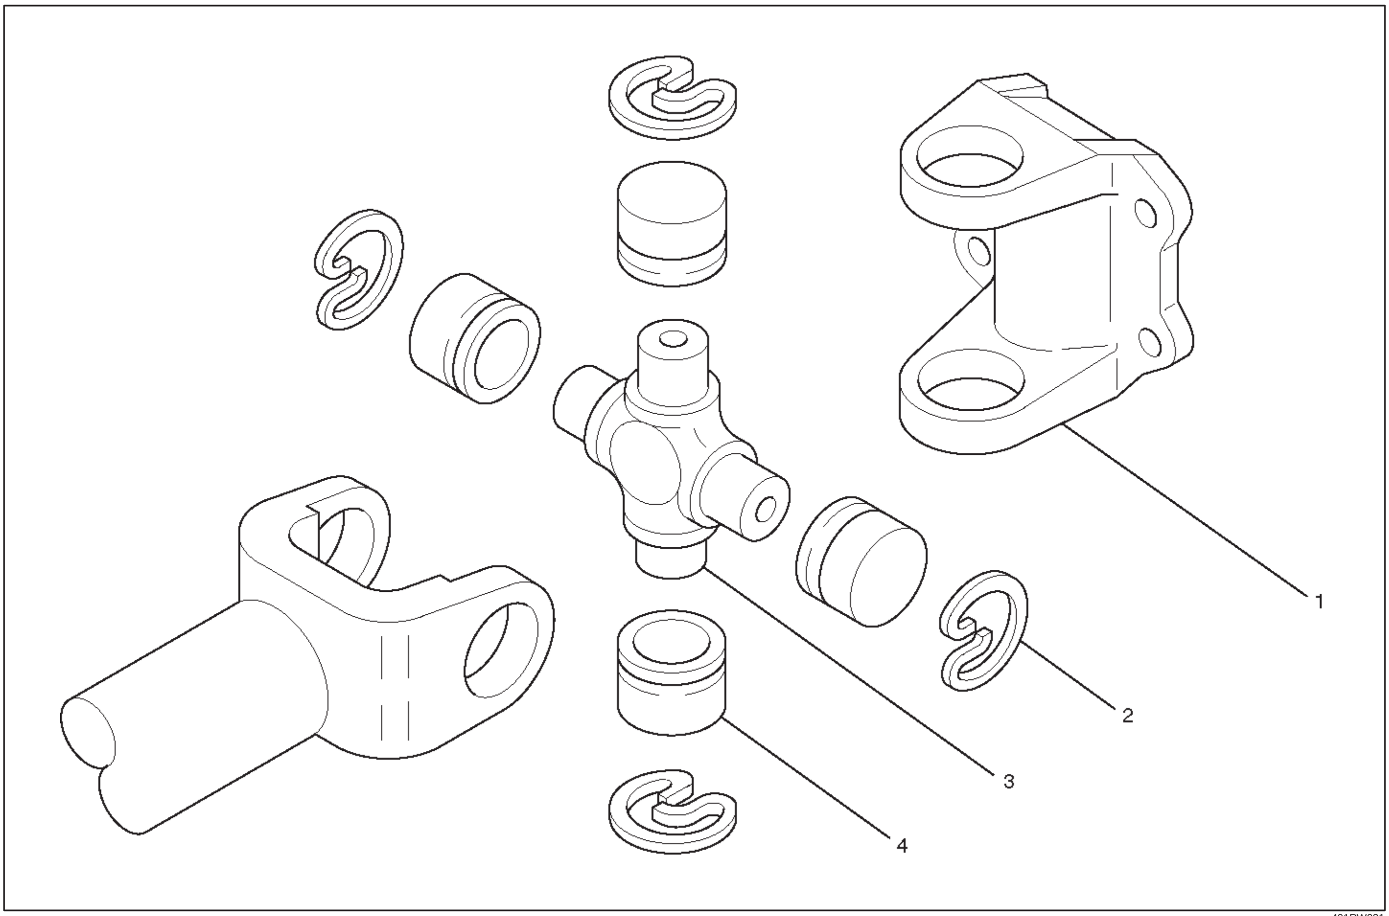
1. Lay the shaft horizontally on a bench and secure.
2. Indicate the original assembled position (1) by marking the phasing of the shaft prior to disassembly.



401RW037

3. Using the flat blade of a screwdriver, pry the loose end of the boot clamp upwards and away from the propeller shaft boot. Be careful not to damage the boot.
4. When boot clamps becomes loose, remove by hand.
5. Repeat for the other boot clamp.
6. Remove the slip yoke assembly from the driveshaft, by securing the boot with one hand and pulling on the slip yoke.
7. Remove the boot from the shaft assembly.

Universal Joint Disassembly



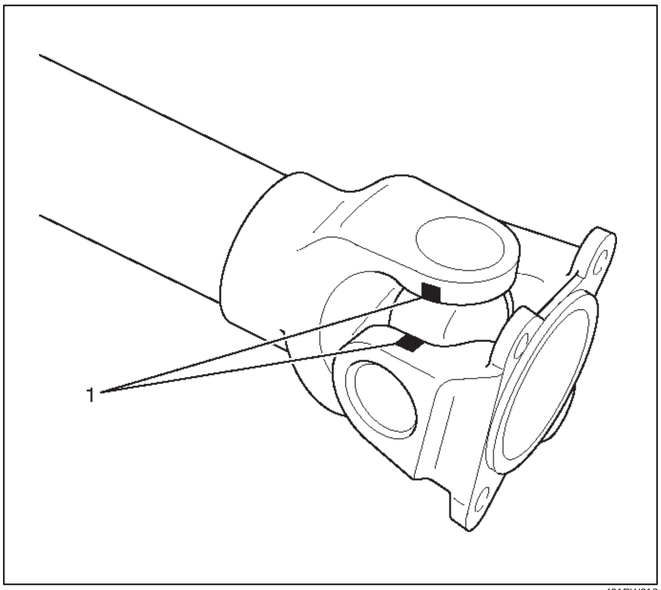
Legend

(1) Flange Yoke
(2) Snap Ring
(3) Spider
(4) Needle Roller Bearing

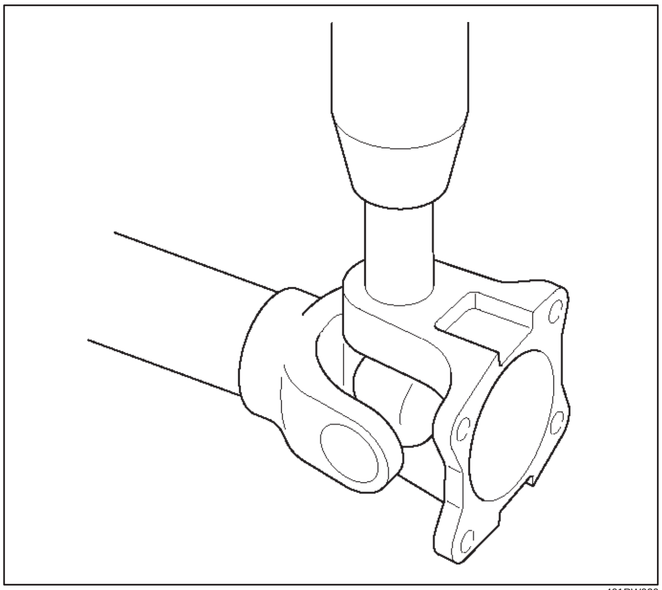
1. Using a soft drift, tap the outside of the bearing cup assembly to loosen snap ring. Tap bearing only hard enough to break assembly away from snap ring.

   Remove snap ring from yoke. Turn joint over, tap bearing away from snap ring, then remove opposite snap ring.

   Apply alignment marks (1) on the yokes of the universal joint, then remove snap ring.



2. Set the yoke in the arbor press with a piece of tube stock beneath it.
   Place a solid plug on the upper bearing assembly and press it through to release the lower bearing assembly.



401RW020

3. If the bearing assembly will not pull out by hand after pressing, tap the base of the lug near the bearing assembly to dislodge it.
4. To remove the opposite bearing, turn the yoke over and straighten the spider in the open hole. Then carefully press on the end of the spider so the remaining bearing moves straight out of the bearing spider hole. If the spider or bearing are cocked, the bearing will score the walls of the spider hole and ruin the yoke.
5. Repeat this procedure on the remaining bearing to remove the spider from the yoke.
6. Make sure of proper position for reinstallation by applying setting marks, then remove spider .

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition is found through inspection.

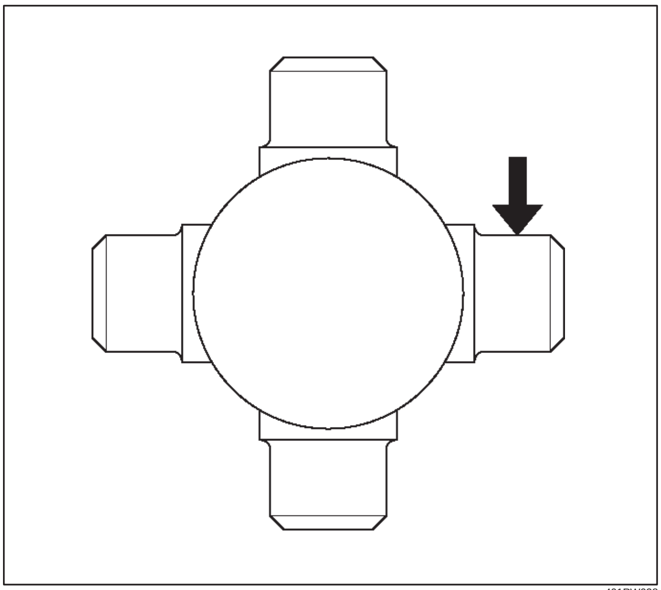
NOTE: When any part of the journal assembly (spider, needle roller bearing) requires replacement, be sure to replace the entire assembly.

Check the following parts for wear, damage, noise or any other abnormal conditions.

1. Spider
2. Needle roller bearing
3. Yoke
4. Flange
5. Boot

Spider pin for wear

Spider pin should be smooth and free from fretting or galling. Visible signs of needle presence is normal, but wear should not be felt.



401RW038

Propeller shaft run–out

Support the propeller shaft on V-blocks (2) and check for run-out by holding the probe of a dial indicator (1) in contact with the shaft.

Static run-out limit:

0.13 mm (0.005 in)

TIR on the neck of the slip tube shaft (with a boot).

0.25 mm (0.010 in)

TIR on the ends of the tubing 3 inch from the welds.

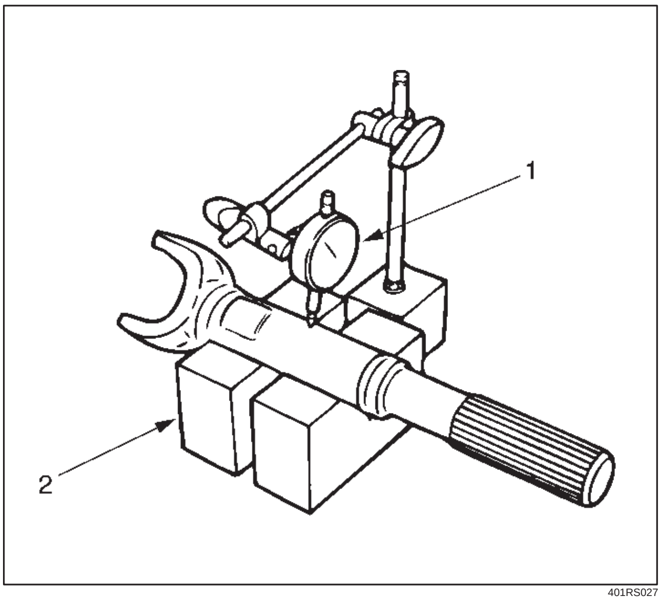
0.38 mm (0.015 in)

TIR at the linear center of the tube.

0.38 mm (0.015 in)

TIR for the full length of tube with 30” or less of tubing.

(TIR : Total Indicator Reading)



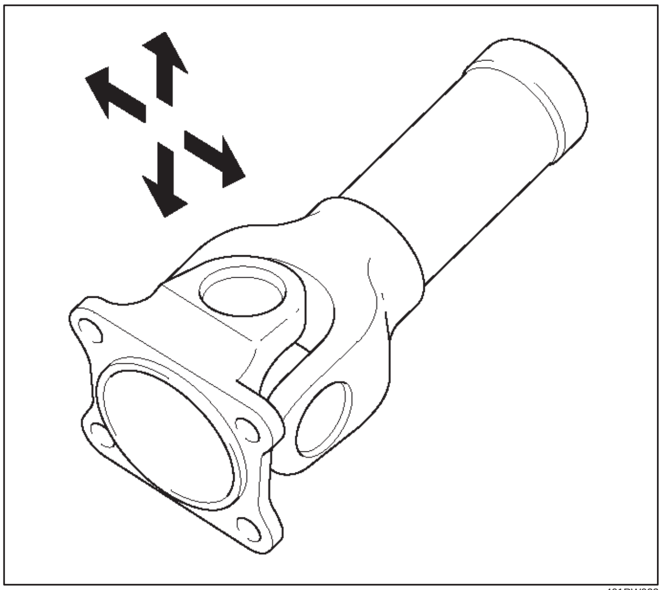
401RS027

Spline

The nylon-coated spline should be free from nicks and dings and the underlying steel spline should not be visible. After cleaning the nylon coating spline, the coating should exhibit only slight indicator of wear.
Grease volume is approximately 10 grams of grease in total. Grease should be evenly applied to both the female and the male slip splines using a small brush. After assembly of the slip joint, the sliding joint should be fully worked from the full collapsed to the full extended position.

Play in the universal joint

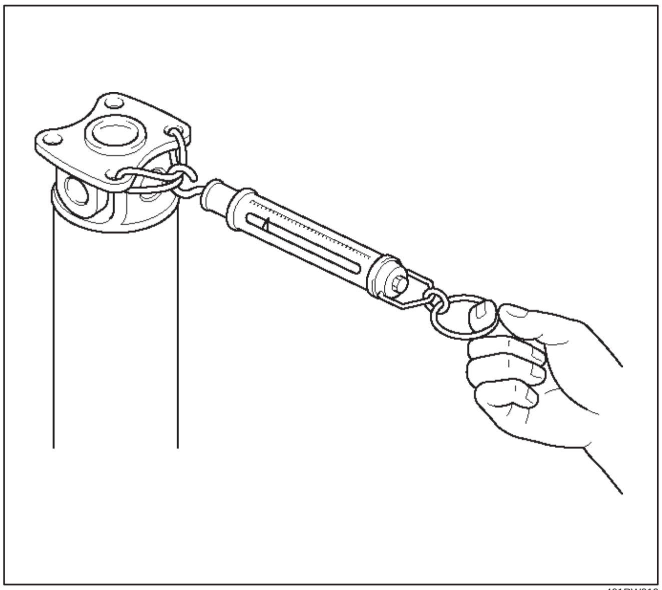
Limit: Less than 0.15 mm (0.006 in)



401RW023

Preload of the universal joint

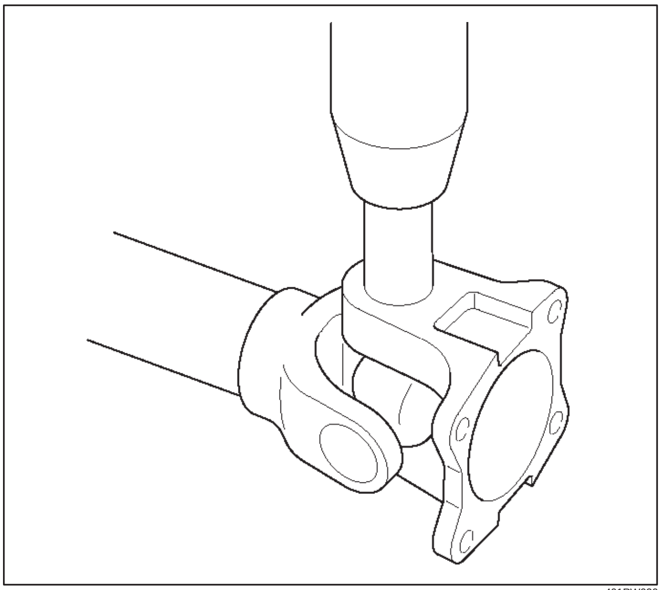
Preload should be 0 to 49 N(0 to11.0 lb). Joints should rotate smoothly and freely and should exhibit no rough or ratchety movement.



401RW019

Universal Joint Reassembly

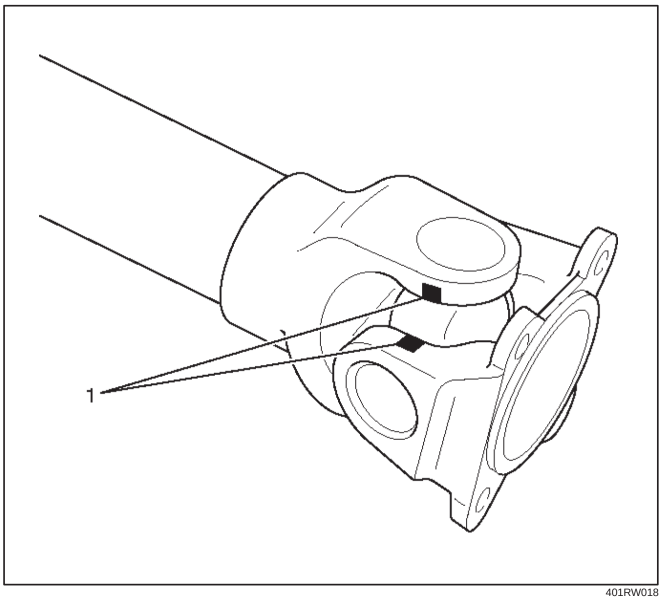
1. Install spider to flange yoke. Be sure to install the spider by aligning the setting marks made during disassembly.
2. Pack the four grease cavities of the spider with a high quality, extreme pressure N.L.G.I. Grade 2 grease. Do not add additional grease to the bearing cup assembly.
3. Move one end of the spider to cause a trunnion to project through the spider hole beyond the outer machined face of the yoke lug. Place a bearing over the trunnion diameter and align it to the spider hole. Using an arbor press, hold the trunnion in alignment with the spider hole and place a solid plug on the upper bearing. Press the bearing into the spider hole enough to install a snap ring.



401RW020

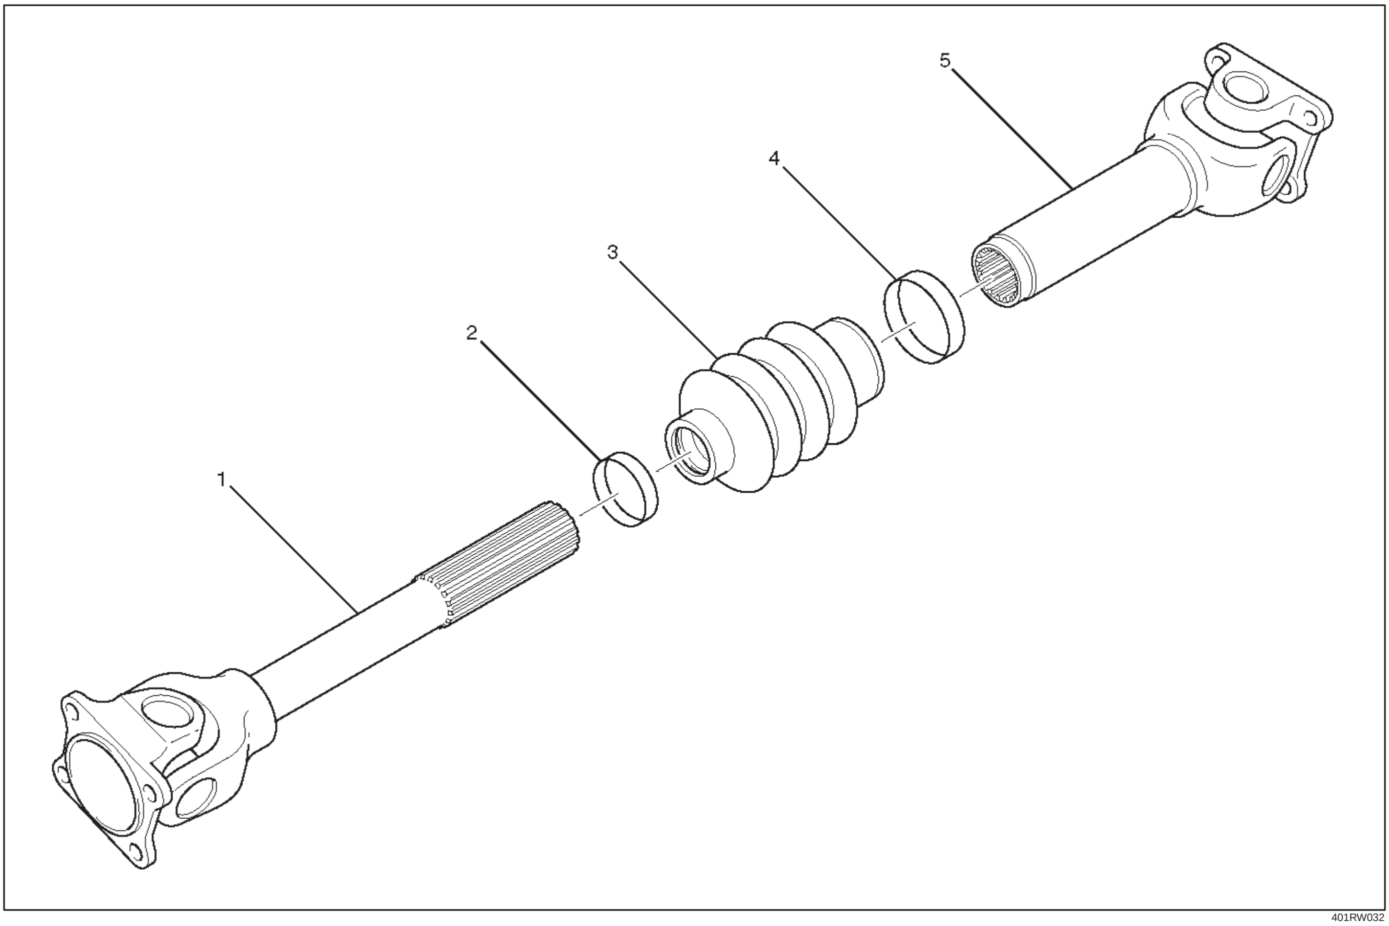
4. Install a snap ring.
   Be sure the snap rings are properly seated in the grooves.
5. Repeat steps 3 and 4 to install the opposite bearing. If the joint is stiff, strike the yoke ears with a soft hammer to seat needle bearings.

6. Align setting marks (1) and join the yokes.



7. Install snap ring.

Reassembly



Legend

- (1) Sleeve Yoke
- (2) Clamp
- (3) Boot
- (4) Clamp
- (5) Tube Assembly

1. Apply grease evenly to both the female and male splines.
2. Apply a small amount of grease by finger to the outer lips of the boot.
3. Slide the boot onto the yoke shaft being careful not to damage the spline coating or boot.
4. Insert the yoke shaft spline into the sleeve being careful to maintain proper phasing. The spider holes should be in line and as per originally marked prior to disassembly.
5. Position boot onto sleeve and yoke shaft in final position over boot grooves.
6. Attach boot clamps and secure using pliers.
7. Be sure clamp is properly seated and secure.

Main Data and Specifications

General Specifications

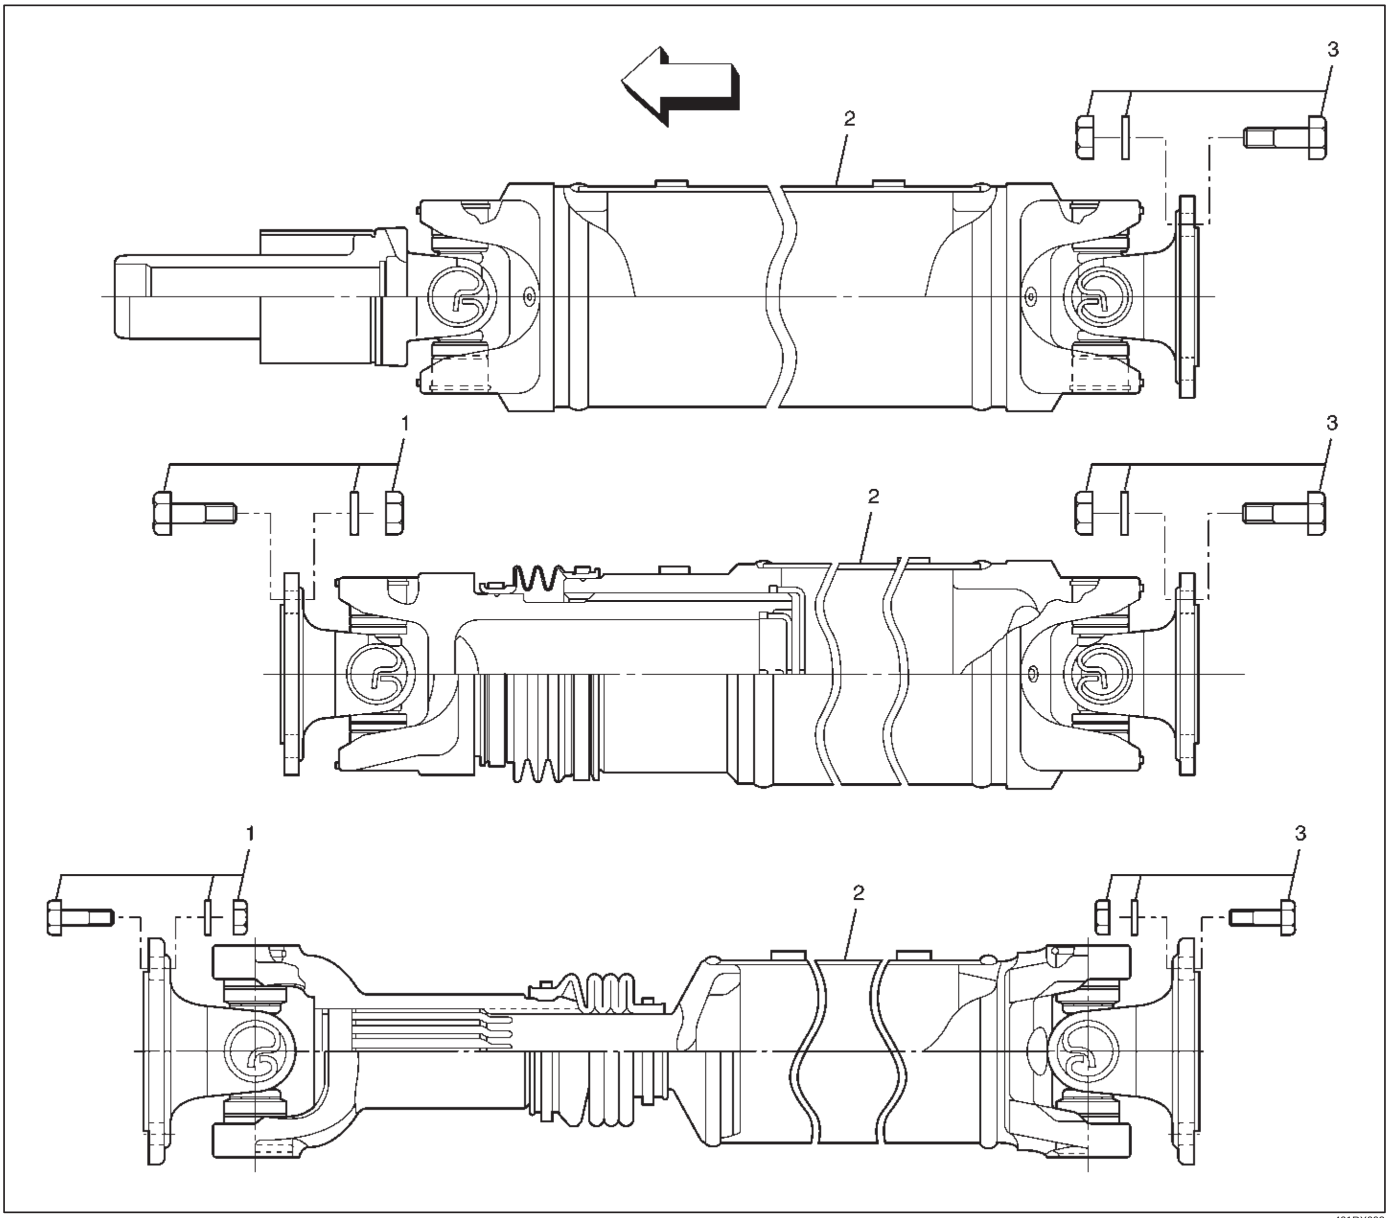
Rear Propeller Shaft

Rear Propeller Shaft and Associated Parts



Legend

(1) Bolt, Nut and Washer (Transfer Side)

(2) Rear Propeller Shaft

(3) Bolt, Nut and Washer (Rear Axle Side)

Removal

1. Raise the vehicle on a hoist.

NOTE: Apply alignment marks on the flange at the rear propeller shaft both front and rear side.

2. Remove transfer side bolt, nut and washer (except spline yoke type).
3. Remove rear axle side bolt, nut and washer.
4. Remove rear propeller shaft.

NOTE: Plug the hole of the transmission rear end to prevent oil leakage (spline yoke type only).

Installation

NOTE: Never install the shaft assembly backwards.

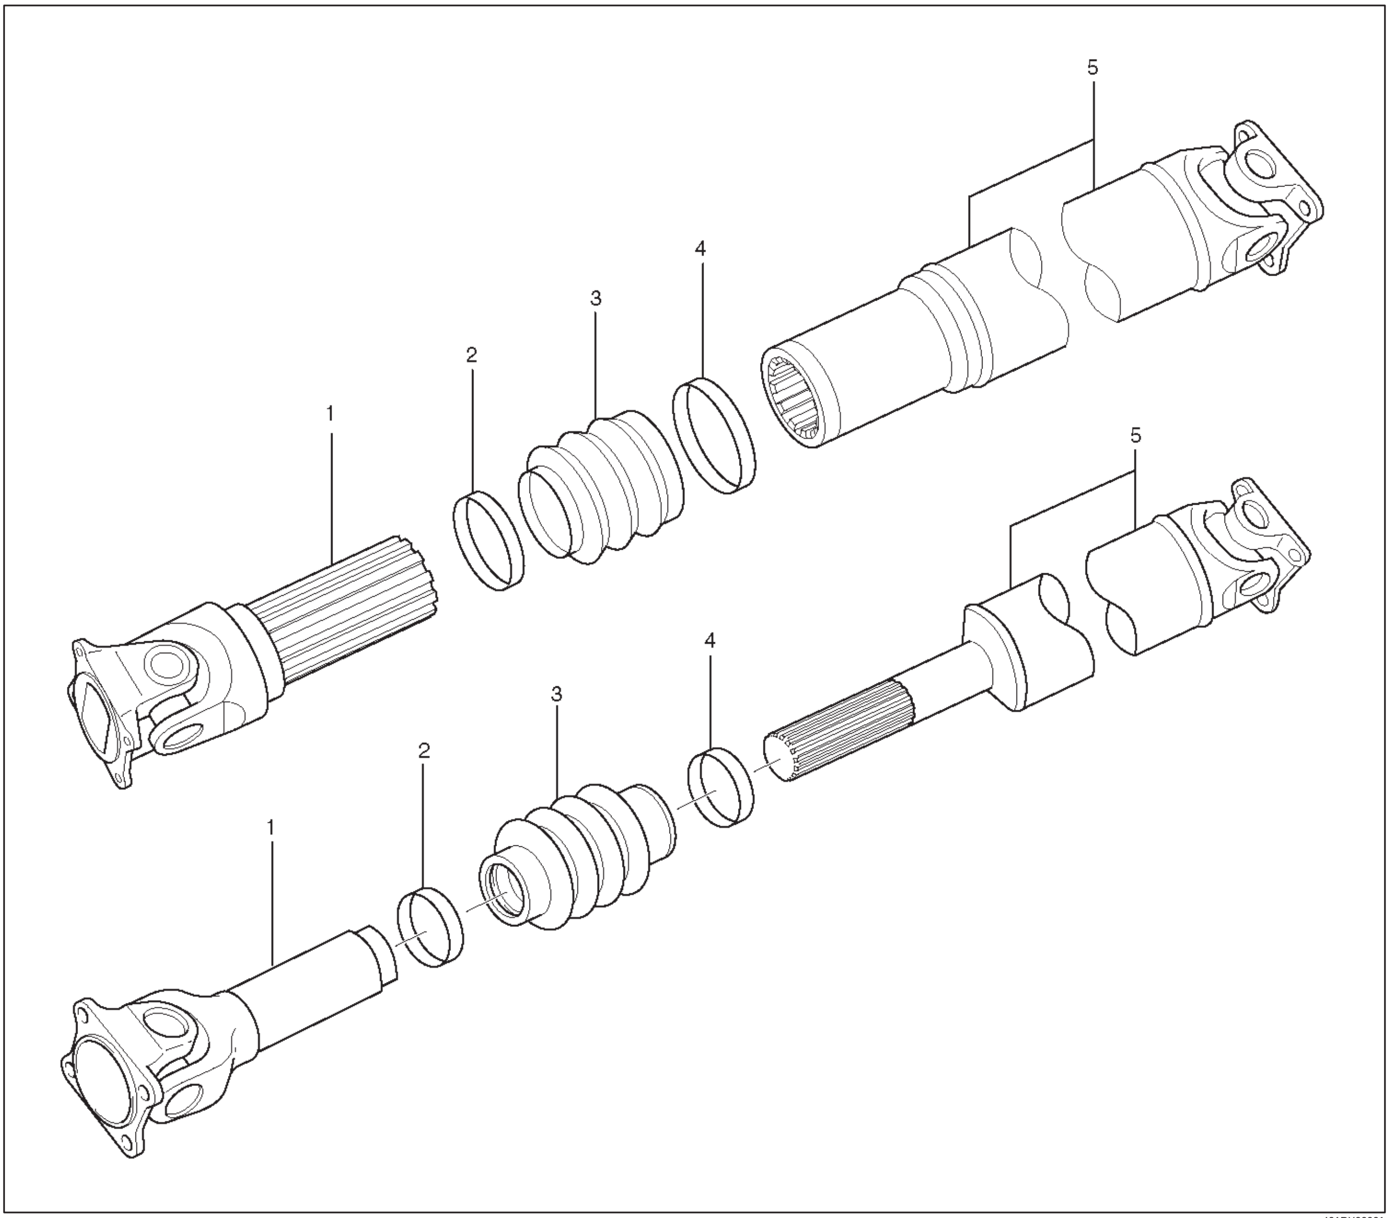
Never insert bar between yoke lugs when tightening or removing bolts.

Completely remove the dust or foreign matter from the connecting surface of flange coupling on each end of the propeller shaft.

1. Align the mark which is applied at removal.
2. Install rear propeller shaft and tighten the bolts to the specified torque.

Torque: 63 N·m(46 lb ft)

Slip Joint Disassembly



Legend

(1) Spline Yoke and Universal Joint Assembly

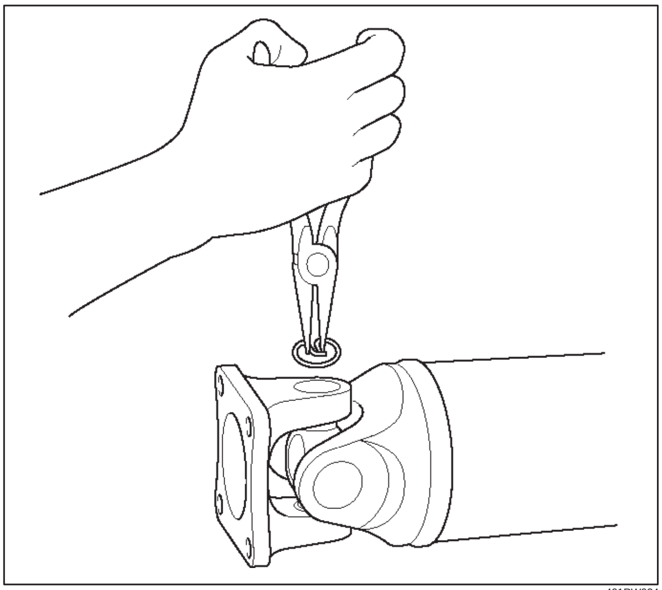
(4) Spider
(5) Flange Yoke
(6) Bearing
(7) Snap Ring
(8) Flange Yoke

NOTE: Aluminum is softer than steel. Care must be taken not to remove excessive material or damage bearing holes.

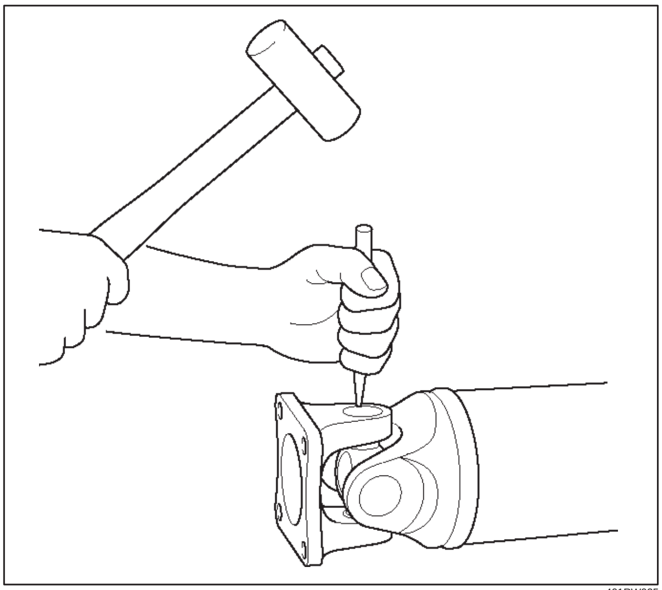
If the vehicle has aluminum tube type propeller shaft, flange yoke, boot kit, journal kit can be replaced. If other parts are damaged, replace propeller shaft as assembly.

1. Apply alignment marks on the yokes of the universal joint, then remove the snap ring.



401RW024

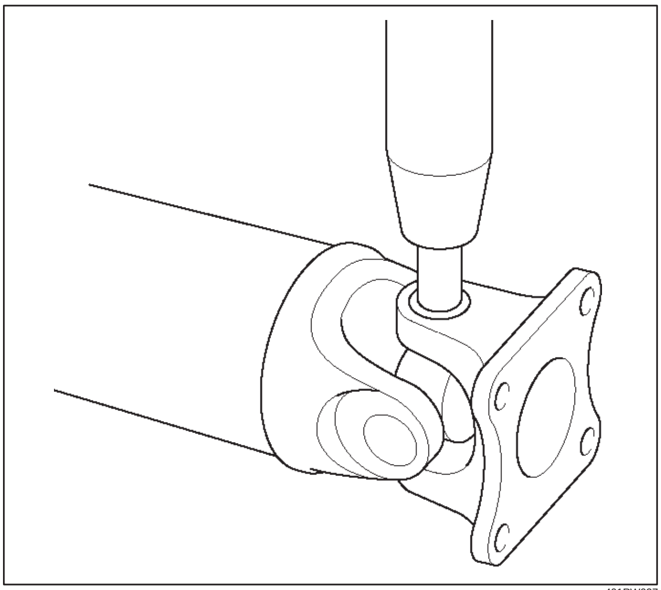
If the snap ring is stuck in position, remove paint from the hole in the yoke or tap around the edge of the bearing lightly with a soft drift.



401RW025

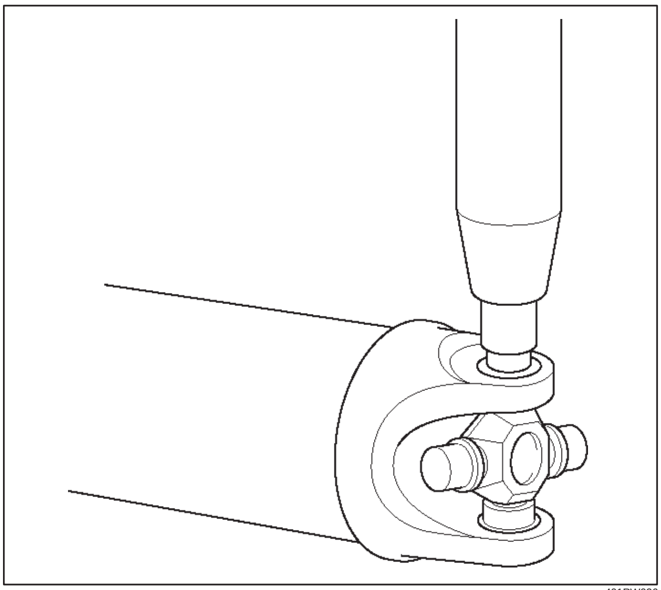
2. Set the yoke in the arbor press with a piece of tube stock beneath it.

   Place a solid plug on the upper bearing and press it through to release the lower bearing.



401RW027

3. If the bearing will not pull out by hand after pressing, tap the base of the lug near the bearing to dislodge it.
4. To remove the opposite bearing, turn the yoke over and straighten the spider in the open spider hole. Then carefully press on the end of the spider so the remaining bearing moves straight out of the bearing spider hole. If the spider or bearing are cocked, the bearing will score the walls of the spider hole and ruin it.



401RW026

5. Repeat this procedure on the remaining bearing to remove the spider from the yoke.

Inspection

- Propeller shaft for run-out Aluminum tube type.

  Static run-out limit : 1.0 mm(0.04 in)

  TIR full length of tubing maximum.

  (TIR : Total Indicator Reading)

- Propeller shaft for runout (Steel tube type).

  Static runout limit : 0.13 mm(0.005 in)

  TIR on the neck of the slip tube shaft (with a boot).

  0.25 mm(0.010 in)

  TIR on the ends of the tubing 3 inch from the welds.

  0.38 mm(0.015 in)

  TIR at the linear center of the tube.

  0.38 mm(0.015 in)

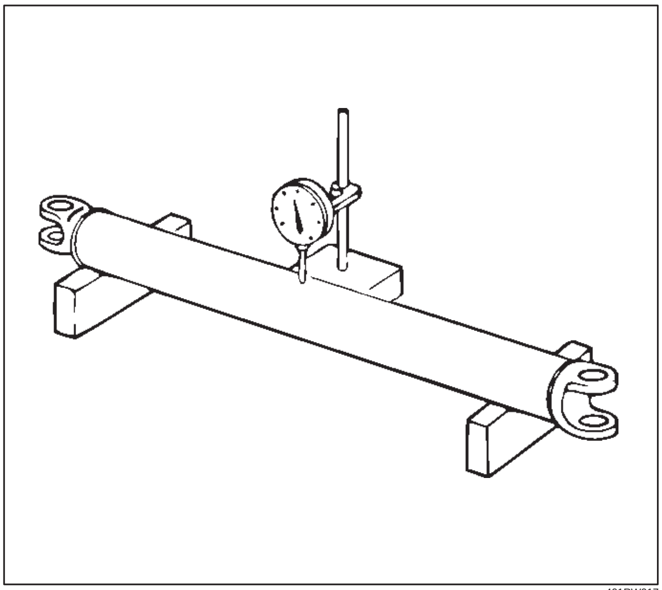
  (TIR: Total Indicator Reading)



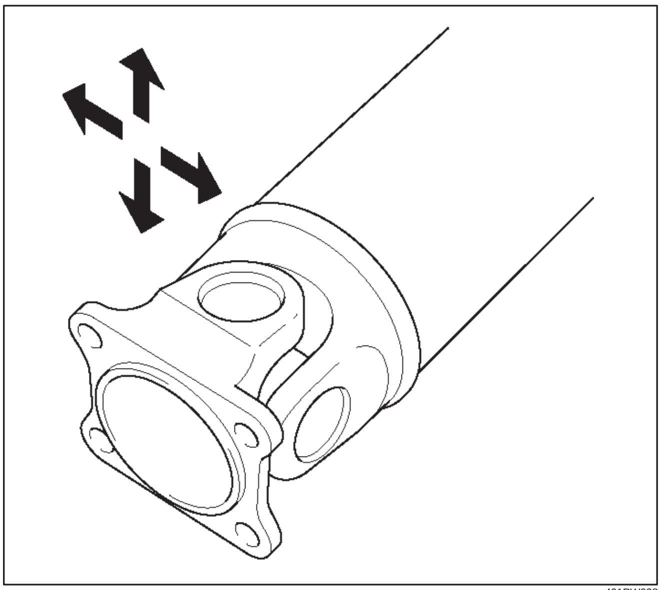
401RW017

- Play in universal joint.

  Limit: Less than 0.15 mm(0.006 in)

- Spider pin should be smooth and free from fretting or galling.

  Visible signs of needle presence is normal, but wear should not be felt.

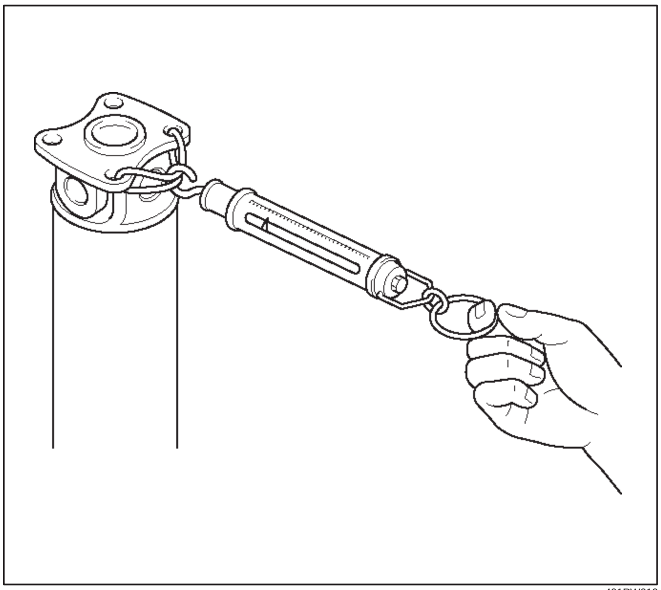


401RW028

- Preload of the universal joint.

  Preload should be 0 to 49 N (0 to 11.0 lb).

  Joints should rotate smoothly and freely and should exhibit no rough or ratchety movement.



401RW019

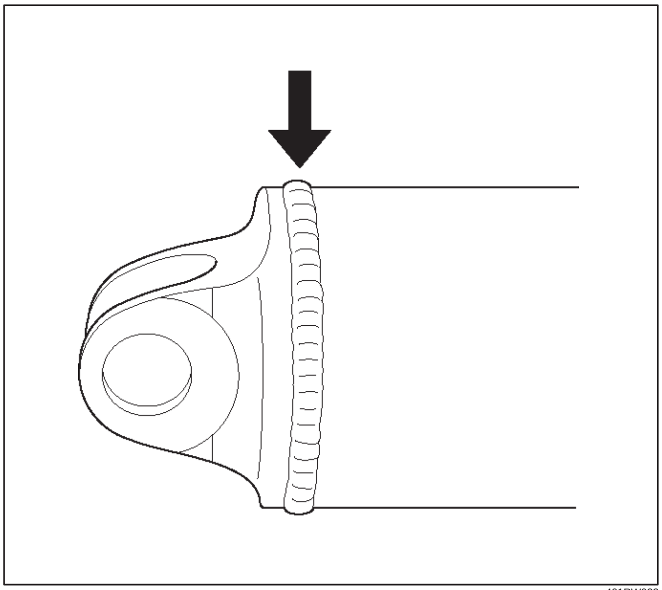
- Inspect splines of slip joint for wear.

  The nylon-coated spline should be free from nicks and dings and the underlying steel spline should not be visible.

  After cleaning the nylon coating spline, the coating should exhibit only slight indicator of wear.

  Grease volume is approximately 10 grams of grease in total. Grease should be evenly applied to both the female and the male slip splines using a small brush. After assembly of the slip joint, the sliding joint should be fully worked from the full collapsed to the full extended position.

- Aluminum tube type only: Inspect the aluminum tubing for surface scratches and dents. These scratches may not exceed 0.2 mm (0.008 in) in depth.



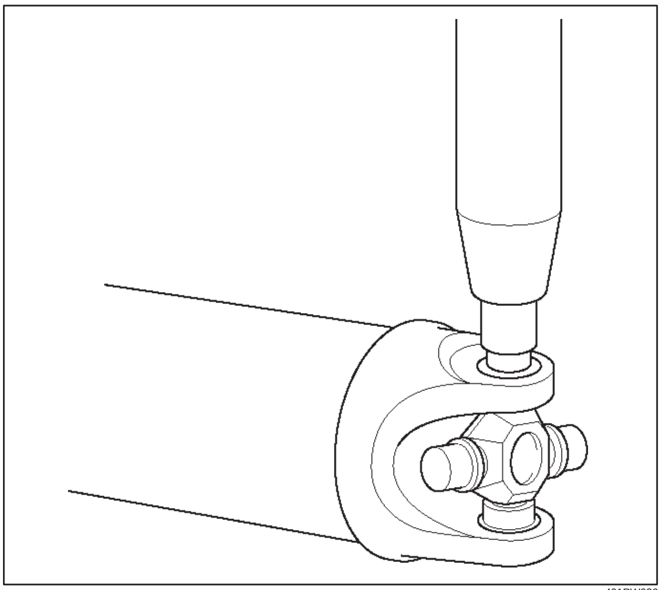
401RW022

- Aluminum tube type only: Visually inspect the circle welds and fittings for any signs of cracks or signs of deterioration. If there are any cracks that exceed 0.2 mm (0.008 in) in depth, the assembly must be replaced.
- Aluminum tube type only: Check to be sure there are no missing balance weights. If balance weights are missing and void has occurred in the aluminum tubing greater than 0.2 mm (0.008 in), the assembly must be replaced.

Universal Joint Reassembly

1. Pack the four grease cavities of the spider with a high quality, extreme pressure N.L.G.I. Grade 2 grease. Do not add additional grease to bearing cup assembly.
2. Move one end of the spider to cause a trunnion to project through the spider hole beyond the outer machined face of the yoke lug. Place a bearing over the trunnion diameter and align it to the spider hole.

   Using an arbor press, hold the trunnion in alignment with the spider hole and place a solid plug on the upper bearing. Press the bearing into the spider hole enough to install snap ring.



401RW026

3. Install a snap ring.

NOTE: Be sure the snap rings are properly seated in the grooves.

4. Repeat steps 2 and 3 to install the opposite bearing. If the joint is stiff, strike the yoke ears with a soft hammer to seat the bearing.
5. Align the setting marks and join the yokes.

Slip Joint Reassembly

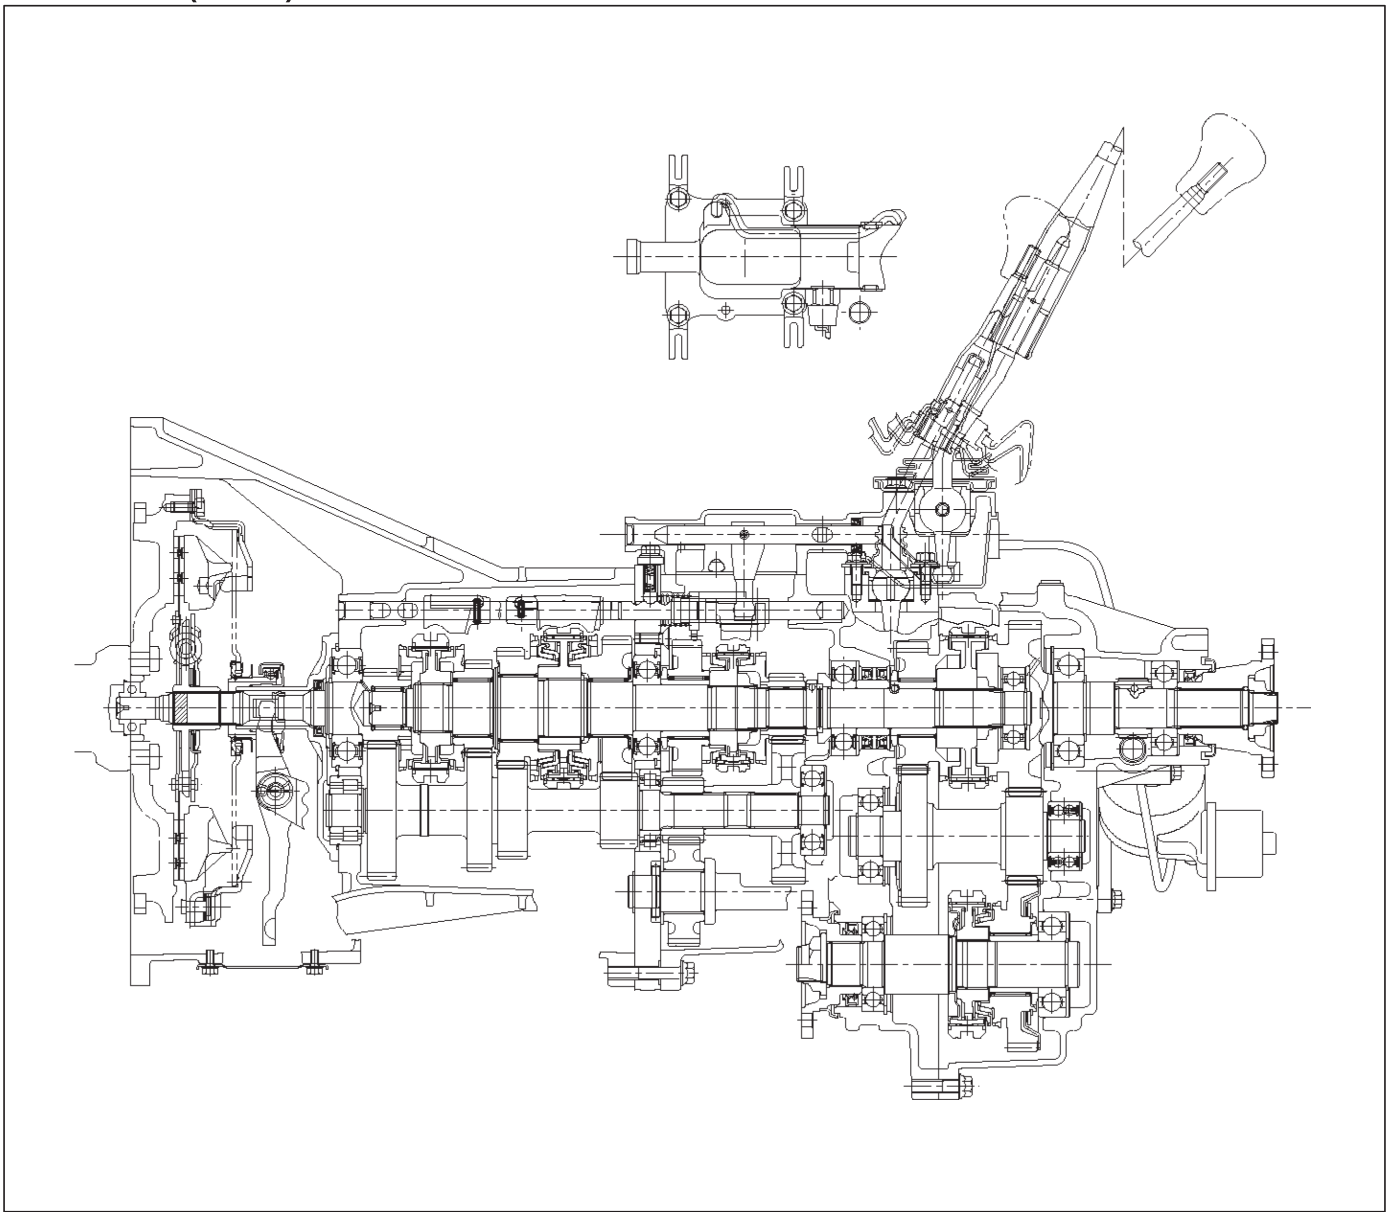
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

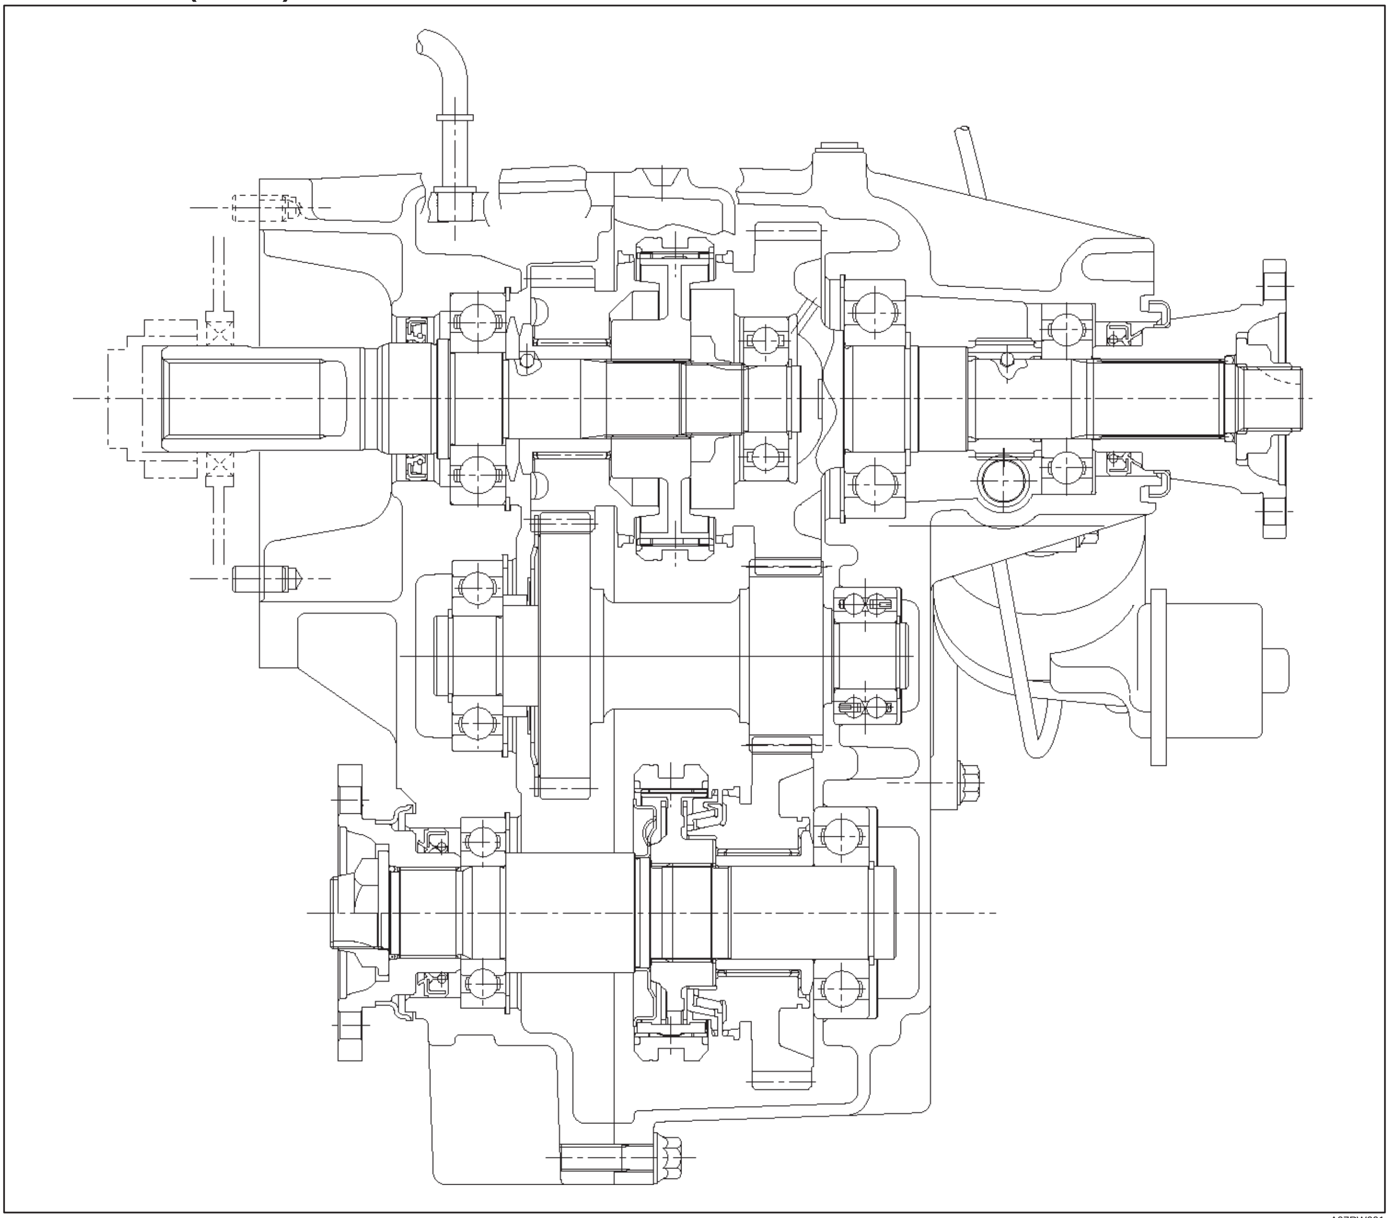
General Description

Transfer Case (for M/T)



A07RW002

Transfer Case (for A/T)



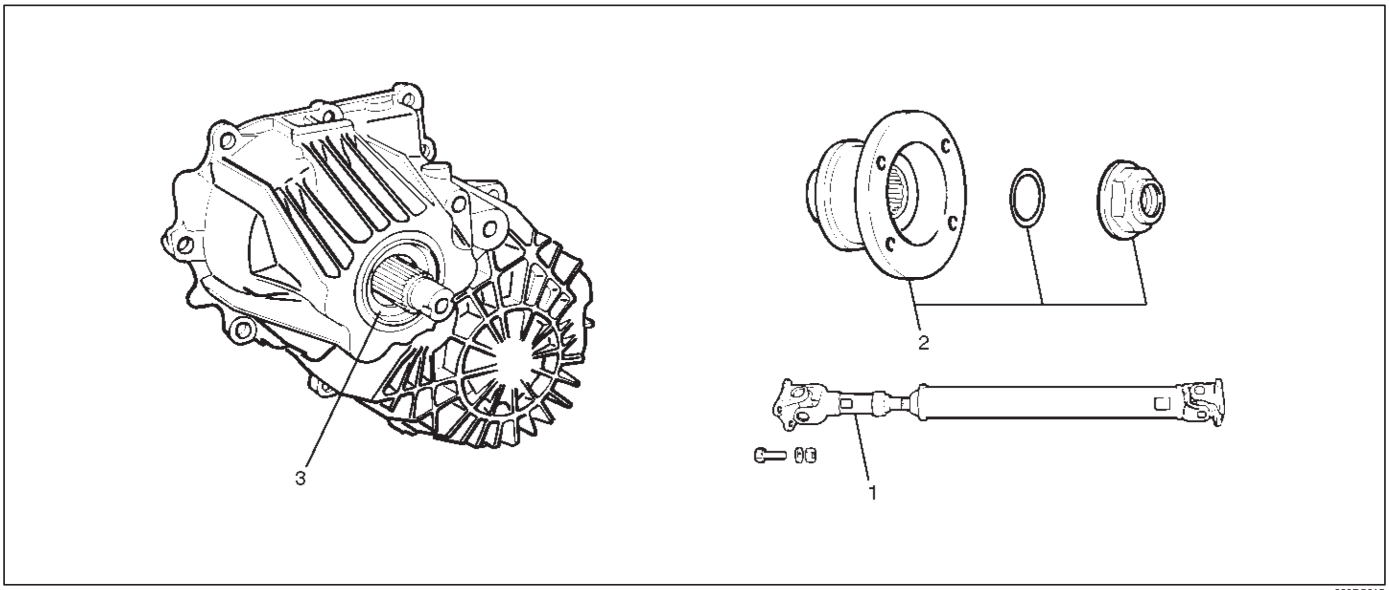
A07RW001

The transfer case is used to provide a means of providing power flow to the front axle. The transfer case also provides a means of disconnecting the front axle, providing better fuel economy and quieter operation when the vehicle is driven on improved roads where four wheel drive is not required. In addition, the transfer case provides an additional gear reduction when placed in low range, which is useful when difficult off–road conditions are encountered.

A floor mounted shift lever is used to select the high–low range. When four wheel drive switch has been turned on, the four wheel drive indicator light is designed to come on and the front axle has been engaged.

Transfer Rear Oil Seal

Transfer Rear Oil Seal and Associated Parts



220RS015

Legend

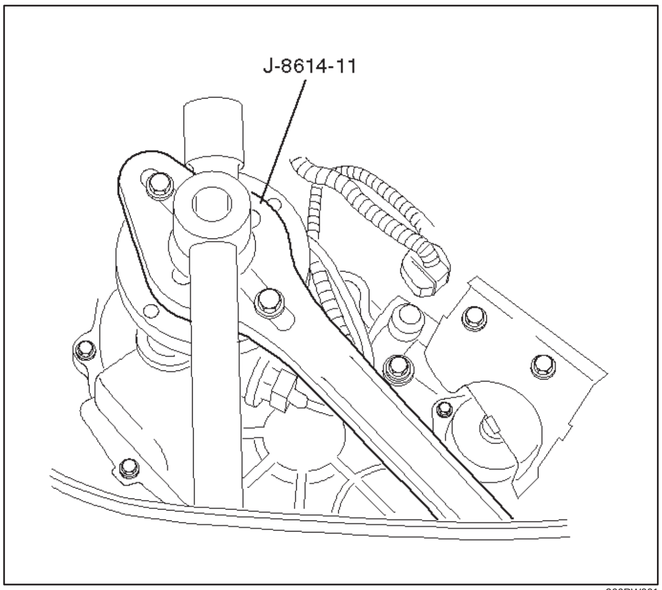
(1) Rear Propeller Shaft

(2) End Nut and Rear Companion Flange

(3) Oil Seal

Removal

1. Disconnect the rear propeller shaft (1) from the transfer case side.
2. Remove end nut and rear companion flange (2), using the companion flange holder J–8614–11.

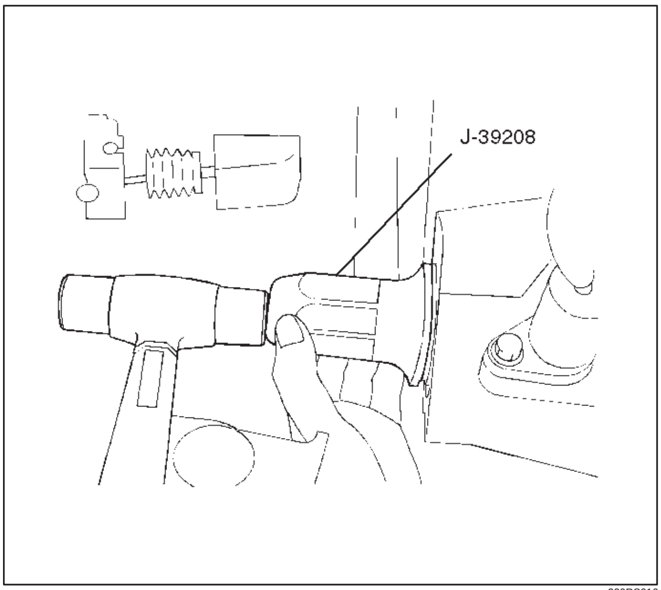


266RW001

3. Use the universal puller to remove the rear companion flange and O–ring.
4. Remove the oil seal from the transfer case.

Installation

1. Install oil seal and apply engine oil to the oil seal outer surfaces.
2. Apply the recommended grease (BESCO L2) or equivalent to the oil seal lip.
3. Use the oil seal installer J–39208 to install the rear seal (3) to the transfer rear case.



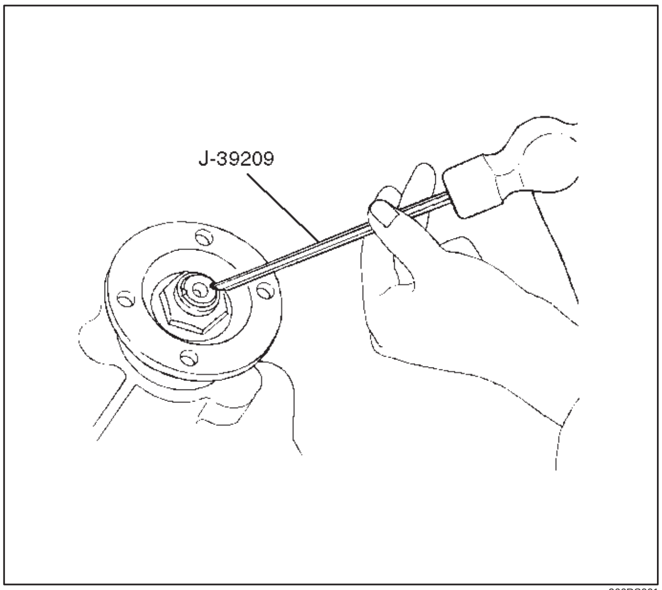
220RS016

4. Install the rear companion flange (2) and O–ring (2).
5. Use the companion flange holder J–8614–11 to install a new end nut (2) and tighten to the specified torque.

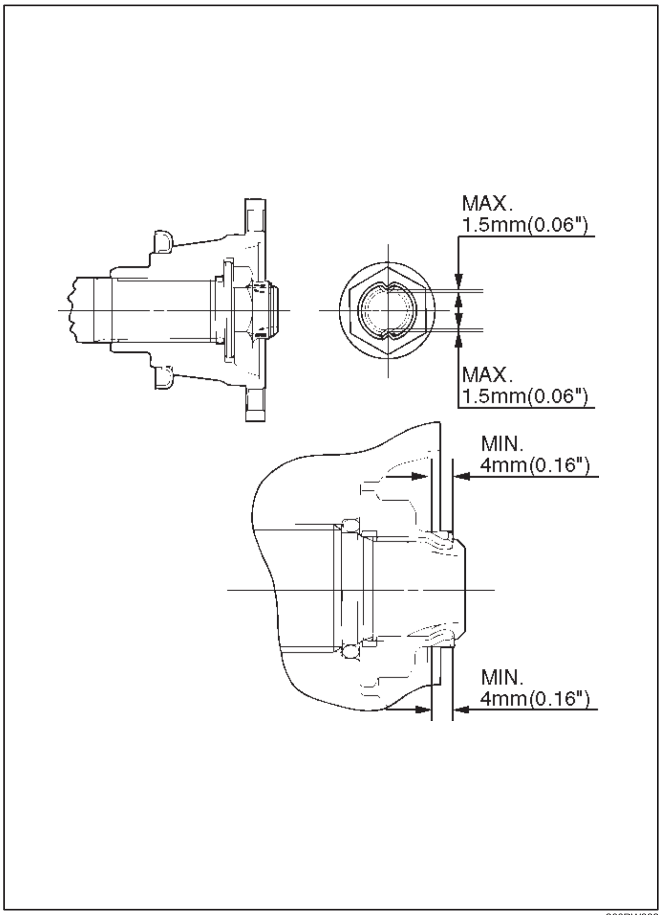
Torque: 167 N·m (123 lb ft)

6. Use the punch J–39209 to stake the end nut at two spots.

NOTE: Be sure to confirm that there is no crack at the staked portion of the end nut (2) after staking.



266RS001



266RW002

7. Connect the rear propeller shaft to the transfer case and tighten to the specified torque.

Torque: 63 N·m 46 (lb ft)

Transfer Case Assembly (A/T)

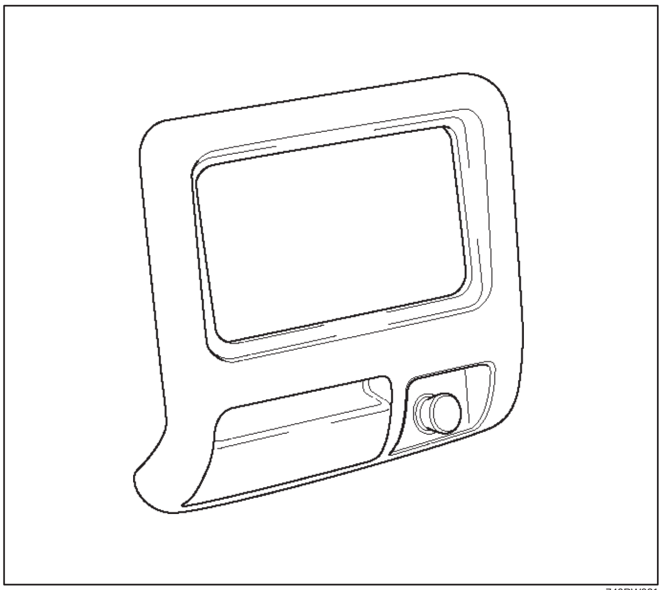
(9) Front Propeller Shaft
(10) Transfer Case Assembly

Removal

NOTE: Before removing transmission and transfer assembly from vehicle, change the transfer mode to 2WD using the 4WD push button switch on dash panel.

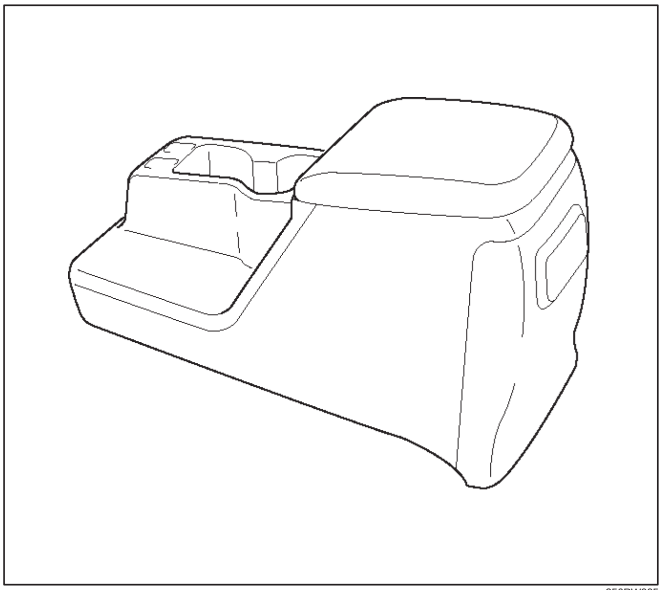
1. Disconnect battery ground cable.
2. Remove transfer control lever knob (1).

3. Remove lower cluster assembly (2).



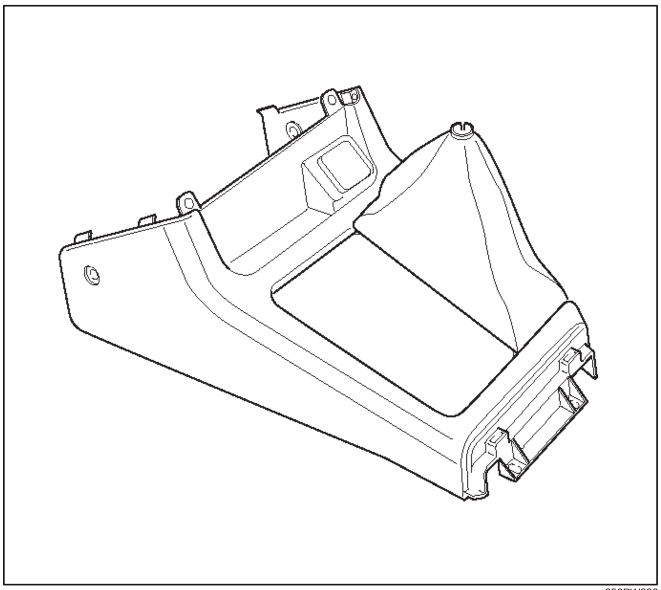
740RW021

4. Remove rear console (3).



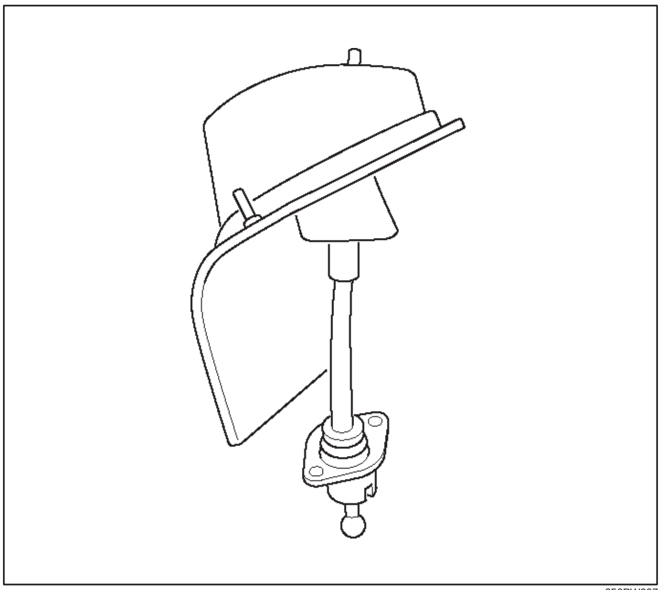
256RW005

5. Remove center console (4).



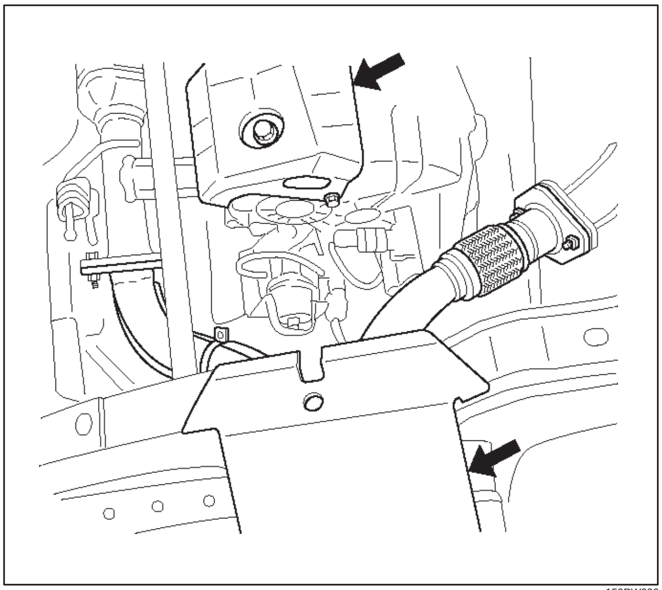
256RW006

6. Remove grommet assembly and transfer control lever (5).



256RW007

7. Raise and support vehicle with suitable stands. Drain transfer case fluid.
8. Remove transfer protector (6) and fairing plate (7).



150RW006

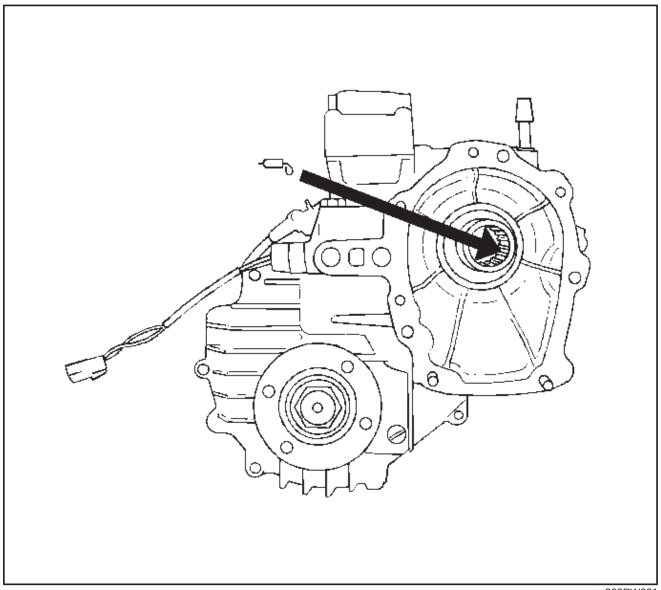
9. Remove rear propeller shaft (8) and front propeller shaft (9).

NOTE: Apply alignment marks on the flange at both front and rear sides.

10. Disconnect harness connectors and clip.
    Connector: transfer switch, 2WD–4WD actuator, speed sensor.
11. Support transmission case with a transmission jack.
12. Remove the top position bolt from transfer control lever hole and others under the floor.
    Remove transfer case (10) from the vehicle.

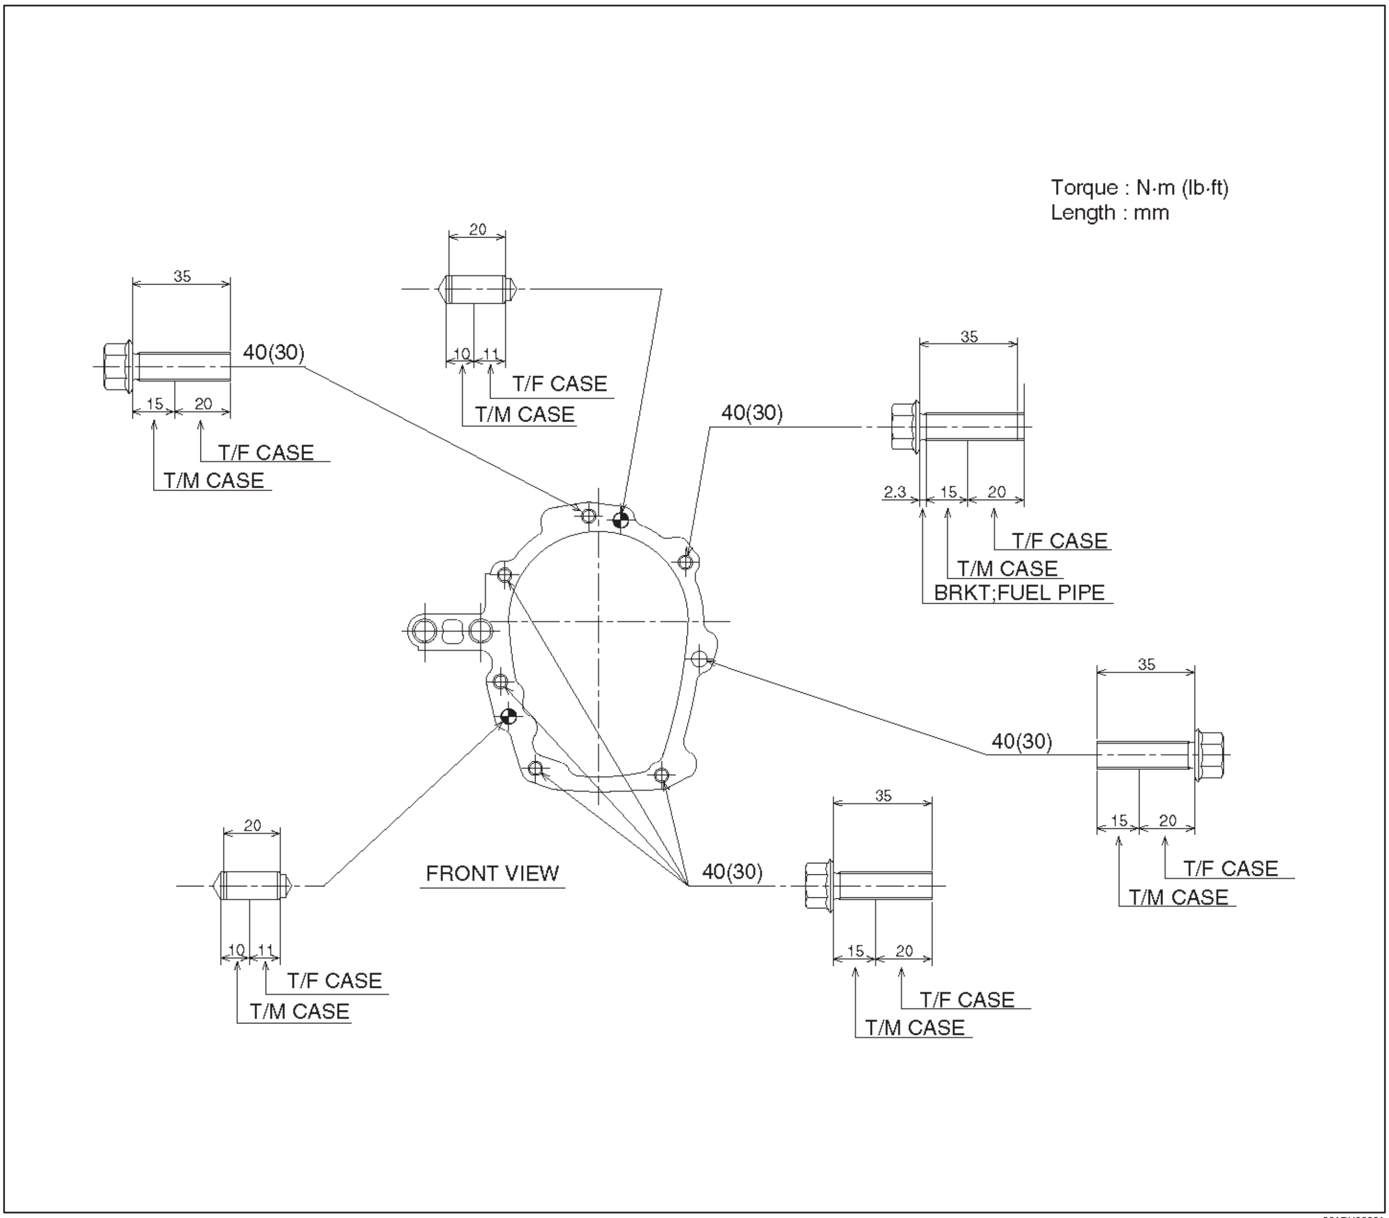
Installation

1. Apply a thin coat of molybdenum disulfide grease to the input shaft spline as shown in the figure.



260RW001

2. Install transfer case (10) to the transmission. Tighten transfer bolts as shown in the figure.

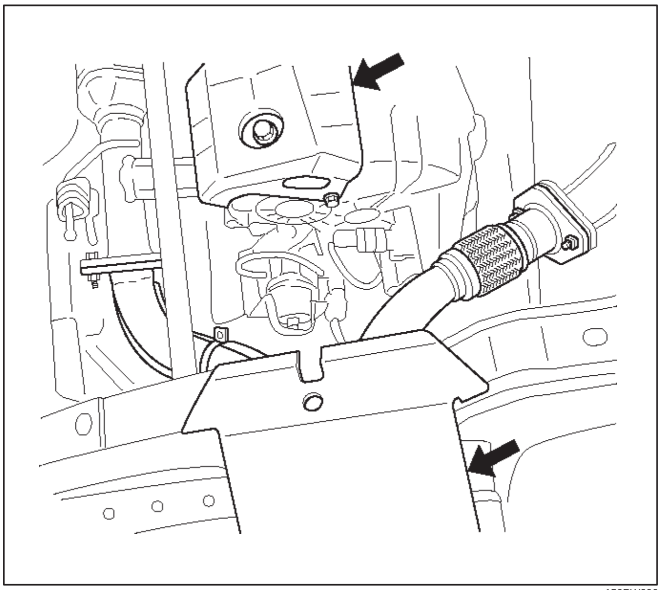


261RX00001

3. Remove the transmission jack from transmission side.
4. Connect harness connectors and clip.
   Connector: transfer switch, 2WD–4WD actuator, speed sensor.
5. Install rear propeller shaft (8) and front propeller shaft (9).

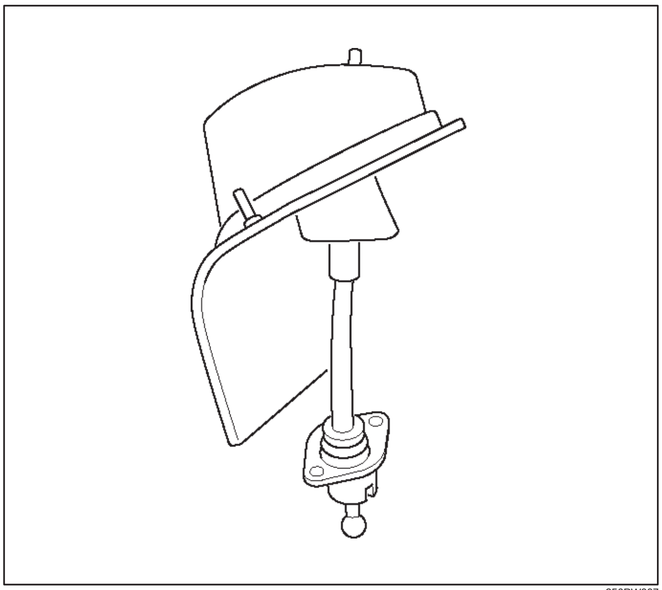
Torque: 63 N·m (46 lb ft)

6. Install transfer protector (6) and fairing plate (7).



150RW006

7. Fill transfer case fluid.
8. Lower the vehicle.
   Install grommet assembly and transfer control lever (5).



256RW007

9. Install center console (4), rear console (3) and lower cluster assembly (2).
10. Install transfer control lever knob (1).

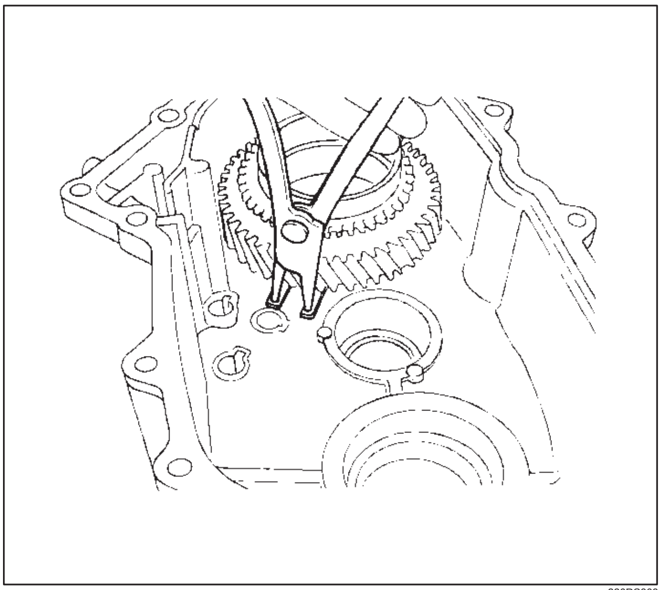
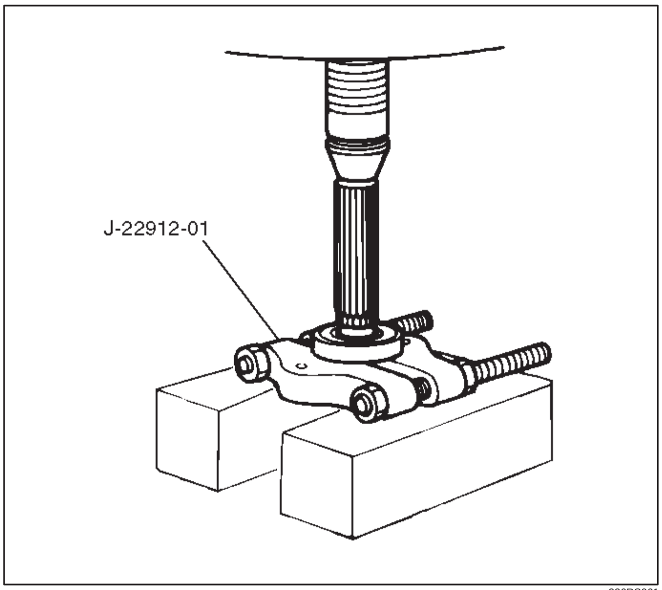
Disassembly

1. Remove bearing snap ring, use a pair of snap ring pliers to remove the snap ring (3).



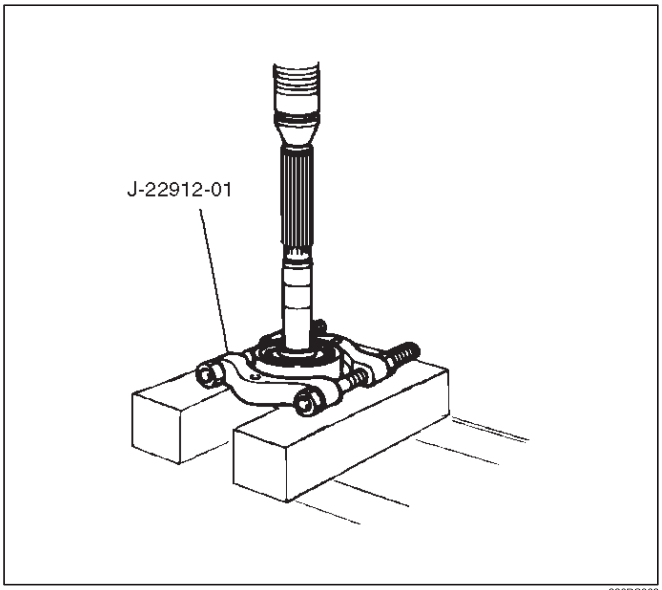
226RS060

2. Remove the rear output shaft assembly (1) from the transfer rear cover (with oil seal) (9).
3. Remove ball bearing (8), using a bench press and the bearing remover J–22912–01.



226RS061

4. Remove speedometer drive gear (7).
5. Remove ball (6).
6. Remove bearing snap ring (5), using a pair of snap ring pliers.
7. Remove rear output shaft (2) from the ball bearing (4), using a bench press and the bearing remover J–22912–01.



226RS062

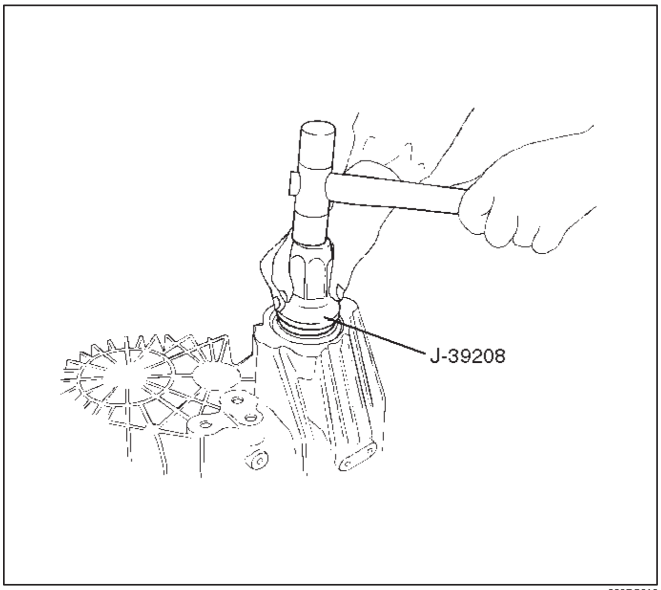
Inspection and Repair

Refer to “TRANSFER CASE ASSEMBLY” in this section for inspection and repair.

Reassembly

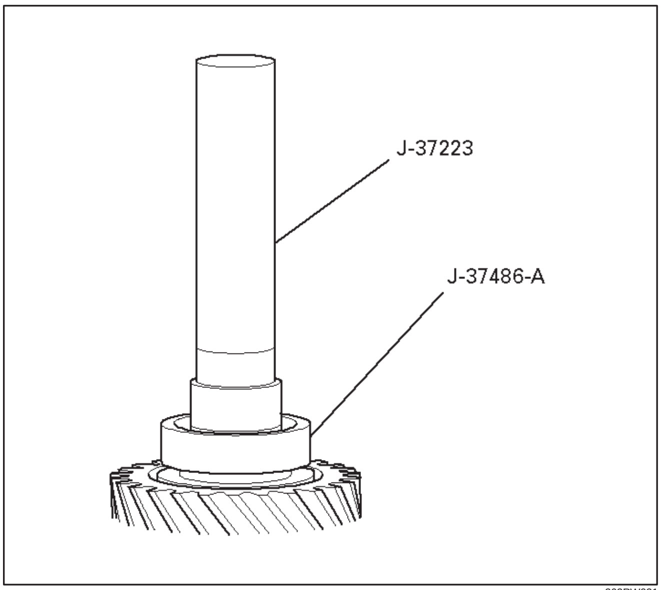
Transfer rear cover (with oil seal) (9). Oil seal replacement.

- Remove the oil seal from the transfer rear cover.
- Apply engine oil to the oil seal outer surfaces.
- Fill in recommended grease (BESCO L2) or equivalent in the oil seal lip.
- Use the oil seal installer J–39208 to install the rear oil seal to the transfer rear cover.



220RS019

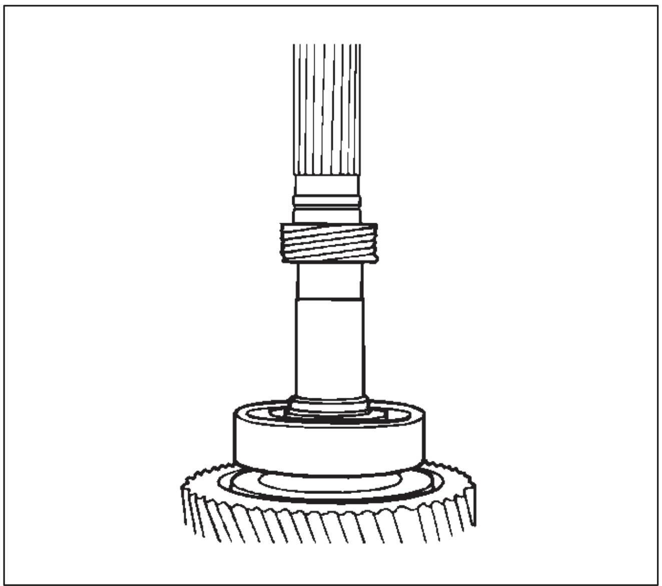
1. Install ball bearing (4) to the rear output shaft (2), using the ball bearing installer J–37223 and the adapter J–37486–A.



262RW021

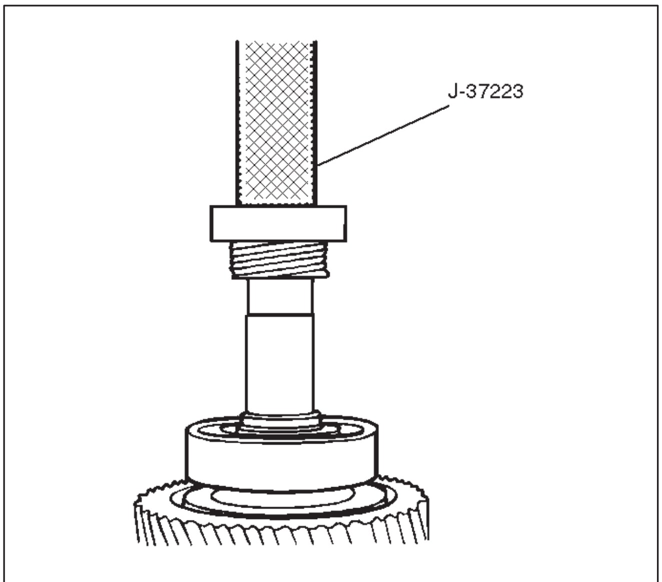
2. Install bearing snap ring (5), using a pair of snap ring pliers.
3. Install ball (6).

4. Install speedometer drive gear (7).



226RS064

5. Use the ball bearing installer J–37223 to install the ball bearing (8).



226RS065

6. Install the rear output shaft assembly (1) to the transfer rear cover (9).
7. Install bearing snap ring (3).

NOTE: The snap ring must be fully inserted into the transfer rear cover snap ring groove.

Detent, Shift Arm, and Interlock Pin (Transfer Case Assembly)

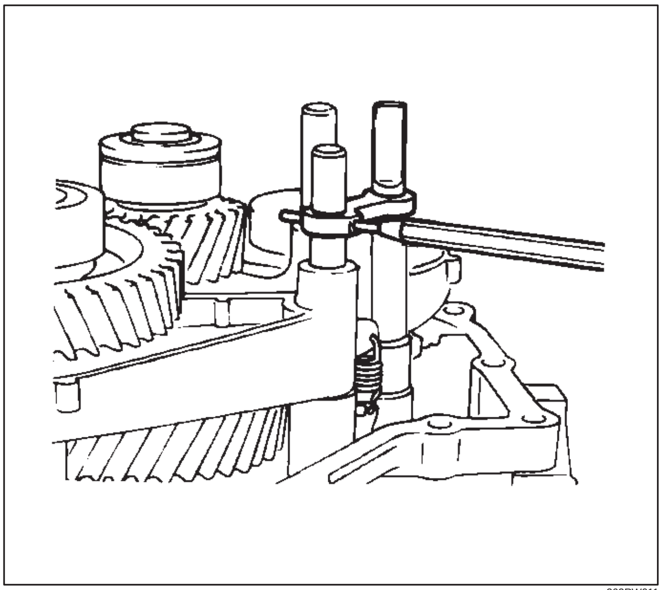
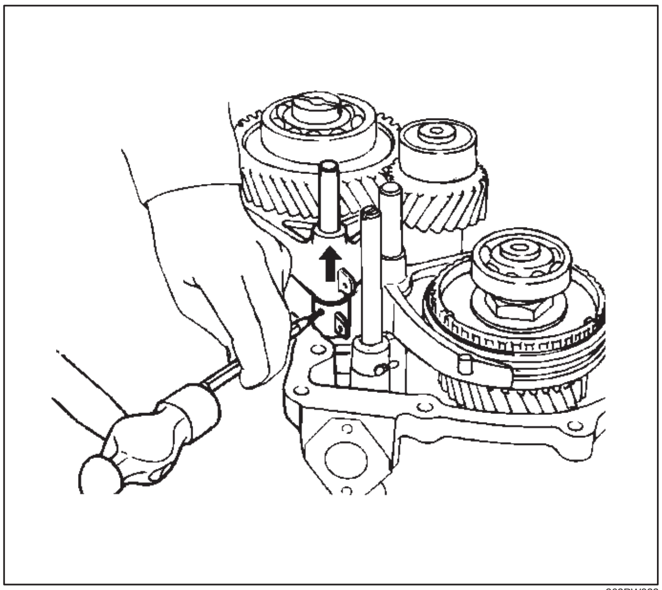
Disassembly

1. Remove detent ball, spring and plug (1).
2. Use a spring pin remover to remove the spring pin (2) from the bridge (6).



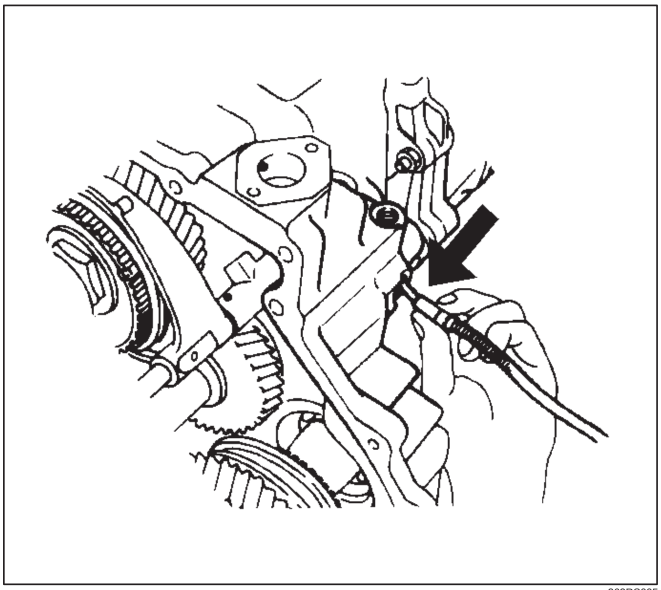
262RW011

3. Remove spring (4).
4. Engage the 2WD–4WD sleeve with front output gear. Remove the spring pin (3) from the block (7). Remove the shift rod (5).



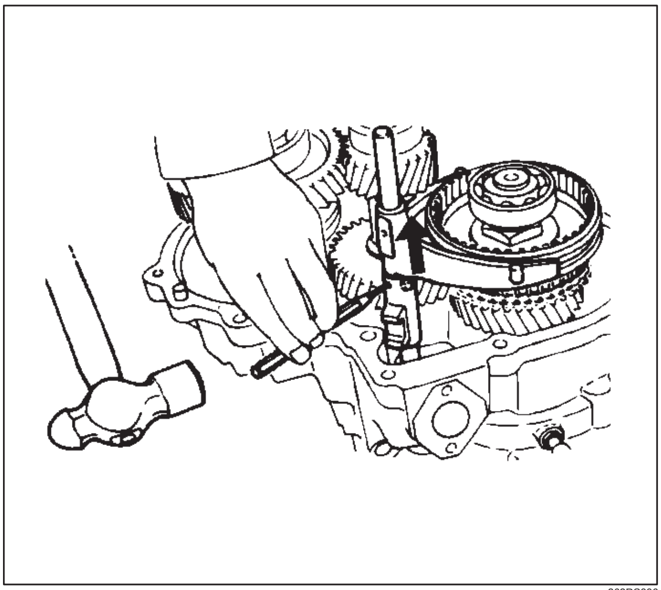
262RW022

5. Remove shift arm (6).
6. Remove shift block (7).
7. Remove 4WD indicator switch (8).
8. Use a magnetic tool to remove the interlock pin (9) and spring (10) from the transfer case (16).



262RS005

9. Remove select rod assembly (11).
10. Use a spring pin remover to remove the shift arm spring pin (12) from the shift arm (14) and shift block (15). Remove the high–low shift rod (13) from transfer case (16).



262RS006

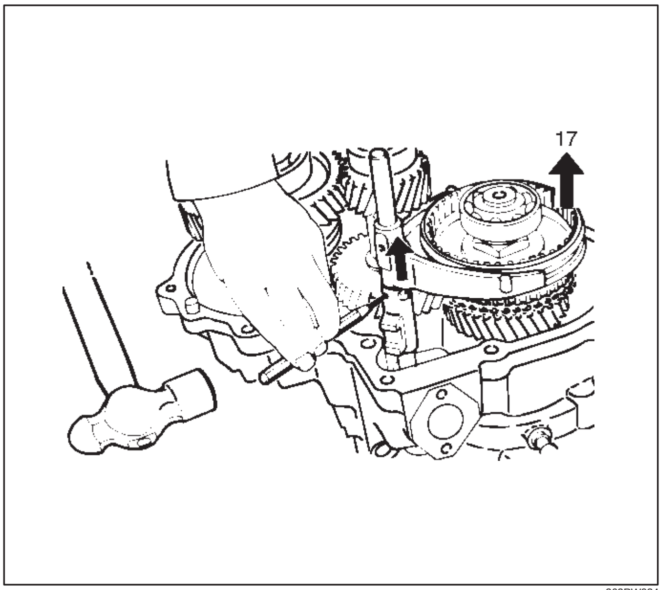
11. Remove shift arm (14).
12. Remove shift block (15) from transfer case (16).

Inspection and Repair

Refer to “TRANSFER CASE ASSEMBLY” in this section for inspection and repair.

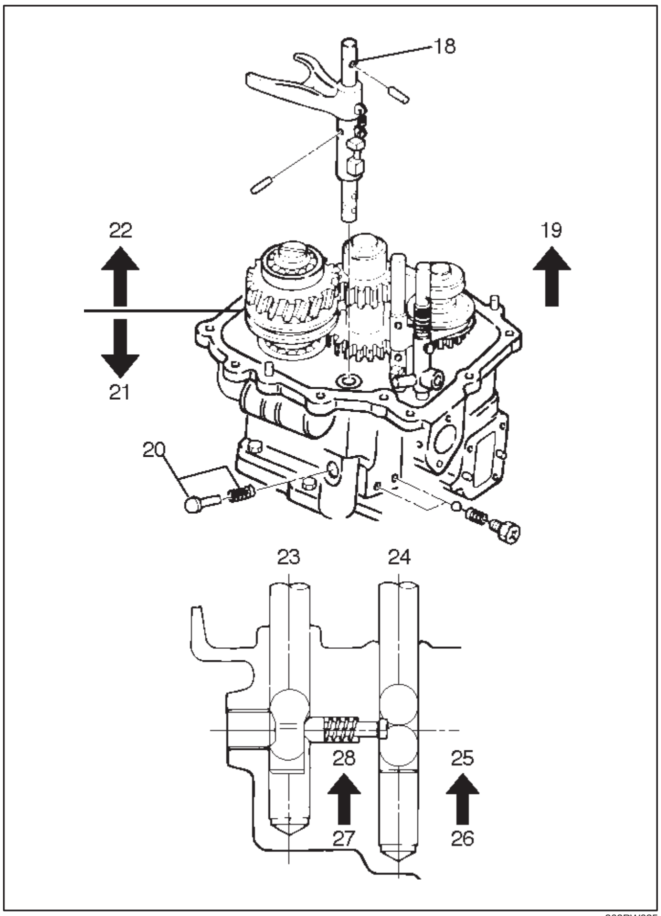
Reassembly

1. Place shift block (15) in transfer case (16).
2. Set shift arm (14) on the High–Low sleeve.
3. Push High–Low shift rod (13) through shift arm (14) and block (14).
4. Engage the High–Low sleeve with the 4H (1) side.
5. Install the spring pin (12) to the shift block (15) and shift arm (14).



262RW034

6. Install select rod assembly (11), joining its lever to shift block groove.
7. Engage the High–Low sleeve with the 4H side and install the interlock pin and spring (10) in the proper direction.
8. Place 2WD–4WD shift block in the transfer case (16).
9. Set 2WD–4WD shift arm on the 2WD–4WD sleeve.
10. Puh 2WD–4WD shift rod through 2WD–4WD shift arm and 2WD–4WD shift block.
11. Install the shift rod: 2WD–4WD (5) with interlock pin pushed in.



262RW035

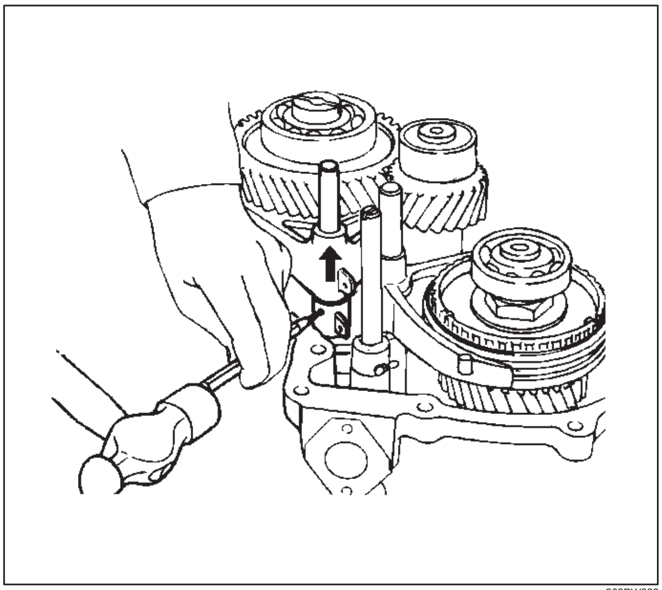
(26) 4L
(27) 4×2
(28) 4×4

12. Install 4WD indicator switch and gasket (8).
    Tighten to the specified torque.

    Torque: 39 N·m (29 lb ft)

13. Install spring (4).

14. Engage the 2WD–4WD sleeve with the 4WD side and install the spring pin (3).



262RW022

15. Install spring pin (2) and bridge (2).
16. Install detent ball, spring and plug and tighten the plug to the specified torque.

Torque: 25 N·m (18 lb ft)

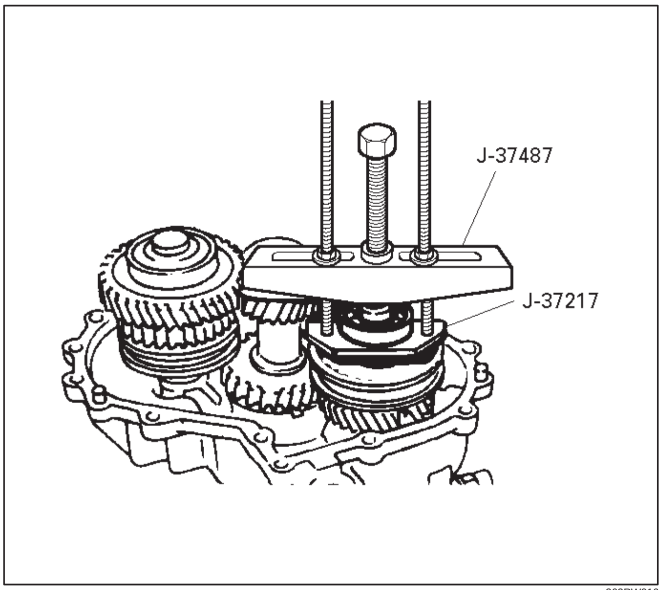
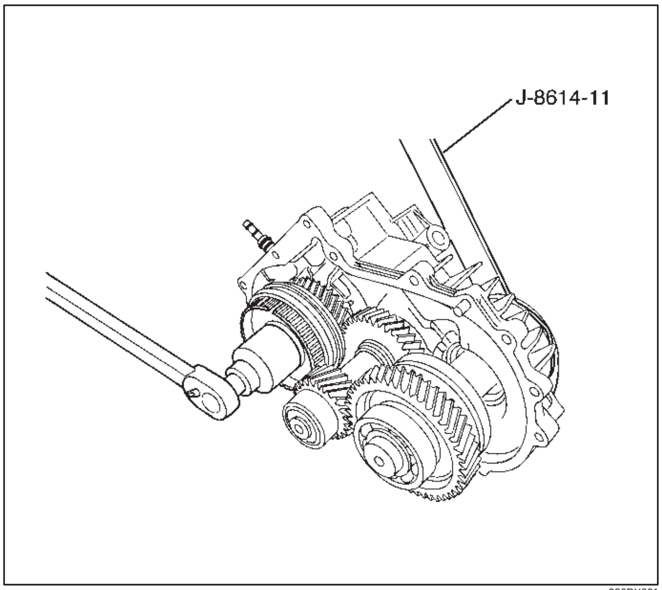
Disassembly

1. Use a pair of snap ring pliers to remove the snap ring (1).
2. Use a bearing remover J–37217 and puller J–37487 to remove the ball bearing (2).



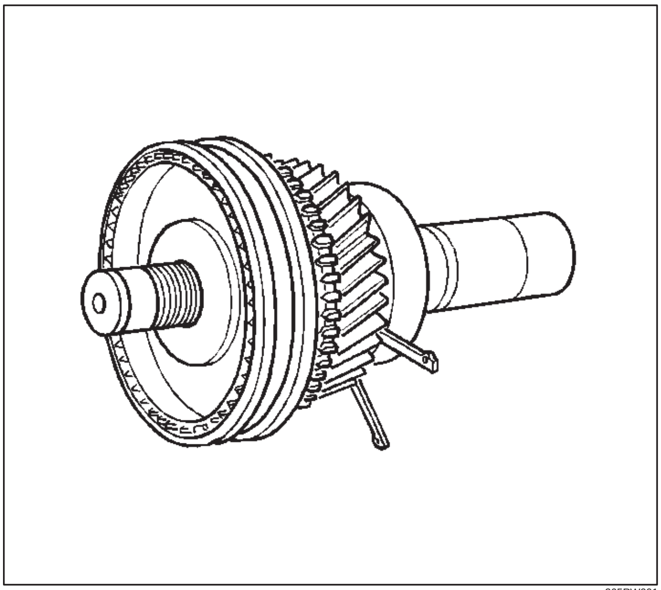
262RW016

3. Install the front companion flange temporarily.
4. Use the Companion flange holder J–8614–11 and lock nut wrench J–37219 to remove the lock nut (3).



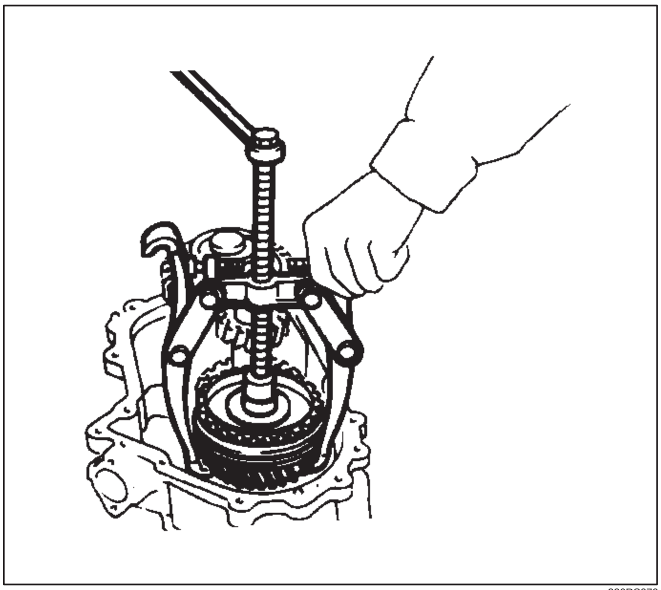
226RX001

5. Remove the front companion flange.
6. Remove snap ring (4). (A/T)
7. Remove the input shaft assembly (5) from the transfer case (42). (A/T)



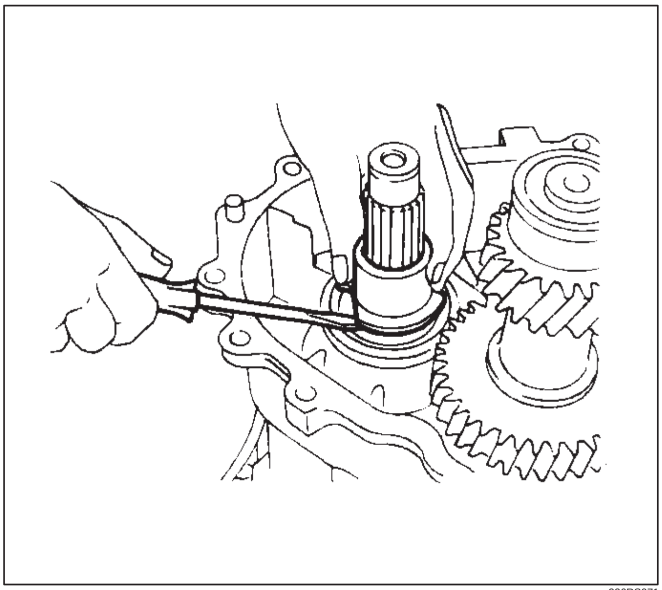
265RW001

8. Use the universal puller to remove the high–low clutch hub and sleeve (6), and transfer input gear (7).



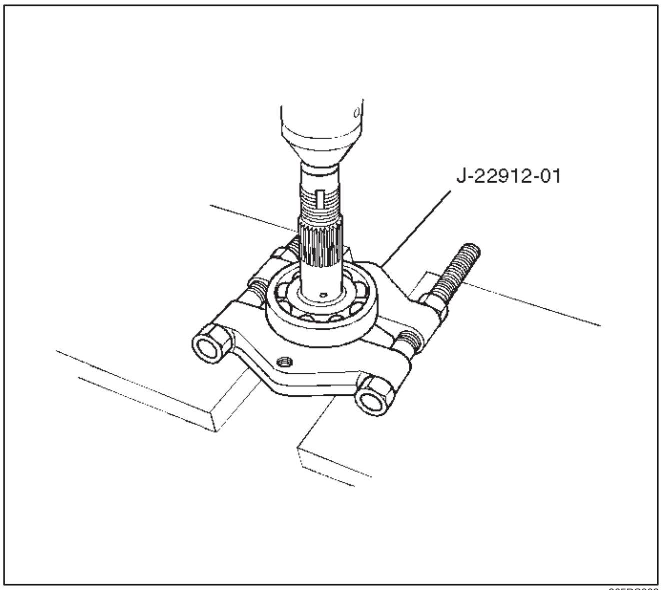
226RS070

9. Remove needle bearing (8).
10. Remove bearing collar (9).



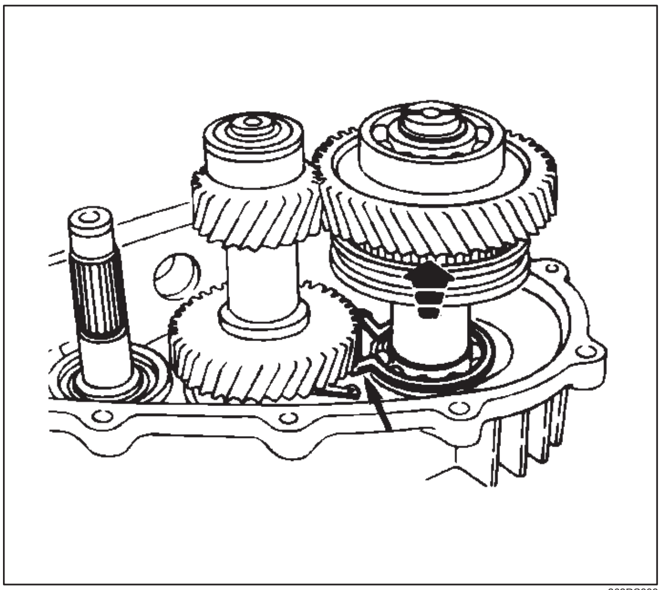
226RS071

11. Remove ball (10).
12. Remove plate (11).
13. Use a bench press and the ball bearing remover J–22912–01 to remove the ball bearing (12) from the input shaft (13). (A/T)



265RS002

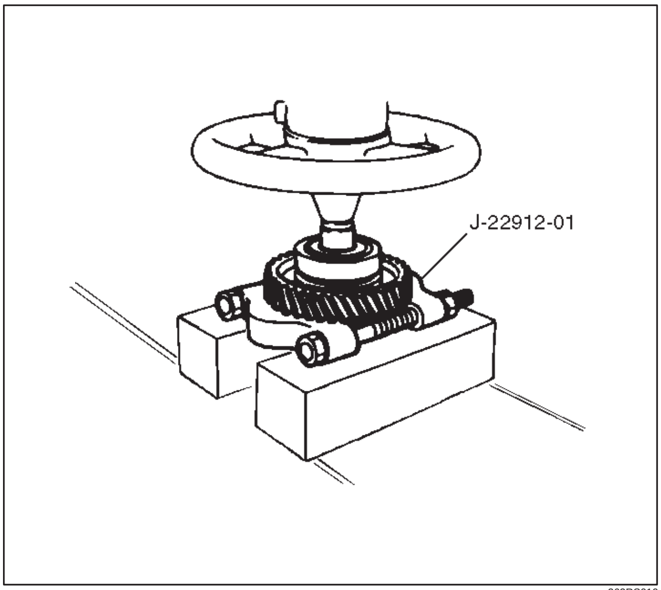
14. Use a pair of snap ring pliers to remove the bearing snap ring (14).
15. Use a plastic hammer to tap the front output gear assembly (15) free.



262RS009

16. Remove bearing snap ring (16).
17. Use a bench press and the bearing remover J–22912–01 to remove the following parts.
18. Remove ball bearing (17), and bearing collar (18). Remove sub–gear snap ring (19), spacer (20), belleville spring (21), and sub–gear (anti–lash plate) (22). (M/T)

    Remove front output gear (23) and needle bearing (24).



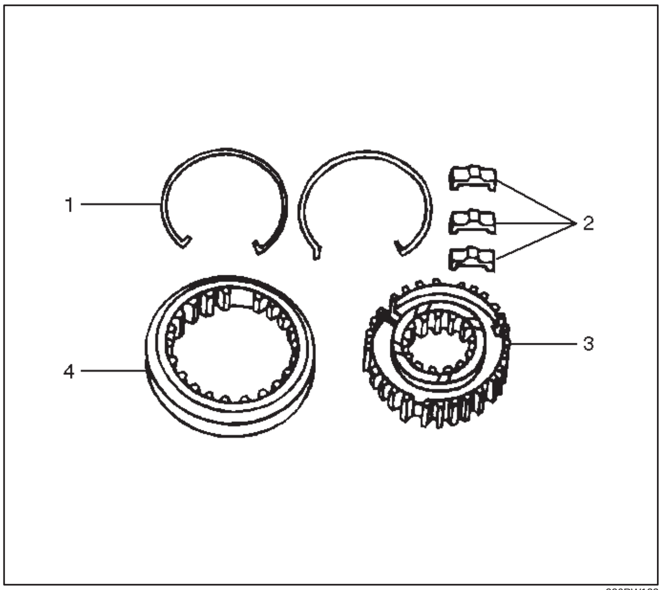
262RS010

19. Remove inside ring (25).
20. Remove outside ring (26).
21. Remove block ring (27).

22. Use a bench press and bearing remover J–22912–01 to remove 2WD–4WD clutch hub and sleeve assembly (28) and stopper plate (29).

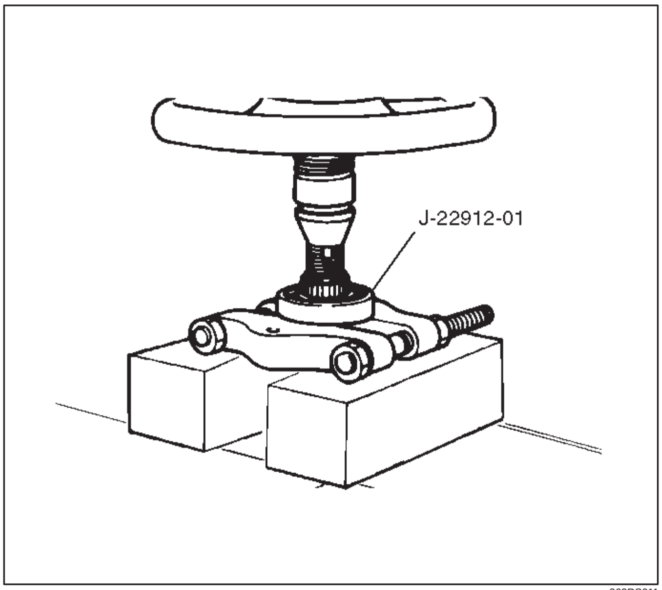
NOTE: Do not reuse the stopper plate.

23. Disassemble the 2WD–4WD clutch hub and sleeve assembly (28).
    - Springs (1)
    - Inserts (2)
    - Clutch Hub (3)
    - Sleeve (4)



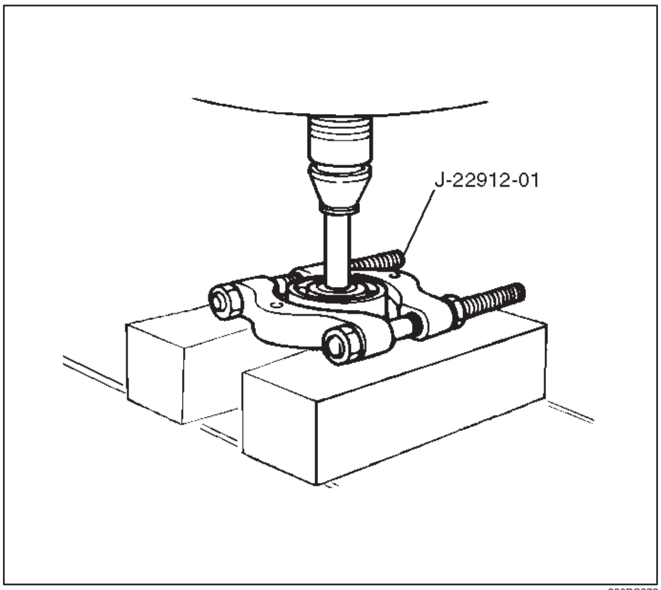
226RW133

24. Use a bench press and the ball bearing remover J–22912–01 to remove the ball bearing (30) from front output shaft (31).



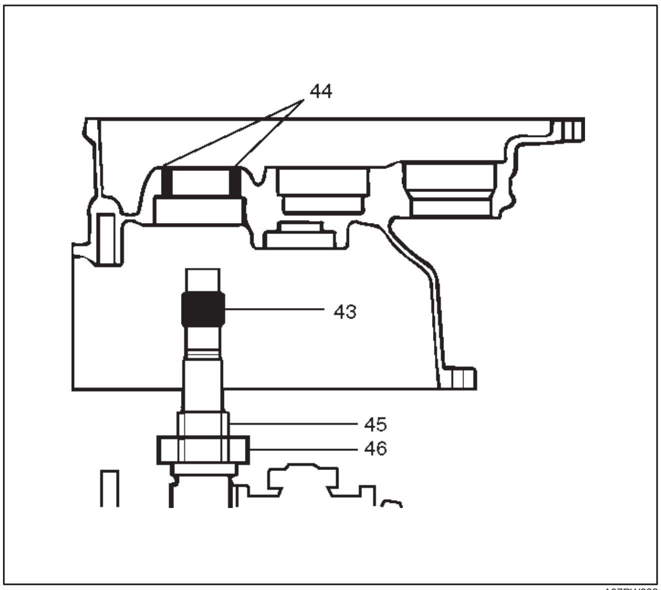
262RS011

25. Remove bearing snap ring (32).
26. Remove the counter gear assembly (33) from the transfer case (42).
27. Use a pair of snap ring pliers to remove the snap ring (34).
28. Use a bench press and the bearing remover J–22912–01 to remove the ball bearing (35).
29. Use a pair of snap ring pliers to remove the snap ring (36).
30. Use a bench press and the bearing remover J–22912–01 to remove the ball bearing (37).



226RS073

31. Remove spacer (38).
32. Remove belleville spring (39).
33. Remove sub–gear (anti–lash plate) (40).
34. Remove counter gear (41).
35. Remove transfer case (with oil seal) (42), performing the following steps (M/T)
    - Cover the shaft splines with adhesive tape (43).



A07RW022

Legend

(43) Adhesive Tape
(44) Oil Seal Lip
(45) Oil Seal Collar
(46) Bearing

- Remove the transfer case together with intermediate plate with gear assembly from the transmission case (M/T).
- Remove the transfer case from the intermediate plat with gear assembly (M/T).

Inspection and Repair

1. Make the necessary repair or parts replacement if wear, damage or any other abnormal conditions are found during inspection.
2. Wash all parts thoroughly in clean solvent. Be sure all old lubricant, metallic particles, dirt, or foreign material are removed from the surfaces of every part. Apply compressed air to each oil feed port and channel in each case half to remove any obstructions or cleaning solvent residue.

Gears

1. Inspect all the gear teeth for signs of excessive wear or damage and check all the gear splines for burrs, nicks, wear or damage. Remove the minor nicks or scratches on an oil stone. Replace any part exhibiting excessive wear or damage.

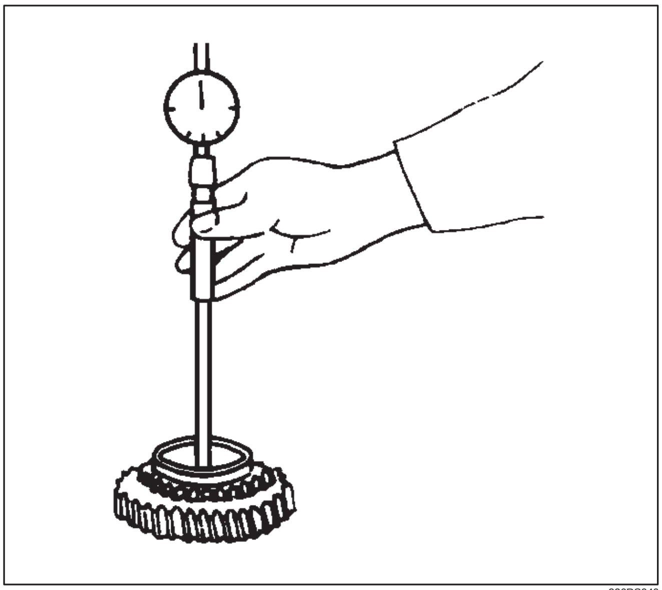
Front Output Gear Inside Diameter

1. Use an inside dial indicator to measure the gear inside diameter.
2. If the measured value exceeds the specified limit, the gear must be replaced.

Gear inside diameter

Standard : 48.000–48.013 mm (1.8898–1.8903 in)

Limit : 48.10 mm (1.894 in)



226RS040

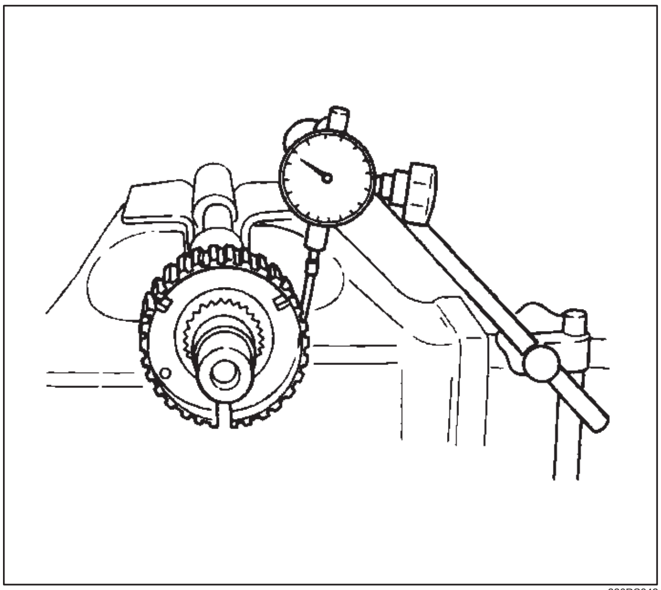
Clutch Hub Spline Play

1. Set a dial indicator to the clutch hub to be measured.
2. Move the clutch hub as far as possible to both the right and the left.
   Note the dial indicator reading.
3. If the measured value exceeds the specified limit, the clutch hub must be replaced.

Clutch hub spline play

Standard : 0–0.1 mm (0–0.004 in)

Limit : 0.2 mm (0.008 in)



226RS042

Bearings

1. Inspect the condition of all the needles and ball bearings. Wash bearings thoroughly in a cleaning solvent. Apply compressed air to the bearings.

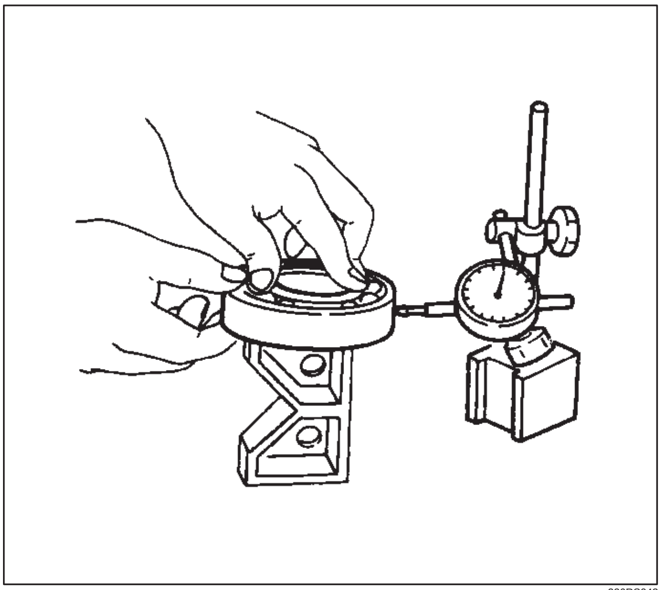
NOTE: Do not allow the bearings to spin. Turn them slowly by hand. Spinning bearings may damage the rollers.

2. Lubricate the bearings with a light oil and check them for roughness by slowly turning the race by hand.

Ball Bearing Play

1. Use a dial indicator to measure the ball bearing play.
2. If the measured value exceeds the specified limit, the ball bearing must be replaced.

Limit : 0.2 mm (0.008 in)



226RS043

Synchronizers

The synchronizer hubs and sliding sleeves are a selected assembly and should be kept together as originally assembled.
Clean synchronizer components with clean solvent and air dry.
Inspect the components for the following:

- Teeth for wear, scuffs, nicks, burrs or breaks.
- Keys and springs for wear, cracks or distortion, replace if these conditions are present.
- If scuffed, nicked or burred conditions cannot be corrected with a soft stone or crocus cloth, replace the component.

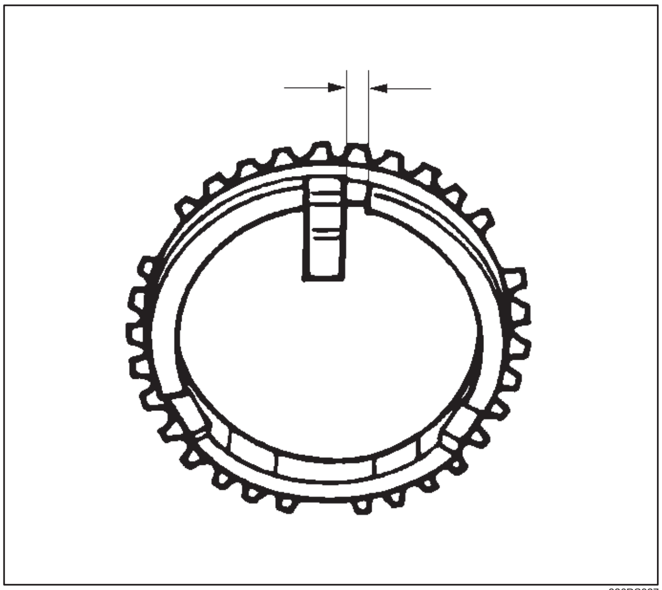
Block Ring and Insert Clearance

1. Use a vernier caliper to measure the clearance between the block ring and the insert.
2. If the measured value exceeds the specified limit, the block ring and the insert must be replaced.

Block ring and insert clearance

Standard : 2.46–2.74 mm (0.097–0.108 in)

Limit : 3.0 mm (0.118 in)



226RS037

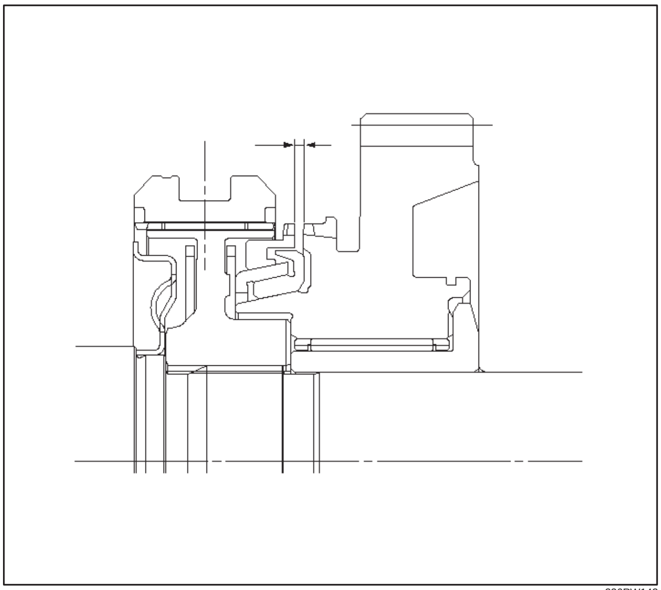
2WD–4WD Synchronizer (3–Cone)

1. Use a thickness gauge to measure the clearance between the block ring and the dog teeth.
2. If the measured value exceeds the specified limit, the 2WD–4WD synchronizer assembly must be replaced.

Block ring and insert clearance

Standard : 1.5 mm (0.059 in)

Limit : 0.8 mm (0.031 in)



226RW142

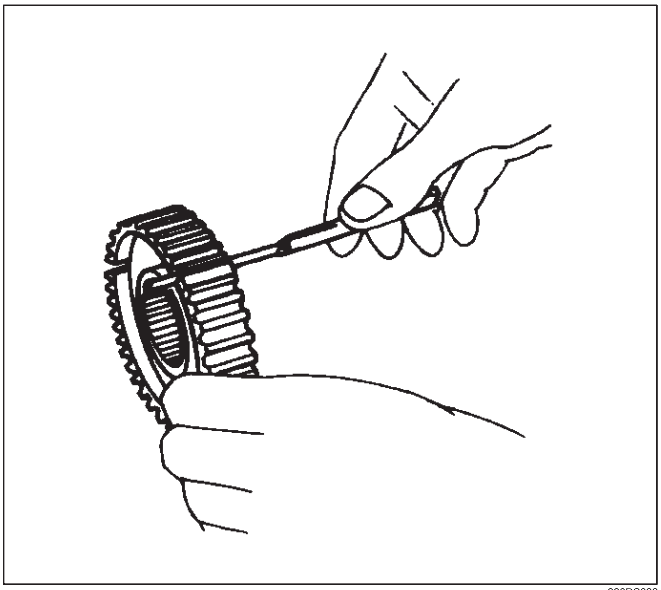
Clutch Hub and Insert Clearance

1. Use a thickness gauge to measure the clearance between the clutch hub and the insert.
2. If the measured value exceeds the specified limit, the clutch hub and the insert must be replaced.

Clutch hub and insert clearance

Standard : 0.01–0.19 mm (0.0004–0.0075 in)

Limit : 0.3 mm (0.012 in)



226RS038

Detent Springs

1. Inspect the springs for distortion, cracks or wear. Replace if these conditions are present.

Detent Spring Free Length

1. Use a vernier caliper to measure the detent spring free length.
2. If the measured value is less than the specified limit, the detent spring must be replaced.

Detent spring free length

Detent ball

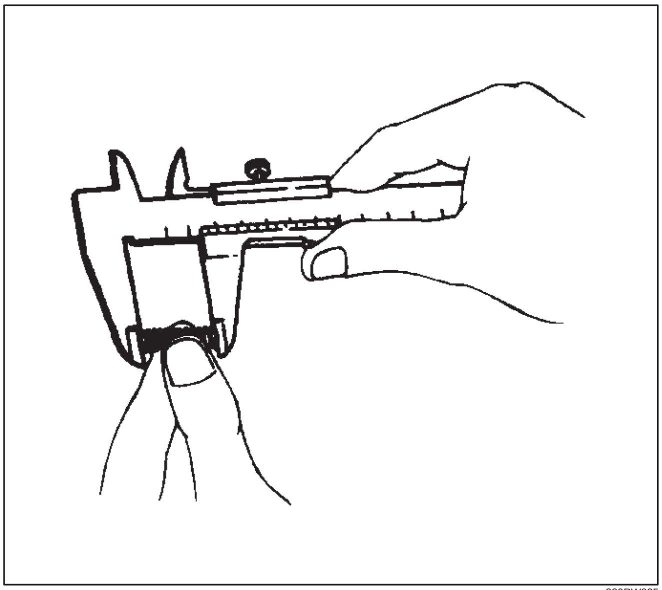
Standard : 23.4 mm (0.921 in)

Limit : 22.8 mm (0.898 in)

Interlock pin

Standard : 15.9 mm (0.626 in)

Limit : 15.3 mm (0.602 in)



220RW035

Detent Spring Tension

1. Use a spring tester to measure the detent spring tension.
2. If the measured value is less than the specified limit, the detent spring must be replaced.

Detent ball

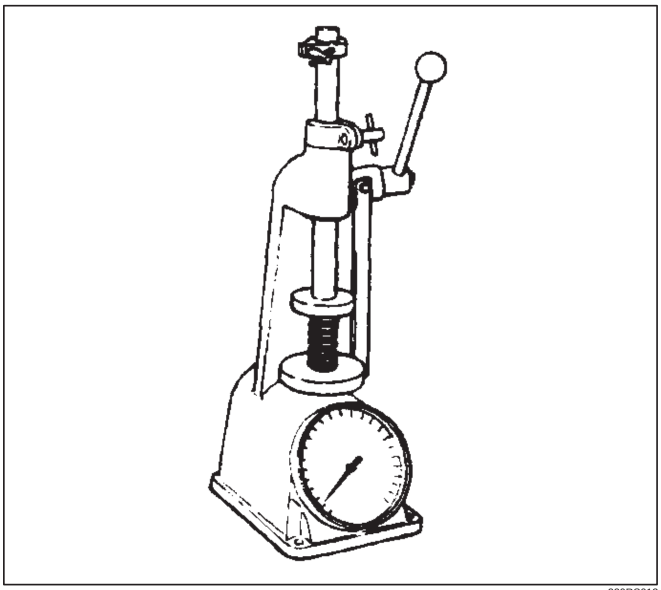
Compressed height : 18.7 mm (0.736 in)

Standard : 68.6–88.2 N (15.4–19.8 lb)

Interlock pin

Compressed height : 11.5 mm (0.453 in)

Standard : 9.8 N (2.2 lb)



220RS013

Shift Arm

1. Inspect the shift arms for wear, distortion or scoring. Replace if these conditions are present.

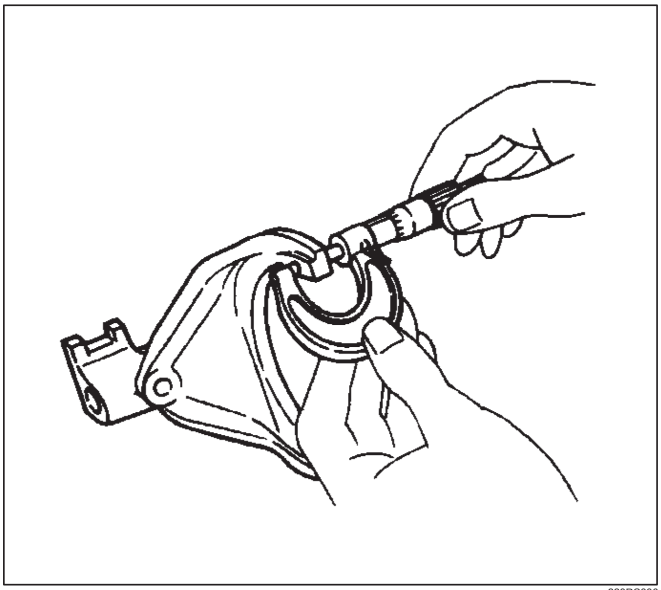
Shift Arm Thickness

1. Use a micrometer to measure the shift arm thickness.
2. If the measured value is less than the specified limit, the shift arm must be replaced.

Shift arm thickness

Standard : 9.60–9.85 mm (0.378–0.388 in)

Limit : 9.0 mm (0.354 in)



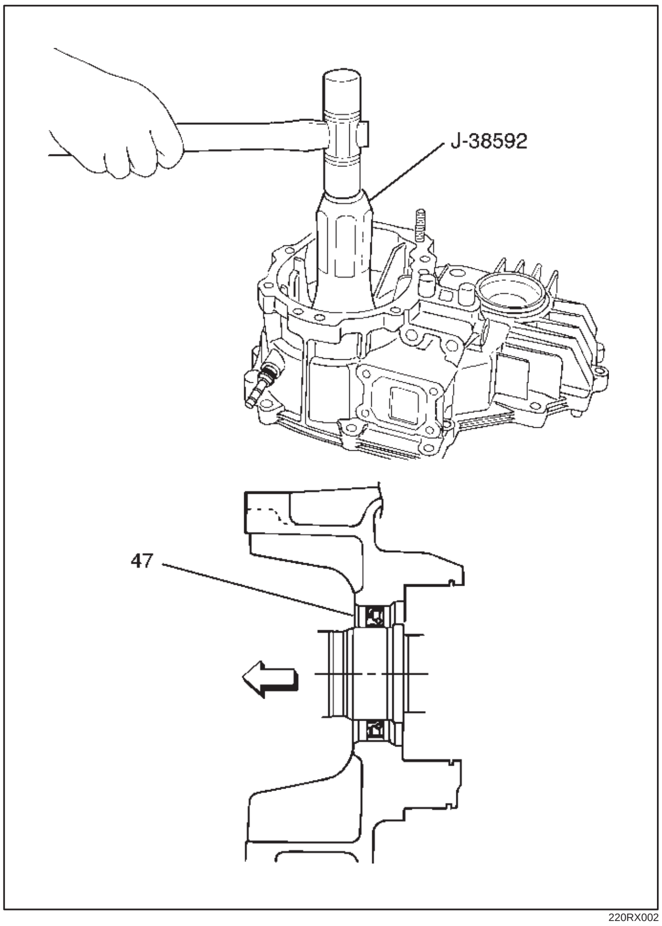
230RS006

Reassembly

Input Shaft Oil Seal Replacement

1. Remove the oil seal from the transfer case.
2. Apply the engine oil to the oil seal outer surfaces.
3. Apply recommended grease (BESCO L2) or equivalent to the oil seal lip.
4. Use the oil seal installer J–38592 (A/T) J–37488 (M/T) and driver handle J–8092 to install the oil seal to the transfer case.

A/T



Legend

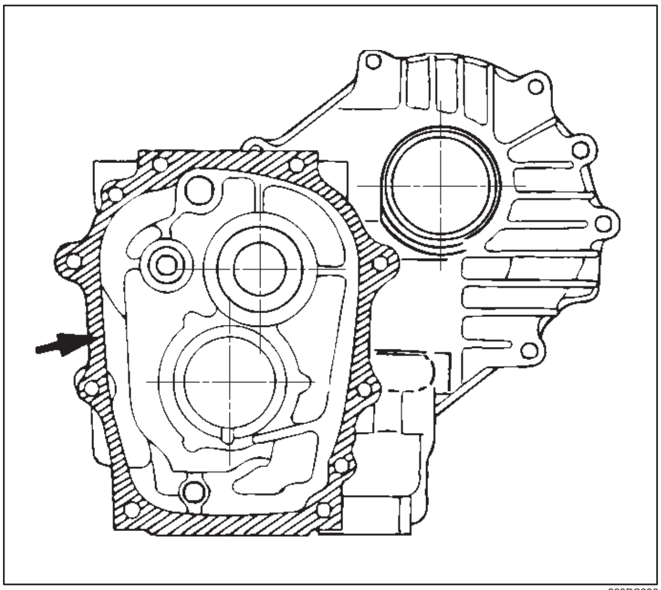
(46) Bearing

- Apply recommended liquid gasket (LOCTITE FMD 127) or its equivalent to the transmission, intermediate plate and transfer case fitting surfaces (M/T).



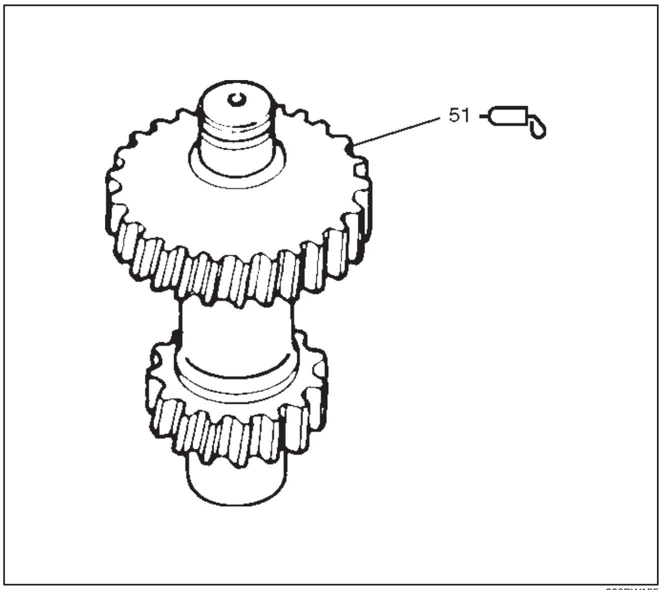
220RS026

Install the transfer case together with intermediate plate with gear assembly to transmission case (M/T).

Tighten the transfer case bolts to the specified torque a little at a time (M/T).

Torque : 37 N·m (27 lb ft)

2. Apply chassis grease (51) to the sub–gear (40) and the counter gear (41) thrust surfaces.

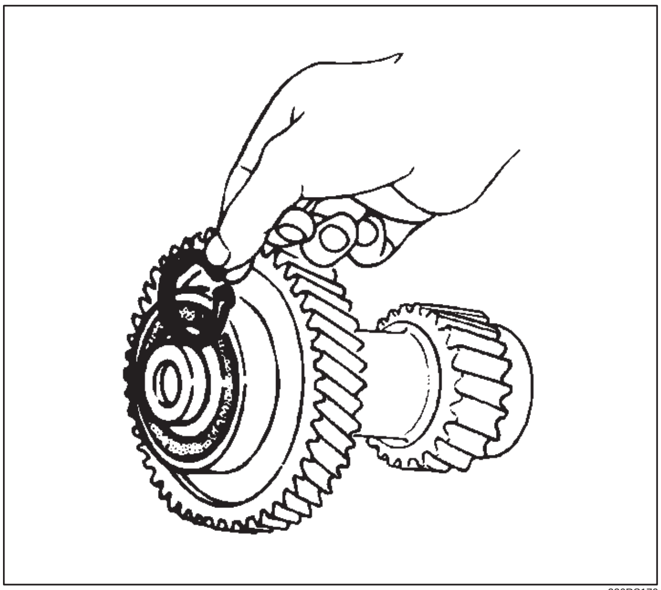


226RW155

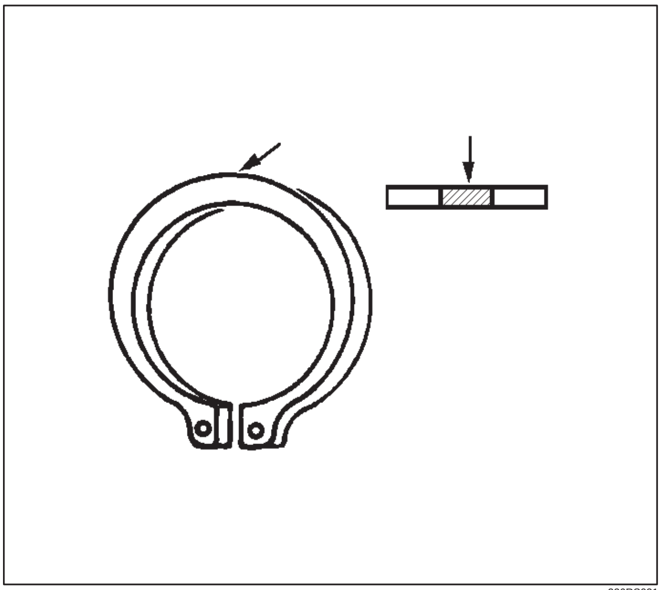
3. Install sub–gear (40) to counter gear (41).
4. Install belleville spring (39).
5. Install spacer.
6. Install ball bearing, using a bench press.
7. Select a snap ring that will allow the minimum axial play.

Clearance : 0–0.1 mm (0–0.004 in)

Snap ring availability:	
Thickness	Color–coding
1.50 mm (0.059 in)	White
1.55 mm (0.061 in)	Yellow
1.60 mm (0.063 in)	Blue



226RS170



226RS021

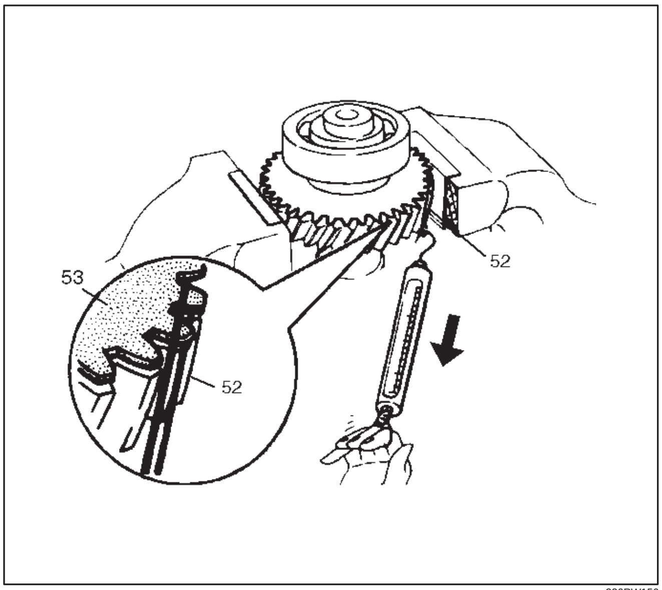
8. Use a pair of snap ring pliers to install the snap ring (36) to the counter gear (41).

Sub–Gear (anti–lash plate) Preload

1. Hook a length of piano wire (52) over one of the sub–gear (53) teeth.
2. Attach the other end of the piano wire (52) to a spring balancer.

3. Measure the sub–gear preload.

Preload : 59–98 N (13–22 lb)

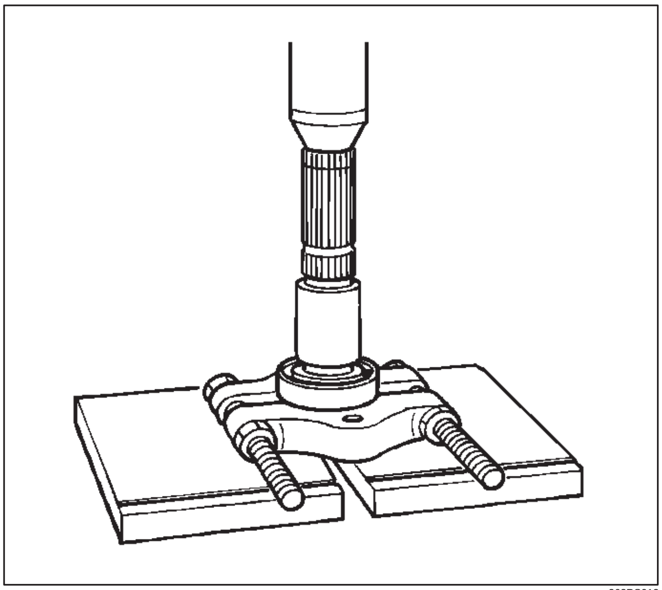


226RW156

9. Install ball bearing (35), using a bench press.
10. Install snap ring (34).
11. Install the counter gear assembly (33) to the transfer case (42).
12. Use a pair of snap ring pliers to install the snap ring (32) to the transfer case (42).

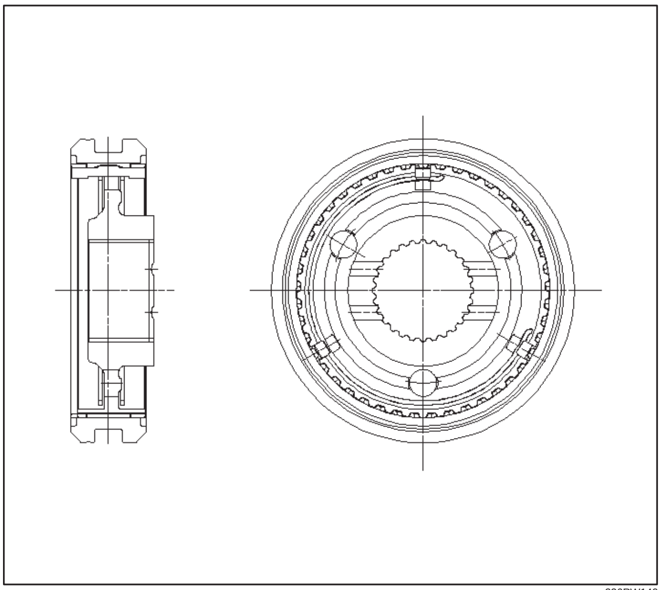
NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

13. Use a bench press to install the ball bearing (30) to the front output shaft (31).



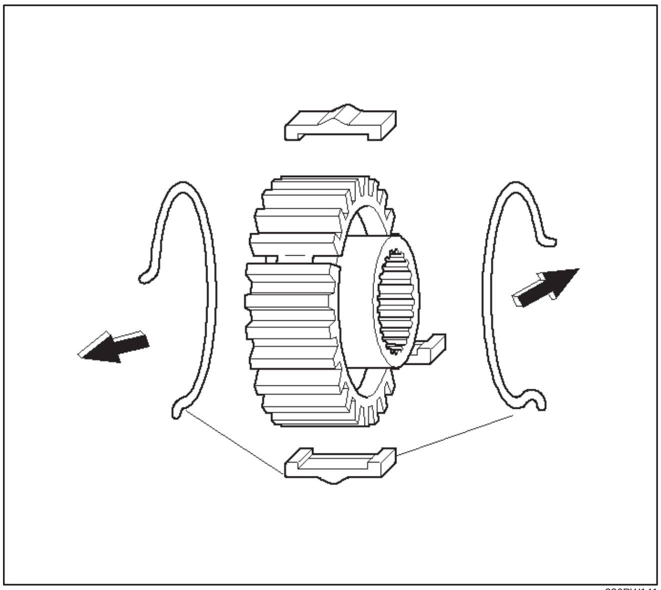
262RS012

14. Assemble the 2WD–4WD clutch hub and sleeve assembly (28).



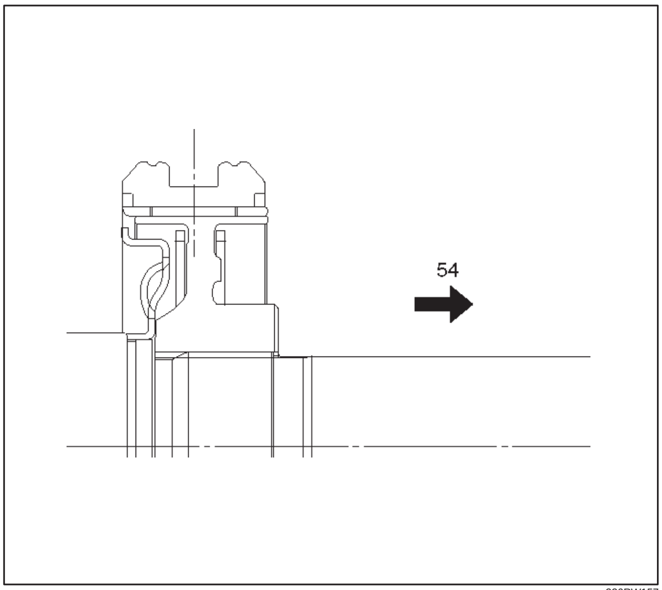
226RW140

15. Engage the springs in the same insert with the open ends away from each other.



226RW141

16. Install a new stopper plate (29) and the clutch hub and sleeve assembly (28) to the front output shaft (31).



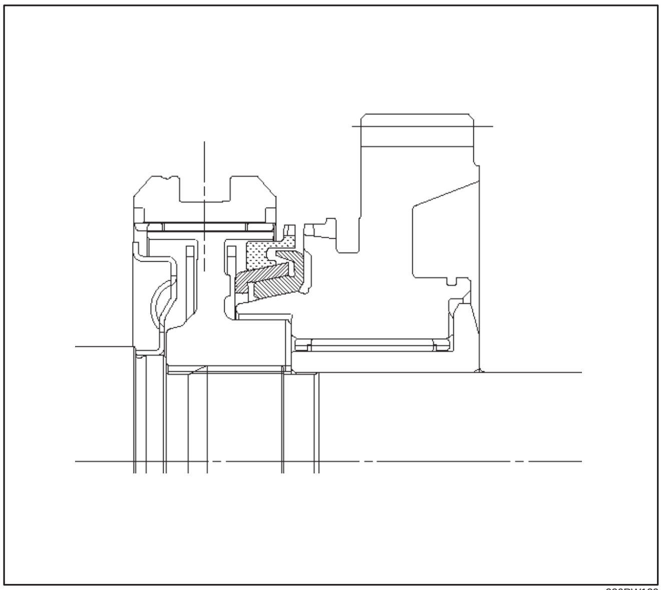
226RW157

Legend

(54) Front Output Gear

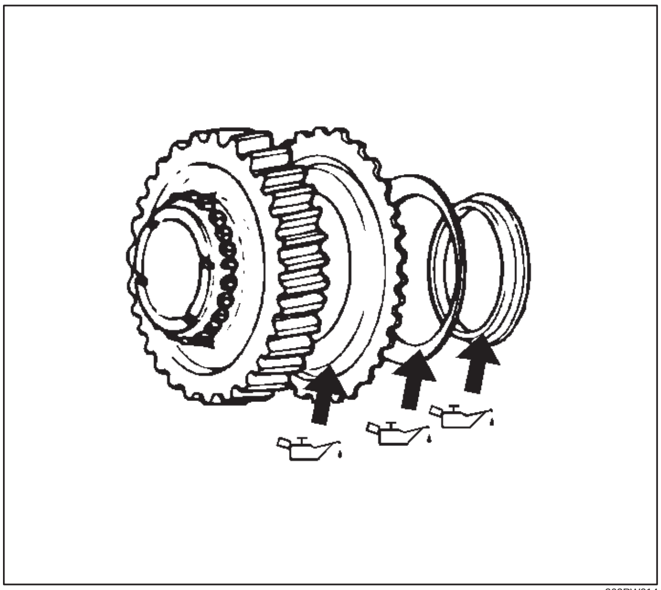
17. The clutch hub face (with the heavy boss) must be facing the front output gear side.
18. Use a bench press to slowly force the clutch hub and sleeve assembly (28) together with the stopper plate (29) into place.
19. Align the inserts with the block ring insert grooves. Install the block ring (27) to the clutch sleeve and hub assembly (28).
20. Install the outside ring (26), inside ring (25) and needle bearing (24) to the front output gear (23) and bearing collar (18).

NOTE: Coat all parts with transmission oil before installing them.



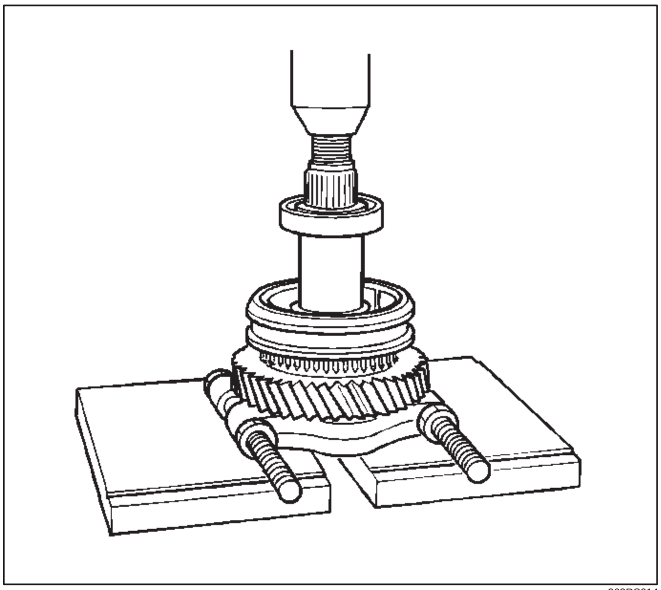
226RW139

21. Apply engine oil to the thrust surfaces of the sub–gear, the belleville spring, and the spacer.



262RW014

22. Install sub–gear (anti–lash plate) (22), belleville spring (21) and spacer (20). (M/T)
23. Install sub–gear snap ring (19). (M/T)
24. Use a bench press to install the needle bearing collar together with the front output gear assembly, aligning inside ring claw with block ring groove.

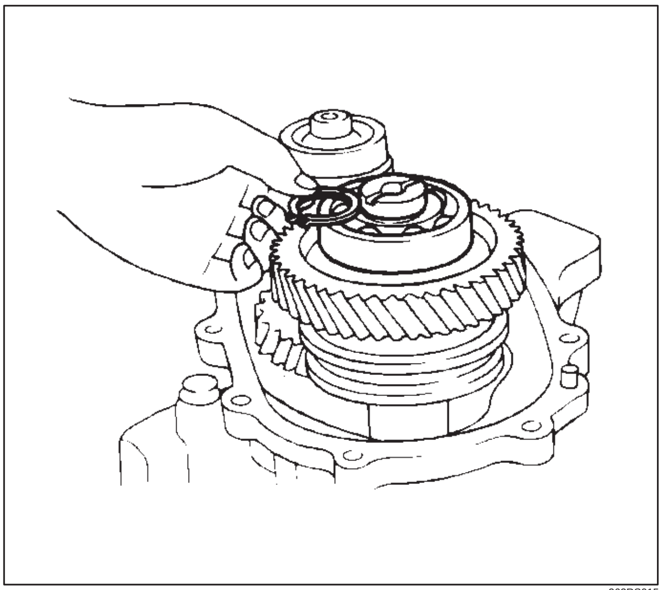


262RS014

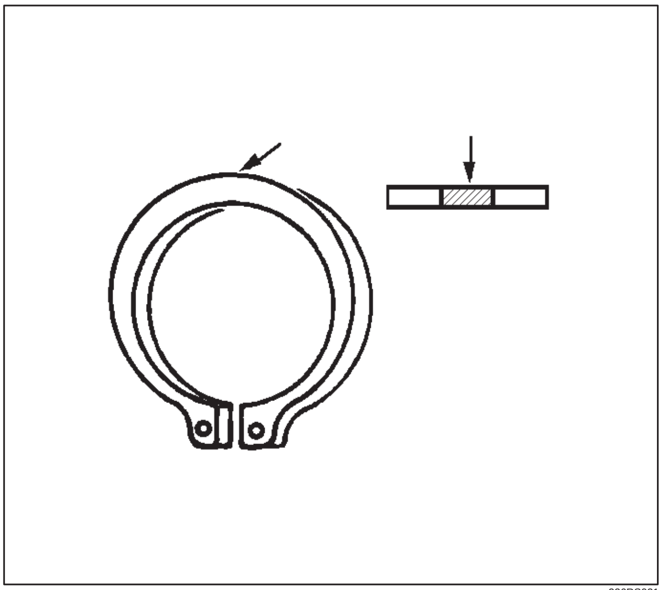
25. Install ball bearing (17), using a bench press.
26. Select a snap ring (16) that will allow the minimum axial play.

Clearance : 0–0.1 mm (0–0.004 in)

Snap ring availability:	
Snap ring thickness	Color coding
1.55 mm (0.061 in)	White
1.60 mm (0.063 in)	Yellow
1.65 mm (0.065 in)	Blue
1.70 mm (0.067 in)	Pink
1.75 mm (0.069 in)	Green
1.80 mm (0.071 in)	Brown
1.85 mm (0.073 in)	Red
1.90 mm (0.075 in)	Orange



262RS015



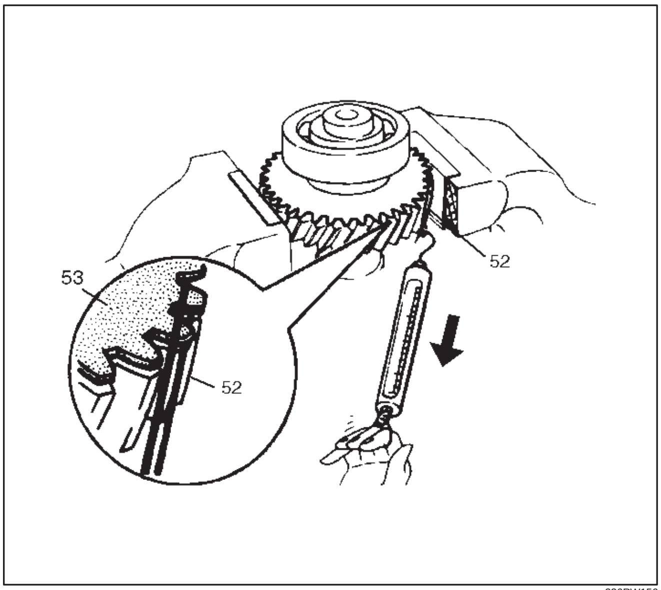
226RS021

27. Use a pair of snap ring pliers to install the snap ring (16) to the output shaft (31).

Sub-gear (anti-lash plate) preload

1. Hook a length of piano wire (52) over one of the sub–gear (53) teeth.
2. Attach the other end of the piano wire to (52) a spring balancer.
3. Measure the sub–gear preload.

Preload: 59–98 N (13–22 lb)

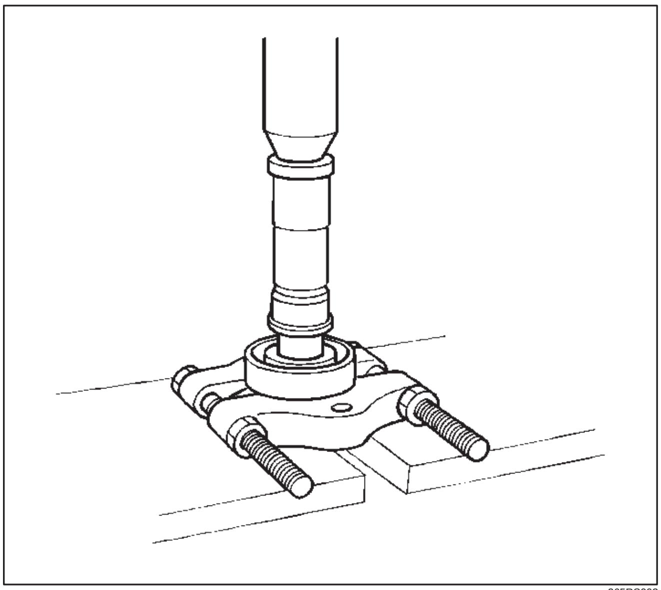


226RW156

28. Install front output gear assembly (15) to transfer case (42).
29. Use a pair of snap ring pliers to install the snap ring (14) to the transfer case (42).

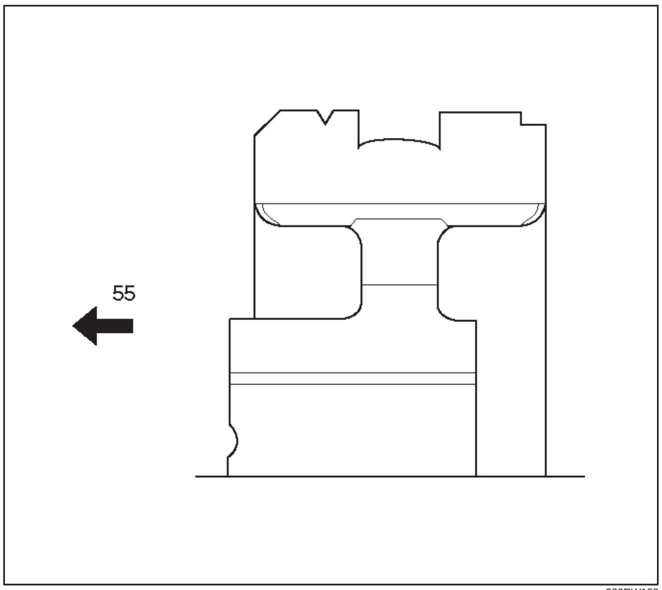
NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

30. Use a bench press to install the ball bearing (12) to the input shaft (13). (A/T)



265RS003

31. Install plate (11), ball (10) and bearing collar (9).
32. Install needle bearing (8) and input gear (7).
33. The clutch hub face (with the heavy boss) must be facing the transfer input gear side (55).



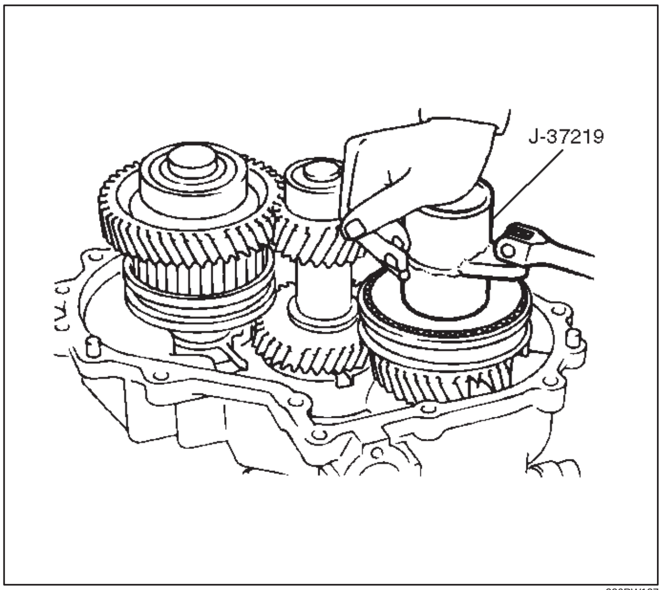
226RW158

34. Install high–low clutch hub and sleeve (6), using a bench press.
35. Install input shaft assembly (5) to transfer case (42). (A/T)
36. Install the snap ring (4) to the transfer case (42). (A/T)

NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

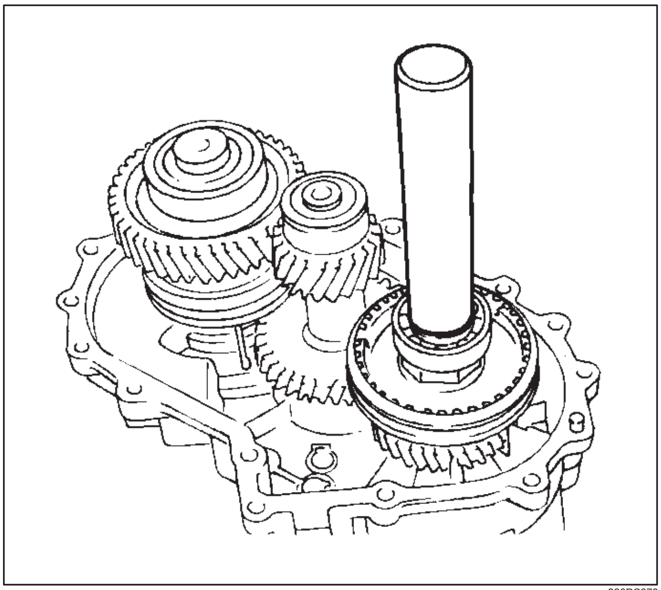
37. Install the front companion flange temporarily and use the flange holder J–8614–11 and lock nut wrench J–37219 to install the lock nut (3).

Torque: 137 N·m (101 lb ft)



226RW137

38. Use the punch to stake the lock nut (3) at one spot.
39. Use a suitable drift and hammer to install the ball bearing (2).



226RS079

40. Install bearing snap ring (1).

Main Data and Specifications

General Specifications

Type	Synchronized type gears shifting between the 2 and 4 wheel drive mode. Constant mesh type gears shifting between “low” and “high”.
Control method	Remote (A/T) and direct (M/T) control with the gear shift lever on the floor for gears shifting between “low” and “high”. Electric control with the button switch on the instrument panel for gears shifting between the 2 and 4 wheel driver mode.
Gear ratio	High; 1.000 Low; 2.050
Oil capacity	1.45 lit. (1.53 U.S. quart)
Type of lubricant	Engine oil Refer to chart in Section 0

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

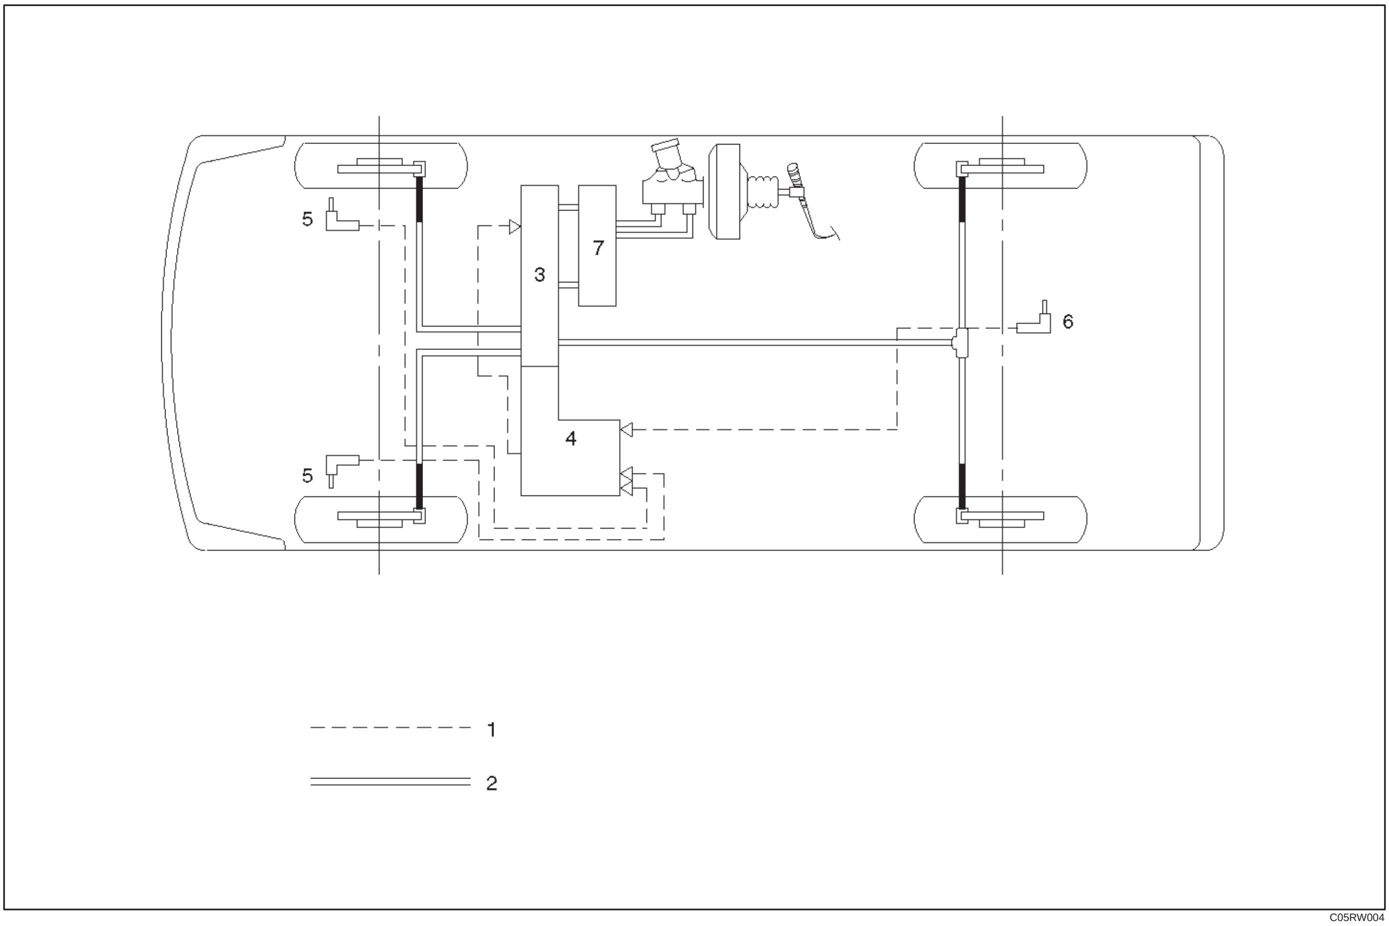
CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The Anti-lock Brake System (ABS) works on all four wheels. A combination of wheel speed sensor and Electronic Hydraulic Control Unit (EHCU) can determine when a wheel is about to stop turning and adjust brake pressure to maintain best braking.

This system helps the driver maintain greater control of the vehicle under heavy braking conditions.

NOTE: The Electronic Hydraulic Control Unit (EHCU) comprises the Hydraulic Unit (H/U) and the coil Integrated Module.



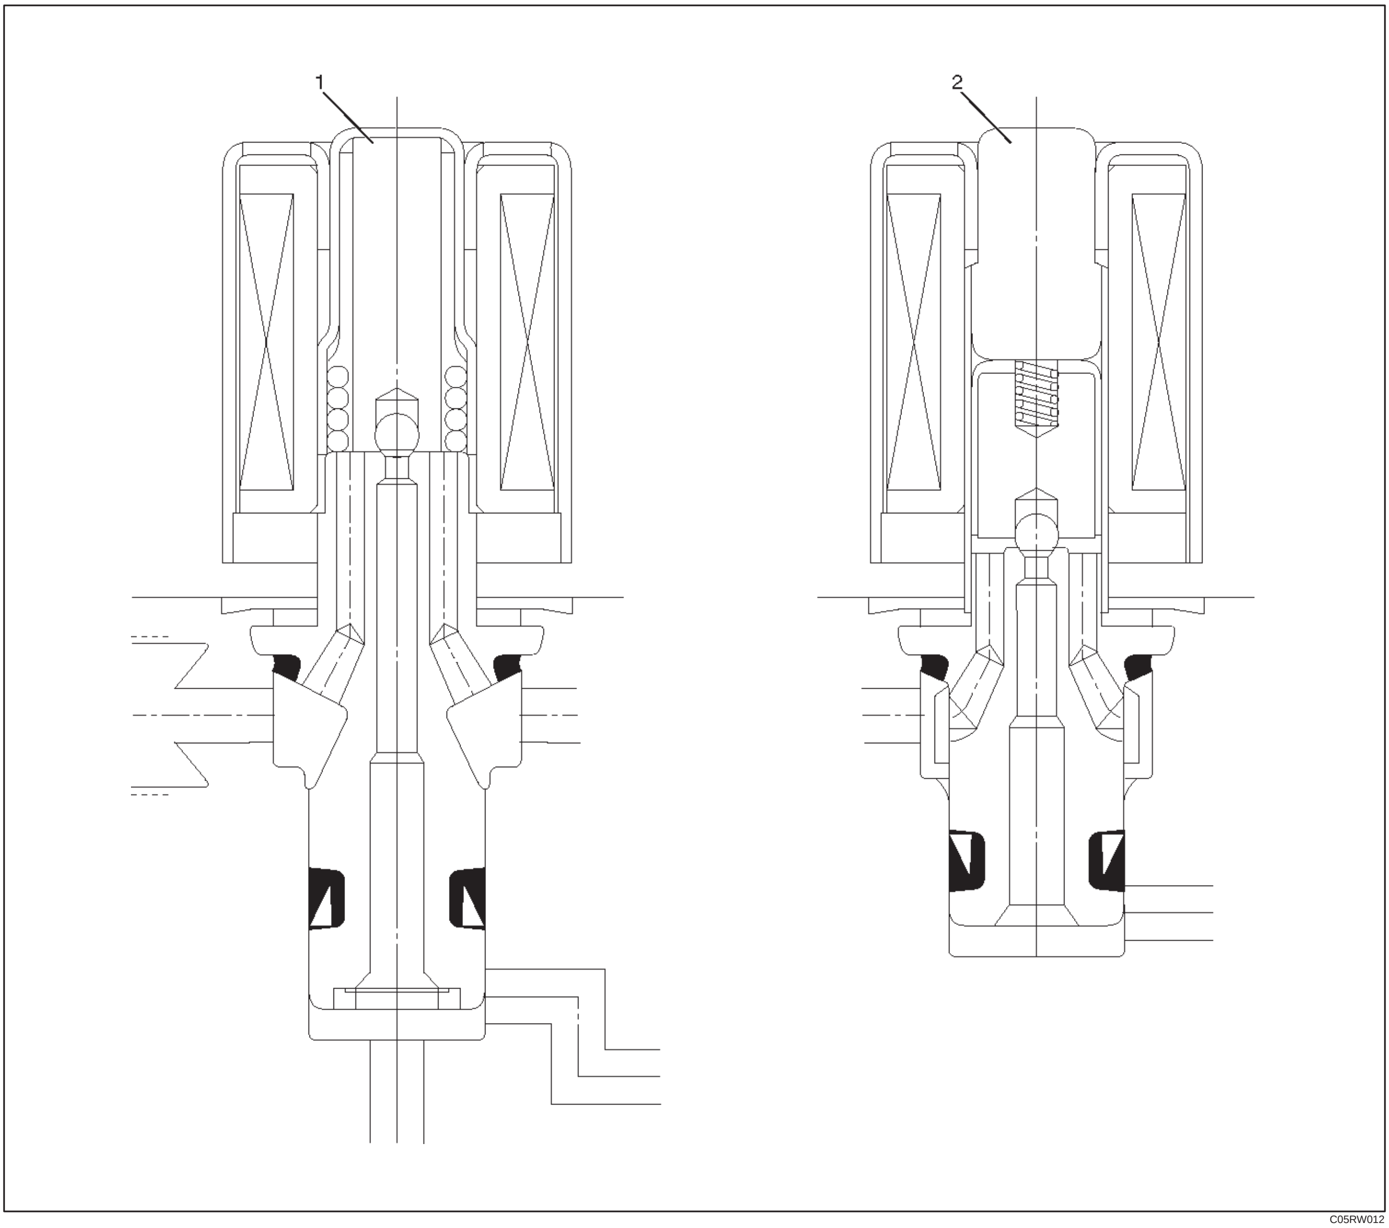
Legend

(1) Electronic
(2) Hydraulic
(3) Hydraulic Unit (H/U)
(4) Coil Integrated Module
(5) Front Wheel Speed Sensor
(6) Rear Wheel Speed Sensor
(7) Proportioning and Bypass (P&B) Valve

Functional Description

Hydraulic Unit (H/U)

Solenoid Valve



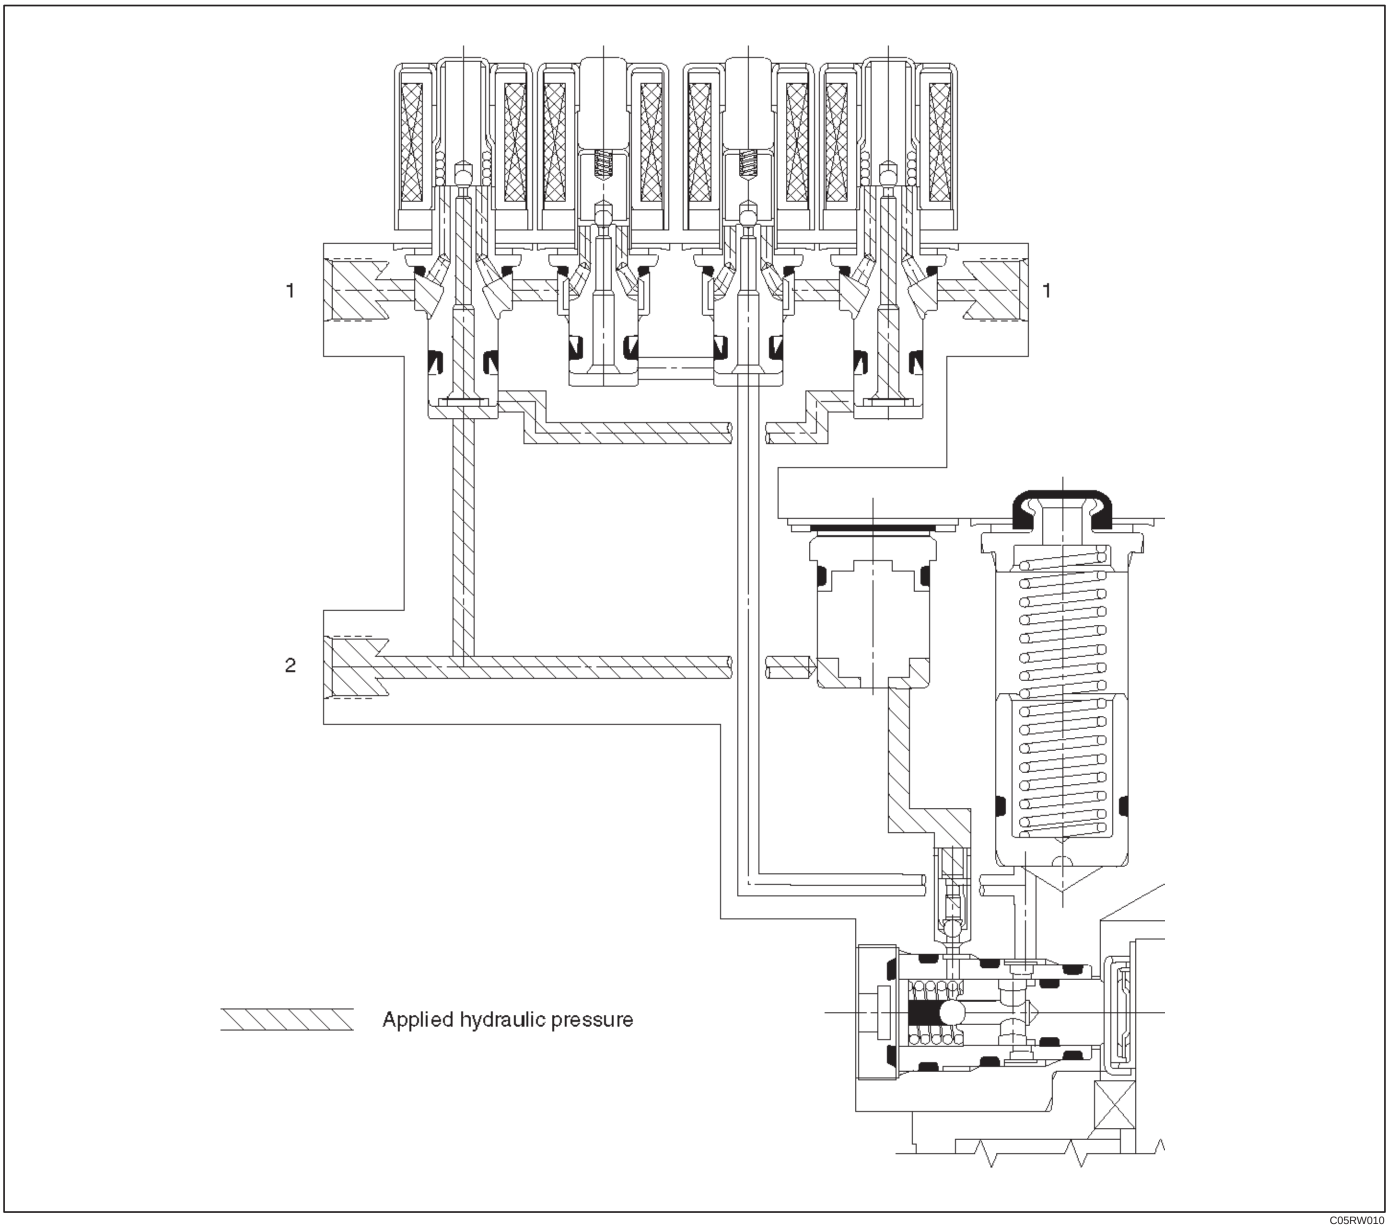
Legend

(1) Isolation Valve
(2) Dump valve

Normal Braking

During normal (non anti-lock) braking, the solenoid valves are without current and closed due to spring force.

Brake fluid travels through the centre of the normally open isolation valve around the normally closed dump valve and on to the brake pistons.



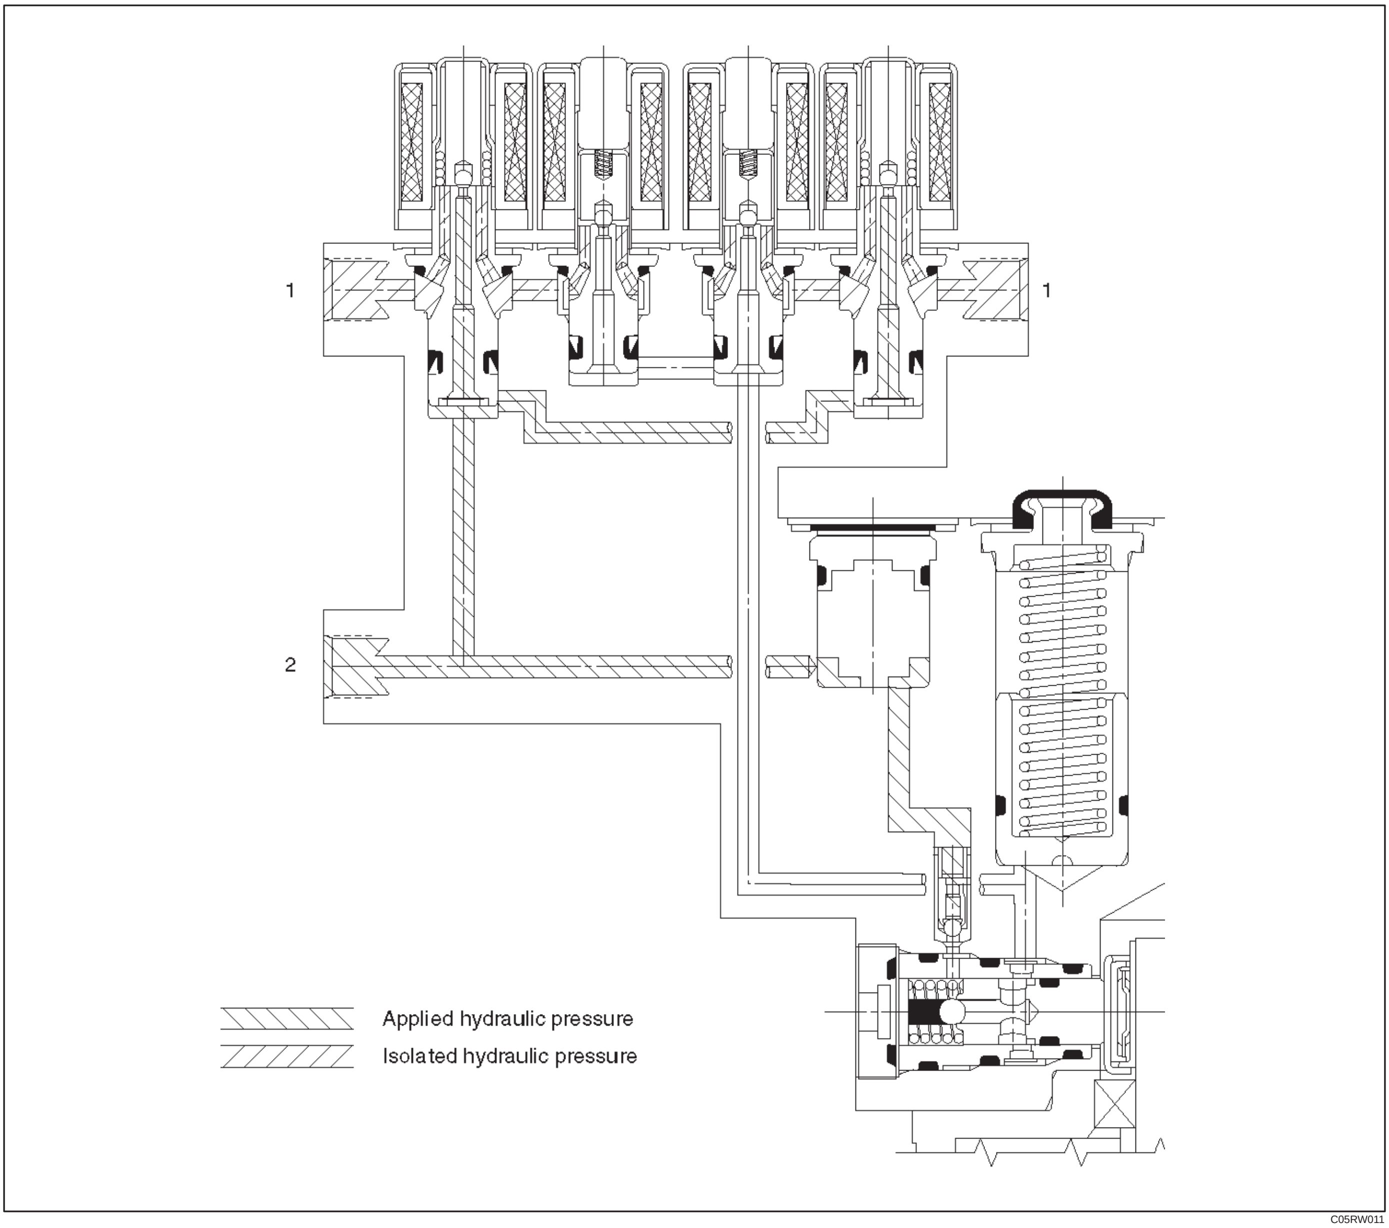
Legend

(1) Brake
(2) Master Cylinder

Pressure Isolation (Pressure Maintain)

The electro-hydraulic control unit is activated when the brakes are applied which sends a signal to the coil integrated module to prepare for a possible anti-lock stop. If the information from the wheel speed sensors indicates excessive wheel deceleration (imminent lockup), the first step in the anti-lock sequence is to isolate the brake pressure being applied by the brake pedal.

The microprocessor in the coil integrated module sends a voltage to the coil to energize and close the isolation valve. This prevents any additional fluid pressure applied by the brake pedal from reaching the wheel. With the isolation valves closed, further unnecessary increase in the brake pressure is therefore prevented.



Legend

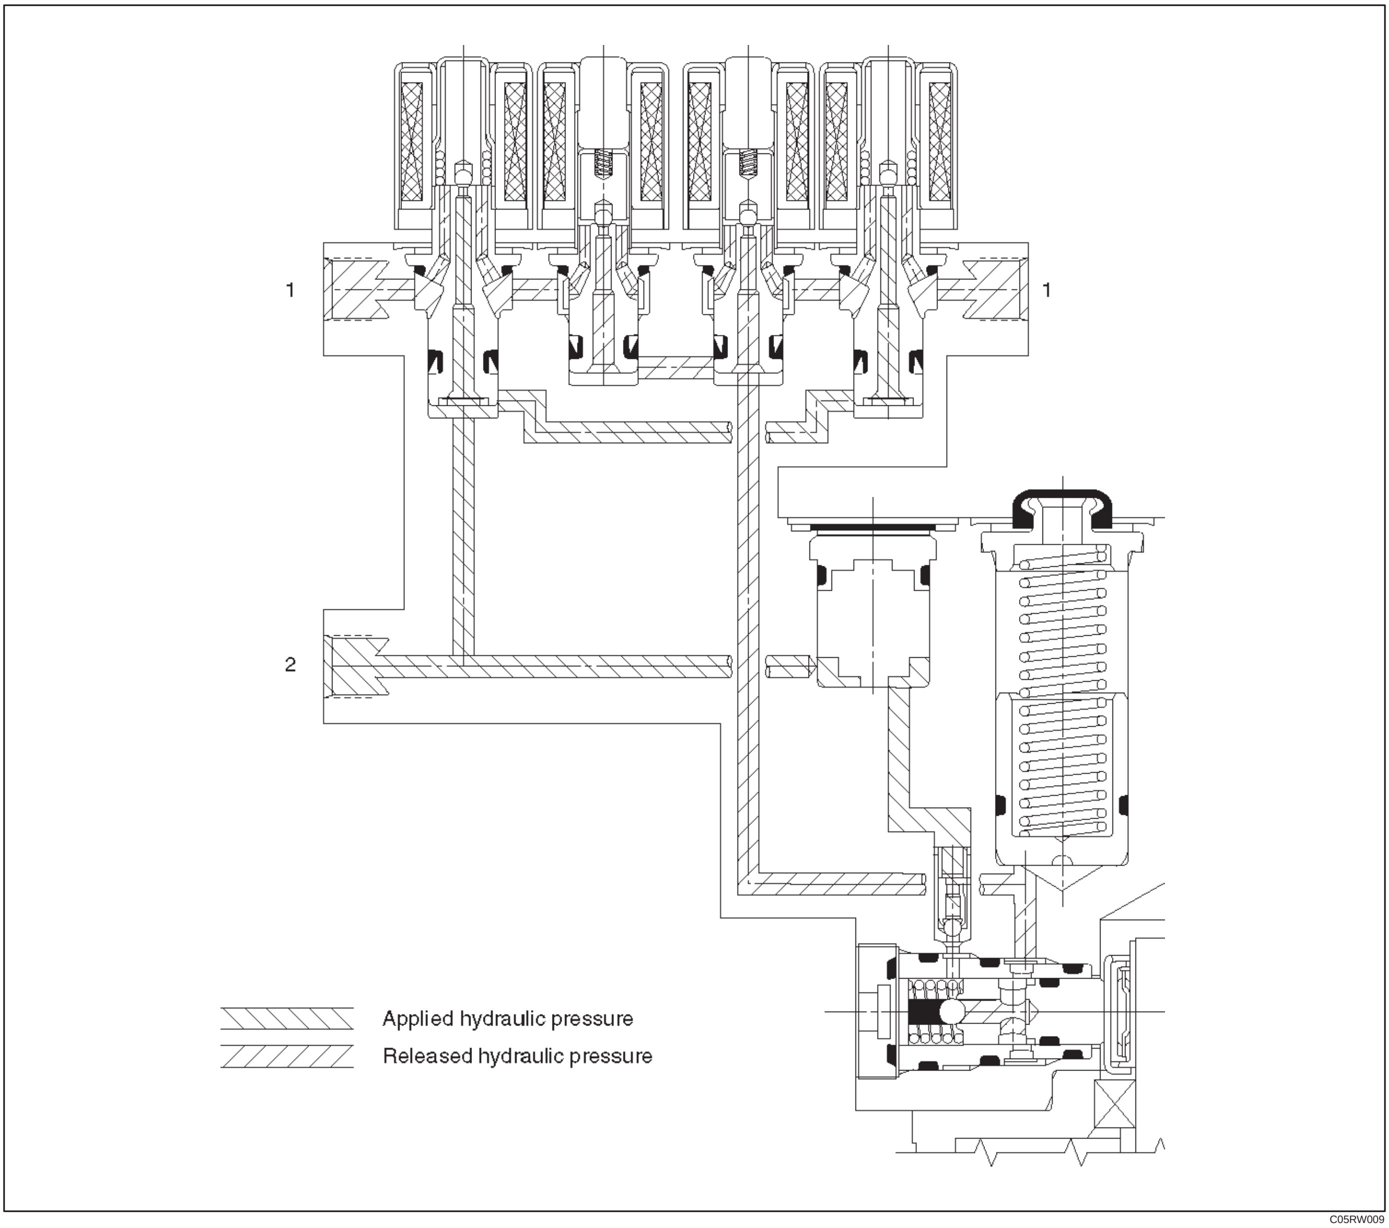
(1) Brake
(2) Master Cylinder

Pressure Reduction

Once the brake pressure is isolated, it must be reduced to allow the wheels to unlock. This is accomplished by dumping a portion of the brake fluid pressure into a low pressure accumulator.

The microprocessor activates the normally closed dump valve to open, allowing fluid from the wheels to be dumped into the accumulator. This is done with very short activation pulses opening and closing the dump valve passageway. Brake pressure is reduced at the wheel and allows the wheel to begin rotating again. The fluid from the brake piston is stored in the accumulator against spring pressure and a portion of this fluid also primes the pump.

The dump valves are operated independently to control the deceleration of the wheel. At this point, the brake pedal is isolated from the base brake system, the hydraulic control unit pumps are primed and the attenuators are ready to pump fluid.



Legend

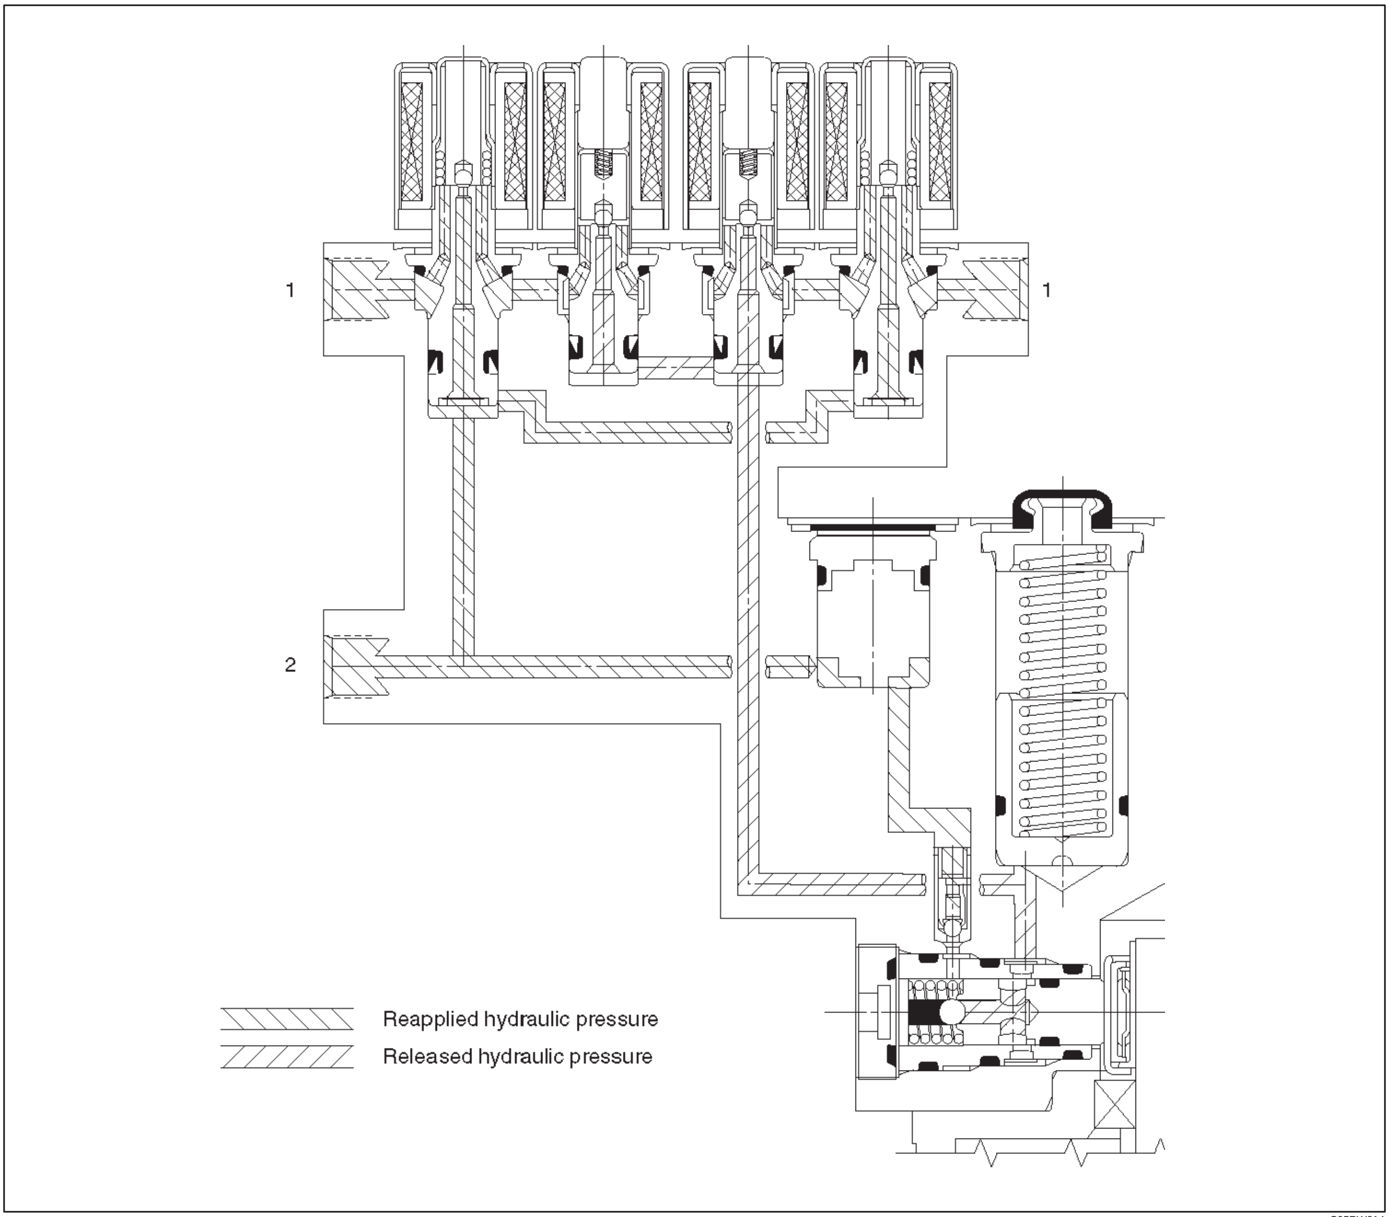
(1) Brake
(2) Master Cylinder

Pressure Increase (Re-apply)

The re-apply sequence is initiated to achieve optimum braking. The isolation valve is momentarily opened to allow master cylinder and pump pressure to reach the brakes. This controlled pressure rise continues until the wheel is at optimum brake output or until the brake pressure is brought up to the master cylinder output pressure.

If more pressure is required, more fluid is drawn from the master cylinder and applied to the brakes. The driver may feel slight pedal pulsations, or pedal drop, this is normal and expected.

As fluid is re-applied to the brakes, the wheel speed will reduce. If the wheels approach imminent lockup again, the module will isolate, dump and re-apply again. This cycle occurs in millisecond intervals, allowing several cycles to occur each second. It is a much faster and more controlled way of “pumping the pedal”.



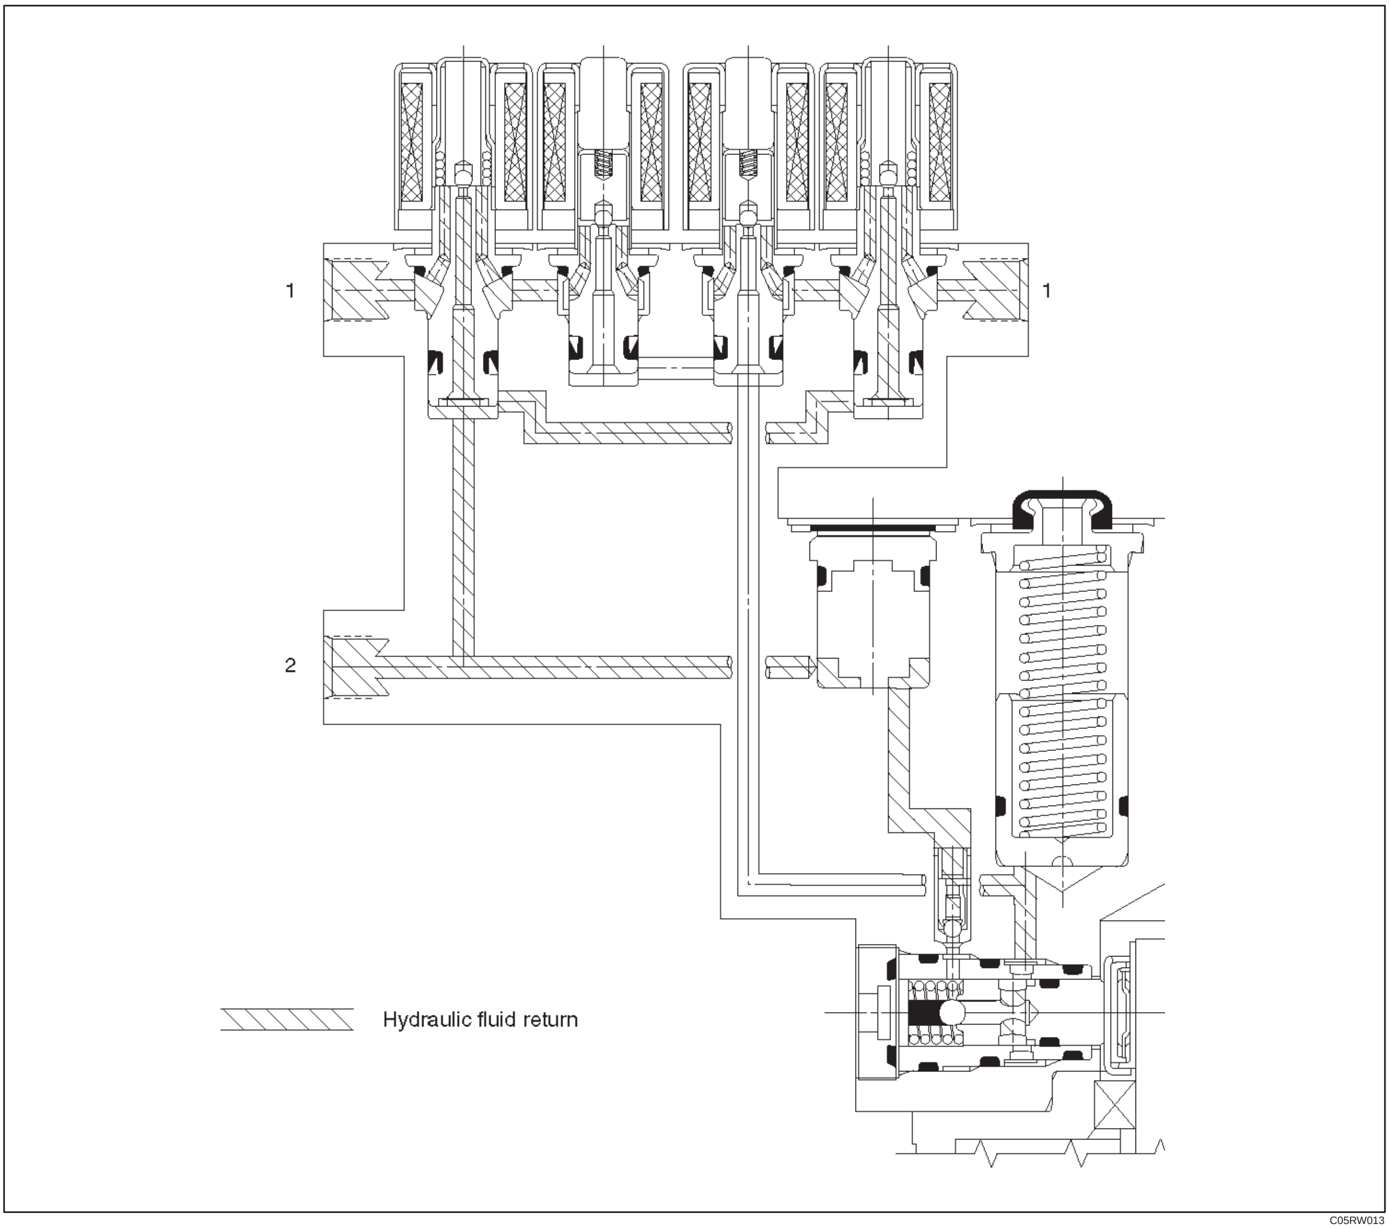
Legend

(1) Brake
(2) Master Cylinder

Brake Release

At the end of the anti-lock stop, when the brake pedal is released, the pump will remain running for a short time to help drain any fluid from the accumulators. As this fluid returns into the system, the spring forces the piston back to its original position.

The isolation valve opens and fluid may return to the master cylinder. Conventional braking is then resumed.



Legend

(1) Brake
(2) Master Cylinder

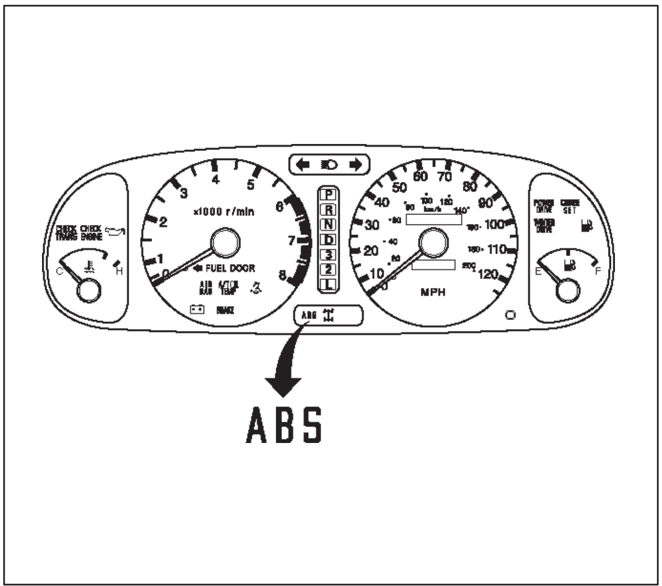
System Components

Electronic Hydraulic Control Unit (EHCU), three Wheel Speed Sensors, Warning Light, and G-sensor.

Electronic Hydraulic Control Unit (EHCU)

The EHCU consists of ABS control circuits, fault detector, and a fail-safe. It drives the hydraulic unit according to the signal from each sensor, cancelling ABS to return to normal braking when a malfunction has occurred in the ABS.
The EHCU has a self-diagnosing function which can indicate faulty circuits during diagnosis.
The EHCU is mounted on the engine compartment rear right side. It consists of a Motor, Plunger Pump, Solenoid Valves.
Solenoid Valves: Reduces or holds the caliper fluid pressure for each front disc brake or both rear disc brakes according to the signal sent from the EHCU.
Reservoir: Temporarily holds the brake fluid that returns from the front and rear disc brake caliper so that pressure of front disc brake caliper can be reduced smoothly.
Plunger Pump: Feeds the brake fluid held in the reservoir to the master cylinder.
Motor: Drives the pump according to the signal from EHCU.
Check Valve: Controls the brake fluid flow.

ABS Warning Light



Vehicles equipped with the Anti-lock Brake System have an amber “ABS” warning light in the instrument panel. The “ABS” warning light will illuminate if a malfunction in the Anti-lock Brake System is detected by the Electronic Hydraulic Control Unit (EHCU). In case of an electronic malfunction, the EHCU will turn “ON” the “ABS” warning light and disable the Anti-lock braking function.
The “ABS” light will turn “ON” for approximately three seconds after the ignition switch is to the “ON” position.
If the “ABS” light stays “ON” after the ignition switch is the “ON” position, or comes “ON” and stays “ON” while driving, the Anti-lock Brake System should be inspected for a malfunction according to the diagnosis procedure.

Wheel Speed Sensor

It consists of a sensor and a rotor. The sensor is attached to the knuckle on the front wheels and to the rear axle case on the rear differential.
The rotor is press-fit in the axle shaft.
The flux generated from electrodes magnetized by a magnet in the sensor varies due to rotation of the rotor, and the electromagnetic induction generates alternating voltage in the coil. This voltage draws a “sine curve” with the frequency proportional to rotor speed and it allows detection of wheel speed.

G-Sensor

The G-sensor installed inside the EHCU detects the vehicle deceleration speed and sends a signal to the EHCU. In 4WD operation, all four wheels may be decelerated in almost the same phase, since all wheels are connected mechanically.
This tendency is noticeable particularly on roads with low friction coefficient, and the ABS control is adversely affected.
The G-sensor judges whether the friction coefficient of road surface is low or high, and changes the EHCU’s operating system to ensure ABS control.

Normal and Anti-lock Braking

Under normal driving conditions, the Anti-lock Brake System functions the same as a standard power assisted brake system. However, with the detection of wheel lock-up, a slight bump or kick-back will be felt in the brake pedal. This pedal “bump” will be followed by a series of short pedal pulsations which occurs in rapid succession. The brake pedal pulsation will continue until there is no longer a need for the anti-lock function or until the vehicle is stopped. A slight ticking or popping noise may be heard during brake applications when the Anti-lock features is being used.
When the Anti-lock feature is being used, the brake pedal may rise even as the brakes are being applied. This is also normal. Maintaining a constant force on the pedal will provide the shortest stopping distance.

Brake Pedal Travel

Vehicles equipped with the Anti-lock Brake System may be stopped by applying normal force to the brake pedal. Although there is no need to push the pedal beyond the point where it stops or holds the vehicle, by applying more force the pedal will continue to travel toward the floor.
This extra brake pedal travel is normal.

Acronyms and Abbreviations

Several acronyms and abbreviations are commonly used throughout this section:

ABS
Anti-lock Brake System

CIM
Coil Integrated Module

CKT
Circuit

DLC
Data Link Connector

EHCU
Electronic Hydraulic Control Unit

FL
Front Left

FR
Front Right

GEN
Generator

H/U
Hydraulic Unit

MV
Millivolts

RR
Rear

RPS
Revolution per Second

VDC
DC Volts

VAC
AC Volts

W/L
Warning Light

WSS
Wheel Speed Sensor

General Diagnosis

General Information

ABS troubles can be classified into two types, those which can be detected by the ABS warning light and those which can be detected as a vehicle abnormality by the driver.

In either case, locate the fault in accordance with the "BASIC DIAGNOSTIC FLOWCHART" and repair.

Please refer to Section 5C for the diagnosis of mechanical troubles such as brake noise, brake judder (brake pedal or vehicle vibration felt when braking), uneven braking, and parking brake trouble.

ABS Service Precautions

Required Tools and Items:

- Box Wrench
- Brake Fluid
- Special Tool

Some diagnosis procedures in this section require the installation of a special tool.

J-39200 High Impedance Multimeter

When circuit measurements are requested, use a circuit tester with high impedance.

Computer System Service Precautions

The Anti-lock Brake System interfaces directly with the Electronic Hydraulic Control Unit (EHCU) which is a control computer that is similar in some regards to the Powertrain Control Module. These modules are designed to withstand normal current draws associated with vehicle operation. However, care must be taken to avoid overloading any of the EHCU circuits. In testing for opens or shorts, do not ground or apply voltage to any of the circuits unless instructed to do so by the appropriate diagnostic procedure. These circuits should only be tested with a high impedance multimeter (J-39200) or special tools as described in this section. Power should never be removed or applied to any control module with the ignition in the "ON" position.

Before removing or connecting battery cables, fuses or connectors, always turn the ignition switch to the "OFF" position.

General Service Precautions

The following are general precautions which should be observed when servicing and diagnosing the Anti-lock Brake System and/or other vehicle systems. Failure to observe these precautions may result in Anti-lock Brake System damage.

- If welding work is to be performed on the vehicle using an electric arc welder, the EHCU and valve block connectors should be disconnected before the welding operation begins.
- The EHCU and valve block connectors should never be connected or disconnected with the ignition "ON" .
- If only rear wheels are rotated using jacks or drum tester, the system will diagnose a speed sensor malfunction and the "ABS" warning light will illuminate. But actually no trouble exists. After inspection stop the engine once and re-start it, then make sure that the "ABS" warning light does not illuminate.

If the battery has been discharged

The engine may stall if the battery has been completely discharged and the engine is started via jumper cables. This is because the Anti-lock Brake System (ABS) requires a large quantity of electricity. In this case, wait until the battery is recharged, or set the ABS to a non-operative state by removing the fuse for the ABS (60A). After the battery has been recharged, stop the engine and install the ABS fuse. Start the engine again, and confirm that the ABS warning light does not light.

Note on Intermittents

As with virtually any electronic system, it is difficult to identify an intermittent failure. In such a case duplicating the system malfunction during a test drive or a good description of vehicle behavior from the customer may be helpful in locating a "most likely" failed component or circuit. The symptom diagnosis chart may also be useful in isolating the failure. Most intermittent problems are caused by faulty electrical connections or wiring. When an intermittent failure is encountered, check suspect circuits for:

- Suspected harness damage.
- Poor mating of connector halves or terminals not fully seated in the connector body (backed out).
- Improperly formed or damaged terminals.

Test Driving ABS Complaint Vehicles

In case that there has been an abnormality in the lighting pattern of “ABS” warning light, the fault can be located in accordance with the “DIAGNOSIS BY “ABS” WARNING LIGHT ILLUMINATION PATTERN” . In case of such trouble as can be detected by the driver as a vehicle symptom, however, it is necessary to give a test drive following the test procedure mentioned below, thereby reproducing the symptom for trouble diagnosis on a symptom basis:

1. Start the engine and make sure that the “ABS” W/L goes OFF. If the W/L remains ON, it means that the Diagnostic Trouble Code (DTC) is stored. Therefore, read the code and locate the fault.

NOTE: The DTC cannot be cleared if the vehicle speed does not exceed 12 km/h (8 mph) at DTC, even though the repair operation is completed.

2. Start the vehicle and accelerate to about 30 km/h (19 mph) or more.
3. Slowly brake and stop the vehicle completely.
4. Then restart the vehicle and accelerate to about 40 km/h (25 mph) or more.
5. Brake at a time so as to actuate the ABS and stop the vehicle.
6. Be cautious of abnormality during the test. If the W/L is actuated while driving, read the DTC and locate the fault.
7. If the abnormality is not reproduced by the test, make best efforts to reproduce the situation reported by the customer.
8. If the abnormality has been detected, repair in accordance with the “SYMPTOM DIAGNOSIS” .

NOTE:

- Be sure to give a test drive on a wide, even road with a small traffic.
- If an abnormality is detected, be sure to suspend the test and start trouble diagnosis at once.

“ABS” Warning Light

When ABS trouble occurs to actuate “ABS” warning light, the trouble code corresponding to the trouble is stored in the EHCU. Only ordinary brake is available with ABS being unactuated. Even when “ABS” warning light is actuated, if the starter switch is set ON after setting it OFF once, the EHCU checks up on the entire system and, if there is no abnormality, judges ABS to work currently and the warning light is lit normally even though the trouble code is stored.

NOTE: Illumination of the “ABS” warning light indicates that anti-lock braking is no longer available. Power assisted braking without anti-lock control is still available.

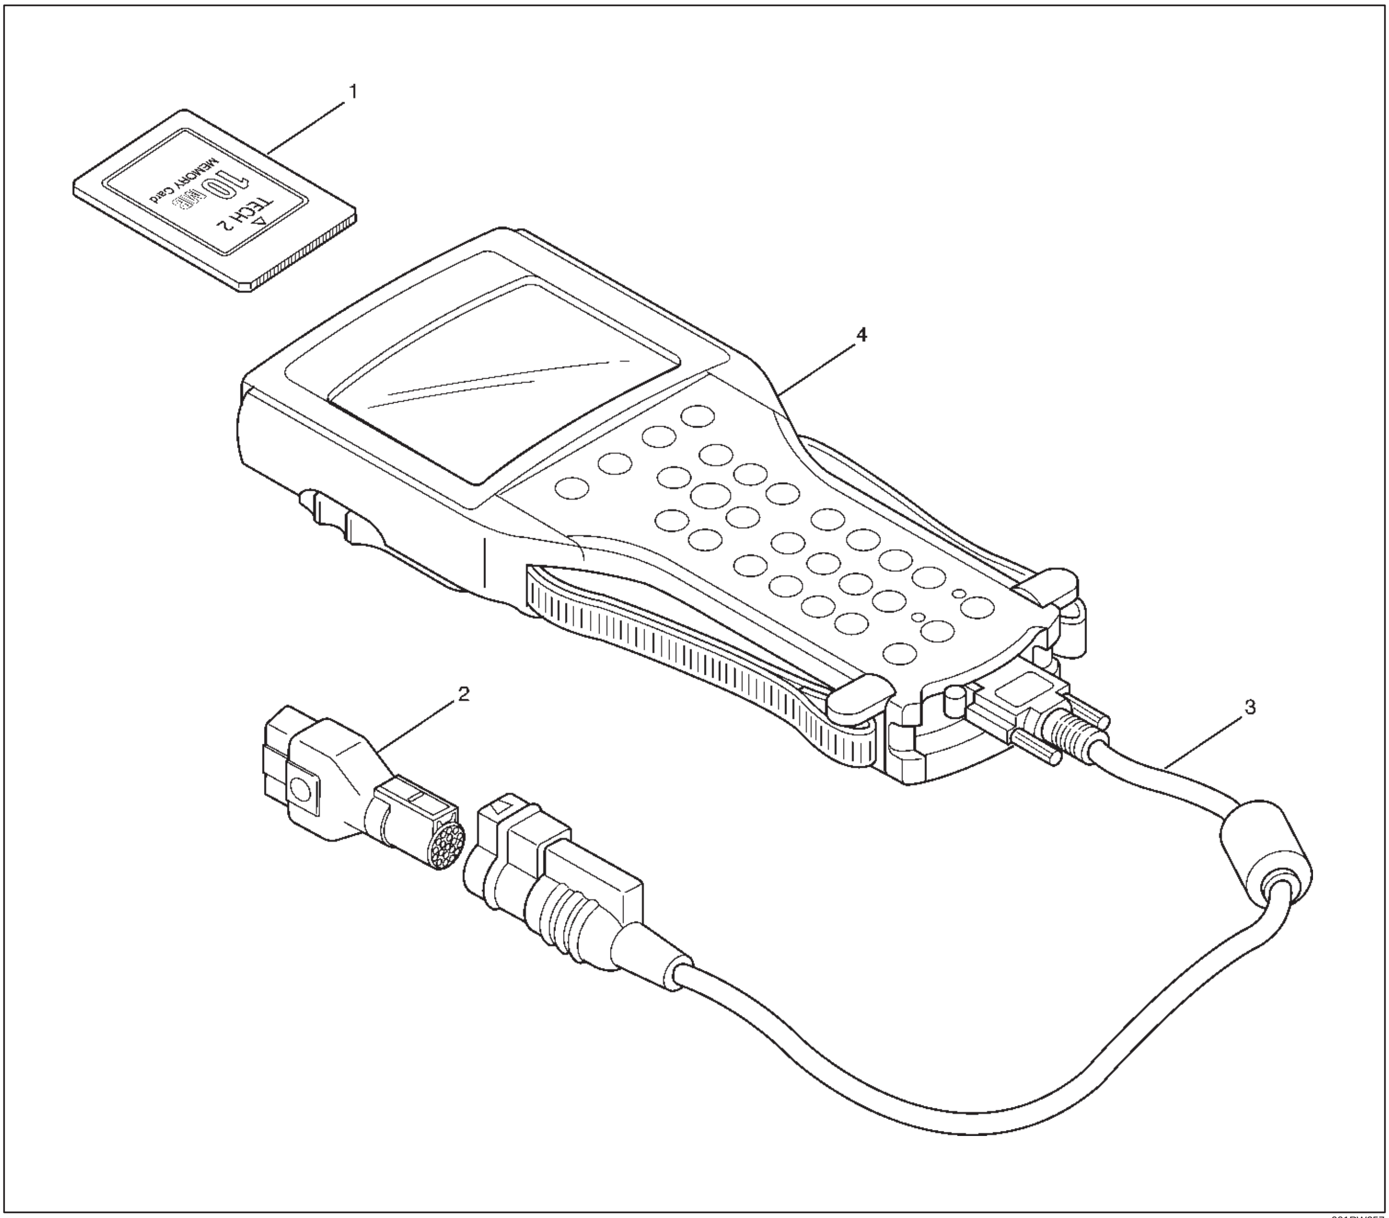
Normal Operation

“ABS” Warning Light

When the ignition is first moved from “OFF” to “RUN” , the amber “ABS” warning light will turn “ON” . The “ABS” warning light will turn “ON” during engine starting and will usually stay “ON” for approximately three seconds after the ignition switch is returned to the “ON” position. The warning light should remain “OFF” at all other times.

Tech 2 Scan Tool

From 98 MY, Isuzu dealer service departments are recommended to use Tech 2. Please refer to Tech 2 scan tool user guide.



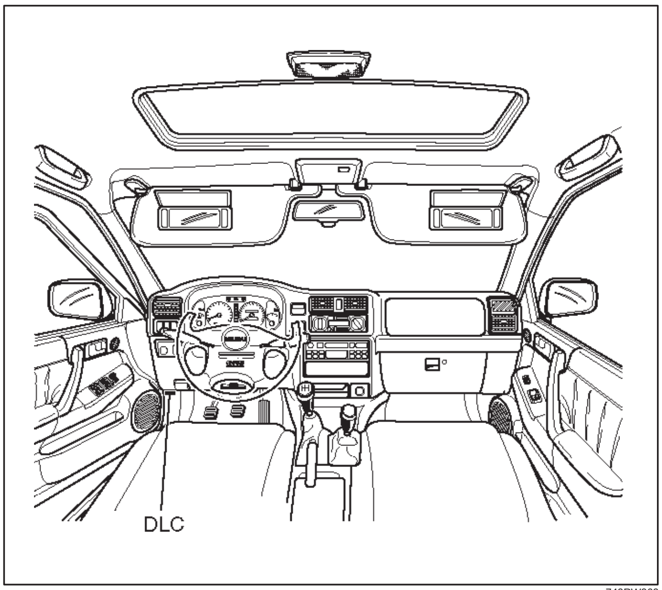
Legend

(1) PCMCIA Card
(2) SAE 16/19 Adaptor
(3) DLC Cable
(4) Tech–2

Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:

1. The Isuzu 98 System PCMCIA card (1) inserts into the Tech 2 (4).
2. Connect the SAE 16/19 adapter (2) to the DLC cable (3).
3. Connect the DLC cable to the Tech 2 (4).
4. Make sure the vehicle ignition is off.
5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC.



740RW060

6. The vehicle ignition turns on.
7. Power up the Tech 2.
8. Verify the Tech 2 power up display.

060RW009

Operating Procedure

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

Battery Voltage	Voltage	• Between 10–16.9V

ACTUATOR TEST

This mode is used to exercise the ABS actuators and make sure they operate normally. Prior to the test, pay attention to the cautions below. (When checking the solenoid valve system, be sure to jack up the vehicle.)

CAUTION:

- Before testing, be sure that the brakes work normally.
- Make sure that the battery is fully charged.Conduct the test by two persons (A TECH 2 operator and a vehicle checker).
- Be sure to start ACTUATOR TEST with the engine stopped.
- Before testing, make sure that electrical trouble, if any, has been completely repaired. Conducting tests of ABS solenoid with electrical circuit problem remaining uncorrected could damage the control unit.

Basic Diagnostic Flow Chart

Step	Action	Yes	No
1	1. Customer complaint. 2. Questioning to customer. 3. Basic inspection (Refer to “Basic inspection procedure”) Using TECH 2?	Go to Step 2	Go to Step 4
2	Make sure of DTC by mode “F0: Diagnostic Trouble Codes”. Is EHCU including DTC?	Clear code and check for repeatability. Go to Step 3	Go to Step 5
3	1. Repair of faulty part. 2. Elimination of DTC. 3. Inspection of “ABS” W/L Illumination pattern with ignition SW “ON”. 4. Test drive. Does trouble repeat?	Repeat the diagnosis it the symptom or DTC appears again Go to Step 1	Go to Step 5
4	Check if the DTC is stored or not. Is EHCU including DTC?	Clear code and check for repeatability Go to Step 3	Trouble diagnosis based on symptom (Refer to “SYMPTOM DIAGNOSIS”) Go to Step 3
5	1. Reconnect all components. Ensure all component are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Finished	Go to Step 5

Basic Inspection Procedure

1. Basic Inspection of Service Brake

Step	Action	Yes	No
1	Is the fluid level normal?	Go to Step 2	Replenish with fluid Go to Step 2
2	Does fluid leak?	Repair Go to Step 3	Go to Step 3
3	Is the booster function normal?	Go to Step 4	Repair Go to Step 4
4	Is the pad and rotor normal?	Go to Step 5	Repair Go to Step 5
5	Reconnect all components. Ensure all component are properly mounted. Was this step finished?	Finished	Go to Step 5

2. Ground Inspection

Step	Action	Yes	No
1	Does ABS—related ground points normally?	Go to Step 2	Repair Go to Step 2
2	Reconnect all components. Ensure all component are properly mounted. Was this step finished?	Finished	Go to Step 2

EHCU Connector Pin-out Checks

- Disconnect Electronic Hydraulic Control Module.
- Perform checks with high impedance digital multimeter J-39200 or equivalent.

No.	Circuit to be Tested	Ignition Switch Position	Multimeter Scale/Range	Measure between Pin Number	Nominal Value	Note
1	Power supply	OFF	20DCV	1 (C–5) 2 (C–5)	11.5V to 14.5V	
2	Ignition enable	OFF	20DCV	1 (C–4) 7 (C–4)	0V to 0.1V	
		ON	20DCV	1 (C–4) 7 (C–4)	11.5V to 14.5V	
3	Stoplight switch	OFF	20DCV	13 (C–4) 7 (C–4)	10.5V to 14.5V	Press brake pedal
4	Ground connection	OFF	200Ω	7 (C–4) Ground	Less than 2Ω	
		OFF	1Ω	2 (C–5) Ground	Less than 0.2Ω	
5	FL speed sensor	OFF	2kΩ	2 (C–4) 10 (C–4)	2.0kΩ to 2.8kΩ	Internal Resistance
		OFF	200kΩ	2 (C–4) 7 (C–4)	more than 100kΩ	Insulation Resistance
		OFF	200mACV	2 (C–4) 10 (C–4)	more than 200mV	Turn wheel at 1RPS
6	FR speed sensor	OFF	2kΩ	3 (C–4) 11 (C–4)	2.0kΩ to 2.8kΩ	Internal Resistance
		OFF	200kΩ	3 (C–4) 7 (C–4)	more than 100kΩ	Insulation Resistance
		OFF	200mACV	3 (C–4) 11 (C–4)	more than 200mV	Turn wheel at 1RPS

Symptom Diagnosis

The symptoms that cannot be indicated by warning light can be divided in the following five categories:

1. ABS works frequently but vehicle does not decelerate.
2. Uneven braking occurs while ABS works.
3. The wheels lock during braking.
4. Brake pedal feel is abnormal.
5. Braking sound (from EHCU) is heard while not braking.

These are all attributable to problems which cannot be detected by EHCU self-diagnosis. Use the customer complaint and a test to determine which symptom is present. Then follow the appropriate flow chart listed below.

No.	Symptom	Diagnostic Flow Charts	
		Without TECH 2	With TECH 2
1	ABS works frequently but vehicle does not decelerate.	Chart A-1	Chart TA-1
2	Uneven braking occurs while ABS works.	Chart A-2	Chart TA-2
3	The wheels are locked.	Chart A-3	Chart TA-3
4	Brake pedal feel is abnormal.	Chart A-4	—
5	Braking sound (from EHCU) is heard while not braking.	Chart A-5	Chart TA-5

Chart A-1 ABS Works Frequently But Vehicle Does Not Decelerate

Step	Action	Yes	No
1	Is braking force distribution normal between front and rear of vehicle?	Go to Step 2	Repair brake parts. Go to Step 8
2	Are axle parts installed normally?	Go to Step 3	Repair axle parts. Go to Step 8
3	Is there play in each or any wheel speed sensor?	Repair wheel speed sensor. Go to Step 8	Go to Step 4
4	Is there damage, or powered iron sticking to each or any wheel speed sensor/sensor ring?	Replace sensor or sensor ring. Go to Step 8	Go to Step 5
5	Is the output of each wheel speed sensor normal? (Refer to chart C-1 or TC-1)	Go to Step 6	Replace wheel speed sensor or repair harness. Go to Step 7
6	Is the input of 4WD controller normal?	Go to Step 7	Replace controller or repair harness. Go to Step 7
7	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 7

Chart TA-1 ABS Works Frequently But Vehicle Does Not Decelerate (Use TECH 2)

Step	Action	Yes	No
1	1. Connect TECH 2. 2. Make sure of the output conditions of each sensor. Is the output of each sensor normal?	Go to Step 2	Replace wheel speed sensor. Go to Step 3
2	Return to Chart A-1. Was the Chart A-1 finished?	Go to Step 3	Go to Step 2
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 3

Chart A-2 Uneven Braking Occurs While ABS Works

Step	Action	Yes	No
1	Is there play in each or any sensor?	Repair. Go to Step 5	Go to Step 2
2	Damage or powdered iron sticking to each or any sensor/sensor ring?	Repair. Go to Step 5	Go to Step 3
3	Is the output of each sensor normal? (Refer to chart C-1 or TC-1)	Go to Step 4	Replace sensor or repair harness. Go to Step 5
4	Is brake pipe connecting order correct?	Replace H/U. Go to Step 5	Reconnect brake pipe correctly. Go to Step 5
5	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 5

Chart TA-2 Uneven Braking Occurs While ABS Works (Use TECH 2)

Step	Action	Yes	No
1	1. Connect TECH 2. 2. Make sure of the output conditions of each sensor. Is the output of each sensor normal?	Go to Step 2	Go to Step 3
2	Check piping by TECH 2 ACTUATOR TEST Is the piping normal?	Replace EHCU. Go to Step 4	Repair the pipe. Go to Step 4
3	Repair and check the wheel speed sensor (Refer to chart B-20 to B-23 , C-1 or TC-1). Was the each chart finished?	Go to Step 4	Go to Step 3
4	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 4

Chart A-3, TA-3 The Wheels Are Locked

Step	Action	Yes	No
1	Is ABS working?	Go to Step 2	Go to Step 6
2	Is vehicle speed under 10 km/h (6mph)?	Normal.	Go to Step 3
3	Is sensor output normal? (Chart C-1 or TC-1)	Go to Step 4	Replace sensor or repair harness. Go to Step 6
4	Is front 4WD controller normal?	Go to Step 5	Replace 4WD controller or repair harness. Go to Step 6
5	Is hydraulic unit grounded properly?	Replace EHCU. Go to Step 6	Correct. Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 6

Chart A-4 Brake Pedal Feed Is Abnormal

Step	Action	Yes	No
1	Is the stop light actuated when the brake pedal is depressed?	Go to Step 2	Go to Step 3
2	1. Turn the ignition switch off. 2. Disconnected EHCU connector. Is the check voltage EHCU connector terminals 13 to 7 when brake pedal is depressed than battery voltage?	Go to Step 4	Harness NG between brake SW and EHCU. Go to Step 6
3	Is stop light fuse normal?	Go to Step 5	Replace stop light fuse. Go to Step 6
4	Is the check continuity between EHCU connector terminals, 7 to body grounded?	Go to Step 6	Repair body grounded harness. Go to Step 6
5	Is brake SW normal?	Repair stop light harness. Go to Step 6	Replace brake SW. Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 6

Chart A-5, TA-5 Braking Sound (From EHCU) Is Heard While Not Braking

Step	Action	Yes	No
1	Is this the first vehicle start after engine start?	It is self checking sound Normal.	Go to Step 2
2	Is vehicle speed under 10 km/h (6 mph)?	It is self checking sound Normal.	Go to Step 3
3	Check for the following condition: ● At the time of shift down or clutch operation. ● At the time of low road friction drive (ice or snow road) or rough road drive. ● At the time of high-speed turn. ● At the time of passing curb. ● At the time of operating electrical equipment switches. ● At the time of racing the engine (over 5000 rpm). Did it occur under any one condition above?	ABS may sometime be actuated even when brake pedal is not applied.	Go to Step 4
4	Is there play in each or any sensor/wheel speed sensor rings?	Repair. Go to Step 7	Go to Step 5
5	Damage or powdered iron sticking to each or any sensor/wheel speed sensor ring?	Repair. Go to Step 7	Go to Step 6
6	Is each sensor output normal? (Refer to chart C-1 or TC-1).	Check harness/ connector for suspected disconnection If no disconnection is found, replace Coil integrated module. Go to Step 7	Repair. Go to Step 7
7	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 7

Diagnostic Trouble Codes

Choose and trace an appropriate flowchart by the numbers listed below to find fault and repair.

Code		Diagnosis	Item	Chart No.
Flash out	Serial Communications			
12	—	—	—	—

Diagnosis By “ABS” Warning Light Illumination Pattern

In the event that there is abnormality in the “ABS” warning light illumination pattern while the key is in the ON position or if the warning light is actuated during driving, trouble should be diagnosed on a illumination pattern basis as follows:

No.	Condition	“ABS” Warning Light Illumination Pattern	Diagnostic
1	Warning light is actuated normally		Normal
2	Warning light is not lit		Warning light lighting circuit trouble→Go to Chart B-1
3	Warning light remains ON		Diagnostic trouble codes are stored. Display diagnostic trouble codes and diagnose on a code basis according to the flow charts.
4	Warning light is actuated while driving		Diagnostic trouble codes are stored. Display diagnostic trouble codes and diagnose on a code basis according to the flow charts.
5	Warning light goes at 12 km/h (8 mph) or higher (After repairing the faulty part)		Even after repairing the faulty part the warning light (W/L) dose not go out it vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Diagnostic Trouble Codes (DTCs)

When the warning light in the meter remains ON, the EHCU stores the fault identification and disables the ABS.

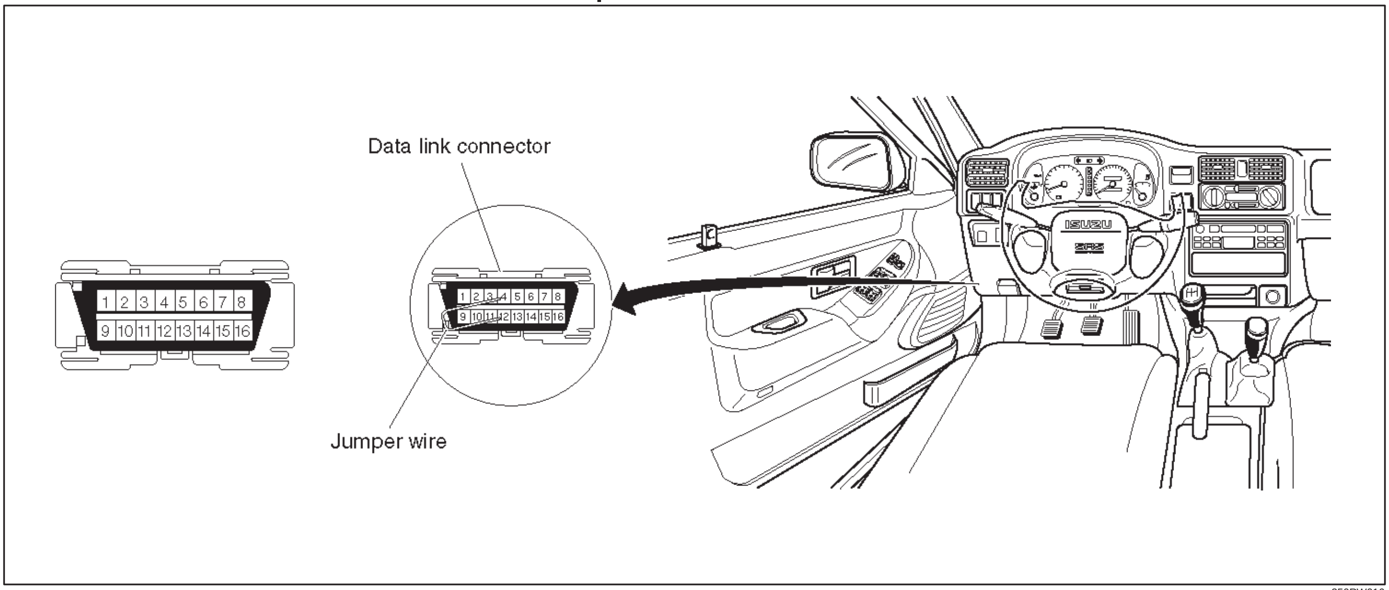
How to display and erase DTCs:

NOTE:

- DTCs can be displayed also by TECH 2. Use "Diagnostic Trouble Codes" mode.

1. How to start DTC display:
   - Confirm that the vehicle has come to a complete stop (with the wheels standing still) and that the brake pedal is not depressed. (Unless these two condition are satisfied, DTC display cannot be started.)
   - With IGN OFF, connect #12 terminal with #4 terminal or # 5 terminal (GND) . Then turn IGN ON.

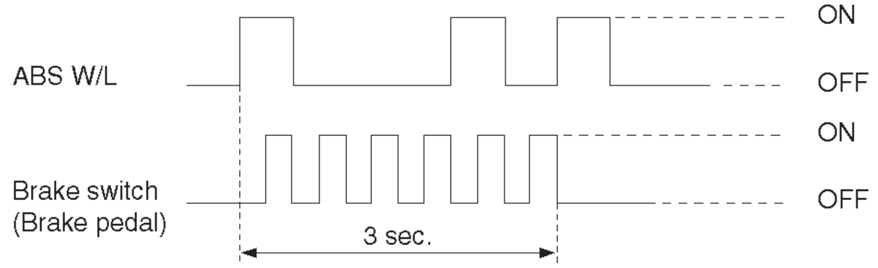
The DLC is located behind the driver side kick panel



350RW016

- Keep #12 terminal connected with #4 terminal or # 5 terminal (GND) during DTC display. (If #12 terminal is separated from #4 terminal or # 5 terminal (GND) during display, display will stop.)

2. DTC display:
   - DTC is displayed by blinking warning light.
   - Double-digit display.
   - First, normal DTC 12 is displayed three times and then any other DTCs are displayed three times. (If no other DTCs have been stored, the display of DTC 12 will be repeated.)
3. How to erase code:
   - Conduct brake switch ON/OFF operation 6 or more times within 3 seconds of self-diagnosis startup.
   - The code cannot be erased if more than 3 seconds have passed since self-diagnosis startup, or if self-diagnosis has started with brake switched on (brake pedaled).

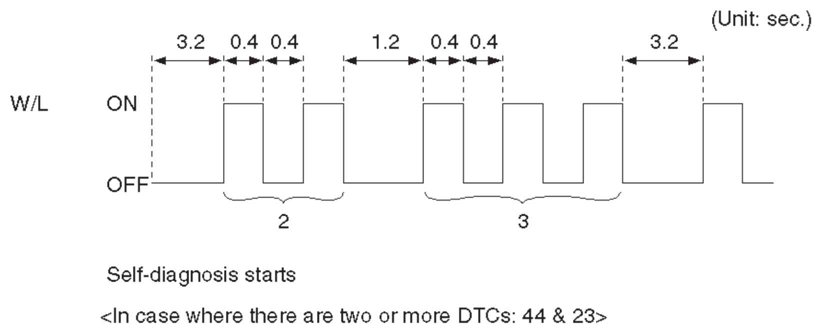


B05RW005

4. Notes
- If the following should occurs during Diagnostic Trouble Code (DTC) display the display will be discontinued. After initial check, the status that is under the control of ABS will be returned :
  – The vehicle starts (The wheels turn) or the brake pedal is depressed.
- Up to 3 different codes can be stored.
- If the ABS should turn OFF due to an intermittent defect, the system will be restored at the next key cycle, if the initial check finds no abnormality (when IGN is switched from OFF to ON).

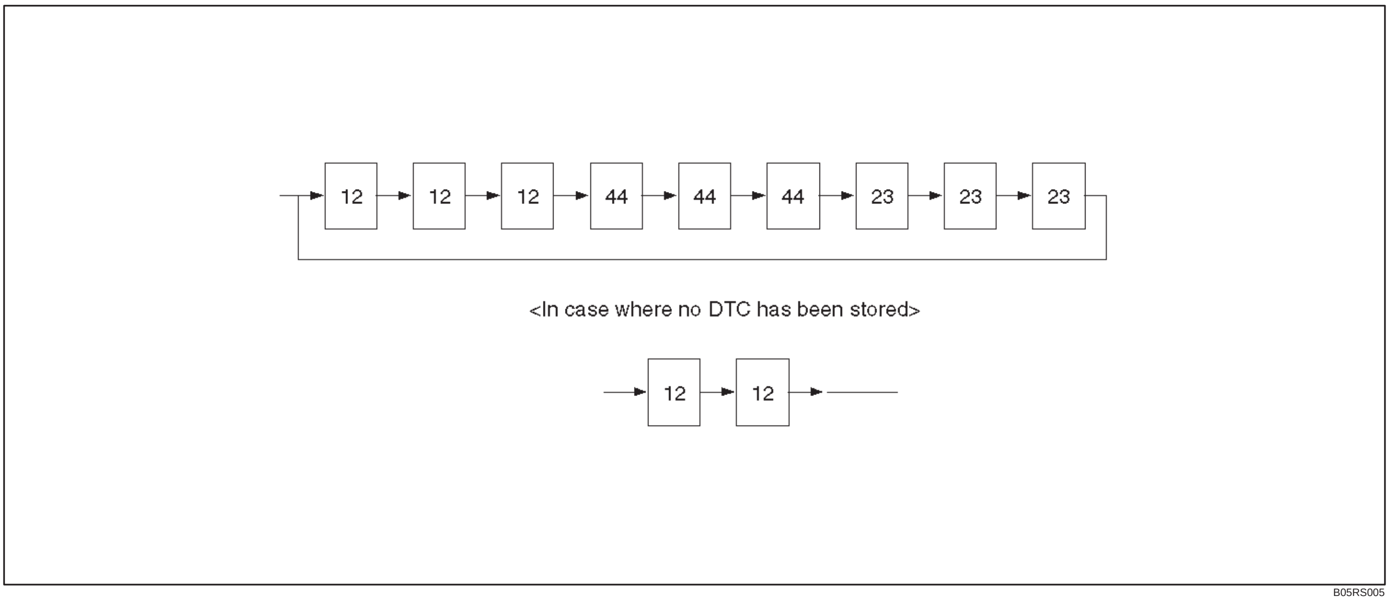
5. An example of DTC display

Display of DTC 23



B05RW006

After displaying DTC 12 three times, one DTC after another is displayed, starting with the most recent one. (However, display is discontinued after about 5 minutes.)



The DTC 12 is displayed repeatedly. (display is discontinued after about 5 minutes after)

Chart B-1 With the key in the ON position (Before starting the engine). Warning light (W/L) is not activated.

Step	Action	Yes	No
1	Is W/L fuse disconnected?	Replace fuse. Go to Step 5	Go to Step 2
2	Is W/L burnt out?	Replace W/L bulb. Go to Step 5	Go to Step 3
3	1. Turn the key off. 2. Disconnect coil integrated module connector (C-4). 3. Turn the key ON. Is the check voltage between coil integrated module connector (C-4) terminals 6 and 7 than battery voltage?	Go to Step 4	Repair harness and connector. Go to Step 5
4	Is the check continuity coil integrated module connector (C-4) terminals, 1 and 7 and body ground.	Check harness for suspected disconnection No fault found: Replace EHCU. Go to Step 5	Repair harness and connector. Go to Step 5
5	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 5

Chart B-2 CPU Error (DTC 14 (Flash out) / C0271, C0272, C0273, C0284 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnected coil integrated module connector. 3. Inspect coil integrated module ground. Is the check resistance between the coil integrated module connector terminals, 2 (C-5) and 7 (C-4) and body ground?	Go to Step 2	Repair the body ground harness. Go to Step 3
2	1. Turn the key off, connect the coil integrated module connector. 2. Erase the trouble code. 3. Turn Ignition off, then on, to perform system self-check. 4. If warning light remains on, display trouble codes once again. Is the check trouble code 14 (Flash out) / C0271, C0272, C0273, C0284 (Serial communications)?	Replace EHCU. Go to Step 3	Inspect in accordance with the DTC displayed.
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 3

Chart B-3 Low or High Ignition Voltage (DTC 15 (Flash out) / C0277, 0278 (Serial communications))

Step	Action	Yes	No
1	Is the check battery voltage normal? (Battery capacity check)	Go to Step 2	Charge or replace battery. Go to Step 2
2	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Turn the key on. Is the check voltage between coil integrated module connector (C-4) terminals 1 and 7, higher than 10V?	Check harness connector for suspected disconnection Fault found: Repair, and perform system self-check No fault found: replace EHCU. Go to Step 3	Repair harness or connector. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 3

Chart B-4 Excessive Dump Time (DTC 17 (Flash out) / C0269 (Serial communications))

Step	Action	Yes	No
1	Check for anything causing extended ABS activation, such as locked brakes or an erratic speed sensor signal. Was a problem found?	Repair or Replace	Go to Step 2
2	1. The key turned off. 2. Replace EHCU. 3. Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 2

Chart B-5 Excessive Isolation Time (DTC 18 (Flash out) / C0274 (Serial communications))

Step	Action	Yes	No
1	Check for anything causing extended ABS activation, such as locked brakes or an erratic speed sensor signal. Was a problem found?	Repair or Replace	Go to Step 2
2	1. The key turned off. 2. Replace EHCU. 3. Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 2

Chart B-6 G-Sensor Output Failure (DTC 21 (Flash out) / C0276 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Replace EHCU. 3. Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 1

Chart B-7 Brake Switch Failure (DTC 22 (Flash out) / C0281 (Serial communications))

Step	Action	Yes	No
1	Is the stop light actuated when the brake pedal is depressed?	Go to Step 2	Go to Step 4
2	1. Turn the key off. 2. Disconnected coil integrated module connector. Is the check voltage coil integrated module connector (C-4) terminals 13 to 7 when brake pedal is depressed than battery voltage?	Go to Step 3	Harness between brake SW and coil integrated module is faulty. Go to Step 6
3	Is the check that pins C-5 connector 2, and C-4 connector 7 have good ground?	Check harness / connector for disconnection Fault found: Repair, and perform system self-check. No fault found: replace EHCU. Go to Step 6	Repair. Go to Step 6
4	Is stop light fuse normal?	Go to Step 5	Replace. Go to Step 6
5	Is brake SW normal?	Abnormal harness in stop light circuit. Repair the harness. Go to Step 6	Replace. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 6

Chart B-8 2WD Controller in 4WD Vehicle Controller (DTC 13 (Flash out) / C0285 (Serial communications)), 4WD State Input Signal Failure (DTC 24 (Flash out) / C0282 (Serial communications))

Step	Action	Yes	No
1	Remove coil integrated module connector. Is the coil integrated module connector (C-4) terminal 8 line normally?	Go to Step 2	Repair. Go to Step 3
2	Is the 4WD controller normally?	Replace EHCU. Go to Step 3	Replace 4WD controller. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 3

Chart B-9 Pump Motor Failure (DTC 32 (Flash out) / C0267, C0268 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the voltage between terminal 1 of the coil integrated module connector (C-5) and body ground. Is the voltage equal to the battery voltage?	Go to Step 2	Repair fuse/harness between battery and coil integrated module connector (C-5) terminal 1. Go to Step 5
2	Is the harness from the hydraulic unit connected to the coil integrated module connector?	Go to Step 3	Connect to the connector. Go to Step 3
3	Is the harness from the hydraulic unit normally?	Go to Step 4	Replace EHCU. Go to Step 5
4	Is the check resistance of hydraulic unit connector terminals 1 and 2 between 0.2 and 1.0 ohms?	Replace EHCU. Go to Step 5	Replace EHCU. Go to Step 5
5	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 5

Chart B-10 EHCU Valve Relay Failure (DTC 35 (Flash out) / C0265, C0266 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the voltage between terminal 1 of the coil integrated module connector (C-5) and body ground. Is the voltage equal to the battery voltage?	Replace EHCU. Go to Step 2	Repair fuse and harness coil integrated module connector (C-5) terminal 1 and battery. Go to Step 2
2	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 2

Chart B-11 FL Isolation Solenoid Coil Failure (DTC 41 (Flash out) / C0245, C0247 (Serial communications))

Step	Action	Yes	No
1	Was the “EHCU Connector Pin–out Checks” performed?	Go to Step 2	Go to “EHCU Connector Pin–out Checks.”
2	1. Turn the key switch to off. 2. Disconnect the 2–way EHCU connector (C–5) from the EHCU. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the “Basic Diagnostic Flow Chart.”
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 3

Chart B-12 FL Dump Solenoid Coil Failure (DTC 42 (Flash out) / C0246, C0248 (Serial communications))

Step	Action	Yes	No
1	Was the “EHCU Connector Pin–out Checks” performed?	Go to Step 2	Go to “EHCU Connector Pin–out Checks.”
2	1. Turn the key switch to off. 2. Disconnect the 2–way EHCU connector (C–5) from the EHCU. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the “Basic Diagnostic Flow Chart.”
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 3

Chart B-13 FR Isolation Solenoid Coil Failure (DTC 43 (Flash out) / C0241, C0243 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCU Connector Pin–out Checks" performed?	Go to Step 2	Go to "EHCU Connector Pin–out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2–way EHCU connector (C–5) from the EHCU. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-14 FR Dump Solenoid Coil Failure (DTC 44(Flash out) / C0242, C0244 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCU Connector Pin–out Checks" performed?	Go to Step 2	Go to "EHCU Connector Pin–out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2–way EHCU connector (C–5) from the EHCU. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-15 Rear Isolation Solenoid Coil Failure (DTC 45 (Flash out) / C0251, C0253 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCU Connector Pin–out Checks" performed?	Go to Step 2	Go to "EHCU Connector Pin–out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2–way EHCU connector (C–5) from the EHCU. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-16 Rear Dump Solenoid Coil Failure (DTC 46 (Flash out) / C0252, C0254 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCU Connector Pin–out Checks" performed?	Go to Step 2	Go to "EHCU Connector Pin–out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2–way EHCU connector (C–5) from the EHCU. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-17 FL Speed Sensor Open or Shorted (DTC 51 (Flash out) / C0225 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the resistance between coil integrated module connector (C-4) terminals 2 and 10. Is the resistance between 2.0k and 2.8k ohms?	Check for faults in harness between speed sensor and coil integrated module. Fault found: Repair, and perform system self-check. No fault found: Replace coil integrated module. Go to Step 3	Go to Step 2
2	Measure the FL speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 3	Replace sensor. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-18 FR Speed Sensor Open or Shorted (DTC 52 (Flash out) / C0221 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the resistance between coil integrated module connector (C-4) terminals 3 and 11. Is the resistance between 2.0k and 2.8k ohms?	Check for faults in harness between speed sensor and coil integrated module. Fault found: Repair, and perform system self-check. No fault found: Replace coil integrated module. Go to Step 3	Go to Step 2
2	Measure the FR speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 3	Replace sensor. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 3

Chart B-19 Rear Speed Sensor Open or Shorted (DTC 53 (Flash out) / C0235 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the resistance between coil integrated module connector (C-4) terminals 4 and 12. Is the resistance between 1.2k and 2.0k ohms?	Check for faults in harness between speed sensor and coil integrated module. Fault found: Repair, and perform system self-check. No fault found: Replace EHCU. Go to Step 3	Go to Step 2
2	Measure the Rear speed sensor resistance at the sensor connector. Is the resistance between 1.2k and 2.0k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 3	Replace sensor. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-20 FL Speed Sensor Missing (DTC 61 (Flash out) / C0226, C0227 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the FL speed sensor resistance between coil integrated module connector (C-4) terminals 2 and 10. Is the resistance between 2.0k and 2.8k ohms?	Go to Step 2	Go to Step 3
2	Is there play sensor/sensor rotor?	Repair. Go to Step 6	Go to Step 4
3	Measure the FL speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 6	Replace sensor. Go to Step 6
4	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 5
5	Is sensor output normal? (Chart C-1-1 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 6	Replace sensor. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 6

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Chart B-21 FR Speed Sensor Missing (DTC 62 (Flash out) / C0222, C0223 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the FR speed sensor resistance between coil integrated module connector (C-4) terminals 3 and 11. Is the resistance between 2.0k and 2.8k ohms?	Go to Step 2	Go to Step 3
2	Is there play sensor/sensor rotor?	Repair. Go to Step 6	Go to Step 4
3	Measure the FR speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 6	Replace sensor. Go to Step 6
4	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 5
5	Is sensor output normal? (Chart C-1-2 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 6	Replace sensor. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 6

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Chart B-22 Rear Speed Sensor Missing (DTC 63 (Flash out) / C0236, C0237 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the Rear speed sensor resistance between coil integrated module connector (C-4) terminals 4 and 12. Is the resistance between 1.2k and 2.0k ohms?	Go to Step 2	Go to Step 3
2	Is there play sensor/sensor rotor?	Repair. Go to Step 6	Go to Step 4
3	Measure the rear speed sensor resistance at the sensor connector. Is the resistance between 1.2k and 2.0k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 6	Replace sensor. Go to Step 6
4	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 5
5	Is sensor output normal? (Chart C-1-3 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 6	Replace sensor. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 6

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Chart B-23 Simultaneous Drop-out of Front Speed Sensor Signal (DTC 64 (Flash out) / C0229 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the FL speed sensor resistance between coil integrated module connector (C-4) terminals 2 and 10. Is the resistance between 2.0k and 2.8k ohms?	Go to Step 2	Go to Step 3
2	Measure the FR speed sensor resistance between coil integrated module connector (C-4) terminals 3 and 11. Is the resistance between 2.0k and 2.8 k ohms?	Go to Step 5	Go to Step 4
3	Measure the FL speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 2	Replace sensor. Go to Step 2
4	Measure the FR speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 5	Replace sensor. Go to Step 5
5	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 6
6	Is there play sensor/sensor rotor?	Repair. Go to Step 7	Go to Step 7
7	Is sensor output normal? (Chart C-1-1&C-1-2 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 8	Replace sensor. Go to Step 8
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat “Basic diagnostic flow chart”	Go to Step 8

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Chart B-24 Wheel Speed Input Abnormality (DTC 65 (Flash out) / C0238 (Serial communications))

Step	Action	Yes	No
1	Using TECH 2?	Go to Step 2	Go to Step 3
2	1. Connect TECH 2. 2. Select Snap shot manual trigger. 3. With wheel speed data displayed, run the vehicle when speed has arrived at 30 km/h (18 mph). 4. Check speed data on each wheel (refer to the criterion given below). * 1 Is the abnormal sensor condition found?	Replace. Go to Step 8	Go to Step 3 All the sensors should follow the following flowchart (without using TECH 2).
3	Is there play in sensor/sensor ring?	Repair. Go to Step 8	Go to Step 4
4	Is there powdered iron sticking to sensor/sensor ring?	Repair. Go to Step 8	Go to Step 5
5	Is there a broken tooth or indentation in sensor ring?	Replace sensor ring. Go to Step 8	Go to Step 6
6	Is there play in wheel bearing?	Adjust or repair. Go to Step 8	Go to Step 7
7	Is the check wiring between sensor and coil integrated module normal?	Replace EHCU. Go to Step 8	Repair, and perform system self-check. Go to Step 8
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat ‘Basic diagnostic flow chart”	Go to Step 8

Sensor Signal Abnormality Criteria using TECH 2

1. While driving, the speed of one or two wheels is 25% or more higher or lower than that of the other wheels.
2. The speed of one or two wheels is 10 km/h (6 mph) or more higher or lower than that of the other wheels.
3. During steady driving, wheel speed changes abruptly.

*1 The vehicle must run on a level paved road.

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop.

Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

It is important to verify that the correct tires are installed on vehicle.

Unit Inspection Procedure

This section describes the following inspection procedures referred to during “SYMPTOM DIAGNOSIS” and “DIAGNOSIS BY ‘ABS’ WARNING LIGHT ILLUMINATION PATTERN” :

	without TECH 2	with TECH 2
Sensor Output Inspection	Chart C-1-1 to C-1-3	Chart TC-1

Chart C-1-1 FL Sensor Output Inspection Procedure

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Jack up the vehicle with all four wheels off the ground. Measure the AC voltage between coil integrated module connector terminals while turning FL wheel at a speed of 1 RPS: Is the check between coil integrated module connector (C-4) terminals 2 and 10 than under 200 mV?	Go to Step 2	OK. Go to Step 3
2	1. Disconnect the wheel speed sensor. 2. Measure resistance between the wheel speed sensor connector terminals 1 and 2. Is the check between connector (C-13) terminals 1 and 2 within 2.0k - 2.8k ohms?	Connector is faulty, or open or short circuit of harness between wheel speed sensor connector and coil integrated module. Inspect and correct the connector or harness. Go to Step 3	Wheel speed sensor is faulty. Replace the wheel speed sensor. Go to Step 3
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 3

Chart C-1-2 FR Sensor Output Inspection Procedure

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Jack up the vehicle with all four wheels off the ground. Measure the AC voltage between coil integrated module connector terminals while turning FR wheel at a speed of 1 RPS: Is the check between coil integrated module connector (C-4) terminals 3 and 11 than under 200 mV?	Go to Step 2	OK. Go to Step 3
2	1. Disconnect the wheel speed sensor. 2. Measure resistance between the wheel speed sensor connector terminals 1 and 2. Is the check between connector (C-33) terminals 1 and 2 within 2.0k - 2.8k ohms?	Connector is faulty, or open or short circuit of harness between wheel speed sensor connector and coil integrated module. Inspect and correct the connector or harness. Go to Step 3	Wheel speed sensor is faulty. Replace the wheel speed sensor. Go to Step 3
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the “Basic diagnostic flow chart”	Go to Step 3

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Removal

1. Remove speed sensor connector.
2. Remove sensor cable fixing bolt (Upper side).
3. Remove sensor cable fixing bolt (Lower side).
4. Remove the speed sensor cable fixing bolt.
5. Remove speed sensor.

Inspection and Repair

1. Check the speed sensor pole piece for presence of foreign materials; remove any dirt, etc.
2. Check the pole piece for damage; replace speed sensor if necessary.
3. Check the speed sensor cable for short or open circuit, and replace with a new one if necessary.
   To check for cable short or open, bend or stretch the cable while checking for continuity.
4. Check the sensor ring for damage including tooth chipping, and if damaged, replace the sensor ring assembly. Refer to removal of the sensor ring in Section 4D "Front hub and disc".

Installation

1. Install speed sensor and take care not to hit the speed sensor pole piece during installation.
2. Install speed sensor fixing bolt and tighten the fixing bolt to the specified torque.

   Torque: 11 N·m (95 lb in)
3. Install speed sensor cable fixing bolt (Lower side) and tighten the fixing bolt to the specified torque.

   Torque : 24 N·m (18 lb ft)
4. Install speed sensor cable fixing bolt (Upper side) and tighten the fixing bolt to the specified torque.

   Torque : 6 N·m (52 lb ft)

NOTE: Confirm that a white line marked on the cable is not twisted when connecting the speed sensor cable.

5. Install speed sensor connector.

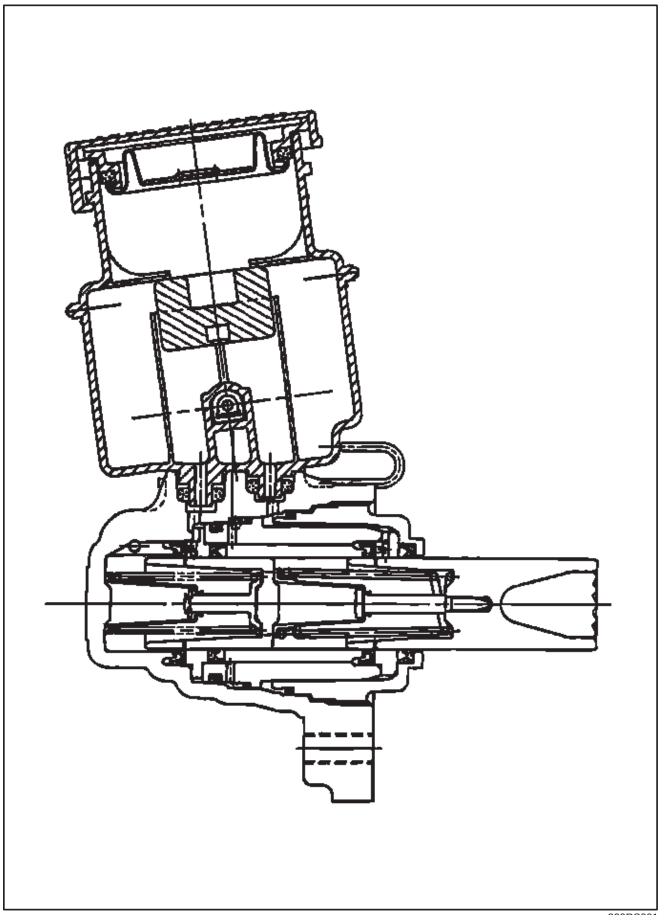
General Description

Master Cylinder Assembly



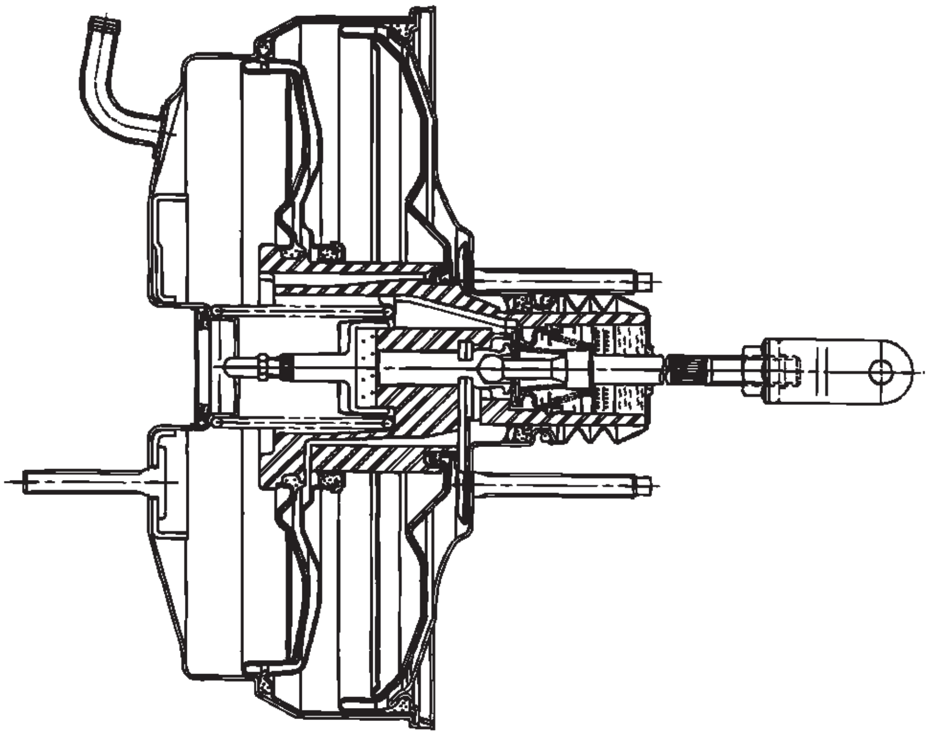
330RS001

The master cylinder contains two pistons that supply the hydraulic pressure for a dual–circuit braking system. The primary piston provides the fluid pressure to the front brakes, while the secondary piston provides the fluid pressure to the rear brakes. If the pressure is lost from either system, the remaining system will function to stop the vehicle.

CAUTION:

1. **The master cylinder is not repairable. If found defective, it must be replaced as a complete assembly.**
2. **If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system. (Refer to "Bleeding Brake Hydraulic System" in this section.)**
3. **The torque values specified are for dry, unlubricated fasteners.**
4. **Perform service operations on a clean bench free from all mineral oil materials.**

Brake Booster



331RS001

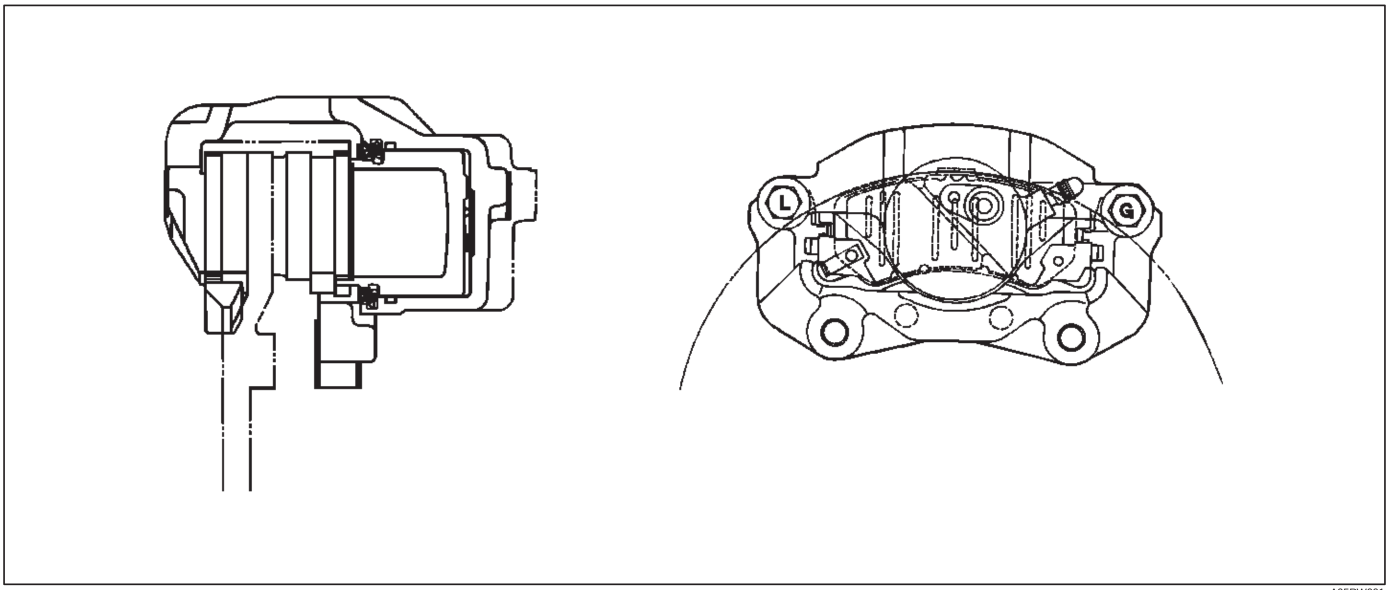
This booster is a tandem vacuum unit with a diaphragm effective diameter 205mm + 230mm. In normal operating mode, with the service brakes in the released position, the tandem vacuum booster operates with vacuum on both sides of its diaphragms. When the brakes are applied, air at atmospheric pressure is admitted to one side of each diaphragm to provide the power assist. When the service brake is released, the atmospheric air is shut off from the one side of each diaphragm. The air is then drawn from the booster through the vacuum check valve to the vacuum source.

CAUTION:

1. **If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.**
2. **The torque values specified are for dry, unlubricated fasteners.**
3. **The vacuum booster is not repairable and must be replaced as complete assembly.**

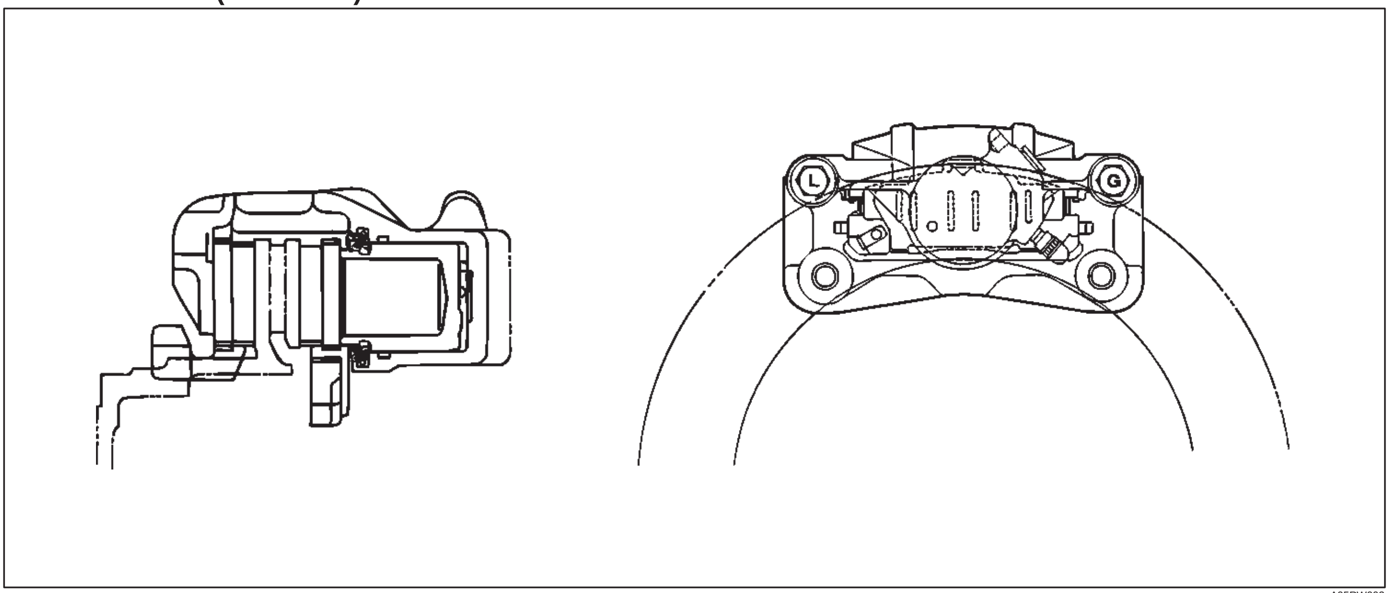
Disc Brake

Front Disc Brake



A05RW001

Rear Disc Brake (4×4 Model)



A05RW002

The disc brake assembly consists of a caliper, piston, rotor, pad assembly and support bracket. The caliper assembly has a single bore and is mounted to the support bracket with two mounting bolts. The support bracket allows the caliper to move laterally against the rotor. The caliper is a one–piece casting with the inboard side containing the piston bore. A square cut rubber seal is located in a groove in the piston bore which provides the hydraulic seal between the piston and the cylinder wall.

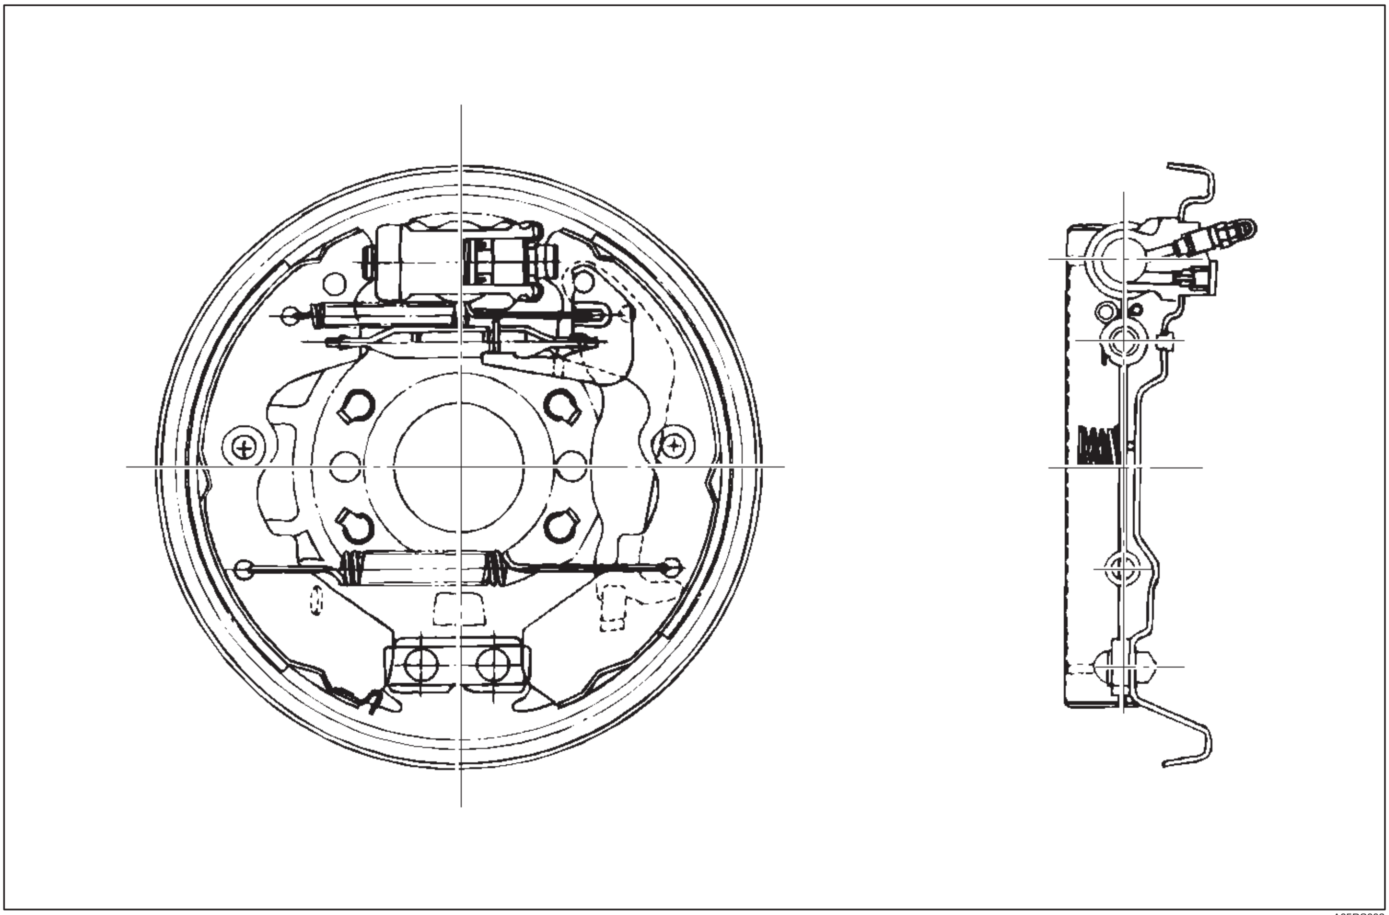
NOTE:

1. Replace all components included in repair kits used to service this caliper.
2. Lubricate rubber parts with clean brake fluid to ease assembly.
3. If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
4. Replace pads in axle sets only.
5. The torque values specified are for dry, unlubricated fasteners.
6. Perform the service operation on a clean bench free from all mineral oil materials.

Operation

Hydraulic pressure, created by applying the brake pedal, is converted by the caliper to a stopping force. This force acts equally against the piston and the bottom of the caliper bore to move the piston outward and to move (slide) the caliper inward resulting in a clamping action on the rotor. This clamping action forces the linings against the rotor, creating friction to stop the vehicle.

Leading/Trailing Drum Brakes (4×2 Model)



A05RS003

This drum brake assembly is a leading/trailing shoe design. Both brake shoes are held against the wheel cylinder pistons by the upper return spring and to the fixed anchor plate by the lower return spring. When the brakes are applied, the wheel cylinder pistons move both shoes out contact the drum.

With forward wheel rotation, the forward brake shoe will wrap into the drum and became self-energized.

With reverse wheel rotation, the rear brake shoe is self-energized. Force from the brake shoes is transferred to the anchor plate through the braking plate to the axle flange. Adjustment is automatic and occurs on any service brake application. Also, with leading/trailing brakes, it is normal for the front shoe to wear at a faster rate than the rear shoe.

Diagnosis

Road Testing The Brakes

Brake Test

Brakes should be tested on a dry, clean, reasonably smooth and level roadway. A true test of brake performance cannot be made if the roadway is wet, greasy or covered with loose dirt so that all tires do not grip the road equally. Testing will also be adversely affected if the roadway is crowned so as to throw the weight of the vehicle toward wheels on one side or if the roadway is so rough that wheels tend to bounce. Test the brakes at different vehicle speeds with both light and heavy pedal pressure; however, avoid locking the wheels and sliding the tires. Locked wheels and sliding tires do not indicate brake efficiency, since heavily braked but turning wheels will stop the vehicle in less distance than locked wheels. More tire–to–road friction is present with a heavily braked turning tire then with a sliding tire.

The standard brake system is designed and balanced to avoid locking the wheels except at very high deceleration levels.

It is designed this way because the shortest stopping distance and best control is achieved without brake lock–up.

Because of high deceleration capability, a firmer pedal may be felt at higher deceleration levels.

External Conditions That Affect Brake Performance

1. Tires: Tires having unequal contact and grip on the road will cause unequal braking. Tires must be equally inflated, identical in size, and the thread pattern of right and left tires must be approximately equal.
2. Vehicle Loading: A heavily loaded vehicle requires more braking effort.
3. Wheel Alignment: Misalignment of the wheels, particularly in regard to excessive camber and caster, will cause the brakes to pull to one side.

Brake Fluid Leaks

With engine running at idle and the transmission in "Neutral", depress the brake pedal and hold a constant foot pressure on the pedal. If pedal gradually falls away with the constant pressure, the hydraulic system may be leaking.

Check the master cylinder fluid level. While a slight drop in the reservoir level will result from normal lining wear, an abnormally low level in reservoir indicates a leak in the system. The hydraulic system may be leaking internally as well as externally. Refer to "Master Cylinder Inspection". Also, the system may appear to pass this test but still have slight leakage. If fluid level is normal, check the vacuum booster push rod length. If an incorrect length push rod is found, adjust or replace the push rod. Check the brake pedal travel and the parking brake adjustment.

When checking the fluid level, the master cylinder fluid level may be low from the "MAX" mark if the front and rear linings are worn. This is not abnormal.

Warning Light Operation

When the ignition switch is in the START position, the "BRAKE" warning light should turn on and go off when the ignition switch returns to the ON position.

The following conditions will activate the "BRAKE" light:

1. Parking brake applied. The light should be on whenever the parking brake is applied and the ignition switch is on.
2. Low fluid level. A low fluid level in the master cylinder will turn the "BRAKE" light on.
3. During engine cranking the "BRAKE" light should remain on. This notifies the driver that the warning circuit is operating properly.

General Diagnosis

Condition	Possible cause	Correction
Brake Pull	Tire inflation pressure is unequal.	Adjust
	Front wheel alignment is incorrect.	Adjust
	Unmatched tires on same axle.	Tires with approx. the same amount of tread should be used on the same axle.
	Restricted brake pipes or hoses.	Check for soft hoses and damaged lines. Replace with new hoses and new double“walled steel brake piping.
	Water or oil on the brake pads.	Clean or replace.
	Brake pads hardened.	Replace
	Brake pads worn excessively.	Replace
	Brake rotor worn or scored.	Grind or replace.
	Disc brake caliper malfunctioning.	Clean or replace.
	Front hub bearing preload incorrect.	Adjust or replace.
	Loose suspension parts.	Check all suspension mountings.
	Loose calipers.	Check and tighten the bolts to specifications.
Brake Roughness or Chatter (Pulsates)	Excessive lateral runout.	Check per instructions. If not within specifications, replace or machine the rotor.
	Parallelism not within specifications.	Check per instructions. If not within specifications, replace or machine the rotor.
	Wheel bearings not adjusted.	Adjust wheel bearings to correct specifications
	Pad reversed (steel against iron).	Replace the brake pad and machine rotor to within specifications.
Excessive Pedal Effort	Malfunctioning vacuum booster.	Check the vacuum booster operation and repair, if necessary.
	Partial system failure.	Check the front and rear brake system for failure and repair. Also, check the brake warning light. If a failed system is found, the light should indicate failure.
	Excessively worn pad.	Check and replace pads in sets.
	Piston in caliper stuck or sluggish.	Remove caliper and rebuild.
	Fading brakes due to incorrect pad.	Remove and replace with original equipment pad or equivalent.
	Vacuum leak to vacuum booster.	Check for ruptured or loose hose.
	Check the direction of check valve within vacuum hose.	Correct vacuum hose direction.
	Grease on the brake pads.	Replace or clean.

Condition	Possible cause	Correction
Excessive Brake Pedal Travel	Air in hydraulic circuit.	Bleed the hydraulic circuit.
	Level of brake fluid in the reservoir too low.	Replenish brake fluid reservoir to specified level and bleed hydraulic circuit as necessary.
	Master cylinder push rod clearance excessive.	Adjust
	Leakage in hydraulic system.	Correct or replace defective parts.
Brake Drag	Master cylinder pistons not returning correctly.	Adjust the stop light switch and vacuum booster push rod. If necessary, rebuild.
	Restricted brake pipes or hoses.	Check for soft hoses or damaged pipes, and replace with new hoses and new double–walled steel brake piping.
	Parking brake maladjusted.	Adjust
	Parking brake lining clearance insufficient.	Adjust
	Brake pedal free play insufficient.	Adjust the brake pedal height or power cylinder operating rod.
	Piston in the master cylinder sticking.	Replace
	Piston in the disc brake caliper sticking.	Replace piston seals.
	Brake pads sticking in caliper.	Clean
	Return spring weakened.	Replace
	Parking brake binding.	Overhaul the parking brakes and correct.
	Front hub bearing preload incorrect.	Adjust or replace.
	Parking brake shoes not returning.	Correct or replace the brake back plate and brake shoe as necessary.
	Obstructions in hydraulic circuit.	Clean
	Rotor warped excessively.	Grind or replace.
	Rear brake drum distorted.	Grind or replace.
	Parking cable sticking.	Grind or replace.
Grabbing or Uneven Braking Action (All conditions listed under “Pulls”)	Malfunctioning vacuum booster.	Check operation and correct as necessary.
	Binding brake pedal mechanism.	Check and lubricate, if necessary.
	Corroded caliper assembly.	Clean and lubricate.
Brake Noisy	Brake pads are worn.	Replace
	Brake pads are hardened.	Replace
	Brake pads are in poor contact with rotor.	Correct
	Brake disc(s) warped, worn or damaged.	Grind or replace.
	Disc brake anti–squeak shims fatigued.	Replace
	Front hub bearings are loose or preload is incorrect.	Adjust or replace.
	Brake disc is rusted.	Grind or replace.

Condition	Possible cause	Correction
Poor Brake Action	Master cylinder faulty.	Correct or replace.
	Vacuum booster faulty.	Correct or replace.
	Level of brake fluid in reservoir too low.	Replenish and bleed.
	Air in hydraulic circuit.	Bleed
	Disc brake caliper faulty.	Clean or replace.
	Water or oil on brake pads.	Clean or replace.
	Brake pads in poor contact with the rotor.	Correct
	Brake pads worn.	Replace
	Brake disc rusted.	Grind or replace.
	Check valve in vacuum hose faulty.	Correct or replace.

Hydraulic Brakes

Filling Master Cylinder Reservoir

CAUTION: Use only specified brake fluid. Do not use any fluid which contains a petroleum base. Do not use a container which has been used for petroleum based fluids or a container which is wet with water. Petroleum based fluid will cause swelling and distortion of rubber parts in the hydraulic brake system. Water mixed with brake fluid lowers the fluid boiling point. Keep all fluid containers capped to prevent contamination.

Always fill the master cylinder reservoir when the engine is cold.

Never allow the brake fluid to come in contact with the painted surfaces.

The master cylinder reservoir must be kept properly filled to ensure adequate reserve and to prevent air and moisture from entering the hydraulic system. However, because of expansion due to heat absorbed from the brakes and the engine, the reservoir must not be overfilled. The brake fluid reservoir is on the master cylinder, which is located under the hood on the left side of the cowl. Thoroughly clean reservoir cap before removal to avoid getting dirt into reservoir. Remove the diaphragm. Add fluid as required to bring level to the "MAX" mark on the reservoir tank. Use "DOT 3" Hydraulic Brake Fluid. If the fluid cap diaphragm is stretched, return it to the original position before installing.

Deterioration of Brake Fluid

Using any other brake fluid than specified or brake fluid with mineral oil or water mixed in will drop the boiling point of brake fluid. It may, in turn, result in vapor lock or deteriorated rubber parts of the hydraulic system. Be sure to change the brake fluid at specified intervals.

If the rubber parts are deteriorated, remove all the system parts and clean them with alcohol. Prior to reassembly, dry the cleaned parts with air to remove the alcohol. Replace all the hoses and rubber parts of the system.

Leakage of Brake Fluid

With engine idling, set shift lever in the neutral position and continue to depress brake pedal at a constant pedal application force.

Should the pedal stroke become deeper gradually, leakage from the hydraulic pressure system is possible. Make sure by visual check that there is no leak.

Bleeding Brake Hydraulic System

A bleeding operation is necessary to remove air from the hydraulic brake system whenever air is introduced into the hydraulic system. It may be necessary to bleed the hydraulic system at all four brakes if air has been introduced through a low fluid level or by disconnecting brake pipes at the master cylinder. If a brake pipe is disconnected at one wheel, only that wheel cylinder/caliper needs to be bled. If the pipes are disconnected at any fitting located between the master cylinder and brakes, then the brake system served by the disconnected pipe must be bled.

1. For 4–Wheel Antilock Brake System (ABS) equipped vehicle, be sure to remove the ABS main fuse 60A located at the relay and fuse box before bleeding air. If you attempt to bleed air without removing the main fuse, air cannot be let out thoroughly, and this may cause damage to the hydraulic unit. After bleeding air, be sure to replace the ABS main fuse back to its original position.
2. Set the parking brake completely, then start the engine.

NOTE: The vacuum booster will be damaged if the bleeding operation is performed with the engine off.

3. Remove the master cylinder reservoir cap.
4. Fill the master cylinder reservoir with brake fluid. Keep the reservoir at least half full during the air bleeding operation
5. Always use new brake fluid for replenishment.
6. In replenishing brake fluid, take care that air bubbles do not enter the brake fluid.

   When the master cylinder is replaced or overhauled, first bleed the air from the master cylinder, then from each wheel cylinder and caliper following the procedures described below.

Bleeding the Master Cylinder

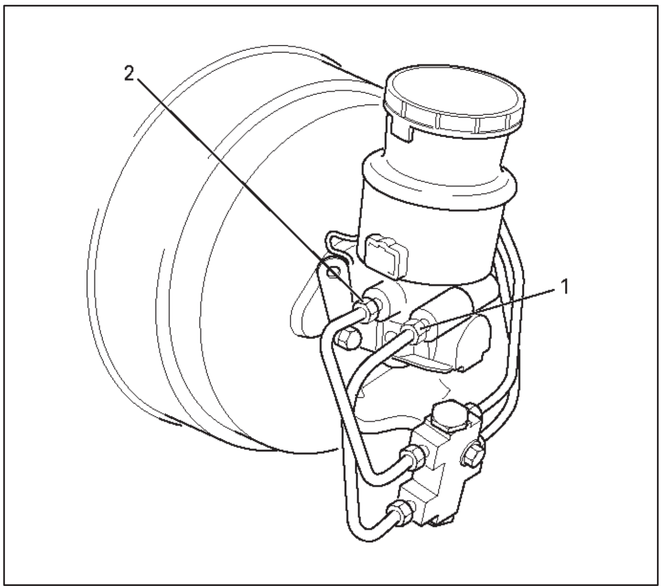
7. Disconnect the rear wheel brake pipe (1) from the master cylinder.

   Check the fluid level and replenish as necessary. If replenished, leave the system for at least one minute.
8. Depress the brake pedal slowly once and hold it depressed.
9. Completely seal the delivery port of the master cylinder with your finger, where the pipe was disconnected then release the brake pedal slowly.
10. Release your finger from the delivery port when the brake pedal returns completely.
11. Repeat steps 8 through 10 until the brake fluid comes out of the delivery port during step 8.

NOTE: Do not allow the fluid level in the reservoir to go below the half–way mark.

12. Reconnect the brake pipe (1) to the master cylinder and tighten the pipe.
13. Depress the brake pedal slowly once and hold it depressed.
14. Loosen the rear wheel brake pipe (1) at the master cylinder.
15. Retighten the brake pipe, then release the brake pedal slowly.
16. Repeat steps 13 through 15 until no air comes out of the port when the brake pipe is loosened

NOTE: Be very careful not to allow the brake fluid to come in contact with painted surfaces.



330RW012

17. Bleed the air from the front wheel brake pipe connection (2) by repeating steps 7 through 16.

Bleeding the Caliper

18. Bleed the air from each wheel in the order listed below:
    - Right rear caliper or wheel cylinder
    - Left rear caliper or wheel cylinder
    - Right front caliper
    - Left front caliper

    Conduct air bleeding from the wheels in the above order. If no brake fluid comes out, it suggests that air is mixed in the master cylinder. In this case, bleed air from the master cylinder. In this case, bleed air from the master cylinder in accordance with steps 7 through 17, and then bleed air from the caliper or wheel cylinder.
19. Place the proper size box end wrench over the bleeder screw.
20. Cover the bleeder screw with a transparent tube, and submerge the free end of the transparent tube in a transparent container containing brake fluid.
21. Pump the brake pedal slowly three (3) times (once/sec), then hold it depressed.
22. Loosen the bleeder screw until fluid flows through the tube.
23. Retighten the bleeder screw.
24. Release the brake pedal slowly.
25. Repeat steps 21 through 24 until the air is completely removed.

    It may be necessary to repeat the bleeding procedure 10 or more times for front wheels and 15 or more times for rear wheels.
26. Go to the next wheel in the sequence after each wheel is bled.

    Be sure to monitor reservoir fluid level.
27. Depress the brake pedal to check if you feel “sponginess” after the air has been removed from all wheel cylinders and calipers.

    If the pedal feels “spongy”, the entire bleeding procedure must be repeated.
28. After the bleeding operation is completed on the each individual wheel, check the level of the brake fluid in the reservoir and replenish up to the “MAX” level as necessary.
29. Attach the reservoir cap.

    If the diaphragm inside the cap is deformed, reform it and install.
30. Stop the engine.

Flushing Brake Hydraulic System

It is recommended that the entire hydraulic system be thoroughly flushed with clean brake fluid whenever new parts are installed in the hydraulic system. Approximately one quart of fluid is required to flush the hydraulic system. The system must be flushed if there is any doubt as to the grade of fluid in the system or if fluid has been used which contains the slightest trace of mineral oil. All rubber parts that have been subjected to a contaminated fluid must be replaced.

Brake Pipes and Hoses

The hydraulic brake system components are interconnected by special steel piping and flexible hoses. Flexible hoses are used between the frame and the front calipers, the frame and rear axle case and the rear axle and the rear calipers.

When the hydraulic pipes have been disconnected for any reason, the brake system must be bled after reconnecting the pipe. Refer to “Bleeding the Brake Hydraulic System” in this section.

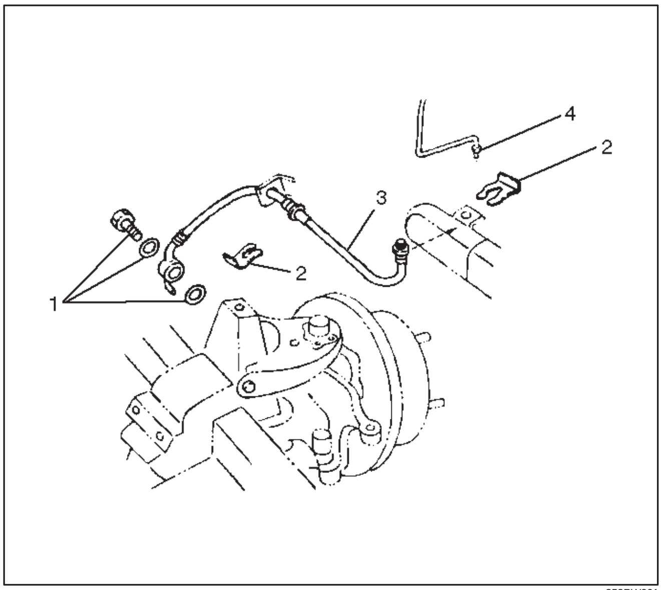
Brake Hose Inspection

The brake hose should be inspected at least twice a year. The brake hose assembly should be checked for road hazard, cracks and chafing of the outer cover, and for leaks and blisters. Inspect for proper routing and mounting of the hose. A brake hose that rubs on suspension components will wear and eventually fail. A light and mirror may be needed for an adequate inspection. If any of the above conditions are observed on the brake hose, adjust or replace the hose as necessary.

CAUTION: Never allow brake components such as calipers to hang from the brake hoses, as damage to the hoses may occur.

Front Caliper Brake Hose

Front Caliper Brake Hose and Associated Parts



352RW001

Legend

(1) Bolt and Gasket
(2) Clip
(3) Hose
(4) Brake Pipe

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove the wheel and tire assembly.
3. Clean dirt, grease, and other foreign material off the hose fittings at both ends.
4. Disconnect brake pipe.
5. Remove clip.
6. Remove bolt and gasket.
7. Remove hose.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the brake pipes to the specified torque

   Torque: 16 N·m (12 lb ft)

2. Tighten the bolt to the specified torque.

   Torque: 35 N·m (26 lb ft)

NOTE: Always use new gaskets and be sure to put the hooked edge of the flexible hose end into the anti–rotation cavity.

After installing the brake hoses, bleed the brakes as described in this section.

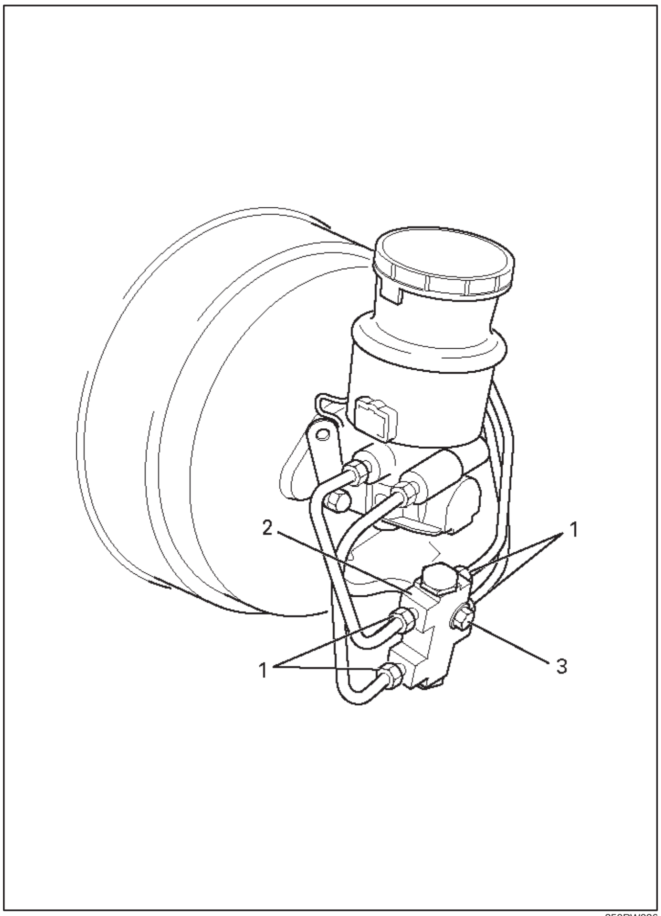
(4) Front Brake

The P&B valve contains two sections, each serving a different function.
The proportioning section of the P&B valve proportions outlet pressure to the rear brakes after a predetermined rear input pressure has been reached. This is done to prevent rear wheel lock up on the vehicles with light rear wheel loads. The valve has a by–pass feature which assures full system pressure to the rear brakes in the event of front brake system malfunction. Also full front pressure is retained in the event of rear brake malfunction.
The P&B valve is not repairable and must be replaced as complete assembly.

Removal

1. The P&B valve is not repairable and must be replaced as a complete assembly. Care must be taken to prevent brake fluid from contacting any painted surface.
2. Remove hydraulic pipes (1) and plug the pipes (1) to prevent the loss of fluid or the entrance of dirt.
3. Remove bolt (3).
4. Remove P&B valve (2).



350RW026

Installation

1. Install P&B valve (2).
2. Install bolt (3) and tighten the bolt to the specified torque.

   Torque: 22 N·m (16 lb ft)

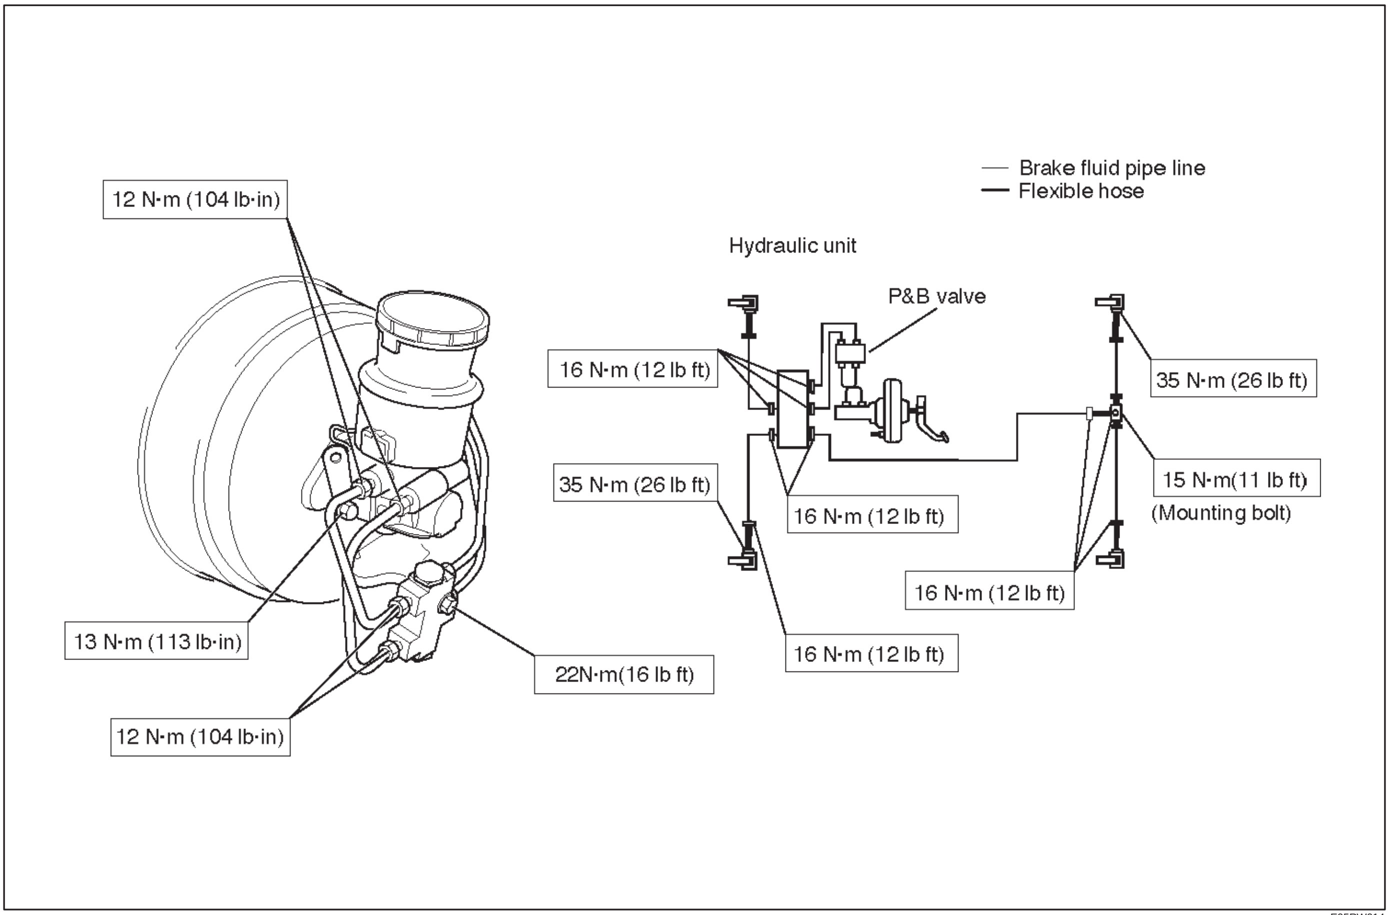
3. Install hydraulic pipes (1) and tighten the bolt to the specified torque.

   Torque: 12 N·m (104 lb in)

4. After installing the brake pipes, bleed the brakes as refer to Bleeding Brake Hydraulic System in this section.

Main Data and Specifications

Torque Specifications



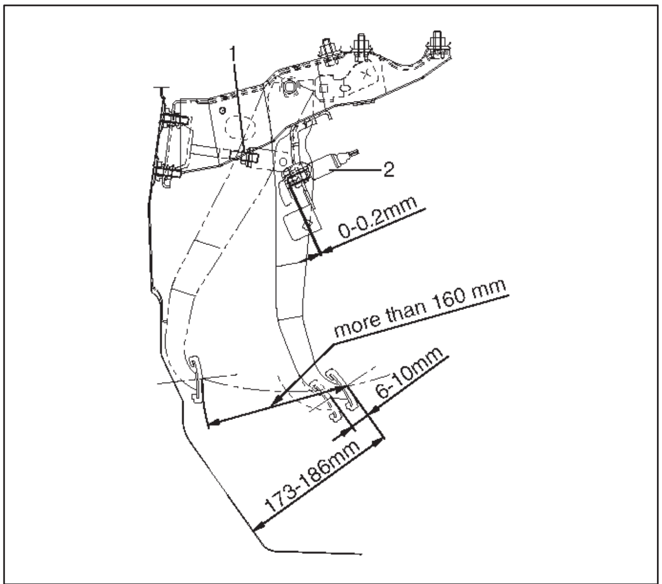
E05RW014

Brake Pedal

Checking Pedal Height

The push rod serves as the brake pedal stopper when the pedal is fully released. Brake pedal height adjustment should be performed as follows:

Adjust Brake Pedal



310RY00004

1. Measure the brake pedal height after making sure the pedal is fully returned by the pedal return spring.
   Pedal height must be measured after starting the engine and receiving it several times.

   Pedal Free Play: 6-10 mm (0.23-0.39 in)

   Pedal Free Play: 173-185 mm (6.81-7.28 in)

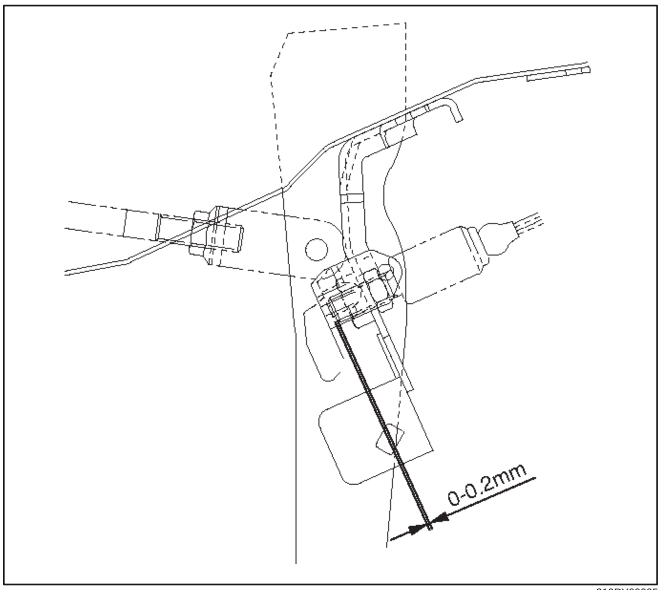
NOTE: Pedal free play must be measured after turning off the engine and stepping on the brake pedal firmly five times or more.

2. If the measured value is not within the above range, adjust the brake pedal as follows:
   a. Disconnect the stoplight switch connector.
   b. Loosen the stoplight switch lock nut.
   c. Rotate the stoplight switch so that it moves away from the brake pedal.
   d. Loosen the lock nut (1) on the push rod.
   e. Adjust the brake pedal to the specified height by rotating the push rod in the appropriate direction.
   f. Tighten the lock nut to the specified torque.

   Torque: 20 N·m (15 lb ft)

   g. Adjust the stoplight switch (2) to the specified clearance (between the switch housing and the brake pedal) by rotating the switch housing.

   Clearance: 0.5–1.0 mm (0.02–0.04 in)

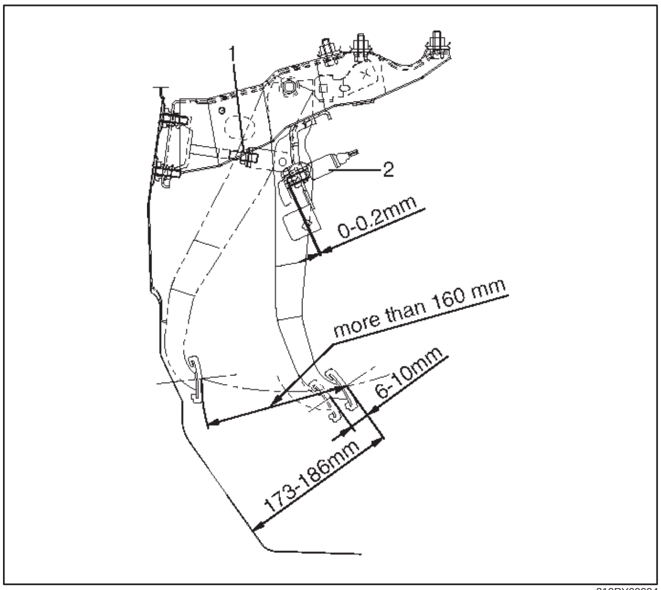


310RY00005

NOTE: While adjusting the stoplight switch, make sure that the threaded part of the stoplight switch does not push the brake pedal.

   h. Tighten the stoplight switch lock nut.
   i. Connect the stoplight switch connector.

Checking Pedal Travel



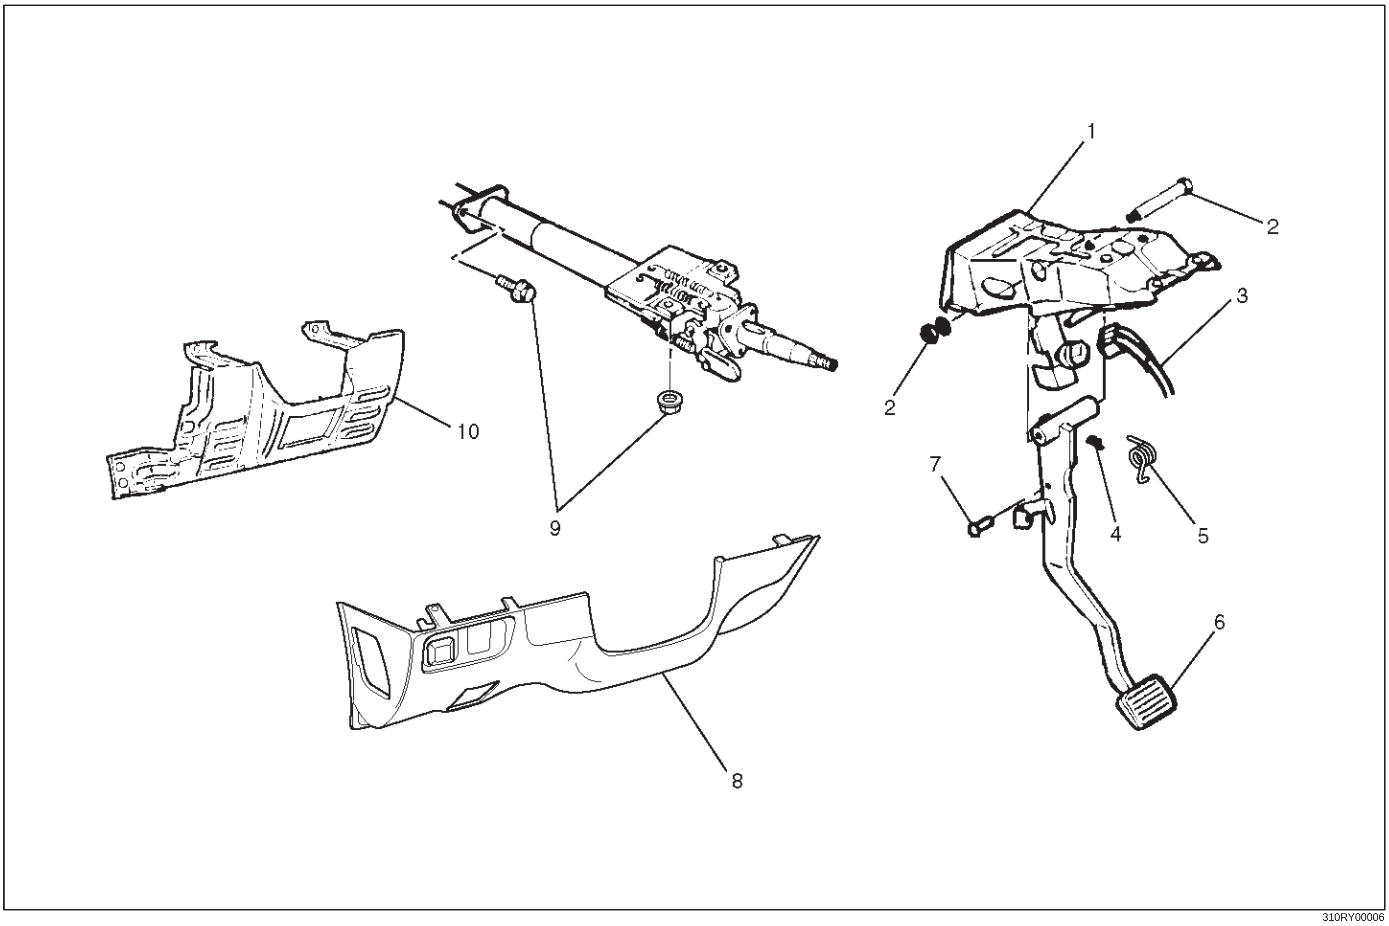
310RY00004

1. Pedal height must be measured after starting the engine and revving it several times to apply vacuum to the vacuum booster fully.

NOTE: Pedal height must be 95 mm (3.7 in) or more when about 50 kg (110.25 lb) of stepping force is applied.

2. If the measured value is lower than the above range, air existing in the hydraulic system is suspected. Perform the bleeding procedure.

Brake Pedal and Associated Parts



Legend

(1) Brake Pedal Bracket Assembly
(2) Fulcrum Pin and Nut
(3) Connector
(4) Snap Pin
(5) Return Spring
(6) Peadl Assembly
(7) Push Rod Pin
(8) Lower Cover
(9) Bolts and Nut
(10) Driver Knee Bolster

Removal

1. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
2. Disconnect the yellow 3 way SRS connector located under the steering column.
3. Remove the engine hood opening lever.
4. Remove lower cover (8).
5. Remove driver knee bolster (10).
6. Disconnect the stop light switch connector (3).
   Disconnect the anti-theft control module connector. Refer to Body and Accessories section.
7. Remove snap pin (4) and push rod pin (7).
8. Remove the steering column shaft fixing bolt and nut (9) on the steering wheel side, and lower the steering column shaft.
9. Remove the brake pedal bracket assembly (1).
10. Remove return spring (5).
11. Remove fulcrum pin and nut (2).
12. Remove pedal assembly (6).

Installation

1. Apply grease to the entire circumference of the fulcrum pin.
2. Install pedal assembly (6) and fulcrum pin and nut (2).
   Tighten the nut (2) to the specified torque.

   Torque: 35 N·m (26 lb ft)
3. Install the brake pedal bracket assembly (1).
   Tighten the bolts and nuts soecified torque.

   Torque: 15 N·m (11 lb ft)
4. Install return spring (5).
5. Adjust pedal free travel.
   Refer to Brake Pedal Adjustment in this section.
6. Tighten the steering column fixing bolt (9) (dash panel) to the specified torque.

   Torque: 19 N·m (14 lb ft)

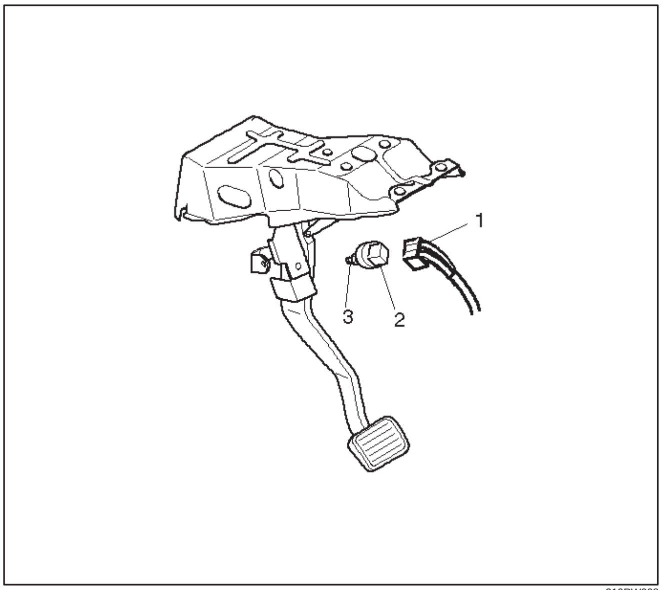
7. Tighten the steering column fixing nut (9) (Cross Beam) to the specified torque.

   Torque: 20 N·m (14 lb ft)

8. Apply grease to the entire circumference of the Push rod pin (7).
9. Install push rod pin (7).
10. Install snap pin (4).
11. Connect the anti-theft control module connector. Refer to Body and Accessories section.
12. Connect the stop light switch connector (3).
13. Install driver knee bolster (10) and lower cover (8).
14. Install the engine hood opening lever.
15. Connect the yellow 3 way SRS connector located under the steering column.
16. Connect the battery "–" terminal cable.

Stoplight Switch

Parts Location



310RW008

Legend

(1) Connector
(2) Switch
(3) Lock Nut

Removal

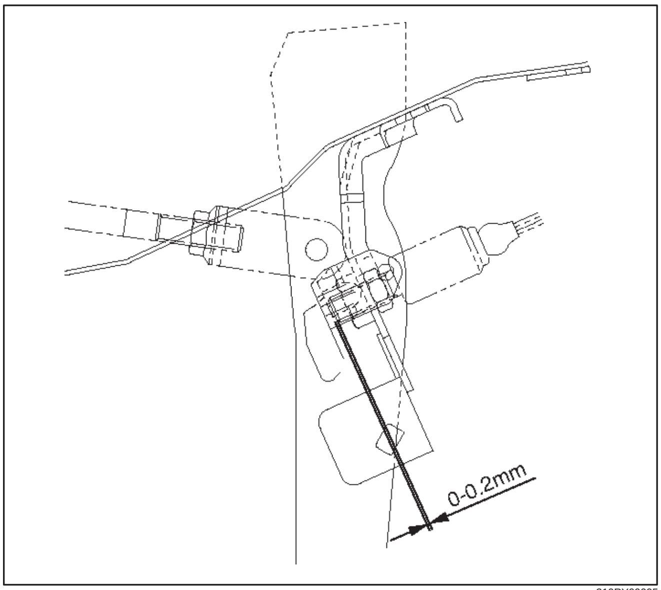
1. Disconnect connector (1)
2. Remove lock nut (3).
3. Remove switch (2).

Installation

1. Adjust the stop light switch to the specified clearance (between switch housing and brake pedal) by rotating the switch housing.

   Clearance : 0-0.2 mm (0-0.08 in)

NOTE: Do not attempt to force the push rod into position during the stop light switch installation and adjustment procedure.



310RY00005

2. Connect connector (1).
3. Install lock nut (3).

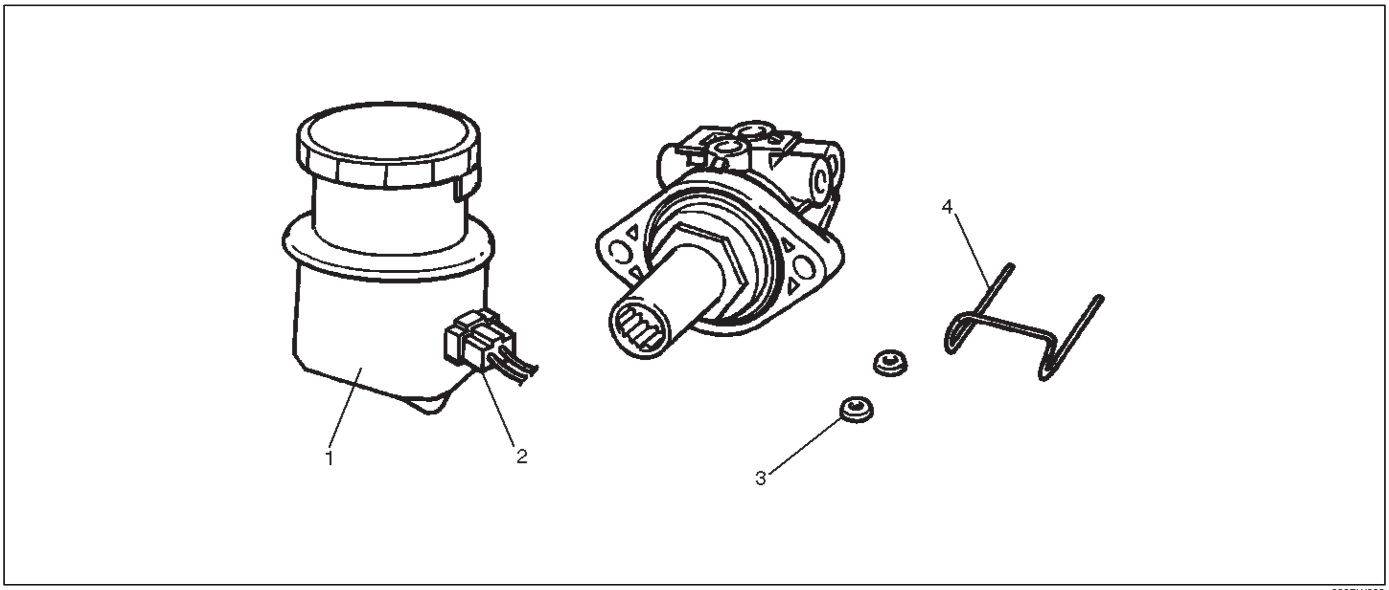
Fluid Reservoir Tank

Fluid Reservoir Tank and Associated Parts



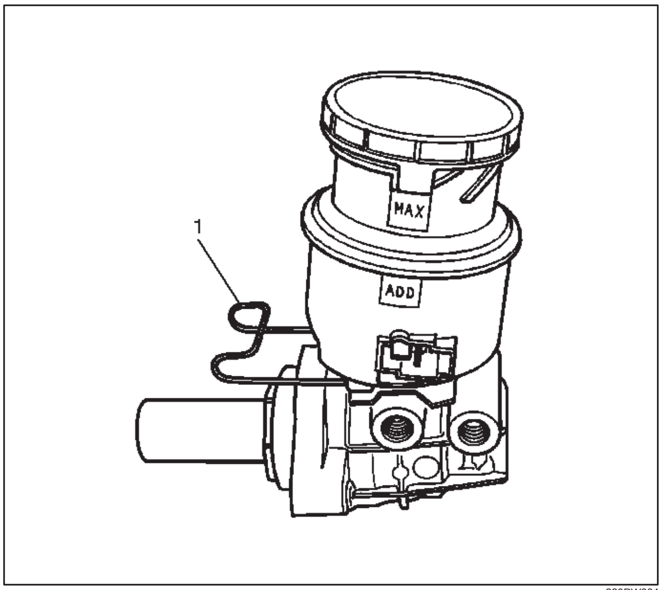
330RW003

Legend
(1) Fluid Reservoir
(2) Electrical Connector
(3) O–ring
(4) Retainer

Removal

NOTE: Before removing the fluid reservoir, remove the brake fluid from the fluid reservoir.

1. Disconnect electrical connector.
2. Remove retainer (1).



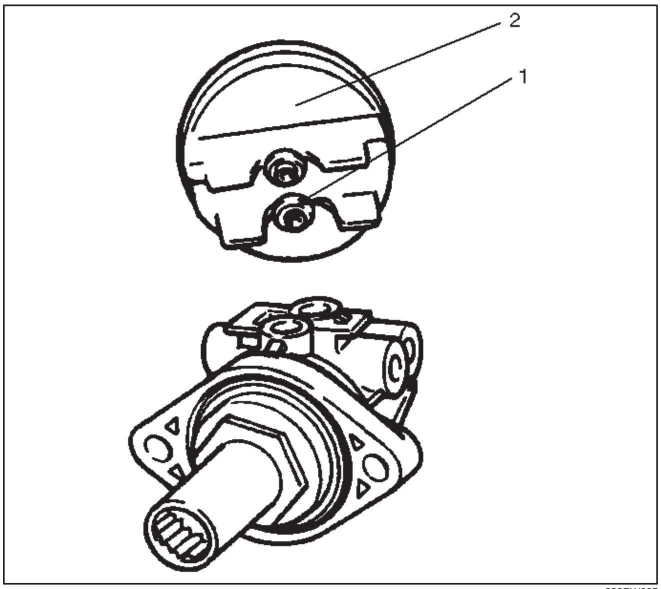
330RW004

3. Remove fluid reservoir and the fluid level sensor built into the fluid reservoir. The fluid level sensor cannot be removed for servicing.
4. Remove O–ring.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

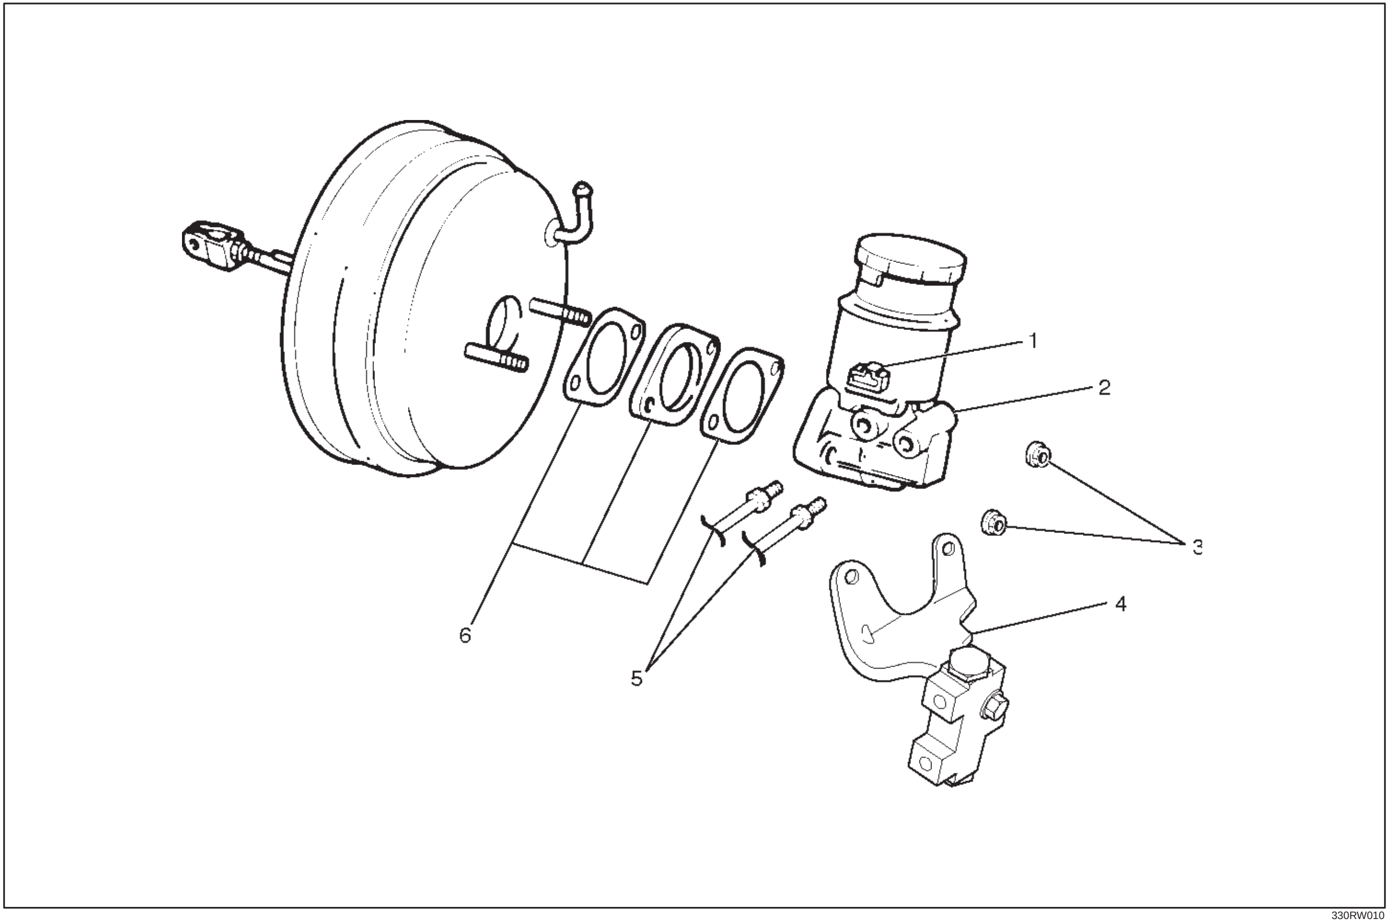
1. O–ring (1) must be set onto the fluid reservoir (2), before installing fluid reservoir.



330RW005

Master Cylinder Assembly

Master Cylinder Assembly and Associated Parts



Legend

(1) Electrical Connector
(2) Master Cylinder
(3) 2 attaching Nuts
(4) P&B Valve and Bracket
(5) Brake Pipes
(6) Spacer and 2 gaskets

Removal

CAUTION: When removing the master cylinder from the vacuum booster, be sure to get rid of the internal negative pressure of the vacuum booster (by, for instance, disconnecting the vacuum hose) in advance.

If any negative pressure remains in the vacuum booster, the piston may possibly come out when the master cylinder is being removed, letting the brake fluid run out.

While removing the master cylinder, further, do not hold the piston as it can be easily pulled out.

Outside surface of the piston is the surface on which seals are to slide. Care should be taken to keep the surface free of cuts and dents.

1. Disconnect electrical connector.
2. Remove brake pipes and after disconnecting the brake pipe, cap or tape the openings of the brake pipe to prevent the entry of foreign matter.
3. Remove 2 attaching nuts.
4. Remove P&B valve and bracket.
5. Remove master cylinder.
6. Remove spacer and the 2 gaskets.

Inspection and Repair

Master Cylinder

The master cylinder is not repairable and must be replaced as a complete assembly if found defective.

Inspection

Excessive brake pedal travel, malfunction or dragging brake suggests that the master cylinder is defective. In such cases perform the following visual check:

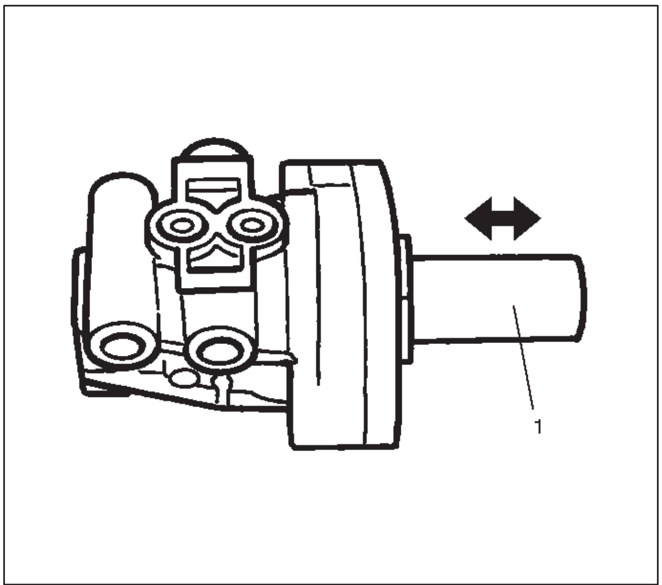
Visual Check

Make parts replacement as required if wear, distortion, nicks, cuts, corrosion, or other abnormal conditions are found through the following parts inspection:

- Master cylinder body
- Fluid reservoir
- O–ring

Functional Inspection of Master Cylinder Piston

Push the primary piston (1) with your fingers to check that it travels smoothly. If the motion is questionable, replace the master cylinder as a complete assembly.

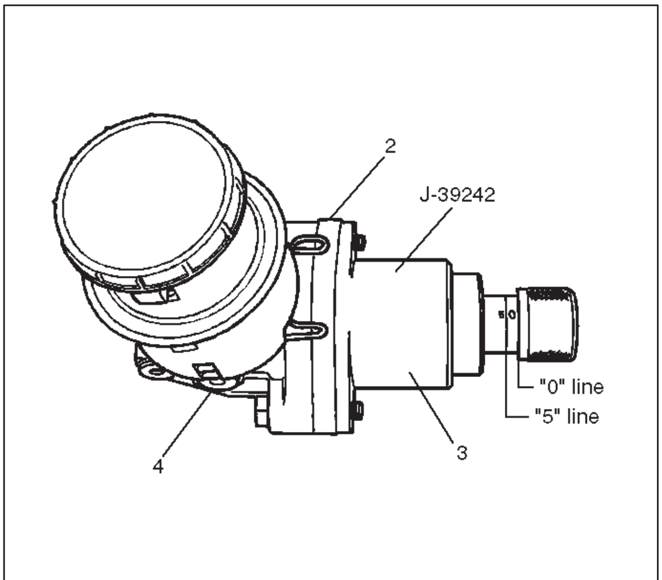


330RW007

Functional Inspection of Master Cylinder

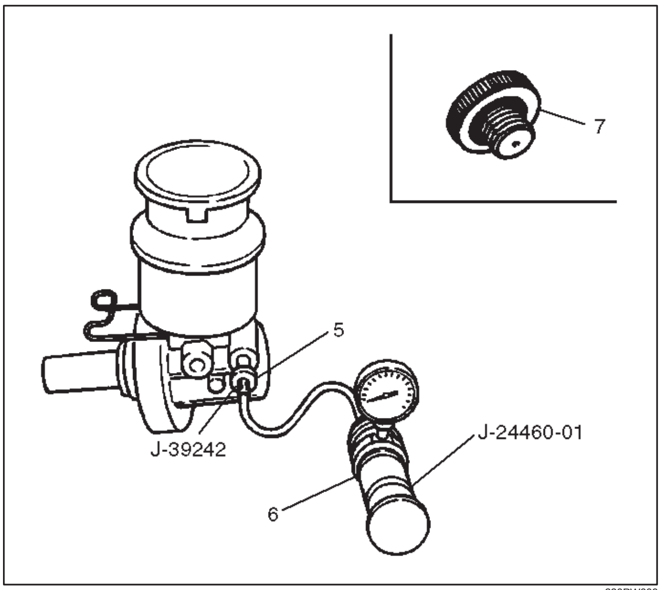
Inspect the master cylinder for function as follows. If any abnormal function is found, replace with a new one.

Install the primary piston holder (3) J–39242 (including the master cylinder attachment (5) and master cylinder plug (7)) onto the master cylinder (4). Make sure the spacer (2) (2 bolts) with its adjusting bolt is screwed in up to the “0” line



330RW008

Connect the master cylinder attachment (5) J–39242 with the end of the radiator cap tester (6) J–24460–01, and apply air pressure with the cap tester. Make sure there is no rise in pressure and that with the adjusting bolt further screwed in 5 mm (align the adjusting bolt to the “5” line). There should be a pressure increase of 0.5 kg/cm^2 or more.



330RW009

NOTE: When checking the front (or primary) side, be sure to mount the master cylinder plug in the rear (or secondary) port.

	“0” Line	“5” Line
Apply air pressure to the front and rear ports	No pressure rise.	Pressure increase of 0.5 kg/cm^2 or more
Remarks	Checks port into the atmospheric pressure chamber	Checks air tightness of the pressure chamber

NOTE:

1. Do not use an air compressor, as the air from the compressor is mixed with compressor oil.
2. When installing the master cylinder onto the vacuum booster, always adjust the vacuum booster push rod. (Refer to “Vacuum Booster” in this section).
3. After the master cylinder is installed onto the vehicle, check for leakage, pedal travel and pedal free play.

Installation

1. Install spacer and the 2 gaskets.
2. Install master cylinder.
   When replacing the master cylinder or vacuum booster or both, always measure the vacuum booster push rod protrusion and adjust it as necessary (Refer to “Vacuum Booster” in section).
3. Install P&B valve and bracket.
4. Install 2 attaching nuts and tighten the attaching nuts to the specified torque.

Torque: 13 N·m (113 lb in)

5. Install brake pipes and tighten the brake pipe to the specified torque.

Master cylinder and P&B valve sides

Torque: 12 N·m (104 lb in)

Others

Torque: 16 N·m (12 lb in)

6. Connect electrical connector.

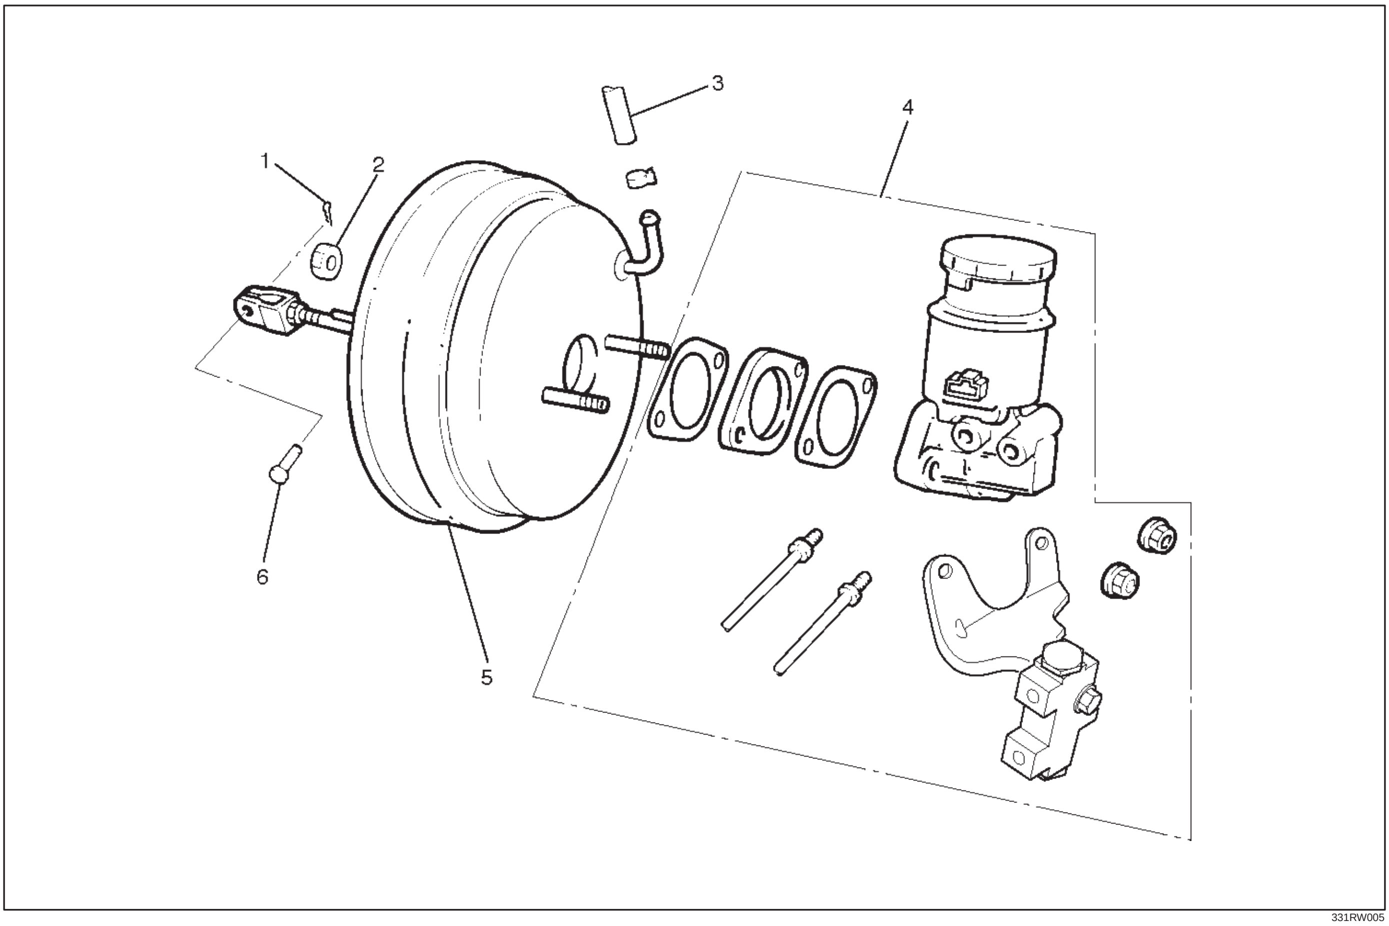
Vacuum Booster Assembly

Vacuum Booster Assembly and Associated Parts



Legend
(1) Pin
(2) Vacuum Booster Fixing Nut
(3) Vacuum Hose
(4) Master Cylinder
(5) Vacuum Booster
(6) Snap Pin

Removal

1. Before removing the vacuum booster assembly, disconnect and remove the brake pipes.
2. Remove master cylinder, refer to “Master Cylinder Removal” in this section.

CAUTION: When removing the master cylinder from the vacuum booster, be sure to get rid of the internal negative pressure of the vacuum booster (by, for instance, disconnecting the vacuum hose) in advance.

If any negative pressure remains in the vacuum booster, the piston may possibly come out when the master cylinder is being removed, letting the brake fluid run out.

While removing the master cylinder, further, do not hold the piston as it can be easily pulled out.

Outside surface of the piston is the surface on which seals are to slide. Care should be taken to keep the surface free of cuts and dents.

3. Remove vacuum hose.
4. Disconnect the yoke clevis from the brake pedal.
5. Remove vacuum booster fixing nut.
6. Remove vacuum booster.

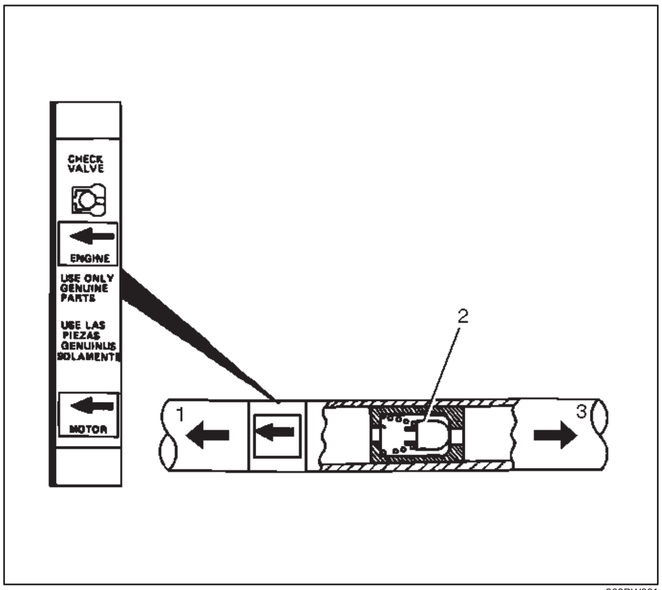
Inspection and Repair

Vacuum Hose (The built in check valve)

1. Inspect the check valve (2), which is installed inside the vacuum hose.
2. Air should pass freely from the vacuum booster (3) to the engine (1).

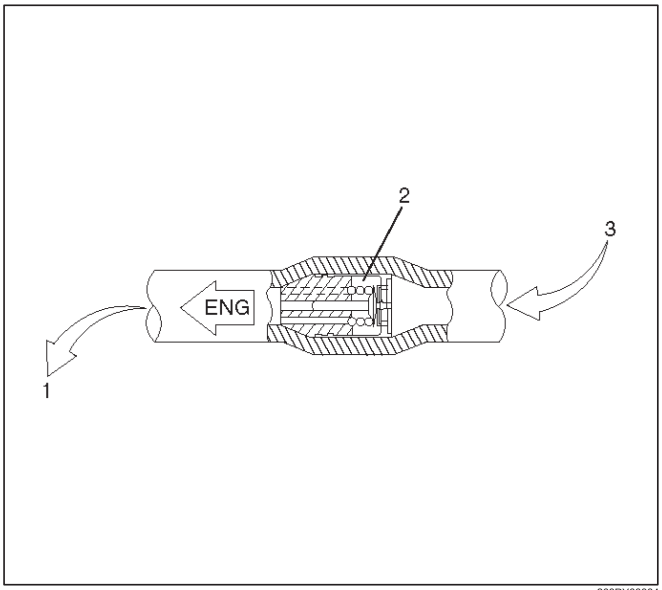
3. Air should not pass from the engine (1) to the vacuum booster (3). If it does, the check valve is inoperative and the vacuum hose built in check valve must be replaced.

HEC ENGINE



360RW001

6VD1 ENGINE



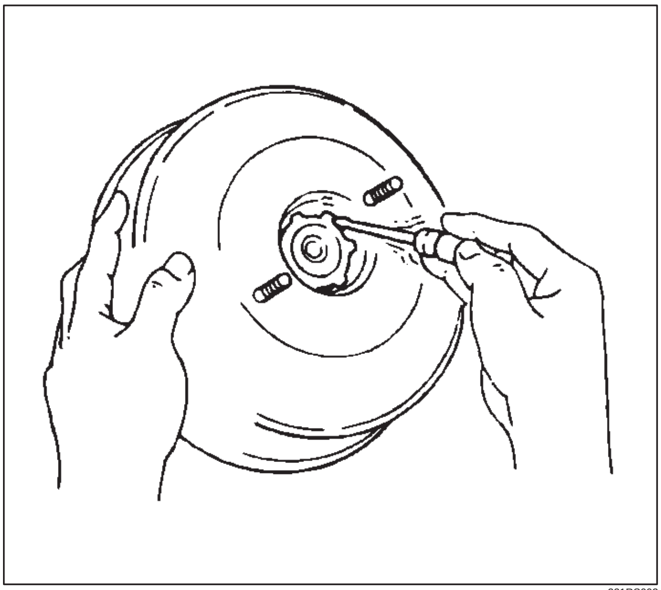
360RY00004

Installation

1. Perform vacuum booster and vacuum booster push rod adjustment.

NOTE: When replacing either the master cylinder or vacuum booster, be sure to measure push rod, and adjust if required.

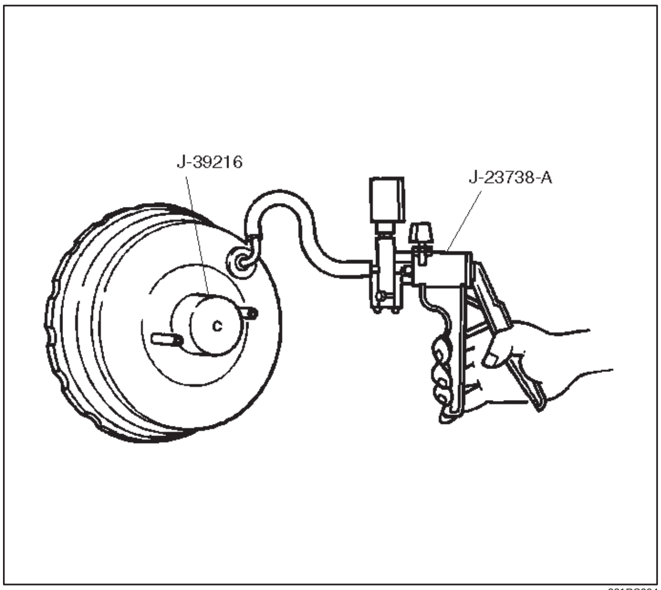
2. Remove retainer from vacuum booster front shell using a small screwdriver. Then gently draw plate and seal assembly out of the shell inside.



331RS003

3. Set push rod gauge J–39216 on vacuum booster, and apply negative pressure by means of vacuum pump J–23738–A so that the pressure in the vacuum booster becomes 500 mm Hg.

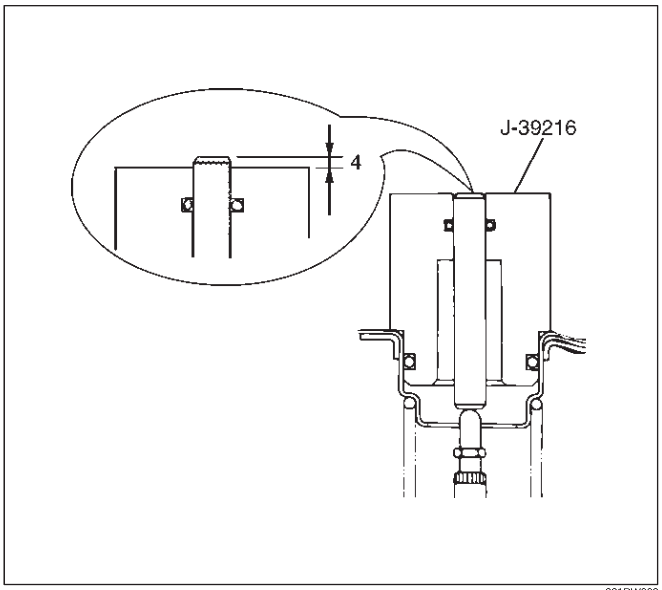
NOTE: Be sure to apply NEGATIVE pressure after installing a push rod gauge on the vacuum booster.



331RS004

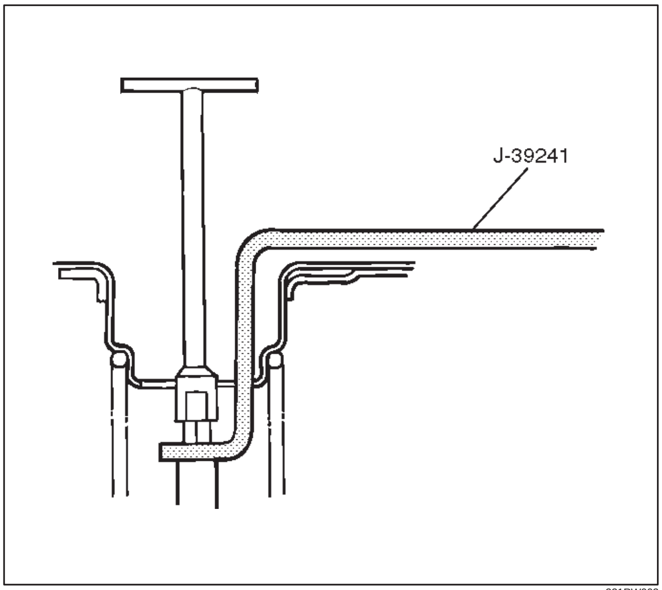
4. Measure dimension (4).

Dimension (4) (Standard): –0.1–0.1 mm (–0.0039–0.0039 in)



331RW002

5. If dimension (4) is out of the standard range, adjust push rod using the Push Rod Support J–39241.



331RW003

6. Mount plate and seal assembly in vacuum booster front shell. Then install the retainer.
7. Install vacuum booster fixing nut and tighten the specified torque.

Torque: 15 N·m (11 lb ft)

8. Install yoke clevis.
9. Connect vacuum hose and make sure that the arrow on the hose points in the direction of the engine.
10. Install master cylinder, refer to “Master Cylinder Installation” in this section.

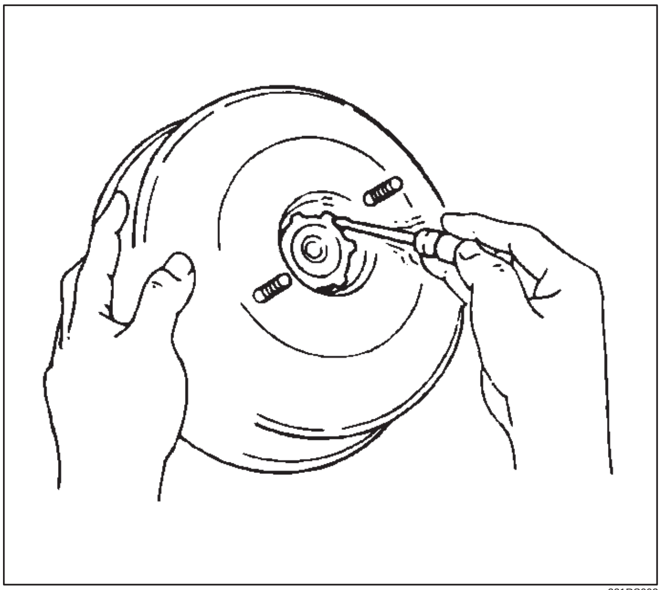
(9) Retainer
(10) Plate and Seal Assembly
(11) Master Cylinder

Removal

1. Remove master cylinder. Refer to "Master Cylinder" in this section.
2. Remove vacuum booster. Refer to "Vacuum Booster" in this section.
3. Remove yoke clevis.
4. Remove lock nut.
5. Remove retaining clip.
6. Remove valve body guard.
7. Remove silencer.
8. Remove filter.
9. Remove 2 gaskets and spacer.
10. Remove retainer, using a small screwdriver to pry out the retainer. Gently pull out the plate and seal assembly from the shell.



331RS003

Inspection and Repair

Visual Check

Make necessary parts replacement if cuts, nicks, excessive wear, or other abnormal conditions are found through inspection. Check the following parts:

- Yoke clevis
- Valve body guard
- Silencer
- Filter plate and seal assembly

Installation

1. Install plate and seal assembly.
2. Install retainer.
3. Install 2 gaskets and spacer.
4. Install filter.
5. Install silencer.
6. Install valve body guard.
7. Install retainer.
8. Install lock nut and yoke clevis and tighten to the specified torque.

   Torque: 20 N·m (15 lb ft)

9. Install vacuum booster, refer to “Vacuum Booster” in this section.
10. Install master cylinder, refer to “Master Cylinder” in this section and after installation, perform brake pedal check and adjustment. Refer to “Brake Pedal” in this section.

Vacuum Booster Overhaul

Vacuum Booster

The vacuum booster cannot be disassembled for repair.
Replace a defective vacuum booster with a new one.

Main Data and Specifications

General Specifications

Vacuum booster diaphragm diameter (Front)	205 mm (8.07 in)
Vacuum booster diaphragm diameter (Rear)	230 mm (9.06 in)
Push rod stroke	More than 32.0 mm (1.26 in)
Plunger diameter	10.25 mm (0.40 in)
Push rod diameter	27.4 mm (1.08 in)

Torque Specifications

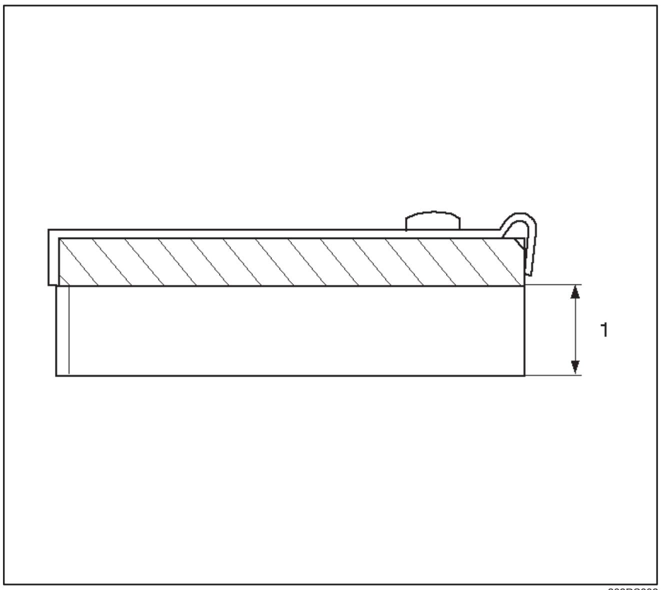
Front Disc Brake Pads

Front Disc Brake Pads Inspection

Check the outer pad by looking at each caliper from above. Check the thickness on the inner pad by looking down through the inspection hole in the top of the caliper. Whenever the pad is worn to about the thickness of the pad base, the pad should be removed for further measurements. The pad should be replaced anytime the pad thickness (1) is worn to within 1.00 mm (0.039 in) of the pad itself.

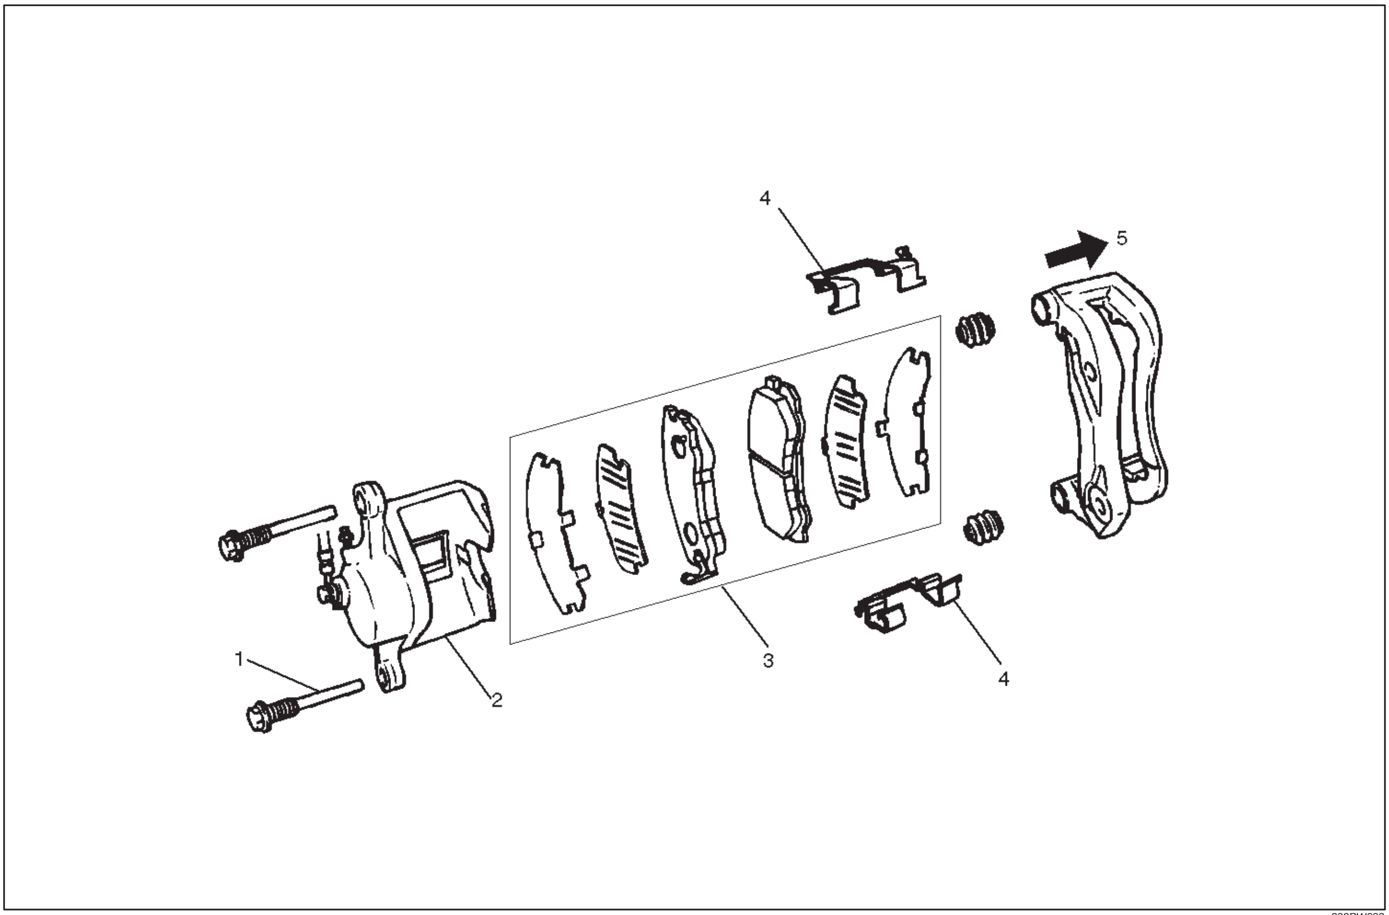
The disc pads have a wear indicator that makes a noise when the pad wears to where the replacement is required.

Minimum limit (1): 1.0 mm (0.039 in)



302RS002

Front Disc Brake Pads and Associated Parts



302RW003

Legend

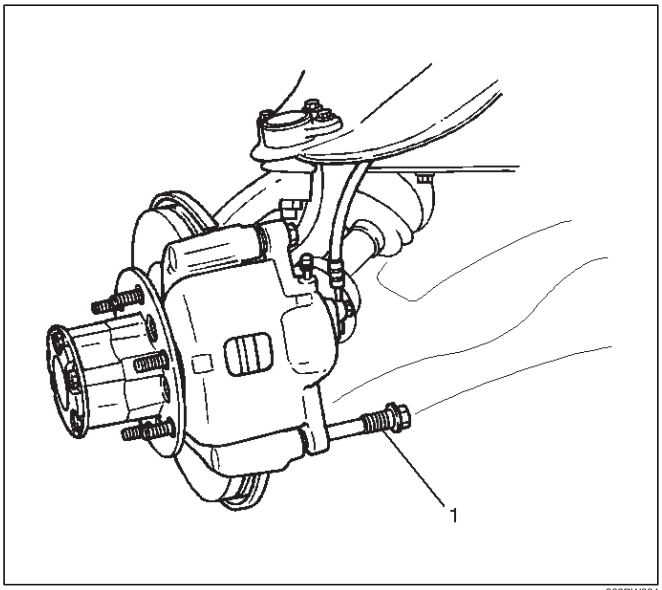
(1) Lock Bolt
(2) Caliper Assembly
(3) Pad Assembly
(4) Clip
(5) Outer Side

Removal

NOTE: If a squealing noise occurs from the front brake while driving, check the pad wear indicator plate. If the indicator plate contacts the rotor, the disc pad assembly should be replaced.

- Draw out two–thirds of the brake fluid from the reservoir.
- Raise the vehicle and support it with suitable safety stands.

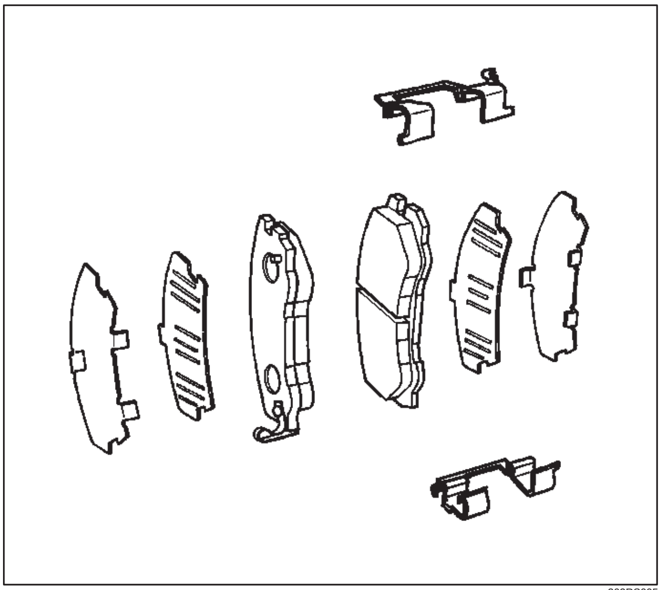
1. Remove wheel and tire assembly, refer to “Wheels and Tires System” in Section 3E.
2. Remove lock bolt (1).



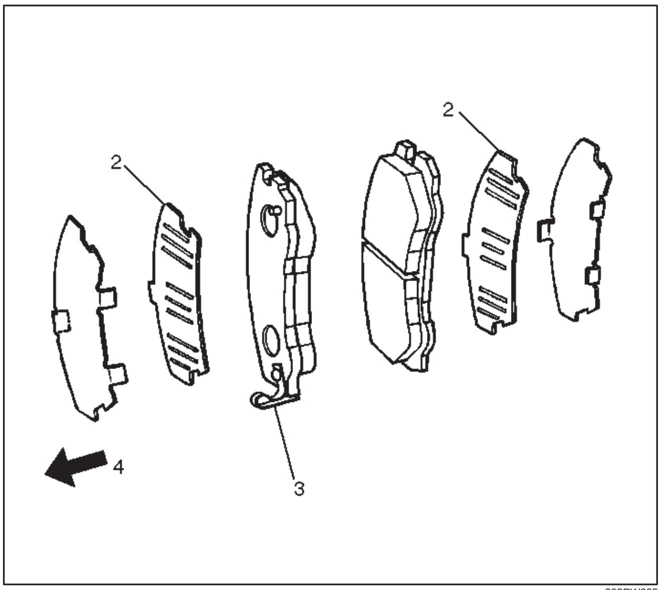
3. Rotate caliper assembly and support the caliper assembly so that the brake hose is not stretched or damaged.
4. Remove pad assembly with shim.
5. Remove Clip.

Installation

1. Install clip.

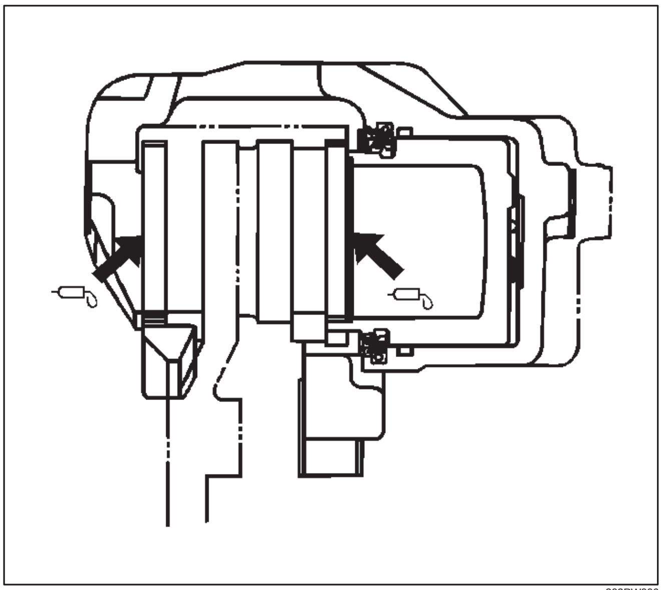


2. Apply special grease (approximately 0.2 g) to both contacting surfaces of the inner shims (2). Wipe off extruded grease after installing. Install pad assembly with shim.



Legend

(2) Inner Shim
(3) Wear Indicator
(4) Inner Side

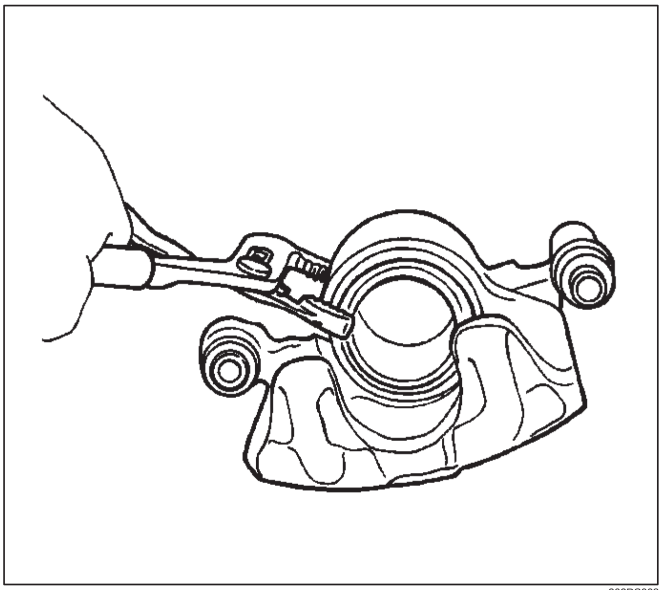


302RW006

3. Use adjustable pliers to bottom the piston into the caliper bore. Be careful do not damage the piston boot and do not damage the flexible hose by twisting or pulling it.

   Install caliper assembly.

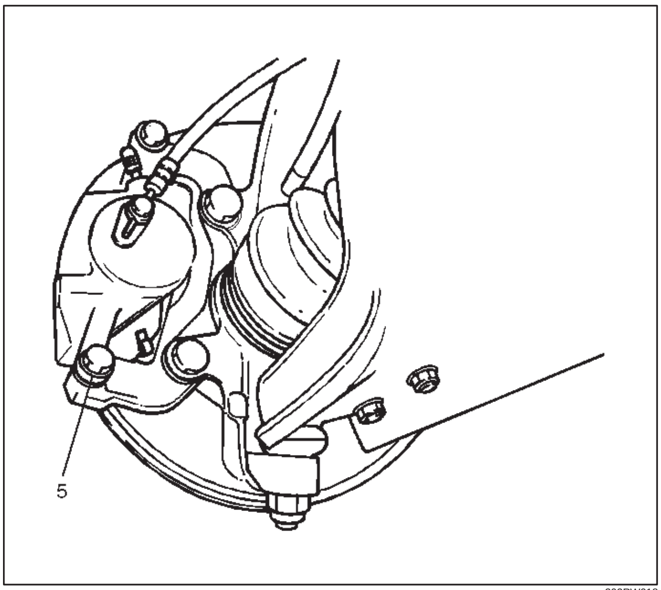
   Set caliper assembly in place.



302RS008

4. Install lock bolt (5) and tighten the bolt to the specified torque.

Torque: 74 N·m (54 lb ft)



302RW018

5. Install wheel and tire assembly, refer to "Wheels and Tires System" in Section 3E.
6. Pump the brake pedal several times to make sure that the pedal is firm. Check the brake fluid level in the reservoir after pumping the brakes.

Front Disc Brake Rotor

Inspection

In the manufacturing of the brake rotor, all the tolerances regarding surface finish, parallelism and lateral runout are held very closely. Maintaining these tolerances provides the surface necessary to assure smooth brake operation.

Lateral Runout

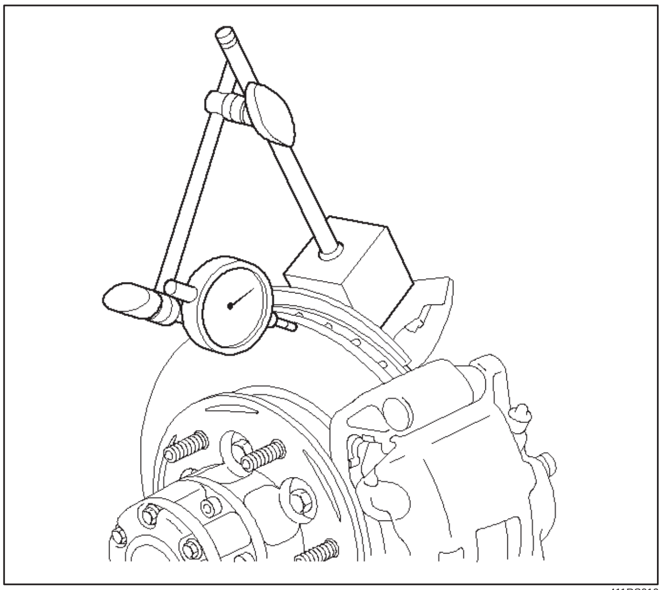
Lateral runout is the movement of the rotor from side to side as it rotates on the spindle. This could also be referred to as “rotor wobble”.

This movement causes the piston to be knocked back into its bore. This results in additional pedal travel and a vibration during braking.

Checking Lateral Runout

1. Adjust the wheel bearing correctly, refer to “Differential” in Section 4A.
2. Attach a dial indicator to some portion of the suspension so that the stem contacts the rotor face about 29 mm (1.14 in) from the rotor edge.
3. Move the rotor one complete rotation and the lateral runout should not exceed 0.13 mm (0.005 in).

Maximum runout: 0.13 mm (0.005 in)



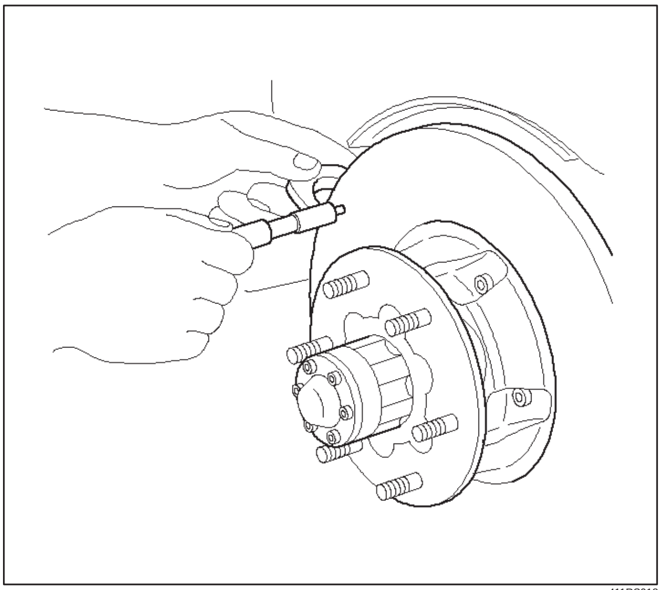
411RS019

Parallelism

Parallelism is the measurement of thickness of the rotor at four or more points around the circumference of the rotor. All measurement must be made at 29 mm (1.14 in) from the edge of the rotor.

The rotor thickness must not vary more than 0.010 mm (0.0004 in) from point to point.

Maximum runout: 0.010 mm (0.0004 in)



411RS018

Replacing Brake Rotors

When installing new brake rotors, do not refinish the surfaces. These parts are at the correct level of surface finish.

Refinishing Brake Rotors
