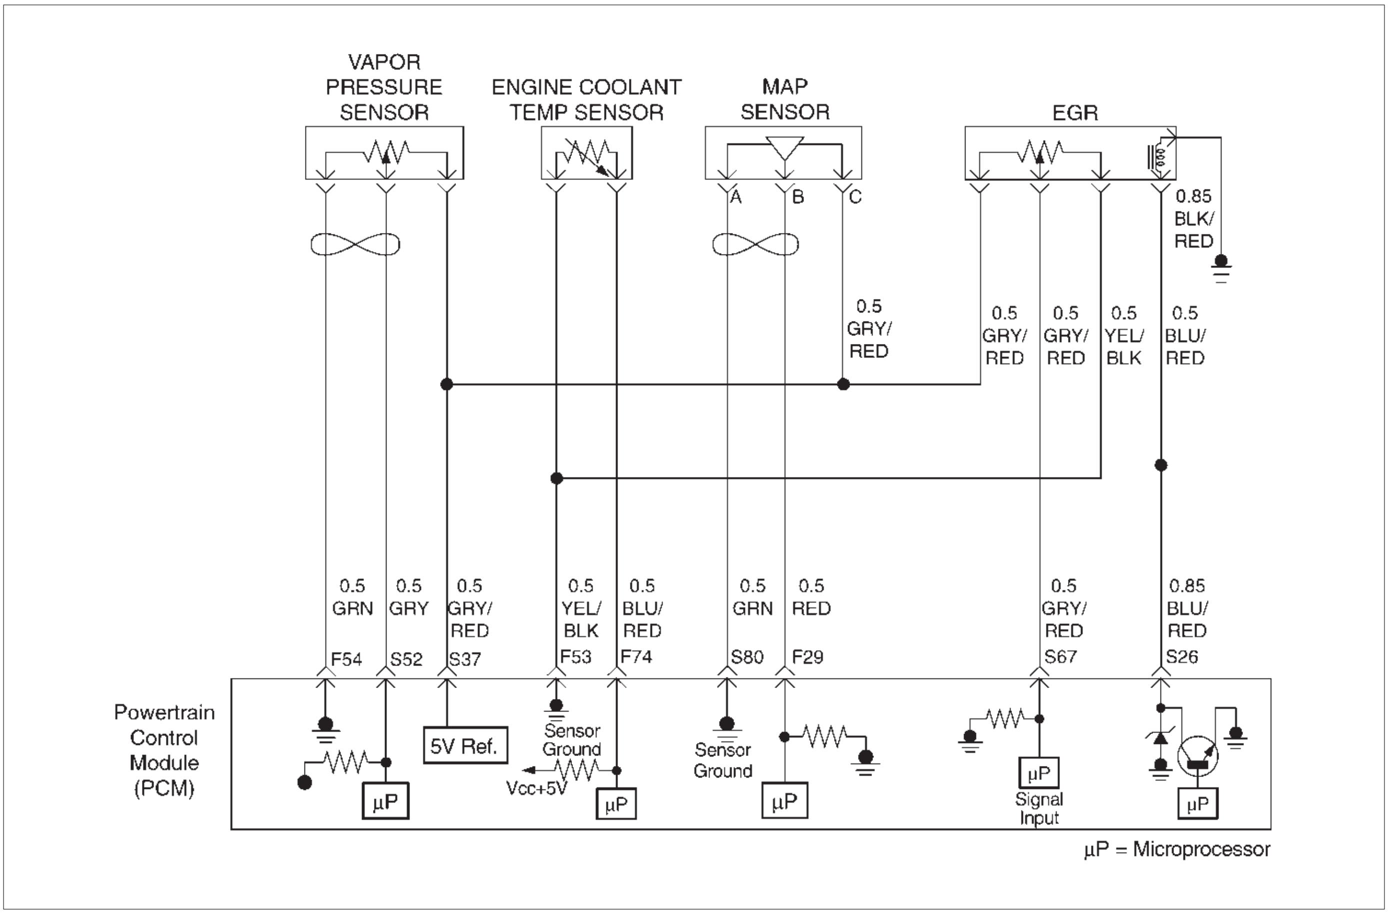
9	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0405 EGR Low Voltage



D06RY00145

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to command from the PCM. If current pintle position voltage indicates less than 0.1 V and last more than 10 seconds, then the PCM will set DTC P0405.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- EGR pintle position is less than 2% and last more than 10 sec. Action taken when the DTC sets.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) as soon as failure detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0402 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0405 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the EGR actual position display on the Tech 2 while moving connectors and wiring harnesses related to EGR valve. A change in the display will indicate the location of the fault.

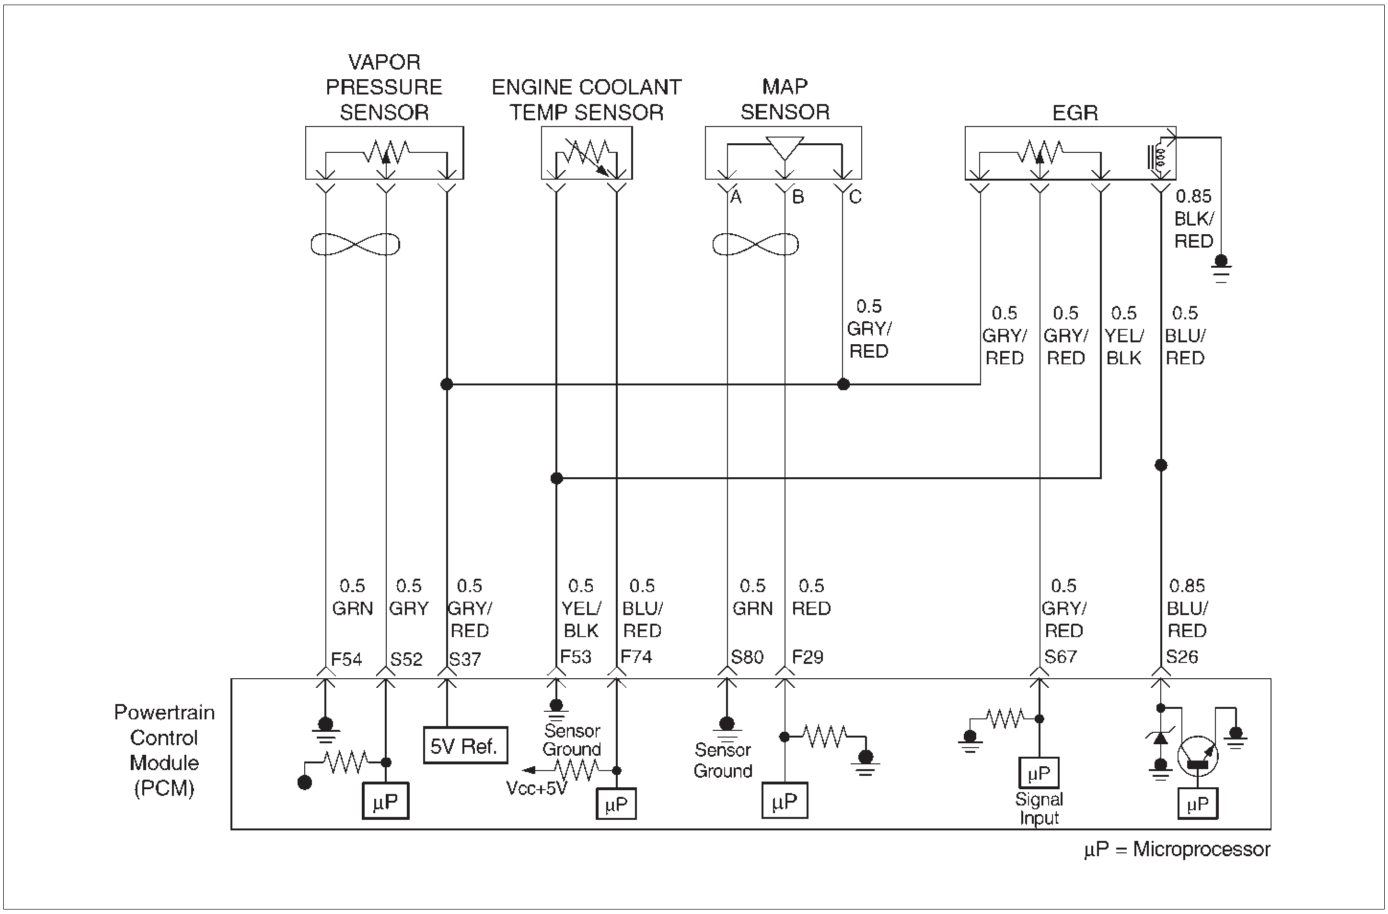
DTC P0405 – EGR Low Volt

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition "ON," engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P0405 until the DTC P0405 test runs. Note the result. Does the Tech 2 indicates DTC P0405 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to *Step 4*	Go to *Step 5*
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
5	1. Disconnect the EGR harness connector. 2. Ignition "ON". 3. At the EGR valve, use a DVM to check the voltage at the 5 volt reference wire (GRY/RED) and ground. Did the DVM indicate the specified value?	4–6 V	Go to *Step 6*	Go to *Step 7*
6	1. Disconnect the EGR harness connector. 2. Measure resistance between terminal 5 volt reference wire and ground. Was resistance in range?	5–5.5 KΩ	Go to *Step 10*	Go to *Step 17*
7	1. Ignition "ON". 2. At the PCM connector, back prove with a DVM at the 5 volt reference for the EGR valve. Did the DVM indicate the specified value?	4–6 V	Go to *Step 8*	Go to *Step 18*
8	Repair the open 5 volt reference circuit. Is the action complete?	—	Verify repair	—
9	Repair the damaged sensor ground wire. Is the action complete?	—	Verify repair	—
10	1. Disconnect the EGR harness 2. Use an ohmmeter to measure between the pintle position pin and the sensor ground pin on the EGR valve. NOTE: J-35616 Connector Test Adapter Kit may be useful for gaining access to the recessed pins on the valve. Was the ohmmeter reading approximately equal to the specified value?	1 to 1.25 KΩ	Go to *Step 13*	Go to *Step 17*
11	1. Ignition "ON". 2. Backprobe with a DVM to measure voltage at EGR valve pintle position pin and sensor ground pin. Was voltage in range?	Less than 0.1 V	Go to *Step 17*	Go to *Step 12*

DTC P0405 – EGR Low Volt (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Ignition "ON". 2. Backprobe with a DVM to measure voltage at PCM sensor ground pin and pintle position pin. Was voltage in range?	Less than 0.1 V	Go to *Step 13*	Go to *Step 18*
13	1. Ignition "OFF". 2. Disconnect the EGR harness. 3. Check short circuit between EGR pintle position circuit and EGR ground circuit. Was any short circuit?	—	Go to *Step 14*	Go to *Step 18*
14	Locate and repair the short to ground in the pintle position circuit Is the action complete?	—	Verify repair	—
15	1. Ignition "OFF". 2. Disconnect the PCM. 3. Ignition "ON". 4. Measure the voltage between the EGR pintle position circuit and ground. Is the measured voltage near the specified value?	Less than 0.1 V	Go to *Step 17*	Go to *Step 16*
16	Check for a short circuit between other wires and the pintle position circuit Is there any short circuit?	—	Repair short circuit Verify repair	Go to *Step 17*
17	Replace the EGR valve. Does DTC P1404 still fail "DTC test on the Tech 2?	—	Go to *Step 18*	Verify repair
18	Examine the PCM pin and terminal connection. Was there a damaged terminal?	—	Go to *Step 4*	Go to *Step 19*
19	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0406 EGR High Voltage



D06RY00145

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to command from the PCM. If current pintle position voltage indicates more than 4.8 V and last more than 10 seconds, then the PCM will set DTC P0406.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- EGR pintle position is more than 99% and last more than 10 sec.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) as soon as failure detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0402 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0404 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the EGR actual position display on the Tech 2 while moving connectors and wiring harnesses related to EGR valve. A change in the display will indicate the location of the fault.

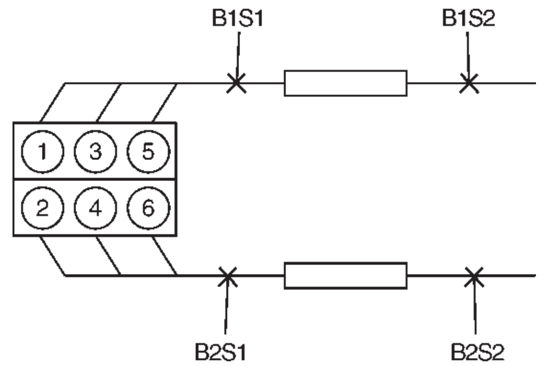
DTC P0406 – EGR High Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition "ON," engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P0406 until the DTC P0406 test runs. Note the result. Does the Tech 2 indicates DTC P0406 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to *Step 4*	Go to *Step 5*
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	Is the action complete?
5	1. Disconnect the EGR harness connector. 2. Ignition "ON". 3. At the EGR valve, use a DVM to check the voltage at the 5 volt reference wire (GRY/RED). Did the DVM indicate the specified value?	4–6 V	Go to *Step 8*	Go to *Step 6*
6	1. Ignition "ON". 2. At the PCM connector, backprove with a DVM at the 5 volt reference for the EGR valve. Did the DVM indicate the specified value?	4–6 V	Go to *Step 7*	Go to *Step 16*
7	Repair the open 5 volt reference circuit Is the action complete?	—	Verify repair	—
8	1. Ignition "OFF" 2. Disconnect the EGR harness. 3. Use a DVM to check for an resistance between 5 V reference and Sensor Ground at EGR sensor terminals. NOTE: J-35616 Connector Test Adapter Kit may be useful for gaining access to the recessed pins on the valve. Was the measured resistance in range?	5 to 5 KΩ	Go to *Step 9*	Go to *Step 15*
9	1. Ignition "OFF". 2. Disconnect the EGR harness. 3. Use a DVM to check for an resistance between Sensor Ground and Signal Wire at EGR sensor terminal. Is there an open circuit?	—	Go to *Step 15*	Go to *Step 10*
10	1. Ignition "OFF". 2. Disconnect the EGR harness at PCM connector. 3. Use a DVM to check for shorted wire between S37 and F53. Is there a shorted wire?	—	Go to *Step 14*	Go to *Step 11*

DTC P0406 – EGR High Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
11	1. Ignition "ON". 2. Use a DVM to backprove at terminal Connector of EGR valve for voltage. Was measured voltage more than 4.8 V?	more than 4.8 V	Go to *Step 12*	Go to *Step 12*
12	1. Ignition "ON". 2. Stay the EGR harness connected. 3. Check voltage by backproving at PCM S37 terminal. Was voltage more than 4.8 V?	4.8 V	Go to *Step 16*	Go to *Step 13*
13	1. Locate short circuit at EGR harness between GRY/RED to GRY/RED or GRY/RED to YEL/BLK, BLU/RED. 2. Replace EGR harness. Is the action complete?	—	Verify repair	—
14	Replace EGR harness. Is the action complete?	—	Verify repair	—
15	Replace the EGR valve. Does DTC P1404 still fail "DTC test on the Tech 2?	—	Go to *Step 16*	Verify repair
16	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0420 TWC System Low Efficiency Bank 1



T321075

Circuit Description

To control emissions of hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx), a three-way catalyst (TWC) is used. The catalyst promotes a chemical reaction which oxidizes the HC and CO present in the exhaust gas, converting them into harmless water vapor and carbon dioxide. The catalyst also reduces NOx, converting it to nitrogen. The powertrain control module (PCM) has the ability to monitor this process using the Bank 1 HO2S 1 and the Bank 1 HO2S 2 heated oxygen sensors. The Bank 1 HO2S 1 sensor produces an output signal which indicates the amount of oxygen present in the exhaust gas entering the three-way catalytic converter. The Bank 1 HO2S 2 sensor produces an output signal which indicates the oxygen storage capacity of the catalyst; this in turn indicates the catalyst's ability to convert exhaust gases efficiently. If the catalyst is operating efficiently, the Bank 1 HO2S 1 signal will be far more active than that produced by the Bank 1 HO2S 2 sensor. If the PCM detects a level of Bank 1 HO2S 2 activity that indicates the catalyst is no longer operating efficiently, DTC P0420 will be set.

Conditions for Setting the DTC

- No related DTCs.
- The engine is operating in "closed loop."
- Engine air load is below 99%.
- Engine coolant temperature is between 70°C (158°F) and 120°C (248°F).
- Mass air flow is between 2.5 g/second and 10 g/second.
- Engine speed is below 200 RPM.
- Catalyst temperature is above 350°C (662°F).
- The PCM determines that the catalyst's oxygen storage capacity is below the acceptable threshold.
- Intake Air Temperature is between –10°C (14°F) and 70°C (158°F).

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0420 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0420 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

The "TWC Monitor Test Counter" displayed on the Tech 2 may be used to monitor the progress of the TWC diagnostic. To complete the TWC diagnostic with a good catalyst, the counter must be allowed to increment to 49 samples and roll over to 0 at least twice. A failed catalyst will require three or more 50-sample tests to report a failure.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

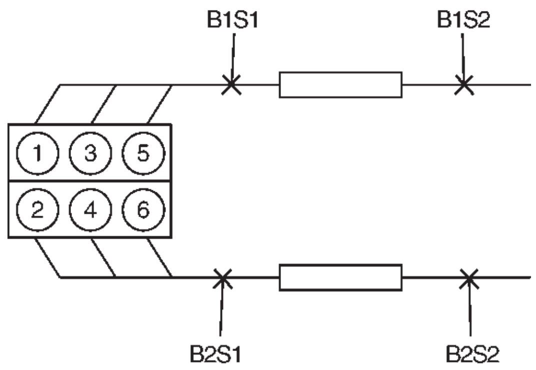
7. Difficulty completing the DTC P0420 “Status This Ign.” test may be encountered in areas where test conditions cannot be maintained easily, especially in urban areas. To minimize the amount of driving required to complete the DTC P0420 “Status This Ign.” test, use the following procedure:

- Allow the engine to warm completely.
- With the vehicle in “Park,” monitor mass air flow on the Tech 2 and hold part throttle to maintain a reading of over 12 g/second for at least 2 minutes. This will achieve the “warm catalyst” required for running the test.
- Operate the vehicle in second or third gear to remain in the DTC P0420 test conditions described in “Conditions for Setting the DTC” as much as possible. If you must stop the vehicle, maintain the “warm catalyst” criteria as follows:
  - Place the vehicle in “Park” or “Neutral.”
  - Hold part throttle to maintain a mass air flow reading of over 15 g/second for the duration of the stop.

DTC P0420 – TWC System Low Efficiency Bank 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Are any other DTCs set (such as P0140)?	—	Diagnose other DTC(s) first	Go to *Step 3*
3	1. Visually and physically inspect the three-way catalytic converter for damage. Check for the following: • dents • severe discoloration caused by excessive temperatures • holes • internal rattle caused by damaged catalyst 2. Also, ensure that the three-way catalytic converter is a proper original equipment manufacturer part. Did your inspection reveal a problem?	—	Go to *Step 6*	Go to *Step 4*
4	1. Visually and physically inspect the exhaust system between the three-way catalytic converter and the rear converter flange for leaks, damage, and loose or missing hardware. 2. If a problem is found, repair as necessary. Did your inspection reveal a problem?	—	Go to *Step 7* to verify repair	Go to *Step 5*
5	1. Visually and physically inspect the Bank 1 HO2S 2. 2. Ensure that the Bank 1 HO2S 2 is secure and that the pigtail and wiring harness is not contacting the exhaust pipe or is not otherwise damaged. 3. If a problem is found, repair as necessary. Did your inspection reveal a problem?	—	Go to *Step 7* to verify repair	Go to *Step 6*
6	Replace the three-way catalytic converter. NOTE: Check for conditions which may cause catalyst damage (refer to *Diagnostic Aids*). Is the action complete?	—	Go to *Step 7* to verify repair	—
7	1. Review and record the Tech 2 Failure Records data. 2. Clear DTC P0420. 3. Start the engine and allow it to warm up until the engine coolant temperature monitored on the Tech 2 is above the specified value. 4. Run the engine to maintain the specified mass air flow range for at least 2 minutes. 5. Operate the vehicle to maintain DTC P0420 test conditions (refer to *DTC Test Description* in *Diagnostic Support* for detailed instructions). 6. Using a Tech 2, monitor “DTC” info for DTC P0420 until the DTC P0420 test runs. 7. Note the test result. Does the Tech 2 indicate DTC P0420 passed this ignition?	Engine coolant temp: greater than 60°C (140°F). Mass air flow: between 8 g/second and 50 g/second	Repair complete. If a driveability symptom still exists, refer to *Symptoms*.	Go to the *Diagnostic Aids*

Diagnostic Trouble Code (DTC) P0430 TWC System Low Efficiency Bank 2



T321075

Circuit Description

To control emissions of hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx), a three-way catalyst (TWC) is used. The catalyst promotes a chemical reaction which oxidizes the HC and CO present in the exhaust gas, converting them into harmless water vapor and carbon dioxide. The catalyst also reduces NOx, converting it to nitrogen. The powertrain control module (PCM) has the ability to monitor this process using the Bank 2 HO2S 1 and the Bank 2 HO2S 2 heated oxygen sensors. The Bank 2 HO2S 1 sensor produces an output signal which indicates the amount of oxygen present in the exhaust gas entering the three-way catalytic converter. The Bank 2 HO2S 2 sensor produces an output signal which indicates the oxygen storage capacity of the catalyst; this in turn indicates the catalyst's ability to convert exhaust gases efficiently. If the catalyst is operating efficiently, the Bank 2 HO2S 1 signal will be far more active than that produced by the Bank 2 HO2S 2 sensor. If the PCM detects a level of Bank 2 HO2S 2 activity that indicates the catalyst is no longer operating efficiently, DTC P0430 will be set.

Conditions for Setting the DTC

- No related DTCs.
- The engine is operating in "closed loop."
- Engine air load is below 99%.
- Engine coolant temperature is between 70°C (158°F) and 115°C (239°F).
- Mass air flow is between 2.5 g/second and 10 g/second.
- Change in engine load is below 8%.
- Engine speed is below 200 RPM.
- Catalyst temperature is above 350°C (662°F).
- The PCM determines that the catalyst's oxygen storage capacity is below the acceptable threshold.
- Intake air temperature is between –20°C (4°F) and 70°C (158°F).

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0430 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0430 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

7. Difficulty completing the DTC P0430 “Status This Ign.” test may be encountered in areas where test conditions cannot be maintained easily, especially in urban areas. To minimize the amount of driving required to complete the DTC P0430 “Status This Ign.” test, use the following procedure:
   - Allow the engine to warm completely.
   - With the vehicle in “Park,” monitor mass air flow on the Tech 2 and hold part throttle to maintain a reading of over 12 g/second for at least 2 minutes. This will achieve the “warm catalyst” required for running the test.
   - Operate the vehicle in second or third gear to remain in the DTC P0430 test conditions described in “Conditions for Setting the DTC” as much as possible. If you must stop the vehicle, maintain the “warm catalyst” criteria as follows:
     - Place the vehicle in “Park” or “Neutral.”
     - Hold part throttle to maintain a mass air flow reading of over 15 g/second for the duration of the stop.

The “TWC Monitor Test Counter” displayed on the Tech 2 may be used to monitor the progress of the TWC diagnostic. To complete the TWC diagnostic with a good catalyst, the counter must be allowed to increment to 49 samples and roll over to 0 at least twice.

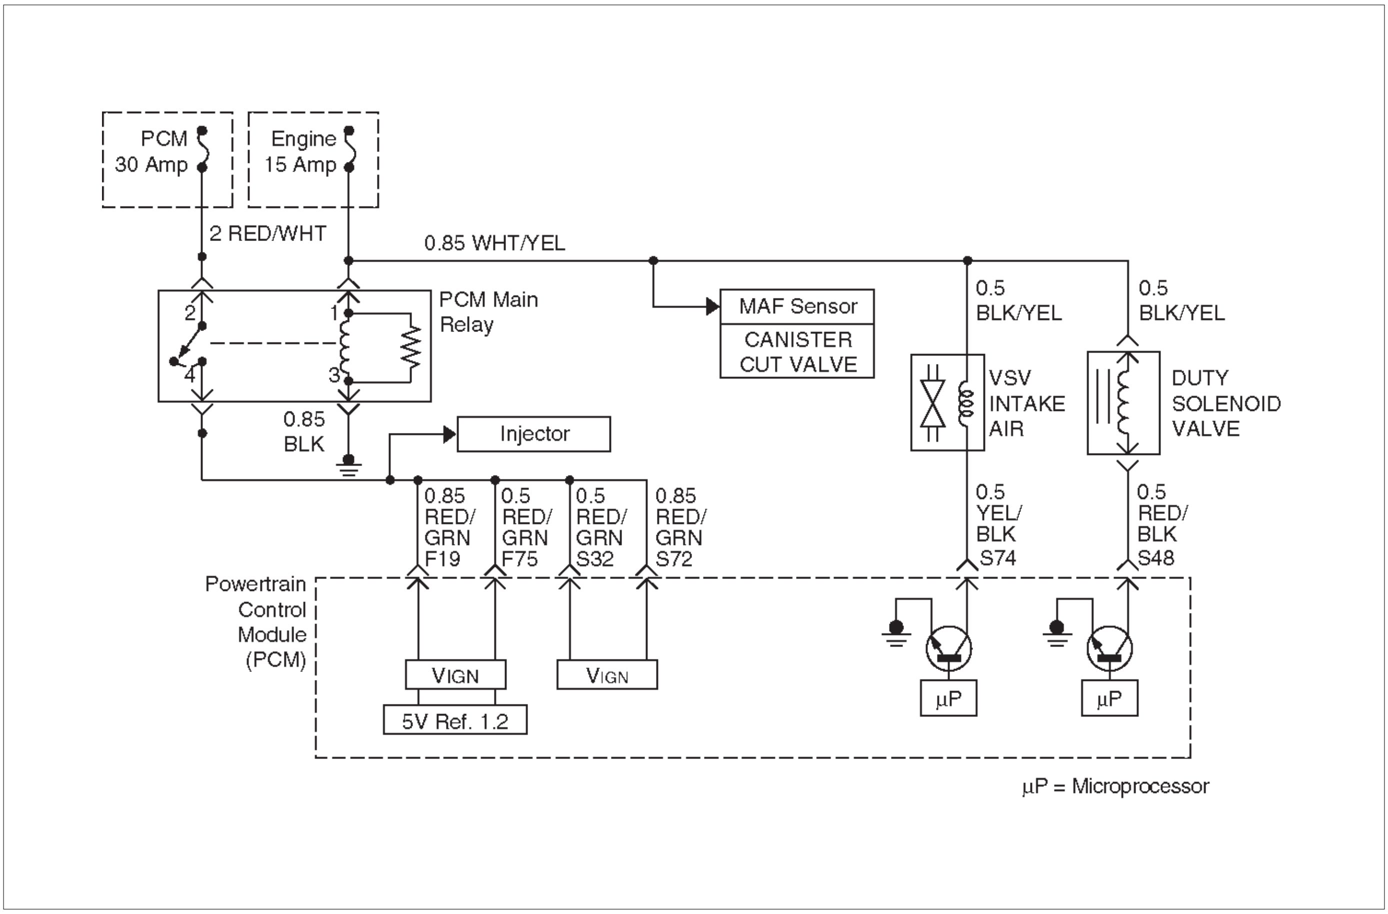
7	1. Review and record the Tech 2 Failure Records data. 2. Clear DTC P0430. 3. Start the engine and allow it to warm up until the engine coolant temperature monitored on the Tech 2 is above the specified value. 4. Run the engine to maintain the specified mass air flow range for at least 6 minutes. 5. Operate the vehicle to maintain DTC P0430 test conditions (refer to *DTC Test Description* in *Diagnostic Support* for detailed instructions). 6. Using a Tech 2, monitor “DTC” info for DTC P0430 until the DTC P0430 test runs. 7. Note the test result. Does the Tech 2 indicate DTC P0430 passed this ignition?	Engine coolant temp: greater than 70°C (158°F). Mass air flow: between 2.5 g/second and 10 g/second	Repair complete. If a driveability symptom still exists, refer to *Symptoms*.	Go to the *Diagnostic Aids*

Diagnostic Trouble Code (DTC) P0440 EVAP System



060RY00158

Circuit Description

The evaporative system includes the following components:

- Fuel tank
- EVAP canister duty solenoid valve
- Fuel tank pressure sensor
- Fuel pipes and hoses
- Vapor lines
- Fuel cap
- Evaporative emissions canister
- Purge lines
- EVAP canister cut valve (purge solenoid)

The evaporative leak detection diagnostic strategy is based on applying vacuum to the EVAP system and monitoring vacuum decay. The powertrain control module (PCM) monitors vacuum level via the fuel tank pressure sensor input. At an appropriate time, the EVAP canister purge solenoid and the EVAP canister vent solenoid are turned “ON,” allowing engine vacuum to draw a small vacuum on the entire evaporative emissions system. If a sufficient vacuum level cannot be achieved, a large leak or a faulty EVAP canister purge solenoid is indicated. This can be caused by the following conditions:

- Disconnected or faulty fuel tank pressure sensor
- Missing or faulty fuel cap
- Disconnected, damaged, pinched, or blocked EVAP purge line
- Disconnected or damaged EVAP vent hose
- Disconnected, damaged, pinched, or blocked fuel tank vapor line
- Disconnected or faulty EVAP canister cut valve
- Disconnected or faulty EVAP canister duty solenoid
- Open ignition feed circuit to the EVAP canister vent solenoid or the EVAP canister cut valve
- Damaged EVAP canister
- Leaking fuel sender assembly O-ring
- Leaking fuel tank or fuel filler neck

Any of the above conditions can set DTC P0440.

Conditions for Setting the DTC

- No TP sensor, IAT sensor, or MAP sensor DTCs set.
- Start-up engine coolant temperature is less than 32°C (90°F).
- Start-up engine coolant temperature is not more than 7°C (13°F) greater than start-up intake air temperature.
- Start-up intake air temperature is greater than 4°C (39°F) .
- Start-up intake air temperature is not more than 2°C (4°F) greater than start-up engine coolant temperature.
- Vehicle speed is less than 5 mph (8 km/h).
- Throttle position is greater than 3%.
- Minimal fuel slosh.
- BARO is greater than 70 kPa.
- The EVAP system is unable to achieve or maintain vacuum during the diagnostic test.

- Above conditions are present for 60 to 180 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the MIL during the second key cycle in which the DTC sets.
- The PCM will store conditions which were present when the DTC set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" when the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0440 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0440 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Cracked or punctured EVAP canister.
- Damaged or disconnected source vacuum line, EVAP purge line, vent hose or fuel tank vapor line.
- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness–Inspect the wiring harness to the EVAP canister vent solenoid, EVAP canister purge solenoid and the fuel tank pressure sensor for an intermittent open or short circuit.
- Kinked, pinched, or plugged vacuum source, EVAP purge, or fuel tank vapor line–Verify that the lines are not restricted.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. If an EVAP canister vent solenoid or an EVAP canister purge solenoid electrical fault is present, the purge system will not operate correctly. Repairing the electrical fault will very likely correct the condition that set DTC P0440.
3. Checks the fuel tank pressure sensor at ambient pressure.
4. Determines whether or not the EVAP system can be sealed sufficiently to be pressurized. If not, the large leak must be located and corrected before continuing with diagnosis.
5. Verifies that the fuel tank pressure sensor accurately reacts to EVAP system pressure changes.
8. Checks for a blocked EVAP canister purge solenoid. The PCM commands the EVAP canister purge solenoid "OFF" (open) and the vent solenoid "ON" (closed) with the Tech 2 "System Perf." EVAP output control function activated. Any pressure in the system should be released through the EVAP canister purge solenoid within a few seconds when "System Perf." is activated.
9. Ensures that sufficient source vacuum is present at the EVAP canister purge solenoid.

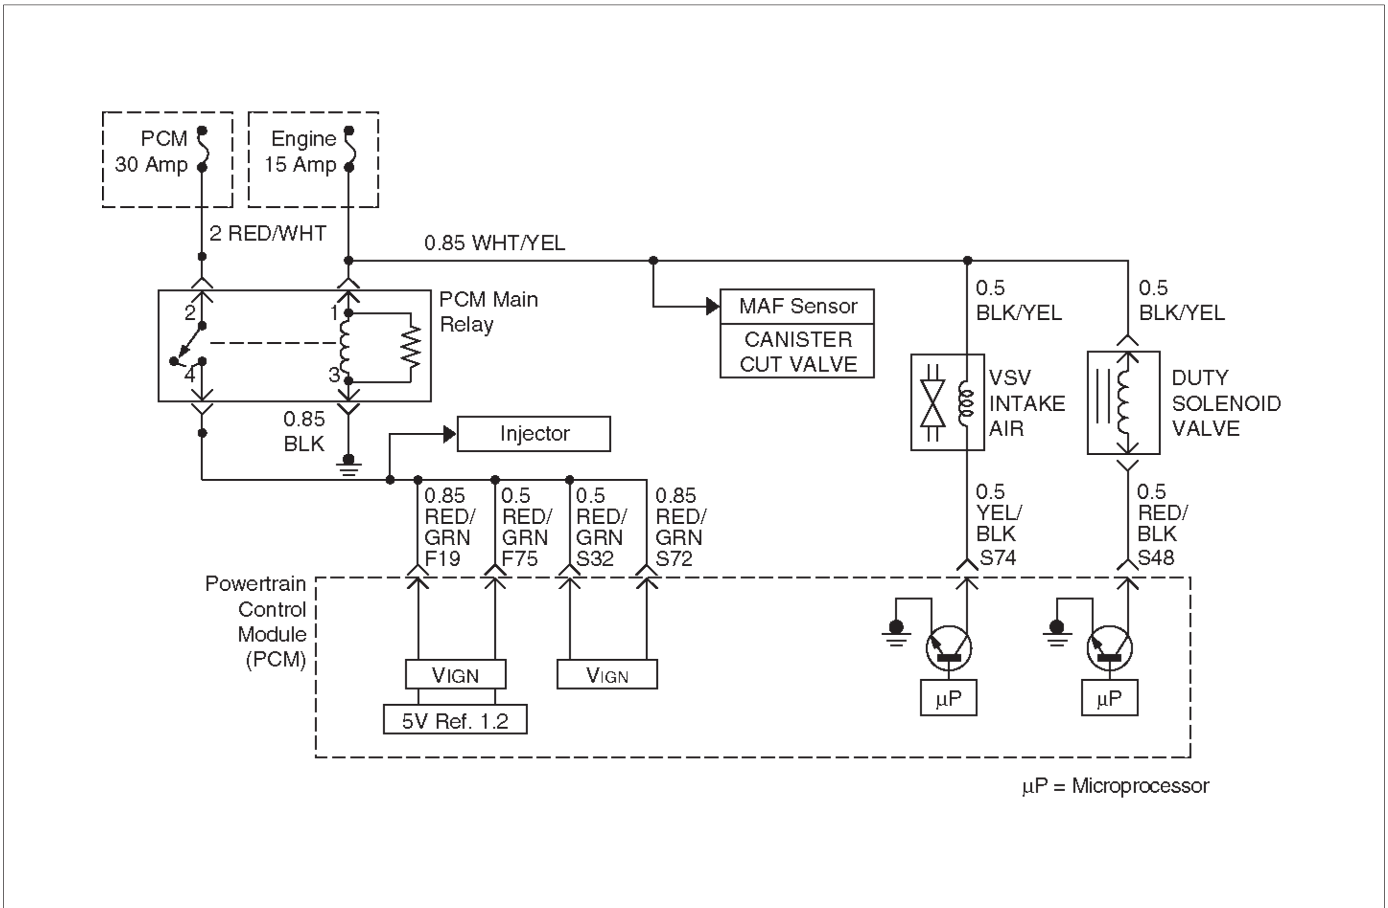
DTC P0440 – EVAP System

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Is DTC P0452 or P0453 also set?	—	Go to *other DTC first*	Go to *Step 3*
3	1. Ignition "OFF." 2. Remove the fuel cap. 3. Ignition "ON." 4. Observe "Fuel Tank Pressure" on the Tech 2. Does the Tech 2 indicate "Fuel Tank Pressure" at the specified value?	1.51 V	Go to *Step 4*	Go to *DTC P0452* or *DTC P0453*
4	1. Replace the fuel cap. 2. Engine is running. 3. Observe "Fuel Tank Vacuum" on the Tech 2. Does Tech 2 indicate "Fuel Tank Vacuum" at the specified value?	1.47–1.51 V	Go to *Step 7*	Go to *Step 6*

DTC P0440 – EVAP System (Cont'd)

Step	Action	Value(s)	Yes	No
5	Ignition "OFF". 1. Disconnect the fuel tank vapor line and the EVAP purge line from the EVAP canister. 2. Block the canister fitting for the fuel tank vapor line. 3. Connect a hand vacuum pump to the canister fitting for the EVAP purge line. 4. Ensure that the EVAP canister vent solenoid is still commanded "ON" (closed). 5. Attempt to apply vacuum to the EVAP canister. Observe "Fuel tank pressure" on the Tech 2. Does the Tech 2 indicate "Fuel tank pressure" at the specified value?	1.47–1.51 V	Go to *Step 8*	Go to *Step 7*
6	1. Visually/physically check for the following conditions: • Restricted fuel tank vapor line. • Restricted EVAP purge line. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *DTC P0452* or *DTC P0453*
7	1. Visually/physically check for the following conditions: • Vent hose disconnected or the damaged. • EVAP canister damaged. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
8	1. Visually/physically check for the following conditions: • Missing or faulty fuel cap. • Disconnected or leaking fuel tank vapor line. • Disconnected or damaged EVAP purge line. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
9	Replace the EVAP canister purge solenoid. Is the action complete?	—	Verify repair	—
10	Locate and repair cause of no source vacuum to the EVAP canister purge solenoid. Is the action complete?	—	Verify repair	—
11	Replace the EVAP canister vent solenoid. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0442 EVAP System Small Leak Detected



060RY00158

Circuit Description

The evaporative system includes the following components:

- Fuel tank
- EVAP canister vent solenoid
- Fuel tank pressure sensor
- Fuel pipes and hoses
- Vapor lines
- Fuel cap
- Evaporative emissions canister
- Purge lines
- EVAP canister purge solenoid

The evaporative leak detection diagnostic strategy is based on applying vacuum to the EVAP system and monitoring vacuum decay. The powertrain control module (PCM) monitors vacuum level via the fuel tank pressure sensor input. At an appropriate time, the EVAP canister purge solenoid and the EVAP canister vent solenoid are turned “ON,” allowing engine vacuum to draw a small vacuum on the entire evaporative emissions system. After the desired vacuum level has been achieved, the EVAP canister purge solenoid is turned “OFF,” sealing the system. A leak is detected by monitoring for a decrease in vacuum level over a given time period, all other variables remaining constant. A small leak in the system will cause DTC P0442 to be set.

Conditions for Setting the DTC

- No TP sensor, ECT sensor, Tank pressure sensor, IAT sensor, or MAP sensor DTCs set.
- The DTC P0440 diagnostic test has passed.
- A vacuum decay condition, indicating a small leak, is detected during the diagnostic test.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) during the second key cycle in which the DTC sets.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0442 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0442 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Cracked or punctured EVAP canister.
- Damaged source vacuum line, EVAP purge line, EVAP vent hose or fuel tank vapor line.

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness–Inspect the wiring harness to the EVAP canister vent solenoid, EVAP canister purge solenoid and the fuel tank pressure sensor for an intermittent open or short circuit.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. If an EVAP canister vent solenoid or an EVAP canister purge solenoid electrical fault is present, the purge system will not operate correctly. Repairing the electrical fault will very likely correct the condition that set DTC P0442.
3. Checks the fuel tank pressure sensor at ambient pressure.
4. Verifies that the fuel tank pressure sensor accurately reacts to EVAP system pressure changes.

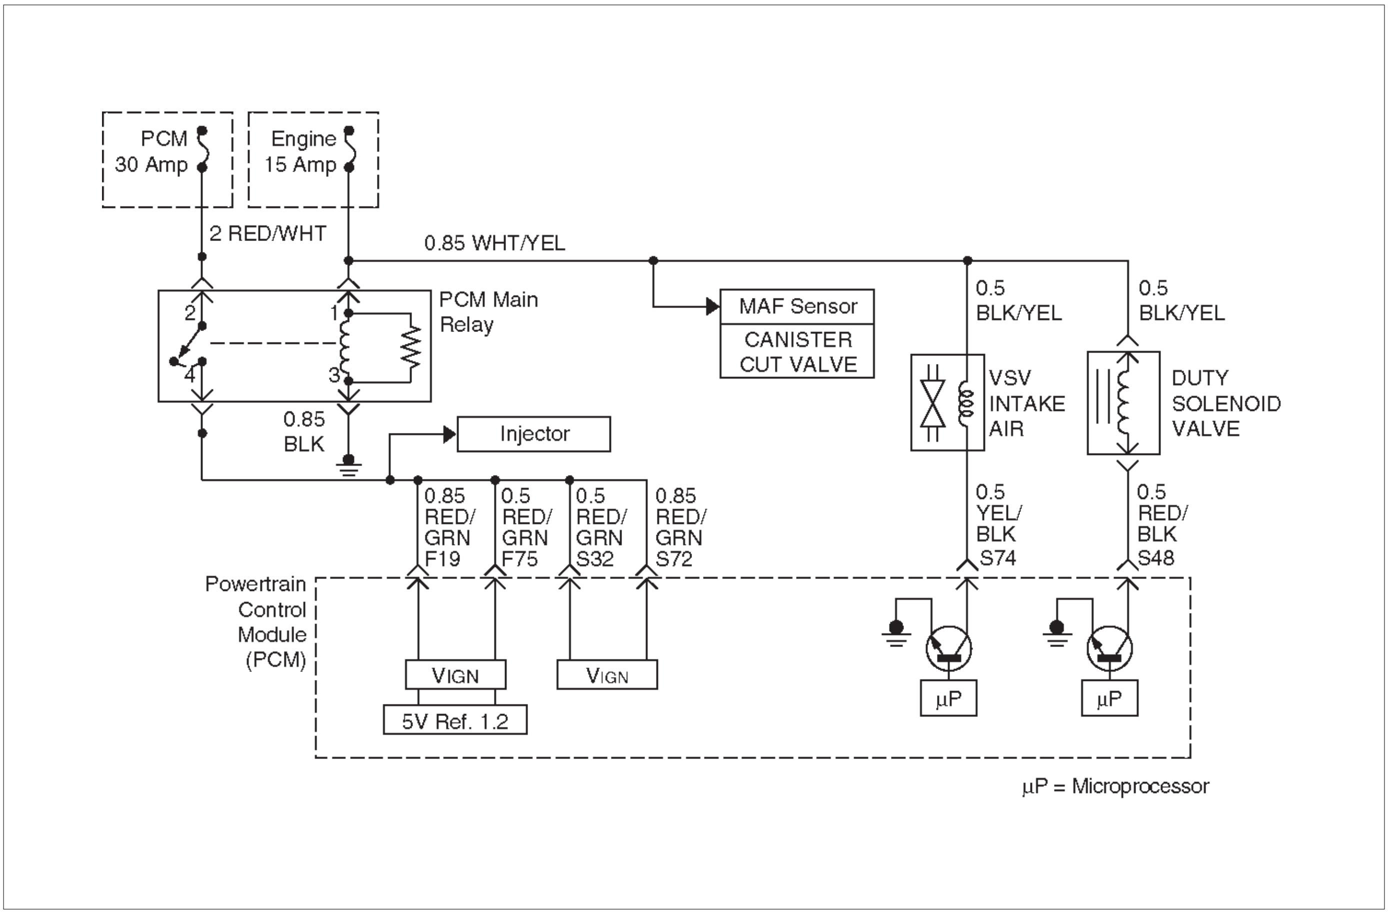
DTC P0442 – EVAP System Leak Detected

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “OFF.” 2. Remove the fuel cap. 3. Ignition “ON.” 4. Observe “Fuel Tank Pressure” on the Tech 2. Does the Tech 2 indicate “Fuel Tank Pressure” at the specified value?	1.51V	Go to *Step 3*	Go to *Fuel Tank Pressure System*
3	**IMPORTANT:** Before continuing with diagnosis, zero the EVAP pressure and vacuum gauges on EVAP pressure/purge cart J 41413 (refer to tool operating instructions). 1. Replace the fuel cap. 2. Capture Failure Records data for DTC P0442 and clear DTCs. 3. Connect the EVAP pressure/purge cart J 41413 to the EVAP service port. 4. Using the Tech 2, command the EVAP canister vent solenoid “ON” (closed). 5. Using the EVAP pressure/purge cart J 41413, pressurize the EVAP system to the specified value. 6. Observe “Fuel Tank Pressure” on the Tech 2. Does the Tech 2 indicate “Fuel Tank Pressure” at the specified value?	1.47V	Go to *Step 4*	Go to *Fuel Tank Pressure System*
4	1. Ignition “ON,” engine idling. 2. Using the Tech 2, command the EVAP canister vent solenoid “ON” (closed). 3. Using the EVAP pressure/purge cart J 41413, pressurize the EVAP system to 15 in. H2O. 4. Switch the rotary switch on the cart to “HOLD” and observe the EVAP pressure gauge. Does the pressure decrease to less than the specified value within 2 minutes?	1.47 – 1.51V	Go to *Step 5*	Refer to *Diagnostic Aids*

DTC P0442 – EVAP System Leak Detected (Cont'd)

Step	Action	Value(s)	Yes	No
5	1. Disconnect the fuel tank vapor line and the EVAP purge line from the EVAP canister. 2. Block the canister fitting for the fuel tank vapor line. 3. Connect a hand vacuum pump to the canister fitting for the EVAP purge line. 4. Ensure that the EVAP canister vent solenoid is still commanded "ON" (closed). 5. Attempt to apply vacuum to the EVAP canister. Can the vacuum be maintained at the specific value?	1.46V	Go to *Step 8*	Go to *Step 6*
6	1. Visually/physically check for the following conditions: • Vent hose disconnected or damaged. • EVAP canister damaged. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 7*
7	Replace the EVAP canister vent solenoid. Is the action complete?	—	Go to *Step 10*	—
8	1. Visually/physically check for the following conditions: • Missing or faulty fuel cap. • Disconnected or leaking fuel tank vapor line. • Disconnected or damaged EVAP purge line. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 9*
9	1. Using Tech 2, command the EVAP canister vent solenoid "ON" (closed). 2. With the cart connected to the EVAP service port, continuously attempt to pressurize the EVAP system by leaving the cart control knob in the pressurize position. 3. Using ultrasonic leak detector J 41416, locate and repair leak in EVAP system. (It may be necessary to partially lower the fuel tank to examine the connections on top of the tank.) Is the action complete?	—	Go to *Step 10*	—
10	1. Ignition "ON," engine not running. 2. Using the Tech 2, command the EVAP canister vent solenoid "ON" (closed). 3. Using the EVAP pressure/purge cart J 41413, pressurize and monitor the EVAP system to 15 in. H_2O. 4. Switch the rotary switch on the cart to "HOLD" and observe the EVAP pressure gauge. Does the pressure decrease to less than the specified value within 2 minutes?	2.14V	Go to *Step 2*	Verify repair

Diagnostic Trouble Code (DTC) P0446 EVAP Canister Vent Blocked



060RY00158

Circuit Description

The evaporative system includes the following components:

- Fuel tank
- EVAP canister vent solenoid
- Fuel tank pressure sensor
- Fuel pipes and hoses
- Vapor lines
- Fuel cap
- Evaporative emissions canister
- Purge lines
- EVAP canister purge solenoid

An incorrect fuel tank pressure sensor signal is detected by monitoring fuel tank pressure when the key is first turned “ON” during a cold start. If the fuel tank pressure signal is out of range, DTC P0446 will set. A restricted or blocked EVAP vent path is detected by monitoring fuel tank pressure during normal operation (EVAP canister vent solenoid open, EVAP canister purge solenoid normal). With the EVAP canister vent solenoid open, vacuum level in the system should be very low unless the vent path is blocked. A blockage can be caused by the following condition:

- Faulty EVAP canister vent solenoid (stuck closed).
- Plugged, kinked or pinched vent hose.
- Shorted EVAP canister vent solenoid driver circuit.
- Plugged evaporative canister.

If any of these conditions are present, DTC P0446 will set.

Conditions for Setting the DTC

- No TP sensor, ECT sensor, Tank pressure sensor, IAT sensor, or MAP sensor DTCs set.
- Start-up engine coolant temperature is less than 32°C (90°F).
- Start-up engine coolant temperature is not more than 7°C (13°F) greater than start-up intake air temperature.
- Vehicle speed is less than 75 mph (120 km/h).
- Throttle position is greater than 7% but less than 30%.
- Minimal fuel slosh.
- Fuel tank level is between 10% and 90%.
- BARO is greater than 70 kPa.
- Fuel tank pressure is not between –1.5 and 1.5.

Action Taken When the DTC Sets

- The PCM will illuminate the MIL during the second key cycle in which the DTC sets.
- The PCM will store conditions which were present when the DTC set as Freeze Frame and Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history DTC P0446 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0446 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness–Inspect the wiring harness to the EVAP canister vent solenoid, EVAP canister purge solenoid and the fuel tank pressure sensor for an intermittent open or short circuit.
- Kinked, pinched, or plugged vent hose–Verify that the vent hose between the EVAP canister and EVAP canister vent solenoid is not restricted.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. If a vent solenoid electrical fault is present, the purge system will not operate correctly. Repairing the electrical fault will very likely correct the condition that set DTC P0446.
3. Checks the fuel tank pressure sensor at ambient pressure.
4. Verifies that the fuel tank pressure sensor accurately reacts to EVAP system pressure changes.
6. Checks for a blocked EVAP canister.

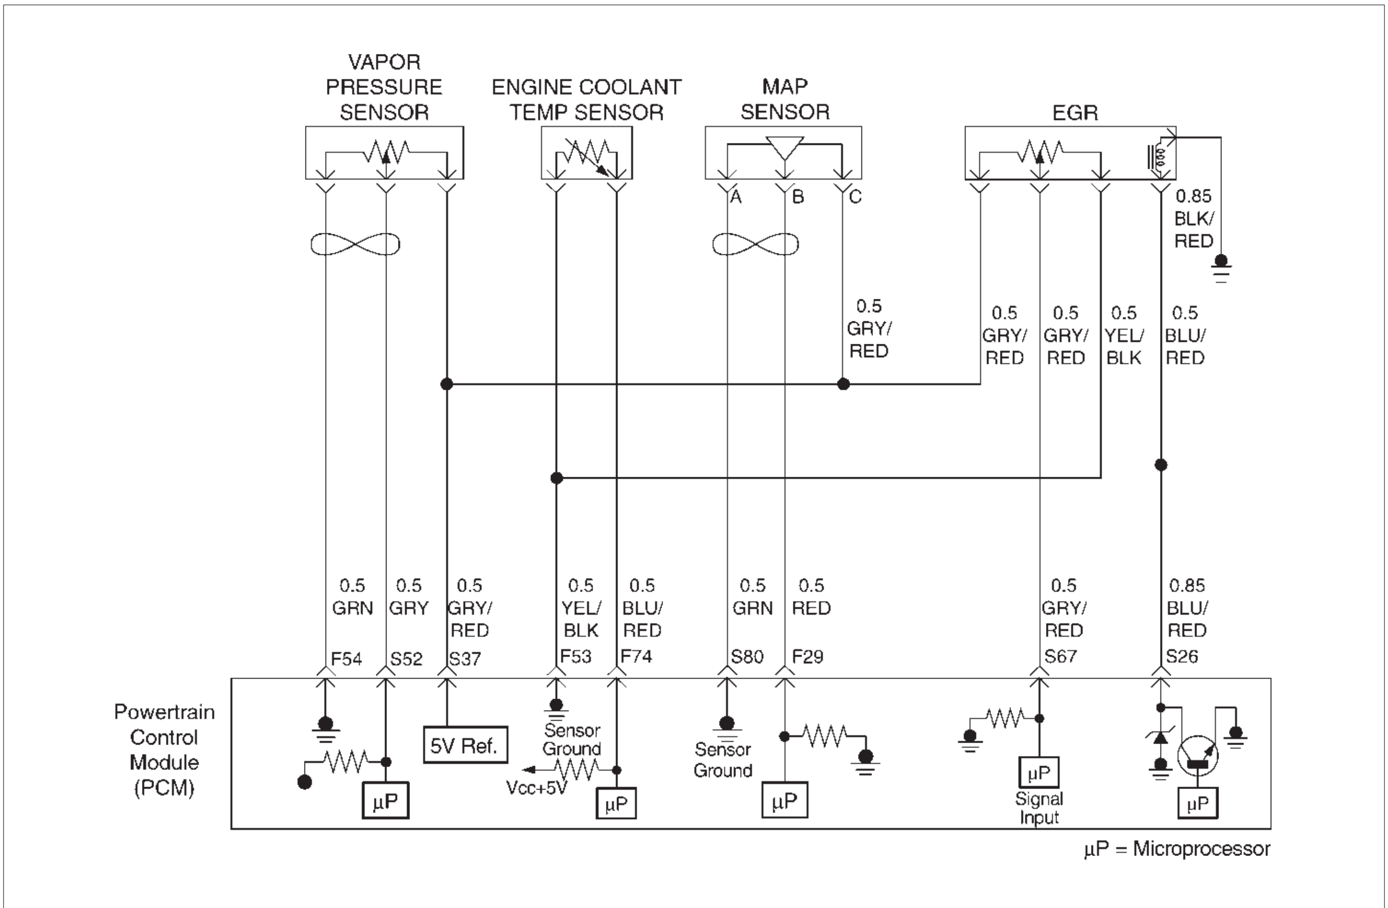
DTC P0446– EVAP Canister Vent Blocked

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON.” 2. Capture Failure Records data for DTC P0446 and clear DTCs. 3. Ignition “OFF.” 4. Remove the fuel cap. 5. Ignition “ON.” 6. Observe “Fuel Tank Pressure” on the Tech 2. Does Tech 2 indicate “Fuel Tank Pressure” at the specified value?	1.51V	Go to *Step 3*	Go to *Fuel Tank Pressure System*
3	**IMPORTANT:** Before continuing with diagnosis, zero the EVAP pressure and vacuum gauges on the EVAP pressure/purge cart J 41413 (refer to tool operating instructions). 1. Replace the fuel cap. 2. Using the Tech 2, command the EVAP vent solenoid “ON” (closed). 3. Connect the EVAP pressure/purge cart J 41413 to the EVAP service port. 4. Using the EVAP pressure/purge cart J 41413, pressurize the EVAP system to the specified value. 5. Observe “Fuel Tank Pressure” on the Tech 2. Does Tech 2 indicate “Fuel Tank Pressure” at the specified value?	1.52 – 1.69V	Go to *Step 4*	Go to *Fuel Tank Pressure System*
4	1. Maintain the EVAP pressure at 5 in. at H2O. 2. Using Tech 2, command the EVAP vent solenoid “OFF” (open) while observing the EVAP pressure gauge on the cart J 41413. Does the EVAP pressure return to the specified value within 5 seconds?	0 in. H2O	Refer to *Diagnostic Aids*	Go to *Step 5*

DTC P0446– EVAP Canister Vent Blocked (Cont'd)

Step	Action	Value(s)	Yes	No
5	1. Disconnect the large vent hose (marked "AIR") from the EVAP canister. 2. Switch the rotary switch on the cart J 41413 to "PURGE." 3. Ignition "ON," engine idling at normal operating temperature. 4. Observe vacuum gauge for 5 seconds while holding the engine speed at 2500 RPM. Does the vacuum remain less than the specified value?	30 in. H2O	Go to *Step 6*	Go to *Step 8*
6	1. Inspect the vent hose between the EVAP canister and the EVAP canister vent solenoid for kinks, pinched areas, or any other form of blockage. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 9*	Go to *Step 7*
7	Replace the EVAP canister vent solenoid. Is the action complete?	—	Go to *Step 9*	—
8	Replace the EVAP canister. Is the action complete?	—	Go to *Step 9*	—
9	1. Using Tech 2, command the EVAP canister vent solenoid "ON" (closed). 2. Using the EVAP pressure/purge cart J 41413, pressurize and monitor the EVAP system to 15 in. H2O. 3. Switch the rotary switch on cart J 41413 to "HOLD." 4. Using the Tech 2, command the EVAP canister vent solenoid "OFF" (open) while observing the EVAP pressure gauge on cart J 41413. Does the EVAP pressure return to the specified value within 5 seconds?	0 in. H^2O	Verify repair	Go to *Step 2*

Diagnostic Trouble Code (DTC) P0452 Fuel Tank Pressure Sensor Low Voltage



D06RY00145

Circuit Description

The powertrain control module (PCM) monitors fuel tank pressure sensor (Vapor pressure sensor) of the Enhanced Evapo system. When the tank pressure output indicates low voltage, PCM will set DTC P0452.

Conditions for Setting the DTC

- Tank sensor output is less than 0.2 volts for 12.5 sec.
- 100 test failures within a 200 tests.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) as soon as failure detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0402 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0404 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Open circuit of 5 volt reference line – Inspect wiring harness from PCM to the sensor. The PCM turns P0452, and P0107 at the same time.
- Open circuit or short circuit to ground line – Inspect wiring harness from PCM to the sensor. The PCM turns P0452 and P0107 at the same time.
- Tank fuel pressure sensor malfunction may cause P0452.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

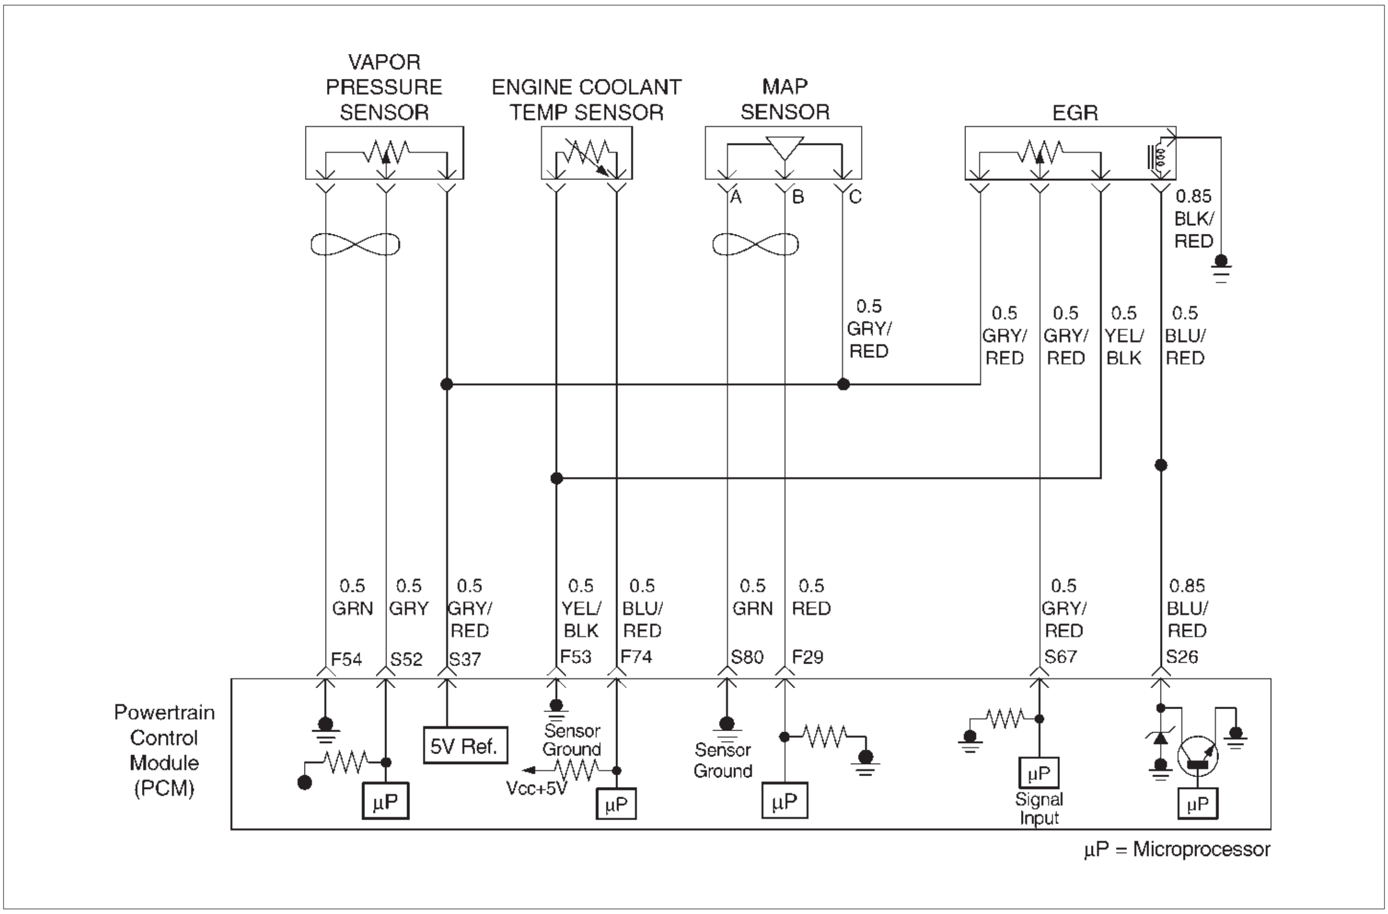
DTC P0452 – Tank Pressure Sensor Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF”, review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor “DTC” info for DTC P0452 until the DTC P0452 test runs. Note the result. Does the Tech 2 indicates DTC P0452 or P0452/P0107 failed this ignition?	—	P0452/P0107 turn on Go to *Step 3* P0452 turns on Go to *Step 6*	Refer to *Diagnostic Aids*
3	1. Ignition “OFF”. 2. Disconnect connector at the PCM. 3. Ignition “ON”. 4. At the PCM connector, measure voltage with a DVM at F54 and S37 terminals. Was the voltage in range of voltage?	4–6 V	Go to *Step 4*	Go to *Step 10*
4	1. Ignition “OFF”. 2. Connect the PCM connector to the PCM. 3. Backprobe with a DVM at fuel tank pressure sensor between 5 V reference terminal and sensor ground terminal. Was the voltage within range?	4–6 V	For P0452 go to *Step 5* and for P0107, go to diagnosis section.	Go to *Step 5*
5	1. Locate open wiring of 5 volt reference circuit from the PCM to fuel tank pressure sensor. 2. Repair wiring harness. Is the action complete?	—	Verify repair	—
6	1. Ignition “ON” 2. At the PCM connector, backprove with a DVM at the sensor output for the voltage. Was voltage within the range?	Less than 0.2 V	Go to *Step 7*	Go to *Step 10*
7	At the sensor output terminal, backprobe with a DVM at the sensor output Was voltage within the range?	Less than 0.2 V	Go to *Step 9*	Go to *Step 8*
8	1. Locate open circuit or short circuit to ground line. 2. Repair the harness. Is the action complete?	—	Verify repair	—
9	1. Locate open circuit or short circuit to ground line. 2. Repair the harness. Is the action complete?	—	Verify repair	—

DTC P0452 – Tank Pressure Sensor Low Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0453 Fuel Tank Pressure Sensor (Vapor pressure Sensor) High Voltage



D06RY00145

Circuit Description

The powertrain control module (PCM) monitors fuel tank pressure sensor (Vapor pressure sensor) of the Enhanced Evapo system. When the tank pressure output indicates high voltage , PCM will set DTC P0453.

Conditions for Setting the DTC

- Tank sensor output is more than 4.9 volts for 12.5 sec.
- 100 test failures within a 200 tests.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) as soon as failure detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0453 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Info function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Open circuit of sensor ground line – Inspect wiring harness from PCM to the sensor. The PCM turns P0453, and P0108 at the same time.
- Open circuit or short circuit to 5 volt reference line – Inspect wiring harness from PCM to the sensor. The PCM turns P0453 and P0108 at the same time.
- Tank fuel pressure sensor malfunction may cause P0453.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

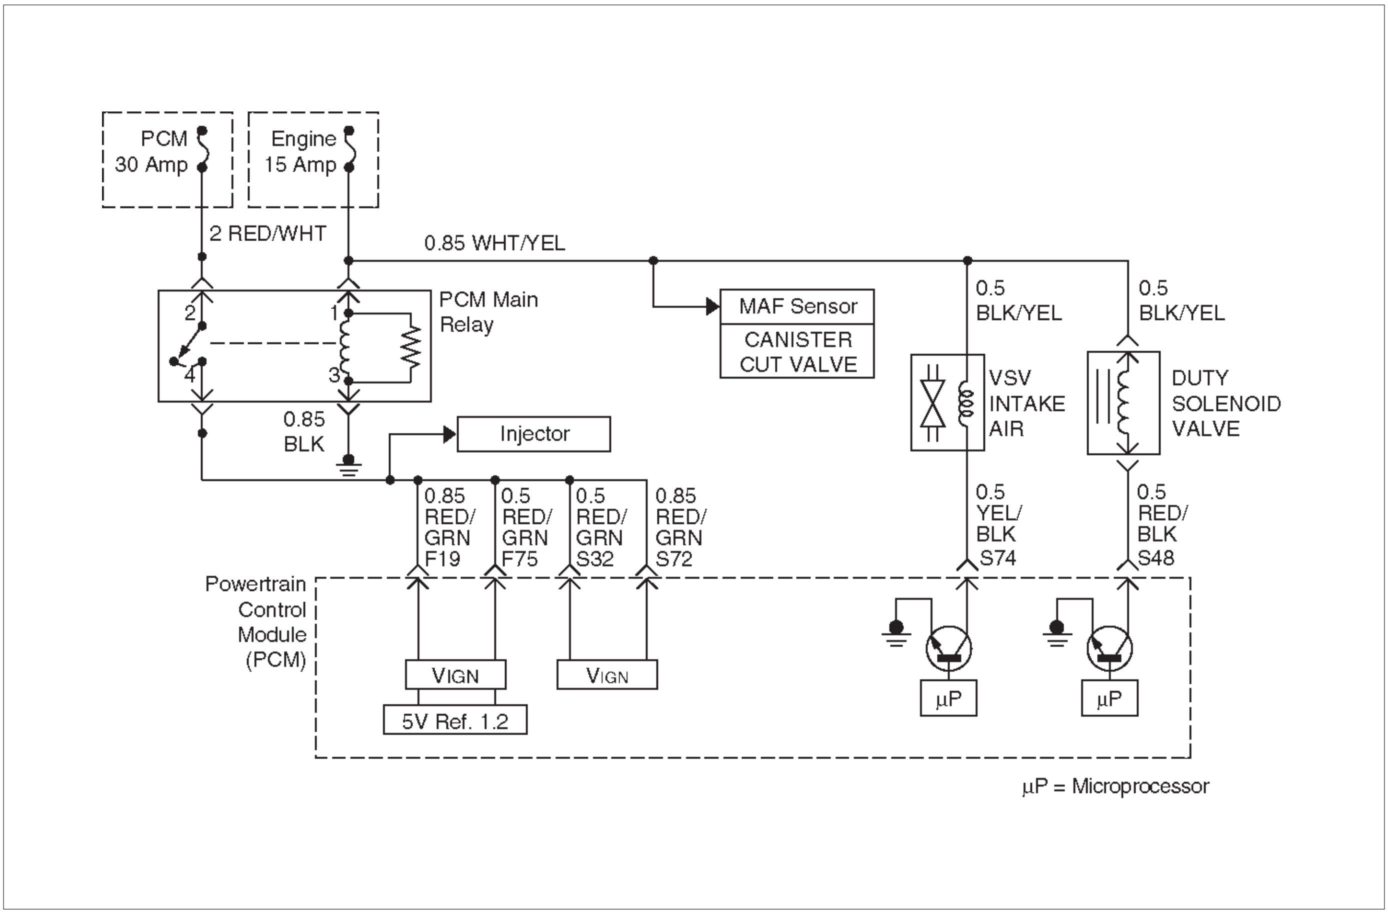
DTC P0453 – Fuel Tank Pressure Sensor High Voltage

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF”, review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor “DTC” info for DTC P0453 until the DTC P0453 test runs. Note the result. Does the Tech 2 indicates DTC P0452 or P0452/P0107 failed this ignition?	—	P0453/P0108 turn on Go to *Step 3* P0452 turns on Go to *Step 6*	Refer to *Diagnostic Aids*
3	1. Ignition “OFF”. 2. Disconnect connector at the PCM. 3. Ignition “ON”. 4. At the PCM connector, measure voltage with a DVM at F54 and S37 terminals. Was the voltage in range of voltage?	4–6 V	Go to *Step 4*	Go to *Step 10*
4	1. Ignition “OFF”. 2. Connect the PCM connector to the PCM. 3. Disconnect sensor harness at fuel pressure sensor. Measure voltage with a DVM at the end of the tank pressure wiring between 5 V reference terminal and sensor ground terminal. Was the voltage within range?	4–6 V	For P0453 go to *Step 6* and for P0108, go to diagnosis section.	Go to *Step 5*
5	1. Locate open wiring of ground line from the PCM to fuel tank pressure sensor. 2. Repair wiring harness. Is the action complete?	—	Verify repair	—
6	1. Ignition “ON”. 2. At the PCM connector, backprove with a DVM at the sensor output for the voltage. Was voltage within the range?	More than 4.9 V	Go to *Step 7*	Go to *Step 10*
7	At the sensor output terminal, backprobe with a DVM at the sensor output. Was the voltage within range?	More than 4.9 V	Go to *Step 9*	Go to *Step 8*
8	1. Locate open circuit or short circuit to ground line. 2. Repair the harness. Is the action complete?	—	Verify repair	—
9	Replace the tank pressure sensor. Is the action complete?	—	Verify repair	—

DTC P0453 – Fuel Tank Pressure Sensor High Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0456 EVAP Very Small Leak



060RY00158

Circuit Description

The evaporative system includes the following components:

- Fuel tank
- EVAP canister vent solenoid
- Fuel tank pressure sensor
- Vapor lines
- Fuel cap
- Evaporative emissions canister
- Purge lines
- EVAP canister purge solenoid

The evaporative leak detection diagnostic strategy is based on applying vacuum to the EVAP systemand monitoring vacuum decay. The powertrain control module(PCM)monitors vacuum level via the fuel tank presuure sensor input .At an appropriate time, the EVAP canister purge solenoid and the EVAP canister vent solenoid are turned "ON," allowing engine vacuum to draw a very small on the entire evaporative emissions system. After the desired vacuum level has been achieved, the EVAP canister purge solenoid is turned "OFF", sealing the system. A leak is detected by monitoring for a decrease in vacuum level over a given time period, all other variables remaining constant.

A very small leak in the system will cause DTC P0456 to be set.

Conditions for setting the DTC

- No MAP DTC's set.
- No TPS DTC's set.
- No IAT DTC's set.
- No ECT DTC's set.
- No tank pressure sensor DTC's set.
- Baro is more than 70KPa.
- A vacuum decay condition, indicating a very small leak, is detected during the diagnostic test.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Warm up cycles have occurred without a fault.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0456 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P0456 can be cleared using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Cracked or punctured EVAP canister.
- Damaged source vacuum line, EVAP purge line, EVAP vent hose or fuel tank vapor line. to wire connection.
- Poor connection at PCM–Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged hanrness-Inspect the wiring harness to the EVAP canister purge solenoid and the fuel tank pressure sensor for an intermittent open or short circuit.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs.

This may assist in diagnosing the condition.

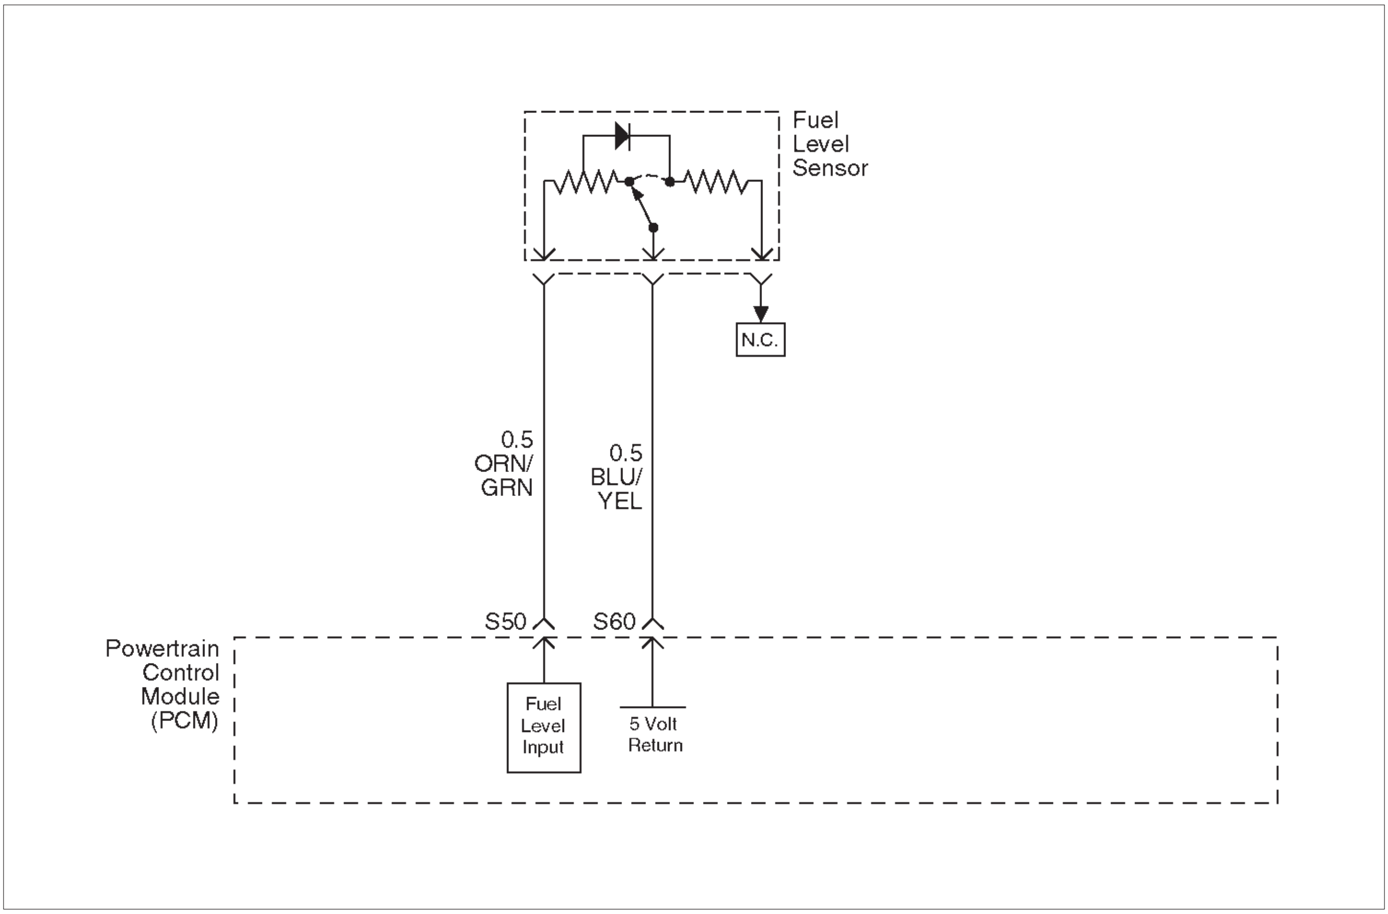
Diagnostic Trouble Code(DTC)P0456 EVAP Very Small Leak

Step	Action	Value(s)	Yes	No
1	Was the “On-Board(OBD)System Check”performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “OFF”. 2. Remove the fuel cap. 3. Ignition “ON”. 4. Observe “Fuel Tank Pressure” on the Tech 2. Does the Tech 2 indicate “Fuel Tank Pressure” at the specified value?	1.51V	Go to*Step 3*	Go to*Fuel Tank Pressure System*
3	1. Visually/physically check for the following conditions: • Vent hose disconnected or darmaged. • EVAP canister damaged. • Fuel cap damaged 2. If a problem is found,repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 4*
4	1. Ignition “ON”, engine “OFF”. 2. Install the fuel cap. 3. Review and record Tech 2 Failure Records data. 4. Operate the vehicle within Failure Records conditions as noted. 5. Using theTech 2,monitor the “DTC” info for DTC P0456. Does the Tech 2 indicate DTC P0456?	—	Go to *Step 5*	Refer to *Diagnostic Aids*
5	1. Ignition “ON”, engine idling. 2. Observe “Fuel Tank Pressure” on the Tech 2. Does the Tech 2 indicate “Fuel Tank Pressure” at the specified value?	—	Refer to *Diagnostic Aids*	Go to *Step 5*
6	1. Ignition “ON”, engine idling. 2. Using theTech 2, command the EVAP canister vent solenoid “ON” (closed) 3. Observe “EVAP canister vent solenoid operation”. second value? 4. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*

Diagnostic Trouble Code(DTC)P0456 EVAP Very Small Leak (Cont'd)

Step	Action	Value(s)	Yes	No
7	1. Visually/physically check for the following conditions: • Disconnected or leaking fuel tank vapor line. • Disconnected or damage EVAP purge line. 2. If a problem is found,repair as necessary. Was a problem found?	—	Verify repair	Refer to *Diagnostic Aids*

Diagnostic Trouble Code (DTC) P0462 Fuel Level Sensor Circuit–Low Voltage



060RY00163

Circuit Description

The fuel level sensor is an important input to powertrain control module (PCM) for the enhanced evaporative system diagnostic. Fuel level information is needed for the PCM to know the volume of fuel in the tank. The fuel level affects the rate of change in air pressure in the evaporative system. Several of the enhanced evaporative system diagnostic sub-tests are dependent upon correct fuel level information. The diagnostic will not run when the tank is greater than 85%, or less than 15% full. Fuel level DTCs should be diagnosed before other evaporative system DTCs because they can cause other DTCs to be set.

The sending unit is a float in the fuel tank which moves a wiper arm across a variable resistor. Low fuel level causes high resistance in the sending unit, and this is recognized by the PCM because the circuit operates at a corresponding low voltage. When the circuit is continuously open or has a high resistance connection, DTC P0462 is set.

Conditions for Setting the DTC

- Fuel tank level “slosh test” is completed.
- Fuel tank level “main test” is completed.
- Fuel tank level data is valid.
- Fuel tank level signal is less than a specified value.
- There are 100 test failures within a 200-test sample.

Action Taken When the DTC Sets

- The PCM will not turn the malfunction indicator lamp (MIL) “ON.”
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- The PCM will turn the MIL “OFF” after three consecutive trips without a fault condition present. A history DTC will be cleared if no fault conditions have been detected for 40 warm-up cycles (engine coolant temperature has risen 4°C (40°F) from the start-up ECT, and ECT exceeds 71°C (160°F) during that same ignition cycle).
- DTC P0462 can be cleared by using the scan tool “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

- Damaged harness–Inspect the wiring harness for damage. If the harness appears to be OK, observe the fuel level display on the scan tool while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

8. The following chart can be used to check the sending unit:

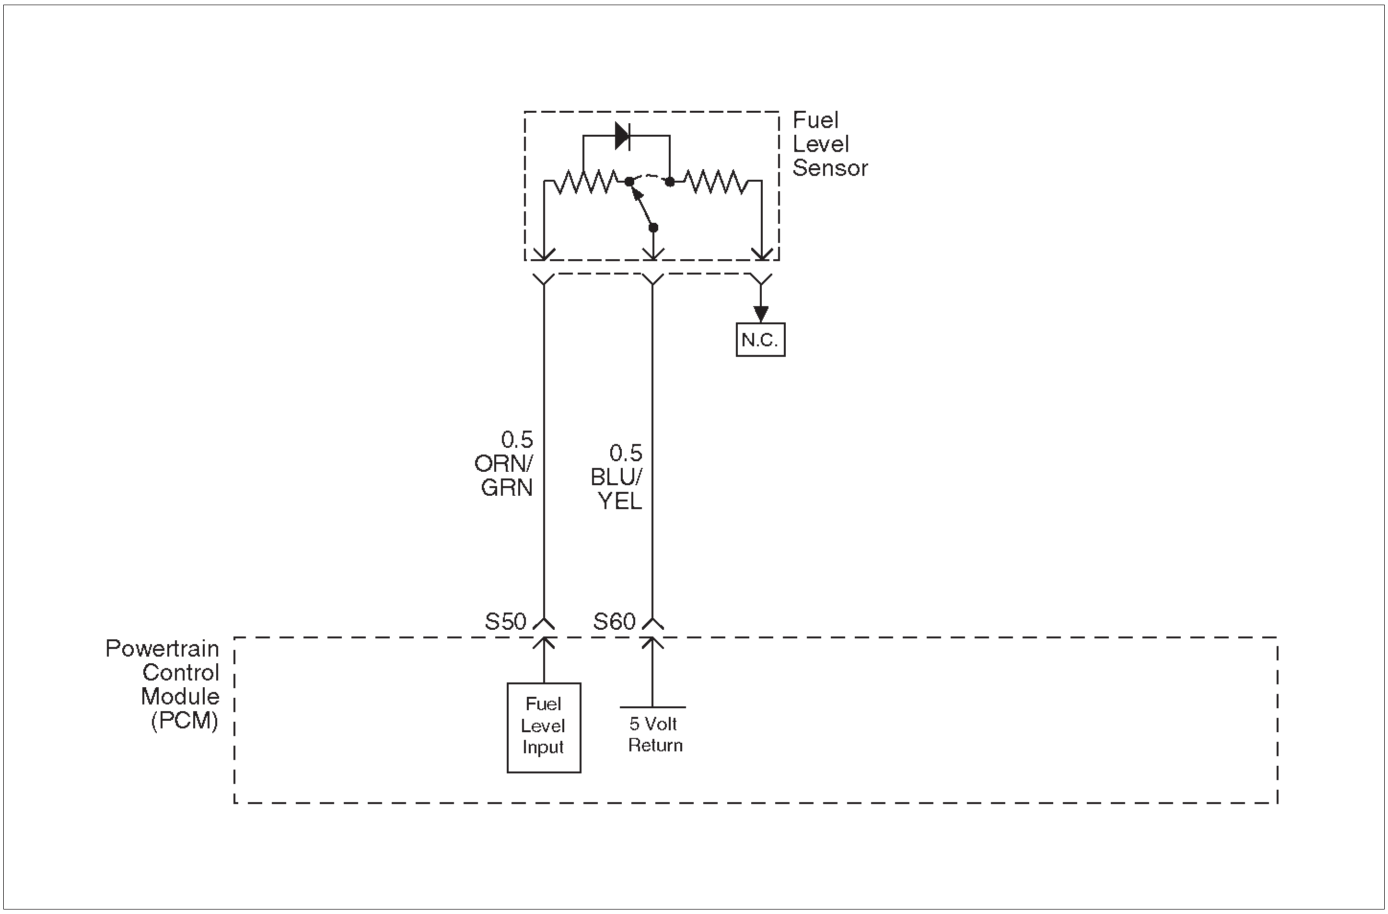
DTC P0462– Fuel Level Sensor Circuit –Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Disconnected the fuel level sensor harness from its connector at the fuel tank. 2. Ignition "ON," engine "OFF." 3. Using a DVM, measure the voltage between the sensor harness positive and ground wires. Is the voltage approximately equal to the specified value?	5 V	Go to *Step 6*	Go to *Step 3*
3	1. Ignition "ON," engine "OFF." 2. With a DVM, backprobe the PCM connector at the terminal which supplies 5 volts to the fuel level sensor. Is the voltage approximately equal to the specified value?	5 V	Go to *Step 4*	Go to *Step 9*
4	1. Ignition "ON," engine "OFF." 2. Fuel level sensor disconnected from wiring harness. 3. With a DVM, probe the 5-volt supply wire at the sensor harness. Is the voltage approximately equal to the value measured in Step 4?	—	Go to *Step 5*	Go to *Step 9*
5	Check for open or high resistance connection in the ground wire between the PCM and the fuel level sensor. Is the action complete?	—	Verify repair	—
6	Remove the fuel level sensor and check the following: • Does the arm move freely? • Are the wires open or intermittently open when wiggled? • Do the resistance values match the specification chart? Was a problem found?	—	Go to *Step 7*	Go to *Step 9*
7	Replace the fuel level sensor. Is the action complete?	—	Verify repair	—

DTC P0462– Fuel Level Sensor Circuit –Low Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
8	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—
9	Short to ground between the PCM connector and the fuel level sensor. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0463 Fuel Level Sensor Circuit–High Voltage



060RY00163

Circuit Description

The fuel level sensor is an important input to powertrain control module (PCM) for the enhanced evaporative system diagnostic. Fuel level information is needed for the PCM to know the volume of fuel in the tank. The fuel level affects the rate of change in air pressure in the evaporative system. Several of the enhanced evaporative system diagnostic sub-tests are dependent upon correct fuel level information. The diagnostic will not run when the tank is greater than 85% or less than 15%, full. Fuel level DTCs should be diagnosed before other evaporative system DTCs because they can cause other DTCs to be set.

The sending unit is a float in the fuel tank which moves a wiper arm across a variable resistor. High fuel level causes low resistance in the sending unit. This is recognized by the PCM because the circuit operates at a corresponding high voltage. When the circuit is continuously shorted to a voltage source greater than a specified value, or when the 5 volt signal is shorted to ground, DTC P0463 is set.

Conditions for Setting the DTC

- Fuel tank level “slosh test” is completed.
- Fuel tank level “main test” is completed.
- Fuel tank level data is valid.
- Fuel tank level signal is greater than a specified value.
- There are 100 test failures within a 200-test sample.

Action Taken When the DTC Sets

- The PCM will not turn the malfunction indicator lamp (MIL) “ON.”
- The PCM will store conditions which were present when the DTC set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- The PCM will turn the MIL “OFF” after three consecutive trips without a fault condition present. A history DTC will be cleared if no fault conditions have been detected for 40 warm-up cycles (engine coolant temperature has risen 4°C (40°F) from the start-up ECT, and ECT exceeds 71°C (160°F) during that same ignition cycle) or the scan tool clearing function has been used.
- DTC P0463 can be cleared by using the scan tool “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

- Damaged harness–Inspect the wiring harness for damage. If the harness appears to be OK, observe the fuel level display on the scan tool while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Test Description

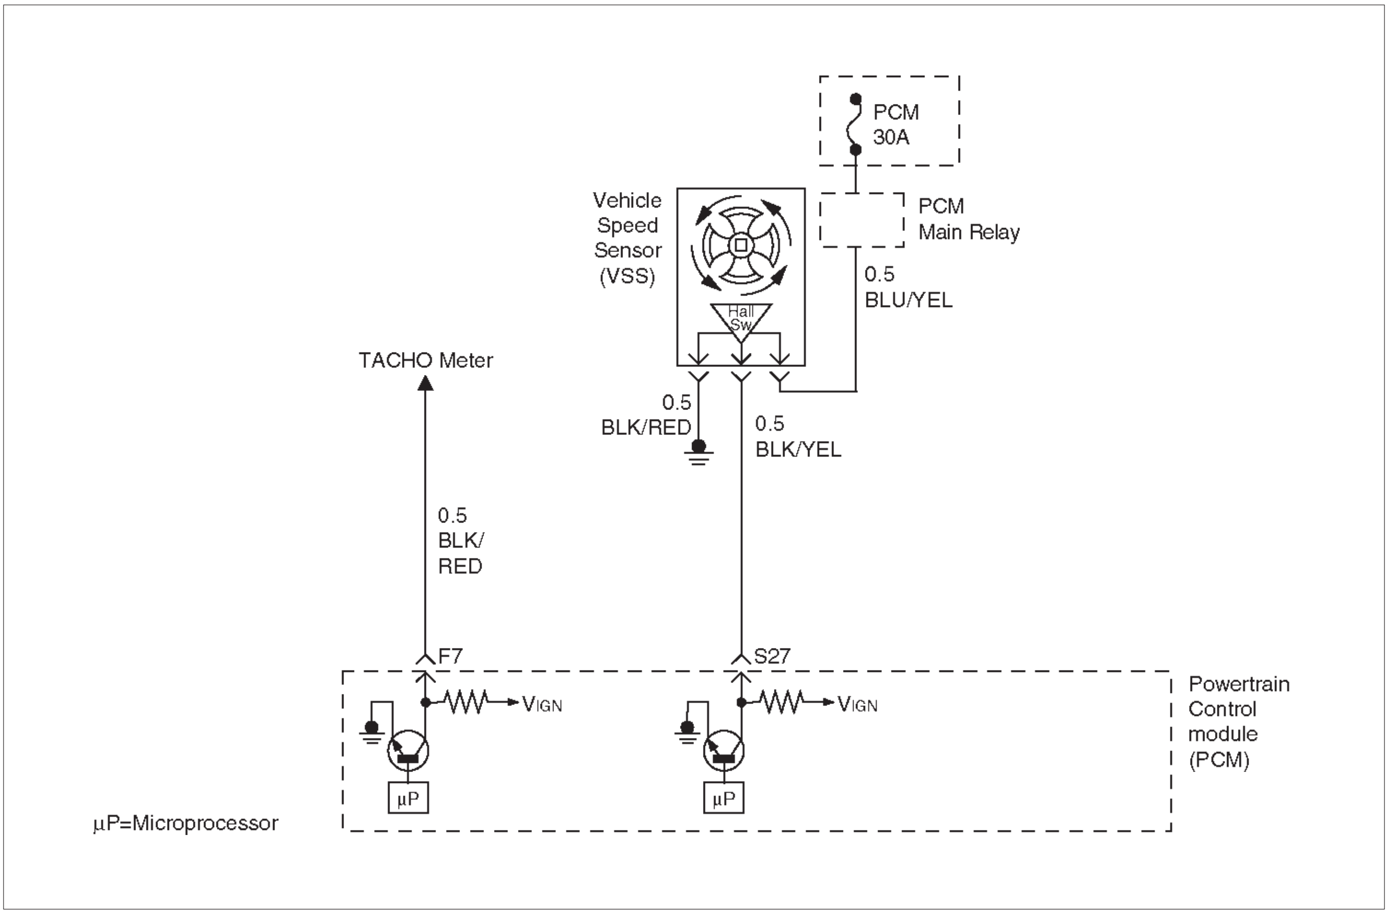
Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. The ETC and MAP sensors share a ground at PCM terminal D9.
9. Equates the resistance values at various float positions to the following fuel gauge readings:

DTC P0463– Fuel Level Sensor Circuit –High Voltage

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Disconnected the fuel level sensor harness from its connector at the fuel tank. 2. Ignition “ON,” engine “OFF.” 3. Using a DVM, measure the voltage between the sensor harness positive and ground wires. Is the voltage approximately equal to the specified value?	5 V	Go to *Step 8*	Go to *Step 3*
3	With the negative DVM lead connected to ground, use the positive DVM lead to probe the sensor ground wire with the harness still disconnected. Does the DVM indicate a short to a voltage source?	—	Go to *Step 4*	Go to *Step 5*
4	Repair short to voltage between the sensor and the PCM. Is the repair complete?	—	Verify repair	—
5	With the negative DVM lead connected to ground, use the positive DVM lead to probe the sensor positive wire with the harness still disconnected. Does the DVM indicate a voltage greater than the specified value?	5 V	Go to *Step 4*	Go to *Step 6*
6	Open circuit between the PCM connector and the fuel level sensor?	—	Verify repair	Go to *Step 7*
7	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—
8	Remove the fuel level sensor and check the following: • Does the arm move freely? • Are the wire leads shorted together? • Do the resistance values match the specification chart? Was a problem found?	—	Go to *Step 9*	Go to *Step 7*
9	Replace the fuel level sensor. Is the repair complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0502 VSS Circuit Low Input



060RY00164

Circuit Description

The vehicle speed sensor has a magnet rotated by the transmission output shaft. Attached to the sensor is a hall effect circuit the interacts with the magnetic field treated by the rotating magnet. A 12-volt operating supply for the speed sensor hall circuit is supplied from the meter fuse. The VSS pulses to ground the 9-volt signal sent from the powertrain control module (PCM) on the reference circuit. The PCM interprets vehicle speed by the number of pulses to ground per second on the reference circuit.

Conditions for Setting the DTC

- Engine is running.
- Engine speed is between 1800 RPM and 2500 RPM.
- Throttle angle is between 10% and 40%.
- Engine load is greater than 50 kPa.
- PCM detects no VSS signal for 12.5 seconds over a period of 15 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0502 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0502 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

10. To avoid backprobing the VSS and possibly damaging a seal or terminal, the VSS output can be tested at the point where the transmission harness connects to the engine harness. Power and ground are applied by jumpers to the VSS through the connectors which are located to the rear of the air cleaner assembly. The VSS signal is monitored with a DVM as the rear driveshaft turns. The wheels can be turned to rotate the driveshaft, or in 2-wheels-drive vehicles the driveshaft can be turned directly.

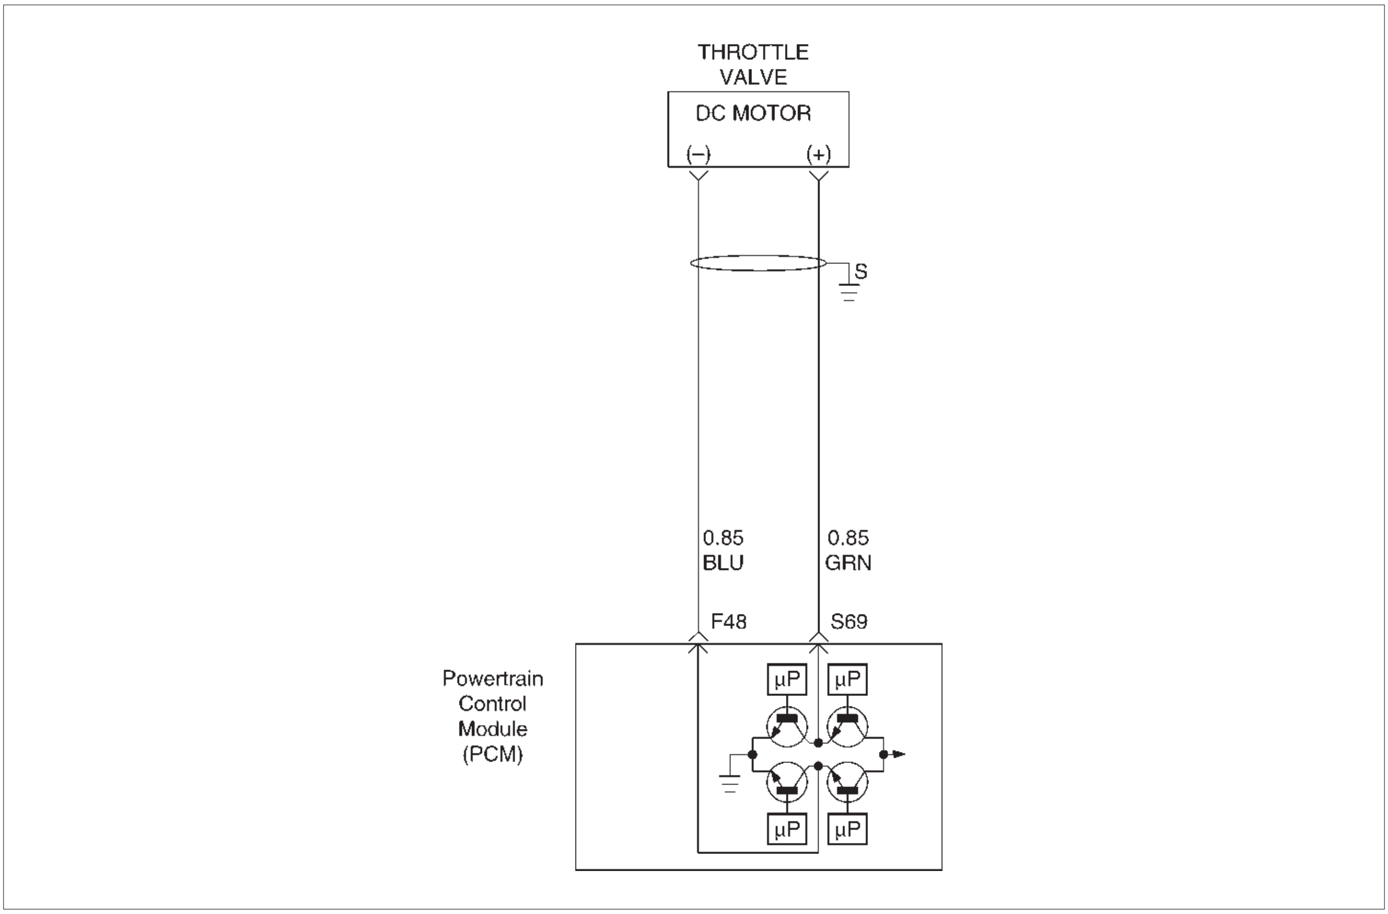
DTC P0502 – VSS Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Does the speedometer work?	—	Go to *Step 10*	Go to *Step 3*
3	1. Disconnect the VSS connector. 2. Ignition "ON." 3. Using a test light to battery +, probe the connector ground wire. Did the light illuminate?	—	Go to *Step 5*	Go to *Step 4*
4	Repair the sensor ground. Is the action complete?	—	Verify repair	—
5	1. Ignition "ON," sensor disconnected. 2. Using a DVM, measure at the VSS connector between ground and voltage supply. Was the measurement near the specified value?	Battery voltage	Go to *Step 7*	Go to *Step 6*
6	Repair the open or short to ground which may have blown the meter fuse. Is the action complete?	—	Verify repair	—
7	1. Ignition "ON," VSS disconnected. 2. Using a DVM, measure at the VSS connector between ground and the wire from the speedometer. Was the measurement near the specified value?	7.5-8 V	Go to *Step 9*	Go to *Step 8*
8	Check for an open or short circuit between the speedometer and the VSS. Was an open or short circuit located?	—	Verify repair	Go to *Step 9*
9	Replace the speedometer. Is the action complete?	—	Verify repair	—

DTC P0502 – VSS Circuit Low Input (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Ignition "OFF." 2. Disconnect the MAF sensor. The connector attaches the VSS wires from the transmission harness to the left-side engine harness. 3. Disconnect the black 16-way connector. 4. Select a terminal adapter from kit J 35616 that can be used with a jumper to supply B+ to the blue wire with a yellow tracer (transmission side of the connector). 5. Use another terminal adapter to attach a voltmeter to the light-green wire with a white tracer (next to the wire in the previous step.) 6. Disconnect the blue connector next to the black 16-way connector, and locate the black/red tracer wire at one corner of the blue connector. The black/red wire is the VSS ground. Use a terminal adapter to attach a jumper to ground to the black/red VSS ground wire at the transmission side of the blue connector. 7. Raise the rear wheels off the ground with transmission in neutral. Does the DVM toggle back and forth between 0.6 V and 10 V as the wheels (and driveshaft) are rotated?	—	Go to *Step 11*	Go to *Step 10*
11	Replace the VSS. Is the action complete?	—	Verify repair	—
12	Check for an open or short between the PCM and the speedometer. Was a problem found?	—	Verify repair	Go to *Step 13*
13	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. ANd also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0506 Idle Air Control System Low RPM



D06RY00161

Circuit Description

The powertrain control module (PCM) controls engine speed by adjusting the position of the throttle control valve (DC motor). The throttle motor is a DC motor driven by one coil. The PCM applies current to the DC motor coil in position (%) to adjustment the throttle valve into a passage in the throttle body to air flow. This method allows highly accurate control of engine speed and quick response to changes in engine load.

If the PCM detects a condition where too low of an idle speed is present and the PCM is unable to adjust idle speed by increasing the throttle position, DTC P0506 will set, indicating a problem with the idle control system.

Conditions for Setting the DTC

- No TPS, VSS, ECT, EGR, MAF, low voltage, fuel system, canister purge, injector control, or ignition control DTCs are set.
- MAP is less than 60 kPa.
- Canister purge duty cycle is above 10%.
- Engine running time is more than 125 seconds.
- Vehicle speed is less than 1 mph.
- Engine coolant temperature (ECT) is above 50°C.
- Ignition voltage is between 9.5 volts and 16.7 volts.
- The throttle is closed.
- EVAP purge duty cycle more than 10%.
- All conditions are met for 10 seconds.
- Engine speed is more than 100-200 RPM lower than desired idle based upon coolant temperature.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- DTC P0506 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM or throttle DC motor – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage.
- Restricted air intake system – Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system.
- Throttle body – Check for objects blocking the ETC passage or throttle bore, excessive deposits in the

ETC passage and on the ETC position, and excessive deposits in the throttle bore and on the throttle plate.

- Large vacuum leak – Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty PCV valve or brake booster hose disconnected.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

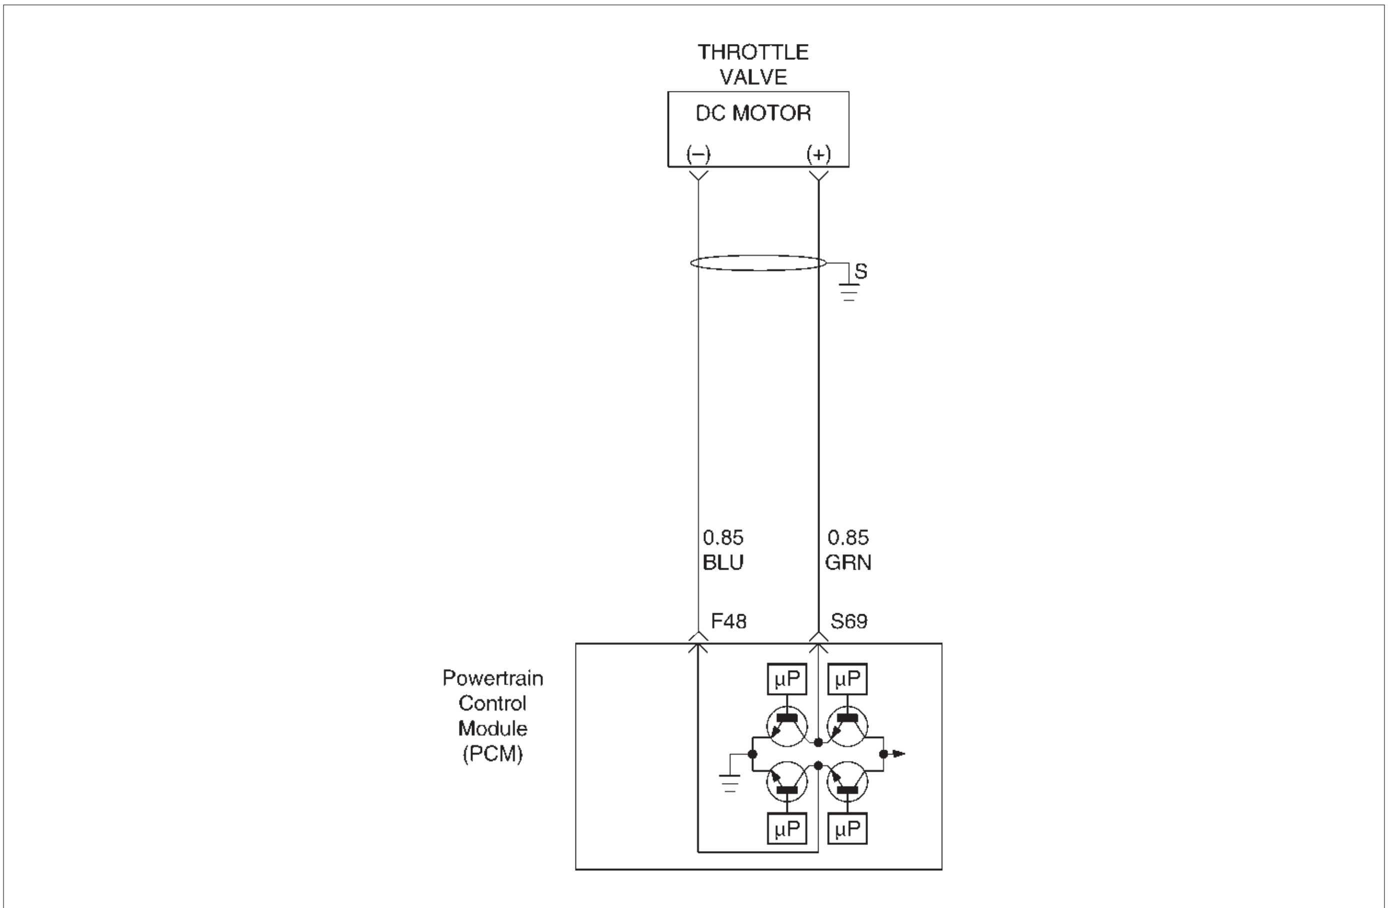
DTC P0506 – Idle Air Control System Low RPM

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Visually/physically inspect for the following conditions: ● Throttle body tampering. ● Restricted intake throttle system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. ● Throttle body: Check for objects blocking the throttle passage or throttle bore, excessive deposits in the throttle passage and on the throttle valve, and excessive deposits in the throttle bore and on the throttle plate. ● Throttle body with lever: Check for objects send round the throttle spring lever that lever is smooth movement, and spring lever has not excessive play Do any of the above require a repair?	—	Refer to *appropriate section foron–vehicle service*	Go to *Step 4*
3	Visually/physically inspect for the following conditions: ● Acceleration pedal tampering. ● Acceleration pedaL : Check for objects blocking the spring or pedal arm. ● Acceleration pedal : Check for objects move the acceleration pedal that pedal is smooth movement, and acceleration pedal arm has not excessive play. Do any of the above require a repair?	—	Refer to *appropriate section foron–vehicle service*	Go to *Step 4*
4	1. Check for a poor connection at the throttle body harness connector. 2. Check for a poor connection at the acceleration position sensor harness connector. 3. If a problem is found, replace faulty terminals as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
5	Check the following circuits for an open, short tovoltage, short to ground, or poor connection at thePCM: ● Throttle position sensor 1 circuit. ● Throttle position sensor 2 circuit. ● Throttle DC motor circuit. ● Throttle position sensor resistance. ● Throttle DC motor resistance. ● If a problem is found, repair as necessary. Was a problem found?	Vcc-GND 1–7kΩ SIG-DND change resistance0.3 – 100Ω	Verify repair	Go to *Step 6*

DTC P0506 – Idle Air Control System Low RPM (Cont'd)

Step	Action	Value(s)	Yes	No
6	Replace the throttle valve. Is the action complete?	—	Go to *Step 3*	—
7	1. Check the following circuits for an open, short tovoltage, short to ground, or poor connection at the PCM: Acceleration position sensor 1 circuit. Acceleration position sensor 2 circuit. C position sensor 2 circuit. V position sensor resistance. 2. If a problem is found, repair as necessary. Was a problem found?	Vcc-GND 4–6kΩ SIG-DND change resistance	Verify repair	Go to *Step 8*
8	Replace the acceleration position sensor. Is the action complete?	—	Go to *Step 9*	—
9	Following below the DTCs stored: P1125, P1290, P1295, P1299	—	Go to *applicableDTC table*	Go to *Step 10*
10	Following below the DTCs stored:P1514, P1515, P1516, P1523, P1271, P1272, P1273	—	Go to *applicable DTC table*	Go to *Step 11*
11	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0507 Idle Air Control System High RPM



D06RY00161

Circuit Description

The powertrain control module (PCM) controls engine speed by adjusting the position of the throttle control valve (DC motor). The throttle motor is a DC motor driven by one coil. The PCM applies current to the DC motor coil in position (%) to adjustment the throttle valve into a passage in the throttle body to air flow. This method allows highly accurate control of engine speed and quick response to changes in engine load.

If the PCM detects a condition where too high of an idle speed is present and the PCM is unable to adjust idle speed by increasing the throttle position, DTC P0507 will set, indicating a problem with the idle control system.

Conditions for Setting the DTC

- No TPS, VSS, ECT, EGR, MAF, low voltage, fuel system, canister purge, injector control or ignition control DTCs are set.
- Barometric pressure is above 75 kPa.
- Canister purge duty cycle is above 10%.
- Engine running time is more than 125 seconds.
- Vehicle speed is less than 1 mph.
- Engine coolant temperature (ECT) is above 50°C.
- Ignition voltage is between 9.5 volts and 16.7 volts.
- The throttle is closed.
- EVAP purge duty cycle is more than 10%.
- All conditions are met for 10 seconds.
- Engine speed is more than 100-200 RPM higher than desired idle based upon coolant temperature.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0507 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0507 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM or throttle DC motor – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage.
- Vacuum leak – Check for a condition that causes a vacuum leak, such as disconnected or damaged hoses, leaks at EGR valve and EGR pipe to intake

manifold, leak at the throttle body, a faulty or incorrectly installed PCV valve, leaks at the intake manifold, etc.

- Throttle body – Check for sticking throttle plate. Also inspect the air passage for deposits or objects which will not allow the ETC position to fully extend or properly seat.

If DTC P0507 cannot be duplicated, reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0507 – Idle Air Control System High RPM

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Visually/physically inspect for the following conditions: ● Throttle body tampering. ● Restricted intake throttle system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. ● Throttle body: Check for objects blocking the throttle passage or throttle bore, excessive deposits in the throttle passage and on the throttle valve, and excessive deposits in the throttle bore and on the throttle plate. ● Throttle body with lever: Check for objects send round the throttle spring lever that lever is smooth movement, and spring lever has not excessive play Do any of the above require a repair?	—	Refer to *appropriate section for on-vehicle service*	Go to *Step 4*
3	Visually/physically inspect for the following conditions: ● Acceleration pedal tampering. ● Acceleration pedaL : Check for objects blocking the spring or pedal arm. ● Acceleration pedal : Check for objects move the acceleration pedal that pedal is smooth movement, and acceleration pedal arm has not excessive play. Do any of the above require a repair?	—	Refer to *appropriate section for on-vehicle service*	Go to *Step 4*
4	1. Check for a poor connection at the throttle body harness connector. 2. Check for a poor connection at the acceleration position sensor harness connector. 3. If a problem is found, replace faulty terminals as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
5	Check the following circuits for an open, short to voltage, short to ground, or poor connection at the PCM: ● Throttle position sensor 1 circuit. ● Throttle position sensor 2 circuit. ● Throttle DC motor circuit. ● Throttle position sensor resistance. ● Throttle DC motor resistance. ● If a problem is found, repair as necessary. Was a problem found?	Vcc-GND 1–7kΩ SIG-DND change resistance 0.3 – 100Ω	Verify repair	Go to *Step 6*

DTC P0507 – Idle Air Control System High RPM (Cont'd)

Step	Action	Value(s)	Yes	No
6	Replace the throttle valve. Is the action complete?	—	Go to *Step 3*	—
7	1. Check the following circuits for an open, short tovoltage, short to ground, or poor connection at the PCM: ● Acceleration position sensor 1 circuit. ● Acceleration position sensor 2 circuit. ● C position sensor 3 circuit. ● V position sensor resistance. 2. If a problem is found, repair as necessary. Was a problem found?	Vcc-GND 4–6kΩ SIG-DND change resistance	Verify repair	Go to *Step 8*
8	Replace the acceleration position sensor. Is the action complete?	—	Go to *Step 9*	—
9	Following below the DTCs stored: P1125, P1290, P1295, P1299	—	Go to *applicable DTC table*	Go to *Step 10*

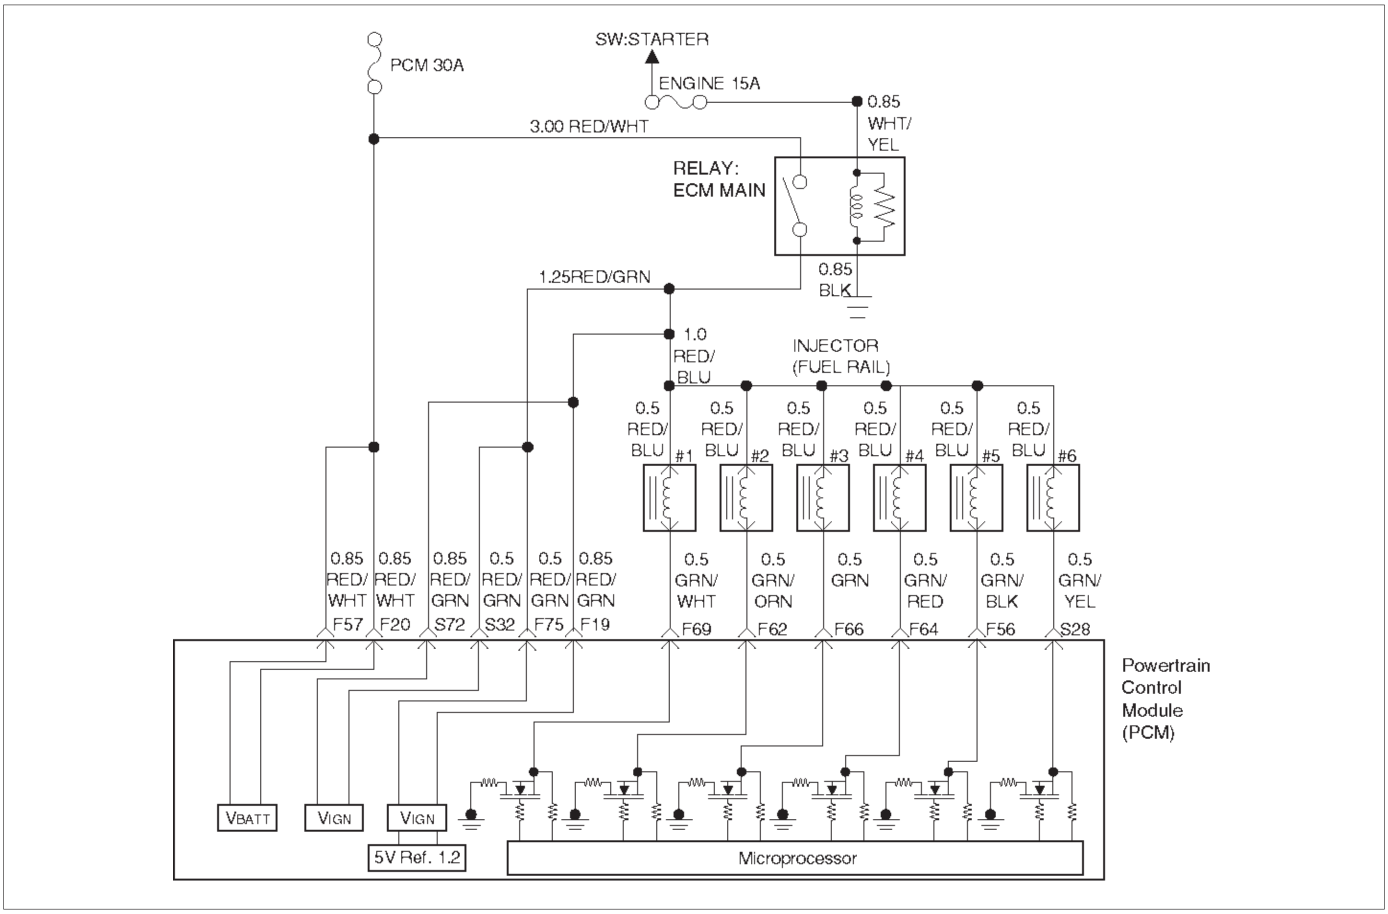
11	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. ANd also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0562 System Voltage Low



060RY00165

Circuit Description

The powertrain control module (PCM) monitors the system voltage on the ignition feed terminal to the PCM. A system voltage DTC will set whenever the voltage is below a calibrated value.

Conditions for Setting the DTC

- Ignition “ON.”
- System voltage is below 11.5 volts for 15 minutes.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store as Failure Records conditions which were present when the DTC was set. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P0562 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0562 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

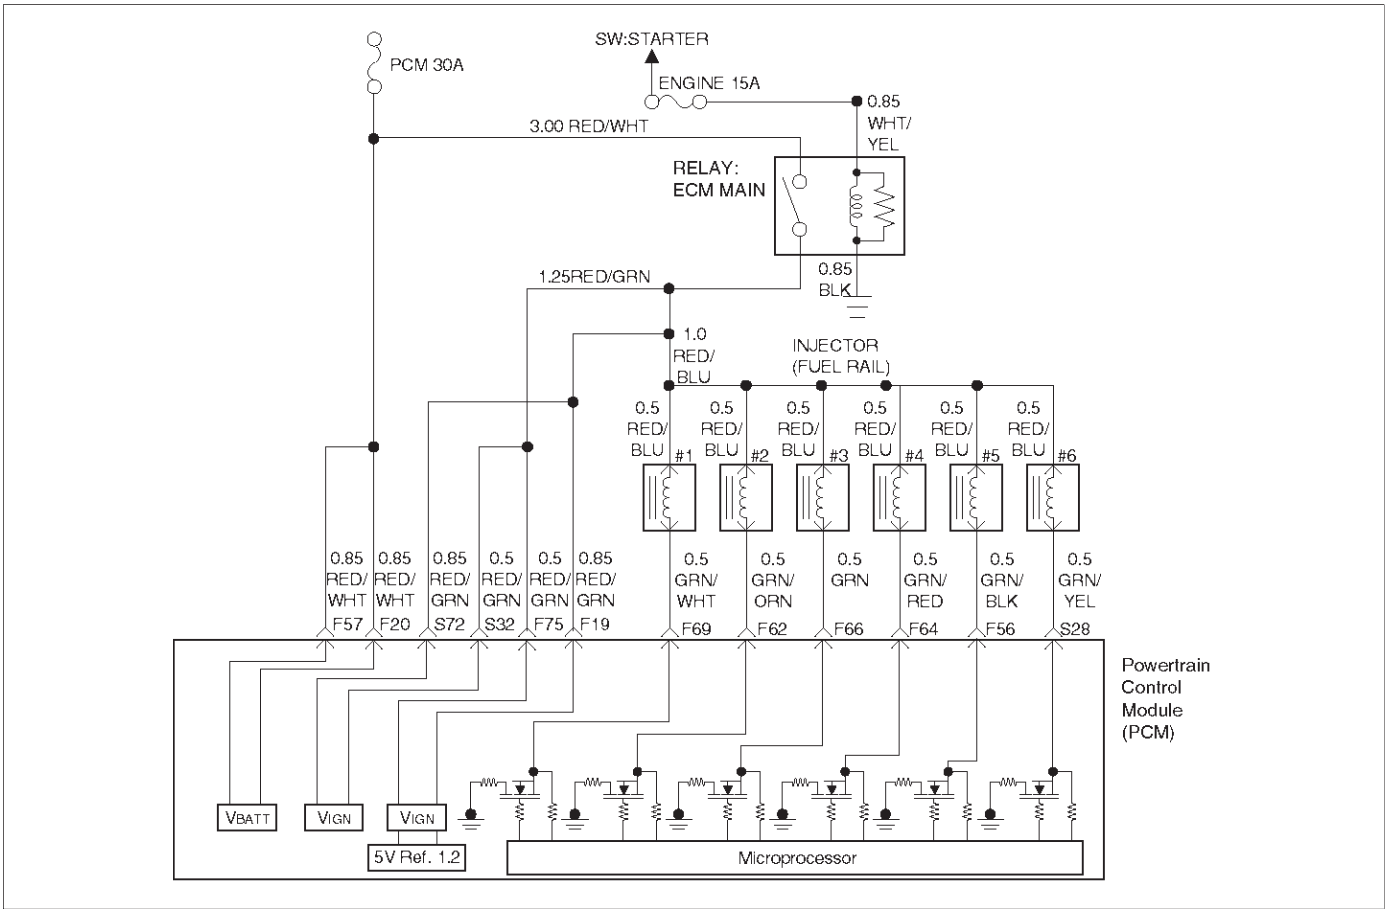
Diagnostic Aids

If the DTC sets when an accessory is operated, check for a poor connection or excessive current draw.

DTC P0562 – System Voltage Low

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Using a DVM, measure the battery voltage at the battery. Is the battery voltage greater than the specified value?	11.5 V	Go to *Step 3*	Charge battery, then go to *Step 3*
3	1. Install a Tech 2. 2. Select "Ignition Volts" on the Tech 2. 3. Start the engine and raise the engine speed to the specified value. 4. Load the electrical system by turning on the headlights, high blower, etc. Is the ignition voltage approximately equal to the specified value?	2000 RPM 12.8-14.1 V	Go to *Step 4*	Go to *Starting/Charging*
4	1. Ignition "OFF." 2. Disconnect the PCM connector at the PCM. 3. Using a DVM, measure the battery voltage at the PCM connector F-20 and F-57. Is it approximately equal to battery voltage?	—	Check for excessive current draw with ignition "OFF," engine "OFF."	Go to *Step 5*
5	1. Check for faulty connections at the PCM harness terminals. 2. Repair as necessary. Was a repair necessary?	—	Verify repair	Go to *Step 6*
6	Check for an open battery feed circuit to the PCM. Is the action complete?	—	Verify repair	Go to *Step 7*
7	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. ANd also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0563 System Voltage High



060RY00165

Circuit Description

The powertrain control module (PCM) monitors the system voltage on the ignition feed terminals to the PCM. A system voltage DTC will set whenever the voltage is above a calibrated value.

Conditions for Setting the DTC

- Ignition "ON."
- System voltage is above 16 volts for 15 minutes.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store as Failure Records only conditions which were present when the DTC was set. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P0563 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0563 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

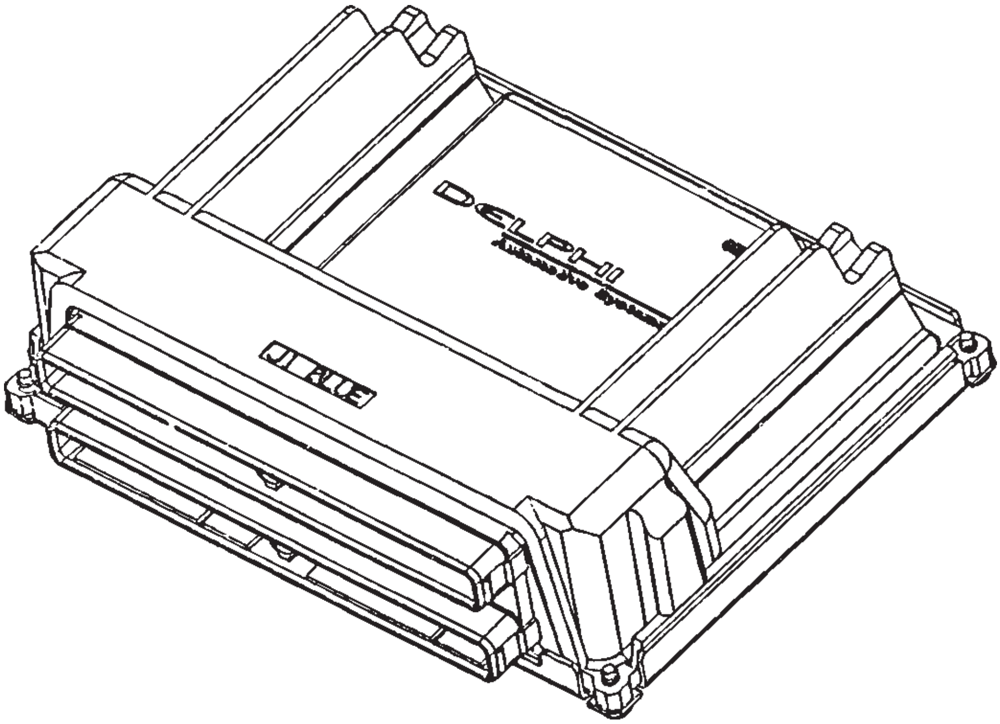
Diagnostic Aids

If the DTC sets when an accessory is operated, check for a poor connection or excessive current draw.

DTC P0563 – System Voltage High

Step	Action	Value(s)	Yes	No
1	Was the “ON-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Using a DVM, measure the battery voltage at the battery. Is the battery voltage less than the specified value?	11.5 V	Go to *Step 3*	Go to *Step 4*
3	1. Charge the battery and clean the battery terminals. 2. Clean the battery ground cable connection if corrosion is indicated. Is the battery voltage less than the specified value?	11.5 V	Replace battery	Go to *Step 4*
4	1. Turn “OFF” all the accessories. 2. Install a Tech 2. 3. Select the ignition voltage parameter on the Tech 2. 4. Start the engine and raise the engine RPM to the specified value. Is the voltage more than 2.5 volts greater than the measurement taken in step 2 or 3?	2000 RPM	Go to *Starting/Charging*	Go to *Step 5*
5	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. ANd also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0601 PCM Memory



060RY014

Circuit Description

The powertrain control module (PCM) used in this vehicle utilizes an electrically erasable programmable read-only memory (EEPROM). The EEPROM contains program information and the calibrations required for engine, transmission, and powertrain diagnostics operation.

Unlike the PROM used in past applications, the EEPROM is not replaceable. When the PCM is replaced or a calibration update is required, the PCM must be programmed using a Tech 2. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for the EEPROM programming procedure.

Conditions for Setting the DTC

- The PCM detects an internal program fault (check sum error).

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0601 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0601 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

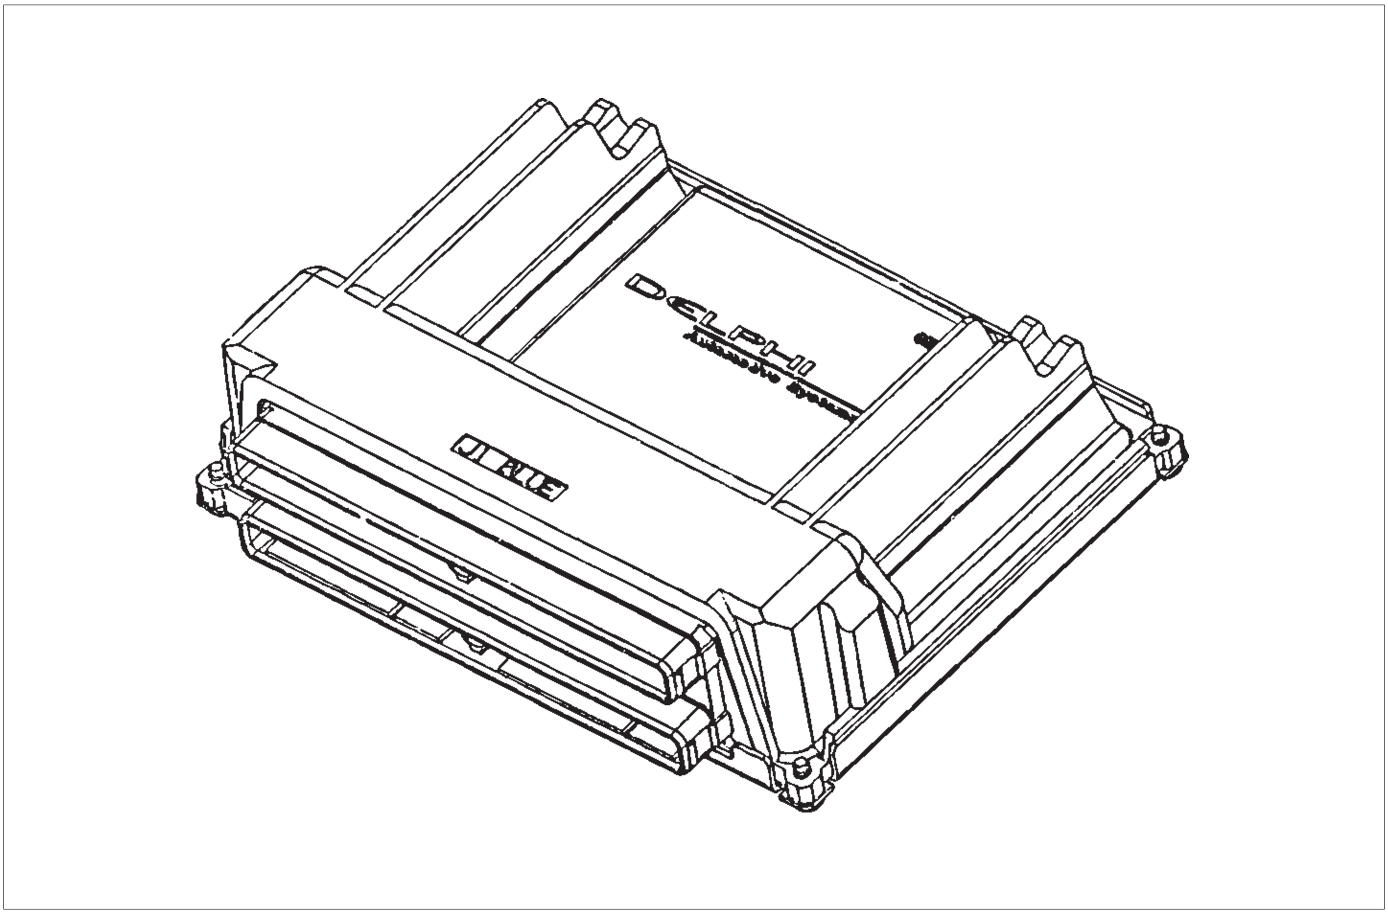
Diagnostic Aids

- DTC P0601 indicates that the contents of the EEPROM have changed since the PCM was programmed. The only possible repair is PCM replacement. Remember to program the replacement PCM with the correct software and calibration for the vehicle.

DTC P0601 – PCM Memory

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. ANd also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0602 PCM Programming Error



060RY014

Circuit Description

The powertrain control module (PCM) used Main CPU and Watchdog CPU software/calibration.

Conditions for Setting the DTC

- This code detects inconsistencies between Main CPU and Watchdog CPU software/calibration.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

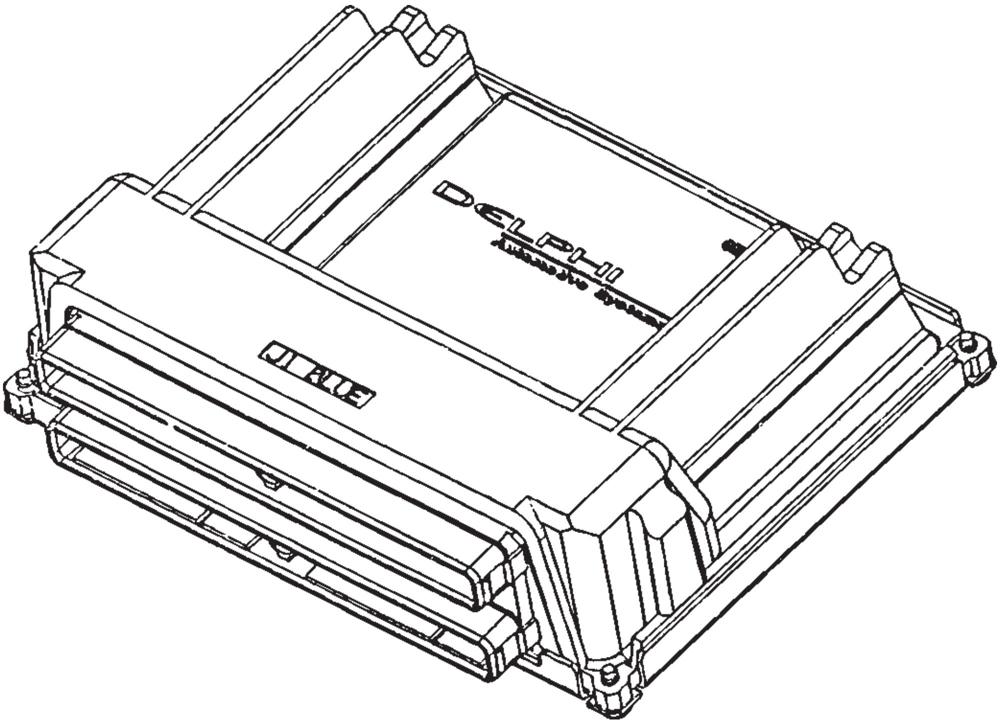
Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0602 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0602 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

DTC P0602 – PCM Programming Error

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. ANd also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0604 PCM RAM Error



060RY014

Circuit Description

The powertrain control module (PCM) used Main CPU RAM and Watchdog CPU RAM.

Conditions for Setting the DTC

- This code detects inconsistencies between Main CPU RAM and Watchdog CPU RAM.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

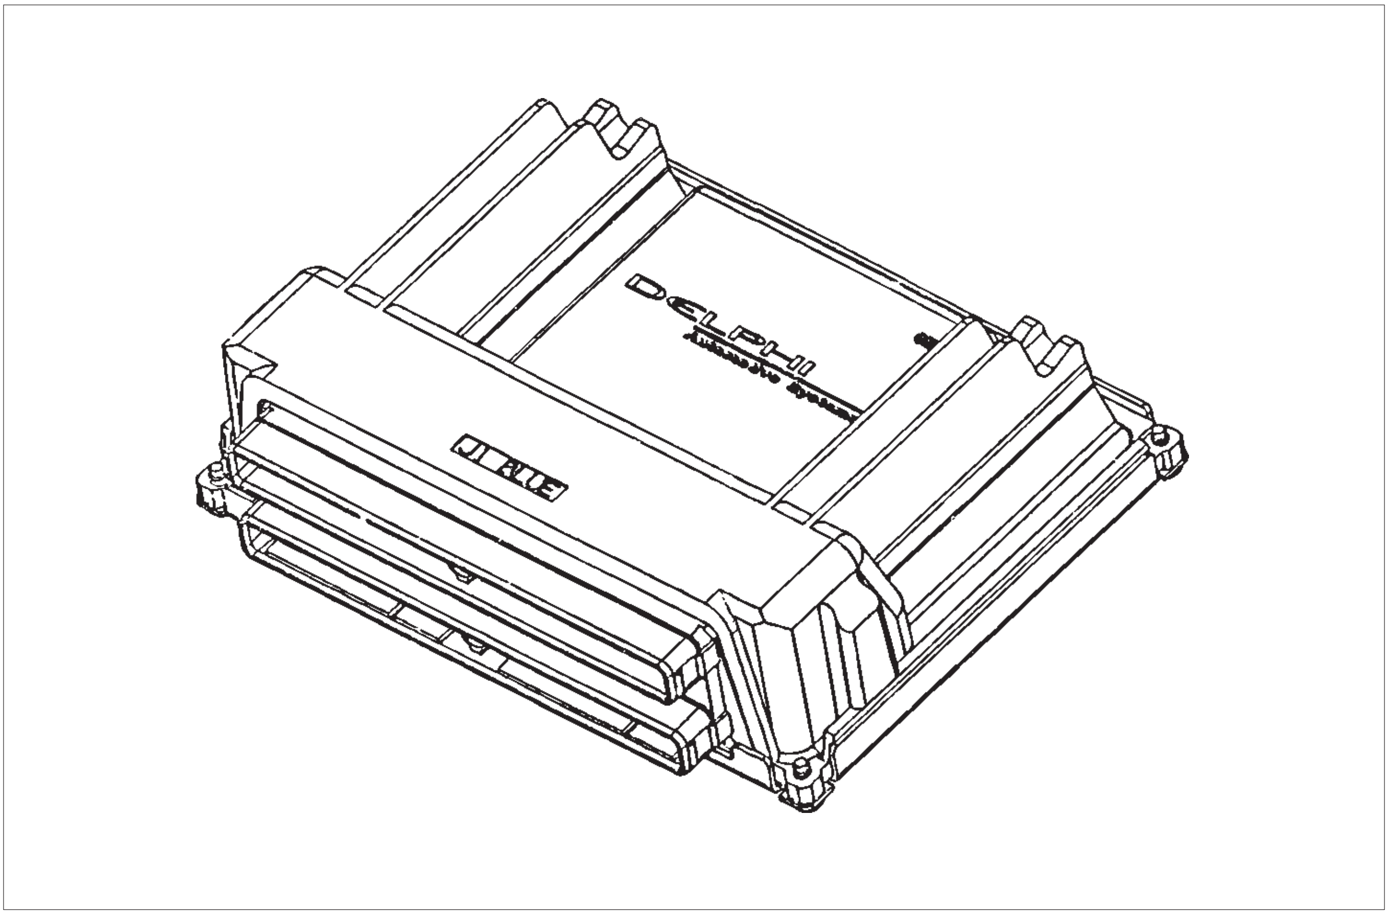
Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0604 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0604 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

DTC P0604 – PCM RAM Error

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. ANd also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0606 PCM Internal Performance



060RY014

Circuit Description

The input/output devices in the PCM include analog-to-digital converters, signal buffers, counters, and special drivers. The PCM controls most components with electronic switches which complete a ground circuit when turned “ON”. These switches are arranged in groups of 4 and 7, called either a surface-mounted quad driver module (QDM), which can independently control up to 4 output terminals, or QDMs which can independently control up to 7 outputs.

Conditions for Setting the DTC

- This code detects inconsistencies between Main CPU A/D converters and Watchdog CPU A/D converters.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

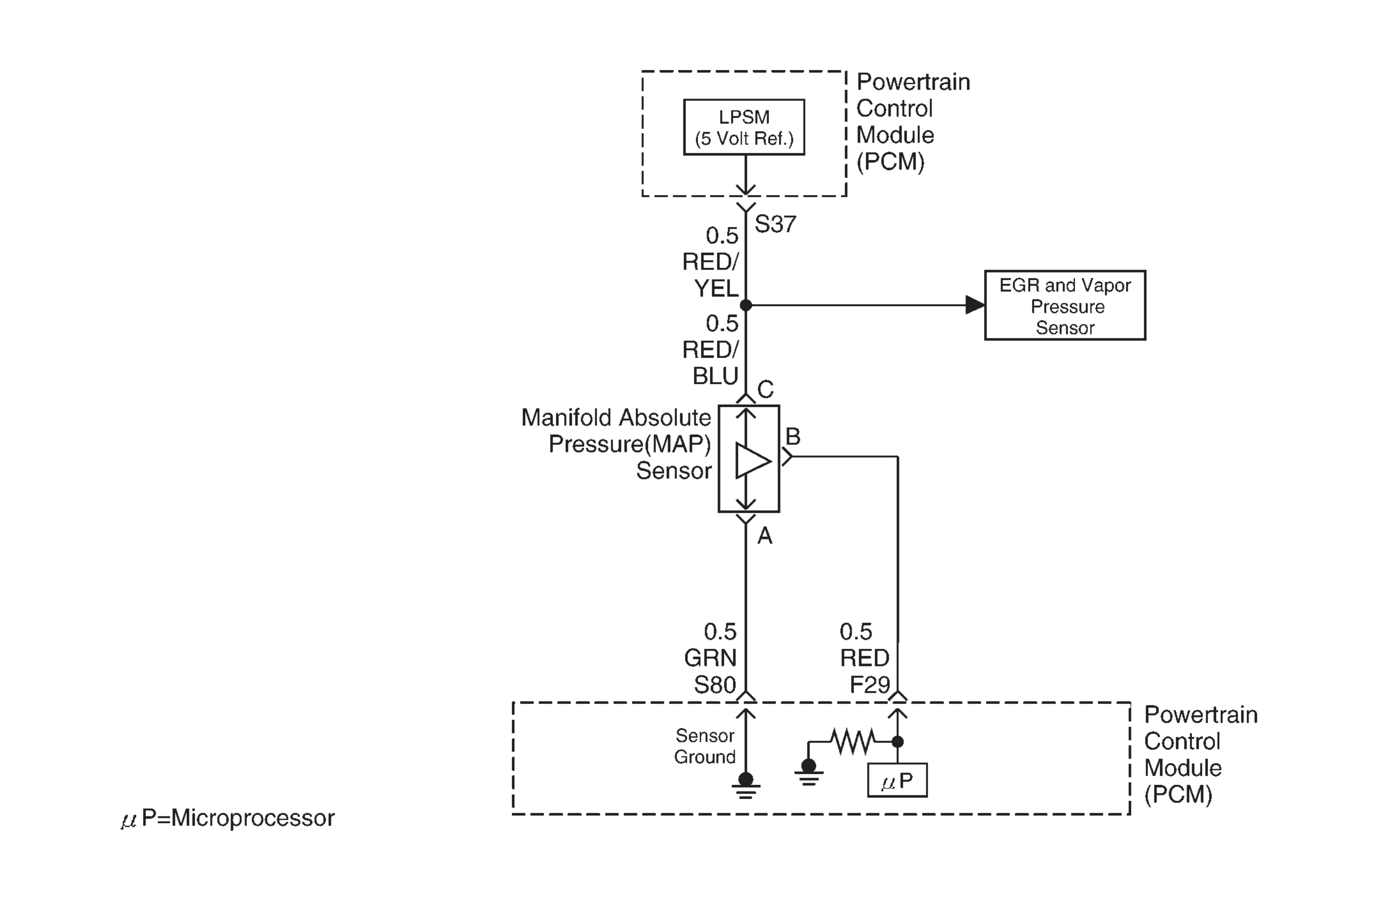
Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0606 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0606 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

DTC P0606 – PCM Internal Performance

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. ANd also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1106 MAP Sensor Circuit Intermittent High Voltage



Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the PCM varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition "ON," engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine manifold pressure changes while the liner EGR flow test diagnostic is being run (refer to *DTC P0401*), to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). The PCM compares the MAP sensor signal to a calculated MAP based on throttle position and various engine load factors. If the PCM detects a MAP signal that is intermittently above the calculated value, DTC P1106 will set.

Conditions for Setting the DTC

- No TP sensor DTCs are present.
- Engine is running for at least 10 seconds.
- Throttle angle is below 3% if engine speed is below 1000 RPM.
- Throttle angle is below 10% if engine speed is above 1000 RPM.
- The MAP sensor indicates an intermittent manifold absolute pressure above 80 kPa for a total of approximately 5 seconds over a 16-second period of time.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1106 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1106 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Leaking or plugged vacuum supply line to the MAP sensor.
- Inspect PCM harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Inspect the wiring harness for damage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often

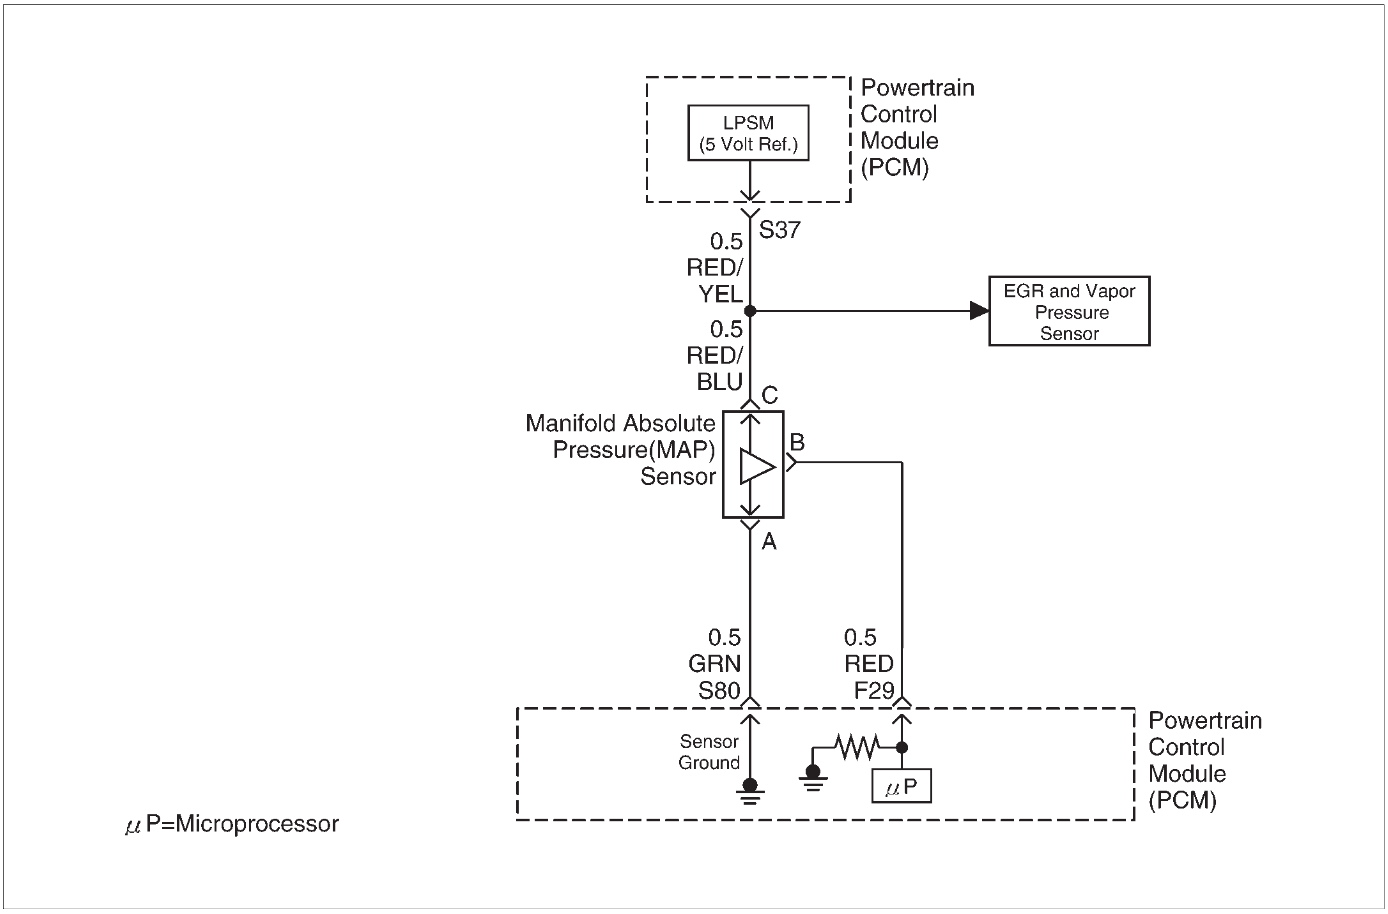
the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

- The MAP sensor shares a 5 Volt Reference with the Fuel Tank Pressure sensor. Check the 5 Volt reference if this DTC is also set.
- The MAP sensor shares a ground with the Fuel Tank Pressure sensor and the ECT Sensor. Check the ground if these other DTCs are also set.

DTC P1106 – MAP Sensor Circuit Intermittent High Voltage

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Is DTC P0108 also set?	—	Go to *DTC P0108* chart first	Go to *Step 3*
3	Are DTC P1111, P1115, and/or P1120 also set?	—	Go to *Step 6*	Go to *Step 4*
4	Check for a poor sensor ground circuit terminal connection at the MAP sensor. Was a problem found?	—	Go to *Step 9*	Go to *Step 5*
5	Check the MAP signal circuit between the MAP sensor connector and the PCM for an intermittent short to voltage. Was a problem found?	—	Go to *Step 10*	Go to *Step 8*
6	Check for an intermittent short to voltage on the 5 volt reference circuit between the PCM and the following components: ● MAP sensor ● EGR valve ● TP sensor Was a problem found?	—	Go to *Step 10*	Go to *Step 7*
7	Check for a poor sensor ground circuit terminal connection at the PCM. Was a problem found?	—	Go to *Step 9*	Go to *Step 8*
8	Check for an intermittent open or a faulty splice in the sensor ground circuit. Was a problem found?	—	Go to *Step 10*	Refer to *Diagnostic Aids*
9	Replace the faulty harness connector terminal for the sensor ground circuit. Is the action complete?	—	Verify repair	—
10	Locate and repair the intermittent open/short circuit in the wiring harness as necessary. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1107 MAP Circuit Intermittent Low Voltage



D06RY00165

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the powertrain control module (PCM) varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition "ON," engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine manifold pressure changes while the linear EGR flow test diagnostic is being run (refer to *DTC P0401*), to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). The PCM compares the MAP sensor signal to a calculated MAP based on throttle position and various engine load factors. If the PCM detects a MAP signal that is intermittently below the calculated value, DTC P1107 will be set.

Conditions for Setting the DTC

- No TP sensor DTCs are present.
- Engine is running.
- Ignition voltage is more than 11 volts.
- Throttle angle is above 1% if engine speed is less than 1000 RPM.
- Throttle angle is above 2% if engine speed is above 1000 RPM.
- The MAP sensor indicates an intermittent manifold absolute pressure below 11 kPa for a total of approximately 5 seconds over a 16-second period of time.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1107 will Clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1107 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- The MAP Sensor shares a 5 Volt reference with the EGR Valve. If these codes are also set, it could indicate a problem with the 5 Volt reference circuit or components itself.
- The MAP Sensor share a ground with the EGR Valve and the IAT Sensor.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors

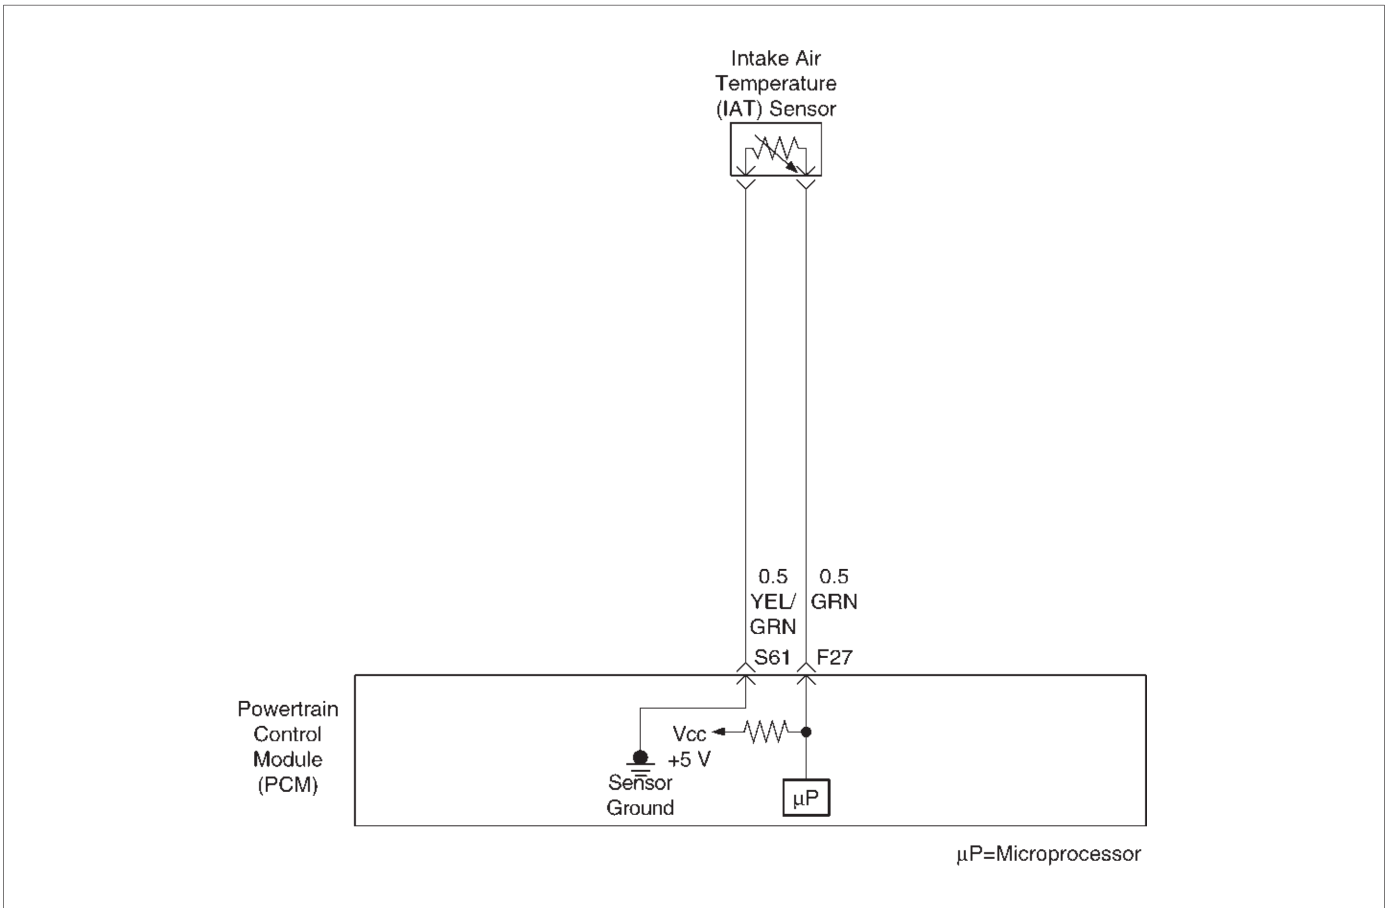
and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P1107 – MAP Sensor Circuit Intermittent Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Is DTC P0107 also set?	—	Go to *DTC P0107* chart first	Go to *Step 3*
3	Check for a poor 5 volt reference circuit or MAP signal circuit terminal connection at the MAP sensor. Was a problem found?	—	Go to *Step 8*	Go to *Step 4*
4	Check the MAP signal circuit between the MAP sensor connector and the PCM for an intermittent open or short to ground. Was a problem found?	—	Go to *Step 9*	Go to *Step 7*
5	Check for an intermittent short to ground on the 5 volt reference circuit between the PCM and the following components: • MAP sensor • EGR valve • TP sensor Was a problem found?	—	Go to *Step 9*	Go to *Step 6*
6	Check for a poor 5 volt reference terminal connection at the PCM. Was a problem found?	—	Go to *Step 8*	Go to *Step 7*
7	Check for an intermittent open or a faulty splice in the 5 volt reference circuit. Was a problem found? (If no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to *Step 9*	Refer to *Diagnostic Aids*
8	Replace the faulty harness connector terminal(s) for the 5 volt reference circuit and/or the MAP signal circuit as necessary. Is the action complete?	—	Verify repair	—
9	Repair intermittent open/short circuit in the wiring harness as necessary. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1111 IAT Sensor Circuit Intermittent High Voltage



D06RY00147

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The powertrain control module (PCM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the PCM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower causing the PCM to monitor a lower voltage. DTC P1111 will set when the PCM intermittently detects an excessively high signal voltage on the intake air temperature sensor signal circuit.

Conditions for Setting the DTC

- The engine has been running for over 4 minutes.
- Vehicle speed is less than 32 km/h (20 mph).
- Engine coolant temperature is above 60°C (140°F).
- Mass air flow is less than 20g/second.
- IAT signal voltage indicates and intake air temperature intermittently less than –39°C (–38°F) (about 5 volts) for approximately 2.5 seconds over a 25-second period of time.

Action Taken When the DTC Sets

- The PCM will substitute a default value for intake air temperature.
- The PCM will store conditions which were present when the DTC set as Failure Records data only. This information will not be stored as Freeze Frame data.
- DTC P1111 does not illuminate the MIL.

Conditions for Clearing the MIL/DTC

- A history DTC P1111 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1111 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM –Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

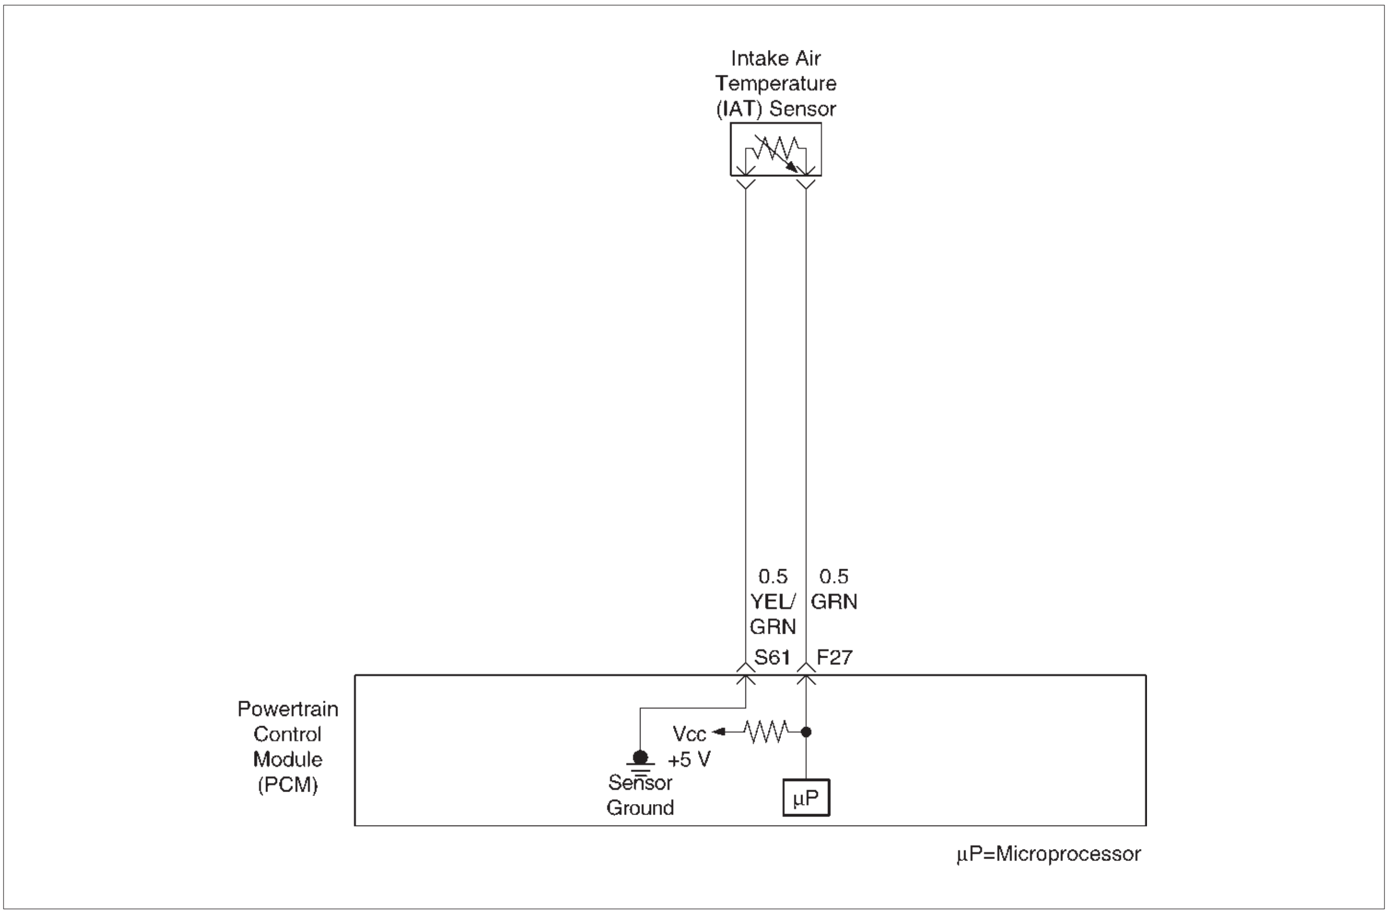
Diagnostic Trouble Code (DTC)
P1112 IAT Sensor Circuit Intermittent Low Voltage



Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The powertrain control module (PCM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the PCM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance becomes lower, causing the PCM to monitor a lower voltage. DTC P1112 will set when the PCM intermittently detects an excessively low signal voltage on the intake air temperature sensor signal circuit.

Conditions for Setting the DTC

- The engine has been running for over 2 minutes.
- Vehicle speed is greater than 48 km/h (30 mph).
- IAT signal voltage is greater than 148°C (298°F) (about 0.10 volt) for a total of 2.5 seconds over a 25-second period of time.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records data only. This information will not be stored as Freeze Frame data.
- The PCM will substitute a default value for intake air temperature.

Conditions for Clearing the MIL/DTC

- A history DTC P1112 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1112 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Verifies that the fault is present.
3. If DTC P1112 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Value Chart." The chart may be used to test the IAT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be shorted above or below a certain temperature. If this is the case, replace the IAT sensor.

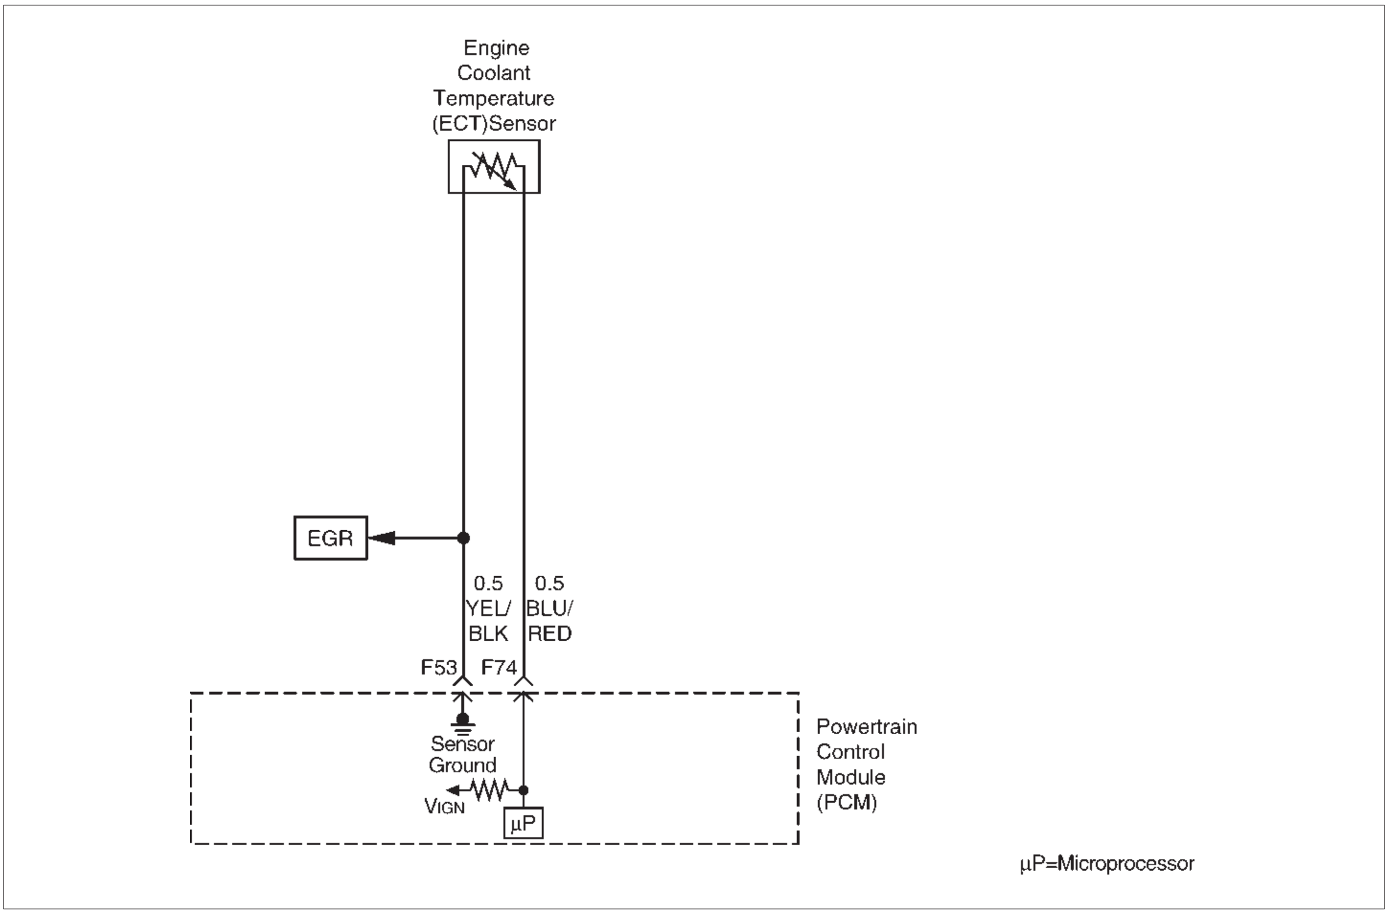
Diagnostic Trouble Code (DTC) P1114 ECT Sensor Circuit Intermittent Low Voltage



D06RY00148

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in the engine coolant stream. The powertrain control module (PCM) applies a voltage (about 5.0 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the PCM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes less, and the ECT signal voltage measured at the PCM drops. With a fully warmed up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts. If the PCM detects an ECT signal that is intermittently below the range of the ECT sensor, DTC P1114 will set.

Conditions for Setting the DTC

- Engine run time longer than 60 seconds.
- The ECT sensor signal is intermittently greater than 150°C (302°F) (about 0.10 volt) for a total of 10 seconds over a 100-second period.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1114 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1114 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often

the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

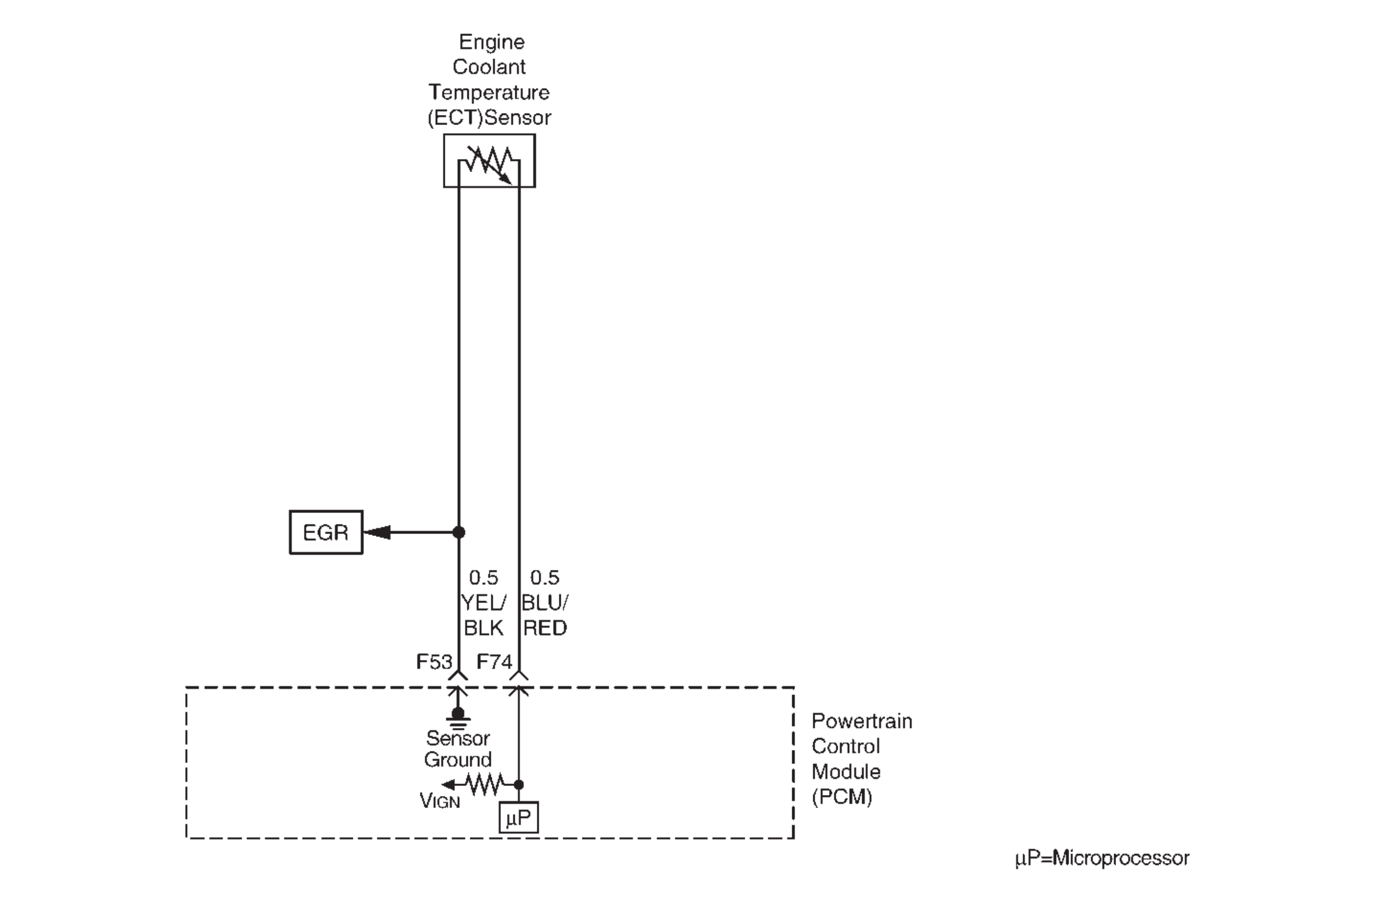
Diagnostic Trouble Code (DTC)
P1115 ECT Sensor Circuit Intermittent High Voltage



D06RY00148

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in the engine coolant stream. The powertrain control module (PCM) applies a voltage (about 5.0 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the PCM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes less, and the ECT signal voltage measured at the PCM drops. With a fully warmed up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts. If the PCM detects an ECT signal that is intermittently above the range of the ECT sensor, DTC P1115 will set.

Conditions for Setting the DTC

- Engine running time longer than 90 seconds.
- The ECT sensor signal is intermittently greater than –39°C (–38°F) (about 5 volts) for a total of 10 seconds over a 100-second period.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1115 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1115 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often

the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

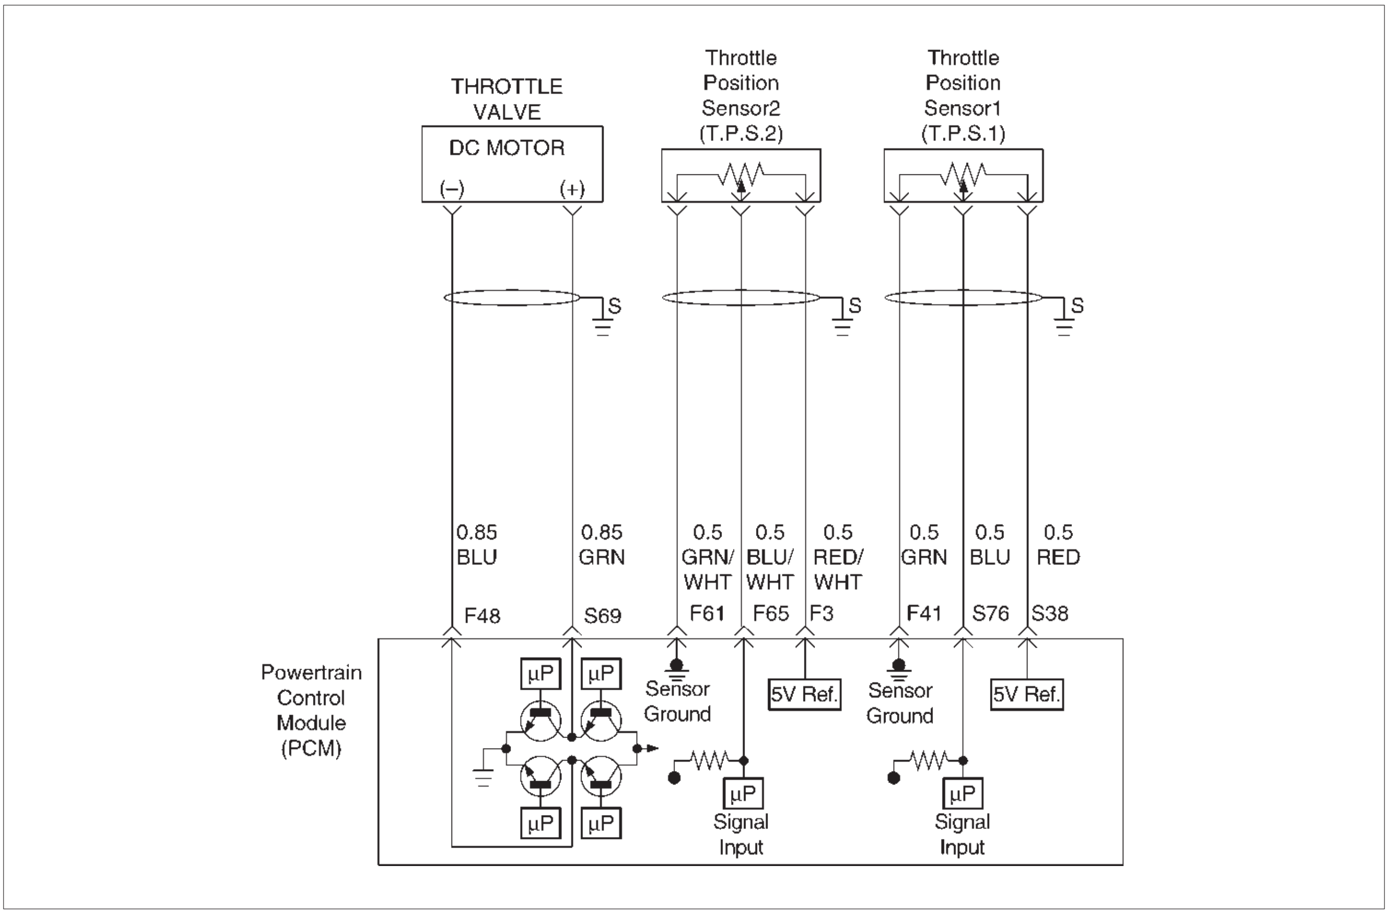
P1120-TPS 1 Throttle Position Sensor (TPS1) Circuit Fault



D06RY00111

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle blade angle.

  The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle(WOT).

  This code detects a continuous short to ground or high in either the cicuit or the sensor.

Conditions for setting the DTC

- The Ignition is “ON”.
- The throttle blade angle is less than 2.5 % or more tnan 97.5 % for 18 failres within 500 test samples (15.6m sec)

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A histror DTC P1120 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1120 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK,observe the TPS 1 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault.

  If DTC P1120 cannot be duplicated,the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC P1120 Diagnostic Chart may isolate the cause of the fault.

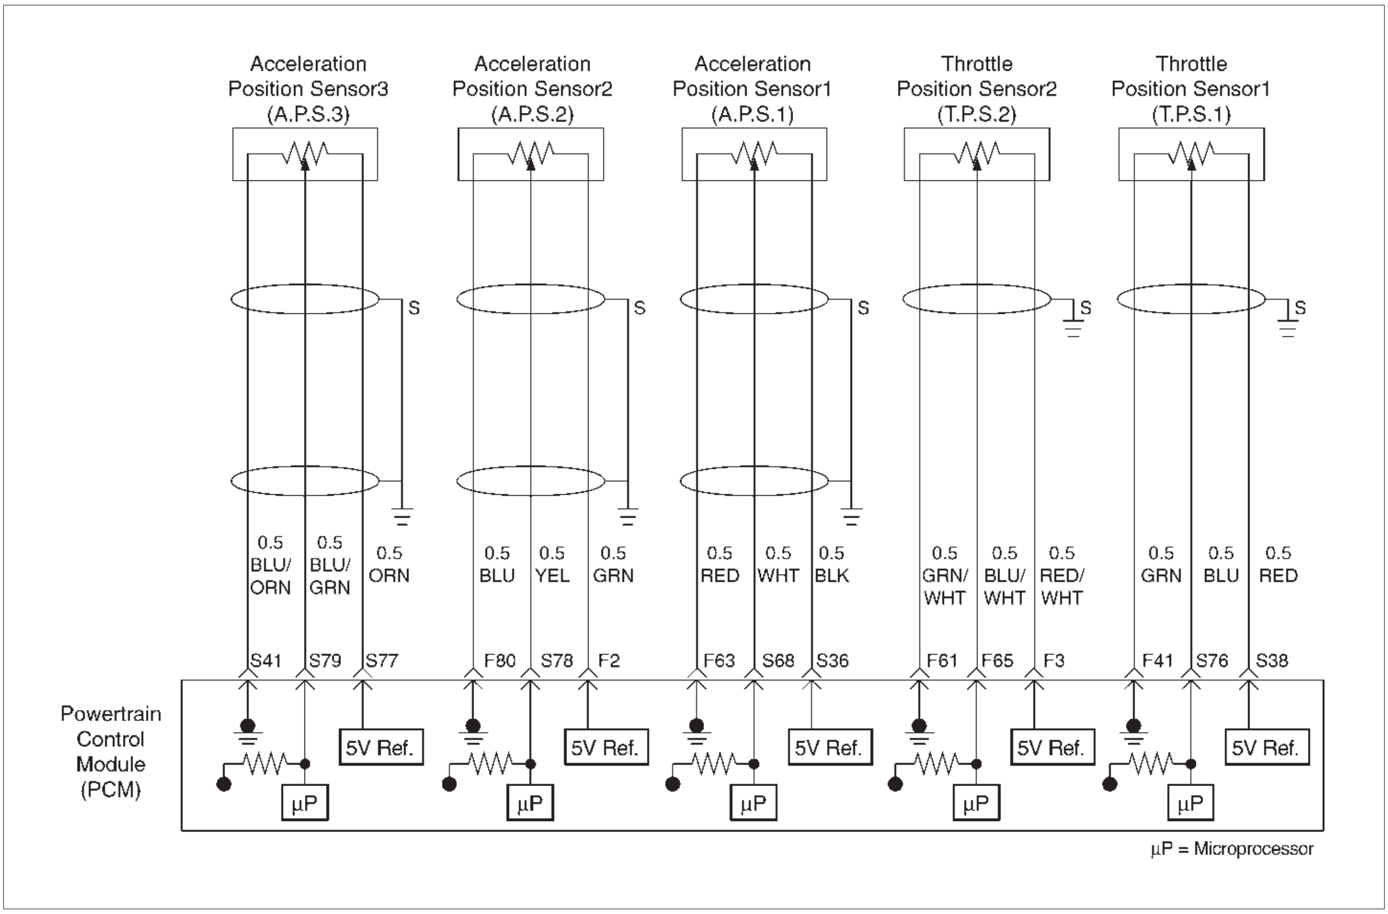
Diagnostic Trouble Code(DTC)P1120-TPS 1 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board(OBD)System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON”, engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65kPa	Go to *Step 3*	Go to *Step 6*
3	1. Disconnect the MAP sensor. 2. Connect a test 5 volt reference circuit and the MAP signal at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value? (If no, start with diagnosis chart forother sensors in the circuit and see if 5V returns.)	—	Go to *Step 5*	Go to *Step 4*
4	1. Check the MAP signal circuit between the PCM and MAP grund circuit. 2. If the MAP signal circuit is open or shoted, repair it as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to *Step 12*
5	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
6	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle =8 % Wide open throttle =92 %	Refer to *Diagnostic Aids*	Go to *Step 7*
7	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0V	Go to *Step 8*	Go to *Step 9*
8	1. Connect a test light between the 5Volt reference circuit and the TP sensor signal circuit at the TPsensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to *Step 11*	Go to *Step 10*
9	Check the following items; 1. TP1 signal circuit for a short to voltage. 2. TP1 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1 sensor ground circuit for a poor connection. 4. If a problem is found,repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*

Diagnostic Trouble Code(DTC)P1120-TPS 1 Circuit Fault (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items; 1. TP signal circuit or 5 volt reference circuit for a poor connection. 2. TP signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
11	Replace the TP sensor. Is the action complete?	—	Verify repair	—
12	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1125 ETC (Electric throttle control) Limit Performance Mode



D06RY00163

Circuit Description

- The acceleration position (AP1) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle will vary about 13 % at idle position to about 87 % at wide open throttle (WOT).

  This code detects if the system is in Limit Performance Mode (Fail safe Mode) and Multiple DTCs performance Mode.

Conditions for setting the DTC

- The Ignition is " ON".
- Limit Performance Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1125 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1125 can be cleared using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the APP sensor 1, APP sensor 2, APP sensor 3 display on the Tech 2 While moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault.

  If DTC P1125 cannot be duplicated,the information includedin the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently,performing the DTC P1125 Diagnostic Chart may isolate the cause of the fault.

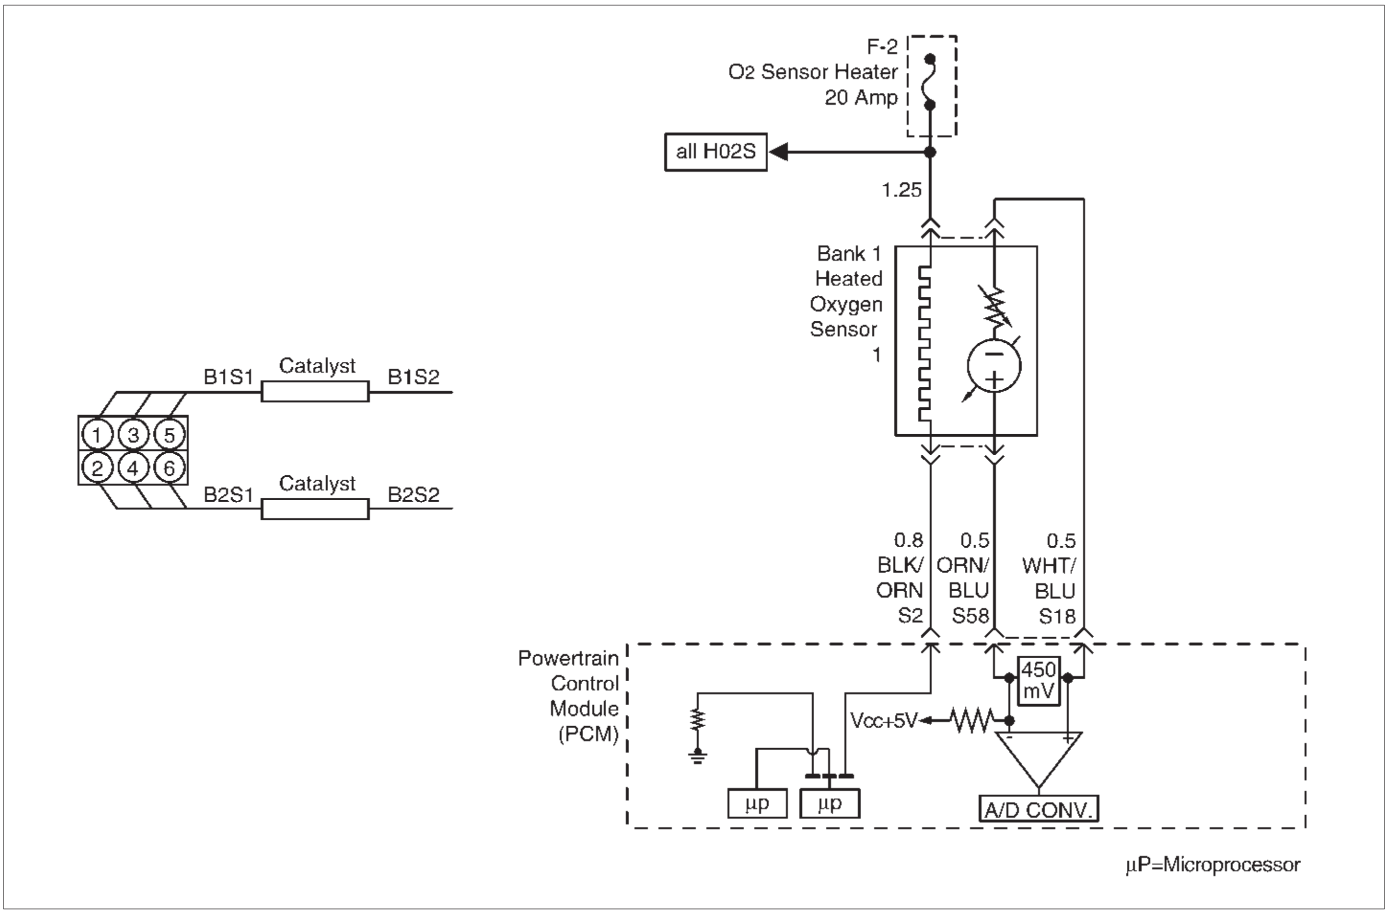
DTC P1125 – ETC Limit Performance Model

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Chcek" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	Observe the AP angle reading on the Tech 2 while slowly opening the throttle. Does the AP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Idle position APP sensor 1 =13 % APP sensor 2, 3 =85 ~ 89 % open throttle APP sensor 1 =85 ~ 89 % APP sensor 2 =11 ~ 15 %	Refer to *Diagnostic Aids*	Go to *Step 4*
4	1. Disconnect the AP sensor. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	0V	Go to *Step 5*	Go to *Step 6*
5	1. Connect a test light between the 5 Voltge supply circuit and the AP1, AP2 AND AP3 sensor signal circuit at the AP sensor harness connector. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	5V	Go to *Step 7*	Go to *Step 8*
6	Check the following items; 1. AP1, AP2 or AP3 signal circuit for a short to voltage. 2. AP1, AP2 or AP3 sensor ground circuit for high resistance between the PCM and the AP sensor. 3. AP1, AP2 or AP3 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
7	Check the following items; 1. AP1, AP2 or AP3 signal circuit or 5 volge supply circuit for a poor connection. 2. AP1, AP2 or AP3 signal circuit or 5 volge supply circuit for high resistance between the PCM and the AP1, AP2 or AP3 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*

DTC P1125 – ETC Limit Performance Model (Cont'd)

Step	Action	Value(s)	Yes	No
8	Replace the AP sensor. Is the action complete?	—	Verify repair	—
9	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed.Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1133 HO2S Insufficient Switching Bank 1 Sensor 1



D06RY00135

Circuit Description

The powertrain control module (PCM) monitors the heated oxygen sensor (HO2S) activity for 90 seconds after “closed loop” and stoichiometric operation have been enabled. During this test period the PCM counts the number of times that the HO2S signal voltage crosses the rich-to-lean and lean-to-rich threshold. If the PCM determines that the HO2S did not switch enough times, DTC P1133 will be set.

A lean-to-rich switch is determined when the HO2S voltage changes above and below 450 mV.

Heated oxygen sensors are used to minimize the amount of time required for “closed loop” fuel control operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors Bank 1 HO2S 1 and Bank 2 HO2S 1 to become active. Oxygen sensor heaters are required by post-catalyst monitor sensors to maintain a sufficiently high temperature for accurate exhaust oxygen content readings further from the engine.

Conditions for Setting the DTC

- Engine coolant temperature (ECT) is above 50°C (122°F) for automatic transmission; 75°C (167°F) for manual transmission.
- Engine is operating in “closed loop”.
- The engine has been running at least one minute.
- Canister purge duty cycle is greater than 2%.
- Engine speed is between 1500 RPM and 3000 RPM.
- Mass air flow (MAF) is between 9 g/second and 42 g/second.
- Above conditions are present for 3 seconds.
- 90 seconds after “closed loop” and stoichiometric operation have been achieved, the PCM monitors the oxygen sensor as it switches above and below 450 mV. If fewer than 23 rich-to-lean and lean-to-rich switches are detected, DTC P1133 will be set.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- ”Open loop” fuel control will be in effect.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1133 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1133 can be cleared by using Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

A malfunction in the HO2S heater ignition feed or ground circuit may cause a DTC P1133 to set. Check HO2S heater circuitry for intermittent faults or poor connections. If connections and wiring are OK and DTC P1133 continues to set, replace the Bank 1 HO2S 1.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help to determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. A condition that affects other heated oxygen sensors indicates probable contamination. To avoid damaging the replacement sensors, correct the condition which caused the contamination before replacing the affected sensors.
5. This step checks for conditions which may cause the heated oxygen sensor to appear faulty. Correct any of the described conditions if present.
11. To avoid damaging replacement sensors, correct the condition which caused the contamination before replacing the affected sensors.

DTC P1133 – HO2S Insufficient Switching Bank 1 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	**IMPORTANT:** If any DTCs are set (except P1153 or P1154) refer to those DTCs before proceeding with this diagnostic chart. 1. Engine idling at operating temperature. 2. Operating the vehicle within parameters specified under “Conditions for Setting the DTC” criteria included in Diagnostic Support. 3. Using a Tech 2, monitor “DTC” info for DTC P1133 until the DTC P1133 test runs. 4. Note the test result. Does the Tech 2 indicate DTC P1133 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Did the Tech 2 also indicate that the P1153 or P1154 tests failed?	—	Go to *Step 20*	Go to *Step 4*
4	Check for leaks at the exhaust pipe joints. Are the joints leaking?	—	Go to *Step 5*	Go to *Step 6*
5	Tighten the bolt/nuts at the leaking joints. Is your action complete?	—	Go to *Step 2*	—
6	Check for gaskets that are damaged or improperly installed. Are there damaged or misaligned gaskets?	—	Go to *Step 7*	Go to *Step 8*
7	1. Replace the damaged gaskets. 2. Align the connections. 3. Tighten the connections. Is your action complete?	—	Go to *Step 2*	—
8	Check for loose exhaust flange connections. Are the flange connections loose?	—	Go to *Step 9*	Go to *Step 10*
9	Tighten the stud nuts or bolts to specifications. Is your action complete?	—	Go to *Step 2*	—
10	Check for burned or corroded exhaust pipes. Are the exhaust pipes burned or corroded?	—	Go to *Step 11*	Go to *Step 12*

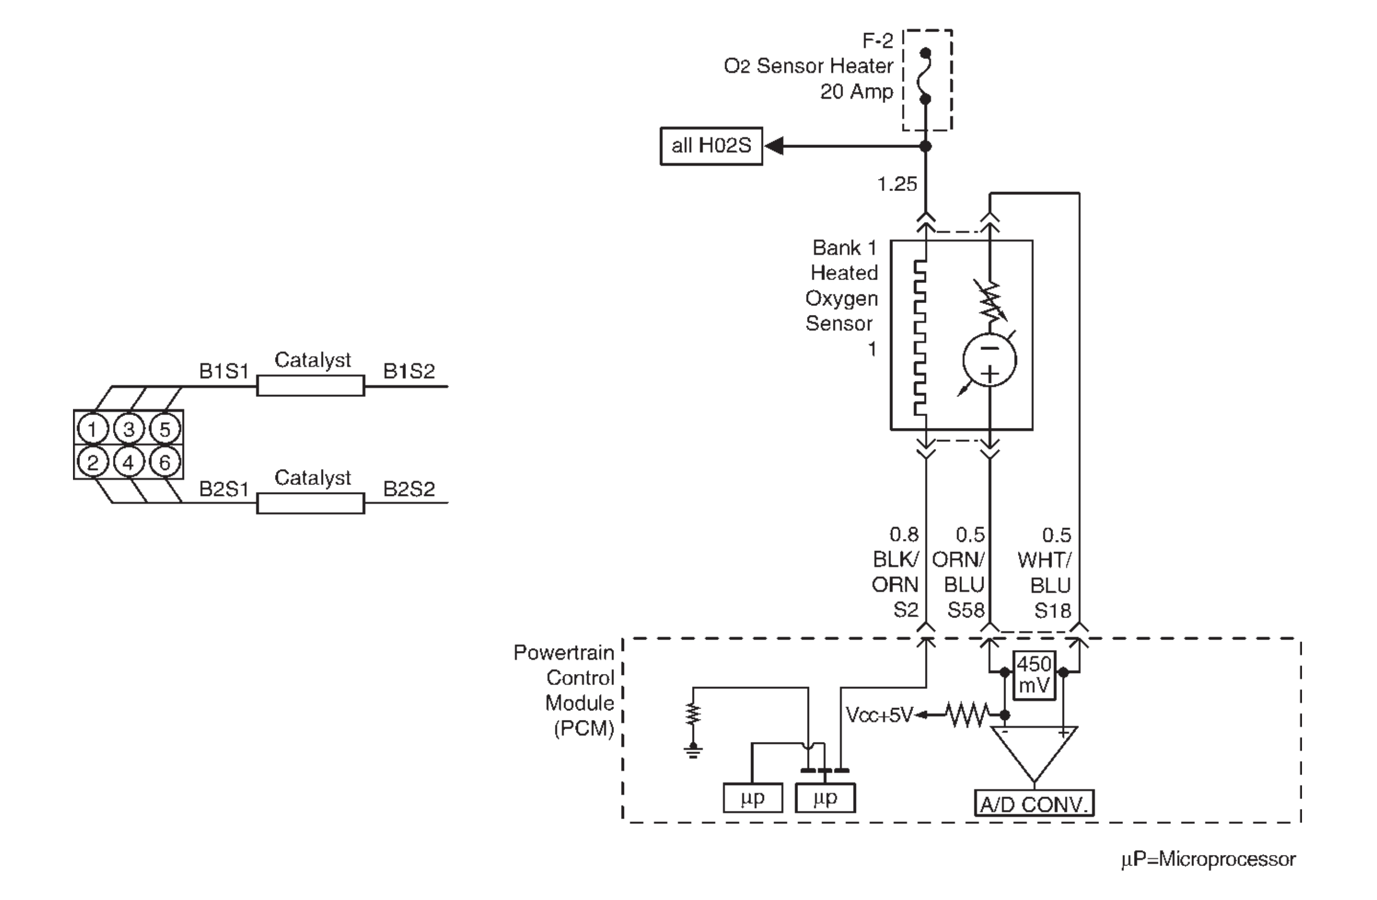
DTC P1133 – HO2S Insufficient Switching Bank 1 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
11	Replace the exhaust pipes, as required. Is your action complete?	—	Go to *Step 2*	—
12	Check for leaks at the exhaust manifold. Are there leaks at the exhaust manifold?	—	Go to *Step 13*	Go to *Step 14*
13	Tighten the bolts to specifications or replace the manifold if necessary. Is your action complete?	—	Go to *Step 2*	—
14	Visually/physically inspect the following items: • Ensure that the Bank 1 HO2S 1 is securely installed. • Check for corrosion on the terminals. • Check the terminals at Bank 1 HO2S 1 and at the PCM. • Check for damaged wiring. Was a problem found in any of the above areas?	—	Verify repair	Go to *Step 15*
15	1. Disconnect Bank 1 HO2S 1. 2. Ignition "ON." 3. Using a DVM at the PCM side of the connector, check the voltage between the high signal circuit and ground. Also measure between the low signal circuit and ground. Are both voltages in the specified range?	3-4 mV	Go to *Step 18*	Go to *Step 16*
16	1. Ignition "OFF." 2. Check for damage to PCM pins or terminals. Was a problem found.	—	Verify repair	Go to *Step 17*
17	Check for a short to voltage or ground or an open in the signal circuit. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Ignition "OFF." 2. Disconnect the PCM connector. 3. With the HO2S disconnected, check for high and low signal circuits shorted together between the PCM and HO2S. Was a problem found?	—	Verify repair	Go to *Step 19*
19	With the PCM connected and Bank 1 HO2S 1 disconnected from the harness, check Bank 1 HO2S 1 with a Tech 2. Is the voltage in the specified range?	425-475 mV	Go to *Step 21*	Go to *Step 22*
20	Replace the affected heated oxygen sensors. NOTE: Before replacing the sensors, the cause of the contamination must be determined and corrected. • Fuel contamination • Use of improper RTV sealant. • Engine oil/coolant consumption. Is the action complete?	—	Verify repair	—

DTC P1133 – HO2S Insufficient Switching Bank 1 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
21	Replace Bank 1 HO2S 1. Is the action complete?	—	Verify repair	—
22	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action compete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1134 HO2S Transition Time Ratio Bank 1 Sensor 1



D06RY00135

Circuit Description

The powertrain control module (PCM) monitors the heated oxygen sensor (HO2S) activity for 90 seconds after “closed loop” and stoichiometric operation have been established. During the monitoring period the PCM counts the number of times that the HO2S responds from rich-to-lean and from lean-to-rich and adds the amount of time it took to complete all transitions. With this information, an average time for all transitions can be determined. The PCM then divides the rich-to-lean average by the lean-to-rich average to obtain a ratio. If the HO2S transition time ratio is not within this range, DTC P1134 will be set, indicating that the oxygen sensor is not responding as expected to changes in exhaust oxygen content.

Conditions for Setting the DTC

- No related DTCs.
- Engine coolant temperature (ECT) is above 50˚C (122˚F) for automatic transmission; 75˚C (167˚F) for manual transmission.
- Engine is operating in “closed loop.”
- The engine has been running at least one minute.
- Canister purge duty cycle is greater than 2%.
- Engine speed is between 1500 RPM and 3000 RPM.
- Mass air flow (MAF) is between 9 g/second and 42 g/second.
- Above conditions are present for a 3-second monitoring period.
- 90 seconds after “closed loop” and stoichiometric operation have been enabled, Bank 1 HO2S 1 transition ratio between lean-to-rich and rich-to-lean is less than 0.44 or greater than 3.8.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after second consecutive trip in which the fault is detected.
- ”Open loop” fuel control will be in effect.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1134 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1134 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

A malfunction in the HO2S heater ignition feed or ground circuit may cause a DTC P1134 to set. Check HO2S heater circuitry for intermittent faults or poor connections. If connections and wiring are OK and DTC P1134 continues to set, replace the Bank 1 HO2S 1.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. A condition that affects other heated oxygen sensors indicates probable contamination. To avoid damaging replacement sensors, correct the condition which caused the contamination before replacing the affected sensors.
5. This step checks for conditions which may cause the heated oxygen sensor to appear faulty. Correct any of the described conditions if present.
8. To avoid damaging replacement sensors, correct the condition which caused the contamination before replacing the affected sensors.

DTC P1134 – HO2S Transition Time Ratio Bank 1 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	**IMPORTANT:** If any DTCs are set (except P1153 and/or P1154), refer to those DTCs before proceeding with this diagnostic chart. 1. Idle the engine at operating temperature. 2. Operate the vehicle within parameters specified under “Conditions for Setting the DTC” criteria included in Diagnostic Support. 3. Using a Tech 2, monitor “DTC” info for DTC P1134 until the DTC P1134 test runs. 4. Note the test result. Does Tech 2 indicate DTC 1134 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Did the Tech 2 also indicate P1153, and/or P1154 test failed?	—	Go to *Step 17*	Go to *Step 4*
4	Check for leaks at the exhaust pipe joints. Are the joints leaking?	—	Go to *Step 5*	Go to *Step 6*
5	Tighten the U-bolt nuts at the leaking joints. Is your action complete?	—	Go to *Step 2*	—

7	1. Replace the damaged gaskets. 2. Align the connections. 3. Tighten the connections. Is your action complete?	—	Go to *Step 2*	—
8	Check for loose exhaust flange connections. Are the flange connections loose?	—	Go to *Step 9*	Go to *Step 10*
9	Tighten the stud nuts or bolts to specifications. Is your action complete?	—	Go to *Step 2*	—
10	Check for burned or corroded exhaust pipes. Are the exhaust pipes burned or corroded?	—	Go to *Step 11*	Go to *Step 12*
11	Replace the exhaust pipes, as required. Is your action complete?	—	Go to *Step 2*	—

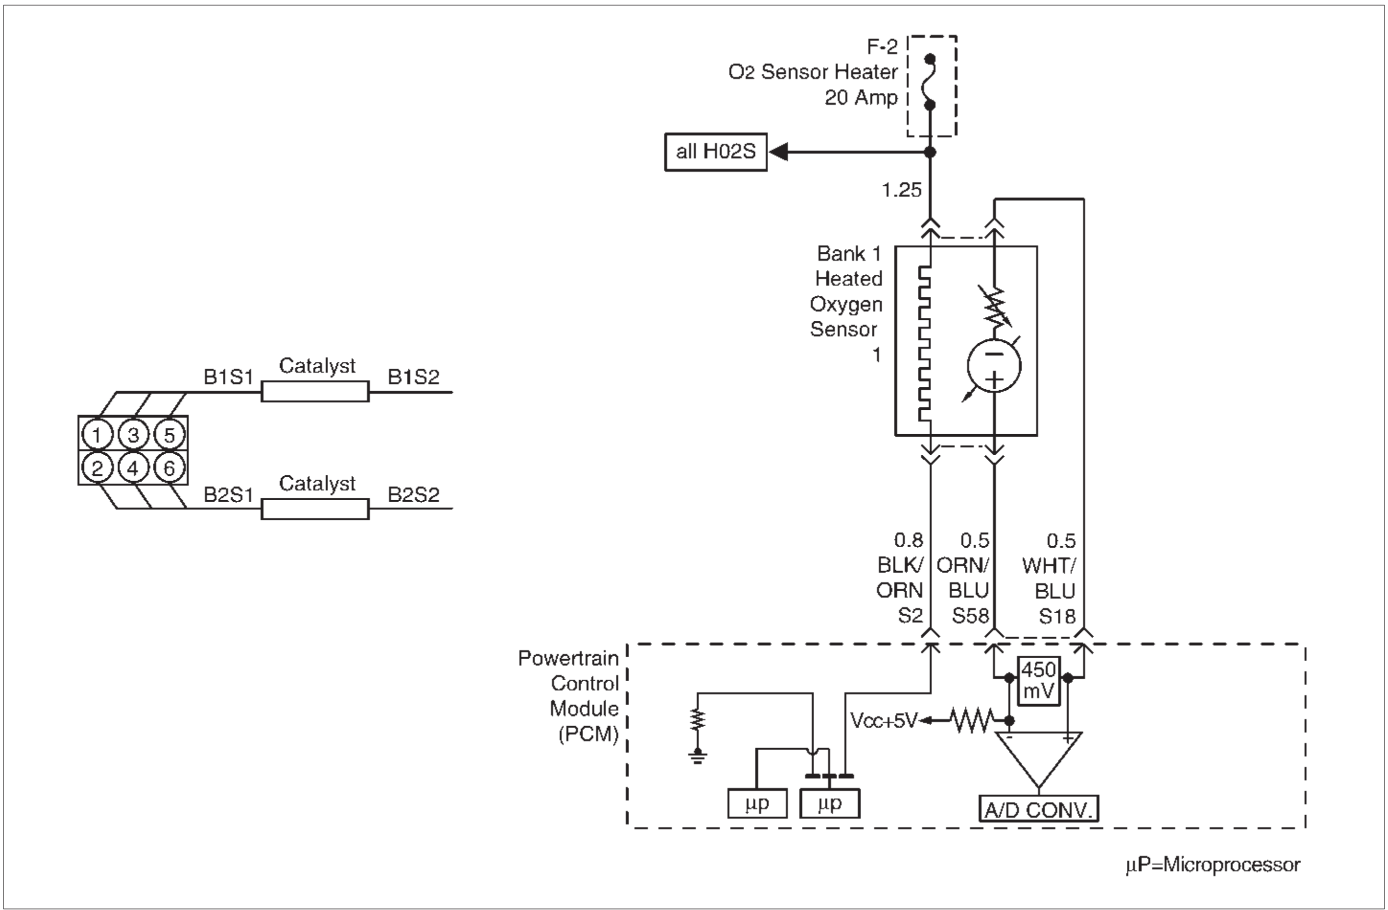
DTC P1134 – HO2S Transition Time Ratio Bank 1 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
12	Check for leaks at the exhaust manifold. Are there leaks at the exhaust manifold?	—	Go to *Step 13*	Go to *Step 14*
13	Tighten the bolts to specifications or replace the manifold if necessary. Is your action complete?	—	Go to *Step 2*	—
14	Visually/physically inspect the following items: ● Ensure that the Bank 1 HO2S 1 is securely installed. ● Check for corrosion on terminals. ● Check the terminal tension (at Bank 1 HO2S 1 and at the PCM). ● Check for damaged wiring. Was a problem found in any of the above areas?	—	Go to *Step 18*	Go to *Step 15*
15	1. Disconnect Bank 1 HO2S 1. 2. Ignition "ON." 3. Using a DVM at the PCM side of the HO2S 1 connector, measure the voltage between the high signal circuit and ground. 4. Also measure the voltage between the low signal circuit and ground. Are both voltages in the specified range?	3-4V	Go to *Step 16*	Go to *Step 19*
16	1. With Bank 1 HO2S 1 disconnected, jumper the high and low (PCM side) signal circuits to ground. 2. Ignition "ON." 3. Using a Tech 2, monitor the Bank 1 HO2S 1 voltage. Does the Tech 2 indicate less than 10 mV and immediately return to about 450 mV when the jumper is removed?	—	Go to *Step 21*	Go to *Step 22*
17	Replace affected heated oxygen sensors. NOTE: Before replacing sensors, the cause of the contamination must be determined and corrected. ● Fuel contamination. ● Use of improper RTV sealant. ● Engine oil/coolant consumption. Is the action complete?	—	Verify repair	—
18	Repair condition as necessary. Is the action complete?	—	Verify repair	—
19	Check for faulty PCM connections or terminal damage. Is the action complete?	—	Verify repair	Go to *Step 20*
20	Repair open, short or grounded signal circuit. Is the action complete?	—	Verify repair	Go to *Step 7*

DTC P1134 – HO2S Transition Time Ratio Bank 1 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
21	Replace Bank 1 HO2S 1. Is the action complete?	—	Verify repair	—
22	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1153 HO2S Insufficient Switching Bank 2 Sensor 1



D06RY00135

Circuit Description

The powertrain control module (PCM) monitors the heated oxygen sensor (HO2S) activity for 90 seconds after "closed loop" and stoichiometric operation have been enabled. During this test period the PCM counts the number of times that the HO2S signal voltage crosses the rich-to-lean and lean-to-rich thresholds. If the PCM determines that the HO2S did not switch enough times, DTC P1153 will be set.

A lean-to-rich switch is determined when the HO2S voltage changes above and below 450 mV.

Heated oxygen sensors are used to minimize the amount of time required for "closed loop" fuel control operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors Bank 1 HO2S 1 and Bank 2 HO2S 1 to become active. Oxygen sensor heaters are required by post-catalyst monitor sensors to maintain a sufficiently high temperature for accurate exhaust oxygen content readings further from the engine.

Conditions for Setting the DTC

- The engine is operating in "closed loop."
- Engine coolant temperature (ECT) is above 50˚C (122˚F) for automatic transmission; 75˚C (167˚F) for manual transmission.
- The engine has been running at least one minute.
- Canister purge duty cycle is greater than 2%.
- Engine speed is between 1500 RPM and 3000 RPM.
- Mass air flow is between 9 g/second and 42 g/second.
- Above conditions are present for a 3 seconds.
- 90 seconds after "closed loop" and stoichiometric operation have been enabled, the PCM monitors the oxygen sensor switching above and below 450 mV. If fewer than 27 rich-to-lean and lean-to-rich switches for Bank 2 HO2S 1 are detected, DTC P1153 will set.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- "Open loop" fuel control will be in effect.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1153 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1153 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

A malfunction in the HO2S heater ignition feed or ground circuit may cause a DTC P1153 to set. Check HO2S heater circuitry for intermittent faults or poor connections. If connections and wiring are OK and DTC P1153 continues to set, replace the Bank 2 HO2S 1.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. A condition that affects other heated oxygen sensors indicates probable contamination. To avoid damaging replacement sensors, correct the condition which caused the contamination before replacing the affected sensors.
5. This step checks for conditions which may cause the heated oxygen sensor to appear faulty. Correct any of the described conditions if present.
8. To avoid damaging replacement sensors, correct the condition which caused the contamination before replacing the affected sensors.

DTC P1153 – HO2S Insufficient Switching Bank 2 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	**IMPORTANT:** If any DTCs are set, (except P1133 and/or P1134), refer to those DTCs before proceeding with this diagnostic chart. 1. Idle the engine at operating temperature. 2. Operate the vehicle within parameters specified under "Conditions for Setting the DTC" criteria included in Diagnostic Support. 3. Using a Tech 2, monitor "DTC" info for DTC P1153 until the DTC P1153 test runs. Note the test result. Does Tech 2 indicate DTC failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Did the Tech 2 also indicate P1133 and/or P1134 test failed?	—	Go to *Step 20*	Go to *Step 4*
4	Check for leaks at the exhaust pipe joints. Are the joints leaking?	—	Go to *Step 5*	Go to *Step 6*
5	Tighten the U-bolt nuts at the leaking joints. Is your action complete?	—	Go to *Step 2*	—
6	Check for gaskets that are damaged or improperly installed. Are there damaged or misaligned gaskets?	—	Go to *Step 7*	Go to *Step 8*
7	1. Replace the damaged gaskets. 2. Align the connections. 3. Tighten the connections. Is your action complete?	—	Go to *Step 2*	—
8	Check for loose exhaust flange connections. Are the flange connections loose?	—	Go to *Step 9*	Go to *Step 10*
9	Tighten the stud nuts or bolts to specifications. Is your action complete?	—	Go to *Step 2*	—
10	Check for burned or corroded exhaust pipes. Are the exhaust pipes burned or corroded?	—	Go to *Step 11*	Go to *Step 12*

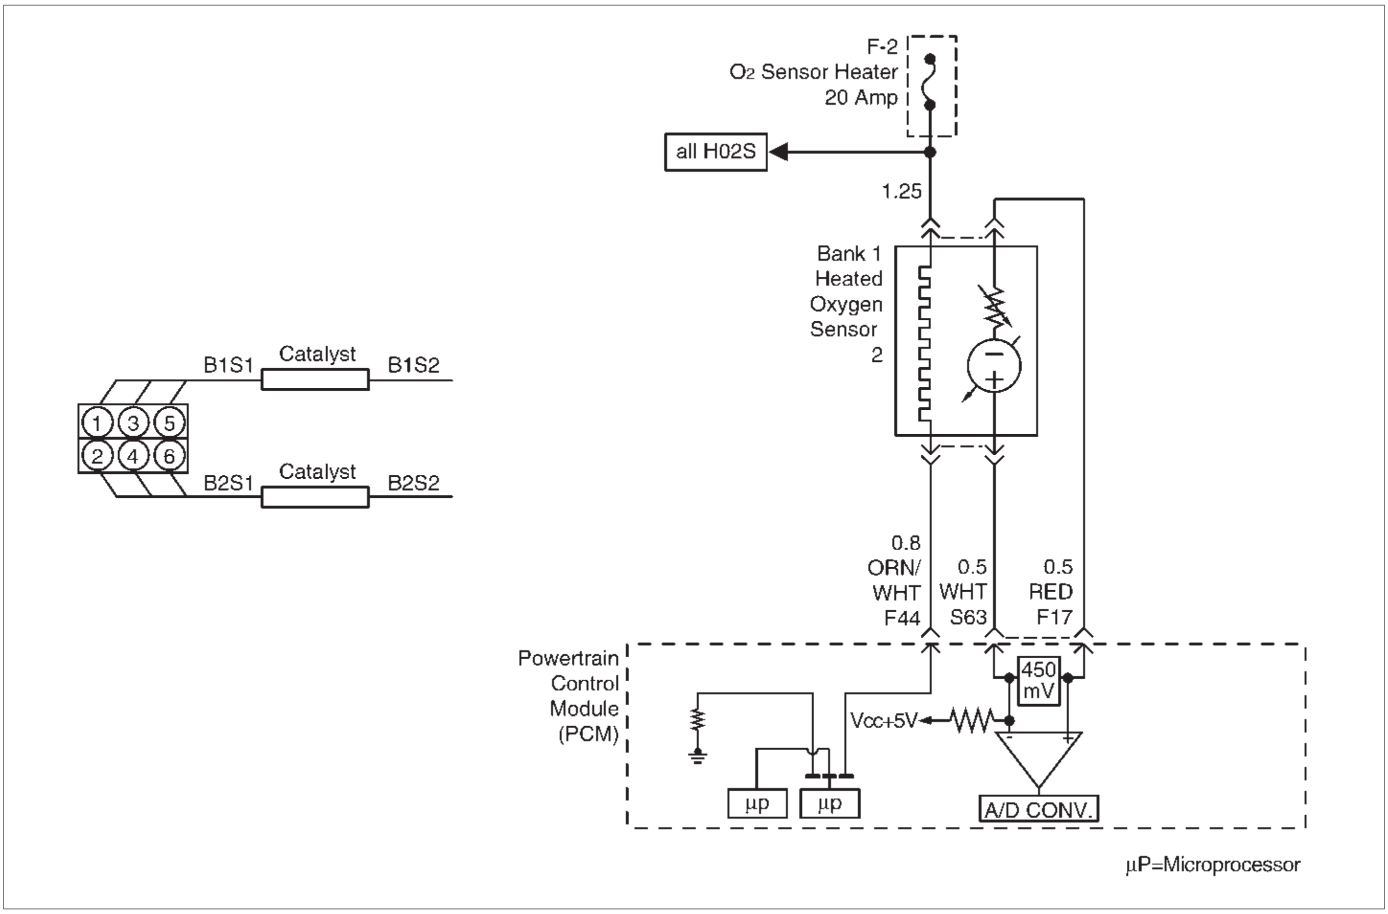
DTC P1153 – HO2S Insufficient Switching Bank 2 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
11	Replace the exhaust pipes, as required. Is your action complete?	—	Go to *Step 2*	—
12	Check for leaks at the exhaust manifold. Are there leaks at the exhaust manifold?	—	Go to *Step 13*	Go to *Step 14*
13	Tighten the bolts to specifications or replace the manifold if necessary. Is your action complete?	—	Go to *Step 2*	—
14	Visually/physically inspect the following items: • Ensure that the Bank 2 HO2S 1 is securely installed. • Check for corrosion on terminals. • Check the terminal tension at Bank 2 HO2S 1 and at the PCM. • Check for damaged wiring. Was a problem found in any of the above areas?	—	Verify repair	Go to *Step 15*
15	1. Disconnect Bank 2 HO2S 1. 2. Ignition "ON." 3. Using a DVM at the PCM side of the connector, check the voltage between the high signal circuit and ground. Also measure between the low signal circuit and ground. Are both voltages in the specified range?	3-4V	Go to *Step 18*	Go to *Step 16*
16	1. Ignition "ON." 2. Check for damage to PCM pins or terminals. Was a problem found?	—	Verify repair	Go to *Step 17*
17	Check for short to voltage or ground or an open in the signal circuit. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Ignition "OFF." 2. Disconnect the PCM connector. 3. With HO2S disconnected, check for high and low signal circuits shorted together between the PCM and HO2S. Was a problem found?	—	Verify repair	Go to *Step 19*
19	With the PCM connected and Bank 2 HO2S 1 disconnected from the harness, check Bank 2 HO2S 1 with a Tech 2. Is the voltage in the specified range?	425-475 mV	Go to *Step 21*	Go to *Step 22*
20	Replace affected heated oxygen sensors. NOTE: Before replacing sensors, the cause of the contamination must be determined and corrected. • Fuel contamination. • Use of improper RTV sealant. • Engine oil/coolant consumption. Is the action complete?	—	Verify repair	—

DTC P1153 – HO2S Insufficient Switching Bank 2 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
21	Replace Bank 2 HO2S 1. Is the action complete?	—	Verify repair	—
22	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1154 HO2S Circuit Transition Time Ratio Bank 2 Sensor 1



Circuit Description

The powertrain control module (PCM) monitors the heated oxygen sensor (HO2S) activity for 90 seconds after "closed loop" and stoichiometric operation have been enabled. During the monitor period the PCM counts the number of times that the HO2S responds from rich-to-lean and from lean-to-rich and adds the amount of time it took to complete all transitions. With this information, an average time for all transitions can be determined. The PCM then divides the rich-to-lean average by the lean-to-rich average to obtain a ratio. If the HO2S transition time ratio is not within this range, DTC P1154 will be set, indicating that the oxygen sensor is not responding as expected to changes in exhaust oxygen content.

Conditions for Setting the DTC

- No related DTCs.
- Engine coolant temperature (ETC) is above 50°C (122°F) for automatic transmission; 75°C (167°F) for manual transmission.
- The engine is operating in "closed loop."
- The engine has been running at least one minute.
- Canister purge duty cycle is greater than 2%.
- Engine speed is between 1500 RPM and 3000 RPM.
- Mass air flow is between 9 g/second and 42 g/second.
- Above conditions are present for a 3-second monitoring period.
- 90 seconds after "closed loop" and stoichiometric operation have been enabled, Bank 2 HO2S 1 transition ratio between lean to rich and rich to lean is less than 0.44 or greater than 3.8.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- "Open loop" fuel control will be in effect.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1154 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1154 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

A multifunction in the HO2S heater ignition feed or ground circuit may cause a DTC P1154 to set. Check HO2S heater circuitry for intermittent faults or poor connections. If connections and wiring are OK and DTC P1154 continues to set, replace the Bank 2 HO2S 1.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. A condition that affects other heated oxygen sensors indicates probable contamination. To avoid damaging replacement sensors, correct the condition which caused the contamination before replacing the affected sensors.

5. This step checks for conditions which may cause the heated oxygen sensor to appear faulty. Correct any of the described conditions if present.

8. To avoid damaging replacement sensors, correct the condition which caused the contamination before replacing the affected sensors.

DTC P1154 – HO2S Transition Time Ratio Bank 2 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	**IMPORTANT:** If any other DTCs are set (except P1133 and/or P1134), refer to those DTCs before proceeding with this diagnostic chart. 1. Idle the engine at operating temperature. 2. Operate the vehicle within parameters specified under “Conditions for Setting the DTC” criteria included in Diagnostic Support. 3. Using a Tech 2, monitor “DTC” info for DTC P1154 until the DTC P1154 test runs. Note the test result. Does Tech 2 indicate DTC failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Did the Tech 2 also indicate P1133, and/or P1134 test failed?	—	Go to *Step 17*	Go to *Step 4*
4	Check for leaks at the exhaust pipe joints. Are the joints leaking?	—	Go to *Step 5*	Go to *Step 6*
5	Tighten the U-bolt nuts at the leaking joints. Is your action complete?	—	Go to *Step 2*	—
6	Check for gaskets that are damaged or improperly installed. Are there damaged or misaligned gaskets?	—	Go to *Step 7*	Go to *Step 8*
7	1. Replace the damaged gaskets. 2. Align the connections. 3. Tighten the connections. Is your action complete?	—	Go to *Step 2*	—
8	Check for loose exhaust flange connections. Are the flange connections loose?	—	Go to *Step 9*	Go to *Step 10*
9	Tighten the stud nuts or bolts to specifications. Is your action complete?	—	Go to *Step 2*	—
10	Check for burned or corroded exhaust pipes. Are the exhaust pipes burned or corroded?	—	Go to *Step 11*	Go to *Step 12*
11	Replace the exhaust pipes, as required. Is your action complete?	—	Go to *Step 2*	—

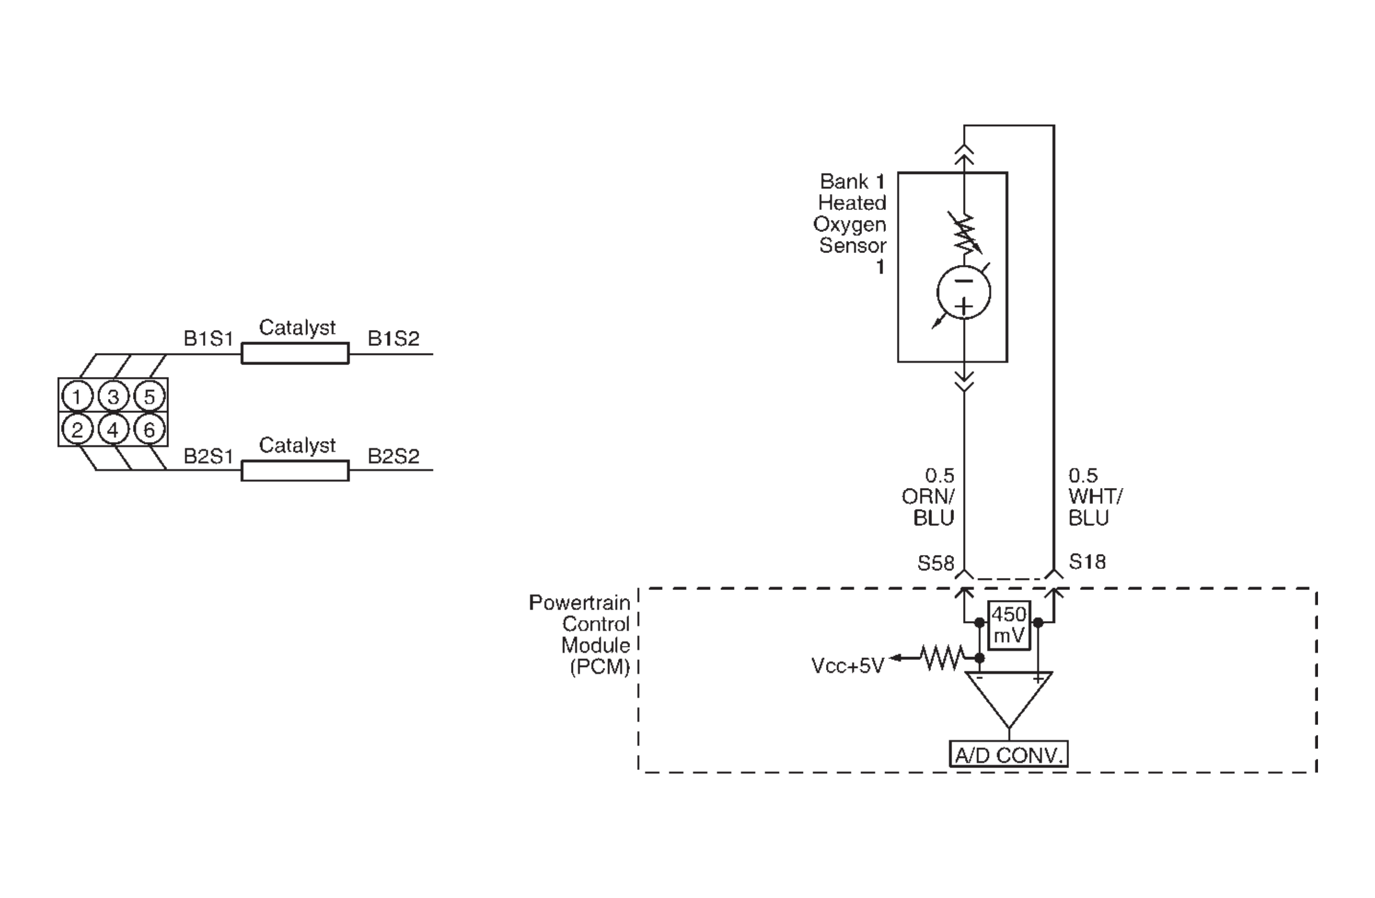
DTC P1154 – HO2S Transition Time Ratio Bank 2 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
12	Check for leaks at the exhaust manifold. Are there leaks at the exhaust manifold?	—	Go to *Step 13*	Go to *Step 14*
13	Tighten the bolts to specifications or replace the manifold if necessary. Is your action complete?	—	Go to *Step 2*	—
14	Visually/physically inspect the following items: • Ensure that the Bank 2 HO2S 1 is securely installed. • Check for corrosion on terminals. • Check terminal tension (at Bank 2 HO2S 1 and at the PCM). • Check for damaged wiring. Was a problem found in any of the above areas?	—	Go to *Step 18*	Go to *Step 15*
15	1. Disconnect Bank 2 HO2S 1. 2. Ignition "ON." 3. Using a DVM at the PCM side of the HO2S 1 connector, measure the voltage between the high signal circuit and ground. Also measure the voltage between the low signal circuit and ground. Are both voltages in the specified range?	3-4 V	Go to *Step 16*	Go to *Step 19*
16	1. With Bank 2 HO2S 1 disconnected, jumper the high and low (PCM side) signal circuits to ground. 2. Ignition "ON." 3. Using a Tech 2, monitor the Bank 2 HO2S 1 voltage. Does the Tech 2 indicate less than 10 mV and immediately return to about 450 mV when the jumper is removed?	—	Go to *Step 21*	Go to *Step 22*
17	Replace affected heated oxygen sensors. NOTE: Before replacing sensors, the cause of the contamination must be determined and corrected. • Fuel contamination. • Use of improper RTV sealant. • Engine oil/coolant consumption. Is the action complete?	—	Verify repair	—
18	Repair condition as necessary. Is the action complete?	—	Verify repair	—
19	Check for faulty PCM connections or terminal damage. Is the action complete?	—	Verify repair	Go to *Step 20*
20	Repair open, short or grounded signal circuit. Is the action complete?	—	Verify repair	—

DTC P1154 – HO2S Transition Time Ratio Bank 2 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
21	Replace Bank 2 HO2S 1. Is the action complete?	—	Verify repair	—
22	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1167 Fuel System Rich During Decel Fuel Cut Off (Bank 1)



D06RY00136

Circuit Description

The powertrain control module (PCM) continuously monitors the heated oxygen sensor (HO2S) activity for 90 seconds after “closed loop” has been enabled. During the monitoring period the powertrain control module (PCM) counts the number of times a rich to lean and respones is indicated and adds the amountof time it look to complete all rich to lean transisitions and lean to rich transitions.

This code detects if Bank1 02 sensor indicated rich exhaust while in Decel Fuel Cut Off (DFCO) for fuel control sensors.

Conditions for setting the DTC

- No related DTCs.
- The engine coolant temperature is more than 60 ˚C (140 ˚F).
- Engine is operating in “closed loop” power enrichment mode for 3 secondes.
- While in “power enrichment” mode the oxygen sensor voltage remains more than 600mV in DFCO.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction malfunction indicator lamp (MIL).
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- A history DTC P1167 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1167 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

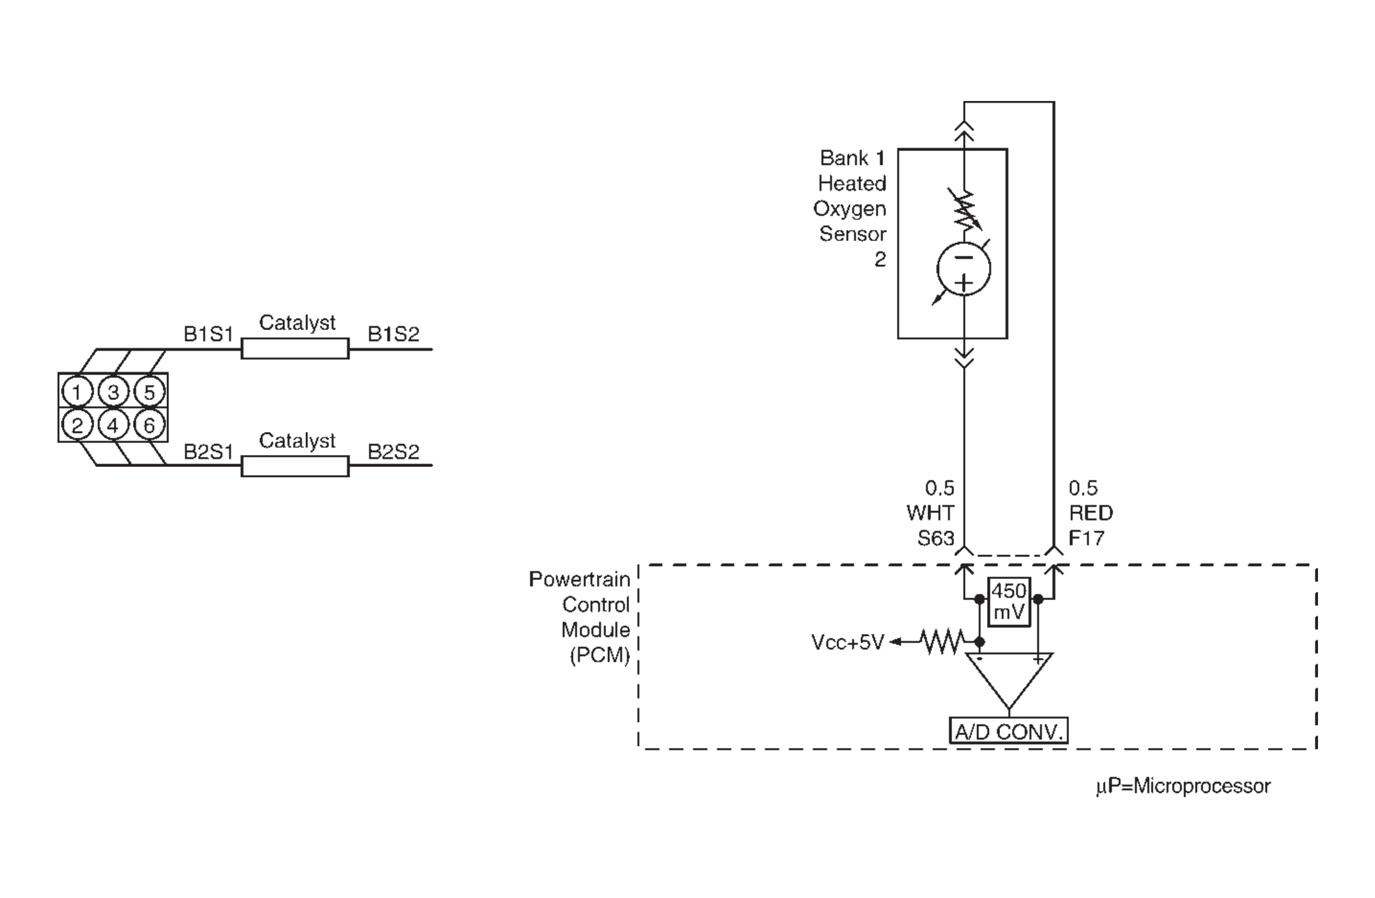
Diagnostic Aids

- Check for faulty fuel injectors and fuel pump.

Diagnostic Trouble Code (DTC)
P1167 Fuel System Rich During Decel Fuel Cut Off (Bank1)

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Are any component related DTCs set?		Go to *component DTC charts*	Go to *Step 3*
3	1. Place the transmission in Park. 2. Using a Tech 2, HO2S 1 voltage while running warm engine 75 ˚C – 95 ˚C (167 ˚F – 203 ˚F) at 1200 RPM. 3. HO2S 1 votages should vary within the specified range. (100 – 900mV) 4. Quickly open the wide open the throtle for a few Did the voltage suddenly rise toward the low endof the specified range?	100 – 600 mV	Go to *OBD System Check*	Go to *Step 4*
4	1. Disconnect the fuel pump relay and crank the engine to relieve the fuel pressure. 2. Install the fuel pressure gauge. 3. Start the engine and idle at normal operating temperatur. 4. Disconnect the vacuum line going to the fuel pressure regurlator. With the engine running, is the fuel pressure within the specified range?	280 – 325Kpa (41 – 46psi)	Go to *OBD System Check*	Go to *Step 5*
5	1. Ignition “OFF”. 2. Remove the fuel pump relay and replace it with a fused jumper which will connect the relay’s battery terminal to the terminal leading to the fuel pump fuse. 3. While the fuel pump is opreating, use pliers to slowly close the return line (do not exceed the first specified value). Using the pliers to restrict the return line, can the fuel pressure be manipulated to exceed the second value? Is the TP sensor reading near the specified value?	414KPa (60psi) 325KPa (46psi)	Refer to *Diagnostic Aids*	Go to *Step 6*
6	Check the following items; ● Faulty fuel pump ● Incorrect fuel pump ● Incorrect fuel being used ● Cold fuel If a problem is found, repair one as necessary. Was a problem found?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1169 Fuel System Rich During Decel Fuel Cut Off (Bank 2)



D06RY00141

Circuit Description

The powertrain control module(PCM) continuously monitors the heated oxygen sensor (HO2S) activity for 90 seconds after “closed loop” has been enabled. During the monitoring period the powertrain control module (PCM) counts the number of times a rich to lean and respones is indicated and adds the amountof time it look to complete all rich to lean transisitions and lean to rich transitions.

This code detects if Bank2 sensor indicated rich exhaust while in Decel Fuel Cut Off (DFCO) for fuel control sensors.

Conditions for setting the DTC

- No related DTCs.
- The engine coolant temperature is more than 60 °C (140 °F).
- Engine is operating in “closed loop” power enrichment mode for 3 secondes.
- While in “power enrichment” mode the oxygen sensor voltage remains more than 600mV in DFCO.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction malfunction indicator lamp(MIL).
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- A history DTC P1169 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1169 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

- Check for faulty fuel injectors and fuel pump.

Diagnostic Trouble Code (DTC) P1169 Fuel System Rich During Decel Fuel Cut Off (Bank2)

Step	Action	Value(s)	Yes	No

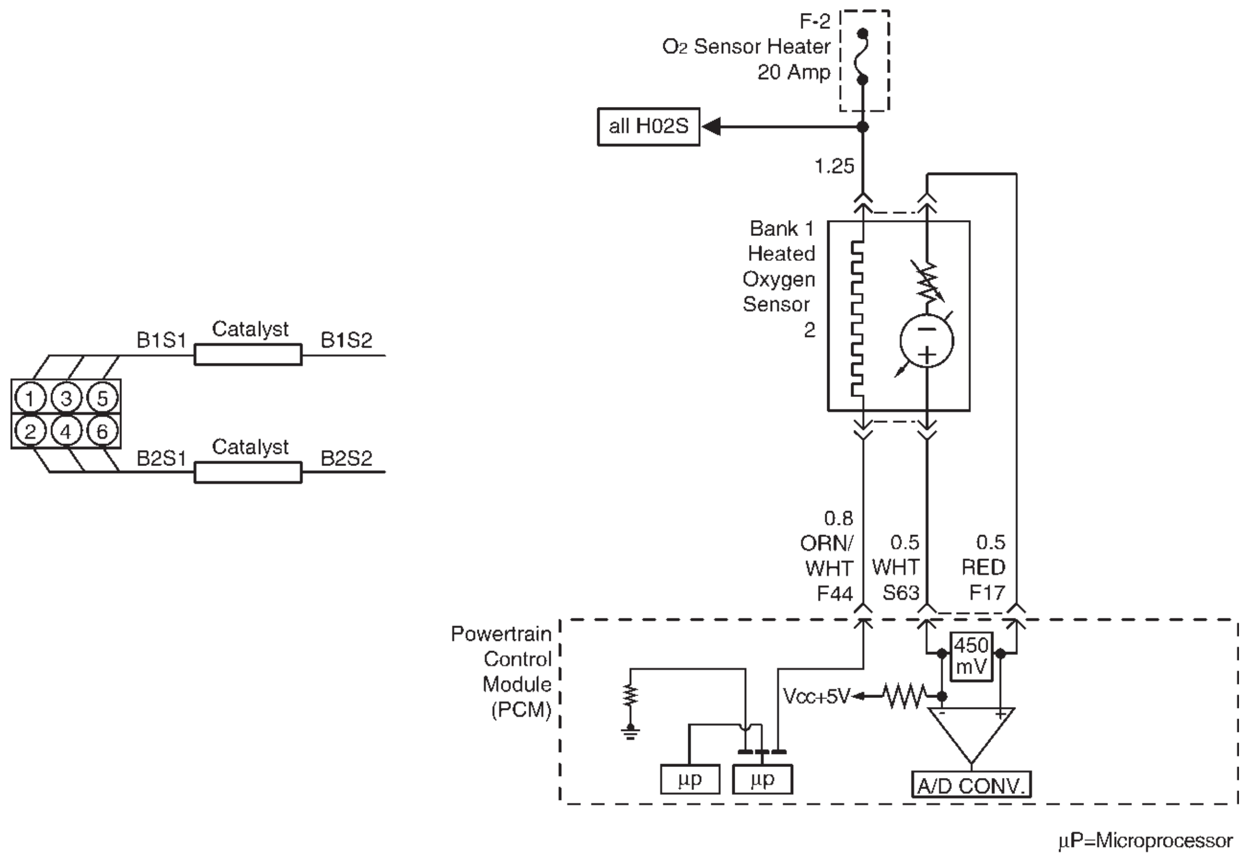
Diagnostic Trouble Code (DTC) P1171 Fuel System Lean During Acceleration



D06RY00139

Circuit Description

The powertrain control module (PCM) internal circuitry can identify if the vehicle fuel system is capable of supplying adequate amounts of fuel during heavy acceleration (power enrichment). The PCM monitors the voltage of the oxygen sensor during power enrichment. When a power enrichment mode of operation is requested during “closed loop” operation (by heavy acceleration), the PCM will provide more fuel to the engine. Under these conditions the PCM should detect a “rich” condition (high oxygen sensor voltage). If this “rich” exhaust is not detected at this time, a DTC P1171 will set. A plugged fuel filter, restricted fuel line, restricted in-tank filter or defective fuel pump can prevent adequate amounts of fuel from being supplied during power enrichment mode.

Conditions for Setting the DTC

- No related DTCs.
- Engine is operating in “closed loop power enrichment” mode for 3 seconds.
- Engine coolant temperature is above 60°C (140°F).
- While in “power enrichment” mode the oxygen sensor voltage remains below 400 mV for 3 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1171 will clear after 40 consecutive warm-up cycles have occurred without a fault.

- DTC P1171 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

- A restricted fuel filter or fuel line, restricted in-tank filter, or a defective fuel pump may supply adequate amounts of fuel at idle, but may not be able to supply enough fuel during heavy acceleration.
- Water or alcohol in the fuel may cause low HO2S voltage during acceleration.
- Check for faulty or plugged fuel injector(s).
- Check for low fuel.

Test Description

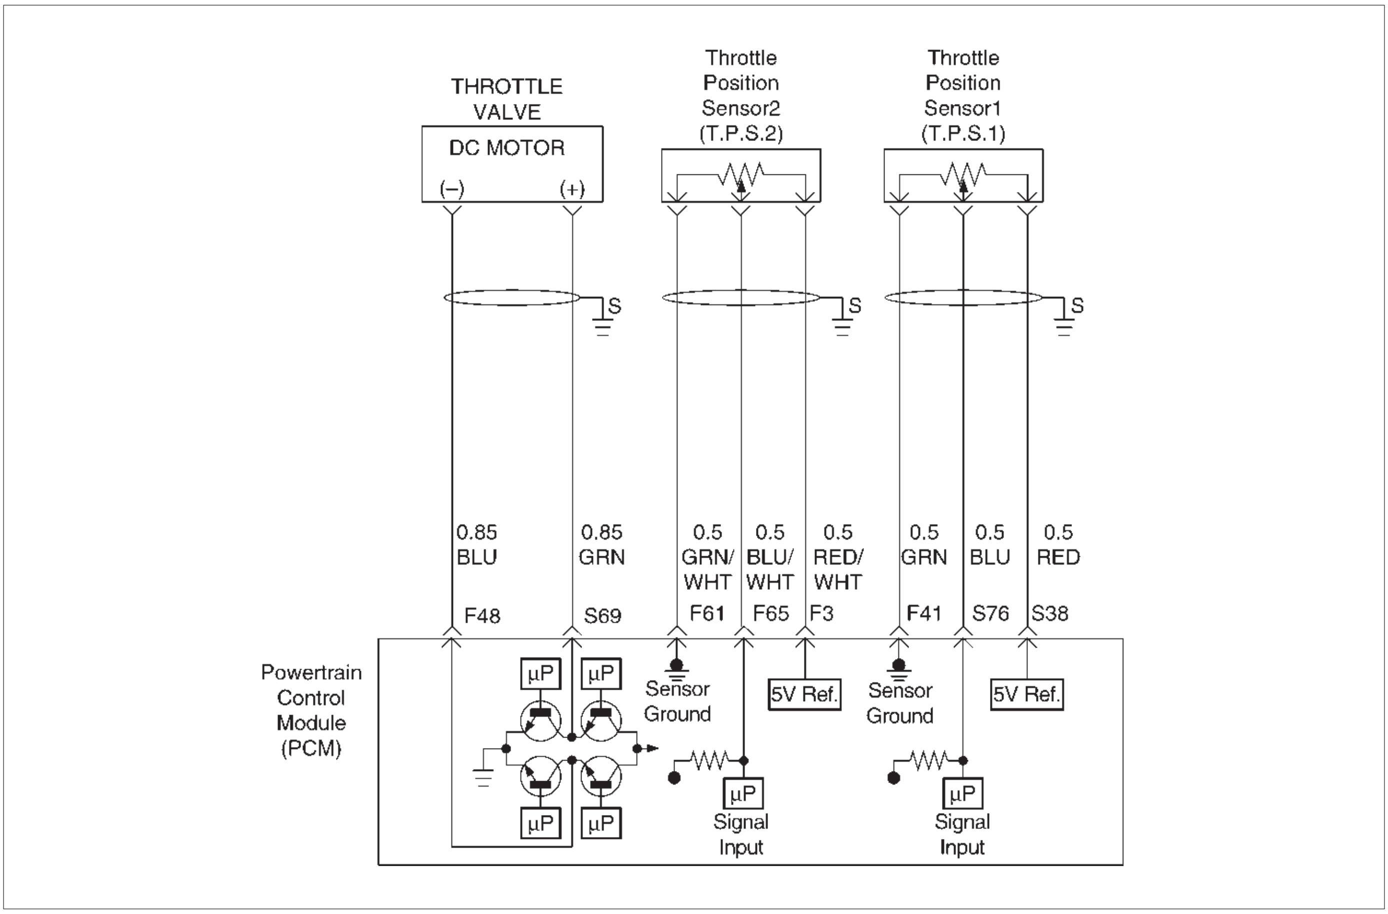
Number(s) below refer to the step number(s) on the Diagnostic Chart.

4. When the engine is idling or at steady cruise, the HO2S voltage should vary from between approximately 100 mV to 900 mV. It is possible to measure a satisfactory fuel pressure at idle even though the pressure may drop at high flow requirements. It may be necessary to watch fuel pressure at high engine load.
5. Wrap a shop towel around the fuel pressure connector to absorb any small amount of fuel leakage that may occur when installing gauge. Ignition “ON,” pump pressure should be 280-320 kPa.
7. Add Caution, Use correct pliers so damage to fuel lines will not occur.

DTC P1171 – Fuel System Lean During Acceleration

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Are any component-related DTCs set?	—	Go to component DTC charts	Go to *Step 3*
3	1. Check the vehicle's fuel tank for an adequate amount of fuel. 2. Add fuel to the vehicle's fuel tank if the tank is almost empty. Was fuel added to the vehicle's fuel tank?	—	Go to *Step 4*	Go to *Step 5*
4	1. Place the transmission in park. 2. Using a Tech 2, observe HO2S 1 voltage while running warm engine 75°C-95°C (167°F-203°F) at 1200 RPM. 3. HO2S 1 voltage should vary within the specified range. 4. Quickly open the throttle halfway for a few seconds. Did the voltage suddenly rise toward the high end of the specified range?	100-900 mV	Go to *Fuel System Electrical Test*	Go to *Step 5*
5	1. Disconnect the fuel pump relay and crank the engine to relieve the fuel pressure. 2. Install the fuel pressure gauge. 3. Start the engine and idle at normal operating temperature. 4. Disconnect the vacuum line going to the fuel pressure regulator. With the engine running, is the fuel pressure within the specified range?	280-325 kPa (41-46 psi)	Go to *OBD System Check*	Go to *Step 6*
6	Check for restricted fuel lines or restricted in-line filter. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Ignition "OFF." 2. Remove the fuel pump relay and replace it with a fused jumper which will connect the relay's battery terminal to the terminal leading to the fuel pump fuse. 3. While the fuel pump is operating, use pliers to slowly close the return line (do not exceed the first specified value). Using the pliers to restrict the return line, can the fuel pressure be manipulated to exceed the second specified value?	414 kPa (60 psi) 325 kPa (46 psi)	Go to *Diagnostic Aids*	Go to *Step 8*
8	Check for: • Faulty fuel pump • Restricted fuel pump strainer (sock) • Incorrect fuel pump • Incorrect fuel being used • Hot fuel Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1220 Throttle Position Senser2 (TPS2) Circuit Fault



D06RY00111

Circuit Description

- The throttle position (TP2) sensor circuit provides a voltage signal relative to throttle blade angle.

  The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle (WOT).

  This code detects a continuous short to ground or high in either the cicuit or the sensor.

Conditions for setting the DTC

- The Ignition is “ON”.
- The throttle blade angle is less than 2.5 % or more tnan 97.5 % for 18 failres within 500 test samples (15.6m sec).

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1120 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1120 can be cleared using the Tech2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- The MAP sensor shares a 5 Volt reference with the Fuel Tank Pressure.If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.
- The MAP sensor shares a ground with the Fuel Tank Pressure,the ECT sensor,and the Transmission Fluid
- Poor connection at PCM-Inspect harness connectors for backed out terminals,improper mating,broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness–Inspect the wiring harness for damage. If the harness appears to be OK,observe the TP sensor display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1120 cannot be duplicated,the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently,performing the DTC P1120 Diagnostic Chart may isolate the cause of the fault.

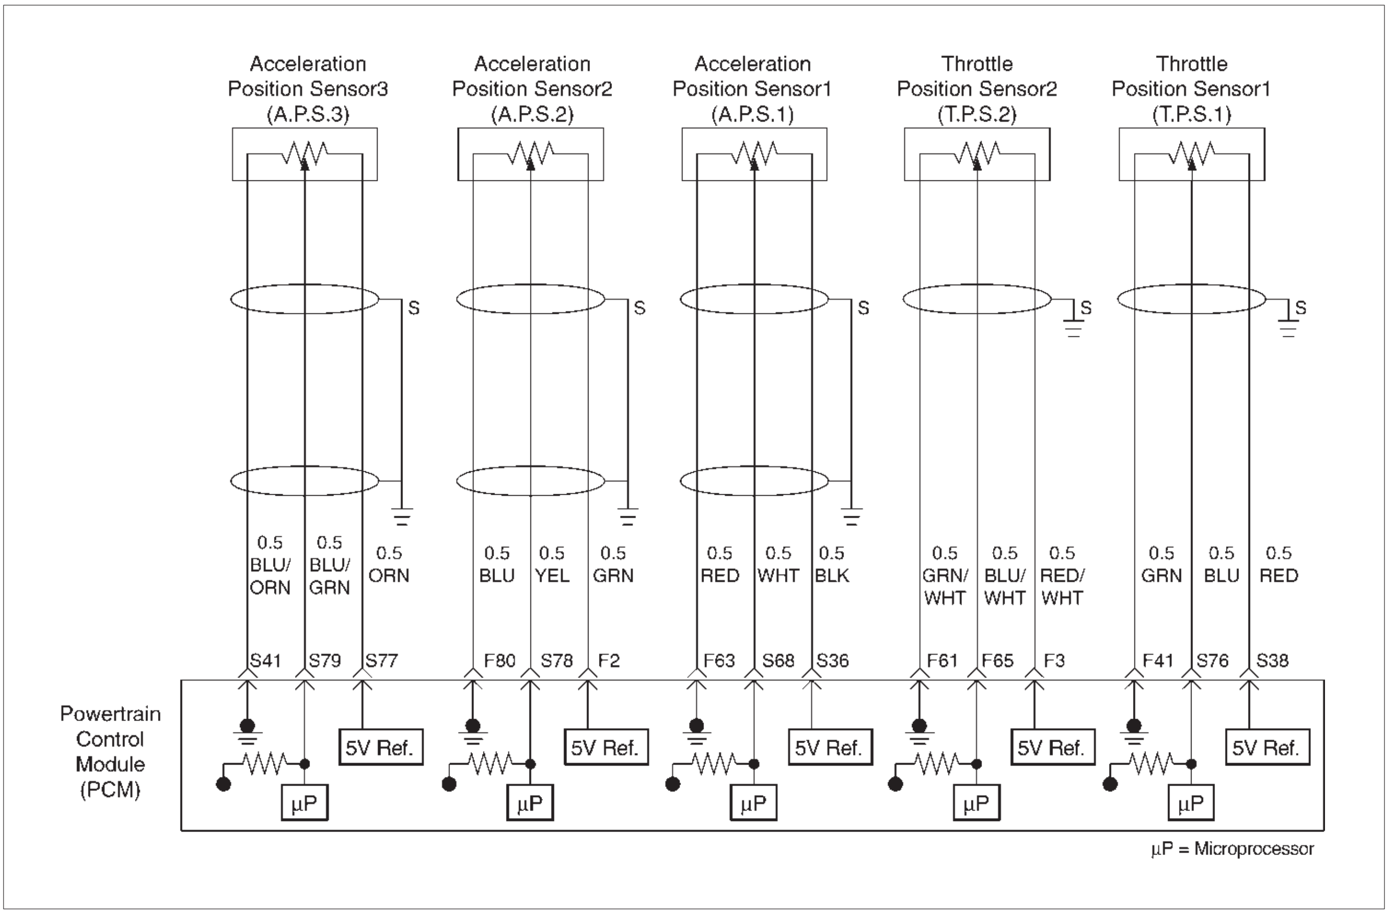
DTC P1220-TPS 2 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Ignition “ON”, engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65 kPa	Go to *Step 4*	Go to *Step 7*
4	1. Disconnect the MAP sensor. 2. Connect a test 5 volt reference circuit and the MAP signal at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value? (If no, start with diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to *Step 6*	Go to *Step 5*
5	1. Check the MAP signal circuit between the PCM and MAP ground circuit. 2. If the MAP signal circuit is open or shorted, repair as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to *Step 13*
6	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
7	Observe the TP angle reading on the Tech-2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed TP sensor 1 =8 ~ 10 % TP sensor 2 =8 ~ 10 % Wide open TP sensor 1 =90 ~ 92 % TP sensor 2 =90 ~ 92 %	Refer to *Diagnostic Aids*	Go to *Step 8*
8	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	0V	Go to *Step 9*	Go to *Step 10*
9	1. Connect a test light between the 5Volt reference circuit and the TP2 sensor signal circuit at the TPsensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to *Step 12*	Go to *Step 11*

DTC P1220-TPS 2 Circuit Fault (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items; 1. TP2 signal circuit for a short to voltage. 2. TP2 sensor ground circuit for high resistance between the PCM and the TP2 sensor. 3. TP2 sensor ground circuit for a poor connection. 4. If a problem is found,repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
11	Check the following items; 1. TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
12	Replace the TP sensor. Is the action complete?	—	Verify repair	—
13	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnosis Truble Code(DTC)
P1221 TPS1 – TPS2 correlation(Circuit Performance)



D06RY00163

Circuit Description

- The powertrain control module (PCM) controls engine speed by adjusting the position of the throttle control valve (DC motor). The throttle motor is a DC motor driven by one coil. The PCM applies current to DC motor coil in steps (%) to adjustment the valve into a passage in the throttle body to air flow.

  This method allows highly accurate control of engine speed and quick response to changes in engine load.
- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP1) will vary about 13% at idle position to about 87% at open throttle(WOT).

  APS signal is used to determine which DC will adjusting throttle position.

  After the APS signal has been processed by the PCM, it will command DC motor to allow a move of throttle position.
- Acceleration pedal – Check for objects blocking the AP sensor or pedal arm with spring, and excessive deposits in the acceleration pedal arm and on the acceleration pedal.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Visually/physically inspect for the following throttle valve conditions.

3.Visually/physically inspect for the following acceleration pedal conditions.

5.Check the following circuits for throttle valve and DC moter. Check the following TP sensor resistance and DC motor.

7.Check the following circuits for acceleration pedal. Check the following AP sensor resistance.

9.Following DTC: Software detect Error for ETC system.

10.Following DTC: Software detect Error for ETC system.

Diagnostic Aids

- An intermittent may be caused by a poor connection, rubbed–through wire insulation or a wire broken inside the insulation. Check for poor connections or a damaged harness. Inspect the PCM harness and connector for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.
- Throttle body – Check for objects blocking the DC motor or throttle bore, excessive deposits in the ETC passage and on the valve spring, and excessive deposits in the throttle bore and on the throttle valve plate.

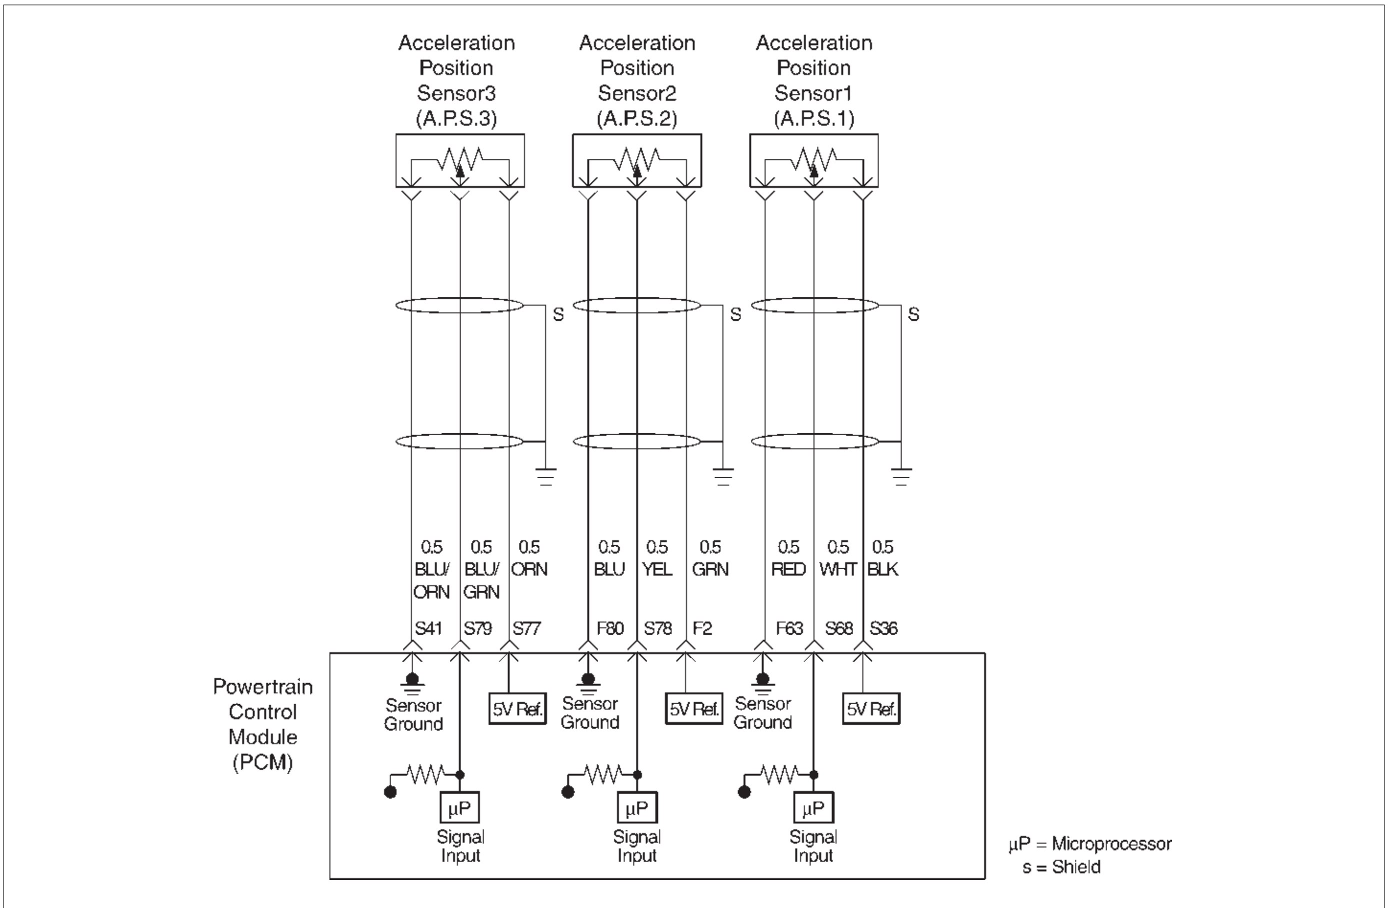
Diagnosis Truble Code(DTC)
P1221 TPS1 – TPS2 correlation(Circuit Perfoemance)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check"performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	Visually/physically inspect for the following conditions: ● Throttle body tampering. ● Restricted intake throttle system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. ● Throttle body: Check for objects blocking the throttle passage or throttle bore, excessive deposits in the throttle passage and on the throttle valve, and excessive deposits in the throttle bore and on the throttle plate. ● Throttle body with lever: Check for objects send round the throttle spring lever that lever is smooth movement, and spring lever has not excessive play Do any of the above require a repair?	—	Refer to *appropriate section for on–vehicle service*	Go to *Step 5*
4	Visually/physically inspect for the following conditions: ● Acceleration pedal tampering. ● Acceleration pedal : Check for objects blocking the spring or pedal arm. ● Acceleration pedal : Check for objects move the acceleration pedal that pedal is smooth movement, and acceleration pedal arm has not excessive play. Do any of the above require a repair?	—	Refer to *appropriate section for on–vehicle service*	Go to *Step 5*
5	1. Check for a poor connection at the throttle body harness connector. 2. Check for a poor connection at the acceleration position sensor harness connector. 3. If a problem is found, replace faulty terminals as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
6	1. Check the following circuits for an open, short to voltage, short to ground, or poor connection at the PCM: Throttle position sensor 1 circuit. Throttle position sensor 2 circuit. Throttle DC motor circuit. Throttle position sensor resistance. Throttle DC motor resistance. 2. If a problem is found, repair as necessary. Was a problem found?	Vcc-GND 1–7kΩ SIG-DND change resistance 0.3 – 100Ω	Verify repair	Go to *Step 7*

Diagnosis Truble Code(DTC)
P1221 TPS1 – TPS2 correlation(Circuit Perfoemance) (Cont'd)

Step	Action	Value(s)	Yes	No
7	Replace the throttle valve. Is the action complete?	—	Go to *Step 4*	—
8	1. Check the following circuits for an open, short to voltage, short to ground, or poor connection at the PCM: • Acceleration position sensor 1 circuit. • Acceleration position sensor 2 circuit. • C position sensor 3 circuit. • V position sensor resistance. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
9	Replace the acceleration position sensor. Is the action complete?	—	Go to *Step 10*	—
10	Following below the DTCs stored: P1125, P1290, P1295, P1299	—	Go to *applicable DTC table*	Go to *Step 11*
11	Following below the DTCs stored: P1514, P1515, P1516, P1523, P1271, P1272, P1273	—	Go to *applicable DTC table*	Go to *Step 12*
12	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1271 APS 1– 2 Correlation Error



D06RY00075

Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP1) will vary about 13 % at idle position to about 87 % at wide open throttle(WOT).

  This code detects a correlation error between APS1 and APS2.

Conditions for setting the DTC

- The Ignition is “ON”.
- The acceleration pedal angle difference is less than 4.5 % between ASP1 and APS2 for 50 counts within 50 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1271 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1271 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the APP sensor 1, APP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1271 cannot be duplicated,the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTCP1271 Diagnostic Chart may isolate the cause of the fault.

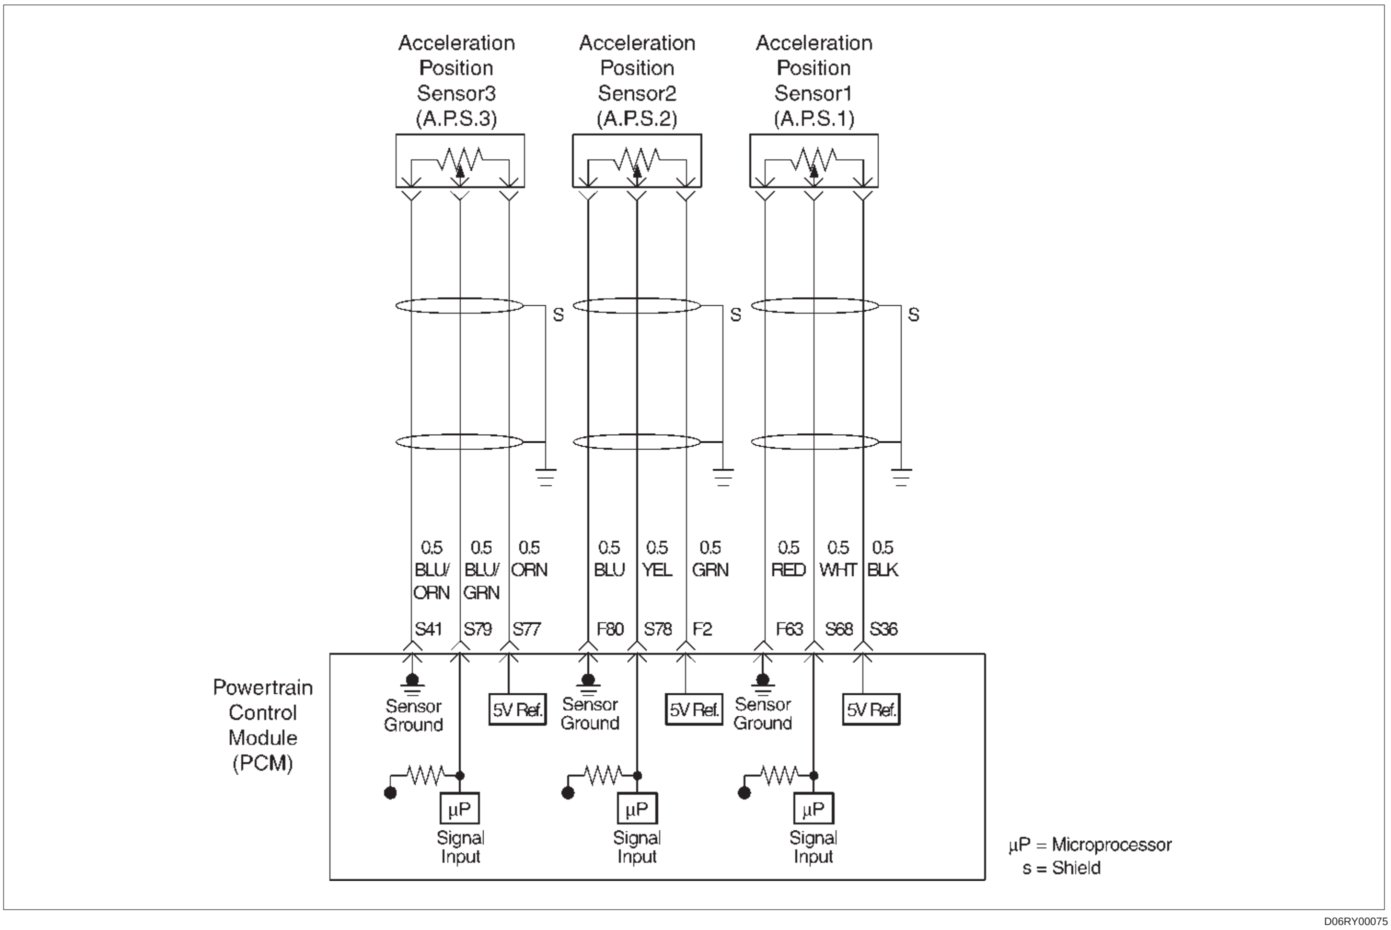
DTC P1271 – APS 1– 2 Correlation Error

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	Observe the AP angle reading on the Tech 2 while slowly opening the throttle. Does the AP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Idle position APP sensor 1 =13 % APP sensor 2 =85 ~ 89 % Wide open throttle APP sensor 1 =85 ~ 89 % APP sensor 2 =11 ~ 15 %	Refer to *Diagnostic Aids*	Go to *Step 4*
4	1. Disconnect the AP sensor. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	0V	Go to *Step 5*	Go to *Step 6*
5	1. Connect a test light between the 5 Voltge supply circuit and the AP sensor signal circuit at the AP1, AP2 sensor harness connector. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	5V	Go to *Step 7*	Go to *Step 8*
6	Check the following items; 1. AP1and AP2 signal circuit for a short to voltage. 2. AP1and AP2 sensor ground circuit for high resistance between the PCM and the AP sensor. 3. AP1and AP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
7	Check the following items; 1. AP1and AP2 signal circuit or 5 volge supply circuit for a poor connection. 2. AP1and AP2 signal circuit or 5 volge supply circuit for high resistance between the PCM and the AP1 and AP2 sensor. 3. If a problem is found,repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*

DTC P1271 – APS 1– 2 Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
8	Replace the AP sensor. Is the action complete?	—	Verify repair	—
9	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released ornot. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1272 APS 2 – 3 Correlation Error



Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP2) will vary about 87 % at idle position to about 13 % at wide open throttle (WOT).

  This code detects a correlation error betweenAPS2 and APS3.

Conditions for setting the DTC

- The Ignition is “ON”.
- The acceleration pedal angle difference is less than 4.5 % between ASP2 and APS3 for 50 counts within 50 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1272 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1272 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals,improper mating,broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the APP sensor 2, APP sensor 3 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1272 cannot be duplicated, the information includedin the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC

P1272 Diagnostic Chart may isolate the cause of the fault.

DTC P1272 – APS 2 – 3 Correlation Error

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	Observe the AP angle reading on the Tech 2 while slowly opening the throttle. Does the AP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Idleposition APP sensor 2 =86 ~ 88 % APP sensor 3 =86 ~ 88 % Wide open throttle APP sensor 2 =12 ~ 14 % APP sensor 3 =32 ~ 36 %	Refer to *Diagnostic Aids*	Go to *Step 4*
4	1. Disconnect the AP sensor. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	0V	Go to *Step 5*	Go to *Step 6*
5	1. Connect a test light between the 5 Voltge supply circuit and the AP sensor signal circuit at the AP2 and AP3 sensor harness connector. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	5V	Go to *Step 6*	Go to *Step 8*
6	Check the following items; 1. AP2 and AP3 signal circuit for a short to voltage. 2. AP2 and AP3 sensor ground circuit for high resistance between the PCM and the AP sensor. 3. AP2 and AP3 sensor ground circuit for a poor connection. 4. If a problem is found,repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
7	Check the following items; 1. AP2 and AP3 signal circuit or 5 volge supply circuit for a poor connection. 2. AP2 and AP3 signal circuit or 5 volge supply circuit for high resistance between the PCM and the AP2 and AP3 sensor. 3. If a problem is found, repair wiring harness as necessary. Diagnostic Trouble Code (DTC) P1273 APS 1 – 3 Correlation Error

D06RY00075

Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP1) will vary about 13 % at idle position to about 87 % at wide open throttle (WOT).

  This code detects a correlation error between APS1 and APS3.

Conditions for setting the DTC

- The Ignition is “ON”.
- The acceleration pedal angle difference is less than 4.5 % between ASP1 and APS3 for 50 counts within 50 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1273 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1273 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK,observe the APP sensor 1, APP sensor 3 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1273 cannot be duplicated,the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently,performing the DTC

P1273 Diagnostic Chart may isolate the cause of the fault.

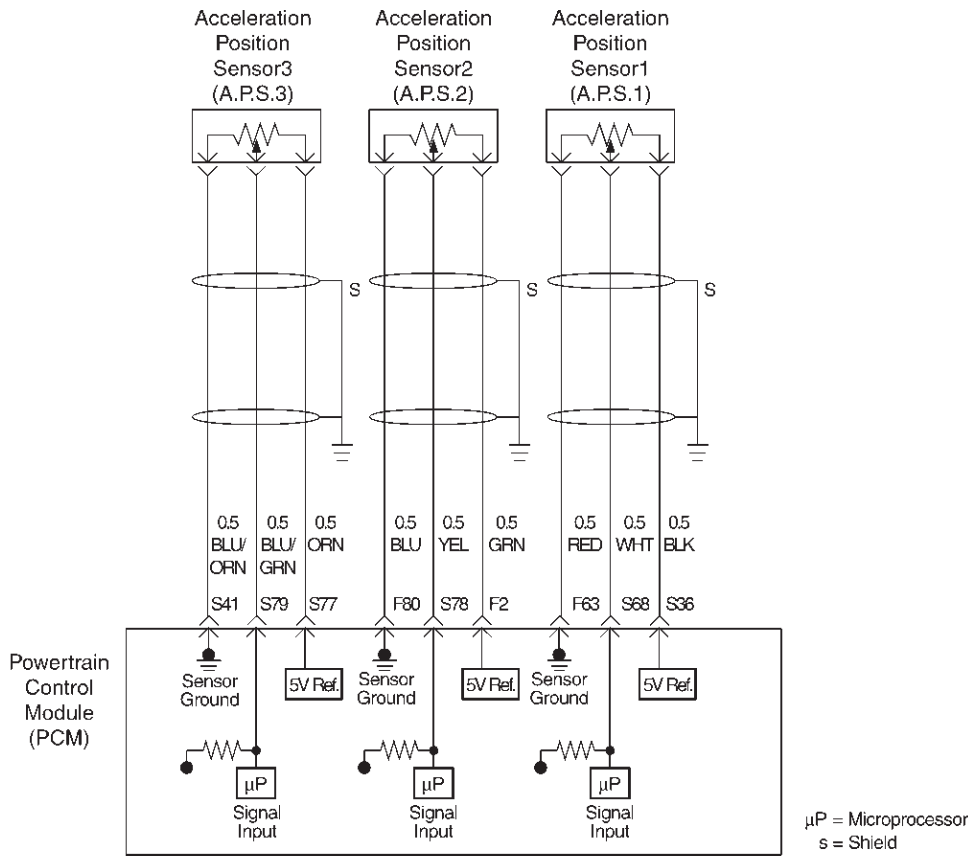
Diagnostic Trouble Code (DTC) P1275 APS 1 Circuit Fault



D06RY00075

Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP1) will vary about 13 % at idle position to about 87 % at wide open throttle (WOT).

  This code detects a continuous short to ground or high in either the cicuit or the sensor.

Conditions for setting the DTC

- The Ignition is “ON”.
- The acceleration pedal angle is less than 2.5 % or more than 97 % for 12 counts within 500 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will store condition which werepresent when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1275 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1275 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK,observe the APP sensor 1 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1275 cannot be duplicated,the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC

P1275 Diagnostic Chart may isolate the cause of the fault.

Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

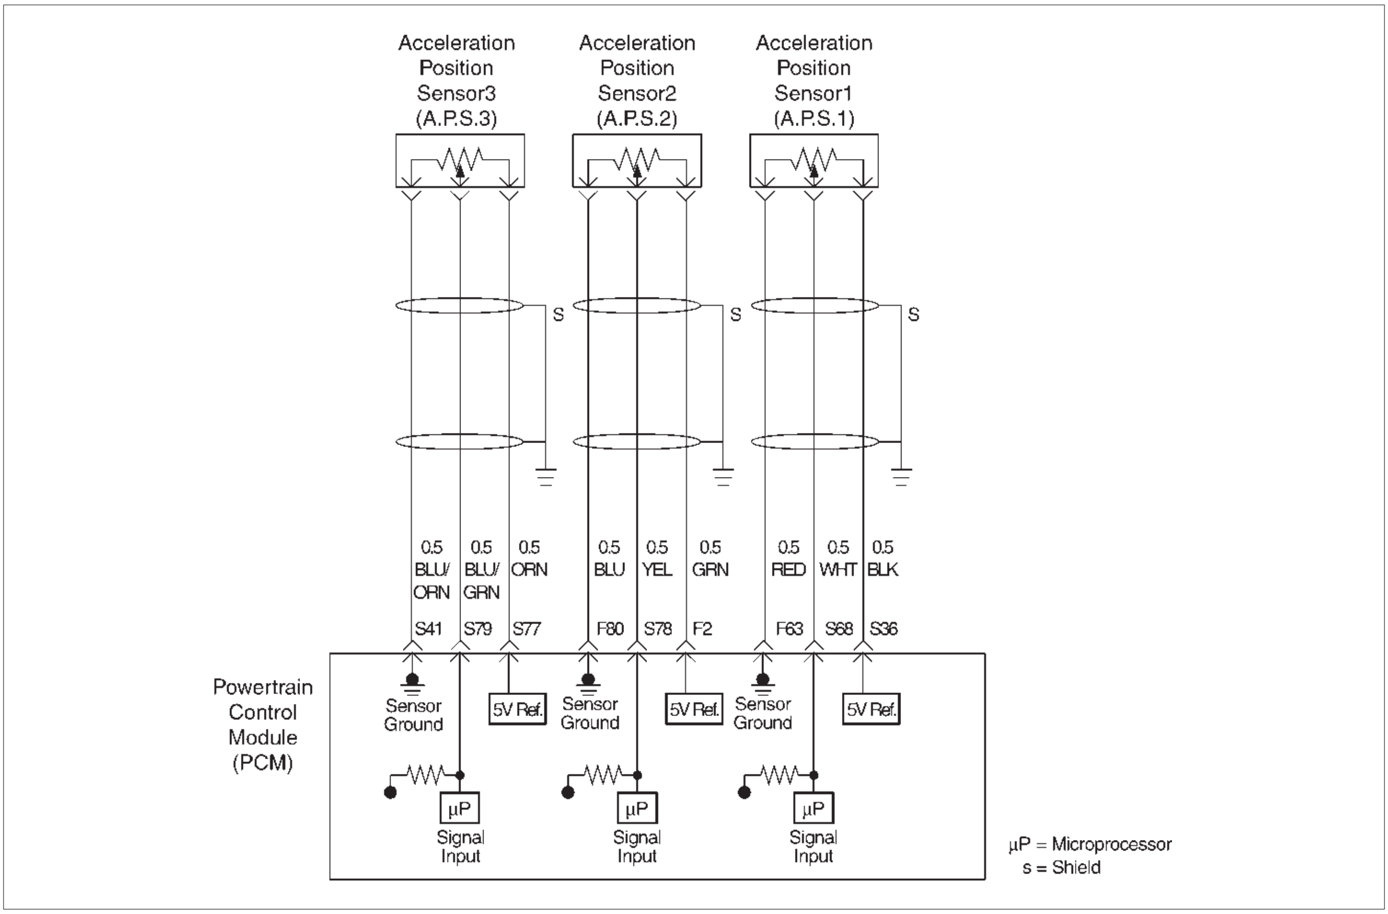
Diagnostic Trouble Code (DTC) P1280 APS 2 Circuit Fault



Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP2) will vary about 87 % at idle position to about 13 % at wide open throttle(WOT).

  This code detects a continuous short to ground or high in either the cicuit or the sensor.

Conditions for setting the DTC

- The Ignition is “ON”.
- The acceleration pedal angle is less than 2.5 % or more than 97 % for 12 counts within 500 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1280 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1280 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the APP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1280 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC

P1280 Diagnostic Chart may isolate the cause of the fault.

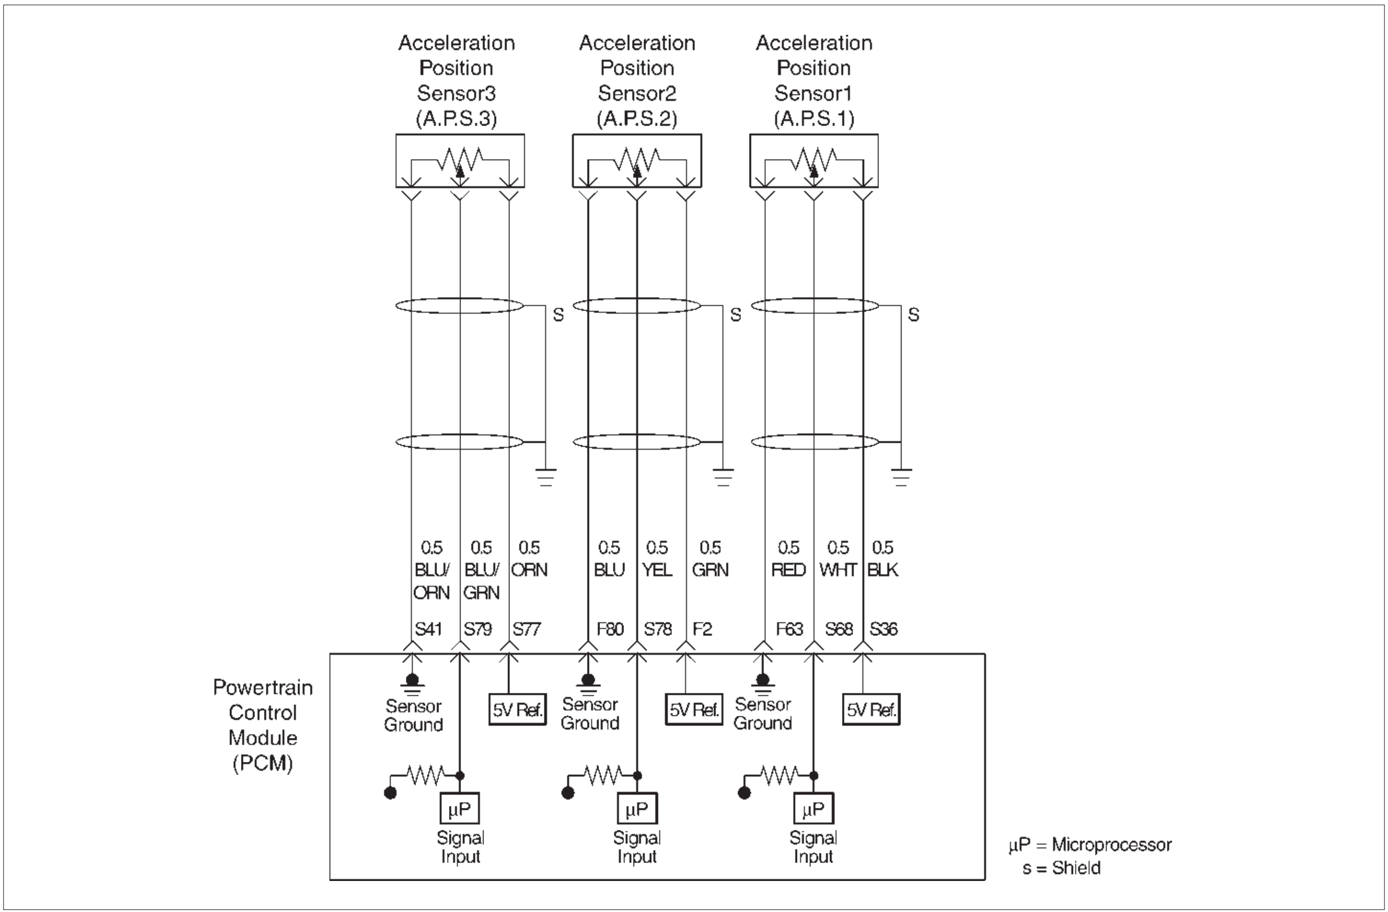
Diagnostic Trouble Code (DTC) P1285 APS 3 Circuit Fault



D06RY00075

Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP3) will vary about 87 % at idle position to about 34 % at wide open throttle(WOT).

  This code detects a continuous short to ground or high in either the circuit or the sensor.

Conditions for setting the DTC

- The Ignition is “ON”.
- The acceleration pedal angle is less than 2.5 % or more than 97 % for 12 counts within 500 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1285 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1285 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the APP sensor 3 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1285 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC

P1285 Diagnostic Chart may isolate the cause of the fault.

DTC P1285 – APS 3 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	Observe the AP angle reading on the Tech 2 while slowly opening the throttle. Does the AP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Idle position =86 ~ 88 %Wide open throttle =32 ~ 36 %	Refer to *Diagnostic Aids*	Go to *Step 4*
4	1. Disconnect the AP sensor. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	0V	Go to *Step 5*	Go to *Step 6*
5	1. Connect a test light between the 5 Voltge supply circuit and the AP3 sensor signal circuit at the AP sensor harness connector. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	5V	Go to *Step 7*	Go to *Step 8*
6	Check the following items; 1. AP3 signal circuit for a short to voltage. 2. AP3 sensor ground circuit for high resistance between the PCM and the AP sensor. 3. AP3 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
7	Check the following items; 1. AP3 signal circuit or 5 volge supply circuit for a poor connection. 2. AP3 signal circuit or 5 volge supply circuit for high resistance between the PCM and the AP3 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
8	Replace the AP sensor. Is the action complete?	—	Verify repair	—
9	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Diagnostic Trouble Code (DTC) P1290 ETC Forced Idle Mode

D06RY00163

Circuit Description

- The acceleration position (AP) sensor circuit provides a voltage signal relative to acceleration pedal angle.

  The acceleration pedal angle (AP1) will vary about 13 % at idle position to about 87 % at wide open throttle (WOT).

  This code detects that if the systm is in Forced Idle Mode. (Fail safe Mode)

Conditions for setting the DTC

- The Ignition is “ON”.
- Forced Idle Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1290 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1290 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the APP sensor 1, APP sensor 2, APP sensor 3 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1290 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC

P1290 Diagnostic Chart may isolate the cause of the fault.

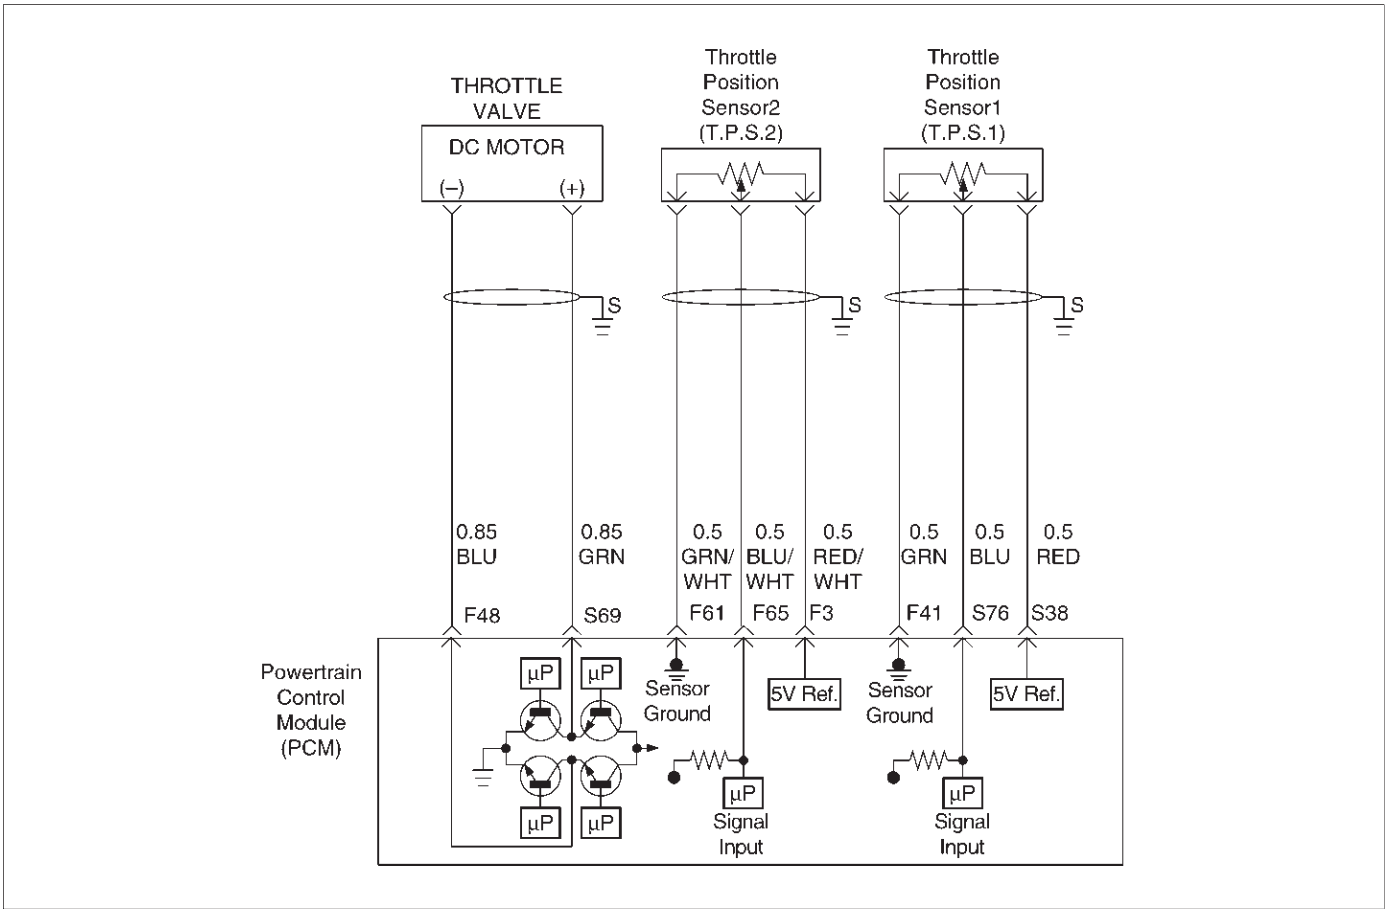
DTC P1290 - ETC Forced Idle Mode

Step	Action	Value(s)	Yes	No
1	Was the “On - Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	Observe the AP angle reading on the Tech2 while slowly opening the throttle. Does the AP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Idle position APP sensor 1 =12 ~ 14 % APP sensor 2, 3 =86 ~ 88 % Wide open throttle APP sensor 1 =86 ~ 88 % APP sensor 2 =12 ~ 14 % APP sensor 3 =32 ~ 36 %	Refer to *Diagnostic Aids*	Go to *Step 4*
4	1. Disconnect the AP sensor. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	0V	Go to *Step 5*	Go to *Step 6*
5	1. Connect a test light between the 5 Voltge supply circuit and the AP1, AP2 and AP3 sensor signal circuit at the AP sensor harness connector. 2. Observe the AP sensor reading on the Tech2. Is the AP sensor reading near the specified value?	5V	Go to *Step 7*	Go to *Step 8*
6	Check the following items; 1. AP1,AP2 and AP3 signal circuit for a short to voltage. 2. AP1, AP2 and AP3 sensor ground circuit for high resistance between the PCM and the AP sensor. 3. AP1, AP2 and AP3 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
7	Check the following items; 1. AP1, AP2 and AP3 signal circuit or 5 volge supply circuit for a poor connection. 2. AP1, AP2 and AP3 signal circuit or 5 volge supply circuit for high resistance between the PCM and the AP1, AP2 and AP3 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*

DTC P1290 - ETC Forced Idle Mode (Cont'd)

Step	Action	Value(s)	Yes	No
8	Replace the AP sensor. Is the action complete?	—	Verify repair	—
9	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1295 Power Management Mode



D06RY00111

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle).

  The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle (WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain Control Module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations.

  A large quantitiy of air entering the engine indicates an accleration or high load situation, while a small quantity or air indicates deceleration or idle.

  The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7g/s at idle to around 25 to 40g/s at maximum engine load.
- This DTC ditects that if the systm is in PowerManagement Mode.(Fail safe Mode)

Conditions for setting the DTC

- The ignition is “ON”.
- Power Management Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1295 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1295 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken

locks, improperly formed or damaged terminals,and poor terminal to wire connection.

- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault.If DTC P1295 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC P1295 Diagnostic Chart may isolate the cause of the fault.

DTC P1295 - Power Management Mode

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P1295. Does the Tech 2 indicate DTC P1295 failed this ignition?	—	Go to *Step 4*	Refer to *Diagnostic Aids*
4	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =8 ~ 10 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =90 ~ 92 %	Go to *Step 9*	Go to *Step 5*
5	1. Ignition "OFF." 2. Disconnect the DC motor. Is the DC motor reading near the specified value?	0.3 ~ 100 Ω	Go to *Step 6*	Go to *Step 8*
6	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the throttle valve assembly. Was a problem found?		Verify repair	Go to *Step 8*
8	Replace the DC motor. (Replace the Throttle valve assembly) Is the action complete?	—	Verify repair	Go to *Step 7*
9	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0V	Go to *Step 10*	Go to *Step 11*

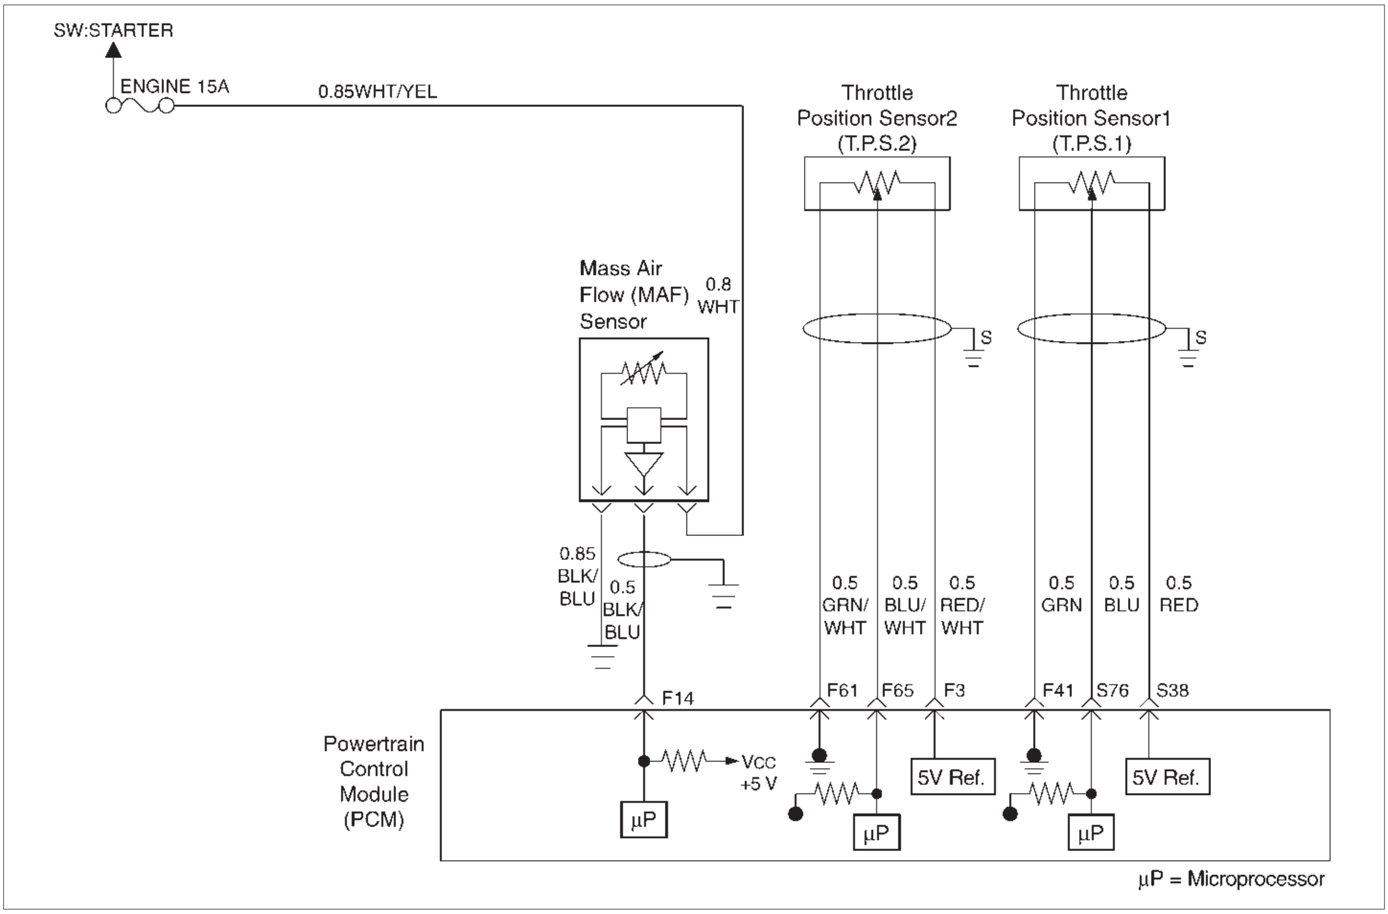
DTC P1295 - Power Management Mode (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Connect a test light between the 5Volt reference "A"circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to *Step 13*	Go to *Step 12*
11	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
12	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
13	Replace the TP sensor. Is the action complete?	—	Verify repair	—
14	1. Start the engine. 2. With the engine idling, monitor "MAF Frequency" display on the Tech 2. Is the "MAF Frequency" below the specified value?	6 ~ 10 g/s	Go to *Step 15*	Go to *Step 18*
15	1. Ignition "OFF." 2. Disconnect the MAF sensor connector. 3. Ignition "ON," engine idling. 4. Using a Tech 2, monitor "MAF Frequency." Does the Tech 2 indicate a "MAF Frequency" at the specified value?	0g/s	Go to *Step 16*	Go to *Step 17*
16	Replace the MAF sensor. Is the action complete?	—	Verify repair	Go to *Step 19*
17	1. Check the MAF harness for incorrect routing near high voltage components (solenoids, relays, motors). 2. If incorrect routing is found, correct the harness routing. Was a problem found?	—	Verify repair	Go to *Step 17*
18	1. With the engine idling, monitor "MAF Frequency." display on the Tech 2. 2. Quickly snap open throttle to wide open throttle while under a road load and record value. Does the Tech 2 indicate a "MAF Frequency" at thespecified value?	6 ~ 10 g/s	Go to *Step 16*	Go to *Step 19*

DTC P1295 - Power Management Mode (Cont'd)

Step	Action	Value(s)	Yes	No
19	1. Ignition "ON",engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65kPa	Go to *Step 20*	Go to *Step 23*
20	1. Disconnect the MAP sensor. 2. Connect a test 5 volt reference circuit and the MAP signal at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value? (If no, start with diagnosis chart forother sensors in the circuit and see if 5V returns.)	—	Go to *Step 22*	Go to *Step 21*
21	1. Check the MAP signal circuit between the PCM and MAP grund circuit. 2. If the MAP signal circuit is open or shoted, repair it as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to *Step 23*
22	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
23	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin.Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1299 ETC Forced Engine Shutdown Mode



D06RY00113

Circuit Description

- The throttle position sensor circuit provides a voltage signal relative to throttle position (blade angle).

  The throttle blade angle will vary about 8% at closed throttle to about 92% at wide open throttle(WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain Control Module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations. A laege quantitiy of air entering the engine indicates an accleration or high load situation, while a small quantity or air indicates deceleration or idle.

  The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7g/s at idle to around 25 to 40g/s at maximum engine load.
- This DTC ditects if the system is in ECT Forced Engine Shutdown Mode.(Fail safe Mode)

Conditions for setting the DTC

- The ignition is “ON”.
- ECT Forced Engine Shutdown Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1299 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1299 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech 2 while

moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1299 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1299 Diagnostic Chart may isolate the cause of the fault.

DTC P1299 - ETC Forced Engine Shutdown Mode

Step	Action	Value(s)	Yes	No

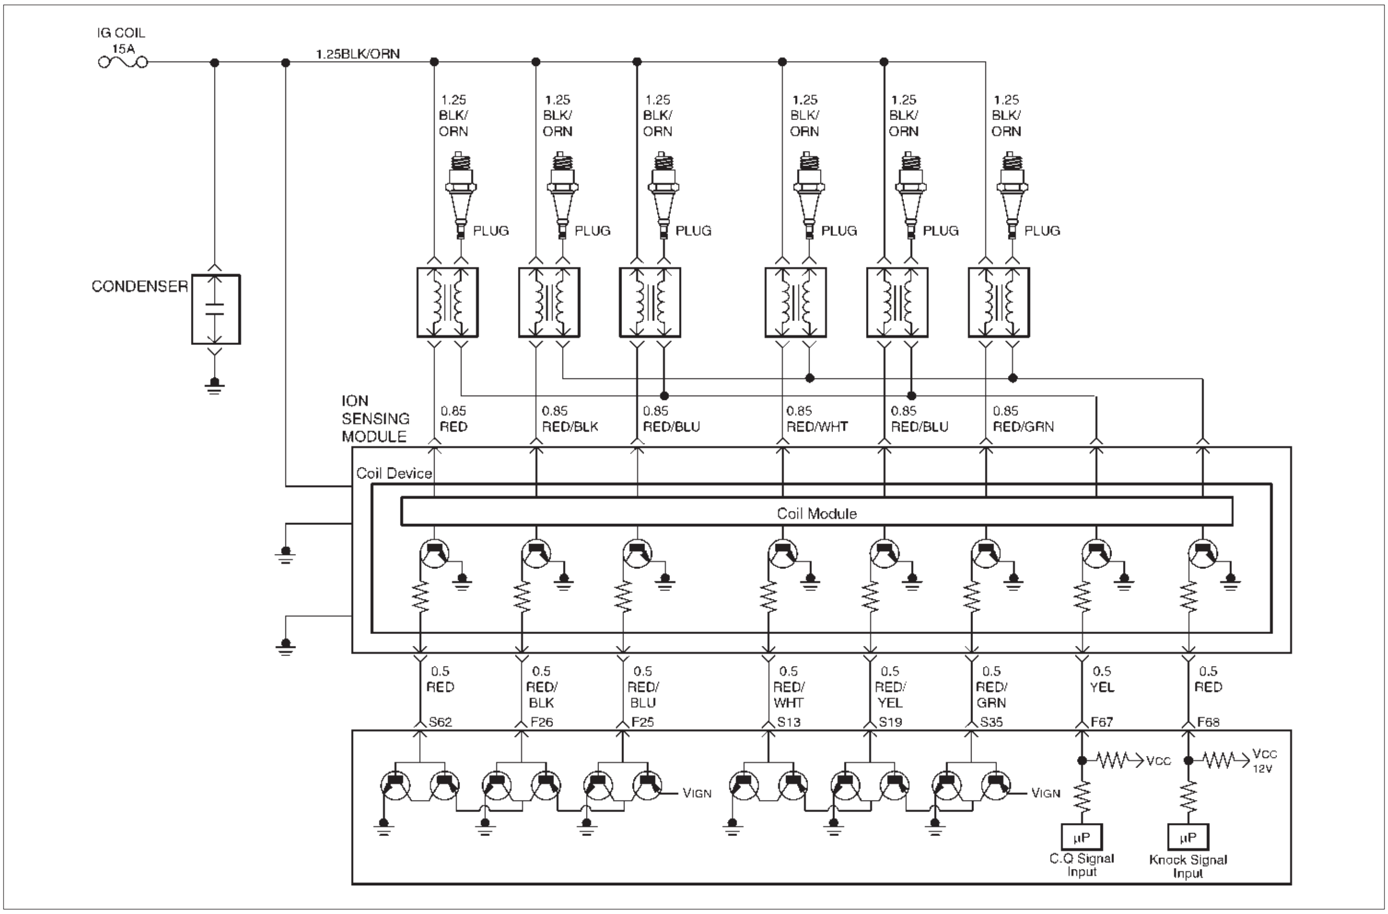
Diagnostic Trouble Code (DTC) P1310 ION Sensing Module Diagnosis



D06RY00067

Circuit Description

The Power Control Module (PCM) checks the validity of the signals used in the ION Sensing module at the following engine operating conditions.

- The Deceleration Fuel Cut Off (DFCO) test is performed to evaluate the Combustion Quality (CQ) signal pulse width if it is below a predetermined value, the value it is expected to be during DFCO conditions. If the CQ signal pilse width is above the predetermined threshold, the fail counter will be incremented. If the failure counter exceeds the calibration, then the test is conplete and a failure will be reported.
- The Power Enrichment (PE) test is performed to evaluate the Combustion Quality (CQ) signal pulse width if it is below a predetermined value, the value it is expected to be during PE conditions.

  If the CQ signal pulse width is above the predetermined threshold, the fail counter will be incremented. If the failure counter exceeds the calibration, then the test is complete and a failure will be reported.
- The Combustion Quality (CQ) test is performed to check if inappropriate (CQ) signal status were detected. If missing CQ pulses or multiple CQ pulses or CQ pulse width calculation errors were detected, the fail counter will be incremented. If the failure counter exceeds the calibration, then the test is complete and a failure will be reported.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- MAP sensor signal is between 26kPa and 100 kPa.
- Fuel level is more than 10%.
- Engine speed is between 650rpm and 6500rpm.
- No Crank DTCs set.
- No System voltage DTCs set.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1310 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1310 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1310 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1310 Diagnostic Chart may isolate the cause of the fault.

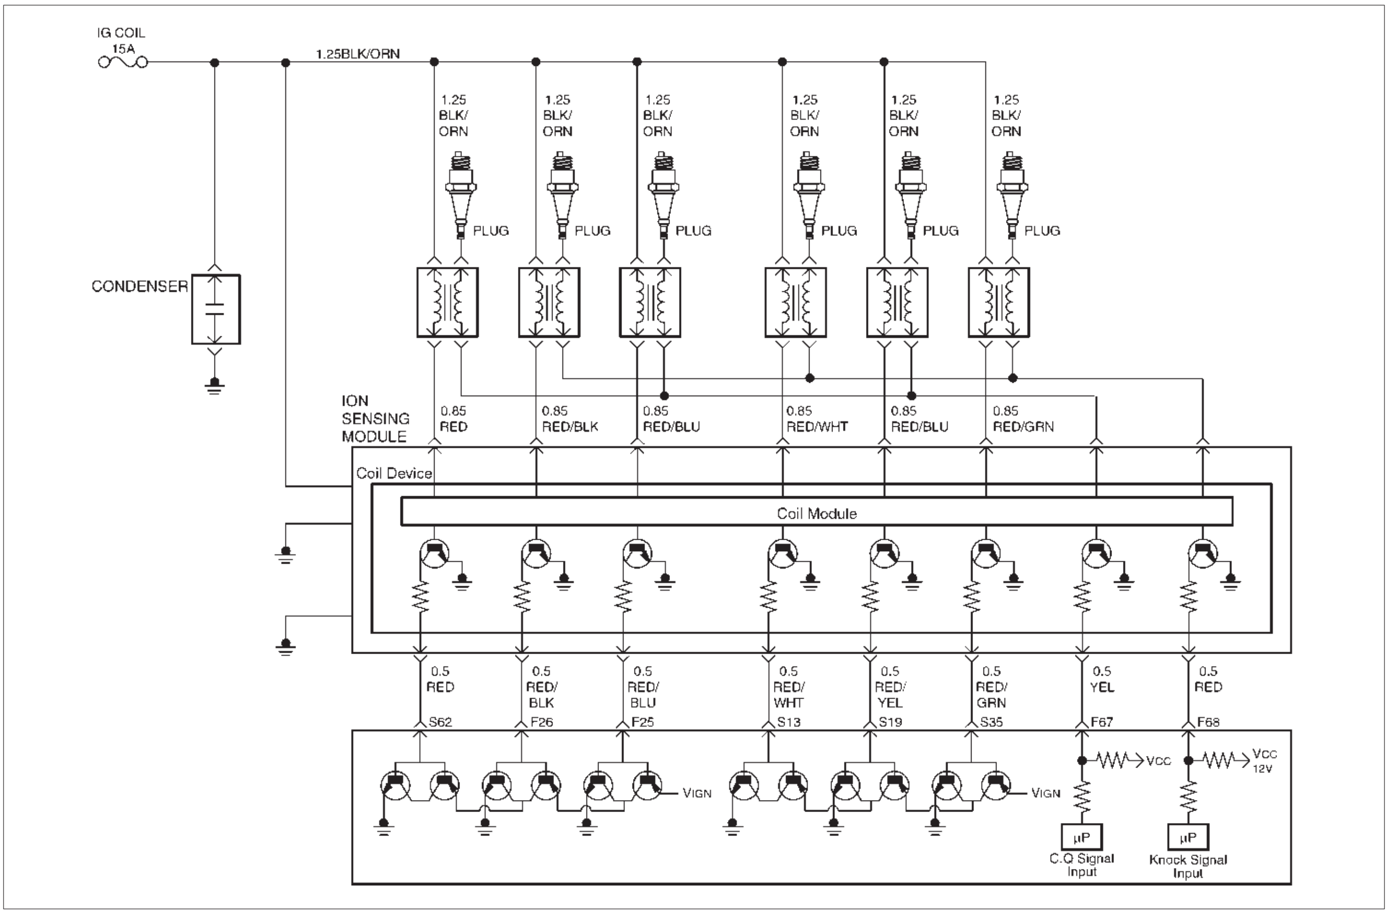
DTC P1310 - ION Sensing Module Diagnostic

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P1310. Does the Tech 2 indicate DTC P1310 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Ignition “OFF.” 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 4*	Go to *Step 3*
4	Check the ION Sensing harness between the PCM and ION Sensing module circuit harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 6*	Go to *Step 5*
6	Check the ION Sensing harness between the ignition coil and ION Sensing module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 9*

DTC P1310 - ION Sensing Module Diagnostic (Cont'd)

Step	Action	Value(s)	Yes	No
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 11*
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to *Step 10*
11	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1311 ION Sensing Module SEC line 1 Circuit Fault



D06RY00067

Circuit Description

- The Power Control Module (PCM) will compara the secondary current reading to a predetermined maximum and minimum thresholds.

  If the secondary current signal pulse width is out of the predetermined renge, the fail counter will be incremented. If the failure counter exceeds the calibration, then the PCM is complete and a failure will be reported. If the sample counter threshold is reached before the failure threshold, then the PCM is complete and pass will be reported.

  This PCM will detect an open/short circuit in the secondary current sense input circuit, misfire on the entire bank for the secondary current sense input circuit, coil failure, and same internal Ignition Current Sense System (ICSS) module faults.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- MAP sensor signal is between 26kPa and 100 kPa.
- Fuel level is more than 10%.
- Engine speed is between 650rpm and 6500rpm.
- ION Sensing Module circuit is open or shorted signals on the SEC 1 line.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1311 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1311 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.
- A change in the display will indicate the location of the fault. If DTC P1311 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.
- If it is determined that the DTC occurs intermittently, performing the DTC P1311 Diagnostic Chart may isolate the cause of the fault.

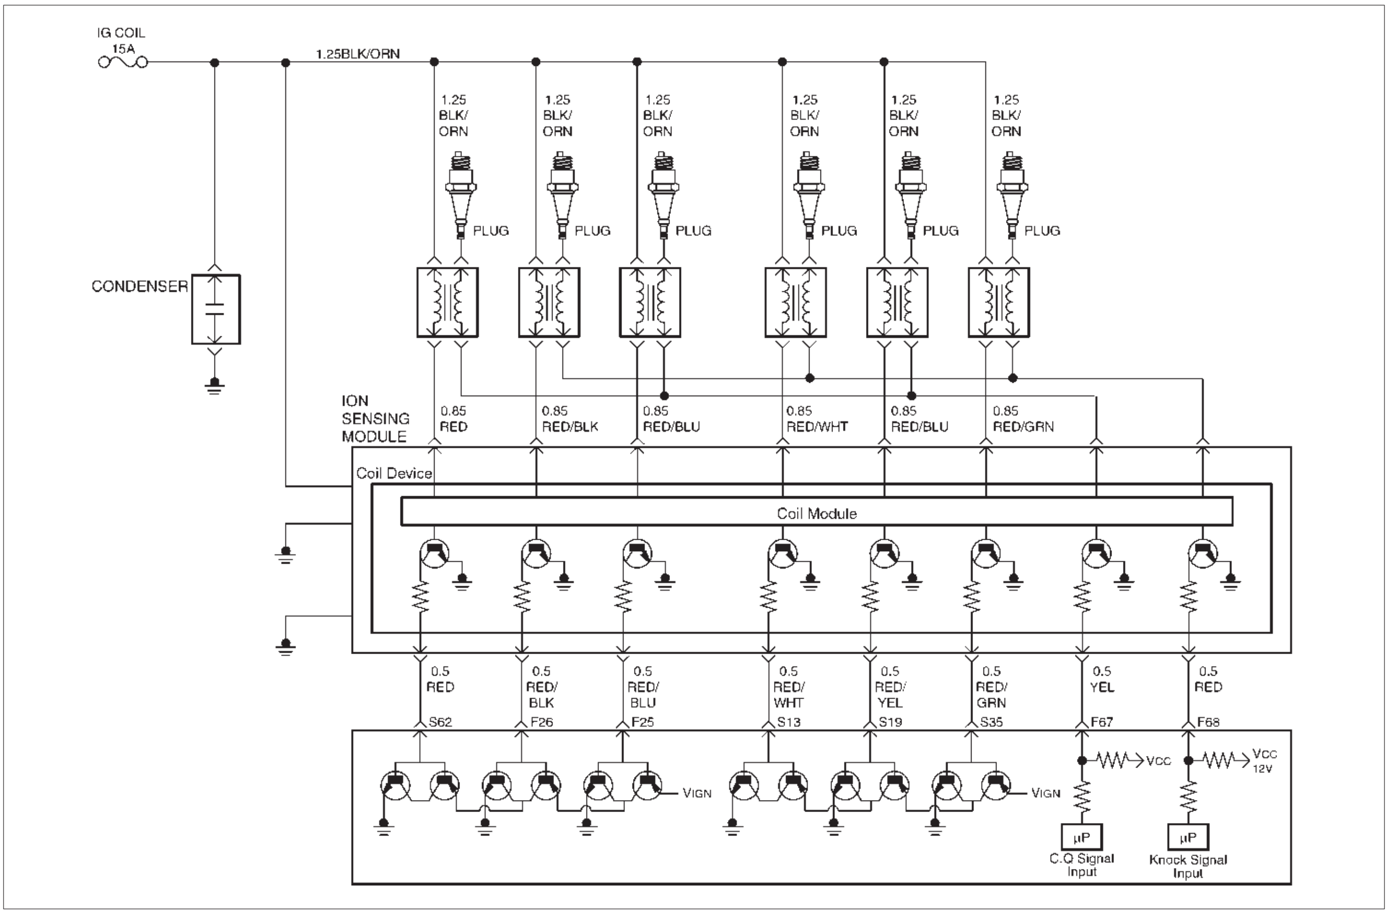
DTC P1311 - ION Sensing Module SEC line 1 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P1311. Does the Tech 2 indicate DTC P1311 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Ignition “OFF.” 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 4*	Go to *Step 3*
4	Check the ION Sensing module harness between the PCM and ION Sensing module circuit at the ION Sensing module harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 6*	Go to *Step 5*
6	Check the ION Sensing module harness between the ignition coil and ION Sensing module circuit at the SEC line 1 harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 9*
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 11*

DTC P1311 - ION Sensing Module SEC line 1 Circuit Fault (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to *Step 10*
11	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1312 ION Sensing Module SEC line 2 Circuit Fault



D06RY00067

Circuit Description

- The Power Control Module (PCM) will compara the secondary current reading to a predetermined maximum and minimum thresholds.

  If the secondary current signal pulse width is out of the predetermined renge, the fail counter will be incremented. If the failure counter exceeds the calibration, then the PCM is complete and a failure will be reported. If the sample counter threshold is reached before the failure threshold, then the PCM is complete and pass will be reported.

  This PCM will detect an open/short circuit in the secondary current sense input circuit, misfire on the entire bank for the secondary current sense input circuit, coil failure, and same internal Ignition Current Sense System (ICSS) module faults.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- MAP sensor signal is between 26kPa and 100 kPa.
- Fuel level is more than 10%.
- Engine speed is between 650rpm and 6500rpm.
- ION Sensing Module circuit is open or shorted signals on the SEC 2 line.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1312 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1312 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1312 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1312 Diagnostic Chart may isolate the cause of the fault.

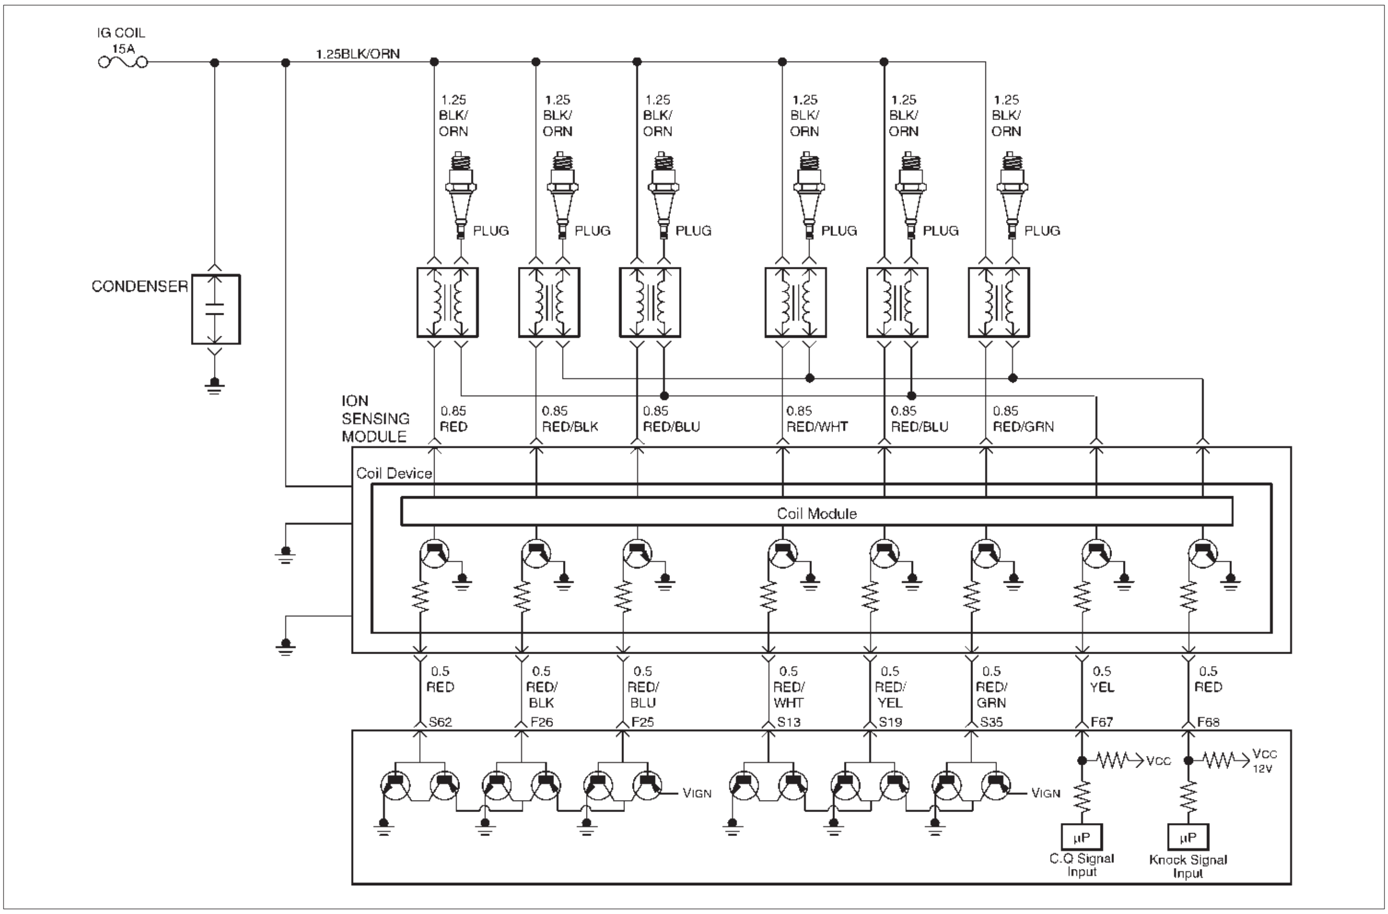
DTC P1312 - ION Sensing Module SEC line 2 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P1312. Does the Tech 2 indicate DTC P1312 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Ignition "OFF." 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 4*	Go to *Step 3*
4	Check the ION Sensing module harness between the PCM and ICSS module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 6*	Go to *Step 5*
6	Check the ION Sensing module harness between the ignition coil and ION Sensing module circuit at the SEC line 2 harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 9*
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 11*

DTC P1312 - ION Sensing Module SEC line 2 Circuit Fault (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to *Step 10*
11	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1326 ION Sensing Module Combustion Quality Input Circuit Fault



D06RY00067

Circuit Description

The Power Control Module (PCM) checks the validity of the signals used in the ION Sensing module at the following engine operating conditions.

- The test is performed to evauate the Combustion Quality (CQ) signal pulse width if it is within a predetermined range. If the CQ signal puls width is out of the predetermined range, the fail counter will be incremented. If the failure counter exceeds the calibration, then test is complete and a failure will be reported. If the sample counter threshold is reached before the failure threshold, then the test is complete and a pass will be reported. This test will detect an open/short in the QC line circuit, ION Sensing module faults and analog input faults in the PCM.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- No Cramk DTCs set.
- No cylinder ID DTCs set.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1326 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1326 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1326 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1326 Diagnostic Chart may isolate the cause of the fault.

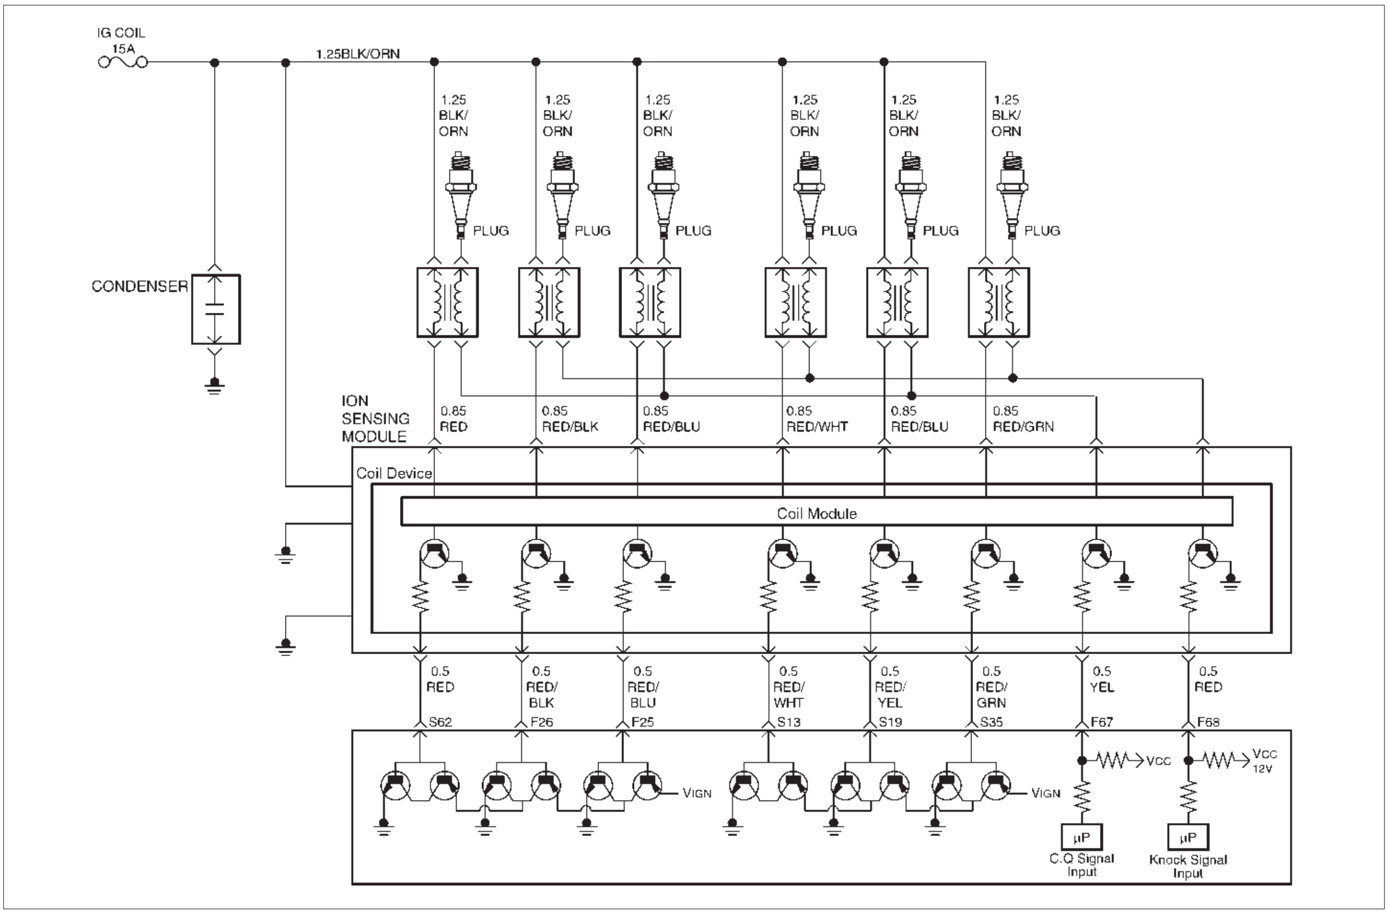
DTC P1326 - ION Sensing Module Combustion

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC”info for DTC P1326. Does the Tech 2 indicate DTC P1326 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Ignition “OFF.” 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 4*	Go to *Step 3*
4	Check the ION Sensing module harness between the PCM and ION Sensing module circuit at the QC line harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 6*	Go to *Step 5*
6	Check the ION Sensing module harness between the ignition coil and ICSS module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 9*
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 11*

DTC P1326 - ION Sensing Module Combustion (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to *Step 10*
11	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin .Check to see if the latest software is released or not. And then Down Load the LATEST PROGRMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)
P1340 ION Sensing Module Cylinder ID Fault (Cylinder Synchronization Fail)



D06RY00067

Circuit Description

The Power Control Module (PCM) checks the validity of the signals used in the ION Sensing module at the following engine opreating conditions.

- This test will return a fault if the cylinder synchronization routine has not been completed after a predetermined number of events after crank. This test will detect fault that will prevent the PCM from synchronaization, such as Knock Signal (KI) - Combustion Quality (CQ) lines being swapped, shorted spark plugs, ION Sensing module faults, an PCM hardware faults.

Conditions for setting the DTC

- Ignition voltage is between 11volt and 16 volts.
- Engine speed is between 650rpm and 6500rpm.
- No ECT DTCs set.
- No injector DTCs set.
- No Fuel Trim DTCs set.
- No Misfire DTCs set.
- No system voltage DTCs set.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1340 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1340 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals,and poor terminal to wire connection.
- Damaged harness–Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1340 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1340 Diagnostic Chart may isolate the cause of the fault.

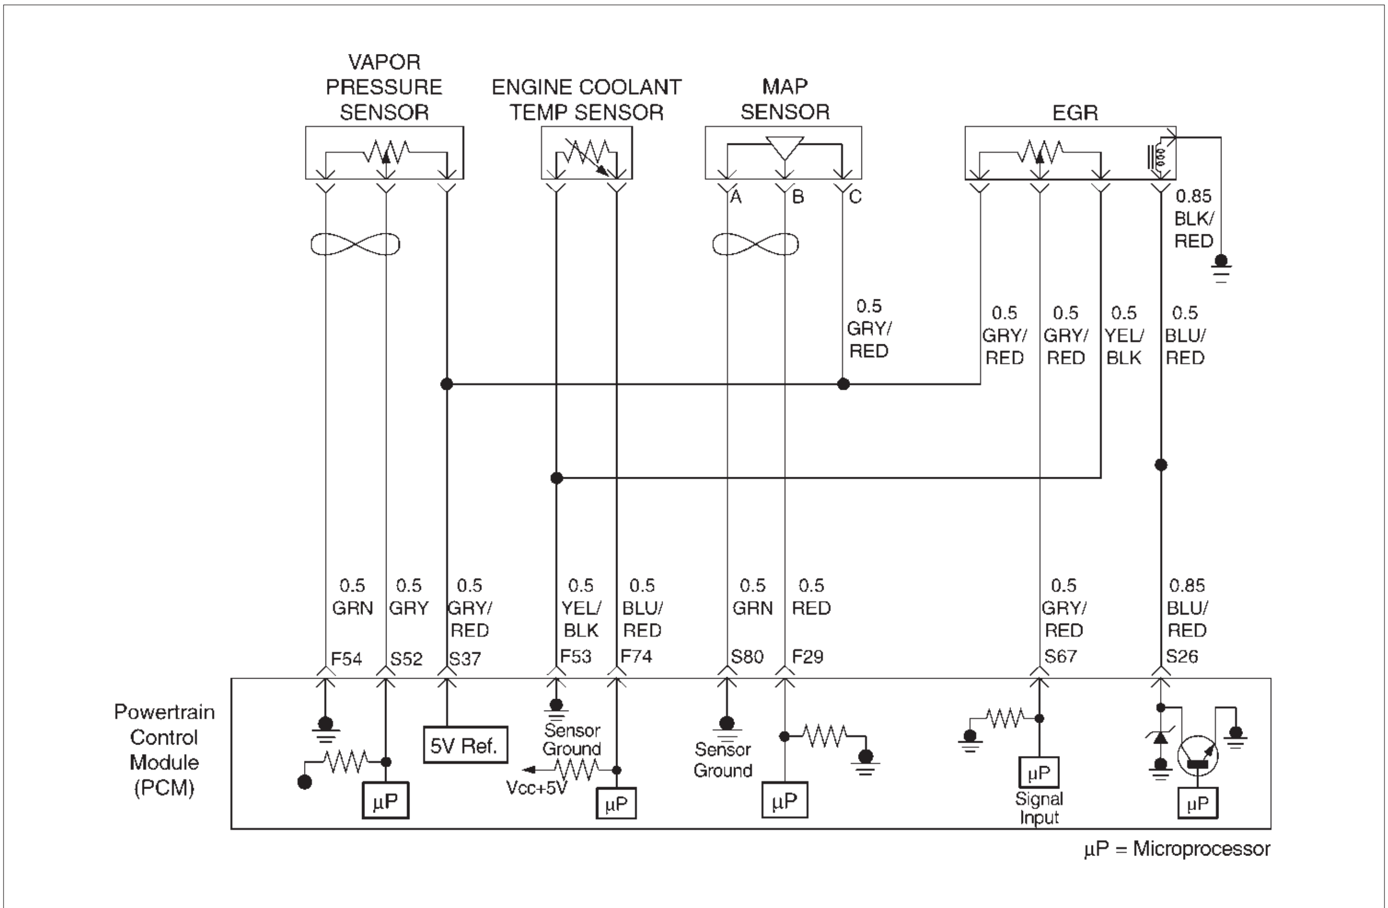
DTC P1340 - ION Sensing Module Cylinder ID Fault (Cylinder Synchronization Fail)

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “ DTC” info for DTC P1340. Does the Tech 2 indicate DTC P1340 failed thisignition?	—	Go to *Step 3*	Refer to *DiagnosticAids*
3	1. Ignition “OFF.” 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 4*	Go to *Step 3*
4	Check the ION Sensing module harness between the PCM and ICSS module circuit at the QC line harness connector. Was a problem found?	—	Verify repair	Go to *Step 6*
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 6*	Go to *Step 5*
6	Check the ION Sensing module harness between the ignition coil and ION Sensing module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 9*
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 11*

DTC P1340 - ION Sensing Module Cylinder ID Fault (Cylinder Synchronization Fail) (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to *Step 10*
11	Replace the PCM. **IMPORTANT:** IMPORTANT; The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin.Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1404 EGR Stuck Closed



D06RY00145

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to commands from the PCM, and to detect a fault if current pintle zero position is different from the learned zero position. If the PCM detects a pintle position signal indicates more than 30 % different between current zero position and the learned zero position for more than 5 seconds, and this condition exists 3 times during trip, then the PCM will set DTC P1404.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- Intake Air temp is more than 3°C.
- Desired EGR position is 0.
- Difference of EGR pintle position between current and the learned zero is more than 30 % for more than 5 seconds, and exists three time to the above condition during a trip the PCM will set DTC 1404. Then it trigger the PCM lights on.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after consecutive 2nd trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1404 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1404 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Excessive carbon deposit on EGR valve shaft and/or foreign material may cause the EGR valve not to fully seated. The carbon deposit may occur by unusual port operation. Remove foreign material and/or excessive carbon deposit on EGR valve shaft and may allow the EGR valve to be fully seated.
- Poor connection or damaged harness – Inspect the wiring harness for damage.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

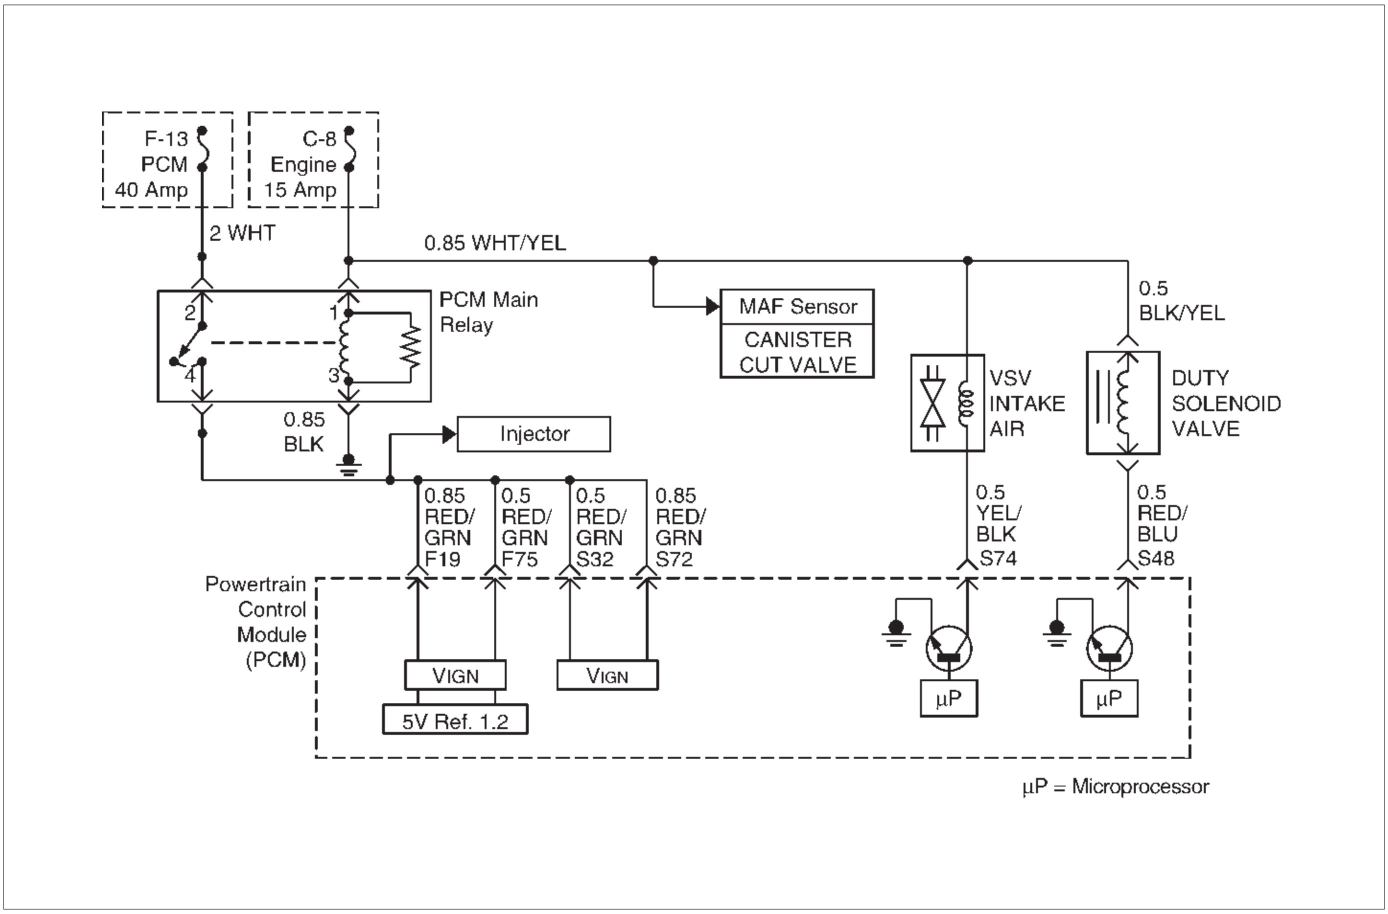
DTC P1404 – EGR Stuck Closed

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON,” engine “OFF”, review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor “DTC inf. for DTC P1404 until the DTC P1404 test runs. Note the result. Does the Tech 2 indicates DTC P1404 failed this ignition?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to *Step 4*	Go to *Step 5*
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
5	1. Remove EGR valve from Engine. 2. Inspect EGR valve for any excessive carbon deposit on EGR shaft. 3. Inspect for any foreign material inside of EGR valve. Was excessive carbon deposit on EGR valve shaft and/or foreign material in EGR valve ?	—	Go to *Step 6*	Go to *Step 7*
6	1. Clean up EGR valve shaft and inside of EGR valve. 2. Remove foreign material from EGR valve. 3. Visually inspect damage of pintle and seat to see if it is bent. If damaged leakage may occur. Was there any severe damage which affects function?	—	Go to *Step 8*	Verify repair Go to *Step 7*
7	1. Install the EGR valve. 2. Ignition “OFF”. 3. Install the Tech 2. 4. Run the engine at idle. 5. On the Tech 2, select EGR Control Test. 6. Use the “UP” arrow to increase the EGR from 0% to 40%. Did EGR work properly?	—	—	Go to *Step 8*
8	1. Reset the learned zero EGR valve position. 2. Repeat step 7. Did EGR work properly?	—	Verify repair	Go to *Step 9*

DTC P1404 – EGR Stuck Closed (Cont'd)

Step	Action	Value(s)	Yes	No
9	Replace the EGR valve. Does DTC P1404 still fail "DTC" test on the Tech 2?	—	Go to *Step 10*	Verify repair
10	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1441 EVAP System Flow During Non-Purge



Circuit Description

Canister purge is controlled by a solenoid valve that allows manifold vacuum to purge the canister. The powertrain control module (PCM) supplies a ground to energize the solenoid valve (purge "ON"). The EVAP purge solenoid control is pulse-width modulated (PWM) or turned "ON" and "OFF" several times a second. The duty cycle (pulse width) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the PCM and the output is commanded when the appropriate conditions have been met.

The EVAP purge vacuum switch is a normally closed switch positioned in the purge line between the canister and to EVAP purge solenoid. The EVAP purge vacuum switch will open when vacuum increases to greater than 5 inches of water in the purge line. The PCM monitors the EVAP purge vacuum switch signal to determine if the evaporative emission control system is working properly. If the switch is open (purge flow detected) when the PCM is not commanding the EVAP purge solenoid "ON," DTC P1441 will be set.

Conditions for Setting the DTC

- No active ECT sensor, IAT sensor, MAP sensor, vacuum switch, or TP sensor DTCs set.
- BARO reading is above 85 kPa.
- Engine coolant temperature is below 70°C (158°F).
- Start-up intake air temperature (IAT) and start-up engine coolant temperature (ECT) are both above 5°C (41°F).
- The difference between start-up ECT and start-up IAT is less than 25°C (45°F).
- TP sensor indicates a throttle position above 12%.
- Battery voltage is between 11.5 volts and 16 volts.
- Engine speed is between 800 and 6,000 RPM.
- Canister purge duty cycle is below 3%.
- Canister purge vacuum switch is open, which results in the PCM signal voltage (from the vacuum switch input) being approximately 12 volts.
- All conditions are present for at least 3 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1441 will clear after 40 consecutive warm–up cycles have occurred without a fault.

- DTC P1441 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wring harness for damage. If the harness appears to be OK, observe the EVAP vacuum switch display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. The canister purge vacuum switch is normally closed when no vacuum (purge) is present. With the ignition “ON” and the engine “OFF,” there shouldn’t be any vacuum (purge) present in the EVAP system.
3. Determines if the PCM is able to control the EVAP purge solenoid valve.
4. Determines if the DTC will set under the conditions present when the DTC was originally stored. If not, the fault is intermittent.
5. Checks for a grounded EVAP purge solenoid driver circuit, a faulty EVAP vacuum switch, or a leaking EVAP purge solenoid valve.

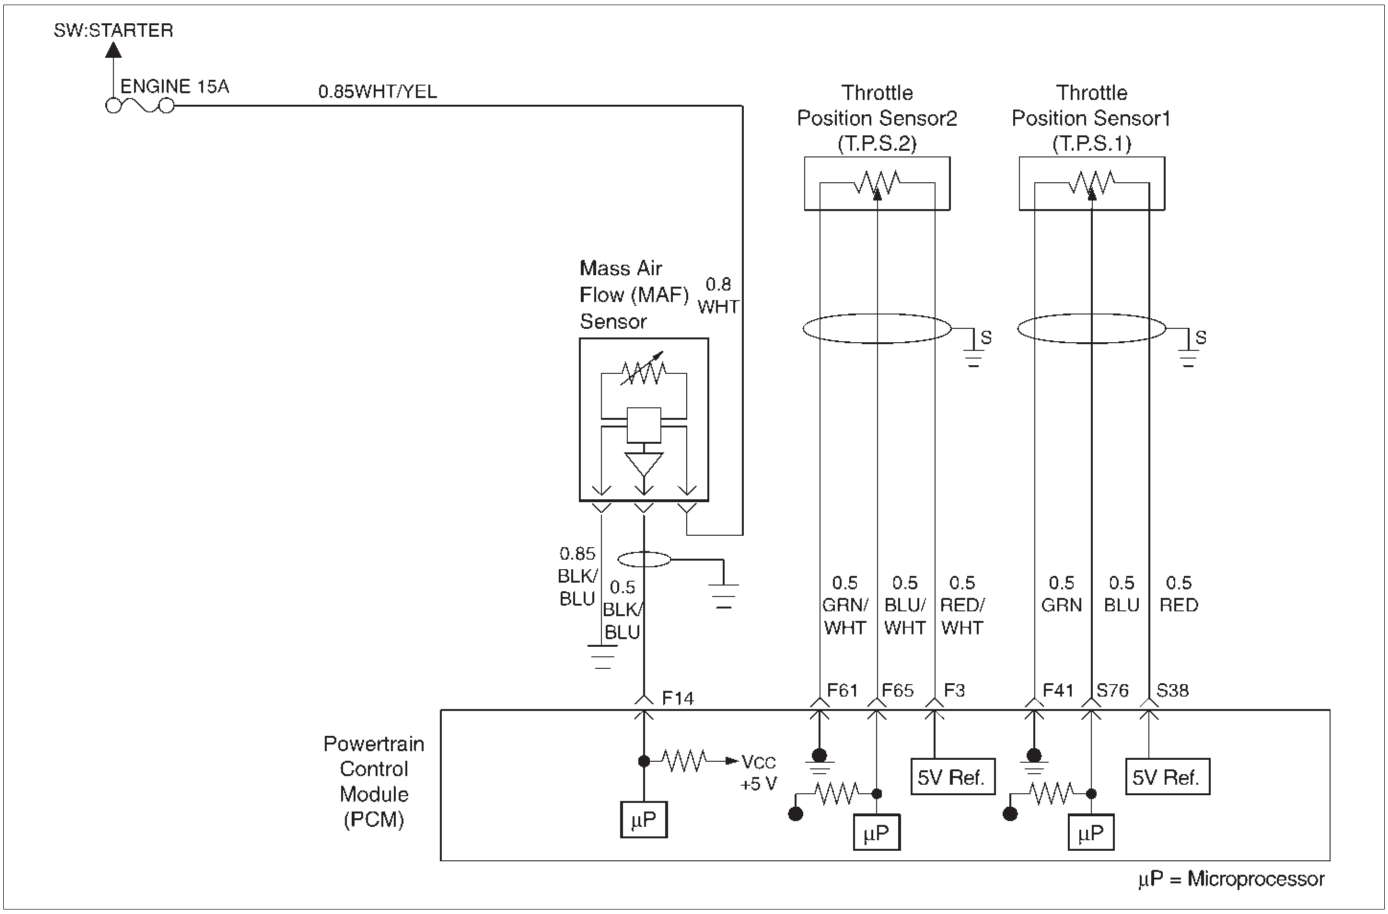
DTC P1441 – EVAP System Flow During Non-Purge

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “OFF.” 2. Remove the fuel filler cap. 3. Ignition “ON.” 4. Observe “Fuel Tank Pressure” on the Tech 2. Is “Fuel Tank Pressure” at the specified value?	1.51V	Go to *Step 3*	Go to *DTC P0452 or P0453*
3	1. Re-install the fuel filler cap. 2. Using the Tech 2, command the EVAP Vent Solenoid Valve “ON” (Closed). 3. Disconnect the canister side rubber hose end that hose is connected between the Purge Solenoid Valve and Canister. **IMPORTANT:** Before continuing with the diagnosis, zero the EVAP pressure/purge cart J41413 (refer to the tool operating instructions). And them monitor the fuel tank inner pressure using the Tech 2. Does the fuel tank pressure remain the specified value?	1.52 - 1.60V	Go to *Step 4*	Go to *Step 6*
4	1. Disconnect the EVAP pressure/purge cart J41413, and then plug the hose end. 2. Disconnect the rubber hose end of engine vacuum source side, (the hose connected between Purge Solenoid Valve and engine). 3. Connect the vacuum hand pump to this rubber hose end. 4. Then apply the -15 in H2O vacuum by the vacuum pump. 5. Monitor the fuel tank inner pressure using the Tech 2. Does the fuel tank inner pressure hold the specified value?	1.47 - 1.51V	Go to *Step 6*	Go to *Step 5*

DTC P1441 – EVAP System Flow During Non-Purge (Cont'd)

Step	Action	Value(s)	Yes	No
5	Replace the Purge Solenoid Valve.	—	Verify Repair	—
6	1. Check leaks, kinks or pinched hoses at the EVAP system rubber hose line, and also check if the rubber hoses are correctly connected or not. 2. Check for a leak from Vent Solenoid Valve and EVAP system rubber hoses, and also check for clogged Filter of air separator which is located near the vent solenoid valve. Was a problem found? Using the Vacuum Hose Routing Diagram, repair or re-connect the rubber hoses correctly.	—	Verify Repair	Go to *Step 7*
7	1. Start engine. 2. Remove the Fuel Filler cap. 3. Using the Tech 2, command the EVAP Vent Solenoid Valve “ON” (closed) and Purge Solenoid Valve “OFF” (0%). 4. Replace the Fuel Filler Cap. 5. Run the engine at 2500RPM constant while monitoring “Fuel Tank Vacuum” on the Tech 2. Does the fuel tank vacuum remain at the specified value while the EVAP Vent Solenoid Valve “ON” (closed) and Purge Solenoid Valve “OFF” (0%)?	30 - 40 %	Verify Repair	Go to *Diagnostic Aids*

Diagnostic Trouble Code (DTC) P1514 TPS - MAF Correlation Error



D06RY00113

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle blade angle.

  The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle (WOT).
- The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain Control Module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations.

  A large quantitiy of air entering the engine indicates an accleration or high load situation, while a small quantity or air indicates deceleration or idle.

  The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7g/s at idle to around 25 to 40g/s at maximum engine load.

Conditions for setting the DTC

- The engine is running.
- No MAF sensor DTCs are set.
- Throttle actuation mode is not off.
- MAF reading-ETC estimated air flow is less than 40g/s for 250 failres within test 1000 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1514 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1514 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM - Inspect harness connectors for backed out terminals, improper mating,broken

locks, improperly formed or damaged terminals,and poor terminal to wire connection.

- Damaged harness - Inspect the wiring harness for damage. If the harness appears to be OK, observe the Mass Air Flow, TP sensor 1, TP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.
- Plugged intake air duct or filter element
- A wide - open throttle acceleration from a stop should cause the mass air flow displayed on a Tech 2 to increase from about 3 – 6 g/s at idle to 100 g/s or greater at the time of the 1 – 2 shift. If not, check for a restriction.

A change in the display will indicate the location of the fault. If DTC P1514 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1514 Diagnostic Chart may isolate the cause of the fault.

DTC P1514 - TPS-MAF Correlation Error

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P1514. Does the Tech 2 indicate DTC P1514 failed this ignition?	—	Go to *Step 4*	Refer to *Diagnostic Aids*
4	1. Start the engine. 2. With the engine idling, monitor “MAF Frequency” display on the Tech 2. Is the “MAF Frequency” below the specified value?	6 ~ 10 g/s	Go to *Step 5*	Go to *Step 8*
5	1. Ignition “OFF.” 2. Disconnect the MAF sensor connector. 3. Ignition “ON,” engine idling. 4. Using a Tech 2, monitor “MAF Frequency.” Does the Tech 2 indicate a “MAF Frequency” at the specified value?	0g/s	Go to *Step 6*	Go to *Step 7*
6	Replace the MAF sensor. Is the action complete?	—	Verify repair	Go to *Step 9*
7	1. Check the MAF harness for incorrect routing near high voltage components (solenoids, relays, motors). 2. If incorrect routing is found, correct the harness routing. Was a problem found?	—	Verify repair	Go to *Step 7*
8	1. With the engine idling, monitor “MAF Frequency.” display on the Tech 2. 2. Quickly snap open throttle to wide open throttle while under a road load and record value. Does the Tech 2 indicate a “MAF Frequency” at thespecified value?	6 ~ 10 g/s	Go to *Step 6*	Go to *Step 9*

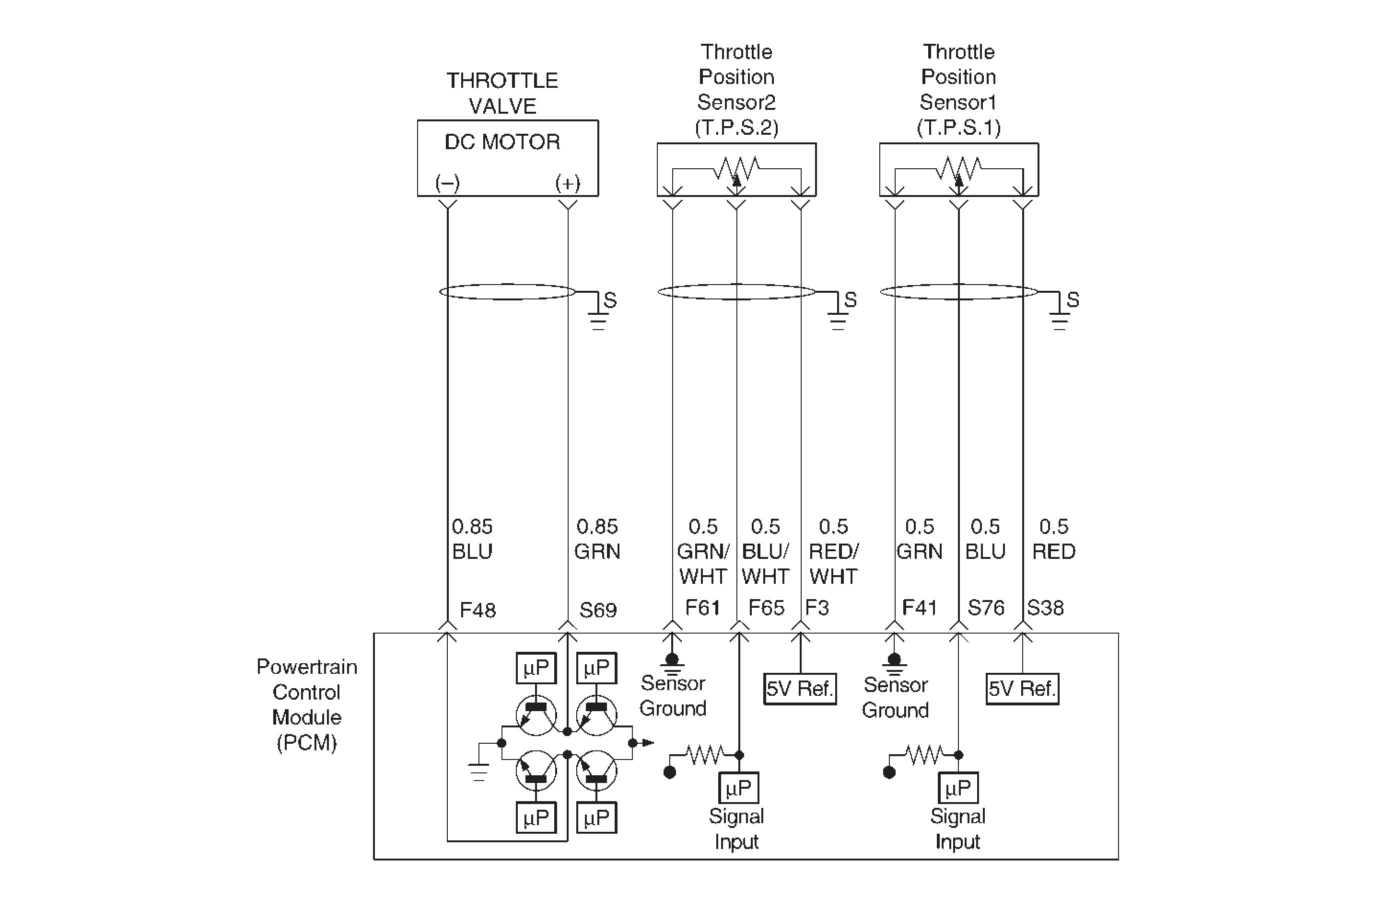
DTC P1514 - TPS-MAF Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Ignition"ON", engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65kPa	Go to *Step 10*	Go to *Step 13*
10	1. Disconnect the MAP sensor. 2. Connect a test 5 volt reference circuit and the MAP signal at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value? (If no, start with diagnosis chart for other sensors in the circuit and see if 5Vreturns.)	—	Go to *Step 12*	Go to *Step 11*
11	1. Check the MAP signal circuit between the PCM and MAP ground circuit. 2. If the MAP signal circuit is open or shoted, repair it as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to *Step 13*
12	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
13	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =8 ~ 10 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =90 ~ 92 %	Refer to *Diagnostic Aids*	Go to *Step 14*
14	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	0V	Go to *Step 15*	Go to *Step 16*
15	1. Connect a test light between the 5Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	5V	Go to *Step 18*	Go to *Step 17*
16	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1 and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 19*

DTC P1514 - TPS-MAF Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
17	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	Replace the TP sensor. Is the action complete?	—	Verify repair	—
19	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin.Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1515 Command - Actual TPS Correlation Error



D06RY00111

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle).

  The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle(WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC ditects the difference between actual throttle position and command throttle position.

Conditions for setting the DTC

- The ignition is “ON”.
- Throttle actuation mode is normal.
- Command Throttle position - Actual Throttle position is more than + 5 % for 100 counts within test 1000 test samples (15.6 m sec) else Actual Throttle position is less than + 40 % and Command Throttle position - Actual Throttle position is more than - 5 % or Command Throttle position - Actual Throttle position is more than - 20 % for 150 failres within test 1000 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1515 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1515 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, mproper mating, locks, improperly formed or damaged terminals, and poor terminal to wire connection.

- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1515 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC P1515 Diagnostic Chart may isolate the cause of the fault.

DTC P1515 - Command - Actual TPS Correlation Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor " DTC" info for DTC P1515. Does the Tech 2 indicate DTC P1515 failed thisignition?	—	Go to *Step 4*	Refer to *Diagnostic Aids*
4	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =8 ~ 10 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =90 ~ 92 %	Go to *Step 8*	Go to *Step 5*
5	1. Ignition "OFF." 2. Disconnect the DC motor. Is the DC motor reading near the specified value?	0.3 ~ 100 Ω	Go to *Step 6*	Go to *Step 7*
6	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to *Step 8*
7	Replace the DC motor. Is the action complete?	—	Verify repair	Go to *Step 6*
8	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0V	Go to *Step 9*	Go to *Step 10*

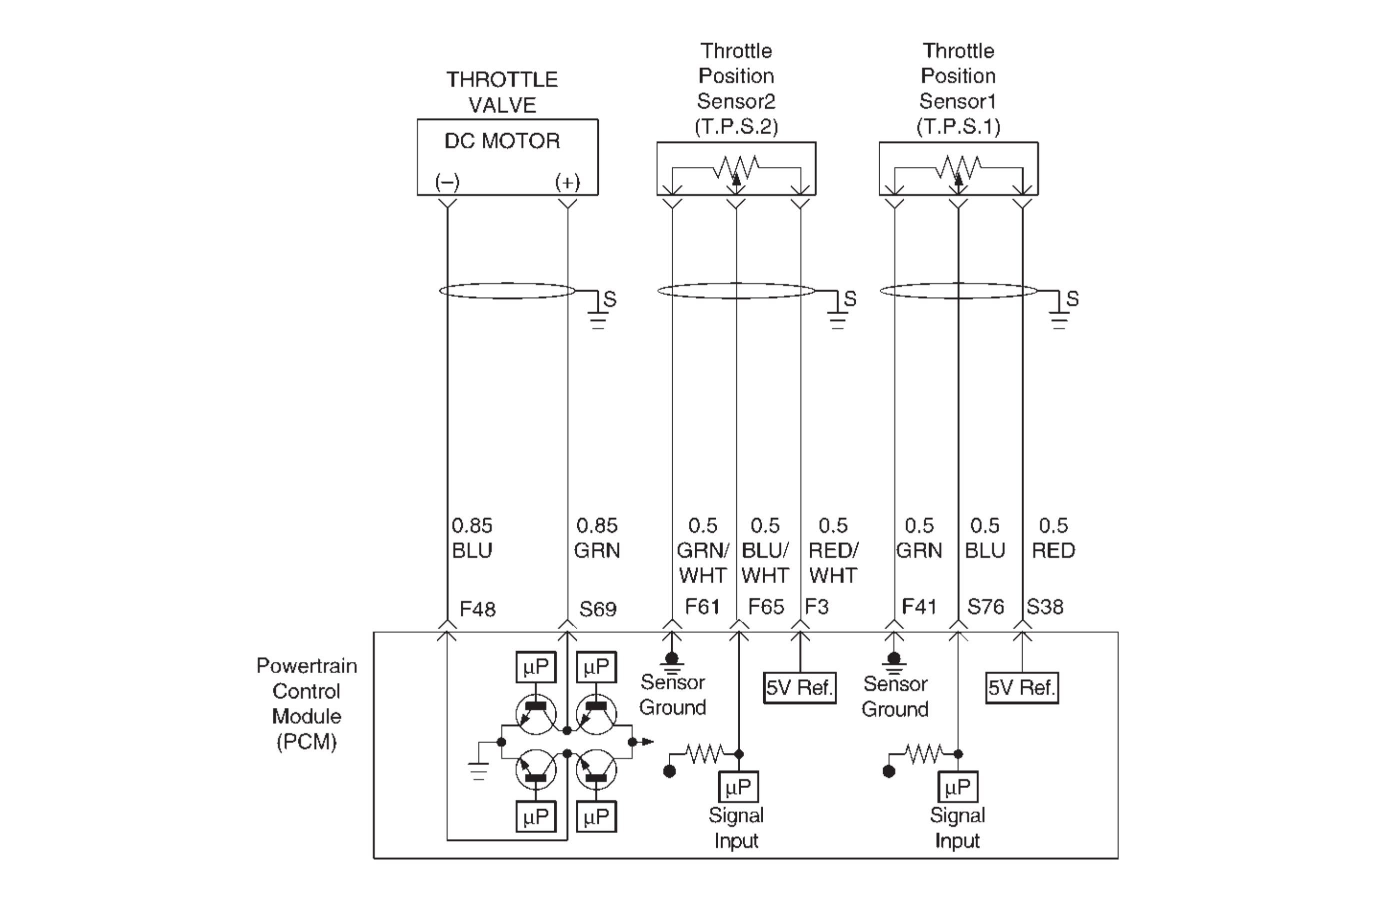
DTC P1515 - Command - Actual TPS Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1and TP2 sensor ground circuit for a poor connection. 4. If a problem is found,repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
11	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
12	Replace the TP sensor. Is the action complete?	—	Verify repair	—
13	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1516 Command - Actual TPS Correlation Error



D06RY00111

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle). The throttle blade angle will vary about 8% at closed throttle to about 92 % at wide open throttle (WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC detects the dufference between actual throttle position and command throttle position in steady state.

Conditions for setting the DTC

- The ignition is “ON”.
- Throttle Actuation mode is normal.
- Command Throttle position-Actual Throttle positionis less than 8 % when desird TPS is sutudy wihtin 0.5 %for 30 second within test samples (30 second)

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1516 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1516 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness - Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1516 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1516 Diagnostic Chart may isolate the cause of the fault.

Was a problem found?	—	Verify repair	Go to *Step 13*
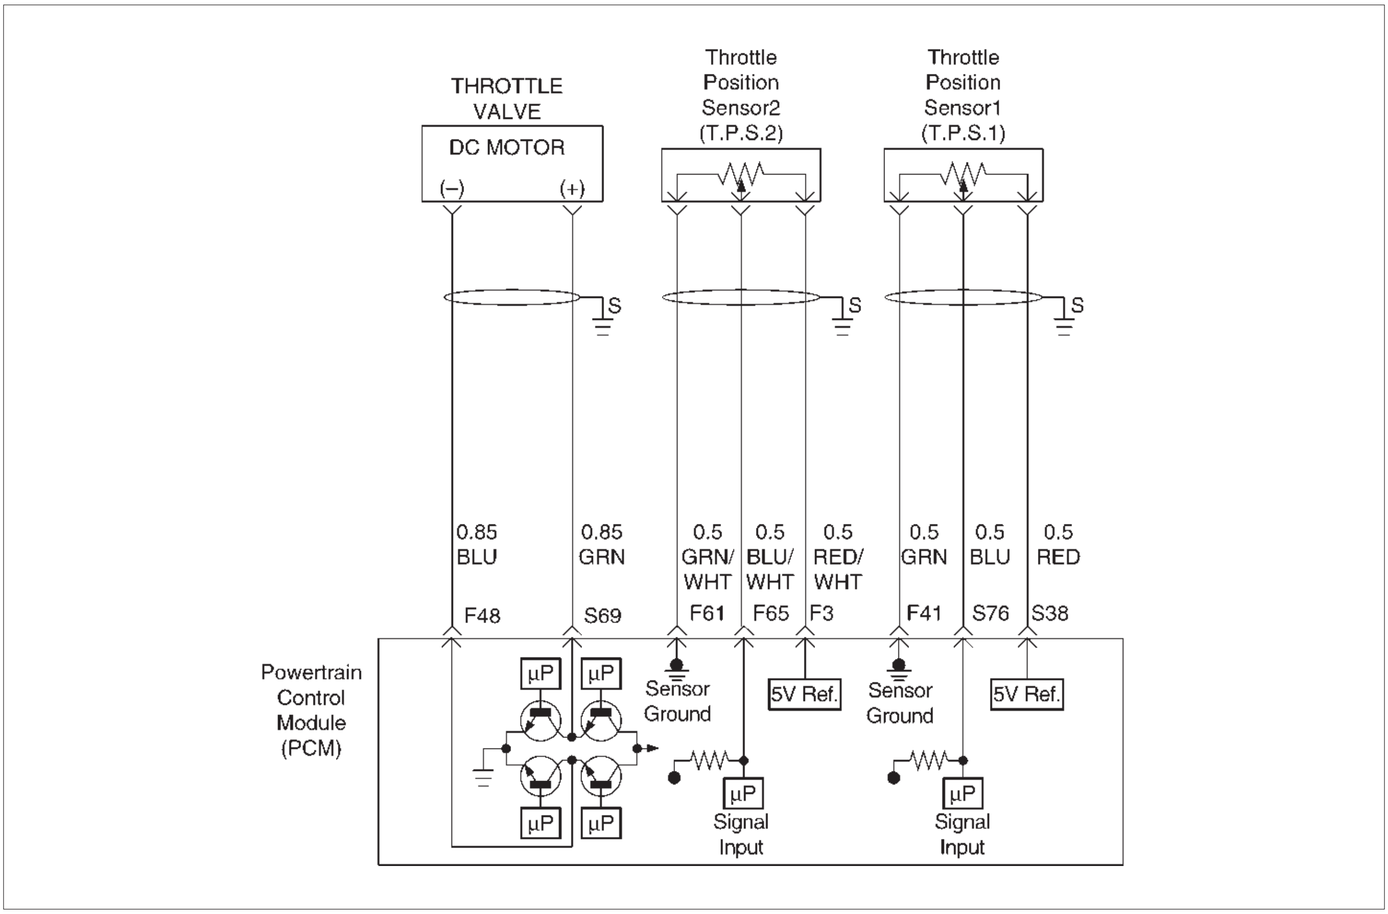
12	Replace the TP sensor. Is the action complete?	—	Verify repair	—
13	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1523 Actuator Control Return Performance



D06RY00111

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle).

  The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle(WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC ditects if the throttle return to the default position at key on, steady state.

Conditions for setting the DTC

- The ignition is “ON”.
- Normalized TPS is less than 0 % but Normalized TPS is more than 25 %.

Action Taken When the DTC Sets

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1523 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1523 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connectons.
- Mis routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

  A change in the display will indicate the location of the fault. If DTC P1523 cannot be duplicated, the information included in the Faillure Records data can be useful in determined vehicle mileage since the DTC was last set.

  If it is determined that the DTC occurs intermittently, performing the DTC P1523 Diagnostic Chart may isolate the cause of the fault.

DTC P1523 - Actuator Control Return Performance

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =8 ~ 10 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =90 ~ 92 %	Go to *Step 7*	Go to *Step 4*
4	1. Ignition “OFF.” 2. Disconnect the DC motor. Is the DC motor reading near the specified value?	0.3 ~ 100 Ω	Go to *Step 5*	Go to *Step 6*
5	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to *Step 7*
6	Replace the DC motor. Is the action complete?	—	Verify repair	Go to *Step 5*
7	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0V	Go to *Step 8*	Go to *Step 9*
8	1. Connect a test light between the 5Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to *Step 11*	Go to *Step 10*
9	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*

DTC P1523 - Actuator Control Return Performance (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
11	Replace the TP sensor. Is the action complete?	—	Verify repair	—
12	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1625 PCM Unexpected Reset

Circuit Description

The powertrain control module (PCM) monitors unexpected PCM reset. This will not turn on MIL light on, only records code DTC P1625.

Conditions for Setting the DTC

- Clock or COP (Computer Operating Properly) reset.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1625 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1625 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

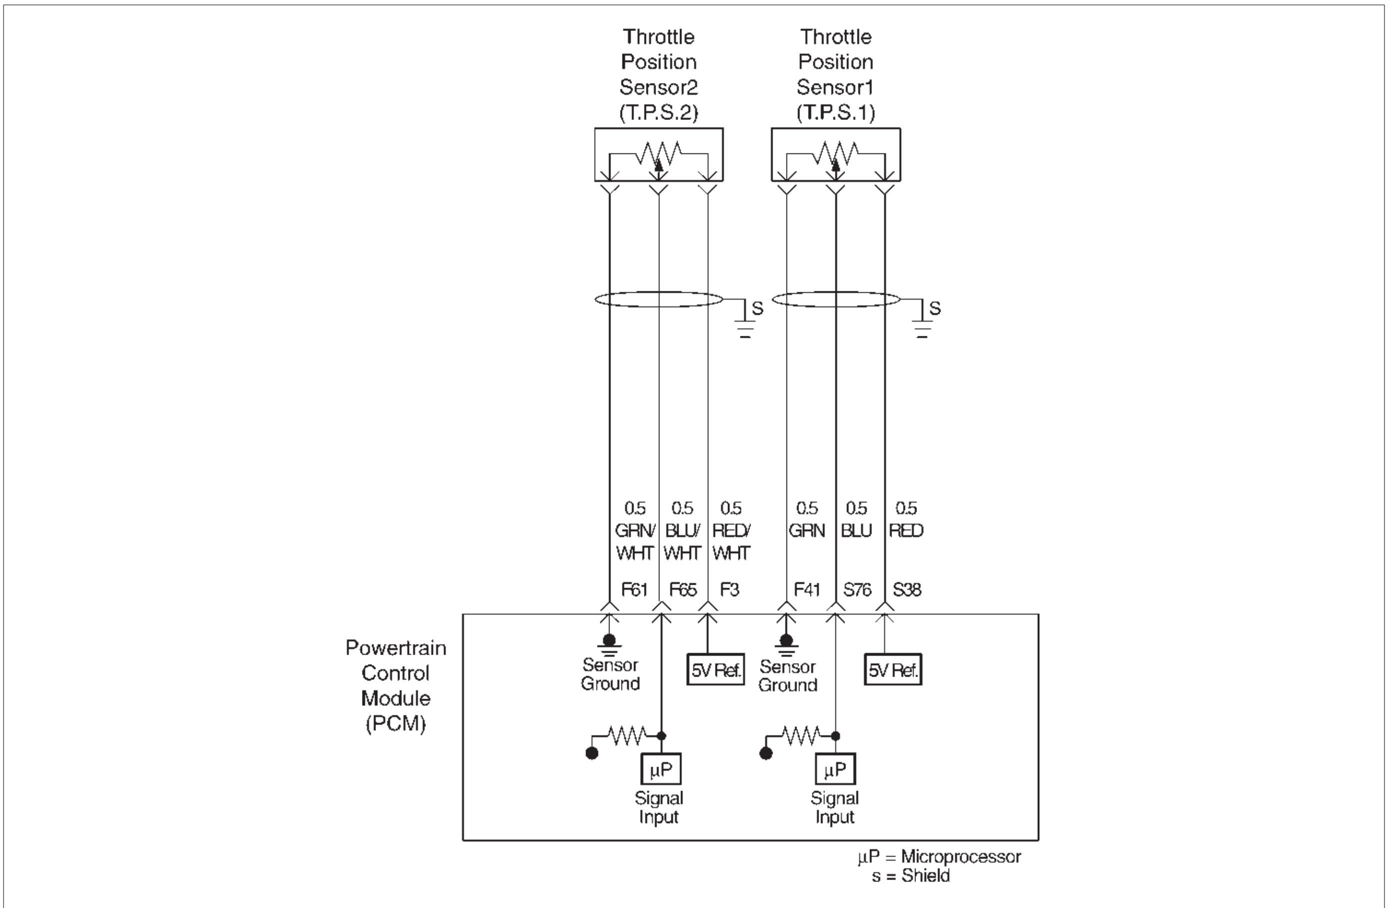
Check for the following conditions:

- P1625 alone stored does not need diagnosis. Clear DTC code.

DTC P1625 – PCM Unexpected Reset

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to *OBD System Check*
2	1. Ignition is "ON". 2. Install the Tech 2. 3. Start the engine at let it Idle. 4. On the Tech 2, select "DTC info". Does the Tech 2 indicate DTC P1625 failed?	—	Go to *Step 3*	Go to *Diagnostic Aids*
3	1. Ignition is "ON". 2. Clear DTC P1625 by using the Tech 2 "Clear Info". 3. Start the engine at let it Idle. 4. On the Tech 2, select "DTC info". Does the Tech 2 indicate DTC P1625 failed?	—	Go to *Step 4*	Go to *Diagnostic Aids*
4	1. Check for aftermarket electronics, such as transceiver, stereos, and anti theft devices. They may radiate EMI into the control system if they are improperly installed. (This may cause a false sensor reading and turn on the MIL.) 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1635 Reference Voltage # 1 Circuit Fault



D06RY00093

Circuit Description

The TP sensor # 1 shares a 5 Volt reference with the PCM.

If the PCM detects the 5 Volt reference for the TP sensor # 1 is failure, DTCP1635 will be set.

Conditions for setting the DTC

- The ignition is “ON”.
- The 5 Volt reference voltage for the TP sensor # 1 is less than 4 volts.
- The 5 Volt reference voltage for the TP sensor # 1 is more than 5 volts.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL) .
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

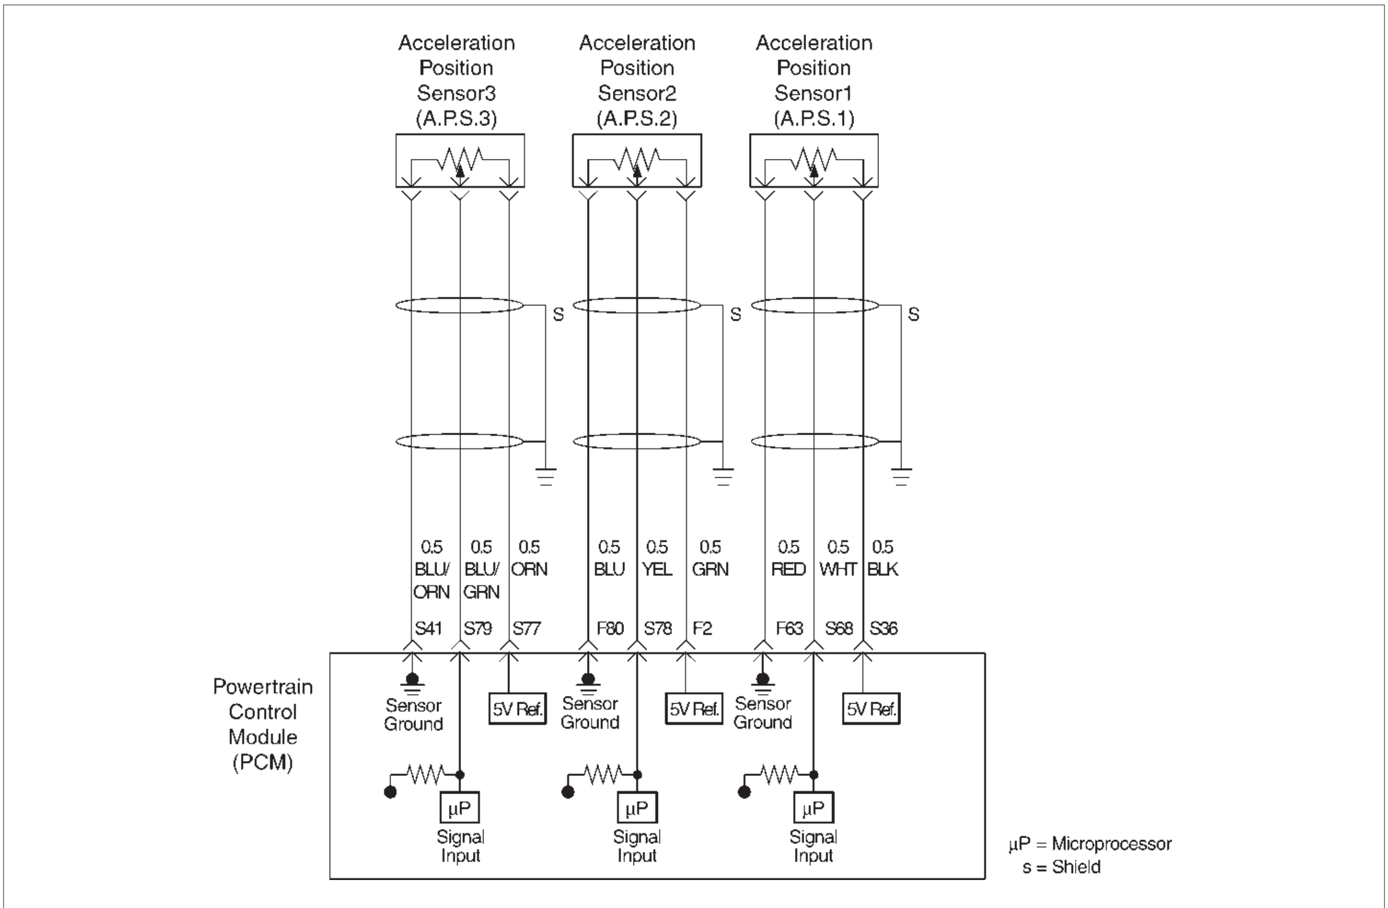
Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1635will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1635 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed. Tech2 “ Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Trouble Code (DTC) P1635 Reference Voltage # 1 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board(OBD)System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal S38 (RED) pin. Is the voltage in specified range?	4.95 – 5.0V	Go to *ETC System Check*	Go to *Step 3*
3	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal F20 (RED/WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to *Step 4*	Go to *Step 5*
4	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal F57 (RED/WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to *Step 6*	Go to *Step 5*
5	Observe the battery voltage and circuit. If the probrem found, repair it as necessary. Was the probrem found?	—	Verify repair	Go to *Step 6*
6	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1639 Reference Voltage # 2 Circuit Fault



D06RY00075

Circuit Description

The AP sensor # 1shares a 5Volt reference with the PCM. If the PCM detects the 5 Volt reference for the AP sensor # 1 is failure, DTC P1635 will be set.

Conditions for setting the DTC

- The ignition is “ON”.
- The 5 Volt reference voltage for the AP sensor # 1 is less than 4 volts.
- The 5 Volt reference voltage for the AP sensor # 1 is more than 5 volts.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condtion is no longer present.
- A history DTC P1639 will clear after 40 cosecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1639 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed. Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Trouble Code (DTC) P1639 Reference Voltage # 2 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal S36 (BLK) pin. Is the voltage in specified range?	4.95 – 5.0V	Go to *ETC System Check*	Go to *Step 3*
3	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal F20(RED/WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to *Step 4*	Go to *Step 5*
4	1. Ignition “ON”, engine not running. 2. Using a DVM at the PCM side of the connector, check the votage at terminal F57 (RED/WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to *Step 6*	Go to *Step 5*
5	Observe the battery voltage and circuit. If the probrem found, repair it as necessary. Was the probrem found?	—	Verify repair	Go to *Step 6*
6	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *ON-Vehicle Service in Power Control Module and Sensors for procedures.* And also refer to latest Service Bulletin.Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replasement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1640 Driver-1-Output Circuit Fault (ODM)

Circuit Description

Output driver modules (ODMs) are used by the powertrain control module (PCM) to turn "ON" many of the current-driven devices that are needed to control various engine and transmission functions. Each ODM is capable of controlling up to 7 separate outputs by applying ground to the device which the PCM is commanding "ON."

Unlike the Quad Driver Modules (QDMs) used in prior model years, ODMs have the capability of diagnosing each output circuit individually. DTC P1640 set indicates an improper voltage level has been detected on an ODM output.

Since A/C is an option, No A/C will cause the air conditioning clutch relay output to always fail. If a fault is seen on the air conditioning clutch relay output, it will not be logged as a fault until the A/C request input interrupts a high voltage, indicating that A/C has been installed.

Conditions for Setting the DTC

- Ignition "ON."
- Engine running.
- No DTC 1618.
- Ignition voltage is above 13.2 volts for 4 seconds.
- Output voltage does not equal ignition voltage when output is "OFF" or output voltage is not less than 1 volt when output is "ON."
- Above conditions occur for at least 1 second.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1640 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P1640 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage, If the harness appears to be OK, disconnect the PCM, turn the ignition "ON" and observe a voltmeter connected to the suspect driver circuit at the PCM harness connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.
- Poor connection at component – Examine for damaged connectors, unplugged connector, or damaged terminals at the following locations: Instrument cluster harness, canister purge solenoid, A/C clutch relay. An open ignition feed circuit at any of these components will cause DTC P1640 to be set.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

4. The Tech 2 Driver Module Status indicates the PCM pin that is affected.

9. The Tech 2 may indicate "short circuit" even when the problem is an open circuit. The cause of an open circuit may be in the component itself-lamp, purge, solenoid, or A/C compressor relay.

11. A short to ground on the ignition side of the component will blow the fuse. Since the fuse was checked in Step 2, a short to ground would be between the affected component and the PCM.

DTC P1640 – Driver-1-Output Circuit Fault (ODM)

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Check the fuse for the driver circuit that was shown as faulty. Was the fuse blown?	—	Go to *Step 3*	Go to *Step 4*
3	1. Check for a short to ground between the fuse and the affected component. 2. Replace the fuse after making any necessary repairs. Is the action complete?	—	Verify repair	—
4	Disconnect the PCM connector for the affected driver circuit. Is there any damage to the PCM pin or connector?	—	Go to *Step 5*	Go to *Step 6*
5	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
6	Were either of the lamp circuits for “Check Engine” or “Check Trans.” indicated as faulty by the Tech 2?	—	Go to *Step 7*	Go to *Step 13*
7	1. Leave the PCM connector for the lamp driver circuit disconnected. 2. Ignition “ON.” 3. Using a DVM, check the voltage at the PCM connector for the affected lamp driver circuit. Was the voltage equal to the specified value?	B+	Go to *Step 15*	Go to *Step 8*
8	1. Ignition “ON.” 2. Check for battery voltage at the fuse for the affected lamp circuit. Was battery voltage available at the fuse?	—	Go to *Step 10*	Go to *Step 9*
9	Repair the open circuit between the ignition switch and the fuse. Is the action complete?	—	Verify repair	—
10	1. Ignition “OFF.” 2. Disconnect the PCM connector for the affected driver terminal. 3. Connect an ohmmeter between a good ground and the PCM connector for the affected driver. Did the ohmmeter indicate continuity?	—	Go to *Step 11*	Go to *Step 12*
11	Repair the short to ground between the affected component and its PCM driver terminal. Is the action complete?	—	Verify repair	—
12	Repair the open circuit between the fuse and the PCM driver terminal for the affected circuit. Is the action complete?	—	Verify repair	—

DTC P1640 – Driver-1-Output Circuit Fault (ODM) (Cont'd)

Step	Action	Value(s)	Yes	No
13	1. Connect the PCM. 2. Start the engine and let it idle. 3. Backprobe the affected terminal at the PCM with a DVM. Was the voltage equal to the specified value?	+B	Go to *Step 15*	Go to *Step 14*
14	1. Run the engine at idle. 2. Check for battery voltage at the fuse for the affected circuit. Was battery voltage available at the fuse?	—	Go to *Step 10*	Go to *Step 9*
15	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1650 Quad Driver Module "A" Fault

Circuit Description

The Quad Driver Module (QDMs) are used by the powertrain control module (PCM) to turn "ON" current–driven devices that are needed to control two engine functions. The PCM monitors open or short circuit of either of Canister Control Purge (CCP) Vent solenoid or Variable Intake Manifold (VIM).

Conditions for Setting the DTC

- Ignition "ON".
- Engine running.
- Ignition voltage.
- Output voltage does not equal voltage is not less than 1 volt when out put is "ON".
- Above conditions occur for at least 0.5 second.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1650 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1650 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage, If the harness appears to be OK, disconnect the PCM, turn the ignition "ON" and observe a voltmeter connected to the suspect driver circuit at the PCM harness connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.
- Poor connection at component – Examine for damaged connectors, unplugged connector, or damaged terminals at the following locations: canister purge solenoid, fuel level sensor. An open ignition feed circuit at any of these components will cause DTC P1650 to be set.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

The following PCM pins are controlled by Quad driver modules (QDMs):

- S74 – VIM
- S48 – Canister control purge

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

4. The Tech 2 Driver Module Status indicates the PCM pin that is affected.

9.The Tech 2 may indicate "short circuit" even when the problem is an open circuit. The cause of an open circuit may be in the component itself.

11.A short to ground on the ignition side of the component will blow the fuse. Since the fuse was checked in Step 2, a short to ground would be between the affected component and the PCM.

DTC P1650 – Quad Driver Module (QDM) Fault

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Check the fuse for the driver circuit that was shown as faulty. Was the fuse blown?	—	Go to *Step 5*	Go to *Step 6*
3	1. Check for a short to ground between the fuse and the affected component. 2. Replace the fuse after making any necessary repairs. Is the action complete?	—	Verify repair	—
4	Disconnect the PCM connector for the affected driver circuit. Is there any damage to the PCM pin or connector?	—	Go to *Step 5*	Go to *Step 6*
5	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
6	Were either of the lamp circuits for "Check Engine" or "Check Trans." indicated as faulty by the Tech 2?	—	Go to *Step 7*	Go to *Step 13*
7	1. Leave the PCM connector for the lamp driver circuit disconnected. 2. Ignition "ON." 3. Using a DVM, check the voltage at the PCM connector for the affected lamp driver circuit. Was the voltage equal to the specified value?	B+	Go to *Step 15*	Go to *Step 8*
8	1. Ignition "ON." 2. Check for battery voltage at the fuse for the affected lamp circuit. Was battery voltage available at the fuse?	—	Go to *Step 10*	Go to *Step 9*
9	Repair the open circuit between the ignition switch and the fuse. Is the action complete?	—	Verify repair	—
10	1. Ignition "OFF." 2. Disconnect the PCM connector for the affected driver terminal. 3. Connect an ohmmeter between a good ground and the PCM connector for the affected driver. Did the ohmmeter indicate continuity?	—	Go to *Step 11*	Go to *Step 12*
11	Repair the short to ground between the affected component and its PCM driver terminal. Is the action complete?	—	Verify repair	—
12	Repair the open circuit between the fuse and the PCM driver terminal for the affected circuit. Is the action complete?	—	Verify repair	—

DTC P1650 – Quad Driver Module (QDM) Fault (Cont'd)

Step	Action	Value(s)	Yes	No
13	1. Connect the PCM. 2. Start the engine and let it idle. 3. Backprobe the affected terminal at the PCM with a DVM. Was the voltage equal to the specified value?	+B	Go to *Step 15*	Go to *Step 14*
14	1. Run the engine at idle. 2. Check for battery voltage at the fuse for the affected circuit. Was battery voltage available at the fuse?	—	Go to *Step 10*	Go to *Step 9*
15	Replace the PCM. **IMPORTANT:** The replacement PCM must be programmed. Refer to *On-Vehicle Service* in *Powertrain Control Module and Sensors* for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Symptom Diagnosis

Preliminary Checks

Before using this section, perform the "On-Board Diagnostic (OBD) System Check" and verify all of the following items:

- The powertrain control module (PCM), and malfunction indicator lamp (MIL) (Check Engine lamp) and Reduced Power Lamp (RPL) are operating correctly.
- There are no DTC(s) stored.
- Tech 2 data is within normal operating range. Refer to *Typical Scan Data Values*.
- Verify the customer complaint and locate the correct symptom in the table of contents. Perform the procedure included in the symptom chart.

Visual/Physical Check

Several of the symptom procedures call for a careful visual/physical check. This can lead to correcting a problem without further checks and can save valuable time.

This check should include the following items:

- PCM grounds for cleanliness, tightness and proper location.
- Vacuum hoses for splits, kinks, and proper connections, as shown on the "Vehicle Emission Control Information" label. Check thoroughly for any type of leak or restriction.
- Air intake ducts for collapsed or damaged areas.
- Air leaks at throttle body mounting area, mass air flow (MAF) sensor and intake manifold sealing surfaces.
- Ignition components for cracking, hardness, and carbon tracking.
- Wiring for proper connections, pinches and cuts.

Intermittents

IMPORTANT: An intermittent problem may or may not turn on the malfunction indicator lamp (MIL) or store a DTC. DO NOT use the Diagnostic Trouble Code (DTC) charts for intermittent problems. The fault must be present to locate the problem.

Most intermittent problems are caused by faulty electrical connections or wiring. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector (backed out).
- Improperly formed or damaged terminal.
- All connector terminals in the problem circuit should be carefully checked for proper contact tension.
- Poor terminal-to-wire connection. This requires removing the terminal from the connector body to check.

Road test the vehicle with a J 39200 Digital Multimeter connected to a suspected circuit. An abnormal voltage when the malfunction occurs is a good indication that there is a fault in the circuit being monitored.

Use a Tech 2 to help detect intermittent conditions. The scan tool has several features that can be used to locate an intermittent condition. Use the following feature to find intermittent faults:

- Using a Tech 2's "Freeze Frame" buffer or "Failure Records" buffer can aid in locating an intermittent condition. Review and record the information in the freeze frame or failure record associated with the intermittent DTC being diagnosed. The vehicle can be driven within the conditions that were present when the DTC originally set.

To check for loss of diagnostic code memory, disconnect the MAP sensor and idle the engine until the MIL (Check Engine lamp) comes on. DTC P0107 should be stored and kept in memory when the ignition is turned "OFF." If not, the PCM is faulty. When this test is completed, make sure that you clear the DTC P0107 from memory.

An intermittent MIL (Check Engine lamp) with no stored DTC may be caused by the following:

- Ignition coil shorted to ground and arcing.
- MIL (Check Engine lamp) wire to PCM shorted to ground.
- Poor PCM grounds. Refer to the PCM wiring diagrams.

Check for improper installation of electrical options such as lights, cellular phones, etc. Check all wires from the PCM to the ignition coils for poor connections.

Check for an open diode across the A/C compressor clutch and check for other open diodes (refer to wiring diagrams in *Electrical Diagnosis*).

If problem has not been found, refer to *PCM Connector Symptom* tables.

- Check the "Calibration ID" of the PCM, and compare it with the latest Isuzu service bulletins and/or Isuzu EEPROM reprogramming equipment to determine if an update to the PCM's reprogrammable memory has been released. To check the "Calibration ID", connect the Tech 2, then look for "Powertrain", then select "Calibration ID". This identifies the contents of the reprogrammable software and calibration contained in the PCM. If the "Calibration ID" is not the most current available, it is advisable to reprogram the PCM's EEPROM memory, which may either help identify a hard-to-find problem or may fix the problem.
- Calibration ID (example)

Part number	9377709
Broadcast Code	CYYD
Identifier	801

Hard Start Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Engine cranks, but does not start for a long time. Does eventually run, or may start but immediately stalls. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 4*
4	Was a visual/physical check performed?	—	Go to *Step 5*	Go to *Visual/Physical Check*
5	Check engine coolant temperature (ECT) sensor for shift in value. After 8 hours with the hood up and the engine not running, connect the Tech 2. With the ignition "ON" and the engine not running, compare engine coolant temperature to intake air temperature. Are ECT and IAT within the specified value of each other?	$\pm$ 5°C ($\pm$ 9°F)	Go to *Step 10*	Go to *Step 6*
6	1. Using a Tech 2, display the engine coolant temperature and note the value. 2. Check the resistance of the engine coolant temperature sensor. 3. Refer to *Engine Coolant Temperature Sensor Temperature vs. Resistance* chart on *DTC P0118 Diagnostic Support* for resistance specifications. Is the resistance value near the resistance for the temperature noted?	—	Go to *Step 8*	Go to *Step 7*
7	Replace the ECT sensor. Is the action complete?	—	Verify repair	—
8	Locate and repair high resistance or poor connection in the ECT signal circuit or the ECT sensor ground. Is the action complete?	—	Verify repair	—
9	1. Check for a faulty, plugged, or incorrectly installed PCV valve. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
10	1. Check for water- or alcohol-contaminated fuel. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Perform the procedure in *Fuel System Pressure Test*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*

Hard Start Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electric Ignition System* for procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Remove the ignition coils and check the ignition coils for cracks or carbon tracking. 2. If a problem is found, replace affected coil(s) as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Check for the following engine mechanical problems (refer to *Engine Mechanical*): ● Low compression ● Leaking cylinder head gaskets ● Worn or incorrect camshaft ● Camshaft drive belt slipped or stripped 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Surges and/or Chuggles Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Engine power variation under steady throttle or cruise. Feels like the vehicle speeds up and slows down with no change in the accelerator pedal. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 4*
4	Was a visual/physical check performed?	—	Go to *Step 5*	Go to *Visual/Physical Check*
5	Be sure that the driver understands transmission torque converter clutch and A/C compressor operation as explained in the owner's manual. Inform the customer how the TCC and the A/C clutch operate. Is the customer experiencing a normal condition?	—	System OK	Go to *Step 6*
6	1. Check the the fuel control heated oxygen sensors (HO2S, B1S1 and B2S1). The fuel control heated oxygen sensors (HO2S) should respond quickly to different throttle positions. If they don't, check them for silicone or other contaminants from fuel or use of improper RTV sealant. The sensors may have a white powdery coating. Silicon contamination causes a high but false HO2S signal voltage (rich exhaust indication). The PCM will then reduce the amount of fuel delivered to the engine, causing a severe driveability problem. For more information, refer to *Powertrain Control Module (PCM) and Sensors*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Check the fuel pressure. Refer to *Fuel System Pressure Test*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Monitor the long term fuel trim on the Tech 2. Is the long term fuel trim significantly in the negative range (rich condition)?	—	Go to *Step 9*	Go to *Step 10*
9	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids* in *DTC P0172 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 11*	Verify repair

Surges and/or Chuggles Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check items that can cause the engine to run lean. Refer to *Diagnostic Aids* in *DTC P0171*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 11*	Verify repair
11	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electric Ignition System* for procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
12	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Check the ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
14	1. Remove the spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Check the injector connections. 2. If any of the injector connectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Check PCM grounds for the cleanliness, tightness and proper locations. Refer to the PCM wiring diagrams in *Electrical Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Check MAF sensor connections. 2. If a problem is found, replace the faulty terminals as necessary. Refer to *Electrical Diagnosis* for wiring repair procedures. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Visually/physically check vacuum hoses for splits, kinks, and proper connections and routing as shown on the "Vehicle Emission Control Information" label. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 19*

Surges and/or Chuggles Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
19	1. Check the exhaust system for possible restriction: • Inspect the exhaust system for damaged or collapsed pipes. • Inspect the muffler for heat distress or possible internal failure. • Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to *Restricted Exhaust System Check*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 20*
20	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records buffer • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Lack of Power, Sluggish or Spongy Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Engine delivers less than expected power. Little or no increase in speed when accelerator pedal is pushed down part-way. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 4*
4	Was a visual/physical check performed?	—	Go to *Step 5*	Go to *Visual/Physical Check*
5	1. Remove and check the air filter element for dirt or restrictions. Refer to *Air Intake System* in *ON-Vehicle Service*. 2. Replace the air filter element if necessary. Was a repair required?	—	Verify repair	Go to *Step 6*
6	1. Check for low fuel pressure. Refer to *Fuel System Pressure Test*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Check for water- or alcohol-contaminated fuel. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	1. Install the Tech 2. 2. Run the engine at idle. 3. On the Tech 2, select F3: Miscellaneous Test, F6: Variable Intake Manifold. 4. Repeat Switch ON or OFF of VIM solenoid valve by using the Tech 2. 5. Check to see if the actuator works normally. 6. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
9	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electronic Ignition System* for procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*

Lack of Power, Sluggish or Spongy Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Remove the spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Check the ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
12	1. Check the PCM grounds for the cleanliness, tightness and proper locations. Refer to the PCM wiring diagrams in *Electrical Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Check the exhaust system for possible restriction: • Inspect the exhaust system for damaged or collapsed pipes. • Inspect the muffler for heat distress or possible internal failure. • Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to *Restricted Exhaust System Check*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	1. Check the torque converter clutch (TCC) for proper operation. Refer to *4L30-E Transmission Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Check for an engine mechanical problem. Check for low compression, incorrect or worn camshaft, loose timing belt, etc. Refer to *Engine Mechanical*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records buffer • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Detonation/Spark Knock Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** A mild to severe ping, usually worse under acceleration. The engine makes sharp metallic knocks that change with throttle opening. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	If Tech 2 readings are normal (refer to *Typical Scan Values*) and there are no engine mechanical faults, fill the fuel tank with a known quality gasoline that has a minimum octane rating of 87 and re-evaluate the vehicle performance. Is detonation present?	—	Go to *Step 5*	Verify repair
5	1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive. 2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to *4L30-E Automatic Transmission Diagnosis*). Was a problem found?	—	Verify repair	Go to *Step 6*
6	1. Check TCC operation. Refer to *4L30-E Transmission Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Check for obvious overheating problems: • Low engine coolant. • Restricted air flow to radiator, or restricted water flow through radiator. • Correct coolant solution should be a 50/50 mix of approved antifreeze/coolant and water. Refer to *Engine Cooling*. • EGR operation. Refer to *DTC P0401*. • ION sensing module fault. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	1. Ignition "OFF." 2. Disconnect the ION sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to *Step 9*	—
9	Check the ION sensing harness between the PCM (F68) and ION sensing module circuit (RED Wire) at the Kl line harness connector. Was a problem found?	—	Verify repair	Go to *Step 10*

Detonation/Spark Knock Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Disconnect the ignition coil. Is the action complete?	—	Go to *Step 11*	—
11	Check the ION sensing harness between the ignition coil and ION sensing module circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to *Step 12*
12	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to *Step 14*
14	Check the following items; 1. ION sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to *Step 10*	Go to *Step 16*
15	Replace the ION sensing module. Is the action complete?	—	Verify repair	Go to *Step 16*
16	1. Check fuel pressure. Refer to Chart Fuel System Pressure Test. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Check items that can cause an engine to run lean (long term fuel trim significantly in the positive range). For a lean condition, refer to *Diagnostic Aids* in *DTC P0171 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Spark plugs for proper heat range. Refer to *General Information*. 2. If incorrect spark plugs are installed, replace spark plugs as necessary. Did any spark plugs require replacement?	—	Verify repair	Go to *Step 19*
19	1. Remove excessive carbon buildup with a top engine cleaner. Refer to instructions on the top engine cleaner can. 2. Re-evaluate vehicle performance. Is detonation still present?	—	Go to *Step 20*	Verify repair

Detonation/Spark Knock Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
20	1. Check for an engine mechanical problem. Perform a cylinder compression check. Refer to *Engine Mechanical*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 21*
21	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records buffer • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Rough, Unstable, or Incorrect Idle, Stalling Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine. Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Go to *Step 14*	Go to *Step 4*
4	Was a visual/physical check performed?	—	Go to *Step 5*	Go to *Visual/Physical Check*
5	1. Check the PCM grounds for cleanliness, tightness and proper routing. Refer to the PCM wiring diagrams in *Electrical Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 6*
6	Observe the long term fuel trim on the Tech 2. Is the long term fuel trim significantly in the negative range (rich condition)?	—	Go to *Step 7*	Go to *Step 8*
7	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids* in *DTC P0172 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
8	Is the long term fuel trim significantly in the positive range (lean condition)?	—	Go to *Step 9*	Go to *Step 10*
9	1. Check items that can cause the engine to run lean. Refer to *Diagnostic Aids* in *DTC P0171 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
10	1. Check for incorrect idle speed. Ensure that the following conditions are present: • The engine is fully warm. • The accessories are “OFF.” 2. Using a Tech 2, monitor the Engine Speed. Is the Engine Speed within the specified values?	Desired Idle Speed	Go to *Step 12*	Go to *Step 11*

Rough, Unstable, or Incorrect Idle, Stalling Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
11	1. Visually/physically inspect for the following conditions: • Restricted air intake system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. • Large vacuum leak. Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty crankcase ventilation valve or a disconnected brake booster hose. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
12	Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Perform the "Injector Coil/Balance Test" in *Fuel Metering System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	1. Check for fuel in the pressure regulator vacuum hose. 2. If fuel is present, replace the fuel pressure regulator assembly. Refer to *Fuel Metering System*. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electronic Ignition System* for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Check for a loose ignition coil ground and ION Sensing Module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Check ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 19*

Rough, Unstable, or Incorrect Idle, Stalling Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
19	Using a Tech 2, monitor the throttle position 1 and 2 angle with the engine idling. Is the TP angle at the specified value and steady?	8 ~ 10%	Go to *Step 20*	Refer to *DTC* for further diagnosis
20	1. Check the positive crankcase ventilation (PCV) valve for proper operation. Refer to *Crankcase Ventilation System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 21*
21	1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive. 2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to *4L30-E Automatic Transmission Diagnosis*). Was a problem found?	—	Verify repair	Go to *Step 22*
22	1. Check for the following engine mechanical items. Refer to *Engine Mechanical* for diagnosis procedures: ● Low compression ● Sticking or leaking valves ● Worn camshaft lobe(s) ● Camshaft drive belt slipped or stripped ● Incorrect valve timing ● Worn rocker arms ● Broken valve springs 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 23*
23	1. Check for faulty motor mounts. Refer to *Engine Mechanical* for inspection of mounts. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 24*
24	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Poor Fuel Economy Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test. (Non-standard tires will cause odometer readings to be incorrect, and that may cause fuel economy to appear poor when it is actually normal.) Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	Check owner's driving habits. • Is the A/C "ON" full time (defroster mode "ON")? • Are tires at the correct pressure? • Are excessively heavy loads being carried? • Is acceleration too much, too often? Was a problem found?	—	Go to *Step 5*	Go to *Step 6*
5	Review the items in Step 4 with the customer and advise as necessary. Is the action complete?	—	System OK	—
6	1. Visually/physically check: Vacuum hoses for splits, kinks, and improper connections and routing as shown on the "Vehicle Emission Control Information" label. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Remove and check the air filter element for dirt or for restrictions. Refer to *Air Intake System*. 2. Replace the air filter element if necessary. Was a repair required?	—	Verify repair	Go to *Step 8*
8	1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Spark Plug Replacement*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
9	1. Check for low engine coolant level. Refer to *Engine Cooling*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*

Poor Fuel Economy Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check for an incorrect or faulty engine thermostat. Refer to *Engine Cooling*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Check for low engine compression. Refer to *Engine Mechanical*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
12	1. Check the TCC operation. Refer to *4L30-E Transmission Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Check the exhaust system for possible restriction: • Inspect the exhaust system for damaged or collapsed pipes. • Inspect the muffler for heat distress or possible internal failure. • Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to *Restricted Exhaust System Check*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	Check for proper calibration of the speedometer. Does the speed indicated on the speedometer closely match the vehicle speed displayed on the Tech 2?	—	Go to *Step 16*	Go to *Step 15*
15	Diagnose and repair an inaccurate speedometer condition as necessary. Refer to *Vehicle Speed Sensor* in *Electrical Diagnosis*. Was a problem found?	—	Verify repair	—
16	1. Check the air intake system and the crankcase for air leaks. Refer to *Air Intake System* and *Crankcase Ventilation System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Review all diagnostic procedures within this table. 2. When all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records buffer • All connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	Perform the procedure in *Fuel System Pressure Test*. Was the fuel pressure normal?	—	Contact Technical Assistance	Verify repair

Excessive Exhaust Emissions or Odors Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Vehicle fails an emission test. Vehicle has excessive “rotten egg” smell. (Excessive odors do not necessarily indicate excessive emissions.) Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Go to *Step 13*	Go to *Step 3*
3	Was a thorough visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	1. Check for vacuum leaks. Check vacuum lines, intake manifold, throttle body, etc. 2. If a problem is found, repair as necessary. Were any vacuum leaks located?	—	Go to *Step 13*	Go to *Step 5*
5	1. Check the fuel cap for proper installation. 2. Secure the fuel cap if necessary. Was the fuel cap installed properly?	—	Go to *Step 6*	Go to *Step 13*
6	1. Check the fuel pressure. Perform the procedure in *Fuel System Pressure Test*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 7*
7	1. Check for a faulty, plugged, or incorrectly installed crankcase ventilation valve; also check the crankcase ventilation system for plugging. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 8*
8	1. Check the injector connections. 2. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 9*
9	1. Perform the “Injector Coil/Balance Test” in *Fuel Metering System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 10*
10	1. Refer to *Engine Cooling* for cooling system diagnosis. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 11*
11	1. Check EVAP canister for fuel loading. Refer to *Evaporative Emission Control System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 12*

Excessive Exhaust Emissions or Odors Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Remove excessive carbon buildup with a top engine cleaner. Refer to the instructions on the top engine cleaner can. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 14*
13	Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 14*
14	Does the exhaust emission test indicate excessive CO and HC levels or is long term fuel trim significantly in the negative range (rich condition)?	—	Go to *Step 15*	Go to *Step 16*
15	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids* in *DTC P0172 Diagnostic Support*. Make any necessary repairs. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 17*
16	1. Check items that can cause the engine to run lean. Refer to *Diagnostic Aids* in *DTC P0171 Diagnostic Support*. Make any necessary repairs. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 17*
17	1. Check the EGR system (refer to *DTC P0401*). 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 18*
18	1. Check for an engine mechanical problem. Perform a cylinder compression check (refer to *Engine Mechanical*). 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 13*	Go to *Step 19*
19	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records butter • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Dieseling, Run-On Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Engine continues to run after key is turned "OFF," but runs very rough. If engine runs smooth, check ignition switch and adjustment. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	1. Check for a short between B+ and any of the ignition feed circuits. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 5*
5	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records butter ● All electrical connections within a suspected circuit and/or system 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Backfire Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Fuel ignites in the intake manifold, or in the exhaust system, making a loud popping noise. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	1. Check for proper ignition voltage coil output with spark tester J 26792 (ST-125). Refer to *Electric Ignition System* for procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 5*
5	1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to *DTC P0172* to determine the cause of a rich condition or *Engine Mechanical* for an oil fouling condition. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 6*
6	1. Visually/physically inspect the ignition coils for cracks. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Check for an intermittent ignition system malfunction: • Intermittent CKP 58X signal. • Intermittent ignition feed circuit or sensor ground circuit to the crankshaft position sensor. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 8*
8	1. Check the fuel pressure. Refer to *Fuel System Pressure Test*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*

Backfire Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Check for the following engine mechanical conditions. Refer to *Engine Mechanical* for diagnosis procedures: • Low compression • Sticking or leaking valves • Worn camshaft lobe(s) • Camshaft drive belt slipped or stripped • Incorrect valve timing 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
10	1. Check the intake and exhaust manifold(s) for casting flash. Refer to *Engine Mechanical*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records butter • All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Cuts Out, Misses Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Steady pulsation or jerking that follows engine speed; usually more pronounced as engine load increases. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Go to *Step 14*	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual/Physical Check*
4	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 5*	Go to *ETC System Check*
5	1. Check the PCM grounds for clearness, tightness and proper routing. Refer to the PCM wiring diagrams in *Electrical Diagnosis*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 6*
6	Observe the long term fuel trim on the Tech 2. Is the long term fuel trim significantly in the negative range (rich condition)?	—	Go to *Step 7*	Go to *Step 8*
7	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids* in *DTC P0172 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
8	Is the long term fuel trim significantly in the positive range (lean condition)?	—	Go to *Step 9*	Go to *Step 10*
9	1. Check items that can cause the engine to run lean. Refer to *Diagnostic Aids* in *DTC P0171 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 10*
10	1. Check for incorrect idle speed. Ensure that the following conditions are present: • The engine is fully warm. • The accessories are "off." 2. Using a Tech 2, monitor the Engine Speed. Is the Engine Speed within the specified values?	Desired Idle Speed	Go to *Step 12*	Go to *Step 11*

Cuts Out, Misses Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
11	1. Visually/physically inspect for the following conditions: • Restricted air intake system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. • Large vacuum leak. Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty PCV valve or brake booster hose disconnected . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 9*
12	Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Perform the "Injector Coil/Balance Test" in *Fuel Metering System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	1. Check for fuel in the pressure regulator vacuum hose. 2. If fuel is present, replace the fuel pressure regulator assembly. Refer to *Fuel Metering System*. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electronic Ignition System* for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Check ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 19*
19	Using a Tech 2, monitor the TP 1, 2 angle with the engine idling. Is the TP angle at the specified value and steady?	8 ~ 10%	Go to *Step 20*	Refer to *DTC P0123* for further diagnosis

Cuts Out, Misses Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
20	1. Check the PCV valve for proper operation. Refer to *Crankcase Ventilation System*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 21*
21	1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive. 2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to *4L30-E Automatic Transmission Diagnosis*). Was a problem found?	—	Verify repair	Go to *Step 22*
22	1. Check the following engine mechanical items. Refer to *Engine Mechanical* for diagnosis procedures: ● Low compression ● Sticking or leaking valves ● Worn camshaft lobe(s) ● Camshaft drive belt slipped or stripped ● Incorrect valve timing ● Worn rocker arms ● Broken valve springs 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 23*
23	1. Check for faulty motor mounts. Refer to *Engine Mechanical* for inspection of mounts. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 24*
24	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records butter ● All electrical connections within a suspected circuit and/or system 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Hesitation, Sag, Stumble Symptom

Step	Action	Value(s)	Yes	No
1	**DEFINITION:** Momentary lack of response as the accelerator is pushed down. Can occur at any vehicle speed. Usually most pronounced when first trying to make the vehicle move, as from a stop sign. May cause the engine to stall if severe enough. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to *Step 3*	Go to *ETC System Check*
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 4*
4	Was a visual/physical check performed?	—	Go to *Step 5*	Go to *Visual/Physical Check*
5	1. Check the fuel control heated oxygen sensors (HO2S, B1S1 and B2S1). The fuel control heated oxygen sensors (HO2S) should respond quickly to different throttle positions. If they don't, check them for silicon or other contaminants from fuel or use of improper RTV sealant. The sensors may have a white powdery coating. Silicon contamination causes a high but false HO2S signal voltage (rich exhaust indication). The PCM will then reduce the amount of fuel delivered to the engine, causing a severe driveability problem. For more information, refer to *Powertrain Control Module (PCM) and Sensors*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 6*
6	1. Check the fuel pressure. Refer to *Fuel System Pressure Test.* 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Observe the TP 1, 2 angle display on the Tech 2 while slowly increasing throttle pedal. Does the TP angle display steadily increase from 8 ~ 10% at closed throttle to 90 ~ 92% at WOT?	—	Go to *Step 8*	Go to *Step 19*
8	Monitor the long term fuel trim on the Tech 2. Is the long term fuel trim significantly in the negative range (rich condition)?	—	Go to *Step 9*	Go to *Step 10*
9	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids* in *DTC P0172 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*

Hesitation, Sag, Stumble Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check items that can cause the engine to run lean. Refer to *Diagnostic Aids* in *DTC P0171 Diagnostic Support*. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to *Electronic Ignition System* for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 12*
12	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Check the ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 14*
14	1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to *Electronic Ignition System*. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Check the PCM grounds for clearness, tightness and proper routing. Refer to the PCM wiring diagrams in Electrical Diagnosis. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Check the MAF sensor connections. 2. If a problem is found, replace the faulty terminals as necessary. Refer to *Electrical Diagnosis* for wiring repair procedures. Was a problem found?	—	Verify repair	Go to *Step 17*

Hesitation, Sag, Stumble Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
17	1. Visually/physically check vacuum hoses for splits, kinks, and proper connections and routing as shown on the "Vehicle Emission Control Information" label. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • Freeze Frame data/Failure Records butter • All electrical connections within a suspected circuit and/or system 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Bank 1 Restricted Exhaust System Check

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Remove the Bank 1 HO2S 2. 2. Install the Exhaust Backpressure Tester (BT-8515-V or equivalent) in place of the Bank 1 HO2S 2. 3. Run the engine at normal operating temperature. 4. Increase the engine speed to 2000 RPM and allow 10 seconds for pressure to build. 5. Observe the exhaust system backpressure reading on the gauge. Does the reading exceed the amount in the value column?	8.62 kPa (1.25 psi)	Go to *Step 3*	Go to *Step 4*
3	Repair the restriction in the exhaust system after the catalytic converter. Possible faults include: • Collapsed pipe • Heat distress • Internal muffler failure Is the action complete?	—	Verify repair	—
4	1. Install the Bank 1 HO2S 2. 2. Install the Exhaust Backpressure Tester in place of Bank 1 HO2S 1. 3. Run the engine at normal operating temperature. 4. Increase the engine speed to 2000 RPM and allow 10 seconds for pressure to build. 5. Observe the exhaust system backpressure reading on the gauge. Does the reading exceed the amount in the value column?	8.62 kPa (1.25 psi)	Go to *Step 5*	No trouble found. If a driveability symptom exists, refer to symptom charts
5	Repair the restriction in the catalytic converter. Is the action complete?	—	Verify repair	—

NOTE: DTCs will be set by running the vehicle to normal operating temperature after a cold start with the O2 sensor disconnected. After performing these tests, use the Tech 2 to erase the DTCs that were set by the lack of O2 sensor activity.

Bank 2 Restricted Exhaust System Check

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Remove the Bank 2 HO2S 2. 2. Install the Exhaust Backpressure Tester (BT-8515-V or equivalent) in place of the Bank 2 HO2S 2. 3. Run the engine at normal operating temperature. 4. Increase the engine speed to 2000 RPM and allow 10 seconds for pressure to build. 5. Observe the exhaust system backpressure reading on the gauge. Does the reading exceed the amount in the value column?	8.62 kPa (1.25 psi)	Go to *Step 3*	Go to *Step 4*
3	Repair the restriction in the exhaust system after the catalytic converter. Possible faults include: • Collapsed pipe • Heat distress • Internal muffler failure Is the action complete?	—	Verify repair	—
4	1. Install the Bank 2 HO2S 2. 2. Install the Exhaust Back pressure Tester in place of Bank 1 HO2S 1. 3. Run the engine at normal operating temperature. 4. Increase the engine speed to 2000 RPM and allow 10 seconds for pressure to build. 5. Observe the exhaust system backpressure reading on the gauge. Does the reading exceed the amount in the value column?	8.62 kPa (1.25 psi)	Go to *Step 5*	No trouble found. If a driveability symptom exists, refer to symptom charts
5	Repair the restriction in the catalytic converter. Is the action complete?	—	Verify repair	—

NOTE: DTCs will be set by running the vehicle to normal operating temperature after a cold start with the O2 sensor disconnected. After performing these tests, use the Tech 2 to erase the DTCs that were set by the lack of O2 sensor activity.

Default Matrix Table

Service Procedure Default Strategy

A referral strategy has been established to assist the technician with additional information when the cause of the failure cannot be determined. If no problem is found after performing diagnostics, then refer to the default matrix table for further diagnostic information.

Default Matrix Table

Strategy Based Diagnostic Charts	Initial Diagnosis	Default Section(s)
On-Board Diagnostic (OBD) System Check	Vehicle does not enter diagnostics.	Chassis Electrical
On-Board Diagnostic (OBD) System Check	Vehicle enters diagnostics and communicates with the Tech 2. MIL is "ON" in diagnostics. Engine does not start and run.	Ignition System Check
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of vibration.	—
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of harsh or soft shift, poor performance, delayed or no engagement into drive or reverse, transmission fluid leak, transmission noise or vibration, or improper TCC operation.	Automatic Transmission
PCM Power and Ground Check	On-Board Diagnostic (OBD) System Check.	Chassis Electrical
PCM Power and Ground Check	On-Board Diagnostic (OBD) System Check. PCM power and ground circuits OK. Data link voltage incorrect.	Chassis Electrical
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of harsh or soft shift, poor performance, delayed or no engagement into drive or reverse, transmission fluid leak, transmission noise or vibration, or improper TCC operation.	Automatic Transmission

Symptoms	Initial Diagnosis	Default Section(s)
Intermittents	1. On-board Diagnostic (OBD) system check. 2. Careful visual/physical inspections.	Chassis Electrical
Hard Starts	1. OBD system check. 2. ETC system check. 3. Sensors (ECT, MAP, MAF, TP) ; MAP output chart. 4. Fuel system electrical test, fuel system diagnosis. 5. Ignition system.	Engine Mechanical, Ignition System Check, Exhaust System Diagnosis

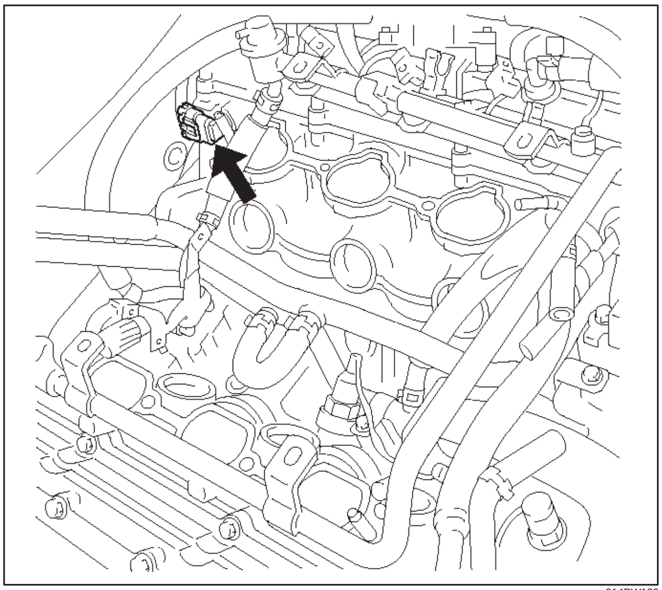
Symptoms	Initial Diagnosis	Default Section(s)
Surges and/or Chuggles	1. OBD system check. 2. ETC system check. 3. Heated oxygen sensors. 4. Fuel system diagnosis. 5. Ignition system.	Calibration ID/Service Bulletins, Ignition System Check, Generator Output, Exhaust System Diagnosis, 4L30-E System Test
Lack of Power, Sluggish or Spongy	1. OBD system check. 2. ETC system check. 3. Fuel system diagnosis. 4. Ignition system. 5. EGR operation. 6. EGR system check.	Refer to *Exhaust System* in *Engine Exhaust*, TCC Operation, Calibration ID/Service Bulletins
Detonation/Spark Knock	1. OBD system check. 2. Transmission range switch. 3. EGR operation. 4. EGR system check. 5. TCC operation. 6. Fuel system diagnosis. 7. Ignition system. 8. ION sensing module check.	TCC operation, Cooling System, Ignition System Check, Calibration ID/Service Bulletins
Rough, Unstable, or Incorrect Idle, Stalling	1. OBD system check. 2. ETC system check. 3. Fuel injector and fuel injector balance test. 4. EVAP emission canister purge valve check. 5. Ignition system. 6. EGR operation.	MAP Output Check, Throttle Linkage, EGR System Check, A/C Clutch Control Circuit Diagnosis, Crankcase Ventilation System, Calibration ID/Service Bulletins, Generator Output Voltage (refer to *Chassis Electrical*), Exhaust Diagnosis
Poor Fuel Economy	1. OBD system check. 2. Careful visual/physical inspection. 3. Ignition system. 4. Cooling system.	TCC Operation, Exhaust System (refer to *Engine Exhaust*)
Hesitation, Sag, Stumble	1. OBD system check. 2. ETC system check. 3. TP. 4. MAP output check. 5. Fuel system diagnosis. 6. Fuel injector and fuel injector balance test. 7. EVAP emission canister purge valve. 8. Ignition system.	EGR Operation, EGR System Check, Generator Output Voltage (refer to *Chassis Electrical*), Calibration ID/Service Bulletins, Ignition System Check
Cuts Out, Misses	1. OBD system check. 2. Cylinder balance test. 3. ETC system check.	Ignition System Check
Engine Cranks But Will Not Run	1. OBD system check.	Fuel System Electrical Diagnosis, Fuel System Diagnosis, Fuel Injector and Fuel Injector Balance Test.

Symptoms	Initial Diagnosis	Default Section(s)
Excessive Exhaust Emissions or Odors	1. OBD system check. 2. Emission test. 3. Cooling system. 4. Fuel system diagnosis. 5. Fuel injector and fuel injector balance test. 6. EVAP emission canister purge valve. 7. Crankcase ventilation system. 8. Ignition system. 9. MAP output check.	EGR System Check, Exhaust Diagnosis, Calibration ID/Service Bulletins
Dieseling, Run-On	1. OBD system check. 2. Careful visual/physical inspection. 3. Fuel system diagnosis.	—
Backfire	1. OBD system check. 2. Ignition system. 3. Fuel system diagnosis. 4. Fuel injector and fuel injector balance test. 5. EGR operation, EGR system check.	Exhaust System Diagnosis, Intake Casting Flash, Ignition System Check
Misfire	1. OBD system check. 2. Ignition system. 3. Fuel system diagnosis. 4. Fuel injector and fuel injector balance test.	Vibrations, Transmission, Driveshaft and Axle
Catalyst Monitor	1. OBD system check. 2. Careful visual/physical inspection. 3. Heated oxygen sensors.	Exhaust System
Fuel Trim	1. OBD system check. 2. Careful visual/physical inspection. 3. Fuel system diagnosis. 4. Heated oxygen sensors, MAF sensors.	Exhaust System Intake Air System
Evaporative Emissions	1. OBD system check. 2. Careful visual/physical inspection. 3. Fuel system diagnosis.	—
Heated Oxygen Sensors	1. OBD system check. 2. Careful visual/physical inspection.	Exhaust System

On-Vehicle Service Camshaft Position (CMP) Sensor

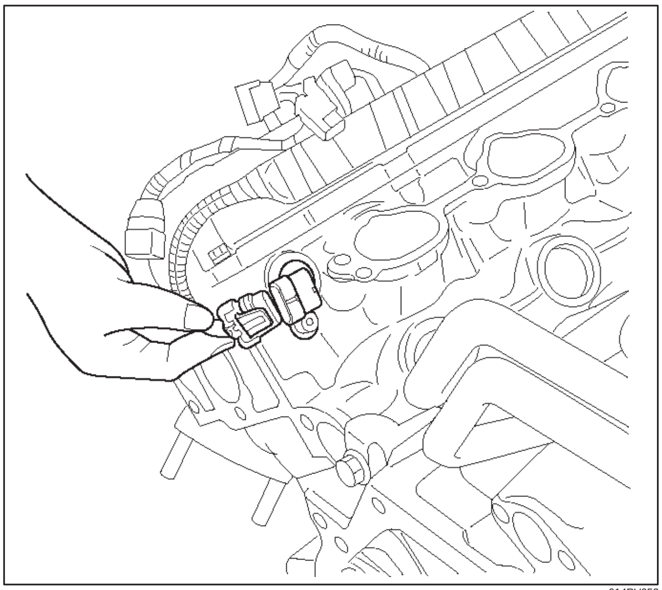
Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the engine cover.
3. Remove the common chamber assembly.
   Refer to Common Chamber in Engine Mechanical section.



014RW120

4. Disconnect the electrical connector to the CMP sensor.



014RV053

5. Remove the CMP retaining bolt from the side of left cylinder head.
6. Remove the CMP sensor from the cylinder head.

Inspection Procedure

1. Inspect the sensor O-ring for cracks or leaks.
2. Replace the O-ring if it is worn or damaged.
3. Lubricate the new O-ring with engine oil.
4. Install the lubricated O-ring.

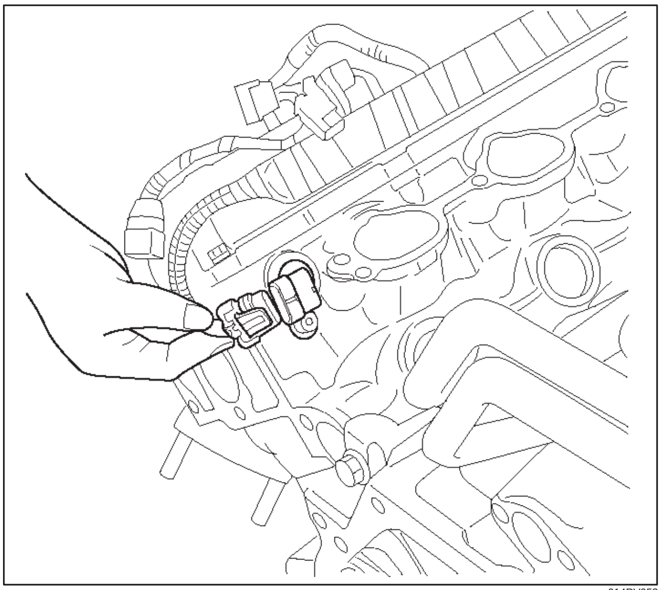
Installation Procedure

1. Install the CMP sensor in the cylinder head.
2. Install the CMP sensor retaining bolt.

Tighten

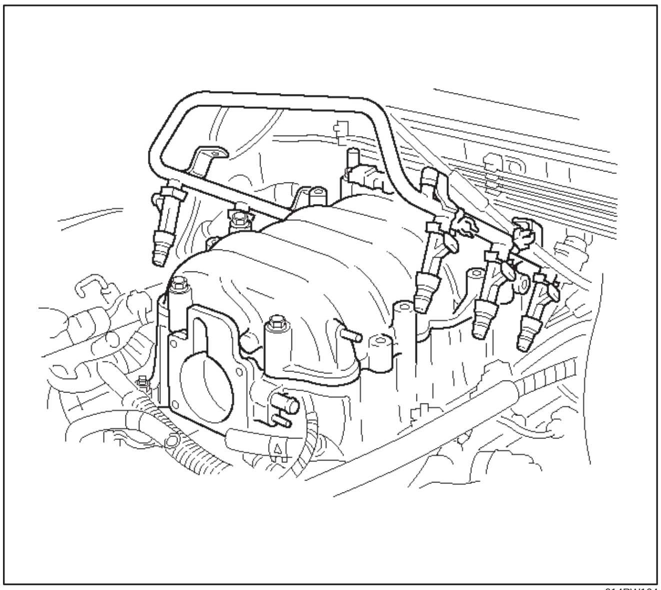
- **Tighten the retaining screw to 9 N·m (78 lb in.).**

3. Connect the electrical connector to the CMP sensor.



014RV053

4. Install the common chamber assembly.
   Refer to Common Chamber in Engine Mechanical section.



014RW164

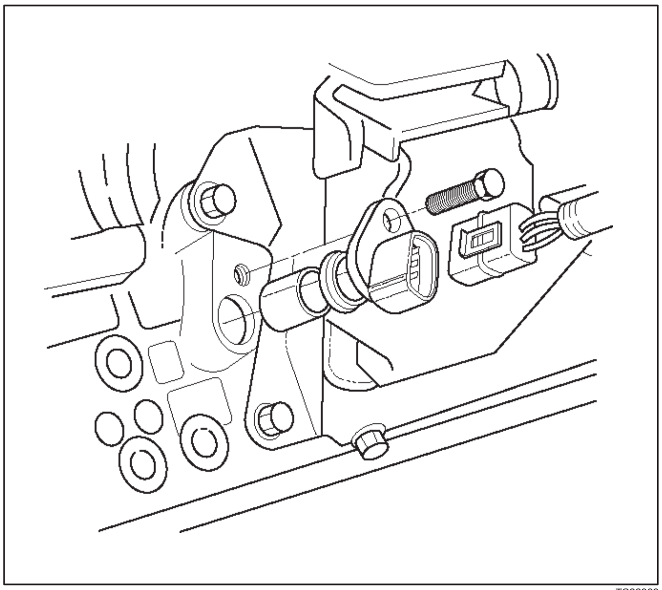
5. Install the engine cover.
6. Connect the negative battery cable.

Crankshaft Position (CKP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector to the CKP sensor.
3. Remove one bolt and the CKP sensor from the right side of the engine block, just behind the mount.

NOTE: Use caution to avoid any hot oil that might drip out.



TS22909

Inspection Procedure

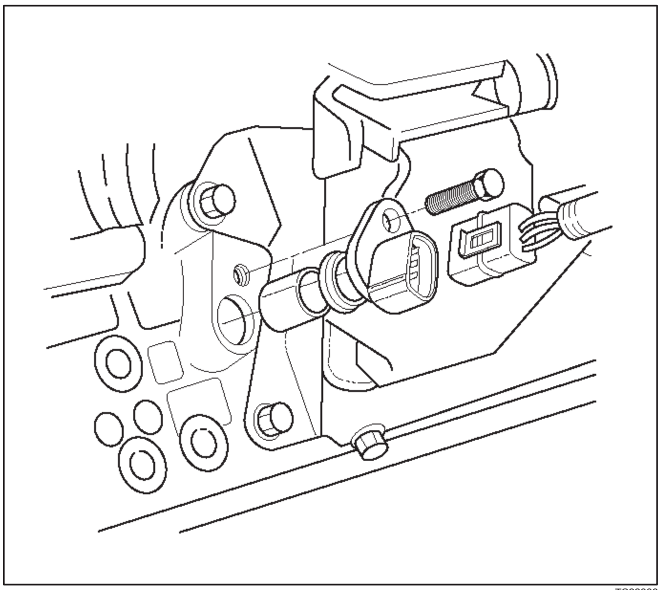
1. Inspect the sensor O-ring for cracks or leaks.
2. Replace the O-ring if it is worn or damaged.
3. Lubricate the new O-ring with engine oil.
4. Install the lubricated O-ring.

Installation Procedure

1. Install the CKP sensor in the engine block.
2. Install the CKP sensor mounting bolt.

Tighten

- **Tighten the mounting bolt to 9 N·m (78 lb in.).**



TS22909

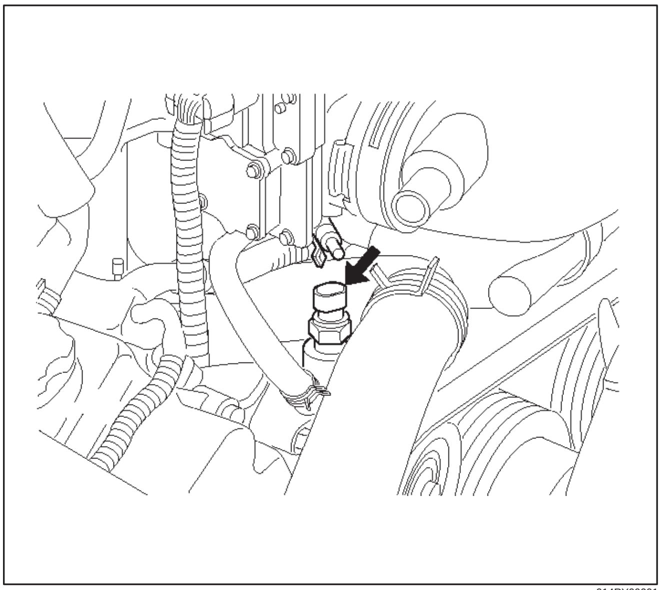
3. Connect the electrical connector to the CKP sensor.
4. Connect the negative battery cable.

Engine Coolant Temperature (ECT) Sensor

Removal Procedure

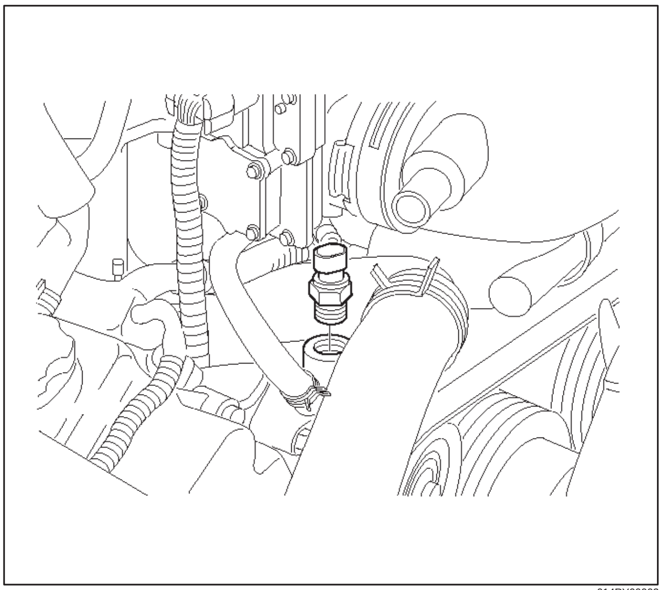
NOTE: Care must be taken when handling the engine coolant temperature (ECT) sensor. Damage to the ECT sensor will affect proper operation of the fuel injection system.

1. Disconnect the negative battery cable.
2. Drain the radiator coolant. Refer to *Draining and Refilling Cooling System* in *Engine Cooling* section.
3. Disconnect the electrical connector.



014RY00001

4. Remove the ECT sensor from the coolant crossover.



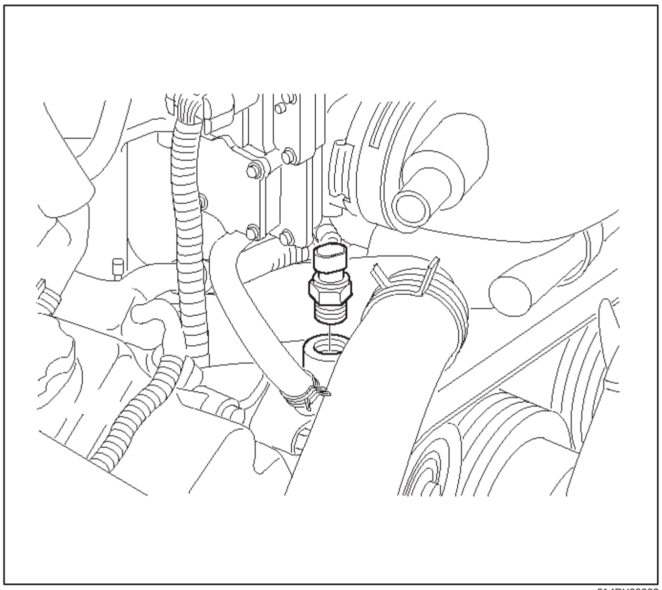
014RY00002

Installation Procedure

1. Apply sealer or the equivalent to the threads of the ECT sensor.
2. Install the ECT sensor in the coolant crossover.

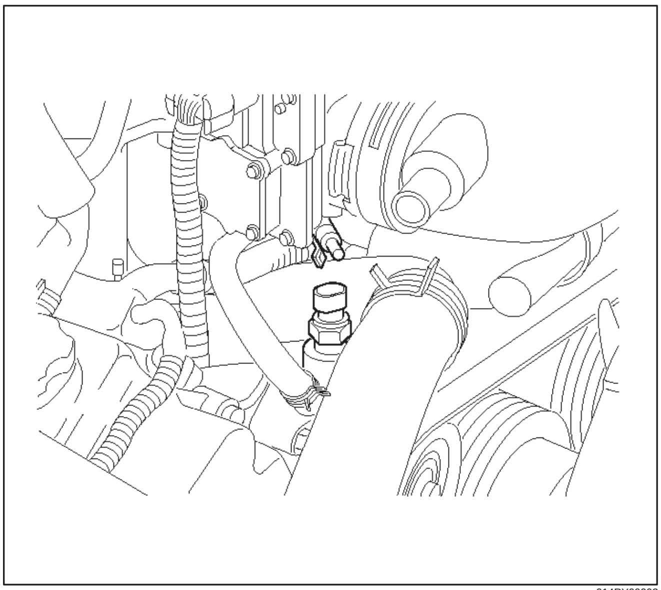
Tighten

- **Tighten the ECT sensor to 30 N·m (22 lb ft.).**



014RY00002

3. Connect the electrical connector.



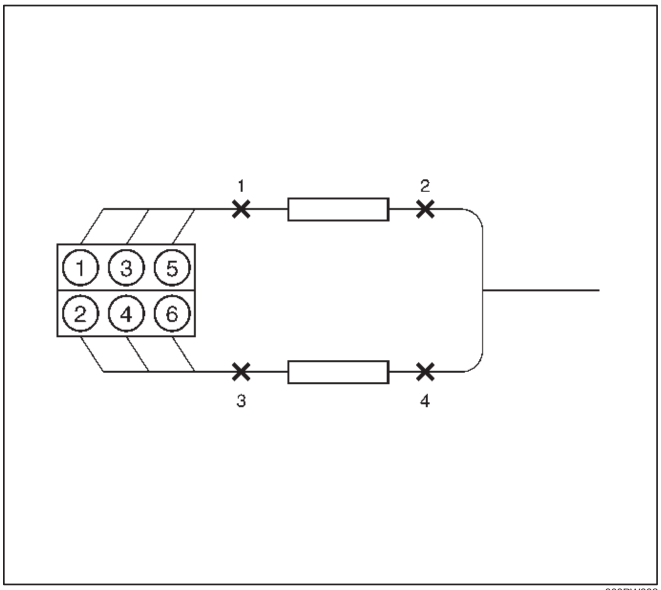
014RY00003

4. Fill the radiator with coolant. Refer to *Draining and Refilling Cooling System* in *Engine Cooling* section.
5. Connect the negative battery cable.

Heated Oxygen Sensor (HO2S)

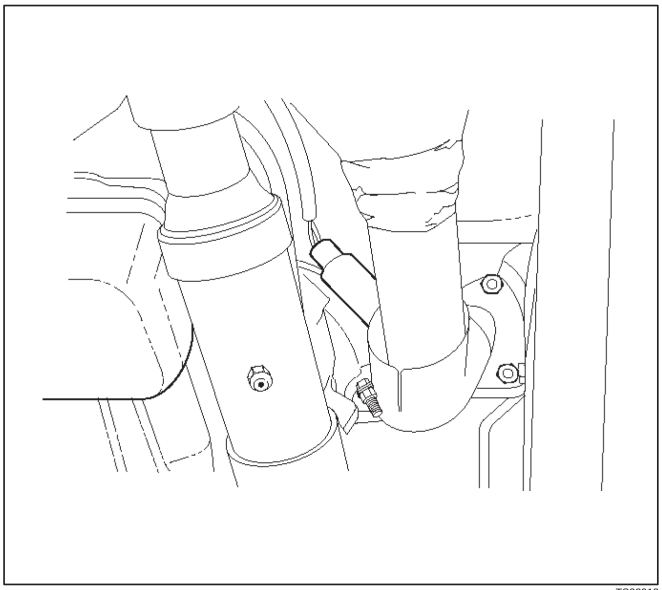
Removal Procedure

1. Disconnect the negative battery cable.
2. Locate the four oxygen sensors.



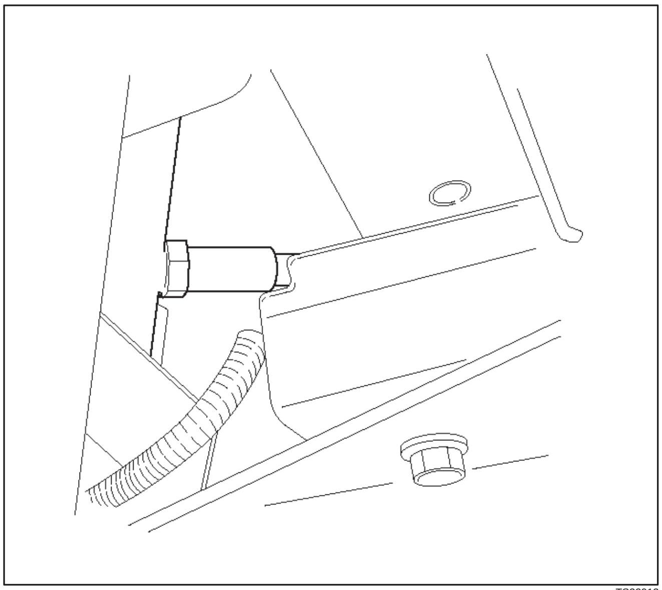
060RW008

- Bank 1 sensor 1 is mounted on the exhaust pipe ahead of the right-hand catalytic converter.



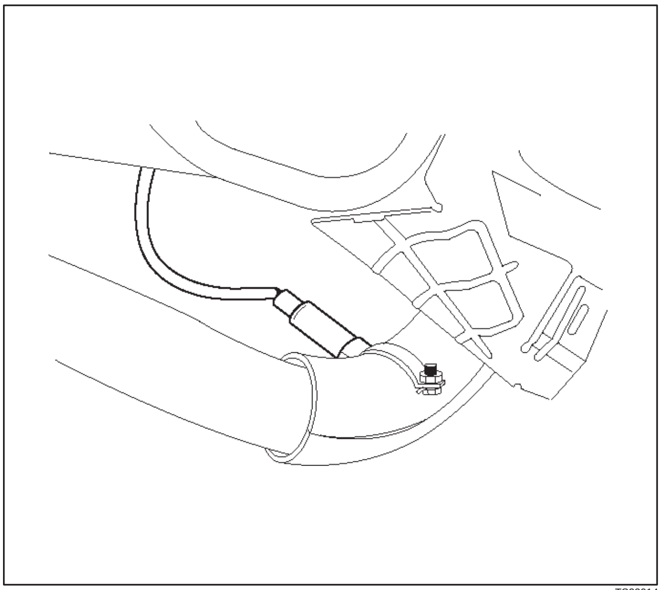
TS22912

- Bank 1 sensor 2 is mounted behind the right-hand catalytic converter.



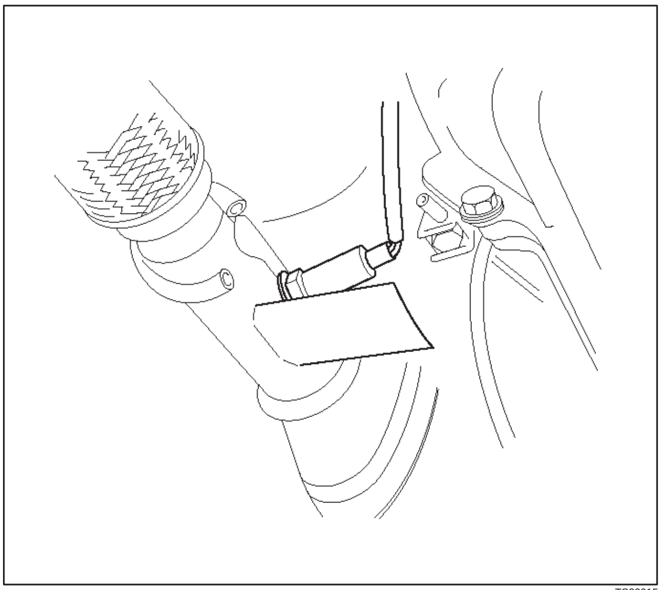
TS22913

- Bank 2 sensor 1 is mounted on the exhaust pipe ahead of the left-hand catalytic converter.



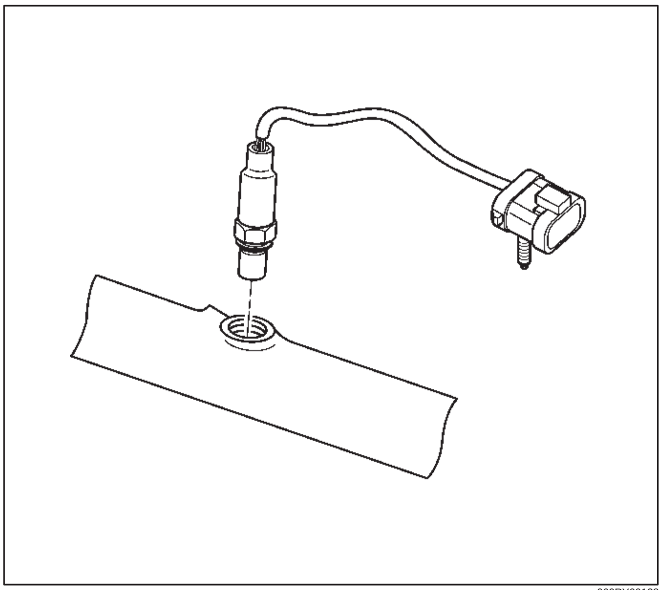
TS22914

- Bank 2 sensor 2 is mounted behind the left-hand catalytic converter.



TS22915

3. Disconnect the pigtail from the wiring harness.

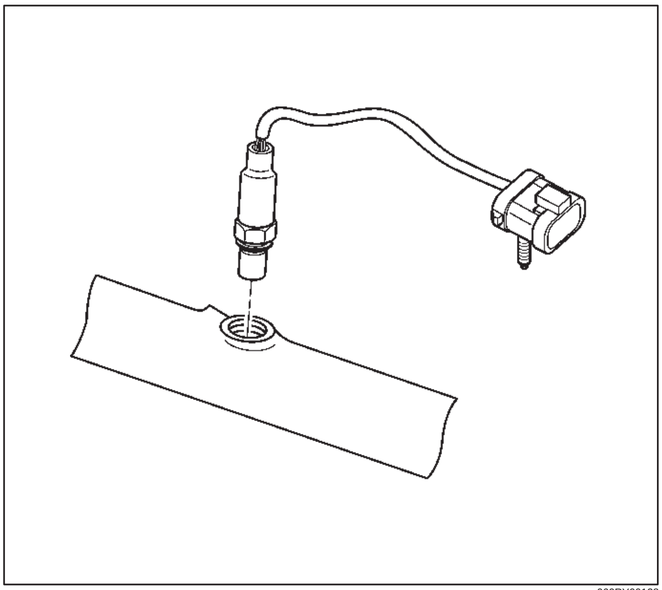


060RY00128

IMPORTANT: The pigtail is permanently attached to the sensor. Be careful not to pull the wires out.

NOTE: Do not use a torch to remove an HO2S unless the sensor is being replaced. Using a torch could damage the sensor.

4. Remove the sensor from the exhaust pipe.
   - Because of the expansion and contraction of the metal in the exhaust system over time, this may be difficult if the engine temperature is below 48°C (120°F).

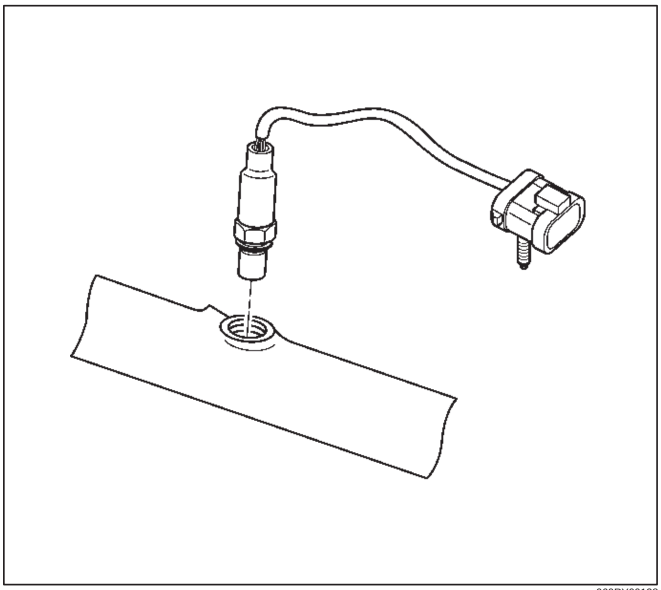


060RY00128

Inspection Procedure

All four sensors are identical. Inspect each in the same way.

1. Inspect the pigtail and the electrical connector for grease, dirt, corrosion, and bare wires or worn insulation.
2. Inspect the louvered end of the sensor for grease, dirt, or other contaminations.



060RY00128

Installation Procedure

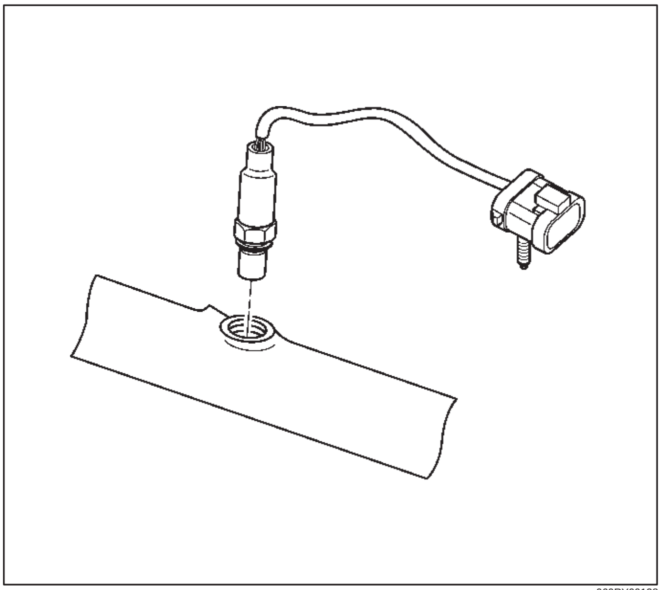
IMPORTANT:

- A special anti-seize compound on the HO2S threads. This compound consists of glass beads suspended in a liquid graphite solution. The graphite burns away with engine heat, but the glass beads will remain, making the sensor easier to remove.
- New or service sensors will already have the compound applied to the threads. If a sensor is removed and is to be reinstalled for any reason, the threads must have anti-seize compound applied.

1. Apply anti-seize compound or the equivalent to the threads of the oxygen sensor, if necessary.
2. Install the oxygen sensor on the exhaust pipe in its original position.

Tighten

- **Tighten the oxygen sensor to 55 N·m (40 lb ft.).**



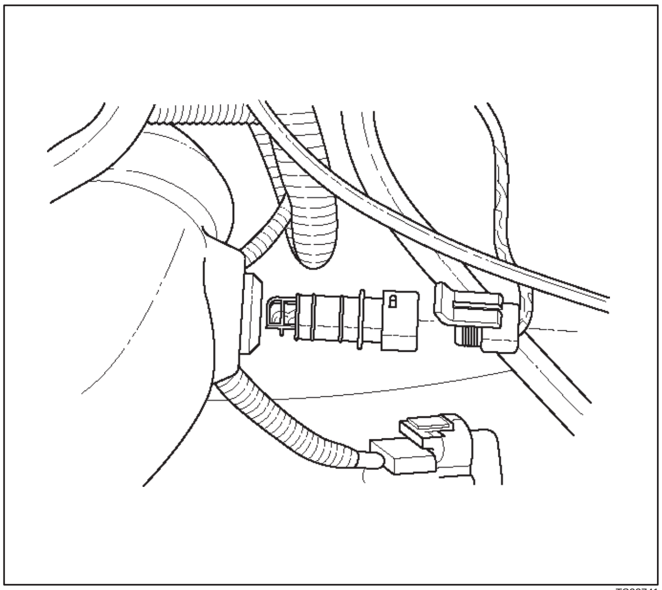
060RY00128

3. Connect the pigtail to the wiring harness.
4. Connect the negative battery cable.

Intake Air Temperature (IAT) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the engine cover
3. The IAT sensor is located in the intake air duct, behind the throttle body.
4. Disconnect the electrical connector from the IAT sensor.

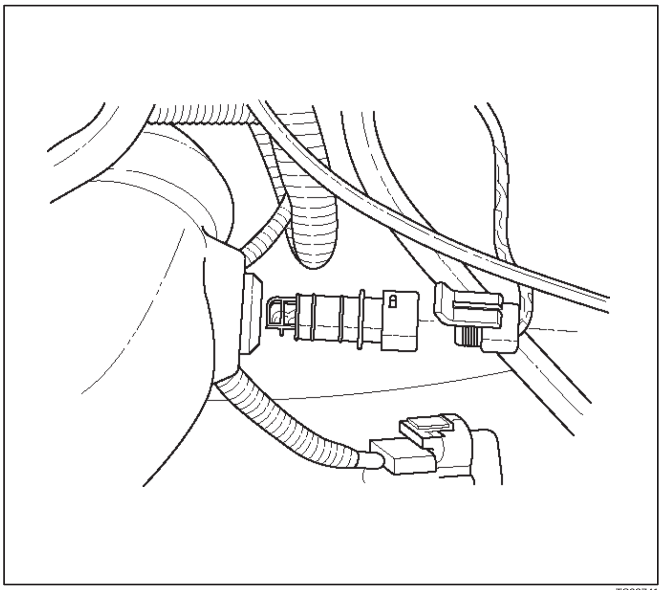


TS23741

5. Remove the IAT sensor from the intake air duct by using a rocking motion while pulling the sensor.

Installation Procedure

1. Install the IAT sensor into the grommet in the intake air duct.
2. Correct the IAT electrical connector.



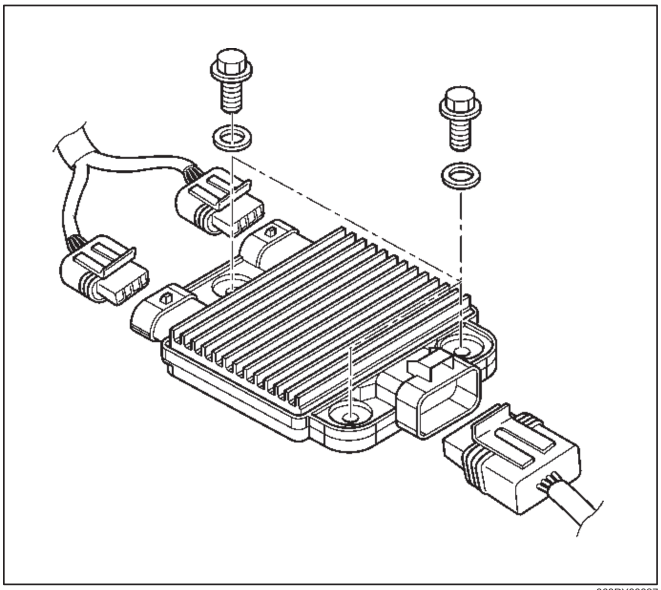
TS23741

3. Install the engine cover.
4. Connect the negative battery cable.

ION Sensing Module

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the ION sensing module connector.
3. Remove the bolts and the ION sensing module from the common chamber.



060RY00087

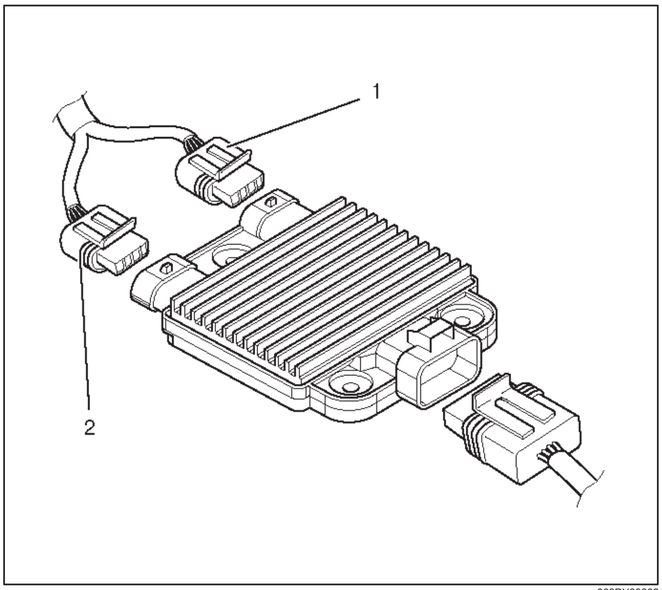
Installation Procedure

1. Install the ION sensing module on the common chamber with the bolts.

Tighten

- **Tighten the ION sensing module to 4 N·m (35 lb in.).**

2. Connect the ION sensing module connectors as shown in the illustration.



Legend

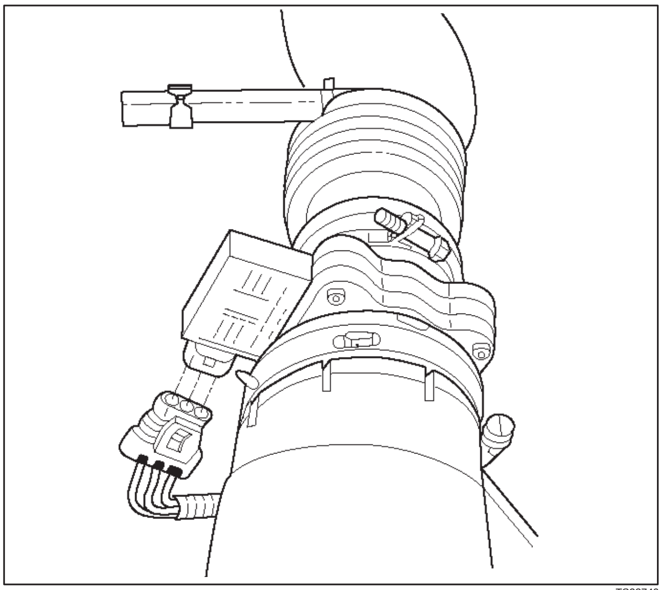
(1) Green Color Connector
(2) Blue Color Connector

3. Connect the negative battery cable.

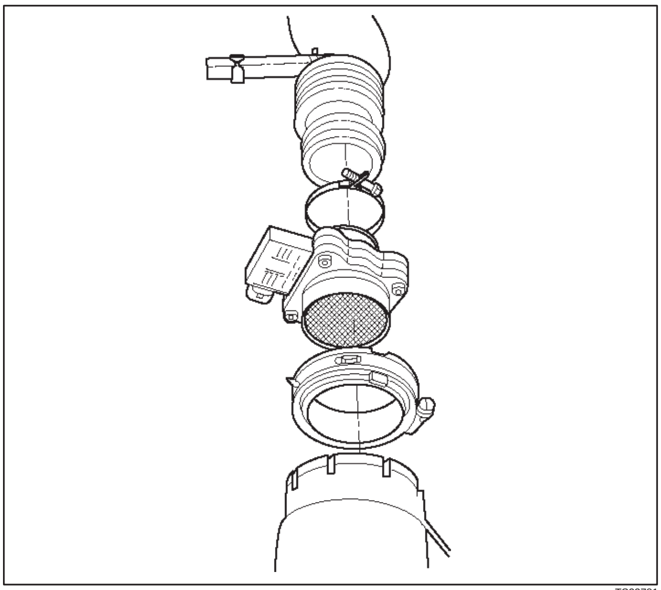
Mass Air Flow (MAF) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the MAF sensor.

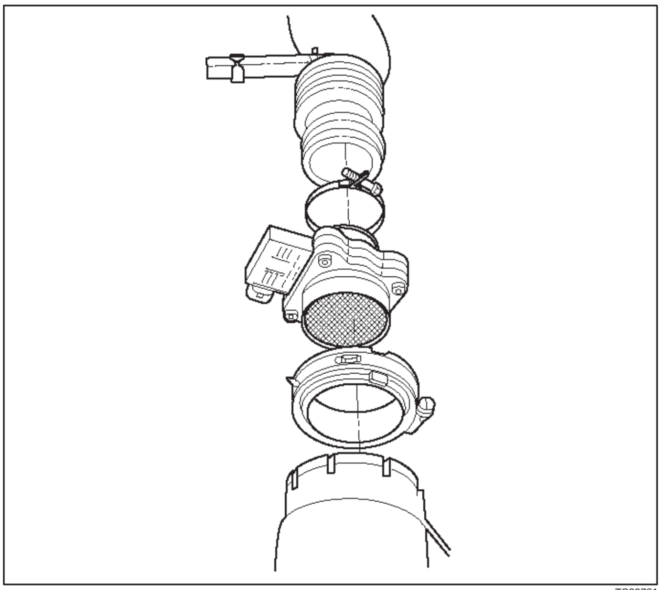


3. Loosen the clamps which secure the intake air duct and the air cleaner to the MAF sensor.
4. Remove the intake air duct from the MAF sensor.
5. Remove the MAF sensor from the air cleaner.



Installation Procedure

1. Install the MAF sensor on the air cleaner with the clamp.
2. Install the intake air duct and the clamp on the MAF sensor.

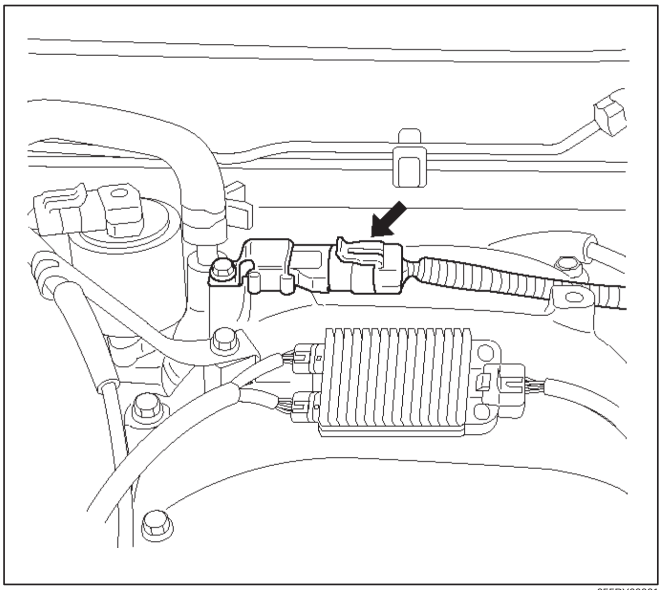


3. Tighten the clamps to secure the MAF sensor to the intake air duct and the air cleaner.
4. Connect the MAF electrical connector.
5. Connect the negative battery cable.

Manifold Absolute Pressure (MAP) Sensor

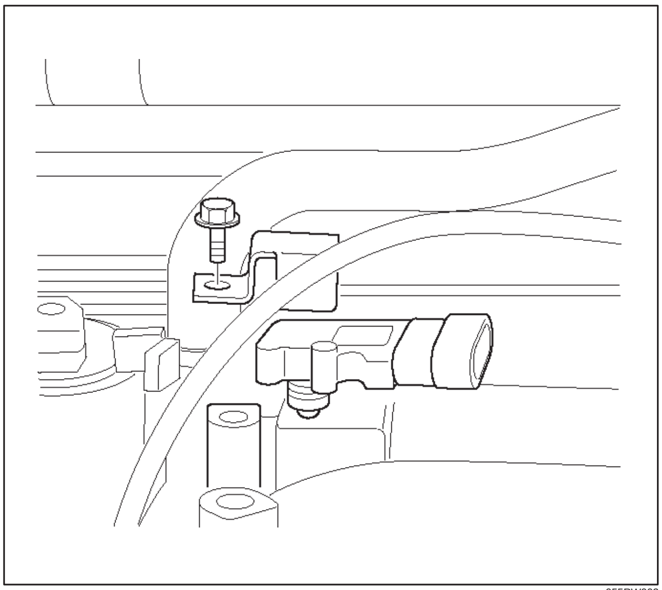
Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the MAP sensor.



055RY00001

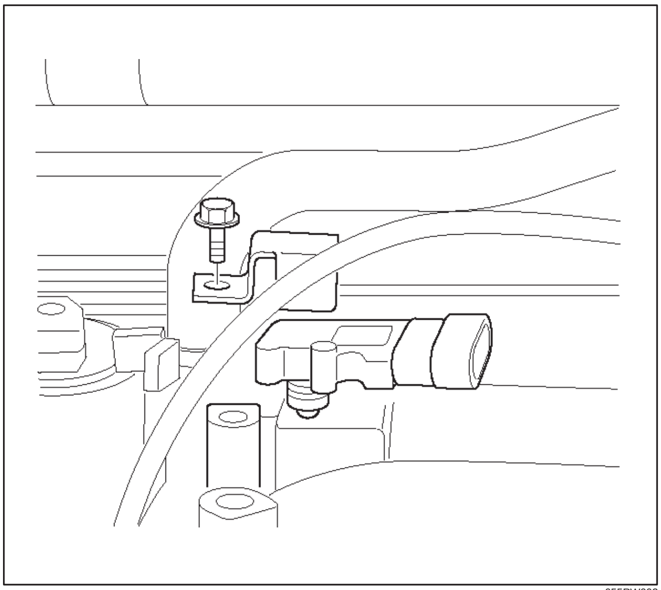
3. Remove the bolt securing the MAP sensor to the mounting bracket on the common chamber.
4. Remove the MAP sensor from the mounting bracket.



055RW002

Installation Procedure

1. Install the MAP sensor in the mounting bracket.



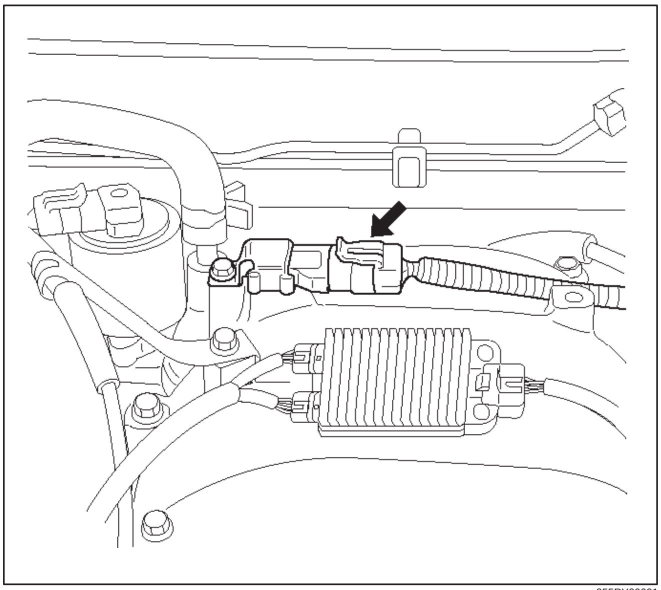
055RW002

2. Install the mounting bracket retaining bolt on the common chamber.

Tighten

- **Tighten the bolt to 20 N·m (12 lb ft.).**

3. Connect the MAP electrical connector.



055RY00001

4. Connect the negative battery cable.

Malfunction Indicator Lamp (MIL)

Removal and Installation Procedure

Refer to Warning light bulb, indicator light valve, illumination light bulb, A/T indicator light bulb in Meter and Gauge.

Reduced Power Lamp

The reduced power lamp (RPL) turns on when the ignition key is moved to the ON position. It should turn off in approximately 3 seconds or immediately after the engine starts.

If the RPL turns on during vehicle operation, a vehicle system failure resulting in reduced engine output is indicated.

If both the reduced RPL and the check engine light turn on, a serious problem affecting vehicle performance is indicated.

Refer to the *OBD system check NO and RPL "ON" steady* in this manual.

Powertrain Control Module (PCM)

Service Precaution

NOTE: To prevent possible electrostatic discharge damage to the PCM, do not touch the connector pins or soldered components on the circuit board.

Electrostatic Discharge (ESD) Damage

Electronic components used in the control systems are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4,000 volts for a person to even feel the zap of a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are by friction and by induction. An example of charging by friction is a person sliding across a car seat.

Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore, it is important to use care when handling and testing electronic components.

NOTE: To prevent possible Electrostatic Discharge damage, follow these guidelines:

- Do not touch the control module connector pins or soldered components on the control module circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, or while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.

NOTE: To prevent internal PCM damage, the ignition must be in the "OFF" position in order to disconnect or reconnect power to the PCM (for example: battery cable, PCM pigtail, PCM fuse, jumper cables, etc.).

IMPORTANT: When replacing the production PCM with a service PCM, it is important to transfer the broadcast code and production PCM number to the service PCM label. This will allow positive identification of PCM parts throughout the service life of the vehicle. Do not record this information on the metal PCM cover.

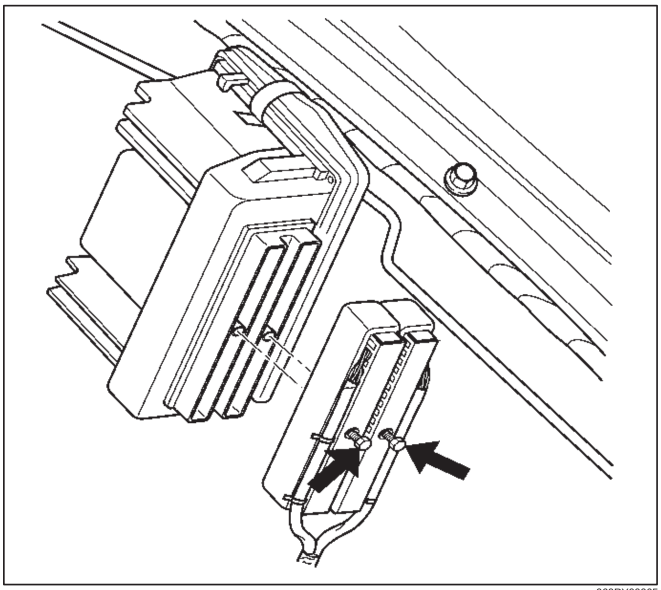
IMPORTANT: The ignition should always be in the "OFF" position in order to install or remove the PCM connectors.

Service of the PCM should normally consist of either replacement of the PCM or EEPROM programming. If the diagnostic procedures call for the PCM to be replaced, the PCM should be checked first to ensure it is the correct part. If it is, remove the faulty PCM and install the new service PCM.

The service PCM EEPROM will not be programmed. DTC P0601 indicates the check sum error.

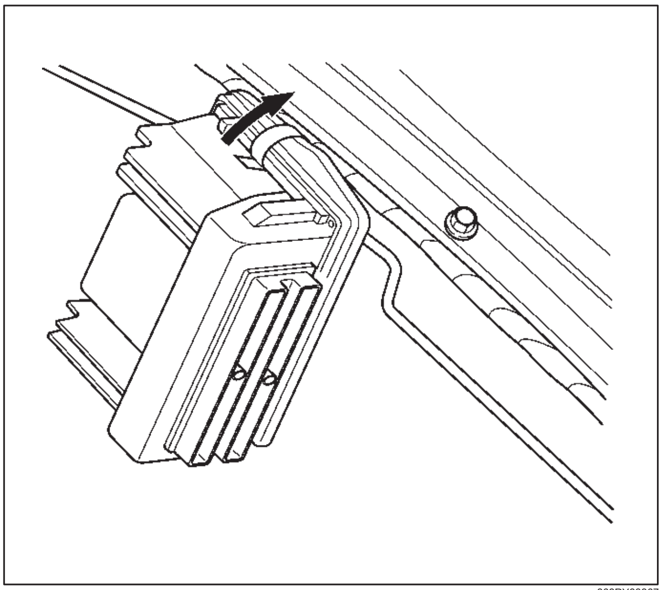
Removal Procedure

1. Disconnect the negative battery cable.
2. Block the wheels.
3. Remove the two screws from the PCM electrical connectors.
4. Disconnect the PCM electrical connectors.



060RY00065

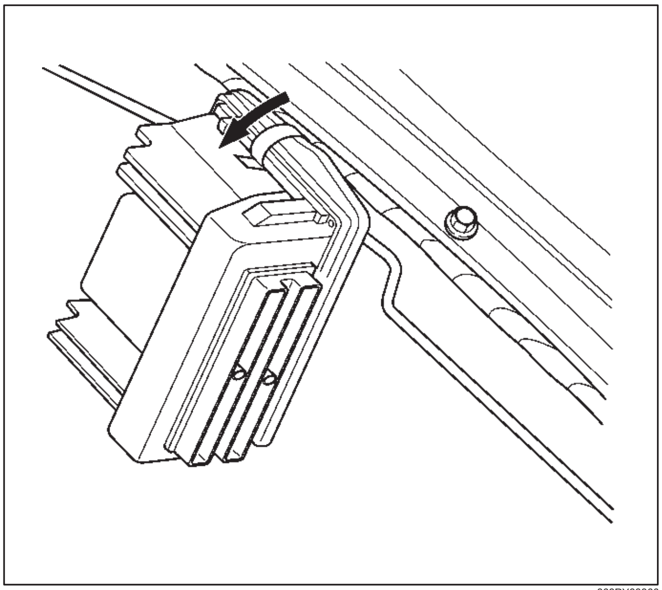
5. After removing the clip which fixes the PCM to the bracket, remove PCM.



060RY00067

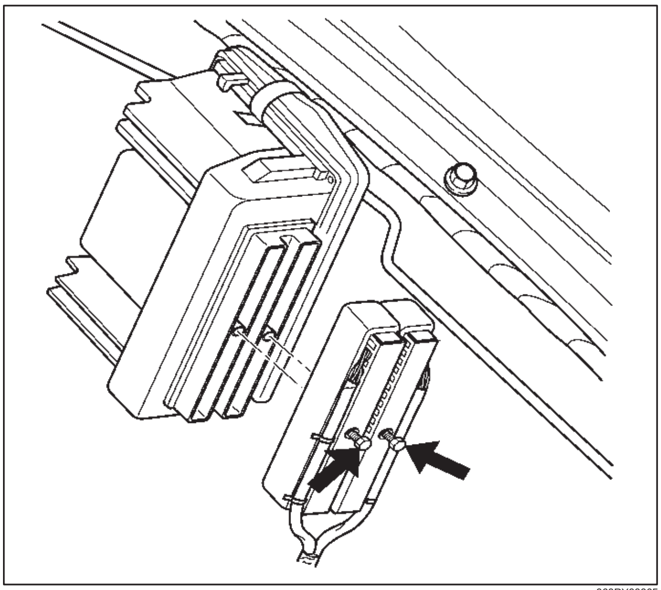
Installation Procedure

1. Install the PCM to bracket and fix with the clip.



060RY00066

2. Connect the PCM electrical connectors.
3. Install the two screws to PCM electrical connectors.



060RY00065

EEPROM

General Description

The Electronically Erasable Programmable Read Only Memory (EEPROM) is a permanent memory that is physically soldered within the PCM. The EEPROM contains program and calibration information that the PCM needs to control powertrain operation.

EEPROM Programming

1. Set-up – Ensure that the following conditions have been met:
   - The battery is fully charged.
   - The ignition is “ON.”
   - The Vehicle Interface Module cable connection at the DLC is secure.
2. Program the PCM using the latest software matching the vehicle. Refer to up-to-date Techline equipment user’s instructions.
3. If the PCM fails to program, proceed as follows:
   - Ensure that all PCM connections are OK.
   - Check the Techline equipment for the latest software version.
   - Attempt to program the PCM. If the PCM still cannot be programmed properly, replace the PCM. The replacement PCM must be programmed.

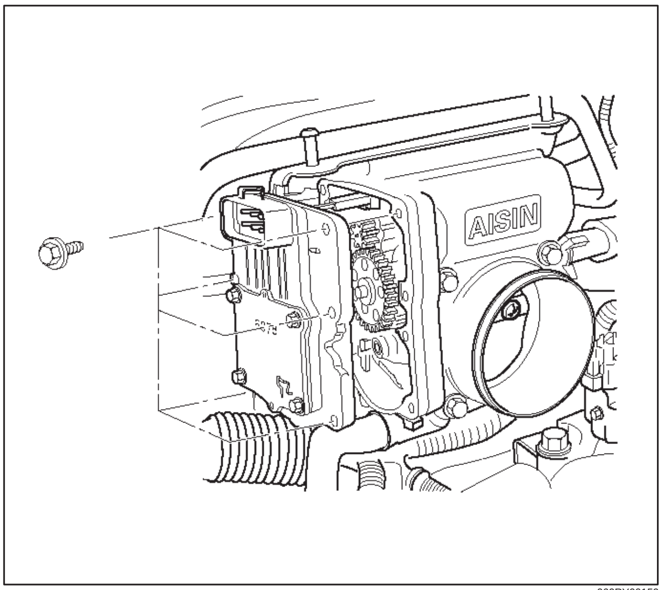
Functional Check

1. Perform the On-Board Diagnostic System Check.
2. Start the engine and run for one minute.
3. Scan for DTCs using the Tech 2.

Throttle Position (TP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the TPS electrical connector.
3. Remove the bolts and the TP sensor from the throttle body.



060RY00159

NOTE: Do not clean the TP sensor by soaking it in solvent. The sensor will be damaged as a result.

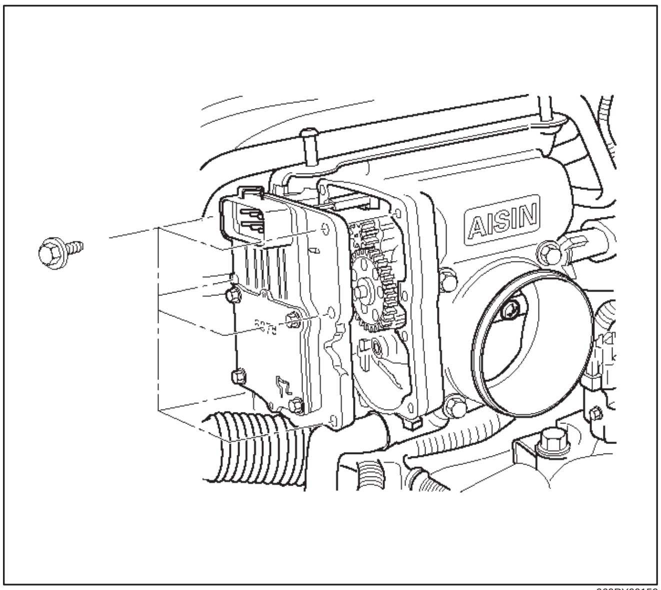
Function Check

Use a Tech 2 to check the TP sensor output voltage at closed throttle.

- The voltage should be under 0.85 volt.
- If the reading is greater than 0.85 volt, check the throttle shaft to see if it is binding.

Installation Procedure

1. Install the TP sensor on the throttle body with the bolts.



060RY00159

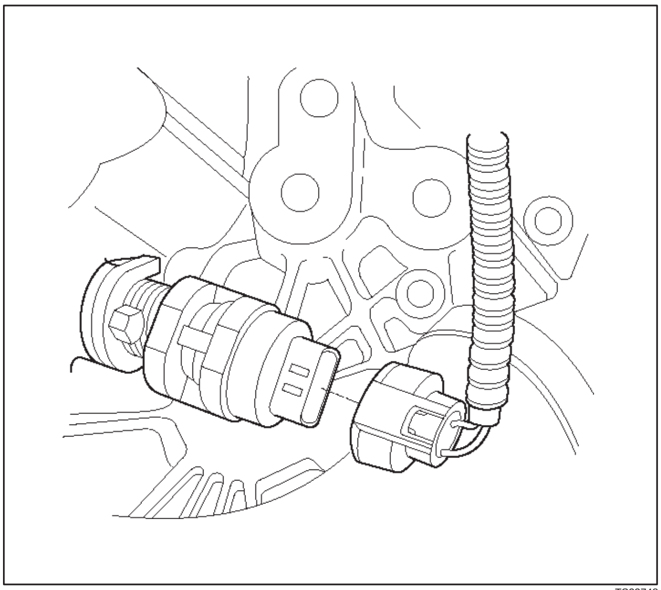
2. Connect the TP electrical connector.
3. Install the negative battery cable.

Vehicle Speed Sensor (VSS)

Removal Procedure

CAUTION: The VSS is located on the right side of the transfer case just ahead of the rear propeller shaft and very close to the exhaust pipes for 4WD and on the extension cover for 2WD. Be sure that the exhaust pipes are cool enough to touch before trying to remove the VSS. If the pipes are hot, you could be burned.

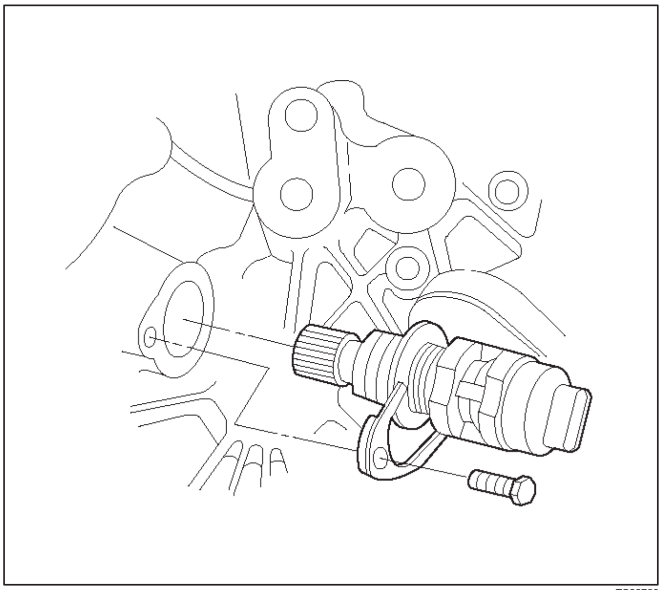
1. Disconnect the negative battery cable.
2. Disconnect the VSS electrical connector.



TS23748

3. Remove the bolt and the clamp securing the VSS in place.

IMPORTANT: Have a container ready to catch any fluid that leaks out when the VSS is removed from the transfer case for 4WD and on the extension cover for 2WD.



TS23780

4. Remove the VSS from the transfer case by wiggling it slightly and pulling it straight out.

Inspection Procedure

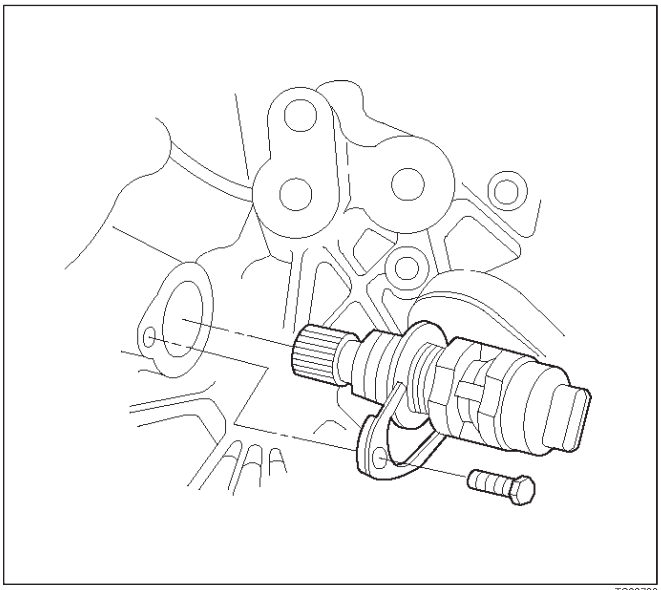
1. Inspect the electrical connector for signs of corrosion or warping. Replace the VSS if the electrical connector is corroded or warped.
2. Inspect the VSS driven gear for chips, breaks, or worn condition. Replace the VSS if the driven gear is chipped, broken or worn.
3. Inspect the O-ring for wear, nicks, tears, or looseness. Replace the O-ring if necessary.

Installation Procedure

1. Install the VSS in the transfer case with the notch for the connector facing the rear.
2. Secure the VSS in place with the clamp and the bolt.

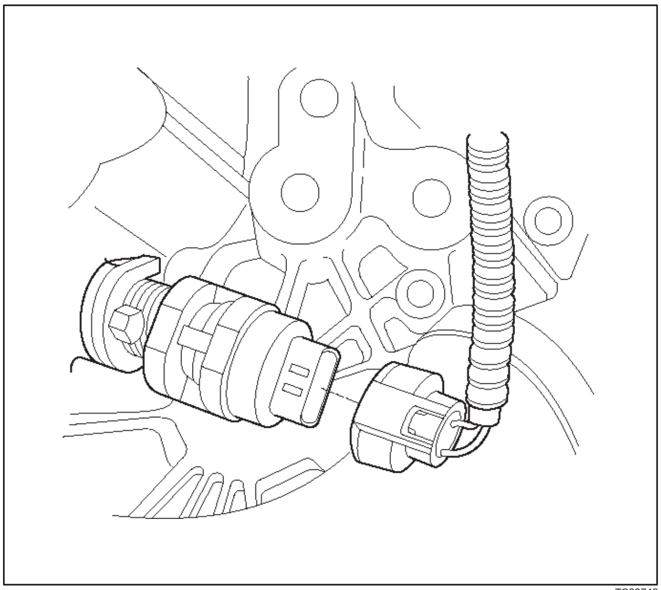
Tighten

- **Tighten the bolt to 16 N·m (12 lb ft.).**



TS23780

3. Connect the VSS electrical connector.



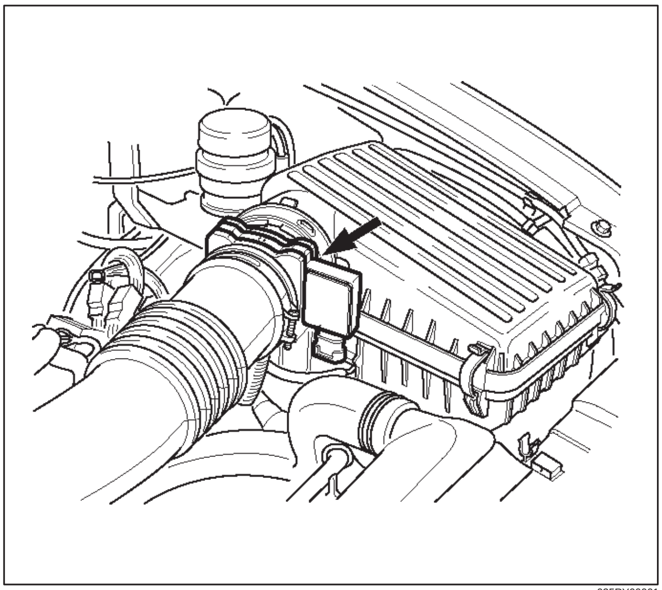
TS23748

4. Check the transfer case oil level. Add fluid if necessary.
5. Connect the negative battery cable.

Air Cleaner/Air Filter

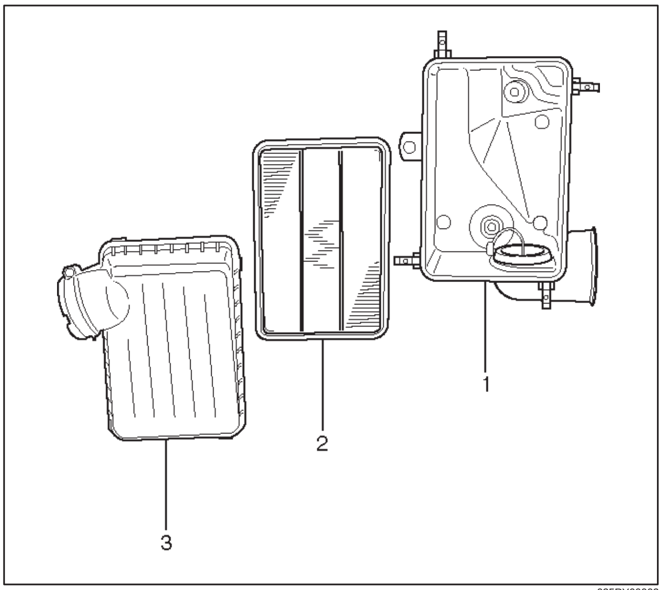
Removal Procedure

1. Loosen the clamp between the air cleaner lid and the mass air flow sensor.



025RY00001

2. Release the four latches securing the lid to the air cleaner housing.
3. Remove the air cleaner lid.
4. Remove the air filter element.
5. Remove the retaining bolts and the air cleaner housing from the vehicle.



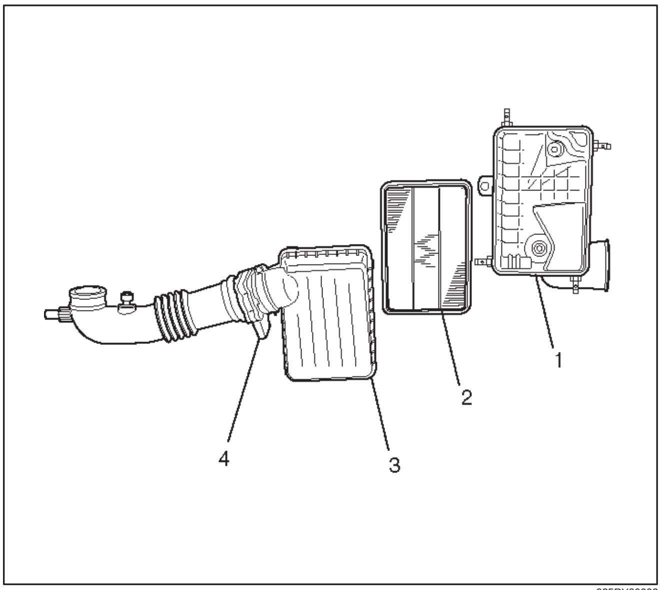
025RY00002

Legend

(1) Air Cleaner Housing
(2) Air Filter Element
(3) Air Cleaner Lid

Installation Procedure

1. Install the air cleaner housing in the vehicle with the retaining bolts.
2. Install the air filter element in the air cleaner housing.
3. Install the air cleaner lid on the MAF sensor and the air cleaner housing.



025RY00003

Legend

(1) Air Cleaner Housing
(2) Air Filter Element
(3) Air Cleaner Lid
(4) Mass Air Flow Sensor

4. Tighten the clamp and secure the four latches between the lid and the air cleaner housing.

Common Chamber

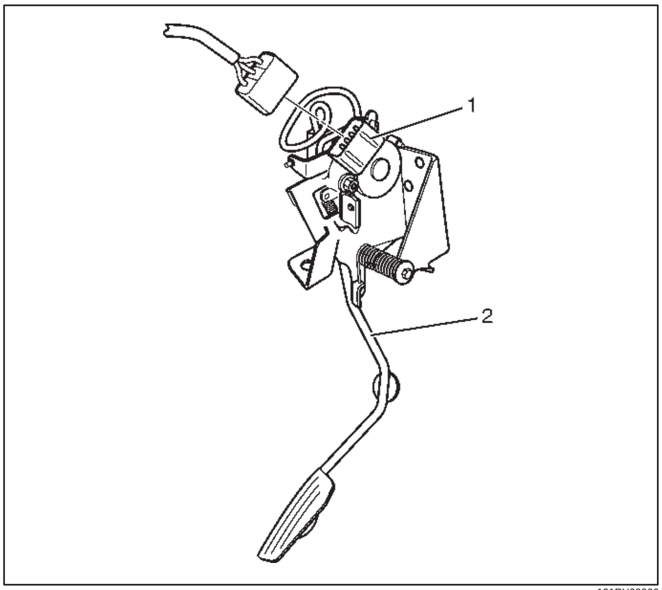
Removal and Installation Procedure

Refer to Common Chamber in Engine Mechanical section.

Accelerator Pedal Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical harness from the accelerator position sensor.

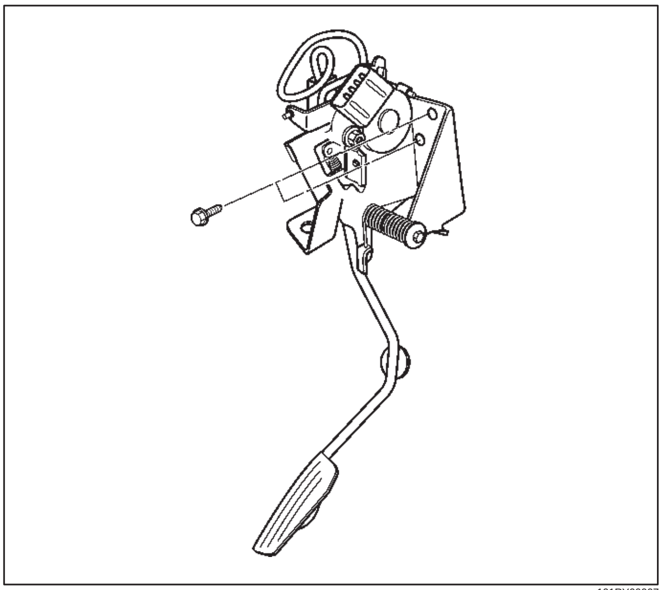


101RY00006

Legend

(1) Accelerator Position Sensor
(2) Accelerator Pedal Assembly

3. Remove the two screws from the accelerator pedal assembly.



101RY00007

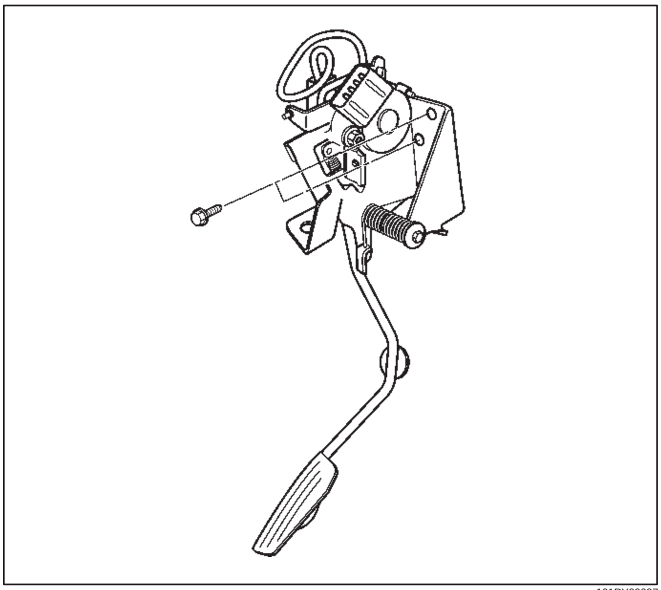
4. Remove the accelerator pedal assembly from the bulkhead.

Installation Procedure

1. Install the accelerator pedal assembly on the bulkhead.
2. Install the two screws to the accelerator pedal assembly.

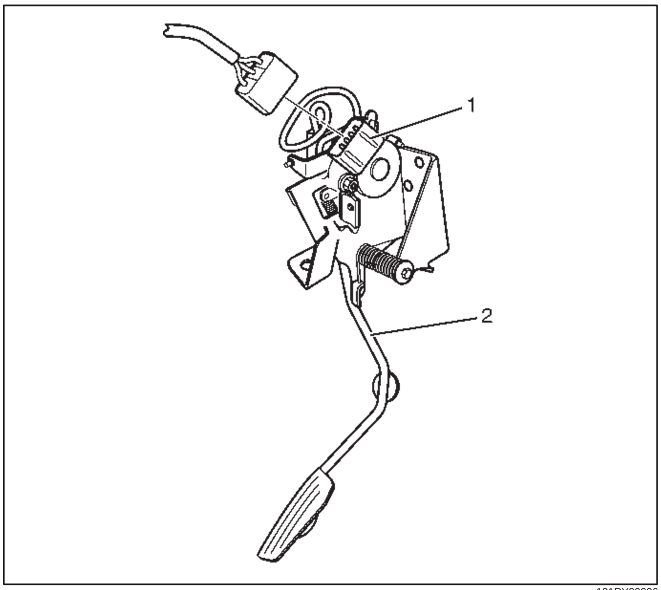
Tighten

- **Tighten the screws to 22 N·m (16 lb ft.).**



101RY00007

3. Connect the electrical harness to the accelerator position sensor.



101RY00006

Legend

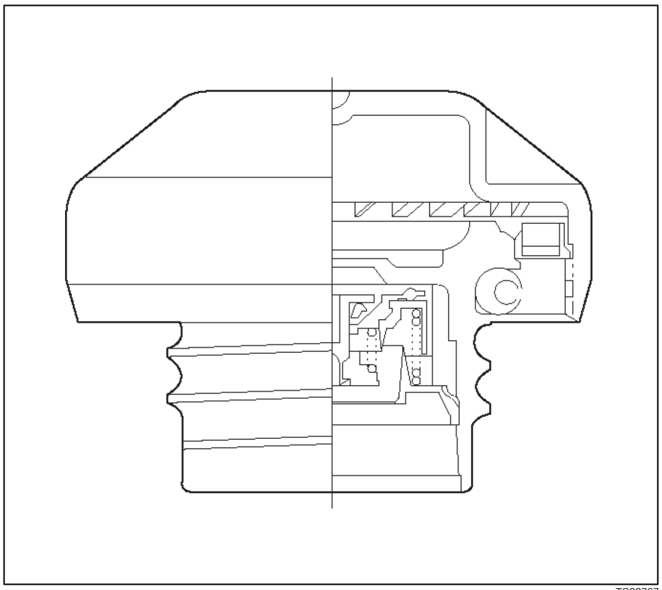
(1) Accelerator Position Sensor
(2) Accelerator Pedal Assembly

4. Install the negative battery cable.

Fuel Filler Cap

General Description

The fuel filler cap includes a vacuum valve and a pressure valve.
If high vacuum or high pressure occurs in the fuel tank, each valve works to adjust the pressure in order to prevent damage of the tank.



TS23767

Inspection Procedure

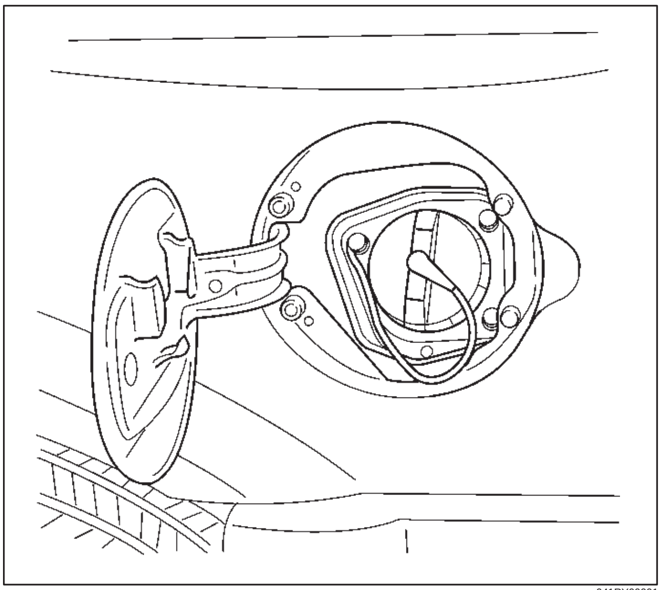
NOTE: Replace the fuel filler cap with the same type of filler cap that was originally installed on the vehicle.

- Check the seal ring in the filler cap for any abnormality and for seal condition.
- Replace the filler cap if any abnormality is found.

Fuel Filter

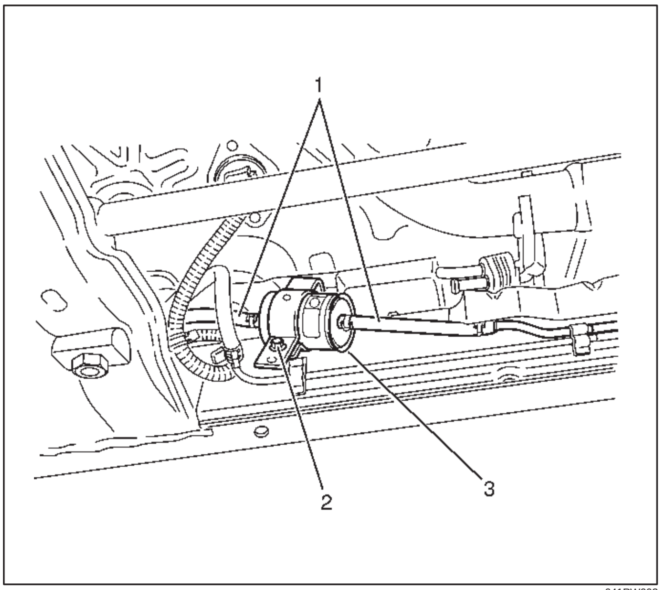
Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the fuel filler cap.



041RY00001

3. Disconnect the fuel hose from the fuel filter on the engine side.
4. Disconnect the fuel hose from the fuel filter on the fuel tank side.
5. Remove the bolt on the fuel filter holder.



041RW003

Legend

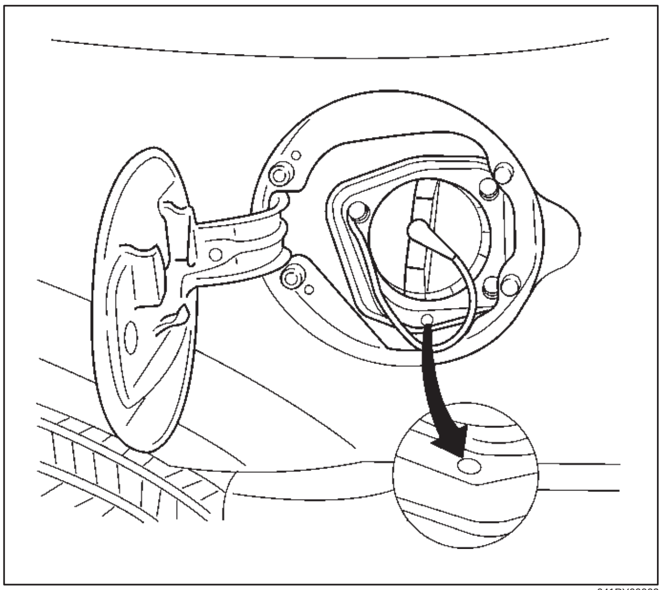
(1) Fuel Hose
(2) Fuel Filter Fixing Bolt
(3) Fuel Filter

6. Remove the fuel filter.

Inspection Procedure

1. Replace the fuel filter when the following occur:
   - Fuel leaks from the fuel filter body.
   - The fuel filter body is damaged.
   - The fuel filter is clogged with dirt or sediment.

2. If the drain hole is clogged, clean the drain.



041RY00002

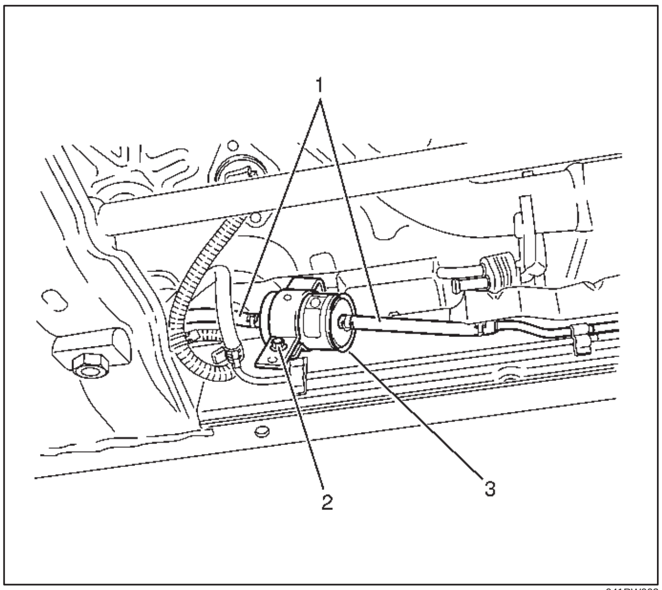
Installation Procedure

1. Install the fuel filter in the correct direction.
2. Install the bolt on the fuel filter holder.

Tighten

- **Tighten the screws to 20 N·m (14 lb ft.).**

3. Connect the fuel hose on the engine side.
4. Connect the fuel hose on the fuel tank side.

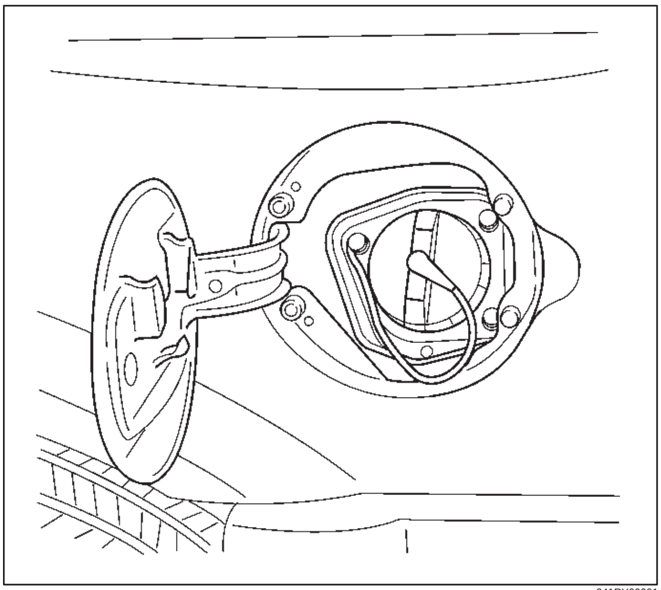


041RW003

Legend

(1) Fuel Hose
(2) Fuel Filter Fixing Bolt
(3) Fuel Filter

5. Install the fuel filler cap.



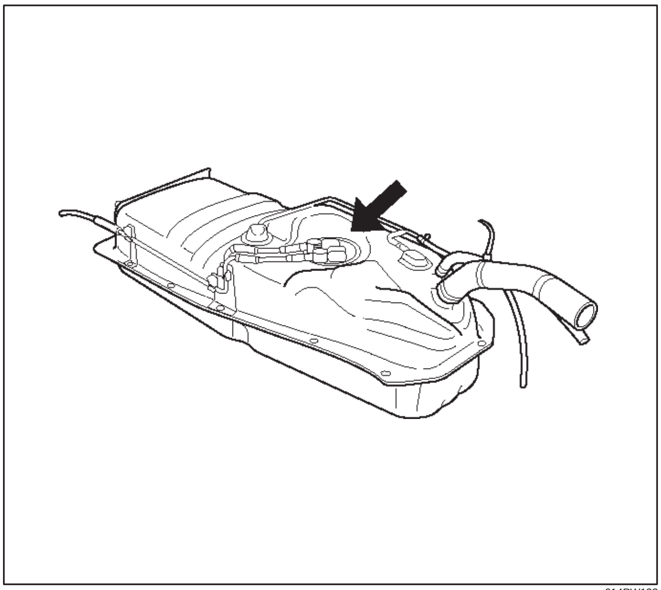
041RY00001

6. Connect the negative battery cable.

Fuel Gauge Unit

Removal Procedure

Refer to *Fuel Gauge Unit Engine Fuel* section.



014RW133

Fuel Injectors

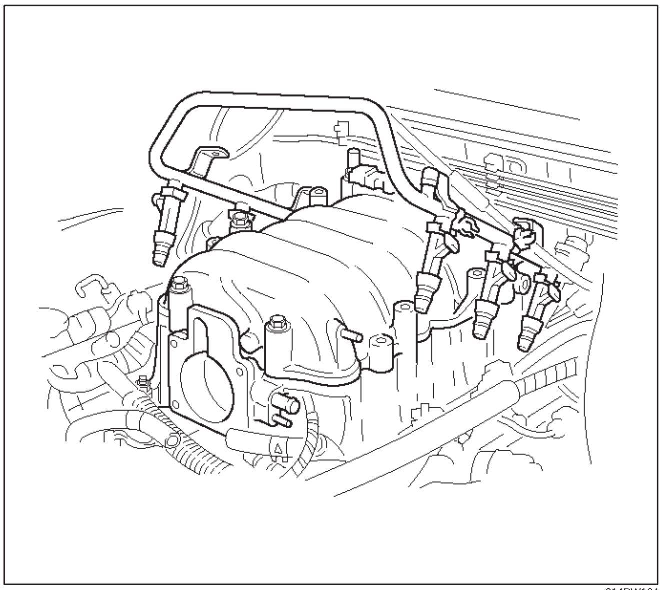
Removal Procedure

NOTE: If the fuel injectors are leaking, the engine oil may be contaminated with fuel. Check the oil for signs of contamination and change the oil and the filter if necessary.

NOTE: Use care in removing the fuel injectors in order to prevent damage to the fuel injector electrical connector pins or the fuel injector nozzles. The fuel injector is an electrical component and should not be immersed in any type of cleaner as this may damage the fuel injector.

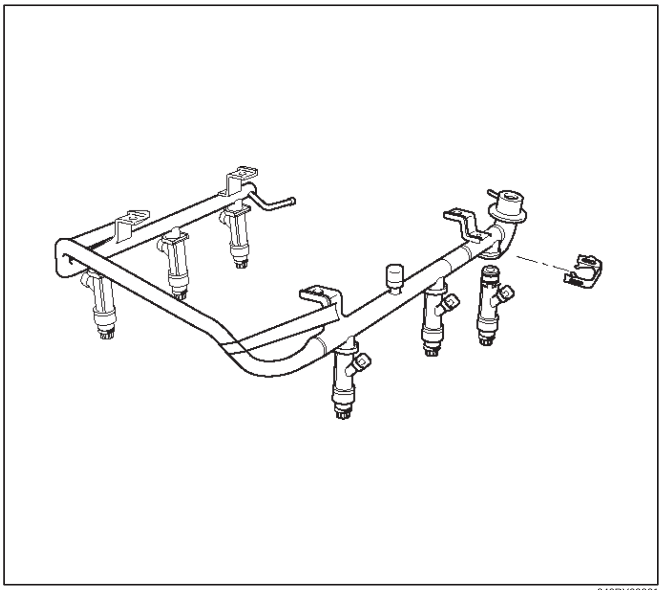
IMPORTANT: Fuel injectors are serviced as a complete assembly only.

1. Disconnect the negative battery cable.
2. Remove the common chamber. Refer to *Common Chamber in Engine Mechanical* section.
3. Remove the fuel rail. Refer to *Fuel Rail* section.



014RW164

4. Remove the injector retainer clip.



040RY00001

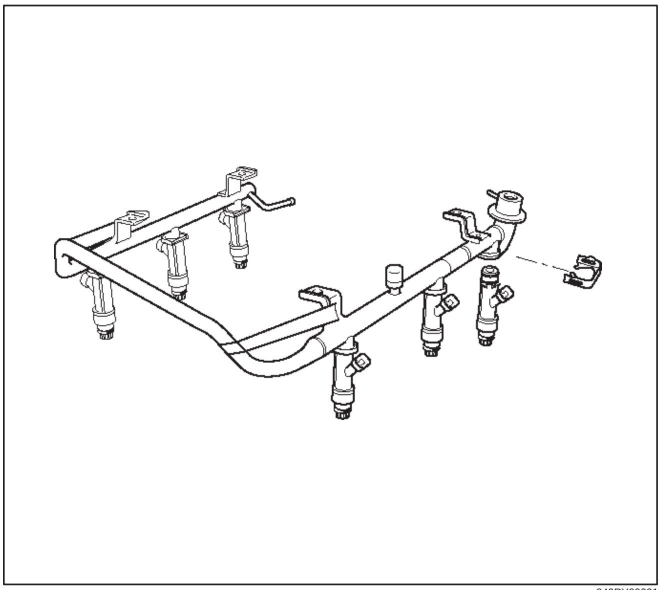
5. Remove the fuel injector assembly.
6. Remove the O-ring from the fuel injector.
7. Remove the O-ring backup from the fuel injector .

Inspection Procedure

1. Inspect the O-rings for cracks or leaks.
2. Replace worn or damaged O-rings.
3. Lubricate the new O-rings with engine oil before installation.

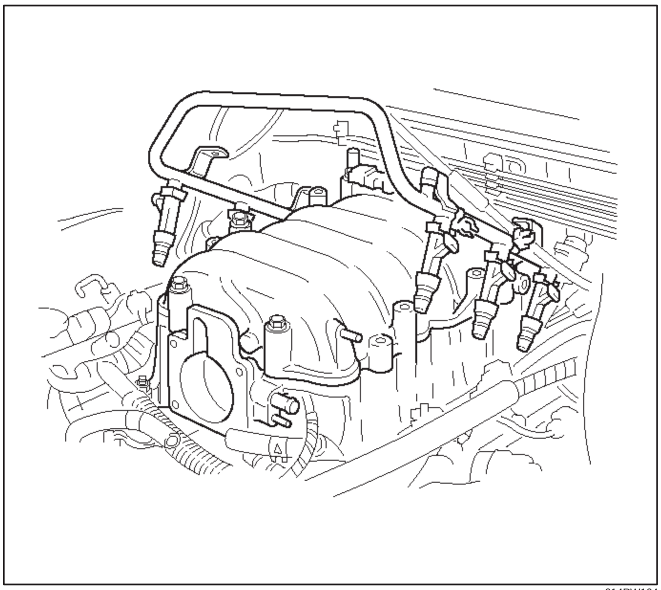
Installation Procedure

1. Install the O-ring backup on the fuel injector.
2. Install the new O-ring on the fuel injector.
3. Install the fuel injector on the fuel rail.



040RY00001

4. Use new fuel injector retainer clips to retain the fuel injector to the fuel rail.
5. Coat the end of the fuel injector with gasoline.
6. Install the fuel rail. Refer to *Fuel Rail* section.



014RW164

7. Install the common chamber. Refer to *Common Chamber in Engine Mechanical* section.
8. Install the engine cover.
9. Connect the negative battery cable.

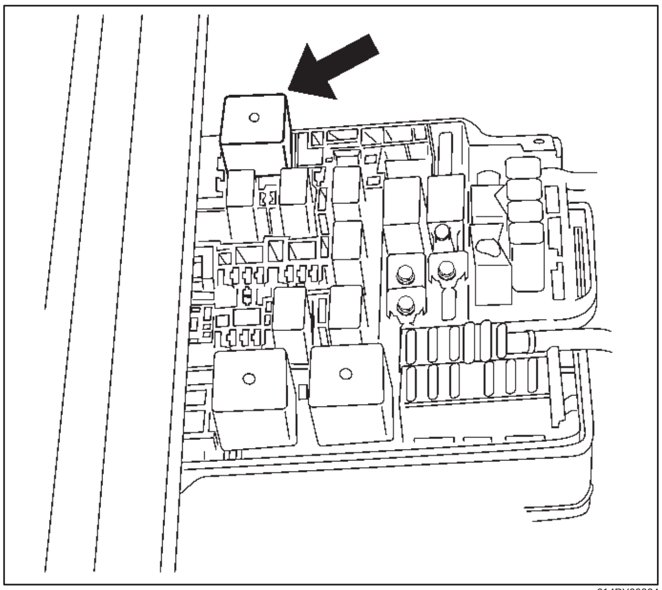
Fuel Metering System

Fuel Pressure Relief Procedure

CAUTION: To reduce the risk of fire and personal injury, there are necessary to relieve the fuel system pressure before filler and gauge unit servicingthe fuel system components.

CAUTION: After relieving the system pressure, a small amount of fuel may be released when servicing fuel lines or connections. Reduce the chance of personal injury by covering the fuel line fittings with a shop towel before you disconnect the fittings. The towels will absorb any fuel that may leak out. When the disconnect is completed, place the towel in an approved container.

1. Remove the fuel cap.
2. Remove the fuel pump relay from the underhood relay box. Refer to *Fuel Pump Relay* section.



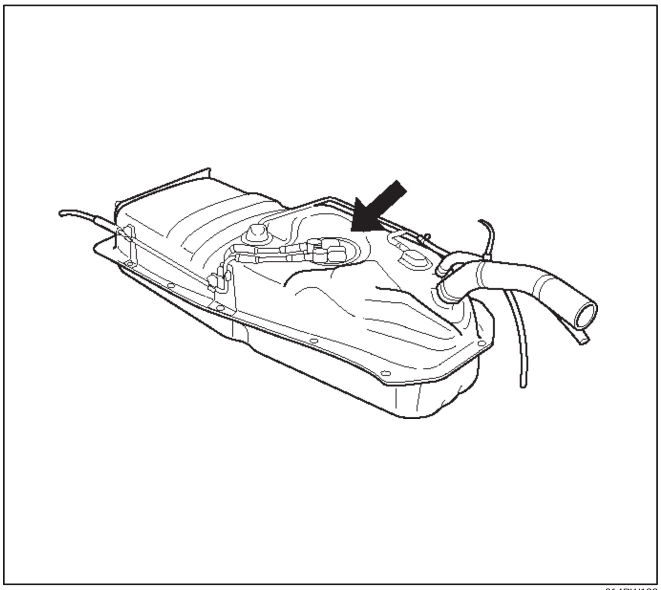
014RY00004

3. Start the engine and allow it to stall.
4. Crank the engine for 30 seconds.
5. Disconnect the negative battery cable.

Fuel Pump Assembly

Removal Procedure

Refer to *Fuel Tank In Fuel Pump Relay* section.

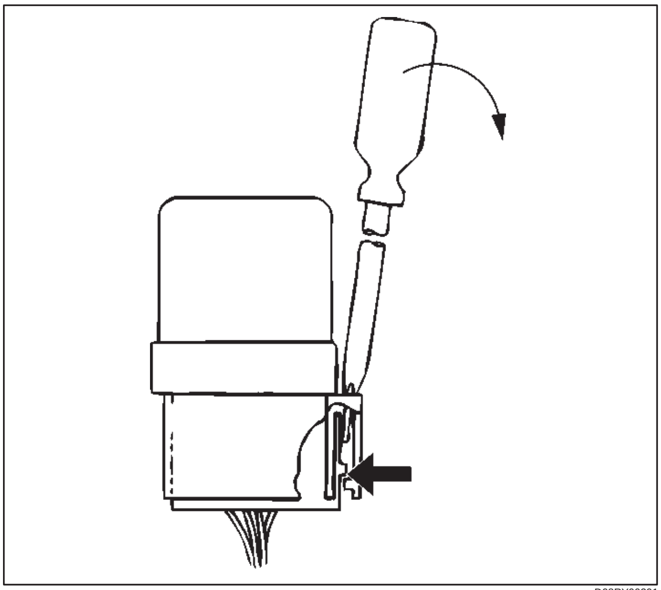


014RW133

Fuel Pump Relay

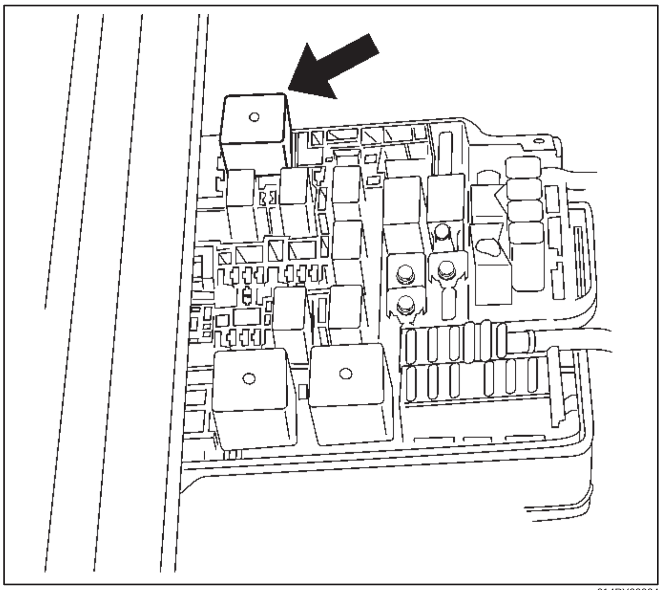
Removal Procedure

1. Remove the fuse and relay box cover from under the hood.
2. Consult the diagram on the cover to determine which is the correct relay.
3. Insert a small screwdriver into the catch slot on the forward side of the fuel pump relay.
   - The screwdriver blade will release the catch inside.



D08RY00291

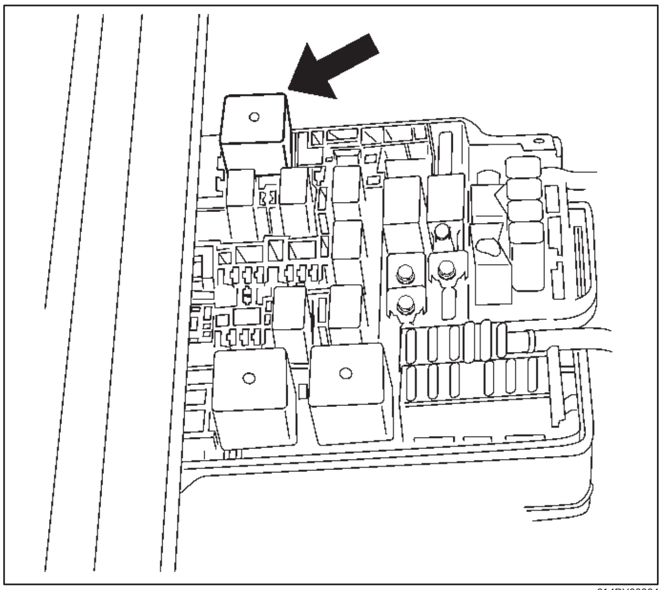
4. Pull the relay straight up and out of the fuse and relay box.



014RY00004

Installation Procedure

1. Insert the relay into the correct place in the fuse and relay box with the catch slot facing forward.
2. Press down until the catch engages.
   - An audible "click" will be heard.



014RY00004

3. Install the fuse and relay box cover.

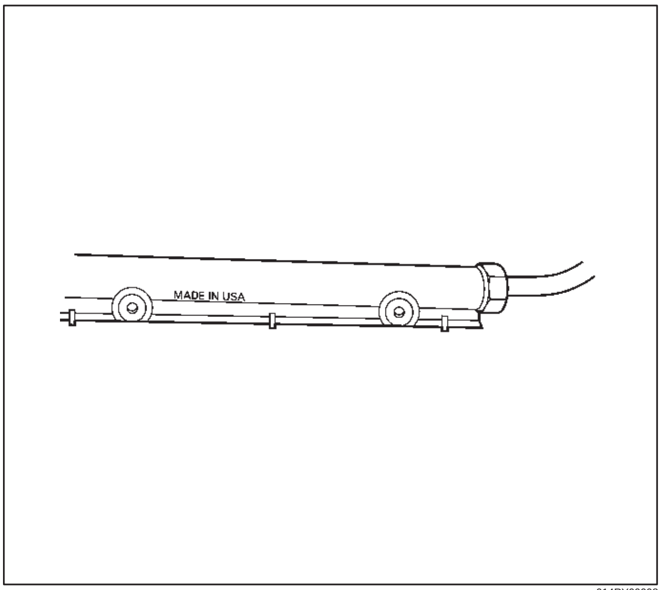
Fuel Rail Assembly

Removal Procedure

NOTE:

- Do not attempt to remove the fuel inlet fitting on the fuel rail. It is staked in place. Removing the fuel inlet fitting will result in damage to the fuel rail or the internal O-ring seal.
- Use care when removing the fuel rail assembly in order to prevent damage to the injector electrical connector terminals and the injector spray tips.
- Fittings should be capped and holes plugged during servicing to prevent dirt and other contaminants from entering open lines and passages.

IMPORTANT: An eight-digit identification number is stamped on the side of the fuel rail. Refer to this number when you service the fuel rail or when a replacement part is required.

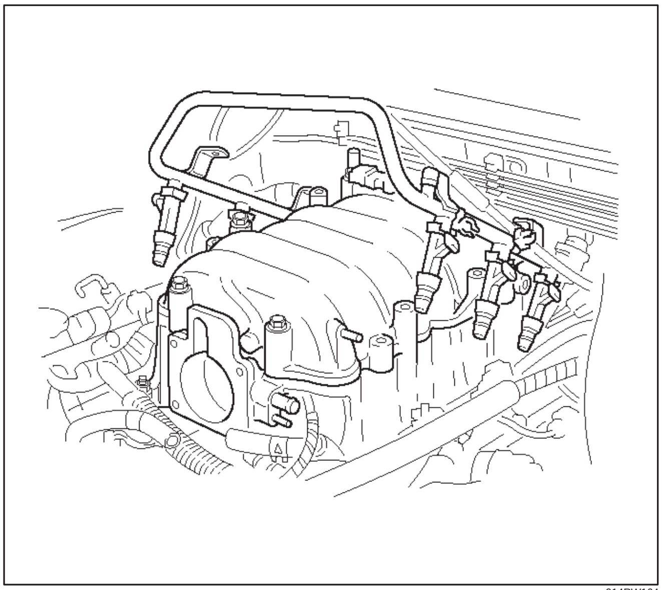


014RY00008

Before removal, the fuel rail assembly may be cleaned with a spray type engine cleaner. Follow the spray package instructions. Do not immerse the fuel rails in liquid cleaning solvent.

1. Depressurize the fuel system. Refer to Fuel Pressure Relief Procedure in this Section.
2. Disconnect the negative battery cable.
3. Remove the engine cover.
4. Disconnect the throttle position sensor electrical connector from throttle body.
5. Disconnect the connectors from manifold absolute pressure sensor, solenoid valve, electric vacuum sensing valve.
6. Disconnect the vacuum hose on canister VSV and positive crankcase ventilation hose.

7. Remove the common chamber. Refer to the common chamber in Engine Mechanical section.
   1. Lift up carefully on the fuel injectors. Do not separate the fuel injectors from the fuel rail.
   2. If an injector becomes separated from the fuel rail, the infector O-ring seals and the retainer clip must be replaced.
   3. Drain residual fuel into an approved container.

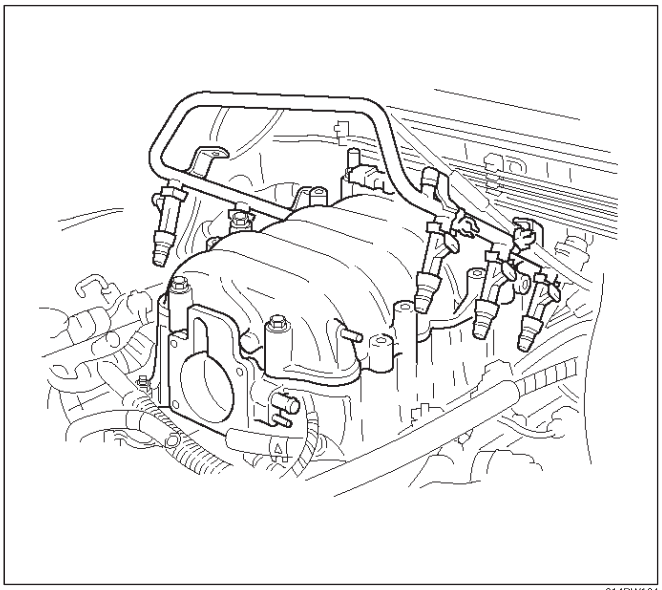


014RW164

8. If removal of the fuel pressure regulator is necessary, refer to *Fuel Pressure Regulator* section.
9. If removal of the fuel injectors is necessary, refer to *Fuel Injectors* section.

Installation Procedure

1. If the fuel injectors were removed, install them. Refer to *Fuel Injectors* section.
2. If the fuel pressure regulator was removed, install it. Refer to *Fuel Pressure Regulator* section.
3. Install the common chamber. Refer to common chamber in engine Mechanical section.



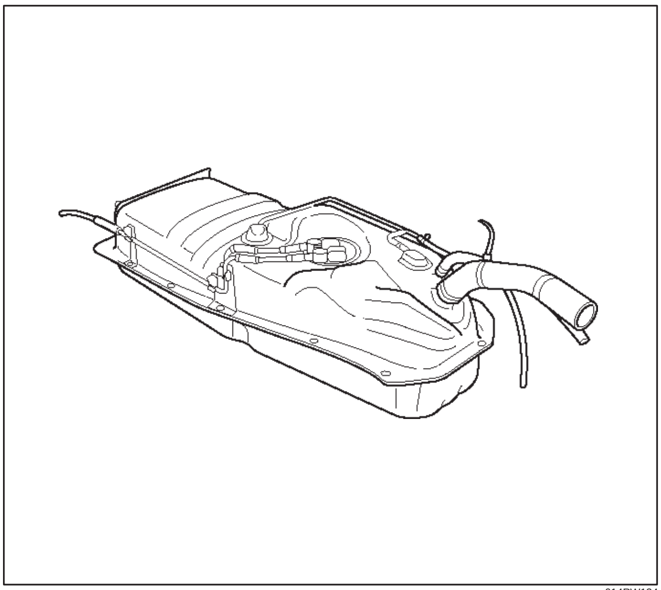
014RW164

4. Connect the vacuum hose on Canister VSV and positive crankcase ventilation hose.
5. Connect the connectors to manifold absolute pressure sensor, solenoid valve, electric vacuum sensing valve.
6. Connect the throttle position sensor electrical connector to throttle body.
7. Install the engine cover.
8. Connect the negative battery cable.
9. Crank the engine until it starts. Cranking the engine may take longer than usual due to trapped air in the fuel rail and in the injectors.

Fuel Tank

Removal Procedure

Refer to *Fuel Tank In Fuel Pump Relay*



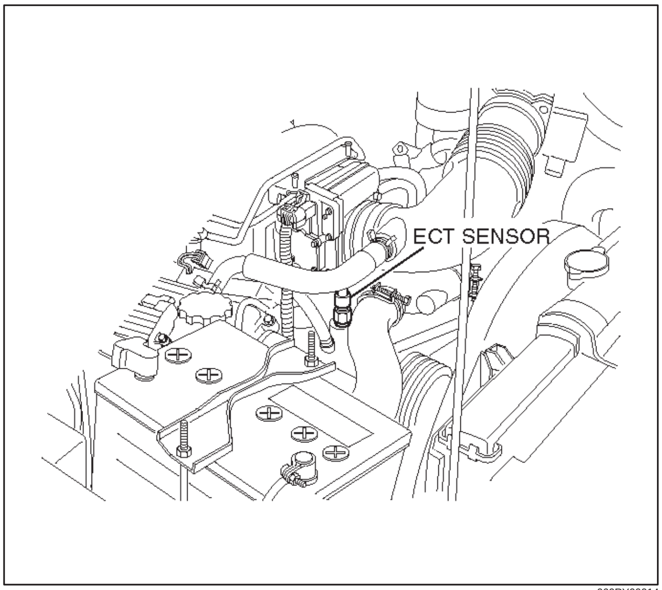
014RW134

Throttle Body (TB)

Removal Procedure

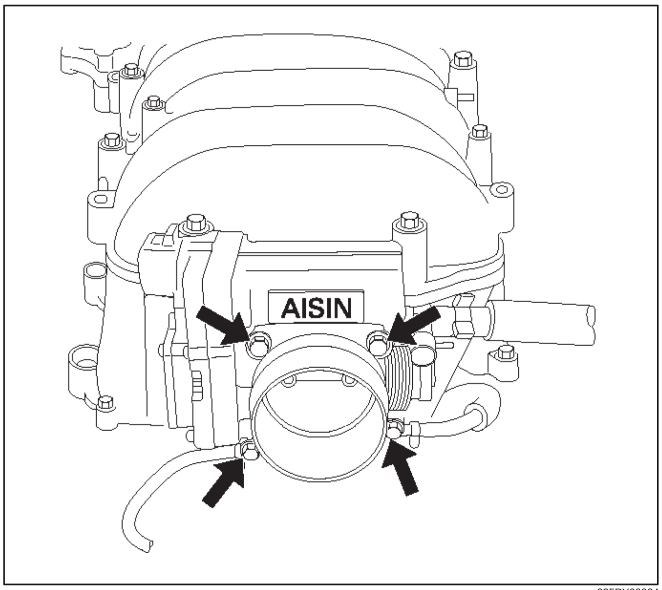
1. Disconnect the negative battery cable.
2. Drain the cooling system. Refer to *Cooling System* section.

3. Disconnect the electrical connectors:
   - Throttle position (TP) sensor.
   - Intake air temperature (IAT) sensor. Refer to *Intake Air Temperature Sensor* section.



060RY00014

4. Disconnect the vacuum hose below the air horn.
5. Remove the intake air duct clamp.
6. Disconnect the intake air duct.
7. Disconnect the coolant lines from the throttle body.
8. Remove the bolts from the common chamber.
9. Remove the throttle body from the common chamber.
10. Remove the gasket from the common chamber.



025RY00004

11. Remove the TP sensor. Refer to *Throttle Position (TP) Sensor* section.

Inspection Procedure

NOTE: Do not use solvent of any type when you clean the gasket surfaces on the intake manifold and the throttle body assembly. The gasket surfaces and the throttle body assembly may be damaged as a result.

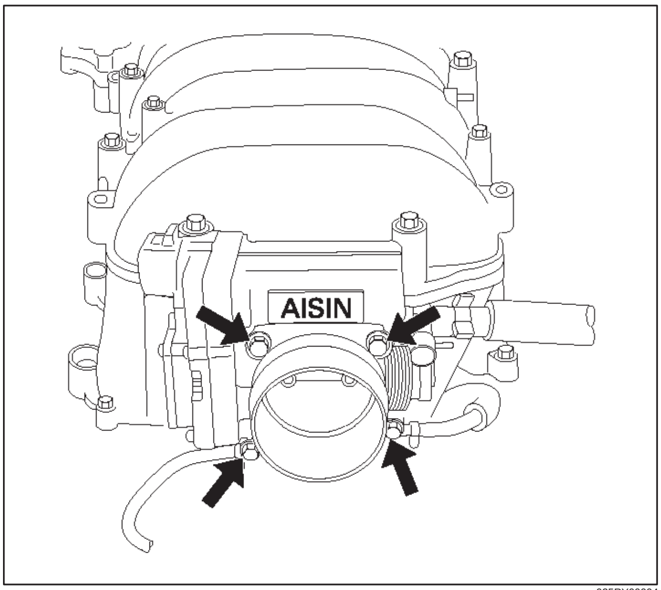
- If the throttle body gasket needs to be replaced, remove any gasket material that may be stuck to the mating surfaces of the manifold.
- Do not leave any scratches in the aluminum casting.

Installation Procedure

1. Install the TP sensor. Refer to *Throttle Position (TP) Sensor* section.
2. Install the gasket on the common chamber.
3. Install the throttle body on the common chamber.
4. Secure the gasket and the throttle body with the four bolts.
   - The vacuum lines must be properly routed under the throttle body before tightening the mounting bolts.

Tighten

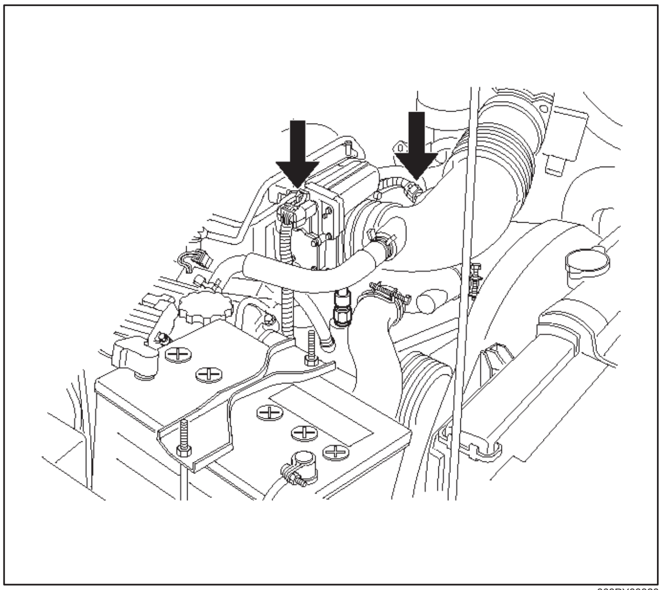
- **Tighten the throttle body mounting bolts to 10 N·m (87 lb in).**



025RY00004

5. Install the coolant lines.
6. Connect all the vacuum lines.
7. Install the intake air duct.
8. Tighten the intake air duct clamp.

9. Connect all the electrical connectors:
   - Throttle position (TP) sensor.
   - Intake air temperature (IAT) sensor. Refer to *Intake Air Temperature Sensor* section.



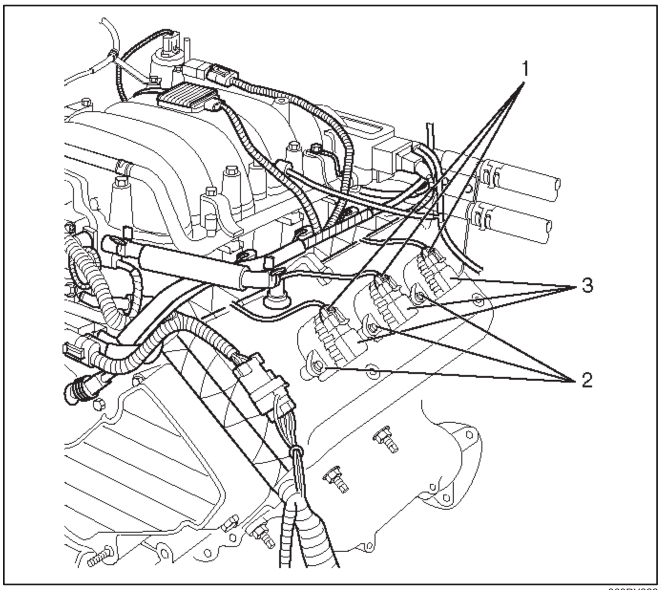
060RY00020

10. Install the accelerator cable assembly. Refer to *Accelerator Cable in Engine Speed Control System* section.
11. Fill the cooling system. Refer to *Cooling System* section.
12. Install the negative battery cable.

Electronic Ignition System

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the ignition coil connector at the ignition coil assemblies.
3. Remove the two screws that secure the ignition coil assemblies to the rocker cover.



060RY022

Legend

(1) Ignition Coil Connectors
(2) Bolts
(3) Ignition Coil Assemblies

4. Remove the ignition coil assemblies and the spark plug boot from the spark plug.
   - Twist the ignition coil assemblies while pulling it straight up.
5. Use the appropriate spark plug socket in order to remove the spark plug from the engine.

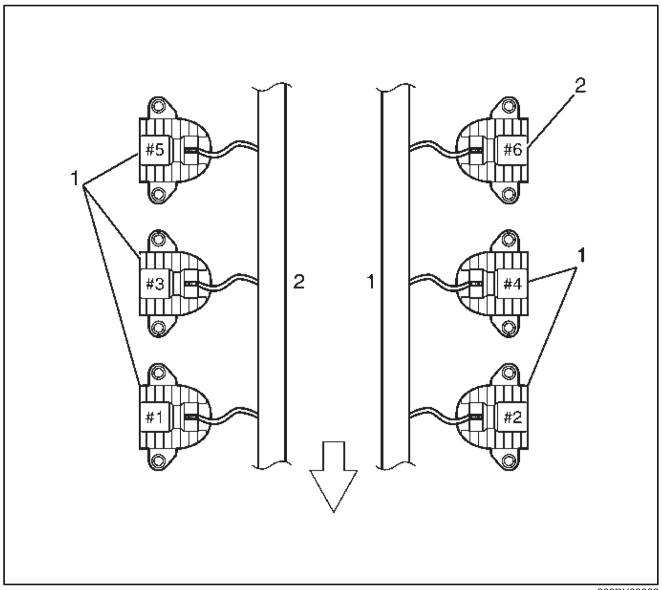
Installation Procedure

NOTE: The plug must thread smoothly into the cylinder head and be fully seated. Use a thread chaser if necessary to clean the threads in the cylinder head. Cross-threading or failure to fully seat the spark plug can cause plug overheating, exhaust blow-by gases, or thread damage. Do not overtighten the spark plugs. Over tightening can cause aluminum threads to strip.

1. Install the spark plug in the engine. Use the appropriate spark plug socket.

   Tighten
   - **Tighten the spark plug to 18 N·m (13 lb ft.).**
2. Install the ignition coil assemblies and spark plug boot over the spark plug.

CAUTION: Ignition coil assembly #6 is different from ignition coil assembly from #1 to #5. Ignition coil assemblies #6 is short type. So, note it when installing ignition coil assembly of #6.



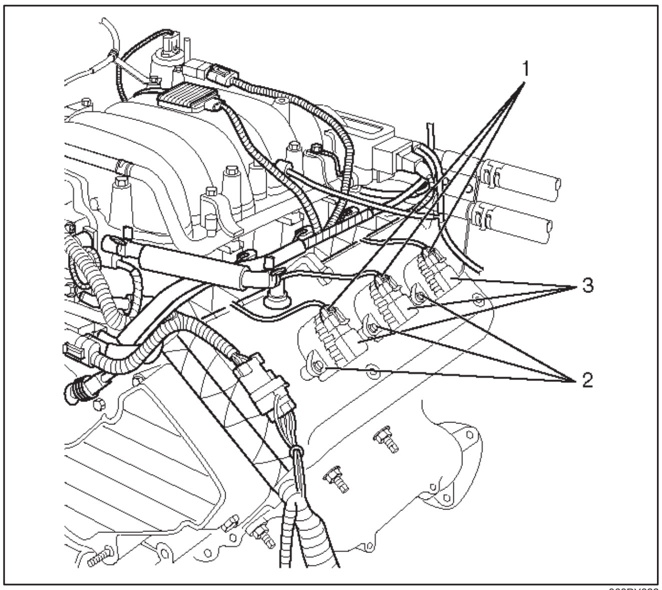
060RY00002

Legend

(1) Long Type Ignition Coil Assemblies (#1 ~ #5)
(2) Short Type Ignition Coil Assembly (#6)

3. Install ignition coil assemblies and tighten the fixing bolts to the specified torque.

Torque: 4 N·m (35.4 lb in)



060RY022

Legend

(1) Ignition Coil Connectors
(2) Bolts
(3) Ignition Coil Assemblies

4. Connect the ignition coil connector at the ignition coil assemblies.
5. Connect the negative battery cable.

Catalytic Converter

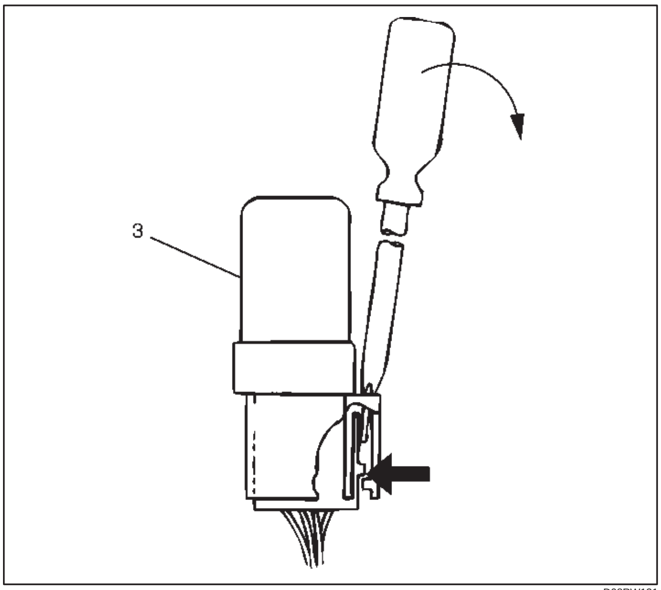
Removal and Installation Procedure

Refer to *Engine Exhaust in Engine* section.

Air Conditioning Thermo Relay

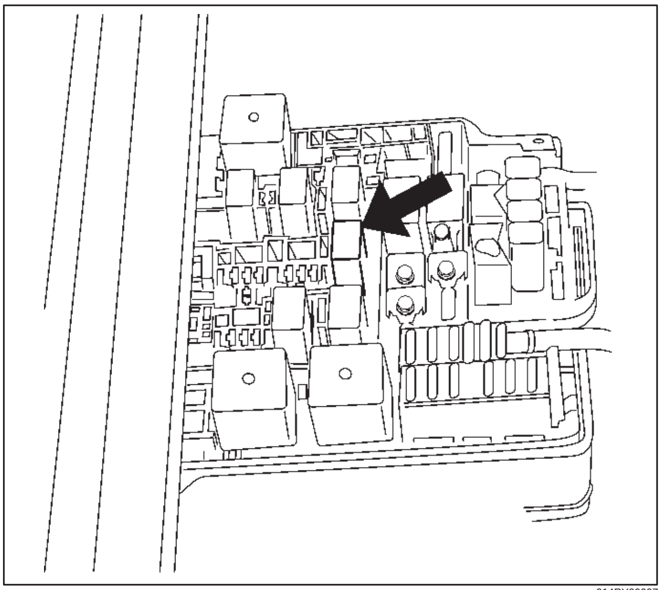
Removal Procedure

1. Remove the fuse and relay box cover from under the hood.
2. Consult the diagram on the cover to determine which is the correct relay.
3. Insert a small screwdriver into the catch slot on the forward side of the fuel pump relay.
   - The screwdriver blade will release the catch inside.



D08RW131

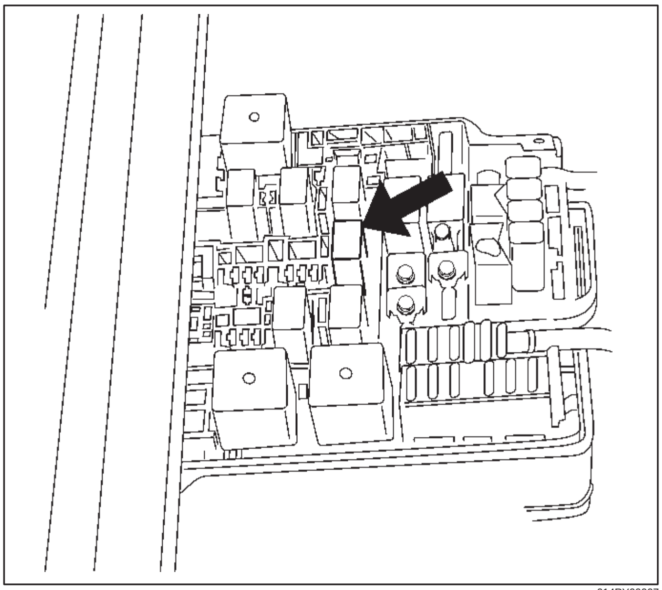
4. Pull the relay straight up and out of the fuse and relay box.



014RY00007

Installation Procedure

1. Insert the relay into the correct place in the fuse and relay box with the catch slot facing forward.
2. Press down until the catch engages.
   - An audible “click” will be heard.
3. Install the fuse and relay box cover.



014RY00007

EVAP Canister Hoses

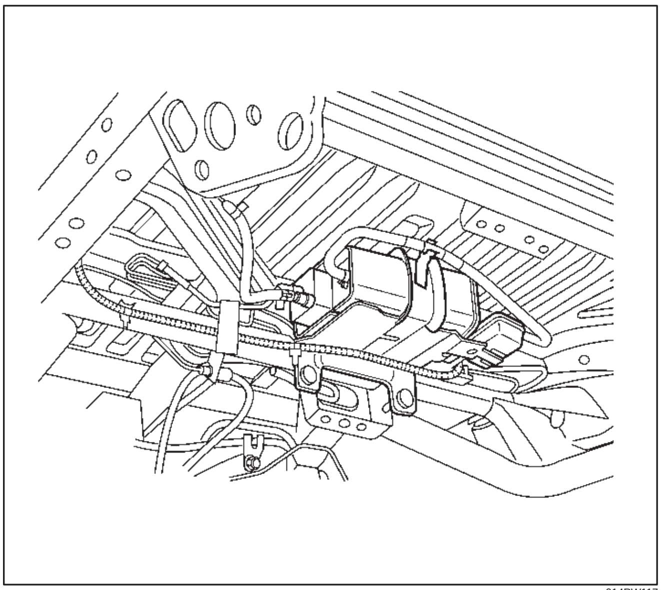
Service Information

To view the routing of the EVAP canister hoses, refer to *Vehicle Emission Control Information* in *Diagnosis*. Use 6148M or equivalent when you replace the EVAP canister hoses.

EVAP Canister

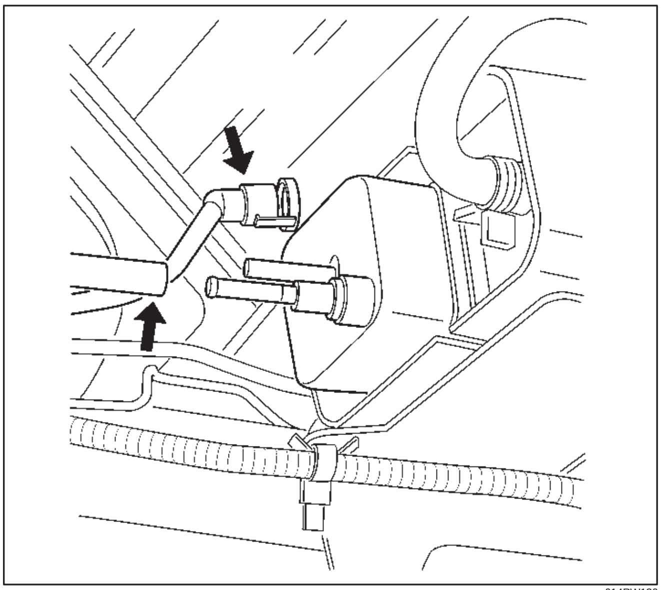
Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the two hoses from the EVAP canister.



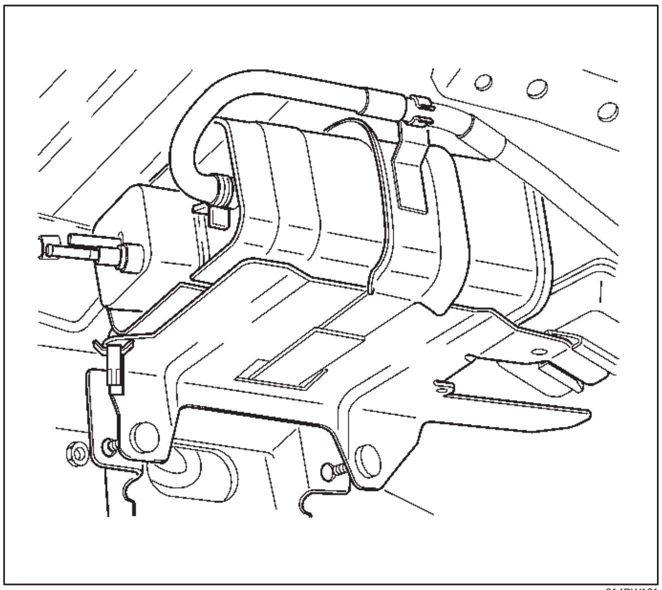
014RW117

3. Disconnect the fuel vapor connector and the purge hose from the EVAP canister vent solenoid.



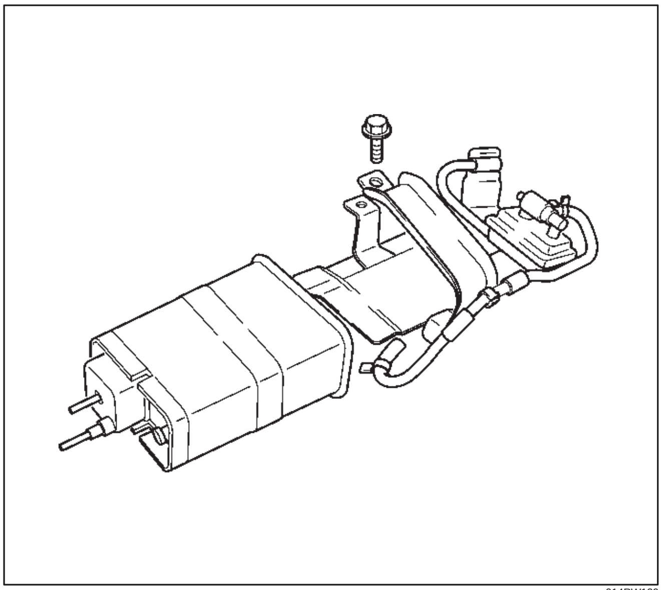
014RW130

4. Remove the two retaining bolts the EVAP canister to the mounting bracket on the cross member.



014RW131

5. Remove the retaining bolt on the mounting bracket the slide the canister out of mounting bracket.



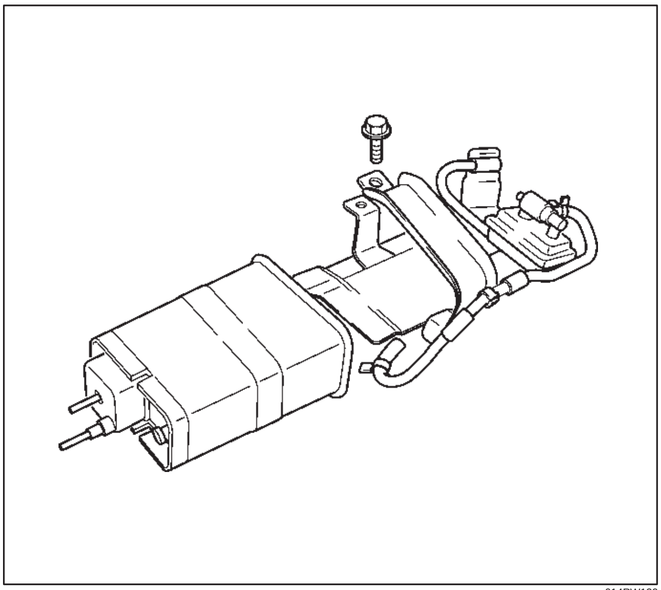
014RW129

Inspection Procedure

1. Inspect the hoses for cracks and leaks.
2. Inspect the canister for a damaged case.

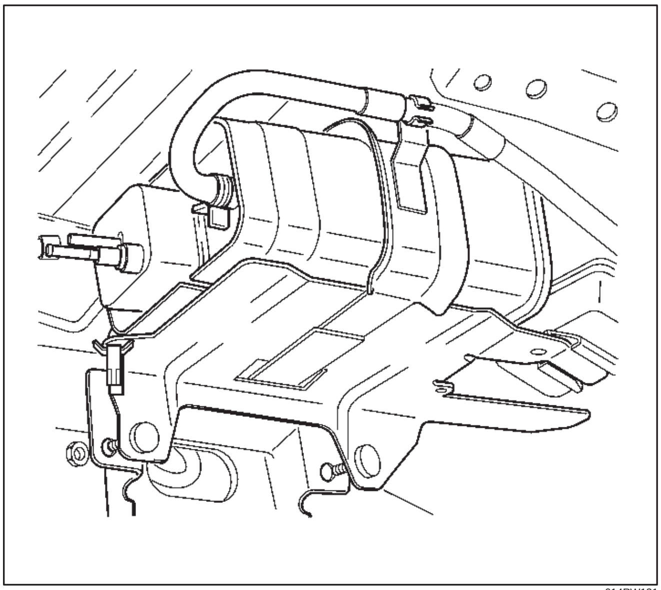
Installation Procedure

1. Slide the canister into mounting bracket the install the mounting bracket bolt.



014RW129

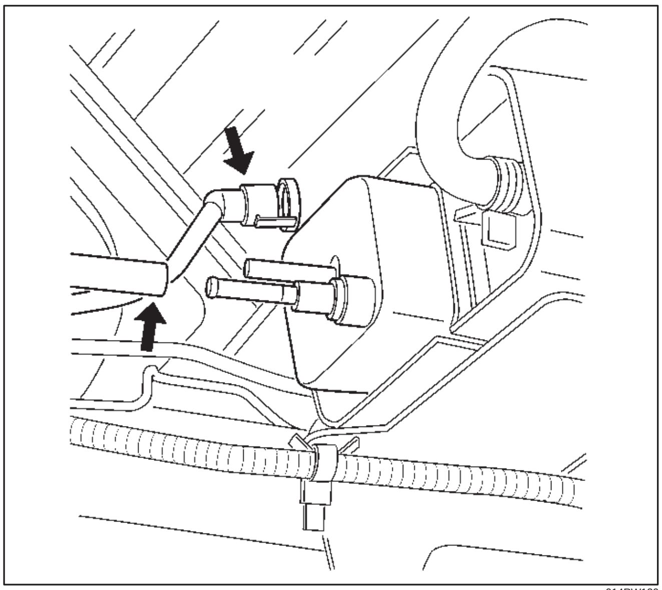
2. Install the retaining bolts the EVAP canister to the mounting bracket on the cross member.



014RW131

3. Connect the fuel vapor connector to the EVAP canister vent solenoid.

4. Connect the two hoses to the EVAP canister.



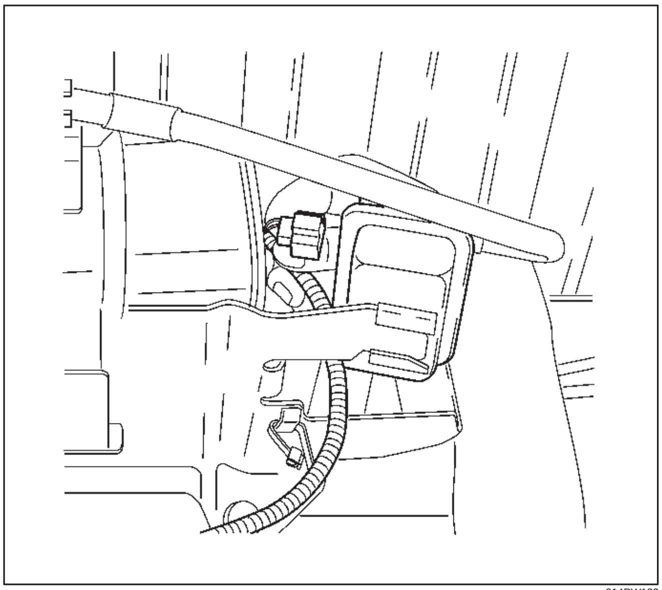
014RW130

5. Disconnect the negative battery cable.

EVAP Canister Vent Solenoid

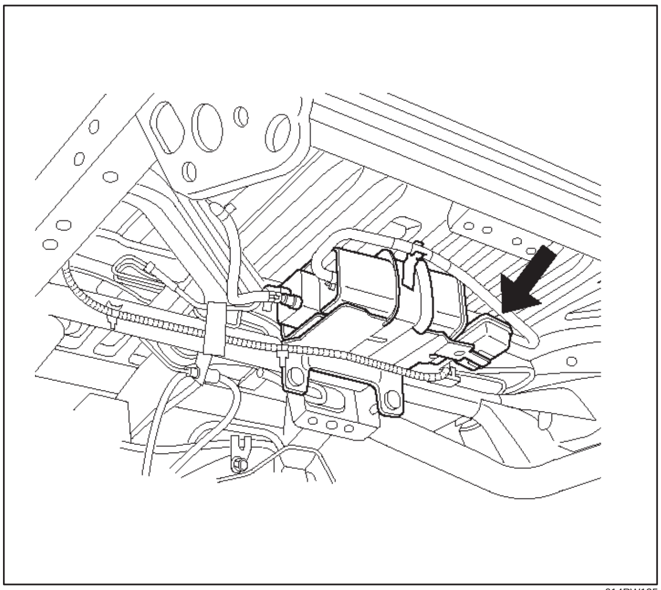
Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the connector and hose.



014RW132

3. Slide the out of EVAP canister vent solenoid from mounting bracket.



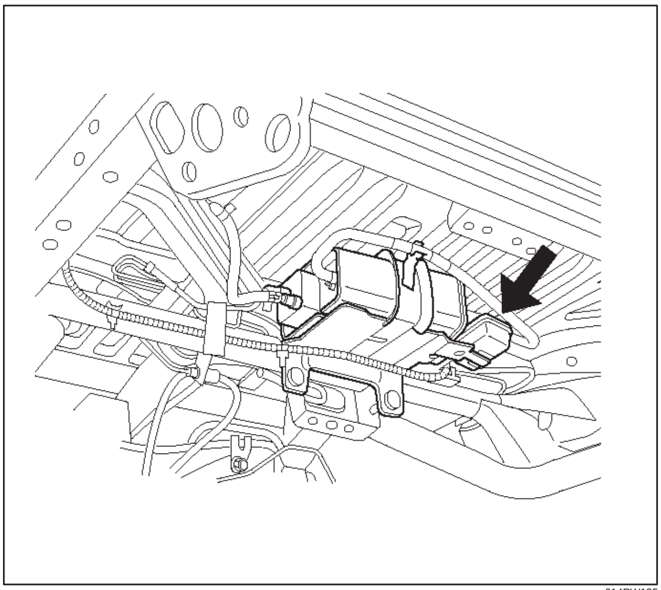
014RW135

Inspection Procedure

1. Check for cracks or leaks.
2. Energize the solenoid and try to blow through it. The solenoid should not allow passage of air when energized. (J 35616 Connector Test Kit can be used to easily attach jumper wires from the battery to the solenoid).

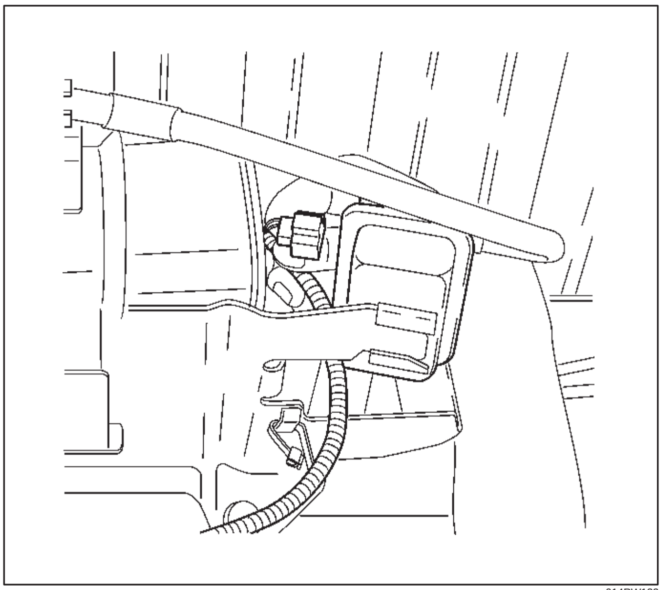
Installation Procedure

1. Slide the into EVAP canister vent solenoid from mounting bracket.



014RW135

2. Connect the connector and hose.



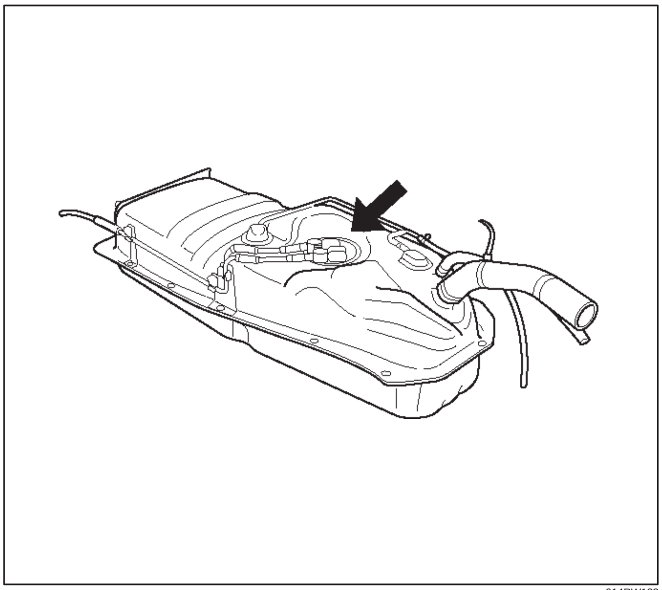
014RW132

3. Connect the negative battery cable.

Fuel Tank Pressure Sensor

Removal Procedure

1. Remove the fuel pump assembly. Refer to *Fuel Tank In Fuel Pump*.
2. Carefully pry the fuel tank pressure sensor out of the top of the fuel pump assembly.



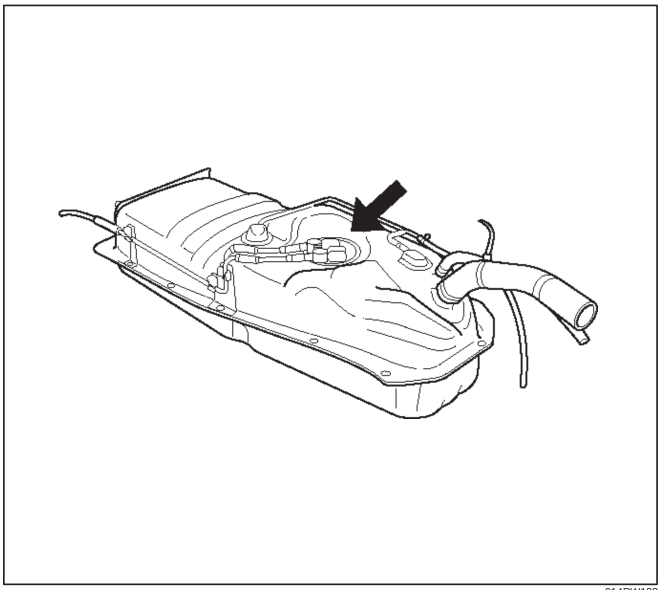
014RW133

Inspection Procedure

1. Inspect the vapor pressure sensor for cracks in the housing and corrosion on the electrical terminals.
2. Inspect the rubber grommet for tears and signs of rot.

Installation Procedure

1. Install the rubber grommet on the fuel pump assembly.



014RW133

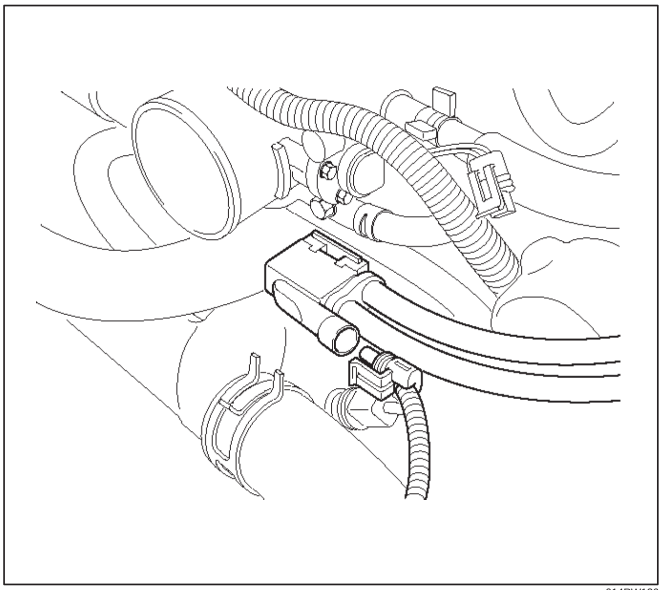
2. Install the fuel tank vapor pressure sensor on the fuel pump assembly.
   - Insert the sensor nipple firmly into the grommet.
   - Keep twisting and pushing the sensor until the wide portion of the nipple shows on the other side of the grommet.
3. Install the fuel pump assembly on the fuel tank. Refer to *Fuel Tank In Fuel Pump.*.

EVAP Canister Purge Solenoid

Removal Procedure

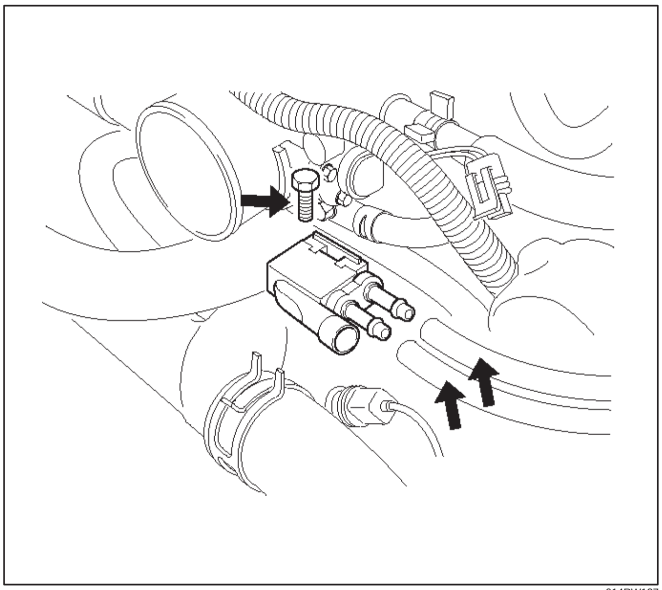
1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the EVAP canister purge solenoid.

3. Disconnect the vacuum hoses from the EVAP canister purge solenoid.



014RW136

4. Remove the EVAP canister purge solenoid retaining bolt from the common chamber.
5. Remove the EVAP canister purge solenoid.



014RW137

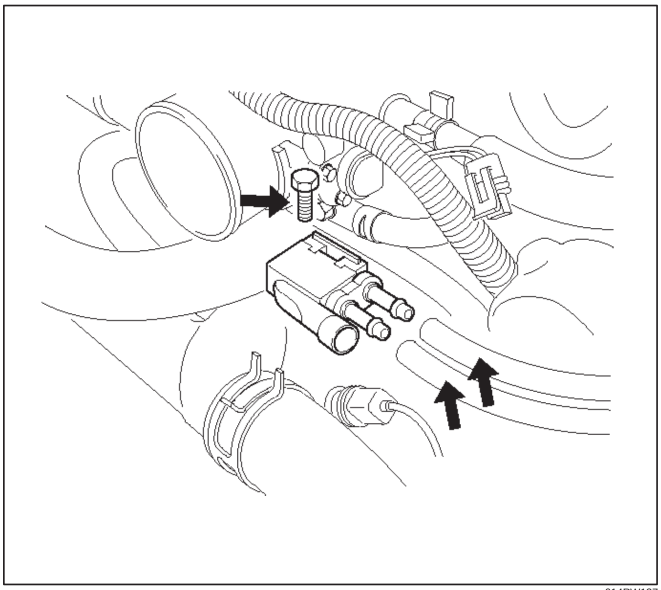
Installation Procedure

1. Install the EVAP canister purge solenoid on the upper intake manifold.
2. Install the EVAP canister purge solenoid retaining bolt.

Tighten

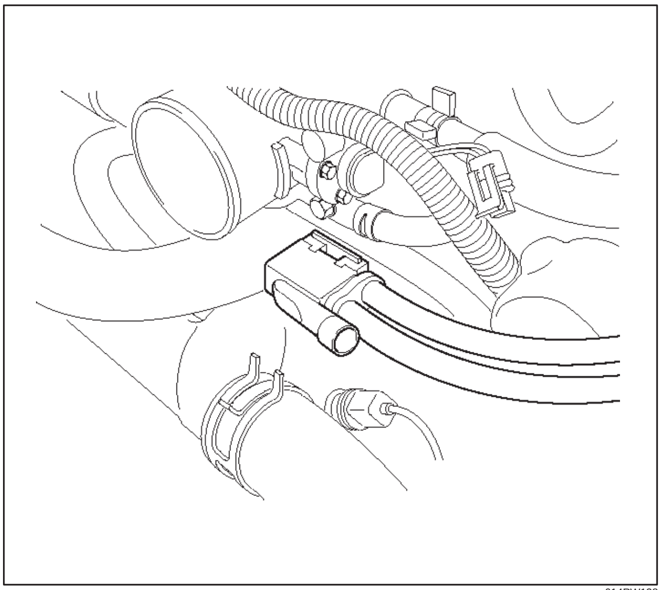
- **Tighten the bolts to 20 N·m (16 lb ft.).**

3. Connect the vacuum hoses to the EVAP canister purge solenoid.



014RW137

4. Connect the electrical connector to the EVAP canister purge solenoid.



014RW138

Fuel Tank Vent Valve

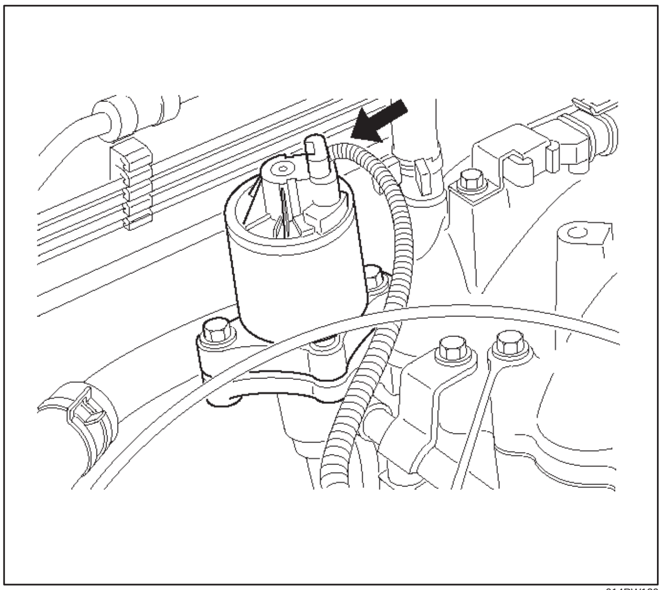
Removal and Installation Procedure

Refer to *Fuel Pump* section.

Linear Exhaust Gas Recirculation (EGR) Valve

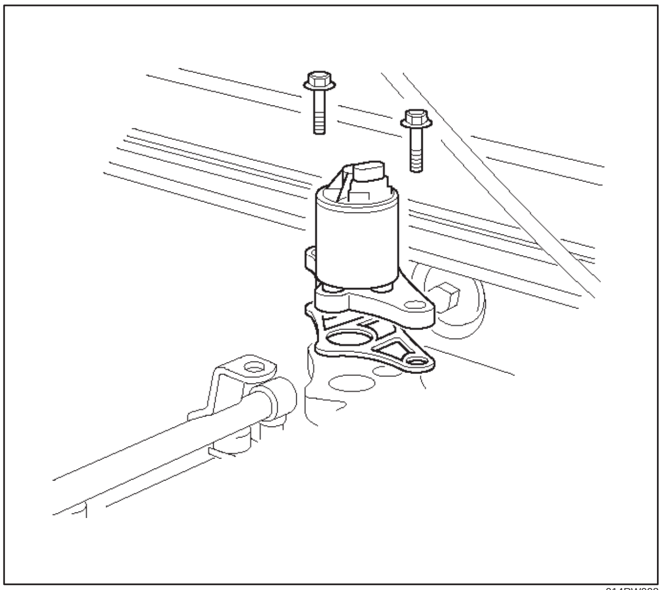
Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector at the EGR valve.



014RW139

3. Remove the bolts from the common chamber.



014RW098

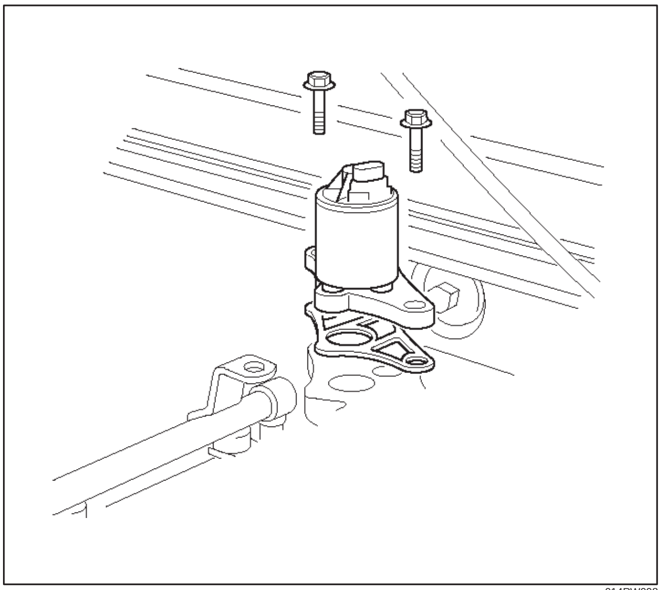
4. Remove the EGR valve from the common chamber manifold.
5. Remove the gasket from the common chamber manifold.

Installation Procedure

1. Install the gasket on the common chamber.
2. Install the EGR valve on the common chamber.
3. Secure the EGR valve and the gasket with the bolts.

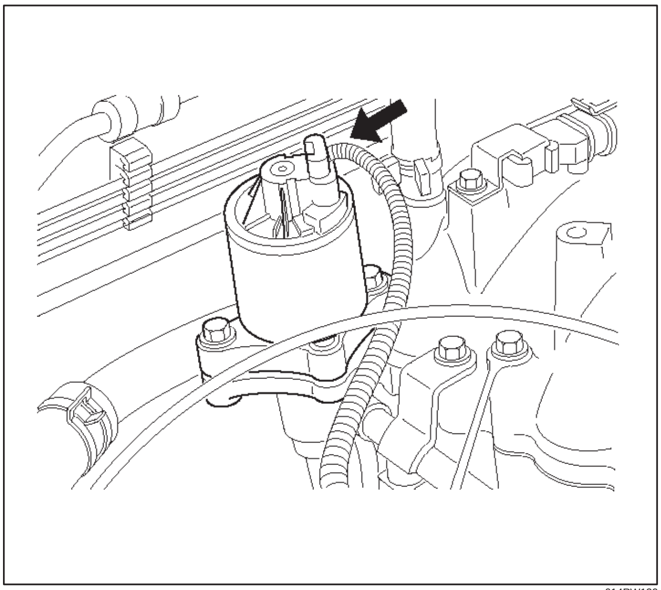
Torque: 25 N·m (18 lb ft)

NOTE: It is possible to install the EGR valve rotated 180° from the correct position. Make sure that the base of the valve is placed so that it aligns with the mounting flange.



014RW098

4. Connect the electrical connector at the EGR valve.



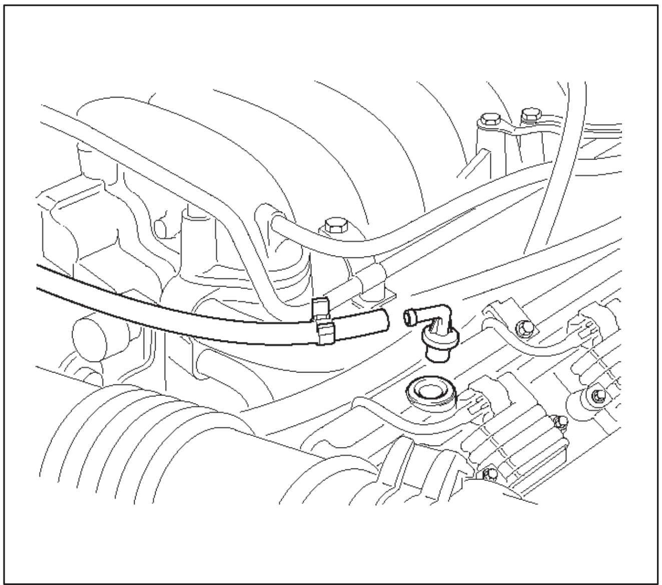
014RW139

5. Connect the negative battery cable.

Positive Crankcase Ventilation (PCV) Valve

Removal Procedure

1. Remove the vacuum hose at the PCV valve.
   - Slide the clamp back to release the hose.
2. Pull the PCV valve from the rubber grommet in the right valve cover.



014RW097

Inspection Procedure

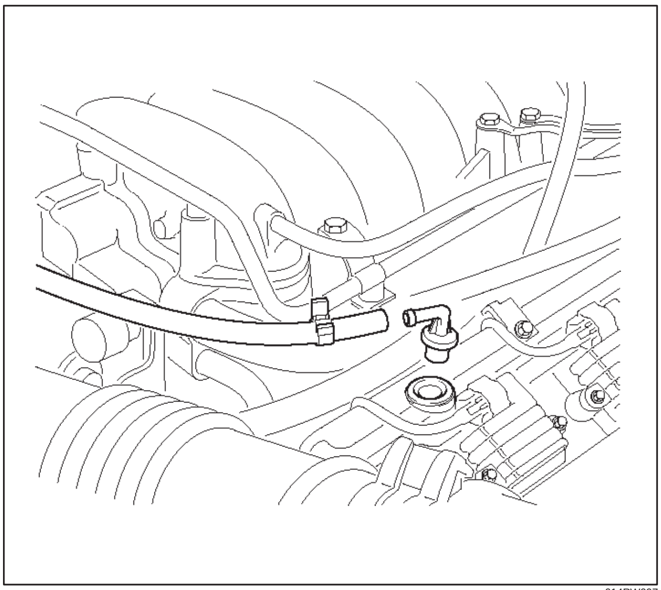
Before inspecting the PCV valve, make sure that the hoses are connected properly and are in good condition. Also check that the oil pan and rocker cover gaskets are sealing properly.

PCV Valve

1. Run the engine at normal operating temperature.
2. Disconnect the valve from the rocker cover.
   RESULT: A hissing noise should be heard from the valve. If no noise is heard, the PCV valve or hose is plugged.
3. Remove the PCV valve from the engine.
   a. Blow air into the rocker cover side of the valve.
   RESULT: Air should pass freely.
   b. Blow air into the air cleaner side of the valve.
   RESULT: Air should not pass through the valve.
4. Re-install the PCV valve and remove the oil filler cap.
   RESULT: A small vacuum should be felt at the oil filler hole.

Installation Procedure

1. Push the PCV valve into the rubber grommet in the left valve cover.
2. Install the vacuum hose on the PCV valve and secure the vacuum hose with the clamp.



014RW097

Wiring and Connectors

Wiring Harness Service

The control module harness electrically connects the control module to the various solenoids, switches and sensors in the vehicle engine compartment and passenger compartment.

Replace wire harnesses with the proper part number replacement.

Because of the low amperage and voltage levels utilized in powertrain control systems, it is essential that all wiring in environmentally exposed areas be repaired with crimp and seal splice sleeves.

The following wire harness repair information is intended as a general guideline only. Refer to *Chassis Electrical* section for all wire harness repair procedures.

Connectors and Terminals

Use care when probing a connector and when replacing terminals. It is possible to short between opposite terminals. Damage to components could result. Always use jumper wires between connectors for circuit checking. NEVER probe through Weather-Pack seals. Use an appropriate connector test adapter kit which contains an assortment of flexible connectors used to probe terminals during diagnosis. Use an appropriate fuse remover and test tool for removing a fuse and to adapt the fuse holder to a meter for diagnosis.

Open circuits are often difficult to locate by sight because oxidation or terminal misalignment are hidden by the connectors. Merely wiggling a connector on a sensor, or in the wiring harness, may temporarily correct the open circuit. Intermittent problems may also be caused by oxidized or loose connections.

Be certain of the type of connector/terminal before making any connector or terminal repair. Weather-Pack and Com-Pack III terminals look similar, but are serviced differently.

PCM Connectors and Terminals

Removal Procedure

1. Remove the connector terminal retainer.
2. Push the wire connected to the affected terminal through the connector face so that the terminal is exposed.
3. Service the terminal as necessary.

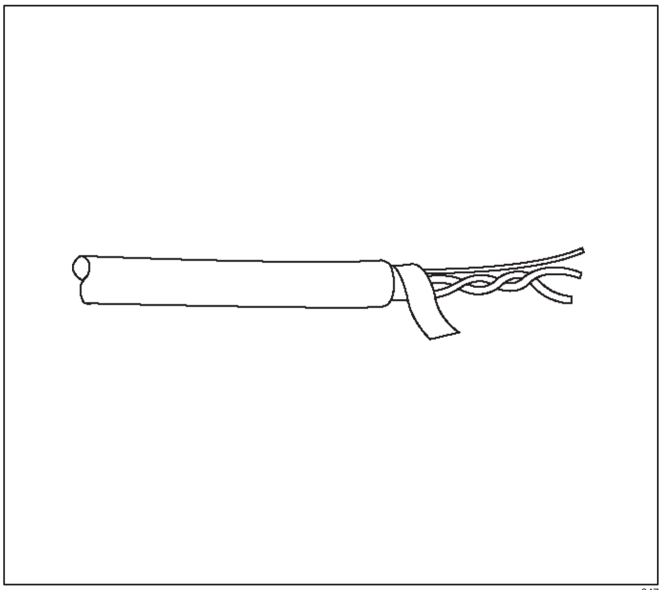
Installation Procedure

1. Bend the tab on the connector to allow the terminal to be pulled into position within the connector.
2. Pull carefully on the wire to install the connector terminal retainer.

Wire Harness Repair: Twisted Shielded Cable

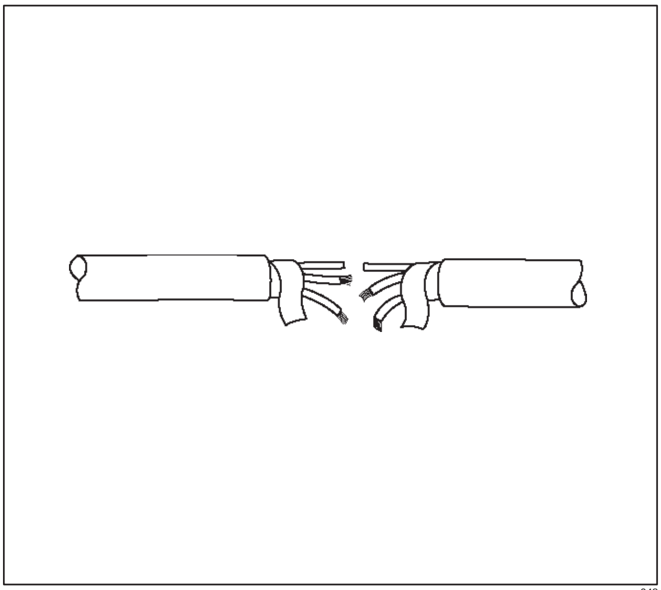
Removal Procedure

1. Remove the outer jacket.
2. Unwrap the aluminum/mylar tape. Do not remove the mylar.



047

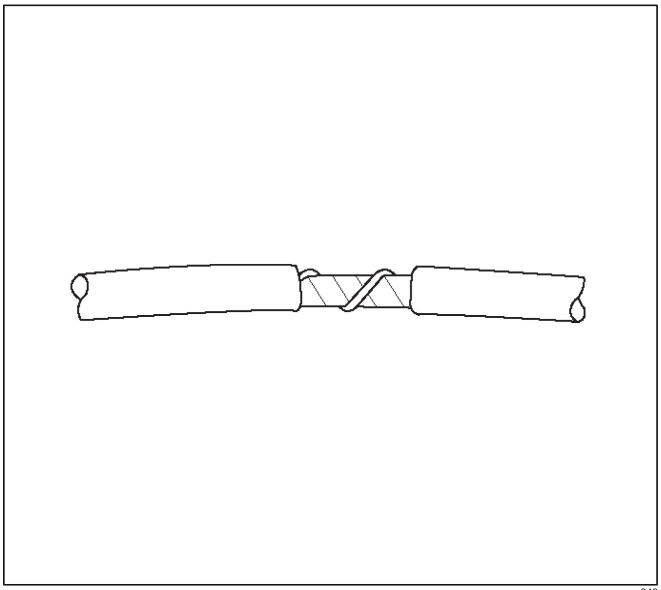
3. Untwist the conductors.
4. Strip the insulation as necessary.



048

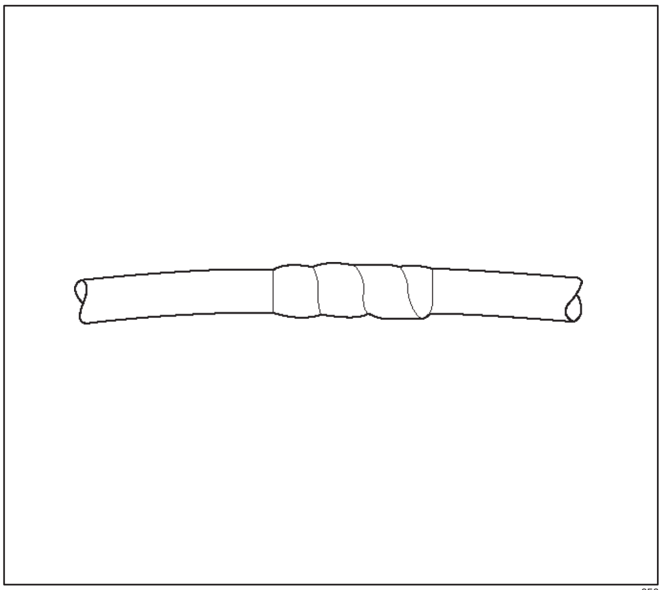
Installation Procedure

1. Splice the wires using splice clips and rosin core solder.
2. Wrap each splice to insulate.
3. Wrap the splice with mylar and with the drain (uninsulated) wire.



049

4. Tape over the whole bundle to secure.

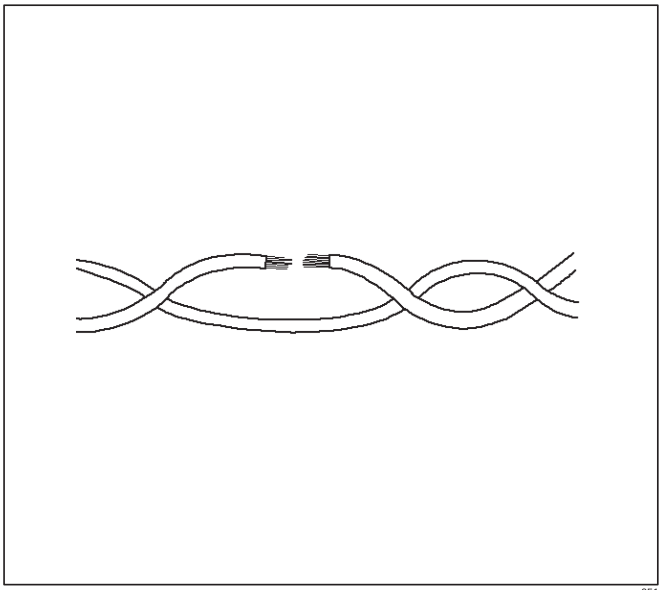


050

Twisted Leads

Removal Procedure

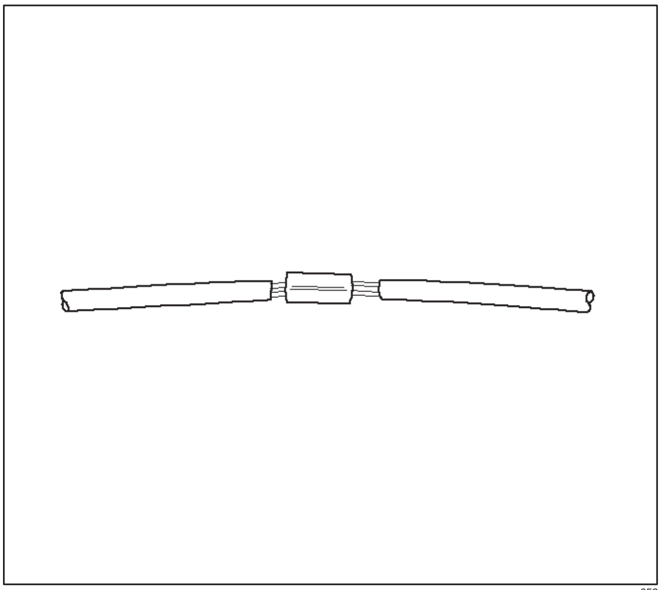
1. Locate the damaged wire.
2. Remove the insulation as required.



051

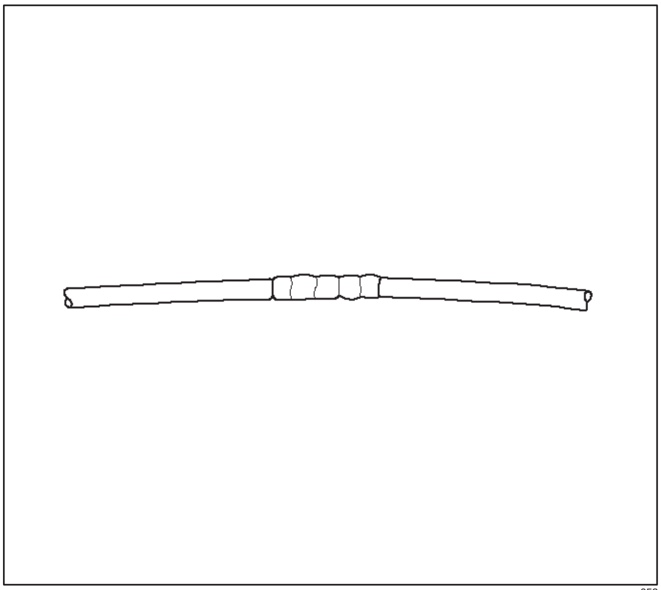
Installation Procedure

1. Use splice clips and rosin core solder in order to splice the two wires together.



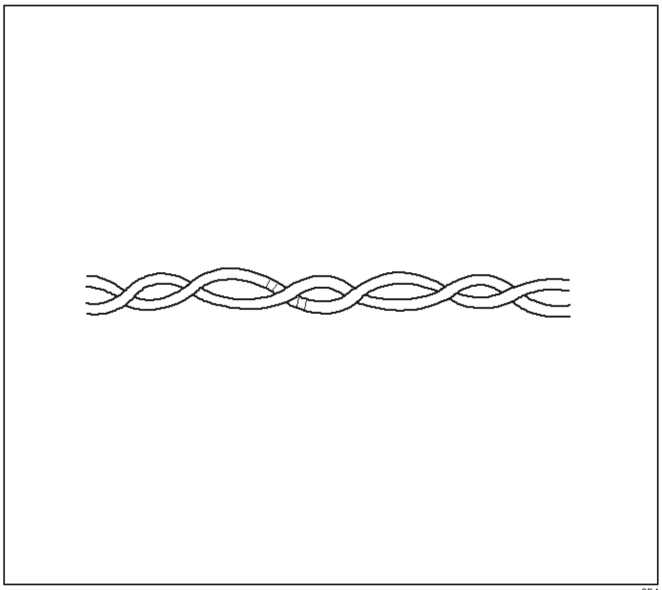
052

2. Cover the splice with tape in order to insulate it from the other wires.

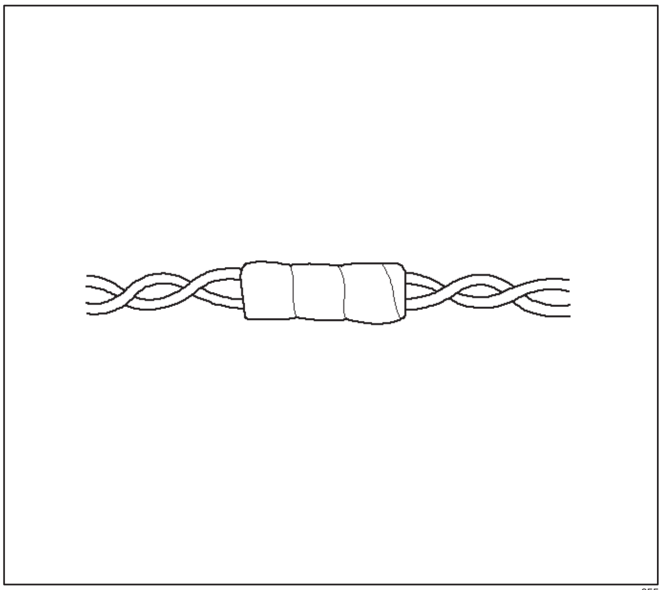


053

3. Twist the wires as they were before starting this procedure.



4. Tape the wires with electrical tape. Hold in place.



Weather-Pack Connector

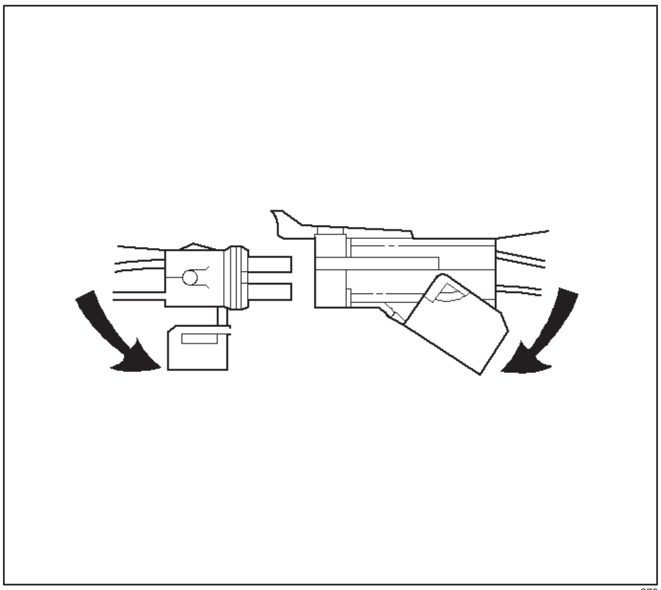
Tools Required

J 28742-A Weather-Pack II Terminal Remover

Removal Procedure

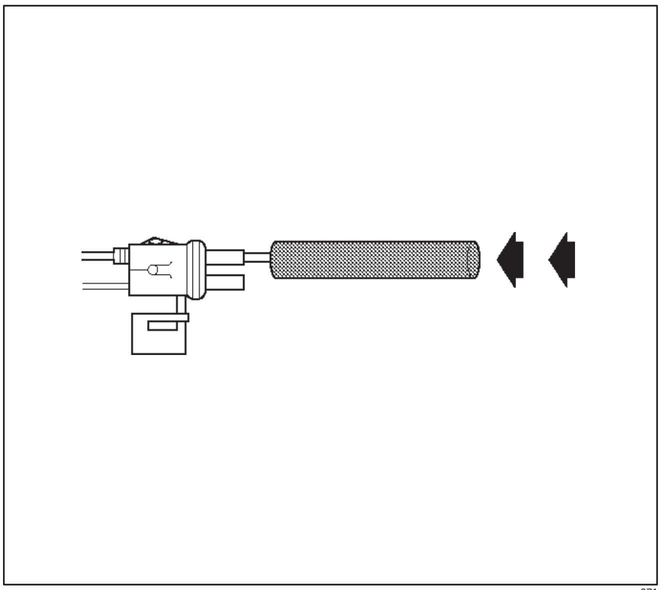
A Weather-Pack connector can be identified by a rubber seal at the rear of the connector. This engine room connector protects against moisture and dirt, which could from oxidation and deposits on the terminals. This protection is important, because of the low voltage and the low amperage found in the electronic systems.

1. Open the secondary lock hinge on the connector.

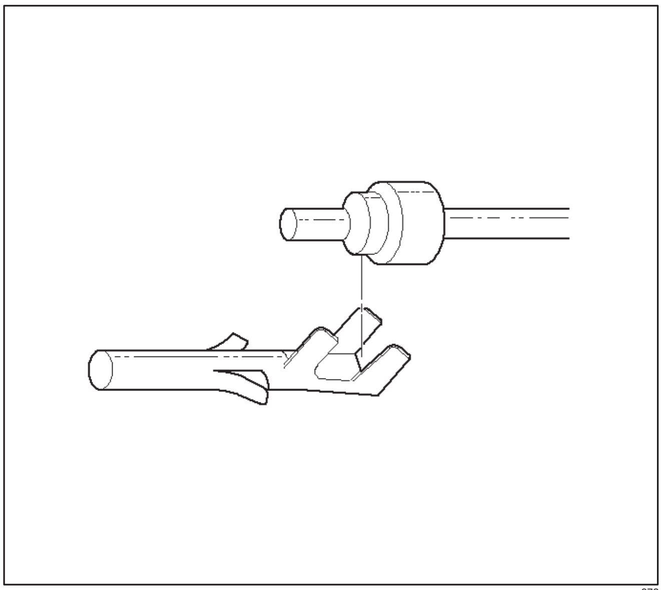


2. Use tool J 28742-A or the equivalent to remove the pin and the sleeve terminals. Push on J 28742-A to release.

NOTE: Do the use an ordinary pick or the terminal may be bent or deformed. Unlike standard blade terminals, these terminals cannot be straightened after they have been improperly bent.



3. Cut the wire immediately behind the cable seal.



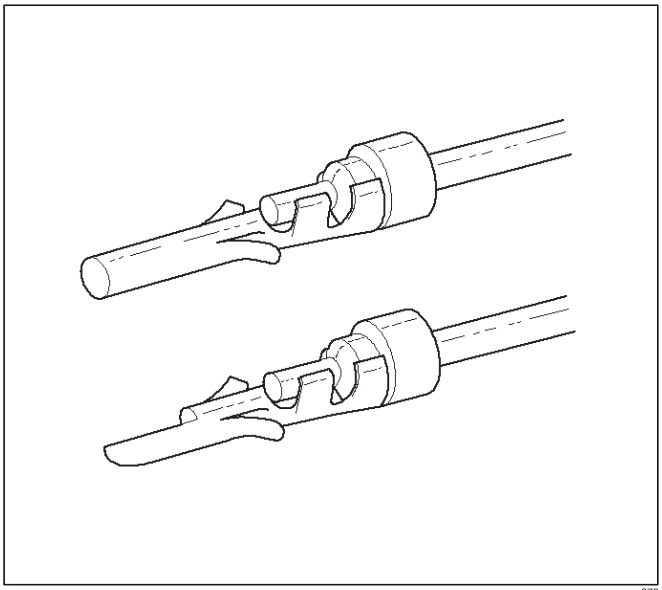
072

Installation Procedure

Make certain the connectors are properly seated and all of the sealing rings are in place when you reconnect the leads. The secondary lock hinge provides a backup locking feature for the connector. The secondary lock hinge is used for added reliability. This flap should retain the terminals even if the small terminal lock tangs are not positioned properly.

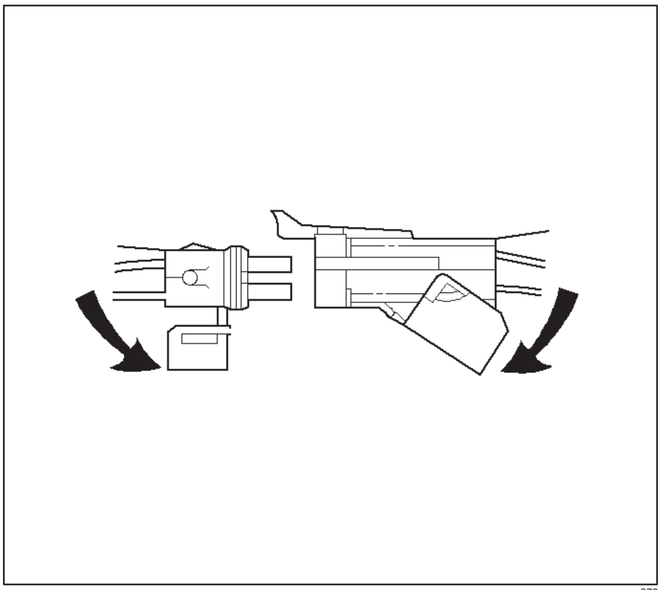
Do not replace the Weather-Pack connections with standard connections. Read the instructions provided with the Weather-Pack connector and terminal packages.

1. Replace the terminal.
2. Slip the new seal onto the wire.
3. Strip 5 mm (0.2”) of insulation from the wire.
4. Crimp the terminal over the wire and the seal.



073

5. Push the terminal and the connector to engage the locking tangs.



070

6. Close the secondary locking hinge.

Com-Pack III

General Information

The Com-Pack III terminal looks similar to some Weather-Pack terminals. This terminal is not sealed and is used where resistance to the environment is not required. Use the standard method when repairing a terminal. Do not use the Weather-Pack terminal tool J 28742-A or equivalent. These will damage the terminals.

Metri-Pack

Tools Required

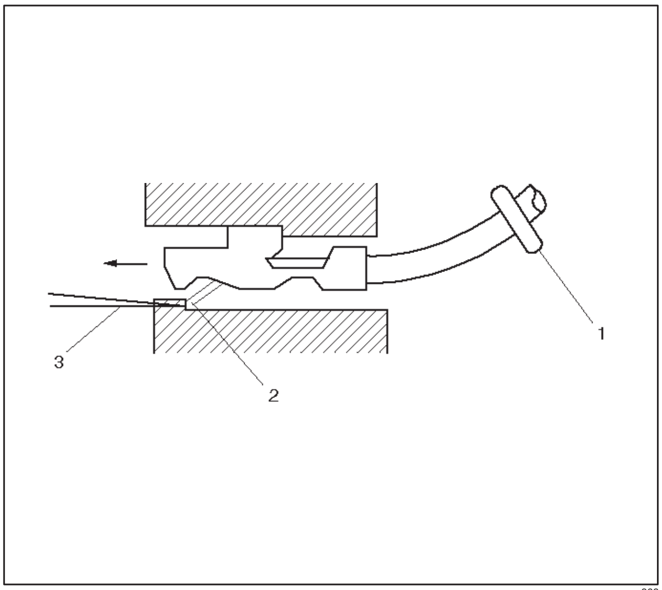
J 35689 Terminal Remover

Removal Procedure

Some connectors use terminals called Metri-Pack Series 150. These may be used at the engine coolant temperature (ECT) sensor.

1. Slide the seal (1) back on the wire.

2. Insert the J 35689 tool or equivalent (3) in order to release the terminal locking tang (2).



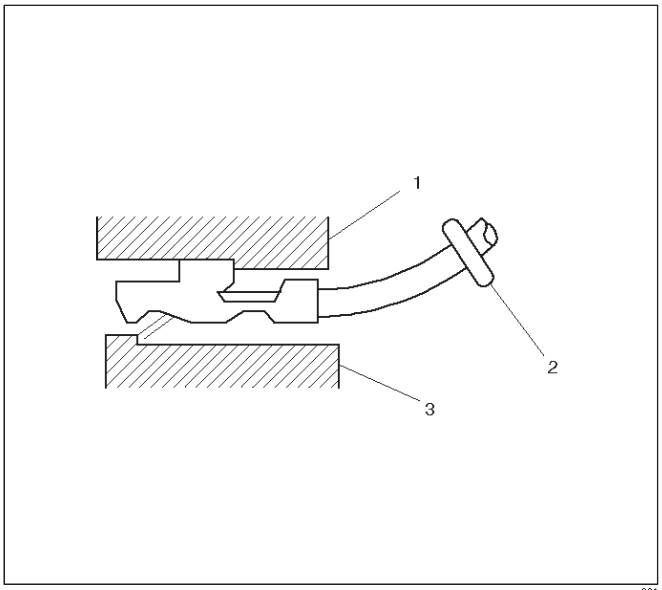
060

3. Push the wire and the terminal out through the connector. If you reuse the terminal, reshape the locking tang.

Installation Procedure

Metri-Pack terminals are also referred to as “pull-to-seat” terminals.

1. In order to install a terminal on a wire, the wire must be inserted through the seal (2) and through the connector (3).
2. The terminal (1) is then crimped onto the wire.



061

3. Then the terminal is pulled back into the connector to seat it in place.

General Description (PCM and Sensors)

58X Reference PCM Input

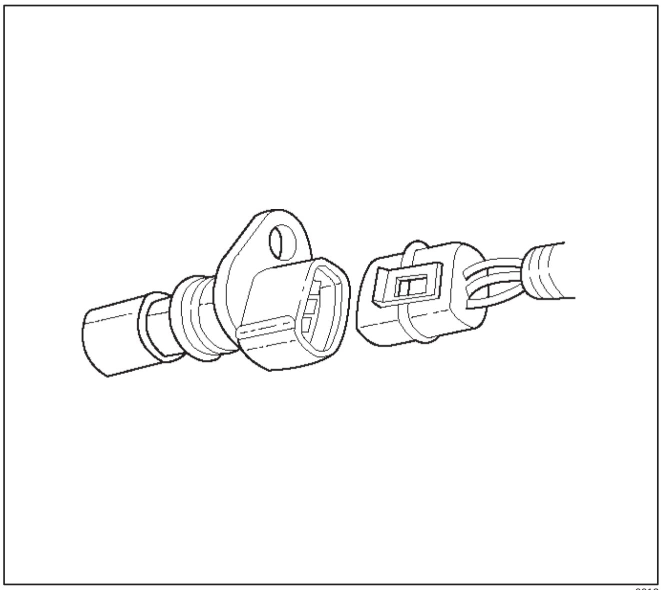
The powertrain control module (PCM) uses this signal from the crankshaft position (CKP) sensor to calculate engine RPM and crankshaft position at all engine speeds. The PCM also uses the pulses on this circuit to initiate injector pulses. If the PCM receives no pulses on this circuit, DTC P0337 will set. The engine will not start and run without using the 58X reference signal.

A/C Request Signal

This signal tells the PCM when the A/C mode is selected at the A/C control head. The PCM uses this to adjust the idle speed before turning "ON" the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the PCM.
Refer to *A/C Clutch Circuit Diagnosis* section for A/C wiring diagrams and diagnosis for the A/C electrical system.

Crankshaft Position (CKP) Sensor

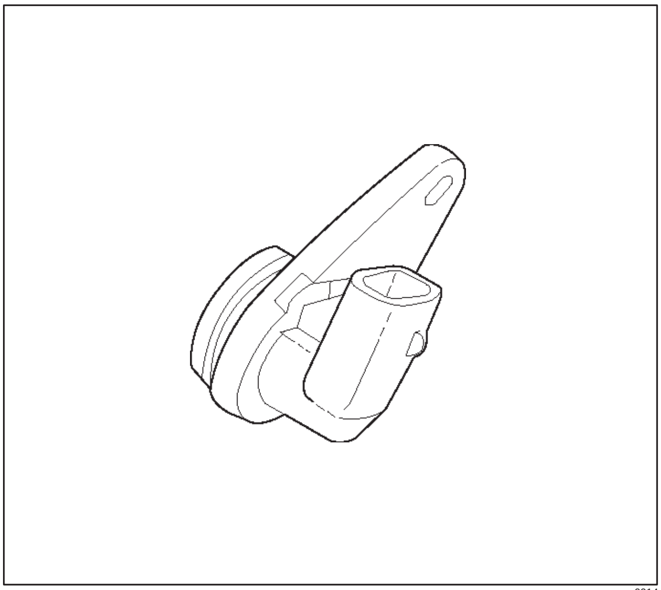
The crankshaft position (CKP) sensor provides a signal used by the powertrain control module (PCM) to calculate the ignition sequence. The CKP sensor initiates the 58X reference pulses which the PCM uses to calculate RPM and crankshaft position.
Refer to *Electronic Ignition System* section for additional information.



0013

Camshaft Position (CMP) Sensor and Signal

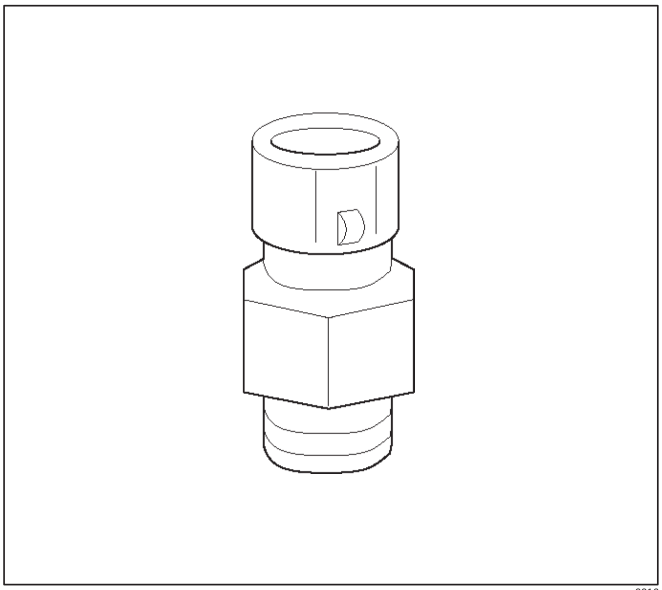
The camshaft position (CMP) sensor sends a CMP signal to the PCM. The PCM uses this signal as a "sync pulse" to trigger the injectors in the proper sequence. The PCM uses the CMP signal to indicate the position of the #1 piston during its power stroke. This allows the PCM to calculate true sequential fuel injection (SFI) mode of operation. If the PCM detects an incorrect CMP signal while the engine is running, DTC P0341 will set. If the CMP signal is lost while the engine is running, the fuel injection system will shift to a calculated sequential fuel injection mode based on the last fuel injection pulse, and the engine will continue to run. As long as the fault is present, the engine can be restarted. It will run in the calculated sequential mode with a 1-in-6 chance of the injector sequence being correct.
Refer to *DTC P0341* for further information.



0014

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor is a thermistor (a resistor which changes value based on temperature) mounted in the engine coolant stream. Low coolant temperature produces a high resistance of 100,000 ohms at –40˚C (–40˚F). High temperature causes a low resistance of 70 ohms at 130˚C (266˚F). The PCM supplies a 5-volt signal to the ECT sensor through resistors in the PCM and measures the voltage. The signal voltage will be high when the engine is cold and low when the engine is hot. By measuring the voltage, the PCM calculates the engine coolant temperature. Engine coolant temperature affects most of the systems that the PCM controls.
The Tech 2 displays engine coolant temperature in degrees. After engine start-up, the temperature should rise steadily to about 85˚C (185˚F). It then stabilizes when the thermostat opens. If the engine has not been run for several hours (overnight), the engine coolant temperature and intake air temperature displays should be close to each other. A hard fault in the engine coolant sensor circuit will set DTC P0177 or DTC P0118. An intermittent fault will set a DTC P1114 or P1115.



0016

Electrically Erasable Programmable Read Only Memory (EEPROM)

The electrically erasable programmable read only memory (EEPROM) is a permanent memory chip that is physically soldered within the PCM. The EEPROM contains the program and the calibration information that the PCM needs to control powertrain operation.

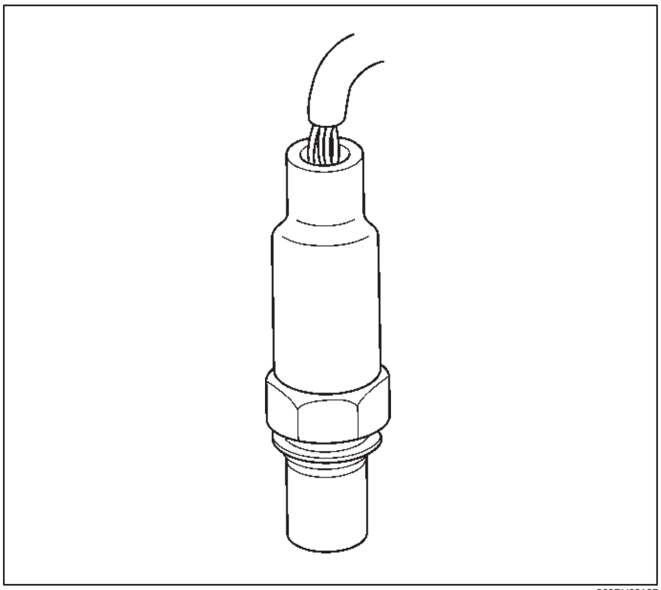
Unlike the PROM used in past applications, the EEPROM is not replaceable. If the PCM is replaced, the new PCM will need to be programmed. Equipment containing the correct program and calibration for the vehicle is required to program the PCM.

Fuel Control Heated Oxygen Sensors

The fuel control heated oxygen sensors (Bank 1 HO2S 1 and Bank 2 HO2S 1) are mounted in the exhaust stream where they can monitor the oxygen content of the exhaust gas. The oxygen present in the exhaust gas reacts with the sensor to produce a voltage output. This voltage should constantly fluctuate from approximately 100 mV to 900 mV. The heated oxygen sensor voltage can be monitored with a Tech 2. By monitoring the voltage output of the oxygen sensor, the PCM calculates the pulse width command for the injectors to produce the proper combustion chamber mixture.

- Low HO2S voltage is a lean mixture which will result in a rich command to compensate.
- High HO2S voltage is a rich mixture which will result in a lean command to compensate.

An open Bank 1 HO2S 1 signal circuit will set a DTC P0134 and the Tech 2 will display a constant voltage between 400-500 mV. A constant voltage below 300 mV in the sensor circuit (circuit grounded) will set DTC P0131. A constant voltage above 800 mV in the circuit will set DTC P0132. Faults in the Bank 2 HO2S 1 signal circuit will cause DTC 0154 (open circuit), DTC P0151 (grounded circuit), or DTC P0152 (signal voltage high) to set. A fault in the Bank 1 HO2S 1 heater circuit will cause DTC P0135 to set. A fault in the Bank 2 HO2S 1 heater circuit will cause DTC P0155 to set. The PCM can also detect HO2S response problems. If the response time of an HO2S is determined to be too slow, the PCM will store a DTC that indicates degraded HO2S performance.



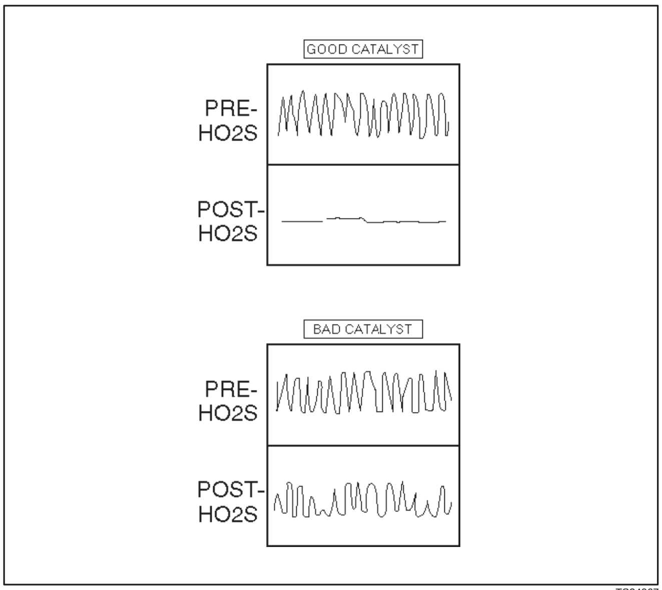
060RY00127

Catalyst Monitor Heated Oxygen Sensors

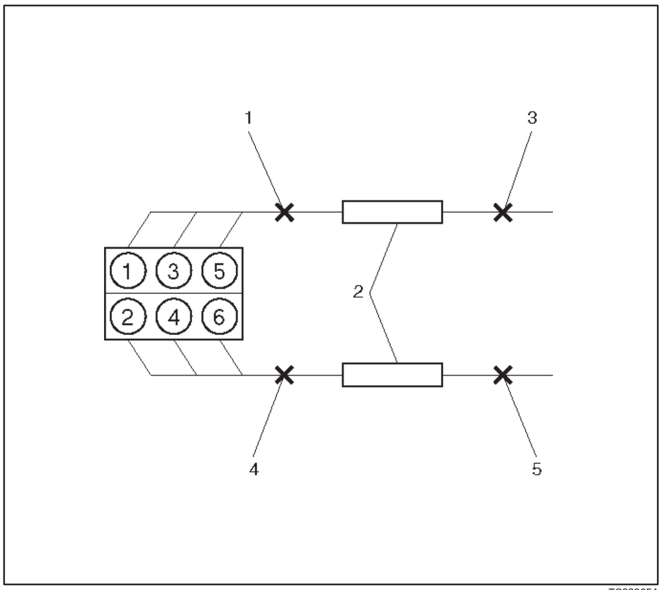
Three-way catalytic converters are used to control emissions of hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx). The catalyst within the converters promotes a chemical reaction. This reaction oxidizes the HC and CO present in the exhaust gas and converts them into harmless water vapor and carbon dioxide. The catalyst also reduces NOx by converting it to nitrogen. The PCM can monitor this process using the Bank 1 HO2S 2 and the Bank 2 HO2S 2 heated oxygen sensors. The Bank 1 HO2S 1 and the Bank 2 HO2S 1 sensors produce an output signal which indicates the amount of oxygen present in the exhaust gas entering the three-way catalytic converter. The Bank 1 HO2S 2 and the Bank 2 HO2S 2 sensors produce an output signal which indicates the oxygen storage capacity of the catalyst. This indicates the catalyst's ability to efficiently convert exhaust gases. If the catalyst is operating efficiently, the Bank 1 HO2S 1 and the Bank 2 HO2S 1 signals will be more active than the signals produced by the Bank 1 HO2S 2 and the Bank 2 HO2S 2 sensors.

The catalyst monitor sensors operate the same as the fuel control sensors. The Bank 1 HO2S 2 and the Bank 2 HO2S 2 sensors' main function is catalyst monitoring, but they also have a limited role in fuel control. If a sensor output indicates a voltage either above or below the 450 mV bias voltage for an extended period of time, the PCM will make a slight adjustment to fuel trim to ensure that fuel delivery is correct for catalyst monitoring.

A problem with the Bank 1 HO2S 2 signal circuit will set DTC P0137, P0138, or P0140, depending on the specific condition. A problem with the Bank 2 HO2S 2 signal circuit will set DTC P0157, P0158, or P0160, depending on the specific condition. A fault in the heated oxygen sensor heater element or its ignition feed or ground will result in lower sensor response. This may cause incorrect catalyst monitor diagnostic results.



TS24067



TS23365A

Legend

(1) Bank 1 Sensor 1 (Fuel Control)
(2) Catalytic Converter
(3) Bank 1 Sensor 2 (Catalyst Monitor)
(4) Bank 2 Sensor 1 (Fuel Control)
(5) Bank 2 Sensor 2 (Catalyst Monitor)

Intake Air Temperature (IAT) Sensor

The intake air temperature (IAT) sensor is a thermistor which changes its resistance based on the temperature of air entering the engine. Low temperature produces a high resistance of 100,000 ohms at –40˚C (–40˚F). High temperature causes low resistance of 70 ohms at 130˚C (266˚F) . The PCM supplies a 5-volt signal to the sensor through a resistor in the PCM and monitors the signal voltage. The voltage will be high when the incoming air is cold. The voltage will be low when the incoming air is hot. By measuring the voltage, the PCM calculates the incoming air temperature. The IAT sensor signal is used to adjust spark timing according to the incoming air density.

The Tech 2 displays the temperature of the air entering the engine. The temperature should read close to the ambient air temperature when the engine is cold and rise as underhood temperature increases. If the engine has not been run for several hours (overnight), the IAT sensor temperature and engine coolant temperature should read close to each other. A fault in the IAT sensor circuit will set DTC P0112 or DTC P0113.

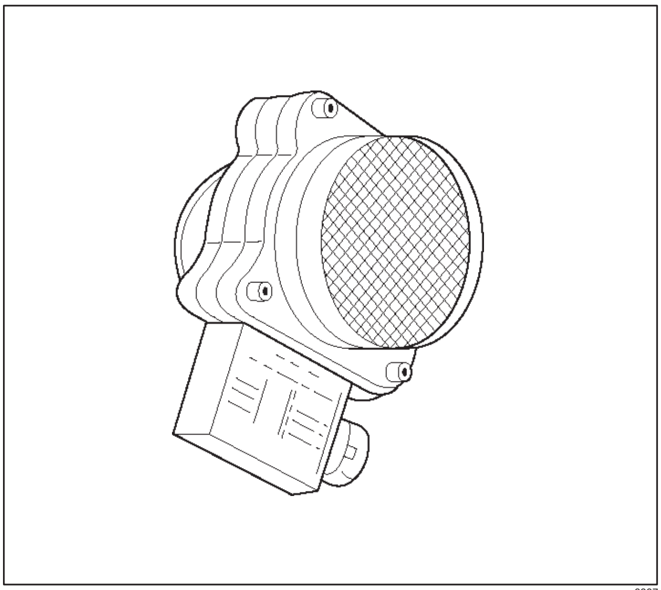
Linear Exhaust Gas Recirculation (EGR) Control

The PCM monitors the exhaust gas recirculation (EGR) actual position and adjusts the pintle position accordingly. The PCM uses information from the following sensors to control the pintle position:

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Mass air flow (MAF) sensor.

Mass Air Flow (MAF) Sensor

The mass air flow (MAF) sensor measures the difference between the volume and the quantity of air that enters the engine. “Volume” means the size of the space to be filled. “Quantity” means the number of air molecules that will fit into the space. This information is important to the PCM because heavier, denser air will hold more fuel than lighter, thinner air. The PCM adjusts the air/fuel ratio as needed depending on the MAF value. The Tech 2 reads the MAF value and displays it in terms of grams per second (gm/s). At idle, the Tech 2 should read between 4-7 gm/s on a fully warmed up engine. Values should change quickly on acceleration. Values should remain stable at any given RPM. A failure in the MAF sensor or circuit will set DTC P0101, DTC P0102, or DTC P0103.



0007

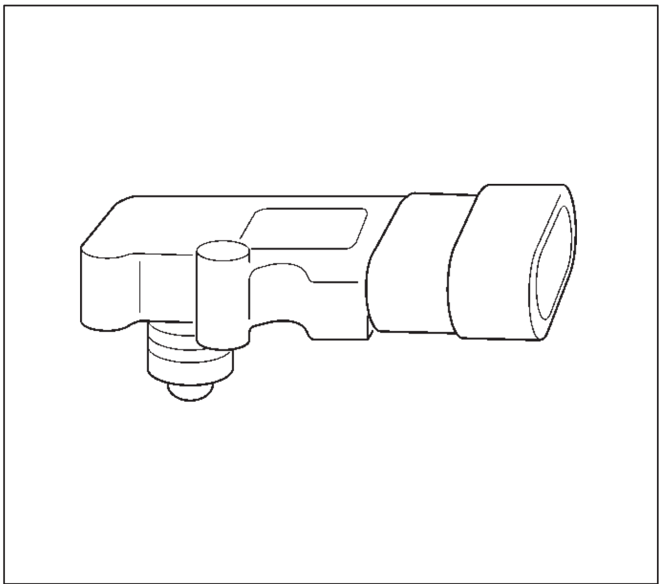
Manifold Absolute Pressure (MAP) Sensor

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the PCM varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine the following:

- Manifold pressure changes while the linear EGR flow test diagnostic is being run. Refer to *DTC P0401*.
- Barometric pressure (BARO).

If the PCM detects a voltage that is lower than the possible range of the MAP sensor, DTC P0107 will be set. A signal voltage higher than the possible range of the sensor will set DTC P0108. An intermittent low or high voltage will set DTC P1107, respectively. The PCM can detect a shifted MAP sensor. The PCM compares the MAP sensor signal to a calculated MAP based on throttle position and various engine load factors. If the PCM detects a MAP signal that varies excessively above or below the calculated value, DTC P0106 will set.



055RW004

Powertrain Control Module (PCM)

The powertrain control module (PCM) is located in the passenger compartment below the center console. The PCM controls the following:

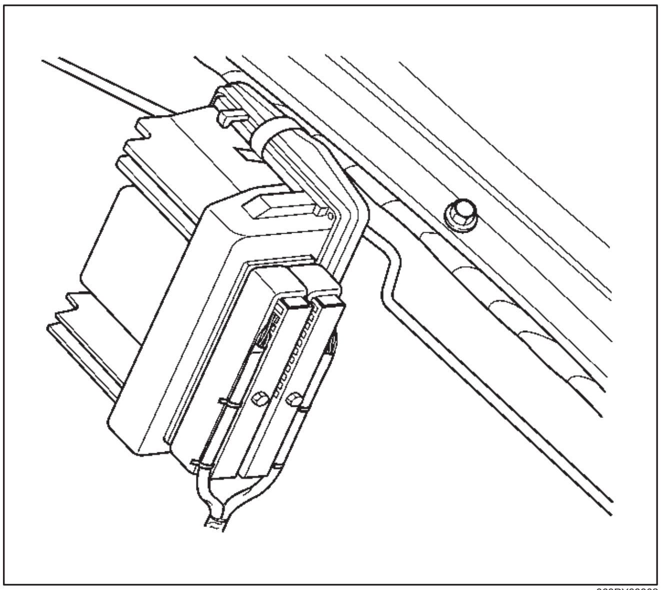
- Fuel metering system.
- Transmission shifting (automatic transmission only).
- Ignition timing.
- On-board diagnostics for powertrain functions.

The PCM constantly observes the information from various sensors. The PCM controls the systems that affect vehicle performance. The PCM performs the diagnostic function of the system. It can recognize operational problems, alert the driver through the MIL (Check Engine lamp), and store diagnostic trouble codes (DTCs). DTCs identify the problem areas to aid the technician in making repairs.

PCM Function

The PCM supplies either 5 or 12 volts to power various sensors or switches. The power is supplied through resistances in the PCM which are so high in value that a test light will not light when connected to the circuit. In some cases, even an ordinary shop voltmeter will not give an accurate reading because its resistance is too low. Therefore, a digital voltmeter with at least 10 megohms input impedance is required to ensure accurate voltage readings. Tool J 39200 meets this requirement. The PCM controls output circuits such as the injectors, fan relays, etc., by controlling the ground or the power feed circuit through transistors or through either of the following two devices:

- Output Driver Module (ODM)
- Quad Driver Module (QDM)



060RY00068

PCM Components

The PCM is designed to maintain exhaust emission levels to government mandated standards while providing excellent driveability and fuel efficiency. The PCM monitors numerous engine and vehicle functions via electronic sensors such as the throttle position (TP) sensor, heated oxygen sensor (HO2S), and vehicle speed sensor (VSS). The PCM also controls certain engine operations through the following:

- Fuel injector control
- Ignition control module
- ION sensing module
- Automatic transmission shift functions
- Cruise control
- Evaporative emission (EVAP) purge
- A/C clutch control

PCM Voltage Description

The PCM supplies a buffered voltage to various switches and sensors. It can do this because resistance in the PCM is so high in value that a test light may not illuminate when connected to the circuit. An ordinary shop voltmeter may not give an accurate reading because the voltmeter input impedance is too low. Use a 10-megohm input impedance digital voltmeter (such as J 39200) to assure accurate voltage readings.

The input/output devices in the PCM include analog-to-digital converters, signal buffers, counters, and special drivers. The PCM controls most components with electronic switches which complete a ground circuit when turned “ON.” These switches are arranged in groups of 4 and 7, called either a surface-mounted quad driver module (QDM), which can independently control up to 4 output terminals, or QDMs which can independently control up to 7 outputs. Not all outputs are always used.

PCM Input/Outputs

Inputs – Operating Conditions Read

- Air Conditioning “ON” or “OFF”
- Engine Coolant Temperature
- Crankshaft Position
- Exhaust Oxygen Content
- Electronic Ignition
- Manifold Absolute Pressure
- Battery Voltage
- Throttle Position
- Vehicle Speed
- Fuel Pump Voltage
- Power Steering Pressure
- Intake Air Temperature
- Mass Air Flow
- Engine Knock
- Camshaft Position

Outputs – Systems Controlled

- EVAP Canister Purge
- Exhaust Gas Recirculation (EGR)
- Ignition Control
- Fuel Control
- ION Sensing Module
- Electric Fuel Pump
- Air Conditioning
- Diagnostics
  - Malfunction Indicator Lamp
  - Data Link Connector (DLC)
  - Data Output
- Transmission Control Module

PCM Service Precautions

The PCM is designed to withstand normal current draws associated with vehicle operation. Avoid overloading any circuit. When testing for opens and shorts, do not ground or apply voltage to any of the PCM’s circuits unless instructed to do so. These circuits should only be tested using digital voltmeter J 39200. The PCM should remain connected to the PCM or to a recommended breakout box.

Reprogramming The PCM

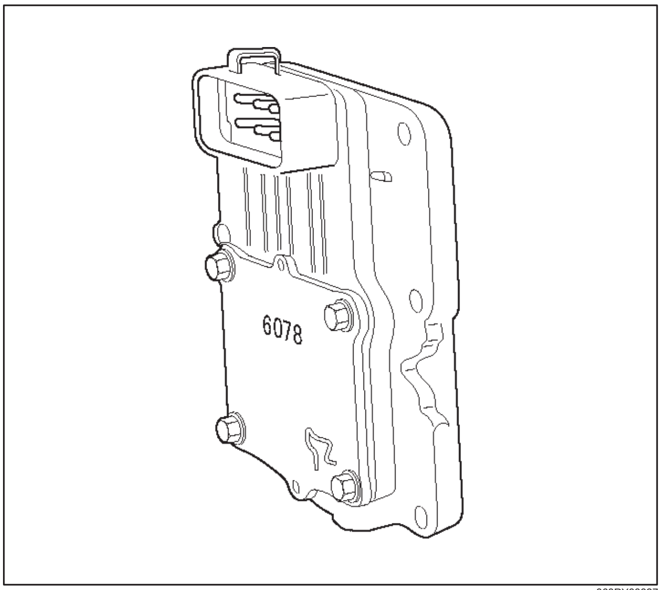
Reprogramming of the PCM is done without removing it from the vehicle . This provides a flexible and cost-effective method of making changes in software calibrations.

Refer to the latest Techline information on reprogramming or flashing procedures.

Throttle Position (TP) Sensor

The throttle position (TP) sensor is a potentiometer connected to the throttle shaft on the throttle body. The PCM monitors the voltage on the signal line and calculates throttle position. As the throttle valve angle is changed (accelerator pedal moved), the TP sensor signal also changes. At a closed throttle position, the output of the TP1 sensor is low. As the throttle valve opens, the output increases so that at wide open throttle (WOT), the output voltage should be above 92% (Tech 2 Display).

The PCM calculates fuel delivery based on throttle valve angle (driver demand). A broken or loose TP sensor may cause intermittent bursts of fuel from an injector and unstable idle because the PCM thinks the throttle is moving.



060RY00027

Transmission Fluid Temperature (TFT) Sensor

The transmission fluid temperature sensor is a thermistor which changes its resistance based on the temperature of the transmission fluid. For a complete description of the TFT sensor, refer to *4L30-E Automatic Transmission Diagnosis* section.

A failure in the TFT sensor or associated wiring will cause DTC P0712 or DTC P0713 to set. In this case, engine coolant temperature will be substituted for the TFT sensor value and the transmission will operate normally.

Transmission Range Switch

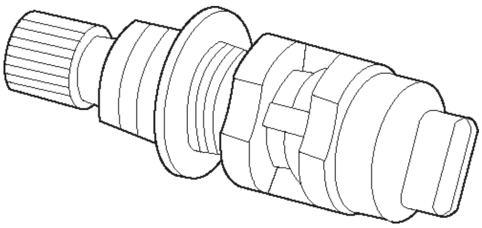
IMPORTANT: The vehicle should not be driven with the transmission range switch disconnected; idle quality will be affected.

The four inputs from the transmission range switch indicate to the PCM which position is selected by the transmission selector lever. This information is used for ignition timing, EVAP canister purge, EGR operation.

For more information on the transmission on the transmission range switch, refer to *4L30-E Automatic Transmission* section.

Vehicle Speed Sensor (VSS)

The PCM determines the speed of the vehicle by converting a plusing voltage signal from the vehicle speed sensor (VSS) into miles per hour. The PCM uses this signal to operate the cruise control, speedometer, and the TCC and shift solenoids in the transmission. For more information on the TCC and shift solenoids, refer to *4L30-E Automatic Transmission* section.



0008

Use of Circuit Testing Tools

Do not use a test light to diagnose the powertrain electrical systems unless specifically instructed by the diagnostic procedures. Use Connector Test Adapter Kit J 35616 whenever diagnostic procedures call for probing connectors.

Aftermarket Electrical and Vacuum Equipment

Aftermarket (add-on) electrical and vacuum equipment is defined as any equipment which connects to the vehicle's electrical or vacuum systems that is installed on a vehicle after it leaves the factory. No allowances have been made in the vehicle design for this type of equipment.

NOTE: No add-on vacuum equipment should be added to this vehicle.

NOTE: Add-on electrical equipment must only be connected to the vehicle's electrical system at the battery (power and ground).

Add-on electrical equipment, even when installed to these guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system such as portable telephones and radios. Therefore, the first step in diagnosing any powertrain problem is to eliminate all aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, it may be diagnosed in the normal manner.

Electrostatic Discharge Damage

Electronic components used in the PCM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4000 volts for a person to feel even the zap of a static discharge.

TS23793

There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

- An example of charging by friction is a person sliding across a vehicle seat.
- Charge by induction occurs when a person with well insulated shoes stands near a highly charged object and momentary touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore it is important to use care when handling and testing electronic components.

NOTE: To prevent possible electrostatic discharge damage, follow these guidelines:

- Do not touch the PCM connector pins or soldered components on the PCM circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.

Upshift Lamp

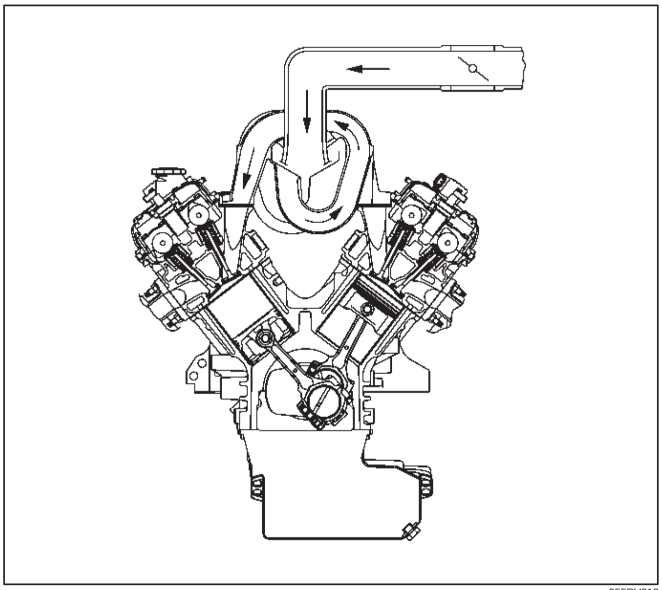
Refer to *Manual Transmission* section.

General Description (Air Induction)

Air Induction System

The air induction system filters contaminants from the outside air, and directs the progress of the air as it is drawn into the engine. A remote-mounted air cleaner prevents dirt and debris in the air from entering the engine. The air duct assembly routes filtered air to the throttle body. Air enters the engine by to following steps:

1. Through the throttle body.
2. Into the common chamber.
3. Through the cylinder head intake ports.
4. Into the cylinders.



055RV010

General Description (Fuel Metering)

Acceleration Mode

The PCM provides extra fuel when it detects a rapid increase in the throttle position and the air flow.

Battery Voltage Correction Mode

When battery voltage is low, the PCM will compensate for the weak spark by increasing the following:

- The amount of fuel delivered.
- The idle RPM.
- Ignition dwell time.

CMP Signal

The PCM uses this signal to determine the position of the number 1 piston during its power stroke, allowing the PCM to calculate true sequential multiport fuel injection (SFI). Loss of this signal will set a DTC P0341. If the CMP signal is lost while the engine is running, the fuel injection system will shift to a calculated sequential fuel injection based on the last fuel injection pulse, and the engine will continue to run. The engine can be restarted and will run in the calculated sequential mode as long as the fault is present, with a 1-in-6 chance of being correct.

Clear Flood Mode

Clear a flooded engine by pushing the accelerator pedal down all the way. The PCM then de-energizes the fuel injectors. The PCM holds the fuel injectors de-energized as long as the throttle remains above 80% and the engine speed is below 800 RPM. If the throttle position becomes less than 80%, the PCM again begins to pulse the injectors "ON" and "OFF," allowing fuel into the cylinders.

Deceleration Mode

The PCM reduces the amount of fuel injected when it detects a decrease in the throttle position and the air flow. When deceleration is very fast, the PCM may cut off fuel completely for short periods.

Engine Speed/Vehicle Speed/Fuel Disable Mode

The PCM monitors engine speed. It turns off the fuel injectors when the engine speed increase above 6400 RPM. The fuel injectors are turned back on when engine speed decreases below 6150 RPM.

Fuel Cutoff Mode

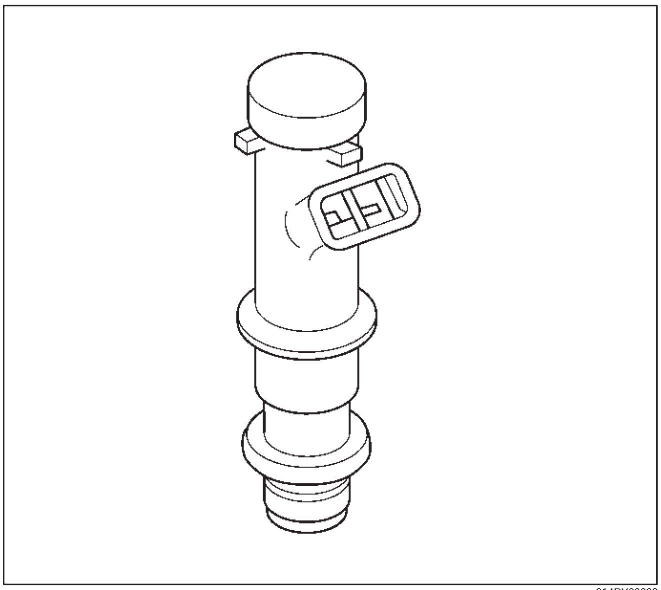
No fuel is delivered by the fuel injectors when the ignition is "OFF." This prevents engine run-on. In addition, the PCM suspends fuel delivery if no reference pulses are detected (engine not running) to prevent engine flooding.

Fuel Injector

The sequential multiport fuel injection (SFI) fuel injector is a solenoid-operated device controlled by the PCM. The PCM energizes the solenoid, which opens a valve to allow fuel delivery.

The fuel is injected under pressure in a conical spray pattern at the opening of the intake valve. Excess fuel not used by the injectors passes through the fuel pressure regulator before being returned to the fuel tank.

A fuel injector which is stuck partly open will cause a loss of fuel pressure after engine shut down, causing long crank times.



014RY00009

Fuel Metering System Components

The fuel metering system is made up of the following parts:

- The fuel injectors.
- The throttle body.
- The fuel rail.

- The fuel pressure regulator.
- The PCM.
- The crankshaft position (CKP) sensor.
- The camshaft position (CMP) sensor.
- The ION sensing module.
- The fuel pump.
- The fuel pump relay.

Basic System Operation

The fuel metering system starts with the fuel in the fuel tank. An electric fuel pump, located in the fuel tank, pumps fuel to the fuel rail through an in-line fuel filter. The pump is designed to provide fuel at a pressure above the pressure needed by the injectors. A fuel pressure regulator in the fuel rail keeps fuel available to the fuel injectors at a constant pressure. A return line delivers unused fuel back to the fuel tank. Refer to *Section 6C* for further information on the fuel tank, line filter, and fuel pipes.

Fuel Metering System Purpose

The basic function of the air/fuel metering system is to control the air/fuel delivery to the engine. Fuel is delivered to the engine by individual fuel injectors mounted in the intake manifold near each intake valve.

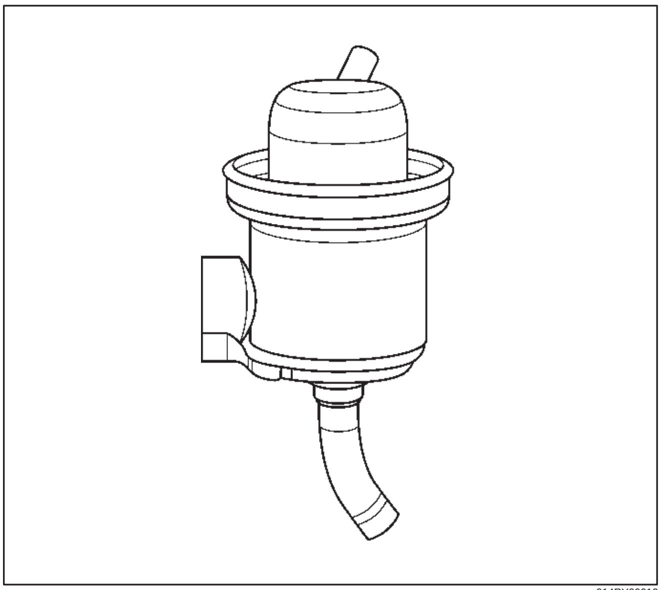
The main control sensor is the heated oxygen sensor (HO2S) located in the exhaust system. The HO2S tells the PCM how much oxygen is in the exhaust gas. The PCM changes the air/fuel ratio to the engine by controlling the amount of time that fuel injector is “ON.” The best mixture to minimize exhaust emissions is 14.7 parts of air to 1 part of gasoline by weight, which allows the catalytic converter to operate most efficiently. Because of the constant measuring and adjusting of the air/fuel ratio, the fuel injection system is called a “closed loop” system.

The PCM monitors signals from several sensors in order to determine the fuel needs of the engine. Fuel is delivered under one of several conditions called “modes.” All modes are controlled by the PCM.

Fuel Pressure Regulator

The fuel pressure regulator is a diaphragm-operated relief valve mounted on the fuel rail with fuel pump pressure on one side and manifold pressure on the other side. The fuel pressure regulator maintains the fuel pressure available to the injector at three times barometric pressure adjusted for engine load. It may be serviced separate.

If the pressure is too low, poor performance and a DTC P0131, DTC P0151,DTC P0171 or DTC P1171 will be the result. If the pressure is too high, excessive odor and/or a DTC P0132, DTC P0152,DTC P0172 will be the result. Refer to *Fuel System Diagnosis* for information on diagnosing fuel pressure conditions.



014RY00010

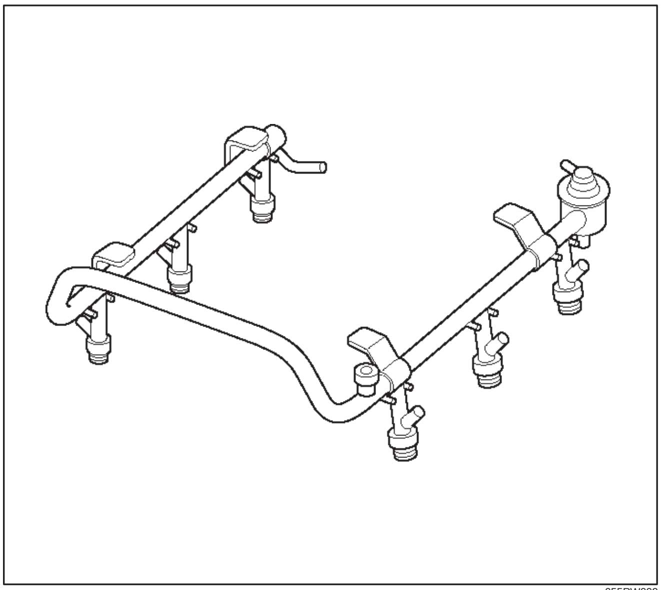
Fuel Pump Electrical Circuit

When the key is first turned “ON,” the PCM energizes the fuel pump relay for two seconds to build up the fuel pressure quickly. If the engine is not started within two seconds, the PCM shuts the fuel pump off and waits until the engine is cranked. When the engine is cranked and the 58 X crankshaft position signal has been detected by the PCM, the PCM supplies 12 volts to the fuel pump relay to energize the electric in-tank fuel pump.

An inoperative fuel pump will cause a “no-start” condition. A fuel pump which does not provide enough pressure will result in poor performance.

Fuel Rail

The fuel rail is mounted to the top of the engine and distributes fuel to the individual injectors. Fuel is delivered to the fuel inlet tube of the fuel rail by the fuel lines. The fuel goes through the fuel rail to the fuel pressure regulator. The fuel pressure regulator maintains a constant fuel pressure at the injectors. Remaining fuel is then returned to the fuel tank.



055RW009

Run Mode

The run mode has the following two conditions:

- Open loop
- Closed loop

When the engine is first started the system is in “open loop” operation. In “open loop,” the PCM ignores the signal from the heated oxygen sensor (HO2S). It calculates the air/fuel ratio based on inputs from the TP, ECT, and MAF sensors.

The system remains in “open loop” until the following conditions are met:

- The HO2S has a varying voltage output showing that it is hot enough to operate properly (this depends on temperature).
- The ECT has reached a specified temperature.
- A specific amount of time has elapsed since starting the engine.
- Engine speed has been greater than a specified RPM since start-up.

The specific values for the above conditions vary with different engines and are stored in the programmable read only memory (PROM). When these conditions are met, the system enters “closed loop” operation. In “closed loop,” the PCM calculates the air/fuel ratio (injector on-time) based on the signal from the HO2S. This allows the air/fuel ratio to stay very close to 14.7:1.

Starting Mode

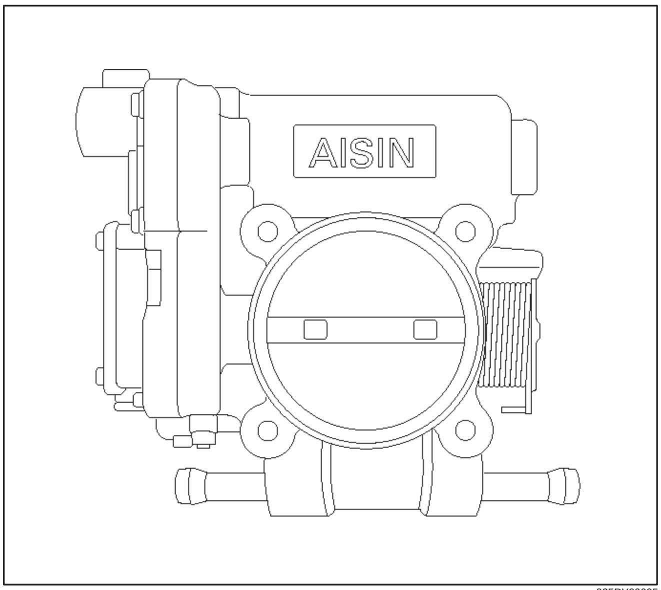
When the ignition is first turned “ON,” the PCM energizes the fuel pump relay for two seconds to allow the fuel pump to build up pressure. The PCM then checks the engine coolant temperature (ECT) sensor and the throttle position (TP) sensor to determine the proper air/fuel ratio for starting.

The PCM controls the amount of fuel delivered in the starting mode by adjusting how long the fuel injectors are energized by pulsing the injectors for very short times.

Throttle Body Unit

The throttle body has a throttle plate to control the amount of air delivered to the engine. The TP sensor are also mounted on the throttle body. Vacuum ports located behind the throttle plate provide the vacuum signals needed by various components.

Engine coolant is directed through a coolant cavity in the throttle body to warm the throttle valve and to prevent icing.

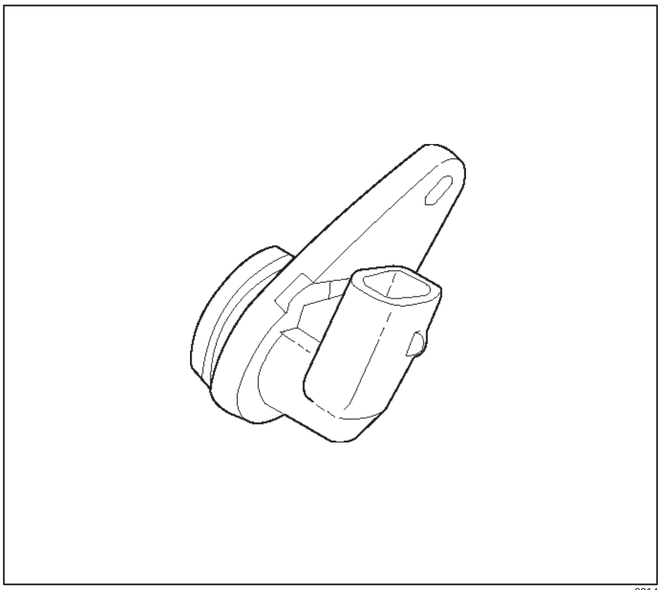


025RY00005

General Description (Electronic Ignition System)

Camshaft Position (CMP) Sensor

CMP is located Left Rear cylinder head. When the Hall-effect switch is activated, it grounds the signal line to the PCM, pulling the camshaft position sensor signal circuit’s applied voltage low. This is a CMP signal. The CMP signals is created as piston #1 is approximately 25° after top dead counter on the power stroke. If the correct CMP signal is not received by the PCM, DTC P0341 will be set.



0014

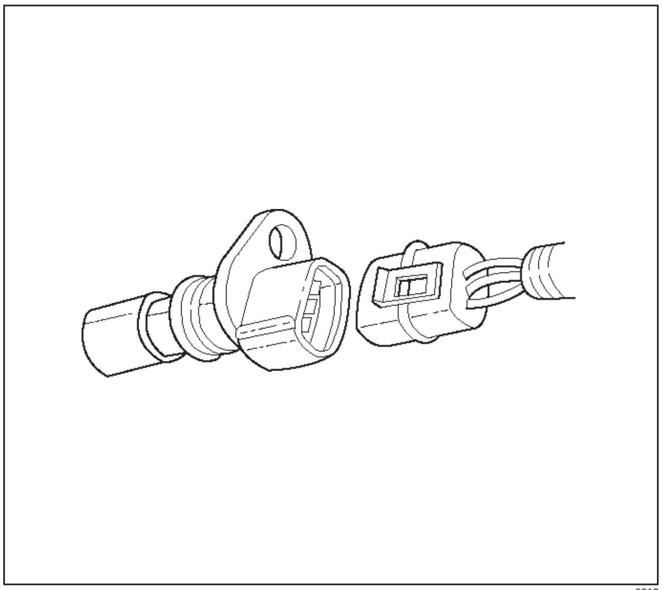
Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor provides a signal used by the powertrain control module (PCM) to calculate the ignition sequence. The sensor initiates the 58X reference pulses which the PCM uses to calculate RPM and crankshaft position. Refer to *Electronic Ignition System* section for additional information.

Electronic Ignition

The electronic ignition system controls fuel combustion by providing a spark to ignite the compressed air/fuel mixture at the correct time. To provide optimum engine performance, fuel economy, and control of exhaust emissions, the PCM controls the spark advance of the ignition system. Electronic ignition has the following advantages over a mechanical distributor system:

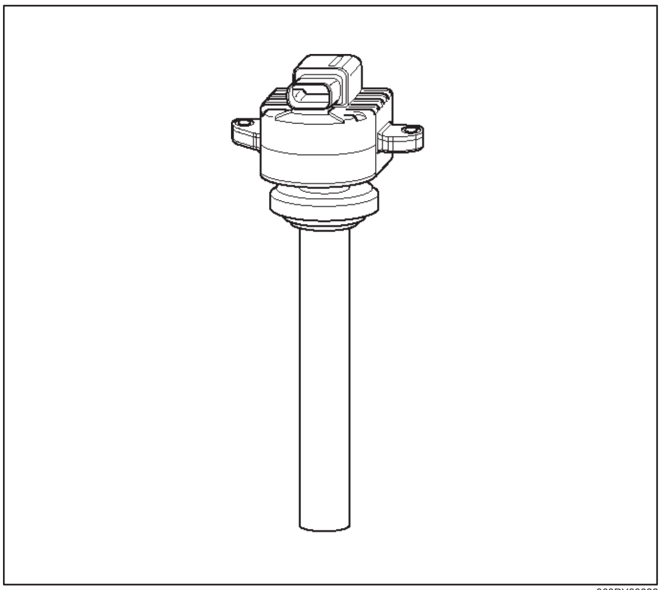
- No moving parts.
- Less maintenance.
- Remote mounting capability.
- No mechanical load on the engine.
- More coil cooldown time between firing events.
- Elimination of mechanical timing adjustments.
- Increased available ignition coil saturation time.



0013

Ignition Coils

A separate coil-at-plug module is located at each spark plug. The coil-at-plug module is attached to the engine with two screws. It is installed directly to the spark plug by an electrical contact inside a rubber boot. A three-way connector provides 12-volt primary supply from the 15-amp ignition fuse, a ground-switching trigger line from the PCM, and a ground.

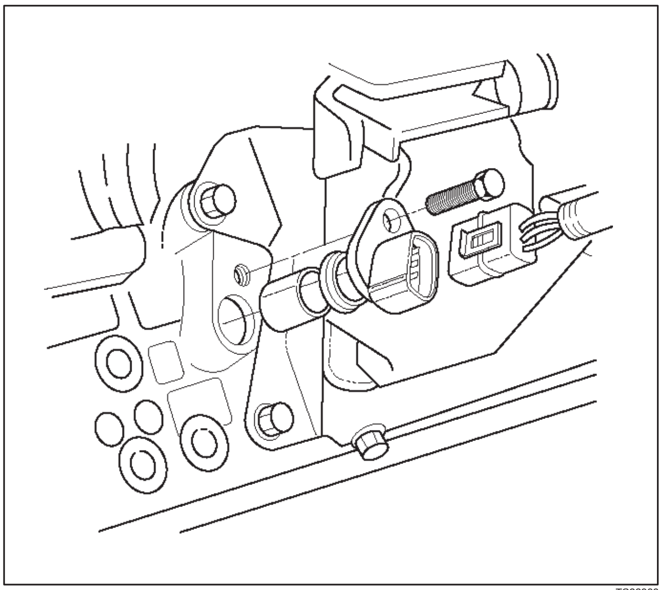


060RY00022

Ignition Control

The ignition control (IC) spark timing is the PCM's method of controlling the spark advance and the ignition dwell. The IC spark advance and the ignition dwell are calculated by the PCM using the following inputs:

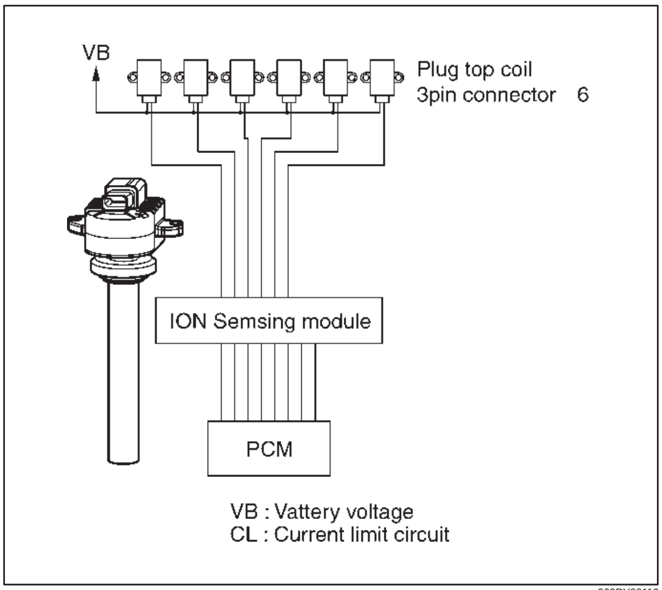
- Engine speed.
- Crankshaft position (58X reference).
- Camshaft position (CMP) sensor.
- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- ION sensing module.
- Park/Neutral position (PRNDL input).
- Vehicle speed (vehicle speed sensor).
- PCM and ignition system supply voltage.
- The crankshaft positron (CKP) sensor sends the PCM a 58X signal related to the exact position of the crankshaft.



TS22909

- The camshaft position (CMP) sensor sends a signal related to the position of the camshaft.

Based on these sensor signals and engine load information, the PCM sends 5V to each ignition coil.



060RY00116

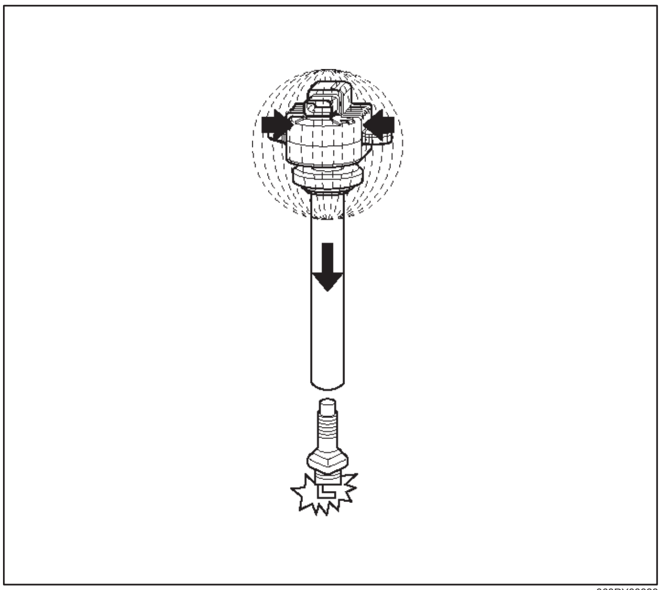
This module has the function to energize and de-energize the primary ignition coil in response to signals from the PCM. The Throttle PCM controls ignition timing and dwell time.

Continuity and out-or-range value check:

This diagnosis detects open circuit or short-circuiting in the Electronic Spark Timing (EST) line by monitoring EST signals. A failure determination is made when the signal voltage remains higher or lower than the threshold for corresponding fault code beyond a predetermined time period.

Diagnosis enabling conditions are as follows:

- RPM is higher than the specified threshold.
- EST line is enabled.



060RY00029

Ignition Control PCM Output

The PCM provides a zero volt (actually about 100 mV to 200 mV) or a 5-volt output signal to the ignition control (IC) module. Each spark plug has its own primary and secondary ignition coil assembly (”coil-at-plug”) located at the spark plug itself. When the ignition coil receives the 5-volt signal from the PCM, it provides a ground path for the B+ supply to the primary side of the coil-at -plug module. When the PCM shuts off the 5-volt signal to the ION sensing module, the ground path for the primary coil is broken. The magnetic field collapses and induces a high voltage secondary impulse which fires the spark plug and ignites the air/fuel mixture.

The circuit between the PCM and the ignition coil is monitored for open circuits, shorts to voltage, and shorts to ground. If the PCM detects one of these events, it will set one of the following DTCs:

- P0351: Ignition coil Fault on Cylinder #1
- P0352: Ignition coil Fault on Cylinder #2
- P0353: Ignition coil Fault on Cylinder #3
- P0354: Ignition coil Fault on Cylinder #4
- P0355: Ignition coil Fault on Cylinder #5
- P0356: Ignition coil Fault on Cylinder #6

Powertrain Control Module (PCM)

The PCM is responsible for maintaining proper spark and fuel injection timing for all driving conditions. To provide optimum driveability and emissions, the PCM monitors the input signals from the following components in order to calculate spark timing:

- Engine coolant temperature (ECT) sensor.
- Intake air temperature (IAT) sensor.
- Mass air flow (MAF) sensor.
- PRNDL input from transmission range switch.
- Throttle position (TP) sensor.
- Vehicle speed sensor (VSS) .
- Crankshaft position (CKP) sensor.

Spark Plug

Although worn or dirty spark plugs may give satisfactory operation at idling speed, they frequency fail at higher engine speeds. Faulty spark plugs may cause poor fuel economy, power loss, loss of speed, hard starting and generally poor engine performance. Follow the scheduled maintenance service recommendations to ensure satisfactory spark plug performance. Refer to *Maintenance and Lubrication* section.

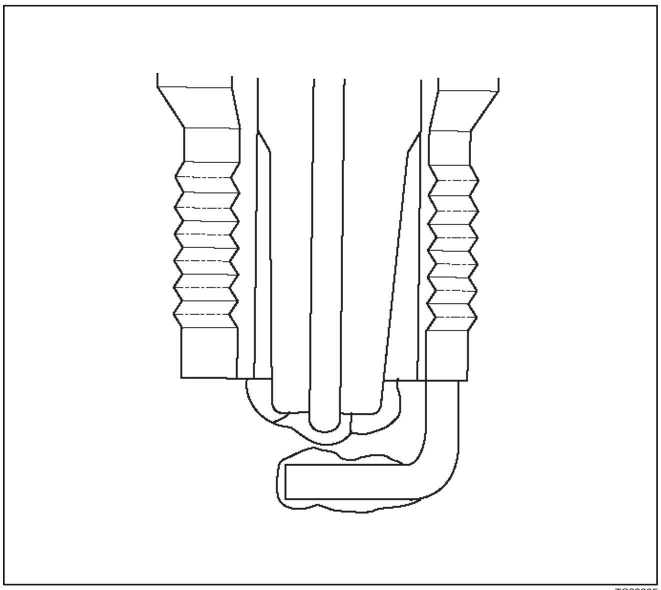
Normal spark plug operation will result in brown to grayish-tan deposits appearing on the insulator portion of the spark plug. A small amount of red-brown, yellow, and white powdery material may also be present on the insulator tip around the center electrode. These deposits are normal combustion by-products of fuels and lubricating oils with additives. Some electrode wear will also occur. Engines which are not running properly are often referred to as “misfiring.” This means the ignition spark is not igniting the air/fuel mixture at the proper time. While other ignition and fuel system causes must also be considered, possible causes include ignition system conditions which allow the spark voltage to reach ground in some other manner than by jumping across the air gap at the tip of the spark plug, leaving the air/fuel mixture unburned. Refer to *DTC P0300*. Misfiring may also occur when the tip of the spark plug becomes overheated and ignites the mixture before the spark jumps. This is referred to as “pre-ignition.”

Spark plugs may also misfire due to fouling, excessive gap, or a cracked or broken insulator. If misfiring occurs before the recommended replacement interval, locate and correct the cause.

Carbon fouling of the spark plug is indicated by dry, black carbon (soot) deposits on the portion of the spark plug in the cylinder. Excessive idling and slow speeds under light engine loads can keep the spark plug temperatures so low that these deposits are not burned off. Very rich fuel mixtures or poor ignition system output may also be the cause. Refer to DTC P0172.

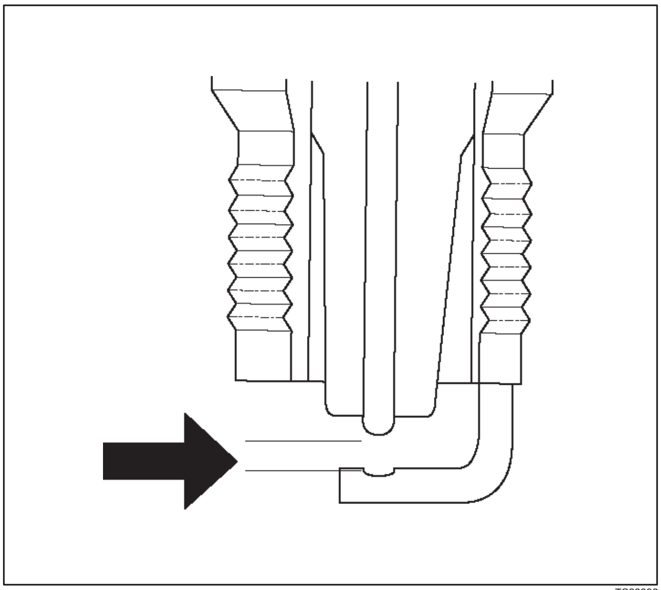
Oil fouling of the spark plug is indicated by wet oily deposits on the portion of the spark plug in the cylinder, usually with little electrode wear. This may be caused by oil during break-in of new or newly overhauled engines.

Deposit fouling of the spark plug occurs when the normal red-brown, yellow or white deposits of combustion by products become sufficient to cause misfiring. In some cases, these deposits may melt and form a shiny glaze on the insulator around the center electrode. If the fouling is found in only one or two cylinders, valve stem clearances or intake valve seals may be allowing excess lubricating oil to enter the cylinder, particularly if the deposits are heavier on the side of the spark plug facing the intake valve.



TS23995

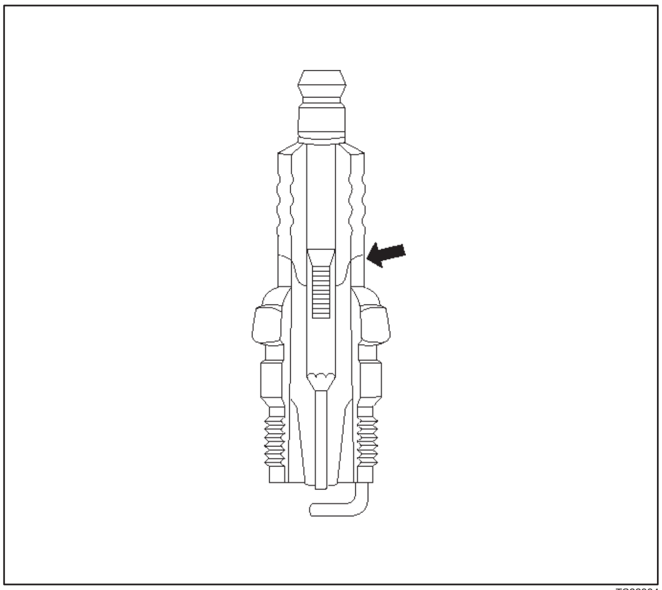
Excessive gap means that the air space between the center and the side electrodes at the bottom of the spark plug is too wide for consistent firing. This may be due to improper gap adjustment or to excessive wear of the electrode during use. A check of the gap size and comparison to the gap specified for the vehicle in *Maintenance and Lubrication* section will tell if the gap is too wide. A spark plug gap that is too small may cause an unstable idle condition. Excessive gap wear can be an indication of continuous operation at high speeds or with engine loads, causing the spark to run too hot. Another possible cause is an excessively lean fuel mixture.



TS23992

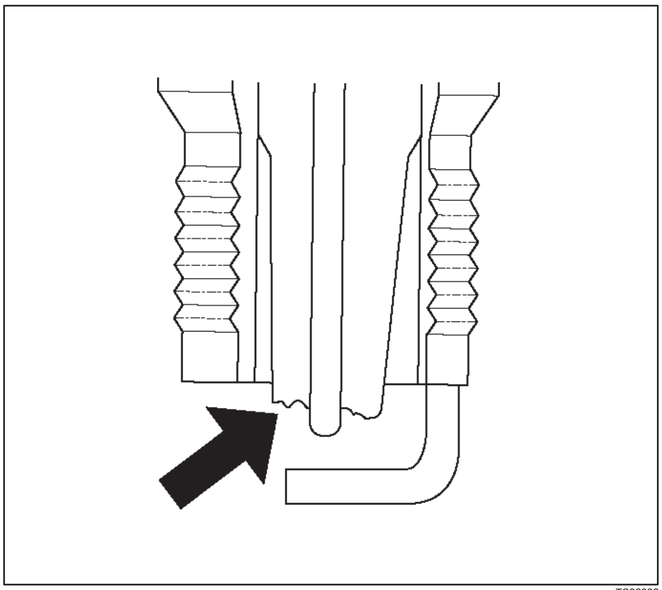
Low or high spark plug installation torque or improper seating can result in the spark plug running too hot and can cause excessive center electrode wear. The plug and the cylinder head seats must be in good contact for proper heat transfer and spark plug cooling. Dirty or damaged threads in the head or on the spark plug can keep it from seating even though the proper torque is applied. Once spark plugs are properly seated, tighten them to the torque shown in the Specifications Table. Low torque may result in poor contact of the seats due to a loose spark plug. Overtightening may cause the spark plug shell to be stretched and will result in poor contact between the seats. In extreme cases, exhaust blow-by and damage beyond simple gap wear may occur.

Cracked or broken insulators may be the result of improper installation, damage during spark plug re-gapping, or heat shock to the insulator material. Upper insulators can be broken when a poorly fitting tool is used during installation or removal, when the spark plug is hit from the outside, or is dropped on a hard surface. Cracks in the upper insulator may be inside the shell and not visible. Also, the breakage may not cause problems until oil or moisture penetrates the crack later.



TS23994

A broken or cracked lower insulator tip (around the center electrode) may result from damage during re-gapping or from “heat shock” (spark plug suddenly operating too hot).



TS23993

- Damage during re-gapping can happen if the gapping tool is pushed against the center electrode or the insulator around it, causing the insulator to crack. When re-gapping a spark plug, make the adjustment by bending only the ground side terminal, keeping the tool clear of other parts.
- ”Heat shock” breakage in the lower insulator tip generally occurs during several engine operating conditions (high speeds or heavy loading) and may be caused by over-advanced timing or low grade fuels. Heat shock refers to a rapid increase in the tip temperature that causes the insulator material to crack.

Spark plugs with less than the recommended amount of service can sometimes be cleaned and re-gapped , then returned to service. However, if there is any doubt about the serviceability of a spark plug, replace it. Spark plugs with cracked or broken insulators should always be replaced.

A/C Clutch Diagnosis

A/C Clutch Circuit Operation

A 12-volt signal is supplied to the A/C request input of the PCM when the A/C is selected through the A/C control switch.

The A/C compressor clutch relay is controlled through the PCM. This allows the PCM to modify the idle air control position prior to the A/C clutch engagement for better idle quality. If the engine operating conditions are within their specified calibrated acceptable ranges, the PCM will enable the A/C compressor relay. This is done by providing a ground path for the A/C relay coil within the PCM. When the A/C compressor relay is enabled, battery voltage is supplied to the compressor clutch coil. The PCM will enable the A/C compressor clutch whenever the engine is running and the A/C has been requested. The PCM will not enable the A/C compressor clutch if any of the following conditions are met:

- The throttle is greater than 90%.
- The engine speed is greater than 6315 RPM.
- The ECT is greater than 119˚C (246˚F).
- The IAT is less than 5˚C (41˚F).
- The throttle is more than 80% open.

A/C Clutch Circuit Purpose

The A/C compressor operation is controlled by the powertrain control module (PCM) for the following reasons:

- It improvises idle quality during compressor clutch engagement.
- It improvises wide open throttle (WOT) performance.
- It provides A/C compressor protection from operation with incorrect refrigerant pressures.

The A/C electrical system consists of the following components:

- The A/C control head.
- The A/C refrigerant pressure switches.
- The A/C compressor clutch.
- The A/C compressor clutch relay.
- The PCM.

A/C Request Signal

This signal tells the PCM when the A/C mode is selected at the A/C control head. The PCM uses this to adjust the idle speed before turning on the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the PCM.

Refer to *A/C Clutch Circuit Diagnosis* section for A/C wiring diagrams and diagnosis for A/C electrical system.

General Description (Evaporative (EVAP) Emission System)

EVAP Emission Control System Purpose

The basic evaporative emission (EVAP) control system used on all vehicles is the charcoal canister storage method. Gasoline vapors from the fuel tank flow into the canister through the inlet labeled “TANK.” These vapors are absorbed into the activated carbon (charcoal) storage device (canister) in order to hold the vapors when the vehicle is not operating. The canister is purged by PCM control when the engine coolant temperature is over 60˚C (140˚F), the IAT reading is over 10˚C (50˚F), and the engine has been running. Air is drawn into the canister through the air inlet grid. The air mixes with the vapor and the mixture is drawn into the intake manifold.

EVAP Emission Control System Operation

The EVAP canister purge is controlled by a solenoid valve that allows the manifold vacuum to purge the canister. The powertrain control module (PCM) supplies a ground to energize the solenoid valve (purge on). The EVAP purge solenoid control is pulse-width modulated (PWM) (turned on and off several times a second). The duty cycle (pulse width) is determined by engine operating conditions including load, throttle positron, coolant temperature and ambient temperature. The duty cycle is calculated by the PCM. The output is commanded when the appropriate conditions have been met. These conditions are:

- The engine is fully warmed up.
- The engine has been running for a specified time.
- The IAT reading is above 10˚C (50˚F).

A continuous purge condition with no purge commanded by the PCM will set a DTC P1441.

Poor idle, stalling and poor driveability can be caused by:

- A malfunctioning purge solenoid.
- A damaged canister.
- Hoses that are split, cracked, or not connected properly.

Enhanced Evaporative Emission Control System

The basic purpose of the Enhanced Evaporative Emissions control system is the same as other EVAP systems. A charcoal-filled canister captures and stores gasoline fumes. When the PCM determines that the time is right, it opens a purge valve which allows engine vacuum to draw the fumes into the intake manifold.

The difference between this and other systems is that the PCM monitors the vacuum and/or pressure in the system to determine if there is any leakage. If the PCM determines that the EVAP system is leaking or not functioning properly, it sets a Diagnostic Trouble Code (DTC) in the PCM memory.

The enhanced EVAP system is required to detect evaporative fuel system leaks as small as 0.040 in. (1.0 mm) between the fuel filler cap and purge solenoid. The system can test the evaporative system integrity by applying a vacuum signal (ported or manifold) to the fuel tank to create a small vacuum. The PCM then monitors the ability of the system to maintain the vacuum. If the vacuum remains for a specified period of time, there are no evaporative leaks and a PASS report is sent to the diagnostic executive. If there is a leak, the system either will not achieve a vacuum, or a vacuum cannot be maintained. Usually, a failure can only be detected after a cold start with a trip of sufficient length and driving conditions to run the needed tests. The enhanced EVAP system diagnostic will conduct up to eight specific sub-tests to detect fault conditions. If the diagnostic fails a sub-test, the PCM will store a Diagnostic Trouble Code (DTC) to indicate the type of detected.

Electrical Components

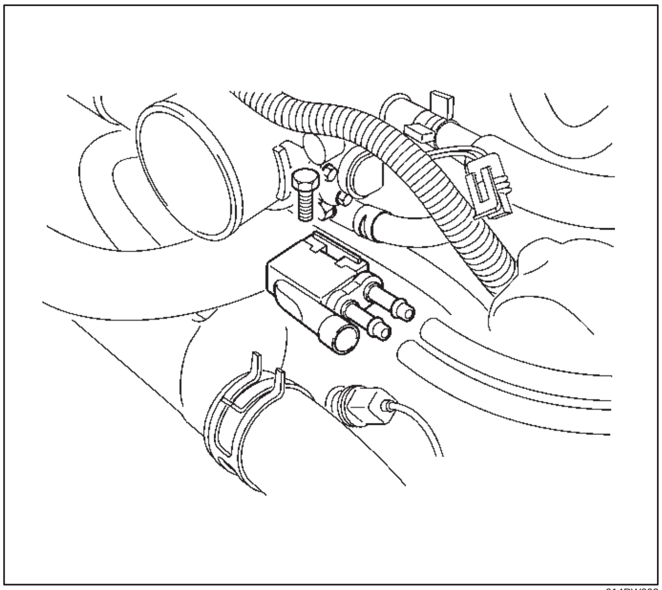
The electrical components that make up the enhanced EVAP system are:

- Fuel Tank Pressure Sensor. The fuel tank pressure sensor is a three-wire strain gauge sensor similar to a common MAP sensor. However, the fuel tank pressure sensor has very different electrical characteristics due to its pressure differential design. The sensor measures the difference between the air pressure (or vacuum) in the fuel tank and the outside air pressure.

The sensor mounts at the top of the fuel pump assembly. A three-wire electrical harness connects it to the PCM. The PCM supplies a five-volt reference voltage and a ground to the sensor. The sensor will return a voltage between 0.1 and 4.9 volts. When the air pressure in the fuel tank is equal to the outside air pressure, such as when the fuel cap is removed, the output voltage of the sensor will be 1.3 to 1.7 volts.

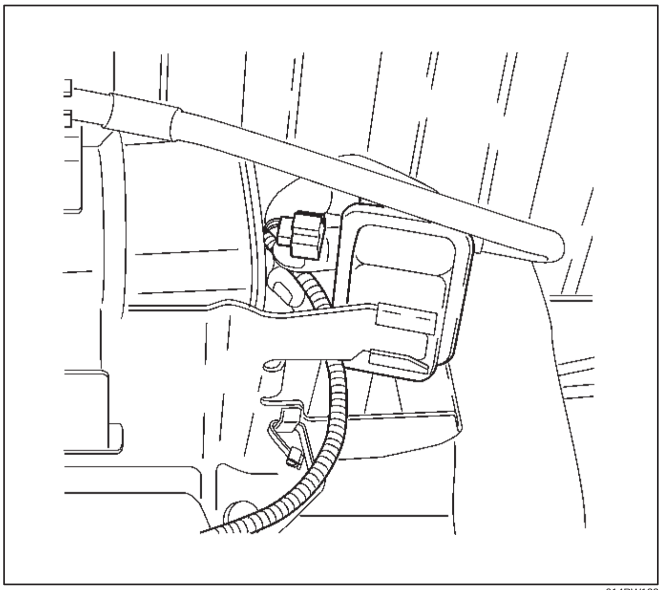
When the air pressure in the fuel tank is 4.5 in. H2O (1.25 kPa), the sensor output voltage will be 0.5 $\pm$ 0.2 V. When there is neither vacuum nor pressure in the fuel tank, the sensor voltage will be 1.5 V. At –14 in. H2O (–3.75 kPa), the sensor voltage will be 4.5 $\pm$ 0.2 V.

- EVAP Canister Purge Solenoid. Normally closed, the purge solenoid opens upon the PCM's signal to allow engine vacuum to purge gasoline fumes from the canister. Mounted on the water pipe to front of the engine assembly.



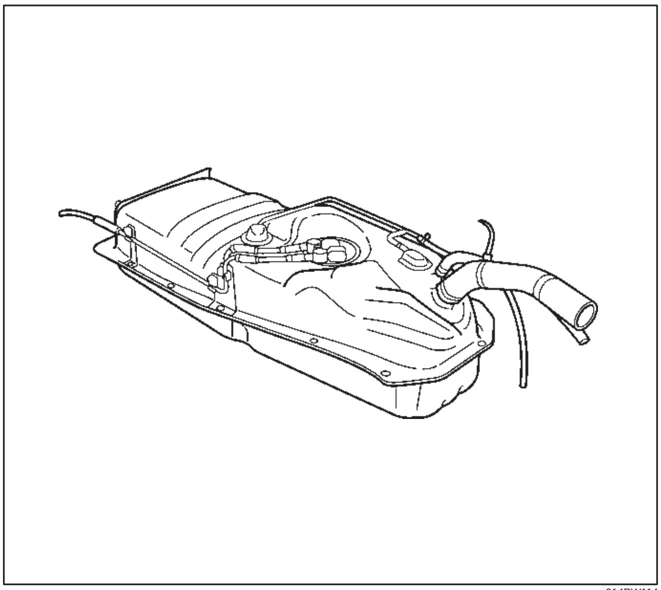
014RW093

- EVAP Canister Vent Solenoid. Located next to the canister, the vent solenoid opens to allow air into the EVAP system. Fresh air is necessary to completely remove gasoline fumes from the canister during purge. The EVAP vent solenoid closes to seal off the evaporative emissions system for leak testing.



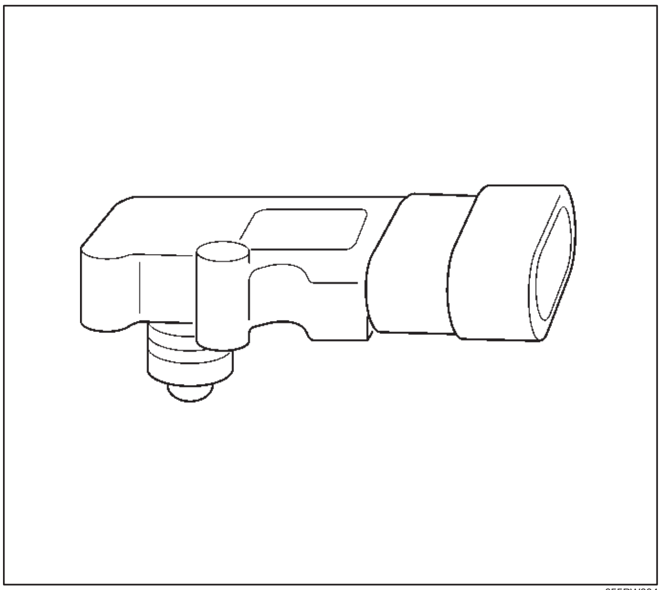
014RW132

- Fuel Level Sensor. The fuel level sensor is an important input to the PCM for the enhanced EVAP system diagnostic. The PCM needs fuel level information to know the volume of fuel in the tank. The fuel level affects the rate of change of air pressure in the EVAP system. Several of the enhanced EVAP system diagnostic sub-tests are dependent upon correct fuel level information. The diagnostic will not run when the tank is less than 15% or more than 85% full. Be sure to diagnose any Fuel Level Sensor DTCs first, as they can cause other DTCs to set.



014RW114

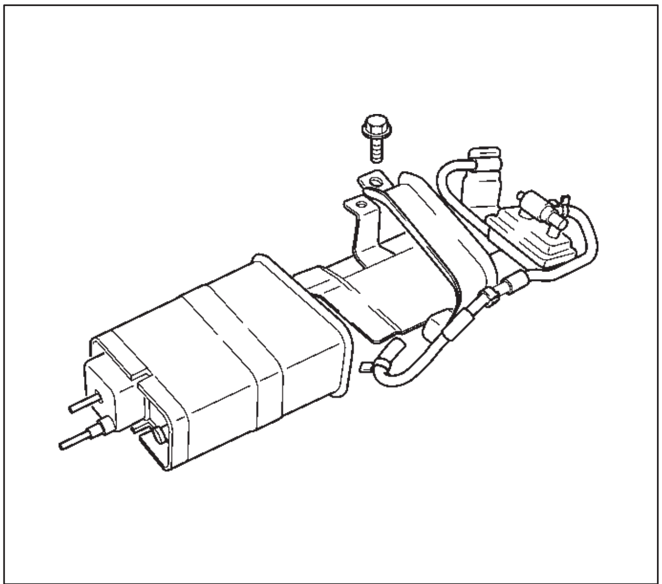
- Manifold Absolute Pressure (MAP) Sensor. The PCM compares the signals from the fuel tank pressure sensor and the MAP sensor to ensure that a relative vacuum is maintained the EVAP system.



055RW004

Non-Electrical Components

- Purge/Vacuum Hoses. Made of rubber compounds, these hoses route the gasoline fumes from their sources to the canister and from the canister to the intake air flow.
- EVAP Canister. Mounted on a bracket ahead of the fuel tank, the canister stores fuel vapors until the PCM determines that engine conditions are right for them to be remove and burned.
- Fuel Tank. The tank has a built-in air space designed for the collection of gasoline fumes.



014RW129

- Vacuum Source. The vacuum source is split between two ports, one on either side of the throttle body.
- Fuel Cap. The fuel cap is designed to be an integral part of the EVAP system.

System Fault Detection

The EVAP leak detection strategy is based on applying vacuum to the EVAP system and monitoring vacuum decay. The PCM monitors vacuum level via the fuel tank pressure sensor. At an appropriate time, the EVAP purge solenoid and the EVAP vent solenoid are turned “ON,” allowing the engine vacuum to draw a small vacuum on the entire evaporative emission system.

After the desired vacuum level has been achieved, the EVAP purge solenoid is turned “OFF,” sealing the system. A leak is detected by monitoring for a decrease in vacuum level over a given time period, all other variables remaining constant. A small leak in the system will cause DTC P0442 to be set.

If the desired vacuum level cannot be achieved in the test described above, a large leak or a faulty EVAP purge solenoid is indicated.

Leaks can be caused by the following conditions:

- Disconnected or faulty fuel tank pressure sensor
- Missing or faulty fuel cap
- Disconnected, damaged, pinched, or blocked EVAP purge line
- Disconnected or damaged EVAP vent hose
- Disconnected, damaged, pinched, or blocked fuel tank vapor line
- Disconnected or faulty EVAP purge solenoid
- Disconnected or faulty EVAP vent solenoid
- Open ignition feed circuit to the EVAP vent or purge solenoid
- Damaged EVAP canister
- Leaking fuel sender assembly O-ring
- Leaking fuel tank or fuel filler neck

A restricted or blocked EVAP vent path is detected by drawing vacuum into the EVAP system, turning “OFF” the EVAP vent solenoid and the EVAP purge solenoid (EVAP vent solenoid “OPEN,” EVAP purge Pulse Width Modulate (PWM) “0%”) and monitoring the fuel tank vacuum sensor input. With the EVAP vent solenoid open, any vacuum in the system should decrease quickly unless the vent path is blocked. A blockage like this will set DTC P0446 and can be caused by the following conditions:

- Faulty EVAP vent solenoid (stuck closed)
- Plugged, kinked or pinched vent hose
- Shorted EVAP vent solenoid driver circuit
- Plugged EVAP canister

The PCM supplies a ground to energize the purge solenoid (purge “ON”). The EVAP purge control is PWM, or turned “ON” and “OFF,” several times a second. The duty cycle (pulse width) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the PCM and the output is commanded when the appropriate conditions have been met.

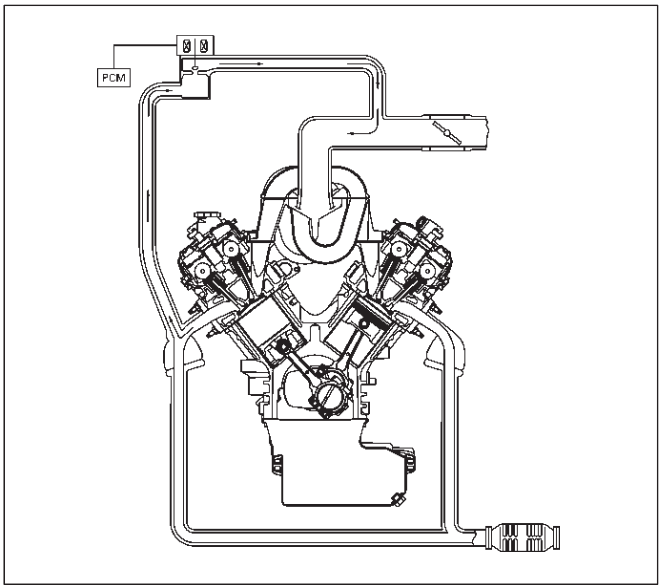
The system checks for conditions that cause the EVAP system to purge continuously by commanding the EVAP vent solenoid “ON” and the EVAP purge solenoid “OFF” (EVAP vent solenoid “CLOSED,” EVAP purge PWM “0%”). If fuel tank vacuum level increases during the test, a continuous purge flow condition is indicated, which will set a DTC P1441. This can be cause by the following conditions:

- EVAP purge solenoid leaking
- EVAP purge and engine vacuum lines switched at the EVAP purge solenoid
- EVAP purge solenoid driver circuit grounded

General Description (Exhaust Gas Recirculation (EGR) System)

EGR Purpose

The exhaust gas recirculation (EGR) system is use to reduce emission levels of oxides of nitrogen (NOx). NOx emission levels are caused by a high combustion temperature. The EGR system lowers the NOx emission levels by decreasing the combustion temperature.



057RW002

Linear EGR Valve

The main element of the system is the linear EGR valve. The EGR valve feeds small amounts of exhaust gas back into the combustion chamber. The fuel/air mixture will be diluted and combustion temperatures reduced.

Linear EGR Control

The PCM monitors the EGR actual positron and adjusts the pintle position accordingly. The uses information from the following sensors to control the pintle position:

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Mass air flow (MAF) sensor.

Linear EGR Valve Operation and Results of Incorrect Operation

The linear EGR valve is designed to accurately supply EGR to the engine independent of intake manifold vacuum. The valve controls EGR flow from the exhaust to the intake manifold through an orifice with a PCM controlled pintle. During operation, the PCM controls pintle position by monitoring the pintle position feedback signal. The feedback signal can be monitored with a Tech 2 as “Actual EGR Pos.” “Actual EGR Pos.” should always be near the commanded EGR position (”Desired EGR Pos.”). If a problem with the EGR system will not allow the PCM to control the pintle position properly, DTC P1406 will set. The PCM also tests for EGR flow. If incorrect flow is detected, DTC P0401 will set. If DTCs P0401 and/or P1406 are set, refer to the DTC charts.

The linear EGR valve is usually activated under the following conditions:

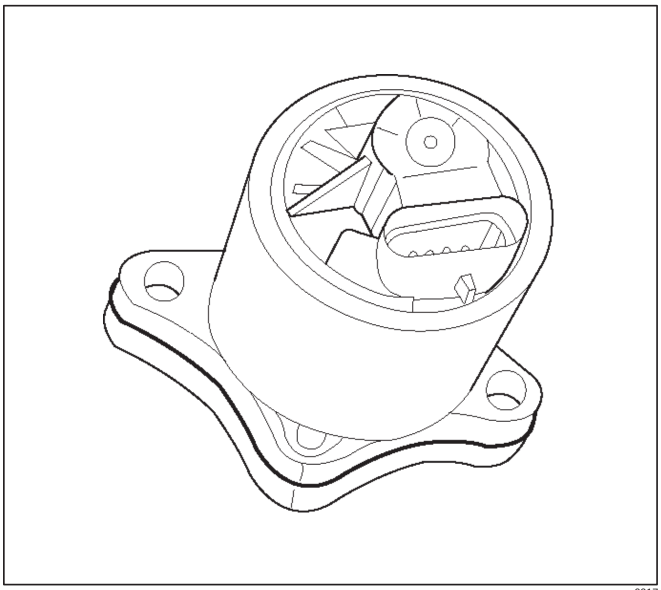
- Warm engine operation.
- Above-idle speed.

Too much EGR flow at idle, cruise or cold operation may cause any of the following conditions to occur:

- Engine stalls after a cold start.
- Engine stalls at idle after deceleration.
- Vehicle surges during cruise.
- Rough idle.
- DTC P0300 (misfire detected).

Too little or no EGR flow may allow combustion temperatures to get too high. This could cause:

- Spark knock (detonation).
- Engine overheating.
- Emission test failure.
- DTC P0401 (EGR flow test).
- Poor fuel economy.



0017

EGR Pintle Position Sensor

The PCM monitors the EGR valve pintle position input to endure that the valve responds properly to commands from the PCM and to detect a fault if the pintle position sensor and control circuits are open or shorted. If the PCM detects a pintle position signal voltage outside the normal range of the pintle position sensor, or a signal voltage that is not within a tolerance considered acceptable for proper EGR system operation, the PCM will set DTC P1406.

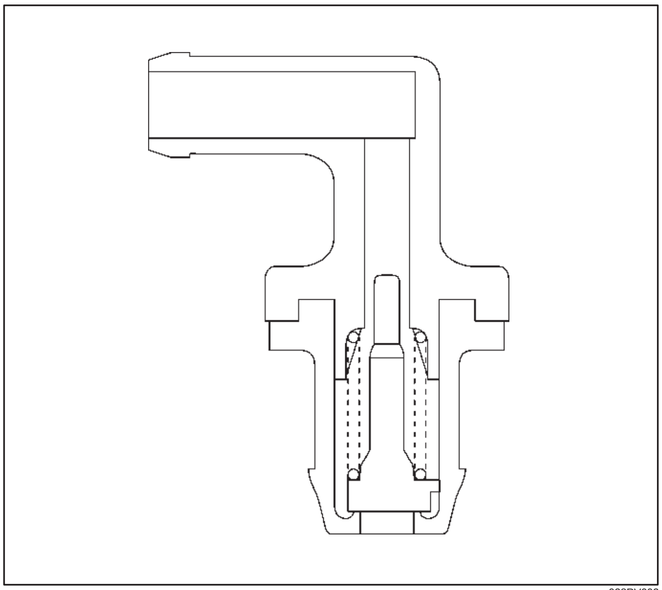
General Description (Positive Crankcase Ventilation (PCV) System)

Crankcase Ventilation System Purpose

The crankcase ventilation system is use to consume crankcase vapors in the combustion process instead of venting them to the atmosphere. Fresh air from the throttle body is supplied to the crankcase and mixed with blow-by gases. This mixture is then passed through the positive crankcase ventilation (PCV) valve into the common chamber.

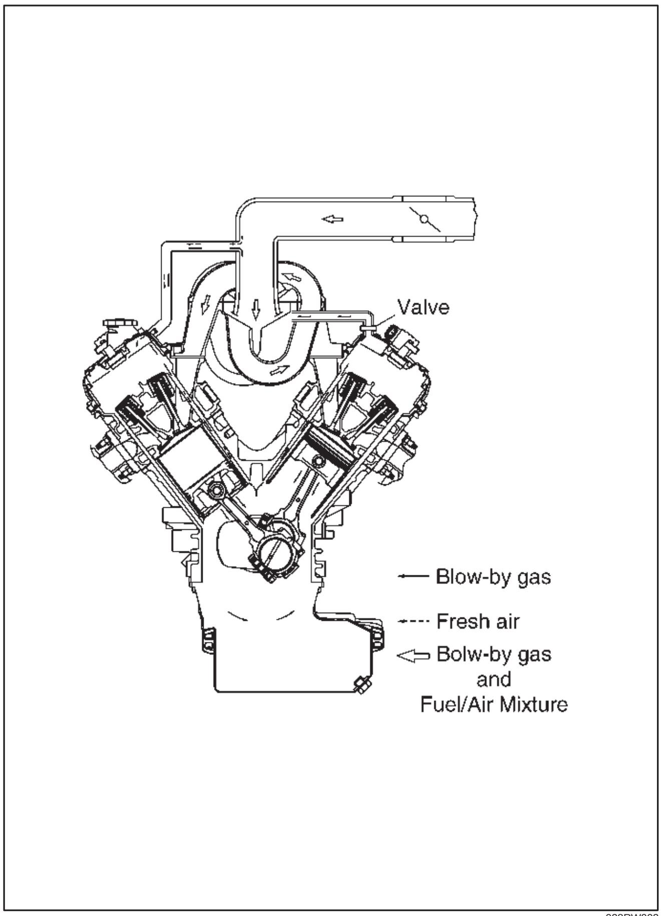
Crankcase Ventilation System Operation

The primary control is through the positive crankcase ventilation (PCV) valve. The PCV valve meters the flow at a rate that depends on the intake vacuum. The PCV valve restricts the flow when the inlet vacuum is highest. In addition, the PCV valve can seal the common chamber off in case of sudden high pressure in the crankcase.



028RV002

While the engine is running, exhaust fuses and small amounts of the fuel/air mixture escape past the piston rings and enter the crankcase. These gases are mixed with clean air entering through a tube from the air intake duct.



028RW002

During normal, part-throttle operation, the system is designed to allow crankcase gases to flow through the PCV valve into the throttle body to be consumed by normal combustion.

A plugged valve or PCV hose may cause the following conditions:

- Rough idle.
- Stalling of slow idle speed.
- Oil leaks.
- Sludge in the engine.

A leaking PCV hose would cause:

- Rough idle.
- Stalling.
- High idle speed.

1. J 41413 EVAP Pressure/Purge Diagnostic Station is a multipurpose tool which is used to perform several diagnostic procedures for enhanced emission testing. The station will accommodate a nitrogen gas filled cylinder which is used to pressurize the vehicle EVAP system for a leakdown test and leak location test when a vehicle is repaired for leakage in the enhanced evaporative emission control system. It also has two additional gauges (inches of mercury and inches of water) which are used to measure both source vacuum and EVAP canister purge vacuum to verify correct operation and vapor flow within the canister purge circuit.
2. J 41416 Ultrasonic Leak Detector is a microprocessor-based device used to detect leaks in the enhanced evaporative emission control system. The evaporative system is pressurized to 30 inches of water using the J 41413 EVAP Pressure/Purge Diagnostic System. Small leaks in the EVAP system will emit sound at a high frequency undetectable by a human ear but detectable with the J 41416. The technician traces along the evaporative system and can pinpoint leaks due to corroded lines, cracked hoses, or a damaged EVAP component. The detector includes a high quality set of headphones to block out surrounding shop noise and the LED sensitivity meter allows a visual reference for locating leaks in conjunction with the audio output heard through the headphones. Powered by (1) nine volt battery.

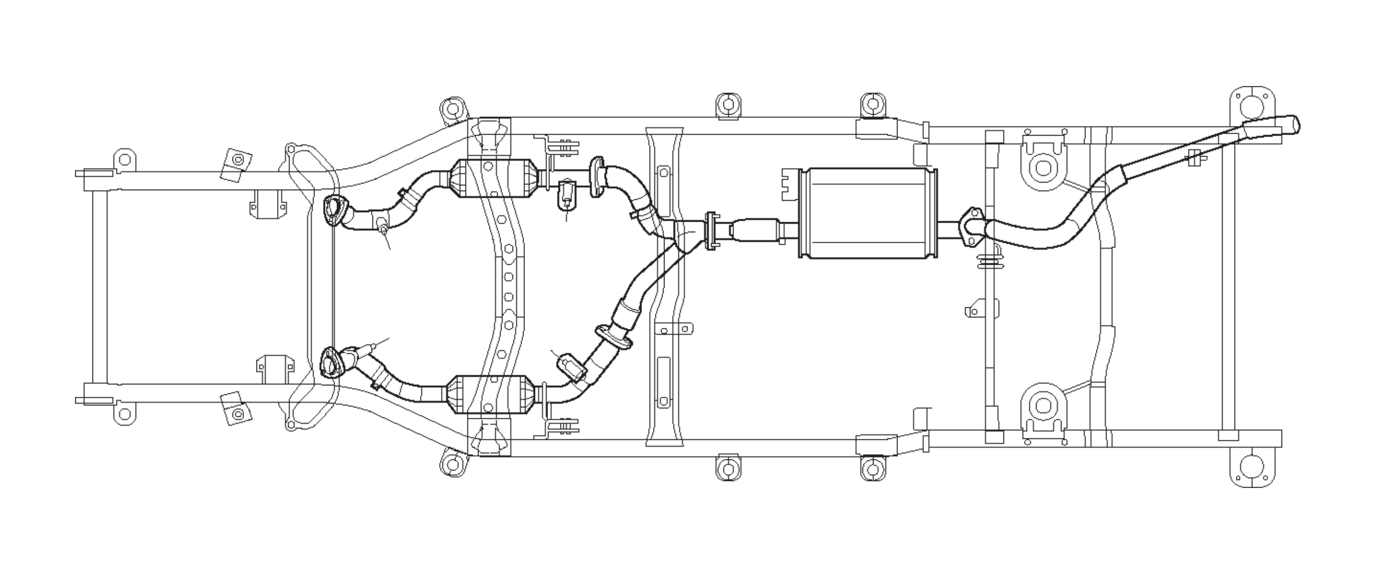
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description



150RW023

When inspecting or replacing exhaust system components, make sure there is adequate clearance from all points on the underbody to prevent overheating the floor pan and possible damage to the passenger compartment insulation and trim materials.

Check complete exhaust system and nearby body areas and rear compartment lid for broken, damaged, missing or mispositioned parts, open seams, holes, loose connections or other deterioration which could permit exhaust fumes to seep into the rear compartment or passenger compartment. Dust or water in the rear compartment may be an indication of a problem in one of these areas. Any faulty areas should be corrected immediately.

Hangers

Various types of hangers are used to support exhaust system(s). These include conventional rubber straps, rubber rings, and rubber blocks.

The installation of exhaust system supports is very important, as improperly installed supports can cause annoying vibrations which can be difficult to diagnose.

Three Way Catalytic Converter

The three way catalytic converter is an emission control device added to the exhaust system to reduce pollutants from the exhaust gas stream.

CAUTION: The catalytic converter requires the use of unleaded fuel only.

Periodic maintenance of the exhaust system is not required. If the vehicle is raised for other service, it is advisable to check the condition of the complete exhaust system.

A dual bed monolith catalytic converter is used in combination with three way catalytic converter.

Catalytic Converter Types:

Three way (Reduction/Oxidation) catalyst

The catalyst coating on the three way (reduction) converter contains platinum and rhodium which lowers the levels of nitrous oxide (NOx) as well as hydrocarbons (HC) and carbon monoxide (Co).

Gasket

The gasket must be replaced whenever a new exhaust pipe, muffler or catalytic converter is installed.

Disassembly

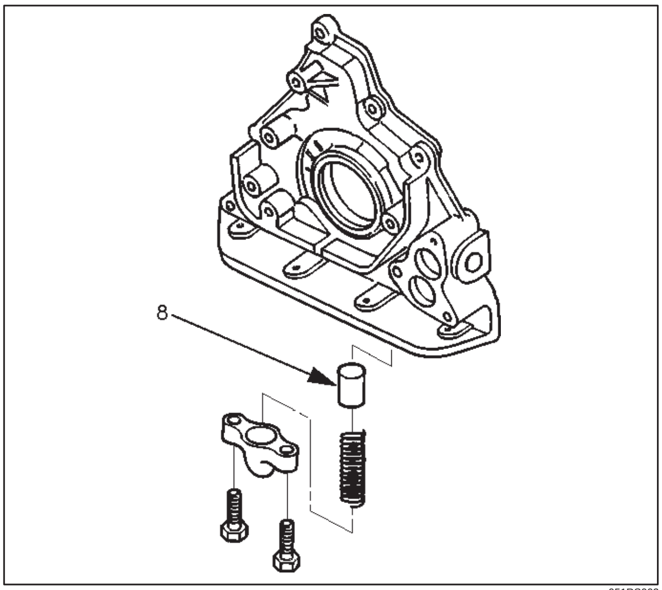
1. Remove crankshaft timing pulley.
2. Remove crankcase with oil pan.
3. Remove oil pipe.
4. Remove oil strainer.
5. Remove oil pump assembly.
6. Remove plug.
7. Remove spring.
8. Remove relief valve.
9. Remove oil pump cover.
10. Remove driven gear.
11. Remove drive gear.
12. Remove oil seal.
13. Remove O-ring.

Inspection and Repair

CAUTION: Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found during inspection.

Relief Valve (8)

- Check to see that the relief valve slides freely.
- The oil pump must be replaced if the relief valve does not slide freely.
- Replace the spring and/or the oil pump assembly (5) if the spring is damaged or badly worn.



051RS002

Body (14) and Gears (10, 11)

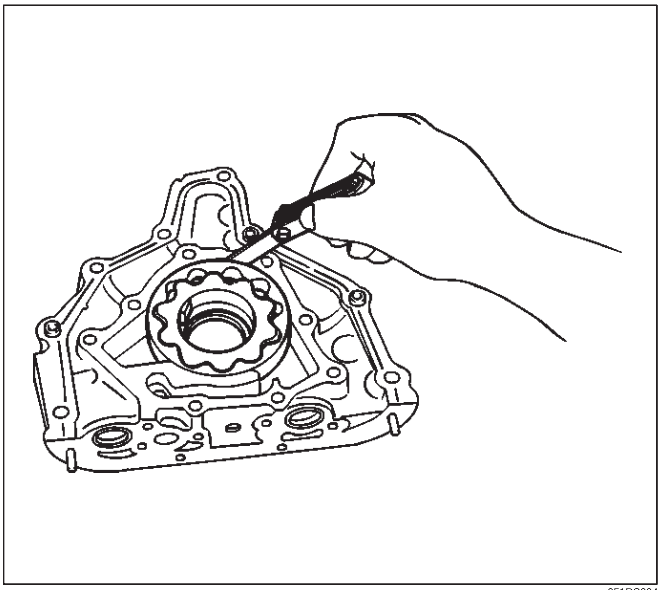
The pump assembly must be replaced if one or more of the conditions below is discovered during inspection.

- Badly worn or damaged driven gear (10).
- Badly worn drive gear (11) driving face.
- Badly scratched or scored body sliding face (14) or driven gear (10).
- Badly worn or damaged gear teeth.

Measure the clearance between the body and the driven gear with a feeler gauge.

Standard : 0.10 mm–0.18 mm (0.0039 in.–0.0070 in)

Limit : 0.20mm (0.0079 in)

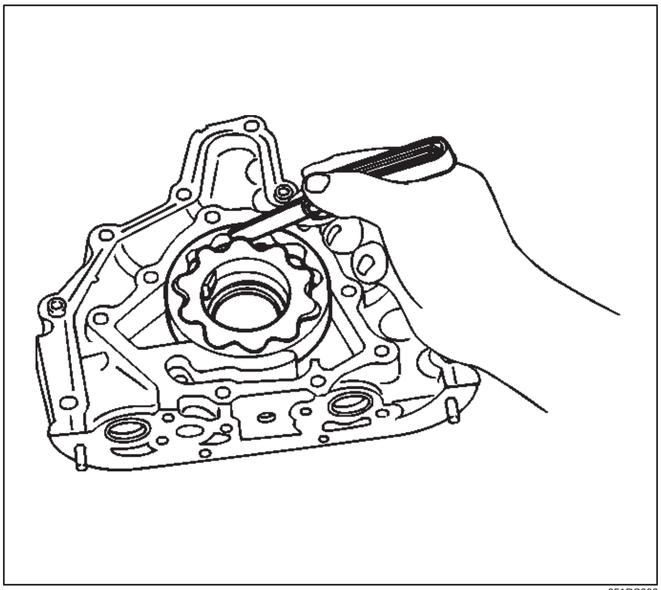


051RS004

- Measure the clearance between the drive gear and driven gear with a feeler gauge.

Standard : 0.11 mm–0.24 mm (0.0043 in–0.0094 in)

Limit : 0.35mm (0.0138 in)



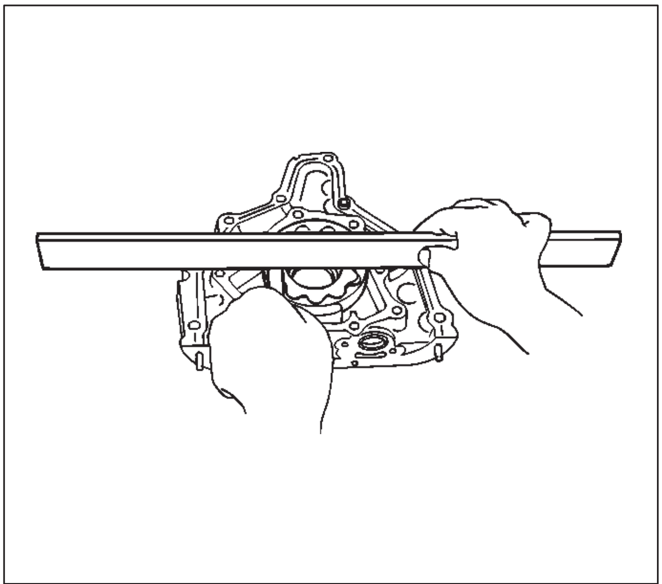
051RS003

- Measure the side clearance with a precision straight edge and a feeler gauge.

Clearance

Standard : 0.03 mm–0.09 mm (0.0011 in–0.0035 in)

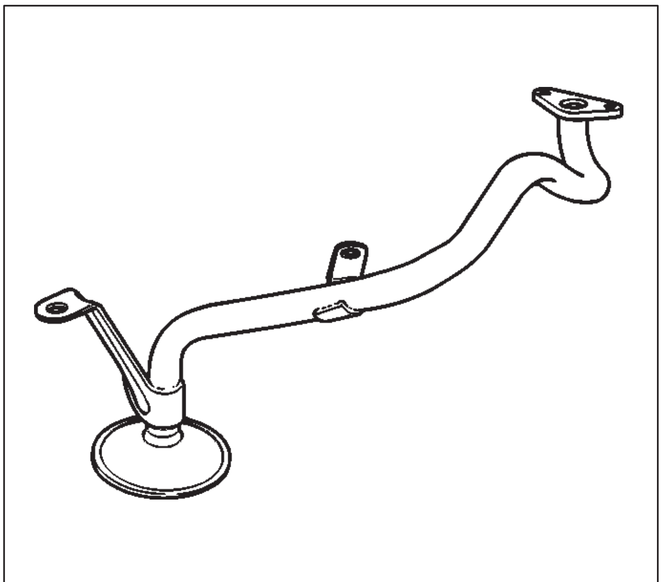
Limit : 0.15mm (0.0059 in)



051RS005

Oil Strainer

Check the oil strainer for cracking and scoring. If cracking and scoring are found, the oil strainer must be replaced.



051RS006

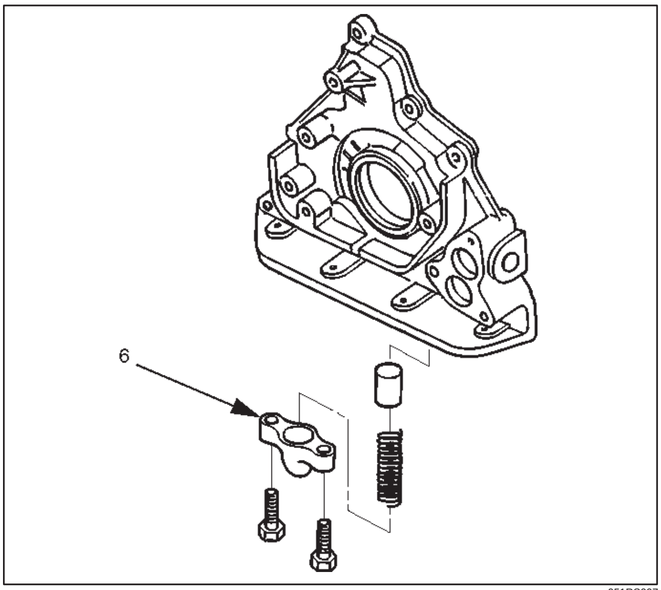
Reassembly

1. Install drive gear (11).
2. Install driven gear (10).
3. Install oil pump cover (9) and first, loosely tighten all of the attaching screws. Next, tighten the attaching screws to the specified torque.

   Torque : 10 N·m (89 lb in)

   After installation, check that the gear rotates smoothly.
4. Install relief valve (8) and apply engine oil to the relief valve and spring (7).
5. Install spring (7).
6. Install the plug (6).

   Torque : 8 N·m (69 lb in)



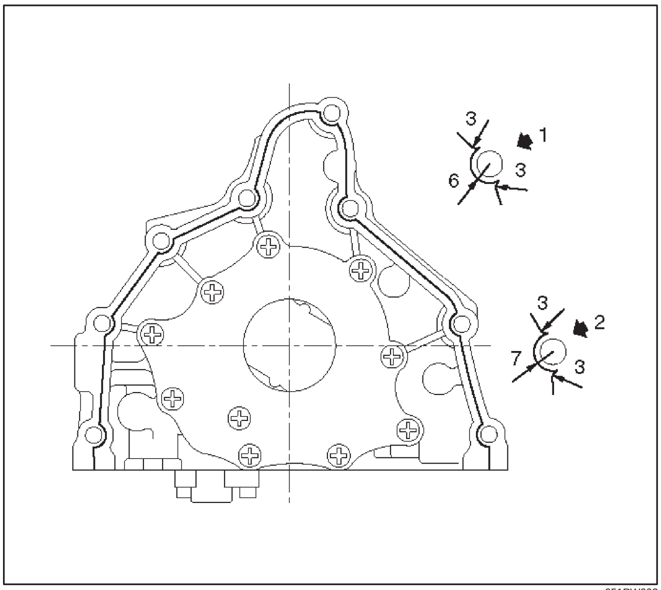
051RS007

7. Install oil pump assembly (5).
   - Carefully remove any oil from the cylinder body and the pump. Apply sealant (TB–1207B or equivalent) to the pump fitting face as shown in illustration. Take care that sealant is not applied to oil port surfaces. The oil pump assembly must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.

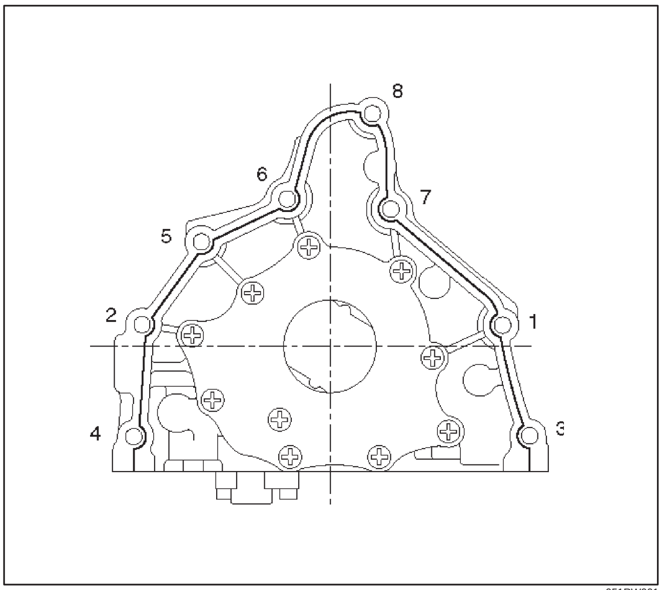
CAUTION: Do not apply an excessive amount of sealant to the contact surface. Applying too much sealant will overflow the contact surfaces. This could cause serious damage to the engine.

- **Attach oil pump assembly to cylinder body.**
- **Tighten the oil pump fixing bolts.**

Torque : 25 N·m (18 lb·ft)



051RW002

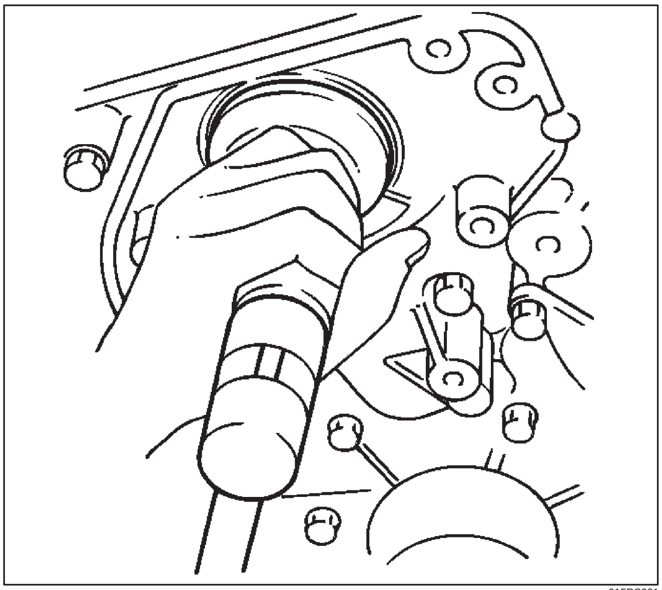


051RW001

Legend

(1) Around Bolt Holes
(2) Around Dowel Pin

8. Install the new oil seal (12). Apply engine oil to the oil seal lip before installation then use J–39202 oil seal Installer, install oil seal.



015RS001

9. Install oil strainer (4) with O-ring (13).

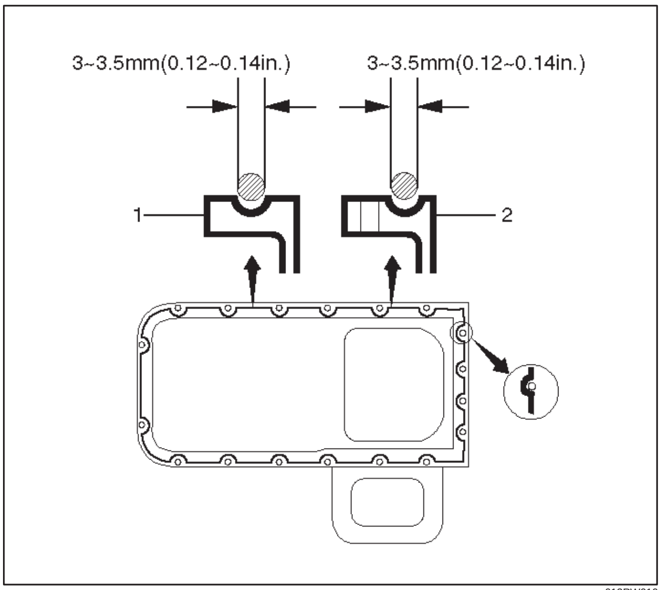
   Torque: 25 N·m (18 lb ft)

10. Install oil pipe (3) with O-ring (13).

    Torque: 25 N·m (18 lb ft)

11. Install crankcase with oil pan (2).
    - Remove oil on crankcase mounting surface and dry the surface.
    - Apply a proper 4.5 mm (0.7 in) wide bead of sealant (TB1207C or equivalent) to the crankcase mounting surface. The bead must be continuous.
    - The crankcase must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.
    - Tighten fixing bolts to the specified torque.

    Torque : 10 N·m (89 lb in)



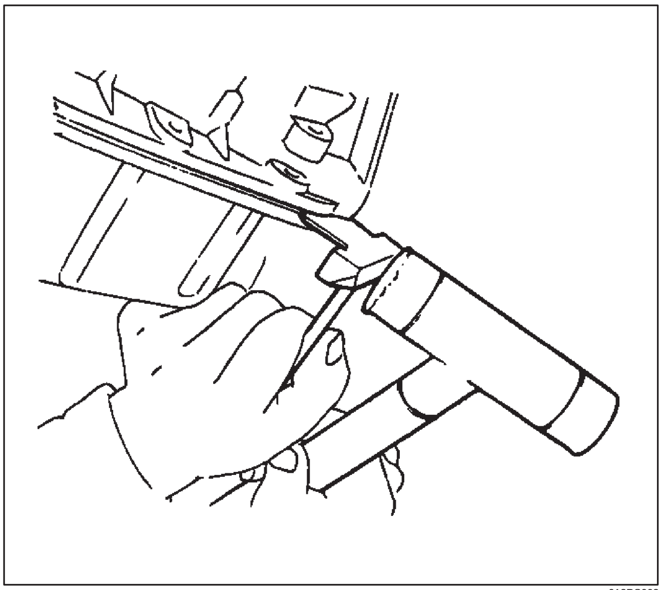
013RW010

12. Install crankshaft timing pulley.

Oil Pan and Crankcase

Removal

1. Disconnect battery ground cable.
2. Lift vehicle by supporting the frame.
3. Remove under cover.
4. Drain engine oil.
5. Remove front wheels.
6. Remove oil level dipstick from level gauge tube.
7. Remove radiator under fan shroud.
8. Remove shift on the fly from axle housing.
9. Remove suspension cross member fixing bolts, 2 pcs each per side and remove suspension cross member.
10. Remove axle housing assembly four fixing bolts from housing isolator side and mounting bolts from wheel side. At this time support the axle with a garage jack and remove axle housing assembly. (for 4×4)
11. Remove the steering unit assembly.
12. Remove starter fixing bolts.
13. Remove oil pan fixing bolts.
14. Remove oil pan, using J-37228 sealer cutter, remove oil pan.

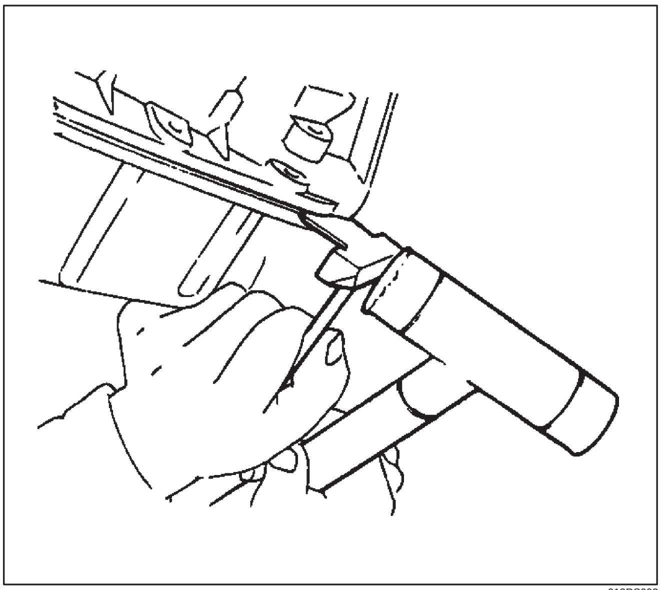


013RS003

15. Remove crankcase fixing bolts.
16. Remove crankcase, using J-37228 sealer cutter, remove crankcase.

NOTE: Do not deform or damage the flange of oil pan and crankcase.

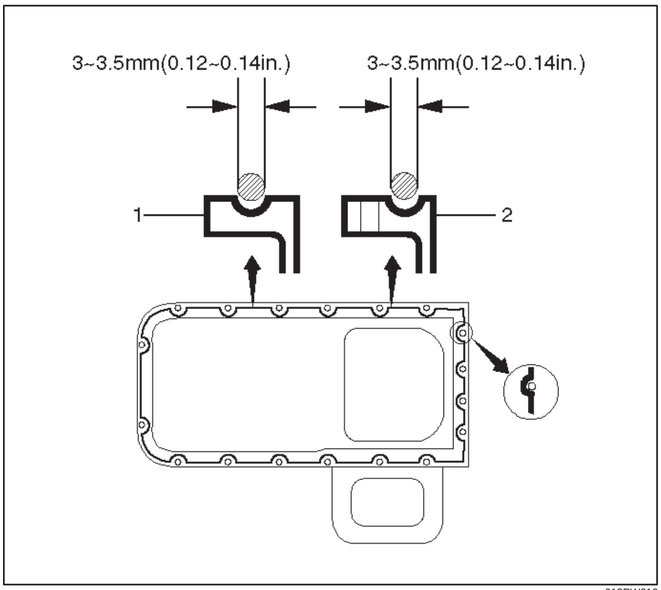
Replace the oil pan and/or crankcase if deformed or damaged.



013RS003

Installation

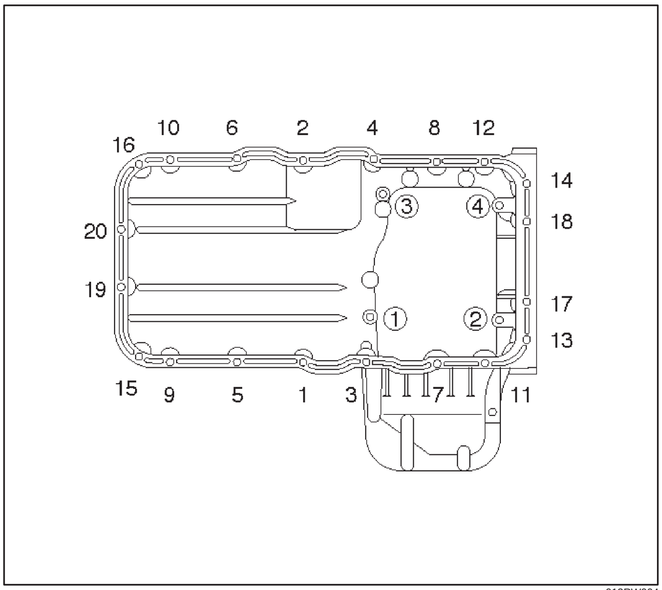
1. Install crankcase.
   A. Remove residual sealant, lubricant and moisture from mounting surface, then dry thoroughly.
   B. Properly apply a 4.5 mm (0.7 in) wide bead of sealant (TB-1207C or equivalent) to mounting surface of crankcase.
   Sealant bead must be continuous.
   - The crankcase must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.



013RW010

C. Install crankcase, tighten crankcase fixing bolts to the specified torque.

Torque : 10 N·m (89 lb in)



013RW004

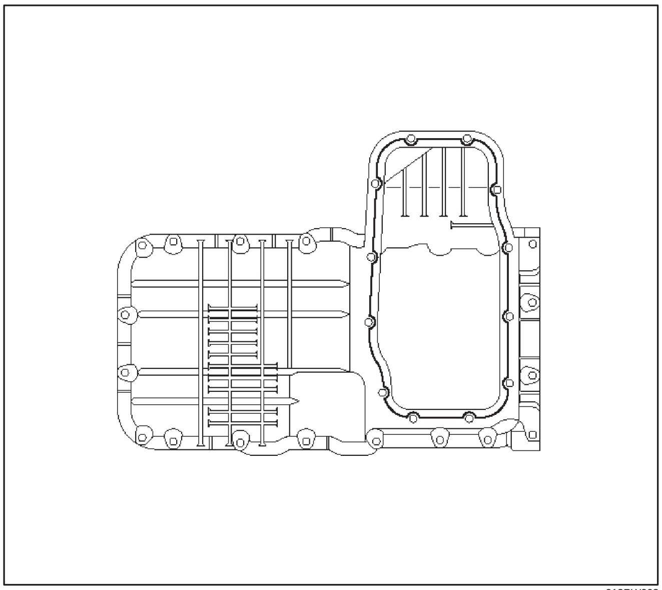
2. Install oil pan

A. Remove residual sealant, lubricant and moisture from mounting surface, then dry thoroughly.

B. Properly apply a 4.5 mm (07 in) wide bead of sealant (TB-1207C or equivalent) to mounting surface of oil pan.

Sealant beat must be continuous.

- The crankcase must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.



013RW003

C. Install oil pan, tighten oil pan fixing bolts to the specified torque.

Torque : 10 N·m (89 lb in)

3. Install starter and tighten fixing bolts.

Torque: 40 N·m (30 lb ft)

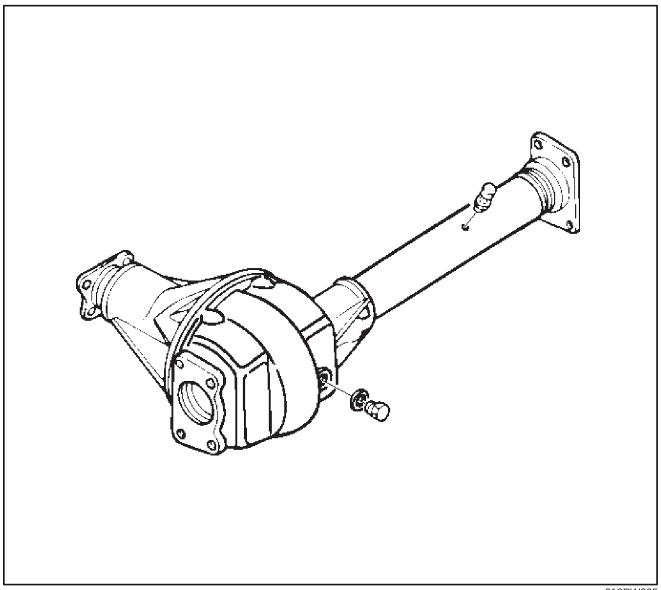
4. Install axle housing assembly and tighten fixing bolts to the specified torque. (for 4×4)

Axle case bolts

Torque : 82 N·m (60 lb ft)

Mounting bolts

Torque : 152 N·m (112 lb ft)



013RW005

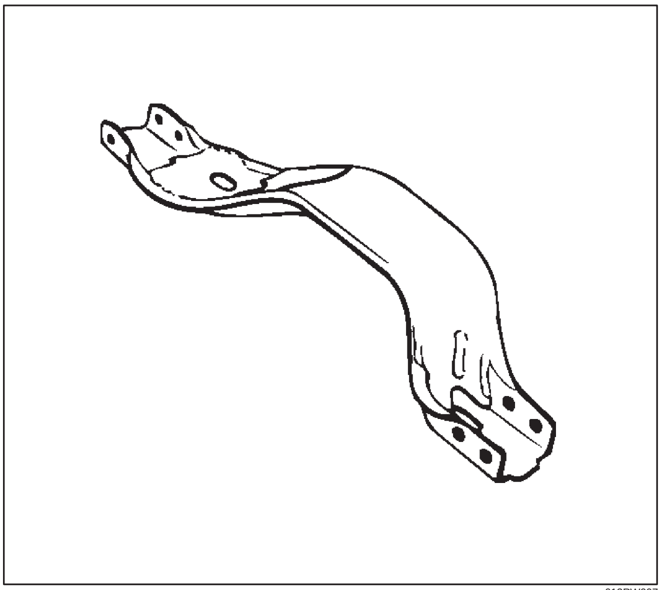
5. Install the shift on the fly.

6. Install relay lever assembly and tighten fixing bolts.

Torque: 44 N·m (32 lb ft)

7. Install suspension cross member and tighten fixing bolts to the specified torque.

Torque : 78 N·m (58 lb ft)



013RW007

8. Install radiator under fan shroud.

9. Install under cover.

10. Install engine oil level dipstick.

11. Fill engine oil until full level on engine oil gauge dipstick.

Oil Pump

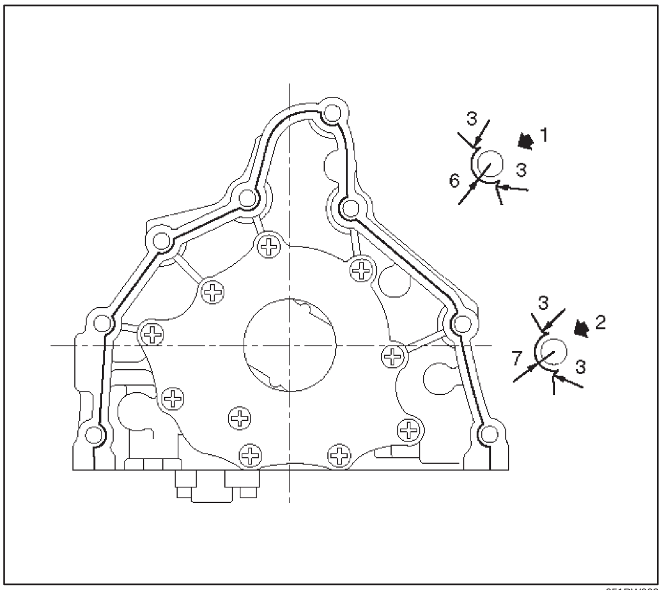
Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove crankcase assembly.
   - Refer to removal procedure for Oil Pan and Crankcase in this manual.
4. Remove crankshaft pulley.
   - Refer to removal procedure for Crankshaft Pulley in this manual.
5. Remove timing belt.
   - Refer to removal procedure for Timing Belt in this manual.
6. Remove timing pulley from crankshaft.
7. Remove four fixing bolts from oil filter assembly.
8. Remove oil strainer fixing bolts, remove oil strainer assembly with O-ring.
9. Remove three bolts from oil pipe and O-ring.
10. Remove eight oil pump fixing bolts, then oil pump assembly.
11. Remove sealant from mounting surface of oil pump assembly, cylinder block and take care not to damage mounting surfaces of oil pump and cylinder block.

Installation

1. Install oil pump assembly
   - Apply sealant (TB-1207B or equivalent) to the oil pump mounting surfaces as shown in the illustration.
   - The oil pump assembly must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.

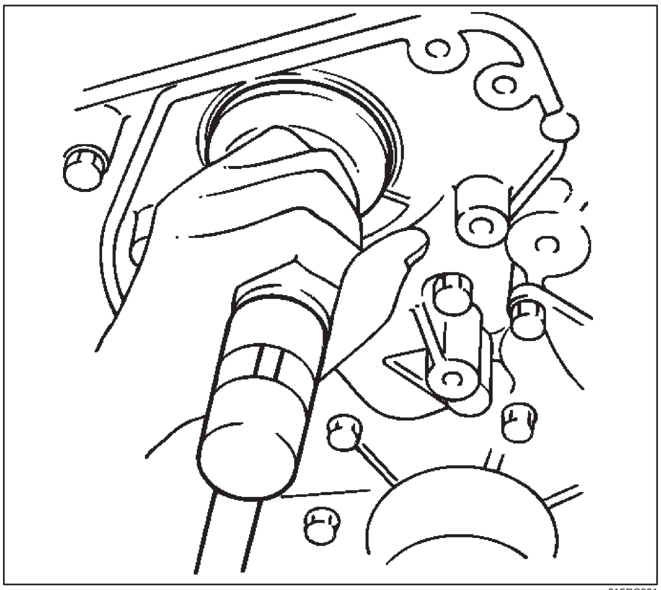
NOTE: Do not apply sealant to the oil ports.



051RW002

- Use J-39202 installer when installing new oil seal.
- Apply engine oil to oil seal lip.
- Install oil pump assembly to the cylinder block.

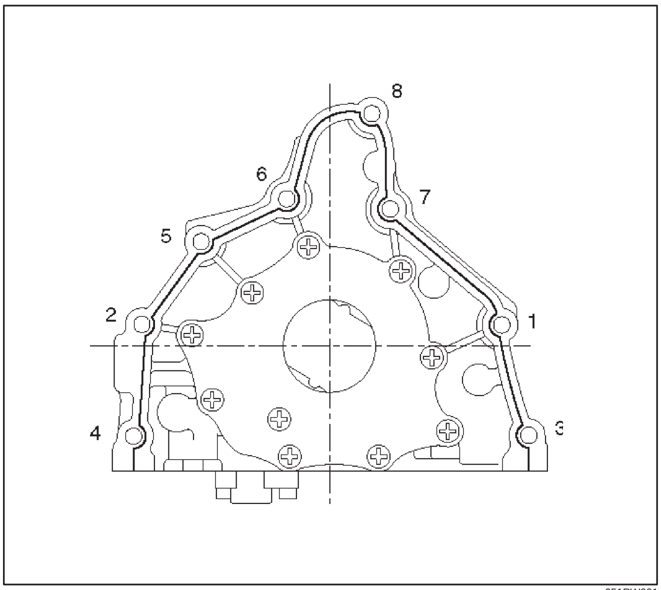
NOTE: Do not damage oil seal during installation of oil pump assembly.



015RS001

- Tighten fixing bolts to the specified torque.

Torque : 25 N·m (18 lb ft)



051RW001

2. Install oil pipe with O-ring, tighten fixing bolt to the specified torque.

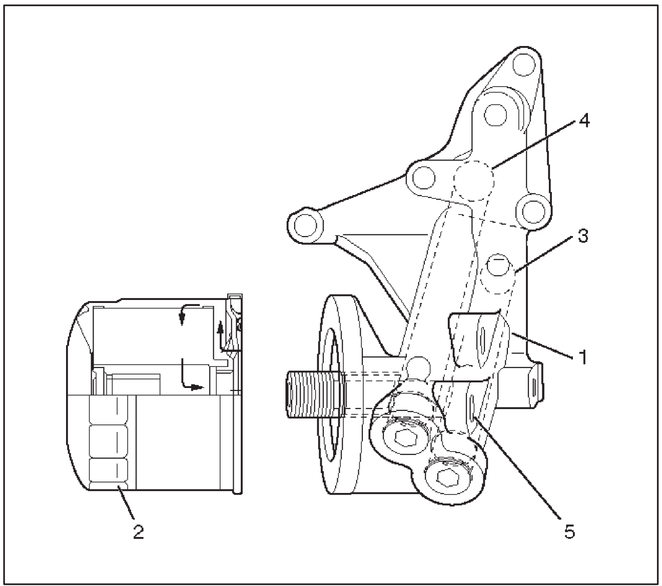
Torque : 10 N·m (89 lb in)

3. Install oil strainer with O-ring, tighten fixing bolt to the specified torque.

Torque : 25 N·m (18 lb ft)

4. Install oil filter assembly and tighten bolts to the specified torque.

Torque : 25 N·m (18 lb ft)



050RW001

Legend

(1) Oil Pump
(2) Oil Filter
(3) Oil Gallery
(4) From Oil Filter
(5) To Oil Filter

5. Install timing pulley on crankshaft.
   Install timing belt.
   - Refer to installation procedure for Timing Belt in this manual.
6. Install crankshaft pulley.
   - Refer to install procedure for Crankshaft Pulley in this manual.
7. Install crankcase assembly.
   - Refer to installation procedure for Oil Pan and Crankcase in this manual.
8. Refill engine oil until full level on engine oil dipstick.

Oil Pump Oil Seal

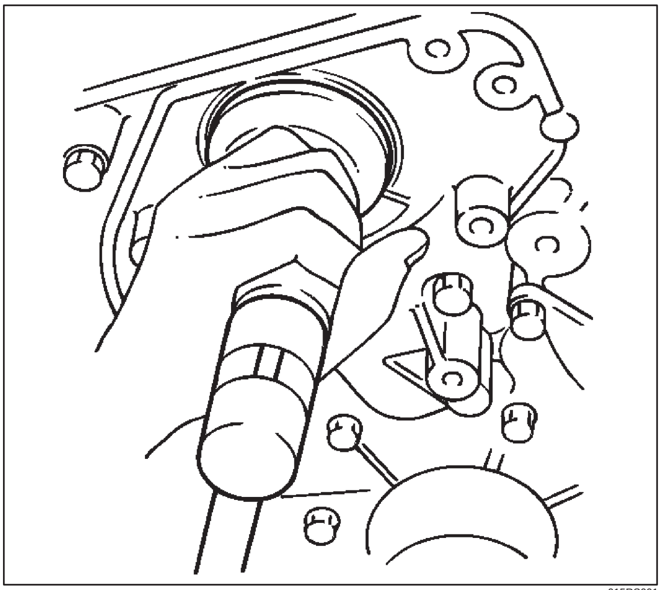
Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove crankshaft pulley.
   - Refer to removal procedure for Crankshaft Pulley in this manual.
4. Remove timing belt.
   - Refer to removal procedure for Timing Belt in this manual.
5. Remove timing pulley from crankshaft.
6. Remove oil pump oil seal using a sealer puller.

NOTE: Take care not to damage sealing surfaces of oil pump and crankshaft when removing oil seal.

Installation

1. Install oil pump oil seal, apply engine oil to oil seal lip, then install oil seal using J-39202 installer.



015RS001

2. Install timing pulley to crankshaft.
3. Install timing belt.
   - Refer to installation procedure for Timing Belt in this manual.
4. Install crankshaft pulley.
   - Refer to installation procedure for CRANKSHAFT PULLEY in this manual.
5. Refill engine oil until full level.

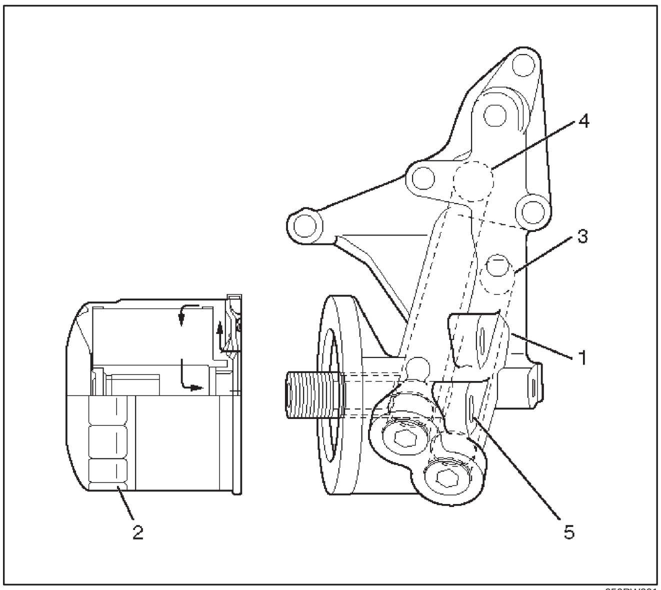
Oil Filter

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove oil filter using J-36390 filter wrench.

Installation

1. Clean filter fitting surface and apply small amount of engine oil to sealing surface.
2. Install oil filter cartridge by hand until it comes in contact with sealing surface then rotate additional 2/3 turn to tighten using J-36390 filter wrench.



Legend

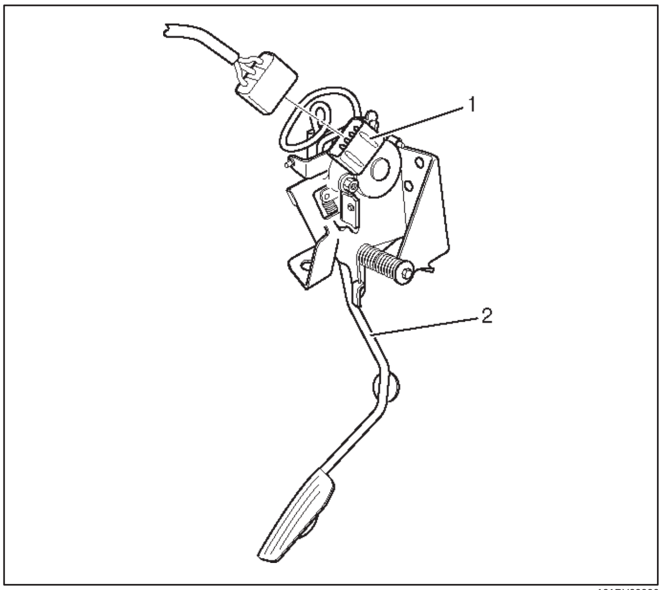
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Accelerator Pedal

Accelerator Pedal and Associated Parts



Legend

(1) Accelerator Position Sensor
(2) Accelerator Pedal Assembly

Removal

1. Disconnect battery ground cable.
2. Disconnect Accelerator position (AP) sensor (1) connector from Accelerator pedal assembly.
3. Remove Accelerator pedal assembly (2).

Installation

1. Install Accelerator pedal assembly (2).
2. Connect AP sensor (1) harness connector.
3. Connect battery ground cable.

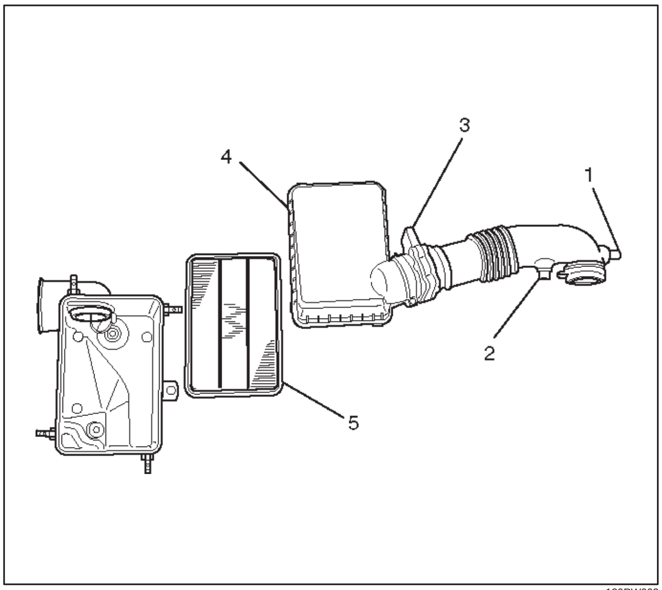
Air Cleaner Element

Removal

1. Remove positive ventilation hose connector(1).
2. Remove intake air temperature sensor(2).
3. Remove air flow sensor(3).
4. Remove air cleaner duct assembly(4).
5. Remove air cleaner element(5).



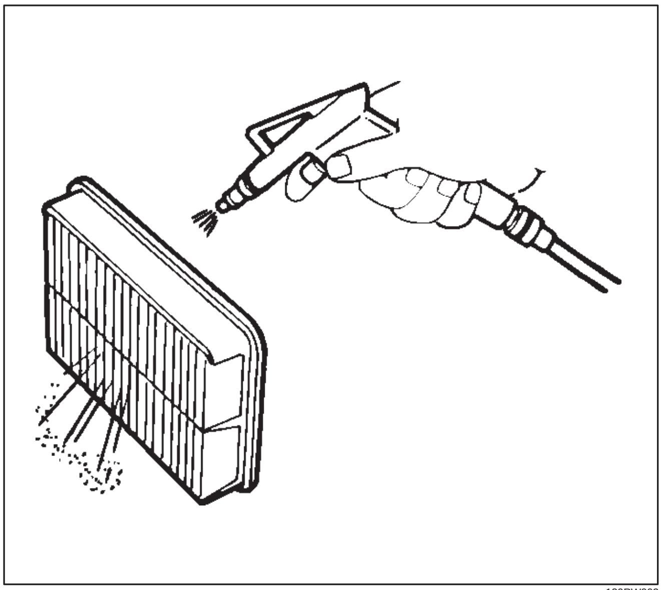
130RW003

Inspection

Check the air cleaner filter for damage or dust clogging. Replace if it is damaged, or clean if it is clogged.

Cleaning Method

Tap the air cleaner filter gently so as not to damage the paper filter, or clean the element by blowing with compressed air of about 490 kPa (71 psi) from the clean side if it is extremely dirty.



130RW002

Installation

1. Install air cleaner element(5).
2. Attach the mass air cleaner duct cover to the body completely, then clamp it with the clip(4).
3. Install air flow sensor(3).
4. Install air temprature sensor(2).
5. Install positive crankcase ventilation hose connector(1).

C07RT010

Normal Operation of 2000 4L30–E Transmission

Torque Converter Clutch (TCC) Application Conditions:

The TCC is normally applied in 2nd, 3rd and 4th gears only when all of the following conditions exist:

— The engine coolant temperature is above 70°C (158°F).

— The brake pedal is released.

— The shift pattern requests TCC apply.

Moreover, TCC is always applied in 2nd, 3rd and 4th gears when the transmission oil temperature is above 135°C (275°F).

This mode should be canceled at 125°C (257°F).

ATF Warning Lamp

The ATF warning lamp will be constantly on (not flashing) if the transmission oil temperature is above 145°C (293°F).

The ATF warning lamp goes off again when the transmission oil temperature is below 125°C (257°F).

Reverse Lock Out

With the selector lever in reverse position, the PCM will not close the PWM solenoid until the vehicle is below 15 km/h (9.3 mph), thus preventing reverse engagement above this speed.

Diagnosis

Introduction

The systematic troubleshooting information covered by this Section offers a practical and systematic approach to diagnosing 4L30–E transmission, using information that can be obtained from road tests, electrical diagnosis, oil pressure checks or noise evaluation.

The key to correcting a complaint is to make use of all of the available symptoms and logically letting them direct you to the cause.

When dealing with automatic transmission complaints, it is best to gather as many symptoms as possible before making the decision to remove the transmission from the vehicle.

Frequently, the correction of the complaint does not require removal of the transmission from the vehicle.

Driver Information

To analyze the problem fill out a complete description of the owner’s complaint.

Please draw a circle around the right information and complete the following form. (The next page is an example of a completed form.)You can draw a circle around many numbers if you are not sure.

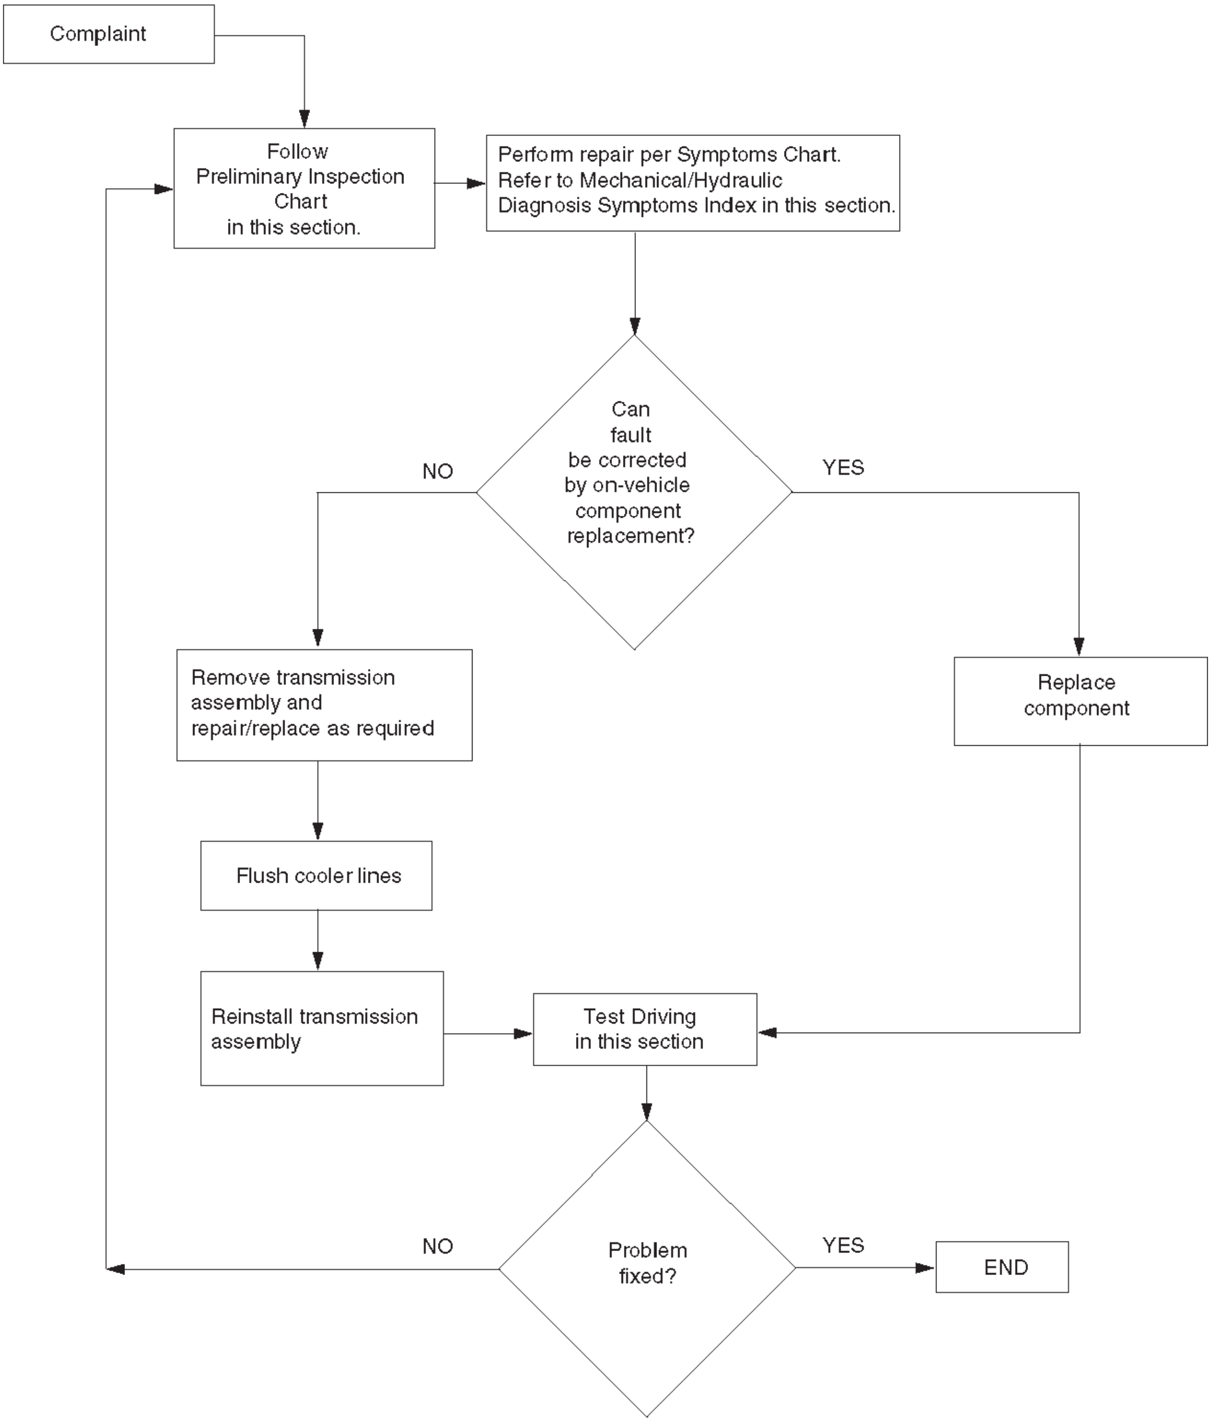
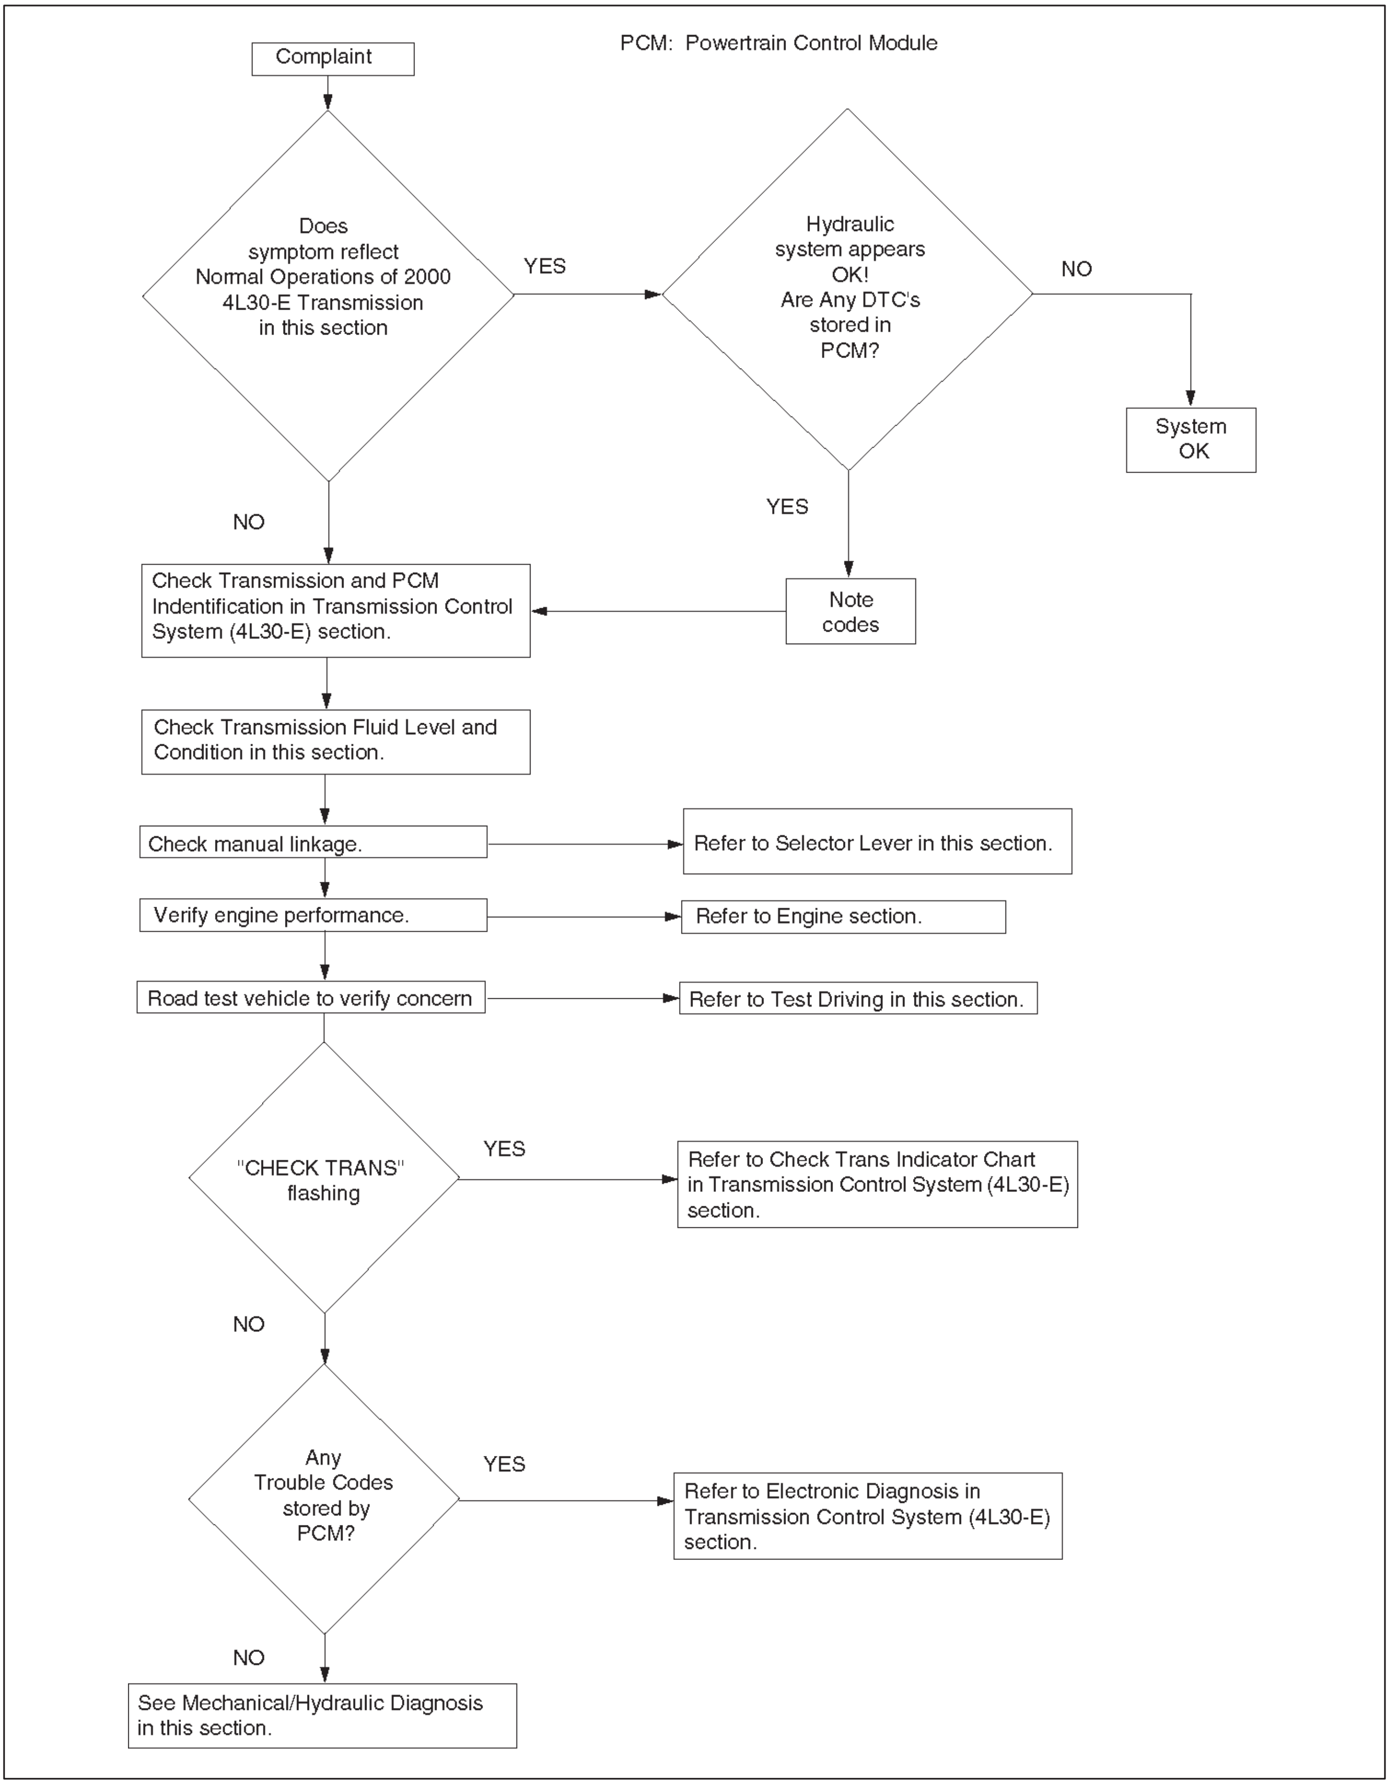
F07RT037

General Diagnosis Procedure



F07RT038

Preliminary Inspection Chart



F07RY00001

Checking Transmission Fluid Level and Condition

Checking fluid level and condition (color and odor) at regular intervals will provide early diagnosis information about the transmission. This information may be used to correct a condition that, if not detected early, could result in major transmission repairs.

IMPORTANT: When new, automatic transmission fluid is red in color. As the vehicle is driven, the transmission fluid will begin to look darker in color. The color may eventually appear light brown.

A dark brown color with burnt odor may indicate excessive fluid deterioration and signal a need for fluid change.

Fluid Level

When adding or changing fluid, use only DEXRON ®–III. Refer to Maintenance and Lubrication in General Information section for maintenance information and servicing interval.

CAUTION: DO NOT OVERFILL.

Overfilling will cause foaming, loss of fluid, abnormal shifting and possible damage to the transmission.

1. Park the vehicle on level ground and apply the parking brake firmly.
2. Check fluid level with engine running at idle.

NOTE: Be sure that transmission fluid temperature is below 30˚C (86˚F).

3. Move the selector lever through all gear ranges.
4. Move the selector lever to “Park”.
5. Let engine idle for 3 minutes and open the overfill screw (1).
6. Add released transmission fluid until it flows out over the overfill screw opening.
7. Let engine idle until a fluid temperature between 32˚C (90˚F) and 57˚C (135˚F) is reached, then close the overfill screw (1).

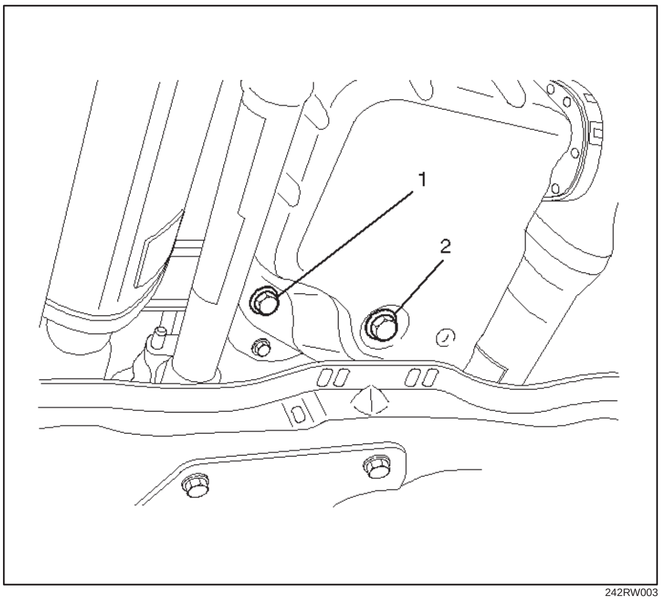
Torque: 38 N•m (28 lb ft)

NOTE: To prevent fluid leaks, the overfill screw and oil drain screws gasket must be replaced each time these screws are removed.

NOTE: Check transmission fluid temperature with scan tool.

Minimum fluid level → 57˚C (135˚F)

Maximum fluid level → 32˚C (90˚F)



CAUTION: Do not open overfill screw with engine stopped.

CAUTION: DO NOT CHECK FLUID LEVEL UNDER THESE CONDITIONS:

- Immediately after driving at sustained highway speeds.
- In heavy city traffic during hot weather.
- If vehicle is towing a trailer.

If the vehicle has been operated under these conditions, shut the engine off and allow the vehicle to “cool” for thirty (30) minutes. After the cool down period, restart the vehicle and continue from step 2 above.

Fluid Condition

	FLUID CONDITION			
	NORMAL*		CONTAMINATED	
COLOR	RED OR LIGHT BROWN	BROWN	NON–TRANSPARENT / PINK	BROWN
DRAIN REQUIRED?	NO	YES	YES	YES
CONTAMI-NATION	NONE	Very small amount of foreign material in bottom of pan	Contamination by coolant or other source	Large pieces of metal or other foreign material in bottom of pan
CORRECT LEVEL AND CONDITION	1. LOW LEVEL: A. Add fluid to obtain proper level & check for external leaks. B. Correct cause of leak. 2. HIGH LEVEL: – Remove excess fluid	– Remove both pans – Change filter – Flush cooler – Add new fluid – Check level	– Repair/replace radiator cooler – Transmission overhaul required – Check for: ● Damaged plates and seals ● Contaminated solenoids – Flush cooler – Add new fluid – Check level	– Transmission overhaul required – Flush cooler and cooler lines – Add new fluid – Check level

*Fluid should be changed according to maintenance schedule.

Test Driving

Some 4L30–E automatic transmission complaints will require a test drive as a part of the diagnostic procedure. Some codes will not set unless the vehicle is moving. The purpose of the test drive is to duplicate the customer's complaint condition and set a current Powertrain Control Module (PCM) trouble code. Perform this procedure before each 4L30–E automatic transmission repair, and again after repairs are made.

IMPORTANT:

- Duplicate the condition under which the customer's complaint was observed.
- Depending on the complaint, the line pressure gauge and the scan tool may be required during the test drive.
- During the test drive, it is important to record all necessary data from the areas being monitored, for use in diagnosis. Also listen for and note any unusual noises.

The following procedure should be used to test drive 4L30–E automatic transmission complaint vehicles:

1. Turn the ignition ON without starting the engine. Check that the "CHECK TRANS" lamp comes on for approximately 2 seconds and then goes out and remains out.
   - If the lamp is flashing, GOTO Check Trans Indicator in Transmission Control System (4L30–E) section.
   - If no serial data is present, GOTO OBD System Check. Refer to Driveability and Emissions in Engine section.
   - If the lamp stays ON or stays OFF, GOTO "Check Trans" Check in Transmission Control System (4L30–E) section.
2. Drive the vehicle. During the test drive, be sure that the transmission achieves normal operating temperature (approx. 20 minutes).
   Allow the transmission to go through all of its gear ranges, checking shift timing and firmness. Duplicate the owner's complaint condition as closely as possible during the test drive.
3. If, during the test drive, the "CHECK TRANS" lamp comes on, use the scan tool to check for trouble codes.
4. If, during the test drive, a problem is felt, but the "CHECK TRANS" lamp does not come on and no trouble codes are present, drive the vehicle with the PCM disconnected (manually shifting the vehicle).
   - In Manual L, the vehicle operates in first gear.
   - In Manual 2, the vehicle operates in third gear.
   - In Manual 3 or "D", the vehicle operates in fourth gear.
   If the problem still exists with the PCM disconnected, refer to Mechanical/Hydraulic Diagnosis in this section.
5. If no problem has been found at this point, check all underhood connections that supply power to the PCM and ignition fuses. Physically and visually inspect all the PCM harness connectors for loose or corroded terminals. Inspect the PCM ground points.

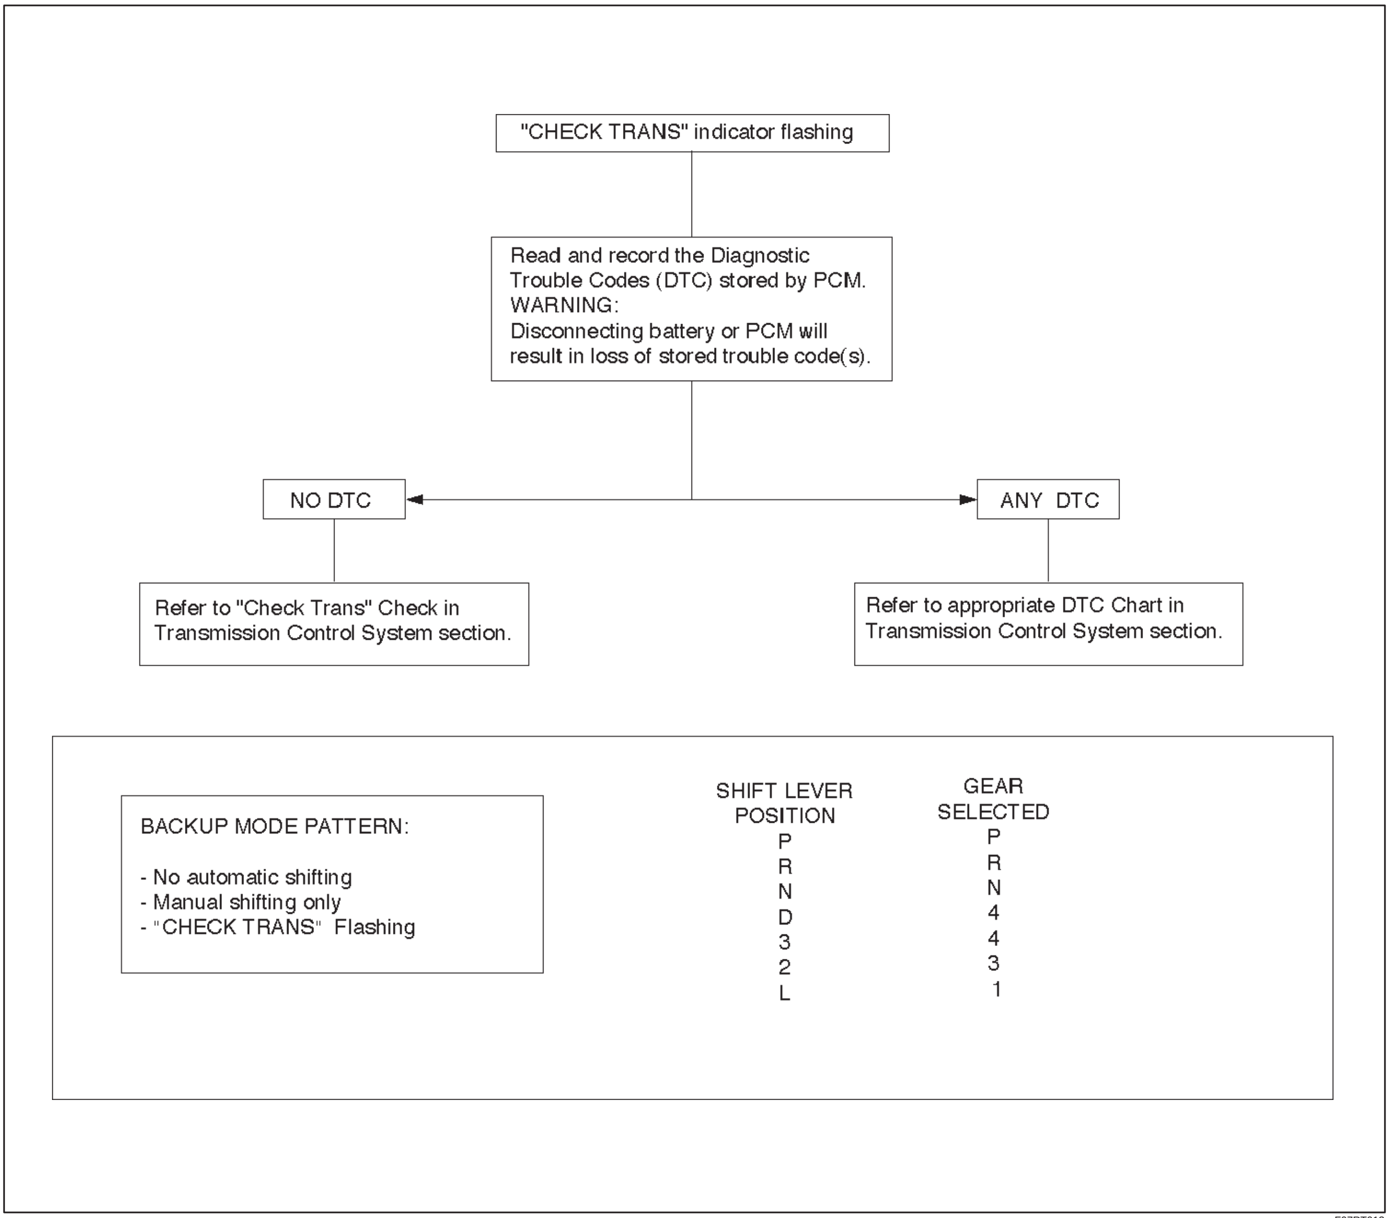
Mechanical / Hydraulic Diagnosis Check Trans Indicator Chart

Perform Preliminary Inspection First!

When the “CHECK TRANS” indicator is flashing, it indicates that a problem related to the transmission, the Powertrain Control Module (PCM), or the vehicle harness has occurred.

The system is now operating in a “BACKUP MODE” where the risk of further damaging the transmission has been reduced. The vehicle may be shifted manually.

If the initial problem is intermittent or seldom, switching the engine OFF/ON might allow normal operation again until the problem reoccurs.



F07RT013

Mechanical / Hydraulic Diagnosis Symptoms Index

Perform Preliminary Inspection First!

CHART	SYMPTOMS
1	NO ENGINE START IN NEUTRAL OR PARK
2	NO FORWARD GEARS IN ANY RANGE/NO REVERSE
3	NO ENGINE BRAKE IN ANY RANGE
4	POOR SHIFTING IN ALL GEARS (ALL HARSH OR ALL SOFT)
5a	DELAYS IN DRIVE AND REVERSE
5b	DELAYS IN REVERSE ONLY
6	DIAGNOSTIC TROUBLE CODE (DTC) P0730
7	HARSH 1–2 SHIFT
8	HARSH 3–4 SHIFT
9a	3–2 DOWNSHIFT COMPLAINT
9b	HARSH SHIFT WHEN SHIFTING INTO “D” OR ACCELERATING FROM STOP
9c	COASTDOWN HARSH SHIFT OR CLUNK AT 3–2 DOWNSHIFT
10	INTERMITTENT 4TH TO 2ND GEAR DOWNSHIFT AT STEADY SPEED
11	ENGINE FLARE AT SHIFTING DURING TURNING ONLY (USUALLY WITH WARM ENGINE)
12	ENGINE FLARE DURING 1–2 OR 2–3 SHIFT
13	SHUDDER ONLY DURING TORQUE CONVERTER CLUTCH (TCC) APPLYING
14	POSSIBLE CAUSES OF TRANSMISSION NOISE
15a	POSSIBLE CAUSES OF LOW LINE PRESSURE
15b	POSSIBLE CAUSES OF HIGH LINE PRESSURE
16	POSSIBLE CAUSES OF TRANSMISSION FLUID LEAKS

NOTE: Numbers with parenthesis on the following charts refer to Parts List at end of this section.

Chart 1: No Engine Start In Neutral Or Park

Step	Action	Yes	No
1	Does engine start when shift lever moved from drive to neutral mostly in hot condition?	Go to Step 2	Go to Step 3
2	Does engine start in park at any condition?	Re–test vehicle	Go to Step 4
3	Does engine also not start in neutral when shift lever moved from park to neutral?	Go to Step 4	Go to Step 5
4	Check mode switch (63) setting. Readjust if necessary. Problems fixed?	Re–test vehicle	Go to Step 5
5	Check start circuit of mode switch (63) open in neutral. Was open found?	Locate and repair open(s).	Replace mode switch (63).

Chart 2: No Forward Gears In Any Range/No Reverse

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	1. Check internal linkage: – Manual linkage (58) not moving manual valve (326). 2. Check for internal mechanical damage: – Turbine shaft (506) broken loose. – Overrun roller clutch (516) broken loose. Was the problem found?	Repair or replace	—

Chart 3: No Engine Brake In Any Range

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	1. Check for overrun clutch leaks caused by: – Damaged piston lip (513) – Check ball defective (504) 2. Check for overrun lockout valve (705) stuck by foreign material. 3. Check for leaks at turbine shaft (506) caused by: – Teflon seal rings damaged (508) – Excessive wear of turbine shaft bearing surfaces. Was the problem found?	Repair or replace	—

Chart 4: Poor Shifting In All Gears (All Harsh Or All Soft)

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Go to Step 3
2	1. Check for these conditions which could affect clutch apply time: – Defective band apply solenoid (323). – Defective servo or/and accumulator piston. – Excessive clutch piston travel. 2. Check of possible causes of internal leaks: – Cut or damaged sealing ring(s) – Damaged sealing gasket(s) – Check ball missing or out of location in 2nd and 3rd clutch pistons. 3. Check for causes of burned clutch plates or band. Was the problem found?	Repair or replace	—
3	Was the line pressure high?	Go to Step 4	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
4	Does DTC P0705 set?	Diagnose those DTC(s) first.	Use Chart 15b: Possible Causes of High Line Pressure in this section.

Chart 5a: Delays In Drive and Reverse

NOTE: A short delay (less than 3 seconds) when first engaging drive or reverse after allowing vehicle to sit overnight is normal.

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	More than 3 second delay in drive and reverse with engine off 1 hour or less. Teflon seals (508) on turbine shaft damaged. Repair	Use Chart 15a: Possible Causes of Low Line Pressure in this section.

Chart 5b: Delays In Reverse Only

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	Main case valve body gasket (88) damaged. – Reverse check ball (85) in valve body (84) missing or out of location. – Check for restrictions at valve body transfer plate orifice. Was the problem found?	Repair	—

Chart 6: Diagnostic Trouble Code (DTC) P0730

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	1. 1st and 2nd gear missing or 3rd and 4th gear missing. Check appropriate shift valve. If OK replace solenoid. 2. No engine brake in any range (All ranges in Drive and Reverse are OK) Check for suspected conditions modifying delays to clutch apply: – Overrun clutch seal damaged. – Excessive overrun clutch piston travel. – Defective 3–4 accumulator piston. – Causes of internal leaks. – Causes of burned clutch plates. 3. 1st and 4th gear missing or 2nd and 3rd gear missing. Shift solenoid A stuck. Replace shift solenoid A. 4. DTC P0730 is set in D range 1st gear above 3500 rpm. Go to Step 3. 5. DTC P0730 is set in D range 3rd gear between 55-80 mph. NOTE: Perform this test within safe and legal limits. Check for suspected conditions modifying delays to clutch apply: – 4th clutch seal damaged. – Excessive 4th clutch piston travel. – Defective 3–4 accumulator piston. – Causes of internal leaks. – Causes of burned clutch plates. Was the problem found?	Repair or replace	—
3	Check 3rd gear in “D” in winter mode. Does vehicle move?	Shift solenoid A stuck. Replace shift solenoid A.	Go to Step 4
4	Check for suspected conditions modifying delays to clutch apply: – 2nd clutch seal damaged. – Excessive 2nd clutch piston travel. – Defective accumulator piston. – Causes of internal leaks. – Check ball missing or out of location in 2nd clutch. – Seals cut, damaged or missing. – Gaskets defective. – Causes of burned clutch plates. Was the problem found?	Repair or replace	—

Chart 7: Harsh 1–2 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Check for 1–2 accumulator valve (320) stuck by foreign material in main case valve body.	Use Chart 15b: Possible Causes of High Line Pressure in this section.

Chart 8: Harsh 3–4 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	1. Check for 3–4 accumulator valve (407) stuck in adapter case valve body (401). 2. Check for 3–4 accumulator piston (18) stuck in adapter case (20). Was the problem found?	Repair or replace	—

Chart 9a: 3–2 Downshift Complaint

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	Does DTC P1850 set?	Diagnose P1850 first.	Replace band apply solenoid (PWM) (323).

Chart 9b: Harsh Shift When Shifting Into “D” Or Accelerating From Stop

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	Does DTC P1850 set?	Diagnose P1850 first.	Replace band apply solenoid (PWM) (323).

Chart 9c: Coastdown Harsh Shift Or Clunk At 3–2 Downshift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	Does DTC P1850 set?	Diagnose P1850 first.	Replace band apply solenoid (PWM) (323).

Chart 10: Intermittent 4TH TO 2ND Gear Downshift At Steady Speed

Step	Action	Yes	No
1	Check for consistent speed sensor reading with scan tool. Was the reading correct?	Replace mode switch for intermittent contact.	Go to Step 2
2	1. Check for wiring harness damage or short to ground. If OK, go to (2). 2. Check transmission speed sensor connections. If OK, go to (3). 3. Replace transmission speed sensor. Was the replacement complete?	—	Replace speed sensor.

Chart 11: Engine Flare At Shifting During Turning Only (Usually With Warm Engine)

Step	Action	Yes	No
1	Check for oil leaks at transmission. Was the problem found?	Replace transmission oil filter and gasket.	—

Chart 12: Engine Flare During 1–2 Or 2–3 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	1. Check for a stuck 1–2 accumulator valve (320). 2. Check for servo piston (106) leaks. 3. Check for a stuck band apply solenoid (323). Was line pressure normal?	Repair or replace	—

Chart 13: Shudder Only During Torque Converter Clutch (TCC) Applying

Step	Action	Yes	No
1	1. TCC shudder is one of the most commonly misdiagnosed conditions in an automatic transmission. The key to diagnosing TCC shudder is to note when it happens and under what conditions. Once the TCC has been fully applied, it is nearly impossible to make it shudder. TCC shudder (short burst of noise normally less than 1 second) will only occur during clutch applying. It is not a steady state condition. 2. Drive until whole drivetrain is at normal operating temperature. – On 4WD vehicles, the test must be performed with transfer case selector lever in “2H” position. – Shudder is a short burst of noise normally less than 1 second in duration, and can be induced by the following maneuver: 3. From coast condition at 50 mph in “D” range (Normal mode), depress the throttle to 1/4-1/3 throttle. If present, shudder will occur within 5 seconds together with TCC application.(The scan tool may be used to determine the exact time of TCC). Was the problem found?	Replace transmission fluid and filter (remove both pans) and flush cooler lines. Replace converter assembly and O-ring on turbine shaft	Perform mechanical inspection of other drivetrain components.

Chart 14: Possible Causes of Transmission Noise

CAUTION: Before checking transmission for what is believed to be transmission noise, ensure presence and positioning of insulating plugs, pads etc. Also make sure that noise does not come from other drivetrain components.

Condition	Possible cause	Correction
Whine or Buzz	Oil level low	Fill with ATF, check for external leaks.
	Plugged or restricted oil filter	Inspect oil filter. Replace oil filter or ATF as necessary.
	Damaged oil filter gasket	Replace oil filter gasket.
Knocking noise from front of transmission.	Loose bolts (Converter to flex plate)	Tighten to specifications.
	Cracked or broken flex plate	Replace flex plate.
	Converter damaged	Replace converter.
Knocking noise while driving, mostly on acceleration.	Transmission mount loose or broken	Tighten mount bolts or replace transmission mount.
	Cooler line mounts loose or broken	Tighten or replace cooler line mounts.
	Cooler lines touching body or frame	Repair or replace as necessary.
Knocking noise when vehicle is stationary.	Loose flex plate mounting bolts	Tighten to specifications.
	Cracked or broken flex plate	Replace flex plate.
	Damaged converter	Replace converter.

Chart 15a: Possible Causes of Low Line Pressure

Step	Action	Yes	No
1	Check oil level. Was the problem found?	Fill with ATF.	Go to Step 2
2	Check for defective throttle position sensor. Was the problem found?	Replace throttle position sensor.	Go to Step 3
3	Check for plugged, loose, or damaged oil filter (79). Was the problem found?	Inspect oil filter, tighten bolts or replace oil filter (79).	Go to Step 4
4	Check for a stuck force motor plunger (404). (Adapter case valve body) Was the problem found?	Replace force motor plunger (404).	Go to Step 5
5	Check for a stuck feed limit valve (412). (Adapter case valve body) Was the problem found?	Replace feed limit valve (412).	Go to Step 6
6	Check for loose converter bolts (4 & 5). Was the problem found?	Tighten converter bolts (4 & 5).	Go to Step 7
7	Check for a stuck pressure regulator valve (208). (Oil pump) Was the problem found?	Replace pressure regulator valve (208).	Go to Step 8
8	Check for a stuck boost valve (205). (Oil pump) Was the problem found?	Replace boost valve (205).	Go to Step 9
9	Check for blocked intermediate oil passages to pressure regulator valve. (Oil pump) Was the problem found?	Replace oil pump.	Go to Step 10
10	Check for defective oil pump (9, 201, 202 & 209). Was the problem found?	Replace oil pump.	Go to Step 11
11	Check for internal leaks. – Check balls missing or out of location in valve bodies – Seals cut or damaged – Gaskets defective, etc. Was the problem found?	Install balls, or correct ball location. Replace seals. Replace gaskets.	—

Chart 15b: Possible Causes of High Line Pressure

NOTE: If transmission is operating in backup mode, high line pressure will be present.

Step	Action	Yes	No
1	Check for defective throttle position sensor. Was the problem found?	Replace throttle position sensor.	Go to Step 2
2	Check for a stuck force motor plunger (404). (Open circuit/intermittent) (Adapter case valve body) Was the problem found?	Replace force motor plunger (404).	Go to Step 3
3	Check for a stuck feed limit valve (412). (Adapter case valve body) Was the problem found?	Replace feed limit valve (412).	Go to Step 4
4	Check converter bolts (4 & 5). Was the problem found?	Tighten converter bolts (4 & 5).	Go to Step 5
5	Check for a stuck pressure regulator valve (208). (Oil pump) Was the problem found?	Replace pressure regulator valve (208).	Go to Step 6
6	Check for a stuck boost valve (205). (Oil pump) Was the problem found?	Replace boost valve (205).	Go to Step 7
7	Check for internal leaks. – Check balls missing or out of location in valve bodies – Seals cut or missing – Gaskets defective, etc. Was the problem found?	Install balls, or correct ball location. Replace seals. Replace gaskets.	—

Chart 16: Possible Causes of Transmission Fluid Leaks

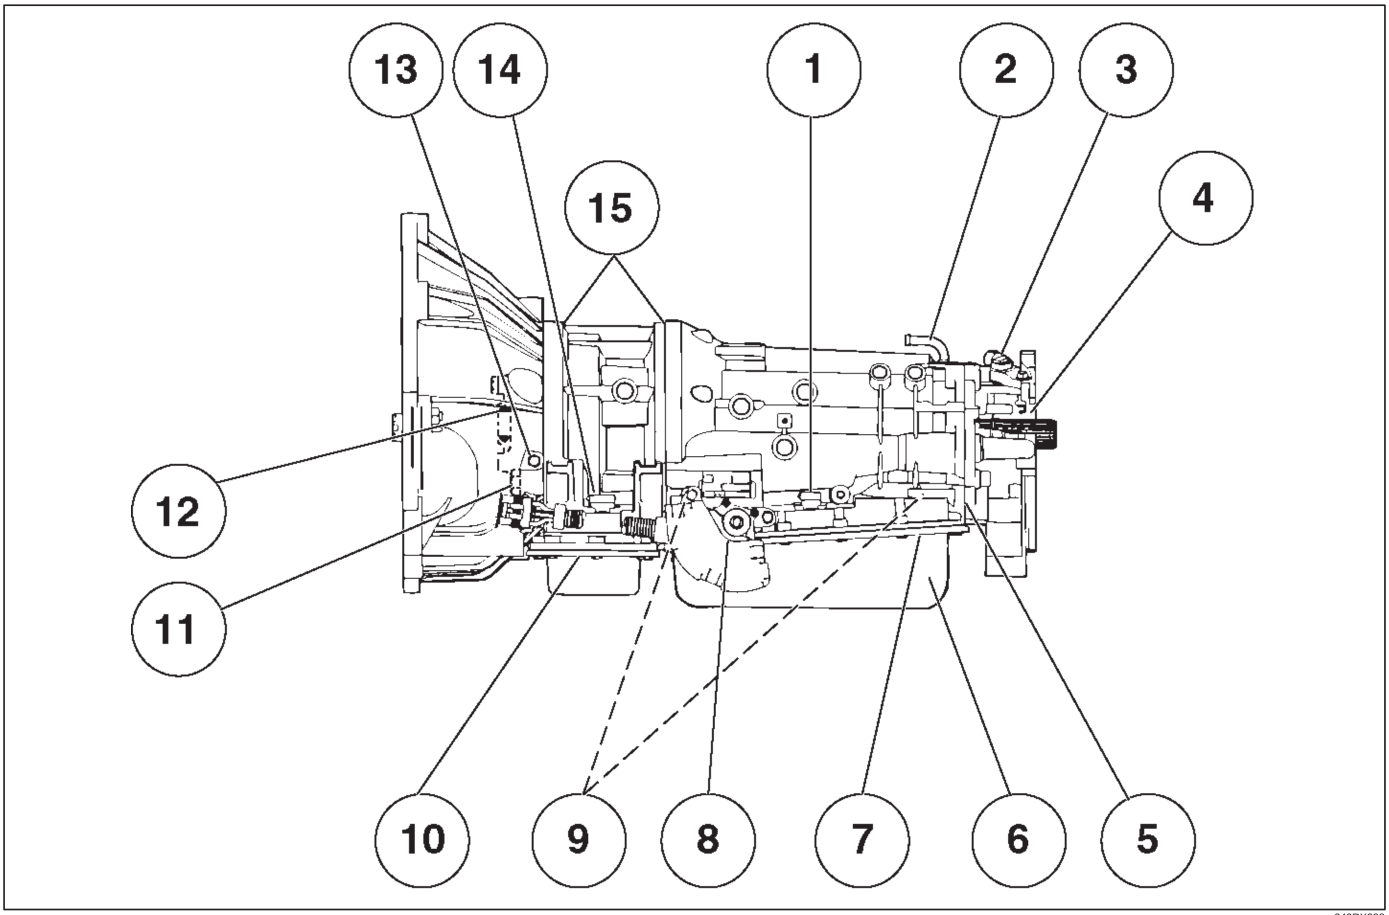
Before attempting to correct an oil leak, the actual source of the leak must be determined. In many cases, the source of the leak may be difficult to determine due to “wind flow” around the engine and transmission.

The suspected area should be wiped clean before inspecting for the source of the leak.

Oil leaks around the engine and transmission are generally carried toward the rear of the vehicle by the air stream. In determining the source of an oil leak, the following two checks should be made:

1. With the engine running, check for external line pressure leaks.
2. With the engine off, check for oil leaks due to the raised oil level caused by drainback of converter oil into the transmission.

Possible Causes of Fluid Leaks Due To Sealing Malfunction



Legend

(1) Electrical Connector (Main Case) Seal
(2) Transmission Vent (Breather)
(3) Speed Sensor O–ring
(4) Extension (Adapter) Lip Seal
(5) Extension (Adapter) to Main Case Gasket

(7) Oil Pan Gasket (Main Case)
(8) Selector Shaft Seal
(9) Oil Cooler Connectors (2)
(10) Oil Pan Gasket (Adapter Case)
(11) Converter housing attaching bolts not correctly torqued
(12) Converter Housing Lip Seal
(13) Line Pressure Tap Plug
(14) Electrical Connector (Adapter Case) Seal
(15) Adapter Case Seal Rings (2)

Stall Test

The stall test allows you to check the transmission for internal abrasion and the one way clutch for slippage. Torque converter performance can also be evaluated.
The stall test results together with the road test results will identify transmission components requiring servicing or adjustment.

Stall Test Procedure:

1. Check the level of the engine coolant, the engine oil, and the automatic transmission fluid. Replenish if necessary.
2. Block the wheels and set the parking brake.
3. Connect a tachometer to the engine.
4. Start the engine and allow it to idle until the engine coolant temperature reaches 70 – 80˚C (158 – 176˚F).
5. Hold the brake pedal down as far as it will go.
6. Place the selector in the “D” range.
7. Gradually push the accelerator pedal to the floor.
   The throttle valve will be fully open.
   Note the engine speed at which the tachometer needle stabilizes.

Stall Speed : 2,100 ±150 rpm

NOTE: Do not continuously run this test longer than 5 seconds.

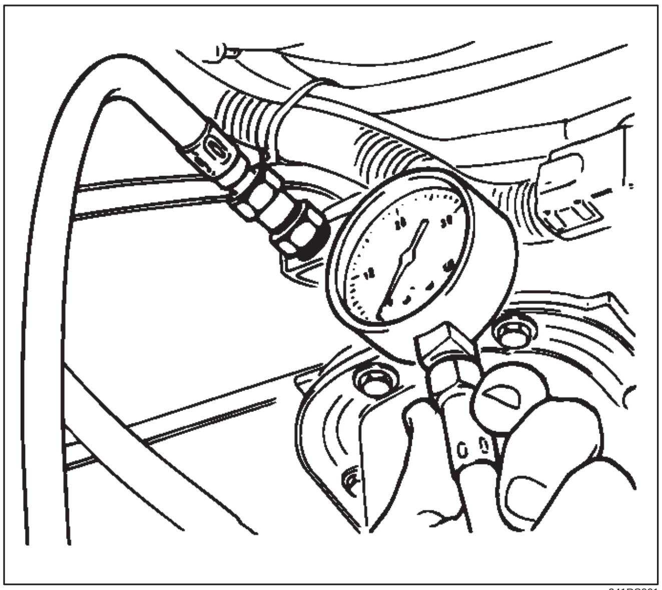
8. Release the accelerator pedal.
9. Place the selector in the “N” range.
10. Run the engine at 1,200 rpm for one minute.
    This will cool the transmission fluid.
11. Repeat Steps 7 – 10 for the “3”, “2”, “L” and “R” ranges.

Line Pressure Test

The line pressure test checks oil pump and control valve pressure regulator valve function. It will also detect oil leakage.

Line Pressure Test Procedure:

1. Check the level of the engine coolant, the engine oil, and the automatic transmission fluid.
   Replenish if required.
2. Block the wheels and set the parking brake.
3. Remove the pressure detection plug at the left side of the transmission case.
   Set J–29770–A pressure gauge and adapter to the pressure detection plug hole.



241RS001

4. Start the engine and allow it to idle until the engine coolant temperature reaches 70 – 80°C (158 – 176°F).
5. Hold the brake pedal down as far as it will go.
6. Place the selector in the “D” range.
7. Note the pressure gauge reading with the engine idling.
8. Gradually push the accelerator pedal to the floor. The throttle valve will be fully open.
   Note the pressure gauge reading with the accelerator pedal fully depressed.

NOTE: Do not continuously run this test longer than 5 seconds.

9. Release the accelerator pedal.
10. Place the selector in the “N” range.
11. Run the engine at 1,200 rpm for one minute.
    This will cool the transmission fluid.
12. Repeat Steps 7 – 11 for the “3”, “2”, “L”, and “R” ranges.
13. Install a pressure detection plug to the transmission case, applying recommended thread locking agent (LOCTITE 242) or its equivalent to thread of plug. Make sure that thread is cleaned before applying locking agents.
14. Tighten the pressure detection plug to the specified torque.

Torque: 9 – 14N·m (7 – 10lb ft)

MODE	LEVER POSITION	ENGINE SPEED	LINE PRESSURE		FORCE MOTOR CURRENT (mA)
			kPa	PSI	
NORMAL/POWER	D,3,2,L	IDLE	590–730	86–106	680–720
WINTER	D	IDLE	300–390	44–57	1,020–1,060
NORMAL/POWER WINTER	REVERSE	IDLE	460–630	67–91	880–920
NORMAL/POWER	D, 3, 2, L	STALL SPEED	1,250–1,380	181–200	70–110

Changing Transmission Fluid

There is no need to change the transmission fluid unless the transmission is used under one or more of the following heavy duty conditions.

A. Repeated short trips

B. Driving on rough roads

C. Driving on dusty roads

D. Towing a trailer

If the vehicle is used under these conditions, change the fluid every 20,000 miles (32,000 km).

1. Place a large drain pan under the oil pan.
2. Remove the transmission oil drain screw (2) and drain fluid.
3. Tighten drain screw (2).

Torque: 38 N•m (28 lb ft)

4. Remove the transmission overfill screw (1) and fill transmission through overfill screw opening, using DEXRON®–III ATF.

NOTE: Add transmission fluid until it flows out over the overfill screw opening.

5. Let engine idle until a fluid temperature between 32˚C (90˚F) and 57˚C (135˚F) is reached.
6. Add transmission fluid until it flows out over the overfill screw opening, then close the overfill screw (1).

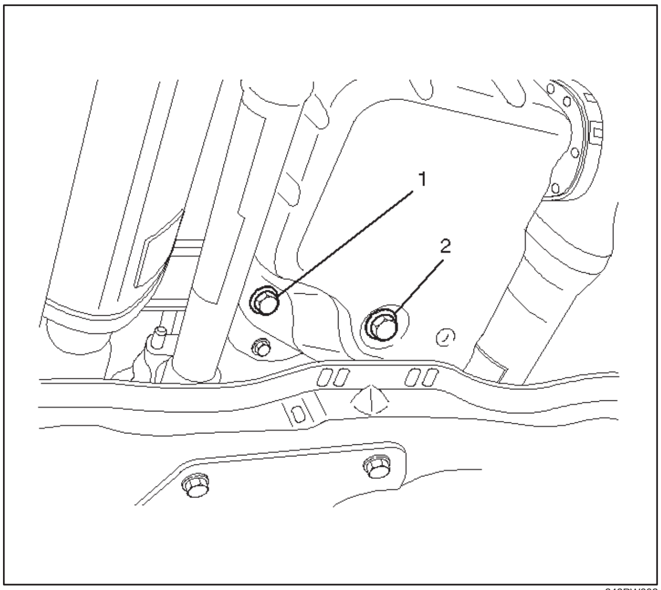
Torque: 38 N•m (28 lb ft)

NOTE: To prevent fluid leaks, the overfill screw and oil drain screws gasket must be replaced each time these screws are removed.

NOTE: Check transmission fluid temperature with scan tool.

7. Reset “Oil Life Monitor” data by using Tech 2.

   Refer to Tech 2 OBD II Connection in Transmission Control System (4L30-E) section.

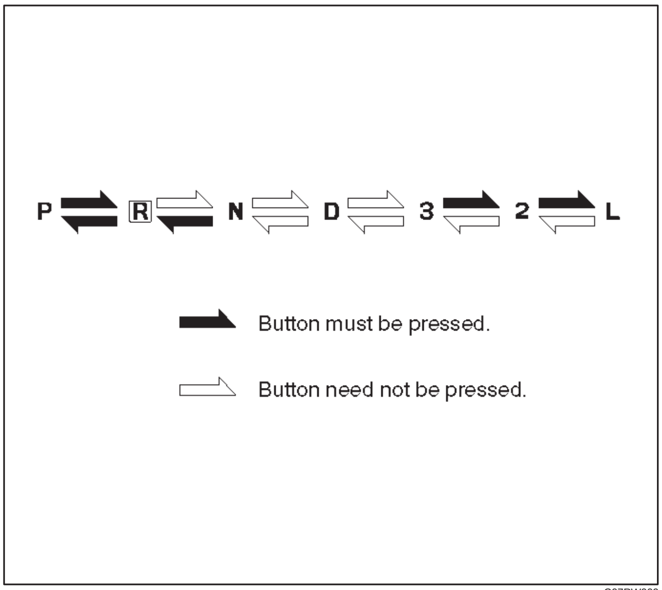


242RW003

Selector Lever

Inspection

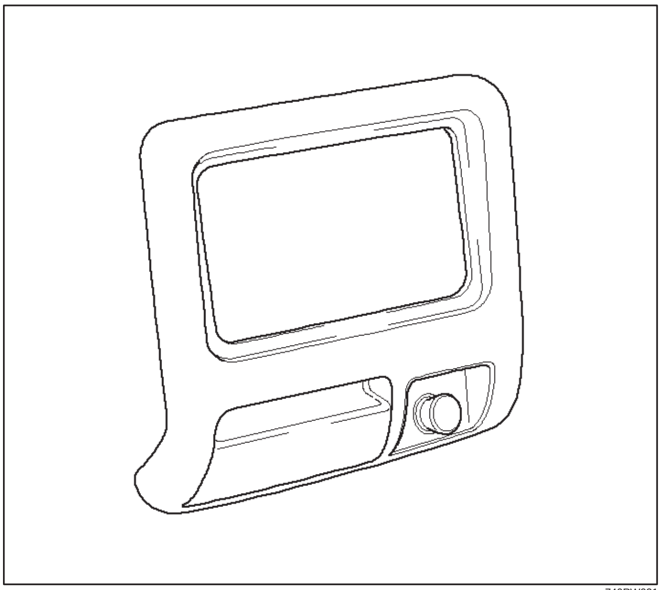
1. Make sure that when the selector lever is shifted from “P” to “L”, a “clicking” can be felt at each shift position. Make sure that the gear corresponds to that of the position plate indicator.
2. Check to see if the selector lever can be shifted as shown in illustration.



C07RW009

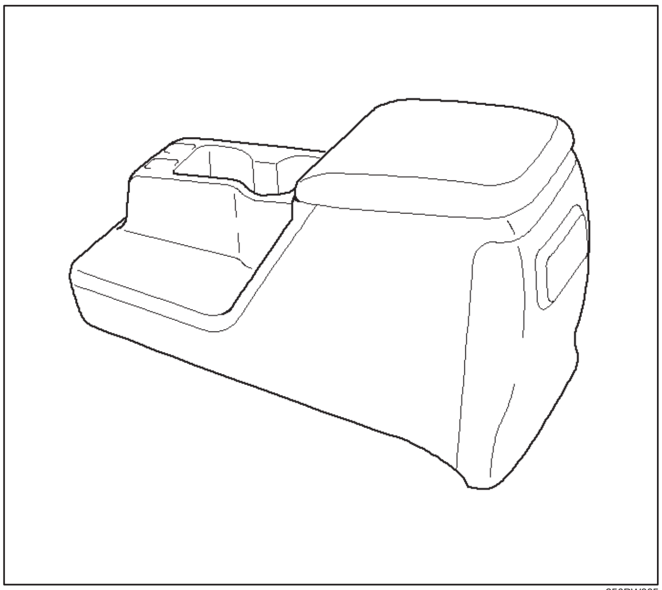
Removal

1. Disconnect battery ground cable.
2. Set ignition Key in “LOCK” position and selector lever in ”P” position.
3. Remove transfer control lever knob (4×4).
4. Remove lower cluster assembly.



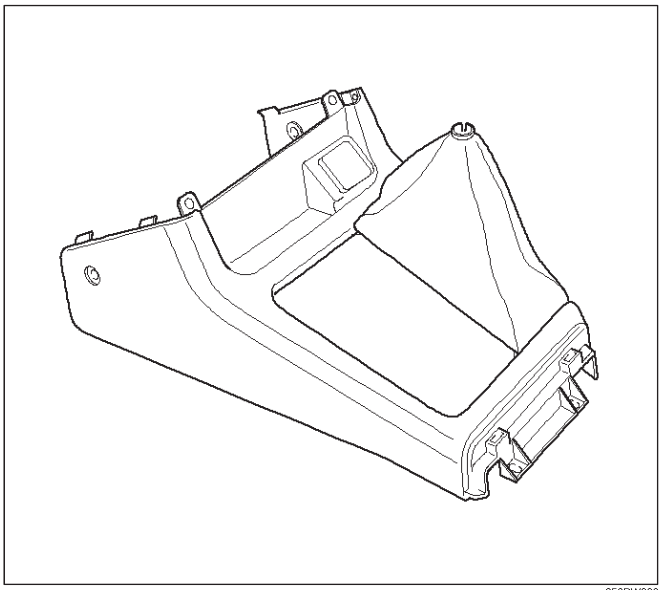
740RW021

5. Remove rear console.



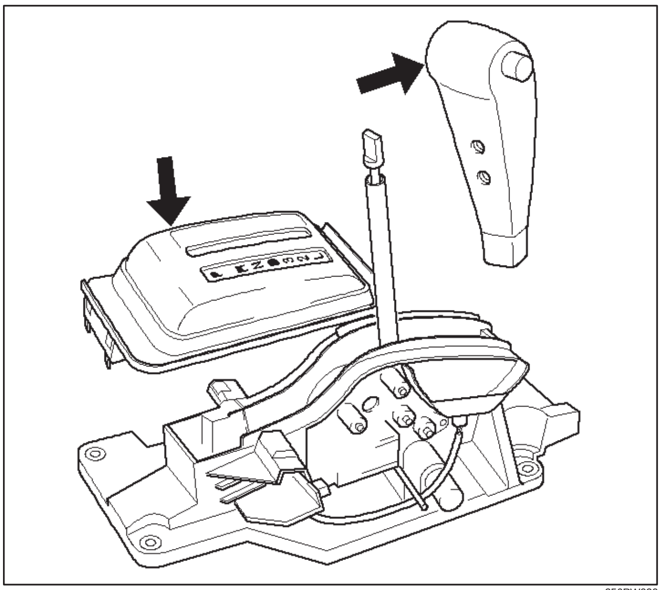
256RW005

6. Remove center console.



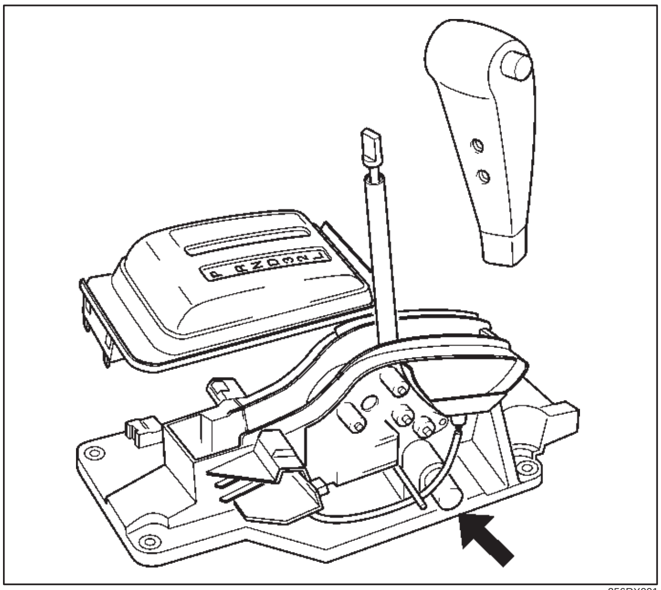
256RW006

7. Remove selector lever knob and cover.



256RW020

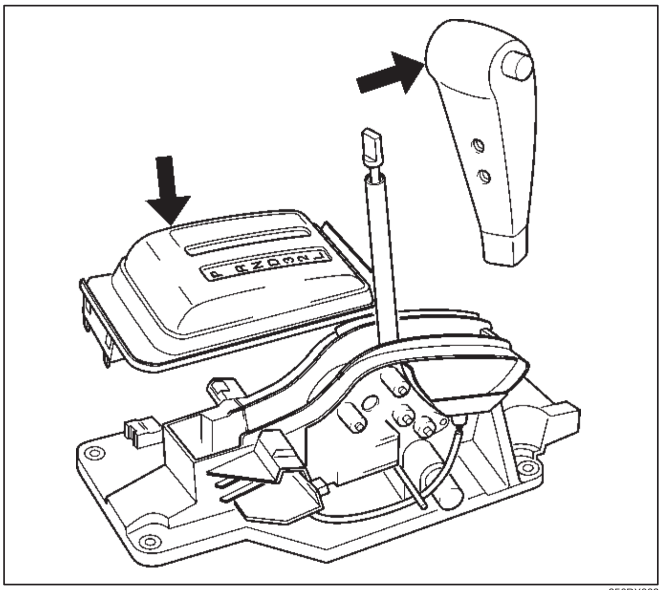
8. Disconnect select cable.
   - Refer to Select Cable in this section.
9. Disconnect shift lock cable.
   - Refer to Shift Lock Cable in this section.
10. Disconnect harness connector.
11. Remove selector lever subassembly.



256RX001

Installation

1. Install selector lever subassembly.
2. Connect harness connector.
3. Connect shift lock cable.
   - Refer to Shift Lock Cable in this section.
4. Connect select cable.
   - Refer to Select Cable in this section.
5. Install selector lever knob and cover.



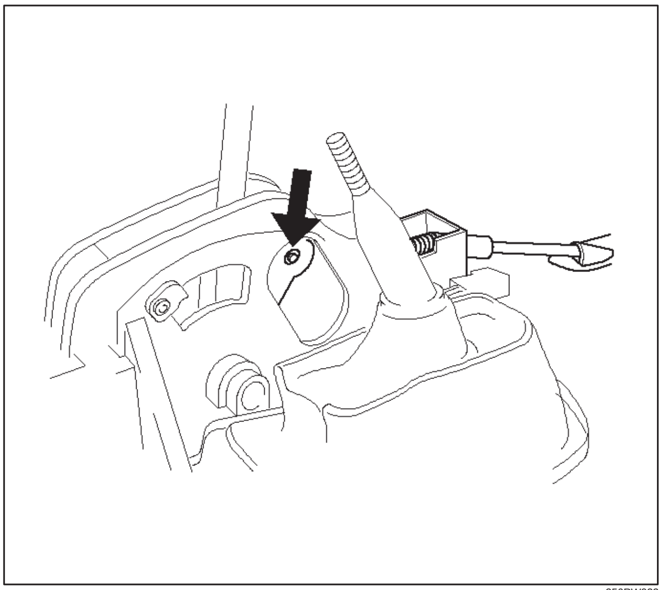
256RX002

6. Install center console.
7. Install rear console.
8. Install lower cluster assembly.
9. Install transfer control lever knob (4×4).
10. Connect negative (–) battery cable.
11. After installation, make sure that the selector lever operates normally, and that each selector position is properly indicated. (The red mark shows through the window.)

Select Cable

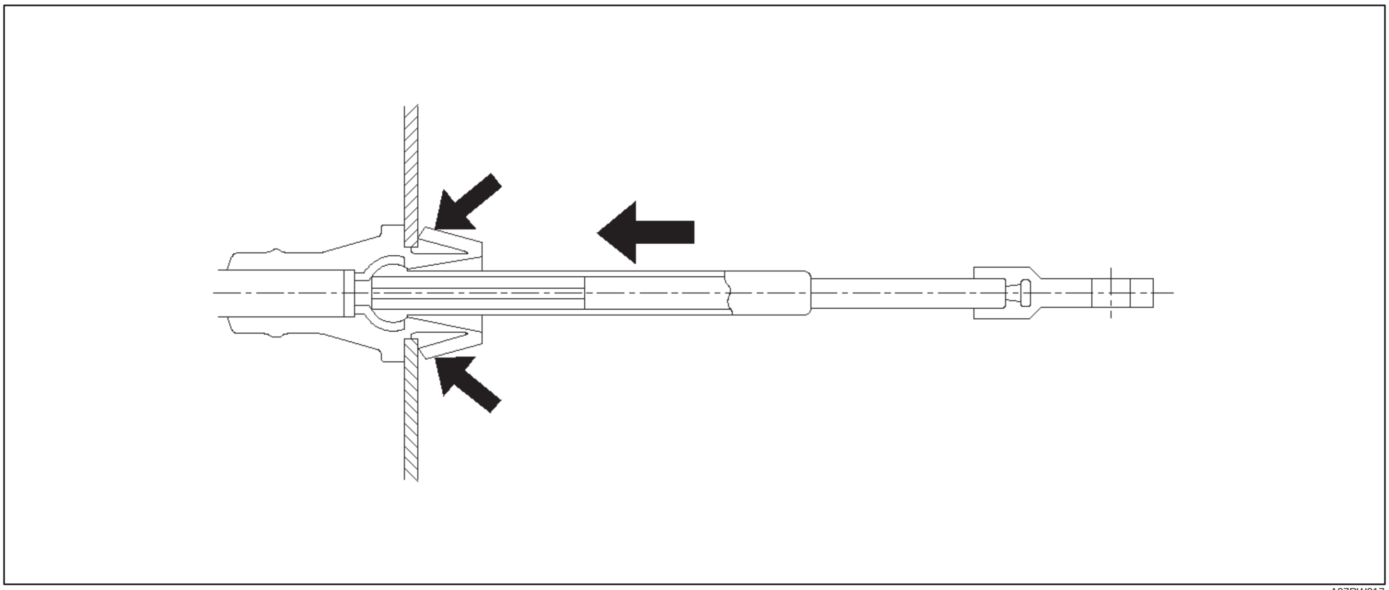
Removal

1. Set selector lever in “P” position.
2. Remove transfer control lever knob, lower cluster assembly, rear console, center console, selector lever knob and cover.
   - Refer to Selector Lever in this section.
3. Disconnect inner cable by pulling projection on pin.



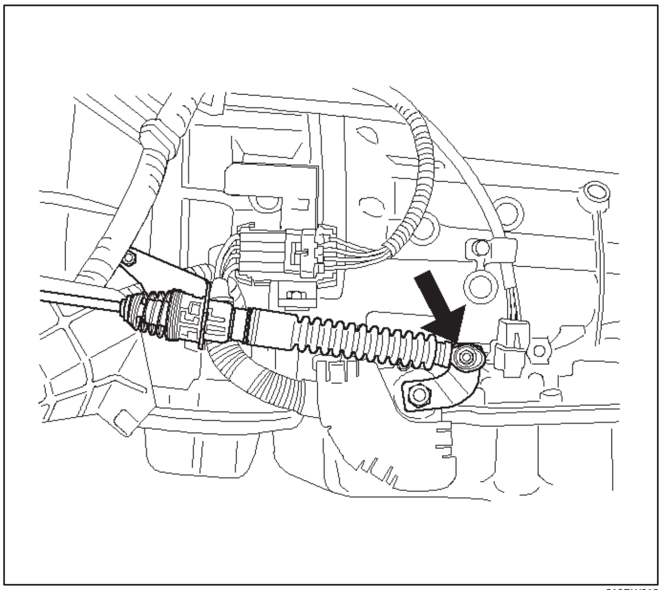
256RW022

4. Press down claws and disconnect cable assembly.



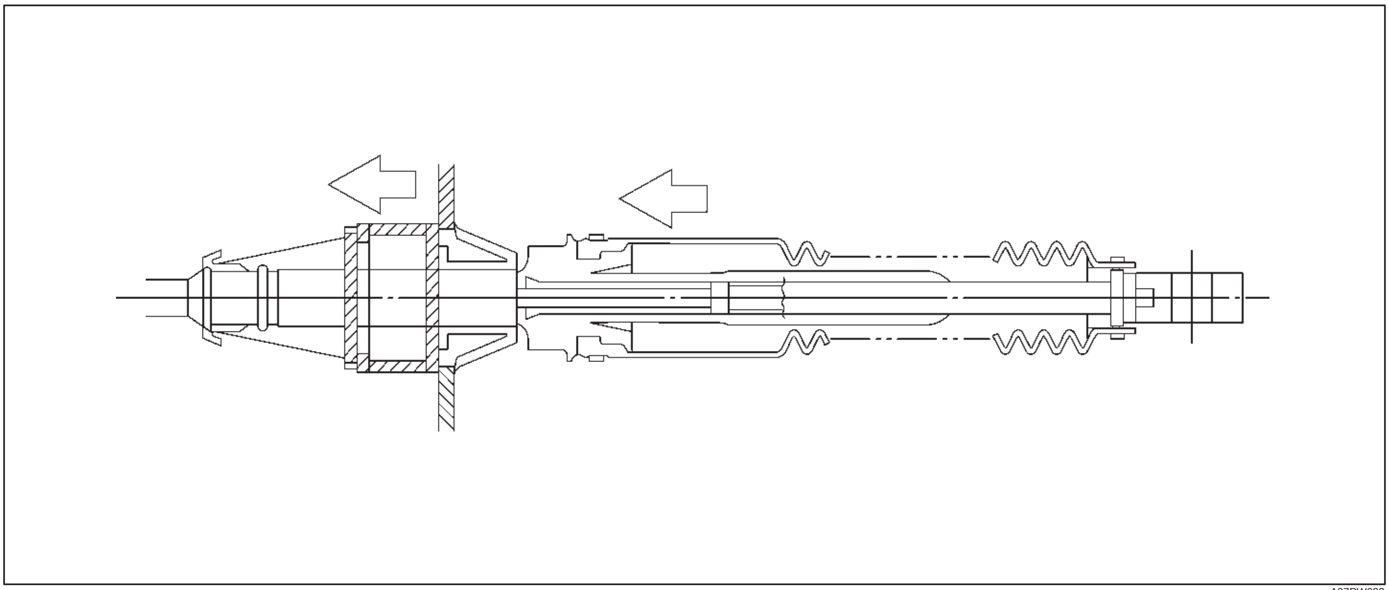
A07RW017

5. Disconnect PCM harness connectors and remove nuts that fasten grommet in select cable assembly.
6. Disconnect inner cable.



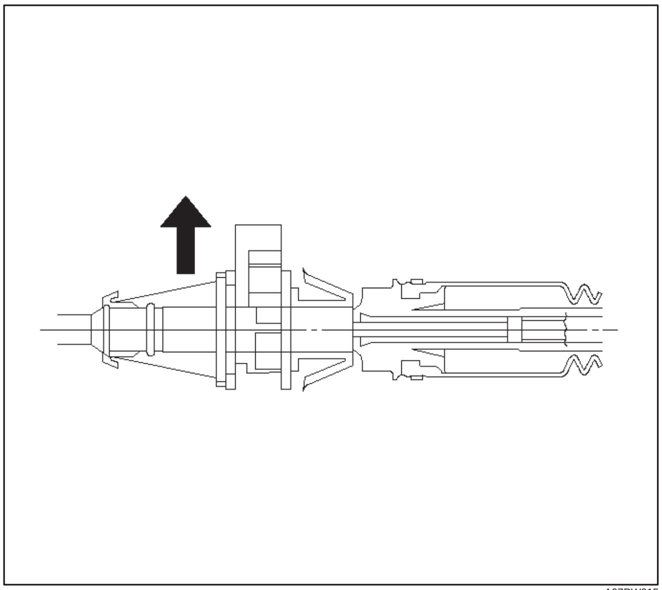
210RW013

7. Slide sleeve and disconnect cable assembly.



A07RW082

8. Pull lock.

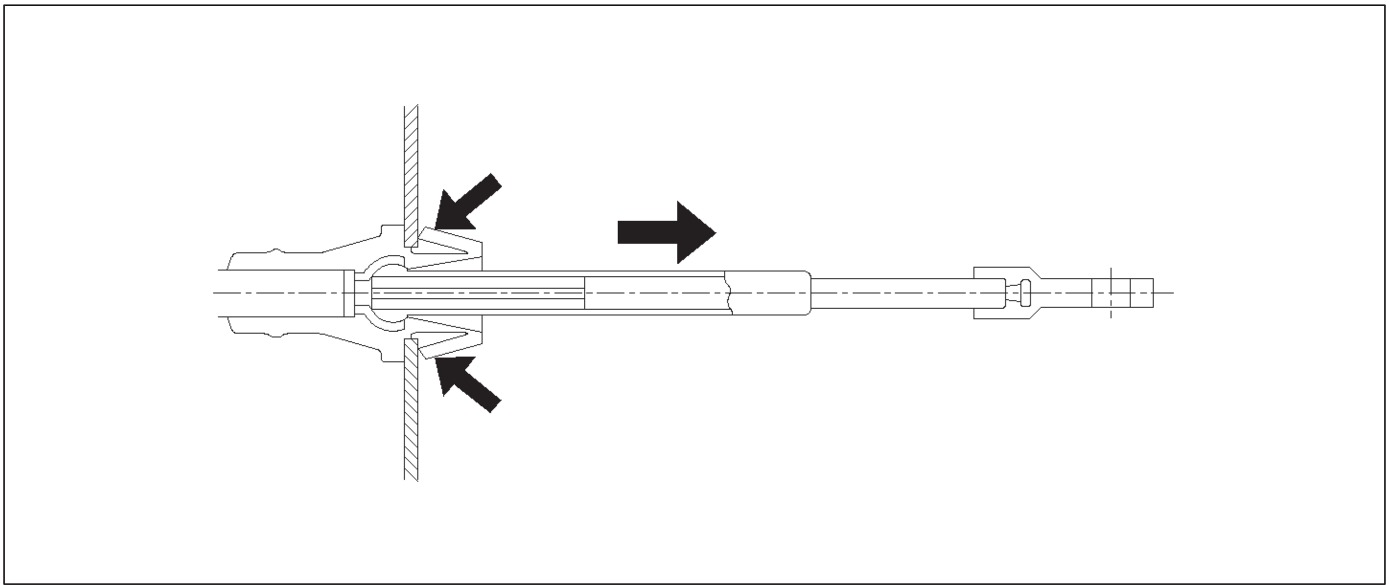


A07RW015

9. Draw select cable assembly into the interior side.

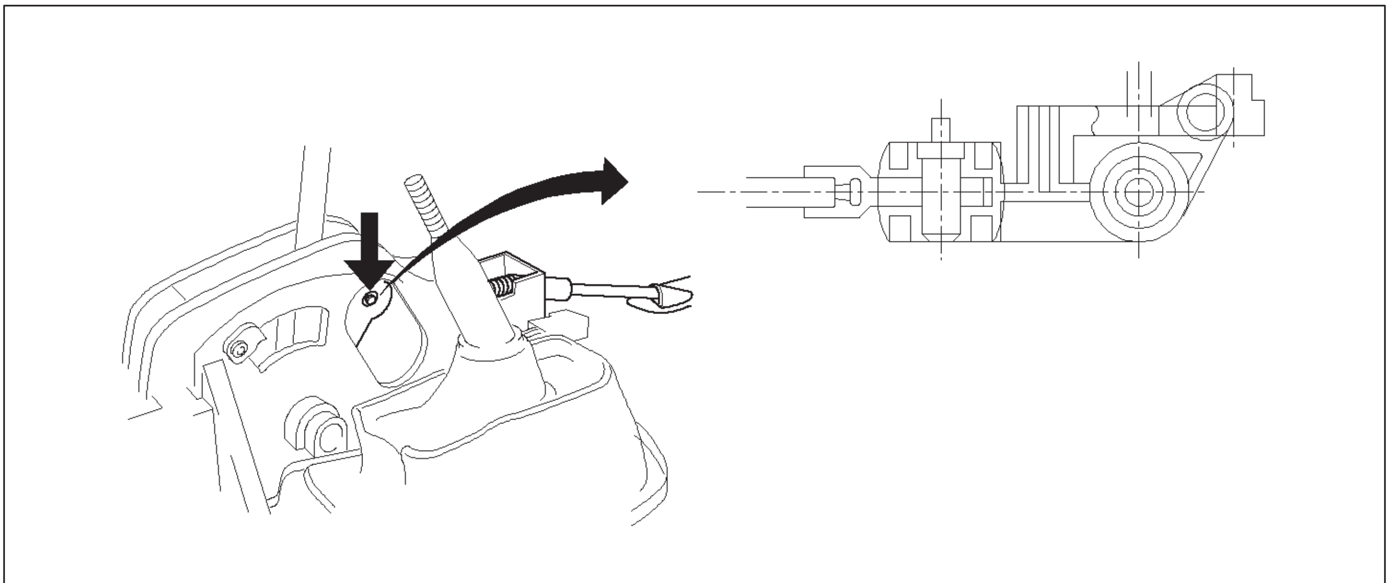
Installation

1. Set selector lever in “P” position.
2. Let out select cable transmission side end from floor hole.
3. Fit outer cable into bracket in selector lever assembly.



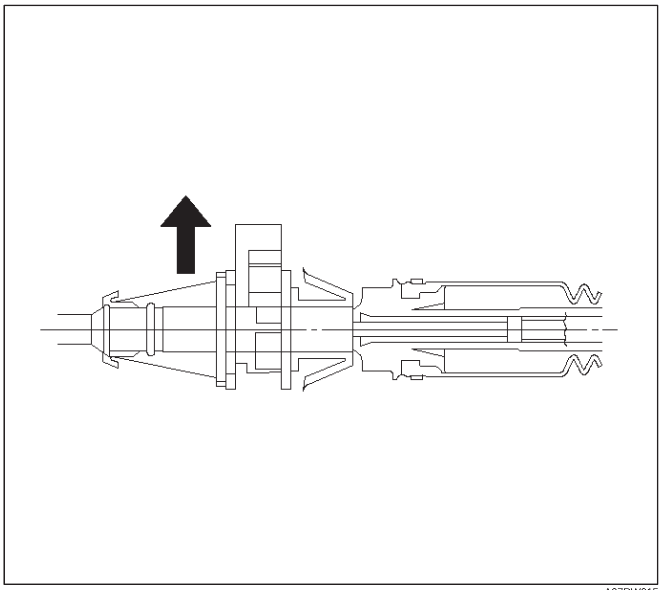
A07RW016

4. Set inner cable end in selector lever and push pin into selector lever hole and inner cable end.



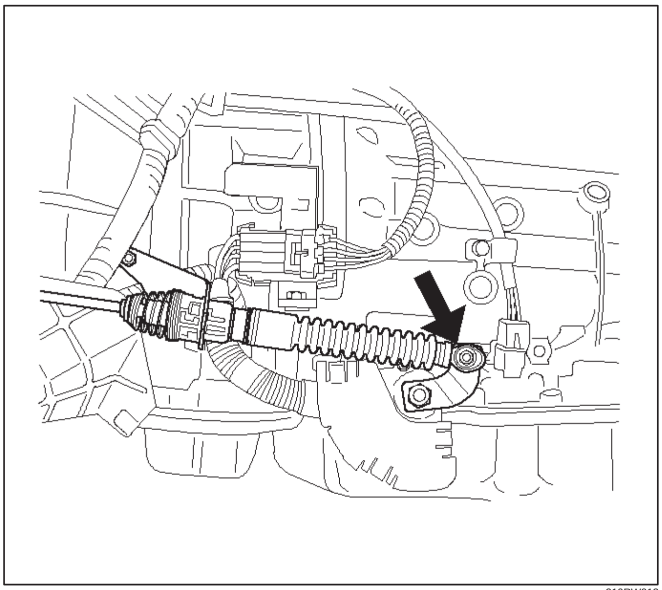
256RW023

5. Check that lock projects.



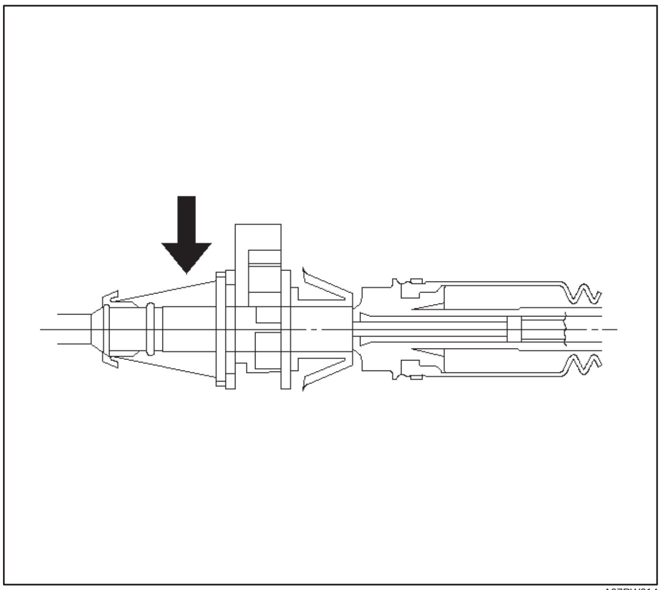
A07RW015

6. Connect adjust end fitting attachment to the bracket on transmission.
7. Set select lever “P” position and connect inner cable to select lever.



210RW013

8. Push lock into adjust end fitting attachment.



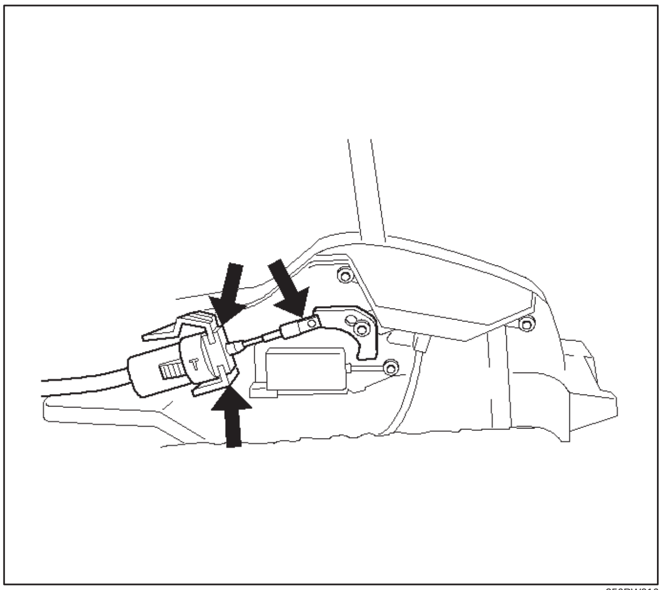
A07RW014

9. Install grommet.
10. About following installation steps, refer to Selector Lever in this section.

Shift Lock Cable

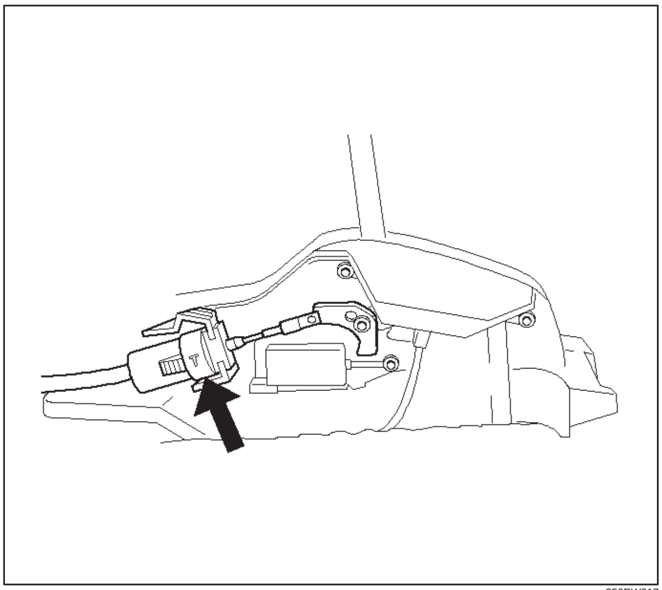
Removal

1. Set ignition key in “LOCK” position and selector lever in “P” position.
2. Remove transfer control lever knob (4×4), lower cluster assembly, rear console, center console, selector lever knob and cover.
   - Refer to Selector Lever in this section.
3. Disconnect inner cable from selector lever assembly then push claw and disconnect cable assembly.



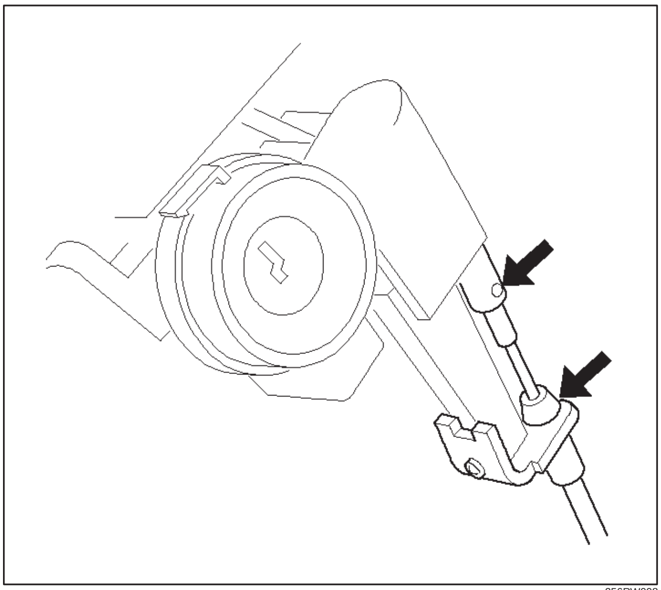
256RW016

4. Disconnect lock adjust.



256RW017

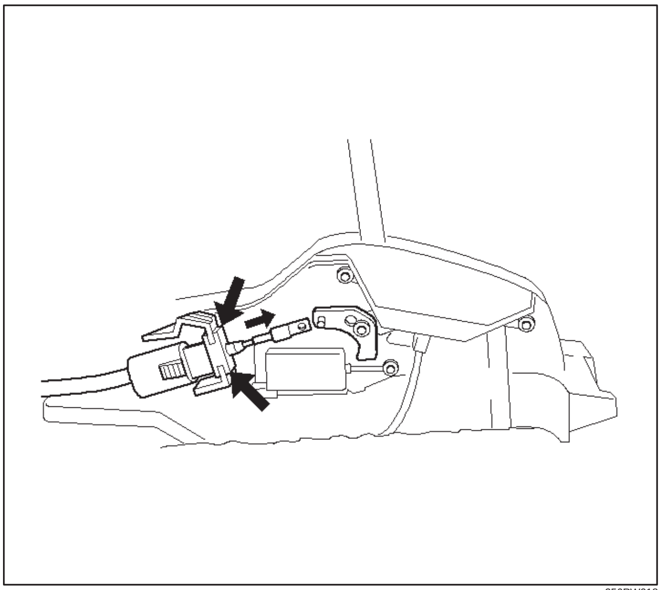
5. Remove instrument panel lower cover and steering column cover.
6. Remove spring pin and disconnect inner cable.
   - Disconnect outer cable from bracket.



256RW008

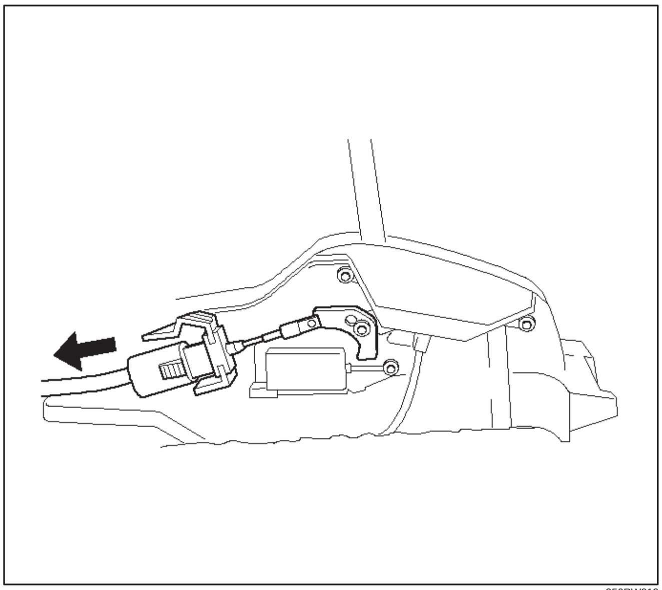
Installation

1. Set ignition key in “LOCK” position and selector lever in “P” position.
2. Connect outer cable to bracket near steering lock.
   - Connect inner cable to steering lock and install spring pin.
3. Install steering column cover and instrument lower cover.
4. Install adjust body of cable assembly to bracket in selector lever assembly.
   - Install inner cable to lever, pulling inner cable with outer cable.



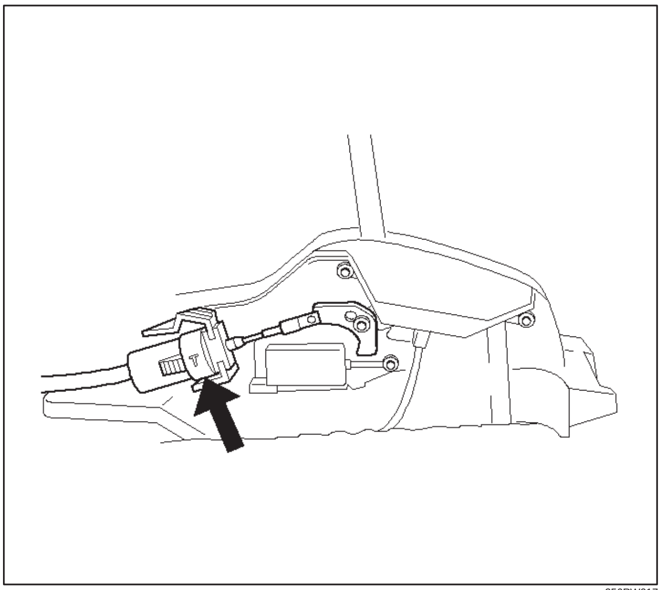
256RW018

5. Check that cable moves smoothly, lightly pulling outer cable rearward.



256RW019

6. Connect lock adjust, aligning “T” mark in the “Up” position.



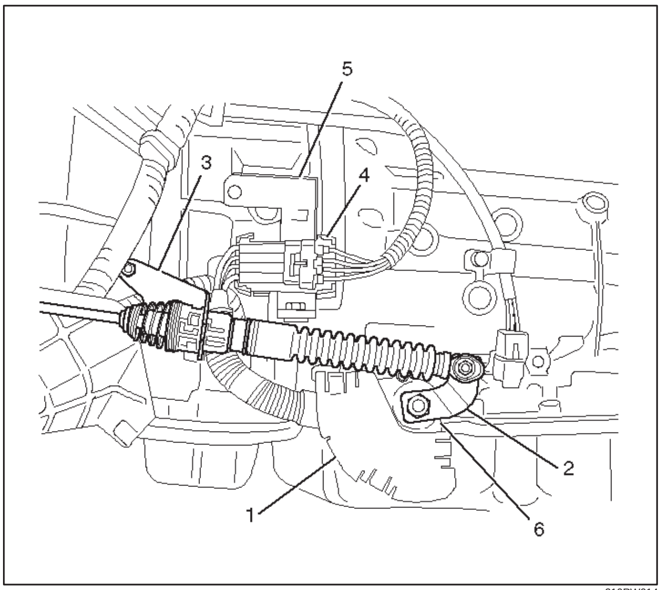
256RW017

7. About following installation steps, refer to Selector Lever in this section.
8. Check the shift lock operation:
   a. Selector lever should not be moved out of “P” position with ignition key in “Lock” position.
   b. Selector lever can be moved out of “P” position with ignition key in “ON”position only when brake pedal is depressed.
   c. ignition key can be turned to “LOCK” position only when selector lever is in “P” position (key can be pulled out).
9. If a. and c. fail, readjust cable. If b. fails, readjust connector wiring and brake pedal switch.

Mode Switch

Removal

1. Place selector lever in neutral.
2. Disconnect battery ground cable.
3. Remove mode switch cover (1).
4. Disconnect selector lever (2) from the mode switch.
5. Remove bracket with cable (3).
6. Disconnect transmission harness from the mode switch connector (4).
7. Remove bracket with mode switch connector from the transmission case.
8. Remove mode switch connector (4) from the bracket (5).
9. Remove two mode switch bolts and nut then remove mode switch (6).



210RW014

Installation

To install, follow the removal steps in the reverse order, noting the following points;

1. Torque

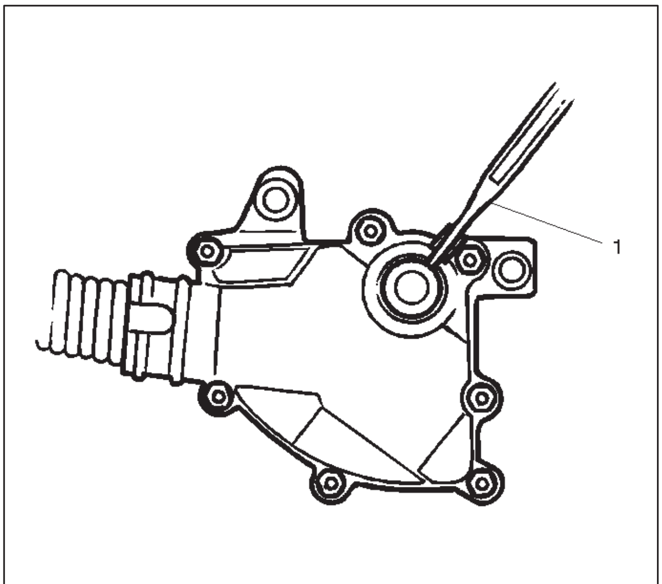
   Mode switch bolt: 13 N•m (113 lb in)

   Selector lever nut: 23 N•m (17 lb ft)

2. Mode switch setting procedure
   Perform either of the following adjustment procedures:

Procedure 1

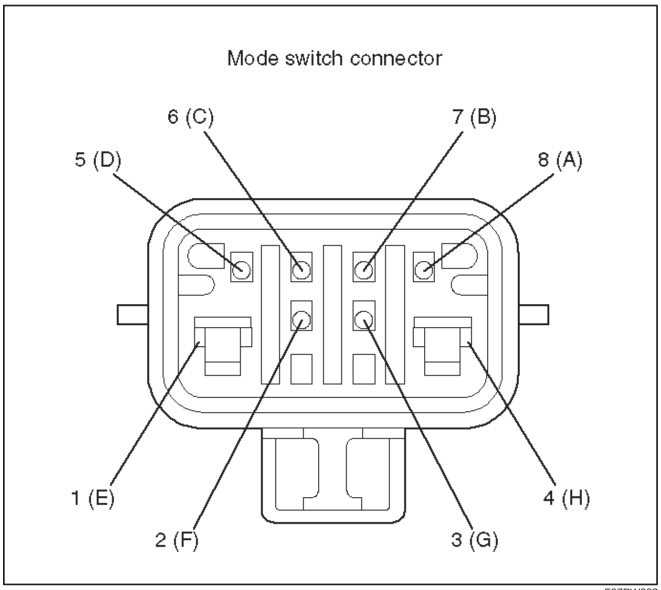
a. Place selector lever in neutral.
b. Remove selector lever from the mode switch.
c. Remove the mode switch cover.
d. Loosen the two 10 mm screws.
e. Rotate the mode switch until the slot in the mode switch housing aligns with the selector shaft bushing, and insert a 3/32 in. (2.4 mm) drill bit or punch (1) into the slot.
f. Tighten the screws to 13 N·m (113 lb in).
g. After completing adjustment, snap the mode switch cover into place.
h. Reinstall the selector lever.



249RW001

Procedure 2

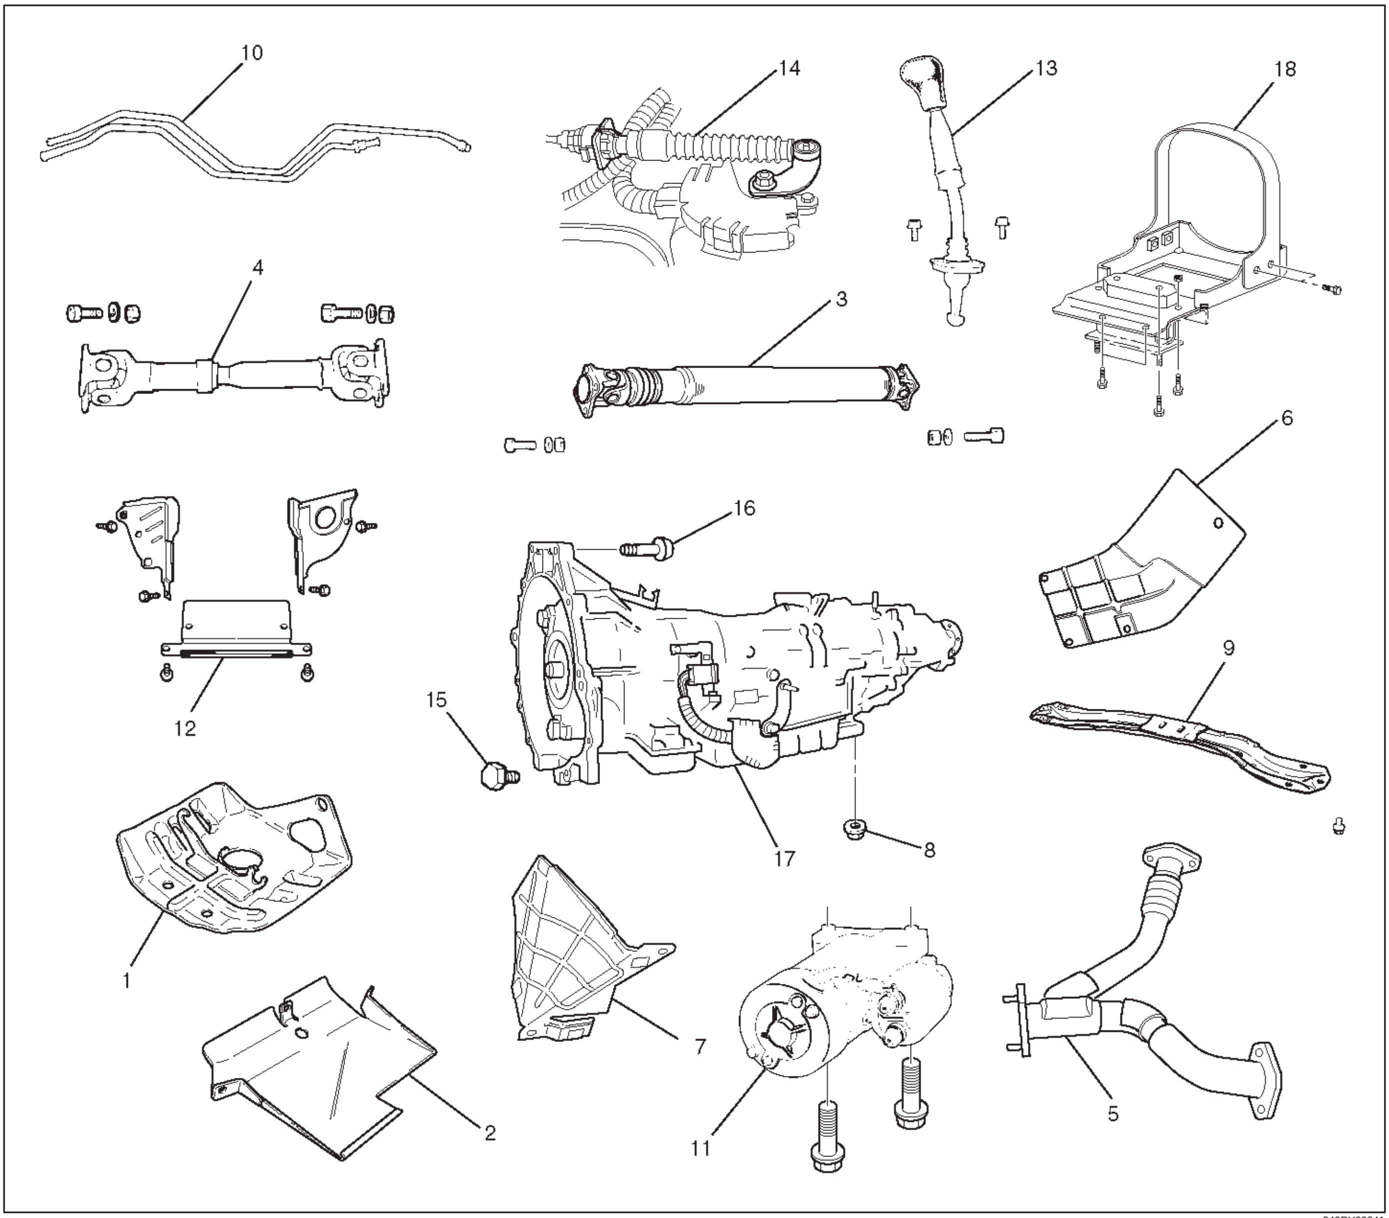
a. Place selector lever in neutral.
b. Disconnect transmission harness connector from mode switch connector.
c. Remove mode switch connector with bracket from the transmission case.
d. Connect multimeter (resistance mode) to terminals 1(E) and 4(H) on mode switch connector.
e. Loosen two mounting screws.
f. Rotate mode switch slightly in both directions to determine the range (approx. 5 degrees) of electrical contact.
g. Position mode switch in middle of contact range.
h. Tighten two mounting screws.
i. Remove multimeter and install mode switch harness connector with bracket to the transmission case.
j. Connect transmission harness connector to mode switch connector.



F07RW003

Transmission (With Transfer Case)

Transmission and Associated Parts



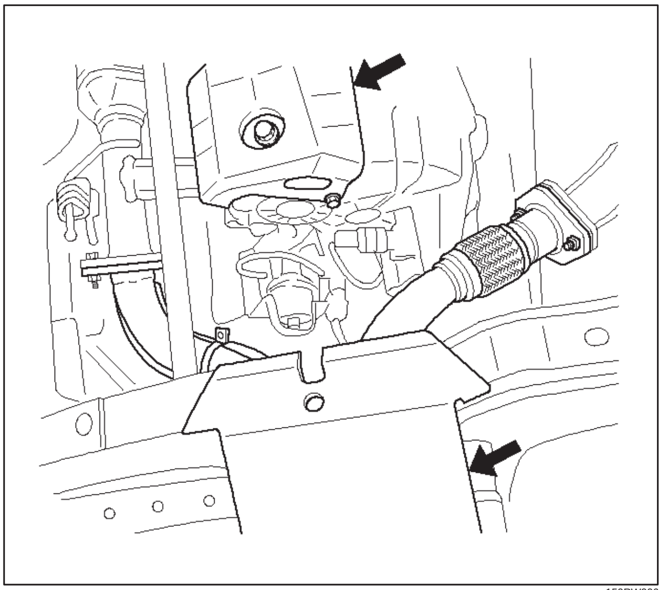
Legend

- (1) Transfer Protector (4×4)
- (2) Fairing Plate
- (3) Rear Propeller Shaft
- (4) Front Propeller Shaft (4×4)
- (5) Center Exhaust Pipe (4×4)
- (6) Fuel Pipe Heat Protector
- (7) Harness Heat Protector
- (8) Rear Mount Nut
- (9) Third Crossmember
- (10) Transmission Oil Cooler Pipe
- (11) Starter
- (12) Under Cover
- (13) Transfer Control Lever (4×4)
- (14) Select Cable
- (15) Torque Converter Bolt
- (16) Engine-Transmission Bolt
- (17) Transmission Assembly (With Transfer Case)
- (18) Rear Mount Rubber and Propeller Protector Assembly (4×2)

Removal

NOTE: Before remove transmission and transfer assembly from vehicle, change the transfer mode to 2WD using push button on dash panel.

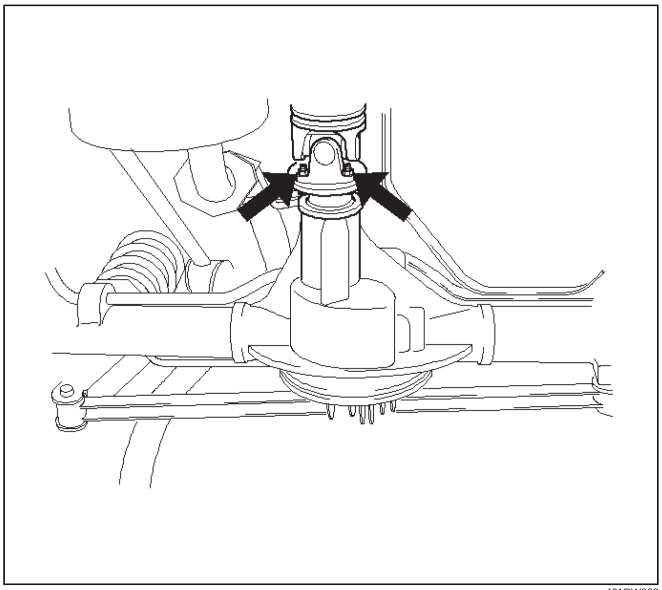
1. Disconnect battery ground cable.
2. Remove transfer protector (4×4) and fairing plate.



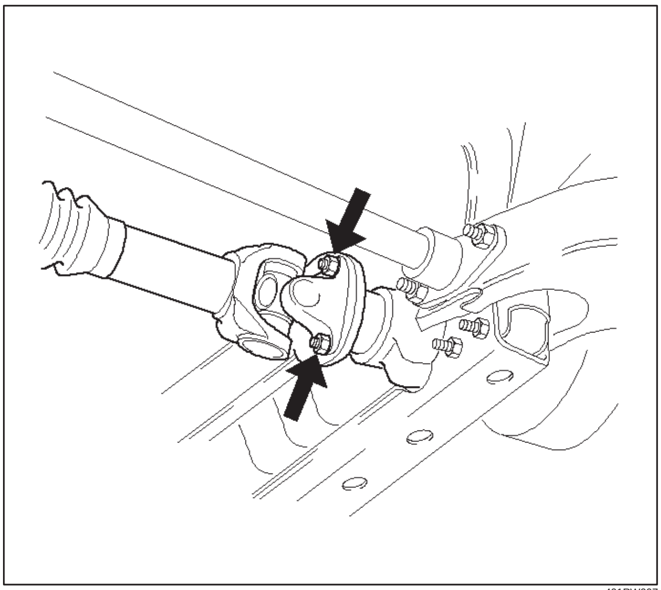
150RW006

3. Remove rear propeller shaft and front propeller shaft (4×4).

NOTE: Apply alignment marks on the flange at both front and rear sides.

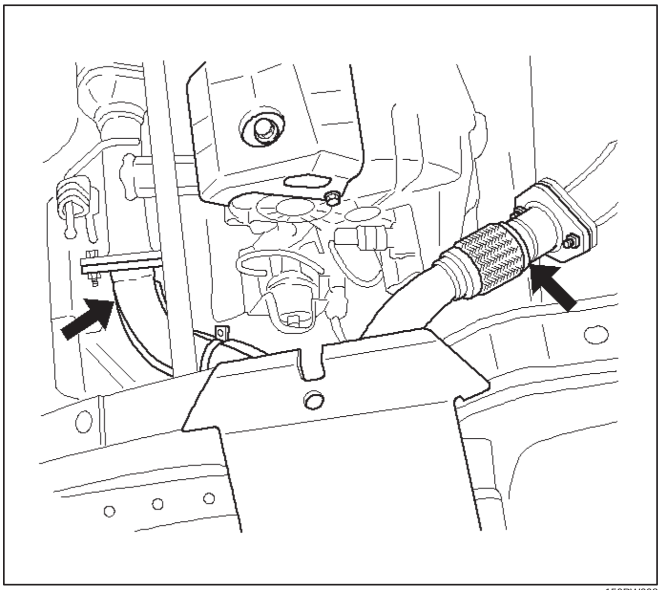


401RW008



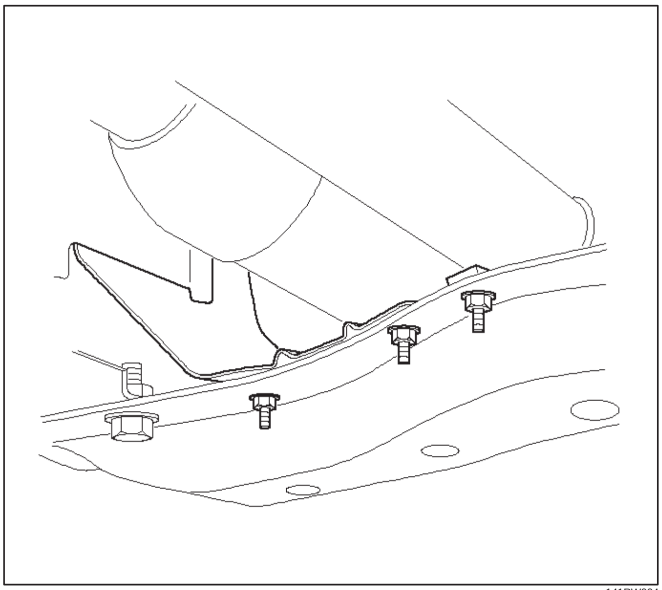
401RW007

4. Remove center exhaust pipe (4×4).



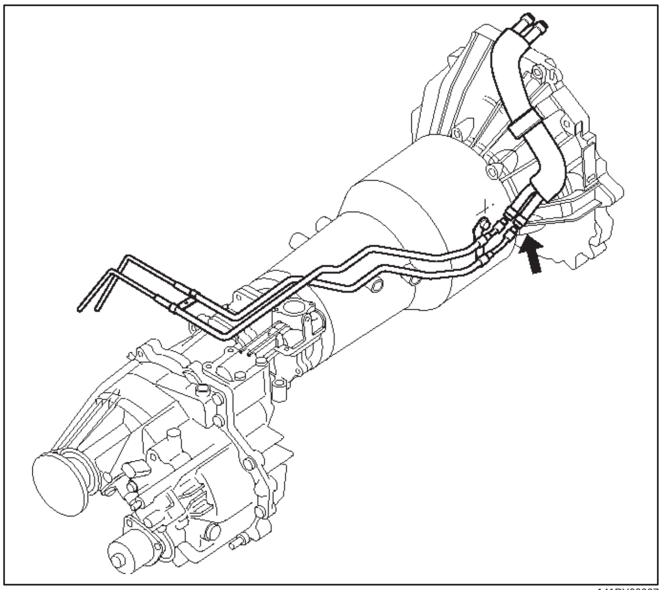
150RW008

5. Remove fuel pipe heat protector and clip.



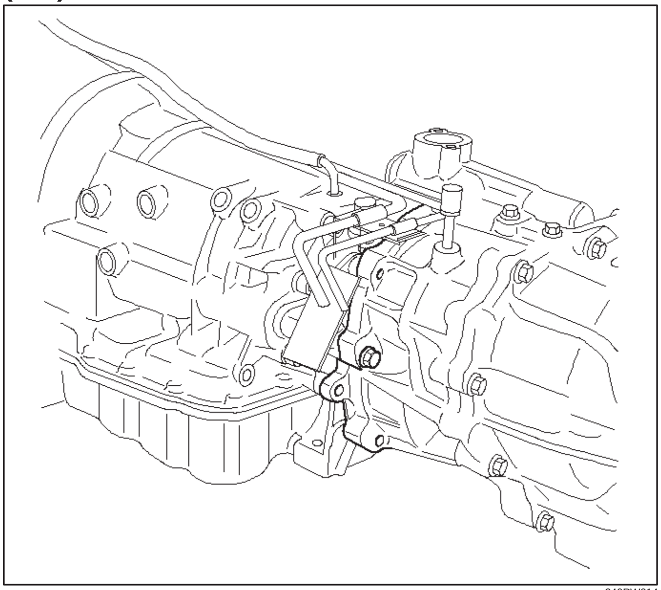
141RW004

6. Disconnect fuel pipe bracket from transmission side.



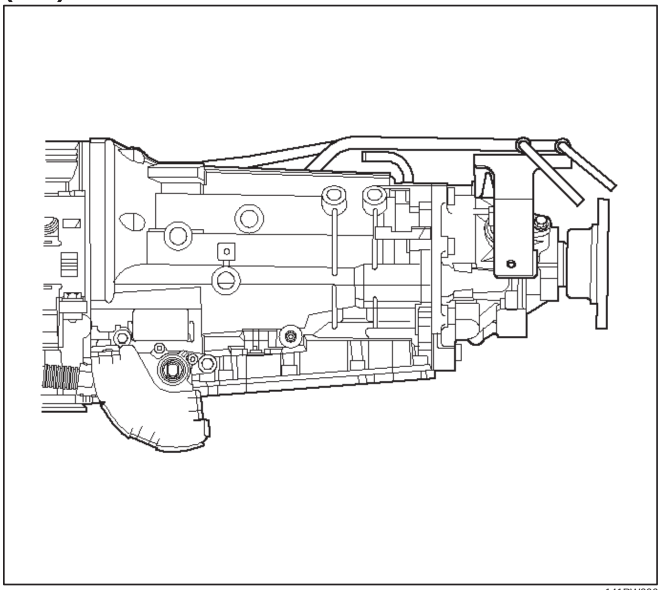
141RY00007

(4×4)



240RW014

(4×2)



141RW006

Fuel hose connector removal procedure

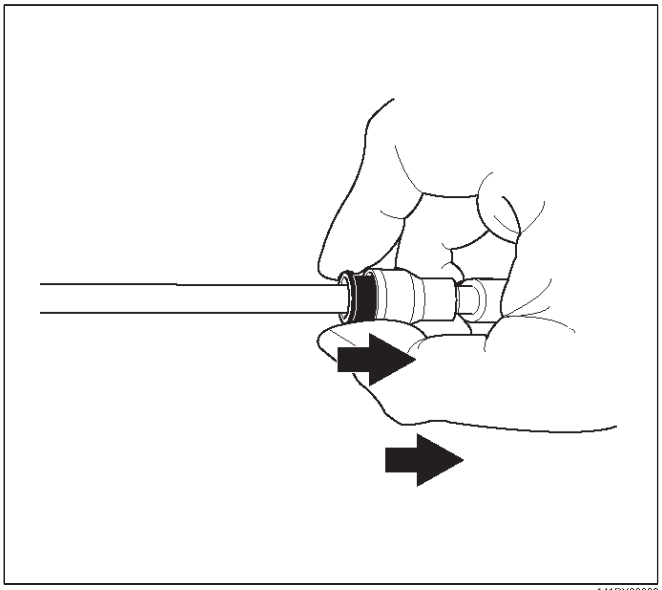
If removal of the fuel hose connector is required for transmission servicing and/or replacement, follow the steps below.

NOTE:

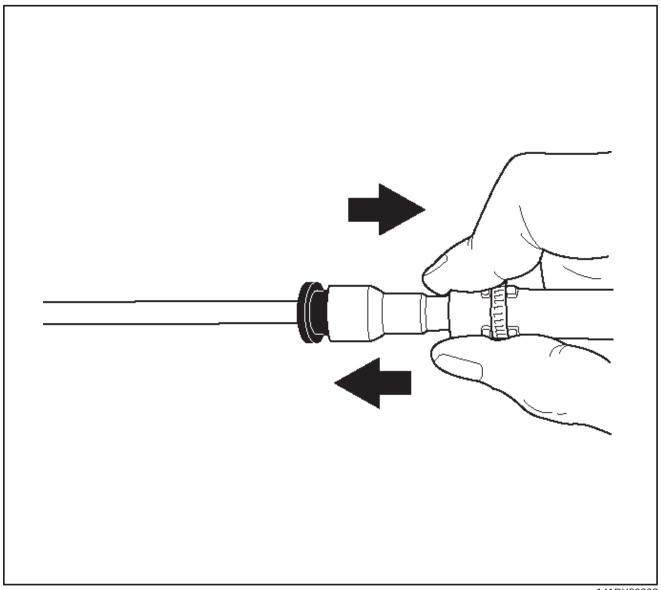
- An O-ring is used as a seal between the fuel pipe and the connector. Take care not to damage the contact surfaces during the removal procedure. Do not allow the serfaces to become contaminated with dirt or other foreign material.
- Perform the entire removal procedure with your hands. Do not use tools.

1. **Separating the connector and fuel pipe**
   1. Clean the fuel pipe and connector to remove mud and other dirt.
   2. Pull the black plastic piece toward the connector. Hold the piece near the connector. Pull the connector from the fuel pipe.

      If the connector and fuel pipe are stuck together, jiggle the connector back and forth to loosen the connector. Do not yank the connector from the fuel pipe.

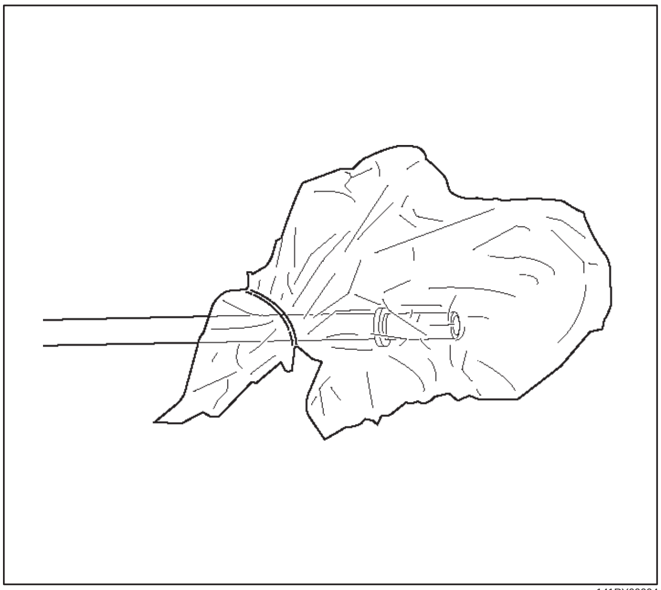


141RY00002



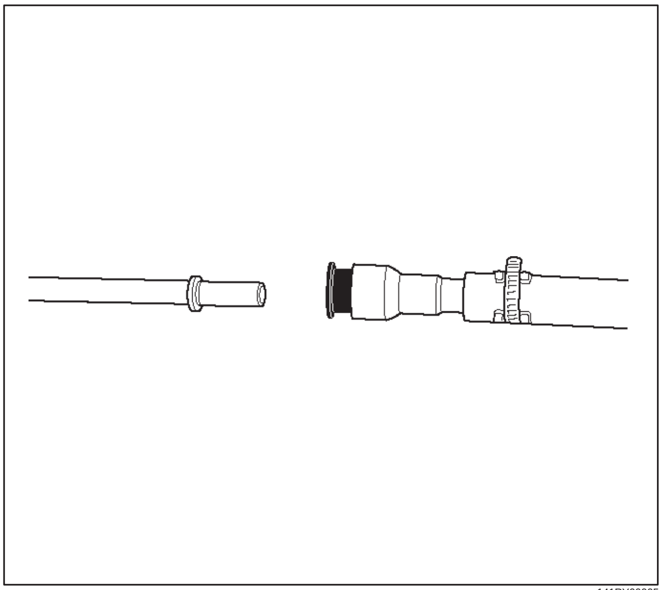
141RY00003

   3. Tie a vinyl bag around the connector and fuel pipe to protect them from dirt.



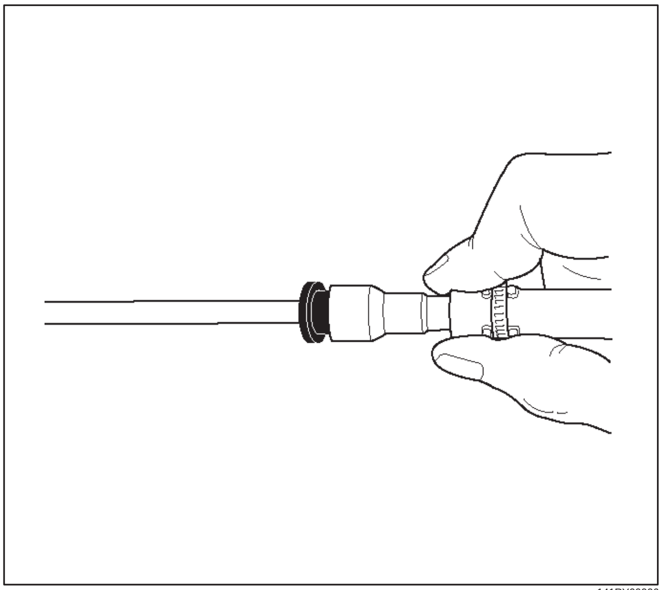
141RY00004

2. **Joining the connector and fuel hose**
   1. Remove the vinyl bags from the connector and fuel hose. Check that the contact surfaces are undamaged and free of dirt and other foreign material. Clean if necessary.
   2. Align the axis of the fuel pipe and connector. Push the connector into the fuel pipe until a distinct click is heard.



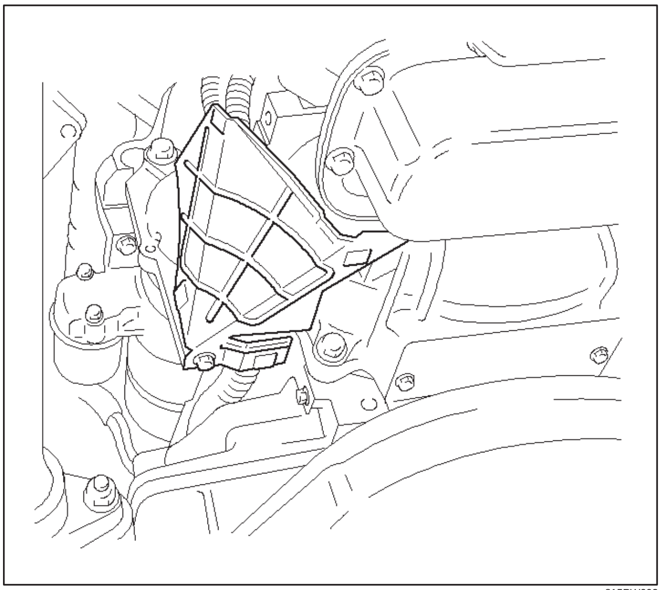
141RY00005

   3. Gently pull on the connector to check that it is securely latched.



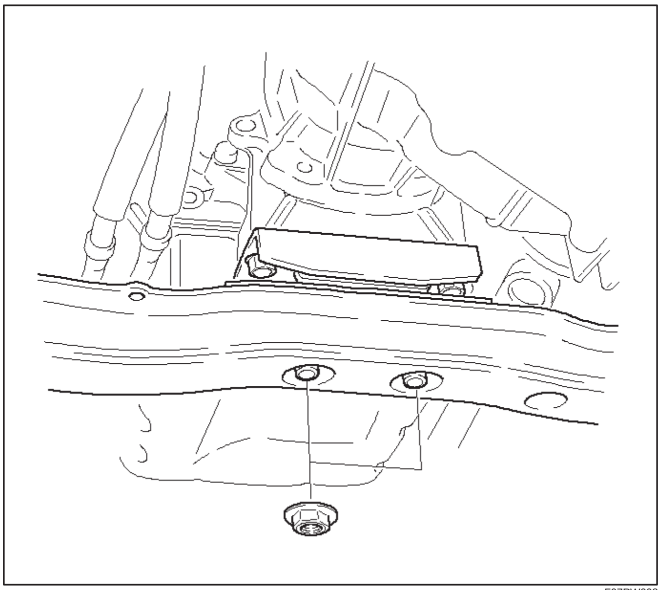
141RY00006

7. Disconnect transmission harness connector and clip.
   Connector : Adapter case, mode switch, main case, magnetic sensor, transfer switch (4×4), 2–4 actuator (4×4) and car speed sensor.
8. Remove harness heat protector.



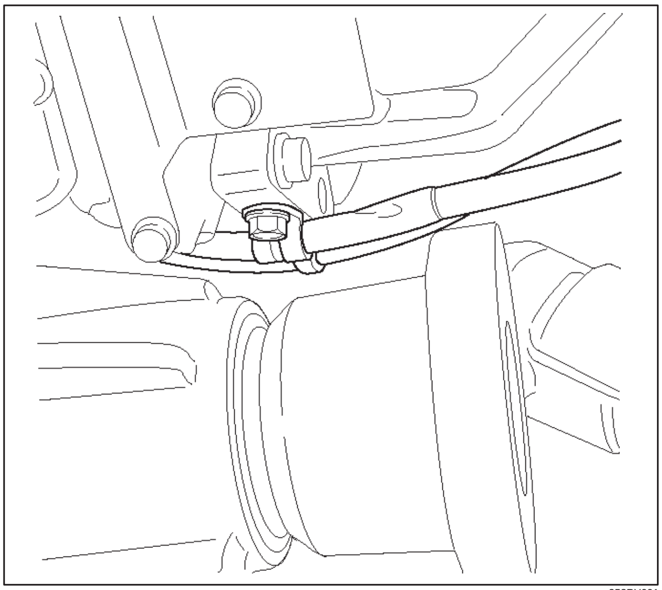
815RW002

9. Support transmission with a jack.
   Remove rear mount nuts from third crossmember.



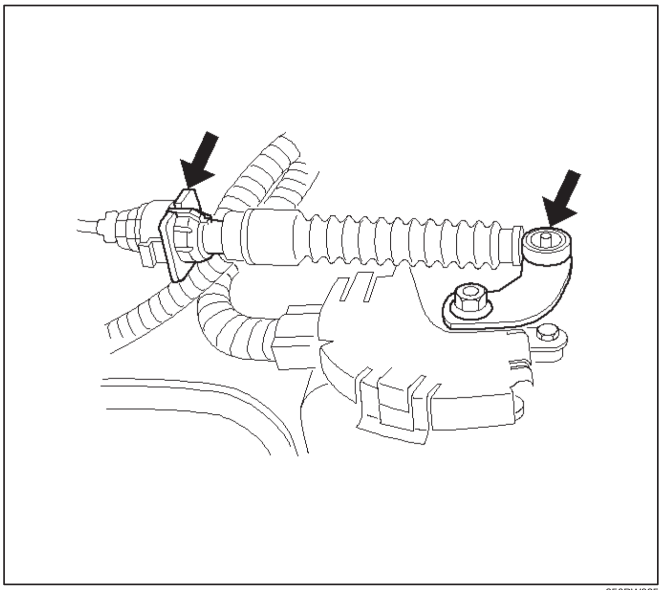
F07RW008

10. Remove third crossmember.
11. Disconnect transmission oil cooler pipes from A/T side.
12. Remove oil pipe clamp and bracket from the converter housing.



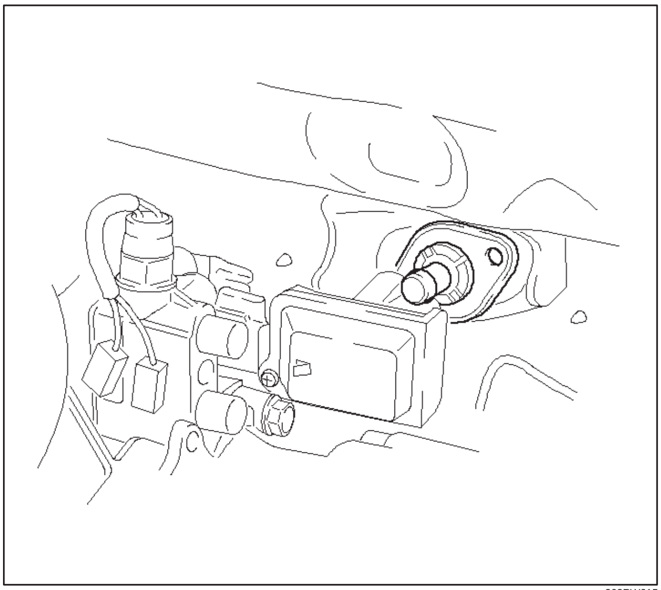
253RY001

13. Loosen oil cooler pipe clamp bolt at the engine mount side.
14. Remove select cable by disconnecting inner cable from select lever and removing outer cable with bracket.



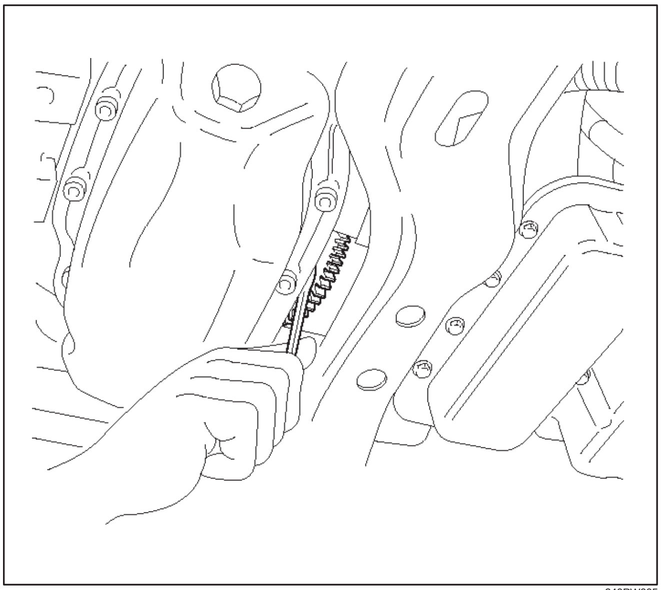
256RW025

15. Remove starter.
16. Remove under covers from the transmission and engine.
17. Remove transfer control lever fixing bolts and push up transfer control lever.



262RW015

18. Remove flex plate torque converter fixing bolts (6 pieces) by turning crankshaft.

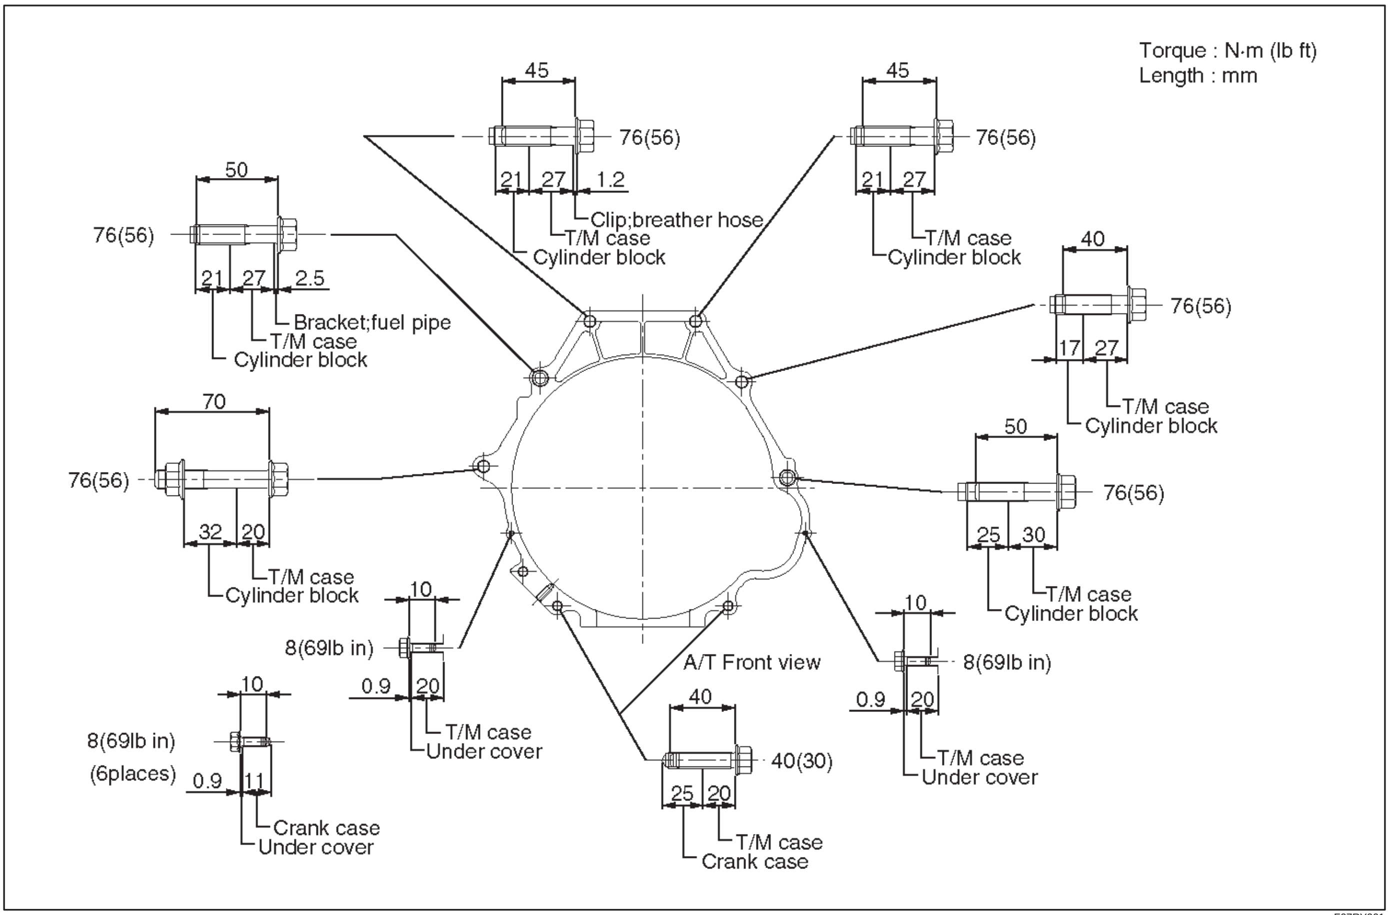


240RW005

19. Remove engine transmission fixing bolts.
20. Pull out transmission from the engine.
21. Remove the rear mount rubber and propeller protector assembly if required (4×2).

Installation

1. Slowly raise transmission jack until front of the transmission is aligned with rear of the engine. Join the transmission to the engine.
2. Tighten engine transmission bolts as shown in the figure.

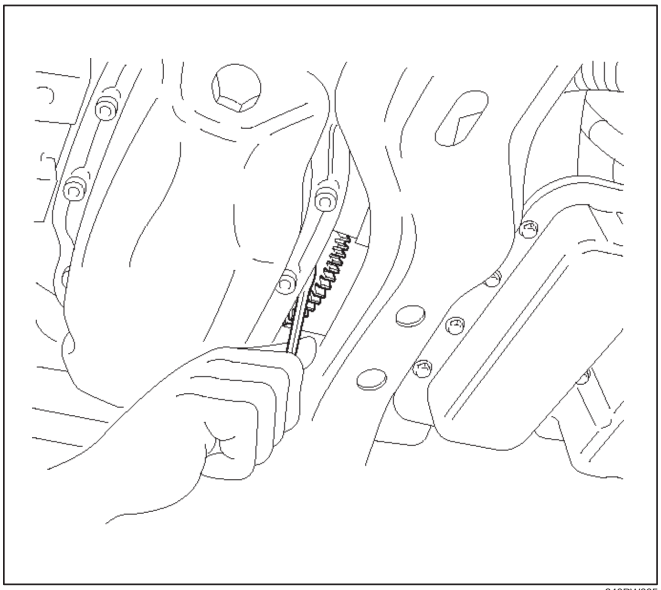


F07RY001

3. Align the flex plate torque converter bolt boss with flex plate hole by turning the torque converter. Install flex plate torque converter bolts (6 pieces) by turning the crankshaft.

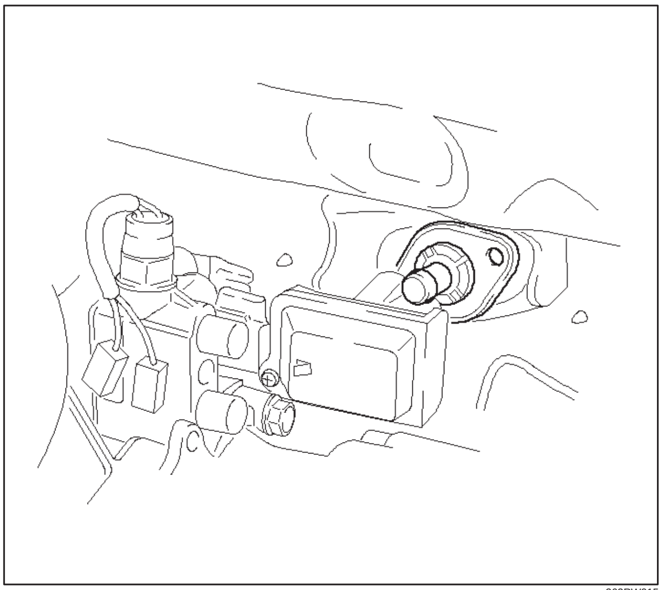
Torque: 54 N•m (40 lb ft)

NOTE: Do not reuse the flex plate torque converter bolt.



240RW005

4. Install transfer control lever on the transfer case (4×4).



262RW015

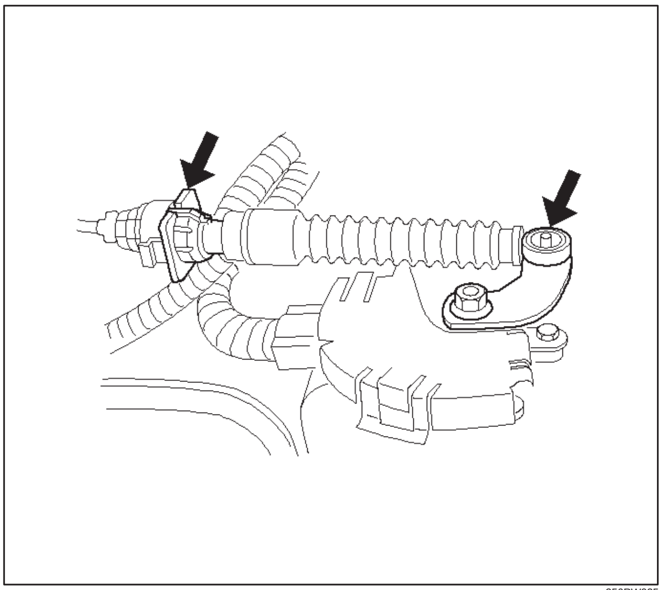
5. Install under covers to the transmission and engine.

Torque: 8 N•m (69 lb in)

6. Install starter.

Torque: 40 N•m (30 lb ft)

7. Install select cable by connecting inner cable to select lever and installing outer cable with bracket.

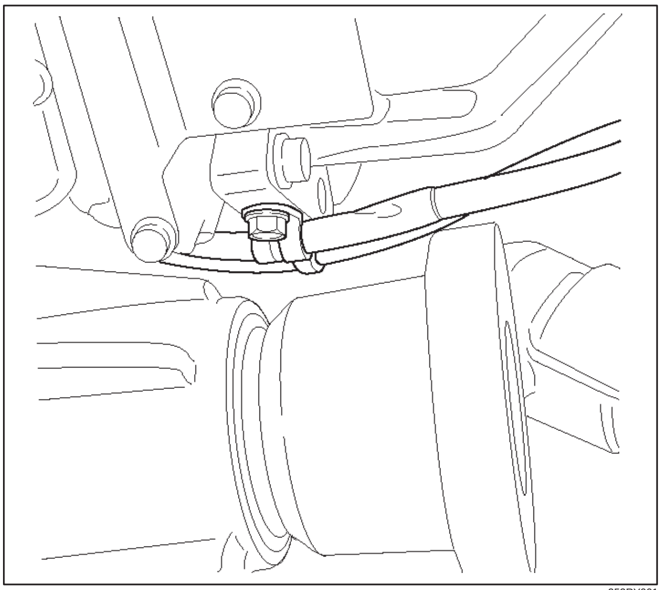


256RW025

8. Connect transmission oil cooler pipes to A/T.

Torque: 44 N•m (33 lb ft)

9. Install oil cooler pipe clamp and bracket to the converter housing.



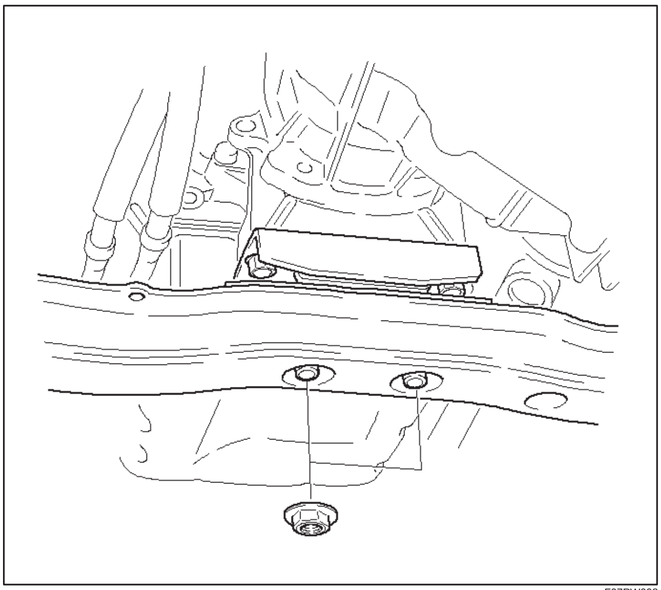
253RY001

10. Tighten oil cooler pipe clamp bolt at the engine mount side.
11. Install third crossmember.

Torque: 76 N•m (56 lb ft)

12. Install rear mount nuts.

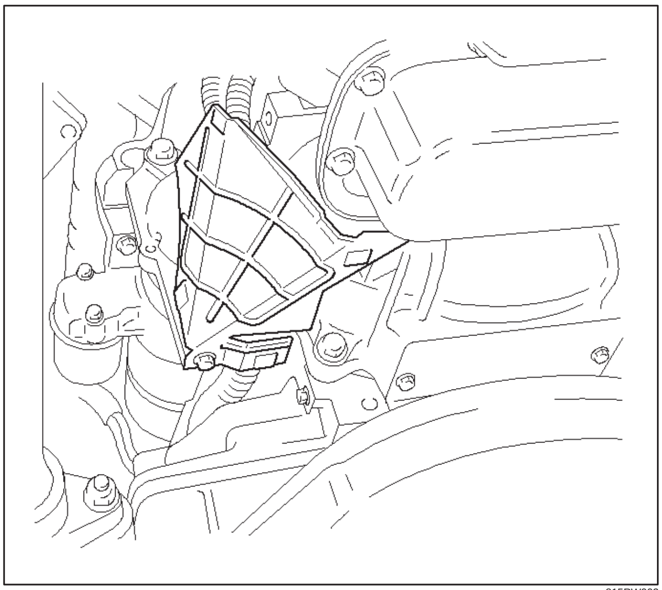
Torque: 50 N•m (37 lb ft)



F07RW008

13. Install harness heat protector.

Torque: 6 N•m (52 lb in)



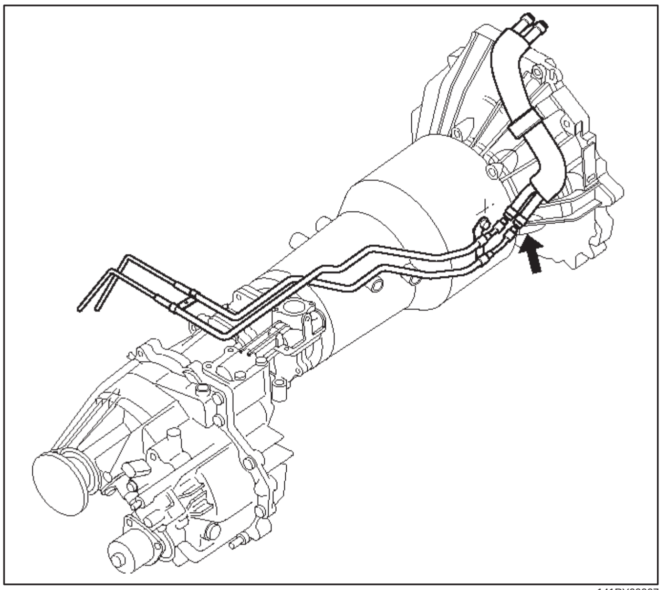
815RW002

14. Connect transmission harness connector and clip.

Connector : Adapter case, mode switch, main case, magnetic sensor, transfer switch, 2–4 actuator and car speed sensor.

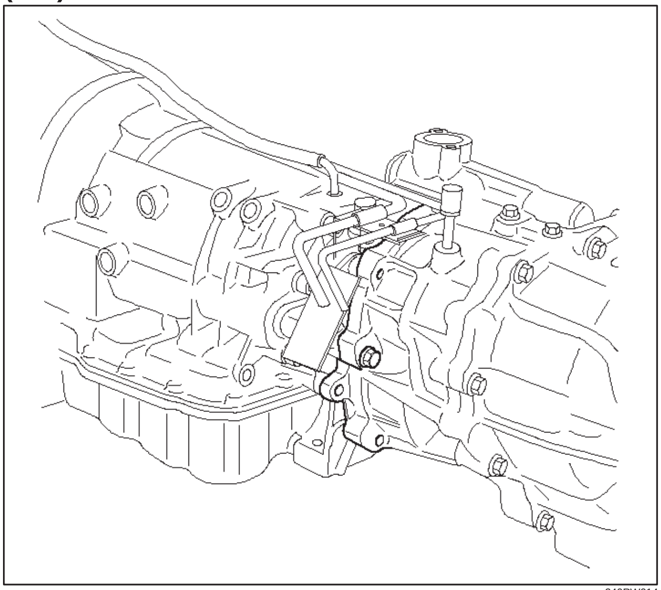
15. Connect fuel pipe bracket to transmission side.

NOTE: See “NOTE” of removal steps.



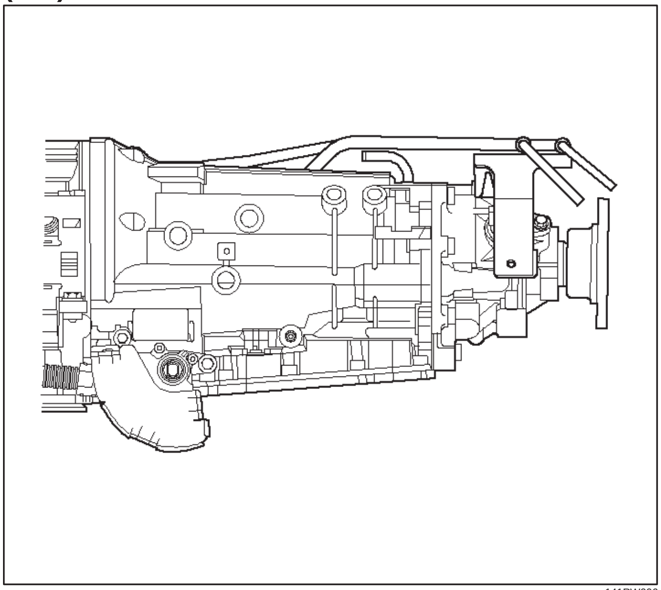
141RY00007

(4×4)



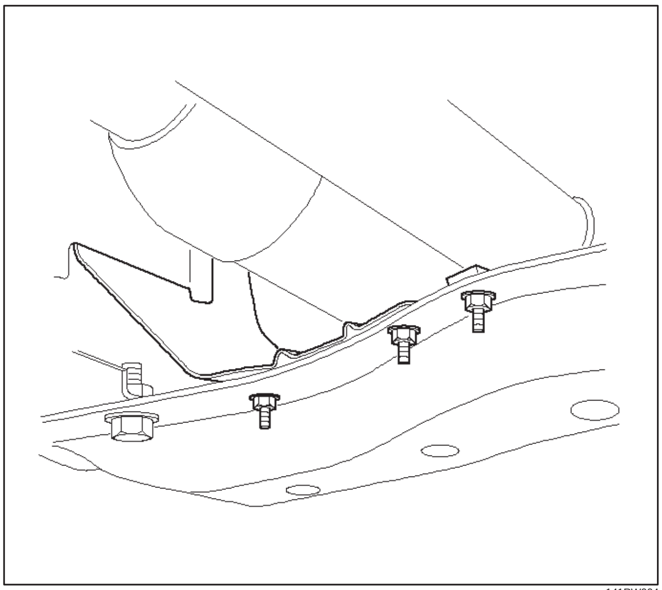
240RW014

(4×2)



141RW006

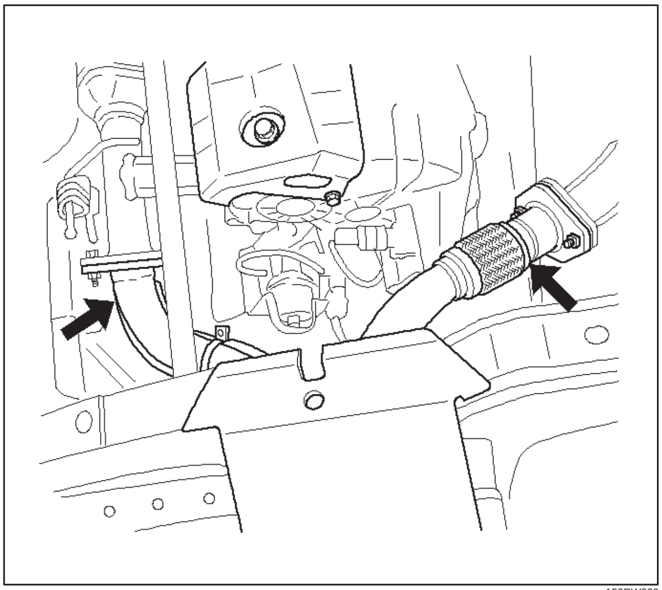
16. Install fuel pipe heat protector and clip.



141RW004

17. Install center exhaust pipe (4×4).

Torque: 43 N•m (32 lb ft)

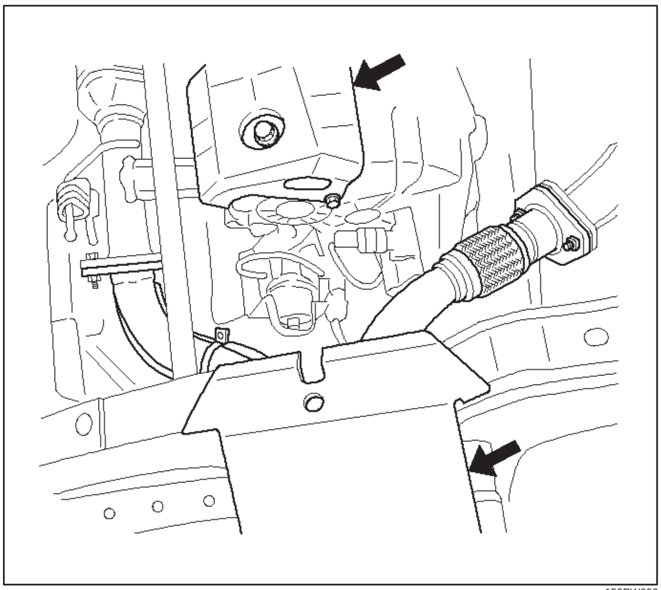


150RW008

18. Install front propeller shaft (4×4) and rear propeller shaft.

Torque: 63 N•m (46 lb ft)

19. Install transfer protector (4×4) and fairing plate.

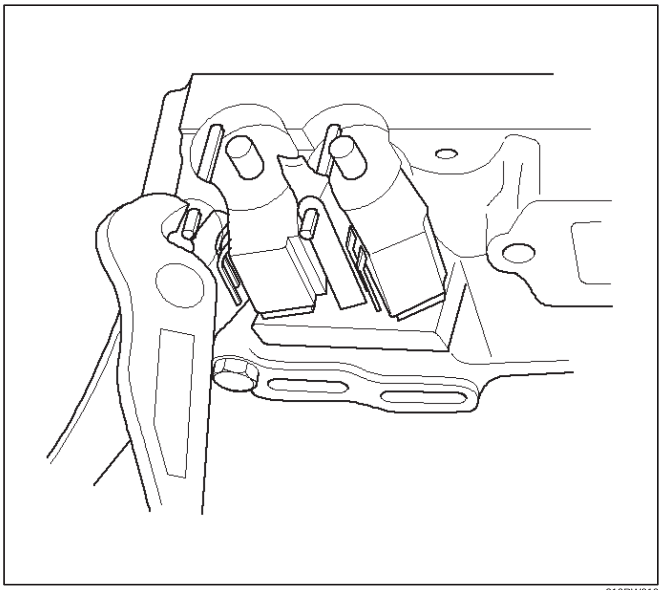


150RW006

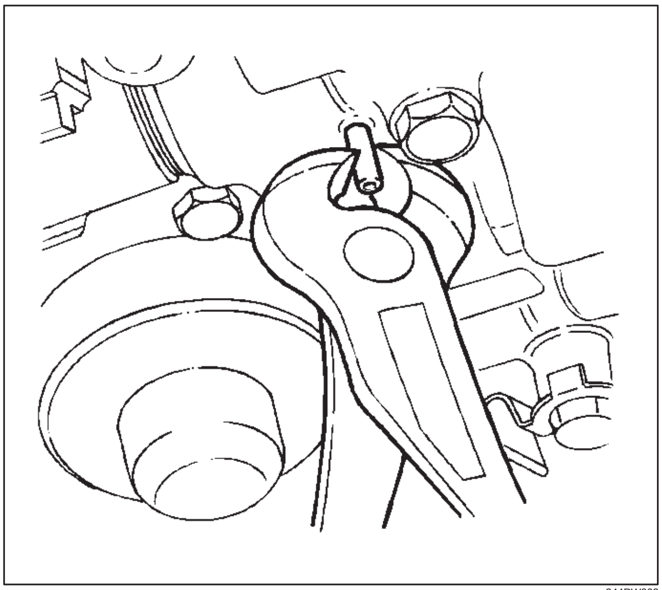
Solenoid (Main Case Valve Body)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove sixteen 10 mm screws, main case oil pan, magnet, and gasket.
5. Remove three 13 mm screws, oil filter.
6. Disconnect wiring harness from band control solenoid and shift solenoids. Pull only on connectors, not on wiring harness.
7. Remove spring pin for shift solenoid A, shift solenoid B, and band control solenoid respectively, using suitable pliers taking care not to damage solenoids.



210RW010

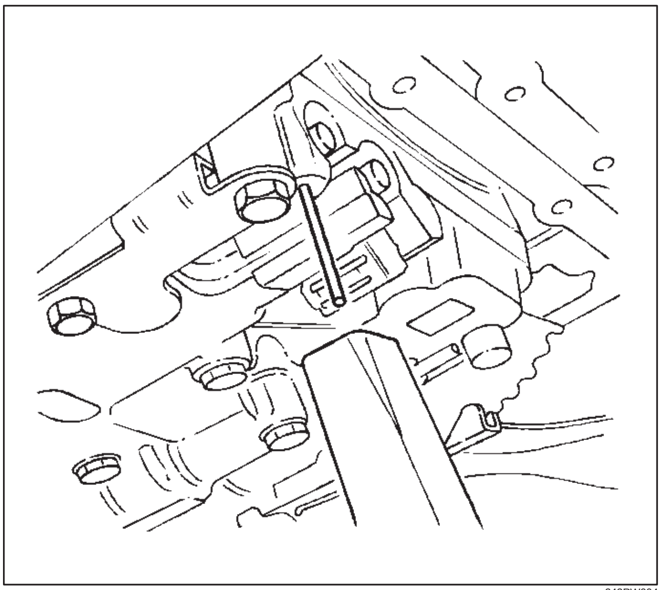


244RW003

8. Remove shift solenoid A, shift solenoid B, band control solenoid, and gaskets from main case valve body. Do not pull on wiring harness. Remove solenoids by grasping the metal tip.

Installation

1. Install shift solenoid A, shift solenoid B, band control solenoid with new gaskets to main case valve body respectively.
2. Carefully install spring pin with hammer to avoid damage to valve body, etc.



243RW004

3. Connect wiring harness to solenoids.
4. Install oil filter with a new gasket and the three 13 mm screws, tighten to the specified torque.

Torque: 20 N•m (15 lb ft)

5. Install magnet, main case oil pan with new gasket, and sixteen 10 mm screws. Tighten the screws to the specified torque.

Torque: 11 N•m (96 lb in)

6. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®–III. Refer to Changing Transmission Fluid in this section.
7. Connect battery ground cable.

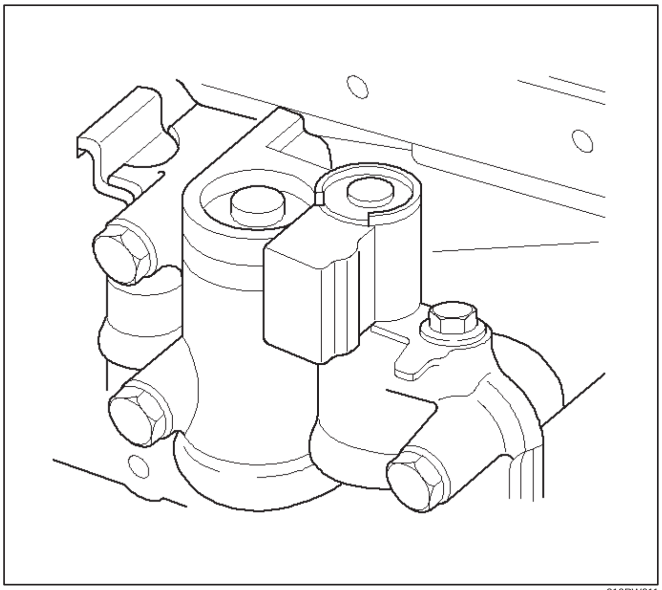
Solenoid (Adapter Case Valve Body)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove adapter case oil pan twelve fixing 10 mm screws, adapter case oil pan, and gasket.

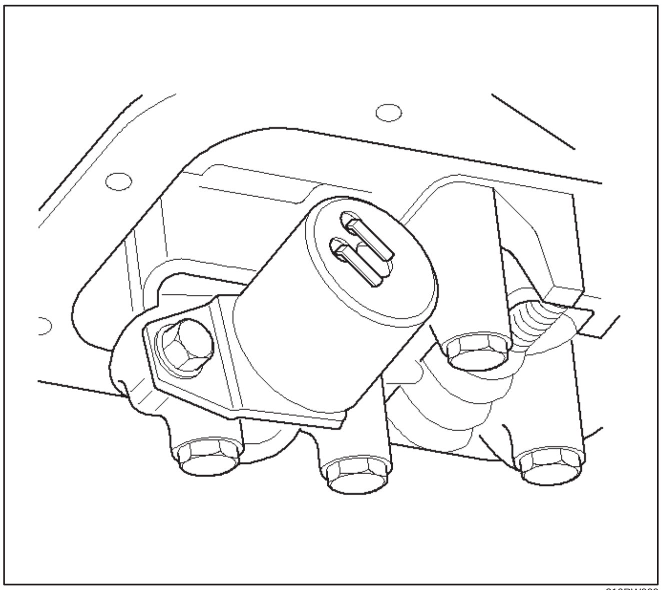
NOTE: Oil pan still contains transmission fluid. Place a large drain container under the oil pan and drain the fluid carefully.

5. Disconnect wiring harness from force motor solenoid and converter clutch solenoid. Pull only on connectors, not on wiring harness.
6. Remove 11 mm bolt and converter clutch solenoid with two O-rings.



210RW011

7. Remove 11 mm bolt, retainer, and force motor solenoid.



210RW009

Installation

1. Install force motor solenoid, retainer, and 11 mm bolt to adapter case valve body. Tighten the bolt to the specified torque.

Torque: 10 N•m (87 lb in)

2. Install converter clutch solenoid with two O-rings, and 11 mm bolt to adapter case valve body. Tighten the bolt to the specified torque.

Torque : 10 N•m (87 lb in)

3. Connect wiring harness assembly to solenoids.
4. Install adapter case oil pan, new gasket, and twelve 10 mm screws. Tighten the screws to the specified torque.

Torque : 11 N•m (96 lb in)

5. Fill transmission through overfill screw hole oil pan, using ATF DEXRON®–III. Refer to Changing Transmission Fluid in this section.
6. Connect battery ground cable.

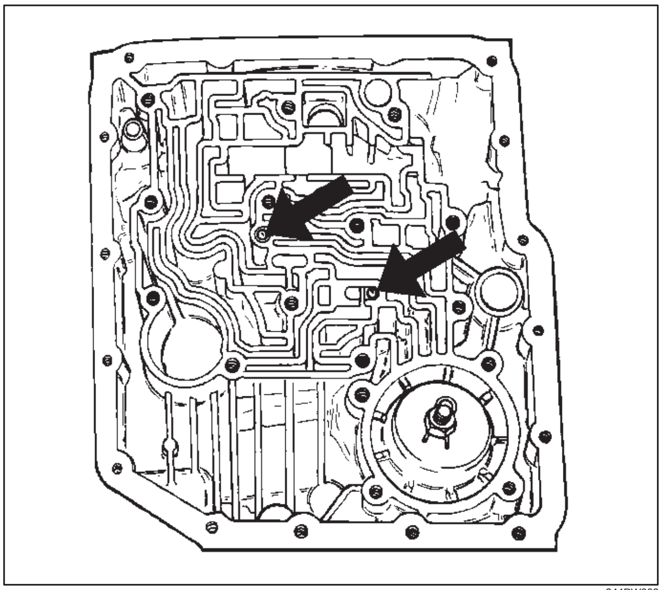
Valve Body Assembly (Main Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove sixteen 10 mm screws, main case oil pan, magnet and gasket.
5. Remove three 13 mm oil filter fixing screws, then remove oil filter.
6. Remove two 13 mm manual detent fixing screws, then remove roller and spring assembly.
7. Disconnect wiring harness from band control solenoid and shift solenoids. Pull only on connectors, not on wiring harness.
8. Remove four 13 mm servo cover fixing screws, then remove servo cover and gasket.
9. Remove seven 13 mm valve body fixing screws.
10. Remove main case valve body with manual valve link and transfer plate. Note the position of the link (long end into valve, short end into range selector lever).
11. Remove transfer plate gasket from main case.
12. Remove two check balls from main case.

Installation

1. Install two check balls to main case.



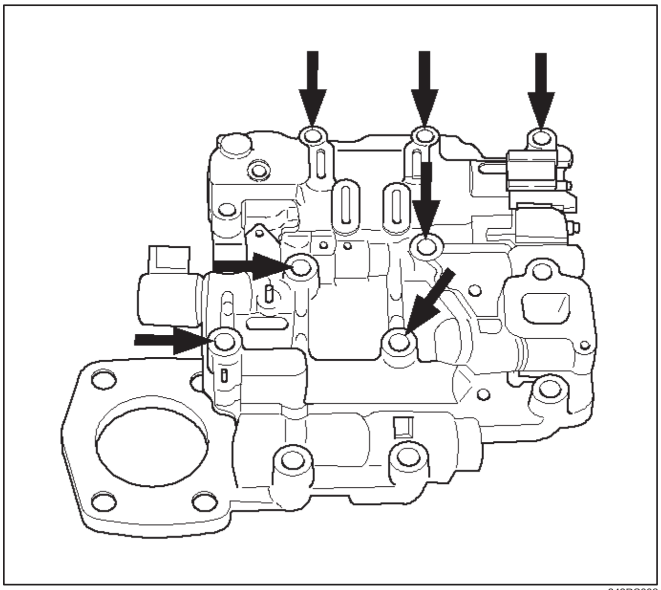
244RW002

2. Inspect electrical 7 way connector and seal of main case. Replace if necessary.
3. Use two J–25025–B guide pin to install main case.
   - Install valve body complete assembly and manual valve link.

NOTE: Valve must be extended as the short end of manual valve link is connected to the range selector lever. Long end of link goes into valve.

4. Install seven 13 mm screws, and tighten them to the specified torque.

Torque: 20 N•m (15 lb ft)



243RS008

5. Remove two guide pins from main case.
6. Install servo cover gasket, cover, and four 13 mm screws. Tighten the screws to the specified torque.

Torque: 25 N•m (18 lb ft)

7. Connect wiring harness to band control and shift solenoids.
8. Install roller and spring assembly to manual detent.
   - Install two 13 mm screws, and tighten them to the specified torque.

Torque: 20 N•m (15 lb ft)

9. Install oil filter and three 13 mm screws. Tighten to the specified torque.

Torque : 20 N•m (15 lb ft)

10. Install oil pan gasket, magnet, oil pan and sixteen 10 mm screws. Tighten the screws to the specified torque.

Torque: 11 N•m (96 lb in)

11. Fill transmission through overfill screw hole of oil pan, using ATF DEXRON®–III. Refer to Changing Transmission Fluid in this section.
12. Connect battery ground cable.

Valve Body Assembly (Adapter Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove twelve 10 mm adapter case oil pan fixing screws, adapter case oil pan, and gasket.

NOTE: Oil pan still contains transmission fluid. Place a large drain container under the oil pan.

Drain the fluid carefully.

5. Disconnect wiring harness from force motor solenoid and converter clutch solenoid. Pull only on connectors, not on wiring harness.
6. Remove seven 13 mm screws from adapter case valve body assembly, then remove transfer plate, two gaskets, and adapter case valve body.

Installation

1. Inspect electrical 4 way connector and seal of adapter case. Replace if necessary.
2. Install gasket, transfer plate, and gasket.
3. Install adapter case valve body and seven 13 mm screws. Tighten the screws to the specified torque.

Torque: 20 N•m (15 lb ft)

4. Connect wiring harness assembly to converter clutch solenoid and force motor.
5. Install oil pan gasket, oil pan, and twelve 10 mm screws. Tighten the screws to the specified torque.

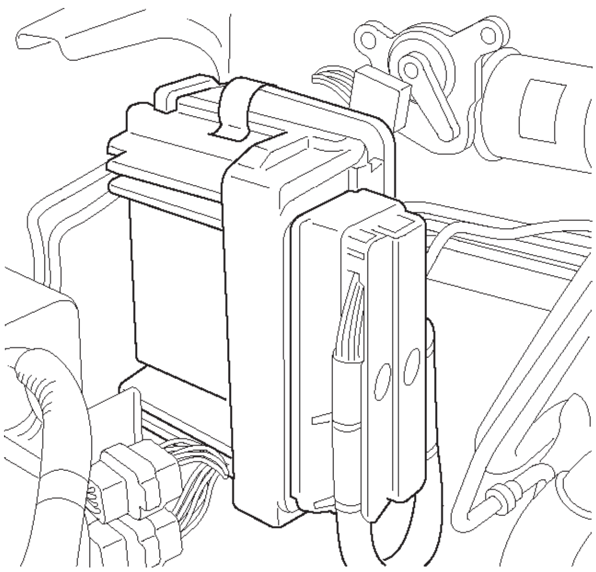
Torque: 11 N•m (96 lb in)

6. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®–III, refer to Changing Transmission Fluid in this section.
7. Connect battery ground cable.

Powertrain Control Module (PCM)

Removal

1. Disconnect battery ground cable.
2. Disconnect PCM wiring harness connectors from PCM.
3. Remove PCM from bracket.



826RY001

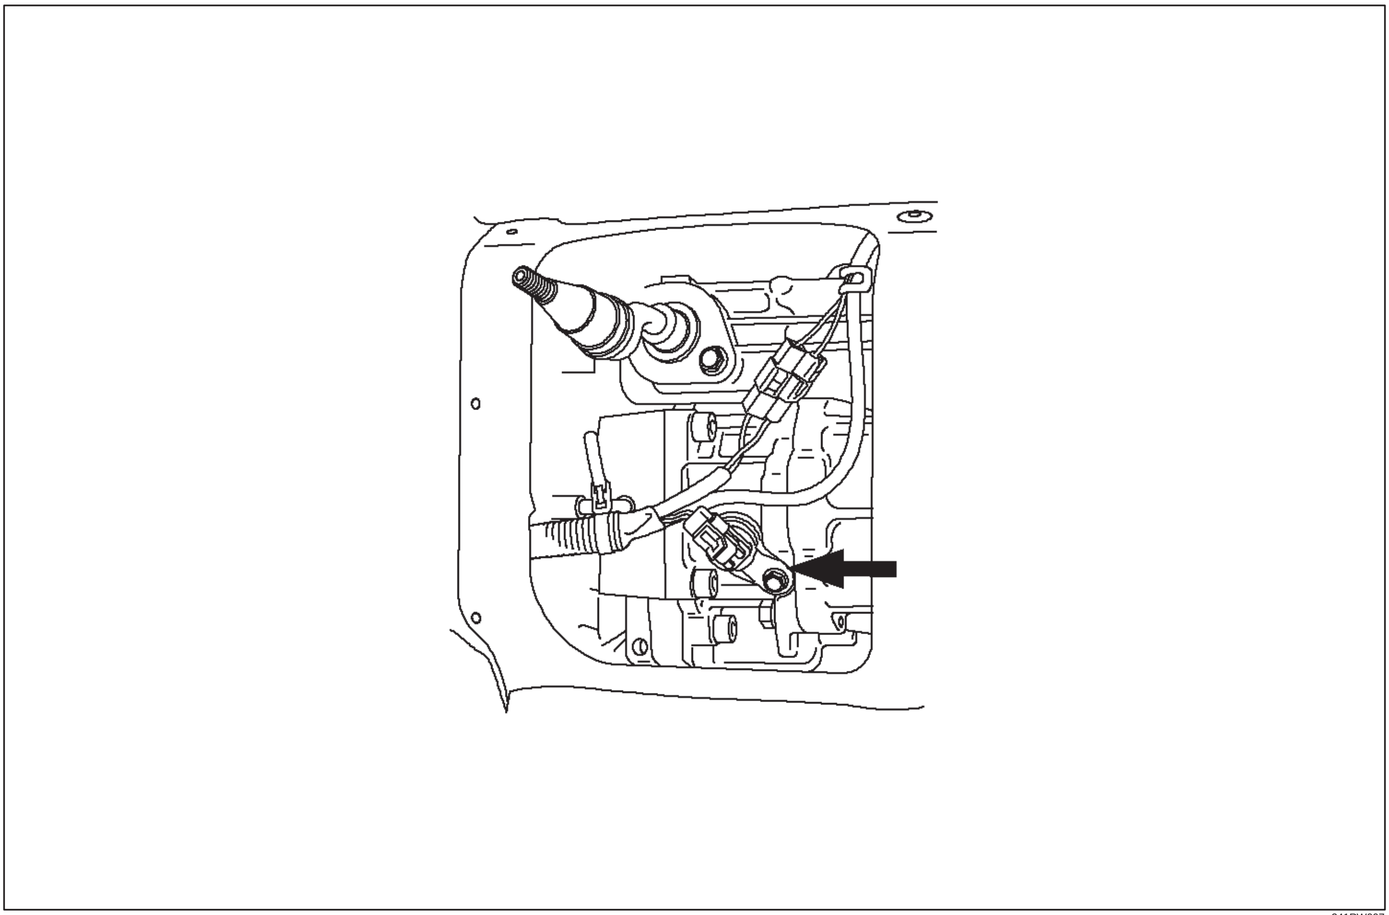
Installation

1. Install PCM to bracket.
2. Connect PCM wiring harness connectors to PCM.
3. Connect battery ground cable.

Speed Sensor (Extension Housing)

Removal

1. Disconnect battery ground cable.
2. Remove front console.
3. Remove selector lever assembly.
4. Disconnect speed sensor harness connector from speed sensor.
5. Remove one 10 mm screw and speed sensor with O-ring.



241RW007

Installation

1. Inspect the speed sensor O-ring, and replace it if necessary.
2. Install speed sensor assembly and 10 mm screw.

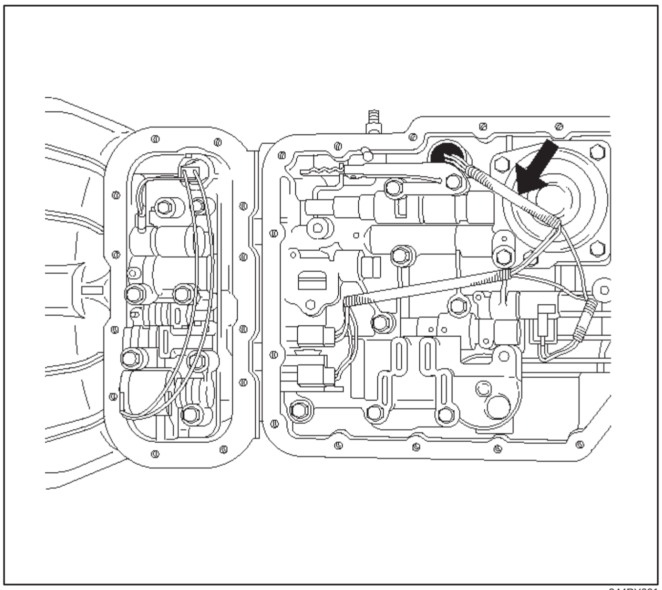
   Torque: 9 N•m (78 lb in)

3. Connect speed sensor harness connector to speed sensor.
4. Install selector lever assembly.
   - Adjust shift lock cable. Refer to Shift Lock Cable in this section.
5. Install front console.
6. Connect battery ground cable.

Transmission Oil Temperature Sensor (Main Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove sixteen 10 mm main case oil pan fixing screws, main case oil pan, and gasket.
5. Disconnect wiring harness from shift solenoids, band apply solenoid, and 7 way connector of main case. Pull only on connectors, not on wiring harness.
6. Remove wiring harness assembly with transmission oil temperature sensor.



244RY001

Installation

1. Install wiring harness assembly with transmission oil temperature sensor to band apply solenoid, shift solenoids, and 7 way connector of main case.
2. Install oil pan gasket, oil pan and sixteen 10 mm fixing screws. Tighten the screws to the specified torque.

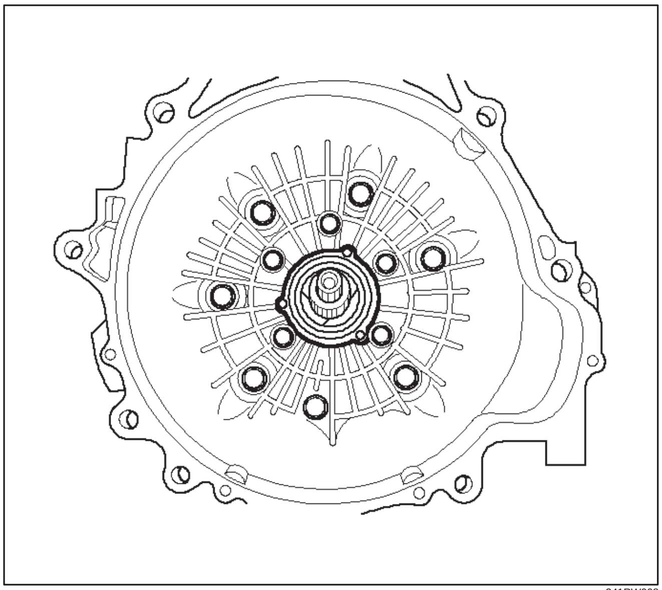
Torque: 11 N•m (96 lb in)

3. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®–III.
   Refer to Changing Transmission Fluid in this section.
4. Connect battery ground cable.

Front Oil Seal (Converter Housing)

Removal

1. Remove transmission assembly from the vehicle ,refer to Transmission in this section.
2. Remove torque converter from converter housing.
3. Remove three screws and oil seal ring from converter housing.



241RW008

Installation

1. Apply clean ATF to the new oil seal ring lip.
   - Install oil seal ring to converter housing, tighten to the specified torque.

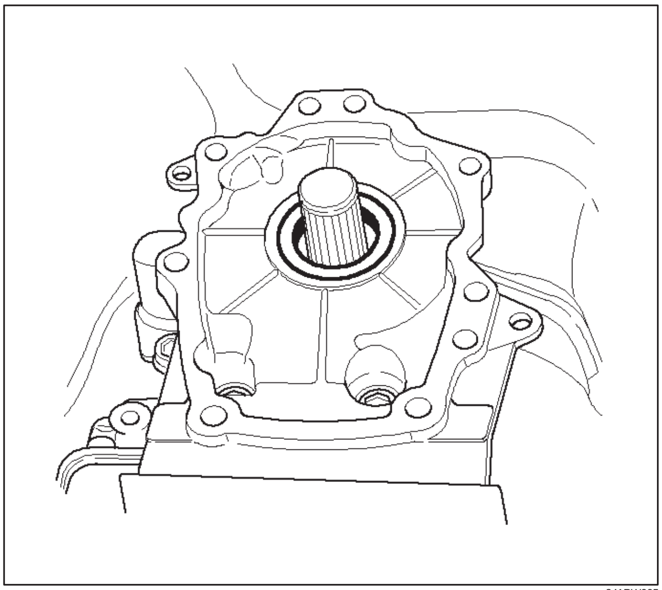
Torque: 3 N•m (26 lb in)

2. Install torque converter to converter housing.
3. Install transmission assembly to the vehicle, refer to Transmission in this section.

Rear Oil Seal (Extension Housing)

Removal

1. Remove transfer case assembly from the vehicle (4×4). Refer to Transfer Case in Drive Line/Axle section.
2. Remove rear oil seal from transmission extension housing.



241RW005

Installation

1. Use J–36797 extension housing oil seal installer, and install the rear oil seal to the transmission extension housing.
2. Install the transfer case assembly to the vehicle (4×4). Refer to Transfer Case in Drive Line/Axle section.

Transmission (4L30–E)

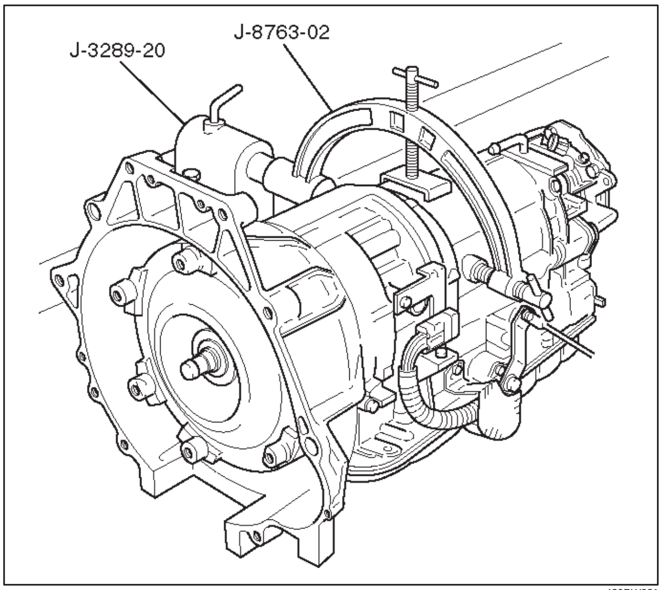
Disassembly

NOTE: During the disassembly and reassembly, perform the following:

- Wash each part thoroughly, and blow air through each oil passage and groove to eliminate blockage.
- Seal rings, roll pins, and gaskets should be replaced.
- When assembling the components, apply DEXRON®–III Automatic Transmission Fluid (ATF) to each seal, rotating part, and sliding part.
- Do not dip part facings, such as clutch or brake drive plates, in cleaner when washing it.
  Also, always coat parts with new ATF two or three times after cleaning with solvent.

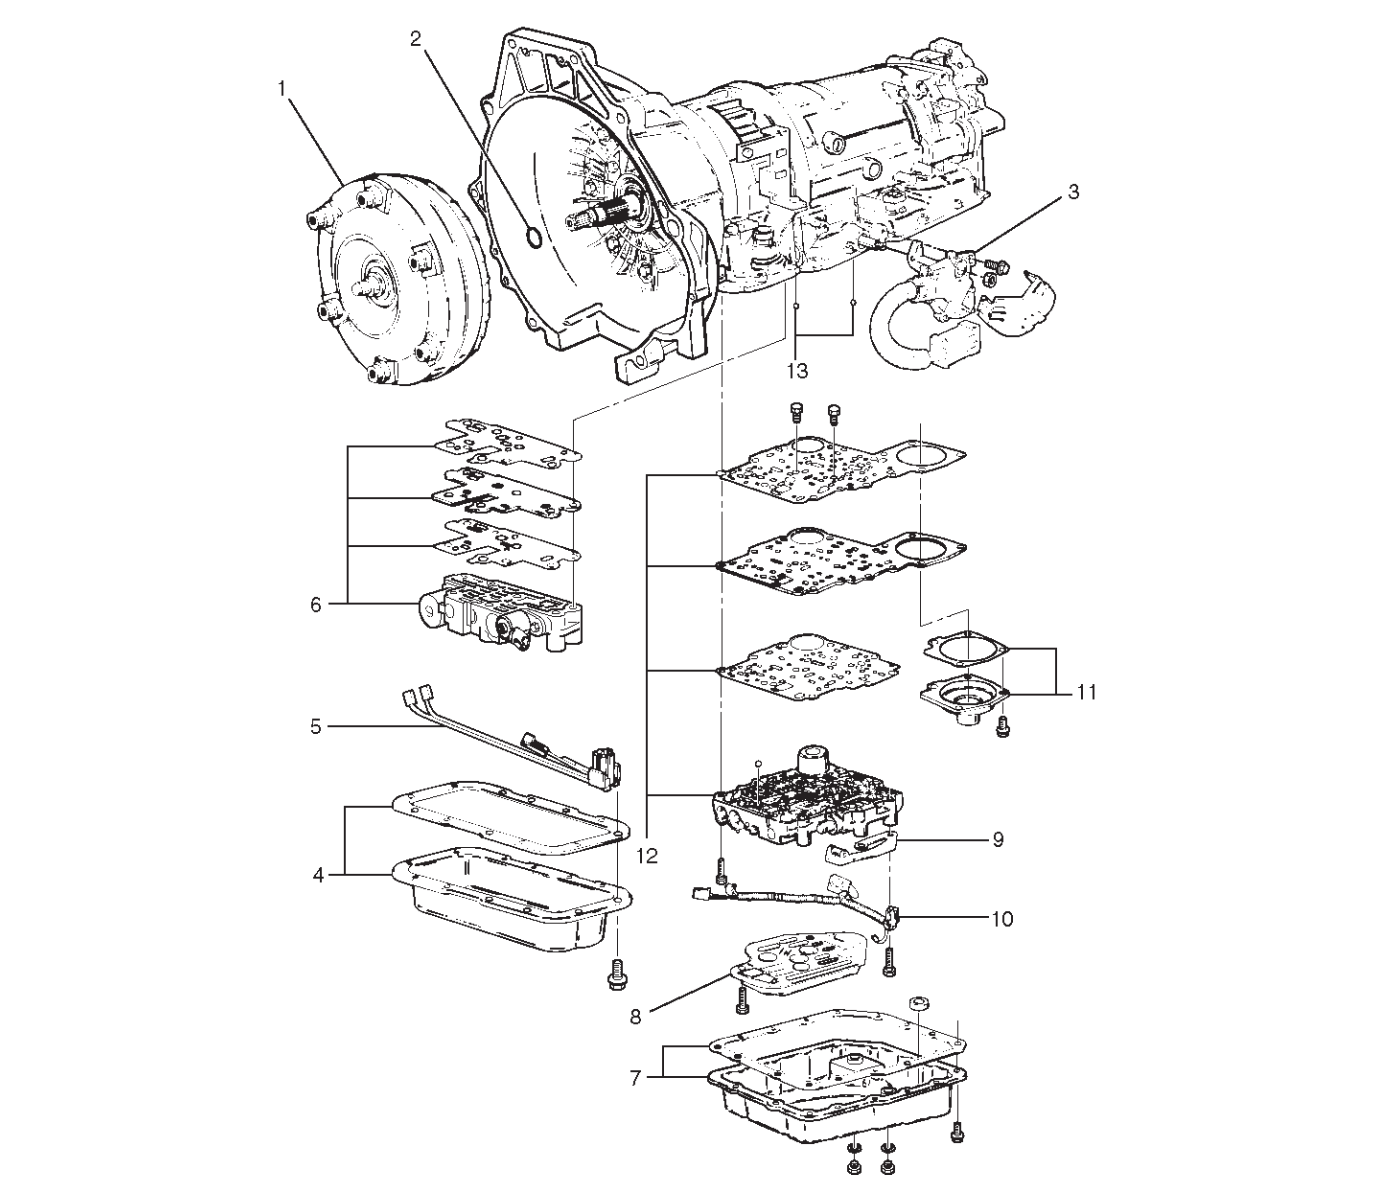
1. Remove torque converter (1).
   - Drain fluid from torque converter.
   - Attach J–8763–02 holding fixture to the transmission and set it on J–3289–20 holding fixture base.

NOTE: Do not overtighten the tool, as case damage may result.



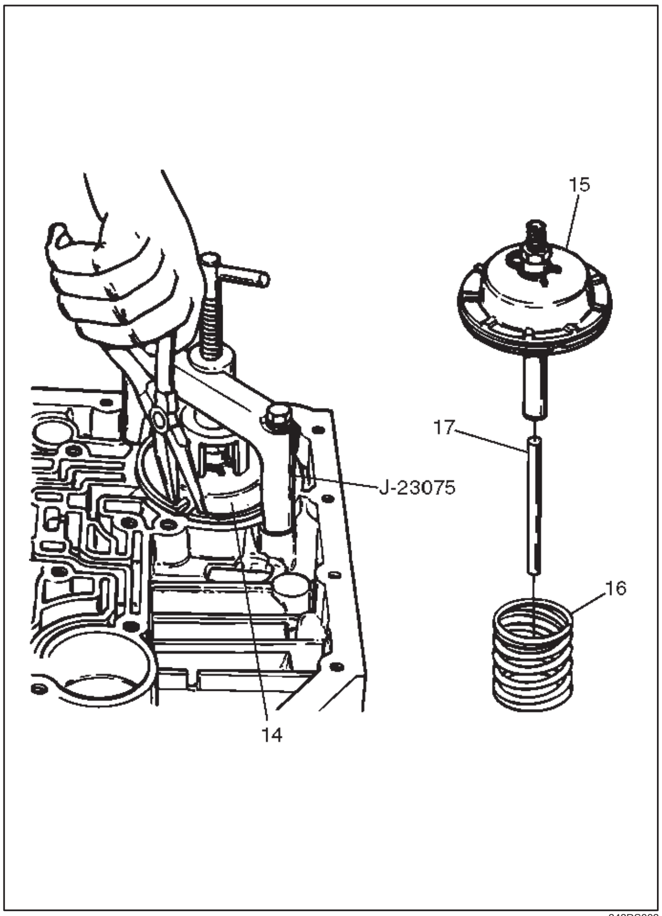
420RW021

2. Remove O-ring (2) from turbine shaft.
3. Remove two 10mm mode switch screws, selector lever nut, cover, and mode switch (3).
4. Remove twelve 10mm adapter case oil pan (4) fixing screws, adapter oil pan, and gasket.
5. Disconnect electrical wiring connections (5) from solenoids and 4 way connector of adapter case. Pull on connectors only, not on wiring harness.
6. Remove seven 13mm adapter case valve body (6) fixing screws, adapter case valve body assembly, transfer plate, and two gaskets.
   - Remove wiring harness and 4 way connector.
7. Remove sixteen 10mm main case oil pan (7) fixing screws, main oil pan, magnet, and gasket.
8. Remove three 13mm oil filter (8) fixing screws and oil filter.
9. Remove two 13mm manual detent (9) fixing screws, roller and spring, and manual detent.
10. Disconnect wiring harness assembly (10) from band apply solenoid, shift solenoids, and main case 7 way connector.
    Pull on connectors only, not on wiring harness.
11. Remove four 13mm servo cover (11) fixing screws, servo cover, and gasket.
12. Remove seven 13mm valve body screws and ground wire from main case.
    - Remove wiring harness assembly (5) from the adapter case side.
    - Remove main valve body assembly (12) with manual valve link and transfer plate. Note the position of the link (long end into valve, short end into range selector lever).
    - Remove 7 way connector.
    - Remove gasket transfer plate from main case.
13. Remove two check balls (13) from main case.



14. Turn transmission to vertical position to drain fluid. Return back to horizontal position when drained.
    - Install J–23075 servo piston spring compressor with offset to the rear of case.
    - Compress servo piston assembly.
    - Remove servo piston retaining ring (14).
    - Slowly release servo piston assembly (15).
    - Remove tool.

15. Remove servo piston assembly (15), return spring (16), and servo apply rod (17).



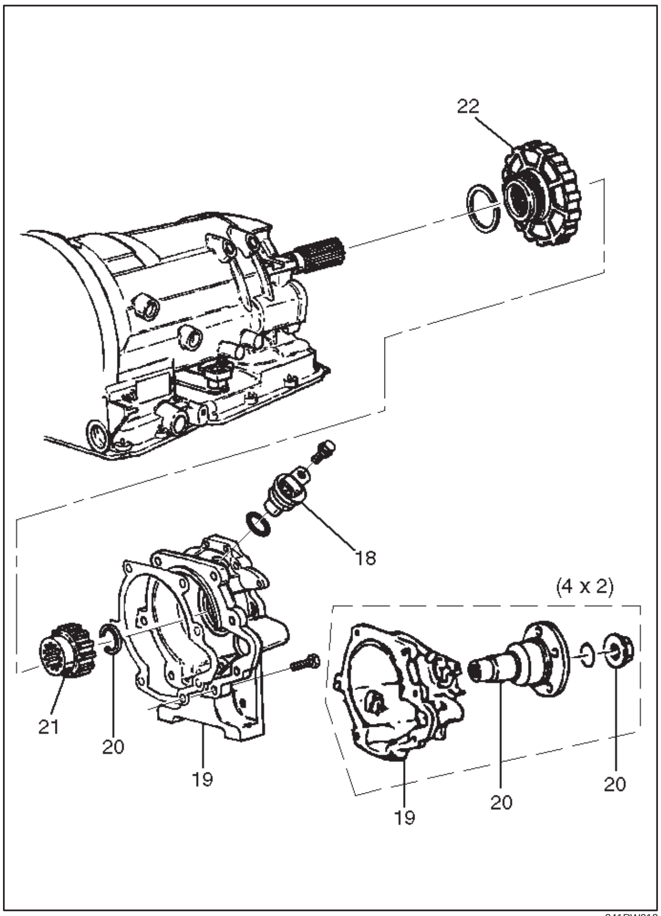
242RS002

16. Rotate transmission to horizontal position, pan side down.
    - Remove one 10mm screw, and speed sensor (18) with “O” ring.
17. Remove seven 8mm extension housing hexagon socket head screws, extension housing assembly (19), and gasket.
18. Remove retaining ring (20). (4×4)

NOTE: Use extra long, needle nose pliers.

- Remove flange nut (20). (4×2)
- Remove flange and O–ring (20). (4×2)

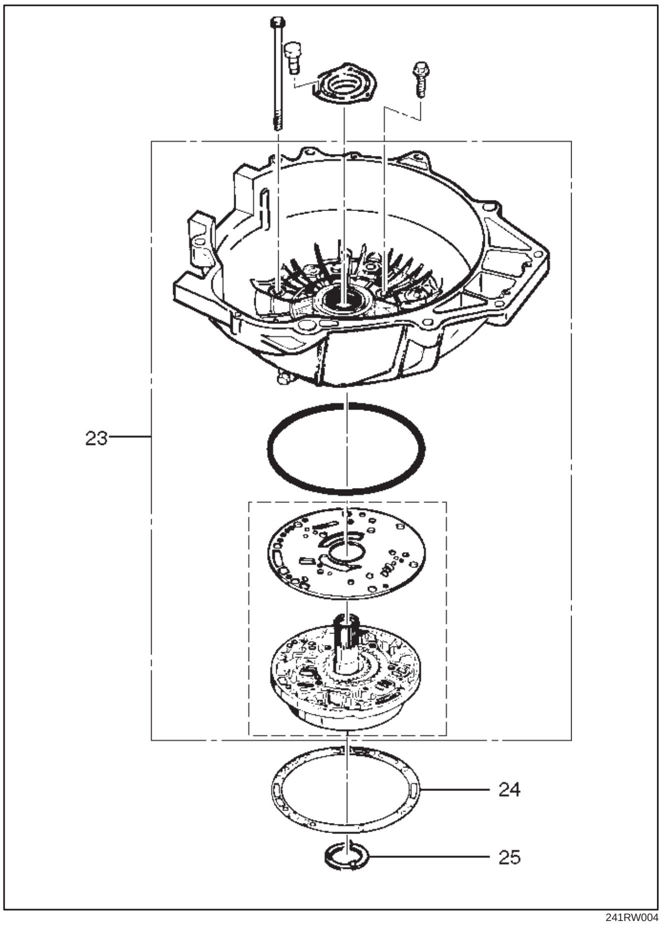
19. Remove speed wheel (21).
20. Remove wheel parking lock (with seal ring) (22).



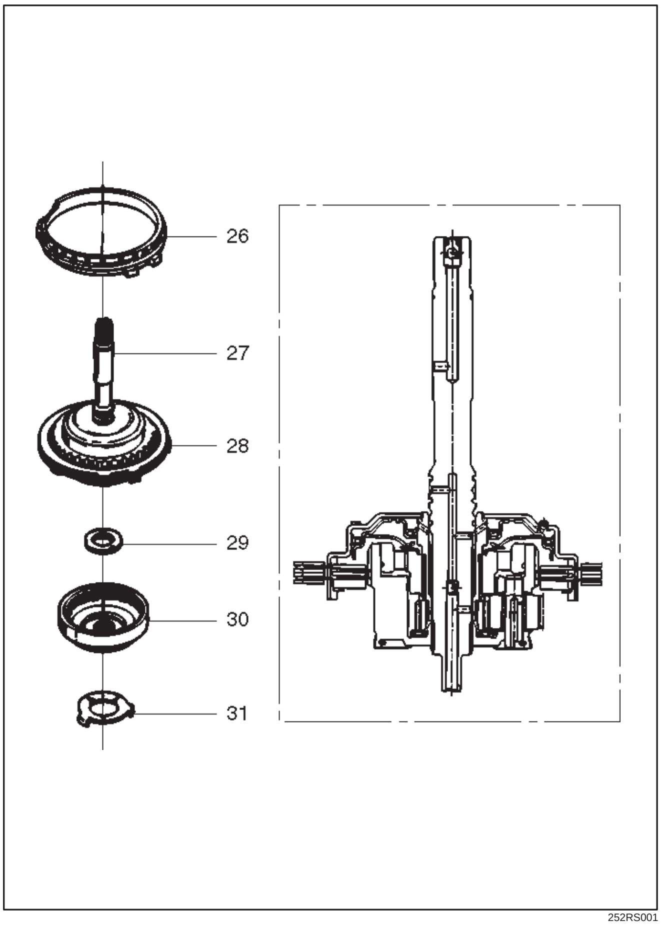
241RW012

21. Rotate transmission to vertical position, converter housing up.
    - Loosen the converter housing and oil pump assembly fixing screws, but do not remove, the five 13 mm inner screws unless oil pump disassembly is required.
    - Remove seven outer screws.
    - Remove converter housing and oil pump assembly (23).
22. Remove gasket (24).

23. Remove selective thrust washer (25).

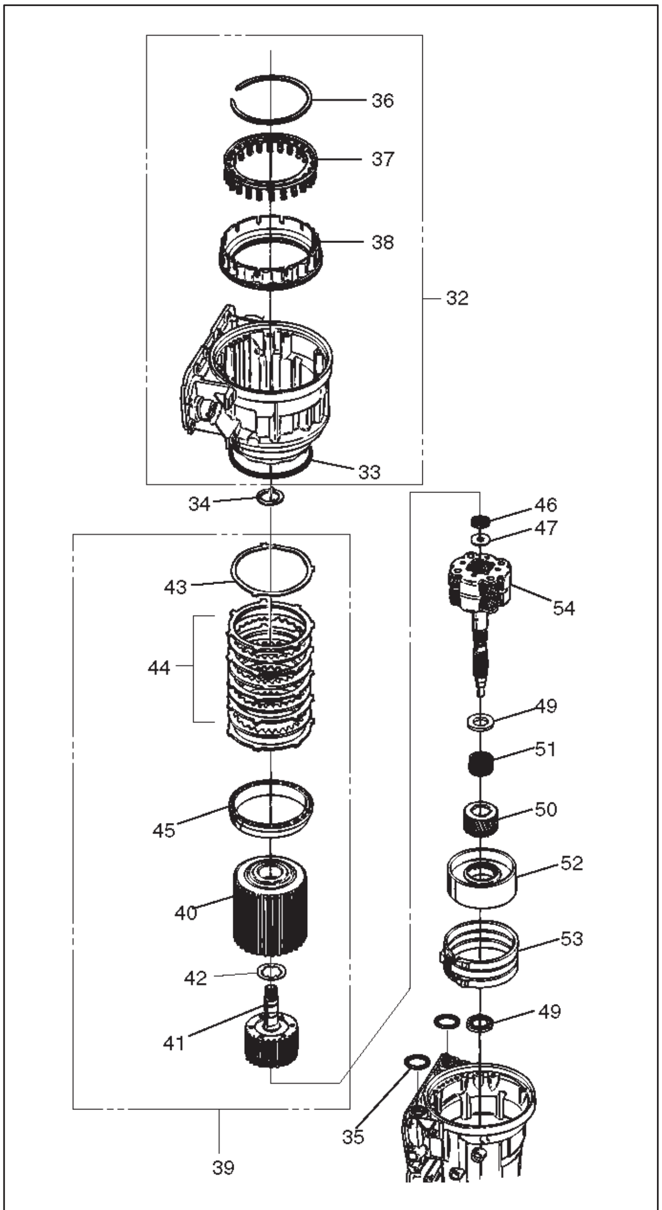


24. Remove fourth clutch retainer (26).
25. Grasp turbine shaft and lift out the overrun clutch housing assembly (27) and fourth clutch plates (28).
26. Remove thrust bearing assembly (29).
27. Remove overdrive internal gear (30).
28. Remove thrust washer (31).



29. Remove adapter case and center support assembly (with fourth clutch piston) (32).
30. Remove seal ring (33).
31. Remove selective thrust washer (34) and two O-ring seals (35) from main case.
32. Use J–23327 and J–23327–90 compressor to compress the fourth clutch spring retainer and springs (37).
    - Release snap ring (36) from groove.
    - Remove clutch compressor and snap ring (36).
33. Remove retainer and spring assembly (37).
34. Insert two converter housing/main case screws to hold adapter case while pulling out fourth clutch piston (38).
    - Remove fourth clutch piston assembly (38) from the adapter case.
    - Remove converter housing/main case screws.
35. Grasp intermediate shaft, twist and pull out the second and third clutch drum assemblies with reverse clutch plates while holding onto output shaft (39).

36. Separate second (40) and third clutch (41) assemblies.
37. Remove thrust washer (42).
38. Remove reverse clutch plates (43 and 44) and reverse clutch pressure plate (45).
39. Remove bearing (46) and washer (47).
40. Remove planetary carrier assembly (48).
41. Remove thrust bearing (49).
42. Remove reaction sun gear (50)
43. Remove needle bearing (51).
44. Remove brake drum (52).
45. Remove brake band (53).
46. Remove thrust bearing (54).



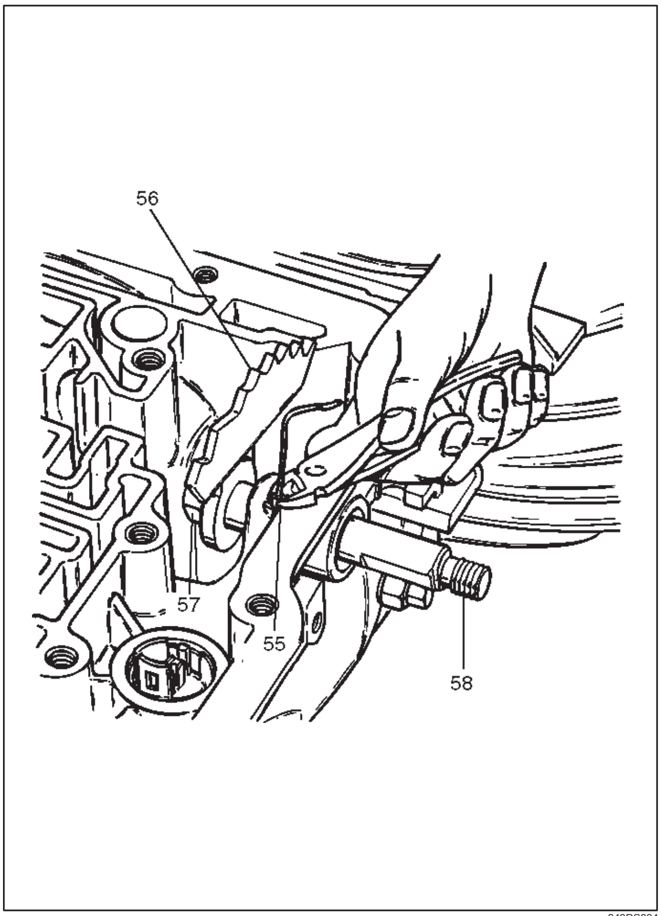
242RW005

47. Rotate case to horizontal position, valve body side facing up.
    - Remove spring pin (55), using cutting pliers, then remove parking lock and selector lever assembly (56).

NOTE: Insert wire in the center of the spring pin to prevent it from collapsing during removal. Be aware of pin height. Protect machined face of main case.

48. Remove parking lock and range selector lever 17 mm nut (57).
49. Remove parking lock and range selector lever (56), and actuator assembly.
50. Remove selector shaft (58).

NOTE: Inspect the shaft for burrs before removing to prevent damaging seal. If necessary, remove burrs by lightly sanding with an oilstone.



249RS004

Reassembly

1. Inspect selector shaft seal and replace it if necessary.

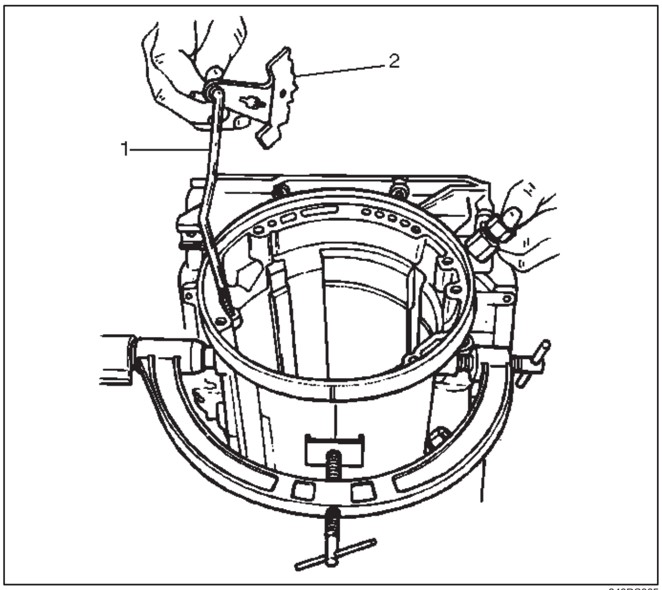
NOTE: Use a seal installer when replacing the seal.

- Install selector shaft.

NOTE: Spring pin groove must be positioned inside the case.

2. Install spring pin. Be sure the selector shaft can move freely.Do not push the pin flush with the case surface. Leave enough height for removal.
3. Install actuator assembly (1).
4. Install parking lock and range selector lever (2) and new 17 mm nut. Tighten the nut to the specified torque.

Torque: 22 N•m (16 lb ft)



249RS005

5. Rotate main case to vertical position, extension end facing down.
   - Install brake band assembly (3).

NOTE: Be sure to align servo pin area with the servo hole.

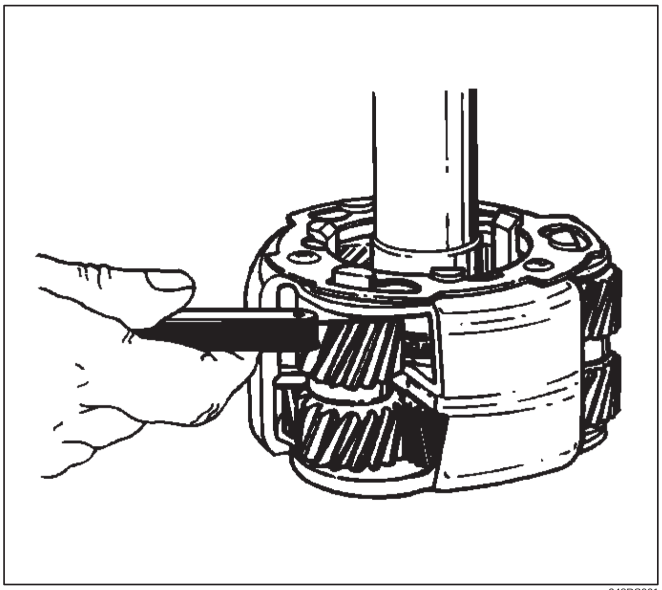
6. Install thrust bearing (4).

NOTE: The case bushing acts as a guide for the thrust bearing.

7. Install brake drum (5).
8. Install reaction sun gear (6).
9. Install needle bearing (7).
10. Inspect planetary carrier assembly (8) for wear and damage. If necessary replace it.
    - Measure pinion end play clearance with a feeler gauge.

Clearance: 0.13mm–0.89mm (0.005 in–0.035 in)

If clearance is outside specified value, replace the planetary carrier assembly.



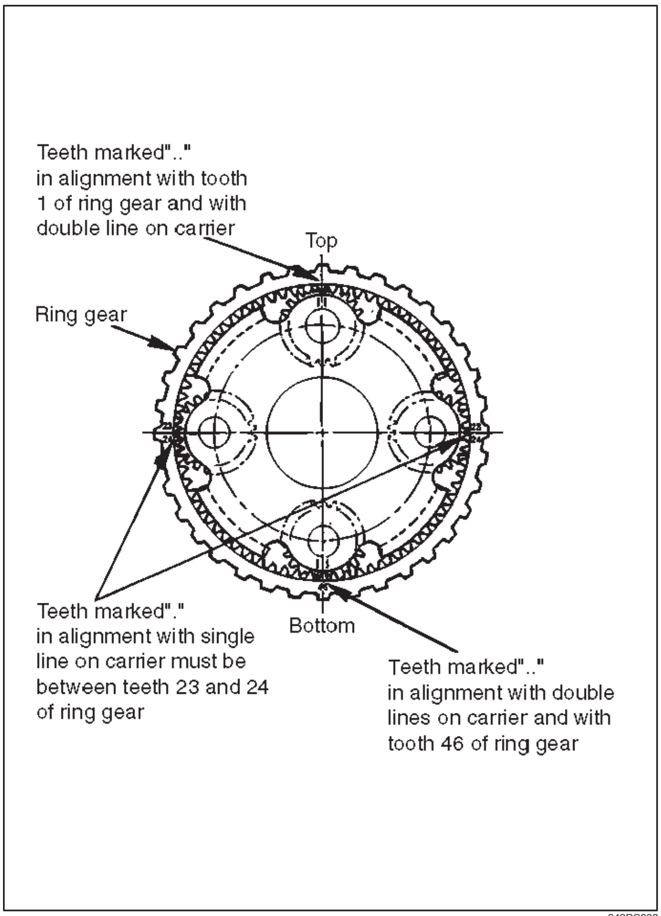
248RS001

11. Install the thrust bearing (9) on the output shaft.

NOTE: Use petroleum jelly to hold the thrust bearing in place.

12. Align planetary pinions. Each pinion is marked with double points to indicate the master tooth space and exactly opposite with a single point to indicate the master tooth. The markings on the planetary carrier consist of double lines which are to be lined up with the double points on two opposite pinions; the single lines are to be lined up with the single points on the other two pinions.
    - After all four pinions are lined up, slide on the third clutch assembly. Rotate third clutch and check mark alignment. Considering that the ring gear tooth between the double points of one planetary pinion is tooth number 1, count the teeth to check that the single points on the two adjacent pinions are between teeth 23 and 24 of the ring gear, and that the ring gear tooth between the double points of the opposite pinion is tooth number 46. If the ring gear and pinions are not lined up, remove and realign them.
13. Install planetary carrier (8) with third clutch (12).

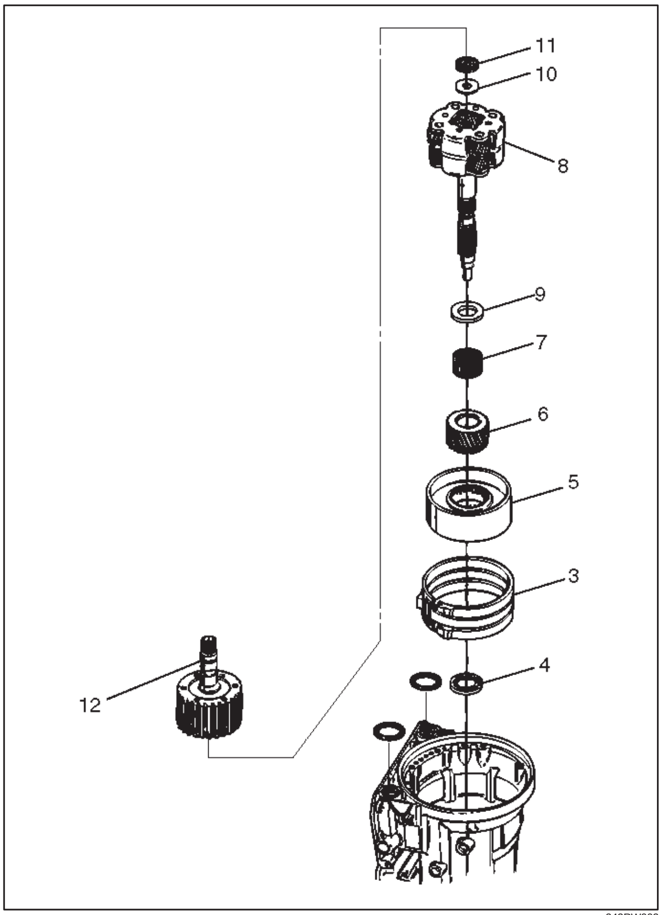
NOTE: Do not force. When properly aligned, the parts will fit together easily.



248RS002

14. Remove the third clutch (12).
15. Install bearing (11) and washer (10).

NOTE: Use petroleum jelly to hold the washer and bearing in place.

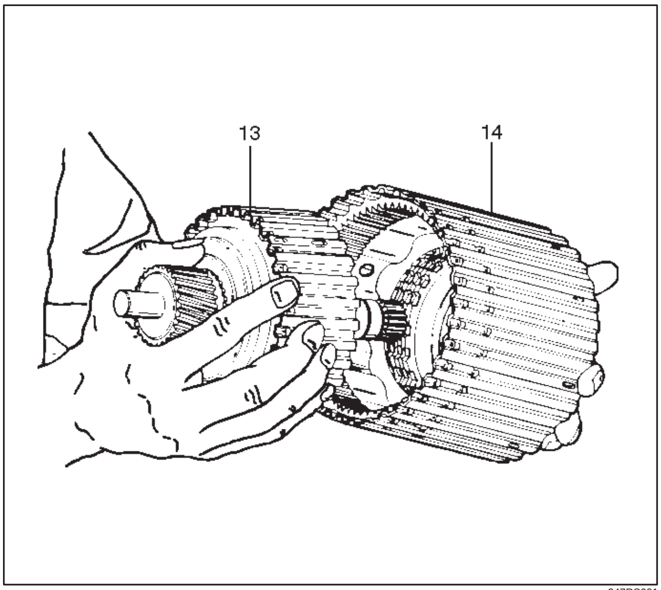


242RW002

16. Carefully align the second clutch plate inner tangs.
    - Install thrust washer, tangs pointing downward, and locating tang positioned in slot on second clutch hub.

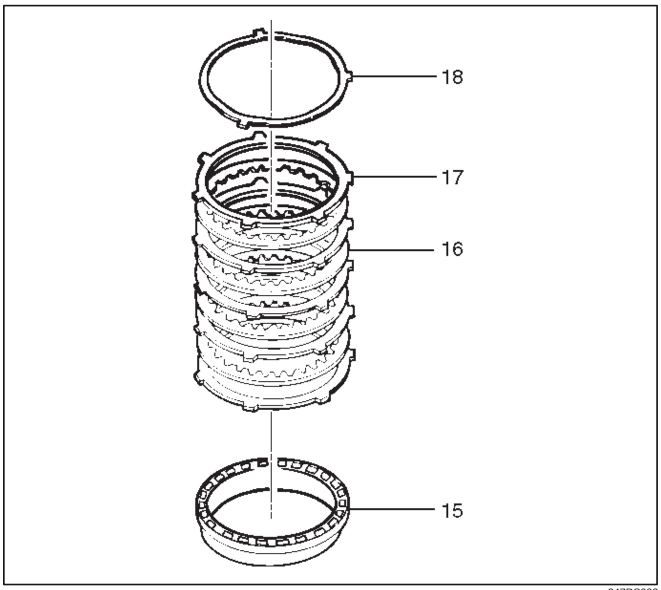
NOTE: Use petroleum jelly to hold thrust washer in place.

17. Install third clutch and intermediate shaft assembly (13) into the second clutch drum (14).
18. Install second and third clutch assemblies into the main case. Twist output shaft and clutch assemblies to ensure proper fit.



247RS001

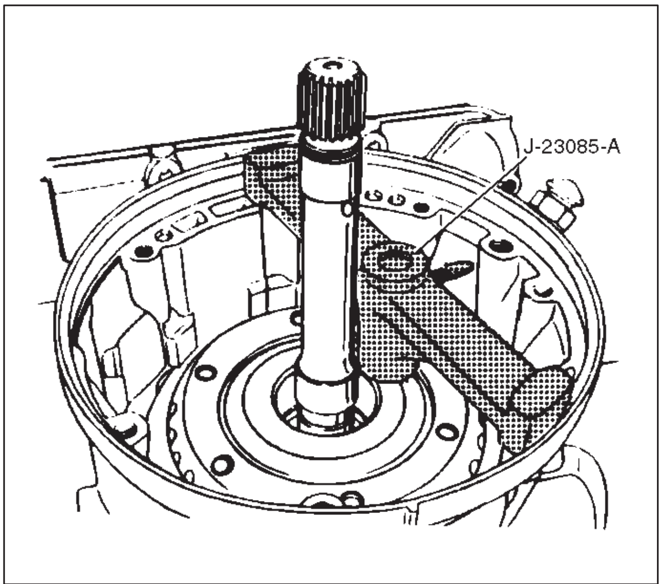
19. Install pressure plate (15) with lip side up, tang facing valve body face.
20. Install reverse clutch plates. Start with a steel plate (17) and alternate with a lined plate (16).
21. Install waved clutch plate (18) with center tang facing valve body side.



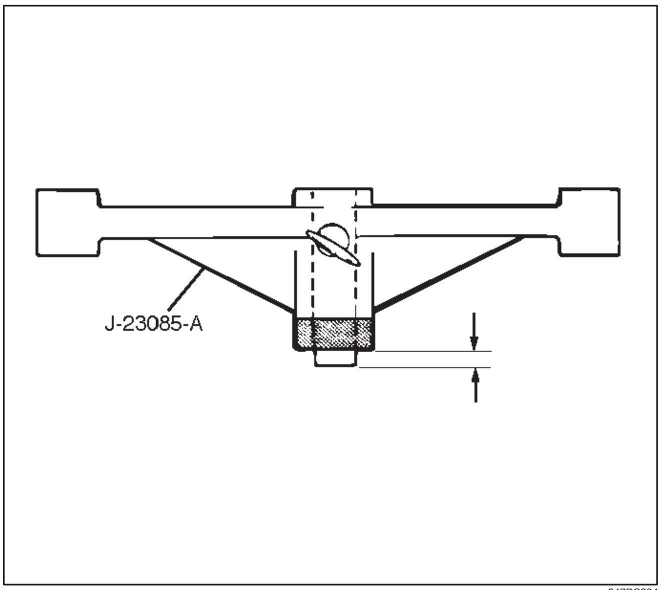
247RS002

22. Second clutch end play measurement
    1. Install the J–23085–A selective washer gauging tool (with spacer ring) on the case flange and against the intermediate shaft.
    2. Position the inner shaft of the gauging tool against the thrust surface of the second clutch hub.
    3. Tighten thumb screw. Remove the tool.
    4. Fit the spacer ring on the inner shaft of the tool.
    5. Measure the gap and select appropriate washer as shown in the chart.

Selective Thrust Washer	
Gap: mm(in)	**Color**
1.53 – 1.63 (0.060 – 0.064)	Yellow
1.72 – 1.82 (0.068 – 0.072)	Red
1.91 – 2.01 (0.075 – 0.079)	Black
2.10 – 2.20 (0.083 – 0.087)	Natural
2.29 – 2.39 (0.090 – 0.094)	Green
2.48 – 2.58 (0.098 – 0.102)	Blue
FOLLOWING THE PROCEDURE SHOULD RESULT IN FINAL END–PLAY FROM 0.36 mm TO 0.79 mm (0.014 in TO 0.031 in)	

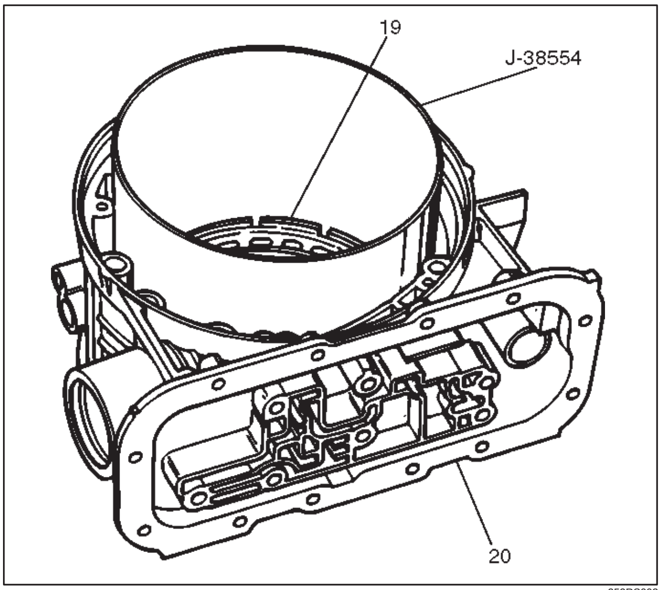


247RS003



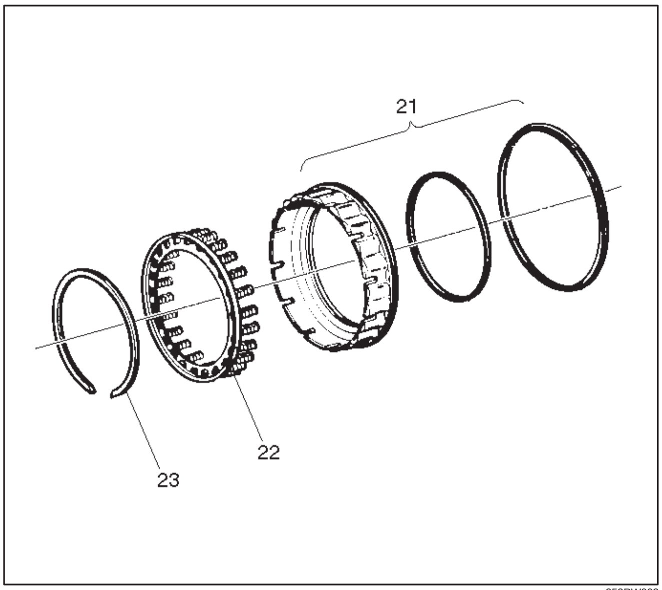
247RS004

23. Inspect fourth clutch piston seals and replace if necessary.
    - Lubricate J–38554 fourth clutch piston fitter and install it on fourth clutch piston (19).
    - Install fourth clutch piston (19) in adapter case (20).
    - Remove fitter.

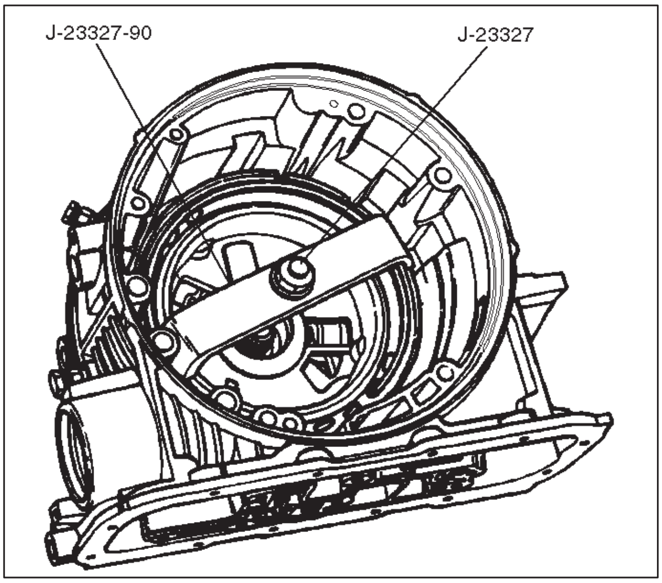


252RS003

24. Install retainer and spring assembly (22) into fourth clutch piston (21).
25. Install snap ring (23) in adapter case.
    - Install J–23327 and J–23327–90 fourth clutch spring compressor.
    - Seat snap ring in groove.
    - Remove compressor.

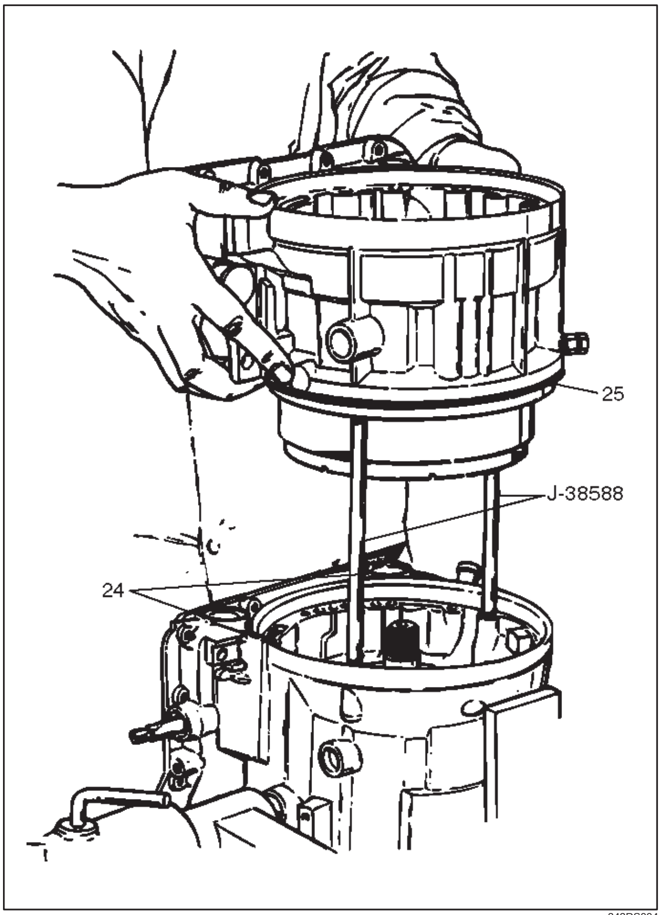


252RW002



252RS004

26. Install selective washer using petroleum jelly.
27. Install two O-ring seals (24) in main case and adapter case/main case seal ring (25).
28. Install J–38588 guide pins.
    - Install adapter case and center support assembly to main case.

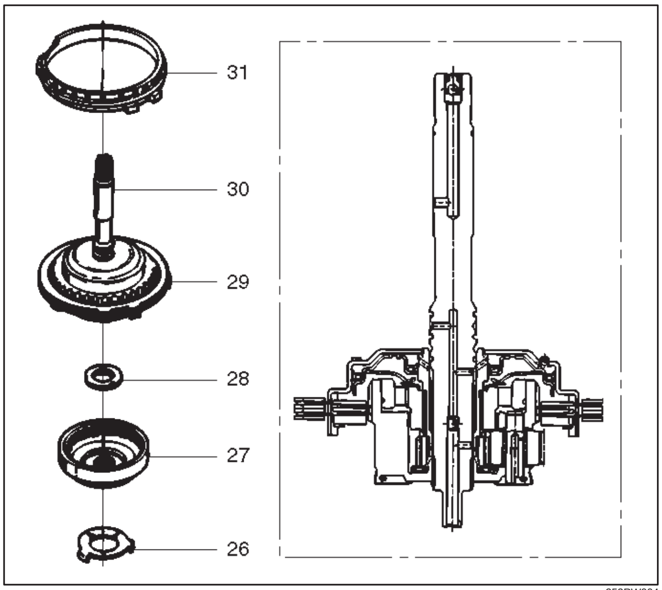


242RS004

29. Install thrust washer (26) into adapter case, with tangs pointing downwards.
30. Preassemble overdrive internal gear (27) and thrust bearing assembly (28) onto the turbine shaft and overrun clutch assembly.

NOTE: Install bearing assembly, black side up. Use petroleum jelly to keep assembly in place.

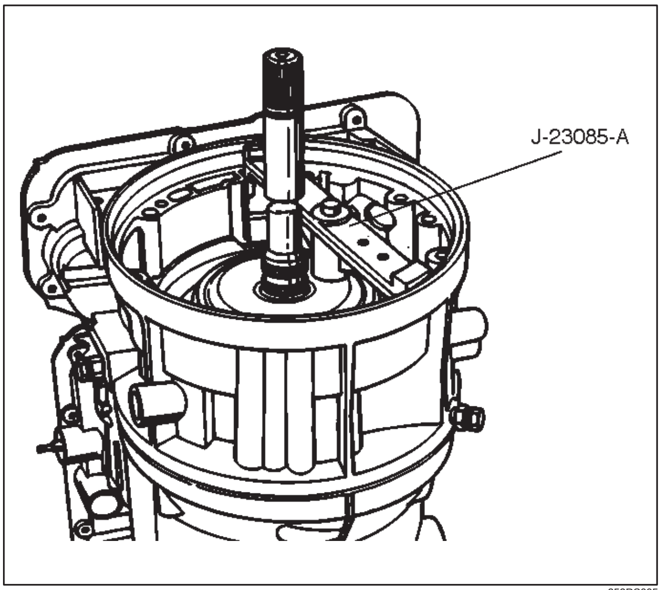
31. Install overdrive carrier (30) and internal gear assembly into adapter case.
32. Install fourth clutch plates (29) in the following order: Steel, Lined, Steel, Steel, Lined, Steel. Steel plates go in with short tang facing towards valve body surface.
33. Install fourth clutch retainer(31) with the notch facing up and positioned towards valve body surface.



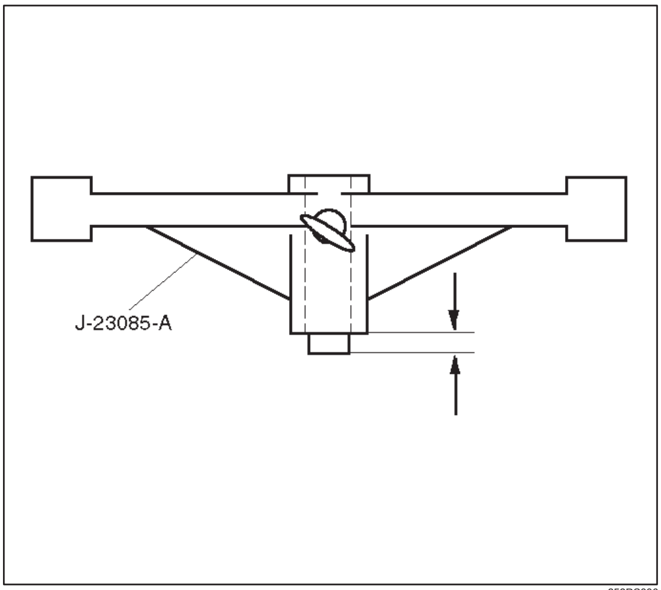
252RW004

34. Overdrive clutch end play measurement
    1. Install the J–23085–A selective washer gauging tool on the adapter case flange and against the input shaft.
    2. Position the inner shaft of the tool against the thrust surface of the overrun clutch housing.
    3. Tighten thumb screw. Remove the tool.
    4. Measure gap. Select appropriate size washer as shown in the chart.
    5. Set selective thrust washer aside.

Selective Thrust Washer	
Gap: mm(in)	**Color**
1.53 – 1.63 (0.060 – 0.064)	Yellow
1.72 – 1.82 (0.068 – 0.072)	Red
1.91 – 2.01 (0.075 – 0.079)	Black
2.10 – 2.20 (0.083 – 0.087)	Natural
2.29 – 2.39 (0.090 – 0.094)	Green
2.48 – 2.58 (0.098 – 0.102)	Blue
FOLLOWING THE PROCEDURE SHOULD RESULT IN FINAL END–PLAY FROM 0.1 mm TO 0.8 mm (0.004 in TO 0.03 in)	



252RS005



252RS006

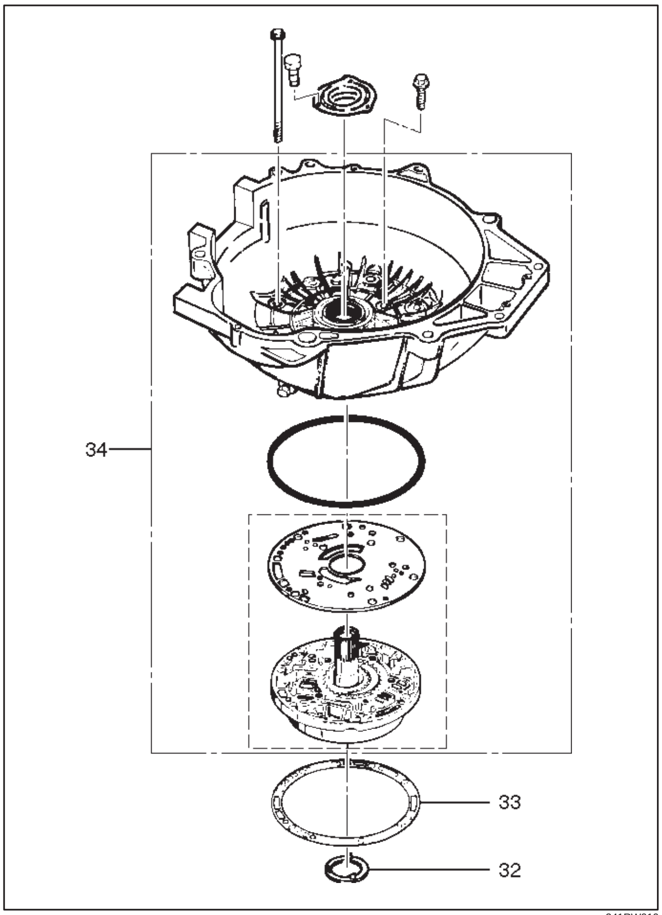
35. Install selective washer (32).

NOTE: Use petroleum jelly to hold selective washer in place.

36. Install gasket (33).
37. Install converter housing and oil pump assembly (34) to adapter case.
   - Fit and tighten seven outer 13 mm screws.

Torque: 39 N•m (29 lb ft)

   - Ensure free rotation of pump using J–23082–01 pump rotation tool.



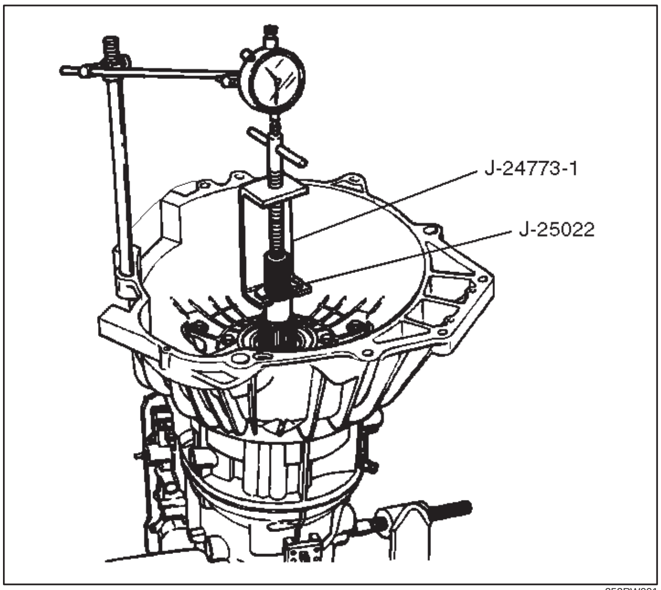
241RW010

38. Overdrive clutch end play measurement
   1. Fit J–25022 and J–24773–1 turbine shaft puller on turbine shaft.
   2. Position axial play checking tool on converter housing mating face.
   3. Pull turbine shaft upwards with puller until first resistance is met. (due to weight of overdrive assembly)
   4. Maintain shaft in this position and set indicator to zero.
   5. Pull turbine shaft further upwards with puller. Read end play shown on indicator.

End play: 0.1mm – 0.8mm (0.004 in – 0.031in)

   6. Remove axial play checking tool and puller.

NOTE: If end play is not correct, repeat selective washer selection.



252RW001

39. Inspect extension housing oil seal and replace if necessary, using J–36797 extension housing oil seal installer.
   - Rotate transmission to horizontal position, with valve body side down.
   - Inspect parking wheel seal ring. Replace if necessary.
   - Install wheel parking lock assembly (35).
40. Install speed wheel (36) and snap ring (37). (4×4)

NOTE: Use extra long, needle nose pliers.

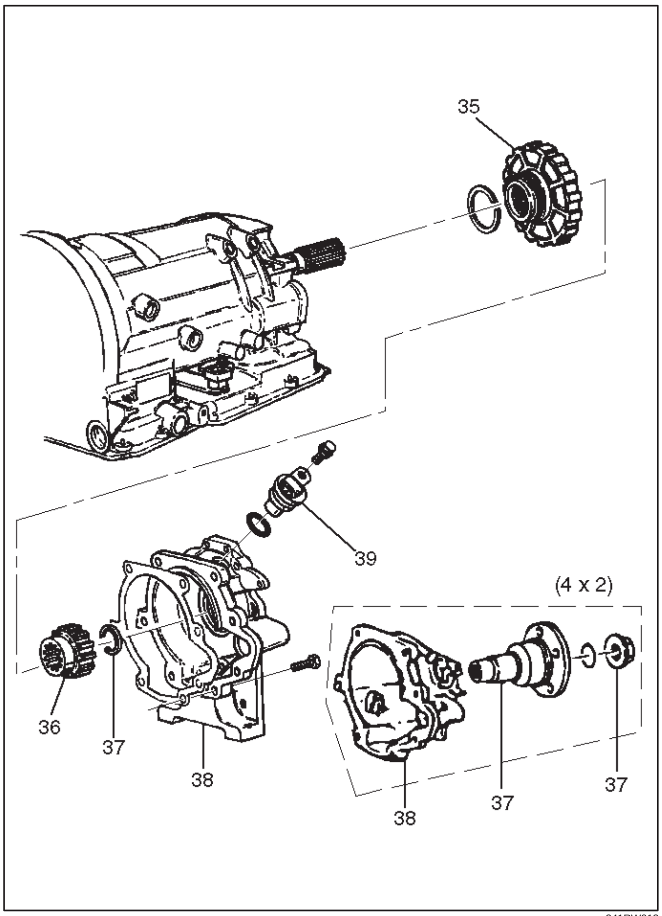
Install flange, O–ring and nut. (4×2)

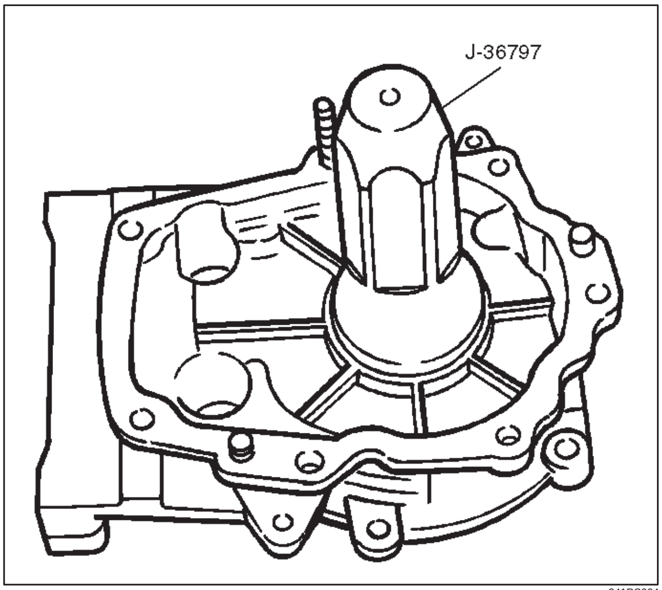
41. Install gasket onto extension assembly with a thin coating of oil.
   - Install extension housing assembly (38), and align parking pawl shaft.
   - Install actuator assembly into extension assembly.
   - Install seven 8 mm hexagon socket head screws.

Torque: 32 N•m (24 lb ft)

42. Inspect speed sensor O-ring. Replace if necessary.
   - Install speed sensor assembly (39) and 10 mm screw.

Torque: 9 N•m (78 lb in)

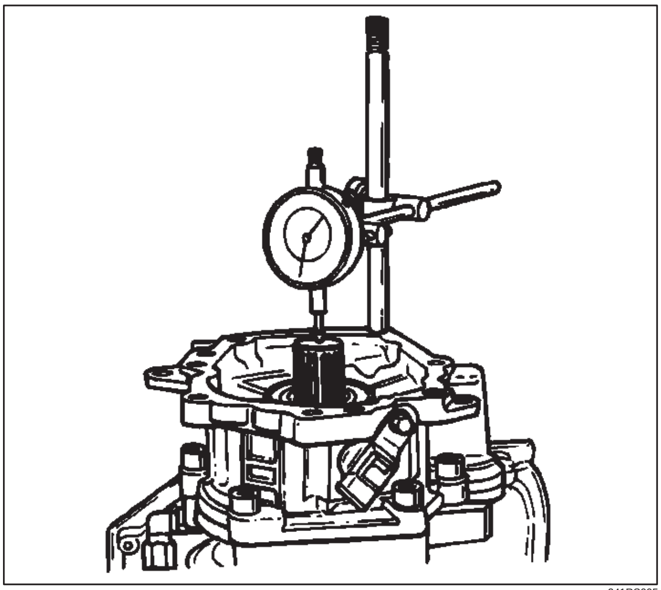




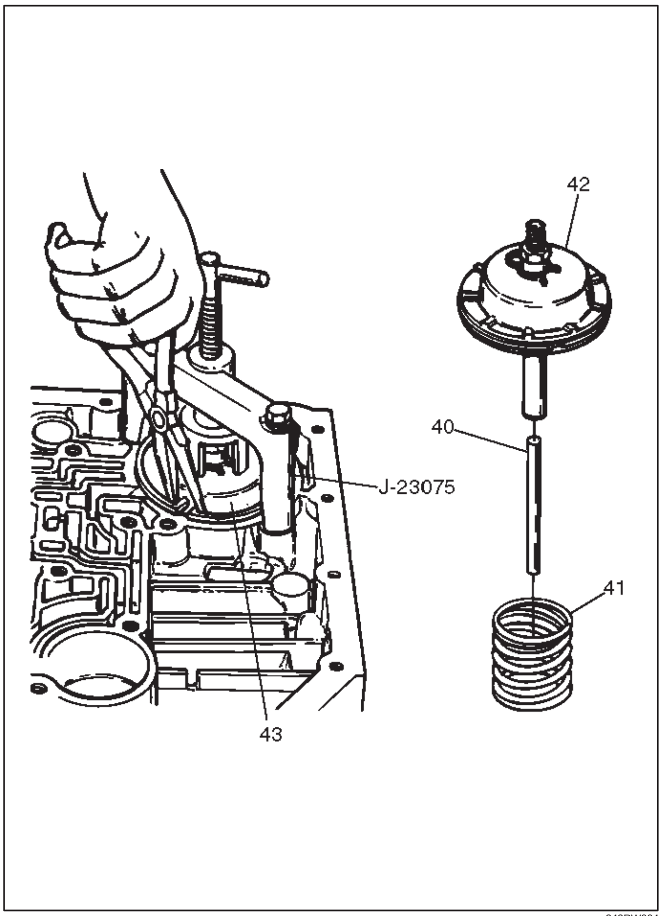
43. Main case end play measurement
    1. Attach axial play checking tool on the extension housing and set indicator to zero on output shaft.
    2. Manually push output shaft upwards.

End play: 0.36mm – 0.80mm (0.014 in – 0.031in)

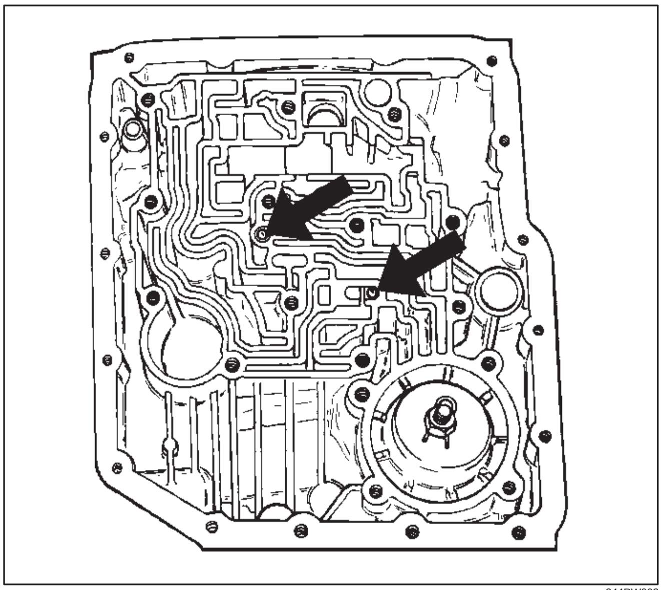
3. Remove axial play checking tool.
4. If end play is not correct, repeat selective washer selection.



44. Inspect servo piston seal ring. Replace if necessary.
    - Ensure brake band is correctly positioned. Rotate output shaft if necessary.
    - Install J–38428 servo piston fitter in servo bore.
    - Install apply rod (40), round end toward band, return spring (41) and piston assembly (42).
45. Install the J–23075 servo spring compressor with offset to rear of case.
    - Compress servo piston seal ring, using fitter while tightening the tool screw.
    - Install servo piston retaining ring (43).
    - Remove tool.
    - Adjust the brake band by tightening the servo adjusting screw to 4.5 N·m torque. Be certain the lock nut is loose, then back-off the screw five turns exactly. Hold piston sleeve with wrench and tighten lock nut to 18.5 N·m torque. Be certain the adjusting screw does not turn.



46. Install two check balls (44).



47. Inspect main case electrical connector and seal, replace if necessary.
    - Install electrical 7 way connector/main case and wiring harness.
48. Install two J–25025–B guide pins into main case.
    - Install main case valve body complete assembly (45) and manual valve link.

NOTE: Valve must be extended as the short end of manual valve link is connected to the range selector lever. Long end of link goes into valve.

- Install seven 13 mm screws, tighten the specified torque.

Torque: 20 N•m (15 lb ft)

- Remove two guide pins.

49. Install servo cover gasket, cover (46) and four 13 mm screws.

Torque: 25 N•m (18 lb ft)

50. Connect wiring harness (47) to band control, shift solenoids, and main case 7 way connector.
51. Install manual detent roller and spring assembly (48) with clip.
    - Install two 13 mm screws.

Torque: 20 N•m (15 lb ft)

52. Install oil filter (49) and three 13 mm screws.

Torque: 20 N•m (15 lb ft)

53. Install oil pan gasket, magnet, main oil pan (50), sixteen 10 mm screws.

Torque: 11 N•m (96 lb in)

54. Inspect adapter case electrical connector and seal. Replace if necessary.
    - Install electrical five pin connector and harness assembly (52) in bottom of adapter case.
55. Install gasket, transfer plate, and gasket.
    - Install adapter case valve body (51) complete and seven 13 mm screws.

Torque: 20 N•m (15 lb ft)

56. Connect wiring harness harness assembly (52) to converter clutch solenoid, force motor, and 4 way connector.
57. Install oil pan gasket, adapter case oil pan (53), and twelve 10 mm screws.

Torque: 11 N•m (96 lb in)

- Rotate transmission, with bottom pan facing down.

58. Install mode switch (54), two 10 mm screws, selector lever nut, and cover.

10 mm screw

Torque: 13 N•m (113 lb in)

Nut

Torque: 23 N•m (17 lb ft)

- Adjust using setting tool, refer to Mode Switch in this section.

59. Install O-ring (55) on turbine shaft.
60. Install torque converter (56).
    The converter assembly must be replaced under any of the following conditions:
    a. Evidence of damage to the pump assembly.
    b. Metal particles are found after flushing the cooler lines.
    c. External leaks in hub weld area.

d. Converter pilot broken, damaged, or poor fit into crankshaft.

e. Converter hub scored or damaged.

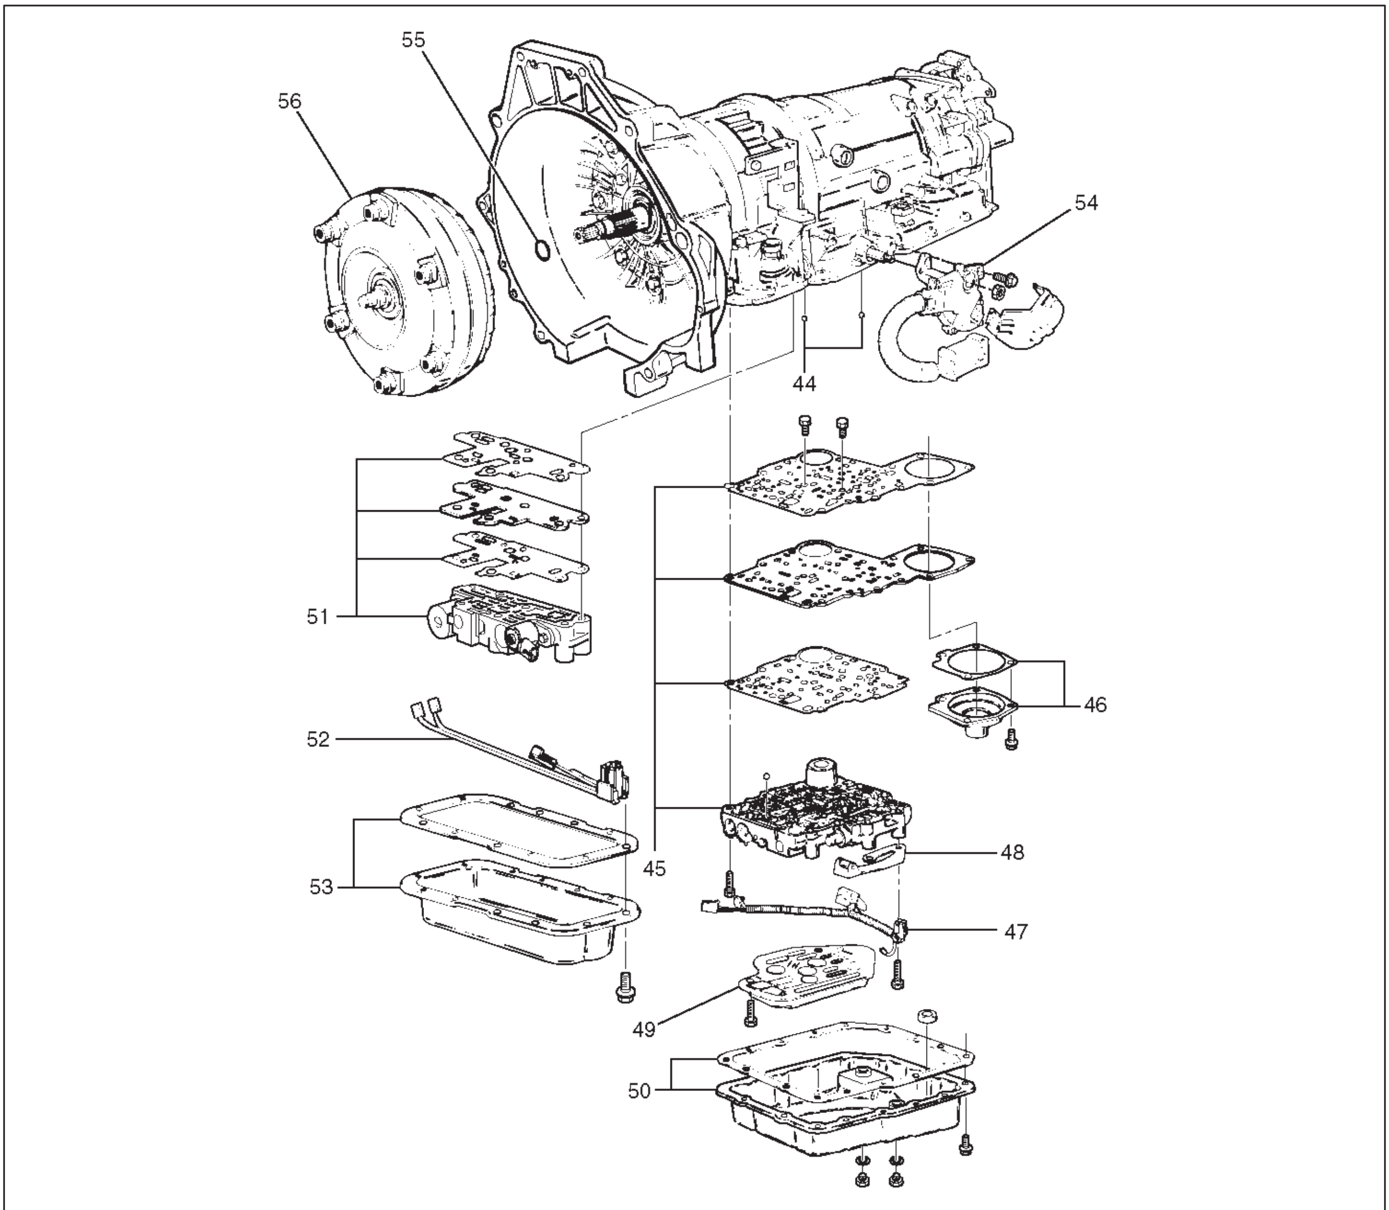
f. Internal failure in stator.

g. Contamination from engine coolant.

h. Excess end play.

- Rotate transmission, bell housing up. Spin converter to insure proper fit.

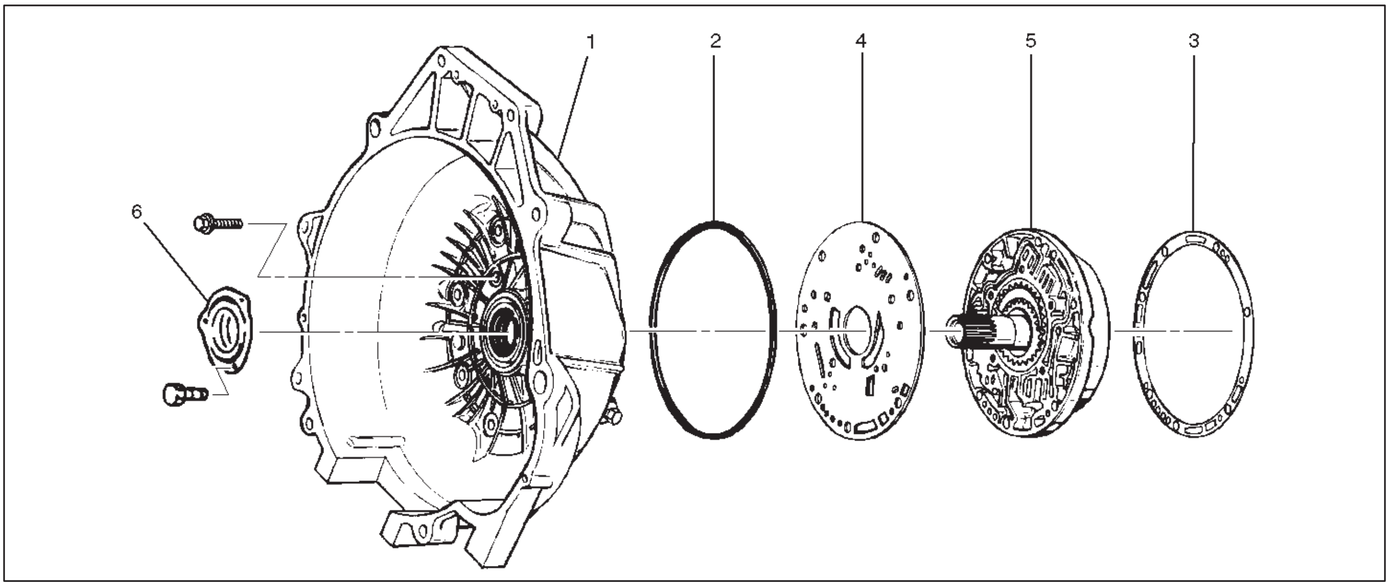
61. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®–III. Refer to Changing Transmission Fluid in this section.



240RY002

Converter Housing and Oil Pump Assembly

Disassembled View



241RW003

Legend
(1) Converter Housing
(2) Outer Seal Ring
(3) Gasket
(4) Wear Plate
(5) Oil Pump Assembly
(6) Oil Seal Ring

Disassembly

1. Remove oil pump assembly from converter housing.
2. Remove outer seal ring.
3. Remove gasket.
4. Remove wear plate.
5. Remove oil seal ring.

Inspection and Repair

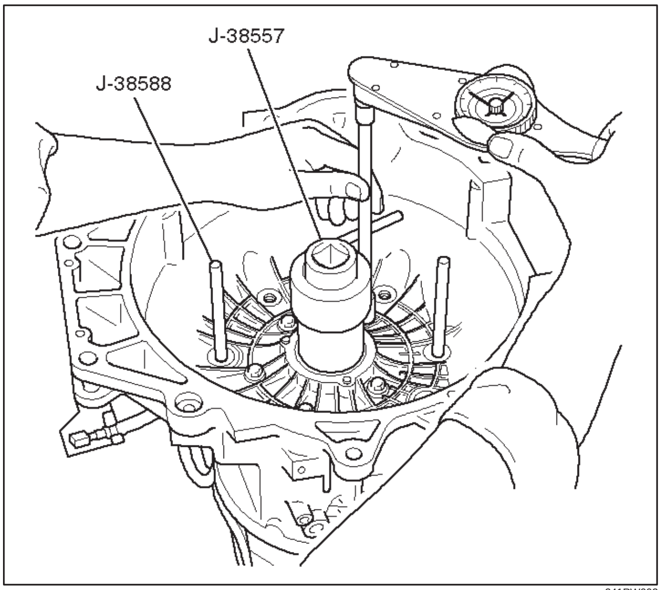
Visual Check:

If any damage, deformation, or local wear is found in a converter housing, outer seal ring, wear plate, or oil seal ring, replace it.

Reassembly

1. Install wear plate onto oil pump assembly.
2. Install converter housing onto complete oil pump assembly. Align with two short J–38588 guide pins on outer bolt holes.
   - Loosely install five 13mm bolts.
   - Center converter housing using J–38557 centering tool.
   - Tighten five inner 13mm bolts in an alternating pattern.

   Torque: 20 N•m (15 lb ft)



241RW002

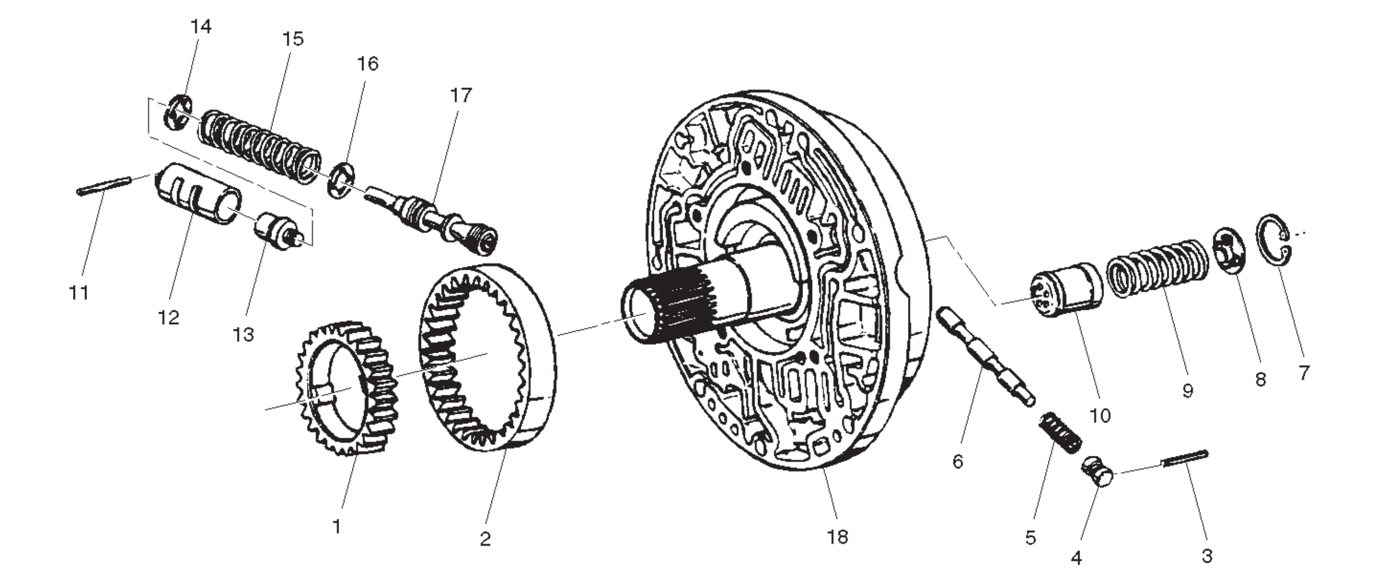
3. Install oil seal ring (3 screws).

   Torque: 3 N•m (26 lb in)

4. Install gasket.
5. Install outer seal ring.

Oil Pump

Disassembled View



Legend

(1) Oil Pump Drive Gear

(12) Sleeve
(13) Boost Valve
(14) Spring Seat
(15) Valve Spring
(16) Spring Seat
(17) Pressure Regulator valve
(18) Oil Pump Assembly

Disassembly

1. Remove oil pump drive gear (1) and driven gear (2).
2. Remove pin (3) from oil pump assembly (18).
3. Remove plug (4), spring (5), and converter clutch control valve (6).
4. Remove snap ring (7) from oil pump assembly (18).
5. Remove spring seat (8), spring (9), and throttle signal accumulator piston (10).
6. Remove sleeve pin (11) from oil pump assembly (18).
7. Remove sleeve (12), boost valve (13), spring seat (14), valve spring (15), spring seat (16), and pressure regulator valve (17).

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Lubricate and preinstall pressure regulator spring seat (16) on valve (17), with the flat side against shoulder.
2. Install pressure regulator valve (17) and spring seat (16) assembly, valve spring (15), and spring seat (14) with the flat side away from spring to oil pump assembly (18).
3. Assemble boost valve (13) into sleeve (12).
4. Install boost valve and sleeve assembly, and sleeve pin (11) to oil pump assembly (18).
5. Install throttle signal accumulator piston (10), spring (9), and spring seat (8), with the flat side away from the spring, and snap ring (7) to oil pump assembly (18).
6. Install converter clutch control valve (6), spring (5), plug (4), and pin (3) to oil pump assembly (18).
7. Install oil pump driven gear (2) and drive gear (1).

Main Case Valve Body

(23) Spring Pin
(24) Plug
(25) 1–2 Accumulator Valve
(26) 1–2 Accumulator Control Valve
(27) Check ball
(28) Main Case Valve Body

Disassembly

1. Remove two 11mm bolts from valve body (28), then remove gaskets and transfer plate (1).
2. Remove manual valve (2).
3. Push in band control solenoid (3) to compress waved washer (5), and remove pin (4).
4. Remove band control solenoid (3) and waved washer (5).
5. Remove spring pin (6) with a 3 mm diameter punch.
6. Remove solenoid A (7) by grasping the metal tip. Do not grasp the connector housing.
7. Remove retainer (8), 1–2/3–4 shift valve (9) and spring (10).
8. Remove spring pin (11) with a 3 mm diameter punch.
9. Remove solenoid B (12) by grasping the metal tip. Do not grasp the connector housing.
10. Remove retainer (13), 2–3 shift valve (14), and spring (15).
11. Remove spring pin (16), plug (17), spring (18) and low pressure control valve (19).
12. Remove spring pin (20), plug (21), and band control screen assembly (22).
13. Remove spring pin (23), plug (24), 1–2 accumulator valve (25), and 1–2 accumulator control valve (26).
14. Remove 1 check ball (27) from valve body (28).

Inspection and Repair

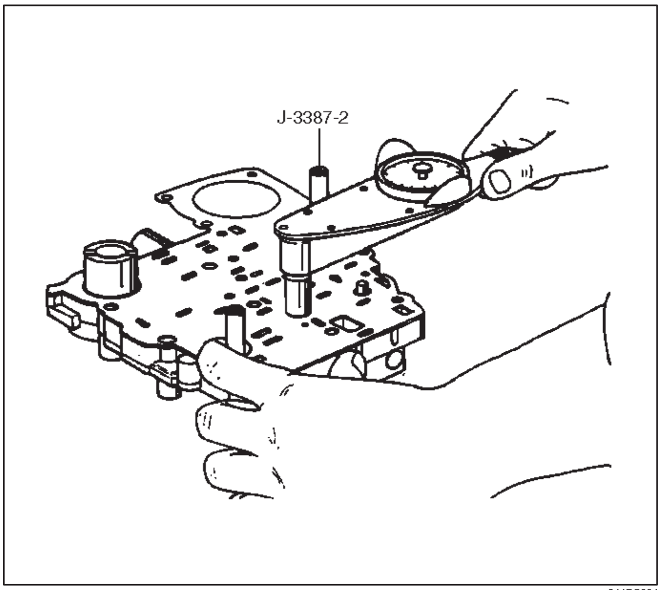
Inspect for the following, and replace any damaged or worn parts:

1. Damage or wear to each valve.
2. Damage in oil passeges.
3. Cracks or damage to valve body.
4. Valve operations.
5. Spring fatigue.

Reassembly

1. Install 1–2 accumulator control valve (26), 1–2 accumulator valve (25), plug (24), and spring pin (23).
2. Install band control screen assembly (22), plug (21), and spring pin (20).
3. Install low pressure control valve (19), spring (18), plug (17), and spring pin (16).
4. Install spring (15), 2–3 shift valve (14), retainer (13), solenoid B (12), and spring pin (11).
5. Install spring (10), 1–2/3–4 shift valve (9), retainer (8), solenoid A (7), and spring pin (6).
6. Install waved washer (5), band control solenoid (3), and pin (4).
7. Install manual valve (2).
8. Install check ball (27) to valve body (28).
9. Install gasket (valve body/transfer plate) and transfer plate using two J–3387–2 guide pins.
   - Install two 11mm bolts.

Torque: 13 N•m (113 lb in)

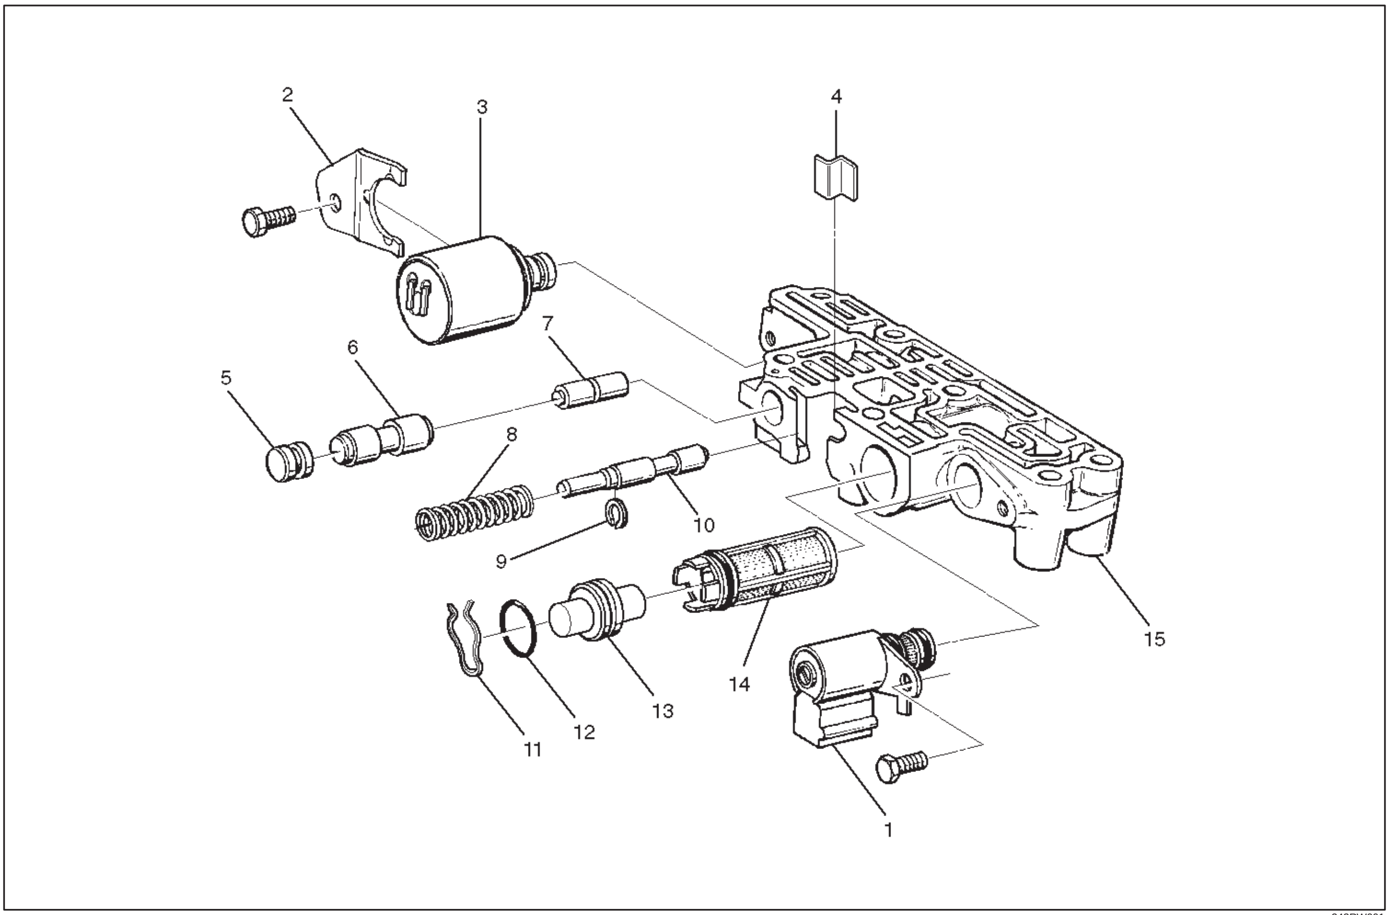


244RS004

- Install gasket (transfer plate/main case).

Adapter Case Valve Body

Disassembled View



243RW001

Legend

(1) Converter Clutch Solenoid Assembly

(3) Force Motor Solenoid
(4) Retainer
(5) Plug
(6) 3/4 Accumulator Valve
(7) 3/4 Accumulator Control Valve
(8) Spring
(9) Retaining Ring
(10) Feed limit Valve
(11) Plug Retainer
(12) O-ring
(13) Plug
(14) Force Motor Screen Assembly
(15) Adapter Case Valve Body

Disassembly

1. Remove 11mm bolt from valve body.
   - Remove converter control solenoid assembly (1).
2. Remove 11mm bolt and retainer (2) from valve body.
   - Remove force motor solenoid (3).
3. Remove retainer (4), plug (5), 3/4 accumulator valve (6), and 3/4 accumulator control valve (7)
4. Remove spring (8), retaining ring (9), and feed limit valve (10).
5. Remove plug retainer (11), O-ring (12), plug (13), and force motor screen assembly (14).
   - Use 5 mm bolt to pull plug.

Inspection and Repair

Inspect for the following, and replace any damaged or worn parts:

1. Damage or wear to each valve.
2. Damage in oil passeges.
3. Cracks or damage to valve body.
4. Valve operations.
5. Spring fatigue.

Reassembly

1. Install force motor screen assembly (14), plug (13), O-ring (12), and plug retainer (11).
2. Install feed limit valve (10), retaining ring (9), and spring (8).

3. Install 3/4 accumulator control valve (7), 3/4 accumulator valve (6), plug (5), and retainer (4).
4. Install force motor solenoid (3).
   - Place solenoid terminals pointing towards mating face.
   - Install retainer (2) and bolt.

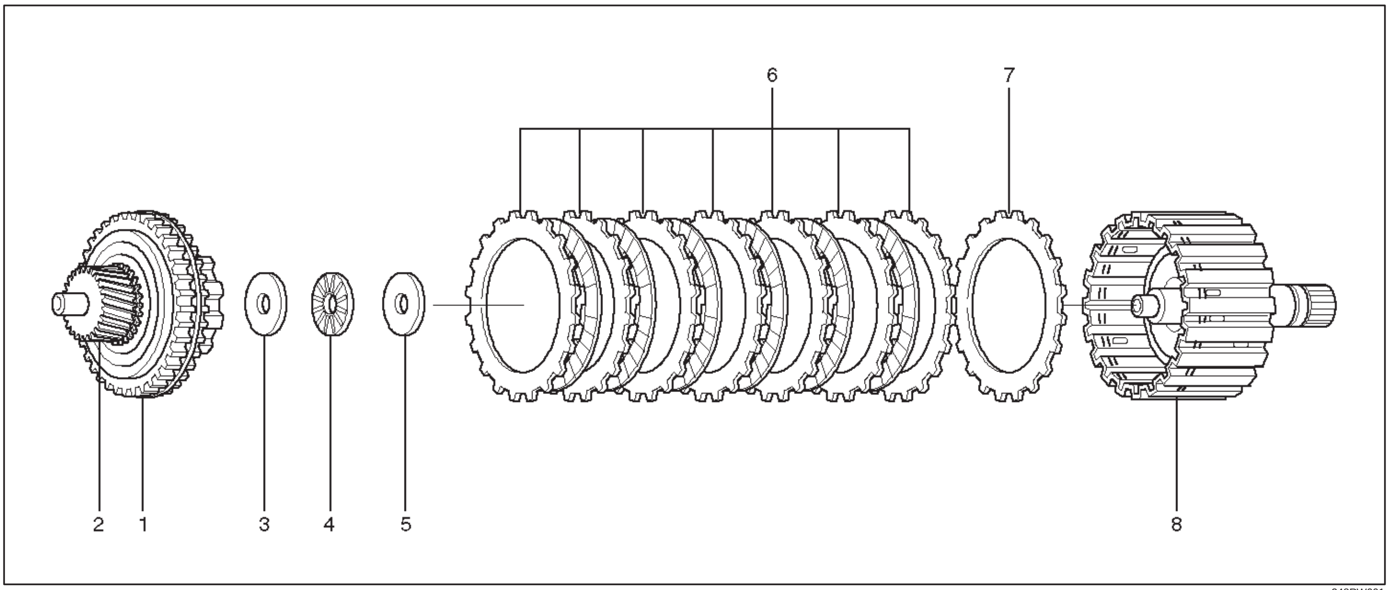
   Torque: 10 N•m (87 lb in)

5. Install converter clutch solenoid assembly with two O-rings (1) to valve body.
   - Install bolt.

   Torque: 10 N•m (87 lb in)

Third Clutch and Sprag Unit

Disassembled View



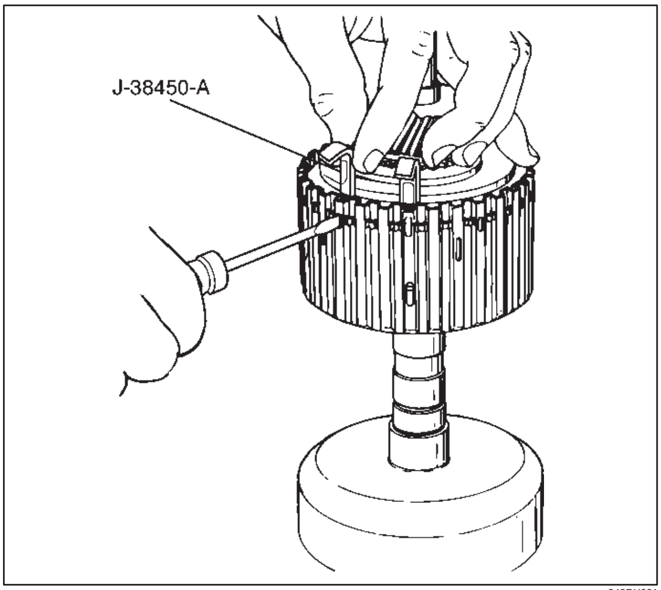
248RW001

Legend

(1) Retaining Ring
(2) Input Sun Gear and Sprag Unit Assembly
(3) Retaining Washer
(4) Bearing
(5) Thrust Washer
(6) Clutch Plates
(7) Third Clutch Spring Cushion Plate
(8) Third Clutch Drum Assembly

Disassembly

1. Place the third clutch drum and intermediate shaft assembly upright, using the overdrive internal gear as a support.
2. Locate the ends of the retaining ring. Depress one end of the ring using a small screwdriver instead of the depressor handle provided with the tool J-38450-A. Slide one blade down between the third clutch drum and the retaining ring.
3. Remove a screwdriver and repeat this step for the other end of retaining ring.
4. Install the remaining four blades approximately (five) notches apart using a screwdriver to depress the retaining ring.
5. Pull up on input sun gear and sprag unit assembly (1 and 2) to release the retaining ring from third clutch drum assembly (8).
6. Remove the tool blades.



248RX001

7. Remove retaining washer (3), bearing (4), thrust washer (5), and clutch plates (6 and 7) from the third clutch drum assembly (8).

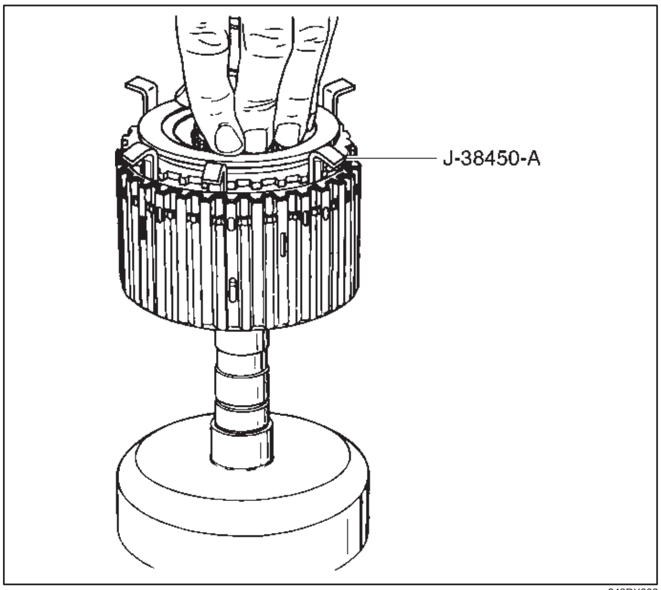
Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

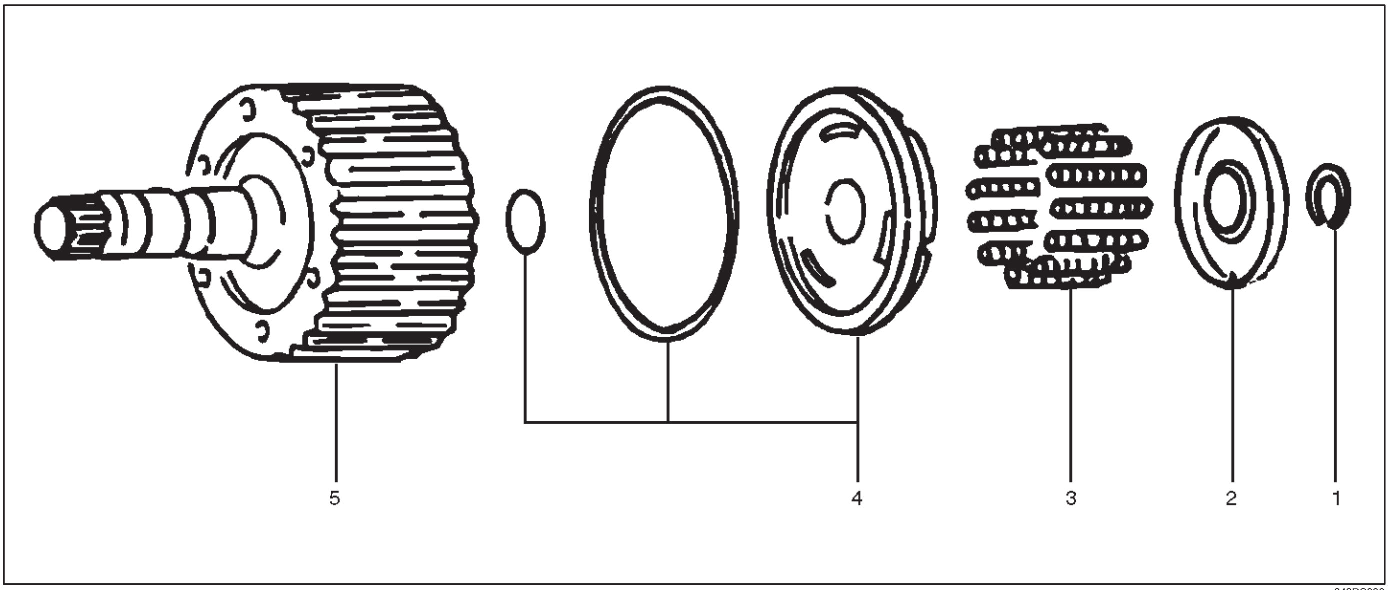
1. Place third clutch drum and intermediate shaft assembly upright, using the overdrive internal gear as a support.
2. Install third clutch spring cushion plate (7), bevel face down.
3. Install third clutch plates (6) into third clutch drum assembly (8). Start with the steel clutch plate and alternate with lined plates.
4. Install thrust washer (5), bearing (4) and retaining washer (3).
5. Fully engage the hub spline of the input sun gear and sprag unit assembly (2) into the third clutch inner tangs.
   - Simultaneously rotate the outer sprag race to engage into the third clutch drum assembly (8).
6. Place J-38450-A blades between the retaining ring and the third clutch drum apporximately (five) notches apart, and one blade at each end of the retaining ring (1). Push down on sprag assembly until the assembly is seated into the third clutch drum assembly (8).
7. Remove the tool blades and engage retaining ring into groove of third clutch drum.



248RX002

Third Clutch

Disassembled View



248RS006

Legend

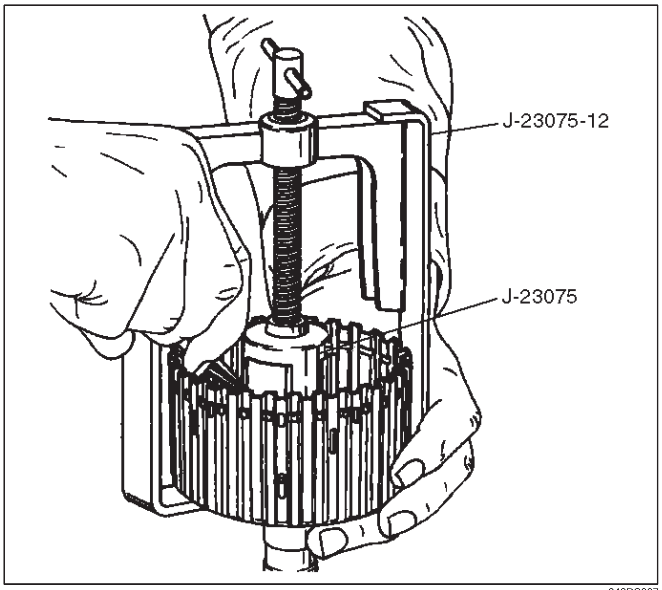
(1) Retaining Ring
(2) Spring Seat
(3) Springs
(4) Piston Assembly
(5) Third Clutch Drum

Disassemble

1. Compress spring seat using the J–23075 spring compressor and J–23075–12 adapter tool.

NOTE: Do not overstress the springs and seat. This will cause damage to the spring seat.

- Remove the tool.
- Remove retaining ring (1).



248RS007

2. Release the spring seat (2).

NOTE: Do not let the spring seat catch in the ring groove.

- Remove spring seat (2) and springs (3).

3. Remove piston assembly (4) from third clutch drum (5).

Inspection and Repair

Visual check:

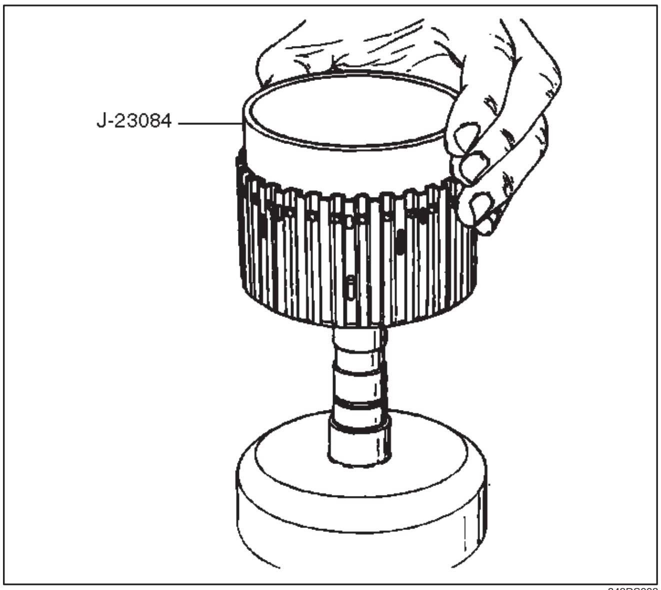
If any damage, deformation or wear is found, replace the damaged part.

Operation check:

Shake the piston and listen for check ball movement. Movement indicates proper check ball operation. Replace the piston if the check ball is missing or falls out.

Reassembly

1. The lip of the piston seal must point toward the front of the transmission. Lubricate the seal lip with transmission fluid.
   - Install piston assembly (4) into the third clutch drum (5). Use the J–23084 third clutch piston installer to protect the outer seal during installation.
   - Remove the seal installer.



248RS008

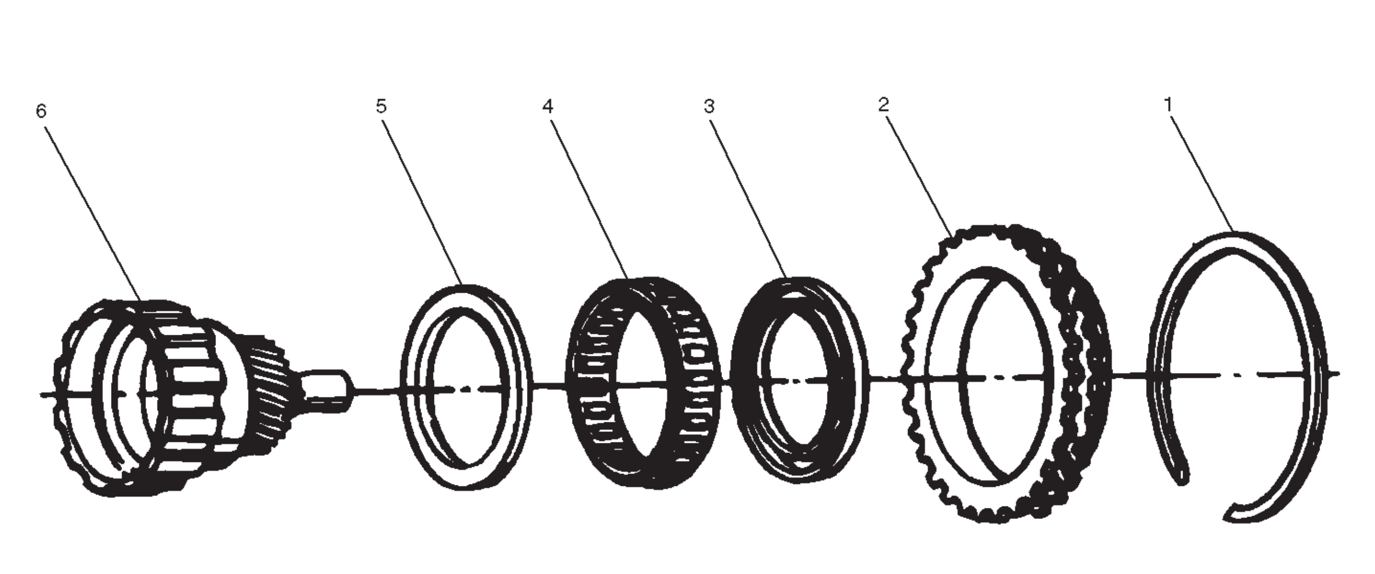
2. Install twelve springs (3) and spring seat (2).
3. Place retaining ring (1) onto spring seat.
   - Compress the piston springs, using the J–23075 piston spring compressor and J–23075–12 adapter.

CAUTION: Do not overstress the springs and seat. Do not let the spring seat catch in the ring groove. This may cause damage to the spring seat.

- Install spring seat retaining ring (1).
- Remove the piston spring compressor and adapter.

Sprag Unit

Disassembled View



248RS009

Legend

(1) Retaining Ring
(2) Sprag Outer Race
(3) Ring
(4) Sprag Assembly
(5) Ring
(6) Third Clutch Hub and Sun Gear Assembly

Disassembly

1. Remove the sprag outer race, retaining ring, and sprag assembly from the third clutch hub and sun gear assembly.
2. Remove the rings and sprag assembly from the sprag outer race.

Inspection and Repair

Visual Check:

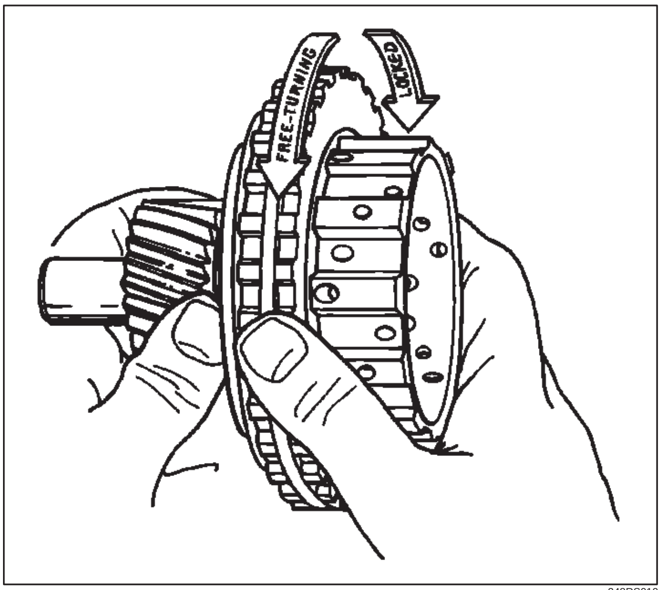
If any damage, deformation or local wear is found, replace the damaged part.

Reassembly

NOTE: Flared shoulder of the sprag cage faces the sun gear. This procedure must be followed exactly to be sure that the sprag assembly is installed properly.

1. Install rings and sprag assembly onto the third clutch hub and sun gear.
2. Install sprag outer race and retaining ring assembly over the sprag cage assembly.
   - Place third clutch hub and sun gear assembly on a flat surface, sun gear facing up. Place sprag outer race and sprag assembly over the sun gear assembly, push down and turn the input sun counterclockwise at the same time.

NOTE: Check correct rotation by holding the sun gear in your left hand and turning the outer race. The outer sprag race should turn freely towards you and should lock turning away from you.



248RS010

Second Clutch

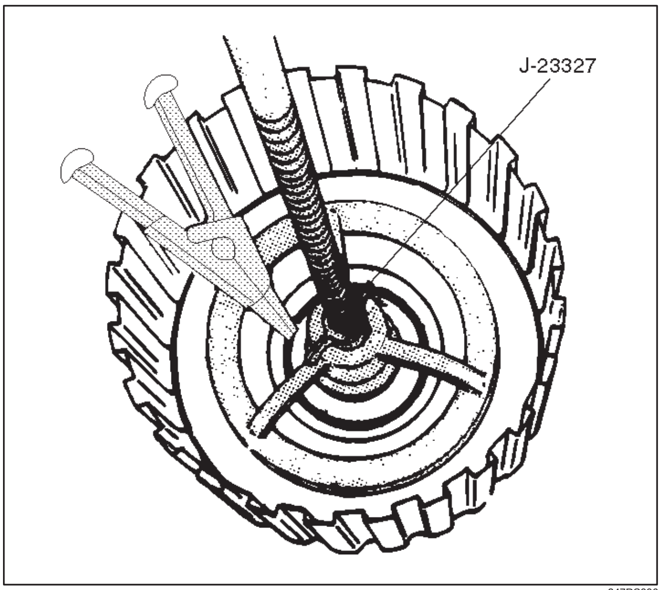
(10) Piston Assembly
(11) Second Clutch Drum

Disassembly

1. Remove retaining ring (1) from second clutch drum (11).
2. Remove ring gear (2), retaining ring (3), and spacer (4).
3. Remove clutch plates (5) and waved washer (6).
4. Remove retaining ring (7) using J–23327 compressor to compress the spring seat (8).
5. Remove spring seat (8), springs (9) and piston assembly (10) from second clutch drum (11).



247RS006

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Operation Check:

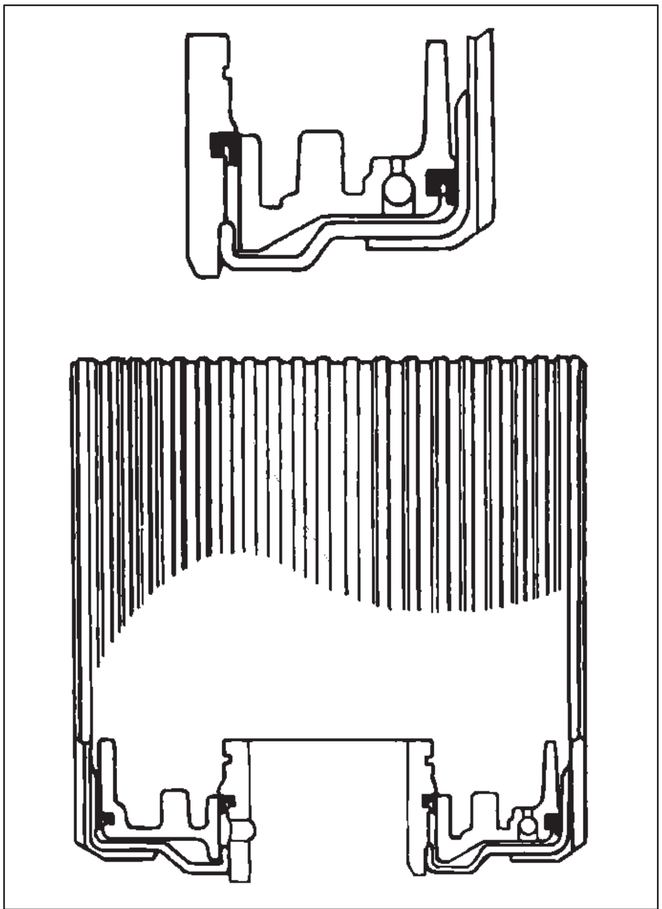
Shake the piston and listen for check ball movement. Movement indicates proper check ball operation. Replace the piston if the check ball is missing or falls out.

Reassembly

1. Install piston assembly (10) into the second clutch drum (11).
   - Lubricate the lip seal with transmission fluid. Use the J–23080–A second clutch piston installer to protect the outer piston lip seal.

NOTE: Lip of the seal should point toward front of transmission.

- Remove the installer.



247RS007

2. Install twenty-two piston springs (9) and spring seat (8) on the second clutch piston (10). Place retaining ring (7) onto spring seat.
   - Use the J–23327 compressor to compress the piston springs.

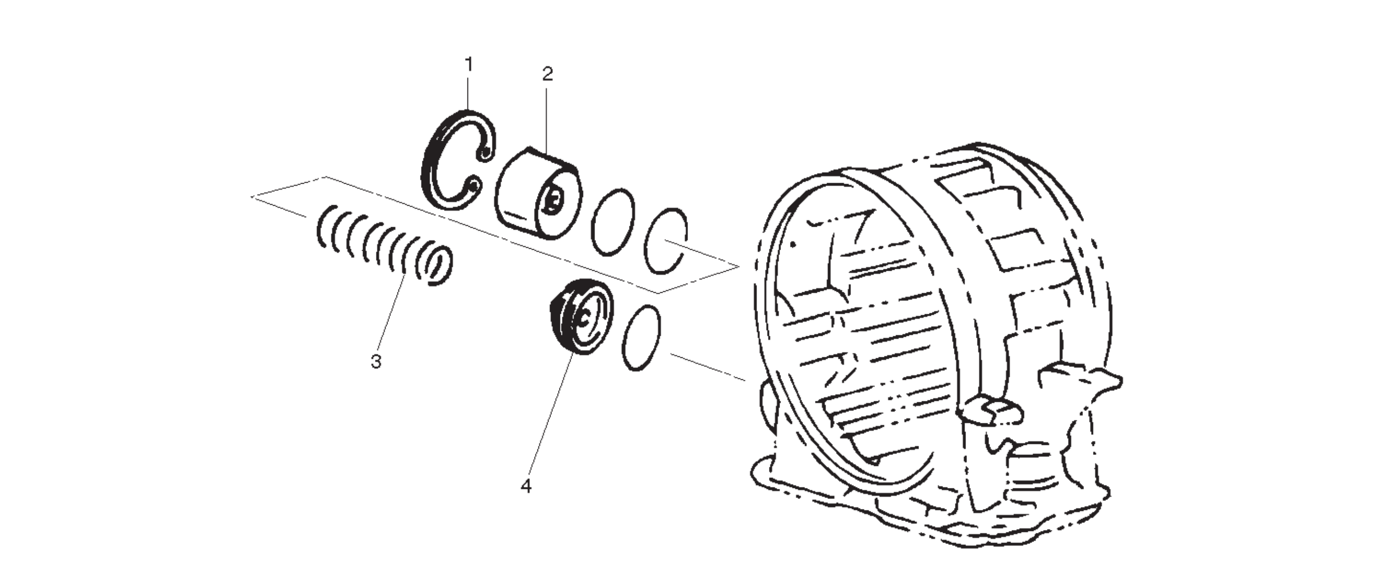
NOTE: Do not let spring seat catch in ring groove.

- Remove the compressor.

3. Install waved plate (6) and clutch plates (5). Start with a steel plate and alternate with lined plates.
   - Align second clutch inner tangs.
4. Install spacer (4), with the fluted end toward clutch plates.
5. Install retaining ring (3), ring gear (2) and retaining ring (1).

3–4 Accumulator Piston

Disassembled View



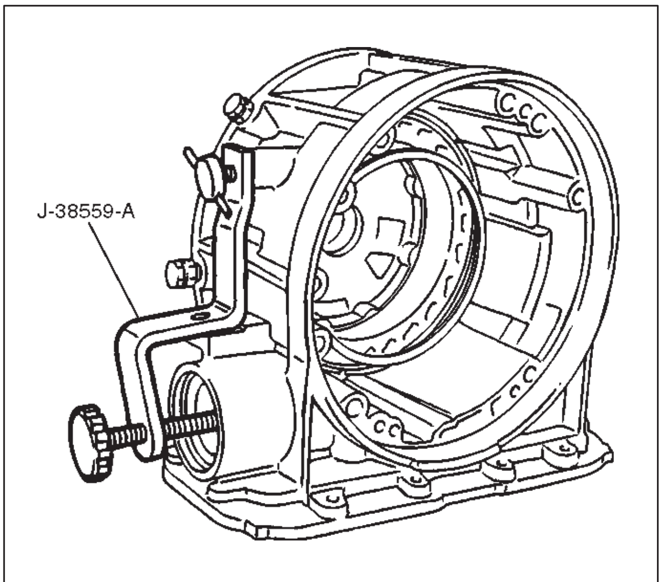
244RS005

Legend

(1) Snap Ring
(2) Cover
(3) Spring
(4) Piston Assembly

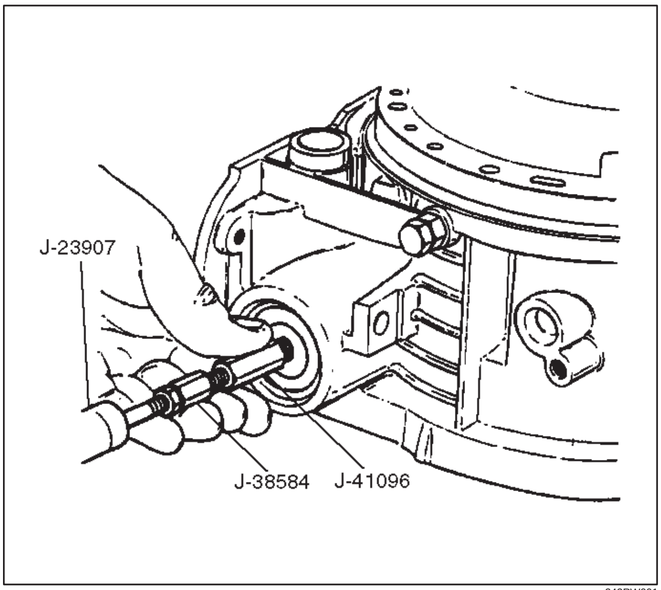
Disassembly

1. Install the J–38559–A cover compressor on adapter case.
   - Compress piston cover then remove snap ring.



242RS007

2. Install the J–41096 cover remover and J–38584 adapter to center hole of cover.
   - Use the J–23907 slide hammer to remove cover.
3. Remove spring and piston assembly.



242RW001

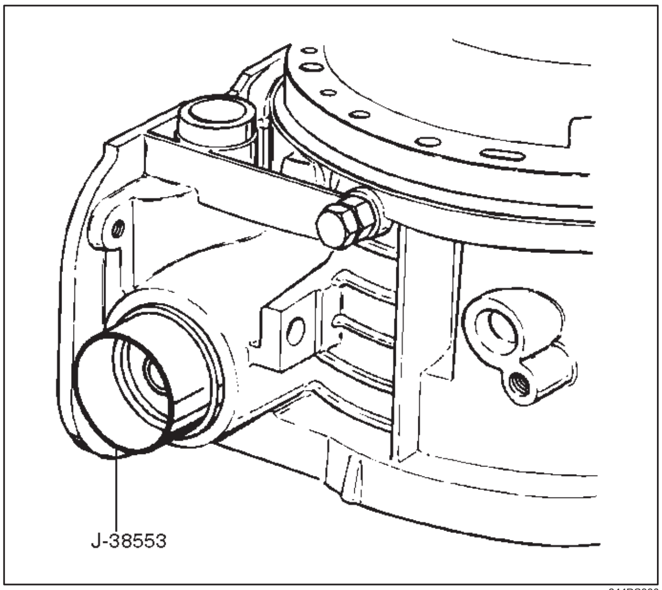
Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

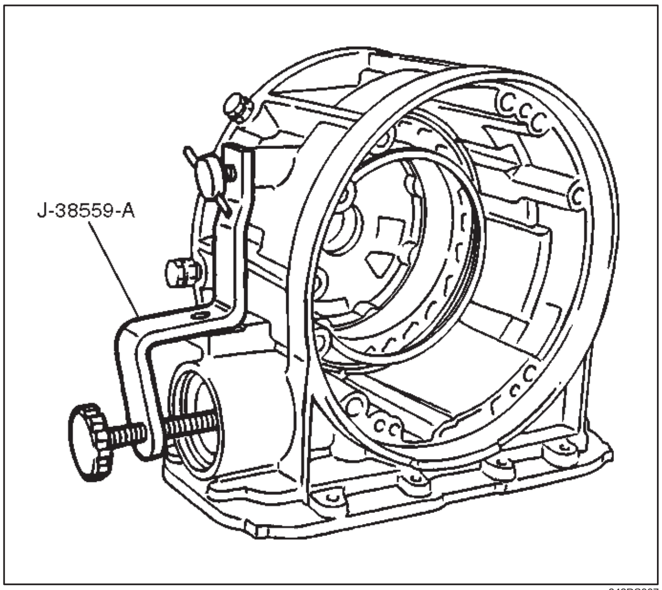
Reassembly

1. Place the J–38553 piston fitter into adaptor case and push the piston into position, using suitable diameter tube.
   - Remove the piston fitter.



244RS006

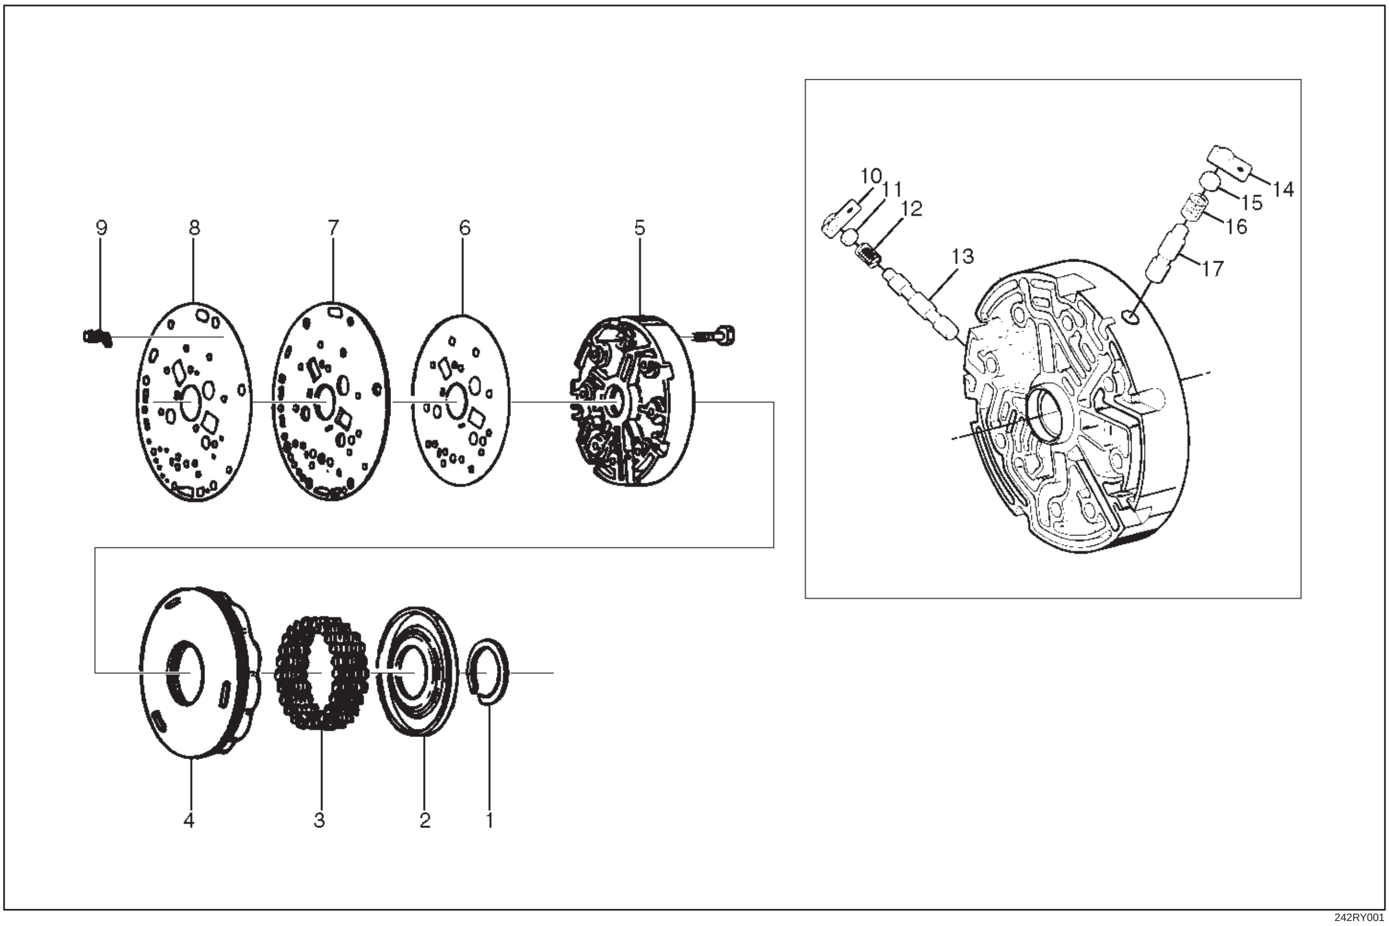
2. Install spring and cover.
3. Install snap ring, using the J–38559–A compressor tool.
   - Install snap ring in groove.
   - Remove the compressor tool.



242RS007

Reverse Clutch Piston and Center Support

Disassembled View



Legend

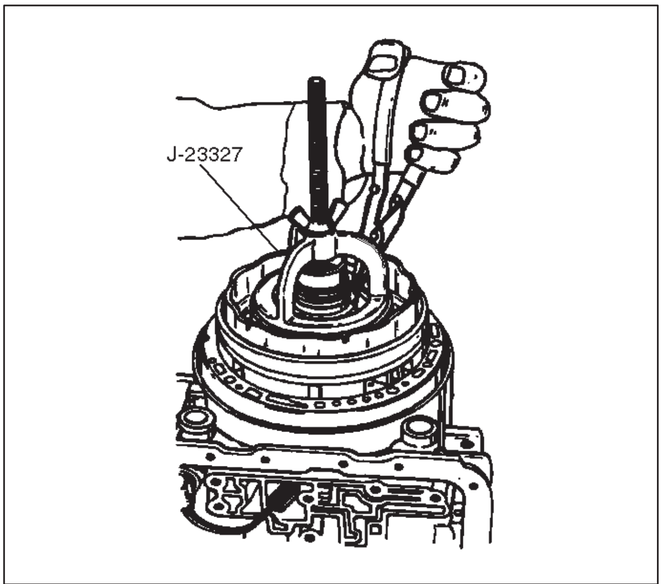
- (1) Retaining Ring
- (2) Spring Seat
- (3) Springs
- (4) Piston Assembly
- (5) Center Support
- (6) Gasket
- (7) Transfer Plate
- (8) Gasket
- (9) Restrictor
- (10) Retainer Plate
- (11) Plug
- (12) Spring
- (13) Overrun Lock Out Valve
- (14) Retainer Plate
- (15) Plug
- (16) Spring
- (17) Reverse Lock Out Control Valve

Disassembly

1. Install the J–23327 compressor tool on spring seat, then compress the spring seat.
   - Remove retaining ring (1).

NOTE: Do not over-stress the springs and seat, as this will cause damage to the spring seat.

- Remove the compressor tool.



247RS008

2. Remove spring seat (2) and springs (3).
3. Remove piston assembly (4).
4. Remove 8 bolts from center support (5), then remove center support (5) from adapter case.
5. Remove gasket transfer plate/outer support (6), center support transfer plate (7), and gasket transfer plate/adapter case (8).
6. Remove restrictor (9) from adapter case housing.
7. Remove retainer plate (10), plug (11), spring (12), and overrun lock out valve (13) from center support (5).
8. Remove retainer plate (14), plug (15), spring (16) and reverse lock out valve (17) from center support (5).

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

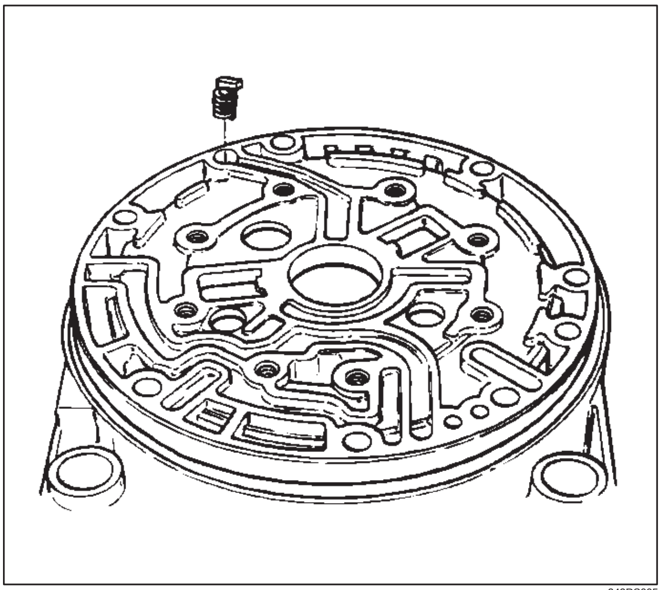
1. Install reverse lock out valve (17) and spring (16) to center support.

NOTE: Ensure correct assembly of valve. The spring should be located over the long small diameter end.

2. Install plug (15) and retainer plate (14).
3. Install overrun lock out valve (13) and spring (12) to center support.

NOTE: Ensure correct assembly of valve. The spring should be located over the long small diameter end.

4. Install plug (11) and retainer plate (10).
5. Place restrictor (9) in the lube overdrive channel in the adapter case housing.



242RS005

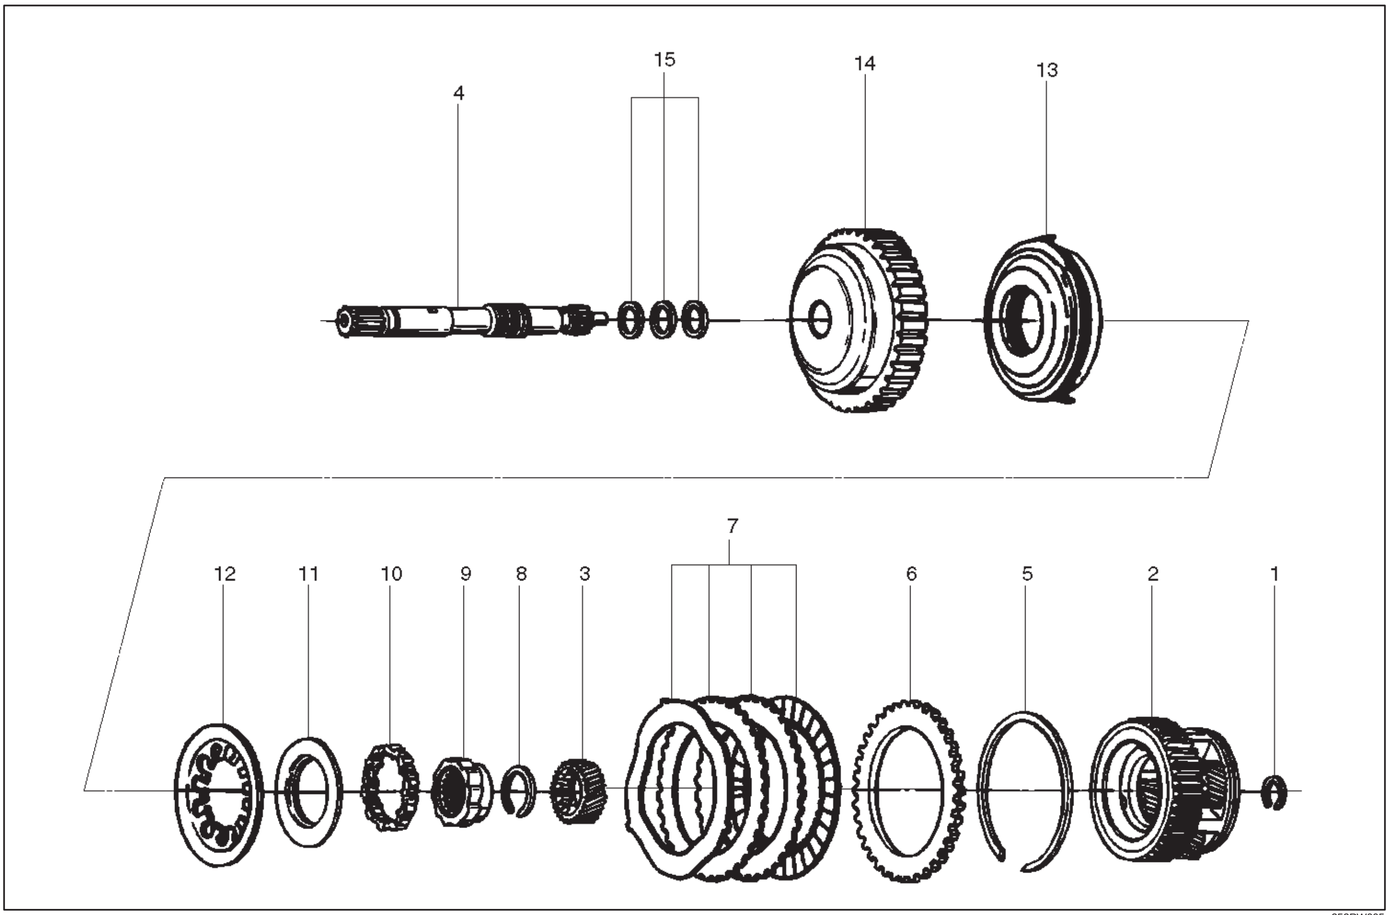
6. Install gasket transfer plate/adapter case (8), center support transfer plate (7), and gasket transfer plate/center support (6).
7. Install center support (5) with 8 bolts.

Torque : 25 N•m (18 lb ft)

8. Install piston assembly (4) into center support (5).
9. Install twenty four springs (3), spring seat (2), and retaining ring (1).
   - Install the J–23327 compressor and compress spring seat (2) and springs (3), then seat snap ring (1) in groove.
   - Remove the tool.

Overrun Clutch and Turbine Shaft

Disassembled View



Legend

(1) Snap Ring
(2) Overdrive Carrier Assembly
(3) Sun Gear
(4) Turbine Shaft
(5) Snap Ring
(6) Backing Plate
(7) Clutch Plates
(8) Snap Ring

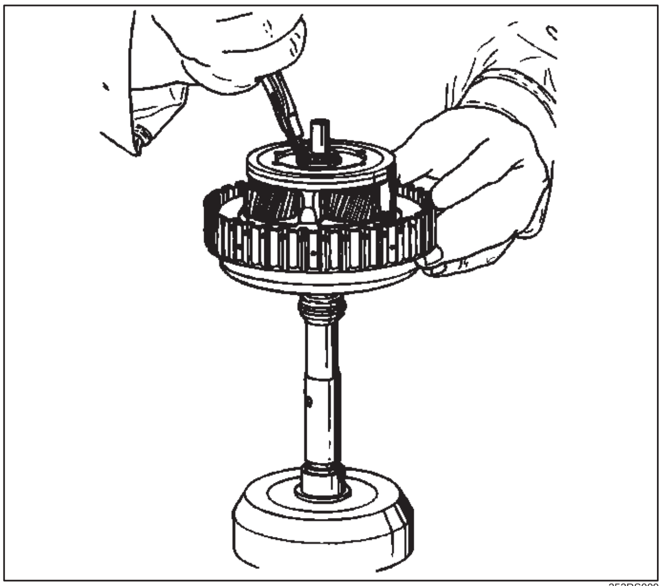
(10) Roller Clutch Assembly
(11) Overrun Clutch Release Spring Retainer
(12) Diaphragm Spring
(13) Piston Assembly
(14) Overrun Clutch Drum
(15) Turbine Shaft Seal Rings

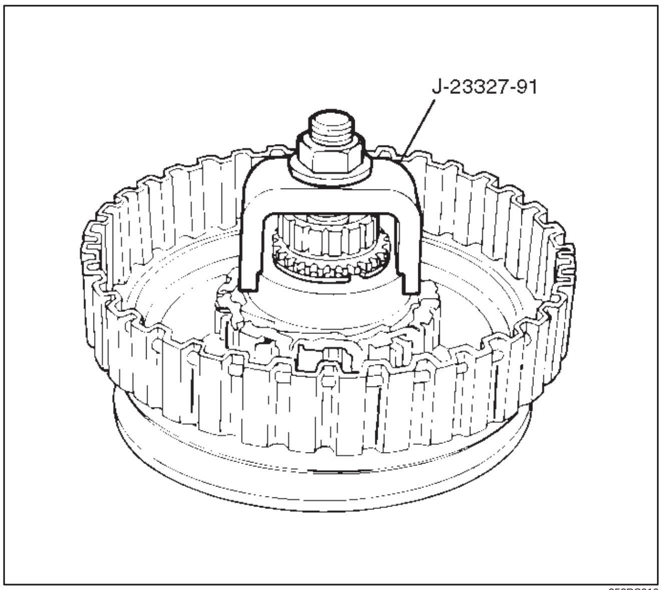
Disassembly

1. Position overrun clutch assembly upright, using the overdrive internal gear as a support.
   - Remove snap ring (1).



252RS009

2. Remove overdrive carrier assembly (2), sun gear (3) and turbine shaft (4).
3. Remove snap ring (5), backing plate (6), and clutch plates (7).
4. Compress diaphragm spring with the J–23327–91 compressor then remove snap ring (8).



252RS010

5. Remove overrun roller clutch cam (9) and roller clutch assembly (10).
6. Remove overrun clutch release spring retainer (11) and diaphragm spring (12).
7. Remove piston assembly (13) from overrun clutch drum (14).
8. Remove turbine shaft seal rings (15).

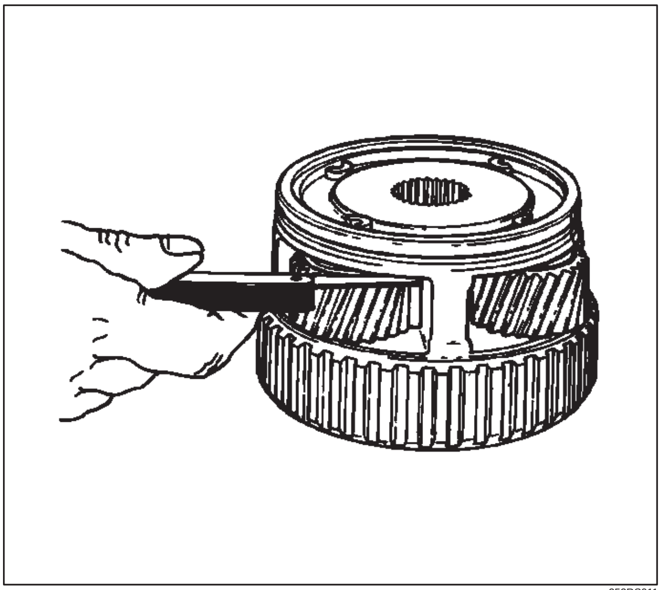
Inspection and Repair

Overdrive Carrier Check

- Check pinion end play with a feeler gauge.

Clearance: 0.24mm–0.64mm (0.0094in–0.025in)

If clearance is outside specified value, replace overdrive carrier assembly.



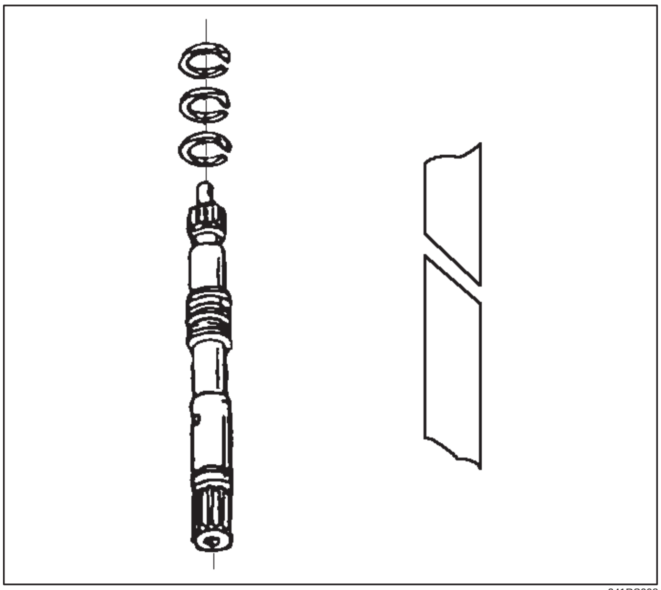
252RS011

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

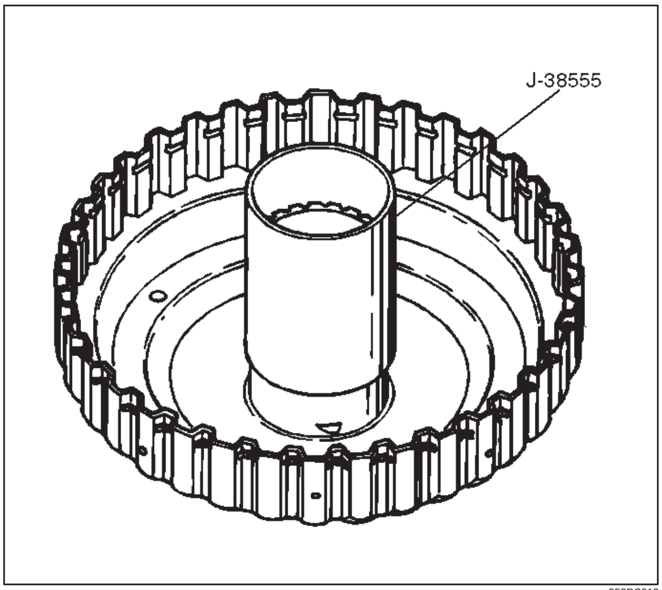
1. Install turbine shaft seal rings (15) with grease (petroleum jelly).



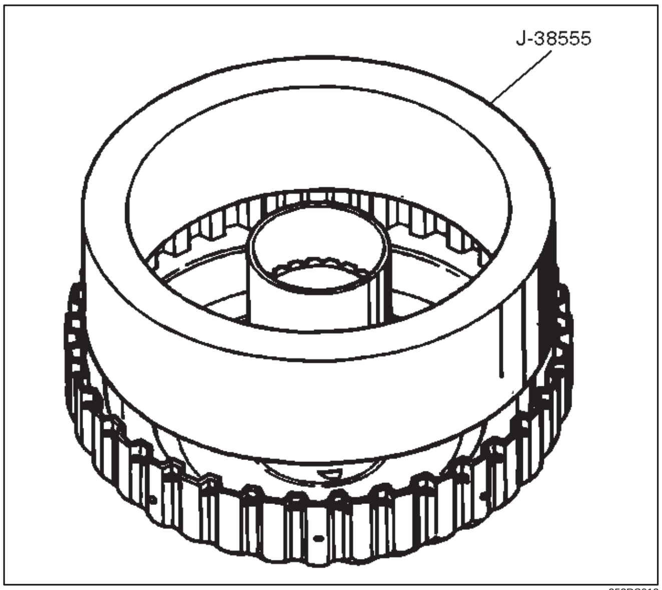
241RS008

2. Install the J–38555 inner installer on the drum (14).
   - Pre-install piston assembly into J–38555 outer installer.
   - Install overrun clutch piston assembly (13). Use the outer installer while pushing piston into drum (14).

- Remove the installer.



252RS012



252RS013

3. Install diaphragm spring (12).
4. Install overrun clutch release spring retainer (11) (lip faces upwards), overrun roller clutch assembly (10) and cam (9).
5. Place snap ring loosely on spring retainer.
   - Hold the J–23327–91 compressor in a vise and compress piston return spring with compressor.
   - Set snap ring (8) in ring groove.
   - Remove the compressor.
6. Install clutch plates (7), start with steel plate and alternate with lined plates.
7. Install backing plate (6).
8. Install snap ring (5).
9. Install overdrive sun gear with countersink pointing downwards.
10. Install the overdrive carrier assembly (2).

NOTE: Turn the assembly in a counter-clockwise direction only until roller clutch enters the outer race. After Installation, rotate the assembly and listen for loose rollers.

11. Install turbine shaft (4) and snap ring (1).

TRANSMISSION CONTROL SYSTEM (4L30–E)

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The 4L30–E is a 4–speed fully automatic transmission. It uses a microcomputer as a control unit to judge running conditions including throttle opening rate and vehicle speed, then it sets the shifting point in the optimum timing so that best driving performance can be achieved.
In addition, the built–in shift mode select function can select three shift modes according to the driver's preference:

- Normal mode –Normal shift pattern.
- Winter mode –Starts in 3rd gear to reduce slippage on ice or snow.
- Power mode has a delayed upshift for when more powerful acceleration is required.

Also, the built–in fail–safe function ("backup mode") assures driving performance even if the vehicle speed sensor, throttle signal or any solenoid fails.
Further, the self–diagnostic function conducts diagnosis in a short time when the control system fails, thus improving serviceability.
The major features of 4L30–E are as follows:

- A compact structure consisting of 2 sets of planetary gears and flat torque converter.
- Electronic control selects the optimum shift mode according to the driving conditions.
- Electronic control maintains the optimum hydraulic pressure for clutch, band brake as well as transmission so that shift feeling is improved.
- Two sets of planetary gears reduce friction of power train.

  Also, a lockup mechanism in the torque converter reduces fuel consumption.
- Wide gear ratio and high torque rate of torque converter provide excellent starting performance.

Electronic Control Diagram

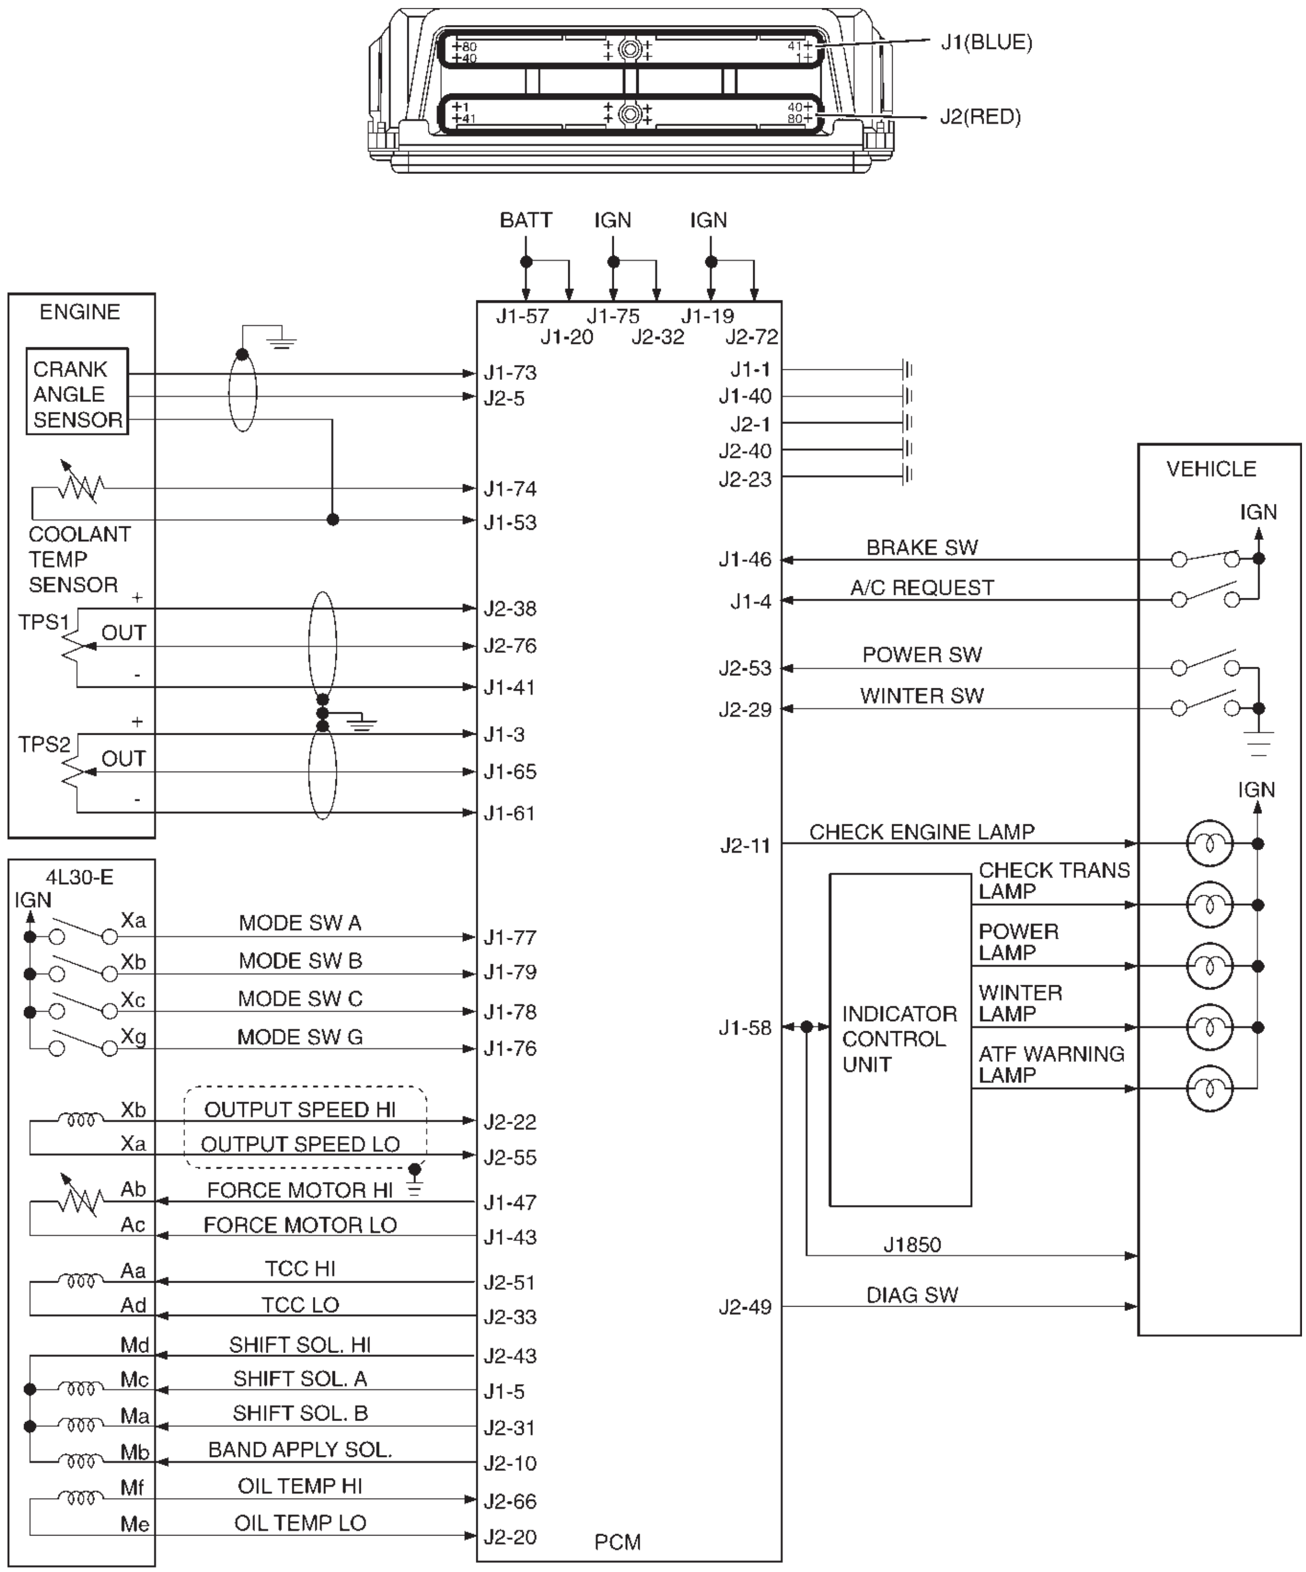
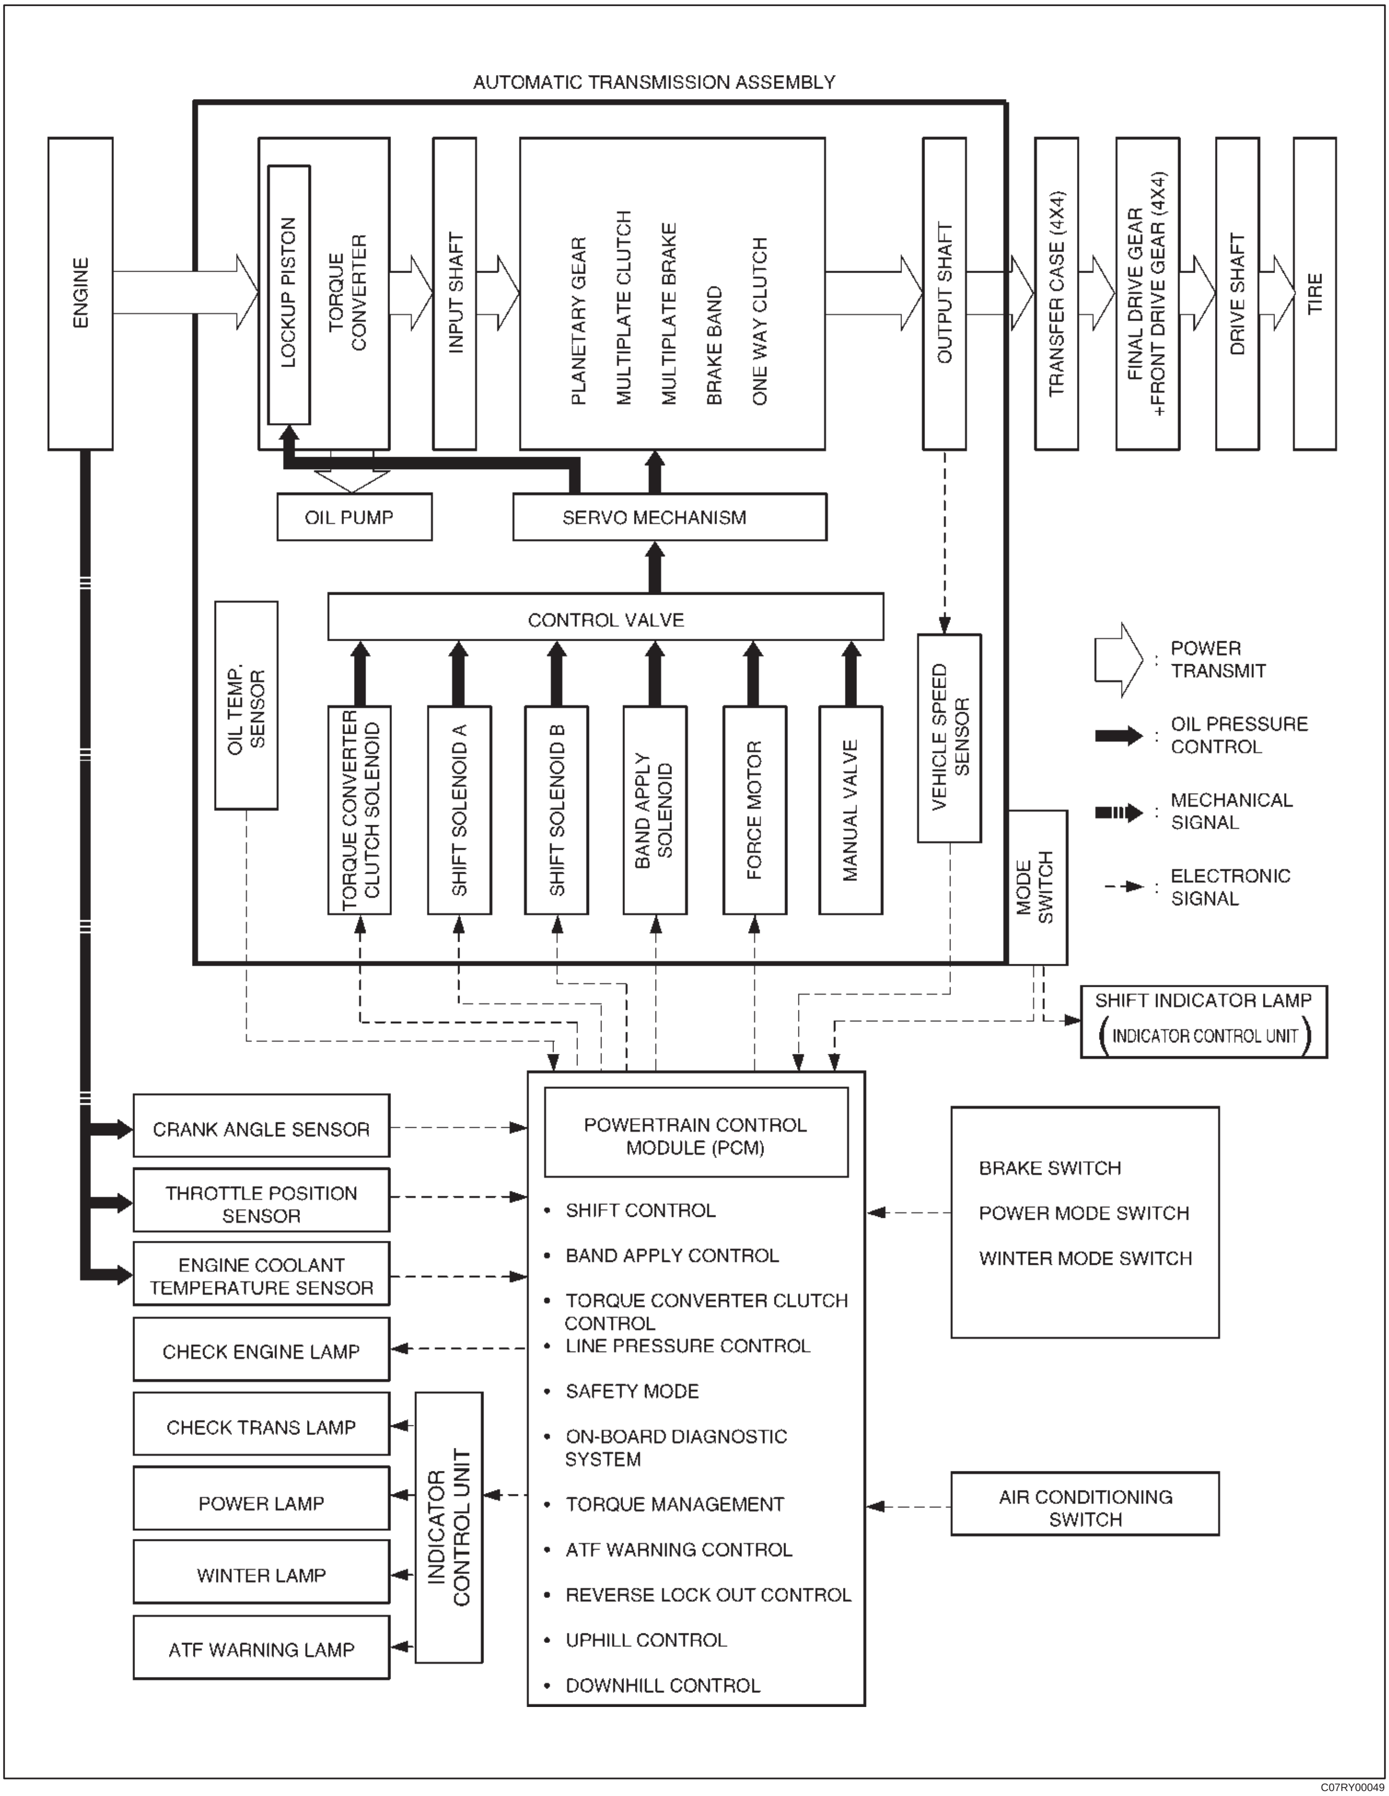
Powertrain Control Module (PCM)



TPS : Throttle Position Sensor
TCC : Torque Converter Clutch

C07RY00048

Control System Diagram



Shift Control

The transmission gear is shifted according to the shift pattern selected by the driver. In shifting gears, the gear ratio is controlled by the ON/ OFF signal using the shift solenoid A and the shift solenoid B.

Band Apply Control

The band apply is controlled when in the 3–2 downshift (engine overrun prevention) and the garage shift (shock control).
The band apply solenoid is controlled by the signal from the Pulse Width Modulation (PWM) to regulate the flow of the oil.

Torque Converter Clutch Control

The clutch ON/OFF is controlled by moving the converter clutch valve through shifting Torque Converter Clutch (TCC) solenoid using the ON/OFF signal.

Line Pressure Control

The throttle signal allows the current signal to be sent to the force motor. After receiving the current signal, the force motor activates the pressure regulator valve to regulate the line pressure.

On–Board Diagnostic System

Several malfunction displays can be stored in the Powertrain Control Module (PCM) memory, and read out of it afterward.
The serial data lines, which are required for the testing of the final assembly and the coupling to other electronic modules, can be regulated by this function.

Fail–Safe Mechanism

If there is a problem in the transmission system, the PCM will go into a “backup” mode.
The vehicle can still be driven, but the driver must use the select lever to shift gears.

Torque Management Control

The transmission control side sends the absolute spark advance signal to the engine control side while the transmission is being shifted. This controls the engine spark timing in compliance with the vehicle running condition to reduce the shocks caused by the change of speed.

ATF Warning Control

The oil temperature sensor detects the ATF oil temperature to control the oil temperature warning, TCC, and the winter mode.

Reverse Lock Out Control

With the selector lever in reverse position, the PCM will not close the PWM solenoid until the vehicle is below 15 km/h (9.3 mph), thus preventing reverse engagement above this speed.

Downhill Control

This mode is automatically activated from NORMAL mode only when downhill conditions are recognized.
The shift pattern is identical to NORMAL mode except 3-4 and 4-3 shift lines at low throttle modified to get engine braking on a larger speed range.

Uphill Control

When uphill condition are recognized the 2-3 and 3-4 shift and TCC apply are down only when the engine torque is sufficient in order to avoid shift hunting.

Shift Mode Control

① Mode Type

Mode Type	Select lever position
Normal drive mode (NOR)	Entire range (excluding "R")
Power drive mode (PWR)	Entire range (excluding "R")
Winter drive mode	"D" range only

② Mode selection

	SWITCH (SW)		LAMP	
Mode Type	POW/NOR. SW	WINTER SW	POWER DRIVE LAMP	WINTER DRIVE LAMP
Normal drive mode (NOR)	OFF	OFF	OFF	OFF
Power drive mode (PWR)	ON	OFF	ON	OFF
Winter drive mode	ON/OFF	ON	OFF	ON

However, the winter switch prevails over the PWR/NOR switch.
The mode becomes normal drive mode when the winter switch is operated from ON to OFF.

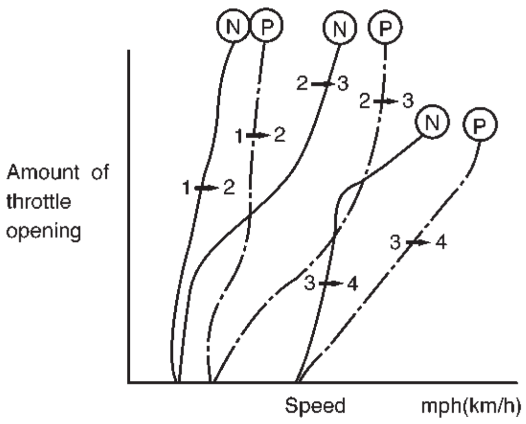
③ Comparison of mode

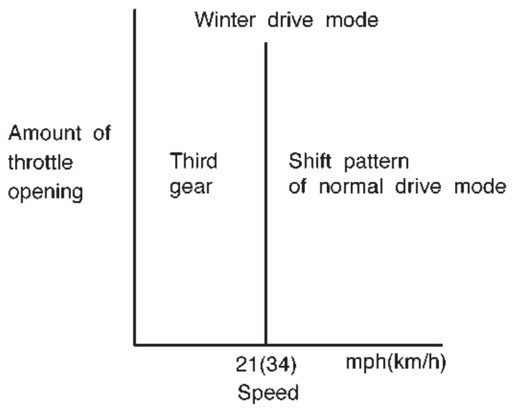
(1) The normal drive mode is set at the normal shift points.

(2) The shift points of the power drive mode are shifted to the higher speed side, compared to the normal drive mode.

(3) The winter drive mode is a special mode used exclusively for starting in third gear.

Shift diagram





F07RX001

Gear Shift Control

(1) Shift pattern

SELECT LEVER RANGE	SHIFT PATTERN
D (Drive)	1⇄2TCC ⇄3TCC ⇄4TCC
3 (Third)	1⇄2TCC ⇄3TCC ←4TCC
2 (Second)	1⇄2TCC ←3TCC
L (First)	1←2

TCC = Torque Converter Clutch

(2) Gear position

The gear is selected by ON/OFF of two solenoids.

Gear \ SOL	A	B
4 (Fourth)	×	×
3 (Third)	○	×
2 (Second)	○	○
1 (First)	×	○
P (park) R (Reverse) N (Neutral)	×	○

○ = ON

× = OFF

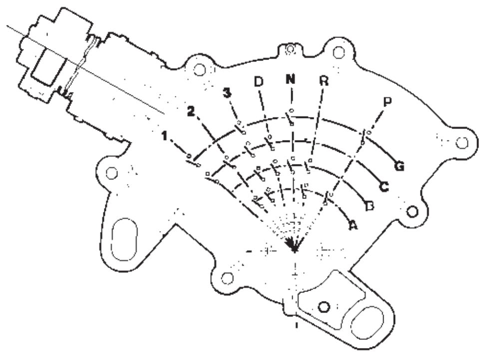
Shift solenoid A (Normally closed) ON → PRESSURE TO SHIFT VALVE

Shift solenoid B (Normally open) OFF → PRESSURE TO SHIFT VALVE

(3) Selecting gear pisition

Seven types of positions can be selected according to 5 signals from the mode switch as below.

	MODE SW TERMINALS				
SELECT LEVER RANGE	5(D)	8(A)	7(B)	6(C)	3(G)
P (park)	•	•			•
R (Reverse)	•	•	•		
N (Neutral)	•		•		•
D (Drive)	•		•	•	
3 (Third)	•	•	•	•	•
2 (Second)	•	•		•	
L (First)	•			•	•



• = Continuity

F07RT034

Winter Drive Mode

1. The winter switch will operate when switched on after all of the following conditions are present:
   a. The gear select position is “D” range only.
   b. Vehicle speed is 7 mph (11 km/h) or less.
   c. Transmission oil temperature is 130°C (266°F) or less.
   d. Accelerator opening is at 8% or less.
2. **Cancel Release**
   1. Cancellation by driver
      a. Turning off the winter drive mode switch
      b. Shifting select position to “3”, “2”, or “L” (Winter drive mode is not canceled by selecting “N”, “R”, or “P”)
      c. Ignition key is turned off.
   2. Automatic cancellation
      a. When vehicle runs at 21mph (34 km/h) or more for 1 second or more
      b. When transmission oil temperature reaches 130°C (266°F) or above

NOTE: The mode returns to normal drive mode or power drive mode after the winter drive mode is canceled.

Backup Mode

If a major system failure occurs which could affect safety or damage the transmission under normal vehicle operation, the diagnostic system detects the fault and overrides the Powertrain Control Module (PCM).
The “CHECK TRANS” light flashes to alert the driver, and the transmission must be manually shifted as follows:

Select lever position	Gear Ratio Selected
D	4 (Fourth)
Manual 3	4 (Fourth)
Manual 2	3 (Third)
Manual L	1 (First)
R	Reverse

Shifts are firmer to prevent clutch slip and consequent wear. The fault should be corrected as soon as possible.

Functions of Input / Output Components

Components			Function
INPUT SIGNAL		Speed sensor (fixed to transmission)	Senses rotation of output shaft and feeds the data to Powertrain Control Module (PCM).
		Throttle position sensor (TPS) (fixed to engine)	Senses the extent of throttle valve opening and the speed of the throttle valve lever motion to open the valve and feeds the data to PCM.
		Brake switch (fixed to brake pedal)	Senses whether the driver has pressed the brake pedal or not and feeds the information to PCM.
		Mode switch (Fixed to transmission)	Senses the select lever position, and feeds the information to PCM.
		Power drive switch (fixed to front console)	Senses whether the driver has selected the power mode, and feeds the information to PCM.
		T/M oil temperature sensor	Senses the T/M oil temperature and feeds the data to PCM.
		Engine coolant tempera-ture sensor	Senses the engine coolant temperature, and feeds the data to PCM.
		Engine speed signal	Feeds the signals monitoring engine speed to PCM from crank angle sensor.
		Air conditioning information	Senses whether the air conditioner has been switched on or not, and feeds the information to PCM.
		Winter switch (fixed to front console)	Senses whether the driver has selected the winter mode, and feeds the information to PCM.
		Cruise controller (Over-drive OFF signal)	Downshift takes place when overdrive OFF signal is received from auto cruise controller integrated in PCM.
OUTPUT SIGNAL	SOLENOID	Shift solenoid A, B	Selects shift point and gear position suited to the vehicle running condition on the basis of PCM output.
		Band apply solenoid	Controls oil flow suited to the vehicle running condition on the basis of PCM output.
		Torque Converter Clutch solenoid	Controls clutch engagement/disengagement suited to the vehicle running condition on the basis of PCM output.
		Force motor (Pressure control solenoid)	Adjusts the oil pump delivery pressure to line pressure suited to the vehicle running condition on the basis of PCM output.
		Power drive mode lamp	Informs the driver whether the vehicle is in power mode or not.
		Winter drive mode lamp	Informs the driver whether the vehicle is in winter mode or not.
		“CHECK TRANS” lamp	Informs the driver of failure in the system.
		ATF warning lamp	Lights when ATF oil temperature rises. (only 4×4)

Diagnosis

Electronic Diagnosis

How To Diagnose The Problem

1. To avoid incorrect diagnostics, this book needs to be followed accurately. Unless stated, **do not jump directly to a section that could contain the solution. Some important information may be missed.**
2. The sections in CAPITALS and bold are the main sections that can be found in the contents.
3. The GOTO **“SECTION”** means to continue to check going to the “section”.
4. The GOTHROUGH **“SECTION”** means to go through the “section” and then to go back to the place the GOTHROUGH was written.
5. BASIC ELECTRIC CIRCUITS:
   You should understand the basic theory of electricity. This includes the meaning of voltage, amps, ohms, and what happens in a circuit with an open or shorted wire. You should also be able to read and understand wiring diagrams.

Check Trans Indicator

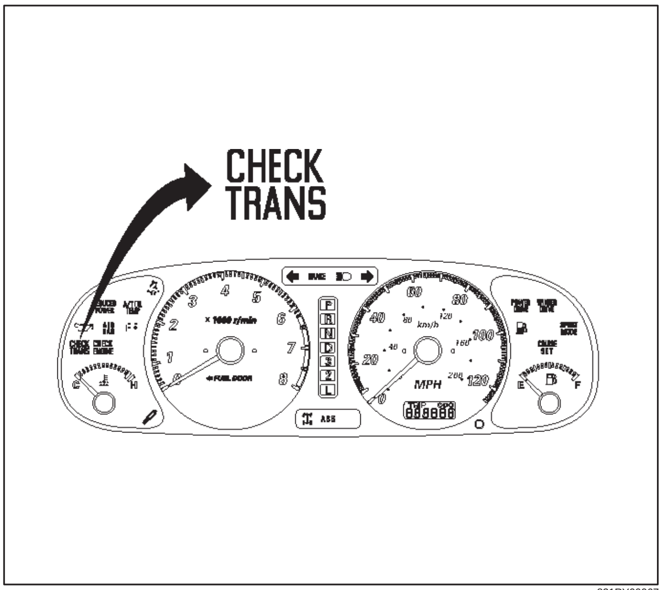
Find CHECK TRANS indicator and verify if it is

A. Flashing: GOTO **DIAGNOSTIC CHECK.**

B. Staying on: GOTHROUGH **CHECK TRANS CHECK**.

C. Is never ON when the ignition key is turned on: GOTHROUGH **CHECK TRANS CHECK**

D. Is ON during 2 seconds at ignition but OFF after: Normal operation. No DTC or malfunction.



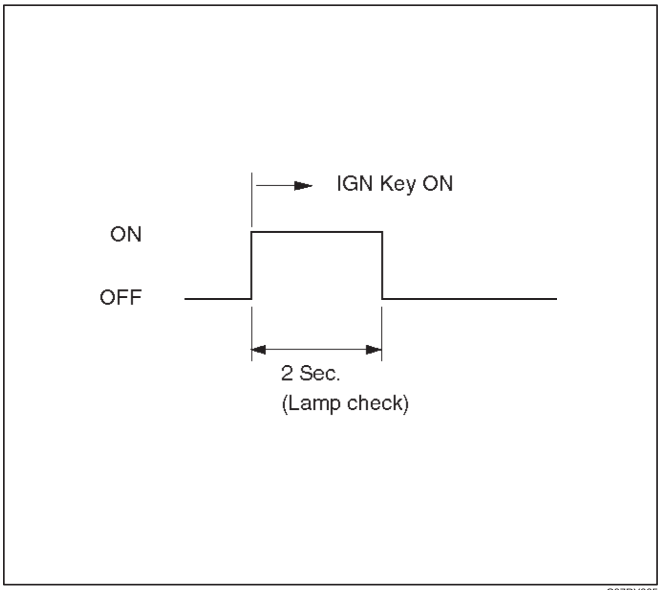
821RY00067

Diagnostic Check

This test determines if the transmission or its input or output connections or sensors are failing.

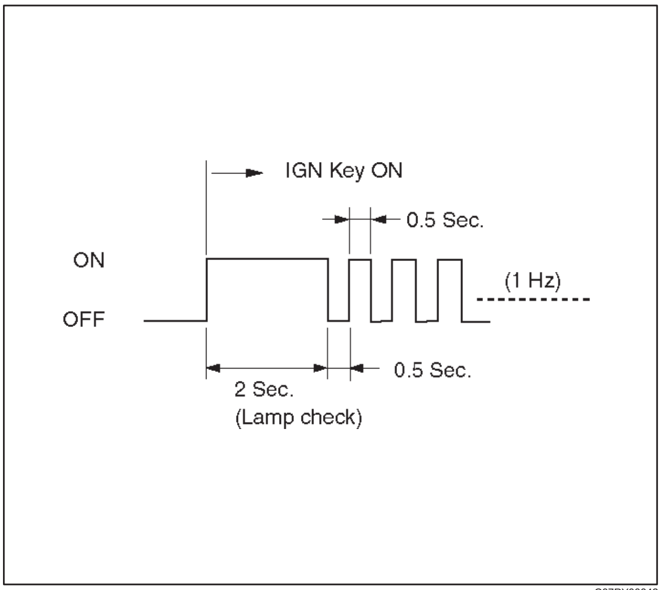
1. Connect the Tech 2: GOTHROUGH **Tech 2 OBD II CONNECTION**.
2. Turn on the ignition but not the engine.
3. Push “F0” on Tech 2 to see the Diagnostic Trouble Code (DTC):
4. Do you have a DTC?
   YES: write down all code numbers and do the **DTC CHECK**
   NO: the DTC can not help you find the problem.
   1. GOTHROUGH **“CHECK TRANS” CHECK**
   2. IF it is flashing and the flash is 0.5 seconds ON and 0.5 seconds OFF, this means that you should have a DTC stored. Please recheck GOTO **DIAGNOSTIC CHECK** and if you find the same problem, replace the Powertrain Control Module (PCM).

Normal



C07RY005

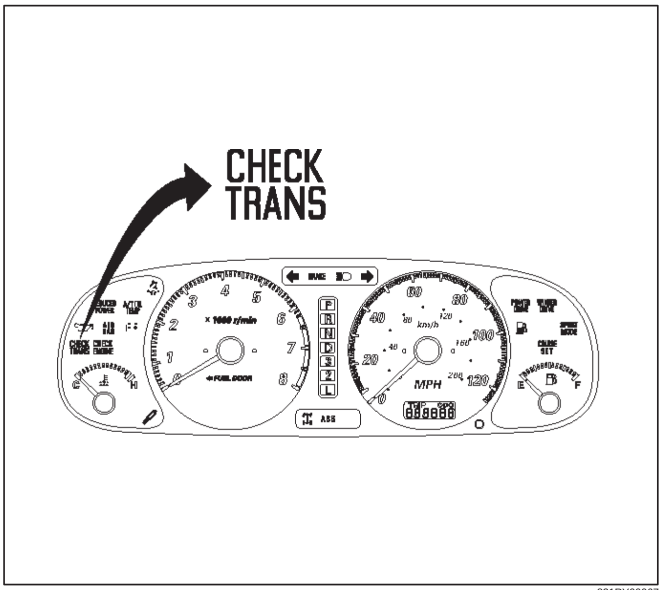
Abnormal



C07RY00042

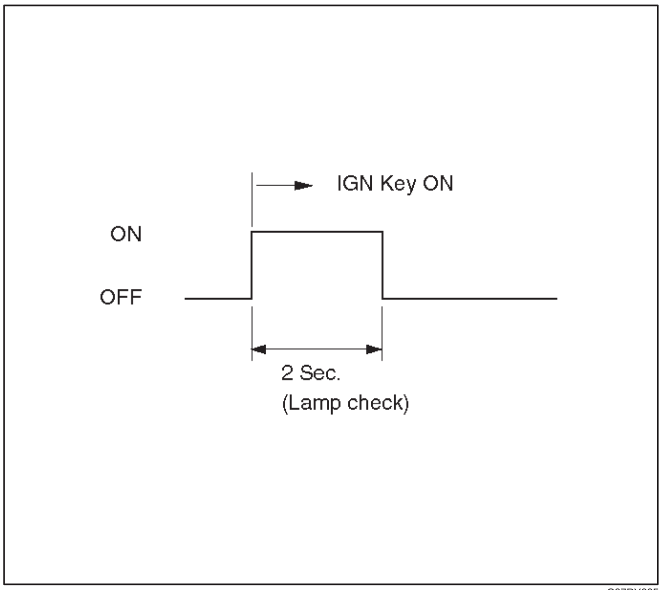
“Check Trans” Check

1. Indicator is ON during 2 seconds at ignition (or when the engine is cranked) but it is OFF after the engine starts. The indicator is working normally GOTO **DIAGNOSTIC CHECK**.



821RY00067

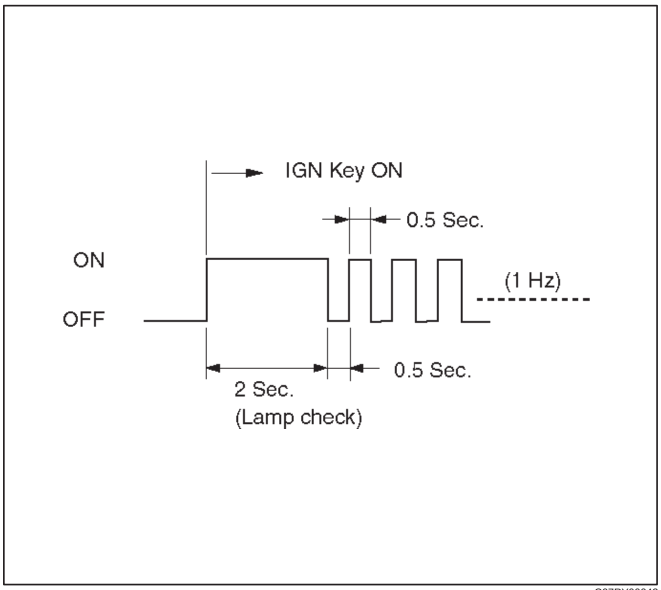
Normal



C07RY005

2. Indicator is flashing and the flash is 0.5 seconds ON and 0.5 seconds OFF always when ignition is on (engine cranked or not). This means that there is a malfunction. GOTO **DIAGNOSTIC CHECK**.

Abnormal



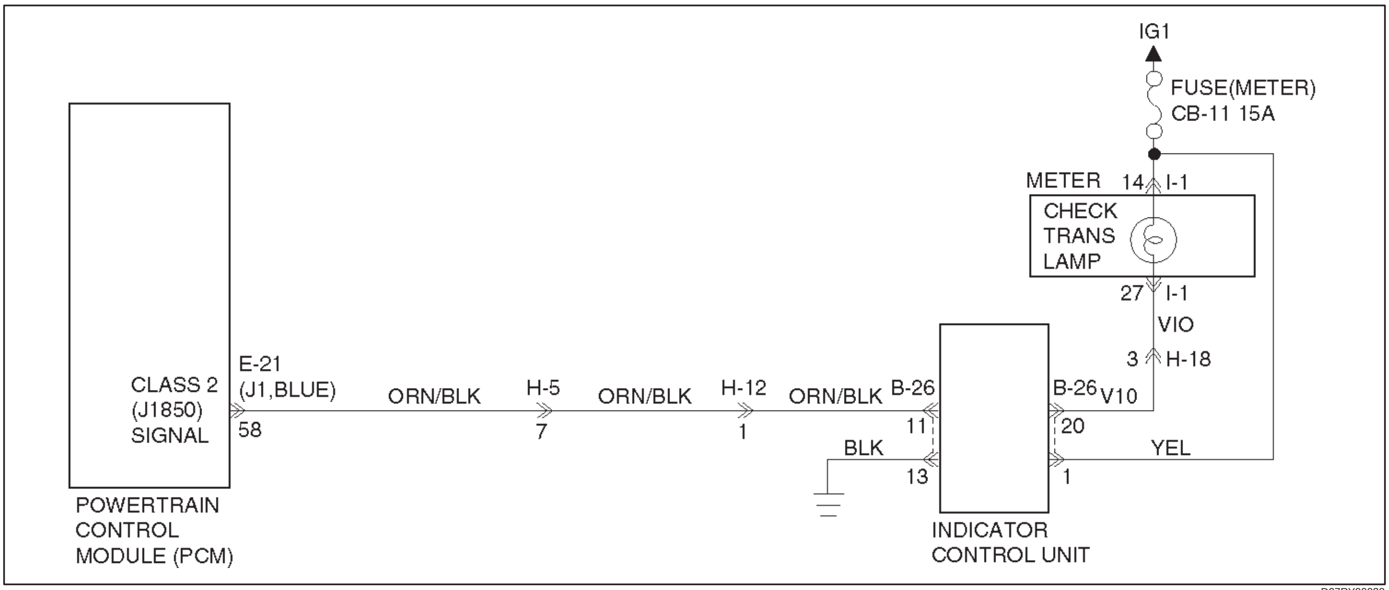
C07RY00042

3. Indicator is staying ON always when Ignition is ON.
   1. This means that connection between the lamp and the indicator control unit is shorted to ground.
   2. Verify if instrument panel terminal 27 of connector I–1 is shorted to ground.
   3. Verify if the indicator control unit connector B–26 terminal 20 is shorted to ground.
   4. Verify that the instrument panel terminal 14 of connector I–1 is connected to battery.
   5. IF problem solved: GOTO **CHECK TRANS INDICATOR**.

   NO:Replace Powertrain Control Module (PCM).
4. Indicator is staying OFF with the ignition ON (engine OFF).
   1. This means that connection between the lamp and the indicator control unit is shorted to battery or opened.
   2. Verify if instrument panel terminal 27 of connector I–1 is shorted to battery or open.
   3. Verify if the indicator control unit connector B–26 terminal 20 is shorted to battery or open.
   4. Verify that the instrument panel terminal 14 of connector I–1 is connected to battery. If not, check the fuses and the connections (terminal 3 of connector H–18) voltage.

5. IF problem solved: GOTO **CHECK TRANS INDICATOR**.

NO: Replace Powertrain Control Module (PCM).

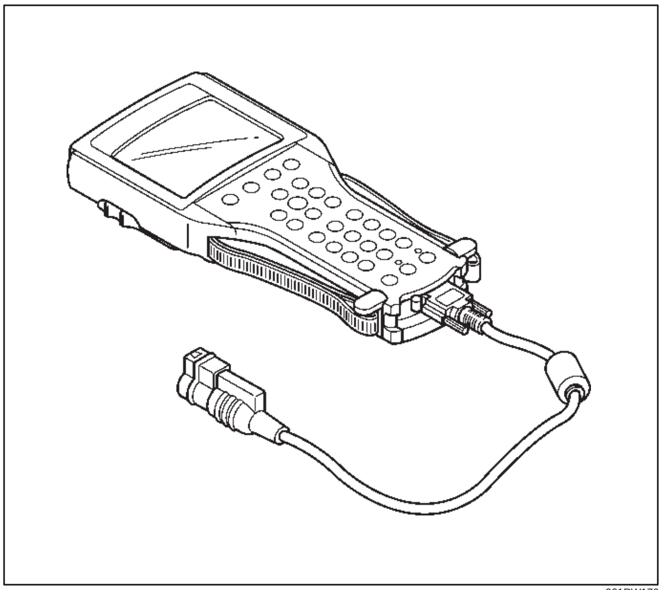


D07RY00028

Tech 2 OBD II Connection

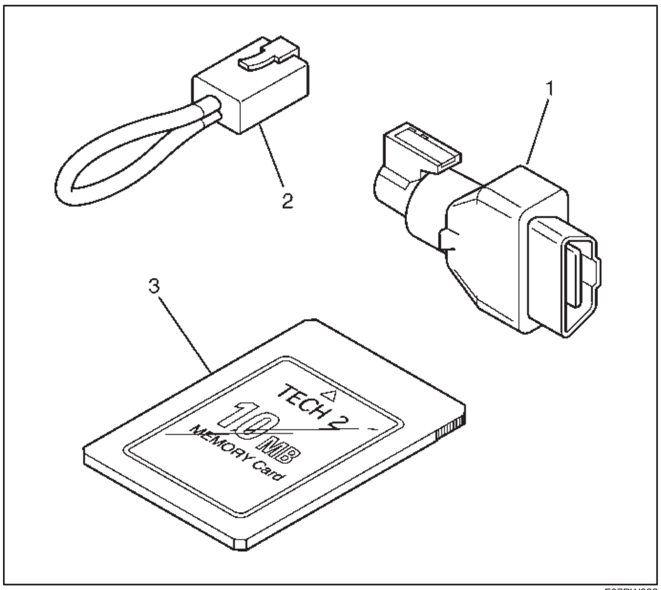
In order to access OBD II Powertrain Control Module (PCM) data, use of the Tech 2 scan tool kit (7000086) is required.

1. The electronic diagnosis equipment is composed of:
   1. Tech 2 hand held scan tool unit (7000057) and DLC cable (3000095).



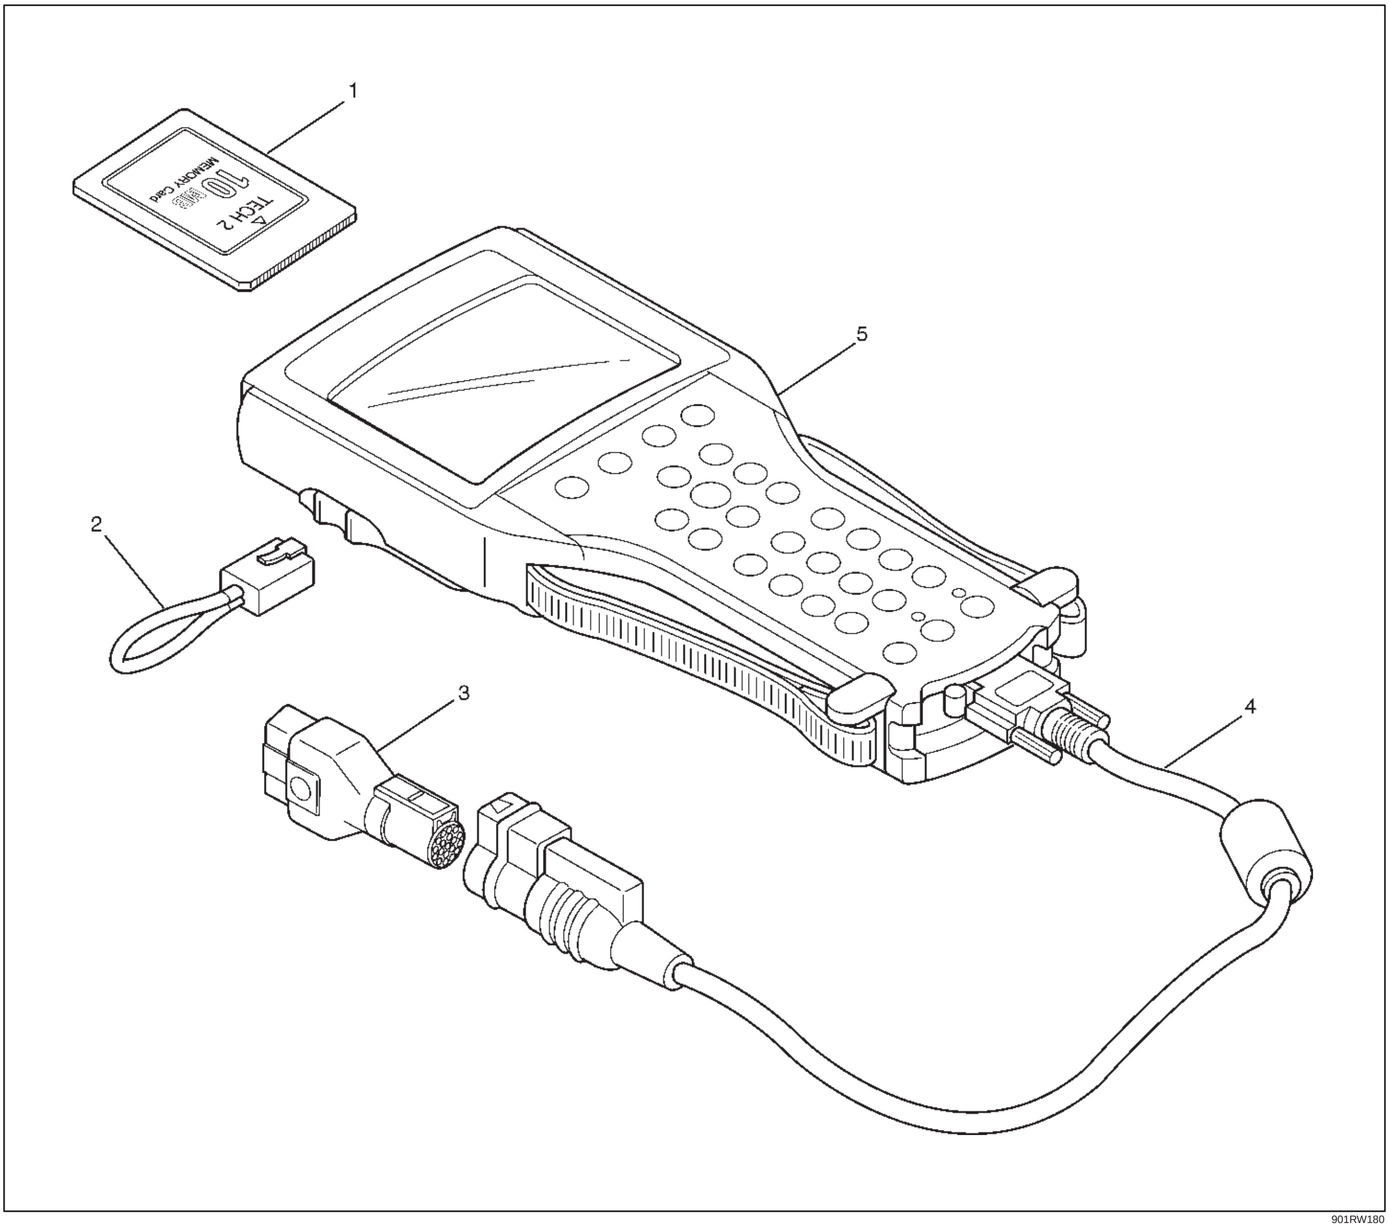
901RW176

2. SAE 16/19 Pin Adapter (3000098)(1), RS232 Loop Back Connector (3000112)(2), and PCMCIA Card (3000117)(3).



F07RW033

2. Connecting the Tech 2

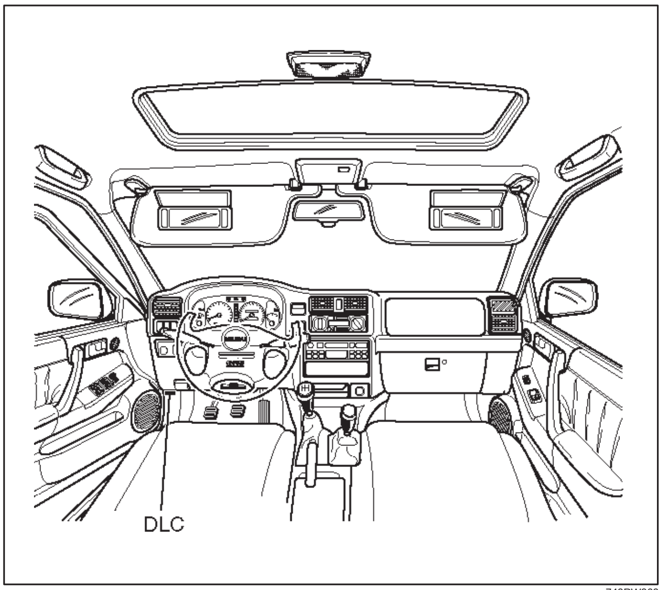


Legend

(1) PCMCIA Card
(2) RS 232 Loop Back Connector
(3) SAE 16/19 Adapter
(4) DLC Cable
(5) Tech 2

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:

1. The Isuzu 2000 System PCMCIA card (1) inserts into the Tech 2 (5).
2. Connect the SAE 16/19 adapter (3) to the DLC cable (4).
3. Connect the DLC cable to the Tech 2 (5)
4. Mark sure the vehicle ignition is off.
5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC.



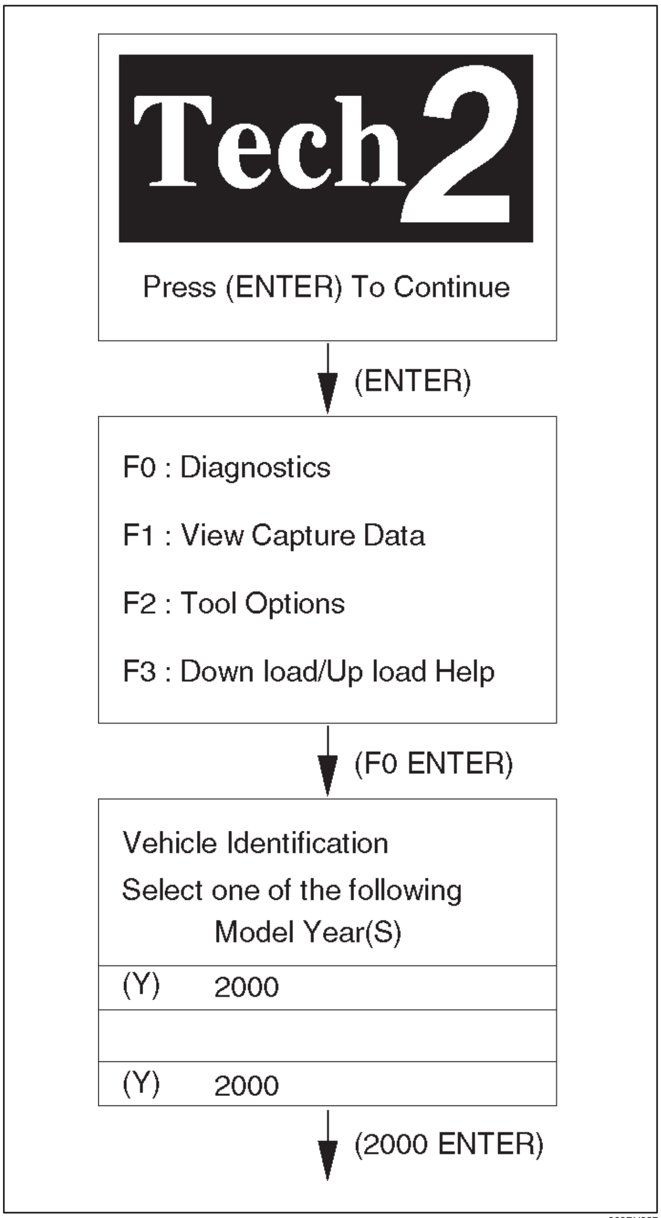
740RW060

6. The vehicle ignition turns on.
7. Verify the Tech 2 power up display.

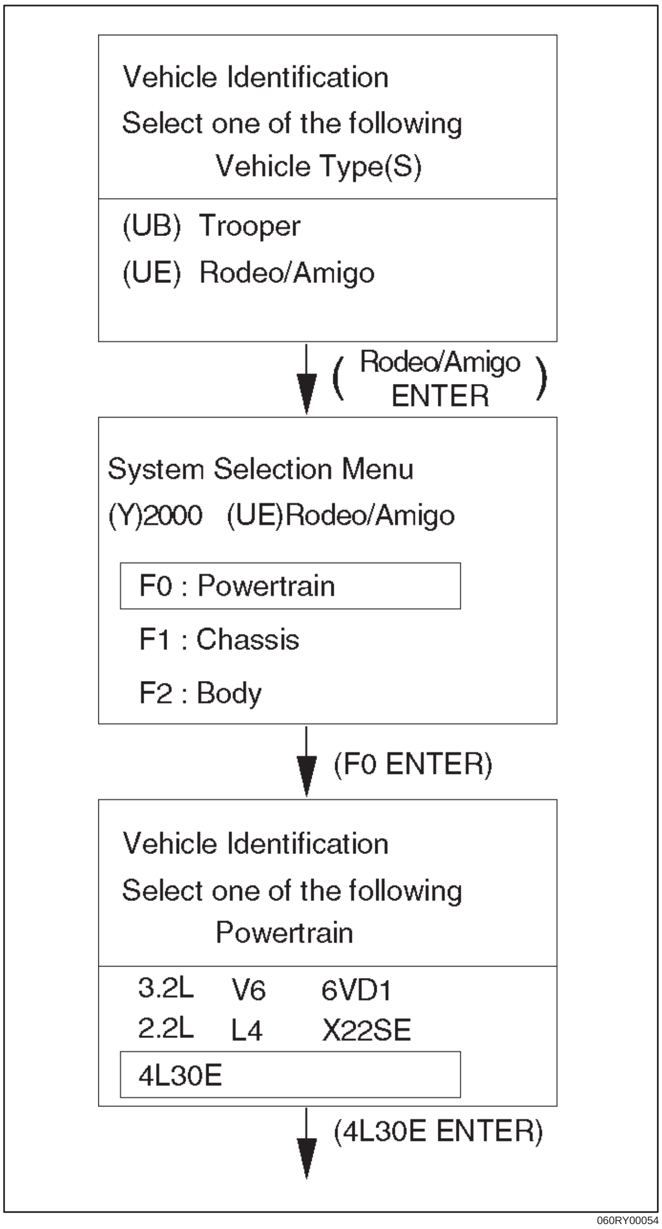
060RW009

NOTE: The RS232 Loop back connector is only to use for diagnosis of Tech 2 and refer to user guide of the Tech 2.

8. The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.



060RY027



Once the test vehicle has been identified an “Application (Powertrain) Menu” screen appears. Please select the appropriate application.

The following table shows, which functions are used for the available equipment versions.

- F0: Diagnostic Trouble Codes
  - F0: Read DTC Info Ordered By Priority
  - F1: Clear DTC Information
  - F2: DTC Information
- F1: Data Display
  - F0: Transmission Data
- F2: Snap Shot
- F3: Actuator Tests
  - F0: Lamps
    - F0: Check Light
    - F1: Winter Drive Lamp
    - F2: Power Drive Lamp
    - F3: AT Oil Temperature Lamp
  - F1: Solenoids
    - F0: Solenoid 1-2/3-4 Test
    - F1: Solenoid 2-3 Test
    - F2: TCC Solenoid
    - F3: Band Apply Solenoid
    - F4: Pressure Control Solenoid (PCS)
- F4: Function Tests
  - F0: Reset Oil Life Monitor

Diagnostic Trouble Codes

The purpose of the "Diagnostic Trouble Codes" mode is to display stored PCM trouble codes.
When "Diagnostic Trouble Codes" is selected an "Application Menu" screen appears.

Clear DTC Information

The purpose of the "Clear DTC Information" mode is to command the clearing of stored PCM trouble codes.
When "Clear DTC Information" is selected, a "Clear DTC Information", warning screen appears. This screen informs you that by cleaning DTC's, "all stored DTC information in controller will be erased".
Do you want to clear DTC's (Yes/No).
Press either the Yes or No key when answering.
After clearing codes, confirm system operation by test driving the vehicle.
Allow the vehicle to shift through all four forward gears in a manner which attempts to repeat the failure condition.

NOTE: When the trouble has not been repaired and the trouble code cannot be erased, check the vehicle again.

DTC Information

When "DTC Information" is selected, an "Application Menu" appears with a list of DTC information function keys addressing DTC specifics and their origins.
Function key selections may vary for particular vehicle and/or system.

Data Display

The purpose of the "Data Display" mode is to continuously monitor data parameters.
The current actual values of all important sensors and signals in the system are display through F1 mode.
When "Data Display" is selected an "Application Menu" appears. Please select either "Engine" or "Transmission Data Display".
See "Transmission Data" on next page.

Snapshot

When "Snapshot" is selected an "Application Menu" appears.
When "Transmission Snapshot" application is selected from the "Application Menu", a "Snapshot Menu" appears, displaying several options. "Snapshot" options may vary from one system to another.
"Snapshot" allows a recording of all vehicle parameters. There parameters may then be replayed at a future point in time.
This action allows you to focus on making the condition occur, rather than trying to view all of the data in anticipation of the fault. The snapshot will collect parameter information around a trigger point that you select.
When a snapshot is taken. It is recorded onto the PCMCIA memory card. When the Tech 2 is powered down. Snapshots are not lost.

Actuator Tests

The purpose of "Actuator Tests" mode is to check for correct operation of electronic system actuators.

Lamps

You can operate the lamps by pressing the "ON" and "OFF" buttons.
Preconditions: none

Solenoid

Solenoid 1-2/3-4, Solenoid 2-3, TCC Solenoid
You can operate the solenoids by pressing the "ON" and "OFF" buttons.
Preconditions: P–N position, no vehicle speed, no engine speed

Band Apply Solenoid
You can operate the solenoid by pressing the "ON" and "OFF" buttons.
Preconditions: P-N position, idle engine speed, no vehicle speed.

Pressure Control Solenoid (PCS)
You can set desired PCS Current using the "Increment" (+20) and "Decrement" (–20) button. The PC Solenoid Data informs about PCS Current, Pressure and Duty Cycle.
Preconditions: P–N position, no engine speed, no vehicle speed

Reset Oil Life Monitor

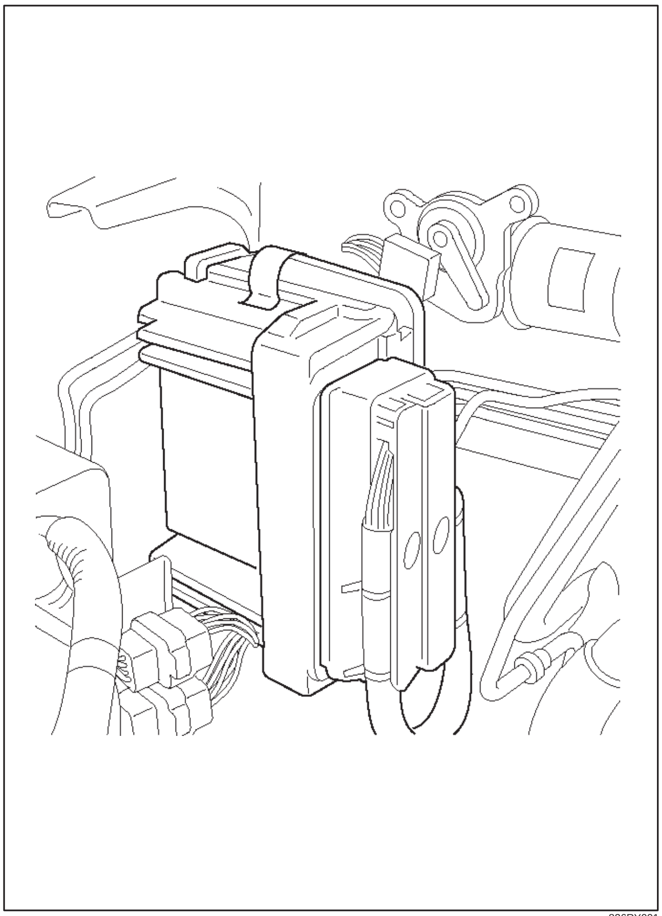
Displays parameter "Oil Life Monitor" and resets to 100% if Yes-button is pressed on Reset-question. "No" leaves test.

Transmission Data

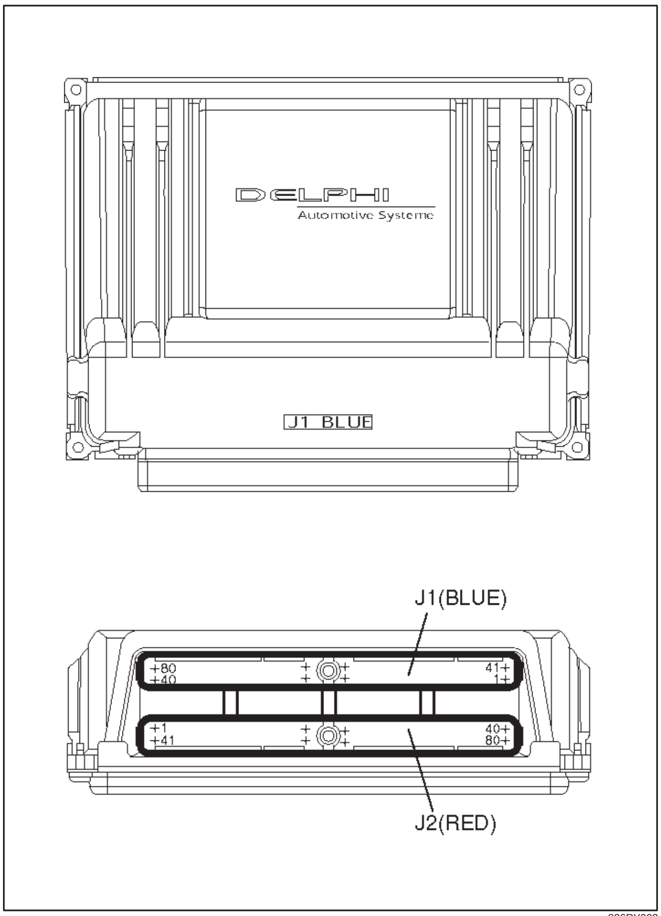
Item	Unit	Engine running at idle
Ignition Voltage	V	12.8 ~ 14.1 V
Engine Speed	RPM	750 ~ 900 RPM
Vehicle Speed	km/h, MPH	0 MPH
AT Output Speed (Automatic Transmission)	RPM	0 RPM
AT Input Speed Ratio (Automatic Transmission)		0.0
Throttle Position	%	0 %
AT Oil Temperature (Automatic Transmission)	˚C, ˚F	70 ~ 80˚C (158 ~ 176˚F)
Transmission Temperature	˚C, ˚F	75 ~ 110˚C (167 ~ 230˚F)
AT Oil Temperature Lamp (Automatic Transmission)	Off, On	Off
AT Oil Life Monitor (Automatic Transmission)	%	100 %
AT Oil Life Lamp (Automatic Transmission)	Off, On	Not used
Commanded Gear		1
Current Gear		1
Mode Switch A	Inactive, Active	Active
Mode Switch B	Inactive, Active	Inactive
Mode Switch C	Inactive, Active	Inactive
Mode Switch G	Inactive, Active	Active
Selector Position		Park
1–2 Shift Solenoid A	Off, On	Off
2–3 Shift Solenoid B	Off, On	On
Solenoid Brake Band	Off, On	Off
TCC Slip Speed	RPM	750 ~ 900 RPM
TCC Solenoid	Off, On	Off
TCC Duty Cycle	%	0 %
PCS Current (Pressure Control Solenoid)	A	approx. 1.0 A
PCS Duty Cycle (Pressure Control Solenoid)	%	approx. 45 %
Desired PCS Pressure (Pressure Control Solenoid)	kPa	43 ~ 52 kPa
Shift Pressure	kPa	43 ~ 52 kPa
Brake Switch	Off, On	On
Winter Switch	On, Off	Off
Winter Drive Lamp	Off, On	Off
Power Switch	Power Drive Normal	Normal
Power Drive Lamp	Off, On	Off
Emergency Mode	Inactive, Active	Inactive
ABS Status	On, Off	(Not used)

OBD II Diagnostic Management System

Powertrain Control Module (PCM) Location



826RY001



826RY002

Class 2 Serial Data Bus

OBD II technology requires a much more sophisticated PCM than does OBD I technology. The OBD II PCM diagnostic management system not only monitors systems and components that can impact emissions, but they also run active tests on these systems and components. The decision making functions of OBD II PCM have also greatly increased. To accommodate this expansion in diagnostic complexity, Isuzu engineers have designed the Class 2 serial data bus, which meets SAE J1850 recommended practice for serial data.

"Serial Data" refers to information which is transferred in a linear fashion – over a single line, one bit at a time. A "Data Bus" is an electronic pathway through which serial data travels.

RODEO previously used a 5 volt data bus called UART, which is an acronym for "Universal Asynchronous Receive and Transmit". When neither the vehicle's control module nor the diagnostic tool, such as a Tech 2, are "talking," the voltage level of the bus at rest is 5 volts. The two computers talk to each other at a rate of 8,192 bits per second, by toggling or switching the voltage on the data bus from 5 volts to ground.

Class 2 data, which is used on OBD II vehicles, is quite different. Data is transferred at a rate of 10.4 kilobits per second, and the voltage is toggled between zero and 7 volts.

C07RT006

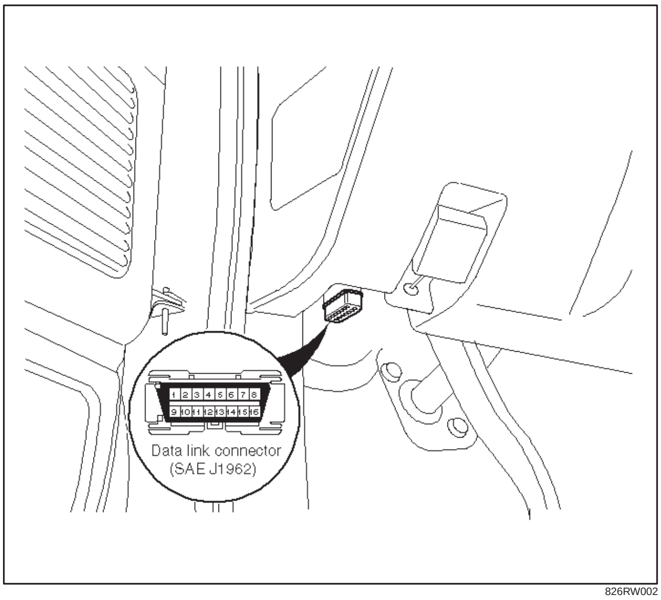
Class 2 data is also pulse width modulated. Each bit of information can have one of two lengths: long or short. On the other hand, UART data bits come in only one length (short). The pulse width modulation of Class 2 data allows better utilization of the data line.

The message carried on Class 2 data streams are also prioritized. This means that if two devices try to communication on the data line at the same time, only the higher priority message will continue. The device with the lower priority message must wait.

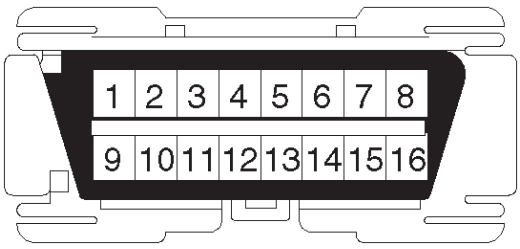
NOTE: The Class 2 data wire is always terminal 2 of the new 16–terminal Data Link Connector (DLC).

16 – Terminal Data Link Connector (DLC)

OBD II standardizes Data Link Connector (DLC) configurations. The DLC, formerly referred to as the ALDL, will be a 16–terminal connector found on the lower left side of the driver's side instrument panel. All manufacturers must conform to this 16–terminal standard.



826RW002



810RT022

PIN 1 –	(Not used)
PIN 2 –	J1850 Bus + L line on 2–wire systems, or single wire (Class 2)
PIN 3 –	(Not used)
PIN 4 –	Chassis ground pin
PIN 5 –	Signal ground pin
PIN 6 –	(Not used)
PIN 7 –	(Not used)
PIN 8 –	(Not used)
PIN 9 –	Primary UART
PIN 10 –	(Not used)
PIN 11 –	(Not used)
PIN 12 –	ABS diagnostic or CCM diagnostic enable
PIN 13 –	SIR diagnostic enable
PIN 14 –	(Not used)
PIN 15 –	(Not used)
PIN 16 –	Battery power from vehicle unswitched (4 AMP MAX.)

Malfunction Indicator Lamp (MIL)

The Malfunction Indicator Lamp (MIL) looks the same as the MIL you are already familiar with ("CHECK ENGINE" lamp). However, OBD II requires that it illuminate under a strict set of guidelines. Basically, the MIL is turned on when the PCM detects a DTC that will impact the vehicle's emissions.

The MIL is under the control of the Diagnostic Executive. The MIL will be turned on if a component or system which has an impact on vehicle emissions indicates a malfunction or fails to pass an emissions–related diagnostic test. It will stay on until the system or component passes the same test, for three consecutive trips, with no emissions–related faults.

Types Of Diagnostic Trouble Codes (DTCs)

The Diagnostic Executive classifies Diagnostic Trouble Codes (DTCs) into certain categories. Each type has different requirements to set the code, and the Diagnostic Executive will only illuminate the Malfunction Indicator Lamp (MIL) for emissions related DTCs. DTCs fall into four categories: A, B, C, and D; only types A and B are emission related The following descriptions define these categories:

TYPE A

Will store the DTC and turn on the MIL ("Check Engine" lamp) on the first trip in which an emission related diagnostic test has run and reported a "test failed" to the Diagnostic Executive.

TYPE B

Will store the DTC and turn on the MIL on the second consecutive trip in which an emission related diagnostic test has run and reported a "test failed" to the Diagnostic Executive. After one failure, the type B DTC is "armed," or prepared to store a history code and turn on the MIL if a second failure occurs. One passed test will disarm a type B DTC. Some special conditions apply to misfire and fuel trim DTCs. For a type B DTC to store and turn on the MIL, two ignition cycles are required.

TYPE C

Will store the DTC and turn on a "SERVICE" lamp ("Check Trans" lamp) on the first trip that a non emission related diagnostic test has run and reported a "test failed" to the Diagnostic Executive. This type of DTC will be used in future applications.

TYPE D

Will store a DTC but will not turn on the MIL on the first trip that a non emission related diagnostic test has run and reported a "test failed" to the Diagnostic Executive. These codes can be very helpful for vehicle service when the driver may comment about a condition, but the MIL did not turn on.

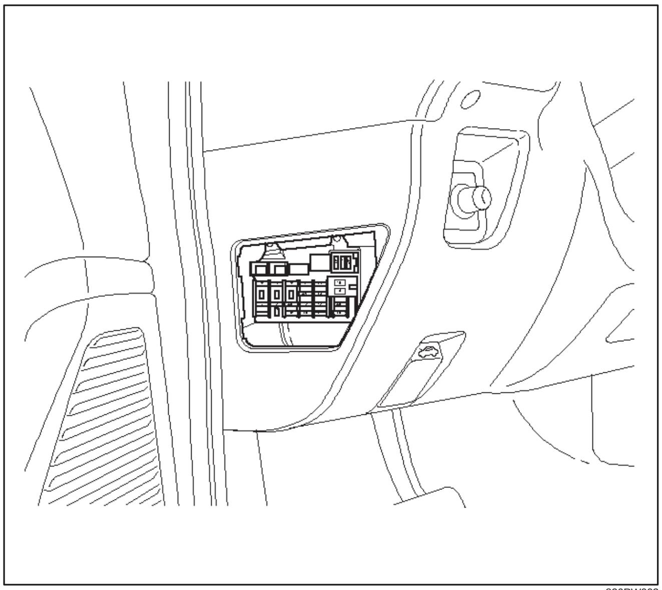
Clear DTC

NOTE: If you clear the DTC (Diagnostic Trouble Codes) you will not be able to read any codes recorded during the last occurrence.

NOTE: To use the DTC again to identify a problem, you will need to reproduce the fault or the problem. This may require a new test drive or just turning the ignition on (this depends on the nature of the fault).

1. IF you have a Tech 2:
   1. Connect the Tech 2 if it is still not connected GOTHROUGH **Tech 2 OBD II CONNECTION.**
   2. Push "F1: Clear DTC Information" in the Application Menu and answer "Yes" to the question "Do you want to clear DTC's?"
      a. When a malfunction remains as it is the Tech 2 displays "4L30E CODES NOT CLEARED". This means that the problem is still there or that the recovery was not done. Please **GOTO DTC CHECK.**
      b. When a malfunction has been repaired and the recovery is done the Tech 2 displays "4L30E CODES CLEARED".

2. IF you have no Tech 2:
   To clear the DTC, remove Fuse “Stop” (CB–13, 15A) for at least 10 seconds.



826RW003

DTC Check

1. Diagnostic Trouble Codes (DTC) have been identified by Tech 2.
2. You have written the list of the DTCs. The order of the malfunctions has no meanings for this PCM. Usually only one or two malfunctions should be set for a given problem.
3. Check directly the DTCs you identified. The DTCs are sorted by number. Refer to Diagnostic Trouble Code (DTC) Identification in this section.

PCM Precaution

The PCM can be damaged by:

1. The electrostatic discharge
2. The short circuit of some terminals to voltage or to ground.

Electrostatic Discharge Damage Description:

1. Electronic components used to control systems are often designed to carry very low voltage, and are very susceptible to damage caused by electrostatic discharge. It is possible for less than 100 volts of static electricity to cause damage to some electronic components. By comparison, it takes as much as 4,000 volts for a person to even feel the zap of a static discharge.
2. There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction. An example of charging by friction is a person sliding across a car seat, in which a charge of as much as 25,000 volts can build up. Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges for the same polarity are drained off, leaving the person highly charged with the opposite polarity. Static charges of either type can cause damage, therefore, it is important to use care when handling and testing electronic components.

NOTICE: To prevent possible electrostatic discharge damage:

1. Do not touch the PCM connector pins or soldered components on the PCM circuit board.
2. Be sure to follow the guidelines listed below if servicing any of these electronic components:
3. Do not open the replacement part package until it is time to install the part.
4. Avoid touching electrical terminals of the part.
5. Before removing the part from its package, ground the package to a known good ground on the vehicle.
6. Always touch a known good ground before handling the part. This step should be repeated before installing the part if the part has been handled while sliding across the seat, while sitting down from a standing position or while walking some distance.

Information On PCM

1. The Powertrain Control Module (PCM) is located in the engine room and is the control center of the electronic transmission control system.
2. The PCM must be maintained at a temperature below 85°C (185°F) at all times. This is most essential if the vehicle is put through a paint baking process. The PCM will become inoperative if its temperature exceeds 85°C (185°F). Therefore, it is recommended that the PCM be removed or that temporary insulation be placed around the PCM during the time the vehicle is in a paint oven or other high temperature process.
3. The PCM is designed to process the various inputs and then respond by sending the appropriate electrical signals to control transmission upshift, downshift, shift feel and torque converter clutch engagement.
4. The PCM constantly interprets information from the various sensors, and controls the systems that affect transmission and vehicle performance. By analyzing operational problems, the PCM is able to perform a diagnostic function by displaying DTC(s) and aid the technician in making repairs.

Intermittent Conditions

If the Tech 2 displays a diagnostic trouble code as intermittent, or if after a test drive a DTC does not reappear though the detection conditions for this DTC are present, the problem is most likely a faulty electrical connection or loose wiring. Terminals and grounds should always be the prime suspect. Intermittents rarely occur inside sophisticated electronic components such as the PCM.

Use the DTC information to understand which wires and sensors are involved.

When an intermittent problem is encountered, check suspect circuits for:

1. Poor terminal to wire connection.
2. Terminals not fully seated in the connector body (backed out).
3. Improperly formed or damaged terminals.
4. Loose, dirty, or corroded ground connections:

   HINT: Any time you have an intermittent in more than one circuit, check whether the circuits share a common ground connection.
5. Pinched or damaged wires.
6. Electromagnetic Interference (EMI):

   HINT: Check that all wires are properly routed away from coil, and generator. Also check for improperly installed electrical options, such as lights, 2–way radios, etc.

Use the F2: SNAPSHOT mode of the Tech 2 to help isolate the cause of an intermittent fault. The snapshot mode will record information before and after the problem occurs. Set the snapshot to “trigger” on the suspect DTC or, if you notice the reported symptom during the test drive, trigger the snapshot manually.

After the snapshot has been triggered, command the Tech 2 to play back the flow of data recorded from each of the various sensors. Sign of an intermittent fault in a sensor circuit is a sudden unexplainable jump in data values out of the normal range.

Transmission and PCM Identification

The chart below contains a list of all important information concerning rear axle ratio, Powertrain Control Module (PCM), and transmission identification.

VEHICLE		Rr axle Ratio	PCM	TRANSMISSION		
Type	Engine		ISUZU Parts No.	Calibration Code	Isuzu Part No.	Model Code
Isuzu / Rodeo	3.2L V6	4.100	8–09385–249–0	I36	8–96018–555–0	FT (4×4)
				I36	8–96022–838–0	FU (4×2)

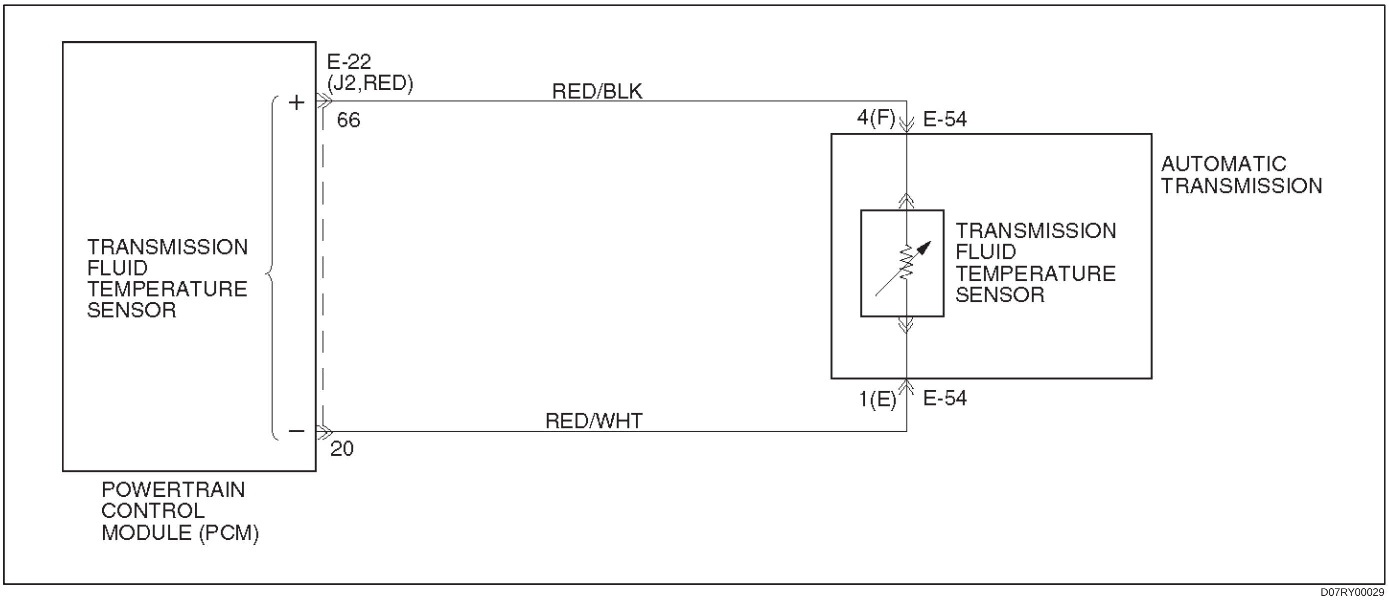
P0756	Shift Solenoid B Performance (Stuck Off)	B	ON	Flash
P0757	Shift Solenoid B Performance (Stuck On)	B	ON	Flash
P0758	Shift Solenoid B Electrical	B	ON	Flash
P1850	Brake Band Apply Solenoid Malfunction	D		
P1860	TCC Solenoid Electrical	B	ON	Flash
P1870	Transmission Component Slipping (TCC Stuck Off)	B	ON	Flash

DTC TYPE	DEFINITION
B	Emission related, turn on MIL (Check Engine) and flashing Check Trans after 2 consecutive trips (Removal to confirmed)
C	Non–emission related, flashing Check Trans on 1st failure
D	Non–emission related, no lamps

NOTE: On the following charts, refer to Powertrain Control Module (PCM) section for Wiring System and the Body and Accessories section for circuit diagram details, parts location, and connector configuration.

DTC P0218 Transmission Fluid Over Temperature



Circuit Description

The Transmission Fluid Temperature (TFT) sensor is a thermister that controls the signal voltage to the PCM. The PCM supplies a 5–volt reference to the sensor on circuit RED/BLK. When the transmission fluid is cold, the sensor resistance is high and the PCM will sense high signal voltage. As the fluid temperature warms to a normal transmission operating temperature of 100°C (212°F), the sensor resistance becomes less and the voltage decreases to 1.5 to 2.0 volts.
This DTC detects a high transmission temperature for a long period of time. This is a type “D” DTC.

Conditions For Setting The DTC

- No TFT DTCs P0712 or P0713.
- TFT is greater than 135°C (275°F).
- All conditions met for 21 seconds.

Action Taken When The DTC Sets

- Hot mode TCC Shift Pattern.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).
- ATF Lamp ON. (TFT is greater than 145°C (293°F))
- Disable E–side TCC OFF request.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm–up cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and transmission 7-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well.

  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check harness routing for a potential short to ground in circuit RED/BLK.
- Scan tool TFT sensor temperature should rise steadily to about 100°C (212°F), then stabilize.
- Check for a “skewed” (mis–scaled) sensor by comparing the TFT sensor temperature to the ambient temperature after a vehicle cold soak. A “skewed” sensor can cause delayed garage shifts or TCC complaints.
- Check for a possible torque converter stator problem.
- Verify customer driving habits, trailer towing, etc.

Test Description

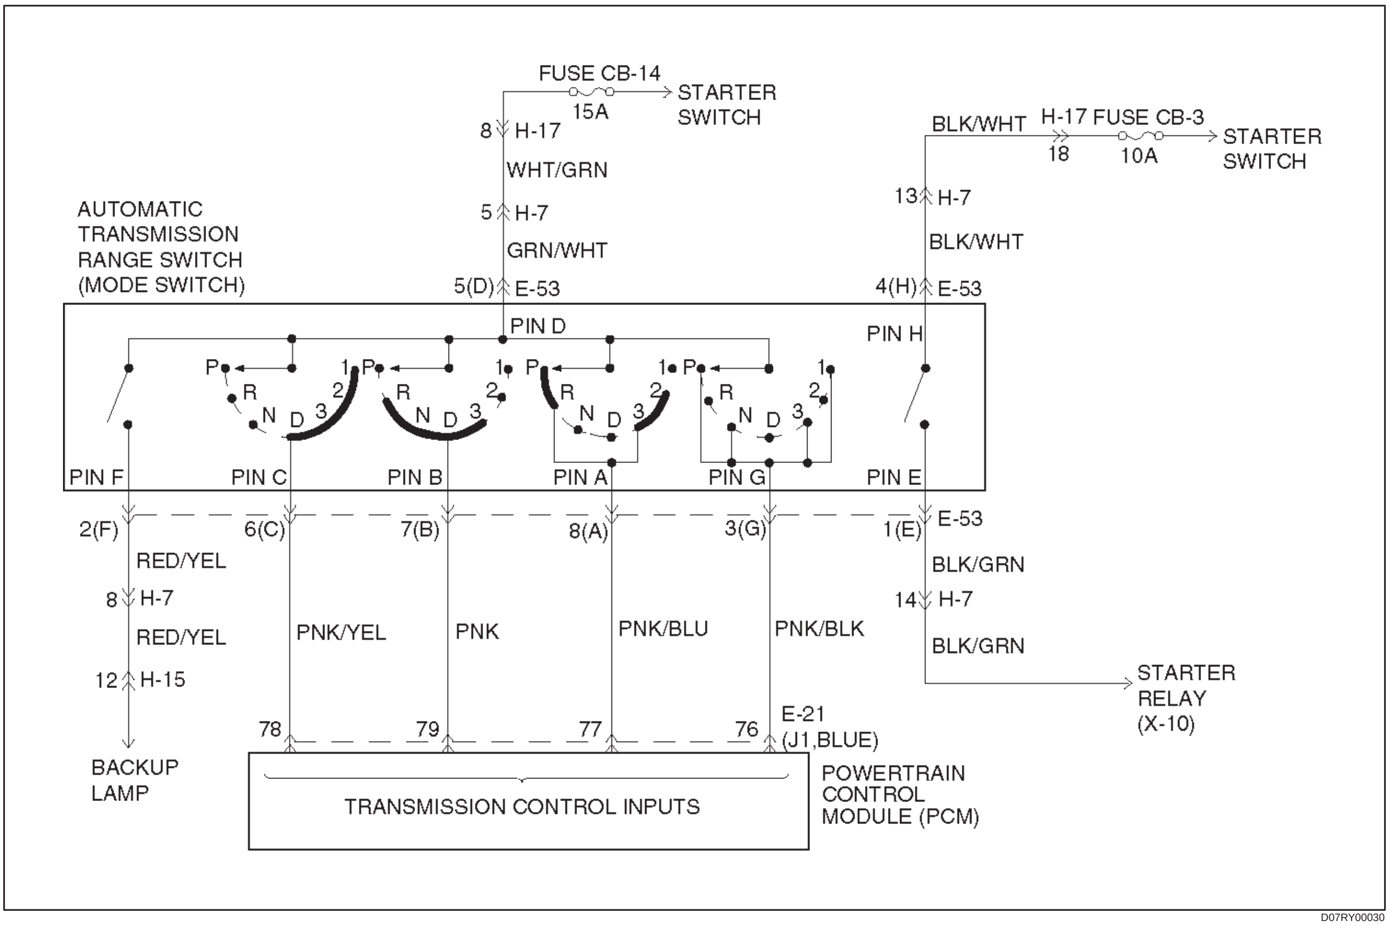
The numbers below refer to the step numbers on the diagnostic chart.

3. This test checks for a “skewed” sensor or shorted circuit.
4. This test simulates a TFT DTC P0713.

DTC P0218 Transmission Fluid Over Temperature

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	Perform the following checks: ● Check for possible engine system problems. ● Transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) Section. Were the checks performed?	Go to Step 3	—
3	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when "Clear Info" function is used. 3. Record the DTC "Failure Records". Is the TFT sensor signal voltage less than 0.33 volts?	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition "off". 2. Disconnect the transmission 7–way connector E–54 (additional DTCs may set). Is the TFT sensor signal voltage greater than 4.92 volts?	Go to Internal Wiring Harness Check	Go to Step 5
5	Inspect/repair circuit RED/BLK for a short to ground. Was a problem found?	Go to Step 7	Go to Step 6
6	1. Inspect the PCM for poor connections. 2. Replace the PCM if no poor connections were found. Is the replacement complete?	Go to Step 7	—
7	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TFT is less than 125°C (257°F) for at least 10 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0705 Transmission Range Switch (Mode Switch) Illegal Position



Circuit Description

- The range switch supplies the Powertrain Control Module (PCM) with information regarding the selector lever position: P, R, N, D, 3, 2 or L. The selector lever position is indicated by the state of four ON/OFF contacts. The range switch is located on one side of the transmission. It is on the transmission manual shaft and is fixed to the main case.
- The range switch is also used to provide the information P or N to the engine crank wiring. The engine can be cranked only if connector E–53 terminal 4(H) is connected to terminal 1(E) which is connected to ground.
- The range switch is also used to provide the backup lamp power in reverse. This is the reason why the range switch is supplied through a 15A fuse (CB–14). This fuse can burn due to a short circuit in the back up lamp.

This DTC detects when a fuse is open or the range switch circuit does not work. This is a type “D” DTC.

Conditions For Setting The DTC

- Range switch illegal positions met for 5 seconds.

Action Taken When The DTC Sets

- Default to D position.
- Inhibit torque management.
- Maximum line pressure.
- Turn Force Motor OFF.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Refer to accompanying chart for the normal range signals and the illegal combinations.
- Inspect the wiring for poor electrical connections at the PCM and at the transmission 8–way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Refer to the “Range Switch Logic Table” for further information.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks the indicated range signal to the manual valve actually selected.
6. This test checks for continuity between each selected range switch connector terminals.

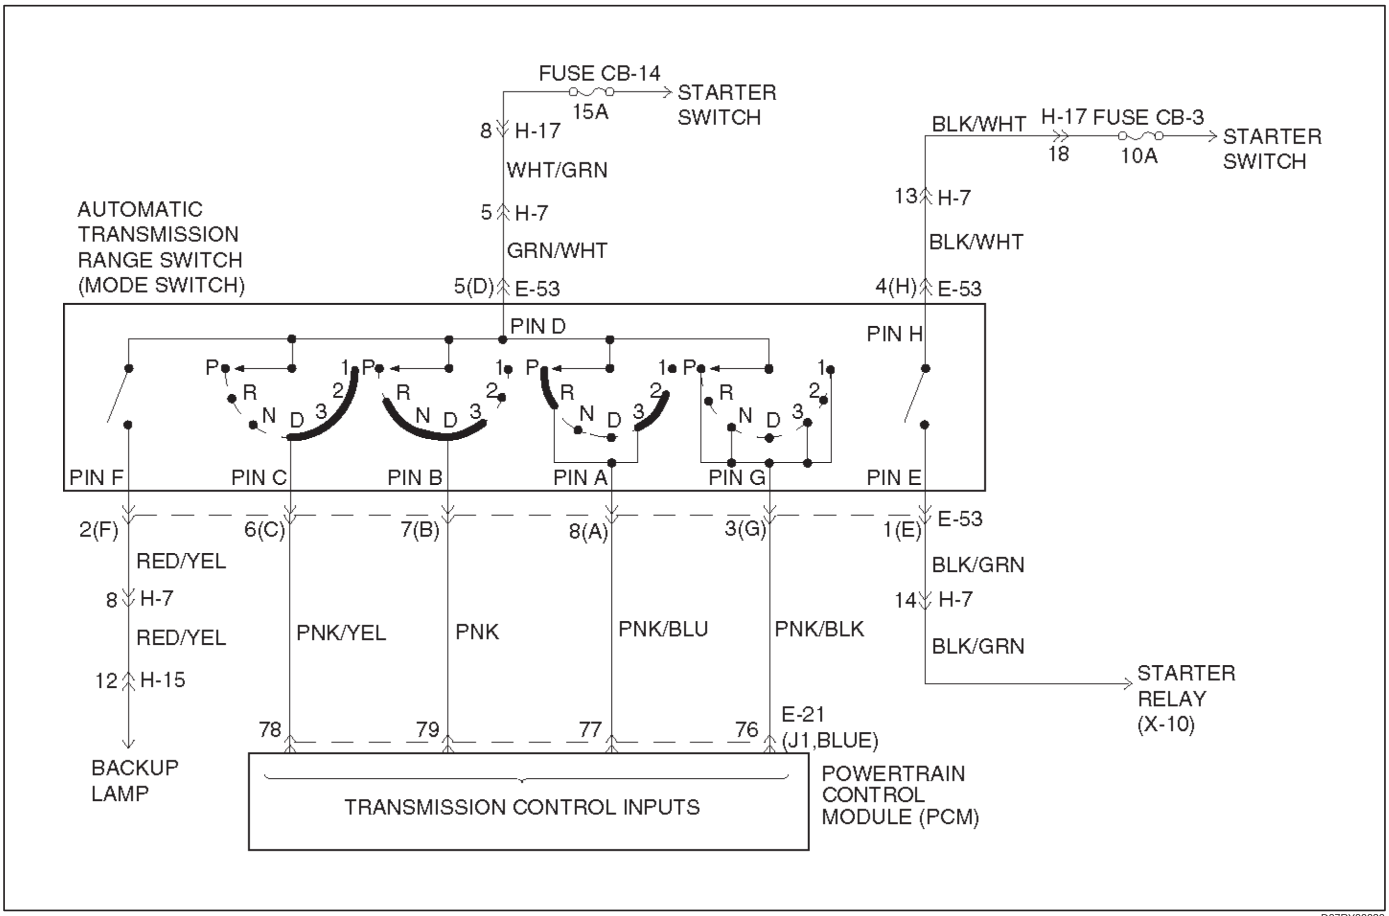
Range Switch Logic Table

Range Position	Range Switch Pin			
	A	B	C	P(G)
Park	ON	OFF	OFF	ON
Reverse	ON	ON	OFF	OFF
Neutral	OFF	ON	OFF	ON
D4	OFF	ON	ON	OFF
D3	ON	ON	ON	ON
2	ON	OFF	ON	OFF
L	OFF	OFF	ON	ON
Illegal	OFF	OFF	OFF	OFF
Illegal	OFF	OFF	OFF	ON

DTC P0705 Transmission Range Switch (Mode Switch) Illegal Position

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	Perform the following checks: ● The transmission linkage from the select lever to the manual valve is adjusted properly. ● Diagnostic circuit check. Were the checks performed?	Go to Step 3	—
3	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Freeze Frame" and "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Freeze Frame" and "Failure Records". 4. Select each transmission range: D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the scan tool "Range Switch" display?	Go to Diagnostic Aids	Go to Step 4
4	Are all range switch pin displays incorrect?	Go to Step 5	Go to Step 6
5	Check fuse and wiring to the 8–way connector terminal 5(D) for opens. Refer to Mode Switch in Automatic Transmission (4L30–E) section. If no problem was found, replace the range switch. Is the replacement complete?	Go to Step 9	—
6	1. Disconnect the 8–way range switch connector. 2. Using ohmmeter, check continuity between terminal 5(D) and respectively terminals 3(G), 6(C), 7(B) and 8(A) of the 8–way range switch connector. 3. Move shift selector lever through all positions and compare results with "Range Switch Logic Table". Is one range switch pin display incorrect?	Go to Step 7	Go to Step 8
7	Check the affected wiring and connector, and repair. Is the repair complete?	Go to Step 9	—
8	Check the Powertrain Control Module (PCM) connectors for poor connection. If no problem was found, replace the PCM. Is the replacement complete?	Go to Step 9	—
9	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and road test the vehicle. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0706 Transmission Range Switch (Mode Switch) Performance



D07RY00030

Circuit Description

- The range switch supplies the Powertrain Control Module (PCM) with information regarding the selector lever position: P, R, N, D, 3, 2 or L. The selector lever position is indicated by the state of four ON/OFF contacts. The range switch is located on one side of the transmission. It is on the transmission manual shaft and is fixed to the main case.
- The range switch is also used to provide the information P or N to the engine crank wiring. The engine can be cranked only if connector E–53 terminal 4(H) is connected to terminal 1(E) which is connected to ground.
- The range switch is also used to provide the back up lamp power in reverse. This is the reason why the mode switch is supplied through a 15A fuse (CB–14). This fuse can burn due to a short circuit in the back up lamp.
- This DTC detects an invalid state of the range switch or the range switch circuit by deciphering the range switch inputs. This is a type “D” DTC.

Conditions For Setting The DTC

This DTC will set if any of the following conditions occurs:

Condition 1 (“R” bad position):

- Engine is running.
- No output speed DTCP0722, P0723.
- Output speed greater than 3,200 RPM.
- Range switch indicates “R”.
- All conditions met for 4 seconds.

Condition 2 (“P” or “N” bad position):

- Engine is running.
- No TPS codes.
- Engine speed is less than 3,000 RPM.
- TP angle is greater than 20%.
- Range switch indicates “P” or “N”.
- All conditions met for 4 seconds.

Action Taken When The DTC Sets

- Default to “D” position.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Refer to the accompanying chart for the normal range signals and the illegal combinations.
- Inspect the wiring for poor electrical connections at the PCM and at the transmission 8–way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Refer to the “Range Switch Logic Table” for further information.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks the indicated range signal to the manual valve actually selected.
6. This test checks for continuity between each selected range switch connector terminals.

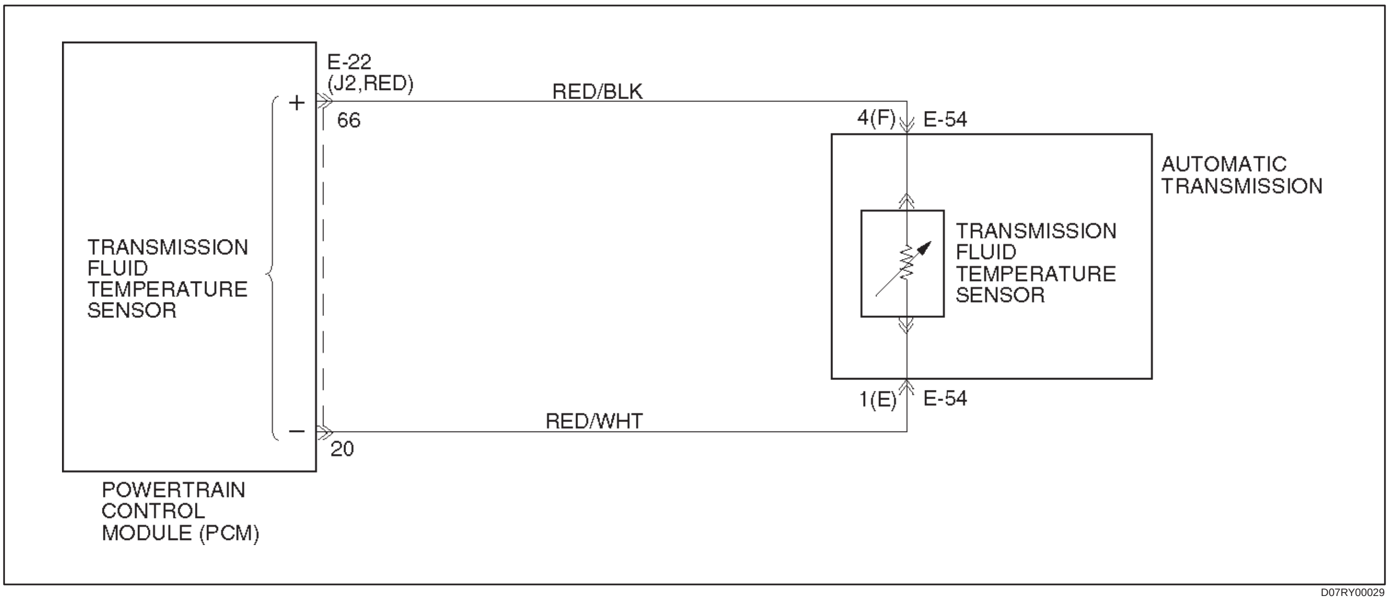
Range Switch Logic Table

Range Position	Range Switch Pin			
	A	B	C	P(G)
Park	ON	OFF	OFF	ON
Reverse	ON	ON	OFF	OFF
Neutral	OFF	ON	OFF	ON
D4	OFF	ON	ON	OFF
D3	ON	ON	ON	ON
2	ON	OFF	ON	OFF
L	OFF	OFF	ON	ON
Illegal	OFF	OFF	OFF	OFF
Illegal	OFF	OFF	OFF	ON

DTC P0706 Transmission Range Switch (Mode Switch) Performance

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	Perform the following checks: ● The transmission linkage from the select lever to the manual valve is adjusted properly. ● Diagnostic circuit check. Were the checks performed?	Go to Step 3	—
3	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. Select each transmission range: D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the scan tool “Range Switch” display?	Go to Diagnostic Aids	Go to Step 4
4	Are all range switch pin displays incorrect?	Go to Step 5	Go to Step 6
5	Check fuse and wiring to the 8–way connector terminal 5(D) for opens. Refer to Mode Switch in Automatic Transmission (4L30–E) section. If no problem was found, replace the range switch. Is the replacement complete?	Go to Step 9	—
6	1. Disconnect the 8–way range switch connector. 2. Using ohmmeter, check continuity between terminal 5(D) and respectively terminals 3(G), 6(C), 7(B) and 8(A) of the 8–way range switch connector. 3. Move shift selector lever through all positions and compare results with “Range Switch Logic Table”. Is one range switch pin display incorrect?	Go to Step 7	Go to Step 8
7	Check the affected wiring and connector, and repair. Is the repair complete?	Go to Step 9	—
8	Check the Powertrain Control Module (PCM) connectors for poor connection. If no problem was found, replace the PCM. Is the replacement complete?	Go to Step 9	—
9	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and road test the vehicle. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0711 Transmission Fluid Temperature (TFT) Sensor Performance



Circuit Description

The TFT sensor is a thermister that controls the signal voltage to the PCM. The PCM supplies a 5 volt reference signal to the sensor on circuit RED/BLK. When the transmission fluid is cold, the sensor resistance is high and the PCM detects high signal voltage. As the transmission fluid temperature increases to normal operating temperature of 100˚C (212˚F), the sensor resistance becomes less and the voltage decreases to 1.5 to 2 volts.

When the PCM detects a TFT sensor that remains at the startup value, or a sensor that has a change delta of greater than 20˚C (36˚F) less than 1 second, DTC P0711 sets. DTC P0711 is a type D.

Conditions For Setting The DTC

- No VSS DTCs P0722 or P0723.
- No Transmission Component Slipping DTC P1870.
- Engine is running.
- TFT is between 20 A/D (Analog/Digital) counts and 248 A/D counts.
- TFT is between –40˚C (–40˚F) and +21˚C (69.8˚F) at engine startup.
- Engine coolant temperature is greater than 70˚C (150˚F).
- Engine coolant temperature has changed by greater than 50˚C (90˚F) since engine startup.
- Vehicle speed has been greater than 5 mph for greater than 410 seconds since engine startup (cumulative timer).
- TCC slip speed has been greater than 120 rpm for greater than 410 seconds since engine startup (cumulative timer).
- Battery voltage is between 10 and 16 volts.

All of the above is true and either of the following occurs:

- If the sensor is stuck, the TFT has not changed for greater than 2 counts (from startup temperature) for greater than 410 seconds.
- If the sensor shows an unrealistic change, the TFT exhibits a change delta of greater than 20˚C (36˚F), greater than 14 times in 7 seconds.

Action Taken When The DTC Sets

- Transmission default temperature will be:

  80˚C (176˚F) if engine temperature code is set.

  100˚C (212˚F) if engine temperature is warm.

  80˚C (176˚F) if engine run time is greater than 5 minutes.

  21˚C (69.8˚F) if engine run time is less than 5 minutes.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM. Inspect the wiring for poor electrical connections at the transmission 7-way connector. Look for the following conditions:
  a. A bent terminal
  b. A backed out terminal
  c. A damaged terminal
  d. Poor terminal tension
  e. A chafed wire
  f. A broken wire inside the insulation

- When diagnosing for an intermittent short or open connection, move the wiring harness while watching the test equipment for a change.
- First diagnose and clear any engine DTCs or TP Sensor codes. Then inspect for any transmission DTCs that may have reset.

Test Description

The number below refers to the step number on the diagnostic chart:

3. This test checks PCM and associated wiring up to the 7–way connector E–54. If the voltage increases to match chart the problem is isolated to the transmission wiring.

Resistance Chart

˚C	˚F	Resistance (kΩ)
–40	–40	672
0	32	65
20	68	25
80	176	2.5
120	248	0.78
150	304	0.37

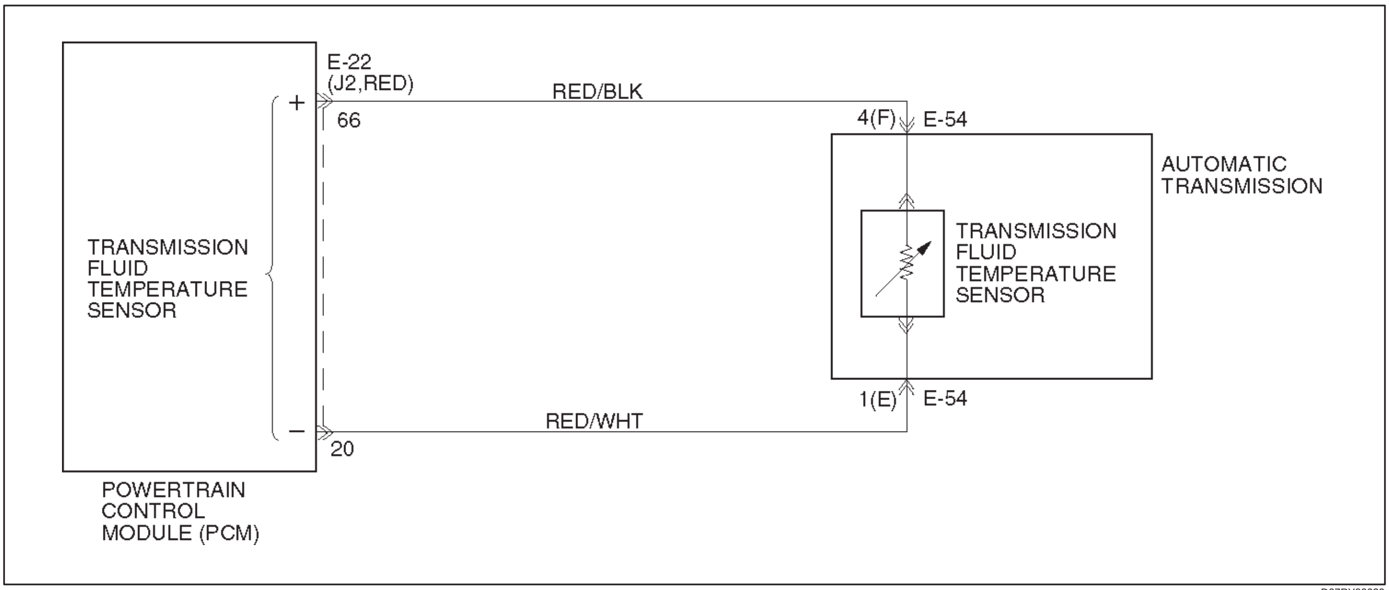
DTC P0711 Transmission Fluid Temperature (TFT) Sensor Performance

Step	Action	Yes	No
1	Was the Powertrain On–Board Diagnostic (OBD) System Check performed?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	Perform the transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section. Did you perform the fluid checking procedure?	Go to Step 3	Go to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section
3	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch to the “on” position. NOTE: Before clearing DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. 4. Select TFT on the scan tool. 5. While observing the scan tool display, move or massage the engine wiring harness from PCM connectors J2–66 and J2–20 to the transmission 7–way connector E–54. Does the TFT change by more than ±20˚C (36˚F)?	Go to Step 6	Go to Step 4
4	1. Turn the ignition “off”. 2. Disconnect the transmission 7–way connector E–54. 3. Install Jumper Harness on the transmission side of the 7–way connector E–54. 4. Using the J39200 DVOM and J35616 Connector Test Adapter Kit, connect the DVOM leads from terminal E54–4(F) to terminal E54–1(E). 5. Set the DVOM on MIN/MAX to measure resistance. 6. Record the TFT sensor resistance. 7. Move or massage the automatic transmission wiring harness assembly from the PCM to the TFT sensor connector. Does the DVOM MAX display a resistance greater than the value recorded in Action item 6 of this step?	Go to Step 7	Go to Step 5
5	Does the DVOM MIN display a resistance less than the value recorded in Action item 6 of step 4?	Go to Step 8	—

DTC P0711 Transmission Fluid Temperature (TFT) Sensor Performance (Cont'd)

Step	Action	Yes	No
6	Inspect circuit RED/BLK and RED/WHT of the engine wiring harness for an intermittent open or short condition. Repair the circuits if necessary. Did you find a problem?	Go to Step 12	Go to Step 11
7	Inspect the automatic transmission wiring harness assembly for an intermittent open in circuits RED/BLK and RED/WHT. Did you find a problem?	Go to Step 9	Go to Step 10
8	Inspect the automatic transmission wiring harness assembly for an intermittent shorted condition in circuits RED/BLK and RED/WHT. Did you find a problem?	Go to Step 9	Go to Step 10
9	Replace the automatic transmission wiring harness assembly. Is the replacement complete?	Go to Step 12	—
10	Replace TFT Sensor. Refer to Transmission Oil Temperature Sensor (Main Case) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 12	—
11	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 12	—
12	In order to verify your repair, perform the following procedure. 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle and ensure the following conditions are met: ● The TFT changes by more than 2.25°C (4.05°F) for 11 seconds since startup. ● The TFT does not change by more than 20°C (36°F) within 0.200 second for a period of at least 11 seconds. 4. Select Specific DTC. 5. Enter DTC P0711. Has the test run and passed?	System OK	Begin the diagnosis again Go to Step 1

DTC P0712 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input



Circuit Description

The TFT sensor is a thermister that controls the signal voltage to the PCM. The PCM supplies a 5–volt reference signal to the sensor on circuit RED/BLK. When the transmission fluid is cold, the sensor resistance is high. The PCM detects high signal voltage. As the transmission fluid temperature increases to the normal operating temperature of 100˚C (212˚F), the sensor resistance becomes less and the voltage decreases to 1.5 to 2 volts. With transmission fluid over temperature and DTC P0218 also set, check the transmission cooling system.

This DTC detects a continuous short to ground in the TFT signal circuit or the TFT sensor. This is a type “D” DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is “on”.
- TFT sensor indicating a voltage less than 0.4 volts.
- All conditions met for 20 seconds.

Action Taken When The DTC Sets

- Transmission default temperature will be:

  80˚C (176˚F) if engine temperature code is set.

  100˚C (212˚F) if engine temperature is warm.

  80˚C (176˚F) if engine run time is greater than 5 minutes.

  21˚C (69.8˚F) if engine run time is less than 5 minutes.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Check harness routing for a potential short to ground in circuit RED/BLK. Scan tool TFT display should rise steadily to about 100˚C (212˚F), then stabilize.
- Inspect the wiring for poor electrical connection at the PCM and transmission 7-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- The temperature to resistance value scale may be used to test the TFT sensor at the various temperature levels to evaluate the possibility of a “skewed” (mis–scaled) sensor.

  A “skewed” sensor could result in delayed garage shifts or TCC complaints.
- Verify customer driving habits, trailer towing, etc.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks for a short to ground or a “skewed” sensor.
4. This test checks for an internal fault within the transmission by creating an open.

Resistance Chart

˚C	˚F	Resistance (kΩ)
–40	–40	672
0	32	65
20	68	25
80	176	2.5
120	248	0.78
150	304	0.37

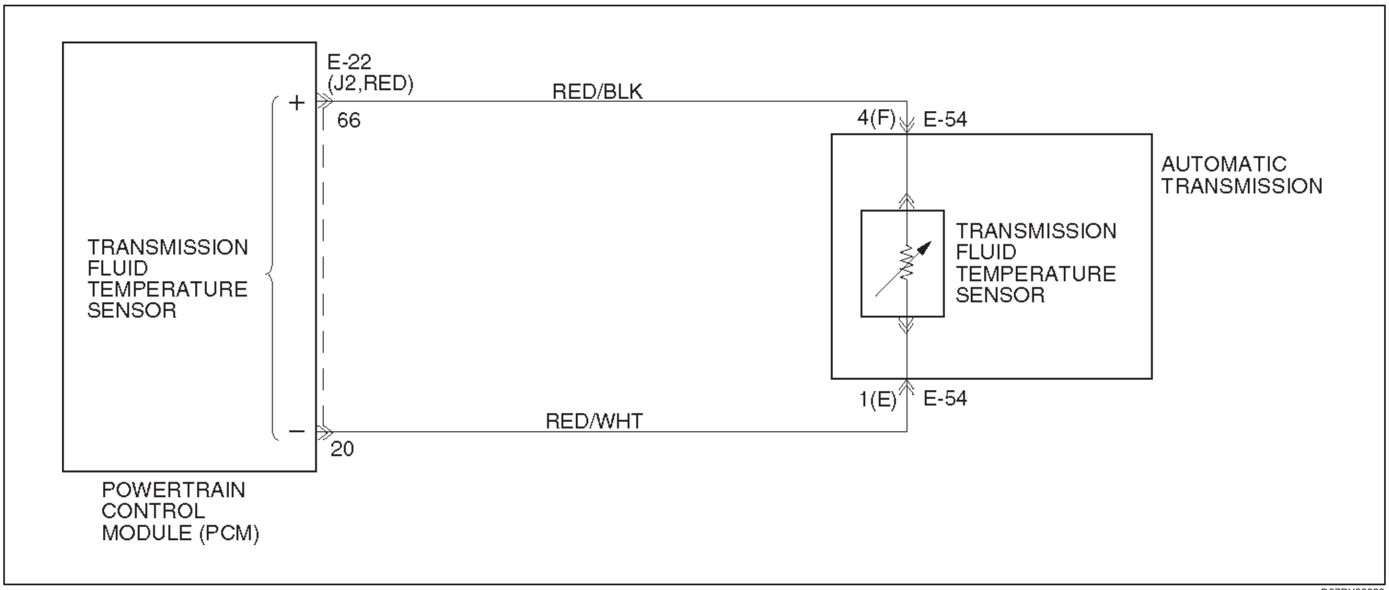
DTC P0712 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	Perform the transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section Was the fluid checking procedure performed?	Go to Step 3	Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section
3	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Freeze Frame" and "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Freeze Frame" and "Failure Records". Does the scan tool display a TFT sensor signal voltage less than 0.4 volts?	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition "off". 2. Disconnect the transmission 7–way connector E–54. 3. Turn the ignition "on". Does the TFT signal voltage change to match the voltage 4.92 volts?	Go to Step 5	Go to Step 10
5	Using the J39200 DVOM, measure the resistance between terminals E54–4(F) and E54–1(E). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 6
6	1. Disconnect the transmission 7–way connector E–54. 2. Using the J39200 DVOM, measure the resistance between terminals E54–4(F) and E54–1(E). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 7
7	1. Remove the transmission oil pan. Refer to Transmission Oil Temperature Sensor (Main Case) in Automatic Transmission (4L30–E) section. 2. Check the internal wiring harness for a short to ground. Was a problem found?	Go to Step 9	Go to Step 8

DTC P0712 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input (Cont'd)

Step	Action	Yes	No
8	1. Disconnect the internal wiring harness at the TFT sensor. 2. Measure the resistance of the TFT sensor. Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 9
9	Replace the TFT Sensor. Is the replacement complete?	Go to Step 13	—
10	Check circuit RED/BLK for a short to ground. Was a problem found?	Go to Step 13	Go to Step 11
11	Check the PCM for faulty connections. Was a problem found?	Go to Step 13	Go to Step 12
12	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 13	—
13	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TFT sensor indicates a voltage greater than 0.33 volts for 2 seconds. 2. Review the scan tool "DTC info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0713 Transmission Fluid Temperature (TFT) Sensor Circuit High Input



D07RY00029

Circuit Description

The TFT sensor is a thermistor that controls the signal voltage to the PCM. The PCM supplies a 5–volt reference signal to the sensor on circuit RED/BLK. When the transmission fluid is cold, the sensor resistance is high and the PCM will sense high signal voltage. As the transmission fluid temperature warms to the normal operating temperature of 100˚C (212˚F), the sensor resistance becomes less and the voltage decreases to about 1.5 to 2 volts.

This DTC detects a continuous open or short to power in the TFT signal circuit or the TFT sensor. This is a type “D” DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is “on”.
- TFT sensor indicating a voltage greater than 4.86 volts.
- All conditions met for 20 seconds.

Action Taken When The DTC Sets

- Transmission default temperature will be:

  80˚C (176˚F) if engine temperature code is set.

  100˚C (212˚F) if engine temperature is warm.

  80˚C (176˚F) if engine run time is greater than 5 minutes.

  21˚C (69.8˚F) if engine run time is less than 5 minutes.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and transmission 7-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Scan tool displays transmission fluid temperature in degrees. After transmission is operating, the temperature should rise steadily to about 100˚C (212˚F), then stabilize.
- The temperature to resistance value scale may be used to check the TFT sensor at the various temperature levels to evaluate the possibility of a “skewed” (mis–scaled) sensor.

  A “skewed” sensor could result in hard shifts or TCC complaints.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This check verifies problem in the TFT sensor circuit.
4. This test simulates a TFT sensor DTC P0712. If the PCM recognizes the low signal voltage (high temperature), and the scan tool displays 146˚C (295˚F) or greater, the PCM and wiring are OK.

5. This test checks the TFT sensor and internal wiring harness.

Resistance Chart

˚C	˚F	Resistance (kΩ)
–40	–40	672
0	32	65
20	68	25
80	176	2.5
120	248	0.78
150	304	0.37

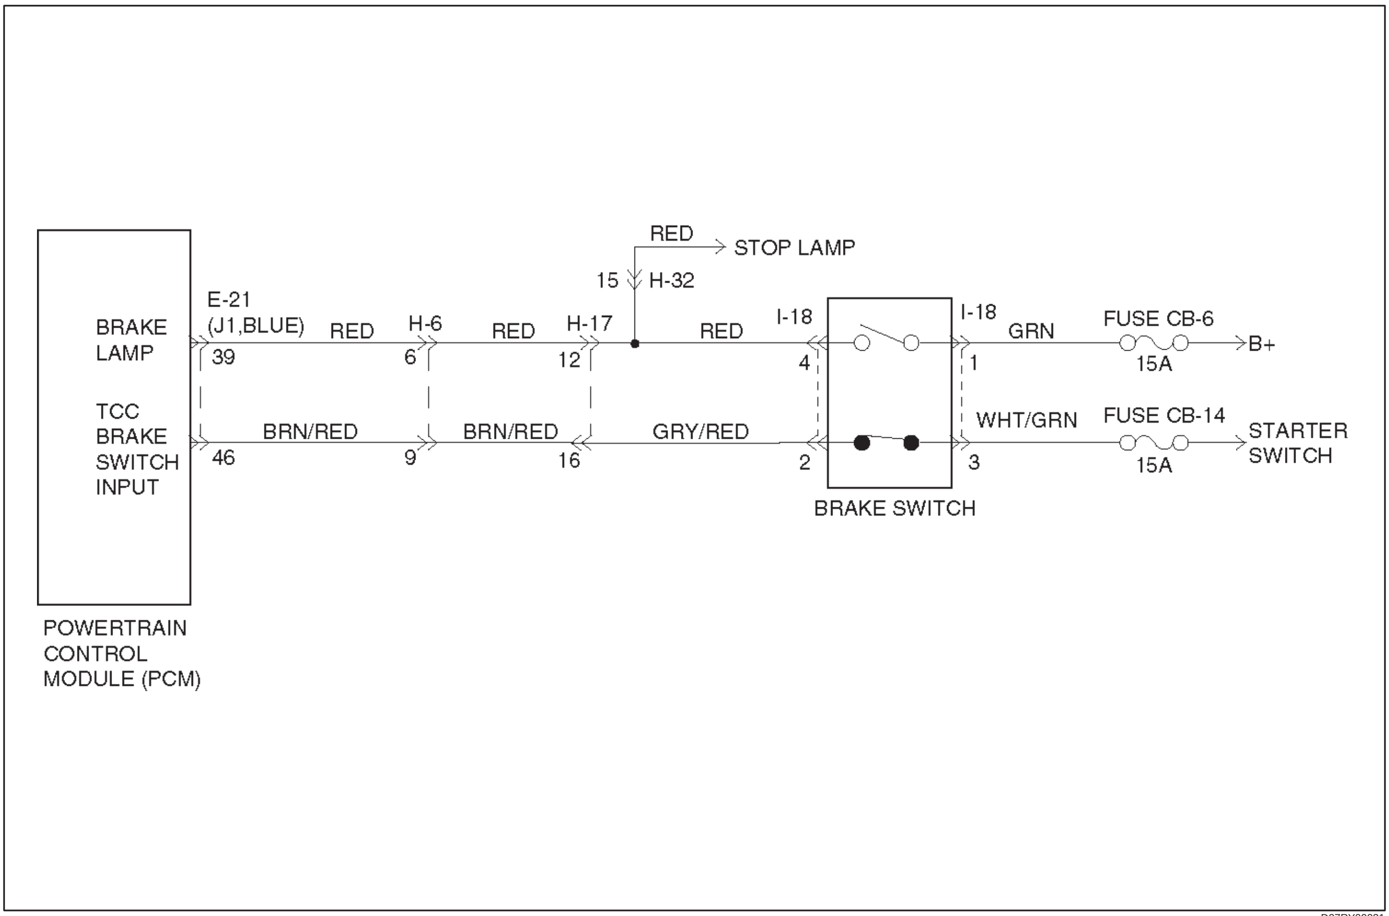
DTC P0713 Transmission Fluid Temperature (TFT) Sensor Circuit High Input

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	Perform the transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section. Was the fluid checking procedure performed?	Go to Step 3	Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section
3	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. Does the scan tool display a TFT sensor signal voltage greater than 4.86 volts?	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition “off”. 2. Disconnect the transmission 7–way connector E–54. 3. Install a fused jumper wire from terminal E54–4(F) to E54–1(E) on the engine harness. 4. Turn the ignition “on”. Does the TFT signal voltage drop to less than 0.4 volts?	Go to Step 5	Go to Step 10
5	1. Turn the ignition “off”. 2. Using the J39200 DVOM, measure the resistance between terminals E54–4(F) and E54–1(E). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 6
6	1. Disconnect the transmission 7–way connector E–54. 2. Using the J39200 DVOM, measure the resistance between terminals E54–4(F) and E54–1(E). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 7

DTC P0713 Transmission Fluid Temperature (TFT) Sensor Circuit High Input (Cont'd)

Step	Action	Yes	No
7	1. Remove the transmission oil pan. 2. Check the internal wiring harness for an open. Refer to Transmission Oil Temperature Sensor (Main Case) in Automatic Transmission (4L30–E) section. Was a problem found and corrected?	Go to Step 14	Go to Step 8
8	1. Disconnect the internal wiring harness at the TFT sensor. 2. Measure the resistance of the TFT sensor. Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 9
9	Replace TFT sensor. Refer to Transmission Oil Temperature Sensor (Main Case) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 14	—
10	Check circuit RED/BLK for an open or short to B+. Was a problem found?	Go to Step 14	Go to Step 11
11	Check circuit RED/WHT for an open. Was a problem found?	Go to Step 14	Go to Step 12
12	Check the PCM for faulty or intermittent connections. Was a problem found?	Go to Step 14	Go to Step 13
13	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 14	—
14	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: 2. TFT sensor indicates a voltage less than 4.92 volts for 2 seconds. 3. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0719 Brake Switch Circuit Low (Stuck On)



Circuit Description:

The brake switch indicates brake pedal status to the Powertrain Control Module (PCM). The brake switch is a normally–closed switch that supplies battery voltage on circuit GRY/RED–BRN/RED to the PCM. Applying the brake pedal opens the switch, interrupting voltage to the PCM. When the brake pedal is released, the PCM receives a constant voltage signal. If the PCM receives a zero voltage signal at the brake switch input, and the Torque Converter Clutch (TCC) is engaged, the PCM de–energizes the Torque Converter Clutch Solenoid Valve (TCC Sol. Valve). The PCM disregards the brake switch input for TCC scheduling if there is a brake switch circuit fault (Refer to Diagnostic Aids).

When the PCM detects an open brake switch circuit (0 volts, low input) during accelerations, then DTC P0719 sets. DTC P0719 is a type D DTC.

Conditions For Setting The DTC

- No OSS Assy. DTCs P0722 or P0723.
- The PCM detects an open brake switch or circuit (0 volts) for 15 minutes without changing for 2 seconds, and the following events occur seven consecutive times.
  - The vehicle speed is less than 8 km/h (5 mph).
  - then the vehicle speed is 8–32 km/h (5–20 mph) for 4 seconds.
  - then the vehicle speed is greater than 32 km/h (20 mph) for 4 seconds.

Action Taken When The DTC Sets

- The PCM does not illuminate the Malfunction Indicator Lamp (MIL).
- DTC P0719 stores in PCM history.

Conditions For Clearing The DTC

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm–up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and brake switch. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check customer driving habits and/or unusual driving conditions (i.e. stop and go, highway).
- Check brake switch for proper mounting and adjustment.

Test Description

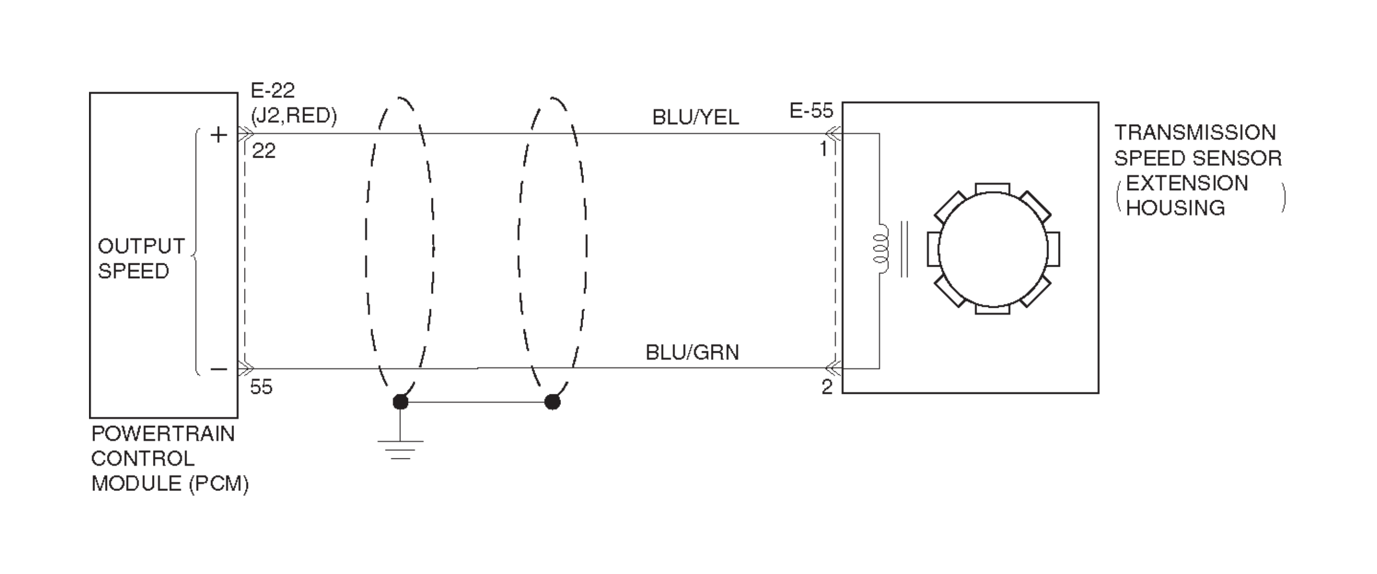
The numbers below refer to the step numbers on the diagnostic chart.

3. This step isolates the brake switch as a source for setting the DTC.

DTC P0719 Brake Switch Circuit Low (Stuck On)

Step	Action	Yes	No
1	Was the Powertrain On–Board Diagnostic (OBD) System Check performed?	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. With the engine "off," turn the ignition switch to the "on" position. NOTE: Before clearing the DTC(s), use the scan tool in order to record the "Failure Records" for reference. Using the "Clear Info" function will erase the stored "Failure Records" from the PCM. 3. Record the "DTC Failure Records", then clear the DTC(s). 4. Select "TCC Brake Switch" on the scan tool. 5. Disconnect the brake switch connector from the brake switch. 6. Connect a test lamp from cavity I18–3 of the brake switch connector to a known good ground. Is the test lamp ON?	Go to Step 3	Go to Step 4
3	Install a J 36169–A Fused Jumper Wire from terminal I18–2 to terminal I18–3 of the brake switch connector. Did the TCC Brake Switch status change from Open to Closed?	Go to Step 7	Go to Step 9
4	1. Remove the fuse CB–14 (15A). 2. Inspect the fuse for an open. Is the fuse open?	Go to Step 5	Go to Step 8
5	Inspect circuit WHT/GRN for a short to ground condition. Repair the circuit if necessary. Did you find a short to ground condition?	Go to Step 11	Go to Step 6
6	Inspect circuit GRY/RED–BRN/RED for a short to ground condition. Repair the circuit if necessary. Did you find a short to ground condition?	Go to Step 11	Go to Step 10
7	Replace the brake switch. Is the replacement complete?	Go to Step 11	—
8	Inspect circuit WHT/GRN for an open condition. Repair the circuit if necessary. Did you find and correct an open condition?	Go to Step 11	—
9	Inspect circuit GRY/RED–BRN/RED for an open. Did you find an open condition?	Go to Step 11	Go to Step 10
10	Replace the PCM. Is the replacement complete?	Go to Step 11	—
11	In order to verify your repair, perform the following procedure: 1. Select DTC. 2. Select Clear Info. 3. With the engine "off," turn the ignition switch to the "on" position. 4. Do not depress the brake pedal. 5. Verify that the TCC Brake Switch status indicates "Closed" (12 volts) for 2 seconds. 6. Select Specific DTC. Enter DTC P0719. Has the test run and passed?	System OK	Begin the diagnosis again. Go to Step 1

DTC P0722 Automatic Transmission Output Speed Sensor (OSS) Low Input



D07RY00032

Circuit Description

Output speed information is provided to the PCM by the OSS, which is a permanent magnet (PM) generator. The PM generator produces a pulsing AC voltage. The AC voltage level and number of pulses increases as the speed of the vehicle increases. The PCM then converts the pulsing voltage to output speed, which is used for calculations. The vehicle speed can be displayed with a scan tool.

This DTC detects a low output speed when there is a high engine speed in a drive gear range. This is a type “B” DTC.

Conditions For Setting The DTC

- No MAP DTCs P0107 or P0108, P0106, P1106, P1107.
- No TPS DTCs P0122 or P0123.
- Not in Park or Neutral.
- TP angle is greater than 10%.
- Engine vacuum is between 0 and 70kPa.
- Engine speed is between 3000 and 7000 rpm.
- Transmission output speed is less than 0 rpm.
- All conditions met for 5 seconds.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- For lamp illuminate refer to DTC type definition (type B).

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool. The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- An OSS DTC P0722 will set when no output speed is at detected at start off.
- Inspect the wiring for poor electrical connection at the PCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move or massage the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

4. This test checks the OSS circuit.
5. This test checks the integrity of the OSS.
7. This test checks the 5–volt and ground circuit of the PCM.

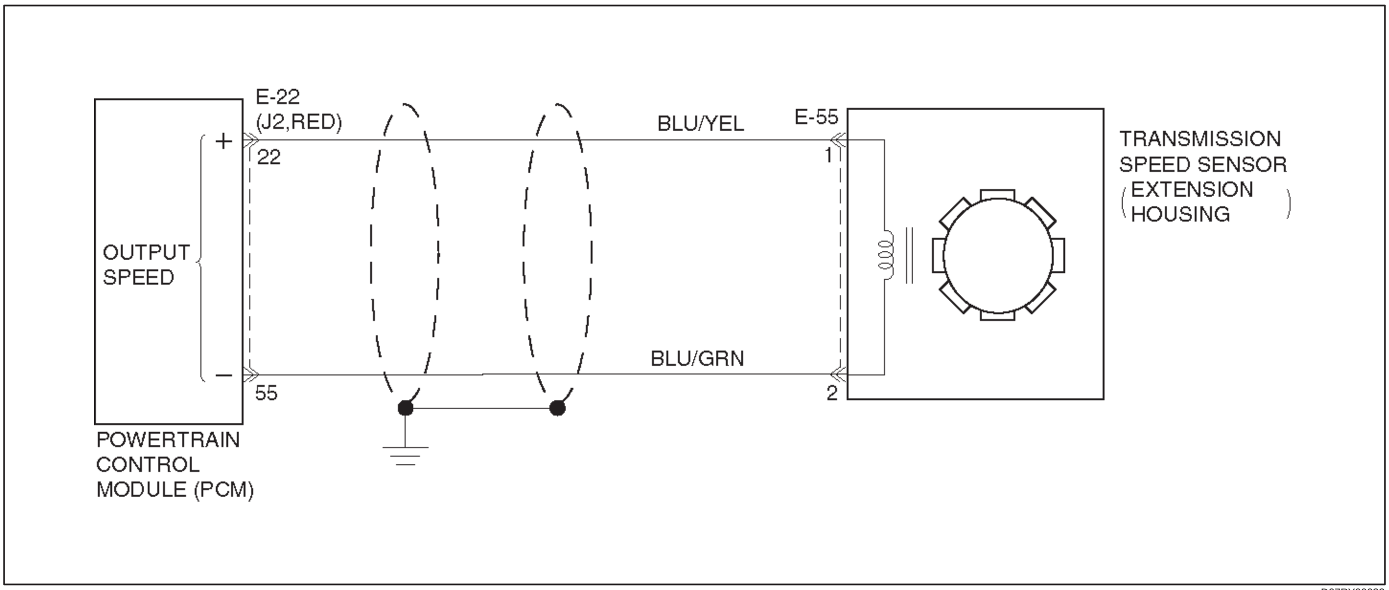
DTC P0722 Automatic Transmission Output Speed Sensor (OSS) Low Input

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. Raise the drive wheels. 5. Start the engine. 6. Place the transmission in any drive range. With the drive wheels rotating, does the “Trans Output Speed” increase with the drive wheel speed?	Go to Diagnostic Aids	Go to Step 3
3	Check for the most current and/or incorrect calibration. Is the calibration current?	Go to Step 16	Go to Step 4
4	1. Turn the ignition “off”. 2. Disconnect the J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between harness connector terminals J2–22 and J2–55. Is the reading 3000 ohms?	Go to Step 5	Go to Step 6
5	1. Select AC volts. 2. Rotate the rear wheels, ensuring the driveshaft is turning. Is the voltage greater than 0.5 volts?	Go to Step 7	Go to Step 8
6	Inspect circuits BLU/YEL and BLU/GRN for a poor connection or an open circuit. Was a problem found?	Go to Step 17	Go to Step 8
7	1. Reconnect the J2 (RED) PCM connector. 2. Disconnect the OSS harness from the OSS. 3. With the engine “off”, turn the ignition “on”. 4. Using the J 39200 DVOM, measure the voltage at the OSS harness connector terminals E55–1 and E55–2. Is the reading between 4.0 to 5.1 volts?	Go to Step 16	Go to Step 10
8	1. Remove the OSS. 2. Check the output shaft speed sensor rotor for damage or misalignment. Refer to Speed Sensor (Extension Housing) in Automatic Transmission (4L30–E) section. Was a problem found?	Go to Step 17	Go to Step 9
9	Replace the OSS. Is the replacement complete?	Go to Step 17	—
10	Was the reading in step 7 less than 4.0 volts?	Go to Step 12	Go to Step 11
11	Was the reading in Step 7 greater than 5.1 volts?	Go to Step 15	—
12	Using the J 39200 DVOM to chassis ground, measure the voltage on circuit BLU/YEL. Is the reading between 4.0 to 5.1 volts?	Go to Step 13	Go to Step 14

DTC P0722 Automatic Transmission Output Speed Sensor (OSS) Low Input (Cont'd)

Step	Action	Yes	No
13	Repair the open in circuit BLU/GRN. Is the repair complete?	Go to Step 17	—
14	Check circuit BLU/YEL for a short to ground or open. Was a problem found and corrected?	Go to Step 17	Go to Step 16
15	Repair the short to B+ in circuit BLU/YEL. Is the repair complete?	Go to Step 17	—
16	Replace the PCM. Refer to Powertrain Control Module (PCM) in automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 17	—
17	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: Transmission output speed is greater than 101 rpm for 3 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0723 Automatic Transmission Output Speed Sensor (OSS) Intermittent



Circuit Description

Output speed information is provided to the PCM by the OSS, which is a permanent magnet (PM) generator. The PM generator produces a pulsing AC voltage. The AC voltage level and number of pulses increases as the speed of the vehicle increases. The PCM then converts the pulsing voltage to output speed, which is used for calculations. The vehicle speed can be displayed with a scan tool.

This DTC detects a fast decrease of output speed when engine running in a drive gear range. This is a type “B” DTC.

Conditions For Setting The DTC

Drive range

- Engine running time is greater than 5 seconds.
- Output speed is greater than 1300 rpm for 2 second.
- NORAW–NOLAST < 200 rpm for 2 seconds.
  - NORAW: Latest raw data of output shaft speed.
  - NOLAST: Fitered previous data of output speed.
- Transmission negative output speed change is greater than 1300 rpm.
- Conditions met for 3 seconds.

Action During Detection Time

- Output speed value is frozen

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- For lamp illuminate refer to DTC type definition (type B).

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- A OSS DTC P0723 will set when output speed has been detected and is lost.
- Inspect the wiring for poor electrical connection at the PCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

4. This test checks the OSS circuit.
5. This test checks the integrity of the OSS.
7. This test checks the 5–volt and ground circuit of the PCM.

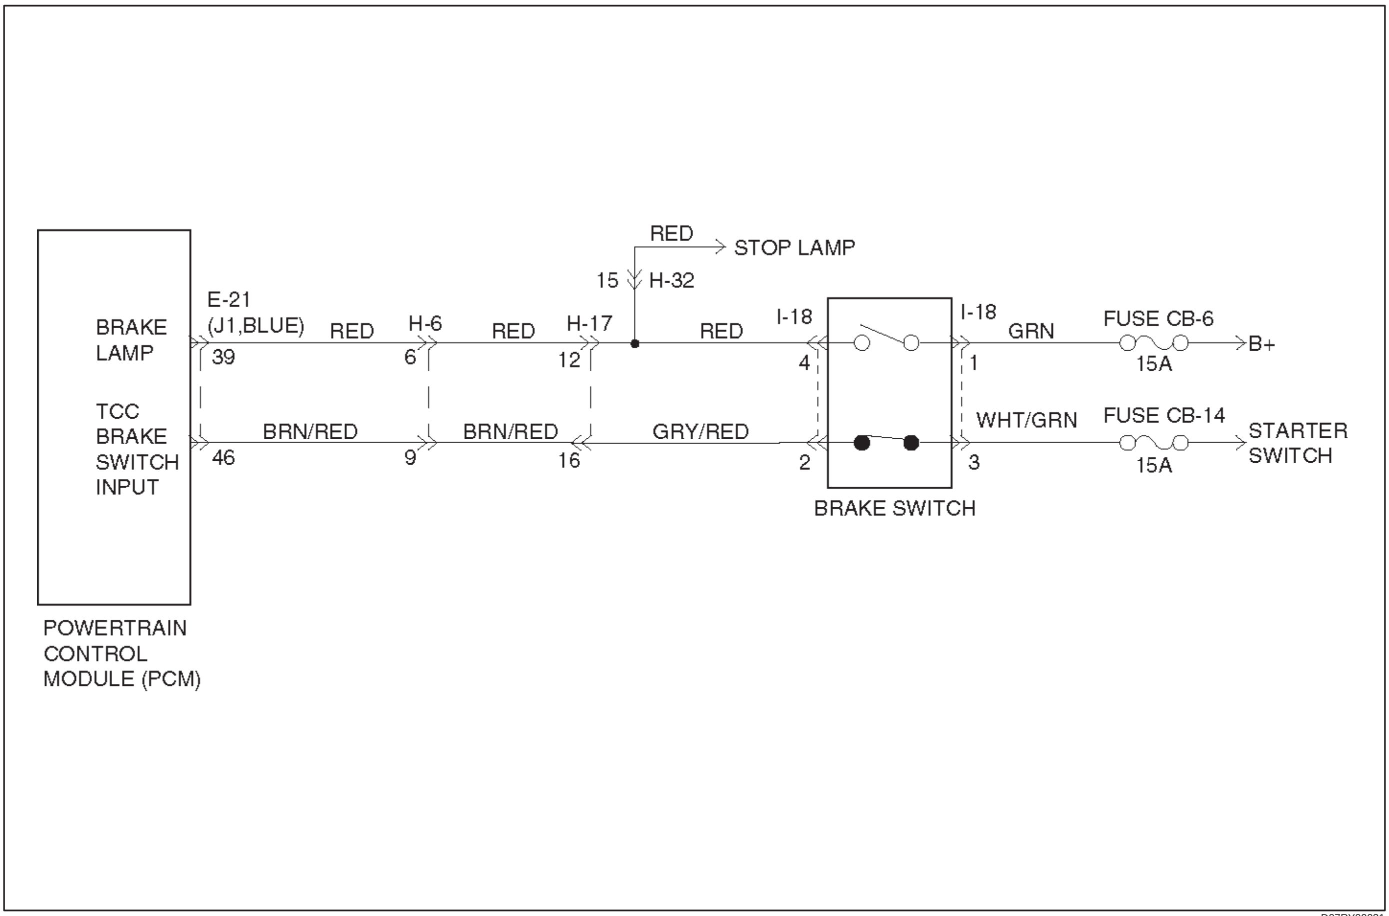
DTC P0723 Automatic Transmission Output Speed Sensor (OSS) Intermittent

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Freeze Frame" and "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Freeze Frame" and "Failure Records". 4. Raise the drive wheels. 5. Start the engine. 6. Place the transmission in any drive range. With the drive wheels rotating, does the "Trans Output Speed" increase with the drive wheel speed?	Go to Diagnostic Aids	Go to Step 3
3	Check for the most current and/or incorrect calibration. Is the calibration current?	Go to Step 16	Go to Step 4
4	1. Turn the ignition "off". 2. Disconnect the J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between harness connector terminals J2–22 and J2–55. Is the reading 3,000 ohms?	Go to Step 5	Go to Step 6
5	1. Select AC volts. 2. Rotate the rear wheels, ensuring the driveshaft is turning. Is the voltage greater than 0.5 volts?	Go to Step 7	Go to Step 8
6	Inspect circuits BLU/YEL and BLU/GRN for a poor connection or an open circuit. Was a problem found?	Go to Step 17	Go to Step 8
7	1. Reconnect the J2 (RED) PCM connector. 2. Disconnect the OSS harness from the OSS. 3. With the engine "off", turn the ignition "on". 4. Using the J 39200 DVOM, measure the voltage at the OSS harness connector terminals E55–1 and E55–2. Is the reading between 4.0 to 5.1 volts?	Go to Step 16	Go to Step 10
8	1. Remove the OSS. 2. Check the output shaft speed sensor rotor for damage or misalignment. Refer to Speed Sensor (Extension Housing) in Automatic Transmission (4L30–E) section. Was a problem found?	Go to Step 17	Go to Step 9
9	Replace the OSS. Is the replacement complete?	Go to Step 17	—
10	Was the reading in step 7 less than 4.0 volts?	Go to Step 12	Go to Step 11
11	Was the reading in Step 7 greater than 5.1 volts?	Go to Step 15	—
12	Using the J 39200 DVOM to chassis ground, measure the voltage on circuit BLU/YEL. Is the reading between 4.0 to 5.1 volts?	Go to Step 13	Go to Step 14

DTC P0723 Automatic Transmission Output Speed Sensor (OSS) Intermittent (Cont'd)

Step	Action	Yes	No
13	Repair the open in circuit BLU/GRN. Is the repair complete?	Go to Step 17	—
14	Check circuit BLU/YEL for a short to ground or open. Was a problem found and corrected?	Go to Step 17	Go to Step 16
15	Repair the short to B+ in circuit BLU/YEL. Is the repair complete?	Go to Step 17	—
16	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 17	—
17	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: Transmission output speed is greater than 101 rpm for 3 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0724 Brake Switch Circuit High (Stuck Off)



D07RY00031

Circuit Description:

The brake switch indicates brake pedal status to the Powertrain Control Module (PCM). The brake switch is a normally–closed switch that supplies battery voltage on circuit GRY/RED–BRN/RED to the PCM. Applying the brake pedal opens the switch, interrupting voltage to the PCM. When the brake pedal is released, the PCM receives a constant voltage signal. If the PCM receives a zero voltage signal at the brake switch input, and the Torque Converter Clutch (TCC) is engaged, the PCM de–energizes the Torque Converter Clutch Solenoid Valve (TCC Sol. Valve). The PCM disregards the brake switch input for TCC scheduling if there is a brake switch circuit fault (Refer to Diagnostic Aids).

When the PCM detects a closed brake switch circuit (12 volts, high input) during decelerations, then DTC P0724 sets. DTC P0724 is a type D DTC.

Conditions For Setting The DTC

- No OSS Assy. DTCs P0722 or P0723.
- The PCM detects a closed brake switch circuit (12 volts) without changing and the following events occur seven consecutive times.
  - The vehicle speed is greater than 32 km/h (20 mph) for 4 seconds.
  - then the vehicle speed is between 8–32 km/h (5–20 mph) for 4 seconds.
  - then the vehicle speed is less than 8 km/h (5 mph).

Action Taken When The DTC Sets

- The PCM does not illuminate the Malfunction Indicator Lamp (MIL).
- DTC P0724 stores in PCM history.

Conditions For Clearing The DTC

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm–up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check customer driving habits and/or unusual traffic conditions (i.e. stop and go, expressway).
- Check brake switch for proper mounting and adjustment.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

2. This step isolates the brake switch as a source for setting the DTC.

DTC P0724 Brake Switch Circuit High (Stuck Off)

Step	Action	Yes	No
1	Was the Powertrain On–Board Diagnostic (OBD) System Check performed?	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. With the engine "off," turn the ignition switch to the "on" position. NOTE: Before clearing the DTC(s), use the scan tool in order to record the "Failure Records" for reference. Using the "Clear Info" function will erase the stored "Failure Records" from the PCM. 3. Record the DTC Failure Records, then clear the DTC(s). 4. Select "TCC Brake Switch" on the scan tool. 5. Disconnect the brake switch connector from the brake switch. Did the TCC brake switch status change from "Closed" to "Open"?	Go to Step 3	Go to Step 4
3	Replace the brake switch. Is the replacement complete?	Go to Step 6	—
4	Inspect circuit GRY/RED–BRN/RED for a short to B+ condition. Repair the circuit if necessary. Did you find a short to B+ condition?	Go to Step 6	Go to Step 5
5	Replace the PCM. Is the replacement complete?	Go to Step 6	—
6	In order to verify your repair, perform the following procedure: 1. Select DTC. 2. Select "Clear Info". 3. With the engine "off" turn the ignition switch to the "on" position. 4. Apply the brake pedal. 5. Verify that the TCC brake switch status indicates "Open" (0 volts) for 2 seconds. 6. Select Specific DTC. Enter DTC P0724. Has the test run and passed?	System OK	Begin the diagnosis again. Go to Step 1

DTC P0730 Gear Error Without Input Speed

LD : LOCKED IN DRIVE FW : FREEWHEELING NE : NOT EFFECTIVE

D07RT015

Circuit Description

- The Powertrain Control Module (PCM) calculates the slippage of the converter and transmission based upon the engine speed, the output speed, and the current gear ratio.
- The slippage of the converter at a high enough engine speed is low. The transmission should not slip more than a given value when there is no shift.
- This DTC detects a slip at each gear. This is a type “C” DTC.

Conditions For Setting The DTC

- No Output Speed Sensor DTC(s) P0722, P0723.
- No Transmission Range Switch DTC(s) P0705, P0706.
- Not in Park, Neutral or Reverse.
- Engine speed is greater than 3500 rpm.
- 3 seconds since upshift.
- 3 seconds since downshift.
- 3 seconds since garage shift (N→D).
- And one of the following conditions occur:
  - Slip is greater than 720 rpm in 1st gear.
  - Slip is greater than 680 rpm in 2nd gear.
  - Slip is greater than 660 rpm on 3rd gear.
  - Slip is greater than 650 rpm on 4th gear.
- All conditions met for 5.5 seconds.

Action Taken When The DTC Sets

- Maximum line pressure.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

- The PCM will illuminate the CHECK TRANS Lamp.
- Turn Force Motor OFF.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn “off” the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from PCM memory by using a scan tool. The DTC can also be cleared from memory when the vehicle has made 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC Actions Taken items when the fault conditions no longer exist and the ignition is cycles “off” long enough to power down the PCM.

Diagnostic Aids

- Check for intermittent output speed sensor circuit problems.
- Check for possible incorrect calibration. (PCM part No., tire specifications, and rear axle ratio)

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This step checks for possible low fluid level causing slipping resulting in an undefined gear ratio.
4. This step checks for correct gear ratios for commanded gears.
5. This step checks for low line pressure.

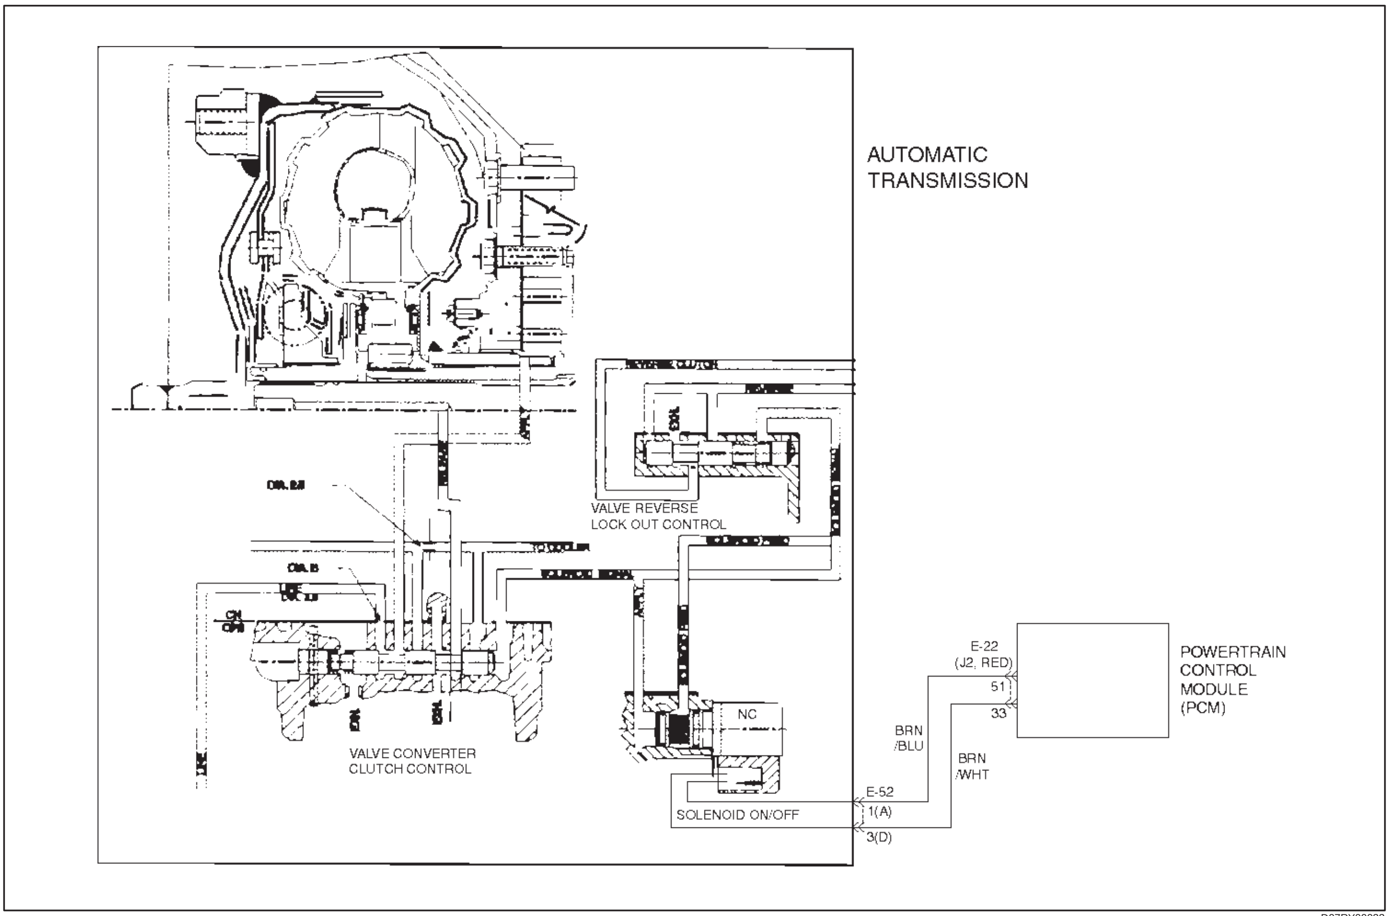
DTC P0730 Gear Error Without Input Speed

Step	Action	Yes	No
1	Were you sent here from the “On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	Visually inspect the transmission cooling system for fluid leaks. • Refer to Chart 16: Possible Causes of Transmission Fluid Leaks of Mechanical/Hydraulic Diagnosis Symptoms Index in Automatic Transmission (4L30–E) section. Was condition found and corrected?	Go to Step 7	Go to Step 3
3	Inspect the transmission fluid level and condition. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section. Has transmission fluid checking procedure been performed?	Go to Step 4	Go to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30–E) section
4	1. Install the scan tool. 2. Turn the ignition switch to the “on” position. 3. Engine not running. NOTE: Before clearing DTC(s) use the scan tool to record the “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 4. Record the Failure Record data. 5. Use the scan tool snapshot mode to record transmission gear ratios. 6. Drive vehicle in transmission gear ranges 1, 2, 3, and D with the engine speed is greater than 3,500 rpm for 5.5 seconds. 7. Record each transmission gear. 1st:2.73 – 2.99 2nd:1.54 – 1.71 3rd:0.93 – 1.05 4th:0.66 – 0.78 Does commanded gear ratio match ranges as shown?	Refer to Diagnostic Aids	Go to Step 5

DTC P0730 Gear Error Without Input Speed (Cont’d)

Step	Action	Yes	No
5	Perform line pressure check. ● Refer to Line Pressure Test in Automatic Transmission (4L30–E) section. Was condition found and corrected?	Go to Step 7	Go to Step 6
6	Check for possible clutch slippage. ● Refer to Chart 6: Diagnostic Trouble Code (DTC) P0730 of Mechanical/Hydraulic Diagnosis Symptoms Index in Automatic Transmission (4L30–E) section. Was condition found and corrected?	Go to Step 7	—
7	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear info” function. 2. Operate the vehicle under the following conditions: ● Drive the vehicle in D4 with the engine speed greater than 3,500 rpm to obtain any one of the following gear ratios for seven seconds. 1st 1:2.73 – 1:2.99 2nd 1:1.54 – 1:1.71 3rd 1:0.93 – 1:1.05 4th 1:0.66 – 1:0.78 Has the last test failed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0742 Torque Converter Clutch (TCC) System Stuck On



Circuit Description

The PCM energizes the TCC solenoid by creating a ignition voltage on circuit BRN/BLU. When ignition voltage is energized by the PCM, the TCC solenoid stops converter signal oil from exhausting. This causes converter signal oil pressure to increase and move the TCC valve. The TCC solenoid will deenergize when the PCM no longer provides an ignition voltage. When the TCC solenoid is deenergized, it will exhaust fluid and release the TCC.

This DTC detects low torque converter slip when the TCC is commanded “off”. This is a type “B” DTC.

Conditions For Setting The DTC

The following conditions occur once per TCC cycle, three consecutive times:

- No TPS DTCs P0122 or P0123.
- No OSS DTCs P0722 or P0723.
- No TCC solenoid DTC P1860.
- TP angle is greater than 20%.
- Engine speed is greater than 500 rpm and less than 3000 rpm.
- Engine vacuum is between 0 and 70 kPa.
- Commanded gear is not 1st.
- Gear range is D4.
- TCC is commanded “off”.
- No TCC stuck off DTC P1870
- TCC slip speed is between –20 and 40 rpm for 2 seconds.
- Vehicle speed is greater than 25 km/h (15 mph) and less than 120 km/h (75 mph).
- Speed ratio is greater than 0.9 and less than 2.0.

Action Taken When The DTC Sets

- For lamp illuminate refer to DTC type definition (type B).
- Inhibit TCC engagement.

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- If the TCC is mechanically stuck "on" with the parking brake applied and any gear range selected, the TCC fluid will mechanically apply the TCC, possibly causing an engine stall.

Test Description

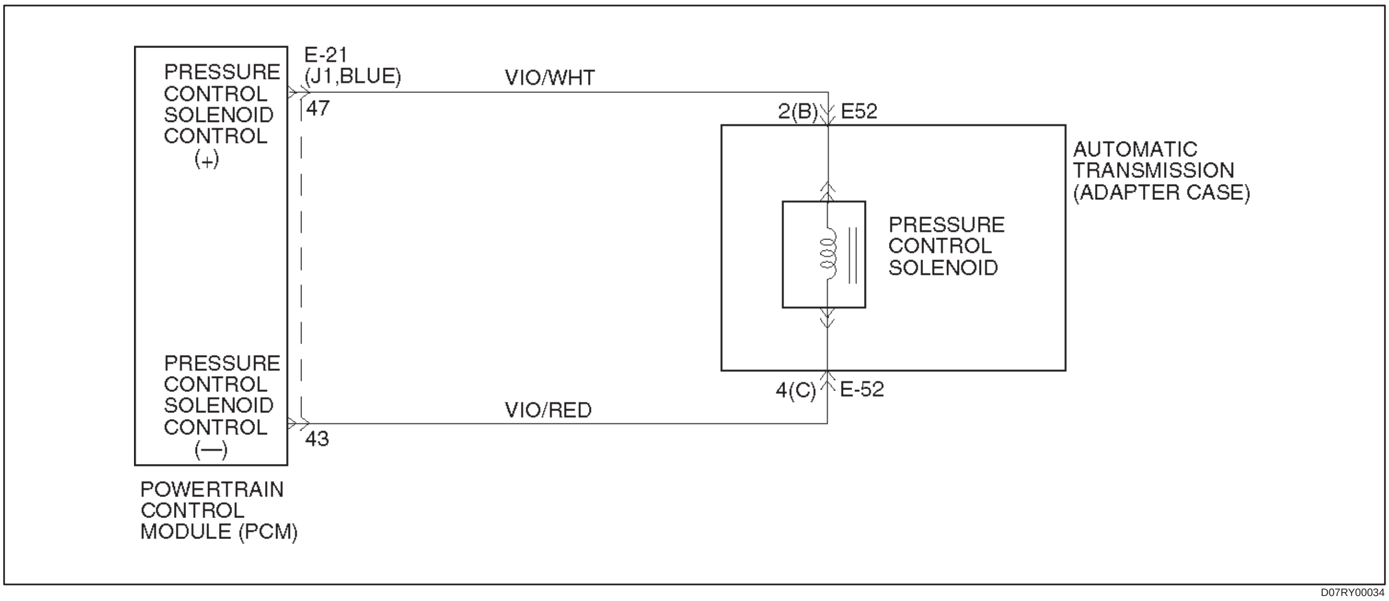
The number below refers to the step number on the diagnostic chart:

3. This test checks the mechanical state of the TCC. (When the PCM commands the TCC solenoid "off", the slip speed should increase).

DTC P0742 Torque Converter Clutch (TCC) System Stuck On

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Freeze Frame" and "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Freeze Frame" and "Failure Records". 4. Using the scan tool, verify the "TP Sensor" operation. Are the "TP Sensor" values within 0.6 – 5.0 volts?	Go to Step 3	Go to Diagnostic Aids
3	Drive the vehicle in the D4 drive range in fourth gear under steady acceleration, with a TP angle greater than 20%. Does the scan tool display "TCC Slip Speed" between –30 and +30 rpm, while the displayed TCC solenoid state is "off"?	Go to Step 4	Go to Diagnostic Aids
4	The TCC is mechanically stuck "on". Check the following items: • Clogged exhaust orifice in the TCC solenoid. • Converter clutch apply valve stuck in the apply position. • Misaligned or damaged valve body gasket. • Restricted release passage. Was a problem found and corrected?	Go to Step 5	—
5	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TCC slip speed must be between 200 and 2,500 rpm for 4 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0748 Pressure Control Solenoid (PCS) (Force Motor) Circuit Electrical



Circuit Description

The PCS is a PCM–controlled device used to regulate transmission line pressure. The PCM compares TPS voltage, engine rpm, and other inputs to determine the line pressure appropriate for a given load. The PCM will regulate the pressure by applying a varying amperage to the PCS. The applied amperage can vary from 70 to 1060 milliampere (mA), and is monitored by the PCM.

This DTC detects a continuous open or short to ground in the PCS circuit or the PCS. This is a type “C” DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- The PCM detects that the different between commanded and actual current is 200 milliampere (mA) for over 1 second.
- Engine speed is greater than 300 rpm.

Action Taken When the DTC Sets

- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).
- Maximum line pressure.
- The PCM will illuminate the CHECK TRANS Lamp.
- Turn Force Motor OFF.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn “off” the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from PCM history by using a scan tool.
- The DTC will be cleared from memory when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 4–way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

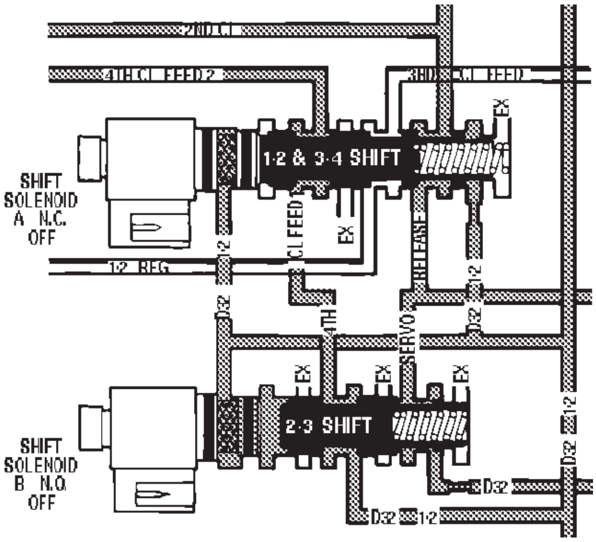
The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the ability of the PCM to command the PCS.
3. This test checks the PCS and internal wiring harness for incorrect resistance.

DTC P0748 Pressure Control Solenoid (PCS) (Force Motor) Circuit Electrical

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Failure Records”. 4. While the engine is operating, put the transmission in Park. 5. Using the scan tool, apply 70 through 1060 milliampere (mA) while observing “PC Ref. Current” and “PC Act. Current”. Is the “PC Act. Current” reading always within 160 mA?	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition “off”. 2. Disconnect the transmission 4–way connector E–52. 3. Using the J39200 DVOM, measure the resistance between terminals E52–2(B) and E52–4(C). Is the resistance within 3–7 ohms?	Go to Step 7	Go to Step 4
4	1. Remove the transmission oil pan. Refer to Solenoid (Adapter Case Valve Body) in Automatic Transmission (4L30–E) section. 2. Disconnect the internal wiring harness at the PCS. 3. Measure the resistance of the PCS. Is the resistance within 3–7 ohms?	Go to Step 6	Go to Step 5
5	Replace the PCS. Is the replacement complete?	Go to Step 10	—
6	Repair the internal wiring harness for an open. Is the repair complete?	Go to Step 10	—
7	Inspect/repair circuits VIO/WHT and VIO/RED. Was a problem found?	Go to Step 10	Go to Step 8
8	Inspect/repair circuits VIO/WHT and VIO/RED for a short to ground or poor connections. Was a problem found?	Go to Step 10	Go to Step 9
9	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 10	—
10	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and ensure the following conditions are met: The PCS duty cycle is not at its electrical high or low limit. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0751 Shift Solenoid A Performance (Stuck Off)



D07RT011

Circuit Description

The shift solenoid A is used to control fluid flow acting on the 1–2 and 3–4 shift valves. The solenoid is a normally close exhaust valve that is used with the shift solenoid B to allow four different shifting combinations.

The DTC detects when there is only a 1–1–4–4 shift pattern depending on the state of the mechanical failure instead of a 1–2–3–4 shift pattern. This is a type "B" DTC.

Conditions For Setting The DTC

- No ETC DTCs.
- No OSS DTCs P0722 or P0723.
- No TCC solenoid DTCs P0742, P1860, P1870.
- No shift solenoid A DTC P0753.
- No shift solenoid B DTC P0758.
- Gear range is D4.
- Transmission temperature is between 20° and 130°C (68° and 266°F).
- Output speed is greater than 375 rpm.
- No range code P0705, P0706.
- No torque code (to be confirmed).
- Engine run for more 0 seconds and not influed cut-off (to be confirmed).

All the above conditions have been met and the combination of conditions 1, 2 occur two consecutive times.

Condition 1:

- 2nd gear is commanded for ≥ 1 second.
- 40 ≤ Engine Torque ≤ 400 N·m
- Speed ratio ≥ 0.6
- Throttle position ≥ 10 %
- 800 ≤ TCC Slip ≤ 4000 rpm
- 2.75 ≤ Modeled Ratio ≤ 3.2 for 1 second.

Condition 2:

- 3rd gear is commanded for ≥ 1 second.
- 40 ≤ Engine Torque ≤ 400 N·m
- Throttle position ≥ 10 %
- 8000 ≤ TCC Slip ≤ 8000 rpm
- Speed ratio ≥ 0.45
- 0.62 ≤ Modeled Ratio ≤ 0.92 for 3 second.

Action Taken When the DTC Sets

- Maximum line pressure.
- For lamp illuminate refer to DTC type definition (type B).
- Turn Force Motor OFF.

Conditions For Clearing The The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Verify that the transmission meets the specifications in the 4L30–E shift speed chart.
- Other internal transmission failures may cause more than one shift to occur.

Test Description

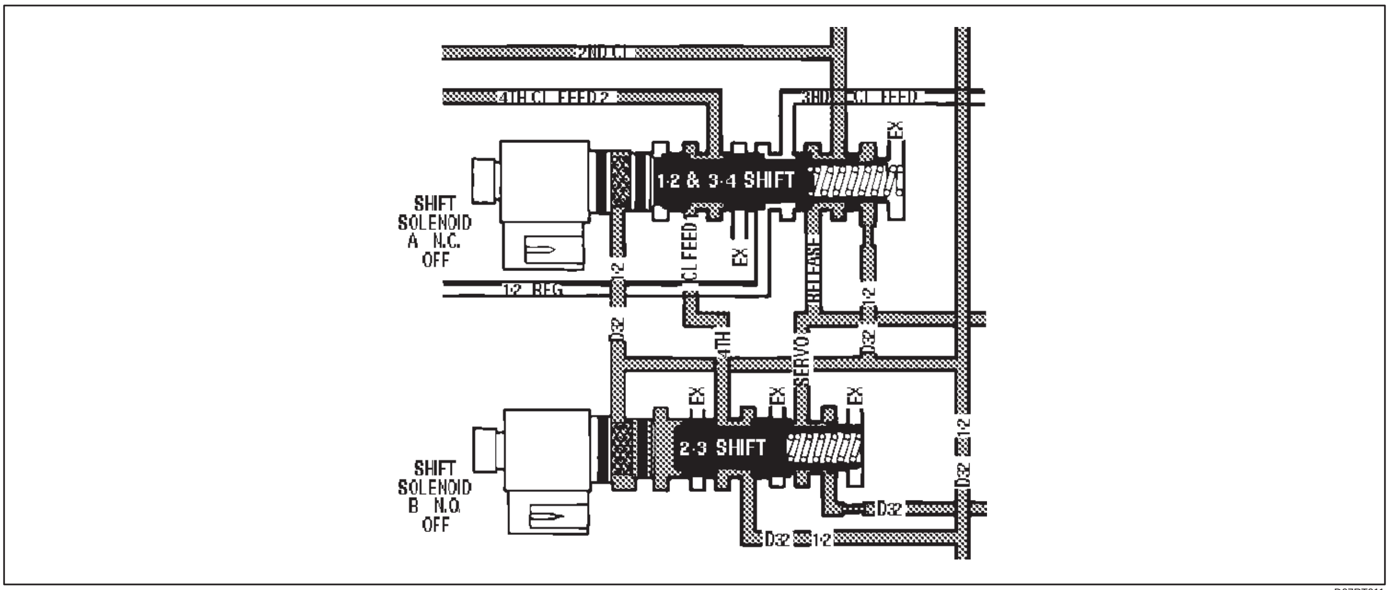
The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the function of the range switch (mode switch).
3. This test checks that the scan tool commanded all shifts, all shifts solenoids responded correctly, but all the shifts did not occur.

DTC P0751 Shift Solenoid A Performance (Stuck Off)

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. With the engine operating, apply the brake pedal and select each transmission range D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the “TR Switch” on the scan tool?	Go to Step 3	Go to“Range Switch Logic Table”
3	1. While the engine is operating, raise the drive wheels. 2. With the transmission in D4 range, use the scan tool to command 1st, 2nd and 3rd, and 4th gears while accelerating the vehicle. Was a 2–3 or 1–4 only shift pattern detected? (Road testing the vehicle may be necessary).	Go to Step 4	Go to Diagnostic Aids
4	Check the shift solenoid/hydraulic circuit for: ● One or both of the shift solenoids for an internal malfunction. ● Contamination or sediment in one or both of the shift solenoids. ● Damaged seals on one or both of the shift solenoids. Refer to Solenoid (Main Case Valve Body) in Automatic Transmission (4L30–E) section. Was a problem found and corrected?	Go to Step 5	Go to Diagnostic Aids
5	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and road test the vehicle. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0752 Shift Solenoid A Performance (Stuck On)



D07RT011

Circuit Description

The shift solenoid A is used to control fluid flow acting on the 1–2 and 3–4 shift valves. The solenoid is a normally close exhaust valve that is used with the shift solenoid B to allow four different shifting combinations.

The DTC detects when there is only a 2–2–3–3 shift pattern depending on the state of the mechanical failure instead of a 1–2–3–4 shift pattern. This is a type “B” DTC.

Conditions For Setting The DTC

- No ETC DTCs.
- No OSS DTCs P0722 or P0723.
- No TCC solenoid DTC P0742, P1860, P1870.
- No shift solenoid A DTC P0753.
- No shift solenoid B DTC P0758.
- Gear range is D4.
- Output speed is greater than 375 rpm.
- Transmission temperature is between 20° and 130°C (68° and 266°F).
- No range code P0705, P0706.
- No torque code (to be confirmed).
- Engine run for more 0 seconds and not influed cut-off (to be confirmed).

All the above conditions have been met and the combination of condition 1, 2 occur two consecutive times.

Condition 1:

- 1st gear is commanded for ≥ 1 sec
- 40 ≤ Engine Torque ≤ 400 N·m
- Throttle positon ≥ 10%
- –8000 ≤ TCC slip ≤ 8000 rpm
- Transmission out speed ≥ 375 rpm
- Speed ratio ≥ 0.3
- 1.5 ≤ Modeled Ratio ≤ 2.4 for 0.687 seconds

Condition 2:

- 4th Gear is commanded for ≥ 1 sec.
- 40 ≤ Engine Torque ≤ 400 N·m
- Trottle position ≥ 10%
- –8000 ≤ TCC slip ≤ 8000 rpm
- Speed ratio ≥ 0.6
- 0.92 ≤ Modeled Ratio ≤ 1.5 for 7 seconds

Action Taken When the DTC Sets

- Maximum line pressure.
- For lamp illuminate refer to DTC type definition (type B).
- Turn Force Motor OFF.

Conditions For Clearing The The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Verify that the transmission meets the specifications in the 4L30–E shift speed chart.
- Other internal transmission failures may cause more than one shift to occur.

Test Description

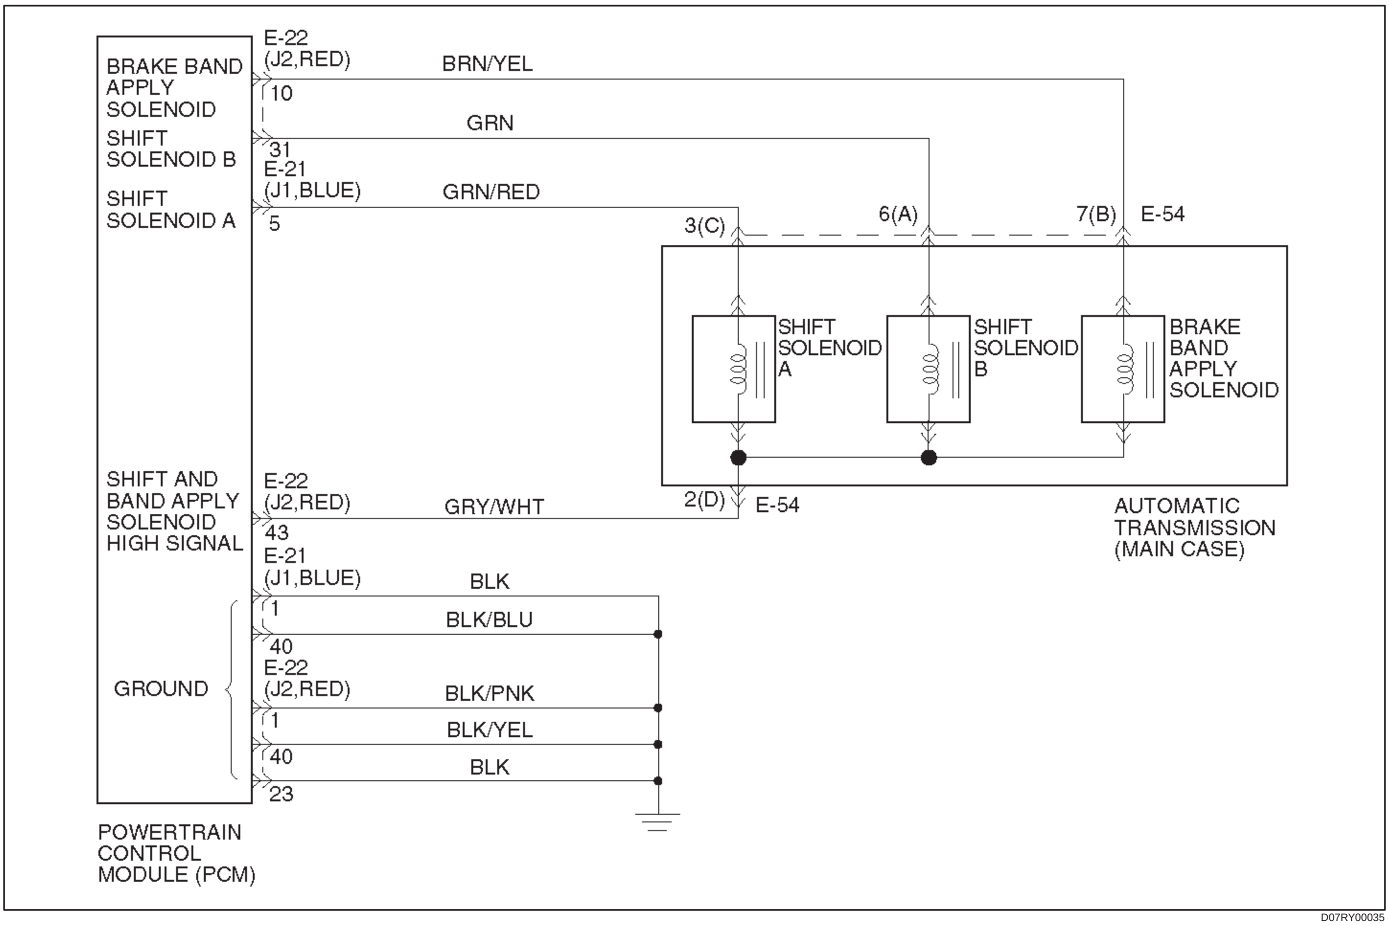
The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the function of the range switch (mode switch).
3. This test checks that the scan tool commanded all shifts, all shifts solenoids responded correctly, but all the shifts did not occur.

DTC P0752 Shift Solenoid A Performance (Stuck On)

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Freeze Frame" and "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Freeze Frame" and "Failure Records". 4. With the engine operating, apply the brake pedal and select each transmission range D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the "TR Switch" on the scan tool?	Go to Step 3	Go to"Range Switch Logic Table"
3	1. While the engine is operating, raise the drive wheels. 2. With the transmission in D4 range, use the scan tool to command 1st, 2nd and 3rd, and 4th gears while accelerating the vehicle. Was a 2–3 or 1–4 only shift pattern detected? (Road testing the vehicle may be necessary).	Go to Step 4	Go to Diagnostic Aids
4	Check the shift solenoid/hydraulic circuit for: • One or both of the shift solenoids for an internal malfunction. • Contamination or sediment in one or both of the shift solenoids. • Damaged seals on one or both of the shift solenoids. Refer to Solenoid (Main Case Valve Body) in Automatic Transmission (4L30–E) section. Was a problem found and corrected?	Go to Step 5	Go to Diagnostic Aids
5	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and road test the vehicle. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0753 Shift Solenoid A Electrical



Circuit Description

- The shift solenoid A is a simple on/off solenoid located in the main case valve body. The solenoid is the normally closed type. In second or third gear the Powertrain Control Module (PCM) energizes the solenoid to open a fluid inlet port. When the port is open, fluid pressure actuates the shift valve.
- The solenoid is activated by a current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage, except in BACKUP MODE or when ignition is off the HSD is turned off.

This DTC detects a continuous open or short to ground in the shift solenoid A circuit or the shift solenoid A. This is a type “B” DTC.

Conditions For Setting The DTC

- Ignition is “on”, Engine “run”.
- Battery voltage is between 10 and 16 volts.
- The PCM commands the solenoid “on” and the voltage remains high (B+), or the PCM commands the solenoid “off” and the voltage remains low (zero volts).
- All conditions met for 0.84 – 1.0 seconds.

Action Taken When The DTC Sets

- Maximum line pressure.
- Immediate landing to 4th gear.
- Inhibit TCC engagement.
- For lamp illuminate refer to DTC type definition (type B).

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 7-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.

- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- An open ignition feed circuit can cause multiple DTCs to set.
- A shift solenoid B DTC P0758 could also set with a shift solenoid A electrical failure.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks for power to the shift solenoid A from the ignition through the PCM.
5. This test measures the resistance of the component.
8. This test checks the function of the shift solenoid A and the transmission internal wiring harness.

Shift Solenoid Status Chart

Gear	Shift solenoid A	Shift solenoid B
1st	OFF	ON
2nd	ON	ON
3rd	ON	OFF
4th	OFF	OFF

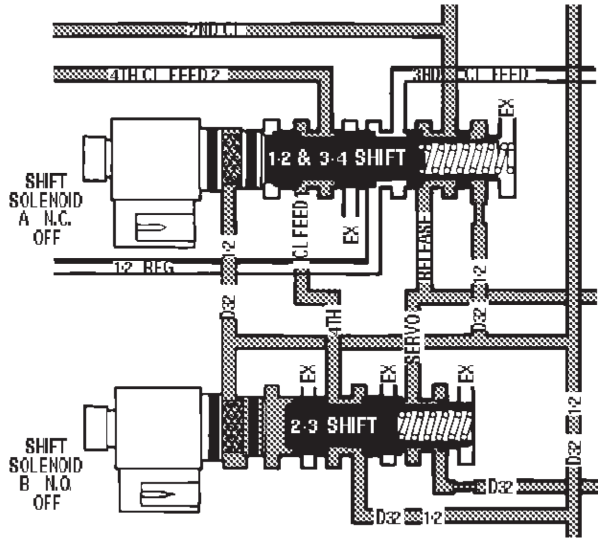
DTC P0753 Shift Solenoid A Electrical

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	1. Install the scan tool. 2. With the engine “on”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. Were DTCs P0753, P0758, P1860 set?	Go to Step 3	Go to Diagnostic Aids
3	1. Turn the ignition “on”. 2. Using the J39200 DVOM, measure the voltage between PCM connector terminals J2–43 and J1–1 (GND). Is the voltage within 10–12 volts?	Go to Step 4	Go to Step 5
4	1. Turn the ignition “off”. 2. Disconnect the J1 (BLUE) and J2 (RED) PCM connector. 3. Turn the ignition “on”. 4. Using the J39200 DVOM, measure the voltage between PCM connector terminals J1–5 and ground. Is the voltage within 10 – 12 volts?	Go to Step 10	Go to Step 5
5	1. Turn the ignition “off”. 2. Disconnect the J1 (BLUE) and J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–43 and J1–5. Is the resistance within 18 – 20 ohms?	Go to Step 6	Go to Step 8
6	1. Disconnect the J1 (BLUE) and J2 (RED) PCM connectors. 2. Using the J39200 DVOM, check a continuity between PCM terminals J1–5 and ground. Is there a continuity?	Go to Step 11	Go to Step 7
7	Using the J39200 DVOM, check a continuity between J2 (RED) PCM terminal 43 and ground. Is there a continuity?	Go to Step 12	Go to Step 9

DTC P0753 Shift Solenoid A Electrical (Cont'd)

Step	Action	Yes	No
8	1. Disconnect the transmission main case 7–way connector E–54. 2. Using the J39200 DVOM, measure the resistance between terminals E54–2(D) and E54–3(C). Is the resistance within 18–20 ohms?	Go to Step 13	Go to Step 14
9	Check every connection at the PCM connector. Was a problem found?	Go to Step 16	Go to Step 15
10	The wiring harness between PCM connector terminals J1–5 and transmission harness terminal E54–3(C) is shorted to voltage. Was a problem found and corrected?	Go to Step 17	—
11	The wiring harness between PCM connector terminal J1–5 and transmission harness terminal E54–3(C) is shorted to ground. Was a problem found and corrected?	Go to Step 17	—
12	The wiring harness between PCM connector terminals J2–43 and transmission harness terminal E54–2(D) is shorted to ground. Was a problem found and corrected?	Go to Step 17	—
13	The wiring harness between PCM connector J1 or J2 and transmission 7–way connector E–54 is open or poor connection. Was a problem found and corrected?	Go to Step 17	—
14	The shift solenoid A is faulty. Replace the shift solenoid A. Refer to Solenoid (Main Case Valve Body) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 17	—
15	The PCM may be faulty. Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 17	—
16	Repair the PCM connector connection. Was a problem found and corrected?	Go to Step 17	—
17	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: • The shift solenoid A is commanded "on" and the voltage drops to zero. • The shift solenoid A is commanded "off" and the voltage increases to B+. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0756 Shift Solenoid B Performance (Stuck Off)



D07RT011

Circuit Description

The shift solenoid B is used to control fluid flow acting on the 2–3 shift valves. The solenoid is a normally open exhaust valve that is used with the shift solenoid A to allow four different shift combinations.

This DTC detects when there is only a 4-3-3-4 shift pattern depending on the state of the mechanical failure instead of a 1-2-3-4 shift pattern. This is a type “B” DTC.

Conditions For Setting The DTC

- No ETC DTCs.
- No OSS DTCs P0722 or P0723.
- No TCC solenoid DTCs P0742, P1860, P1870.
- No shift solenoid DTCs P0753, P0758.
- Gear range is D4.
- Output speed is greater than 375 rpm.
- Transmission fluid temperature is between 20˚ and 130˚C (68˚ and 266˚F).
- No range code P0705, P0706.
- No torque code (to be confirmed).
- Engine run for more 0 seconds and influed cut-off (to be confirmed).

  All the above conditions have been met and the combination of condition 1, 2 occur two consecutive times.

Condition 1:

- 1st gear is commanded for ≥ 1 second
- 40 ≤ Engine Torque ≤ 400 N·m
- Throttle position ≥ 10 %
- –2300 ≤ TCC Slip ≤ 200 rpm.
- Transmission output speed ≥ 400 rpm
- Speed ratio ≥ 0.3
- 0.60 ≤ Modeled Ratio ≤ 1.49 for 1 second.

Condition 2:

- 2nd gear is commanded for ≥ 1 second
- 40 ≤ Engine Torque ≤ 400 N·m
- Throttle position ≥ 10 %
- –8000 ≤ TCC Slip ≤ 8000 rpm.
- Speed ratio ≥ 0.6
- 0.92 ≤ Modeled Ratio ≤ 1.5 for 0.687 second.

Action Taken When the DTC Sets

- Maximum line pressure.
- For lamp illuminate refer to DTC type definition (type B).
- Turn Force Motor OFF.

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Verify that the transmission meets the specifications in the 4L30-E shift speed chart.
- Other internal transmission failures may allow more than one shift to occur.

Test Description

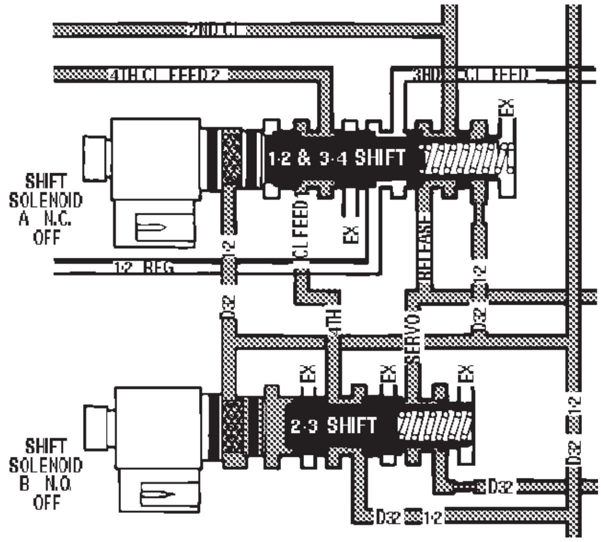
The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the function of the range switch (mode switch).
3. This test checks for selected gear ratio vs. a ratio not obtainable under normal driving conditions.

DTC P0756 Shift Solenoid B Performance (Stuck Off)

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. With the engine operating, apply the brake pedal and select each transmission range D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the “TR Switch” on the scan tool?	Go to Step 3	Go to “Range Switch Logic Table”
3	1. While the engine is operating, raise the drive wheels. 2. With the transmission in D4 range, use the scan tool to command 1st, 2nd, and 3rd, and 4th gears while accelerating the vehicle. Was 1st gear commanded and not achieved, or 4th gear commanded and other than 4th gear occurred? (Road testing the vehicle may be necessary.)	Go to Step 4	Go to Diagnostic Aids
4	Check the shift solenoid/hydraulic circuit for: • One or both of the shift solenoids for an internal malfunction. • Contamination or sediment in one or both of the shift solenoids. • Damaged seals on the one or both of the shift solenoids. Refer to Solenoid (Main Case Valve Body) in Automatic Transmission (4L30–E) section. Was a problem found and corrected?	Go to Step 5	Go to Diagnostic Aids
5	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and road test the vehicle. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0757 Shift Solenoid B Performance (Stuck On)



D07RT011

Circuit Description

The shift solenoid B is used to control fluid flow acting on the 2–3 shift valves. The solenoid is a normally open exhaust valve that is used with the shift solenoid A to allow four different shift combinations.
This DTC detects when there is only a 1–2–2–1 shift pattern depending on the state of the mechanical failure instead of a 1–2–3–4 shift pattern. This is a type “B” DTC.

Conditions For Setting The DTC

- No ETC DTCs.
- No OSS DTCs P0722 or P0723.
- No TCC solenoid DTC P0742, P1860, P1870.
- No shift solenoid DTCs P0753.
- No shift solenoid B DTC P0758.
- Gear range is D4.
- Output speed is greater than 375 rpm.
- Transmission fluid temperature is between 20° and 130°C (68° and 266°F).
- No range code P0705, P0706.
- No torque code (to be confirmed).
- Engine run for more 0 seconds and not influed cut-off (to be confirmed).

All of the above conditions have been met and the combination of condition 1,2 occur two consecutive times.

Condition 1:

- 3rd gear is commanded for ≥ 1 second
- 40 ≤ Engine Torque ≤ 400 N·m
- Throttle positon ≥ 10%
- –8000 ≤ TCC slip ≤ 8000 rpm
- Transmission out speed ≥ 375 rpm
- Speed ratio ≥ 0.6
- 1.44 ≤ Modeled Ratio ≤ 2.4 for 4 seconds

Condition 2:

- 4th Gear is commanded for ≥ 1 second
- 15 ≤ Engine Torque ≤ 400 N·m
- Trottle position ≥ 10%
- –8000 ≤ TCC slip ≤ 8000 rpm
- Speed ratio ≥ 0.6
- 2.75 ≤ Modeled Ratio ≤ 3.2 for 2 seconds

Action Taken When the DTC Sets

- Maximum line pressure.
- For lamp illuminate refer to DTC type definition (type B).
- Turn Force Motor OFF.

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Verify that the transmission meets the specifications in the 4L30-E shift speed chart.
- Other internal transmission failures may cause more than one shift to occur.

Test Description

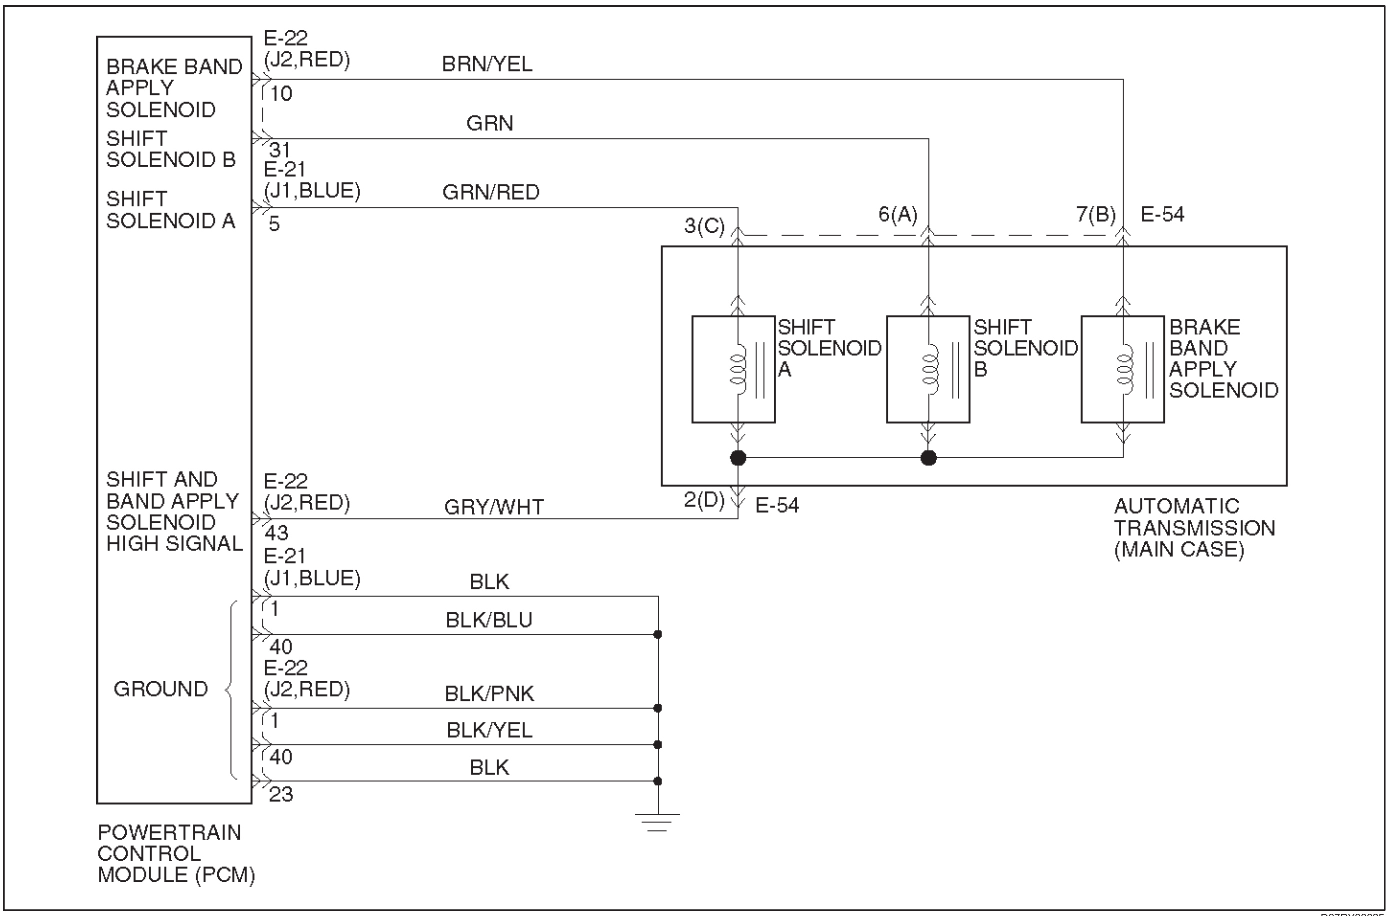
The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the function of the range switch (mode switch).
3. This test checks for selected gear ratio vs. a ratio not obtainable under normal driving conditions.

DTC P0757 Shift Solenoid B Performance (Stuck On)

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emissions in Engine section
2	1. Install the scan tool. 2. With the engine “off”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. 4. With the engine operating, apply the brake pedal and select each transmission range D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the “TR Switch” on the scan tool?	Go to Step 3	Go to “Range Switch Logic Table”
3	1. While the engine is operating, raise the drive wheels. 2. With the transmission in D4 range, use the scan tool to command 1st, 2nd, and 3rd, and 4th gears while accelerating the vehicle. Was 1st gear commanded and not achieved, or 4th gear commanded and other than 4th gear occurred? (Road testing the vehicle may be necessary.)	Go to Step 4	Go to Diagnostic Aids
4	Check the shift solenoid/hydraulic circuit for: • One or both of the shift solenoids for an internal malfunction. • Contamination or sediment in one or both of the shift solenoids. • Damaged seals on the one or both of the shift solenoids. Refer to Solenoid (Main Case Valve Body) in Automatic Transmission (4L30–E) section. Was a problem found and corrected?	Go to Step 5	Go to Diagnostic Aids
5	1. After the repair is complete, use the scan tool to select “DTC”, then “Clear Info” function and road test the vehicle. 2. Review the scan tool “DTC Info”. Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0758 Shift Solenoid B Electrical



Circuit Description

- The shift solenoid B is a simple on/off solenoid located in the main case valve body. It is normally open. When the port is open, fluid pressure actuates the shift valve. In first or second gear, the Powertrain Control Module (PCM) energizes the solenoid to close a fluid inlet port.
- The solenoid is activated by current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage. In BACKUP MODE or when the ignition is off, the HSD is turned off.

This DTC detects a continuous open or short to ground in the shift solenoid B circuit or shift solenoid B. This is a type “B” DTC.

Conditions For Setting The DTC

- Ignition is “on”, Engine “run”.
- Battery voltage is between 10 and 16 volts.
- The PCM commands the solenoid “on” and the voltage remains high (B+), or the PCM commands the solenoid “off” and the voltage remains low (zero volts).
- All conditions met for 0.84 ~ 1.0 seconds.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- For lamp illuminate refer to DTC type definition (type B).
- The PCM will illuminate the Malfunction Indicator Lamp (MIL) and CHECK TRANS lamp.

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.

- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and transmission 7-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

5. This test measures the resistance of the component.

6. This test checks the function of the shift solenoid B and the transmission internal wiring harness.

9. This test checks for power to the shift solenoid B from the ignition through the PCM.

Shift Solenoid Status Chart

Gear	Shift solenoid A	Shift solenoid B
1st	OFF	ON
2nd	ON	ON
3rd	ON	OFF
4th	OFF	OFF

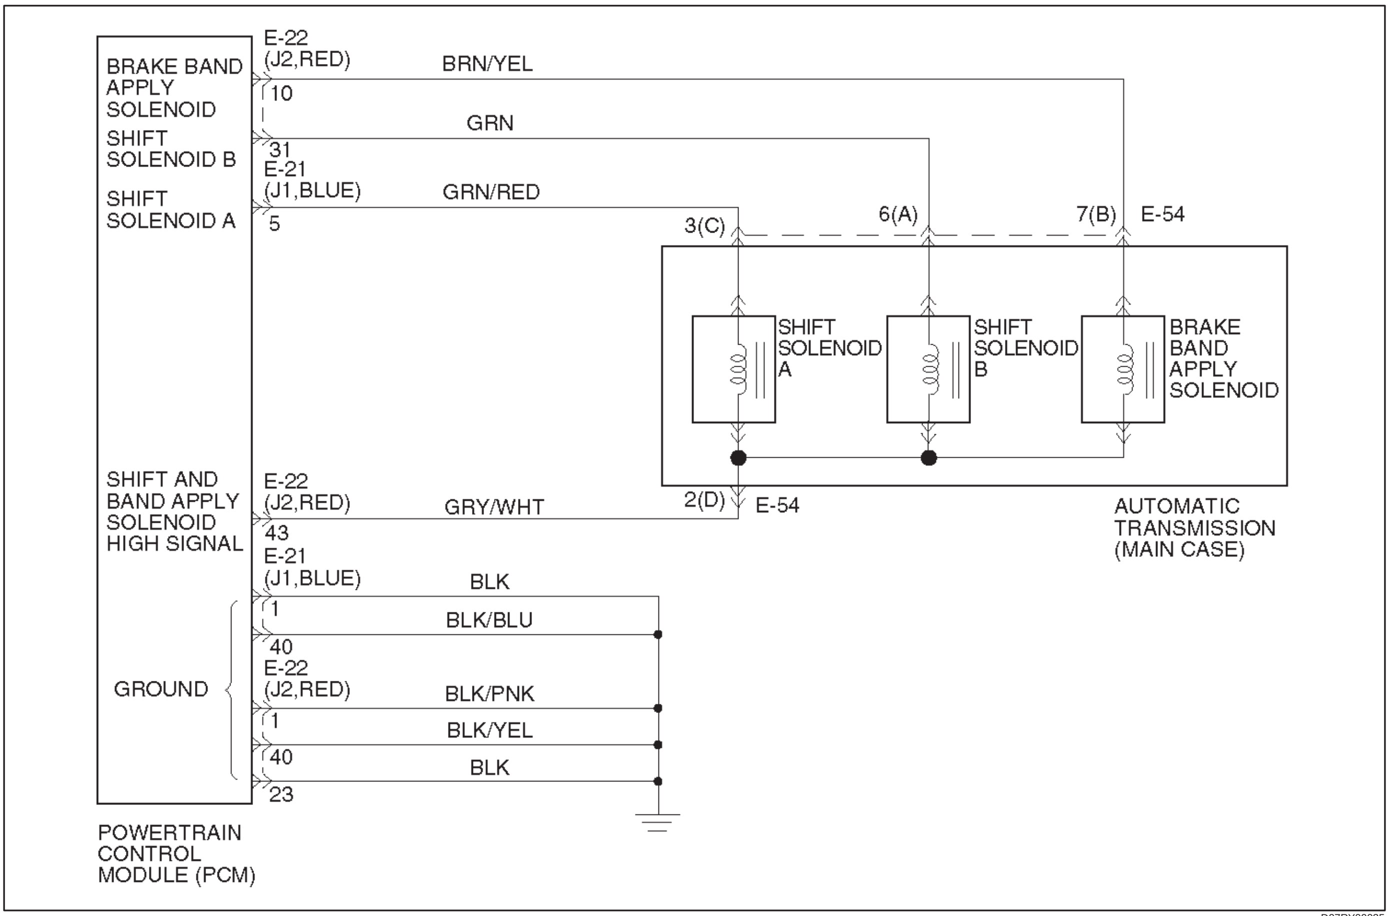
DTC P0758 Shift Solenoid B Electrical

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	1. Install the scan tool. 2. With the engine "on", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Freeze Frame" and "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Freeze Frame" and "Failure Records". Were DTCs P0753, P0758, P1860 set?	Go to Step 4	Go to Step 3
3	1. The engine "on". 2. Apply brake pedal and select transmission range "D". 3. Press and hold down the winter switch and select transmission mode "winter". Does the scan tool display DTC P0758 at 3rd gear?	Go to Step 7	Go to Diagnostic Aids
4	1. Turn the ignition "off". 2. Disconnect the J1 (BLUE) and J2 (RED) PCM connectors. 3. Turn the ignition "on". 4. Using the J39200 DVOM, measure the voltage between PCM connector terminals J2–31 and J2–1. Is the voltage within 10 – 12 volts?	Go to Step 13	Go to Step 5
5	1. Turn the ignition "off". 2. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–31 and J2–43. Is the resistance within 18 – 20 ohms?	Go to Step 14	Go to Step 6
6	1. Disconnect the transmission main case connector E–54. 2. Using the J39200 DVOM, measure the resistance between terminals E54–6(A) and E54–2(D). Is the resistance within 18 – 20 ohms?	Go to Step 15	Go to Step 16
7	1. Turn the ignition "off". 2. Disconnect the J1 (BLUE) and J2 (RED) PCM connectors. 3. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–31 and J2–43. Is the resistance within 18 – 20 ohms?	Go to Step 8	Go to Step 10
8	Using the J39200 DVOM, check a continuity between PCM connector terminal J2–31 and ground. Is there a continuity?	Go to Step 17	Go to Step 9
9	Using the J39200 DVOM, check a continuity between PCM connector terminal J2–43 and ground. Is there a continuity?	Go to Step 18	Go to Step 11
10	1. Disconnect the transmission main case connector E–54. 2. Using the J39200 DVOM, measure the resistance between terminals E54–6(A) and E54–2(D). Is the resistance within 18 – 20 ohms?	Go to Step 19	Go to Step 20
11	Check every connection of the PCM. Was a problem found and corrected?	Go to Step 22	Go to Step 12

DTC P0758 Shift Solenoid B Electrical (Cont'd)

Step	Action	Yes	No
12	1. Connect the J1 (BLUE) and J2 (RED) PCM connectors to the PCM. 2. Turn the ignition "on", the engine "on". 3. Repeat Step 3. Does the scan tool display DTC P0758 at 3rd gear?	Go to Step 21	Go to Diagnostic Aids
13	The wiring harness between PCM connector terminal J2–31 and transmission main case terminal E54–6(A) is shorted to voltage. Was a problem found and corrected?	Go to Step 22	—
14	The PCM internal terminal J2–31 is shorted to voltage. Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 22	—
15	The wiring harness between PCM connector and transmission main case connector is shorted. Was a problem found and corrected?	Go to Step 22	—
16	The shift solenoid B is faulty, or the internal wiring harness from the shift solenoid B is shorted. Was a problem found and corrected?	Go to Step 22	—
17	The wiring harness between PCM connector terminal J2–31 and transmission main case connector terminal E54–6(A) is shorted to ground. Was a problem found and corrected?	Go to Step 22	—
18	The wiring harness between PCM connector terminal J2–43 and transmission main case connector terminal E54–2(D) is shorted to ground. Was a problem found and corrected?	Go to Step 22	—
19	The wiring harness between PCM connector terminal J2–31 and transmission main case connector terminal E54–6(A), or between PCM connector terminal J2–43 and main case connector terminal E54–2(D) is open. Was a problem found and corrected?	Go to Step 22	—
20	The internal wiring harness from the shift solenoid B is open, or the shift solenoid B is faulty. Was a problem found and corrected?	Go to Step 22	—
21	Replace the PCM. Is the replacement complete?	Go to Step 22	—
22	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: ● The shift solenoid B is commanded "on" and voltage drops to zero. ● The shift solenoid B is commanded "off" and voltage increases to B+. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P1850 Brake Band Apply Solenoid Malfunction



Circuit Description

- The brake band apply solenoid is a normally open solenoid which controls the flow of fluid for brake band application. The Powertrain Control Module (PCM) uses Pulse Width Modulation (PWM) and changes the duty cycle to control the solenoid. The PCM turns the solenoid on (energized) and off (deenergized) at a constant frequency. The length of time the solenoid is energized during each on/off cycle is called the pulse width. By varying or "modulating" the pulse width, the solenoid output pressure is changed. Since the solenoid is normally open, increasing the pulse width increases the duty cycle and decreases the output pressure. PWM control provides smooth band application without an accumulator. The band is only applied in first and second gears.
- In the event of an electrical failure (open), the solenoid regulates at the maximum oil flow (0% duty cycle).
- The solenoid is activated by a current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage. When the ignition is off, the HSD is turned off.

This DTC detects a continuous open or short to ground in the brake band apply solenoid circuit or the brake band apply solenoid. This is a type "D" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is "on", Engine "run".
- The PCM commands the solenoid "on" and the voltage remains high (B+), or the PCM commands the solenoid "off" and the voltage remains low (zero volts).
- All conditions met in 1.34 ~ 1.56 seconds.

Action Taken When The DTC Sets

- Inhibit brake band apply solenoid.
- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 7–way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks for power to the brake band apply solenoid from the ignition through the PCM.
4. This test checks the resistance of the transmission internal wiring harness and brake band apply solenoid.
5. This test checks the ability of the PCM and wiring to control the ground circuit.

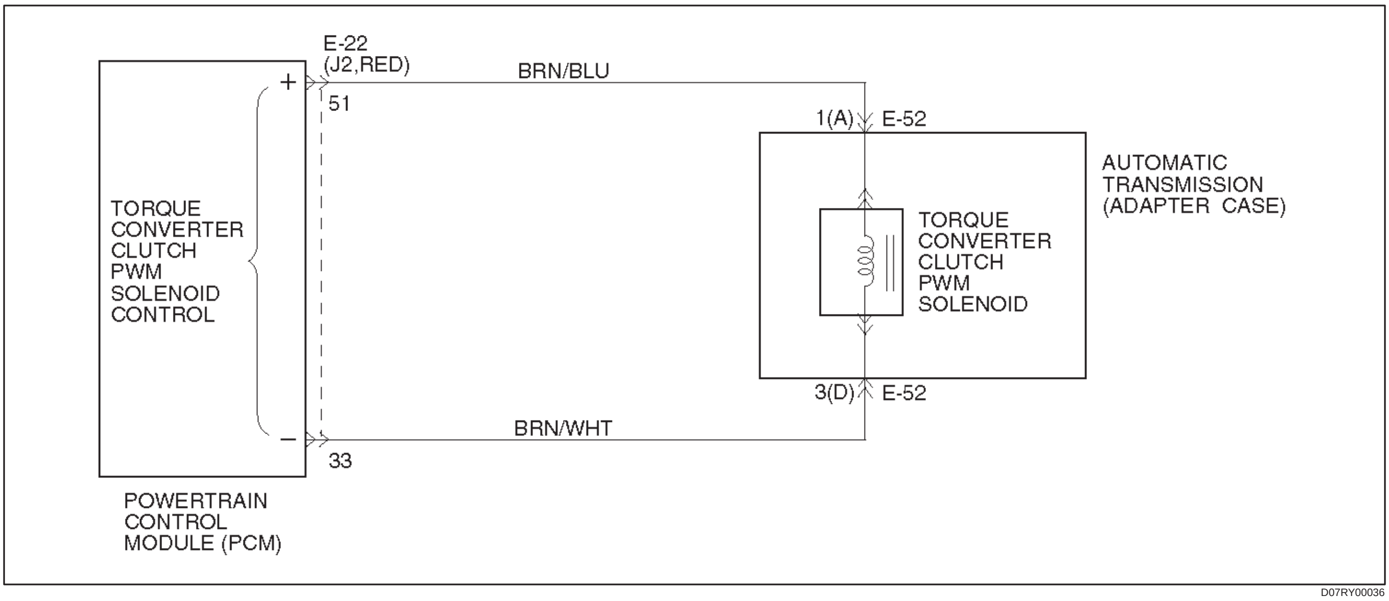
DTC P1850 Brake Band Apply Solenoid Malfunction

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	1. Install the scan tool. 2. With the engine “on”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the “Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. Were DTCs P0753, P0758 set?	Go to Step 3	Go to Step 4
3	Using the J39200 DVOM, back probe between PCM connector terminals J2–43 and J2–1. Is the voltage between 10 to 12 volts?	Go to Step 5	Go to Step 6
4	1. Turn the ignition “off”. 2. Disconnect the J1 (BLUE) and J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–43 and J2–10. Is the resistance within 10–12 ohms?	Go to Step 10	Go to Step 11
5	Using the J39200 DVOM, back probe between PCM connector terminals J2–10 and J2–1. Is the voltage between 10 to 12 volts?	Go to Step 19	Go to Step 4
6	1. Turn the ignition “off”. 2. Disconnect the J1 (BLUE) and J2 (RED) PCM connector. 3. Using the J39200 DVOM, check continuity between PCM terminal J2–43 and ground. Is there a continuity?	Go to Step 7	Go to Step 8
7	1. Disconnect the transmission main case connector E–54. 2. Using the J39200 DVOM, check continuity between the terminal E54–7(B) and ground. Is there continuity?	Go to Step 13	Go to Step 14
8	1. Disconnect the J1 (BLUE) and J2 (RED) PCM Connector. 2. Using the J39200 DVOM, measure the resistance between the PCM connector terminals J2–43 and J2–10. Is the resistance within 10–12 ohms?	Go to Step 19	Go to Step 9
9	1. Disconnect the transmission main case connector E–54. 2. Using the J39200 DVOM, measure the resistance between the terminals E54–7(B) and E54–2(D). Is the resistance within 10–12 ohms?	Go to Step 15	Go to Step 16
10	Using the J39200 DVOM, check continuity between PCM terminal J2–10 and ground. Is there continuity?	Go to Step 12	Go to Step 19
11	1. Disconnect the transmission main case connector E–54. 2. Using the J39200 DVOM, measure the resistance between the terminals E54–7(B) and E54–2(D). Is the resistance within 10–12 ohms?	Go to Step 18	Go to Step 16

DTC P1850 Brake Band Apply Solenoid Malfunction (Cont'd)

Step	Action	Yes	No
12	1. Disconnect the transmission main case connector E–54. 2. Using the J39200 DVOM, check continuity between the terminals E54–7(B) and ground. Is there a continuity?	Go to Step 13	Go to Step 17
13	The brake band apply solenoid is faulty, or the internal wiring harness from the brake band apply solenoid is shorted to ground. Was a problem found and corrected?	Go to Step 20	—
14	The wiring harness between the PCM connector terminal J2–43 and the transmission main case connector terminal E54–2(D) is shorted to ground. Was a problem found and corrected?	Go to Step 20	—
15	The wiring harness between the PCM connector terminal J2–43 and the transmission main case connector terminal E54–2(D) is open. Was a problem found and corrected?	Go to Step 20	—
16	The brake band apply solenoid is faulty, or the internal wiring harness from the brake band apply solenoid is open. Was a problem found and corrected?	Go to Step 20	—
17	The wiring harness between the PCM connector terminal J2–10 and the transmission main case connector terminal E54–7(B) is shorted ground. Was a problem found and corrected?	Go to Step 20	—
18	The wiring harness between the PCM connector terminal J2–10 and the transmission main case connector terminal E54–7(B) is open. Was a problem found and corrected?	Go to Step 20	—
19	Check every connection at the PCM. If OK, replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 20	—
20	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: ● The brake band apply solenoid is commanded "on" and the volts drop to zero. ● The brake band apply solenoid is commanded "off" and the volts increase to B+. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P1860 TCC Solenoid Electrical



Circuit Description

The PCM allows current to flow through the solenoid (0 or 12 volts). This current flow through the solenoid coil creates a magnetic field that magnetizes the solid core. The magnetized core attracts the check ball to seat against spring pressure. This blocks the exhaust for the TCC signal fluid and allows solenoid feed drive fluid to feed to TCC signal circuit. The TCC signal fluid pressure acts on the torque converter clutch control valve. When the TCC control valve is in the apply position, line pressure is directed through the TCC valve to apply the torque converter clutch. The TCC solenoid is attached to the valve body within the transmission.

This DTC detects a continuous open or short to ground or ignition in the TCC circuit or the TCC solenoid. This is a type "B" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- No shift solenoid A DTCs P0751 or P0752 or P0753.
- No shift solenoid B DTCs P0756 or P0757 or P0758.
- Ignition "on". Engine "run".
- The PCM commands the solenoid "on" and the voltage remains low (zero volts).
- The PCM commands the solenoid "off" and the voltage remains high (B+).
- All conditions met for 0.875 ~ 1.25 seconds.

Action Taken When The DTC Sets

- Inhibit TCC engagement.
- For lamp illuminate refer to DTC type definition (TYPE B).

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and at the transmission 4–way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks for voltage to the solenoid.
4. This test checks the ability of the PCM and wiring to control the ignition circuit.
8. This test checks the resistance of the TCC solenoid and the internal wiring harness.

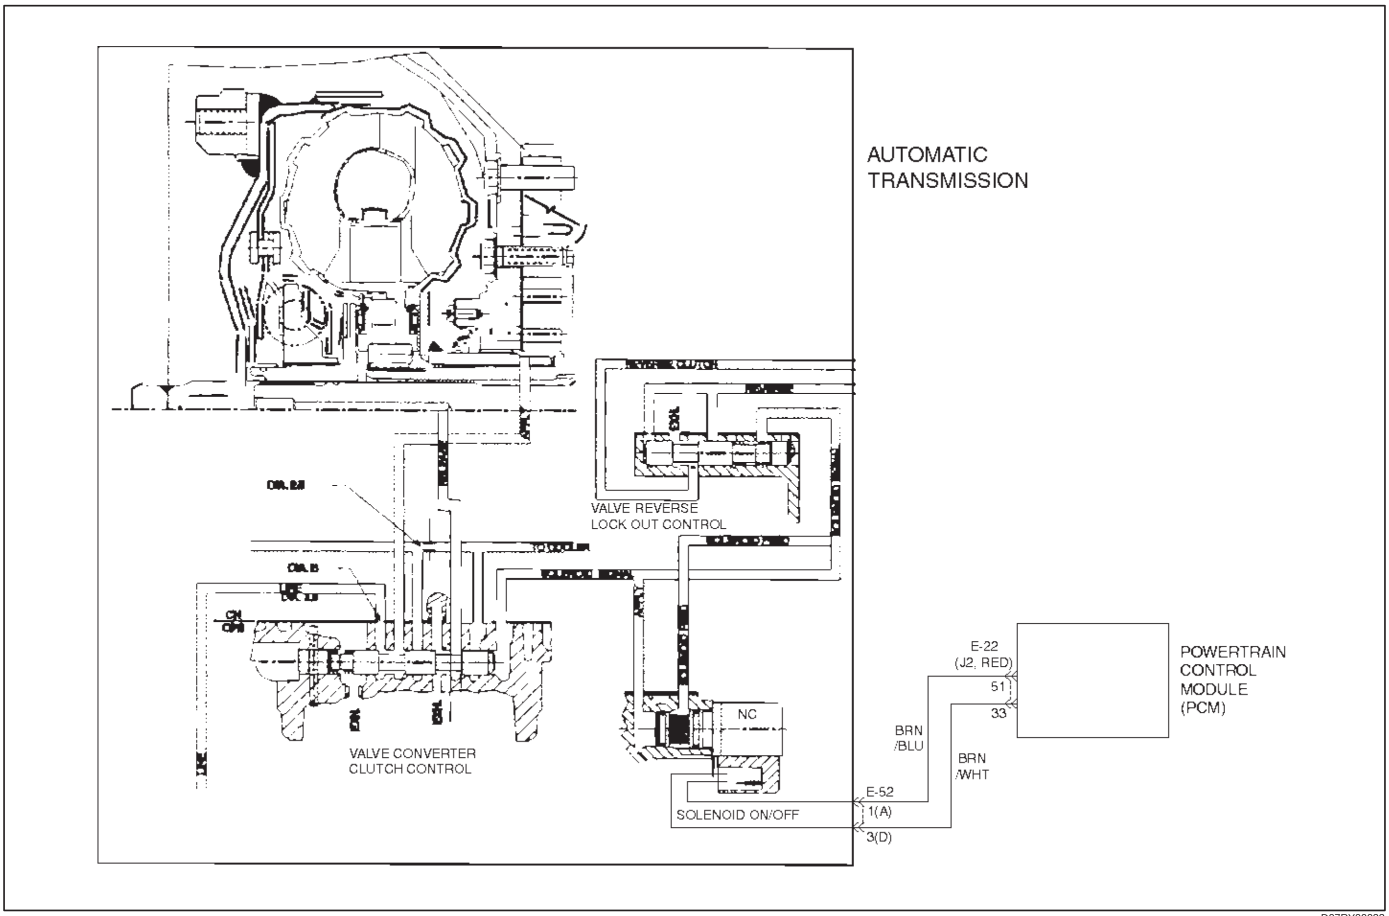
DTC P1860 TCC Solenoid Electrical

Step	Action	Yes	No
1	Were you sent here from the “Powertrain On–Board Diagnostic (OBD) System Check”?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	1. Install the scan tool. 2. With the engine “on”, turn the ignition switch “on”. NOTE: Before clearing DTC(s), use the scan tool to record “Freeze Frame” and “Failure Records” for reference, as data will be lost when the“Clear Info” function is used. 3. Record the DTC “Freeze Frame” and “Failure Records”. Was DTC P1860 set?	Go to Step 3	Go to Step 4
3	Using the J39200 DVOM, back probe between PCM connector terminals J2–51 and J2–33. Is the voltage 0?	Go to Step 5	Go to Step 6
4	1. Apply brake pedal and select transmission range “D”. 2. Do a test drive, and increase the vehicle speed to TCC “on” at 4th. Does the scan tool display DTC P1860 at TCC “ON”?	Go to Step 9	Go to Diagnostic Aids
5	1. Turn the ignition “off”. 2. Disconnect the J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between PCM connector terminals J2–51 and J2–33. Is the resistance within 18 – 20 ohms?	Go to Step 7	Go to Step 8
6	The wiring harness between PCM connector terminal J2–51 and transmission adapter case connector terminal E52–1(A) is shorted to voltage. Was a problem found and corrected?	Go to Step 15	Go to Step 16
7	Intermittent condition. Check the wiring harness and terminals between PCM connector J2 and transmission adapter case connector E–52. Was a problem found and corrected?	Go to Step 15	Go to Step 16
8	1. Disconnect the transmission adapter case connector E–52. 2. Using the J39200 DVOM, measure the resistance between terminal E52–1(A) and ground. Is the resistance within 18 – 20 ohms?	Go to Step 13	Go to Step 14
9	1. Turn the ignition “off”. 2. Disconnect the J2 (RED) PCM connector. 3. Using the J39200 DVOM, measure the resistance between terminals J2–51 and J2–33. Is the resistance within 18 – 20 ohms?	Go to Step 15	Go to Step 10
10	1. Disconnect the transmission adapter case connector E–52. 2. Using the J39200 DVOM, measure the resistance between terminal E52–1(A) and ground. Is the resistance within 18–20 ohms?	Go to Step 11	Go to Step 12
11	The wiring harness between PCM connector J2 and adapter case connector E–52 is shorted to ground. Was a problem found and corrected?	Go to Step 17	—

DTC P1860 TCC Solenoid Electrical (Cont'd)

Step	Action	Yes	No
12	The TCC solenoid is faulty, or the internal wiring harness from the TCC solenoid is shorted to ground. Was a problem found and corrected?	Go to Step 17	—
13	The wiring harness between PCM connector terminal J2–51 and adapter case terminal E52–1(A) is open. Was a problem found and corrected?	Go to Step 17	—
14	The TCC solenoid is faulty, or the internal wiring harness from the TCC solenoid is open. Was a problem found and corrected?	Go to Step 17	—
15	Check every connection at the PCM. If OK, replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30–E) section. Is the replacement complete?	Go to Step 17	—
16	Check the PCM connector terminal J2–51, and transmission adapter case connector terminal E52–1(A). Was a problem found and corrected?	Go to Step 17	—
17	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: ● The TCC solenoid is commanded "on" and the volts increase to B+. ● The TCC solenoid is commanded "off" and the volts drop to zero. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P1870 Transmission Component Slipping (TCC Stuck Off)



Circuit Description

The PCM monitors the difference in engine speed and transmission output speed. In D3 drive range with the TCC engaged, the engine speed should closely match transmission output speed.

This DTC detects excessive TCC slip when the TCC is engaged. This is a type "B" DTC.

Conditions For Setting The DTC

The following conditions are met for three TCC cycles with reported excessive TCC slip conditions.

- No OSS DTCs P0722 or P0723.
- No shift solenoid A DTCs P0751 or P0752 or P0753.
- No shift solenoid B DTCs P0756 or P0757 or P0758.
- No TCC solenoid DTCs P0742 or P1860 or P1870.
- Engine speed is between 1000 and 3500 rpm for 0.5 seconds.
- Engine vacuum is between 0 and 70 kPa.
- Gear range is D4.
- TP angle is greater than 10%.
- TFT is between 20° and 150°C (68° and 302°F).
- TCC slip speed is between 250 rpm and 800 rpm for 3 times 7 seconds.
- Vehicle speed is between 25 km/h (15 mph) and 255 km/h (158 mph).
- Speed ratio is between 0.6 and 0.95.
- 13% < TPS < 99%
- 50 < Engine Torque < 300 N·m
- Low (0.8) < TCC capacity < hi (0.99) for 5 seconds.

Action Taken When The DTC Sets

- Only stored in memory.
- For lamp illuminate refer to DTC type definition (TYPE B).

Conditions For Clearing The MIL/DTC

- The PCM will turn off the MIL and CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Range switch malfunction could set a DTC P1870.
- A mechanical failure of the shift solenoids, TCC solenoid, or TCC PWM solenoid could set a DTC P1870.

- Internal transmission failures may set a DTC P1870.
- An intermittent or incorrect engine speed signal may set a DTC P1870.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the indicated range signal to the actual selected range. A faulty switch could set a DTC P1870.
3. This test checks the torque converter for slippage while in a commanded lockup state.

Range Switch Logic Table

Range Position	Range Switch Pin			
	A	B	C	P(G)
Park	ON	OFF	OFF	ON
Reverse	ON	ON	OFF	OFF
Neutral	OFF	ON	OFF	ON
D4	OFF	ON	ON	OFF
D3	ON	ON	ON	ON
2	ON	OFF	ON	OFF
L	OFF	OFF	ON	ON
Illegal	OFF	OFF	OFF	OFF
Illegal	OFF	OFF	OFF	ON

DTC P1870 Transmission Component Slipping (TCC Stuck Off)

Step	Action	Yes	No
1	Were you sent here from the "Powertrain On–Board Diagnostic (OBD) System Check"?	Go to Step 2	Go to OBD System Check Refer to Driveability and Emission in Engine section
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Freeze Frame" and "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Freeze Frame" and "Failure Records". 4. Apply the brake pedal. 5. Select each transmission range: D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the scan tool "TR Switch" display?	Go to Step 3	Go to "Range Switch Logic Table"
3	Drive the vehicle in 4th gear while the TCC is engaged. At any time is the "TCC Slip Speed" greater than 130 rpm for 8 seconds while the TCC is engaged?	Go to System Diagnosis Charts	Go to Diagnostic Aids

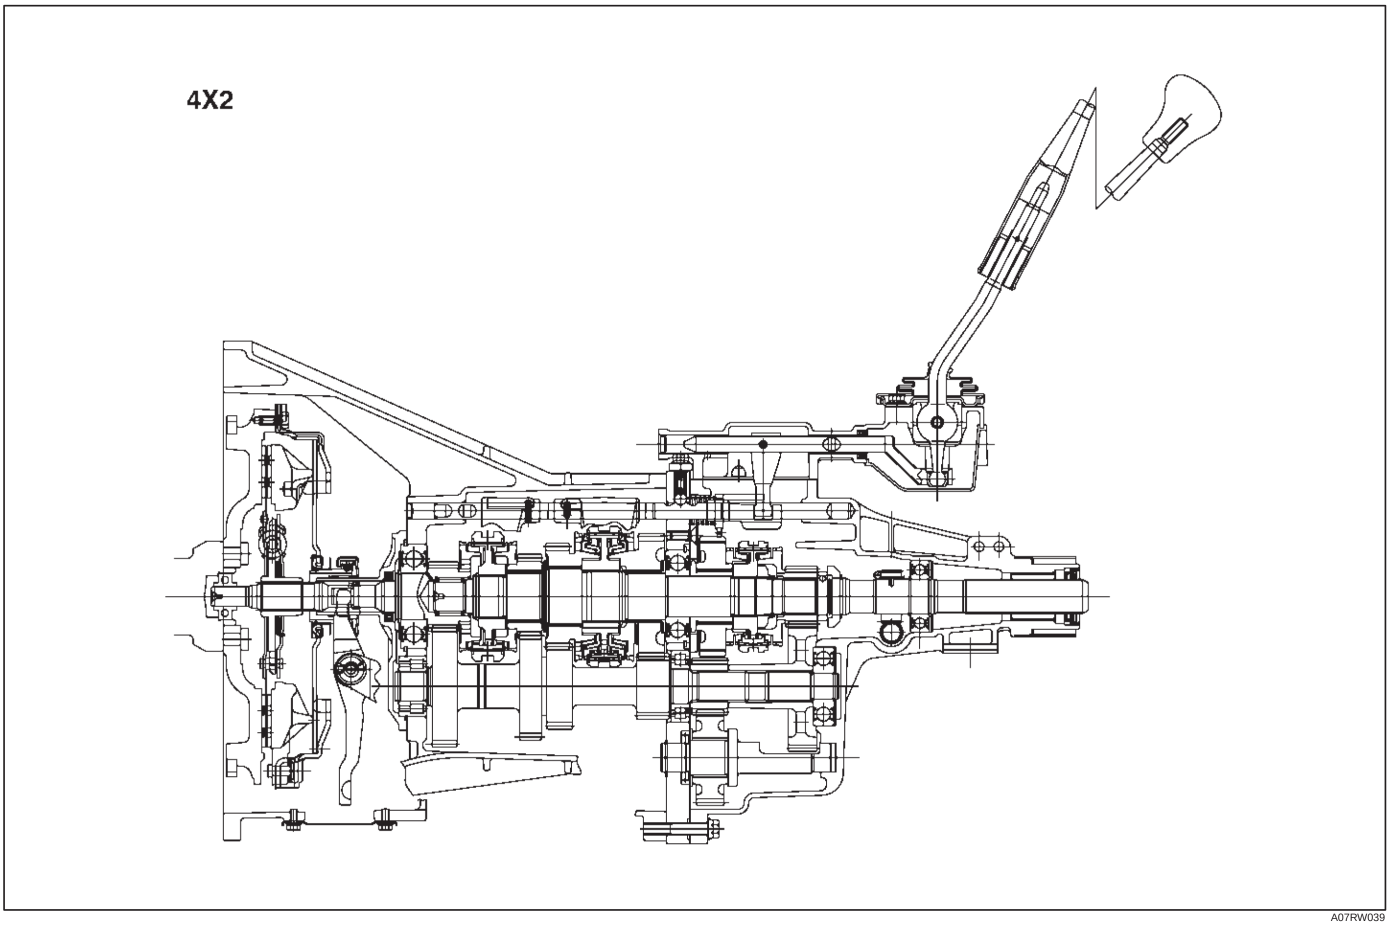
CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

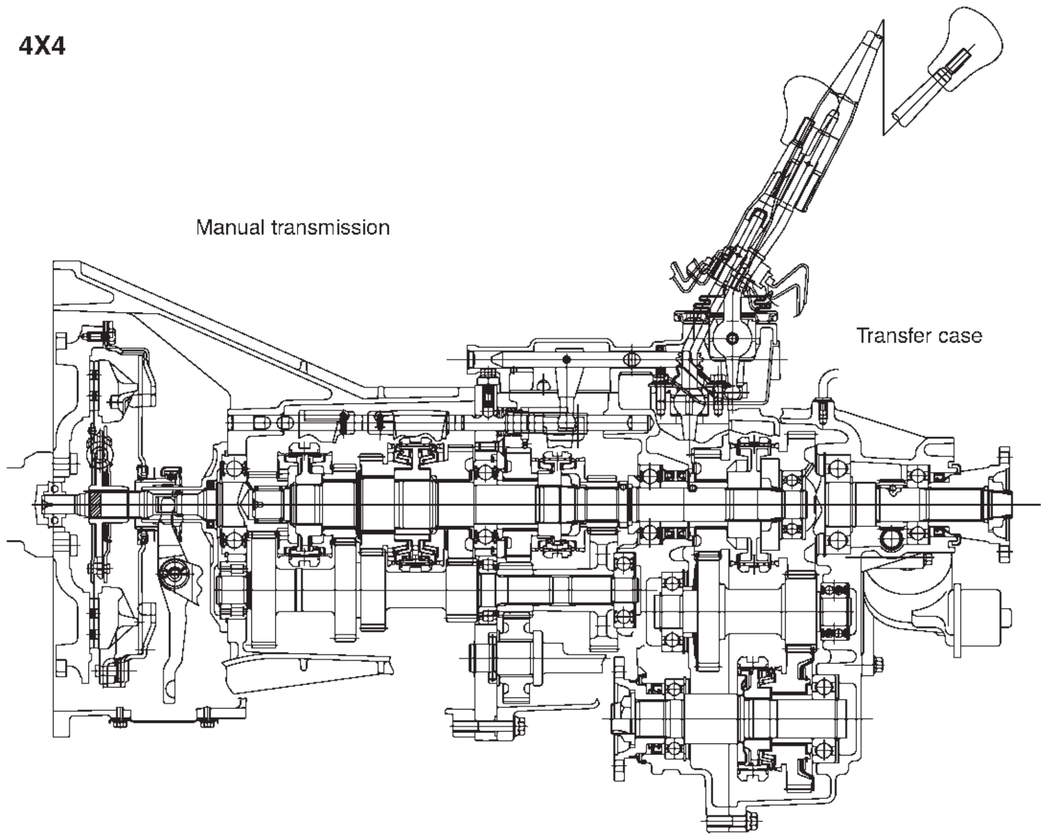
CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description



A07RW039

4X4



A07RW040

The MUA5C is a constant mesh transmission, synchronized in all speeds. The transmission is designed for a great reduction of the shift effort and the quietest possible operation.

Principle parts of the transmission are the integral clutch housing, intermediate plate, the transfer case, the rear cover, and the gears.

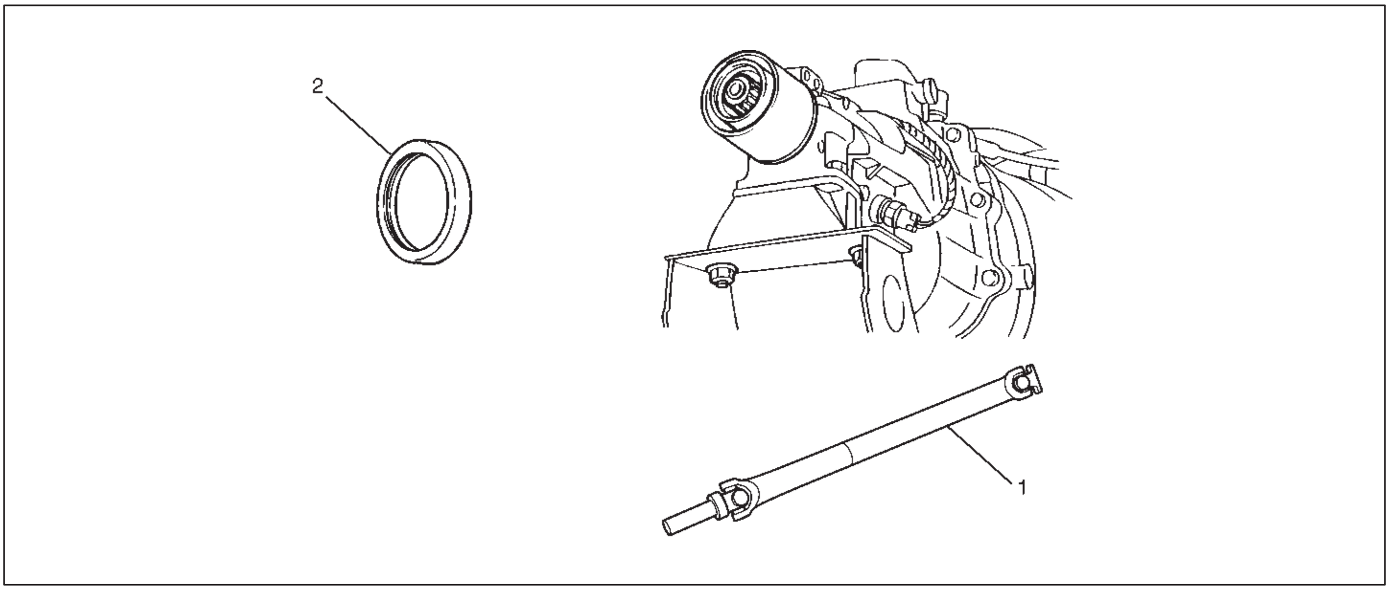
The transmission control box and transfer control box are built into the transmission and transfer case.

Diagnosis

Condition	Possible cause	Correction
Abnormal noise	Flywheel pilot bearing worn	Replace
	Bearings worn or broken (Mainshaft, counter shaft, and transfer shaft)	Replace
	Gear tooth contact surfaces worn or scuffed (Mainshaft, counter shaft, reverse idler gear and transfer gears)	Replace
	Splines worn (Mainshaft, synchronizer clutch hub)	Replace
	Gear or bearing thrust face seized	Replace
	Lack of backlash between meshing gears	Replace
Hard Shifting	Improper clutch pedal free play	Readjust
	Change lever sliding portions worn	Repair or replace Regrease
	Shift block, shift rod and/or control box sliding faces worn	Replace
	Shift arm and synchronizer sleeve groove worn	Replace worn parts
	Thrust washer, collar, and/or gear thrust faces worn (Mainshaft and counter shaft thrust play)	Replace worn parts
	Synchronizer parts worn	Replace
Walking or Jumping out of gear	Detent ball worn	Replace
	Detent spring weakened or broken	Replace
	Shift rod and/or control box sliding faces worn	Replace
	Shift arm and synchronizer sleeve groove worn	Replace worn parts
	Thrust washer, collar, and/or gear thrust faces worn (Mainshaft and counter shaft thrust play)	Replace worn parts
	Bearings worn or broken	Replace
	Splines worn (Mainshaft, synchronizer hub)	Replace
	Synchronizer spring weakened or broken	Replace
Oil leakage	Loose drain plug(s) and/or filler plug(s)	Tighten Replenish oil
	Defective or improperly installed gasket(s)	Replace
	Oil seal worn or scratched	Replace

Rear Oil Seal (4X2)

Disassembled View



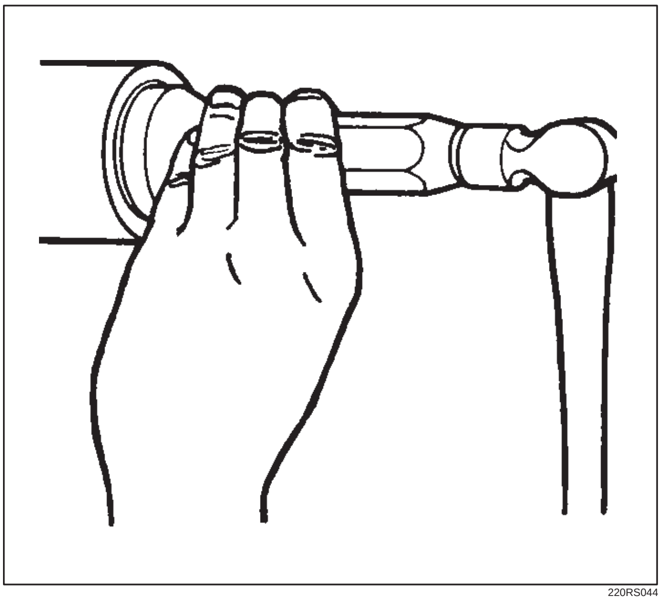
Legend
(1) Rear Propeller Shaft
(2) Rear Oil Seal

Removal

1. Raise and support vehicle with suitable jack stands.
2. Remove propeller shaft flange yoke bolts and nuts at the differential side.
   Remove propeller shaft from the transmission main shaft spline.
3. Use a screwdriver to pry the rear oil seal from the rear cover.

Installation

1. Install a new oil seal(2) or (3) using the installer J–29769.



2. Insert the splined yoke into the transmission mainshaft spline.
3. Install the propeller shaft flange yoke to the drive pinion flange.

Torque: 63 N·m (46 lb ft)

4. Check transmission fluid level.
5. Lower vehicle.

Transmission

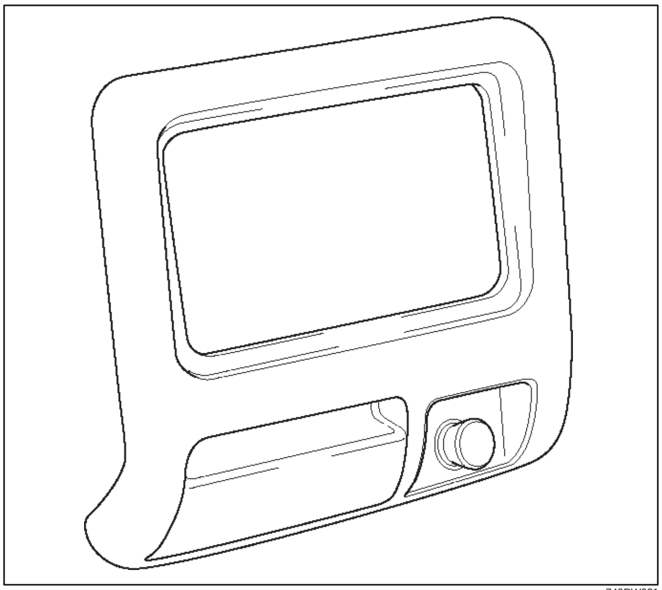
Removal

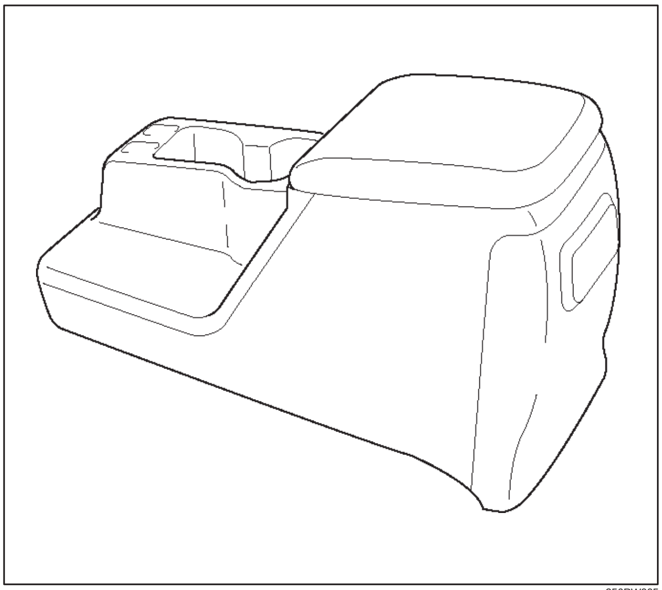
NOTE: Befor removing transmission assembly(4X4) from vehicle, change the transfar mode to 2WD using the 4WD push button on dash panel.

1. Disconnect battery ground cable.
2. Remove gear control lever knob(1).
3. Remove transfer control lever knob(2) (4X4).
4. Remove lower cluster assembly.



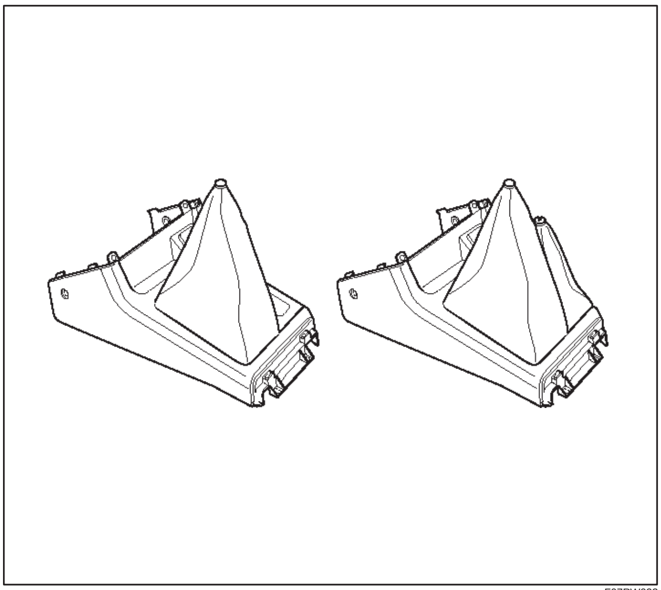
740RW021

5. Remove rear console.



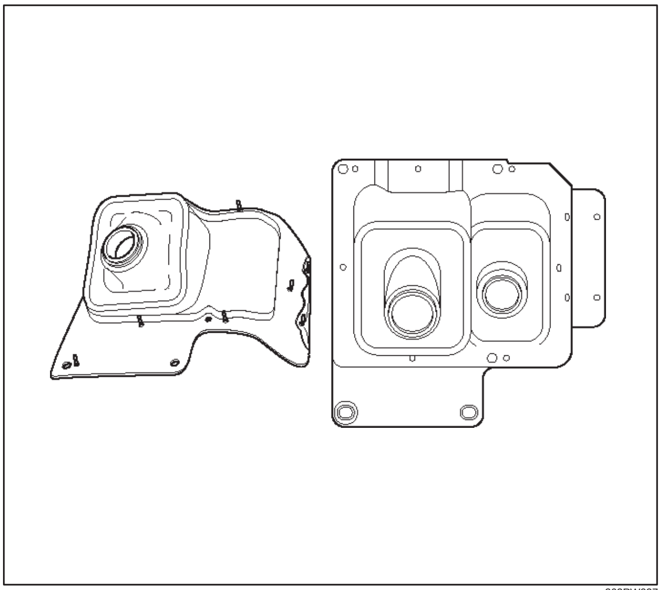
256RW005

6. Remove center console(3).



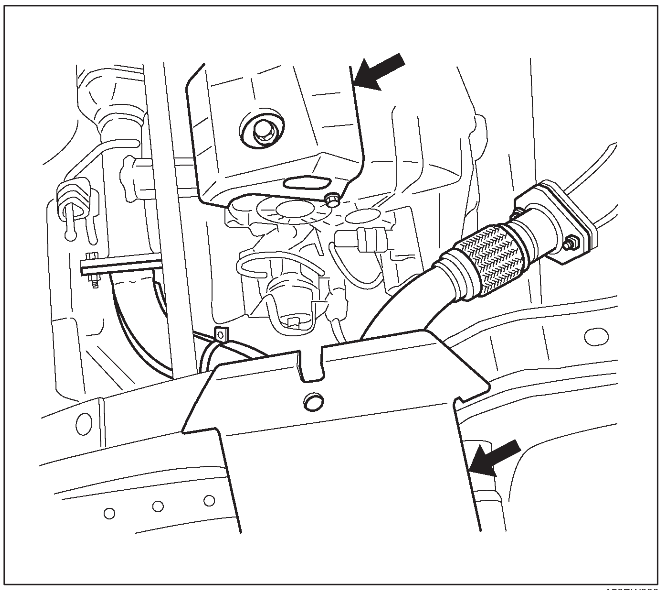
F07RW023

7. Remove grommet assembly(4).



262RW027

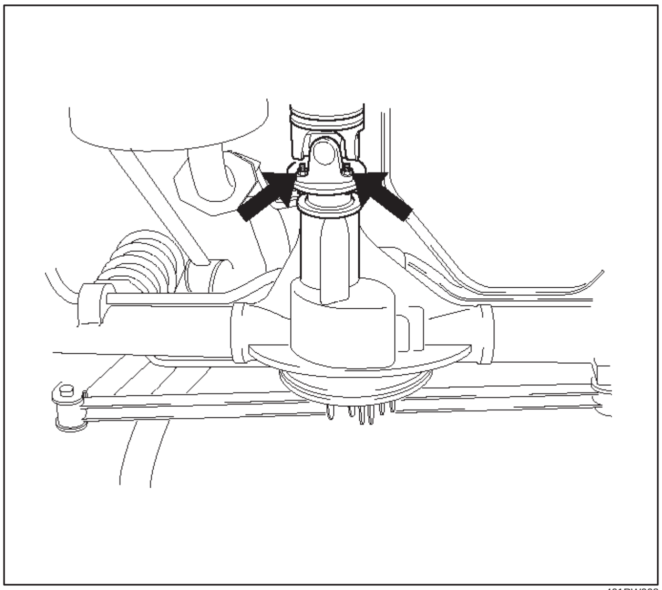
8. Remove gear control lever(5) and transfer control lever(5) (4X4).
9. Raise and support vehicle with suitable stands.
   Remove transfer protector(6) (4X4) and fairing plate(7).



150RW006

10. Remove rear propeller shaft(8).

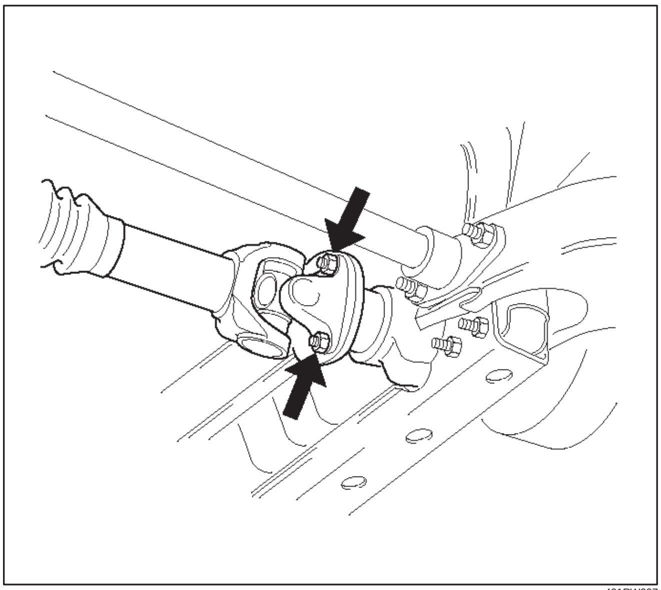
NOTE: Apply alignment marks on the flange at both front and rear sides.



401RW008

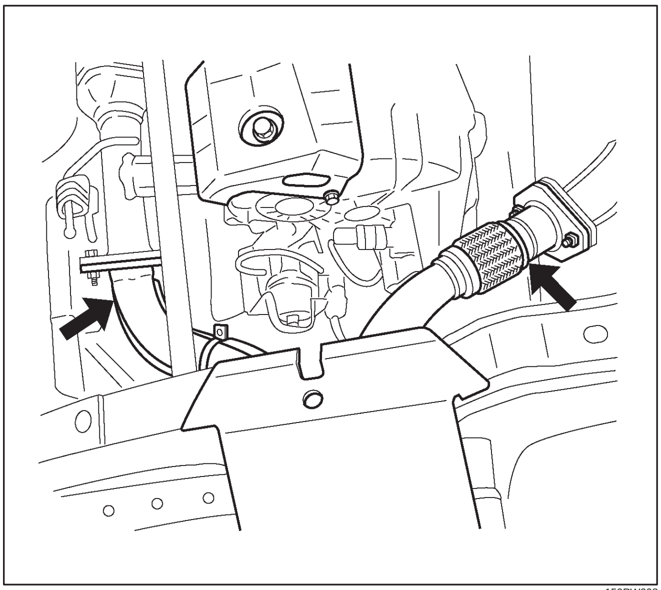
11. Remove front propeller shaft(9) (4X4).

NOTE: Apply alignment marks on the flange at both front and rear sides.



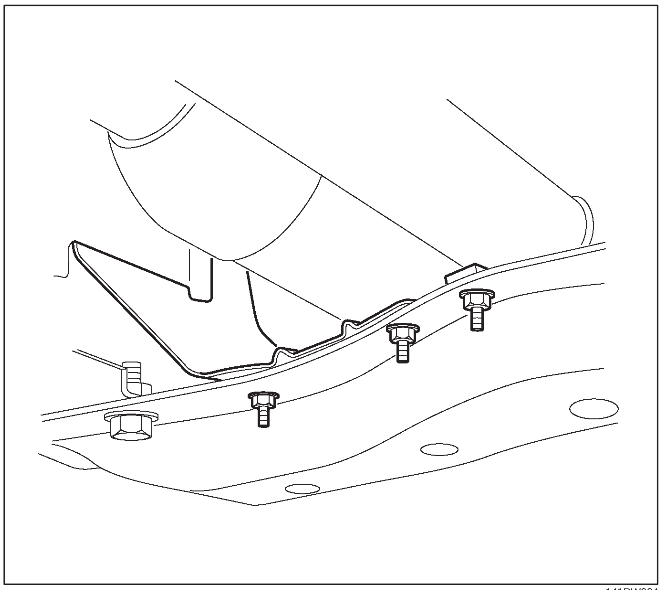
401RW007

12. Remove center exhaust pipe(10) (6VD1 engine).



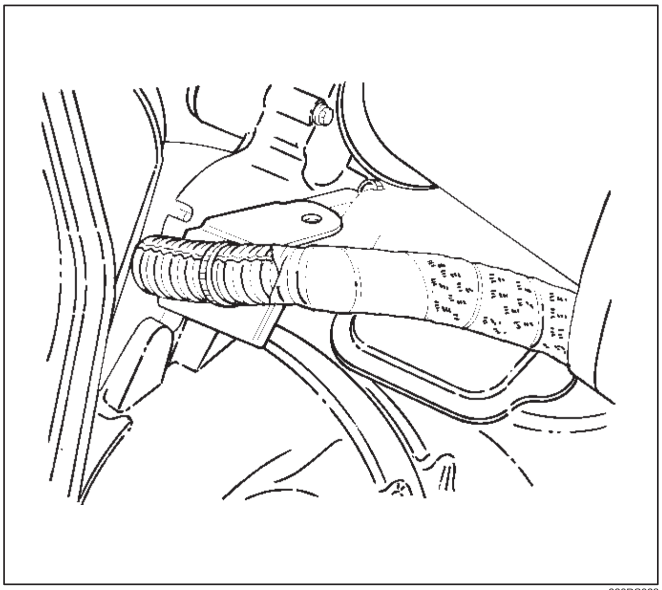
150RW008

13. Remove fuel pipe heat protector(11) and clip.



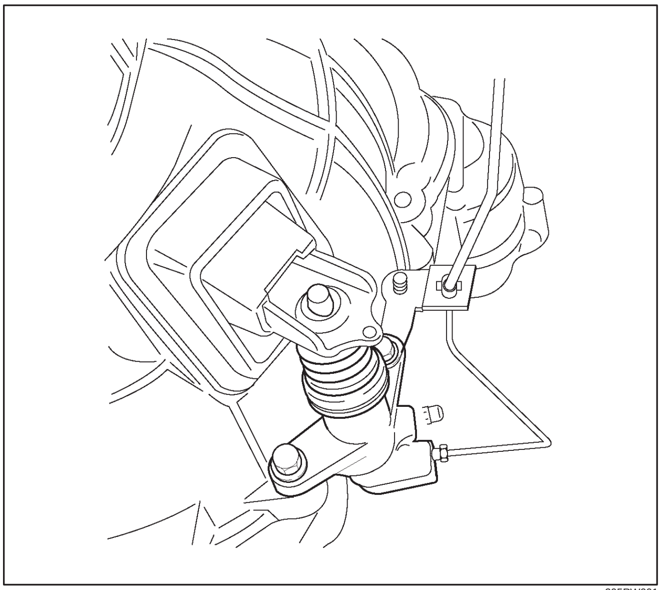
141RW004

14. Disconnect transmission harness connectors and clip.
    Connector: Transfer switch (4X4), 2–4 actuator (4X4), speed sensor, back up switch 1–2 and 3–4 indicator switch.
15. Remove transmission harness clamps(12) from the transmission case and bracket.



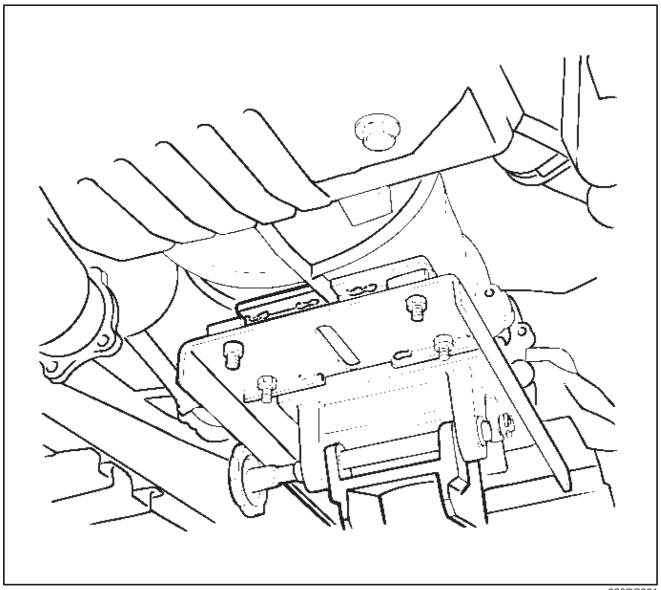
220RS028

16. Remove harness heat protector(13) (6VD1 engine).
17. Remove slave cylinder(14) and flexible hose fixing bracket (X22SE engine).



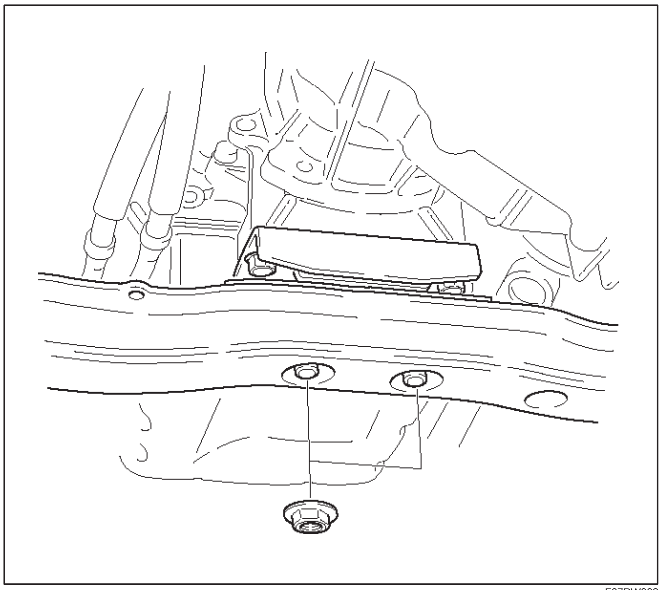
205RW001

18. Remove dust covers(15) (6VD1 engine).
19. Support transmission with a transmission jack.

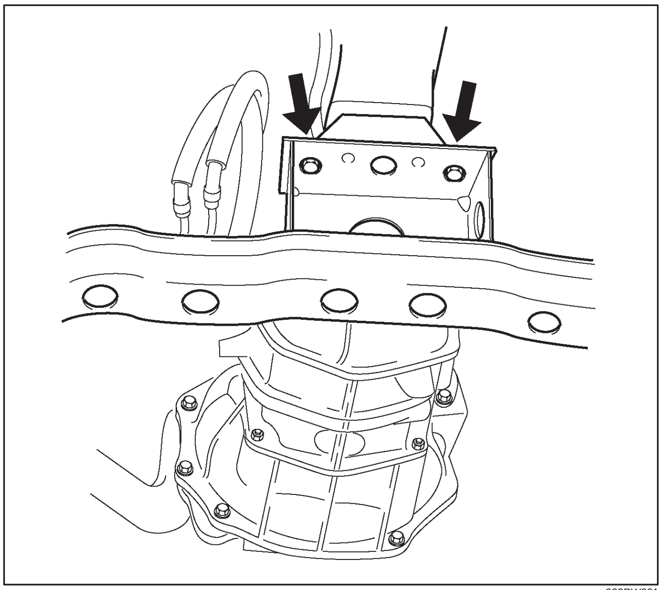


220RS001

20. Remove engine rear mount nuts(16) from third crossmember.

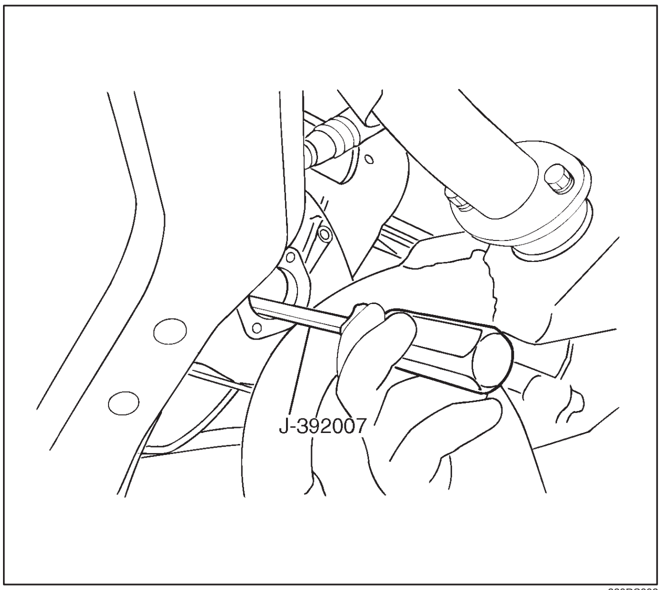


F07RW008



022RW001

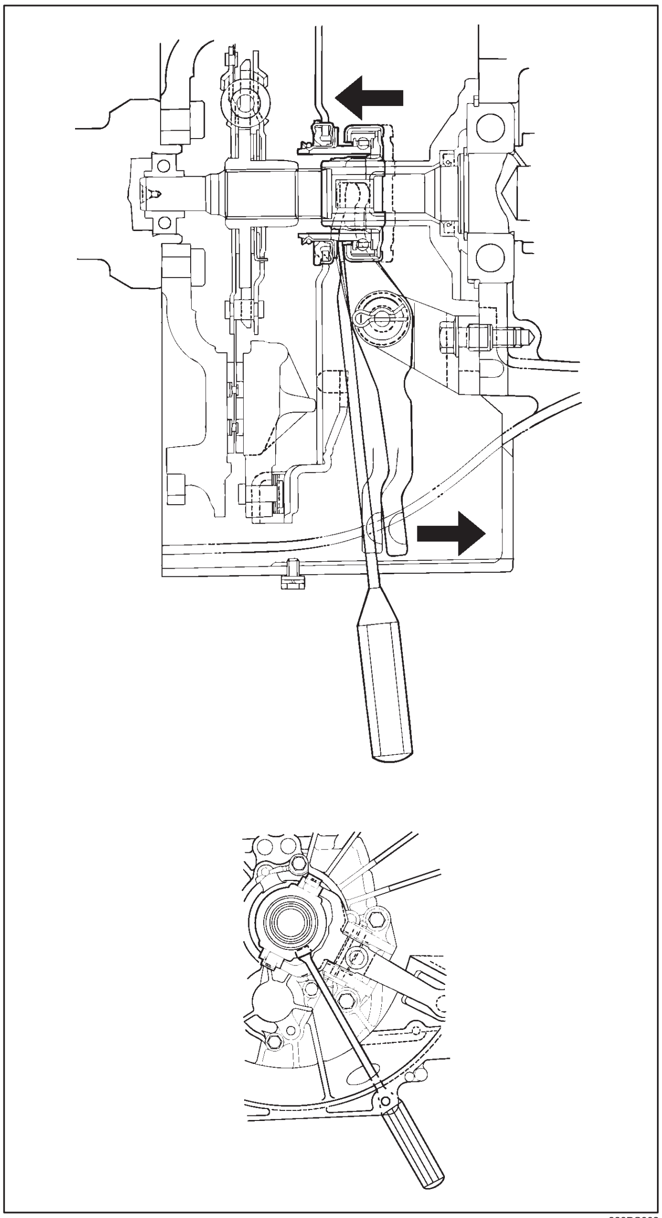
21. Remove third crossmember(17) by removing six fixing bolts.
22. Remove starter(18) (6VD1 engine).
23. Remove flywheel under cover(19). 6VD1 engine:3 pieces, X22SE engine:1 piece.
24. Use clutch release bearing remover J–39207 to disconnect the clutch release bearing from the clutch pressure plate (6VD1 engine).



220RS002

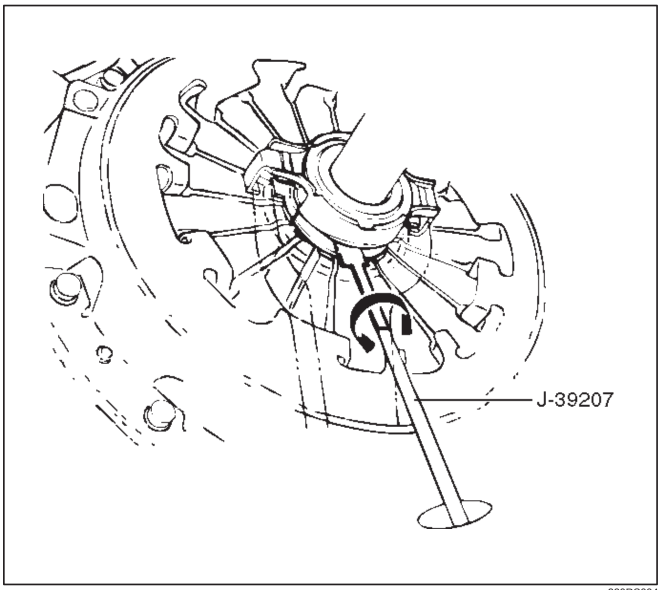
25. Pull the shift fork toward the transmission to press the clutch release bearing against the clutch (6VD1 engine).
26. Insert the clutch release bearing remover between the wedge collar and the release bearing (6VD1 engine).

NOTE: Be sure not to insert the remover between the wedge collar and the clutch.



220RS003

27. Turn the remover to separate the release bearing (6VD1 engine).

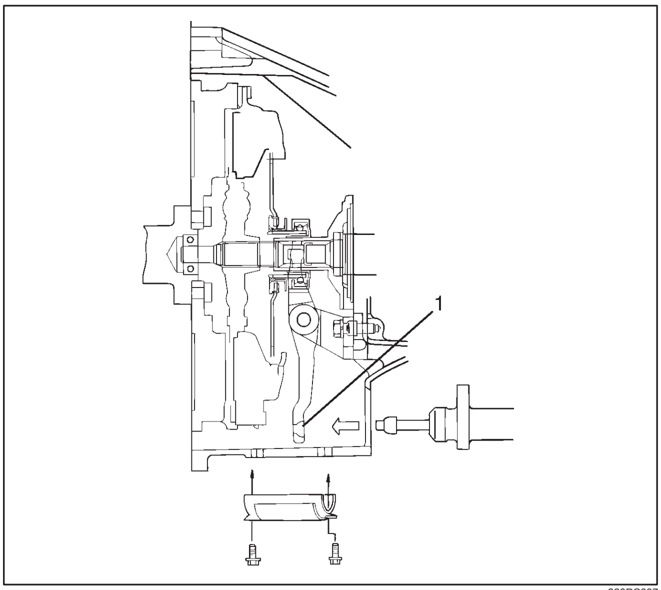


220RS004

28. Remove transmission retaining nuts and bolts(20). Remove transmission(21) from the vehicle.

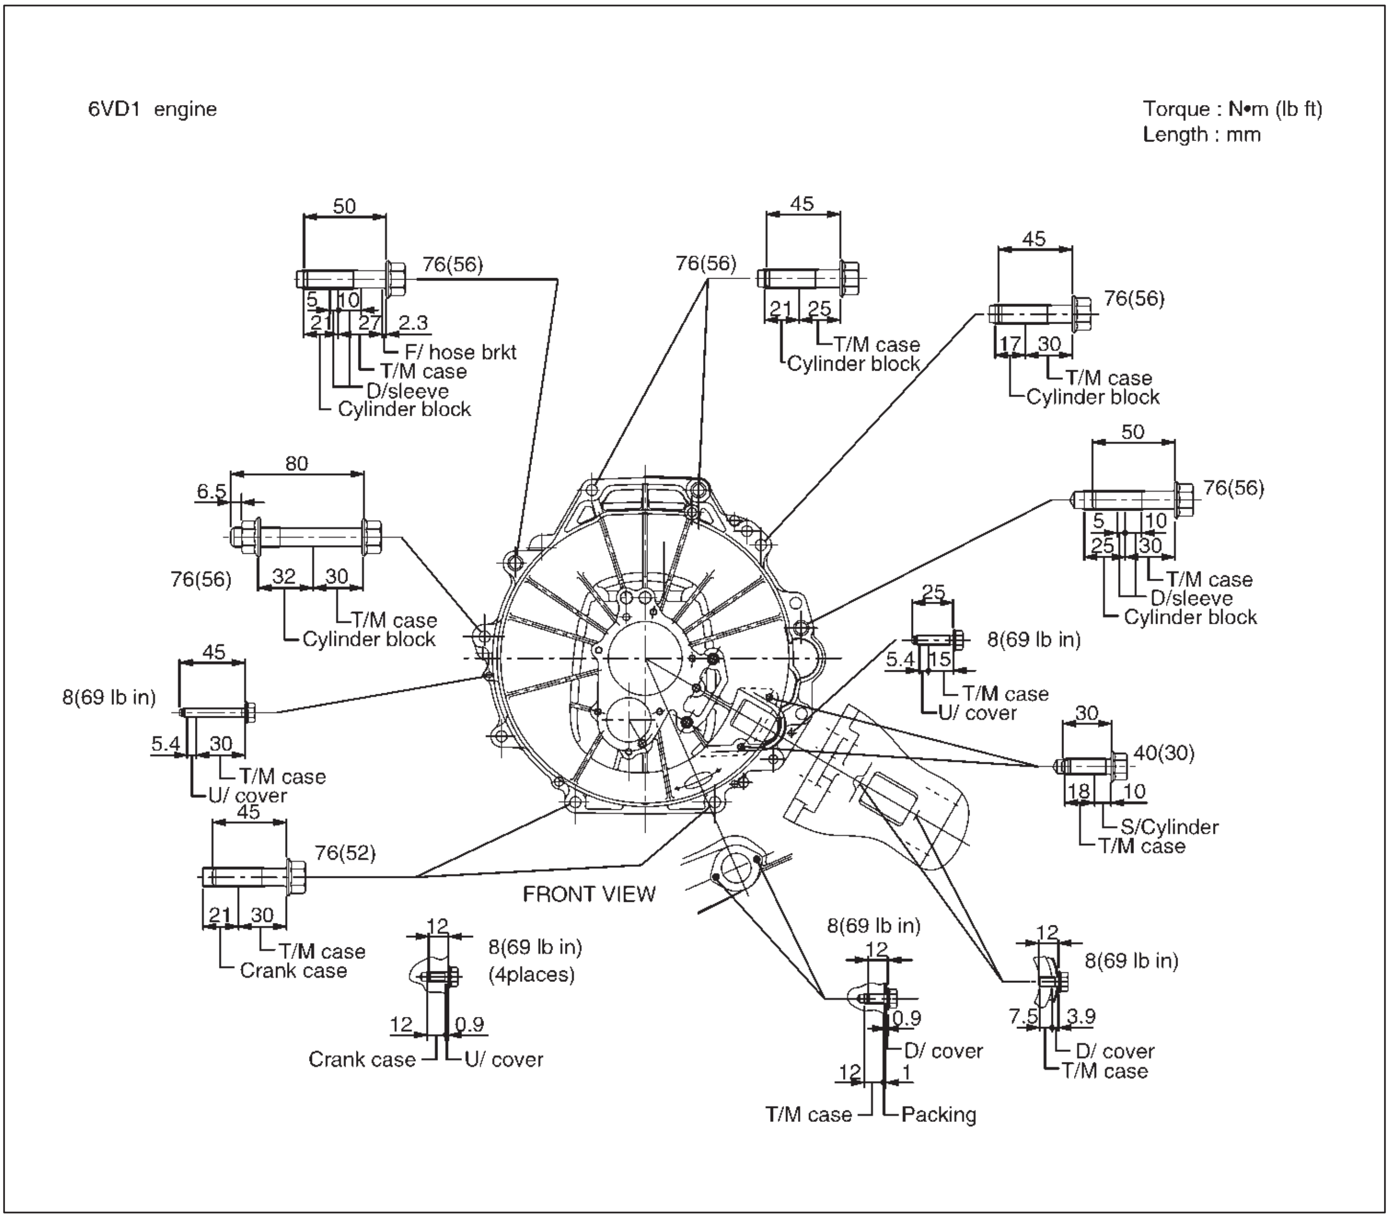
Installation

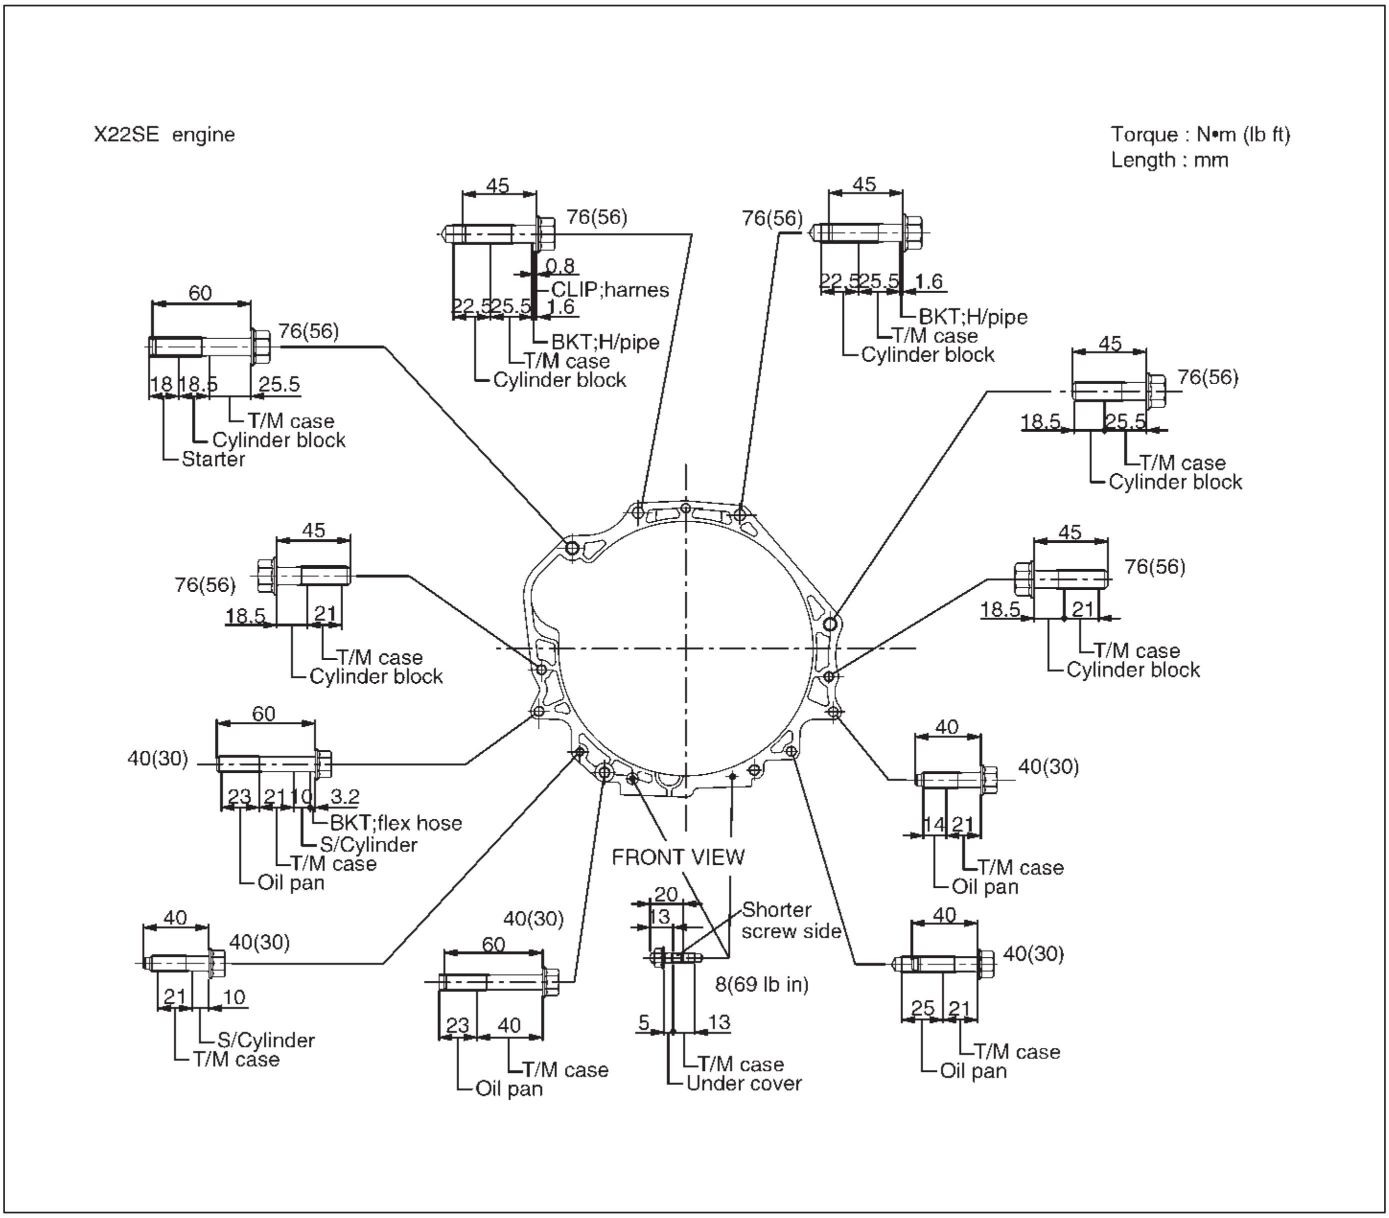
1. Apply a thin coat of molybdenum disulfide grease to the top gear shaft spline.
2. Slowly operate the transmission jack until the front of transmission is aligned with the rear of the engine. The slope of the engine and the transmission must be the same.
3. Align the top gear shaft spline with the clutch driven plate spline.



220RS007

4. Install the transmission to the engine.
   Tighten the transmission nuts and bolts as shown in the figure.

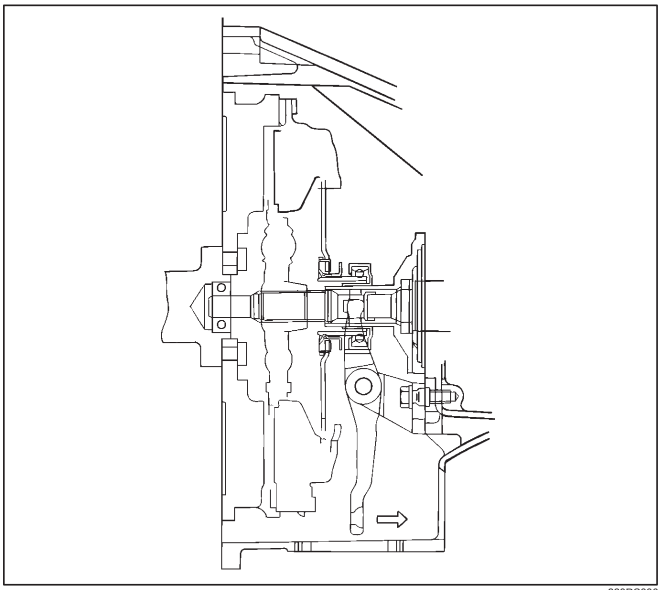




5. Apply a force of 59 – 78 N (13.2 – 17.6 lb) to the tip of the shift fork in the direction of the transmission to engage the clutch pressure plate and release bearing.

NOTE: A click sound is heard when the release bearing and the tip of the diaphragm spring engage each other.

Check to see if they are securely engaged by pushing the tip of the shift fork toward the engine side while applying a force of about 25 N (5.5 lb). If the shift fork will not move, then they are securely engaged.



220RS006

6. Install flywheel under cover(19). 6VD1 engine 3 pieces, HEC engine 1 piece.

Torque: 8 N·m (69 lb in)

7. Install starter(18).

Torque: 40 N·m (30 lb ft)

8. Install third crossmember(17).

Torque: 50 N·m (37 lb ft)

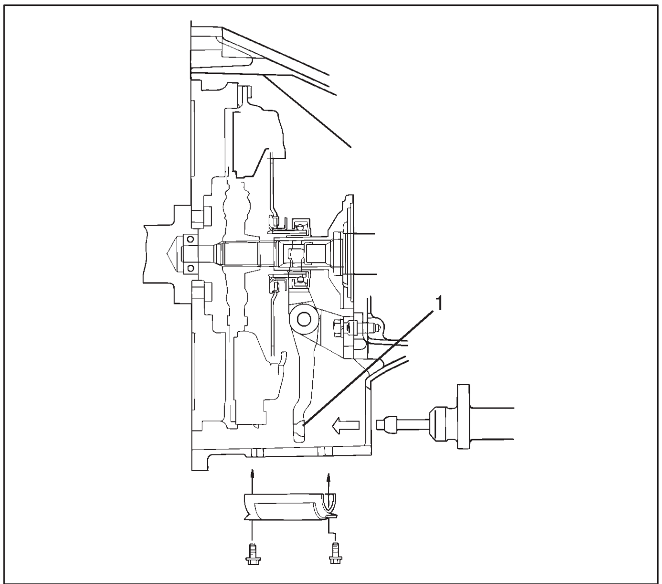
9. Install engine rear mount nuts(16).

Torque: 40 N·m (30 lb ft)

Remove the transmission jack from transmission side.

10. Apply grease to top hole portion of the shift fork.
Install slave cylinder(14) and flexible hose fixing bracket (X22SE engine).

Torque: 43 N·m (32 lb ft)



220RS007

Legend

(1) Apply Grease

11. Install clutch dust covers(15) to clutch housing (6VD1 engine).

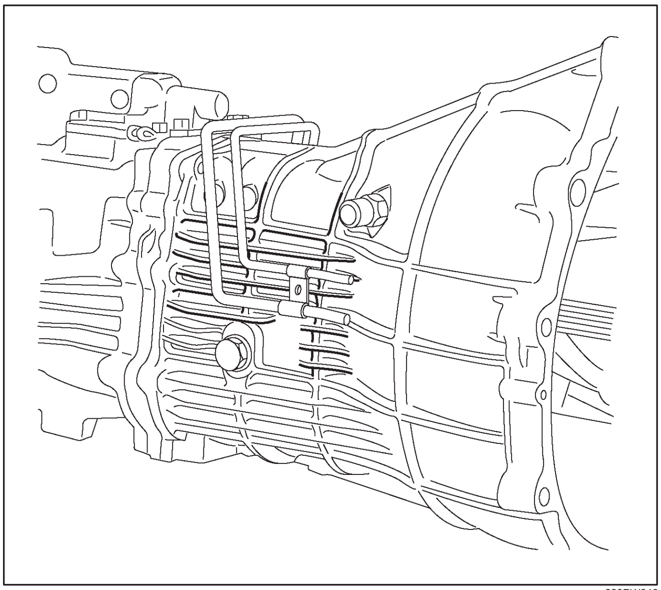
Torque: 6 N·m (52 lb in)

12. Connect transmission harness connectors and clip.
Connector: transfer switch (4X4), 2–4 actuator (4X4), car speed sensor, 1–2 and 3–4 indicator switch.

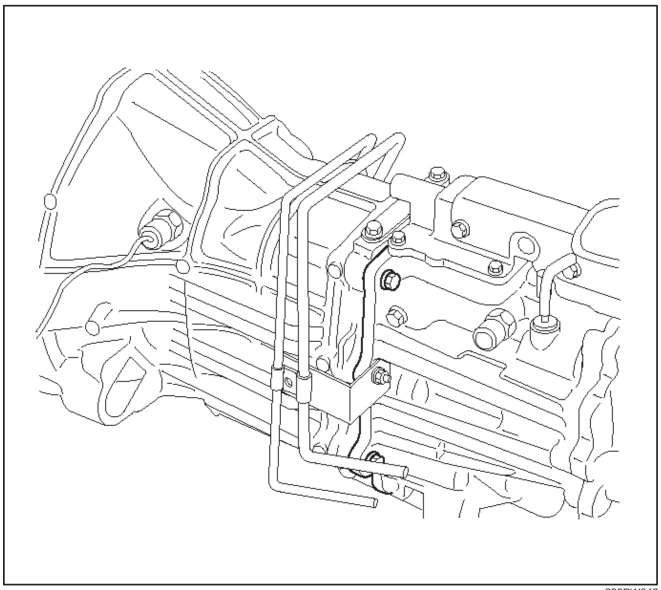
13. Install bracket and transmission harness clamps(12) to the transmission case.

14. Install harness heat protector(13) (6VD1 engine).

15. Connect fuel pipe to transmission side.

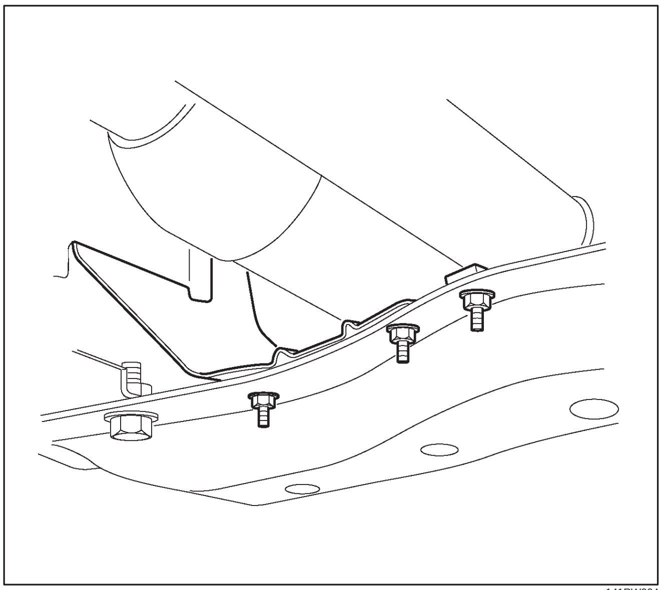


220RW046



220RW047

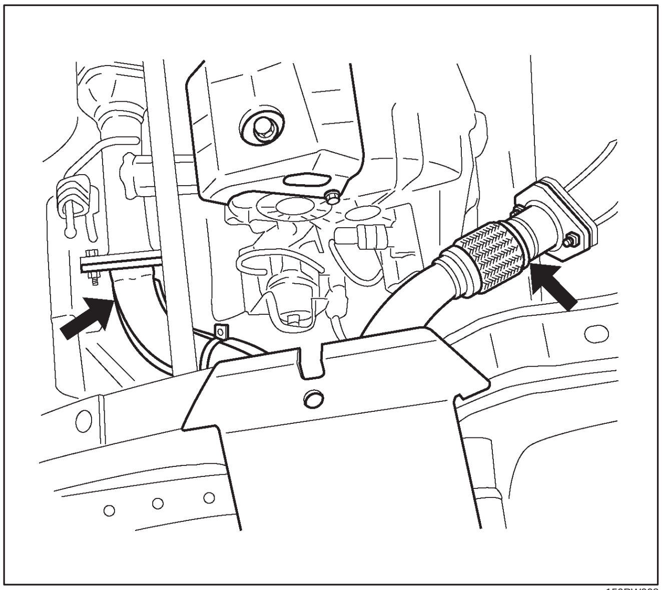
16. Install fuel pipe heat protector(11) and clip.



141RW004

17. Install center exhaust pipe(10) (6VD1 engine).

Torque: 43 N·m (32 lb ft)

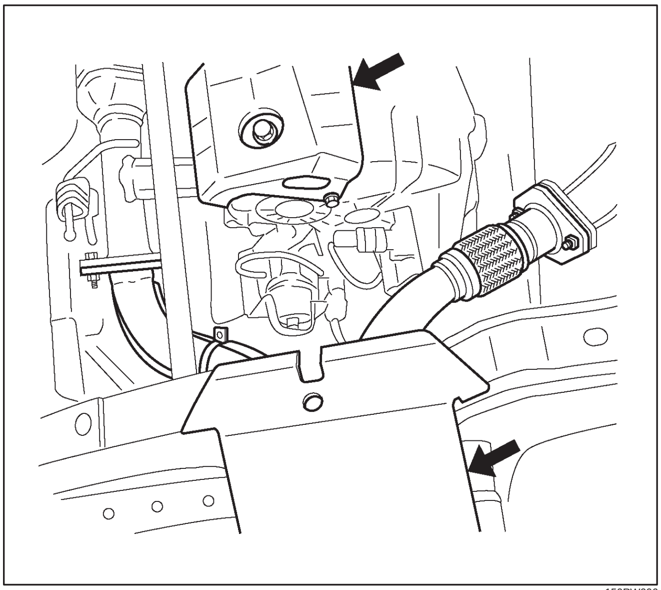


150RW008

18. Install front(9) (4X4) and rear propeller shaft(8).

Torque: 63 N·m (46 lb ft)

19. Install transfer protector(6) (4X4) and fairing plate(7). Lower the vehicle.



150RW006

20. Install gear control lever(5) and transfer control lever(5) (4X4).
21. Install grommet assembly(4).
22. Install center console(3), rear console and lower cluster assembly.
23. Install transfer control lever knob(2) (4X4) and gear control lever knob(1).
24. Connect battery ground cable.

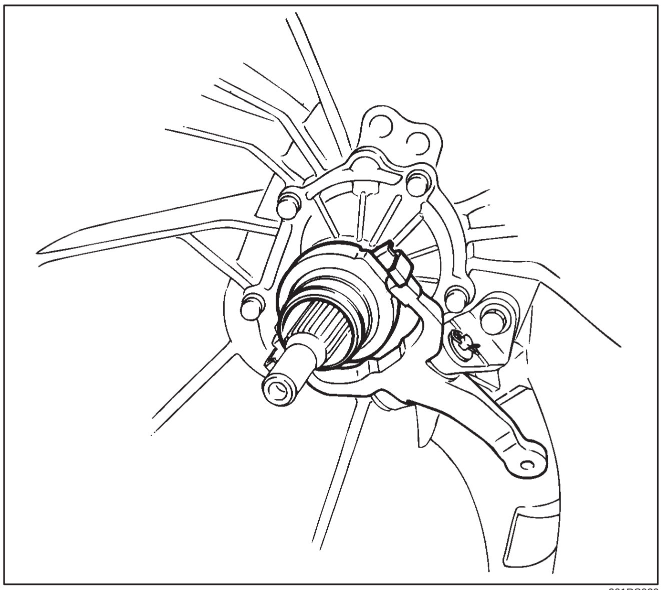
(10) 1–2 and 3–4 Indicator Switch, Pin, and Ball
(11) Intermediate Plate with Gear Assembly
(12) Transmission Case

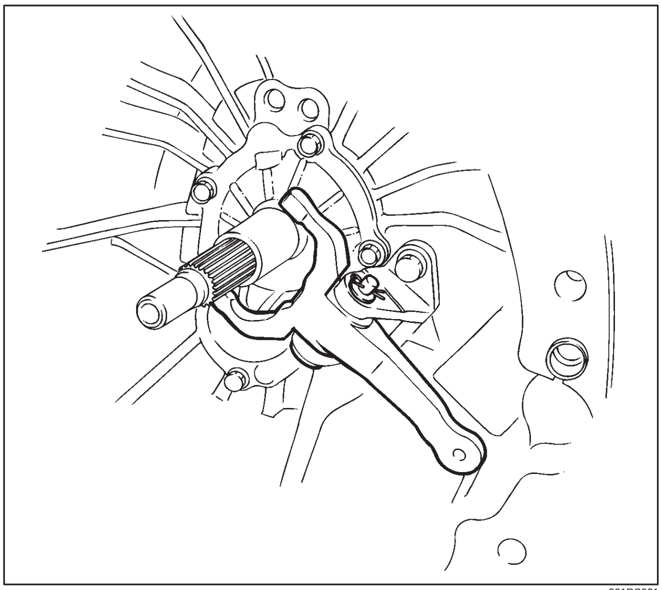
Disassembly

1. Clean the exterior of the unit with solvent.
2. Remove the drain plug from the transmission case and drain the lubricant.
3. Remove the clutch release bearing(1) from the transmission case.



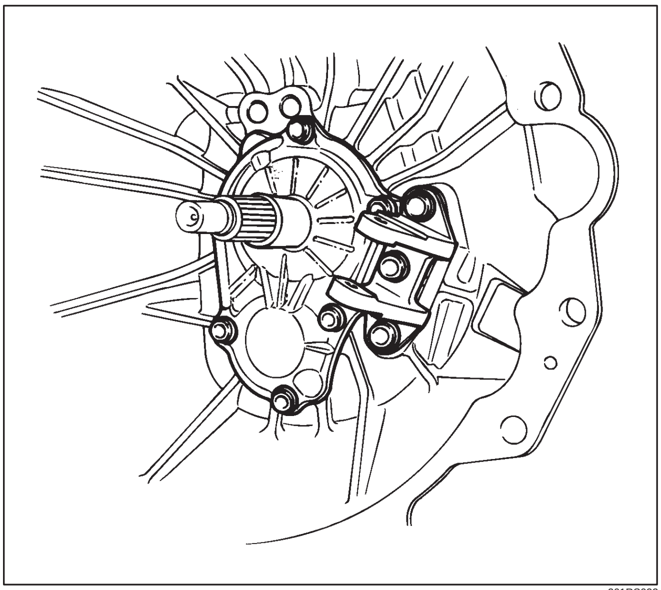
201RS020

4. Remove the snap pin.
   Remove the shift fork pin and shift fork(2) from the fulcrum bridge.



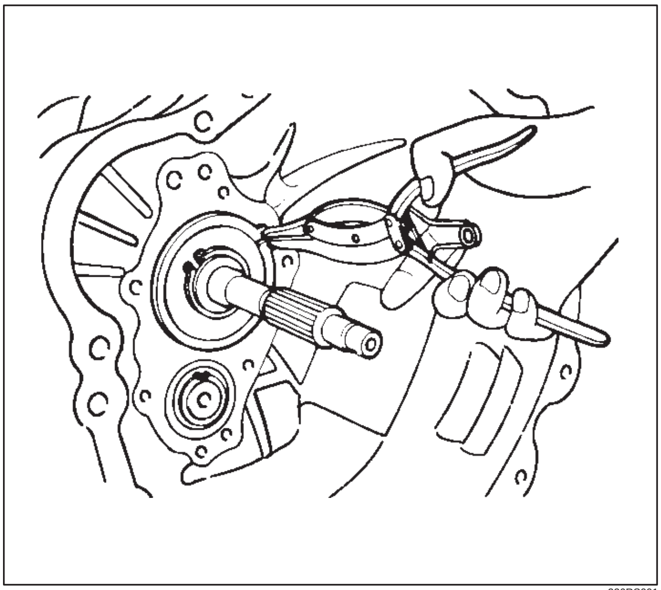
201RS021

5. Remove the fulcrum bridge bolts.
   Remove the fulcrum bridge(3) from the transmission case.
   Remove the front cover(4) and gasket from the transmission case.



201RS022

6. Remove snap ring(5) fixing counter front bearing.
7. Use a pair of snap ring pliers to remove the snap ring(6) fixing top gear bearing.



226RS001

8. Remove the speedometer sensor(7).
   Remove the plate(7).
   Remove the driven gear bushing and driven gear(7).

NOTE: Apply a reference mark to the driven gear bushing before removal.

9. Remove gear control box assembly(8).
10. Remove the rear cover assembly from the transmission case.
11. Remove 1–2 and 3–4 indicator switch(10), pin(10) and ball(10).
    Remove intermediate plate with gear assembly(11) from transmission case(12).

Reassembly

1. Apply recommended liquid gasket (LOCTITE 17430) or its equivalent to the transmission case(12), intermediate plate(11) and rear cover(9) fitting surfaces.
2. Install the intermediate plate with gear assembly(11) to the transmission case(12).
   Pull out the top gear shaft until the ball bearing snap ring groove protrudes from the transmission case front cover fitting face.
   Avoid subjecting the mainshaft to sudden shock or stress.
3. Tighten the transmission rear cover bolts to the specified torque.

   Torque: 37 N·m (27 lb ft)

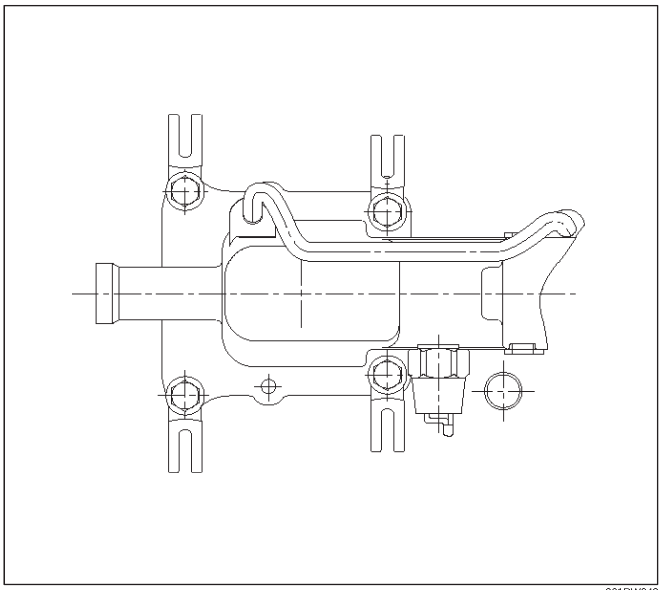
NOTE:

Notes When Tightening the Bolt:

- After cleaning the bolt hole, dry it thoroughly with air.
- After cleaning the screw face of a removed bolt or new one, dry it thoroughly. Apply recommended liquid gasket (LOCTITE 242) or its equivalent before tightening it.

4. Install a new gasket and gear control box assembly(8).
   Install the harness clips and brackets and then tighten four new gear control box bolts to the specified torque.

   Torque: 20 N·m (14 lb ft)



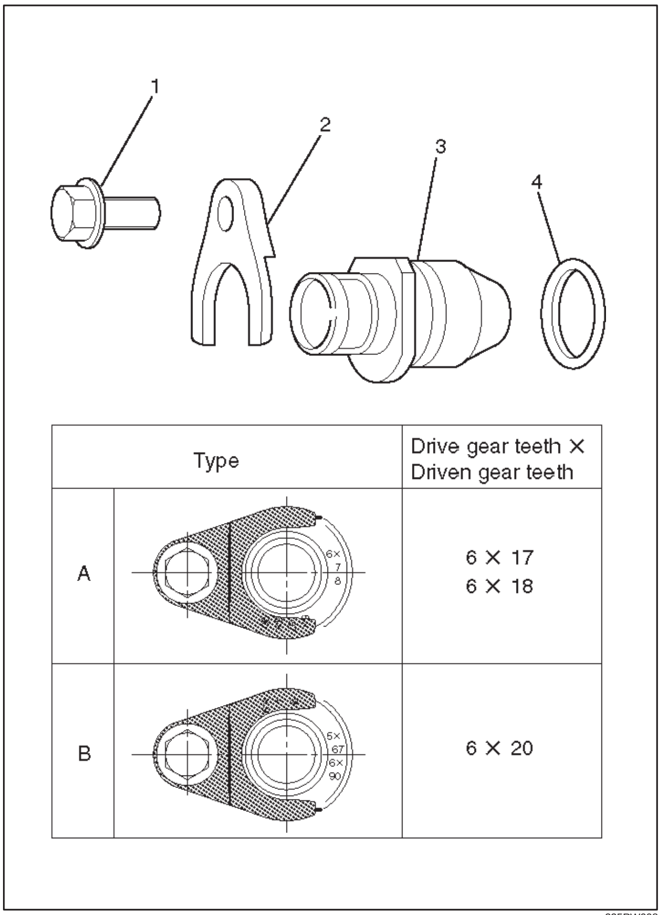
261RW043

5. Install the O-ring(4) to the speedometer driven gear bushing(3).
   Install the driven gear to the speedometer driven gear bushing(3).
6. Install the speedometer driven gear assembly(7) to the transmission rear cover(9).
   Install the plate(1) to the transmission rear cover(9).

   Torque: 15 N·m (11 lb ft)

7. Install the speedometer sensor(7).

   Torque: 27 N·m (20 lb ft)



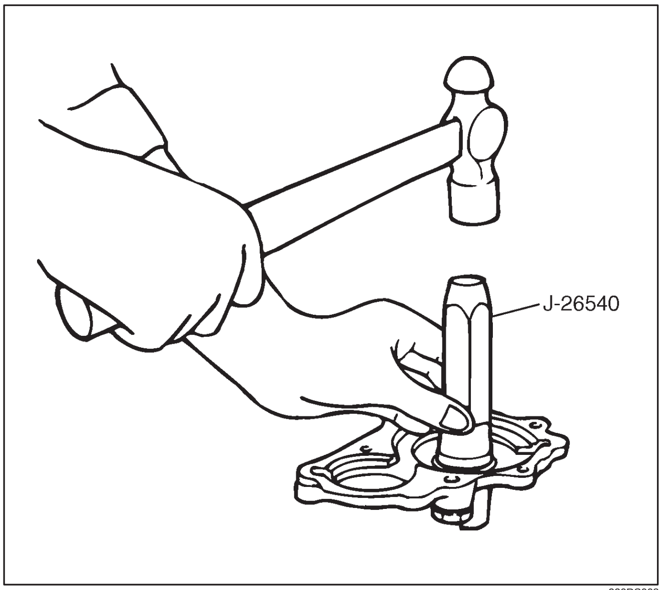
Type		Drive gear teeth × Driven gear teeth
A		6 × 17 6 × 18
B		6 × 20

225RW008

8. Install top gear bearing snap ring(6) and counter front bearing snap ring(5).
   - Use a pair of snap ring pliers to install the snap rings to the mainshaft and countershaft.
   - The snap rings must be fully inserted into the bearing snap ring groove.
9. Install front cover (with oil seal) (4).

Front Cover Oil Seal Replacement

- Remove the oil seal from the front cover.
- Apply engine oil to a new oil seal outer circumference.
- Apply recommended grease to the oil seal lip.
- Use the oil seal installer J–26540 to install the oil seal to the front cover.



220RS008

10. Install a new packing and front cover(4) to the transmission case.

NOTE: Take care not to damage the oil seal.

Notes When Tightening the Bolt:

- After cleaning the bolt hole, dry it thoroughly with air.
- After cleaning the screw face of a removed bolt or new one, dry it thoroughly. Apply recommended liquid gasket (LOCTITE 242) or its equivalent before tightening it.

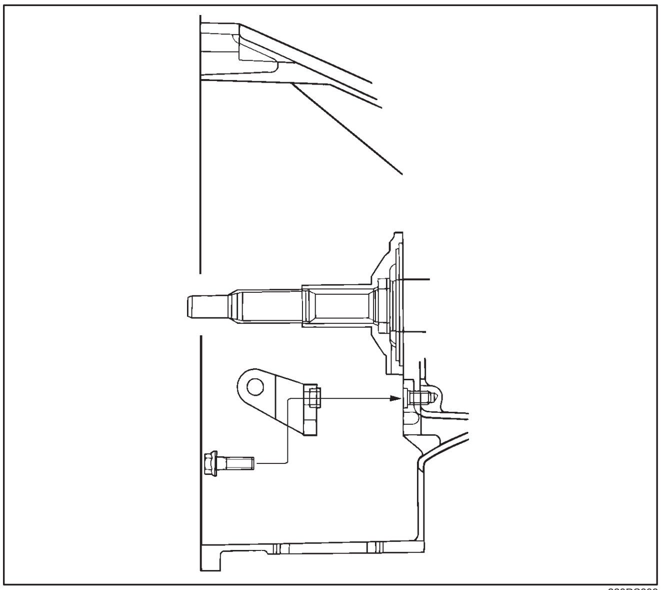
  Tighten six new front cover bolts to the specified torque.

Torque: 25 N·m (18 lb ft)

11. Install the fulcrum bridge(3) to the transmission case.

    Tighten three fulcrum bridge bolts to the specified torque.

Torque: 38 N·m (28 lb ft)

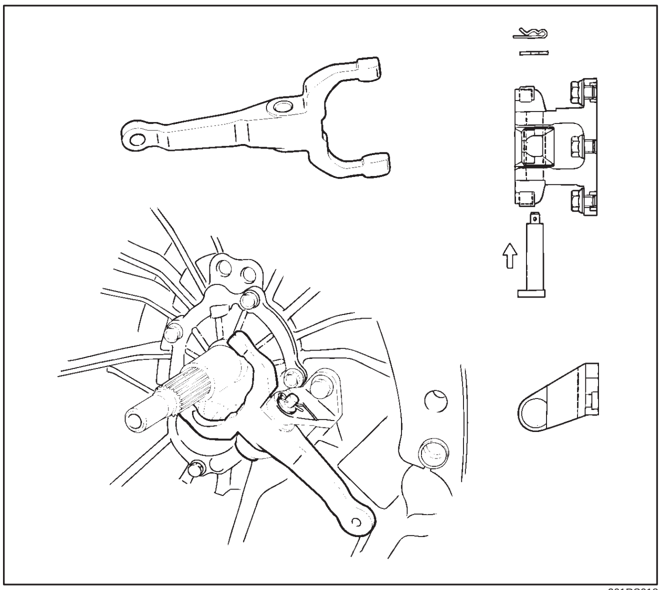


220RS009

12. Apply grease to the pin hole inner circumferences and thrust surfaces.

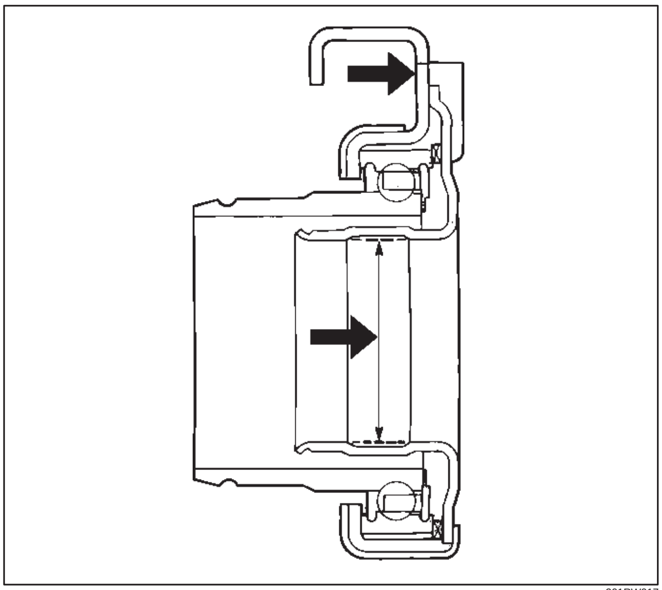
    Attach the shift fork(2) to the fulcrum bridge(3) by inserting the shift fork pin from the bottom side of the fulcrum bridge.

    Install the washer and snap pin.



201RS018

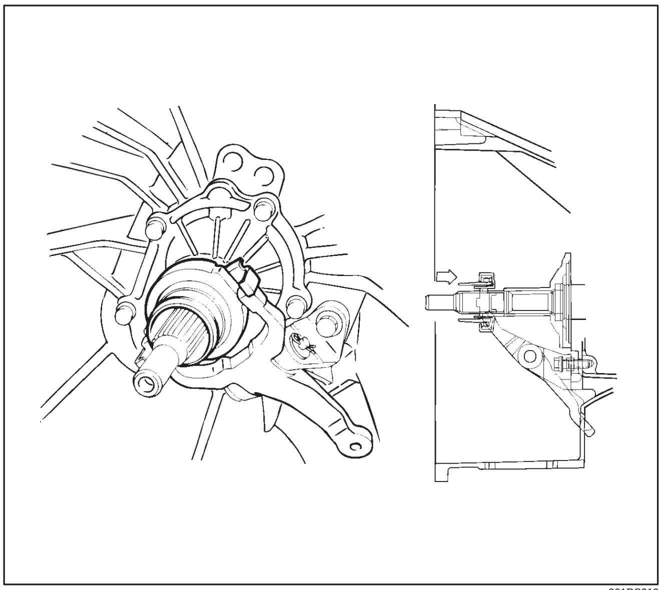
13. Apply grease to the areas as shown in the figure.



201RW017

- Install the release bearing(1) to the shift fork(2) in the proper direction.

NOTE: Ensure release bearing is properly positioned during installation, as shown in the figure.



201RS019

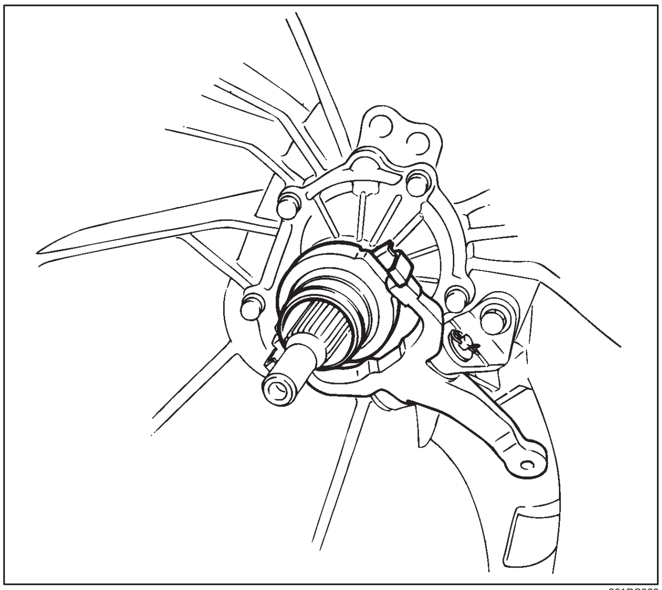
Disassembly

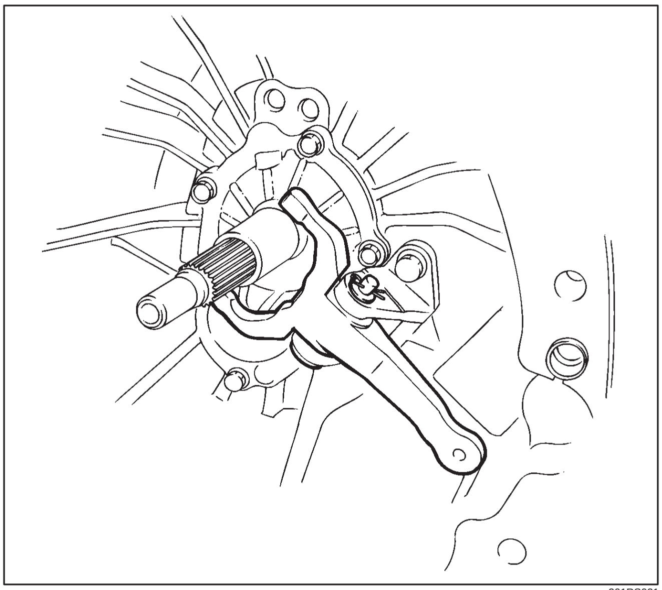
1. Clean the exterior of the unit with solvent.
2. Remove the drain plug from the transmission case and transfer case and drain the lubricant.
3. Remove the clutch release bearing(1) from the transmission case.



201RS020

4. Remove the snap pin.

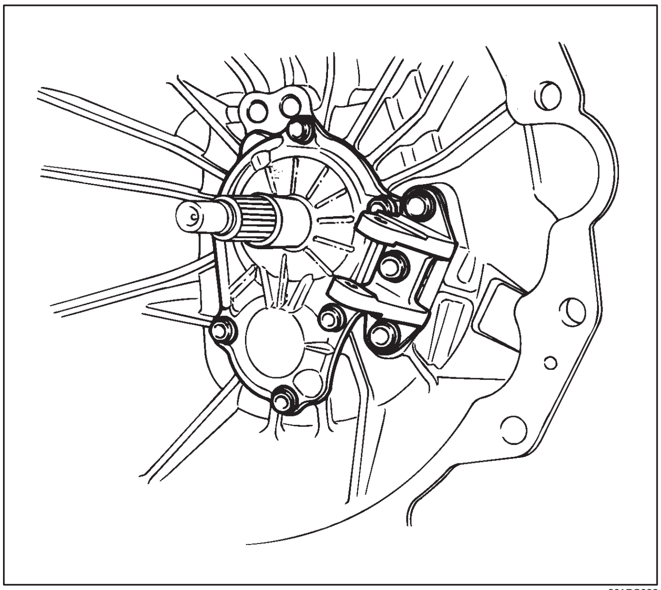
   Remove the shift fork pin and shift fork(2) from the fulcrum bridge(3).



201RS021

5. Remove the fulcrum bridge bolts.
   - Remove the fulcrum bridge(3) from the transmission case.

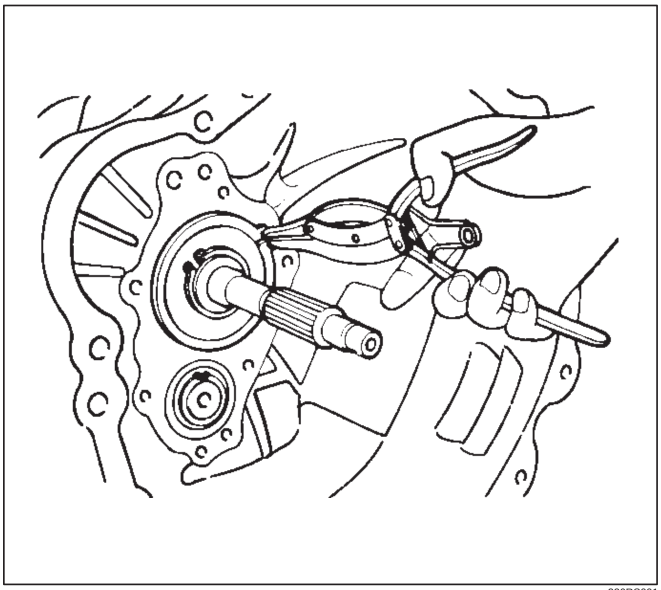
   Remove the front cover(4) and gasket from the transmission case.



201RS022

6. Remove counter front bearing snap ring(5) and top gear bearing snap ring(6).

   Use a pair of snap ring pliers to remove the snap ring.

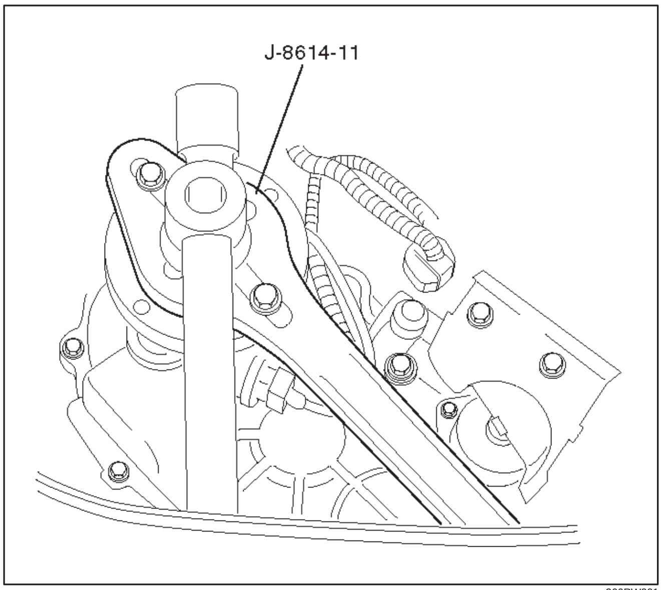


226RS001

7. Remove the speedometer sensor(7).
   Remove the plate(7).
   Remove the driven gear bushing and driven gear(7).

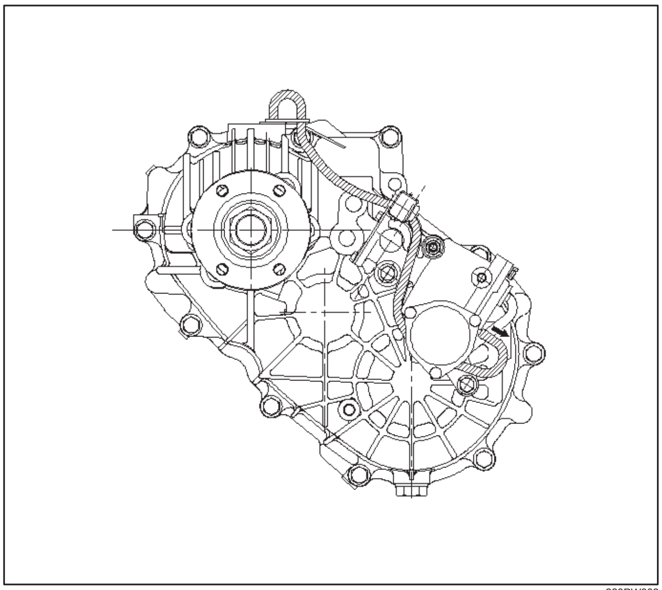
NOTE: Apply a reference mark to the driven gear bushing before removal.

8. Remove front companion flange(8) and rear companion flange(9) using the flange holder J–8614–11 to remove the end nut.



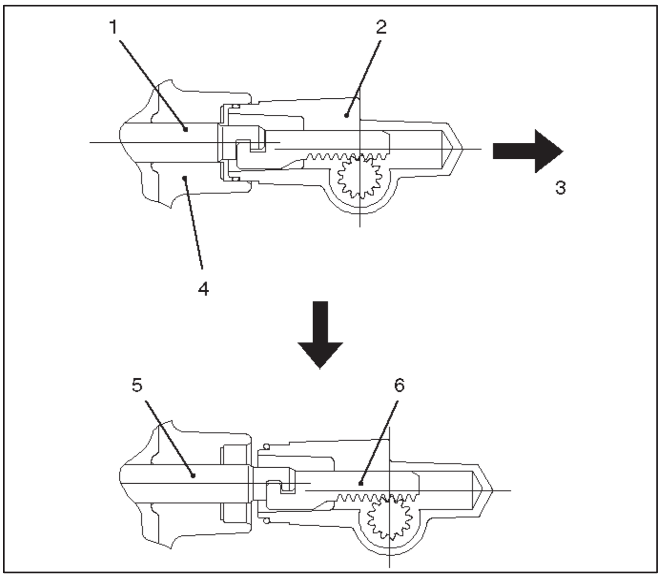
266RW001

9. Disconnect breather hose from transmission and remove gear control box assembly(10).
10. Remove 2WD–4WD actuator assembly(11) by performing the following steps:
    1. Disconnect the actuator breather hose from 2WD–4WD actuator assembly(11).



220RW002

2. Remove the 2WD–4WD actuator assembly bolts.
3. Pull the 2WD–4WD actuator assembly with 2WD–4WD shift rod.



220RW027

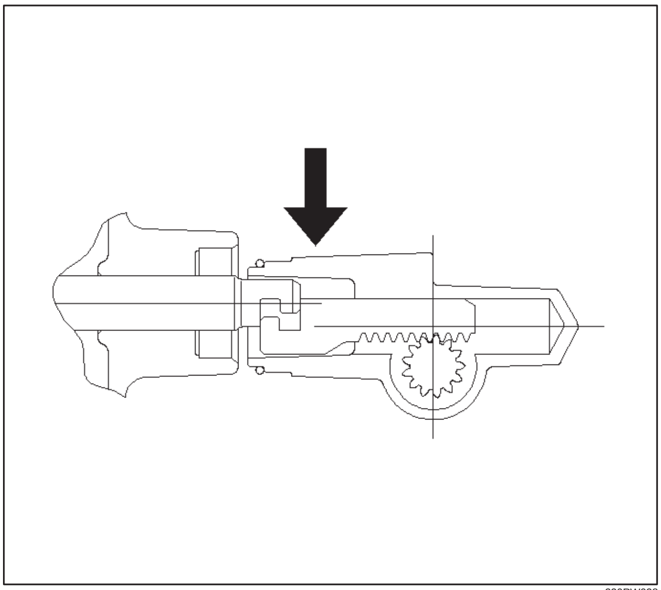
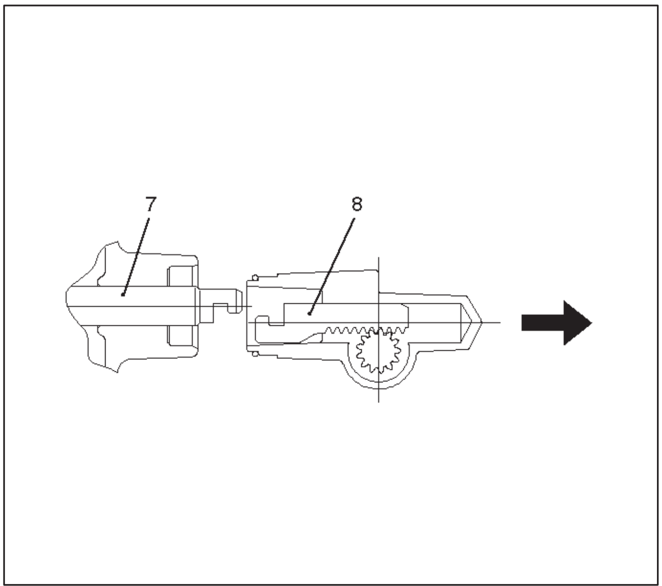
4. Offset the actuator assembly.



220RW028

5. Remove the actuator assembly.



220RW029

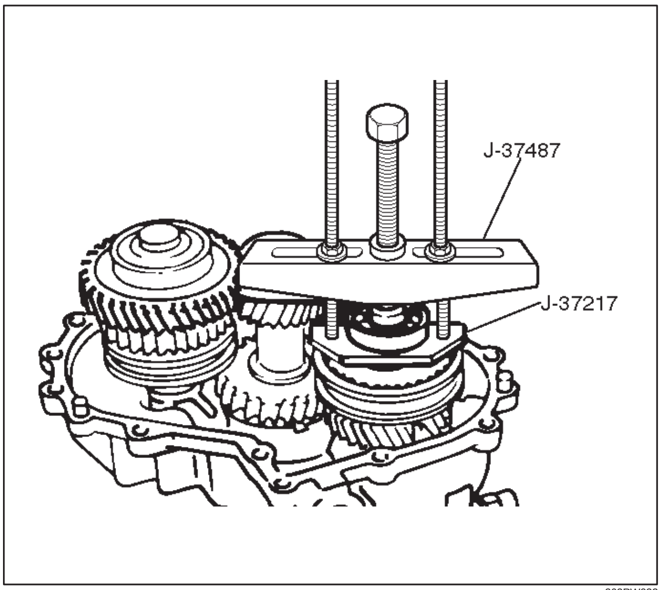
Legend

(7) Position: 4WD

(8) Mode: 2WD

NOTE: Before removing the transmission and transfer assembly from vehicle, change the transfer mode to 2WD using the 4WD push button switch on dash panel.

11. Remove the transfer rear cover assembly(12) from the transfer case(28).
12. Regarding detent, shift arm, and interlock pin(13) disassembly, refer to Detent, Shift Arm, and Interlock Pin in Drive Line/Axle section.
13. Use a pair of snap ring pliers to remove the bearing snap ring(14).
14. Use a bearing remover J–37217 and puller J–37487 to remove the ball bearing(15).

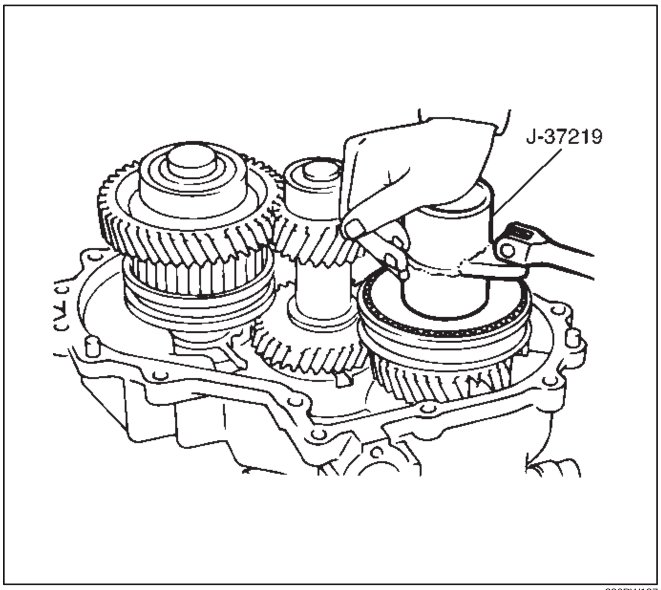


262RW032

15. Install the front companion flange temporarily.

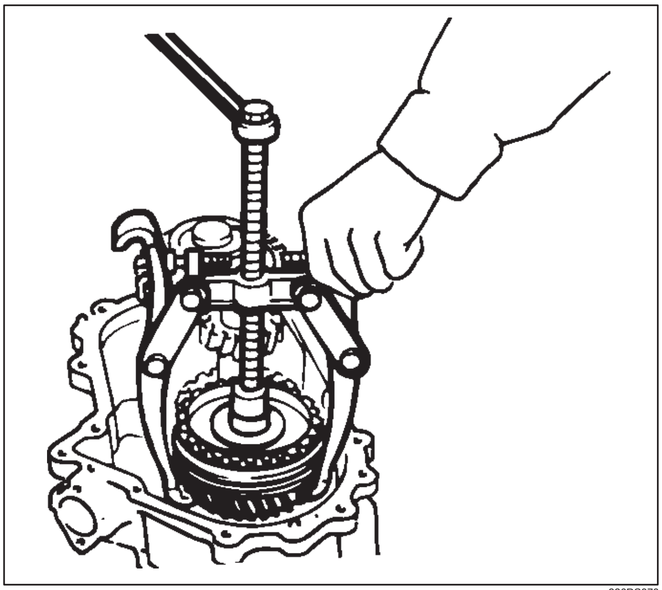
    Use the flange holder J–8614–11 and lock nut wrench J–37219 to remove the lock nut(16).

    Remove the front companion flange.



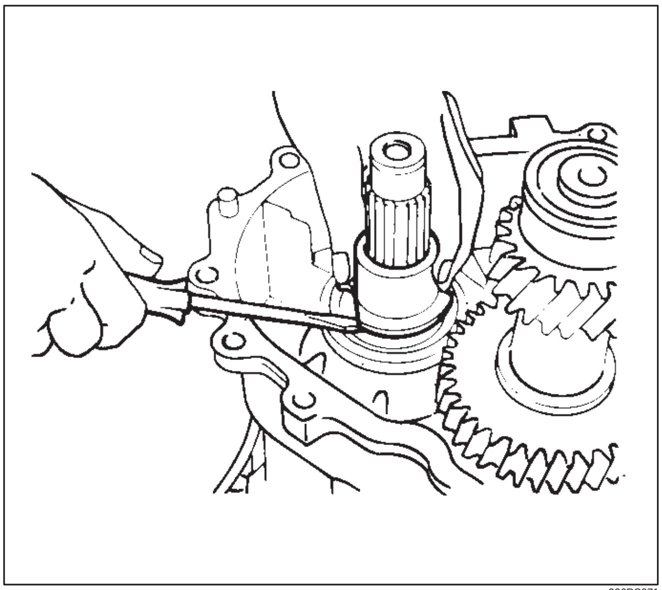
226RW137

16. Remove high-low clutch sleeve(17).
    Use the universal puller to remove the high-low clutch hub(17) and transfer input gear(18).



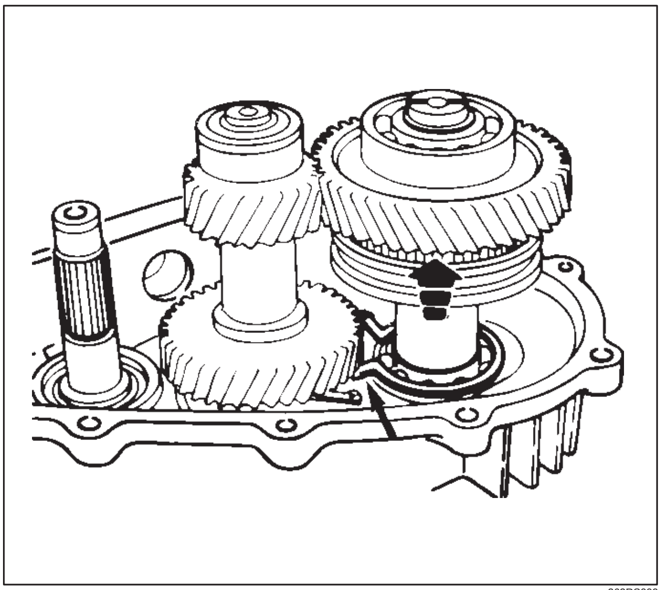
226RS070

17. Remove needle bearing(19), bearing collar(20), ball(21), and plate(22).



226RS071

18. Use a pair of snap ring pliers to remove the bearing snap ring(23).
19. Use a plastic hammer to tap the front output gear assembly(24) free.



262RS009

20. Remove bearing snap ring(25) by using a pair of snap ring pliers.
21. Remove the counter gear assembly(26) from the transfer case(28).
22. Remove 1–2 and 3–4 indicator switch, pin and ball(27).
23. Remove the transfer case assembly(28) from the transmission case.
    - Refer to Transfer Case Assembly in Drive Line/Axle section for repair of transfer case assembly.
24. Pull out intermediate plate with gear assembly(29) from transmission case.

Reassembly

1. Apply recommended liquid gasket (LOCTITE 17430) or its equivalent to the transmission case(30), intermediate plate(29) and transfer case(28) fitting surfaces.
2. Install the intermediate plate with gear assembly(29) to the transmission case(30).
   Pull out the top gear shaft until the ball bearing snap ring groove protrudes from the transmission case front cover fitting face.
   Avoid subjecting the mainshaft to sudden shock or stress.
3. Install the transfer case assembly(28) to the intermediate plate with gear assembly.
   Tighten the eight transmission-transfer case bolts to the specified torque.

   Torque: 37 N·m (27 lb ft)

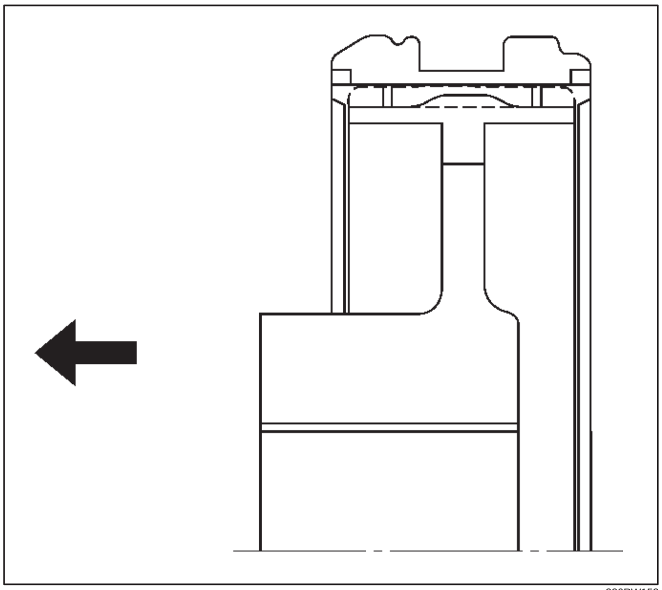
   Refer to Transfer Rear Case Assembly in Drive Line/Axle section for oil seal replacement.
4. Install 1–2 and 3–4 indicator switch, pin and ball(27).
5. Install the counter gear assembly(26) to the transfer case(28).
6. Use a pair of snap ring pliers to install the snap ring(25) to the transfer case(28).

NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

7. Install front output gear assembly(24).
8. Use a pair of snap ring pliers to install the snap ring (23) to the transfer case(28).

NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

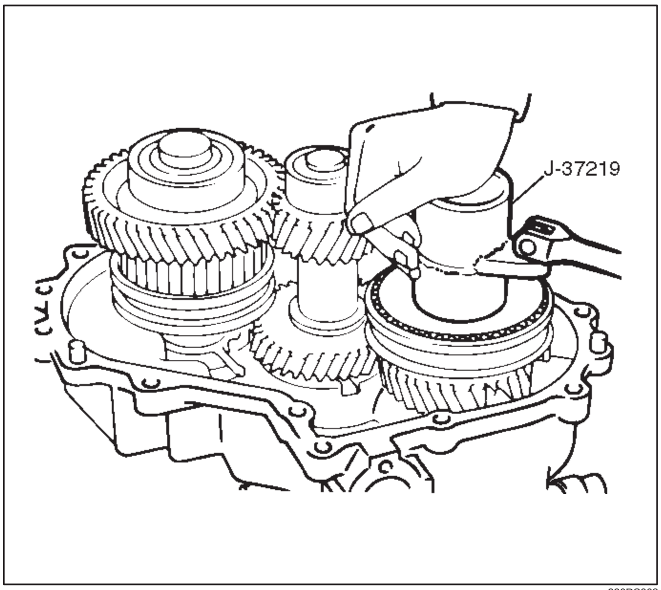
9. Install plate(22), ball(21), bearing collar(20), needle bearing(19), and transfer input gear(18).
10. Install High-low clutch hub and sleeve(17).
    The clutch hub face (with the heavy boss) must be facing the transfer input gear side.



226RW152

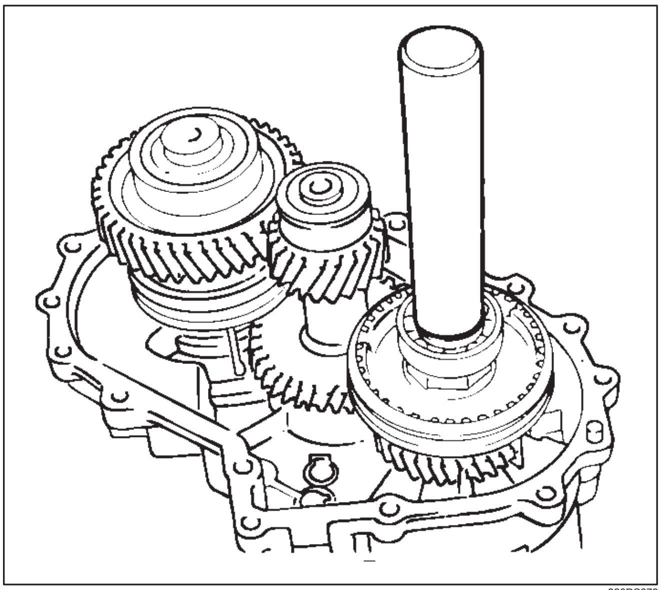
11. Install the front companion flange temporarily.
    - Use the flange holder J–8614–11 and lock nut wrench J–37219 to install the lock nut(16).

Torque: 137 N·m (101 lb ft)



226RS068

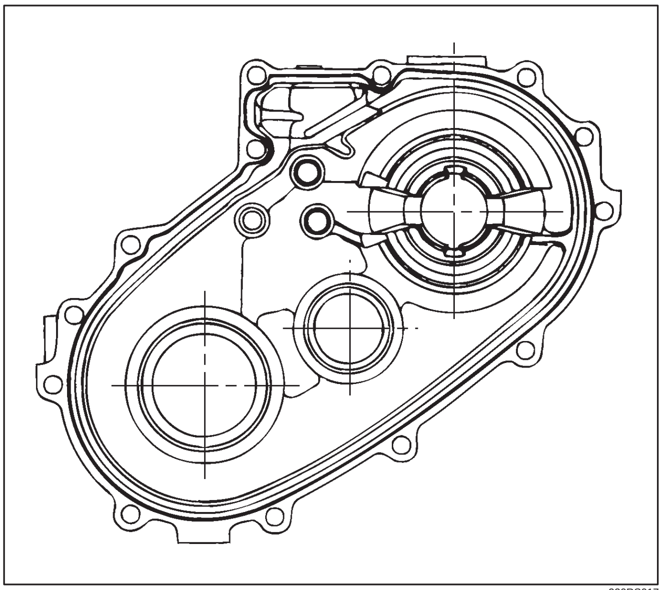
12. Use the punch to stake the lock nut at one spot.
13. Use a suitable drift and hammer to install the ball bearing(15).



226RS079

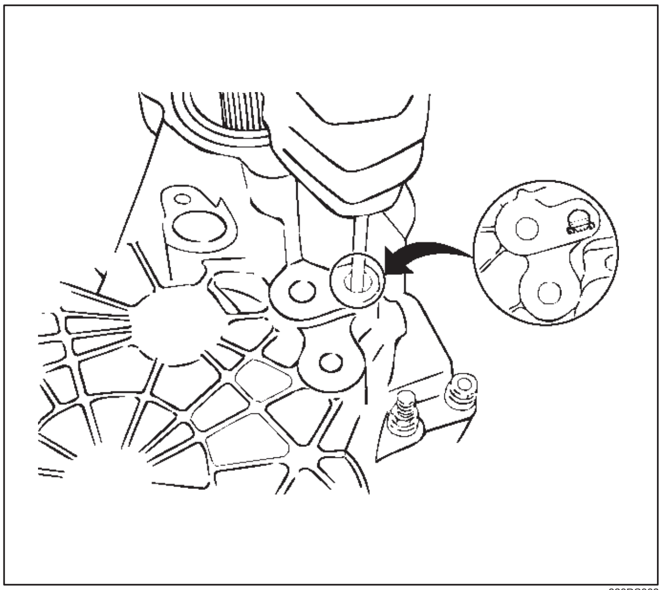
14. Use a pair of snap ring pliers to install the bearing snap ring(14).
15. Regarding detent, shift arm, and interlock pin(13) assembly, refer to Detent, Shift Arm, and Interlock Pin in Drive Line/Axle section.

16. Apply recommended liquid gasket (LOCTITE 17430) or its equivalent to the transfer rear case fitting faces.



220RS017

17. Perform the following steps before fitting the transfer rear case(12):
    1. Shift the High-Low shift rod to the 4H side.
    2. The cut-away portion of select rod head should align with the rear case hole's stopper.

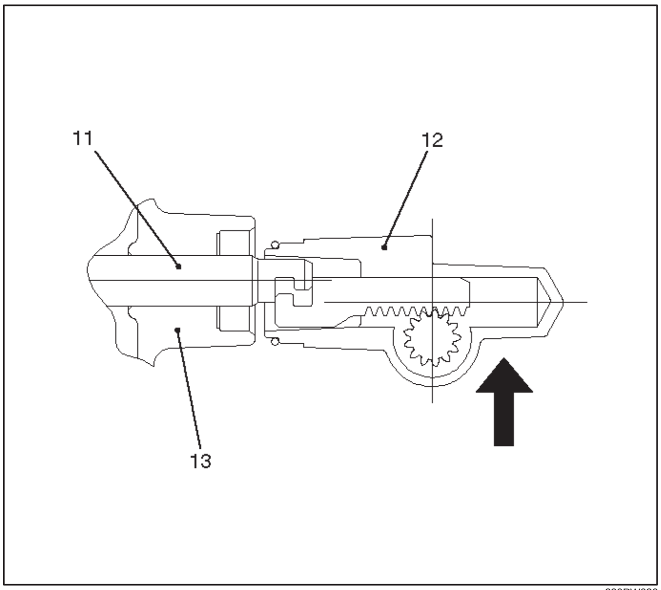


230RS002

18. Tighten the eleven transfer rear case bolts to the specified torque.

Torque: 37 N·m (27 lb ft)

19. Install 2WD–4WD actuator assembly(11) by performing the following steps.
    1. Shift the 2WD–4WD shift rod to the 4WD side.
    2. Join the rod grooves of 2WD–4WD actuator assembly and shift rod.

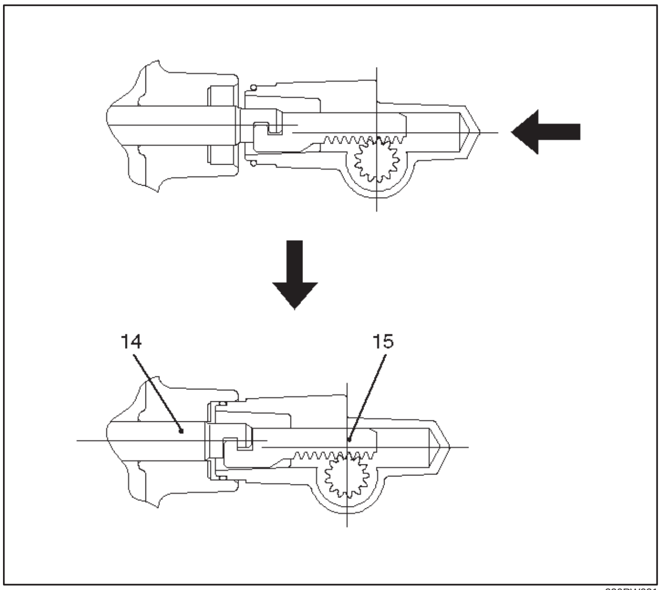


220RW030

Legend

(11) Shift Rod: 2WD–4WD (Position: 4WD)
(12) 2WD–4WD Actuator Assembly (Mode: 2WD)
(13) Rear Case Assembly

3. Push the 2WD–4WD actuator assembly with 2WD–4WD shift rod till the shift rod reaches the 2WD position.



220RW031

Legend

(14) Position: 2WD
(15) Mode: 2WD

4. Tighten the 2WD–4WD actuator bolts to the specified torque.

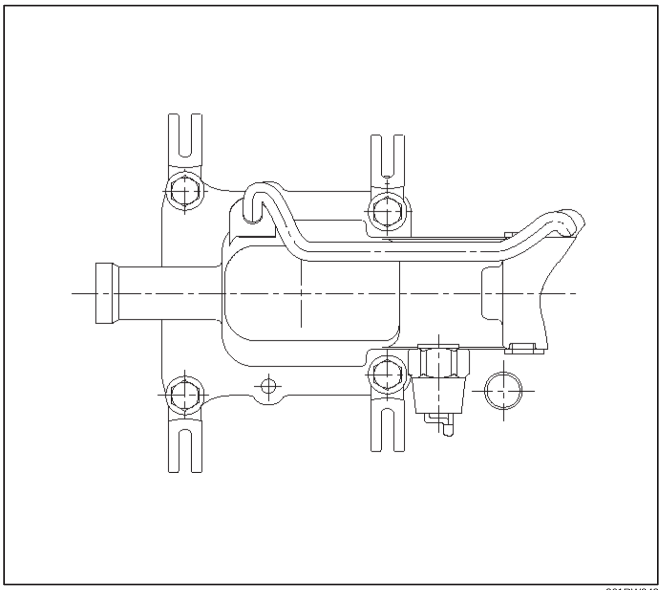
Torque: 19 N·m (14 lb ft)

5. Connect the actuator breather hose to actuator.

20. Install a new packing and gear control box assembly(10).

    Install the harness clips and brackets and then tighten four new gear control box bolts to the specified torque.

Torque: 20 N·m (14 lb ft)



261RW043

21. Install the rear and front companion flange(9) (8).

    Install the O-ring(9).

    Use the flange holder J–8614–11 to tighten the flange nuts(9) (8) to the transfer case.

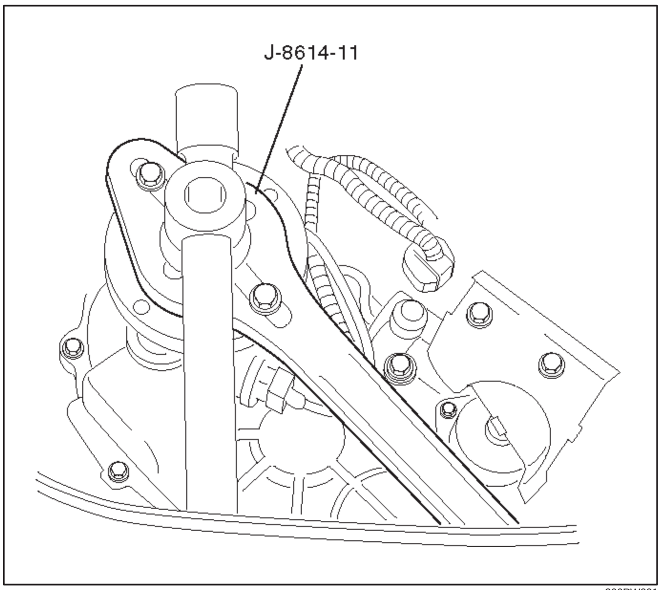
    Tighten new transfer flange nuts(9) (8) to the specified torque.

Rear Companion Flange

Torque: 167 N·m (123 lb ft)

Front Companion Flange

Torque: 137 N·m (101 lb ft)



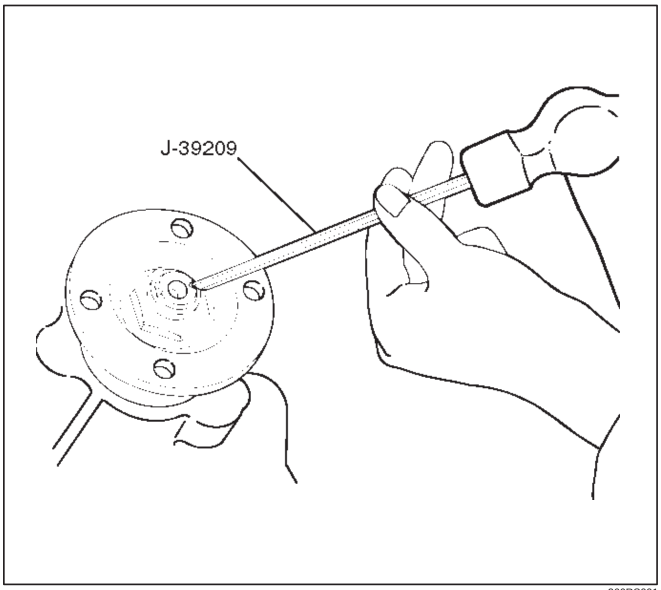
266RW001

22. Use the punch J–39209 to stake the rear companion flange nut at two spots.

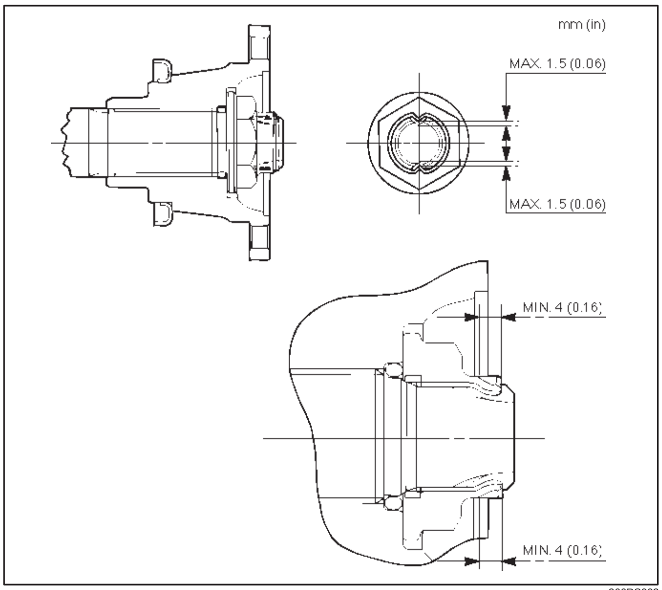
    Punch: J–39209

    - Stake the front companion flange nut at one spot.

NOTE: Be sure to confirm that there is no crack at the staked portion of the flange nut after staking.



266RS001

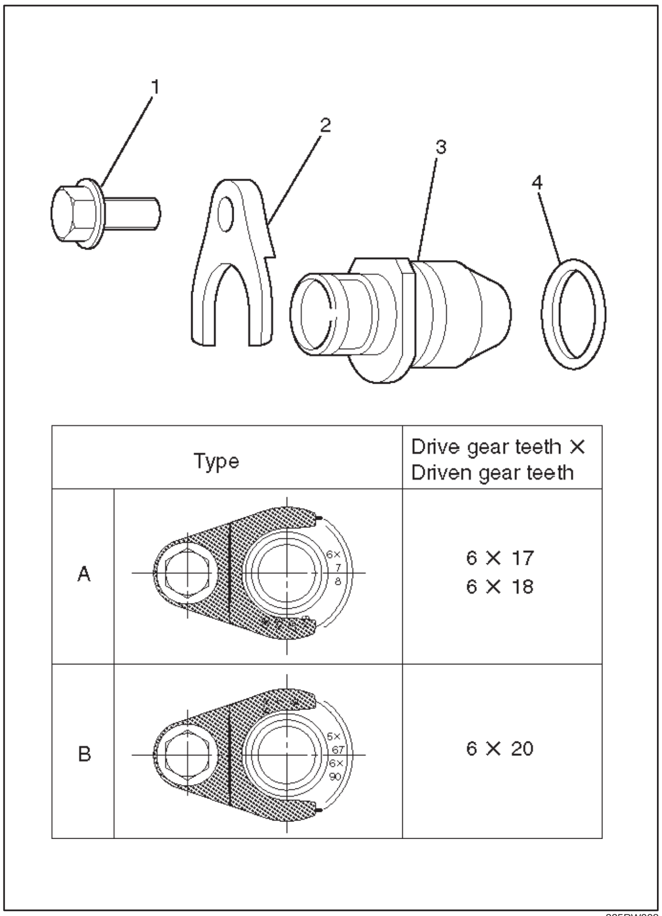


266RS003

23. Install the O-ring (4) to the speedometer driven gear bushing(3).

    Install the driven gear to the speedometer driven gear bushing(3).

    Install the speedometer driven gear assembly(7) to the transfer rear cover.



225RW008

24. Install the plate to the transfer rear cover.

    Torque: 15 N·m (11 lb ft)

25. Install the speedometer sensor.

    Torque: 27 N·m (20 lb ft)

26. Install top gear bearing snap ring(6) and counter front bearing snap ring(5).

    Use a pair of snap ring pliers to install the snap rings to the mainshaft and countershaft.

    The snap rings must be fully inserted into the bearing snap ring groove.

27. Install a new packing and front cover (with oil seal) (4) to the transmission case.

NOTE: Take care not to damage the oil seal.

Notes When Tightening the Bolt:

- After cleaning the bolt hole, dry it thoroughly with air.
- After cleaning the screw face of a removed bolt or new one, dry it thoroughly. Apply recommended liquid gasket (LOCTITE 242) or its equivalent before tightening it.

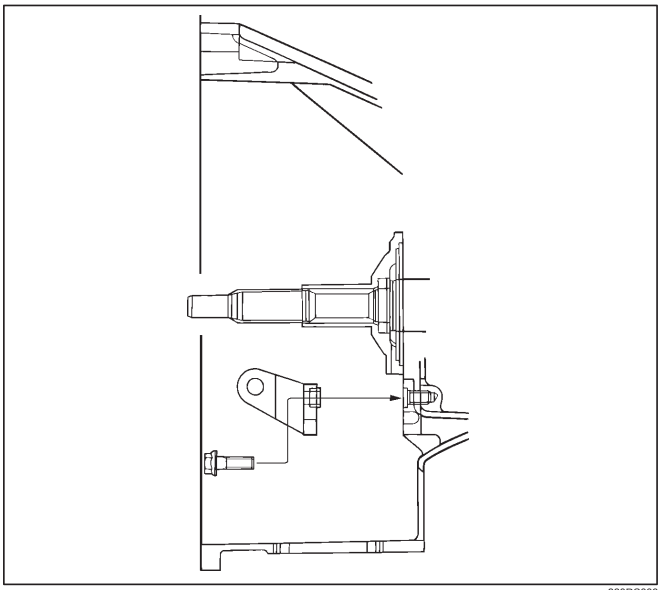
  Tighten six new front cover bolts to the specified torque.

  Torque: 25 N·m (18 lb ft)

28. Install the fulcrum bridge(3) to the transmission case.

    Tighten three fulcrum bridge bolts to the specified torque.

    Torque: 38 N·m (28 lb ft)

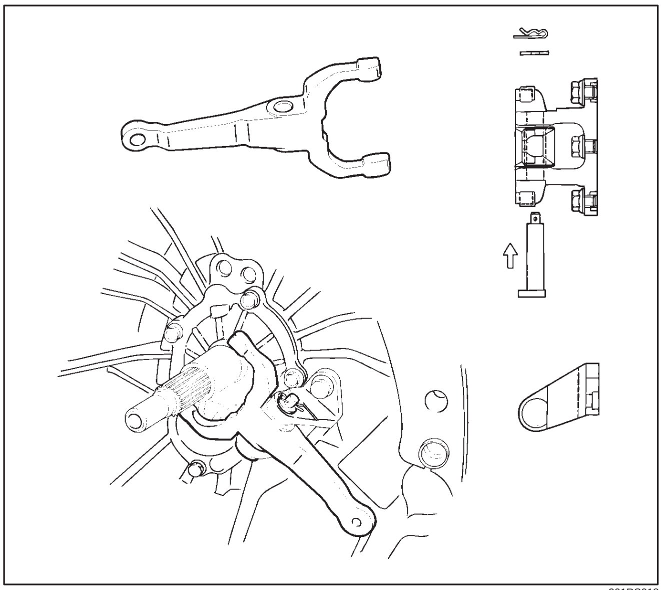


220RS009

29. Apply grease to the pin hole inner circumferences and thrust surfaces.

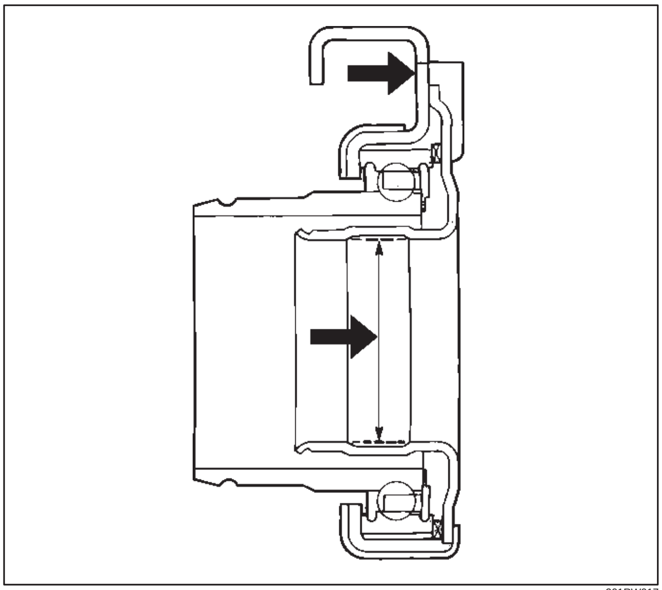
    Attach the shift fork(2) to the fulcrum bridge(3) by inserting the shift fork pin from the bottom side of the fulcrum bridge.

    Install the washer and snap pin.



201RS018

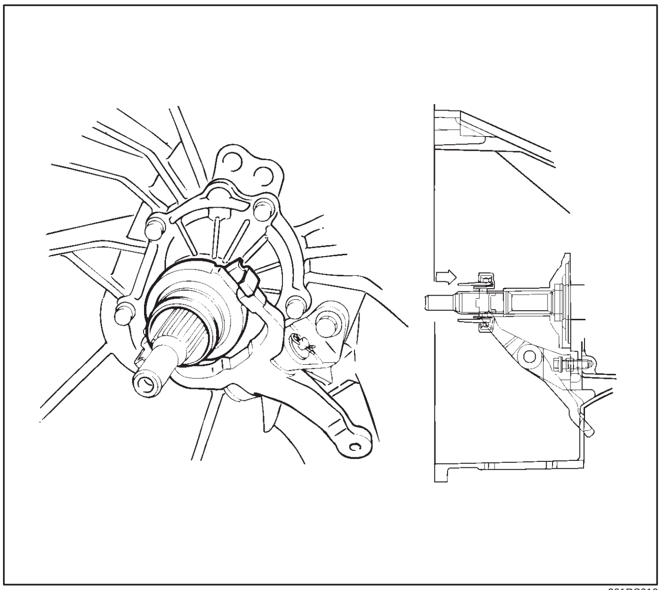
30. Apply grease to the areas shown in the figure.



201RW017

Install the release bearing(1) to the shift fork(2) in the proper direction.

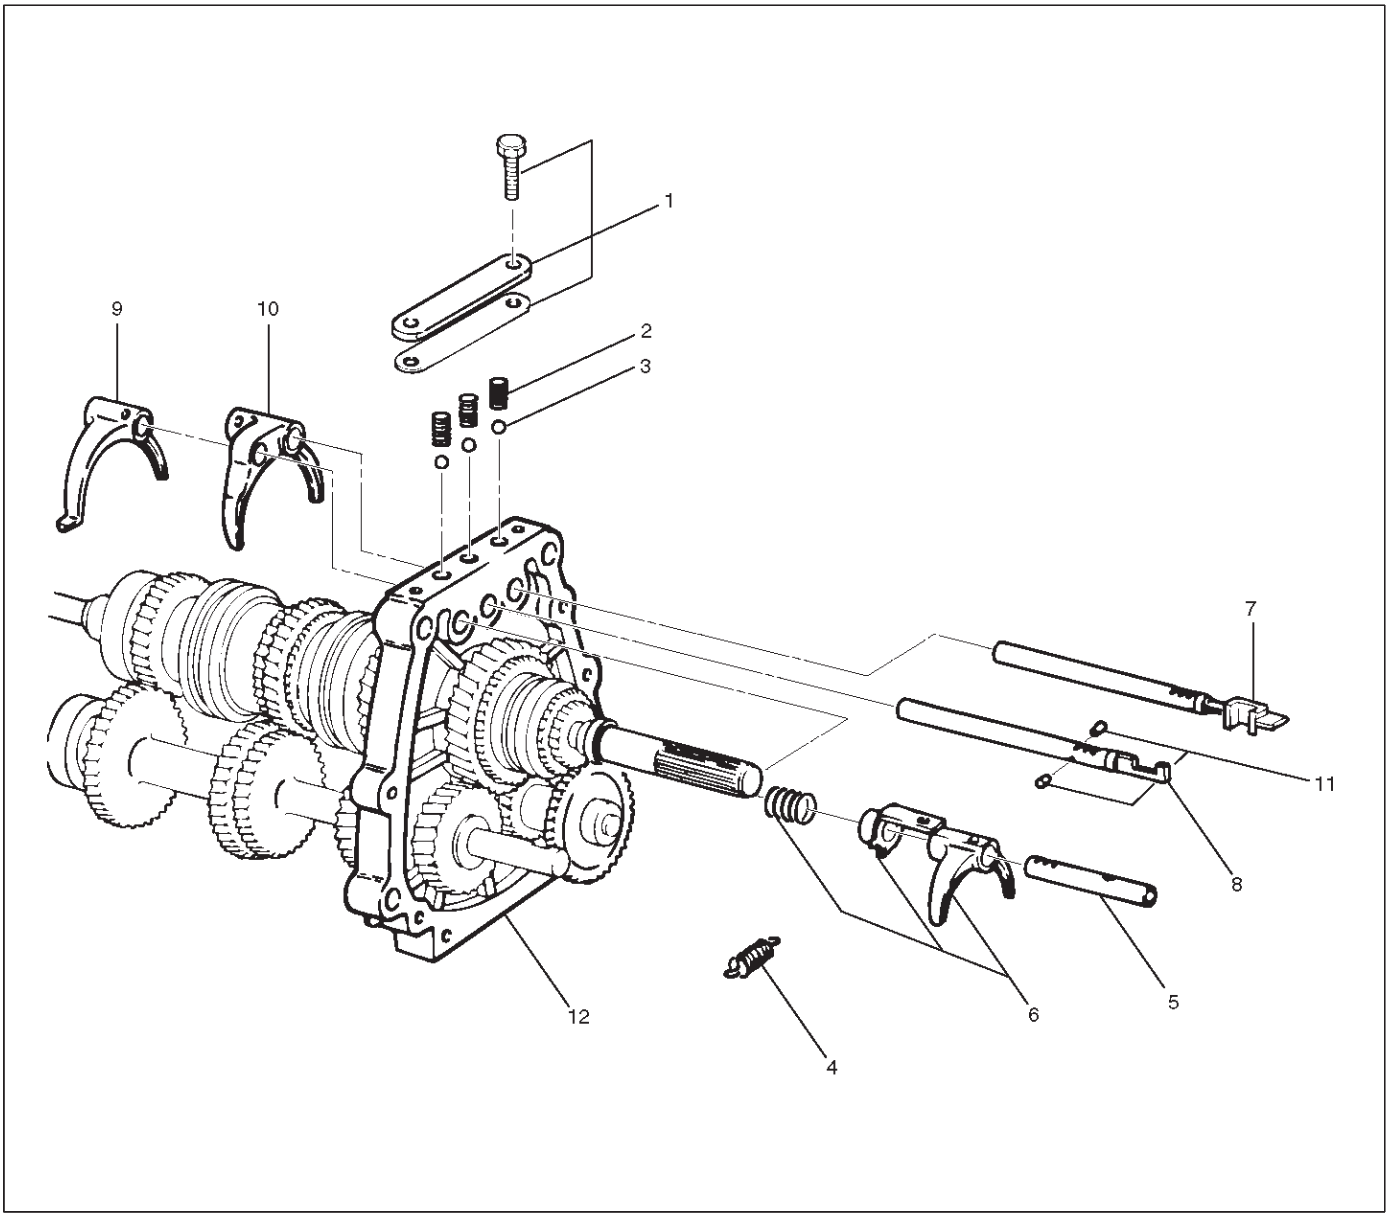
NOTE: Ensure release bearing is properly positioned during installation, as shown in the figure.



201RS019

Intermediate Plate with Gear Assembly, Detent, Shift Arm, and Interlock Pin

Disassembled View

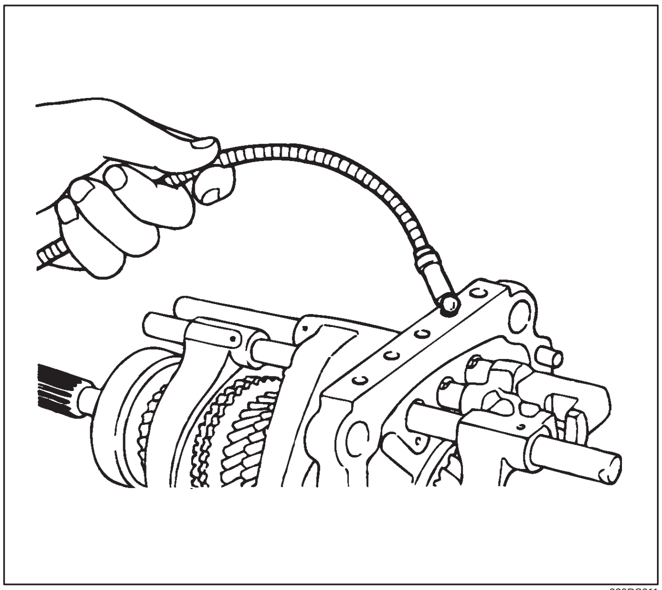


Legend

(1) Detent Spring Plate and Gasket
(2) Detent Spring
(3) Detent Ball
(4) Spring
(5) Rev–5th Shift Rod
(6) Rev–5th Shift Arm and Reverse Inhibitor
(7) 1st–2nd Shift Rod
(8) 3rd–4th Shift Rod
(9) 3rd–4th Shift Arm
(10) 1st–2nd Shift Arm
(11) Interlock Pin
(12) Intermediate Plate and Gear Assembly

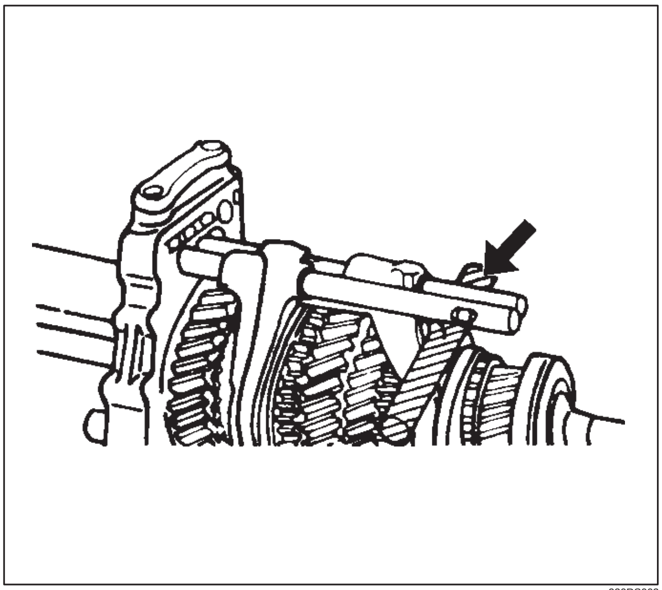
Disassembly

1. Remove detent spring plate and gasket(1), detent spring(2) and detent ball(3).
   Use a magnetic hand to remove the detent balls from the intermediate plate.



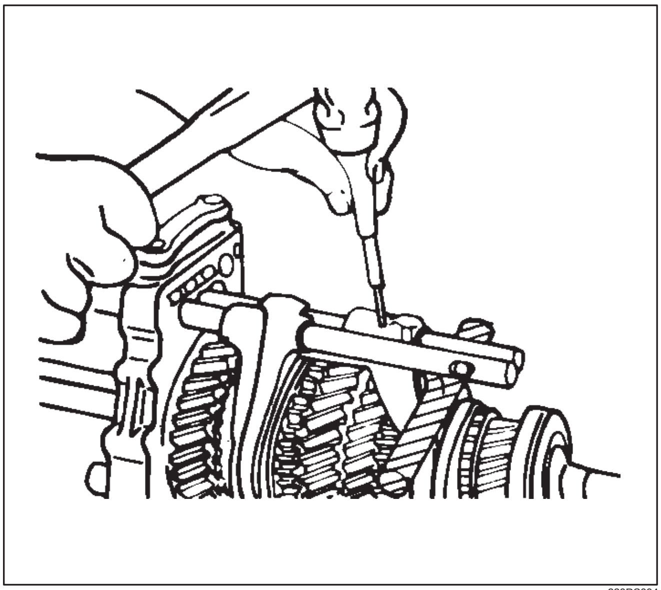
220RS011

2. Remove spring(4).
3. Remove rev–5th shift rod(5), and rev–5th shift arm and reverse inhibitor(6).
   Remove 1st–2nd shift rod(7), 3rd–4th shift rod(8), 3rd–4th shift arm(9), and 1st–2nd shift arm (10).
   - Hold a round bar against the shift rod end.



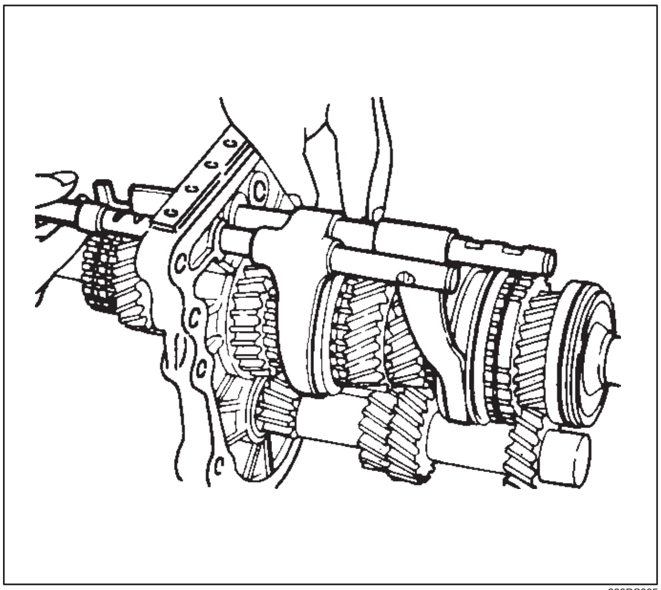
230RS003

- Use a spring pin remover to remove the shift arm spring pins from the shift arms and the shift rods.



230RS004

- Move the 3rd–4th shift rod forward.



230RS005

- Remove the rev–5th, 1st–2nd and 3rd–4th shifter rods carefully. Interlock pins are located between the shifter rods in the intermediate plate.

4. Remove interlock pin(11) from intermediate plate and gear assembly(12).

Inspection and Repair

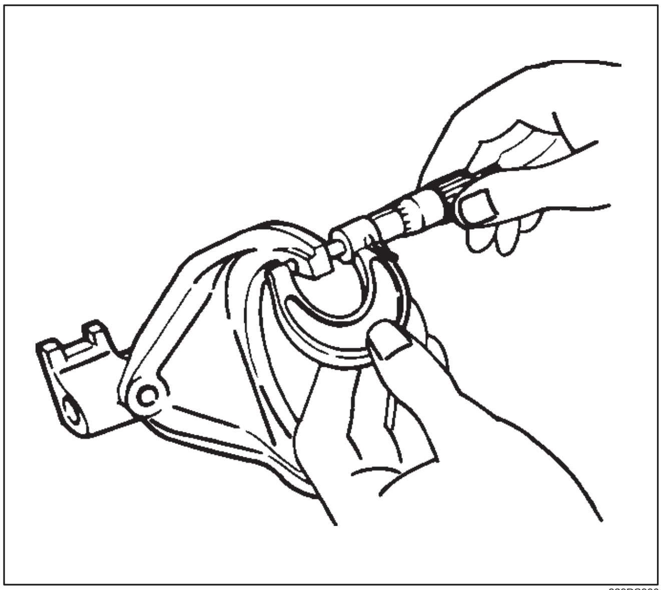
Make the necessary adjustments, and part replacements if excessive wear or damage is discovered during inspection.

Shift Arm Thickness

- Use a micrometer to measure the shift arm thickness.
  If the measured value is less than the specified limit, the shift arm must be replaced.

Shift Arm Thickness

	Standard	Limit
1st–2nd	9.60–9.85 mm (0.378–0.388 in)	9.0 mm (0.354 in)
3rd–4th Rev.5th	9.60–9.80 mm (0.378–0.386 in)	



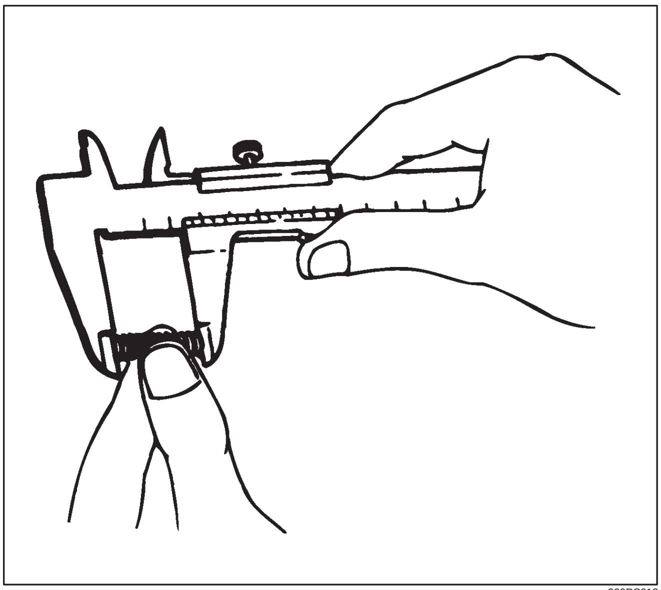
230RS006

Detent Spring Free Length

- Use a vernier caliper to measure the detent spring free length.
  If the measured value is less than the specified limit, the detent spring must be replaced.

Detent Spring Free Length

Standard	Limit
26.8 mm (1.06 in)	26.2 mm (1.03 in)



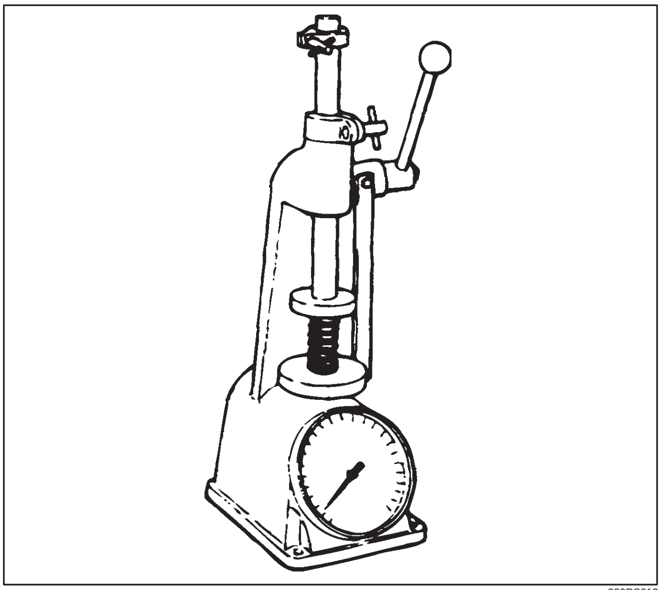
220RS012

Detent Spring Tension

- Use a spring tester to measure the valve spring tension.
  If the measured value is less than the specified limit, the detent spring must be replaced.

Detent Spring Tension

Compressed height	Standard
20 mm (0.787 in)	87.2 – 97.1 N (19.6 – 21.8 lb)



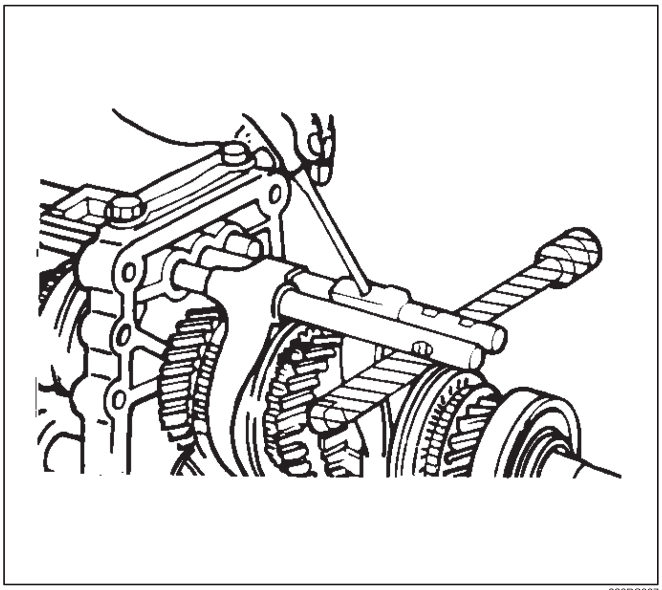
220RS013

Reassembly

1. Install 1st–2nd shift arm(10) and 3rd–4th shift arm(9) to intermediate plate and gear assembly(12).
2. Install 3rd–4th shift rod(8) and 1st–2nd shift rod(7).
   - Install the interlock pin(11) to the shift rod.
   - Install the shift rod together with the interlock pin to the intermediate plate.

     Do not allow the interlock pin to fall from the shift rod.
   - Hold a round bar against the shift rod end lower face to protect it against damage.
   - Install a new spring pin.

     Never reinstall the used spring pin.



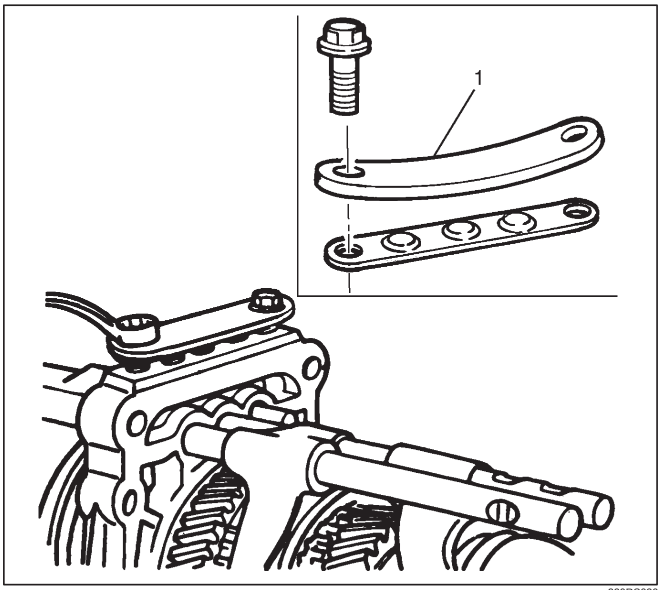
230RS007

3. Install rev–5th shift arm and reverse inhibitor(6) and rev–5th shift rod(5).
   - Apply oil to the reverse inhibitor inner surface.
   - Install the interlock pin(11) to the shift rod.
   - Install the shift rod together with the interlock pin to the intermediate plate.

     Do not allow the interlock pin to fall from the shift rod.
   - Hold a round bar against the shift rod end lower face to protect it against damage.
   - Install a new spring pin.

     Never reinstall the used spring pin.
4. Install spring(4).
5. Put detent balls(3) in the intermediate plate holes.
   - Apply oil to the detent balls.
6. Install detent springs(2) and detent spring plate and gasket(1).
   - Install a new gasket and the detent spring plate.
   - Tighten the detent spring plate bolts to the specified torque.

Torque: 20 N·m (14 lb ft)



220RS030

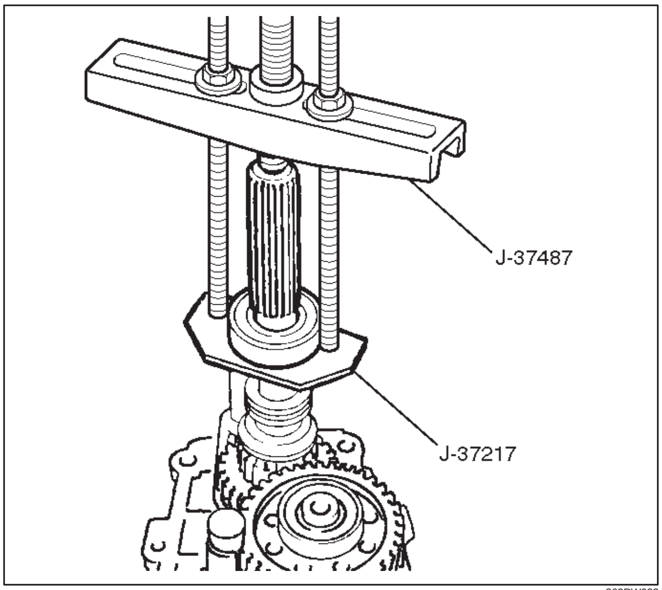
(29) Bearing Snap Ring
(30) Intermediate Plate

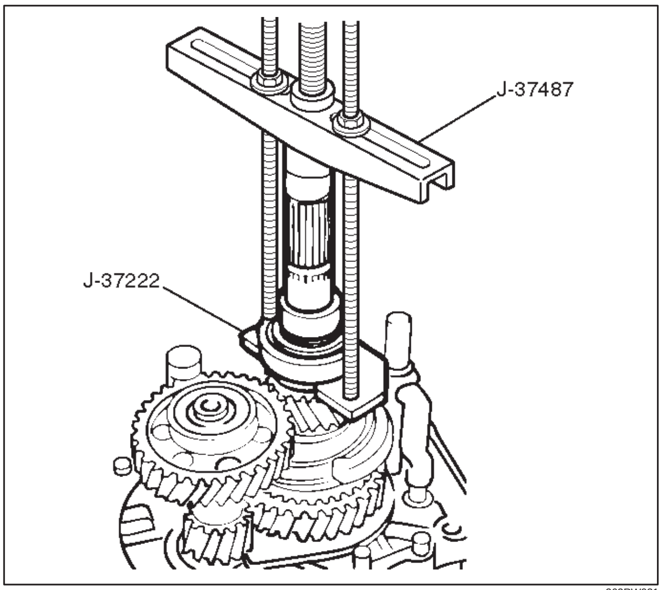
Disassembly

1. Use a pair of snap ring pliers to remove the bearing snap ring(1). (4X2)
2. Set the bearing remover J–37217 and puller J–37487 to the bearing and the mainshaft end to remove ball bearing(2). (4X2)



262RW033

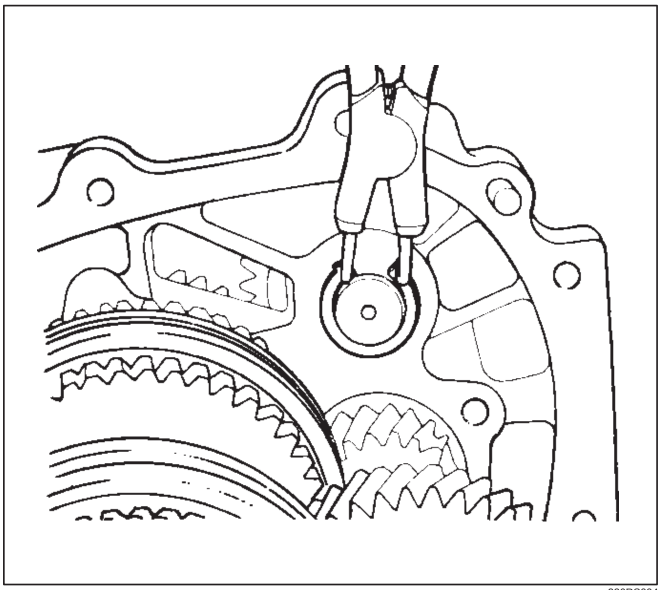
3. Remove bearing snap ring(3), speedometer drive gear(4), clip(5), retainer snap ring(6) and retainer(7). (4X2)
4. Set the retaining ring remover J–37222 and puller J–37487 to the retainer(7) and the mainshaft end. (4X4)



262RW031

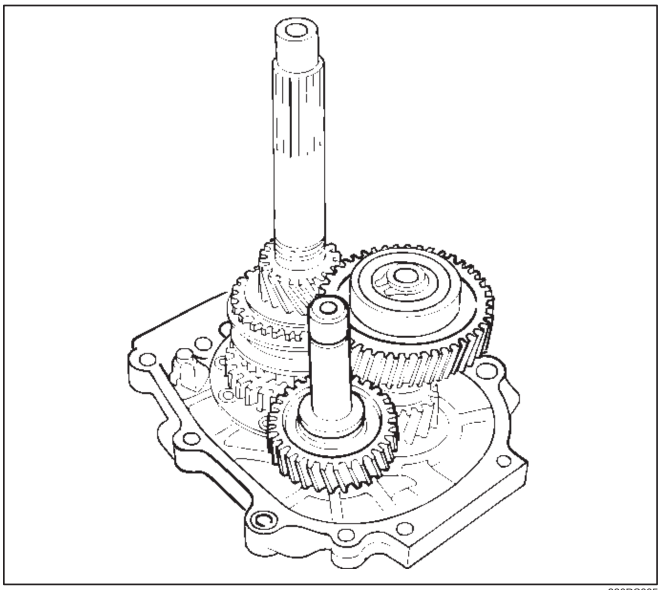
5. Remove the retainer(7) together with the bearing(2) and the oil seal collar(1). (4X4)

   The universal puller may be used in place of the retaining ring remover.
6. Remove thrust plate(8) and thrust washer and lock ball(9).
7. Use a pair of snap ring pliers to remove reverse idler gear snap ring(10).



226RS004

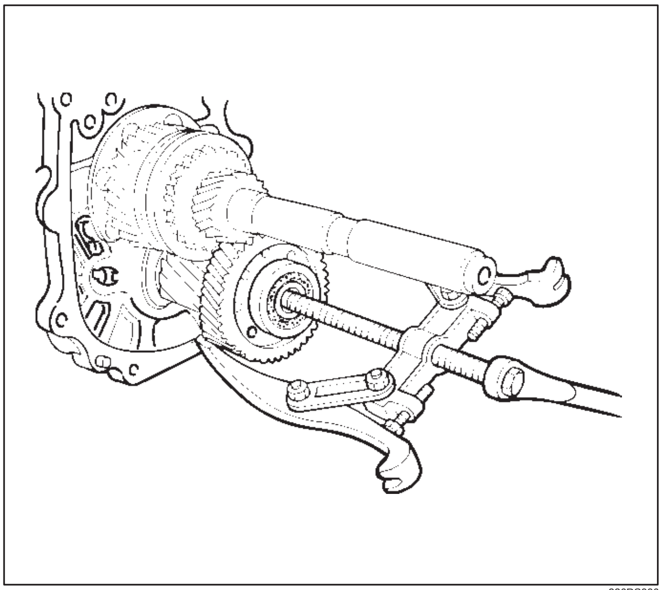
8. Remove the reverse idler gear assembly(11) from the intermediate plate(30).



226RS005

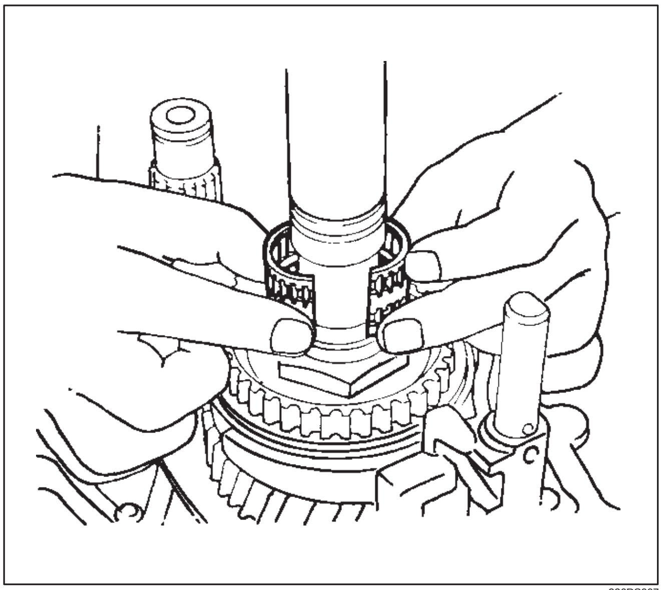
9. Remove idle shaft pin(12), thrust washer(13), reverse idler gear(14), and reverse idler shaft(15).
10. Use a pair of snap ring pliers to remove the snap ring(16).

11. Attach the bearing remover to the counter gear shaft. Use the bearing remover to remove the ball bearing(17) and the counter 5th gear(18).



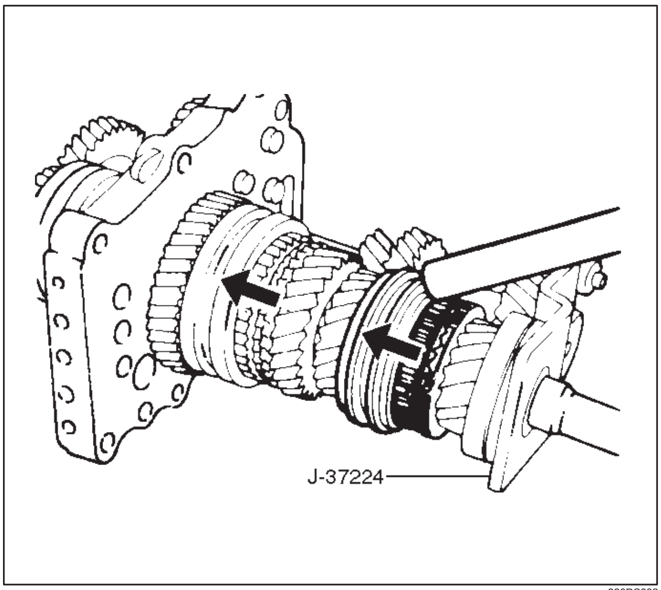
226RS006

12. Remove counter reverse gear(19).
13. Remove 5th gear(20), 5th block ring(21), and needle bearing (2 piece type) (22).



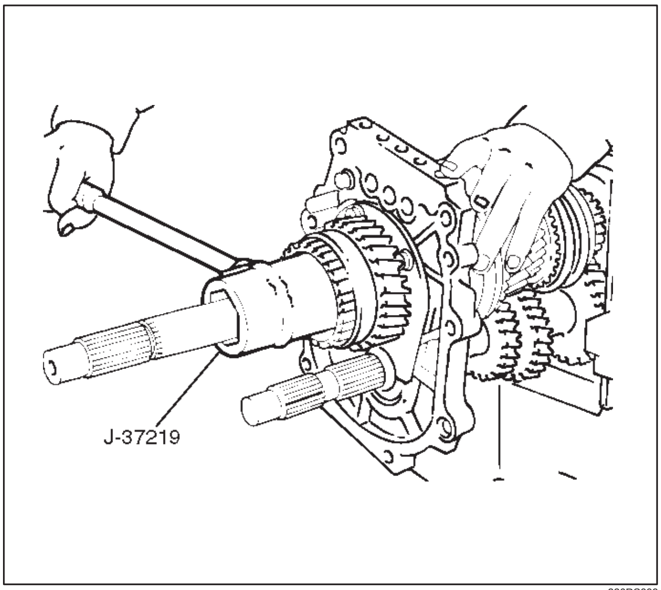
226RS007

14. Engage the 3rd–4th synchronizer with the 3rd gear. Engage the 1st–2nd synchronizer with the 1st gear. Attach the holding fixture J–37224 and base J–3289–20 to the mainshaft and the counter gear.



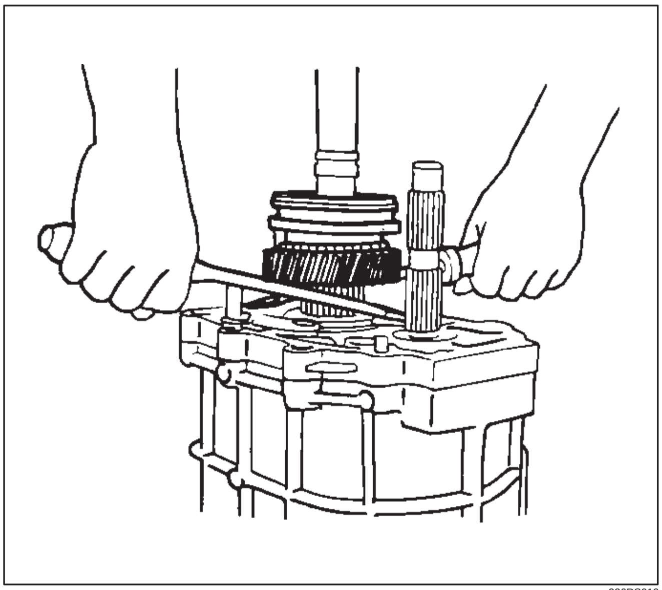
226RS008

Use the mainshaft nut wrench J–37219 to remove the mainshaft nut(23).



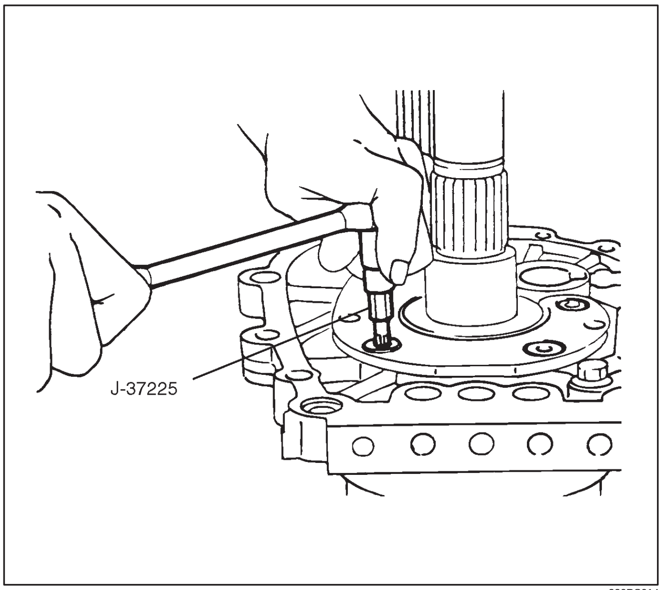
226RS009

15. Use pry bars between the reverse gear(26) and bearing plate(28) to remove the Rev–5th synchronizer assembly(24) together with reverse block ring(25) and reverse gear(26).



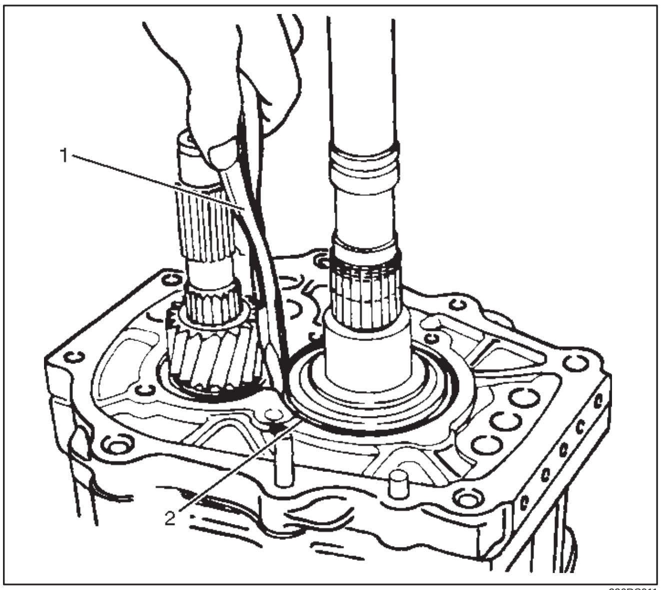
226RS010

16. Remove needle bearing(27).
17. Use the torx bit wrench J–37225(T45) to remove the bearing plate and screw(28) from the intermediate plate.



220RS014

18. Use the snap ring pliers(2) to remove the mainshaft bearing snap ring(1) (29).



226RS011

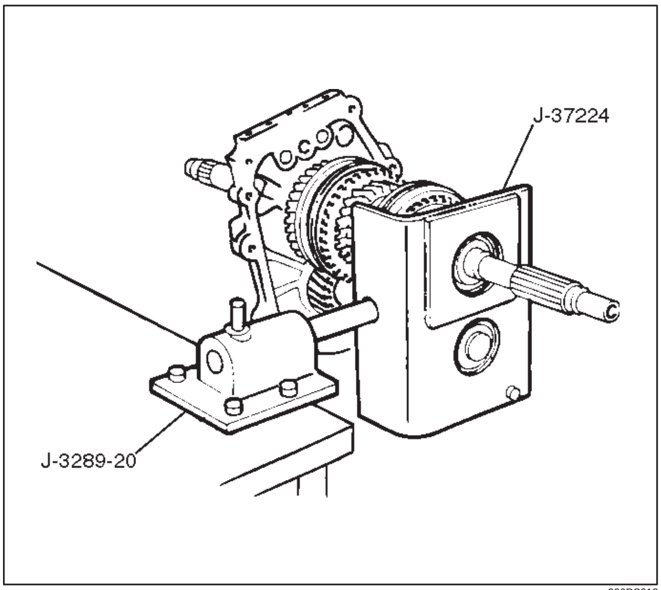
19. Hold the snap ring open with the pliers.
    Push the intermediate plate(30) toward the rear of the transmission to remove it.
    The bearing snap ring will come free.

Inspection and Repair

Refer to Top Gear Shaft, Main Gear Shaft, and Counter Gear in this section for inspection and repair.

Reassembly

1. Mesh the counter gear with the mainshaft assembly.
   Install the holding fixture J–37224 and base J–3289–20 to the mainshaft and the counter gear.



226RS012

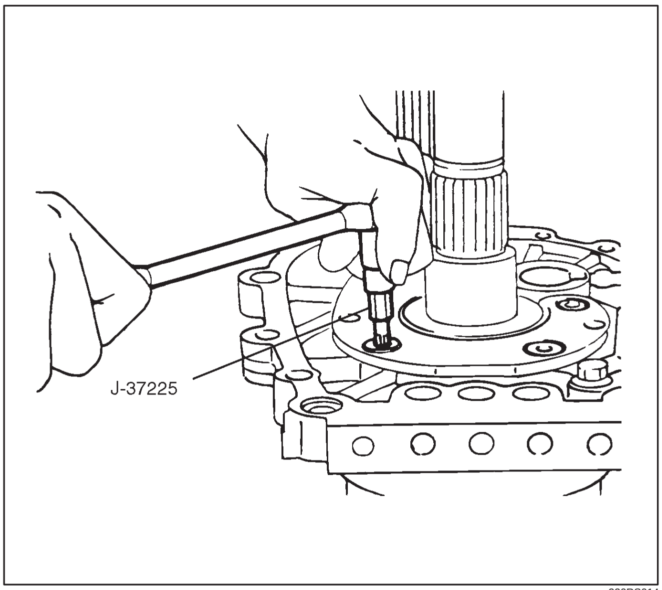
2. Place the holding fixture (with the mainshaft and the counter shaft) in a vise.

   Install the intermediate plate(30).
3. Install bearing snap ring(29).
4. Apply recommended thread locking agents (LOCTITE 242) or its equivalent to each of the bearing plate screw threads.

   Install bearing plate and screw(28).

   Tighten the screws to the specified torque by using torx bit wrench J–37225.

Torque: 15 N·m (11 lb ft)

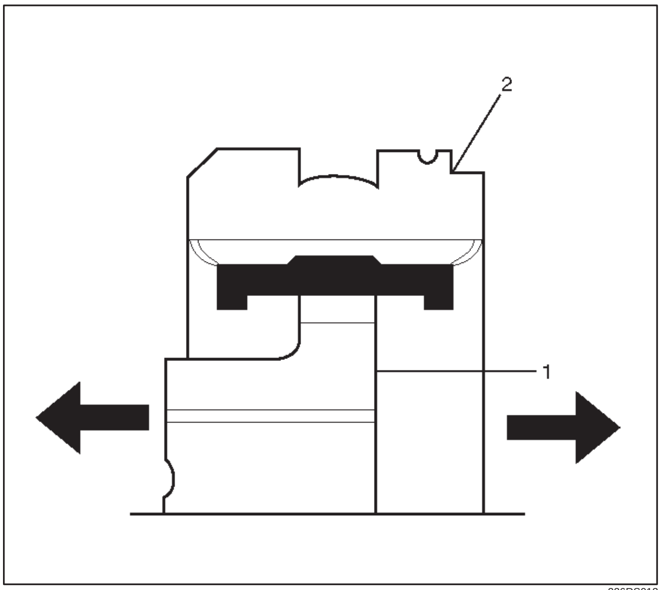


220RS014

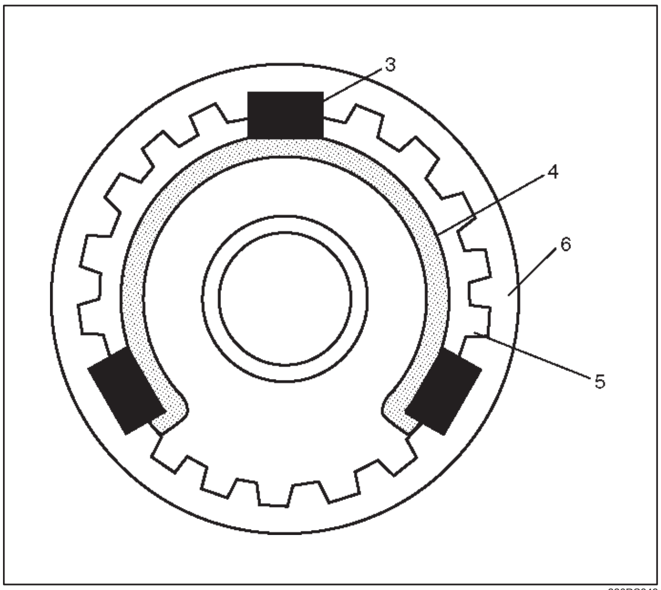
5. Install needle bearing(27), reverse gear(26), and reverse block ring(25).
6. Assemble rev–5th synchronizer assembly(24) by performing the following steps.
   1. Turn the clutch hub face(1) toward the sleeve groove(2) (rear side) on the outer circumference.
   2. Check that the inserts(3) fit snugly into the block ring insert grooves.
   3. Check that the inserts springs(4) are fitted to the inserts as shown in the illustration.
   4. Check that the clutch hub(5) and the sleeve(6) slide smoothly.

5. Install the synchronizer assembly to the mainshaft.

   The clutch hub face (with the heavy boss) must be facing the reverse gear side.

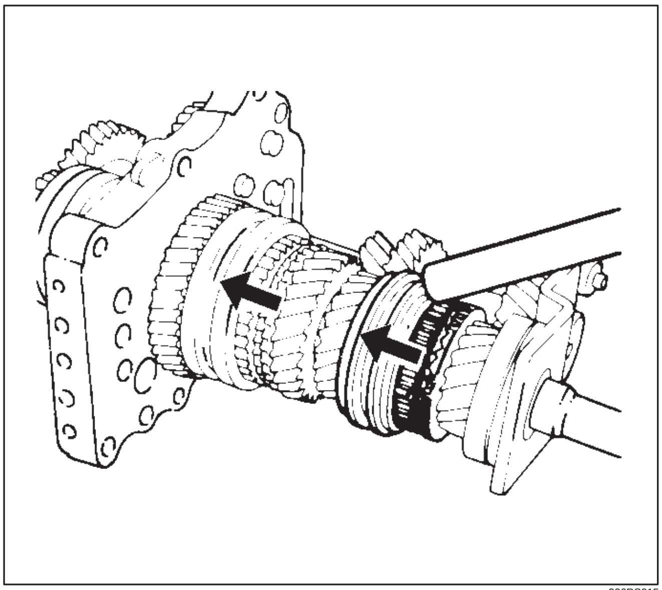


226RS013



226RS049

7. Mesh the 1st–2nd and 3rd–4th synchronizers with both the 1st and 3rd gears (double engagement).

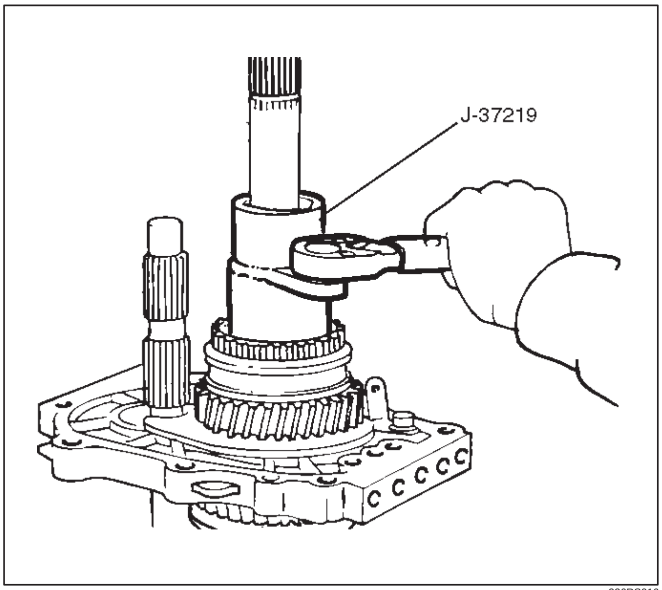


226RS015

This will prevent the mainshaft from turning.

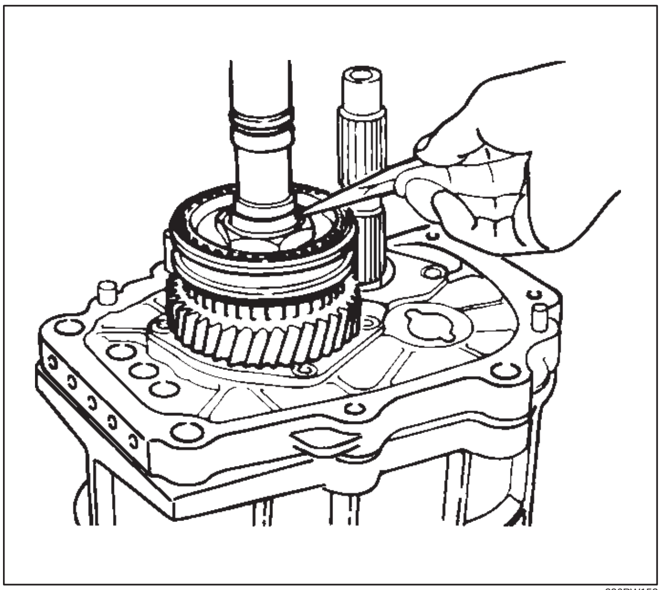
8. Install the new mainshaft hub nut.
   Use the mainshaft nut wrench J–37219 to tighten the mainshaft nut(23) to the specified torque.

Torque: 137 N·m (101 lb ft)



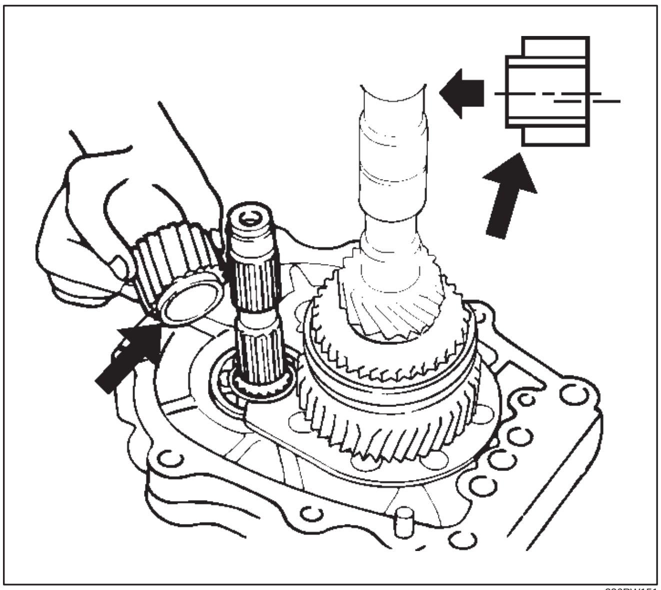
226RS016

9. Use a punch to stake the mainshaft nut.



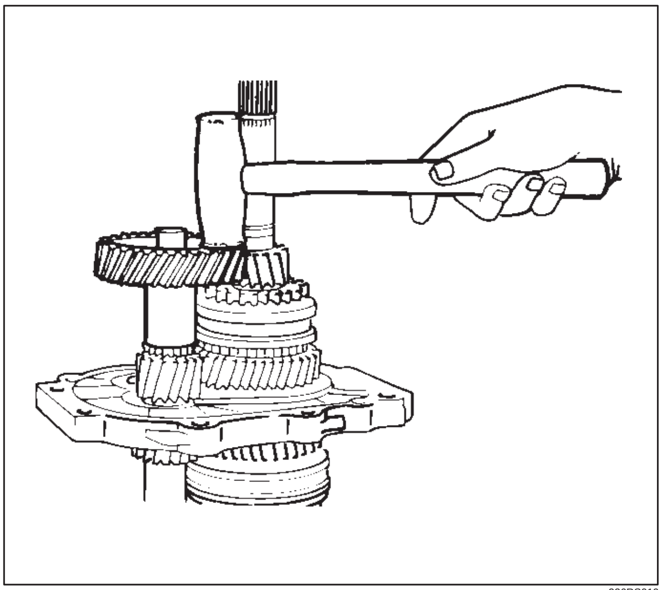
226RW153

10. Install needle bearing(22), 5th block ring(21), and 5th gear(20).
11. Apply engine oil to the counter reverse gear(19) and the reverse gear(26).
    Install the counter reverse gear(19) to the counter shaft.
    The reverse gear projection must be facing the intermediate plate.



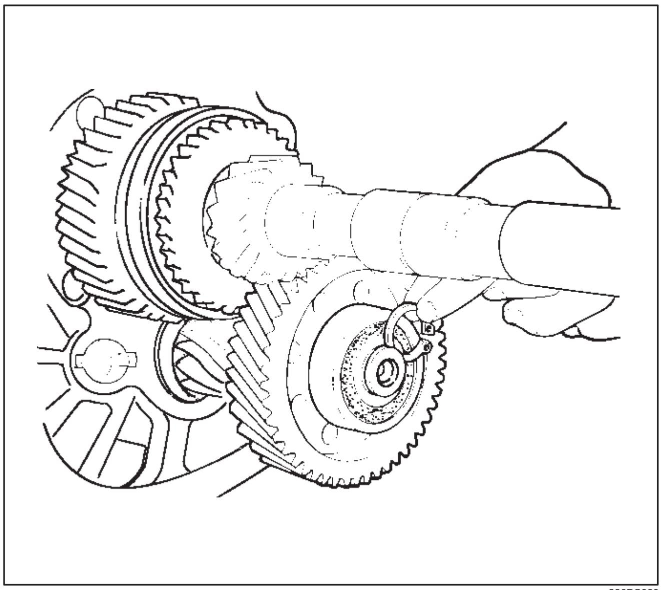
226RW151

12. Install the counter 5th gear(18) to the transmission.



226RS019

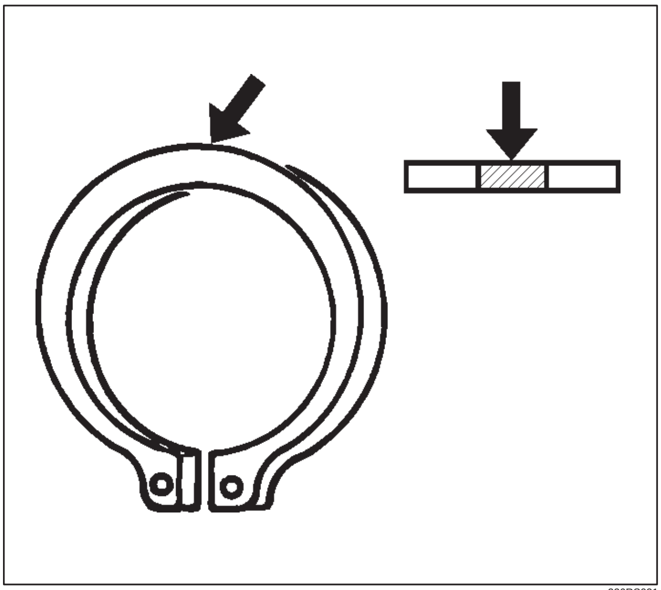
13. Install ball bearing(17) and bearing snap ring by performing the following steps:
    - Select the snap ring which will provide the minimum clearance between the ball bearing and the snap ring.



226RS020

- There are six snap ring sizes available.

  The snap rings are color-coded to indicate their thickness.



226RS021

Ball Bearing and Snap Ring Clearance

Standard: 0–0.15 mm (0–0.0059 in)

Snap Ring Availability

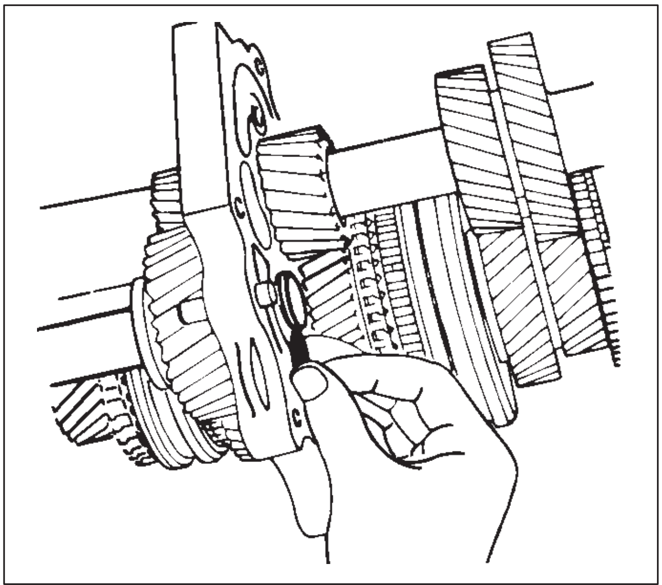
Thickness	Color Coding
1.1 mm (0.043 in)	White
1.2 mm (0.047 in)	Yellow
1.3 mm (0.051 in)	Blue
1.4 mm (0.055 in)	Pink
1.5 mm (0.059 in)	Green
1.6 mm (0.063 in)	Brown

- Use a pair of snap ring pliers to install the snap ring(16) to the counter gear shaft.

  The snap ring must be fully inserted into the counter gear shaft snap ring groove.

14. Assemble reverse idler shaft(15), reverse idler gear(14), thrust washer(13), and idle shaft pin(12) into reverse idler gear assembly(11).

15. Select reverse idler gear snap ring(10) which will provide the minimum clearance between the intermediate plate(30) and the snap ring(10).



226RS022

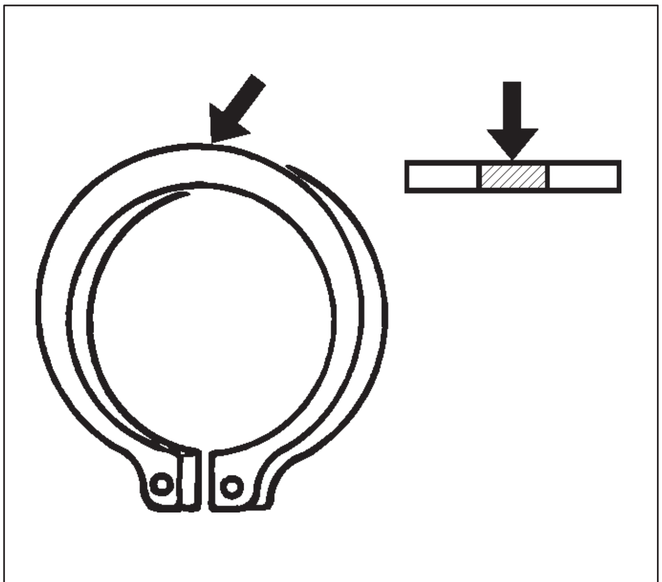
- There are three snap ring sizes available.
  The snap rings are color-coded to indicate their thickness.

Intermediate Plate and Snap Ring Clearance

Standard: 0 – 0.15 mm (0 – 0.0059 in)

Snap Ring Availability

Thickness	Color Coding
1.2 mm (0.047 in)	White
1.3 mm (0.051 in)	Yellow
1.4 mm (0.055 in)	Blue



226RS021

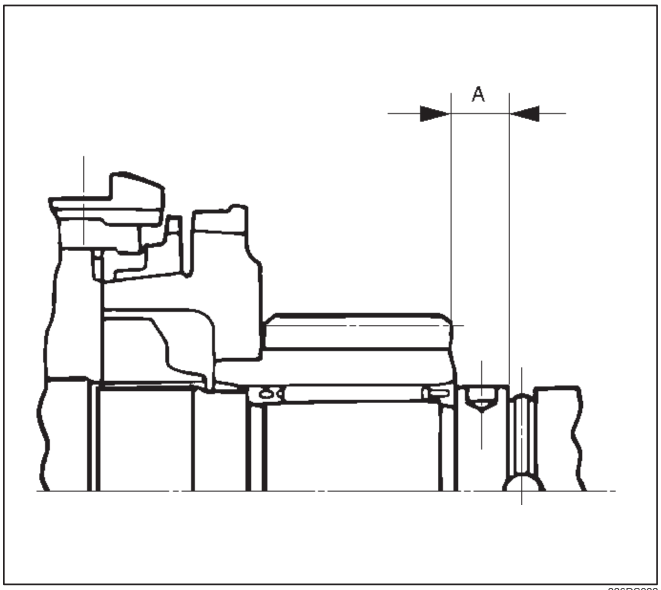
- Use a pair of snap ring pliers to install the snap ring to the reverse idler shaft.
  The snap ring must be fully inserted into the reverse idler shaft snap ring groove.

16. Install thrust washer and lock ball(9) by performing the following steps:
    - Use a thickness gauge to measure the clearance between the 5th gear and the thrust washer.

5th Gear and Thrust Washer Clearance

Standard: 0.10 – 0.25 mm (0.004 – 0.010 in)

- Measure clearance “A” as shown in the figure.

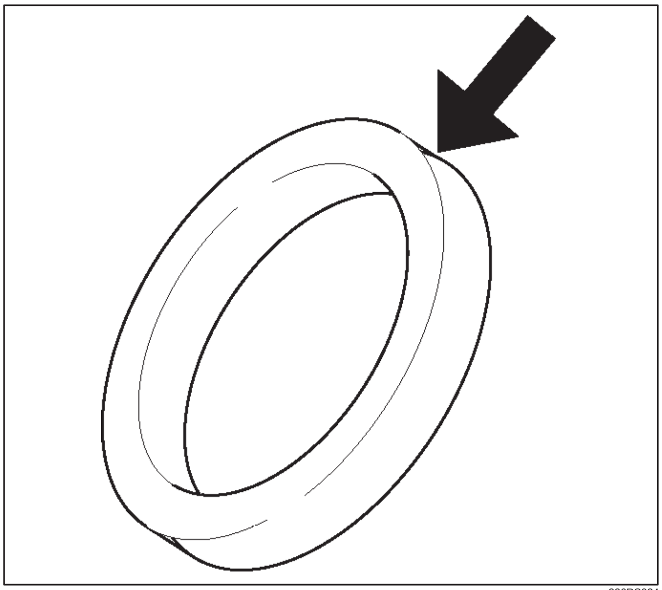


226RS023

- Select appropriate thrust washer from chart.
- There are four thrust washer sizes available.
- The thrust washers are color coded to indicate their thickness.

Thrust Washer Availability

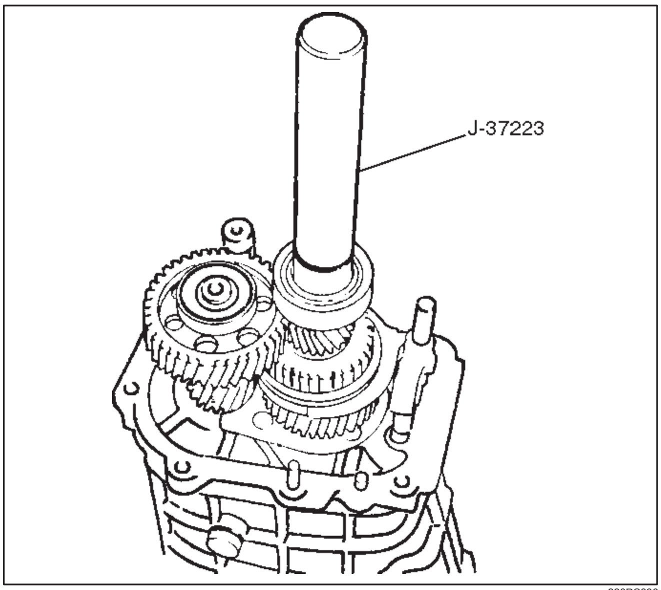
Thickness mm (in)	Color Coding	A mm (in)	Clearance mm (in)
7.9 (0.311)	White	8.05–8.1 (0.317–0.319)	0.15–0.25 (0.006–0.010)
8.0 (0.315)	Yellow	8.1–8.2 (0.319–0.323)	0.1–0.25 (0.004–0.010)
8.1 (0.319)	Green	8.2–8.3 (0.323–0.327)	0.1–0.25 (0.004–0.010)
8.2 (0.323)	Bluen	8.3–8.36 (0.327–0.329)	0.1–0.21 (0.004–0.008)



226RS024

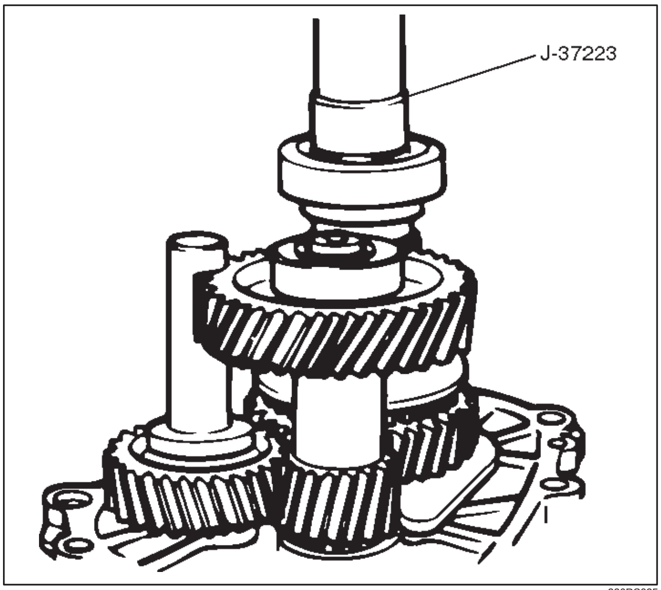
- Apply grease to the thrust washer and the lock ball.
- Install the thrust washer and the lock ball.

17. Install thrust plate(8) and retainer(7).
18. Install retaining snap ring(6), clip(5), speedometer drive gear(4), and bearing snap ring(3). (4X2)
19. Use the installer J–37223 to install the ball bearing(2) to the mainshaft. (4X2)



226RS096

20. Install bearing snap ring(1). (4X2)
21. Apply engine oil to the bearing inner and outer circumference. (4X4)
    Use the installer J–37223 to install the ball bearing(2) to the mainshaft in proper direction. (4X4)



226RS025

22. Install oil seal collar(1). (4X4)

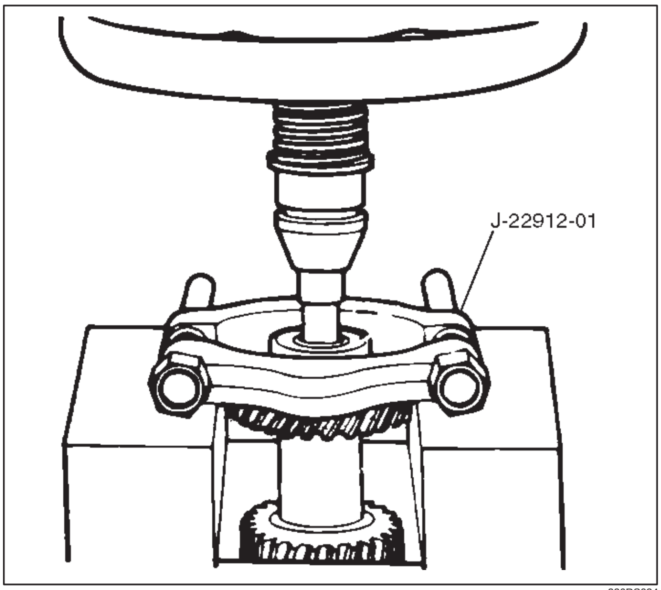
15. Remove bearing snap ring(27)
16. Use a bench press and the bearing remover J–22912–01 to remove the front roller bearing(28).



226RS034

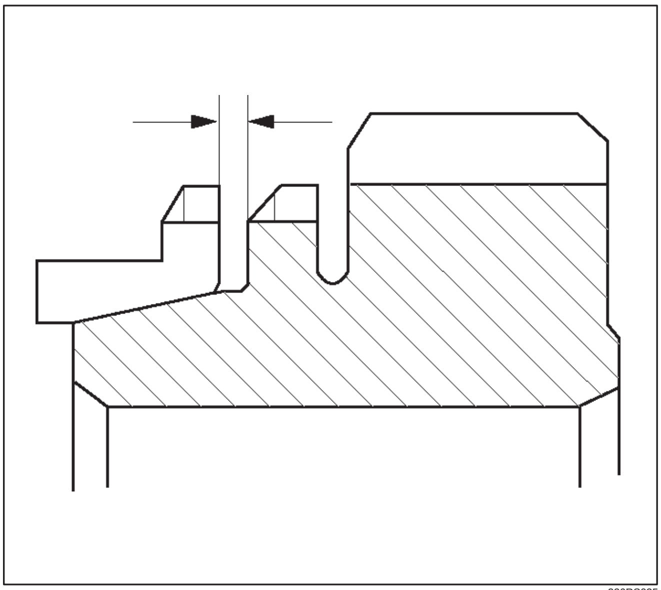
17. Remove center roller bearing(29) from counter gear shaft(30).

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Block Ring and Dog Teeth Clearance

- Use a thickness gauge to measure the clearance between the block ring and the dog teeth.



226RS035

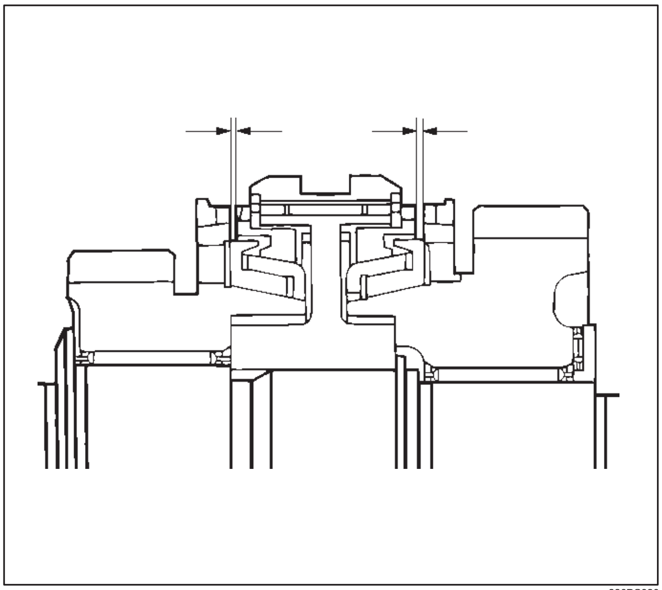
If the measured value exceeds the specified limit, the block ring must be replaced.

Block Ring and Dog Teeth Clearance

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.032 in)

1st–2nd Synchronizer (3–CONE)

- Use a thickness gauge to measure the clearance between the block ring and the dog teeth.



226RS036

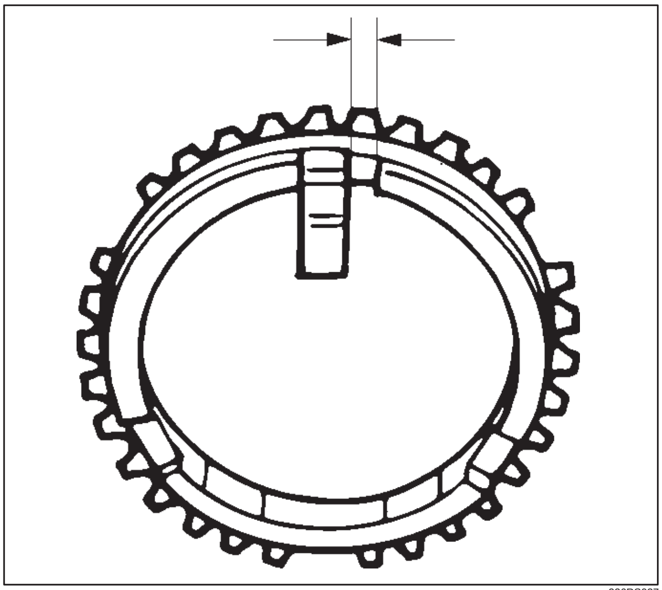
If the measured value exceeds the specified limit,the 1st–2nd synchronizer assembly must be replaced.

Block Ring and Dog Teeth Clearance

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.032 in)

Block Ring and Insert Clearance

- Use a vernier caliper or thickness gauge to measure the clearance between the block ring and the insert.



226RS037

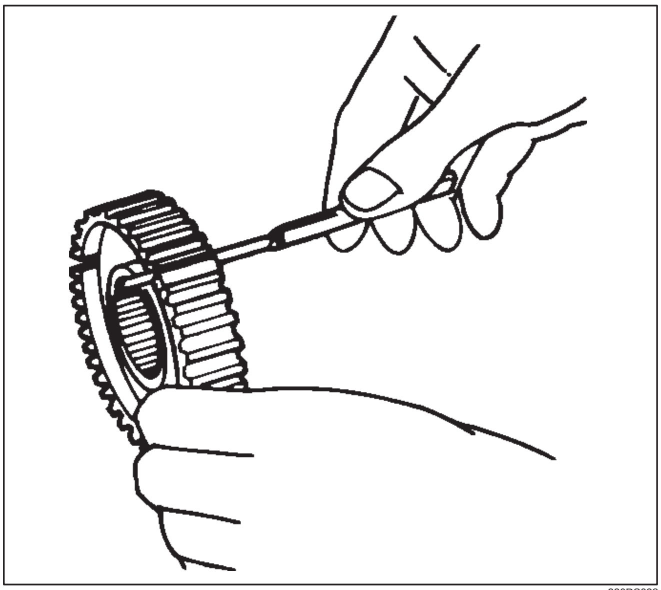
If the measured value exceeds the specified limit, the block ring and the insert must be replaced.

Block and Insert Clearance

	Standard	Limit
3rd–4th	3.46 – 3.74 mm (0.136 – 0.147 in)	4.0 mm (0.158 in)
1st–2nd	4.34 – 4.66 mm (0.171 – 0.183 in)	4.9 mm (0.193 in)
Rev–5th	3.59 – 3.91 mm (0.141 – 0.154 in)	4.1 mm (0.161 in)

Clutch Hub and Insert Clearance

- Use a thickness gauge to measure the clearance between the clutch hub and the insert.



226RS038

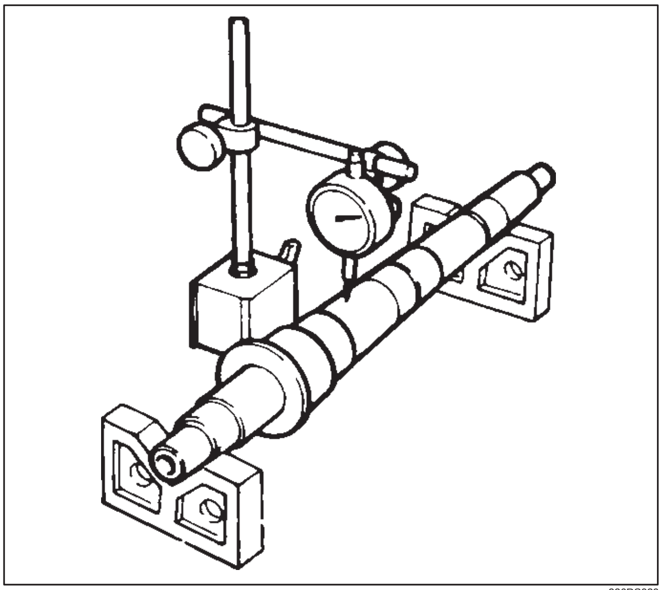
If the measured value exceeds the specified limit, the clutch hub and the insert must be replaced.

Clutch Hub and Insert Clearance

	Standard	Limit
3rd–4th	0.01 – 0.19 mm (0.0004 – 0.0075 in)	0.3 mm (0.012 in)
1st–2nd Rev–5th	0.09 – 0.31 mm (0.0035 – 0.0122 in)	0.4 mm (0.016 in)

Mainshaft Run-out

- Install the mainshaft to V-blocks.
- Use a dial indicator to measure the mainshaft central portion run-out.



226RS039

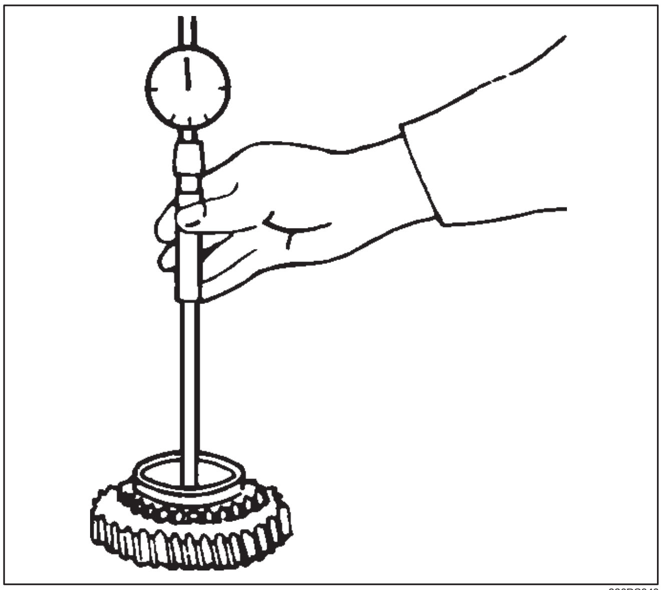
If the measured mainshaft run-out exceeds the specified limit, the mainshaft must be replaced.

Mainshaft Run–out

Limit: 0.05 mm (0.0020 in)

Gear Inside Diameter

- Use an inside dial indicator to measure the gear inside diameter.



226RS040

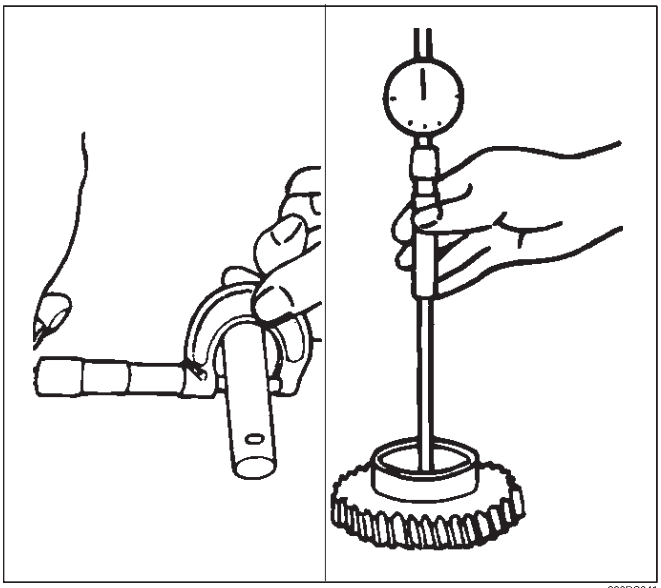
If the measured value is less than the specified limit, the gear must be replace.

Gear Inside Diameter

	Standard	Limit
1st 3rd	45.000 – 45.013 mm (1.771 – 1.772 in)	45.100 mm (1.776 in)
2nd	52.000 – 52.013 mm (2.047 – 2.048 in)	52.100 mm (2.051 in)
Rev.	48.000 – 48.013 mm (1.889 – 1.890 in)	48.100 mm (1.894 in)
5th	32.000 – 32.013 mm (1.259 – 1.260 in)	32.100 mm (1.246 in)

Reverse Idler Gear and Idler Gear Shaft Clearance

- Use a micrometer to measure the idler gear shaft diameter.
- Use an inside dial indicator to measure the idler gear inside diameter.



226RS041

- Calculate the idler gear and idler gear shaft clearance.

  Idler gear inside diameter-idler gear shaft diameter = idle gear and idler gear shaft clearance.

  If the measured value exceeds the specified limit, the idle gear and/or the idler gear shaft must be replaced.

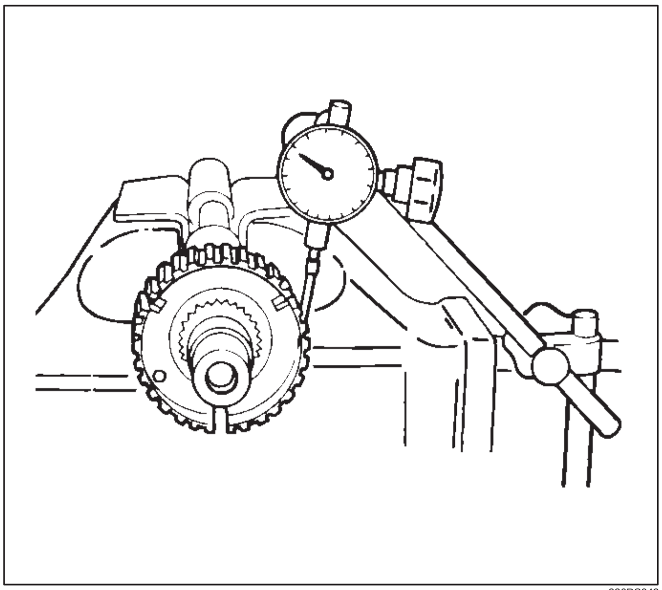
Idler Gear and Idler Gear Shaft Clearance

Standard: 0.041–0.074 mm (0.016–0.0029 in)

Limit: 0.150 mm (0.0059 in)

Clutch Hub Spline Play

- Set a dial indicator to the clutch hub to be measured.



226RS042

- Move the clutch hub as far as possible to both the right and the left.
  Note the dial indicator reading.
  If the measured value exceeds the specified limit, the clutch hub must be replaced.

Clutch Hub Spline Play

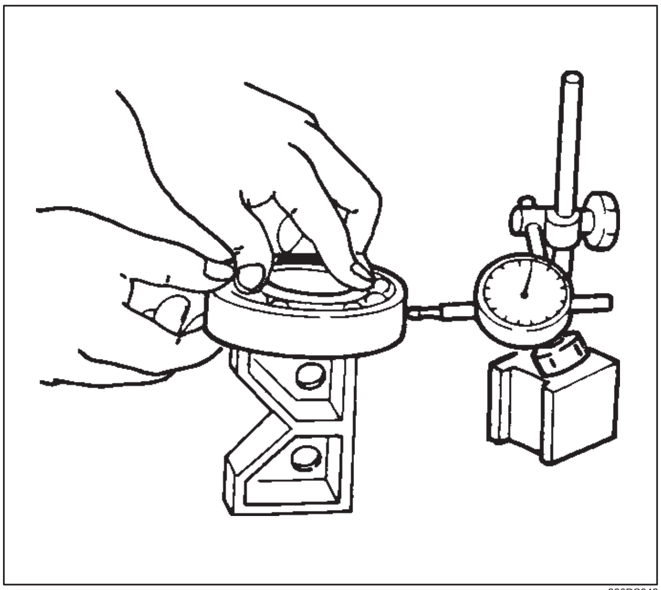
	Standard	Limit
1st–2nd 3rd–4th	0 – 0.1 mm (0 – 0.004 in)	0.2 mm (0.008 in)
Rev. 5th	0 – 0.2 mm (0 – 0.008 in)	0.3 mm (0.012 in)

Ball Bearing Play

- Use a dial indicator to measure the ball bearing play.

Ball Bearing Play

Limit: 0.2 mm (0.008 in)

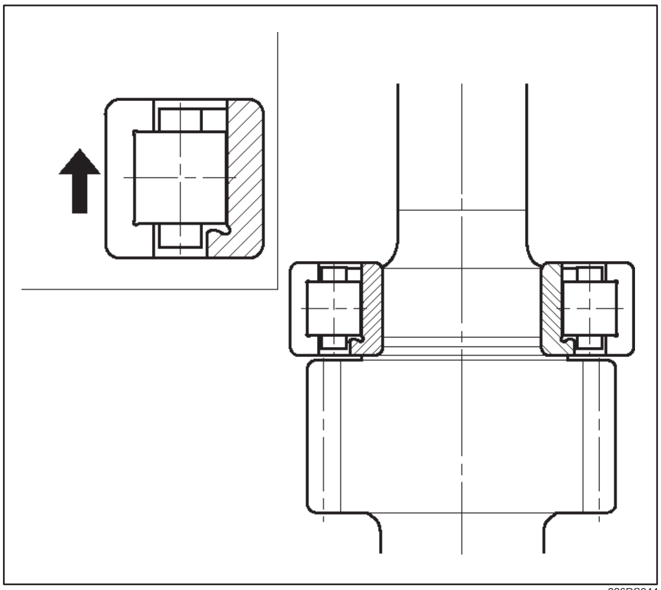


226RS043

Reassembly

1. Install center roller bearing(29) to counter gear shaft(30).
   - Apply engine oil to the bearing inner and outer circumferences.
   - Install the roller bearing in the proper direction.

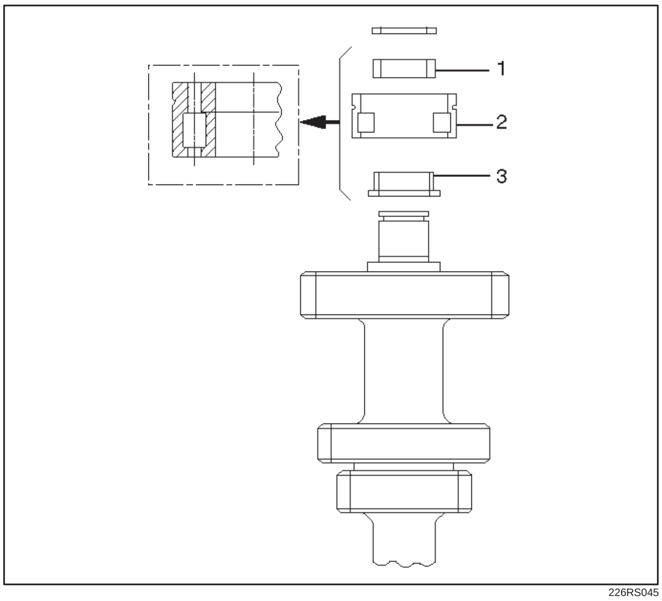
NOTE: Check that outer race moves only in the direction of arrow.



226RS044

2. Install front roller bearing(28) by performing the following steps.
   - Use bearing installer to install the front roller bearing inner race to the counter gear shaft.
   - Install the outer race and roller assembly.
     The snap ring groove must be facing the transmission front side.

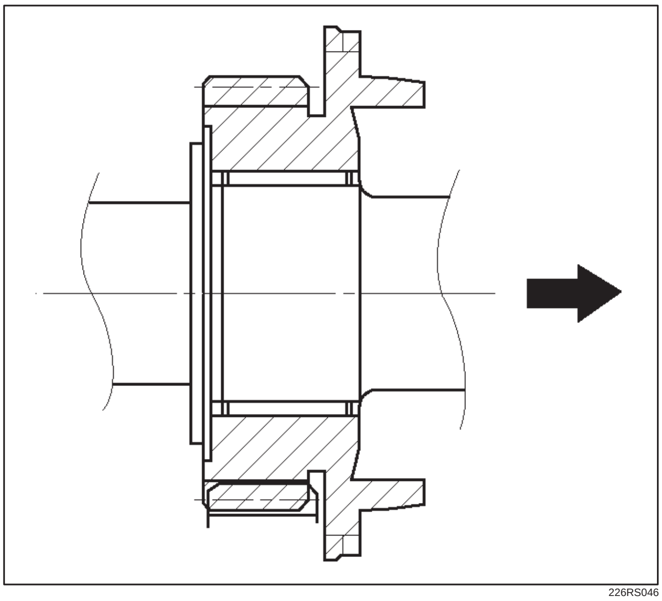
- Use bearing installer J–35283 to install the ring.



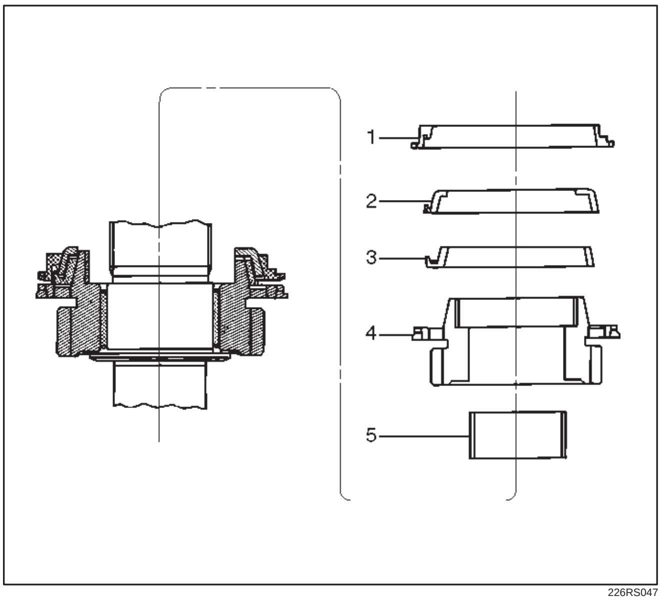
Legend

(1) Ring
(2) Outer Race and Roller Assembly
(3) Inner Race

3. Install bearing snap ring(27) to mainshaft(26).
4. Apply engine oil to the needle bearing(25) and the 2nd gear thrust surfaces.
   Install the needle bearing(25) and the 2nd gear(24) to the mainshaft.
   The 2nd gear dog teeth must be facing the transmission rear side.



5. Assemble 2nd inside ring(23), 2nd outside ring(22), and 2nd block ring(21).
   - Apply engine oil to the synchronizer ring friction surfaces.

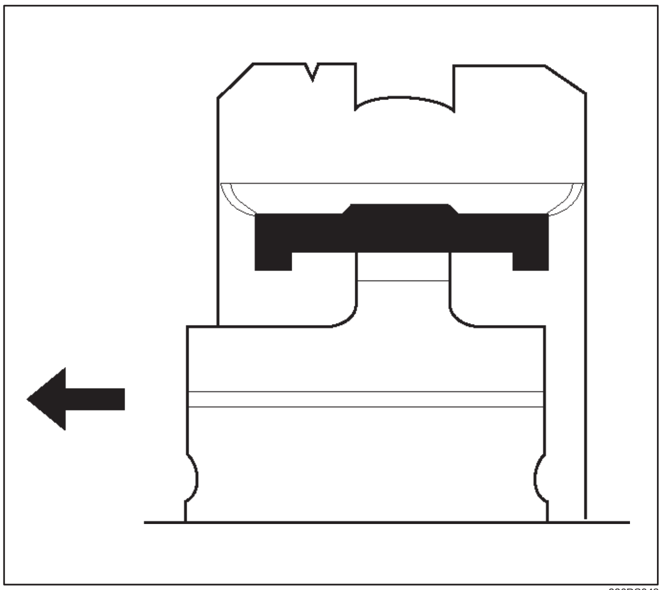


Legend

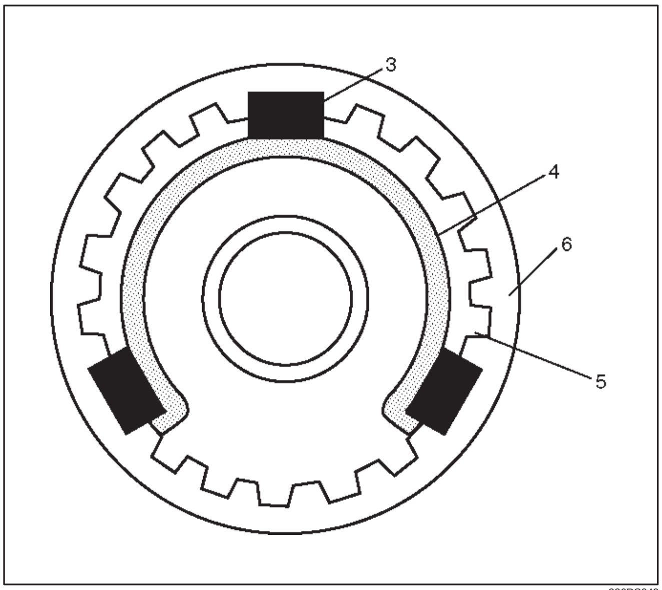
(1) Block Ring
(2) Outside Ring
(3) Inside Ring
(4) 2nd Gear
(5) Needle Bearing

6. Assemble 1st–2nd synchronizer assembly by performing the following steps:
   1. Check that the inserts(3) fit snugly into the block ring insert grooves.
   2. Check that the inserts springs(4) are fitted to the inserts as shown in the illustration.
   3. Check that the clutch hub(5) and the sleeve(6) slide smoothly.
   4. Install the synchronizer assembly to the mainshaft.

   The clutch hub face (with the heavy boss) must be facing the 2nd gear side.

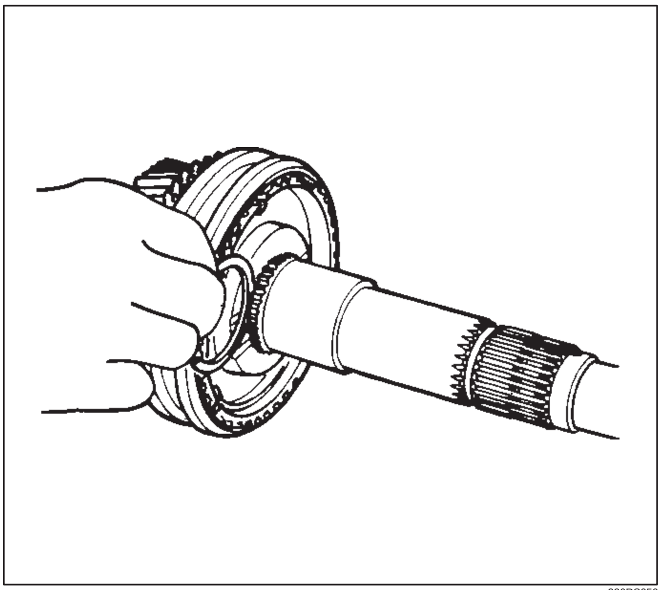


226RS048



226RS049

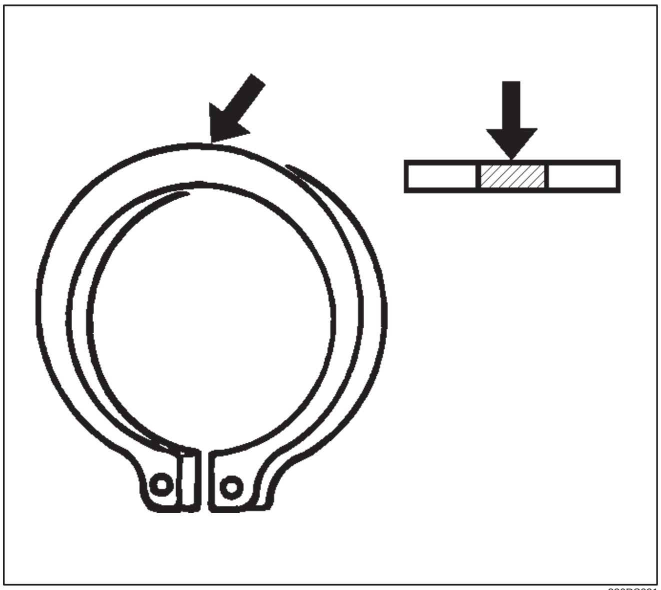
7. Install clutch hub snap ring(19) by performing the following steps:
   - Select the snap ring which will provide the minimum clearance between the 1st–2nd clutch hub and the snap ring.



226RS050

There are three snap ring sizes available.

The snap rings are color coded to indicate their thickness.



226RS021

Clutch Hub and Snap Ring Clearance

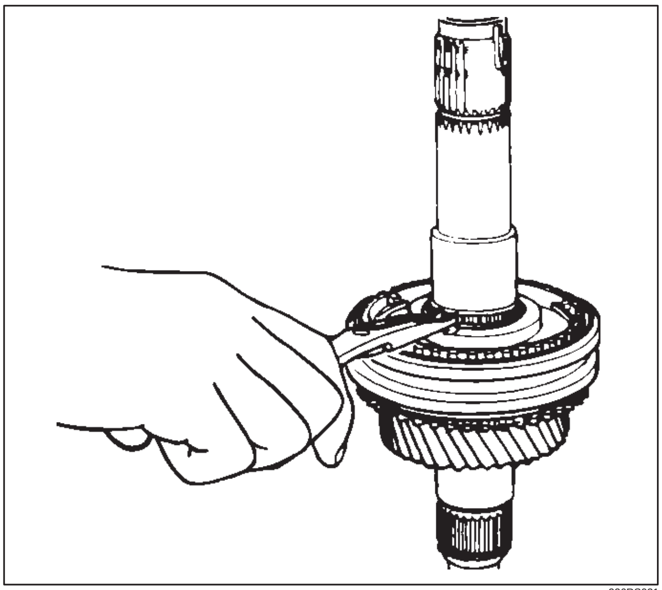
Standard: 0 – 0.1 mm (0 – 0.004 in)

Snap Ring Availability

Thickness	Color Coding
1.80 mm (0.071 in)	White
1.85 mm (0.073 in)	Yellow
1.90 mm (0.075 in)	Blue

- Use a pair of snap ring pliers to install the snap ring to the mainshaft.

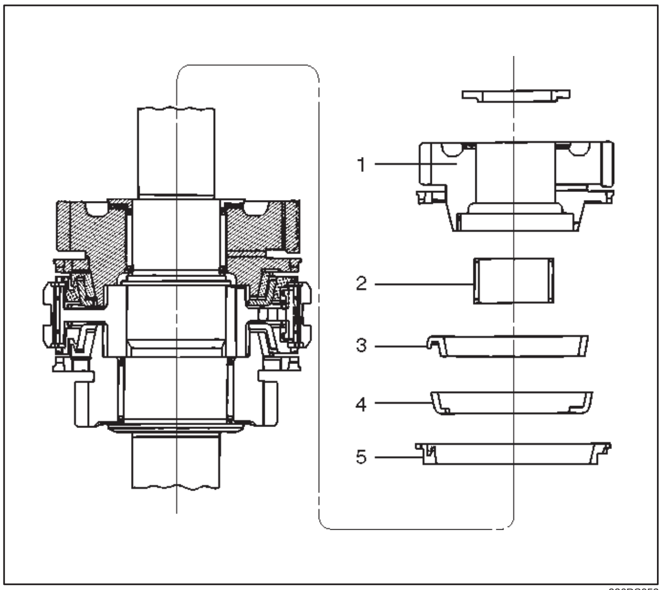
  The snap ring must be fully inserted into the mainshaft snap ring groove.



226RS031

8. Install needle bearing(18), 1st block ring(17), 1st outside ring(16), 1st inside ring(15), and 1st gear(14).
   - Apply engine oil to the needle bearing, 1st gear thrust surfaces and synchronizer ring friction surfaces.
   - Install the needle bearing and the 1st gear to the mainshaft.

     The 1st gear dog teeth must be facing the transmission front side.



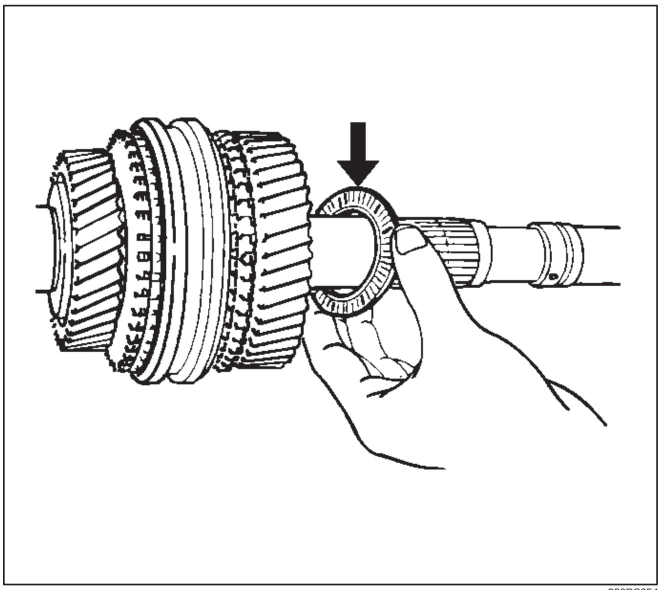
226RS053

Legend

(1) 1st Gear
(2) Needle Bearing
(3) Inside Ring
(4) Outside Ring
(5) Block Ring

9. Install the 1st gear thrust bearing and the race(13) to the main shaft.

   The thrust bearing side must be facing the transmission front side.



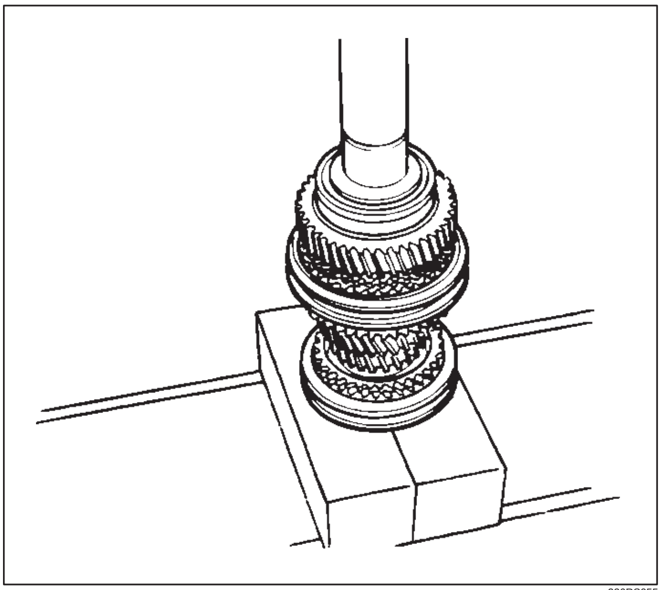
226RS054

10. Apply engine oil to the mainshaft ball bearing(12) and the mainshaft(26).

    Install the ball bearing(12) and needle bearing collar(11) to the mainshaft(26).

    The ball bearing snap ring groove must be facing the transmission rear side.

    Use a bench press and installer J–6133–01 to slowly force the collar into place.

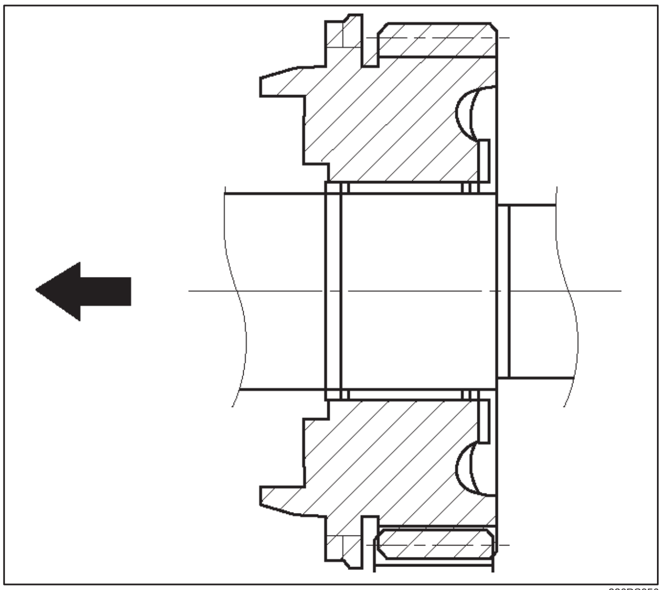


226RS055

11. Apply engine oil to the needle bearing and the 3rd gear thrust surfaces.

    Install the needle bearing(10) and the 3rd gear(9) to the mainshaft.

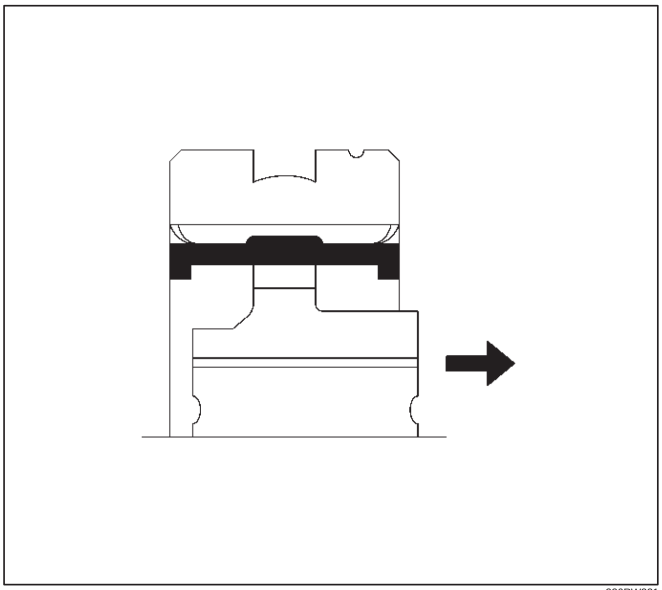
    The 3rd gear dog teeth must be facing the transmission front side.



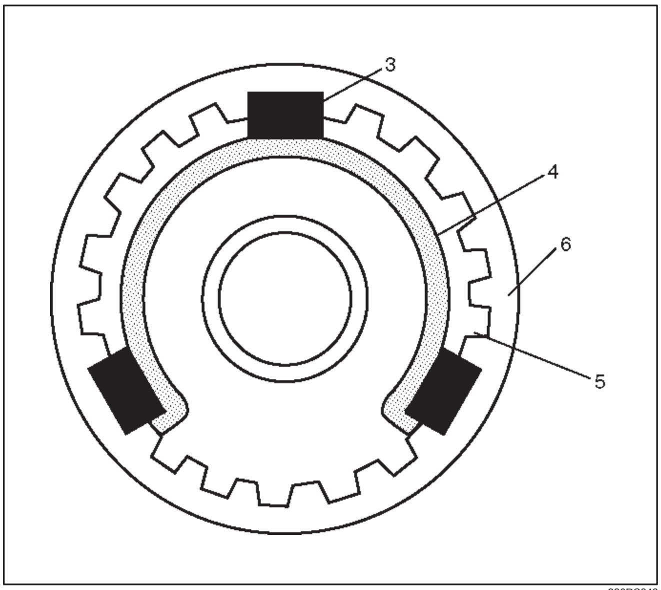
226RS056

12. Install 3rd block ring(8).
13. Check and install 3rd–4th synchronizer assembly(7) by the following steps:
    1. Check that the inserts(3) fit snugly into the block ring insert grooves.
    2. Check that the insert springs(4) are fitted to the inserts as shown in the illustration.
    3. Check that the clutch hub(5) and the sleeve(6) slide smoothly.
    4. Install the synchronizer assembly to the mainshaft.

    The clutch hub face (with the heavy boss) must be facing the 3rd gear side.

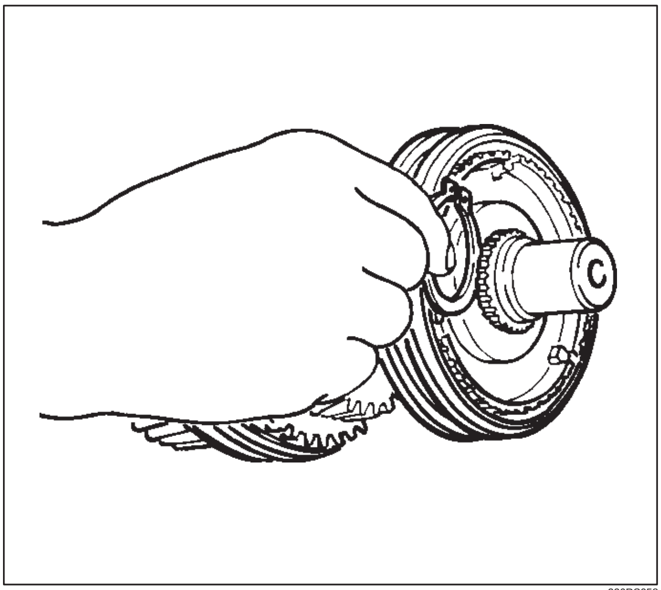


226RW221



226RS049

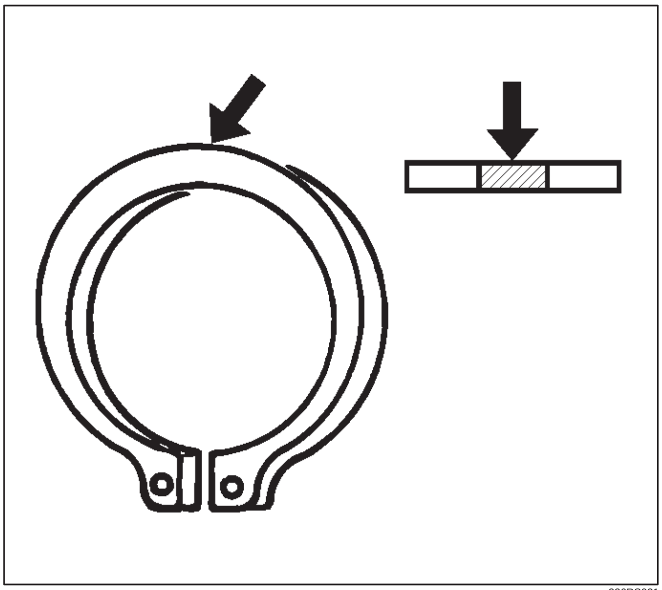
14. Select and install mainshaft snap ring(6) in the following way:
    - Select the snap ring which will provide the minimum clearance between the 3rd–4th clutch hub and the snap ring.



226RS058

There are three snap ring sizes available.

The snap rings are color coded to indicate their thickness.



226RS021

Clutch Hub and Snap Ring Clearance

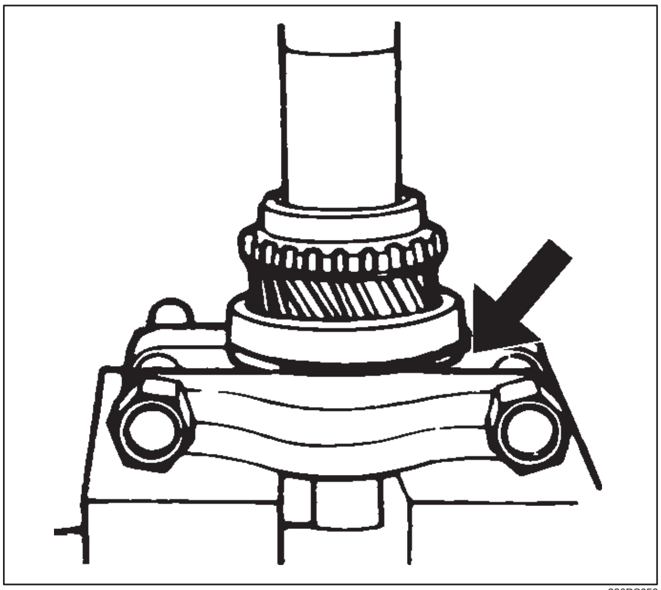
Standard: 0 – 0.1 mm (0 – 0.004 in)

Snap Ring Availability

Thickness	Color Coding
1.80 mm (0.071 in)	White
1.85 mm (0.073 in)	Yellow
1.90 mm (0.075 in)	Blue

- Use a pair of snap ring pliers to install the snap ring to the mainshaft.
  The snap ring must be fully inserted into the mainshaft snap ring groove.

15. Install top block ring(5).
16. Apply grease to the bearing inner and outer circumferences and install needle bearing(4).
17. Use a bench press to install the top gear shaft ball bearing(3) to the top gear shaft(2).



226RS059

The snap ring groove must be facing the transmission front side.

18. Use a pair of snap ring pliers to install the top gear shaft snap ring(1) to the bearing.

Main Data and Specifications

General Specifications

		4X2	4X4
Transmission type		Fully synchronized forward and reverse gears	
Transfer case		—	Synchronized type gears shifting between the 2– and 4–wheel drive mode. Constant mesh type gears between “low” and “high”
Control method		Remote control with the gear shift lever on the floor.	
Gear ratio: Transmission	1st	3.767	
	2nd	2.248	
	3rd	1.404	
	4th	1.000

Service Precaution

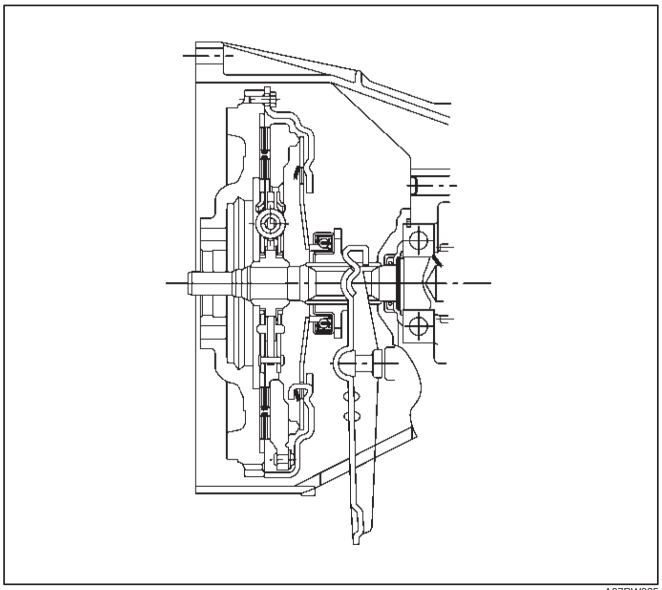
WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

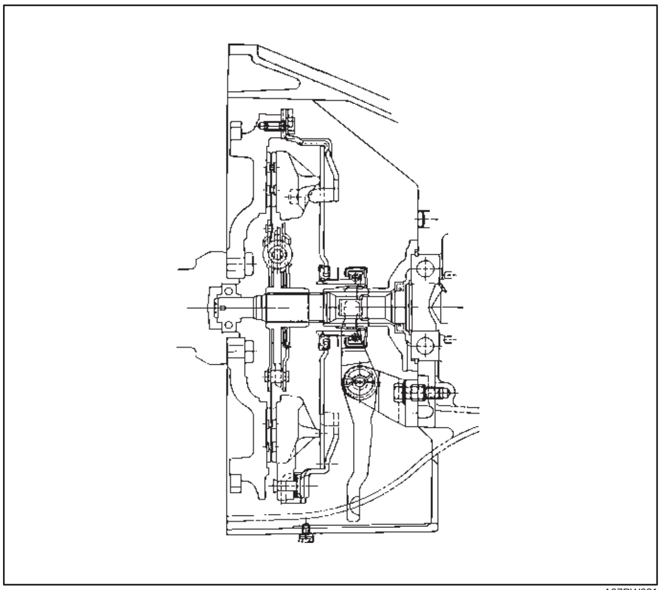
Clutch

X22SE



A07RW035

6VD1



A07RW031

The clutch assembly consists of the pressure plate assembly and the driven plate assembly.

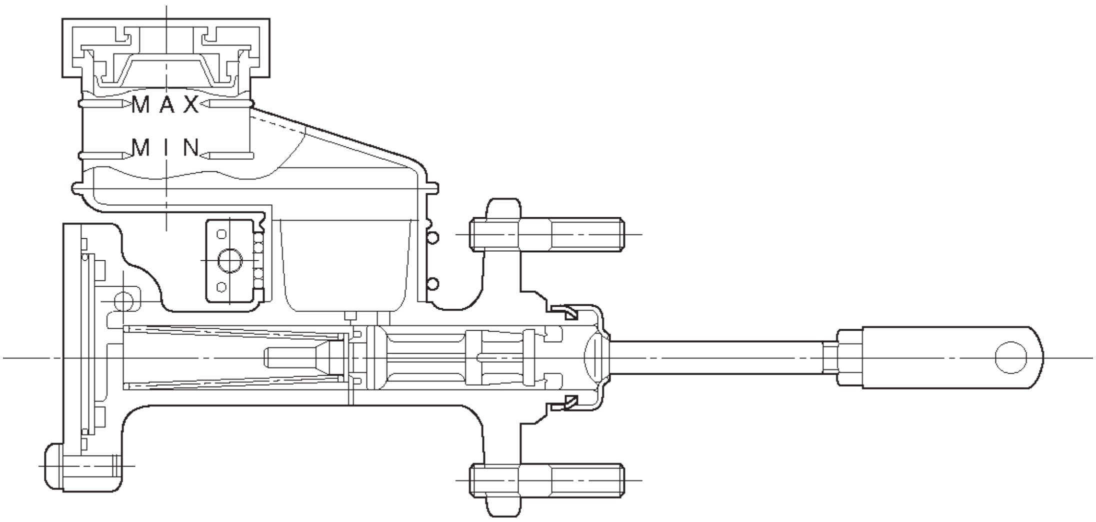
The clutch pedal is connected to the release bearing through the shift fork.

The driven plate assembly is installed between the flywheel and the pressure plate. Diaphragm spring pressure holds the driven plate against the flywheel and the pressure plate to provide the friction necessary to engage the clutch.

Depressing the clutch pedal moves the shift fork against the release bearing. The release bearing force overcomes the force of the diaphragm spring and separates the driven plate from the flywheel and pressure plate to disengage the clutch.

For 6VD1 (3.2L) engine model, the pull–type clutch is employed.

Master Cylinder

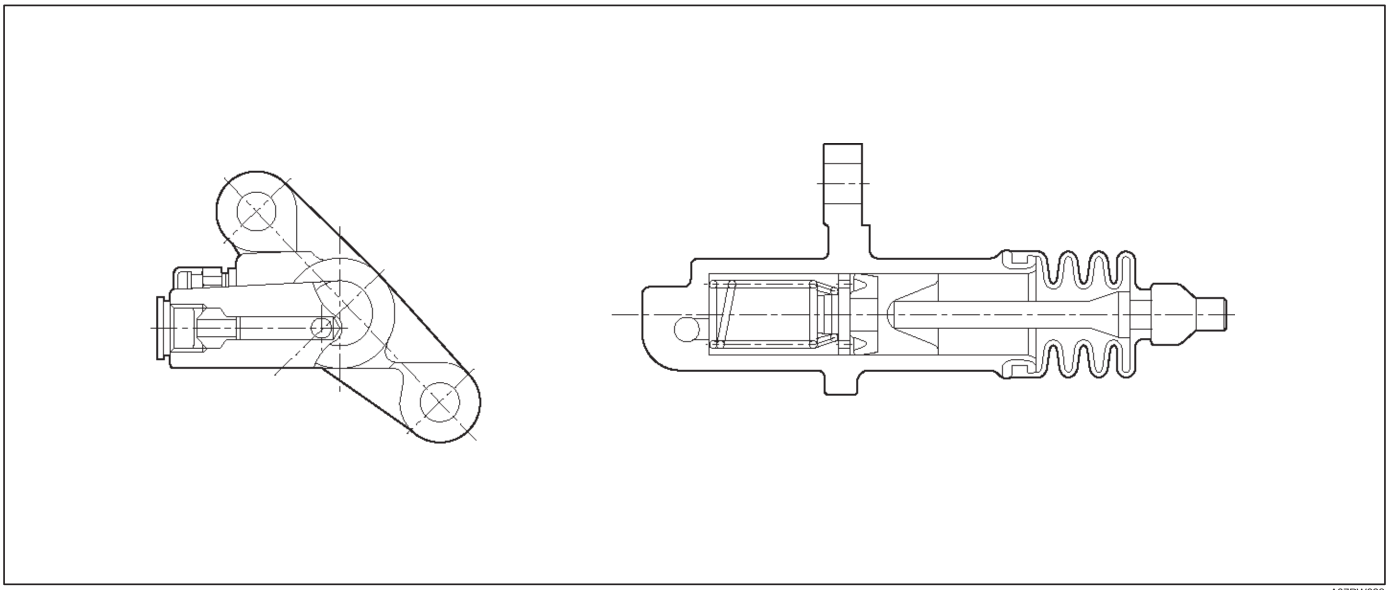


A07RW007

The master cylinder converts mechanical energy into hydraulic energy.
Depressing the clutch pedal causes the push rod to move against the piston to close the return port.
Clutch fluid is forced out of the master cylinder.
Releasing the clutch pedal causes the return spring to force the piston back to its original position.

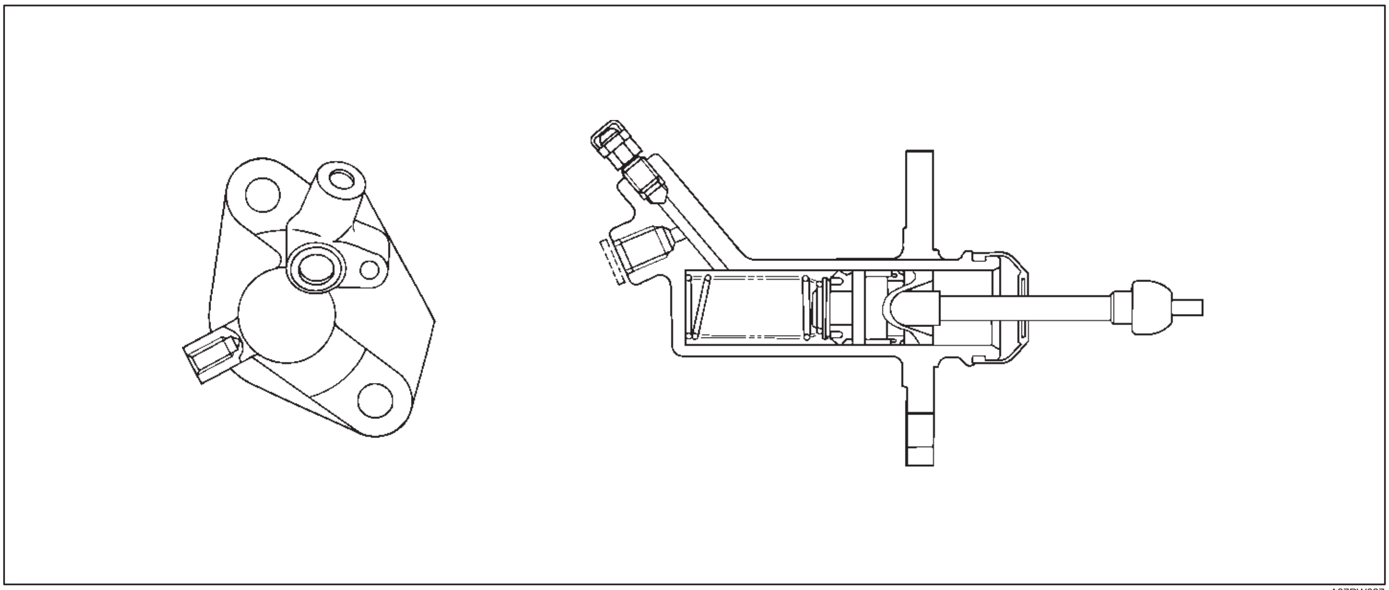
Slave Cylinder

X22SE



A07RW028

6VD1

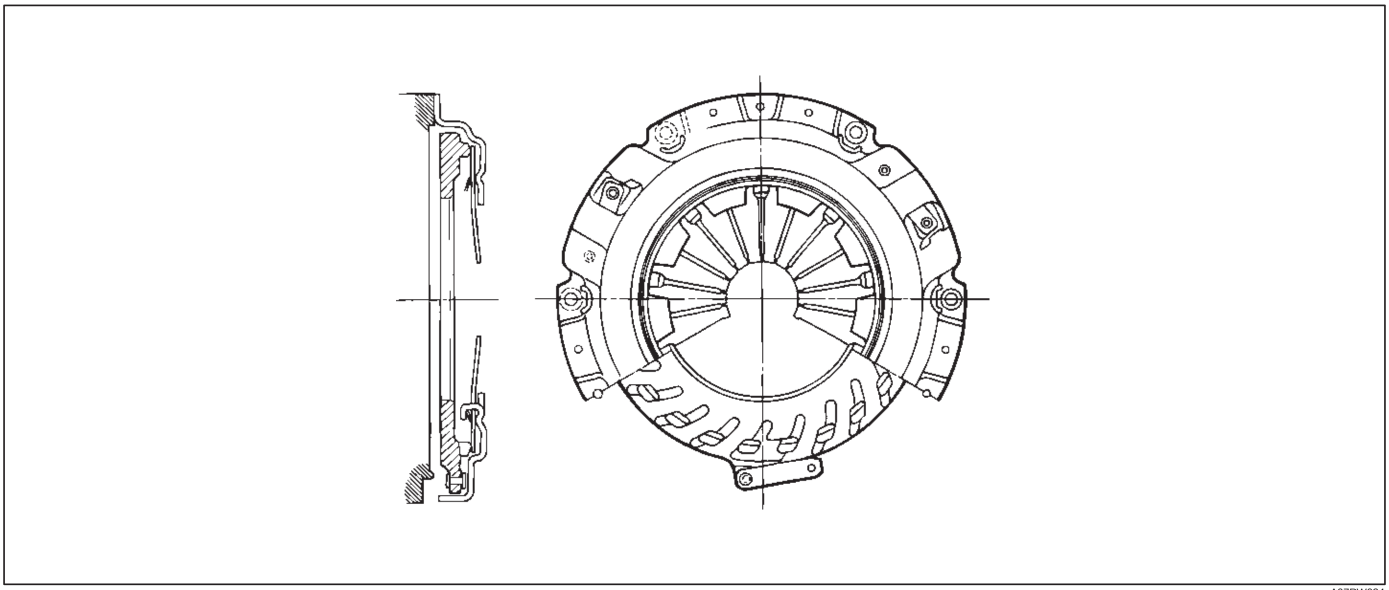


A07RW037

The slave cylinder converts hydraulic energy into mechanical energy. Hydraulic fluid supplied by the master cylinder moves the slave cylinder piston to actuate the shift fork. The mechanical energy produced by the slave cylinder is directly proportional to the diameters of the master cylinder and the slave cylinder.

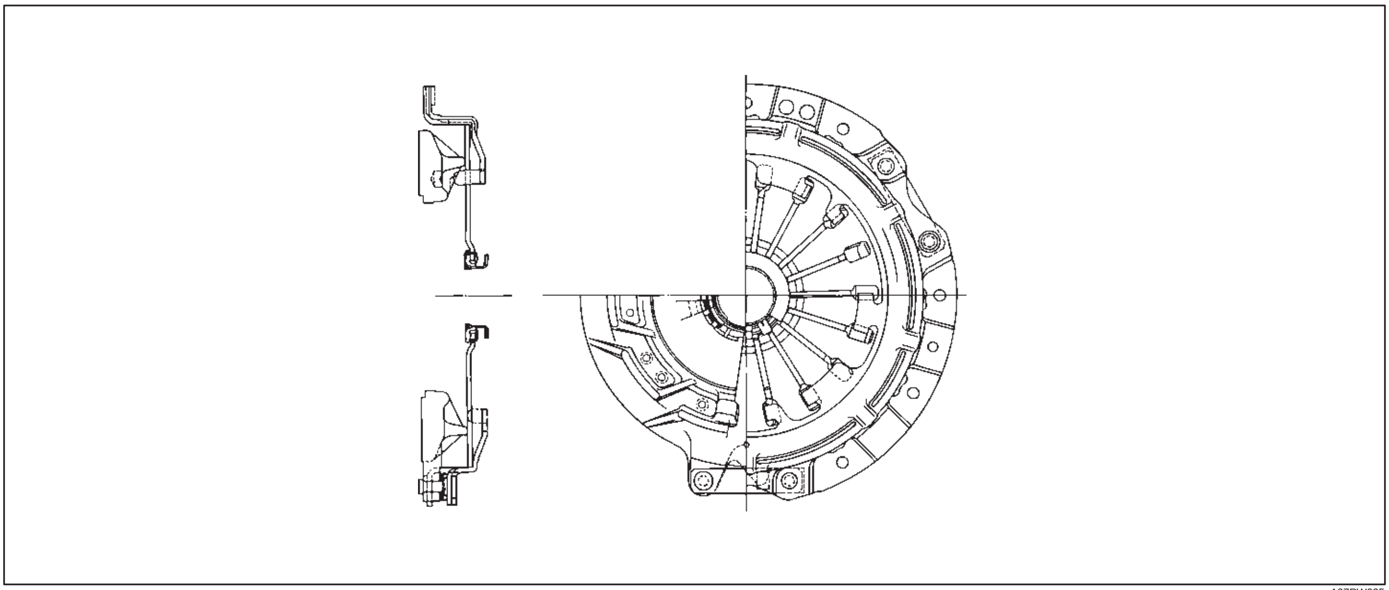
Pressure Plate Assembly

X22SE



A07RW024

6VD1



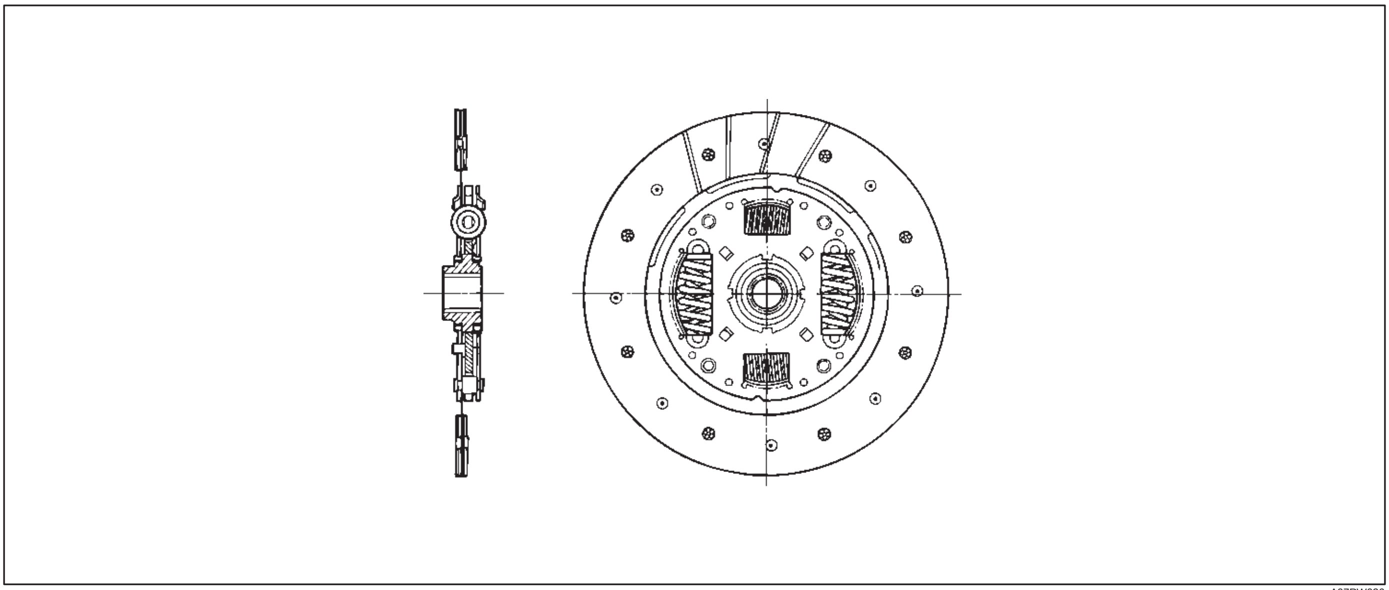
A07RW025

The pressure plate assembly consists of the clutch cover, the pressure plate with diaphragm spring.

Operating the clutch pedal causes the pressure plate to move in an axial direction to engage and disengage the clutch.

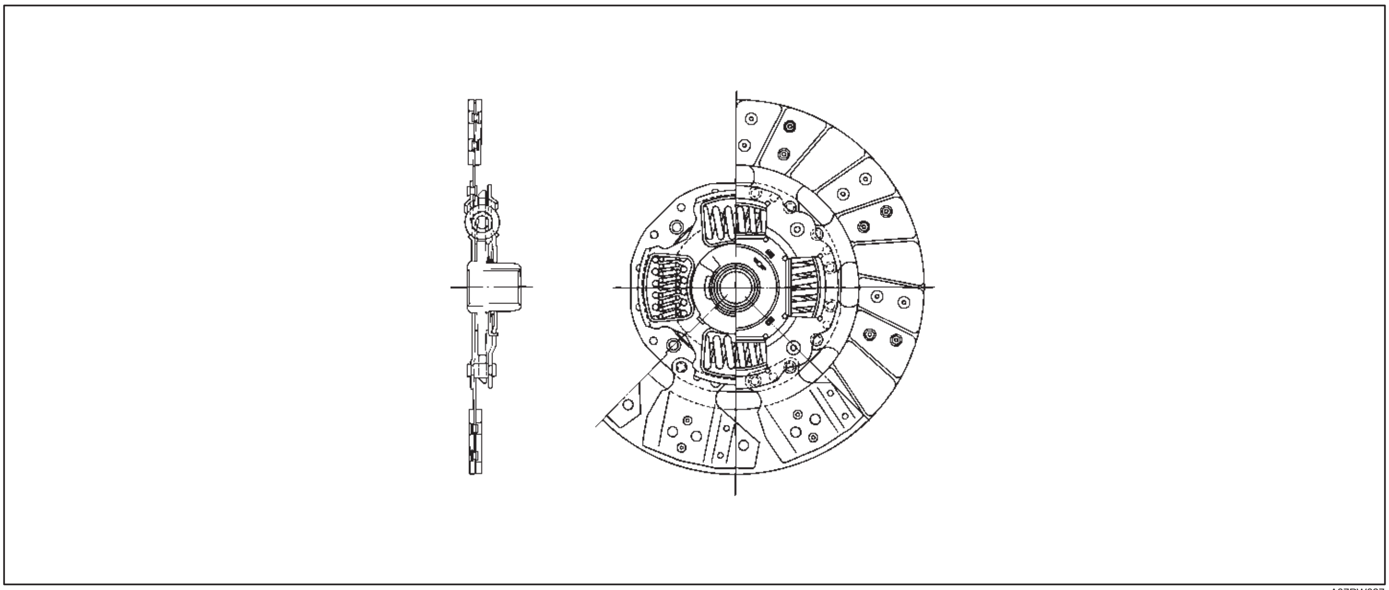
Driven Plate Assembly

X22SE



A07RW026

6VD1



A07RW027

The driven plate assembly consists of the plate and the facing.

The plate consists of the clutch center, the cushioning plate, and the torsion springs.

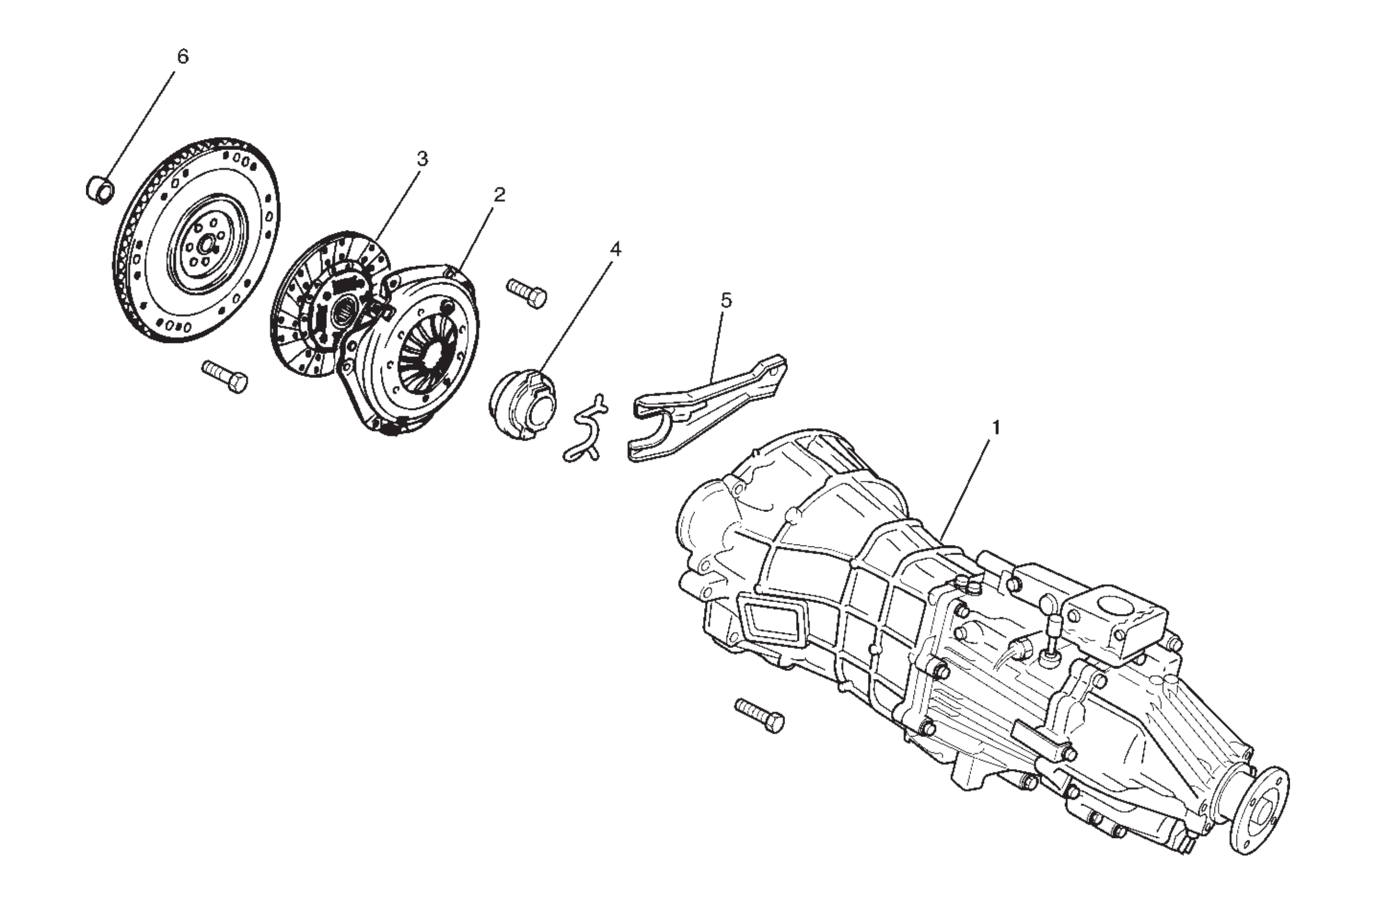
The facing is riveted to both sides of the cushioning plate. The cushioning plate provides a longer service life by minimizing wear and vibration at the clutch contact surfaces.

Diagnosis

Condition	Possible cause	Correction
Dragging	Air in circuit.	Bleed and check for damage.
	Driven plate worn or warped.	Replace.
	Clutch fork off the ball stud.	Install correctly and lubricate.
	Diaphragm spring weak or tip of fingers worn.	Replace.
	Driven plate sticking on splines.	Clean and free splines and lubricate with grease.
	Pilot bearing worn or damaged.	Replace.
	Master cylinder and slave cylinder seals worn.	Replace.
Slipping	Clutch facing worn.	Replace.
	Driven plate friction pads worn or oilsoaked.	Replace and check for leaks as needed.
	Diaphragm spring weak.	Replace pressure plate.
	Pressure plate or flywheel warped.	Replace.
	Master cylinder and slave cylinder seals worn.	Replace as needed.
Chattering	Clutch facing in poor contact or facing warped.	Replace.
	Surface of facing hardened.	Replace.
	Driven plate friction pads oil soaked.	Replace and check for leaks.
	Damper springs weakened or broken.	Replace.
	Rivets on clutch plate loosened.	Replace.
	Pressure plate or flywheel warped.	Replace as needed.
Rattling	Diaphragm spring weak.	Replace the pressure plate.
	Clutch fork loose or off the ball stud.	Replace the retaining spring or install the fork correctly.
	Driven plate springs weak or oil in the damper.	Replace and check for leaks as needed.
Release bearing noisy with the clutch engaged	Release bearing binding.	Clean, or replace if damaged, and lubricate.
	Clutch fork off the ball stud or loose spring tension.	Install correctly, and lubricate.
	Linkage return springs weak.	Replace.
Noisy	Release bearing worn or damaged.	Replace.
	Clutch fork off the ball stud.	Install correctly and lubricate.
	Pilot bearing loose.	Replace.
Pedal stays on the floor when disengaged	Replace bearing binding.	Free up, or replace, and lubricate.
	Diaphragm spring weak.	Replace the pressure plate.
Pedal is hard to push	Hydraulic line blocked or crimped.	Clean out or replace.
	Master or slave cylinders bindinig.	Repair or replace as needed.
	Driven plate worn.	Replace.
Squeaking	Ball stud not lubricated or incorrectly lubricated.	Lubricate with high temperature grease.

Clutch Assembly (X22SE)

Clutch Assembly (X22SE) and Associated Parts



201RX003

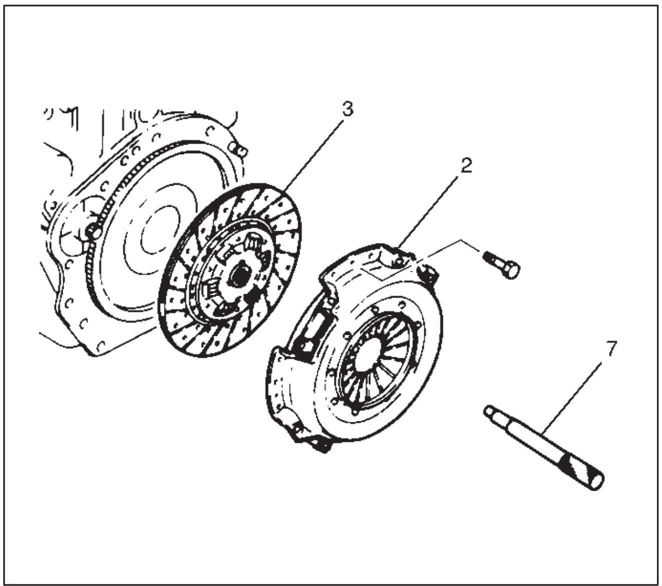
Legend

(1) Transmission Assembly
(2) Pressure Plate Assembly
(3) Driven Plate Assembly
(4) Release Bearing
(5) Shift Fork
(6) Crank Shaft Bearing

Removal

1. Remove transmission assembly, refer to “MANUAL TRANSMISSION” of Section 7B for “REMOVAL AND INSTALLATION” procedure.

2. Use the clutch pilot aligner (7) J–42877 to prevent the driven plate assembly from falling free.

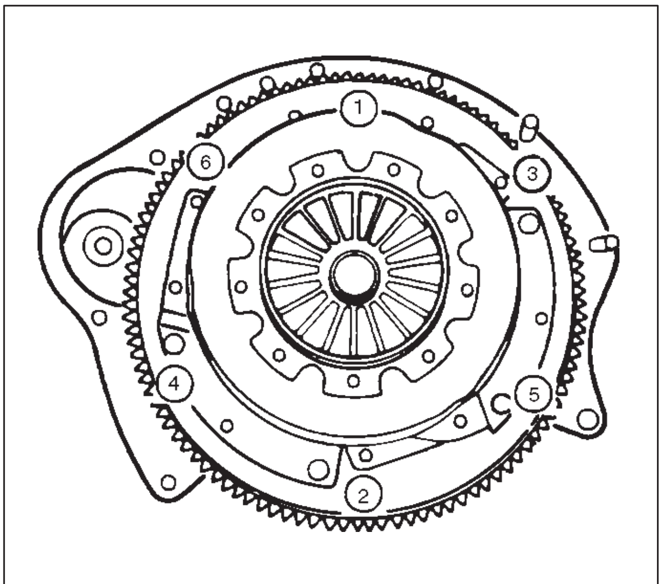


201RX002

Legend

(3) Driven Plate Assembly
(2) Pressure Plate Assembly
(7) Pilot Aligner

3. Mark the flywheel, clutch cover and pressure plate (2) lug for alignment when installing.
4. Loosen the clutch cover bolts in the numerical order shown in the illustration.

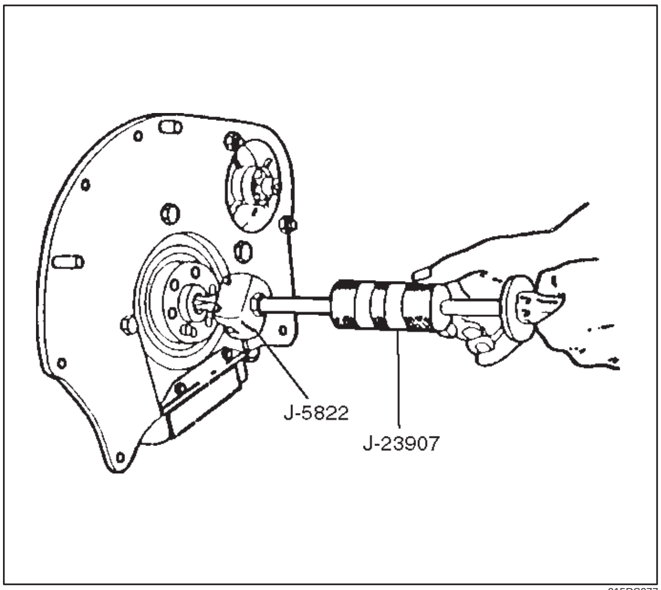


201RS036

5. Remove pressure plate assembly (2) and driven plate assembly (3).
6. Remove release bearing (4).

NOTE: The release bearing is permanently packed with lubricant and should not be soaked in cleaning solvent, as this will dissolve the lubricant.

7. Remove shift fork.
   - Do not remove crank shaft bearing (6) except for replacement.
     Remove the crank shaft bearing (6) using remover J–5822 and sliding hammer J–23907.



015RS077

Inspection and Repair

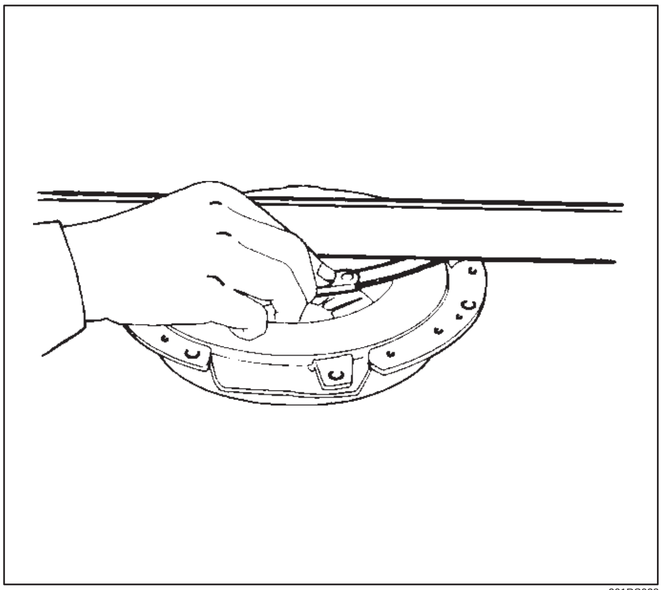
Make necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspection.

Pressure Plate Assembly

Visually inspect the pressure plate friction surface for excessive wear and heat cracks. If excessive wear or deep heat cracks are present, the pressure plate must be replaced.

Pressure Plate Warpage

Use a straight edge and a feeler gauge to measure the pressure plate friction surface flatness in four directions.



201RS038

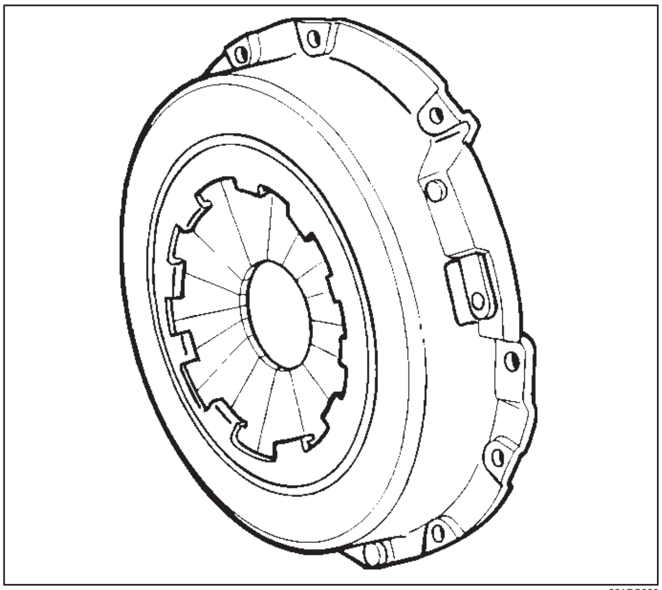
If any of the measured values exceed the specified limit, the pressure plate must be replaced.

Pressure Plate Warpage

Limit: 0.3mm (0.012in)

Clutch Cover

Visually inspect the entire clutch cover for excessive wear, cracking, and other damage. The clutch cover must be replaced if any of these conditions are present.



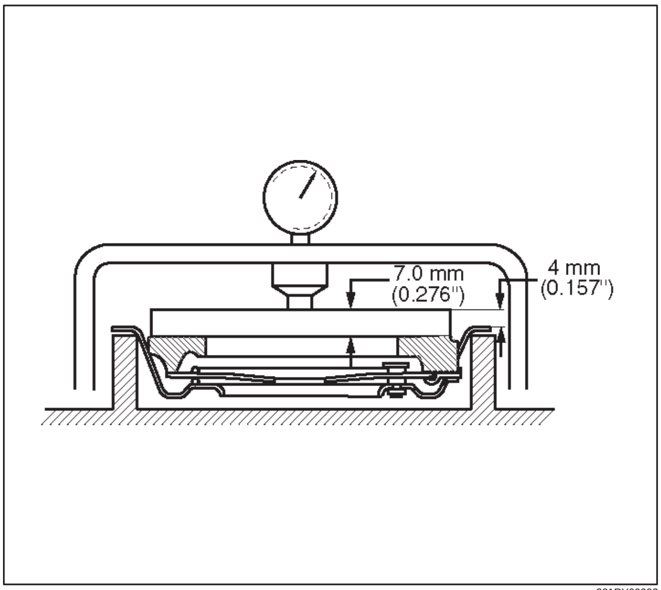
201RS039

Clutch Set Force

1. Invert the pressure plate assembly.
2. Place a new driven plate over the pressure plate. A metal sheet with thickness of 7.0mm (0.276in) may be used in place of the driven plate.
3. Compress the pressure plate assembly until the distance becomes 4mm (0.157in).
4. Note the pressure gauge reading.

Clutch Set Force

Standard: 5488N (1235lb)



201RY00003

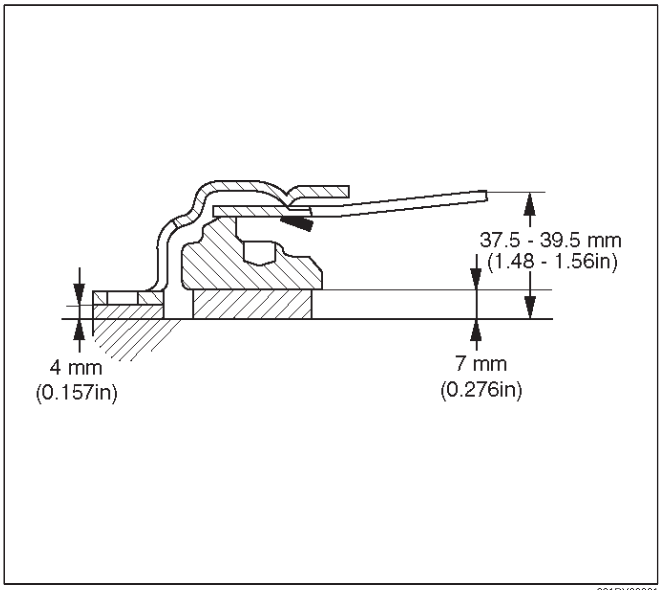
Diaphragm Spring Finger Height

1. Place a 7.0mm (0.276in) spacer beneath the pressure plate.
2. Fully compress the pressure plate and diaphragm spring.
   There are two ways to do this:
   a. Use a bench press to press down on the assembly from the top.
   b. Tighten the fixing bolts.

3. Measure the spring finger height from base to spring tip.
   If the measured value exceeds the specified limit, the pressure plate assembly must be replaced.

   Spring Finger Height

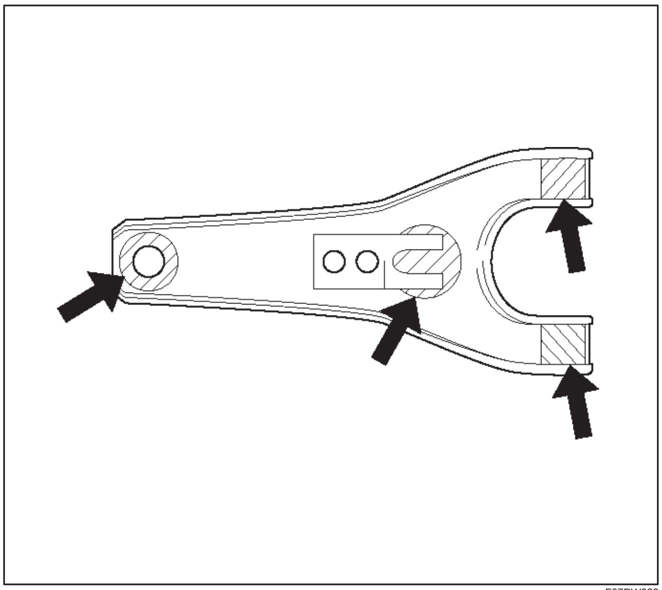
   Standard: 37.5 mm – 39.5 mm (1.48 in – 1.56 in)



201RY00001

Shift Fork

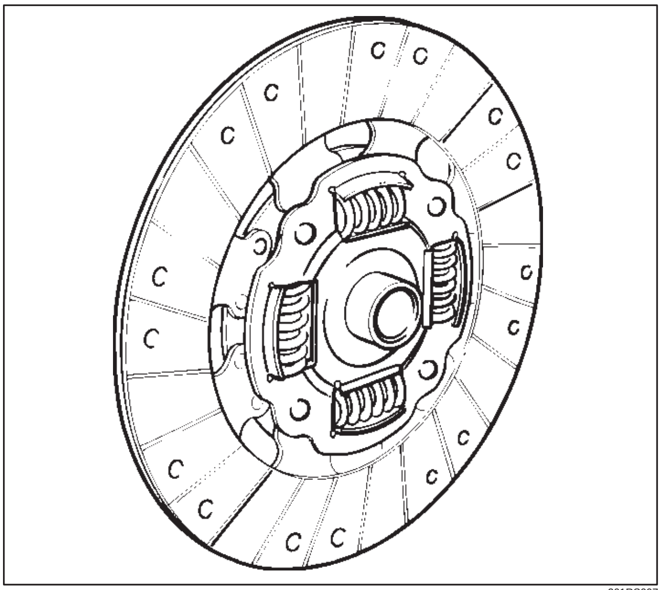
1. Visually inspect the surfaces of the shift fork making contact with the shift block.
2. Remove any minor stepping or abrasion from the shift block with an oil stone.
3. Apply molybdenum disulfide type grease to the areas as shown in the figure.



F07RW030

Driven Plate Assembly

1. Visually inspect the torsion spring for looseness, breakage, and weakening. If any of these conditions are discovered, the driven plate assembly must be replaced.
2. Visually inspect the facing surfaces for cracking and excessive scorching. Visually inspect the facing surfaces for the presence of oil or grease. If any of these conditions are discovered, the facing must be cleaned or replaced.

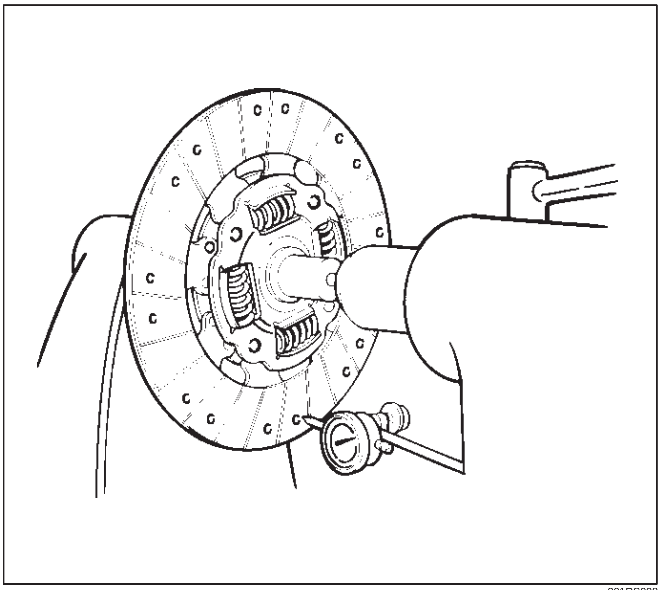


201RS007

3. Check that the driven plate moves smoothly on the transmission top gear shaft spline.
   Minor ridges on the top gear shaft spline may be removed with an oil stone.

Driven Plate Warpage

1. Insert the clutch pilot aligner J–42877 into the driven plate splined hub.
   The clutch pilot aligner must be held perfectly horizontal.
2. Set a dial indicator to the driven plate outside circumference.



201RS008

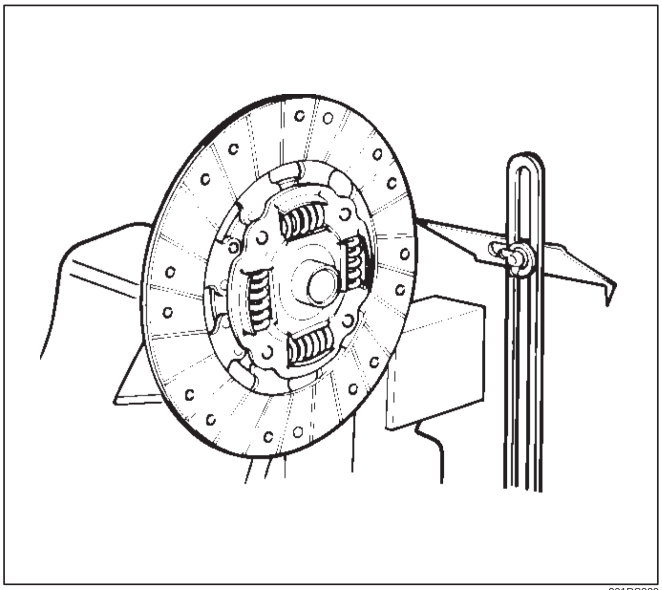
3. Slowly turn the driven plate. Read the dial indicator as you turn the driven plate.
   If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Warpage
Standard: 0.7 mm (0.028 in)
Limit: 1.0 mm (0.039 in)

Driven Plate Splined Hub Spline Wear

1. Clean the driven plate splined hub.
2. Install the driven plate to the transmission top gear shaft spline.
3. Set a surface gauge to the driven plate outside circumference.
4. Slowly turn the driven plate counterclockwise. Measure the spline rotation play as you turn the driven plate.

Driven Plate Splined Hub Spline Wear
Standard: 0.5 mm (0.020 in)
Limit: 1.0 mm (0.039 in)

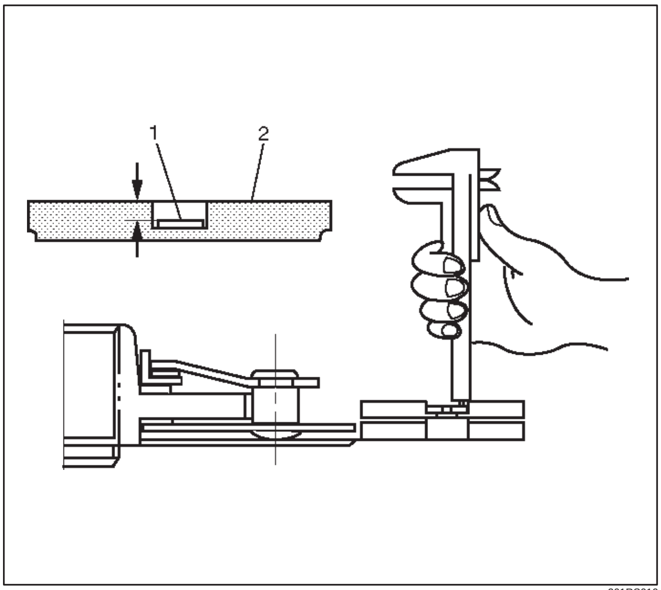


201RS009

Rivet Head Depression

Use a depth gauge or a straight edge with steel rule to measure the rivet head depression (1) from the facing surface (2).
Be sure to measure the rivet head depression on both sides of the driven plate. If the measured value is less than the specified limit, the facing must be replaced.

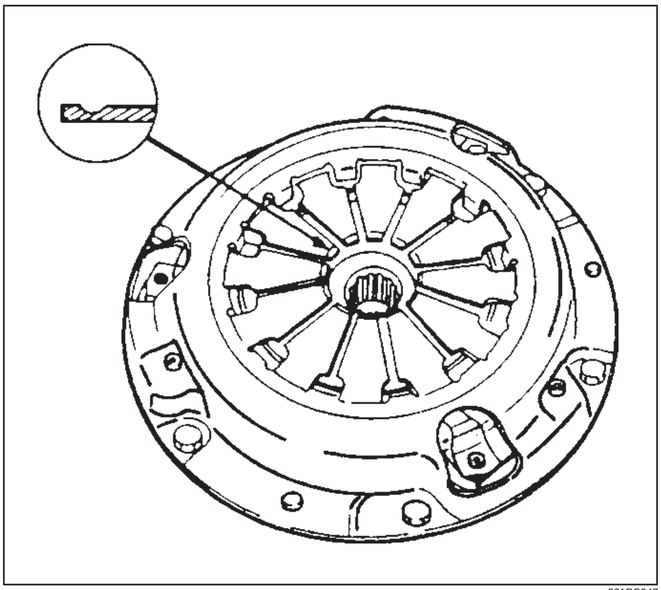
Rivet Head Depression
Standard: MIN 1.3 mm (0.051 in)
Limit: 0.2 mm (0.008 in)



201RS010

Pressure Plate Assembly

Check the cover for cracks and distortion, and the diaphragm spring for heat distortion, loosened rivets. Check the diaphragm spring for wear.

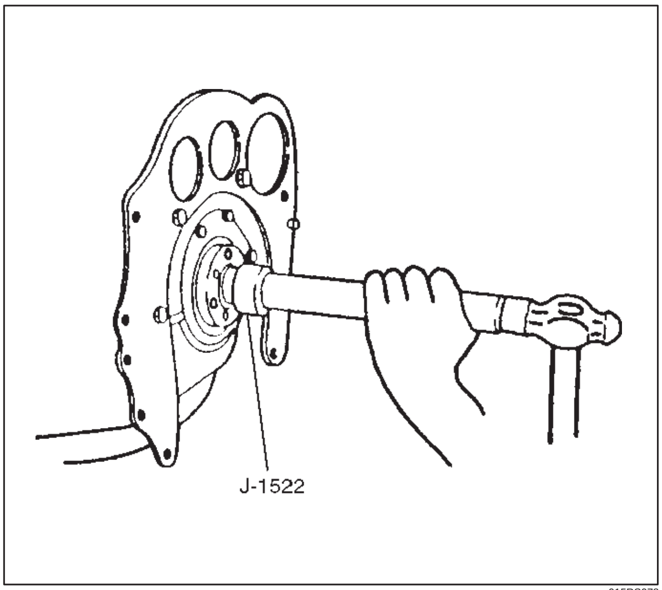


201RS047

Installation

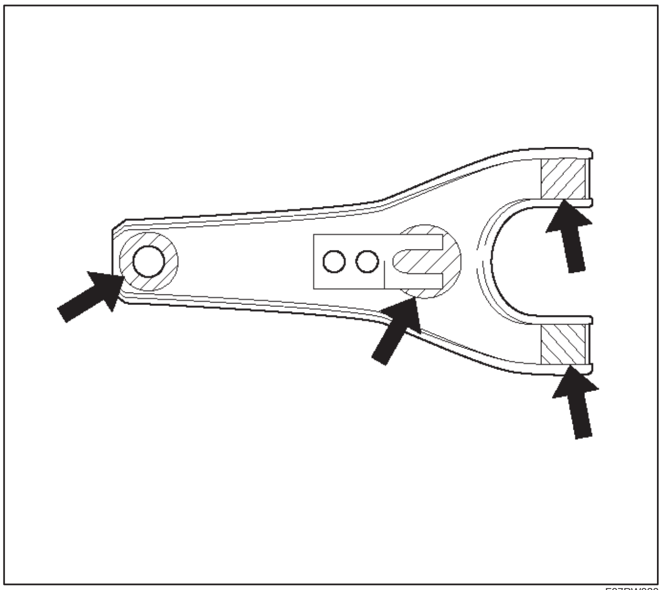
1. Clean and lubricate with grease.
2. Use installer J–1522 to install crankshaft bearing (6).

X22SE



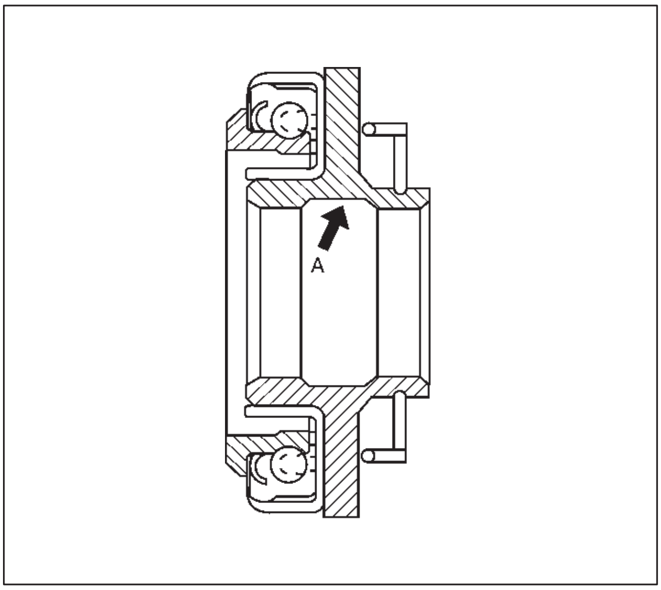
015RS078

3. Apply molybdenum disulfide type grease to the areas as shown in the figure and install shift fork (5).

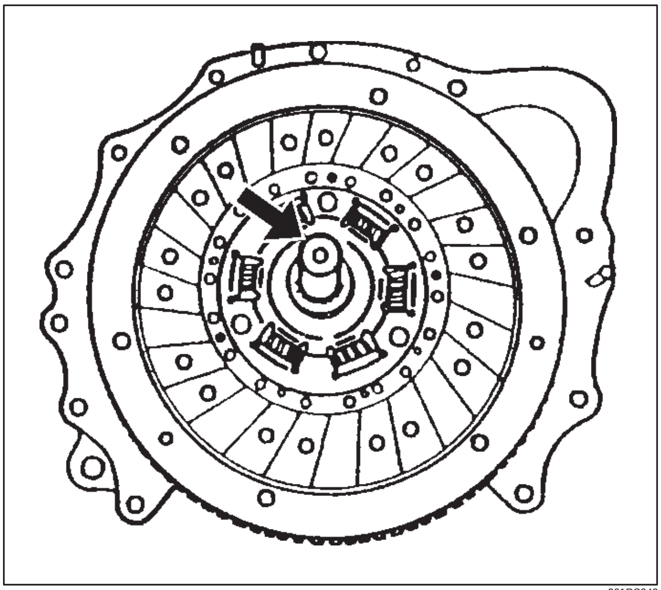


F07RW030

4. Pack the inside recess (A) of the release bearing with grease as shown in the figure.



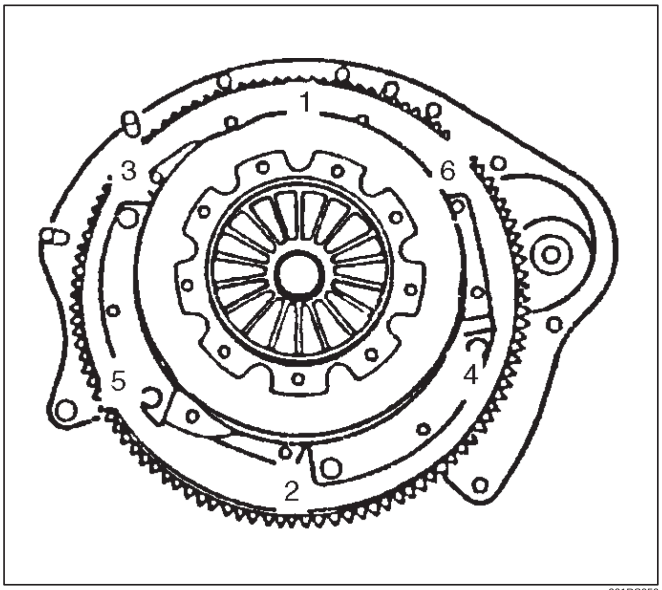
5. Install driven plate assembly by using aligner J–42877 (MUA).



201RS049

6. Tighten the bolts holding the pressure plate assembly (2) in the order shown in the figure.

Torque: 18N·m (13 lb ft)



201RS050

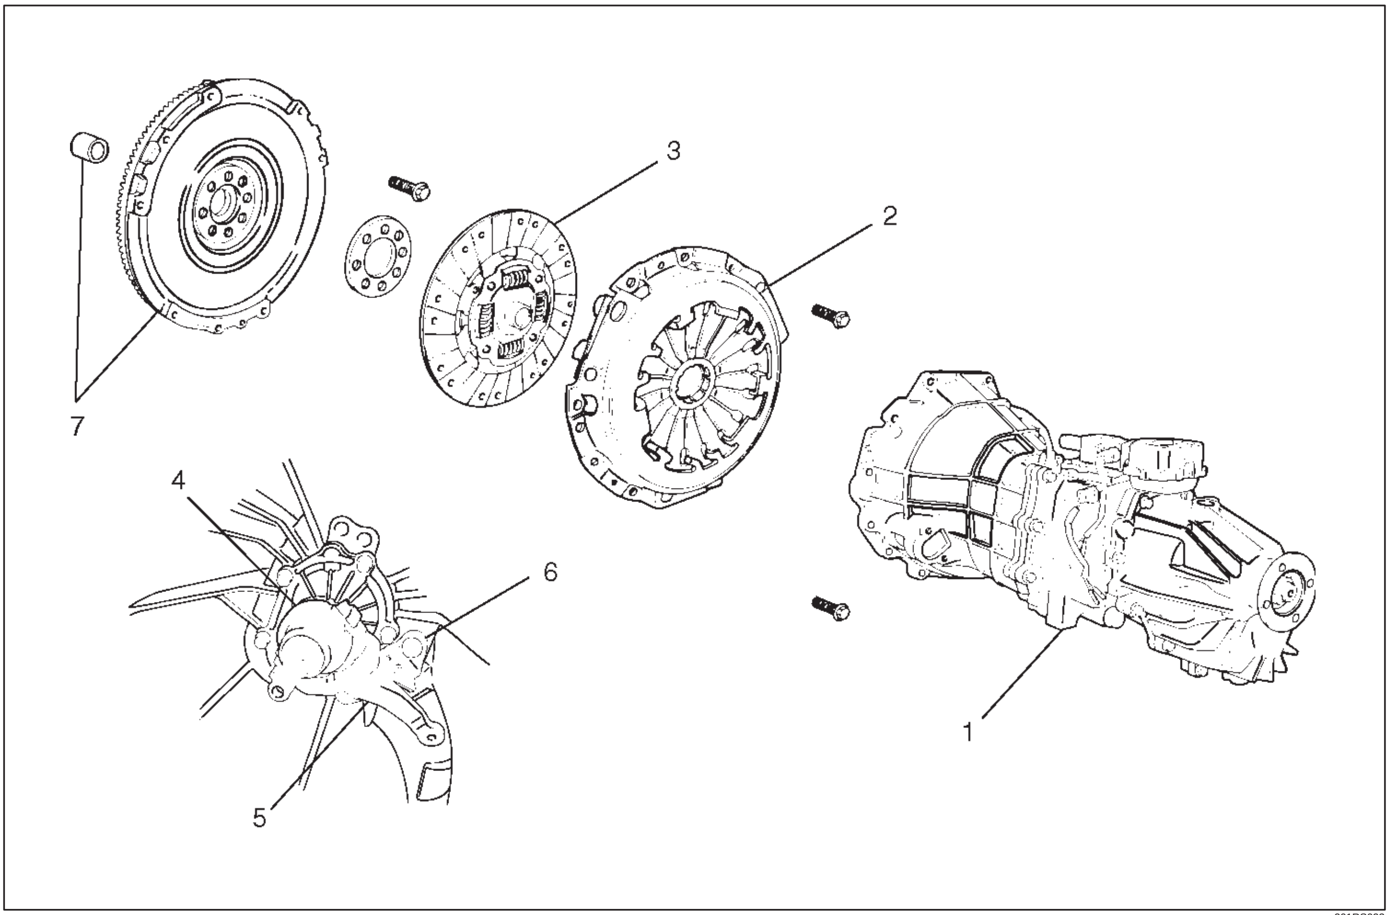
7. Remove the aligner.

NOTE: Do not strike the aligner with a hammer to remove it.

8. Install transmission assembly (1) to the engine. Refer to Transmission Installation in Manual Transmission section.

Clutch Assembly (6VD1)

Clutch Assembly (6VD1) and Associated Parts



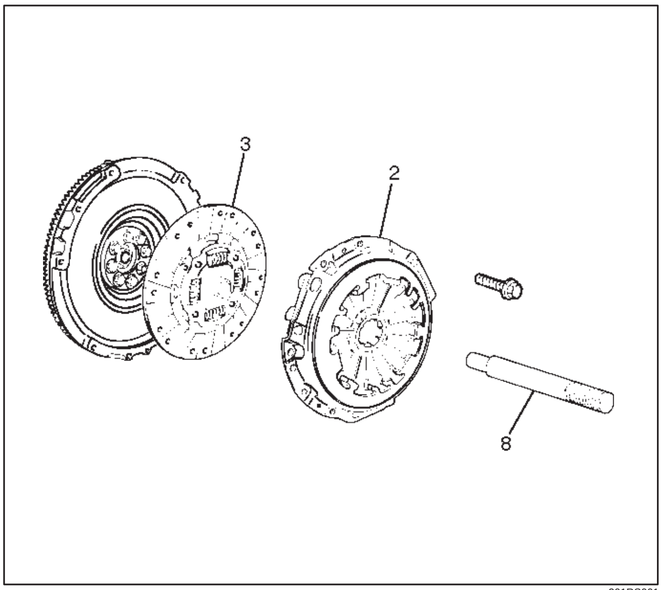
Legend

(1) Transmission Assembly
(2) Pressure Plate Assembly
(3) Driven Plate Assembly
(4) Release Bearing
(5) Shift Fork
(6) Fulcrum Bridge
(7) Flywheel Assembly and Crankshaft Bearing

Removal

1. Refer to “MANUAL TRANSMISSION” of Section 7B for “REMOVAL AND INSTALLATION” procedure of transmission assembly (1).

2. Use the pilot aligner J24547 to prevent the driven plate assembly (3) from falling free.

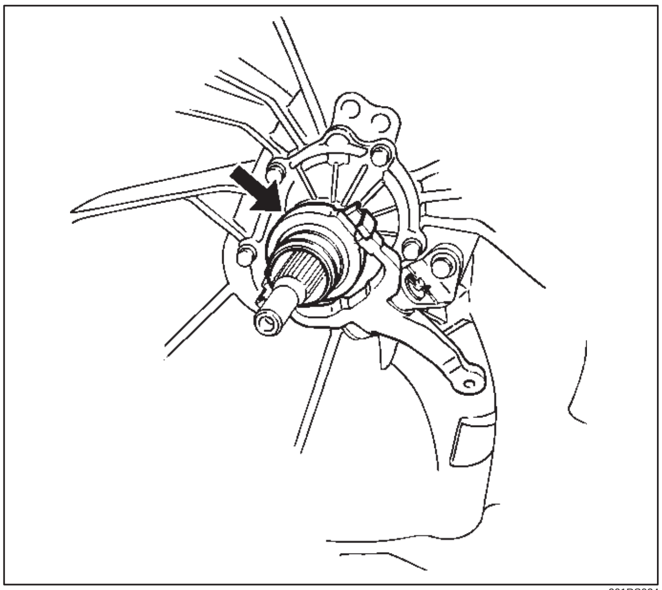


201RS001

Legend

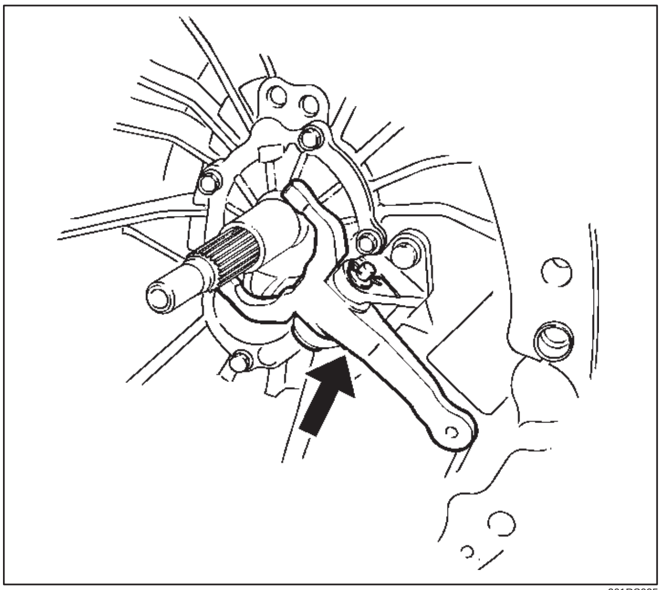
(2) Pressure Plate Assembly
(3) Driven Plate Assembly
(8) Pilot Aligner

3. Mark the flywheel, clutch cover and pressure plate lug for alignment when installing.
4. Remove the release bearing (4) from the transmission case.



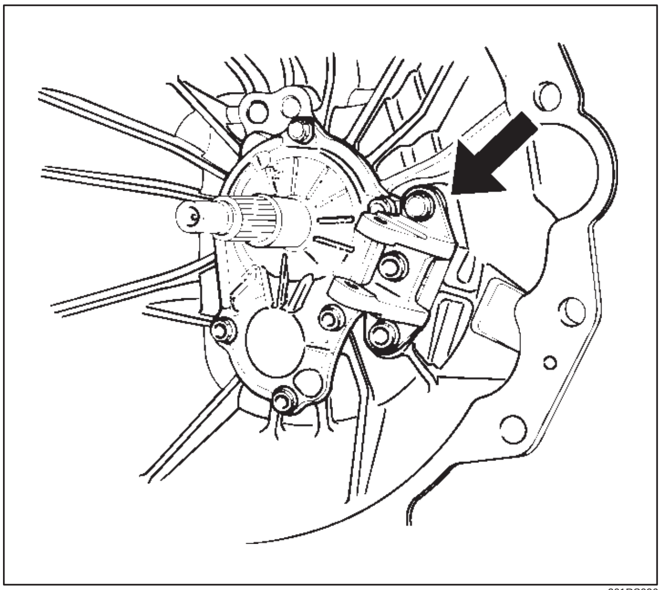
201RS024

5. Remove the snap pin. Remove the shift fork pin and shift fork from the fulcrum bridge.



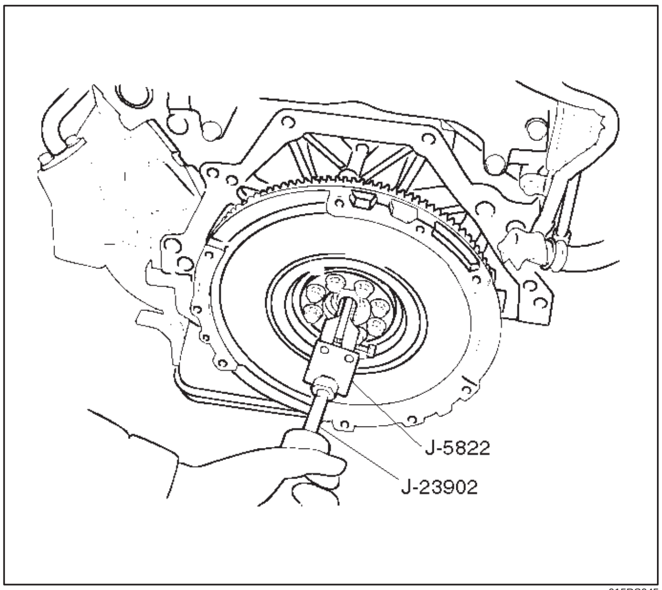
201RS025

6. Remove the fulcrum bridge bolts. Remove the fulcrum bridge (6) from the transmission case.



201RS026

- Do not remove crankshaft bearing (7) except for replacement.
- Use the remover J–5822 and sliding hammer J–23907 to remove the crankshaft bearing.



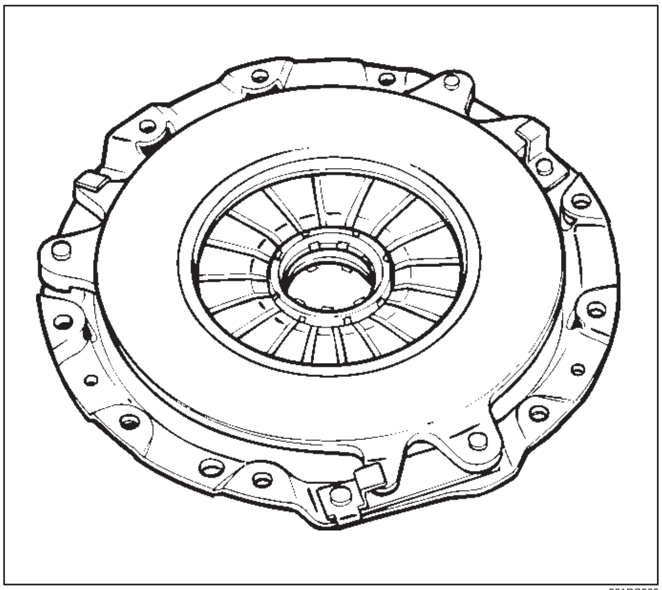
015RS045

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, or any other abnormal condition are found through inspection.

Pressure Plate Assembly

- Visually check the pressure plate friction surface for excessive wear and heat cracks. If excessive wear or deep heat cracks are present, the pressure plate must be replaced.



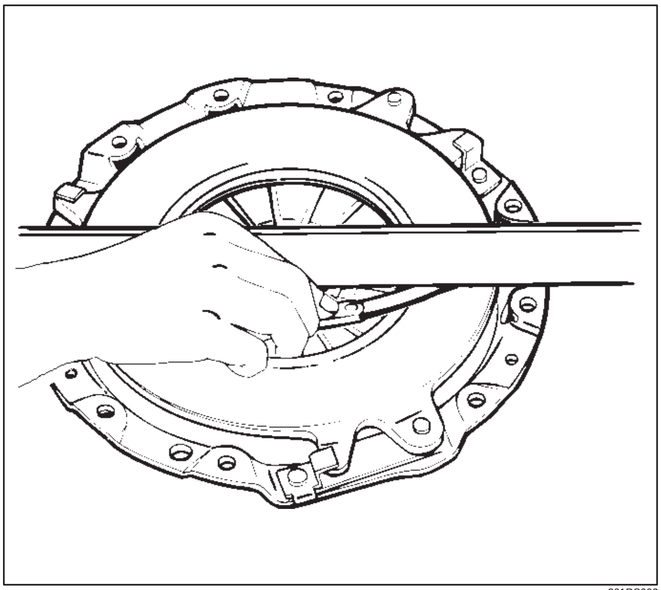
201RS002

Pressure Plate Warpage

- Use a straight edge and a feeler gauge to measure the pressure plate friction surface flatness in four directions. If any of the measured values exceed the specified limit, the pressure plate must be replaced.

Pressure Plate Warpage

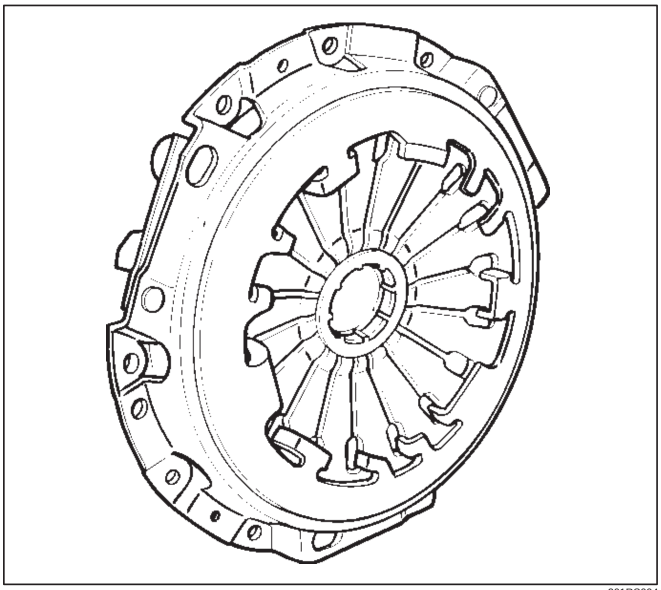
Limit: 0.3 mm (0.012 in)



201RS003

Clutch Cover

- Visually check the entire clutch cover for excessive wear, cracking, and other damage. The clutch cover must be replaced if any of these conditions are present.



201RS004

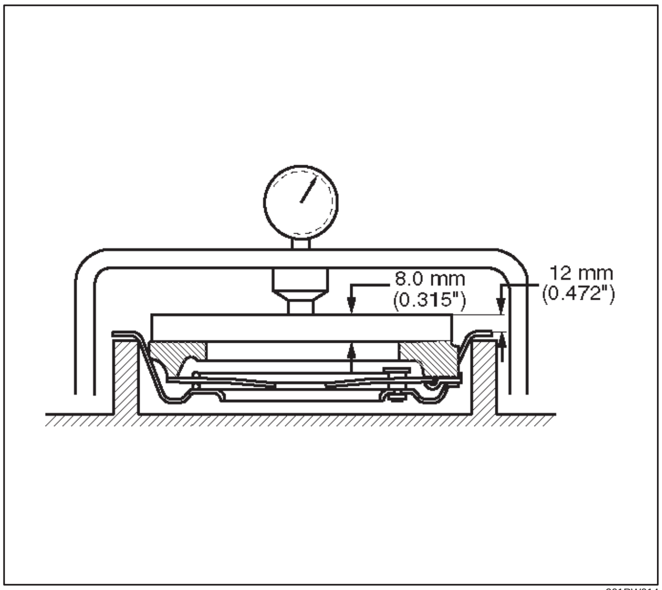
Clutch Set Force

1. Invert the pressure plate assembly.
2. Place a new driven plate over the pressure plate. A metal sheet with thickness of 8.0mm (0.315in) may be used in place of the driven plate.
3. Compress the pressure plate assembly until the distance becomes 12mm (0.472in).
4. Note the pressure gauge reading. If the measured value is less than the specified limit, the pressure plate assembly must be replaced.

Clutch Set Force

Standard: 7208N (1621lb)

Limit: 6669N (1499lb)



201RW014

Diaphragm Spring Finger Height

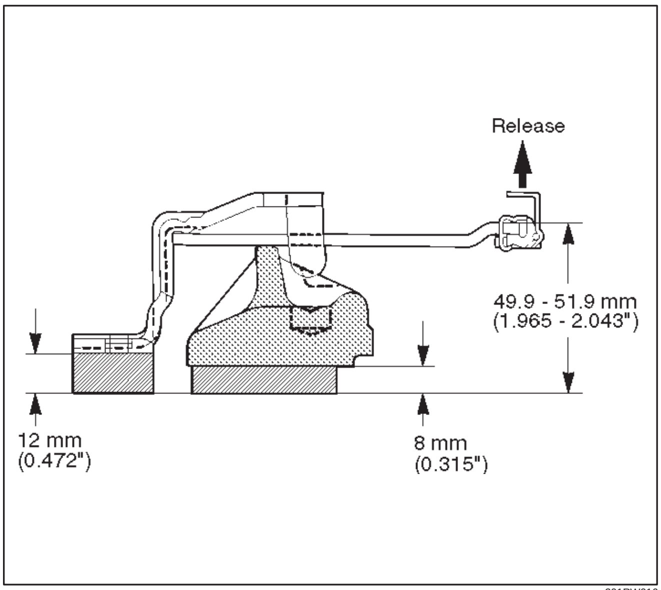
1. Place a new driven plate or a 8.0mm (0.315in) spacer beneath the pressure plate.
2. Fully compress the pressure plate and diaphragm spring.
   There are two ways to do this:
   a. Use a bench press to press down on the assembly from the top.
   b. Tighten the fixing bolts.

NOTE: Preload on diaphragm spring finger must be 4998N (11-22lb) in direction of release, when clutch cover assembly is bolted to the flywheel.

3. Measure the spring height from base to spring tip. If the measured value exceeds the specified limit, the pressure plate assembly must be replaced.

Spring Finger Height

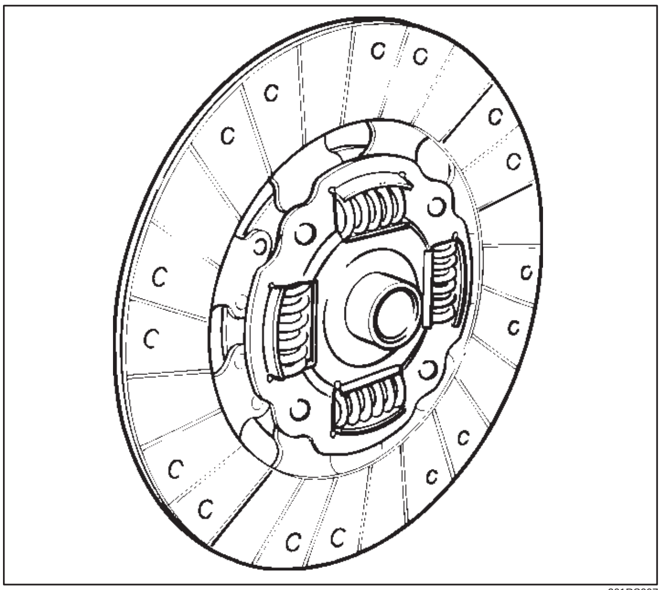
Standard: 49.9 – 51.9 mm (1.965– 2.043 in)



201RW016

Driven Plate Assembly

- Visually check the torsion spring for looseness, breakage, and weakening. If any of these conditions are discovered, the driven plate assembly must be replaced.
- Visually check the facing surfaces for cracking and excessive scorching. Visually inspect the facing surfaces for the presence of oil or grease. If any of these conditions are discovered, the facing must be cleaned or replaced.
- Check that the driven plate moves smoothly on the transmission top gear shaft spline. Minor ridges on the top gear shaft spline may be removed with an oil stone.



201RS007

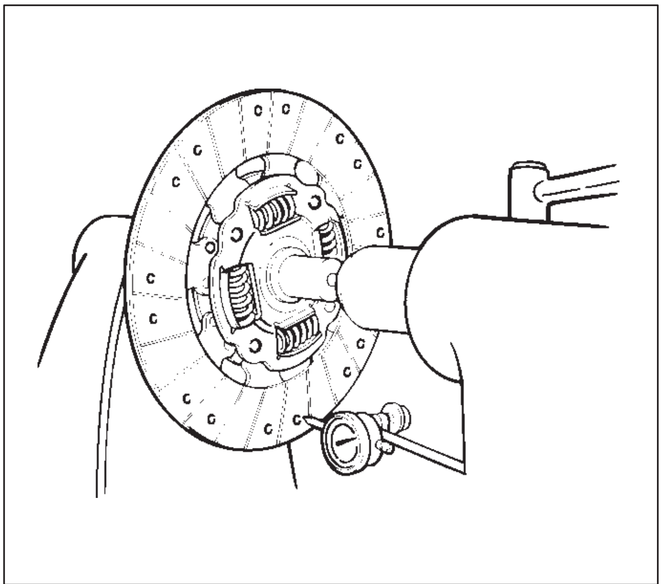
Driven Plate Warpage

1. Insert the clutch pilot aligner J–24547 into the driven plate splined hub. The clutch pilot aligner must be held perfectly horizontal.
2. Set a dial indicator to the driven plate outside circumference.
3. Slowly turn the driven plate. Read the dial indicator as you turn the driven plate. If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Warpage

Standard: 0.7mm (0.028in)

Limit: 1.0mm (0.039in)



201RS008

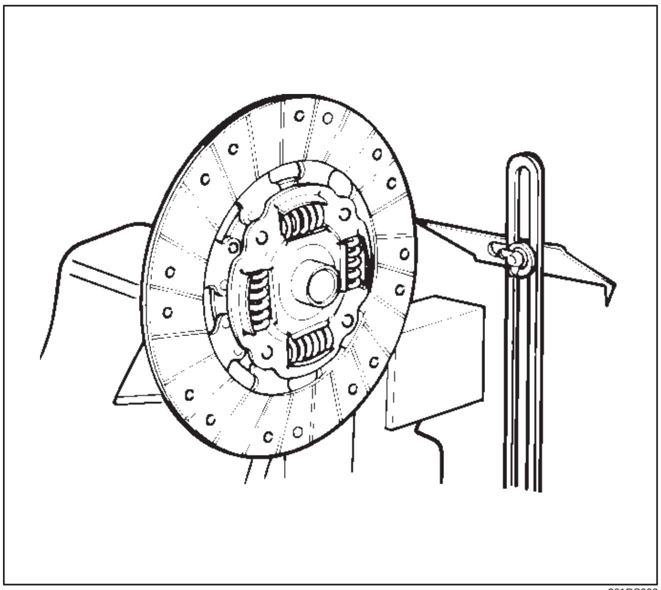
Driven Plate Splined Hub Spline Wear

1. Clean the driven plate splined hub.
2. Install the driven plate to the transmission top gear shaft spline.
3. Set a surface gauge to the driven plate outside circumference.
4. Slowly turn the driven plate counterclockwise. Measure the spline rotation play as you turn the driven plate. If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Warpage

Standard: 0.5mm (0.020in)

Limit: 1.0mm (0.039in)



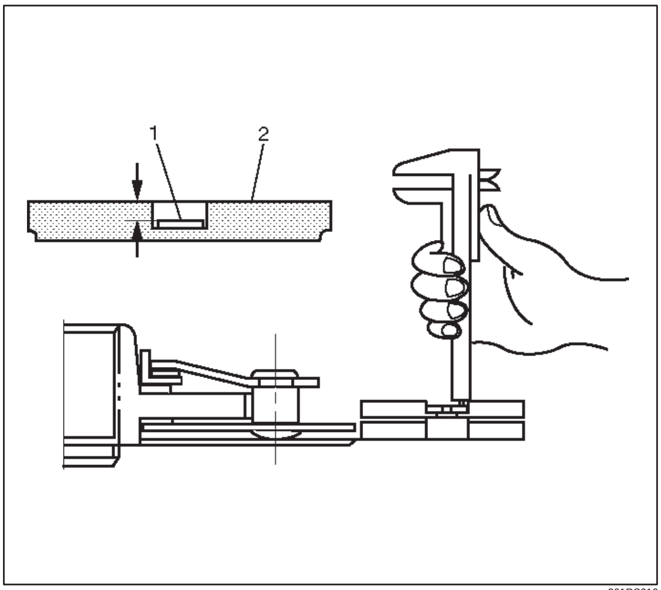
201RS009

Rivet Head Depression

- Use a depth gauge or a straight edge with steel rule to measure the rivet head depression (1) from the facing surface (2).
- Be sure to measure the rivet head depression on both sides of the driven plate. If the measured value is less than the specified limit, the driven plate assembly must be replaced.

Rivet Head Depression

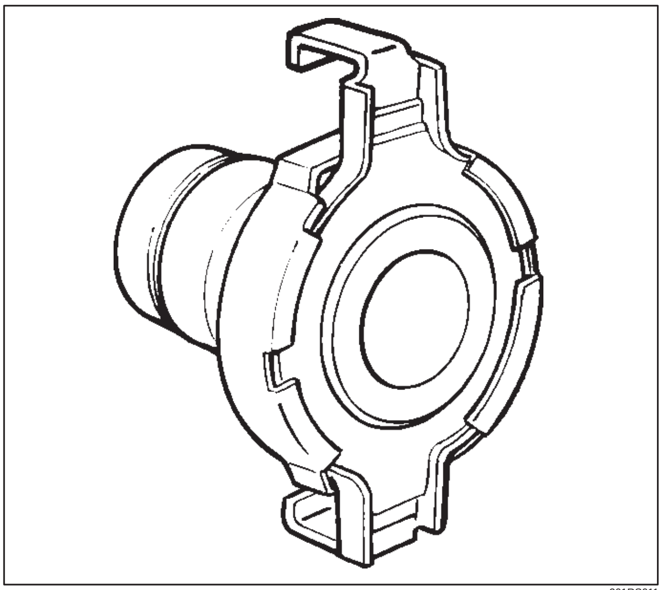
	Standard	Limit
Fly wheel side	1.2–1.8mm (0.047–0.071in)	0.2mm (0.008in)
Pressure plate side	1.6–2.2mm (0.062–0.087in)	



201RS010

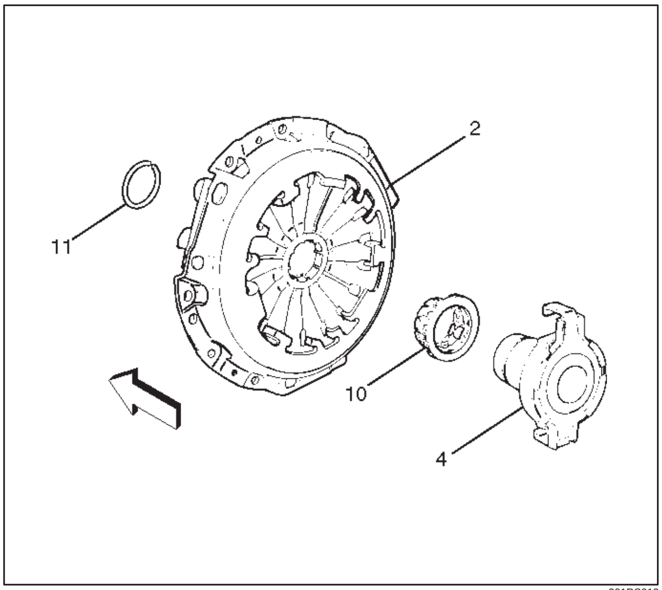
Release Bearing

- Visually check the release bearing for excessive play, noise and breakage. If any of these conditions are discovered, the release bearing must be replaced.



201RS011

- When replacing the release bearing (4), replace both the wedge collar (10) and wire ring (11) at the same time.



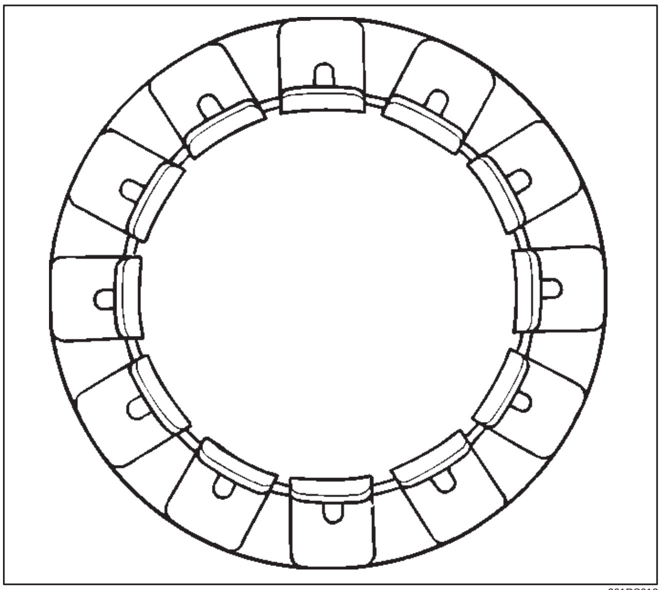
201RS012

Legend

(2) Pressure Plate Assembly
(4) Release Bearing
(10) Wedge collar
(11) Wire Ring

Wedge Collar (10)

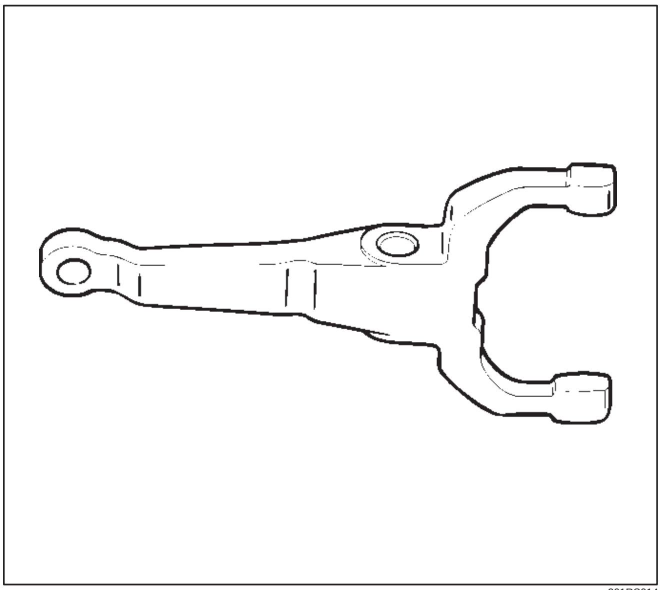
- Visually check the surfaces of the wedge collar making contact with the release bearing for excessive wear and damage.
- Replace exhibiting excessive wear or damage.



201RS013

Shift Fork

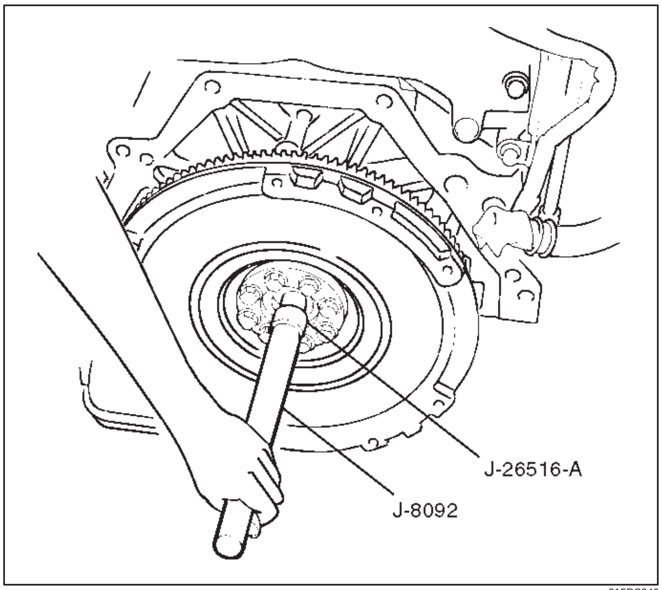
- Visually check the surfaces of the shift fork making contact with the release bearing for excessive wear and damage.
- Remove any minor stepping or abrasion from shift fork with an oil stone. Replace exhibiting excessive wear or damage.



201RS014

Installation

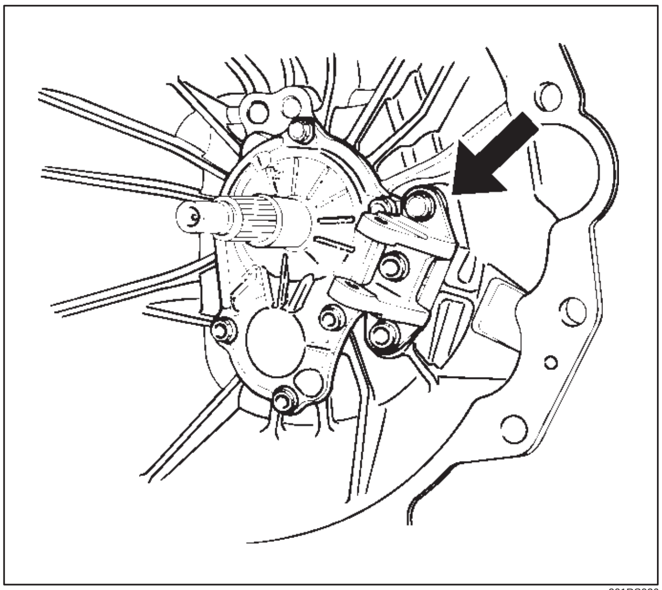
1. Clean and lubricate with grease.
2. Use the installer J–26516–A and driver handle J–8092 to install the crankshaft bearing (7).



015RS046

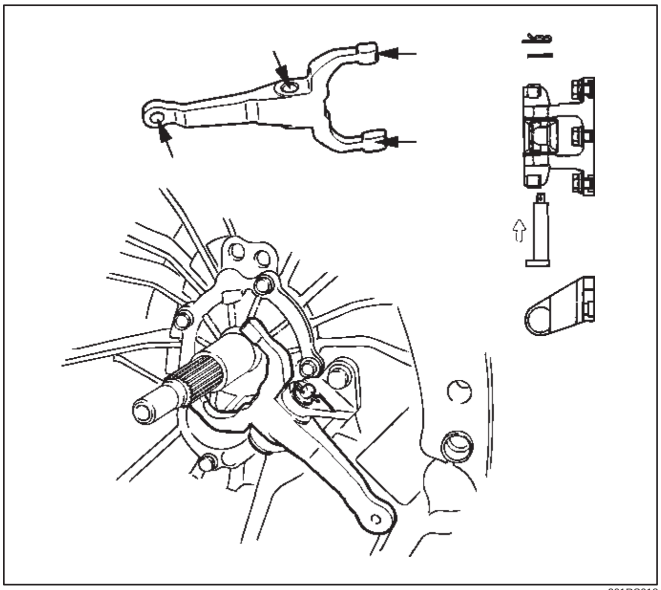
3. Install the fulcrum bridge (6) to the transmission case. Tighten three fulcrum bridge bolts to the specified torque.

Torque: 38 N·m (28 lb ft)



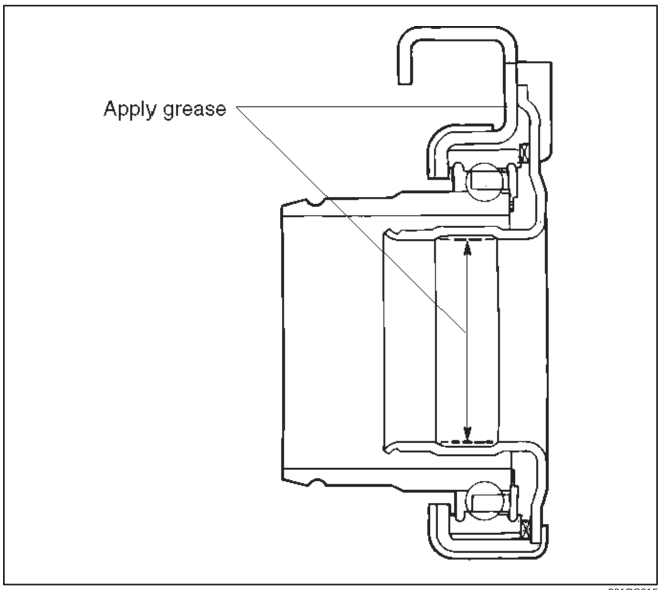
201RS026

4. Apply molybdenum disulfide type grease to the pin hole inner circumferences and thrust surfaces. Attach the shift fork (5) to the fulcrum bridge (6) and insert the pin from below of the fulcrum bridge. Install the washer and snap pin.



201RS018

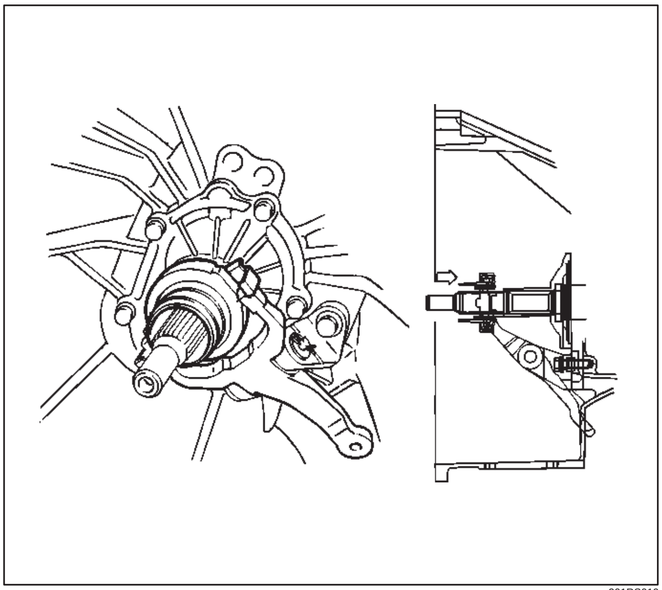
5. Apply molybdenum disulfide type grease to the areas shown in the figure.



201RS015

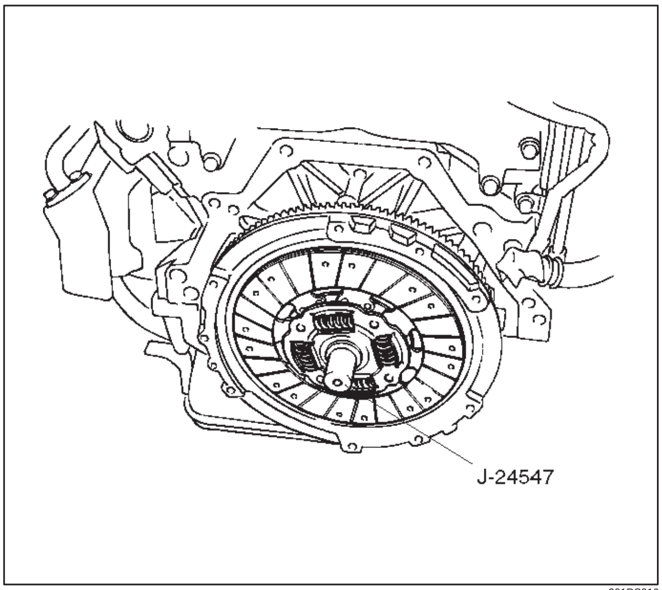
Install the release bearing (4) in the proper direction.

NOTE: Ensure release bearing is properly positioned during installation, as shown in the figure.



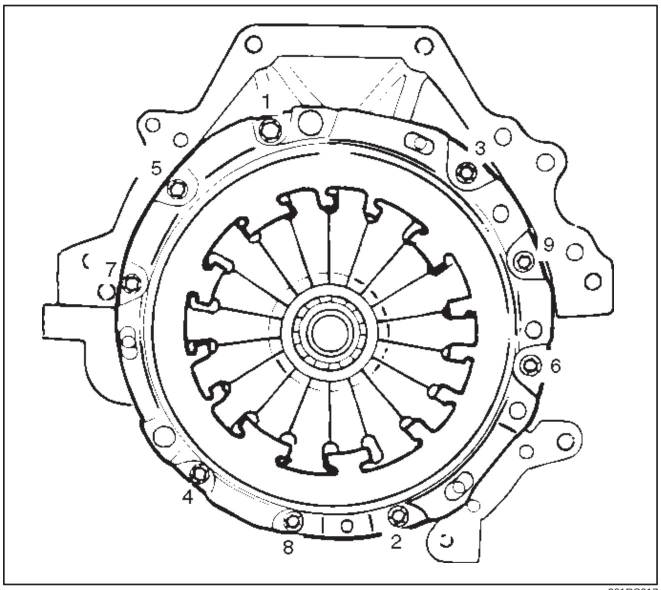
201RS019

6. Use the pilot aligner J–24547 to install the driven plate assembly (3).



201RS016

7. Tighten the bolts holding the pressure plate assembly (2) in the order shown in the figure.



201RS017

Torque: 18 N·m (13 lb ft)

8. Remove the aligner.

NOTE: Do not strike the aligner with a hammer to remove it.

9. Install transmission assembly to the engine.

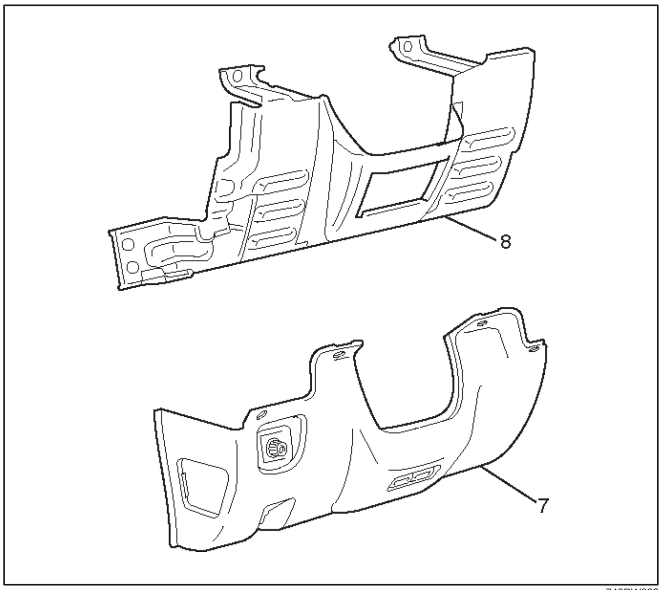
Removal

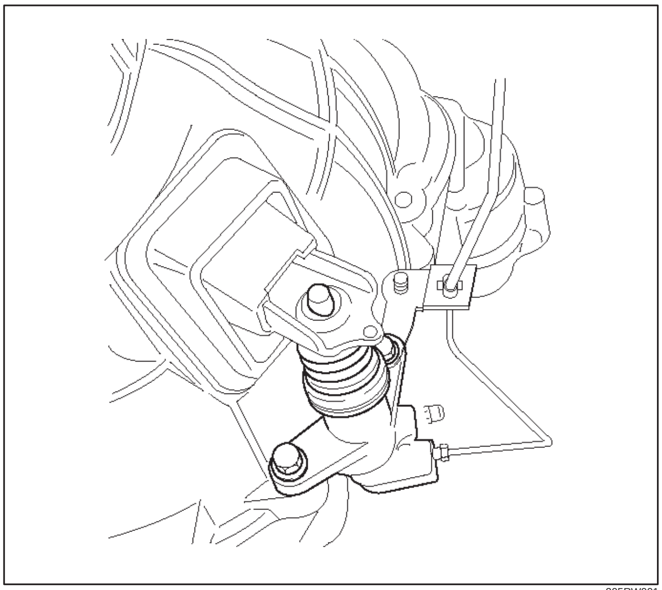
1. Disconnect the ground battery cable.
2. Remove the instrument panel lower cover (7) and driver knee bolster panel assembly (8).



Legend
(7) Driver Lower Cover
(8) Driver Knee Bolster Panel

3. Remove pin and jaw joint pin (1).
4. Remove pedal assembly and switch (2).
5. Remove oil line pipe (3).
6. Remove slave cylinder assembly (4).

X22SE MUA



7. Remove master cylinder assembly (5).
8. Remove oil line hose (6).

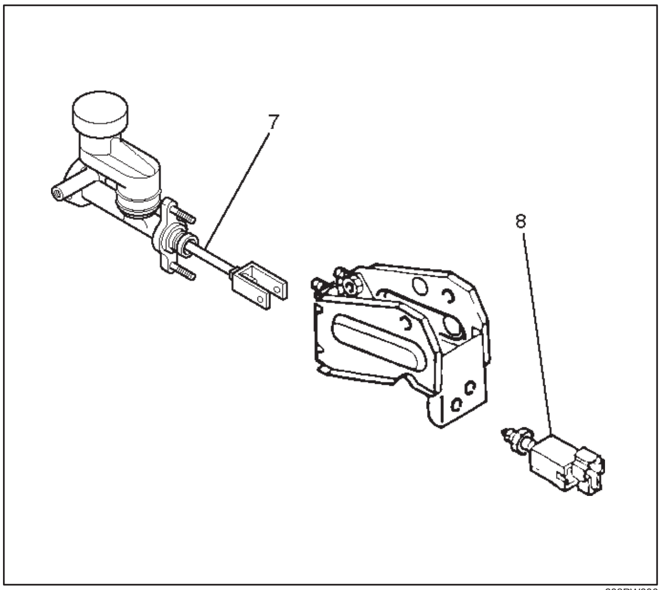
Inspection and Repair

Make necessary adjustments, repairs, and part replacements if wear, damage or other problems are discovered during inspection.

Installation

Clutch Pedal Adjustment

1. With clutch switch.
   1. Disconnect clutch switch connector.
   2. Loosen lock nut, then turn switch out until there is a gap between the switch plunger and clutch pedal.

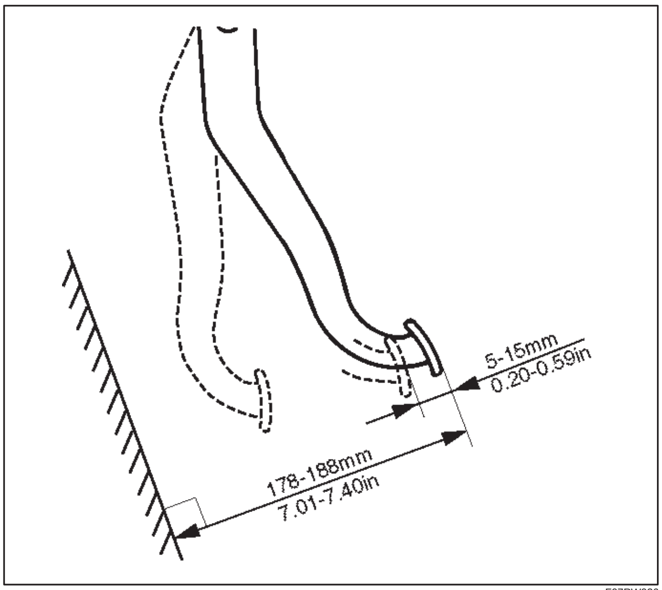


Legend
(7) Push Rod
(8) Clutch Switch

2. Loosen clutch master cylinder push rod lock nut. Turn push rod by hand to set clutch pedal height to within specification. Tighten push rod lock nut.

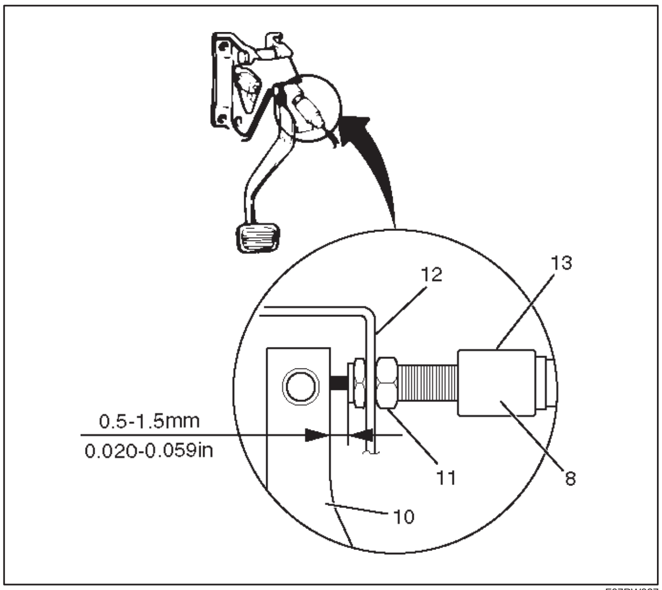
Clutch Pedal Height

178 – 188 mm (7.01 – 7.40 in)



F07RW026

3. With clutch switch.
   1. Turn the clutch switch until the switch bolt just touches the clutch pedal arm.
   2. Adjust clutch switch by backing it out half a turn, and measure the clearance between the clutch pedal arm and the clutch switch bolt end.



F07RW027

Legend
- (8) Clutch Switch
- (10) Clutch Pedal Arm
- (11) Lock Nut
- (12) Bracket
- (13) Back Out Switch 1/2 Turn

   3. Lock the lock nut.
   4. Connect clutch switch connector.

Clutch Switch and Clutch Pedal Clearance

0.5 – 1.5 mm (0.020 – 0.059 in)

4. After adjusting the clutch pedal height, push the clutch pedal by hand to ensure the clutch pedal free play is within specification.

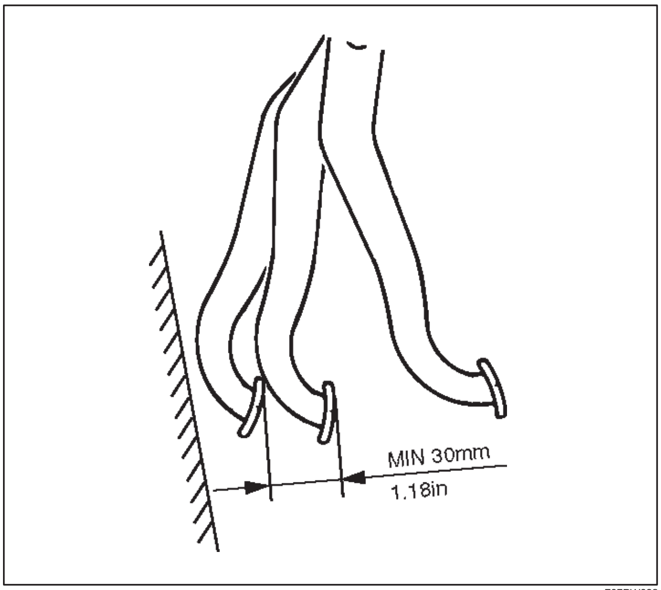
Pedal Free Play

5 – 15 mm (0.20 – 0.59 in)

5. Perform clutch pedal engagement height inspection:
   1. Operate the parking brake lever and block the wheels.
   2. Start the engine, fully step on the clutch pedal slowly and move the shift lever 1st position.
   3. With the engine idling, release the clutch pedal slowly and measure its stroke – just prior to its clutching position.

Clutch Pedal Engagement Height (H3)

MIN. 30 mm (1.18 in)



F07RW028

6. If the measured value exceeds the specified limit, check the following points and repair if necessary:
   - Hydraulic circuit for fluid leakage or air in circuit.
   - Clutch disc warped.
   - Diaphragm spring weakened or tip of fingers worn.
   - Driven plate sticking on sprines.
   - Release bearing worn or damaged.
   - Master cylinder and slave cylinder worn.

Torque

- **Master cylinder to dash panel**
  16 N·m (12 lb ft)
- **Clutch pedal to dash panel**
  15 N·m (11 lb ft)
- **Master cylinder push rod to yoke**
  17 N·m (12 lb ft)

- **Clutch pipe to master cylinder**
  16 N·m (12 lb ft)
- **Clutch pipe to flex, hose**
  20 N·m (14 lb ft)

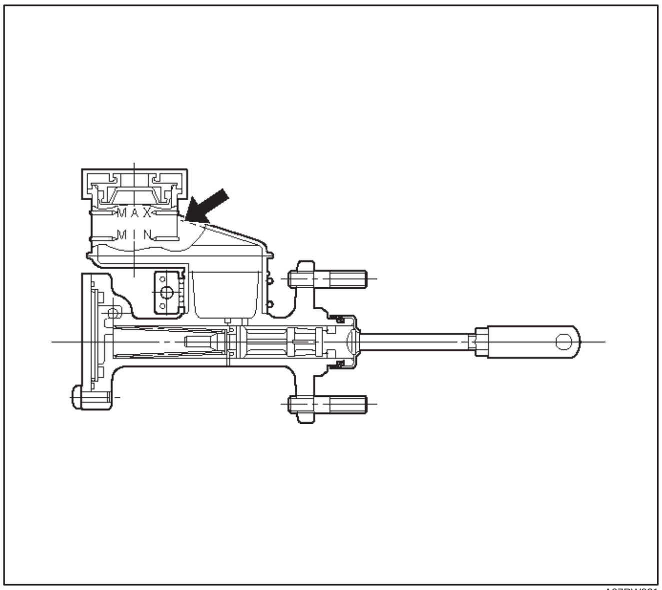
- **Clutch pipe to slave cylinder**
  20 N·m (14 lb ft)

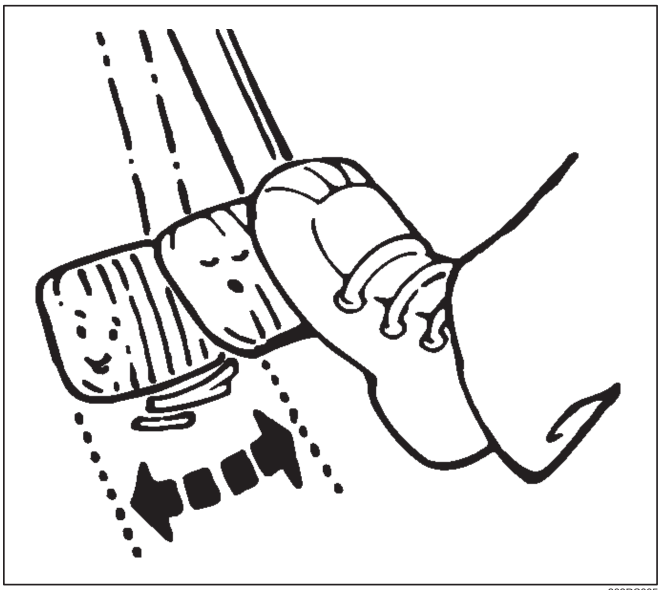
Bleeding

1. Check the level of clutch fluid in the reservoir and replenish if necessary.



A07RW021

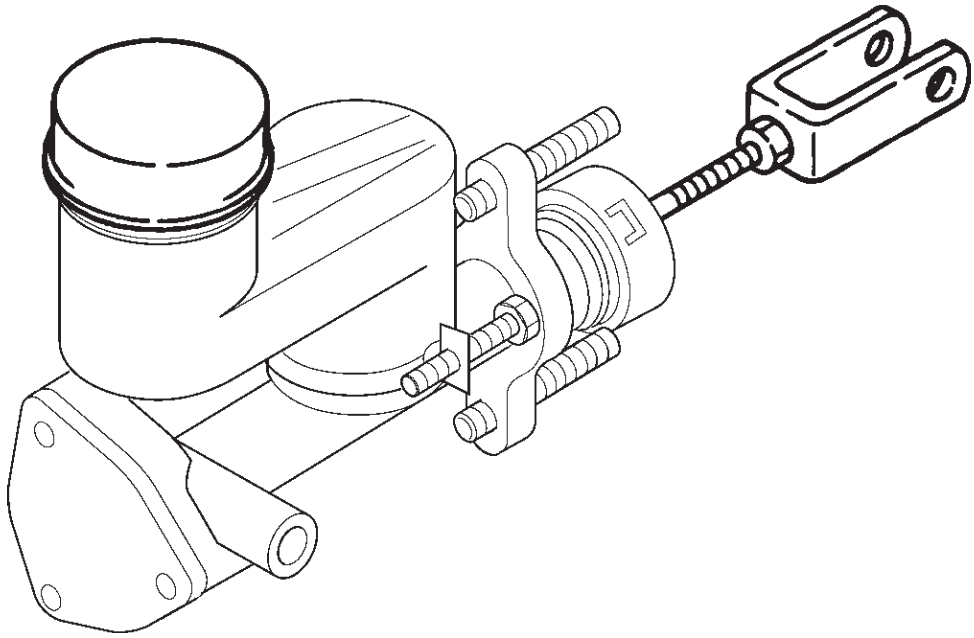
2. Bleeding the slave cylinder.
   1. Remove the rubber cap from the bleeder screw and wipe clean the bleeder screw. Connect a vinyl tube to the bleeder screw and insert the other end of the vinyl tube into a transparent container.
   2. Pump the clutch pedal repeatedly and hold it depressed.



203RS005

   3. Loosen the bleeder screw to release clutch fluid with air bubbles into the container, then tighten the bleeder screw immediately.
   4. Release the clutch pedal carefully. Repeat the above operation until air bubbles disappear from the clutch fluid being pumped out into the container. During the bleeding operation, keep the clutch fluid reservoir filled to the specified level. Reinstall the rubber cap.

Master Cylinder

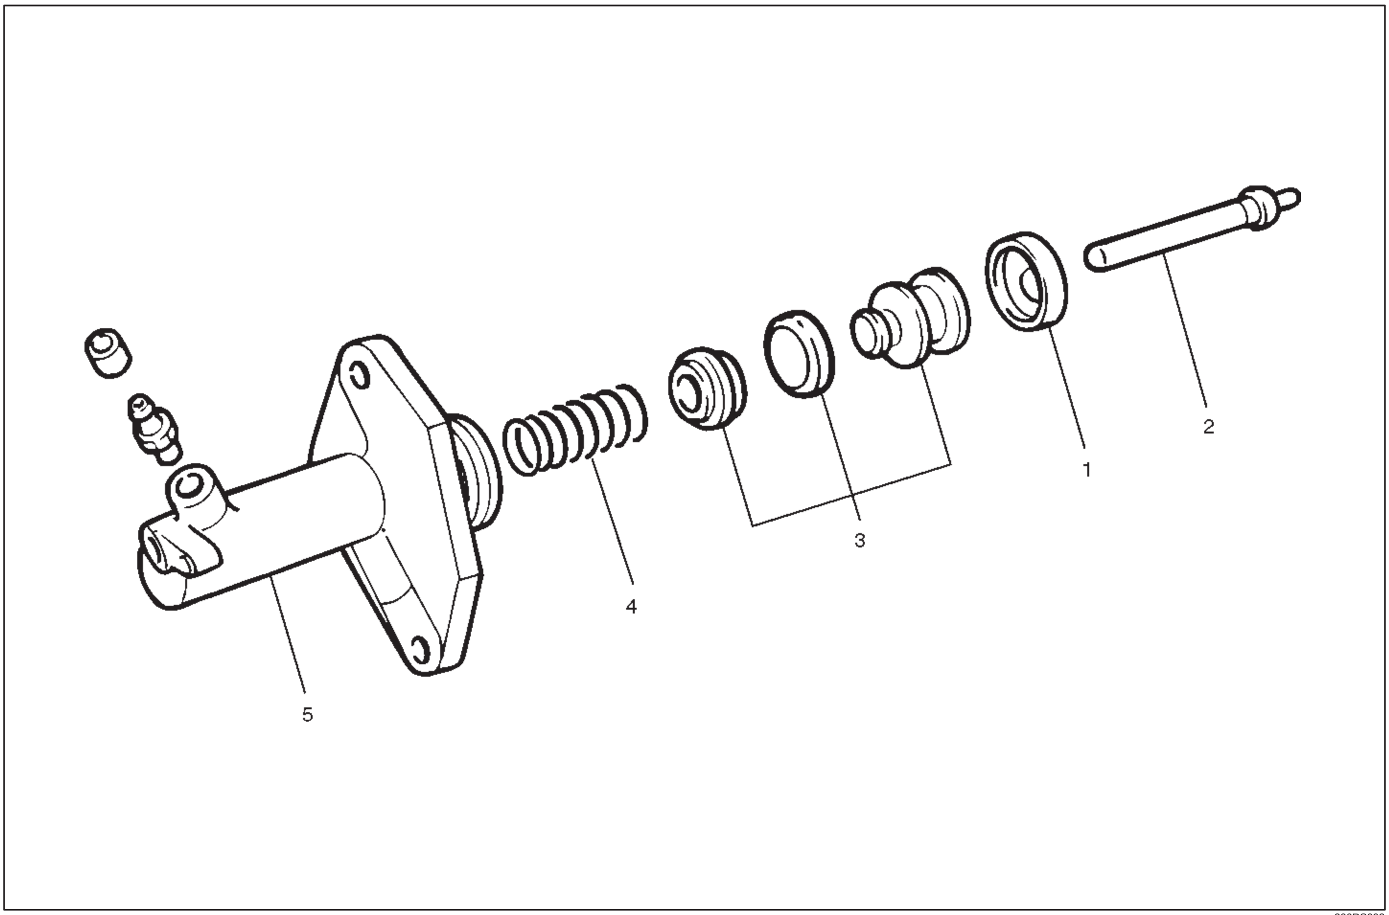


208RX001

NOTE: Disassembling and assembling the master cylinder is not approved.

Slave Cylinder

Disassembled View



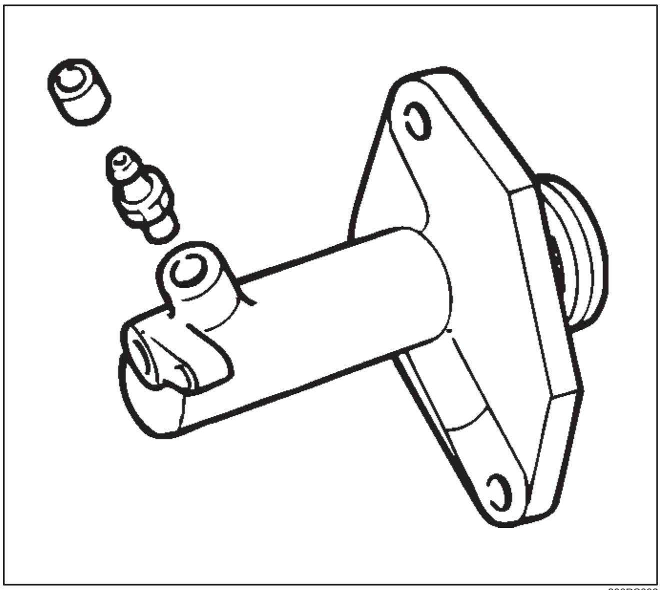
206RS002

Legend

(1) Push Rod
(2) Boot
(3) Piston and Piston Cup
(4) Spring
(5) Cylinder Body

Disassembly

1. Disassemble boot (1), push rod (2), piston and piston cup (3), and spring (4) from cylinder body (5).



206RS003

Inspection and Repair

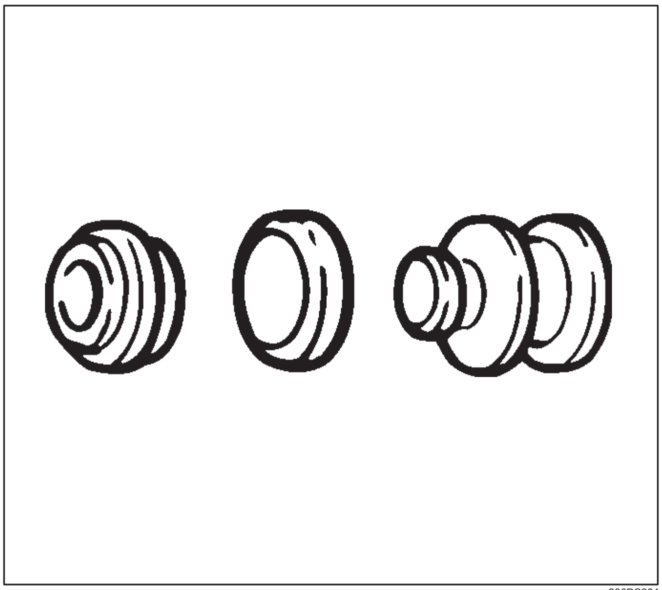
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Cylinder Body

1. Clean the cylinder body.
2. Check the fluid return port for restrictions and clean it if necessary.

Piston and Piston Cup

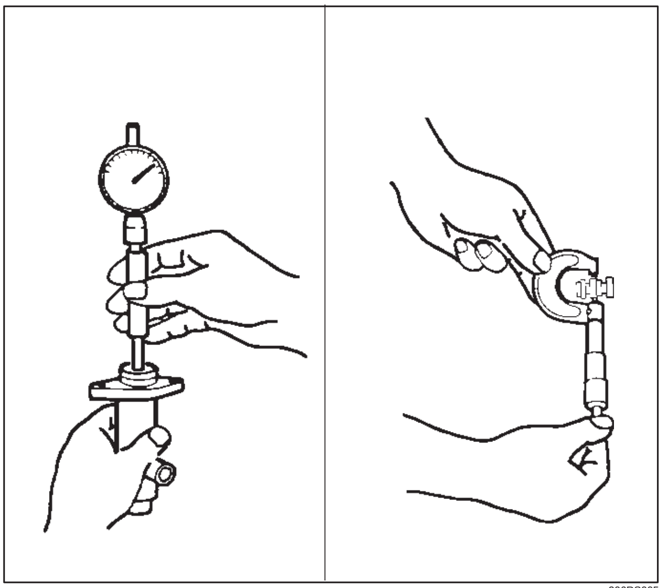
1. Visually inspect the disassembled piston and piston cup for excessive wear and damage.



206RS004

Replace the inner parts with new parts if necessary.

2. Measure the clearance between slave cylinder wall and piston.



206RS005

If the measured value exceeds the specified limit, the slave cylinder assembly must be replaced.

Standard: 0.07 mm (0.0028 in)

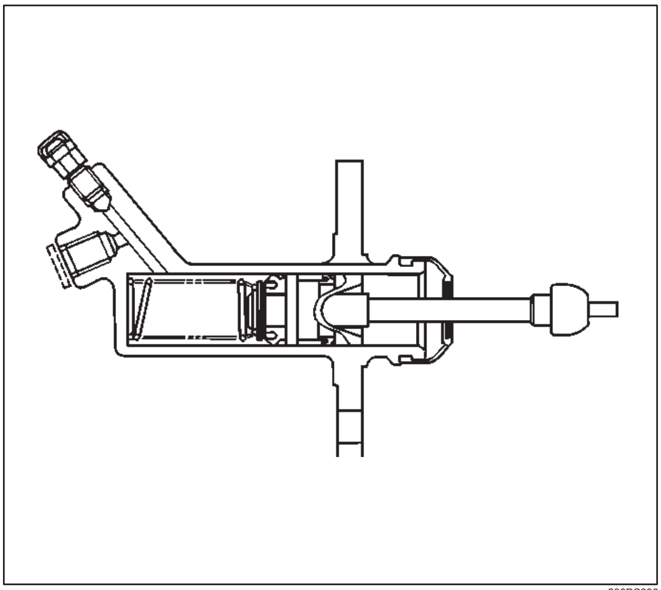
Limit: 0.15 mm (0.0059 in)

Reassembly

To reassemble, follow the disassembly steps in the reverse order, noting the following points:

Piston Assembly

1. Before installing the parts, apply a thin coat of rubber grease.
2. Install cup in groove in piston with the lip turned to the front of cylinder. Use care so as not to scratch the cylinder.



206RS006

Main Data and Specifications

General Specifications

Engine	X22SE	6VD1
Type	Dry single plate type with diaphragm spring	
Size	240 mm (9.45 in)	260 mm (10.24 in)
Pressure plate		
Outside diameter	299 mm (11.77 in)	332 mm (13.07 in)
Clamping force	5488 N (1235 lb)	7208 N (1621 lb)
Spring finger height	37.5 – 39.5 mm (1.476 – 1.555 in)	49.9 – 51.9 mm (1.965 – 2.043 in)
Driven plate

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

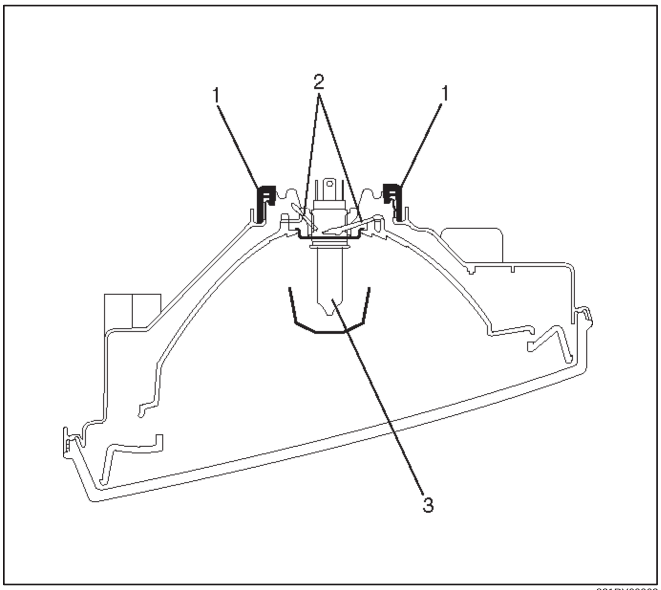
CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fasteners joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fasteners. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Headlight Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the headlight bulb (3).
   - Disconnect the connector.
   - Remove the bulb cover (1).
   - Release the retaining ring (2).

CAUTION: The halogen light bulb produces heat and temperature rises high, therefore, if the glass surface is contaminated, it will be burnt by heat leaving stains which will not come out. This may reduce the illuminating power or damage the bulb due to thermal deformation during evaporation. In order to prevent this problem, do not touch the glass surface with your fingers.



821RY00063

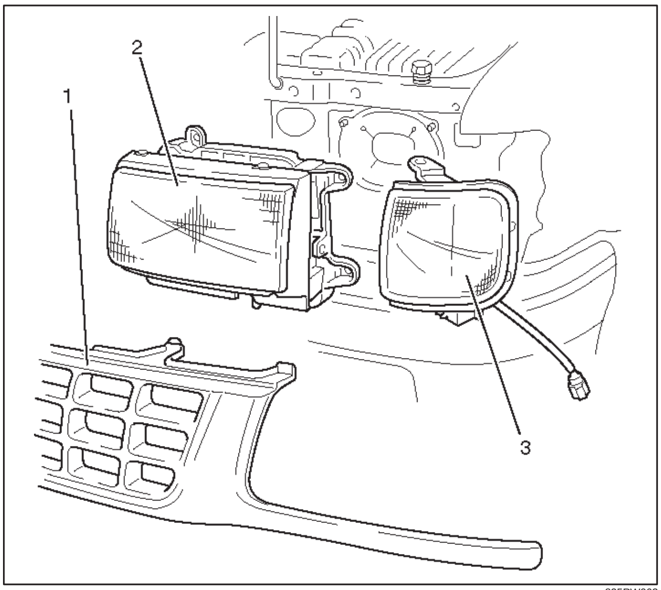
Installation

To install, follow the removal steps in the reverse order.

Headlight Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille (1).
   - Remove eight clips and a screw.
3. Remove the front combination light (3).
   - Remove three screws.
   - Disconnect the connector.
4. Remove the headlight assembly (2).
   - Disconnect the connector.
   - Remove four screws.



825RW063

Installation

To install, follow the removal steps in the reverse order.

CAUTION: After installing the headlight, be sure to adjust the headlight aim.

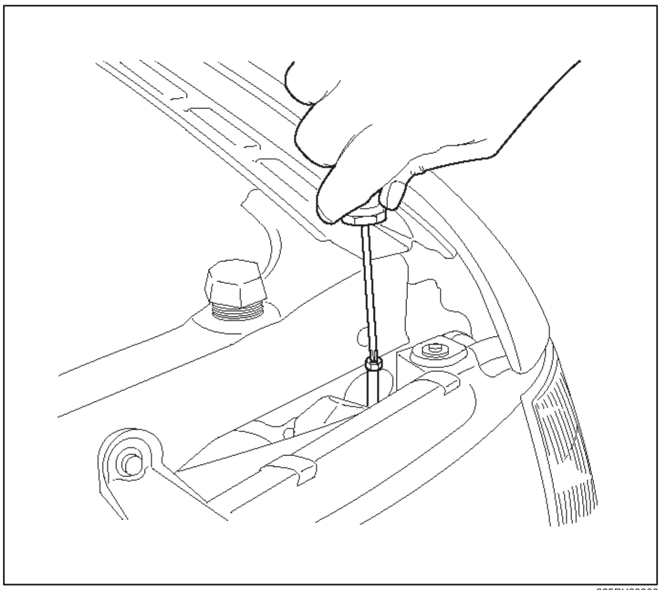
Headlight Adjustment

Preparation

Place the unloaded vehicle on a level surface and check to see if the inflation pressure of the tires is correct, the lenses are clean, and the battery is sufficiently charged. Adjust the aim with the headlight tester, if necessary.
When adjusting, follow the procedure of the tester manufacture’s.

Vertical Adjustment

Use a screwdriver for vertical adjustment.

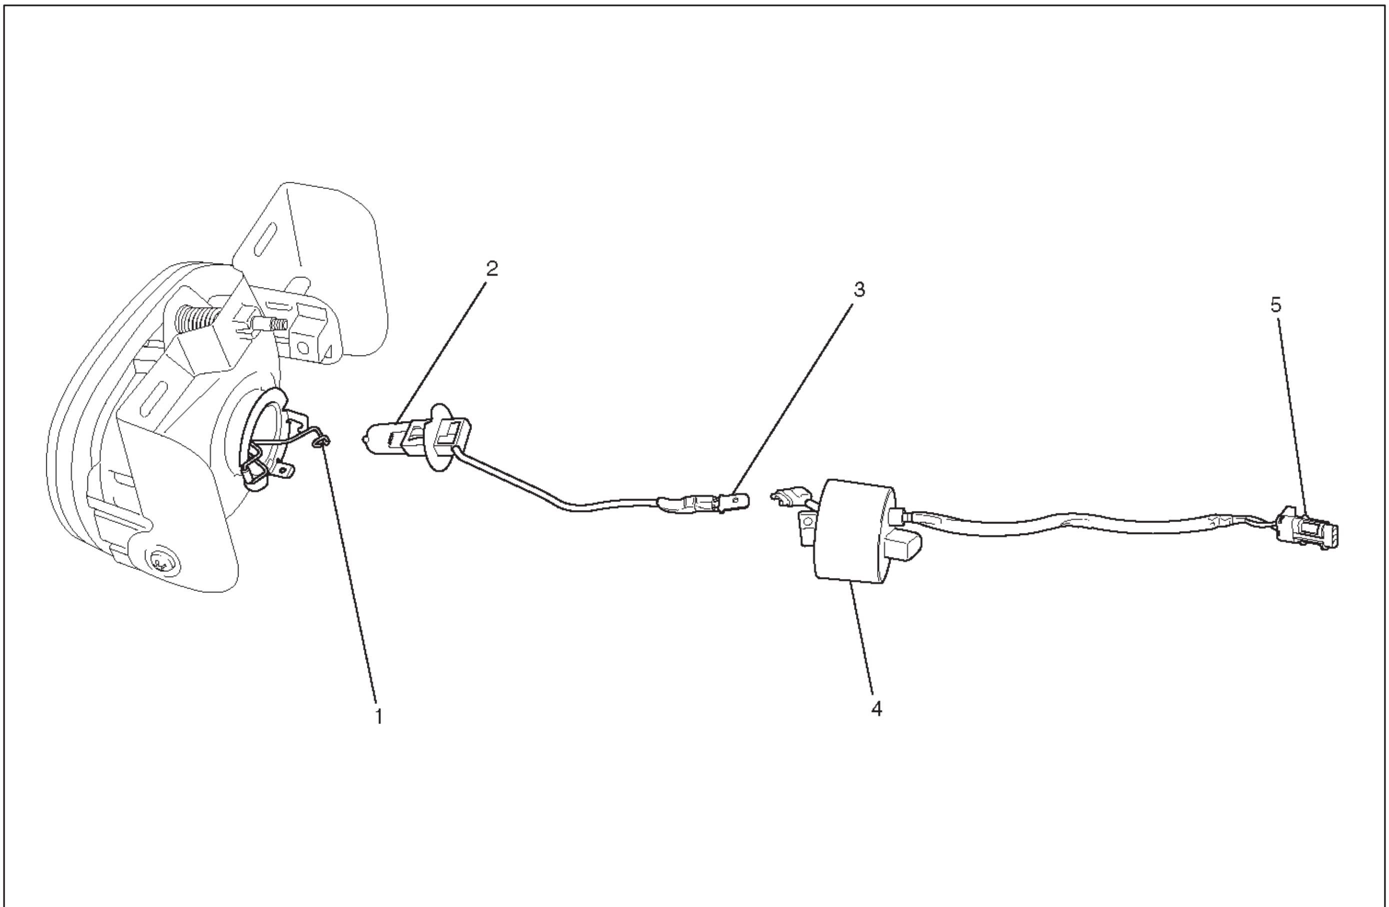


825RY00066

Fog Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the fog light bulb (2).
   - Disconnect the connector (5).
   - Remove the cap (4).
   - Loosen the retaining clip (1).
   - Pull out the bulb (2).
   - Disconnect the terminal (3).



825RY00068

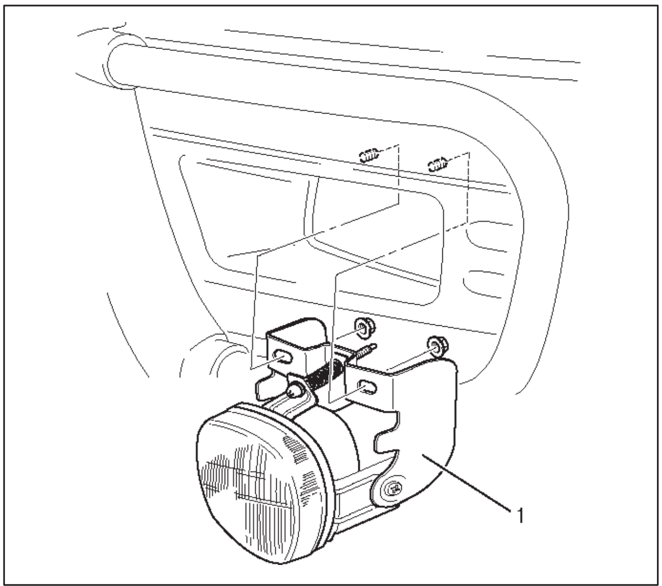
Installation

To install, follow the removal steps in the reverse order.

Fog Light Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the fog light assembly (1).
   - Disconnect the connector.
   - Remove two nuts from the bracket.



825RY00065

Installation

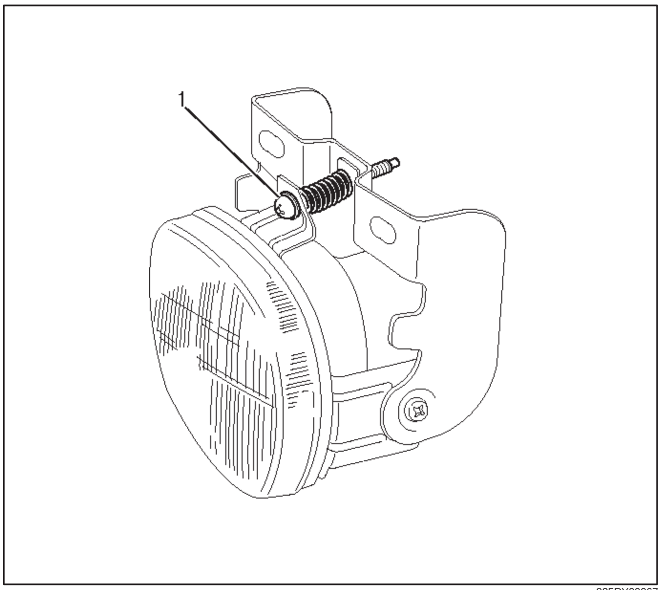
To install, follow the removal steps in the reverse order.

CAUTION: After installing the fog light, be sure to adjust the fog light aim.

Fog Light Adjustment

Vertical Adjustment

Turn the adjusting screw (1) with a screwdriver to adjust the aim of the fog light vertically.

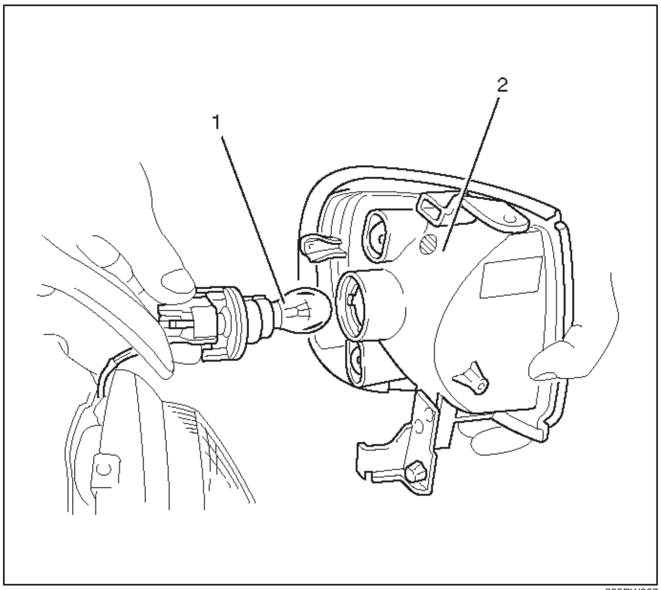


825RY00067

Side Marker Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille.
   - Refer to Engine Hood and Fender in Body Structure section.
3. Remove the front combination light (2).
   - Remove three screws.
4. Remove the bulb (1).
   - Remove the side marker light socket by turning it counterclockwise.
   - Remove the bulb by turning it counterclockwise while pushing it at the same time.



825RW067

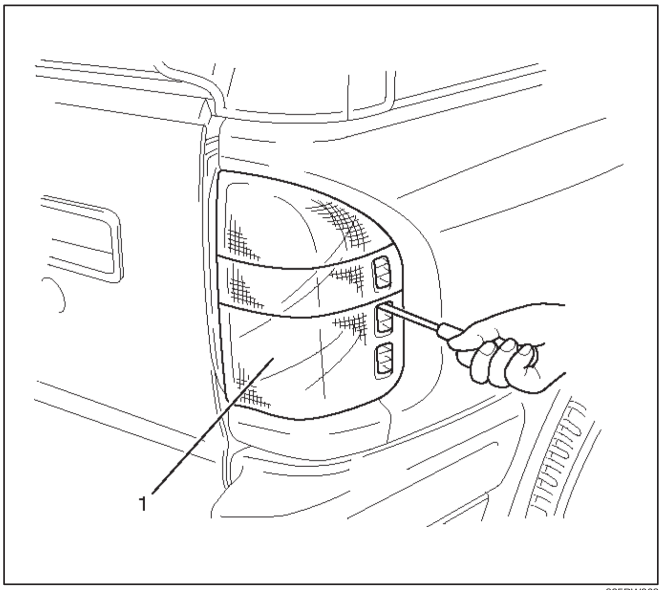
Installation

To install, follow the removal steps in the reverse order.

Taillight Bulb

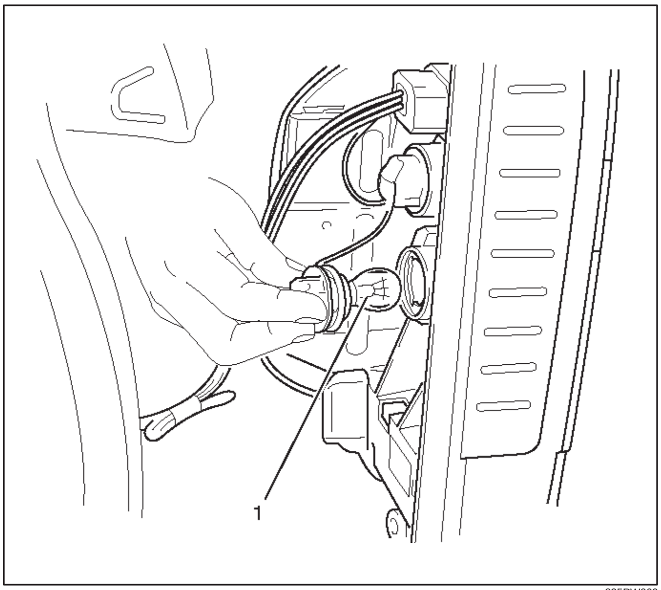
Removal

1. Disconnect the battery ground cable.
2. Remove the rear combination light assembly (1).
   - Remove three screws.
   - Pull out the rear combination light assembly to ward you.



825RW068

3. Remove the bulb (1).
   - Remove the taillight socket by turning it counterclockwise.
   - Remove the bulb by turning it counterclockwise while pushing it at the same time.



825RW069

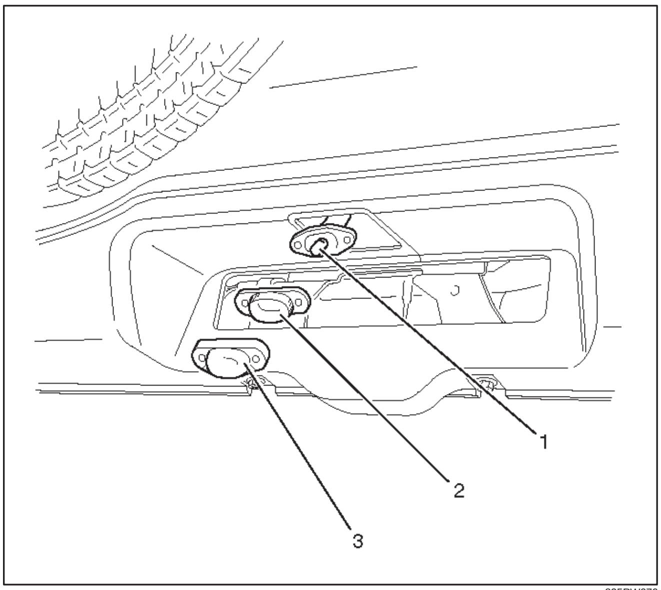
Installation

To install, follow the removal steps in the reverse order.

License Plate Light Bulb (Bumper Type)

Removal

1. Disconnect the battery ground cable.
2. Remove the lens cover (3).
   - Remove two screws.
3. Remove the lens (2).
4. Remove the bulb (1).
   - Pull out the bulb from the socket.



825RW070

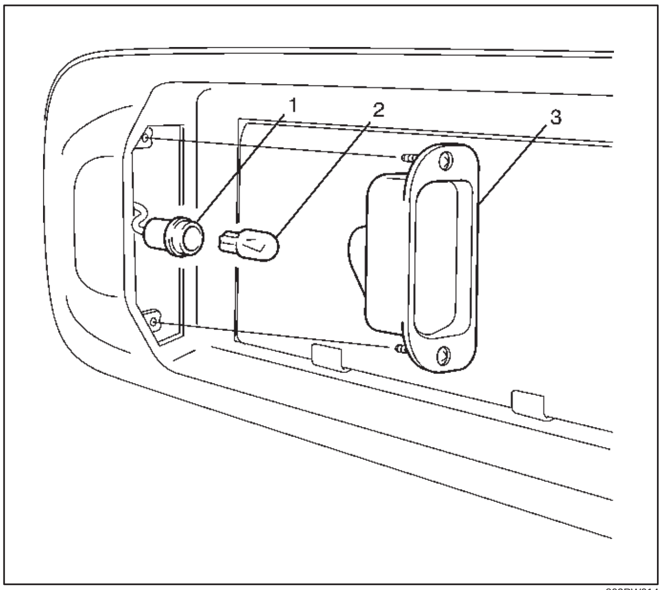
Installation

To install, follow the removal steps in the reverse order.

License Plate Light Bulb (Tailgate Type)

Removal

1. Disconnect the battery ground cable.
2. Remove the lens cover (3).
   - Remove two screws.
3. Remove the bulb (2).
   - Pull out the bulb from the socket (1).



803RW014

Installation

To install, follow the removal steps in the reverse order.

Stoplight Bulb

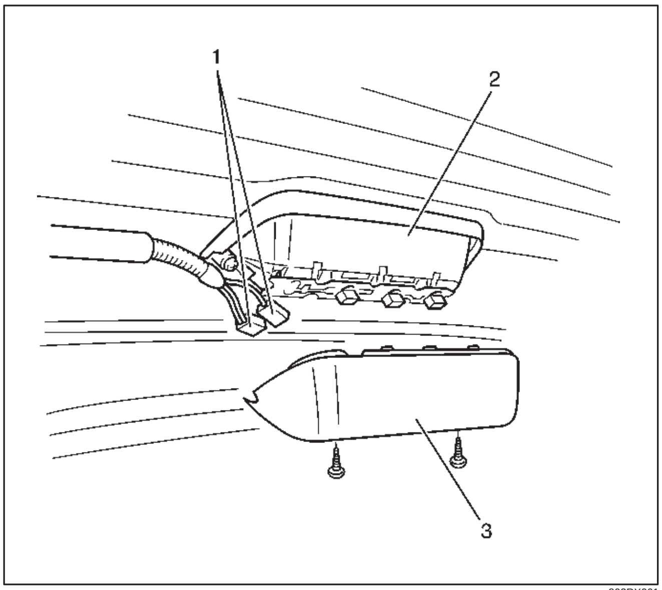
Removal and Installation

Refer to Taillight Bulb in this section.

High Mounted Stoplight Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the high mounted stoplight assembly (2).
   - Remove the cover (3).
   - Disconnect the connectors (1).
   - Remove two screws.



803RX001

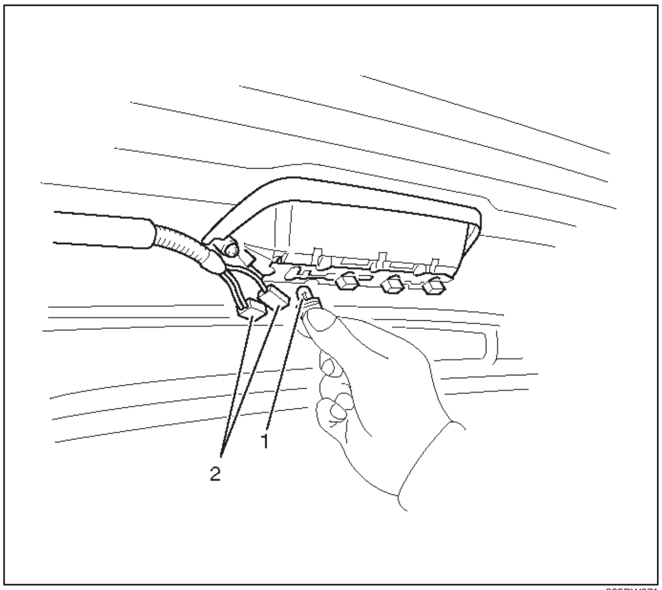
Installation

To install, follow the removal steps in the reverse order.

High Mounted Stoplight Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the cover.
3. Disconnect the connectors (2).
4. Remove the bulb (1).
   - Remove the socket by turning it counterclockwise.



825RW071

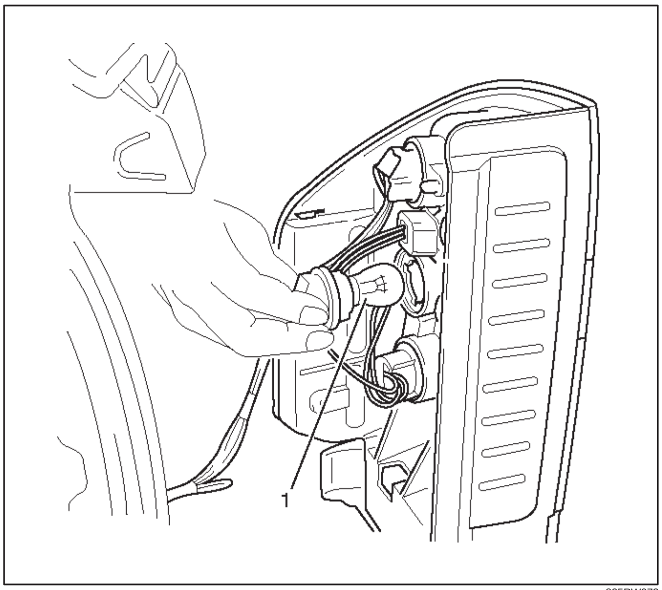
Installation

To install, follow the removal steps in the reverse order.

Backup Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the rear combination light assembly.
   - Refer to the Taillight Bulb removal step 2 in this section.
3. Remove the bulb (1).
   - Remove the backup light socket by turning it counterclockwise.
   - Remove the bulb by turning it counterclockwise while pushing it at the same time.



825RW073

Installation

To install, follow the removal steps in the reverse order.

Front Turn Signal Light Bulb

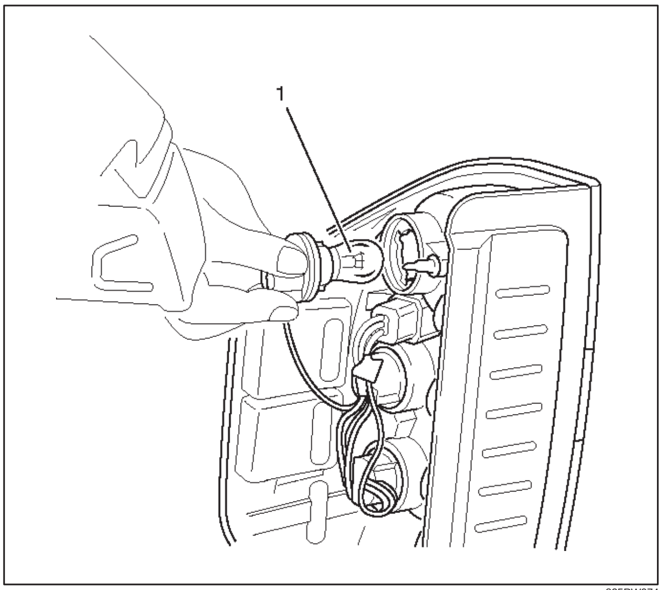
Removal and Installation

Refer to Side Marker Light Bulb in this section.

Rear Turn Signal Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the rear combination light assembly.
   - Refer to the Taillight Bulb removal step in this section.
3. Remove the bulb (1).
   - Remove the rear turn signal light socket by turning it counterclockwise.
   - Remove the bulb by turning it counterclockwise while pushing it at the same time.



825RW074

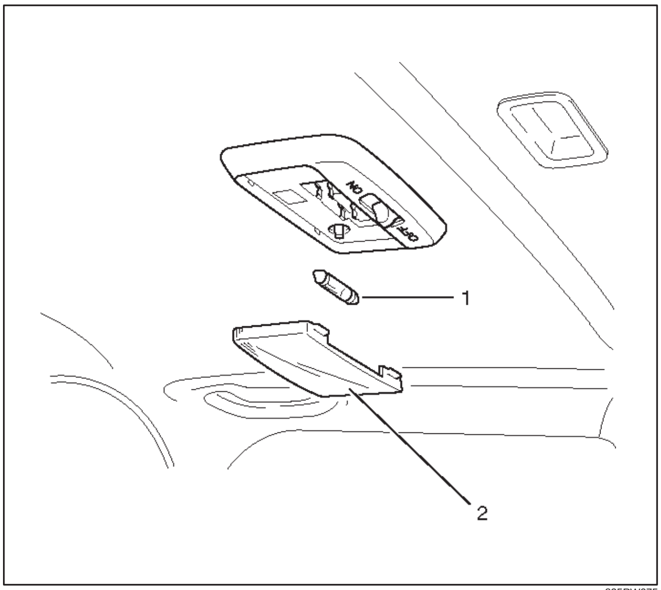
Installation

To install, follow the removal steps in the reverse order.

Dome Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
   - Pull out the bulb.



825RW075

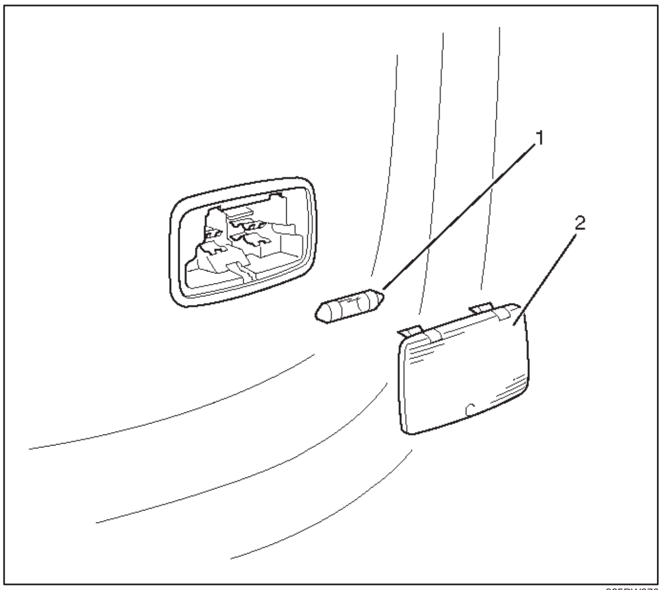
Installation

To install, follow the removal steps in the reverse order.

Courtesy Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
   - Pull out the bulb.



825RW076

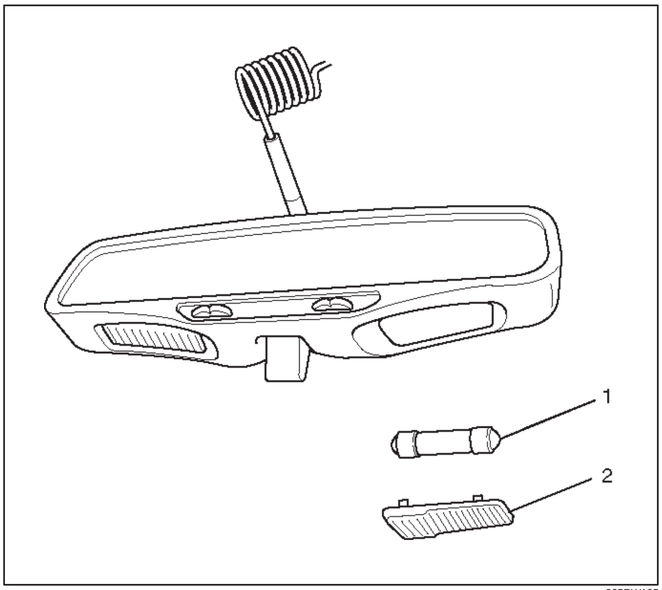
Installation

To install, follow the removal steps in the reverse order.

Spotlight Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
   - Pull out the bulb.



825RW105

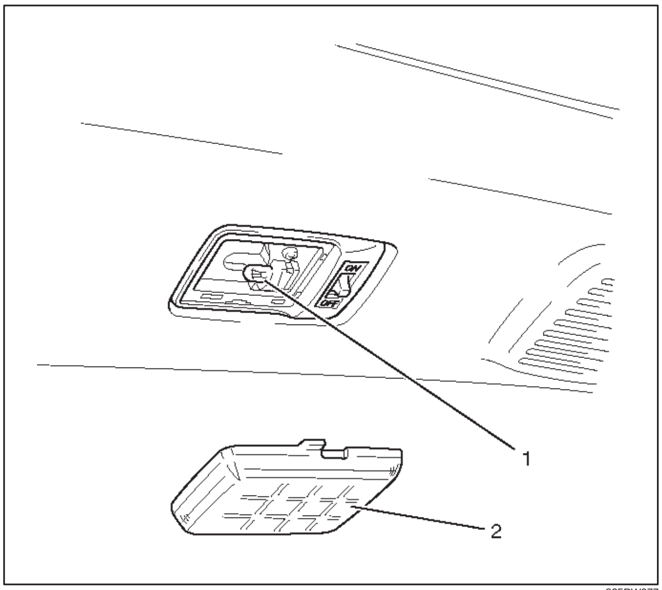
Installation

To install, follow the removal steps in the reverse order.

Luggage Room Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
   - Pull out the bulb.



825RW077

Installation

To install, follow the removal steps in the reverse order.

HVAC Bezel Illumination Light Bulb

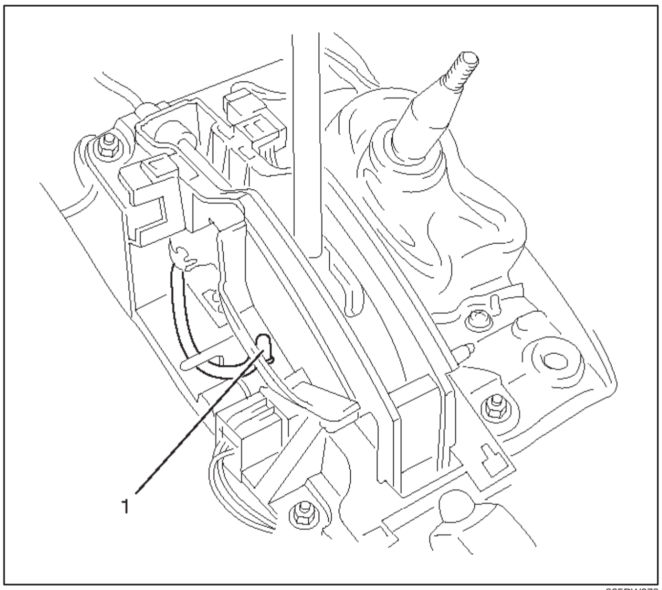
Removal and Installation

Refer to Control Panel Illumination bulb in Heating, Ventilation and Air Conditioning (HVAC) section.

Shift Lever Illumination Light Bulb (A/T)

Removal

1. Disconnect the battery ground cable.
2. Remove the console assembly.
   - Remove four screws.
3. Remove the bulb (1).
   - Turn the bulb socket counterclockwise.
   - Pull out the bulb from the socket.



825RW078

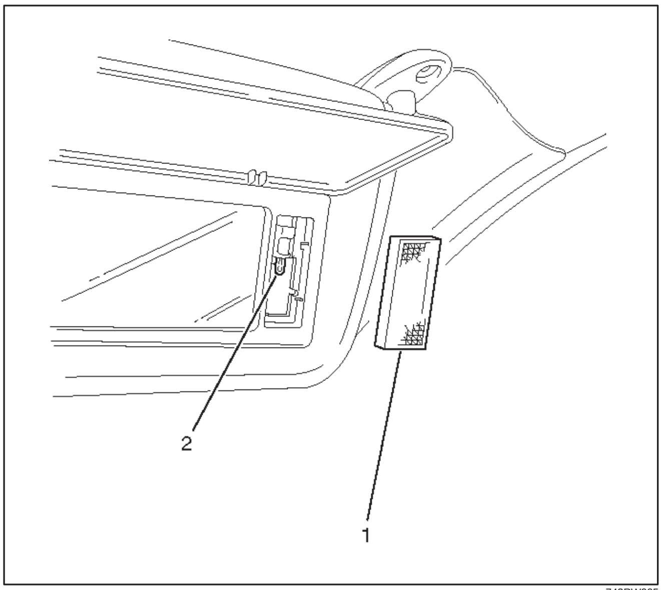
Installation

To install, follow the removal steps in the reverse order.

Vanity Mirror Illumination Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (1).
3. Remove the bulb (2).
   - Attach some scotch tape to the bulb and pull it out.



743RW005

Installation

To install, follow the removal steps in the reverse order.

Starter Switch

Removal and Installation

Refer to Lock cylinder in steering section.

Lighting Switch (Combination Switch)

Removal and Installation

Refer to Combination Switch in Steering section.

Dimmer·Passing Switch (Combination Switch)

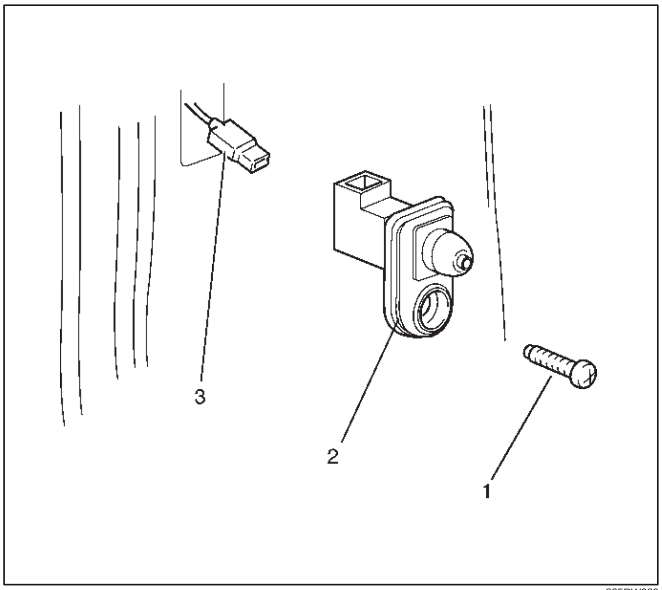
Removal and Installation

Refer to Combination Switch in Steering section.

Door Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the door switch (2).
   - Remove the screw (1).
   - Disconnect the connector (3).



825RW289

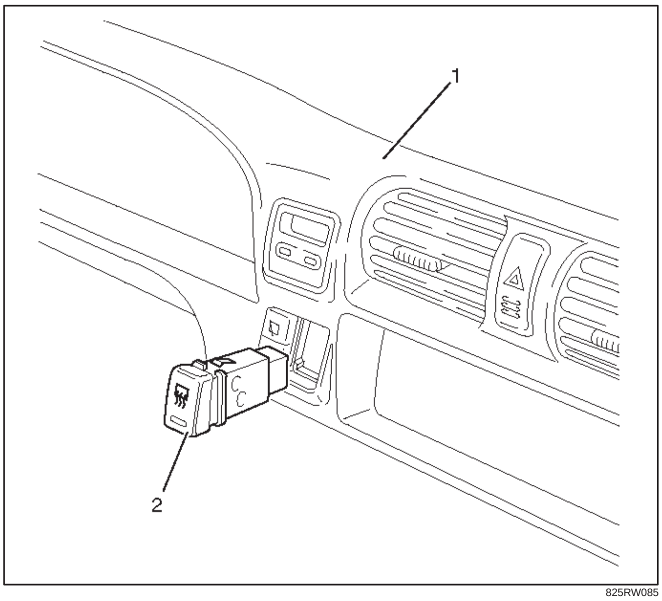
Installation

To install, follow the removal steps in the reverse order.

Rear Defogger Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
   - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the rear defogger switch (2).
   - Disconnect the switch connector.
   - To remove the switch, push the lock from the back side of the meter cluster assembly.



Installation

To install, follow the removal steps in the reverse order.

Key Remind Switch (Starter Switch)

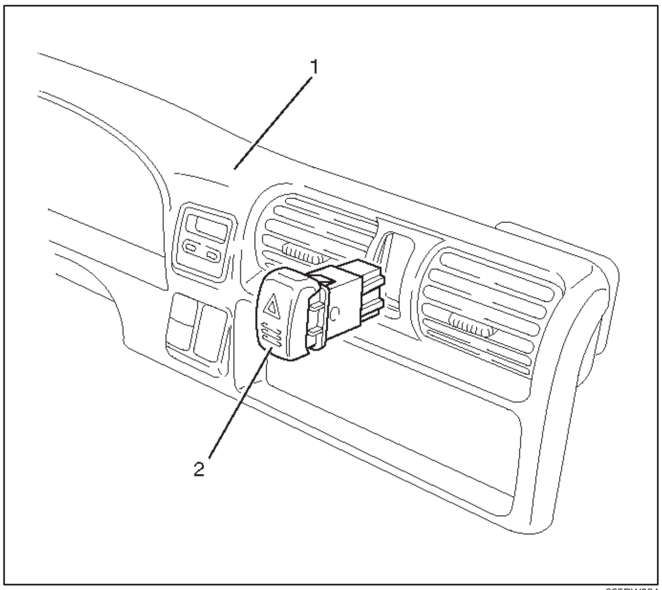
Removal and Installation

Refer to Lock Cylinder in Steering section.

Hazard Warning Light Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
   - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the hazard warning switch (2).
   - Disconnect the switch connector.
   - To remove the switch, push the lock from the back side of the meter cluster assembly.



825RW084

Installation

To install, follow the removal steps in the reverse order.

Stoplight Switch

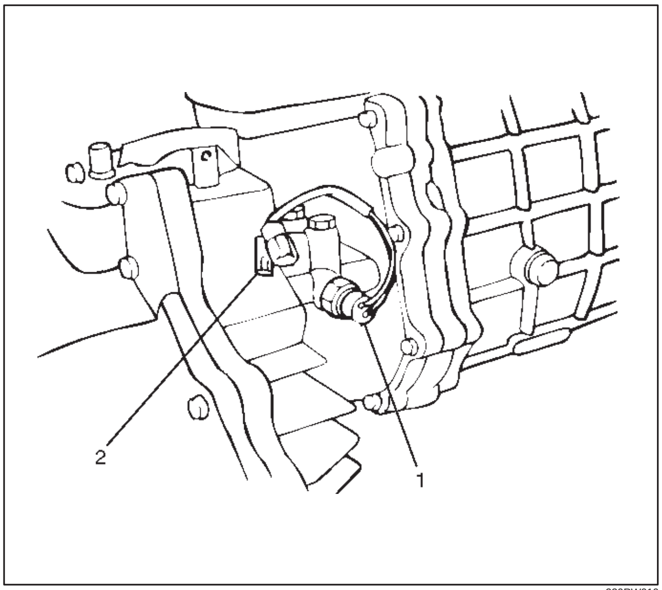
Removal and Installation

Refer to Stoplight Switch in Brake section.

Backup Light Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the backup light switch (1).
   - Disconnect the connector (2).



230RW010

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Apply liquid gasket to the screw portion of the switch to prevent oil leak.

Turn Signal Light Switch (Combination Switch)

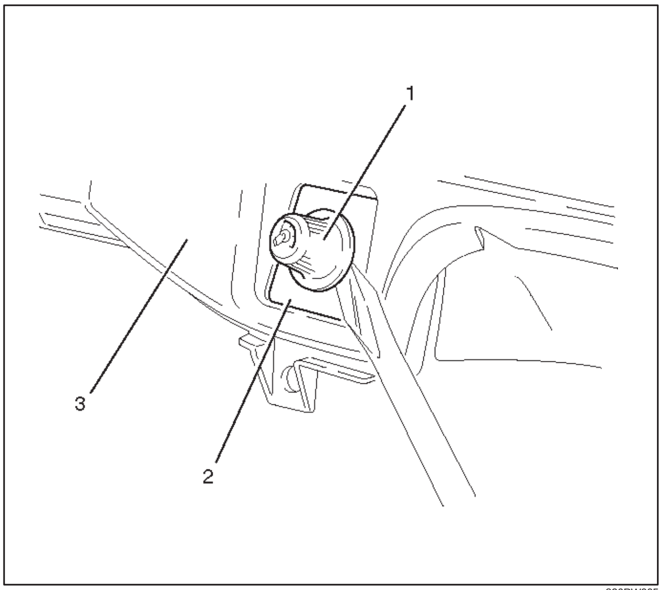
Removal and Installation

Refer to Combination Switch in Steering section.

Illumination Controller

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel driver lower cover assembly (3).
   - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the illumination controller (2).
   - Disconnect the controller connector.
   - Remove the controller knob (1).
   - Remove the nut.
   - Remove the controller from the back side of the instrument panel driver lower cover assembly.



826RW005

Installation

To install, follow the removal steps in the reverse order.

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Windshield Wiper/Washer System

General Description

The circuit consists of the starter switch, windshield wiper & washer switch, windshield wiper motor, windshield washer motor and alarm & relay control unit.

When the windshield wiper & washer switch is turned on with the starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.
The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The alarm & relay control unit relay is used to control motion of the wiper.

Windshield Wiper And Washer Switch

Removal and Installation

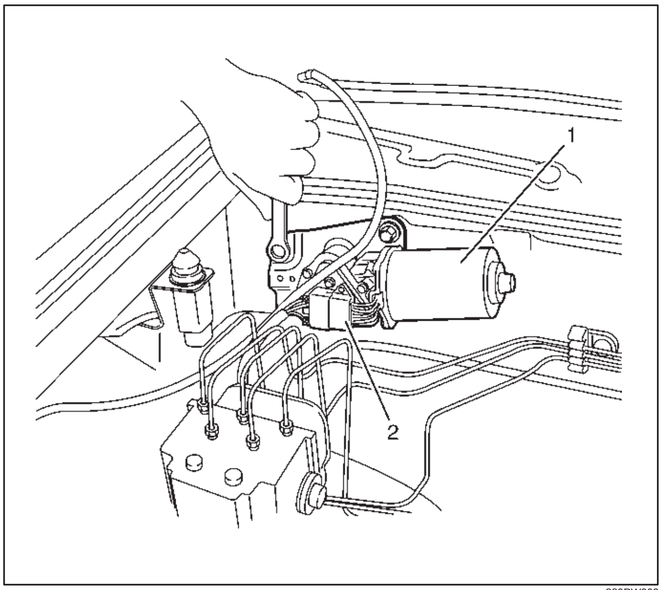
Refer to Combination Switch in Steering section.

Windshield Wiper Motor

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector(2).
3. Remove 4 mounting bolts.
4. Remove the nut of the wiper motor shaft, and disconnect the linkage.
5. Remove the windshield wiper motor(1).

CAUTION: To facilitate the removal of the nuts, be sure to put out the tip portion of the linkage sufficiently through the mounting hole of the motor by sliding the wiper blade slowly.



880RW002

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the wiper motor shaft nut to the specified torque.

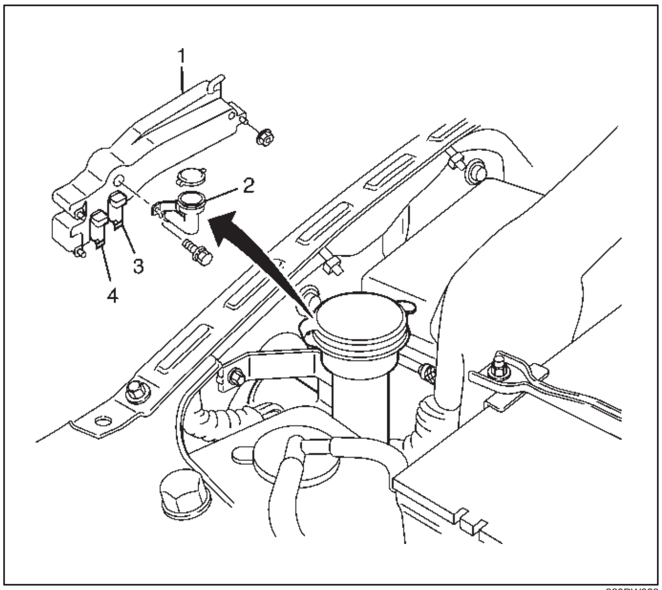
   Torque: 14 N·m (122 lb in)

2. Remove the wiper arms on both sides, and rotate the wiper motor until it gets to the autostop position to reinstall the wiper blade.

Windshield Washer Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the fender inner liner (right side).
3. Disconnect the windshield washer motor connector and the rear washer motor connector.
4. Disconnect the windshield washer hose connector and the rear washer hose connector.
5. Remove the filler neck (2).
   - Remove the bolt.
6. Remove the washer tank (1).
   - Remove the three nuts.
7. Pull the windshield washer motor (4) from the washer tank.

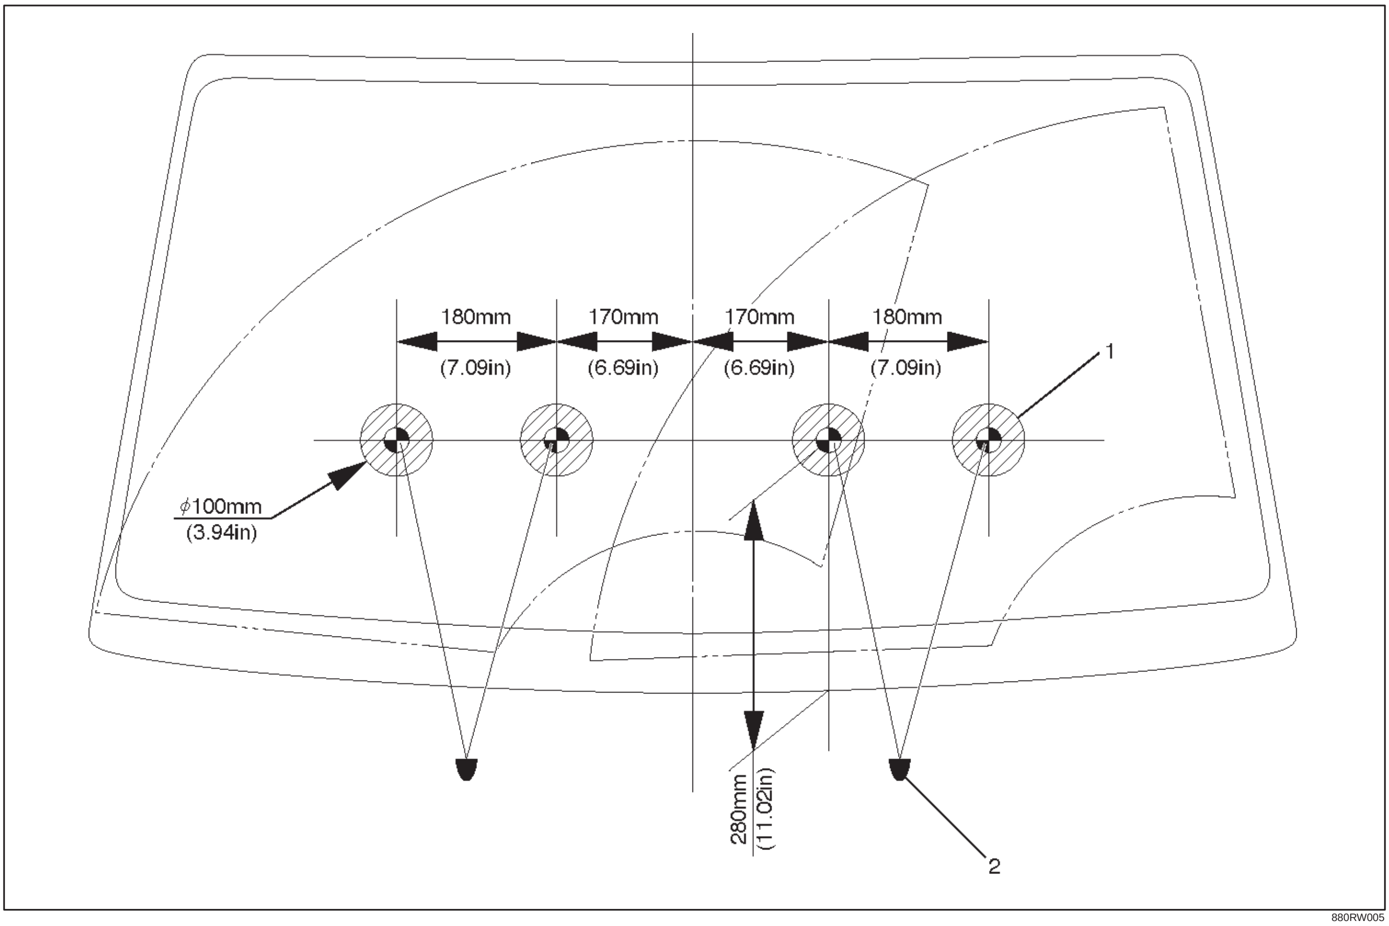


880RW028

Installation

To install, follow the removal steps in the reverse order.

Windshield Washer Spray Pattern

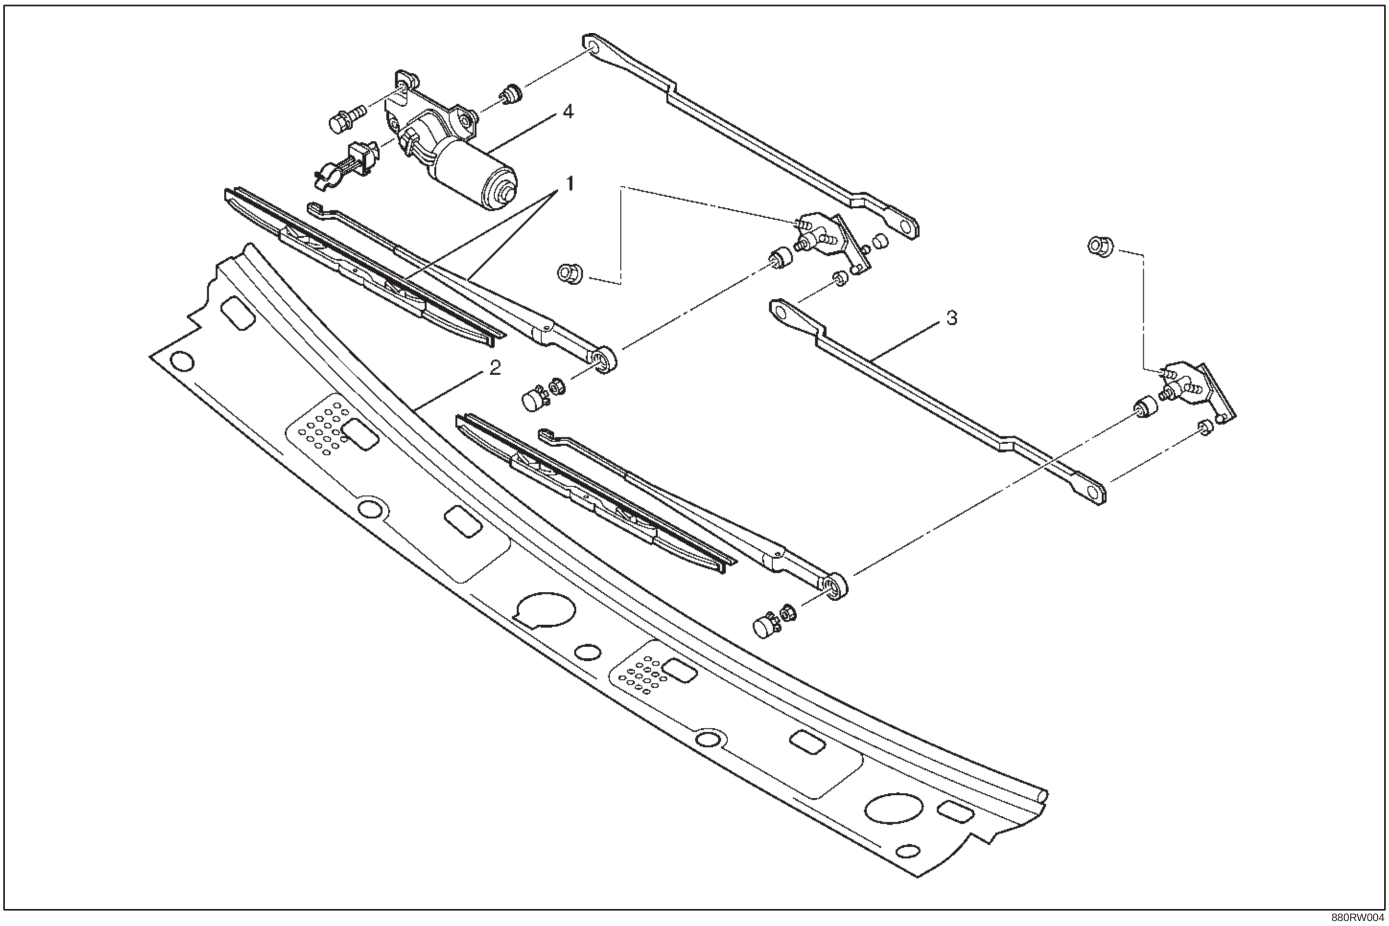


Legend

(1) Spray Target
(2) Washer Nozzle

Windshield Wiper Linkage

Windshield Wiper Linkage and Associated Parts



Legend

(1) Windshield Wiper Arm/Blade
(2) Vent Cowl Cover
(3) Windshield Wiper Linkage Assembly
(4) Windshield Wiper Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the windshield wiper arm/blade.
3. Remove the vent cowl cover.
4. Remove the windshield wiper motor.
5. Remove the pivot assembly mounting nuts, fixing screws.
6. Take out the windshield wiper linkage assembly from the opening of the cowl.

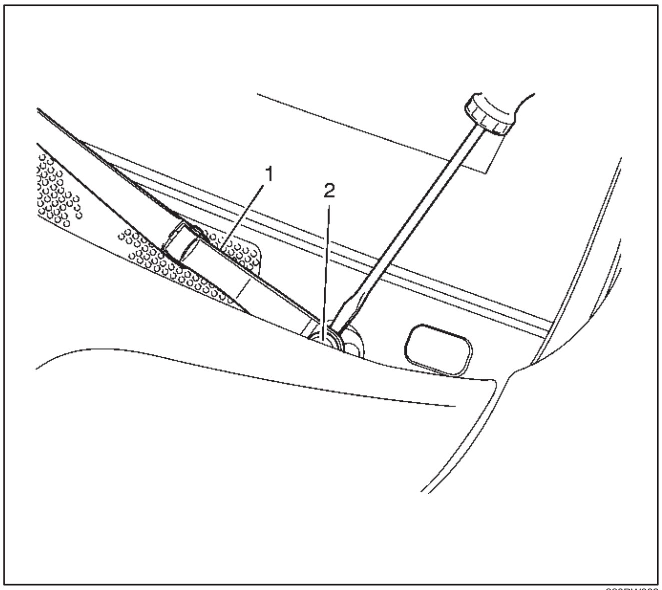
Installation

To install, follow the removal steps in the reverse order.

Windshield Wiper Arm/Blade

Removal

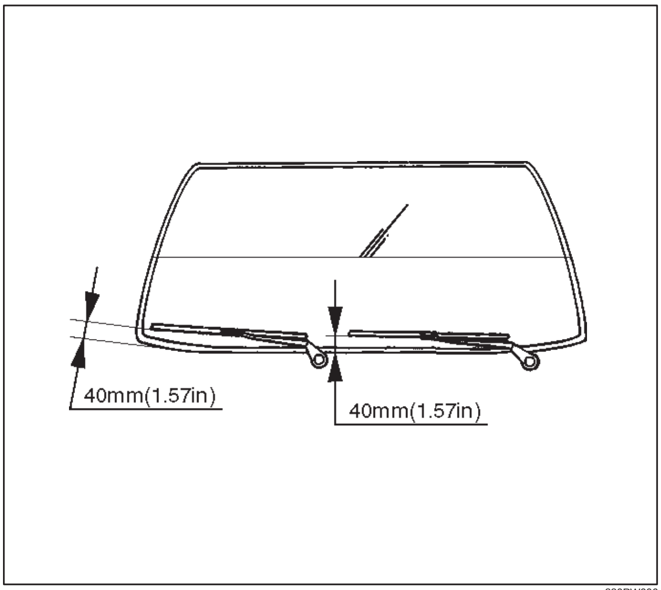
1. Dry the cap(2) off with the tip of a screwdriver.
2. Remove the nut.
3. Remove the wiper arm/blade(1).



880RW003

Installation

To install, follow the removal steps in the reverse order, noting the following points:



880RW006

1. Before installing the wiper arm/blade to the shaft, confirm that the motor stops at the autostop position.
2. Set the wiper arm/blade so that the tips of both blades are positioned about 40 mm (1.57 in) from the upper edge of the cowl cover as shown in the figure.
3. Tighten the nuts to the specified torque.

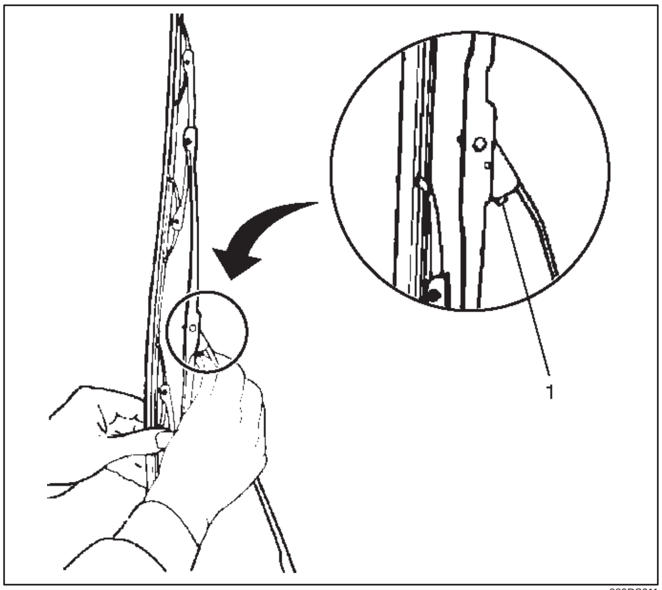
Torque: 23 N·m (17 lb ft)

Windshield Wiper Blade Rubber

Removal

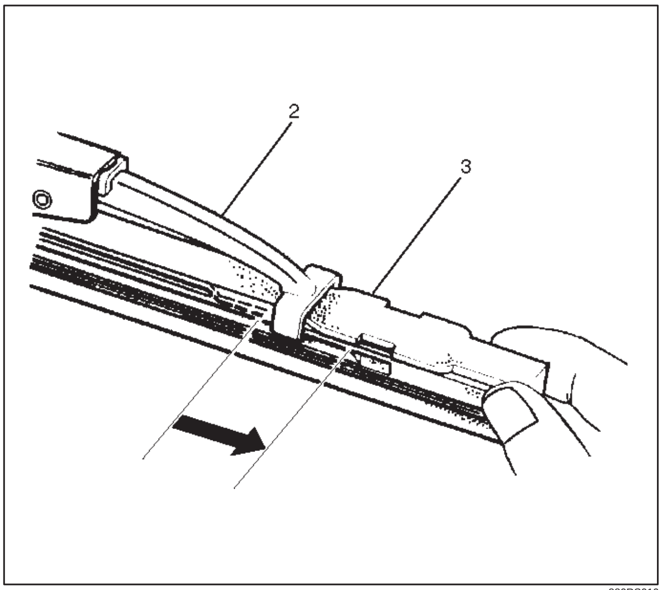
1. Push the wiper blade lock(1) while pulling the wiper blade in the arrow direction as shown in the figure.

CAUTION: When the wiper blade has been removed, wrap the tip of the wiper arm with cloth, to avoid damaging the glass.



880RS011

2. Pull the end of rubber and remove the projection(3) from the click of the blade stay (2).



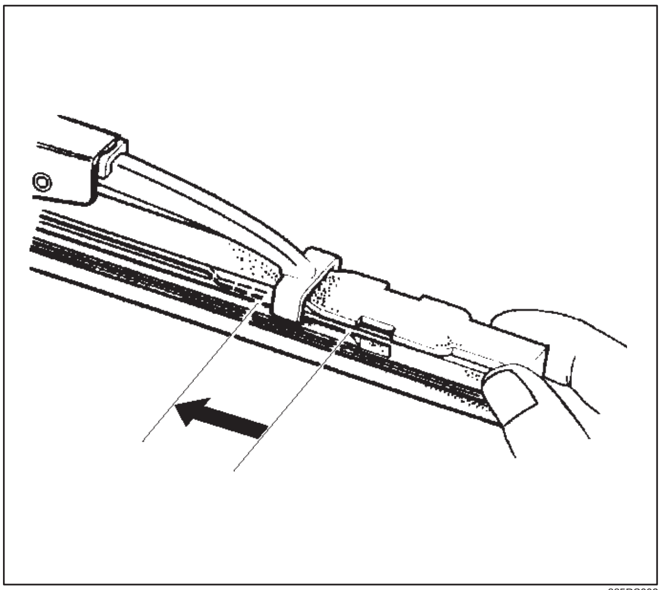
880RS010

3. Pull the rubber out in the same direction.

Installation

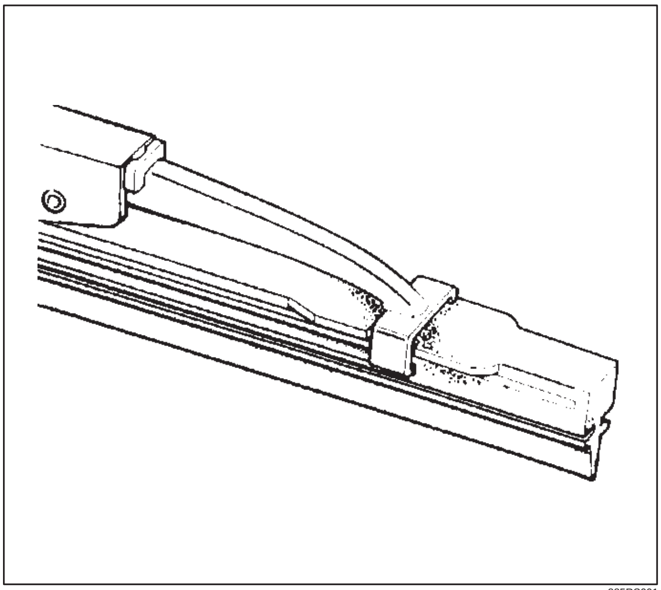
To install, follow the removal steps in the reverse order, noting the following points:

1. Install the click of the blade stay in the groove of the new rubber and slide it in. Complete wiper blade installation by pushing the click.



885RS002

2. Finally, check that the click of the stay has caught in the hole of the rubber.



885RS001

Rear Wiper/Washer System

General Description

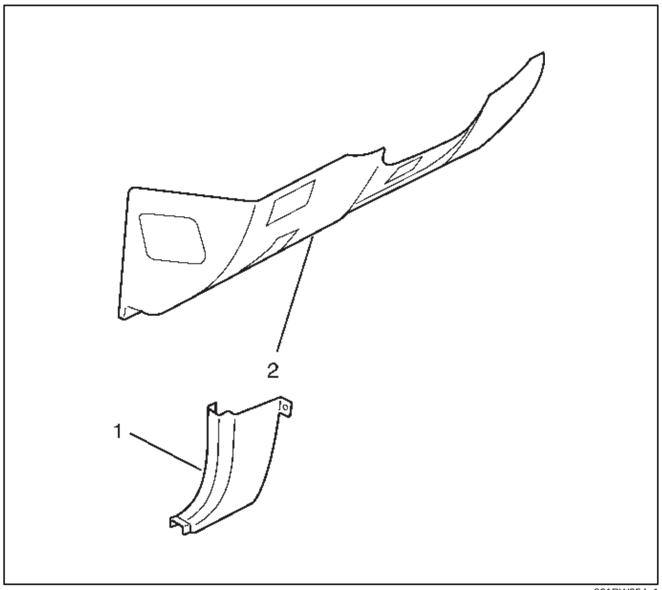
The circuit consists of the starter switch, rear wiper & washer switch, rear wiper motor, rear washer motor and Alarm & relay control unit.

When the rear wiper & washer switch is turned on with the starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.
The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The alarm & relay control unit is used to control motion of the wiper.

Rear Wiper and Washer Switch

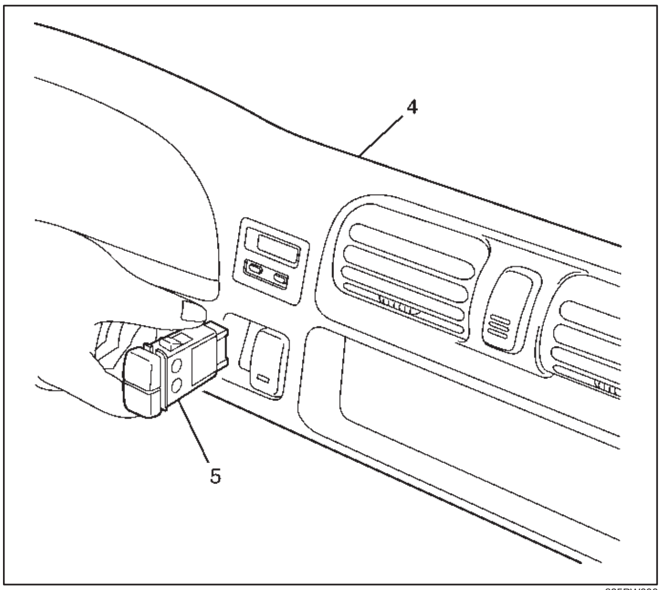
Removal

1. Disconnect the battery ground cable.
2. Remove the dash side trim panel(1).
3. Remove the lower cover assembly(2).
   - Refer to Instrument panel Assembly in Body Structure section.



821RW254–1

4. Remove the meter cluster assembly(4).
5. Remove the rear wiper & washer switch (5).
   - Disconnect the connector.
   - Push the lock from the back side of the meter cluster assembly.



825RW090

Installation

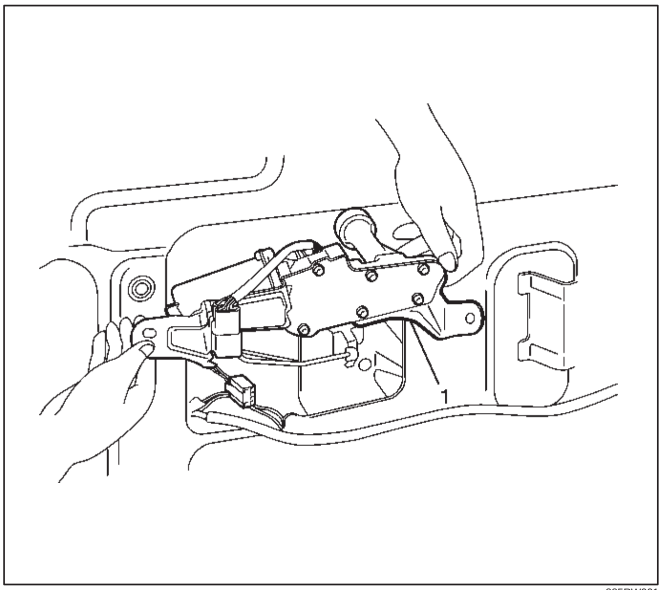
To install, follow the removal steps in the reverse order, noting the following point:

1. Push the switch with your fingers until it locks securely.

Rear Wiper Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim pad.
3. Remove the wiper arm/blade.
   Refer to Rear Wiper Arm/Blade in section.
4. Remove the rear wiper motor (1).
   - Disconnect the connector.
   - Remove the rear wiper motor fixing screws.

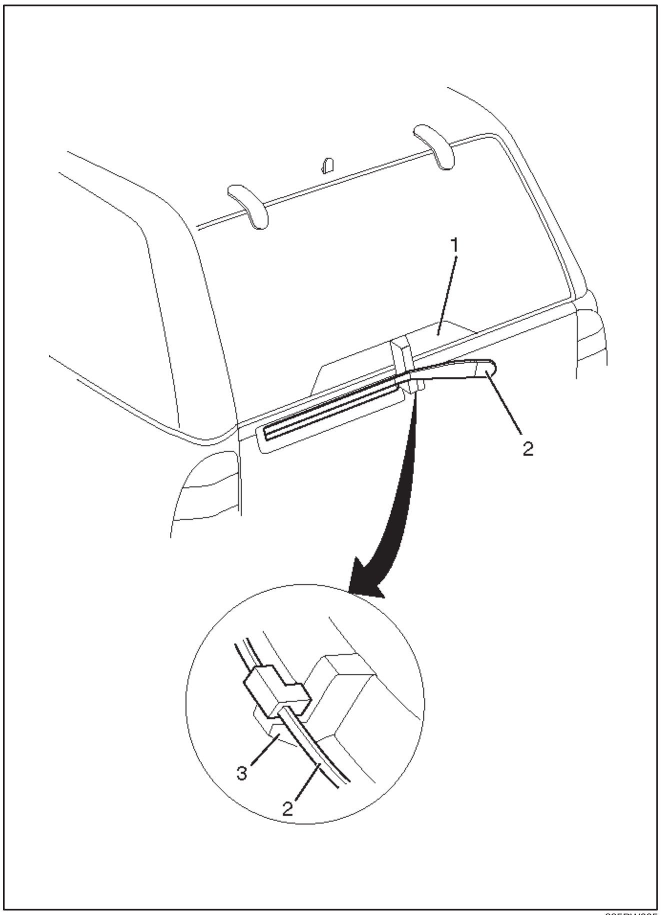


885RW001

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Before installing the wiper arm/blade to the motor shaft, confirm that the motor stops at the autostop position.
2. Install the wiper arm/blade so that the wiper arm (2) contact with the stopper portion (3) on the hatch gate cover (1) as shown in the figure.



885RW005

3. Tighten the motor shaft nut to the specified torque.

   Torque: 10 N·m (87 lb in)

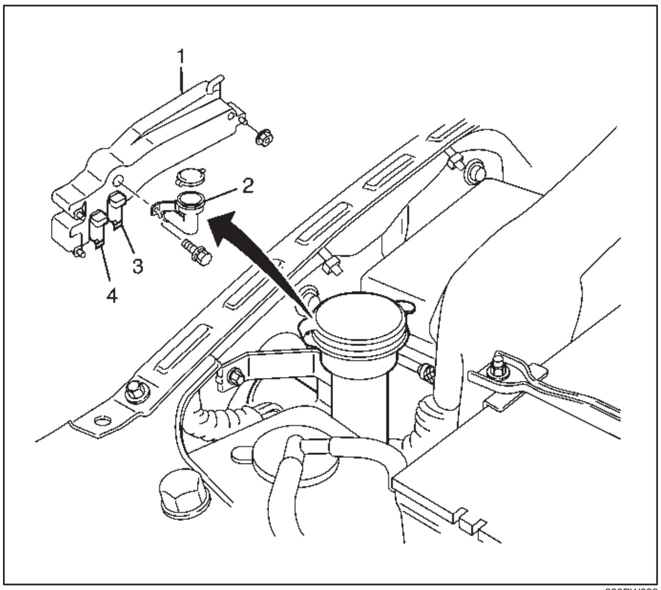
4. Tighten the wiper arm nut to the specified torque.

   Torque: 14 N·m (122 lb in)

Rear Washer Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the fender inner liner (right side).
3. Disconnect the windshield washer motor connector and the rear washer motor connector.
4. Disconnect the windshield washer hose connector and the rear washer hose connector.
5. Remove the filler neck (2).
   - Remove the bolt.
6. Remove the washer tank (1).
   - Remove the three nuts.
7. Pull out the rear washer motor (3) from the washer tank.



880RW028

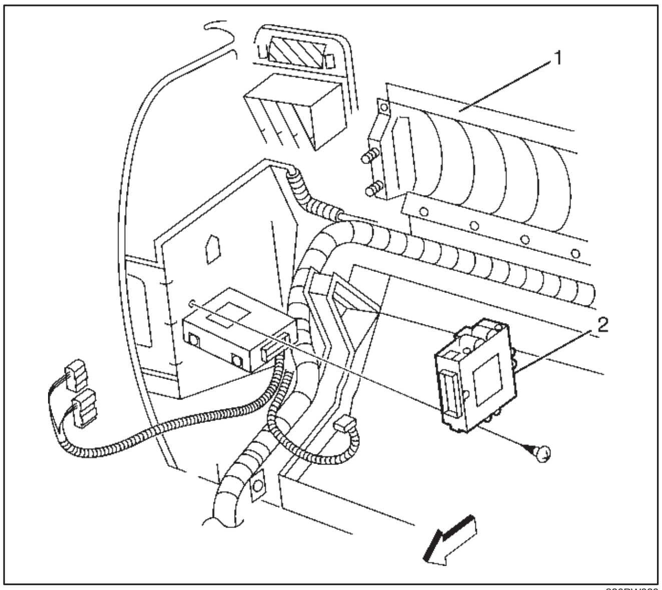
Installation

To install, follow the removal steps in the reverse order.

Alarm and Relay Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel (1).
3. Remove the alarm and relay control unit (2).
   Disconnect the connector.



826RW039

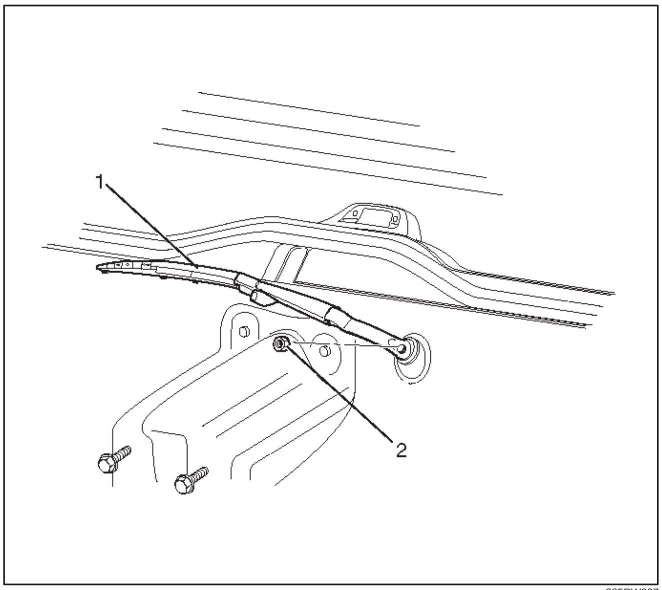
Installation

To install, follow the removal steps in the reverse order.

Rear Wiper Arm/Blade

Removal

1. Remove the arm nut(2).
2. Remove the wiper arm/blade(1).



885RW007

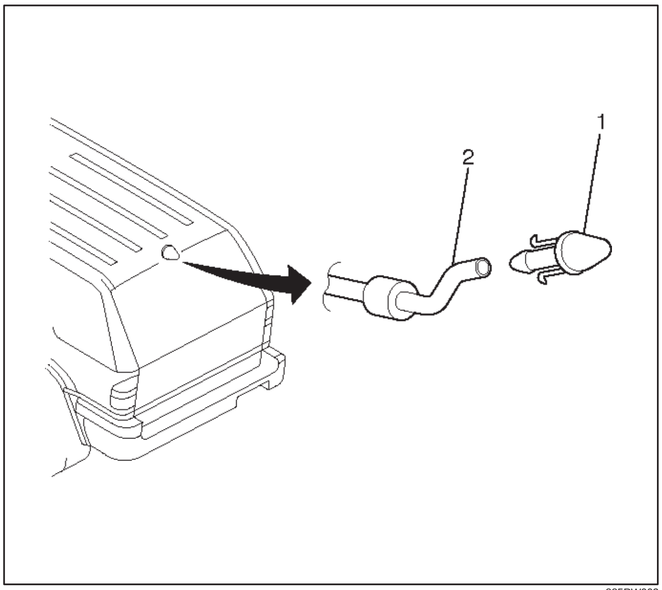
Installation

Refer to Rear Wiper Motor in section.

Rear Washer Nozzle

Removal

1. Remove the washer nozzle(1).
   - Pull out the washer nozzle from the washer hose (2).

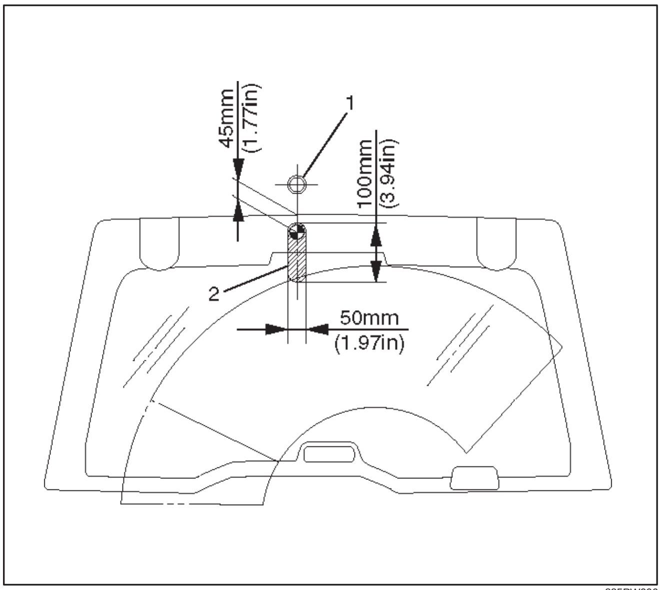


885RW003

Installation

To install, follow the removal steps in the reverse order.

Rear Washer Spray Pattern



885RW006

Legend

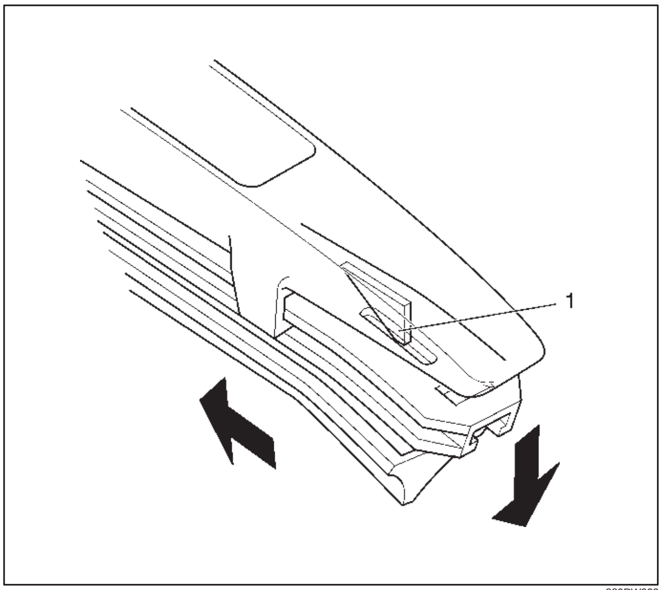
(1) Washer Nozzle
(2) Spray Target

Rear Wiper Blade Rubber

Removal

1. Remove the wiper blade from the wiper arm.
2. Push out the wiper rubber from the wiper blade by sliding it horizontally while holding down the rubber on the wiper blade convex (1) side.

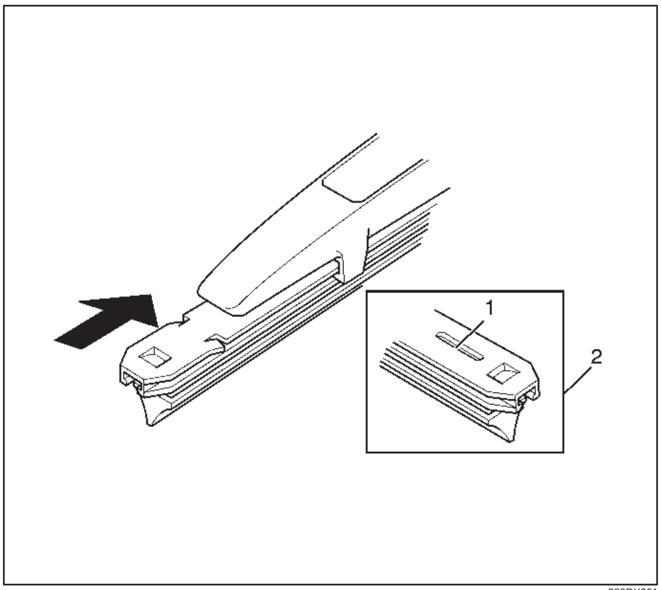
CAUTION: When the wiper blade has been removed, wrap the tip of the wiper arm with cloth, to avoid damaging the glass.



880RW022

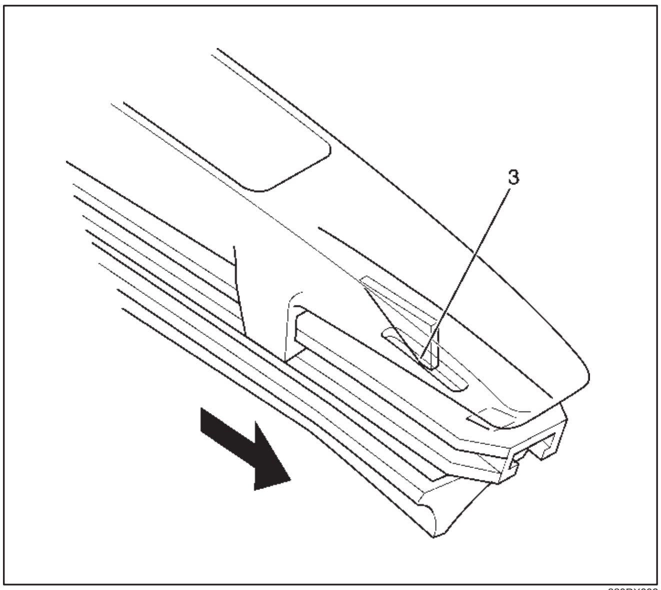
Installation

1. Install the wiper blade rubber.
   - Insert the tip of wiper rubber (2) from the opposite side of removal in the arrow direction.



880RX001

   - Check if the convex part (3) of wiper blade is installed in the groove of the wiper rubber.



880RX002

Service Precaution

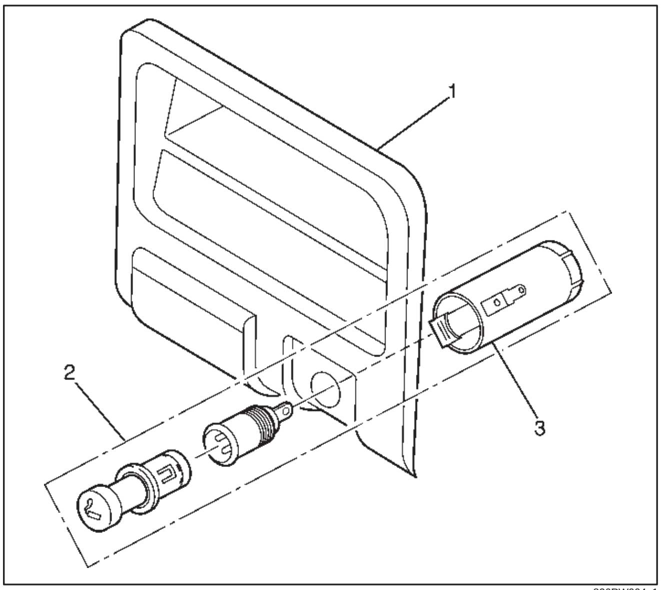
WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fasteners joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fasteners. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Cigarette Lighter

General Description

When the cigarette lighter is pushed in with the starter switch at either “ACC” or “ON” position, a circuit is formed in the cigarette lighter case to heat the lighter coil.
The cigarette lighter springs back to its original position after the lighter coil is heated.



826RW004–1

Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly (1).
   - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the cigarette lighter assembly (2).
   - Disconnect the connectors.
   - Remove the socket (3).

Installation

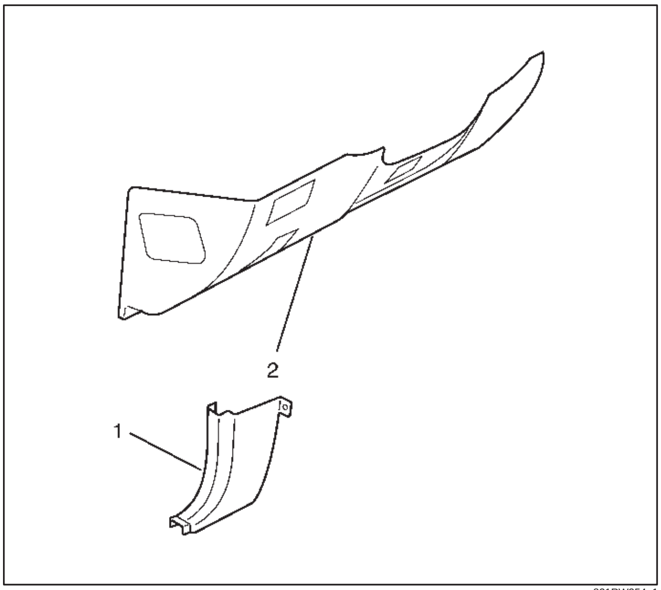
To install, follow the removal steps in the reverse order, noting the following point:

1. When installing the bezel, align the projected portion of the socket with the notch of the bezel.

Digital Clock

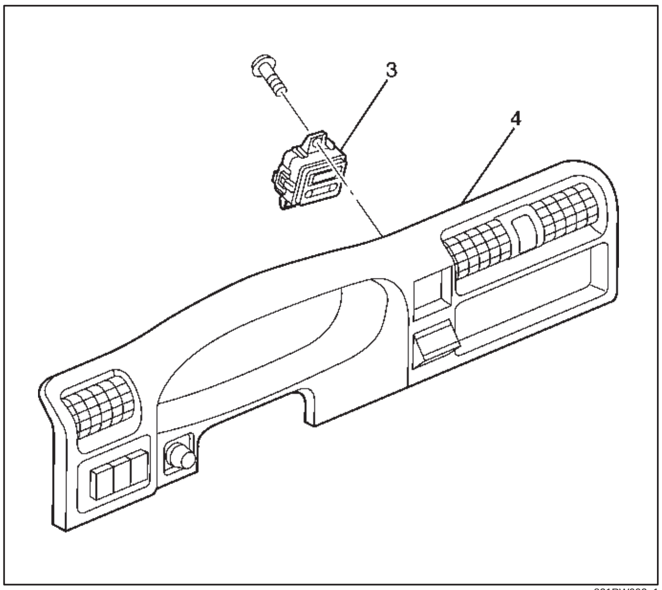
Removal

1. Disconnect the battery ground cable.
2. Remove the dash side trim panel-LH (1).
   Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the lower cover assembly (2).
   Refer to instrument Panel Assembly in Body Structure section.



821RW254–1

4. Remove the meter cluster assembly (4).
   Refer to Instrument Panel Assembly in Body Structure section.
5. Remove the digital clock (3).
   - Remove the fixing screw.
   - Disconnect the connector.



821RW092–1

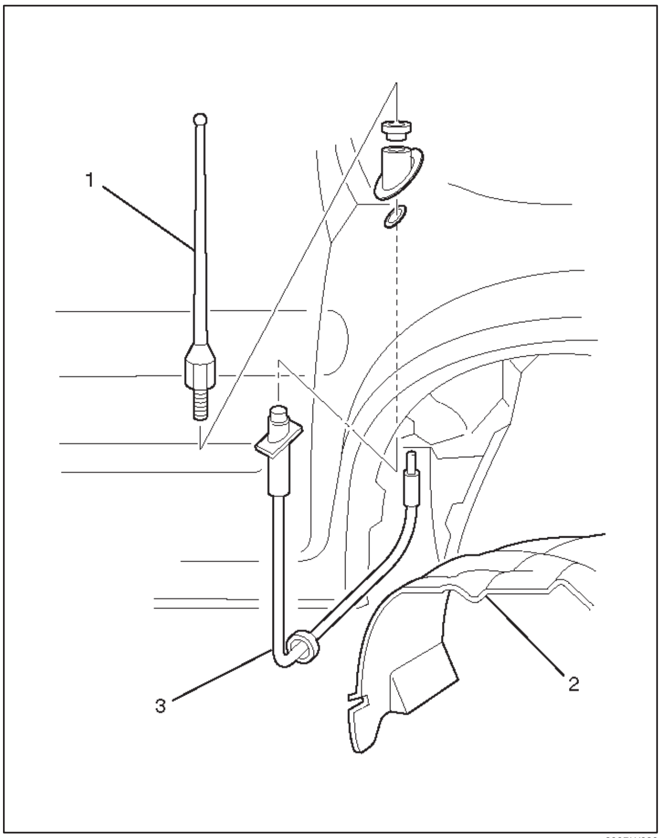
Installation

To install, follow the removal steps in the reverse order.

Rod Type Antenna

Removal

1. Disconnect the battery ground cable.
2. Turn the antenna rod (1) counterclockwise to remove it.
3. Remove three screws and nine clips to remove the fender inner liner (2).
4. Disconnect the feeder cable connector (3) at the inside of the vehicle, remove the housing bracket screw, turn the lock nut counterclockwise to remove it together with the base mold and then remove the housing.



890RW020

Installation

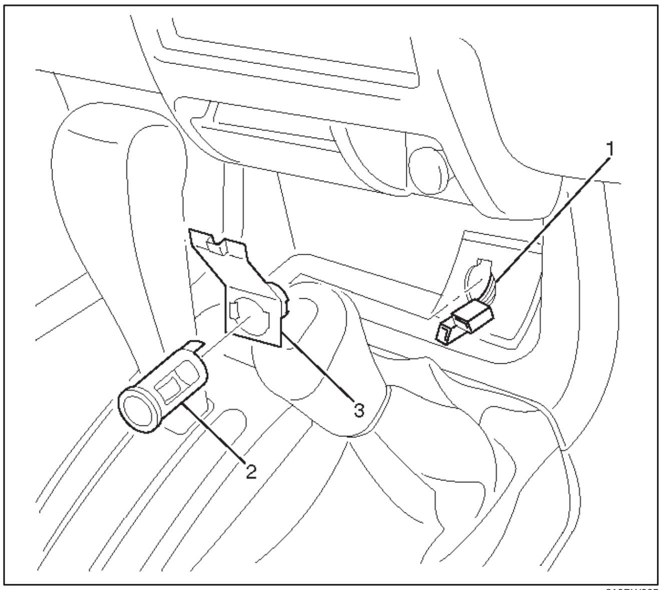
To install, follow the removal steps in the reverse order, noting the following point:

Accessory Socket

Front Accessory Socket

Removal

1. Disconnect the battery ground cable.
2. Remove the front console assembly.
3. Remove the front accessory socket (2).
   - Disconnect the connectors (1).
   - Pull out the front accessory socket from the soket cover (3).



810RW005

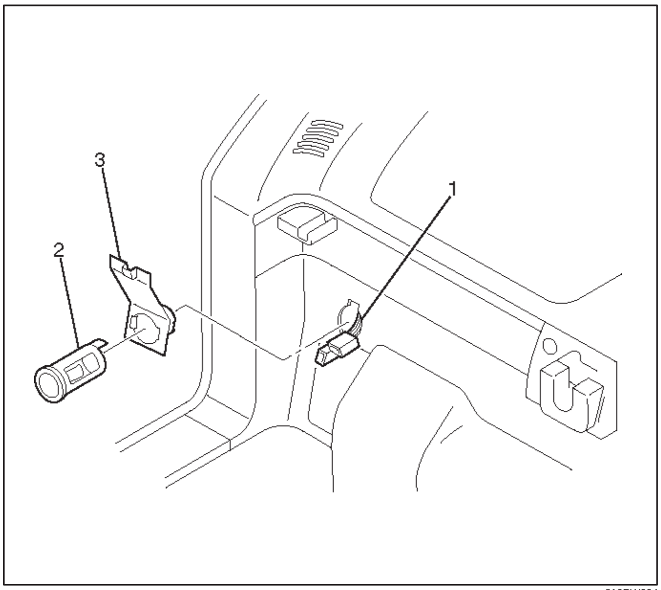
Installation

To install, follow the removal steps in the reverse order, noting the following point:

Rear Accessory Socket

Removal

1. Disconnect the battery ground cable.
2. Remove the quarter trim lower cover.
3. Remove the rear accessory socket (2).
   - Disconnect the connectors (1).
   - Pull out the front accessory socket from the soket cover (3).



810RW004

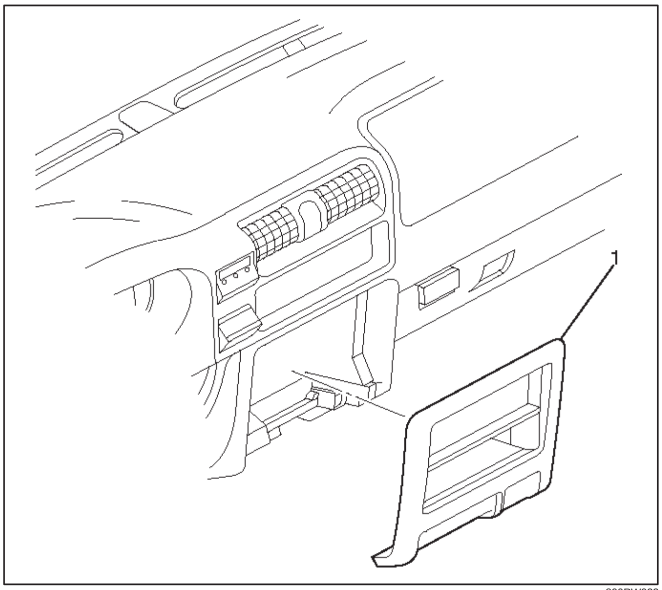
Installation

To install, follow the removal steps in the reverse order, noting the following point:

Radio

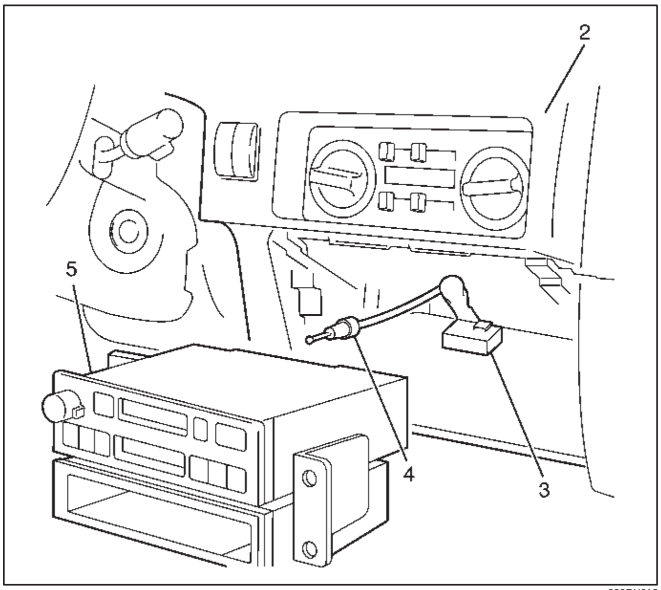
Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly (1).
   - Refer to Instrument Panel Assembly in Body Structure section.



890RW022

3. Remove the radio (5).
   - Remove the two fixing screws.
   - Disconnect the connector (3) and the antenna cable (4).



890RX013

Installation

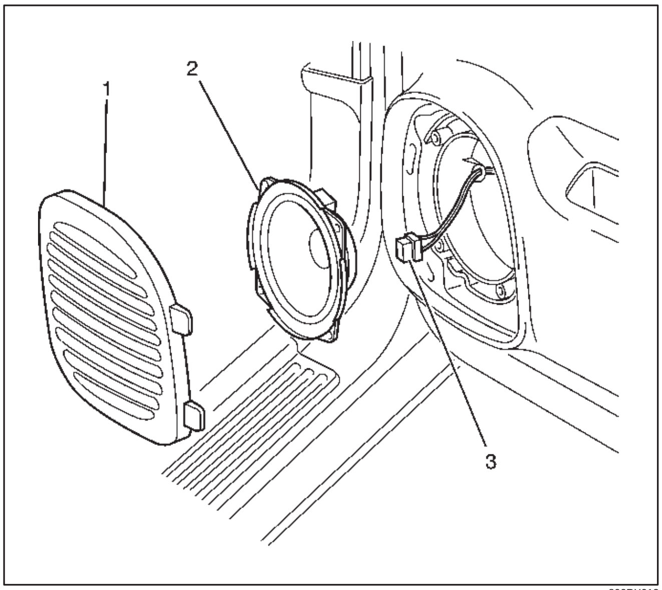
To install, follow the removal steps in the reverse order, noting the following point:

Speaker

Front Speaker

Removal

1. Disconnect the battery ground cable.
2. Pull the grille (1) to release the locks and then remove it.
3. Remove four screws and disconnect the connector (3) to remove the speaker (2).



890RX012

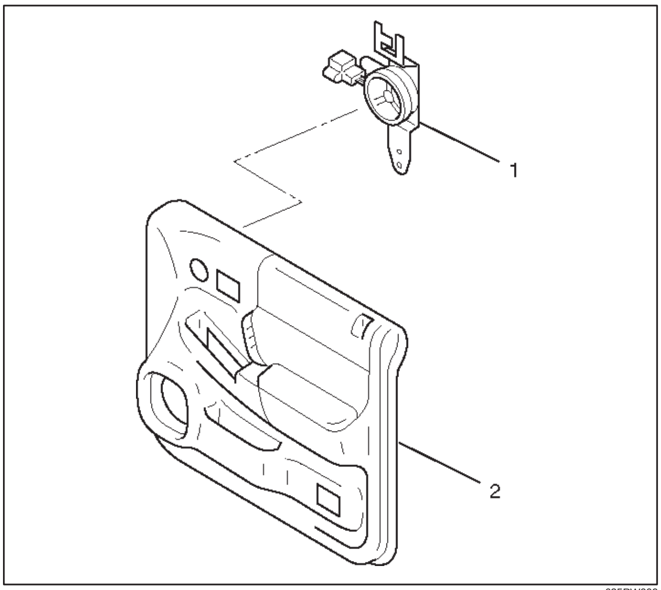
Installation

To install, follow the removal steps in the reverse order, noting the following point:

Tweeter Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the front door trim pad (2).
   - Refer to Front Window Regulator, Glass And Glass Run in Body Structure section:
3. Remove the tweeter (1).
   - Disconnect the connector.



635RW009

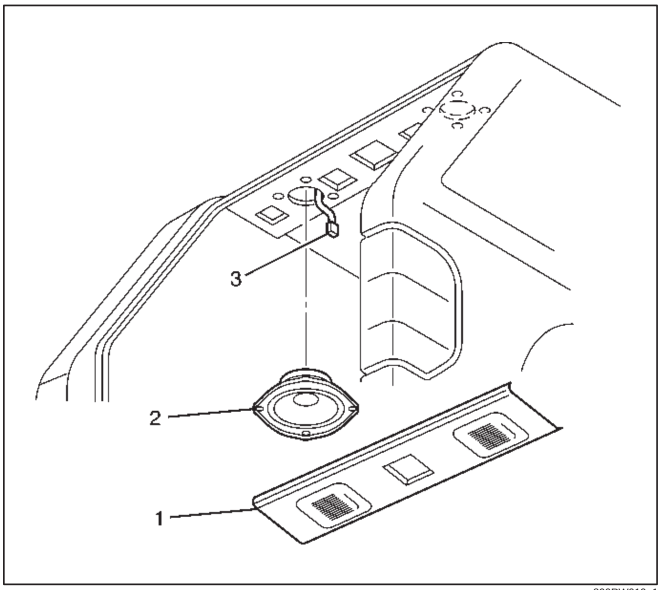
Installation

To install, follow the removal steps in the reverse order, noting the following point:

Rear Speaker

Removal

1. Disconnect the battery ground cable.
2. Remove the roof rear lining (1).
   - Release the locks and clips.
3. Remove the speaker (2).
   - Remove the four screws.
   - Disconnect the connector (3).



890RW019–1

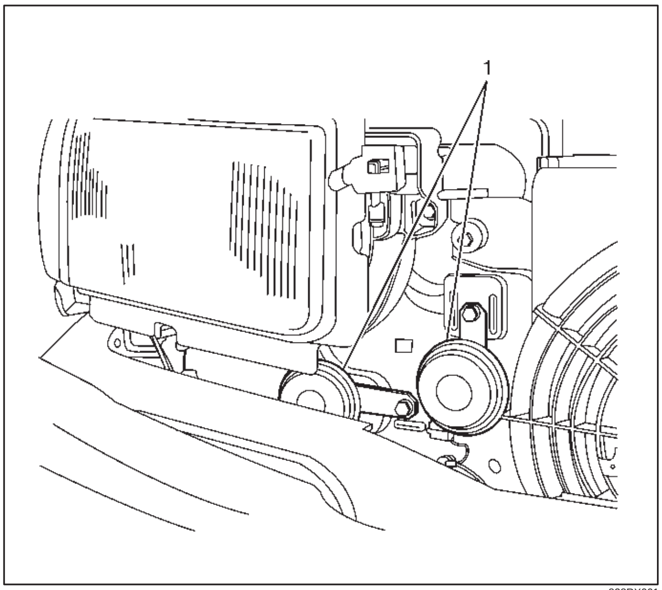
Installation

To install, follow the removal steps in the reverse order, noting the following point:

Horn

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille.
   - Refer to Engine Hood and Fender in Body Structure section.
3. Remove the horn (1).
   - Disconnect the connector.
   - Remove the horn mounting bolt.



828RX001

Installation

To install, follow the removal steps in the reverse order.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The circuit consists of the starter switch, meter assembly, Vehicle speed sensor, transmission switch, lighting switch, turn signal switch, thermo unit, oil pressure unit, Powertrain Control Module (PCM), fuel tank unit, 4WD switch, oil pressure switch, parking brake switch, brake fluid switch, seat belt switch, illumination controller, multi meter and ambient sensor.

Meter Assembly

General Description

The meter assembly has the speedometer, tachometer, engine coolant temperature gauge, fuel gauge and warning/indicator lights. In addition, the meter assembly.

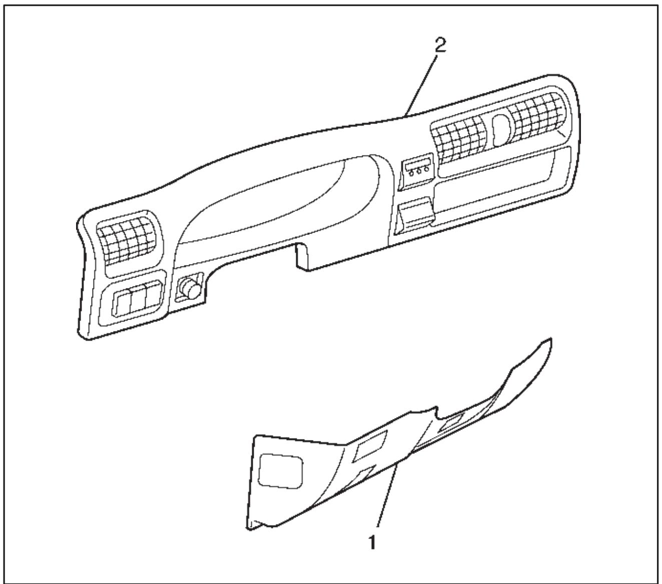
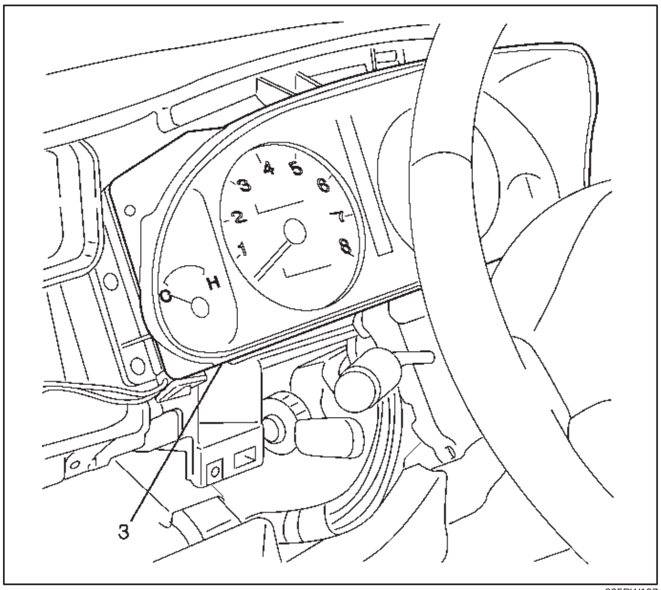
Removal

1. Disconnect the battery ground cable.
2. Remove the Dash Side Trim Panel –LH.
3. Remove the lower cover Assembly(1).
   - Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the meter cluster Assembly(2).
   - Refer to the Instrument Panel Assembly in Body Structure section.



821RW253

5. Remove the meter assembly(3).
   - Remove four fixing screws.
   - Disconnect the meter connector.



825RW197

CAUTION: The removed meter assembly should be placed upright or with its face side up.

Installation

To install, follow the removal steps in the reverse order.

Warning Light Bulb and Indicator Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the meter assembly.
   - Refer to the Meter Assembly removal steps in Meter and Gauge section.
3. Remove the bulb.
   - Hold the bulb socket by hand, rotate it counterclockwise and pull it out.

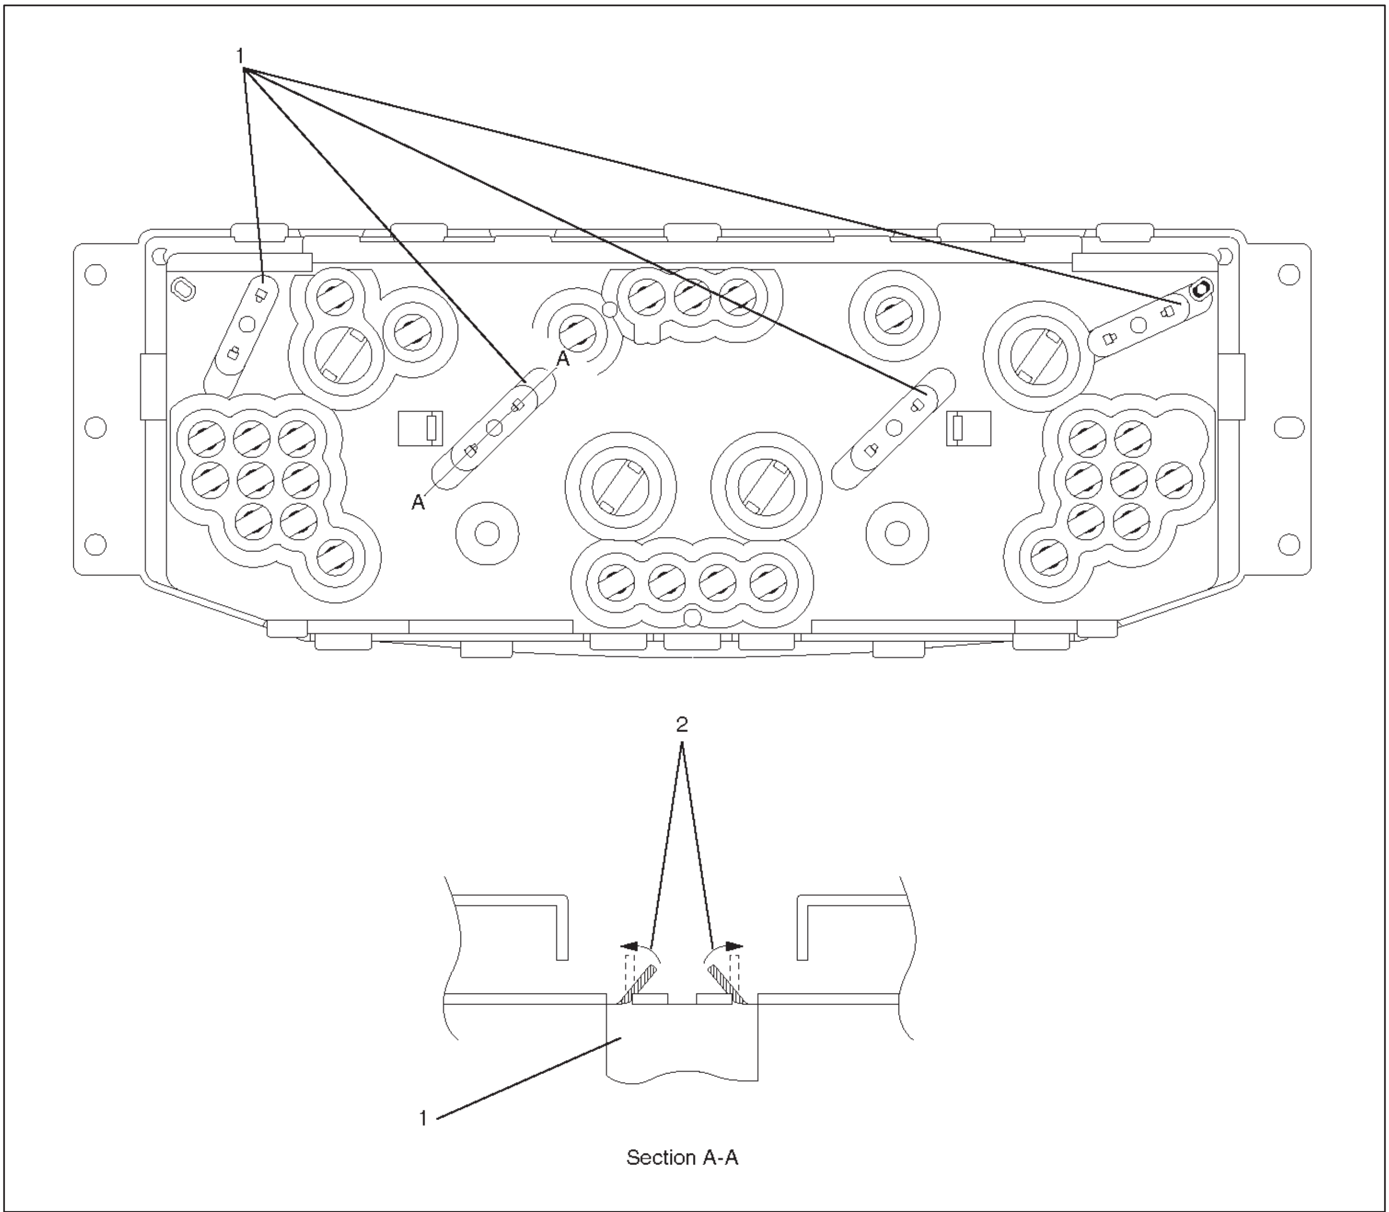
Installation

To install, follow the removal steps in the reverse order.

A/T Shift Indicator Light Bulb

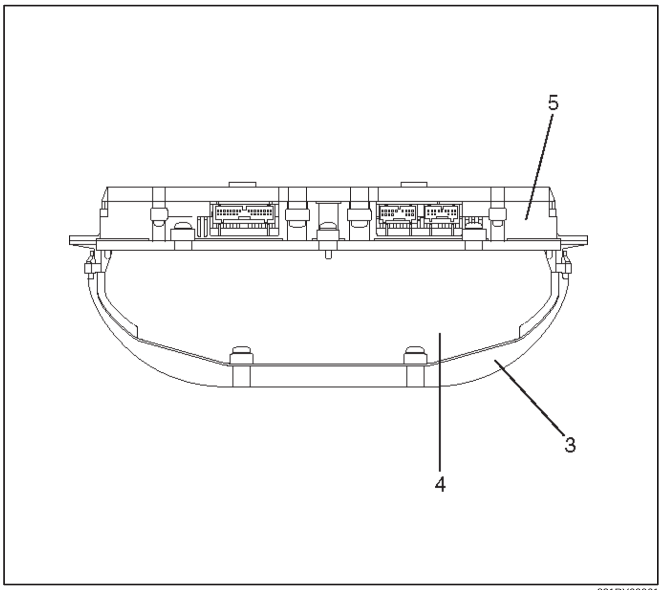
Removal

1. Disconnect the battery ground cable.
2. Pry up the bended portions(2) of the metal cover(1).



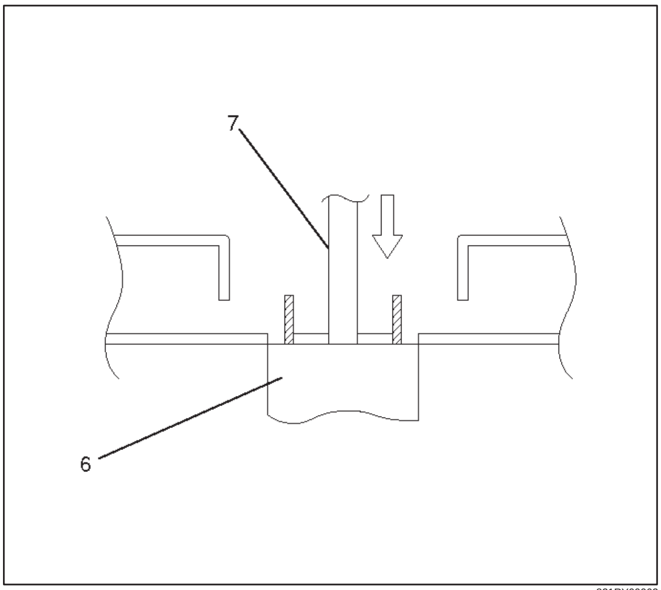
821RY00060

3. Remove the meter lense(3) from the meter visor(4).
4. Remove the meter visor from the meter case(5).



821RY00061

5. Remove the meter assembly.
   - Push the metal cover(6) with the screw driver(7).



821RY00062

6. Remove the meter rear cover.
7. Remove the meter circuit board.
8. Remove the A/T shift indicator bulb.

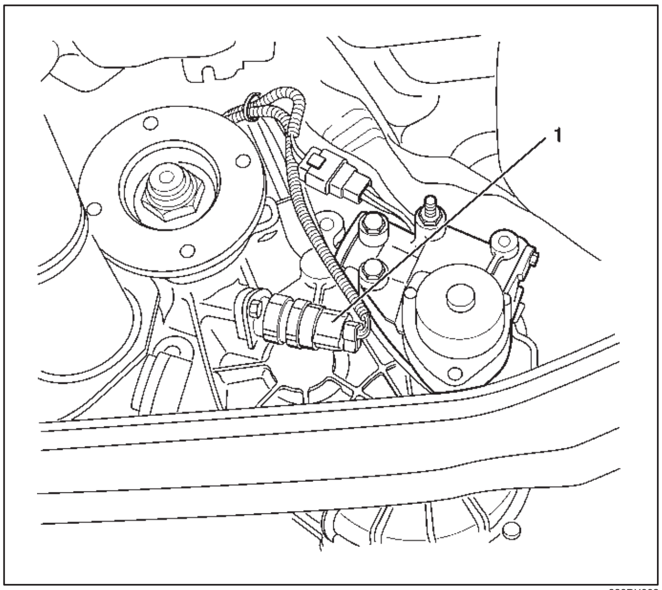
Installation

To install, follow the removal steps in the reverse order.

Vehicle Speed Sensor

Removal

1. Disconnect the battery ground cable.
2. Remove the vehicle speed sensor(1).
   - Disconnect the connector.
   - Rotate the sensor counterclockwise.



220RX003

Installation

To install, follow the removal steps in the reverse order, noting the following point.

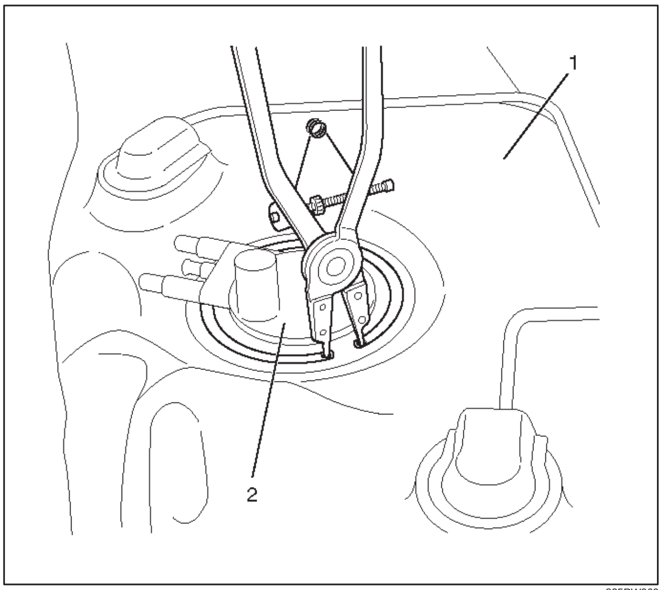
1. Tighten the vehicle speed sensor to the specified torque.

Torque: 27 N·m (20 lb ft)

Fuel Tank Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the fuel tank(1).
   - Refer to the Fuel Tank removal steps in Engine section
3. Remove the fuel tank unit(2).
   - Disconnect the connector.
   - Remove the five fixing screws.



825RW060

Installation

To install, follow the removal steps in the reverse order.

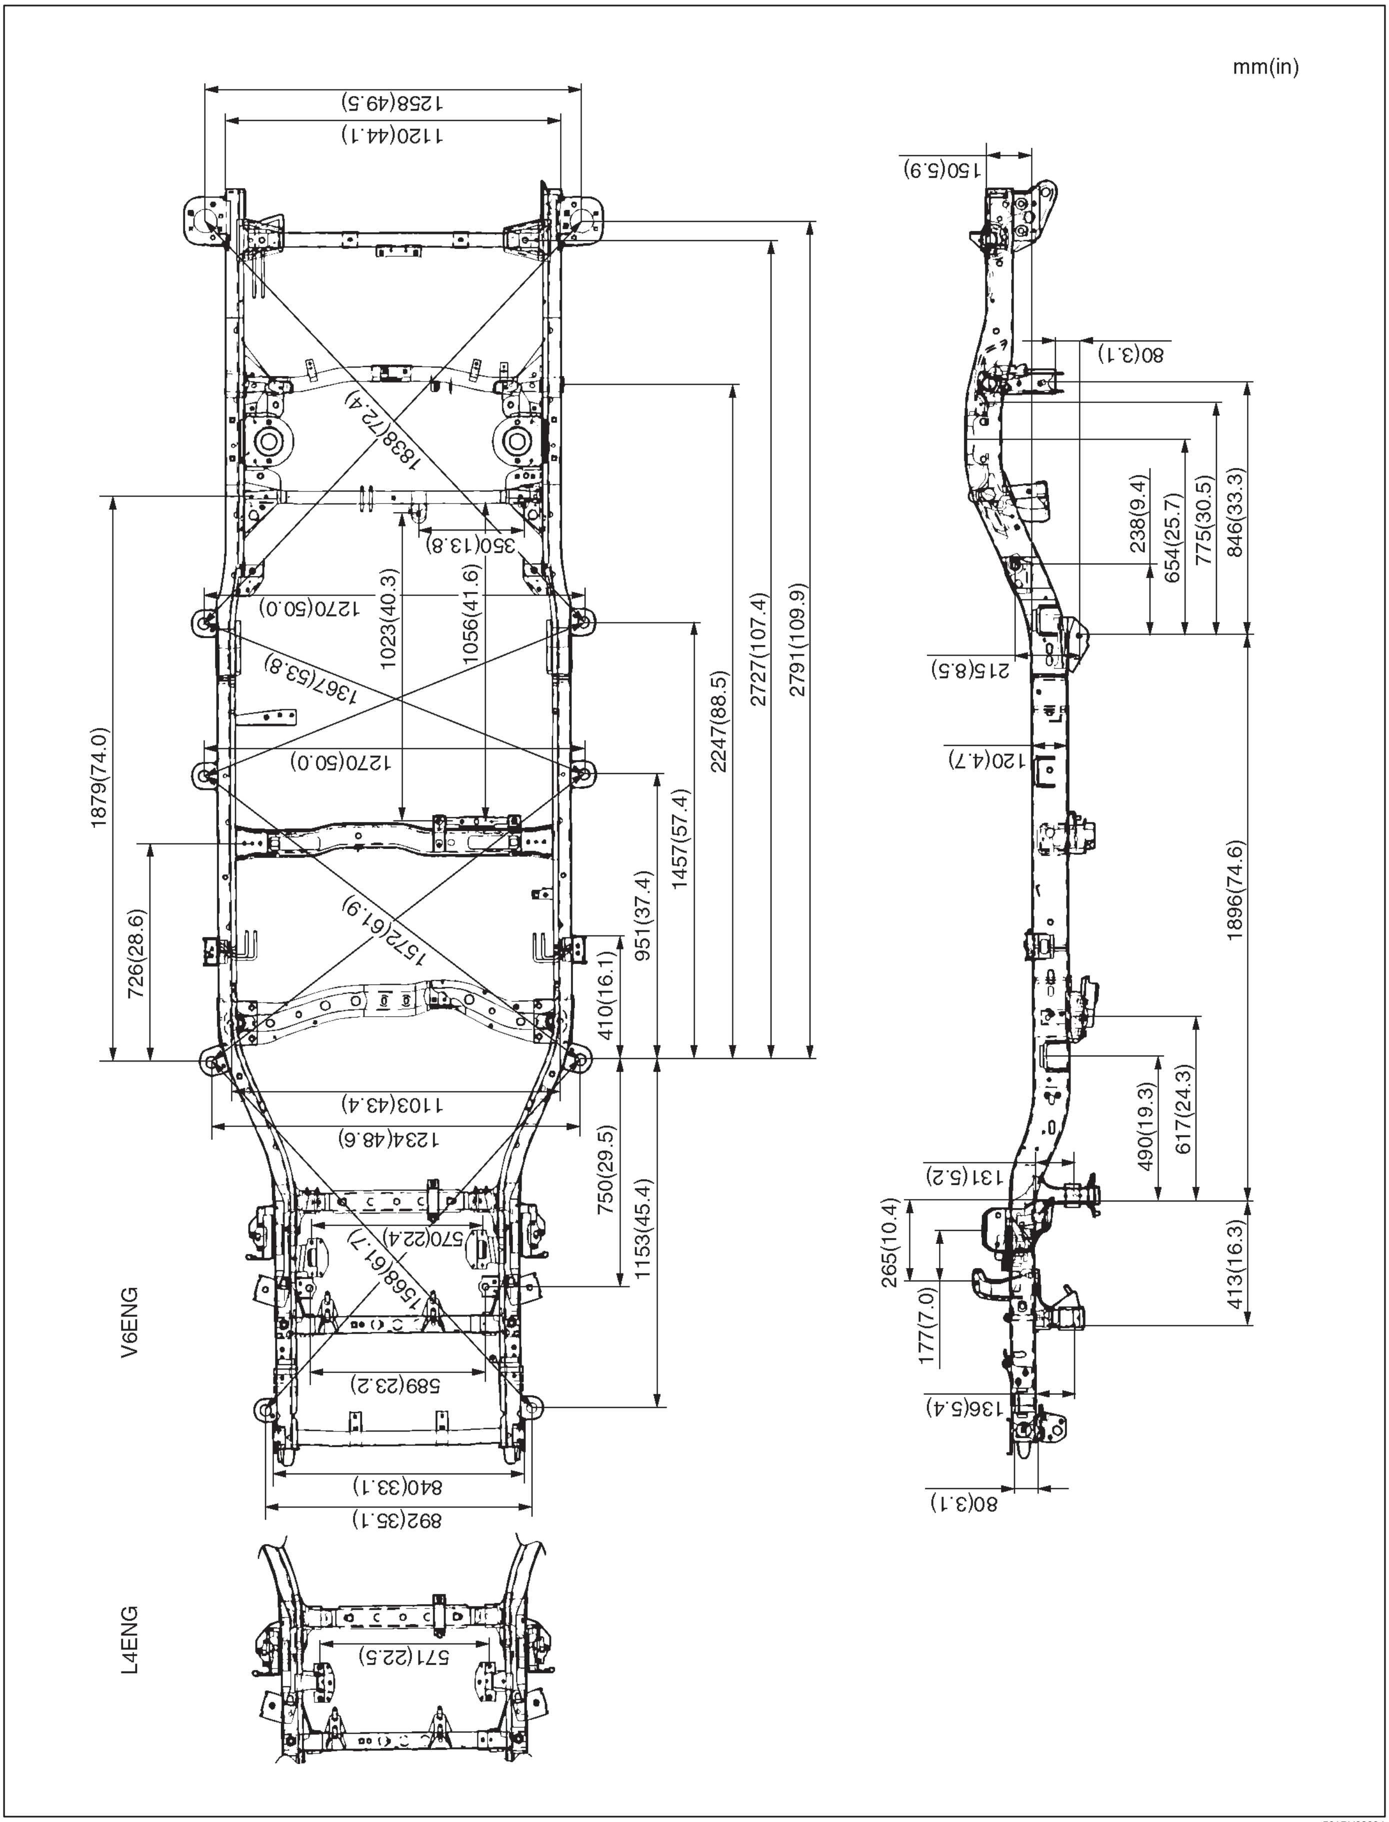
Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Frame

General Description

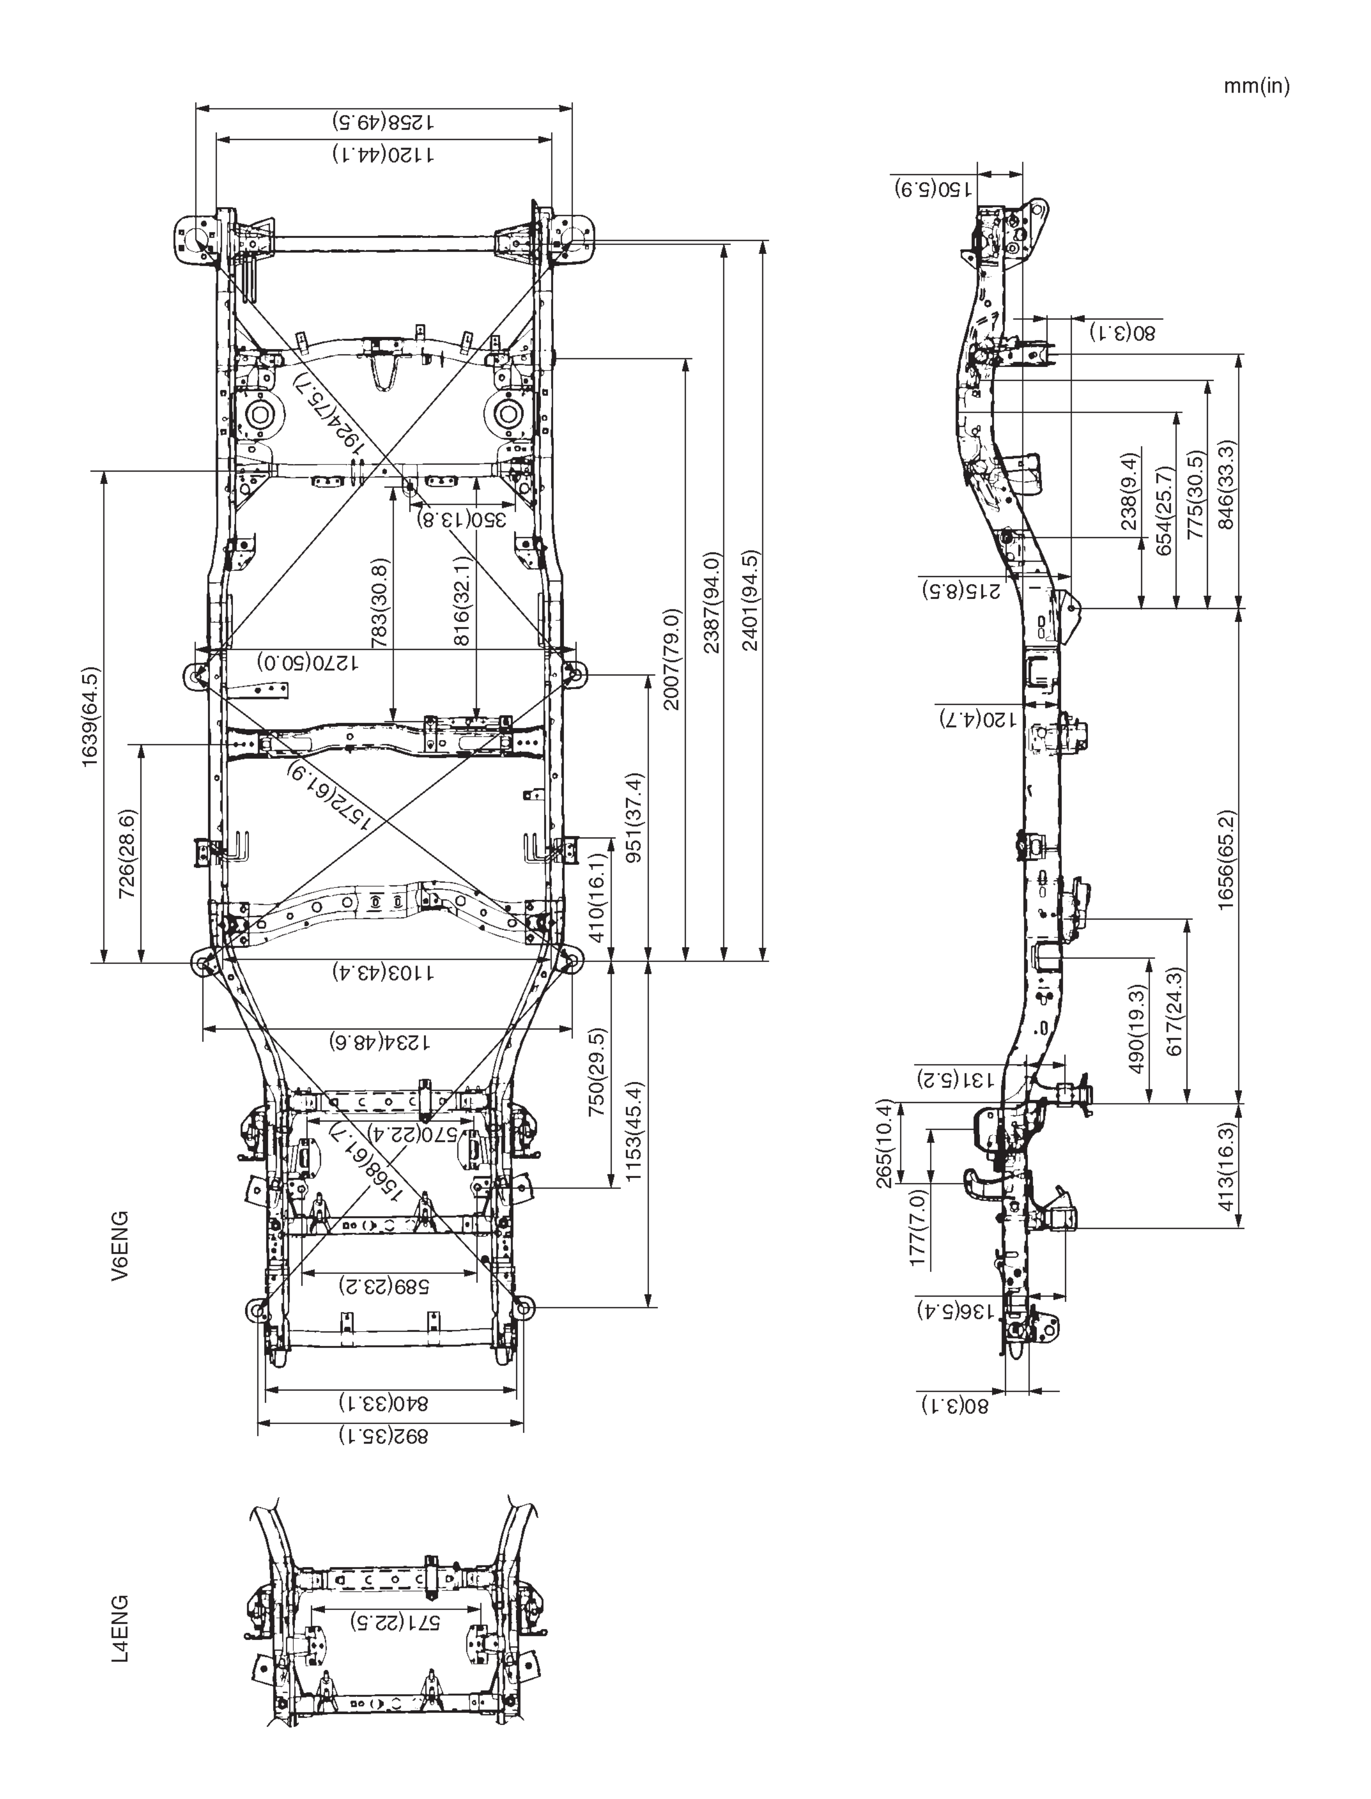
Proper frame alignment is important to assure normal vehicle life and performance of many other parts of the vehicle. If the vehicle has been involved in a fire, collision or has been overloaded, it is necessary to check the frame alignment.

Frame Dimensions (LWB)



501RY00004

Frame Dimensions (SWB)



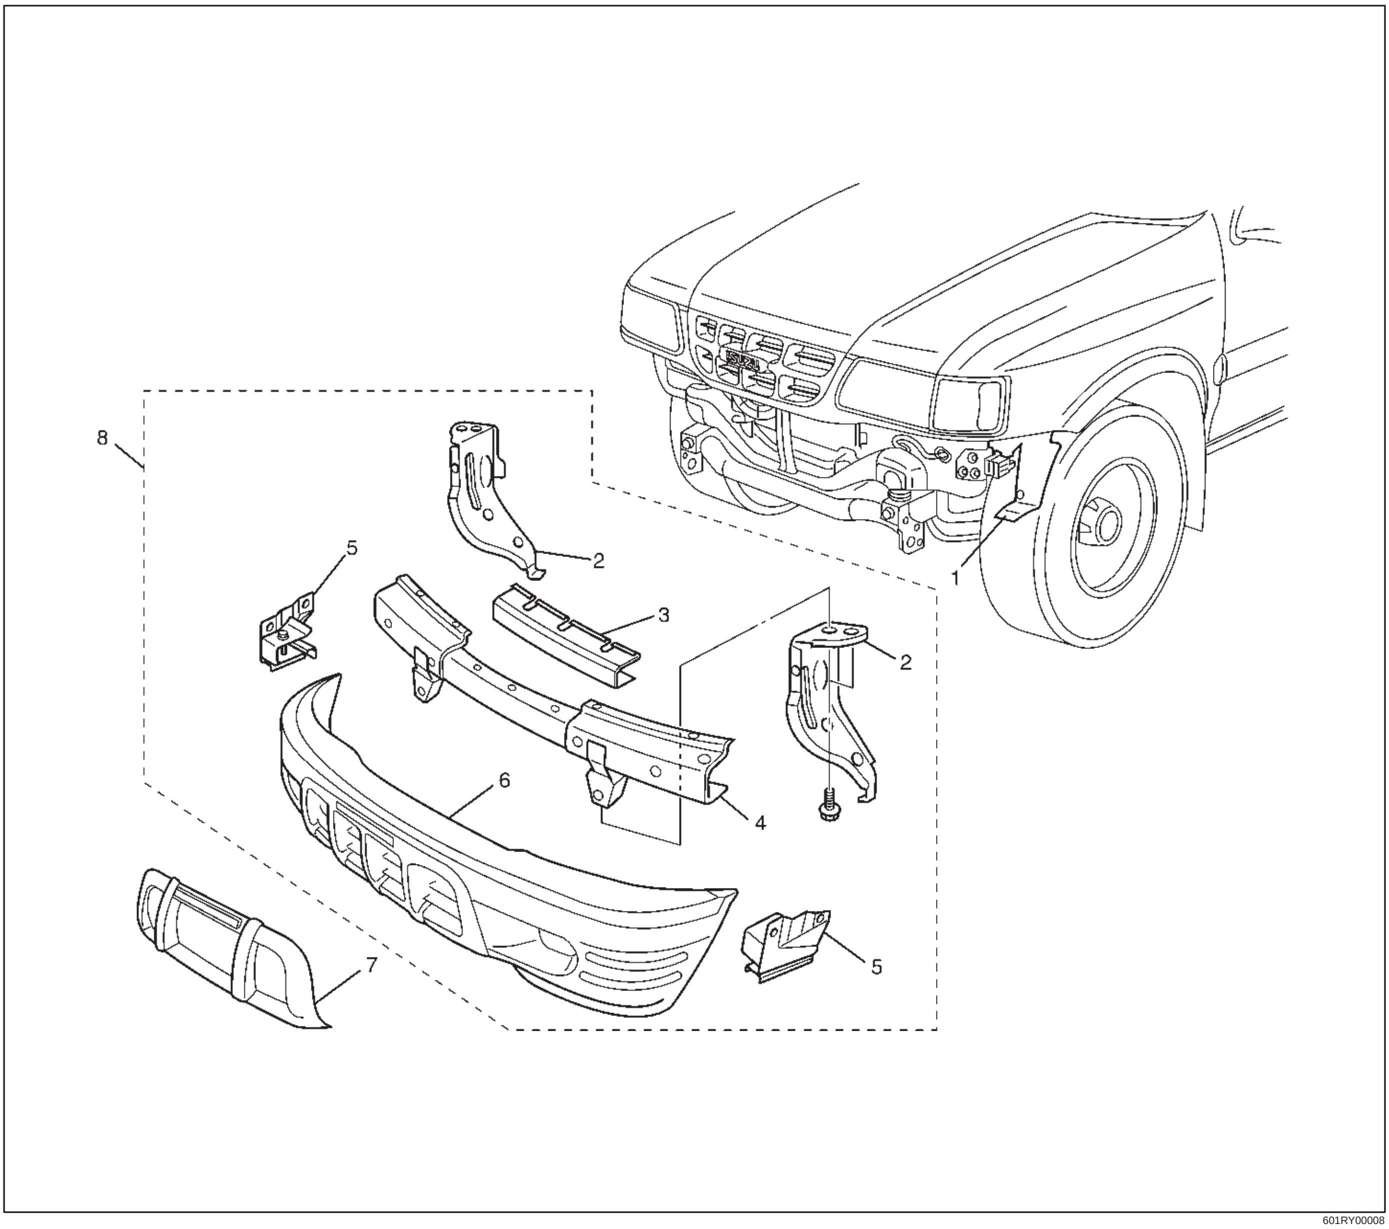
501RY00005

General Description (Bumper)

Front and rear bumpers consist of bumper fascia, support, and reinforcement.
The absorbing capability for both front and rear bumper systems are achieved through reinforcements in each bumper.

Front Bumper

Parts Location

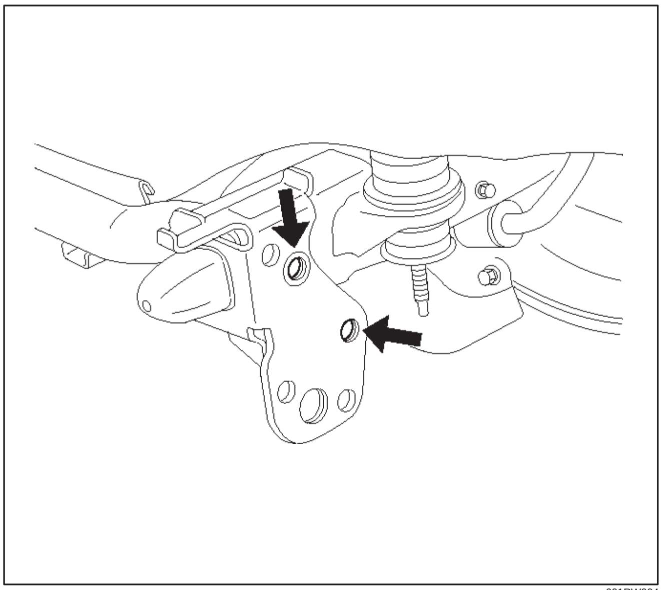


Legend

(1) Inner Liner
(2) Backbar
(3) Support Assembly
(4) Front Bumper Reinforcement Assembly
(5) Bumper Support
(6) Front Bumper Fascia
(7) Front Bumper Extension (SWB only)
(8) Front Bumper Assembly

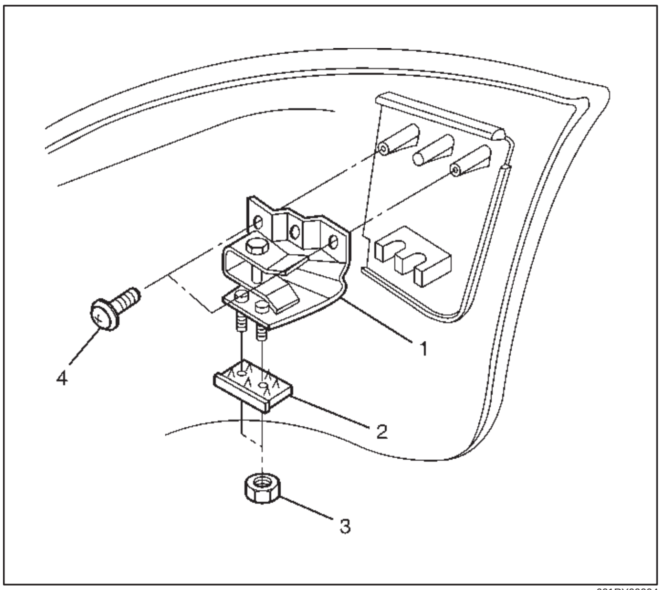
Removal

1. Disconnect the battery ground cable.
2. Disconnect front fog light connector (With fog light).
3. Remove each clip on the right and left side of the inner liner.
4. Remove the front bumper fixing bolts.
   - Remove the two bolts from both sides of the front bumper.



601RW004

5. Remove the front bumper assembly.
6. Remove the support assembly.
   - Remove the three fixing bolts.
7. Remove the front bumper reinforcement assembly.
   - Remove the eleven fixing bolts.
8. Remove the front bumper extension (SWB only).
   - Remove the three nuts and nine bolts.
9. Remove the three bolts at each backbar and remove backbars.
10. Remove the front fog light assembly (With fog light).
11. Remove the front bumper slider(1).
    - Remove the two screws(4) and the two nuts(3), and release the claw from the washer(2).



601RY00004

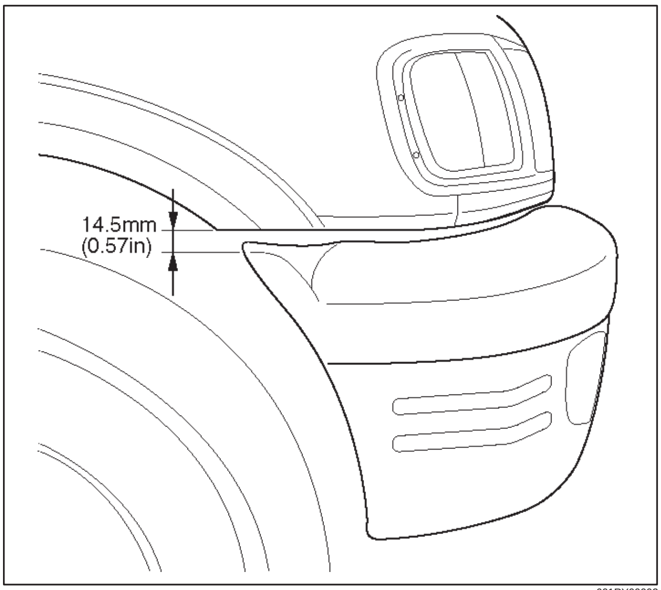
Installation

To install, follow the removal steps in reverse order noting the following points:

1. Tighten the front bumper assembly fixing bolts to the specified torque.

   Torque : 147 N·m (108 lb ft)

2. Front bumper adjustment
   - When the bolts fixing front bumper assembly are tightened, adjustment should be made between the backbar and front side bumper so that a clearance of 14.5 mm (0.57 in) is provided between the lower side of the fender and the upper side of the front bumper.

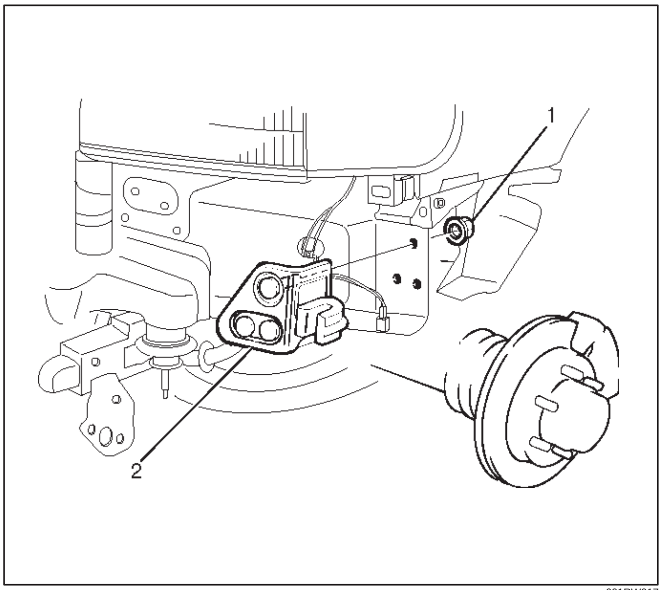


601RY00002

Front Bumper Slider Bracket

Removal

1. Disconnect the battery ground cable.
2. Remove the front bumper.
   - Refer to Front Bumper in this section.
3. Remove the three nuts(1) and draw out the slider bracket(2).



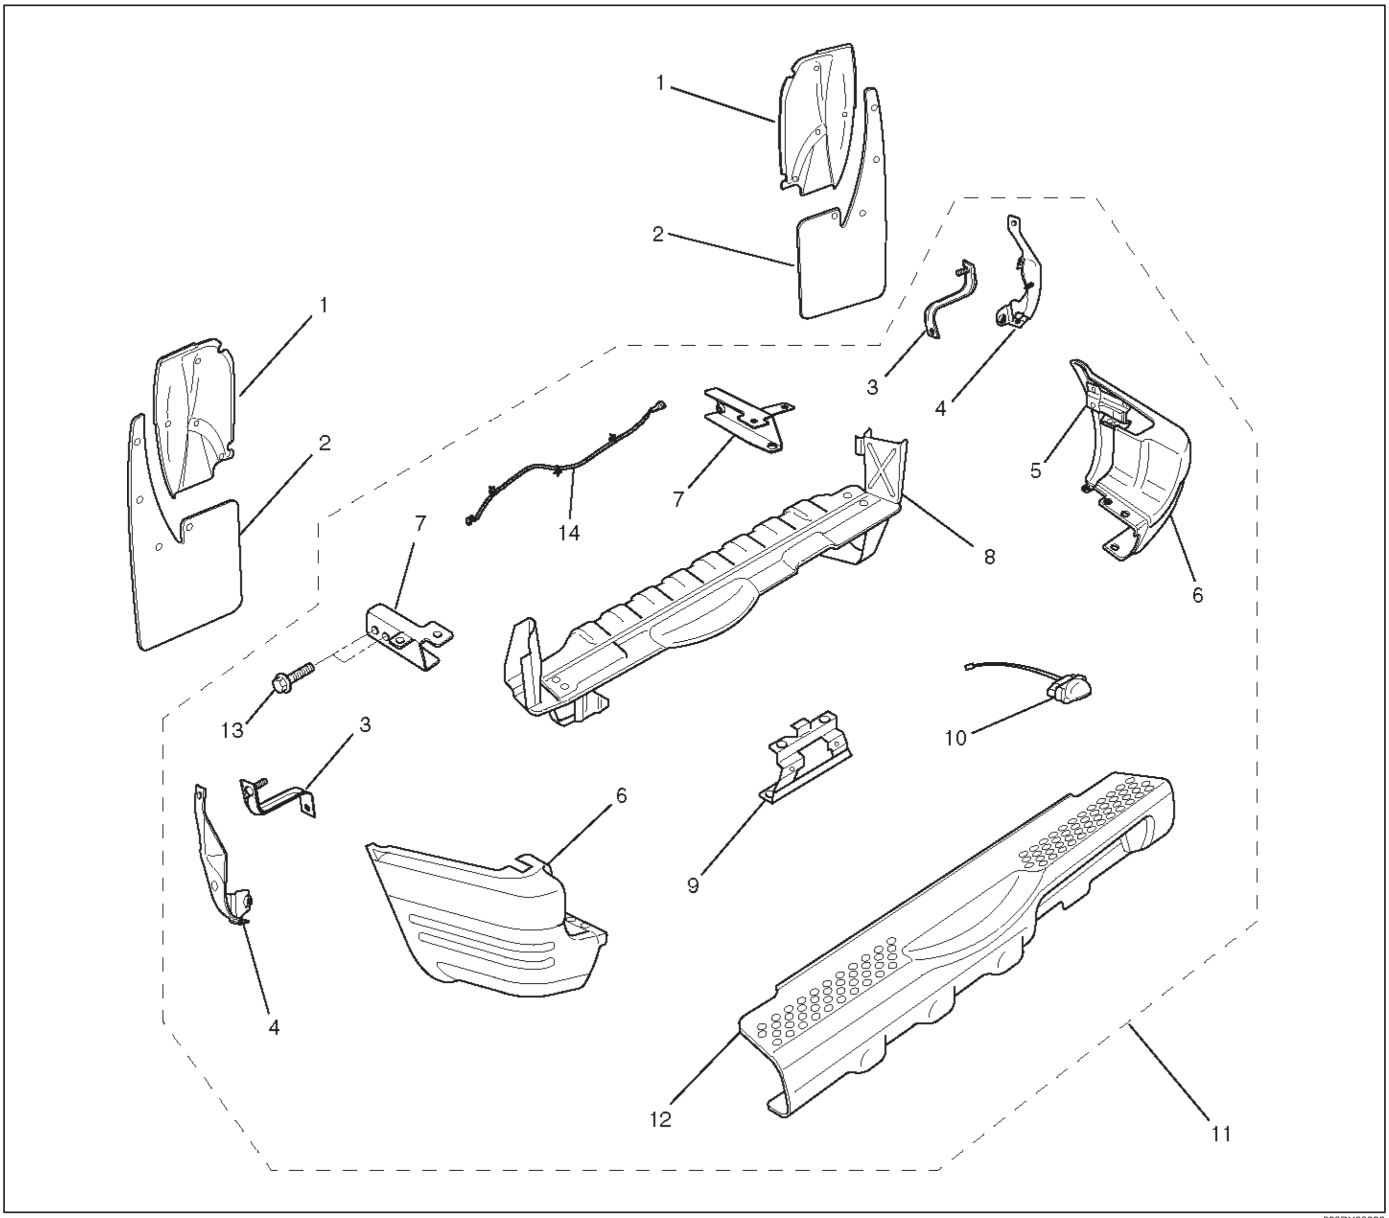
601RW017

Installation

To install, follow the removal steps in reverse order.

Rear Bumper

Parts Location (Spare tire mounted tailgate model)

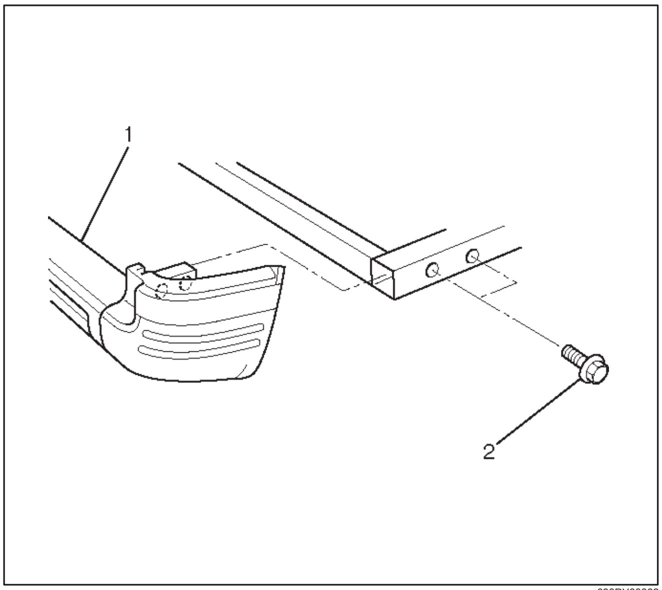


Legend

(1) Protector
(2) Rear Mud Flap
(3) Bumper Bracket
(4) Rear Bumper Support
(5) Rear Bumper Slider Bracket
(6) Rear Corner Bumper
(7) Backber
(8) Rear Bumper Reinforcement Assembly
(9) Rear License Plate Bracket
(10) License Plate Light Assembly
(11) Rear Bumper Assembly
(12) Rear Center Bumper
(13) Rear Bumper Fixing Bolt
(14) License Plate Light Harness

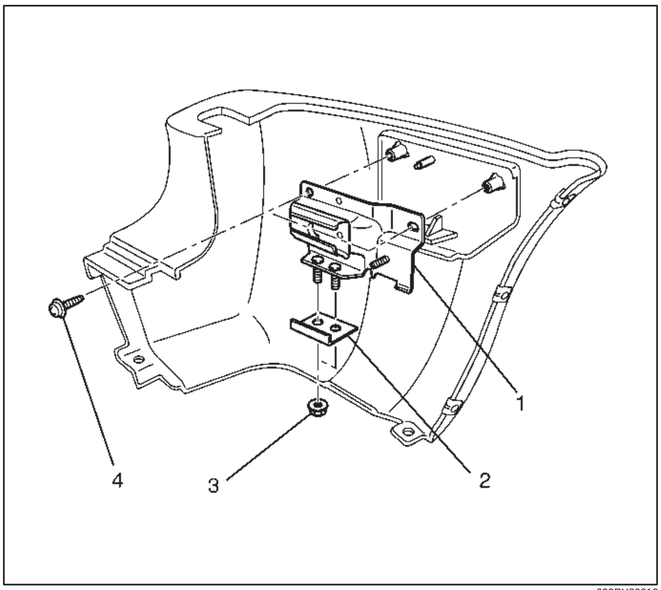
Removal

1. Disconnect the battery ground cable.
2. Remove the rear mud flaps.
   - Remove the four bolts.
3. Remove the protectors.
   - Remove the three clips on the right side and five clips on the left side.
4. Remove the bumper brackets.
   - Remove the two nuts.
5. Remove the rear bumper supports.
   - Remove the nut and bolt.
6. Remove the rear bumper assembly(1).
   - Remove the two bolts(2) from each side.
   - Disconnect the license plate light harness connector.
   - Open the tailgate in an angle of 60° to avoid the interference with the spare tire.



690RY00002

7. Remove the license plate light assembly and license plate harness.
8. Remove the rear license plate bracket.
9. Remove the rear center bumper.
   - Remove the eight clips from the step part and three bolts from each upper and lower sides.
10. Remove the rear corner bumpers.
    - Remove the three bolts from each rear corner bumper.
11. Remove the rear bumper slider brackets(1).
    - Remove the two screws(4) and two nuts(3), and then remove claw caught in the washer(2).



690RY00010

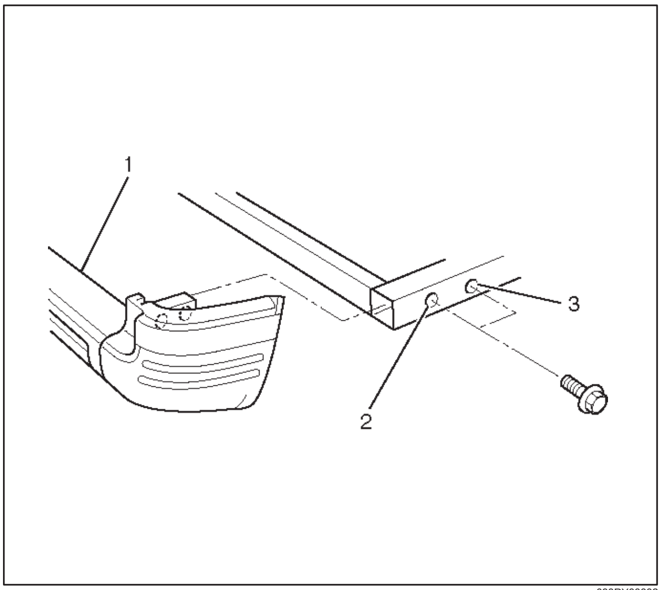
12. Remove the backbers from the rear bumper reinforcement assembly.
    - Remove the three bolts at each backber.

Installation

To install, follow the removal steps in reverse order, noting the following points:

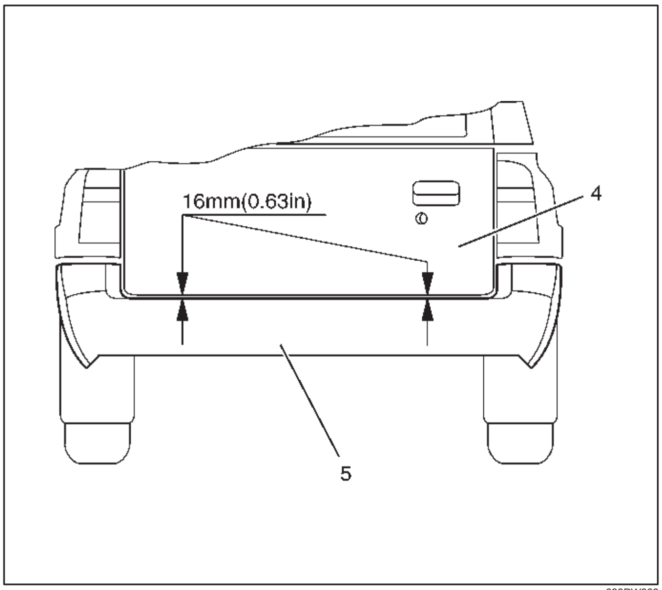
1. Partially tighten the rear bumper bolts(2) (3) and adjust the clearance between the body (tailgate) and the rear bumper(1).
   Then fully tighten the rear bumper bolts(2) (3).

   Torque : 147 N·m (108 lb ft)



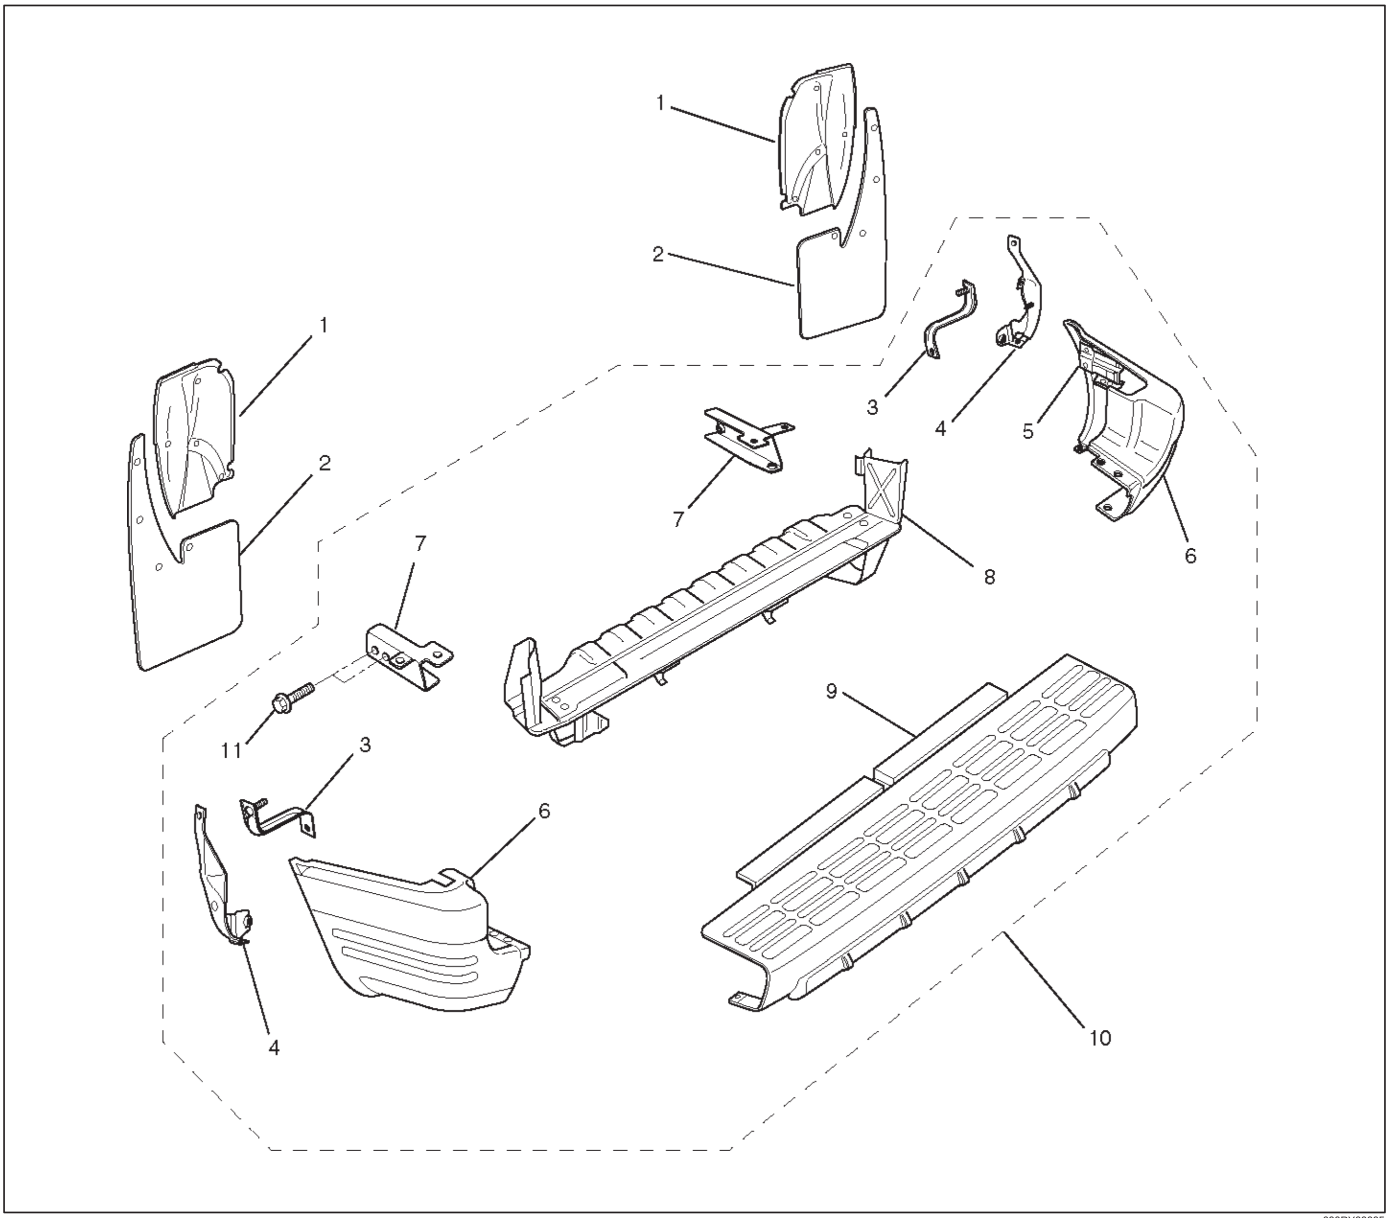
690RY00003

2. Rear bumper adjustment.
   - When the bolts fixing rear bumper assembly are tightened, adjustment should be made with shims so that clearances shown in the figure below are provided between the body (tailgate) (4) and the rear bumper(5).



690RW009

Parts Location (Spare tire mounted under floor model)



Legend

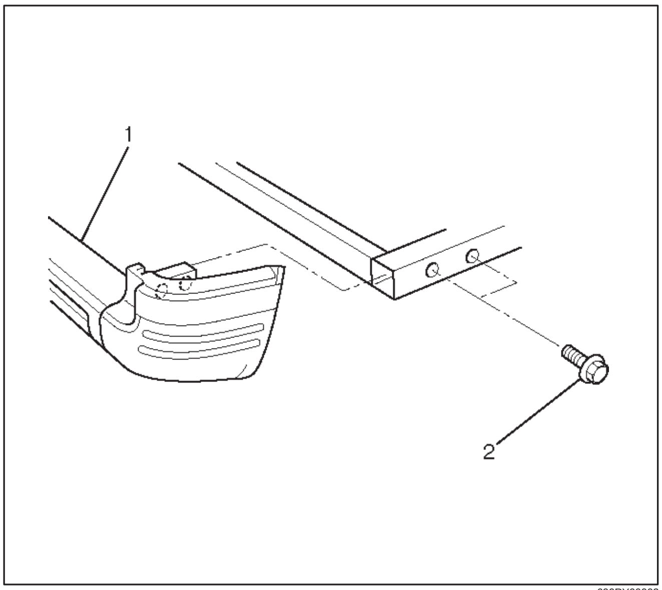
(10) Rear Bumper Assembly
(11) Rear Bumper Fixing Bolt

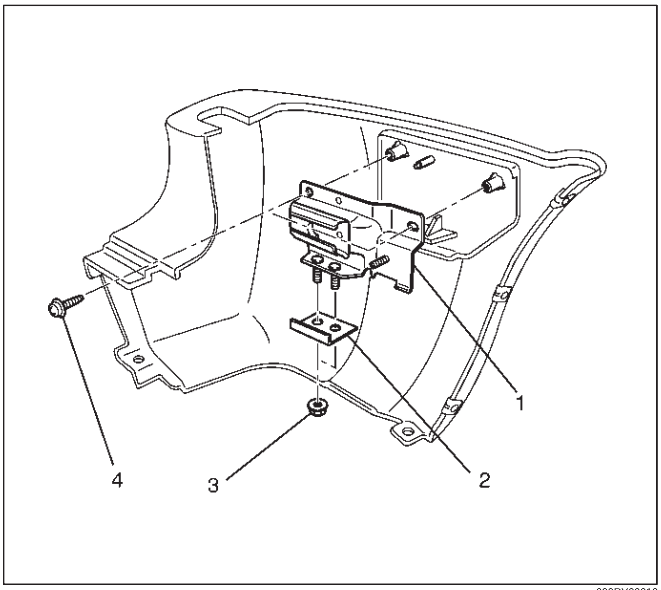
Removal

1. Disconnect the battery ground cable.
2. Remove the rear mud flaps.
   - Remove the four bolts.
3. Remove the protectors.
   - Remove the three clips on the right side and five clips on the left side.
4. Remove the bumper brackets.
   - Remove the two nuts.
5. Remove the rear bumper supports.
   - Remove the nut and bolt.
6. Remove the rear bumper assembly(1).
   - Remove the two bolts(2) from each side.



690RY00002

7. Remove the rear center bumper.
   - Remove the ten clips from the step part and three bolts from each upper and lower sides.
8. Remove the rear corner bumpers.
   - Remove the three bolts from each rear corner bumper.
9. Remove the rear bumper slider brackets(1).
   - Remove the two screws(4) and two nuts(3), and then remove claw caught in the washer(2).



690RY00010

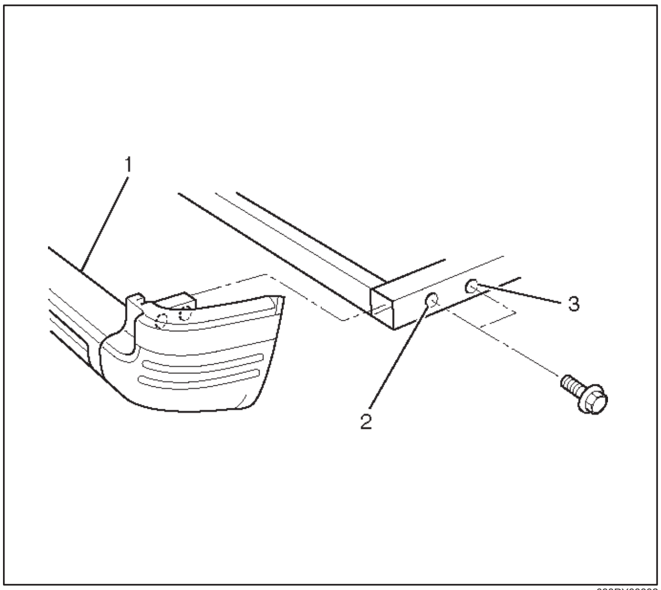
10. Remove the backbers from the rear bumper reinforcement assembly.
    - Remove the three bolts at each backber.

Installation

To install, follow the removal steps in reverse order, noting the following points:

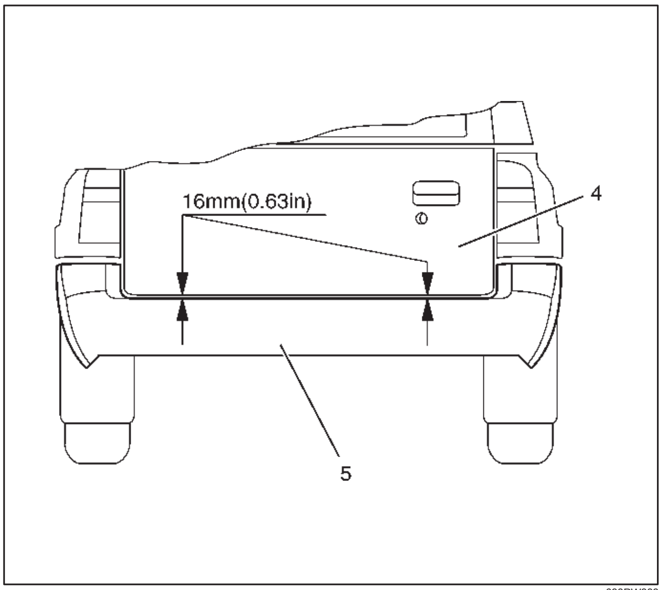
1. Partially tighten the rear bumper bolts(2) (3) and adjust the clearance between the body (tailgate) and the rear bumper(1).
   Then fully tighten the rear bumper bolts(2) (3).

   Torque : 147 N·m (108 lb ft)



690RY00003

2. Rear bumper adjustment.
   - When the bolts fixing rear bumper assembly are tightened, adjustment should be made with shims so that clearances shown in the figure below are provided between the body (tailgate) (4) and the rear bumper(5).



690RW009

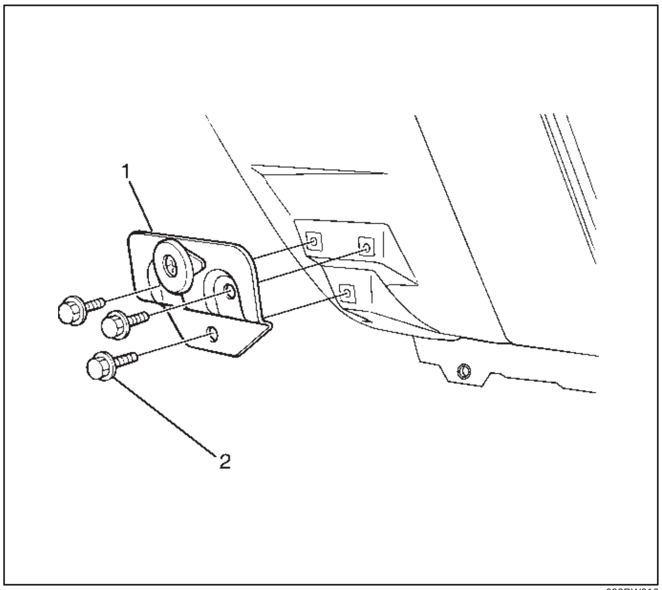
3. Tighten the spare tire fixing bolts to the specified torque.

Torque : 118 N·m (87 lb ft)

Rear Bumper Slider

Removal

1. Remove the Rear bumper.
   - Refer to Rear bumper removal (in this section).
2. Remove the rear bumper slider(1).
   - Remove the three bolts(2).



690RW016

Installation

To install, follow the removal steps in reverse order, noting the following point.

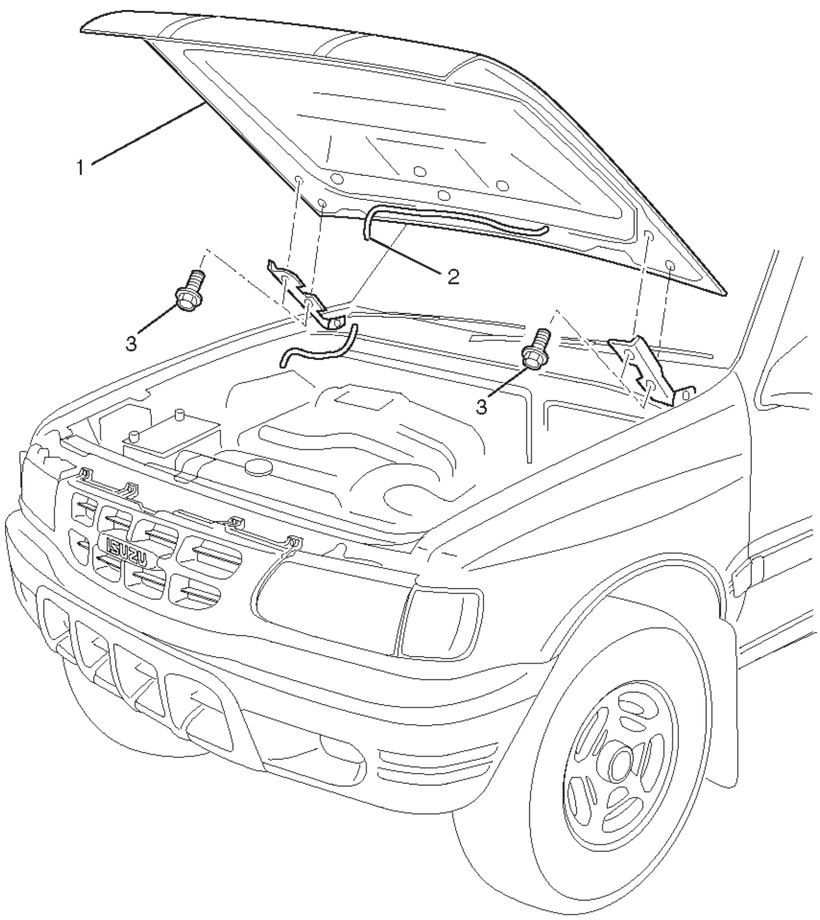
1. Apply chassis grease to the slider and the slider bracket moving surface.

General Description (Sheet Metal)

This section includes items of front end sheet metal that are attached by bolts, screws or clips and related accessory components.
Anticorrosion materials have been applied to the interior surfaces of some metal panels to provide rust resistance. When servicing these panels, areas on which this material has been disturbed, should be properly recoated with service–type anticorrosion material.

Engine Hood

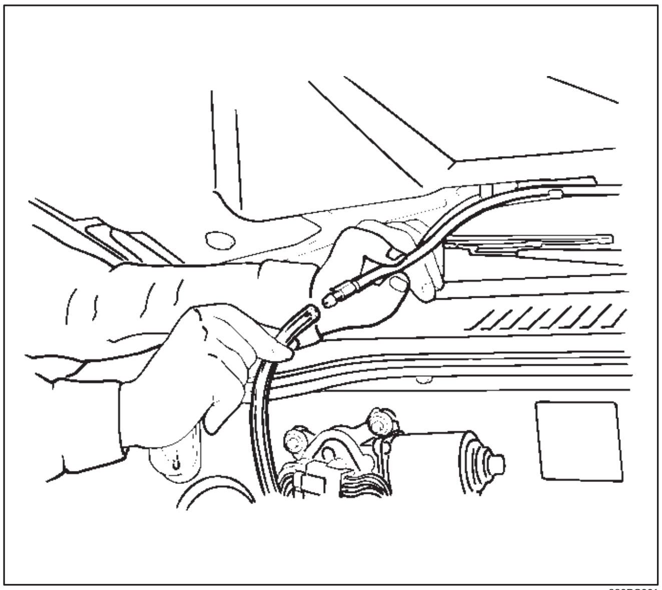
Parts Location



Legend
(1) Engine Hood Assembly
(2) Windowshield Washer Nozzle Tube
(3) Hood Hinge Bolt

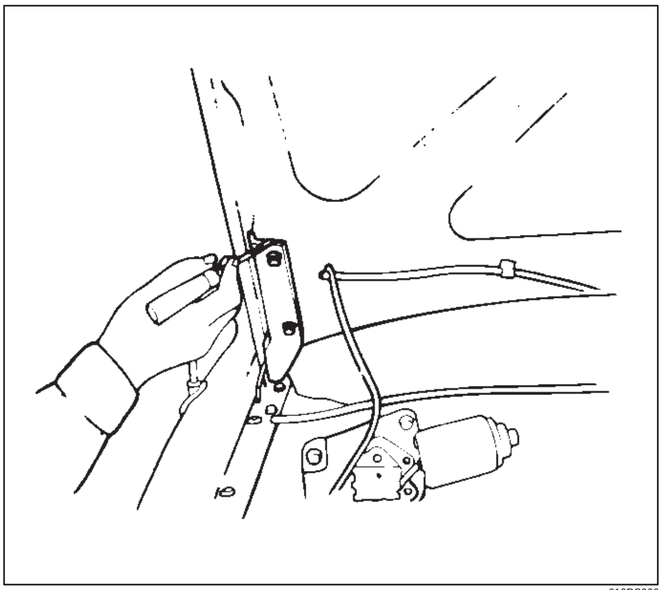
Removal

1. Open the hood.
2. Support the hood.
3. Remove the windshield washer nozzle tube.



880RS001

4. Remove the hood hinge bolts.
   - Before removing the hinges from the engine hood, scribe a mark showing location of the hinges to facilitate installation in the original position.



610RS006

5. Remove the engine hood.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the engine hood hinge fixing bolts to the specified torque.

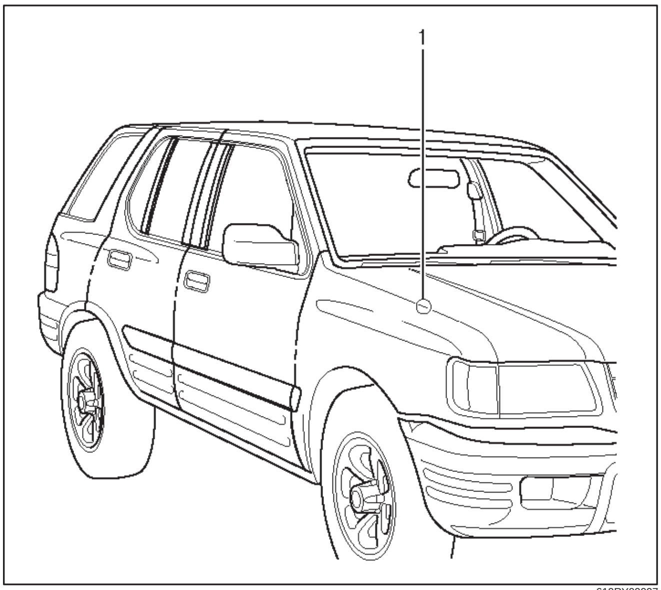
   Torque : 10 N·m (87 lb in)

2. Check the engine hood and fender(1).

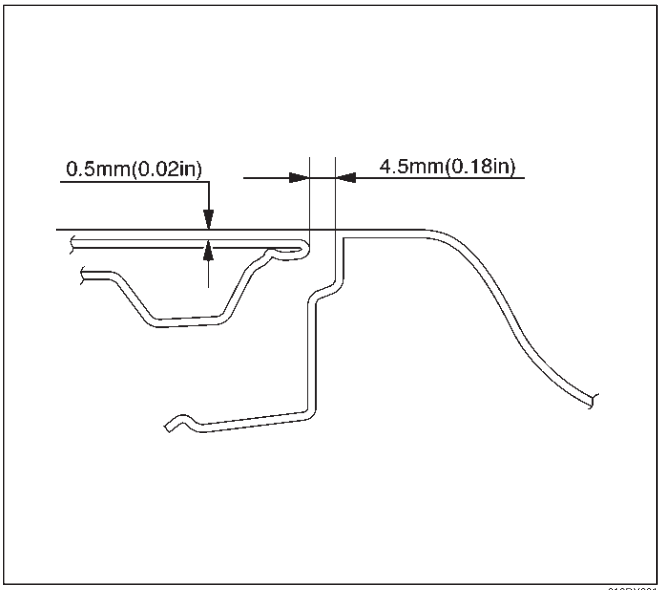
   Clearance: 4.5 mm (0.18 in)

   Height (step): 0.5 mm (0.02 in)

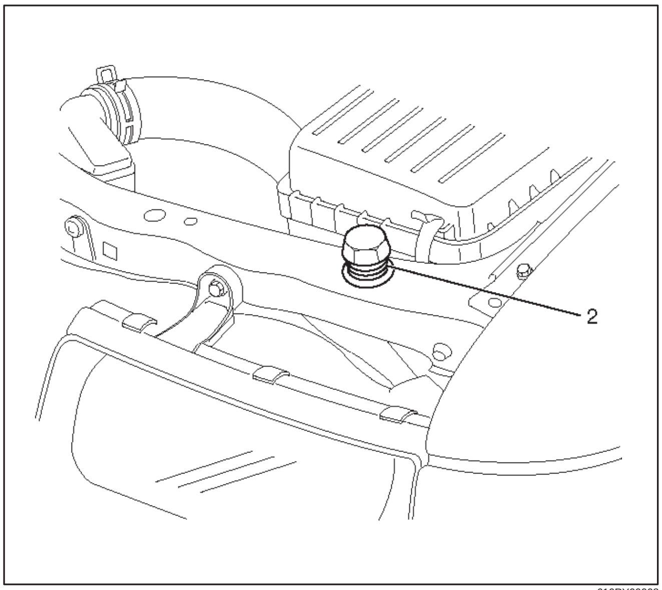
   - Adjust clearance with the hinges on the engine hood.
   - Adjust height (step) with the hood rests(2).



610RY00007



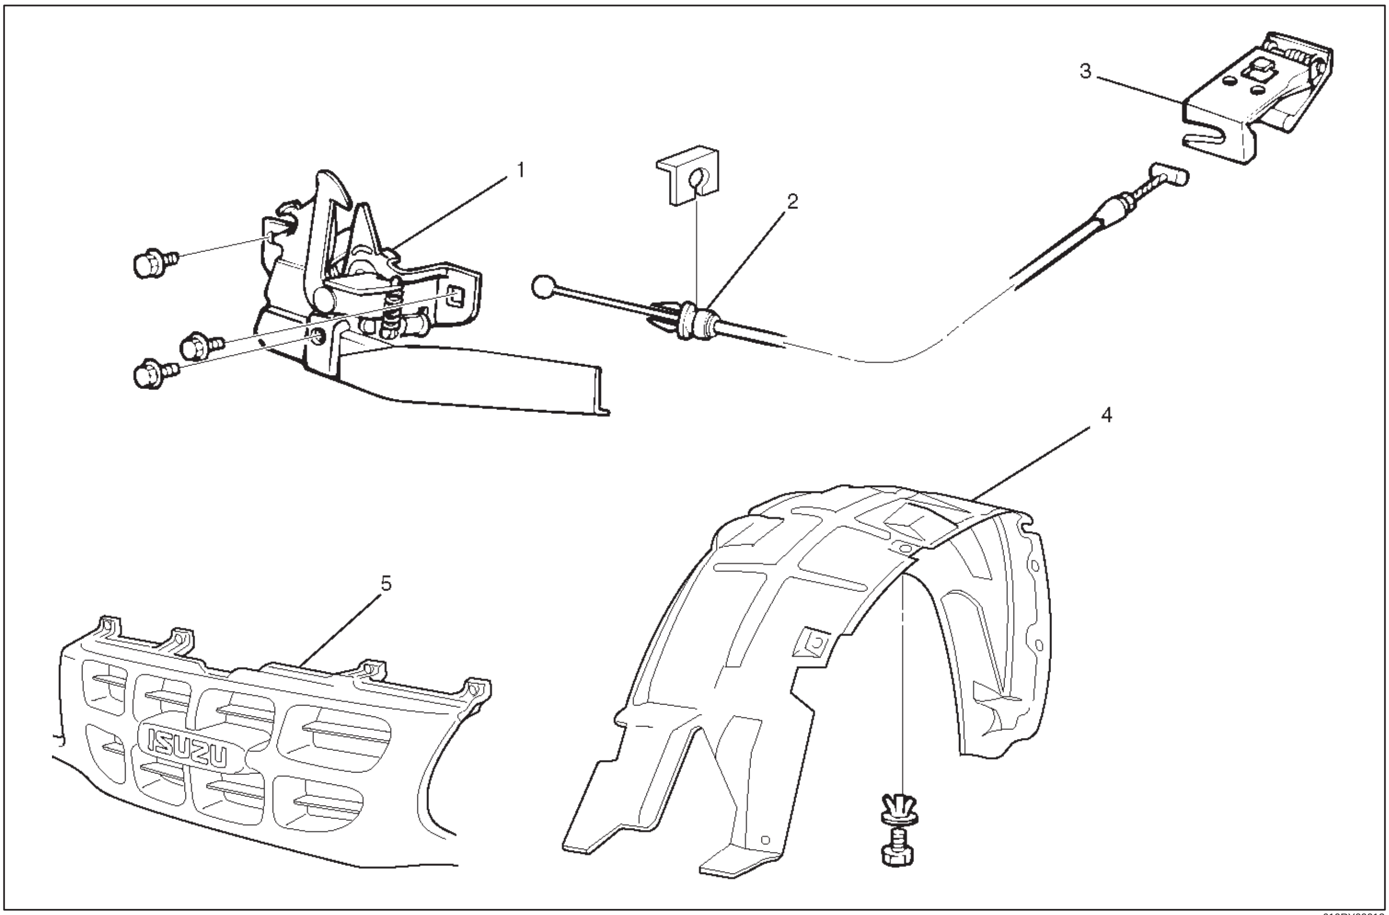
610RX001



610RY00008

Engine Hood Lock

Parts Location



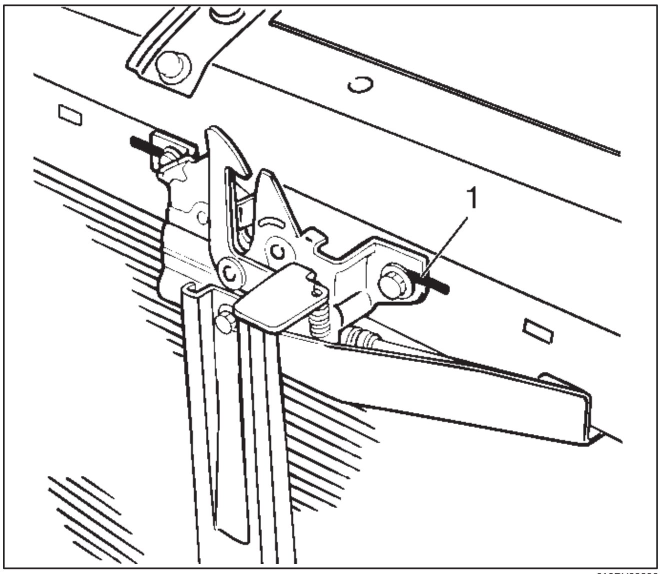
610RY00012

Legend

(1) Engine Hood Lock Assembly
(2) Control Cable
(3) Hood Lock Control Lever
(4) Inner Liner
(5) Radiator Grille

Removal

1. Remove the hood lock control lever.
2. Remove the inner liner.
3. Remove the control cable.
   - Remove the cable fixing clips from the body panel.
4. Remove the radiator grille.
   - Refer to Radiator Grille in this section.
5. Remove the engine hood lock assembly.
   - Apply setting marks(1) to the hood lock assembly and the body prior to removal.



610RY00006

Installation

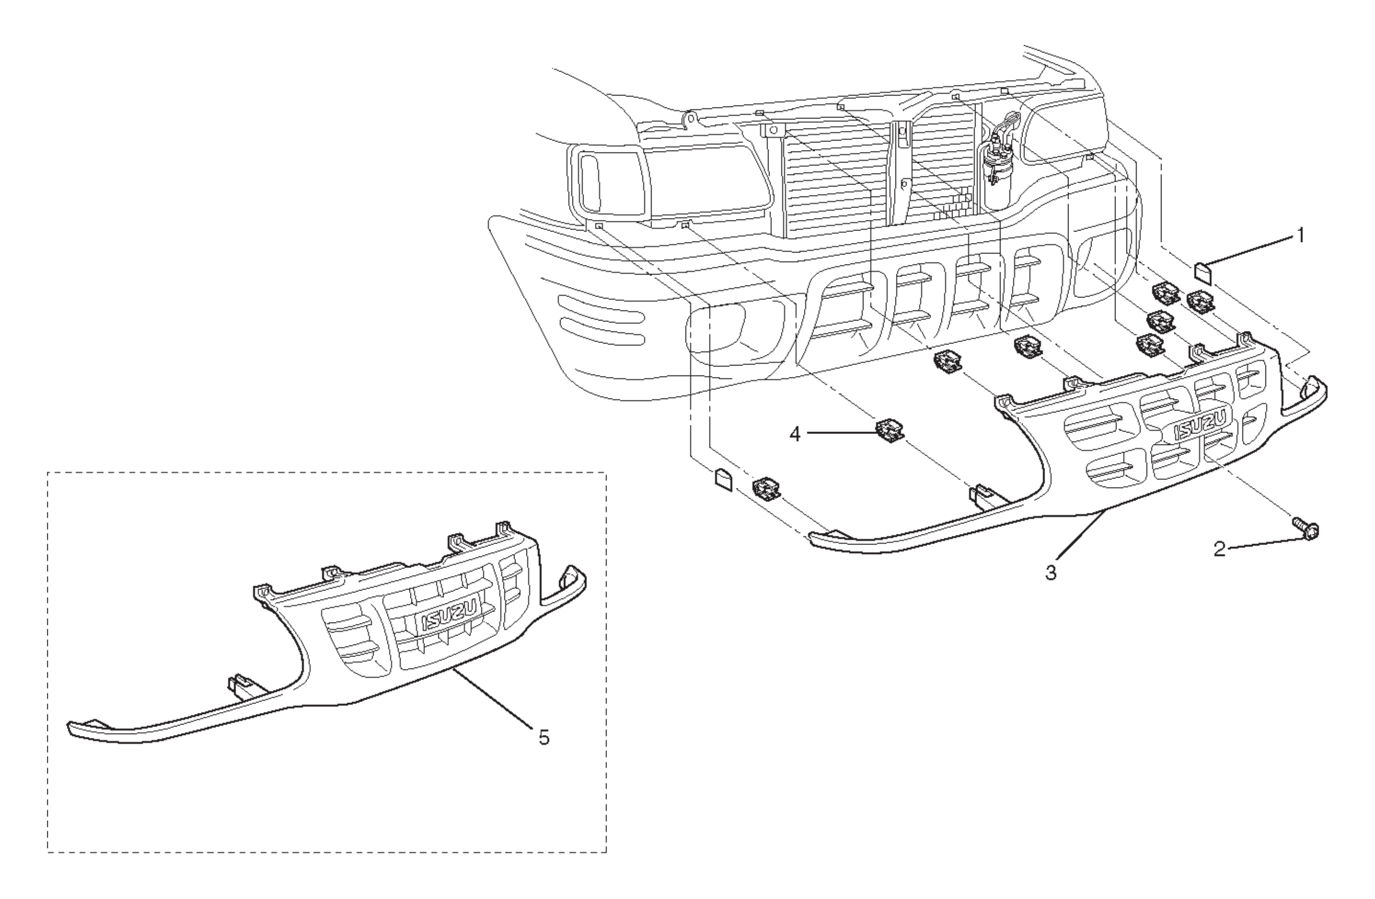
To install, follow the removal steps in the reverse order noting the following points:

1. Reroute the control cable to its original position, and check and see if the lock assembly and control lever work normally.
2. Tighten the hood lock assembly fixing bolts to the specified torque.

   Torque : 10 N·m (87 lb in)

Radiator Grille

Parts Location

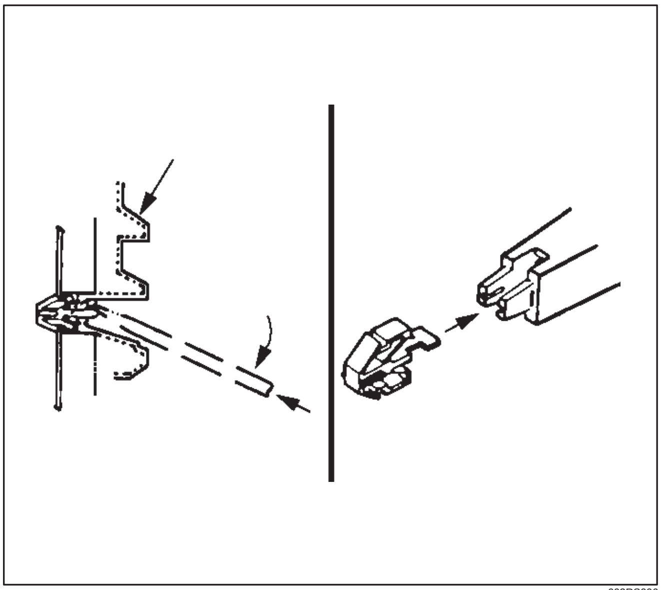


603RY00004

Legend
(1) Radiator Grille Rubber
(2) Screw
(3) Radiator Grille Assembly (LWB)
(4) Clip
(5) Radiator Grille Assembly (SWB)

Removal

1. Open the hood.
2. Support the hood.
3. Remove radiator grille.
   - Raise the clips on the radiator grille and remove screw.



603RS006

4. Pull out the radiator grille rubber from fender panel front lower side.

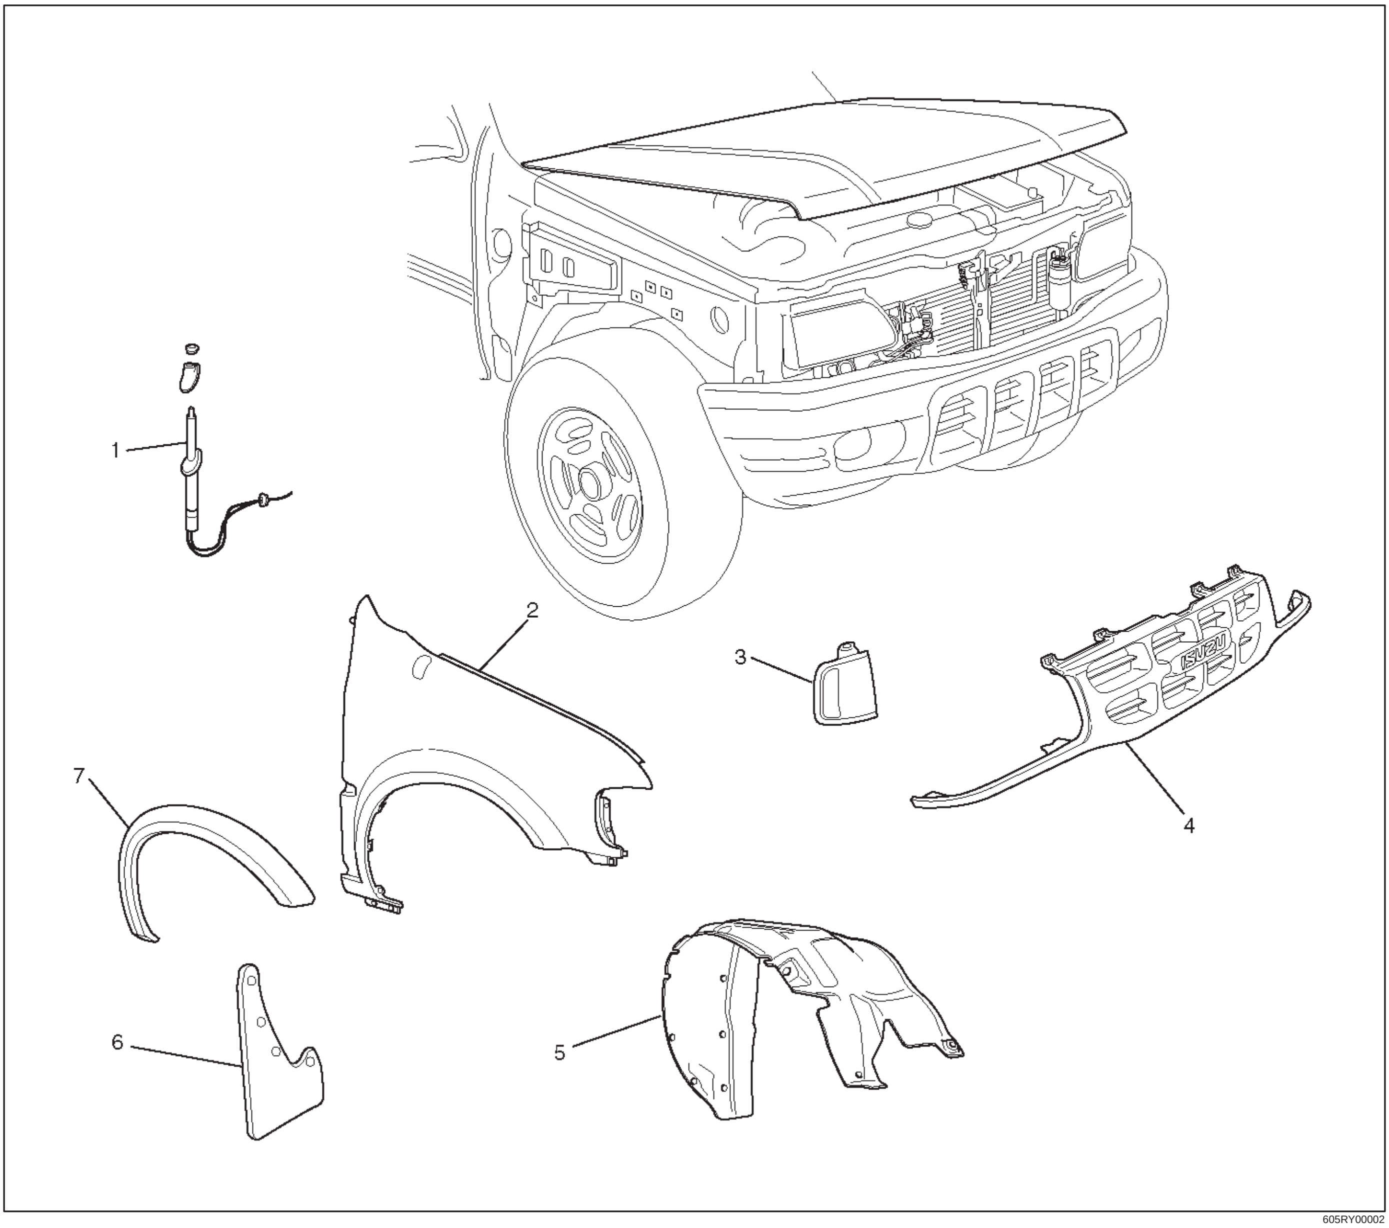
Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Install the radiator grille clips remaining on the body side in the radiator grille, and then install the radiator grille on the body.

Front Fender Panel

Parts Location



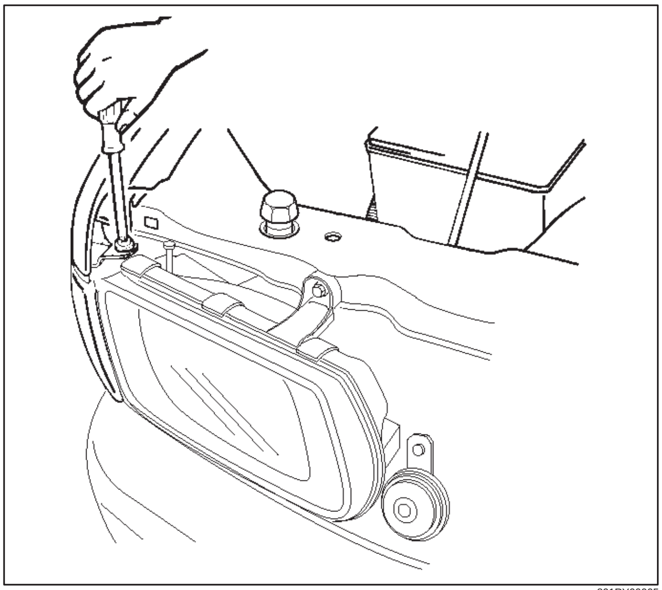
Legend

(1) Antenna Assembly
(2) Front Fender Panel
(3) Front Combination Light Assembly
(4) Radiator Grille
(5) Inner Liner
(6) Front Mud Flap
(7) Front Wheel Arch Moulding (if so equipped)

Removal

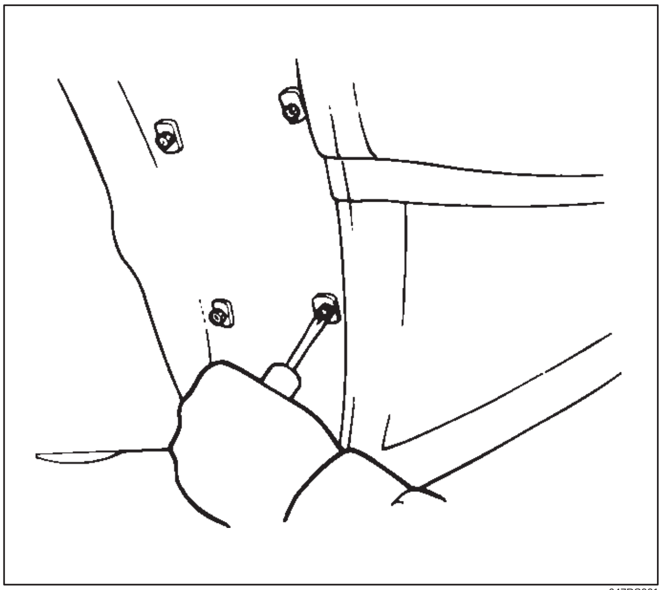
1. Disconnect the battery ground cable.
2. Remove the radiator grille assembly.
   - Refer to Radiator Grille in this section.

3. Remove the front combination light assembly.
   - Remove the fixing screw and disconnect the connector.



801RY00005

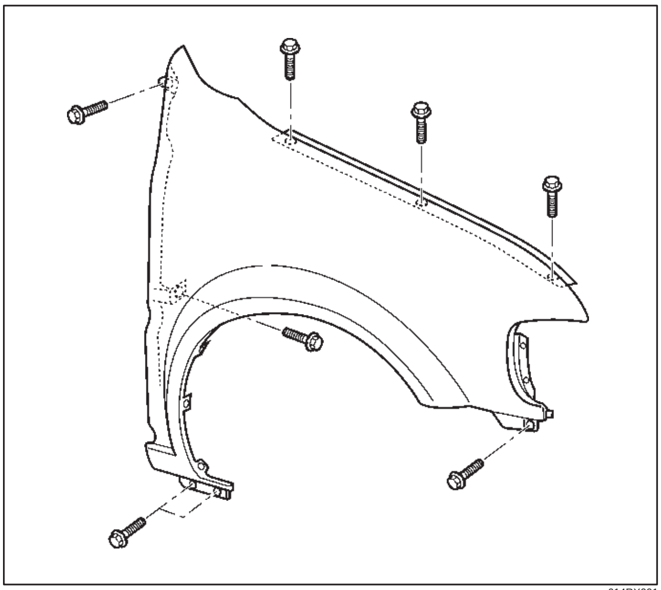
4. Remove the front mud flap.
5. Remove the inner liner.



647RS001

6. Remove the antenna assembly.
   - Refer to Rod Type Antenna in Entertainment section.

7. Remove the front fender panel.
   - Remove the eight fixing bolts.



614RX001

8. Remove the front wheel arch moulding (If so equipped).
   - Refer to Wheel Arch Moulding in Exterior/Interior Trim section.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the front fender panel fixing bolts to the specified torque.

   Torque : 7 N·m (61 lb in)

2. Check the fender and front door(1).

   Clearance: 5.0 mm (0.196 in)

   Height (step): Flush

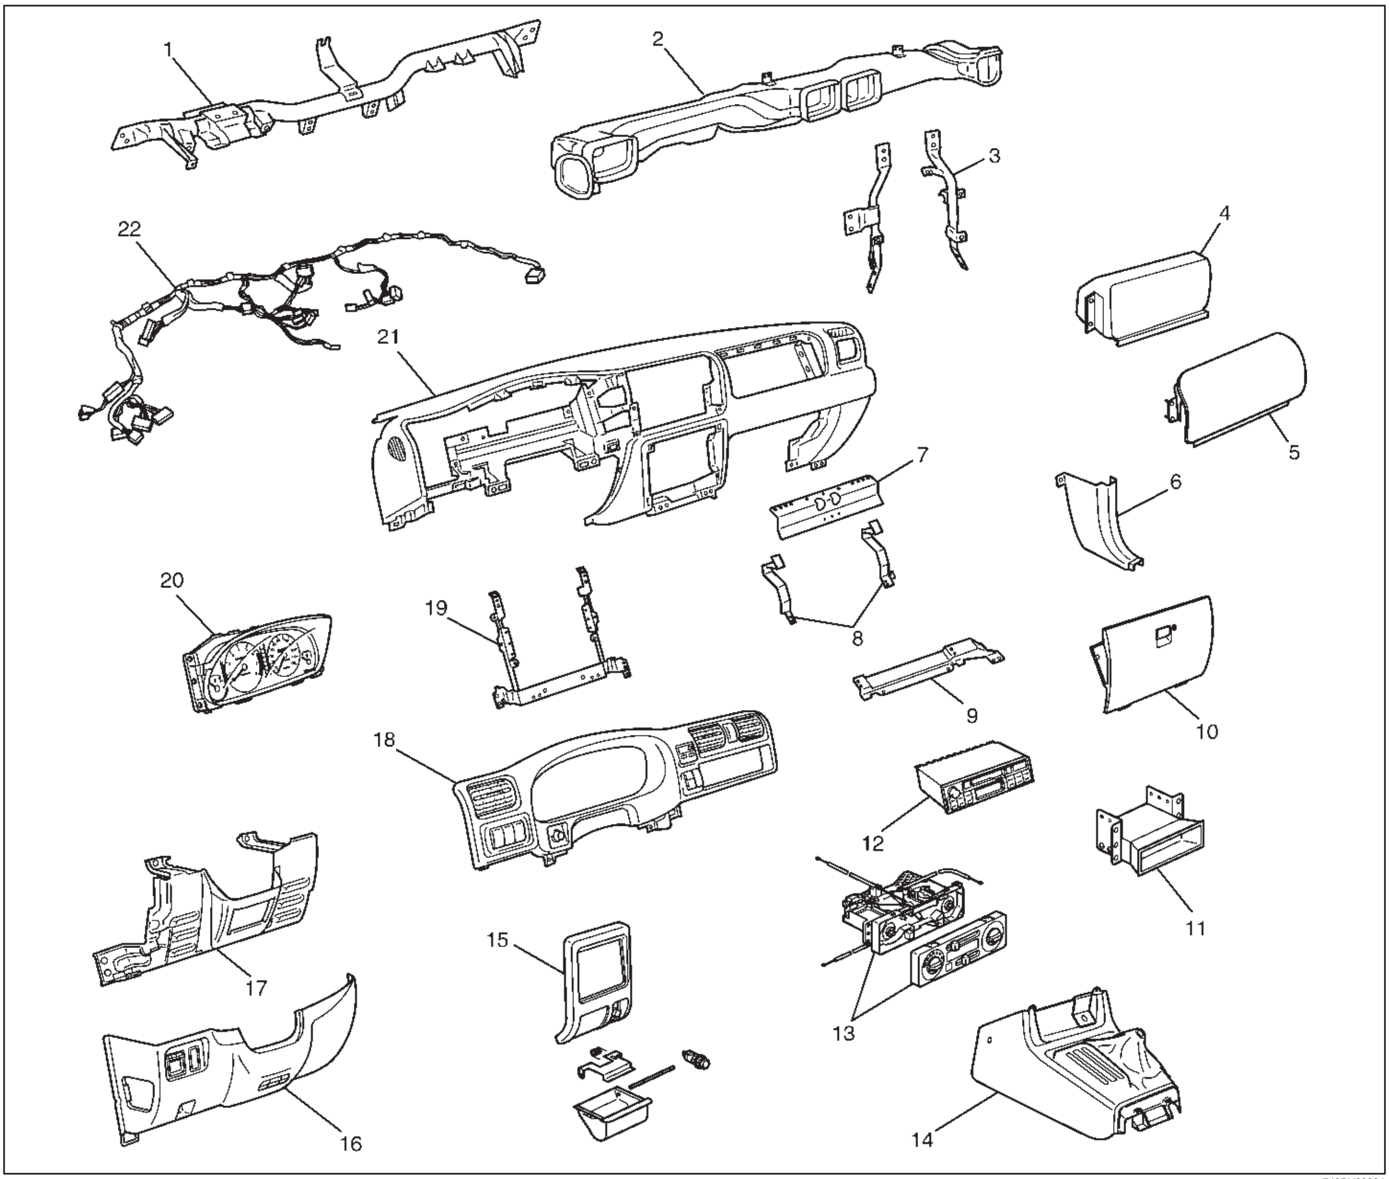
General Description (Body)

This publication contains essential removal, installation, adjustment and maintenance procedures.

Instrument Panel Assembly

Parts Location



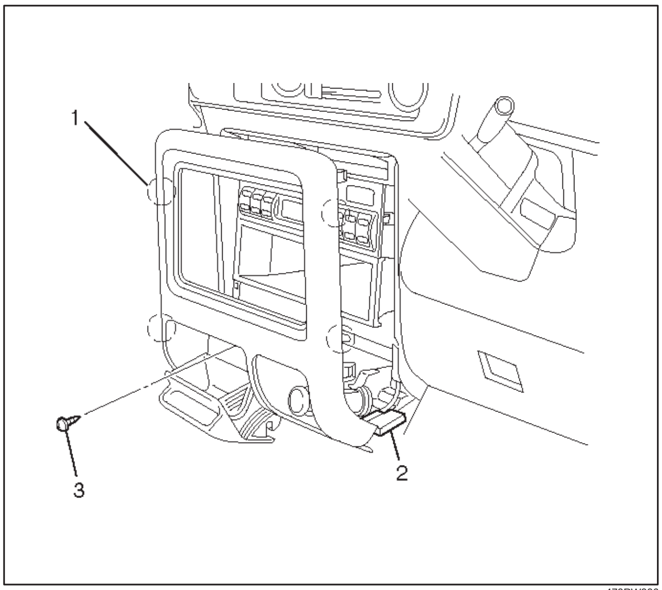
Legend

(1) Cross Beam
(2) Vent Duct Assembly
(3) Instrument Panel Stay
(4) Passenger Air Bag
(5) Passenger Air Bag Cover
(6) Dash Side Trim Panel
(7) Instrument Upper Reinforcement
(8) Glove Box Side Reinforcement
(9) Passenger Lower Bracket
(10) Glove Box
(11) Audio Sub Box
(12) Radio Assembly
(13) Control Lever Assembly
(14) Front Console Assembly
(15) Lower Cluster Assembly
(16) Instrument Panel Driver Lower Cover Assembly
(17) Driver Knee Bloster Assembly
(18) Meter Cluster Assembly
(19) Instrument Panel Center Reinforcement
(20) Meter Assembly
(21) Instrument Panel Assembly
(22) Instrument Harness Assembly

Removal

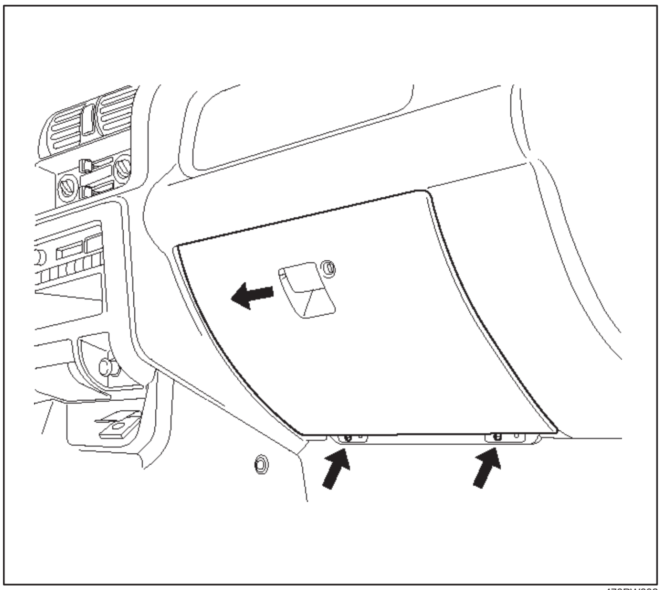
CAUTION: For precautions on installation or removal of SRS – air bag system, refer to Supplemental Restraint System (SRS) – AIR BAG in Restraint section.

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly.
   - Remove screw (3) and pull out the cluster at the clip positions (1).
   - Disconnect the cigarette lighter connectors (2).



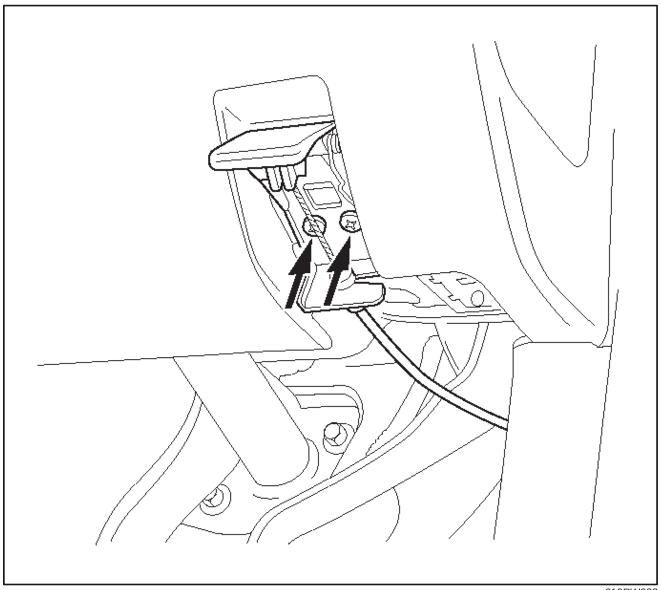
470RW006

3. Remove the radio assembly and audio sub box.
   - Refer to Radio in Entertainment section.
4. Remove the front and rear consoles.
   - Refer to Consoles in Exterior/Interior Trim section.
5. Remove the dash side trim panels.
   - Remove the sill plates, then remove the trim panels.
6. Remove the glove box.
   - Remove the two fixing screws.



470RW002

7. Remove the instrument panel driver lower cover assembly.
   - Remove the engine hood opener two fixing screws and another one fixing screw.
     After four clips are pried, disconnect switch connector and duct.

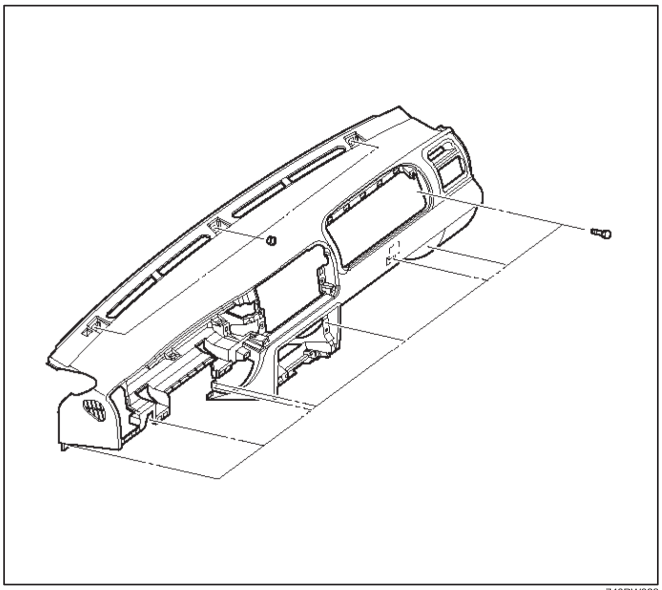


610RW023

8. Remove the meter cluster assembly.
   - Remove the five fixing screws, two clips and switch connectors.
9. Remove the meter assembly.
   - Remove the four fixing screws and disconnect the connectors.
10. Remove the driver knee bolster assembly.
    - Remove the six fixing bolts and screw.
11. Remove the control lever assembly.
    - Refer to Control Lever Assembly and/or Control Cable in Heating, Ventilation and Air Conditioning (HVAC) section.
12. Remove the Instrument panel assembly.

CAUTION: For precautions on installation or removal of SRS – air bag system, refer to Supplemental Restraint System (SRS) – AIR BAG in Restraint section.

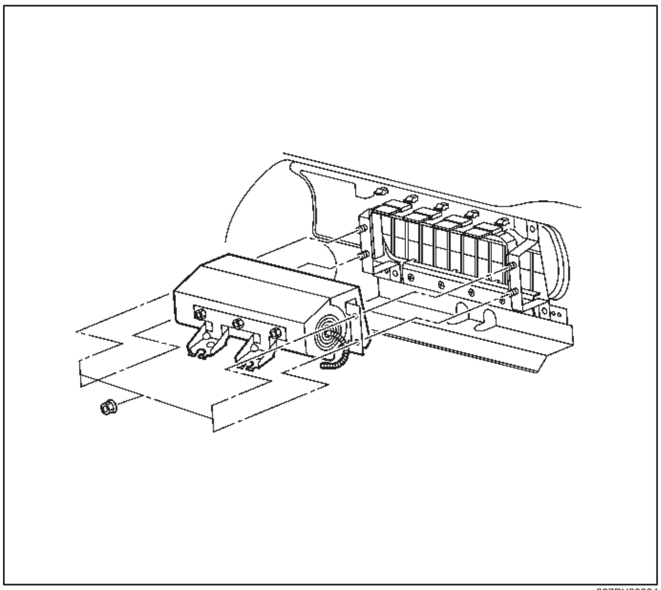
- Disconnect the instrument harness connectors (six connectors on the driver's side, three connectors on the passenger side and two connectors on the center side).
- Disconnect radio antenna cable plug and the ground cable fixing bolts from dash side panel.
- Remove the two fixing bolts of passenger air bag assembly and disconnect the connector.
- Remove the two fixing screws from fuse box.
- After pry the three hole cover from the surface of instrument panel, remove the three nuts.
- Remove the six bolts and one screw.



740RW038

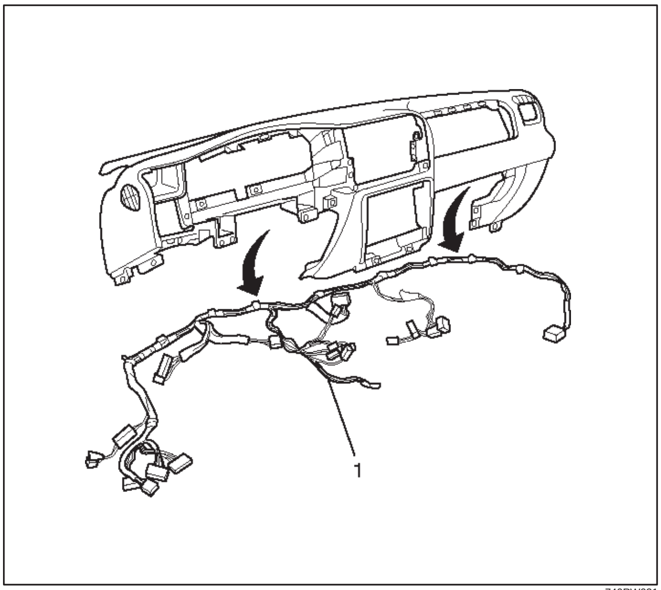
13. Remove the passenger air bag (1).
    - Remove the four fixing nuts.

CAUTION: For precautions on installation or removal of SRS – air bag system, refer to Supplemental Restraint System in Restraint section.



827RY00004

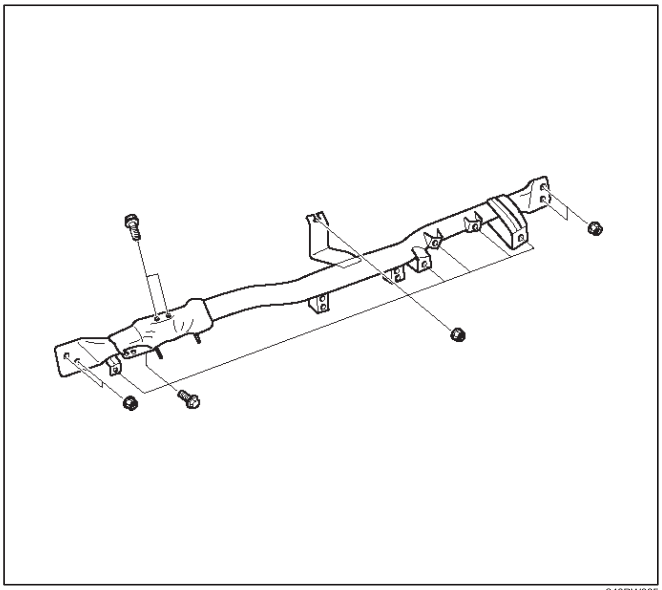
14. Remove the vent duct assembly.
    - Remove the five fixing screws.
15. Remove the passenger lower bracket.
    - Remove the three screws.
16. Remove the glove box side reinforcement.
17. Remove the instrument upper reinforcement.
    - Remove the nine screws.
18. Remove the instrument panel center reinforcement.
    - Remove the six screws.
19. Remove the instrument panel harness assembly (1).
    - Remove the clips.



740RW031

20. Remove the instrument panel stays.
    - Remove the two fixing nuts and two fixing bolts for each bracket.

21. Remove the cross beam.
    - Remove the five fixing nuts, two fixing bolts (upper) and six fixing bolts (lower).



840RW005

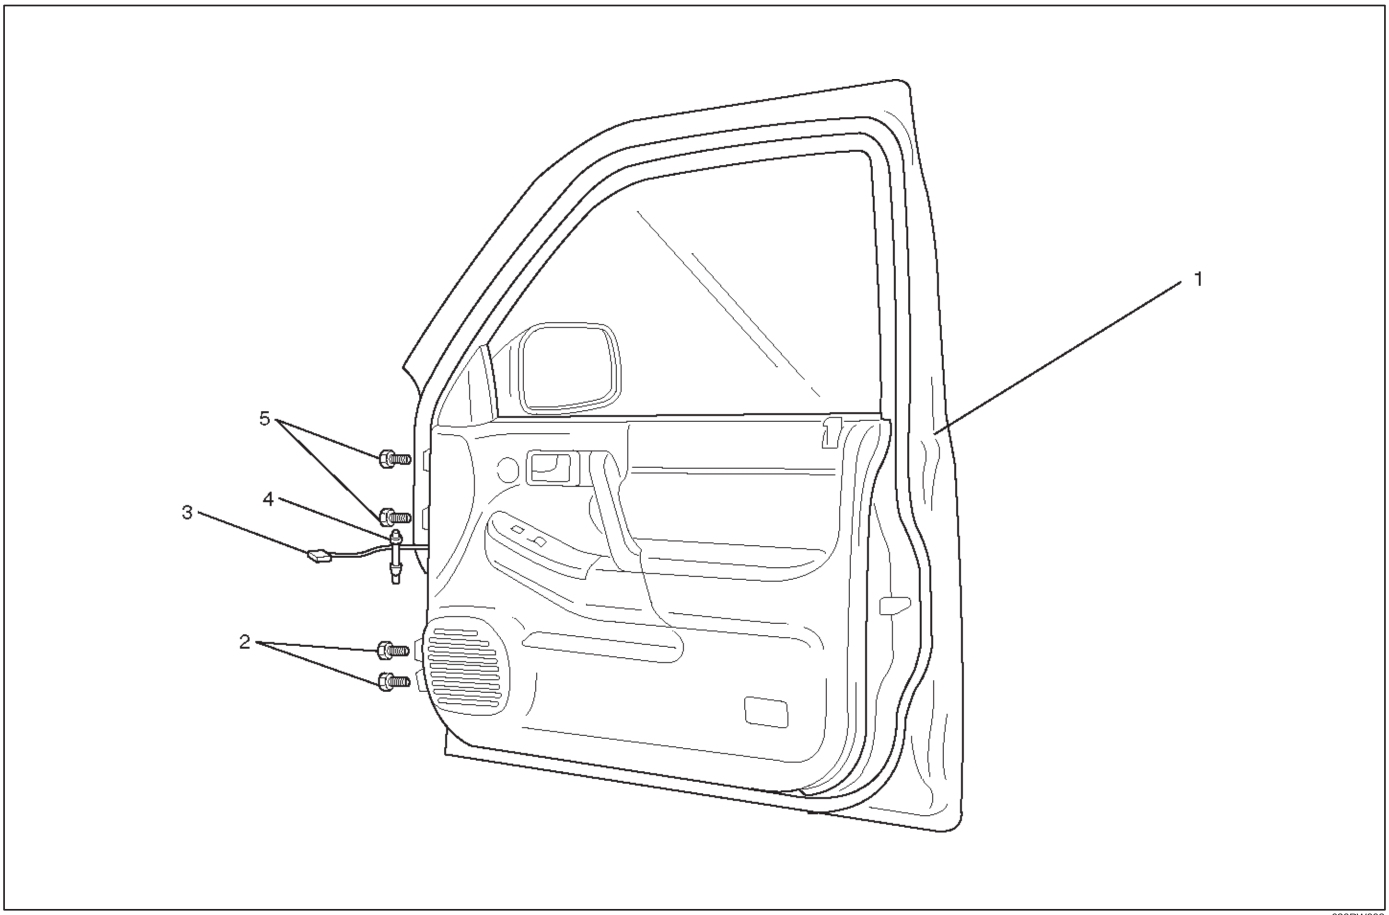
Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Adjust the control cable.
   - Refer to Control Lever Assembly in Heating, Ventilation and Air Conditioning (HVAC) section.

Front Door Assembly

Parts Location



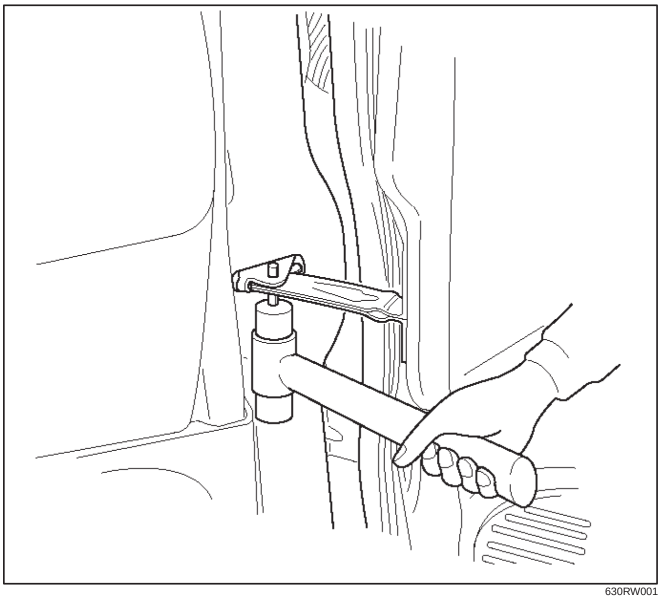
630RW002

Legend

(1) Front Door Assembly
(2) Lower Hinge Bolt
(3) Door Harness Connection
(4) Door Check Arm Pin
(5) Upper Hinge Bolt

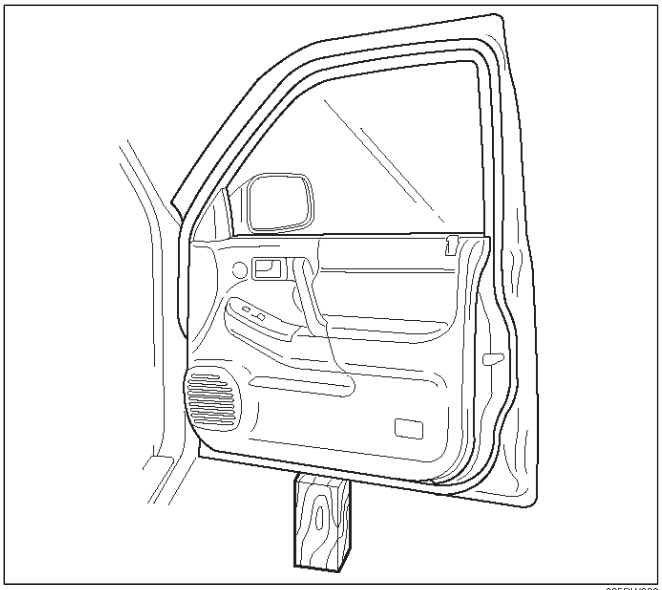
Removal

1. Disconnect the battery ground cable.
2. Apply a setting mark on the body side hinge.
3. Remove the door check arm pin.



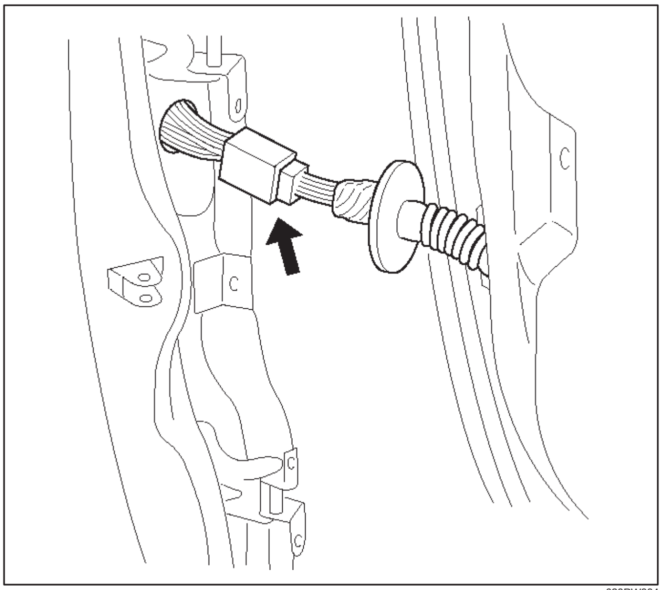
630RW001

4. Remove the upper and lower hinge bolts.
   - Position a wood block under the door for protection and support the door assembly with hands during removal or installation.



635RW003

5. Remove the door harness connection.
   - Pull the door harness grommet out in order to disconnect the harness connection.



630RW004

6. Remove the front door assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Align the door fitting to the body.
   - Check the fender and front door (3).

   Clearance: 5.0 mm (0.196 in)

   Height (step): Flush

   - Check the front door and rear door (2).

   Clearance: 6.0 mm (0.23 in)

   Height (step): Flush

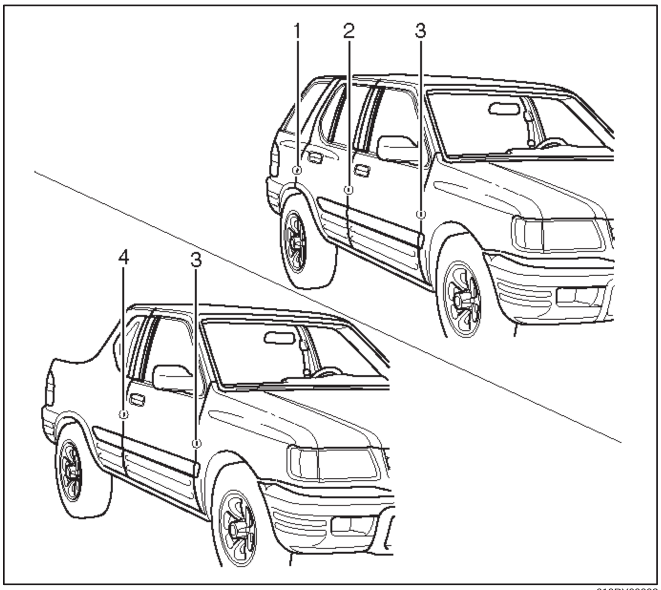
   - Check the rear door and body (1) (4).

   Clearance: 5.0 mm (0.196 in)

   Height (step): Flush

   Adjust clearance with door hinges.

   Adjust height (step) by tapping on the fender lightly with a rubber hammer.



610RY00003

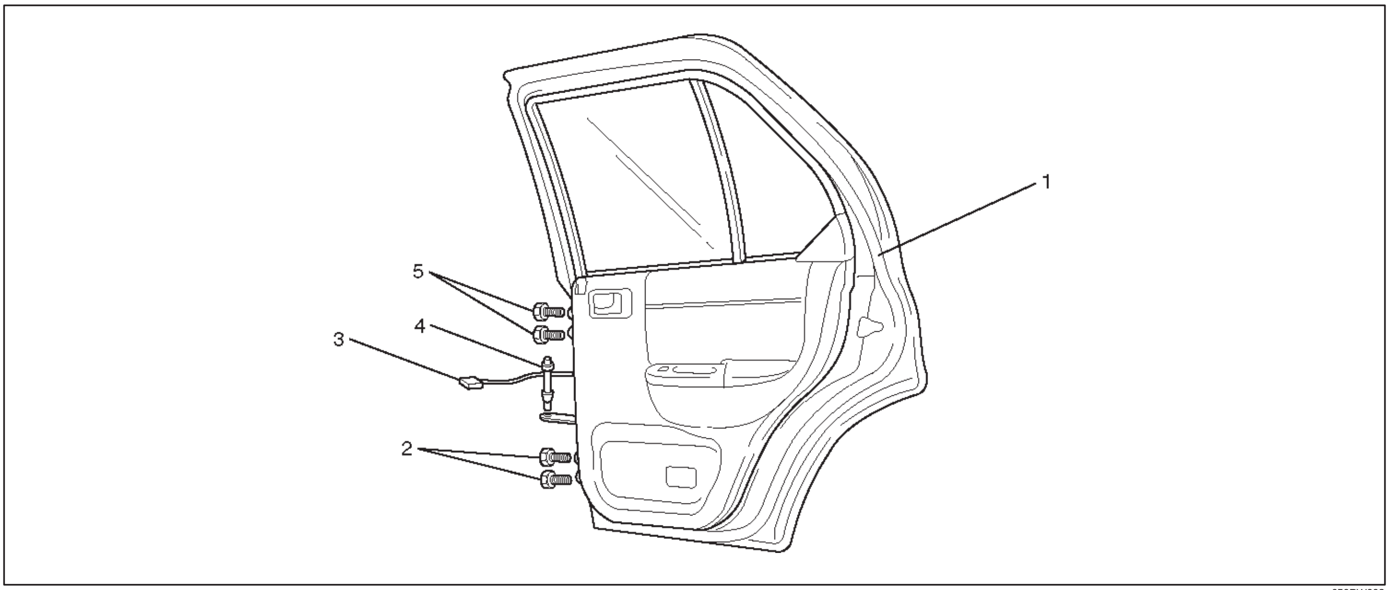
2. Tighten the door hinge bolts to the specified torque.

   Torque : 34 N·m (25 lb ft)

3. Apply chassis grease to the door check arm pin and the door hinge moving surface.

Rear Door Assembly

Parts Location

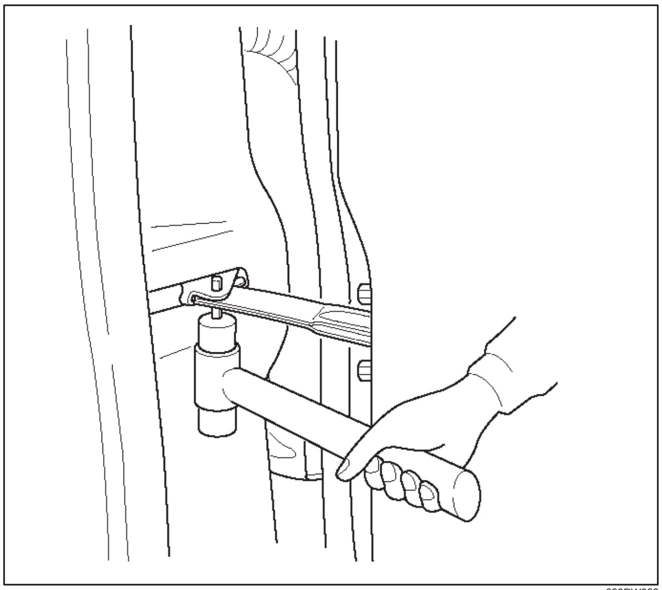


650RW003

Legend
- (1) Rear Door Assembly
- (2) Lower Hinge Bolt
- (3) Door Harness Connection
- (4) Door Check Arm Pin
- (5) Upper Hinge Bolt

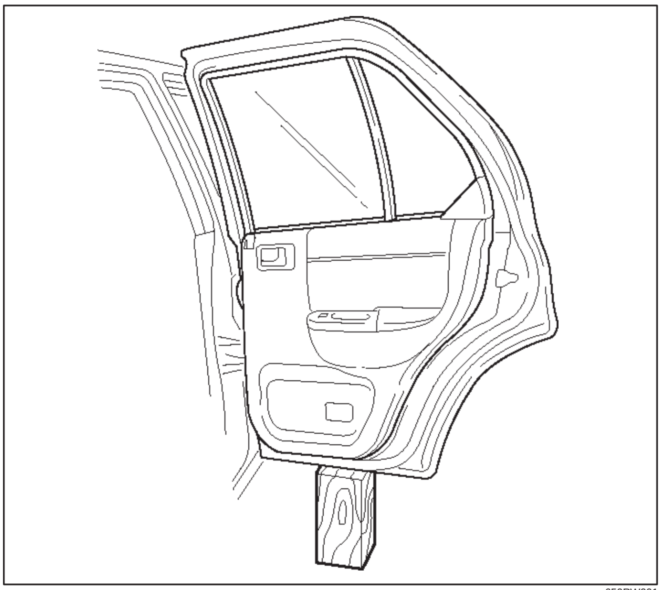
Removal

1. Disconnect the battery ground cable.
2. Apply a setting mark on the body side hinge.
3. Remove the door check arm pin.



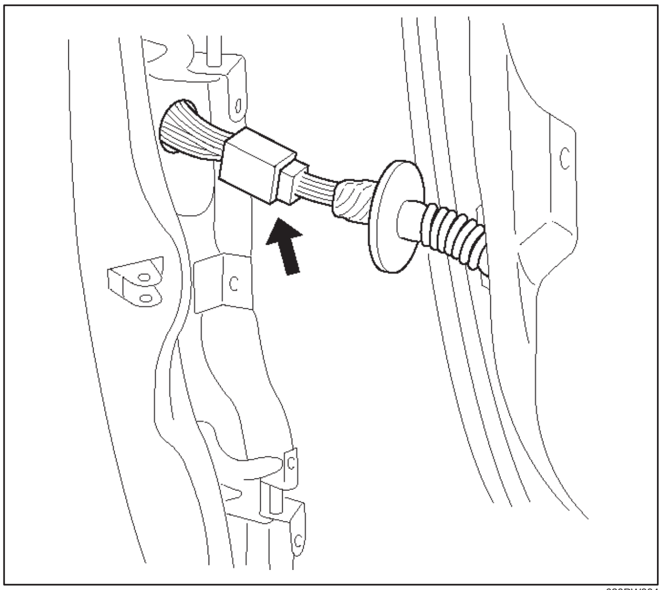
630RW003

4. Remove the upper and lower hinge bolts.
   - Position a wood block under the door for protection and support the door assembly with hands during removal or installation.



650RW001

5. Remove the door harness connection.
   - Pull the door harness grommet out in order to disconnect the door harness connection.



630RW004

6. Remove the rear door assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

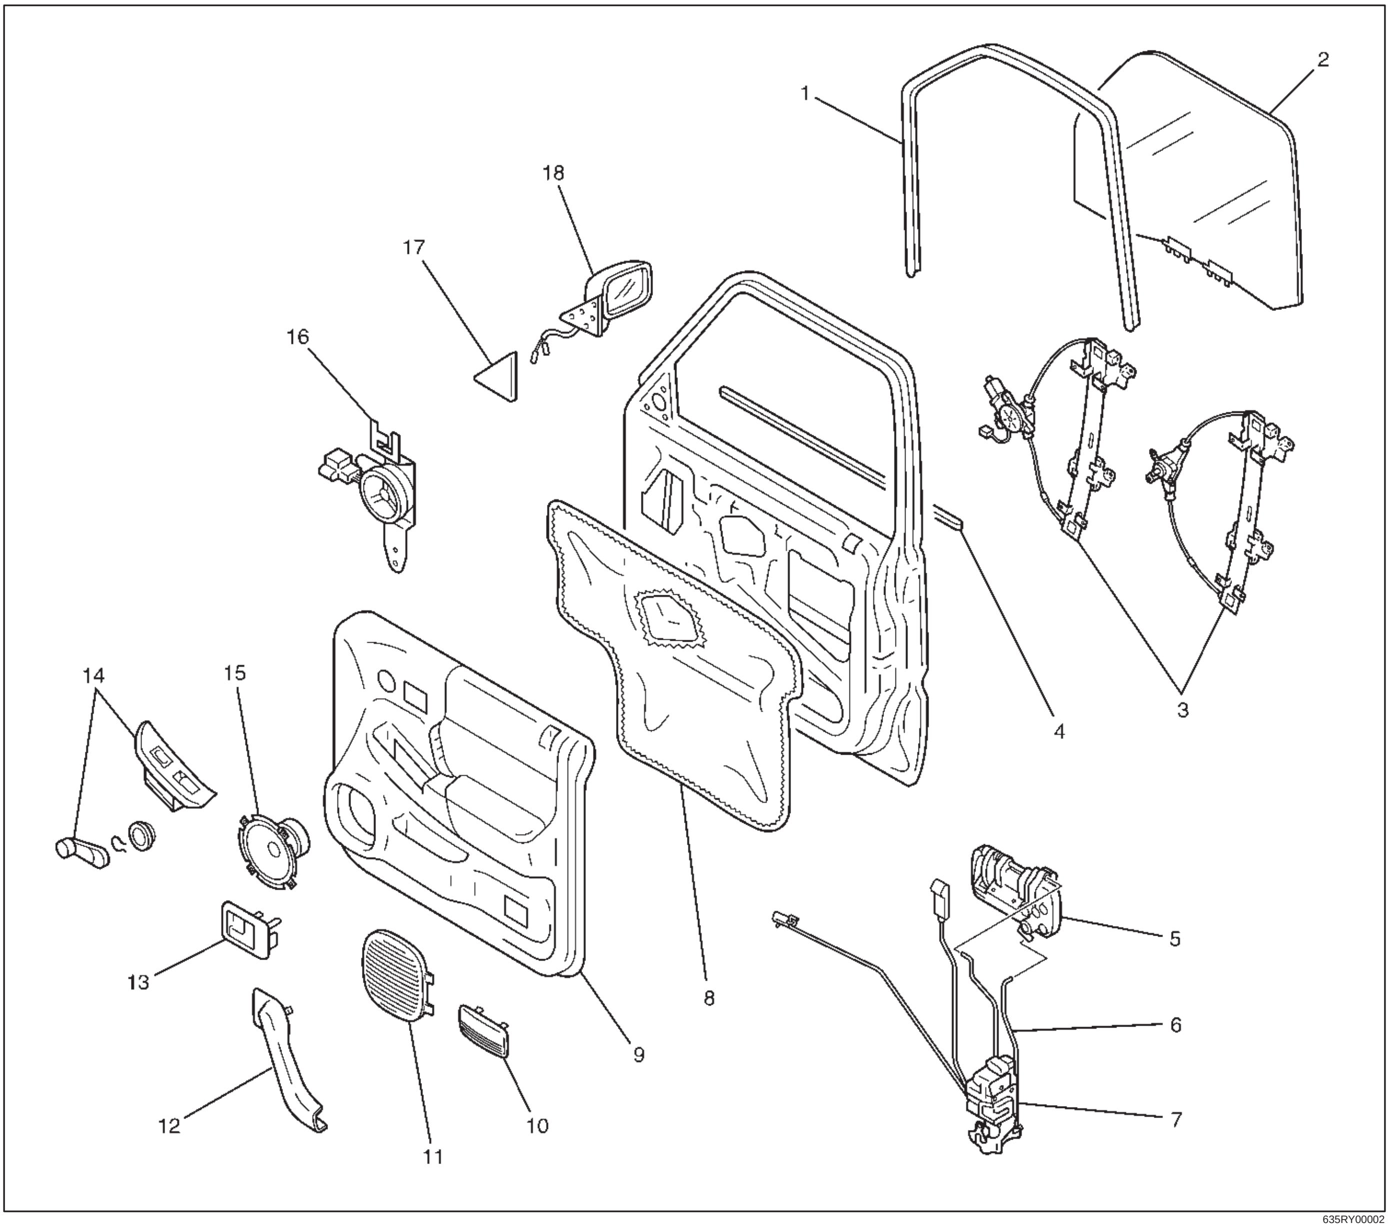
1. Align the door fitting to the body by referring to Front Door Assembly in this section.
2. Tighten the door hinge bolts to the specified torque.

   Torque : 34 N·m (25 lb ft)

3. Apply chassis grease to the check arm pin and the door hinge moving surface.

Front Window Regulator, Glass and Glass Run

Parts Location

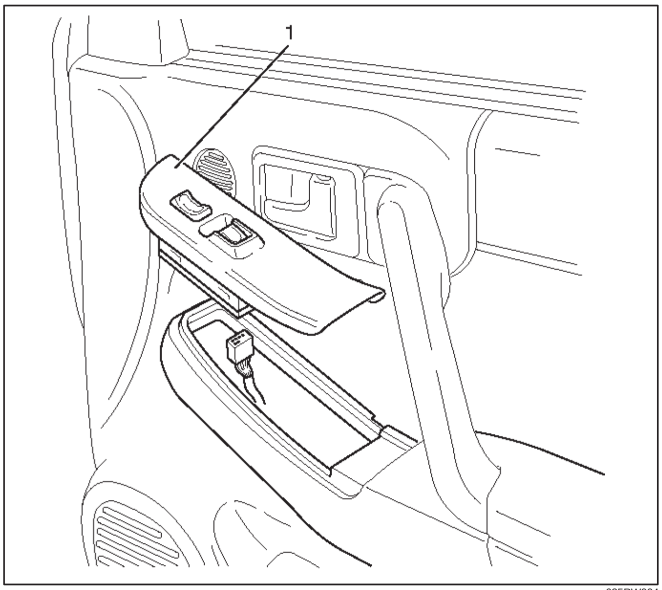


Legend

(1) Glass Run
(2) Glass
(3) Window Regulator
(4) Waist Seal
(5) Outside Handle
(6) Locking Link
(7) Door Lock Assembly
(8) Waterproof Sheet
(9) Door Trim Panel
(10) Courtesy Light Lens
(11) Speaker Grille
(12) Grip Cover
(13) Inside Handle
(14) Power Window Switch/Window Regulator Handle
(15) Speaker Assembly
(16) Tweeter
(17) Door Mirror Cover
(18) Door Mirror Assembly

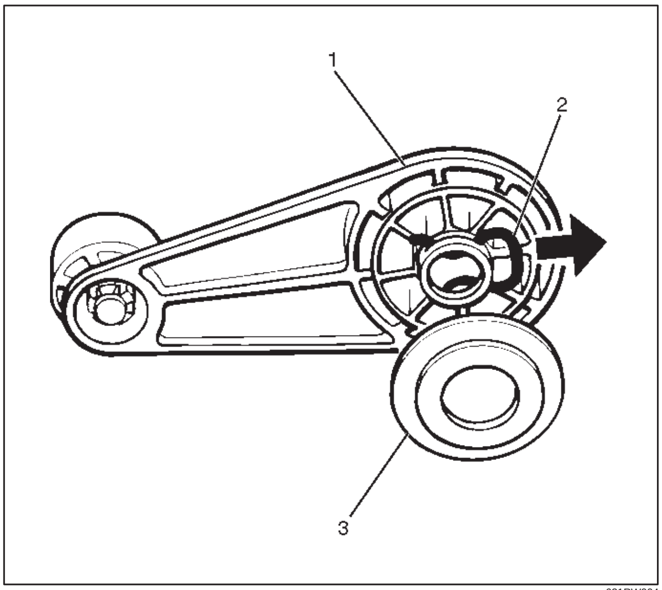
Removal

1. Disconnect the battery ground cable.
2. Remove the power window switch/regulator handle.
   - Pry out the power window switch and remove the connectors.



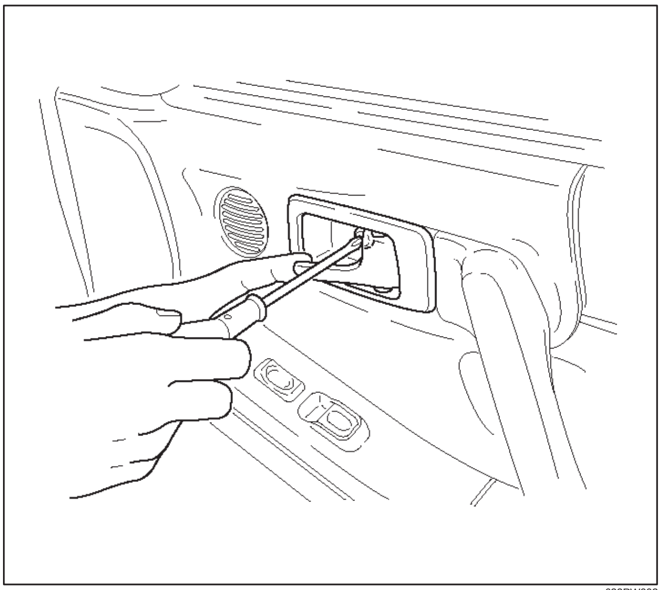
635RW004

   - To remove the regulator handle (1), remove the clip (2) at the root of the handle by using wire with hook.



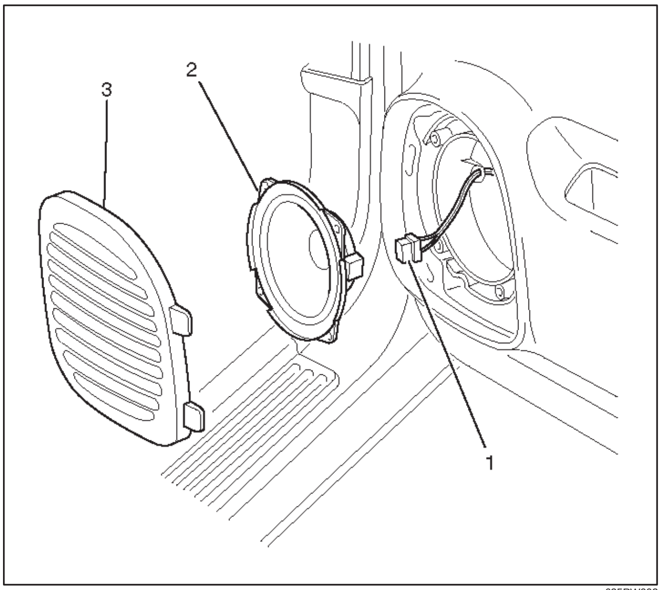
631RW004

3. Remove the screw while pulling the inside lever toward you and then remove the inside handle.



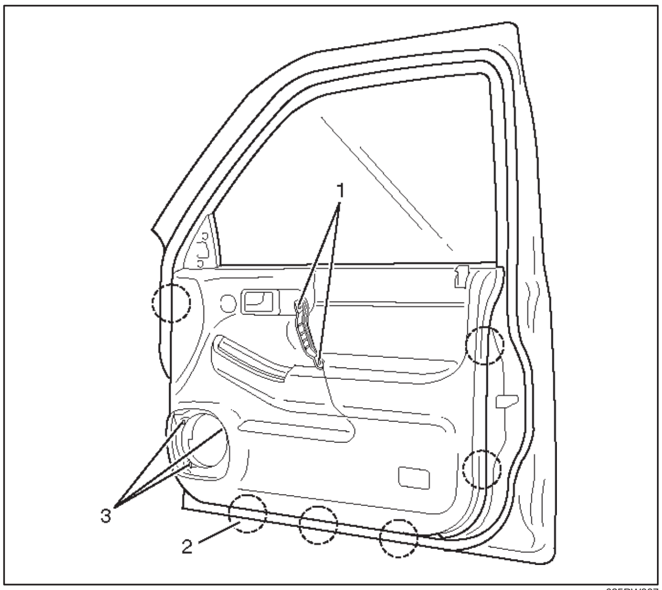
632RW003

4. Remove the speaker grille (3).
   - Pull out the front side of the grille.
5. Remove the speaker assembly (2).
   - Remove the 4 screws and disconnect the speaker harness connector (1).



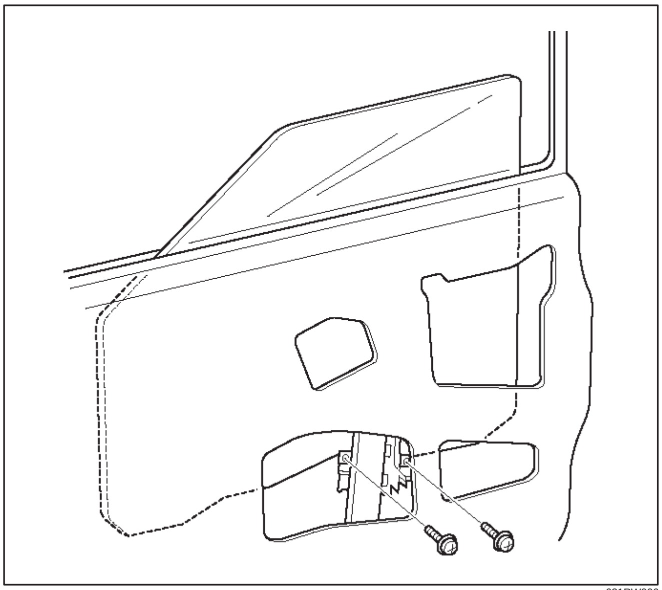
635RW002

6. Remove the door mirror cover.
7. Remove the grip cover.
8. Remove the 5 screws (1), (3) and pull out the trim panel at the 6 clip positions (2).

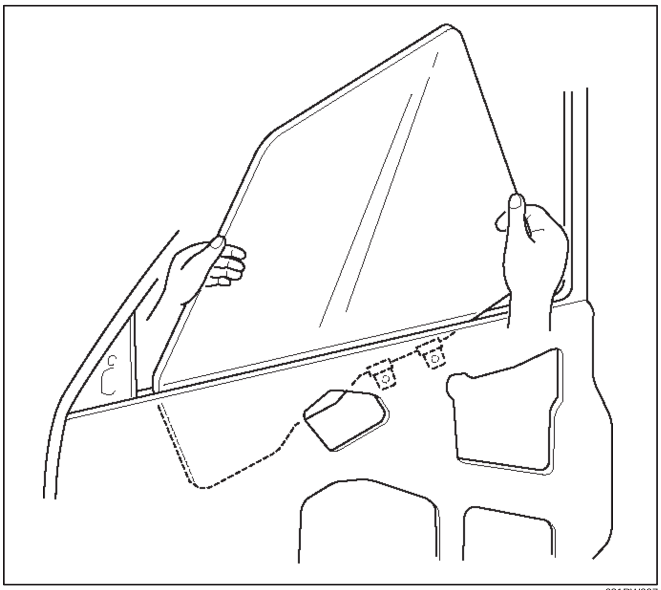


635RW007

9. Remove the waterproof sheet.
10. Remove the 2 screws through the access hole and pull out the glass upward.

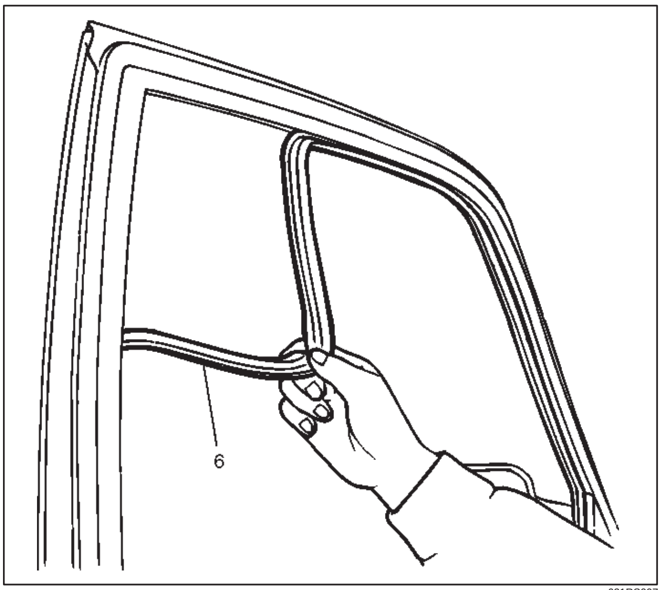


631RW006



631RW007

11. Remove the window regulator.
    - Disconnect the window regulator motor harness connector, if equipped with power windows.
12. Remove the glass run.
    - Pull the glass run (6) out from the door frame groove.

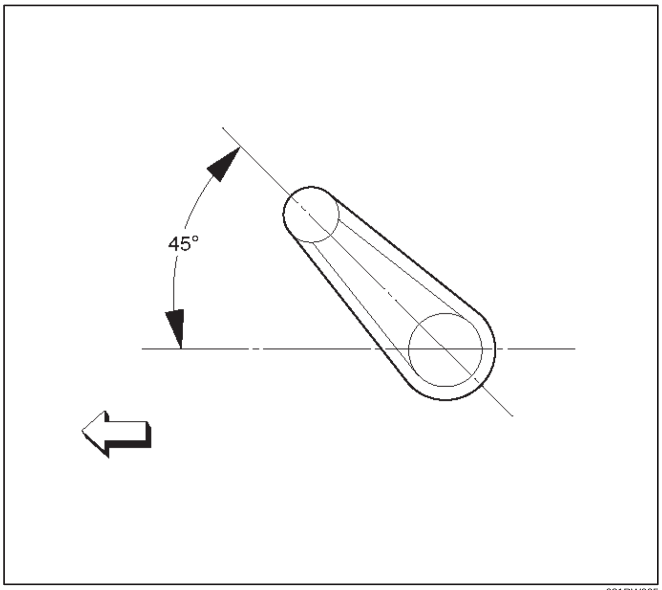


631RS007

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Install the regulator handle as shown in the illustration, if equipped without power windows.

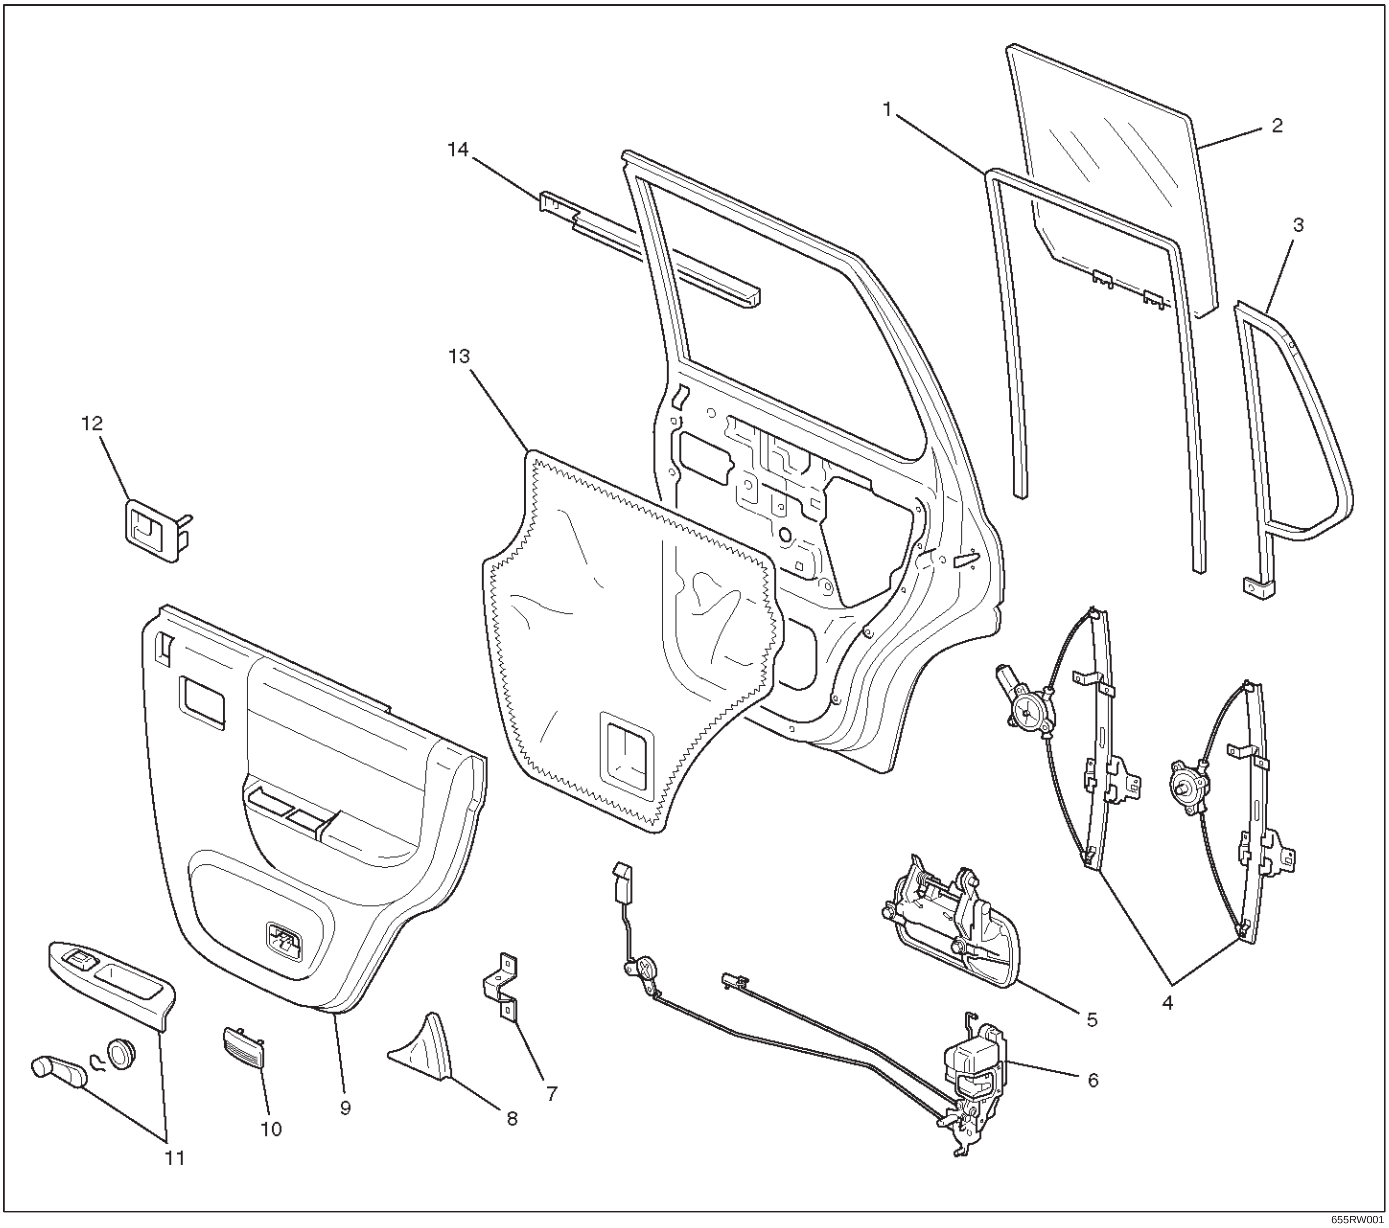


631RW005

2. Check to see that the window regulator operates smoothly and the glass opens and closes properly. Install the waterproof sheet with to clearance between the door panel and the water proof sheet.

Rear Window Regulator, Glass and Glass Run

Parts Location

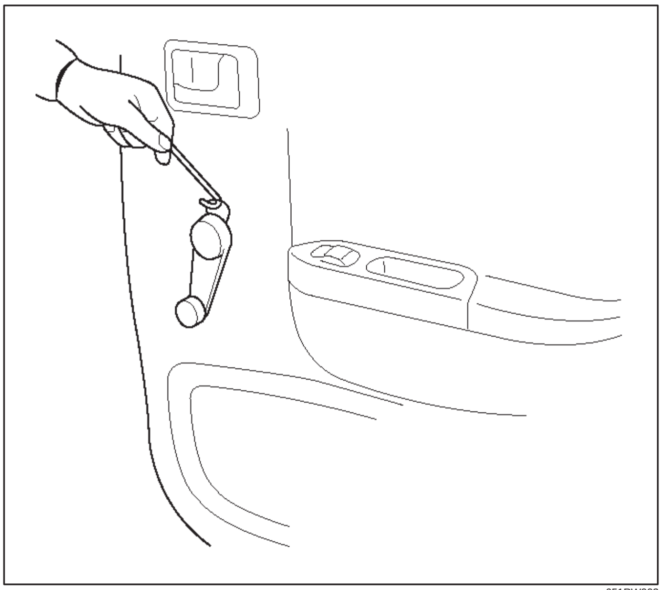


Legend

(1) Glass Run
(2) Glass
(3) Fixed Glass
(4) Window Regulator
(5) Outside Handle
(6) Door Lock Assembly
(7) Bracket
(8) Rear Corner Garnish
(9) Door Trim Panel
(10) Courtesy Light Lens
(11) Power Window Switch/Window Regulator Handle
(12) Inside Handle
(13) Waterproof Sheet
(14) Waist Seal

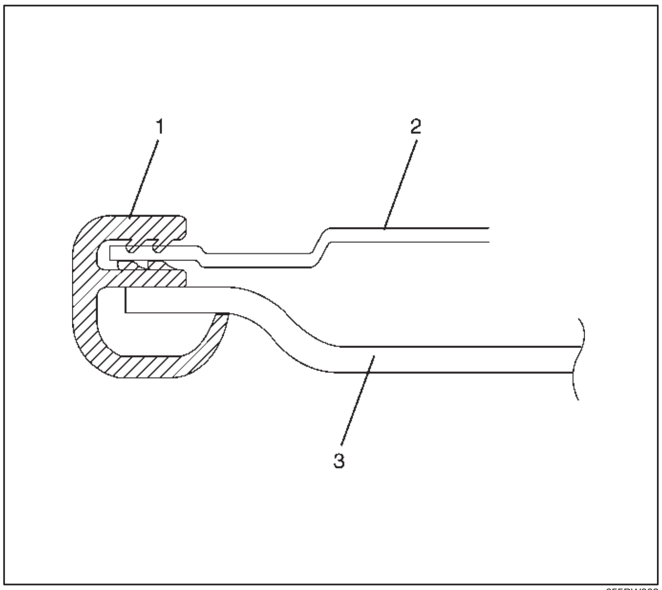
Removal

1. Disconnect the battery ground cable.
2. Remove the rear corner garnish.
3. Remove the window regulator handle.
   - Remove the clip on the rear side of the regulator handle using a wire.



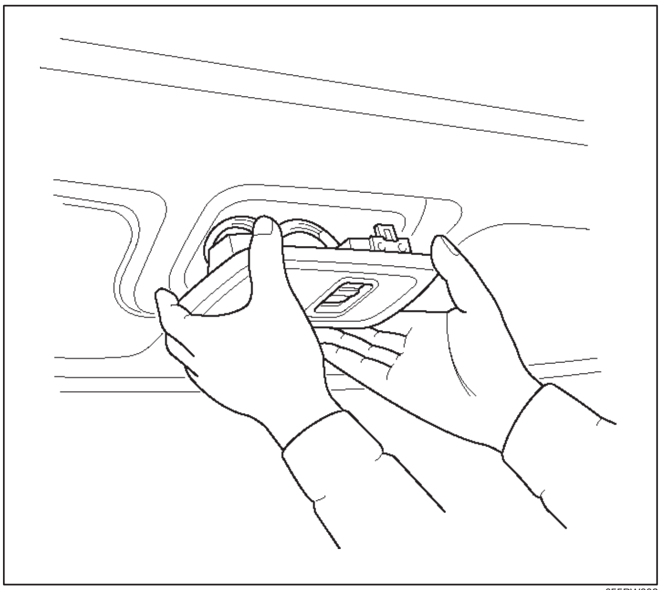
651RW003

4. Remove the screw while pulling the inside lever toward you and then remove the inside handle.
5. Remove the 1 screw at the pull case.



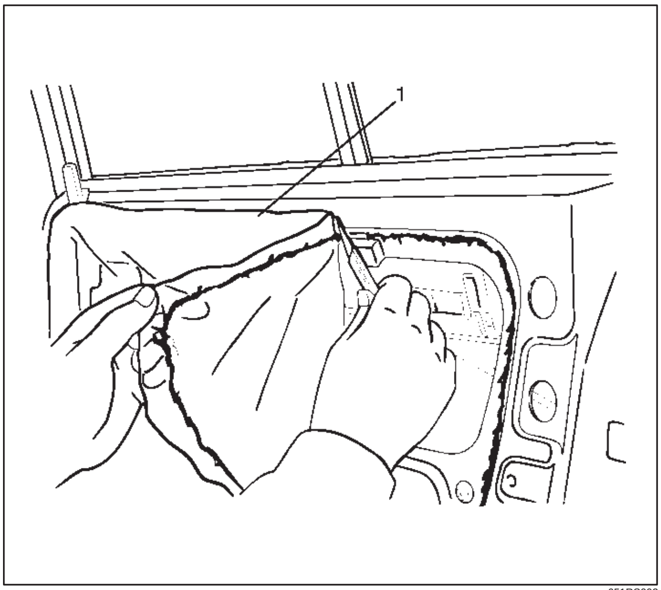
655RW003

6. Remove the rear corner garnish.
7. Pull out the trim panel at the 8 clip positions.
   - Disconnect the power window switch connector and courtesy light connector.



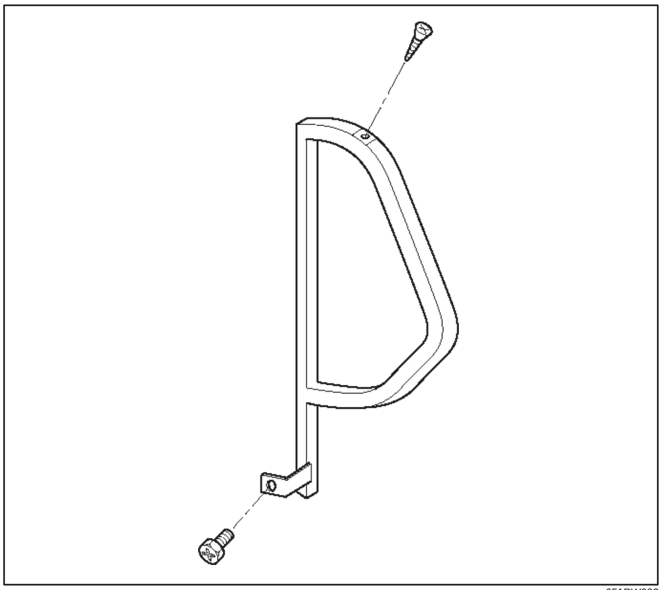
655RW002

8. Remove the power window switch, if equipped.
9. Remove the bracket.
10. Remove the waterproof sheet (1).
    - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.



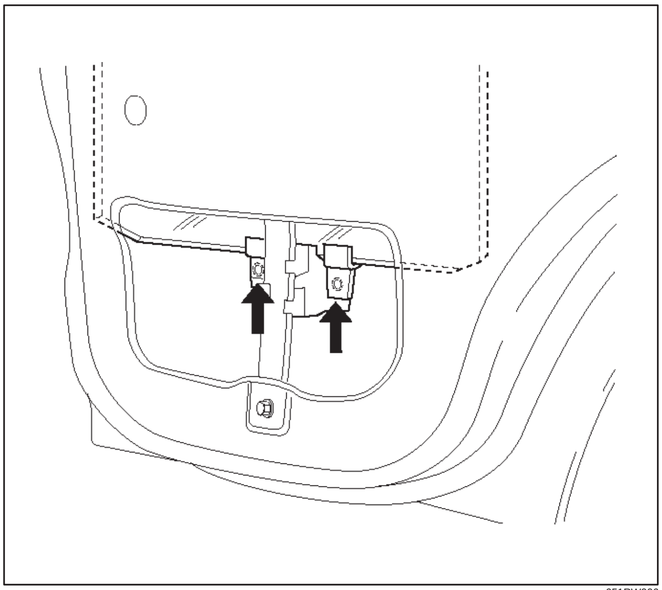
651RS002

11. Remove the fixied glass.
- Remove one bolt and screw as shown in the figure, then pull it upward.



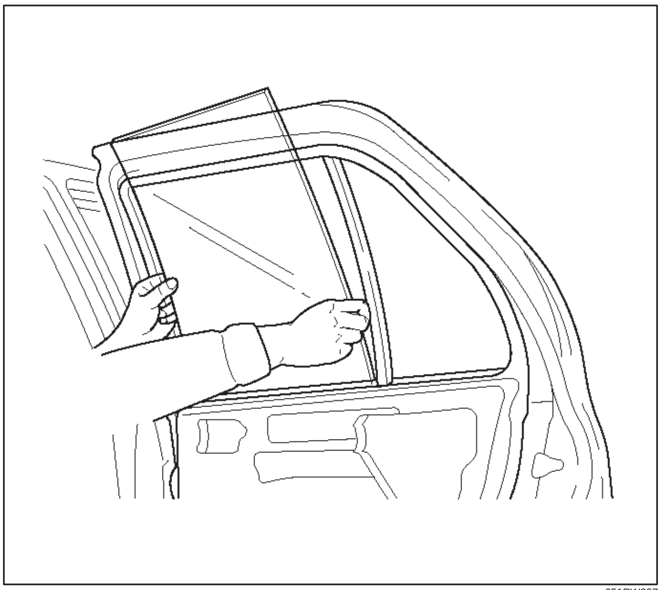
651RW002

12. Remove the glass.
- First, align the height of regulator to the access hole. Remove 2 screws attaching bottom channel and regulator, then remove the glass.



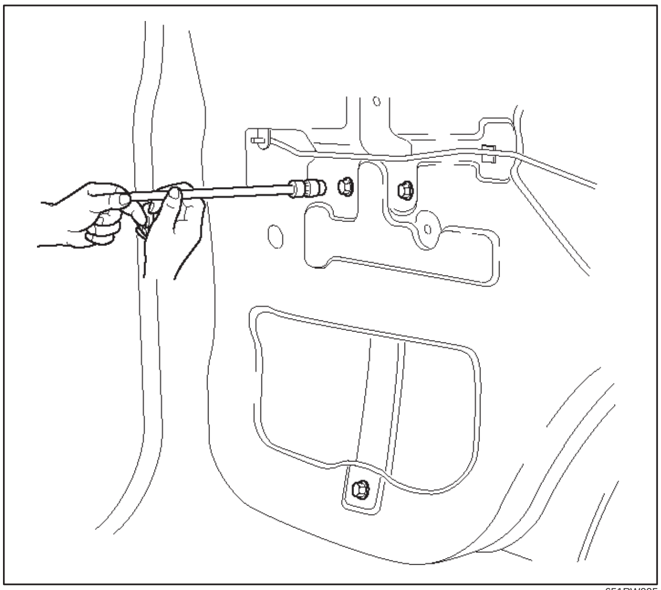
651RW006

- Remove the window glass by tilting it as necessary.



651RW007

13. Remove the window regulator.
- Remove the window regulator fixing bolts and pull the regulator out from the lower hole of the door panel.



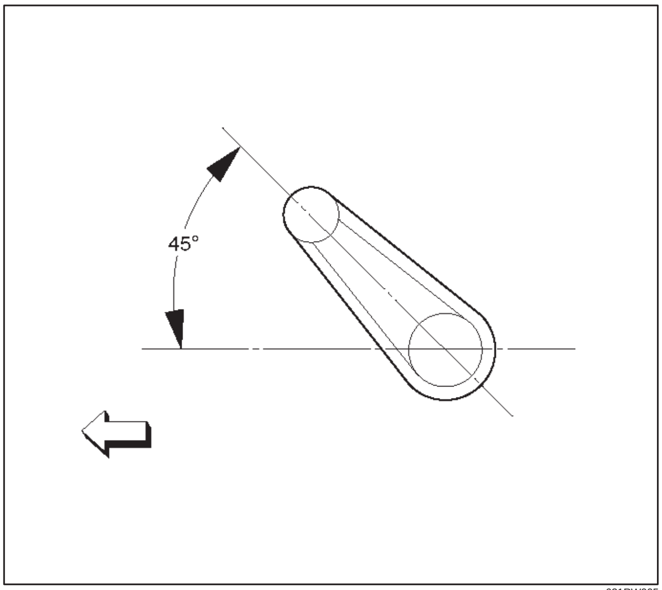
651RW005

14. Remove the glass run.
- Pull the glass run out from the door frame.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Install the regulator handle as shown in the illustration, if equipped without power windows.

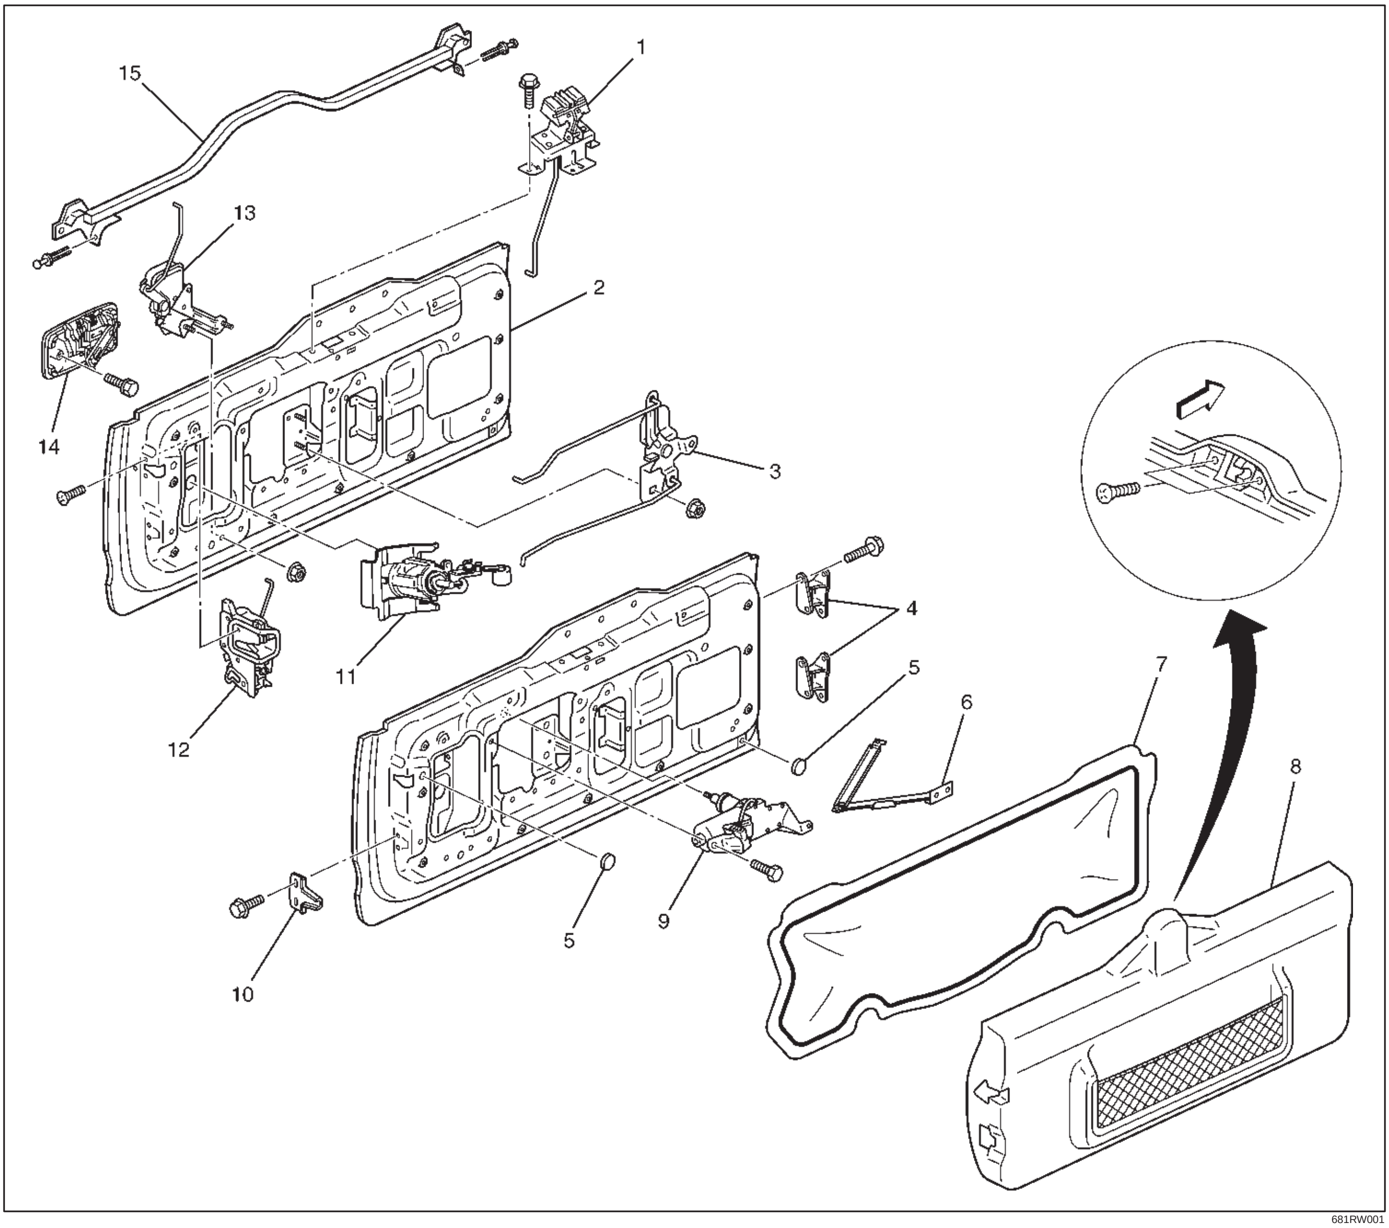


631RW005

2. Check to see that the window regulator operates smoothly and the glass opens and closes properly. Install the waterproof sheet with no clearance between the door panel and the waterproof sheet.

Tailgate (LWB)

Parts Location

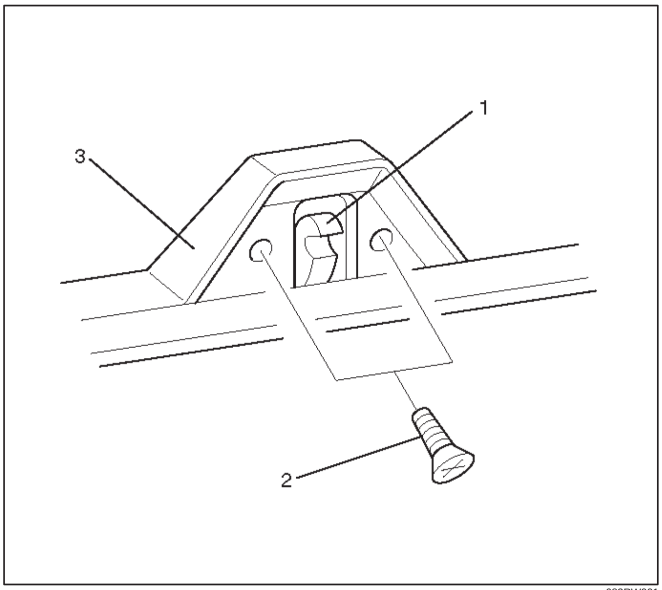


Legend

(1) Hatchgate Lock Assembly
(2) Tailgate Assembly
(3) Tailgate Bell Crank
(4) Hinges
(5) Plug
(6) Tailgate Stopper Link
(7) Waterproof Sheet
(8) Trim Cover Assembly
(9) Rear Wiper Motor
(10) Dove Tail
(11) Key Cylinder
(12) Tailgate Lock Assembly
(13) Hatchgate Lock Actuator Assembly
(14) Outside Handle
(15) Tailgate Waist Seal

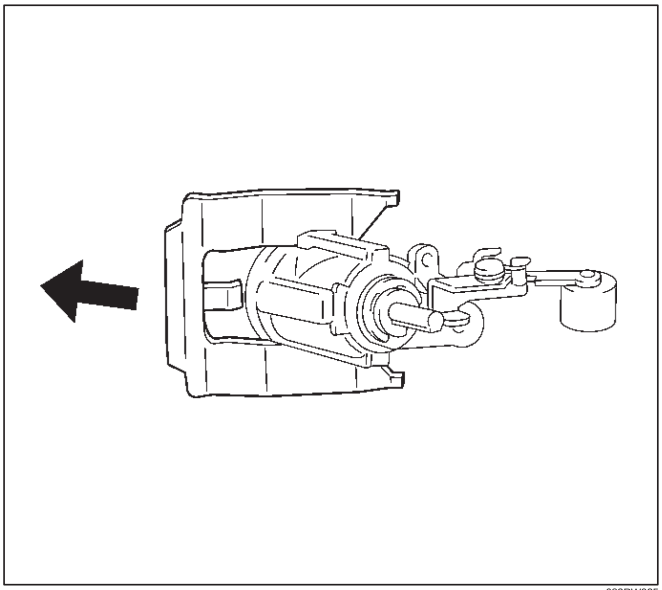
Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim cover assembly (3).
   - Remove the two screws (2) holding the hatchgate lock assembly (1) first and the two screws fixing the trim cover assembly. Pull up the trim cover while detaching the clips from tailgate panel.



683RW001

3. Remove the waterproof sheet.
   - Remove the waterproof sheet, taking special care so as not to break it.
4. Remove the hatchgate lock.
   - Disconnect the lock link and connector and remove the three fixing bolts.
5. Remove the key cylinder.
   - Disconnect the locking links.
   - Remove the key cylinder retaining clip with screwdriver to remove the key cylinder.



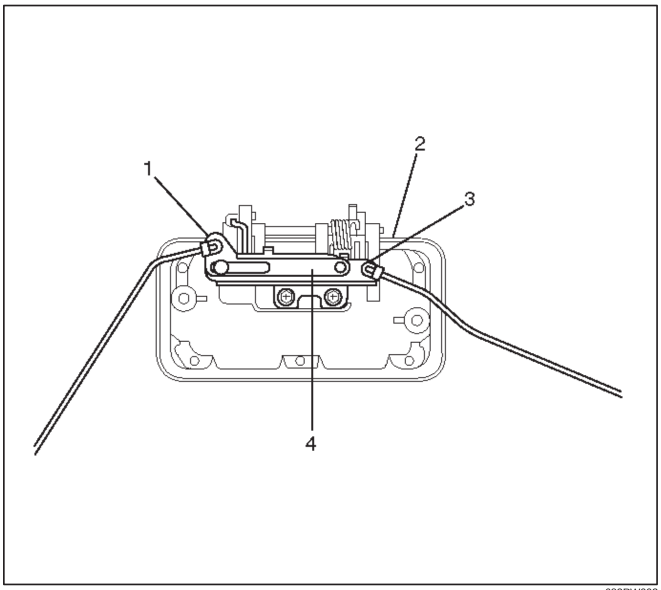
683RW025

6. Remove the hatchgate lock actuator assembly.
   - Disconnect the actuator harness connector.
   - Remove the two nuts holding hatchgate lock actuator assembly from inside.
7. Remove the outside handle.
   - Remove the two bolts holding the outside handle from inside.
8. Remove the tailgate lock assembly.
   - Remove the three screws holding the lock assembly.
9. Remove the dove tail.
10. Remove the tailgate locking links.
11. Remove the rear wiper arm.
    - Refer to Rear Wiper Arm/Blade in Wiper/Washer System section.
12. Remove the rear wiper motor.
13. Remove the tailgate harness cable.
14. Remove the spare tire carrier.
    - Refer to Spare Tire Carrier in this section.
15. Remove the tailgate stopper link.
16. Remove the tailgate assembly.
    - Remove the tailgate assembly, taking care so as not to damage the hinge. Tailgate assembly is heavy and removal operation require two people.
17. Remove the tailgate waist seal.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. When setting up links, pay attention to the position and direction of the links.



683RW003

Legend

(1) Tailgate Lock Link
(2) Outside Handle
(3) Key Cylinder Lock Link
(4) Cancel Mechanism

2. Tighten the tailgate hinge fixing bolts to the specified torque.

   Torque: 34 N·m (25 Ib ft)

3. Tighten the tailgate stopper link fixing bolts to the specified torque.

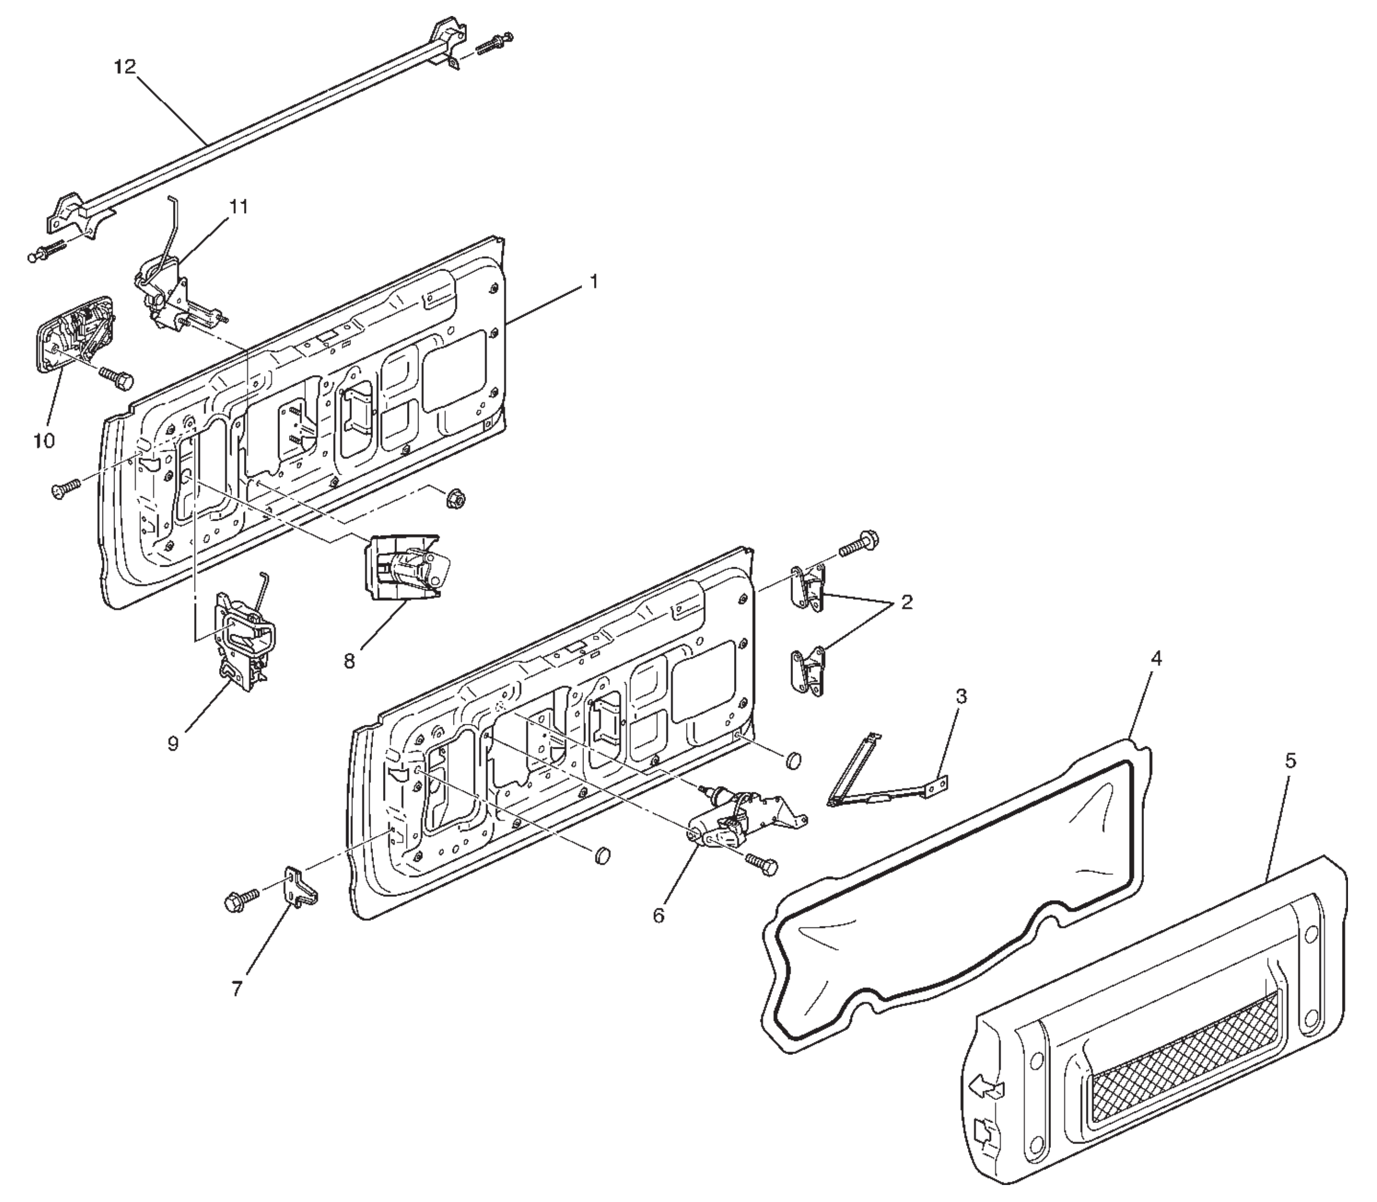
   Torque: 34 N·m (25 Ib ft)

4. Tighten the dove tail fixing bolts to the specified torque.

   Torque: 25 N·m (19 Ib ft)

Tailgate (SWB)

Parts Location



Legend

(1) Tailgate Assembly
(2) Hinges
(3) Tailgate Stopper Link
(4) Waterproof Sheet
(5) Tailgate Trim Cover Assembly
(6) Rear Wiper Motor
(7) Dove Tail
(8) Key Cylinder
(9) Tailgate Lock Assembly
(10) Outside Handle
(11) Hatchgate Lock Actuator Assembly
(12) Tailgate Waist Seal

Removal

1. Disconnect the battery ground cable.
2. Remove the spare tire carrier.
   - Refer to Spare Tire Carrier in this section.
3. Remove the rear wiper arm.
   - Refer to Rear Wiper Arm/Blade in Wiper/Washer System section.
4. Remove the tailgate glass stay and tailgate glass.
   - Refer to Tailgate Glass (SWB) in this section.

5. Remove the tailgate trim cover assembly.
   - Remove the two screws fixing the trim cover assembly and pull up the trim cover after detaching the clips from tailgate panel.
6. Remove the waterproof sheet.
   - Remove the waterproof sheet, taking special care so as not to break it.
7. Remove the rear wiper motor.
   - Disconnect the motor connector and remove the two fixing bolts.
8. Remove the key cylinder.
   - Disconnect the locking links.
   - Remove the key cylinder retaining clip with screwdriver to remove the key cylinder.
9. Remove the hatchgate lock actuator assembly.
   - Disconnect the actuator harness connector.
   - Remove the two nuts holding hatchgate lock actuator assembly from inside.
10. Remove the outside handle.
    - Remove the two bolts holding the outside handle from inside.
    - Disconnect the locking link.
11. Remove the tailgate lock assembly.
    - Remove the three screws holding the lock assembly.
12. Remove the dove tail.
13. Remove the tailgate harness cable.
14. Remove the tailgate stopper link.
15. Remove the tailgate assembly.
    - Remove the tailgate assembly, taking care so as not to damage the hinge. Tailgate assembly is heavy and removal operation requires two people.
16. Remove the tailgate waist seal.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Tighten the tailgate hinge fixing bolts to the specified torque.

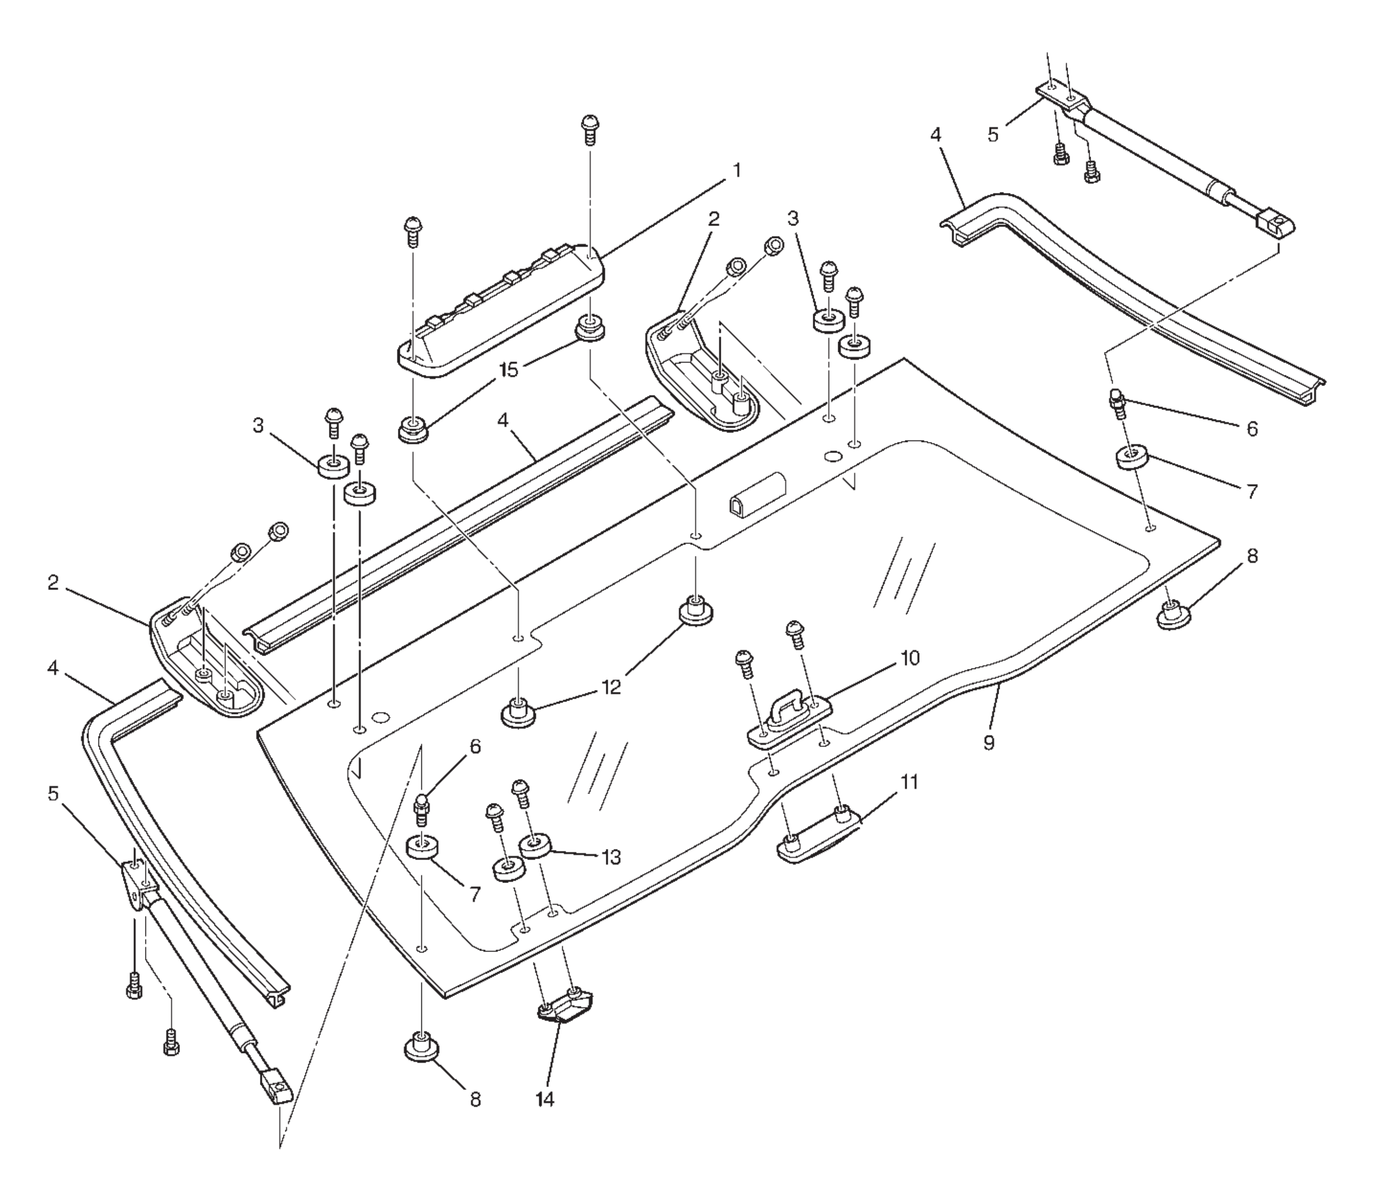
   Torque: 34 N·m (25 lb ft)
2. Tighten the tailgate stopper link fixing bolts to the specified torque.

   Torque: 34 N·m (25 lb ft)
3. Tighten the dove tail fixing bolts to the specified torque.

   Torque: 25 N·m (19 lb ft)

Rear Hatchgate (LWB)

Parts Location

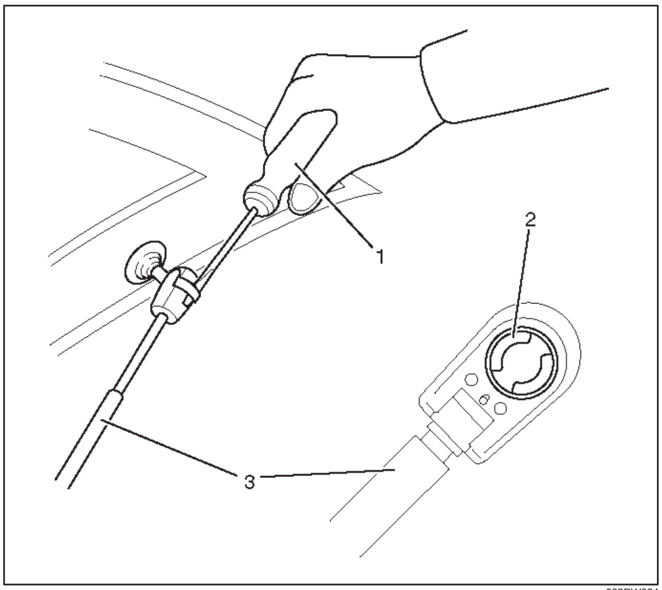


Legend

(1) High Mount Stoplight
(2) Hatchgate Hinge
(3) Hinge Collar
(4) Hatchgate Glass Seal
(5) Hatchgate Gas Stay
(6) Hatchgate Ball Stud
(7) Ball Stud Spacer
(8) Ball Stud Fastener
(9) Hatchgate Glass
(10) Hatchgate Striker
(11) Striker Fastener
(12) High Mount Stoplight Fastener
(13) Outside Handle Collar
(14) Outside Handle
(15) High Mount Stoplight Spacer

Removal

1. Disconnect the battery ground cable.
2. Disconnect the high mount stoplight and rear defogger harness connectors.
3. Remove the hatchgate ball stud (LH and RH).
   - Remove gas stay fixing screw and pull up the gas stay assembly (3) from the ball stud by spreading the retainer (2) holding the ball stud at the end of the gas stay with screwdriver (1), etc.



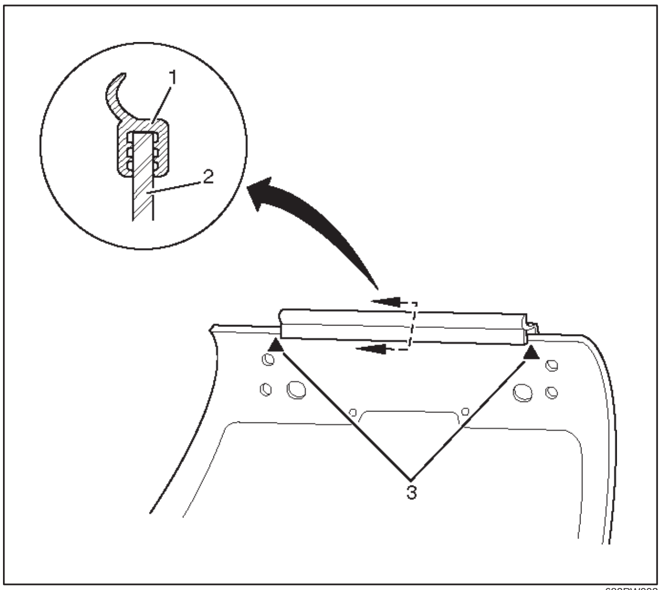
683RW004

4. Remove the hatchgate hinge nuts from body side.
5. Remove the hatchgate glass.
   - When pulling down the hatchgate glass, exercise special care so as not to damage it.
     Hatchgate glass assembly is heavy and removal operation requires the two people.
6. Remove the two screws to remove hatchgate striker and fastener.
7. Remove the outside handle.
8. Remove the hinges.
9. Remove the high mount stoplight.
10. Remove the hatchgate finisher.

Installation

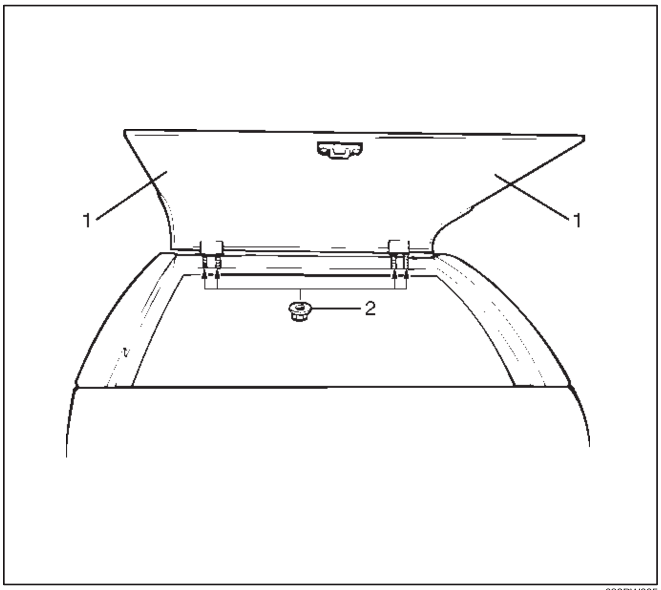
To install, follow the removal steps in the reverse order, noting the following points.

1. Attach the upper seal (1) to the hatchgate glass (2) indicated portion (3) so that the end of the glass contacts the bottom of the upper seal.



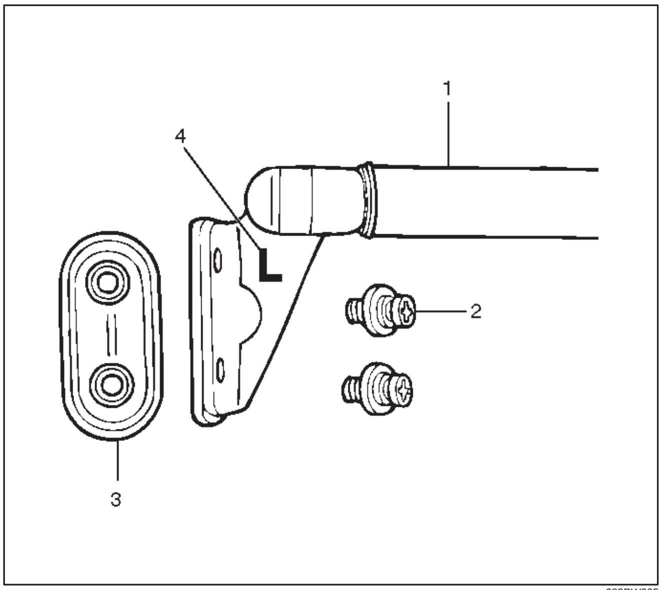
682RW003

2. When installing the hatchgate glass, first attach the hinge to the hatchgate glass. Align the stud of the hinge to the hole at body while supporting the hatchgate glass with two people at indicated positions (1), and then partially tighten the hinge to body nut (2).
   After adjustment (refer to Adjustment in this section) is completed, fully tighten the nut, hinge to body nut.
   - Hatchgate hinge assembly for left and right sides from each other.



682RW005

3. When installing gas stay assembly (1), first install the gas stay onto the rear quarter panel with fixing screw (2) and fastener (3) and then attach the gas stay upper end to the ball stud by spreading the retainer with screwdriver, etc. Gas stay assemblies for left and right sides differ from each other (The letter (4) L(LH) or R(RH) is embossed on the gas stay assembly.)



683RW005

4. When installing hatchgate striker assembly, first partially tighten the fixing screw and close the hatchgate and tailgate. Then fully tighten the fixing screw with the condition that the striker fits the hatchgate lock assembly at the tailgate.

   Make sure that clearance exists between hatchgate striker and lock assembly.

   After installation, again make sure that the striker fits the lock assembly properly.
5. Tighten the nuts; hinge to body (LH and RH)

   Torque : 6 N·m (52 lb in)
6. Tighten the screws; glass and hinge fix (LH and RH)

   Torque : 6 N·m (52 lb in)

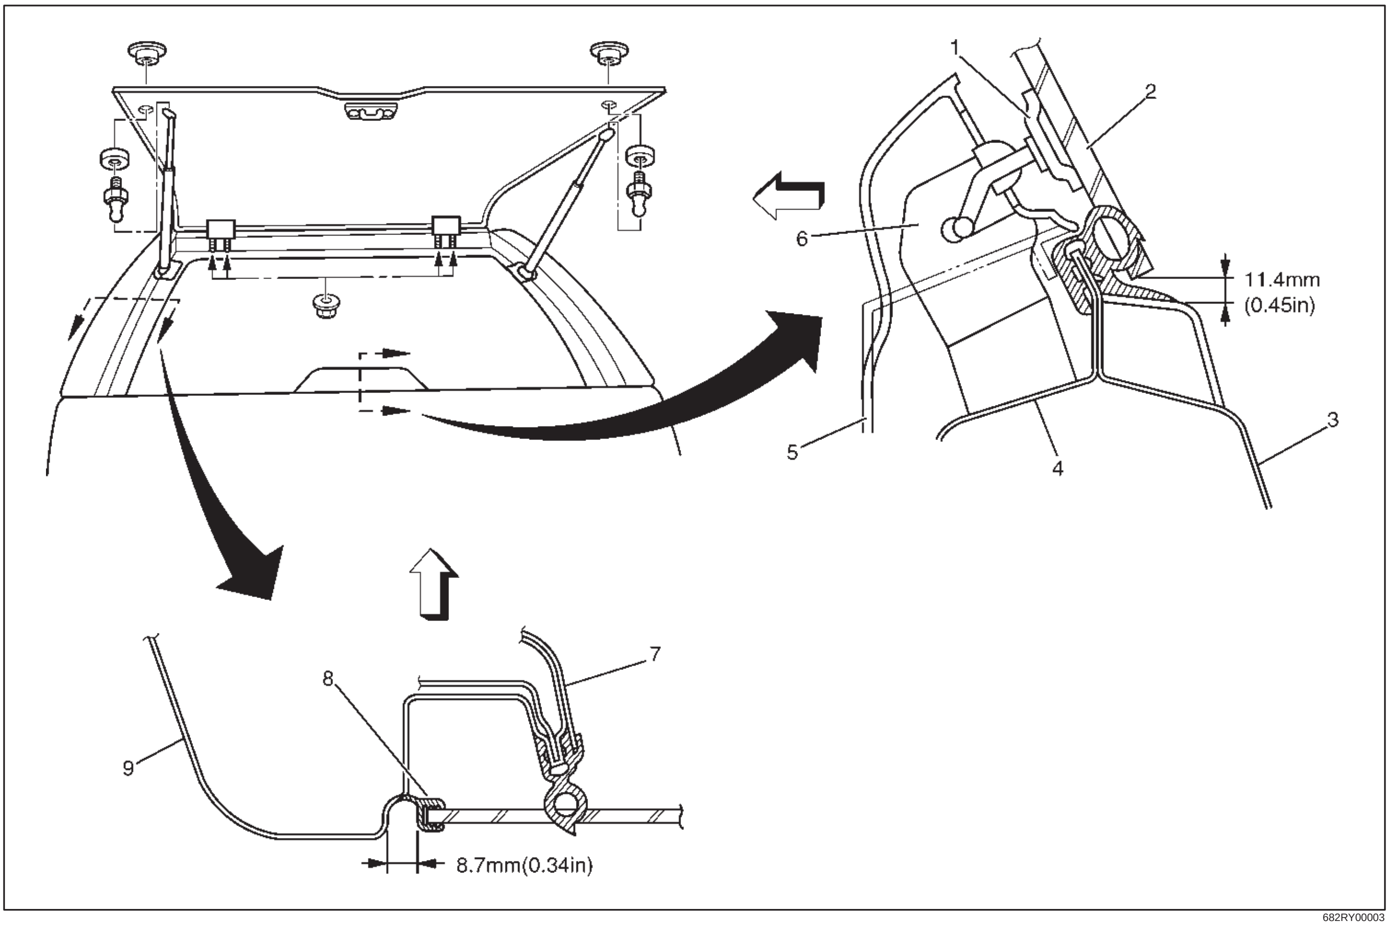
NOTE: When installing the hinge to the body, exercise special care not to damage the body paint surface.

7. Tighten the hatchgate striker fixing screws.

   Torque : 6 N·m (52 lb in)

Adjustment

- Hatchgate alignment is obtained by moving hatchgate hinges.



Legend

(1) Hatchgate Striker
(2) Hatchgate Glass
(3) Tailgate Outer Panel
(4) Tailgate Inner Panel
(5) Trim Cover
(6) Hatchgate Lock Assembly
(7) Quarter Trim
(8) Hatchgate Glass Seal
(9) Quarter Outer Panel

Tailgate Glass (Resin Top)

- (6) Bolt
- (7) Cap
- (8) Screw
- (9) Collar
- (10) Gasket
- (11) Clip
- (12) Grommet
- (13) Nut

Removal

1. Disconnect the battery ground cable.
2. Remove the spare tire.
3. Remove the rear wiper.
   - Refer to Rear Wiper Arm/Blade in Wiper/Washer System section.
4. Disconnect the rear defogger connectors (LH & RH).

5. Remove the tailgate glass stays.
   - Remove the two seats of two tailgate trim cover fixing bolts.
6. Remove the tailgate glass assembly.
   - Remove the two caps each on the left and right sides, then remove the screws.
   - Remove the two clips from the two ends of the tailgate moulding, then lift the glass assembly up and out.
   - Removing and installing the glass assembly require two persons.
7. Remove the tailgate seal.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

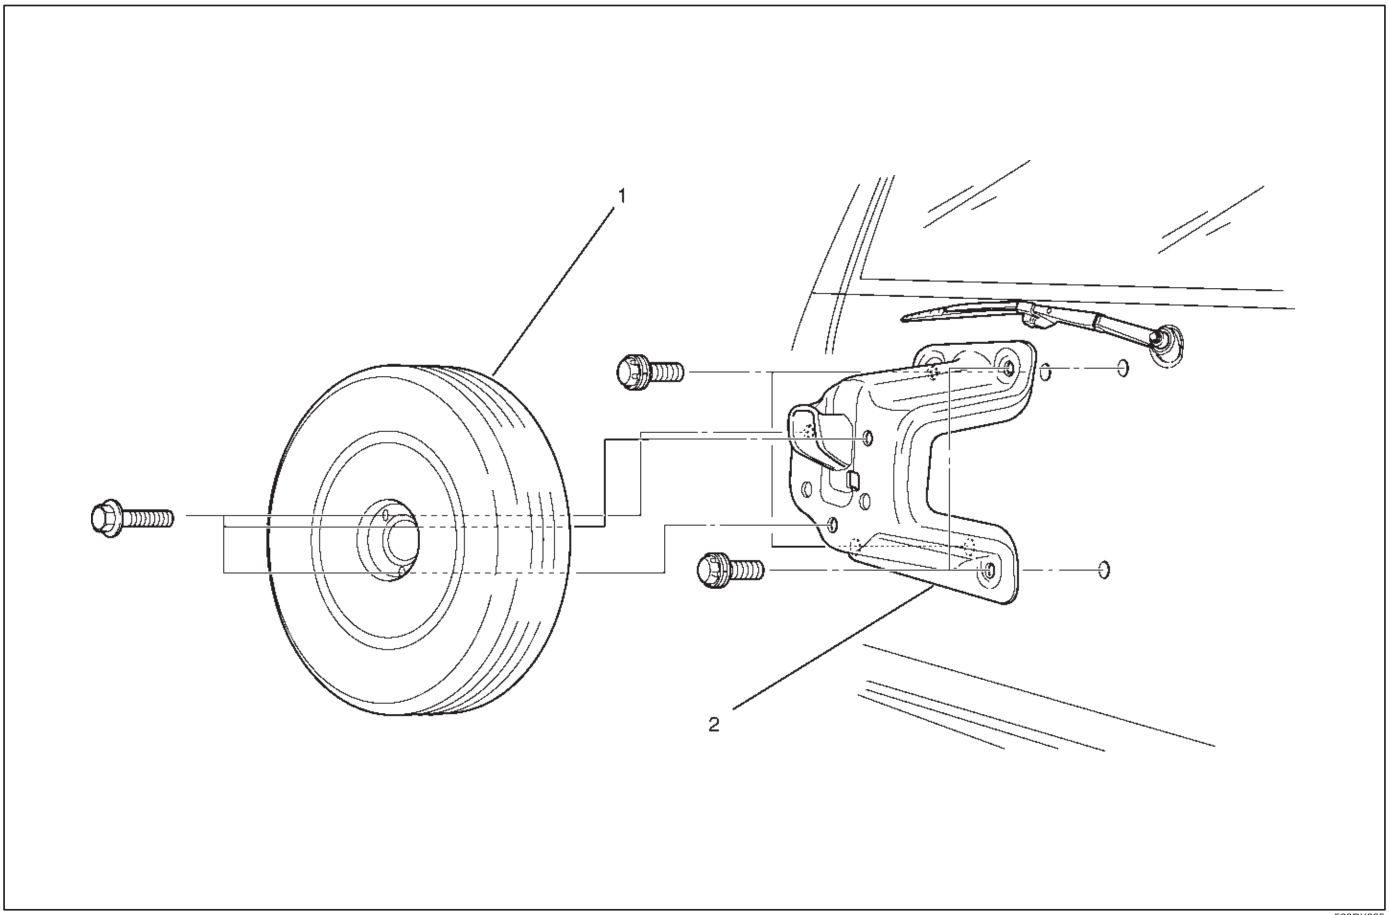
1. Tighten the tailgate glass stay fixing bolts to the specified torque.

   Torque : 19 N·m (14 lb ft)

2. Make sure the lip is properly oriented when installing the tailgate seal.

Spare Tire Carrier

Parts Location



530RX005

Legend

(1) Spare Tire
(2) Spare Tire Carrier

Removal

1. Remove the spare tire.
2. Remove the spare tire carrier by using spare tire carrier nut wrench J–34355.

Installation

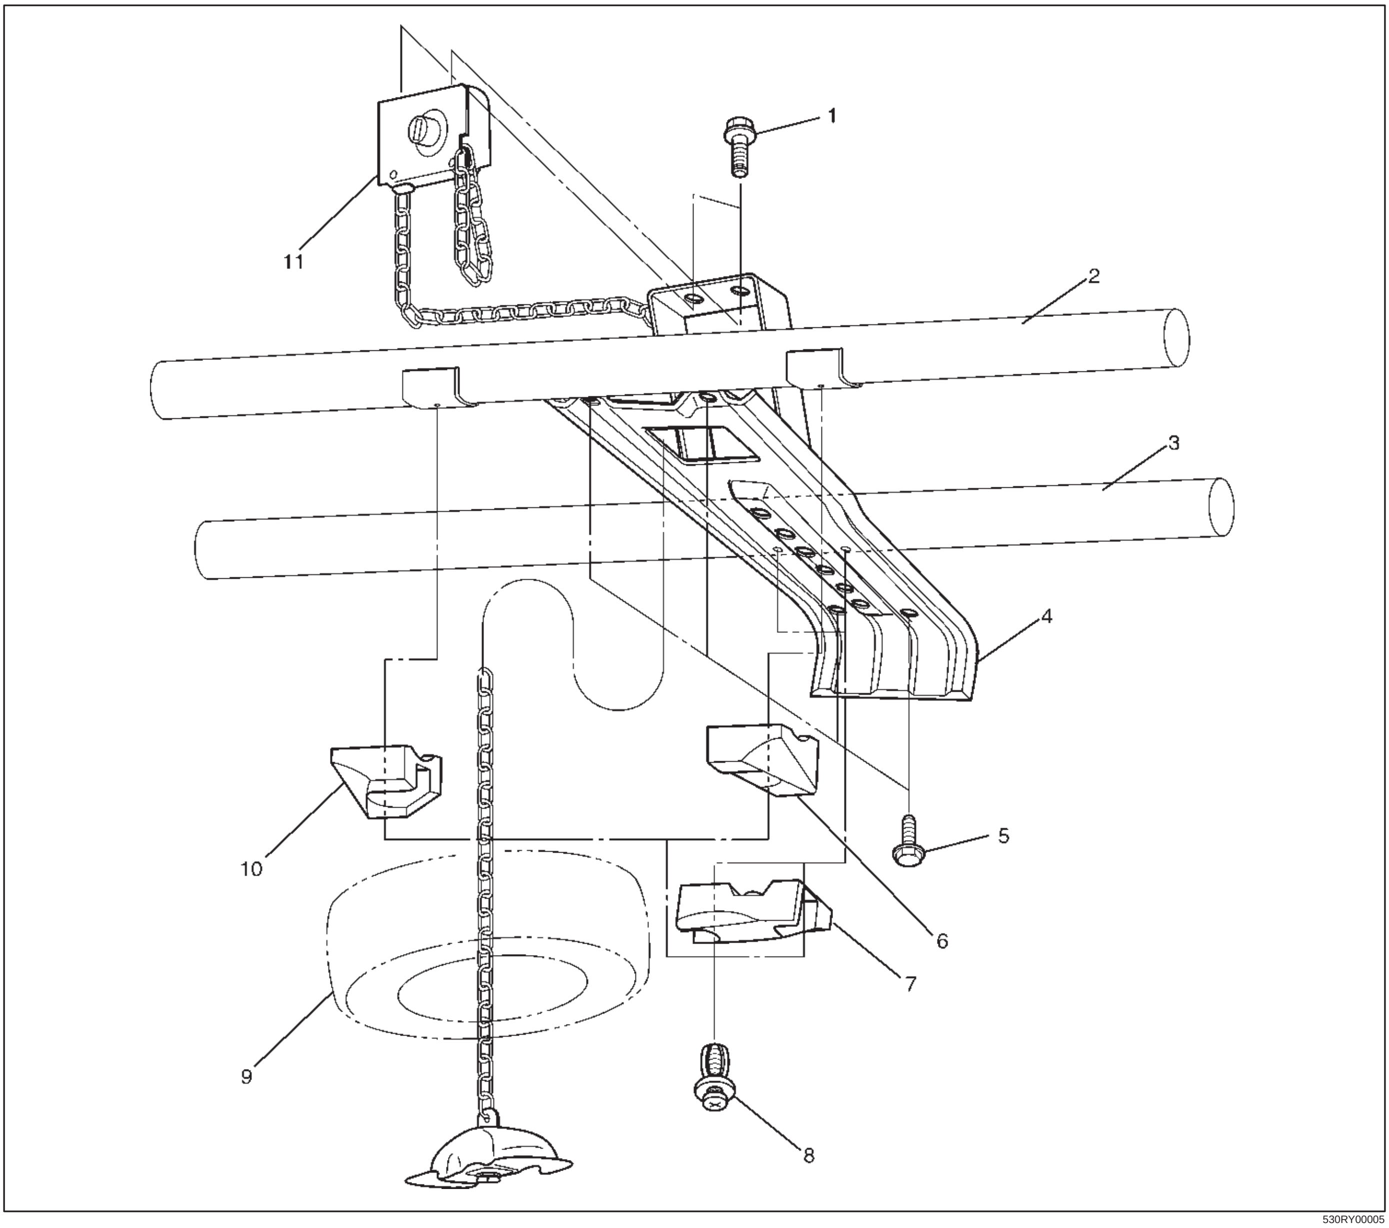
1. Spare tire carrier.
   - Tighten the carrier fixing bolts to the specified torque.

   Torque : 31 N·m (23 lb ft)
2. Spare tire
   - Tighten the spare tire fixing bolts to the specified torque.

   Torque : 118 N·m (87 lb ft)

Spare Tire Hanger

Parts Location



Legend

(1) Spare Tire Hanger Assembly Fixing Bolt
(2) End Cross Member
(3) Rear Suspension · Cross Member

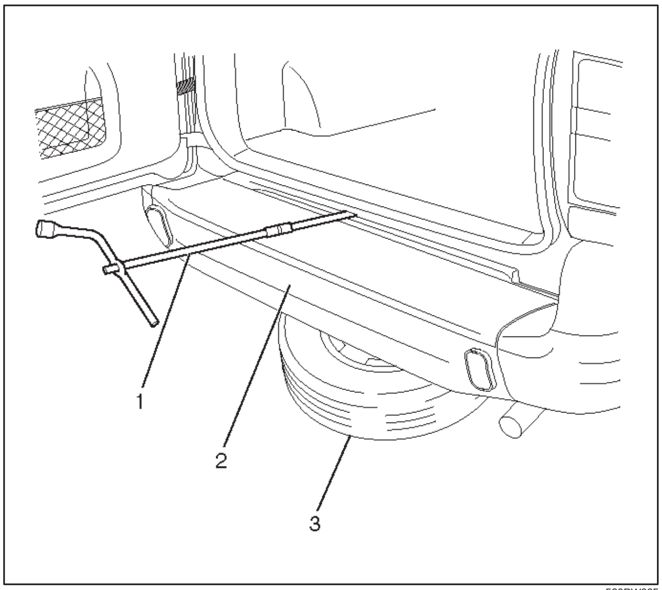
(7) Spare Tire Stopper Rubber (Front)
(8) Stopper Rubber Fixing Clip
(9) Spare Tire
(10) Spare Tire Stopper Rubber (LH)
(11) Spare Tire Hanger Assembly

Removal

1. Open the hatch gate and tail gate.
2. Remove the spare tire (3).
   - Put the spare tire handle (1) to the center of upper side of rear bumper (2) and turn counterclockwise. Put spare tire down.



530RW005

3. Remove the spare tire support.
   - Remove the four bolts that are fixed to frame cross member.
4. Remove the spare tire hanger assembly.
   - Remove the two fixing bolts.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Install the spare tire firmly.
2. Tighten the spare tire support fixing bolts to the specified torque.

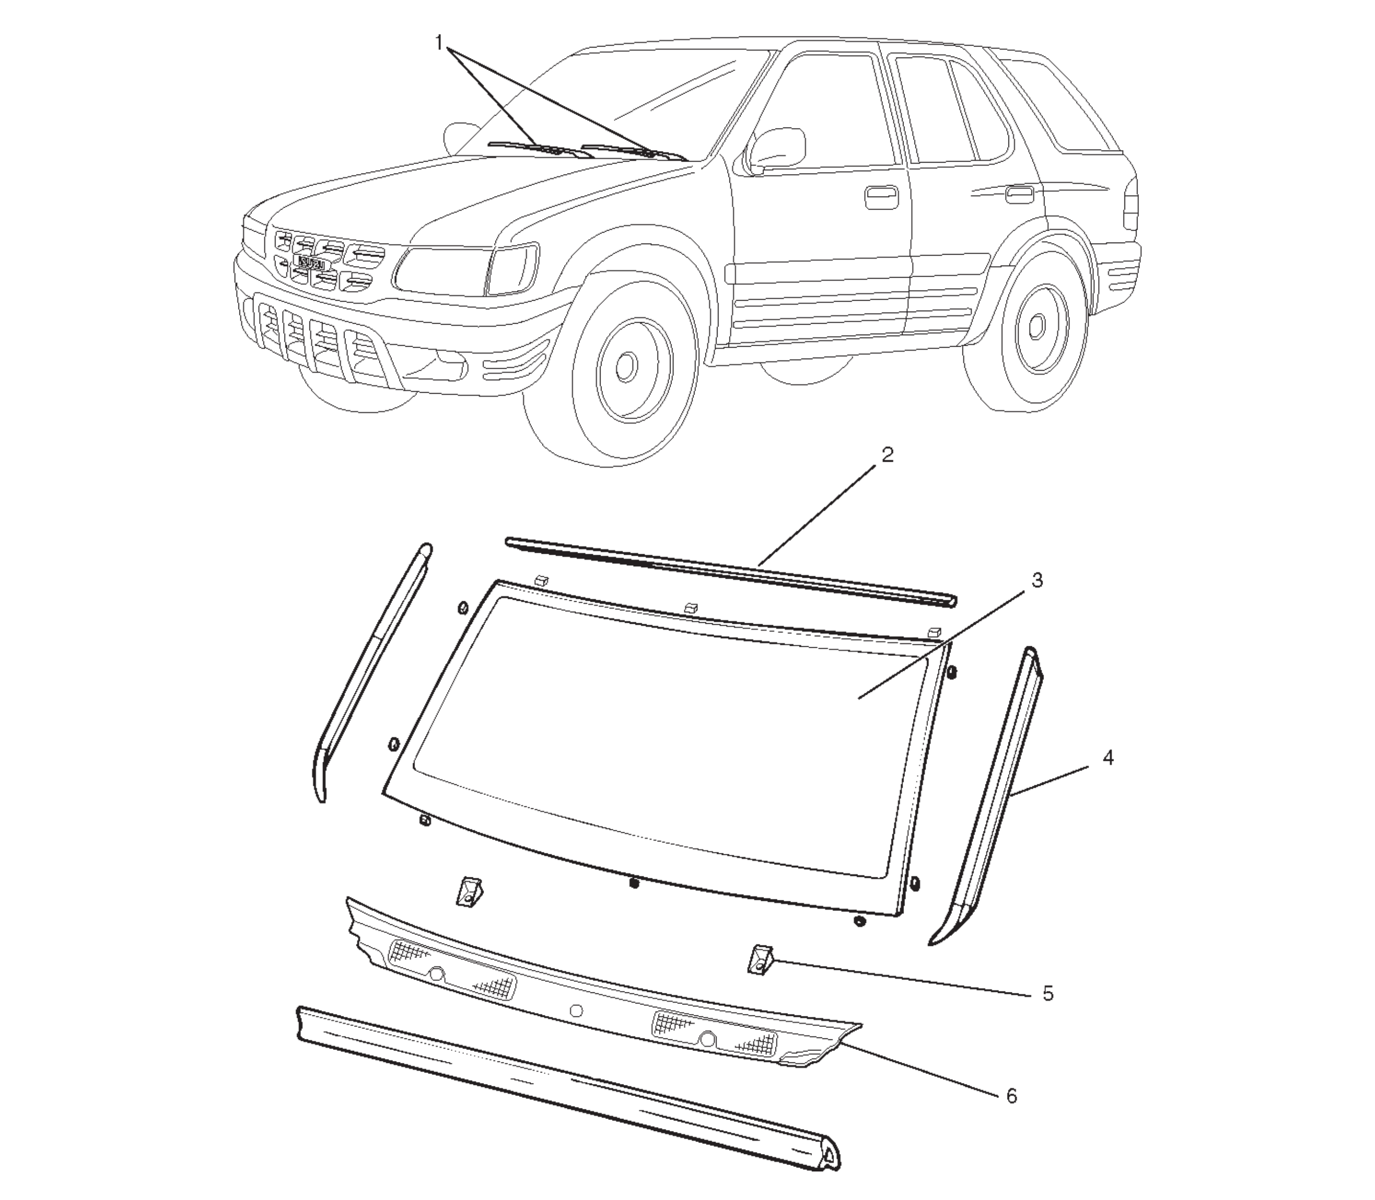
   Torque : 40 N·m (4.1 kg·m)

3. Tighten the spare tire hanger fixing bolts to the specified torque.

   Torque : 19 N·m (1.9 kg·m)

Windshield

Parts Location



607RY00001

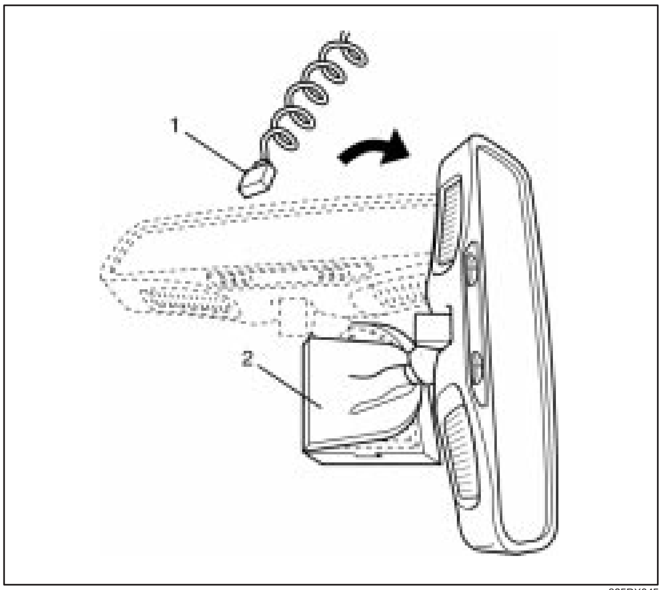
Legend

(1) Windshield Wiper Arm
(2) Windshield Upper Molding
(3) Windshield
(4) Windshield Side Molding
(5) Windshield Support
(6) Front Cowl Cover

Removal

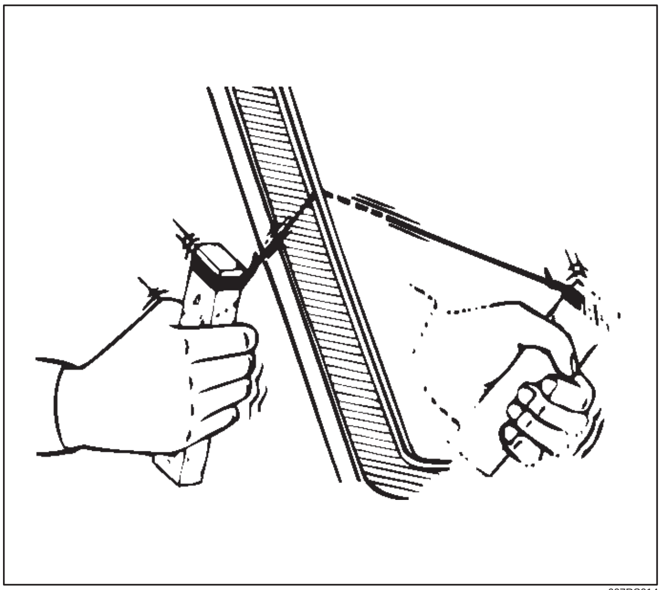
1. Disconnect the battery ground cable.
2. Remove the front pillar trim cover.
   - Turn up the finisher and pry the trim cover clips free from the body panel.
3. Remove the sunvisors and sunvisor holders.
   - Refer to Headlining in Exterior/Interior Trim section.
4. Remove the rear view mirror.
   - Disconnect the connector (1).

- Turn the channel mount (2) 90 degrees clockwise and pull down.



825RX045

5. Remove the windshield wiper arm.
   - Refer to Windshield Wiper Arm/Blade in Wiper/Washer System section.
6. Remove the windshield side molding.
   - Pull the molding out from drip rail.
7. Remove the front cowl cover.
8. Remove the windshield support.
9. Remove the upper moulding.
10. Remove the windshield.
    - Use a knife to cut through part of the adhesive caulking material.
    - Secure one end of a piece of steel piano wire (0.02 inches in diameter) to a piece of wood that can serve as a handle.
    - Use a pair of needle nose pliers to insert the other end of the piano wire through the adhesive caulking material at the edge of the windshield glass.
    - Secure the other end of the piano wire to another piece of wood.
    - With the aid of an assistant, carefully move the piano wire with a sawing motion to cut through the adhesive caulking material around the entire circumference of the windshield glass.
    - Attach some cloth tape (1) on the body for protecting the painting surface.



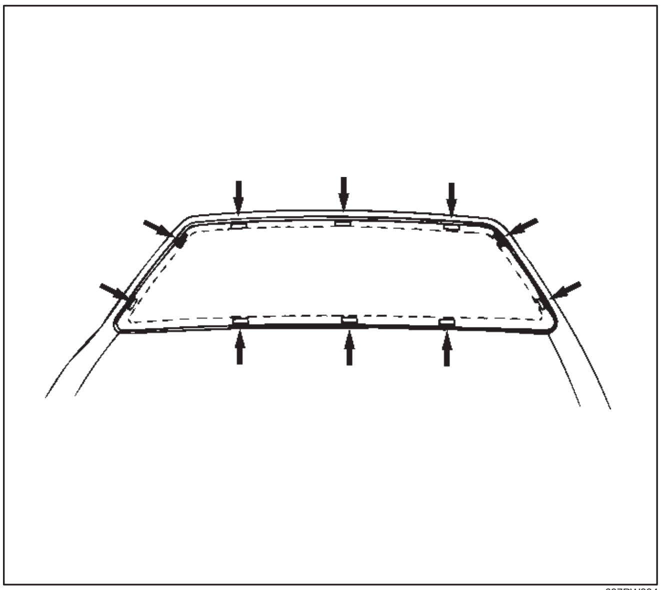
607RS014

- Clean the remaining adhesive caulking material from the area of the body which holds the windshield.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Clean the bonding surfaces of both the windshield and body panel with a soft rag and white gasoline.
2. Install the spacer.
   - Attach spacers in ten locations as shown in the figure.
   - Always use new spacer.



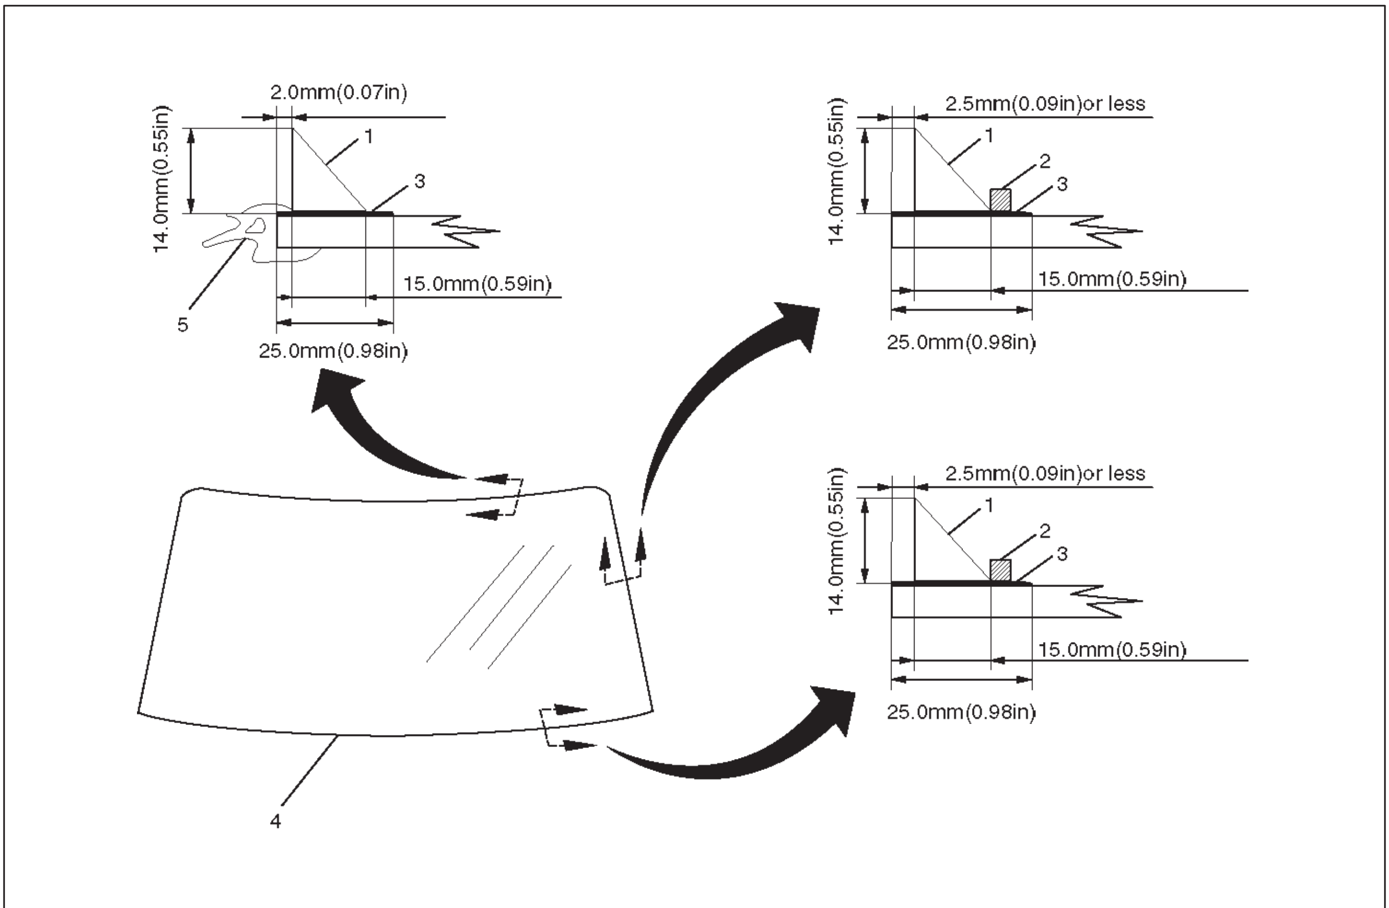
607RW004

3. Install the windshield upper molding.
   - Peel off the tear-away paper from the windshield upper molding, and start applying it with one end of the glass and cut away the surplus at the other end of the glass for length adjustment.
   - Always use new upper molding.
4. Temporary install the windshield support.
5. Apply the primer to the windshield and body panel.
   - Apply the primer (3) (Sun star # 435-40 or equivalent) to the windshield side bonding surface as shown in the figure.
   - Apply the primer (Sun star # 435-95 or equivalent) to the body side bonding surface.

NOTE: Apply an adhesive 3 minutes or more but within 24 hours after the application of primer. If more than 24 hours have passed, reapply primer.

Primer should be handled as following:

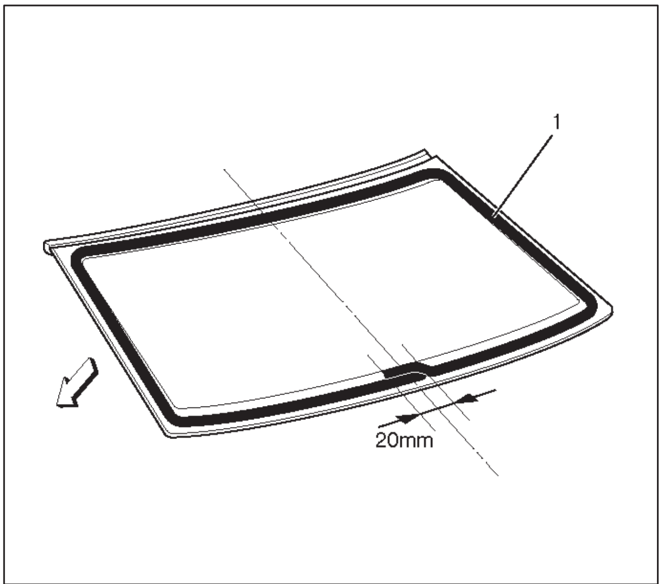
1. Use the primer manufactured 3 months or less ago and having been kept in an refrigerator.
2. Wipe off primer-stains on positions other than requires application.
3. Stir the primer for a minute or more before use.



Legend

(1) Adhesive
(2) Sealing Dam
(3) Primer Coating Area
(4) Windshield
(5) Upper Molding

6. Apply the adhesive (1) to the windshield.
   - After drying primer completely, apply a sealing adhesive (Sun star # 555 or equivalent) along the edge of the glass so that the sealing adhesive has a 20 mm (0.79 in) junction at middle of the base of the glass.



607RW015

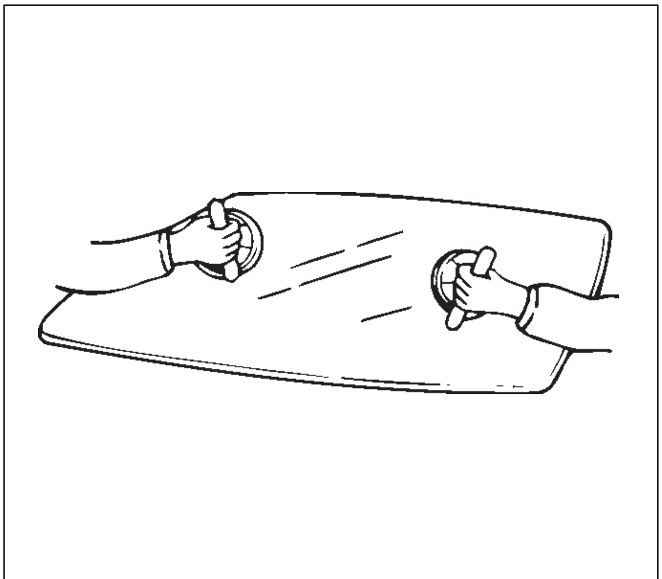
NOTE: Apply an adhesive 3 minutes or more but within 24 hours after the application of primer. If more than 24 hours have passed, reapply primer.

Adhesive should be handled as follows:

1. Use the adhesive manufactured 3 months or less ago.
2. Wipe off adhesive-stains on positions other than requires application.

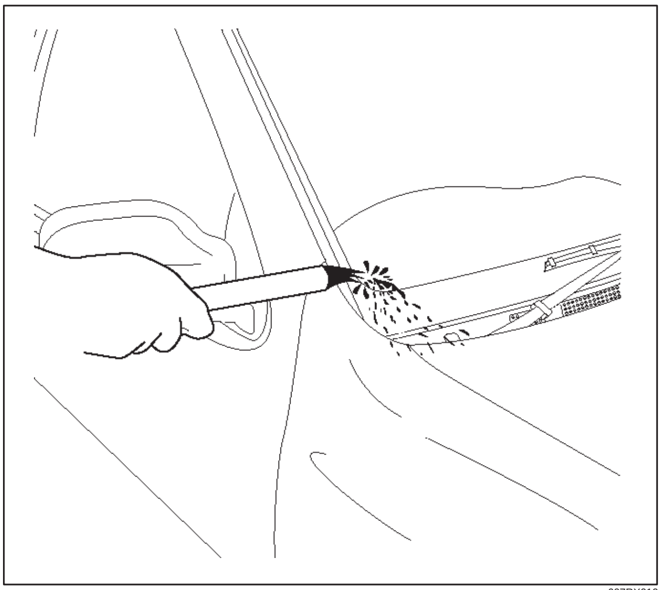
7. Install the windshield.
   - Set the windshield with sealing adhesive applied to entire circumference in the body panel. Specifically, adjust windshield support with the upper molding making contact with the body panel, press the glass, and tighten the windshield support.

NOTE: Affix the glass within 5 minutes of application.



607RS017

8. Install the front cowl cover.
9. Install side molding.
   - Use white gasoline and a soft cloth to wipe away any excess adhesive.
   - Cure the bonding at a temperature of 20˚C – 30˚C (68˚F – 86˚F) for 24 hours.
   - Check that the windshield does not leak water.

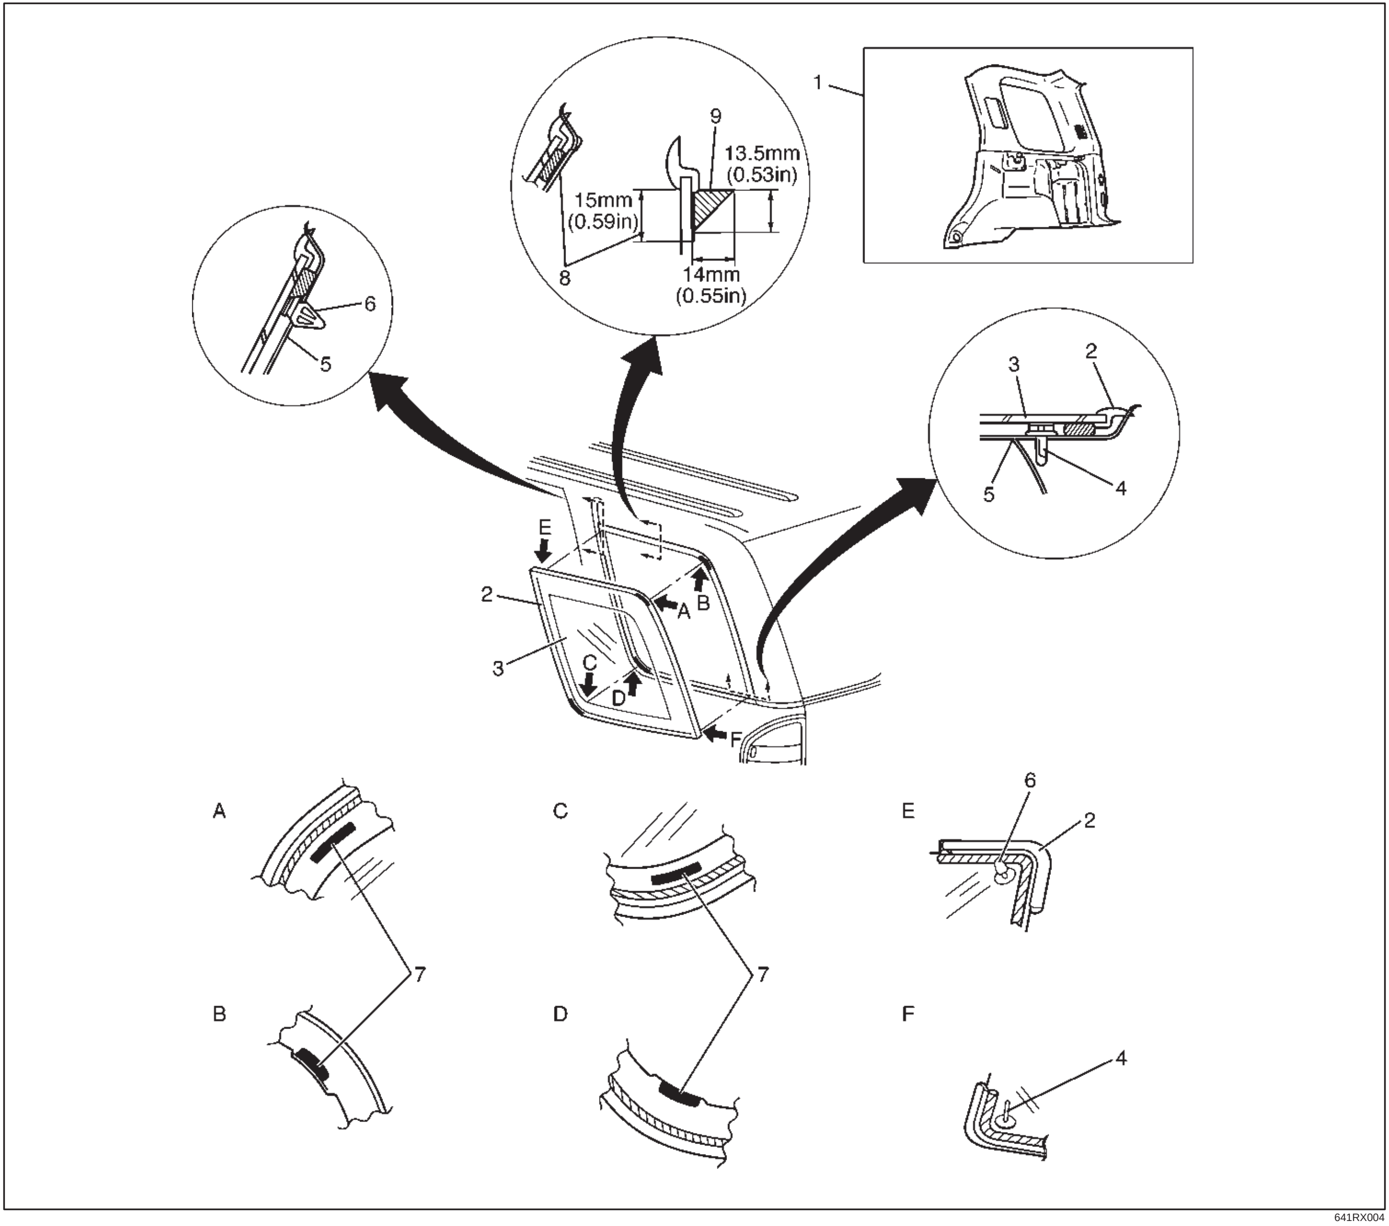


607RX010

10. Install windshield wiper arm.

Rear Quarter Glass (LWB)

Parts Location



Legend

(1) Quarter Trim Panel
(2) Rear Quarter Glass Molding
(3) Rear Quarter Glass
(4) Clip
(5) Body Panel
(6) Clip
(7) Fastener Tape
(8) Primer Coating Area (Glass side & Body side)
(9) Sealant

Removal

1. Disconnect the battery ground cable.
2. Remove the rear quarter trim panel.
   - Refer to Interior Trim Panels (LWB) in Exterior/Interior Trim section.
3. Remove the rear quarter glass.
   - Refer to Windshield in this section.

Installation

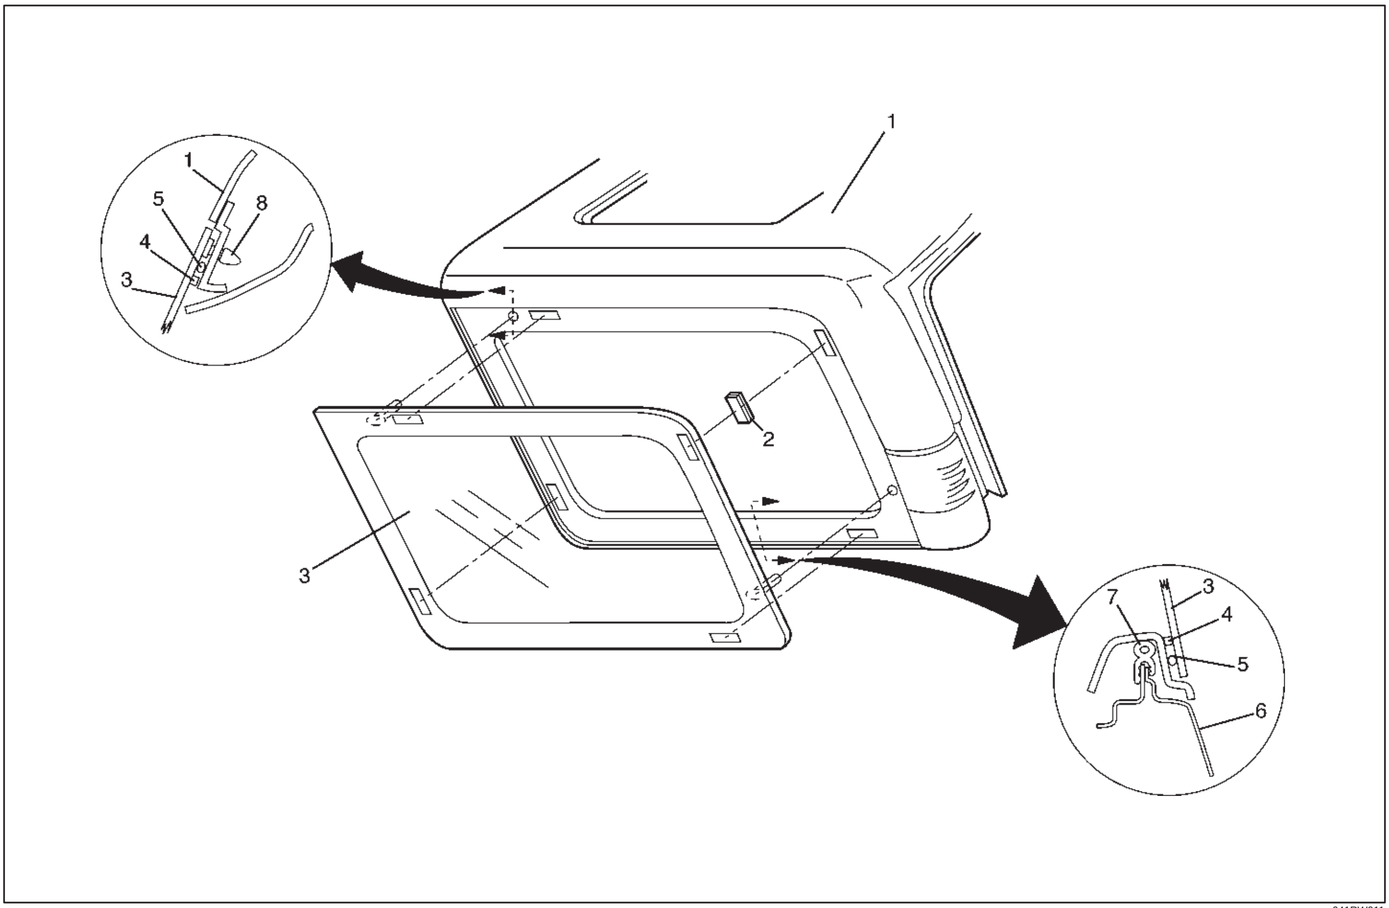
1. Rear quarter glass.
   - Clean the bonding surfaces of both the glass and the body panel.
   - Be absolutely sure to apply glass primer to the side glass.
   - Be absolutely sure to apply body primer fully to the body.

NOTE: Immediately wipe off the primer left on the body or extruded sealant.

   - Attach the fastener to the indicated position of body with sealant as shown in the figure.
   - Apply the sealant to the circumference of glass as shown in the figure.
   - Insert the location pins on glass into the panel, push the glass against the panel, and bond them.
   - Attach the molding to the body with sealant.
   - Cure the bonding at a temperature of 20°C – 30°C (68°F – 86°F) for 24 hours.
   - Check that the rear quarter glass does not leak water.
2. Install the rear quarter trim panel.

Rear Quarter Glass (Resin Top)

Parts Location



641RW011

Legend

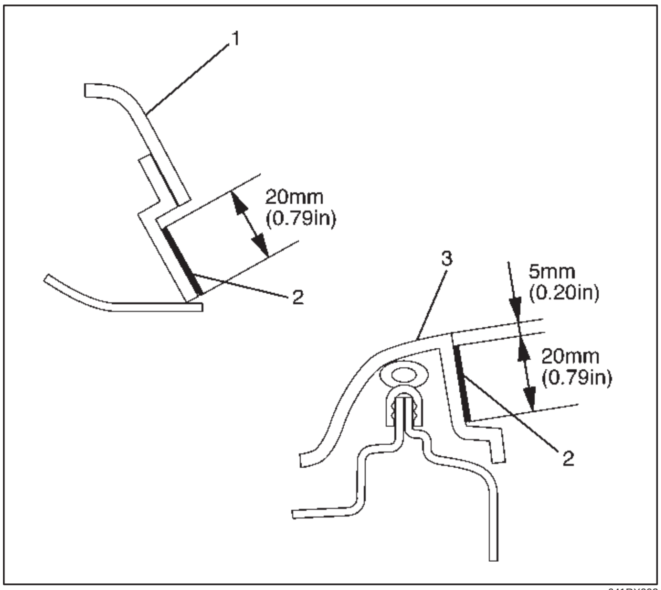
(1) Resin Top
(2) Fastener Tape
(3) Rear Quarter Glass Assembly
(4) Dam Seal
(5) Adhesive
(6) Body Panel
(7) Weather Strip
(8) Clip

Removal

1. Disconnect the battery ground cable.
2. Remove the rear quarter glass assembly.
   - Refer to Windshield in this section.

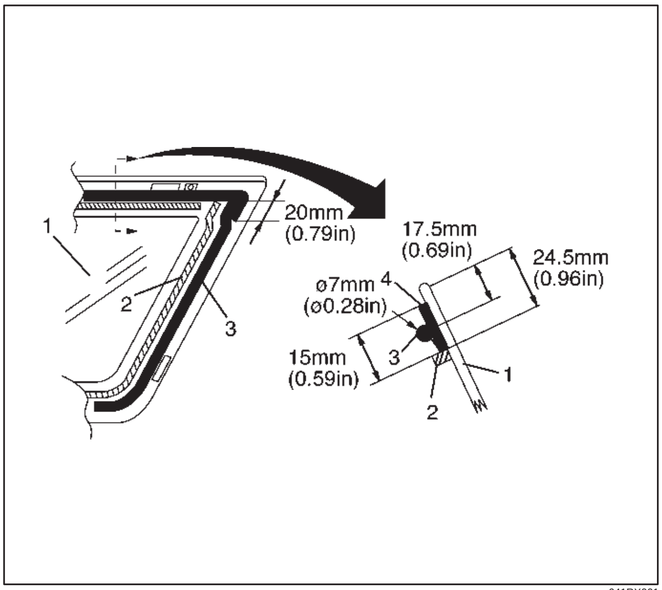
Installation

1. Use alcohol or the like to wipe clean the areas of the resin top and glass assembly that are to be affixed to each other.
2. Apply the primer (2) to the area of the resin top to which the glass is to be affixed.
   - Top edge (1) and bottom edge (3) primer coat areas.



641RX002

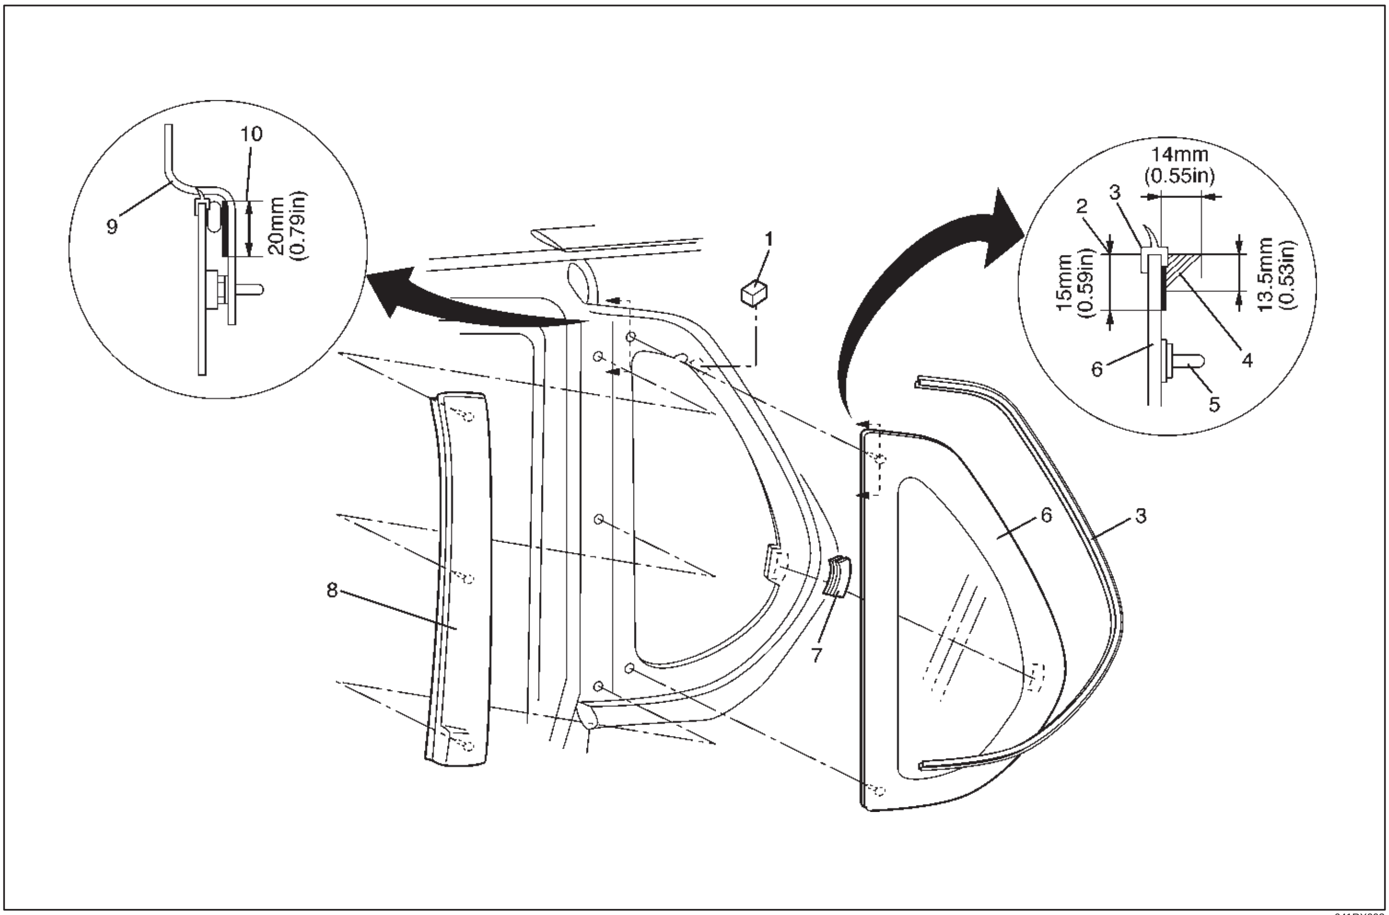
3. Stick the fasteners tape to the body in the specified locations.
4. Install the rear quarter glass assembly (1).
   - Apply the primer (4) to the rear quarter glass as shown in the figure.
   - Stick the dam seal (2) in place and then apply adhesive (3), as shown in the figure.
   - Allow a 20mm (0.79 in) overlap at the ends of the adhesive.
   - Insert the glass clips into the hole in the panel and then push the glass against the panel to affix it in place.



641RX001

Side Window Glass (SWB)

Parts Location



Legend

(1) Spacer
(2) Primer Coating Area on Glass Side
(3) Side Window Molding
(4) Adhesive
(5) Clip
(6) Side Window Glass
(7) Fastener Tape
(8) Side Window Garnish Assembly
(9) Body Panel
(10) Primer Coating Area on Body Side

Removal

1. Remove the quarter trim cover.
   - Refer to Interior Trim Panels (SWB) in Exterior/Interior Trim section.
2. Remove the side window garnish assembly.
   - Pull out the three clips to disengage them.
3. Remove the side window molding.
4. Remove the side window glass.
   - Refer to Windshield in this section.

Installation

1. Install the side window glass.
   - Clean the areas of the glass and body panel that are to be affixed to each other.
   - Apply the primer to the specified areas of the glass and body panel.
   - Stick the spacer and fastener tape in place in the specified locations.
   - Apply the adhesive to the entire circumference of the glass, as shown in the figure.
   - Insert the glass clips into the panel and then push the glass against the panel to affix it in place.
   - Wipe away any adhesive that oozes out around the edges.
2. Install the side window garnish assembly.
   - Install it securely so that it does not come loose in places.

3. Install the side window molding.
   - Insert it securely so that it does not come loose in places.
   - Make sure that there is no water leakage from the side window glass.
4. Install the quarter trim cover.

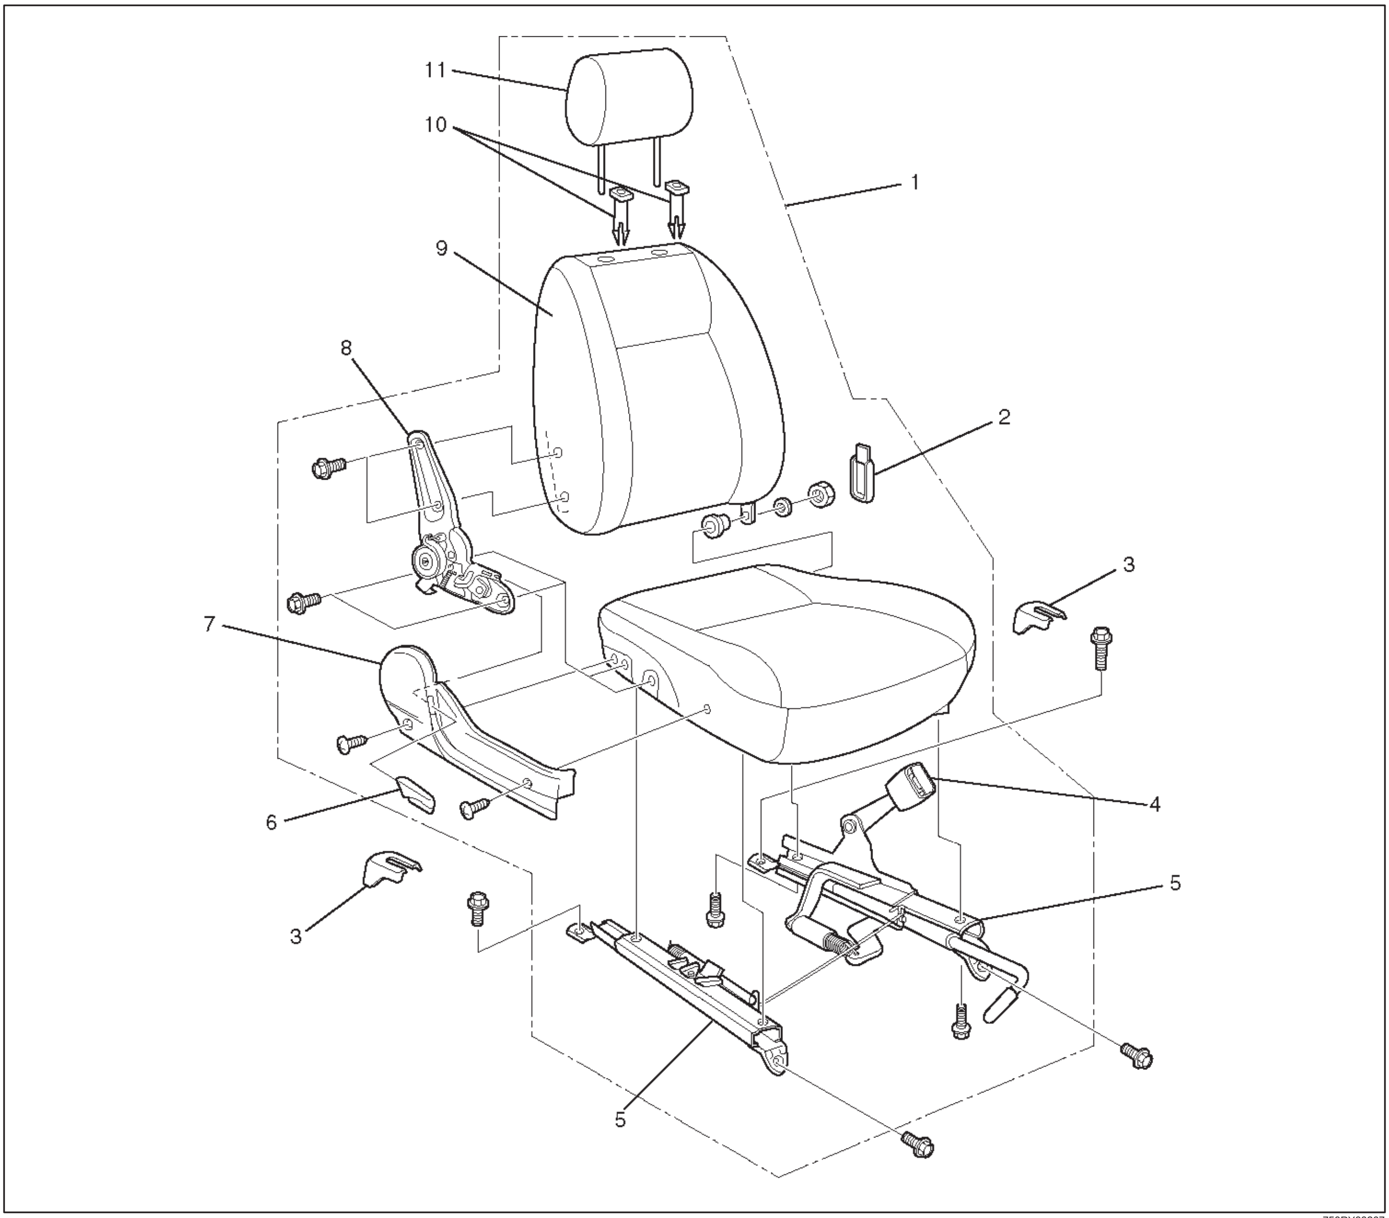
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Seat Assembly

Front Seat Assembly and Associated Parts



750RY00267

Legend

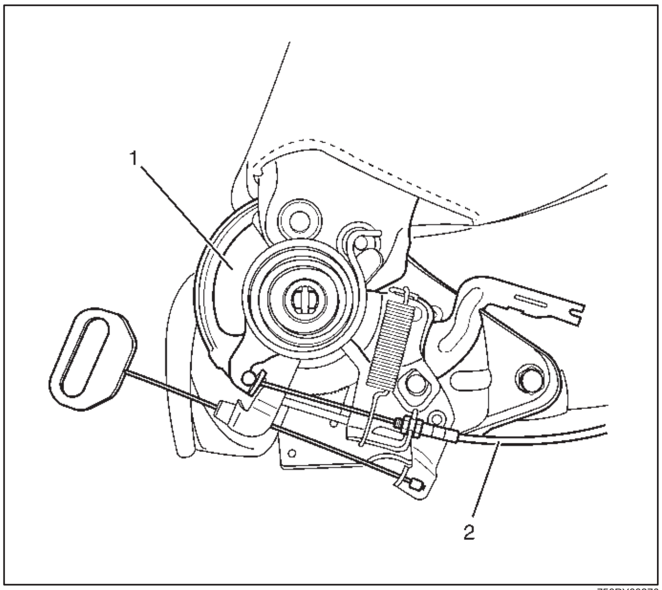
(1) Front Seat Assembly
(2) Hinge Cover
(3) Rear Cover
(4) Front Seat Belt Buckle Assembly
(5) Seat Adjuster
(6) Reclining Knob
(7) Side Cover
(8) Reclining Device
(9) Seat Back Assembly
(10) Guide Holder
(11) Headrest

Removal

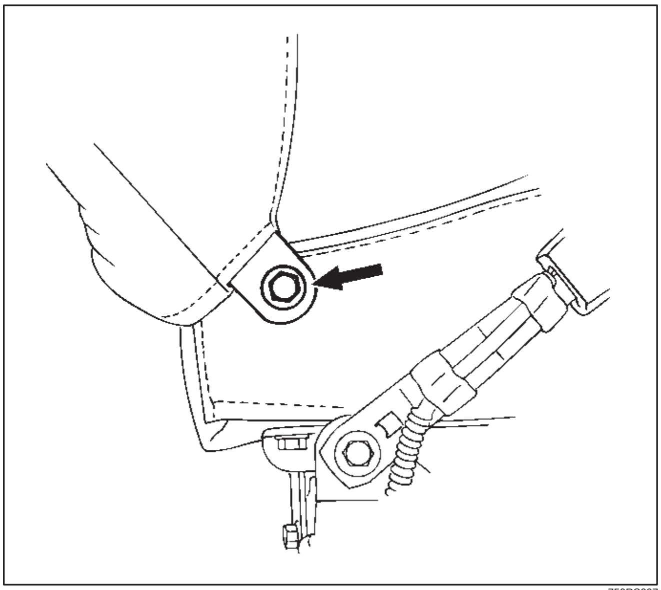
1. Disconnect the battery ground cable.
2. Remove the rear covers.
3. Remove the front seat assembly.
   - Remove the four fixing bolts.
   - Disconnect the seat belt warning connector (Driver's side only).

4. Pull out the reclining knob.
5. Remove the side cover.
   - Remove the two screws.
6. Remove the headrest.
7. Remove the reclining device.
   - Turn up the seat back trim cover in order to remove the reclining device fixing bolts (LWB).

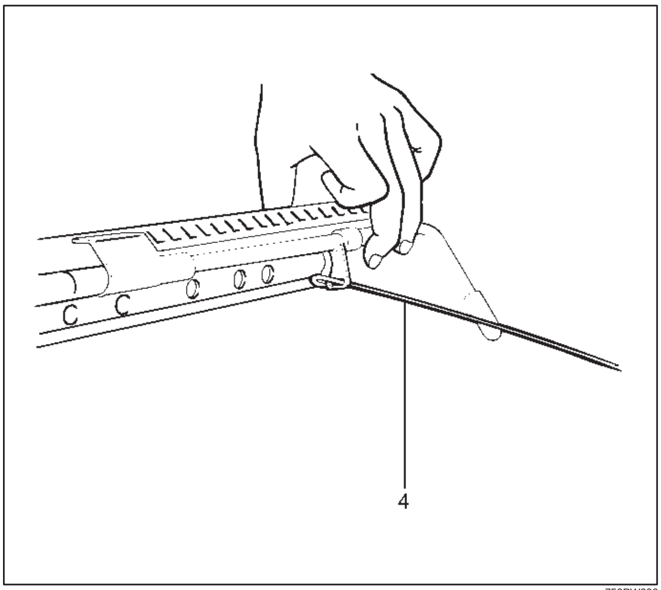
   - Remove the device (1) and disconnect the walk–in cable (2) (SWB).



8. Remove the seat back assembly.
   - Remove the seat back assembly fixing nut on the opposite side of the reclining device.



9. Remove the trim cover (Seat back side).
10. Remove the guide holder.
    - Pull the guide holder out by holding the bottom end of it from the seat back assembly.
11. Remove the seat adjuster.
    - Disconnect the release wire (4) and remove the fixing bolts.



12. Remove the seat belt buckle assembly.
13. Remove the trim cover (Seat cushion side).

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the reclining device fixing bolts to the specified torque.

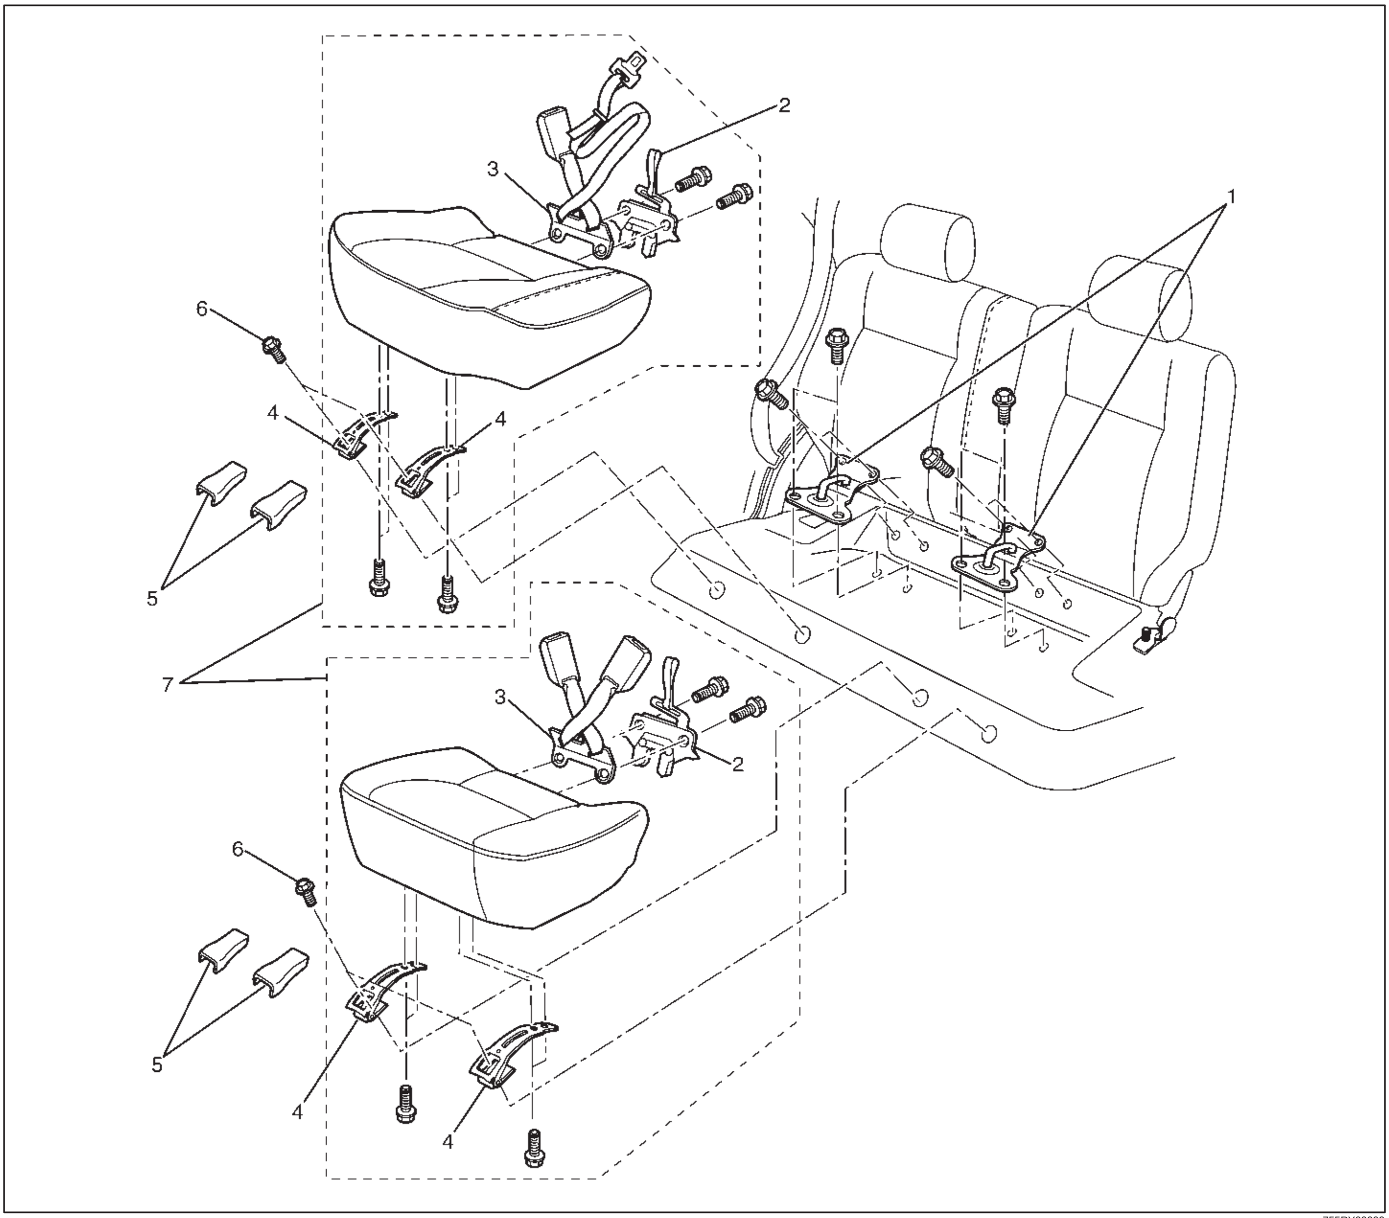
   Torque: 46 N·m (34 lb ft)

2. Tighten the front seat assembly fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

Rear Seat Assembly (LWB)

Rear Seat Cushion Assembly and Associated Parts



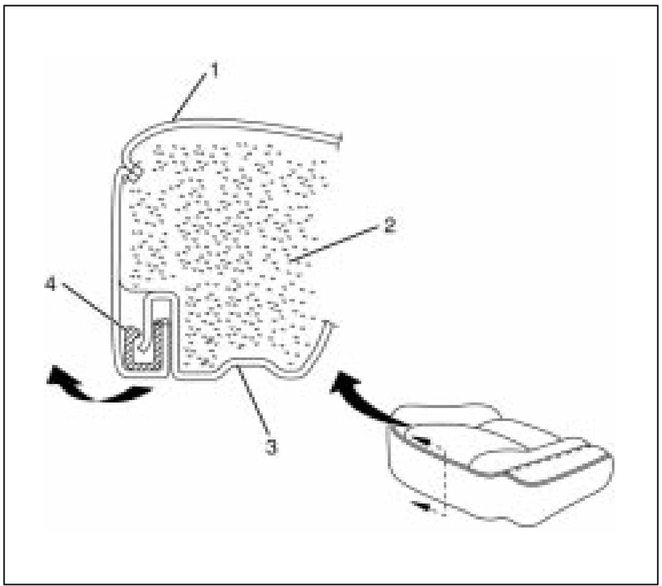
Legend

(1) Rear Seat Lock Striker
(2) Rear Seat Lock Assembly
(3) Rear Seat Belt Buckle Assembly
(4) Seat Cushion Hinge
(5) Hinge Cover
(6) Seat Cushion Fixing Bolt
(7) Rear Seat Cushion Assembly

Removal

1. Remove the hinge covers.
2. Remove the seat cushion fixing bolts.
3. Remove the seat cushion assembly.
   - Pull on the strap of the rear seat lock assembly to release the seat lock.
4. Remove the seat cushion hinges.

5. Remove the rear cushion trim cover (1) and rear seat cushion pad (2).
   - Remove cushion trim cover from rear cushion frame (3) with prying the plastic retainers (4).



755RX028

6. Remove the rear seat lock assembly and rear seat belt buckle assembly.
7. Remove the rear seat lock strikers.
   - Remove the four bolts at each striker.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the rear seat lock assembly and rear seat belt buckle assembly fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

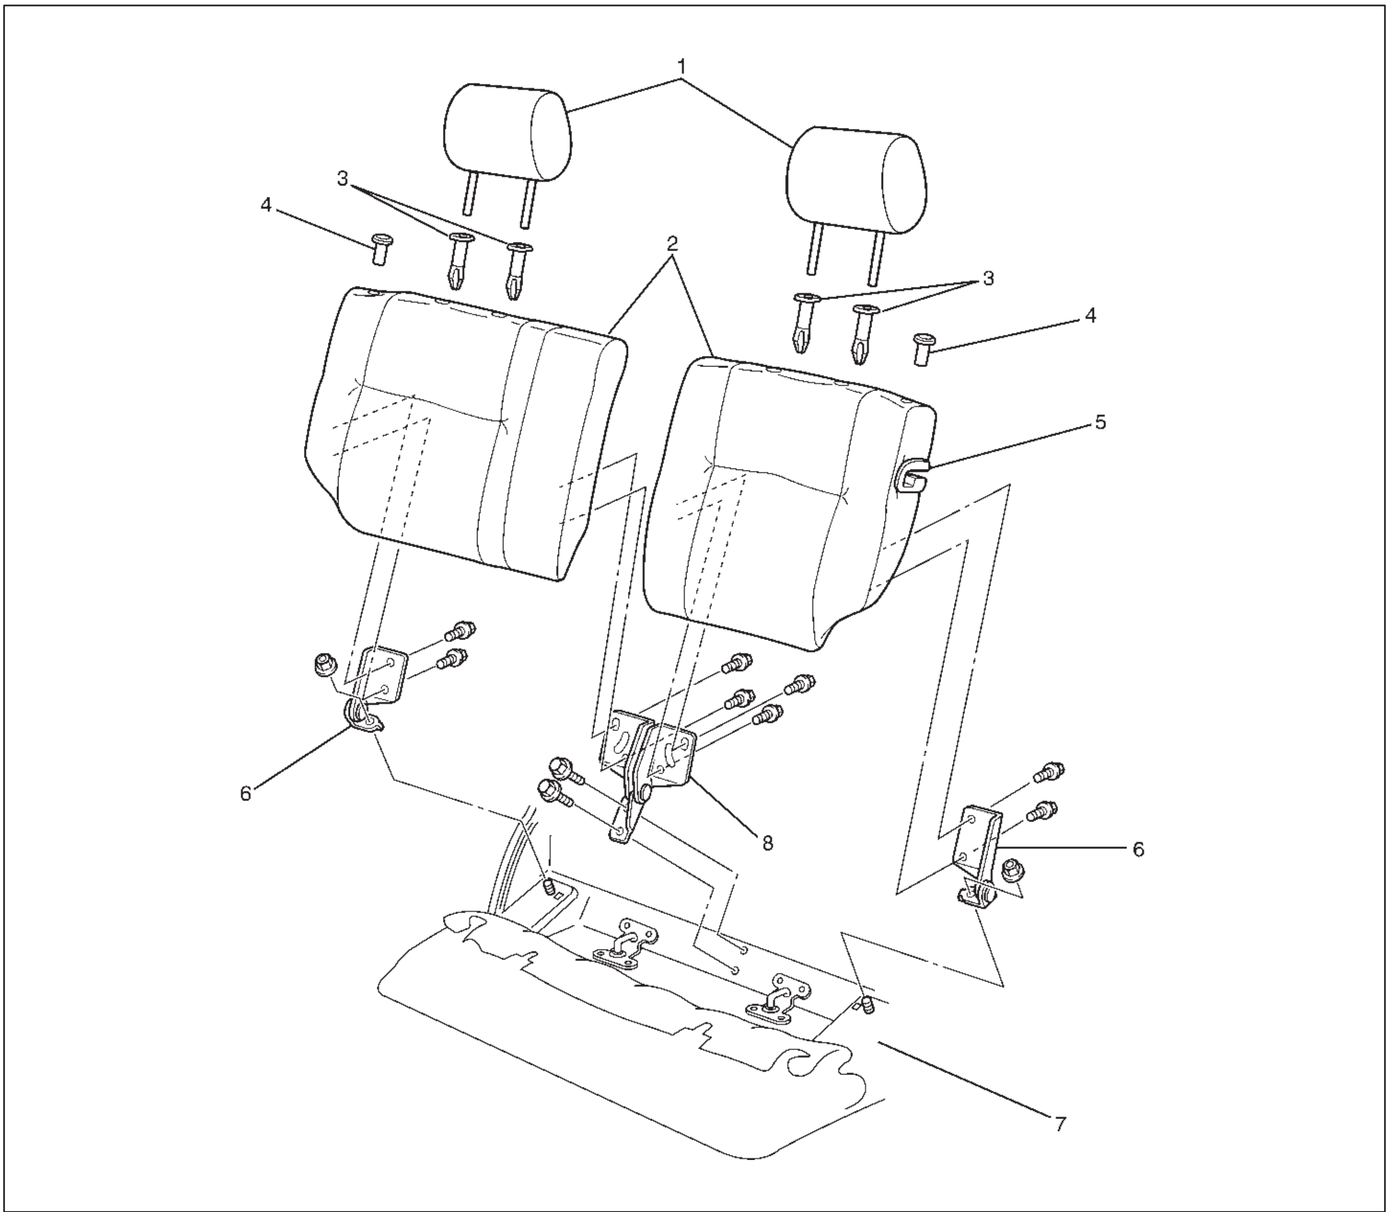
2. Tighten the rear seat lock striker fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

3. Tighten the seat cushion hinge fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

Rear Seat Back Assembly and Associated Parts



Legend

(1) Headrest
(2) Seat Back Assembly
(3) Guide Holder
(4) Release Knob
(5) Seat Lock Cover
(6) Side Hinge
(7) Body Floor Panel
(8) Center Hinge

Removal

1. Pull on the release knob and fold the seat back assembly forward.
2. Remove the luggage floor carpets.
   - Remove the carpet fixing nine clips at each from the backside of the seat back assembly.
3. Remove the seat back assembly.
   - Remove the four fixing bolts at each seat back.
4. Remove the seat lock covers.
5. Remove the headrests.
6. Remove the release knobs.
   - Turn the knob counterclockwise to remove it.
7. Remove the trim covers.
8. Remove the guide holders.
9. Remove the side hinges.
   - Remove the one fixing nut at each side hinge.

10. Remove the center hinge.
    - Remove the two fixing bolts.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the center hinge fiixng bolts to the specified torque.

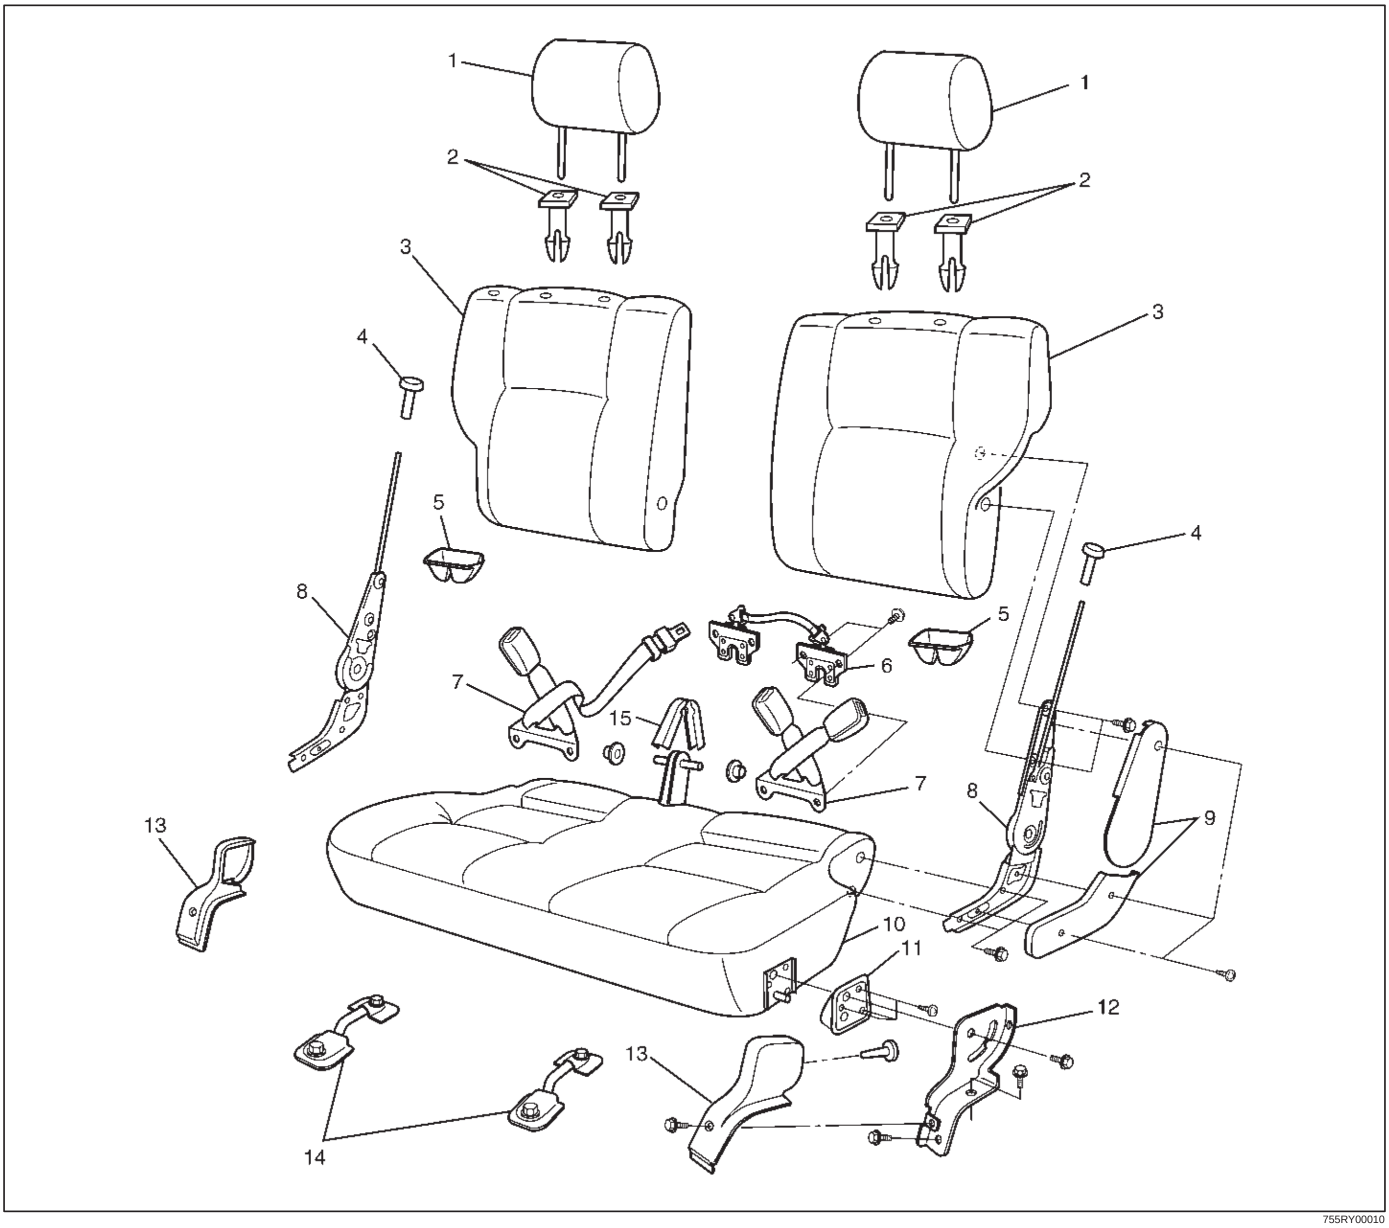
   Torque: 39 N·m (29 lb ft)

2. Tighten the side hinge fixing nuts to the specified torque.

   Torque: 29 N·m (22 lb ft)

Rear Seat Assembly (SWB)

Rear Seat Assembly and Associated Parts



Legend

(1) Headrest
(2) Guide Holder

(10) Rear Seat Cushion Assembly
(11) Support Cover
(12) Rear Seat Leg
(13) Rear Seat Leg Cover
(14) Rear Floor Lock Striker
(15) Free Hinge Cover

Removal

1. Fold the rear seat backs forward.
   - Pull up on the left and right release knobs.
2. Remove the rear seat leg covers.
   - Remove the one screw and clip from each.
3. Remove the rear seat assembly.
   - Remove the two sets of two fixing bolts from left and right sides, then pull on the seat lock strap to release the seat lock.
4. Remove the device covers (left and right).
   - Remove the three screws from each.
5. Remove the release knobs (left and right).
6. Remove the rear seat back assemblies (left and right).
   - Remove the two sets of two reclining device fixing bolts from the sides of the seat backs.
7. Remove the headrests.
8. Remove the trim covers.
9. Remove the guide holders.
10. Remove the reclining devices.
    - Remove the two sets of two fixing bolts from the sides of the seat cushions.
11. Remove the rear seat legs (left and right).
12. Remove the support covers (left and right).
    - Remove the three screws from each.
13. Remove the seat lock covers (left and right).
14. Remove the seat lock assemblies and the rear seat belt buckle assemblies (left and right).
    - Remove the two sets of two fixing bolts.
15. Remove the free hinge cover.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the seat lock assemblies and the rear seatbelt buckle assemblies to the specified torque.

   Torque: 39 N·m (29 lb ft)
2. Tighten the reclining devices to the specified torque.

   Torque: 46 N·m (34 lb ft)
3. Tighten the rear seat assembly fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

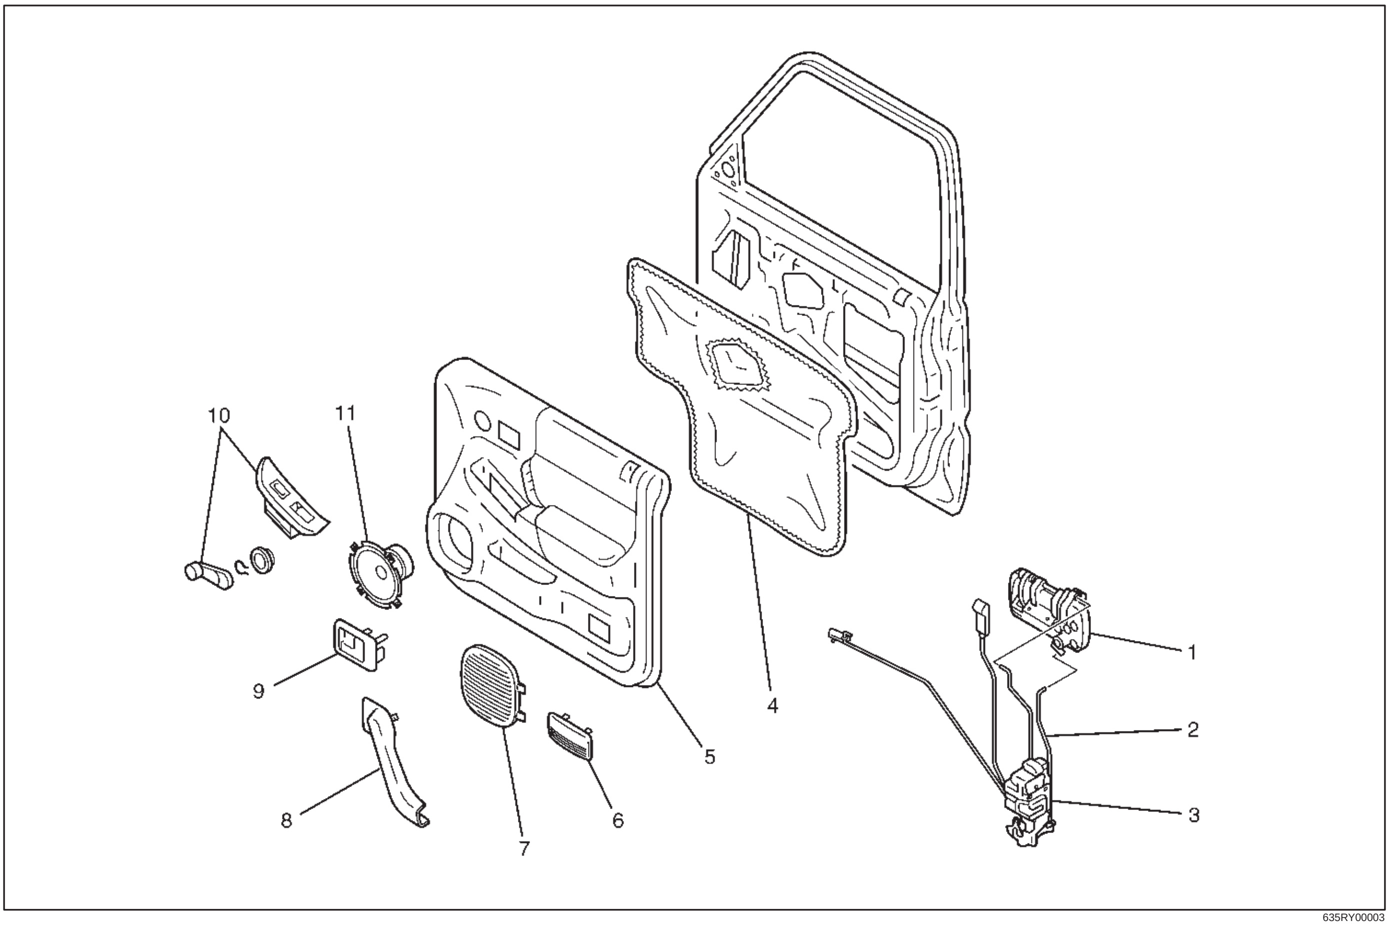
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fasteners joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fasteners. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Door Lock Assembly

Front Door Lock Assembly and Associated Parts

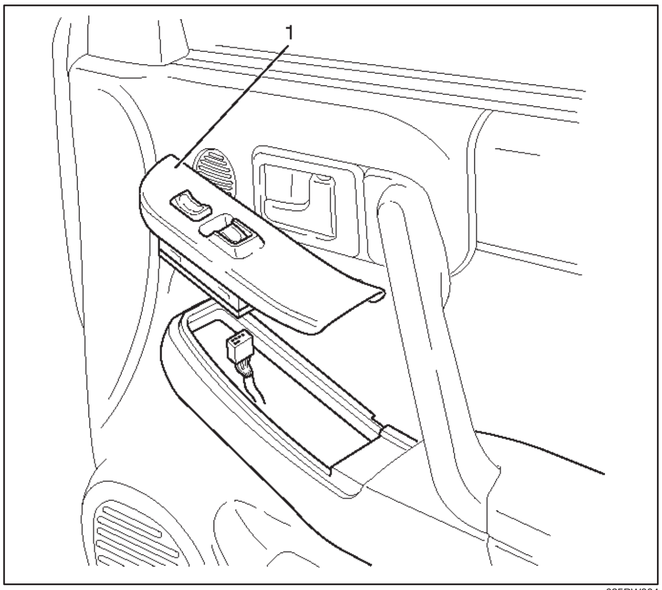


Legend

(1) Outside Handle
(2) Door Locking Link
(3) Door Lock Assembly
(4) Waterproof Sheet
(5) Door Trim Panel
(6) Courtesy Light Lens
(7) Speaker Grille
(8) Grip Cover
(9) Inside Handle
(10) Power Window Switch/Window Regulator Handle
(11) Speaker Assembly

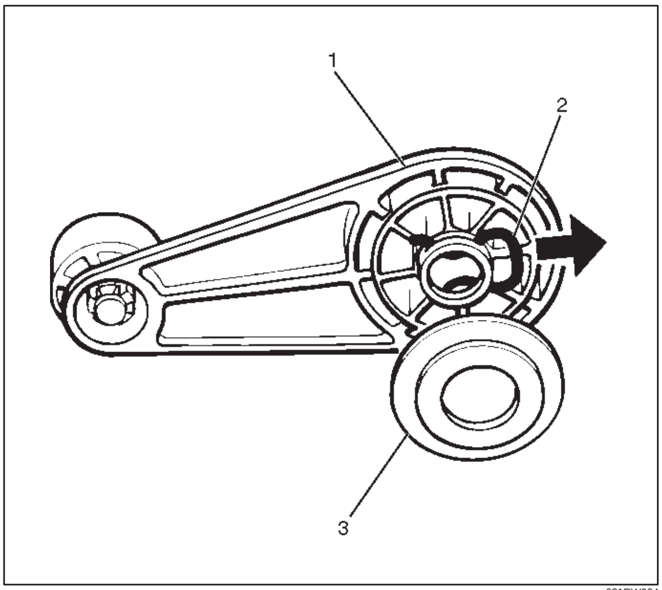
Removal

1. Disconnect the battery ground cable.
2. Remove the power window switch (1)/regulator handle.
   - Pry out the power window switch and remove the connectors.



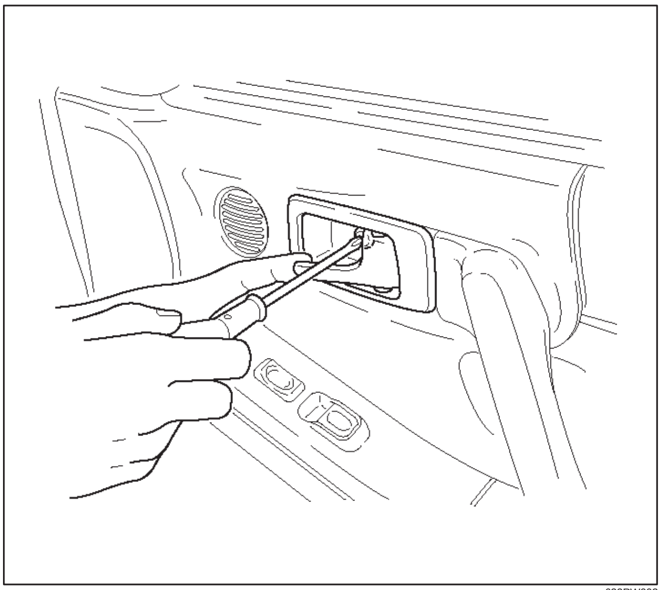
635RW004

   - To remove the regulator handle (1), remove the clip (2), at the root of the handle by using wire with hook.



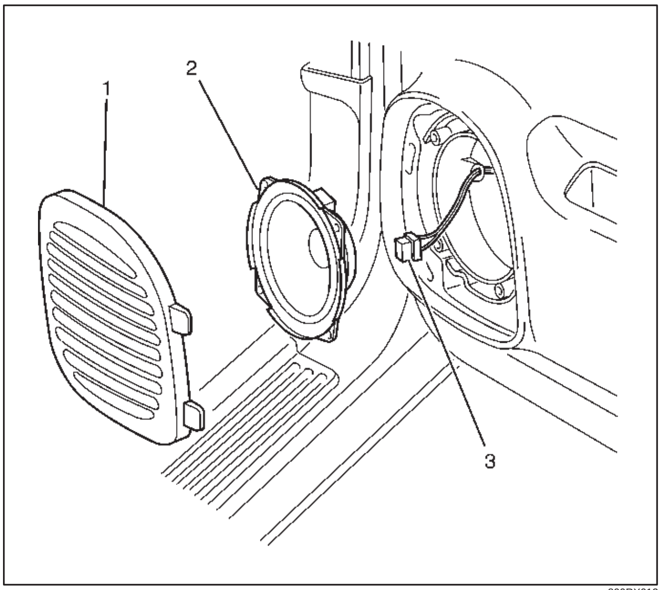
631RW004

3. Remove the screw while pulling the inside lever toward you and then remove the inside handle.



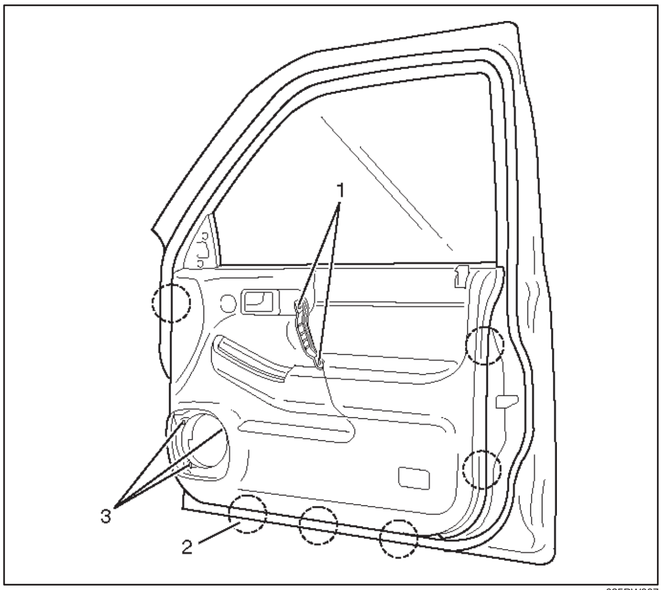
632RW003

4. Remove the speaker grille (1).
   - Pull out the front side of the grille.
5. Remove the speaker assembly (2).
   - Remove 4 screws and disconnect the speaker harness connector (3).



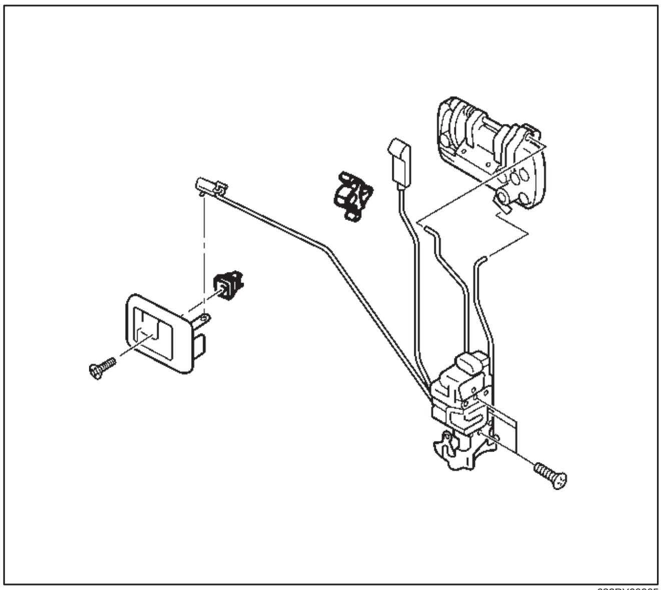
890RX012

6. Remove the courtesy light lens.
7. Remove the 5 screws (1), (3) and pull out the door trim panel at the 6 clip (2) positions.



635RW007

8. Remove the waterproof sheet.
   - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
9. Raise the glass up to the uppermost position, and then remove the rear guide rail.
10. Disconnect the locking links then remove the door lock assembly fixing screws and door lock assembly.

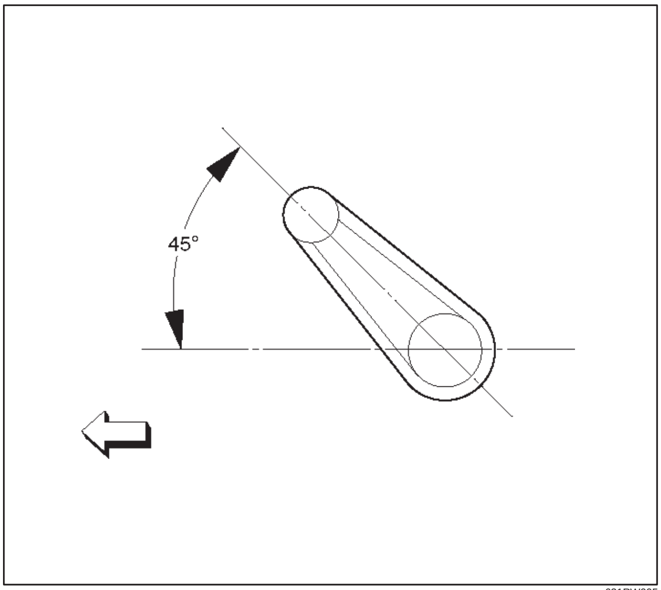


632RY00005

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Apply chassis grease to the lock assembly and striker moving surface.
2. Install the regulator handle as shown in the illustration, if equipped without power windows.



631RW005

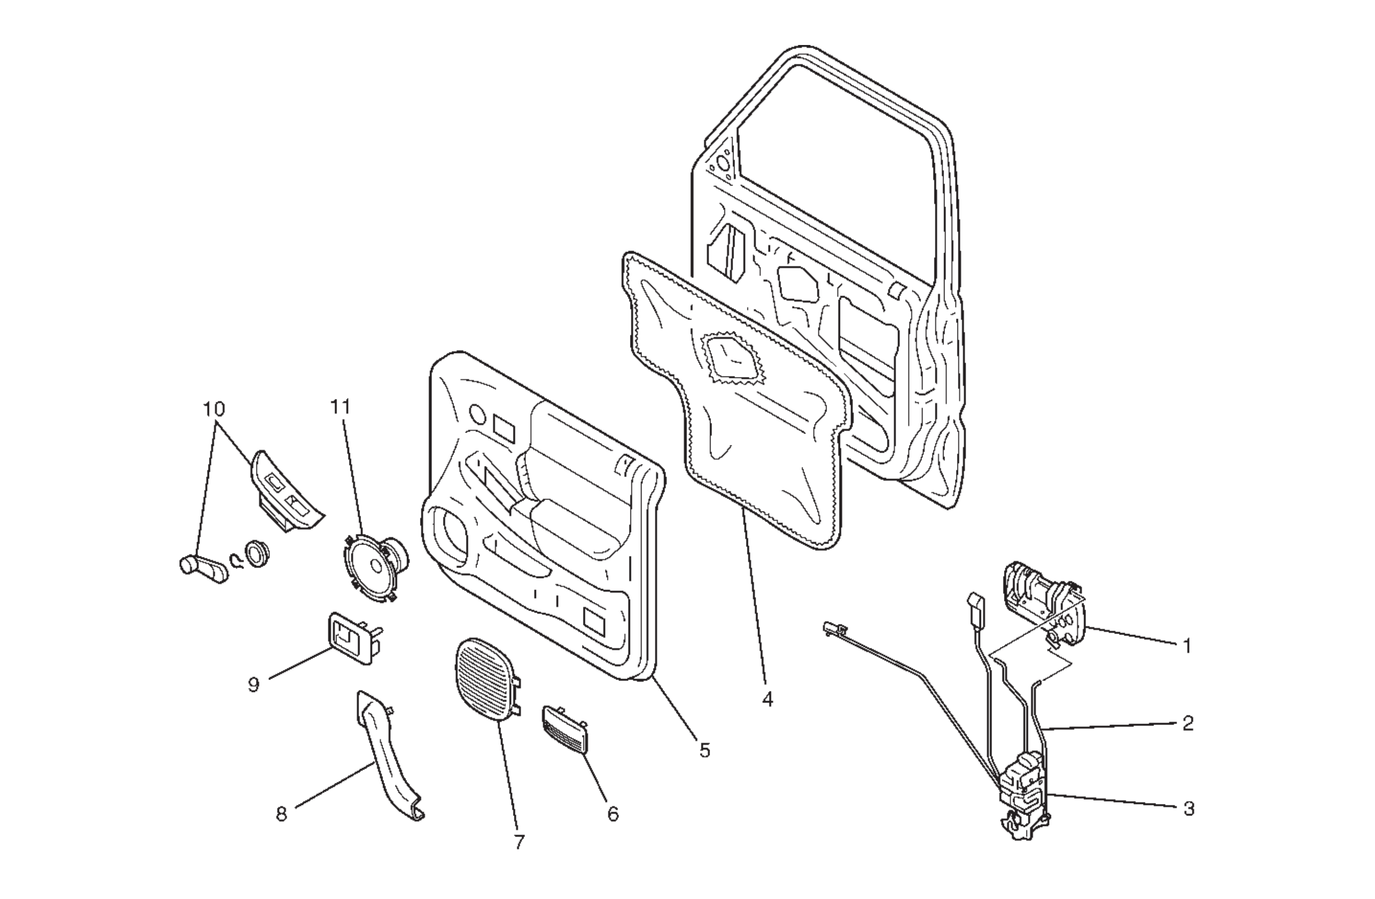
3. Tighten the door lock assembly fixing screws to the specified torque.

Torque 7 N·m (61 lb in)

4. Check that the door lock operates smoothly.

Front Outside Handle

Front Outside Handle and Associated Parts



Legend

(1) Outside Handle
(2) Door Locking Link
(3) Door Lock Assembly
(4) Waterproof Sheet
(5) Door Trim Panel
(6) Courtesy Light Lens
(7) Speaker Grille
(8) Grip Cover
(9) Inside Handle
(10) Power Window Switch/Window Regulator Handle
(11) Speaker Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the door trim panel.
   - Refer to Front Door Lock Assembly in this section.
3. Remove the waterproof sheet.
   - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
4. Disconnect the locking links and remove the outside handle.
5. Remove the fixing clip to remove the door lock cylinder.

Installation

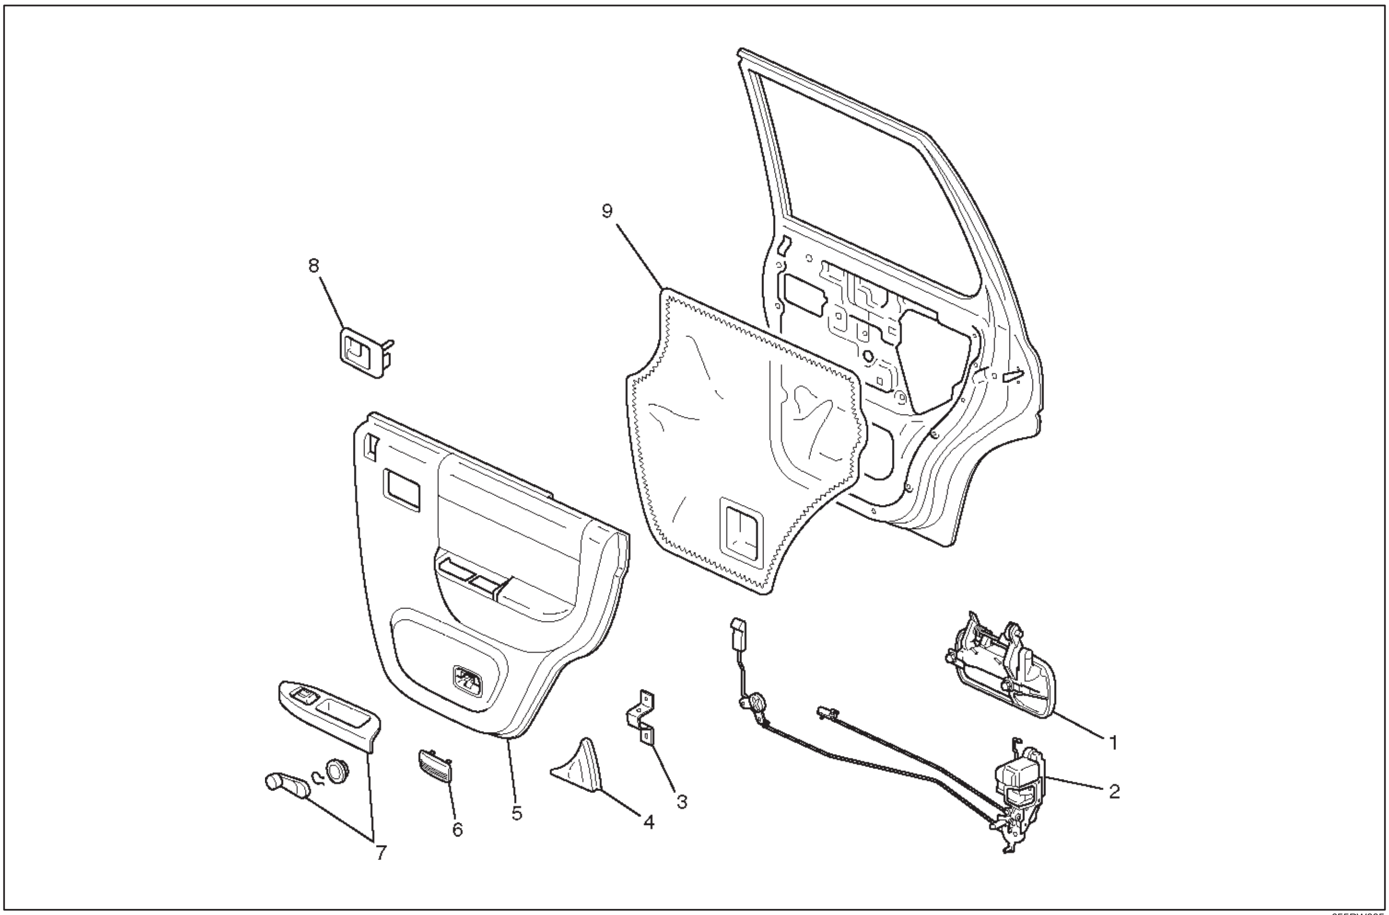
To install, follow the removal steps in the reverse order, noting the following points:

1. Be sure to install the door lock cylinder at a right angle to the outside handle.
2. Check for smooth outside handle and lock cylinder operation.
3. Tighten the outside handle fixing bolts to the specified torque.

Torque 9 N·m (78 lb in)

Rear Door Lock Assembly

Rear Door Lock Assembly and Associated Parts



655RW005

Legend

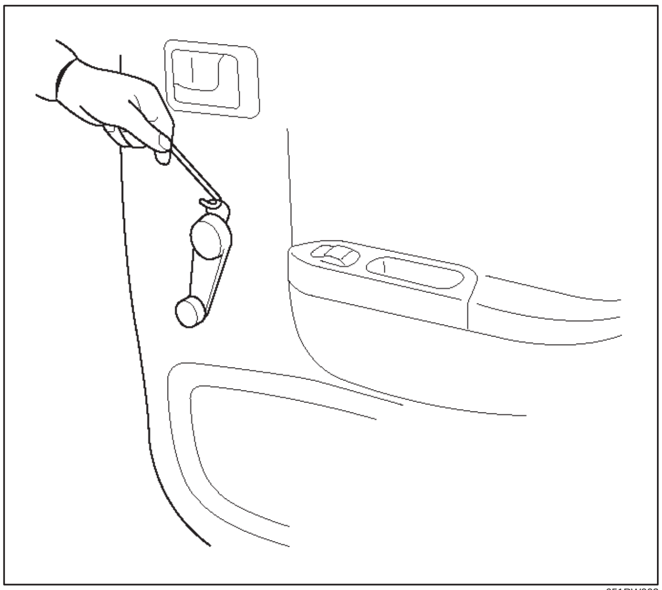
(9) Waterproof Sheet

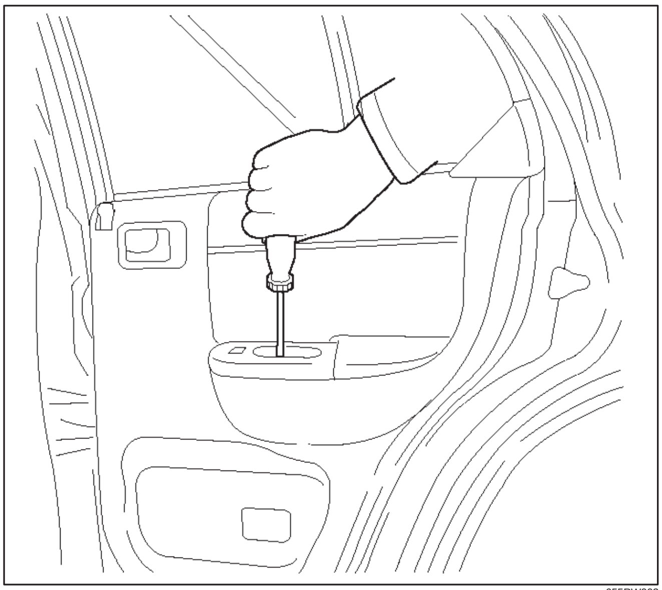
Removal

1. Disconnect the battery ground cable.
2. Remove the rear corner garnish.
3. Remove the courtesy light lens.
4. Remove the window regulator handle.
   - Remove the clip on the rear side of the regulator handle using a wire.



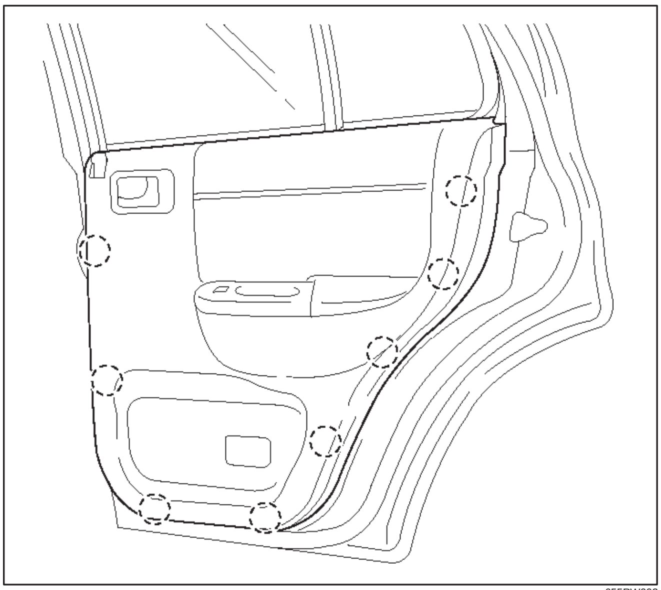
651RW003

5. Remove the screw while pulling the inside lever toward you and then remove the inside handle.
6. Remove the 2 screws at the pull case and courtesy light.



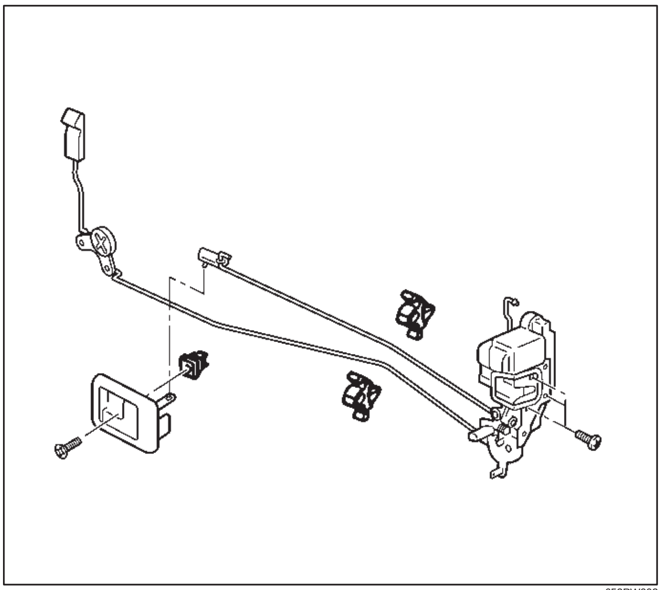
655RW003

7. Pull out the trim panel at the 8 clip positions.
   - Disconnect the power window switch connector and courtesy light connector.



655RW002

8. Remove the power window switch, if equipped.
9. Remove the bracket.
10. Remove the waterproof sheet.
    - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
11. Disconnect the locking links and remove the door lock assembly fixing screws to remove the door lock assembly.



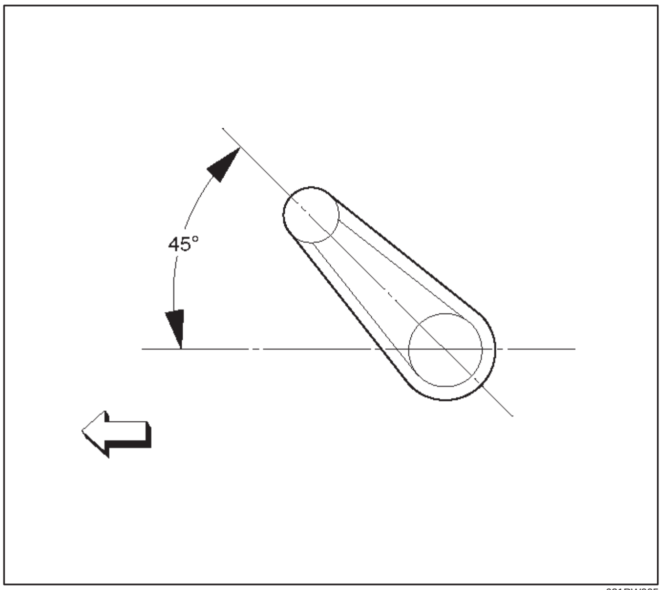
652RW002

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Apply chassis grease to the lock assembly and striker moving surface.

2. Install the regulator handle as shown in the illustration, if equipped without power windows.



631RW005

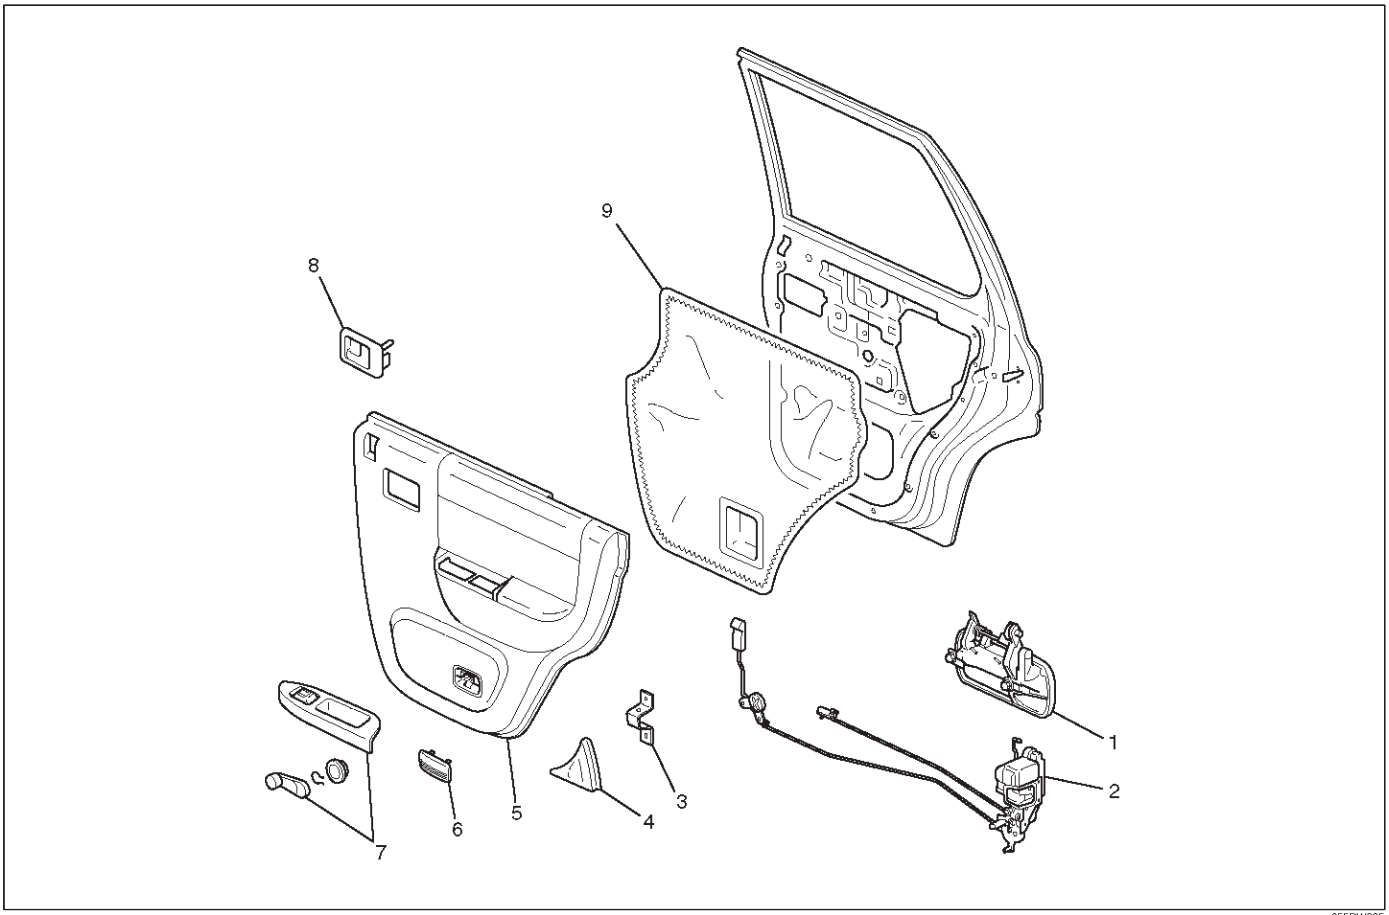
3. Tighten the door lock assembly fixing screws to the specified torque.

Torque 7 N·m (61 Ib in)

4. Check that the door lock operates smoothly.

Rear Outside Handle

Rear Outside Handle and Associated Parts



655RW005

Legend
- (1) Outside Handle
- (2) Door Lock Assembly
- (3) Bracket
- (4) Rear Corner Garnish
- (5) Door Trim Panel

- (7) Power Window Switch/Window Regulator Handle
- (8) Inside Handle
- (9) Waterproof Sheet

Removal

1. Disconnect the battery ground cable.
2. Remove the door trim panel.
   - Refer to Rear Door Lock Assembly in this section.
3. Remove the waterproof sheet.
   - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
4. Disconnect the locking link and remove fixing bolts to remove the outside handle.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Check that the outside handle operates smoothly.
2. Tighten the outside handle fixing bolts to the specified torque.

Torque 9 N·m (78 lb in)

Tailgate Lock and Hatchgate Lock (LWB)

Tailgate Lock, Hatchgate Lock and Associated Parts

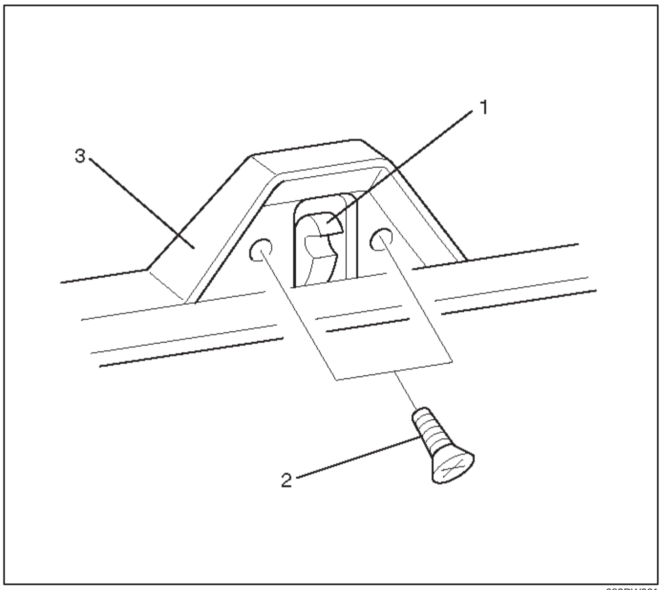
(9) Hatchgate Lock Actuator Assembly

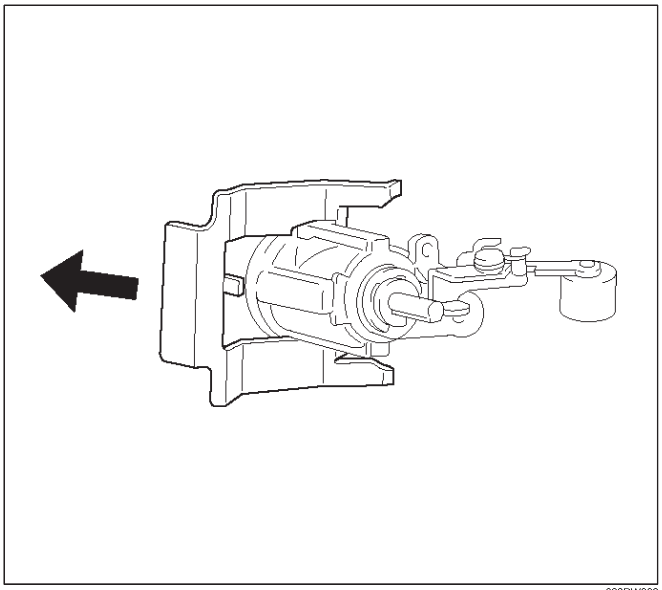
Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim cover assembly (3).
   - Remove the 2 screws (2) holding the hatchgate lock assembly (1) first, and pull up the trim cover while detaching the clips from tailgate panel.



683RW001

3. Remove the waterproof sheet.
   - Remove the waterproof sheet, taking special care so as not to break it.
4. Remove the hatchgate lock.
   - Disconnect the lock link and connector and remove the 3 fixing bolts.
5. Remove the key cylinder.
   - Disconnect the lock links.
   - Remove the key cylinder retaining clip with screw driver to remove the key cylinder.



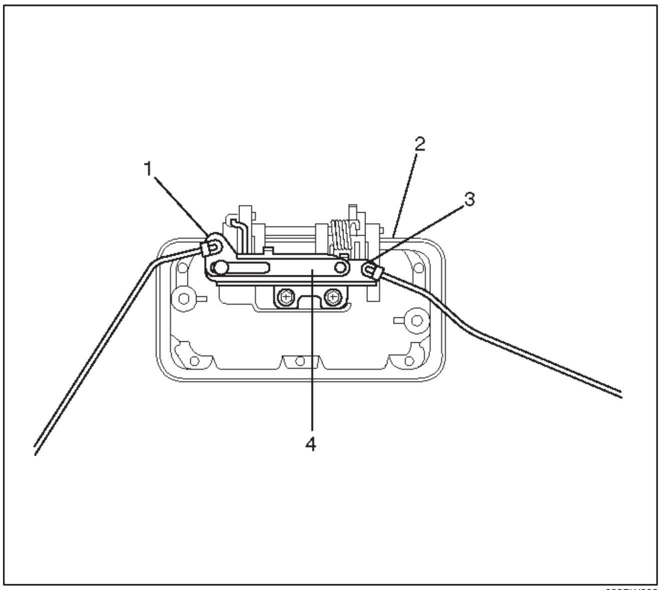
683RW002

6. Remove the hatchgate lock actuator assembly.
   - Disconnect the actuator harness connector.
   - Remove the 2 bolts holding hatchgate lock actuator assembly from inside.
7. Remove the outside handle.
   - Remove the 2 bolts holding the outside handle from inside.
8. Remove the tailgate lock assembly.
   - Remove the 3 screws holding the lock assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. When setting up links, pay attention to the position and direction of the links.



683RW003

Legend

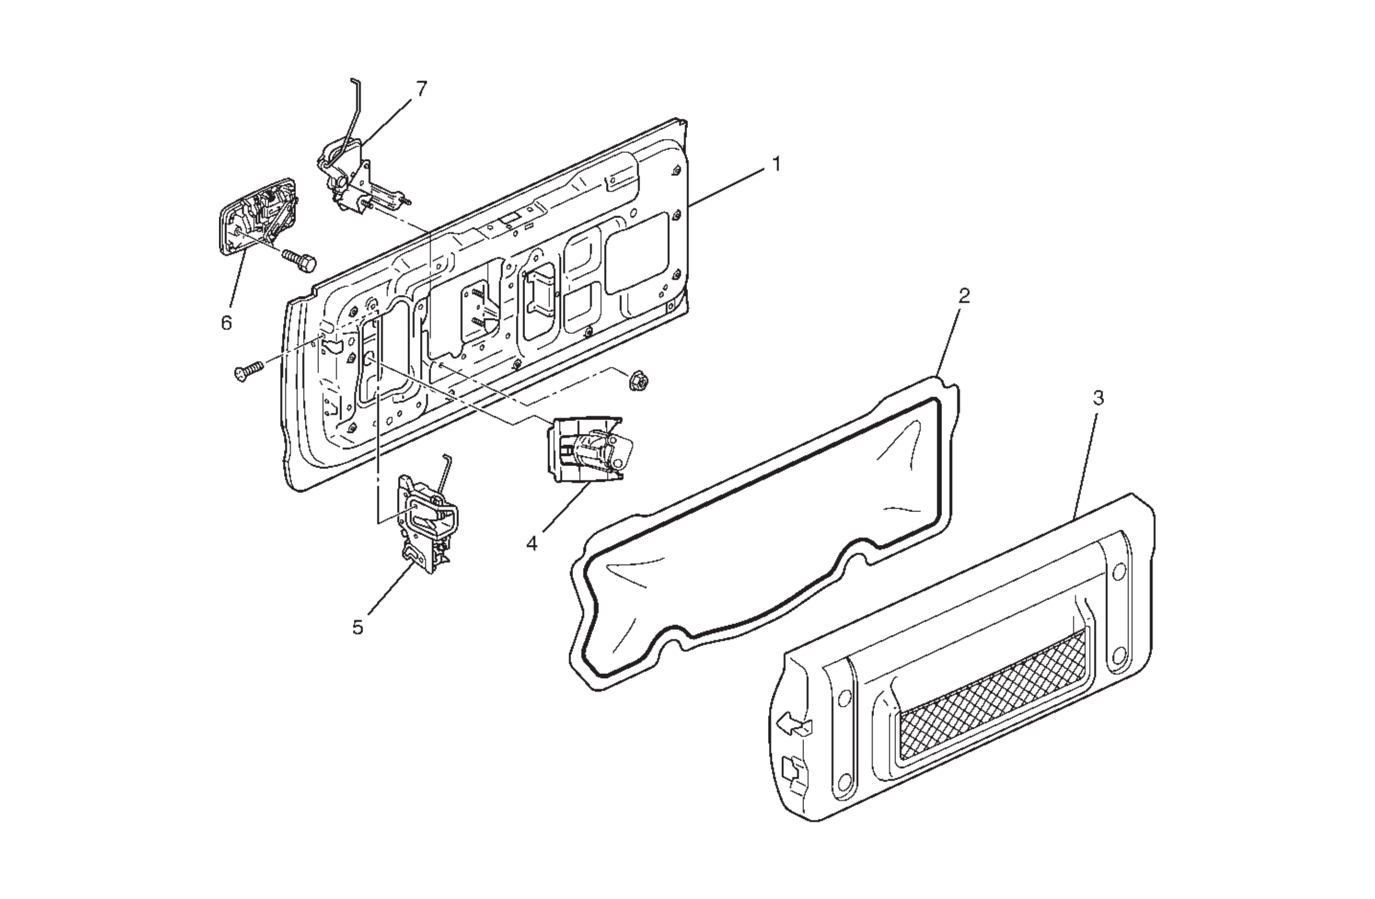
(1) Tailgate Lock Link
(2) Outside Handle
(3) Key Cylinder Link
(4) Cancel Mechanism

2. Apply chassis grease to the lock assembly and striker moving surface.
3. Check that the tailgate lock operates correctly after installing it.
4. Tighten the hatchgate lock assembly fixing bolts to the specified torque.

   Torque 7 N·m (61 lb in)

Tailgate Lock (SWB)

Tailgate Lock and Associated Parts



681RY00001

Legend

(1) Tailgate Assembly
(2) Waterproof sheet
(3) Trim Cover Assembly
(4) Key Cylinder
(5) Tailgate Lock Assembly
(6) Outside Handle
(7) Hatchgate Lock Actuator Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate glass assembly and tailgate glass stay.
   - Refer to Tailgate Glass (SWB) in Body Structure section.
3. Remove the tailgate trim cover assembly.
   - Remove the two screws fixing the trim cover assembly and pull up the trim cover after detaching the clips from tailgate panel.
4. Remove the waterproof sheet.
   - Remove the waterproof sheet, taking special care so as not to break it.
5. Remove the key cylinder.
   - Disconnect the lock links.
   - Remove the key cylinder retaining clip with screw driver to remove the key cylinder.
6. Remove the hatchgate lock actuator assembly.
   - Disconnect the actuator harness connector.
   - Remove the two nuts holding hatchgate lock actuator assembly from inside.
7. Remove the outside handle.
   - Disconnect the lock link.
   - Remove the two bolts holding the outside handle from inside.
8. Remove the tailgate lock assembly.
   - Remove the three screws holding the lock assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

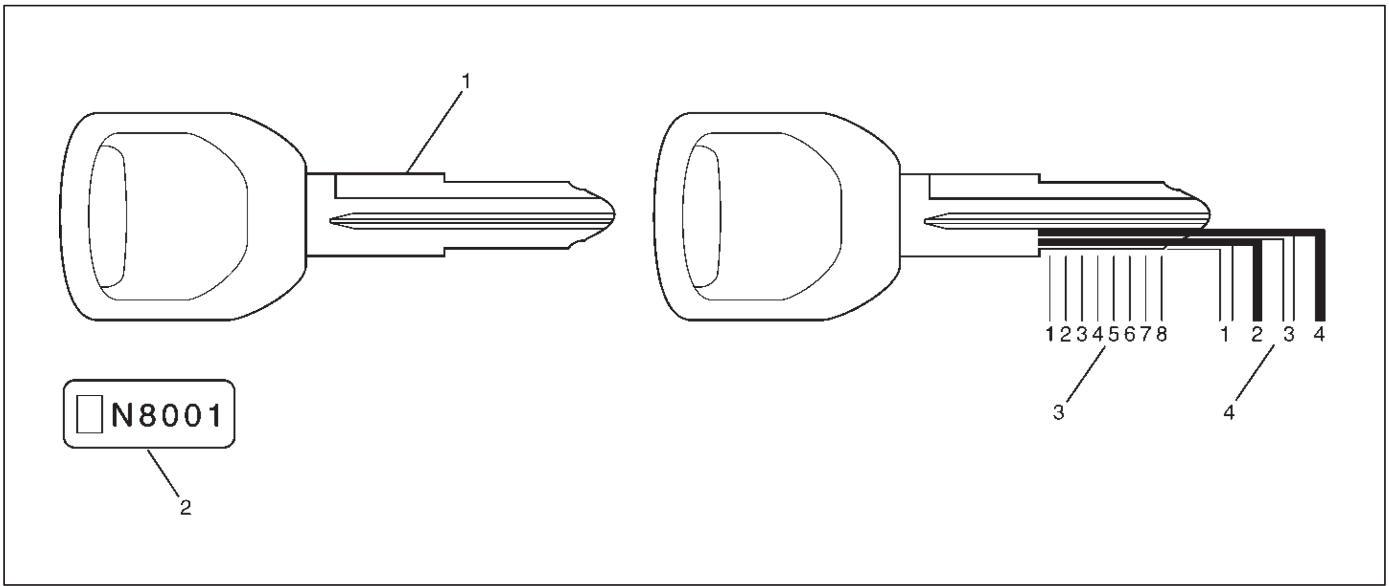
1. Apply chassis grease to the lock assembly and striker moving surface.
2. Tighten the hatchhgate lock assembly fixing screws to the specified torque.

   Torque 7 N·m (61 lb in)

3. Check that the tailgate lock operates correctly after installing it.

Key

Key Coding



730RX001

Legend

(1) Key (Actual size)
(2) Key Code Tag
(3) Position
(4) Level

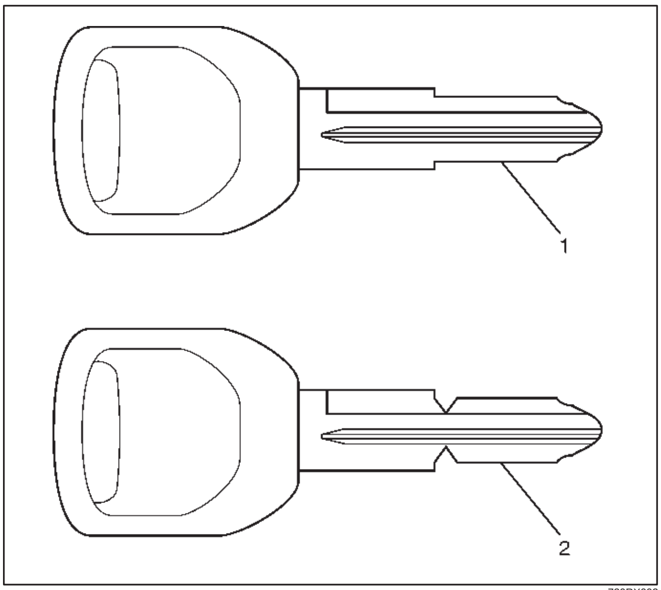
One key is used for the ignition, door, and tailgate lock cylinders. The keys are cut on both edges to make them reversible.

Key identification is obtained from the five character key code stamped on the key code tag. From this key code, the key code cutting combination can be determined from a code list (available to owners of key cutting equipment from suppliers).

If key codes are not available from records or tags, the key code can be obtained from the right hand door lock cylinder (if lock has not been replaced). Lock cylinders supplied by the factory as service parts are unmarked.

If the original key is available, the key code cutting combination can be determined by laying the key on the diagram shown in the figure.

Key Styles



730RX002

Legend

(1) Blank Key Style “A”
(2) Blank Key Style “B”

The keys come in styles A or B depending on the key code cutting combination. When the first position in the combination is a 1, 2 or 3, Style A is used. When the first position is a 4, Style B (factory pre–cut key) is used.

Power Door Lock System

General Description

The circuit consists of the door lock (& power window) switch, door lock actuator for the front and rear door, tailgate lock actuator and the door lock key switch.
The front door lock switch–LH is always provided with the battery voltage.
The key or the inside lock button on the both driver's and the front passenger's door can activate the lock mechanism of all the doors (including the tailgate).
When the driver's door lock switch or the front passenger's door lock switch is turned on, current flows for about one second to the door lock actuator of each door connected in parallel with the front door lock (& power window) switch–LH to activate the actuator to lock and unlock the doors.

Door Lock Key Switch

Removal and Installation

- Refer to the Front Door Lock Assembly removal and installation steps in this section.

Front Door Lock Actuator

Removal and Installation

- Refer to the Front Door Lock Assembly removal and installation steps in this section.

Rear Door Lock Actuator

Removal and Installation

- Refer to the Rear Door Lock Assembly removal and installation steps in this section.

Tailgate Lock Actuator

Removal and Installation

- Refer to the Tailgate Lock Assembly removal and installation steps in this section.

Anti–Theft System

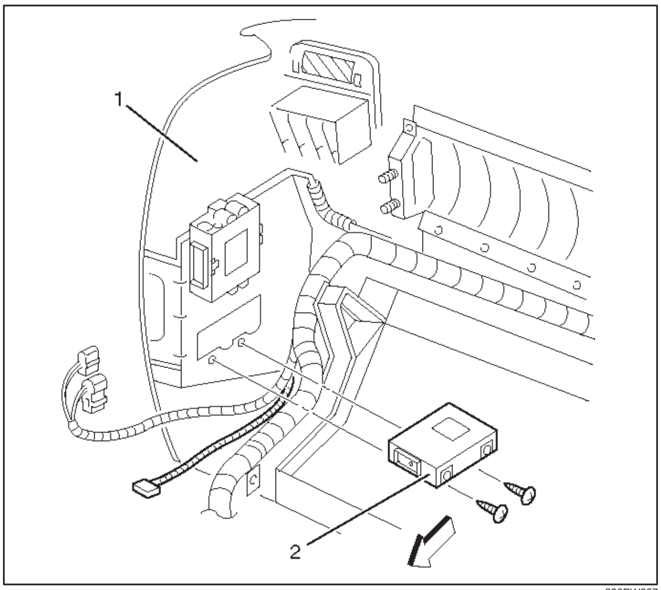
General Description

The circuit consists of the starter switch, anti–theft & keyless entry controller, anti–theft horn, front door and tailgate key switch (detect and tamper) switch, door lock actuator for each door, engine hood switch, clutch start switch (M/T), ANTI–THEFT indicator light and mode switch (A/T).
The system operates as follows: After locking the starter switch and removing the starter key (this sets the alarm), if the door is unlocked in any way other than with the proper key, the headlights start flashing, the horn sounds, and the starter circuit is disabled. (However, the engine hood and all the doors must be locked and closed.)
Once the system has been placed in the warning or alarm condition, it can be released only when the starter switch is shifted from "OFF" to "ACC" by the starter key, or when the lock of the front door or the tailgate is released (to activate the detect switch) by the starter key.

Anti–Theft & Keyless Entry Controller

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel assembly (1).
   - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the anti–theft & keyless entry controller (2).
   - Disconnect the connector.
   - Remove two fixing screws.



826RW007

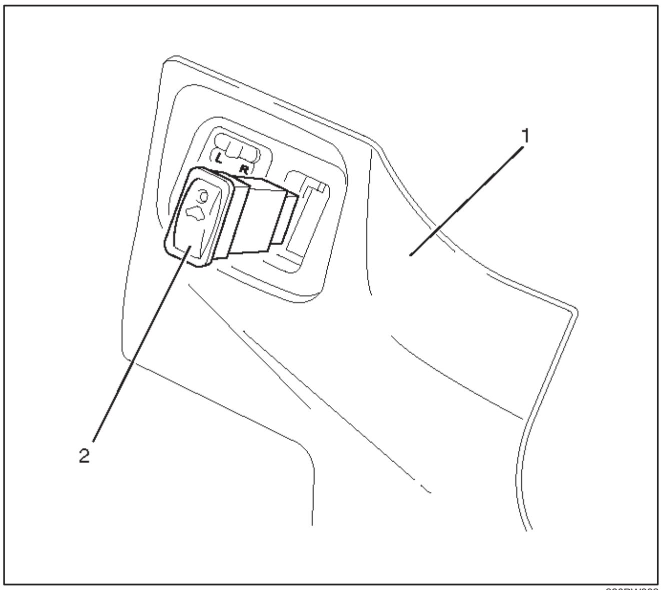
Installation

To install, follow the removal steps in the reverse order.

Anti–Theft Indicator

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel driver lower cover assembly (1).
   - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the anti–theft indicator (2).
   - To remove the indicator, push the lock from the back side of the instrument panel driver lower cover assembly.



826RW008

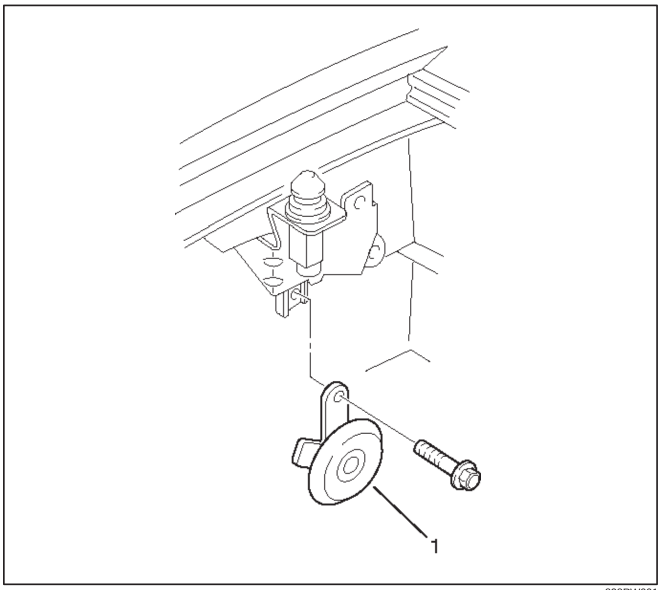
Installation

To install, follow the removal steps in the reverse order.

Anti–Theft Horn

Removal

1. Disconnect the battery ground cable.
2. Remove the anti–theft horn (1).
   - Disconnect the connector.
   - Remove a fixing bolt.



828RW001

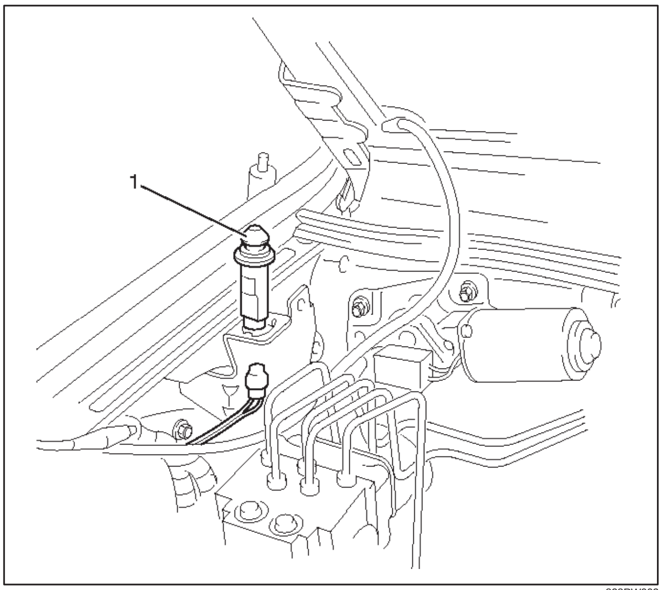
Installation

To install, follow the removal steps in the reverse order.

Engine Hood Switch

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector.
3. Remove the engine hood switch (1).



828RW002

Installation

To install, follow the removal steps in the reverse order.

Anti–theft & Keyless Entry Control Unit/Transmitter Replacement

Anti–theft & Keyless Entry Control Unit Replacement

1. Remove and install the control unit.
   - Refer to Anti–theft & Keyless Entry Control Unit Removal and Installation in this section.
2. Register ID code.
   - Refer to ID Code Registration in this section.
3. Check that the keyless entry system works normally.

Transmitter Replacement

1. Prepare a new transmitter.
2. Regiter ID code.
   - Refer to ID Code Registration in this section.
3. Check that the keyless entry system works normally.

Transmitter Battery Replacement

1. Remove a screw to remove the cover.
2. Remove the batteries.
3. Set the new batteries into the transmitter.
4. Install the cover to the transmitter.
5. Check that the keyless entry system works normally.

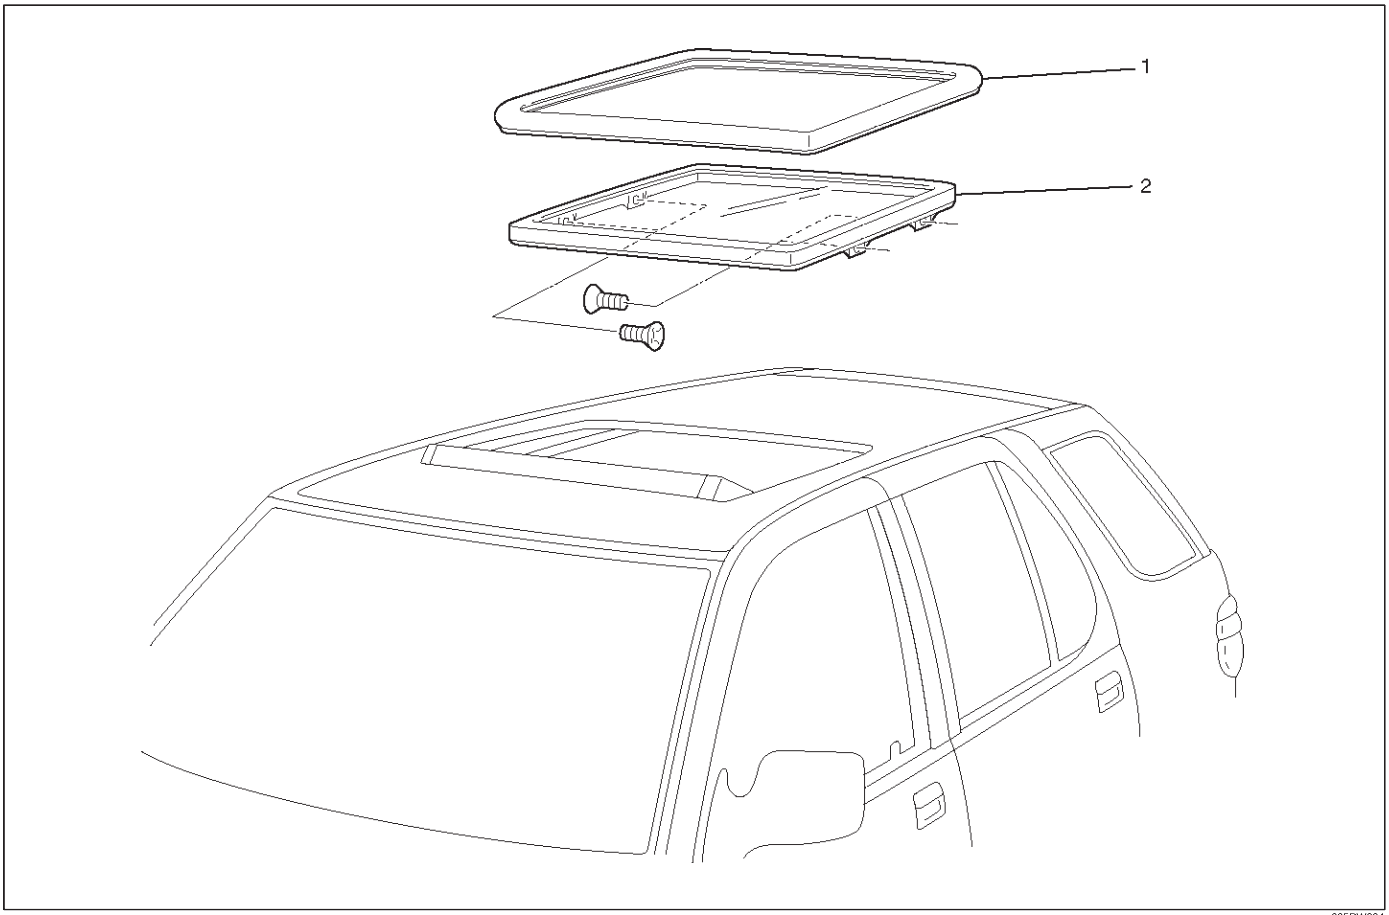
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Sunroof Glass (LWB)

Sunroof Glass and Associated Parts

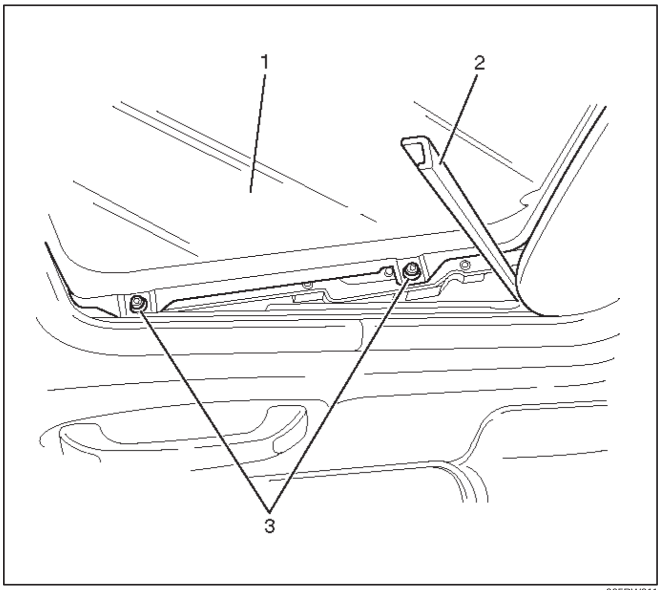


665RW004

Legend
(1) Sunroof Weatherstrip
(2) Sunroof Glass

Removal

1. Tilt the sunroof and open the sunshade.
2. Disconnect the battery ground cable.
3. Pull out the front of sight shield (2).
4. Remove four sunroof glass fixing Torx screws (3) to remove the sunroof glass (1).



665RW011

Installation

1. Be sure to install the sunroof weatherstrip so that the joint of the weatherstrip is on the rear side of the vehicle.
2. Temporary install the glass to the sunroof frame.
3. Open and shut the sunroof four to five times to position correctly the sunroof weatherstrip and the glass in the longitudinal and latitudinal setting positions.
4. Adjust the setting position to flush the surface between the roof panel and weatherstrip of sunroof glass.
5. Tighten the sunroof glass fixing screws to the specified torque.

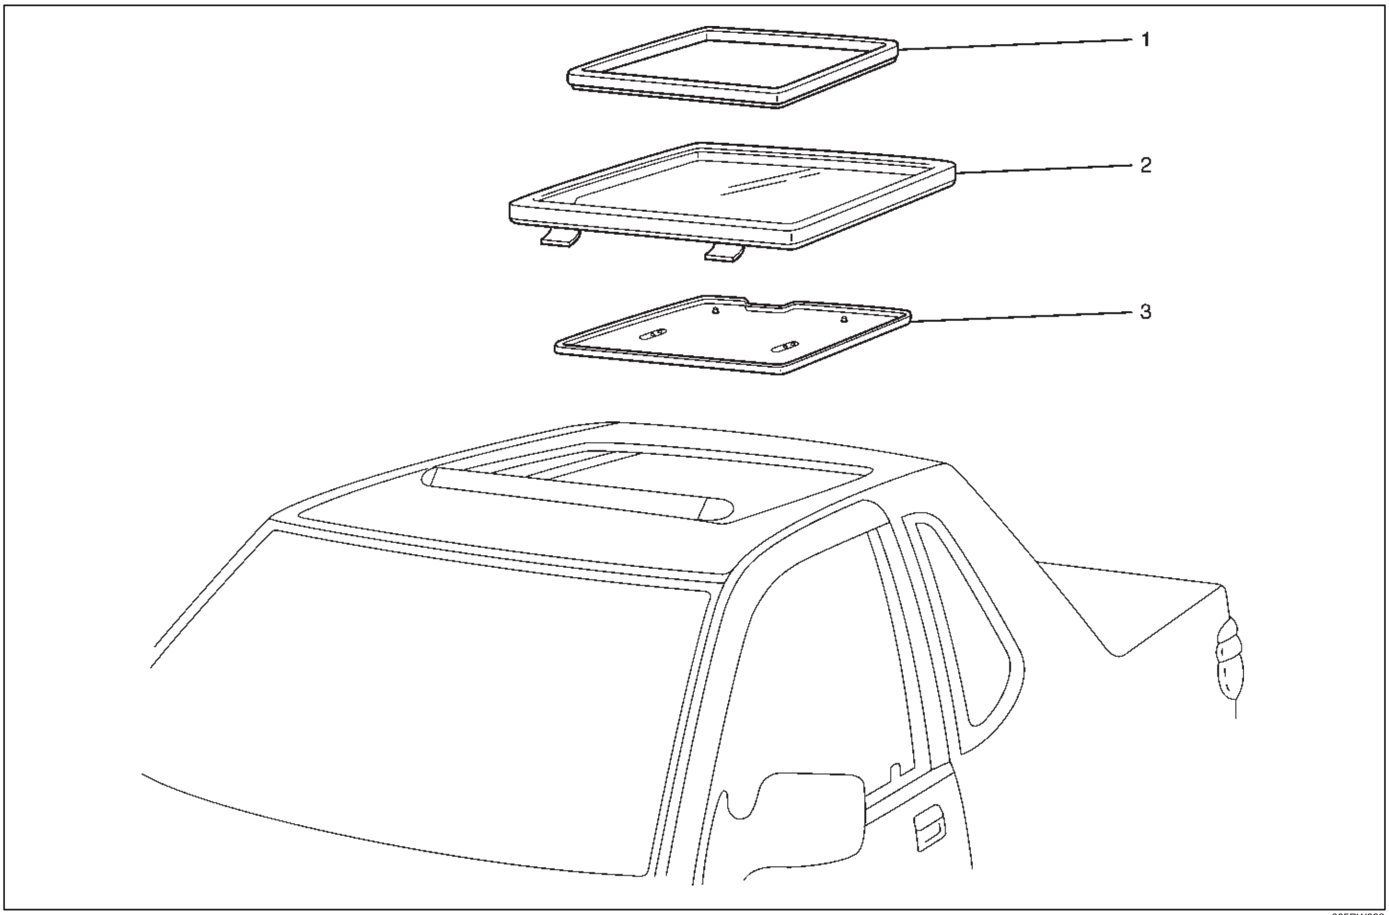
Torque: 4 N·m (35 lb in)

6. After the sunroof glass is installed, recheck the roof panel and sunroof glass for vertical install position.

   If out of standard, adjust with fixing screws.

Sunroof Glass (SWB)

Sunroof Glass and Associated Parts



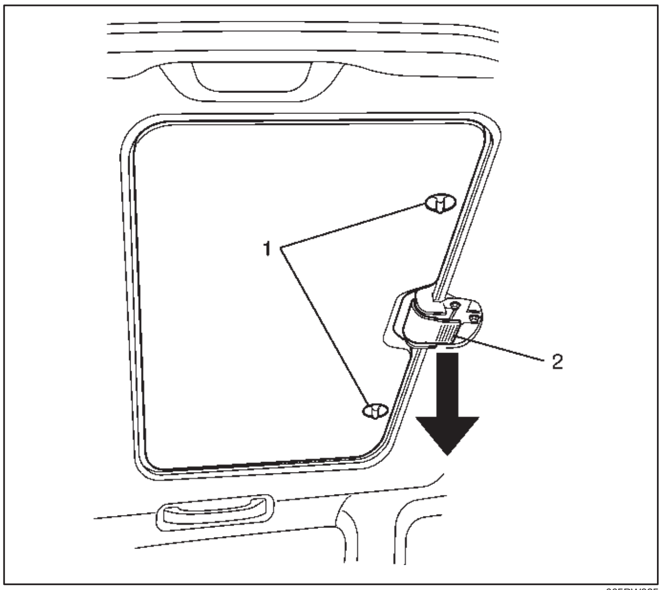
665RW028

Legend

(1) Sunroof Weather Strip
(2) Sunroof Glass Assembly
(3) Sunshade Assembly

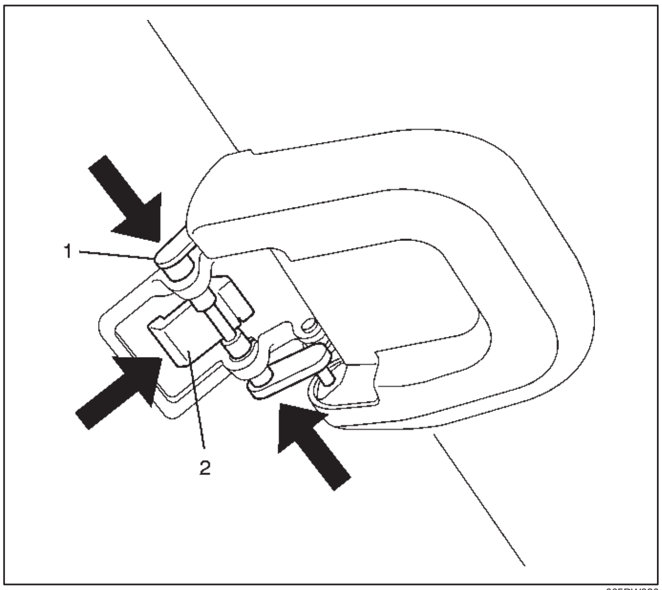
Removal

1. Disconnect the battery ground cable.
2. Remove the sunshade assembly.
   - Turn the knobs (1) 90 degrees and pull it out at angle. Then pull the sunroof handle (2) to disengage the lock.



665RW025

3. Remove the sunroof glass assembly.
   - Push the safety lever (2) behind the handle and push in on the hinge pins (1) from the left and right to disengage them. Raise the rear end of the sunroof glass assembly at an angle pull it free.



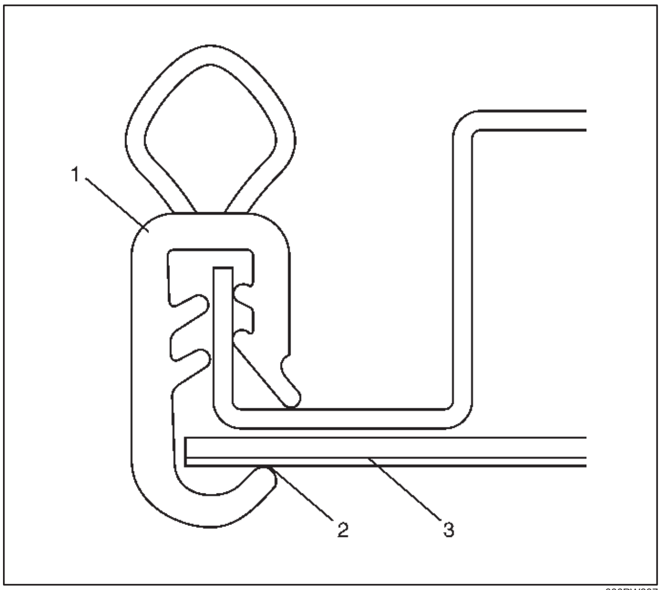
665RW026

4. Remove the sunroof handle cover and sunroof handle plate.
   - Remove the screw form the cover and the three fixing nuts form the plate.
5. Remove the weather strip.
6. Remove the headlining.
   - Refer to Headlining in Exterior/Interior Trim section.

Installation

To install, follow the removal steps in the reverse order, nothing the following points.

1. When attaching the sunroof weather strip (1), make sure that the lip (2) securely overlaps the headlining (3).
   - Assemble with the positioning marks centered toward the rear of the vehicle.



666RW007

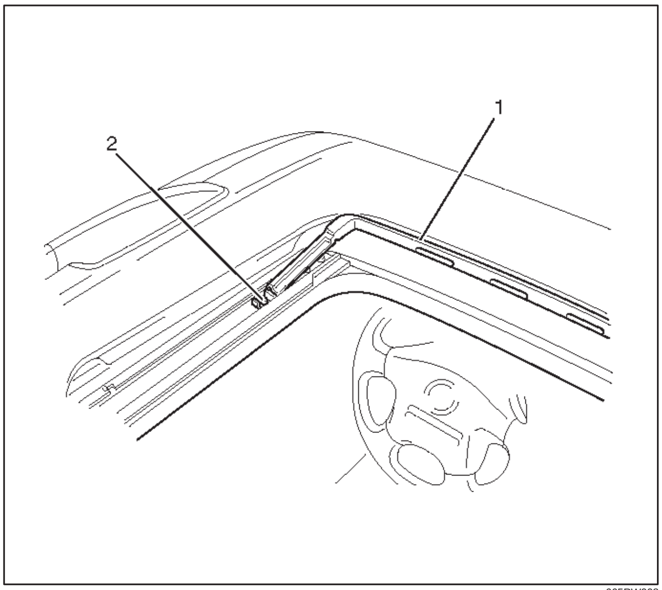
2. Tighten the sunroof handle plate fixing nuts to the specified torque.

Torque: 8 N·m (69 lb in)

Sunroof Deflector (LWB)

Removal

1. Open the sunroof.
   - Let a 5 mm drill go through two blind rivets (2) to disengage riveted portions.
2. Remove the sunroof deflector (1).



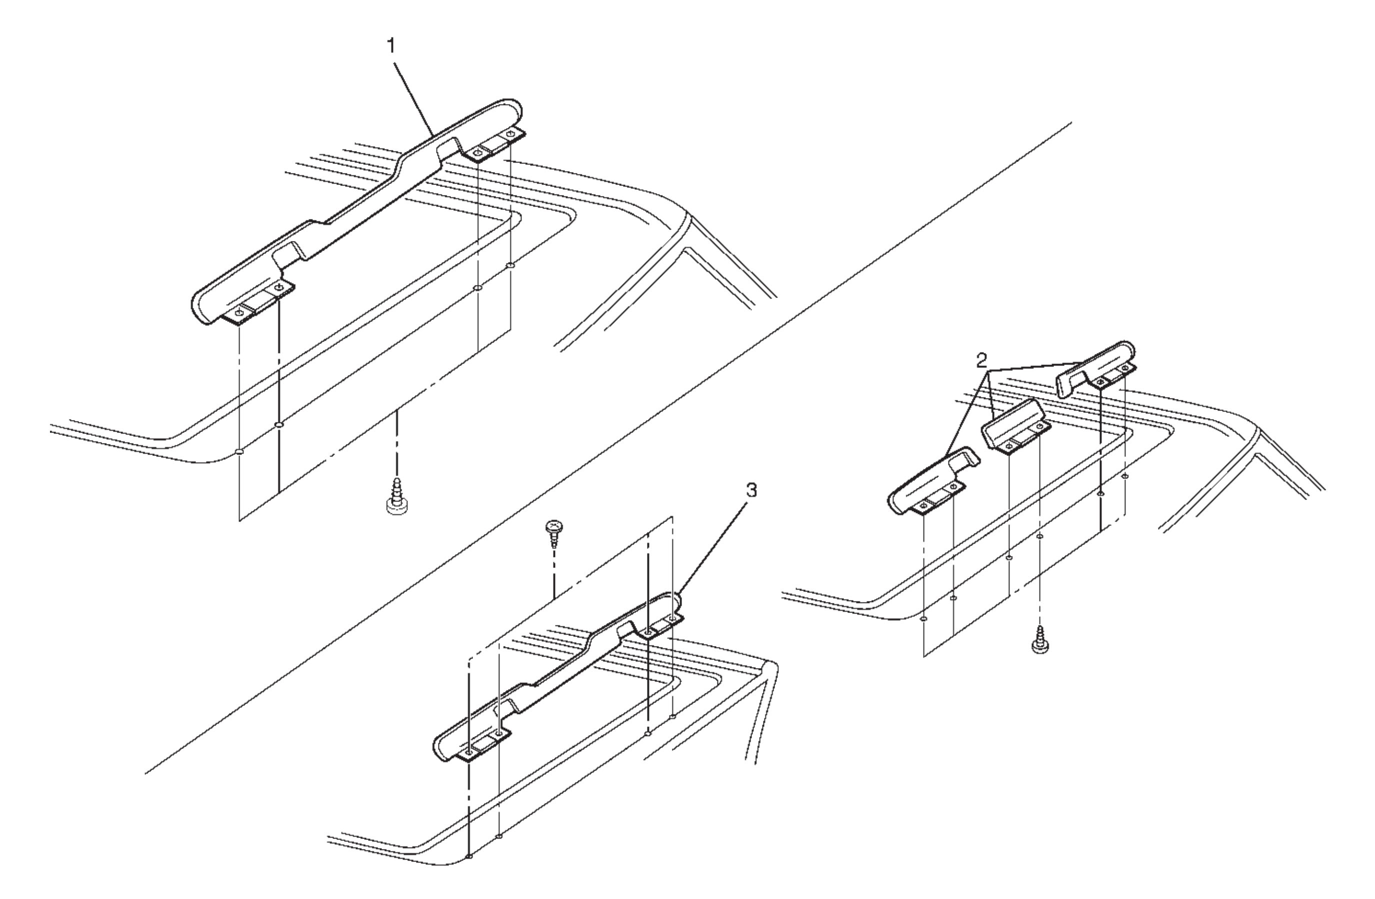
665RW008

Installation

To install, follow the removal steps in the reverse order.

Sunroof Deflector (SWB)

Parts Location



Legend

(1) Sunroof Deflector Assembly (Soft Top)
(2) Front Sunroof Deflector Assembly (Resin Top)
(3) Rear Sunroof Deflector Assembly (Resin Top)

Removal

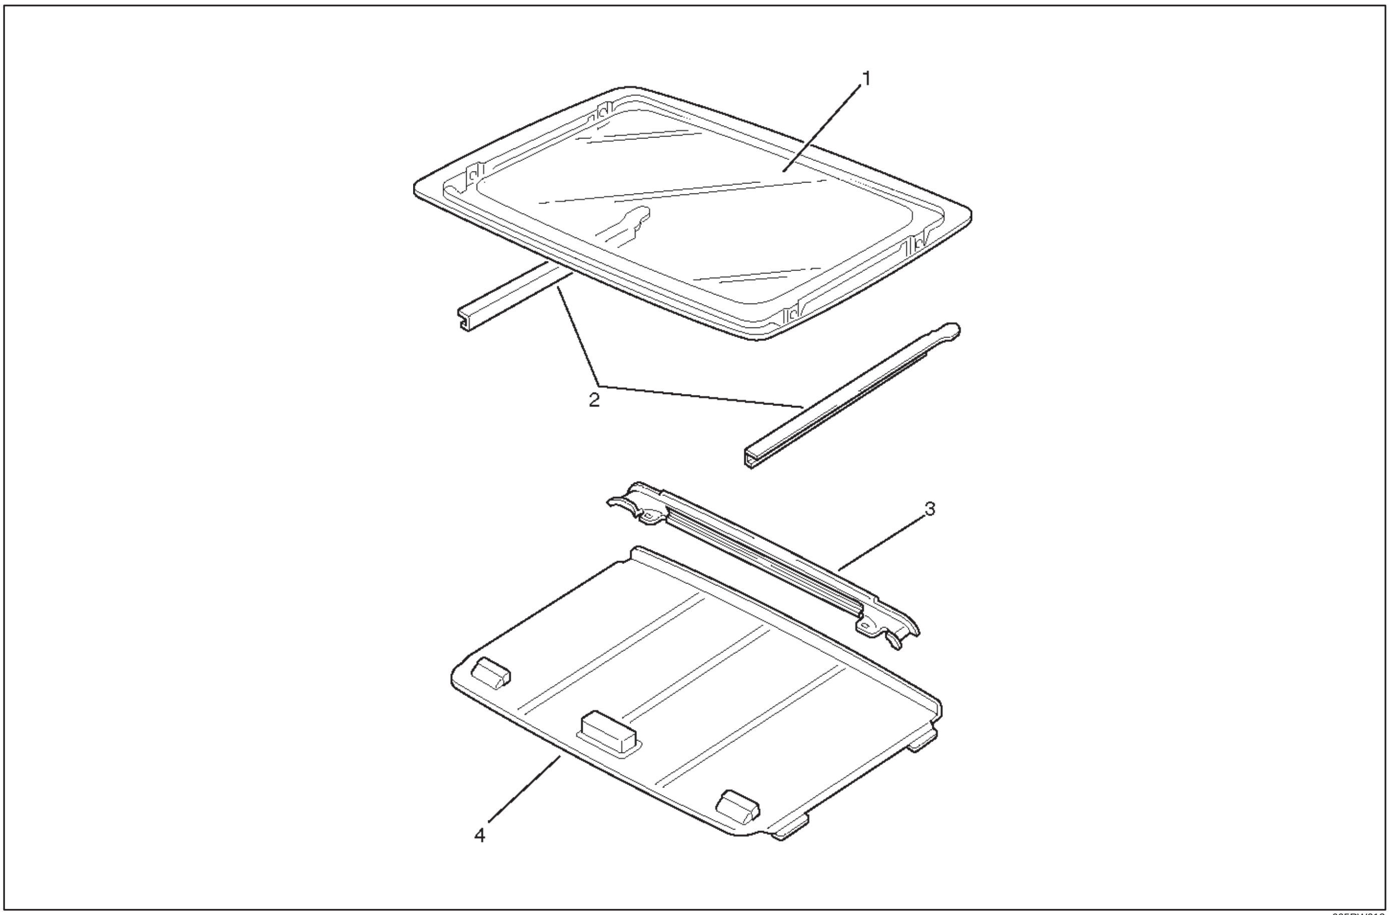
1. Disconnect the battery ground cable.
2. Remove the sunroof glass.
   - Refer to Sunroof Glass in this section.
3. Remove the headlining (Front roof side).
   - Refer to Headlining in Exterior/Interior Trim section.
4. Remove the sunroof deflector.
   - Remove the fixing screws.

Installation

To install, follow the removal steps in the reverse order.

Sunshade (LWB)

Disassembled View

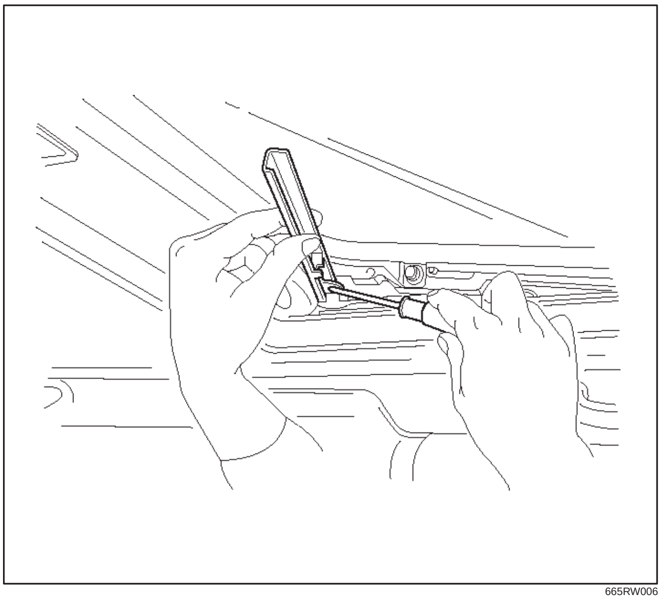


665RW012

Legend
(1) Sunroof Glass
(2) Sight Shield
(3) Sunshade Stopper
(4) Sunshade

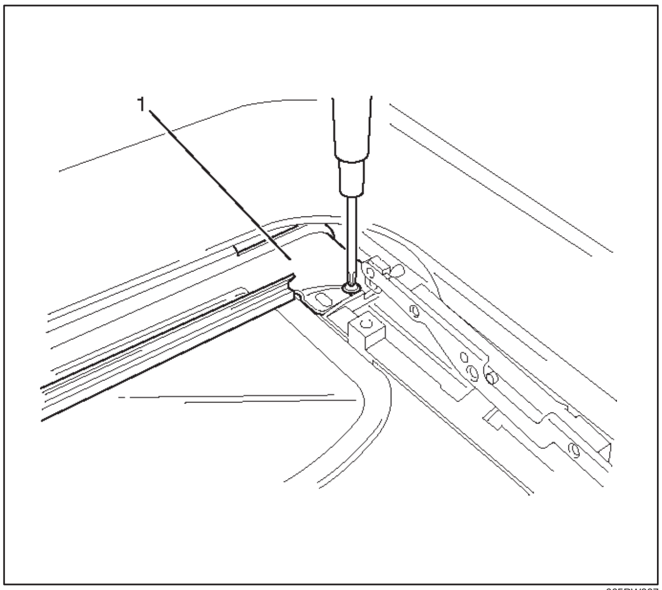
Removal

1. Tilt the sunroof.
2. Disconnect the battery ground cable.
3. Remove the sunroof glass.
   - Refer to Sunroof Glass in this section.
4. Pull the sight shield upward using screwdriver.



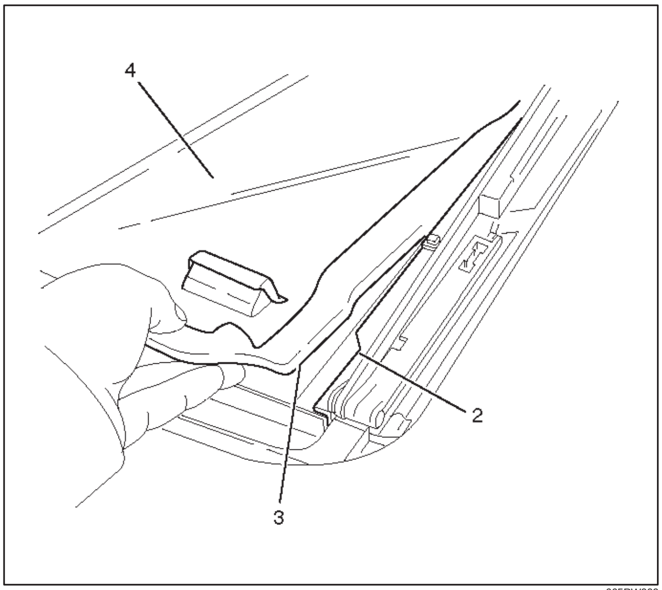
665RW006

5. Remove 2 sunshade stopper fixing screws and remove sunshade stopper (1).



665RW007

6. Pull out the sunshade (4) up to the guide rail edge. Lift the front of sunshade and clear the projection (3) of sunshade through the notch (2) of guide rail edge, then draw the sunshade out of the roof.



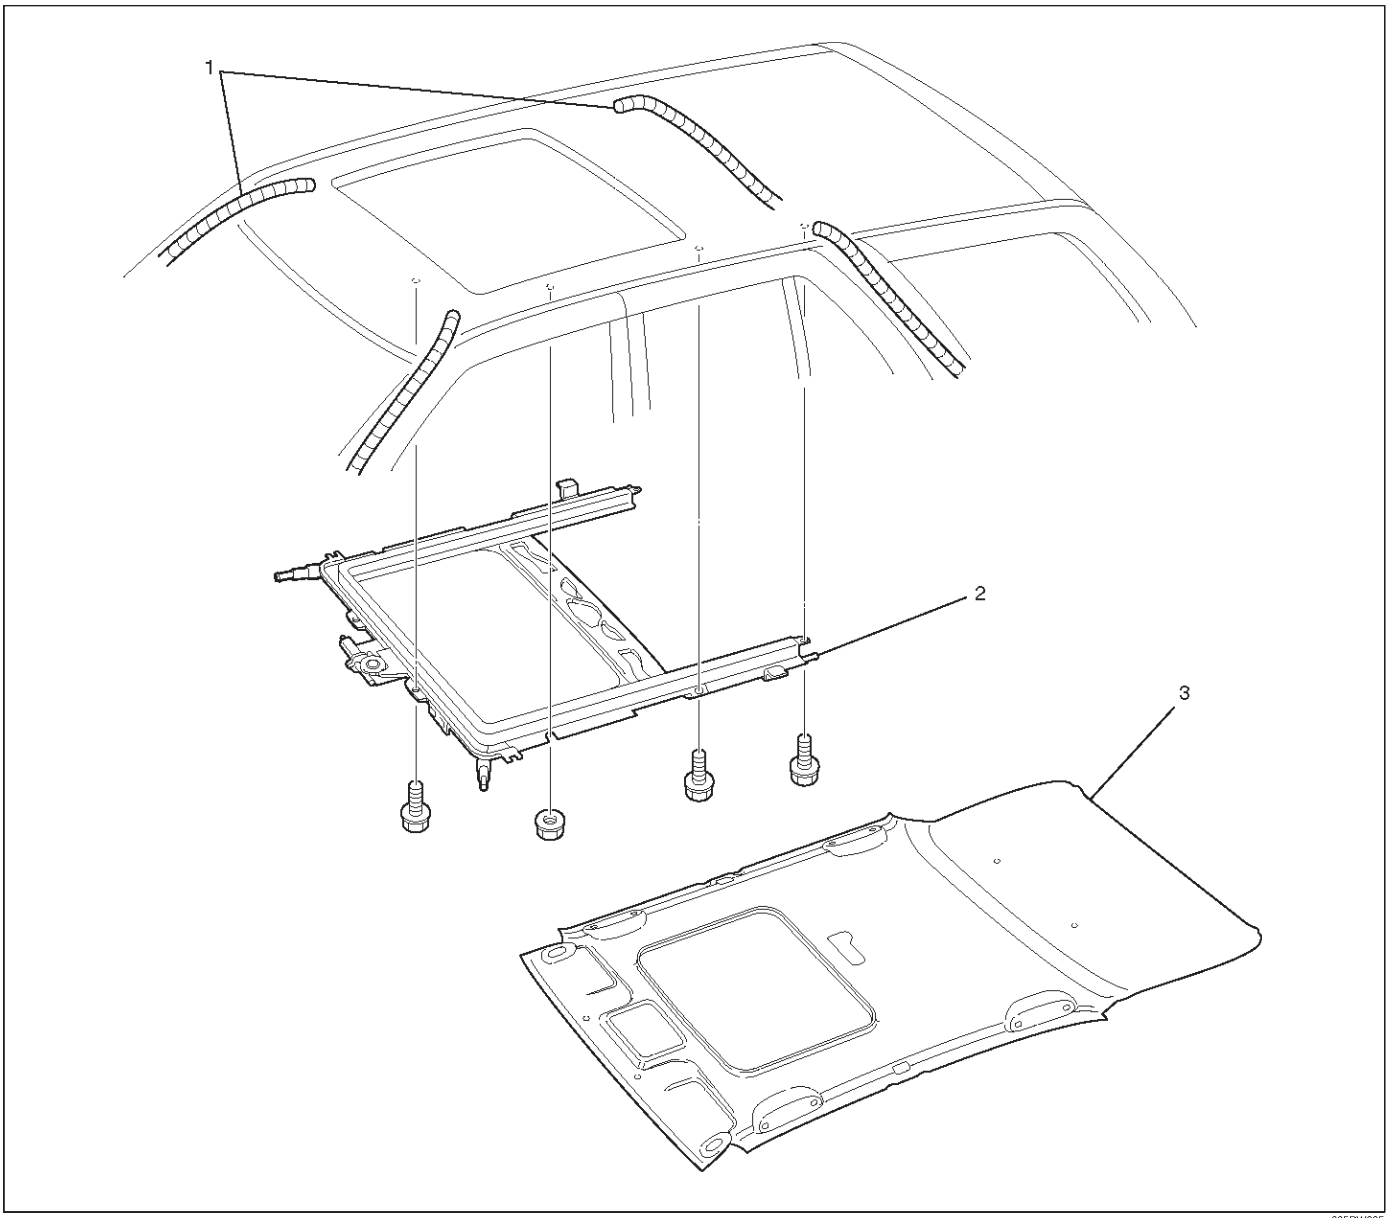
665RW009

Installation

To install, follow the removal steps in the reverse order.

Sunroof Frame Complete Assembly (LWB)

Sunroof Frame Complete Assembly and Associated Parts

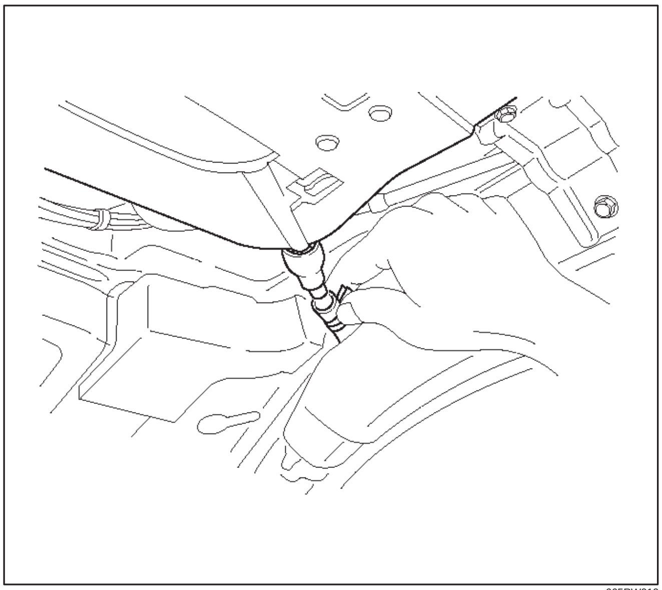


Legend
(1) Sunroof Drain Hose
(2) Sunroof Frame Complete Assembly
(3) Headlining

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining.
   - Refer to Headlining in Exterior/Interior Trim section.

3. Disconnect the sunroof drain hose at the sunroof frame side as shown in the figure.



665RW010

4. Disconnect the sunroof harness connection.
5. Remove two sunroof frame complete assembly fixing nuts (front side) and six fixing bolts from the frame complete assembly, and then remove the sunroof frame complete assembly.

NOTE: Be sure to remove the frame complete assembly while supporting it.

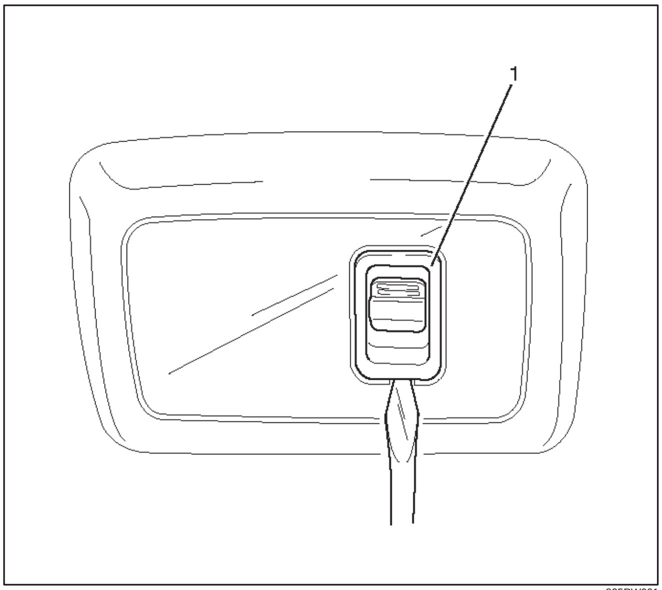
Installation

1. Install the sunroof frame complete assembly.
2. After installing the frame complete assembly, loosen the sunroof glass fixing nuts and adjust the sunroof glass setting position.
   - Refer to Sunroof Glass in this section.
3. Install the sunroof drain hose.
4. Install the headlining.
   - Refer to Headlining in Exterior/Interior Trim section.

Sunroof Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the sunroof switch (1).
   - Remove the switch by pushing the spring with the tip of a screwdriver.
   - Disconnect the switch connector.



825RW091

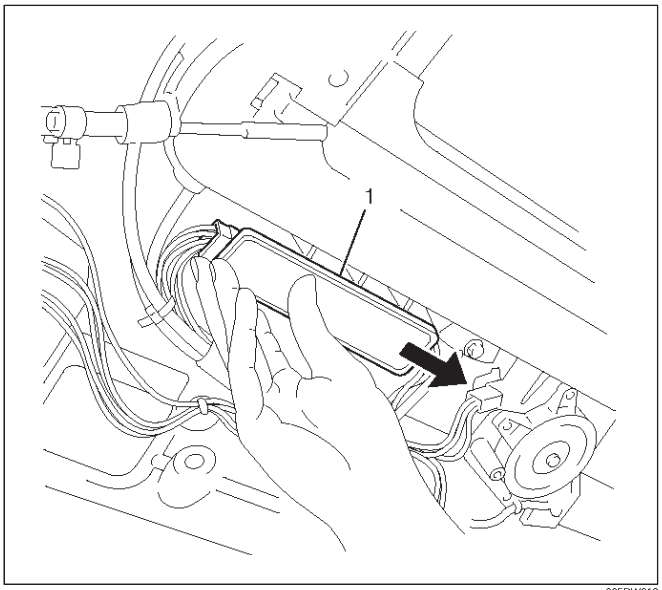
Installation

To install, follow the removal steps in the reverse order.

Sunroof Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining (2).
   - Refer to Headlining in Exterior/Interior Trim section.
3. Remove the sunroof control unit (1).
   - Disconnect two connectors.
   - Remove two screws.



665RW013

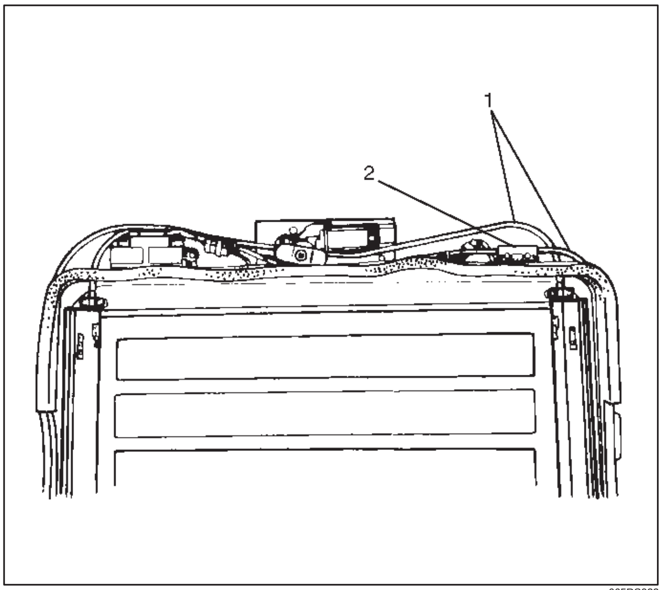
Installation

To install, follow the removal steps in the reverse order.

Safety Stop Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the sunroof drive unit assembly (1) to remove the safety stop switch (2).
   - Refer to Sunroof Frame Complete Assembly in this section.



665RS022

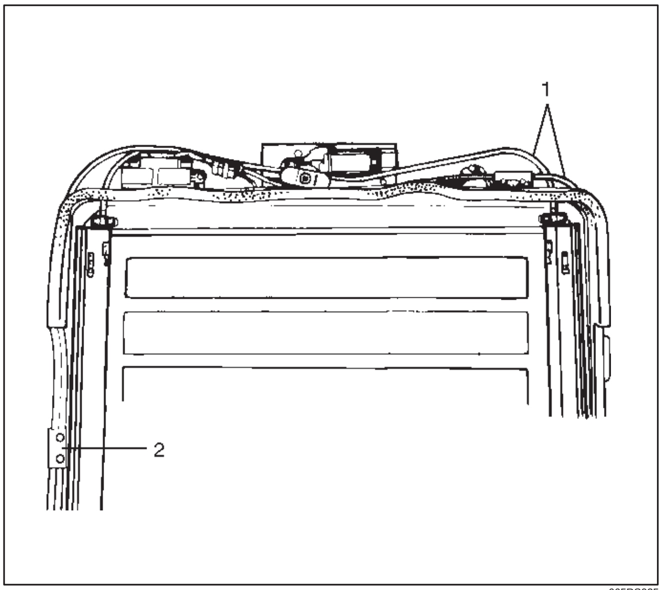
Installation

To install, follow the removal steps in the reverse order.

Limit Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the sunroof drive unit assembly (1) to remove the limit switch (2).
   - Refer to Sunroof Frame Complete Assembly in this section.



665RS025

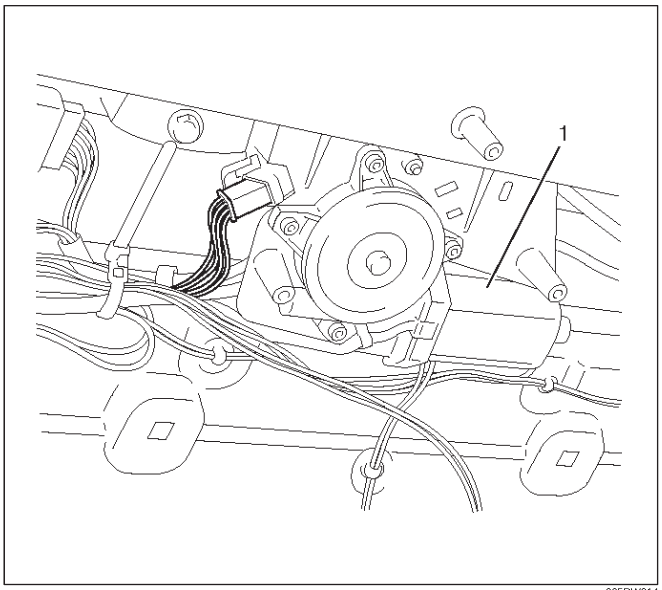
Installation

To install, follow the removal steps in the reverse order.

Sunroof Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining (2).
   - Refer to Headlining in Exterior/Interior Trim section.
3. Remove the sunroof motor (1).
   - Disconnect the connector.
   - Remove three nuts and two screws.



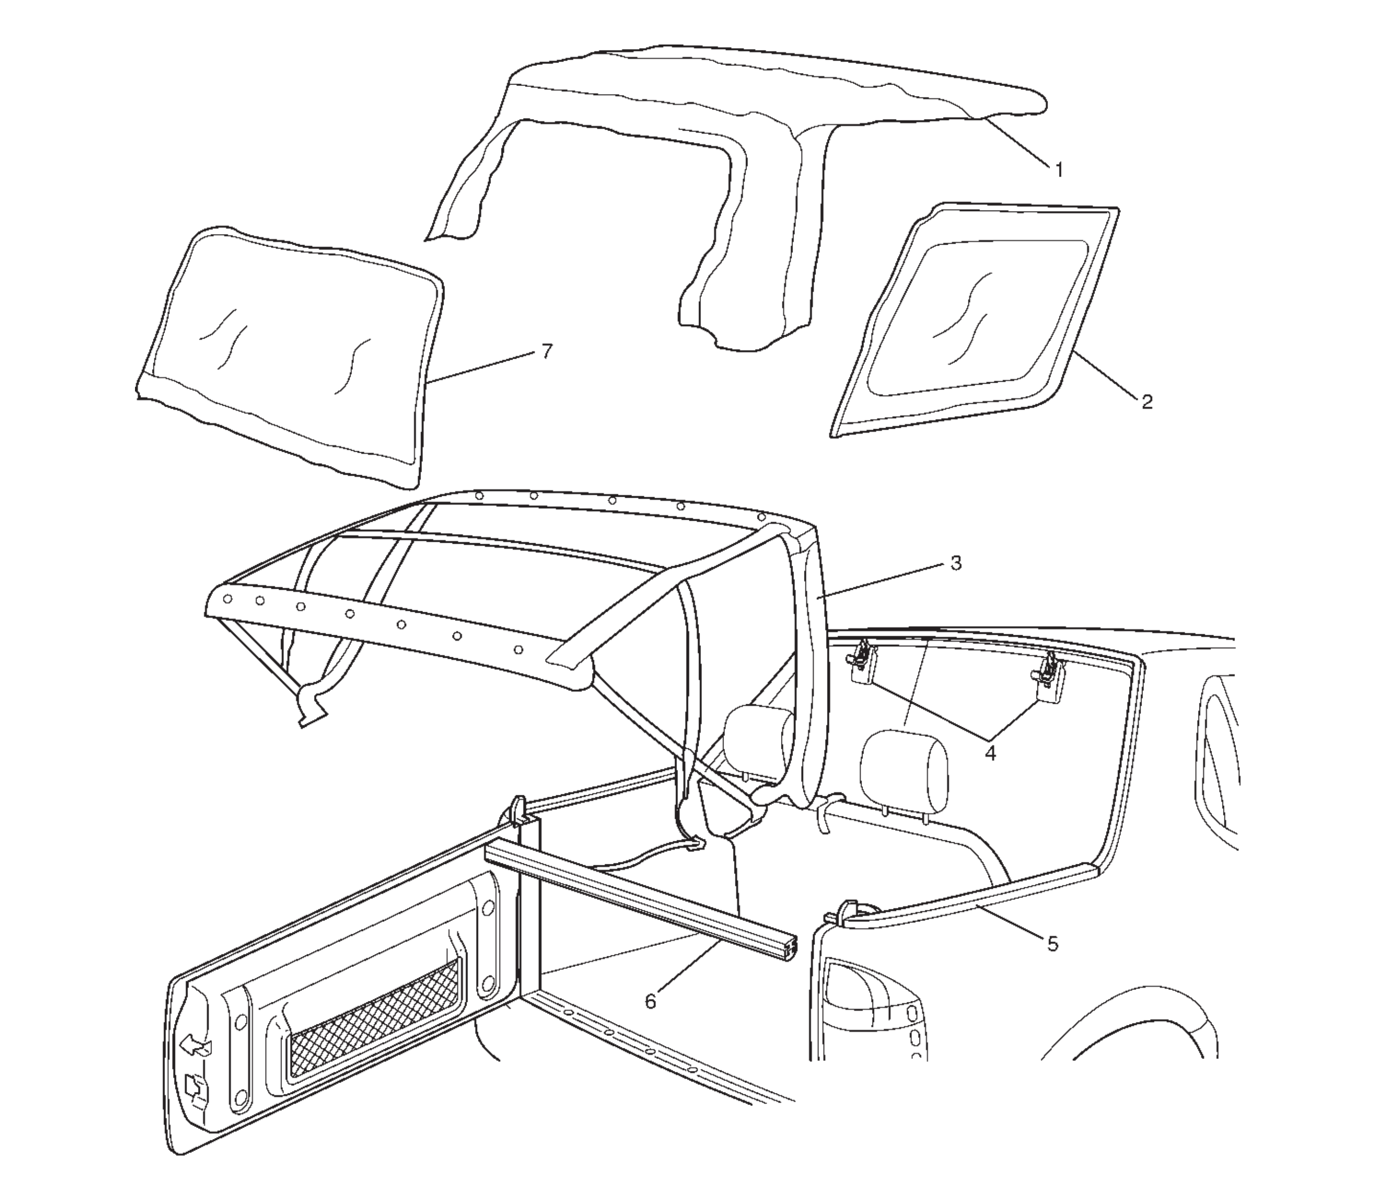
665RW014

Installation

To install, follow the removal steps in the reverse order.

Soft Top Assembly

Soft Top Assembly and Associated Parts



Legend

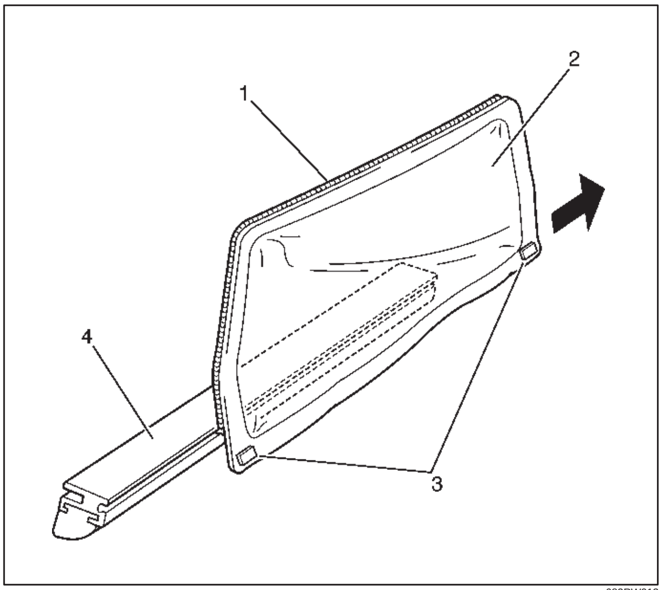
(1) Tarpaulin Assembly
(2) Quarter Window Assembly
(3) Tarpaulin Frame Assembly
(4) Soft Top Latch Assembly
(5) Quarter Moulding Assembly
(6) Support Bar Assembly
(7) Back Window Assembly

Removal

1. Remove the quarter window assembly (LH & RH).
   - Peel off the velcro fasteners and unzip the zippers.
2. Remove the back window assembly (2).
   - Peel off the velcro fasteners (3), unzip the zipper (1) and pull the back window assembly toward the rear together with the support bar assembly (4). Then slide the back window out to the side.

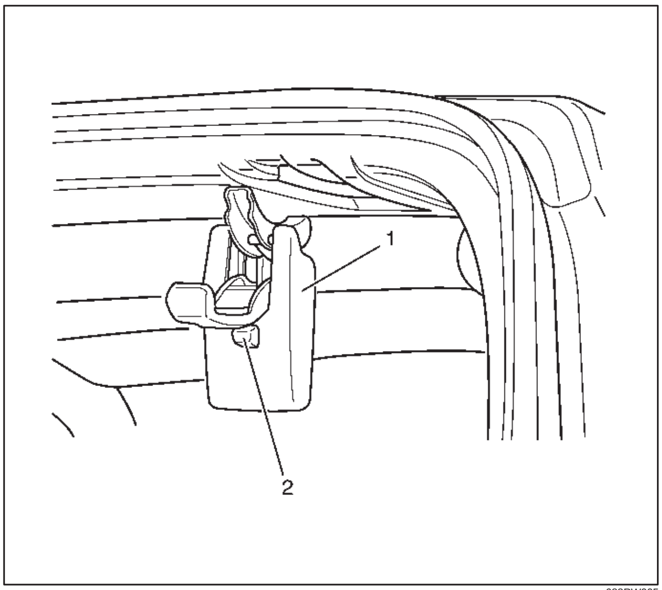
NOTE: After removing the side windows and back window, be careful not to bend then or place other objects on top of them as this could scratch or crack them.

Exercise caution when handling and storing the windows.



682RW013

3. Press the lock botton (2) of the soft top latch assembly (1) and lower the lock knob to disengage the lock. Then remove the hooks of the tarpaulin frame assembly (LH & RH).



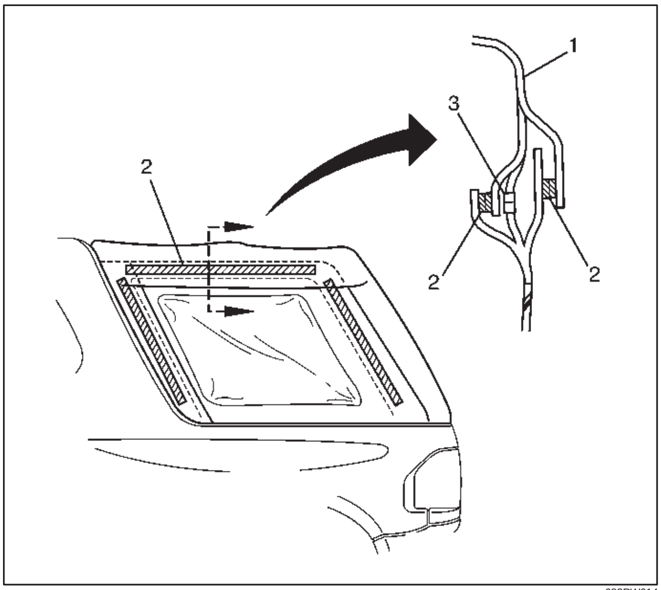
688RW005

4. Remove the tarpautin assembly.
   - Disengage the 14 hocks.
5. Remove the tarpautin frame assembly.
   - Remove the four fixing bolts.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

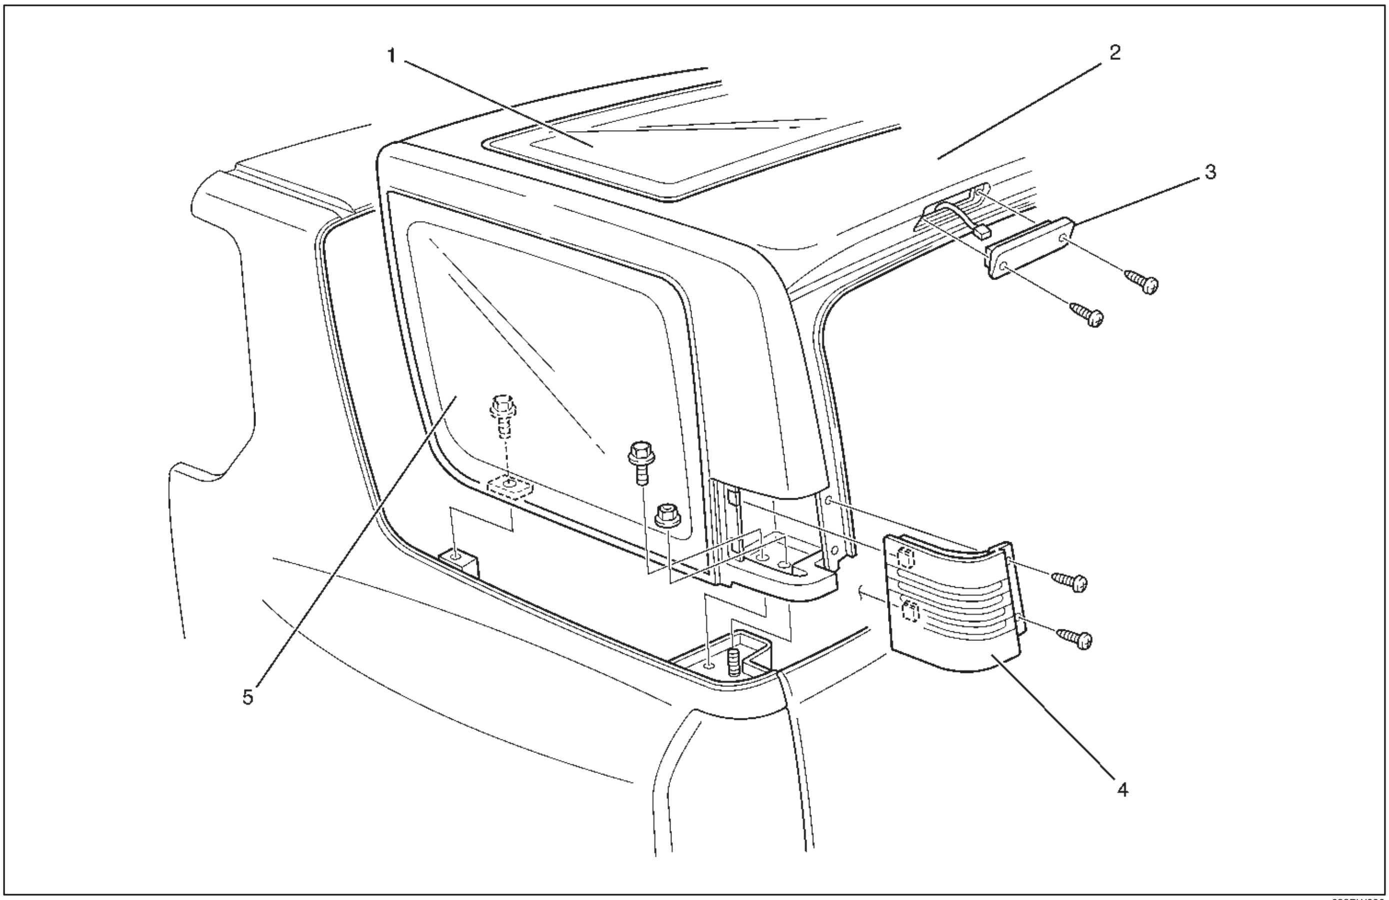
1. After securely covering the zippers (3) with the flaps (1), smooth out the fastener tape (2) with your hands so that there are on folds or turned up portions of the flaps.



682RW014

Resin Top Assembly

Resin Top Assembly and Associated Parts

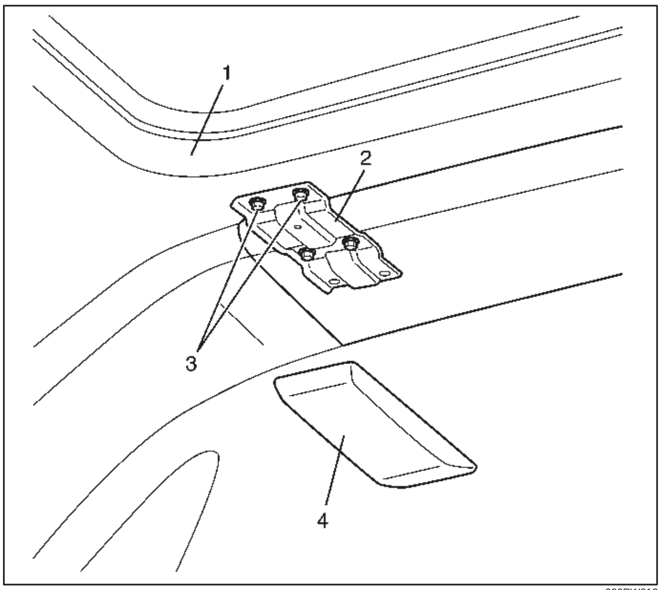


688RW006

Legend
(1) Rear Sun Roof Assembly
(2) Resin Top Assembly
(3) High Mount Stoplight
(4) Air Outlet Grille Assembly
(5) Rear Quarter Glass

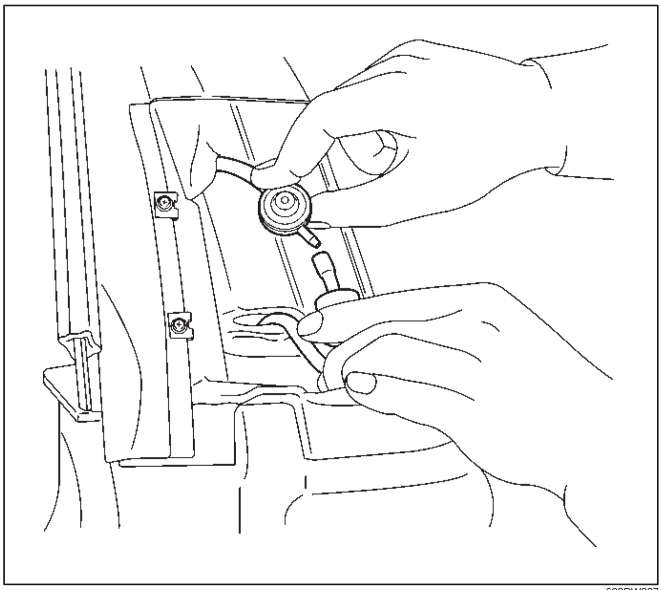
Removal

1. Disconnect the battery ground cable.
2. Remove the rear sun roof glass.
   - Refer to Sun Roof Glass in this section.
3. Remove the sun roof deflector.
   - Remove the four fixing screws.
4. Remove the rear roof bracket covers (4) and remove the both sets of two bolts (3) on the resin top sides of the rear roof brackets (2).



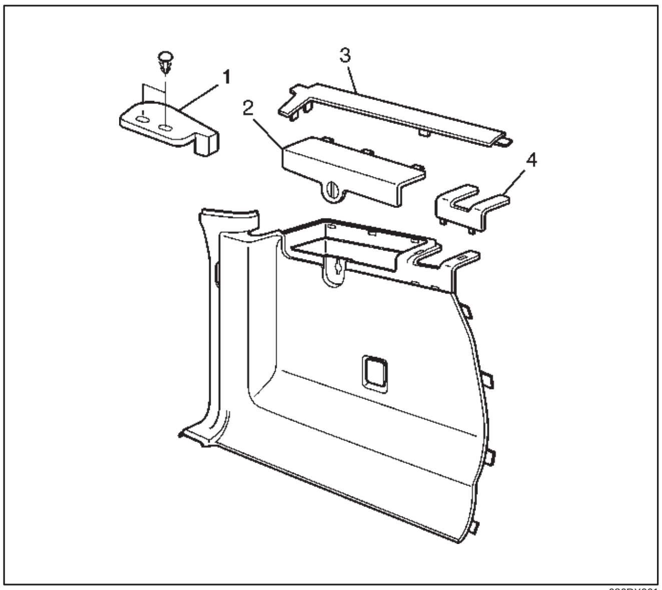
666RW010

5. Remove the air outlet grille assembly (LH & RH).
   - Remove the two screws and pull the grille assemblies off toward the rear.
6. Remove the luggage light assembly and disconnect the connector.
7. Remove the high mount stoplight assembly and disconnect the connector.
8. Disconnect the rear washer hose (Right side, inside air outlet grille assembly).



688RW007

9. Disconnect the harness connector for the resin top (Left side, behind the luggage side trim).
   - Remove the canopy cover (1), the luggage side lid (2) and luggage side upper cover (3). Then pull out the harness and disconnect the connector.



686RX001

10. Remove the resin top assembly.
    - Remove the two fixing bolts each and nut each from the left and right sides, then lift the resin top up and off.

Installation

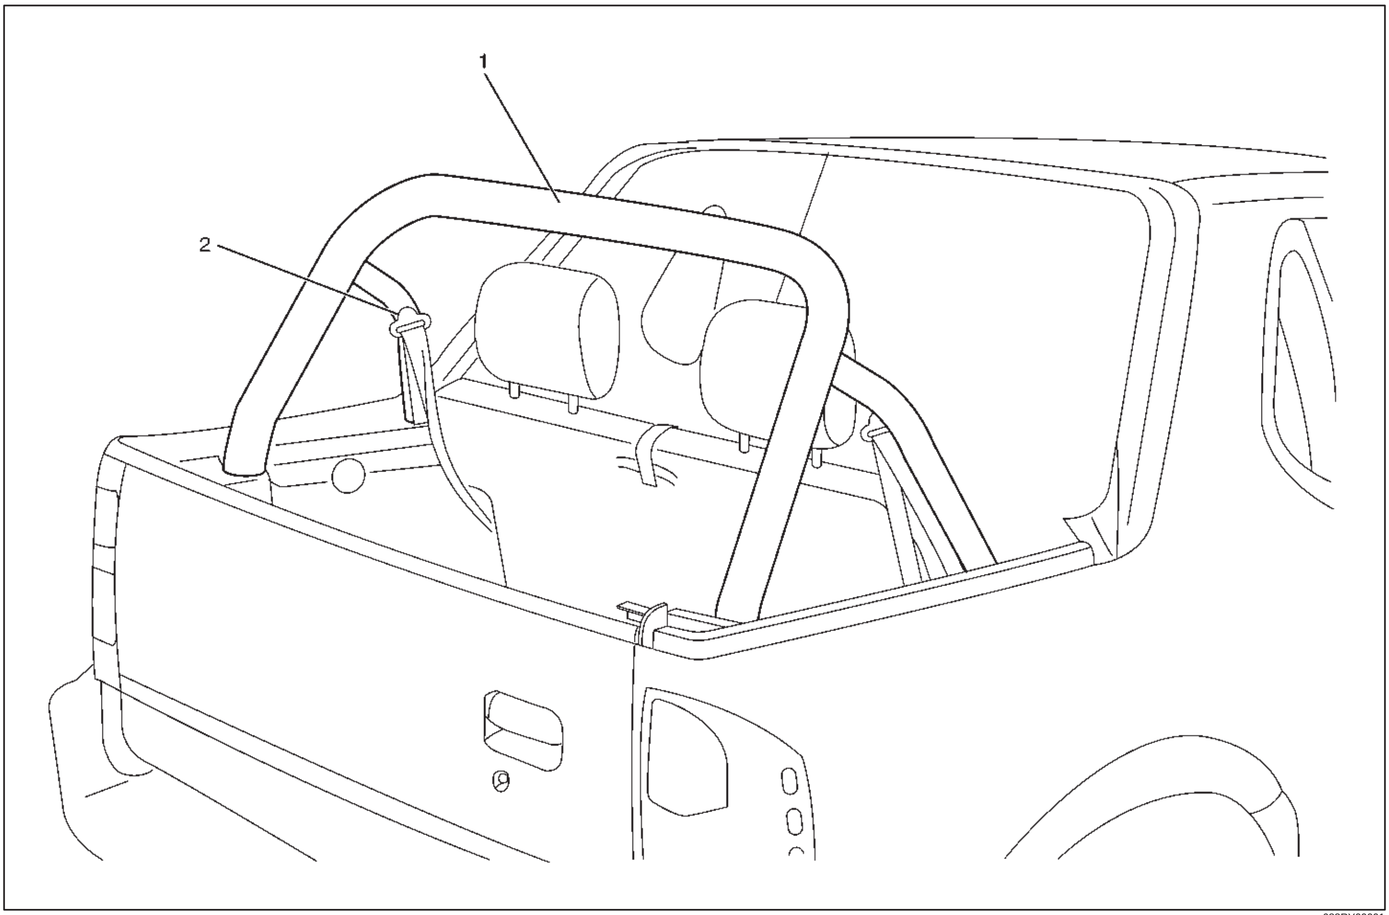
To install, follow the removal steps in the reverse order, noting the following points.

1. Removing and mounting the resin top should always be performed by two persons.
2. Tighten the resin top fixing bolts and nuts to the specified torque.

Torque: 15 N·m (11 lb ft)

Seat Belt Cross Bar Assembly

Seat Belt Cross Bar Assembly and Associated Parts

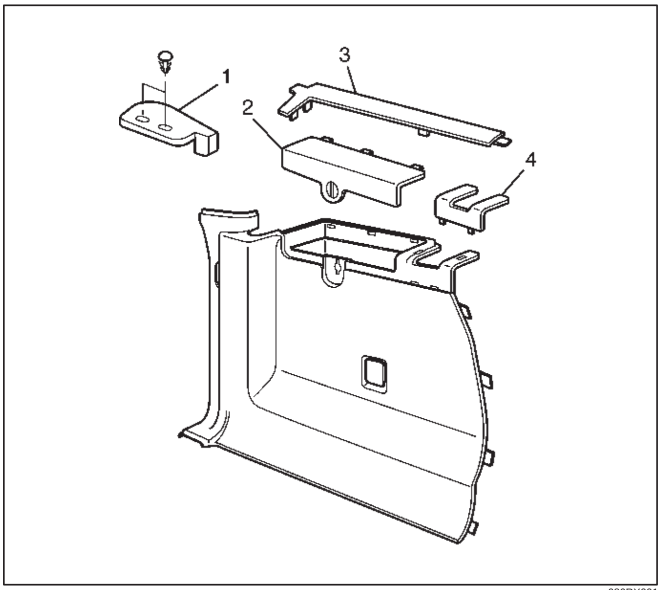


688RY00001

Legend
(1) Seat Belt Cross Bar Assembly
(2) Rear Seat Belt Assembly

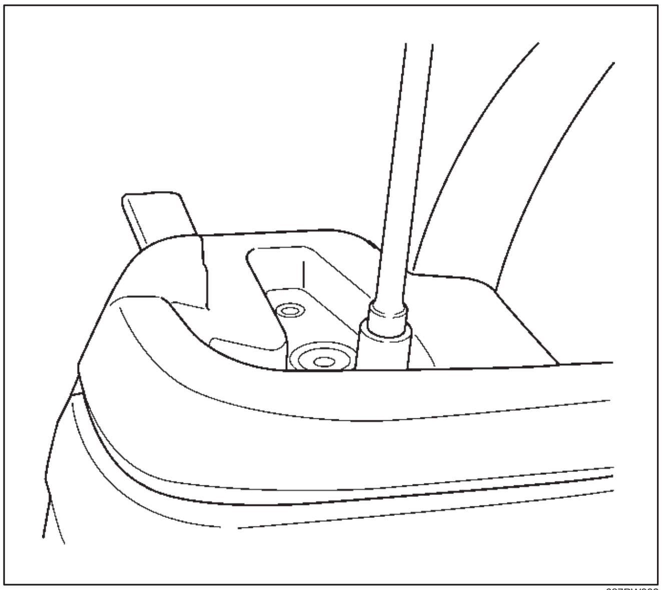
Removal

1. Disconnect the battery ground cable.
2. Remove the soft top assembly or resin top Assembly.
   - Refer to Soft Top assembly or Resin Top Assembly in this section.
3. Remove the luggage side lid (2).
4. Remove the luggage side upper cover (3).
5. Remove the luggage side front cover (4).
6. Remove the canopy cover (1) (Resin top model).
   - Remove the two fixing clips.



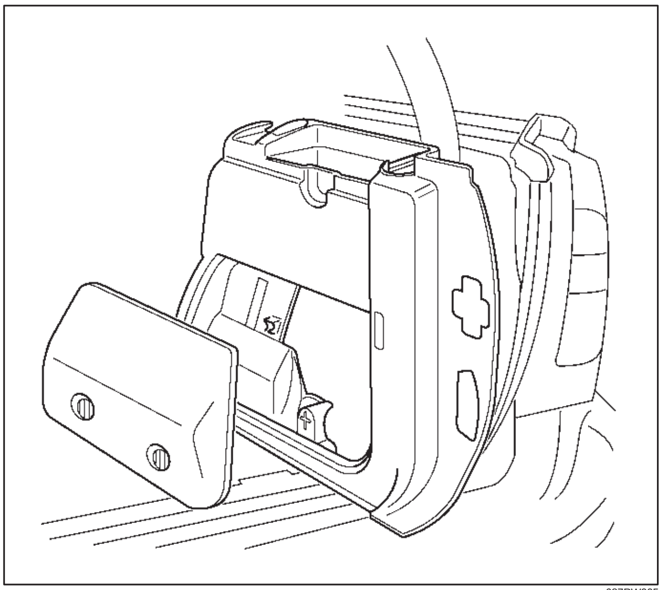
686RX001

7. Remove the left and right quarter side moldings (Soft top model).
   - Remove the six bolts and six screws.



687RW002

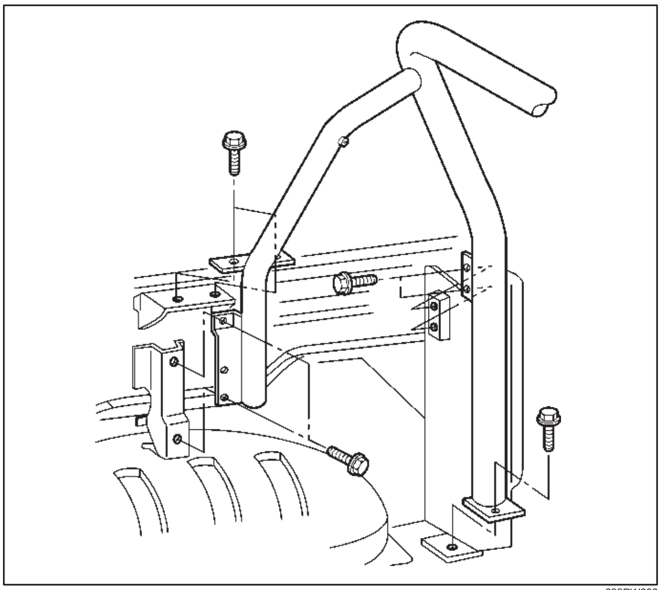
8. Remove the weather strip.
9. Remove the rear end floor trim cover.
   - Remove the five fixing screws.
10. Remove the right luggage side trim cover.
    - Remove the jack & tool lid and take out the tools. Then remove the fixing screw and pull the clips out from the body panel.



687RW005

- To remove the left luggage side trim cover, disconnect the accessory socket connector.

11. Remove the rear seat belt assembly.
    - Refer to Rear Seat Belt in Restraints section.
12. Remove the seat belt cross bar assembly.
    - Remove the two sets of seven fixing bolts on the left and right sides. Note that on the soft top model, two sets of the fixing bolts are also used to secure the tarpaulin frame assembly in place, and that on the resin top model, one set of the fixing bolts are also used to secure the resin top in place.



688RW009

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the rear seat belt anchor bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

2. Tighten the seat belt cross bar assembly fixing bolts to the specified torque.

   Torque: 19 N·m (14 lb ft)

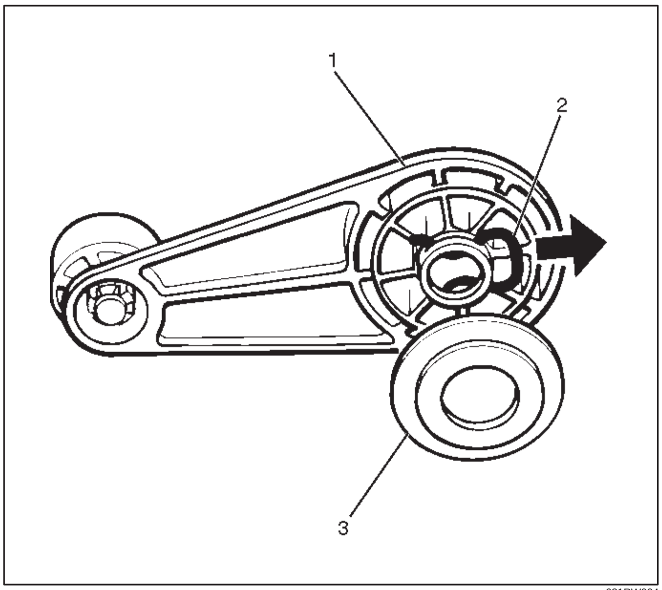
(12) Grip Cover
(13) Inside Handle
(14) Power Window Switch/Window Regulator Handle
(15) Speaker Assembly
(16) Tweeter
(17) Door Mirror Cover
(18) Door Mirror Assembly

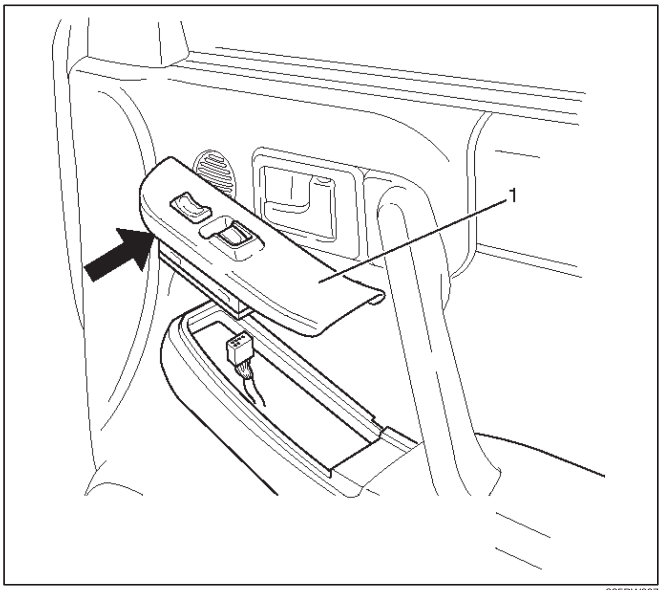
Removal

1. Disconnect the battery ground cable.
2. Remove the door mirror assembly.
   - Refer to Door Mirror Assembly in this section.
3. Remove the regulator handle (1).
   - Pull the hook (2) out and remove the regulator handle.



631RW004

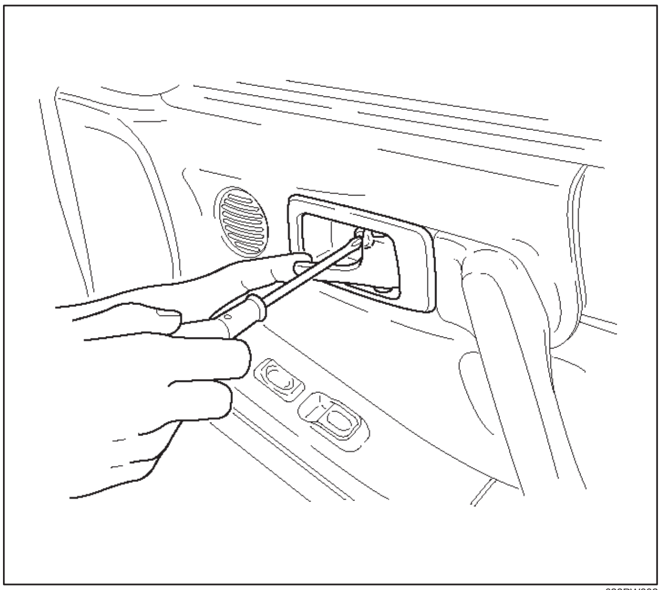
4. Remove the power window switch (1).
   - Pry the power window switch out and disconnect the switch connector.



825RW097

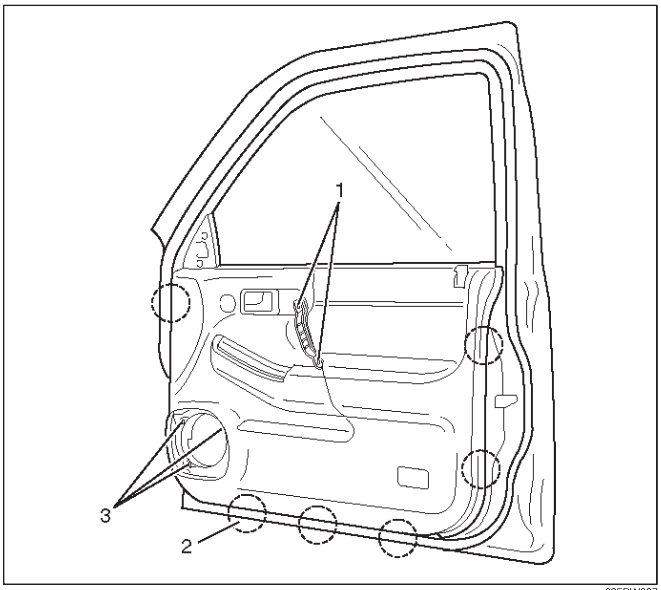
5. Remove the speaker cover.
6. Remove the front speaker.
   - Remove the front speaker fixing screws in order to disconnect the speaker connector.
7. Remove the inside handle fixing screw.

CAUTION: Take care not to apply excessive force on the inside handle link, lest this link is elongated, which could make it impossible to operate the door with the inside handle.



632RW003

8. Remove the door trim panel.
   - Remove 5 fixing screws (1), (3) in order to take off 6 clips (2) from the door panel.



635RW007

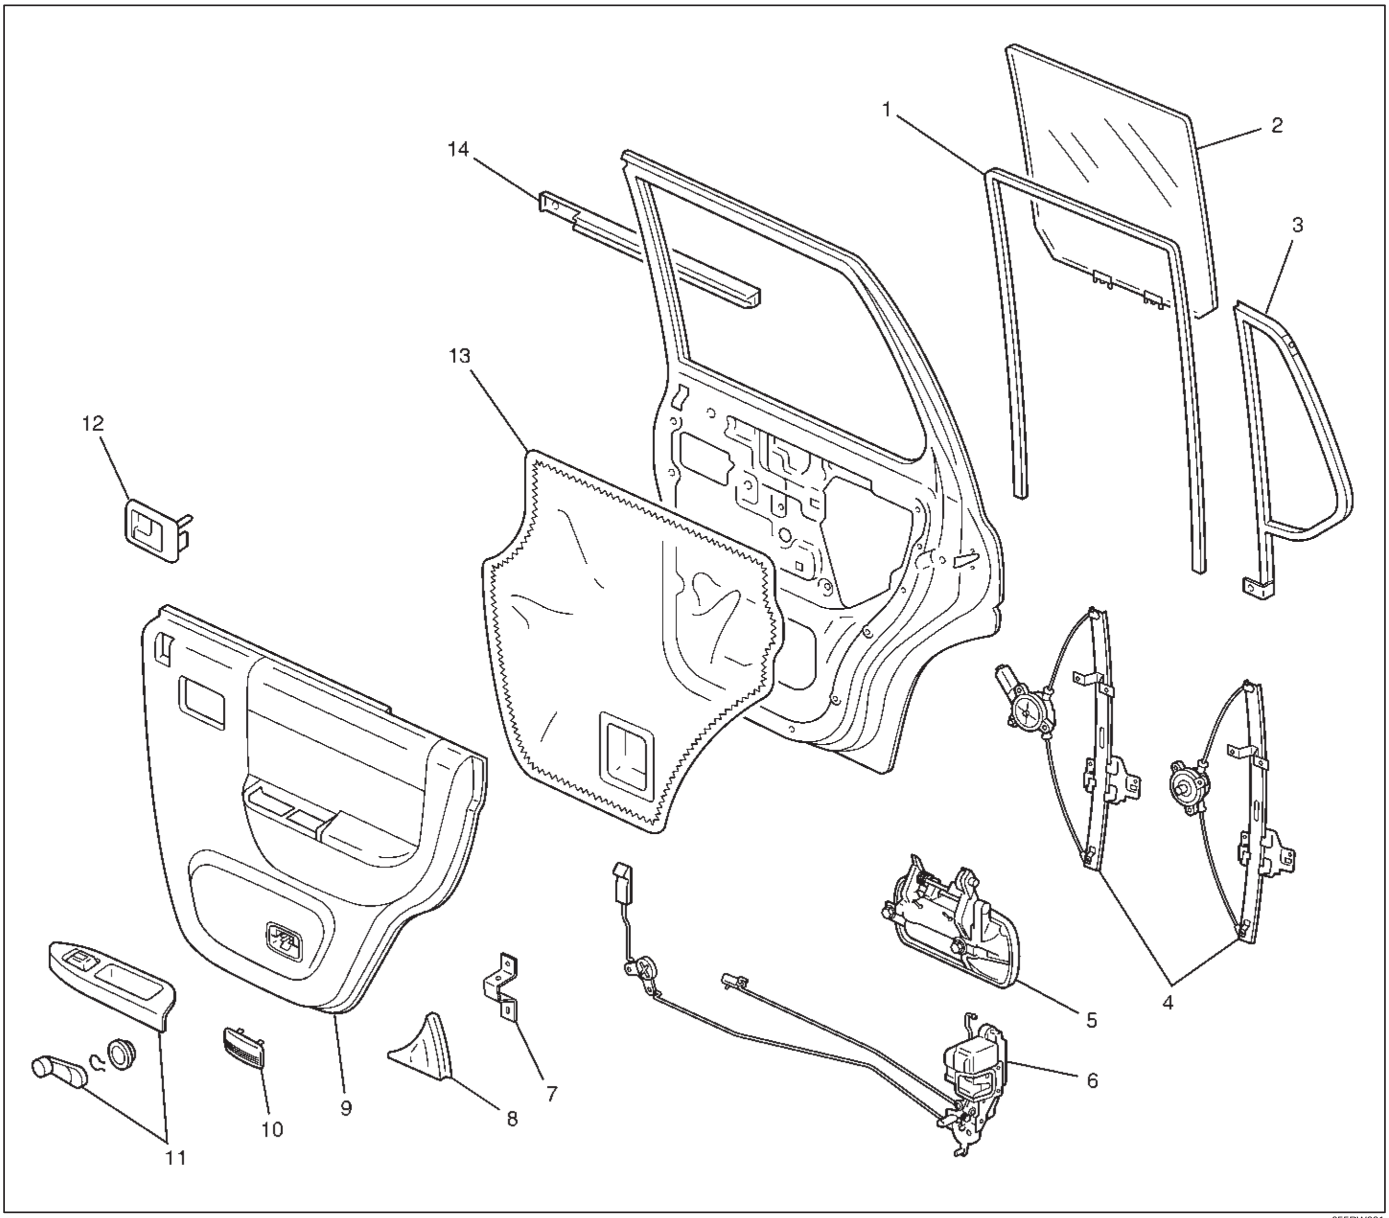
   - Disconnect the tweeter and courtesy light connectors to lift the door trim panel and unlock the engagement of the waist seal section. Then, pass the inside handle through the mounting hole of the trim panel, and detach the trim panel.
9. Remove the inside handle.
10. Remove the tweeter.

Installation

To install, follow the removal steps in the reverse order.

Rear Door Trim Panel

Rear Door Trim Panel and Associated Parts



655RW001

Legend

(1) Glass Run
(2) Glass
(3) Fix Window Glass

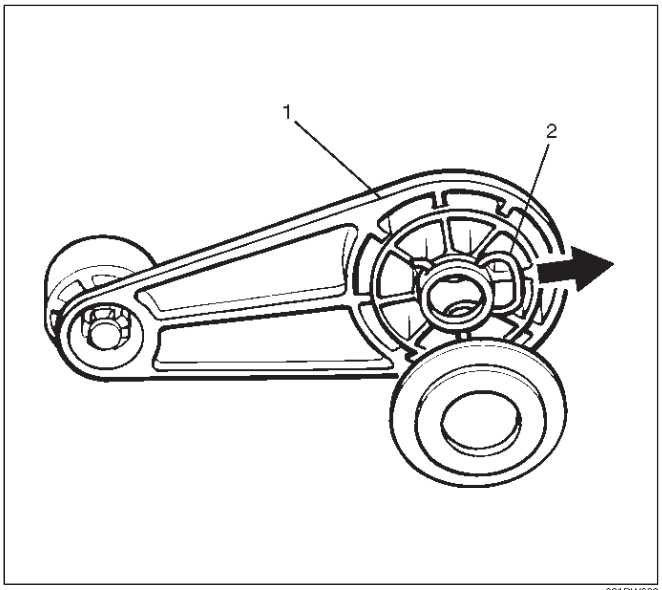
(9) Door Trim Panel
(10) Courtesy Light Lens
(11) Power Window Switch/Window Regulator Handle
(12) Inside Handle
(13) Waterproof Sheet
(14) Outer Waste Seal

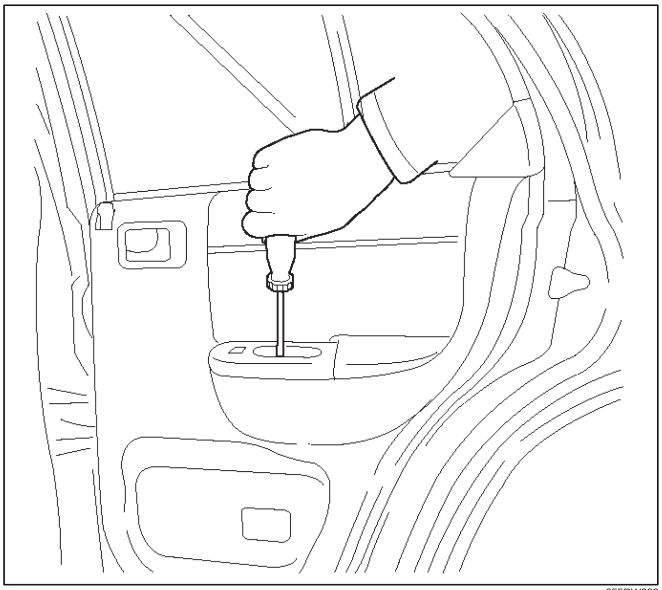
Removal

1. Disconnect the battery ground cable.
2. Remove the regulator handle(1).
   - Pull the hook(2) out and remove the regulator handle.



631RW002

3. Remove the one screw from the pullcase.

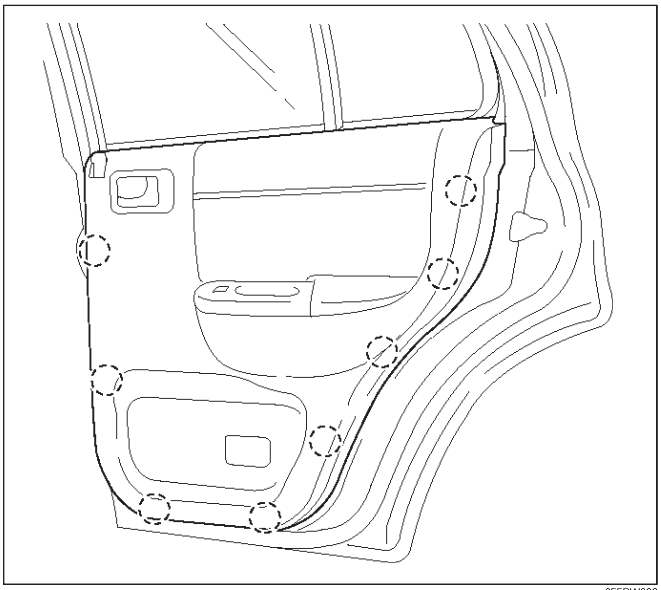


655RW003

4. Remove the inside handle fixing screw.

CAUTION: Take care not to apply excessive force on the inside handle link, lest this link be elongated, which could make it impossible to operate the door with the inside handle.

5. Remove the rear door corner garnish.
6. Remove the door trim panel.
   - Pull out the eight clip positions from the door panel.



655RW002

- Disconnect the power window switch and courtesy light connectors to lift the trim panel and unlock the engagement of the waist seal section, then pass the inside lever through the mounting hole of the trim panel, and detach the trim panel.

7. Remove the inside handle.
8. Remove the power window switch.
   - Remove the fixing screws of switch from backside of rear door trim.

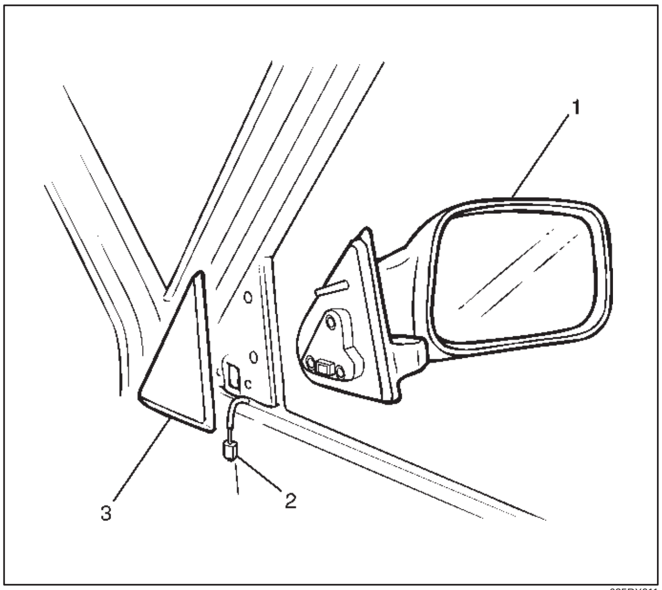
Installation

To install, follow the removal steps in the reverse order.

Door Mirror Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the door mirror cover (3).
3. Remove the door mirror assembly (1).
   - Remove the three bolts and disconnect the connector (2).



635RX011

Installation

To install, follow the removal steps in the reverse order.

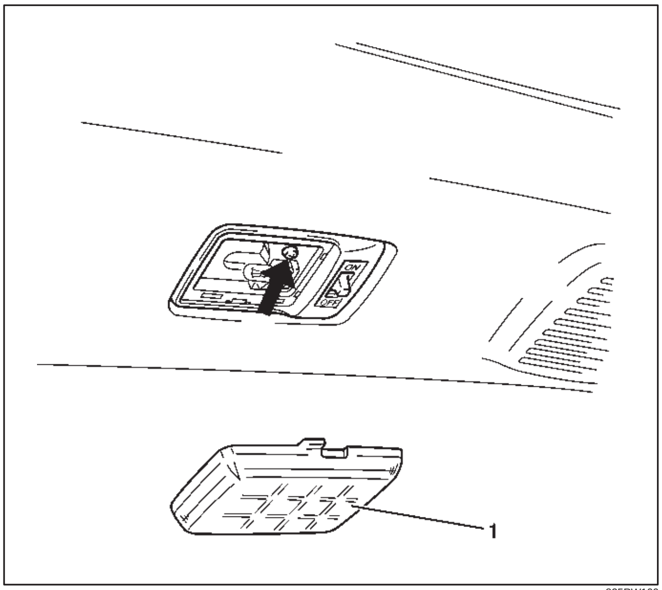
(10) Upper Center Pillar Trim Cover
(11) Front Pillar Trim Cover

Removal

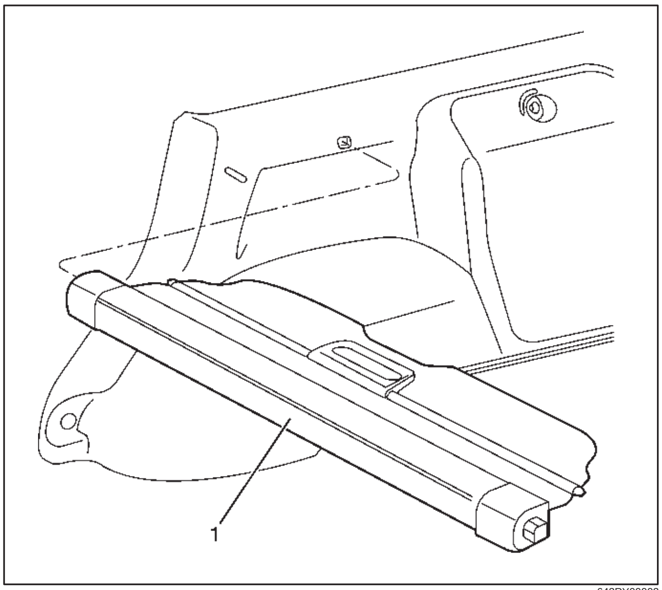
1. Disconnect the battery ground cable.
2. Remove the sill plates (Front & Rear).
3. Remove the dash side trim cover.
4. Remove the lower center pillar trim cover.
   - Remove the lower anchor bolt cover and lower anchor bolt from the front seat belt.
   - Pry the trim cover clips free from the body panel.
5. Remove the door finishers (Front & Rear).
6. Remove the upper center pillar trim cover.
   - Pry the trim cover clips free from the body panel.
7. Remove the front pillar trim cover.
   - Ply the trim cover clips free from the body panel.
8. Remove the tailgate weather strip.
9. Remove the rear end floor trim cover.
   - Remove the five fixing screws.

10. Remove the luggage room light.
    - Remove the luggage room light lens (1) and the fixing screw.
    - Disconnect the luggage room light connector.



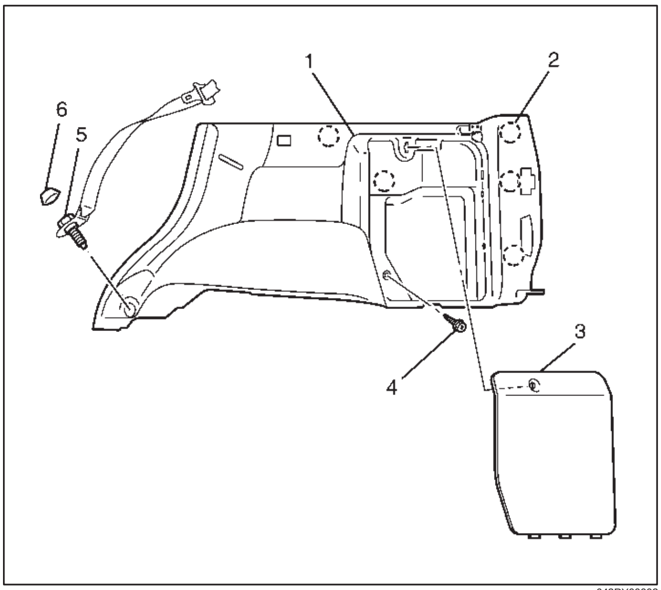
825RW100

11. Remove the rear roof trim cover.
    - Pry the trim cover clips free from the body panel.
12. Remove the tonneau cover assembly (1).



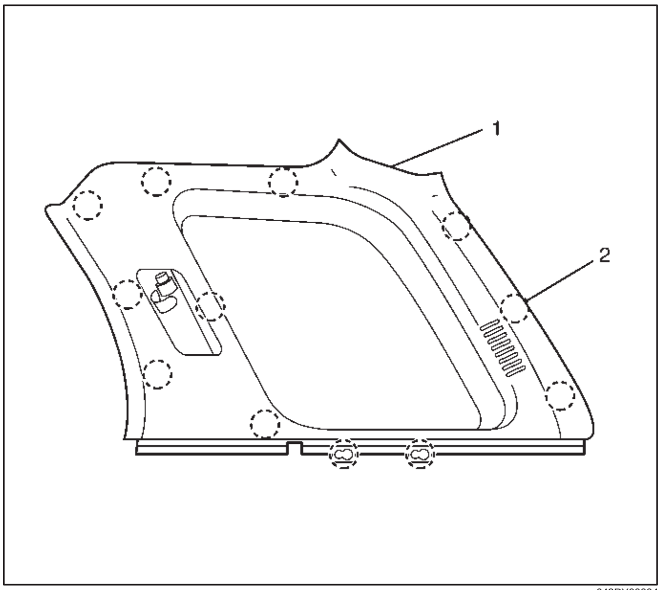
643RY00002

13. Remove the lower anchor bolt cover (6) and the lower anchor bolt (5) from the rear seat belt.
14. Remove the lower quarter trim cover (1).
    - Remove the tool box lid (3) and fixing screw (4).
      Pry the five (RH) or six (LH) clip positions (2) free from the body panel.
    - Disconnect the accessory socket connector (LH side).



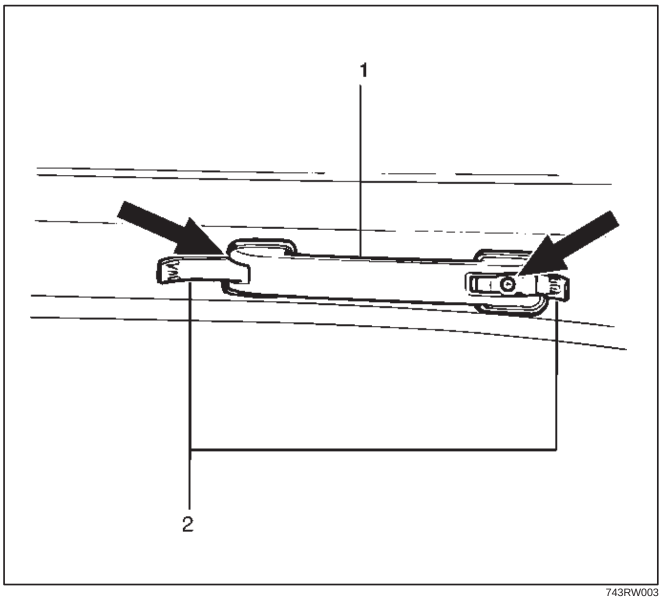
643RY00003

15. Remove the upper quarter trim cover (1).
    - Pry the twelve clip positions (2) free from the body panel.



643RY00004

16. Remove the front pillar assist grip (1) (Front & Rear).
    - Open the both sides of the assist grip cover (2) and remove the fixing screws and the front pillar assist grip.



Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Tighten the seat belt anchor bolt to the specified torque.

   Torque: 39 N·m (29 lb ft)

Interior Trim Panels (SWB)

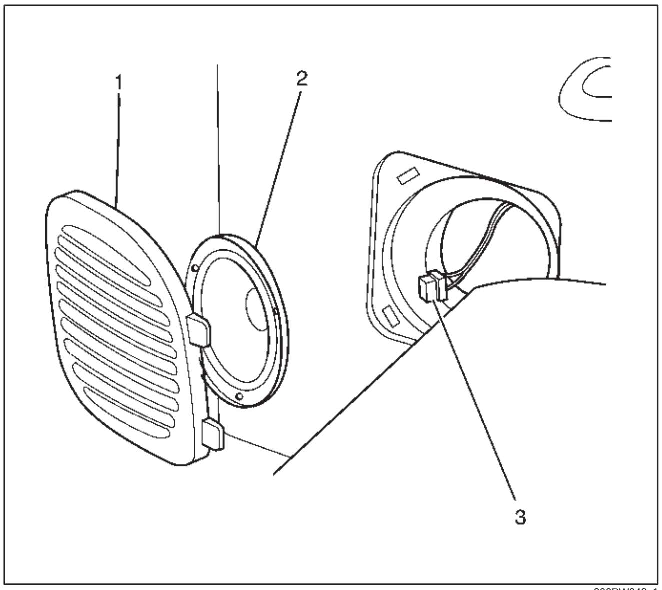
(5) Rear End Floor Trim Cover
(6) Luggage Side Trim Cover
(7) Lower Quarter Trim Cover
(8) Sill Plate
(9) Door Seal Finisher
(10) Front Pillar Trim Cover

Removal

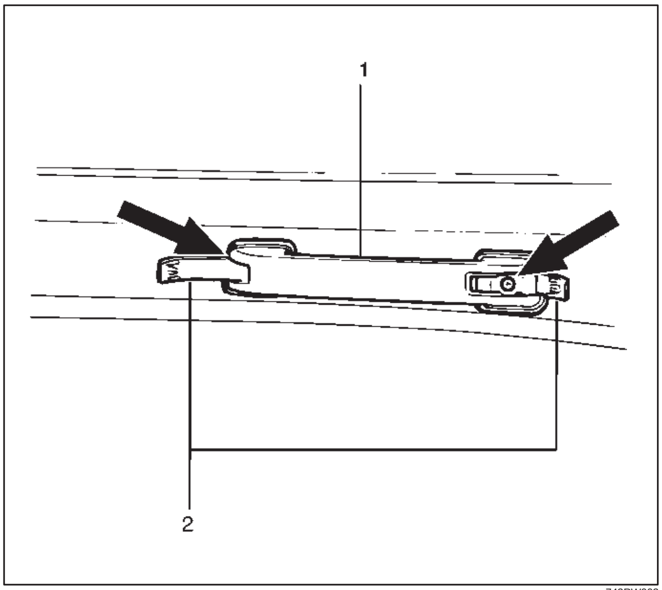
1. Disconnect the battery ground cable.
2. Remove the soft top assembly or resin top assembly.
   - Refer to Soft Top Assembly or Resin Top Assembly in Sun Roof/Convertible Top section.
3. Remove the rear seat assembly.
   - Refer to Rear Seat Assembly in Seats section.
4. Remove the weather strip.
5. Remove the luggage sid trim cover.
   - Refer to Seat Belt Cross Bar Assembly in Sun Roof/Convertible Top section.
6. Remove the sill plate.
7. Remove the dash side trim cover.

8. Remove the rear speaker assembly.
   - Disengage the front portion of the speaker grille (1) and pull it forward and off.
   - Remove the three fixing screws securing the speaker (2) in place and disconnect the connector (3).



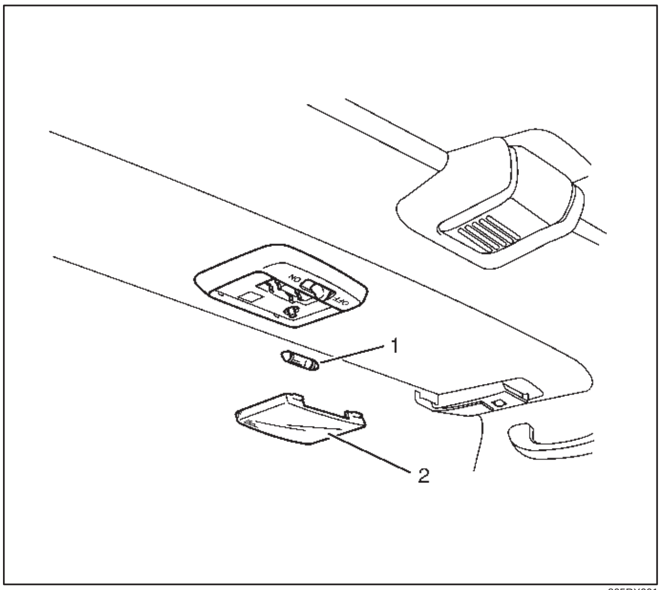
890RW048–1

9. Remove the front and rear seat belt lower anchor bolts.
10. Remove the lower quarter trim cover.
    - Disengage the clips from the body panel by twisting them free.
11. Remove the assist grips (1) (Front & Rear).
    - Open the both sides of the assist grip cover (2) and remove the fixing screws.



743RW003

12. Remove the door seal finisher.
13. Remove the dome light.
    - Remove the dome light lens (2) and the fixing screws.
    - Disconnect the dome light connector.



805RX001

14. Remove the rear roof bracket (Resin top model) or the soft top latch (Soft top model).
15. Remove the rear roof trim cover.
16. Remove the upper quarter trim cover.
17. Remove the front pillar trim cover.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the front and rear seat belt anchor bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

Headlining (LWB)

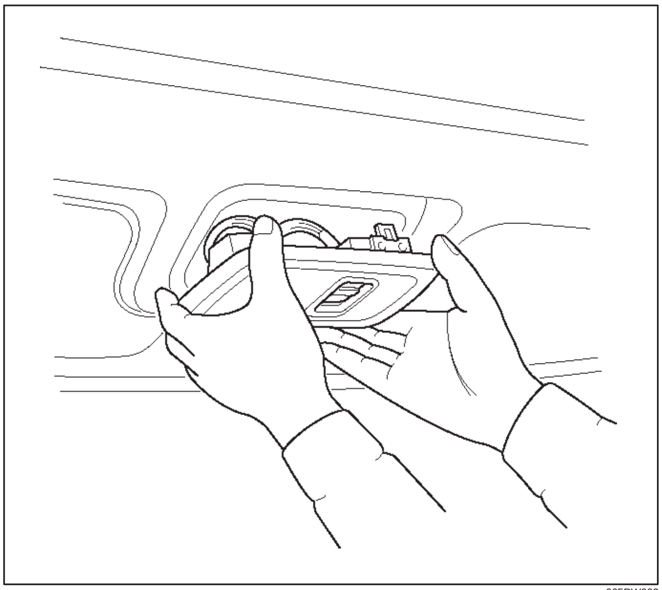
(8) Sunroof Switch (With Sunroof)
(9) Sunvisors
(10) Sunvisor Holder

Removal

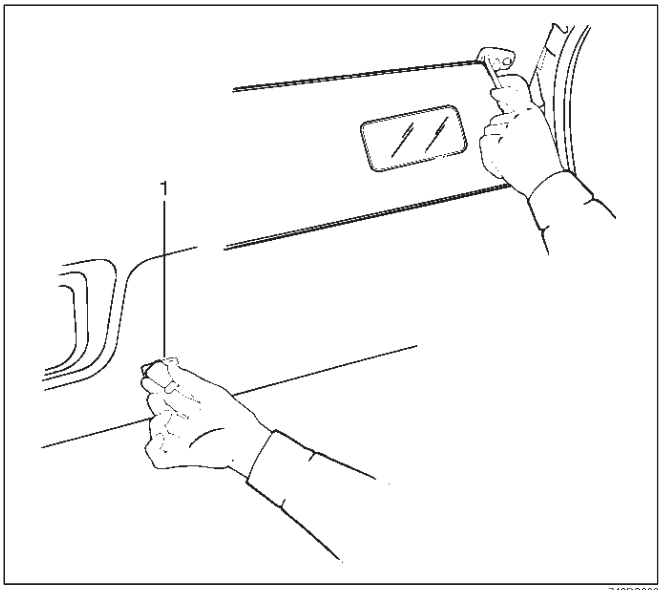
1. Disconnect the battery ground cable.
2. Remove the interior trim panels.
   - Refer to Interior Trim Panels (LWB) in this section.
3. Remove the dome light.
   - Remove the dome light lens and the fixing screws.
   - Disconnect the dome light connectors.

4. Remove the sunroof switch (With sunroof).
   - Pry the clip positions free from the sunroof switch bracket and disconnect the connector.
   - Disconnect the vanity mirror illumination connector. (if so equipped)



665RW002

5. Remove the sunvisors.
   - Remove the fixing screws and pull out the sunvisor holder (1) to remove it.



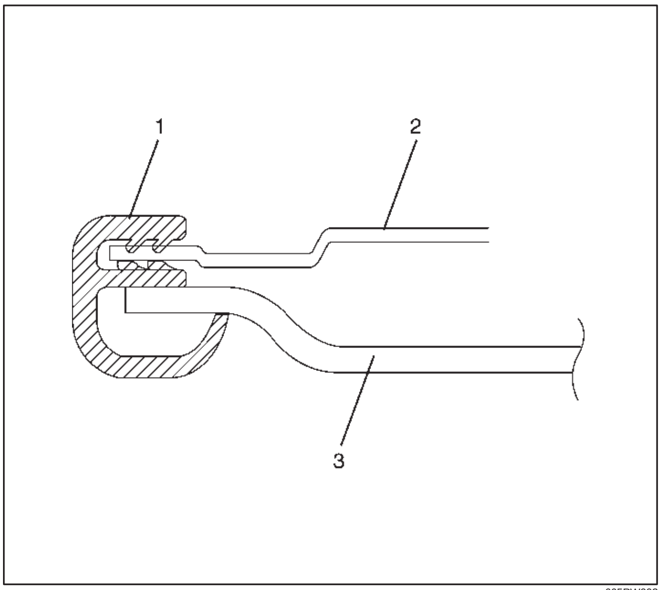
743RS006

6. Remove the sunroof finisher (With sunroof).
7. Remove the headlining.
   - Remove the headlining fixing clips.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Install the headlining so that the fixing clips will not come off.
2. To install the sunroof finisher (1), first fit it in at one place with the headlining (3) close to the sunroof frame complete (2), then install the entire finisher tightly by hitting it with a plastic hammer, not allowing it to move up.



665RW003

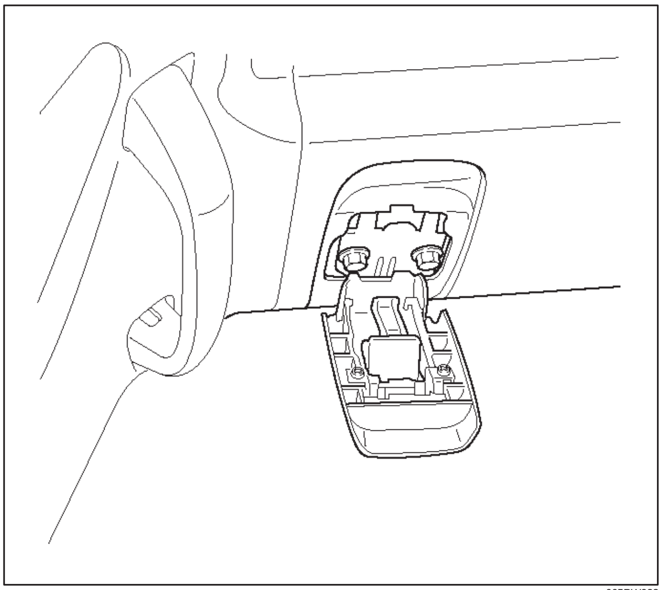
(8) Headlining

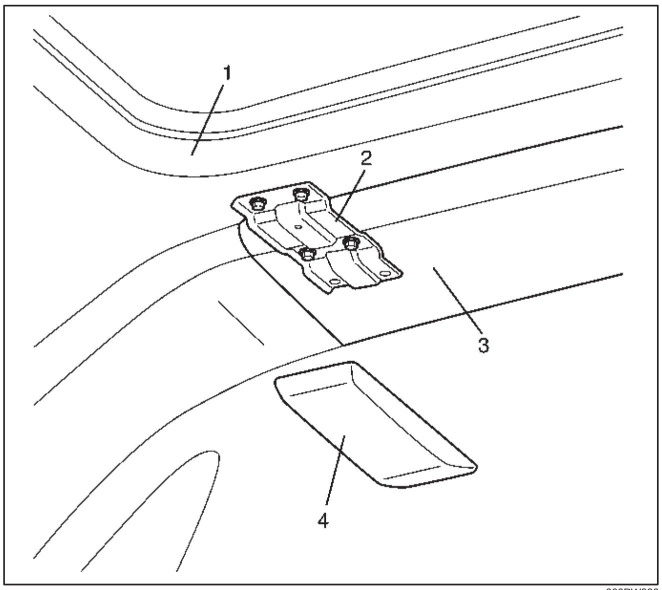
Removal

1. Disconnect the battery ground cable.
2. Remove the soft top latch (Soft top model).
   - Remove two bolts.



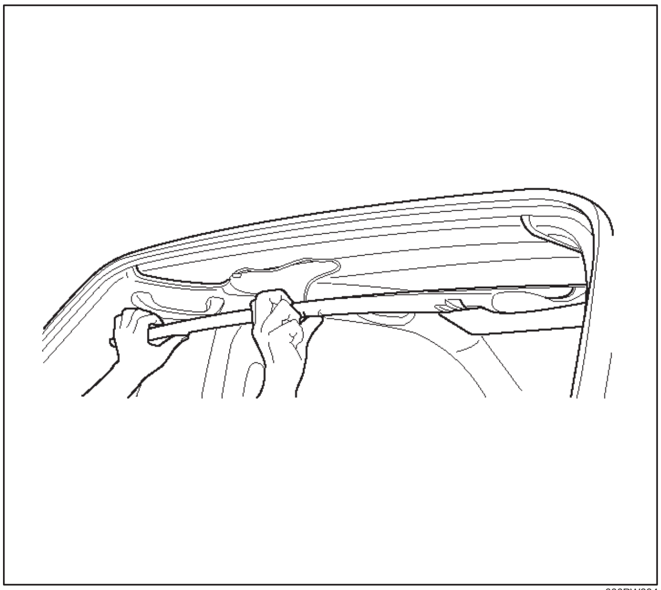
665RW023

   - Remove the rear roof bracket cover (4), rear roof bracket (2) connecting with resin top (1) and rear roof trim cover (3) by removing four fixing bolts (Resin top model).



666RW006

3. Remove the dome light lenz.
4. Remove the dome light.
   - Remove the fixing screws.
   - Disconnect the dome light connector.
5. Remove the rear roof trim cover.



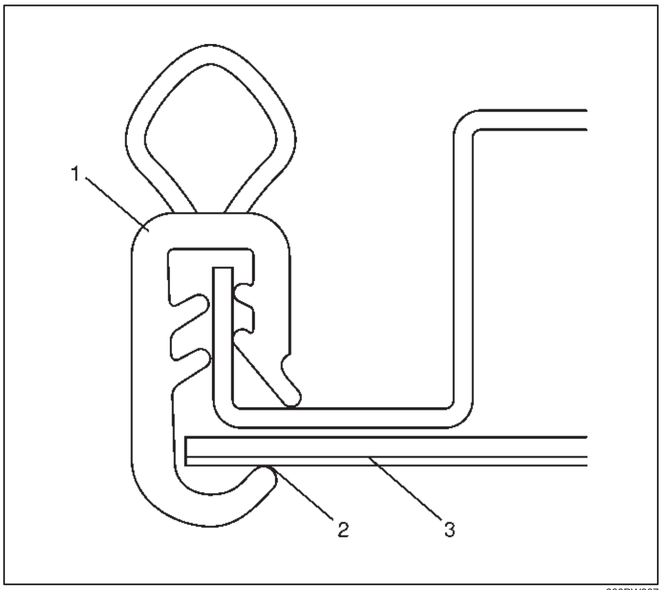
666RW004

6. Remove the interior trim panels.
   - Refer to Interior Trim Panels (SWB) in Exterior/Interior Trim section.
7. Remove the sunroof glass assembly.
   - Refer to Sunroof Glass in Sunroof/Convertible Top section.
8. Remove the sun roof handle cover and sunroof handle plate.
   - Remove the screw from the cover and the three fixing nuts from the plate.
9. Remove the sunvisor.
   - Remove the sunvisor fixing screws and the sunvisor holder.
10. Remove the sunroof finisher.
11. Remove the headlining.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

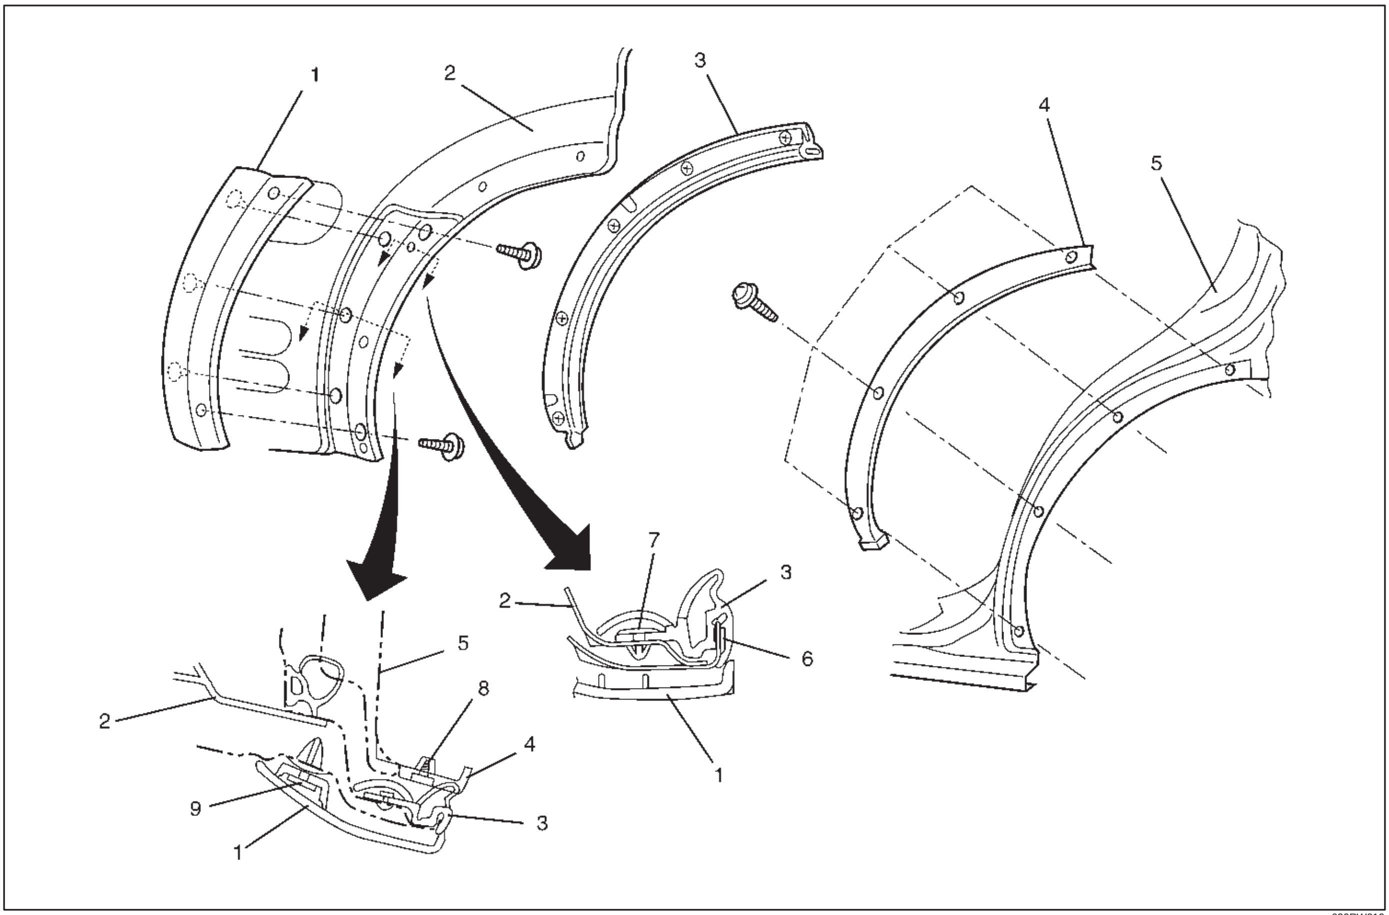
1. In case of installing sunroof finisher (1), fit the lip (2) to the headlining surely.



666RW007

Wheel Arch Protector (LWB)

Wheel Arch Protector and Associated Parts



Legend

(1) Wheel Arch Protector
(2) Rear Door Panel
(3) Rear Door Wheel Arch Seal
(4) Wheel Arch Cover
(5) Body Panel
(6) Double Sided Adhesive Tape
(7) Clip
(8) Screw Grommet
(9) Clip

Removal

1. Remove the wheel arch cover.
   - Remove the four fixing screws.
2. Remove the wheel arch protector.
   - Remove the two fixing screws from the back side of the rear door panel and pull out the clips at three positions.
3. Remove the rear door wheel arch seal.
   - After disengaging five clips, peel off the double sided adhesive tape.

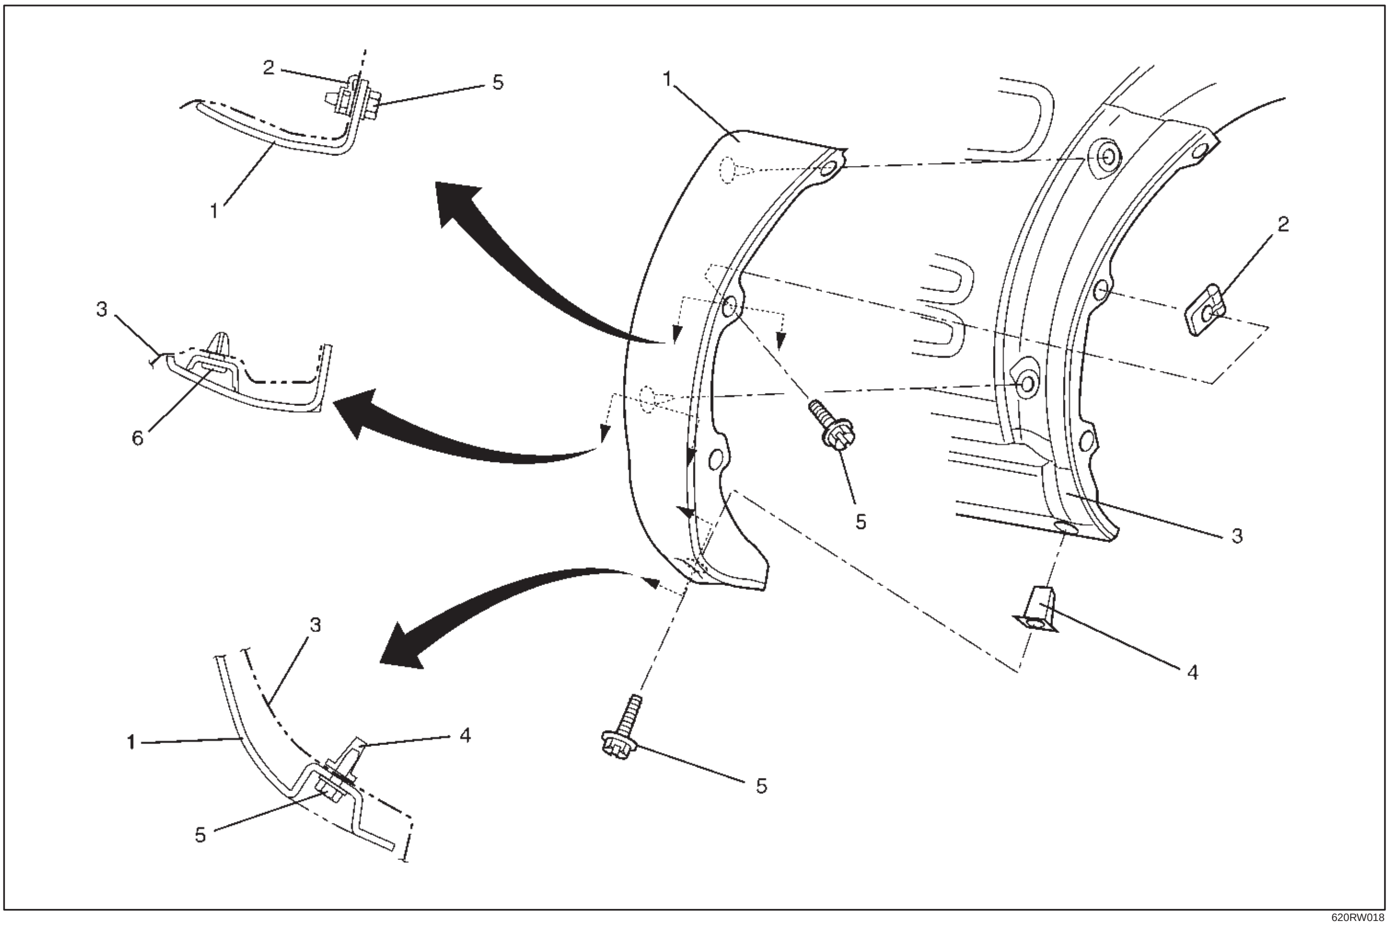
Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Use a new double sided adhesive tape whenever installing the rear door wheel arch seal.
   Using a white gasoline, clean the places in advance where a double sided adhesive tape is affixed.

Wheel Arch Protector (SWB)

Wheel Arch Protector and Associated Parts



Legend

(1) Wheel Arch Protector
(2) Spire Nut
(3) Quarter Outer Panel
(4) Screw Grommet
(5) Screw
(6) Clip

Removal

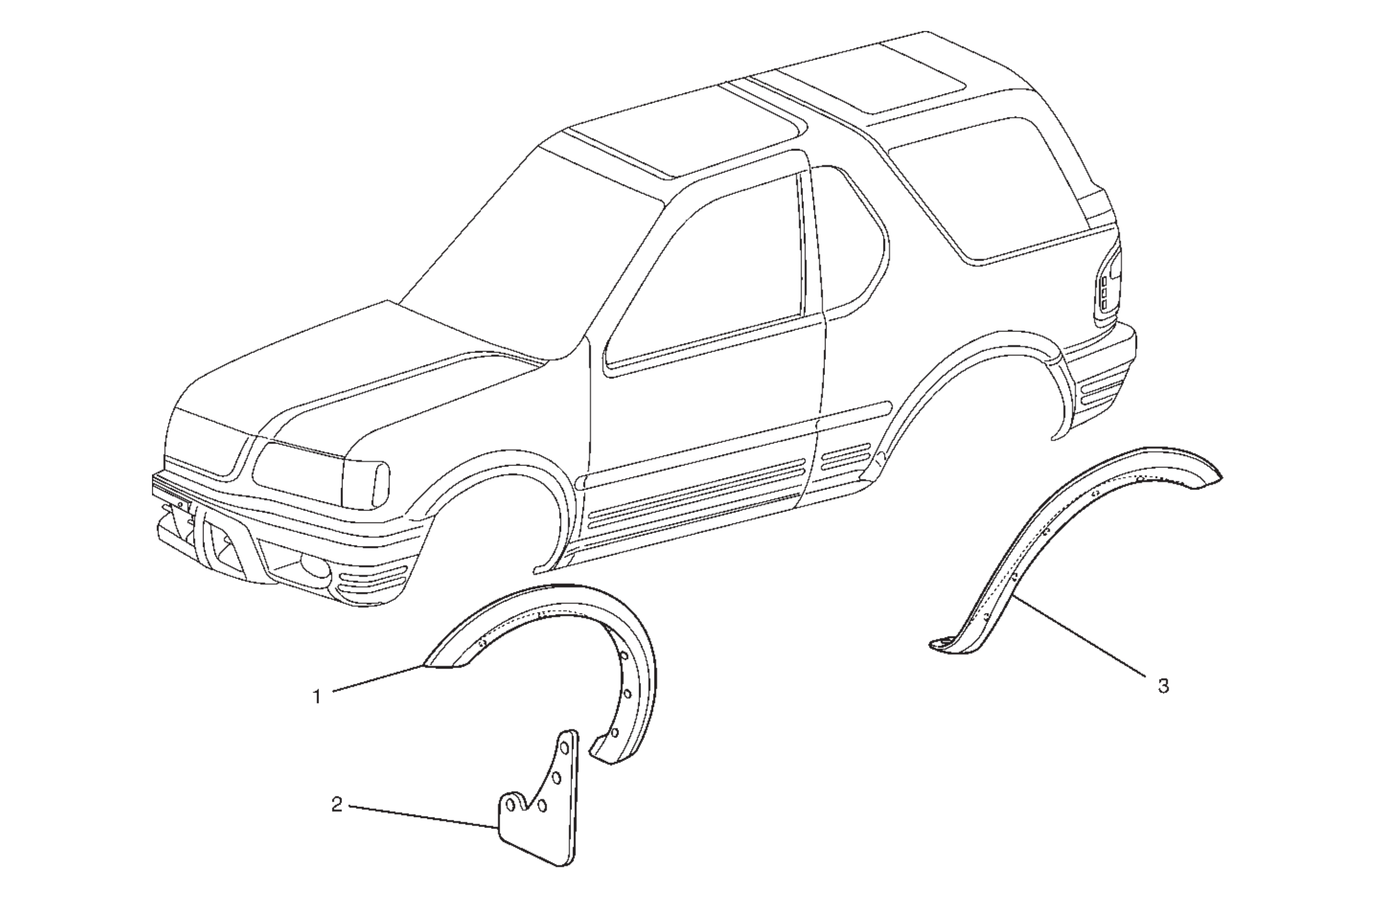
1. Remove the wheel arch protecter.
   - Remove the four fixing screws and pull out the clips at two positions.

Installation

To install, follow the removal steps in the reverse order.

Wheel Arch Molding (SWB)

Wheel Arch Molding and Associated Parts

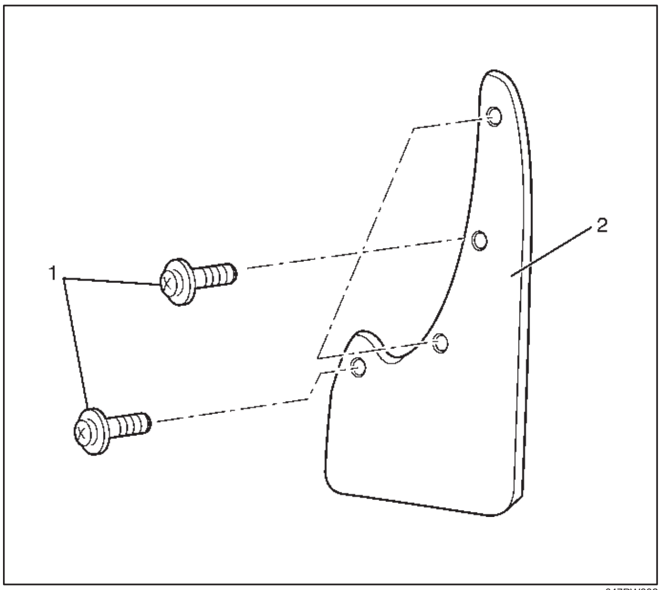


620RY00002

Legend
(1) Front Wheel Arch Molding
(2) Front Mud Flap
(3) Rear Wheel Arch Molding

Removal

1. Remove the front mud flap (2).
   - Remove the four fixing screws (1).
     (Three of four screws are fixed together with molding.)

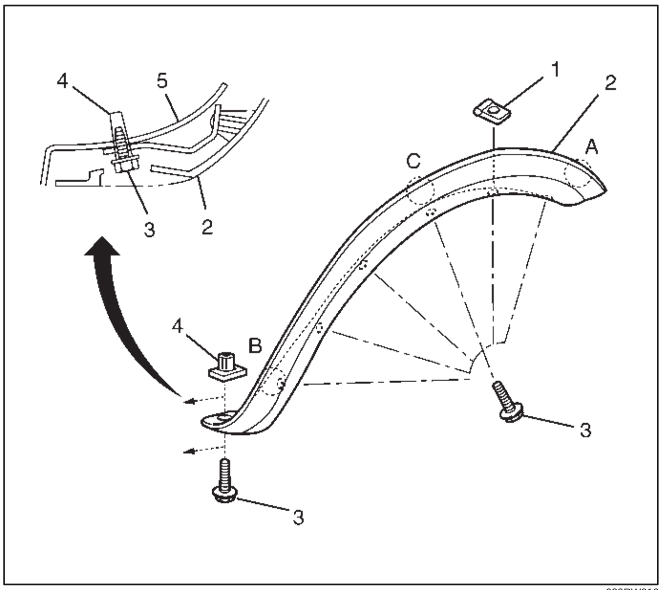


647RW002

2. Remove the front wheel arch molding.
   - Remove the three fixing screws and pull out the clips at three positions from the fender panel.
3. Remove the rear wheel arch molding.
   - Remove the seven fixing screws and pull out the clips at three positions from the quarter outer panel.

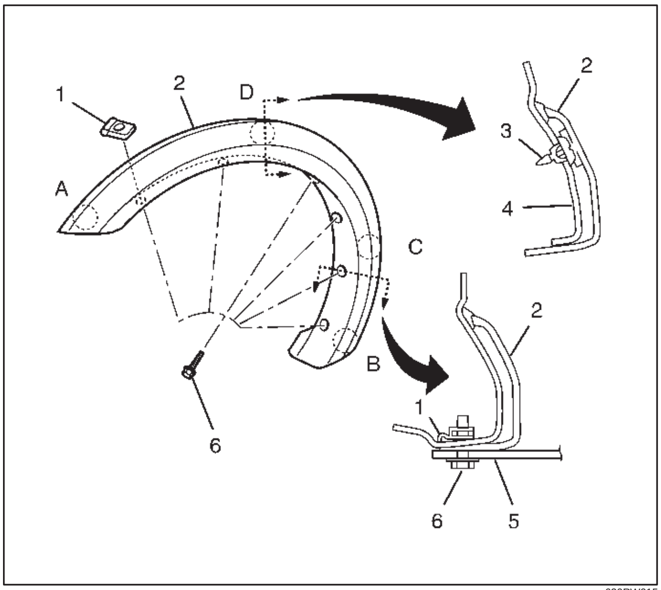
Installation

1. Install the rear wheel arch molding (2).
   - Install the six spire nuts (1) and one screw grommet (4) to the body panel (5).
   - Put the three clips of the rear wheel arch molding into the body panel in order of A, B and C.
   - Install the seven fixing screws (3).



620RW016

2. Install the front wheel arch molding (2).
   - Install the six spire nuts (1) to the body panel (4).
   - Put the four clips (3) of the front wheel arch molding into the body in order of A, B, C and D.
3. Install the six fixing screws (6).
   (Three of six screws are fixed together with the front mud flap.)

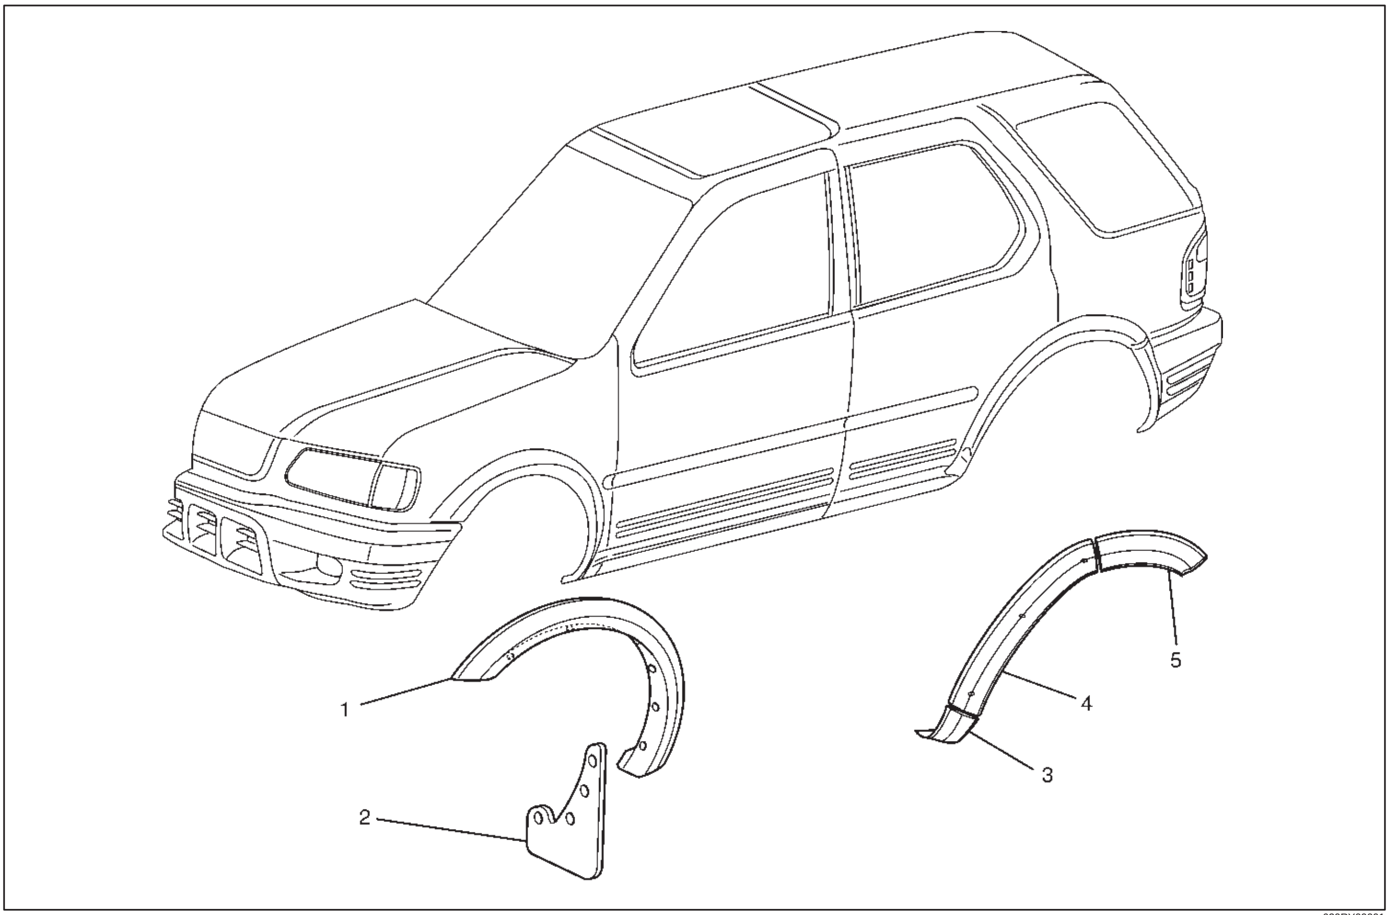


620RW015

4. Install the front mud flap.

Wheel Arch Molding (LWB)

Wheel Arch Molding and Associated Parts



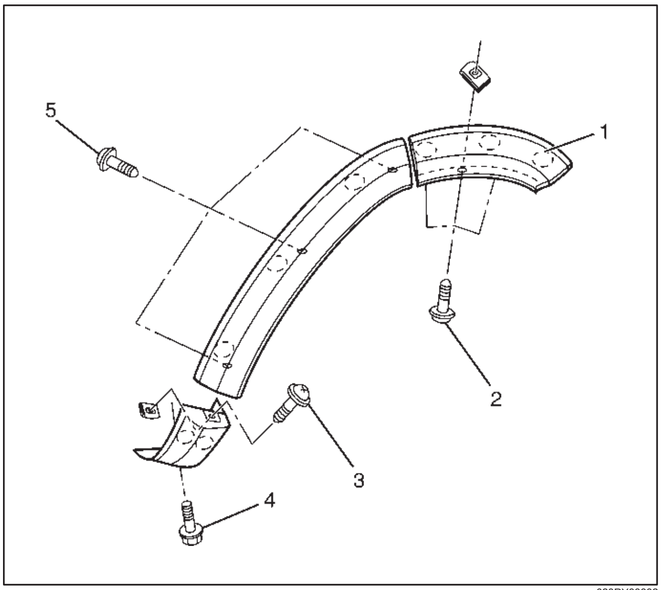
620RY00001

Legend

(1) Front Wheel Arch Molding
(2) Front Mud Flap
(3) Rocker Wheel Arch Extension
(4) Rear Wheel Arch Molding
(5) Quarter Panel Wheel Arch Molding

Removal

1. Remove the front mud flap and front wheel arch molding.
   - Refer to Wheel Arch Molding (SWB) in this section.
2. Remove the rocker wheel arch extension.
   - Remove the fixing bolt (4) and screw (3). Pull out the extension with the two clips (1) from the rocker outer panel.
3. Remove the quarter panel wheel arch molding.
   - Remove the three fixing screws (2) and pull out the molding with the three clips (1) from the quarter outer panel.
4. Remove the rear wheel arch molding.
   - Remove the three fixing screws (5) of the back of the door panel and pull out the molding with the three clips (1) from the door outer panel.



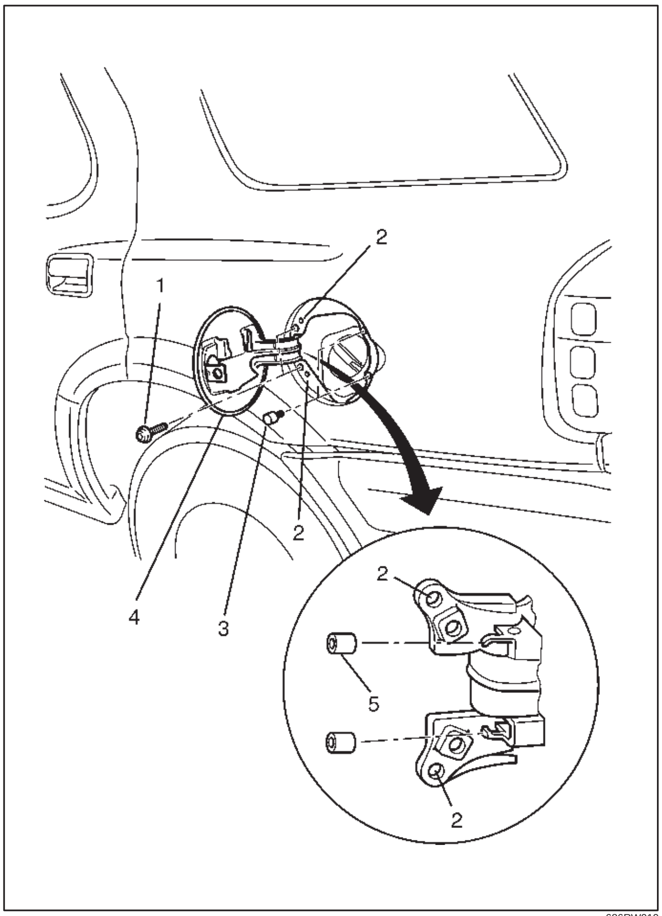
620RY00003

Installation

To install, follow the removal steps in the reverse order.

Fuel Filler Door

Parts Location



686RW010

Legend

(1) Fuel Filler Door Fixing Screw
(2) Basic Hole
(3) Fuel Filler Door Buffer
(4) Fuel Filler Door
(5) Fuel Filler Door Hinge Buffer

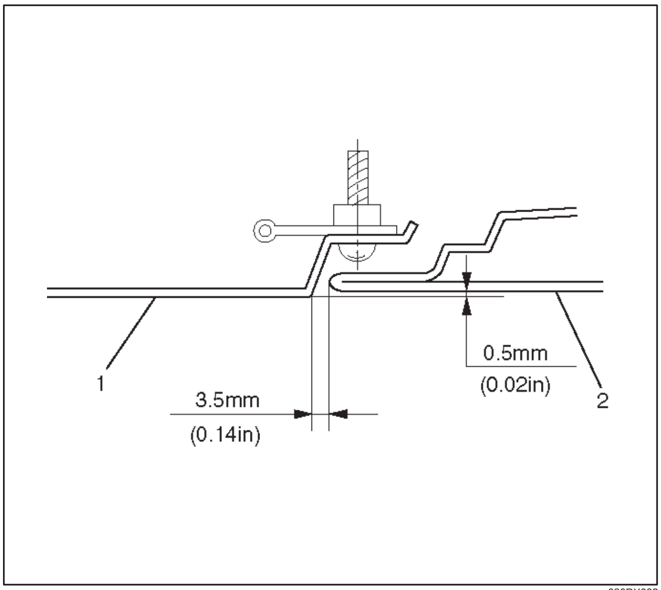
Removal

1. Open the fuel filler door.
2. Remove the fuel filler door.
   - Remove the two fixing screws.
3. Pull out the fuel filler door buffer.
4. Pull out the fuel filler hinge buffer.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

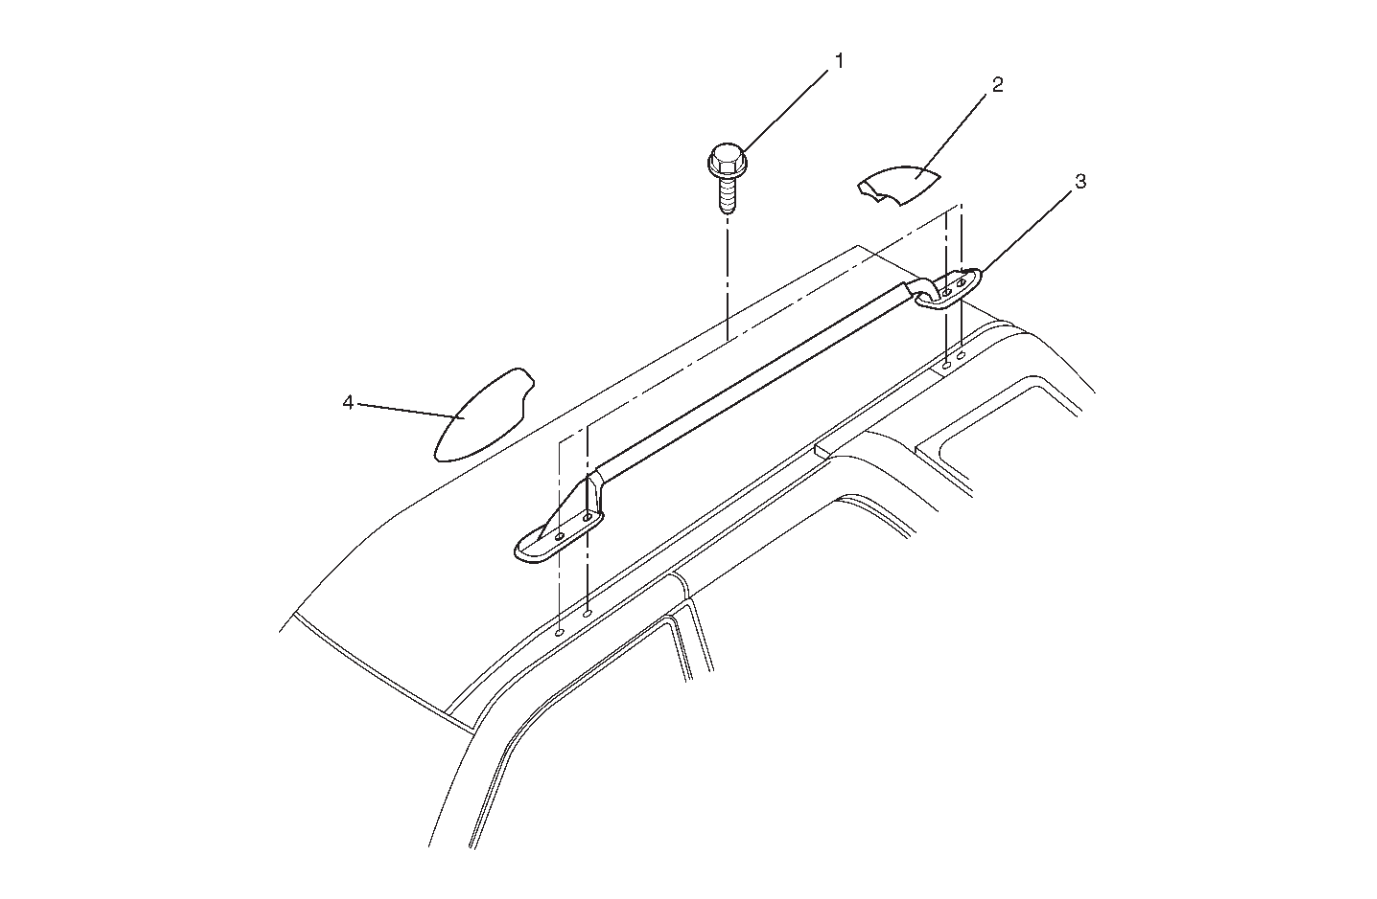
1. Install the fuel filler door to match the basic hole.
2. Adjust the clearance between quarter outer panel (1) and fuel filler door (2).



686RX003

Roof Rail

Parts Location



660RY00011

Legend
(1) Roof Rail Fixing Bolt
(2) Rear Roof Rail Cover
(3) Roof Rail Sub Assembly
(4) Front Roof Rail Cover

Removal

1. Remove the front and rear of roof rail cover.
   - Pry the roof rail covers.
2. Remove the roof rail sub assembly.
   - Remove the four fixing bolts at each roof rail.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the roof rail sub assembly fixing bolts to the specified torque.

Torque 8 N·m (69 lb in)

Power Door Mirror System

General Description

The system consists of the starter switch, door mirror switch, rear defogger/mirror defogger switch and door mirrors on both sides.

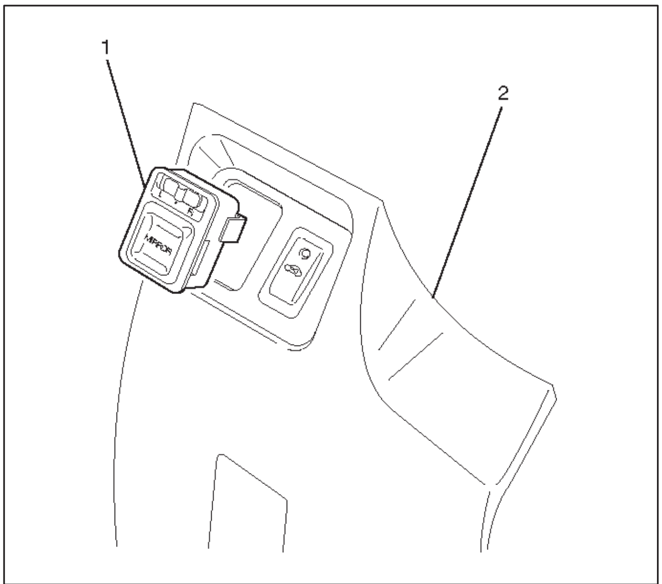
When the door mirror switch is operated with the starter switch at either “ACC” or “ON” position, the motor in the door mirror (on either side) rotates to allow the horizontal and vertical adjustment of mirror angles.

When the rear defogger/mirror defogger switch is turned “ON” (with the starter switch at “ON” position), the heaters in both left and right mirrors and the rear windshield glass are active defog both mirrors and rear windshield glass at the same time.

Door Mirror Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel lower cover (2).
   Refer to the instrument panel assembly in Body Structure section.
3. Remove the door mirror switch (1).



825RW094

Rear Defogger/Mirror Defogger Switch

Refer to the Rear Defogger/Mirror switch removal and installation steps in Lighting System section.

Door Mirrors

Refer to the Door mirrors removal and installation steps in Exterior/Interior Trim section.

Power Window System

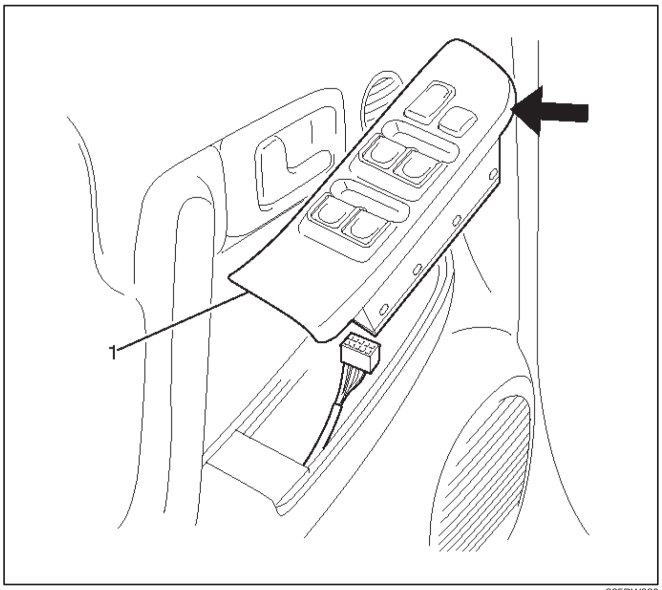
General Description

The power window system consists of power window switches and power window motors on driver and passenger sides and power window relay. With the starter switch in "ON" position, the battery voltage is supplied through power window relay to the power window switches on driver and passenger sides. Selection of up or down switch changes the motor rotating direction to open or close the window.
When the lock switch on the switch panel on the driver side is pressed, the power window switch is in open state. As a result, the power source to the other switches are cut off, and the power window motors do not run.

Power Window Switch Driver Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the switch (1).
   - Pull out the switch by pushing the spring with the tip of a screwdriver.
   - Disconnect the connector.



825RW080

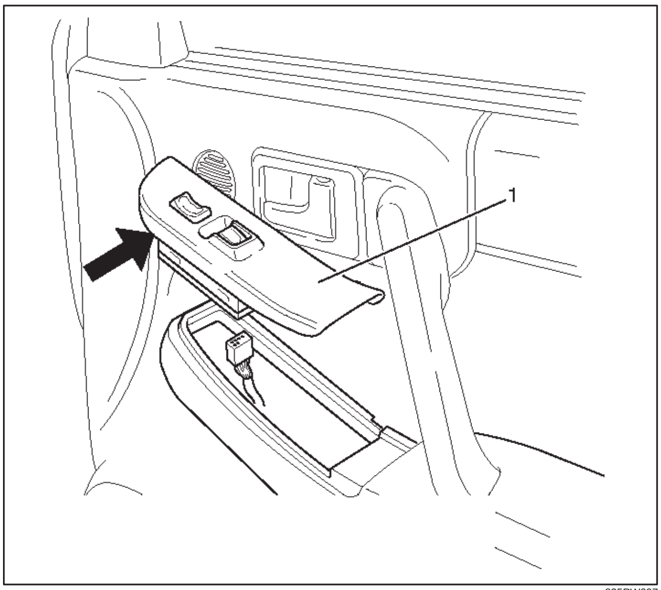
Installation

To install, follow the removal steps in the reverse order.

Front Passenger Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the switch (1).
   - Pull out the switch by pushing the spring with the tip of a screwdriver.
   - Disconnect the connector.



825RW097

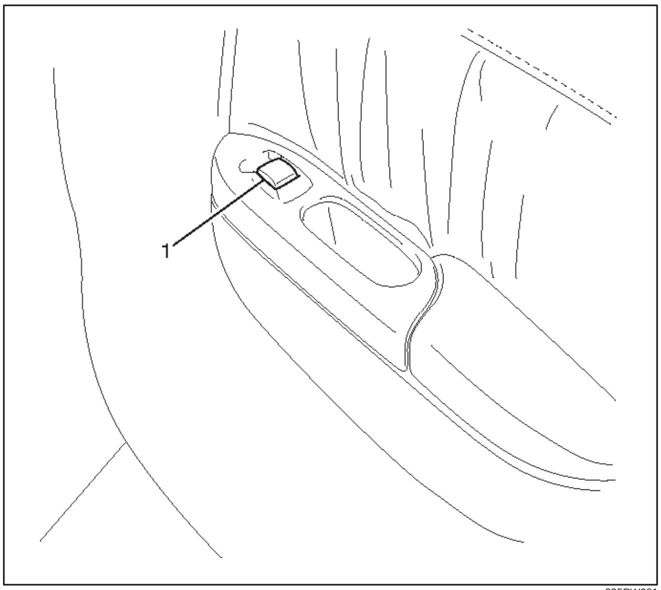
Installation

To install, follow the removal steps in the reverse order.

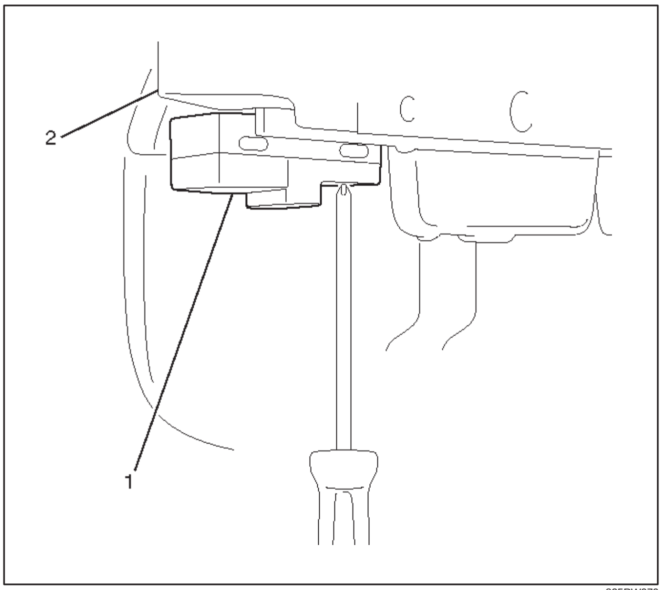
Rear-Left and Right Sides

Removal

1. Disconnect the battery ground cable.
2. Remove the rear door trim pad (2).
   - Refer to the Rear Door Trim Pad removal steps in Exterior/Interior Trim section.
   - Disconnect the rear power window switch (1) connector.
3. Remove the rear power window switch (1).
   - Remove the switch fixing screw from the back side of the rear door trim (2).



825RW081



825RW079

Installation

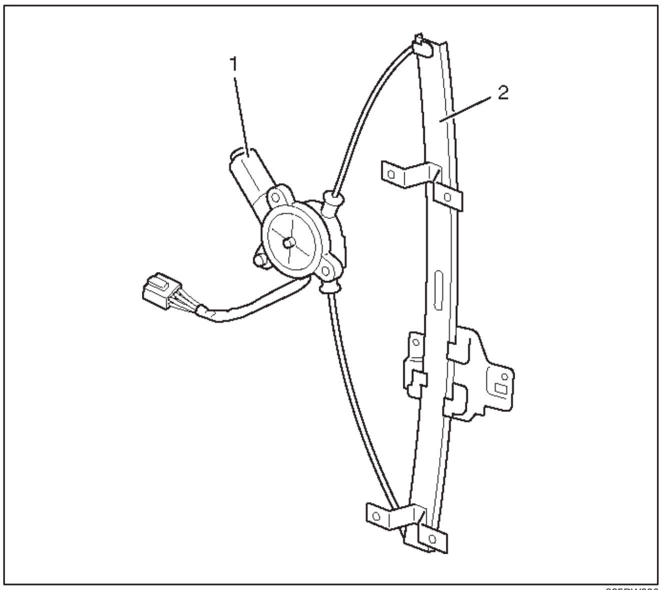
To install, follow the removal steps in the reverse order.

Power Window Motor

Driver Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the window regulator assembly (2).
   - Refer to the Window Regulator and Glass removal steps in Body Structure section.
3. Remove the power window motor (1).
   - Remove three screws.



825RW096

Installation

To install, follow the removal steps in the reverse order.

Front Passenger Seat Side

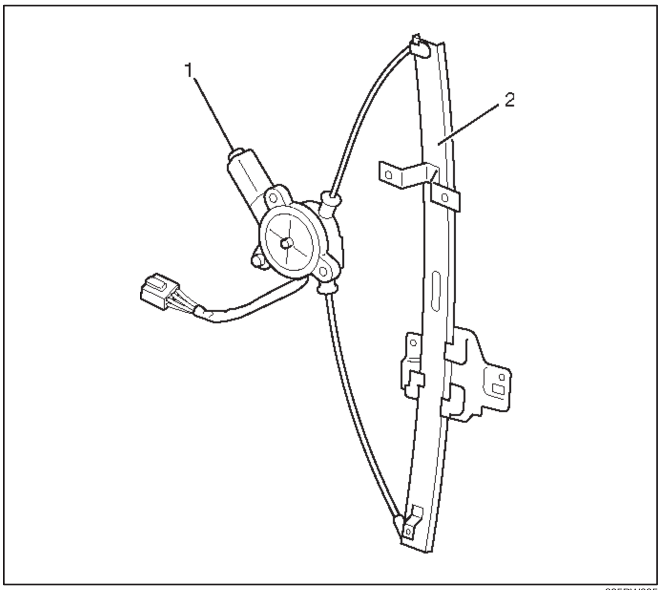
Removal and Installation

Refer to the Front Window Motor — Driver Seat side removal and installation steps in this section.

Rear-Left Side

Removal

1. Disconnect the battery ground cable.
2. Remove the rear window regulator assembly (2).
   - Refer to the Rear Window Regulator and Glass removal steps in Body Structure section.
3. Remove the power window motor (1).
   - Remove three screws.



825RW095

Installation

To install, follow the removal steps in the reverse order.

Rear-Right Side

Removal and Installation

Refer to the Rear Power Window Motor — Left Side removal and installation steps in this section.

RESTRAINTS

SEAT BELT SYSTEM

CONTENTS

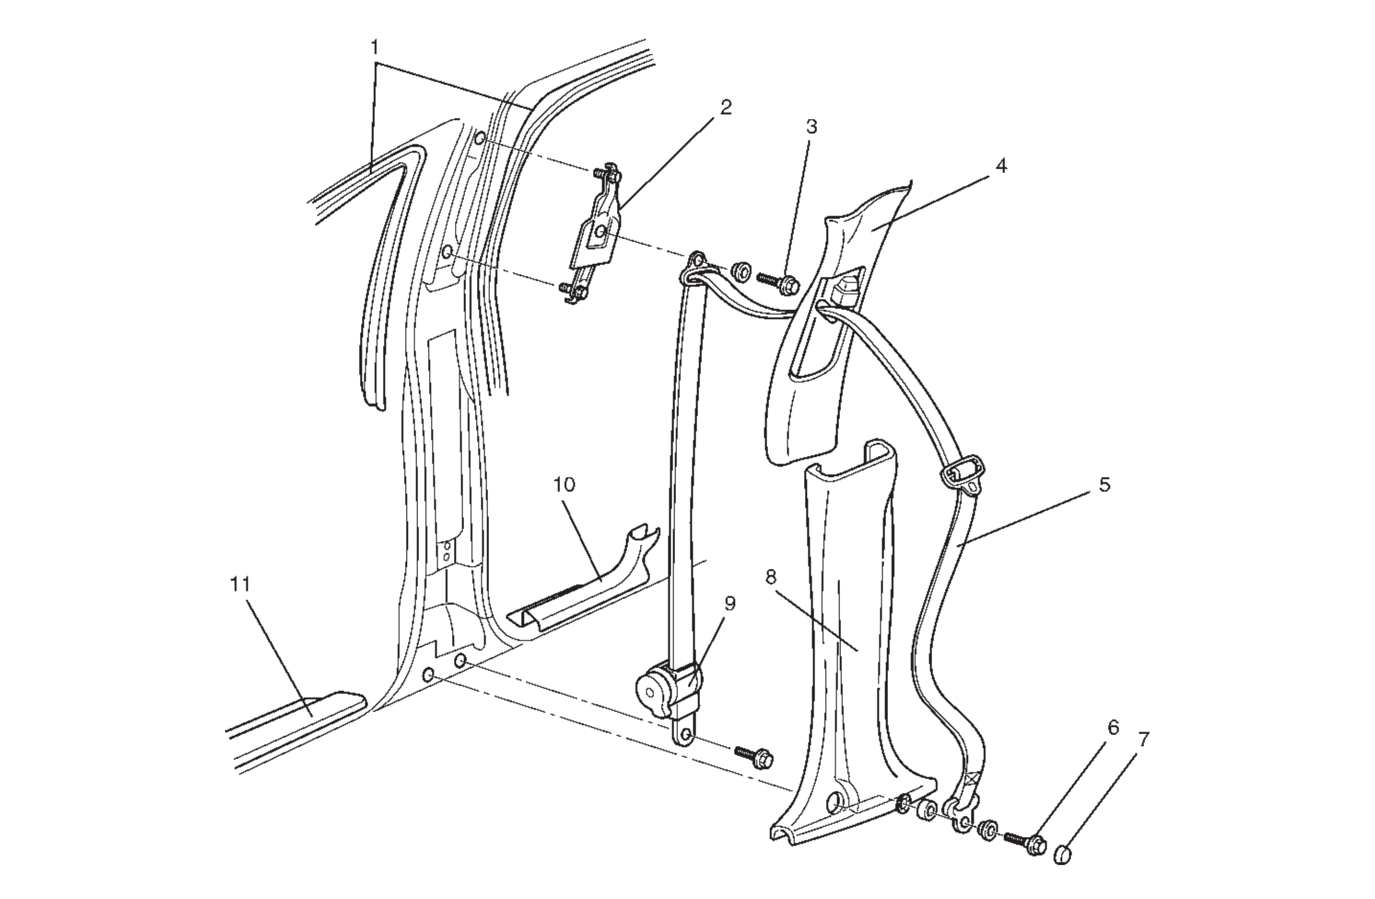
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Seat Belt (LWB)

Front Seat Belt and Associated Parts



Legend

- (1) Door Seal Finisher (Front & Rear)
- (2) Adjustable Shoulder Anchor Assembly
- (3) Seat Belt Upper Anchor Bolt
- (4) Center Pillar Upper Trim Cover
- (5) Front Seat Belt Assembly
- (6) Seat Belt Lower Anchor Bolt
- (7) Cap
- (8) Center Pillar Lower Trim Cover
- (9) Retractor
- (10) Rear Sill Plate
- (11) Front Sill Plate

Removal

1. Disconnect the battery ground cable.
2. Remove the sill plate (Front & Rear).
3. Remove the cap and seat belt lower anchor bolt.
4. Remove the center pillar lower trim cover.
5. Remove the door seal finisher (Front & Rear).
6. Remove the center pillar upper trim cover.
7. Remove the seat belt upper anchor bolt.
8. Remove the retractor fixing bolt.
9. Remove the seat belt assembly.
10. Remove the adjustable shoulder anchor assembly.
    - Remove the two fixing bolts.

Inspection

If any of the following abnormalities is found, replace on an assembly basis.

- Deform and malfunction of adjustable shoulder anchor.
- No smooth move of upper/lower anchors in the circumferential direction.
- Damaged and/or deformed through ring.
- Damaged and/or deformed tongue.
- Damaged and/or frayed of webbing.
- Deformed retractor bracket.
- Seat belt not rewound up.
- Resistance or abnormal sound when seat belt is wound out and rewound.
- Retractor abnormality.

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
   - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
   - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.
3. ALR (Automatic Locking Retractor)/ELR check (Except for driver's seat).
   - When rewound after winding out the seat belt, make sure the seat belt cannot be taken out. After rewinding, make sure it has returned to its normal operation.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

CAUTION: When changing the front seat belt, confirm the part No. and change the seat belt in same part No.

1. Tighten the adjustable shoulder anchor assembly fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

2. Tighten the seat belt anchor bolts (Upper & Lower) and the retractor fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

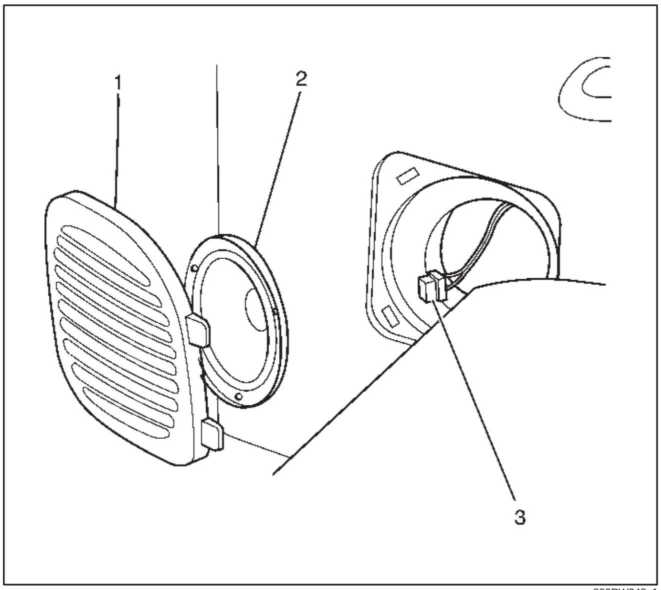
(10) Sill Plate
(11) Door Seal Finisher

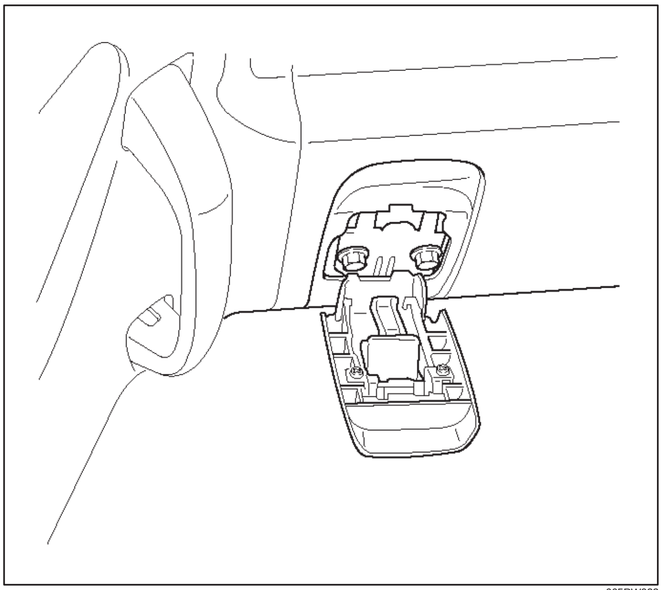
Removal

1. Disconnect the battery ground cable.
2. Remove the rear seat assembly.
   - Refer to Rear Seat Assembly in Seats section.
3. Remove the soft top assembly or resin top assembly.
   - Refer to Soft Top Assembly or Resin Top Assembly in Sunroof/Convertible Top section.
4. Remove the luggage side trim cover.
   - Refer to Rear Seat Belt (SWB) in this section.
5. Remove the sill plate.
6. Remove the seat belt lower anchor bolt (Front & Rear).
7. Remove the rear speaker (2).
   - Remove the speaker grille (1) and remove the speaker fixing screws.
   - Disconnect the connector (3).

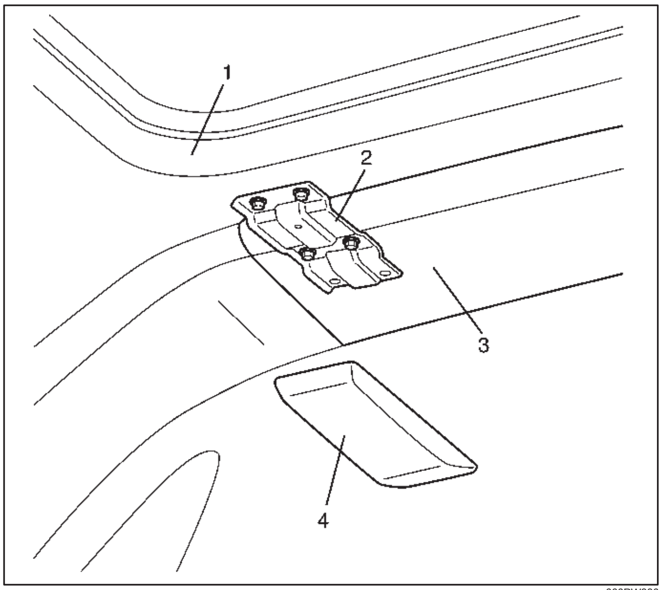


890RW048–1

8. Remove the quarter lower trim cover.
   - Pry the trim cover retainers free from the body panel.
9. Remove the dome light.
   - Remove the dome light lens and the fixing screws.
   - Disconnect the dome light connector.
10. Remove the soft top latch (Soft top model).
    - Remove two bolts.



11. Remove the rear roof bracket (2) (Resin top model).
    - Remove the rear roof bracket cover (4) and remove rear roof bracket connecting with resin top (1) and rear roof trim cover (3) by removing four fixing bolts.



12. Remove the rear roof trim cover.
13. Remove the assist grip.
14. Remove the door seal finisher.
15. Remove the quarter upper trim cover.
16. Remove the seat belt upper anchor bolt.
17. Remove the retractor fixing bolt.
18. Remove the seat belt assembly.
19. Remove the adjustable shoulder anchor assembly.
    - Remove two bolts.

Inspection

If any of the following abnormalities is found, replace on an assembly basis.

- Deform and malfunction of adjustable shoulder anchor.
- No smooth move of upper/lower anchors in the circumferential direction.
- Damaged and/or deformed through ring.
- Damaged and/or deformed tongue.
- Damaged and/or frayed of webbing.
- Deformed retractor bracket.
- Seat belt not rewound up.
- Resistance or abnormal sound when seat belt is wound out and rewound.
- Retractor abnormality.

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
   - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
   - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.
3. ALR (Automatic Locking Retractor)/ELR check (Except for driver's seat).
   - When rewound after winding out the seat belt, make sure the seat belt cannot be taken out. After rewinding, make sure it has returned to its normal operation.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

CAUTION: When changing the front seat belt, confirm the part No. and change the seat belt in same part No.

1. Tighten the adjustable shoulder anchor assembly and retractor fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)
2. Tighten the seat belt anchor bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

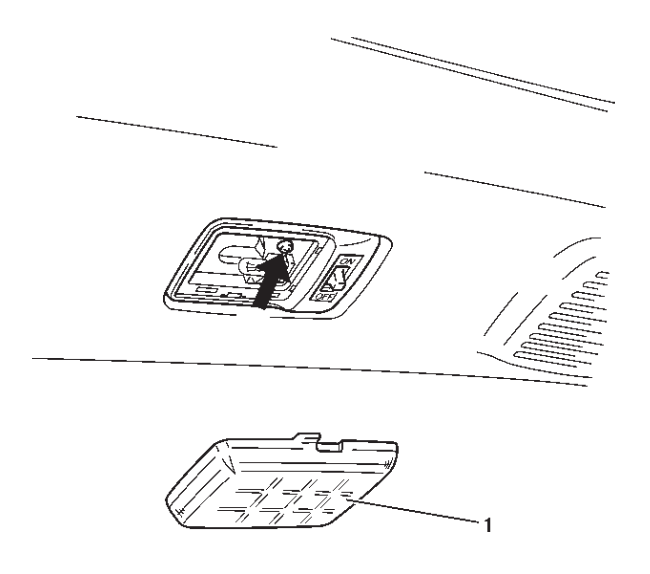
Removal

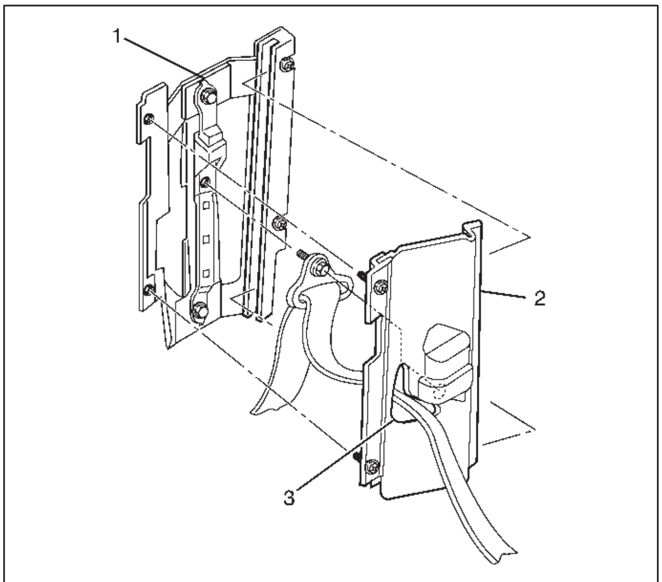
1. Disconnect the battery ground cable.
2. Remove the tailgate weather strip.
3. Remove the rear end floor trim cover.

4. Remove the luggage room light.
   - Remove the luggage room light lens (1) and the fixing screw.
   - Disconnect the luggage room light connector.



825RW100

5. Remove the rear roof trim cover.
   - Pry the trim cover clips free from the body panel.
6. Remove the rear sill plate.
7. Remove the cap and the lower anchor bolt (5).
8. Remove the quarter trim cover.
   - Refer to Interior Trim Panel (LWB) in Exterior/Interior Trim section.
9. Remove the slider plate trim assembly (2).
   - Remove the two fixing screws from the adjustable shoulder anchor (1).
   - Pull out the seat belt through the hole (3) on the slider plate trim.



755RW069

10. Remove the seat belt upper anchor bolt.
11. Remove the retractor.
12. Remove the rear seat belt assembly.
13. Remove the adjustable shoulder anchor assembly.
    - Remove the two fixing bolts.

Inspection

If any of the following abnormalities is found, replace on an assembly basis.

- Deform and malfunction of adjustable shoulder anchor.
- No smooth move of upper/lower anchors in the circumferential direction.
- Damaged and/or deformed through ring.
- Damaged and/or deformed tongue.
- Damaged and/or frayed of webbing.
- Deformed retractor bracket.
- Seat belt not rewound up.
- Resistance or abnormal sound when seat belt is wound out and rewound.
- Retractor abnormality.

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
   - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
   - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.
3. ALR (Automatic Locking Retractor)/ELR check (Except for driver's seat).
   - When rewound after winding out the seat belt, make sure the seat belt cannot be taken out. After rewinding, make sure it has returned to its normal operation.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the adjustable shoulder anchor assembly fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

2. Tighten the seat belt anchor bolts (Upper & Lower) and the retractor fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

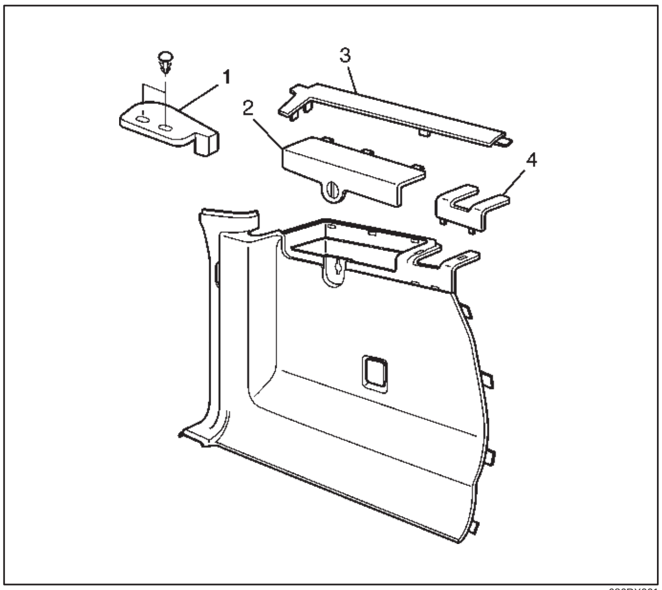
Removal

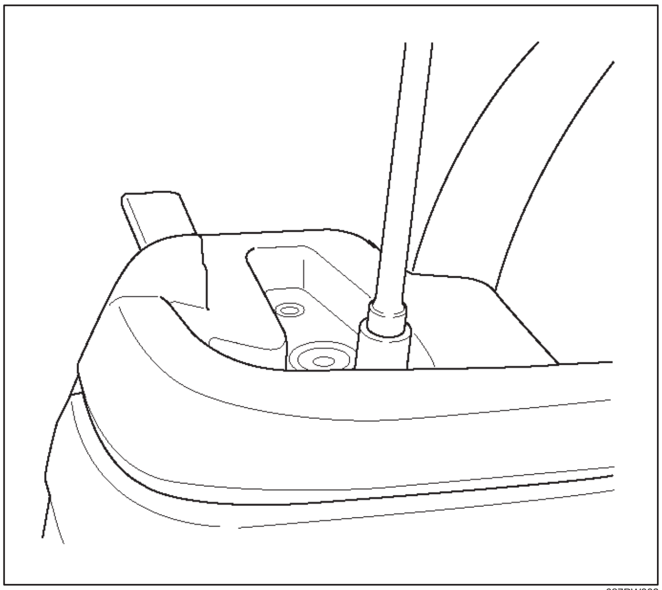
1. Disconnect the battery ground cable.
2. Remove the luggage side lid (2).
3. Remove the luggage side front cover (4).
4. Remove the luggage side upper cover (3).

5. Remove the canopy cover (1) (Resin top model).
   - Remove two fixing clips.



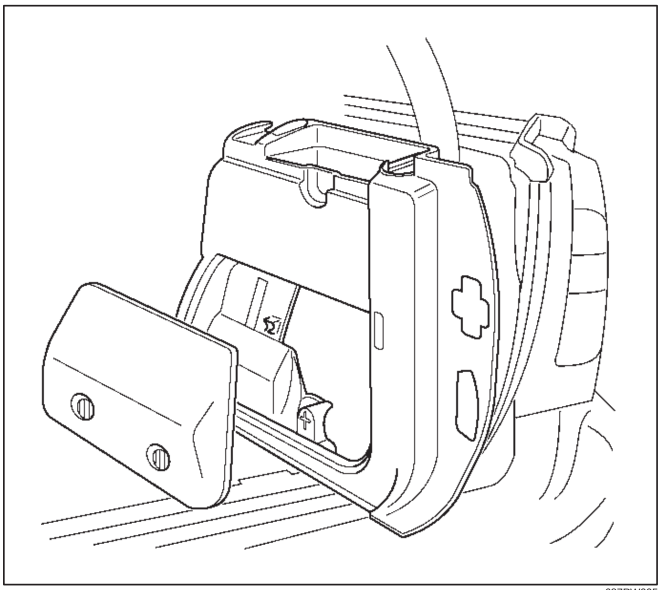
686RX001

   - Remove the three bolts and three screws, and then remove quarter side molding (Soft top model).



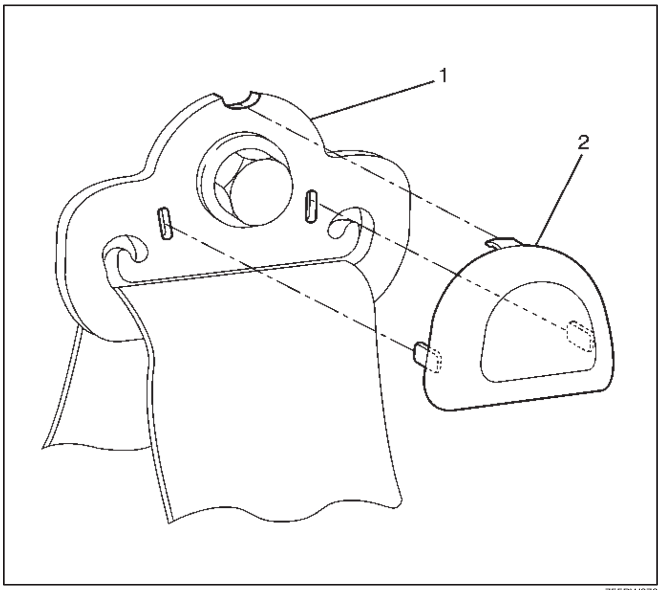
687RW002

6. Remove the tailgate weather strip.
7. Remove the rear end floor trim cover.
8. Remove the luggage side trim cover (RH).
   - Remove the jack & tool lid and remove the tool.
   - Remove fixing screw and pry the trim cover retainers free from the body panel.



687RW005

9. Remove the luggage side trim cover (LH).
   - Remove fixing screw and pry the trim cover retainers free from the body panel.
   - Disconnect the accessory socket connectors.
10. Remove the cap and seat belt lower anchor bolt.
11. Remove the shoulder anchor cover (2).
    - Release the hooked portion of cover from the shoulder anchor (1).



755RW070

12. Remove the seat belt upper anchor bolt.
13. Remove the retractor.
14. Remove the rear seat belt assembly.

Inspection

If any of the following abnormalities is found, replace on an assembly basis.

- No smooth move of upper/lower anchors in the circumferential direction.
- Damaged and/or deformed through ring.
- Damaged and/or deformed tongue.
- Damaged and/or frayed of webbing.
- Deformed retractor bracket.
- Seat belt not rewound up.
- Resistance or abnormal sound when seat belt is wound out and rewound.
- Retractor abnormality.

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
   - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
   - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.
3. ALR (Automatic Locking Retractor)/ELR check (Except for driver's seat).
   - When rewound after winding out the seat belt, make sure the seat belt cannot be taken out. After rewinding, make sure it has returned to its normal operation.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Align the projection of the retractor to the square hole of the seat belt cross bar assembly bracket.
2. Tighten the retractor fixing bolts to the specified torque.

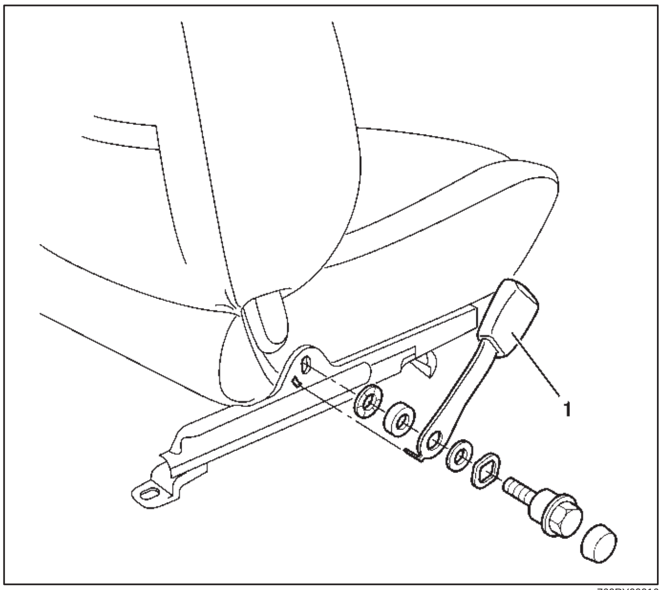
   Torque: 39 N·m (29 lb ft)
3. Tighten the seat belt anchor bolt to the specified torque.

   Torque: 39 N·m (29 lb ft)

Front Seat Buckle Assembly

Removal

1. Disconnect the battery ground cable.
2. Disconnect the seat belt warning connector (driver's side) and remove a clip.
3. Remove the front seat buckle assembly (1).



760RY00016

Installation

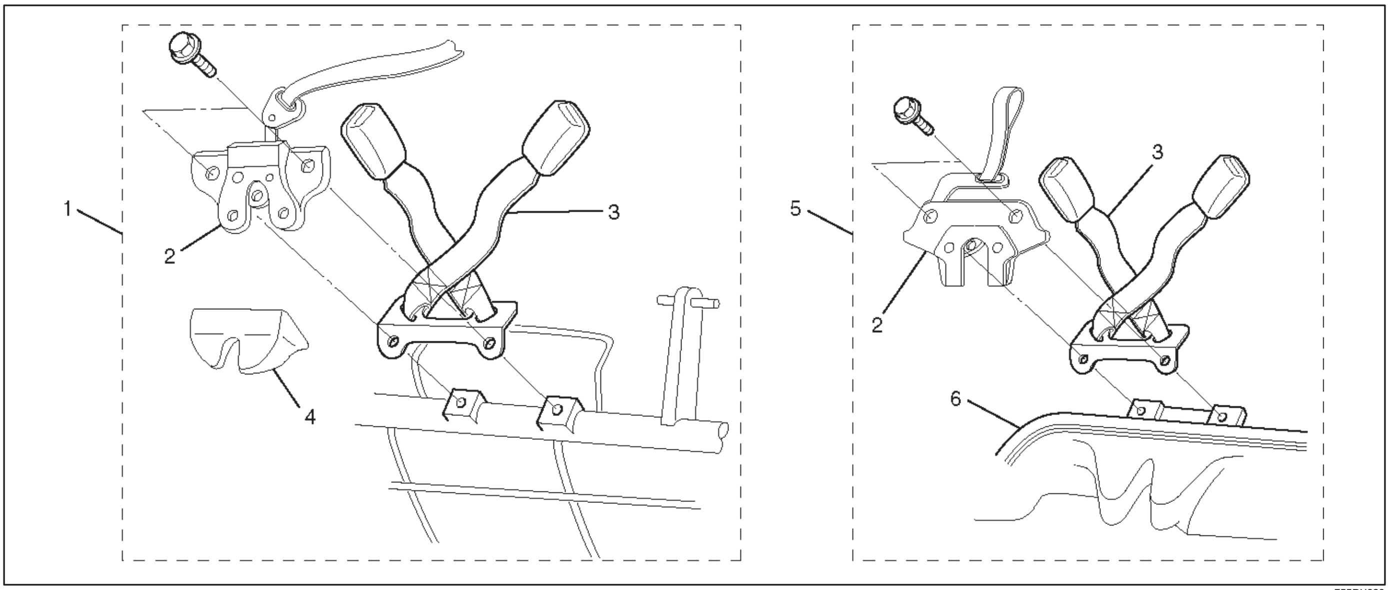
To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the buckle anchor bolt to the specified torque.

   Torque: 39 N·m (29 lb ft)

Rear Center Seat Belt / Buckle Assembly

Rear Center Seat Belt / Buckle Assembly and Associated Parts



Legend

(1) SWB

Removal

1. Remove the seat lock cover (SWB).
2. Remove the rear cushion frame assembly (LWB).
   - Refer to Rear Seat Assembly in Seats section.
3. Remove the rear seat lock assembly and rear seat belt buckle assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the rear seat lock assembly and rear seat belt buckle assembly fixing bolts to the specified torque.

   Torque: 39 N·m (29 lb ft)

NOTE: Removal and installation procedure of rear center seat belt assembly same as rear seat belt buckle assembly procedures.

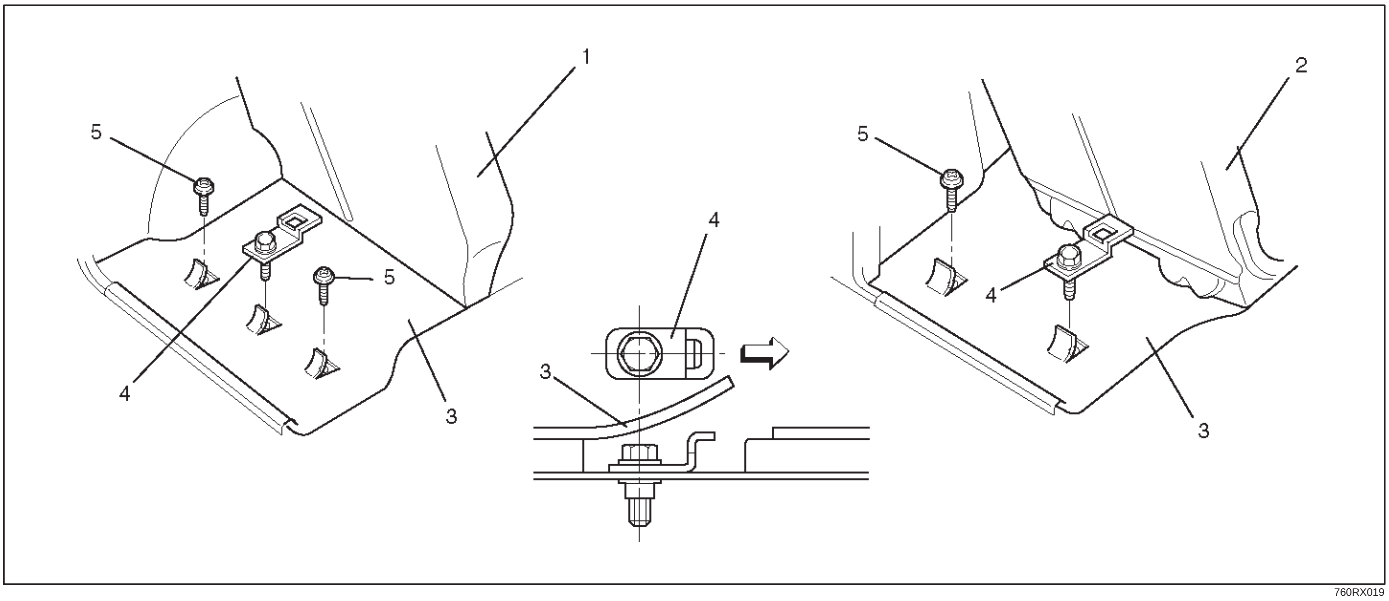
Child Seat Tether Anchor Bracket (Child Restraint)

General Description

Plastic plug is provided at two or three places on the luggage floor panel.
LWB
Remove the center plug fom the floor panel.

SWB
Remove the right plug from the floor panel.
Install the bracket to the hole where the plug is removed.
Alternatively, the bracket may be installed in the right-hand or left-hand plug hole.

Child Seat Tether Anchor Bracket and Associated Parts



Legend
(1) Rear Seat (LWB)
(2) Rear seat (SWB)

RESTRAINTS

SUPPLEMENTAL RESTRAINT SYSTEM (SRS)

CONTENTS

Service Precaution

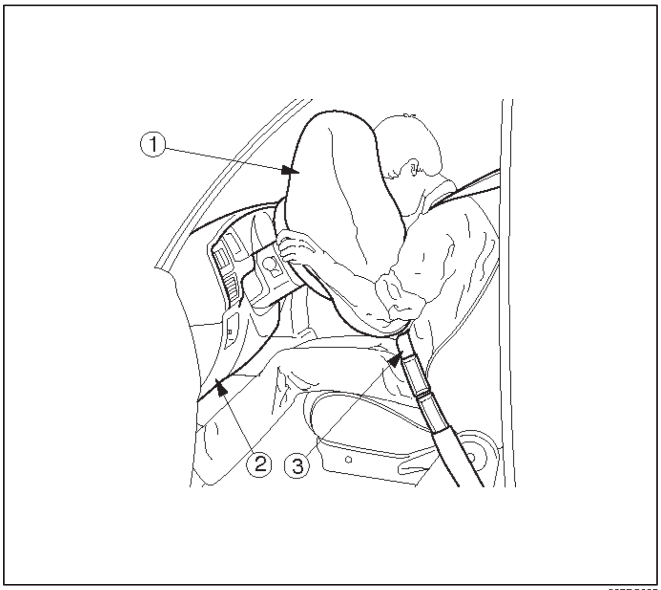
WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

Restraint Devices

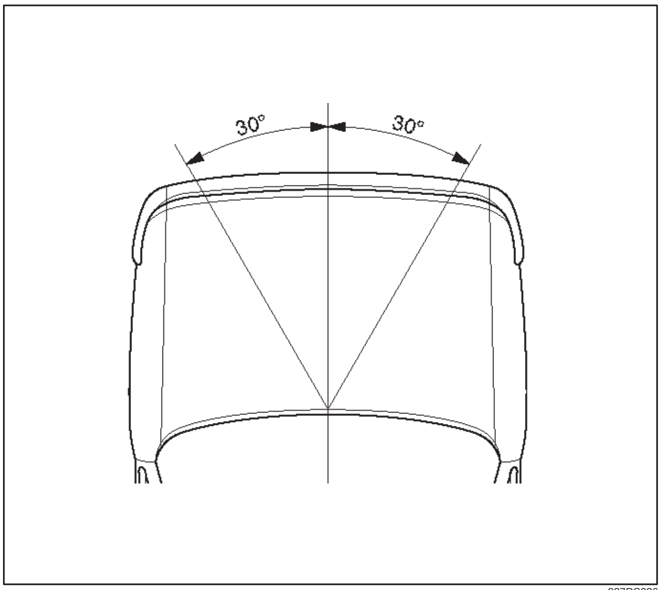


827RS035

Legend
(1) Deployed Air Bag
(2) Knee Bolster
(3) Seat Belt

The Supplemental Restraint System (SRS) helps supplement the protection offered by the driver and front passenger seat belts by deploying an air bag from the center of the steering wheel and from the top of the right side of the instrument panel.

The air bag deploys when the vehicle is involved in a frontal crash of sufficient force up to 30 degrees off the centerline of the vehicle. To further absorb the crash energy there is a knee bolster located beneath the instrument panel for both the driver and passenger, and the steering column is collapsible.



827RS036

System Description

The SRS consists of the Sensing and Diagnostic Module (SDM), the driver air bag assembly, the SRS coil assembly, the passenger air bag assembly, and the “AIR BAG“ warning lamp in the instrument cluster. The SDM, SRS coil assembly (driver side only), driver air bag assembly, passenger air bag assembly and connector wire make up the deployment loops. The function of the deployment loops is to supply current through air bag assembly, which will cause deployment of the air bags in the event of a frontal crash of sufficient force, up to 30 degrees off the centerline of the vehicle. The air bag assemblies are only supplied enough current to deploy when the SDM detects vehicle velocity changes severe enough to warrant deployment.

The SDM contains a sensing device which converts vehicle velocity change to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags.

Component Description

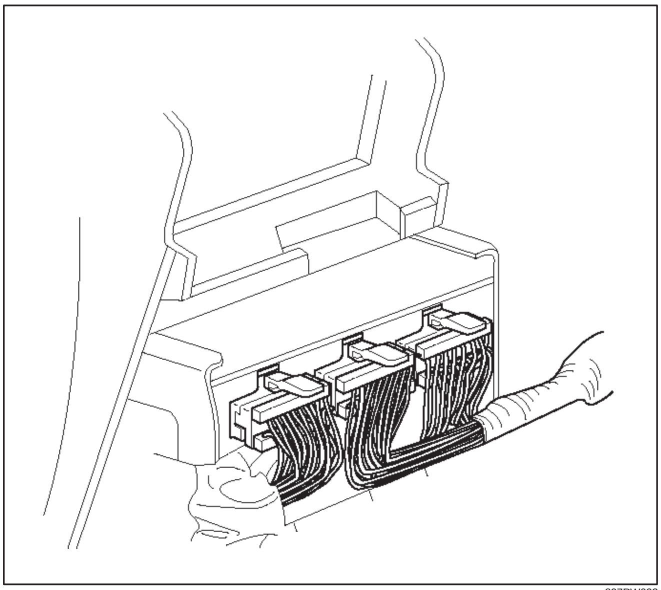
SDM (Sensing and Diagnostic Module)

WARNING: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTED TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

The Sensing and Diagnostic Module (SDM) is designed to perform the following functions in the SRS:

1. Energy Reserve — The SDM maintains 24–Volt Loop Reserve (24VLR) energy supply to provide deployment energy when ignition voltage is lost in a frontal crash.
2. Frontal Crash Detection — The SDM monitors vehicle velocity changes to detect frontal crashes which are severe enough to warrant deployment.
3. Air Bag Deployment — When a frontal crash of sufficient force is detected, the SDM will cause enough current to flow through the air bag assembly to deploy the air bag.
4. Malfunction Detection — The SDM performs diagnostic monitoring of SRS electrical components and sets a diagnostic trouble code when a malfunction is detected.
5. Frontal Crash Recording — The SDM records information regarding SRS status during frontal crash.
6. Malfunction Diagnosis — The SDM displays SRS diagnostic trouble codes and system status information through the use of a scan tool.
7. Driver Notification — The SDM warns the vehicle driver of SRS malfunctions by controlling the “Air Bag” warning lamp.

The SDM is connected to the SRS wiring harness by a 24–pin connector. This harness connector uses a shorting clip across certain terminals in the contact area. This shorting clip connects the “AIR BAG” warning lamp to ground when the SDM harness connector is disconnected or CPA (Connector Position Assurance) is not inserted even if completely connected. This will cause the “AIR BAG” warning lamp to come “ON” steady whenever the ignition switch is at the ON or START positions with the SDM disconnected.

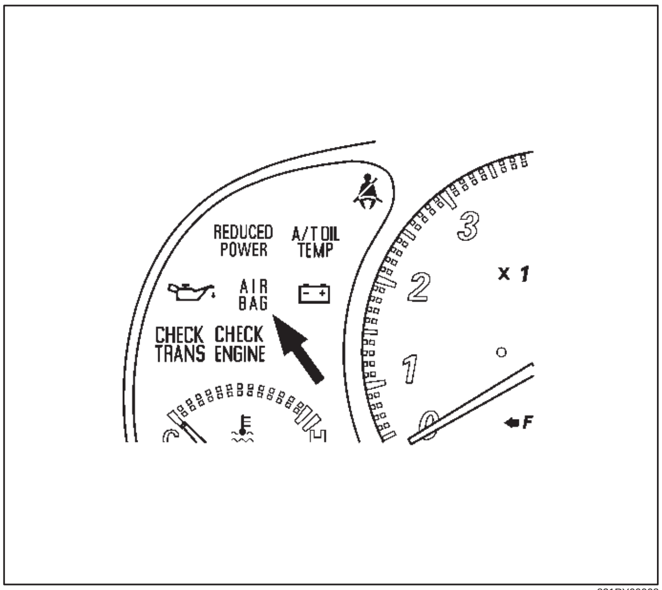


“Air Bag” Warning Lamp

Ignition voltage is applied to the “AIR BAG” warning lamp when the ignition switch is at the ON or START positions. The SDM controls the lamp by providing ground with a lamp driver. The “AIR BAG” warning lamp is used in the SRS to do the following:

1. Verify lamp and SDM operation by flashing SEVEN (7) times when the ignition switch is first turned “ON”.
2. Warn the vehicle driver of SRS electrical system malfunctions which could potentially affect the operation of the SRS. These malfunctions could result in nondeployment in case of a frontal crash or deployment for conditions less severe than intended.

The “AIR BAG” warning lamp is the key to driver notification of SRS malfunctions. For proper lamp operation, refer to the “SRS Diagnostic System Check” in this section.



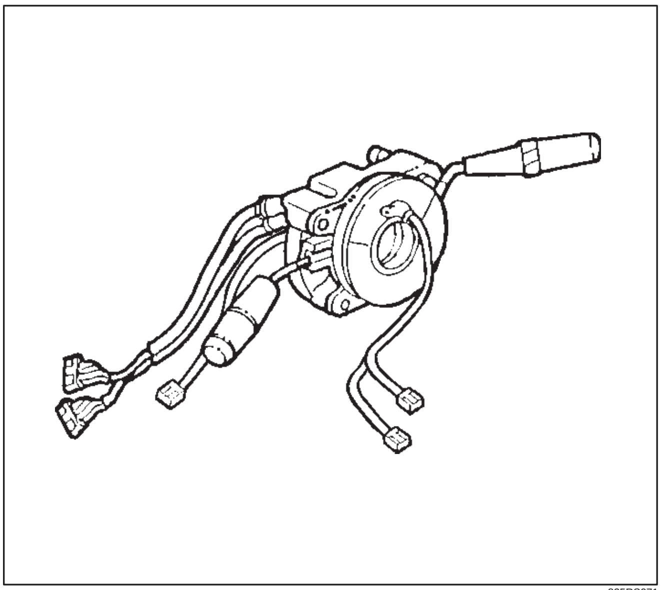
821RY00008

SRS Coil Assembly

The SRS coil assembly consists of two current carrying coils. This is attached to the steering column and allow rotation of the steering wheel while maintaining continuous contact of the driver deployment loop to the driver air bag assembly.

There is a shorting clip on the yellow 2–pin connector near the base of steering column which connects the SRS coil to the SRS wiring harness.

The shorting clip shorts to the SRS coil and driver air bag assembly when the yellow 2–pin connector is disconnected. The circuit to the driver air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the steering column or other SRS components.



825RS071

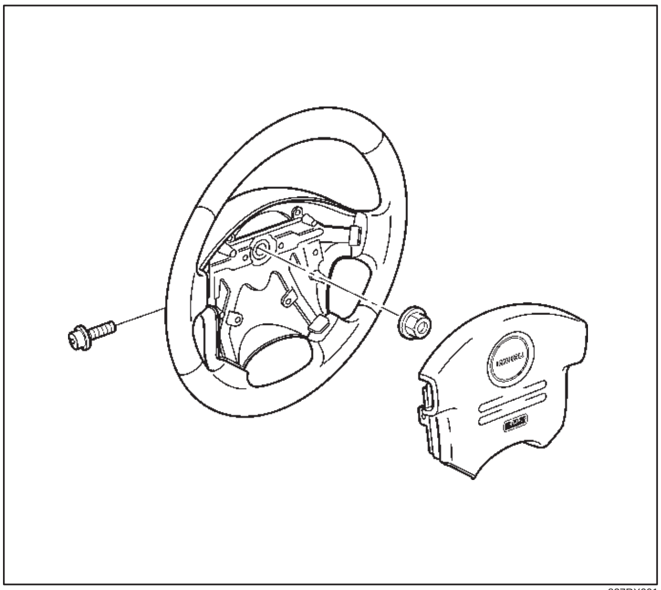
Air Bag Assemblies

The air bag assembly consist of an inflatable air bag assembly and an inflator (a canister of gas–generating material and an initiating device). When the vehicle is in a frontal crash of sufficient force.

The SDM causes current flow through the deployment loops. Current passing through the inflator ignites the material in the air bag assembly. The gas produced from this reaction rapidly inflates the air bag assembly.

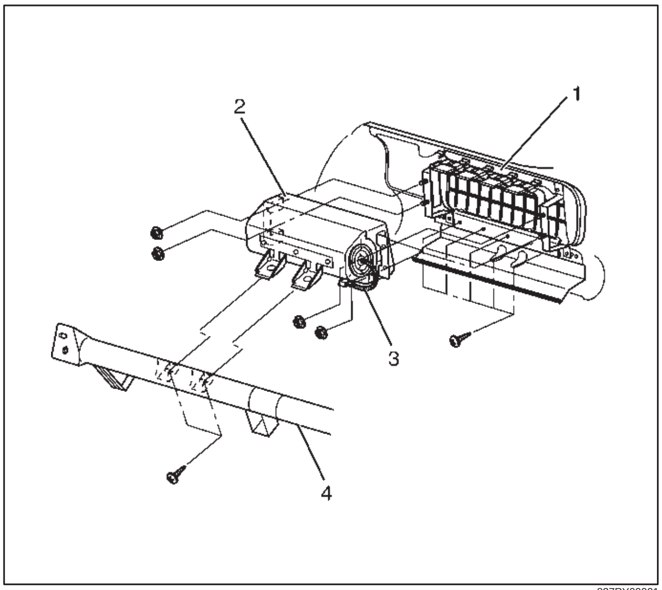
There is a shorting clip on the driver air bag assembly connector which connects the SRS coil assembly. The shorting clip shorts across the driver air bag assembly circuits when driver air bag assembly connector is disconnected.

The circuit to the driver air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the driver air bag assembly, the steering column or other SRS components.



827RX001

There is a shorting clip on the passenger air bag assembly connector which connects to the SRS harness. The shorting clip shorts across the passenger air bag assembly circuit when the passenger air bag assembly connector is disconnected. The circuit to the passenger air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the passenger air bag assembly, the instrument panel or other SRS components.



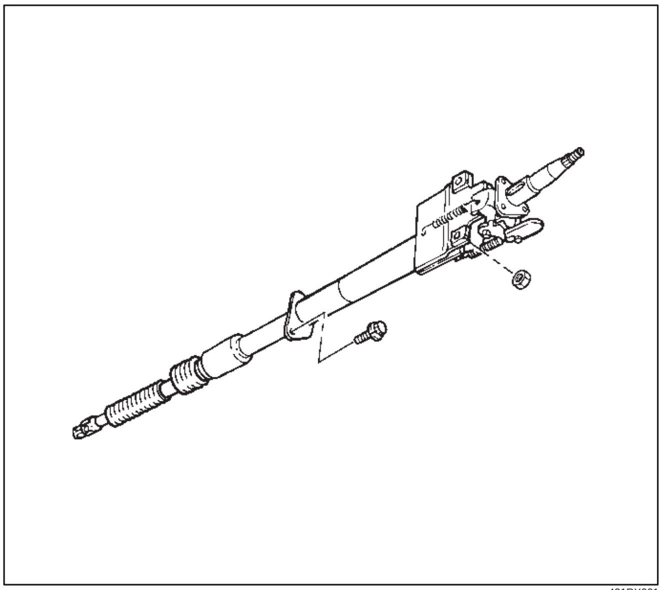
827RY00001

Legend

(1) Passenger Air Bag Door
(2) Passenger Air Bag Assembly
(3) Passenger Air Bag Harness
(4) Cross Beam

Steering Column

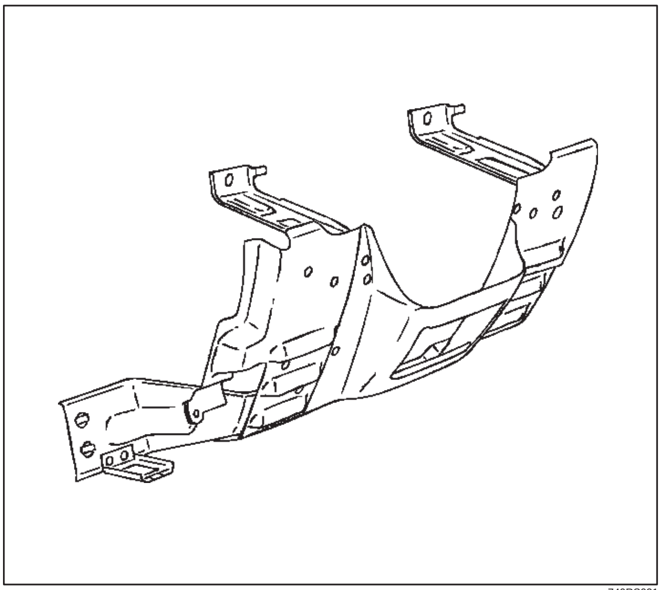
The steering column absorbs energy and is designed to compress in a frontal crash to decrease the chance of injury to the driver.



431RX001

Knee Bolster

The knee bolsters are used to absorb energy to protec knees and control the forward movement of the vehicle's front seat occupants during a frontal crash, by limiting leg movement.



740RS021

Definition

Air Bag
An inflatable cloth cushion designed to deploy in certain frontal crashes. It supplements the protection offered by the seat belts by distributing the impact load more evenly over the vehicle occupant's head and torso.

Asynchronous
Performed in a nonperiodic fashion, (i. e., no defined time or interval).

(B+)
Battery voltage, (B+) The voltage available at the battery at the time of the indicated measurement. With the key "ON" and the engine not running, the system voltage will likely be between 12 and 12.5 volts. At idle the voltage may be 14 to 16 volts. The voltage could be as low as 10 volts during engine cranking.

Bulb Check
The SDM will cause the "AIR BAG" warning lamp to flash seven times and then go "OFF" whenever the ignition switch transitions to the ON position from any other ignition switch position and no malfunctions are detected.

"CONTINUOUS MONITORING"
Tests performed by the SDM on the SRS every 100 milliseconds while "Ignition 1" voltage is in the normal operating voltage range at the SDM.

Data Link Connector (DLC)
Formerly "DLC" a connector which allows communication with an external computer, such as a scan tool.

Datum Line
A base line parallel to the plane of the underbody or frame from which all vertical measurements originate.

Deploy
To inflate the air bag.

Deployment Loops
The circuits which supply current to the air bag assemblies to deploy the air bag.

Diagnostic Trouble Code (DTC)
Formerly “Code”, a numerical designator used by the SDM to indicate specific SRS malfunctions.

Driver Current Source
An output of the SDM which applies current into the driver air bag assembly circuit during the “Initiator Assembly Resistance Test”.

Driver Air Bag Assembly
An assembly located in the steering wheel hub consisting of an inflatable bag, an inflator and an initiator.

EEPROM
Electronically Erasable Programmable Read Only Memory. Memory which retains its contents when power is removed from the SDM.

Ignition Cycle
The voltage at the SDM “Ignition 1” inputs, with ignition switch “ON”, is within the normal operating voltage range for at least ten seconds before turning ignition switch “OFF”.

Ignition 1
A battery voltage (B+) circuit which is only powered with the ignition switch in the ON, or START positions.

Initiator
The electrical component inside the air bag assembly which, when sufficient current flows, sets off the chemical reaction that inflates the air bag.

“Initiator Assembly Resistance Test”
Tests performed once each ignition cycle when no malfunctions are detected during “Turn–ON” or “Continuous Monitoring.” This test checks for the correct SDM configuration for the vehicle, shorts to “Ignition 1” in the deployment loops, high resistance or opens in the “Driver Side High”, “Driver Side Low”, “Passenger Side High” and “Passenger Side Low” circuits and measures the resistance of the inflator assembly consisting of: 1) Initiators, 2) SRS coil assembly (driver side only), 3) Connectors and associated wiring.

Normal Operating Voltage Range
The voltage measured between the SDM “Ignition 1” terminals and “Ground” terminals is between 9 and 16 volts.

Passenger Current Source
An output of the SDM which applies current into the passenger air bag assembly circuit during the “Initiator Assembly Resistance Test”.

Passenger Air Bag Assembly
An assembly located in the right side of the instrument panel consisting of an inflatable bag, an inflator and an initiator.

Scan Tool
An external computer used to read diagnostic information from onboard computers via the data link connector.

SDM
Sensing and Diagnostic Module which provides reserve energy to the deployment loops, deploys the air bags when required and performs diagnostic monitoring of all SRS components.

Serial Data
Information representing the status of the SRS.

SRS
Supplemental Restraint System.

SRS Coil Assembly
An assembly of two current–carrying coils in the driver deployment loop that allows the rotation of the steering wheel while maintaining the continuous contact of the driver deployment loop to the driver air bag assembly.

SRS Wiring Harness
The wires and connectors that electrically connect the components in the SRS.

“Turn–ON”
Test which the SDM performs on the SRS once during each ignition cycle immediately after “Ignition 1” voltage is applied to the SDM and before “Continuous Monitoring”.

Diagnosis

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON–POWERED PROVE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

Diagnostic Trouble Codes

The “SRS Diagnostic System Check” must always be the starting point of any SRS diagnosis. The “SRS Diagnostic System Check” checks for proper “AIR BAG” warning lamp operation and checks for SRS diagnostic trouble codes using the scan tool.

1. Current diagnostic trouble codes – Malfunctions that are presently being detected. Current diagnostic trouble codes are stored in RAM (Random Access Memory).
2. History diagnostic trouble codes – All malfunctions detected since the last time the history memory was cleared. History diagnostic trouble codes are stored in EEPROM.

Scan Tool Diagnostics

A scan tool is used to read current and history diagnostic trouble codes and to clear all diagnostic trouble codes after a repair is completed. The scan tool must be updated to communicate with the SRS through a replaceable cartridge before it can be used for SRS diagnostics. To use the scan tool, connect it to the data link connector and turn the ignition switch “ON”. The scan tool reads serial data from the SDM “Serial Data” line terminal “24” to the data link connector terminal “9”.

Use of Special Tools

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC, OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON POWERED PROVE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT. YOU SHOULD BE FAMILIAR WITH THE TOOLS LISTED IN THIS SECTION UNDER THE HANDLING SRS SPECIAL TOOLS.

You should be able to measure voltage and resistance. You should be familiar with proper use of a scan tool such as the Tech 2 Diagnostic Computer, SRS Driver/Passenger Load Tool J–41433, Connector Test Adapter Kit J–35616–A, and the DVM (Digital Multimeter) J–39200.

Repairs and Inspections Required After an Accident

NOTE: If any SRS components are damaged, they must be replaced. If SRS component mounting points are damaged, they must be replaced.

- Never use SRS parts from another vehicle. This does not include remanufactured parts purchased from an authorized dealer; they may be used for SRS repairs.
- Do not attempt to service the SDM, the SRS coil assembly, or the air bag assembly. Service of these items is by replacement only.
- Verify the part number of replacement air bag assembly.

CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.

The air bag assembly has identification colors on the bar code label from ’00 model as follows.

Light blue color for driver air bag assembly.

Light blue color for passenger air bag assembly.

Use only the air bag assembly for Rodeo (UE) models.

CAUTION: Proper operation of the sensors and Supplemental Restraint System (SRS) requires that any repairs to the vehicle structure return it to the original production configuration. Deployment requires, at a minimum, replacement of the SDM, air bag assembly and dimensional inspection of the steering column. Any visible damage to the SDM mounting bracket (s) requires replacement, and the steering column must be dimensionally inspected, whether deployment occurred or not.

Accident With Deployment – Component Replacement and Inspections

Certain SRS components must be replaced or inspected for damage after a frontal crash involving air bag deployment. Those components are:

- Air bag assembly
- SDM

CAUTION: Refer to "SDM Replacement Guidelines" below for important information on SDM replacement in both deployment and non deployment crashes.

- SRS coil assembly—Inspect wiring and connector for any signs of scorching, melting, or damage due to excessive heat. Replace if damaged. Refer to SRS coil assembly in this section.

Accident With or Without Deployment—Component Inspection

Certain SRS and restraint system components must be inspected after any crash, whether the air bag deployed or not. Those components are:

- Steering column—Dimensionally inspect per "Checking Steering Column for Accident Damage" in 3 of this workshop manual.
- Knee bolsters and mounting points— Inspect for any distortion, bending, cracking, or other damage.
- I/P steering column reinforcement plate— Inspect for any distortion, bending, cracking, or other damage.
- I/P braces—Inspect for any distortion, bending, cracking, or other damage.
- Seat belts and mounting points—Refer to "Seat Belts" in 10 of this workshop manual.

SDM Replacement Guidelines

SDM replacement policy requires replacement of SDM, after crash involving air bag deployment when "SRS Warning Lamp" turn "ON", "SRS Diagnosis" should be done according to "Section 9J1".

Wiring Damage

If any SRS wire harness is damaged, it should be replaced. Don't repair SRS. It is replace only.

SRS Connector (Plastic Body And Terminal Metal Pin) Damage

If any connector or terminal in the SRS wire harness (except pigtails) is damaged, it should be replaced.

SRS Wire Pigtail Damage

If the wiring pigtail (a wire or wires attached directly to the device, not by a connector) is damaged, the entire component (with pigtail) must be replaced. Examples of "pigtail" components are the driver air bag assembly, the passenger air bag assembly, and the SRS coil assembly.

On–Vehicle Service

Service Precautions

WARNING: WHEN PERFORMING SERVICE ON OR AROUND SRS COMPONENTS OR SRS WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE SRS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNEEDED SRS REPAIRS.

The SDM in Driver—Passenger SRS can maintain sufficient voltage to cause a deployment for up to 15 seconds after the ignition switch is turned "OFF", the battery is disconnected, or the fuse powering the SDM is removed.

Many of the service procedures require removal of the "SRS–1" fuse, and disconnection of the air bag assembly from the deployment loop to avoid an accidental deployment. If the air bag assembly is disconnected from the deployment loop as noted in the "Disabling the SRS" procedure that follows, service can begin immediately without waiting for the 15 second time period to expire.

Disabling The SRS

Removal

Turn the ignition switch to "lock" and remove key.

1. Remove SRS fuse SRS–1, from left dash side lower fuse block or disconnect battery.
2. Disconnect yellow 2–pin connector at the base of steering column.
3. Remove glove box assembly, Refer to "Passenger Air Bag Assembly Replacement" in section 9J–28.
4. Disconnect yellow 2–pin connector behind the glove box assembly.

CAUTION: With the "SRS–1" fuse removed and ignition switch "ON", "AIR BAG" warning lamp will be "ON". This is normal operation and does not indicate an SRS malfunction.

Enabling The SRS

Installation

CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.

The air bag assembly has identification colors on the bar code label from ’00 model as follows.

Light blue color for driver air bag assembly.

Light blue color for passenger air bag assembly.

Use only the air bag assembly for Rodeo (UE) models.

Turn ignition switch to “LOCK” and remove key.

1. Connect yellow 2–pin connector passenger air bag assembly.
2. Install glove box assembly, refer to “Passenger Air Bag Assembly Replacement” in section 9J–28.
3. Connect yellow 2–pin connector at the base of steering column.
4. Install “AIR BAG” fuse SRS–1 to left dash side lower fuse block or connect battery.

Turn ignition switch to “ON” and verify that the “AIR BAG” warning lamp flashes seven times and then turns “OFF” If it does not operate as described, perform the “SRS Diagnostic System Check” in section 9J1–3.

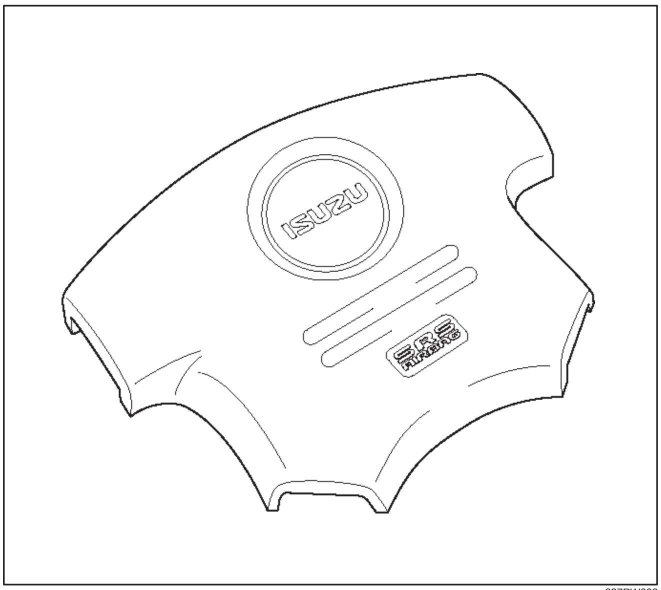
Handling / Installation / Diagnosis

1. Air bag assembly should not be subjected to temperatures above 93˚C (200˚F).
2. Air bag assembly, and SDM should not be used if they have been dropped from a height of 100 centimeters (3.28 feet).
3. When a SDM is replaced, it must be oriented with the arrow on the sensor pointing toward the front of the vehicle. It is very important for the SDM to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the SDM mounting surface is free of any dirt or other foreign material.
4. Do not apply power to the SRS unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
5. The “SRS Diagnostic System Check” must be the starting point of any SRS diagnostics. The “SRS Diagnostic System Check” will verify proper “AIR BAG” warning lamp operation and will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacement.

Air Bag Assembly Handling / Shipping / Scrapping

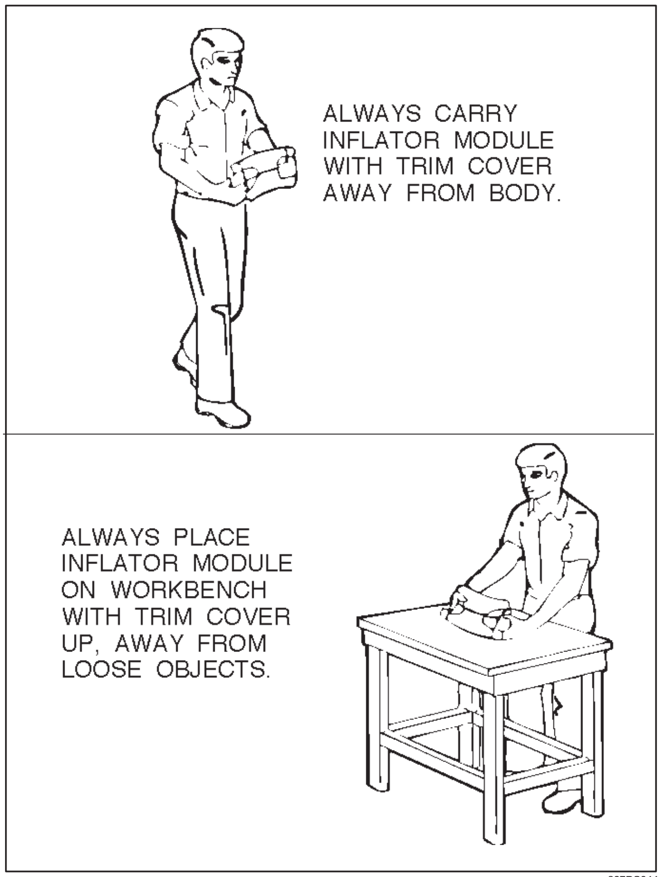
Live (Undeployed) Air Bag Assembly

Special care is necessary when handling and storing a live (undeployed) air bag assembly. The rapid gas generation produced during deployment of the air bag could cause the air bag assembly, or an object in front of the air bag assembly, to be thrown through the air in the unlikely event of an accidental deployment.



827RW009

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG OPENING IS POINTED AWAY FROM YOU. IN CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. NEVER CARRY THE AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF THE MODULE.



827RS044

Air Bag Assembly Shipping Procedure For Live (Undeployed) Air Bag Assemblies

Service personnel should refer to the latest Service Bulletins for proper SRS air bag assembly shipping procedures.

Deployed Air Bag Assembly

You should wear gloves and safety glasses. After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present.

Air Bag Assembly Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) air bag assembly. This information covers proper procedures for disposing of a live air bag assembly.
Before a live air bag assembly can be disposed of, it must be deployed. Alive air bag assembly must not be disposed of through normal refuse channels.

WARNING: FAILURE TO FOLLOW PROPER SUPPLEMENTAL RESTRAINT SYSTEM (SRS) AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. AN UNDPLOYED AIR BAG ASSEMBLY MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE, AND / OR LOCAL LAW.

In situations which require deployment of a live air bag assembly module, deployment may be accomplished inside or outside the vehicle. The method employed depends upon the final disposition of the particular vehicle, as noted in "Deployment Outside Vehicle" and "Deployment Inside Vehicle" in this section.

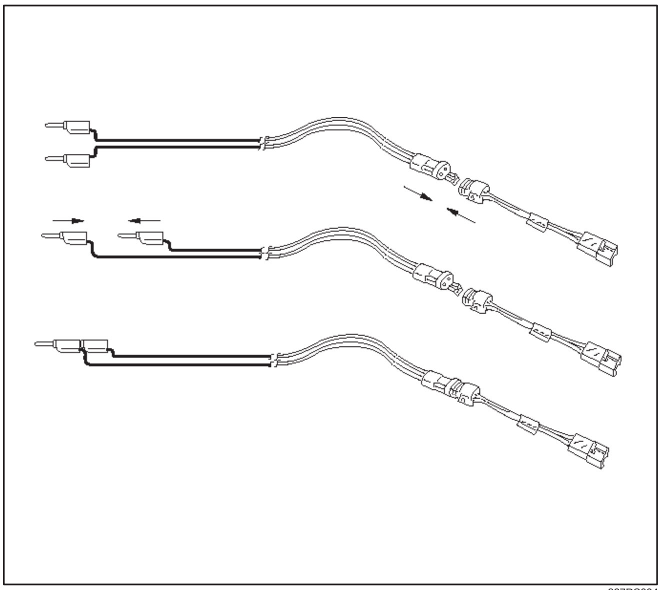
Deployment Outside Vehicle (Driver Air Bag Assembly)

Deployment outside the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which the vehicle will be returned to useful service after a functionally or cosmetically deficient air bag assembly is replaced. Deployment and disposal of a malfunctioning air bag assembly is, of course, subject to any required retention period.
For deployment of a live (undeployed) air bag assembly outside the vehicle, the deployment procedure must be followed exactly. Always wear safety glasses during this deployment procedure until a deployed air bag assembly is scrapped or until an undeployed air bag assembly is shipped. Before performing the procedures you should be familiar with servicing the SRS and with proper handling of the air bag assembly. Procedures should be read fully before they are performed.
The following procedure requires use of J–41434 SRS deployment harness with appropriate pigtail adapter. Do not attempt procedure without J–41434 adapter.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT HARNESS TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT HARNESS TO THE DRIVER AIR BAG ASSEMBLY. DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

NOTE: This information applies only to driver air bag assembly . Refer to "Deployment Outside Vehicle (Passenger Air Bag Assembly)" in this section for information on passenger air bag assembly scrapping.

1. Turn ignition switch to "LOCK", remove key and put on safety glasses.
2. Inspect J–41434 SRS Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail adapter is damaged, discard and obtain a replacement.
3. Short the two SRS deployment harness leads together by fully seating one banana plug into the other. SRS deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed.

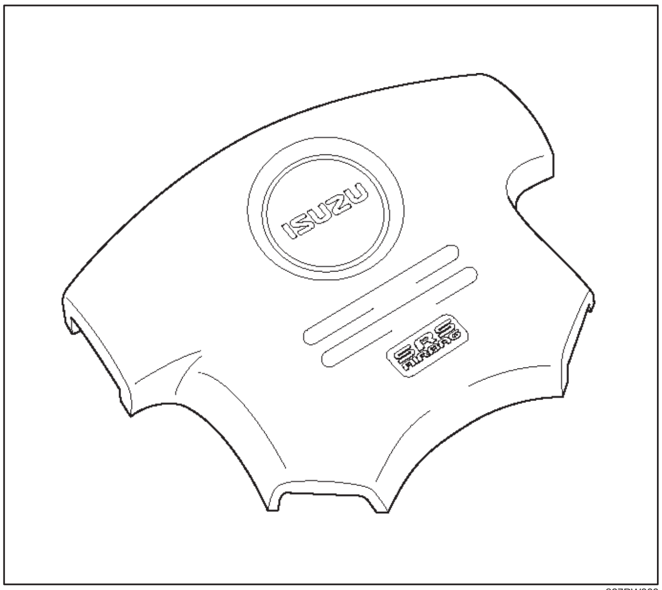


827RS004

4. Connect the appropriate pigtail adapter to the SRS deployment harness.
5. Remove the driver air bag assembly from vehicle. Refer to Inflator Module Removal in this Section 9J–3.

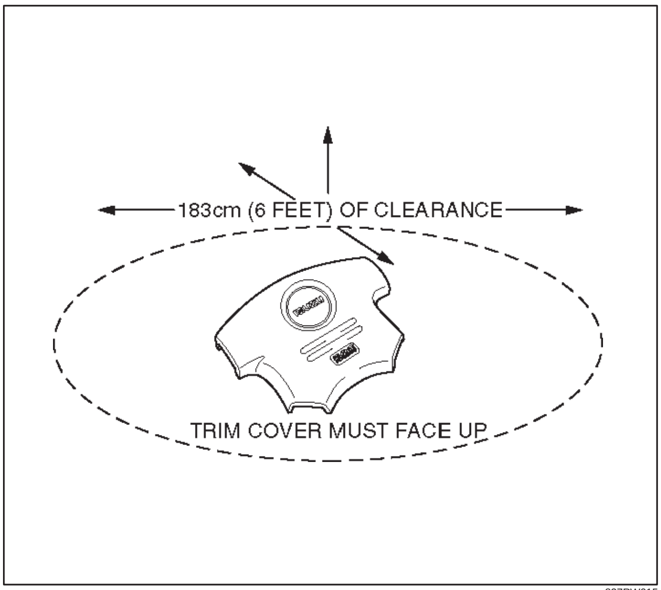
WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE AIR BAG AND TRIM COVER UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

6. Place the driver air bag assembly on a work bench or other surface away from all loose or flammable objects with its trim cover facing up, away from the surface.



827RW009

7. Clear a space on the ground about 183 cm (six feet) in diameter where the driver air bag assembly is to be deployed. A paved, outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where there is no activity and sufficient ventilation is recommended. Ensure no loose or flammable objects are within the deployment area.



827RW015

8. Place the driver air bag assembly, with its trim cover facing up, on the ground in the space just cleared.
9. Stretch the SRS deployment harness and pigtail adapter from the driver air bag assembly to its full length.
10. Place a power source near the shorted end of the SRS deployment harness. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
11. Connect the driver air bag assembly to the pigtail adapter on the SRS deployment harness. Deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The driver air bag assembly will immediately deploy the air bag when a power source is connected to it.

NOTE: Ensure that the pigtail adapter is firmly seated into the driver air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the driver air bag assembly connector functioning (shorted) and may result in non deployment of the driver air bag assembly.

12. Verify that the area around the driver air bag assembly is clear of all people and loose or flammable objects.
13. Verify that the driver air bag assembly is resting with its trim cover facing up.
14. Notify all people in the immediate area that you intend to deploy the driver air bag. The deployment will be accompanied by a substantial noise which may startle the uninformed.
15. Separate the two banana plugs on the SRS deployment harness.

NOTE: When the air bag deploys, the driver air bag assembly may jump about 30 cm (one foot) vertically. This is a normal reaction of the driver air bag to the force of the rapid gas expansion inside the air bag.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the driver air bag.

WARNING: DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

16. Connect the SRS deployment harness wires to the power source to immediately deploy the driver air bag. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
17. Disconnect the SRS deployment harness from the power source.
18. Short the two SRS deployment harness leads together by fully seating one banana plug into the other.
19. In the unlikely event that the driver air bag assembly did not deploy after following these procedures, proceed immediately with Steps 24 through 26. If the driver air bag assembly did deploy, proceed with Steps 20 through 23.
20. Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed driver air bag assembly. After the driver air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This power consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with the atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE INFLATOR MODULE TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED AIR BAG ASSEMBLY NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY.

AFTER A DRIVER AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE DRIVER AIR BAG ASSEMBLY WILL BE VERY HOT. DO NOT TOUCH THE METAL AREAS OF THE DRIVER AIR BAG ASSEMBLY FOR ABOUT TEN MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED DRIVER AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL, WEAR GLOVES AND HANDLE BY THE AIR BAG OR TRIM COVER.

21. Disconnect the pigtail adapter from the driver air bag assembly as soon after deployment as possible. This will prevent damage to the pigtail adapter or SRS deployment harness due to possible contact with the hot driver air bag assembly canister. The pigtail adapter can be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
22. Dispose of the deployed driver air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
23. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the driver air bag assembly did not deploy after following these procedures.

24. Ensure that the SRS deployment harness has been disconnected from the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other.
25. Disconnect the pigtail adapter from the driver air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE INFLATOR MODULE UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

26. Temporarily store the driver air bag assembly with its trim cover facing up, away from the surface upon which it rests.

Deployment Outside Vehicle (Passenger Air Bag Assembly)

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. UNDEPLOYED AIR BAG ASSEMBLIES MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE AND/OR LOCAL LAWS.

Deployment out of the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which a functionally or cosmetically deficient air bag assembly is replaced. Deployment and disposal of an air bag assembly is, of course, subject to any required retention period.

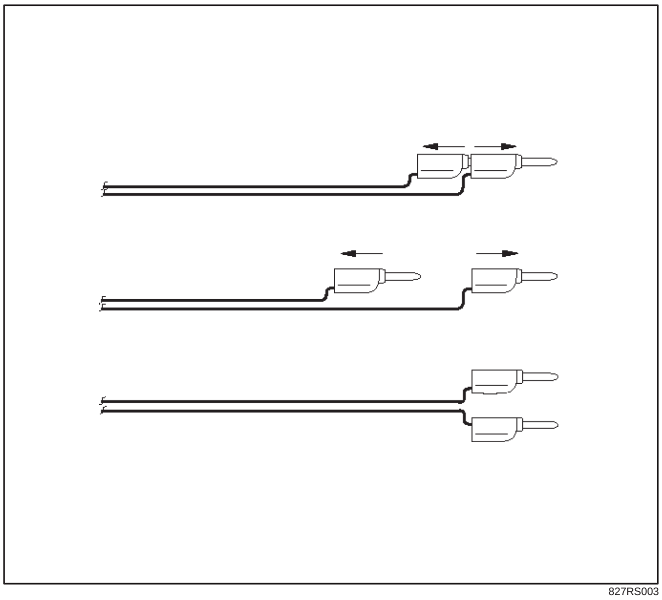
For deployment of a live air bag assembly out of the vehicle, the deployment procedure must be followed exactly. ALWAYS wear safety glasses during this

deployment procedure until the deployed air bag assembly is scrapped. Before performing the procedures, you should be familiar with servicing the SRS system and with proper handling of the air bag assembly. Procedures should be read fully before they are performed.
The following procedure requires use of J–42986 SRS Deployment Harness with the appropriate pigtail adapter. The procedure also requires the use of J–41497 Passenger Side SRS Module Deployment Fixture. Do not attempt this procedure without J–42986 and fixture J–41497.

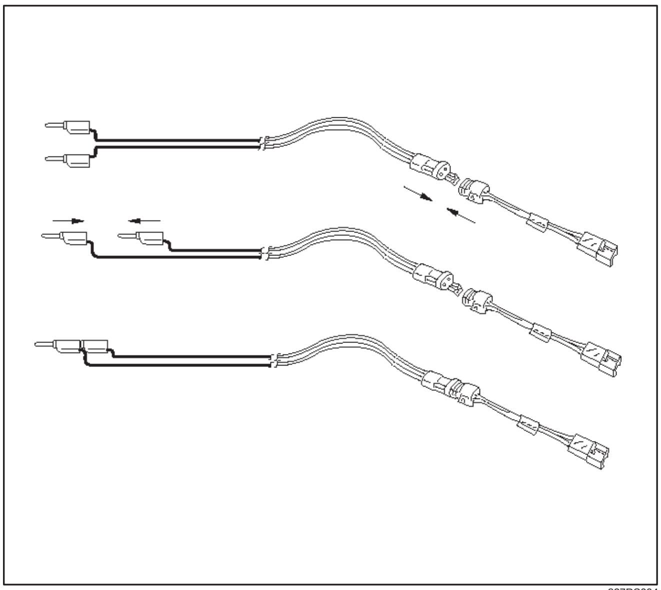
WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT HARNESS TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT HARNESS TO THE AIR BAG ASSEMBLY. DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

NOTE: This information applies only to passenger air bag assembly. Information for disposing of a live driver air bag assembly can be found in “Deployment Outside Vehicle” (Driver Air Bag Assembly) in this section.

1. Turn ignition switch to “LOCK” remove key, and put on safety glasses.
2. Inspect J–41434 SRS Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail is damaged, discard and obtain a replacement.
3. Short the two SRS Deployment Harness leads together by fully seating one banana plug into the other. The SRS Deployment Harness shall remain shorted and not be connected to a power source until the air bag is to be deployed.



4. Connect the appropriate pigtail adapter to the SRS Deployment Harness



5. Remove passenger air bag assembly from vehicle. Refer to “Passenger Air Bag Assembly Removal ” in this Section.
6. Clear a space on the ground approximately 185 cm (six feet) in diameter where the fixture with attached air bag assembly is to be placed for deployment. A paved outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where is no activity and sufficient ventilation is recommended. Ensure that no loose or flammable objects are within the deployment area.
7. Place the J–41497 on the bench vice. This is necessary to provide sufficient stabilization of the fixture during deployment.
8. Attach the passenger air bag assembly in the J–41497. Air bag assembly must be mounted such that the bag will deploy upward. SECURELY HAND–TIGHTEN ALL FASTENERS PRIOR TO DEPLOYMENT.
9. Stretch the SRS Deployment Harness and pigtail adapter from the air bag assembly to its full length.
10. Place a power source near the shorted end of the SRS deployment harness. (Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.)
11. Connect the air bag assembly to the pigtail adapter on the SRS deployment harness. The SRS Deployment Harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The air bag assembly will immediately deploy the air bag when a power source is connected to it.

NOTE: Ensure that the pigtail adapter is firmly seated into the air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the air bag assembly connector functioning (shorting the deployment circuit) and may result in non deployment of the air bag assembly.

12. Verify that the area around the passenger air bag assembly is clear of all people and loose or flammable objects.

13. Verify that the passenger air bag assembly is firmly and properly in J–41497.
14. Notify all people in the immediate area of your intention to deploy the passenger air bag assembly. The deployment will be accompanied by a substantial noise which may startle the uninformed.
15. Separate the two banana plugs on the SRS deployment harness.

NOTE: When air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the air bag assembly.

WARNING: DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

16. Connect the SRS deployment harness wires to the power source to immediately deploy the air bag assembly. Recommended application : 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
17. Disconnect the SRS deployment harness from the power source.
18. Short the two SRS deployment harness leads together by fully seating one banana plug into the other.
19. In the unlikely event that the passenger air bag assembly did not deploy after following these procedures, proceed immediately with Steps 24 through 26. If the passenger air bag assembly deployed as intended, proceed with Steps 20 through 23.
20. Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly. After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide quickly reacts with the atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present for very long after deployment.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED INFLATOR MODULE NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY. AFTER AN AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE AIR BAG ASSEMBLY WILL BE HOT. DO NOT TOUCH THE METAL AREAS OF THE AIR BAG ASSEMBLY FOR ABOUT THIRTY MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL, WEAR GLOVES AND HANDLE BY THE AIR BAG ITSELF.

21. Disconnect the pigtail adapter from the air bag assembly as soon after deployment as possible to avoid damage to the pigtail adapter or SRS deployment harness from contacting the hot air bag assembly canister. The pigtail adapter and SRS deployment harness are designed to be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
22. Dispose of the deployed air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
23. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following the above procedures.

24. Ensure that the SRS deployment harness has been disconnected from the the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other.
25. Disconnect the pigtail adapter from the air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

26. Temporarily store the air bag assembly with the bag facing up, away from the surface upon which it rests.

Deployment Inside Vehicle (Vehicle Scrapping Procedure)

Deployment inside vehicle is proper when the vehicle is to be destroyed or salvaged for component parts. This includes, but is not limited to, the following situations:

1. The vehicle has completed its useful life.
2. The vehicle has been damaged beyond repair in a non deployment type accident.
3. The vehicle has been stripped or damaged beyond repair in a theft.
4. The vehicle will be salvaged for component parts to be used on a vehicle with a different Vehicle Identification Number (VIN) as opposed to being rebuilt as same VIN. Never use SRS components from another vehicle.

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. UNDEPLOYED AIR BAG ASSEMBLIES MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE AND/OR LOCAL LAWS.

1. Turn ignition switch to “LOCK”, remove key and put on safety glasses.
2. Remove all loose objects from front seats.
3. Disconnect SRS coil assembly, yellow 2–pin connector located at the base of the steering column.
4. Cut the SRS coil assembly yellow 2–pin harness connector from the vehicle leaving at least 16 cm (six inches) of wire at the connector.
5. Strip 13 mm (1/2 inch) of insulation from yellow–green and yellow–black wire lead of the connector.
6. Cut two 900 cm (30 feet) deployment wires from 0.8 mm^2 (18 gauge) or thicker multi–strand wire. These wires will be used to fabricate the driver deployment harness.
7. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.
8. Short the wires by twisting together one end from each. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT WIRES TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT WIRES TO THE AIR BAG ASSEMBLY LEADS. DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

9. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure.
10. Bend twisted connection made in the previous step flat and wrap tightly with electrical tape to insulate and secure.
11. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire.
12. Connect the deployment harness to the driver air bag assembly, yellow 2–pin connector at the base of the steering column. Route deployment harness out the driver side of the vehicle.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED.

THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT.

CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE.

FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

13. Disconnect passenger air bag assembly, yellow 2–pin connector located behind glove box assembly.
14. Cut the passenger air bag assembly harness connector from the vehicle leaving at least 16 cm (six inches) of wire at the connector.
15. Strip 13 mm (1/2 inch) of insulation from yellow–green and yellow–red wire lead of the connector.
16. Cut two 900 cm (30 feet) deployment wires from 0.8 mm^2 (18 gauge) or thicker multi–strand wire. These wires will be used to fabricate the passenger deployment harness.
17. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.
18. Short the wires by twisting together one end from each. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT WIRES TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT WIRES TO THE AIR BAG ASSEMBLY LEADS. DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

19. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure.
20. Bend twisted connection made in the previous step flat and wrap tightly with electrical tape to insulate and secure.
21. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire.
22. Connect the deployment harness to the passenger air bag assembly, yellow 2–pin connector located behind the glove box assembly. Route deployment harness out the passenger side of the vehicle.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE

DEPLOYMENT WIRES SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

23. Verify that the inside of the vehicle and the area surrounding the vehicle are clear of all people and loose or flammable objects.
24. Stretch the driver and passenger deployment harness to their full length.
25. Completely cover windshield area and front door window openings with a drop cloth, blanket or similar item. This reduces the possibility of injury due to possible fragmentation of the vehicle's glass or interior.
26. Notify all people in the immediate area that you intend to deploy the air bags. The deployment will be accompanied by a substantial noise which may startle the uninformed.
27. Separate the two ends of the driver deployment harness wires.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the air bags.

28. Connect the driver deployment harness wires to a power source to immediately deploy the driver air bag assembly. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
29. Separate the two ends of the passenger deployment harness wires.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

30. Connect the passenger deployment harness wires to a power source to immediately deploy the passenger air bag assembly. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested. Put on a pair of shop gloves and safety gasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly. After an air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE HOT DEPLOYED AIR BAG ASSEMBLY NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN FIRE OR PERSONAL INJURY.

After an air bag assembly has been deployed, the metal canister and surrounding areas of the air bag assembly will be very hot. Do not touch the metal areas of the air bag assembly for about 30 minutes after deployment. If the deployed air bag assembly must be moved before it is cool, wear gloves and handle by the air bag or trim cover.

31. Short the driver deployment harness wires by twisting together one end from each. Repeat this procedure for the passenger deployment harness.
32. Carefully remove drop cloth from vehicle and clean off any fragments or discard drop cloth entirely.
33. Disconnect driver deployment harness and passenger deployment harness from vehicle and discard.
34. In the unlikely event that either or both of the air bag assemblies did not deploy after following these procedures, proceed immediately with Steps 36 through 37. If the air bag assembly deployed, proceed to step 35.
35. With both air bags deployed, the vehicle may be scrapped in the same manner as a non–SRS equipped vehicle.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following these procedures.

36. Remove the undeployed air bag assembly (s) from the vehicle. For driver air bag assembly refer to in the "Passenger Air Bag Assembly Removal" in this section 9J–28.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG

ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN PERSONAL INJURY.

37. Temporarily store the air bag assembly with the air bag opening facing up, away from the surface upon which it rests.

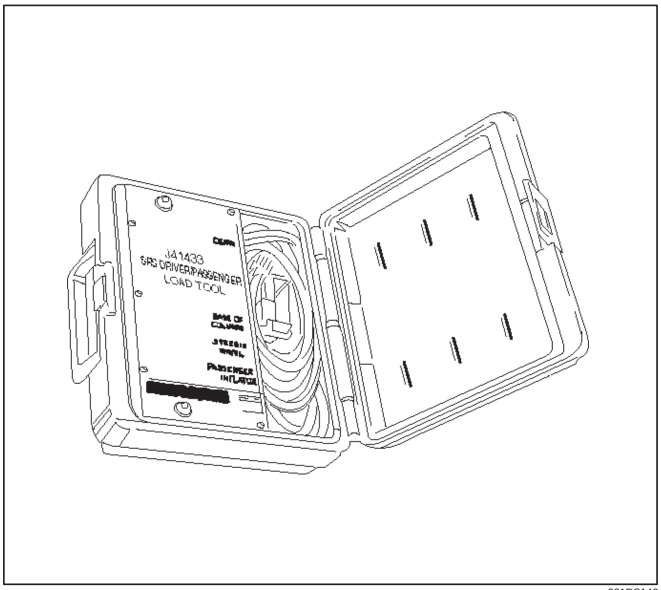
Deployed Air Bag Assembly Handling

Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly.

After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

Special Tools

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON POWERED PROBE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.



901RS146

J–41433 SRS Driver/Passenger Load Tool

The SRS Driver/Passenger Load Tool J–41433 is used only when called for in this section. It is used as a diagnostic aid and safety device to prevent inadvertent air bag assembly deployment.

The load tool has four yellow connectors attached to its case.

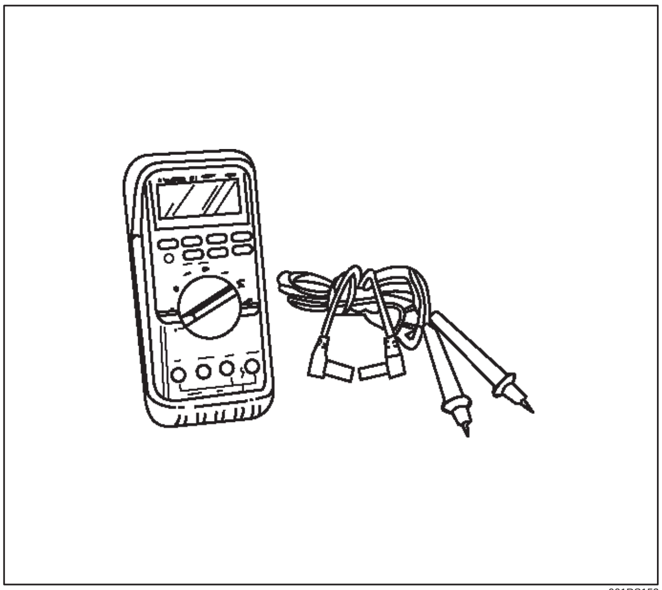
The three small connectors are electrically functional and serve as resistive load substitutions.

No more than two connectors are used at any time. One of the small connectors is used to substitute for the load of the driver air bag assembly when it is connected at the top of the column to the SRS coil assembly. Another small connector is used to substitute for the load of the driver air bag assembly and the SRS coil assembly when it is connected at the base of the column to the SRS wiring harness. The third small connector is used to substitute for the load of the passenger air bag assembly when connected to the passenger air bag assembly harness connector.

By substituting the resistance of the load tool when called for, a determination can be made as to whether an inflator circuit component is causing system malfunction and which component is causing the malfunction. The load tool should be used only when specifically called for in the diagnostic procedures.

J–39200 DVM

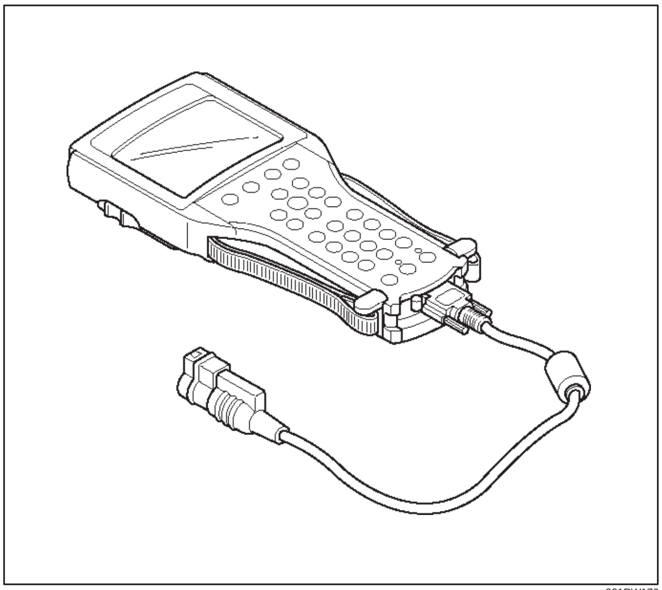
The J–39200 DVM is the preferred DVM for use in SRS diagnosis and repair. However, J–34029–A may be used if J–39200 is not available. No other DVMs are approved for SRS diagnosis and repair.



901RS153

Scan Tool

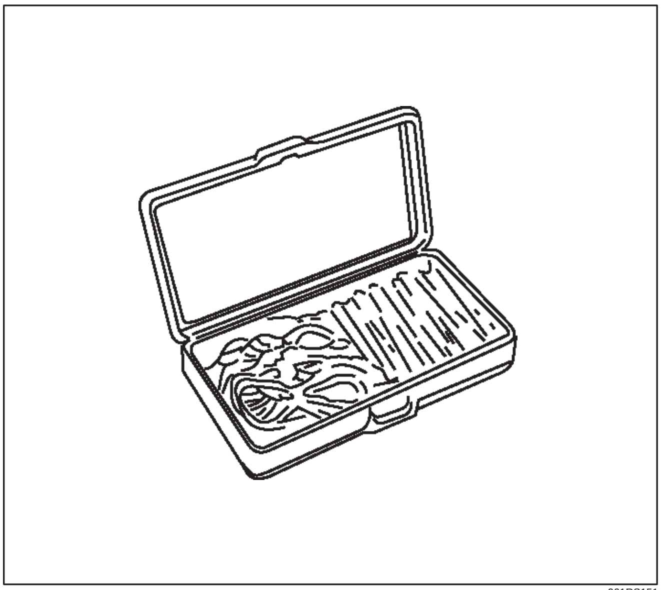
The Tech 2 is used to read and clear SRS Diagnostic Trouble Codes (DTCs). Refer to the Tech 2 Operator's Manual for specific information on how to use the Tech 2.



901RW176

J–35616–A Connector Test Adapter Kit

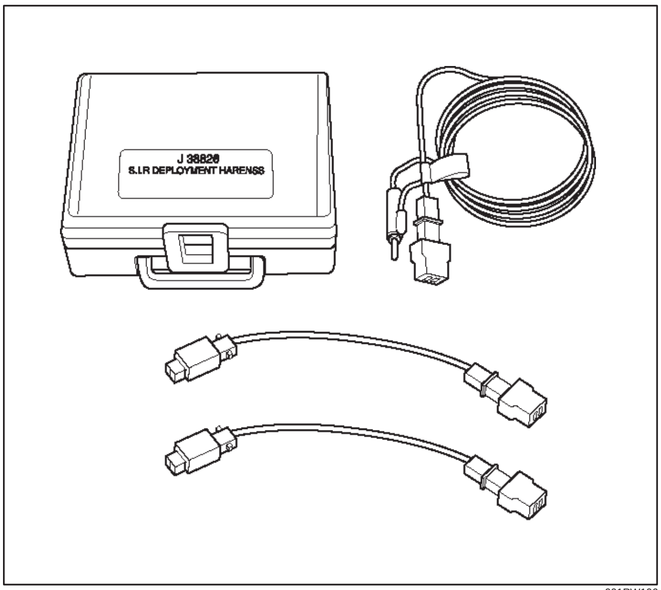
The J–35616–A Connector Test Adapter Kit must be used whenever a diagnostic procedure requests checking or probing a terminal. Using the appropriate adapter will ensure that no damage to the terminal will occur from the DVM prove, such as spreading or bending. The adapter will also give an idea of whether contact tension is sufficient, helping to find an open or intermittent open due to poor terminal contact.



901RS151

J–42986 SRS Deployment Tool

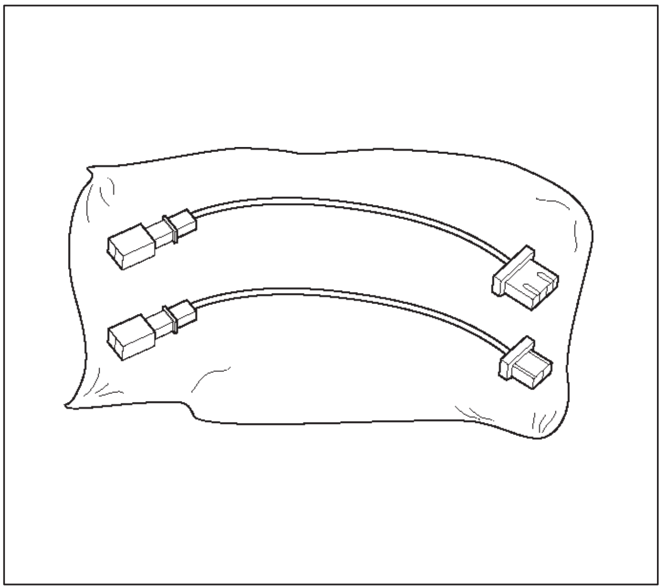
The J–42986 SRS Deployment Tool must be used for deployment of the undeployed air bag.



901RW106

J–42987 SRS Adapter For Load Tool

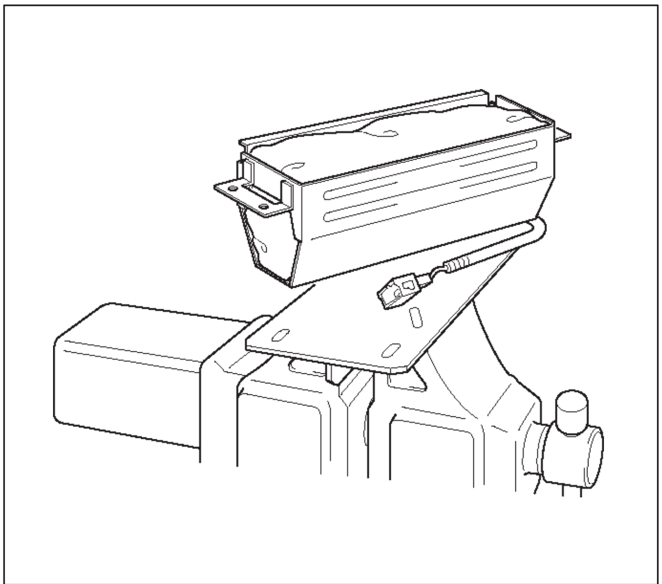
The J–42987 SRS Adapter be used for connect previous load tool to new SRS system when inspect SRS system harness.



901RW107

J–41497 SRS Deployment Fixture

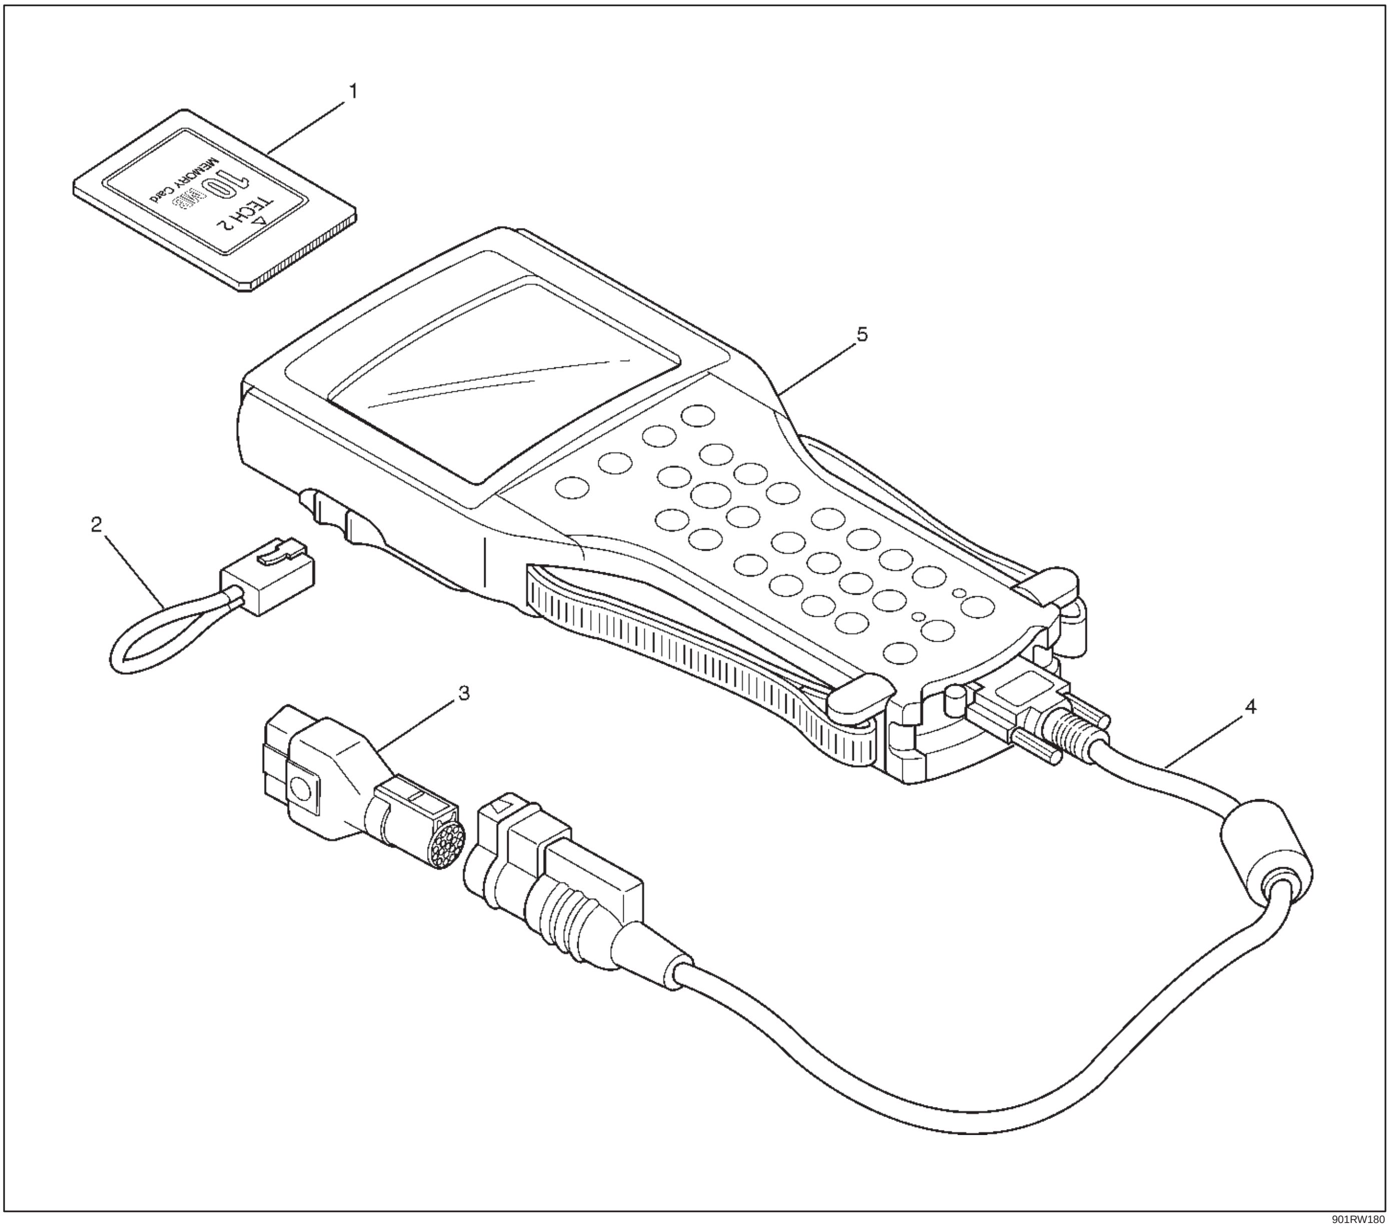
The J–41497 SRS Deployment Fixture must be used for deployment of the undeployed passenger side air bag.



901RW088

Tech 2 Scan Tool

From 1998 RODEO (UE), dealer service departments are recommended to use Tech 2. Please refer to Tech 2 scan tool user guide.



901RW180

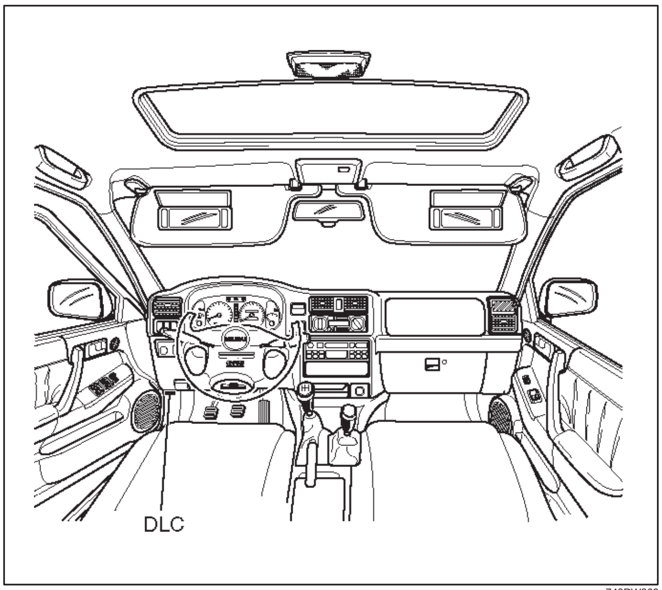
Legend

(1) PCMCIA Card
(2) RS 232 Loop Back Connector
(3) SAE 16/19 Adaptor
(4) DLC Cable
(5) Tech–2

Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:

1. The Isuzu 2000MY System PCMCIA card (1) inserts into the Tech 2 (5).
2. Connect the SAE 16/19 adapter (3) to the DLC cable (4).
3. Connect the DLC cable to the Tech 2 (5)
4. Make sure the vehicle ignition is off.
5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC.



740RW060

6. The vehicle ignition turns on.
7. Verify the Tech 2 power up display.

060RW009

NOTE: The RS232 loop back connector is only to use for diagnosis of Tech 2 and refer to user guide of the Tech 2.

Operating Procedure

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

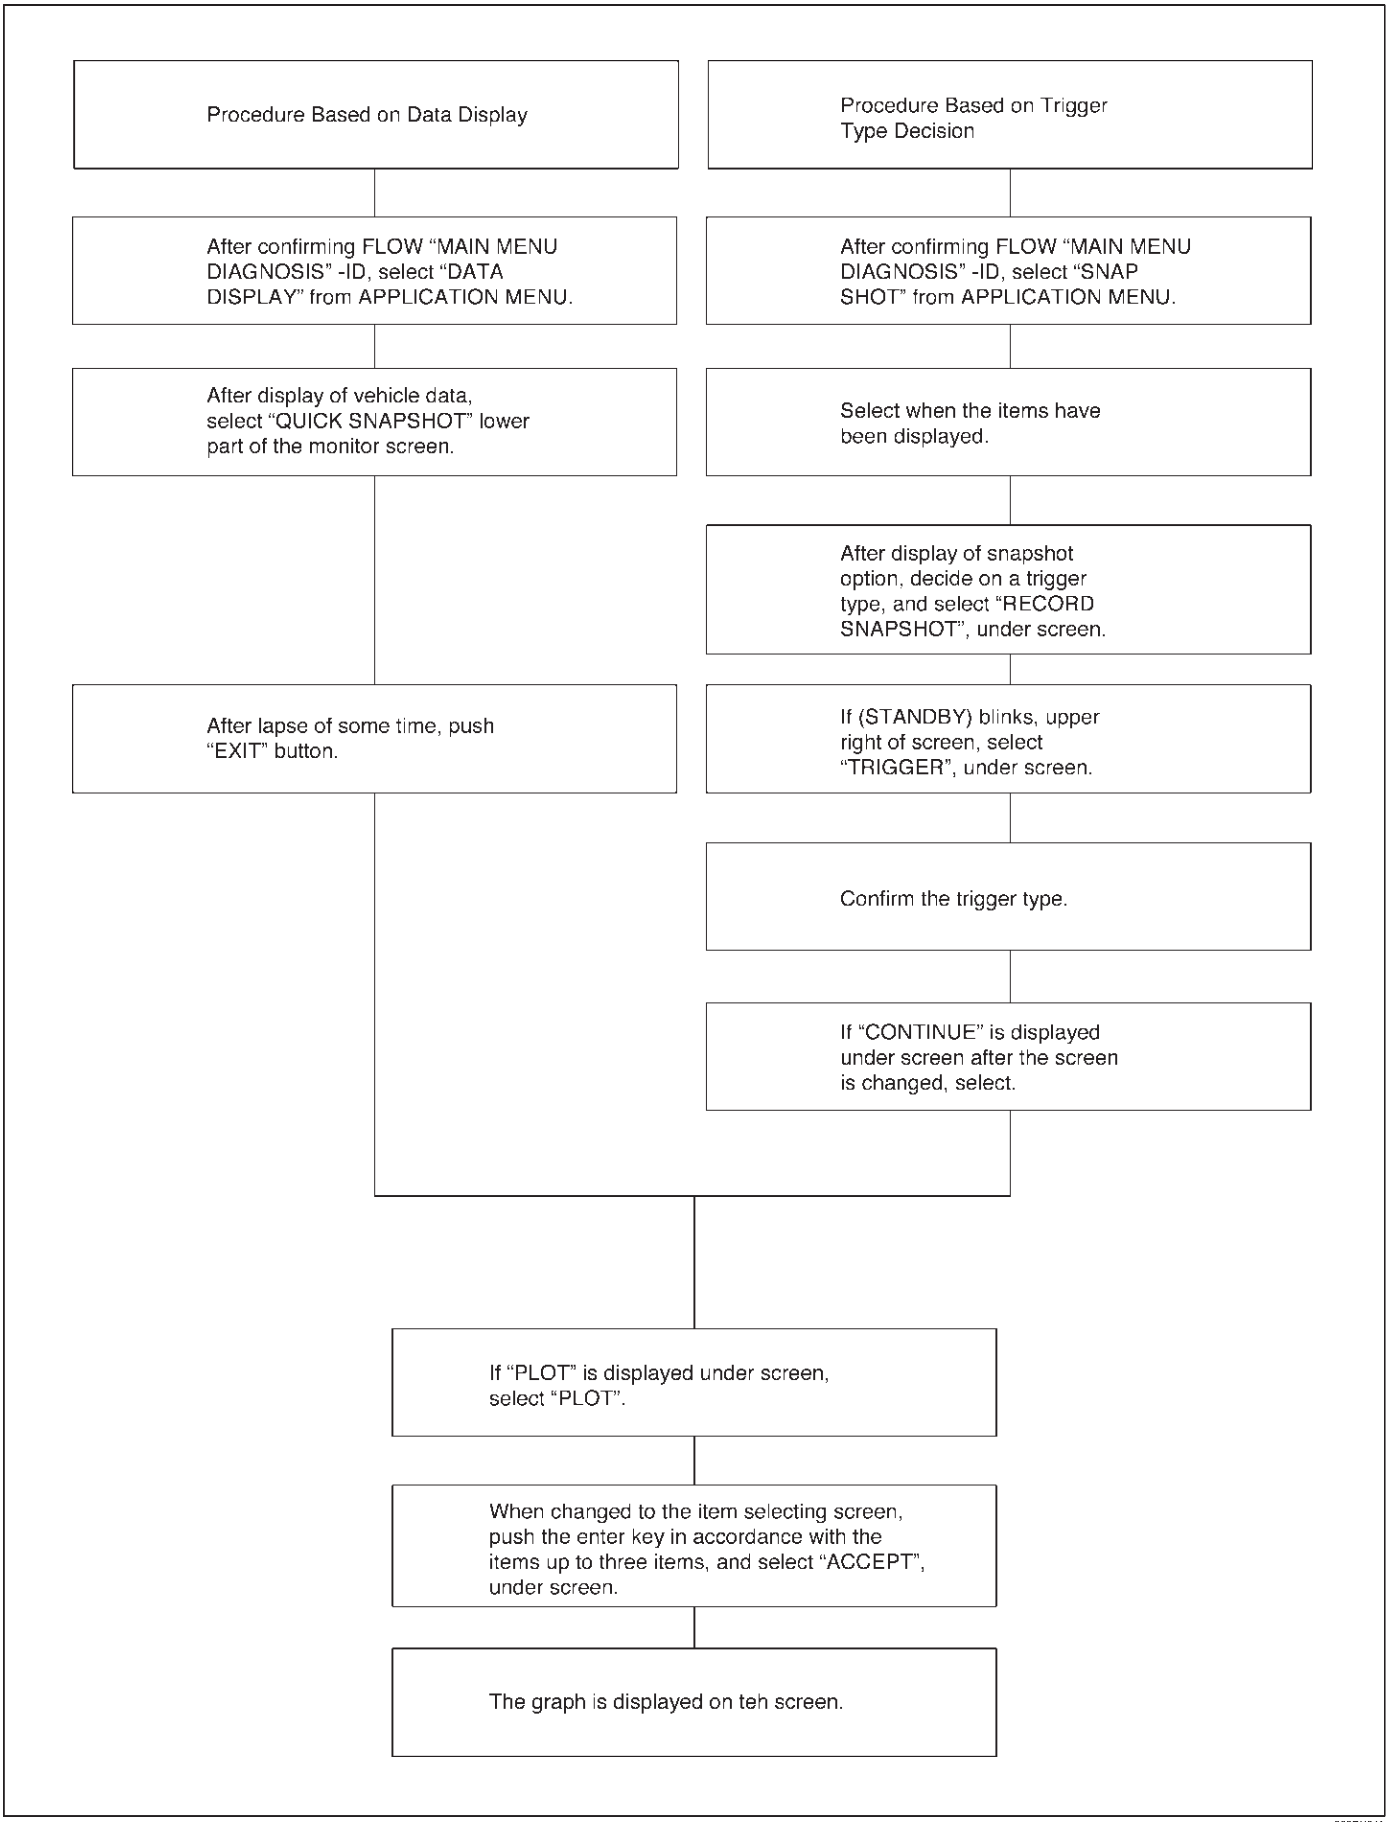
Plottong Snapshot Graph

This test selects several necessary items from the data list to plot graphs and makes data comparison on a long term basis. It is an effective test particularly in emission related evaluations.
For trouble diagnosis, you can collect graphic data (snap shot) directly from the vehicle.
You can replay the snapshot data as needed. Therefore, accurate diagnosis is possible, even though the vehicle is not available.

Plotting Graph Flow Chart (Plotting graph after obtaining vehicle information)



060RX041

Flow Chart for Snapshot Replay (Plotting Graph)

Press the enter-key in initial display.

↓

Select "VIEW CAPTURE DATA"

↓

If snapshot option is displayed, decide on a trigger type, and slect “REVIEW DATA” under screen.

↓

When the data triggered by vehicle is displayed, select the data.
(Plural display of data depending on the number of times of triggering.)

↓

data is displayed on the screen.
To see the graph, select “PLOT” under screen.

↓

Changed to the item selection screen, push the enter key up to three times, and select “ACCEPT” under screen.

↓

The graph is displayed on the screen.

060RX040

Service Precaution

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. if the above conditions are not followed, parts or system damage could result.

WARNING: WHEN PERFORMING SERVICE ON OR AROUND SRS COMPONENTS OR SRS WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE SRS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNEEDED SRS REPAIRS.

The SDM in Driver–Passenger SRS can maintain sufficient voltage to cause a deployment for up to 15 seconds after the ignition switch is turned "OFF," the battery is disconnected, or the fuse powering the SDM is removed.

Many of the service procedures require removal of the "SRS–1" fuse, and disconnection of the air bag assembly from the deployment loop to avoid an accidental deployment. If the air bag assembly is disconnected from the deployment loop as noted in the "Disabling the SRS" procedure that follows, service can begin immediately without waiting for the 15 second time period to expire.

Disabling The SRS

Removal

Turn the ignition switch to "OFF" and turn the steering wheel so that the vehicle's wheels are pointing straight ahead.

1. Remove SRS fuse SRS–1, from left dash side lower fuse block or disconnect battery.
2. Disconnect yellow 2–pin connector at the base of steering column.
3. Remove glove box assembly; Refer to "Passenger Air Bag Assembly Replacement" in this section.
4. Disconnect passenger air bag assembly yellow 2–pin connector behind the glove box assembly.

CAUTION: With the "SRS–2" fuse removed and ignition switch "ON," the "AIR BAG" warning lamp will be "ON." This is normal operation and does not indicate an SRS malfunction.

Enabling The SRS

Installation

Turn ignition switch to "LOCK" and remove key.

1. Connect yellow 2–pin connector passenger air bag assembly.
2. Install glove box assembly, Refer to "Passenger Air Bag Assembly Replacement" in this section.
3. Connect yellow 2–pin connector at the base of the steering column.
4. Install "AIR BAG" fuse SRS–1 to left dash side lower fuse block or connect battery.

Turn ignition switch to "ON" and verify that the "AIR BAG" warning lamp flashes seven times and then turns "OFF" If it does not operate as described, perform the "SRS Diagnostic System Check" in section 9J–2.

Handling / Installation / Diagnosis

1. Air bag assembly should not be subjected to temperatures above 65˚C (150˚F).
2. Air bag assembly, and SDM should not be used if they have been dropped from a height of 100 centimeters (3.28 feet) or more.
3. When a SDM is replaced, it must be oriented with the arrow on the SDM pointing toward the front of the vehicle. It is very important for the SDM to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the SDM mounting surface is free of any dirt or other foreign material.
4. Do not apply power to the SRS unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
5. The "SRS Diagnostic System Check" must be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" will verify proper "AIR BAG" warning lamp operation and will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacements.

Inspections Required After An Accident

CAUTION: Certain SRS components must be replaced after a frontal crash involving air bag deployment.

In all types of accidents regardless of "Air Bag" deployment, visually inspect all of the following components and replace as required:

— Driver air bag assembly
— Passenger air bag assembly
— Steering wheel
— SRS coil assembly
— Steering column
— Knee bolster and instrument panel mounting attachments
— Driver seat and belt
— Passenger seat and belt
— SDM

SDM always should be checked according to "SDM Replacement Guidelines".

CAUTION: Refer to "SDM replacement Guidelines" below for important information on SDM replacement in both deployment and non–deployment crashes.

Inspect SRS coil assembly wiring and steering wheel for any signs of scorching, meting, or damage due to excessive heat. If coil assembly wire or steering wheel is damaged, replace them. The steering column and wheel must be dimensionally checked to determine if they are damaged. Refer to in this Section 9J–3 of this manual.

Never use SRS parts from another vehicle. This does not include remanufactured parts purchased from an authorized Retailer; they may be used for SRS repairs.

Do not attempt to repair the SDM, the SRS harness, the SRS coil assembly, the air bag assembly, the steering wheel, or the steering column. Service of these items is replacement only. Verify replacement part numbers.

CAUTION: Proper operation of the SDM and Supplemental Restraint System (SRS) requires that any repairs to the vehicle structure return it to its original production configuration.

Sensing and Diagnostic Module (SDM)

Service Precautions

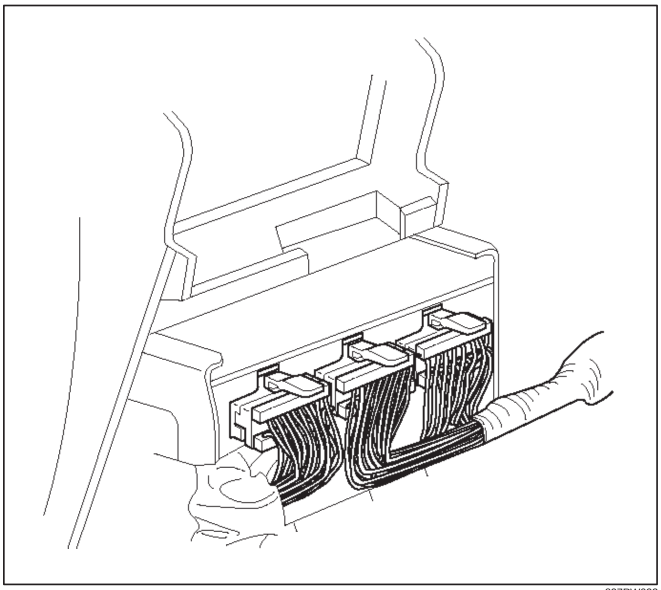
WARNING: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING SDM. NEVER STRIKE OR JAR SDM. UNDER SOME CIRCUMSTANCES, IT COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY OR IMPROPER OPERATION OF THE SUPPLEMENTAL RESTRAINT SYSTEM (SRS). SDM MOUNTING BRACKET BOLTS MUST BE CAREFULLY TORQUED TO ASSURE PROPER OPERATION. NEVER POWER UP THE SRS WHEN SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

WARNING: PROPER OPERATION OF THE SENSING AND DIAGNOSTIC MODULE (SDM) REQUIRES THE SDM TO BE RIGIDLY ATTACHED TO THE VEHICLE STRUCTURE AND THAT THE ARROW ON THE SENSOR BE POINTING TOWARD THE FRONT OF THE VEHICLE.

SDM is specifically calibrated and is keyed to the SDM location SRS wiring harness. Caution should be used to ensure proper location of the SDM. The keying of the SDM to its location and wiring harness connectors should never be modified in the field.

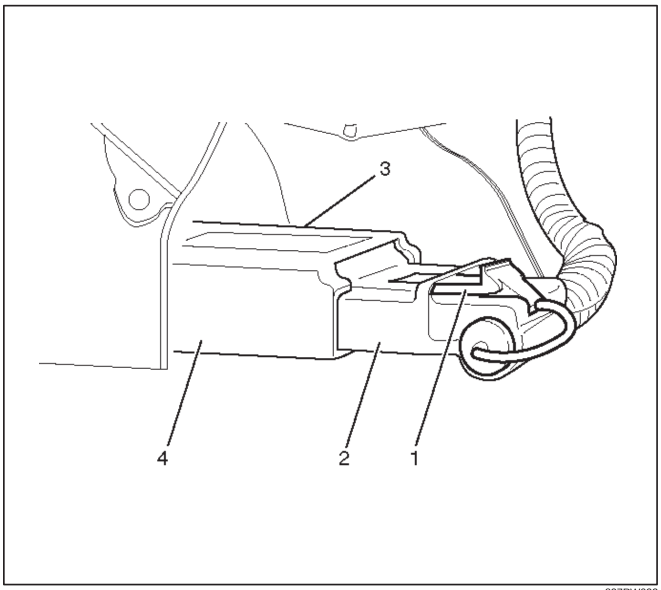
Removal

1. Disable the SRS. (Refer to “Disable the SRS” in this manual)
2. Remove dressing panel around the radio and disconnect cigar lighter harness.
3. Remove the transfer sift lever knob.
4. Remove the center console.
5. Remove three connector from PCM.
6. Remove PCM with bracket.(Fixed four bolts)
7. Remove right side stay between instrument panel and floor.
8. Remove driver and passenger seat.
9. Turn over carpet to rear side.
10. Remove air conditioning duct for rear seat. (Transform the duct during removing it)



827RW023

11. Pull CPA (1) (Connector Position Assurance–red color) out and push connector lock down to disconnect the SDM harness connector (2).
12. Remove the three SDM fixing bolts (4) and remove SDM (3).



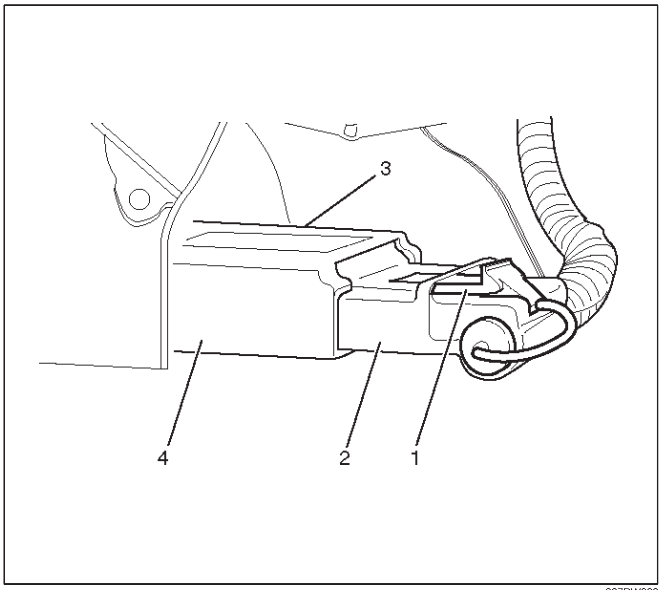
827RW022

Installation

1. Install the SDM (3) on bracket and fixing bolts (4) and tighten the fixing bolts to the specified torque.

Torque: 10 N·m ± 3 N·m (87 lb in ± 26 lb in)

2. Connect the SDM harness connector (2) and after that, put CPA into connector (1).



827RW022

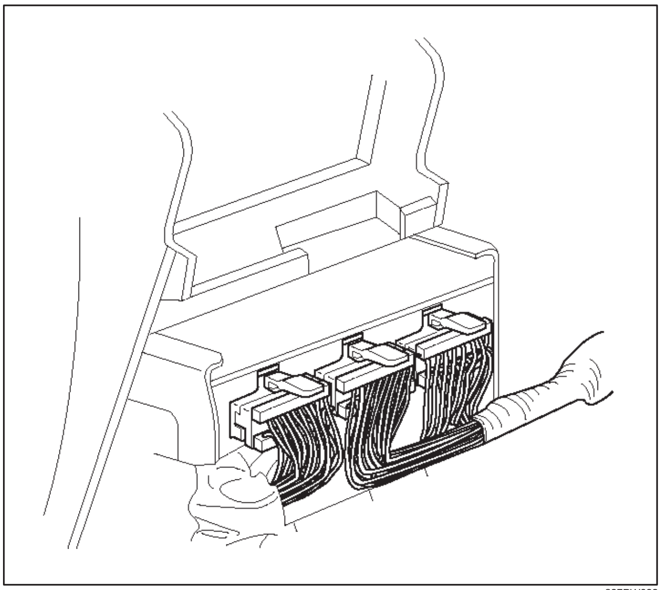
3. Install air conditioning duct for rear seat to normal position.
4. Return carpet normal position.
5. Install right side stay between instrument panel and floor, tighten to the specified torque.

Torque: 10 N·m ± 3 N·m (87 lb in ± 26 lb in)

6. Install PCM with bracket and tighten to the specified torque.

Torque: 10 N·m ± 3 N·m (87 lb in ± 26 lb in)

7. Reconnect three connector to PCM.
8. Install the center console.
9. Install the transfer shift lever knob.
10. Install the dressing panel around the radio and reconnect cigar lighter harness.
11. Enable the SRS. (Refer to “Enabling the SRS” in this manual)



827RW023

Driver Air Bag Assembly

Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

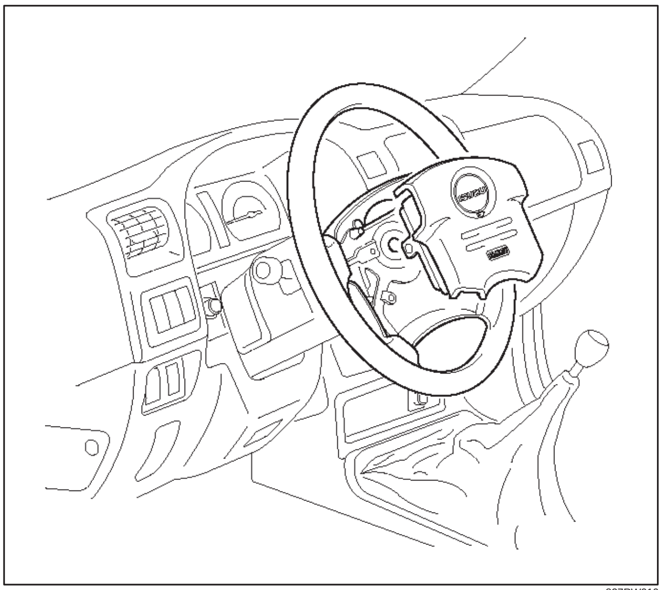
WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the SRS. (Refer to “Disabling the SRS” in this section.)
2. Remove air bag assembly from steering wheel by removing two bolts. Lift air bag assembly out of steering wheel.

3. Disconnect connector and remove air bag assembly.



827RW010

Installation

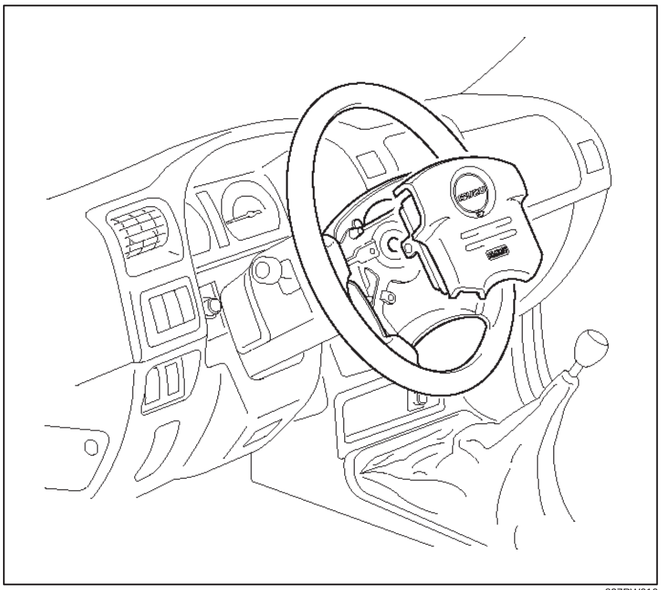
1. Connect air bag to wiring harness connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

2. Install air bag into steering wheel and tighten bolts to specified sequence as shown in figure.

Torque: 8.8 N·m (78 lb in)

CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.
The air bag assembly has identification colors on the bar code label from ’00 model as follows.
Light blue color for driver air bag assembly.
Light blue color for passenger air bag assembly.
Use only the air bag assembly for “UE”.



827RW010

3. Enable the SRS. (Refer to “Enabling the SRS” in this section.)

Steering Wheel

Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

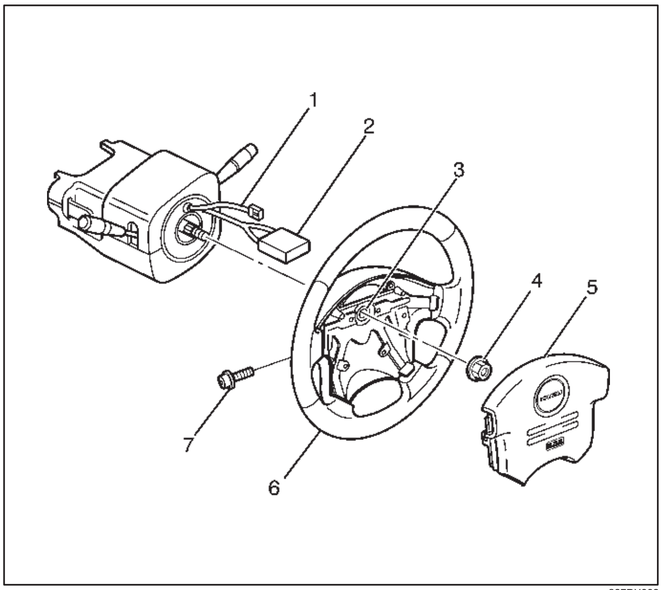
NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the SRS. (Refer to “Disabling the SRS” in this section.)
2. Remove the air bag assembly (5) from steering wheel (6) by removing two bolts (7). Lift air bag assembly out of steering wheel.
3. Disconnect connector (2) and remove air bag assembly.
4. Disconnect horn lead (1)
5. Remove steering wheel attachment nut (4).

6. Move the tires to the straight ahead position before removing the steering wheel. Install steering wheel puller onto steering wheel and remove steering wheel with J–29752.
7. Apply a setting mark (3) across the steering wheel and shaft so parts can be reassembled in their original position.
8. Feed wiring through the wheel and remove wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.



827RX002

Installation

1. Install the steering wheel and align the setting marks (3).
2. Tighten the steering wheel fixing nut (4) to the specified torque.

   Torque: 34 N·m (25 lb ft)
3. Connect horn lead (1).
4. Connect air bag to wiring harness connector (2).

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

5. Install air bag into steering wheel and tighten bolts (7) to specified sequence as show in figure.

   Torque: 8.8 N·m (78 lb in)

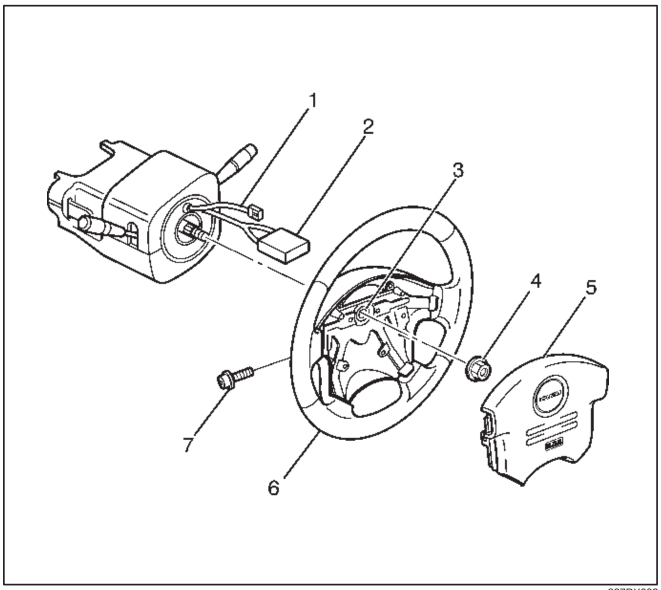
CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.

The air bag assembly has identification colors on the bar code label from ’00 model as follows.

Light blue color for driver air bag assembly.

Light blue color for passenger air bag assembly.

Use only the air bag assembly for “UE”.



827RX002

6. Enable the SRS. (Refer to “Enabling The SRS” in this section.)

SRS Coil Assembly

Service Precaution

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

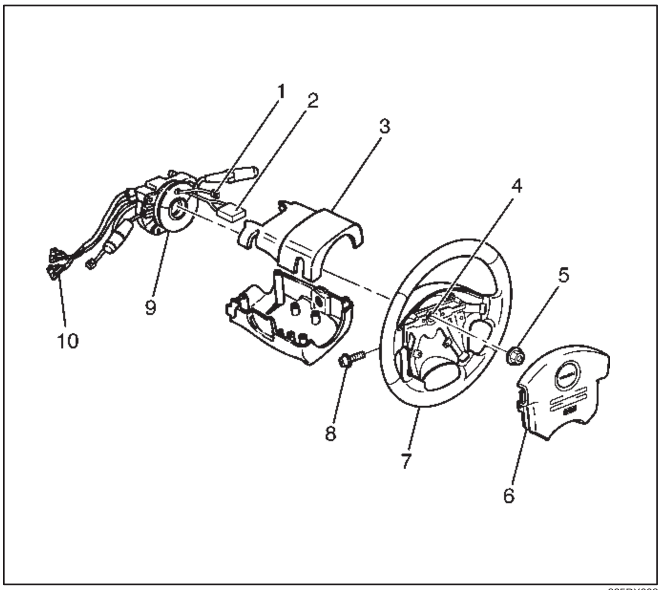
Removal

1. Disable the SRS. (Refer to “Disabling the SRS” in this section.)
2. Remove the air bag assembly (6) from steering wheel (7) by removing two bolts (8). Lift air bag assembly out of steering wheel.
3. Disconnect the 2–pin yellow connector (2) and remove air bag assembly.
4. Disconnect horn lead connector (1).
5. Remove the steering wheel attachment nut (5).
6. Move the tires to the straight ahead position before removing the steering wheel and remove wheel with J–29752.
7. Apply a setting mark (4) across the steering wheel and shaft so parts can be reassembled in their original position.
8. Feed wiring though the wheel and remove wheel.
9. Remove the steering lower cover.
10. Remove the driver knee bolster assembly.
11. Remove the steering column cover (3).
12. Disconnect the wiring harness connectors (10) located at the base of steering column.

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

13. Remove the combination switch assembly with SRS coil (9).

NOTE: SRS coil is a part of combination switch assembly, which cannot be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.



825RX008

Installation

1. Install the combination switch assembly with SRS coil (9).
2. Connect the wiring harness connectors (10) located at the base of steering column.
3. Turn the SRS coil clockwise to full, return about 3 turns and align the neutral mark.

NOTE: Whenever installing the new combination switch with SRS coil, be sure to tear off the lock pin for aligning the neutral position before it is installed to the base of steering column.

CAUTION: When turning the SRS coil clockwise to full, stop turning if resistance is felt. Forced further turning may damage the cable in the SRS coil.

4. Install the steering column cover (3).

CAUTION: When installing the steering column cover, be sure to through each harness as illustrated so that the harnesses starter switch, combination switch and SRS coil may not catch wiring.

5. Install the driver knee bolster assembly.
6. Install the steering lower cover.

7. Install the steering wheel and align the setting marks (4).
8. Tighten the steering wheel fixing nut (5) to the specified torque.

Torque: 34 N·m (25 lb ft)

9. Connect horn lead (1).
10. Connect air bag to wiring harness connector (2).

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

11. Install Air Bag (6) into steering wheel and tighten bolts (8) to specified sequence as figure.

Torque: 8.8 N·m (78 lb in)

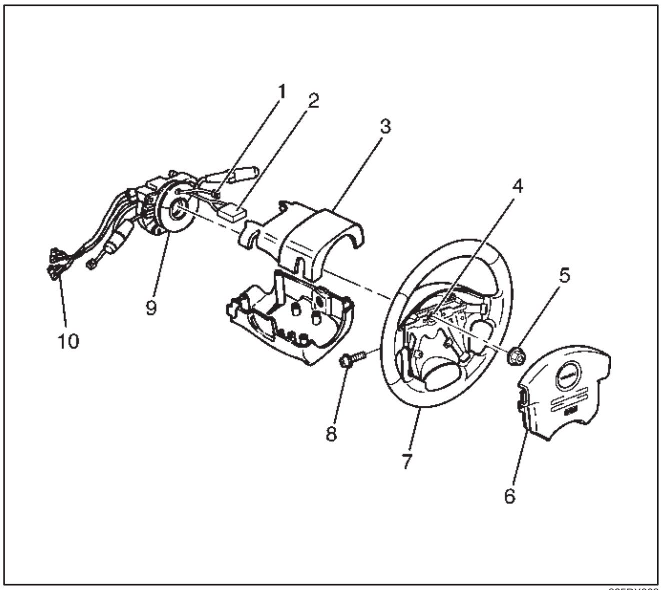
CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.

The air bag assembly has identification colors on the bar code label from '00 model as follows.

Light blue color for driver air bag assembly.

Light blue color for passenger air bag assembly.

Use only the air bag assembly for "UE".



825RX008

12. Enable the SRS. (Refer to "Enabling The SRS" in this section.)

Steering Column

Service Precaution

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

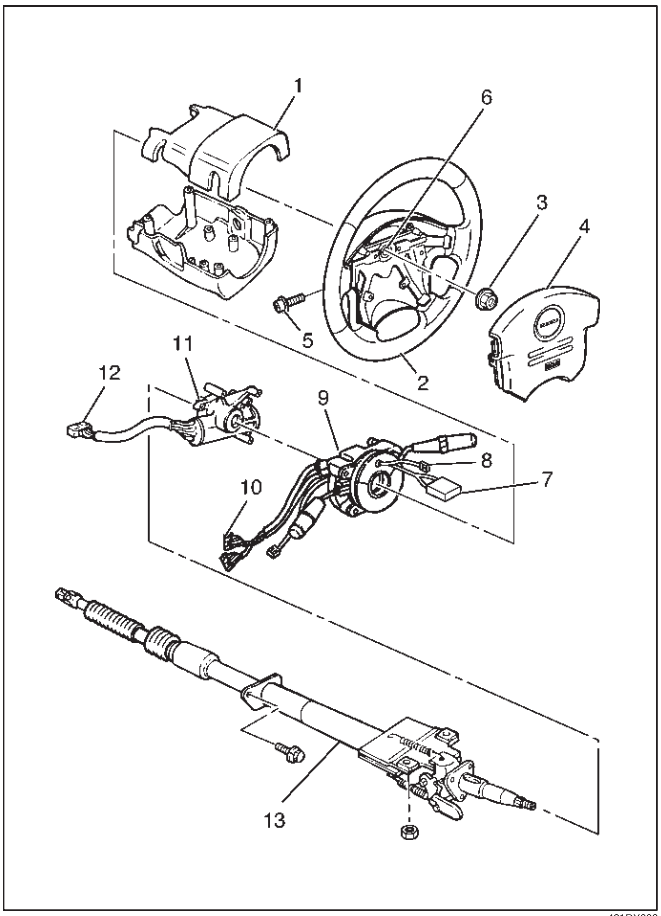
1. Disable the SRS. (Refer to “Disabling The SRS” in this section.)
2. Remove the air bag assembly (4) from steering wheel (2) by removing two bolts (5). Lift air bag assembly out of steering wheel.
3. Disconnect the 2–pin yellow connector (7) and remove air bag assembly.
4. Disconnect horn lead connector (8).
5. Remove the steering wheel attachment nut (3).
6. Move the tires to the straight ahead position before removing the steering wheel and removing wheel with J–29752.
7. Apply a setting mark (6) across the steering wheel and shaft so parts can be reassembled in their original position.
8. Feed wiring though the wheel and remove wheel.
9. Remove the steering lower cover.
10. Remove the driver knee bolster assembly.
11. Remove the steering column cover (1).
12. Disconnect the wiring harness connectors (10) located at the base of steering column.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

13. Remove the combination switch assembly with SRS coil (9).

NOTE: SRS coil is a part of combination switch assembly, which cannot be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

14. Remove the snap ring.
15. Remove the cushion rubber.
16. Disconnect shift lock cable (A/T only)
17. Disconnect the starter switch harness connector (12) located base of steering column.
18. Remove steering lock cylinder assembly (11).
19. Apply a setting mark across the universal joint and steering shaft to reassemble the parts in their original position.
20. Remove steering column assembly (13).



431RX002

Installation

1. Install the steering column assembly (13) and align the setting marks on the universal joint and steering shaft made during removal.
2. Tighten the steering column fixing bolts (dash panel side) to the specified torque.

   Torque: 20 N·m (14 lb ft)
3. Tighten the steering column fixing nuts (Cross beam) to the specified torque.

   Torque: 20 N·m (14 lb ft)
4. Tighten the universal joint to the specified torque.

   Torque: 31 N·m (23 lb ft)
5. Install steering lock cylinder assembly (11).
6. Connect shift lock cable (For A/T)
7. Install cushion rubber.
8. Install snap ring.
9. Install the combination switch assembly with SRS coil (9).
10. Connect the wiring harness connector (10) located on the base of steering column.
11. Turn the SRS coil clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil clockwise to full, stop turning if resistance is felt. Further forced turning may damage the cable in the SRS coil.

12. Install steering column cover (1).

CAUTION: When installing the steering column cover, be sure to wire (through each harness) as illustrated so that the harnesses starter switch, combination switch and SRS coil may not catch wiring.

13. Install the steering wheel (2) and align the setting marks (6).
14. Tighten the steering wheel fixing nut (3) to the specified torque.

   Torque: 34 N·m (25 lb ft)
15. Connect horn lead (8).
16. Connect air Bag wiring harness connector (7).

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

17. Install air bag into steering wheel and tighten bolts (5) to specified sequence as shown in figure.

   Torque: 8.8 N·m (78 lb in)

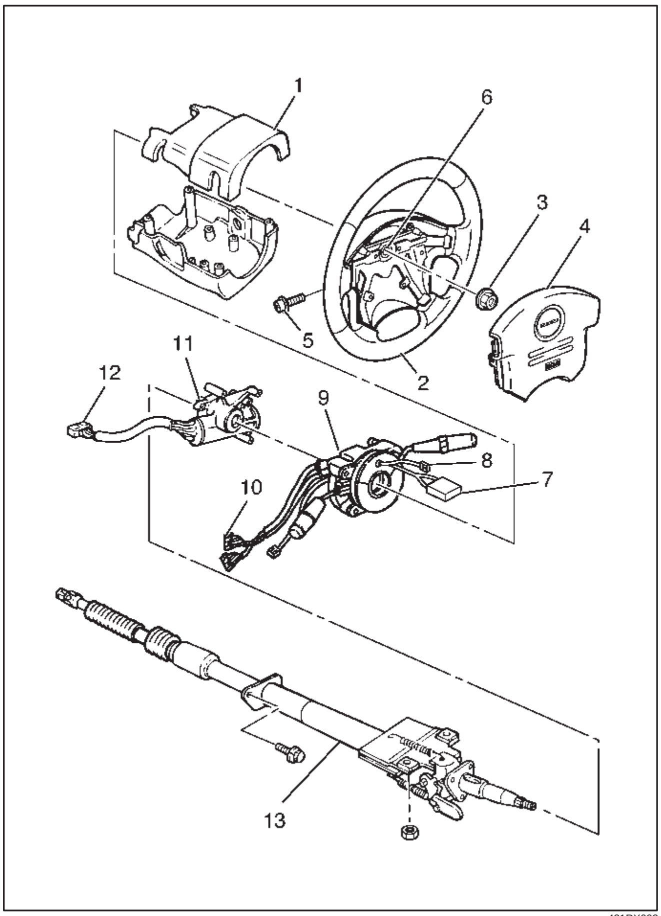
CAUTION: Never use the air bag assembly from another vehicle and difference model year air bag assembly.

The air bag assembly has identification colors on the bar code label from ’00 model as follows.

Light blue color for driver air bag assembly.

Light blue color for passenger air bag assembly.

Use only the air bag assembly for “UE”.



431RX002

18. Enable the SRS (Refer to “Enabling The SRS” in this section.)

Passenger Air Bag Assembly

Service Precaution

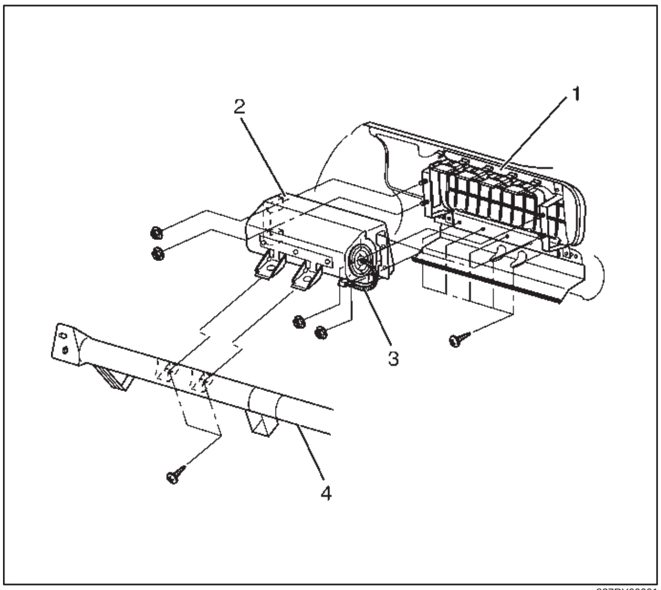
WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the SRS. (Refer to “Disabling the SRS” in this section.)
2. Remove glove box assembly.
3. Disconnect passenger air bag assembly harness connector.
4. Remove air bag assembly fixing bolts and nuts.
5. Remove passenger air bag assembly from glove box opening of instrument panel.



Legend
(1) Passenger Air Bag Door
(2) Passenger Air Bag Assembly
(3) Passenger Air Bag Harness
(4) Cross Beam

Installation

1. Install passenger air bag assembly from glove box opening of instrument panel.
2. Install air bag assembly fixing nuts and bolts, and tighten to specified torque.

Torque: 7.8 N·m (69 lb in)

3. Connect air bag assembly harness connector.
4. Install glove box assembly.
5. Enable the SRS (Refer to “Enabling the SRS” in this section.)

RODEO

RESTRAINTS

SRS CONTROL SYSTEM

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnostic Information

Diagnostic Procedures

WARNING: WHEN FASTENERS ARE REMOVED, ALWAYS REINSTALL THEN AT THE SAME LOCATION FROM WHICH THEY WERE REMOVED. IF A FASTENER NEEDS TO BE REPLACED, USE THE CORRECT PART NUMBER FASTENER FOR THAT APPLICATION. IF THE CORRECT PART NUMBER FASTENER IS NOT AVAILABLE, A FASTENER OF EQUAL SIZE AND STRENGTH (OR STRONGER) MAY BE USED. FASTENERS THAT ARE NOT REUSED, AND THOSE REQUIRING THREAD LOCKING COMPOUND WILL BE CALLED OUT. THE CORRECT TORQUE VALUE MUST BE USED WHEN INSTALLING FASTENERS THAT REQUIRE IT. IF THE ABOVE CONDITIONS ARE NOT FOLLOWED, PARTS OR SYSTEM DAMAGE COULD RESULT.

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NONPOWERED, PROBE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

The diagnostic procedures used in this section are designed to aid in finding and repairing SRS problems. Outlined below are the steps to find and repair SRS problems quickly and effectively. Failure to carefully follow these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts Replacement.

1. **Perform The "SRS Diagnostic System Check."**

The "SRS Diagnostic System Check" should always be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation and checks for SRS trouble codes using both "Flash Code" and "Scan Tool" Methods.

2. **Refer To The Proper Diagnostic Chart As Directed By The "SRS Diagnostic System Check."**

The "SRS Diagnostic System Check" will lead you to the correct chart to diagnose any SRS problems. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts Replacement.

3. **Repeat the "SRS Diagnostic System Check" After Any Repair Or Diagnostic Procedures Have Been Performed.**

Performing the "SRS Diagnostic System Check" after all repair or diagnostic procedures will assure that the repair has been made correctly and that no other conditions exist.

Diagnostic Codes

The Sensing and Diagnostic Module (SDM) maintains a history record of all diagnostic codes that have been detected since the SRS codes were last cleared during service.

1. Active Codes—Faults that are presently detected this ignition cycle. Active codes are stored in RAM (Random Access Memory).
2. History Codes—All faults detected since the last time the history fault memory was cleared. History codes are stored in EEPROM. (Electronically Erasable Programmable Read only Memory)

How To Read Trouble Codes

All codes (Active and history) can be read (or cleared) by using a scan tool or equivalent.
If a DTC is not available, have the vehicle serviced by dealer.

How To Clear Trouble Codes

Trouble codes can only be cleared by using a scan tool. If a scan tool is not available then inform the owner of the stored codes and suggest that the codes are cleared upon the next visit to a dealership.

Scan Tool Diagnostics

A scan tool can be used to read current and history codes and to clear all history codes after a repair is complete. The scan tool must be updated to communicate with the SRS through a replaceable cartridge for SRS diagnostics. To use the scan tool, connect it to the DLC and turn the ignition switch "ON". Then follow the manufacturer's directions for communication with the SRS. The scan tool reads serial data from the SDM "Serial Data" output (terminal 24) to the DLC.

Basic Knowledge Required

Before using this section of the Service Manual, there is some basic knowledge which will be required. Without this knowledge, you will have trouble using the diagnostic procedures in this section. Use care to prevent harm or unwanted deployment. Read all cautions in the service manual and on warning labels attached to SRS components.

Basic Electrical Circuits

You should understand the basic theory of electricity including series and parallel circuits, and understand the voltage drops across series resistors. You should know the meaning of voltage (volts), current (amps), and resistance (ohms). You should understand what happens in a circuit with an open or a shorted wire. You should be able to read and understand a wiring diagram.

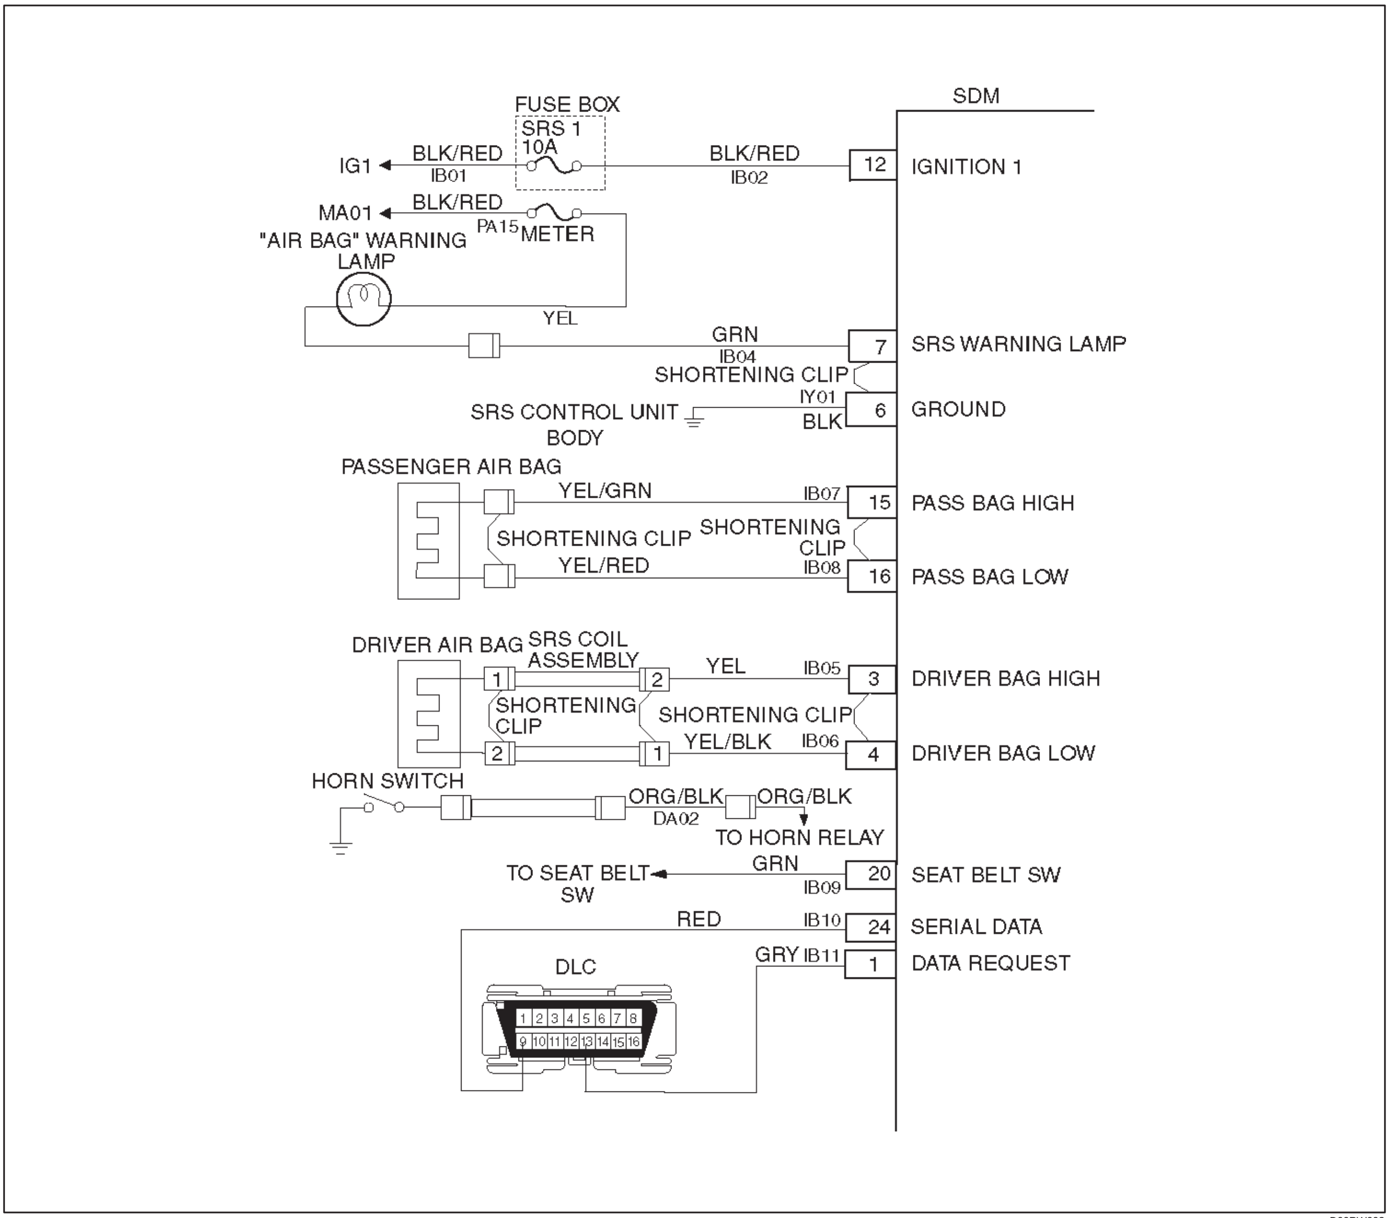
"Flash Code" Diagnostics

Flash code diagnostics can be used to read current codes and to determine if history codes are present but cannot be used to clear codes or read history codes. Flash code diagnostics is enabled by grounding by terminal 13 shorting to terminal 4 of the DLC with the ignition switch "ON". Grounding terminal 13 of the DLC pulls the "Diagnostics Request" input (Terminal 1) of the SDM low and signals the SDM to enter the flash code diagnostic display mode.

The SDM displays the trouble codes by flashing the warning lamp. Each code that is displayed will consist of a number of flashes which represents the tens digit, a 1.2 second pause, following by a number of flashes which represents the ones digit of the code. Each code is displayed one time before moving on to the next code. After all of the codes have been displayed, the entire code sequence will continually by repeated until ground is removed from terminal 13 of the DLC.

Two special codes exist when reading in the flash code mode (Flash Code 12 and Flash Code 13). "Flash Code 12" will always be the first code displayed when the flash code mode is enabled Code 12 is not an indication of a SRS problem but an indication that the flash code mode has been enabled. If there are no current or history codes present, the SDM will display code 12 until ground is removed from the DLC at terminal 13. "Flash Code 13" will be displayed if there are history codes. To read the history codes, a scan tool must be used.

System Schematic



D09RW002

SRS Diagnostic System Check

The diagnostic procedures used in this section are designed to find and repair SRS malfunctions. To get the best results, it is important to use the diagnostic charts and follow the sequence listed below:

A. Perform the "SRS Diagnostic System Check."

The "SRS Diagnostic System Check" must be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation, the ability of the SDM to communicate through the "Serial Data" line and whether SRS diagnostic trouble codes exist.

B. Refer to the proper diagnostic chart as directed by the "SRS Diagnostic System Check."

The "SRS Diagnostic System Check" will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.

C. Repeat the "SRS Diagnostic System Check" after any repair or diagnostic procedures have been performed.

Performing the "SRS Diagnostic System Check" after all repair or diagnostic procedures will ensure that the repair has been made correctly and that no other malfunctions exist

Circuit Description

When the ignition switch is first turned "ON", "ignition 1" voltage is applied from the "SRS–1" fuse to the SDM at the "ignition 1" input terminals "12". The SDM responds by flashing the "AIR BAG" warning lamp seven times while performing tests on the SRS.

Notes On System Check Chart:

Number(s) below refer to step number(s) on the "SRS Diagnostic System Check" chart.

1. The "AIR BAG" warning lamp should flash seven times after ignition is first turned "ON."
2. After the "AIR BAG" warning lamp flashes seven times, it should turn "OFF."
3. Improper operation of the "AIR BAG" warning lamp is indicated. This test differentiates a warning lamp stays "ON" condition from a warning lamp does not come "ON" condition.
4. This test checks for the proper operation of the "Serial Data" line. This test will also determine whether history diagnostic trouble codes are stored and, if so, identify them.
5. This test checks for proper operation of the "Serial Data" line. This test will also identify the stored diagnostic trouble codes and whether they are current or history.

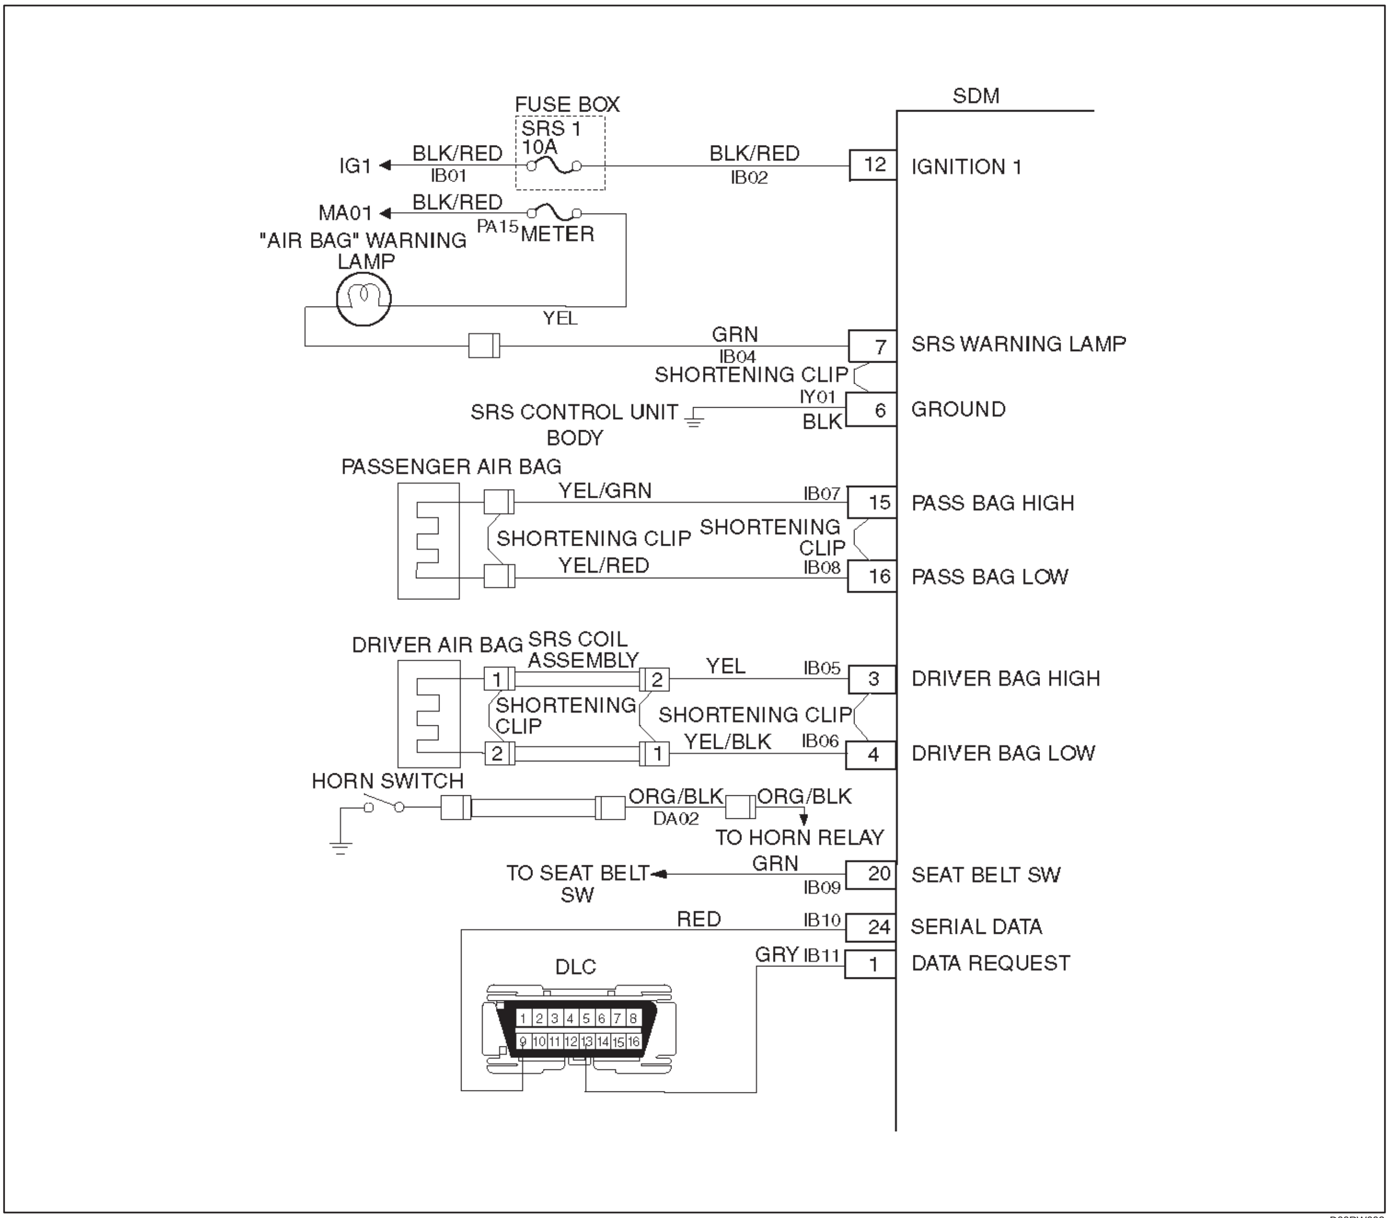
Diagnostic Aids:

The order in which diagnostic trouble codes are diagnosed is very important. Failure to diagnose the diagnostic trouble codes in the order specified may result in extended diagnostic time, incorrect diagnosis and incorrect parts Replacement.

SRS Diagnostic System Check

Step	Action	Yes	No
1	Confirm the “AIR BAG” warning lamp when ignition switch is turned “ON.” Does the “AIR BAG” warning lamp flash seven (7) times?	Go to Step 2	Go to Step 3
2	Confirm the “AIR BAG” warning lamp after it flashed 7 times. Does the “AIR BAG” warning lamp go “OFF”?	Go to Step 4	Go to Step 5
3	Confirm the “AIR BAG” warning lamp when ignition switch is turned “ON.” Does the “AIR BAG” warning lamp come “ON” steady?	Go to Chart B.	Go to Chart C.
4	1. Ignition switch “OFF.” 2. Connect a scan tool to data link connector. 3. Follow direction given in the scan tool instruction manual. 4. Ignition switch “ON.” 5. Request the SRS diagnostic trouble code display recode all history diagnostic trouble code(s) specify as such, on repair order. Is diagnostic trouble code(s) displayed?	Ignition switch “OFF.” When DTC 71 is set, go to DTC 71 chart. For all other history codes refer to “Diagnostics Aids” for that specific DTC. A history DTC indicates the malfunction has been repaired or is intermittent.	SRS is functional and free of malfunctions, no further diagnosis is required. If scan tool indicates “No Data Received,” refer to chassis electrical section.
5	1. Ignition switch “OFF.” 2. Connect a scan tool to data link connector. 3. Follow directions as given in the scan tool instruction manual. 4. Ignition switch “ON.” 5. Request the SRS diagnostic trouble code display, recode all diagnostic trouble code(s), specifying as current or history on repair order. Is diagnostic trouble code(s) displayed?	Ignition switch “OFF.” When DTC 53 is set, go to DTC 53 chart. When DTC 51 is set, go to DTC 51 chart. When DTC 19 is set, go to DTC 19 chart. When DTC 25 is set, go to DTC 25 chart. Diagnose remaining current DTCs from lowest to highest.When only history DTCs exist, Refer to “Diagnostics Aids” for that specific DTC. A history DTC indicates the malfunction has been repaired or is intermittent.	If scan tool indicates “No Data Received,” refer to chassis electrical section.

Chart A SDM Integrity Check



D09RW002

Circuit Description:

When the SDM recognizes “ignition 1” voltage, applied to terminals “12”, is greater than 9 volts, the “AIR BAG” warning lamp is flashed 7 times to verify operation. At this time the SDM performs “Turn–ON” tests followed by “Continuous Monitoring” tests. When a malfunction is detected, the SDM sets a current diagnostic trouble code and illuminates the “AIR BAG” warning lamp. The SDM will clear current diagnostic trouble codes and move them to a history file when the malfunction is no longer detected and/or the ignition switch is cycled, except for DTCs 51, 53 and 71. DTC 71 can only be cleared using a scan tool “Clear Codes” command in case that the malfunction on DTC 71 has been solved and no DTCs 51 and 53 were remained. DTCs 51, 53 and 71 can not be cleared after a “Clear Codes” command is issued.

Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

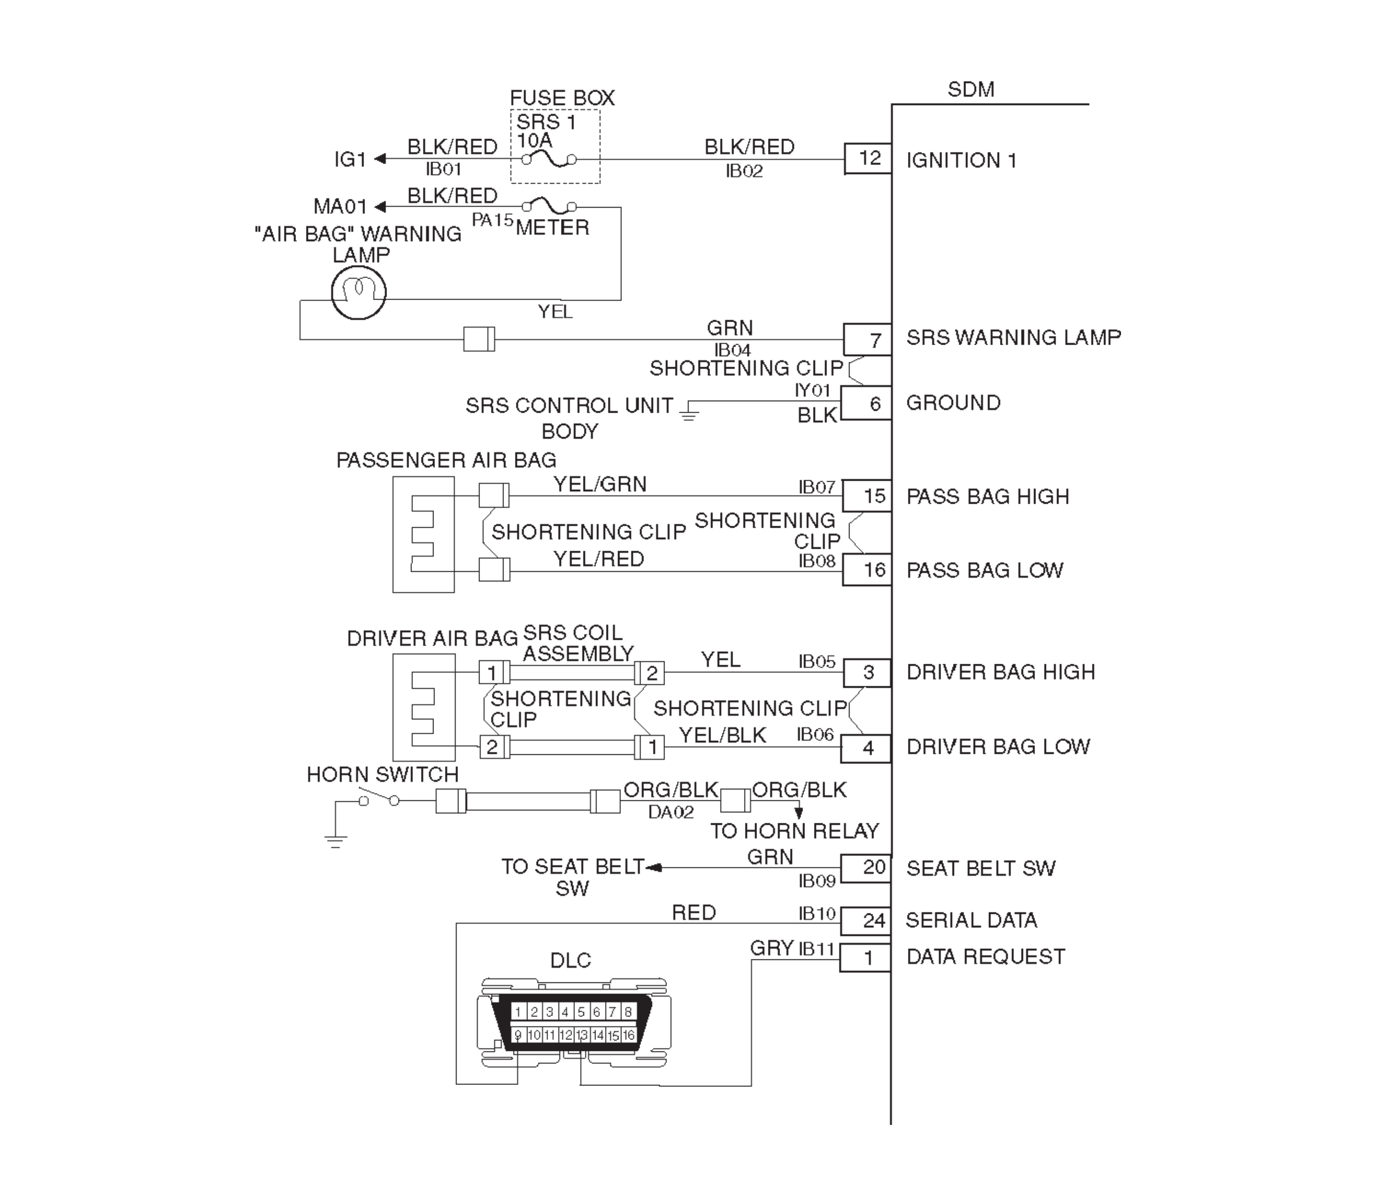
1. This test Confirm s a current malfunction. If no current malfunction is occurring (history DTC set) the “Diagnostic Aids” for the appropriate diagnostic trouble code should be referenced. The SDM should not be replaced for a history diagnostic trouble code.
2. This test checks for a malfunction introduced into the SRS during the diagnostic process. It is extremely unlikely that a malfunctioning SDM would cause a new malfunction to occur during the diagnostic process.
3. When all circuitry outside the SDM has been found to operate properly, as indicated by the appropriate diagnostic chart, then and only then should the SDM be replaced.

Chart A SDM Integrity Check

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	1. This chart assumes that the “SRS Diagnostic System Check” and either a symptom chart or a diagnostic trouble code chart diagnosis have been performed When all circuitry outside the SDM has been found to operate properly, as indicated by the appropriate diagnostic chart, and the symptom or DTC remains current, the following diagnostic procedures must be performed to verify the need for SDM Replacement. 2. Ignition switch “OFF.” 3. Reconnect all SRS components, ensure all components are properly mounted. 4. Ensure the ignition switch has been “OFF” for at least 15 seconds. 5. Confirm “AIR BAG” warning lamp as ignition switch is turned “ON.” Does warning lamp flash 7 times then go “OFF”?	The symptom or DTC is no longer occurring. Clear SRS diagnostic trouble codes. Repeat the “SRS Diagnostic System Check.”	Go to Step 2
2	Using a scan tool, request diagnostic trouble code display. Is the same symptom or DTC occurring as was when the “SRS Diagnostic System Check ” was first performed?	Ignition switch “OFF.” Go to the appropriate chart for the indicated malfunction.	Go to Step 3
3	1. Clear “SRS Diagnostic Trouble Codes.” 2. Ignition switch “OFF” for at least two minutes. 3. Confirm “AIR BAG” warning lamp as ignition switch is turned “ON.” Does warning lamp flash 7 times then go “OFF”?	SRS is functional and free of malfunctions. No further diagnosis is required. Go to Step 4	Ignition switch “OFF.” Replace SDM. Go to Step 4
4	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the “SRS Diagnostic System Check.”	Go to Step 4

Chart B "AIR BAG" Warning Lamp Comes "ON" Steady



D09RW002

Circuit Description:

When the ignition switch is first turned "ON", "ignition 1" voltage is applied from the "MA01" meter fuse to "AIR BAG", warning lamp which is connected to "SRS warning lamp", terminal "7". The "SRS–1" fuses apply system voltage to the "ignition 1" inputs, terminals "12". The SDM responds by flashing the "AIR BAG" warning lamp 7 times. If "ignition 1" voltage is less than 9 volts, the "AIR BAG" warning lamp will come "ON" solid with no DTCs set.

Chart Test Description:

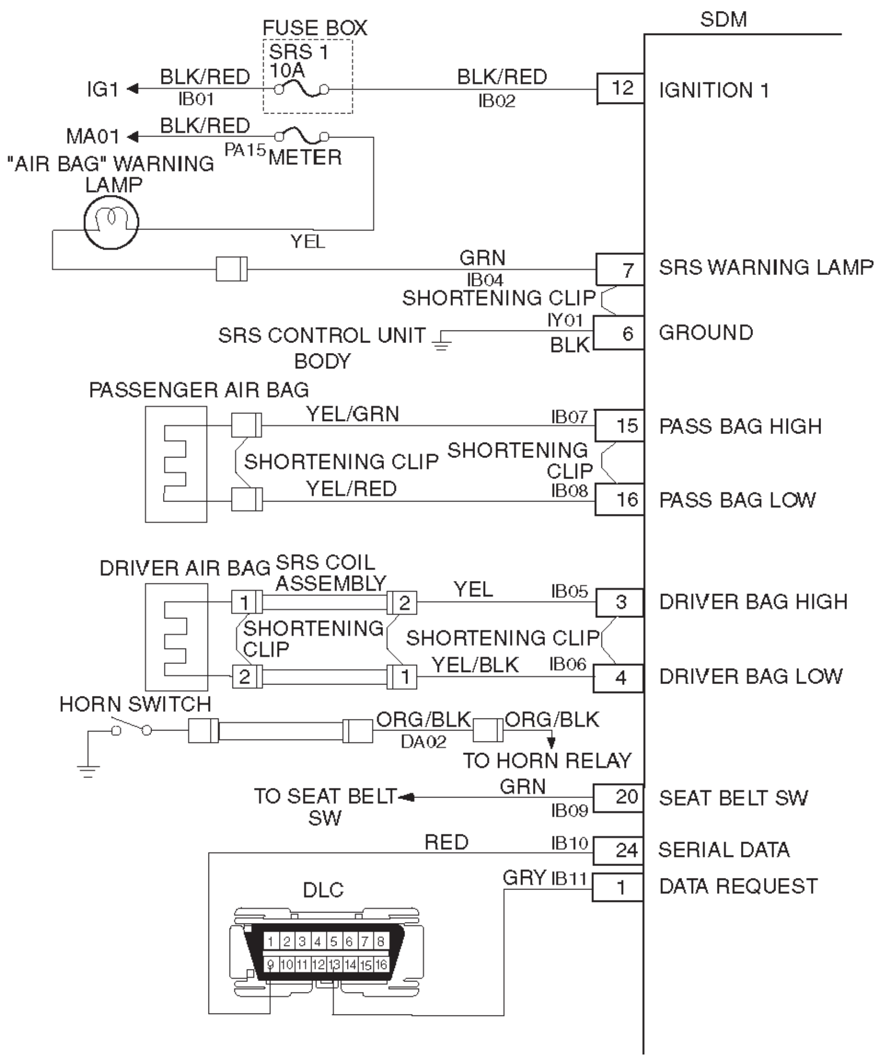
Number (s) below refer to step number (s) on the diagnostic chart.

2. This test checks for an open in the "ignition 1" circuit to the SDM.
3. This test checks for the voltage of "ignition 1."
4. This test determines whether the malfunction is a short to ground in CKT IB04 – GRN.

Chart B "AIR BAG" Warning Lamp Comes "ON" Steady

Step	Action	Yes	No
1	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Ignition switch "OFF." 3. Connect scan tool to data link connector, Follow directions as given in the scan tool instruction manual. 4. Ignition switch "ON." 5. Request SRS diagnostic trouble code display. Does scan tool indicate "No Data Received"?	Go to Step 2	Go to Step 3
2	1. Ignition switch "OFF." 2. Inspect SDM harness connector connection to SDM. Is it securely connected to the SDM?	Ignition switch "OFF." Replace SDM. Go to Step 5	Connect SDM securely to de–activate shorting clip in SDM harness connector. Go to Step 5
3	Using scan tool, request SRS data list. Is "ignition" more than 9 volts?	Go to Step 4	Ignition switch "OFF." Replace SDM. Go to Step 5
4	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assemblies. Yellow 2–pin connectors located at base of steering column and behind the glove box assembly. 3. Disconnect SDM. 4. Measure resistance from SDM harness connector terminal "6" to ground. Does J–39200 display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 5
5	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 5

Chart C “AIR BAG” Warning Lamp Does Not Comes “ON” Steady



D09RW002

Circuit Description:

When the ignition switch is first turned “ON”, “ignition 1” voltage is applied from the “MA01” meter fuse to the “AIR BAG” warning lamp which is connected to “SRS warning lamp”, terminal “7”. The “SRS–1” fuse apply system voltage to the “ignition 1” inputs, terminals “12”. The SDM responds by flashing the “AIR BAG” warning lamp seven times. If “ignition 1” voltage is more than 16 volts, the “AIR BAG” warning lamp will be still “OFF” solid with no DTCs set.

Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

1. This test decides whether power is available to SDM warning lamp power feed circuit.
2. This test determines whether the voltage is present in the warning lamp circuit.
3. This test determines if the malfunction is in the instrument cluster.
4. This test checks for open in the warning lamp circuitry.
5. This test isolates the IB04–GRN circuit and checks for a short in the IB04–GRN circuit to B+.
8. This test checks for a short from the SDM warning lamp power feed circuit to ground.
9. This test determines whether the short to ground is due to a short in the wiring.

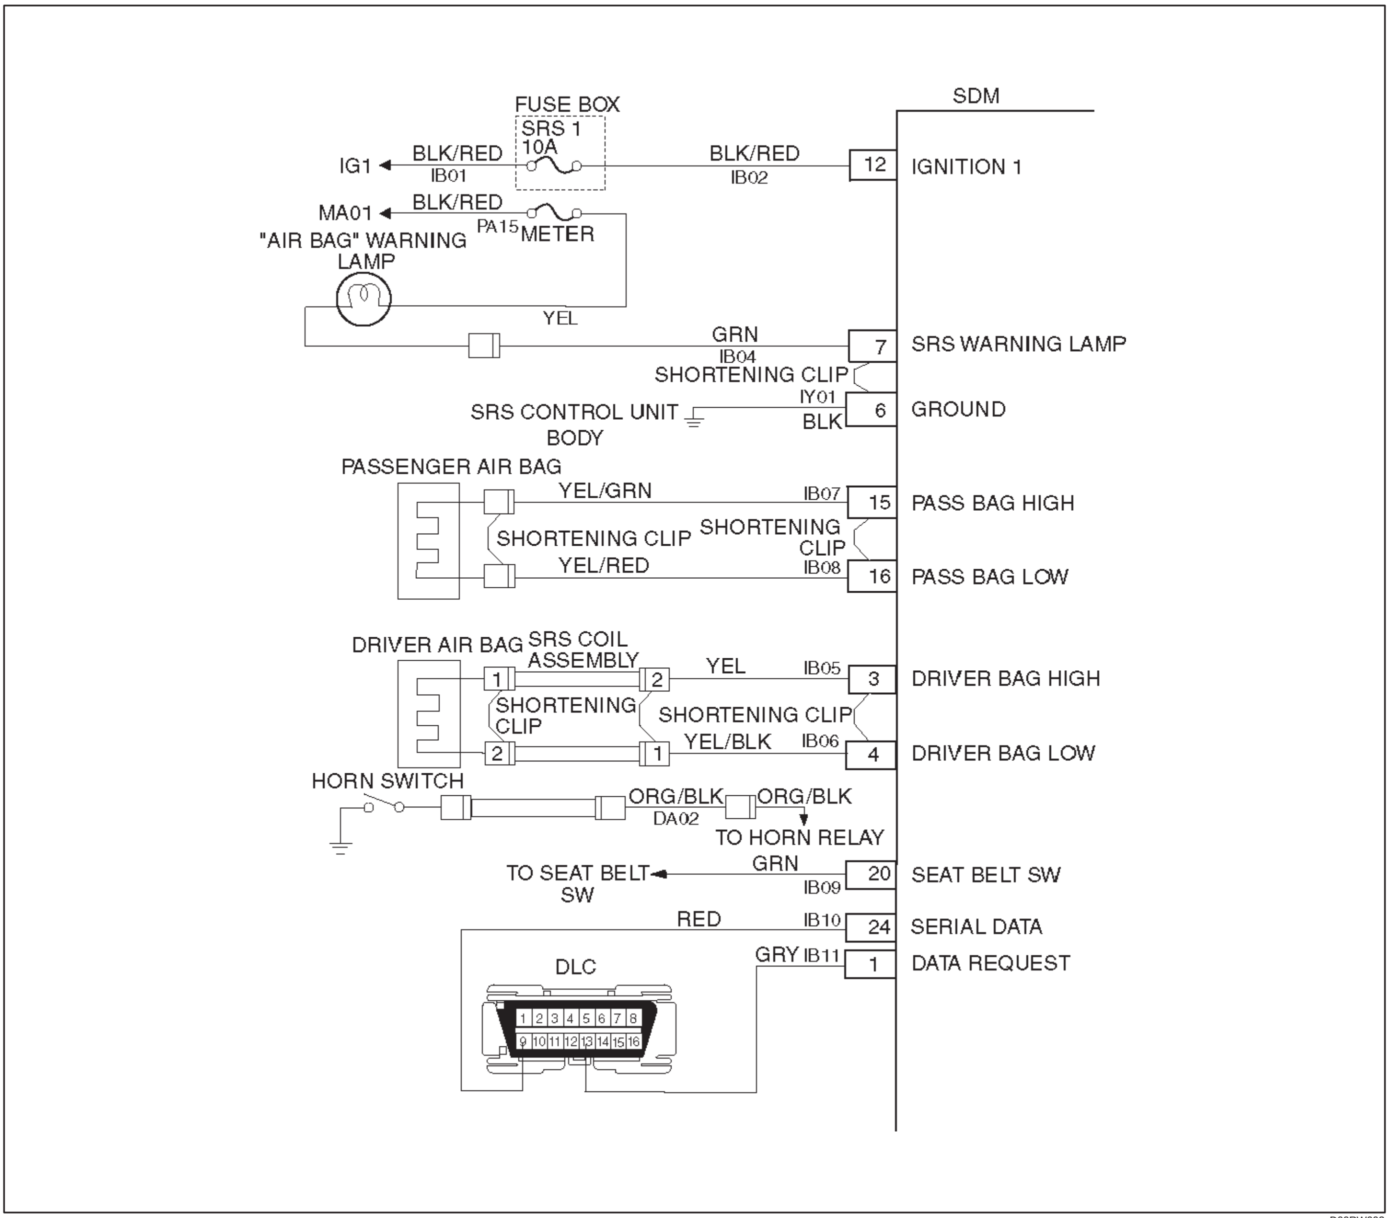
Chart C “AIR BAG” Warning Lamp Does Not Comes “ON” Steady

Step	Action	Yes	No
1	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Ignition switch “OFF.” 3. Remove and inspect “MA01” meter fuse to the “AIR BAG” warning lamp. Is fuse good?	Go to Step 2	Go to Step 7
2	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag assemblies. Yellow 2–pin connectors located at base of steering column and behind the glove box assembly. 3. Disconnect SDM. 4. Ignition switch “ON.” 5. Measure voltage on SDM harness connector from terminal “7” to terminal “6” (ground). Is system voltage present on terminal “7”?	Go to Step 4	Go to Step 3
3	1. Ignition switch “OFF.” 2. Remove instrument meter cluster. 3. Check for proper connection to instrument cluster at IB04–GRN terminal. 4. If OK, then remove and inspect “AIR BAG” bulb. Is bulb good?	Go to Step 5	Replace bulb. Go to Step 6
4	1. Ignition switch “OFF.” 2. Disconnect instrument meter cluster harness connector. 3. Ignition switch “ON.” 4. Measure voltage on SDM harness connector from terminal “7” to terminal “6” (ground). Is voltage 1 volt or less?	Go to Chart A.	Replace SRS harness. Go to Step 6
5	1. Install bulb. 2. Measure resistance from instrument meter cluster harness connector IB04–GRN terminal to SDM harness connector terminal “7”. Is resistance 5.0 ohms or less?	Service instrument meter cluster. Go to Step 6	Replace SRS harness. Go to Step 6
6	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the “SRS Diagnostic System Check.”	Go to Step 6
7	Were you sent here from chart C?	Go to Step 8	Go to Step 1
8	1. Replace “MA01” meter fuse. 2. Ignition switch “ON” wait 10 seconds then ignition switch “OFF.” 3. Remove and inspect “MA01” meter fuse. Is fuse good?	Install “MA01” meter fuse. Go to Step 10	Go to Step 9

Chart C “AIR BAG” Warning Lamp Does Not Comes “ON” Steady (Cont’d)

Step	Action	Yes	No
9	1. Disconnect SRS coil and passenger air bag assemblies. Yellow 2–pin connectors located at base of steering column and behind the glove box assembly. 2. Disconnect SDM. 3. Replace “MA01” meter fuse. 4. Ignition switch “ON” wait to 10 seconds. 5. Ignition switch “OFF”. 6. Remove and inspection “MA01” meter fuse. Is fuse good?	Install “MA01” meter fuse. Go to Chart A.	Replace SRS harness. Replace“MA01” meter fuse. Go to Step 10
10	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the “SRS Diagnostic System Check.”	Go to Step 10

DTC 15 Passenger Deployment Loop Resistance High



D09RW002

Circuit Description:

When the ignition switch is turned "ON", the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Resistance Measurement Test". "Passenger Bag Low" terminal "16" is grounded through a resister and the passenger current source connected to "Passenger Bag High" terminal "15" allows a known amount of current to flow. By monitoring the voltage difference between "Passenger Bag High" and "Passenger Bag Low" the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YEL/GRN and IB08–YEL/RED connector terminal contact.

DTC Will Set When:

The combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YEL/GRN and IB08–YEL/RED, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn–ON."
2. "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test verifies proper connection of the yellow 2–pin connector.
4. This test checks for proper contact and/or corrosion of the yellow 2–pin connector terminals.
5. The test checks for a malfunctioning passenger air bag assembly.
6. This test determines whether the malfunction is due to high resistance in the wiring.

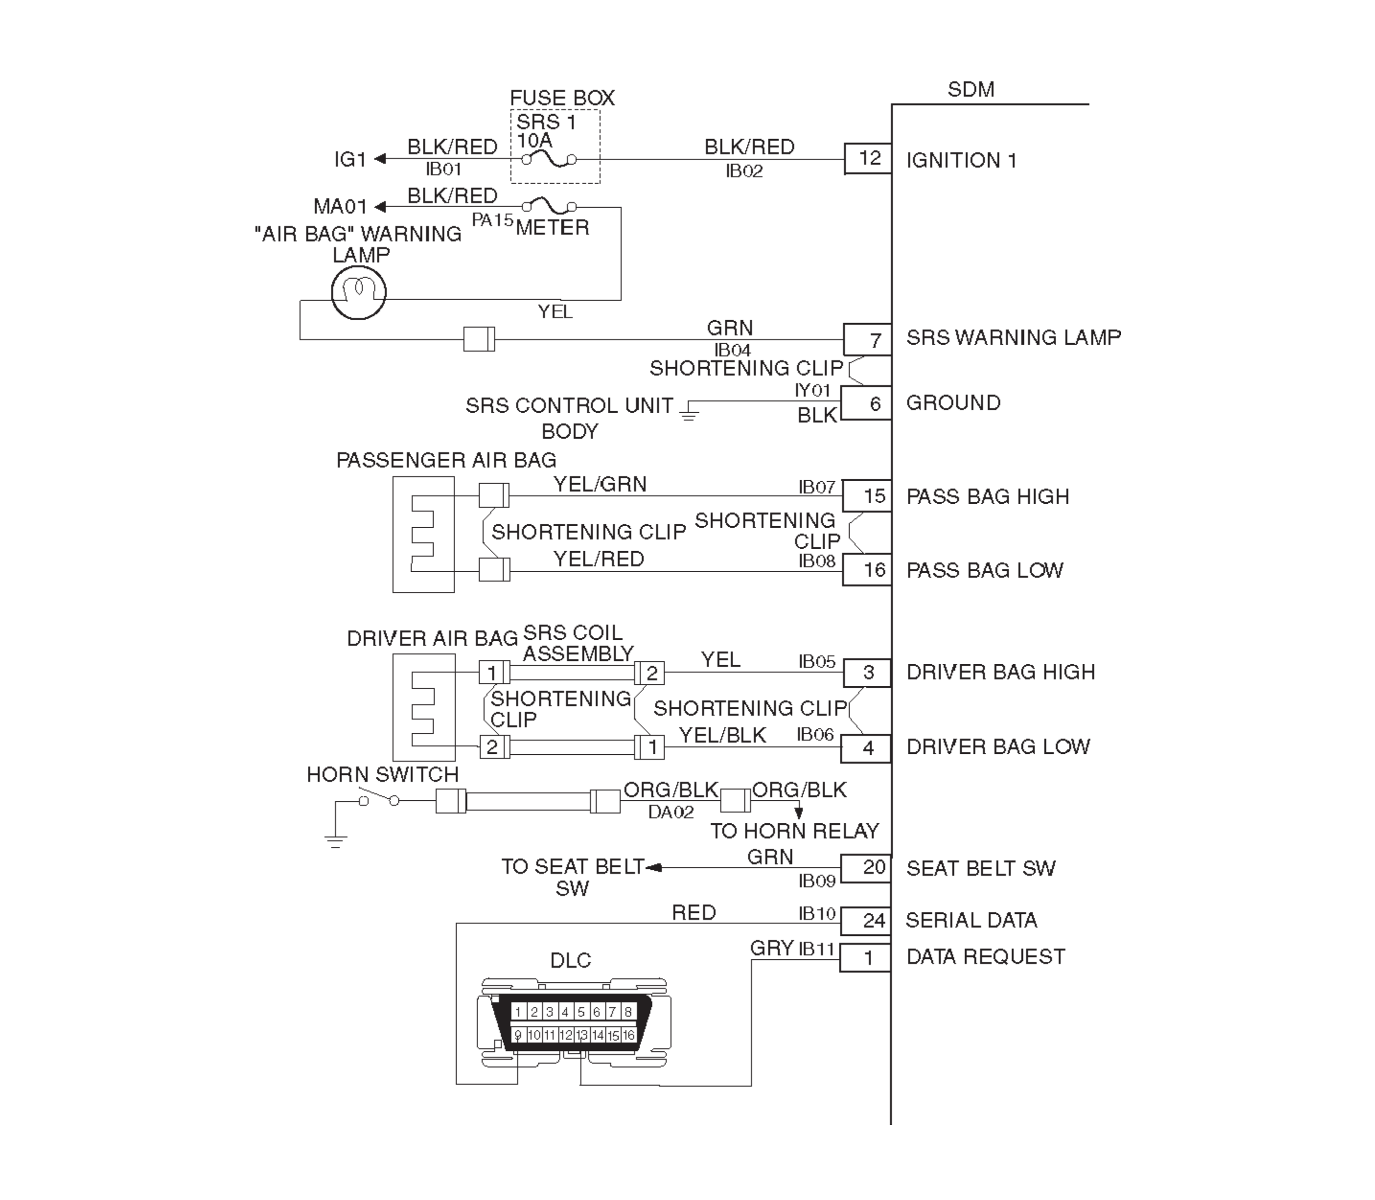
Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the passenger air bag assembly harness connector terminals “1” and “2”, SDM terminal “15” and “16”, or a poor wire to terminal connection in CKTs IB07–YEL/GRN and IB08–YEL/RED. This test for this diagnostic trouble code is only run while the “AIR BAG” warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 15 Passenger Deployment Loop Resistance High

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Use scan tool data list function, read and record the passenger deployment loop resistance. Is passenger resist more than 2.9 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch “OFF.” 2. Make sure the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly is seated properly. Is the yellow 2–pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2–pin connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly. 2. If OK, reconnect the passenger air bag assembly 2–pin connector. 3. Ignition switch “ON.” Is DTC 15 current?	Go to Step 5	Ignition switch “OFF.” Go to Step 7
5	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag 2–pin connectors located at the base of the steering column and behind the glove box assembly. 3. Connect J–41433 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 15 current?	Go to Step 6	Ignition switch “OFF.” Replace the passenger air bag assembly. Go to Step 7
6	1. Ignition switch “OFF.” 2. There has been an increase in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB07–YEL/GRN and IB08–YEL/RED, and SDM connector terminal “15” and “16” to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A.
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the “SRS Diagnostic System Check.”	Go to Step 7

DTC 16 Passenger Deployment Loop Resistance Low



D09RW002

Circuit Description:

When the ignition switch is turned "ON", the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Resistance Measurement Test". "Passenger Bag Low" terminal "16" is grounded through a resistor and the passenger current source connected to "Passenger Bag High" terminal "15" allows a known amount of current to flow. By monitoring the voltage difference between "Passenger Bag High" and "Passenger Bag Low", the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YEL/GRN and IB08–YEL/RED connector terminal contact.

DTC Will Set When:

The combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YEL/GRN and IB08–YEL/RED, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn–ON",
2. "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test verifies connection of the yellow 2–pin connector.
4. This test cheeks for proper operation of the shorting clip in the yellow 2–pin connector.
5. The test checks for a malfunction passenger air bag assembly.
6. This test determines whether the malfunctioning is due to shorting in the wiring.

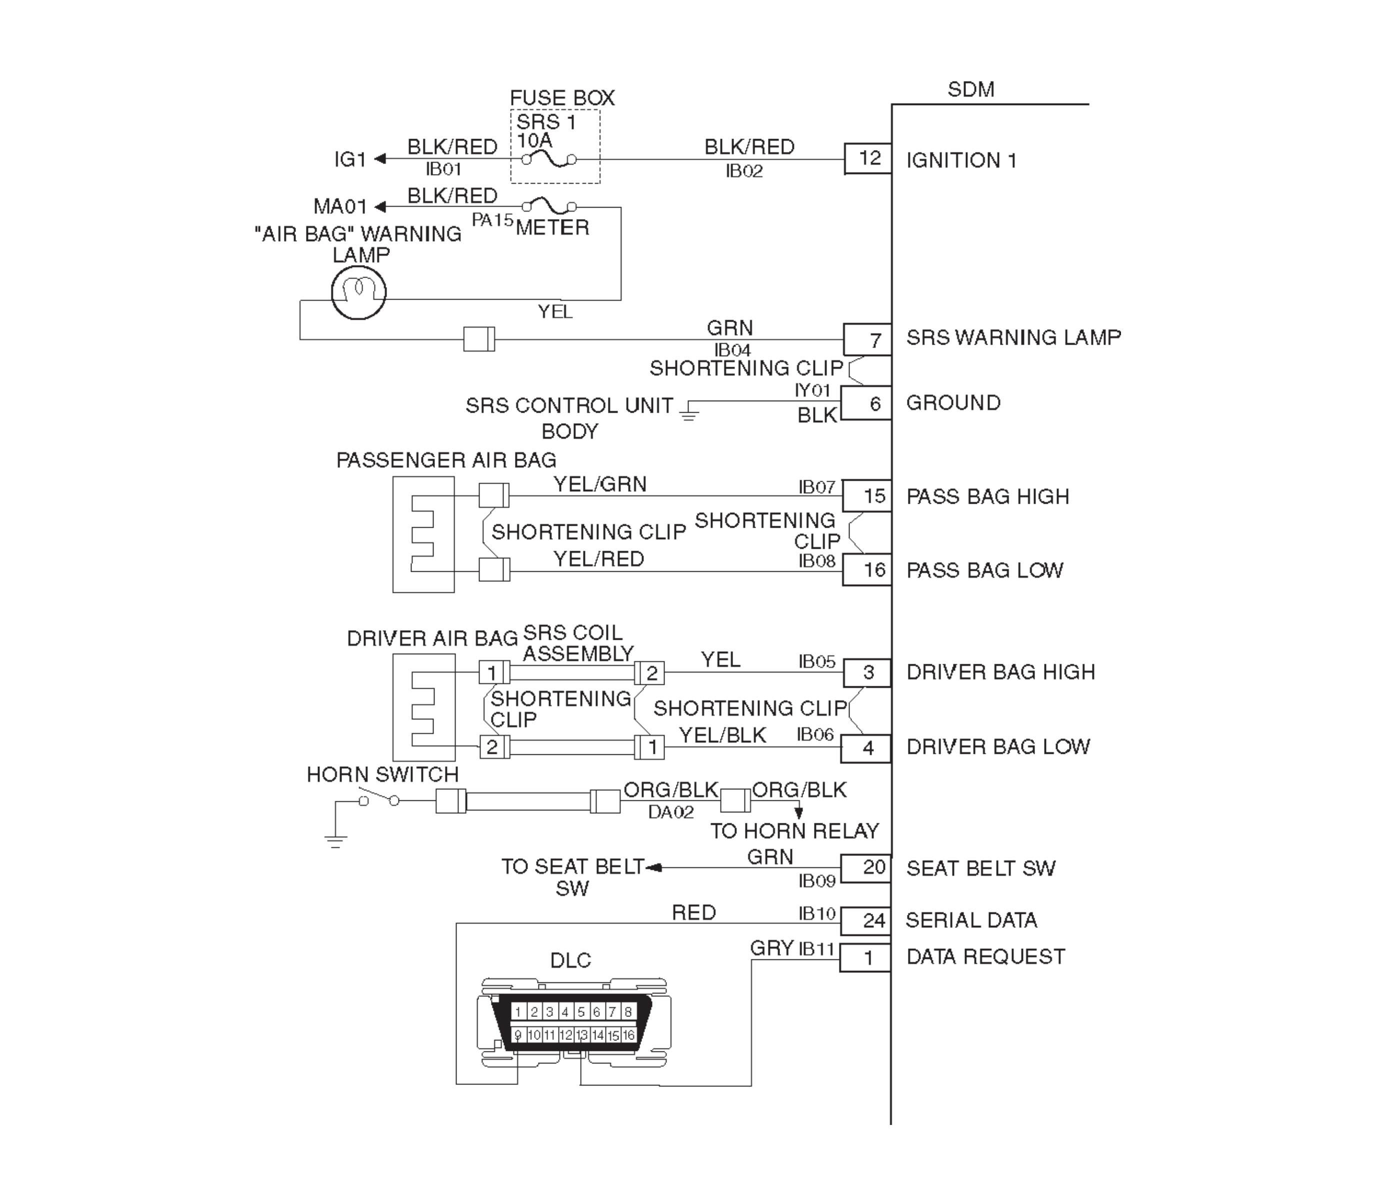
Diagnostic Aids:

An intermittent condition is likely to be caused by a short between CKTs IB07–YEL/GRN and IB08–YEL/RED, or a malfunctioning shorting clip on the passenger air bag assembly which would require replacement of the air bag assembly. The test for this diagnostic trouble code is only run while “AIR BAG” warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 16 Passenger Deployment Loop Resistance Low

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Using scan tool data list function, read and record the passenger deployment loop resistance. Is passenger resist. less than 1.4 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch “OFF.” 2. Make sure the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly is seated properly. Is the yellow 2–pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2–pin connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly. 2. If OK, reconnect the passenger air bag assembly 2–pin connector. 3. Ignition switch “ON.” Us DTC 16 current?	Go to Step 5	Ignition switch “OFF.”Go to Step 7
5	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag 2–pin connectors located at the base of the steering column and behind the glove box assembly. 3. Connect J–41433 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 16 current?	Go to Step 6.	Ignition switch “OFF.” Replace the passenger air bag assembly. Go to Step 7
6	1. Ignition switch “OFF.” 2. There has been a decrease in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB07–YEL/GRN and IB08–YEL/RED, and SDM connector terminal “15” and “16” to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A.
7	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the “SRS Diagnostic System Check.”	Go to Step 7

DTC 17 Passenger Deployment Loop Open



D09RW002

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. During “Continuous Monitoring” diagnostics, a fixed amount of current is flowing in the deployment loop. This produces proportional voltage drops in the loop. By monitoring the voltage difference between “Passenger Bag High” and “Passenger Bag Low”, the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YEL/GRN and IB08–YEL/RED, and connector terminal contact.

DTC Will Set When:

The voltage difference between “Passenger Bag High” terminal “15” and “Passenger Bag Low” terminal “16” is above or equal to a specified value for 500 milliseconds during “Continuous Monitoring”.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage difference between “Passenger Bag High” terminal “15” and “Passenger Bag Low” terminal “16” is below a specified value for 500 milliseconds during “Continuous Monitoring”.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.

3. This test verifies proper connection of the yellow 2–pin connector.
4. This test cheeks for proper contact and/or corrosion of the shorting clip in the yellow 2–pin connector terminals.
5. The test checks for a malfunctioning passenger air bag assembly.
6. This test determines whether there is an open in the wiring.

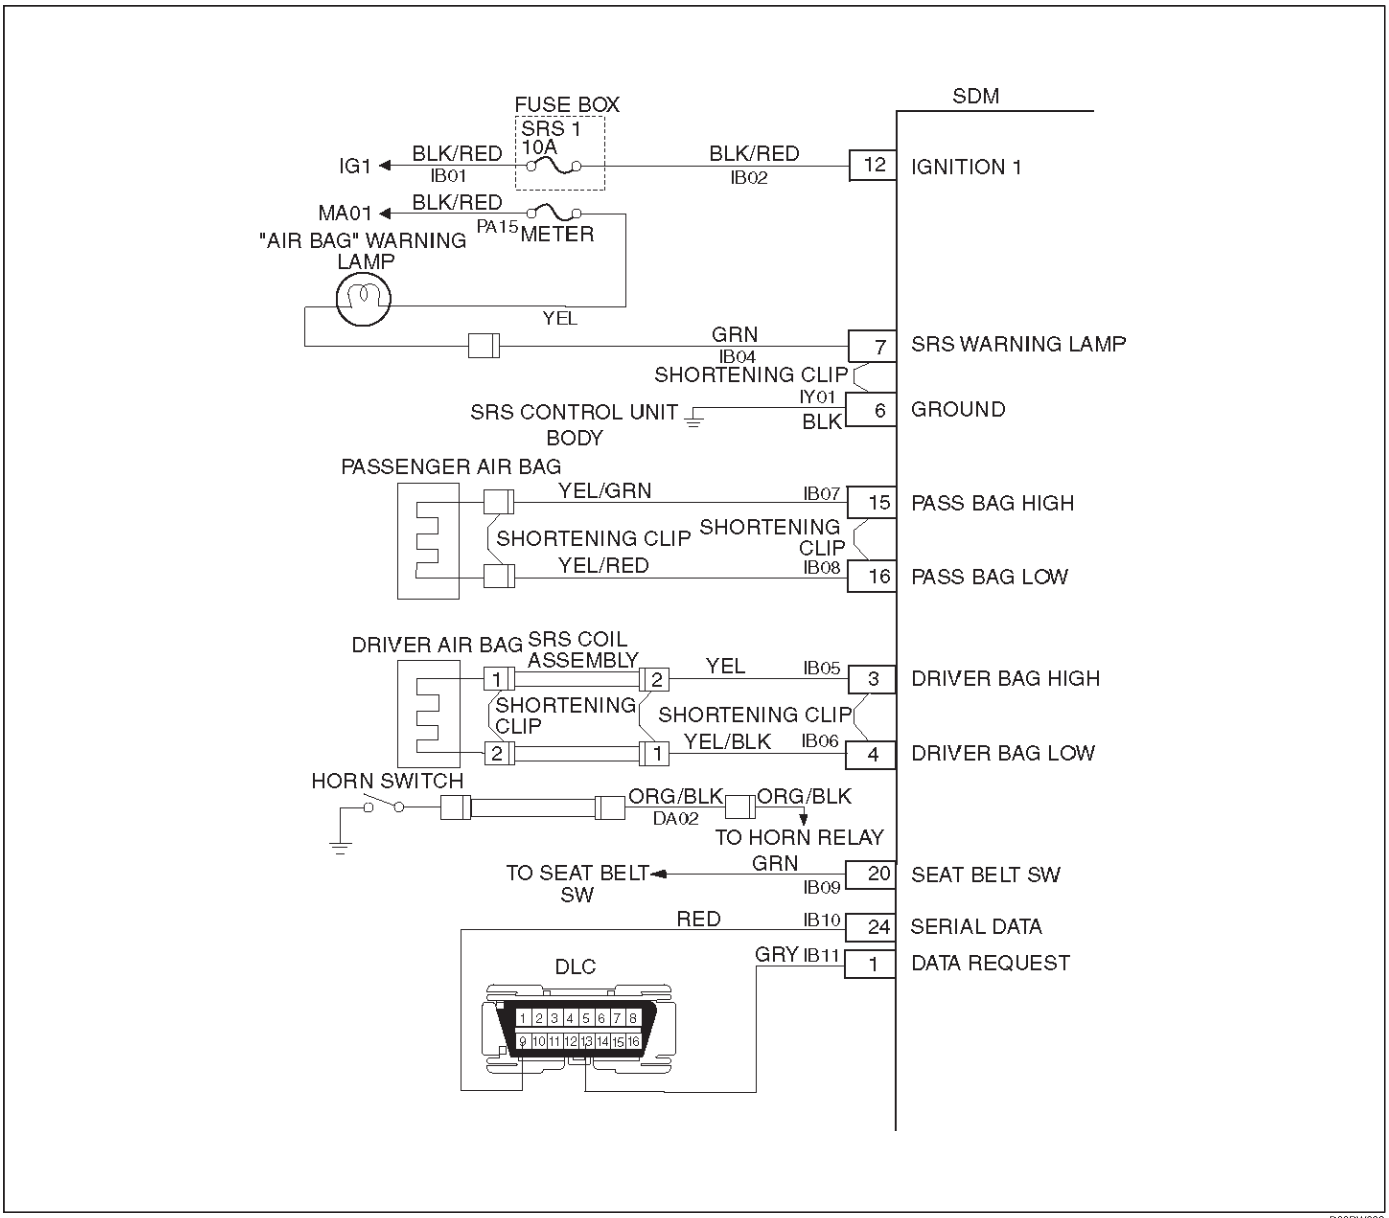
Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the passenger air bag assembly harness connector terminals “1” and “2,” SDM terminals “15” and “16,” or an open in CKT IB07–YEL/GRN and IB08–YEL/RED.

DTC 17 Passenger Deployment Loop Open

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Using scan tool data list function, read and record the passenger differential voltage. Is passenger differential voltage. more than 4.0 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch “OFF.” 2. Make sure the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly is seated properly. Is the yellow 2–pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2–pin connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2–pin connector located behind the glove box assembly. 2. If OK, reconnected the passenger air bag assembly yellow 2–pin connector. 3. Ignition switch “ON.” Is DTC 17 current?	Go to Step 5	Ignition switch “OFF.” Go to Step 7
5	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag assembly yellow 2–pin connectors located at the base of the steering column and behind the glove box assembly. 3. Connect J–41433 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 17 current?	Go to Step 6	Ignition switch “OFF.” Replace the passenger air bag assembly. Go to Step 7
6	1. Ignition switch “OFF.” 2. There has been an open circuit in the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB07–YEL/GRN and IB08–YEL/RED, and SDM connector terminal “15” and “16” to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A.
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the “SRS Diagnostic System Check.”	Go to Step 7

DTC 18 Passenger Deployment Loop Short To Ground



Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltages at “Driver Bag Low” terminal “4” and “Passenger Bag Low” terminal “16” to detect short to ground in the air bag assembly circuits.

DTC Will Set When:

Neither of the two air bag assemblies is open.

“Ignition 1” is within the normal operating voltage range. Once these conditions are met and the voltage at “Passenger Bag Low” is below a specified value, DTC 18 will set. This test is run once each ignition cycle and “Continuous Monitoring”.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

This malfunction is no longer occurring and the ignition switch is turned “OFF”.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart:

2. This test determines whether the SDM is malfunctioning.
3. This test isolates the malfunction to one side of the passenger air bag assembly yellow 2–pin connector behind glove box compartment.
4. This test determines whether the malfunction is in CKT IB07–YEL/GRN.

5. This test determines whether the malfunction is in CKT IB08–YEL/RED.

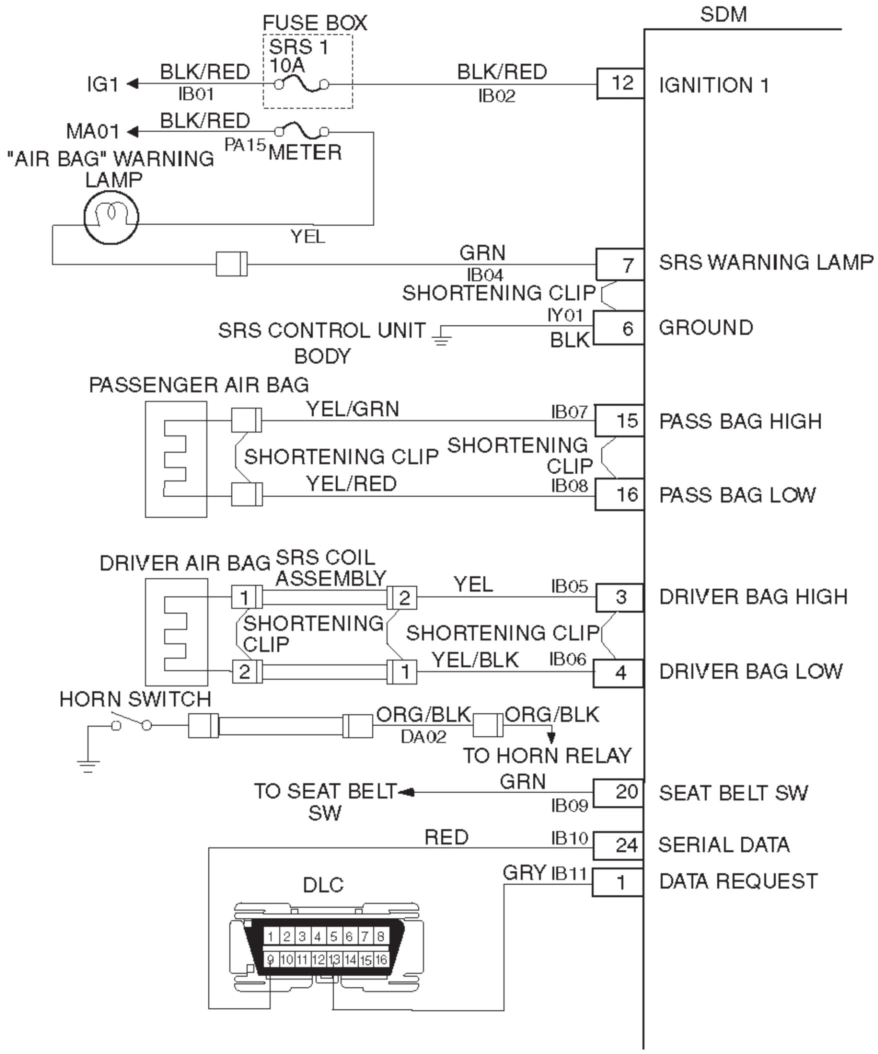
Diagnostic Aids:

An intermittent condition is likely to be caused by a short to ground in the passenger air bag assembly circuit. Inspect CKTs IB07–YEL/GRN and IB08–YEL/RED carefully for cutting or chafing. If the wiring pigtail of the passenger air bag assembly is damaged, the component must be replaced.

DTC 18 Passenger Deployment Loop Short To Ground

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator's manual. 4. Ignition switch "ON." 5. Read passenger sense LO. Is passenger sense LO less than 1.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect passenger air bag assembly yellow 2–pin connector behind the glove box assembly.. 3. Leave driver air bag assembly connected. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to passenger air bag assembly harness connector. 4. Ignition switch "ON." Is DTC 18 current?	Go to Step 4	Ignition switch "OFF." Replace passenger air bag assembly. Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SRS driver / passenger load tool. 3. Measure resistance on SDM harness connector from terminal "15" to terminal "6" (ground). Does J–39200 display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 6
5	Measure resistance on SDM harness connector from terminal "6" "16" to terminal (ground). Does J–39200 display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 6
6	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 6

DTC 19 Passenger Deployment Loop Short To Voltage



D09RW002

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltages at “Driver Bag Low” terminal “4” and “Passenger Bag Low” terminal “16” to detect short to B+ in the air bag assembly circuits.

DTC Will Set When:

“Ignition 1” is within the normal operating voltage range. Once these conditions are met and the voltage at “Passenger Bag Low” is above a specified value, DTC 19 will set. This test is run once each ignition cycle and “Continuous Monitoring”.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets DTC 19 and also DTC 71.

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test isolates the malfunction to one side of the passenger air bag assembly yellow 2–pin connector behind glove box compartment.
4. This test determines whether the malfunction is in CKT IB07–YEL/GRN.

5. This test determines whether the malfunction is in CKT IB08–YEL/RED.

Diagnostic Aids:

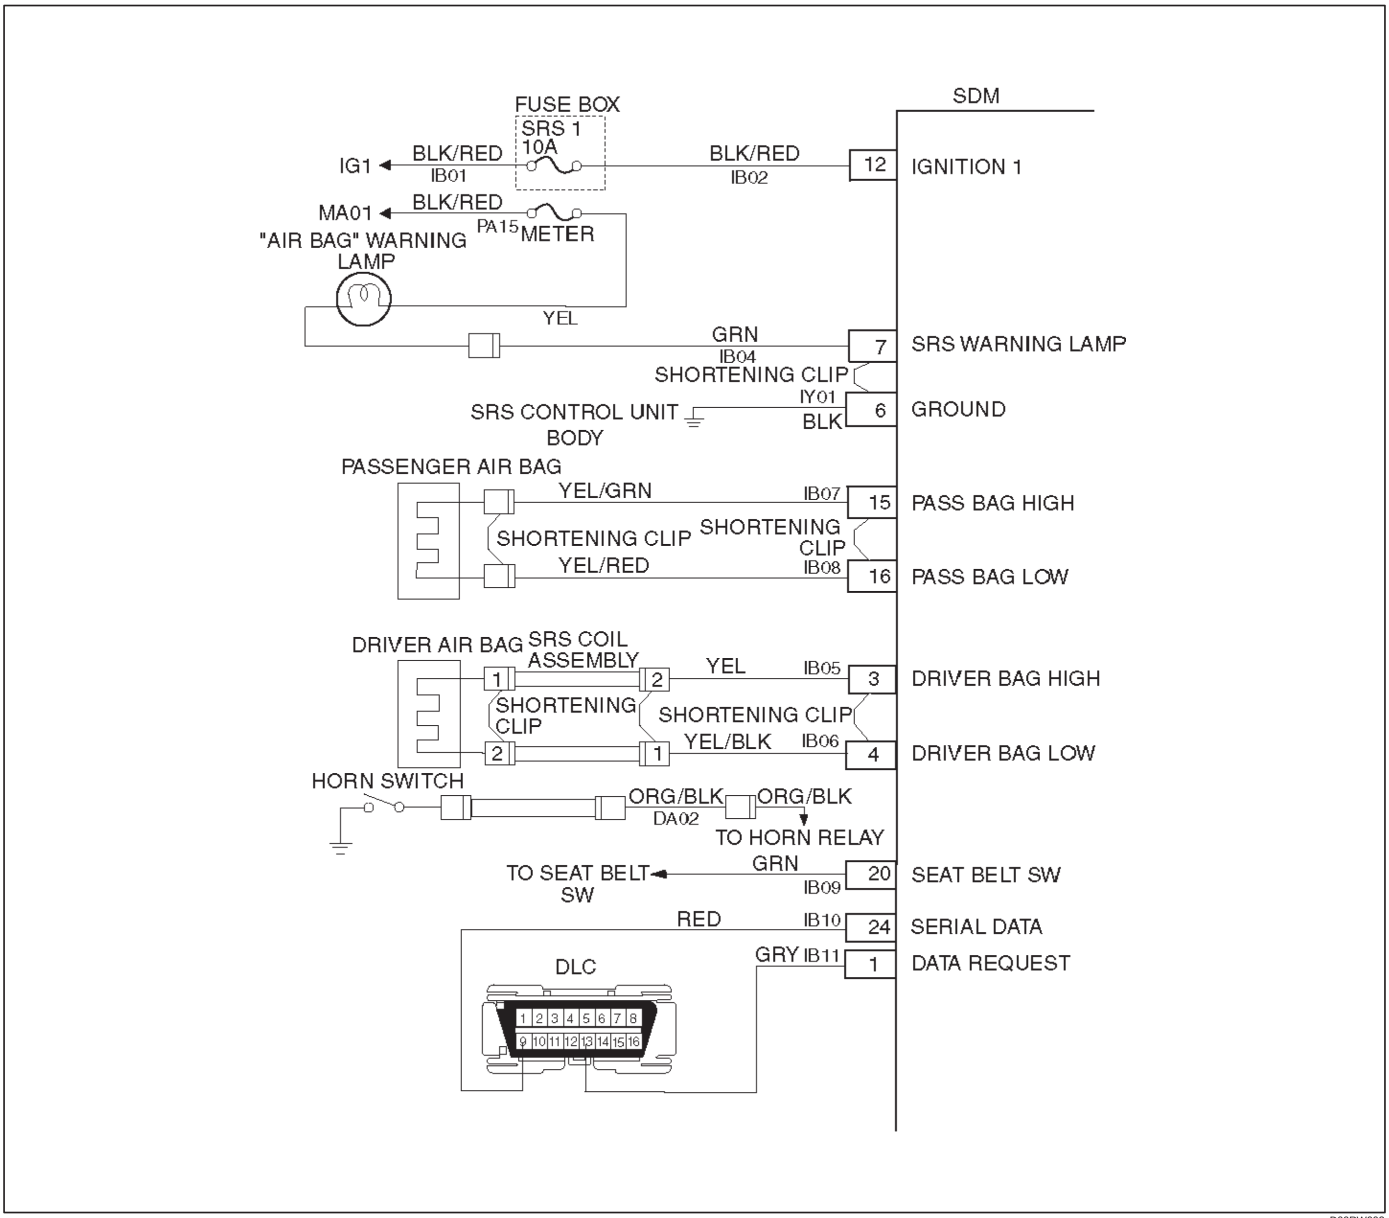
An intermittent condition is likely to be caused by a short to B+ in the passenger air bag assembly circuit. Inspect CKTs IB07–YEL/GRN and IB08–YEL/RED carefully for cutting or chafing. If the wiring pigtail of the passenger air bag assembly is damaged, the component must be replaced. A careful inspection of CKT IB07–YEL/GRN and IB08–YEL/RED, including the passenger air bag assembly pigtail is essential to ensure that the replacement SDM will not be damaged.

DTC 19 Passenger Deployment Loop Short To Voltage

CAUTION: When DTC 19 has been set, it is necessary to replace the SDM. Setting DTC 19 and 25 or 51 or 53 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is no longer present, DTC 71 will remain current. Ensure that the short to voltage condition is repaired prior to installing a replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator's manual. 4. Ignition switch "ON." 5. Read passenger sense LO. Is passenger sense LO more than 3.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect passenger air bag assembly yellow 2–pin connector behind the glove box assembly. 3. Leave driver air bag assembly connected. 4. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to passenger air bag assembly harness connector. 5. Ignition switch "ON." Is passenger sense LO more than 3.5 volts?	Go to Step 4	Ignition switch "OFF." Replace passenger air bag assembly. Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SDM. 3. Disconnect SRS driver / passenger load tool. 4. Measure resistance on SDM harness connector from terminal "15" to terminal "12" (IGNITION 1). Does J–39200 display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 6
5	Measure resistance on SDM harness connector from terminal "16" to terminal "12" (IGNITION 1). Does J–39200 display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 6
6	1. Reconnect all components, ensure all component are properly mounted. 2. Ignition switch "ON." Is passenger sense LO less than 3.5 volts?	Ignition switch "OFF."Replace SDM.Go to Step 7	Go to Chart A.
7	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 21 Driver Deployment Loop Resistance High



D09RW002

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM then proceeds with the “Resistance Measurement Test” “Driver Bag Low” terminal “4” is grounded through a current sink and the driver current source connected to “Driver Bag High” terminal “3” allows a known amount of current to flow. By monitoring the voltage difference between “Driver Bag High” and “Driver Bag Low”, the SDM calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring CKTs IB05–YEL and IB06–YEL/BLK, and connector terminal contact.

DTC Will Set When:

The combined resistance of the driver air bag assembly, SRS Coil assembly, harness wiring CKTs IB05–YEL and IB06–YEL/BLK, and connector terminal contact is above a specified value. This test run once each ignition cycle during the “Resistance Measurement Test” when:

No “higher priority faults” are detected during “Turn–ON”

“Ignition 1” voltage is in the specified value.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets DTC 21.

DTC Will Clear When:

The ignition switch is turned “OFF”.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test verifies proper connection of the yellow 2–pin connector at the base of the steering column.
4. This test checks for proper contact and/or corrosion of the 2–pin connector terminals at the base of steering column.
5. This test isolate the malfunction to one side of the SRS coil assembly yellow 2–pin connector located at the base of the steering column.
6. This test determines whether the malfunction is due to high resistance in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

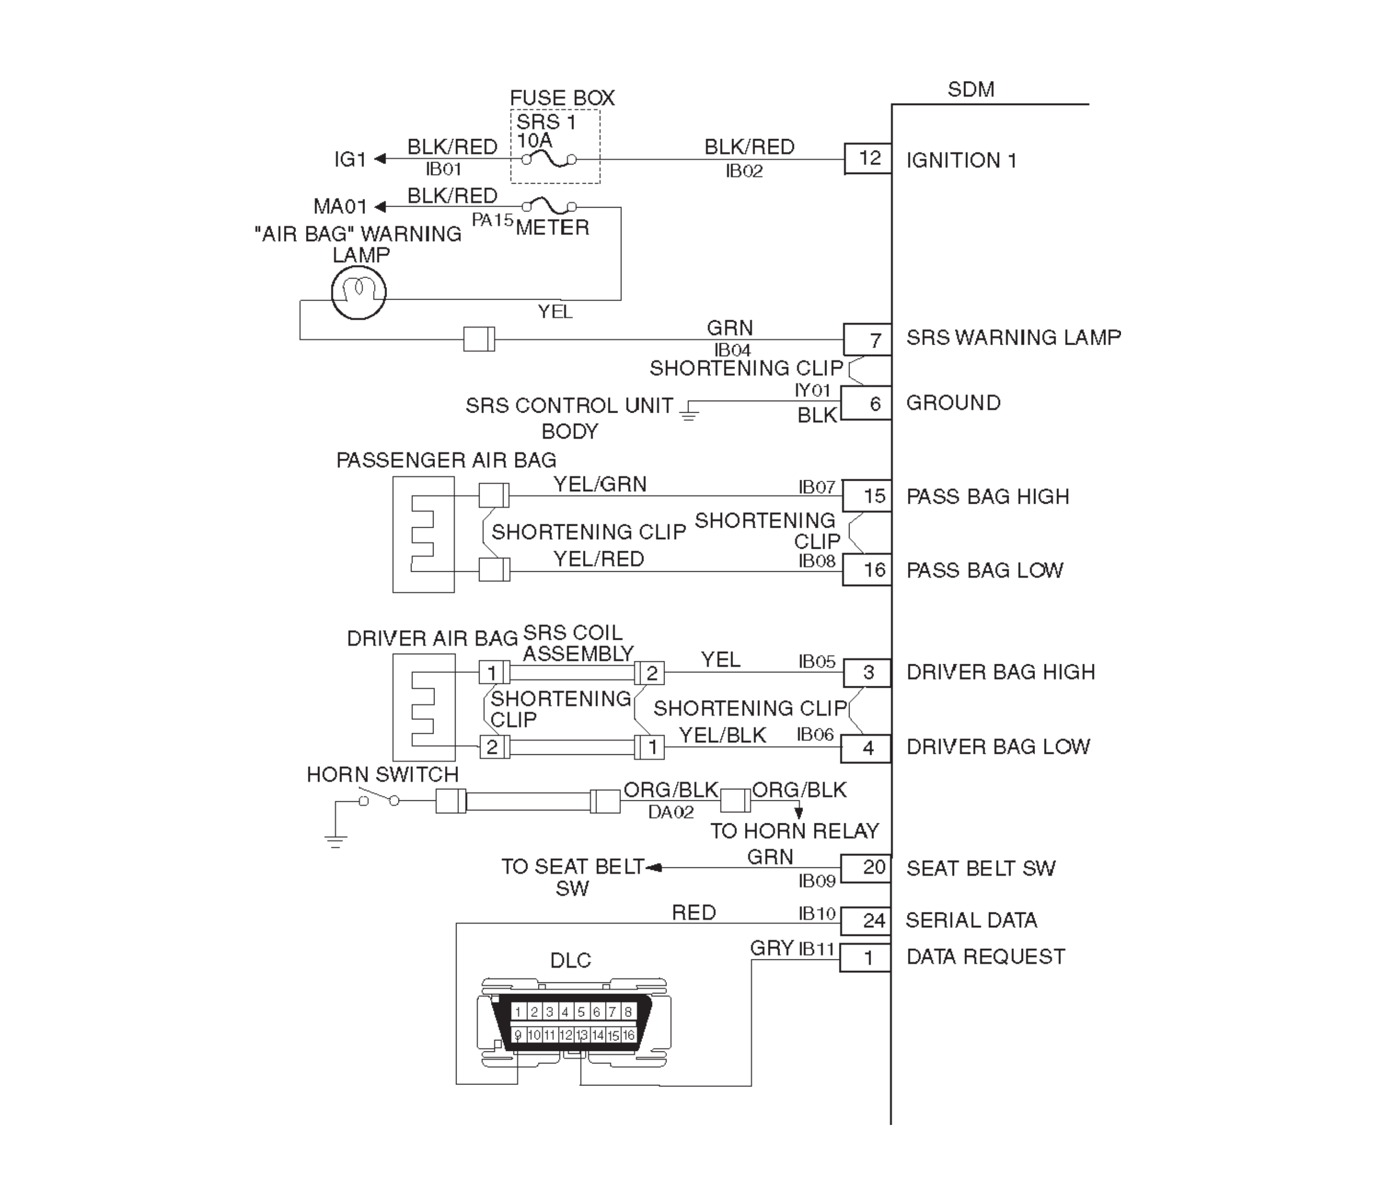
Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at terminals “1” and “2” of the SRS coil 2–pin connector at the base of the steering column, terminal “1” and “2” of the driver air bag assembly 2–pin connector at the top of the steering column, SDM terminals “3” and “4” or a poor wire to terminal connection in CKT IB05–YEL or IB06–YEL/BLK. The test for this diagnostic trouble code is only run while the “AIR BAG” warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 21 Driver Deployment Loop Resistance High

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Use scan tool data list function, read and record the driver deployment loop resistance. Is driver deployment loop resistance more than 4.4 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch “OFF.” 2. Disconnect driver air bag assembly yellow 2–pin connector located at base of steering column is seated properly. Is the 2–pin connector connected properly?	Go to Step 4	Seat SRS coil assembly 2–pin connector properly.Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2–pin connector located base of steering column. 2. If OK, reconnect the SRS coil assembly yellow 2–pin connector. 3. Ignition switch “ON.” Is DTC 21 current?	Go to Step 5	Ignition switch “OFF.” Go to Step 8
5	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag assembly yellow 2–pin connectors located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 21 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch “OFF.” 2. There has been a increase in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB05–YEL/IB06–GRN and YEL/BLK, and SDM connector terminal “3” and “4” to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A.
7	1. Ignition switch “OFF.” Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. Connect SRS driver / passenger load tool J–41433 on the top of steering column. Reconnect SRS coil assembly harness connector as the base of steering column. Ignition switch “ON.” Is DTC 21 current?	Ignition switch “OFF.” Replace SRS COIL ASSEMBLY. Refer to in this section 9J–24. Go to Step 8	Ignition switch “OFF.” Replace driver air bag assembly. Go to Step 8
8	Reconnect all components, ensure all component are properly mounted. Clear diagnostic trouble codes. Was this step finished?	Repeat the “SRS Diagnostic System Check.”	Go to Step 8.

DTC 22 Driver Deployment Loop Resistance Low



D09RW002

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests “ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.The SDM then proceeds with the “Resistance Measurement Test” “Driver Bag Low” terminal “4” is grounded through a current sink and the driver current source connected to “Driver Bag High” terminal “3” allows a known amount of current to flow. By monitoring the voltage difference between “Driver Bag High” and “Driver Bag Low” the SDM calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring CKTs IB05–YEL and IB06–YEL/BLK and connector terminal contact.

DTC Will Set When:

The combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring CKTs IB05–YEL and IB06–YEL/BLK and connector terminal contact is above a specified value. This test is run once each ignition cycle during the “Resistance Measurement Test” when:

1. No “higher priority faults” are detected during “Turn–ON”
2. “Ignition 1” voltage is in the specified value.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets DTC 22.

DTC Will Clear When:

The ignition switch is turned “OFF.”

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test verifies proper connection of the yellow 2–pin connector at the base of the steering column.
4. This test checks for proper operation of the shorting clip in the yellow 2–pin connector.
5. This test isolate the malfunction to one side of the SRS coil assembly yellow 2–pin connector located at the base of steering column.
6. This test determines whether the malfunction is due to shorting in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

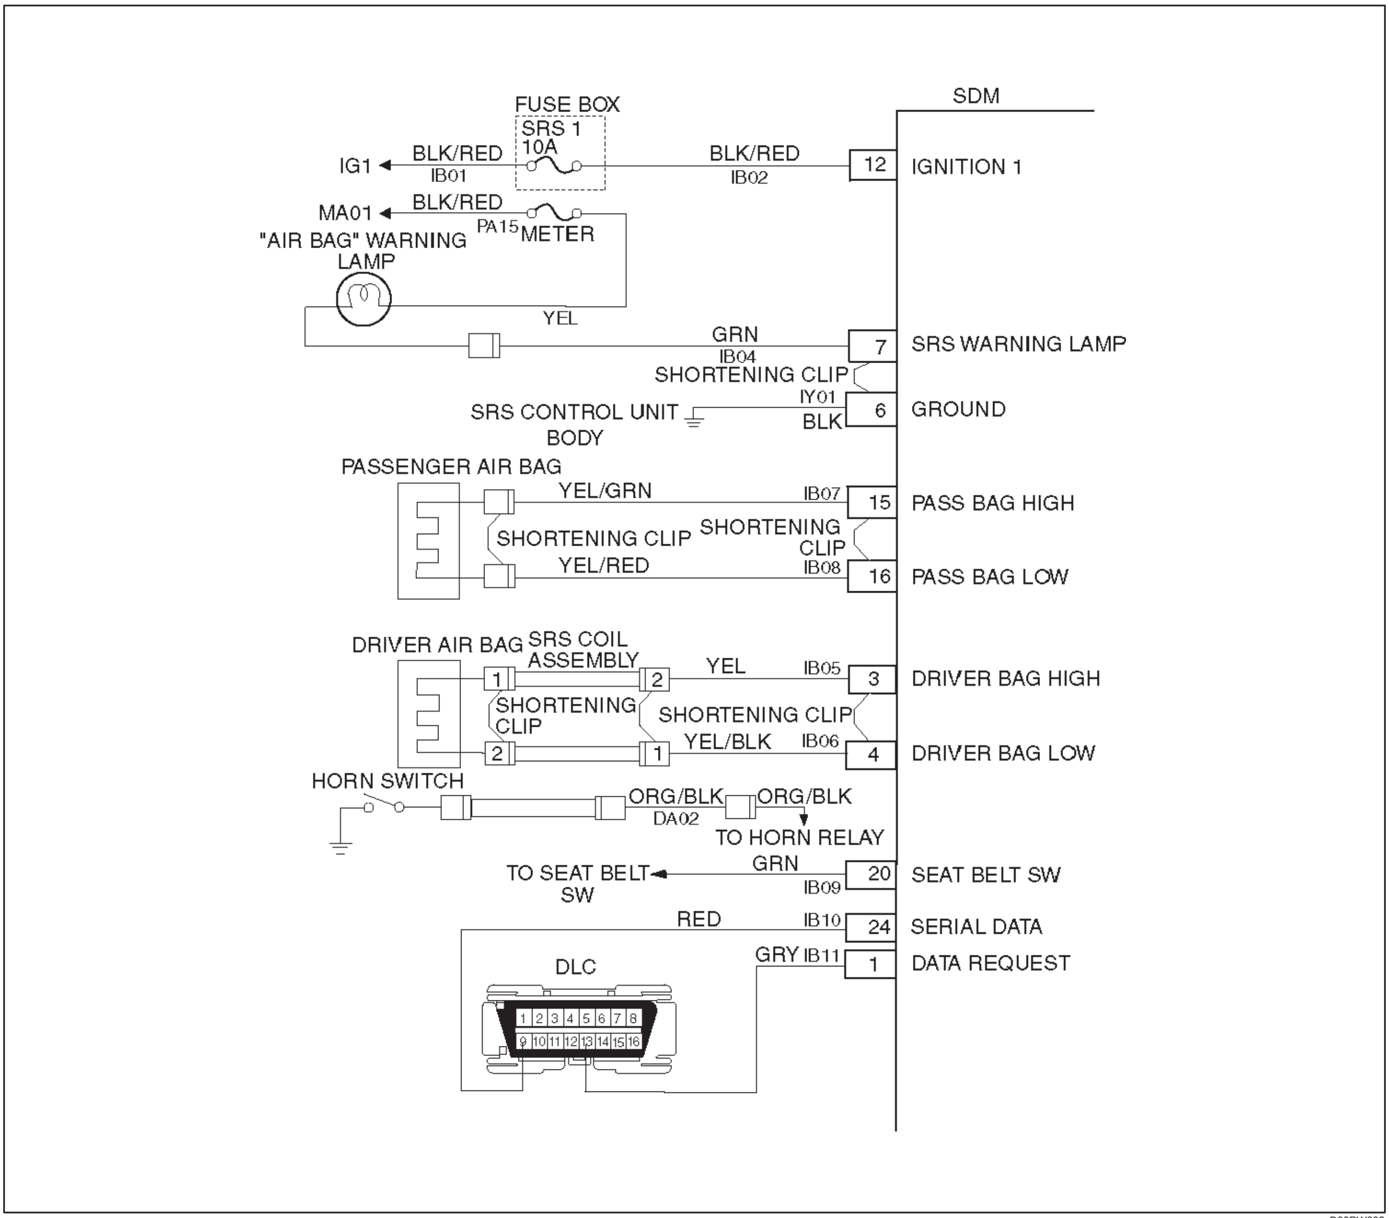
Diagnostic Aids:

An intermittent condition is likely to be caused by a short between CKT IB05–YEL or IB06–YEL/BLK or a malfunctioning shorting clip on the driver air bag assembly or SRS coil assembly which would require replacement of the component. The test for this diagnostic trouble code is only run while the “AIR BAG” warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 22 Driver Deployment Loop Resistance Low

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Use scan tool data list function, read and record the driver deployment loop resistance. Is driver resist. less than 1.9 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch “OFF.” 2. Make sure the SRS coil assembly yellow 2–pin connector located at the base of steering column is seated properly. Is the 2–pin connector connected properly?	Go to Step 4	Seat driver air bag assembly 2–pin connector properly. Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2–pin connector located base of steering column. 2. If OK, reconnect the driver air bag assembly yellow 2–pin connector. 3. Ignition switch “ON.” Is DTC 22 current?	Go to Step 5	Ignition switch “OFF.” Go to Step 8
5	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag 2–pin connectors located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 22 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch “OFF.” 2. There has been a decrease in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB05–YEL and IB06–YEL/BLK, and SDM connector terminal “3” and “4” to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A.
7	1. Ignition switch “OFF.” 2. Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. 3. Connect SRS driver / passenger load tool J–41433 to the top of steering column. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch “ON.” Is DTC 22 current?	Ignition switch “OFF.” Replace SRS coil assembly. Refer to in this section 9J–24. Go to Step 8	Ignition switch “OFF.” Replace driver air bag assembly. Go to Step 8
8	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the “SRS Diagnostic System Check.”	Go to Step 8

DTC 24 Driver Deployment Loop Short To Ground



D09RW002

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltage at “Driver Bag Low” terminal “4” and “Passenger Bag Low” terminal “16” to detect shorts to ground in the air bag assembly circuits.

DTC Will Set When:

Neither of the two air bag assemblies is open.

“Ignition 1” is within the normal operating voltage range. This test is run once each ignition cycle and “Continuous Monitoring”. Once these conditions are met and the voltage at “Driver Bag Low” is below a specified value, DTC 24 will set.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The malfunction is no longer occurring and the ignition is turned “OFF.”

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the SDM is malfunctioning
3. This test isolates the malfunction to one side of the SRS coil assembly yellow 2–pin connector at the base of the steering column.
4. This test determines whether the malfunction is in CKT IB05–YEL.

5. This test determines whether the malfunction is in CKT IB06–YEL/BLK.
6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

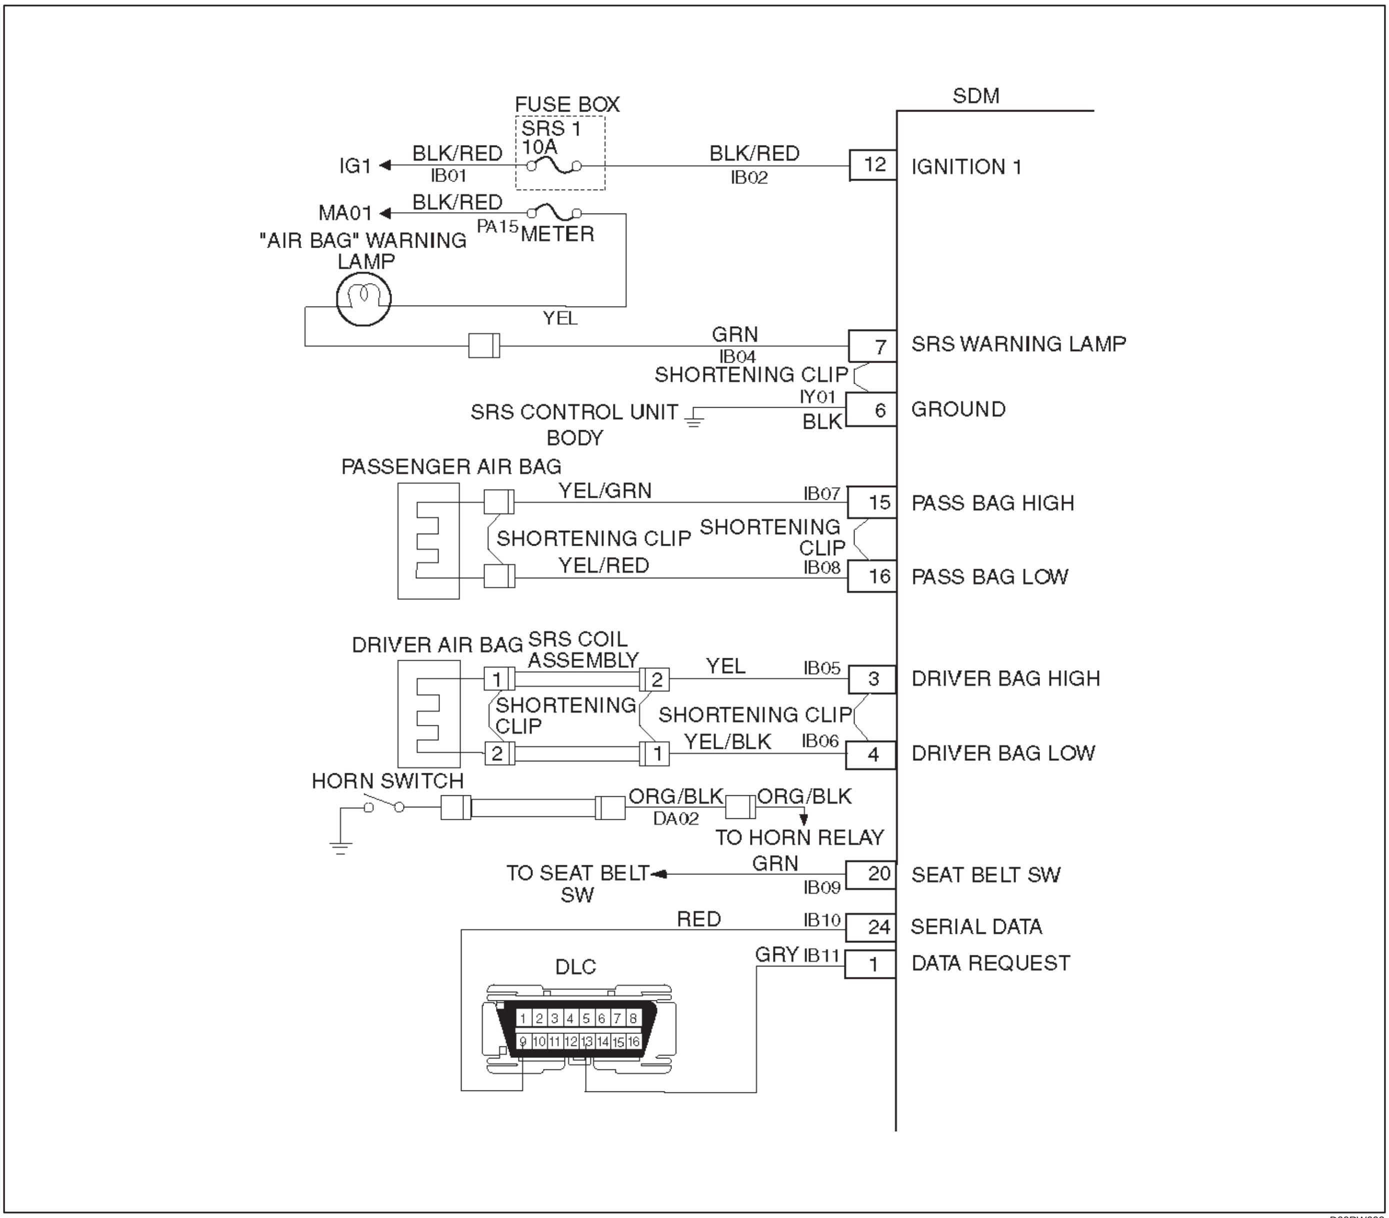
Diagnostic Aids:

An intermittent condition is likely to be caused by a short to ground in the driver air bag assembly circuit. Inspect CKTs IB05–YEL and IB06–YEL/BLK carefully for cutting or chafing.

DTC 24 Driver Deployment Loop Short To Ground

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Ignition switch “OFF.” 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator’s manual. Ignition switch “ON.” 4. Read driver sense LO. Is driver sense LO less than 1.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch “OFF.” 2. Disconnect SRS coil assembly yellow 2–pin connector located at base of the steering column. Leave passenger air bag assembly connected. 3. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to SRS coil assembly harness connector. 4. Ignition switch “ON.” Is DTC 24 current?	Go to Step 4	Go to Step 6
4	1. Ignition switch “OFF.” 2. Disconnect SDM. 3. Disconnect SRS driver / passenger load tool. 4. Measure resistance on SDM harness connector “3” to terminal “6” (ground). Does J–39200 display “0L” (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 7
5	Measure resistance on SDM harness connector from terminal “4” to terminal “6” (ground). Does J–39200 display “0L” (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 7
6	1. Ignition switch “OFF.” 2. Disconnect SRS driver / passenger load tool J–41433 from SRS coil assembly harness connector. 3. Connect SRS driver / passenger load tool J–41433 and appropriate adapter J–35616–A to driver air bag assembly harness connector. Located top of the steering column. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch “ON.” Is DTC 24 current?	Ignition switch “OFF.” Replace SRS coil assembly. Refer to in this section 9J–24. Go to Step 7	Ignition switch “OFF.” Replace driver air bag assembly. Go to Step 7
7	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the “SRS Diagnostic System Check.”	Go to Step 7

DTC 25 Driver Deployment Loop Short To Voltage



D09RW002

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltage at “Driver Bag Low” terminal “4” and “Passenger Bag Low” terminal “16” to detect shorts to B+ in the air bag assembly circuits.

DTC Will Set When:

“Ignition 1” is in the normal operating voltage range. This test is run once each ignition cycle and “Continuous Monitoring”. Once these conditions are met and the voltage at “Driver Bag Low” is above a specified value, DTC 25 will set.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets DTC 25 and also DTC 71

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the SDM is malfunctioning.
3. This test isolates the malfunction to one side of the SRS coil assembly yellow 2–pin connector at the base of steering column.
4. This test determines whether the malfunction is in CKT IB05–YEL.
5. This test determines whether the malfunction is in CKT IB06–YEL/BLK.

6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids:

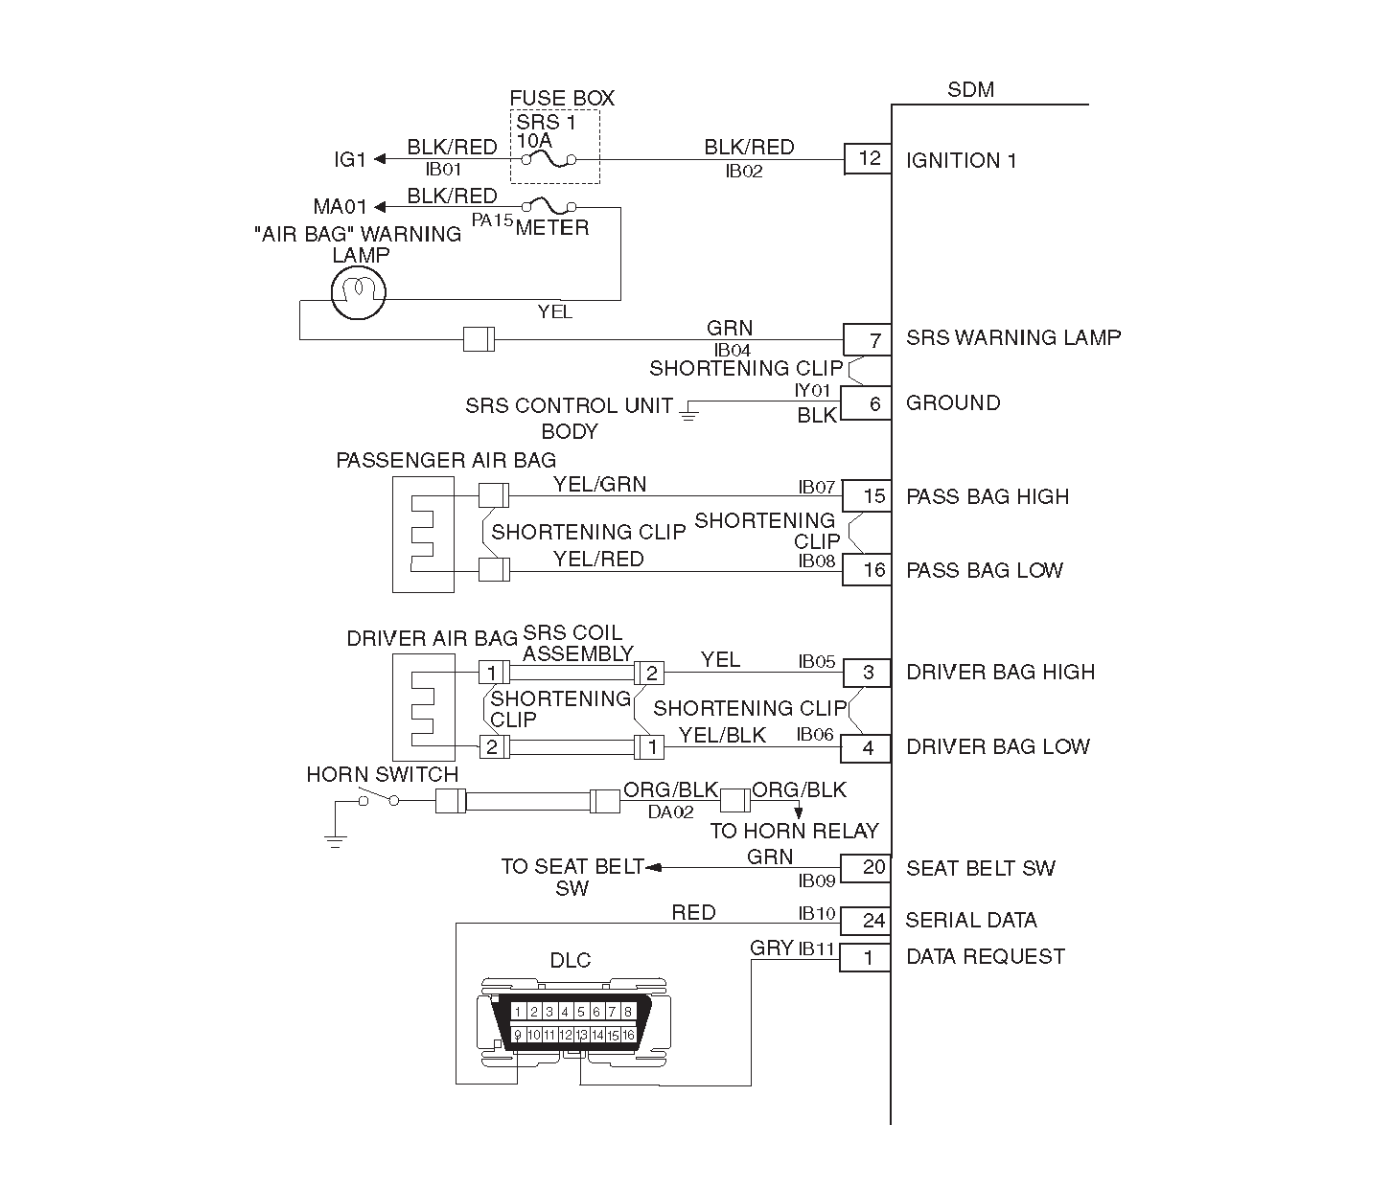
An intermittent condition is likely to be caused by a short to B+ in the driver air bag assembly circuit. Inspect CKTs IB05–YEL and IB06–YEL/BLK carefully for cutting or chafing. If the wiring pigtail of the driver air bag assembly and SRS coil assembly is damaged, the components must be replaced. A careful inspection of CKT IB05–YEL and IB06–YEL/BLK, including the SRS coil assembly and driver air bag assembly is essential to ensure that the replacement SDM will not be damaged.

DTC 25 Driver Deployment Loop Short To Ignition

CAUTION: When DTC 25 has been set, it is necessary to replace the SDM. Setting DTC 25 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is no longer present, DTC 71 will remain current. Ensure that the short to voltage condition is repaired prior to installing a replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator's manual. 4. Ignition switch "ON." 5. Read driver sense LO. Is driver sense LO more than 3.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect SRS coil assembly yellow 2–pin connector at the base of the steering column. Leave passenger air bag assembly connected. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to SRS coil assembly harness connector. 3. Ignition switch "ON." Is driver sense LO more than 3.5 volts?	Go to Step 4	Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SDM. 3. Disconnect SRS drive / passenger load tool. 4. Measure resistance on SDM harness connector from terminal "3" to terminal "12" (Ignition 1). Does J–39200 display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 7
5	Measure resistance on SDM harness connector from terminal "4" to terminal "12" (Ignition 1). Does J–39200 display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 7
6	1. Ignition switch "OFF." 2. Connect SRS driver / passenger load tool J–41433 and appropriate adapter J–35616–A to driver air bag assembly harness connector located of top of the steering column. 3. Reconnect SRS coil assembly harness connector as the base of steering column. 4. Ignition switch "ON." Is driver sense LO more than 3.5 volts?	Ignition switch "OFF." Replace SRS coil assembly. Go to Step 7	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 7
7	1. Reconnect all components, ensure all components are properly mounted. 2. Ignition switch "ON." Is passenger sense LO less than 3.5 volts?	Replace SDM. Go to Step 8	Go to Chart A.
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 8

DTC 26 Driver Deployment Loop Open



D09RW002

Circuit Description:

When the ignition switch is turned “ON”, the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

During “Continuous Monitoring” diagnostics, a fixed amount of current is following in the deployment loop. This produces proportional voltage drops in the loop. By monitoring the voltage difference between “Driver Bag High” and “Driver Bag Low”, the SDM calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring CKTs IB05–YEL and IB06–YEL/BLK, and connector terminal contact.

DTC Will Set When:

The voltage difference between “Driver Bag High” terminal “3” and “Driver Bag Low” terminal “4” is above or equal to a specified value for 500 milliseconds during “Continuous Monitoring.”

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage difference between “Driver Bag High” terminal “3” and “Driver Bag Low” terminal “4” is below a specified value for 500 milliseconds during “Continuous Monitoring.”

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart:

1. This test determines whether the malfunction is in the SDM.

2. This test verifies proper connection of the yellow 2–pin connector at the base of the steering column.
3. This test checks for proper contact and/or corrosion of the yellow 2–pin connector at the base of the steering column.
4. This test isolates the malfunction to one side of the SRS coil assembly yellow 2–pin connector located at the base of steering column.
5. This test determines whether the open is in the wiring.
6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

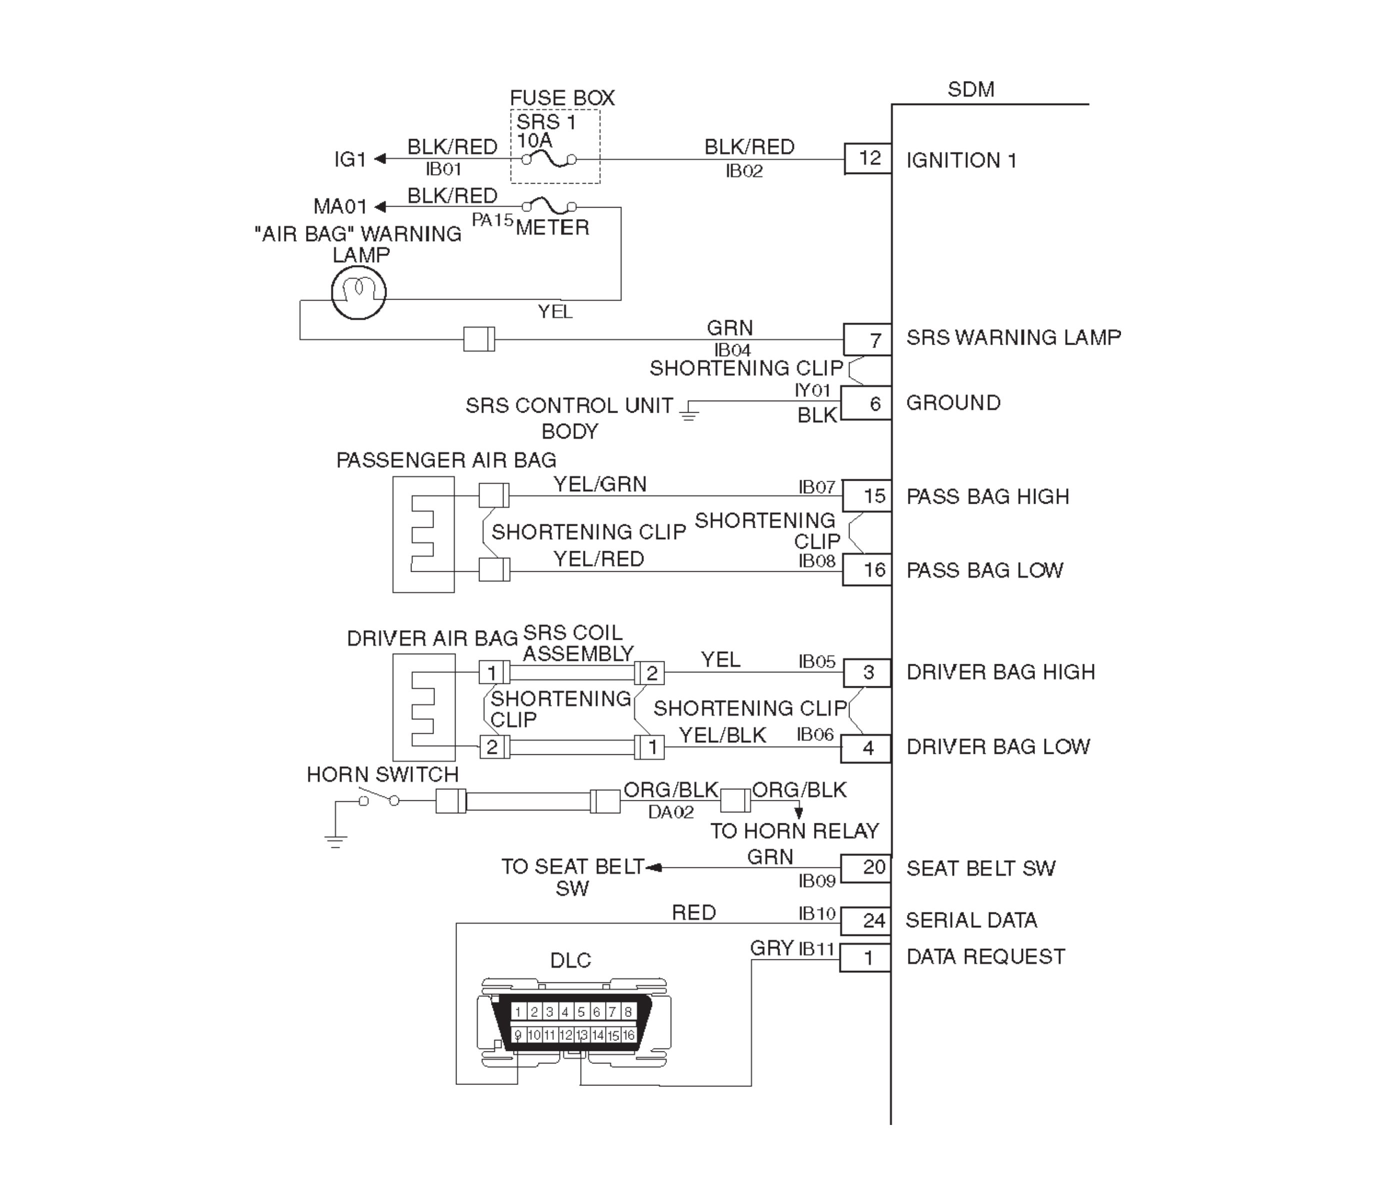
Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the driver air bag assembly harness 2–pin connector terminals “1” and “2” at the top of the steering column, SRS coil assembly harness 2–pin connection terminals “1” and “2”, SDM terminals “3” and “4”, or an open in CKTs IB05–YEL and IB06–YEL/BLK.

DTC 26 Driver Deployment Loop Open

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	1. When measurements are requested in this chart use J–39200 DVM with correct terminal adapter from J–35616–A. 2. Use scan tool data list function, read and record the driver differential voltage. Is driver differential voltage more than 4.0 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch “OFF.” 2. Make sure the SRS coil assembly yellow 2–pin connector located at the base of steering column is seated properly. Is the yellow 2–pin connector connected properly?	Go to Step 4	Seat driver air bag assembly 2–pin connector. Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2–pin connector located base of steering column. 2. If OK, reconnect the SRS coil assembly yellow 2–pin connector. 3. Ignition switch “ON”. Is DTC 26 current?	Go to Step 5	Ignition switch “OFF.” Go to Step 8
5	1. Ignition switch “OFF.” 2. Disconnect SRS coil and passenger air bag assembly, yellow 2–pin connectors located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool J–41433 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch “ON.” Is DTC 26 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch “OFF.” 2. There has been an open circuit in the driver deployment loop. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB05 YEL and IB06 YEL/BLK, and SDM connector terminal “3” AND “4” to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A.
7	1. Ignition switch “OFF.” 2. Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. 3. Connect SRS driver / passenger load tool J–41433 on steering column. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch “ON.” Is DTC 26 current?	Ignition switch “OFF.” Replace SRS coil assembly, refer to in this section 9J–3. Go to Step 8	Ignition switch “OFF.” Replace driver air bag assembly. Go to Step 8
8	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the “SRS Diagnostic System Check.”	Go to Step 8

DTC 51 Deployment Event Commanded



D09RW002

Circuit Description:

The SDM contains a sensing device which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags and causing DTC 51 to set.

DTC Will Set When:

The SDM detects a frontal crash, up to 30 degrees off the centerline of the vehicle, of sufficient force to warrant deployment of the air bags.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp records “Crash Data”, and sets a diagnostic trouble code.

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

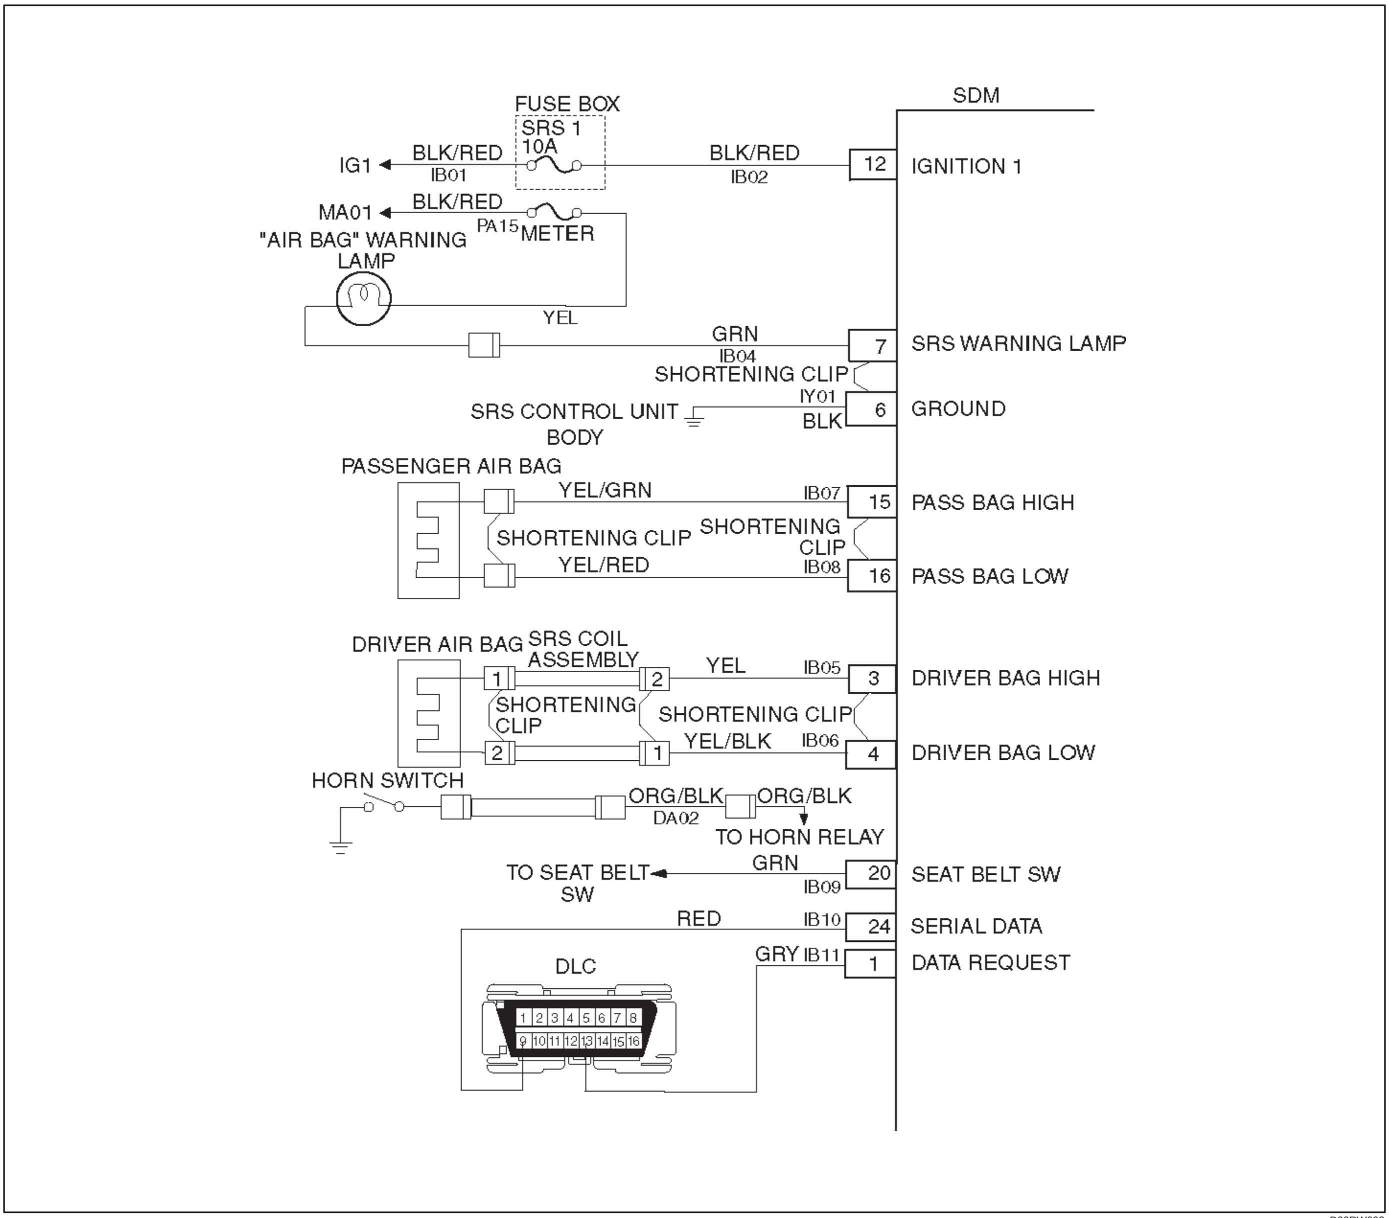
2. If air bag assembly (s) has not deployed, DTC 51 may have falsely set.
3. If DTC 51 has set with no signs of frontal impact, the diagnostic trouble code has falsely set.

DTC 51 Deployment Event Commanded

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	Ignition switch “OFF.” Have air bag assemblies deployed?	Replace components and perform inspections as directed in “repairs and inspections required after an accident” in this section. Clear diagnostic trouble codes. Repeat the “SRS Diagnostic System Check.”	Go to Step 3
3	Inspect front of vehicle and undercarriage for signs of impact. Were signs of impact found?	Replace components and perform inspections as directed in “repairs and inspections required after an accident” in this section. Clear diagnostic trouble codes. Repeat the “SRS Diagnostic System Check.”	Ignition switch “OFF.” Replace SDM. Reconnect all SRS system components, ensure all components are properly mounted.Repeat the “SRS Diagnostic System Check.”

DTC 53 Deployment Commanded With Deployment Loop Fault Or Energy Reserves Out Of Range



D09RW002

Circuit Description:

The SDM contains a sensing drive which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags. DTC 53 is set accompanying with DTC 51 when a deployment occurs while an air bag assembly circuit fault is present that could possible result in a no deployment situation in one or both air bag assemblies.

DTC Will Set When:

The SDM detects a frontal crash, up to 30 degrees off the centerline of the vehicle, of sufficient force to warrant deployment of the air bags and an inflator circuit fault is present.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp records “Crash Data”, and sets a diagnostic trouble code.

DTC Will Clear When:

The SDM is replaced. If DTC 53 is set, one or more DTCs will be set in addition to DTC 53. Malfunction(s) setting DTC(s) (other than DTC 71) must be repaired so that DTC(s) will not be set when a new SDM is installed.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

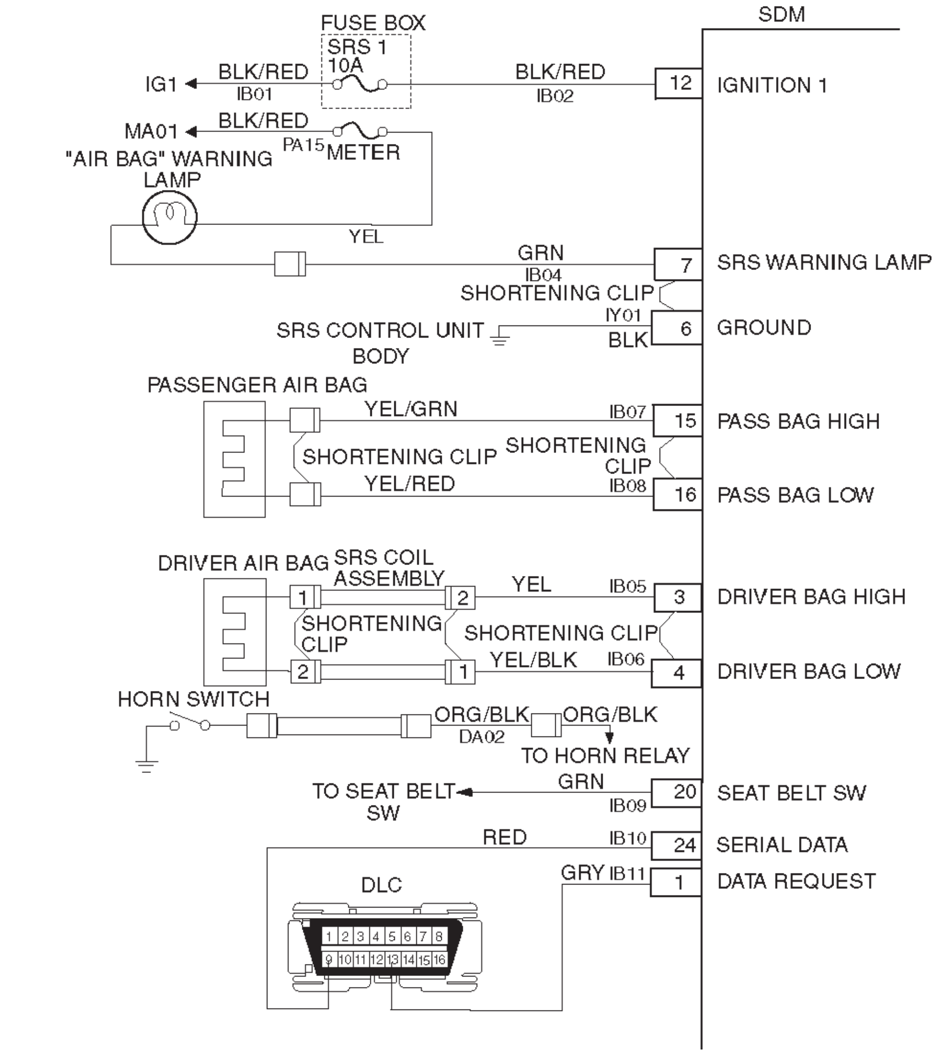
2. If air bag assembly has not deployed, DTC 53 may have falsely set.
3. If DTC 53 has set with no signs of frontal impact, the diagnostic trouble code has falsely set.

DTC 53 Deployment Commanded With Deployment Loop Fault Or Energy Reserves Out Of Range

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	Ignition switch “OFF.” Have air bag assemblies deployed?	Replace components and perform inspections as directed in “repairs and inspections required after an accident” in this section. Clear diagnostic trouble codes. Repeat the “SRS Diagnostic System Check.”	Go to Step 3
3	Inspect front of vehicle and undercarriage for signs of impact. Were signs of impact found?	Replace components and perform inspections as directed in “repairs and inspections required after an accident” in this section. Clear diagnostic trouble codes. Repeat the “SRS Diagnostic System Check.”	Ignition switch “OFF.” Replace SDM. Reconnect all SRS system components, ensure all components are properly mounted. Repeat the “SRS Diagnostic System Check.”

DTC 61 Warning Lamp Circuit Failure



D09RW002

Circuit Description:

When the ignition switch is turned “ON”, battery voltage is applied to the “AIR BAG” warning lamp and to the “ignition 1” input terminal “12”. The SDM responds by flashing the “AIR BAG” warning lamp seven times. The SDM monitors the lamp driver output by comparing the output state at “SRS warning lamp” terminal “7” to the microprocessor commanded state. When “ignition 1” is in the specified value, and the output state Does not match the commanded state of the lamp driver for 500 milliseconds, DTC 61 is set.

DTC Will Set When:

“Ignition 1” voltage is in the specified value and the output state at the “SRS warning lamp” terminal does not match the commanded state of the lamp driver for 500 milliseconds. This test is run every 100 milliseconds during “Continuous Monitoring” tests and once per each ignition cycle at the beginning.

Action Taken:

SDM attempts to turn “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned “OFF.”

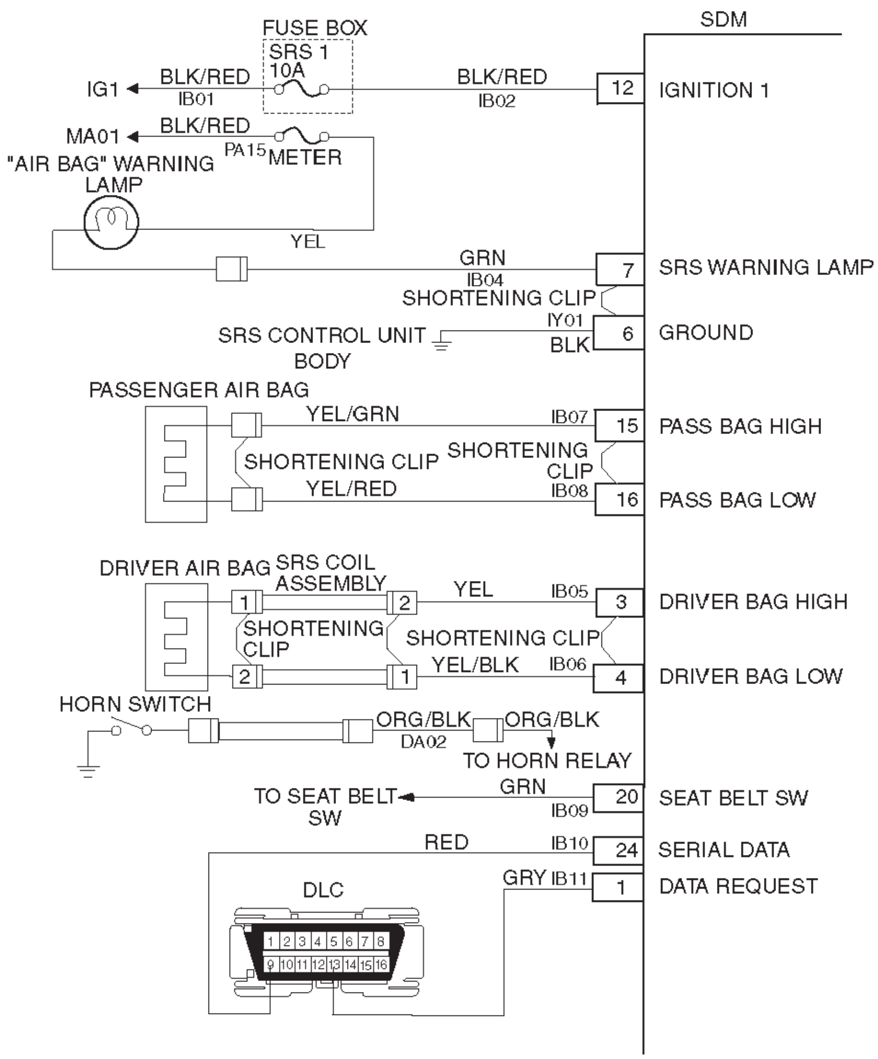
Diagnostic Aids:

Refer to Charts B and C to diagnose warning lamp circuit malfunctions.

DTC 61 Warning Lamp Circuit Failure

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	1. Malfunctions within the “AIR BAG” warning lamp circuitry will set this diagnostic trouble code. 2. These malfunctions are addressed in the “SRS Diagnostic System Check” via Chart B and Chart C. 3. Failure to properly perform the “SRS Diagnostic System Check” may result in misdiagnosis. 4. Ignition switch “ON.” 5. Clear SRS diagnostic trouble codes. Is DTC 61 SET?	Ignition switch “OFF.” Go to Chart A.	Repeat the “SRS Diagnostic System Check.”

DTC 71 Internal SDM Fault



D09RW002

Circuit Description:

DTC 71 is an indication of a potential internal SDM malfunction and will set if any of the following conditions are detected:

1) Deployment or microprocessor energy reserve failure.
2) EEPROM failure.
3) ROM failure.
4) RAM failure.
5) Calibration check sum failure.
6) Deployment switch faults.
7) Accelerometer fault.
8) Arming sensor fault.
9) Diagnostic current faults.
10) DTC 19
11) DTC 25
12) DTC 51
13) DTC 53

DTC Will Set When:

Any of the above indicated malfunctions are detected by the SDM. The malfunctions described above are tested mainly during “Continuous Monitoring” and some ones run each ignition cycle.

Action Taken:

SDM turns “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

A scan tool “Clear Codes” commanded is received by the SDM. Some of the indicated malfunctions will only allow the “AIR BAG” warning lamp to go out.
But when DTC 19, 25, 51, 53 are also set, SDM is Replaced.

DTC 71 Internal SDM Fault

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

CAUTION: When DTC 19 or 25 or 51 or 53 has been set it is necessary to Replace the SDM. Setting DTC 19 and 25 or 51 or 53 will also cause DTC 71 to set. When a scan tool “CLEAR CODES” command is issued and the malfunction is no longer present, DTC 51 or 53 and DTC 71 will remain current. Ensure that the short to voltage condition DTC 19, 25 is repaired prior to installing a Replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check.”
2	Confirm SRS “Diagnostic System Check.” Is DTC 19 or 25 or 51 or 53 also set (current or history)? (Refer to notice above).	Go to DTC 19 if DTC 19 is set. Go to DTC 25 if DTC 25 is set. Go to DTC 51 if DTC 51 is set. Go to DTC 53 if DTC 53 is set.	Ignition switch “OFF.” Replace SDM. Repeat the “SRS Diagnostic System Check.”

RODEO

CONTROL SYSTEM

CRUISE CONTROL SYSTEM

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The cruise control keeps the vehicle running at a fixed speed until a signal canceling this fixed speed is received. When the main switch “AUTO CRUISE” is turned on with the vehicle in the running mode, the battery voltage is applied to the PCM. When a signal from the control switch is input to the PCM while the vehicle is in this state, the cruise control system is activated. Also, while the system is operating, the “AUTO CRUISE” indicator light in the meter assembly lights up.

1 . SET/COAST Switch Function

1. **Set Function:** When the SET/COAST switch is pressed and released with the main switch on, the speed at which the vehicle is running at that moment is stored in the memory, and the vehicle automatically runs at the speed stored.
2. **Coast–Down Function:** When the SET/COAST switch is kept on while the vehicle is running, the vehicle decelerates during that time. The speed at which vehicle is running when the control switch is turned off is stored in the memory, and the vehicle automatically returns to the stored speed.
3. **Tap–Down Function:** When the SET/COAST switch is turned on and off instantaneously while the vehicle is running, the vehicle decelerates a mile for each on/off operation. The vehicle speed at which the vehicle was running when the SET/COAST was turned off last is stored in the memory, and the vehicle automatically returns to this stored speed.

2 . RESUME/ACCEL Switch Function

1. **Resume Function:** When the RESUME, ACCEL switch is turned on/off after the system is temporarily deactivated by pressing the brake or clutch pedal while the vehicle is running, the vehicle resumes, the speed stored before the system was released.
2. **Accelerate Function:** When the RESUME/ACCEL switch is kept on after the system is released completely, the vehicle accelerates its speed during that time. The vehicle speed at which the vehicle was running when the switch was turned off is stored in the memory, and the vehicle automatically returns to this speed.
3. **Tap–Up Function:** When the RESUME/ACCEL switch is turned on and off instantaneously while the vehicle is running, the vehicle accelerates a mile for each on/off operation. The vehicle speed at which the vehicle was running when the switch was turned off last is stored in the memory, and the vehicle automatically returns to this stored speed.

3 . CANCEL Function

1. **Temporary Cancellation:**
   - When the cancel switch is turned on.
   - When the brake pedal is pressed.
   - When the clutch pedal is pressed. (M/T)
   - When the select lever is shifted to any position other than “D”, “3”, “2” or “L”. (A/T)
   - When the vehicle speed has decreased about 12.5 mph (20 km/h) or more than the stored speed.
2. **Complete Cancellation:**
   - When the starter switch or the main switch is turned off.
   - When the failsafe function is activated.
   - When the vehicle speed gets lower than 20 mph (32 km/h).

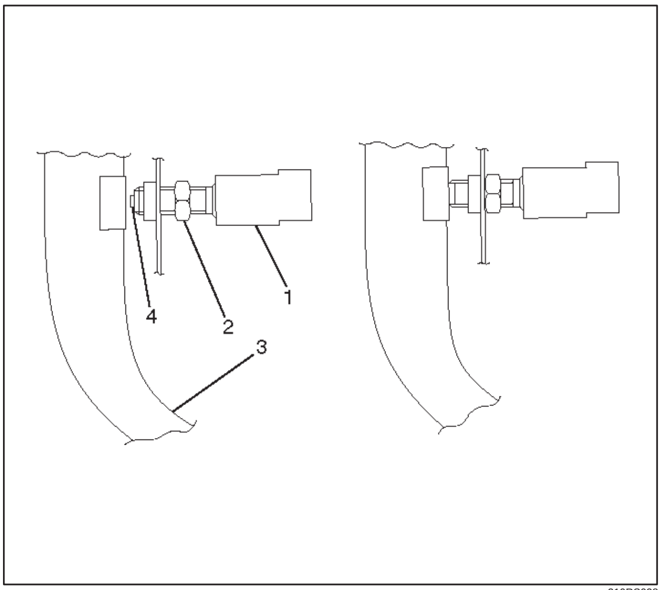
Brake Switch

Removal and Installation

Refer to the Brake Pedal Replacement in Brake section.

Adjustment

1. Check that the brake pedal (3) is fully returned by pedal return spring.
2. Disconnect the switch connector.
3. Loosen the lock nut (2).
4. Rotate the brake switch (1) by hand until push rod disappears from brake switch tip (4).
5. Return the brake switch by a half turn.
6. Tighten the lock nut.
7. Connect the switch connector.

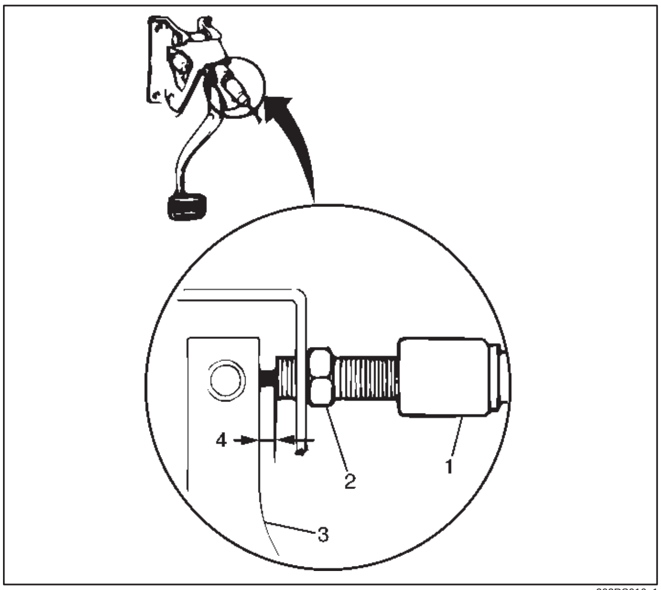


310RS028

Clutch Switch

Removal and Installation

Refer to the Clutch Control removal and installation steps in Clutch section.



203RS016–1

Adjustment

1. Turn the clutch switch (1) until the switch plunger is fully retracted against the clutch pedal arm.
2. Adjust clutch switch by backing it out half a turn and measure the clearance (4) between the clutch pedal arm (3) and the clutch switch.
3. Lock the lock nut(2).
4. Connect clutch switch connector.

Clutch Switch (bolt) and Clutch Pedal Clearance

0.5 – 1.5 mm (0.020 – 0.059 in)

Powertrain Control Module (PCM)

Removal and Installation

Refer to Powertrain Control Module (PCM) in Engine section.

Mode Switch

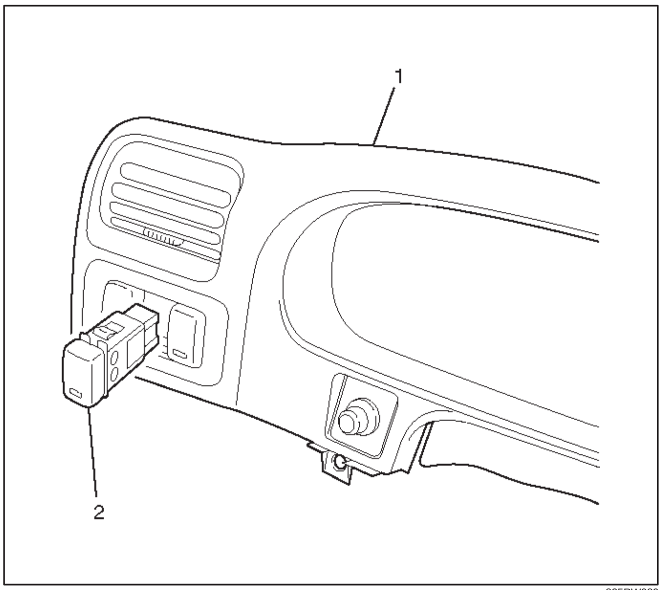
Removal and Installation

Refer to the Mode Switch removal and installation steps in Automatic Transmission section.

Cruise Control Main Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
   - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the rear defogger switch (2).
   - Disconnect the switch connector.
   - To remove the switch, push the lock from the back side of the instrument panel cluster assembly.



825RW089

Installation

To install, follow the removal steps in the reverse order.

Cruise Control Switch (Combination Switch)

Removal and Installation

Refer to the Lighting Switch (Combination Switch) removal and installation steps in Lighting System section.

Diagnosis

Cruise control system is controlled by the PCM as well as 6VE1 engine and automatic transmission. DTC codes are stored in the PCM if troubles occur in the circuit. DTC codes categorized “type D” are shown only by the Tech 2 scan tool. The following chart only shows some typical DTCs for cruise control system. Refer to PCM Diagnostic Trouble Codes in Driveability and Emissions for entire DTC diagnosis.

DTC	TROUBLE PART	DTC TYPE	MAJOR CONDITION OF TROUBLE	DIAGNOSIS PERIOD
P0565	CRUISE MAIN CIRCUIT	D	● THE SWITCH CONTACT REMAINS ON FOR 15 SECONDS OR MORE. ● NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 60 TIMES WITHIN 1 SECOND.	DIAGNOSIS IS ENABLED IN 130 SECONDS AFTER THE SWITCH OPERATED.
P0566	CRUISE CANCEL CIRCUIT	D	● THE SWITCH CONTACT REMAINS ON FOR 40 SECONDS OR MORE. ● NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 100 TIMES WITHIN 1.6 SECONDS.	DIAGNOSIS IS ENABLED IN 120 SECONDS AFTER THE SWITCH OPERATED.
P0567	CRUISE RESUME CIRCUIT	D	● THE SWITCH CONTACT REMAINS ON FOR 50 SECONDS OR MORE. ● NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 100 TIMES WITHIN 1.6 SECONDS.	DIAGNOSIS IS ENABLED IN 110 SECONDS AFTER THE SWITCH OPERATED.
P0568	CRUISE SET CIRCUIT	D	● THE SWITCH CONTACT REMAINS ON FOR 120 SECONDS OR MORE. ● NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 100 TIMES WITHIN 1.6 SECONDS.	DIAGNOSIS IS ENABLED IN 125 SECONDS AFTER THE SWITCH OPERATED.

DTC: Diagnostic Trouble Code

NOTE: The DTCs are detected while the engine is running

General Repair Instruction

1. If a floor jack is used, the following precautions are recommended.
   Park vehicle on level ground, “block” front or rear wheels, set jack against the recommended lifting points (see “Lifting Instructions” in this section), raise vehicle and support with chassis stands and then perform the service operations.
2. Before performing service operations, disconnect ground cable from the battery to reduce the chance of cable damage and burning due to short circuiting.
3. Use a cover on body, seats and floor to protect them against damage and contamination.
4. Brake fluid and anti–freeze solution must be handled with reasonable care, as they can cause paint damage.
5. The use of proper tools and recommended essential and available tools, where specified, is important for efficient and reliable performance of service repairs.
6. Use genuine Isuzu parts.
7. Used cotter pins, plastic clips, gaskets, O–rings, oil seals, lock washers and self–locking nuts should be discarded and new ones should be installed, as normal function of the parts cannot be maintained if these parts are reused.
8. To facilitate proper and smooth reassembly operation, keep disassembled parts neatly in groups. Keeping fixing bolts and nuts separate is very important, as they vary in hardness and design depending on position of installation.
9. Clean the parts before inspection or reassembly. Also clean oil ports, etc. using compressed air, and make certain they are free from restrictions.
10. Lubricate rotating and sliding faces of the parts with oil or grease before installation.
11. When necessary, use a sealer on gaskets to prevent leakage.
12. Carefully observe all specifications for bolt and nut torques.
13. When removing or replacing parts that require refrigerant to be discharged from the air conditioning system, be sure to use the Vehicle Refrigerant Recovery and Recycling Equipment (VRRRE) to recover and recycle Refrigerant–134a.
14. When a service operation is completed, make a final check to be sure the service has been done properly and the problem has been corrected.
15. SUPPLEMENTAL RESTRAINT SYSTEM
    The vehicle is equipped with a Supplemental Restraint System (SRS) – Air Bags. This system is not to be serviced without consulting the appropriate service information. Consult Section 9J “SRS System” if work is to be done on the front of the vehicle such as bumper, sheet metal, seats, wiring, steering wheel or column. Also review SRS system information if any arc welding is to be done on the vehicle. The SRS system equipped vehicle can be identified by:
    1. “AIR BAG” warning light on the instrument cluster.
    2. A Code “K” or “M” for fifth digit of Vehicle Identification Number.

Illustration Arrows

Arrows are designed for specific purposes to aid your understanding of technical illustrations.

Arrow Type	Application
	Front of vehicle
	Up Side

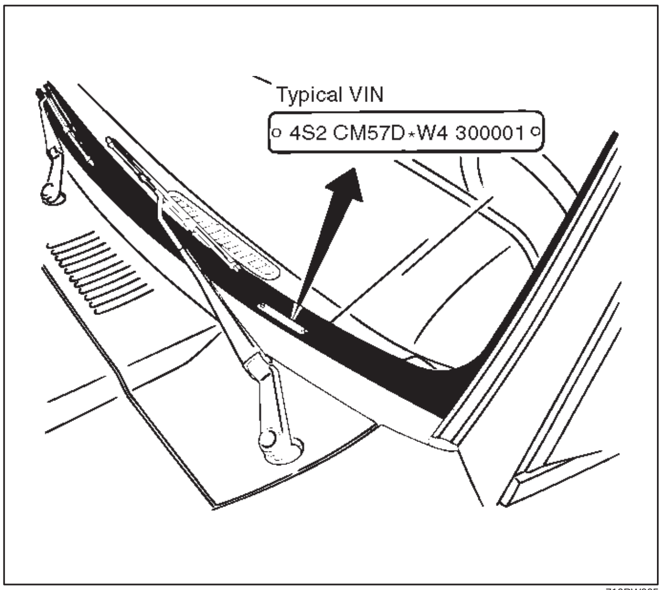
	● Gas other than ambient air ● Hot air flow
	● Ambient air mixed with another gas ● Can indicate temperature change
	Motion or direction
	Lubrication point oil or fluid
	Lubrication point grease
	Lubrication point jelly

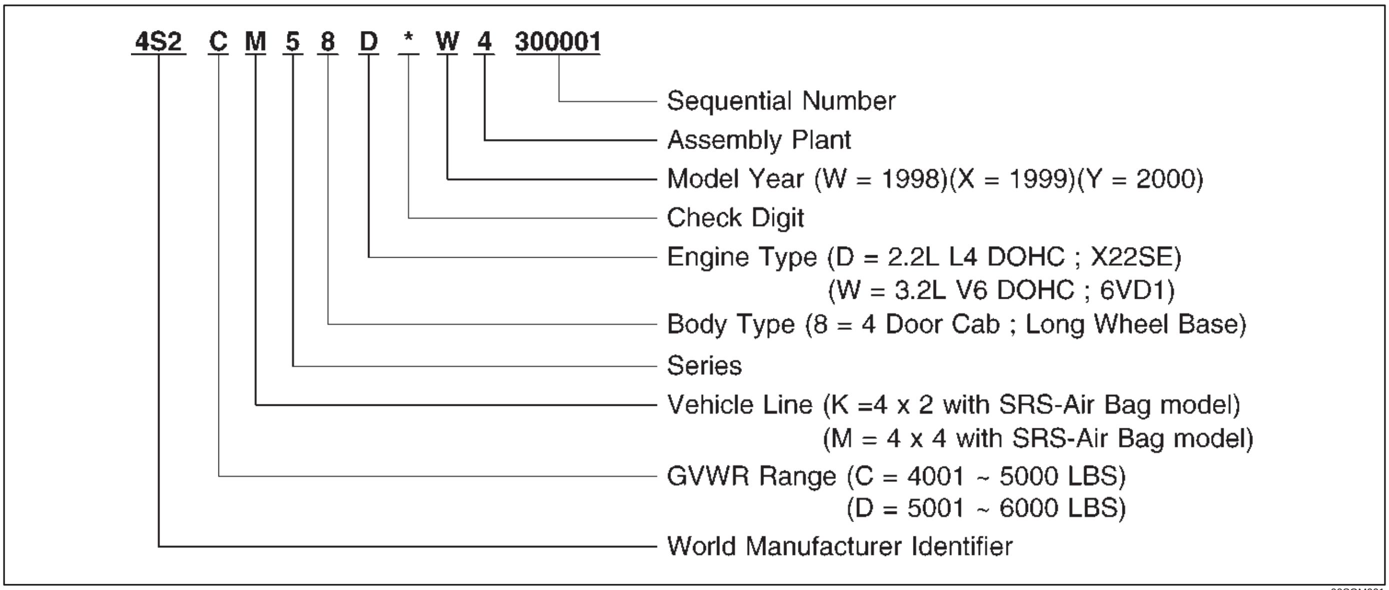
Identification

Vehicle Identification Number (VIN)

This is the legal identification of the vehicle. it is located on the left bottom of the windshield. It can be easily seen through the windshield from outside the vehicle.



710RW005

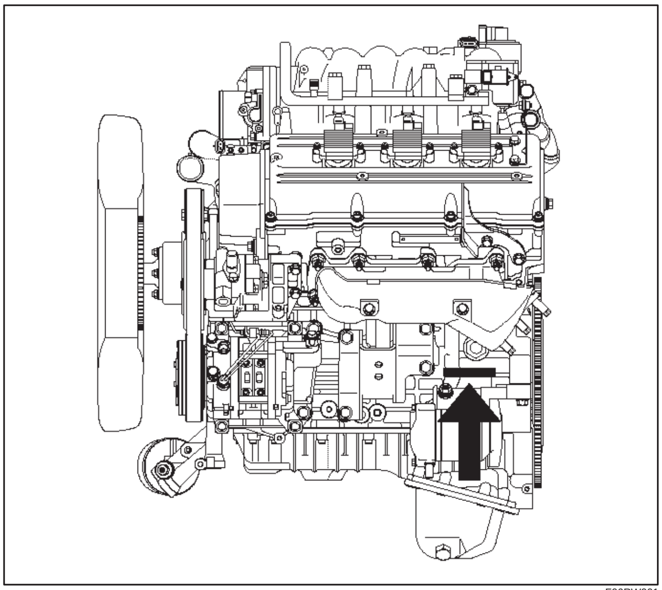


00SGM001

Engine Serial Number

- **6VD1 Engine**

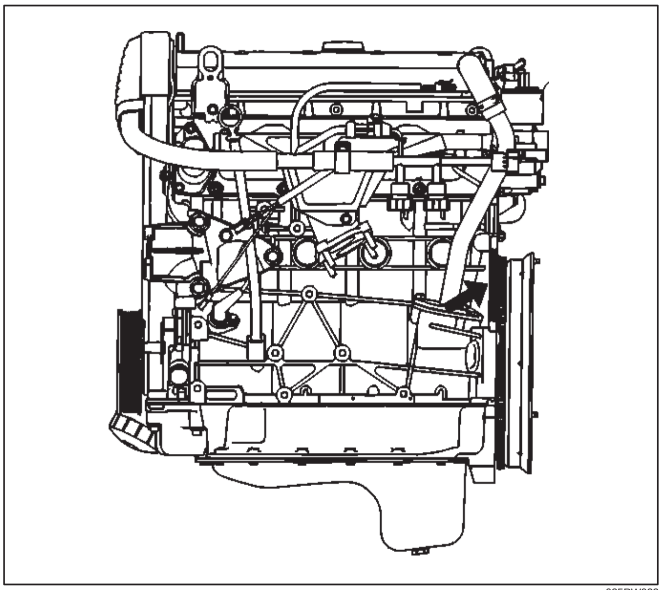
The gasoline engine serial number is stamped on the left rear lower area of the cylinder block above the starter.



F06RW001

- **X22SE Engine**

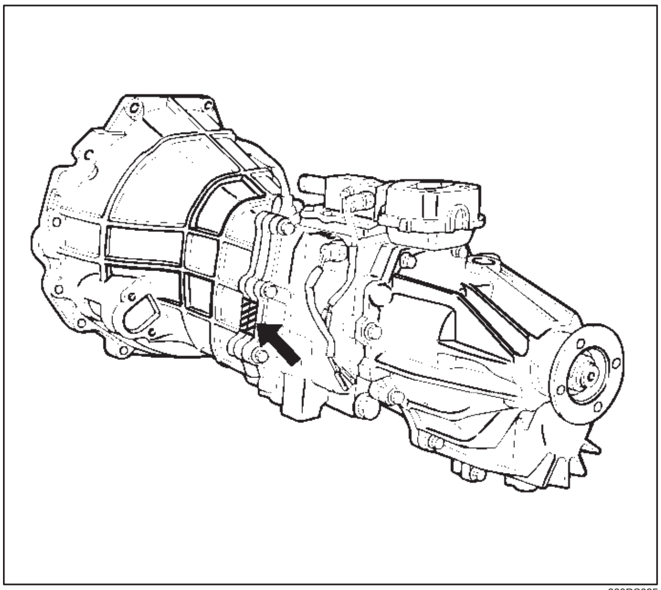
The gasoline engine serial number is stamped on the rear end raised area of the cylinder block left side.



035RW022

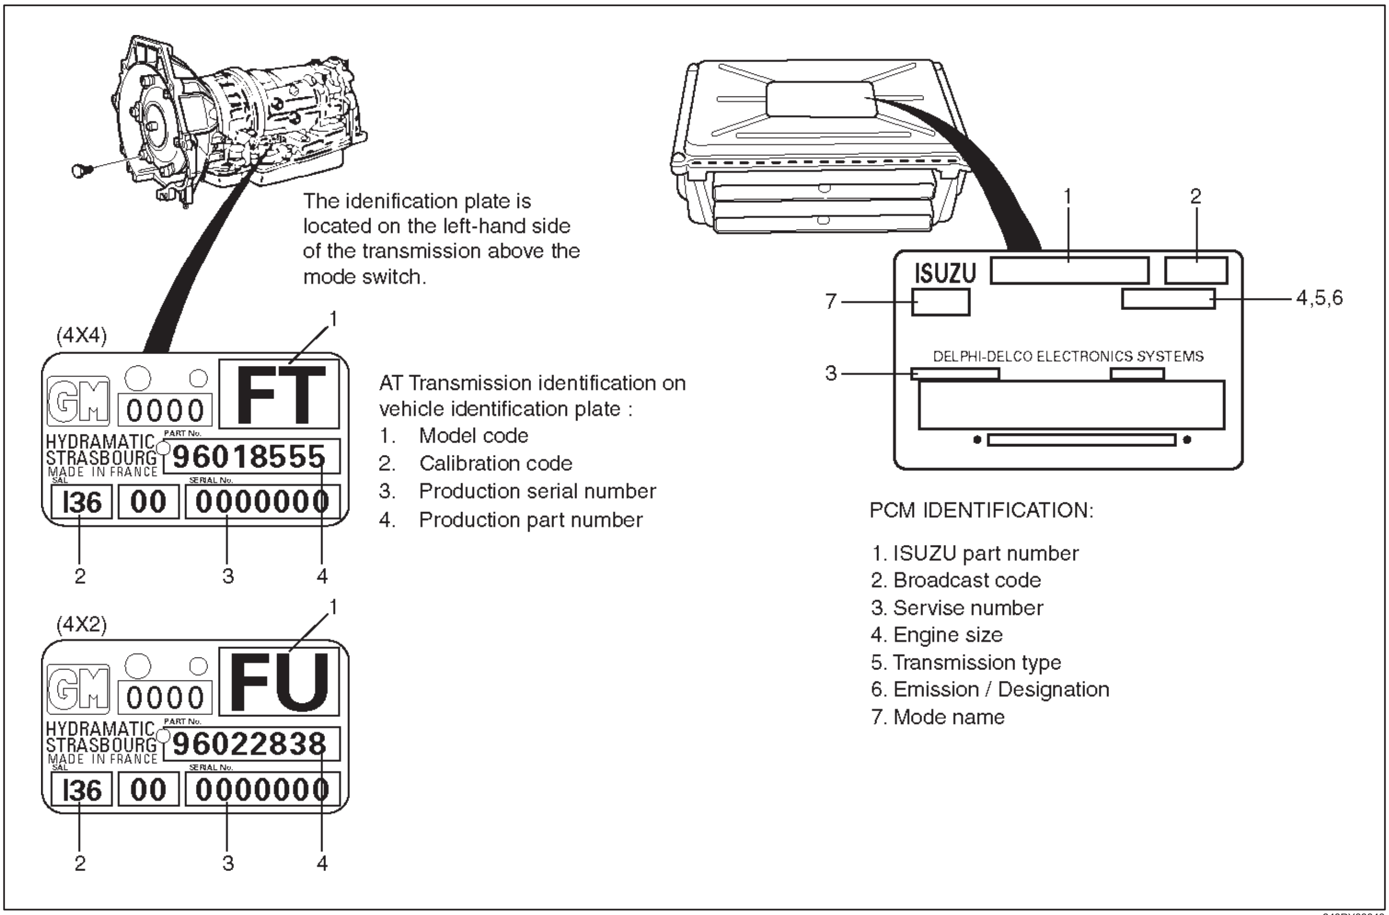
Transmission Serial Number

Manual : Stamped on the left side of the transmission intermediate plate.



220RS025

Automatic : Stamped on the identification plate, located on the left side of the transmission above the mode switch.



240RY00040

Theft Prevention Standard

The 8 major components listed below will be marked with 17 digit VIN at the stage of production. In addition its service parts will be marked with manufacturer's trade mark, "R" mark and "DOT" mark.

Reference Figure No.	COMPONENT		INDICATION	
			PRODUCTION	SERVICE PARTS
0A-10	ENGINE	1– 6VD1 – X22SE	VIN plate	R DOT Mark stamping
0A-11	TRANSMISSION	2– Manual transmission	VIN plate	R DOT Mark stamping
		– Automatic transmission	VIN plate	R DOT Mark label
0A-11	BODY	3– Engine hood 4– Front door 5– Fender 6– Front bumper 7– Back door 8– Rear bumper	VIN label	R DOT Mark label

Anti Theft Stamping/Plate/Label

PRODUCTION	Example 	Example 
SERVICE PARTS	R DOT	R DOT

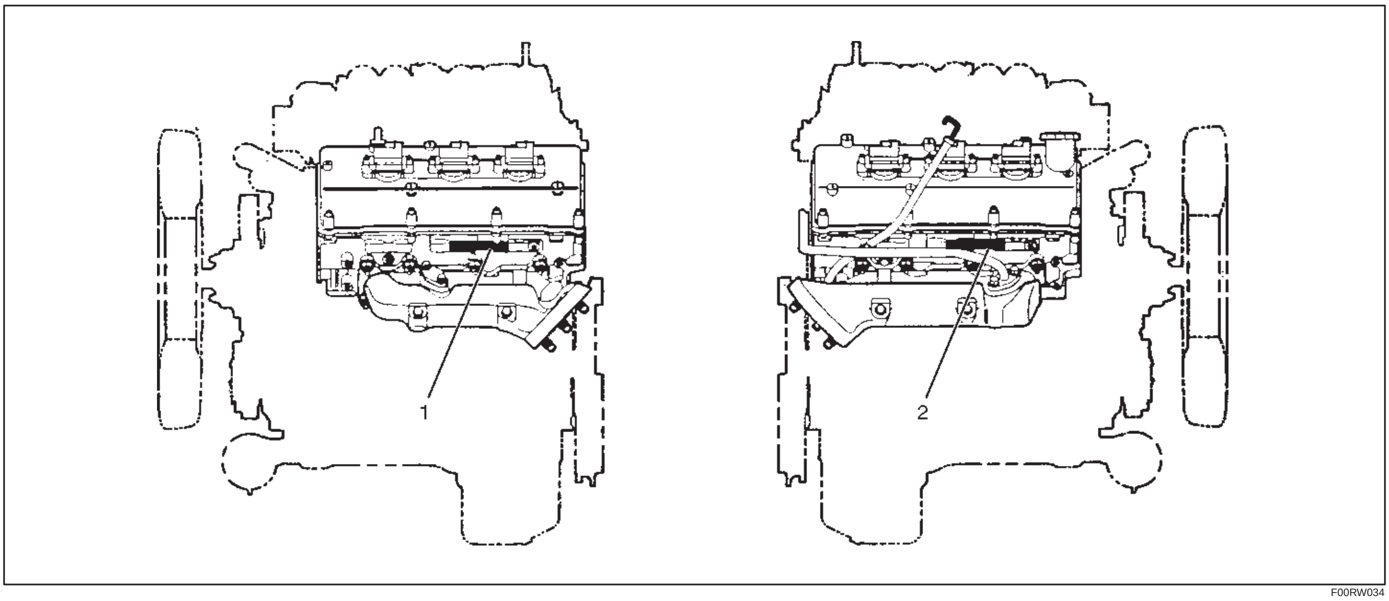
Anti Theft Stamping/Label/Plate Location

The stamping, label and plate locations are indicated by arrows in the illustration below.

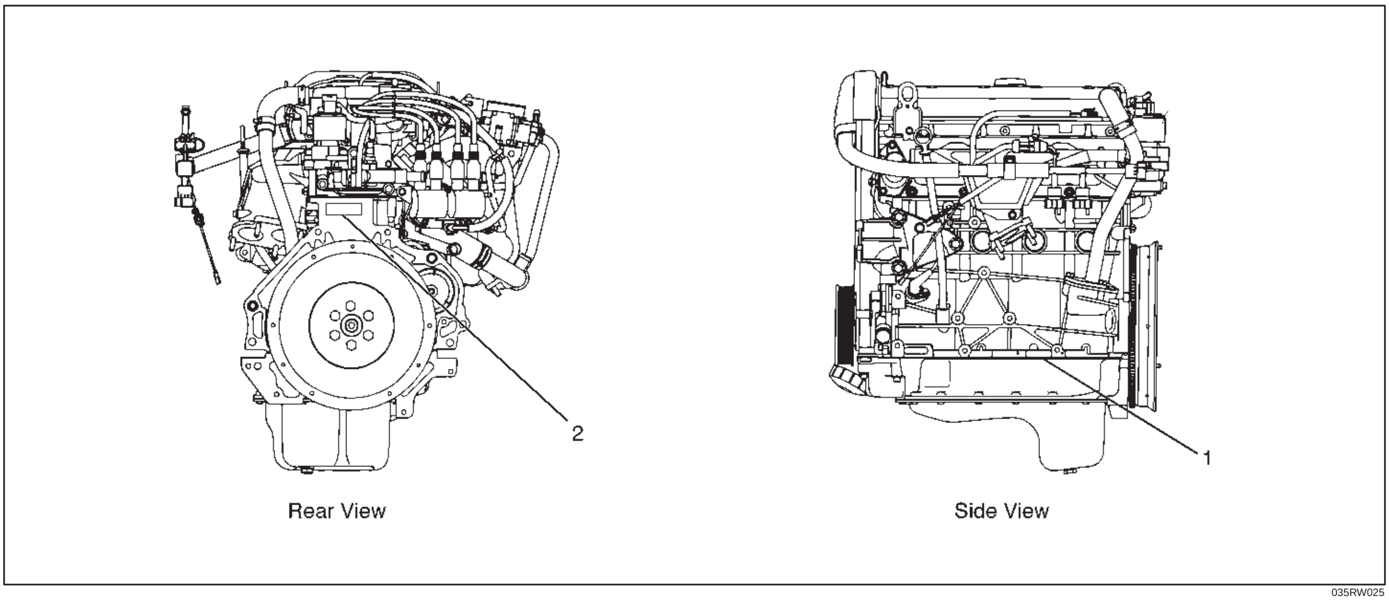
NOTE:

1. VIN plate locations for production.
2. Stamping locations for service parts.

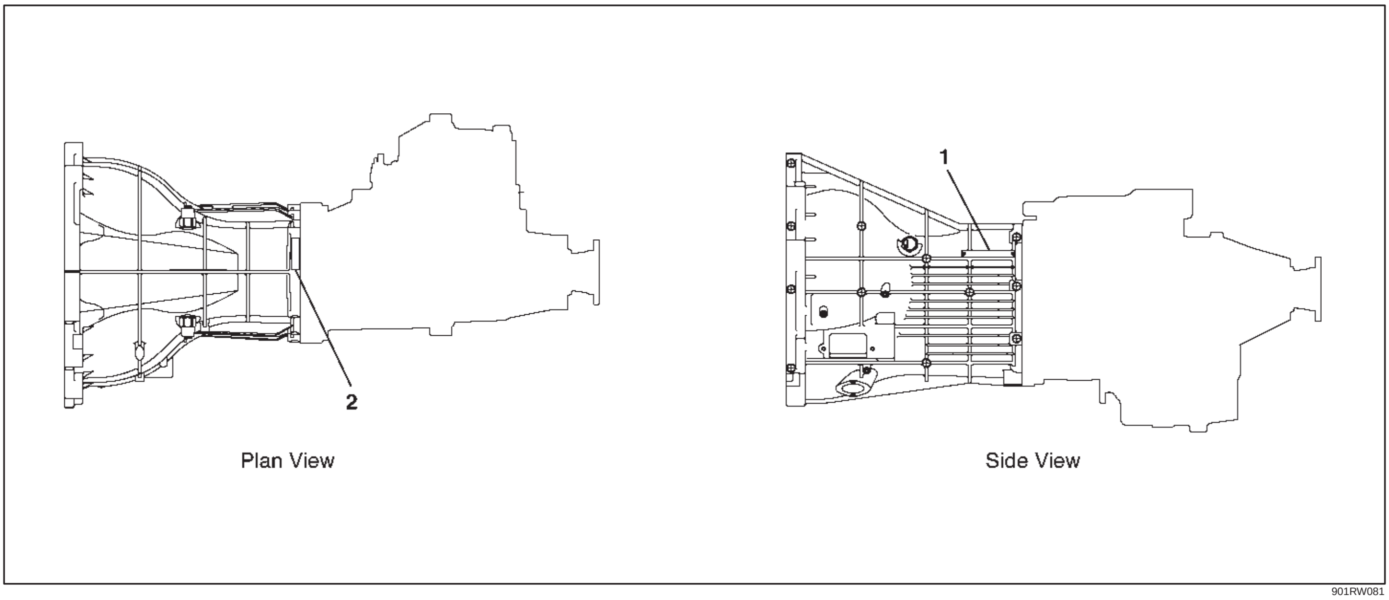
Engine (6VD1)



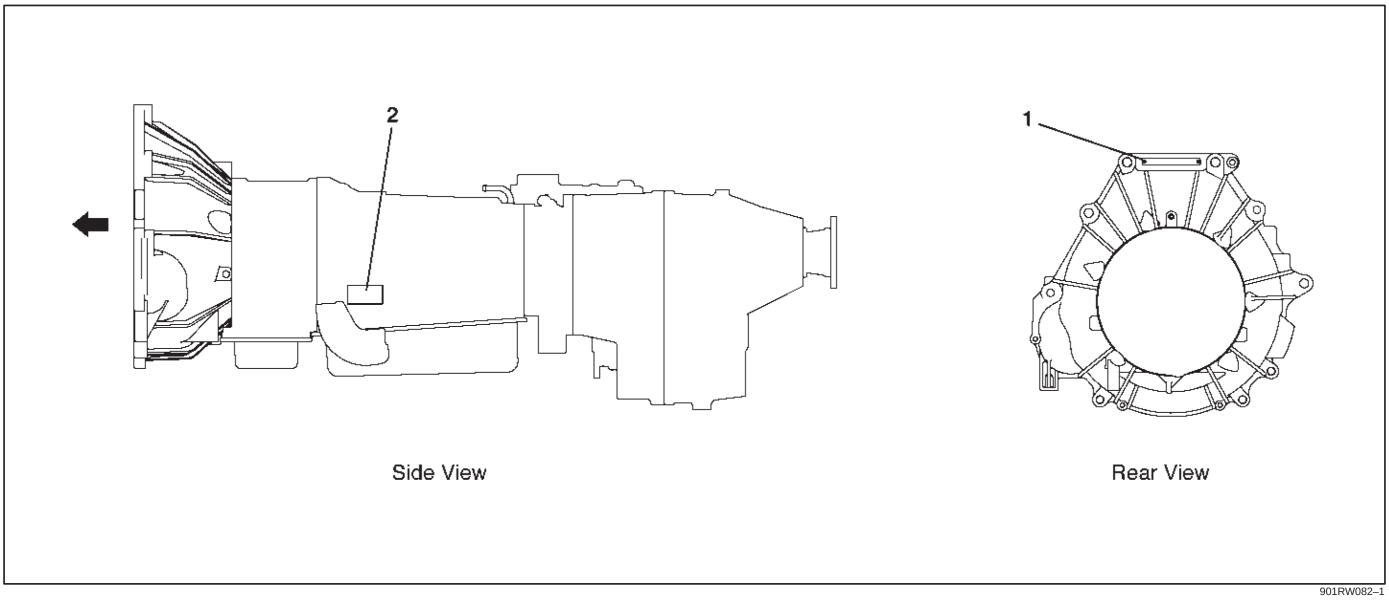
Engine (X22SE)



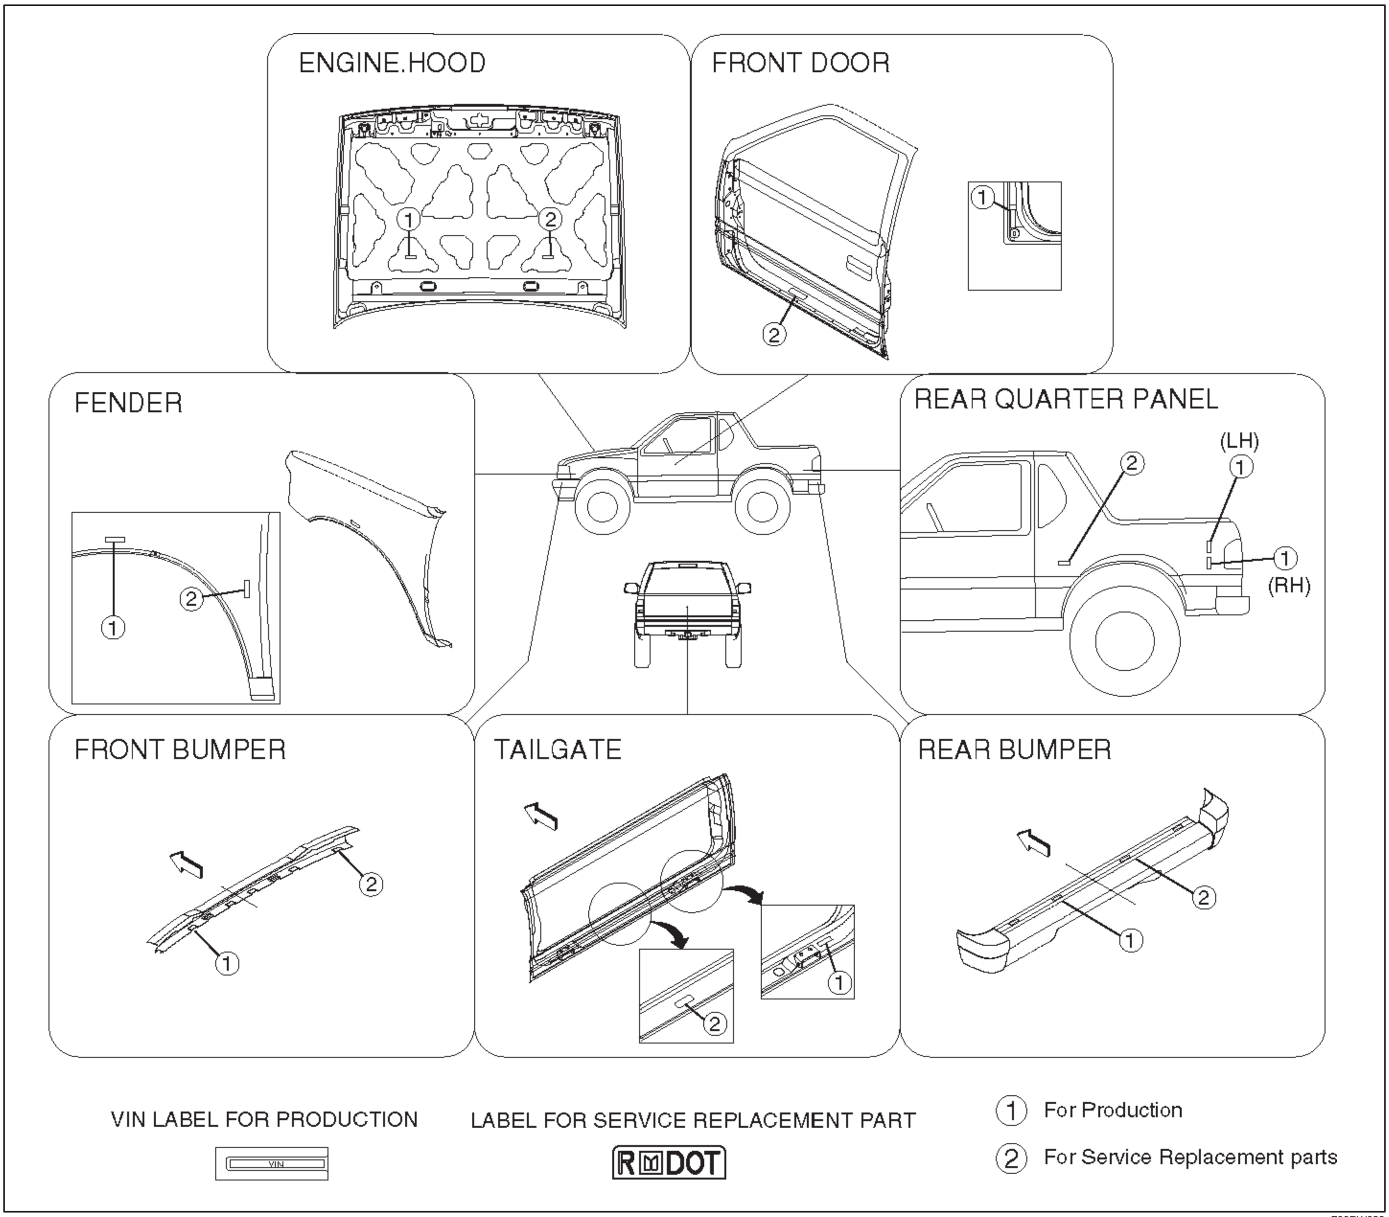
Manual Transmission (MUA)



Automatic Transmission (THM)



Body



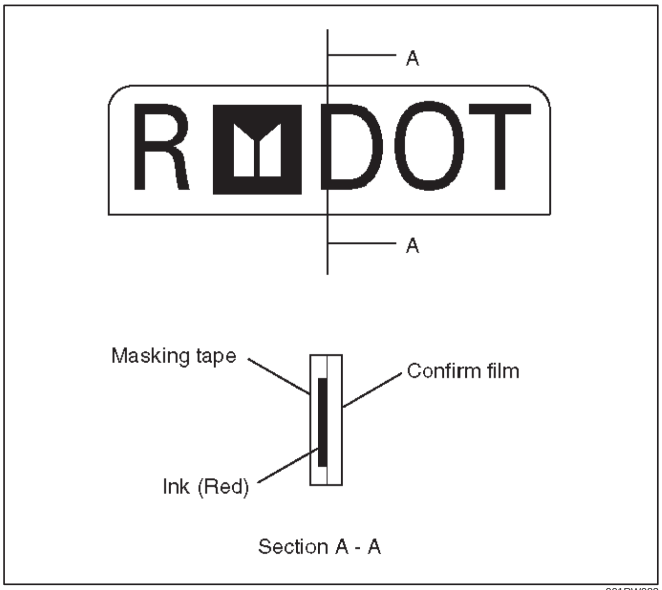
F00RW033

Body Label Instructions

Do not peel off the masking tape until completion of paint work when replacing these parts, as the tape is affixed on the label attached to service parts for body of the anti–theft component.

NOTE: Be sure to pull off the masking tape after paint work has been completed.

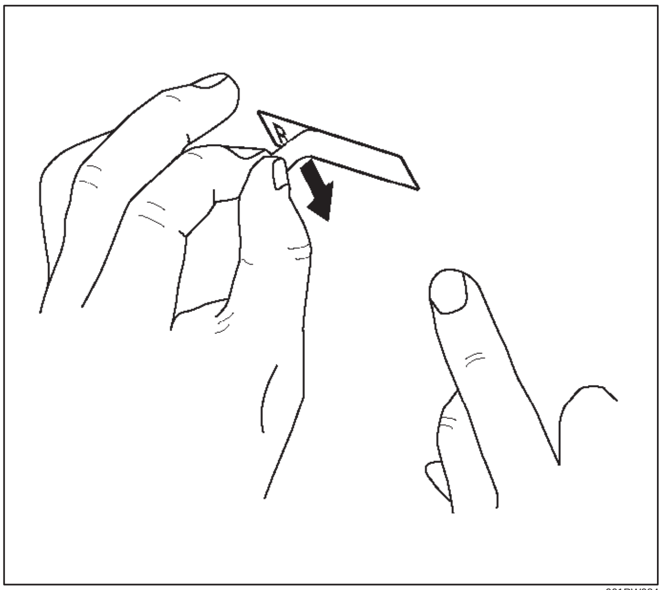
Do not attempt to remove this label for any reason.



901RW083

Precautions in pulling off the masking tape

1. Use only your finger nail or a similar blunt instrument to peel off the masking tape. Use of a sharp object will damage the underlying anti–theft label.
2. Be careful not to damage the paint around the label.



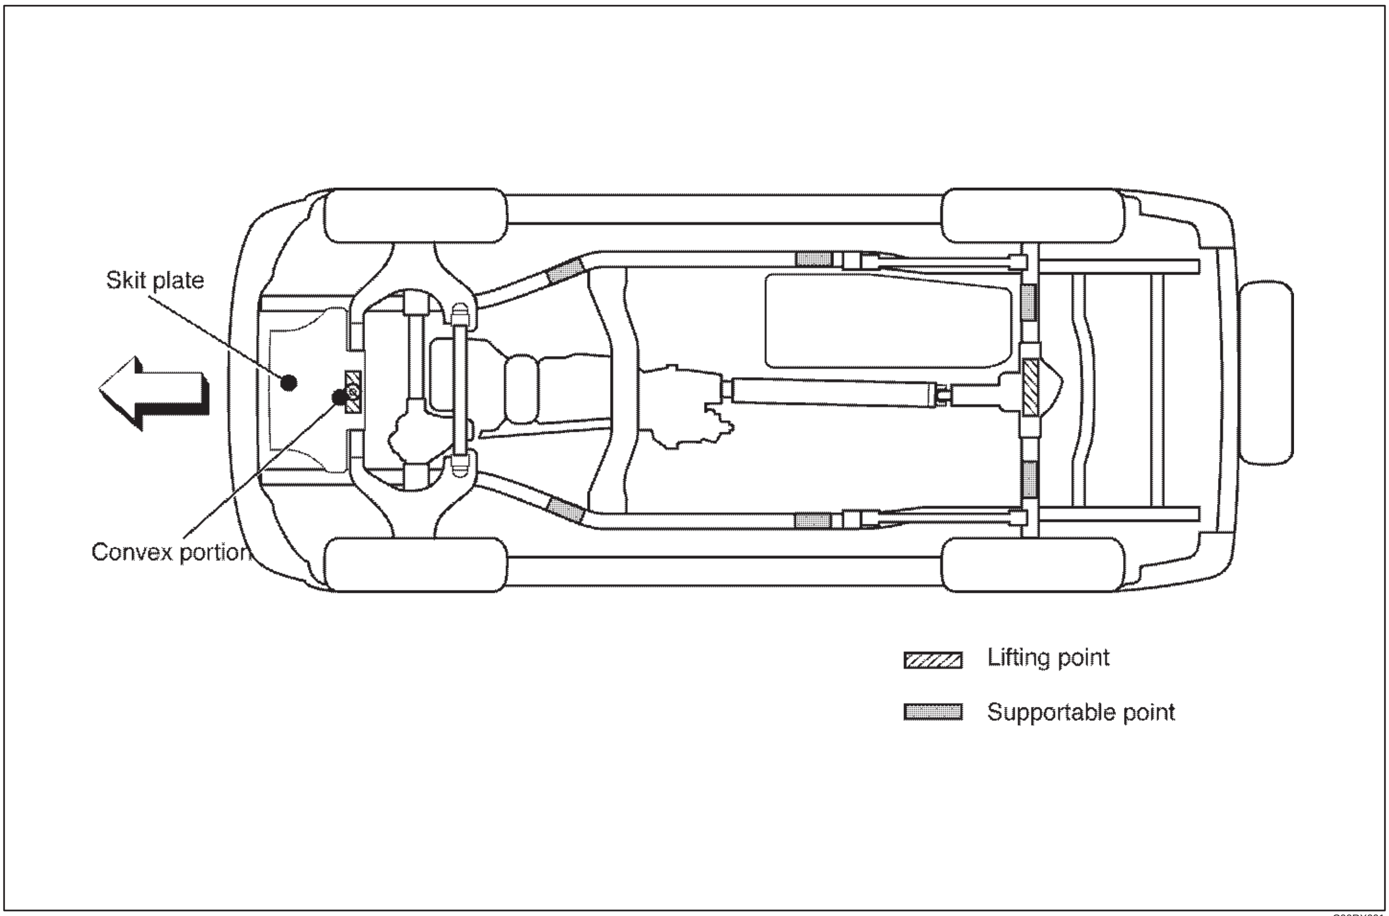
901RW084

Lifting Instructions

CAUTION:

- **If a lifting device other than the original jack is used, it is most important that the device be applied only to the correct lifting points. Raising the vehicle from any other point may result in serious damage.**
- **When jacking or lifting a vehicle at the frame side rail or other prescribed lift points, be certain that lift pads do not contact the catalytic converter, brake pipes or cables, or fuel lines. Such contact may result in damage or unsatisfactory vehicle performance.**

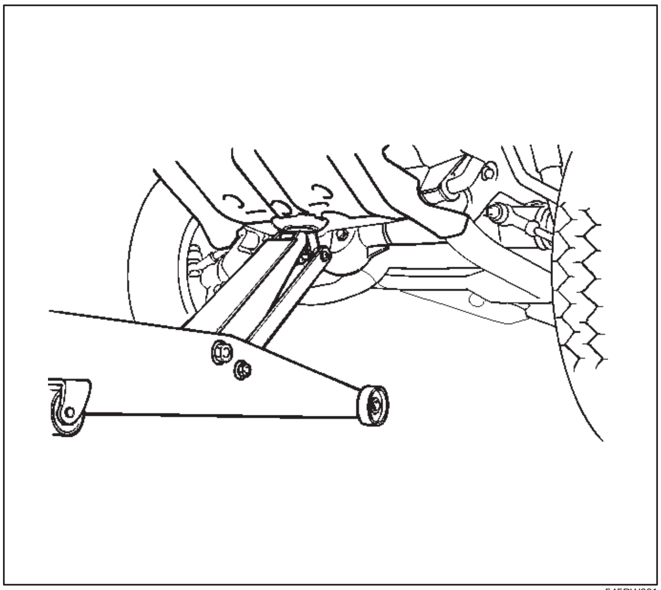
Lifting Points and Supportable Point Locations



C00RX001

Lifting Point: Front

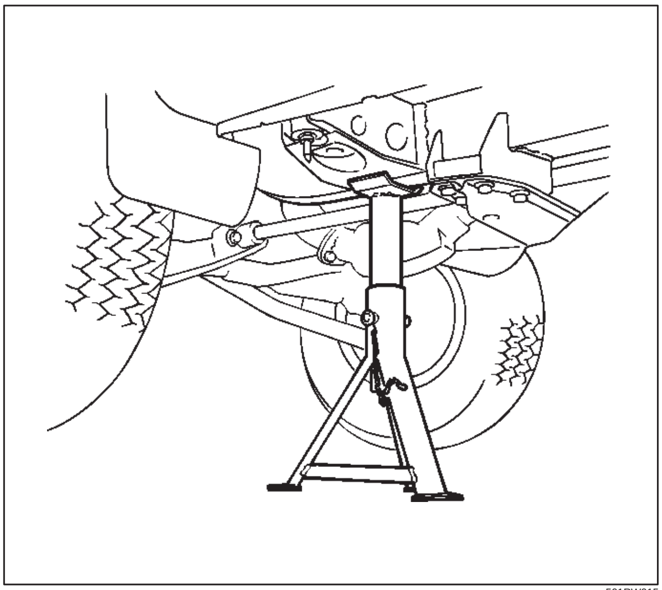
- When using a floor jack, lift on the Convex portion of the skid plate.



545RW001

Supportable Point: Front

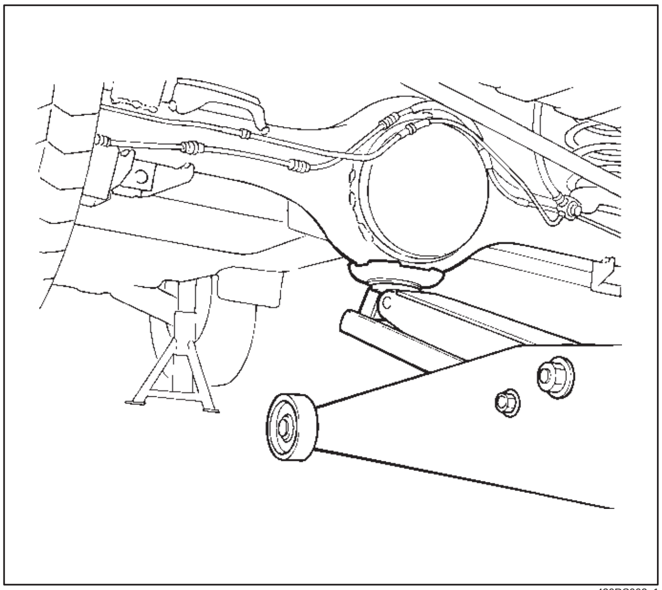
- Position the chassis stands at the bottom of the frame sidemember, behind the front wheel.



501RW015

Lifting Point: Rear

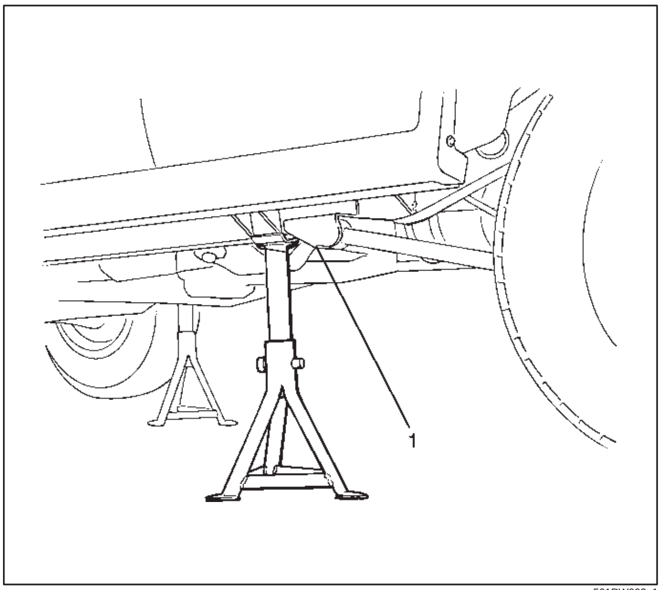
- Position the floor jack at the center of the rear axle case when lifting the vehicle.



420RS002–1

Supportable Point: Rear

- Position the chassis stands at the bottom of the frame sidemember, just in front of the trailing link bracket.



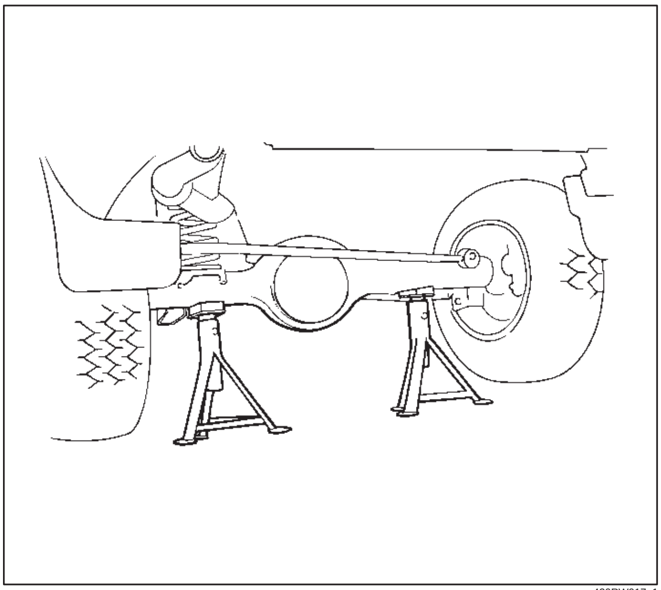
501RW002–1

Legend

(1) Trailing Link Bracket

Supportable Point: Rear

- Position the chassis stands at the bottom of the rear axle case.



420RW017–1

Standard Bolts Torque Specifications

The torque values given in the following table should be applied where a particular torque is not specified.

Strength Class	4.8	8.8		9.8
		Refined	Non-Refined	
Bolt Identification				
	 No mark			
Bolt Diameter × Pitch (mm)				
M 6X1.0	4 – 8 N·m (3 – 6 lb ft)	5 – 10 N·m (4 – 7 lb ft)		–
M 8X1.25	8 – 18 N·m (6 – 13 lb ft)	12 – 23 N·m (9 – 17 lb ft)		17 – 30 N·m (12 – 22 lb ft)
M 10X1.25	21 – 34 N·m (15 – 25 lb ft)	28 – 46 N·m (20 – 34 lb ft)		37 – 63 N·m (27 – 46 lb ft)
* M10X1.5	20 – 33 N·m (14 – 25 lb ft)	28 – 45 N·m (20 – 33 lb ft)		36 – 60 N·m (27 – 44 lb ft)
M12X1.25	49 – 74 N·m (36 – 54 lb ft)	61 – 91 N·m (45 – 67 lb ft)		76 – 114 N·m (56 – 84 lb ft)
* M12X1.75	45 – 69 N·m (33 – 51 lb ft)	57 – 84 N·m (42 – 62 lb ft)		72 – 107 N·m (53 – 79 lb ft)
M14X1.5	77 – 115 N·m (56 – 85 lb ft)	93 – 139 N·m (69 – 103 lb ft)		114 – 171 N·m (84 – 126 lb ft)
* M14X2.0	72 – 107 N·m (53 – 79 lb ft)	88 – 131 N·m (65 – 97 lb ft)		107 – 160 N·m (79 – 118 lb ft)
M16X1.5	104 – 157 N·m (77 – 116 lb ft)	135 – 204 N·m (100 – 150 lb ft)		160 – 240 N·m (118 – 177 lb ft)
* M16X2.0	100 – 149 N·m (74 – 110 lb ft)	130 – 194 N·m (95 – 143 lb ft)		153 – 230 N·m (113 – 169 lb ft)
M18X1.5	151 – 226 N·m (111 – 166 lb ft)	195 – 293 N·m (144 – 216 lb ft)		230 – 345 N·m (169 – 255 lb ft)
M20X1.5	206 – 310 N·m (152 – 229 lb ft)	270 – 405 N·m (199 – 299 lb ft)		317 – 476 N·m (234 – 351 lb ft)
M22X1.5	251 – 414 N·m (185 – 305 lb ft)	363 – 544 N·m (268 – 401 lb ft)		425 – 637 N·m (313 – 469 lb ft)
M24X2.0	359 – 539 N·m (265 – 398 lb ft)	431 – 711 N·m (318 – 524 lb ft)		554 – 831 N·m (409 – 613 lb ft)

The asterisk * indicates that the bolts are used for female–threaded parts that are made of soft materials such as casting, etc.

Abbreviations Charts

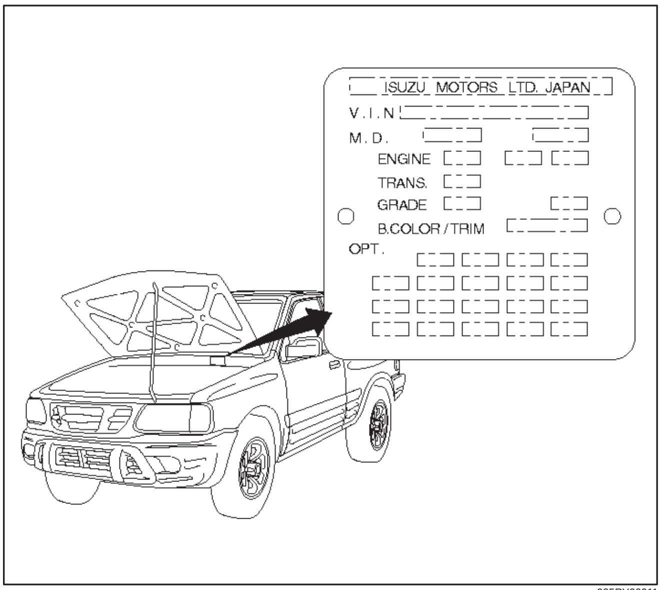
List of automotive abbreviations which may be used in this manual

A — Ampere(s)
ABS — Antilock Brake System
AC — Alternating Current
A/C — Air Conditioning
ACCEL — Accelerator
ACC — Accessory
ACL — Air Cleaner
Adj — Adjust
A/F — Air Fuel Ratio
AIR — Secondary Air Injection System
Alt — Altitude
AMP — Ampere(s)
ANT — Antenna
ASM — Assembly
A/T — Automatic Transmission/Transaxle
ATDC — After Top Dead Center
ATF — Automatic Transmission Fluid
Auth — Authority
Auto — Automatic
BARO — Barometric Pressure
Bat — Battery
B+ — Battery Positive Voltage
Bbl — Barrel
BHP — Brake Horsepower
BPT — Backpressure Transducer
BTDC — Before Top Dead Center
° C — Degrees Celsius
CAC — Charge Air Cooler
Calif — California
cc — Cubic Centimeter
CID — Cubic Inch Displacement
CKP — Crankshaft Position
CL — Closed Loop
CLCC — Closed Loop Carburetor Control
CMP — Camshaft Position
CO — Carbon Monoxide
Coax — Coaxial
Conn — Connector
Conv — Converter
Crank — Crankshaft
Cu. In. — Cubic Inch
CV — Constant Velocity
Cyl — Cylinder(s)
DI — Distributor Ignition
Diff — Differential
Dist — Distributor
DLC — Data Link Connector
DOHC — Double Overhead Camshaft
DTC — Diagnostic Trouble Code
DTM — Diagnostic Test Mode
DTT — Diagnostic Test Terminal
DVM — Digital Voltmeter (10 meg.)
DVOM — Digital Volt Ohmmeter
EBCM — Electronic Brake Control Module
ECM — Engine Control Module
ECT — Engine Coolant Temperature
EEPROM — Electronically Erasable Programmable Read Only Memory
EGR — Exhaust Gas Recirculation
EI — Electronic Ignition
ETR — Electronically Tuned Receiver
EVAP — Evaporation Emission
Exh — Exhaust
° F — Degrees Fahrenheit
Fed — Federal (All States Except Calif.)
FF — Front Drive Front Engine
FL — Fusible Link
FLW — Fusible Link Wire
FP — Fuel Pump
FRT — Front
ft — Foot
FWD — Front Wheel Drive
4WD — Four Wheel Drive
4 x 4 — Four Wheel Drive
4 A/T — Four Speed Automatic Transmission/Transaxle
Gal — Gallon
GEN — Generator
GND — Ground
Gov — Governor
g — Gram
Harn — Harness
HC — Hydrocarbons
HD — Heavy Duty
Hg — Hydrargyrum (Mercury)
HiAlt — High Altitude
HO2S — Heated Oxygen Sensor
HVAC — Heater–Vent–Air–Conditioning
IAC — Idle Air Control
IAT — Intake Air Temperature
IC — Integrated Circuit / Ignition Control
ID — Identification / Inside Diameter
IGN — Ignition
INJ — Injection
IP — Instrument Panel
IPC — Instrument Panel Cluster
Int — Intake
ISC — Idle Speed Control
J/B — Junction Block
kg — Kilograms
km — Kilometers
km/h — Kilometer per Hour
kPa — Kilopascals
kV — Kilovolts (thousands of volts)
kW — Kilowatts
KS — Knock Sensor
L — Liter
lb ft — Foot Pounds
lb in — Inch Pounds
LF — Left Front
LH — Left Hand
LR —Left Rear
LS — Left Side
LWB — Long Wheel Base
L–4 — In–Line Four Cylinder Engine
MAF — Mass Air Flow
MAN — Manual
MAP — Manifold Absolute Pressure
Max — Maximum
MC — Mixture Control
MFI — Multiport Fuel Injection
MIL — Malfunction Indicator Lamp
Min — Minimum
mm — Millimeter
MPG — Miles Per Gallon
MPH — Miles Per Hour
M/T — Manual Transmission/Transaxle
MV — Millivolt

N — Newtons
NA — Natural Aspirated
NC — Normally Closed
N·M — Newton Meters
NO — Normally Open
NOX — Nitrogen, Oxides of
OBD — On-Board Diagnostic
OD — Outside Diameter
O/D — Over Drive
OHC — Overhead Camshaft
OL — Open Loop
O2 — Oxygen
O2S — Oxygen Sensor
PAIR — Pulsed Secondary Air Injection System
P/B — Power Brakes
PCM — Powertrain Control Module
PCV — Positive Crankcase Ventilation
PRESS — Pressure
PROM — Programmable Read Only Memory
PNP — Park/Neutral Position
P/S — Power Steering
PSI — Pounds per Square Inch
PSP — Power Steering Pressure
Pt. — Pint
Pri — Primary
PWM — Pulse Width Modulate
Qt. — Quart
REF — Reference
RF — Right Front
RFI — Radio Frequency Interference
RH — Right Hand
RPM — Revolutions Per Minute
RPM Sensor — Engine Speed Sensor
RPO — Regular Production Option
RR — Right Rear
RS — Right Side
RTV — Room Temperature Vulcanizing
RWAL — Rear Wheel Antilock Brake
RWD — Rear Wheel Drive
SAE — Society of Automotive Engineers
Sec — Secondary
SFI — Sequential Multiport Fuel Injection
SI — System International
SIR — Supplemental Inflatable Restraint System
SOHC — Single Overhead Camshaft
Sol — Solenoid
SPEC — Specification
Speedo — Speedometer
SRS — Supplemental Restraint System
ST — Start / Scan Tool
Sw — Switch
SWB — Short Wheel Base
SYN — Synchronize
Tach — Tachometer
TB — Throttle Body
TBI — Throttle Body Fuel Injection
TCC — Torque Converter Clutch
TCM — Transmission Control Module
TDC — Top Dead Center
Term — Terminal
TEMP — Temperature
TOD— Torque On Demand
TP — Throttle Position
TRANS — Transmission/Transaxle
TURBO — Turbocharger
TVRS — Television & Radio Suppression
TVV — Thermal Vacuum Valve
TWC — Three Way Catalytic Converter
3 A/T — Three Speed Automatic Transmission/Transaxle
2WD — Two Wheel Drive
4 x 2 — Two Wheel Drive
U–joint — Universal Joint
V — Volt(s)
VAC — Vacuum
VIN — Vehicle Identification Number
VRRRE — Vehicle Refrigerant Recovery and Recycling Equipment
V–ref — ECM Reference Voltage
VSS — Vehicle Speed Sensor
VSV — Vacuum Switch Valve
V–6 — Six Cylinder “V” Engine
V–8 — Eight Cylinder ”V” Engine
W — Watt(s)
w/ — With
w/b — Wheel Base
w/o — Without
WOT — Wide Open Throttle

Service Parts Identification Plate

The Vehicle Information Plate (Service Parts ID plate) is provided on all vehicle models.
It is located on the center dash wall inside the engine compartment. The plate lists the VIN (Vehicle Identification Number), paint information and all production options and special equipment on the vehicle when it was shipped from the factory.



905RY00011

AMIGO

GENERAL INFORMATION

Maintenance and Lubrication

CONTENTS

Maintenance Schedule List

Normal Vehicle Use

The maintenance instructions in this Maintenance Schedule are based on the assumption that the vehicle will be used as designed:

- to carry passengers and cargo within the limitations specified on the tire placard located on the inside of the glove compartment door;
- to be driven on reasonable road surfaces within legal operating limits;
- to be driven on a daily basis, as a general rule, for at least several miles/kilometers;
- to be driven on unleaded fuel

Unusual or severe operating conditions will require more frequent vehicle maintenance, as specified in the following sections.

Severe Driving Conditions

If the vehicle is usually operated under any of the severe driving conditions listed below, it is recommended that the applicable maintenance services be performed at the specified interval shown in the chart below.

Severe driving conditions:

- Towing a trailer, using a camper or car top carrier.
- Repeated short trips of less than 8 Km (5 miles) with outside temperature remaining below freezing.
- Extensive idling and/or low speed driving for long distances, such as police, taxi or door–to–door delivery use.
- Operating on dusty, rough, muddy or salt spread roads.

ITEMS	INTERVAL
CHANGE ENGINE OIL AND OIL FILTER	Every 3,000 miles (4,800 km) or 3 months
CHANGE AUTOMATIC TRANSMISSION FLUID	Every 20,000 miles (32,000 km)
CHANGE REAR AXLE OIL	Every 15,000 miles (24,000 km)
REPLACE TIMING BELT	Every 75,000 miles (120,000 km)
REPLACE AIR CLEANER FILTER	See explanation of service, page 0B–5
CHANGE POWER STEERING FLUID	Every 30,000 miles (48,000 km)

UEROM4

Explanation of Complete Vehicle Maintenance Schedule

Brief explanations of the services listed in the preceding Maintenance Schedule are presented below.
Replace all questionable parts and note any necessary repairs as you perform these maintenance procedures.

Front and Rear Axle Lubricant Replacement

Check the lubricant level after every 7,500 miles (12,000 km) of operation and add lubricant to level of filler hole if necessary.
Replace the front and rear axle lubricant at 15,000 miles (24,000 km) and 30,000 miles (48,000 km) and after every 30,000 miles (48,000 km) of operation thereafter.

Manual Transmission Lubricant Replacement

Check the lubricant level after every 7,500 miles (12,000 km) of operation and add lubricant to level of filler hole if necessary.
Replace the transmission lubricant at 15,000 miles (24,000 km) and 30,000 miles (48,000 km) and after every 30,000 miles (48,000 km) of operation thereafter.

Transfer Case Lubricant Replacement

Check the lubricant level after every 7,500 miles (12,000 km) of operation and add lubricant to level of filler hole if necessary.
Replace the transfer case lubricant at 15,000 miles (24,000 km) and 30,000 miles (48,000 km) and after every 30,000 miles (48,000 km) of operation thereafter.

Air Cleaner Element Replacement

Replace the air cleaner under normal operating conditions every 30,000 miles (48,000 km).
Operation of the vehicle in dusty areas will necessitate more frequent replacement.

Spark Plug Replacement

Replace the plugs at 100,000 miles (160,000 km) intervals with the type specified at the end of this section.

Cooling System Service

Drain, flush and refill system with new engine coolant. Refer to “Recommended Fluids and Lubricants” in this section, or ENGINE COOLING (SEC.6B).

Timing Belt Replacement

Replacement of the timing belt is recommended at every 100,000 miles (160,000 km).
Failure to replace the timing belt may result in serious damage to the engine.

Valve Clearance Adjustment (V6, 3.2L ENG)

Incorrect valve clearance will result in increased engine noise and reduced engine output.
Retorque the camshaft bracket bolts before checking and adjusting the valve clearance.
Check and adjust the valve clearance if noise occurs.

Tire Rotation

Rotate tires every 7,500 miles (12,000 km).

Spark Plug Wire Inspection

Check the spark plug wires at 60,000 mile (96,000 km) intervals.

Front Wheel Bearings Lubricant Replacement

Clean and repack the front wheel bearings at 30,000 miles (48,000 km) intervals.
Refer to DRIVE SHAFT SYSTEM (SEC. 4C).

Radiator Core and Air Conditioning Condenser Cleaning

Clean the front of the radiator core and air conditioning condenser, at 60,000 miles (96,000 km) intervals.

Fluid Level Check

A fluid loss in any system (except windshield washer) may indicate a problem. Repair the system at once.

Engine oil level

Check level and add if necessary. The best time to check the engine oil level is when the oil is warm. After stopping the engine with the vehicle on a level surface, wait a few minutes for the oil to drain back to the oil pan. Pull out the oil level indicator (dipstick). Wipe it clean and push the oil level indicator back down all the way. Pull out the oil level indicator, keeping the tip down, and look at the oil level on it.

Add oil, if needed, to keep the oil level above the “ADD” mark and between the “ADD” and “FULL” marks in the operating range area. Avoid overfilling the engine since this may cause engine damage. Push the oil level indicator back down all the way after taking the reading. If you check the oil level when the oil is cold, do not run the engine first. The cold oil will not drain back to the pan fast enough to give a true oil level.

Engine coolant level and condition

Check engine coolant level in the coolant reservoir and add engine coolant if necessary. Inspect the engine coolant and replace it if dirty or rusty.

Windshield washer fluid level

Check washer fluid level in the reservoir and add if necessary.

Power steering system reservoir level

Check and keep at the proper level.

Brake master cylinder reservoir level

Check fluid. Keep fluid at proper level. A low fluid level can indicate worn disc brake pads which may need to be serviced.

Hydraulic clutch system

Check fluid level in the reservoir. Add fluid as required.

Battery fluid level

Check fluid level in the battery.

Fluid Leak Check

Check for fuel, water, oil or other fluid leaks by looking at the surface beneath the vehicle after it has been parked for a while. Water dripping from the air conditioning system after use is normal. If you notice gasoline fumes or fluid at any time, locate the source and correct it at once.

Engine Oil and Oil Filter Replacement

Always use API SE, SF, SG, SH or ILSAC GF–1 quality oils of the proper viscosity.
When choosing an oil, consider the range of temperatures the car will be operated in before the next oil change. Then, select the recommended oil viscosity from the chart.
Always change the oil and the oil filter as soon as possible after driving in a dust storm.

Engine Cooling System Inspection

Inspect the coolant/anti–freeze. If the coolant is dirty or rusty, drain, flush and refill with new coolant. Keep coolant at the proper mixture for proper freeze protection, corrosion inhibitor level and best engine operating temperature. Inspect hoses and replace if cracked, swollen or deteriorated. Tighten the hose clamps if equipped with screw–type clamps. Clean outside of radiator and air conditioning condenser. Wash filler cap and neck. To help ensure proper operation, a pressure test of both the cooling system and the cap is also recommended.

Exhaust System Inspection

Visually inspect the exhaust pipes, muffler, heat shields and hangers for cracks, deterioration, or damage.
Be alert to any changes in the sound of the exhaust system or any smell of fumes. These are signs the system may be leaking or overheating. Repair the system at once, if these conditions exist. (See also “Engine Exhaust Gas Safety” and “Three Way Catalytic Converter” in the Owner’s manual.)

Fuel Cap, Fuel Lines, and Fuel Tank Inspection

Inspect the fuel tank, the fuel cap and the fuel lines every 60,000 miles (96,000 km) for damage which could cause leakage.
Inspect the fuel cap and the gasket for correct sealing and physical damage. Replace any damaged parts.

Drive Belt Inspection

Check the serpentine belt driving for cracks, fraying, wear, and correct tension every 30,000 miles (48,000 km). Replace as necessary.

Wheel Alignment, Balance and Tires Operation

Uneven or abnormal tire wear, or a pull right or left on a straight and level road may show the need for a wheel alignment. A vibration of the steering wheel or seat at normal highway speeds means a wheel balancing is needed. Check tire pressure when the tires are “cold” (include the spare).
Maintain pressure as shown in the tire placard, which is located on the driver’s door lock pillar.

Steering System Operation

Be alert for any changes in steering action. An inspection or service is needed when the steering wheel is harder to turn or has too much free play, or if there are unusual sounds when turning or parking.

Brake Systems Operation

Watch for the “BRAKE” light coming on. Other signs of possible brake trouble are such things as repeated pulling to one side when braking, unusual sounds when braking or between brake applications, or increased brake pedal travel. If you note one of these conditions, repair the system at once.
For convenience, the following should be done when wheels are removed for rotation: Inspect lines and hoses for proper hookup, bindings, leaks, crack, chafing etc. Inspect disc brake pads for wear and rotors for surface condition.
Inspect other brake parts, including parking brake drums, linings etc., at the same time. Check parking brake adjustment.
Inspect the brakes more often if habit or conditions result in frequent braking.

Parking Brake and Transmission Park Mechanism Operation

Park on a fairly steep hill and hold the vehicle with the parking brake only. This checks holding ability. On automatic transmission vehicles, shifting from “P” position to the other positions cannot be made unless the brake pedal is depressed when the key switch is in the “ON” position or the engine is running.

WARNING: BEFORE CHECKING THE STARTER SAFETY SWITCH OPERATION BELOW, BE SURE TO HAVE ENOUGH ROOM AROUND THE VEHICLE. THEN FIRMLY APPLY BOTH THE PARKING BRAKE AND THE REGULAR BRAKE. DO NOT USE THE ACCELERATOR PEDAL. IF THE ENGINE STARTS, BE READY TO TURN OFF THE KEY PROMPTLY. TAKE THESE PRECAUTIONS BECAUSE THE VEHICLE COULD MOVE WITHOUT WARNING AND POSSIBLY CAUSE PERSONAL INJURY OR PROPERTY DAMAGE.

Front (4WD only) and Rear Propeller Shaft

Lubricate center-package of double cardan joint with chemtool. HVLC Ep-2 or equivalent at the intervals shown in the maintenance schedule. Check propeller shaft flange-to-pinion bolts for proper torque of 63 N·m (46 ft.lbs.) for front and rear propeller shaft.

Starter Safety Switch Operation (Automatic Transmission)

Check by trying to start the engine in each gear while setting the parking brake and the foot brake. The starter should crank only in “P” (Park) or “N” (Neutral).

Starter Safety Switch Operation (Manual Transmission)

To check, place the shift lever in “Neutral”, push the clutch pedal halfway and try to start. The starter should not crank. The starter should crank only when the clutch pedal is fully depressed.

Accelerator Linkage Lubrication

Lubricate the accelerator pedal fulcrum pin with chassis grease.

Steering and Suspension Inspection

Inspect the front and rear suspension and steering system for damaged, loose or missing parts or signs of wear. Inspect power steering lines and hoses for proper hookup, binding, leaks, cracks, chafing, etc.

Body and Chassis Lubrication

Lubricate the key lock cylinders, the hood latch, the hood and door hinges, the door check link, the parking cable guides, the underbody contact points, and the linkage.

Automatic Transmission Fluid Replacement

Under harsh operating conditions, such as constant driving in heavy city traffic during hot weather, or in hilly or mountainous terrain, change the transmission fluid and service the sump filter after every 20,000 miles (32,000 km) of operation.
More over, the remaining life percentage of ATF can be estimated by using TECH–II as an auxiliary tool to judge the right time for ATF replacement.
The remaining life percentage is calculated from ATF’S heat history. When it is close to 0%, ATF replacement is recommended.

Auto Cruise Control Inspection

Check to see if the clearance between cruise link and accelerator link is normal. Also check that the connected properly.

Clutch Lines and Hoses Inspection

Check lines and hoses for proper attachment, binding, leaks, cracks, chafing, deterioration, etc. Any questionable parts should be replaced or repaired at once. When abrasion or wear is evident on lines or hoses, the cause must be corrected.

Clutch Control Lubrication

Lubricate the clutch pedal bushing, the clevis pin, and pedal spring every 15,000 miles (24,000 km) or 6 months. If a squeaking noise arises from around the bushing or the clevis pin at the clutch pedal arm when the clutch pedal is depressed, lubricate them.

Clutch Pedal Free Play Inspection

Note the clutch pedal free play. It should be 5 – 15 mm (0.2 – 0.6 in). Adjust clutch control when there is little or no free play.

Accelerator Linkage Inspection

Inspect for interference, binding, and damaged or missing parts. Check accelerator pedal for smooth operation and even pedal effort. Replace parts as needed.

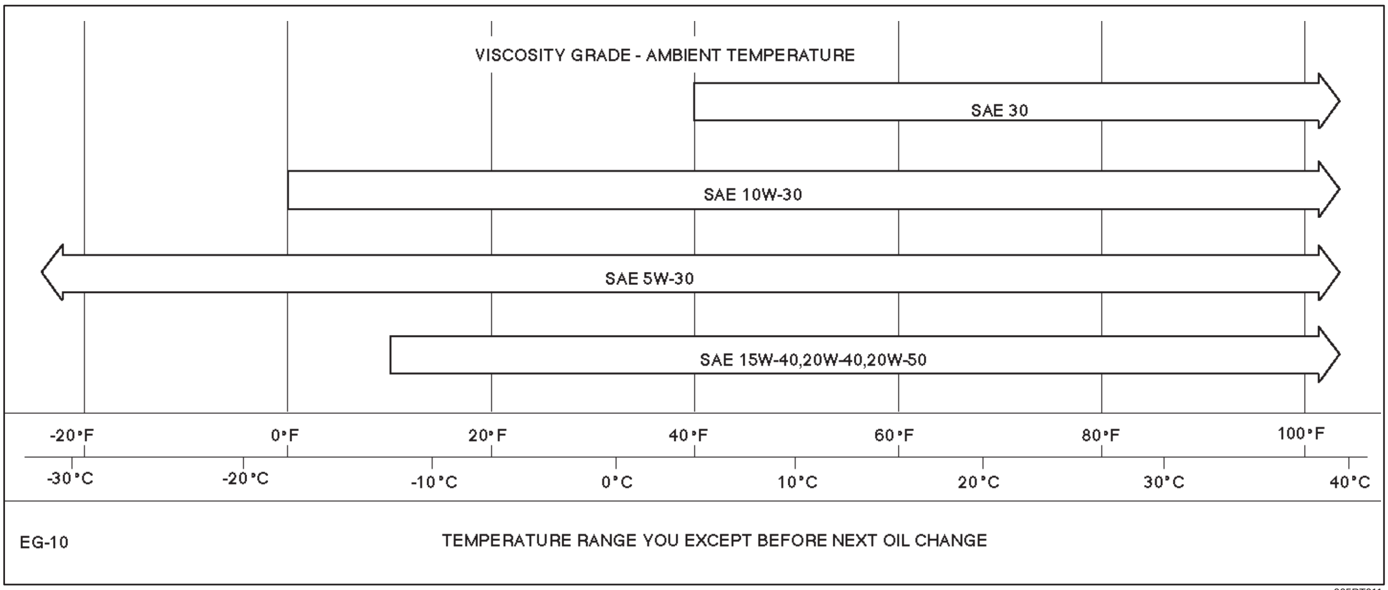
Recommended Fluids and Lubricants

USAGE	FLUID/LUBRICANT
Engine	API SE, SF, SG, SH or ILSAC GF-1 Engine oil (See oil chart on the following page for proper viscosity)
Engine coolant	Mixture of water and good quality ethylene glycol base type antifreeze.
Brake system	DOT-3 hydraulic brake fluid.
Power steering system	DEXRON® III Automatic transmission fluid.
Automatic transmission & T5 Type Manual Transmission	DEXRON® -III Automatic transmission fluid.
MUA Type Manual transmission & Transfer case	Engine oil (See oil chart on following page for proper viscosity)
Rear axle and front axle	GL-5 gear lubricant (Standard differential) GL-5 Limited slip differential gear lubricant together with limited slip differential lubricant additive (Part No. 8-01052-358-0) or equivalent (If equipped with optional limited slip differential) (See oil chart in this section for proper viscosity)
Clutch system a. Pivot points b. Clutch fork joint c. Master cylinder	 Chassis grease Chassis grease DOT-3 hydraulic brake fluid
Hood latch assembly a. Pivots and spring anchor b. Release pawl	 Engine oil Chassis grease
Hood and door hinges	Engine oil
Chassis lubrication	Chassis grease
Parking brake cables	Chassis grease
Front wheel bearings	Multipurpose grease
Shift on the fly system	GL-5 gear lubricant (SAE 75W-90)
Body door hinge pins and linkage, fuel door hinge, rear compartment lid hinges	Engine oil
Windshield washer solvent	Washer fluid
Key lock cylinder	Synthetic light weight engine oil (SAE 5W-30)
Accelerator linkage	Chassis grease

Lubricant Viscosity Chart

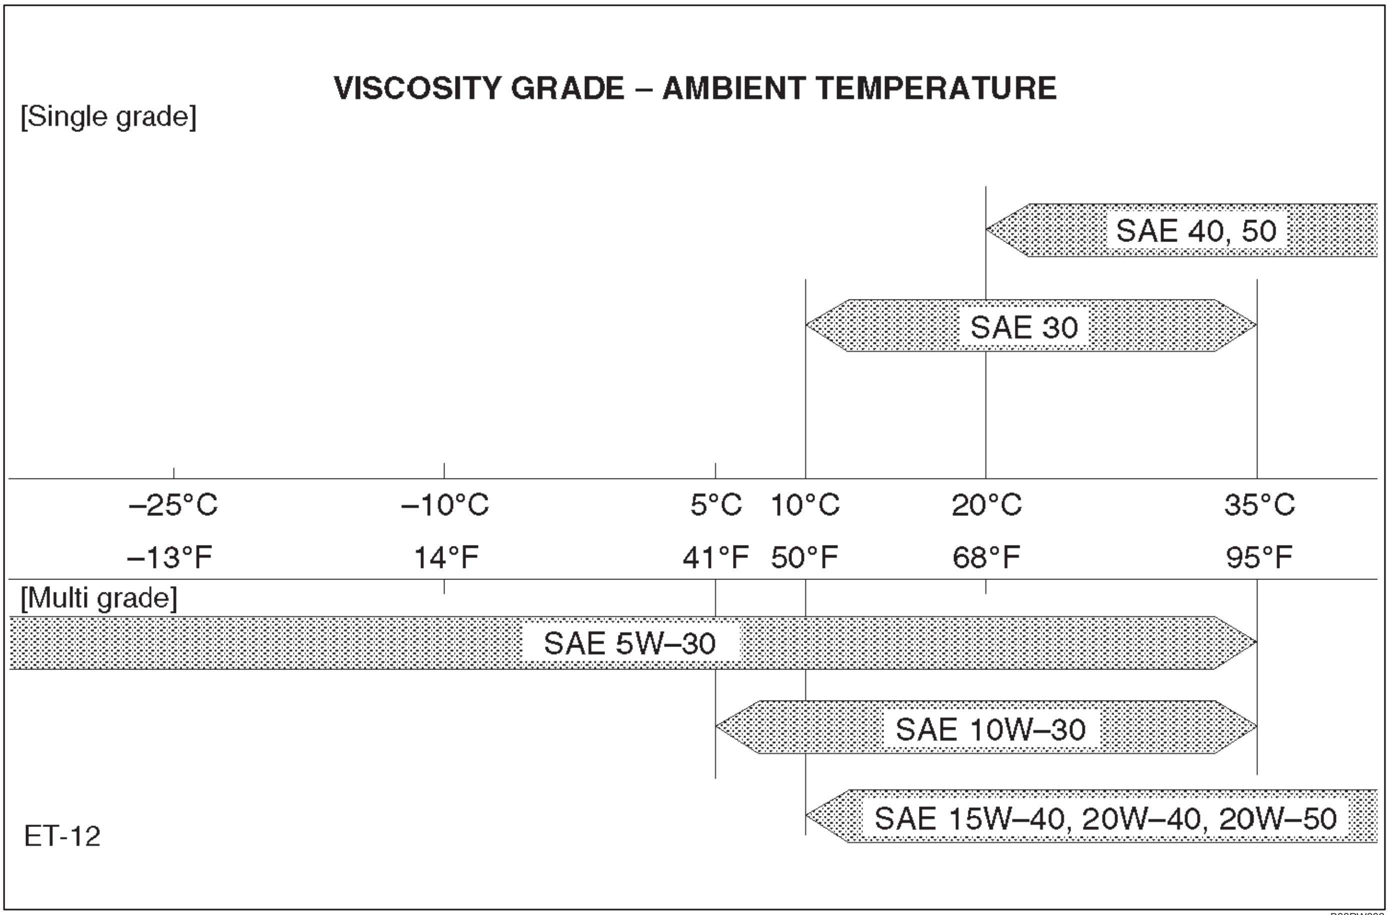
Lubricants should be carefully selected according to the lubrication chart. It is also important to select viscosity of lubricants according to the ambient temperature by referring to the following table.

Oil Viscosity Chart for Gasoline Engine



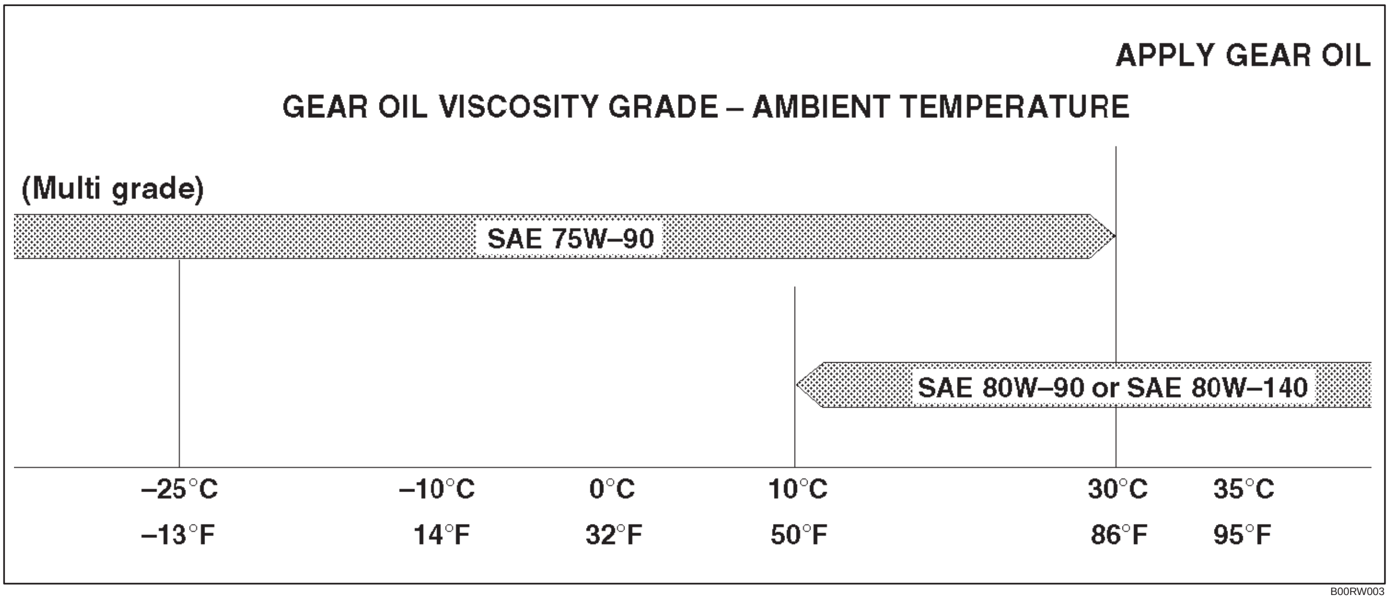
905RT011

Oil Viscosity Chart for Manual Transmission and Transfer Case

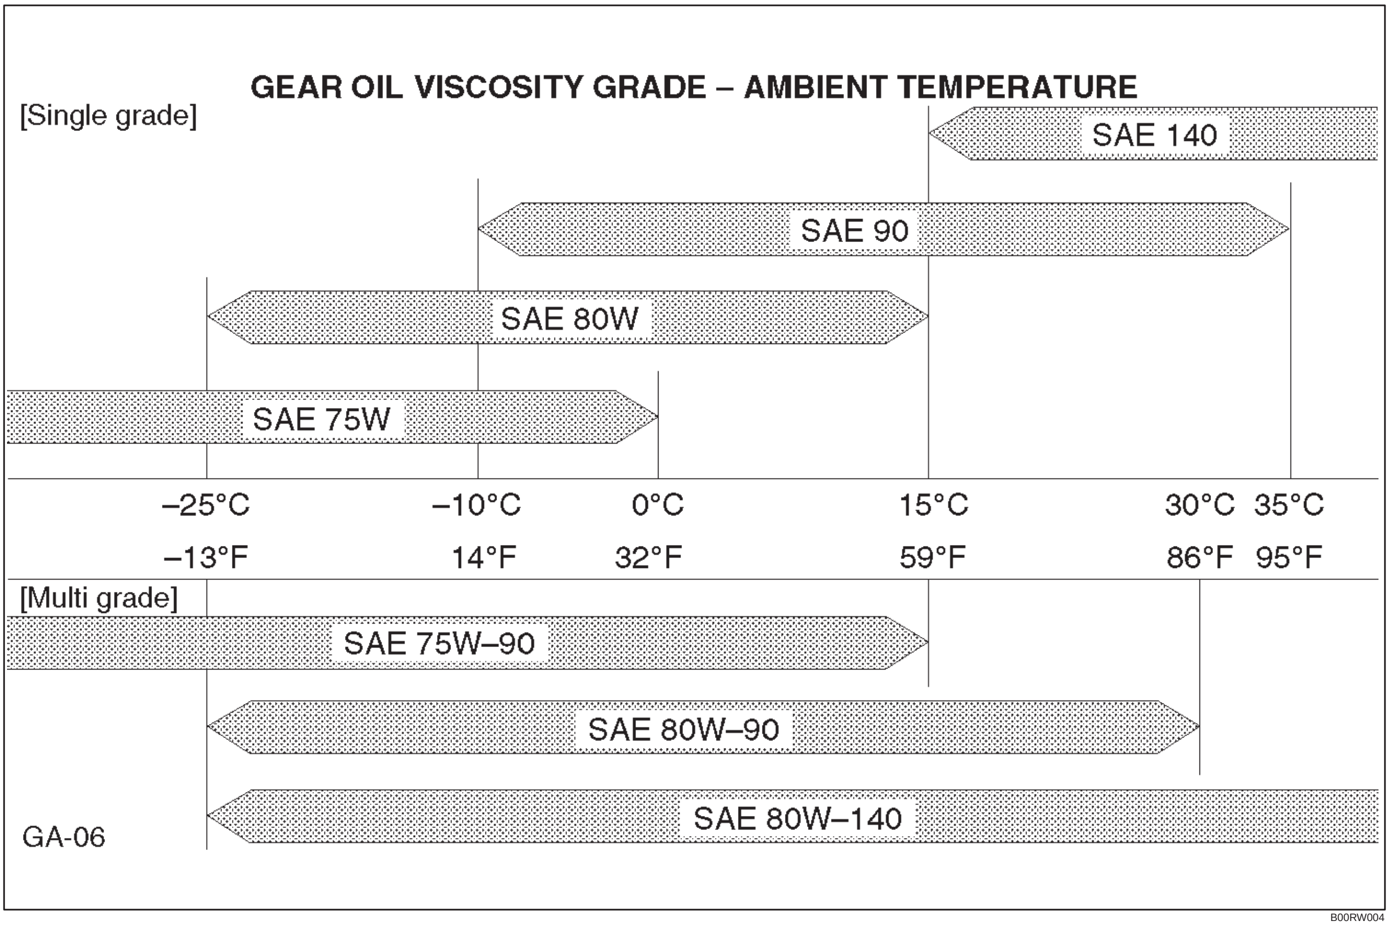


B00RW002

Oil Viscosity Chart for Front Axle



Oil Viscosty Chart for Rear Axle



Recommended Liquid Gasket

Type	Brand Name	Manufacturer	Remarks
RTV* Silicon Base	Three Bond 1207B Three Bond 1207C Three Bond 1215 Three Bond 1280 Three Bond 1281	Three Bond Three Bond Three Bond Three Bond Three Bond	For Engine Repairs For Axle Case Repairs T/M Repairs T/M
Water Base	Three Bond 1141E	Three Bond	For Engine Repairs
Solvent	Three Bond 1104 Belco Bond 4 Belco Bond 401 Belco Bond 402	Three Bond Isuzu Isuzu Isuzu	For Engine Repairs
Anaerobic	LOCTITE 515 LOCTITE 518 LOCTITE 17430	Loctite Loctite Loctite	All

* RTV: Room Temperature Vulcaning

NOTE:

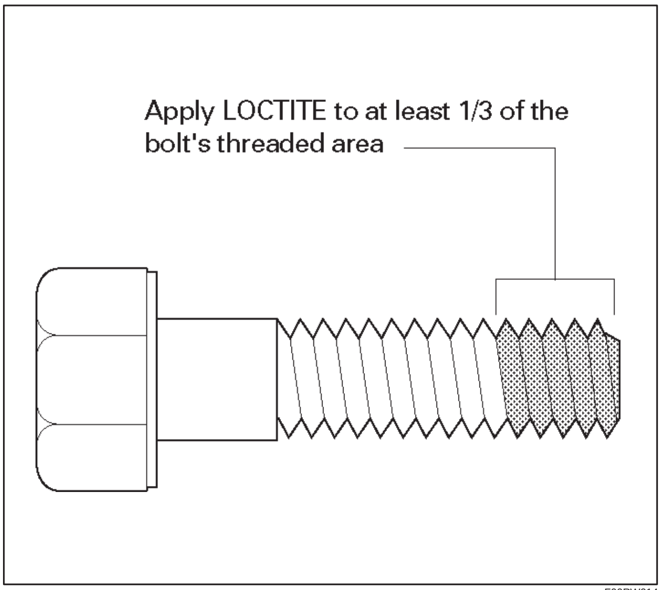
1. It is very important that the liquid gaskets listed above or their exact equivalent be used on the vehicle.
2. Be careful to use the specified amount of liquid gasket.
   Follow the manufacturer's instructions at all times.
3. Be absolutely sure to remove all lubricants and moisture from the connecting surfaces before applying the liquid gasket.
   The connecting surfaces must be perfectly dry.
4. Do not apply LOCTITE 17430, LOCTITE 515 and LOCTITE 518 between two metal surfaces having a clearance of greater than 0.25 mm (0.01 in). Poor adhesion will result.

Recommended Thread Locking Agents

LOCTITE Type	LOCTITE Color
LOCTITE 242	Blue
LOCTITE 262	Red
LOCTITE 271	Red

Application Steps

1. Completely remove all lubricant and moisture from the bolts and the female-threaded surfaces of the parts to be joined.
   The surfaces must be perfectly dry.
2. Apply LOCTITE to the bolts.



F00RW014

3. Tighten the bolts to the specified torque.
   After tightening, be sure to keep the bolts free from vibration and torque for at least an hour until LOCTITE hardens.

NOTE: When the application procedures are specified in this manual, follow them.

Maintenance Service Data

Service Data and Specifications

ENGINE	Valve clearance (cold): only V6–3.2L ENG	Intake 0.28±0.05 mm (0.011±0.002 in) Exhaust 0.3±0.05 mm (0.012±0.002 in)
	Spark plug type	K16PR-P11/PK16PR11/RC10PYP4
	Spark plug gap	1.05 mm (0.04 in)
CLUTCH	Clutch pedal free play	5-15 mm (0.20-0.59 in)
BRAKE	Brake pedal free play	6-10 mm (0.24-0.39 in)
	Parking brake travel	6-7 notches
WHEEL ALIGNMENT	Toe-in (Front)	0±2 mm (0±0.08 in)
	Toe-in (Rear)	0±5 mm (0±0.2 in)
	Camber (Front)	0˚±30’
	Camber (Rear)	0˚±1˚
	Caster (Front)	2˚ 30’±45’
	Toe–Axis (Rear)	±1˚
PROPELLER SHAFT	Flange torque	63 N·m (46 lb ft)
WHEEL AND TIRES	Size	P245/70R16
	Wheel nut torque	118 N·m (87 lb ft)
	Tire inflation pressure (Front)	180 kPa (20 psi)
	* Tire inflation pressure (Rear)	180 kPa (20 psi)

* Unless otherwise specified on tire information label on the vehicle.

Approximate Capacities

	Items		Metric Measure	U.S. Measure
Fuel tank			80 L	21.1 Gal.
* Crankcase (V6–3.2L ENGINE)	Oil Change with Filter		4.7 L	5.0 Qt
	Oil Change without Filter		4.0 L	4.2 Qt
* Crankcase (L4–2.2L ENGINE)	Oil Change with Filter		4.5 L	4.8 Qt
	Oil Change without Filter		4.2 L	4.4 Qt
Coolant	M/T (V6–3.2L ENG)		11.0 L	11.6 Qt
	M/T (L4–2.2L ENG)		6.9 L	7.3 Qt
	A/T (V6–3.2L ENG)		11.1 L	11.7 Qt
Transmission	Manual		2.95 L	3.1 Qt
	Automatic		8.6 L	9.1 Qt
Transfer			1.45 L	1.5 Qt
Axle	Rear		1.77 L	1.87 Qt
	Front	V6–3.2L ENG	1.25 L	1.33 Qt
		L4–2.2L ENG	1.05 L	1.12 Qt
Shift on the fly system			0.12 L	0.13 Qt
Power steering			1.0 L	1.1 Qt
Air conditioning (R-134a)			0.6 L	1.32 Qt

*Crankcase capacities shown are approximate refill capacities. After refill, recheck oil level.

STEERING

POWER-ASSISTED STEERING SYSTEM

CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnosis

Since the problems in steering, suspension, wheels and tires involve several systems, they must all be considered when diagnosing a complaint. To identify the symptom, always road test the vehicle first. Proceed with the following preliminary inspections and correct any defects which are found.

1. Inspect tires for proper pressure and uneven wear.
2. Raise vehicle on a hoist, then inspect front and rear suspension and steering linkage for loose or damaged parts.
3. Spin the front wheels. Inspect for out-of-round tires, out-of-balance tires, loose and/or rough wheel bearings.

General Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
	Tires not adequately inflated.	Adjust the pressure.

Condition	Possible cause	Correction
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel run–out.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial run–out of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
	Parts in power steering valve defective.	Replace power steering unit.
Hard Steering	Bind in steering linkage ball studs, upper or lower end ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to “Power steering system diagnosis”
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower end ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.

Condition	Possible cause	Correction
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.

Power Steering System

There is some noise in all power steering systems. One of the most common is a hissing sound when the steering wheel is fully turned and the car is not moving. This noise will be most evident when the steering wheel is operated while the brakes are applied. There is no relationship between this noise and steering performance. Do not replace the valve unless the “hissing” noise is extremely objectionable. A replacement valve will also have a slight noise, and is not always a cure for the condition.

Condition	Possible cause	Correction
Rattle or Chucking Noise	Pressure hose touching other parts of vehicle.	Adjust hose position. Do not bend tubing by hand.
	Tie rod ends loose.	Tighten or replace tie rod end.
	Loose steering unit mounting.	Tighten steering unit mounting.
Poor Return of Steering Wheel to Center	Improper front wheel alignment.	Adjust front wheel alignment.
	Wheel bearing worn.	Replace front wheel bearing.
	Tie rod end binding.	Replace tie rod end.
	Ball joint binding.	Replace ball joint.
	Tight or frozen steering shaft bearing.	Replace steering assembly.
	Sticky or plugged steering unit valve.	Flush or replace steering unit.
	Entry of air in the power steering system.	Bleed the system.
Momentary Increase In Effort When Turning Wheel Fast To Right or Left	High internal leakage.	Repair steering gear.
	Power steering fluid level low.	Replenish fluid.
Steering Wheel Surges or Jerks When Turning Especially During Parking	Insufficient pump pressure.	Repair pump assembly.
	Sticky steering unit valve.	Flush or replace steering unit.
	Power steering fluid level low.	Replenish fluid.
Excessive Wheel Kick Back or Loose Steering	Air in system.	Bleed hydraulic system.
	Tie rod end loose.	Tighten tie rod end.
	Wheel bearing worn.	Replace wheel bearing.
Hard Steering or Lack or Power Assist	Sticky steering unit valve.	Flush or replace steering unit.
	Insufficient pump pressure.	Repair pump assembly.
	Excessive internal pump leakage.	Repair pump assembly.
	Excessive internal steering gear leakage.	Repair steering gear.
	Power steering fluid level low.	Replenish fluid.

Power Steering Pump

Foaming milky power steering fluid, low fluid level, and possible low pressure can be caused by air in the fluid, or loss of fluid due to internal pump leakage. Check for leak and correct. Bleed the system. Extremely cold temperatures will cause air bubbles in the system if the fluid level is low. If the fluid level is correct and the pump still foams, remove the pump from the vehicle and check housing for cracks. If the housing is cracked, replace the pump housing.

Condition	Possible cause	Correction
Low Pressure Due to Steering Pump	Relief valve sticking or inoperative.	Replace relief valve.
	Side plate not flat against cam ring.	Replace side plate.
	Extreme wear of cam ring.	Replace cam ring.
	Scored side plate or rotor.	Replace side plate or rotor.
	Vanes sticking in rotor slots.	Repair or replace vanes and rotor.
	Cracked or broken side plate.	Replace side plate.
	High internal leakage.	Repair internal leakage.
Low Pressure Due to Steering Gear	Scored housing bore.	Replace housing.
Growling Noise In Steering Pump	Excessive back pressure in hoses or steering unit caused by restriction.	Repair steering unit or pump.
	Scored side plate or rotor.	Replace side plate or rotor.
	Worn cam ring.	Replace cam ring.
Groaning Noise In Steering Pump	Air in the fluid.	Bleed hydraulic system.
	Low fluid level.	Replenish fluid.
	Pump mounting loose.	Tighten mounting bolt.
Rattling Noise In Steering Pump	Vanes sticking in rotor slots.	Repair or replace vanes and rotor.
	Vane improperly installed.	Repair rotor and vane.
Swishing Noise In Steering Pump	Damaged relief valve.	Replace relief valve.
Whining Noise In Steering Pump	Scored side plate and vanes.	Replace side plate and vanes.

Steering Column Lock System

Condition	Possible cause	Correction
Will Not Unlock	Damaged lock cylinder.	Replace lock cylinder.
	Damaged park lock cable.	Replace park lock cable.
Will Not Lock	Lock spring broken or worn.	Replace lock cylinder.
	Damaged lock cylinder.	Replace lock cylinder.
	Ignition switch stuck.	Repair or replace ignition switch.
	Park lock cable damaged.	Replace park lock cable.
Key Cannot be Removed in “OFF-LOCK”	Ignition switch is not set correctly.	Correct ignition switch.
	Damaged lock cylinder.	Replace lock cylinder.
	Faulty shift lock mechanism.	Repair or replace the shift lock mechanism.

Column

Condition	Possible cause	Correction
Noise in Column	Universal joint loose.	Tighten joint.
	Shaft lock snap ring not seated.	Place snap ring in proper position.

Turn Signal Switch

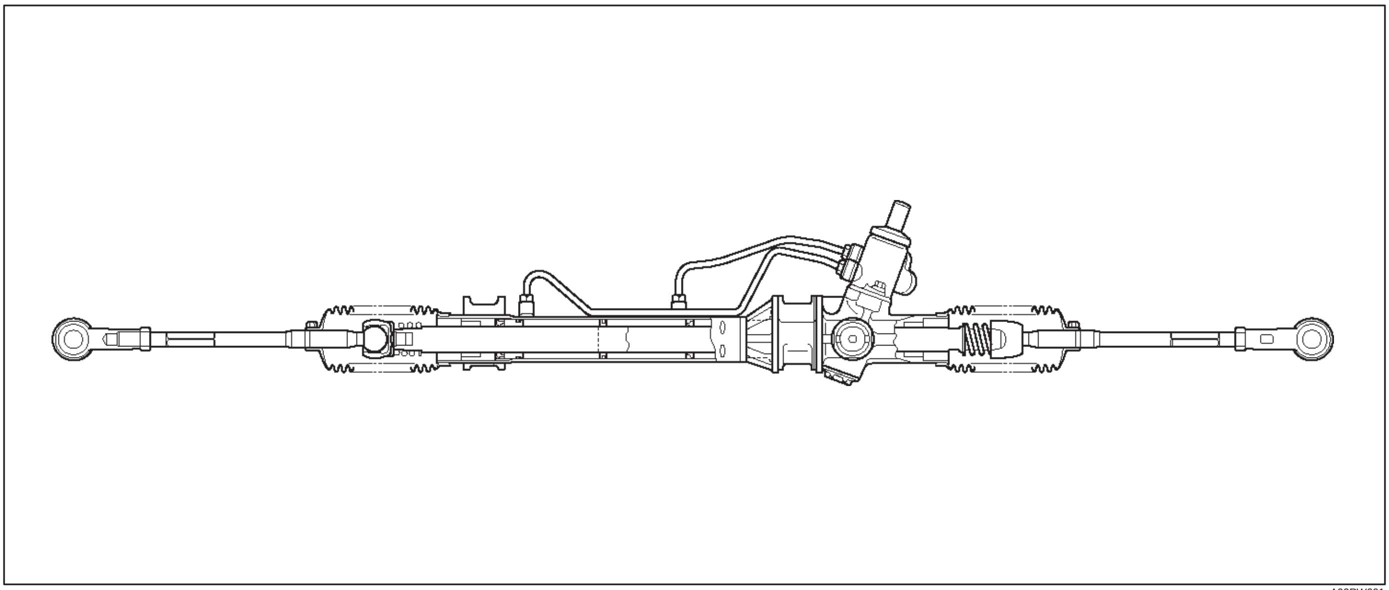
This diagnosis covers mechanical problems only. Refer to Turn Signal Switch in Electrical section for electrical diagnosis.

Condition	Possible cause	Correction
Turn Signal Will Not Stay In Turn Position	Foreign material or loose parts preventing movement of yoke.	Repair or replace signal switch.
	Broken or missing detent or canceling spring.	Replace signal switch.
Turn Signal Will Not Cancel	Loose switch mounting screws.	Tighten mounting screws.
	Switch or anchor bosses broken.	Replace turn signal switch.
	Broken, missing or out of position detent, return or canceling spring.	Replace turn signal switch.
	Worn canceling cam.	Replace turn signal switch.
Turn Signal Difficult To Operate	Turn signal switch arm loose.	Tighten arm screw.
	Broken or distorted yoke.	Replace turn signal switch.
	Loose or misplaced springs.	Replace turn signal switch.
	Foreign parts and/or material.	Repair turn signal switch.
	Loose turn signal switch mounting screws.	Tighten mounting screws.
Turn Signal Will Not Indicate Lane Change	Broken lane change pressure pad or spring hanger.	Replace turn signal switch.
	Broken, missing or misplaced lane change spring.	Replace turn signal switch.
	Base of wire damaged.	Replace turn signal switch.
Hazard Switch Cannot Be Turned Off	Foreign material between hazard switch to turn signal switch body.	Repair or replace hazard switch.
No Turn Signal Lights	Electrical failure in chassis harness.	Refer to Electrical section.
	Inoperative turn signal flasher unit.	Replace flasher unit.
	Loose chassis harness connector.	Repair loose connector.
Front or Rear Turn Signal Lights Not Flashing	Burned-out or damaged turn signal bulb.	Replace bulb.
	High resistance connection to ground at bulb socket.	Repair bulb socket.
	Loose chassis harness connector.	Repair loose connector.

General Description

The hydraulic power steering system consists of a pump, an oil reservoir, a steering unit, a pressure hose and a return hose.

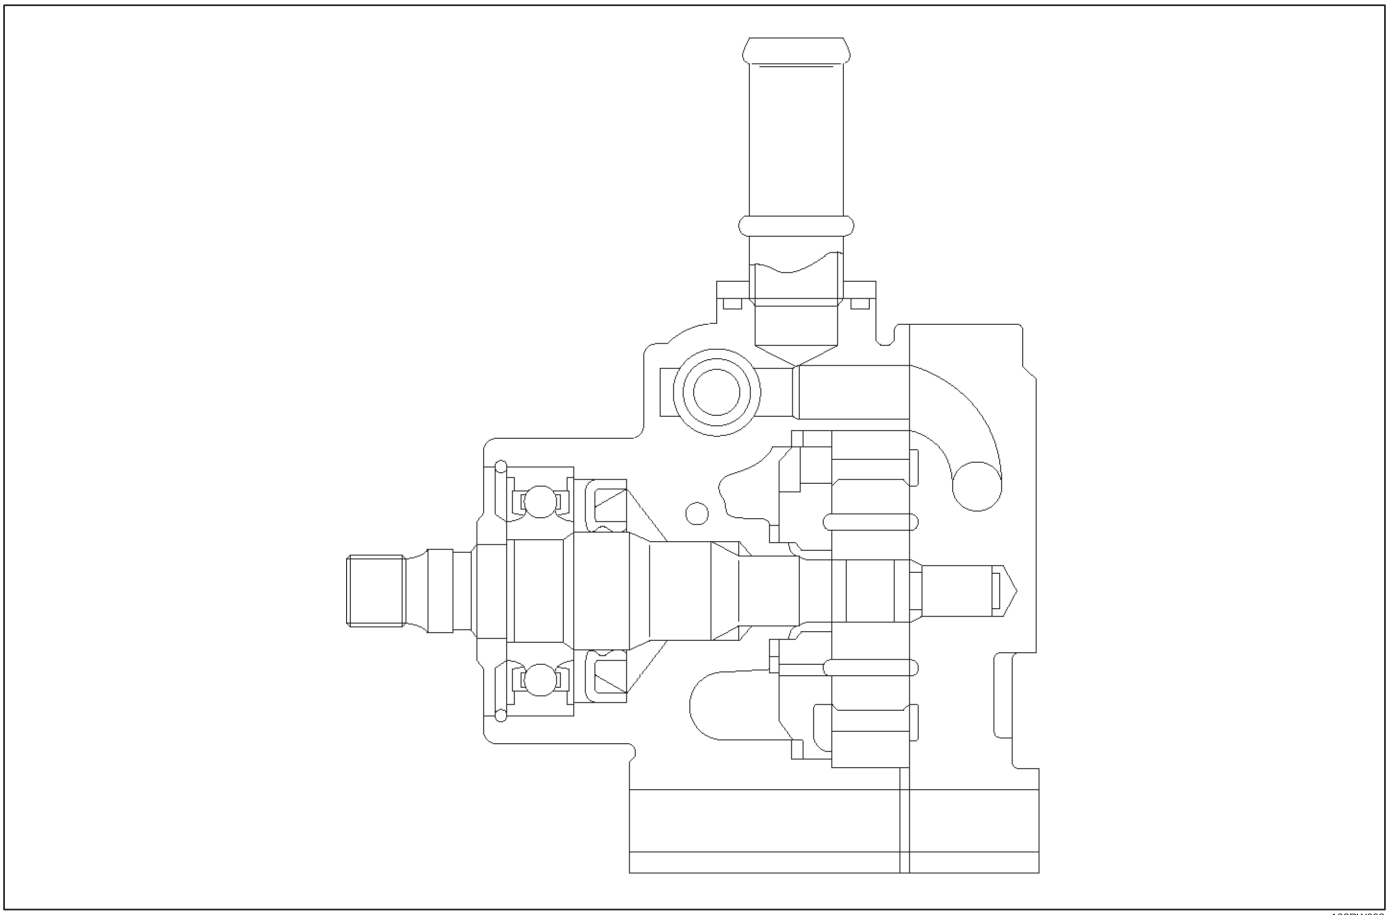
Power Steering Unit



A02RW001

The power steering unit is rack and pinion type.
The toe–in angle can be adjusted by turning the rod on each side.
The steering housing cannot be disassembled.

Hydraulic Pump



A02RW003

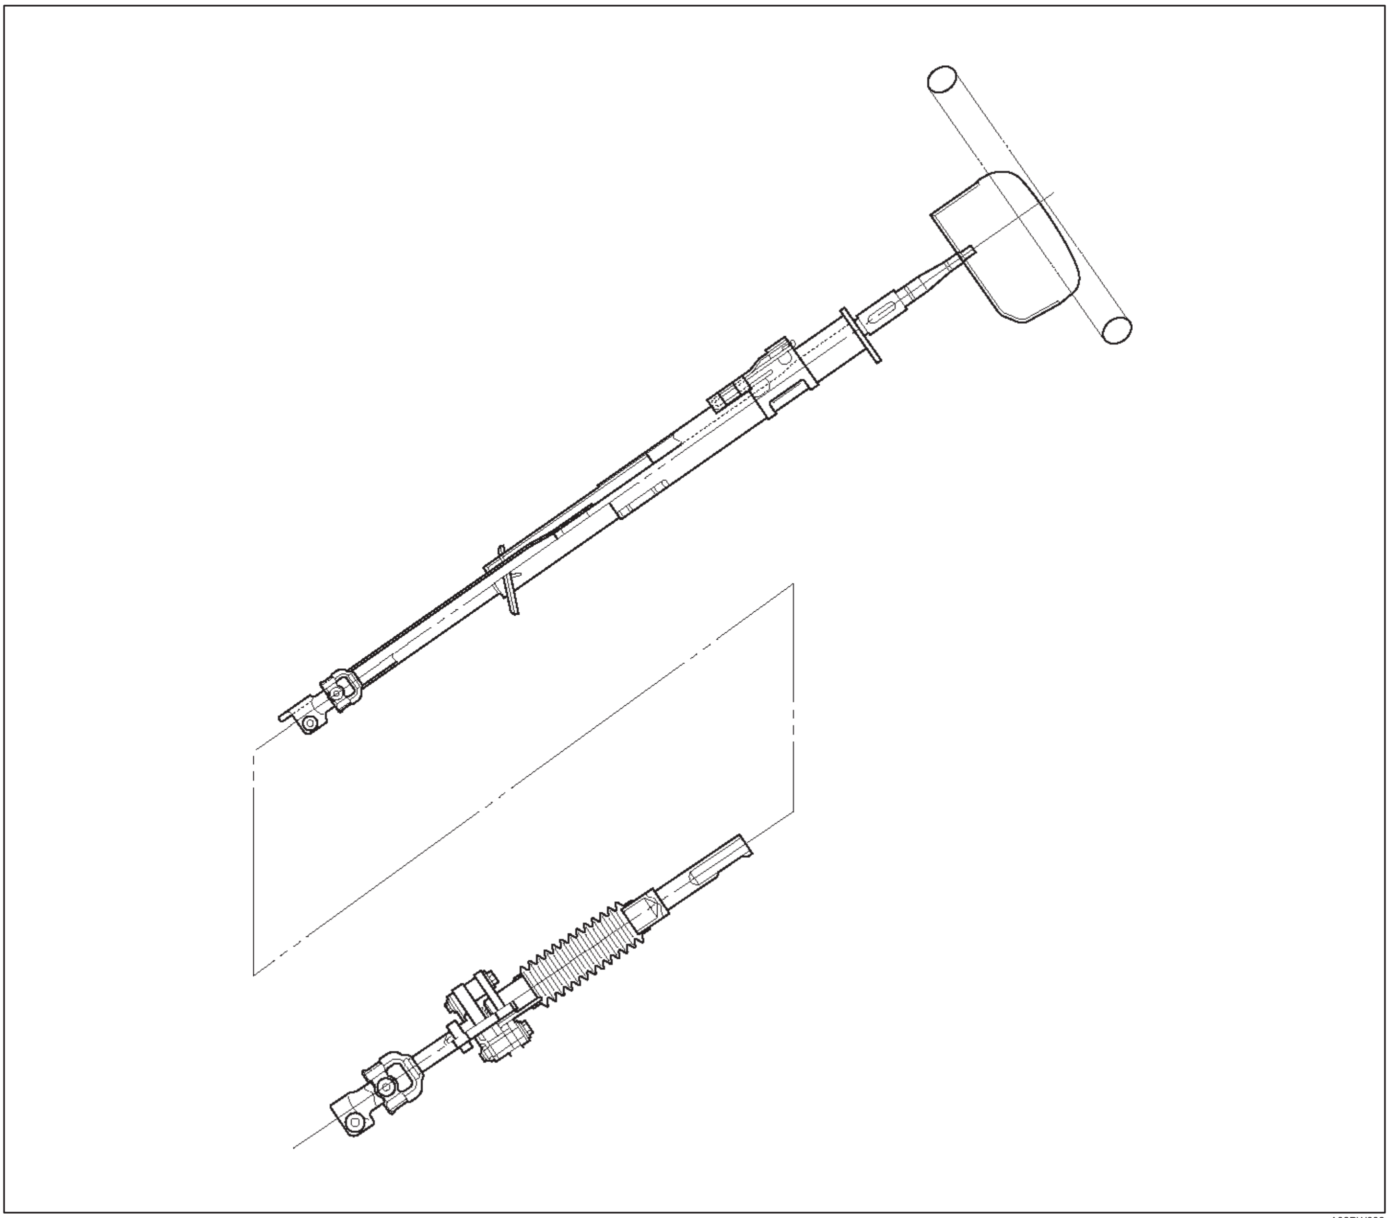
The hydraulic pump is vane-type design. The submerged pump has housing and internal parts that are inside the reservoir and operate submerged in oil. There are two bore openings at the rear of the pump housing. The larger opening contains the cam ring, pressure plate, thrust plate, rotor and vane assembly, and end plate. The smaller opening contains the pressure line union, flow control valve and spring.

The flow control orifice is part of the pressure line union. The pressure relief valve inside the flow control valve limits the pump pressure.

Pressure Switch

When hydraulic pressure reaches 3430 kPa (500 psi), the pressure switch closes causing the Engine Control Module (ECM) to actuate the idle air control valve, which increases the engine rpm to prevent the overload-induced engine speed slow down. The switch opens when hydraulic pressure drops to 2940 kPa (430 psi).

Steering Column



A02RW002

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLE-SHOOTING THE SRS SYSTEM, DO NOT USE ELECTRICAL TEST EQUIPMENT, SUCH AS BATTERY-POWERED OR A/C-POWERED VOLT-METER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER. INSTRUCTION IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

When servicing a vehicle equipped with Supplemental Restraint System, pay close attention to all WARNINGS and CAUTIONS.

For detailed explanation about SRS, refer to Restraints section.

The steering column has three important features in addition to the steering function:

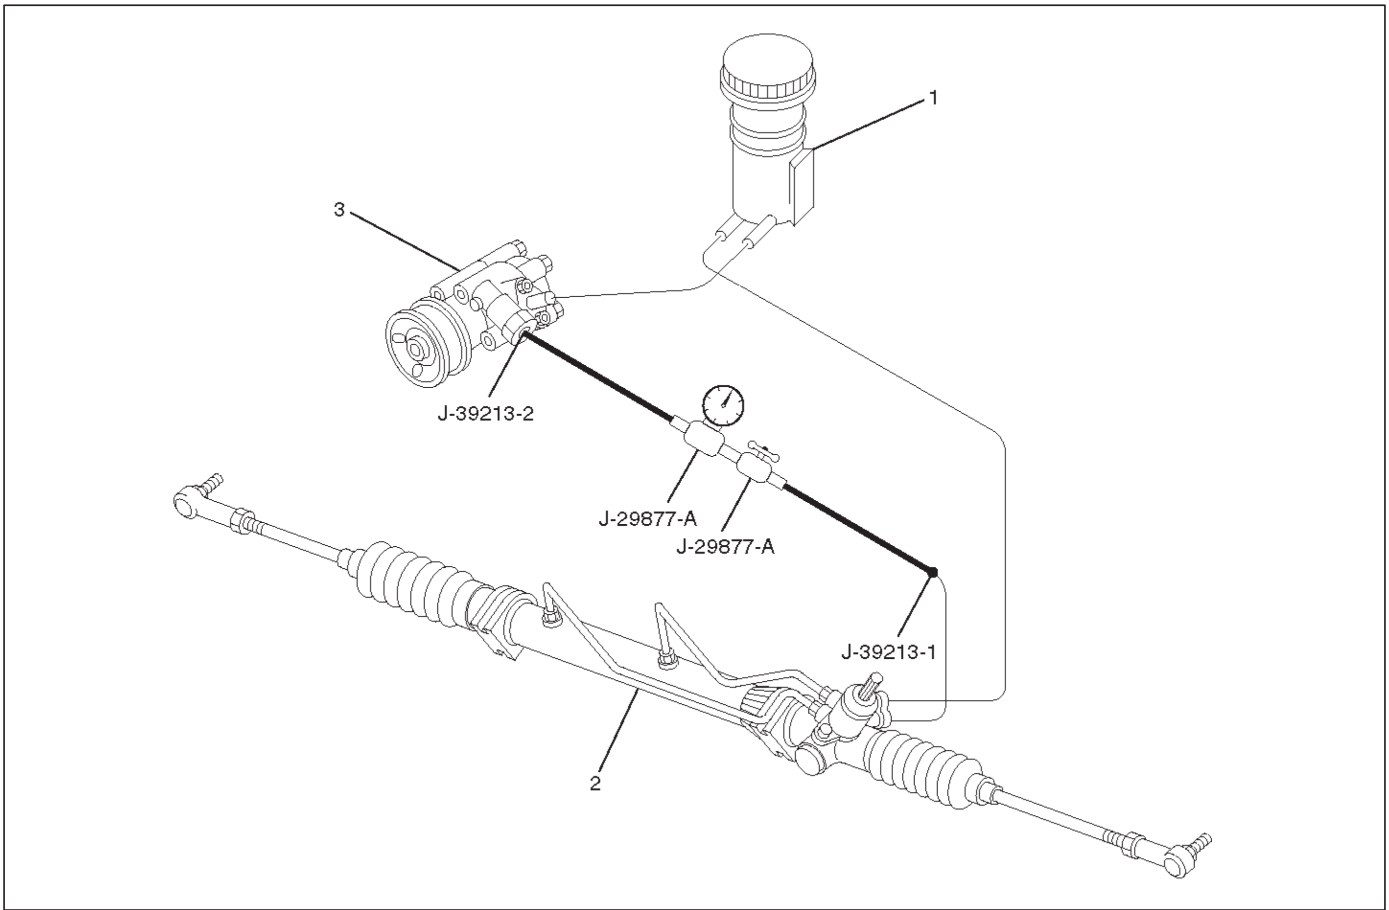
1. The column is energy absorbing, designed to compress in a front-end collision to minimize the possibility of injury to the driver of the vehicle.
2. The ignition switch and lock are mounted conveniently on the column.
3. With the column mounted lock, the ignition and steering operation can be locked to prevent theft of the vehicle.

The column can be disassembled and reassembled. However, to insure the energy absorbing action, use only the specified screws, bolts and nuts as designated, and tighten them to the specified torque.

Handle the column with care when it is removed from the vehicle. A sharp blow on the end of steering shaft or shift lever, or dropping the assembly could shear or loosen the fasteners that maintain column rigidity.

Power Steering System Test

Test Procedure



Legend

(1) Fluid Reservoir
(2) Power Steering Unit
(3) Power Steering Pump

Test of fluid pressure in the power steering system is performed to determine whether or not the oil pump and power steering unit are functioning normally.

The power steering system test is used to identify and isolate hydraulic circuit difficulties. Prior to performing this test, the following inspections and corrections, if necessary, must be made.

- Inspect pump reservoir for proper fluid level.
- Inspect pump belt for proper tension.
- Inspect pump driver pulley condition.

1. Place a container under the pump to catch the fluid when disconnecting or connecting the hoses.
2. With the engine NOT running, disconnect the pressure hose at the power steering pump and install power steering tester J-29877-A. The gage must be between the shutoff valve and pump. Open the shutoff valve.
3. Check the fluid level. Fill the reservoir with power steering fluid, to the “Full” mark. Start the engine, then turn the steering wheel and momentarily hold it against a stop (right or left). Turn the engine off and check the connections at tester for leakage.

4. Bleed the system. Refer to Bleeding the Power Steering System in this section.
5. Start the engine and check the fluid level. Add power steering fluid if required. When the engine is at normal operating temperature, increase engine speed to 1500 rpm.

CAUTION: Do not leave shutoff valve fully closed for more than 5 seconds, as the pump could become damaged internally.

6. Fully close the shutoff valve. Record the highest pressures.
   - If the pressure recorded is within 9300–9800 kPa (1350–1420 psi), the pump is functioning within its specifications.
   - If the pressure recorded is higher than 9800 kPa (1420 psi), the valve in the pump is defective.
   - If the pressure recorded is lower than 9300 kPa (1350 psi), the valve or the rotating group in the pump is defective.
7. If the pump pressures are within specifications, leave the valve open and turn (or have someone else turn) the steering wheel fully in both directions. Record the highest pressures and compare with the maximum pump pressure recorded in step 6. If this pressure cannot be built in either side of the power steering unit, the power steering unit is leaking internally and must be replaced.
8. Shut the engine off, remove the testing gauge.
9. Reconnect the pressure hose, check the fluid level and make the needed repairs.
10. If the problem still exists, the steering and front suspension must be thoroughly examined.

Maintenance

The hydraulic system should be kept clean and fluid level in the reservoir should be checked at regular intervals and fluid added when required. Refer to Recommended Fluids and Lubricants in General Information section for the type of fluid to be used and the intervals for filling.

If the system contains some dirt, flush it as described in this section. If it is exceptionally dirty, the pump must be completely disassembled before further usage. (The steering unit cannot be disassembled.)

All tubes, hoses, and fittings should be inspected for leakage at regular intervals. Fittings must be tight. Make sure the clips, clamps and supporting tubes and hoses are in place and properly secured.

Power steering hoses and lines must not be twisted, kinked or tightly bent. Air in the system will cause spongy action and noisy operation. When a hose is disconnected or when fluid is lost, for any reason, the system must be bled after refilling. Refer to Bleeding the Power Steering System in this section.

- Inspect belt for tightness.
- Inspect pulley for looseness or damage. The pulley should not wobble with the engine running.
- Inspect hoses so they are not touching any other parts of the vehicle.
- Inspect fluid level and fill to the proper level.

Fluid Level

1. Run the engine until the power steering fluid reaches normal operating temperature, about 55˚C (130˚F), then shut the engine off.
2. Check the level of fluid in the reservoir.
3. If the fluid level is low, add power steering fluid as specified in General Information to the proper level and install the receiver cap.
4. When checking the fluid level after the steering system has been serviced, air must be bled from the system. Refer to Bleeding the Power Steering System in this section.

Bleeding The Power Steering System

When a power steering pump or unit has been installed, or an oil line has been disconnected, the air that has entered the system must be bled out before the vehicle is operated. If air is allowed to remain in the power steering fluid system, noisy and unsatisfactory operation of the system may result.

Bleeding Procedure

When bleeding the system, and any time fluid is added to the power steering system, be sure to use only power steering fluid as specified in General Information.

1. Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
2. Start the engine and let it run for a few seconds. Do not turn the steering wheel. Then turn the engine off.
3. Add fluid if necessary.
4. Repeat the above procedure until the fluid level remains constant after running the engine.
5. Raise and support the front end of the vehicle so that the wheels are off the ground.
6. Start the engine. Slowly turn the steering wheel right and left, lightly contacting the wheel stops.
7. Add power steering fluid if necessary.
8. Lower the vehicle, set the steering wheel at the straight forward position after turning it to its full steer positions 2 or 3 times, and stop the engine.
9. Check the fluid level and refill as required.
10. If the fluid is extremely foamy, allow the vehicle to set a few minutes, then repeat the above procedure.

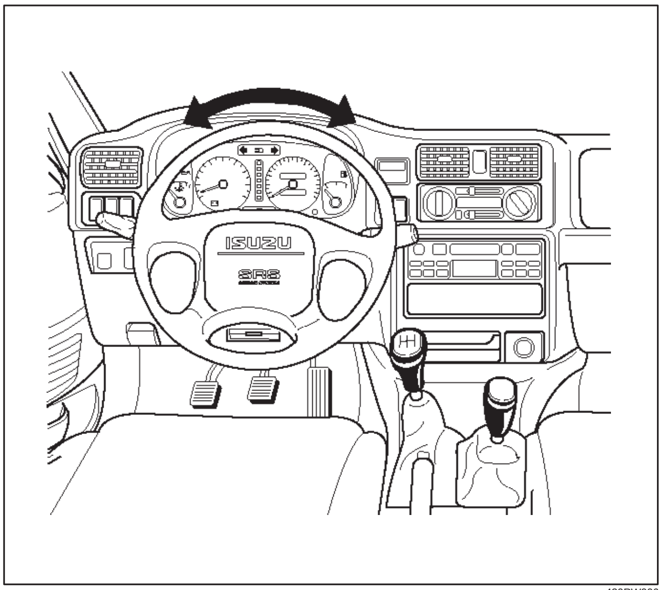
Flushing The Power Steering System

1. Raise and support the front end of the vehicle off the ground until the wheels are free to turn.
2. Remove the fluid return line at the pump inlet connector and plug the connector port on the pump. Position the line toward a large container to catch the draining fluid.
3. While running the engine at idle, fill the reservoir with new power steering fluid. Turn the steering wheel in both directions. Do not contact or hold the steering wheel to the wheel stops. This will cause the pump to go to pressure relief mode, which may cause a sudden fluid overflow at the reservoir.

4. Install all the lines and hoses. Fill the system with new power steering fluid and bleed the system as described in Bleeding The Power Steering System. Operate the engine for about 15 minutes.

   Remove the pump return line at the pump inlet and plug the connection on the pump. While refilling the reservoir, check the draining fluid for contamination. If foreign material is still evident, replace all lines, disassemble and clean or replace the power steering system components. Do not re-use any drained power steering fluid.

Steering Wheel Free Play Inspection



430RW006

1. With the tires in the straight-ahead position, check the amount of steering wheel play by turning the wheel in both directions until the tires begin to move.

NOTE: The wheel free play should be checked with the engine running.

Free play: 0 – 30 mm (0 – 1.18 in)

2. Also check the steering wheel for play and looseness in the mount by moving it back and forth and sideways. When test driving, check for hard steering, steering shimmy and tendency to pull to one side.

Front End Alignment Inspection and Adjustment

General Description

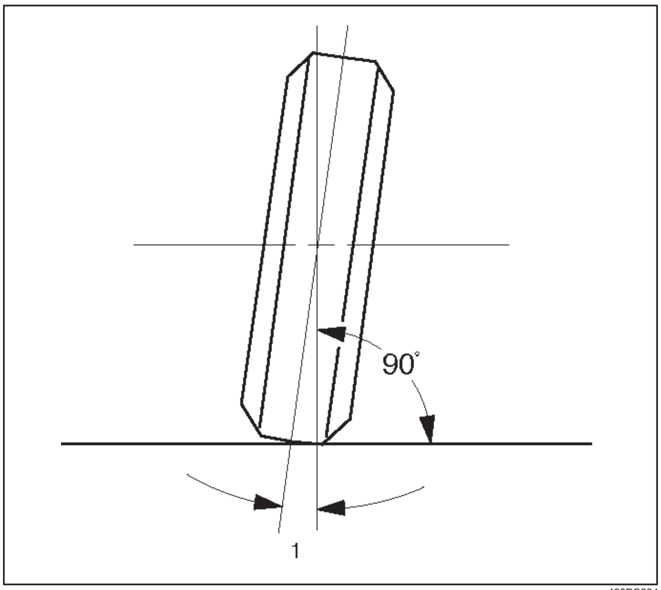
“Front End Alignment” refers to the angular relationship between the front wheels, the front suspension attaching parts and the ground.

Proper front end alignment must be maintained in order to insure efficient steering, good directional stability and to prevent abnormal tire wear.

The most important factors of front end alignment are wheel toe-in, wheel camber and axle caster.

Camber:

This illustration shows view from the front of the vehicle.

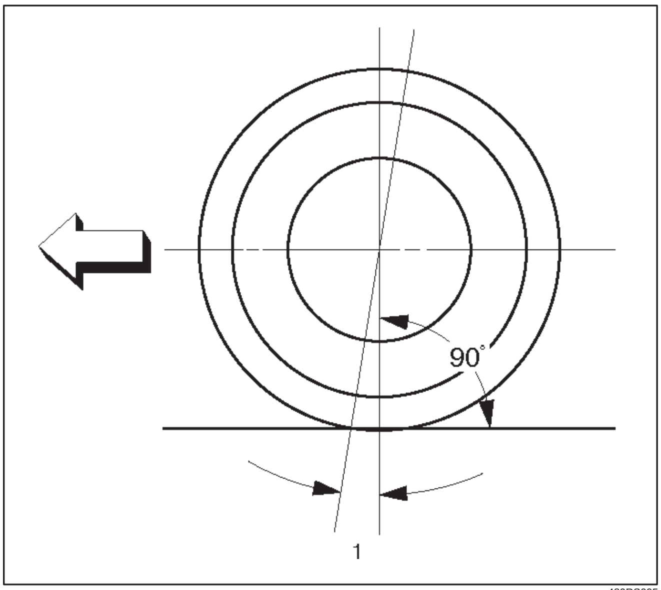


480RS004

Camber is the vertical tilting inward or outward of the front wheels. When the wheels tilt outward at the top, the camber is positive (+). When the wheels tilt inward at the top, the camber is negative (-). The amount of tilt measured in degrees from the vertical is called the camber angle (1). If camber is extreme or unequal between the wheels, improper steering and excessive tire wear will result. Negative camber causes wear on the inside of the tire, while positive camber causes wear to the outside.

Caster:

This illustration shows view from the side of the vehicle.

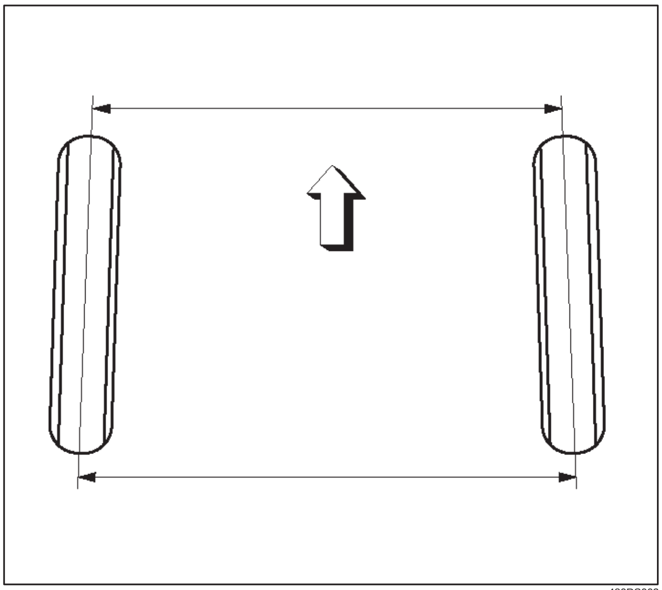


480RS005

Caster (1) is the vertical tilting of the wheel axis either forward or backward (when viewed from the side of the vehicle). A backward tilt is positive (+) and a forward tilt is negative (-). On the short and long arm type suspension you cannot see a caster angle without a special instrument, but if you look straight down from the top of the upper control arm to the ground, the ball joints do not line up (fore and aft) when a caster angle other than 0 degree is present. With a positive angle, the lower ball joint would be slightly ahead (toward the front of the vehicle) of the upper ball joint center line.

Toe-in:

This illustration shows view from the top of the vehicle.



480RS003

Toe-in is the measured amount the front wheels are turn in. The actual amount of toe-in is normally a fraction of a degree. Toe-in is measured from the center of the tire treads or from the inside of the tires. The purpose of toe-in is to insure parallel rolling of the front wheels and to offset any small deflections of the wheel support system which occurs when the vehicle is rolling forward. Incorrect toe-in results in excessive toe-in and unstable steering. Toe-in is the last alignment to be set in the front end alignment procedure.

Inspection

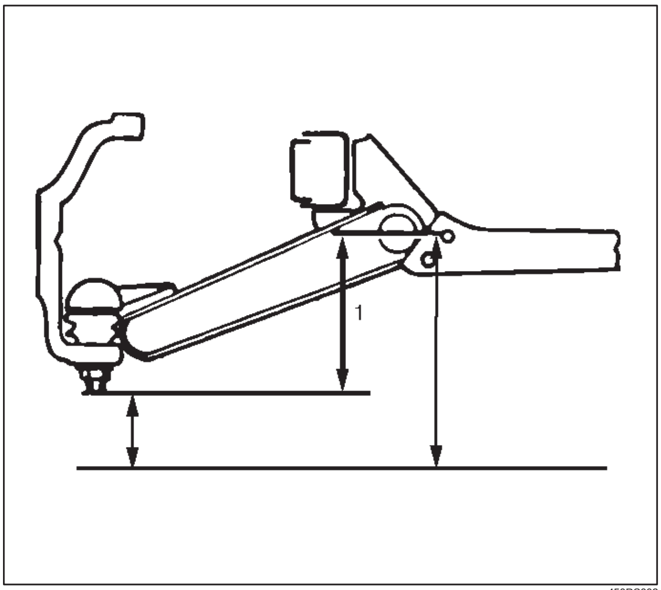
Before making any adjustments affecting caster, camber or toe-in, the following front end inspection should be made.

1. Inspect the tires for proper inflation pressure. Refer to Main Data and Specifications in Wheel and Tire System section.
2. Make sure that the vehicle is unladen condition (With no passenger or loading).
3. Make sure that the spare tire is installed at the normal position.
4. Inspect the front wheel bearings for proper adjustment. Refer to Front Hub and Disc Overhaul in Suspension section.
5. Inspect the ball joints and tie rod ends. If excessive looseness is noted, correct before adjusting. Refer to Steering Linkage in this section.
6. Inspect the wheel and tires for run-out. Refer to Wheel Replacement in Wheel and Tire System section.
7. Inspect the trim height. If not within specifications, the correction must be made before adjusting caster.
8. Inspect the steering unit for looseness at the frame.
9. Inspect shock absorbers for leaks or any noticeable noise. Refer to Shock Absorber in Suspension section.
10. Inspect the control arms or stabilizer bar attachment for looseness. Refer to Suspension section .
11. Inspect the front end alignment using alignment equipment. Follow the manufacturer's instructions.
12. Park the vehicle must be on a level surface.

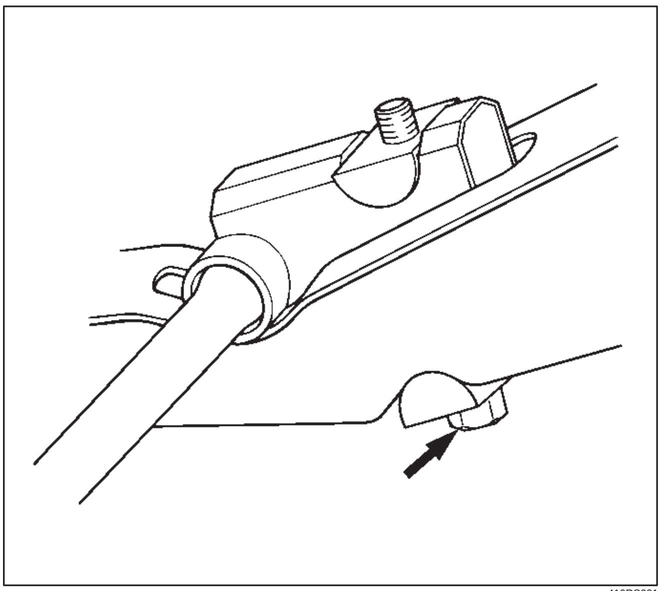
Trim Height Adjustment

Adjust the trim height (1) by means of the adjusting bolt on the height control arms.

CAUTION: When adjusting front end alignment, be sure to begin with trim height first, as it may change other adjusted alignments.



450RS003



410RS001

1. Check and adjust the tire inflation pressures.
2. Park the vehicle on a level ground and move the front of the vehicle up and down several times to settle the suspension.
3. Make necessary adjustment with the adjusting bolt on the height control arms.

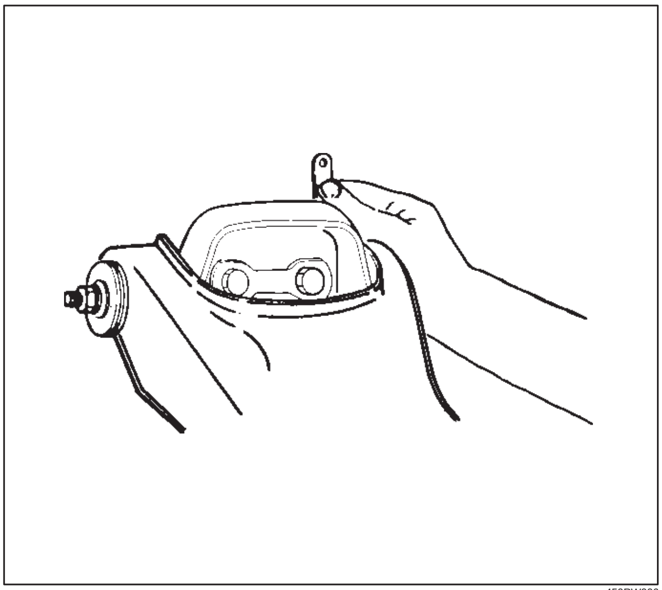
Trim height: 119 ± 5 mm (4.69 ± 0.2 in)

Caster Adjustment

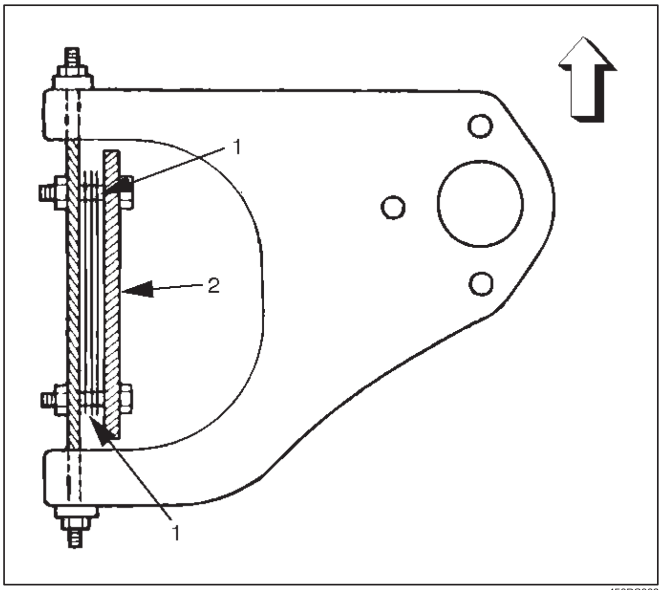
The caster angle can be adjusted by means of the caster shims (1) installed between the chassis frame (2) and fulcrum pins.

Caster angle: 2°30’ ± 45’

CAUTION: Left and right side must be equal within 30’.



450RW006



450RS002

NOTE: Difference of the caster shim front/rear thickness should be 3.6 mm (0.142 in) or less. Overall thickness of caster shim and camber shim should be 10.8 mm (0.425 in) or less.

Tighten the fulcrum pin bolt to the specified torque.

Torque: 152 N·m 112 (lb ft)

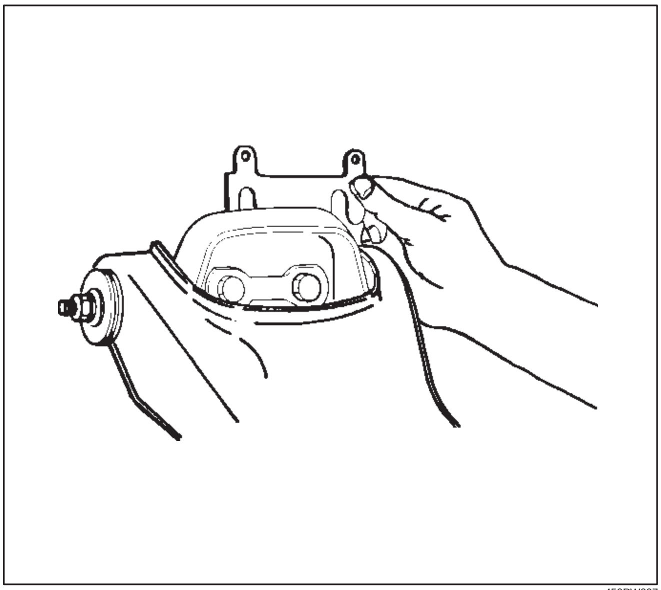
Camber Adjustment

The camber angle can be adjusted by means of the camber shims (2) installed in position between the chassis frame (1) and fulcrum pins

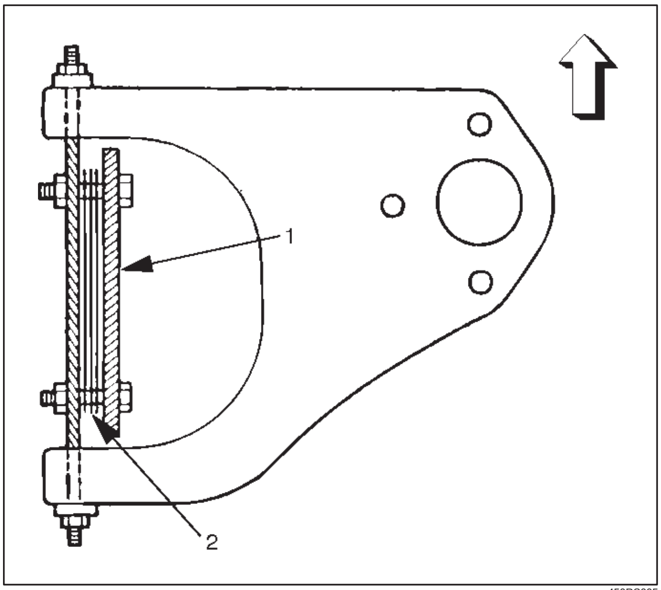
Camber angle: 0° ± 30’

King pin inclination: 12°30’ ± 30’

CAUTION: Left and right side must be equal within 30’.



450RW007



450RS005

NOTE: Overall thickness of caster shim and camber shim should be 10.8 mm (0.425 in) or less.

Tighten the fulcrum pin bolt to the specified torque.

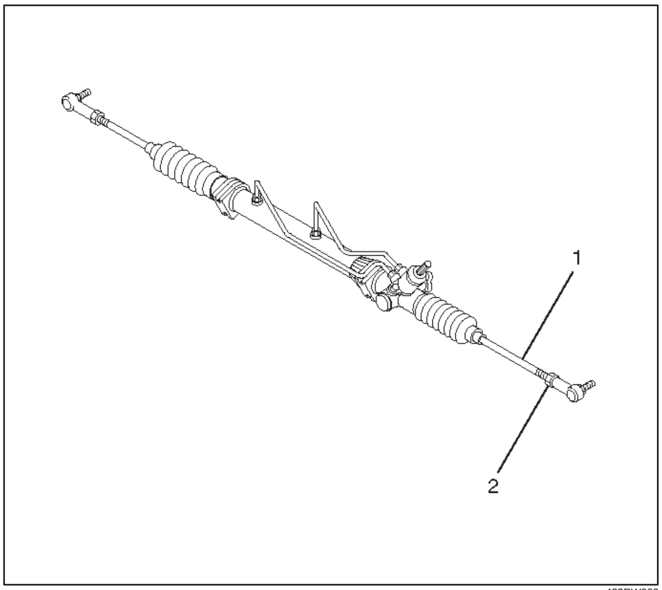
Torque: 152 N·m (112 lb ft)

	Position of shims		Camber angle	Caster angle
	Front side	Rear side		
Caster shim	When added	When removed	Decreases	Decreases
	When removed	When added	Increases	Increases
	—	When removed	Unchanged	Decreases
	—	When added	Unchanged	Increases
Camber shim	When added		Decreases	Unchanged
	When removed		Increases	Unchanged

Toe-in Adjustment

1. To adjust the toe-in angle, loosen the lock nuts (2) on the tie rod (1) and turn the tie rod. Turn both rods the same amount, to keep the steering wheel centered .

Toe-in: 0 ± 2 mm (0 ± 0.08 in)



433RW003

2. Tighten the lock nut to the specified torque.

Torque: 118 N·m (87 lb ft)

Main Data and Specifications

General Specification

Caster		2°30’ ± 45’
Camber		0° ± 30’
King pin inclination		12°30’ ± 30’
Toe-in		0 ± 2 mm (0 ± 0.08 in)
Max. steering angle	inside	32.6° (+0°30’ to –2°30’)
	outside	31.8°

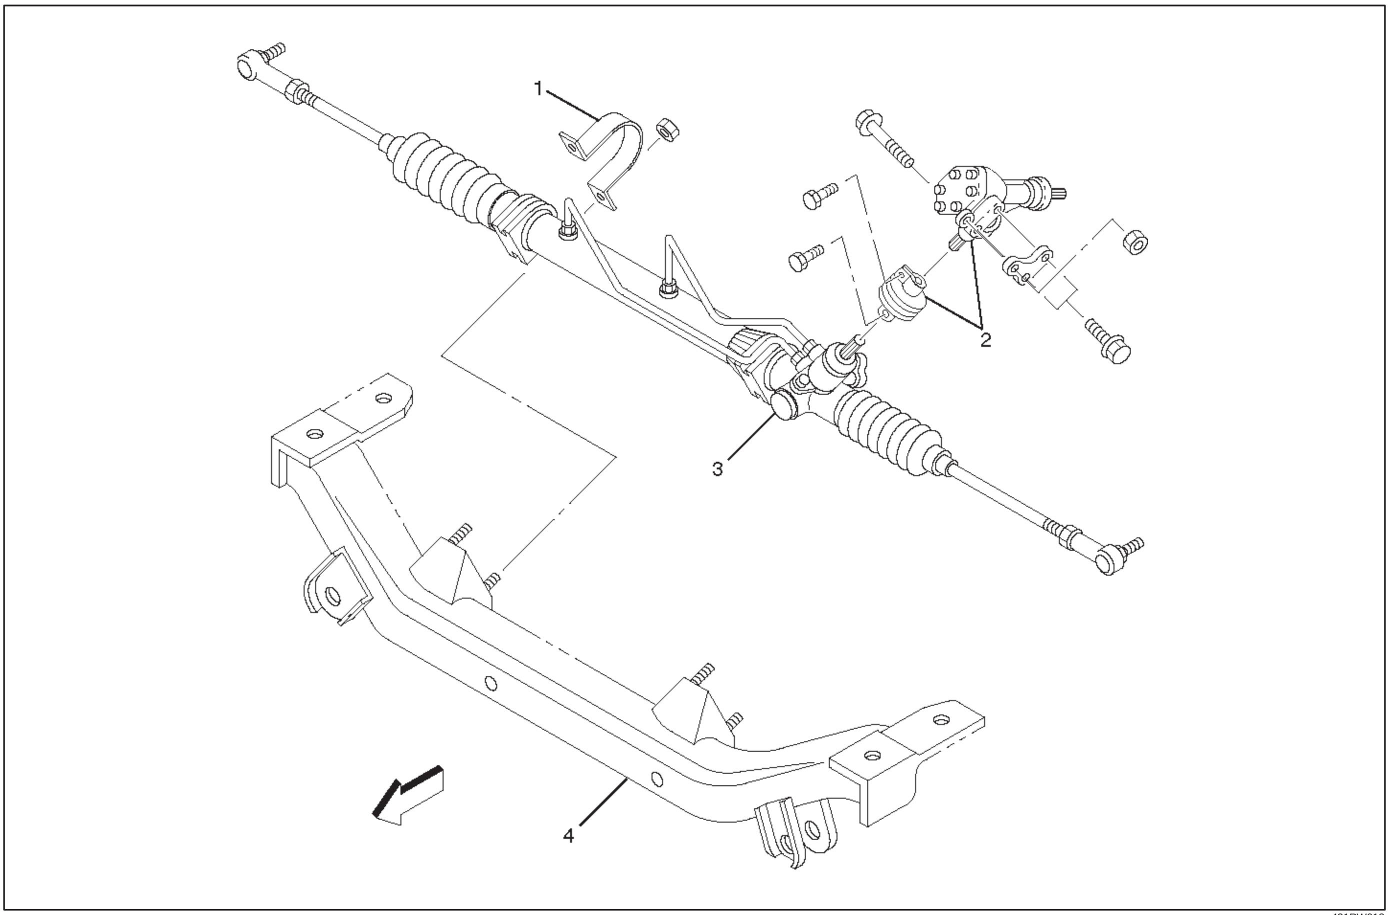
Power Steering Unit

Power Steering Unit and Associated Parts



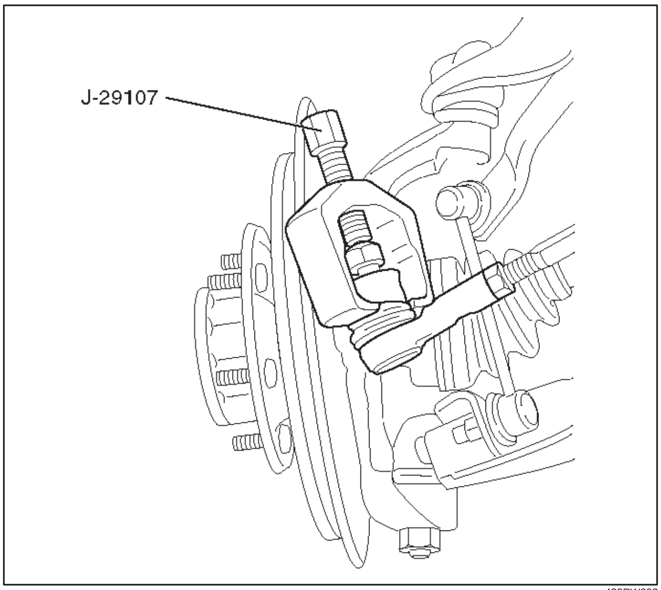
431RW013

Legend

(1) Bracket
(2) Transfer Gear Assembly
(3) Power Steering Unit Assembly
(4) Crossmember

Removal

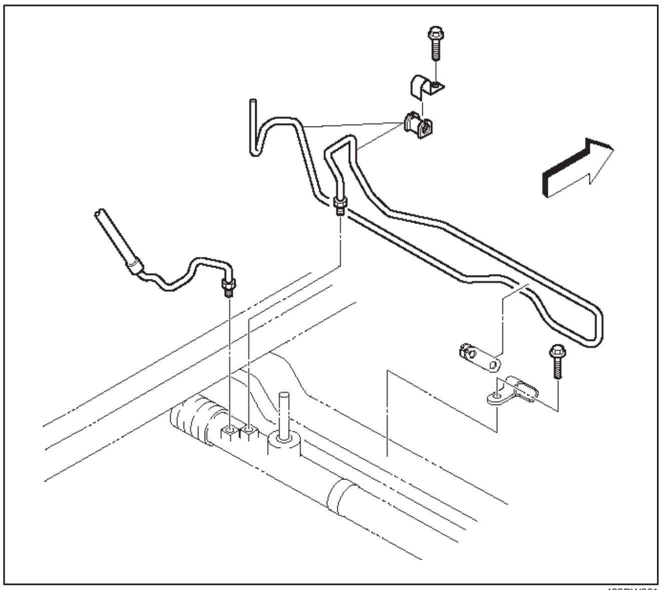
1. Remove the stone guard.
2. Remove the transfer gear assembly.
   Make a setting mark across the coupling flange and steering unit to ensure reassembly of the parts in the original position.
3. Drain power steering fluid.
4. Remove the tie rod end assembly from knuckle.
   Use tie rod end remover J–29107.



433RW002

5. Disconnect the feed line and return line from steering unit.
   Remove the clips on the crossmember and frame.
   Wire the power steering line to frame.

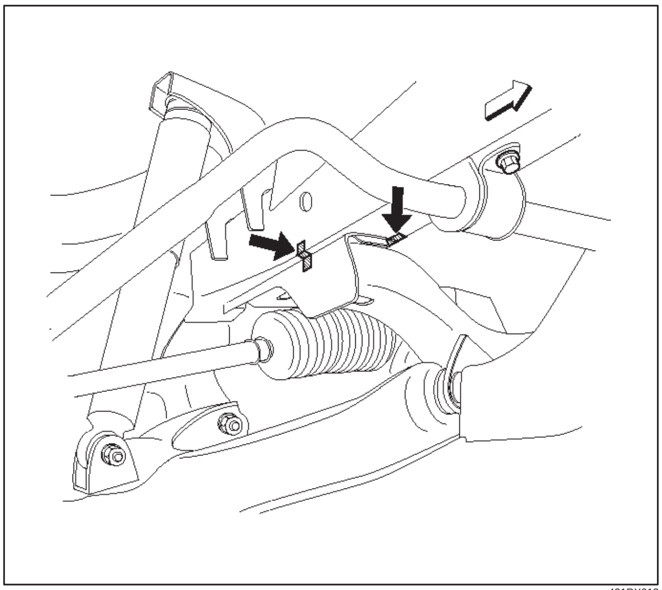
NOTE: Take care to prevent foreign matter from entry when disconnect the power steering line.



435RW001

4×4 model:

1. Remove the torsion bar. Refer to Front Suspension in Suspension section.
2. Remove the lower control arm bolt (Frame side).
   Refer to Front Suspension in Suspension section.
3. Apply a setting mark across the crossmember and frame so parts can be reassembled in their original position.



431RX013

4. Remove the crossmember fixing bolt.
5. Remove the power steering unit with the crossmember.
6. Remove the power steering unit.

4×2 model:

1. Remove the power steering unit from the crossmember.

Installation (4×2 Model)

1. Install power steering unit to crossmember.
   Tighten fixing bolt to specified torque.

   Torque: 116 N·m (85 lb ft)
2. Connect the feed line and return line.

   Torque: 25 N·m (18 lb ft)
3. Install tie–rod end assembly to knuckle.

   Torque: 118 N·m (87 lb ft)
4. Install transfer gear assembly.
   Align the setting marks made at removal.

   Torque: 31 N·m (23 lb ft)
5. Install the stone guard.
6. Bleed the system.
   Refer to Bleeding the Power Steering System in this section.

Installation (4×4 Model)

1. Install power steering unit to crossmember.
   Tighten fixing bolt to specified torque.

   Torque: 116 N·m (85 lb ft)
2. Install power steering unit with crossmember to frame by aligning the setting marks made when removing.
   Tighten crossmember mounting bolt to specified torque.

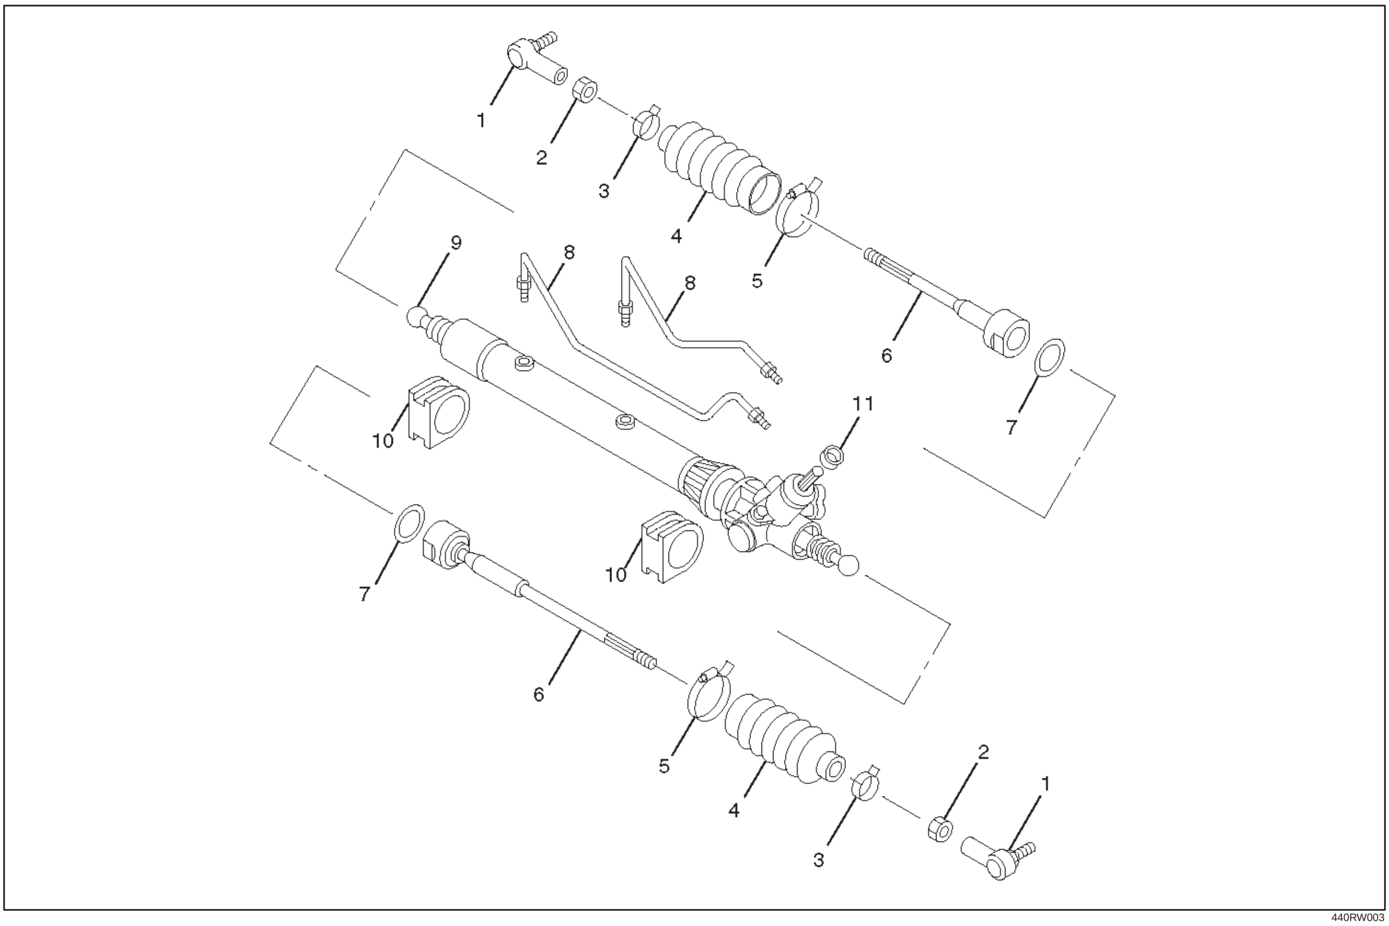
   Torque: 190 N·m (140 lb ft)
3. Install lower control arm bolt.
   Refer to Front Suspension in Suspension section.
4. Install torsion bar.
   Refer to Front Suspension in Suspension section.
5. Connect the feed line and return line.

   Torque: 25 N·m (18 lb ft)
6. Install tie–rod end assembly to knuckle.

   Torque: 118 N·m (87 lb ft)
7. Install transfer gear assembly.
   Align the setting marks made at removal.

   Torque: 31 N·m (23 lb ft)
8. Install the stone guard.
9. Bleed the system.
   Refer to Bleeding the Power Steering System in this section.

Power Steering Unit Disassembled View



Legend

(1) Tie-rod End
(2) Lock Nut
(3) Clip
(4) Bellows
(5) Band
(6) Tie-rod Assembly
(7) Tab Washer
(8) Oil Line
(9) Valve Housing Assembly
(10) Mounting Rubber
(11) Dust Cover

Disassembly

NOTE: The valve housing is made of aluminum and care should be exercised when clamping in a vise, etc. to prevent distortion or damage.

1. Loosen lock nut and remove tie–rod end.
2. Remove clip and band, then remove bellows.
3. Remove tie-rod assembly.
   To remove, move the boot toward the tie-rod end, then remove tab washer.
4. Remove oil line, mounting rubber and dust cover.

Inspection and Repair

Inspect the following parts for wear, damage or any abnormal conditions.

Tie-rod End

If looseness or play is found when checked by moving the end of ball joint at tie-rod end, replace tie-rod end.

Tie-rod Assembly

If the resistance is insufficient or play is felt when checked by moving the ball on the tie-rod, replace the tie-rod assembly.

Rubber Parts

If wear or damage is found through inspection, replace with new ones.

Reassembly

1. Install mounting rubber and dust cover (If removed).
2. Install oil line.

   Torque: 13 N· m (113 lb in)
3. Install tie-rod assembly with tab washer.
   Apply grease to ball joint, install tie-rod and tab washer, then tighten to specified torque.

   Torque: 83 N·m (61 lb ft)

   After tightening, bend tab washer against width across flat of inner ball joint.

4. Apply a thin coat of grease to the shaft for smooth installation. Then install bellows.
5. Install band and clip.
6. Install tie-rod end and tighten lock nut.

Torque: 118 N·m (87 lb ft)

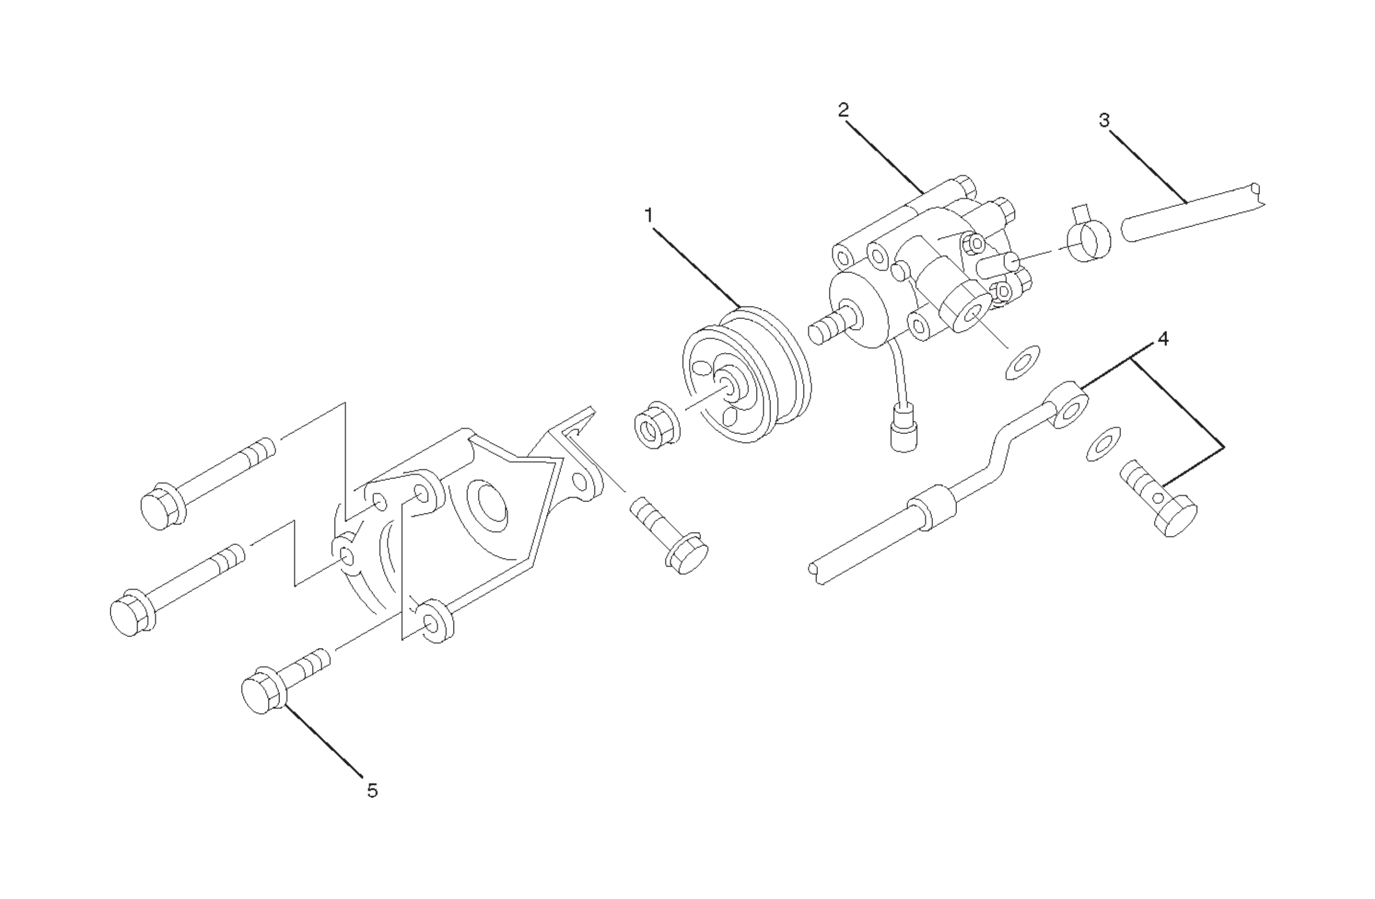
Power Steering Pump

Power Steering Pump and Associated Parts



436RW001

Legend

(1) Pulley
(2) Pump Assembly
(3) Hose, Suction
(4) Hose, Flexible
(5) Bolt

Removal

1. Remove the drive belt.
2. Remove the pulley.
3. Place a drain pan below the pump.
4. Disconnect the suction hose.
5. Disconnect the flexible hose.
6. Remove the power steering fixing bolt and remove the pump assembly.

Installation

1. Install the pump assembly to the pump braket, tighten the fixing bolt to the specified torque.

   Torque: 46 N·m (34 lb ft)

2. Install the flexible hose.
   Tighten the eye bolt to specified torque.

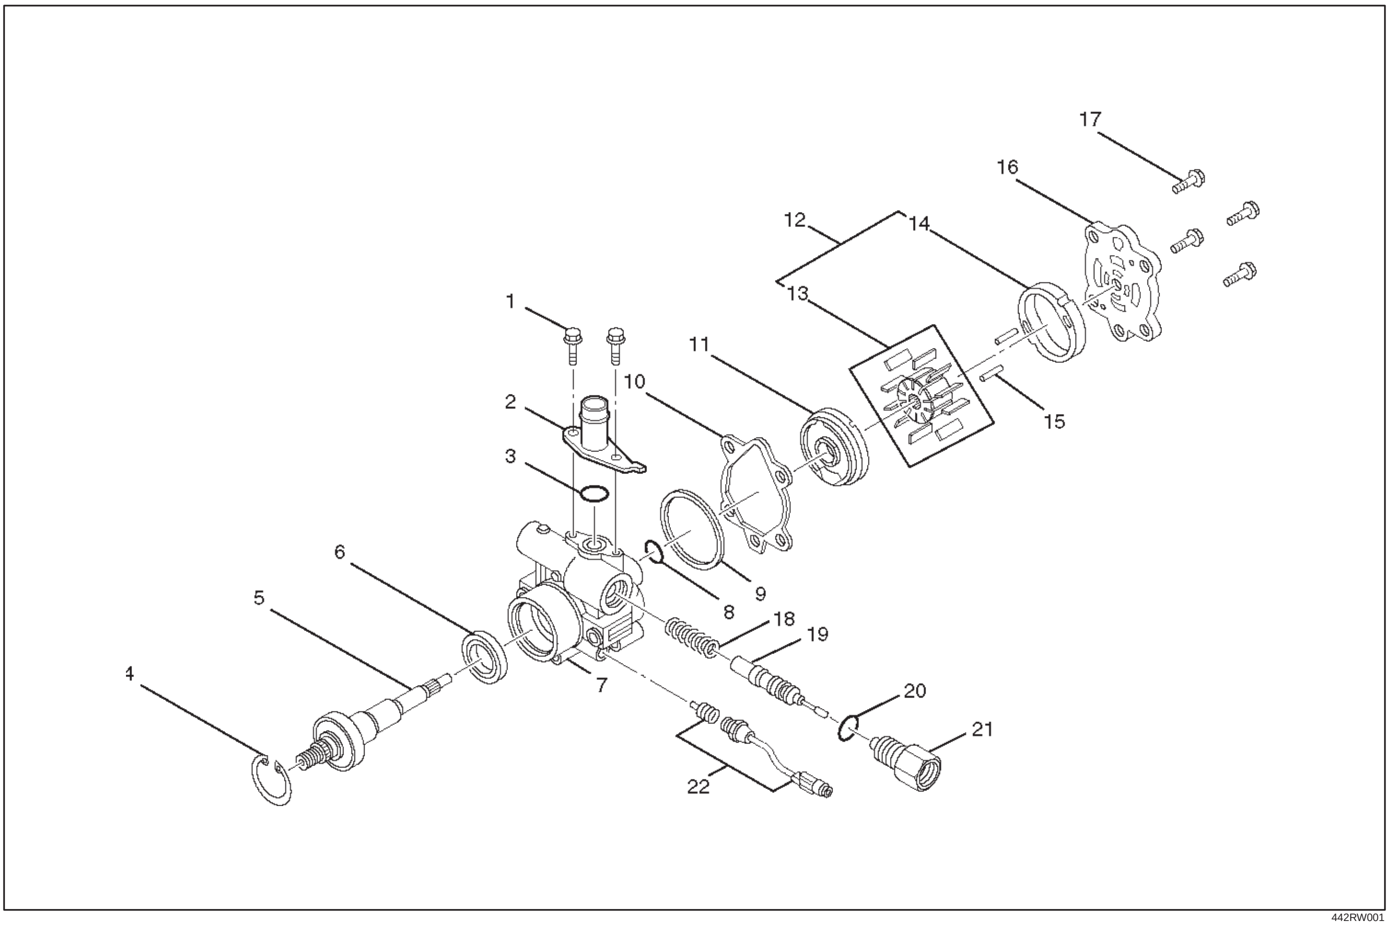
   Torque: 54 N·m (40 lb ft)

3. Install the pulley and tighten the nut to the specified torque.

   Torque: 78 N·m (58 lb ft)

4. Install the drive belt.
5. Connect the suction hose, then fill and bleed system.
   Refer to Bleeding the Power Steering System in this section.

Power Steering Pump Disassembled View



Legend

(1) Bolt

(15) Pin
(16) Rear Housing
(17) Bolt
(18) Spring
(19) Relief Valve
(20) O-ring
(21) Connector
(22) Pressure Switch

Disassembly

1. Clean the oil pump with solvent (plug the discharge and suction ports to prevent the entry of solvent).
   Be careful not to expose the oil seal of shaft assembly to solvent.
2. Remove the bolt, suction pipe and O-ring.
3. Remove the connector, O-ring, relief valve and spring.
4. Remove the pressure switch assembly.
5. Remove the retaining ring.
6. Remove the shaft assembly.
7. Remove the oil seal.

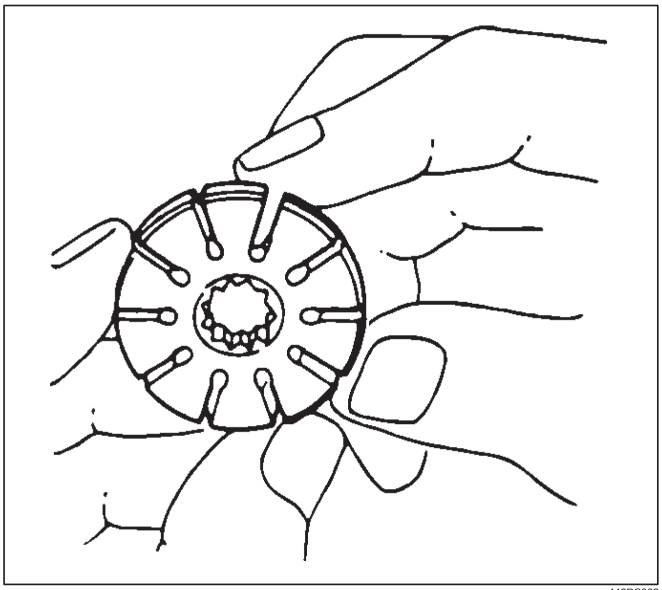
CAUTION: When removing the oil seal, be careful not to damage the housing.

8. Remove the bolt, rear housing and gasket.
9. Remove the pump cartridge assembly from the front housing.
10. Remove two O-rings.

Inspection and Repair

Make all necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspection.

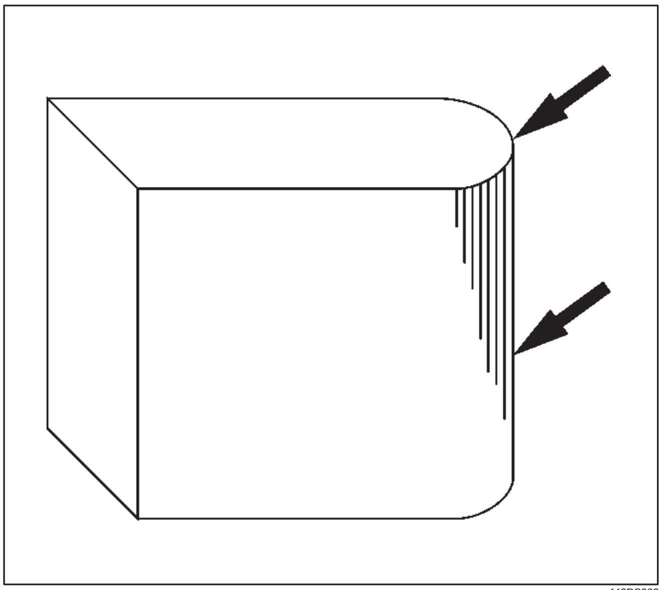
Rotor



442RS002

Check that the groove in the vane is free from excessive wear and that the vane slides smoothly. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Vane



442RS003

Sliding faces of the vane should be free from wear. (Particularly the curved face at the tip that contact with the cam should be free from wear and distortion). When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Cam

The inner face of the arm should have a uniform contact pattern without a sign of step wear. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Side Plate

The sliding faces of parts must be free from step wear (more than 0.01 mm), which can be felt by the finger nail. The parts with minor scores may be reused after lapping the face.

Relief Valve

The sliding face of the valve must be free from burrs and damage. The parts with minor scores may be reused after smoothing with emery cloth (#800 or finer).

Shaft

Oil seal sliding faces must be free from a step wear which can be felt by the finger nail. Needle bearing fitting face must be free from damage and wear.

O-ring, Oil Seal, Retaining Ring

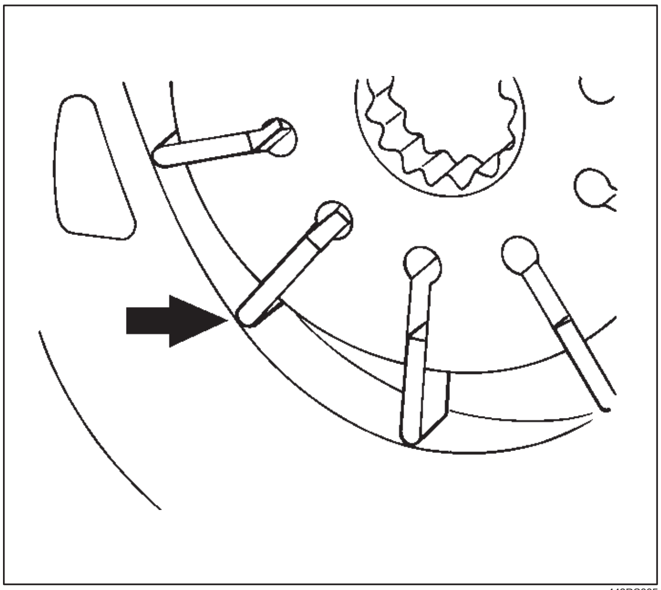
Be sure to discard used parts, and always use new parts for installation. Prior to installation, lubricate all seals and rings with power steering fluid.

Reassembly

1. Install oil seal to front housing. Be sure to discard used oil seal, and always use new parts for installation.

CAUTION: When installing the oil seal, be careful not to damage the oil seal contacting surface of the housing.

2. Install shaft assembly.
3. Install retaining ring.
4. Install the vanes to roter with curved face in contact with the inner wall of cam.



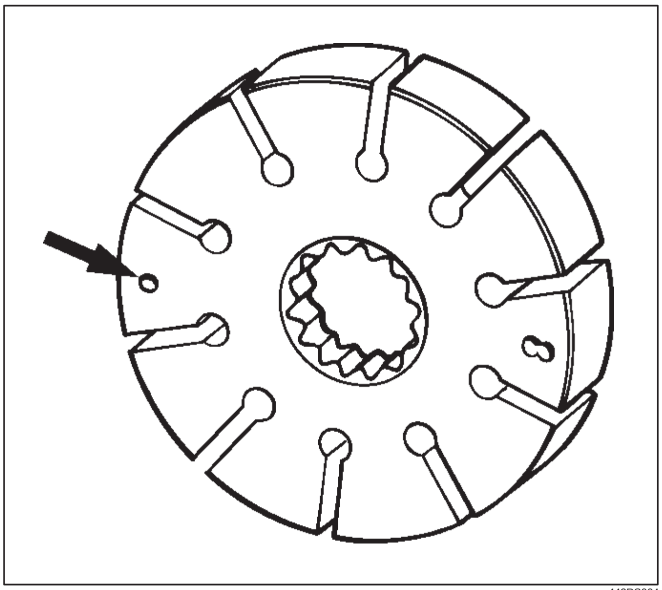
442RS005

5. Install roter and vanes to cam.
6. Install pin to cam.
7. Install two new O-rings to front housing. Be sure to discard used O-ring.

8. Install side plate.

CAUTION: When installing side plate, becareful not to damage its inner surface. Damaged side plate may cause poor pump performance, pump seizure or oil leakage.

9. Install pump cartridge assembly to front housing.
   Install the rotor with punch mark facing the front housing.



442RS004

10. Install rear housing with a new gasket. Be sure to discard used gasket. Then install bolt and tighten it to specified torque.

    Torque: 18 N·m (13 lb ft)

11. Install suction pipe with a new O-ring. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.

    Torque: 16 N·m (12 lb ft)

12. Install relief valve and spring.
13. Install connector with a new O-ring. Be sure to discard used O-ring. Tighten the connector to specified torque.

    Torque: 74 N·m (54 lb ft)

14. Install pressure switch assembly and tighten it to specified torque.

    Torque: 20 N·m (14 lb ft)

Removal

1. Remove universal joint bolt (steering shaft side).
2. Remove universal joint bolt (steering unit side).
3. Loosen fixing bolt and nut and remove transfer gear assembly with shim.

Inspection and Repair

The transfer gear assembly cannot be disassembled. If damage or abnormal condition are found, replace to new ones.

Installation

1. Install transfer gear assembly with shim and tighten bolt and nut to the specified torque.

Torque: 54 N·m (40 lb ft)

2. Connect universal joint (both side) and tighten the bolt to the specified torque.

Torque: 31 N·m (23 lb ft)

Supplemental Restraint System Steering Wheel & Column

Service Precaution

This steering wheel and column repair section covers the Supplemental Restraint System (SRS) steering column. The following repair procedures are specific to SRS components. When servicing a vehicle equipped with Supplemental Restraint System, pay close attention to all WARNINGS and CAUTIONS.

For detailed explanation about SRS, refer to Restraints section.

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

SAFE HANDLING OF INFLATOR MODULES REQUIRES FOLLOWING THE PROCEDURES DESCRIBED BELOW FOR BOTH LIVE AND DEPLOYED MODULES.

SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY (AIR BAG). AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY (AIR BAG) SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY (AIR BAG) IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AN AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE.

NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS SYSTEM, DO NOT USE ELECTRICAL TEST EQUIPMENT, SUCH AS BATTERY-POWERED OR A/C-POWERED VOLT-METER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER.

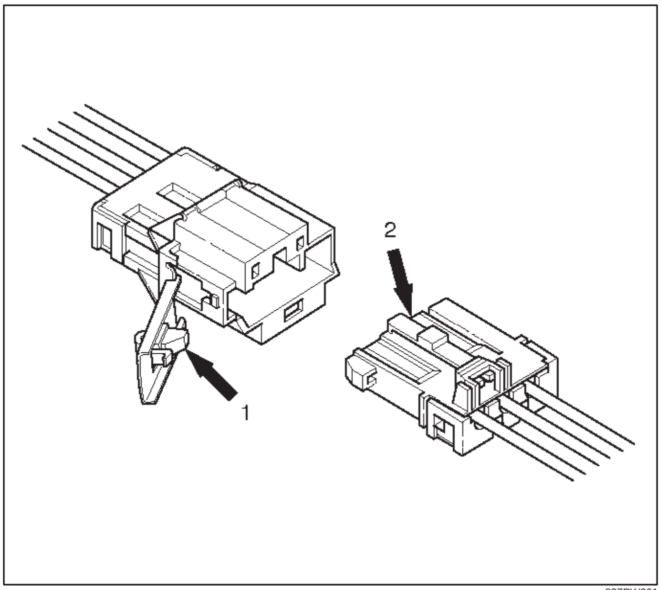
INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

SRS Connectors

CAUTION: Double-lock type yellow color connectors are used for supplemental restraint system-air bag circuit.

When removing the cable harness, disconnect the connector by unlocking at two places, outside (1) and inside (2). In such a case, do not pull the wires. Otherwise, wire disconnection may occur.

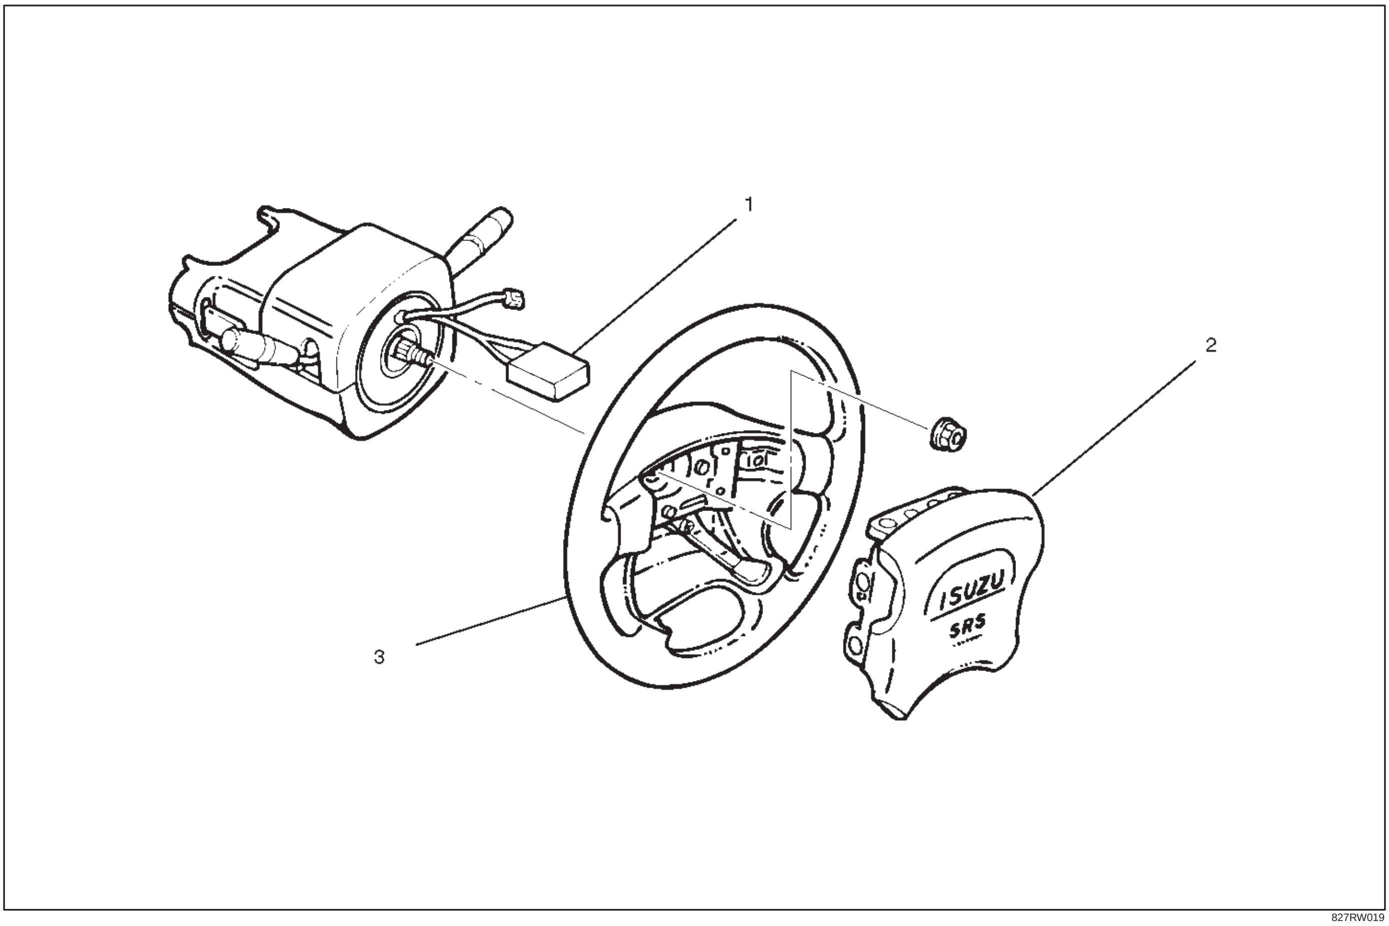
When connect the double lock type SRS connector, insert the connector completely and lock at outside. Imperfect locking may cause malfunction of SRS circuit.



827RW001

Inflator Module

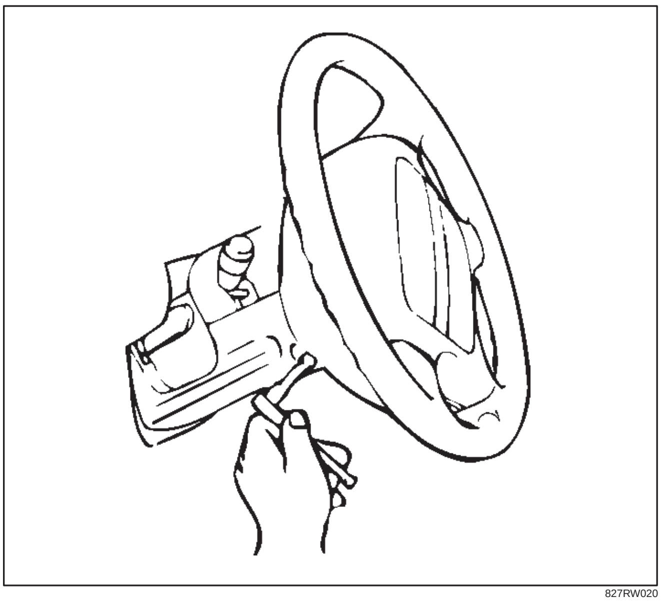
Inflator Module and Associated Parts



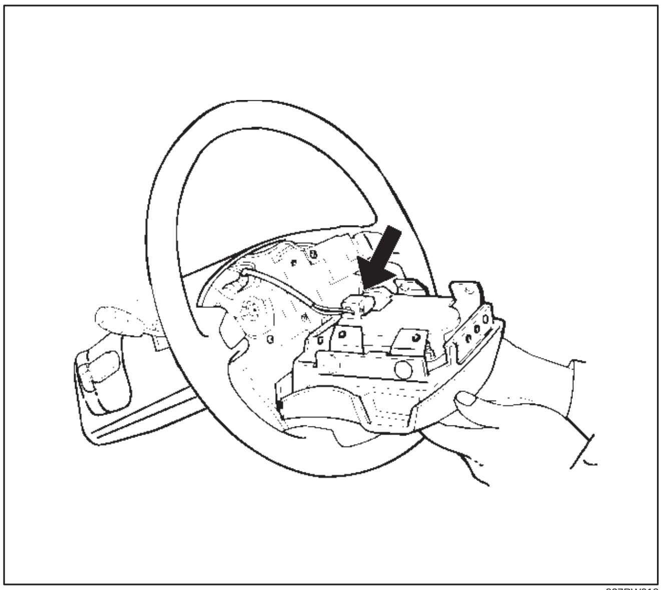
Legend
(1) Module Connector
(2) Inflator Module
(3) Fixing Bolt

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.
5. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly .



6. Disconnect the yellow 2-way SRS connector located behind the inflator module.

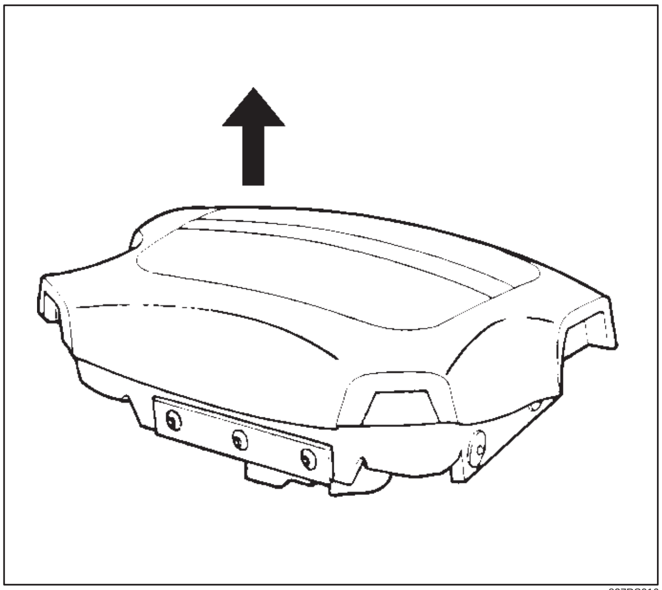


827RW018

7. Remove inflator module.

Inspection and Repair

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE TRIM COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT .



827RS016

The inflator module consists of a cover, air bag, inflator, and retainer. Inspect the inflator module mainly for the following:

- Check for holes, cracks, severe blemishes and deformation on the cover.
- Check that the retainer is not deformed.
- Check for defects such as damage and breakage in the lead wire for the igniter.

If an abnormality is found as the result of the inspection, replace the inflator module with a new one.

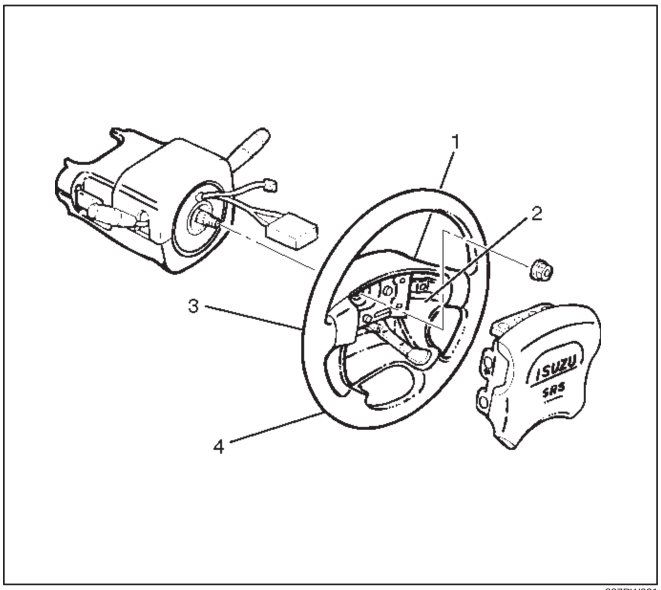
Installation

1. Install inflator module.
2. Support the module and carefully connect the module connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

3. Secure the module with one bolt to relieve weight on the wire connector and tighten bolts to specified sequence as illustrated.

Torque: 8 N·m (69 lb in)

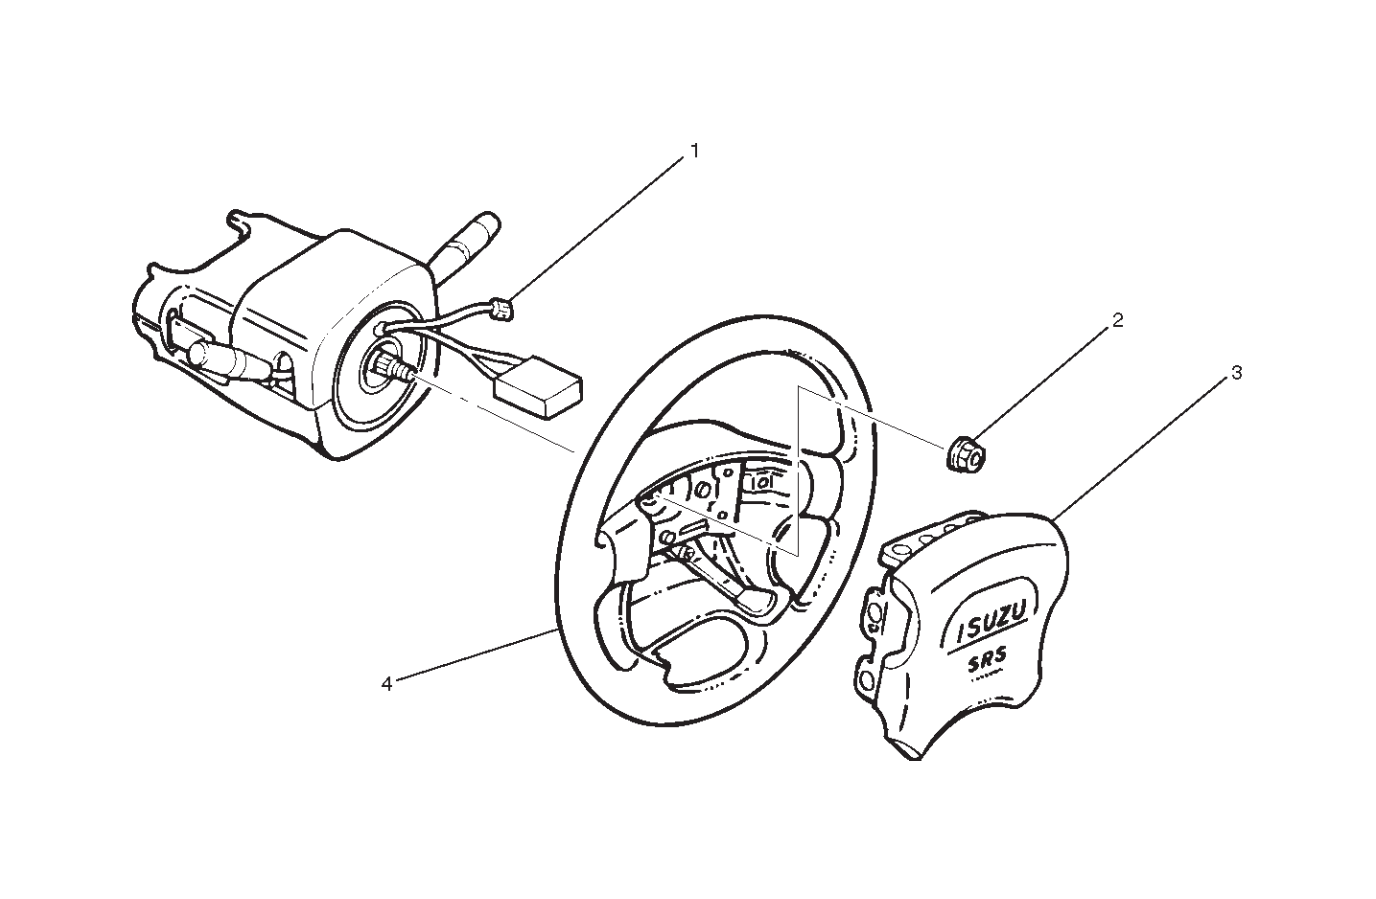


827RW021

4. Connect the yellow 2-way SRS connector located under the steering column.
5. Connect the battery “–” terminal cable.
6. Set ignition to “ON” while watching warning light. Light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Steering Wheel

Steering Wheel and Associated Parts



827RW017

Legend

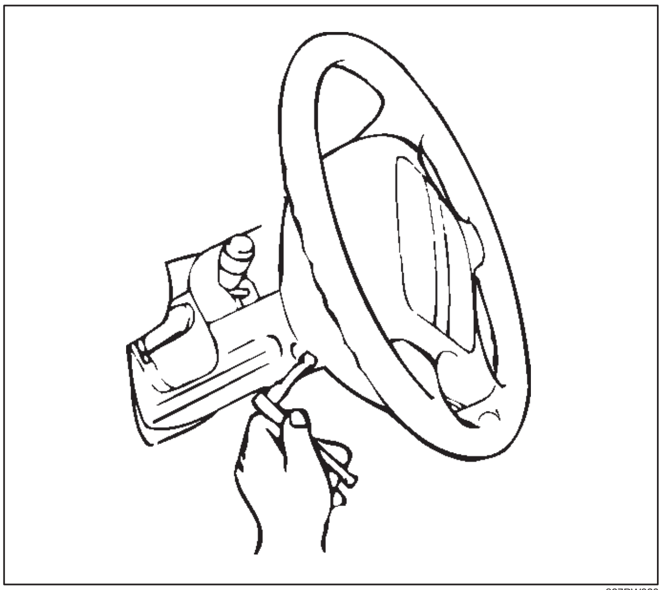
(1) Horn Lead
(2) Steering Wheel Fixing Nut
(3) Inflator Module
(4) Steering Wheel

CAUTION: Once the steering column is removed from the vehicle, the column is extremely susceptible to damage. Dropping the column assembly on its end could collapse the steering shaft or loosen the slide block which maintains column rigidity. Leaning on the column assembly could cause the jacket to bend or deform. Any of the above damage could impair the column's collapsible design. If it is necessary to remove the steering wheel, use only the specified steering wheel puller. Under no conditions should the end of the shaft be hammered upon, as hammering could loosen slide block which maintains column rigidity.

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

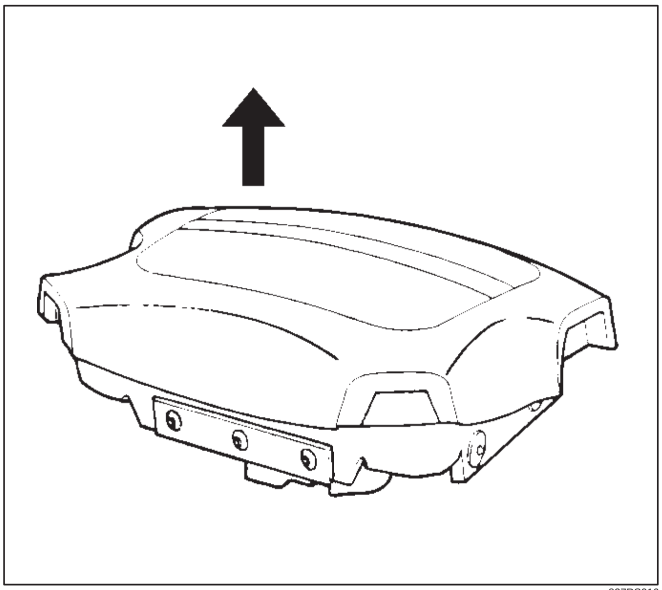
5. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.



827RW020

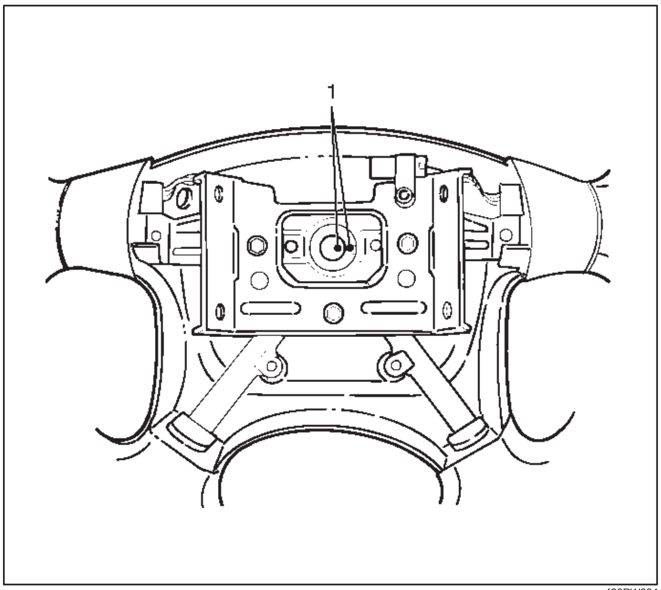
6. Disconnect the yellow 2-way SRS connector located behind the inflator module.

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE TRIM COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.



827RS016

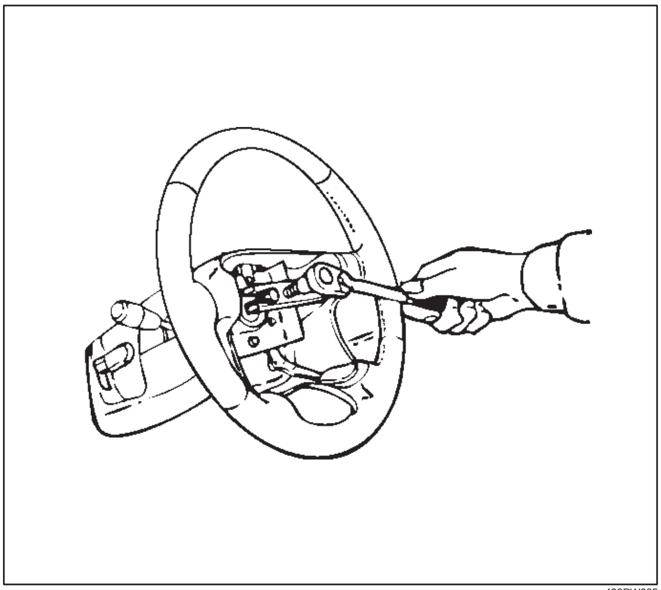
7. Disconnect horn lead.
8. Remove steering wheel fixing nut.
9. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position, then remove steering wheel.



430RW004

10. Move the front wheels to the straight ahead position, then use steering wheel remover J–29752 to remove the steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.



430RW005

Installation

1. Install steering wheel by aligning the setting marks made when removing.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

2. Tighten the steering wheel fixing nut to the specified torque.

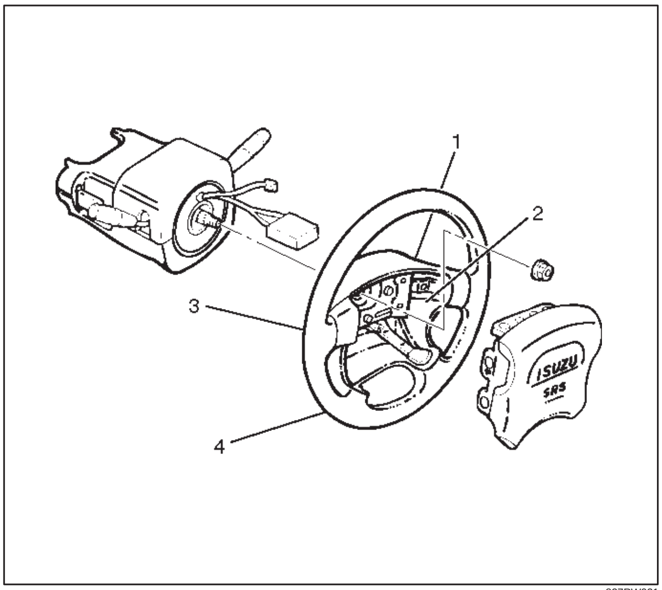
   Torque: 34 N·m (25 lb ft)

3. Connect horn lead.
4. Support the module and carefully connect the module connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinches.

- Secure the module with one bolt to relieve weight on the wire connector.
- Tighten bolts to specified sequence as illustrated.

Torque: 8 N·m (69 lb in)

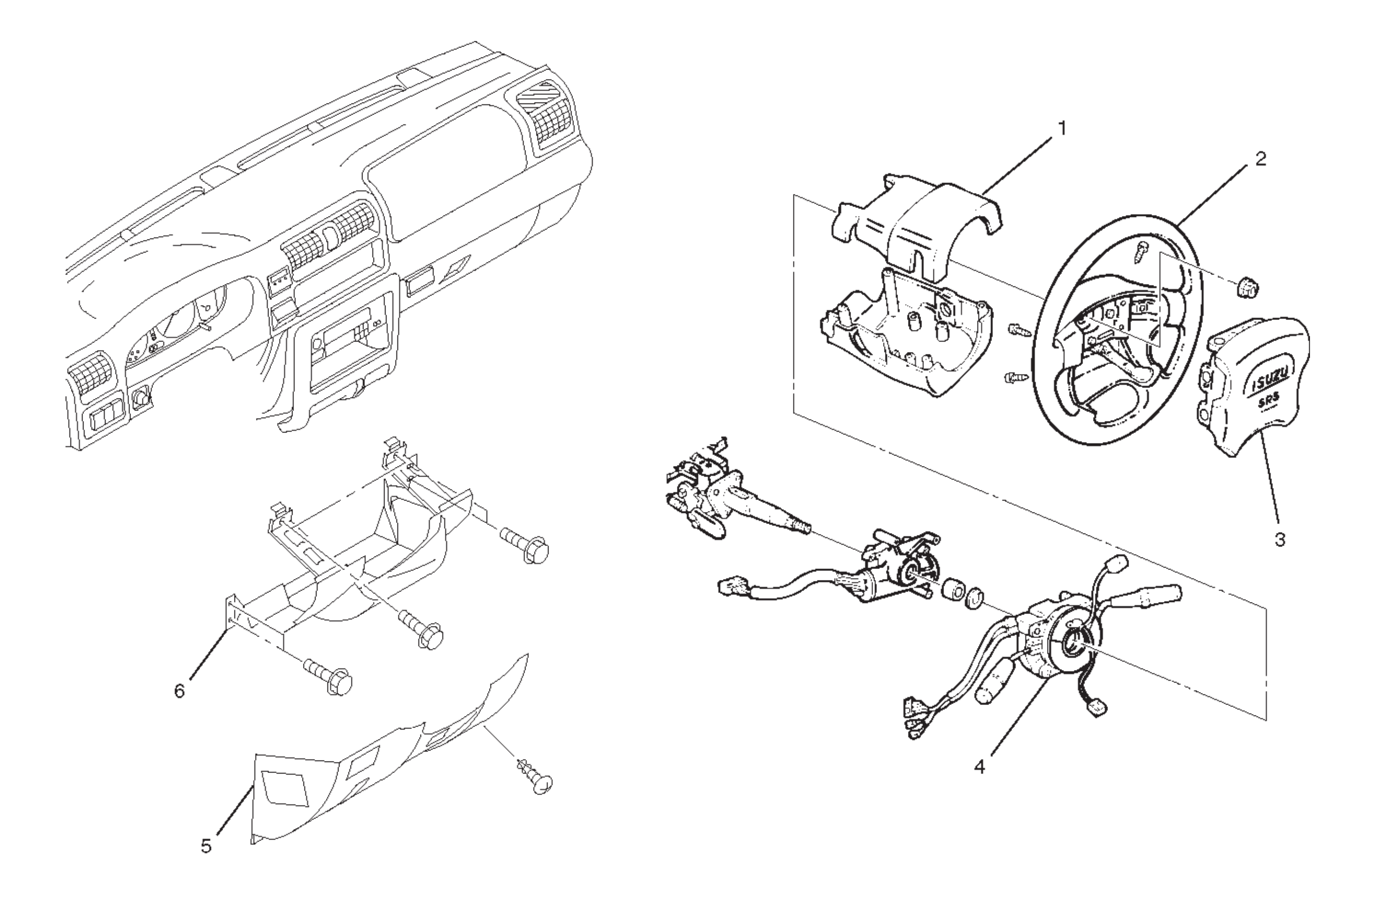


827RW021

5. Connect the yellow 2-way SRS connector located under the steering column.
6. Connect the battery "–" terminal cable.
7. Turn the ignition switch to "ON" while watching warning light. Light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Combination Switch

Combination Switch and Associated Parts



431RW012

Legend

(1) Steering Column Cover
(2) Steering Wheel
(3) Inflator Module
(4) Combination Switch and SRS Coil Assembly
(5) Steering Lower Cover
(6) Driver Knee Bolster (reinforcement)

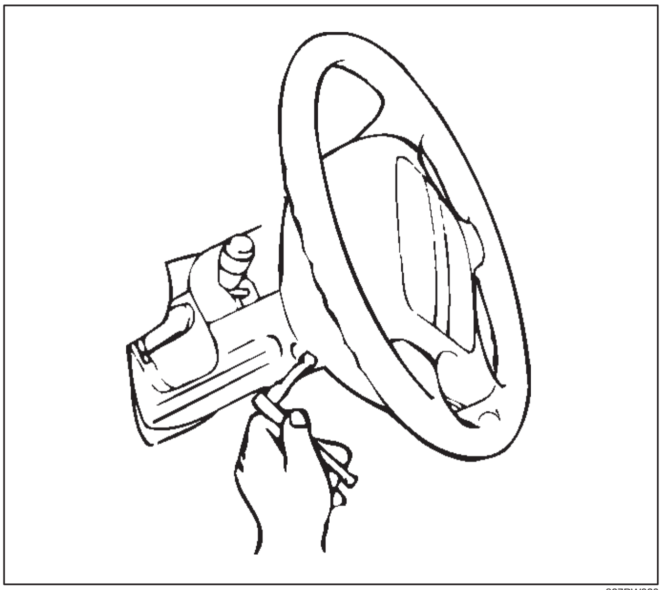
Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

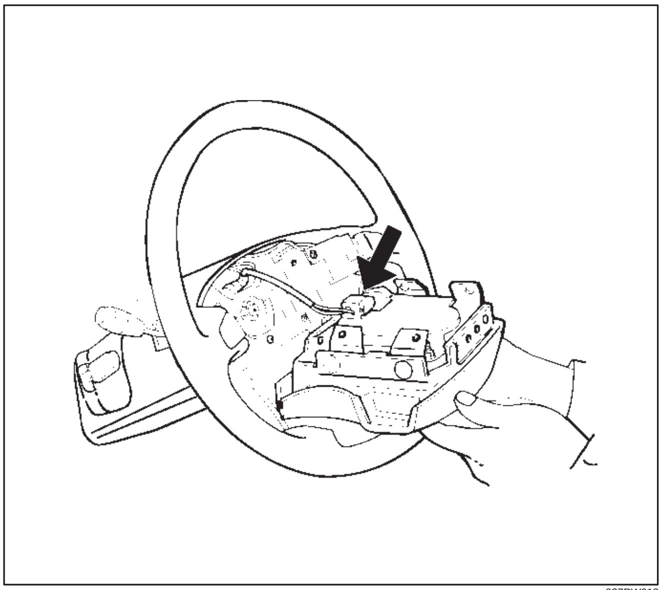
CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to become uncentered which will cause damage to the coil assembly.

5. Remove the engine hood opening lever, then remove steering lower cover.
6. Remove the driver knee bolster (reinforcement).

7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly. Disconnect the yellow 2-way SRS connector located behind the inflator module, then remove inflator module.

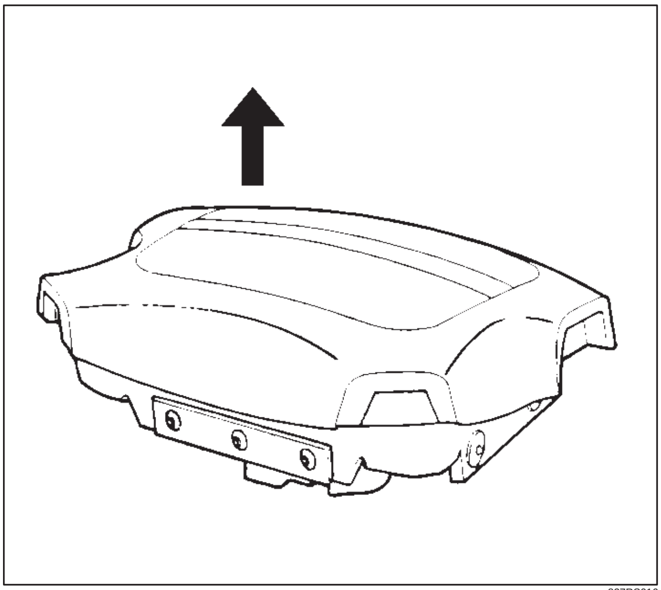


827RW020



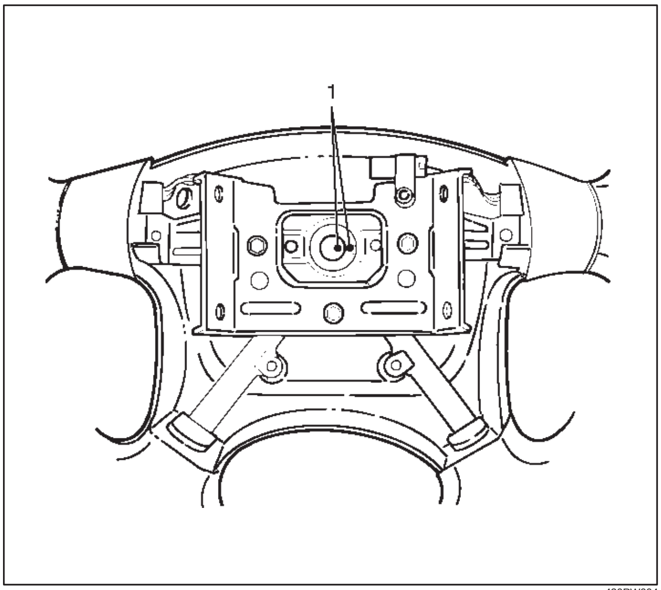
827RW018

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE TRIM COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.



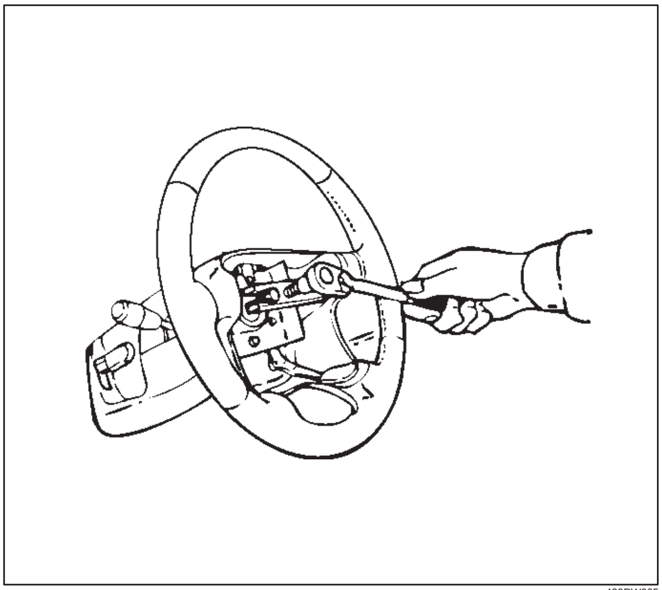
827RS016

8. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover J–29752 to remove the steering wheel.



430RW004

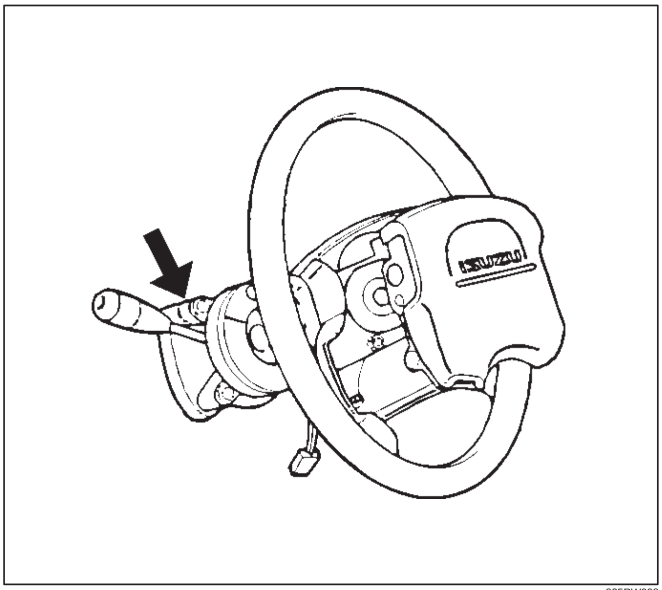
CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.



430RW005

9. Remove steering column cover.
10. Disconnect the wiring harness connectors located under the steering column then remove combination switch and SRS coil assembly.

NOTE: The SRS coil is a part of the combination switch assembly, which can not be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

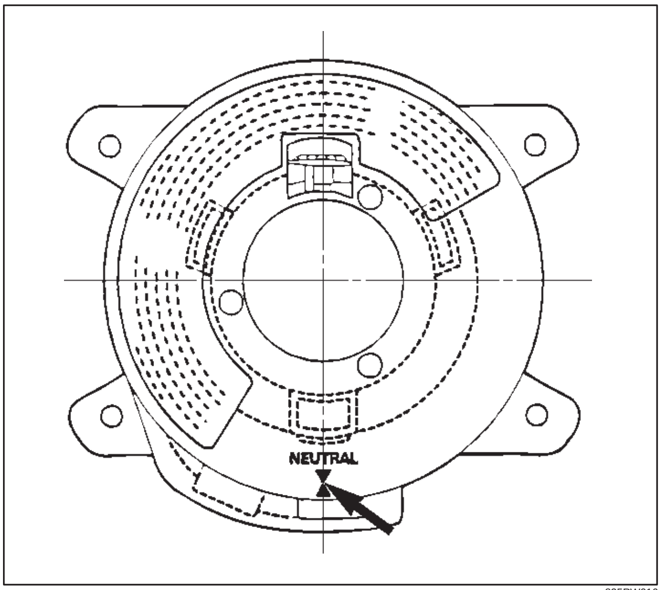


825RW098

Installation

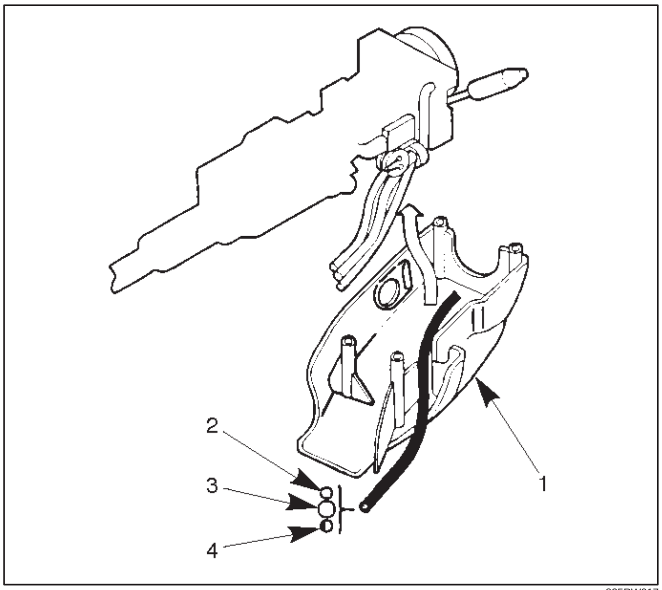
1. Install combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column. Then turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage to the cable in the SRS coil.



825RW016

2. When installing the steering column cover, be sure to route each wire harness as illustrated so that the harnesses do not catch on any moving parts.



825RW017

Legend

(1) Steering Column Cover
(2) Starter Switch Harness
(3) Combination Switch Harness
(4) Inflator Module Harness

3. Align the setting marks made when removing then install steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

4. Tighten the steering wheel fixing nut to the specified torque.

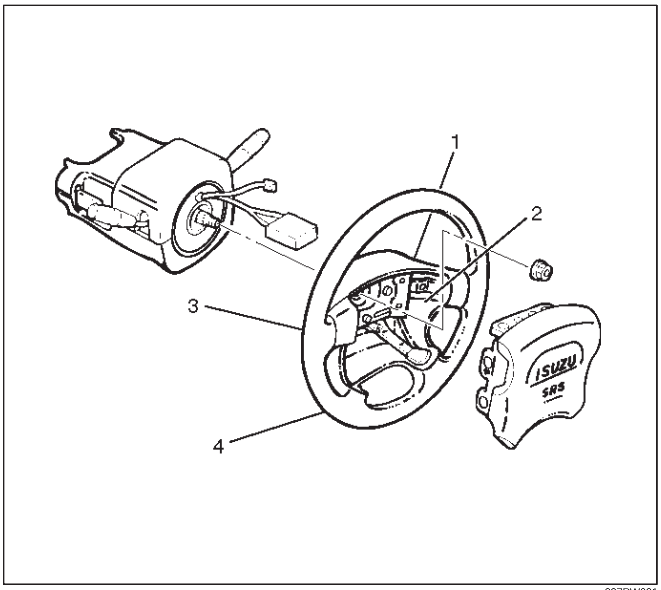
Torque: 34 N·m (25 lb ft)

5. Support the inflator module and carefully connect the module connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

6. Secure the module with one bolt to relieve weight on the wire connector.
7. Tighten bolts to specified sequence as illustrated.

Torque: 8 N·m (69 lb in)

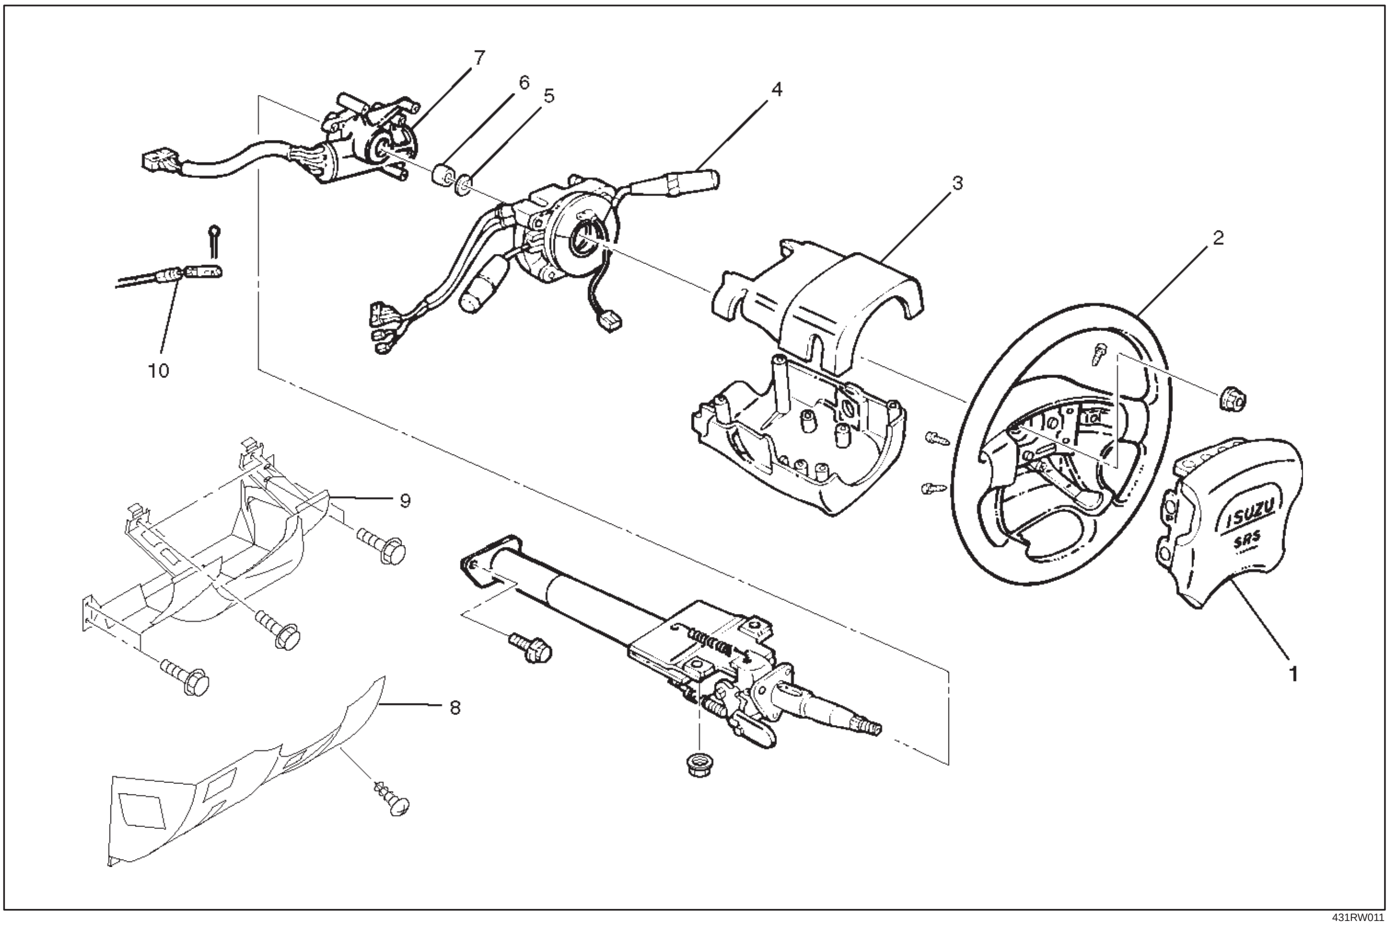


827RW021

8. Install driver knee bolster (reinforcement).
9. Install steering lower cover then Install the engine hood opening lever.
10. Connect the wiring harness connectors.
11. Connect the battery “-” terminal cable.
12. Turn the ignition switch to “ON” while watching warning light and check the light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Lock Cylinder

Lock Cylinder and Associated Parts



Legend

(5) Snap Ring
(6) Cushion Rubber
(7) Lock Cylinder Assembly
(8) Steering Lower Cover
(9) Driver Knee Bolster (reinforcement)
(10) Shift Lock Cable (for A/T)

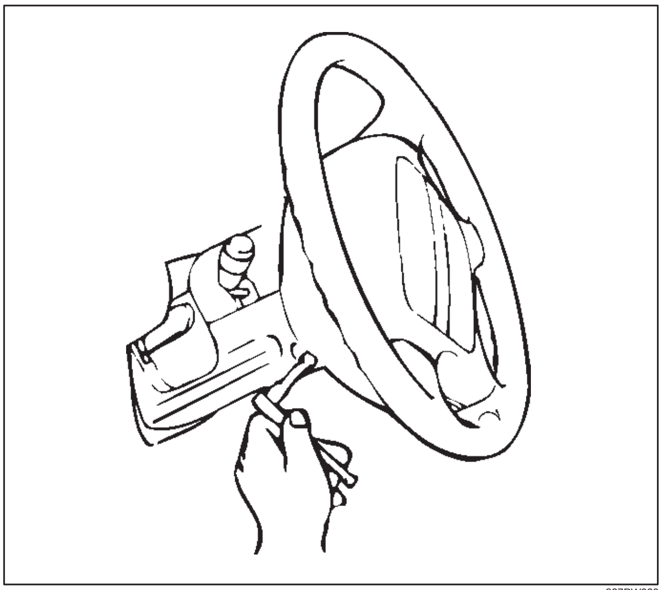
Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to become uncentered which will cause damage to the coil assembly.

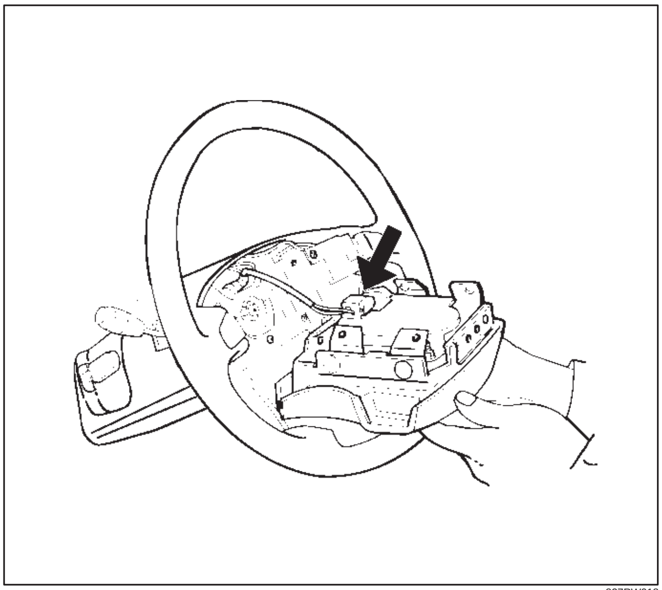
5. Remove the engine hood opening lever and steering lower cover.
6. Remove driver knee bolster (reinforcement).

7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.



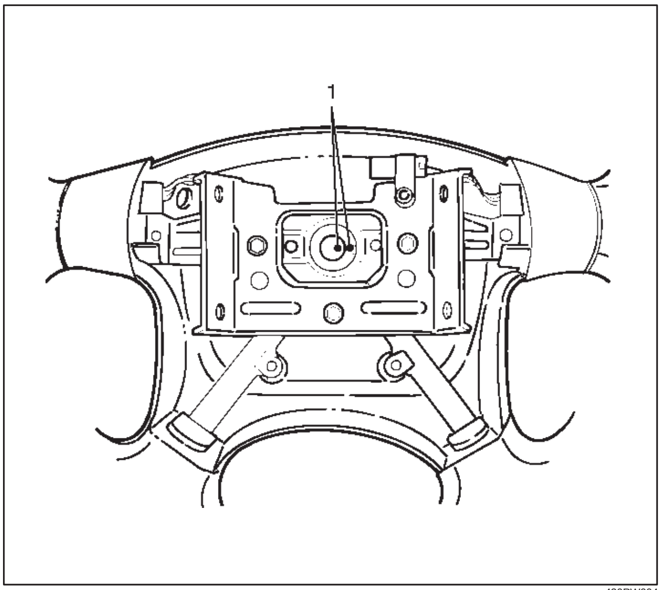
827RW020

8. Disconnect the yellow 2-way SRS connector located behind the inflator module.



827RW018

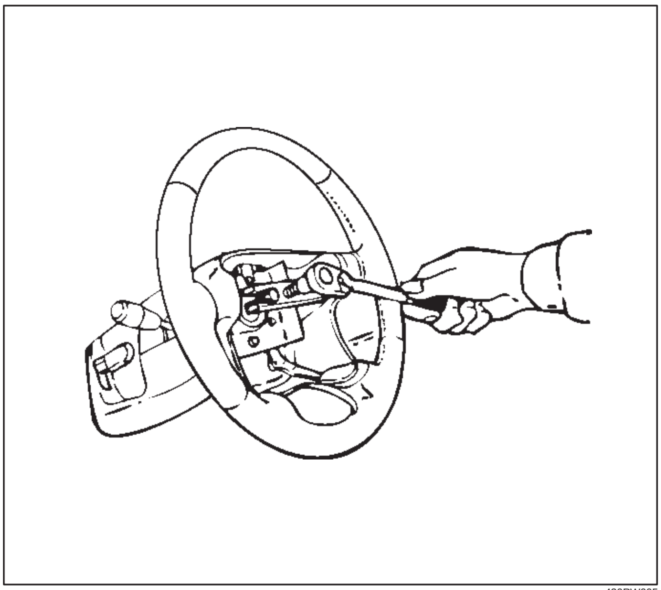
9. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position.



430RW004

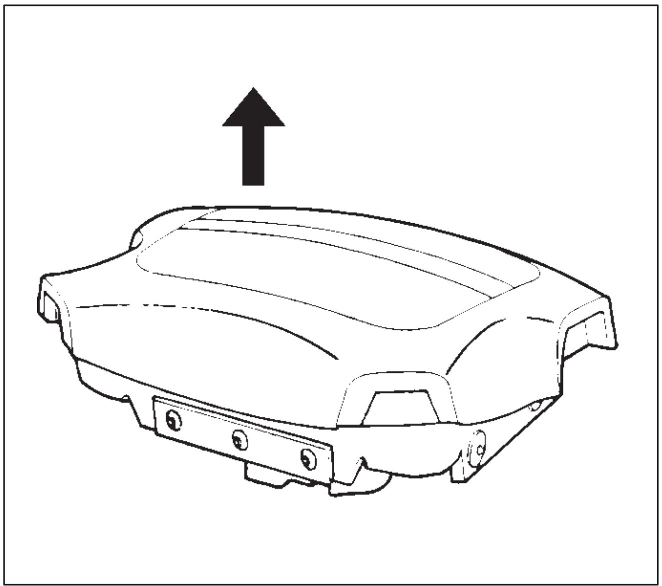
10. Move the front wheels to the straight ahead position, then use steering wheel remover J–29752 to remove the steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.



430RW005

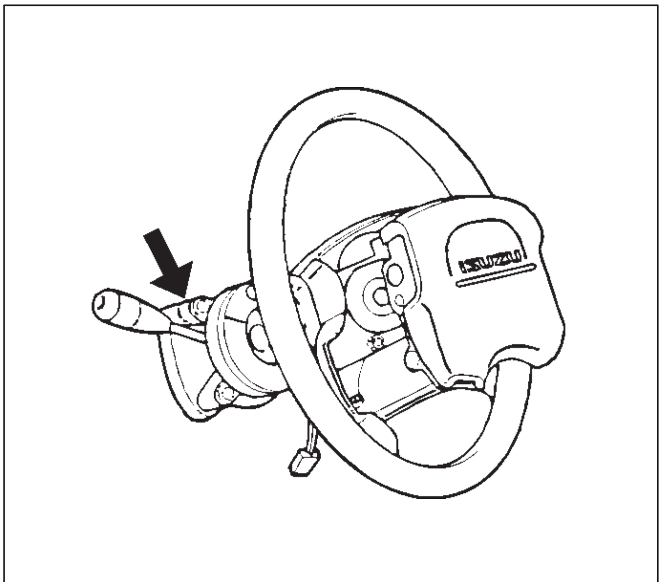
WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE TRIM COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.



827RS016

11. Remove steering column cover.
12. Disconnect the wiring harness connectors located under the steering column.
13. Remove the combination switch assembly with SRS coil.

NOTE: The SRS coil is a part of the combination switch assembly, which can not be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.



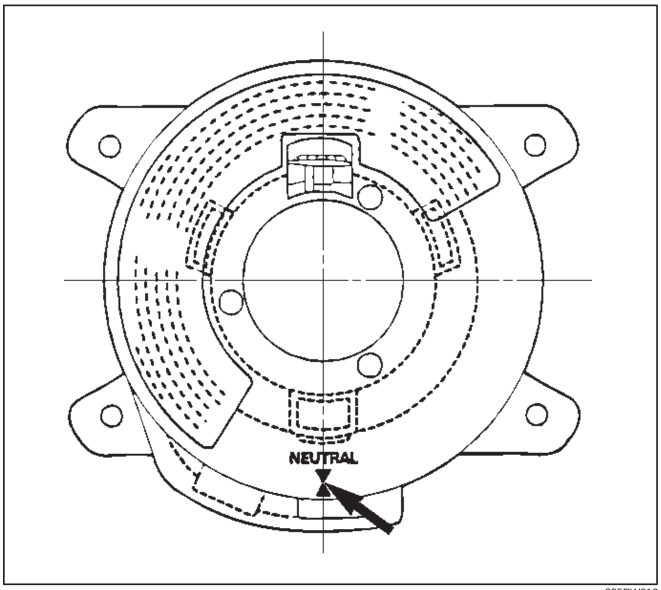
825RW098

14. Remove snap ring.
15. Remove cushion rubber.
16. Remove shift lock cable (for A/T).
17. Disconnect the starter switch harness connector located under the steering column then remove lock cylinder assembly.

Installation

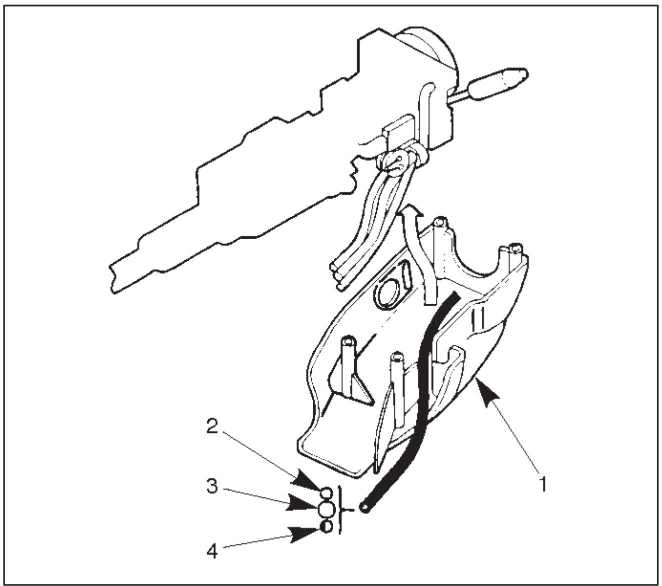
1. Install lock cylinder assembly.
2. Install shift lock cable (for A/T).
3. Install cushion rubber.
4. Install snap ring.
5. Install Combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column.
6. Turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage the cable in the SRS coil.



825RW016

7. When installing the steering column cover, be sure to wire (through each harness) as illustrated so that the harnesses starter switch, combination switch and SRS coil may not catch wiring.



825RW017

Legend

(1) Steering Column Cover
(2) Starter Switch Harness
(3) Combination Switch Harness
(4) Inflator Module Harness

8. Install steering wheel by aligning the setting marks made during removal.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

9. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34 N·m (25 lb ft)

10. Support inflator module and carefully connect the module connector, then install inflator module.

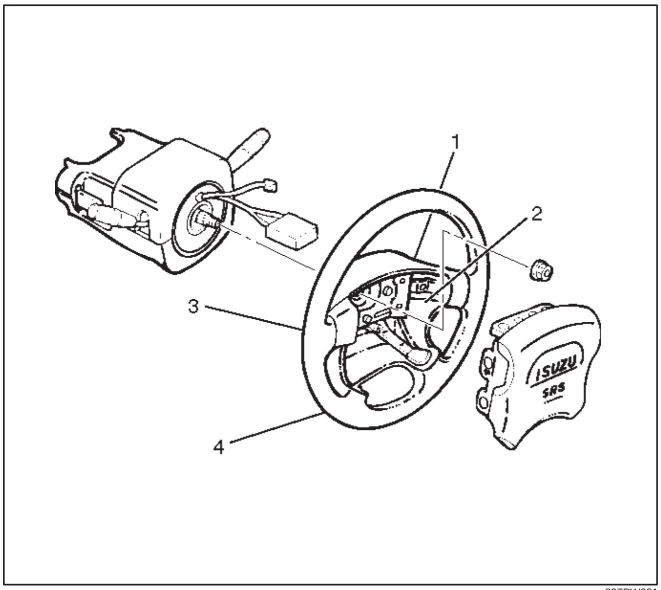
NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

11. Secure the inflator module with one bolt to relieve weight on the wire connector.

12. Tighten fixing bolts to specified sequence as illustrated.

Torque: 8 N·m (69 lb in)

13. Install driver knee bolster (reinforcement).



827RW021

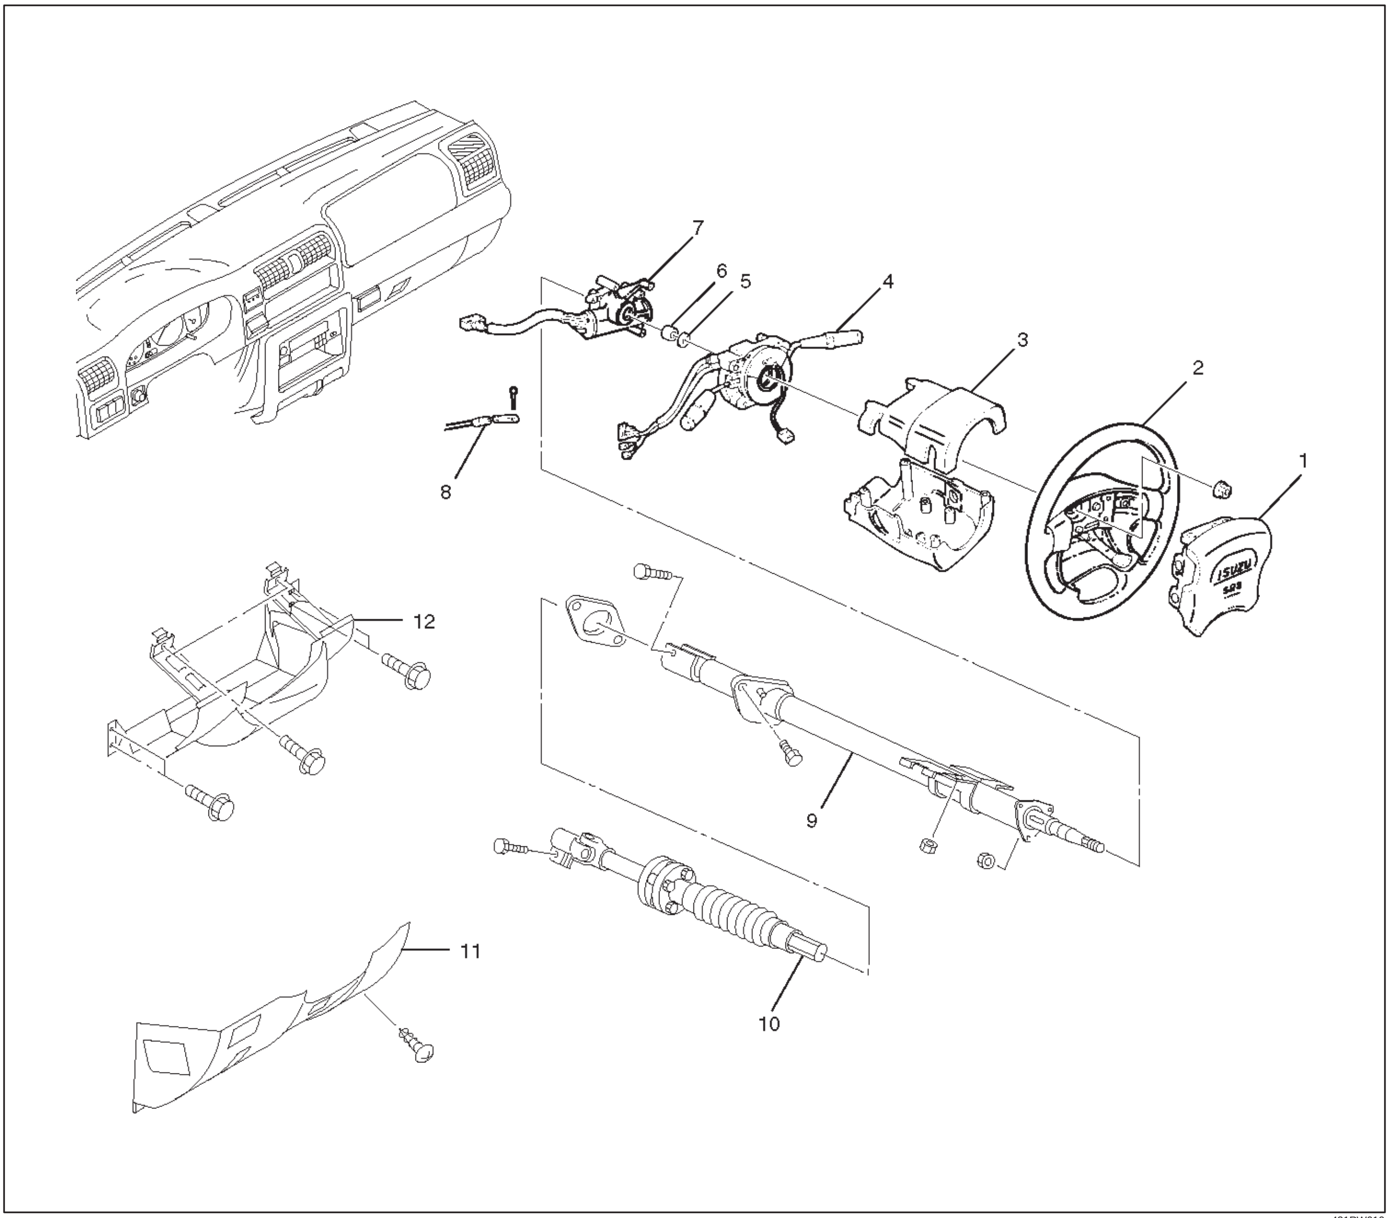
14. Install steering lower cover, then install the engine hood opening lever.
15. Connect the yellow 2-way SRS connector located under the steering column.
16. Connect the battery “–” terminal cable.

System Inspection

Turn the ignition switch to “ON” while watching warning light.
The light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Steering Column

Steering Column and Associated Parts



Legend

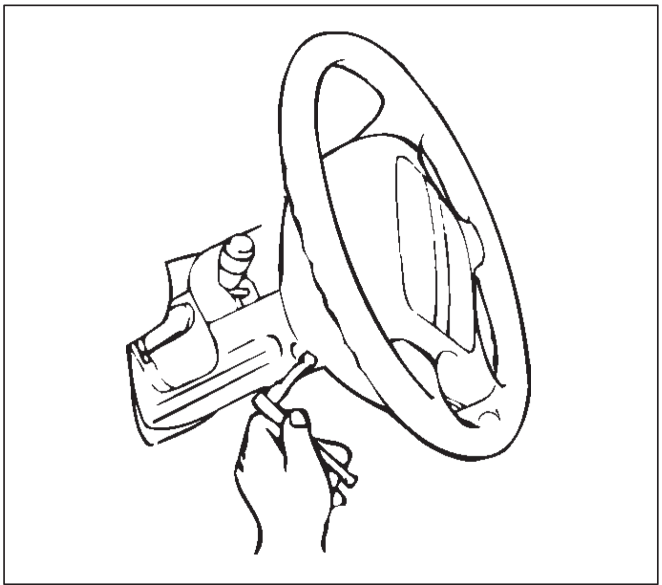
- (1) Inflator Module
- (2) Steering Wheel
- (3) Steering Column Cover
- (4) Combination Switch and SRS Coil Assembly
- (5) Snap Ring
- (6) Cushion Rubber
- (7) Lock Cylinder Assembly
- (8) Shift Lock Cable (For A/T)
- (9) Steering Column Assembly
- (10) Second Steering Shaft
- (11) Steering Lower Cover
- (12) Driver Knee Bolster (reinforcement)

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "–" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

CAUTION: The wheel of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering column from the steering gear. Failure to do so will cause the SRS coil assembly to become uncentered which will cause damage to the SRS coil assembly.

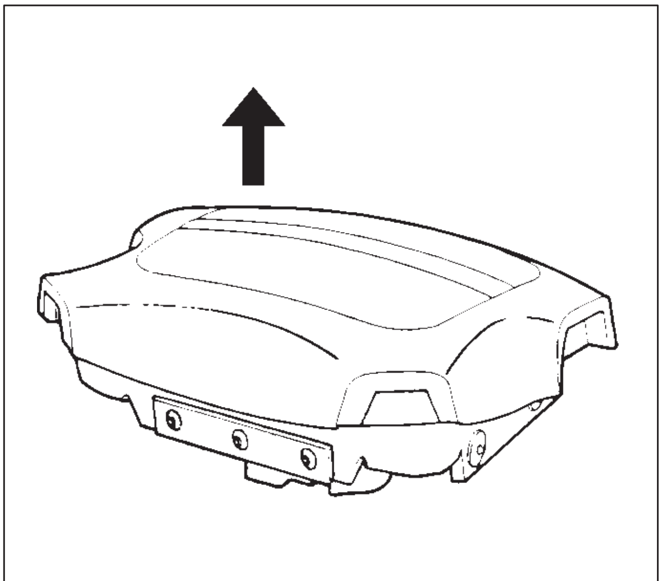
5. Remove the engine hood opening lever, then remove steering lower cover.
6. Remove driver knee bolster (reinforcement).
7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.



827RW020

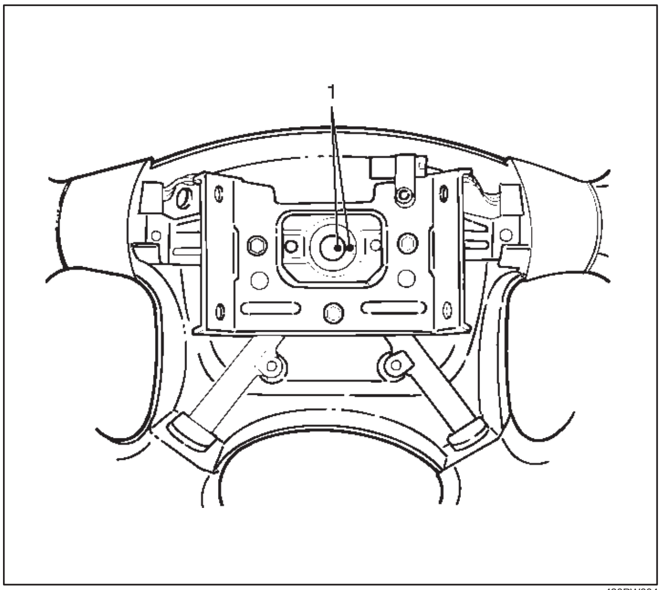
8. Disconnect the yellow 2-way SRS connector located behind the inflator module.
9. Remove inflator module.

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE TRIM COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.

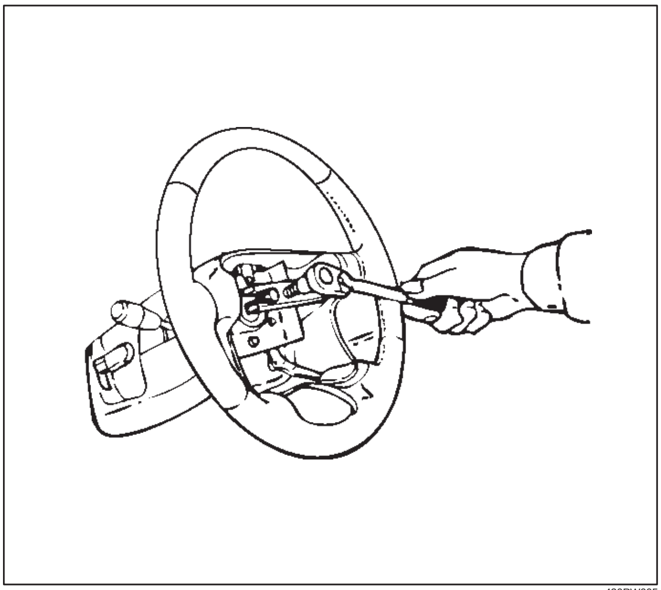


827RS016

10. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover J–29752 to remove the steering wheel.



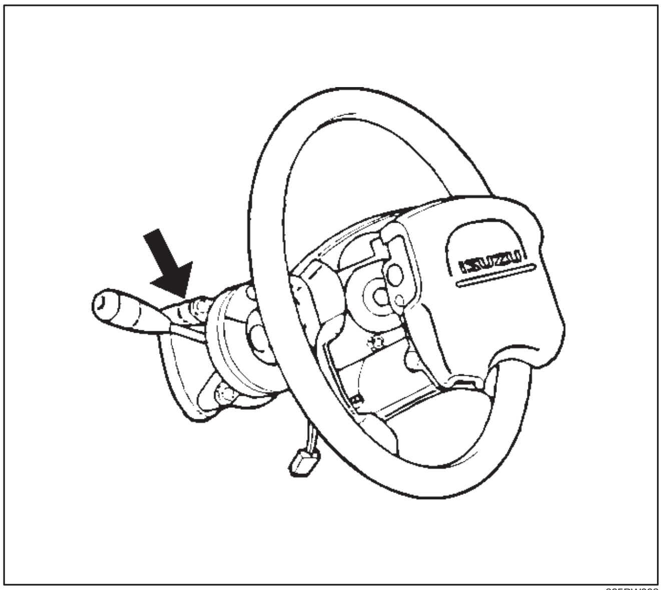
430RW004



430RW005

11. Remove steering column cover.
12. Disconnect the wiring harness connectors located under the steering column.
13. Remove the combination switch assembly with SRS coil.

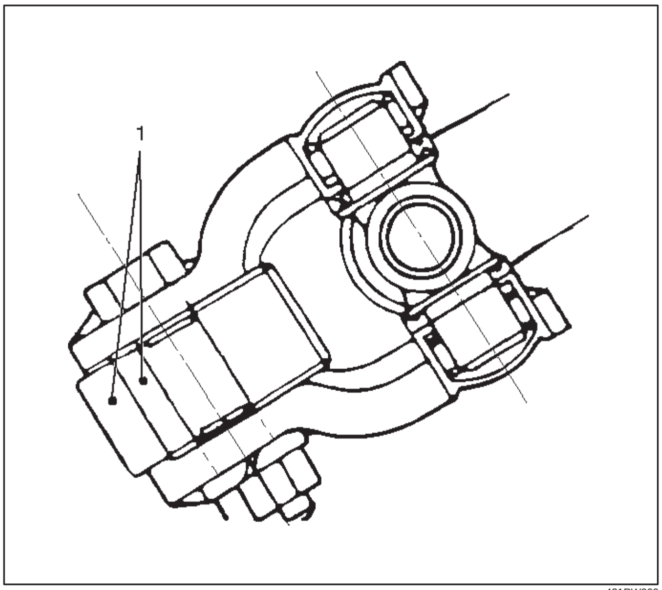
NOTE: SRS coil is a part of combination switch assembly, which can not be replaced singly. Therefore, be sure not to remove the SRS coil from the combination switch assembly.



825RW098

14. Remove snap ring.
15. Remove cushion rubber.
16. Remove shift lock cable (For A/T).
17. Disconnect the starter switch harness connector located under the steering column, then remove lock cylinder assembly.
18. Apply a setting mark (1) across the universal joint and second steering shaft to reassemble the parts in their original position, then remove steering column assembly and second shaft.

NOTE: A setting mark can be easily made if the shaft is withdrawn a little by loosening the steering shaft universal joint.



431RW009

Installation

1. Install steering column assembly and second steering shaft.
2. Align the setting marks on the universal joint and second steering shaft made during removal.
3. Tighten the steering column fixing bolt (dash panel) to the specified torque.

   Torque: 19 N·m (14 lb ft)

4. Tighten the steering column fixing bolt (pedal bracket) to the specified torque.

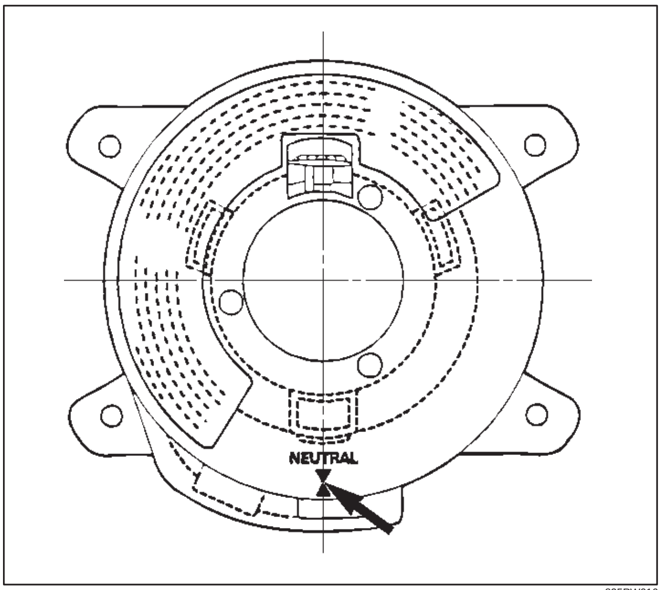
   Torque: 20 N·m (14 lb ft)

5. Tighten the universal joint to the specified torque.

   Torque: 31 N·m (23 lb ft)

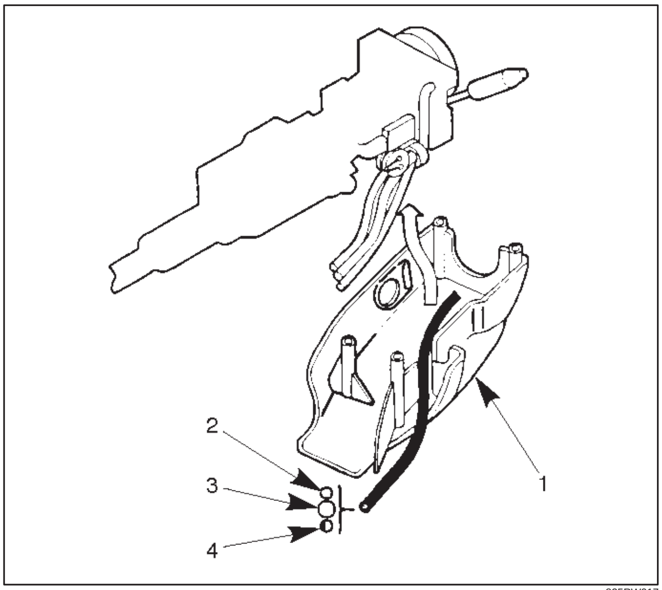
6. Install lock cylinder assembly.
7. Install shift lock cable (For A/T).
8. Install cushion rubber.
9. Install snap ring.
10. Install combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column.
11. Turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage to the cable in the SRS coil.



825RW016

12. When installing the steering column cover, be sure to route each wire harness as illustrated so that the harnesses do not catch any moving parts.



825RW017

Legend

(1) Steering Column Cover
(2) Starter Switch Harness
(3) Combination Switch Harness
(4) Inflator Module Harness

13. Install steering wheel and align the setting marks made when removing.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

14. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34 N·m (25 lb ft)

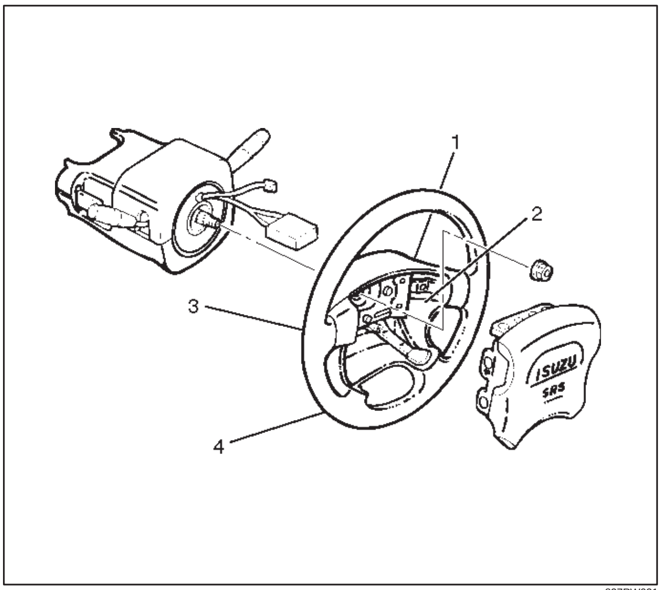
15. Support the module and carefully connect the module connector then install inflator module.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

16. Secure the module with one bolt to relieve weight on the wire connector.

17. Tighten bolts to specified sequence as illustrated.

Torque: 8 N·m (69 lb in)



827RW021

18. Install driver knee bolster (reinforcement).
19. Install steering lower cover.
20. Install the engine hood opening lever.
21. Connect the yellow 2-way SRS connector located under the steering column.
22. Connect the battery "–" terminal cable.

System Inspection

Turn the ignition switch to "ON" while watching warning light.
The light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The front suspension is designed to allow each wheel to compensate for changes in the road surface level without greatly affecting the opposite wheel. Each wheel is independently connected to the frame by a steering knuckle, ball joint assemblies, and upper and lower control arms. The front wheels are held in proper relationship to each other by two tie-rods which are connected to steering arms on the knuckles, and to a steering unit.

All models have a front suspension system consisting of control arms, stabilizer bar, shock absorber and a torsion bar. The front end of the torsion bar is attached to the lower control arm. The rear of the torsion bar is mounted into a height control arm at the crossmember. Vehicle trim height is controlled by adjusting this arm.

Shock absorbers are mounted between the brackets on the frame and the lower control arms. The lower portion of each shock absorber is attached to the lower control arm. The upper portion of each shock absorber extends through a frame bracket and is secured with two rubber bushings, two retainers and a nut.

Ball joint assemblies are bolted to the outer end of the upper and lower control arm and are attached to the steering knuckle.

The inner ends of the upper control arm have pressed in bushings. Bolts, passing through the bushing, attach the control arm to the frame. The inner ends of the lower control arm are attached to the frame by bolts passing through the bushings.

Side roll of the front suspension is controlled by a spring steel stabilizer bar. It is mounted in rubber bushings, which are held to the frame by brackets. The ends of the stabilizer bar are connected to the lower control arms by links.

Diagnosis

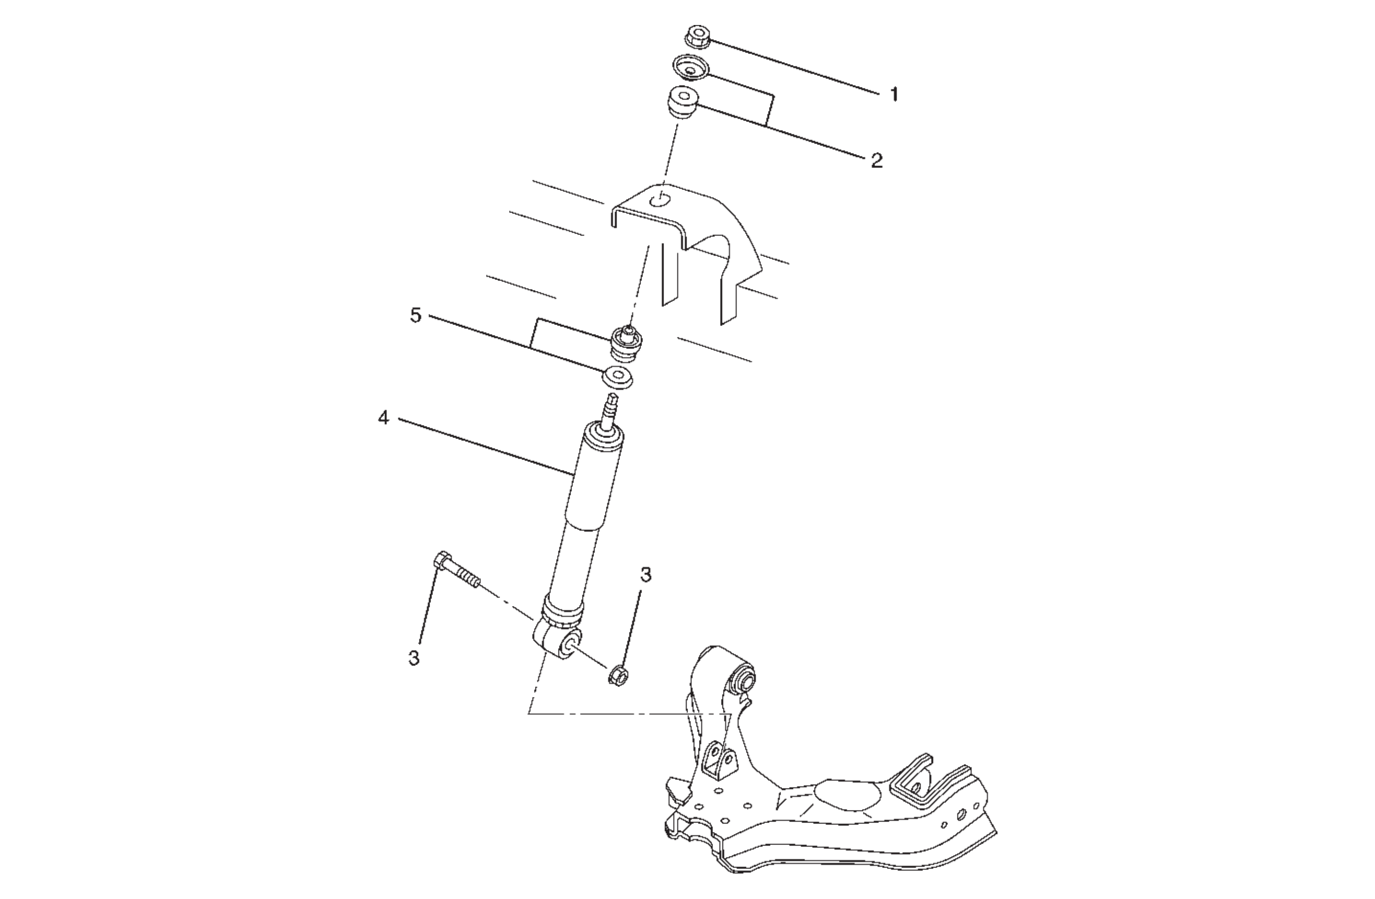
Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
	Tires not adequately inflated.	Adjust the pressure.
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.

Condition	Possible cause	Correction
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
	Parts in power steering valve defective.	Replace power steering unit.
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.

Condition	Possible cause	Correction
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Shock Absorber

Shock Absorber and Associated Parts



Legend

(1) Nut
(2) Rubber Bushing and Washer
(3) Bolt and Nut
(4) Shock Absorber
(5) Rubber Bushing and Washer

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
3. Remove bolt and nut.
4. Remove nut.
5. Remove rubber bushing and washer.
6. Remove shock absorber.
7. Remove rubber bushing and washer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts :

- Shock absorber
- Rubber bushing

Installation

1. Install rubber bushing and washer.
2. Install shock absorber.
3. Install rubber bushing and washer.
4. Install nut, then tighten it to the specified torque.

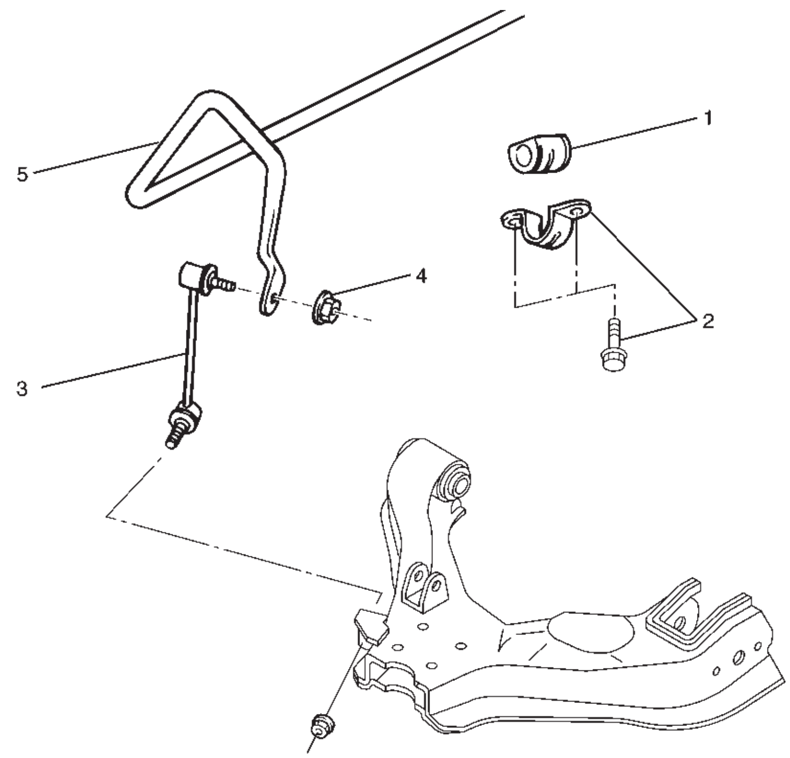
   Torque: 20 N·m (14 lb ft)

5. Install bolt and nut, then tighten to the specified torque.

   Torque: 93 N·m (69 lb ft)

Stabilizer Bar

Stabilizer Bar and Associated Parts



410RW007

Legend

(1) Rubber Bushing
(2) Bracket
(3) Link
(4) Nut
(5) Stabilizer Bar

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove the stone guard.
3. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
4. Remove nut.

CAUTION: Be careful not to break the ball joint boot.

5. Remove link.
6. Remove bracket.
7. Remove stabilizer bar.
8. Remove rubber bushing.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts :

- Stabilizer bar
- Rubber bushing
- Link ball joint

Installation

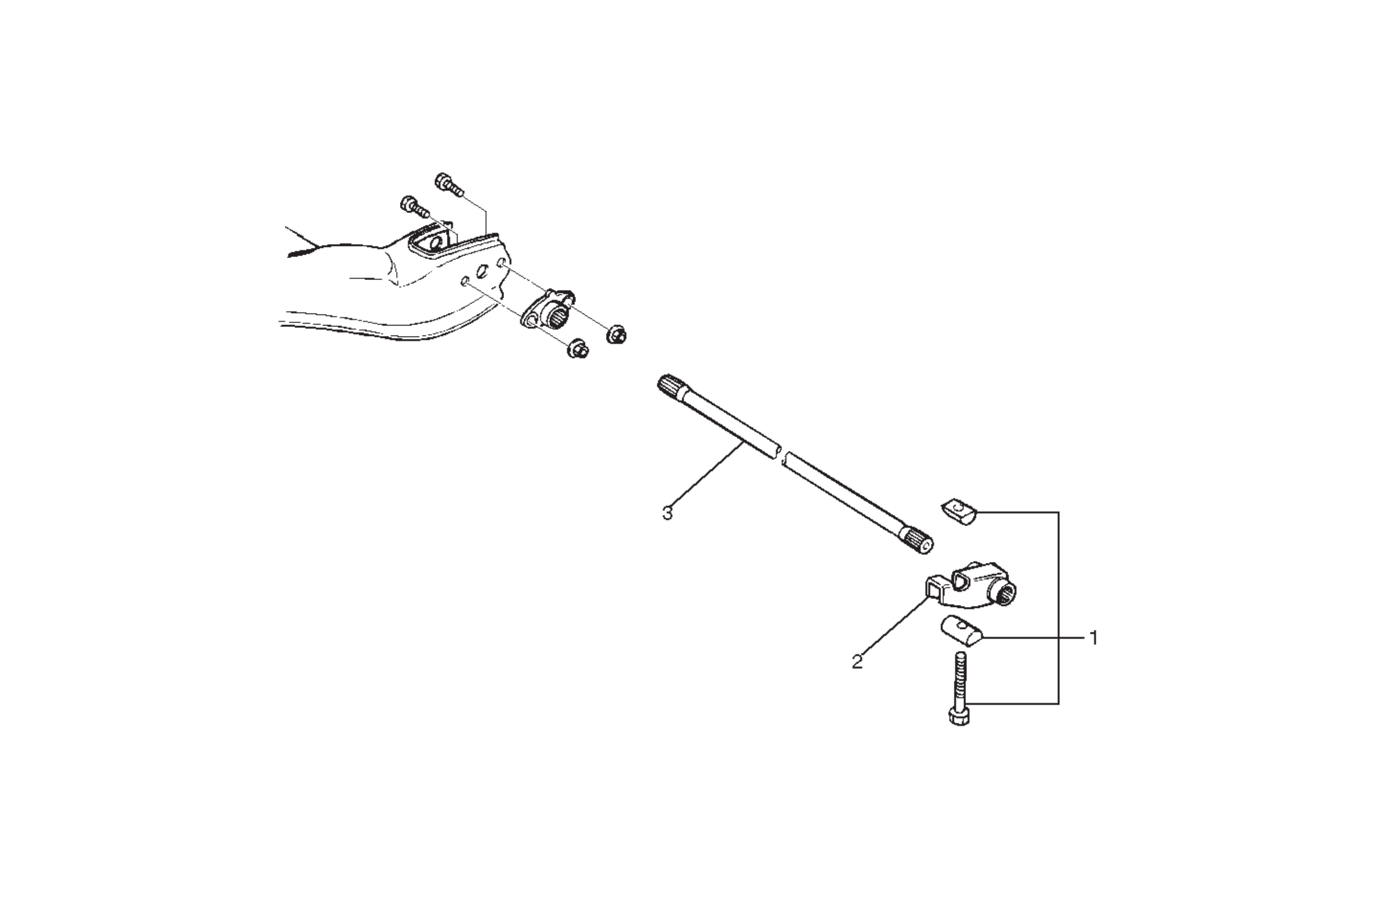
1. Install rubber bushing.
2. Install stabilizer bar.
3. Install bracket, then tighten it to the specified torque.

   Torque: 25 N·m (18 lb ft)
4. Install link.
5. Install nut, then tighten it to the specified torque.

   Torque: 50 N·m (37 lb ft)

Torsion Bar

Torsion Bar and Associated Parts



410RS003

Legend

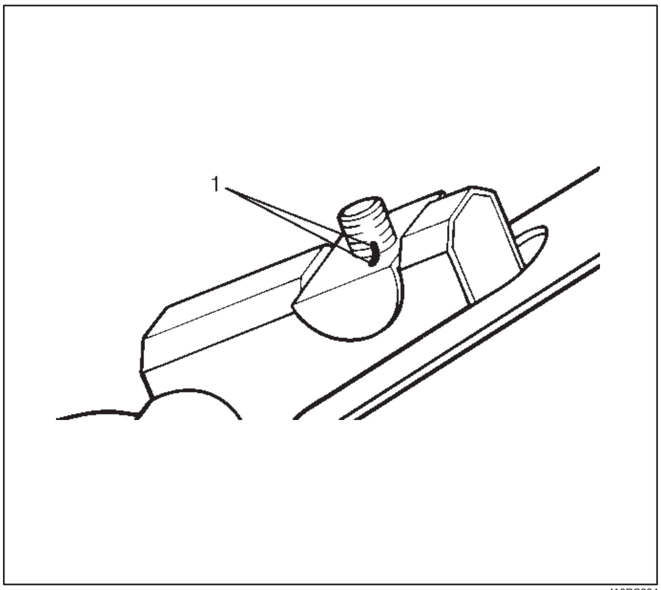
(1) Adjust Bolt, End Piece and Seat

(2) Height Control Arm

(3) Torsion Bar

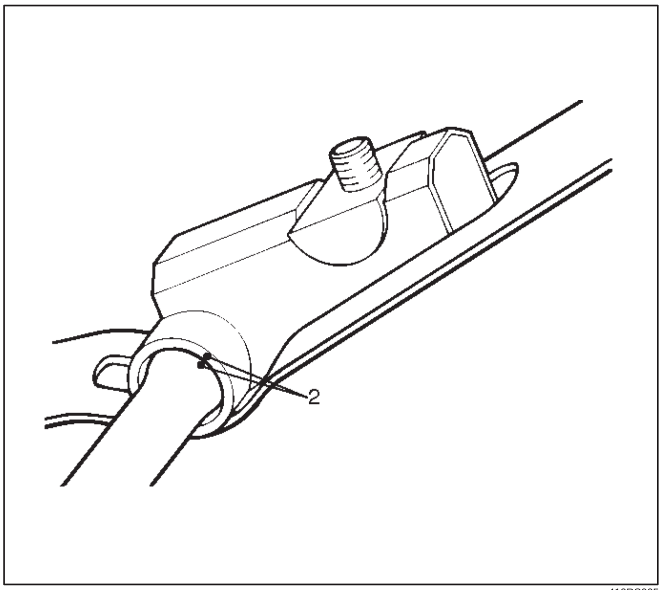
Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Apply the setting marks(1) to the adjust bolt and end piece, then remove adjust bolt, end piece and seat.



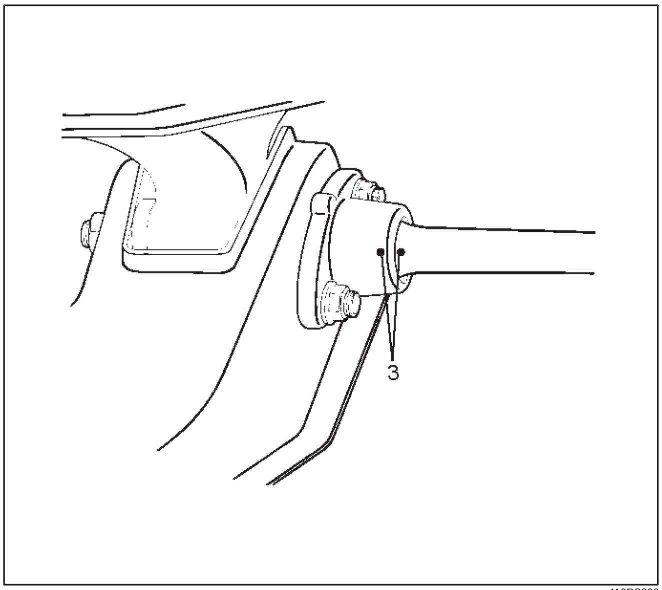
410RS004

3. Apply the setting marks(2) to the height control arm and torsion bar, then remove height control arm.



410RS005

4. Apply the setting marks(3) to the torsion bar and lower control arm, then remove torsion bar.



410RS006

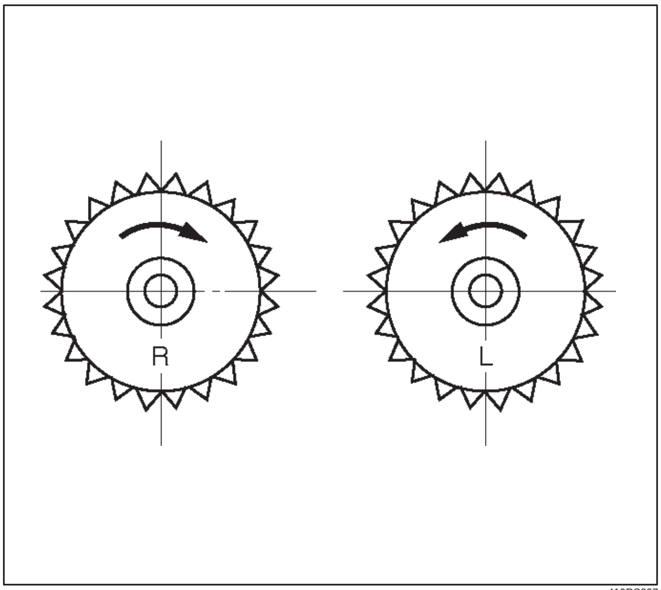
Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

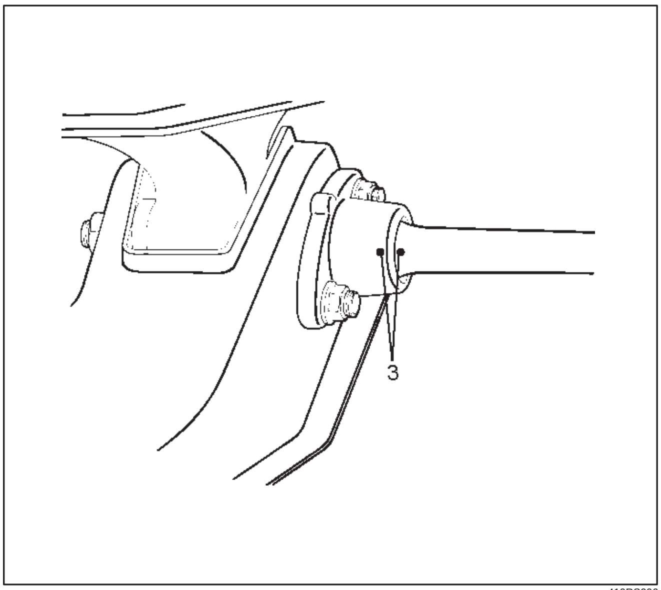
- Torsion bar
- Height control arm
- Adjust bolt
- Rubber seat

Installation

1. Apply grease to the serrated portions, then install torsion bar. Make sure the bars are on their correct respective sides and align the setting marks(3).

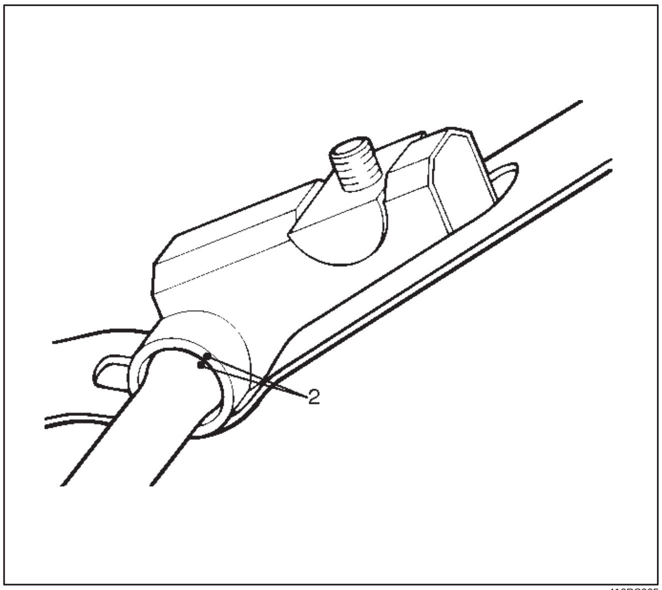


410RS007



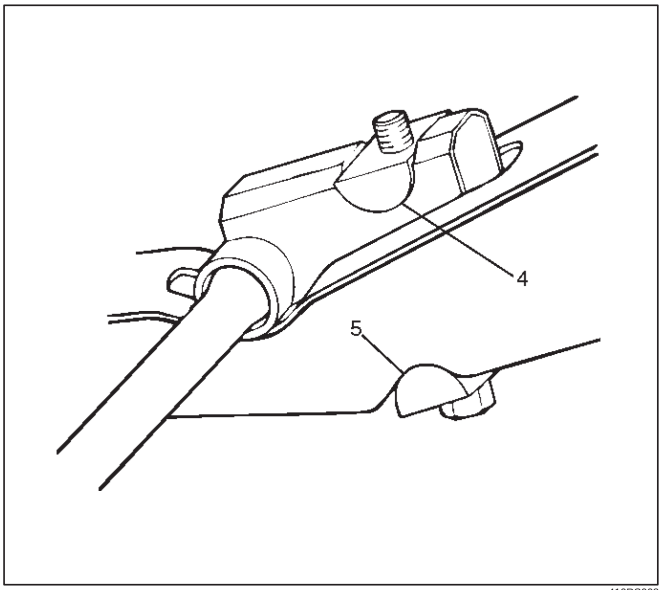
410RS006

2. Apply grease to the portion that fits into the bracket then install height control arm and align the setting marks(2).



410RS005

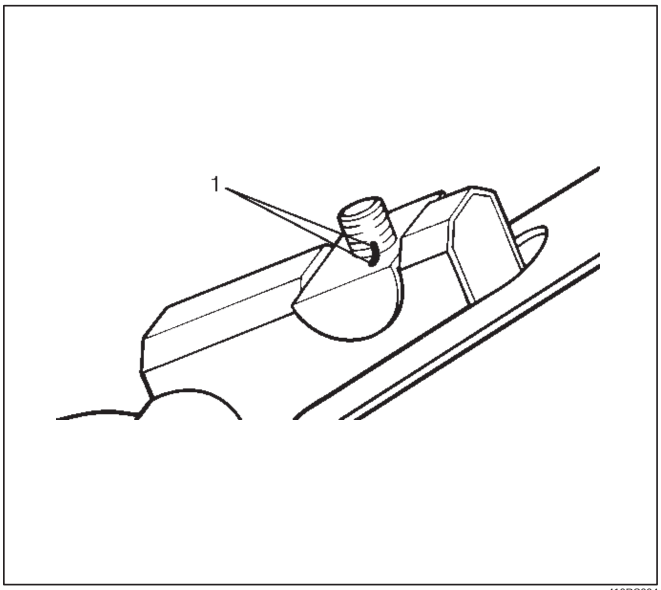
3. Apply grease to the bolt portion of the end piece(4). Apply grease to the portion of the seat(5) that fits into the bracket.



410RS008

4. Apply grease to the serrated portions.
5. Install adjust bolt and seat, then turn the adjust bolt to the setting mark(1) applied during disassembly.

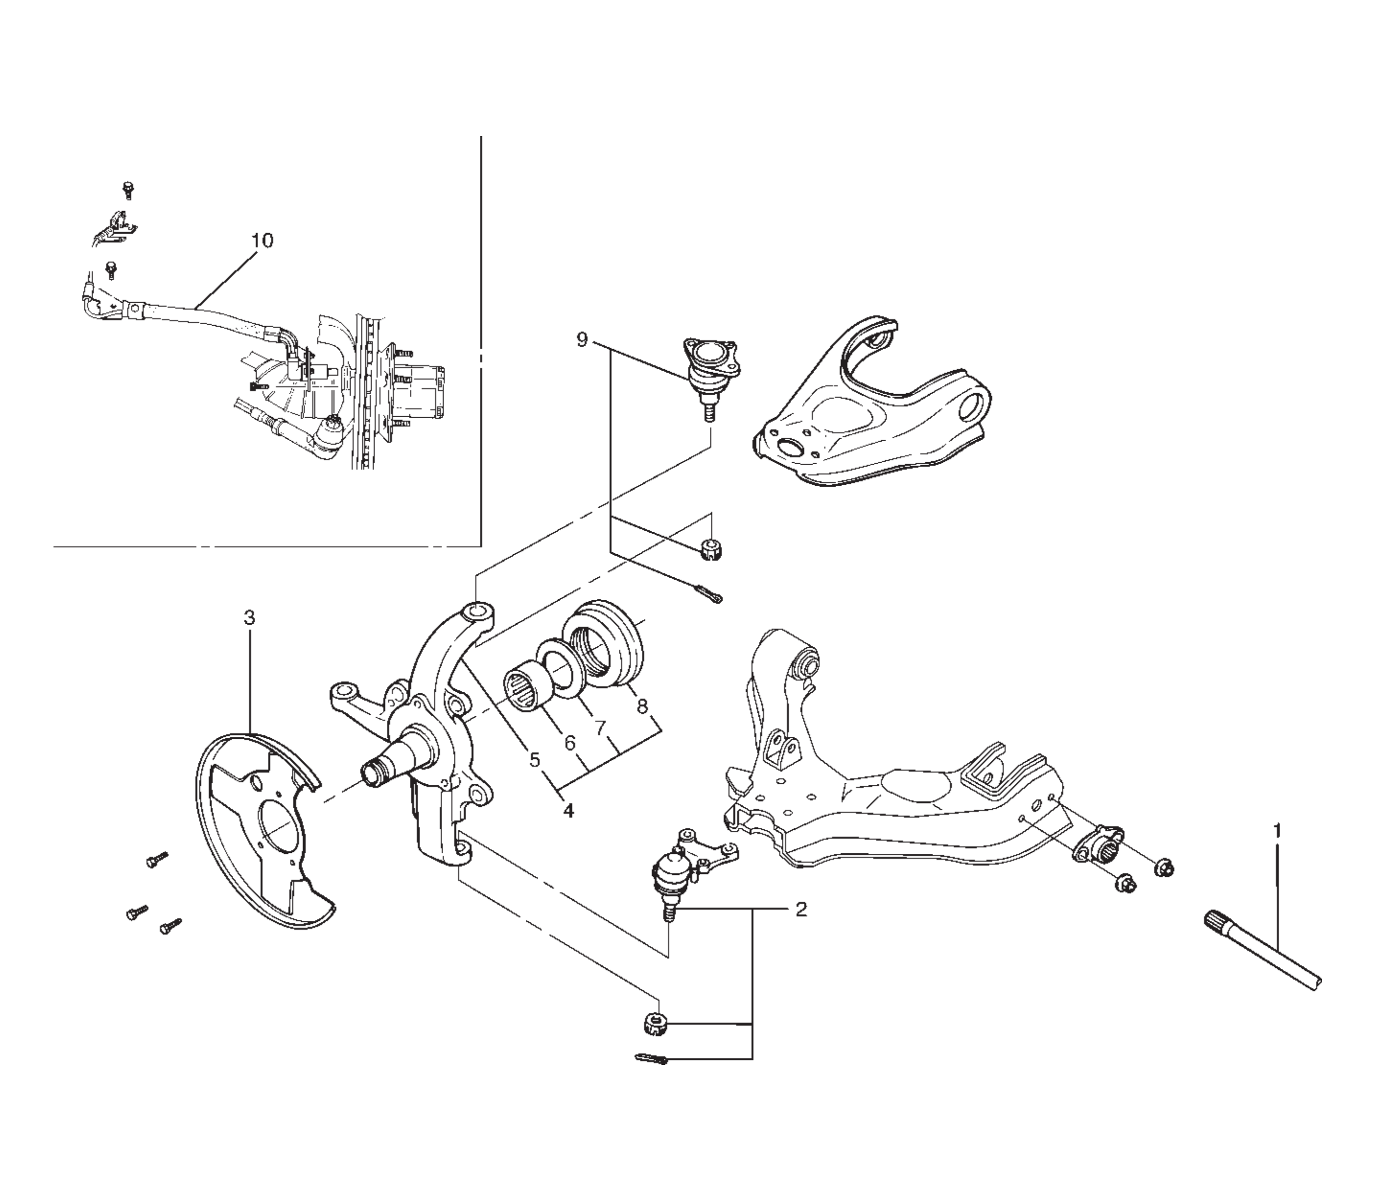
NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering section.



410RS004

Knuckle

Knuckle and Associated Parts



Legend

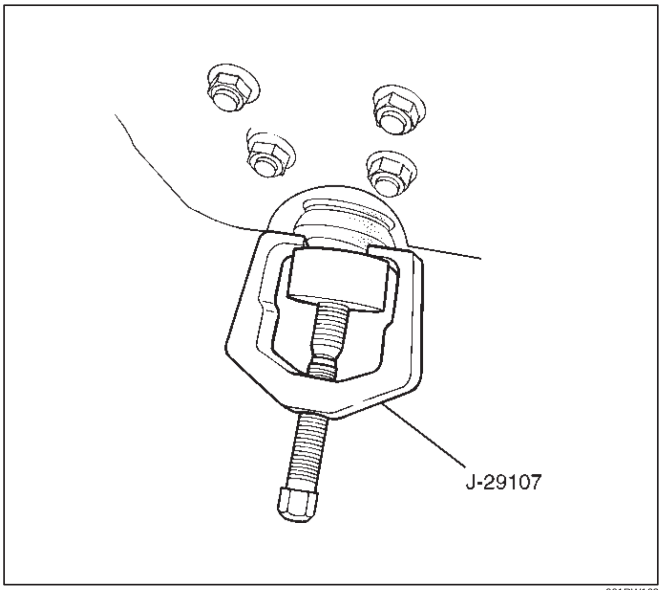
(1) Torsion Bar
(2) Lower Ball Joint
(3) Back Plate
(4) Knuckle Assembly
(5) Knuckle
(6) Needle Bearing
(7) Thrust Washer
(8) Oil Seal
(9) Upper Ball Joint
(10) Wheel Speed Sensor

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper. Refer to Disc Brakes in Brake section.
4. Remove the hub assembly. Refer to Front Hub and Disk in this section.
5. Remove tie–rod end from the knuckle. Refer to Power Steering Unit in Steering section.
6. Remove the speed sensor from the knuckle.
7. Loosen torsion bar by height control arm adjust bolt, then remove torsion bar. Refer to Torsion Bar in this section.
8. Remove wheel speed sensor.

9. Remove back plate.
10. Remove lower ball joint by using remover J–29107.

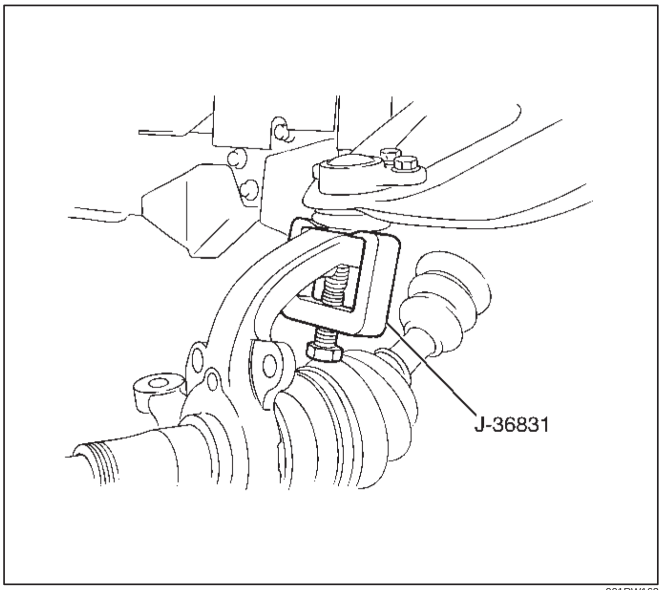
CAUTION: Be careful not to damage the ball joint boot.



901RW163

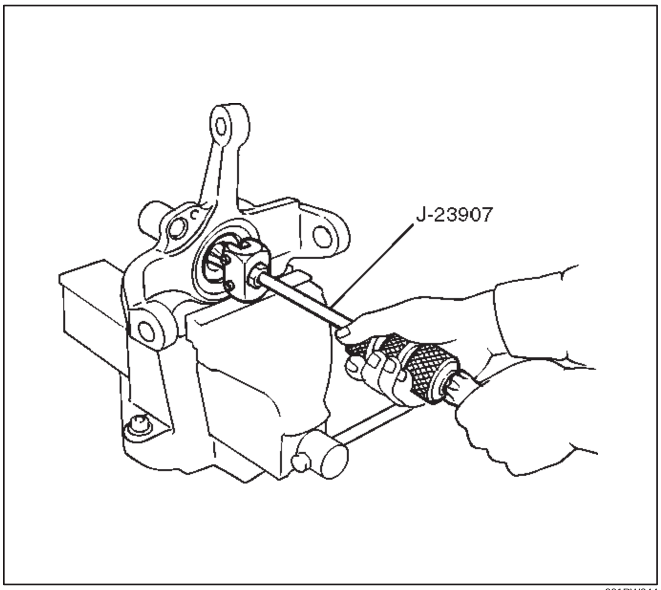
11. Remove upper ball joint by using remover J–36831.

CAUTION: Be careful not to damage the ball joint boot.



901RW162

12. Remove knuckle assembly.
13. Remove oil seal (Except 2WD model).
14. Remove washer (Except 2WD model).
15. Remove needle bearing by using remover J–23907 (Except 2WD model).



901RW044

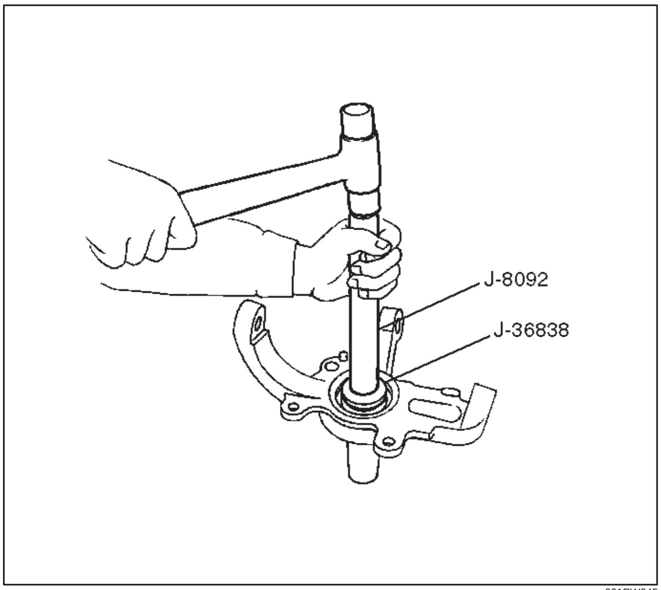
Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

- Knuckle
- Knuckle arm
- Needle bearing
- Thrust washer

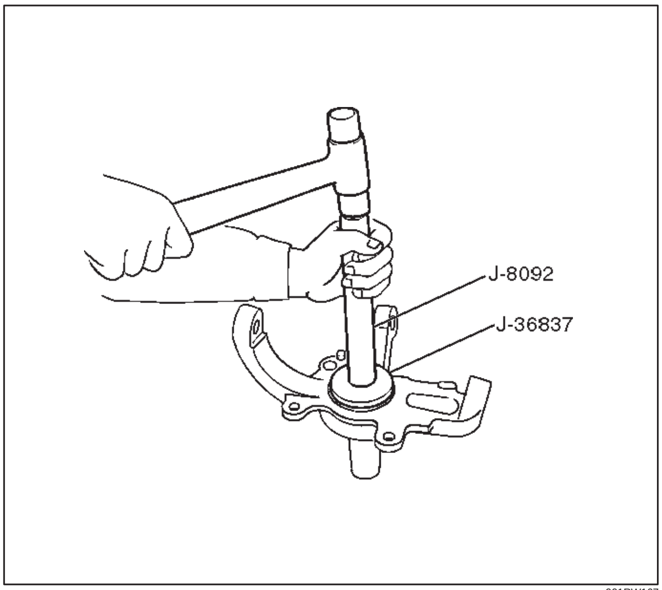
Installation

1. Apply appropriate amount of multipurpose type grease to the new bearing (Approx. 5 g) and install needle bearing by using installer J–36838 and J–8092 (Except 2WD model).



901RW045

2. Apply multipurpose type grease to the thrust washer, and install washer with chamfered side facing knuckle (Except 2WD model).
3. Use a new oil seal, and apply multipurpose type grease to the area surrounded by the lip (approx. 2 g). Then use installer J–36837 and J–8092 to install oil seal. After fitting the oil seal to the installer, drive it to the knuckle using a hammer or bench press until the tool front face contacts with the thrust washer (Except 2WD model).



901RW167

4. Install knuckle assembly.
5. Install upper ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

TorqUA00 N·m (72 lb ft)

6. Install lower ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

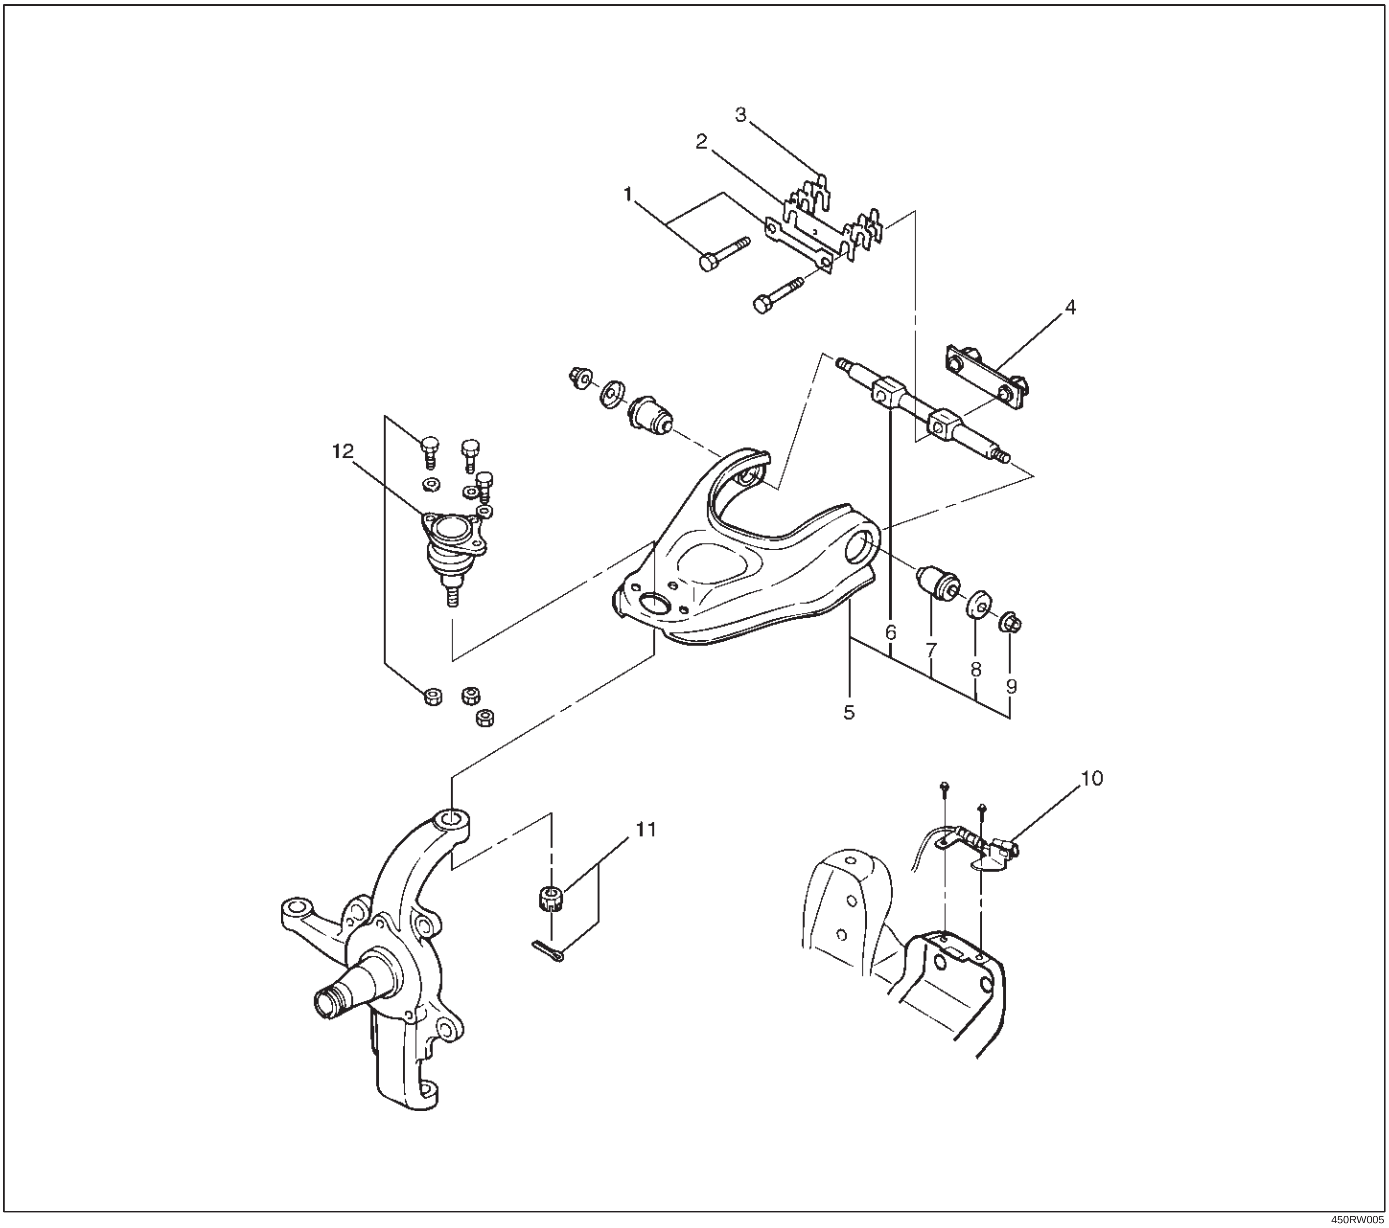
Torque: 147 N·m (108 lb ft)

7. Install back plate.
8. Install wheel speed sensor.
9. Install torsion bar, refer to Torsion Bar in this section.

NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering.

Upper Control Arm

Upper Control Arm and Associated Parts



Legend

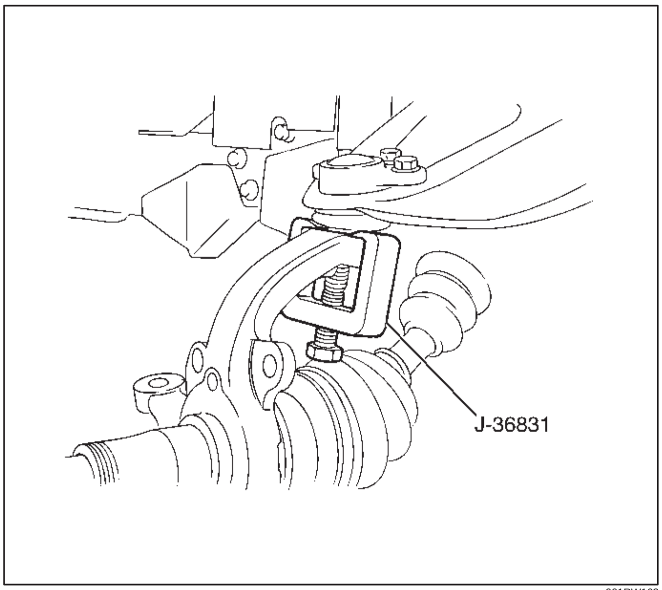
(1) Bolt and Plate
(2) Camber Shims
(3) Caster Shims
(4) Nut Assembly
(5) Upper Control Arm Assembly
(6) Fulcrum Pin
(7) Bushing
(8) Plate
(9) Nut
(10) Speed Sensor Cable
(11) Nut and Cotter Pin
(12) Upper Ball Joint

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper and disconnect brake pipe. Refer to Disc Brakes in Brake section.
4. Support lower control arm with a jack.
5. Remove speed sensor cable.

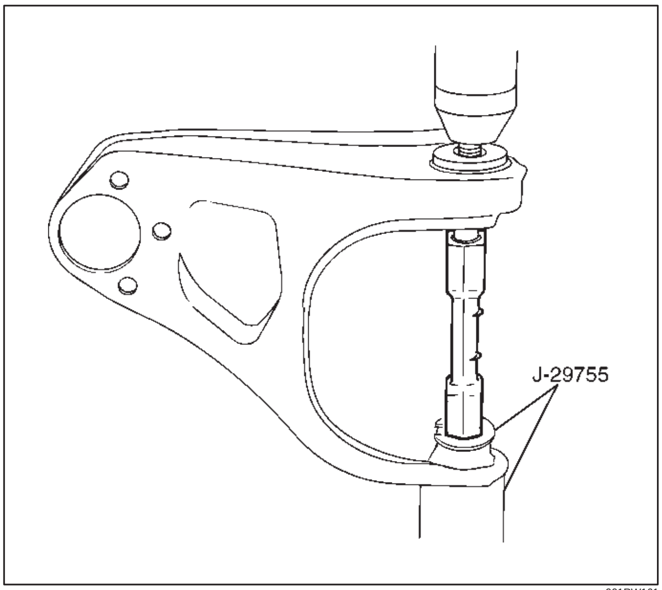
6. Remove nut and cotter pin then use remover J–36831.

CAUTION: Be careful not to damage the ball joint boot.

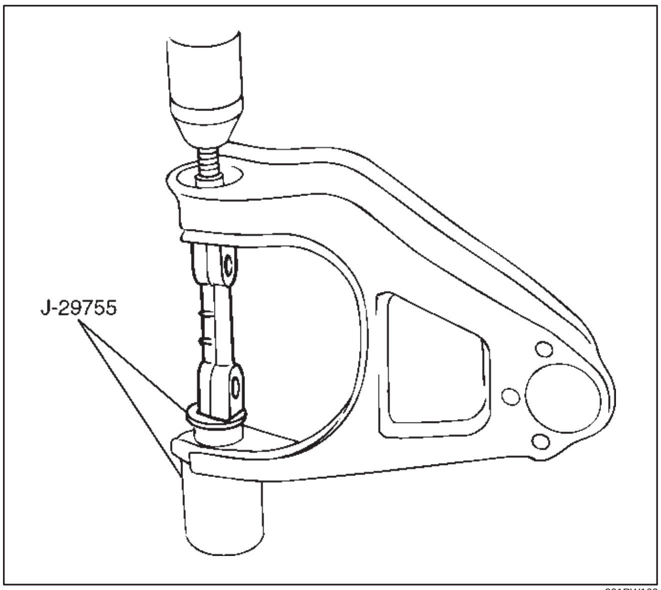


901RW162

7. Remove upper ball joint.
8. Remove bolt and plate.
9. Remove nut assembly.
10. Remove camber shims and note the positions and number of shims.
11. Remove caster shims and note the positions and number of shims.
12. Remove upper control arm assembly.
13. Remove nut.
14. Remove plate.
15. Remove bushing by using remover J–29755.



901RW161



901RW160

16. Remove fulcrum pin.

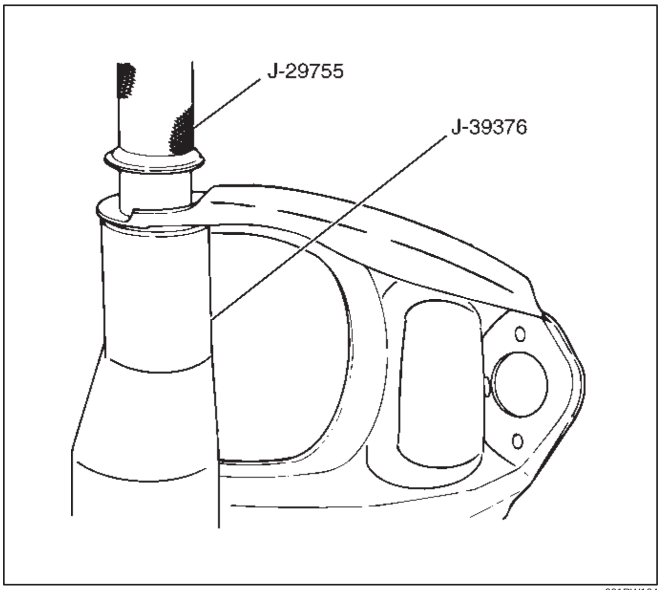
Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.
Check the following parts:

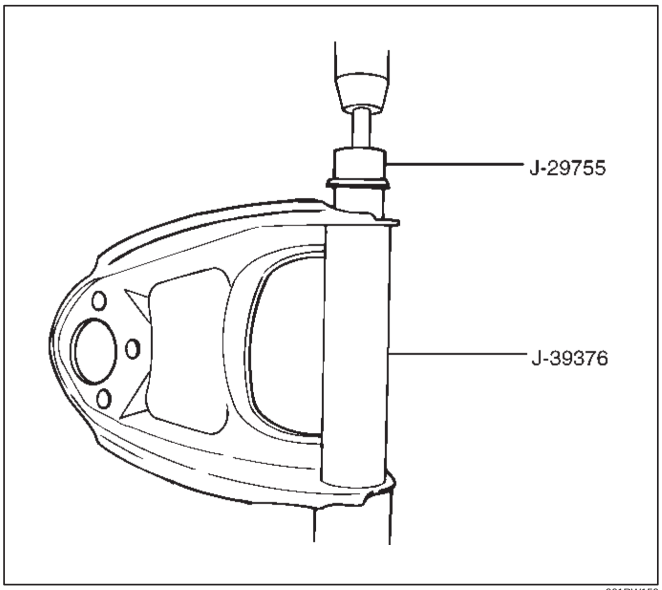
- Upper control arm
- Bushing
- Fulcrum pin

Installation

1. Install fulcrum pin.
2. Install bushing by using installer J–29755 and J–39376.



901RW164



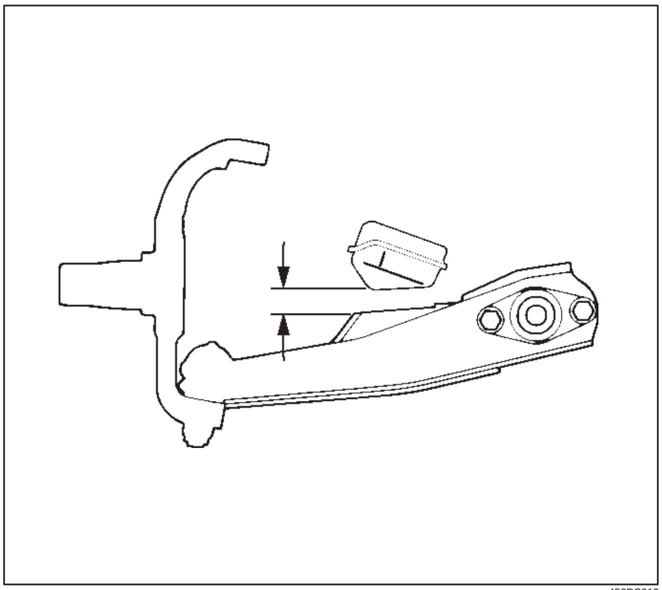
901RW159

3. Install plate.
4. Install nut and tighten fulcrum pin nut finger–tight.

NOTE: Torque fulcrum pin nut after adjusting buffer clearance.

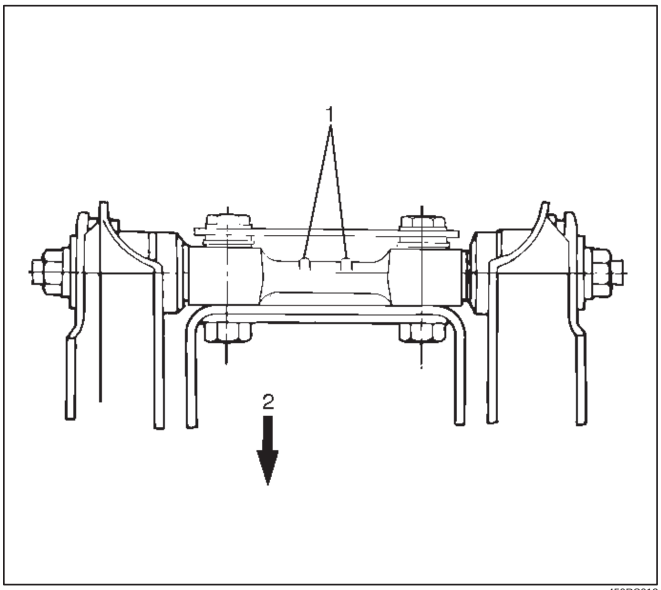
Buffer clearance: 22 mm (0.87 in)

Torque: 108 N·m (80 lb ft)



450RS012

5. Install upper control arm assembly with the fulcrum pin projections turned inward.

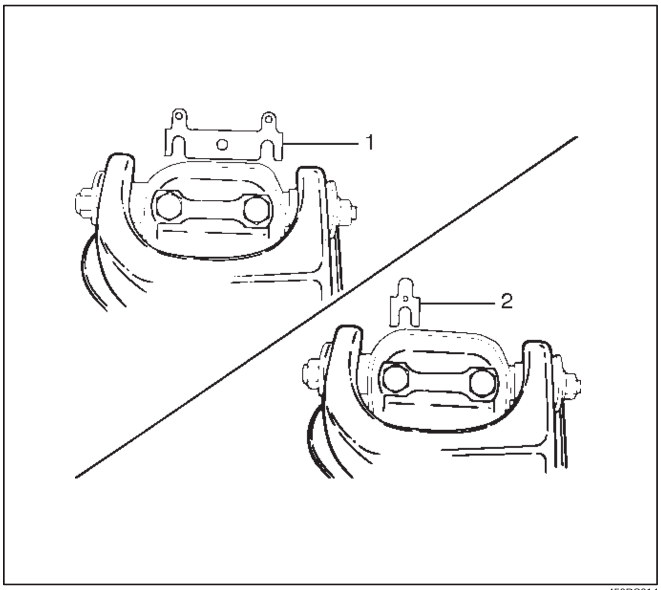


450RS013

Legend

(1) Projection
(2) Outward

6. Install the caster shims(2) between the chassis frame and fulcrum pin.
7. Install the camber shims(1) between the chassis frame and fulcrum pin.



450RS014

8. Install nut assembly.
9. Install bolt and plate, then tighten the bolt to the specified torque.

Torque: 152 N·m (112 lb ft)

10. Install upper ball joint and tighten it to the specified torque.

Torque: 57 N·m (42 lb ft)

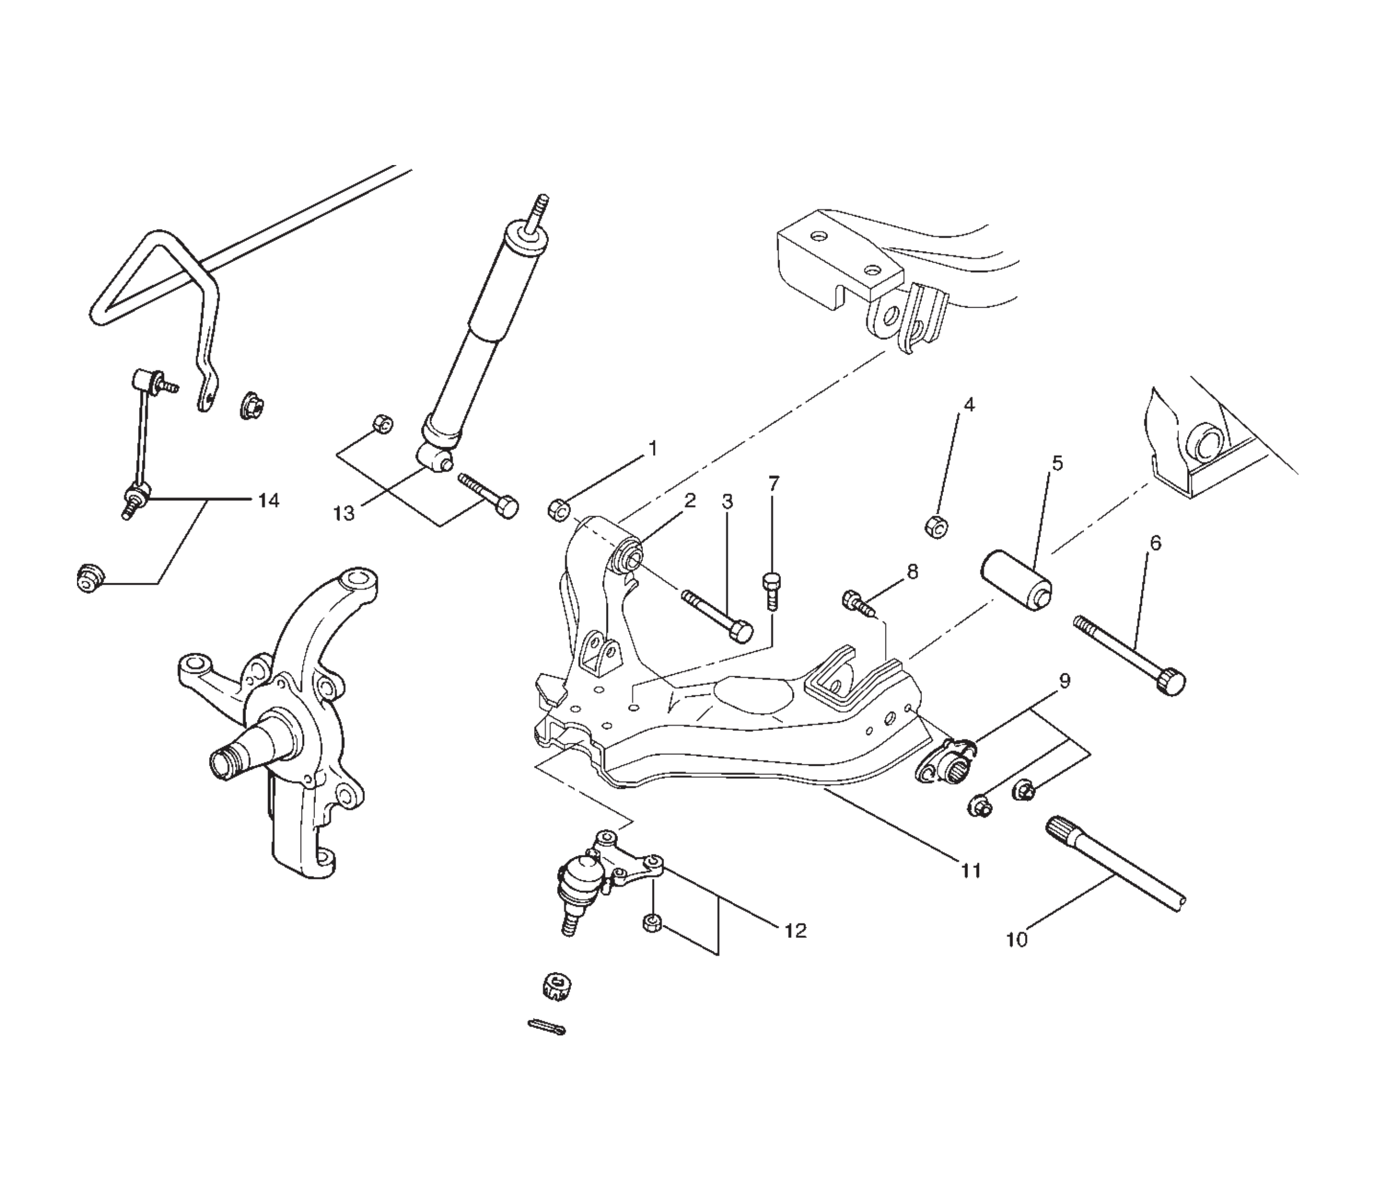
11. Install nut and cotter pin then tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

TorqUA00 N·m (72 lb ft)

12. Install speed sensor cable.

Lower Control Arm

Lower Control Arm and Associated Parts



Legend

(1) Nut, Front
(2) Bush, Front
(3) Bolt, Front
(4) Nut, Rear
(5) Bush, Rear
(6) Bolt, Rear
(7) Bolt, Lower Ball Joint

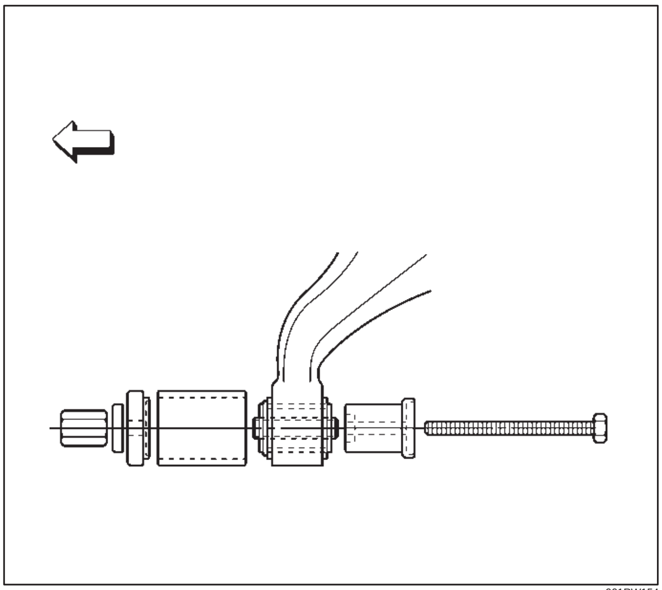
(9) Torsion Bar Arm Bracket
(10) Torsion Bar
(11) Lower Control Arm
(12) Lower Ball Joint
(13) Shock Absorber
(14) Stabilizer Link

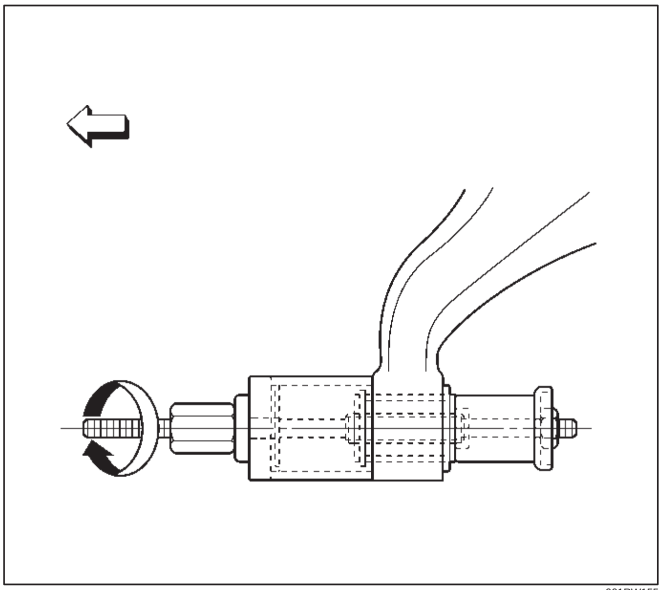
Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
4. Remove the retaining ring from the front axle driving shaft to release the shaft from hub(Except 2WD model). Refer to Front Hub and Disc in Driveline/Axle section.
5. Support lower control arm with a jack.

6. Remove front nut.
7. Remove rear nut.
8. Remove torsion bar, refer to Torsion Bar in this section.
9. Remove torsion bar arm bracket.
10. Disconnect the stabilizer link at the lower control arm.
11. Remove the shock absorber lower end from the lower control arm.
12. Remove the lower ball joint from the lower control arm.
13. Remove front bolt.
14. Remove rear bolt.
15. Remove lower control arm.
16. Remove torsion bar arm bolt.
17. Remove lower ball joint bolt.
18. Remove front bushing by using remover J–36833.

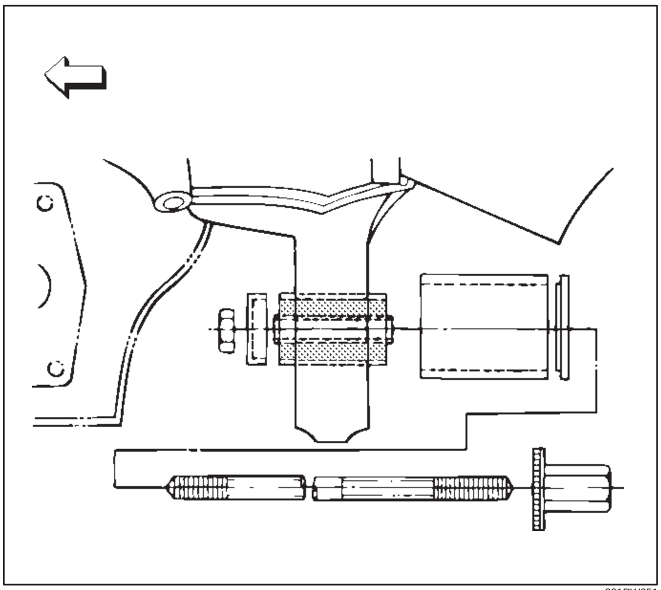


901RW154

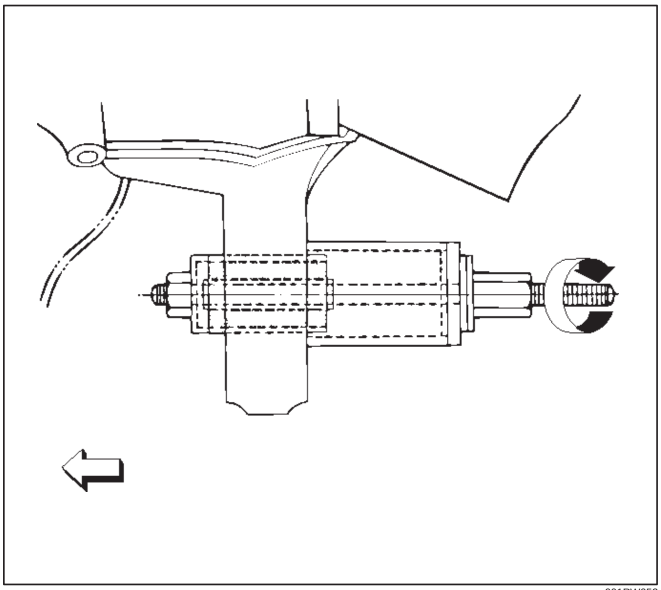


901RW155

19. Remove rear bushing by using remover J–36834.



901RW051



901RW052

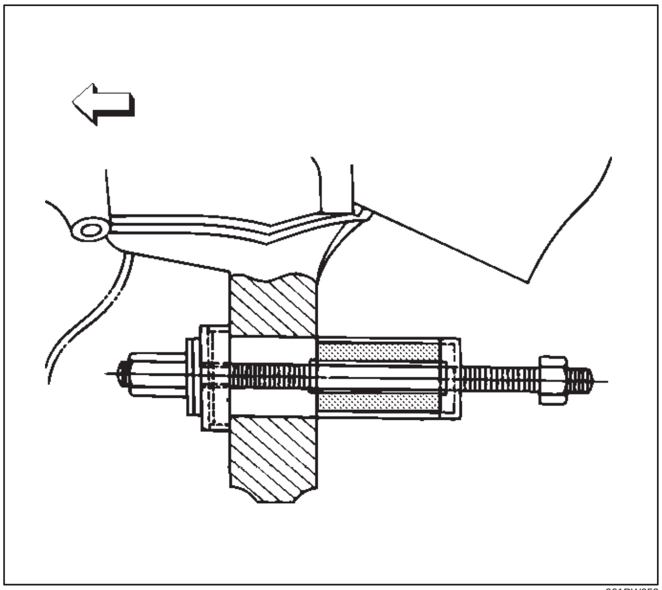
Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

- Lower control arm
- Bushing

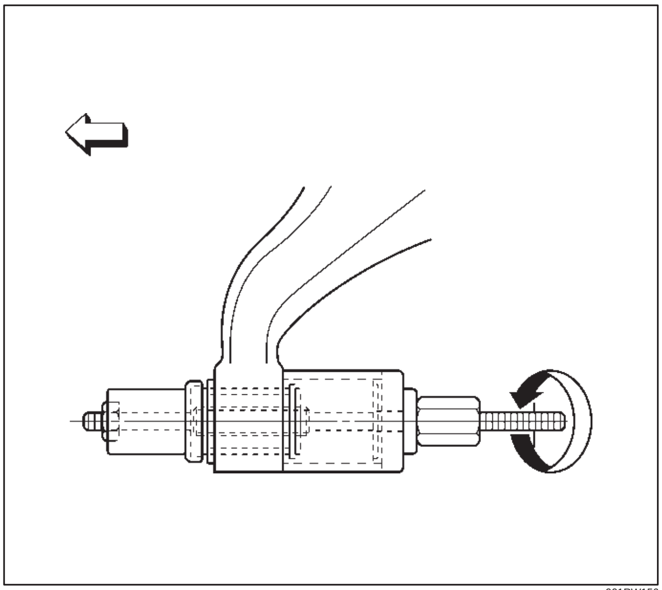
Installation

1. Install rear bushing by using installer J–36834.



901RW053

2. Install front bushing by using installer J–36833.



901RW156

3. Install lower ball joint bolt.
4. Install torsion bar arm bolt.
5. Install lower control arm.
6. Install rear bolt.
7. Install front bolt.
8. Install lower ball joint and tighten it to the specified torque.

   Torque: 116 N·m (85 lb ft)

9. Install shock absorber and tighten it to the specified torque.

   Torque: 93 N·m (69 lb ft)

10. Install stabilizer link and tighten it to the specified torque.

    Torque: 50 N·m (37 lb ft)

11. Install torsion bar arm bracket and tighten it to the specified torque.

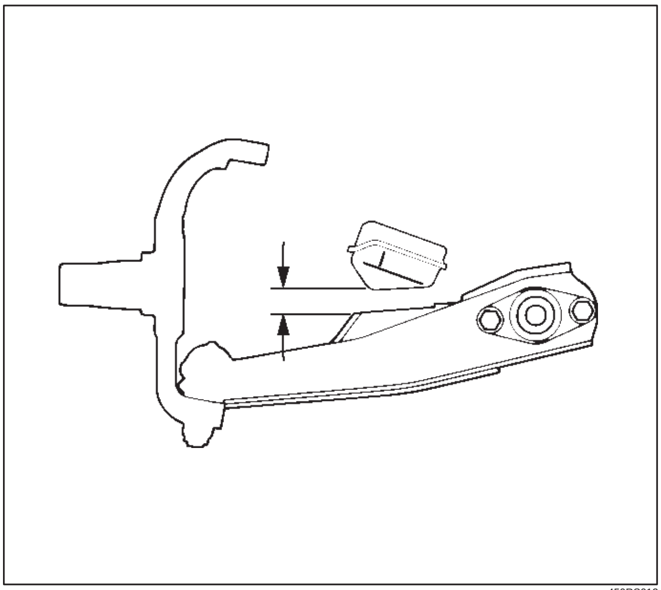
    Torque: 116 N·m (85 lb ft)

12. Install Torsion bar, refer to Torsion Bar in this section.
13. Install rear nut and tighten lower link nut finger–tight.

NOTE: Torque lower control arm nut after adjusting buffer clearance.

Buffer clearance: 22 mm (0.87 in)

Torque: 235 N·m (174 lb ft)



450RS012

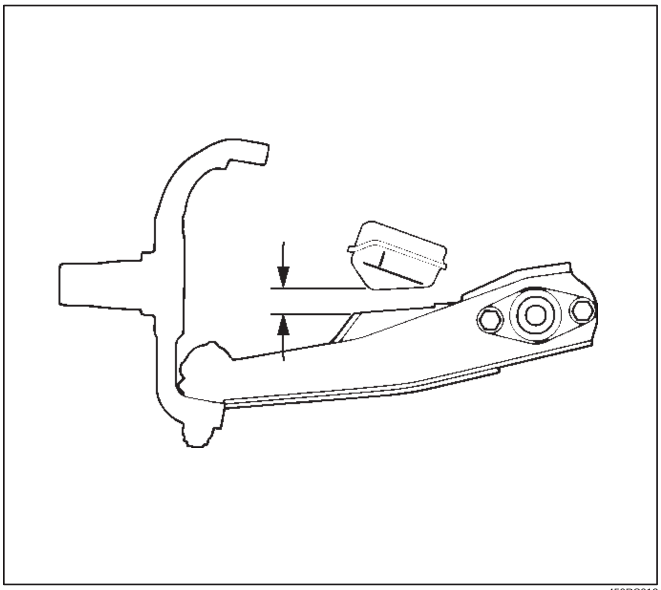
14. Install front nut then tighten lower link nut finger-tight.

NOTE: Torque lower control arm nut after adjusting buffer clearance .

Buffer clearance: 22 mm (0.87 in)

Torque: 190 N·m (140 lb ft)

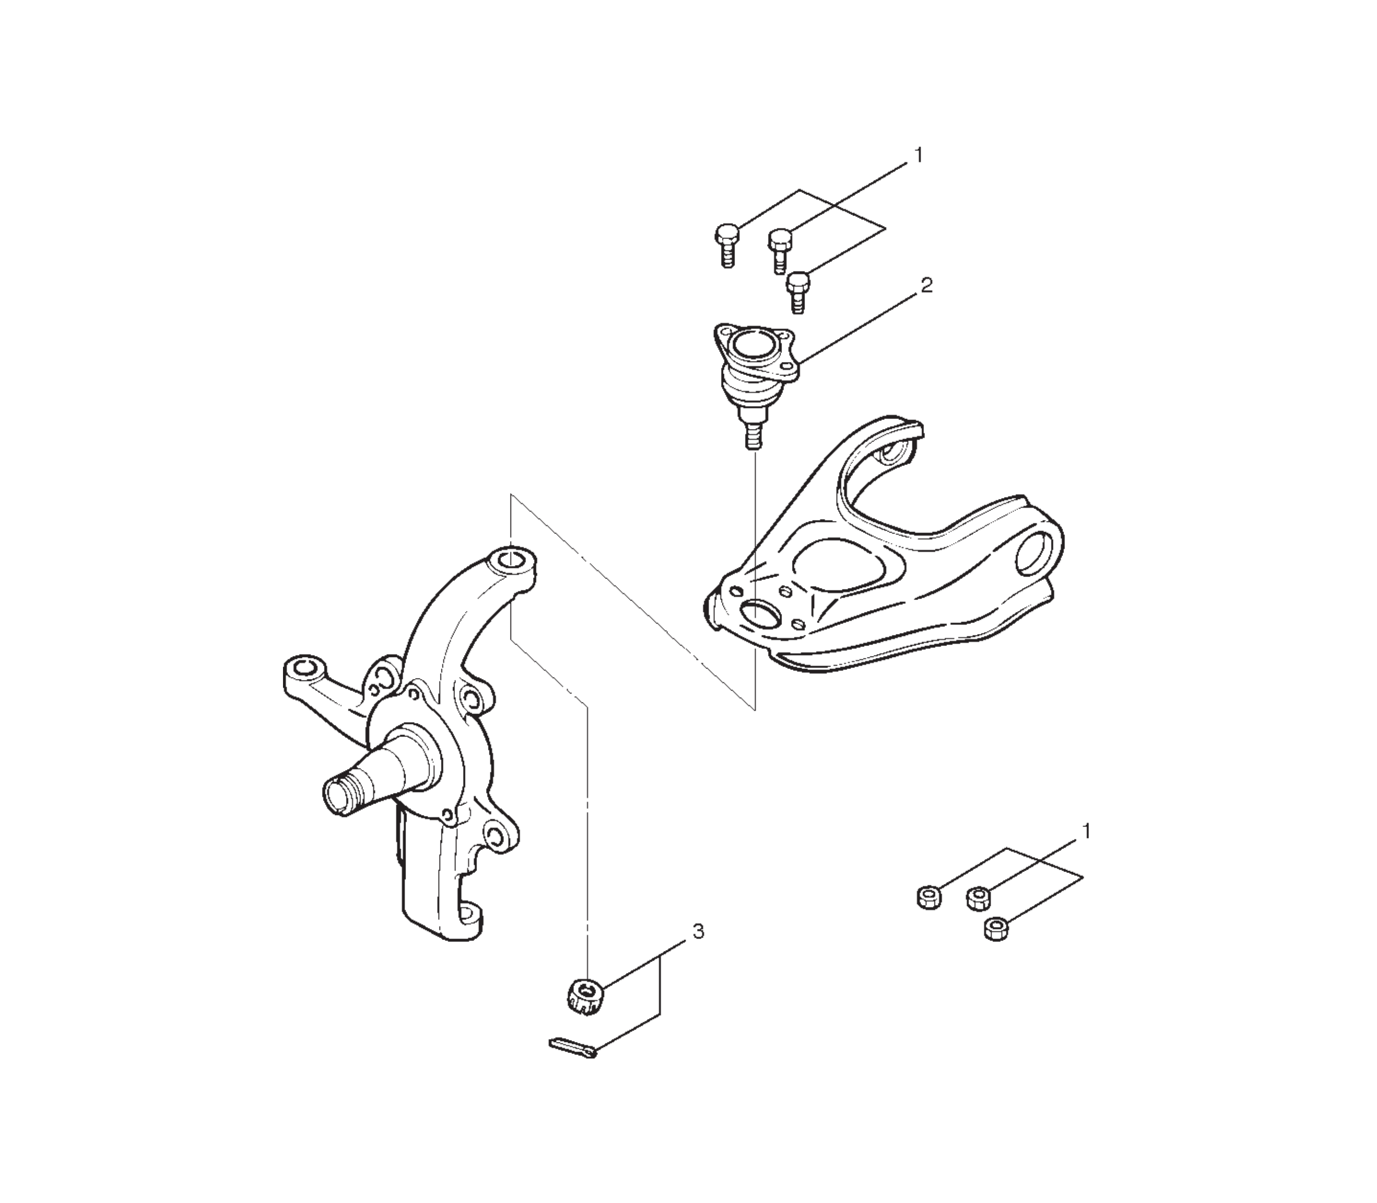
NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering section.



450RS012

Upper Ball Joint

Upper Ball Joint and Associated Parts



Legend

(1) Bolt and Nut

(2) Upper Ball Joint

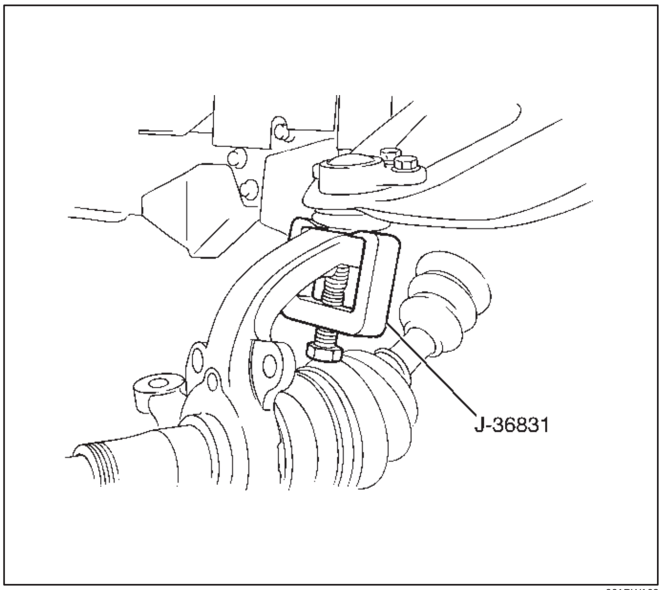
(3) Nut and Cotter Pin

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove the speed sensor from the knuckle.

3. Remove upper ball joint nut and cotter pin, then use remover J–36831 to remove the upper ball joint from the knuckle.

CAUTION: Be careful not to damage the ball joint boot.



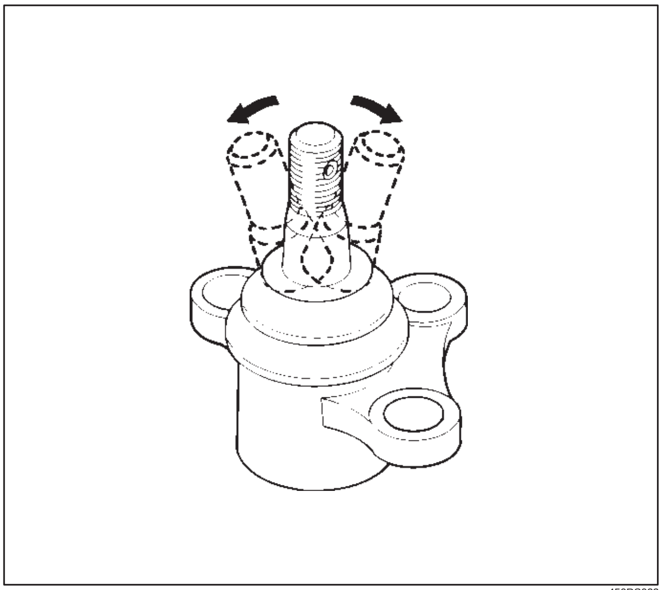
901RW162

4. Remove bolt and nut.
5. Remove upper ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.

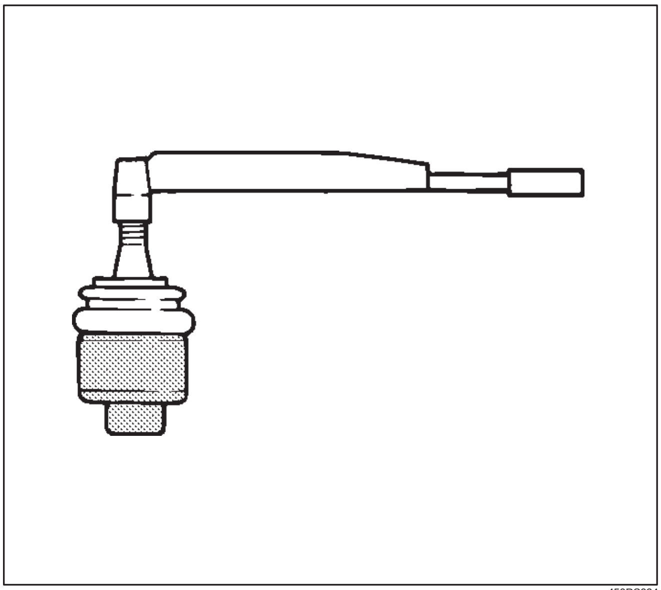
- Inspect the lower end boot for damage or grease leak. Move the ball joint as shown in the figure to confirm its normal movement.
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.



450RS023

- After moving the ball joint 4 or 5 times, attach nut then measure the preload.

Starting torque: 0.5 –3.2 N·m (0.4–2.4 lb ft)



450RS024

If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install upper ball joint.
2. Install bolt and nut, then tighten them to the specified torque.

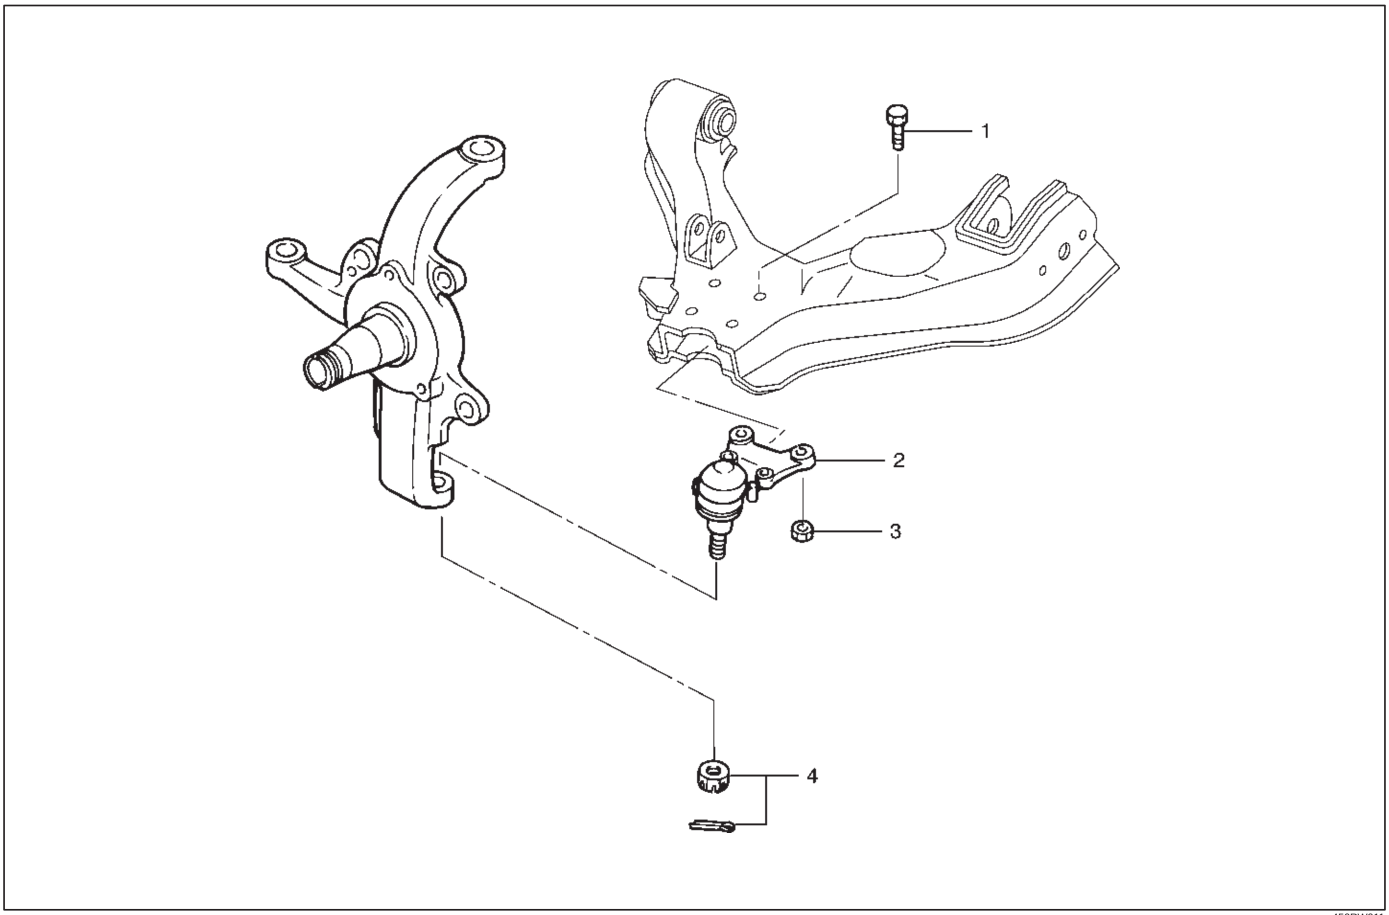
Torque: 57 N·m (42 lb ft)

3. Install nut and cotter pin, then tighten the nut to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

TorqUA00 N·m (72 lb ft)

Lower Ball Joint

Lower Ball Joint and Associated Parts



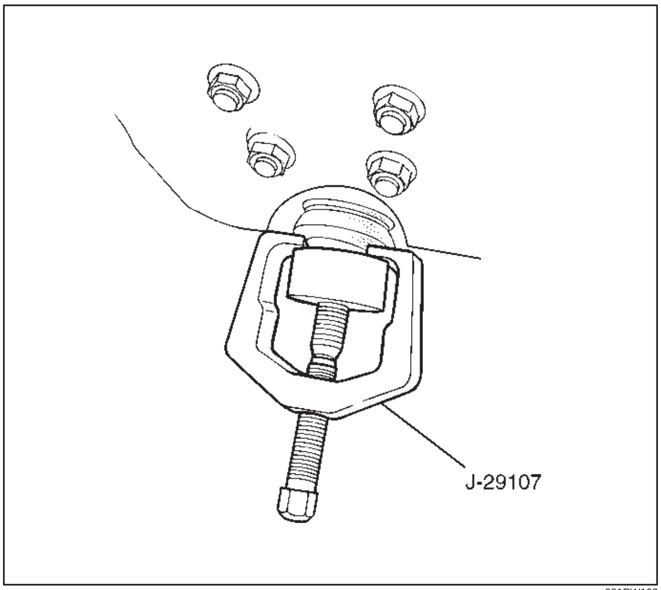
450RW011

Legend
(1) Bolt
(2) Lower Ball Joint
(3) Nut
(4) Nut and Cotter Pin

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
4. Remove the retaining ring from the front axle driving shaft to release the shaft from hub(Except 2WD model). Refer to Front Hub and Disc in Driveline/Axle section.
5. Support lower control arm with a jack.
6. Remove lower ball joint nut and cotter pin, then use remover J–29107 to remove the lower ball joint from the knuckle.

CAUTION: Be careful not to damage the ball joint boot.



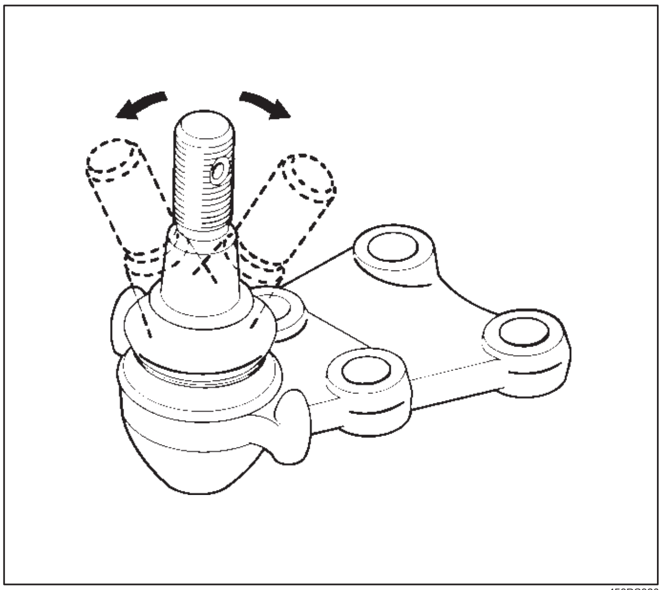
901RW163

7. Remove nut.
8. Remove bolt.
9. Remove lower ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

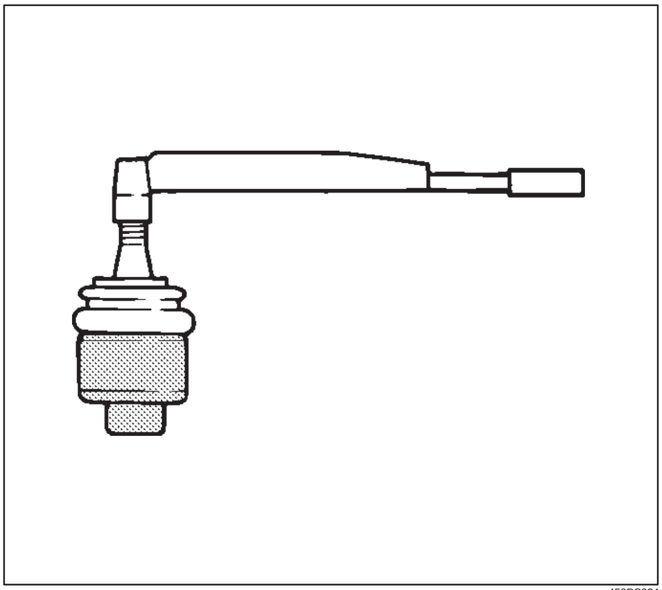
- Inspect the lower end boot for damage or grease leak. Move the ball joint as shown in the figure to confirm its normal movement .
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.



450RS026

- After moving the ball joint 4 or 5 times, attach nut the measure the preload.

Starting torque: 0.5–6.4 N·m (0.4–4.7 lb ft)



450RS024

- If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install lower ball joint.
2. Install bolt.
3. Install nut and tighten it to the specified torque.

Torque: 116 N·m (85 lb ft)

4. Install ball joint nut, then tighten it to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147 N·m (108 lb ft)

Main Data and Specifications

General Specifications

Front suspension	Type	Independent wishbone arms, torsion bar spring with stabilizer bar.
Torsion bar spring	Length	1142 mm (45.0 in)
	Diameter	27.0 mm (1.06 in)
Front shock absorber	Type	Hydraulic, double acting, telescopic
	Piston diameter	30.0 mm (1.18 in)
	Stroke	125.0 mm (4.92 in)
	Compressed length	255.0 mm (10.04 in)
	Extended length	380.0 mm (14.96 in)
Stabilizer bar	Diameter	25.0 mm (0.98 in)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The rear suspension is a 5-link, coil spring type suspension with a stabilizer bar, consisting of two trailing links, two upper links, lateral rod, shock absorber, and stabilizer. In this suspension, the links are specially arranged to enable the rear axle to move freely, thereby expanding suspension stroke, reducing friction, and improving lateral rigidity and roll control. All these result in improved stability, riding comfort, and rough road maneuverability.

Each link connects the axle housing with the frame through a runner bushing. The axle housing is supported by the trailing links and upper links longitudinally and by the lateral rod latitudinally.

Diagnosis

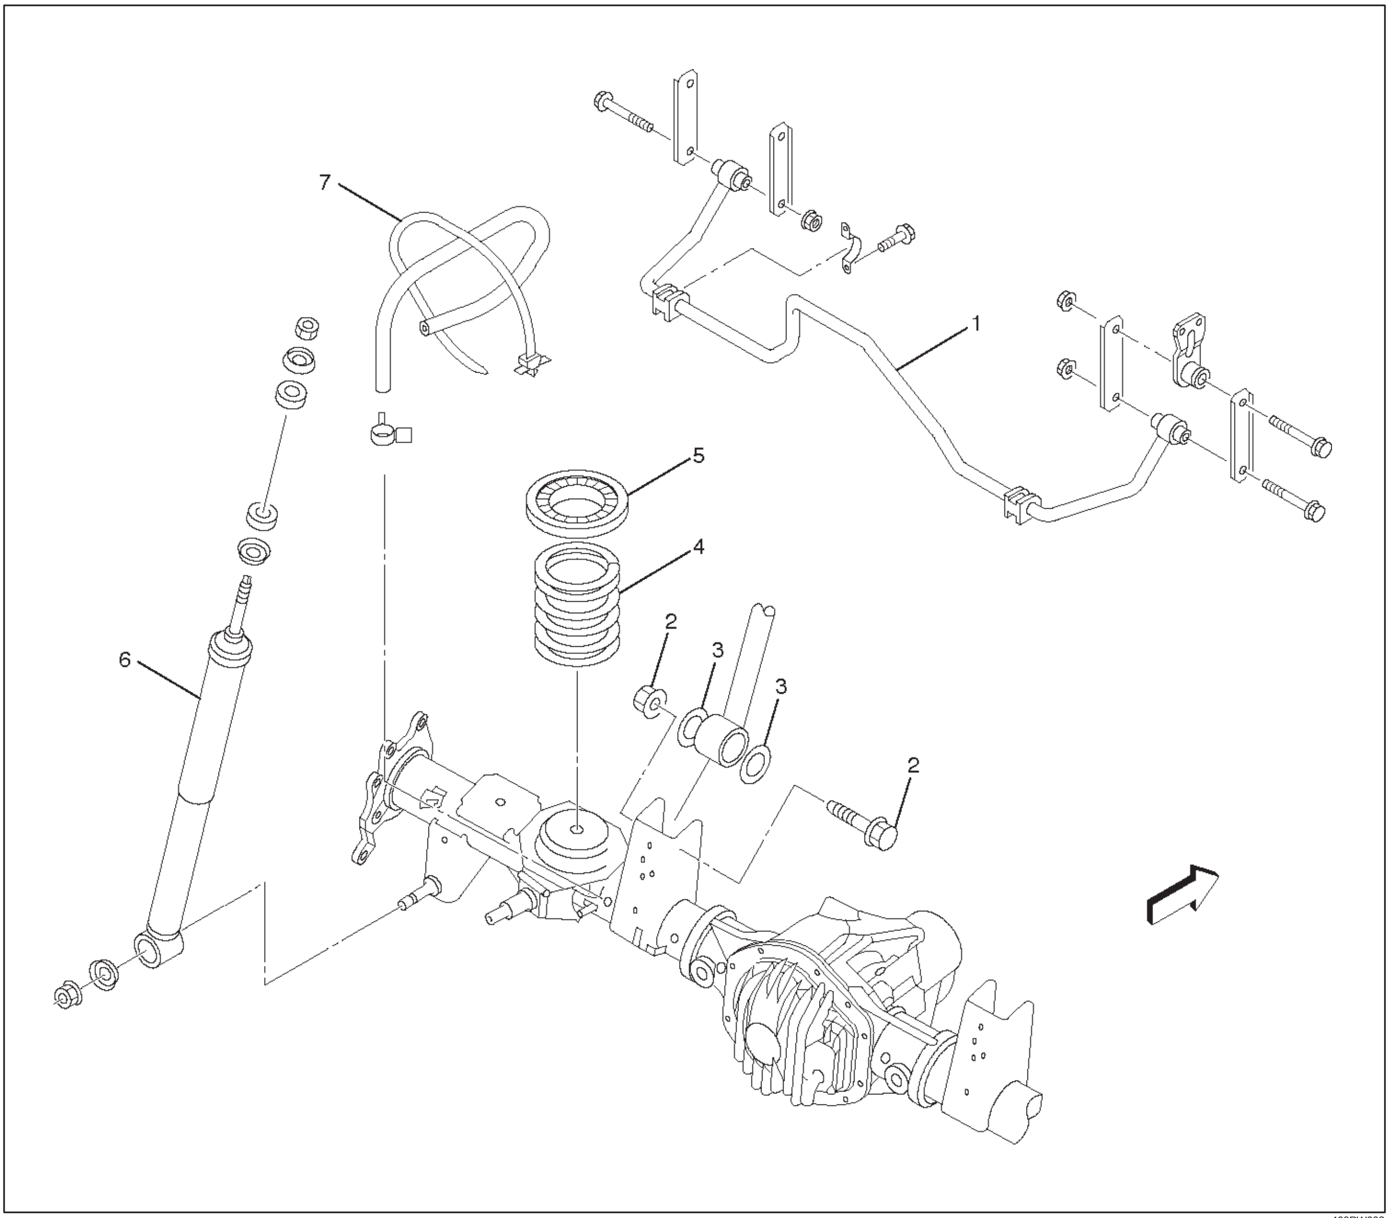
Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
	Tires not adequately inflated.	Adjust the pressure.
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
	Parts in power steering valve defective.	Replace power steering unit.

Condition	Possible cause	Correction
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.

Condition	Possible cause	Correction
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Coil Spring

Coil Spring and Associated Parts



Legend

(1) Stabilizer Bar
(2) Upper Link Fixing Bolt and Nut
(3) Rubber Plate
(4) Coil Spring
(5) Insulator
(6) Shock Absorbar
(7) Breather Hose

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Support the rear axle case with a jack.
3. Disconnect brake hose at the crossmember.
4. Remove breather hose.
5. Remove upper link fixing bolt, nut and rubber plate on the rear axle case (left-side only).
6. Disconnect the stabilizer bar at the stabilizer link.
7. Remove the shock absorber from the axle case.
8. Remove spring insulator.
9. Remove the insulator and coil spring while lowering the rear axle case.

CAUTION: Be sure not to let the brake hose, parking brake cable, and breather hose extend to their full length.

Inspection and Repair

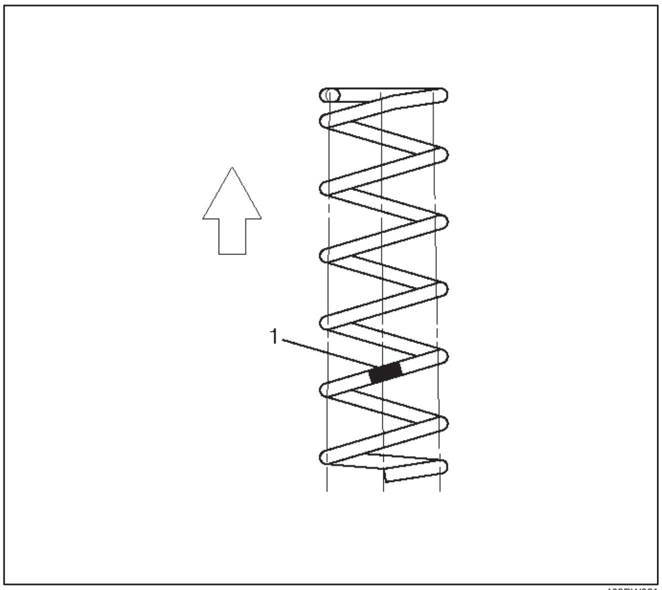
Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Coil spring
- Insulator

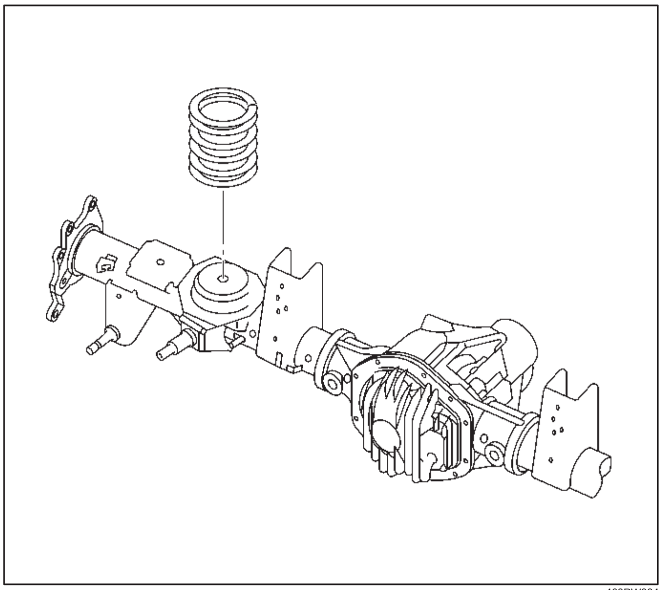
Installation

1. Install coil spring and make sure that the coil spring is installed in the proper position. Paint mark(1) should be downward.



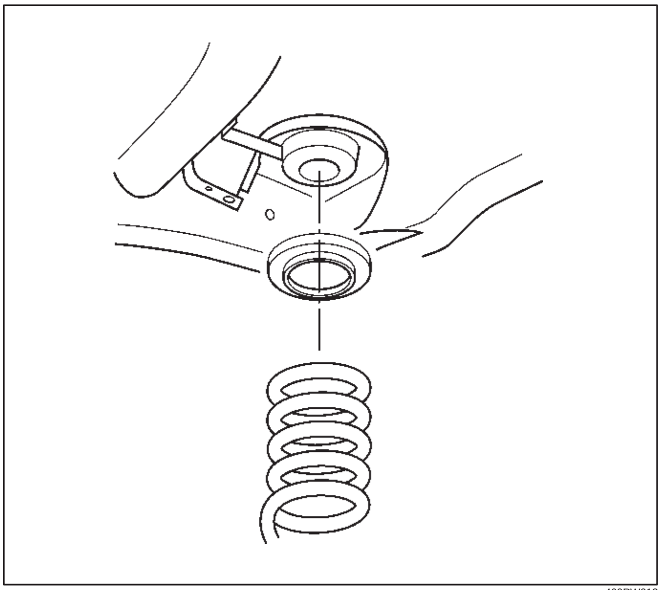
460RW001

2. Fit the end of the coil spring to the coil spring seat and mount the coil spring on the rear axle case.



460RW004

3. Install the insulator on the coil spring. Jack up the axle case gently with the top of the coil spring set to the spring seat on the frame side.



460RW013

4. Install shock absorber and tighten the nut lightly, then retighten it to the specified torque after the vehicle is at curb height.

NOTE: When mounting shock absorber, be sure not to use grease on bushings or any other nearby part.

Torque: 78 N·m (58 lb ft)

5. Install stabilizer bar.

Torque: 31 N·m (23 lb ft)

6. Install upper link with rubber plate and tighten fixing bolt.

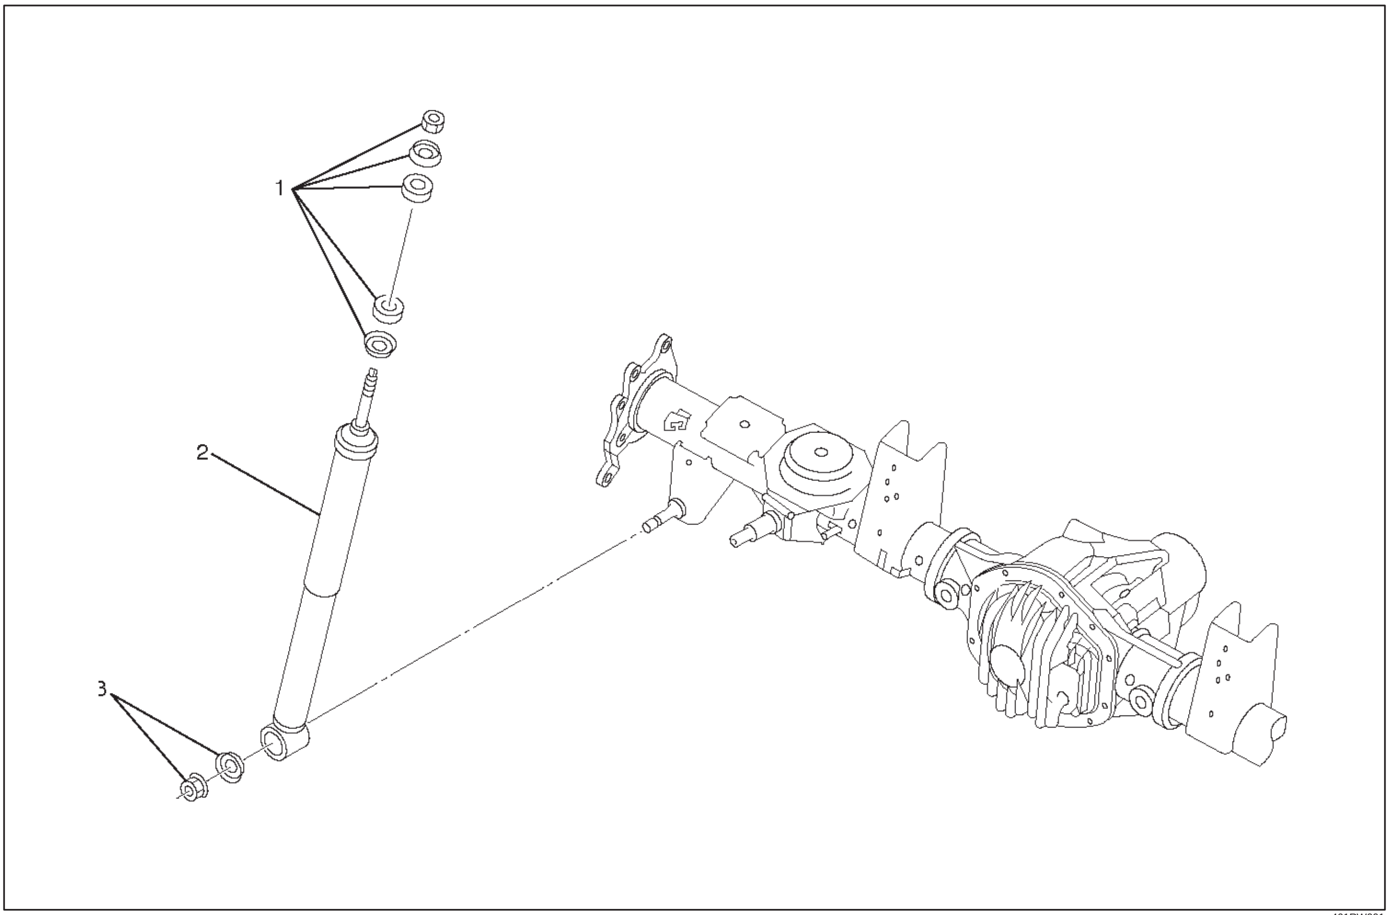
Torque: 137 N·m (101 lb ft)

7. Install breather hose.
8. Connect brake hose and bleed the brake system.

   Refer to Bleeding the Brake Hydraulic System in Brake section.

Shock Absorber

Shock Absorber and Associated Parts



Legend
(1) Nut, Bush and Washer
(2) Shock Absorber
(3) Nut and Washer

Removal

1. Remove shock absorber fixing nut, bush and washer (upper side).
2. Remove shock absorber fixing nut and washer (lower side).
3. Remove shock absorber.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

- Shock absorber
- Rubber bushing

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

Installation

1. Install shock absorber. When mounting shock absorber, be sure not to use grease on bushings or any other nearby part.
2. Install nut and washer (lower side), then tighten the nut lightly. Retighten to the bolt and nut specified torque after the vehicle is at curb height.

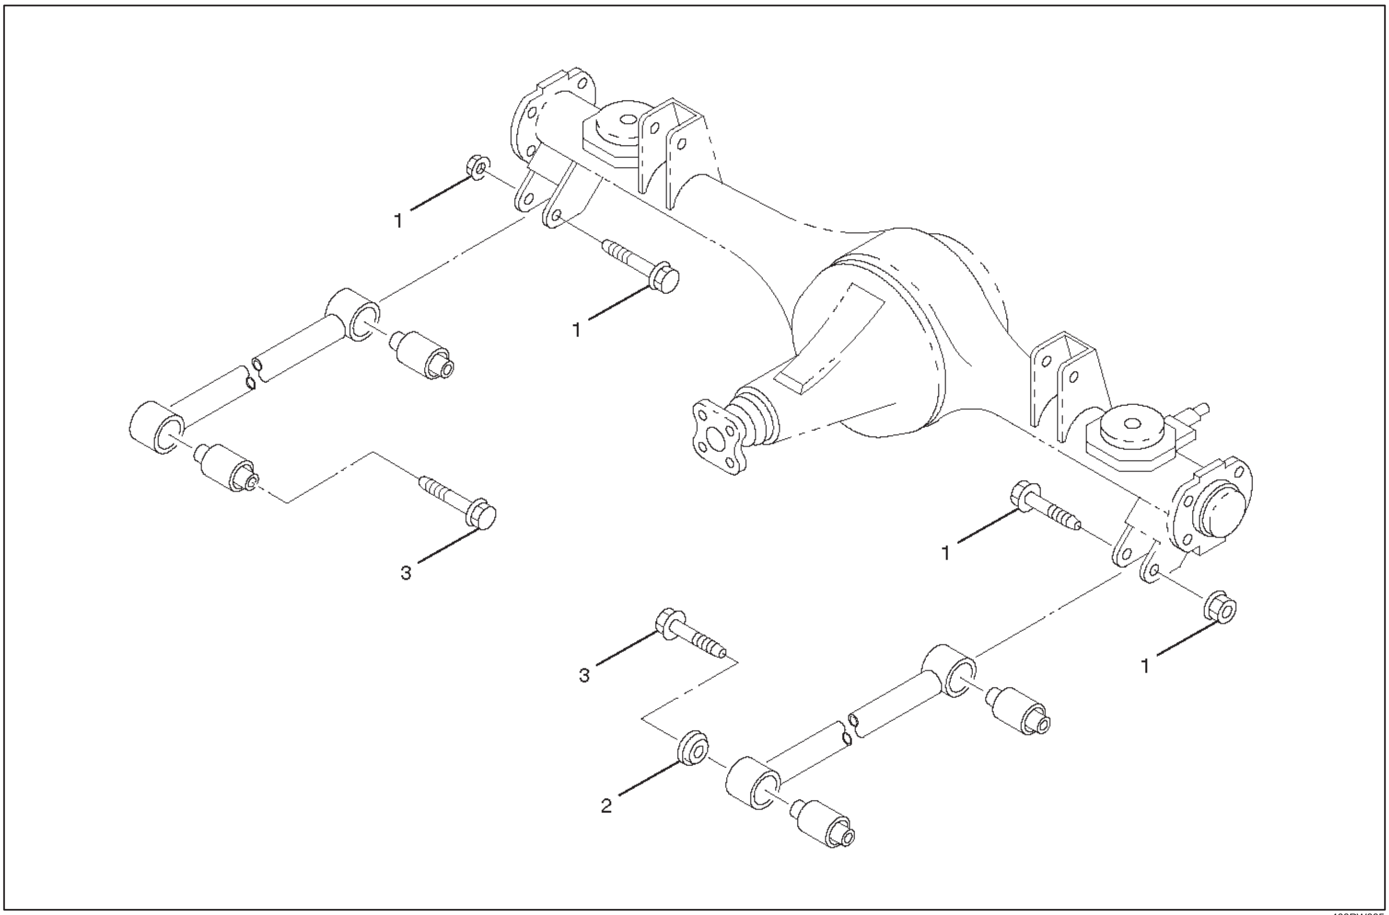
Torque: 78 N·m (58 lb ft)

3. Install nut, bush and washer (upper side), then tighten the nut lightly. Retighten to the nut specified torque after the vehicle is at curb height.

Torque: 20 N·m (14 lb ft)

Trailing Link

Trailing Link and Associated Parts



460RW005

Legend
(1) Bolt and Nut (Axle side)
(2) Protector (Left side only)
(3) Bolt (Frame side)

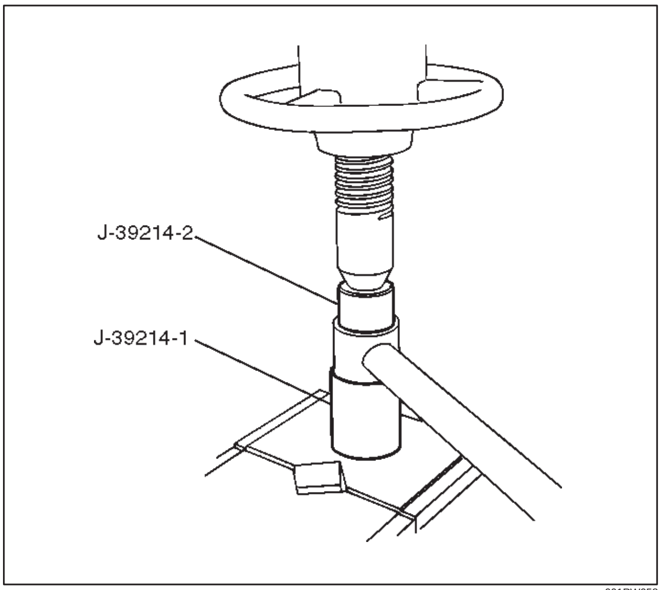
Removal

1. Remove the parking brake cable from the trailing link.
2. Remove the trailing link fixing bolt, nut and protector.
3. Remove trailing link.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

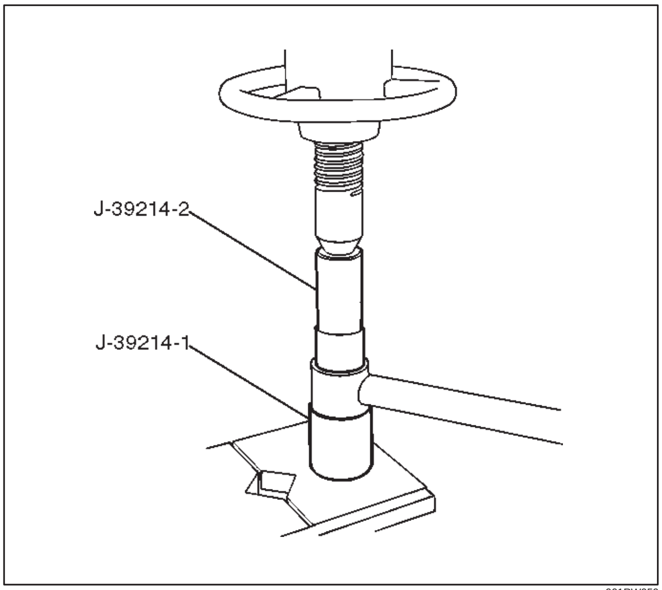
1. Trailing link
2. Rubber bushing
   - Remove the rubber bushing by using remover J–39214.



901RW058

- Install the rubber bushing by using installer J–39214.

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

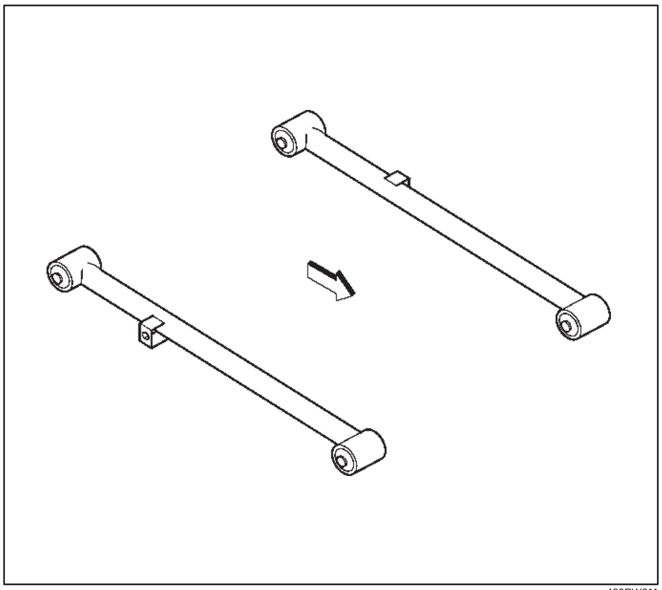


901RW059

Installation

1. Install trailing link. Make sure that the trailing link is in its correct position.

NOTE: When mounting trailing link, be sure not to use grease on bushings or any other nearby part.



460RW011

2. Install bolt, nut and protector. Tighten the bolts and nuts lightly, then retighten them to the specified torque after the vehicle is at curb height.

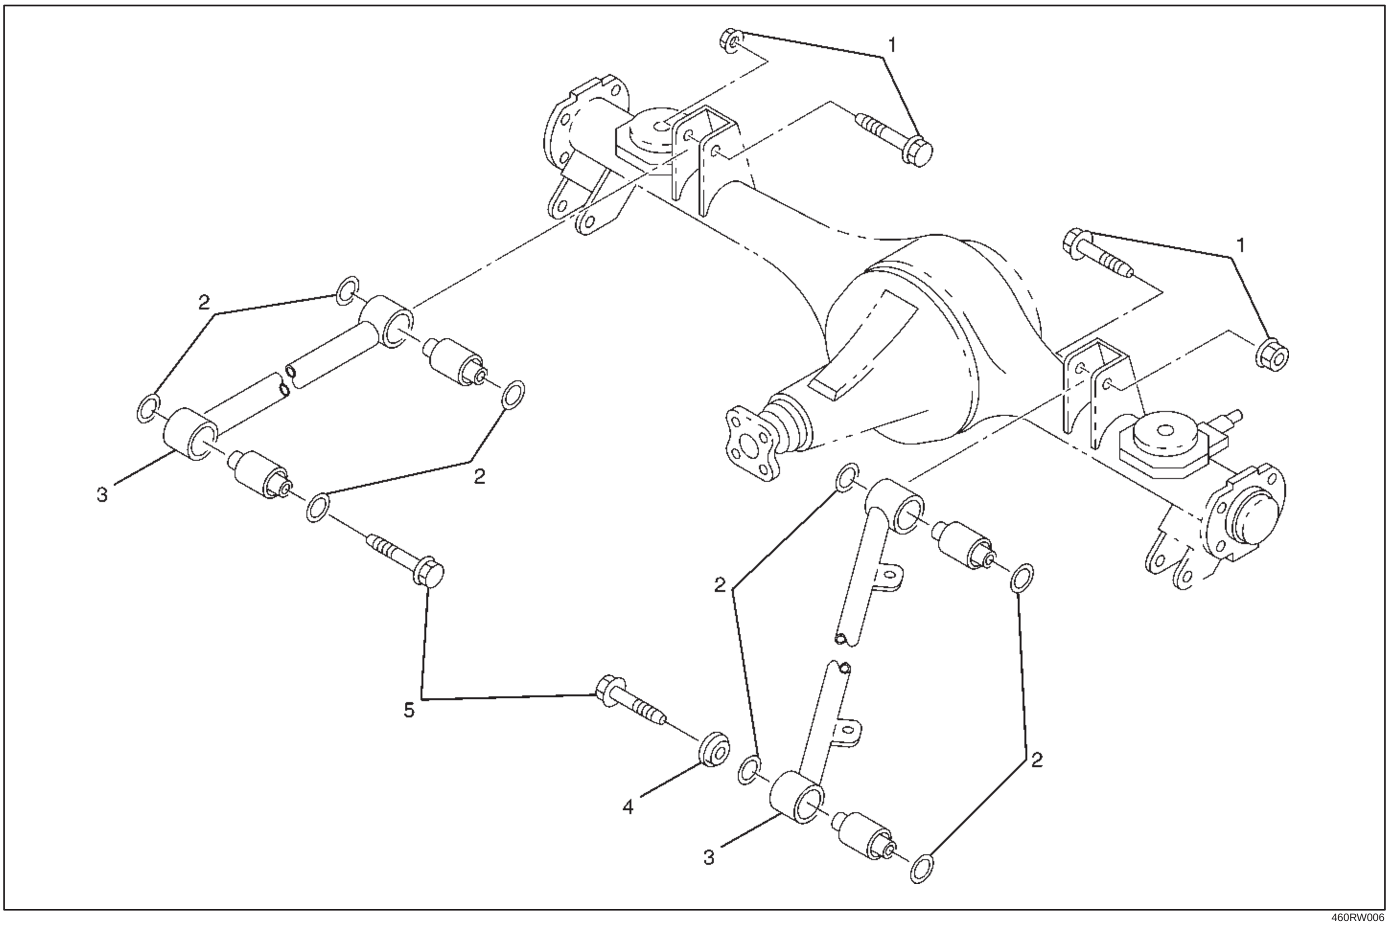
Torque: 137 N·m (101 lb ft)

3. Install parking brake cable.

CAUTION: The parking brake cable should not be overstrained or slackened.

Upper Link

Upper Link and Associated Parts



Legend

(1) Bolt and Nut (Axle side)
(2) Rubber Plate
(3) Upper Link
(4) Protector (Left side only)
(5) Bolt (Frame side)

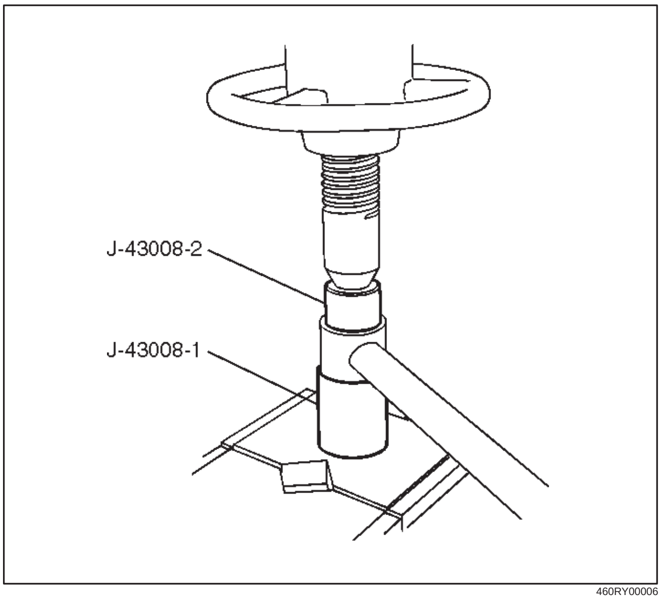
Removal

1. Remove fuel tank. Refer to Engine Fuel in Engine section.
2. Remove the speed sensor cable from the upper link.
3. Remove bolt, nut, rubber plate and protector.
4. Remove upper link.

Inspection and Repair

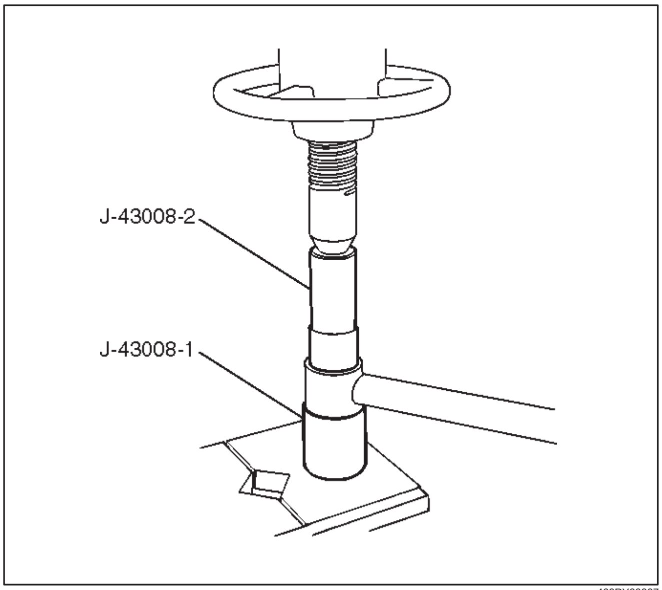
Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

1. Upper link
2. Rubber bushing
   - Remove the rubber bushing by using remover J–43008.



- Install the rubber bushing by using to installer J–43008.

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

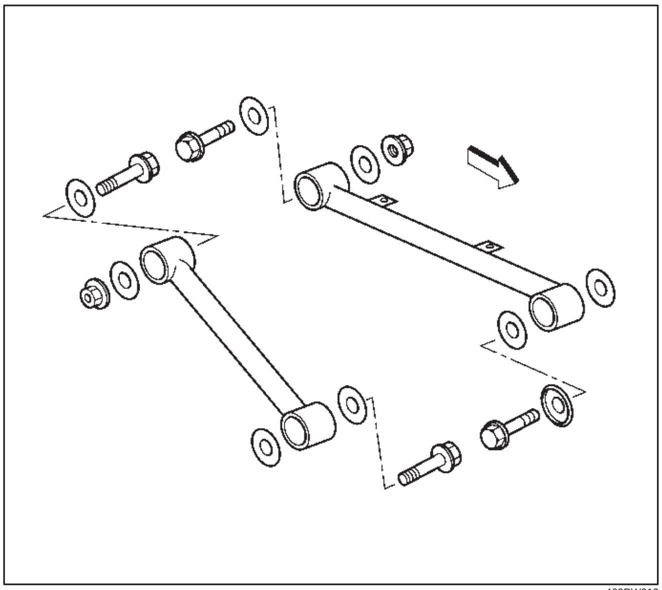


460RY00007

Installation

1. Install upper link. Make sure that the upper link is in its correct position.

NOTE: When mounting upper link, be sure not to use grease bushings or any other nearby part.



460RW012

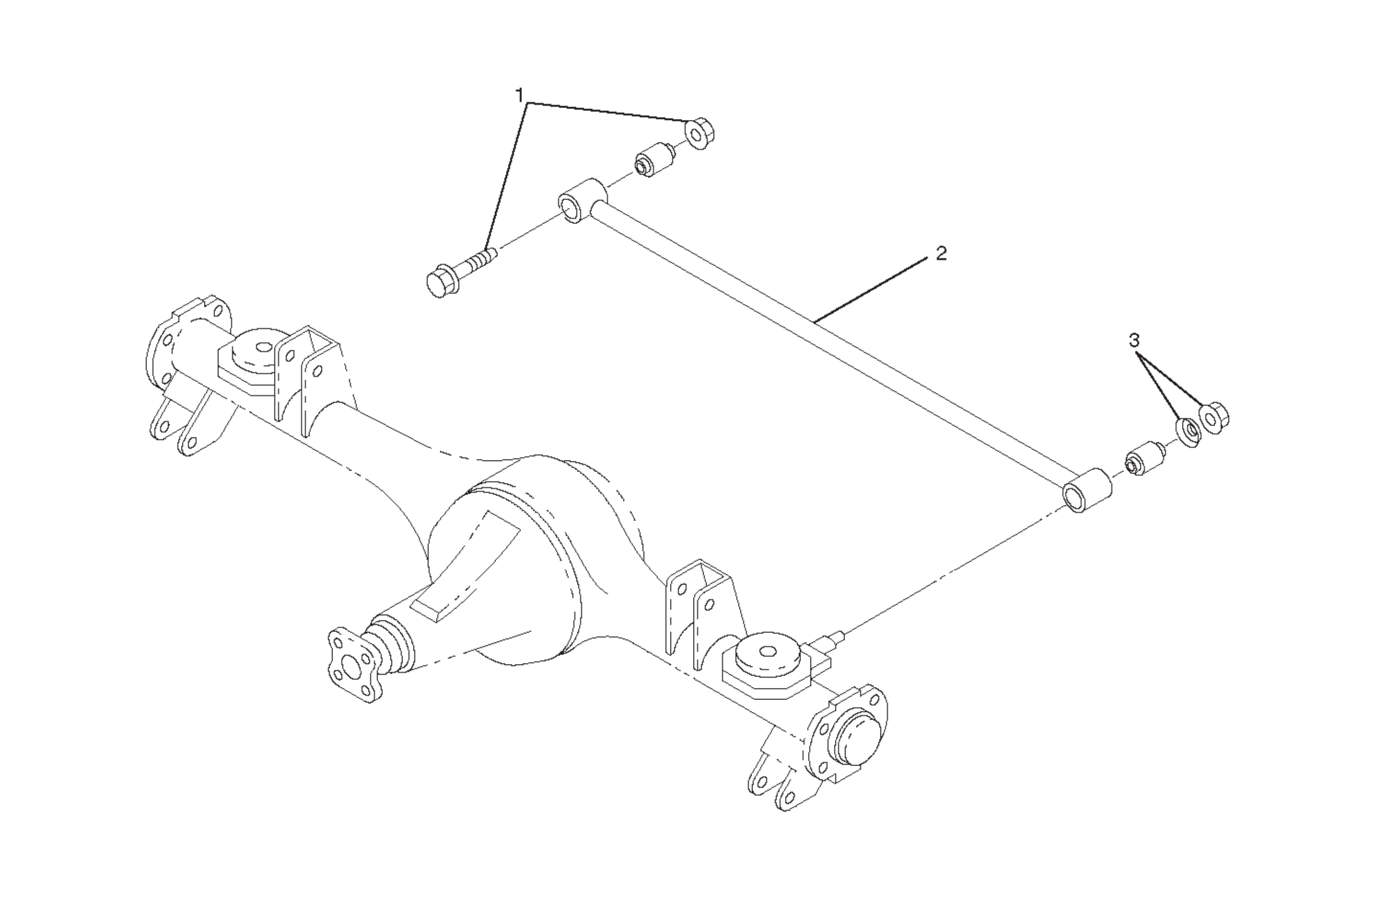
2. Install bolt, nut, rubber plate and protector. Tighten the bolts and nuts lightly, then retighten them to the specified torque after the vehicle is at curb height.

   Torque: 137 N·m (101 lb ft)

3. Install speed sensor cable.
4. Install fuel tank.

Lateral Rod

Lateral Rod and Associated Parts



460RW007

Legend

(1) Bolt and Nut (Frame side)
(2) Lateral Rod
(3) Nut and Washer (Axle side)

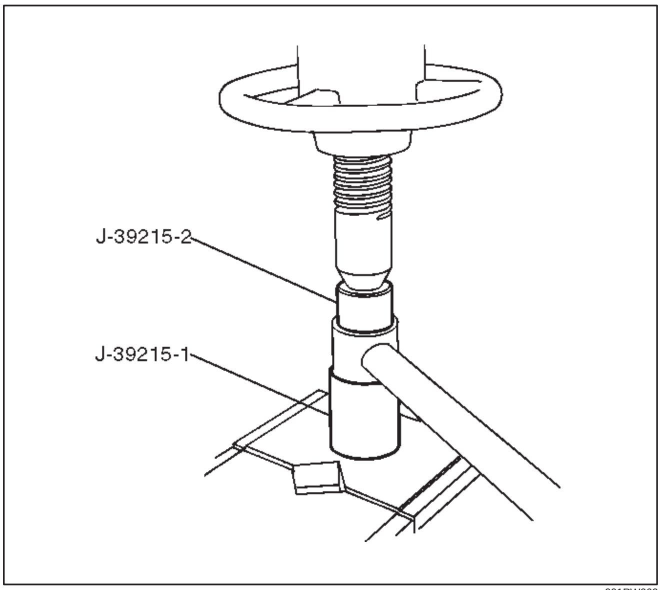
Removal

1. Remove nut and washer.
2. Remove bolt and nut.
3. Remove lateral rod.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

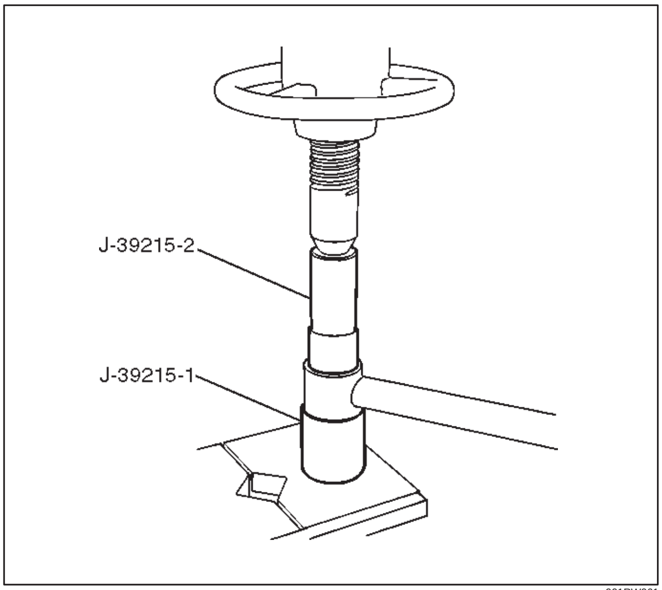
1. Lateral rod
2. Rubber bushing (Frame side)
   - Remove the rubber bushing (Frame side) by using remover J–39214.



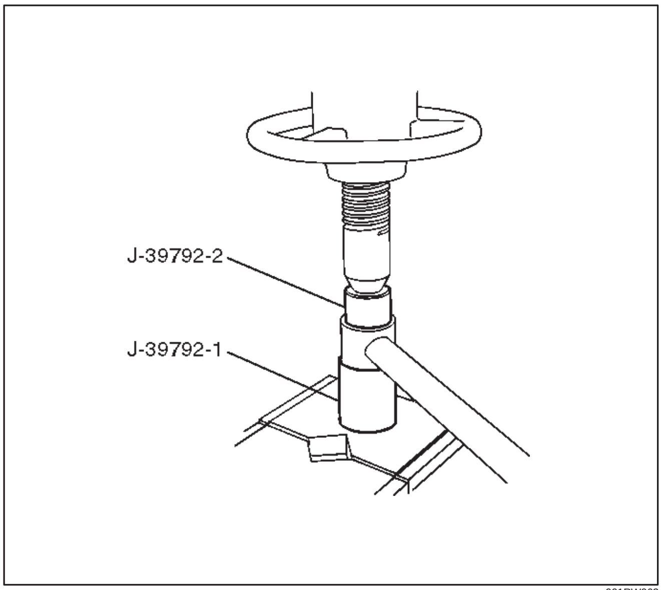
901RW060

- Install the rubber bushing (Frame side) by using Installer J–39215.

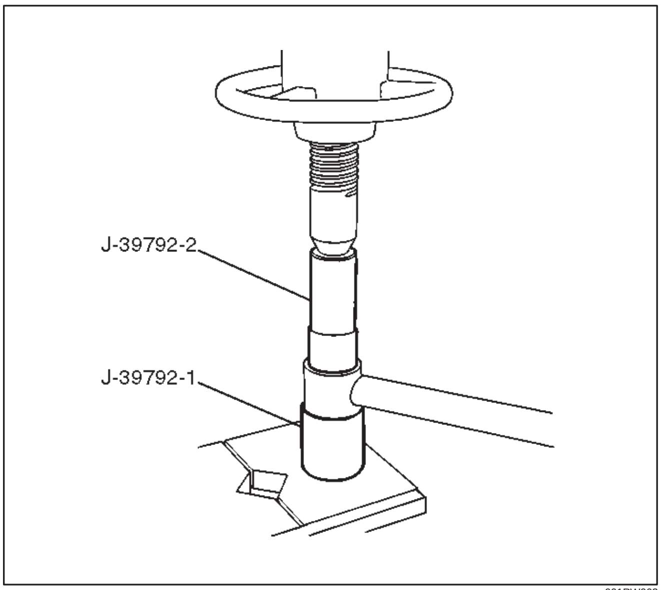
NOTE: When mounting rubber bushings, do not use grease on bushings or any other nearby parts.



3. Rubber bushing (Axle side)
   - Remove the rubber bushing (Axle side) by using remover J–39792.



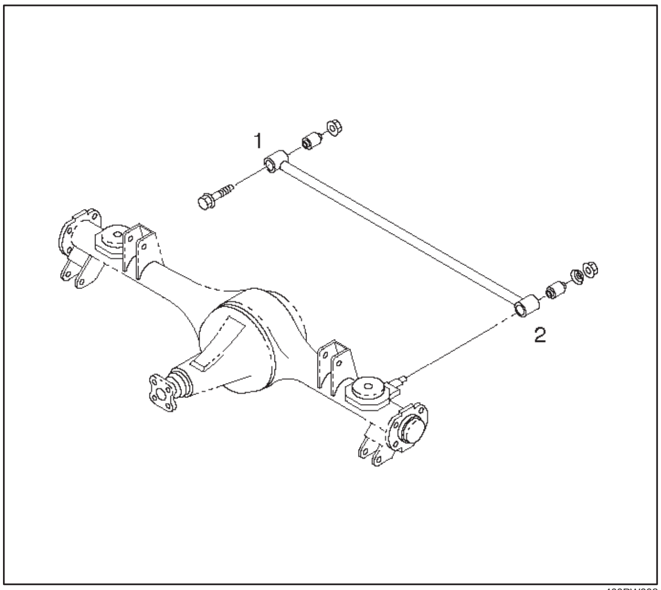
- Install the rubber bushing (Axle side) by using installer J–39792.



Installation

1. Install lateral rod and make sure that the lateral rod is in its correct position.

NOTE: When mounting lateral rod, be sure not to use grease on bushings or any other nearby part.



Legend

(1) Frame Side
(2) Axle Side

2. Install bolt and nut. Tighten the bolt and nut lightly, then retighten them to the specified torque after the vehicle is at curb height.

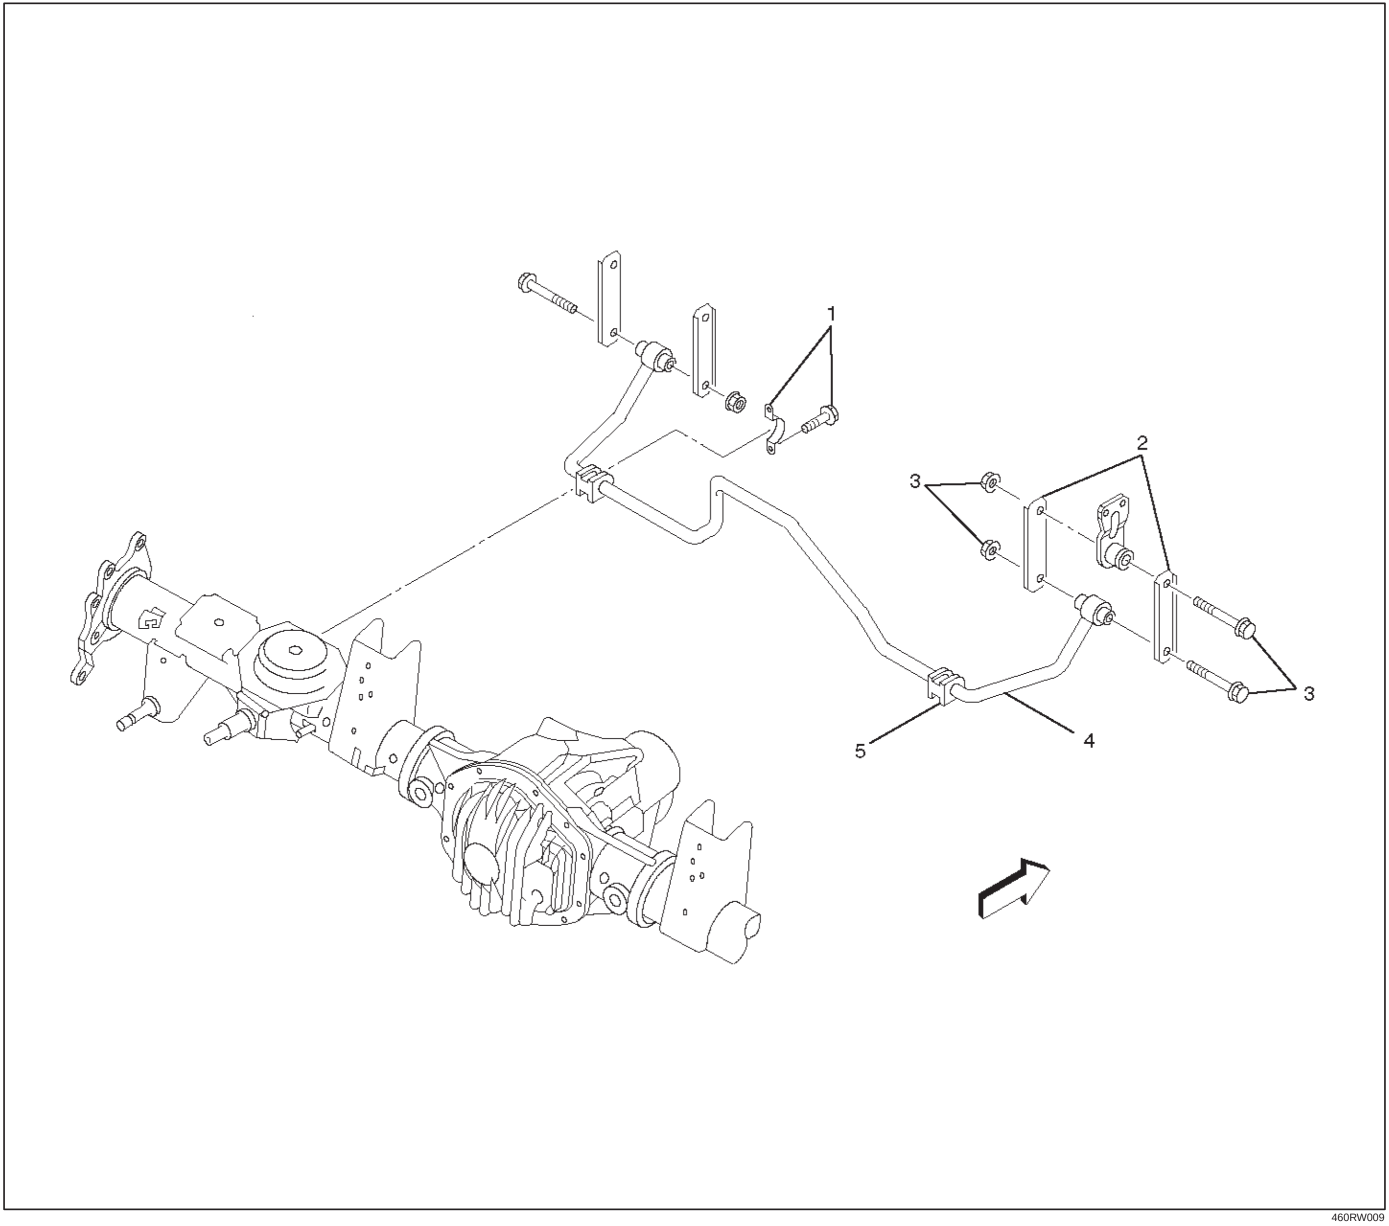
Torque: 137 N·m (101 lb ft)

3. Install nut and washer. Tighten the nut lightly, then retighten the nut to the specified torque after the vehicle is at curb height.

Torque: 78 N·m (58 lb ft)

Stabilizer Bar

Stabilizer Bar and Associated Parts



Legend

(1) Bracket
(2) Link
(3) Bolt and Nut
(4) Stabilizer Bar
(5) Rubber Bushing

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove bolt and nut.
4. Remove link.

CAUTION: Be careful not to damage the ball joint boot.

5. Remove bracket.
6. Remove rubber bushing.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.
Check the following parts:

- Stabilizer bar
- Rubber bushing
- Link

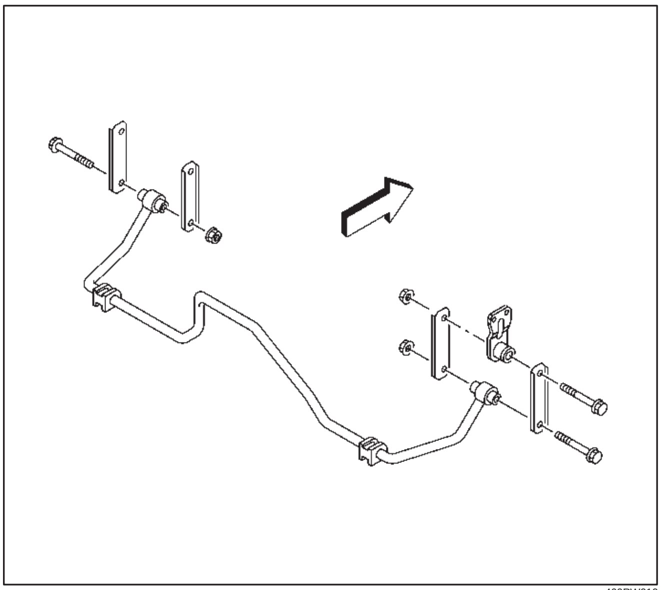
Installation

1. Install rubber bushing.
2. Install bracket to axle housing and tighten to the specified torque.

Torque: 25 N·m (19 lb ft)

3. Install link.
4. Install bolt and nut, then tighten the nut to the specified torque.

Torque: 31 N·m (27 lb ft)



460RW010

Main Data and Specifications

General Specifications

Rear suspension	Type	5–Link, coil spring type with stabilizer bar.
Coil spring	Free length	374.5mm (14.74in)
	Spring diameter	12.3mm (0.48in)
	Coil diameter (inner)	105mm (4.13in)
	Effective No. of turns	6.23
	Total No. of turns	7.73
Shock absorber	Type	Hydraulic, double acting, telescopic
	Piston diameter	30mm (1.18in)
	Stroke	175mm (6.89in)
	Extended length	473.5mm (18.64in)
	Compressed length	298.5mm (11.75in)
Stabilizer bar	Diameter	19mm (0.71in)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Intellignet suspension system uses a microcomputer as a control unit to judge running conditions including engine revolution from Powertrain Control Module, vehicle speed from vehicle speed sensor, a brake switch signal, and vertical and horizontal G-sensor signal, then sets optimum damping force so that best running stability can be achieved.
In addition two ride modes (i.e. “COMFORT” and “SPOPT”) can be selected according to the driver’s preference.

System Components

Control Unit, 3 Vertical G-sensors, Horizontal G-sensor, 4 Actuators, 4 Adjustable Damping Force Shock Absorbers, and Warning Lamp.

Control Unit

The Control Unit consists of Adjustable Damping Force Shock Absorber control circuits, fault detector, and a fail-safe. It drives the actuator according to the signal from each sensor.
The Control Unit has a self-diagnosing function which can indicate faulty circuits during diagnosis.
The Control Unit is mounted in the center of the instrument panel.

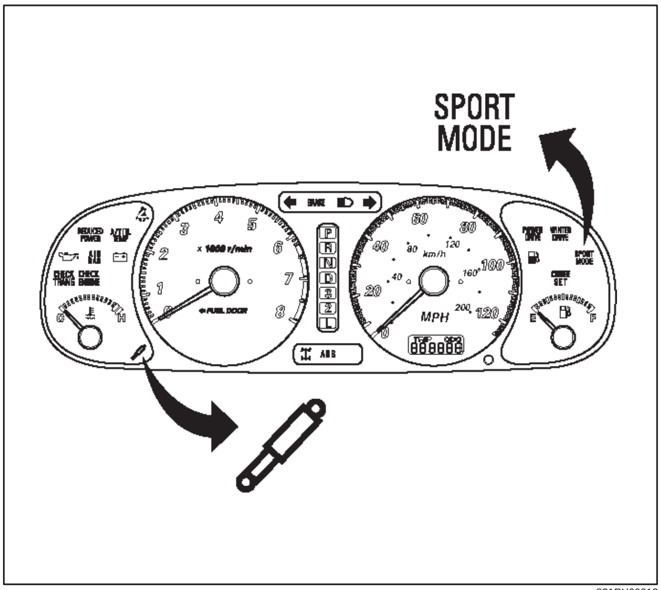
Actuator

Front actuators installed on front shock absorbers and rear actuator installed inside rear shock absorbers control damping force of shock absorber by the Control Unit signal.

Adjustable Damping Force Shock Absorber

This type shock absorber is used in front and rear intelligent suspension. According to running condition the Control Unit changes shock absorber damping force and obtains good running stability.

Warning Lamp



821RY00013

Vehicles equipped with the Intelligent Suspension have an amber warning lamp in the instrument panel. The warning lamp will illuminate if a malfunction in the Intelligent Suspension System is detected by the Control Unit. In case of an important electronic malfunction, the Control Unit will turn“ON” the warning lamp.

Vertical G-Sensor

Front G-sensors installed inside front actuators and the rear G-sensor installed on the rear left frame side detect the vehicle vertical gravity and send a signal to the Control Unit.

Horizontal G-Sensor

The G-sensor installed inside the Control Unit detects the vehicle turning speed and sends a signal to the Control Unit.

General Diagnosis

General Information

Intelligent Suspension System troubles can be classified into two types, those which can be detected by the warning lamp and those which can be detected as a vehicle abnormality by the driver.
In either case, locate the fault in accordance with the“BASIC DIAGNOSTIC FLOWCHART” and repair.
Please refer to Section 3 for the diagnosis of mechanical troubles such as abnormal noise, vehicle pulls, excessive tire wear, wheel hop and shimmy, shake or vibration.

Service Precautions

Required Tools and Items:

- Box Wrench
- Special Tool

Some diagnosis procedures in this section require the installation of a special tool.

J-39200 High Impedance Multimeter

When circuit measurements are requested, use a circuit tester with high impedance.

Computer System Service Precautions

The Intelligent Suspension System interfaces directly with the Control Unit which is a control computer that is similar in some regards to the Powertrain Control Module. These modules are designed to withstand normal current draws associated with vehicle operation. However care must be taken to avoid overloading any of the Control Unit circuits. In testing for opens or shorts, do not ground or apply voltage to any of the circuits unless instructed to do so by the appropriate diagnostic procedure. These circuits should only be tested with a high impedance multimeter (J-39200) or special tools as described in this section. Power should never be removed or applied to any control module with the ignition in the “ON” position.Before removing or connecting battery cables, fuses or connectors, always turn the ignition switch to the“OFF” position.

General Service Precautions

The following are general precautions which should be observed when servicing and diagnosing the Intelligent Suspension System and/or other vehicle systems. Failure to observe these precautions may result in Intelligent Suspension System damage.

- If welding work is to be performed on the vehicle using an electric arc welder, the Control Unit connectors should be disconnected before the welding operation begins.
- The Control Unit connectors should never be connected or disconnected with the ignition“ON”.

Parts Handling

Be careful when handling the actuator, control unit, or G-sensor. They should not be dropped or thrown, because the semi-conductor G-sensor tip damage may result.

FLASHING CODES

1. ON BOARD DIAGNOSIS (SELF-DIAGNOSIS)
   1. The Control Unit conducts a self-test of most of the wiring and components in the system each time the key is turned ON. If a fault is detected the Control Unit will store a Diagnostic Trouble Code (DTC) in memory. It's a number that corresponds to a specific problem.
   2. When the problem detected is important: the warning lamp turns on until the fault is repaired and the Control Unit memory is cleared.
2. DIAGNOSTIC TROUBLE CODES (DTC)
   1. DTC can be displayed by the Control Unit by shorting together terminals 3 and 4 or 5 of the Diagnosis Connector (C-34) located left side of instrument panel.

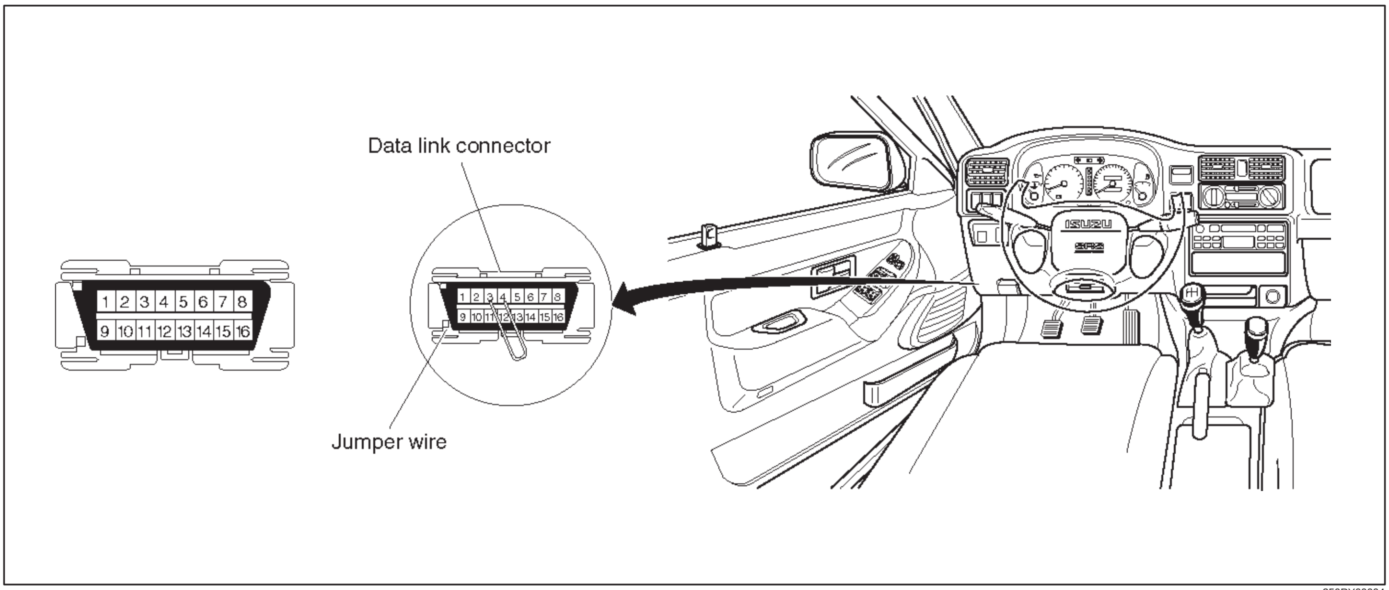
4: Actuator Rear LH, Lateral G-sensor



350RY00004

2. IF a code is flashed, wait until the lamp is flashing.
3. Conduct brake switch ON/OFF 6 or more times on condition that one operation is within 2 seconds.
4. After this, the warning lamp will be OFF for 3.5 seconds and then will flash each DTC.
   1. When there are more than 9 flashes this means that the indicator is constantly flashing, OFF for 4 seconds ON for 0.5 seconds. In this case there is no DTC stored in memory.
   2. When there are less than 9 flashes you will see DTC of a digit and when all codes have been displayed they are displayed again beginning from the first one.
   3. The DTCs are displayed in lower number order.

CLEAR DTC

Remark: If you clear the DTC (Diagnosis Trouble Codes) you will not be able to read any codes recorded during the last Trouble.

Remark: To be able to use the DTC again to identify a problem you will need to reproduce the fault or the problem. This may require a new test drive or just turning the ignition on (this depends on the nature of the fault).

1. Short the Diagnosis Connector C-34 terminal 3 to terminal 4 or 5 (ground).

- IF it is flashing and the flash is 0.5 seconds ON and 4 seconds OFF without interruption, this means that there is no DTC. The DTCs are already cleared.

INTERMITTENT CONDITIONS

If the Warning Lamp flashes a diagnostic trouble code as intermittent, or if after a test drive a DTC does not reappear though the detection conditions for this DTC are present: the problem is most likely a faulty electrical connection or loose wiring. Terminals and grounds should always be the prime suspect. Intermittents rarely occur inside sophisticated electronic components such as the Control Unit.

Use the DTC information to understand which wires and sensors are involved.

When an intermittent problem is encountered, check suspect circuits for:

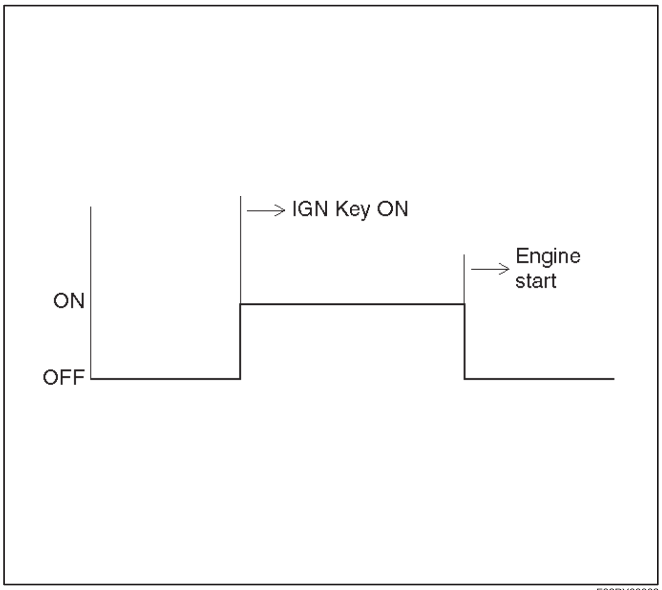
1. Poor terminal to wire connection.
2. Terminals not fully seated in the connector body (backed out).
3. Improperly formed or damaged terminals.
4. Loose, dirty, or corroded ground connections:

   HINT: Any time you have an intermittent in more than one circuit, check whether the circuits share a common ground connection.
5. Pinched or damaged wires.
6. Electro-Magnetic Interference (EMI):

   HINT: Check that all wires are properly routed away from spark plug wires, distributor wires, coil, and generator. Also check for improperly installed electrical options, such as lights, 2-way radios, etc.

BULB CHECK

When the starter switch is turned on in the normal state, the Control Unit turns on the Warning Lamp to check the bulb. After the engine starts, the Warning Lamp turns off.



F03RY00003

DTC CHECK

1. Diagnosis Trouble Codes (DTC) have been identified by FLASHING CODES.
2. You have written the list of the DTC. The order of the malfunctions has no meanings for this Control Unit. Usually only one or two malfunctions should be set for a given problem.
3. Check directly the DTCs you identified. The DTC are sorted by number:

   DIAGNOSTIC TROUBLE CODES.

9	Control Unit Abnormality	Yes	OFF	Control stop or normal drive circuit fixed on R mode.

DTC2 Actuator Coil Over Current

Circuit Description

The A, B, C, and D are the actuator motor coil terminals. DC 12V driving voltage is applied between terminals A and C and terminals B and D so that the shock absorber oil valves are rotated at every 7.5˚ step feed.

Diagnostic Aids

- Inspect the wiring for poor electrical connections between the control unit 24 way connector and the actuator connectors. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.
  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

DTC2 Actuator Coil Over Current

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the actuator connectors C–45, C–44, F–7, and F–6. 3. Measure the resistance between the actuator side connector C–44 terminals 1 and 2. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 2*	Go to *Step 3*
2	1. Measure the resistance between the actuator side connector C–44 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 4*	Go to *Step 3*
3	Replace the actuator FR.	—	Go to *Step 4*	—
4	1. Measure the resistance between the actuator side connector C–45 terminals 1 and 2. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 5*	Go to *Step 6*
5	1. Measure the resistance between the actuator side connector C–45 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 7*	Go to *Step 6*
6	Replace the actuator FL.	—	Go to *Step 7*	—
7	1. Measure the resistance between the shock absorber side connector F–6 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 8*	Go to *Step 9*

9	Replace the rear shock absorber RR.	—	Go to *Step 10*	—

DTC2 Actuator Coil Over Current (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Measure the resistance between the shock absorber side connector F–7 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 11*	Go to *Step 12*
11	1. Measure the resistance between the shock absorber side connector F–7 terminals 7 and 8. Does the resistance indicate within the specified value?	6.4–7.2Ω	Go to *Step 13*	Go to *Step 12*
12	Replace the rear shock absorber RL.	—	Go to *Step 16*	—
13	If all steps are correct, check the continuity between the control unit connector C–50 terminal 1 and connector terminal C50–4, C50–17, C50–5, C50–18, C50–6, C50–19, C50–7, C50–20, C50–8, C50–21, C50–9, C50–22, C50–10, C50–23, C50–11, and C50–24. Is there continuity?	—	Go to *Step 15*	Go to *Step 16*
14	Repair the circuit.	—	Go to *Step 16*	—
15	Replace the control unit.	—	Go to *Step 16*	—
16	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *"Basic Diagnosis Flow".*	Go to *Step 16*

DTC3 Actuator Coil/Position Sensor Open Circuit or Short

Circuit Description

The A, B, C, and D are the actuator motor coil terminals. DC 12V driving voltage is applied between terminals A and C and terminals B and D so that the shock absorber oil valves are rotated at every 7.5° step feed.
The PSW is actuator position signal and detects relative angles between the piston–rod and the control-rod. The actuator outputs the PSW to the control unit.

Diagnostic Aids

- Inspect the wiring for poor electrical connections between the control unit 16 way connector and the actuator connectors. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.
  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

DTC3 Actuator Coil/Position Sensor Open Circuit or Short

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the actuator connectors C–50, C–45, C–44, F–7, and F–6. Is the continuity between the connector C–44 terminals 1 and 2?	—	Go to *Step 2*	Go to *Step 3*
2	Is the continuity between the connector C–44 terminals 3 and 4?	—	Go to *Step 4*	Go to *Step 3*
3	Replace the actuator FR.	—	Go to *Step 4*	—

35	Is the continuity between the connector F–7 terminal 7 and connector C–50 terminal 24?	—	Go to *Step 37*	Go to *Step 36*
36	Repair the circuit.	—	Go to *Step 37*	—
37	1. Disconnect the terminals C–51, C–43, C–46, F–6, and F–7. Is the continuity between the connector–terminal C51–29 and C43–6, C51–37 and C46–6, C51–33 and F6–2, C51–41 and F7–2?	—	Go to *Step 38*	Go to *Step 41*

DTC3 Actuator Coil/Position Sensor Open Circuit or Short (Cont'd)

Step	Action	Value(s)	Yes	No
38	Is the continuity between the connector C–50 terminal 1 (GND) and the connector C–51 terminals 29, 33, 37, and 41?	—	Go to *Step 41*	Go to *Step 39*
39	Is there the continuity between connector-terminal C51–27 and C51–35, C51–31 and C51–39, C51–32 and C51–40, and C51–34 and C51–42?	—	Go to *Step 41*	Go to *Step 40*
40	Is there the continuity between connector C–50 terminal 1 and connector C–51 terminals 27, 31, 32, and 34?	—	Go to *Step 41*	Go to *Step 42*
41	Repair the circuit.	—	Go to *Step 44*	—
42	1. If all steps are correct, replace following units one by one in the following order. Give a test drive and if normal, reinstall it. 1) actuator FR, 2) actuator FL, rear shock absorber, 3) RR and 4) RL. Does the DTC3 remain?	—	Go to *Step 43*	Go to *Step 44*
43	Replace the control unit.	—	Go to *Step 44*	—
44	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *"Basic Diagnosis Flow".*	Go to *Step 44*

DTC4 G-Sensor Open Circuit or Short

Circuit Description

The G-sensor sends the voltage (Vout) corresponding to the vehicle vertical gravity to the control unit.
The control unit supplies DC 5V power (Vcc) to each G-sensor.
The control unit watches the G-sensor operation through Vcc signal.

Diagnostic Aids

- Inspect the wiring for poor electrical connections between the control unit connectors and the actuator connectors. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.

  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

DTC4 G-Sensor Open Circuit or Short

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the connectors C–51, C–52, C–43, C–46, and F–5. Is there the continuity between the connector-terminal C51–28 and C43–5, C51–30 and C46–5, and C52–45 and F5–1?	—	Go to *Step 2*	Go to *Step 5*
2	Is the continuity between the connector-terminal C51–27 and C43–1, C51–31 and C46–1, and C52–44 and F5–2?	—	Go to *Step 3*	Go to *Step 5*
3	Is there the continuity between the connector-terminal C51–36 and C43–2, C51–38 and C46–2, and C52–56 and F5–3?	—	Go to *Step 4*	Go to *Step 5*
4	1. Disconnect the connectors C–50, C–51, and C–52. Is there the continuity between the connector-terminal C51–28 and C51–35, C51–30 and C51–39, C52–45 and C52–55, C51–27 and C51–35, C51–31 and C51–39, C52–44 and C52–55, C51–32 and C51–40, C51–34 and C51–42, C51–36 and C51–35, C51–38 and C51–39, and C52–56 and C52–55?	—	Go to *Step 5*	Go to *Step 7*
5	Repair the circuit.	—	Go to *Step 6*	—
6	Replace following units one by one in the following order. Give a test drive and if normal, reinstall it. 1) G3-sensor 2) Actuator FL 3) Actuator FR 4) Control Unit	—	Go to *Step 7*	—
7	1. Reconnect all components, ensure all components are properly mounted. 2. Clear th DTC. Was this step finished?	—	Go to *“Basic Diagnosis Flow.”*	Go to *Step 7*

DTC5 Vehicle Speed Sensor Open Circuit or Short

Circuit Description

Output speed information is provided to the control unit by the vehicle speed sensor. The vehicle speed sensor produces a pulsing AC voltage. The AC voltage level and number of pulses increases as the speed of the vehicle increases. The control unit then converts the pulsing voltage to vehicle speed.

Diagnostic Aids

- Inspect the wiring for poor electrical connections between the control unit 22 way connector and the speed sensor connectors. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.

  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

DTC5 Vehicle Speed Sensor Open Circuit or Short

Step	Action	Value(s)	Yes	No
1	1. Jack up and support the rear axle on the stand. 2. Change the transfer mode to 2WD, using the 4WD push button switch on instrument panel. 3. Shift the transmission lever in a forward position and rotate the rear wheels. Does the speedo-meter operate?	—	Go to *Step 2*	Go to *Step 3*
2	1. Open the throttle and rev up engine speed. 2. Using a volt meter, measure the voltage between the meter B connector I–2 terminals 7 and 16 (GND). Does the voltage change alternately at the specified values?	0V and 12V	Go to *Step 7*	Go to *Step 5*
3	1. Turn off the starter switch and disconnect the control connectors C–50 and C–52. 2. Check the continuity between the vehicle speed sensor connector terminal 3 and meter B connector I–2 terminal 7. Is there continuity?	—	Go to *Step 4*	Go to *Step 6*
4	1. Check the continuity between the control unit connector C–50 terminal 1 and control unit connector C–52 terminal 48. Is there continuity?	—	Go to *Step 5*	Go to *Step 6*
5	Repair or replace the vehicle speed sensor.	—	Go to *Step 8*	—
6	Repair the circuit between the vehicle speed sensor connector terminal 3 and the meter B connector I–2 terminal 7 or the circuit between the control unit connector C–52 terminal 48 and the speed sensor connector terminal 3.	—	Go to *Step 8*	—
7	Repair the circuit between the connector H–6 terminal 16 and the control unit connector C–52 terminal 48 or replace the control unit.	—	Go to *Step 8*	—
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear th DTC. Was this step finished?	—	Go to *“Basic Diagnosis Flow.”*	Go to *Step 8*

DTC6 Stop Lamp Switch Open Circuit or Short

Circuit Description

The brake switch is used to indicate brake pedal status. The normally opened brake switch signal voltage circuit is opened.
Brake switch supplies a B+ signal on circuit RED to the control unit when the brakes are applied. The control unit uses this signal to work dive control when the brakes are applied.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the control unit and brake switch. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check customer driving habits and/or unusual driving conditions (i.e. stop and go, highway).
- Check brake switch for proper mounting and adjustment.

DTC6 Stop Lamp Switch Open Circuit or Short

Step	Action	Value(s)	Yes	No
1	1. With the engine "off", turn the ignition switch "on". If ABS code is set, check applicable fuse. 2. Apply then release the brake pedal. Is the brake lamp turned on with the brake pedal applied, and then turned off when the brake pedal is released?	—	Go to *Diagnostic Aids*	Go to *Step 2*
2	1. Connect the test light to ground. 2. Back probe ignition feed circuit terminal I18–1 at the brake switch. Is the test light "on"?	—	Go to *Step 3*	Go to *Step 4*
3	1. Connect the test light to ground. 2. Back probe circuit terminal I18–4 at the brake switch. Is the test light "off"?	—	Go to *Step 7*	Go to *Step 5*
4	Repair the open in battery feed circuit terminal I18–1 to the brake switch. If fuse is open, check circuit terminal I18–4 for a short to ground. Is the test light "off"?	—	Go to *Step 13*	—
5	Disconnect brake switch connector I–18 and ignition switch "on".	—	Go to *Step 8*	Go to *Step 6*
6	Check the brake switch short (I18–1 and I18–4).	—	Go to *Step 9*	Go to *Step 10*
7	Check circuit terminal I18–4 for a short to voltage. Ignition switch "on".	—	Go to *Step 8*	Go to *Step 10*
8	1. Disconnect the control unit connector C–52. 2. Check circuit terminal I18–4 for a short to voltage. Was a problem found?	—	Go to *Step 13*	Go to *Step 10*

DTC6 Stop Lamp Switch Open Circuit or Short (Cont'd)

Step	Action	Value(s)	Yes	No
9	Replace the brake switch. Is the replacement complete?	—	Go to *Step 13*	—
10	1. Turn the ignition "off". 2. Reconnect the control unit connector C–52 Turn the ignition "on". Is the brake lamp turned on with the brake applied, then turned off with the brake pedal released?	—	Go to *Diagnostic Aids*	Go to *Step 11*
11	Check the control unit for faulty or intermittent connections. Was a problem found and corrected?	—	Go to *Step 13*	Go to *Step 12*
12	Replace the control unit. Is the replacement complete?	—	Go to *Step 13*	—
13	1. After the repair is complete, clear the DTC. The switch signal must indicate 0 volts for 1 seconds with the brake pedal applied. 2. Conduct a test drive. 3. Review the DTC. Has the last test failed or is the current DTC displayed?	—	Begin diagnosis again Go to *Step 1*	Go to *Repair verified*

DTC7 Engine Speed Signal Open Circuit or Short

Circuit Description

PCM (Powertrain Control Module) converts signals from the crankshaft position sensor into the engine speed signals (pulse) and sends these to the control unit and tachometer.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the control unit connector. Look for possible bent, backed out, deformed, or damaged terminals. Check for weak terminal tension as well.

  Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check harness routing for a potential short to ground in circuit BLK/RED.

DTC7 Engine Speed Signal Open Circuit or Short

Step	Action	Value(s)	Yes	No
1	NOTE: Confirm that DTC P0336 or P0337 does not exist. If either exists, warning lamps, “CHECK ENGINE” and “CHECK TRANS” are turned on. Repair the engine, referring to Section 6E “Driveability and Emission”. 1. Turn on the starter switch. 2. Start the engine. 3. Open the throttle and rev up engine speed. Does the tachometer operate according to engine speed?	—	Go to *Step 3*	Go to *Step 2*
2	Repair the tachometer, referring to Section 8D Wiring System in Body and Accessories.	—	Go to *Step 6*	—
3	1. Turn off the starter switch. 2. Check continuity between the control unit connector C–52 terminal 59 and PCM connector E–21 terminal F7. Is there continuity ?	—	Go to *Step 4*	Go to *Step 5*
4	Replace the control unit.	—	Go to *Step 6*	—
5	Repair the circuit.	—	Go to *Step 6*	—
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. 3. Conduct a test drive. Has the last test failed or does the current DTC exist?	—	Begin diagnosis again Go to *Step 1*	Repair verified

DTC9 Control Unit Abnormality

Replace the control unit.

DTC9–1 Control Unit Blown Fuse for FR Actuator

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the actuator connector C–44. 3. Measure the resistance between the actuator side connector C–44 terminals 1 and 2. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 2*	Go to *Step 3*
2	1. Measure the resistance between the actuator side connector C–44 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 4*	Go to *Step 3*
3	Replace the actuator FR.	—	Go to *Step 7*	—
4	1. If all steps are correct, check the continuity between the control unit connector C–50 terminal 1 and connector-terminal C50–4, C50–17, C50–5, C50–18. Is there continuity?	—	Go to *Step 5*	Go to *Step 6*
5	Repair the circuit.	—	Go to *Step 7*	—
6	Replace the control unit.	—	Go to *Step 7*	—
7	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *“Basic Diagnosis FLow”.*	Go to *Step 7*

DTC9–2 Control Unit Blown Fuse for FL Actuator

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the actuator connector C–45. 3. Measure the resistance between the actuator side connector C–45 terminals 1 and 2. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 2*	Go to *Step 3*
2	1. Measure the resistance between the actuator side connector C–45 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 4*	Go to *Step 3*
3	Replace the actuator FL.	—	Go to *Step 7*	—
4	1. If all steps are correct, check the continuity between the control unit connector C–50 terminal 1 and connector-terminal C50–6, C50–19, C50–7, C50–20. Is there continuity?	—	Begin diagnosis again Go to *Step 5*	Go to *Step 6*
5	Repair the circuit.	—	Go to *Step 7*	—
6	Replace the control unit.	—	Go to *Step 7*	—
7	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *“Basic Diagnosis FLow”.*	Go to *Step 7*

DTC9–3 Control Unit Blown Fuse for RR Shock Absorber

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the shock absorber connector F–6. 3. Measure the resistance between the shock absorber side connector F–6 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 2*	Go to *Step 3*
2	1. Measure the resistance between the shock absorber side connector F–6 terminals 7 and 8. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 4*	Go to *Step 3*
3	Replace the shock absorber RR.	—	Go to *Step 7*	—
4	1. If all steps are correct, check the continuity between the control unit connector C–50 terminal 1 and connector-terminal C50–8, C50–21, C50–9, C50–22. Is there continuity?	—	Begin diagnosis again Go to *Step 5*	Go to *Step 6*
5	Repair the circuit.	—	Go to *Step 7*	—
6	Replace the control unit.	—	Go to *Step 7*	—
7	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *“Basic Diagnosis FLow”.*	Go to *Step 7*

DTC9–4 Control Unit Blown Fuse for RL Shock Absorber

Step	Action	Value(s)	Yes	No
1	1. Turn off the starter switch. 2. Disconnect the shock absorber connector F–7. 3. Measure the resistance between the shock absorber side connector F–7 terminals 3 and 4. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 2*	Go to *Step 3*
2	1. Measure the resistance between the shock absorber side connector F–7 terminals 7 and 8. Does the resistance indicate within the specified value?	6.4– 7.2Ω	Go to *Step 4*	Go to *Step 3*
3	Replace the shock absorber RL.	—	Go to *Step 7*	—
4	1. If all steps are correct, check the continuity between the control unit connector C–50 terminal 1 and connector-terminal C50–10, C50–23, C50–11, C50–24. Is there continuity?	—	Begin diagnosis again Go to *Step 5*	Go to *Step 6*
5	Repair the circuit.	—	Go to *Step 7*	—
6	Replace the control unit.	—	Go to *Step 7*	—
7	1. Reconnect all components, ensure all components are properly mounted. 2. Clear the DTC. Was this step finished?	—	Go to *“Basic Diagnosis FLow”.*	Go to *Step 7*

Control Unit

3. Remove the nut.
4. Disconnect bracket.
5. Remove the nut.
6. Disconnect the washer.
7. Remove the shock absorber.
   Refer to *Shock Absorber in this section.*

Inspection and Repair

Refer to *shock Abosorber in this section.*

Installation

1. Install the shock absorber.
   Refer to *Shock Absorber in this section.*
2. Install the washer and nut (5), then tighten it to the specified torque.
   Torque: 37 N· m (27 lbft)
3. Install the bracket and nut (3), then tighten it to the specified torque.
   Torque: 37 N· m (27 lbft)
4. Fit the top of the shock absorber rod in the connection part of the actuator.

NOTE:

The mating section is width fitting across flats.

If these normally fit, the distance between the actuator lower face and the bracket upper face is about 1 mm.

5. Install 2 screws then tighten it to the specified torque.
   3 N· m (26 lbft)
6. Connect the connector to the harness and insert the connector to the bracket.
7. Connect the actuator harness with the clip.
8. Connect the battery ground cable.

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector (1) from the harness and remove the connector (1) from the bracket.
3. Remove the clip.
4. Remove the rear shock absorber.
   Refer to *Shock Absorber in this section.*
5. Disconnect the connector (10) from the harness and remove the connector (10) from the gusset.
6. Remove the nut and washer.
7. Disconnect the G-sensor.

Inspection and Repair

Refer to Shock Absorber in this section.

Installation

1. Set the G-sensor on the gusset.
2. Install the washer and nut, then tighten it to the specified torque.
   Torque: 41 N· m (30 lbin)
3. Connect the connector (10) to the harness and insert the connector (10) to the gusset.
4. Install the rear shock absorber.
   Refer to *Shock Absorber in this section.*
5. Connect the connector (1) to the harness and insert the connector (1) to the bracket.
6. Insert the clip to the bracket.
7. Connect the battery ground cable.

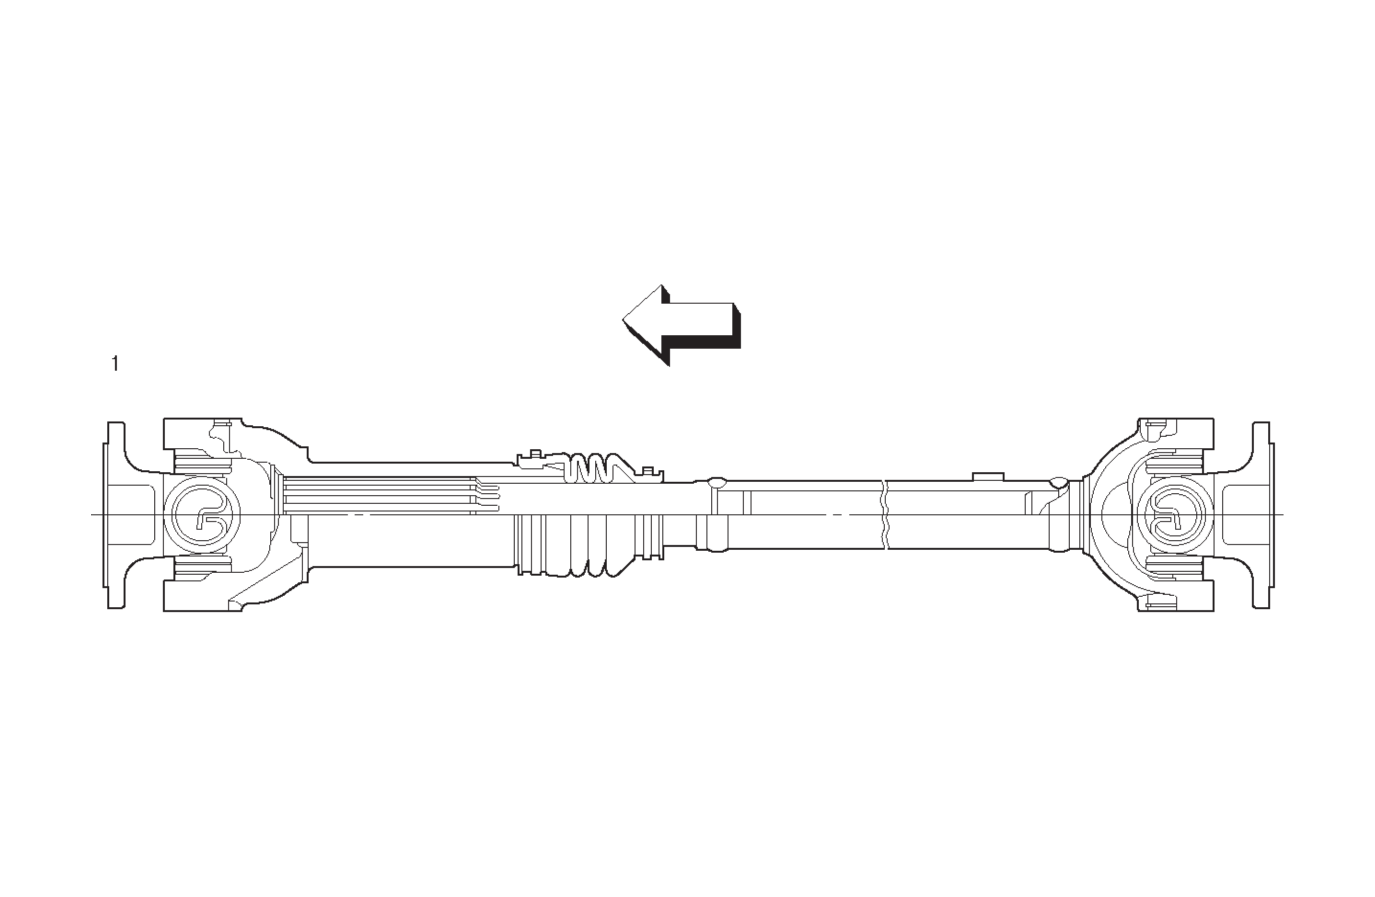
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM(SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED , do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Propeller Shaft

General Description



Legend

(1) Single Cardan Joint Type (for 6VD1)

Propeller Shaft

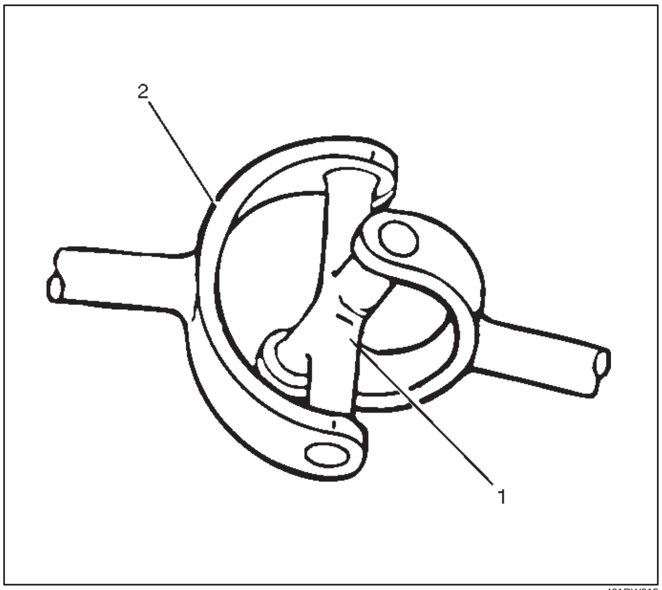
Torque is transmitted from the transmission to the front axle through one propeller shaft and universal joint assembles. All propeller shafts are the balanced tubular type. A splined slip joint is provided in some drivelines.

- Since the propeller shaft is total balanced carefully, welding or any other modification are not permitted.
- Alignment marks should be applied to each propeller shaft before removal.
- Be sure vehicle is stopped, engine is not running, brake is secured and vehicle is secured to prevent injury.
- Be careful not to grip the propeller shaft tube too tightly in the bise as this will be cause deformation.

Phasing

The propeller shaft is designed and built with the yoke lugs (ears) in line with each other. This design produces the smoothest running shaft possible, called phasing.Vibration can be caused by an out–of–phase propeller shaft.The propeller shaft will absorb vibrations from speeding up and slowing down each time the universal joint goes around.This vibration would be the same as a person snapping rope and watching the ”wave” reaction flow to the end.A propeller shaft working in phase would be similar to two persons snapping a rope at the same time, and watching the ”waves” meet and cancel each other out.In comparison, this would be the same as the universal joints on a propeller shaft.A total cancellation of vibration produces a smooth flow of power in the driveline.It is very important to apply a reference mark to the propeller shaft before removal, to assure installation alignment.

Universal Joint



401RW015

Legend

(1) Spider
(2) Yoke

A universal joint consists of two Y-shaped yokes connected by a crossmember called a spider.

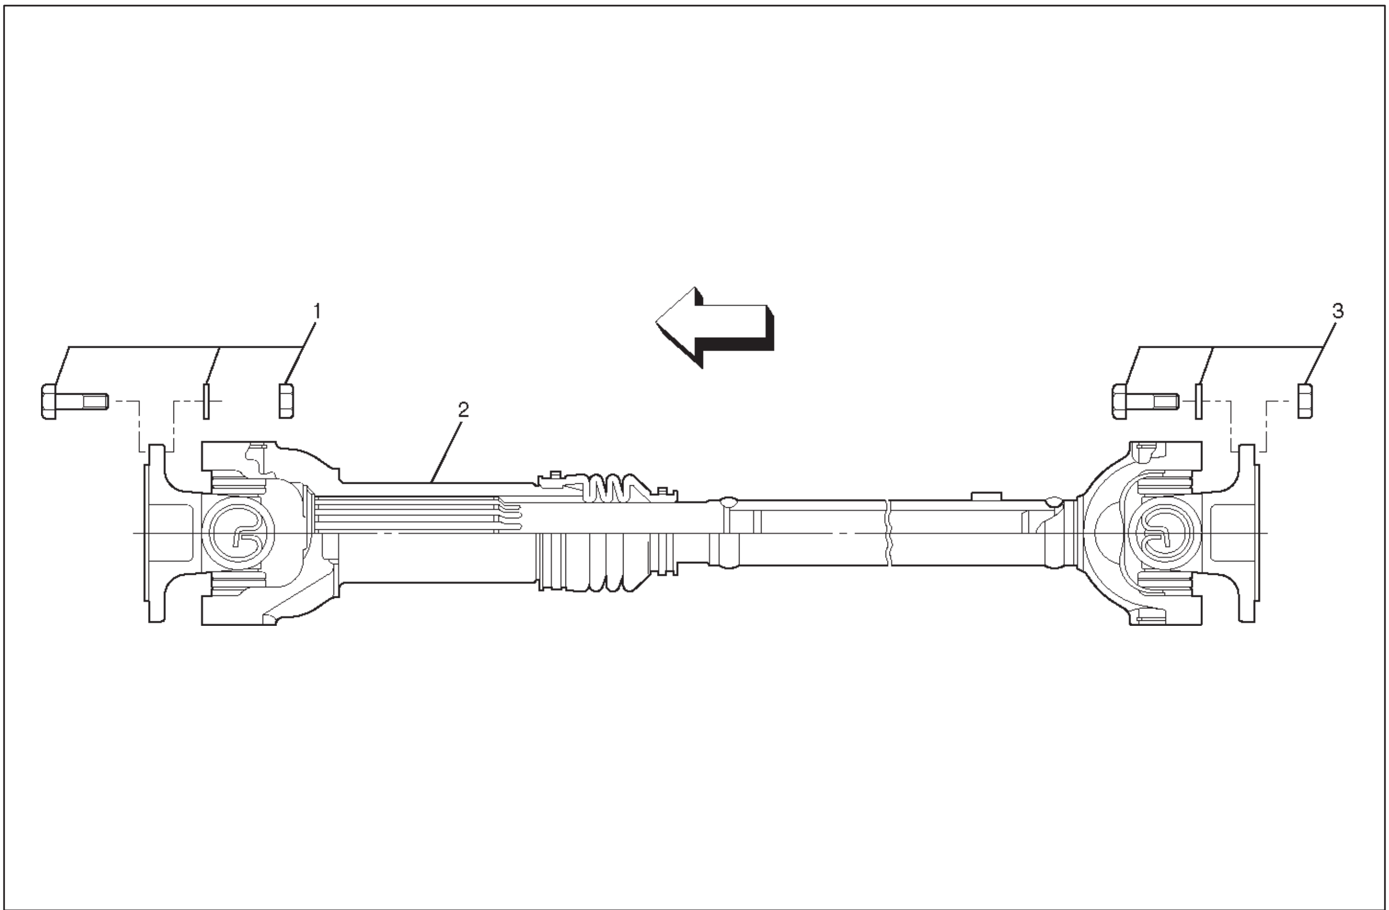
The spider is shaped like a cross. Universal joints are designed to handle the effects of various loadings and front or rear axle windup during acceleration. Within the designed angle variations, the universal joint will operate efficiently and safely. When the design angle is changed or exceeded the operationallife of the joint may decrease.

The bearings used in universal joints are of the needle roller type. The needle rollers are held in place on the trunnions by round bearing cups. The bearing cups are held in the yokes by snap rings.

Diagnosis of Propeller Shaft and Universal Joint

Condition	Possible cause	Correction
Universal Joint Noise.	Worn universal joint bearings.	Replace.
	Improper lubrication.	Lubricate as directed.
	Loose flange bolts.	Tighten to specifications.
Ping, Snap, or Click in Drive Line (Usually Heard on Initial Load after the Transmission is in Forward or Reverse Gear)	Loose bushing bolts on the rear springs or upper and lower control arms.	Tighten the bolts to specified torque.
	Loose or out-of-phase end yoke.	Remove end yoke, turn 180 degrees from its original position, lubricate the splines and reinstall. Tighten the bolts and pinion nut to specified torque.
Knocking or Clanking Noise in the Driveline when in High or Neutral Gear at 16km/h(10mph)	Worn or damaged universal joint	Replace the universal joint.
Squeak	Lack of lubricant.	Lubricate joints and splines. Also check for worn or brinelled parts.
Shudder on Acceleration (Low Speed)	Loose or missing bolts at the flanges.	Replace or tighten bolts to specified torque.
	Incorrectly set front joint angle.	Install shim under the transmission support mount to change the front joint angle.
	Worn universal joint.	Replace.
Vibration	Incorrect shaft runout.	Replace.
	Shaft out of balance.	Adjust.
	Transmission rear housing bushing, transfer case housing bushing worn.	Replace.
	Yoke spline jammed.	Replace.

Front Propeller Shaft and Associated Parts



401RW093

Legend

(1) Bolt, Nut and Washer (Front Axle Side)

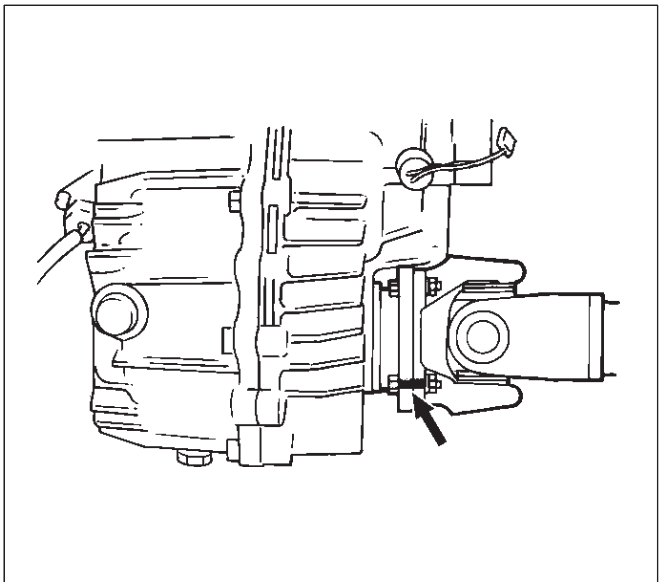
(2) Front Propeller Shaft (Single Cardan Type)

(3) Bolt, Nut and Washer (Transfer Side)

Removal

1. Raise the vehicle on a hoist.

NOTE: Apply alignment marks on the flange at the front propeller shaft both front and rear side.



401RS020

2. Remove bolt, nut and washer (Front axle side).
3. Remove bolt, nut and washer (Transfer side).
4. Remove front propeller shaft.

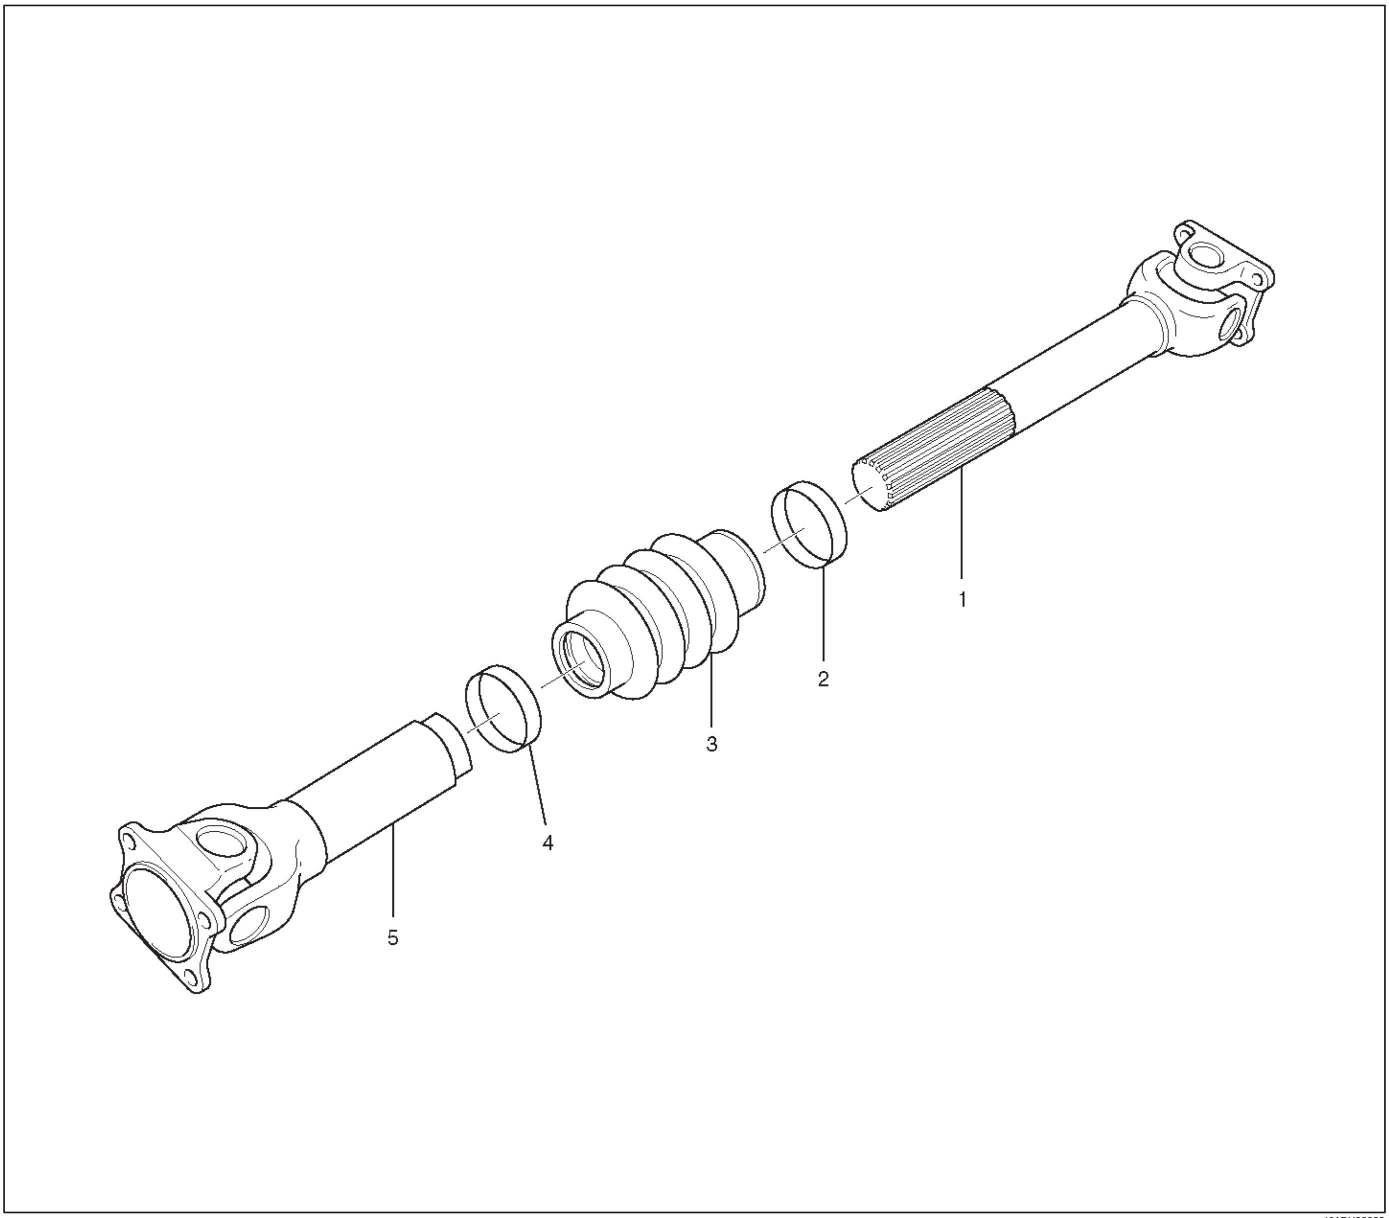
Installation

NOTE: Never install the shaft assembly backwards. Never insert bar between yoke lugs when tightening or removing bolts. Completely remove the black paint from the connecting surface of flange coupling on each end of propeller shaft. Clean so that no foreign matter will be caught in between.

1. Align the mark which is applied at removal. Install front propeller shaft and tighten the bolts to the specified torque.

Torque: 63 N·m (46 lb ft)

Slip Joint Disassembly



Legend

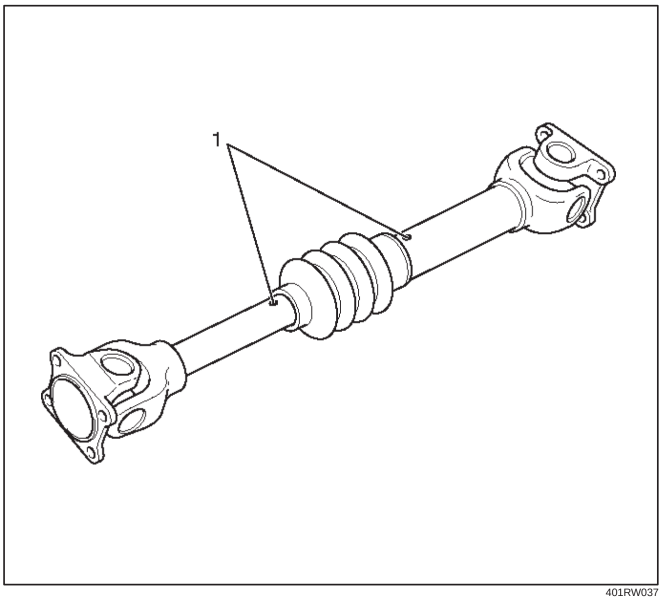
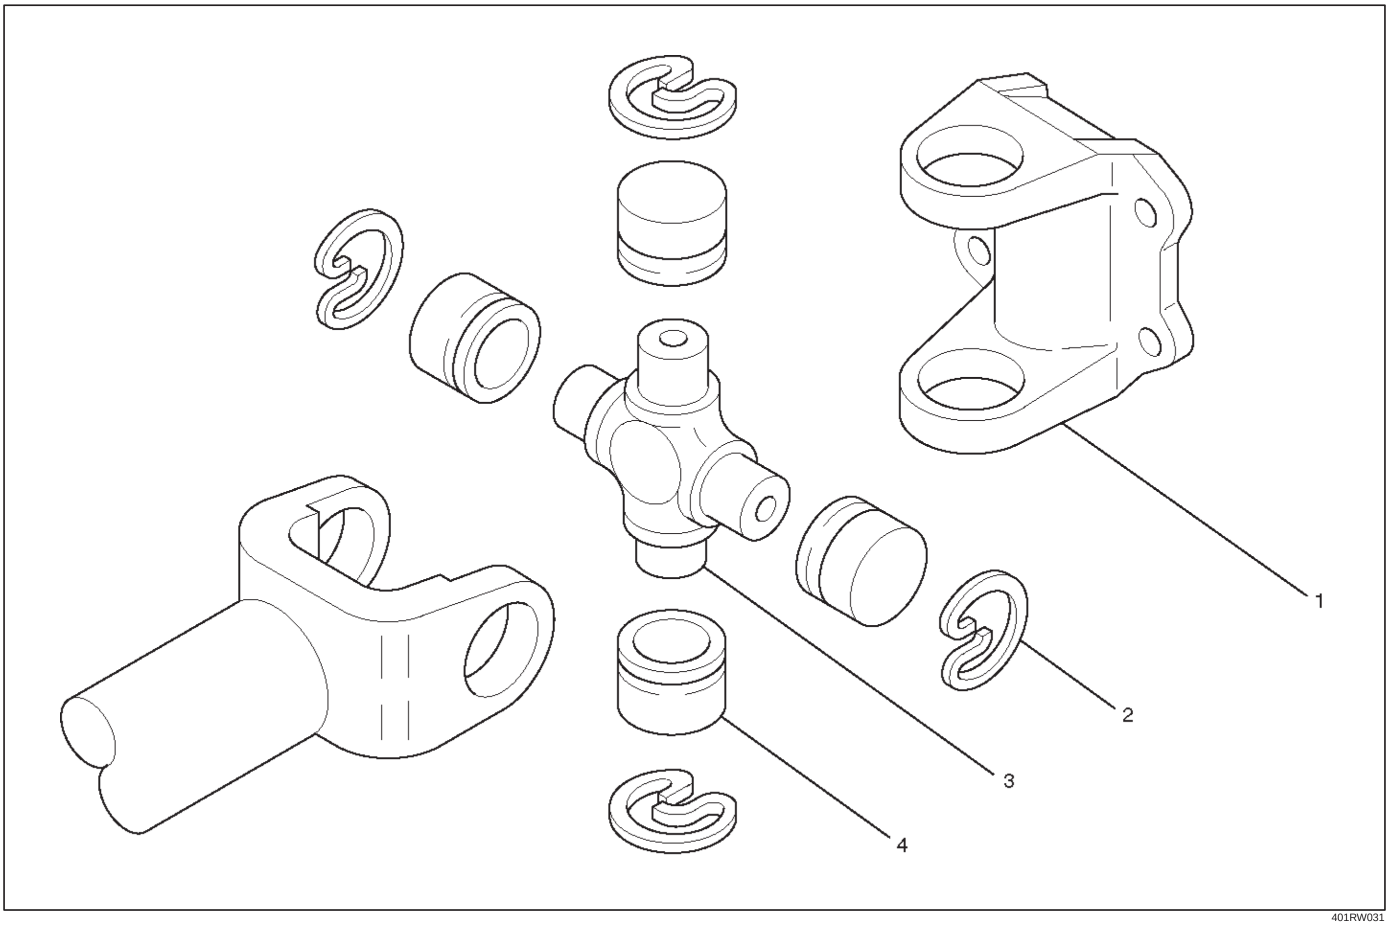
(2) Clamp
(3) Boot
(4) Clamp
(5) Tube Assembly

1. Lay the shaft horizontally on a bench and secure.
2. Indicate the original assembled position (1) by marking the phasing of the shaft prior to disassembly.



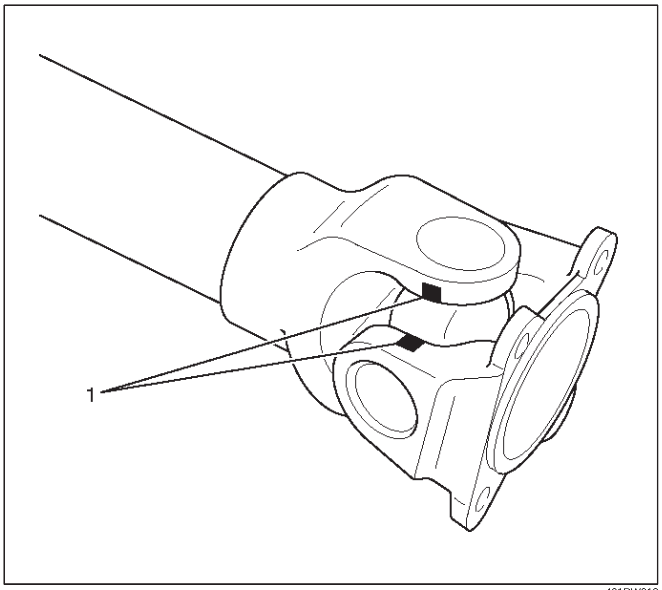
3. Using the flat blade of a screwdriver, pry the loose end of the boot clamp upwards and away from the propeller shaft boot. Be careful not to damage the boot.
4. When boot clamps becomes loose, remove by hand.
5. Repeat for the other boot clamp.
6. Remove the spline yoke assembly from the tube assembly, by securing the boot with one hand and pulling on the spline yoke.
7. Remove the boot from the tube assembly.

Universal Joint Disassembly(Single Cardan Type)



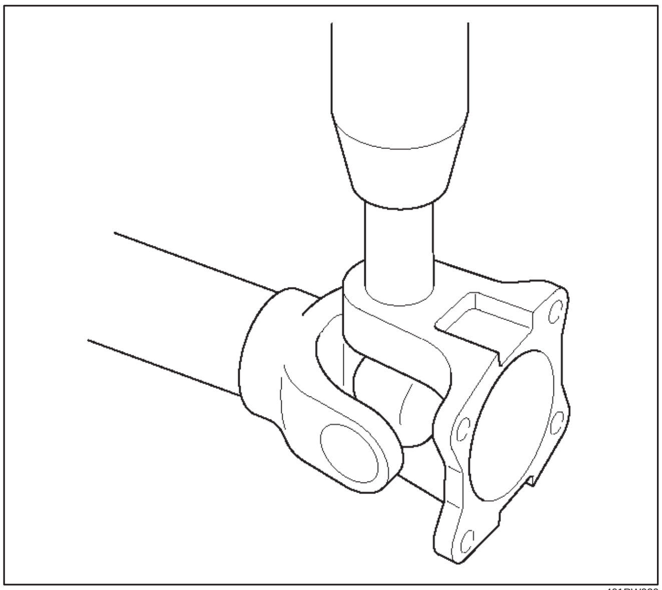
Legend
(1) Flange Yoke
(2) Snap Ring
(3) Spider
(4) Needle Roller Bearing

1. Using a soft drift, tap the outside of the bearing cup assembly to loosen snap ring. Tap bearing only hard enough to break assembly away from snap ring.
   Remove snap ring from yoke. Turn joint over, tap bearing away from snap ring, then remove opposite snap ring.
   Apply alignment marks (1) on the yokes of the universal joint, then remove snap ring.



401RW018

2. Set the yoke in the arbor press with a piece of tube stock beneath it.
   Place a solid plug on the upper bearing assembly and press it through to release the lower bearing assembly.

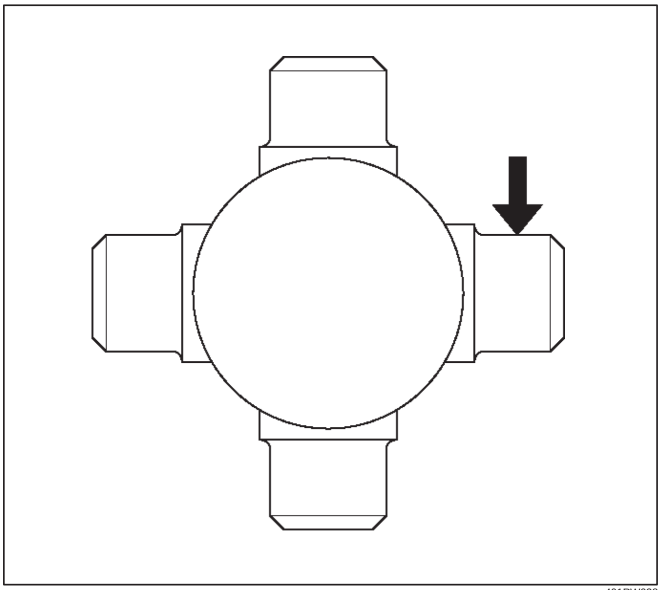


401RW020

3. If the bearing assembly will not pull out by hand after pressing, tap the base of the lug near the bearing assembly to dislodge it.
4. To remove the opposite bearing, turn the yoke over and straighten the spider in the open hole. Then carefully press on the end of the spider so the remaining bearing moves straight out of the bearing spider hole. If the spider or bearing are cocked, the bearing will score the walls of the spider hole and ruin the yoke.
5. Repeat this procedure on the remaining bearing to remove the spider from the yoke.
6. Make sure of proper position for reinstallation by applying setting marks, then remove spider .

Spider pin for wear

Spider pin should be smooth and free from fretting or galling. Visible signs of needle presence is normal, but wear should not be felt.



401RW038

Propeller shaft runout

Support the propeller shaft on V-blocks (2) and check for runout by holding the probe of a dial indicator (1) in contact with the shaft.

Static runout limit:

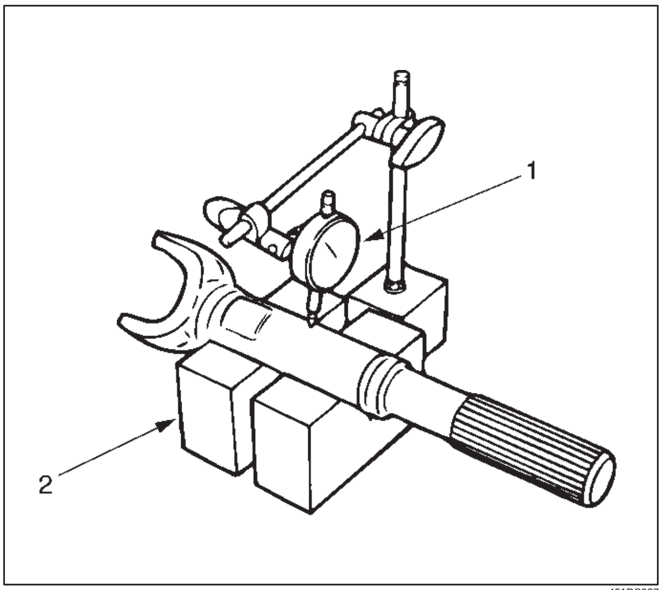
0.13 mm (0.005 in)
TIR on the neck of the slip tube shaft (with a boot).

0.25 mm (0.010 in)
TIR on the ends of the tubing 3 inch from the welds.

0.38 mm (0.015 in)
TIR at the linear center of the tube.

0.38 mm (0.015 in)
TIR for the full length of tube with 30” or less of tubing.

(TIR : Total Indicator Reading)



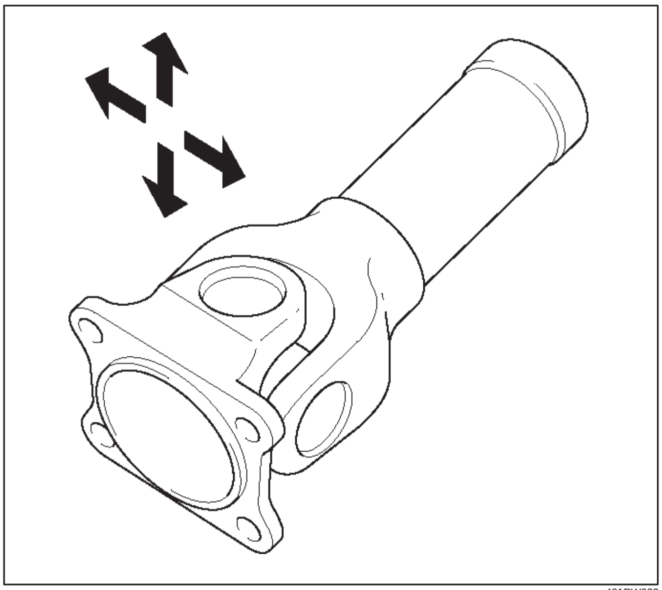
401RS027

Spline

The nylon-coated spline should be free from nicks and dings and the underlying steel spline should not be visible. After cleaning the nylon coating spline, the coating should exhibit only a slight indication of wear.
Grease volume is approximately 10 grams of grease in total. Grease should be evenly applied to both the female and the male slip splines using a small brush. After assembly of the slip joint, the sliding joint should be fully worked from the full collapsed to the full extended position.

Play in the universal joint

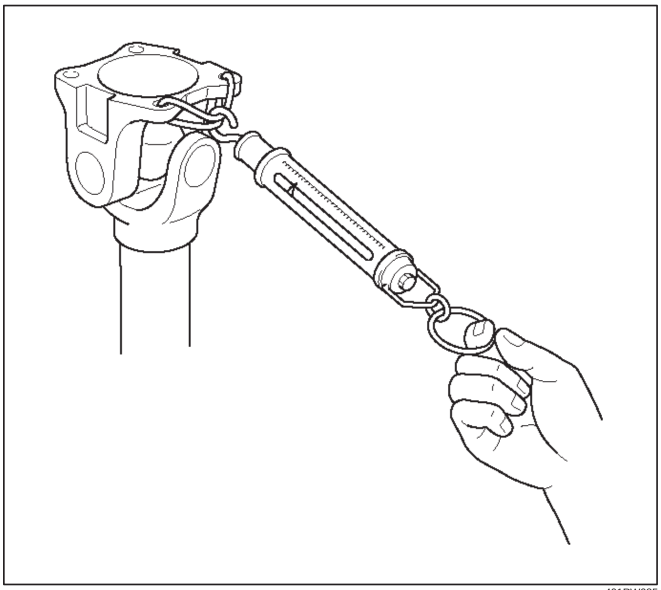
Limit: Less than 0.15 mm (0.006 in)



401RW023

Preload of the universal joint

Preload should be 0 to 24.9 kg(0 to11.3 lb). Joints should rotate smoothly and freely and should exhibit no rough or ratchety movement.



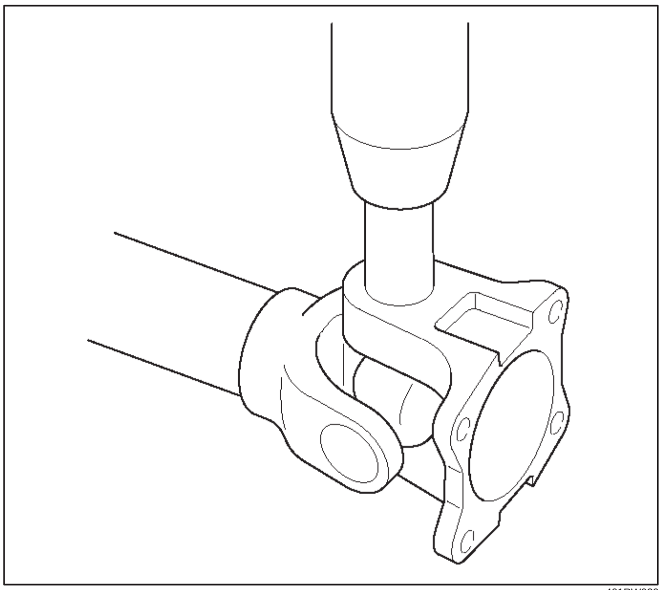
401RW085

Boot

Check the boot for crack or damage. If necessary, replace the boot.
If abnormal condition are found on the boot, inspect the grease for mixing of foreign material.
If the grease is good condition, and slip joint works well, replace the boot, replenish grease, and reassemble the slip joint.
If the foreign material is found in the grease, check the spline for wear and damage.

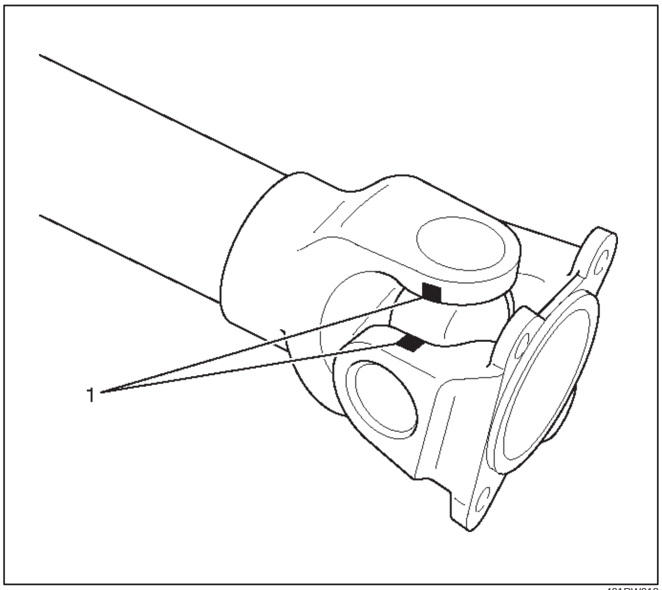
Universal Joint Reassembly(Single Cardan Type)

1. Install spider to flange yoke. Be sure to install the spider by aligning the setting marks made during disassembly.
2. Pack the four grease cavities of the spider with a high quality, extreme pressure N.L.G.I. Grade 2 grease. Do not add additional grease to the bearing cup assembly.
3. Move one end of the spider to cause a trunnion to project through the spider hole beyond the outer machined face of the yoke lug. Place a bearing over the trunnion diameter and align it to the spider hole. Using an arbor press, hold the trunnion in alignment with the spider hole and place a solid plug on the upper bearing. Press the bearing into the spider hole enough to install a snap ring.



401RW020

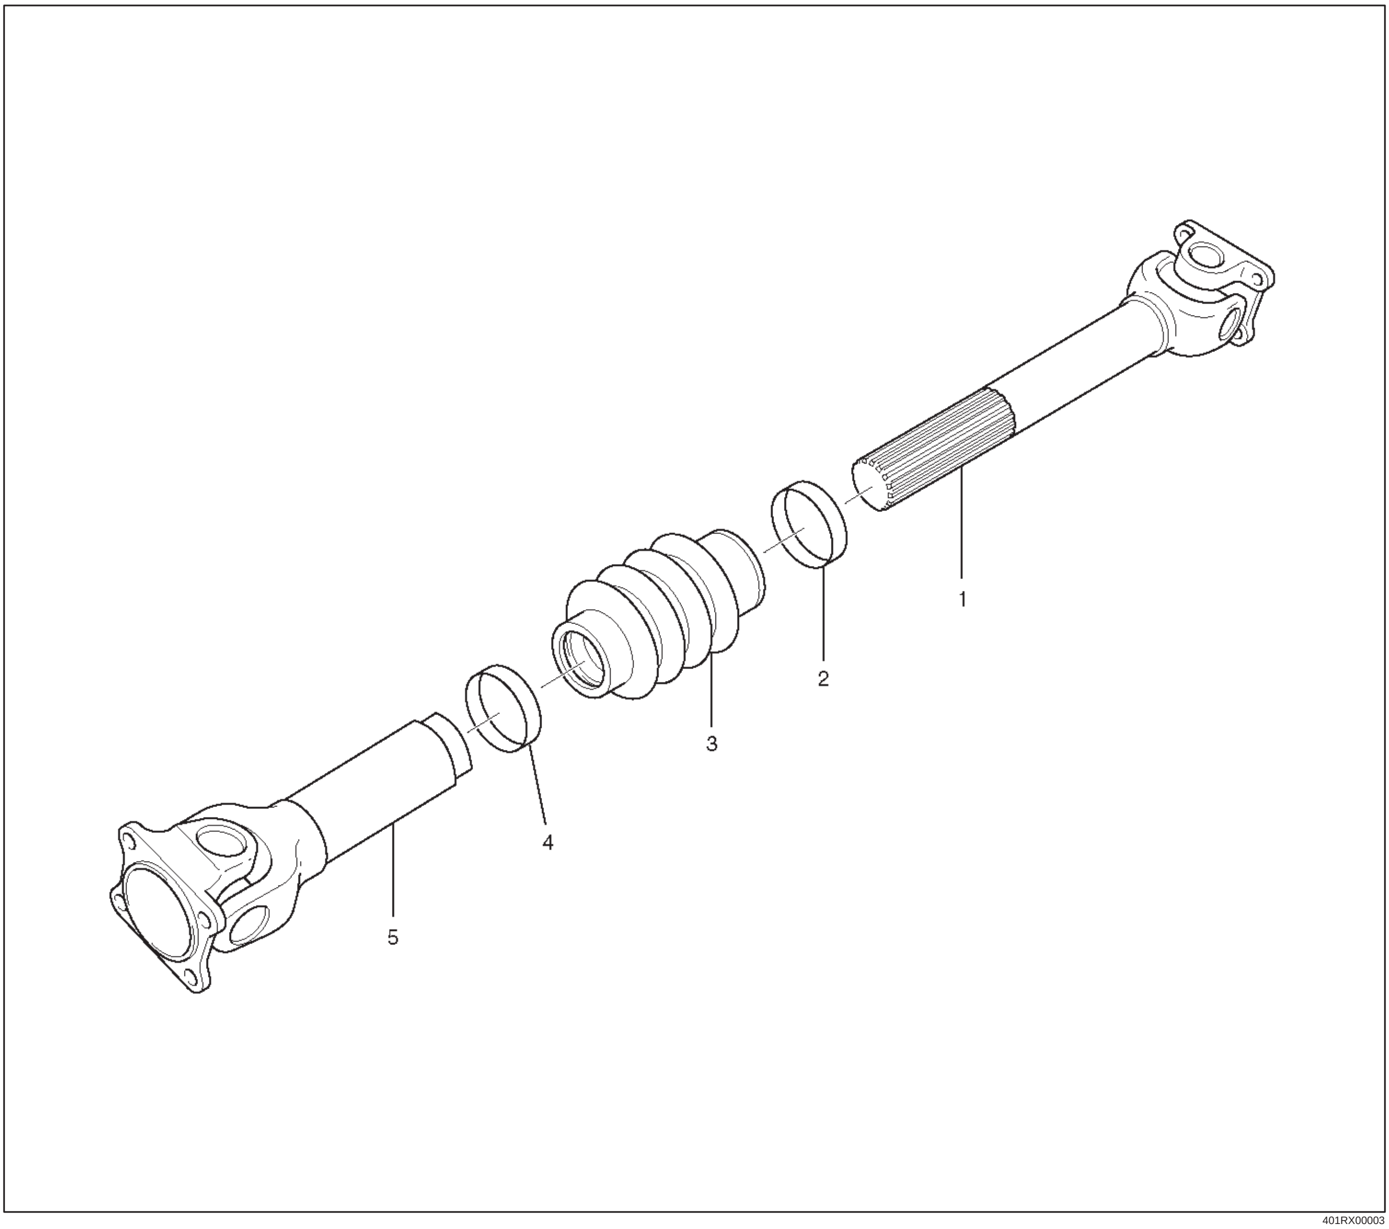
4. Install a snap ring.
   Be sure the snap rings are properly seated in the grooves.
5. Repeat steps 3 and 4 to install the opposite bearing. If the joint is stiff, strike the yoke ears with a soft hammer to seat needle bearings.
6. Align setting marks (1) and join the yokes.



401RW018

7. Install snap ring.

Slip Joint Reassembly



Legend

(1) Spline Yoke shaft
(2) Clamp
(3) Boot
(4) Clamp
(5) Tube Assembly

1. Apply grease evenly to both the female and male splines.
2. Apply a small amount of grease by finger to the outer lips of the boot.
3. Slide the boot (smaller diameter side) onto the spline yoke shaft being careful not to damage the spline coating or boot.
4. Insert the spline yoke shaft into the tube assembly being careful to maintain proper phasing. The spider holes should be in line and as per originally marked prior to disassembly.
5. Position boot onto tube and yoke shaft in final position over boot grooves.
6. Attach boot clamps and secure using pliers.
7. Be sure clamp is properly seated and secure.

CAUTION: Use new clamp which is the same parts as original. Do not use other clamp to avoid bad balancing of shaft or the grease leakage.

Propeller Shaft

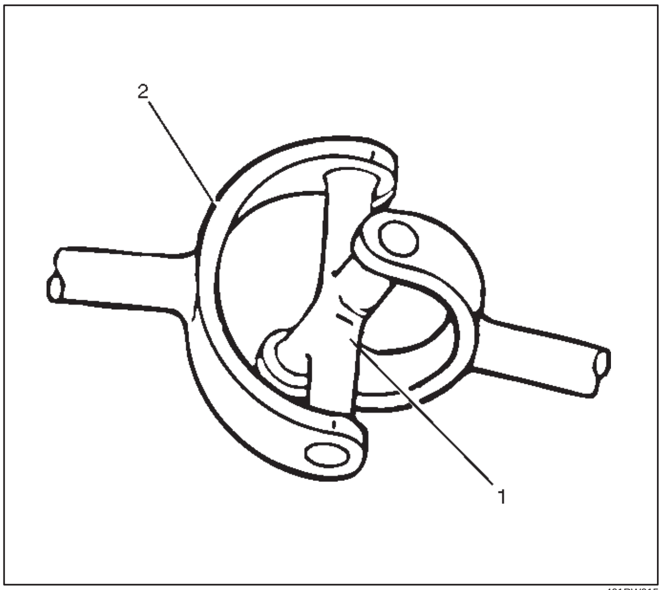
Torque is transmitted from the transmission to the rear axle through one propeller shaft and universal joint assemblies. All propeller shafts are the balanced tubular type. A splined slip joint is provided in some drivelines.

- Since the propeller shaft is total balanced carefully, welding or any other modification are not permitted.
- Alignment marks should be applied to each propeller shaft before removal.
- Be sure vehicle is stopped, engine is not running, brake is secured and vehicle is secured to prevent injury.
- Be careful not to grip the propeller shaft tube too tightly in the bise as this will be cause deformation.

Phasing

The propeller shaft is designed and built with the yoke lugs (ears) in line with each other.This design produces the smoothest running shaft possible, called phasing.Vibration can be caused by an out-of-phase propeller shaft.The propeller shaft will absorb vibrations from speeding up and slowing down each time the universal joint goes around. This vibration would be the same as a person snapping a rope and watching the ”wave” reaction flow to the end.A propeller shaft working in phase would be similar to two persons snapping a rope at the same time, and watching the ”waves” meet and cancel each other out.In comparison, this would be the same as the universal joints on a propeller shaft.A total cancellation of vibration produces a smooth flow of power in the driveline.It is very important to apply a reference mark to the propeller shaft before removal, to assure installation alignment.

Universal Joint



401RW015

Legend

(1) Spider
(2) Yoke

A universal joint consists of two Y-shaped yokes connected by a crossmember called a spider.

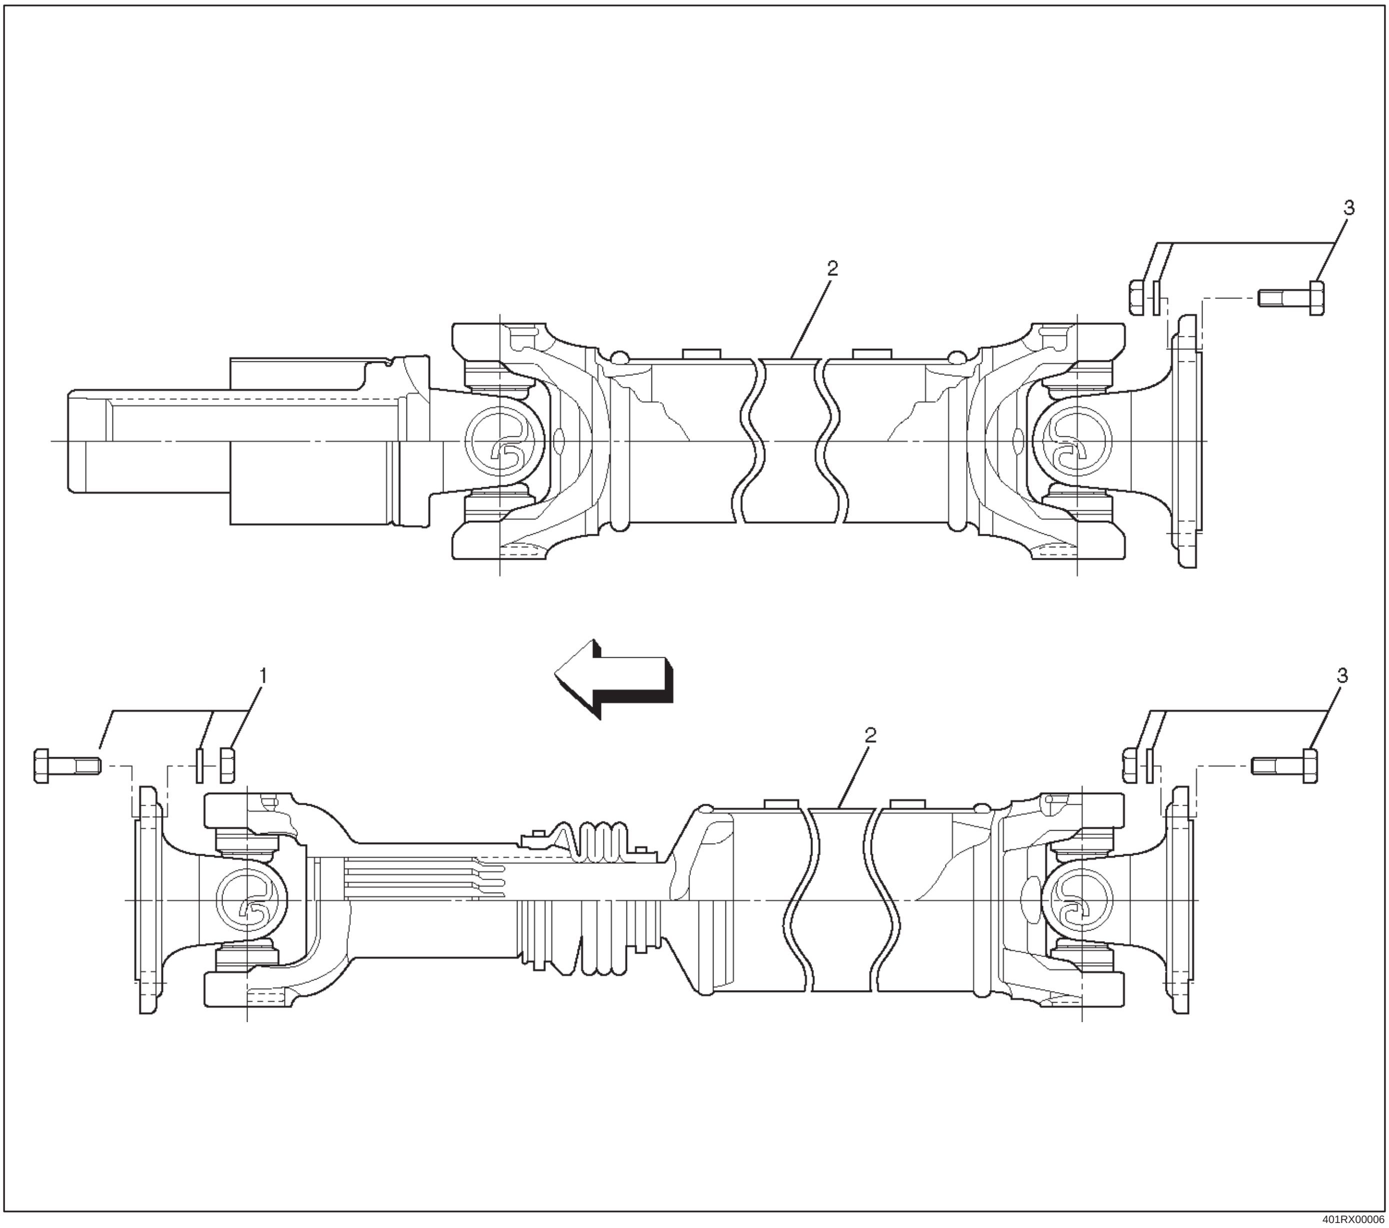
The spider is shaped like a cross. Universal joints are designed to handle the effects of various loadings and front or rear axle windup during acceleration. Within the designed angle variations, the universal joint will operate efficiently and safely. When the design angle is changed or exceeded the operationallife of the joint may decrease.

The bearings used in universal joints are of the needle roller type. The needle rollers are held in place on the trunnions by round bearing cups. The bearing cups are held in the yokes by snap rings.

Diagnosis of Propeller Shaft and Universal Joint

Condition	Possible cause	Correction
Leak at the Front Slip Yoke (An Occasional Drop of Lubricant Leaking from the Splined Yoke is Normal)	Rough surface on splined yoke; burred nicked or worn.	Replace the seal. Minor burrs can be Smoothed by careful use of crocus cloth or fine stone honing. Replace the yoke if badly burred.
	Defective transmission rear oil seal.	Replace the transmission rear oil seal and replenish the transmission oil.
Universal Joint Noise.	Worn universal joint bearings.	Replace.
	Improper lubrication.	Lubricate as directed.
	Loose flange bolts.	Tighten to specifications.
Ping, Snap, or Click in Drive Line (Usually Heard on Initial Load after the Transmission is in Forward or Reverse Gear)	Loose bushing bolts on the rear springs or upper and lower control arms.	Tighten the bolts to specified torque.
	Loose or out-of-phase end yoke.	Remove end yoke, turn 180 degrees from its original position, lubricate the splines and reinstall. Tighten the bolts and pinion nut to specified torque.
Squeak	Lack of lubricant.	Lubricate joints and splines. Also check for worn or brinelled parts.
Shudder on Acceleration (Low Speed)	Loose or missing bolts at the flanges.	Replace or tighten bolts to specified torque.
	Incorrectly set front joint angle.	Install shim under the transmission support mount to change the front joint angle.
	Worn universal joint.	Replace.
Vibration	Incorrect shaft runout.	Replace.
	Shaft out of balance.	Adjust.
	Transmission rear housing bushing, transfer case housing bushing worn.	Replace.
	Yoke spline jammed.	Replace.

Rear Propeller Shaft and Associated Parts



Legend

(1) Bolt, Nut and Washer (Transfer Side)

(2) Rear Propeller Shaft

(3) Bolt, Nut and Washer (Rear Axle Side)

Removal

1. Raise the vehicle on a hoist.

NOTE: Apply alignment marks on the flange at the rear propeller shaft both front and rear side.

2. Remove transfer side bolt, nut and washer (4×4 model only).
3. Remove rear axle side bolt, nut and washer.
4. Remove rear propeller shaft.

NOTE: Plug the hole of the transmission rear end to prevent oil leakage (4×2 model only).

Installation

NOTE: Never install the shaft assembly backwards.

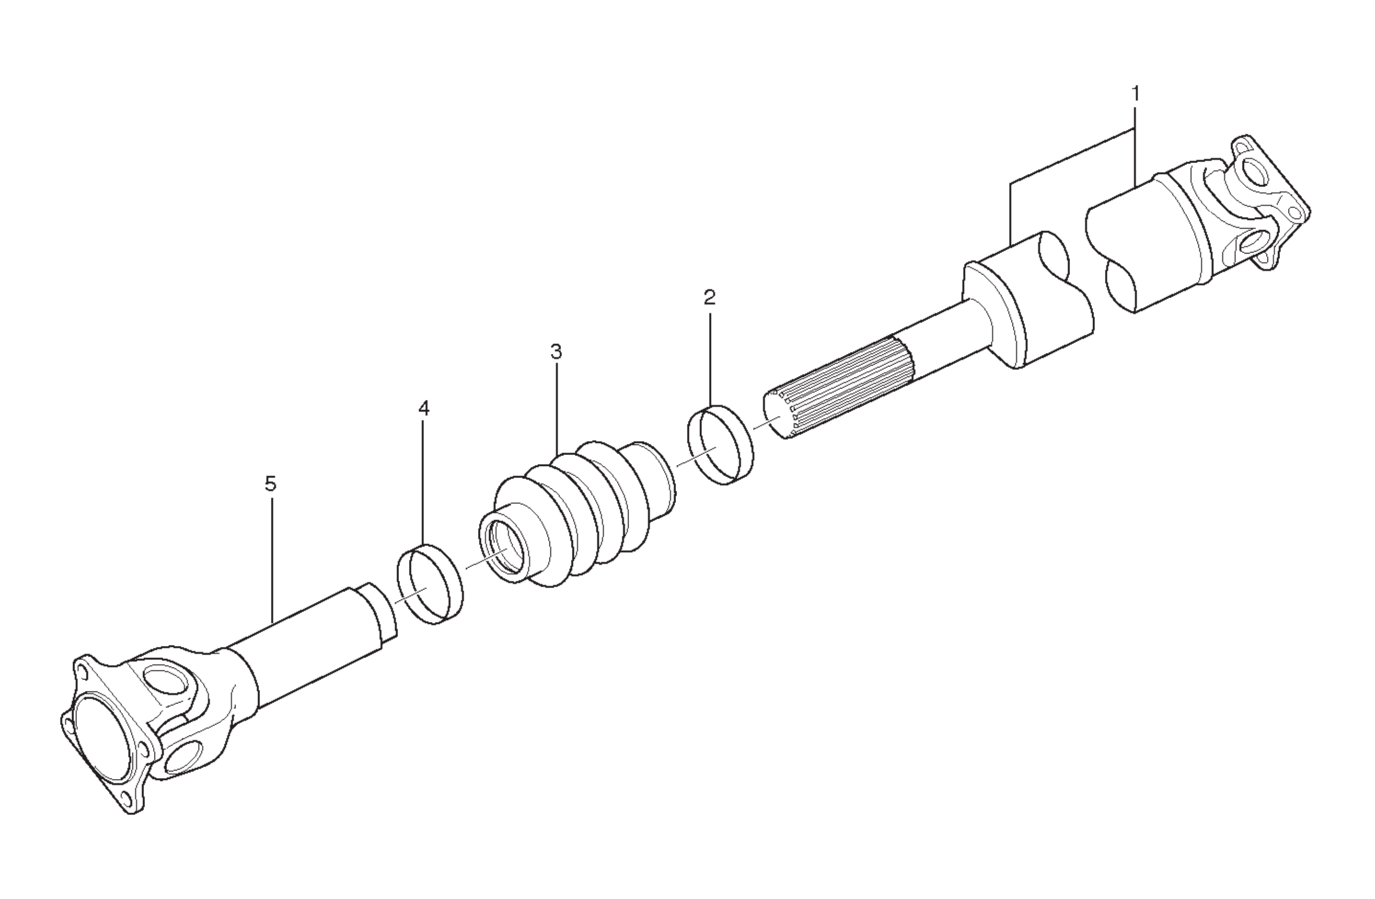
Never insert bar between yoke lugs when tightening or removing bolts.

Completely remove the dust or foreign matter from the connecting surface of flange coupling on each end of the propeller shaft.

1. Align the mark which is applied at removal.
2. Install rear propeller shaft and tighten the bolts to the specified torque.

Torque: 63 N·m(46 lb ft)

Slip Joint Disassembly (6VD1 Model Only)

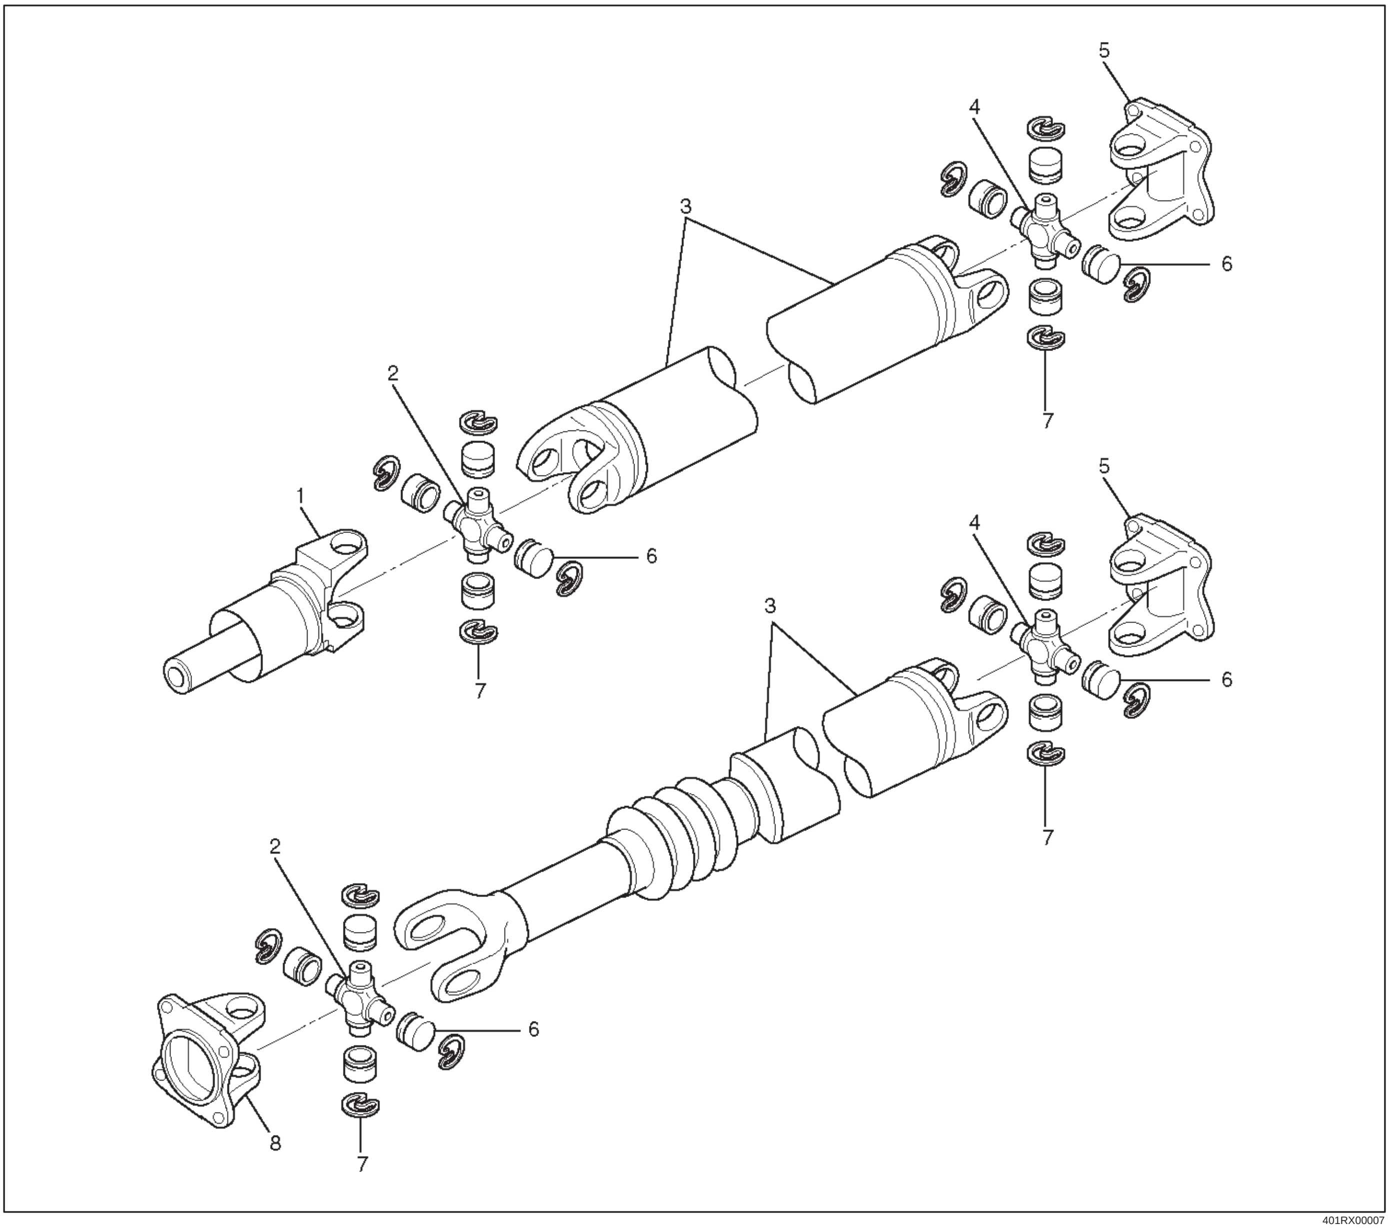


401RW081

Legend
(1) Spline Yoke and Universal Joint Assembly
(2) Clamp
(3) Boot
(4) Clamp
(5) Tube and Universal Joint Assembly

1. Lay the shaft horizontally on a bench and secure.
2. Indicate the original assembled position by marking the phasing of the shaft prior to disassembly.
3. Using the flat blade of a screwdriver, pry the loose end of the boot clamp upwards and away from the propeller shaft boot. Be careful not to damage the boot.
4. When boot clamps becomes loose, remove by hand.
5. Repeat for the other boot clamp.
6. Remove the spline yoke assembly from the tube assembly, by securing the boot with one hand and pulling on the spline yoke.
7. Remove the boot from the tube assembly.

Universal Joint Disassembly



Legend

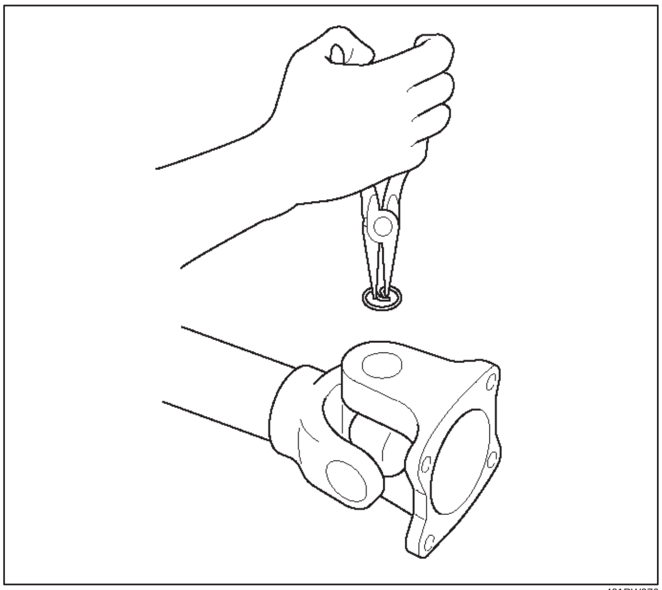
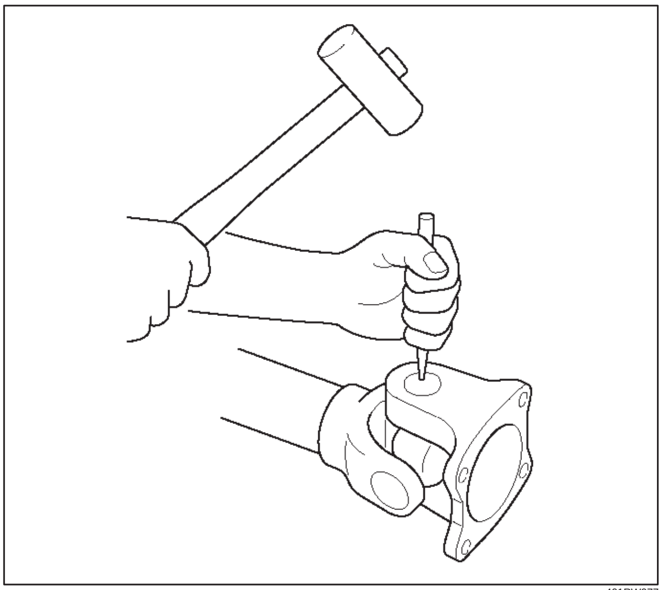
(5) Flange Yoke
(6) Bearing
(7) Snap Ring
(8) Flange Yoke (6VD1 model)

1. Apply alignment marks on the yokes of the universal joint, then remove the snap ring.



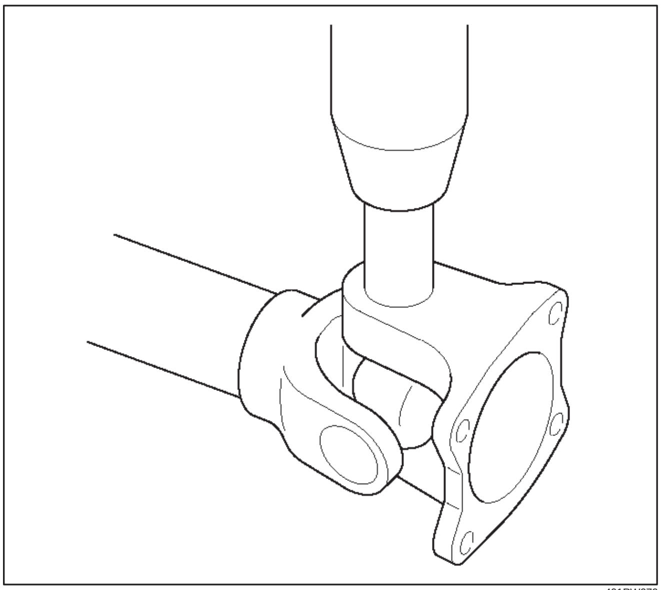
401RW076

If the snap ring is stuck in position, remove paint from the hole in the yoke or tap around the edge of the bearing lightly with a soft drift.



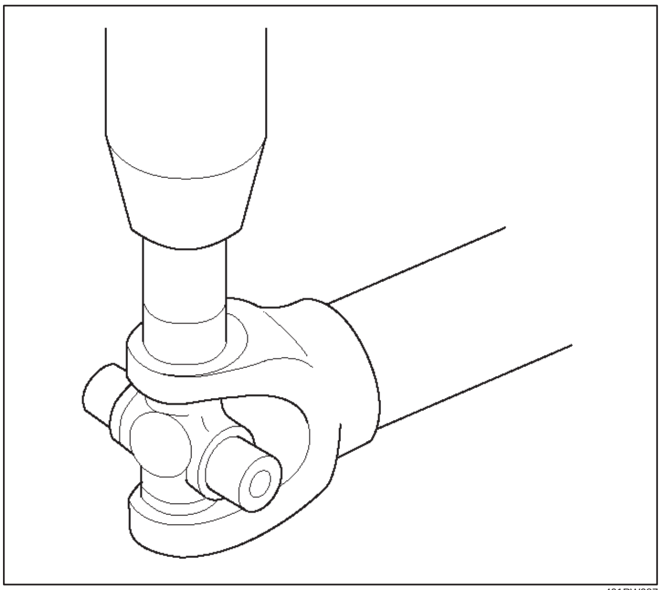
401RW077

2. Set the yoke in the arbor press with a piece of tube stock beneath it.
   Place a solid plug on the upper bearing and press it through to release the lower bearing.



401RW079

3. If the bearing will not pull out by hand after pressing, tap the base of the lug near the bearing to dislodge it.
4. To remove the opposite bearing, turn the yoke over and straighten the spider in the open spider hole. Then carefully press on the end of the spider so the remaining bearing moves straight out of the bearing spider hole. If the spider or bearing are cocked, the bearing will score the walls of the spider hole and ruin it.



401RW087

5. Repeat this procedure on the remaining bearing to remove the spider from the yoke.

Inspection

- Propeller shaft for runout.

Static runout limit : 0.13 mm(0.005 in)

TIR on the neck of the slip tube shaft (with a boot).

0.25 mm(0.010 in)

TIR on the ends of the tubing 3 inch from the welds.

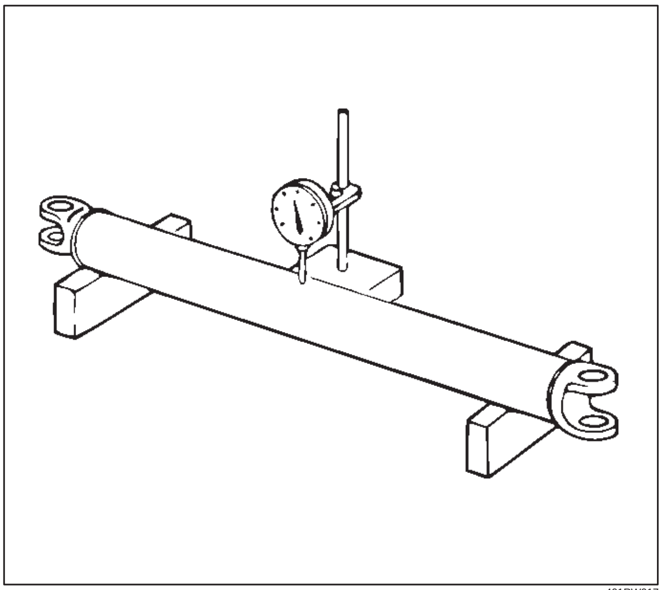
0.38 mm(0.015 in)

TIR at the linear center of the tube.

0.38 mm(0.015 in)

TIR for the full length of tube with 30” or less of tubing.

TIR: Total Indicator Reading)



401RW017

- Play in universal joint.

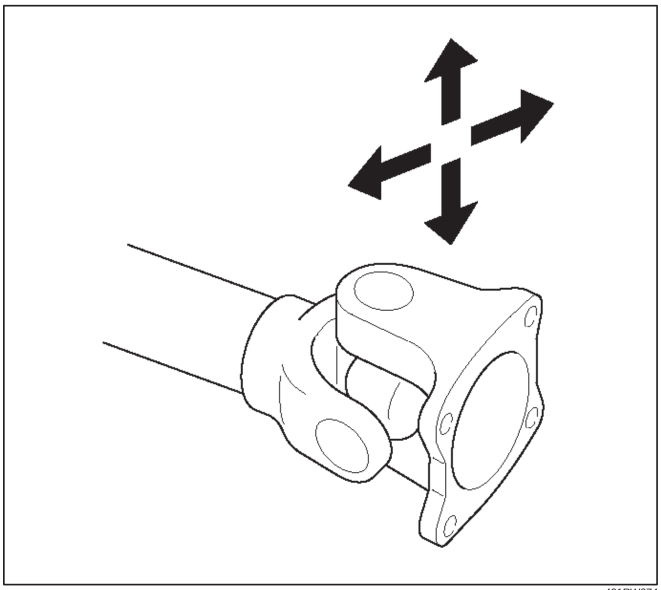
Limit: Less than 0.15 mm(0.006 in)

- Spider pin should be smooth and free from fretting or galling.
  Visible signs of needle presence is normal, but wear should not be felt.
- Inspect boot.
  Check the boot for crack or damage. If necessary, replace the boot.

  If abnormal condition are found on the boot, inspect the grease for mixing of foreign material.

  If the grease is good condition, and slip joint works well, replace the boot, rplenish grease, and reassemble the slip joint.

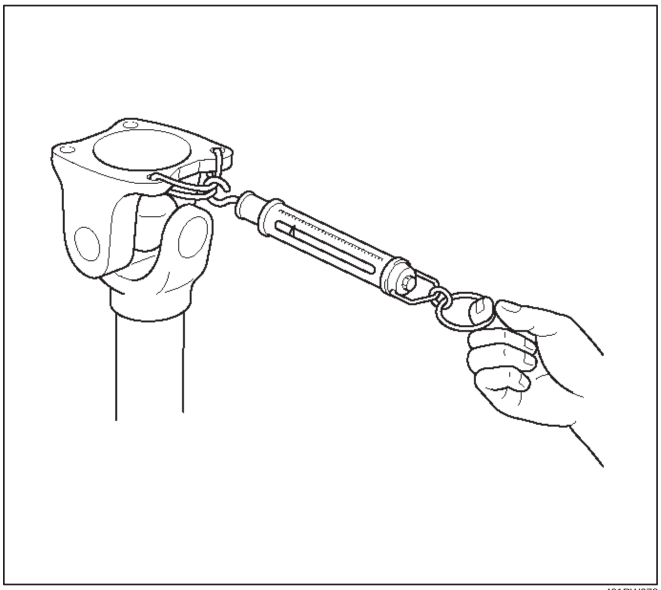
  If the foreign material is found in the grease, check the spline for wear and damage.



401RW074

- Preload of the universal joint.
  Preload should be 0 to 24.9 kg (0 to 11.3 lb).

  Joints should rotate smoothly and freely and should exhibit no rough or ratchety movement.



401RW078

- Inspect splines for wear.
  The nylon-coated spline should be free from nicks and dings and the underlying steel spline should not be visible.

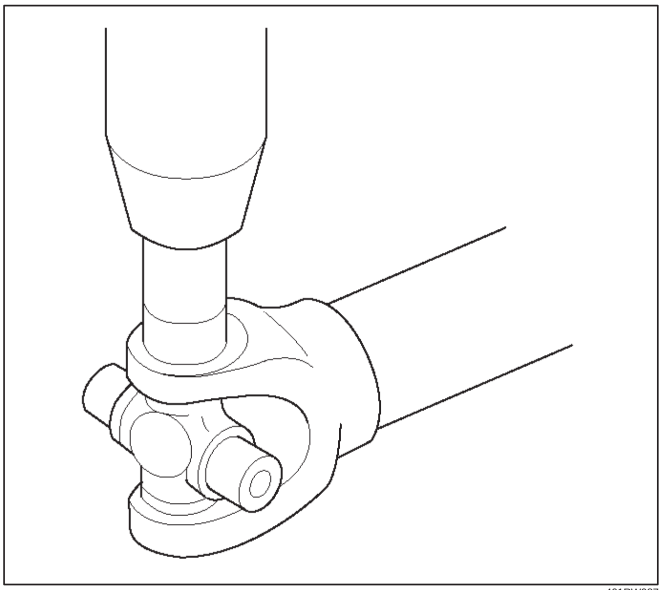
  After cleaning the nylon coating spline, the coating should exhibit only slight indicator of wear.

  Grease volume is approximately 10 grams of grease in total. Grease should be evenly applied to both the female and the male slip splines using a small brush. After assembly of the slip joint, the sliding joint should be fully worked from the full collapsed to the full extended position.

Universal Joint Reassembly

1. Pack the four grease cavities of the spider with a high quality, extreme pressure N.L.G.I. Grade 2 grease. Do not add additional grease to bearing cup assembly.
2. Move one end of the spider to cause a trunnion to project through the spider hole beyond the outer machined face of the yoke lug. Place a bearing over the trunnion diameter and align it to the spider hole.

   Using an arbor press, hold the trunnion in alignment with the spider hole and place a solid plug on the upper bearing. Press the bearing into the spider hole enough to install snap ring.



401RW087

3. Install a snap ring.

NOTE: Be sure the snap rings are properly seated in the grooves.

4. Repeat steps 2 and 3 to install the opposite bearing. If the joint is stiff, strike the yoke ears with a soft hammer to seat the bearing.
5. Align the setting marks and join the yokes.
