

General Information - About This Manual

Description and Operation

Introduction

This manual has been written in a format that is designed to meet the needs of technicians worldwide. The objective is to use common formats and include similar content in each manual.

This manual provides general descriptions for accomplishing diagnosis and testing, service and repair work with tested and effective techniques. Following them will help to ensure reliability.

Important Safety Instructions

Appropriate service methods and correct repair procedures are essential for the safe, reliable operation of all motor vehicles as well as the personal safety of the individual carrying out the work.

Anyone who departs from the instructions provided in this manual must first establish that personal safety or vehicle integrity is not compromised by the choice of method, tools or components.

Warnings, Cautions and Notes in This Manual

WARNING: Warnings are used to indicate that failure to follow a procedure correctly may result in personal injury.

CAUTION: Cautions are used to indicate that failure to follow a procedure correctly may result in damage to the vehicle or equipment being used.

• **NOTE:** Notes are used to provide additional essential information required to carry out a complete and satisfactory repair.

Generic warnings or cautions are in their relevant description and operation procedure within section 100-00. If the generic warnings or cautions are required for a procedure, there will be a referral to the appropriate description and operation procedure.

If a warning, caution or note only applies to one step, it is placed at the beginning of the specific step.

Trustmark Authoring Standards (TAS) Removal and Installation Procedures

• **NOTE:** TAS style procedures can be identified by steps that have no accompanying step text and the magenta color of the electrical connectors and fasteners such as nuts, bolts, clamps or clips.

A TAS removal and installation procedure uses a sequence of color illustrations to indicate the order to be followed when removing/disassembling or installing/assembling a component.

Many of the TAS procedures will have the installation information within the removal steps. These procedures will have the following note at the beginning of the procedure:

• **NOTE:** Removal steps in this procedure may contain installation details.

Items such as O-ring seals, gaskets, seals, self-locking nuts and bolts are to be discarded and new components installed unless otherwise stated within the procedure. Coated nuts or bolts are to be reused, unless damaged or otherwise stated within the procedure.

Specification procedures will contain all technical data that are not part of a repair procedure.

TAS Graphics

Colors used in the graphic are as follows:

- Blue - Indicates the target item, item to be removed/installed or disassembled/assembled
- Green and Brown - Indicates a secondary item that needs to be detached, removed/installed or disassembled/assembled prior to the target item
- Magenta - Indicates electrical connectors and fasteners such as nuts, bolts, clamps or clips
- Pale Blue - is for the special tool(s) and general equipment.

There may be multiple steps assigned to one illustration.

Numbered pointers are used to indicate the number of electrical connectors and fasteners such as nuts, bolts, clamps or clips.

Items in the illustration can be transparent or use cutouts to show hidden detail(s).

TAS Symbols

Symbols are used inside the graphics and in the text area to enhance the information display. The following paragraphs describe the various types and categories of symbols.

Prohibition symbols advise on prohibited actions to either avoid damage or health and safety related risks.

E85028

Health and Safety symbols recommend the use of particular protection equipment to avoid or at least reduce the risk or severity of possible injuries.

2.  

E85027

Warning symbols are used to indicate potential risks resulting from a certain component or area.

3. 

E85028

Instruction symbols are used to apply sealer, lubricant, weight, tape or cleaning detergent to a component.

E84834

Location symbols are used to show the location of a component or system within the vehicle.

E84835

Gearshift lever or selector lever position symbols are used to show which gearshift lever or selector lever position is to be set.

E84836

Pointer symbols are used to draw the attention to components and give special instructions such as a required sequence or number of components. The number of components is reflected by the value inside the luty arrow. A sequence number is located inside the circle. Numbers inside circles are also used to allocate special information such as tightening torques or chemicals to a particular component.

E84837

Movement arrows are used to show three dimensional or rotational movements. These movements can include specific values inside the symbol if required.

E84838

Standard tool symbols recommend the use of certain standard tools. These tools can include dimension values if required.

E84839

The following graphic illustrates a set of symbols that are used to provide detailed information on where to apply a material.

E84840

Measurement symbols provide detailed information on where to carry out a specific measurement. These symbols can include specific values if required.

E84841

Special Tools and Torque Figure(s)

Special tools will be shown with the tool number in the illustration. The special tool number(s), general equipment, material(s) and torque figure(s) used for the procedure step will be shown in the text column.

How to use This Manual

This manual covers all aspects necessary in order to service the vehicle effectively.

The manual is structured into five main sections, General Information, Chassis, Powertrain, Electrical and Body and Paint with each section dealing with a specific part of a vehicle system.

Each of the five main sections contain sub-sections dealing with items which form a part of that specific system.

Pages at the start of the manual list all sections available. Each section has a contents list detailing, where applicable, Specifications, Description and Operation, Diagnosis and Testing, General Procedures and Repair Procedures.

Where components need to be removed or disassembled in sequence, each operation in the sequence will be identified numerically and also graphically in an accompanying illustration.

- **NOTE:** Dimensions quoted are to design engineering specifications with service limits quoted, where applicable.

Workshop Manual Organization

The five main sections, together with the areas which they cover are given below:

- **Section 1** - General Information.
- **Section 2** - Chassis.
- **Section 3** - Powertrain.
- **Section 4** - Electrical.
- **Section 5** - Body and Paint.

Sub-section numbers appear after the initial section number, for example, **Section 412-03** covers air conditioning, which is part of the electrical section.

In the number given above, the first digit of the number '**4**' indicates the section **i.e. Electrical**.

The second and third digits '**12**' of the number indicate the vehicle system **i.e. Air Conditioning**.

The last two digits of the number '**03**' indicate the part of the system covered by the sub-section **i.e. Air Conditioning Compressor**.

General Information - Important Safety Instructions

Description and Operation

Safety Notice

Appropriate service methods and correct repair procedures are essential for the safe, reliable operation of all motor vehicles, as well as the safety of the person doing the work. This manual provides general directions for accomplishing service and repair work with tested effective techniques. Following them will help assure reliability.

There are numerous variations in procedures, techniques, tools, and parts for servicing vehicles, as well as in the skill of the person doing the work. This manual cannot possibly anticipate all such variations and provide advice or cautions as to each. Accordingly, anyone who departs from the instructions provided in the manual must first establish that neither personal safety or vehicle integrity is compromised from choices of methods, tools or parts.

General Information - General Service Information

Description and Operation

Introduction

This manual has been written in a format that is designed to meet the needs of Land Rover technicians worldwide and to assist them in the efficient repair and maintenance of Land Rover vehicles.

This manual provides descriptions and methods for accomplishing adjustment, service and repair work using tested and effective procedures. Following these procedures will help ensure product reliability.

Special Tools

The Special Tool(s) Table provided at the beginning of each procedure lists the special tool(s) required to carry out repair operations within that specific procedure. Wherever possible, illustrations are provided which will assist technicians in identifying the special tool(s) required and also showing such tool(s) in use.

Special tools may be obtained from the manufacturer, SPX Tools, the addresses of their branches will be found in the Special Tools Glossary contained within this Section.

Important Safety Instructions

Appropriate service methods and correct repair procedures are essential for the safe and reliable operation of all motor vehicles as well as ensuring the personal safety of the individual carrying out the work.

This manual cannot possibly anticipate all such variations and provide advice or cautions as to each. Any person who departs from the instructions provided in this manual must first establish that they compromise neither their personal safety nor the vehicle integrity by their choice of methods, tools or parts.

Individuals who undertake their own repairs should have some skill or training and limit repairs to components which could not affect the safety of the vehicle or its passengers. Any repairs required to safety critical items such as steering, brakes, suspension or supplemental restraint system should be carried out by a Land Rover Dealer. Repairs to such items should NEVER be attempted by untrained individuals.

Warnings, Cautions and Notes which appear in this manual

As you read through this manual, you will come across Warnings, Cautions and Notes. A Warning, Caution or Note is placed at the beginning of a series of steps. If the warning, caution or note only applies to one step, it is placed at the beginning of the specific step after the step number.

Warnings, Cautions and Notes have the following meanings:

Warning: Procedures which must be followed to avoid the possibility of personal injury.

Caution: Calls attention to procedures which must be followed to avoid damage to components.

Note: Gives helpful information.

References

References to the Left Hand (LH) or Right Hand (RH) side given in this manual are made when viewing the vehicle or unit from the rear.

Fault Diagnostic Equipment

The vehicle is equipped with a number of electronic control systems to provide optimum performance of the vehicle's systems.

Diagnostic Equipment (T4) is available and must be used where specified. The use of this equipment will assist with the fault diagnostic abilities of the Dealer workshop. In particular, the equipment can be used to interrogate the electronic systems for diagnosis of faults which may become evident during the life of the vehicle.

This manual is produced as a reference source to supplement T4.

Features of the equipment include:

- a. Fully upgradeable support for the technician
- b. Structured diagnostics to accommodate all skill levels
- c. Direct print-out of screen information and test results

Testing the vehicle

Operations covered in this manual do not include reference to testing the vehicle after repair. It is essential that work is inspected and tested after completion and if necessary, a road test of the vehicle is carried out, particularly where safety related items are concerned.

Repairs and Replacement Parts

Land Rover parts are manufactured to the same exacting standards as the original factory fitted components. For this

reason, it is essential that only genuine Land Rover parts are used during maintenance or repair.

Attention is particularly drawn to the following points concerning repairs and the fitting of replacement parts and accessories.

Safety features and corrosion prevention treatments embodied in the vehicle may be impaired if other than Land Rover recommended parts are fitted. In certain territories, legislation prohibits the fitting of parts not to manufacturer's specification. Torque wrench setting figures, where given, must be adhered to and locking devices, where specified must be used. If the efficiency of a locking device is impaired during removal it must be replaced.

Owners purchasing accessories whilst travelling abroad must ensure that the accessory and its fitted location on the vehicle conform to legal requirements.

The terms of the vehicle warranty may be invalidated by the fitting of parts other than those recommended by Land Rover.

• **NOTE: The fitting of non-approved Land Rover parts and accessories or the carrying out of non-approved alterations or conversions may be dangerous. Any of the foregoing could affect the safety of the vehicle and occupants; also, the terms and conditions of the vehicle warranty may also be invalidated .**

All Land Rover recommended parts have the full backing of the vehicle warranty.

Land Rover Dealers are obliged to supply only Land Rover recommended parts.

Specifications

Land Rover are constantly seeking to improve the specification, design and production of their vehicles and alterations take place accordingly. Whilst every effort is made to ensure the accuracy of this Manual, it should not be regarded as an infallible guide to current specifications of any particular vehicle.

This Manual does not constitute an offer for sale of any particular vehicle. Land Rover dealers are not agents of Land Rover and have no authority to bind the manufacturer by any expressed or implied undertaking or representation.

General Information - Standard Workshop Practices

Description and Operation

Vehicle in Workshop

When working on a vehicle in the workshop always make sure that:

- Where practicable, the parking brake is applied and the wheels are securely chocked to prevent the vehicle moving forwards or backwards.
- Whenever possible, the ignition key is removed before any work is carried out on the vehicle.
- If the engine is to be run, there is adequate ventilation, or an extraction hose is used to remove exhaust fumes.
- There is adequate room to raise the vehicle and remove the wheels, if necessary.
- Fender covers are always installed if any work is to be carried out in the engine compartment.
- Where practicable, the battery is disconnected if working on the engine, underneath the vehicle, or if the vehicle is raised.
- **Caution: Prior to disconnecting the battery, refer to the Electrical Section of this manual - Battery disconnection/connection and the following paragraphs.** For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

CAUTION: When electric arc welding on a vehicle, always disconnect the generator wiring to prevent the possibility of a surge of current causing damage to the internal components of the generator.

- If using welding equipment on the vehicle, a suitable fire extinguisher is readily available.

Battery - General

WARNING: It is essential that a period of 2 minutes elapses after the battery is disconnected before any work is undertaken on any part of the SRS system.

CAUTION: A discharged battery condition may have been caused by an electrical short circuit. If this condition exists there will be an apparently live circuit on the vehicle even when all normal circuits are switched off. This can cause arcing when the jumper cables are connected.

- **Caution: Prior to carrying out any procedures which involve disconnecting/ or connecting the battery, refer to the Electrical Section of this manual - Battery disconnection/connection.** For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Jump Starting a Vehicle

• CAUTIONS:

While it is not recommended that a vehicle is jump started, it is recognized that this may occasionally be the only practical way to mobilize a vehicle. Reference should be made to the following and also to the Electrical Section of this manual - Jump Starting.

It is advisable not to use starter/charger sets for jump starting but if this is unavoidable, make sure that the sets are not used in the 'START' mode.

- Always make sure that the jumper cables are adequate for the task.
- Always make sure that the slave battery is of the same voltage (12 volts) as the vehicle battery. The batteries must be connected in parallel.
- Make sure that the battery terminals of both batteries are fully tightened.
- Where another vehicle is used to jump start a disabled vehicle, make sure that the two vehicles are not touching.
- It is advisable that the engine of the donor vehicle is switched off during jump starting; take care to make sure that the battery of the donor vehicle does not also become discharged.
- Always make sure that switchable electric circuits are OFF before connecting jump cables. This reduces the risk of arcing occurring when the final connection is made.

Following jump starting of a disabled vehicle, the discharged battery must be checked for serviceability and recharged as soon as possible to avoid permanent damage.

Do not rely on the generator to restore a discharged battery. For a generator to recharge a battery, it would take in excess of eight hours continuous driving with no additional loads placed on the battery.

Trickle charging (defined as voltages <16 volts) may be carried out with the battery connected. Make sure that the battery terminals are fully tightened prior to trickle charging.

CAUTION: Boost charging may only be carried out with the battery disconnected from the vehicle.

Towing the Vehicle

WARNING: When towing is necessary, reference must be made to the Jacking, Lifting and Towing Section of this Manual.

When the vehicle is being towed the ignition switch must be in position II (steering lock released and warning lights illuminated). Only then will the steering, turn signal lamps, horn and stop lamps be operational. Failure to follow these instructions may result in personal injury. It must be noted that with the engine not running, the power steering and brake booster will be inoperative therefore, greater effort will be needed to steer the vehicle and apply the brakes.

General installation Instructions

Component removal

Whenever possible, clean components and the surrounding area before removal.

- Blank off openings exposed by component removal.
- Following disconnection, seal fuel, oil or hydraulic lines immediately using suitable blanking plugs or caps.
- Seal open ends of exposed oilways using suitable tapered hardwood plugs or conspicuous plastic plugs.
- Immediately a component is removed, place it in a suitable container; use a separate container for each component and its associated parts.
- Clean bench and provide marking materials, labels and containers before disassembling components.

Disassembling

Observe scrupulous cleanliness when disassembling components, particularly when brake, fuel, air suspension or hydraulic system parts are disassembled. A particle of dirt or cloth fragment could cause a serious malfunction if trapped in these systems.

- Blow out all tapped holes, crevices, oilways and fluid passages with dry, compressed air.

WARNING: Suitable eye protection must be worn.

- Use suitable marker ink to identify mating parts, do not use a scribe or centre punch as they could initiate cracks or distortion.
- Wire or tape mating parts together where necessary to prevent accidental interchange.
- Suitably identify parts which are to be renewed and to those parts requiring further inspection. Keep these parts separate.
- To make sure that the correct replacement part has been obtained, do not discard a part due for renewal until after comparing it with the new part.

Cleaning components

Always use cleaning agents which are suitable for the work being undertaken and the components being cleaned. NEVER use gasoline (petrol) as a cleaning agent (degreaser). Always make sure that the component being cleaned is compatible with the cleaning agent.

Always follow the manufacturer's instructions regarding the use of cleaning agents and make sure that the environment in which the work is being undertaken is suitable. See Health and Safety Precautions for further information regarding cleaning.

General inspection of components

All components should be inspected for wear or damage before reassembling.

- Always make sure that component to be inspected is clean and free from oil or grease.
- When a component is to be checked dimensionally against design specified values, use the appropriate measuring equipment i.e. micrometers, verniers, surface plates, dial test indicators (DTI).
- Always make sure that all measuring equipment is correctly calibrated before use.
- Reject a component which is not within specified values/limits or if it appears to be damaged.
- A component may be reinstalled if dimensions obtained during checking are at the maximum tolerance limit and it is in an undamaged condition.
- Bearing journal clearances should be checked where necessary using Plastigage.
- Gaskets, seals and O-ring seals are to be re-used unless damaged.

Joints and Joint Faces

All gaskets should be installed dry unless stated otherwise. Always apply the specified lubricant to O-rings and install O-rings using the fingers only.

Use gasket removal spray and/or plastic scrapers to remove traces of old gasket.

CAUTION: DO NOT use metal scrapers or emery cloth as these may damage the sealing surfaces.

Many joints use sealants instead of gaskets as the sealing medium. Where this is the case, the sealant together with its part number will be found listed in the relevant repair operation and also in the sealants table.

CAUTION: Always remove all traces of the old sealant prior to reassembly. Use plastic scrapers, specified solvents where available or dry, lint free cloth. DO NOT use metal scrapers or emery cloth as these may damage the sealing surfaces. Make sure that sealing surfaces are free from oil or grease as sealants will not adhere properly to contaminated surfaces.

Do not allow sealant to enter tapped holes or oilways.

Locking Devices

Always replace locking devices with one of the same design and of the correct size.

Tab washers

Always release locking tabs before loosening fixings, do not re-use tab washers.

Locknuts

Always use a backing spanner when loosening and tightening locknuts, brake and fuel pipe unions.

Roll pins

Always install new roll pins of the correct size.

Circlips

Always install new circlips ensuring that they are of the correct size for the groove.

Woodruff keys

Woodruff keys may be re-used provided there is no indication of wear or distortion.

Remove any burrs from edges of keyways using a fine file.

Split pins

Never attempt to straighten and re-use a split pin, always make sure that replacement pins are of the correct size for the hole in which they are to be installed.

Screw Threads

- Damaged nuts, bolts and screws must always be discarded. Attempting to recut or repair damaged threads with a tap or die impairs the strength and fit of the threads and is not recommended.
- **NOTE:** During certain repair operations, it may be necessary to remove traces of thread locking agents using a tap. Where this is necessary, the instruction to do so will appear in the relevant operation and it is essential that a tap of the correct size and thread is used.
- Some bolts are coated with a thread locking agent and unless stated otherwise, they must not be re-used. New bolts having the same part number as the original must always be installed. When nuts or bolts are to be discarded, the repair operation and relevant torque chart will include an instruction to that effect. Do not use proprietary thread locking agents as they may not meet the specification required. See also Encapsulated ('Patched') Bolts and Screws.
- Always make sure that replacement nuts and bolts are at least equal in strength to those that they are replacing. Castellated nuts must not be loosened to accept a split pin except in recommended cases when this forms part of an adjustment.
- Do not allow oil or grease to enter blind holes, the hydraulic action resulting from tightening the bolt or stud can split the housing and also give a false torque reading.
- Always tighten a nut, bolt or screw to the specified torque figure, damaged or corroded threads can give a false torque reading.
- Nut and bolt loosening and tightening sequences, where given, must ALWAYS be followed. Distortion of components or faulty sealing of joints will result if the sequences are not followed. Where an instruction is given to tighten in stages, these stages must be adhered to; do not attempt to combine stages particularly where certain stages involve tightening by degrees.
- To check or re-tighten a fixing to a specified torque, first loosen a quarter of a turn, then retighten to the specified torque figure.
- Unless instructed otherwise, do not lubricate bolt or nut threads prior to installing.

Where it is stated that bolts and screws may be re-used, the following procedures must be carried out:

- Check that threads are undamaged.
- Remove all traces of locking agent from the threads.

CAUTION: DO NOT use a wire brush; take care that threads are not damaged.

- Make sure that threads are clean and free from oil or grease.
- Apply the specified locking agent to the bolt threads.

Bolt and Nut Identification

E48627

An ISO metric bolt or screw made of steel and larger than 6 mm in diameter can be identified by either of the symbols ISO M or M embossed or indented on top of the bolt head.

In addition to marks identifying the manufacturer, the top of the bolt head is also marked with symbols indicating the strength grade e.g. 8.8, 10.9, 12.9, 14.9. Alternatively, some bolts and screws have the M and strength grade symbol stamped on the flats of the hexagon.

Encapsulated ('Patched') bolts and screws

E48628

Encapsulated ('patched') bolts and screws have a thread locking agent applied to the threads during manufacture. Most thread locking agents are colored, the band of color extending for 360° around the thread. Some locking agents however, are neutral in color and may not be so easily identified apart from a slightly darker area of thread where the locking agent has been applied. The locking agent is released and activated by the tightening process and is then chemically cured to provide the locking action.

Self-locking bolts and screws

E48629

Unless stated in a specific repair procedure, self-locking bolts and screws i.e. nylon patched or trilobular thread can be re-used provided that resistance is felt when the locking portion enters the female thread.

Nylon patched bolts and screws have a locking agent either applied to, or inserted in the threaded portion. They are identified by the presence of a colored section of thread extending approximately 180° around the thread or by a colored plug inserted into the bolt.

Trilobular bolts have a special thread form which creates a slight interference with the thread of the hole or nut into which it is screwed.

CAUTION: Do Not re-use self-locking fasteners in critical locations e.g. drive plates/flywheel or engine bearings. Do not install non self-locking fasteners where a self-locking fastener is specified.

Trilobular bolts should not be used as a substitute for patched bolts.

Nut identification

E48630

A nut with an ISO metric thread is marked on one face or one of the hexagonal flats with the strength grade symbol 8, 12, 14. Some nuts with the strength grade 4, 5 or 6 are also marked and some have the metric symbol M on the hexagonal flat opposite the strength grade marking.

A clock face system is sometimes used as an alternative method of indicating the strength grade. The external chamfers or a face of the nut is marked in a position relative to the appropriate hour mark on a clock face to indicate the strength grade.

A dot is used to locate the 12 o'clock position and a dash to indicate the strength grade. If the grade is above 12, two dots identify the 12 o'clock position.

When tightening a slotted or castellated nut, never loosen it to insert a split pin except where specified as part of an adjustment procedure. If difficulty is experienced in correctly positioning the slot, alternative washers or nuts should be selected.

Where a nut is tightened to adjust or maintain bearing pre-load, the tightening procedure must be adhered to.

Self-locking nuts

Unless stated otherwise, self-locking nuts once removed must be discarded and new nuts of the same type and strength grade installed.

Air Suspension

Always make sure that suitable eye protection is worn when working on the air suspension system.

Ball and Roller Bearings

When removing and installing bearings, make sure that the following practices are observed to make sure component serviceability:

CAUTION: Service tools have been developed for removing the majority of bearings; these must always be used where specified.

- Remove all traces from bearing under inspection by cleaning with a suitable degreasant; maintain absolute cleanliness throughout operations.
- Conduct a visual inspection for markings on rolling elements, raceways, outer surfaces of outer or inner surfaces of inner rings. Reject any bearings found to be marked since marking in these areas indicates onset of wear.
- Hold inner race of bearing between finger and thumb of one hand and rotate outer race to check that it revolves absolutely smoothly. Repeat holding outer race and rotating inner race. DO NOT spin the bearing.
- Rotate outer ring gently using a reciprocating movement whilst holding inner ring; feel for any check or obstruction to rotation. Reject bearing if movement is not absolutely smooth.
- Check bearing for blueing or signs of overheating.
- Lubricate bearing with the specified lubricant.
- Inspect bearing surface of shaft and bearing housing for discoloration or other markings which indicate overheating of bearing or movement between bearing and seating.
- Before installing bearing, make sure that shaft and bearing housing are clean and free from burrs.
- If one bearing of a pair shows signs of wear, overheating etc., it is advisable to replace bearings as a pair unless it is suspected that one bearing may have been faulty when installed, was installed incorrectly or the fault arose due to oil seal failure.
- Never reinstall a bearing unless it is in a fully serviceable condition.

E48560

- When installing a bearing to a shaft, only apply force to the inner ring of the bearing. When installing a bearing into a housing, only apply force to the outer ring of the bearing.

CAUTION: Service tools have been developed for installing the majority of bearings; these must always be used where specified.

- In the case of grease lubricated bearings, fill the space between the bearing and outer seal with the recommended grade of grease before installing the seal.

CAUTION: When a waxed oil seal (installed dry) type of oil seal is to be installed, take great care that grease does not contaminate the running surface of the seal.

- Always make suitable reference marks between the components of separable bearings e.g. taper roller bearings when disassembling to make sure correct location of components when assembling. Never install new rollers in an outer ring, always install a new bearing assembly.

Brake Pads and Linings

Always install the correct grade and specification of brake pads and linings. When replacing these items, always replace as complete axle sets.

Brake Hydraulics

Always observe the following recommendations when working on the braking system:

WARNING: Do not intermix brake fluid of different specifications.

- Always use two spanners when loosening or tightening brake pipes or hose connections.
- Make sure that hoses run in a natural curve and are not kinked or twisted.
- Install brake pipes and hoses securely in their retaining clips and make sure that they cannot contact a potential chafing point.
- Containers used for brake fluid must be kept absolutely clean.
- Do not store brake fluid in unsealed containers, the fluid will absorb water which will lower the boiling point of the fluid.
- Do not allow brake fluid to be contaminated with other fluids such as mineral oil and do not put brake fluid in a container which has previously been used for storing other fluids.
- Do not re-use brake fluid which has been bled from the system.
- Always use brake fluid or a suitable brake cleaning fluid to clean hydraulic components.
- Unless stated otherwise, use only clean brake fluid to lubricate hydraulic seals and components.
- Always install blanking plugs to hoses, pipes or components immediately after disconnection.
- Check thread compatibility of original equipment with replacement components.
- Observe absolute cleanliness when working with hydraulic components.

Pipes and Hoses

When removing or installing flexible hydraulic pipes and hoses, make sure that the following procedures are observed to make sure component serviceability:

- Prior to removal, clean area around hose or pipe end which is to be disconnected.
- Obtain appropriate blanking plugs or caps before disconnecting hose or pipe end fittings in order that connections can be plugged immediately following disconnection.
- Always install blanking plugs or caps to pipes and unions immediately following disconnection.
- Clean hose or pipe and blow through with an air line.

WARNING: Suitable eye protection must be worn.

- Check hoses externally for cracks, separation of plies, security of end fittings and external damage; replace faulty hoses.
- Check pipes for signs of corrosion and chafing, replace as necessary.

CAUTION: If pipes are found to be chafed, rectify clips, mounting points etc., to prevent further problems in service.

- When installing hoses, make sure that no unnecessary bends are introduced and that hoses are not kinked, twisted or positioned close to potential chafing points.
- When installing pipes, make sure that pipes are positioned and clipped clear of potential chafing points.
- Always replace sealing washers installed to banjo bolts, sealing plugs etc.
- Always use a backing spanner when tightening unions and do not overtighten union nuts or banjo bolts.
- After engagement of 'quick-fit' connection hoses, perform a 'tug' test to make sure connection is securely installed.
- After any work on hydraulic systems, always check for fluid leaks whilst a second operator applies working pressure to the brake pedal or operates the system that has been worked on.

Fuel system hoses

Some fuel hoses are made up of two laminations, an armoured rubber outer sleeve and an inner viton core. Whenever a hose is removed, make sure that the inner bore is inspected to check that the viton lining has not become separated from the outer sleeve.

WARNING: Never attempt to repair fuel hoses or rectify leaking 'quick-fit' connectors. The fuel hose and connectors must be replaced as an assembly.

Fuel system hose clips

E48636

Certain fuel system hose clips are of the 'break-off head' type where a slot in the screw head shears off when the clip is tightened to a specific torque. These clips may be removed using a screwdriver and must be replaced with new clips on reassembly. Clips must be tightened until the portion of the slot shears off. Do not attempt to tighten clips by any other method, do not install any other type of clip.

'Quick-fit' connections are also installed to certain fuel hoses. After engagement of 'quick-fit' connections, perform a 'tug' test to make sure connection is securely installed.

Other fuel system hose clips are of the 'Jubilee' type and there may be a tamper proof cover installed over the screw head. These cover must be carefully removed before slackening the clip and should be replaced after final tightening, ensuring that the internal hexagon on the cover is correctly located on the clip screw.

Cooling system hoses

CAUTION: The following precautions must be observed to make sure that the integrity of the cooling system hoses and their connection to the system is maintained.

Hose orientation and connection

Correct orientation of cooling system hoses is important to make sure that hoses do not become fatigued or damaged through contact with adjacent components.

E48633

Where orientation marks are provided on the hose and corresponding component, the marks must be aligned when the hose is installed. Hoses must be installed fully on to their connection points, usually a moulded form on a pipe provides a positive indicator.

Hose clips

E48634

Markings are usually provided on the hose to indicate the correct clip position. If no markings are provided, position the clip directly behind the retaining lip at the end of the stub pipe. Worm drive clips should be orientated with the crimped side of the drive housing facing towards the end of the hose or the hose may become pinched between the clip and the stub pipe retaining lip. Unless otherwise stated, worm drive clips should be tightened to 3 Nm (2 lb-ft). Make sure that hose clips do not foul adjacent components.

E48635

Oetiker clips may be removed by bending the tag (arrowed) and releasing the free end of the clip. Clips must not be re-used. When installing new clips, make sure clip is positioned on hose before tightening and make sure that when clip is tightened, the tag is located in the longitudinal slot in the free end of the clip (arrowed in illustration).

'Quick-fit' connections are also installed to certain hoses/pipes. Inspect 'quick-fit' connections for damage, prior to connection. Replace if damaged. After engagement of 'quick-fit' connections, perform a 'tug' test to make sure connection is securely installed.

Heat protection

Always make sure that heat shields and protective sheathing are in good condition; replace if damage is evident. Particular care must be taken when routing hoses close to hot engine components such as the exhaust manifolds and exhaust gas recirculation (EGR) pipes. Hoses will relax and deflect slightly when hot, make sure this movement is taken into account when routing and securing hoses.

Electrical Precautions

General

The following guidelines are intended to make sure the safety of the operator whilst preventing damage to the electrical and electronic components of this vehicle.

Equipment

Prior to commencing any test procedure on the vehicle, make sure that the relevant test equipment is working correctly and that any harness or connectors are in good condition. It is particularly important to check the condition of all plugs and leads of mains operated equipment.

Polarity

Never reverse connect the vehicle battery and always make sure the correct polarity when connecting test equipment.

High voltage circuits

Whenever disconnecting live ht circuits, always use insulated pliers and never allow the open end of the ht lead to contact other components, particularly ECU's.

Vehicles installed with Bi-Xenon headlamp bulbs

WARNING: The following precautions must be observed as failure to comply may result in exposure to ultra-violet

rays, severe electric shock, burns or risk of an explosion.

- Safety goggles and gloves must be worn.
- Make sure that headlamps are switched off before removing bulbs.
- Do not touch the glass portion of the bulb.
- On no account should headlamps be switched on with the bulb removed from the headlamp.
- Bulb testing may only be carried out with the bulb installed in the headlamp.
- Bulbs must be disposed of in accordance with the local authority bye-laws.

Connectors and harnesses

The engine compartment of a vehicle is a particularly hostile environment for electrical components and connectors. Always observe the following:

- Make sure electrically related items are dry and oil free before disconnecting/connecting test equipment.
- Make sure that disconnected multiplugs and sensors are protected from any possible oil, coolant or other liquid contamination. Any such contamination could impair performance or lead to component failure.
- Never force connectors apart or pull on the wiring harness.
- Always make sure locking tabs are disengaged before disconnecting multiplugs etc. and make sure that correct orientation is achieved before connection.
- Make sure that any protection covers, insulation etc. are replaced if disturbed.

Having confirmed that a component is faulty, carry out the following:

- Switch off the ignition and disconnect the battery.
- Remove the component and support the disconnected harness.
- When replacing electrical components, keep oily hands away from electrical connections and make sure that locking tabs on connectors are fully engaged.

Battery Disconnection/Connection

Always refer to the Electrical Section of this manual - Battery Connection/Disconnection prior to attempting to connect or disconnect the battery.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Fuel Handling Precautions

The following information lists basic precautions which must be observed if fuel is to be handled safely. It also outlines other areas of risk which must not be ignored. As this information is issued for basic guidance only, consult your local Fire Department where any doubt as to personal and environmental safety exists - See also Health and Safety Precautions.

General precautions

Always have the correct type of fire extinguisher containing Foam, CO₂, Gas or powder accessible when handling or draining fuel or dismantling fuel systems. Fire extinguishers must also be located in areas where fuel is stored.

Make sure that suitable warning signs are exhibited.

Keep all sources of ignition well away from areas where fuel is being handled.

Make sure that any leadlamps are flameproof and kept clear of spillage.

• WARNINGS:

Do not disassemble or reassemble fuel system components whilst vehicle is over a pit.

No one should be permitted to repair components associated with fuel without first having specialist training.

Always disconnect the vehicle battery before carrying out disassembly, reassembly or draining work on a fuel system.

Fuel tank and system draining

Draining must be carried out in accordance with the procedures given in the relevant Fuel System section of this manual.

• WARNINGS:

Never drain fuel or work on a fuel system while the vehicle is over a pit. Extraction or draining of fuel must be carried out in a well ventilated area.

Never switch on or operate mobile (cellular) phones in the vicinity of vehicles when operations are being carried out on the fuel system.

Always attach fuel vapor warning labels to fuel tanks immediately after draining.

Containers used for storing fuel must be clearly marked with the contents and placed in a safe storage area which meets the requirements of the local authority.

CAUTION: Some fuel lines are now installed with 'quick release' connectors. If a connector is damaged, no attempt

must be made to repair the connector, a new fuel line and connector(s) assembly must be installed.

Always release pipe clips fully before attempting to disconnect fuel pipes.

Fuel tank repairs

CAUTION: No attempt should be made to repair a plastic fuel tank. If the structure of the tank is damaged, a new tank must be installed.

Oil seals

Never use a seal which has been improperly stored or handled.

- Take great care when removing old seals that the sealing surfaces and seal housing are not damaged.
- Carefully examine seal before installing to make sure that it is clean and undamaged.
- Make sure that the surface on which the seal is to run and also the seal housing is clean and free from burrs or scratches. Renew the component if the sealing surface cannot be restored.
- Special tools and protection sleeves are provided for installing the majority of seals and must be used when specified.
- Many seals are now coated with a protective wax and DO NOT need to be lubricated prior to installing. Always check the relevant repair procedure which will state if a seal must be installed dry. Never touch these seals with oily hands as the oil will contaminate the protective coating and affect the sealing properties of the seal; also, make sure that installing tools and protection sleeves are free from oil and grease. Seals which must be lubricated prior to installing should have the recommended lubricant applied to the areas specified in the repair procedure.
- Make sure that a seal is installed the correct way round. For example, the lip of the seal must face towards the lubricant which it is sealing.
- When installing an oil seal, make sure that it is positioned square to shaft and housing. Where the seal is to be installed to a housing prior to installing over a shaft, take care not to allow the weight of an unsupported shaft to rest on the seal.

E48561

- Always use the recommended special tool and protection sleeve to install an oil seal. If no tool is specified, use a suitable mandrel approximately 0.4 mm (0.015 in) smaller than the outside diameter of the seal. Use adhesive tape on the shaft to protect the sealing lip of the seal.

E48562

- Press or drift the seal in to the depth of its housing if the housing is shouldered or flush with the face of the housing where no shoulder is provided. Make sure that the seal is not tilted in the housing when it is installed.

Supplementary Restraint System (SRS) Precautions

WARNING: Do not install rear facing child seats in the front passenger seat.

The SRS contains components which are potentially hazardous to service personnel if not handled correctly. The following guidelines and precautions are intended to alert personnel to potential sources of danger and emphasise the importance of ensuring the integrity of the SRS components installed to the vehicle.

WARNING: The following precautions **MUST** be adhered to when working on the SRS system:

- The correct procedures must always be used when working on SRS components.
- Persons working on the SRS system must be fully trained and have been issued with the safety guidelines.
- The airbag modules contain extremely flammable and hazardous compounds. Contact with water, acids or heavy metals may produce harmful or explosive results. Do not dismantle, incinerate or bring into contact with electricity before the unit has been deployed.
- Always replace a seat belt assembly that has withstood the strain of a severe vehicle impact or if the webbing shows signs of fraying.
- Allow a period of 2 minutes to elapse after disconnecting the battery before undertaking any work on the SRS system.
- Always disconnect the vehicle battery before carrying out any electric welding on a vehicle installed with an SRS system.

CAUTION: Do not expose airbag modules or seat belt pre-tensioners to temperatures exceeding 85° C (185° F).

It should be noted that these precautions are not restricted to operations performed when servicing the SRS system. The same care should be exercised when working on ancillary systems and components located in the vicinity of SRS components; these include but are not limited to:

- Steering wheel airbag, clock spring.
- Passenger front airbag.
- Head airbag modules - front and rear.
- Seat belt pre-tensioners.
- SRS harnesses, link leads and connectors.
- Side curtain air bags.

Making the system safe

Before working on or in the vicinity of SRS components, make sure the system is rendered safe by performing the following operations:

- Remove the ignition key.
- Disconnect the battery, earth lead first.
- Wait 2 minutes for the SRS power circuit to discharge before commencing work.

• **NOTE:** The SRS uses energy reserve capacitors to keep the system active in the event of electrical supply failure under crash conditions. It is necessary to allow the capacitors sufficient time to discharge (2 minutes) in order to avoid the risk of accidental deployment.

Installation

In order to make sure system integrity, it is essential that the SRS system is regularly checked and maintained so that it is ready for effective operation in the event of a collision. Carefully inspect SRS components before installation. Do not install a part that shows signs of being dropped or improperly handled, such as dents, cracks or deformation.

WARNING: The integrity of the SRS systems is critical for safety reasons. Make sure the following precautions are always adhered to:

- Do not install accessories or other objects to trim panels which cover airbags.
- Never install used SRS components from another vehicle or attempt to repair an SRS component.
- When repairing an SRS system, only use genuine new parts.
- Never apply electrical power to an SRS component unless instructed to do so as part of an approved test procedure.
- Special fixings are necessary for installing an airbag module – do not use other fixings and make sure that all fixings are tightened to the correct torque.
- Always use new fixings when replacing an SRS component.

• **CAUTIONS:**

Take care not to trap airbag modules when installing interior trim components.

Make sure SRS components are not contaminated by oil or grease.

• **NOTE:** Following seat belt pre-tensioner deployment, the seat belts can still be used as conventional seat belts but will need to be replaced as soon as possible to make sure full SRS protection.

• **NOTE:** If the SRS components are to be replaced, the part number/bar code of the new unit must be recorded.

SRS component testing precautions

The SRS components are triggered using relatively low operating currents, always adhere to the following :

WARNING: Never use a multimeter or other general purpose equipment on SRS components. Use only T4 to diagnose system faults.

E48960

⚠ WARNING: Do not use electrical test equipment on the SRS harness while it is connected to any of the SRS components, it may cause accidental deployment and injury.

Handling and storage

Always observe the following precautions when handling SRS components:

E48961

- Never drop an SRS component. The airbag diagnostic control unit is a particularly shock sensitive device and must be handled with extreme care. Airbag modules and seat belt pre-tensioners could deploy if subjected to a strong shock.
- Never wrap your arms around an airbag module. If a module has to be carried, hold it by the cover with the cover uppermost and the base away from your body.
- Never transport airbag modules or seat belt pre-tensioners in the passenger compartment of a vehicle. Always use the luggage compartment of the vehicle for carrying airbag modules and seat belt pre-tensioner units.
- Never attach anything to an airbag cover or any trim component covering an airbag module. Do not allow anything to rest on top of an airbag module.
- Always keep components cool, dry and free from contamination.
- Never apply grease or cleaning solvents to seat belt pre-tensioner units, component failure could result.
- Always store an airbag module with the deployment side uppermost. If it is stored deployment side down, accidental deployment will propel the airbag module with sufficient force to cause serious injury.
- Keep new airbag modules in their original packaging until just prior to installing. Place the old module in the empty packaging for carriage.

E48963

• WARNINGS:

⚠ When handling any SRS component, hold by the gas generator housing, DO NOT hold by the airbag. Do not wrap the thumb around the gas generator while holding. Do not drape airbag over shoulder or around neck. For seat buckle type pre-tensioners, hold by the piston tube, with the open end of the piston tube pointing towards the ground and the buckle

facing away from your body. Do not cover the end of the piston tube. DO NOT hold buckle type pre-tensioners by the bracket assembly or cable. Never point the piston tube towards your body or other people.

 Airbag modules and seat belt pre-tensioners are classed as explosive devices. For overnight and longer term storage, they must be stored in a secure steel cabinet which has been approved as suitable for the purpose and has been registered with the local authority.

 Store airbag modules or seat belt pre-tensioners in a designated storage area. If there is no designated storage area available, store in the locked luggage compartment of the vehicle and inform the workshop supervisor.

 CAUTION: Improper handling or storage can internally damage the airbag module making it inoperative. If you suspect the airbag module has been damaged, install a new module and refer to the deployment/disposal procedures for disposal of the damaged module.

SRS harness and connectors

Always observe the following precautions with regards to SRS system electrical wiring:

E48965

- Never attempt to modify, splice or repair SRS wiring.
 - Never install electrical equipment such as a mobile telephone, two-way radio or in-car entertainment system in such a way that it could generate electrical interference in the airbag harness. Seek specialist advice when installing such equipment.
- NOTE: SRS wiring can be identified by a special yellow outer sleeve protecting the wires (black with yellow stripe protective coverings are sometimes used).

E48964

 WARNING: Always make sure SRS wiring is routed correctly. Be careful to avoid trapping or pinching the SRS wiring.

E48966

 **WARNING:** Do not leave the connectors hanging loose or allow SRS components to hang from their harnesses. Look for possible chafing points.

Impact crash sensors - inspection

After any degree of side or frontal body damage, inspect the impact crash sensors. Replace a crash sensor if there is any sign of damage.

 **CAUTION:** Take extra care when painting or carrying out bodywork repairs in the vicinity of the crash sensors. Avoid direct exposure of the crash sensors or link harnesses to heat guns, welding or spraying equipment. Take care not to damage sensor or harness when reinstalling components.

Clock spring

 **CAUTION:** Always follow the procedure for installing and checking the clock spring as instructed in the SRS repairs section. Comply with all safety and installation procedures to make sure the system functions correctly. Observe the following precautions:

- Do not unlock and rotate the clock spring when it is removed from the vehicle.
- Do not turn the road wheels when the clock spring is removed from the vehicle.
- Always make sure the clock spring is removed and installed in its central position and with the front road wheels in the straight ahead position - refer to SRS repair section for the correct removal and installation procedure.
- If a new clock spring is being installed, make sure the locking tab holding the spring's rotational position is not broken; units with a broken locking tab must not be used.

Airbag and pre-tensioner deployment

 **WARNING:** During deployment parts of the airbag module become hot enough to burn you. Wait 30 minutes after deployment before touching the airbag module.

Deployment procedures and precautions as detailed in this manual should be strictly adhered to. Only personnel who have undergone the appropriate training should undertake deployment of airbag and pre-tensioner modules. The following precautions must be complied with:

- Only use deployment equipment approved for the intended purpose.
- Deployment of airbag / pre-tensioner modules must be performed in a well ventilated area which has been designated for the purpose.
- Make sure airbag / pre-tensioner modules are not damaged or ruptured before attempting to deploy.
- Where local legislation exists, notify the relevant authorities of intention to deploy airbag and pretensioner units.
- When deploying airbag pre-tensioner units, make sure that all personnel are at least 15 metres (45 feet) away from the deployment zone.
- Make sure deployment tool is connected correctly, in compliance with the instructions detailed in the SRS section of this manual. In particular, make sure deployment tool is NOT connected to battery supply before connecting to airbag module connector.
- When deploying seat belt pre-tensioners, make sure pre-tensioner unit is secured correctly to the seat.
- When removing deployed airbag modules and pre-tensioner units, wear protective clothing. Use gloves and seal deployed units in a plastic bag.
- Following deployment of any component of the SRS system within the vehicle, all SRS components must be replaced. DO NOT re-use or salvage any parts of the SRS system.
- Do not lean over an airbag module when connecting deployment equipment.

If a vehicle is to be scrapped, undeployed airbag modules and pre-tensioner units must be manually deployed. In this case airbags can be deployed in the vehicle. Before deployment, make sure the airbag module is secure within its correct mounting position. Deployment of the driver's airbag in the vehicle may damage the steering wheel; if the vehicle is not being scrapped, deploy the module outside of the vehicle.

SRS Component Replacement Policy

• **CAUTIONS:**

 The Restraints Control Module (RCM) will log a crash fault after every impact which is severe enough to cause airbag

deployment. **It is possible to have three crashes/impacts logged after one event where, for example, a front, side and rollover has occurred. After the third fault is logged, the SRS warning lamp will be illuminated and the restraints control module (RCM) must be replaced.**

The SRS side/front impact sensor(s) must be replaced if there are any signs of physical damage or if the restraints control module (RCM) is registering a fault.

The following information details the policy for replacement of SRS components as a result of a vehicle accident.

Impacts which do not deploy the airbags or pre-tensioners

Check for structural damage in the area of the impact paying particular attention to bumper armatures, longitudinals and bracketry.

Impacts which deploy the airbags or pre-tensioners

The replacement and inspection policy is dependent on the type and severity of the crash condition. The following guidelines are the minimum that should be exercised as a result of the deployment of specific SRS components.

Check for structural damage in the area of impact paying particular attention to bumper armatures, longitudinals and bracketry.

Front Airbag Deployment - Driver and Passenger

CAUTION: If the front airbags are deployed, the following components must be replaced:

- Driver airbag module
- Passenger airbag module
- Fly leads (where applicable) connecting front airbag modules to SRS harness
- Front seat belt buckle pre-tensioner
- Rear seat belt pre-tensioners - if installed
- Driver's seat belt retractor - if installed
- Clock spring
- Any front impact sensors that have been physically damaged or if a fault is being registered
- Restraints control module (RCM) if the three crashes/impacts have been stored

Additionally, the following items must be inspected for damage and replaced as necessary:

- Front passenger's seat belt retractor and webbing, tongue latching function, 'D' loop and body anchorage point
- Rear seat belt buckles, webbing, buckle covers, body anchorage points and tongue latching function
- Instrument panel moulding adjacent to passenger airbag module
- Steering wheel
- Front seat frames and head restraints
- Steering column - if adjustment is lost or if there are signs of collapse
- Seat belt height adjusters
- Rear seat belts

Side Air Bags

CAUTION: If the side curtain air bags are deployed, the following components must be replaced on the side of the vehicle on which the deployment occurred:

- Side curtain airbag
- Any side impact sensors that have been physically damaged or if a fault is being registered
- Restraints Control Module (RCM) if the three crashes/impacts have been stored

Additionally, the following items must be inspected for damage and replaced as necessary:

- Front seat belts, retractors and webbing, tongue latching function, 'D' loop and body anchorage points
- Rear seat belt buckles, webbing, buckle covers, tongue latching function, and body anchorage points
- Front seat frame and head restraints
- Door trim casing
- Seat belt height adjusters
- Rear seat belts

Head airbag modules

CAUTION: If the head airbag modules are deployed, the following components must be replaced on the side of the vehicle on which the deployment occurred:

- Head airbag modules
- Link lead between airbag gas generator and restraints control module (RCM) harness
- Airbag retaining clips
- Internal trim finisher
- Front seat belt buckle pre-tensioners
- Any side impact sensors that have been physically damaged or if a fault is being registered
- Restraints Control Module (RCM) if the three crashes/impacts have been stored

Additionally, the following items must be inspected for damage and replaced as necessary:

- Headlining
- Component mounting brackets

- Front seat belts, retractors and webbing, tongue latching function, 'D' loop and body anchorage points
- Rear seat belt buckles, webbing, buckle covers, tongue latching function, and body anchorage points
- Adjacent trim components
- Seat belt height adjusters

Rear impacts

CAUTION: If the seat belt pre-tensioners are deployed during a rear impact, the following components must be replaced:

- Seat belt pre-tensioners
- Front and rear seat belt retractors used during the impact
- Restraints Control Module (RCM) if the three crashes/impacts have been stored

Additionally, the following items must be inspected for damage and replaced as necessary:

- Seat belt height adjusters
- Front seat belts, retractors and webbing, tongue latching function, 'D' loop and body anchorage points
- Rear seat belt buckles, webbing, buckle covers, tongue latching function, and body anchorage points

(A/C) System Precautions

The A/C system contains fluids and components which could be potentially hazardous to the service engineer or the environment if not serviced and handled correctly. The following guidelines are intended to alert the service engineer to potential sources of danger and emphasise the importance of ensuring the integrity of the A/C operating conditions and components installed to the vehicle.

Where necessary, additional specific precautions are detailed in the relevant sections of this Manual and also in the Health and Safety Section. These precautions must be referred to prior to commencing repair operations.

The refrigerant used in the A/C system is HC-134a (Hydrofluorocarbon) R134a.

• WARNINGS:

Service must only be carried out by personnel familiar with both the vehicle system and the charging and testing equipment. All operations must be carried out in a well ventilated area away from open flame and heat sources.

R134a is a hazardous liquid and when handled incorrectly can cause serious injury. Suitable protective clothing, consisting of face protection, heat proof gloves, rubber boots and rubber apron or waterproof overalls, must be worn when carrying out operations on the A/C system.

Remedial actions

WARNING: Due to its low evaporating temperature, R134a must be handled with care. R134a splashed on any part of the body will cause immediate freezing of that area. Also, refrigerant cylinders and replenishment trolleys when discharging will freeze skin to them if contact is made.

If an accident involving R134a should occur, conduct the following remedial actions:

- If liquid R134a enters the eye, do not rub it. Gently run large quantities of eye wash over affected eye to raise the temperature. If an eye wash is not available, cool, clean water may be used to flush the eye. After rinsing, cover the eye with a clean pad and seek immediate medical attention.
- If liquid R134a is splashed onto the skin, run large quantities of water over the affected area to raise the temperature. Implement the same action if the skin comes in contact with discharging cylinders. Wrap the contaminated body parts in blankets (or similar materials) and seek immediate medical attention.
- If the debilitating effects of inhalation of R134a vapour are suspected, seek fresh air. If the affected person is unconscious, move them away from the contaminated area to fresh air and apply artificial respiration and/or oxygen and seek immediate medical attention.

Service precautions

Observe the following precautions when handling components used in the system:

- A/C units must not be lifted by their hoses, pipes or capillary lines.
- Hoses and lines must not be subjected to any twist or stress; the efficiency of the system will be impaired by kinks or restrictions. Make sure that hoses are correctly positioned before tightening couplings, and make sure that all clips and supports are utilised.
- Flexible hoses should not be positioned closer than 100 mm (4.0 in) to the exhaust manifold unless protected by heat shielding.
- Completed assemblies must be checked for refrigeration lines touching metal panels. Any direct contact of components and panels may transmit noise and so must be eliminated.
- The appropriate torque wrench must be used when tightening refrigerant connections to the stipulated value. An additional spanner must be used to hold the union to prevent twisting of the pipe when tightening connections.
- Before connecting any hose or pipe, make sure that refrigerant oil is applied to the seat of the new O-rings, **BUT NOT** to the threads of the connection.
- All protective plugs or caps must remain in place in the component until immediately prior to connection.
- Make sure components are at room temperature before uncapping/unplugging, to prevent condensation of moisture from the air that enters it.
- When disconnecting, immediately plug or cap all pipes to prevent ingress of dirt and moisture into the system.
- Components must not remain uncapped/unplugged, if a system has been left uncapped/unplugged for 24 hours or longer, a new receiver/drier must be installed.
- The receiver/drier contains desiccant which absorbs moisture. It must be positively sealed at all times. A

- receiver/drier that has been left uncapped for longer than 24 hours must not be used; install a new unit.
- The receiver/drier should be the last component connected to the system to make sure optimum dehydration and maximum moisture protection of the system.
- Whenever a component of the refrigeration system is replaced, it will also be necessary to install a new receiver/drier unit.
- Use alcohol and a clean lint-free cloth to clean dirty connections.
- Make sure that all new parts installed are marked for use with R134a.
- When a major repair has been completed, a leak test should be conducted; refer to the Repairs Section of this manual for the correct procedure.

Refrigerant oil

CAUTION: Refrigerant oil (ND-8 PAG) easily absorbs water and must not be stored for long periods. Do not pour unused refrigerant oil back into the container. Always use an approved refrigerant oil.

When replacing components in the system, drain the refrigerant oil from the component being replaced into a graduated container. On assembly, add the quantity of refrigerant oil drained to the new component - See Compressor Replacement in this Section.

A/C Compressor

A new compressor is sealed and pressurised with Nitrogen gas. When installing a new compressor, slowly release the sealing cap; gas pressure should be heard to vent as the seal is broken.

CAUTION: A new compressor should always be sealed and could be pressurised with nitrogen gas. To avoid possible oil loss, release the sealing cap(s) slowly. Do not remove the cap(s) until immediately prior to connecting the pipes to the compressor.

Rapid refrigerant discharge

If the A/C system is damaged as a result of an accident and the system is punctured, the refrigerant will discharge rapidly. The rapid discharge of refrigerant will also result in the loss of most of the oil from the system. The compressor must be removed and all the remaining oil in the compressor drained and refilled as instructed in the air conditioning section of this manual.

Precautions for refrigerant recovery, recycling and recharging

When the A/C system is recharged, any existing refrigerant is first recovered from the system and recycled. The system is then charged with the required weight of refrigerant and volume of refrigerant oil.

WARNING: Refrigerant must always be recycled before re-use to make sure that the purity of the refrigerant is high enough for safe use in the system. Recycling should always be carried out with equipment which is design certified by Underwriter Laboratory Inc. for compliance with SAE J1991. Other equipment may not recycle refrigerant to the required level of purity.

• CAUTIONS:

A R134a Refrigerant Recovery Recycling Recharging Station must not be used with any other type of refrigerant. Refrigerant R134a from domestic and commercial sources must not be used in motor vehicle systems.

The system must be evacuated immediately before recharging commences. Delay between evacuation and recharging is not permitted.

A/C Compressor Replacement

A new compressor is supplied filled with a full charge (X cm³) of refrigerant oil.

A calculated quantity of oil must be drained from the new compressor before installing. To calculate the quantity of oil to be drained:

- Remove the drain plug from the old compressor.
- Invert the compressor and gravity drain the oil into a calibrated measuring cylinder. Rotate the compressor clutch to make sure the compressor is completely drained.
- Note the quantity of oil drained (Y cm³).
- Calculate the quantity of oil to be drained from the new compressor using the following formula: $X \text{ cm}^3 - (Y \text{ cm}^3 + 20 \text{ cm}^3) = Q \text{ cm}^3$
- Remove the drain plug from the new compressor and drain Q cm³ of oil. install and tighten the compressor drain plug.

Vehicle Weights

Item	kg	lb
Maximum Gross Vehicle Weight (GVW) - All models*	3230	7106
Maximum weight of unbraked trailer:		
On-road	750	1650
Off-road	750	1650
Maximum towable weight (mass) - Trailers with overrun brakes		
On-road	3500	7700
Off-road	1000	2205
Maximum roof rack load (Including the mass of the roof rack):		

Item	kg	lb
On-road	75	110
Off-road	75	110

* Weight quoted is the maximum weight possible for vehicles in this model range; weights may be less for certain variants depending upon trim level, territorial requirements etc.

Vehicle Dimensions

Item	mm	in
Length - including number plate plinth - All models	4842	190.6
Width - All models:		
Mirrors extended	2189	86.2
Mirrors folded	2009	79.1
Coil Suspension - Maximum height - At EEC kerb weight - All models:		
With roof rack and rails	1891	74.4
With roof antenna module	1938	76.3
Air Suspension - Maximum height - At normal ride height - All models:		
With roof rack and rails	1891	74.4
With roof antenna module	1938	76.3
Wheelbase - All models	2885	113.5
Front overhang - All models	820	32.3
Rear overhang - All models	1130	44.5
Maximum roof load	75 kg	165 lb
Track - All models:		
Front	1601	63.0
Rear	1601	63.0
Coil Suspension:		
Underbody - Running clearance to exhaust - Minimum - Kerb weight	185	7.3
Front axle to axle undertray clearance	203	7.9
Rear axle to differential casing clearance	214	8.4
Air Suspension:		
Underbody - Running clearance to exhaust - Minimum - Kerb weight	185	7.3
Front axle to axle undertray clearance	203	7.9
Rear axle to differential casing clearance	214	8.4
Suspension articulation - All models:		
Front	255	10.03
Rear	330	12.9
Coil Suspension:		
Wading depth	600	23.6
Approach angle	32.2°	32.2°
Departure angle - Towbar NOT installed:		
With full size spare wheel	24.9°	24.9°
With space saver wheel	26.7°	26.7°
Departure angle - Towbar installed - NOT NAS vehicles	15.7°	15.7°
Departure angle - Towbar installed - NAS vehicles	18°	18°
Departure angle - Adjustable height towbar installed	14°	14°
Air Suspension:		
Wading depth - Off-road height	700	27.5
Approach angle:		
Standard ride height	32.2°	32.2°
Off-road ride height	37.2°	37.2°
Departure angle - Towbar NOT installed - Standard ride height:		
With full size spare wheel	24.9°	24.9°
With space saver wheel	26.7°	26.7°
Departure angle - Towbar NOT installed - Off-road ride height:		
With full size spare wheel	27.9°	27.9°
With space saver wheel	29.5°	29.5°
Departure angle - Towbar installed - NOT NAS vehicles:		
Standard ride height	15.7°	15.7°
Off-road ride height	18.5°	18.5°
Departure angle - Towbar installed - NAS vehicles:		
Standard ride height	18°	18°
Off-road ride height	21°	21°
Departure angle - Adjustable height towbar installed:		
Standard ride height	14°	14°
Off-road ride height	16.6°	16.6°
Ramp angle - Coil Suspension	22.8°	
Ramp angle - Air Suspension		
Standard ride height	22.8°	22.8°
Off-road ride height	27.9°	27.9°

General Information - Health and Safety Precautions

Description and Operation

Introduction

Modern vehicles contain many materials and liquids which if not handled with care can be hazardous to both personal health and the environment. Also, many of the procedures associated with vehicle maintenance and repair involve physical hazards or other risks to health.

This subsection lists some of these hazardous operations and the materials and equipment associated with them. Precautions necessary to avoid these hazards are identified.

The list is not exhaustive and all operations and procedures and the handling of materials, should be carried out with health and safety in mind.

Before using any product the Materials Safety Data Sheet supplied by the manufacturer or supplier should be consulted.

WARNING: Many liquids and other substances used in motor vehicles are poisonous and should under no circumstances be consumed and should, as far as possible, be kept from contact with the skin. These liquids and substances include acid, anti-freeze, brake fluid, fuel, windscreen washer additives, lubricants, refrigerants and various adhesives.

Acids and Alkalis

For example - alkalis such as caustic soda used in cleaning materials; acids such as sulphuric acid used in batteries.

Both alkalis and acids are irritant and corrosive to the skin, eyes, nose and throat. They cause burns and can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Make sure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

Highly flammable, explosive – observe No Smoking policy.

Used within the vehicle as safety restraints.

The inflator contains a high-energy propellant which, when ignited, produces a VERY HOT GAS (2500°C).

The gas inflator (generator) used in air bags is Sodium Azide. This material is hermetically sealed in each air bag module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with Sodium Azide:

- Wash affected areas thoroughly with water.
- **SEEK IMMEDIATE MEDICAL ASSISTANCE.**

Air Bags - Do's

- Do store modules in an upright position.
- Do keep modules dry.
- Do carry modules with the cover side pointing away from the body.
- Do place modules with their cover side upwards.
- Do carefully inspect modules for damage.
- Do stand to one side when connecting modules.
- Do make sure all test equipment is properly calibrated and maintained.
- Do wash hands after handling deployed air bags.

Air Bags - Do Not

- Do Not store highly flammable material together with modules or gas generators.
- Do Not store gas generators at temperatures exceeding 80°C.
- Do Not store modules upside down.
- Do Not attempt to open a gas generator housing.
- Do Not expose gas generators to open flame or sources of heat.
- Do Not place anything on top of a module cover.
- Do Not use damaged modules.
- Do Not touch a fired module or gas generator for at least 10 minutes after firing.
- Do Not use any electrical probes on the wiring circuit.

Air Suspension

Whenever work is being undertaken on the air suspension system, suitable eye protection must be worn.

Air Conditioning Refrigerant

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution such as a solution of 9% Sodium Chloride and Purified Water. **DO NOT RUB THE EYES AND SEEK IMMEDIATE MEDICAL ATTENTION.**

Air Conditioning Refrigerant

Do Not

- Do Not expose refrigerant bottles to sunlight or heat.
- Do Not expose refrigerant bottles to frost.
- Do Not drop refrigerant bottles.
- Do Not vent refrigerant to atmosphere under any circumstance.
- Do Not mix refrigerants.

Adhesives and Sealants

Many adhesives and sealants are highly flammable – OBSERVE NO SMOKING POLICY. These items, should be stored in flameproof cabinets in No Smoking areas. Cleanliness and tidiness in use should be observed, for example disposable paper covering benches. All adhesives and sealants should be dispensed from applicators where possible; containers, including secondary containers, should be labelled appropriately.

Anaerobic, Cyanoacrylate (super-glues) and other Acrylic Adhesives

Many are irritant, sensitizing or harmful to the skin and respiratory tract. Some are eye irritants.

Skin and eye contact should be avoided and the manufacturer's instructions followed.

Cyanoacrylate adhesives (super-glues) MUST NOT contact the skin or eyes. If skin or eye tissue is bonded, cover with a clean moist pad and **SEEK IMMEDIATE MEDICAL ATTENTION**. Do not attempt to pull skin tissue apart. Use in well ventilated areas as vapors can cause irritation to the nose and eyes.

For two-pack systems see Resin-based and Isocyanate Adhesives/Sealers.

Solvent-based Adhesives/Sealers - See Solvents

Follow manufacturers instructions.

Water-based Adhesives/Sealers

Those based on polymer emulsions and rubber/latex may contain small amounts of volatile, toxic and harmful chemicals. Skin and eye contact should be avoided and adequate ventilation provided during use.

Hot Melt Adhesives

In the solid state, they are safe. In the molten state they may cause burns and health hazards may arise from the inhalation of toxic fumes.

Use appropriate protective clothing and a thermostatically controlled heater with a thermal cut-out and adequate extraction.

Resin-based Adhesives/Sealers, for example Epoxide and Formaldehyde Resin-based

Mixing should be carried out in well ventilated areas as harmful or toxic volatile chemicals may be released.

Skin contact with uncured resins and hardeners can result in irritation, dermatitis, and absorption of toxic or harmful chemicals through the skin. Splashes can damage the eyes.

Provide adequate ventilation and avoid skin and eye contact.

Isocyanate (Polyurethane) Adhesives/Sealers

See also Resin-based Adhesives

Individuals suffering from asthma or respiratory allergies should not work with or near these materials as sensitivity reactions can occur.

Over exposure is irritating to the eyes and respiratory system. Excessive concentrations may produce effects on the nervous system including drowsiness. In extreme cases, loss of consciousness may result. Long term exposure to vapour concentrations may result in adverse health effects.

Prolonged contact with the skin may lead to skin irritation and in some cases, dermatitis.

Splashes entering the eye will cause discomfort and possible damage.

Any spraying should preferably be carried out in ventilated booths which incorporate facilities for removing vapors and spray droplets from the breathing zone.

Wear appropriate gloves, eye and respiratory protection.

Antifreeze

May be flammable when undiluted.

Vapors may be given off from coolant antifreeze when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed, can be fatal; **SEEK IMMEDIATE MEDICAL ATTENTION.**

Battery Acids

See also Alkalis and Acids.

Gases released during battery charging are explosive. Always remove the battery from the vehicle prior to charging. Never use naked flames or allow sparks near charging or recently charged batteries. NEVER add acid to a battery, the chemical reaction produced will be violent and explosive. In cases of eye contact, wash affected area with copious amounts of water and **SEEK IMMEDIATE MEDICAL ATTENTION.**

Make sure there is adequate ventilation during battery charging, observe NO SMOKING POLICY.

Brake Pads and Linings

Always fit the correct grade and specification of brake pads and linings. When renewing pads and linings, always replace as complete axle sets.

Brake and Clutch Fluid

Splashes to the skin and eyes are irritating and in the long term can be damaging, avoid prolonged skin contact. In cases of eye contact, wash affected area with copious amounts of water and SEEK IMMEDIATE MEDICAL ATTENTION.

Chemical Materials

All chemical materials should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers.
- Do remove chemical materials from the skin and clothing as soon as practicable after soiling. Change heavily soiled clothing and have it cleaned.
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes.
- Do avoid breathing vapors, aerosols, dusts or fumes; inadequate container labelling; fire and explosion hazards.
- Do wash before job breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials.
- Do keep work areas clean, uncluttered and free of spills.
- Do store chemical materials according to national and local regulations.
- Do keep chemical materials out of the reach of children.

Chemical Materials - Do Not

- Do Not mix chemical materials except under the manufacturers instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together.
- Do Not spray chemical materials, particularly those based on solvents, in confined spaces, for example when people are inside a vehicle.
- Do Not apply heat or flame to chemical materials except under the manufacturers instructions. Some are highly flammable and some may release toxic or harmful fumes.
- Do Not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas such as pits.
- Do Not transfer chemical materials to unlabelled containers.
- Do Not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities.
- Do Not use emptied containers for other materials except when they have been cleaned under supervised conditions.
- Do Not sniff or smell chemical materials, even brief exposure to high concentrations of fumes can be toxic or harmful.

Corrosion Protection Materials

Some corrosion protection materials are highly flammable – observe NO SMOKING POLICY.

These materials are varied and the manufacturers instructions must always be followed. The materials may contain solvents, resins or petroleum products. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Dust

Dust or powder produced during repair operations may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and sources of ignition.

Electrical Equipment

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Make sure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Make sure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged. If using cable reel extension equipment, ALWAYS ensure that the cable is fully unwound from the reel.

Make sure that electrical equipment and flexes do not come into contact with water.

Make sure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Make sure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Make sure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim.
- If this is not possible, **DO NOT TOUCH THE VICTIM** but push or drag the person from the source of electricity using dry, non-conductive material.
- Commence resuscitation if trained to do so.
- **SEEK IMMEDIATE MEDICAL ATTENTION.**

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasoline (Petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Gas Oil (Diesel engine)

Soot, discomfort and irritation usually give adequate warning of hazardous fume concentrations.

Fibre Insulation

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt; others such as fluoroelastomers when burnt or damaged by excessive heat can break down and produce highly corrosive hydrofluoric acid - See Fluoroelastomers.

Should any material be in a burnt or overheated condition, handle with extreme caution and wear protective clothing when handling such items. Dispose of such material in accordance with local regulations.

Decontaminate and dispose of protective clothing immediately after use.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Make sure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

In case of cold burns, from alternative fuels, place affected area in cool to cold water.

Individuals affected by inhalation of gases and fumes should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving him the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomers (Synthetic Rubber)

Many 'O' rings, seals, hoses, flexible pipes and other similar which appear to be manufactured from natural rubber are, in fact, made of synthetic materials called Fluoroelastomers.

Under normal operating conditions, these materials are safe and do not constitute a health hazard. However, if the materials are damaged by burning or exposure to excessive heat, they can break down and produce highly corrosive hydrofluoric acid.

WARNING: Contact with hydrofluoric acid can cause serious burns on contact with the skin. If skin contact does occur, carry out the following steps immediately:

Remove any contaminated clothing.

SEEK IMMEDIATE MEDICAL ATTENTION

Irrigate affected area of skin with copious amounts of cold water or limewater for 15 to 60 minutes.

Foams - Polyurethane

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapour/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be carried out in areas having suitable fume extraction equipment.

Fuels

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - OBSERVE NO SMOKING POLICY.

Swallowing gasoline (petrol) can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Inhalation into the lungs, through vomiting, is a very serious hazard.

Gasoline (petrol) dries the skin and can cause irritation and prolonged or repeated contact may cause dermatitis; if it is allowed to enter the eyes, it will cause severe smarting. Wash affected area with copious amounts of water and **SEEK IMMEDIATE MEDICAL ATTENTION.**

Gasoline (petrol) may contain appreciable quantities of benzene, which is toxic upon inhalation and the concentration of vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Make sure there is adequate ventilation when handling and using gasoline (petrol). Great care must be taken to avoid the serious consequences of inhalation in the event of vapour build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline (petrol) storage tanks.

Gasoline (petrol) should not be used as a cleaning agent. It must not be siphoned by mouth.

Gas-oil (Diesel Fuel)

Combustible.

Prolonged skin contact with high boiling point gas oils (diesel fuel) may cause serious skin disorders including skin cancer.

Inhalation into the lungs will cause internal bleeding - **SEEK IMMEDIATE MEDICAL ATTENTION.**

If swallowed, DO NOT induce vomiting - SEEK IMMEDIATE MEDICAL ATTENTION.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - OBSERVE NO SMOKING POLICY.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

If swallowed, DO NOT induce vomiting - SEEK IMMEDIATE MEDICAL ATTENTION.

Gas Cylinders

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 138 bar (13800 kPa) (2000 lbf/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow or direct sunlight. Fuel gases, for example acetylene and propane should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines and also to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never overload equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment or using spraying equipment.

Make sure there is adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, for example diesel injector, at the skin as the fluid may penetrate to the underlying tissue and cause serious injury.

Jacking

Always refer to the Jacking and Lifting section of this manual prior to raising the vehicle off the ground.

When vehicle is to be raised by means of a jack, ensure that it is standing on level ground, that parking brake is applied and wheels are chocked. ALWAYS use the recommended jacking points and ensure that vehicle jack has sufficient load capacity for the weight of the vehicle.

WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Ensure that hoists have sufficient load capacity for the weight of the vehicle.

Legal Aspects

There are many laws and regulations relating to health and safety in the use and disposal of materials and equipment in a workshop.

For a safe working environment and to avoid environmental pollution, workshops should be familiar, in detail, with the many health and safety laws and regulations within their country, published by both national and local authorities.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with engine oil will result in the removal of natural fats from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils.
- Wear protective clothing, including impervious gloves where practicable.
- Do not put oily rags into pockets.
- Avoid contaminating clothes, particularly underpants, with oil.
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly.
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to help the removal of oil from the skin.
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanoline replace the natural skin oils which have been removed.
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay.
- Where practicable, degrease components prior to handling.
- Where there is a risk of eye contact, eye protection should be worn, for example chemical goggles or face shields; in addition an eye wash facility should be provided.

Environmental Precautions

This section provides general information which can help to reduce the environmental impacts from the activities carried out in workshops.

Emissions to air

Many of the activities that are carried out in workshops emit gases and fumes which can contribute to global warming, depletion of the ozone layer and/or the formation of photochemical smog at ground level. By considering how the workshop activities are carried out, these gases and fumes can be minimised, thus reducing the impact on the environment.

Exhaust fumes

Running car engines is an essential part of workshop activities and exhaust fumes need to be ventilated to atmosphere. However, the amount of time engines are running and the position of the vehicle should be carefully considered at all times, to reduce the release of poisonous gases and minimise the inconvenience to people living nearby.

Solvents

Some of the cleaning agents used are solvent based and will evaporate rapidly to atmosphere if used carelessly, or if containers are left unsealed. All containers must be firmly closed when not required and solvent should be used sparingly. Wherever possible, solvents having a low toxicity and flammability should be selected. Always follow the instructions supplied by the solvent manufacturer. Similarly, many paints are solvent based and the spray should be used in such a way as to reduce emissions to a minimum.

Refrigerant

It is illegal to release any refrigerant into the atmosphere. Discharge and replacement of these materials from air conditioning units should only be carried out using the appropriate equipment.

Discharges to water

Most workshops will have two systems for discharging waste water - storm drains and foul drains. Storm drains should only receive clean water i.e. rainwater. Foul drains will accept many of the normal waste water i.e. washing water, detergents and domestic type waste BUT NOT oil, petrol, solvent, acids, hydraulic fluid, antifreeze and similar fluids. If in doubt, always consult the local authority or water company.

Spillages

Every precaution must be taken to prevent spillage of oil, fuel, solvents etc., reaching the drains. All handling of such materials must take place well away from drains and preferably in an area with a suitable containing wall to prevent discharge into drains or watercourses. If a spillage occurs, it must be soaked up immediately using a spill kit where provided.

Checklist

Spillage prevention:

- Store liquids in a secure area.
- Make sure that taps on liquid containers are secure and cannot be accidentally turned on.
- Protect bulk storage tanks from vandalism by locking the valves.
- Transfer liquids from one container to another in an area away from open drains.
- Ensure lids are replaced securely on containers.
- Have spill kits available near to points of storage and liquid handling areas.

Spill Kits

Special materials are available to absorb a number of different substances. They can be in granular form, ready to use and are supplied in suitable containers. Disposal of used spill absorbing material is dealt with in Waste management.

Land contamination

Oils, fuels and solvents etc. can contaminate any soil with which they come into contact. Such materials MUST never be disposed of by pouring on to soil and every precaution must be taken to avoid spillage reaching soil. Waste materials

stored on open ground could either leak or have contaminating substances washed off them that would contaminate the land. Always store these materials in suitable skips or similarly robust containers.

Legal compliance

Some sites may have a discharge consent for effluent discharge to the foul drain for a car wash etc. It is essential to know the types of effluent which are allowed to be discharged into the drain and to check the results of any monitoring carried out by the Water Company.

Where paint spraying operations are carried out it may be necessary to apply to the Local Authority for an air emissions licence to operate the plant. If such a licence is necessary, additional precautions will be necessary to comply with the requirements and the results of any air quality monitoring must be checked regularly.

Checklist

Always adhere to the following:

- Know what legal consents and licences apply to the operations.
- Check that the emissions and discharges comply with legal requirements.

Waste Management

Pollution can be reduced by careful handling, storage and disposal of all waste materials that occur on sites. Legislation makes it illegal to dispose of waste materials other than to licensed waste carriers and disposal sites.

This means that it is necessary to not only know what the waste materials are but also to have the necessary documentation and licences.

Handling and storage of waste

Ensure that waste materials are not poured down the drain or on to soil and are stored in such a way that they do not escape on to land or soil.

All waste must be segregated into individual types e.g. oils, metals, batteries, scrap components etc. This will prevent any reaction between different materials and assist in disposal.

Disposal of waste

Dispose of waste in accordance with the following guidelines:

- **Fuel, hydraulic fluid, anti-freeze and oil:** Keep separate and dispose of to specialist contractors.
- **Refrigerant:** Collect in specialist equipment and reuse.
- **Detergents:** Safe to pour down the foul drain if diluted.
- **Paint, thinners:** Keep separate and dispose of to specialist contractor.
- **Components:** Return to supplier for refurbishment or disassemble and reuse any suitable parts. Dispose of remainder in ordinary waste.
- **Small parts:** Reuse any suitable parts, dispose of the remainder in ordinary waste.
- **Metals:** Can be sold if separate from general waste.
- **Tyres:** Keep separate and dispose of to specialist contractor. DO NOT attempt to dispose of tyres by burning.
- **Components/materials containing asbestos:** Keep separate and dispose of to specialist contractor.
- **Oil and fuel wastes (e.g. rags, used spill kit material):** Keep separate and dispose of to specialist contractors.
- **Air filters:** Keep separate and dispose of to specialist contractors.
- **Rubber/plastics:** Dispose of in ordinary waste.
- **Hoses:** Dispose of in ordinary waste.
- **Batteries:** Keep separate and dispose of to specialist contractors.
- **Air bags - DANGER EXPLOSIVES:** Keep separate and dispose of to specialist contractors.
- **Electrical components:** Return to supplier for refurbishment or disassemble and reuse any suitable components. Dispose of remainder in ordinary waste.
- **Catalytic converters:** May be sold if kept separate from general waste.
- **Packaging:** Compact/recycle as much as possible and dispose of in ordinary waste.
- **Office/paper waste:** Recycle paper and toner and ink cartridges, dispose of remainder in ordinary waste.

Noise

Car alarm testing, panel beating, running engines, using air tools etc. are operations which invariably produce a large amount of noise. The location of such activities and also the time of day must be carefully considered having regard to the proximity of houses schools etc.

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Solder

Solders are mixtures of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease, and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

For example acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and dewaxing materials, paints, plastics, resins and thinners.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure of high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs, for example through vomiting, is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Make sure there is good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, for example paints, adhesives, and metal coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturers instructions.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load, for example a suspended engine.

Always make sure that lifting equipment such as jacks, hoists, axle stands and slings are adequate and suitable for the job, in good condition and regularly maintained.

Viton

In common with many other manufacturers vehicles, some components installed to Land Rover vehicles have seals, 'O' rings or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecnoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400°C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the general body system. **WHERE CASES OF SKIN CONTACT OCCUR, SEEK IMMEDIATE MEDICAL HELP.**

O-rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected O-ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious as the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the

commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralise the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding.

Resistance Welding

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultra-violet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

CAUTION: Some of the components installed to the vehicle e.g. the interior cross beam and underbonnet cross member are manufactured from magnesium alloy. On no account should any welding operations be attempted on these components.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultra-violet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, FOR EXAMPLE BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

General Information - Solvents, Sealants and Adhesives

Description and Operation

Solvents

WARNING: Always handle all solvents, sealers and adhesives with extreme care. Some contain chemicals or give off fumes which can be dangerous to health. Always follow the manufacturers instructions. If in doubt about any substance, particularly a solvent, DO NOT use it.

CAUTION: If in doubt about the suitability of any proprietary solvent or sealer for a particular application, contact the manufacturer of the product for information.

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included as an ingredient in a sealer or adhesive.

Sealers

Certain procedures in this manual involve the use of sealants during installation of components. Where a sealant is required, the application, together with the Land Rover part number is given in the General Specification at the start of each section and an instruction that a sealant must be used appears in the relevant repair procedure.

It is essential that the sealant(s) specified for a particular procedure are used, DO NOT use any other sealant.

Always remove traces of old sealant using a plastic scraper or suitable solvent, never use emery cloth or metal scrapers.

Adhesives

Whenever a procedure involves the use of an adhesive, the adhesive specified must be used and the manufacturer's instructions regarding application together with any health and safety precautions must be followed.

General Information - Petrol and Petrol-Ethanol Fuel Systems Health and Safety Precautions

Description and Operation

• WARNINGS:

Fuel may not give adequate warning before toxic or harmful effects arise.

Exposure to fuel can be harmful and can cause severe health damage or death.

Extreme care must be exercised when handling hot fluids. Always wash off spilled fluids from affected areas of skin immediately.

Highly flammable mixtures are always present and may ignite when working on fuel systems. Do not allow naked flames, sparks or lighted substances to come near fuel related components.

Fuel must not be used as a cleaning agent.

Keep fuel containers tightly closed, out of direct sunlight and in a cool area. Keep away from heat sources, ignition sources and oxidizing agents.

SKIN CONTACT: Excessive or prolonged skin contact with diesel fuel may cause serious skin disorders including skin cancer.

SKIN CONTACT: Fuel is mildly irritating to the skin and may cause dermatitis due to defatting effect. Remove contaminated clothing. Wash affected areas of skin with soap and water. Seek medical attention for any persistent skin irritation or abnormality. Wash contaminated clothing before reuse.

EYE CONTACT: Fuel is mildly irritating to the eyes. Flush with plenty of running water, blinking as often as possible. Do not force the eyelid open. Seek medical attention for any persistent eye irritation or abnormality.

SWALLOWED: Fuel is moderately toxic and tends to foam on vomiting. If drawn into the lungs, inflammation may develop. Do not induce vomiting. If spontaneous vomiting occurs place the victim in a forward position to reduce the risk of fuel being drawn into the lungs. Give nothing by mouth. If breathing but unconscious, place in the recovery position. If breathing has stopped, apply artificial respiration. Seek immediate medical attention.

INHALED: Fuel is toxic to the respiratory and other body systems. Exposure may result in various symptoms including drowsiness, unconsciousness or severe health damage. Move a victim to fresh air. Keep a victim warm and at rest. If unconscious, place in the recovery position. If not breathing, apply artificial respiration. Give cardiac massage if necessary. Seek immediate medical attention.

• CAUTIONS:

Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components.

Make sure that the workshop area in which the vehicle is being worked on is as clean and as dust free as possible.

General Information - Road/Roller Testing

Description and Operation

Road or rolling road testing may be carried out for various reasons and a procedure detailing pre-test checks, through engine starting and stopping, pre-driving checks, on-test checks to final checks on completion of the test are given.

Unless complete vehicle performance is being checked, the full road test procedure need not be carried out. Instead, those items particularly relevant to the system(s) being checked can be extracted.

Pre-Test Checks

WARNING: If the brake system hydraulic fluid level is low, pedal travel is excessive or a hydraulic leak is found, do not attempt to road test the vehicle until the reason for the low fluid level, excessive pedal travel or hydraulic leak is found and rectified.

It is suggested that pre-test and functional tests of those systems/circuits which affect the safe and legal operations of the vehicle, such as brakes, lights and steering, should always be carried out before the road or rolling road test.

- Engine oil level
- Engine coolant level
- Tires, for correct pressure, compatible types and tread patterns, and wear within limits.
- There is sufficient fuel in the tank to complete the test.
- Check all around the engine, transmission and under the vehicle for oil, coolant, hydraulic and fuel leaks. Make a note of any apparent leaks and wipe off the surrounding areas to make it easier to identify the extent of the leak on completion of the test.

Starting the Engine

• **NOTE:** On initial drive away from cold and within the first 1.5 km (1 mile), do not depress accelerator pedal beyond half travel until the vehicle has attained a minimum speed of 25 km/h (15 miles/h). Never operate at high engine speed or with the accelerator pedal at full travel whilst the engine is cold.

With the ignition switched off, check:

- The parking brake is applied.
- **Manual gearbox:** The gear lever is in neutral.
- **Automatic gearbox:** The selector lever is in 'P' - Park
- **Transfer box:** 'H' - High is selected
- All instrument gauges read zero.

With the ignition switched on, check:

- Ignition controlled warning lights come on.
- Engine temperature gauge registers a reading compatible with the engine temperature.
- Fuel gauge registers a reading appropriate to the fuel level in the tank.
- The operation of the parking brake warning light and fluid level warning indicator light.

On Road Test Check:

CAUTION: At commencement of road testing, check the brake operation while still travelling at low speed before continuing with the test. If the brakes pull to one side, or appear to be otherwise faulty, do not continue with the road test until the fault has been found and rectified.

- **Manual gearbox:** Clutch pedal operation is not stiff or heavy.
- **Manual gearbox:** Initial gear engagement is smooth and there is no evidence of clutch drag.
- The parking brake releases completely.
- **Manual gearbox:** Clutch takes up the drive smoothly, without slip or judder.
- Gear changing is smooth, and there are no abnormal noises or vibrations from the gearbox.
- The engine power output is satisfactory, acceleration is smooth and accelerator pedal operation is not stiff or heavy, and engine speed returns to idle correctly.
- There is no excessive or abnormally colored smoke from the engine under normal driving, heavy load or overrun conditions.
- Steering operation is smooth, accurate, not excessively heavy or with excessive free play or vibration. Does not pull to one side and self centres smoothly after cornering.
- All instruments register the correct readings and operate correctly.
- Switches and controls operate smoothly and positively, warning or indicator lights operate correctly and the direction indicator control self cancels when the steering is returned to the straight ahead position.
- Heating and ventilation systems work correctly and effectively.
- Brakes operate efficiently.

Brake Testing

Avoid brake testing on busy roads where it can cause inconvenience or danger to other road users.

CAUTION: Brake testing which includes heavy brake applications should not be carried out with new brake pads/discs until the components have bedded-in. New brake friction components will not reach full efficiency until the bedding-in process is complete. Note that when new parking brake shoes or rear brake discs have been fitted, it is essential that the 'bedding-in' procedure given in Section 206-05 - Parking Brake Removal and Installation is carried out.

Test the brakes at several speeds within the normal operating range using both light and heavy pedal pressure. Note any tendency to snatch, pull or drag, and any undue delay in application or release.

Allow the vehicle to coast and note any tendency to pull to one side, or evidence that the brakes are binding.

After stopping the vehicle (not immediately after a period of heavy braking), carefully check the brake temperature. A disc which feels appreciably hotter than the others, could indicate that the pads on that disc are binding.

After completion of the test, check for:

- Oil, coolant, hydraulic, air and fuel leaks.
- Abnormal temperature of any moving components or assemblies, e.g. wheel hubs, transmission etc., which might indicate over tightness or lack of lubrication.

Rolling Road Testing

Four-Wheel Rolling Road

WARNING: Do not operate the footbrake or parking brake whilst the rollers are driving the road wheels. Ensure that once disconnected, propeller shafts are properly secured and clear of all moving components.

Provided that front and rear rollers are rotating at identical speeds and that normal workshop safety standards are applied, there is no speed restriction during testing except any that may apply to the tires.

Ensure that the parking brake is released prior to engaging roller driving mechanism.

Two-Wheel Rolling Road

CAUTION: On no account should an attempt be made to carry out any form of testing on a two-wheel rolling road.

Two-wheel rolling road testing must not be performed on this vehicle.

General Information - Special Tool Glossary

Description and Operation

Service Tools

Special service tools have been developed to facilitate removal, dismantling and assembly of mechanical components in a cost effective and time efficient manner. The use of such special tools also helps prevent the potential for damage to components.

Some operations described in this manual cannot be carried out properly without the aid of the relevant service tools.

All orders and enquiries from the United Kingdom and European countries except Germany, Austria, Switzerland and Spain and countries not in the following list should be sent direct to:

SPX UK Ltd.,

General Information - Diagnostic Trouble Code (DTC) Index **DTC: Air Suspension Control Module (RLM)**

Description and Operation

Air Suspension Control Module (RLM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Air Suspension Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Vehicle Dynamic Suspension](#) (204-05 Vehicle Dynamic Suspension, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1A84-55	Car Configuration Data - not configured	<ul style="list-style-type: none"> System not configured - Data does not match that expected for specification Incorrect software version loaded 	<ul style="list-style-type: none"> Configure the Car Configuration File (CCF) using the approved diagnostic system. Ensure the Air Suspension Control Module software is the correct version (available from the Global Technical Reference web-site). Clear the DTC and test for normal operation
C112F-72	Air Spring Valve - actuator stuck open	<ul style="list-style-type: none"> Corner valve stuck open (fully or partially) Vehicle driven while system in "Tight Tolerance" mode 	<ul style="list-style-type: none"> Where possible, refer to the guided diagnostic routine for this DTC on the approved diagnostic system. Complete corner valve checks. If necessary, clear tight tolerance mode. Clear the DTC and retest
C1130-66	Air Spring Air Supply - signal has too many transitions / events	<ul style="list-style-type: none"> Air spring leak Leak in air harness to air spring Corner valve leak to gallery Compressor assembly fault Vehicle driven while system in "Tight Tolerance" mode 	<ul style="list-style-type: none"> Visually inspect the system for air leakage. Where possible, refer to the guided diagnostic routine for this DTC on the approved diagnostic system
C1130-7A	Air Spring Air Supply - fluid leak or seal failure	<ul style="list-style-type: none"> Detached or burst air pipe Leaking air spring or pipe to air spring (large leak) Loose pipe connection Insufficient pressure from compressor Height sensor fault 	<ul style="list-style-type: none"> Visually inspect the system for an excessive air leak. Check the height sensor linkage(s) for damage/restrictions. Visually inspect the air harness for evidence of melting, crushing, kinking or collapsing. Where possible, refer to the guided diagnostic routine for this DTC on the approved diagnostic system
C1131-92	Air Supply - performance or incorrect operation	<ul style="list-style-type: none"> Loose or burst air pipe Detached air pipe Leaking pipe from reservoir valve block to air supply unit or either axle valve block Insufficient pressure from compressor Reservoir valve block piped incorrectly 	<ul style="list-style-type: none"> Visually inspect the system for air leakage. Check the reservoir valve block pipes for correct routing and installation
C1A01-19	LED - circuit current above threshold	<ul style="list-style-type: none"> Switch pack LED circuit current above threshold LED cathode (negative) connection shorted to positive One or more LEDs short circuit 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check the LED_NEG circuit between the air suspension control module and switch pack for short circuit to battery. Repair as necessary. Clear the DTC and test for normal operation. If the DTC is still logged suspect the switch pack

General Information - Diagnostic Trouble Code (DTC) Index DTC: Anti-Lock Braking System (ABS)

Description and Operation

Anti-Lock Braking System (ABS)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the ABS Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Anti-Lock Control - Traction Control](#) (206-09A Anti-Lock Control - Traction Control, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
C0030-38	Left Front Tone Wheel - Signal frequency incorrect	<ul style="list-style-type: none"> Signal frequency incorrect Damaged ABS sensor ring 	Check front left wheel speed sensor ring for missing teeth or damage. After rectification, either clear the DTCs and cycle the ignition or cycle the ignition and drive the vehicle above 15kph to ensure the lamps extinguish. When cycling the ignition, allow sufficient time for the 'P' symbol illumination to extinguish on the gear shifter (if installed) before returning the ignition state to on
C0031-14	Left Front Wheel Speed Sensor - Circuit short to ground or open	<ul style="list-style-type: none"> Sensor short circuit to ground or open circuit Sensor fault 	Check the sensor lead and connector for damage. If damaged, renew the sensor. Refer to the electrical circuit diagrams and check the circuit between the sensor and the ABS module

DTC	Description	Possible Causes	Action
C0051-28	Steering Wheel Position Sensor - Signal bias level out of range/zero adjustment failure	<ul style="list-style-type: none"> ● Signal bias level out of range/zero adjustment failure ● Incorrect angle sensor installed ● Wheel speed sensor wiring incorrectly wired across one axle ● Steering angle sensor fault 	Check for a correctly installed steering angle sensor. Refer to the electrical circuit diagrams and check the circuit between the wheel speed sensors and the ABS module to ensure the sensors on one axle are correctly wired to the correct control module left or right pin outs. Renew the steering angle sensor. After rectification, either clear the DTCs and cycle the ignition or cycle the ignition and drive the vehicle (not always in a straight line) for at least 9 seconds to ensure the lamps extinguish. When cycling the ignition, allow sufficient time for the 'P' symbol illumination to extinguish on the gear shifter (if installed) before returning the ignition state to on
C0051-67	Steering Wheel Position Sensor - Signal incorrect after event	<ul style="list-style-type: none"> ● Sensor signal incorrect after event ● Steering angle sensor fault ● Control module software error 	Check for other DTCs that may aid diagnosis, especially in the steering angle sensor module. Renew the steering angle sensor. Clear the DTC and retest. If the problem persists, renew the ABS control module. Refer to the warranty policy and procedures manual if a module is suspect
C0062-28	Longitudinal Acceleration Sensor - Signal bias level out of range/zero adjustment failure	<ul style="list-style-type: none"> ● Sensor signal bias level out of range/zero adjustment failure ● Incorrectly installed sensor 	Check installation and mounting of sensor cluster. Clear the DTC and retest, if problem persists renew the sensor. After rectification, either clear the DTCs and cycle the ignition or cycle the ignition and drive the vehicle above 15kph to ensure the lamps extinguish. When cycling the ignition, allow sufficient time for the 'P' symbol illumination to extinguish on the gear shifter (if installed) before returning the ignition state to on
C0062-54	Longitudinal Acceleration Sensor - Missing calibration	<ul style="list-style-type: none"> ● Sensor missing calibration ● Incorrect sensor installed ● Incorrectly configured sensor 	Ensure the correct sensor has been installed. Check mounting, connector and fuse of the sensor. Configure the sensor cluster using the manufacturers approved diagnostic system
C0062-64	Longitudinal Acceleration Sensor - Signal plausibility failure	<ul style="list-style-type: none"> ● Sensor signal plausibility failure ● Incorrectly installed sensor 	Clear the DTC and retest. Check mounting, connector and fuse of the sensor. Configure the sensor cluster using the manufacturers approved diagnostic system
C0063-14	Yaw Rate Sensor - Circuit short to ground or open	<ul style="list-style-type: none"> ● Sensor circuit short to ground or open ● Sensor fault 	The most likely cause of the fault is an open circuit on the harness. Refer to the electrical circuit diagrams and check the circuit between the sensor and the control module. Repair as necessary. Clear the DTC and retest. If the problem persists, renew the sensor
C0063-1C	Yaw Rate Sensor - Circuit voltage out of range	<ul style="list-style-type: none"> ● Sensor circuit voltage out of range 	Refer to the electrical circuit diagrams and check the sensor power supply circuit
C0063-27	Yaw Rate Sensor - Signal rate of change above threshold	<ul style="list-style-type: none"> ● Sensor circuit power supply fuse failure ● Sensor insecurely mounted ● Sensor fault ● Control module software error 	Refer to the electrical circuit diagrams and check the sensor power supply fuse. Check the yaw rate sensor connector condition. Ensure the sensor is correctly secured. If problem persists, renew the sensor. If the problem still persists, renew the ABS control module. Refer to the warranty policy and procedures manual if a module is suspect
C0063-28	Yaw Rate Sensor - Signal bias level out of range/zero adjustment failure	<ul style="list-style-type: none"> ● Sensor signal bias level out of range/zero adjustment failure ● Sensor insecurely mounted ● Sensor fault 	Ensure the sensor is correctly secured. If problem persists, renew the sensor
C0063-41	Yaw Rate Sensor - General checksum failure	<ul style="list-style-type: none"> ● Sensor general checksum failure ● Sensor fault ● Control module fault 	Renew the sensor. If the problem persists, renew the ABS control module. Refer to the warranty policy and procedures manual if a module is suspect
C0063-49	Yaw Rate Sensor - Internal electronic failure	<ul style="list-style-type: none"> ● Sensor internal electronic failure 	Clear the DTC and retest. If the problem persists, renew the sensor
C0063-4A	Yaw Rate Sensor - Incorrect component installed	<ul style="list-style-type: none"> ● Incorrect sensor installed 	Clear the DTC and retest. If the fault still exists renew the Yaw rate sensor with the suitable sensor cluster and repeat test cycle
C0063-64	Yaw Rate Sensor - Signal plausibility failure	<ul style="list-style-type: none"> ● Sensor signal plausibility failure - The sensor value is not within the expected range compared to the steering angle sensor. ● Sensor insecurely mounted 	<ul style="list-style-type: none"> • NOTE: This DTC can be set if the vehicle is being tested on chassis dyno rollers. <p>Ensure the sensor is correctly secured. Check that the steering angle sensor is correctly calibrated using the manufacturers recommended diagnostic system. If problem persists, renew the sensor. After rectification, either clear the DTCs and cycle the ignition or cycle the ignition and drive the vehicle above 80kph (not always in a straight line) to ensure the lamps extinguish. When cycling the ignition,</p>

DTC	Description	Possible Causes	Action
			allow sufficient time for the 'P' symbol illumination to extinguish on the gear shifter (if installed) before returning the ignition state to on
C0063-86	Yaw Rate Sensor - Signal invalid	<ul style="list-style-type: none"> ● Sensor signal invalid ● Incorrectly configured sensor 	Clear the DTC and retest. If the problem persists, renew the sensor
C0063-95	Yaw Rate Sensor - Incorrect assembly	<ul style="list-style-type: none"> ● Sensor incorrect assembly/internal sensor fault 	Ensure the correct sensor has been installed. Clear the DTC and retest. If the problem persists, renew the sensor. If the problem persists, renew the ABS control module. Refer to the warranty policy and procedures manual if a module is suspect
C0063-96	Yaw Rate Sensor - Component internal failure	<ul style="list-style-type: none"> ● Sensor power supply intermittent connection ● Sensor ground intermittent connection ● Sensor internal failure 	Refer to the electrical circuit diagrams and check the sensor power supply and ground connections to the sensor. Check the sensor connector and ABS module for security and integrity (water ingress of damaged pins). If the problem persists, renew the yaw rate sensor. Calibrate the new sensor using the manufacturers approved diagnostic system. If the fault returns after an ignition cycle, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
C0064-64	Roll Rate Sensor - Signal plausibility failure	<ul style="list-style-type: none"> ● Sensor signal plausibility failure ● Sensor insecurely mounted 	Ensure the sensor is correctly installed/secured. Clear DTC and Retest. If problem persists, renew the sensor
C006A-54	Multi-axis Acceleration Sensor - Missing calibration	<ul style="list-style-type: none"> ● Sensor missing calibration ● Serial number of yaw rate sensor saved in stored in control module memory does not match serial number of sensor ● Incorrect sensor installed ● Installed sensor not correctly calibrated 	Check that the correct sensor has been installed. Configure the sensor cluster using the manufacturers approved diagnostic system. If calibration fails several times, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
C0072-4B	Brake Temperature Too High - Over temperature	<ul style="list-style-type: none"> ● Excessive use of brakes ● Excessive use of traction control system 	This DTC is for information only. Clear the DTC
C101F-49	Generic Valve Failure - Internal electronic failure	<ul style="list-style-type: none"> ● ABS modulator internal fault 	Renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
C1109-24	Vehicle Dynamics Control Switch - Signal stuck high	<ul style="list-style-type: none"> ● Signal stuck high - DSC Switch operation fault - If the DSC switch is pressed for longer than 1 minute, the switch is deemed to be malfunctioning 	Check the switch operation. Refer to the electrical circuit diagrams and check the DSC switch and circuits. Check and install a new DSC switch as required
C1A77-16	Valve Relay Supply Circuit - Circuit voltage below threshold	<ul style="list-style-type: none"> ● Circuit voltage below threshold ● Fuse ● Harness/connector damaged 	Refer to the electrical circuit diagrams and check the harness connection and fuse to the valve relay circuits
C1A90-12	Wheel Speed Sensor Supply - Circuit short to battery	<ul style="list-style-type: none"> ● Wheel speed sensor supply circuit short circuit to power 	Refer to the electrical circuit diagrams and check the wheel speed sensor power supply line circuits between the sensors and the control module
C1A95-4A	Wheel Speed Sensor - Incorrect component installed	<ul style="list-style-type: none"> ● The incorrect wheel speed sensor has been installed 	Check the correct wheel speed sensors are installed. Clear the DTC and retest
C1A95-64	Wheel Speed Sensor - Signal plausibility failure	<ul style="list-style-type: none"> ● Signal plausibility failure ● Wheel speed sensor fault (any) ● Sensor ring damaged, incorrect or defective ● Harness fault ● Incorrect wheel/tire assembly size 	Check for correct wheel/tire sizes. Check the wheel speed sensors and circuits for damage. Remove the sensor and visually inspect the sensor ring on the constant velocity joint (CVJ) for missing or damaged teeth. If the sensor ring is damaged, renew the CVJ. Use an oscilloscope to examine the signals from all wheel speed sensors for abnormal high frequencies (modulation and peak signals). Renew sensors as necessary. After rectification, either clear the DTCs and cycle the ignition or cycle the ignition and drive the vehicle above 15kph for at least 30 seconds to ensure the lamps extinguish. When cycling the ignition, allow sufficient time for the 'P' symbol illumination to extinguish on the gear shifter (if installed) before returning the ignition state to on

DTC	Description	Possible Causes	Action
C1A96-64	Brake Light Switch - Signal plausibility failure	<ul style="list-style-type: none"> ● Signal plausibility failure ● Stop lamp switch fault ● Harness/connector issue 	Check the Stop lamp function. Ensure the brake lamp switch is correctly installed and configured. Refer to the electrical circuit diagrams and check the stop lamp switch circuit, rectify as necessary. Check the engine control module for DTCs. After rectification, either clear the DTCs and cycle the ignition or cycle the ignition and drive the vehicle above 15kph with at least one brake pedal press to ensure the lamps extinguish. When cycling the ignition, allow sufficient time for the 'P' symbol illumination to extinguish on the gear shifter (if installed) before returning the ignition state to on
C1A97-24	Lateral Accelerometer - Signal stuck high	<ul style="list-style-type: none"> ● Signal stuck high ● Yaw rate/lateral acceleration sensor internal error 	Renew the combined lateral acceleration/yaw rate sensor
C1A98-2F	Yaw Rate Sensor - Signal erratic	<ul style="list-style-type: none"> ● Yaw rate sensor signal fault for 2 minutes 	Information only, regard as normal operation. Clear the DTC, cycle the ignition and retest. If the fault reoccurs, renew the combined lateral acceleration/yaw rate sensor. When cycling the ignition, allow sufficient time for the 'P' symbol illumination to extinguish on the gear shifter (if installed) before returning the ignition state to on
C1A98-96	Yaw Rate Sensor - Component internal failure	<ul style="list-style-type: none"> ● Incorrect assembly ● Sensor installation incorrect ● Yaw rate/lateral acceleration sensor internal error 	Check the combined lateral acceleration/yaw rate sensor installation and orientation. Check mounting, connector and fuse of the sensor. Clear the DTC and retest. If the problem persists, renew the combined lateral acceleration/yaw rate sensor
C1B00-29	Steering Angle Sensor - Signal invalid	<ul style="list-style-type: none"> ● Sensor signal invalid ● Sensor installation incorrect ● steering angle sensor fault 	Check steering angle sensor module for DTCs. Check the steering angle sensor installation and orientation. Clear the DTC and retest. If the problem persists, renew the sensor
C1B00-49	Steering Angle Sensor - Internal electronic failure	<ul style="list-style-type: none"> ● Sensor internal electronic failure 	Check steering angle sensor module for DTCs. Renew the sensor
C1B00-64	Steering Angle Sensor - Signal plausibility failure	<ul style="list-style-type: none"> ● Sensor signal plausibility failure ● Sensor installation incorrect ● steering angle sensor fault ● Yaw rate sensor installation incorrect 	Check steering angle sensor module for DTCs. Check the steering angle sensor installation and orientation. Check the yaw rate sensor installation and orientation. Clear the DTC and retest. If the problem persists, renew the steering angle sensor
C1B00-92	Steering Angle Sensor - Performance or incorrect operation	<ul style="list-style-type: none"> ● Sensor performance or incorrect operation ● Sensor installation incorrect ● steering angle sensor fault 	Check steering angle sensor module for DTCs. Check the steering angle sensor installation and orientation. Check the yaw rate sensor installation and orientation. Clear the DTC and retest. If the problem persists, renew the steering angle sensor
C1B02-16	Return Pump - Circuit voltage below threshold	<ul style="list-style-type: none"> ● Return pump circuit voltage below threshold ● Harness damaged ● Defective fuse 	Refer to the electrical circuit diagrams and check the circuit, fuses and the connection to the ABS module. Rectify as necessary. After rectification, either clear the DTCs and cycle the ignition or cycle the ignition and drive the vehicle above 15kph to ensure the lamps extinguish. When cycling the ignition, allow sufficient time for the 'P' symbol illumination to extinguish on the gear shifter (if installed) before returning the ignition state to on
C1B02-49	Return Pump - Internal electronic failure	<ul style="list-style-type: none"> ● ABS control module internal electronic failure 	Renew the ABS modulator. Refer to the warranty policy and procedures manual if a module is suspect
C1B22-24	Hill Descent Switch - Signal stuck high	<ul style="list-style-type: none"> ● Signal stuck high - If the HDC switch is pressed for longer than 1 minute, this DTC may be logged. ● Harness/connector issue 	Check the switch operation. Refer to the electrical circuit diagrams and check the switch and circuit for short to power
C2009-64	Front Axle Wheel Speed Sensors Swapped - Signal plausibility failure	<ul style="list-style-type: none"> ● Sensor location swapped 	Swap the front wheel speed sensor locations. Clear the DTC and retest. In order to clear the DTC/warning lamp after fault is rectified, the vehicle must be driven above 15km/h
C200A-64	Rear Axle Wheel Speed Sensors Swapped - Signal plausibility failure	<ul style="list-style-type: none"> ● Sensor location swapped 	Swap the rear wheel speed sensor locations. Clear the DTC and retest. In order to clear the DTC/warning lamp after fault is rectified, the vehicle must be driven above 15km/h

Check the battery condition and state of charge. Check the vehicle charging system. Refer to the relevant workshop manual section
U3006-17	Control Module Input Power "A" - Circuit voltage above threshold	<ul style="list-style-type: none"> ● ABS control module circuit voltage above threshold ● Charging system fault 	Check the battery condition and state of charge. Check the vehicle charging system. Refer to the relevant workshop manual section
U3006-1C	Control Module Input Power "A" - Circuit voltage out of range	<ul style="list-style-type: none"> ● ABS control module circuit voltage out of range, a momentary low voltage occurred 	Check the battery condition and state of charge. Check the vehicle charging system. Check the connector security to the module. Refer to the relevant workshop manual section

General Information - Diagnostic Trouble Code (DTC) Index **DTC: Audio Amplifier Module (AAM)**

Description and Operation

Audio Amplifier Module (AAM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Audio Amplifier Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Information and Entertainment System](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1A00-49	Control Module - Internal electronic failure	<ul style="list-style-type: none"> Amplifier internal electrical failure (can be set in more than one module) Touch screen display (TSD) internal electrical failure (can be set in more than one module) 	Refer to the electrical guides and check the power and ground circuits to the module. General Information - Diagnostic Trouble Code (DTC) Index **DTC: Audio Front Control Module - High Line (ACM)**

Description and Operation

Audio Front Control Module - High Line (ACM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Audio Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Information and Entertainment System](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1A56-01	Antenna - General Electrical Failure	<ul style="list-style-type: none"> Antenna connection is broken 	Check the antenna connection and circuit and for signs damage. Repair/renew as necessary
B1D21-15	Remote Control Switch - Circuit short to battery or open	<ul style="list-style-type: none"> Remote control switch circuit short circuit to power or open circuit 	Refer to the electrical circuit diagrams and check the steering wheel remote control switch circuit. Repair/renew as necessary
B1D79-01	Microphone Input - General Electrical Failure	<ul style="list-style-type: none"> Microphone circuit open circuit, short circuit to ground or short circuit to power Microphone configuration mismatched with Car Configuration File (CCF) 	Refer to the electrical circuit diagrams and check the microphone input circuit. Configure the system using the manufacturers approved diagnostic system
U0010-88	Medium Speed CAN Communication Bus - Bus off	<ul style="list-style-type: none"> BUS off 	Check for other modules reporting CAN Bus off or lost communication faults. Check CAN wiring. Using the manufacturer approved diagnostic system, complete a CAN integrity test. Refer to the electrical circuit diagrams and check the module CAN, power and ground circuits. U2104-23	Trip Meter Reset Button - Signal stuck low	<ul style="list-style-type: none"> ● Signal stuck low ● Switch activated for more than One minute ● Switch failure 	<ul style="list-style-type: none"> • NOTE: The Trip Switch connection at the Central Junction Box is C0581-25 <p>Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch. Refer to the warranty policy and procedures manual if a module/component is suspect</p>
U2300-64	Central Configuration - Signal plausibility failure	<ul style="list-style-type: none"> ● Tire pressure monitoring system configuration data is invalid caused by incorrect car / local configuration file(s) 	Using the manufacturer approved diagnostic system check and amend the car / local configuration file (s)
U3000-49	Control Module - Internal electronic failure	<ul style="list-style-type: none"> ● Internal electronic failure 	Renew Central Junction Box. Refer to the warranty policy and procedures manual if a module/component is suspect
U3001-54	Control Module Improper Shutdown - Missing calibration	<ul style="list-style-type: none"> ● Missing calibration ● EEPROM hasn't stored the final axis position of the steering column telescope/tilt position 	Check for other steering column telescope/tilt DTCs. Clear the DTC and operate the steering column through the complete telescope and tilt functions ranges. If the DTC returns, configure the steering column module using the manufacturers approved diagnostic system by running the relevant Configuration and Set up application

General Information - Diagnostic Trouble Code (DTC) Index DTC: Climate Control Module (HVAC)

Description and Operation

Climate Control Module (HVAC)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Climate Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Climate Control System](#) (412-00 Climate Control System - General Information, Diagnosis and Testing).

DTC	Description	Possible Causes	Action

When cool, clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policy and procedures manual if a module is suspect

General Information - Diagnostic Trouble Code (DTC) Index DTC: Digital Audio Control Module C (DACMC)

Description and Operation

Digital Audio Control Module C (DACMC)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Digital Audio Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: Audio System (415-01, Description and Operation).

DTC	Description	Possible Causes	Action
B1A56-02	Antenna - General signal failure	<ul style="list-style-type: none"> Antenna general signal failure 	Renew the diversity antenna amplifier
B1A56-11	Antenna - Circuit short to ground	<ul style="list-style-type: none"> Diversity antenna amplifier circuit short to ground 	Refer to the electrical guides and check the diversity antenna amplifier circuit and the antenna for short circuit to ground

U3000-98	Control Module - Component or system over temperature	<ul style="list-style-type: none"> Diversity antenna amplifier component or system over temperature 	Consider moving the amplifier mounting position to prevent unit overheating. Cool the vehicle interior down by ensuring it is in the shade and have the A/C on cool. When cool, clear the DTC and retest. If the problem persists, renew the amplifier module

General Information - Diagnostic Trouble Code (DTC) IndexDTC: Driver/Passenger Door Module (DDM/PDM)

Description and Operation

Driver/Passenger Door Module (DDM/PDM)

• CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the digital multimeter leads into account

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If diagnostic trouble codes are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals

• NOTE: Where an 'on demand self-test' is referred to, this can be accessed via the 'diagnostic trouble code monitor' tab on the manufacturers approved diagnostic system

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Driver/Passenger Door Control Modules, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Rear View Mirrors](#) (501-09 Rear View Mirrors, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B108F-23	Cabin Lock/Unlock Switch - Signal stuck low	<ul style="list-style-type: none"> ● Cabin lock/unlock switch signal stuck ● Switch pressed for longer than 20 seconds ● Switch circuit short circuit to power or ground ● Switch failure 	<ul style="list-style-type: none"> ● Check the switch operation and serviceability. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power and ground supply circuits to both modules

General Information - Diagnostic Trouble Code (DTC) Index DTC: Driver/Passenger Front Seat Module (DSM/PSM)

Description and Operation

Driver/Passenger Front Seat Module (DSM/PSM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Drivers/Passenger Seat Modules, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Seats](#) (501-10 Seating, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1060-11	Seat Headrest Motor Output - Circuit short to ground	<ul style="list-style-type: none"> ● Circuit short to ground 	Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat headrest motor circuit
B1060-15	Seat Headrest Motor Output - Circuit short to battery or open	<ul style="list-style-type: none"> ● Circuit short to battery or open 	Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat headrest motor circuit
B1064-31	Seat Headrest Motor Sensor - no signal	<ul style="list-style-type: none"> ● No signal from sensor ● Sensor/motor malfunction ● Harness/connector problem 	Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat headrest motor sensor circuit
B106D-24	Headrest Up Switch - Signal stuck high	<ul style="list-style-type: none"> ● Signal stuck high ● Switch malfunction 	Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B106E-24	Headrest Down Switch - Signal stuck high	<ul style="list-style-type: none"> ● Signal stuck high ● Switch malfunction 	Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit

Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Instrument Panel Cluster and Seat Control Module
U0199-00	Lost Communication With "Door Control Module A" - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Door Control Module and Seat Control Module
U0300-00	Software Incompatibility - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Check the module configuration using the approved diagnostic system. Check that the module software versions are the latest release and update as necessary
U1A14-49	CAN Initialization Failure - internal electronic failure	<ul style="list-style-type: none"> ● Module internal electronic failure 	Suspect Seat Control Module. Refer to the warranty policy and procedures manual if a module is suspect
U1A4C-00	Build / End of Line mode Active - No sub type information	<ul style="list-style-type: none"> ● Vehicle configuration incorrect 	Check the module configuration using the approved diagnostic system
U3000-49	Control Module - Internal electronic failure	<ul style="list-style-type: none"> ● Internal electronic failure - Internal RAM/ROM error 	Renew the Control module. Refer to the warranty policy and procedures manual if a module is suspect
U3001-46	Control Module Improper Shutdown - calibration / parameter memory failure	<ul style="list-style-type: none"> ● Calibration/parameter memory failure - Any motor activation (slide, height and recline axis) has been interrupted by an control module power disconnection while in manufacturing mode 	Clear the DTC and retest. If the problem persists, configure the module using the manufacturers approved diagnostic system
U3002-81	Vehicle Identification Number - invalid serial data received	<ul style="list-style-type: none"> ● Invalid serial data received 	Configure the module using the manufacturers approved diagnostic system
U3003-16	Battery Voltage - Circuit voltage below threshold	<ul style="list-style-type: none"> ● Battery voltage below threshold (8 volts) 	Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module
U3003-17	Battery Voltage - Circuit voltage above threshold	<ul style="list-style-type: none"> ● Battery voltage above threshold 	Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module

General Information - Diagnostic Trouble Code (DTC) Index DTC: Electric Steering Column Lock Module (VIM)

Description and Operation

Electric Steering Column Lock Module (VIM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Electric Steering Column Lock Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

DTC	Description	Possible Causes	Action
B100D-16	Column Lock Authorisation - circuit voltage below threshold	<ul style="list-style-type: none"> Electric Steering Column Lock circuit short to ground, high resistance, open circuit Electric Steering Column Lock failure 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check Electric Steering Column Lock circuit for short to ground, high resistance, open circuit. If the problem persists, check and install a new Electric Steering Column Lock. Refer to the warranty policy and procedures manual if a module is suspect
B100D-29	Column Lock Authorisation - signal invalid	<ul style="list-style-type: none"> Unlock or lock sensor invalid 	<ul style="list-style-type: none"> Clear the DTC, perform an on demand self-test and retest. If the problem persists, check and install a new Electric Steering Column Lock. Refer to the warranty policy and procedures manual if a module is suspect
B100D-42	Column Lock Authorisation - general memory failure	<ul style="list-style-type: none"> Electric Steering Column Lock internal memory failure 	<ul style="list-style-type: none"> Clear the DTC. Complete a CAN network integrity test using the manufacturers approved diagnostic system. Perform an on demand self-test and retest. If the problem persists, check and install a new Electric Steering Column Lock. Refer to the warranty policy and procedures manual if a module is suspect
B100D-51	Column Lock Authorisation - not programmed	<ul style="list-style-type: none"> Electric Steering Column Lock not programmed 	<ul style="list-style-type: none"> Configure the Electric Steering Column Lock using the manufacturers approved diagnostic system
B100D-62	Column Lock Authorisation - signal compare failure	<ul style="list-style-type: none"> Encrypted data exchange does not match between Electric Steering Column Lock and the Central Junction Box 	<ul style="list-style-type: none"> Configure the Electric Steering Column Lock using the manufacturers approved diagnostic system. Configure the Central Junction Box using the manufacturers approved diagnostic system. If the problem persists, complete a CAN network integrity test using the manufacturers approved diagnostic system. Perform an on demand self-test and retest
B100D-64	Column Lock Authorisation - signal plausibility failure	<ul style="list-style-type: none"> Incorrect conditions to allow locking action to continue 	<ul style="list-style-type: none"> Clear the DTC and complete a CAN network integrity test using the manufacturers approved diagnostic system. , Perform an on demand self-test and retest. Check for other control module DTCs, in particular the ABS and powertrain modules. Rectify as necessary. Select the data logging function and confirm the 'Vehicle speed' and 'Engine speed' values are consistent with actual values
B100D-72	Column Lock Authorisation - actuator stuck open	<ul style="list-style-type: none"> Electric Steering Column Lock unable to reach locked state Electric Steering Column Lock internal failure 	<ul style="list-style-type: none"> Clear the DTC. Ensure the vehicle battery supply voltage is between 9-16Volts. Complete a CAN network integrity test using the manufacturers approved diagnostic system. Perform an on demand self-test and retest. If the problem persists, check and install a new Electric Steering Column Lock. Refer to the warranty policy and procedures manual if a module is suspect

DTC	Description	Possible Causes	Action
B100D-73	Column Lock Authorisation - actuator stuck closed	<ul style="list-style-type: none"> ● Electric Steering Column Lock unable to reach unlocked state ● Electric Steering Column Lock internal failure 	<ul style="list-style-type: none"> ● Clear the DTC. Ensure the vehicle battery supply voltage is between 9-16Volts. Ensure the column lock bolt movement is not obstructed or restricted (the parked position of the road wheels may be exerting a turning force through the steering column, preventing the lock from releasing. The steering wheel may need to be held against the force to allow the column lock to release). Complete a CAN network integrity test using the manufacturers approved diagnostic system. Perform an on demand self-test and retest. If the problem persists, check and install a new Electric Steering Column Lock. Refer to the warranty policy and procedures manual if a module is suspect
B100D-77	Column Lock Authorisation - commanded position not reachable	<ul style="list-style-type: none"> ● Electric Steering Column Lock unable to reach unlocked or locked state ● Electric Steering Column Lock internal failure 	<ul style="list-style-type: none"> ● Clear the DTC. Ensure the vehicle battery supply voltage is between 9-16Volts. Ensure the column lock bolt movement is not obstructed or restricted (the parked position of the road wheels may be exerting a turning force through the steering column, preventing the lock from releasing. The steering wheel may need to be held against the force to allow the column lock to release). Complete a CAN network integrity test using the manufacturers approved diagnostic system. Perform an on demand self-test and retest. If the problem persists, check and install a new Electric Steering Column Lock. Refer to the warranty policy and procedures manual if a module is suspect
B100D-92	Column Lock Authorisation - performance or incorrect operation	<ul style="list-style-type: none"> ● Electric Steering Column Lock mechanism jammed, obstructed ● Electric Steering Column Lock internal failure 	<ul style="list-style-type: none"> ● Clear the DTC. Ensure the vehicle battery supply voltage is between 9-16Volts. Ensure the column lock bolt movement is not obstructed or restricted (the parked position of the road wheels may be exerting a turning force through the steering column, preventing the lock from releasing. The steering wheel may need to be held against the force to allow the column lock to release). Complete a CAN network integrity test using the manufacturers approved diagnostic system. Perform an on demand self-test and retest. If the problem persists, check and install a new Electric Steering Column Lock. Refer to the warranty policy and procedures manual if a module is suspect
B100D-94	Column Lock Authorisation - unexpected operation	<ul style="list-style-type: none"> ● Electric Steering Column Lock mechanism jammed, obstructed ● Electric Steering Column Lock internal failure 	<ul style="list-style-type: none"> ● Clear the DTC. Ensure the vehicle battery supply voltage is between 9-16Volts. Ensure the column lock bolt movement is not obstructed or restricted (the parked position of the road wheels may be exerting a turning force through the steering column, preventing the lock from releasing. Refer to the electrical circuit diagrams. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation
P0425-62	Catalyst Temperature Sensor Circuit (Bank 1, Sensor Circuit 1) - signal compare failure	<ul style="list-style-type: none"> ● Pre-catalytic converter temperature sensor signal compare failure(right-hand bank sensor 1) ● Pre-catalytic converter temperature sensor correlation compare with at least two other sensors ● Pre-catalytic converter temperature sensor failure ● Pre-catalytic converter temperature sensor circuit - short to ground, power or open circuit 	Refer to the electrical circuit diagrams and check pre-catalytic converter temperature sensor circuit for open circuit, short to ground, short to power. Check pre-catalytic converter temperature sensor for dirt contamination, corrosion, water ingress damage. Renew the sensor
P0426-00	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1, Sensor Circuit 1) - no sub type information	<ul style="list-style-type: none"> ● Pre-catalytic converter temperature sensor gradient check (right hand bank sensor 1) ● Pre-catalytic converter temperature sensor failure ● Pre-catalytic converter temperature sensor circuit - short to ground, power or open circuit ● Pre-catalytic converter temperature sensor circuit high resistance 	Refer to the electrical circuit diagrams and check pre-catalytic converter temperature sensor circuit for open circuit, short to ground, short to power and intermittent poor or dirty connections. Renew the sensor
P0426-1A	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1, Sensor Circuit 1) - circuit resistance below threshold	<ul style="list-style-type: none"> ● Pre-catalytic converter temperature sensor circuit resistance below threshold (right-hand bank sensor 1) ● Pre-catalytic converter temperature sensor plausibility at cold start, temperature difference too high ● Pre-catalytic converter temperature sensor stuck at high temperature value 	Refer to the electrical circuit diagrams and check pre-catalytic converter temperature sensor circuit for low resistance, short to ground. Renew the sensor
P0426-1B	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1, Sensor Circuit 1) - circuit resistance above threshold	<ul style="list-style-type: none"> ● Pre-catalytic converter temperature sensor circuit resistance above threshold (right-hand bank sensor 1) ● Pre-catalytic converter temperature sensor plausibility at cold start, temperature difference too low ● Pre-catalytic converter temperature sensor stuck at high temperature value 	Refer to the electrical circuit diagrams and check pre-catalytic converter temperature sensor circuit for high resistance, open circuit. Renew the sensor
P0426-1E	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1, Sensor Circuit 1) - circuit resistance out of range	<ul style="list-style-type: none"> ● Pre-catalytic converter temperature sensor circuit resistance out of range (right-hand bank sensor 1) ● Pre-catalytic converter temperature sensor plausibility at engine running, temperature too low ● Pre-catalytic converter temperature sensor stuck at low temperature value 	Refer to the electrical circuit diagrams and check pre-catalytic converter temperature sensor circuit for open circuit, short to ground, short to power. Check pre-catalytic converter temperature sensor for dirt contamination, corrosion, water ingress damage. Renew the sensor

General Information - Diagnostic Trouble Code (DTC) Index TDV6 3.0L

Diesel, DTC: Engine Control Module (PCM)

Description and Operation

Engine Control Module (PCM) 3.0L TdV6

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Engine Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Diagnosis and Testing).

DTC	Description	Possible Cause	Action
B1087-93	LIN Bus "A" - No operation	<ul style="list-style-type: none"> Generator LIN bus communication circuit failure 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check the generator LIN bus circuit, for short circuit to power, short circuit to ground, open circuit. P0201-00	Cylinder 1 Injector Circuit / Open - no sub type information	<ul style="list-style-type: none"> ● Injector disconnected ● Injector harness wiring high resistance, short circuit to ground ● Injector failure 	For fuel system tests, refer to the relevant workshop manual section. Refer to the electrical circuit diagrams and check the sensor circuit. If no circuit fault exists, renew the injector. Clear the DTC and retest
P0202-00	Cylinder 2 Injector Circuit / Open - no sub type information	<ul style="list-style-type: none"> ● Injector disconnected ● Injector harness wiring high resistance, short circuit to ground ● Injector failure 	For fuel system tests, refer to the relevant workshop manual section. Refer to the electrical circuit diagrams and check the sensor circuit. If no circuit fault exists, renew the injector. Clear the DTC and retest
P0203-00	Cylinder 3 Injector Circuit / Open - no sub type information	<ul style="list-style-type: none"> ● Injector disconnected ● Injector harness wiring high resistance, short circuit to ground ● Injector failure 	For fuel system tests, refer to the relevant workshop manual section. Refer to the electrical circuit diagrams and check the sensor circuit. If no circuit fault exists, renew the injector. Clear the DTC and retest

General Information - Diagnostic Trouble Code (DTC) Index V8 5.0L Petrol, DTC: Engine Control Module (PCM)

Description and Operation

Engine Control Module (PCM) 5.0L V8

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Engine Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Electronic Engine Controls](#) (303-14D Electronic Engine Controls - V8 5.0L Petrol, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B10A2-31	Crash Input - No signal	<ul style="list-style-type: none"> • NOTE: - Circuit SRS_SIGNAL - • Loss of communication between restraints control module and engine control module 	<ul style="list-style-type: none"> • Refer to the electrical circuit diagrams and check restraints control module pulse width modulated SRS signal line circuit, hard wired connection between engine control module and restraints control module for short circuit to ground, short circuit to power, open circuit. Repair circuit as required, clear the DTC and retest
B10AC-81	Cruise Control Switch - Invalid serial data received	<ul style="list-style-type: none"> • The engine control module has received an invalid command from the steering wheel switch pack 	<ul style="list-style-type: none"> • Clear the DTC and press all the steering wheel switches, re-check for DTCs. Refer to the electrical circuit diagrams and check the speed control switch circuit for open circuit, short circuit to power, short circuit to ground, disconnected • Check and install a new steering wheel module as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B10AC-82	Cruise Control Switch - Alive / sequence counter incorrect / not updated	<ul style="list-style-type: none"> • Cruise buttons alive counter is not incrementing. Which suggests that the LIN bus is faulty • Steering wheel module is not connected • Steering wheel module failure 	<ul style="list-style-type: none"> • Refer to the electrical circuit diagrams and check the speed control switch circuit for open circuit, short circuit to power, short circuit to ground, disconnected • Refer to the electrical circuit diagrams and check the LIN bus between steering wheel module and the CAN gateway • Check and install a new steering wheel module as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B10AC-83	Cruise Control Switch - Value of signal protection calculation incorrect	<ul style="list-style-type: none"> • Cruise buttons checksum incorrect, incorrect cruise switches fitted to vehicle 	<ul style="list-style-type: none"> • Check and install new cruise switches as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component

DTC	Description	Possible Causes	Action
B10AC-96	Cruise Control Switch - Component internal failure	<ul style="list-style-type: none"> ● Speed control switch circuit, open circuit, short circuit to power, short circuit to ground, disconnected ● Speed control switch failure ● Steering wheel module failure 	<ul style="list-style-type: none"> ● Check for related DTCs in other central junction boxes ● Refer to the electrical circuit diagrams and check the speed control switch circuit for open circuit, short circuit to power, short circuit to ground, disconnected ● Check and install a new speed control switch as required. Check and install a new steering wheel module as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B10FF-68	Ignition Control - Event information	<ul style="list-style-type: none"> ● Spark plug(s) fault ● Wiring harness fault ● Ignition coil(s) fault 	<ul style="list-style-type: none"> ● Refer to repair manual and check spark plug(s) for condition and security. Replace any defective components as required ● Refer to electrical wiring diagrams and check ignition coil circuit for intermittent open circuit, short circuit to power, short circuit to ground ● Check and install a new coil(s) as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B11DB-01	Battery Monitoring Module - General electrical failure	<ul style="list-style-type: none"> ● NOTE: - Circuit BATTERY - ● Charging system fault ● Battery monitoring signal line circuit fault ● Vehicle battery fault 	<ul style="list-style-type: none"> ● Refer to electrical wiring diagrams and check charging system for faults. Perform any repairs required ● Refer to the electrical wiring diagrams and check the battery monitoring system module circuit for open circuit, short circuit to ground, short circuit to power ● Refer to the workshop manual and the battery care manual, inspect the vehicle battery and ensure it is fully charged and serviceable before performing further tests
B11DB-87	Battery Monitoring Module - Missing message	<ul style="list-style-type: none"> ● NOTE: - Circuit BATTERY - ● Battery signal line circuit fault 	<ul style="list-style-type: none"> ● Refer to the electrical wiring diagrams and check the battery monitoring system module circuit for open circuit, short circuit to ground, short circuit to power ● Refer to the electrical circuit diagrams and check the LIN circuit for short circuit to ground, short circuit to power, open circuit
B1206-68	Crash Occurred - Event information	<ul style="list-style-type: none"> ● NOTE: - Circuit SRS_SIGNAL - ● Engine control module has detected the vehicle has crashed - event information DTC only 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the engine control module to restraints control module circuit for short circuit to ground, short circuit to power, open circuit. Repair circuit as required, clear the DTC and retest

Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component

General Information - Diagnostic Trouble Code (DTC) Index DTC: Front Controls Interface Module (FCIM) - Front Integrated Control Panel

Description and Operation

Front Controls Interface Module (FCIM) - Front Integrated Control Panel

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Front Controls Interface Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Information and Entertainment System](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
U0010-88	Medium Speed CAN Communication Bus - bus off	<ul style="list-style-type: none"> CAN network circuit short to ground, short to power, open circuit 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0140-00	Lost Communication With Body Control Module - no sub type information	<ul style="list-style-type: none"> CAN network failure between Front Integrated Control Panel and Central Junction Box 	Refer to the electrical circuit diagrams and check the power and ground connections to the Central Junction Box. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Front Integrated Control Panel and the Central Junction Box
U0155-00	Lost Communication With Instrument Panel Cluster (IPC) Control Module - no sub type information	<ul style="list-style-type: none"> CAN network failure between Front Integrated Control Panel and Instrument Panel Cluster 	Refer to the electrical circuit diagrams and check the power and ground connections to the Instrument Panel Cluster. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Front Integrated Control Panel and the Instrument Panel Cluster
U0164-00	Lost Communication With HVAC Control Module - no sub type information	<ul style="list-style-type: none"> CAN network failure between HVAC Control Module and Front Integrated Control Panel 	Refer to the electrical circuit diagrams and check the power and ground connections to the HVAC Control Module. DTC	Description	Possible Causes	Action
B1A85-11	Ambient Light Sensor - circuit short to ground	<ul style="list-style-type: none"> ● Ambient light sensor circuit short to ground ● Ambient light sensor failure 	<p>• NOTE: The ambient light sensor and circuits are integral to the Front Controls Interface Module B</p> <p>Clear DTC and re-test. If DTC remains, check Ambient Light Sensor Voltage (0x721C) Datalogger signal using manufacturer approved diagnostic system. Check the voltage decreases when the sensor is covered and increases when a light source is directed into the sensor. If the sensor voltage does not change with varying light intensity suspect the Front Controls Interface Module B. Refer to the warranty policy and procedures manual prior to installing a new module</p>
B1A85-12	Ambient Light Sensor - circuit short to battery	<ul style="list-style-type: none"> ● Ambient light sensor circuit short to power ● Ambient light sensor failure 	<p>• NOTE: The ambient light sensor and circuits are integral to the Front Controls Interface Module B</p> <p>Clear DTC and re-test. If DTC remains, check Ambient Light Sensor Voltage (0x721C) Datalogger signal using manufacturer approved diagnostic system. Check the voltage decreases when the sensor is covered and increases when a light source is directed into the sensor. If the sensor voltage does not change with varying light intensity suspect the Front Controls Interface Module B. Refer to the warranty policy and procedures manual prior to installing a new module</p>

General Information - Diagnostic Trouble Code (DTC) Index DTC: Front Entertainment Module (FEM)

Description and Operation

Front Entertainment Module (FEM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Front Entertainment Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Information and Entertainment System](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B100F-25	Video Input "B" - signal shape / waveform failure	<ul style="list-style-type: none"> Rear camera disconnected Camera malfunction 	Check the video signal connection and whether it is being broadcasted. Where available, configure the rear camera using the manufacturers approved diagnostic system. Check whether the rear camera is broadcasting an image by entering diagnostics selecting 'Video Input Test' then press 'Rear View Camera'. Check whether a clear image is displayed. Refer to the electrical circuit diagrams and check the video signal circuit between the rear camera and the Camera Control Module. If the problem persists, renew the camera. Clear the DTC and retest
B1010-25	Video Input "C" - signal shape / waveform failure	<ul style="list-style-type: none"> Television/Rear seat entertainment video input disconnected TV/DVD malfunction 	Check the video signal connection and whether it is being broadcasted. Where available, configure the TV or Rear Seat Entertainment module (RSE) using the manufacturers approved diagnostic system. Check whether the TV or RSE is broadcasting an image by entering diagnostics selecting 'Video Input Test' then press 'TV/RSE'. Check whether a clear image is displayed. Refer to the electrical circuit diagrams and check the video signal circuit from the RSE. If the problem persists, renew the RSE. Refer to the warranty policy and procedures manual if a module is suspect Clear the DTC and retest
B108E-14	Display - Circuit short to ground or open circuit	<ul style="list-style-type: none"> Display circuit short circuit to ground or open circuit Module internal fault 	Renew the Front Entertainment Module. Refer to the warranty policy and procedures manual if a module is suspect
B108E-17	Display - circuit voltage above threshold	<ul style="list-style-type: none"> Display circuit voltage above threshold Module internal fault 	Renew the Front Entertainment Module. Refer to the warranty policy and procedures manual if a module is suspect
B108E-1C	Display - circuit voltage out of range	<ul style="list-style-type: none"> Display circuit voltage out of range Module internal fault 	Renew the Front Entertainment Module. Refer to the warranty policy and procedures manual if a module is suspect
B108E-87	Display - missing message	<ul style="list-style-type: none"> Display internal video signal fault Module internal fault 	Clear the DTC and switch of the ignition. Allow sufficient time for the infotainment relay to power down and retest. If DTC persists reprogram the display via a software update using the manufacturers approved diagnostic system. Clear the DTC and switch of the ignition. Allow sufficient time for the infotainment relay to power down and retest. If DTC persists renew the Front Entertainment Module. Refer to the warranty policy and procedures manual if a module is suspect
B119F-11	GPS Antenna - circuit short to ground	<ul style="list-style-type: none"> Antenna circuit short circuit to ground 	Check the global positioning system (GPS) connector to the front entertainment module for security and integrity. Check the GPS antenna is not damaged. Refer to the electrical circuit diagrams and check the circuit between the GPS antenna and the front entertainment module. Repair as necessary. Where an approved diagnostic

DTC	Description	Possible Causes	Action
			system is available, enter the diagnostics and select 'GPS Information'. Check that latitude and longitude data is shown and GPS satellites are being seen
B119F-13	GPS Antenna - circuit open	<ul style="list-style-type: none"> ● Antenna circuit open circuit ● Antenna not connected 	Check the global positioning system (GPS) connector to the front entertainment module for security and integrity. Check the GPS antenna is not damaged. Refer to the electrical circuit diagrams and check the circuit between the GPS antenna and the front entertainment module. Repair as necessary. Where an approved diagnostic system is available, enter the diagnostics and select 'GPS Information'. Check that latitude and longitude data is shown and GPS satellites are being seen
B11A3-49	Gyroscope - Internal electronic failure	<ul style="list-style-type: none"> ● Control module internal electronic failure 	Renew the Front Entertainment Module. Refer to the warranty policy and procedures manual if a module is suspect
B121C-13	Hard Drive - circuit open	<ul style="list-style-type: none"> ● Module internal hard drive open circuit/not connected ● Control module internal electronic failure 	Renew the Front Entertainment Module. Refer to the warranty policy and procedures manual if a module is suspect
B121C-44	Hard Drive - data memory failure	<ul style="list-style-type: none"> ● Control module internal electronic failure 	Renew the front Entertainment Module. Refer to the warranty policy and procedures manual if a module is suspect
B1D55-14	Antenna #2 - Circuit short to ground or open circuit	<ul style="list-style-type: none"> ● NOTE: This DTC is always set after the On Demand Self Test (ODST) has been run. Ignore this DTC, if this is the only DTC set ● Antenna disconnected ● Antenna circuit short circuit to ground ● Antenna circuit open circuit 	Check that the traffic message (TMC) connector is connected to the front entertainment module and the TMC antenna or circuit is not damaged. Where an approved diagnostic system is available, enter diagnostics and select 'RDS-TMC Information'. Check the date/time and frequency is shown
B1D56-14	Antenna #3 - Circuit short to ground or open circuit	<ul style="list-style-type: none"> ● Antenna disconnected ● Antenna circuit short circuit to ground ● Antenna circuit open circuit 	Check that the vehicle information and communication systems (VICS) connector is connected to the front entertainment module and the VICS antenna or circuit is not damaged. Where an approved diagnostic system is available, enter diagnostics and select 'RDS-TMC Information'. Check that latitude and longitude data is shown and GPS satellites are being seen
U1A01-56	Communication Link - Invalid / incomplete configuration	<ul style="list-style-type: none"> ● Invalid/incomplete configuration 	Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. Configure the module using the manufacturers approved diagnostic system. If DTC persists renew the Front Entertainment Module. Refer to the warranty policy and procedures manual if a module is suspect
U1A4B-82	Control Module Processor B - alive / sequence counter incorrect / not updated	<ul style="list-style-type: none"> ● Module internal sequence counter incorrect/not updated 	Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. Configure the module using the manufacturers approved diagnostic system. If DTC persists renew the Front Entertainment Module. Refer to the warranty policy and procedures manual if a module is suspect
U1A4B-87	Control Module Processor B - missing message	<ul style="list-style-type: none"> ● Module missing message 	Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. Configure the module using the manufacturers approved diagnostic system. If DTC persists renew the Front Entertainment Module. Refer to the warranty policy and procedures manual if a module is suspect
U2005-62	Vehicle Speed - signal compare failure	<ul style="list-style-type: none"> ● Vehicle speed and calculated GPS system vehicle speed mismatch ● Vehicle speed signal circuit between ABS and navigation system module - short or open circuit 	Check the ABS connector and wiring harness. Where an approved diagnostic system is available, enter diagnostics and select 'Vehicle Signals'. Check that the vehicle speeds both increase when the car is moving. Refer to the electrical circuit diagrams and check vehicle speed signal circuit between the ABS module and navigation system module
U2101-00	Control Module Configuration Incompatible - no sub type information	<ul style="list-style-type: none"> ● Car Configuration File parameter mismatch ● Invalid/incomplete configuration 	Using the manufacturers approved diagnostic system, check the Car Configuration File parameters match the vehicle setup
U2101-4A	Control Module Configuration Incompatible - incorrect component installed	<ul style="list-style-type: none"> ● Navigation map license mismatch ● Invalid/incomplete configuration 	Enter the navigation menu and select 'Map changer'. Check that the map regions match the Front Entertainment Module market

DTC	Description	Possible Causes	Action
U210A-85	Temperature Sensor - signal above allowable range	<ul style="list-style-type: none"> ● Media Orientated System Transport (MOST) Fibre Optic Transceiver (FOT) overheating 	Cool the vehicle interior down by ensuring it is in the shade and the A/C on cool. Where an approved diagnostic system is available, enter diagnostics and select 'Vehicle Signals'. Check the Media Orientated System Transport (MOST), Fibre Optic Transceiver (FOT) and Printed Circuit Board (PCB) temperatures. When cool, clear the DTC and retest. Refer to the warranty policy and procedures manual if a module is suspect
U3003-17	Battery Voltage - circuit voltage above threshold	<ul style="list-style-type: none"> ● Battery voltage above threshold 	Where an approved diagnostic system is available, enter diagnostics and select 'Vehicle Signals'. Compare the Battery voltage with the control module vehicle voltage. Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module

General Information - Diagnostic Trouble Code (DTC) Index DTC: Fuel Fired Booster Heater Module (AHCM)

Description and Operation

Fuel Fired Booster Heater Module (AHCM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all diagnostic trouble codes that could be logged in the fuel fired booster heater module, for additional diagnosis and testing information refer to the relevant diagnosis and testing section.
For additional information, refer to: [Fuel Fired Booster Heater](#) (412-02B Auxiliary Heating, Diagnosis and Testing).

• **NOTE:** Where an 'on demand self-test' is referred to, this can be accessed via the 'DTC Monitor' tab on the manufacturers approved diagnostic system.

DTC	Description	Possible Causes	Action
B1206-53	Crash Occurred - deactivated	<ul style="list-style-type: none"> Crash signal received over CAN network 	<ul style="list-style-type: none"> NOTE: Event information - the restraints control module has recorded a crash event Using the manufacturer approved diagnostic system, check other modules for related diagnostic trouble codes

			module

General Information - Diagnostic Trouble Code (DTC) Index DTC: Headlamp Control Module A (HCM)

Description and Operation

Headlamp Control Module A (HCM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Headlamp Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Headlamps](#) (417-01 Exterior Lighting, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1041-04	Levelling Control - System internal failures	<ul style="list-style-type: none"> No headlamp levelling functionality - Module internal failure 	Install a new headlamp Control module as required. Refer to the warranty policy and procedures manual
B1041-54	Levelling Control - Missing calibration	<ul style="list-style-type: none"> Levelling sensor calibration routine not carried out 	<ul style="list-style-type: none"> NOTE: Sensor calibration routine must be carried out with the vehicle unladen and with correct tire pressures. Carry out the levelling sensor calibration routine using the manufacturer approved diagnostic system
B1087-83	LIN Bus "A" - Value of signal protection calculation incorrect	<ul style="list-style-type: none"> Checksum error 	Clear the DTC and re-test. If the DTC remains install a new headlamp Control module. Refer to the warranty policy and procedures manual
B1087-86	LIN Bus "A" - Signal invalid	<ul style="list-style-type: none"> Signal invalid 	Clear the DTC and re-test. If the DTC remains install a new headlamp Control module. Refer to the warranty policy and procedures manual
B1087-88	LIN Bus "A" - Bus off	<ul style="list-style-type: none"> Bus Off LIN Bus circuit short circuit to ground 	Refer to the electrical circuit diagrams and check the LIN bus circuit. Check for other related DTCs
B10AE-11	Headlamp Leveling Motor - Circuit short to ground	<ul style="list-style-type: none"> Headlamp Levelling motor Control circuit - short to ground 	Refer to the electrical circuit diagrams and check headlamp levelling motor Control circuit for short to ground and the motor signal voltage
B10AE-12	Headlamp Leveling Motor - Circuit short to battery	<ul style="list-style-type: none"> Headlamp levelling motor Control circuit - short to power 	Refer to the electrical circuit diagrams and check headlamp levelling motor Control circuit for short to power
B10AE-64	Headlamp Leveling Motor - Signal plausibility failure	<ul style="list-style-type: none"> signal plausibility failure 	Refer to the electrical circuit diagrams and check the LIN bus circuit. Check for other related DTCs
B1A59-11	Sensor 5 Volt Supply - Circuit short to ground	<ul style="list-style-type: none"> Headlamp levelling sensor 5 volt supply circuit - short to ground 	Refer to the electrical circuit diagrams and check headlamp levelling sensor 5 volt supply circuit for short to ground
B1A59-12	Sensor 5 Volt Supply - Circuit short to battery	<ul style="list-style-type: none"> Headlamp levelling sensor 5 volt supply circuit - short to power 	Refer to the electrical circuit diagrams and check headlamp levelling sensor 5 volt supply circuit for short to power
B1D64-01	Left Headlamp Swivelling Motor - General electrical failure	<ul style="list-style-type: none"> General electrical failure- Left headlamp swivelling motor error 	Check the headlamp connections, clear the DTC and re-test. If the DTC remains install a new headlamp
B1D64-04	Left Headlamp Swivelling Motor - System internal failures	<ul style="list-style-type: none"> System internal failures - Left headlamp swivelling motor error 	Check the headlamp connections, clear the DTC, switch off the ignition and allow sufficient time for the module to power down and re-test. If the DTC persists, install a new headlamp
B1D64-87	Left Headlamp Swivelling Motor - Missing message	<ul style="list-style-type: none"> Missing message 	Check the headlamp connections, clear DTC and re-test. If DTC remains install a new headlamp

DTC	Description	Possible Causes	Action
B1D65-01	Right Headlamp Swivelling Motor - General electrical failure	<ul style="list-style-type: none"> General electrical failure- right headlamp swivelling motor error 	Clear the DTC and re-test. If the DTC remains install a new headlamp
B1D65-04	Right Headlamp Swivelling Motor - System internal failures	<ul style="list-style-type: none"> System internal failures - Right headlamp swivelling motor error 	Check the headlamp connections, clear the DTC, switch off the ignition and allow sufficient time for the module to power down and re-test. If the DTC persists, install a new headlamp
B1D65-87	Right Headlamp Swivelling Motor - Missing message	<ul style="list-style-type: none"> Missing message 	Check the headlamp connections, clear DTC and re-test, if DTC remains install a new headlamp
B1D68-00	Left Headlamp Swivelling Feedback Sensor - No sub type information	<ul style="list-style-type: none"> sensor not detected 	Check the headlamp connector for integrity. Refer to the circuit diagrams and check headlamp circuit. Clear DTC and re-test, if DTC remains install a new headlamp
B1D69-00	Right Headlamp Swivelling Feedback Sensor - No sub type information	<ul style="list-style-type: none"> sensor not detected 	Check the headlamp connector for integrity. Refer to the circuit diagrams and check headlamp circuit. Clear DTC and re-test, if DTC remains install a new headlamp
C1A04-11	Right Front Height Sensor - Circuit short to ground	<ul style="list-style-type: none"> Height sensor harness wiring short circuit to ground 	Check the Ride Level Module for DTCs. Check the sensor connector for damage. Refer to the electrical circuit diagrams and check the sensor circuit for continuity or short circuit. Check sensor signal changes when sensor is rotated. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system
C1A04-15	Right Front Height Sensor - Circuit short to battery or open	<ul style="list-style-type: none"> Height sensor harness wiring short circuit to power 	Check the Ride Level Module for DTCs. Check the sensor connector for damage. Refer to the electrical circuit diagrams and check the sensor circuit for continuity or short circuit. Check sensor signal changes when sensor is rotated. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system
C1A04-64	Right Front Height Sensor - Signal plausibility failure	<ul style="list-style-type: none"> Height sensor signal plausibility failure 	Check the Ride Level Module for DTCs. Check the sensor connector for damage. Refer to the electrical circuit diagrams and check the sensor circuit for continuity or short circuit. Check sensor signal changes when sensor is rotated. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system
C1A06-11	Right Rear Height Sensor - Circuit short to ground	<ul style="list-style-type: none"> Height sensor harness wiring short circuit to ground 	Check the Ride Level Module for DTCs. Check the sensor connector for damage. Refer to the electrical circuit diagrams and check the sensor circuit for continuity or short circuit. Check sensor signal changes when sensor is rotated. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system
C1A06-15	Right Rear Height Sensor - Circuit short to battery or open	<ul style="list-style-type: none"> Height sensor harness wiring short circuit to power 	Check the Ride Level Module for DTCs. Check the sensor connector for damage. Refer to the electrical circuit diagrams and check the sensor circuit for continuity or short circuit. Check sensor signal changes when sensor is rotated. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system
C1A06-64	Right Rear Height Sensor - Signal plausibility failure	<ul style="list-style-type: none"> Height sensor signal plausibility failure 	Check the Ride Level Module for DTCs. Check the sensor connector for damage. Refer to the electrical circuit diagrams and check the sensor circuit for continuity or short circuit. Check sensor signal changes when sensor is rotated. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system
U0001-88	High Speed CAN Communication Bus - Bus off	Bus off	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0101-00	Lost Communication with TCM - No sub type information	<ul style="list-style-type: none"> CAN Bus communication error 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Transmission Control Module and Headlamp Control Module

DTC	Description	Possible Causes	Action
U0102-00	Lost Communication with Transfer Case Control Module - No sub type information	<ul style="list-style-type: none"> ● CAN Bus communication error 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Transfer Case Control Module and Headlamp Control Module
U0121-00	Lost Communication With Anti-Lock Brake System (ABS) Control Module - No sub type information	<ul style="list-style-type: none"> ● CAN Bus communication error 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the ABS Module and Headlamp Control Module
U0126-00	Lost Communication With Steering Angle Sensor Module - No sub type information	<ul style="list-style-type: none"> ● CAN Bus communication error 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Steering Angle Sensor Control Module and Headlamp Control Module
U0140-00	Lost Communication With Body Control Module - No sub type information	<ul style="list-style-type: none"> ● CAN Bus communication error 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Central Junction Box and Headlamp Control Module
U0142-00	Lost Communication With Body Control Module "B" - No sub type information	<ul style="list-style-type: none"> ● CAN Bus communication error 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Central Junction Box and Headlamp Control Module
U0300-00	Internal Control Module Software Incompatibility - No sub type information	<ul style="list-style-type: none"> ● Car Configuration File information incompatible to ECU 	Check/amend Car Configuration File using the manufacturer approved diagnostic system
U0402-00	Invalid Data Received From Transmission Control Module - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Check the Transmission Control Module for related DTCs and refer to the relevant DTC index
U0403-00	Invalid Data Received From Transfer Case Control Module - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Check the Transfer Case Control Module for related DTCs and refer to the relevant DTC index
U0415-00	Invalid Data Received From Anti-Lock Brake System Control Module - No sub type information	<ul style="list-style-type: none"> ● Invalid data received from ABS module 	Check the ABS Module for related DTCs and refer to the relevant DTC index
U0428-00	Invalid Data Received From Steering Angle Sensor Module - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Check the steering angle sensor module for related DTCs and refer to the relevant DTC index
U2100-00	Initial Configuration Not Complete - No sub type information	<ul style="list-style-type: none"> ● Car Configuration File information not received completely 	Check/amend Car Configuration File using manufacturer approved diagnostic system
U2101-00	Control Module Configuration Incompatible - No sub type information	<ul style="list-style-type: none"> ● Car Configuration File information incompatible to ECU 	Check/amend Car Configuration File using manufacturer approved diagnostic system
U3002-81	Vehicle Identification Number - Invalid serial data received	<ul style="list-style-type: none"> ● Stored VIN does not match most recent VIN 	Check/amend Car Configuration File using manufacturer approved diagnostic system
U3003-16	Battery Voltage - Circuit voltage below threshold	<ul style="list-style-type: none"> ● Circuit voltage below threshold 	Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical guides and check the power and ground supply circuits to the module.
U3003-17	Battery Voltage - Circuit voltage above threshold	<ul style="list-style-type: none"> ● Circuit voltage above threshold 	Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical guides and check the power and ground supply circuits to the module
U3003-62	Battery Voltage - Signal compare failure	<ul style="list-style-type: none"> ● Mis-match in battery voltage, between Central Junction Box and headlamp Control module, of 2 volts or more 	Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power and ground supply circuits to both modules

General Information - Diagnostic Trouble Code (DTC) Index DTC: Headlamp Control Module B (HCM2)

Description and Operation

Headlamp Control Module B (HCM2)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Headlamp Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Autolamps](#) (417-01 Exterior Lighting, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1286-16	Interior Mirror - Circuit voltage below threshold	<ul style="list-style-type: none"> Mirror circuit voltage below threshold <ul style="list-style-type: none"> The electrochromic function does not work 	<ul style="list-style-type: none"> This DTC is for information only. Clear the DTC and retest. If the problem persists, renew the mirror module. Refer to the warranty policy and procedures manual if a module is suspect
B1286-17	Interior Mirror - Circuit voltage above threshold	<ul style="list-style-type: none"> Mirror circuit voltage above threshold <ul style="list-style-type: none"> The electrochromic function does not work 	<ul style="list-style-type: none"> This DTC is for information only. B12C0-54	Left Mirror Camera - missing calibration	<ul style="list-style-type: none"> ● Left mirror camera not calibrated 	<ul style="list-style-type: none"> ● Using the manufacturer approved diagnostic system calibrate the left mirror camera
B12C1-19	Right Mirror Camera - Circuit current above threshold	<ul style="list-style-type: none"> ● Right mirror camera circuit current above threshold ● Right mirror camera is drawing little or no current, indicating an open circuit fault or disconnected camera 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the right mirror camera circuit for short to power, open circuit, high resistance
B12C1-31	Right Mirror Camera - no signal	<ul style="list-style-type: none"> ● Right mirror camera circuit fault ● Right mirror camera faulty 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the right mirror camera circuit for open circuit ● Check and install new right mirror camera as required Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B12C1-49	Right Mirror Camera - internal electronic failure	<ul style="list-style-type: none"> ● Right mirror camera internal electronic failure 	<ul style="list-style-type: none"> ● Check and install new right mirror camera as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component

DTC	Description	Possible Causes	Action
B12C1-54	Right Mirror Camera - missing calibration	<ul style="list-style-type: none"> Right mirror camera not calibrated 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system calibrate the right mirror camera
P1603-00	EEPROM Malfunction - No sub type information	<ul style="list-style-type: none"> Control module internal memory error 	Clear the DTC and retest. If the DTC resets, renew the module. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
U0010-88	Medium Speed CAN Communication Bus - bus off	<ul style="list-style-type: none"> Bus off 	Refer to the electrical circuit diagrams and check CAN private network for short, open circuit. Carry out CAN network integrity tests using the manufacturer approved diagnostic system. Refer to the Network Communications section of the workshop manual
U0300-00	Internal Control Module Software Incompatibility - No sub type information	<ul style="list-style-type: none"> Incorrect software loaded Lost CAN signal 	Check for other modules reporting CAN Bus off or lost communication faults. If other modules report problems, check the software version in the Central Junction Box using the manufacturers approved diagnostic system. If no other modules report problems, check the software version in the parking aid module. Update as necessary
U1A4B-49	Control Module Processor B - internal electronic failure	<ul style="list-style-type: none"> Internal electronic failure 	Clear the DTC and retest. If the DTC resets, renew the module. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
U201A-51	Control Module Main Calibration Data - not programmed	<ul style="list-style-type: none"> Local config/calibration file missing/invalid (LCF) 	Configure the module using the approved diagnostic system
U3000-46	Control Module - calibration / parameter memory failure	<ul style="list-style-type: none"> Internal memory error 	Clear the DTC and retest. If the DTC resets, renew the module. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
U3000-47	Control Module - watchdog / safety MicroController failure	<ul style="list-style-type: none"> Watchdog/safety MicroController failure 	Clear the DTC and retest. If the DTC resets, renew the module. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
U3000-49	Control Module - internal electronic failure	<ul style="list-style-type: none"> Internal memory error 	Clear the DTC and retest. If the DTC resets, renew the module. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
U3000-98	Control Module - component or system over temperature	<ul style="list-style-type: none"> Component or system over temperature 	Consider the environmental conditions before suspecting a module. Allow the module to cool, clear the DTC and retest. Refer to the warranty policy and procedures manual if a module is suspect
U3003-62	Battery Voltage - Signal compare failure	<ul style="list-style-type: none"> Signal compare failure 	Check vehicle battery connections and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module

General Information - Diagnostic Trouble Code (DTC) Index DTC: Instrument Cluster (IPC)

Description and Operation

Instrument Cluster (IPC)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Instrument Panel Cluster, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.
For additional information, refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1009-51	Ignition Authorisation - not programmed	<ul style="list-style-type: none"> Ignition authorisation not programmed 	Configure the instrument cluster using the manufacturers approved diagnostic system
B1009-87	Ignition Authorisation - missing message	<ul style="list-style-type: none"> Ignition authorisation message missing 	Configure the instrument cluster using the manufacturers approved diagnostic system
B100D-64	Column Lock Authorisation - signal plausibility failure	<ul style="list-style-type: none"> Request to lock or unlock steering column lock has failed due to engine RPM or vehicle speed 	Check the engine control module for related stored DTCs
B1026-12	Steering Column Lock - Circuit short to battery	<ul style="list-style-type: none"> Steering column lock circuit short to power 	Refer to the wiring diagrams and check the electric steering column ground circuit
B104A-00	Button 1 - No sub type information	<ul style="list-style-type: none"> No sub type information Joy pad switch is faulty 	Check the harness connector to the instrument cluster for security and integrity. Clear the DTC and retest the switch function. If the problem persists, renew the instrument cluster. Refer to the warranty policies and procedures before renewing the module
B104B-00	Button 2 - No sub type information	<ul style="list-style-type: none"> No sub type information Joy pad switch is faulty 	Check the harness connector to the instrument cluster for security and integrity. Clear the DTC and retest the switch function. If the problem persists, renew the instrument cluster. Refer to the warranty policies and procedures before renewing the module
B104C-00	Button 3 - No sub type information	<ul style="list-style-type: none"> No sub type information Joy pad switch is faulty 	Check the harness connector to the instrument cluster for security and integrity. Clear the DTC and retest the switch function. If the problem persists, renew the instrument cluster. Refer to the warranty policies and procedures before renewing the module
B104D-00	Button 4 - No sub type information	<ul style="list-style-type: none"> No sub type information Joy pad switch is faulty 	Check the harness connector to the instrument cluster for security and integrity. Clear the DTC and retest the switch function. If the problem persists, renew the instrument cluster. Refer to the warranty policies and procedures before renewing the module
B104E-00	Button 5 - No sub type information	<ul style="list-style-type: none"> No sub type information Joy pad switch is faulty 	Check the harness connector to the instrument cluster for security and integrity. Clear the DTC and retest the switch function. If the problem persists, renew the instrument cluster. Refer to the warranty policies and procedures before renewing the module
B108E-13	Display - Circuit open	<ul style="list-style-type: none"> Cluster display connector fails continuity check, continuity circuit in display flex cable open circuit 	Renew the instrument cluster. Refer to the warranty policy and procedures manual if a module is suspect

DTC	Description	Possible Causes	Action
B10B7-86	Rear Air Discharge Temperature - Signal invalid	<ul style="list-style-type: none"> ● Display illumination area temperature sensor signal is out of range 	Check the harness connector to the instrument cluster for security and integrity. Clear the DTC and retest the switch function. If the problem persists, renew the instrument cluster. Refer to the warranty policy and procedures manual if a module is suspect
B115C-7A	Transfer Fuel Pump - fluid leak or seal failure	<ul style="list-style-type: none"> ● Transfer fuel pump fault, fluid leak or seal failure 	Check for other fuel pump related DTCs. Renew the transfer fuel (jet) pump
B1A14-96	RCM Warning Lamp - Component internal failure	<ul style="list-style-type: none"> ● SRS LED failure ● Warning lamp circuit fault 	Check the harness connector to the Instrument Cluster for security and integrity. Clear the DTC and retest the switch function. If the problem persists, renew the Instrument Cluster. Refer to the warranty policies and procedures before renewing the module
B1A68-86	Ambient Temperature Sensor - Signal invalid	<ul style="list-style-type: none"> ● Internal board temperature sensor signal is out of range/invalid 	Check the harness connector to the Instrument Cluster for security and integrity. Clear the DTC and retest the switch function. If the problem persists, renew the Instrument Cluster. Refer to the warranty policies and procedures before renewing the module
B1A85-96	Ambient Light Sensor - Component internal failure	<ul style="list-style-type: none"> ● Internal light sensor failure 	Check the harness connector to the Instrument Cluster for security and integrity. Clear the DTC and retest the switch function. If the problem persists, renew the Instrument Cluster. Refer to the warranty policies and procedures before renewing the module
P0485-12	Fan Power/Ground Circuit - Circuit short to battery	<ul style="list-style-type: none"> ● Fan power/ground circuit short to power 	Refer to the electrical wiring diagrams and check the cluster cooling fan circuit and rectify as necessary. Clear the DTC and retest
P060A-08	Internal Control Module Monitoring Processor Performance - Bus Signal/Message Failures	<ul style="list-style-type: none"> ● Internal communication errors are causing lock-ups and resets 	Suspect the Instrument Cluster. Refer to the warranty policies and procedures before renewing the module
P0607-4B	Control Module Performance - Over temperature	<ul style="list-style-type: none"> ● Cluster over temperature 	Check the cluster cooling fan/circuit and rectify as necessary. Clear the DTC and retest
P0610-55	Control Module Vehicle Options Error - Not configured	<ul style="list-style-type: none"> ● Control module incorrectly configured 	Configure the module using the manufacturers approved diagnostic system
U0001-88	High Speed CAN Communication Bus - bus off	<ul style="list-style-type: none"> ● High speed CAN Bus circuit fault ● Module internal failure 	Refer to the electrical circuit diagrams and check the high speed CAN Bus circuit for fault. Using the manufacturer approved diagnostic system, complete a CAN network integrity test
U0010-88	Medium Speed CAN Communication Bus - bus off	<ul style="list-style-type: none"> ● Medium speed CAN Bus circuit fault ● Module internal failure 	Refer to the electrical circuit diagrams and check the medium speed CAN Bus circuit for fault. Using the manufacturer approved diagnostic system, complete a CAN network integrity test
U0100-00	Lost Communication With ECM/PCM "A" - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Engine Control Module and Instrument Cluster
U0101-00	Lost Communication with TCM - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Transmission Control Module and Instrument Cluster
U0102-00	Lost Communication with Transfer Case Control Module - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Transfer Case Control Module and Instrument Cluster

U3002-81	Vehicle Identification Number - invalid serial data received	<ul style="list-style-type: none"> ● Invalid vehicle identification number 	Configure the Car Configuration File using the approved diagnostic system
U3003-16	Control Module - Circuit voltage below threshold	<ul style="list-style-type: none"> ● Circuit voltage below threshold (9V) 	Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module
U3003-17	Control Module - Circuit voltage above threshold	<ul style="list-style-type: none"> ● Circuit voltage above threshold (16V) 	Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module
U3003-62	Control Module - Signal compare failure	<ul style="list-style-type: none"> ● Signal compare failure 	Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module

General Information - Diagnostic Trouble Code (DTC) Index DTC: Navigation Control Module (NAV)

Description and Operation

DTC Index

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Touch Screen Display (TSD) for additional Diagnosis and Testing information refer to the Navigation System, Section 415-00.

• CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the control module is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Causes	Action
B100F-25	Video Input "B" - Signal shape/waveform failure	<ul style="list-style-type: none"> Rear proximity camera video input disconnected Camera malfunction 	<ul style="list-style-type: none"> Check the video signal connection and whether it is being broadcasted. Where available, configure the rear / proximity cameras using the approved diagnostic system. Check whether the rear / proximity cameras are broadcasting an image by entering touch screen diagnostics selecting 'Video Input Test' then press 'Rear View / Proximity Camera'. Check whether a clear image is displayed. Refer to the electrical circuit diagrams and check the video signal circuit between the rear / proximity cameras and the Camera Control Module If the problem persists, renew the camera or cameras. Clear the DTC and perform an on demand self test
B1010-25	Video Input "C" - Signal shape/waveform failure	<ul style="list-style-type: none"> Television/Rear seat entertainment video input disconnected TV/DVD malfunction 	<ul style="list-style-type: none"> Check the video signal connection and whether it is being broadcasted. Where available, configure the TV or DVD using the manufacturers approved diagnostic system. Check whether the TV or Rear Seat Entertainment Module (RSE) is broadcasting an image by entering diagnostics selecting 'Video Input Test' then press 'TV/DVD'. Check whether a clear image is displayed. Refer to the electrical circuit diagrams and check the video signal circuit from the TV or Rear Seat Entertainment (RSE) module If the problem persists, renew the Television or Rear Seat Entertainment Module (RSE) or DVD module. Refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B108E-14	Display - Circuit short to ground or open	<ul style="list-style-type: none"> Internal display circuit short circuit to ground, open circuit 	<ul style="list-style-type: none"> Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. If the DTC persists contact Dealer Technical Support (DTS)

DTC	Description	Possible Causes	Action
B108E-17	Display - Circuit voltage above threshold	<ul style="list-style-type: none"> ● Internal display circuit short circuit to ground, open circuit 	<ul style="list-style-type: none"> ● Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. If the DTC persists contact Dealer Technical Support (DTS)
B108E-1C	Display - Circuit voltage out of range	<ul style="list-style-type: none"> ● Internal display circuit short circuit to ground, open circuit 	<ul style="list-style-type: none"> ● Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. If the DTC persists contact Dealer Technical Support (DTS)
B108E-87	Display- missing message	<ul style="list-style-type: none"> ● Display communication failure 	<ul style="list-style-type: none"> ● Clear the DTC and switch off the ignition. Allow sufficient time for the infotainment relay to power down and retest. If DTC persists reprogram the Front Entertainment Module (FEM)
B108E-88	Display - Bus off	<ul style="list-style-type: none"> ● Bus off ● Front Entertainment Module (FEM) internal failure 	<ul style="list-style-type: none"> ● Clear the DTC and switch off the ignition. Allow sufficient time for the infotainment relay to power down and retest. If DTC persists renew the Front Entertainment Module (FEM). Refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B119F-11	GPS Antenna - Circuit short to ground	<ul style="list-style-type: none"> ● Global Positioning System (GPS) antenna circuit short circuit to ground 	<ul style="list-style-type: none"> ● Check the global positioning system (GPS) [blue] connector to the Front Entertainment Module (FEM) for security and integrity. Check that the GPS antenna is not damaged. Refer to the electrical circuit diagrams and check the circuit between the GPS antenna and the Front Entertainment Module (FEM). Test the GPS outside in open space for more than 2 minutes after power on. Enter touch screen diagnostics and select 'Next', 'Vehicle Information' then 'GPS Information'. Check that HDOP is less than 5 and GPS satellites show more than 4 'P's
B119F-13	GPS Antenna - Circuit open	<ul style="list-style-type: none"> ● Antenna circuit open circuit ● Antenna not connected 	<ul style="list-style-type: none"> ● Check the global positioning system (GPS) [blue] connector to the Front Entertainment Module (FEM) for security and integrity. Check that the GPS antenna is not damaged. Refer to the electrical circuit diagrams and check the circuit between the GPS antenna and the Front Entertainment Module (FEM). Test the GPS outside in open space for more than 2 minutes after power on. Enter touch screen diagnostics and select 'Next', 'Vehicle Information' then 'GPS Information'. Check that HDOP is less than 5 and GPS satellites show more than 4 'P's
B11A3-49	Gyroscope - Internal electronic failure	<ul style="list-style-type: none"> ● Internal gyroscope failure 	<ul style="list-style-type: none"> ● Enter touch screen diagnostics and select 'Next', 'Vehicle information' then 'Vehicle sensor'. Check that the Gyro sensor voltage is around 2500mV when stationary, but changes along the bearing when the car is moving while turning the steering wheel. If the Gyro sensor voltage or bearing does not change when the car is moving while turning the steering wheel renew the Front Entertainment Module (FEM). Refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B121B-13	Keypad Input Switch - Circuit open	<ul style="list-style-type: none"> ● Touch screen display input key circuit open circuit ● Touch screen display input key fault 	<ul style="list-style-type: none"> ● Check whether the input keys are working by entering the touch screen diagnostics and selecting 'Hard Key Test'. If one or more of the input keys do not respond (except audio off) renew the Front Entertainment Module. Refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B121C-13	Hard Drive - Circuit open	<ul style="list-style-type: none"> ● Module internal hard drive open circuit/not connected 	<ul style="list-style-type: none"> ● Check whether the Hard Drive is connected by entering the touch screen diagnostics selecting 'Next' then 'HDD Information'. Check that the hard drive serial number, operating time and model name appear. If the SMART test fails 'NG' renew the Front Entertainment Module (FEM). Refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component

DTC	Description	Possible Causes	Action
B121C-44	Hard Drive - Data memory failure	<ul style="list-style-type: none"> ● internal hard drive data memory failure 	<ul style="list-style-type: none"> ● Check whether the Hard Drive is connected by entering the touch screen diagnostics selecting 'Next' then 'HDD Information'. Check that the hard drive serial number, operating time and model name appear. If the SMART test fails 'NG' renew the Front Entertainment Module (FEM). Refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B1D56-14	Antenna #3 - Circuit short to ground or open	<ul style="list-style-type: none"> ● Vehicle Information and Communication Antenna (VICS) disconnected ● Vehicle Information and Communication Antenna (VICS) circuit short circuit to ground, open circuit 	<ul style="list-style-type: none"> ● Enter touch screen diagnostics and select 'Next', 'Vehicle information', 'VICS' then 'Radio Wave Beacon' and 'Infrared beacon'. Check that Time and Beacon number data are shown. Check that the Vehicle Information and Communication System (VICS) antenna or circuit is not damaged ● Refer to the electrical circuit diagrams and check the circuit between the Vehicle Information and Communication System (VICS) antenna and the Front Entertainment Module (FEM) for short to ground, open circuit
U1A01-56	Communication Link -Invalid/incomplete configuration	<ul style="list-style-type: none"> ● Internal communication failure 	<ul style="list-style-type: none"> ● Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. If the DTC persists reprogram the Front Entertainment Module (FEM) ● If DTC still persists renew the Front Entertainment Module. Refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
U1A4B-82	Control Module Processor B - Alive/sequence counter incorrect/not updated	<ul style="list-style-type: none"> ● Internal communication failure 	<ul style="list-style-type: none"> ● Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. Enter touch screen diagnostics and select 'Configurations'. Check that the vehicle type is displayed and the sub CPU SW version are shown. If the DTC persists reprogram the Front Entertainment Module (FEM). Refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
U1A4B-87	Control Module Processor B - Missing message	<ul style="list-style-type: none"> ● Internal communication failure 	<ul style="list-style-type: none"> ● Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. Refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
U2005-62	Vehicle Speed - Signal compare failure	<ul style="list-style-type: none"> ● Vehicle speed and calculated GPS system vehicle speed mismatch ● Vehicle speed signal circuit between Anti-Lock Braking (ABS) Module and Navigation System Module (NAV) short to ground, short to power 	<ul style="list-style-type: none"> ● Check the Anti-Lock Braking (ABS) Module connector and wiring harness. using the manufacturer approved diagnostic system, enter diagnostics and select 'Vehicle Signals'. Check that the vehicle speeds both increase when the car is moving ● Refer to the electrical circuit diagrams and check vehicle speed signal circuit between the Anti-Lock Braking (ABS) Module and Navigation System Module (NAV) for short to ground, short to power, open circuit
U2101-00	Control Module Configuration Incompatible - No sub type information	<ul style="list-style-type: none"> ● Car Configuration File (CCF) parameter mismatch ● Invalid/incomplete configuration 	<ul style="list-style-type: none"> ● Enter touch screen diagnostics and select 'Self Test' and wait for the test results to complete. The Car Configuration File (CCF) mismatch parameter(s) will be listed in the description with DTC 'U210100'. The Car Configuration File (CCF) parameters values for Brand, HLDF, MMMType, Navigation, MMMJapan, MMMFitted, MMMVariant, NavRegion, MMM3, VICS, GPSReceiver, Intercom, ParkingAidDisplay, HandOfDrive or AmbientLight can be found by entering the touch screen diagnostics 'Vehicle Configurations' and pressing 'Next' until the parameter is shown. Contact Dealer Technical Support (DTS) reporting the Car Configuration (CCF) parameter name and value ● Contact dealer technical support to assist in re-configuring the Car Configuration File (CCF) using the manufacturers approved diagnostic

DTC	Description	Possible Causes	Action
			<p>system. Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down</p>
U2101-4A	Control Module Configuration Incompatible - Incorrect component installed	<ul style="list-style-type: none"> ● Navigation map license mismatch ● Invalid/incomplete configuration 	<ul style="list-style-type: none"> ● If the map screen is not shown after entering diagnostics and pressing 'I Agree' then start routine 0x6024 'Update Map Configuration' with option 0x03. Allow 30 seconds for the routine to complete before entering the map screen. If a map screen is still not shown Contact Dealer Technical Support (DTS) ● Enter the navigation menu and select 'Map changer'. Check that the map regions match the Front Entertainment Module market. The Car Configuration File parameters values for MapConfiguration can be found by entering the touch screen diagnostics 'Vehicle Configurations' and pressing 'Next' until the parameter is shown. Contact Dealer Technical Support (DTS) to assist in re-configuring the Car Configuration File (CCF) for the map market using the manufacturers approved diagnostic system. Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down
U210A-85	Temperature Sensor - signal above allowable range	<ul style="list-style-type: none"> ● Front Entertainment Module (FEM) over temperature ● Interior cabin over heating 	<ul style="list-style-type: none"> ● Cool the vehicle interior down by ensuring it is in the shade and have the A/C on cool. Enter touch screen diagnostics and select 'Vehicle Signals'. Check the Media Orientated System Transport (MOST) FOT temperature ● When cool, clear the DTC and retest
U3003-17	Battery Voltage - Circuit voltage above threshold	<ul style="list-style-type: none"> ● Battery voltage above 16 volts 	<ul style="list-style-type: none"> ● Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module

General Information - Diagnostic Trouble Code (DTC) Index DTC: Occupant Classification System (OCS)

Description and Operation

Occupant Classification System (OCS)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Occupant Classification System, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Air Bag Supplemental Restraint System \(SRS\)](#) (501-20B Supplemental Restraint System, Diagnosis and Testing).

DTC	Description	Possible Cause	Action

General Information - Diagnostic Trouble Code (DTC) Index DTC: Parking

Aid Module (PAM)

Description and Operation

Parking Aid Module (PAM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Parking Aid Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Parking Aid](#) (413-13 Parking Aid, Diagnosis and Testing).

• **NOTE:** Physical damage to the sensor (impact damage or scratched sensor surface) must **NOT** be changed under warranty.

DTC	Description	Possible Causes	Action
B1B36-01	Front Right Outer Sensor - General Electrical Failure	<ul style="list-style-type: none"> General electric failure Signal circuit short circuit to ground Signal circuit high resistance Connector/harness problem Sensor missing 	If DTCs B1B36-01, B1B38-01, B1B4001 and B1B42-01 are all present, check the Car Configuration File and vehicle specification to ensure front sensors have been specified. If correctly specified, check that front bumper has sensors and wiring loom installed. Check the front bumper wiring harness connector to main wiring loom for security and integrity. Check the connectors to the parking aid module for security and integrity. Clear DTCs and power up parking aid system and confirm problem resolution. If problem persists, check the Car Configuration File to ensure correct configuration for front and rear sensors relative to installed vehicle specification. Check whether the correct parking aid module has been installed to the vehicle. Check the correct/latest software has been installed. Correct the Car Configuration File or update to the correct software, clear DTCs, power up parking aid system and confirm problem resolution. Refer to the electrical circuit diagrams and check the front bumper harness for short circuit between signal and ground wires within harness. Check the front bumper harness for short circuit to bodywork or other grounded components (chafing). Check the wiring and sensor connectors for integrity and damage, then re-connect sensor and confirm connection (connector latched). Clear DTC, power up parking aid system and check corrective action. If the problem persists then renew the sensor. Clear DTC, power up parking aid system and check corrective action
B1B36-12	Front Right Outer Sensor - Circuit short to battery	<ul style="list-style-type: none"> Signal circuit short circuit to power 	Check front bumper harness for signs of damage. Check the connector for integrity and damage, then re-connect sensor to confirm connection. Cycle ignition to power up parking aid system and check corrective action. B1B52-01	Rear Sounder - Park Aid - General Electrical Failure	<ul style="list-style-type: none"> ● General electric failure ● Signal circuit short circuit to ground ● Signal circuit high resistance ● Connector/harness problem 	<p>Check the connector for integrity and damage, then re-connect sounder to confirm connection. Cycle ignition to power up parking aid system and check corrective action. Refer to the electrical circuit diagrams and check the sounder circuit. If the problem persists, renew the sounder only</p>

DTC	Description	Possible Causes	Action
B1B52-12	Rear Sounder - Park Aid - circuit short to battery	<ul style="list-style-type: none"> Signal circuit short circuit to ground 	Check the connector for integrity and damage, then re-connect sounder to confirm connection. Cycle ignition to power up parking aid system and check corrective action. Refer to the electrical circuit diagrams and check the sounder circuit. If the problem persists, renew the sounder only
B1B52-12	Rear Sounder - Park Aid - Circuit short to battery	<ul style="list-style-type: none"> Signal circuit short circuit to ground 	Check the connector for integrity and damage, then re-connect sounder to confirm connection. Cycle ignition to power up parking aid system and check corrective action. Refer to the electrical circuit diagrams and check the sounder circuit. If the problem persists, renew the sounder only
B1B54-11	Function LED - Park Aid - Circuit short to ground	<ul style="list-style-type: none"> Signal circuit short circuit to ground 	Check the parking aid switch and LED functionality. Refer to the electrical circuit diagrams and check the circuit. Repair/renew as necessary
B1B57-11	Front Sensors Power Circuit - circuit short to ground	<ul style="list-style-type: none"> Front sensor power circuit short circuit to ground Connector/harness problem 	Check the connector for integrity and damage, then re-connect sensor to confirm connection. Check the connector. Cycle ignition to power up parking aid system and check corrective action. Refer to the electrical circuit diagrams and check the front bumper circuit. If the problem persists, renew the sounder only
B1B58-11	Rear Sensors Power Circuit - Circuit short to ground	<ul style="list-style-type: none"> Rear sensor power circuit short circuit to ground Connector/harness problem 	Check the connector for integrity and damage, then re-connect sensor to confirm connection. Check the connector. Cycle ignition to power up parking aid system and check corrective action. Refer to the electrical circuit diagrams and check the rear bumper circuit. If the problem persists, renew the sounder only
B1C30-73	Disable Switch - Actuator stuck closed	<ul style="list-style-type: none"> Actuator stuck closed 	Check the switch function. Refer to the electrical circuit diagrams and check the circuit
U0010-00	Medium Speed CAN Communication Bus - No sub type information	<ul style="list-style-type: none"> No sub type information 	Check for other modules reporting CAN Bus off or lost communication faults. Check CAN wiring. Where available, using the manufacturer approved diagnostic system, complete a CAN integrity test. Refer to the electrical circuit diagrams and check the module CAN, power and ground circuits. Refer to the Network Communications section of the workshop manual
U0140-87	Lost Communication With Body Control Module - missing message	<ul style="list-style-type: none"> No sub type information 	Check for other modules reporting CAN Bus off or lost communication faults. Check CAN wiring. Where available, using the manufacturer approved diagnostic system, complete a CAN integrity test. Refer to the electrical circuit diagrams and check the module CAN, power and ground circuits. Refer to the Network Communications section of the workshop manual
U0155-00	Lost Communication With Instrument Panel Cluster (IPC) Control Module - No sub type information	<ul style="list-style-type: none"> CAN Link ECM/IPC network malfunction 	Check for other modules reporting CAN Bus off or lost communication faults. Check CAN wiring. Where available, using the manufacturer approved diagnostic system, complete a CAN integrity test. Refer to the electrical circuit diagrams and check the module CAN, power and ground circuits. Refer to the Network Communications section of the workshop manual
U0300-00	Internal Control Module Software Incompatibility - No sub type information	<ul style="list-style-type: none"> No sub type information 	Check for other modules reporting CAN Bus off or lost communication faults. If other modules report problems, check the software version in the Central Junction Box using the manufacturers approved diagnostic system. If no other modules report problems, check the software version in the parking aid module. Check the configuration of the Car Configuration File using the manufacturers recommended diagnostic system. Update as necessary
U0422-00	Invalid Data Received From Body Control Module - No sub type information	<ul style="list-style-type: none"> No sub type information 	Check for other modules reporting CAN Bus off or lost communication faults. If other modules report problems, check the software version in the Central Junction Box using the manufacturers approved diagnostic system. If no other modules report problems, check the software version in the parking aid module. Update as necessary.
U0423-00	Invalid Data Received From Instrument Panel Control Module - No sub type information	<ul style="list-style-type: none"> No sub type information 	Check for other modules reporting CAN Bus off or lost communication faults. Check CAN wiring. Using the manufacturer approved diagnostic system, complete a CAN integrity test. Refer to the electrical circuit diagrams and check the module CAN, power and ground circuits. Refer to the Network Communications section of the workshop manual
U0443-00	Invalid Data Received From Body Control Module "B" - No sub type information	<ul style="list-style-type: none"> No sub type information 	Check for other modules reporting CAN Bus off or lost communication faults. Check CAN wiring. Using the manufacturer approved diagnostic system, complete a CAN integrity test. Refer to the electrical circuit diagrams and check the module CAN, power and ground circuits. Refer to the Network Communications section of the workshop manual
U2100-00	Initial Configuration Not Complete - No sub type information	<ul style="list-style-type: none"> No sub type information 	Configure the module using the manufacturers approved diagnostic system
U2101-00	Control Module Configuration Incompatible - No sub type	<ul style="list-style-type: none"> No sub type information 	Configure the module using the manufacturers approved diagnostic system

DTC	Description	Possible Causes	Action
	information		
U3000-49	Control Module - Internal electronic failure	<ul style="list-style-type: none"> ● Audio unit internal electronic failure(internal error) 	Refer to the electrical circuit diagrams and check the power and ground circuits to the module. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policy and procedures manual if a module is suspect
U3002-81	Vehicle Identification Number - invalid serial data received	<ul style="list-style-type: none"> ● Invalid serial data received 	Configure the module using the manufacturers approved diagnostic system
U3003-62	Battery Voltage - Signal compare failure	<ul style="list-style-type: none"> ● Signal compare failure 	Check vehicle battery connections and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module

General Information - Diagnostic Trouble Code (DTC) Index **DTC: Parking Brake Module (PBM)**

Description and Operation

Parking Brake Module (PBM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Parking Brake Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Parking Brake](#) (206-05 Parking Brake and Actuation, Diagnosis and Testing).

Bedding mode is a special mode available in the parking brake module (PBM) that disables the stability assist system (ABS) and allows the parking brake to provide the braking force rather than the conventional braking system whilst the vehicle is moving at a velocity of >3kph. This mode is entered via a series of brake pedal presses and switch applications, full details on this procedure is available in the relevant section of the workshop manual. If brake bedding mode is entered accidentally by the driver the RED warning lamp will flash in the Instrument Cluster, the module will return to normal operational mode when the ignition has been cycled. This DTC (C1104-68) is intended to highlight the fact that although the RED lamp was illuminated there was no fault present in the control module.

• **NOTE:** Where reference is made to a drive cycle test, refer to the relevant Diagnosis and Testing Section.

DTC	Description	Possible Causes	Action
C0062-01	Longitudinal Acceleration Sensor - General electrical failure	<ul style="list-style-type: none"> General electrical failure 	Check the electrical connections to the sensor. Clear the DTC and retest. If the problem persists, renew the sensor
C0062-02	Longitudinal Acceleration Sensor - General signal failure	<ul style="list-style-type: none"> General signal failure 	Check the electrical connections to the sensor. Clear the DTC and retest. If the problem persists, renew the sensor
C0062-54	Longitudinal Acceleration Sensor - Missing calibration	<ul style="list-style-type: none"> Missing calibration 	Check the electrical connections to the sensor. Calibrate the sensor using the manufacturers approved diagnostic system
C1104-68	Brake Bedding Mode - Event information	<ul style="list-style-type: none"> Event information Brake bedding mode has been entered 	This is not a fault. This is where the parking brake bedding-in mode has been activated. For information on how the bedding-in mode is activated and deactivated
C1A41-01	Clutch Pedal Sensor - General Electrical Failure	<ul style="list-style-type: none"> General electrical failure 	Check the electrical connections to the sensor. Clear the DTC and retest. If the problem persists, renew the sensor
C1A41-02	Clutch Pedal Sensor - General signal failure	<ul style="list-style-type: none"> General signal failure 	Check the electrical connections to the sensor. Clear the DTC and retest. If the problem persists, renew the sensor
C1A43-01	Motor Supply - General electrical failure	<ul style="list-style-type: none"> • NOTE: The electric motor is part of the parking brake actuator module Internal motor circuit fault 	Clear DTCs, complete drive cycle 3 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect
C1A43-19	Motor Supply - Circuit current above threshold	<ul style="list-style-type: none"> Circuit current above threshold 	Refer to the electrical circuit diagrams and check the circuit. Check the power and ground connections to the modules
C1A43-67	Motor Supply - Signal incorrect after event	<ul style="list-style-type: none"> Signal incorrect after event 	Check the functionality of the park brake. Check for other related DTCs. Clear the DTC and retest. If the problem persists, renew the park brake actuator
C1A46-01	Mismatch Between Motor Drive Current and Resultant Force - General Electrical Failure	<ul style="list-style-type: none"> General electrical failure 	Check the functionality of the park brake. Check for other related DTCs. Clear the DTC and retest. If the problem persists, renew the park brake actuator.

DTC	Description	Possible Causes	Action
C1A46-64	Mismatch Between Motor Drive Current and Resultant Force - Signal plausibility failure	<ul style="list-style-type: none"> ● Signal plausibility failure 	Check the functionality of the park brake. Check for other related DTCs. Clear the DTC and retest. If the problem persists, renew the park brake actuator
C1A47-01	Force Sensor - General electrical failure	<ul style="list-style-type: none"> ● NOTE: The force sensor is part of the parking brake actuator module ● Internal force sensor electrical fault 	Clear DTCs, complete drive cycle 1 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect.
C1A47-02	Force Sensor - General signal failure	<ul style="list-style-type: none"> ● NOTE: The force sensor is part of the parking brake actuator module ● Internal force sensor plausibility failure 	Clear DTCs, complete drive cycle 3 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect.
C1A47-54	Force Sensor - Missing calibration	<ul style="list-style-type: none"> ● NOTE: The force sensor is part of the parking brake actuator module ● Internal force sensor not calibrated 	Clear DTCs, complete drive cycle 1 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect.
C1A48-01	Warning Lamp - General electrical failure	<ul style="list-style-type: none"> ● Parking brake actuator module to instrument cluster warning lamp circuit open circuit ● Parking brake actuator module to instrument cluster warning lamp circuit short circuit to ground ● Parking brake actuator module to instrument cluster warning lamp circuit short circuit to power ● Parking brake actuator module fault ● Instrument cluster fault 	Check the parking brake actuator module to instrument cluster warning lamp circuit. Refer to the electrical circuit diagrams. Rectify as necessary. Refer to the warranty policy and procedures manual if a module is suspect. Clear DTCs, complete drive cycle 1 to test for normal operation
C1A53-68	Manual Emergency Release Activated - Event information	<ul style="list-style-type: none"> ● Emergency release cable activated and stuck/damaged ● Parking brake cables seized/damaged ● Actuator jammed 	Check that the emergency release cable is not permanently pulled (or stuck). Check the parking brake cables for broken or loose connections. Attempt to re-engage the parking brake by pulling the apply switch TWICE. Clear DTCs, complete the following drive cycle. Pull the parking brake emergency release cable. Pull the parking brake switch to the apply position, hold until the parking brake motor has stopped (this may take up to 20 seconds). Release the switch to idle position. For parking brake actuator module manual emergency release
U0073-88	Control Module Communication Bus "A" Off - Bus off	<ul style="list-style-type: none"> ● Bus off 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0100-00	Lost Communication With ECM/PCM "A" - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the engine control module and parking brake module
U0101-00	Lost Communication with TCM - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the transmission control module and parking brake module
U0102-00	Lost Communication With Transfer Case Control Module - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the ABS module and parking brake module
U0121-00	Lost Communication With Anti-Lock Brake System (ABS) Control Module - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the ABS

DTC	Description	Possible Causes	Action
			module and parking brake module
U0140-00	Lost Communication With Body Control Module - No sub type information	<ul style="list-style-type: none"> No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the generic electronics module and parking brake module
U0300-55	Internal Control Module Software Incompatibility - not configured	<ul style="list-style-type: none"> Parking brake module configuration does not match vehicle configuration Parking brake actuator module fault 	Check that the correct module is installed to the vehicle. Check that the Car Configuration File (CCF) is being correct. Configure the module(s) using the approved diagnostic system

U0401-68	Invalid Data Received from ECM/PCM A - event information	<ul style="list-style-type: none"> ● Event information 	Check the Engine Control Module for related DTCs and refer to the relevant DTC index

General Information - Diagnostic Trouble Code (DTC) Index DTC: Portable Audio Interface Module (APIM)

Description and Operation

Portable Audio Interface Module (APIM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Accessory Protocol Interface Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

DTC	Description	Possible Causes	Action
U3000-13	Control Module - Circuit open	<ul style="list-style-type: none"> Universal serial bus (USB) harness between portable audio interface panel and user interface panel is not properly connected Connection - detect circuit between portable audio interface panel and user interface panel is not grounded Universal serial bus (USB) harness between portable audio interface panel and user interface panel is open circuit 	Check for correct connection of universal serial bus (USB) harness between portable audio interface panel and user interface panel. Refer to the electrical circuit diagrams and check portable audio interface module connection detect circuit between portable audio interface panel and user interface panel is grounded. Install universal serial bus (USB) harness between portable audio interface panel and user interface panel as required, refer to the new module/component installation note at the top of the DTC Index
U3000-44	Control Module - Data memory failure	<ul style="list-style-type: none"> Portable audio interface module internal RAM memory failure 	Suspect the portable audio interface module. Check and install a new module as required. Refer to the warranty policy and procedures manual if a module is suspect
U3000-45	Control Module - Program memory failure	<ul style="list-style-type: none"> Portable audio interface module internal flash memory failure 	Suspect the portable audio interface module. Check and install a new module as required. Refer to the warranty policy and procedures manual if a module is suspect
U3000-55	Control Module - Not configured	<ul style="list-style-type: none"> Portable audio interface module not configured correctly 	Re-program the portable audio interface module, clear DTC and re-test. If DTC remains carry out MOST tests and test USB cable for open, short circuit, clear DTC and re-test. If DTC remains suspect the portable audio interface module, check and install a new module as required. Refer to the warranty policy and procedures manual if a module is suspect
U3003-62	Battery Voltage - Signal compare failure	<ul style="list-style-type: none"> Portable audio interface module voltage differs more than $\pm 2V$ compared to central electronics module voltage 	Refer to the electrical circuit diagrams and check the fuses, power and ground connections to both modules

General Information - Diagnostic Trouble Code (DTC) Index DTC: Rear Differential Control Module (RDCM)

Description and Operation

Rear Differential Control Module (RDCM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Rear Differential Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Rear Drive Axle and Differential](#) (205-02 Rear Drive Axle/Differential, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
P0562-00	System Voltage Low - No sub type information	<ul style="list-style-type: none"> Rear Differential Control Module voltage supply below 9V 	Check the battery charge condition, refer to the electrical circuit diagrams and check the wiring to the Rear Differential Control Module, repair as necessary
P0563-00	System Voltage High - No sub type information	<ul style="list-style-type: none"> System voltage high (supply voltage supply greater than 16 volts) 	Check Engine control module for stored DTCs , Suspect charging system fault. Refer to the electrical circuit diagrams and check, power and ground circuit for fault
P0604-00	Internal Control Module Random Access Memory (RAM) Error - No sub type information	<ul style="list-style-type: none"> Rear Differential Control Module internal error 	Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
P0605-00	Internal Control Module Read Only Memory (ROM) Error - No sub type information	<ul style="list-style-type: none"> Rear Differential Control Module internal error 	Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
P0606-00	Control Module Processor - No sub type information	<ul style="list-style-type: none"> Watch dog reset - Internal control module failure 	This is a control module internal check DTC and is not necessarily a fault. If no other DTCs are logged and no customer complaint exists, clear/ignore this DTC. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
P0607-00	Control Module Performance - No sub type information	<ul style="list-style-type: none"> Rear Differential Control Module internal error - charge pump voltage below threshold 	Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
P0652-00	Sensor Reference Voltage 'B' Circuit Low - No sub type information	<ul style="list-style-type: none"> Position sensor supply below 5.7V Sensor failure(within actuator) 	Refer to the electrical circuit diagrams and check the differential actuator sensor position circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P0653-00	Sensor Reference Voltage 'B' Circuit High - No sub type information	<ul style="list-style-type: none"> Position sensor supply above 8.3V Internal control module failure 	Refer to the electrical circuit diagrams and check the differential actuator hall sensor ref voltage at the control module or the actuator. If voltage is too high, then suspect control module fault. Refer to the warranty policy and procedures manual if a module is suspect
P0666-00	PCM/ECM/TCM Internal Temperature Sensor 'A' Circuit - No sub type information	<ul style="list-style-type: none"> Rear Differential Control Module internal temperature sensor value above 105°C 	This is a control module internal check DTC and is not necessarily a fault. If no other DTCs are logged and no customer complaint exists, clear this DTC and retest. Check the security of control module fixings. Check the module ground connection. Consider environmental conditions before suspecting the control module. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect

DTC	Description	Possible Causes	Action
P0702-64	Transmission Control System Electrical - Signal plausibility failure	<ul style="list-style-type: none"> ● Implausibility of differential motor temperature sensor and oil temperature sensor readout detected ● Motor or oil temperature sensor circuit short circuit to ground or power 	Check the rear differential oil quantity and specification. Refer to the relevant section of the workshop manual. Check both temperature sensor circuits and connectors for damage/water ingress, repair as necessary. Where available, after vehicle has been switched off for at least an hour, use the manufacturer approved diagnostic system to read motor temperature and oil temperature sensor values. Temperature difference should be less than 25°C. Clear the DTC and retest
P0712-00	Transmission Fluid Temperature Sensor 'A' Circuit Low - No sub type information	<ul style="list-style-type: none"> ● Differential actuator internal temperature sensor open circuit or short circuit to ground 	Refer to the electrical circuit diagrams and check the differential actuator sensor circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P0713-00	Transmission Fluid Temperature Sensor 'A' Circuit High - No sub type information	<ul style="list-style-type: none"> ● Differential actuator internal temperature sensor open circuit or short circuit to power 	Refer to the electrical circuit diagrams and check the circuit between oil temp sensor and control module connector, repair as necessary. Measure oil temp sensor resistance at control module connector. Resistance should be less than 10K if oil temp >0°C. If not suspect, oil temp sensor open-circuit. If no circuit problems exist, renew the sensor
P0806-00	Clutch Position Sensor Circuit Range/Performance - No sub type information	<ul style="list-style-type: none"> ● Mismatch of actual and expected/calculated actuator position - Internal differential actuator error 	Calibrate the clutch and range change mechanism using the manufacturer approved diagnostic system. Clear the DTC and retest. If the problem persists, renew the differential actuator
P0807-00	Clutch Position Sensor Circuit Low - No sub type information	<ul style="list-style-type: none"> ● Differential actuator internal position sensor supply, ground, signal A or B open circuit or sensor supply, signal A or B short circuit to ground 	Refer to the electrical circuit diagrams and check the differential actuator motor position hall sensor signal circuit (A or B), repair as necessary. If no circuit problems exist, renew the differential actuator
P0808-00	Clutch Position Sensor Circuit High - No sub type information	<ul style="list-style-type: none"> ● Differential actuator internal position sensor signal 1 or 2 short circuit to power 	Refer to the electrical circuit diagrams and check the differential actuator motor position hall sensor signal circuit (A or B), repair as necessary. If no circuit problems exist, renew the differential actuator
P080A-00	Clutch Position Not Learned - No sub type information	<ul style="list-style-type: none"> ● Rear Differential Control Module (RDCM) not calibrated ● Differential clutch stuck or out of tolerance 	Using the manufacturer approved diagnostic system, calibrate the Rear Differential Control Module. Clear the DTC and retest. If the problem persists, renew the rear differential assembly. Refer to the warranty policy and procedures manual if a differential is suspect.
P0894-00	Transmission Component Slipping - No sub type information	<ul style="list-style-type: none"> ● Differential actuator internal magnetic brake is slipping 	Renew the differential actuator
P0900-00	Clutch Actuator Circuit/Open - No sub type information	<ul style="list-style-type: none"> ● Differential actuator supply open circuit 	Refer to the electrical circuit diagrams and check the differential actuator circuit, repair as necessary
P0901-00	Clutch Actuator Circuit Range/Performance - No sub type information	<ul style="list-style-type: none"> ● Differential actuator supply short circuit ● Both DC motor supply leads are short circuited together ● H Bridge overload detected 	Refer to the electrical circuit diagrams and check the differential actuator circuit. Check the actuator circuit resistance carefully (a good motor also has a low resistance). Repair as necessary
P0902-00	Clutch Actuator Circuit Low - No sub type information	<ul style="list-style-type: none"> ● Differential actuator supply circuit short to ground. 	Refer to the electrical circuit diagrams and check the differential actuator circuit, repair as necessary
P0903-00	Clutch Actuator Circuit High - No sub type information	<ul style="list-style-type: none"> ● Differential actuator supply circuit short to power 	Refer to the electrical circuit diagrams and check the differential actuator circuit, repair as necessary
P1603-00	EEPROM Malfunction - No sub type information	<ul style="list-style-type: none"> ● Rear Differential Control Module internal error 	Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
P1783-00	Transmission Over-Temperature Condition - No sub type information	<ul style="list-style-type: none"> ● Rear Differential oil sump temperature sensor value above 160°C 	Confirm the customer complaint and vehicle usage at the time of DTC event. Check the operation of the rear differential. Check the rear differential oil quantity and specification. Refer to the relevant section of the workshop manual. Clear the DTC and retest. If the problem persists, suspect an electrical fault. Check for water ingress into wiring harness/connectors. Renew the actuator
P186A-00	Differential Lock-Up Actuator Brake Control Circuit/Open - No sub type information	<ul style="list-style-type: none"> ● Open circuit of actuator internal magnetic brake supply leads 	Refer to the electrical circuit diagrams and check the differential actuator circuit, repair as necessary. If no circuit problems exist, renew the differential actuator

DTC	Description	Possible Causes	Action
P186B-00	Differential Lock-Up Actuator Brake Control Circuit Low - No sub type information	<ul style="list-style-type: none"> Short circuit to ground of both differential actuator internal magnetic brake pins 	Refer to the electrical circuit diagrams and check the differential actuator circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P186C-00	Differential Lock-Up Actuator Brake Control Circuit High - No sub type information	<ul style="list-style-type: none"> Short circuit to power of both differential actuator internal magnetic brake pins 	Refer to the electrical circuit diagrams and check the differential actuator circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P186D-00	Clutch Actuator Stuck - No sub type information	<ul style="list-style-type: none"> Actuator fault 	Using the manufacturers approved diagnostic system, calibrate the Rear Differential Control Module/clutch actuator. If the problem persists, renew the actuator
P2742-00	Transmission Fluid Temperature Sensor 'B' Circuit Low - No sub type information	<ul style="list-style-type: none"> Rear differential oil sump temperature sensor short circuit to ground 	Refer to the electrical circuit diagrams and check the differential oil temperature sensor circuit, repair as necessary
P2743-00	Transmission Fluid Temperature Sensor 'B' Circuit High - No sub type information	<ul style="list-style-type: none"> Rear differential oil sump temperature sensor open circuit or short circuit to power 	Refer to the electrical circuit diagrams and check the differential oil temperature sensor circuit, repair as necessary
P2785-00	Clutch Actuator Temperature Too High - No sub type information	<ul style="list-style-type: none"> Extensive prolonged off-road use Insufficient oil quantity Incorrect oil specification Internal actuator problem 	Check for other DTCs (e.g. P186B). If multiple DTCs exist, suspect a control module internal fault. Confirm the customer complaint and vehicle usage at the time of DTC event. Check the operation of the rear differential. Check the rear differential oil quantity and specification. Refer to the relevant section of the workshop manual. Clear the DTC and retest. If the problem persists, renew the actuator
P2787-00	Clutch Temperature Too High - No sub type information	<ul style="list-style-type: none"> Rear differential clutch pack temperature (calculated) above 200°C 	Confirm the customer complaint and vehicle usage at the time of DTC event. Check the operation of the rear differential. Check the rear differential oil quantity and specification. Refer to the relevant section of the workshop manual. Clear the DTC and retest. If the problem persists, renew the actuator
U0001-88	High Speed CAN Communication Bus - Bus off	Bus off	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0100-00	Lost Communication With ECM/PCM "A" - No sub type information	<ul style="list-style-type: none"> No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Engine Control Module and Rear Differential Control Module
U0102-00	Lost Communication With Transfer Case Control Module - No sub type information	<ul style="list-style-type: none"> No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Transfer Case Control Module and Rear Differential Control Module
U0121-00	Lost Communication With Anti-Lock Brake System (ABS) Control Module - No sub type information	<ul style="list-style-type: none"> No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Anti-lock Braking System module and Rear Differential Control Module
U0140-00	Lost Communication With Body Control Module - No sub type information	<ul style="list-style-type: none"> No sub type information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Central Junction Box and Rear Differential Control Module
U0300-00	Internal Control Module Software Incompatibility - No sub type information	<ul style="list-style-type: none"> Rear Differential Control Module not configured Incorrect software installed 	Check & confirm differential control module installed is correct. If correct, clear DTC, ignition off for 5 seconds, ignition on and then check if DTC reoccurs. If the problem persists, configure the module using the manufacturers approved diagnostic system
U0403-68	Invalid Data Received From Transfer Case Control Module - Event information	<ul style="list-style-type: none"> Event information 	Check the transfer case control module for related DTCs and refer to the relevant DTC index

DTC	Description	Possible Causes	Action
U0415-68	Lost Communication With Anti-Lock Brake System (ABS) Control Module - Event information	<ul style="list-style-type: none"> ● Event information 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Anti-lock Braking System module and Rear Differential Control Module
U0422-68	Invalid Data Received from Body Control Module - Event information	<ul style="list-style-type: none"> ● Event information- invalid vehicle configuration message 	Check the generic electronics module for related DTCs and refer to the relevant DTC index
U0443-68	Invalid Data Received From Body Control Module "B" - Event information	<ul style="list-style-type: none"> ● Event information 	Check the generic electronics module for related DTCs and refer to the relevant DTC index
U1A14-49	CAN Initialization failure- Internal electronic failure	<ul style="list-style-type: none"> ● Rear Differential Control Module has failed the CAN serial data communication software initialization or the CAN controller initialization ● Internal control module failure 	Clear the DTC and retest. If the problem persists, configure the module using the manufacturers approved diagnostic system. Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect

General Information - Diagnostic Trouble Code (DTC) Index DTC: Rear Entertainment Module (REM)

Description and Operation

Rear Entertainment Module (REM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Rear Entertainment Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Information and Entertainment System](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1A00-44	Control Module - data memory failure	<ul style="list-style-type: none"> Rear entertainment control module - data memory failure 	Refer to the warranty policy and procedures manual if a module is suspect
B1A00-98	Control Module - component or system over temperature	<ul style="list-style-type: none"> Rear entertainment control module, component or system over-temperature 	Check the module and circuits. Refer to the electrical circuit diagrams. Clear the DTC and retest. Consider the atmospheric conditions before suspecting a module.
B1D50-79	Digital Disk Player - Mechanical linkage failure	<ul style="list-style-type: none"> Digital versatile disc (DVD) changer mechanical fault - Error report from AiNet 	Check for a mechanical fault (jammed magazine, etc). Rectify as necessary
B1D50-93	Digital Disk Player - No operation	<ul style="list-style-type: none"> Digital versatile disc (DVD) changer is not responding Communication error between the main and DVD microprocessors - No response from AiNet 	Refer to the electrical circuit diagrams and check the AiNet circuits. Rectify as necessary
B1D50-98	Digital Disk Player - Component or system over temperature	<ul style="list-style-type: none"> A high temperature condition has been detected 	Check the installation of the DVD module. Make sure there is sufficient airflow. Clear the DTC and retest. Consider the atmospheric conditions before suspecting a module
B1D81-93	Rear Left Display Module - No operation	<ul style="list-style-type: none"> Left-hand rear display is not responding Communication error between the main and left-hand display microprocessors No response from the IS bus 	Check the IS bus circuits. Refer to the electrical circuit diagrams
B1D81-98	Rear Left Display Module - Component or system over temperature	<ul style="list-style-type: none"> A high temperature condition has been detected 	Clear the DTC and retest. Consider the atmospheric conditions before suspecting a module
B1D82-93	Rear Right Display Module - No operation	<ul style="list-style-type: none"> Right-hand rear display is not responding Communication error between the main and right-hand display microprocessors No response from the IS bus 	Check the IS bus circuits. Refer to the electrical circuit diagrams
B1D82-98	Rear Right Display Module - Component or system over temperature	<ul style="list-style-type: none"> A high temperature condition has been detected 	Clear the DTC and retest. Consider the atmospheric conditions before suspecting a module
B1D83-93	Center Display Module - no operation	<ul style="list-style-type: none"> Center display is not responding Communication error between the main and center display microprocessors No response from the IS bus 	Check the center display and IS bus circuits. Refer to the electrical circuit diagrams

General Information - Diagnostic Trouble Code (DTC) Index DTC: Remote Function Actuator (RFA)

Description and Operation

Remote Function Actuator (RFA)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Remote Function Actuation Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Locks, Latches and Entry Systems](#) (501-14 Handles, Locks, Latches and Entry Systems, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B102B-00	Passive Key - no sub type information	<ul style="list-style-type: none"> Passive key response error Incorrect key Key incorrectly programmed 	<ul style="list-style-type: none"> Re-Program the key using the manufacturers approved diagnostic system
B10A9-00	Remote Keyless Entry Less Than 2 Keys Programmed - no sub type information	<ul style="list-style-type: none"> Secret key has been programmed to the vehicle but less than 2 key fobs have been programmed 	<ul style="list-style-type: none"> Re-Program the key fobs using the manufacturers approved diagnostic system
B10C1-00	Left Front Unlock Pull Switch - signal stuck open	<ul style="list-style-type: none"> No power supply to door handle Switch circuit open, or short circuit to power 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check the power supply to the door handle. Check the switch circuit is not open circuit or short to power. Repair wiring as required
B10C1-24	Left Front Unlock Pull Switch - signal stuck ON	<ul style="list-style-type: none"> Switch circuit short circuit to ground Switch fault 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check the switch circuit is not short to ground. Repair wiring as required. If no wiring harness faults suspect switch, refer to the warranty policy and procedures manual if a module/component is suspect
B10C2-00	Left Rear Unlock Pull Switch - signal stuck open	<ul style="list-style-type: none"> No power supply to door handle Switch circuit open, or short circuit to power 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check the power supply to the door handle. Check the switch circuit is not open circuit or short to power. Repair wiring as required

Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network. Clear the diagnostic trouble code and retest. If the problem persists, check and install new keyless vehicle module as required. Refer to the warranty

DTC	Description	Possible Causes	Action
			policy and procedures manual if a module/component is suspect
U0140-00	Lost Communication With Body Control Module - no sub type information	<ul style="list-style-type: none"> CAN connection open or fault in body control module 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the central junction box and keyless vehicle module. Clear the diagnostic trouble code and retest. If the problem persists, check and install new body control module as required. Refer to the warranty policy and procedures manual if a module/component is suspect
U0300-00	Internal Control Module Software Incompatibility - no sub type information	<ul style="list-style-type: none"> Signal configuration file not loaded 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system check and up-date the car configuration file as required. Clear the diagnostic trouble code and re-test
U201F-00	External Receiver - no sub type information	<ul style="list-style-type: none"> Communication to the RF receiver module has been lost, short either to ground, or battery 	<ul style="list-style-type: none"> Check K-Line wiring. Refer to the electrical circuit diagrams and check the module K-Line, power and ground circuits. Clear the diagnostic trouble code and retest. If the problem persists, check and install new keyless vehicle module or RF receive module as required. Refer to the warranty policy and procedures manual if a module/component is suspect
U201F-31	External Receiver - No signal	<ul style="list-style-type: none"> Communication to the RF receiver module has been lost 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check remote keyless entry module circuit for short to power, open circuit, high resistance Check and install a new RF receiver module or keyless vehicle module as required
U201F-95	External Receiver - incorrect assembly	<ul style="list-style-type: none"> The RF receiver frequency does not match the car config file parameter 	<ul style="list-style-type: none"> Verify car config value for RF frequency is correct. If not, re-configure body control module with proper car configuration file. If correct, replace RF receiver with proper frequency unit.
U2100-00	Initial Configuration Not Complete - no sub type information	<ul style="list-style-type: none"> Calibration file has not been received or is incomplete 	<ul style="list-style-type: none"> Reload the correct calibration file for the vehicle type into the module using the manufacturer approved diagnostic system
U2101-00	Control Module Configuration Incompatible - no sub type information	<ul style="list-style-type: none"> Car configuration parameter is outside expected value 	<ul style="list-style-type: none"> Verify car config value sent by body control module is correct for the vehicle. If not, re-configure body control module with proper car configuration file. If correct, reload the correct calibration file for the vehicle type into the module using the manufacturer approved diagnostic system
U3000-49	Control Module - internal electronic failure	<ul style="list-style-type: none"> Internal electronic failure 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check the power and ground circuits to the module. Refer to the warranty policy and procedures manual if a module is suspect
U3002-81	Vehicle Identification Number - invalid serial data received	<ul style="list-style-type: none"> Invalid vehicle identification number 	<ul style="list-style-type: none"> Configure the car configuration file using the manufacturer approved diagnostic system

General Information - Diagnostic Trouble Code (DTC) Index DTC: Restraints Control Module (RCM)

Description and Operation

Restraints control module (RCM)

WARNING: TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BACKUP POWER SUPPLY MUST BE DEPLETED BEFORE REPAIRING OR REPLACING ANY AIR BAG SUPPLEMENTAL RESTRAINT SYSTEM (SRS) COMPONENTS. TO DEplete THE BACKUP POWER SUPPLY ENERGY, DISCONNECT THE BATTERY GROUND CABLE AND WAIT ONE MINUTE. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN PERSONAL INJURY.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

- NOTE: Given the legal implications of a restraints system failure, harness repairs to Air Bag module circuits are not acceptable. Where the text refers to "REPAIR the circuit", this will normally mean the replacement of a harness.
- NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.
- NOTE: When performing electrical voltage or resistance checks, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When checking resistance, always take the resistance of the DMM leads into account.
- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint checks.
- NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.
- NOTE: If DTCs are recorded and, after performing the pinpoint checks, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Restraints control module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Air Bag Supplemental Restraint System \(SRS\)](#) (501-20B Supplemental Restraint System, Diagnosis and Testing).

DTC	Description	Possible Cause	Action
B0001-11	Driver Frontal Stage 1 Deployment Control - circuit short to ground	<ul style="list-style-type: none"> • Driver Airbag Ignitor (Stage 1) circuit short to ground 	<ul style="list-style-type: none"> • Refer to electrical circuit diagrams and test Driver Airbag Ignitor (Stage 1) circuit for short to ground • Check for intermittent shorts to ground within the clockspring by rotating the steering column during the checks

General Information - Diagnostic Trouble Code (DTC) Index DTC: Satellite Digital Audio Radio System Module (SARM)

Description and Operation

Satellite Digital Audio Radio System Module (SARM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Satellite Radio Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Audio System](#) (415-01A Audio Unit, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1A89-11	Satellite Antenna - Circuit short to ground	<ul style="list-style-type: none"> ● Circuit short to power. The Satellite Digital Audio Radio Module has detected a vehicle power measurement for a period longer than expected, or has detected a vehicle power measurement when another value was expected ● Satellite Digital Audio Radio antenna cable short to ground ● Internal failure Satellite Digital Audio Radio Module ● Internal failure Satellite Digital Audio Radio antenna 	Refer to the electrical circuit diagrams and check Satellite Digital Audio Radio antenna cable for short to ground. Install Satellite Digital Audio Radio antenna harness as required. Suspect the Satellite Digital Audio Radio Module, check and install a new Satellite Digital Audio Radio Module as required. Suspect the Satellite Digital Audio Radio antenna, check and install a new Satellite Digital Audio Radio antenna as required. Refer to the warranty policy and procedures manual if a Module is suspect

General Information - Diagnostic Trouble Code (DTC) Index DTC: Terrain Response Control Module (ATCM)

Description and Operation

Terrain Response Control Module (ATCM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the All Terrain Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: [Ride and Handling Optimization](#) (204-06 Ride and Handling Optimization, Diagnosis and Testing).

• **NOTE:** There are references to "power latch" within the DTC index. This is where the module must be reset by means of a complete power down and power up.

DTC	Description	Possible Causes	Action
C1A00-46	Control Module - Calibration/parameter memory failure	<ul style="list-style-type: none"> The Terrain response control module has indicated a calibration/parameter memory failure for embedded systems using FLASH memory. This is equivalent to EEPROM in RAM/ROM/EEPROM embedded systems Corruption in the non-volatile memory storage system (EEPROM) in the Terrain response control module 	Rectify this DTC before attempting to rectify others. Record all DTCs logged and clear them. With ignition on select a terrain response special program, turn off the ignition, then turn back on the ignition and verify the selected special program is still active. If the selected terrain response special program is still not active and has returned to the general program, confirm if DTC has returned. Repeat procedure again once more. If DTC is still present install a new terrain response rotary control switch and control module. Refer to the warranty policy and procedures manual if a module is suspect
C1A01-96	LED - Component internal failure	<ul style="list-style-type: none"> LED circuit short circuit to ground or open circuit 	<p>• NOTE: If the system is in 'failsafe default mode due to another issue no LEDs will illuminate. This fault does not cause the system to go to 'failsafe default'.</p> <p>Refer to the Description and Operation section of workshop manual. Check terrain response system, special program LEDs. One or more of the LEDs is suspected of not illuminating as appropriate. With the engine running move the terrain response rotary control switch through all five programmes and confirm the appropriate special program LED does not illuminate when the terrain response rotary control switch is in that position. Suspect the terrain response rotary control switch and control module, check and install a new terrain response rotary control switch and control module as required. Refer to the warranty policy and procedures manual if a module is suspect</p>
C1A02-94	Rotary Encoder Stuck In Intermediate Position - Unexpected operation	<ul style="list-style-type: none"> The terrain response rotary control switch is held in an intermediate position (between the special programmes) for more than 60 seconds Foreign object preventing correct operation of terrain response rotary control switch Mechanical damage to the terrain response rotary control switch 	<p>• NOTE: Suspect driver error do not replace the terrain response rotary control at this time</p> <p>Check for foreign object preventing correct operation of terrain response rotary control. Start the vehicle engine, rotate the terrain response rotary control until it has located a genuine detent, wait 60 seconds. Stop the vehicle engine, clear the DTC and retest</p>

DTC	Description	Possible Causes	Action
U0001-88	High Speed CAN Communication Bus Off - Bus off	<ul style="list-style-type: none"> ● Bus off. The Terrain response control module has detected the data bus is not available ● CAN bus short circuit to ground, power or open circuit ● Failure of another control module on the CAN bus 	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0100-00	Lost Communication With The ECM/PCM 'A' - No sub type information	<ul style="list-style-type: none"> ● The Terrain response control module has not received one or more expected messages from the Engine Control Module ● Engine Control Module power circuit open circuit ● Engine Control Module ground circuit open circuit ● High speed CAN circuit communications failure ● Engine Control Module disconnected from the high speed CAN communication bus ● Engine Control Module disconnected from the high speed CAN communication bus ● Engine Control Module high speed CAN Low circuit open circuit ● Engine Control Module not configured ● Engine Control Module failure 	Using the manufacturer approved diagnostic system, check the Engine Control Module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the Engine Control Module. Refer to electrical circuit diagrams check the power and ground connections to Engine Control Module. Check the high speed CAN low and CAN high circuits, repair as necessary. Clear the DTC and retest. If the problem persists, suspect the Engine Control Module. Refer to the warranty policy and procedures manual if a module is suspect. Check the system is operating correctly and the DTC does not return
U0101-00	Lost Communication With The TCM - No sub type information	<ul style="list-style-type: none"> ● The Terrain response control module has not received one or more expected messages from the Transmission Control Module ● High speed CAN circuit communications failure ● Transmission Control Module power circuit open circuit ● Transmission Control Module ground circuit open circuit ● Transmission Control Module disconnected from the high speed CAN communication bus ● Transmission Control Module disconnected from the high speed CAN communication bus ● Transmission Control Module high speed CAN Low circuit open circuit ● Transmission Control Module not configured ● Transmission Control Module failure 	Using the manufacturer approved diagnostic system, check the Transmission Control Module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the Transmission Control Module. Refer to electrical circuit diagrams check the power and ground connections to Transmission Control Module. Check the high speed CAN low and CAN high circuits, repair as necessary. Clear the DTC and retest. If the problem persists, suspect the Transmission Control Module. Refer to the warranty policy and procedures manual if a module is suspect. Check the system is operating correctly and the DTC does not return
U0102-00	Lost Communication With The Transfer Case Control Module - No sub type information	<ul style="list-style-type: none"> ● The Terrain response control module has not received one or more expected messages from the Transfer Case Control Module ● High speed CAN circuit communications failure ● Transfer Case Control Module power circuit open circuit ● Transfer Case Control Module ground circuit open circuit ● Transfer Case Control Module disconnected from the high speed CAN communication bus ● Transfer Case Control Module high speed CAN Low circuit open circuit ● Transfer Case Control Module high speed CAN High circuit open circuit ● Transfer Case Control Module not configured 	Using the manufacturer approved diagnostic system, check the Transfer Case Control Module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the Transfer Case Control Module. Refer to electrical circuit diagrams check the power and ground connections to Transfer Case Control Module. Check the high speed CAN low and CAN high circuits, repair as necessary. Clear the DTC and retest. If the problem persists, suspect the Transfer Case Control Module. Refer to the warranty policy and procedures manual if a module is suspect. Check the system is operating correctly and the DTC does not return

DTC	Description	Possible Causes	Action
U0121-00	Lost Communication With Anti-Lock Brake System (ABS) Control Module - No sub type information	<ul style="list-style-type: none"> ● Transfer Case Control Module failure 	<p>Using the manufacturer approved diagnostic system, check the ABS Control Module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the ABS Control Module. Refer to electrical circuit diagrams check the power and ground connections to ABS Control Module. Check the high speed CAN low and CAN high circuits, repair as necessary. Clear the DTC and retest. If the problem persists, suspect the ABS Control Module. Refer to the warranty policy and procedures manual if a module is suspect. Check the system is operating correctly and the DTC does not return</p>
U0132-00	Lost Communication With Suspension Control Module 'A' - No sub type information	<ul style="list-style-type: none"> ● The Terrain response control module has not received one or more expected messages from the Suspension Control Module (Ride Level Module) ● High speed CAN circuit communications failure ● Suspension Control Module power circuit open circuit ● Suspension Control Module ground circuit open circuit ● Suspension Control Module disconnected from the high speed CAN communication bus ● Suspension Control Module high speed CAN Low circuit open circuit ● Suspension Control Module high speed CAN High circuit open circuit ● Suspension Control Module not configured ● Suspension Control Module failure 	<p>Using the manufacturer approved diagnostic system, check the Suspension Control Module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the Suspension Control Module. Refer to electrical circuit diagrams check the power and ground connections to Suspension Control Module. Check the high speed CAN low and CAN high circuits, repair as necessary. Clear the DTC and retest. If the problem persists, suspect the Suspension Control Module. Refer to the warranty policy and procedures manual if a module is suspect. Check the system is operating correctly and the DTC does not return</p>
U0139-00	Lost Communication With Suspension Control Module 'B' - No sub type information	<ul style="list-style-type: none"> ● The Terrain response control module has not received one or more expected messages from the Suspension Control Module (Continuously Variable Dampening) ● High speed CAN circuit communications failure ● Suspension Control Module power circuit open circuit ● Suspension Control Module ground circuit open circuit ● Suspension Control Module disconnected from the high speed CAN communication bus ● Suspension Control Module high speed CAN Low circuit open circuit ● Suspension Control Module high speed CAN High circuit open circuit ● Suspension Control Module not configured ● Suspension Control Module failure 	<p>Using the manufacturer approved diagnostic system, check the Suspension Control Module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the Suspension Control Module. Refer to electrical circuit diagrams check the power and ground connections to Suspension Control Module. Check the high speed CAN low and CAN high circuits, repair as necessary. Clear the DTC and retest. If the problem persists, suspect the Suspension Control Module. Refer to the warranty policy and procedures manual if a module is suspect. Check the system is operating correctly and the DTC does not return</p>

DTC	Description	Possible Causes	Action
U0140-00	Lost Communication With Body Control Module - No sub type information	<ul style="list-style-type: none"> ● The Terrain response control module has not received one or more expected messages from the Central Junction Box ● High speed CAN circuit communications failure ● Central Junction Box power circuit open circuit ● Central Junction Box ground circuit open circuit ● Central Junction Box disconnected from the high speed CAN communication bus ● Central Junction Box high speed CAN Low circuit open circuit ● Central Junction Box high speed CAN High circuit open circuit ● Central Junction Box not configured ● Central Junction Box failure 	Using the manufacturer approved diagnostic system, check the Central Junction Box for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the Central Junction Box. Refer to electrical circuit diagrams check the power and ground connections to Central Junction Box. Check the high speed CAN low and CAN high circuits, repair as necessary. Clear the DTC and retest. If the problem persists, suspect the Central Junction Box. Refer to the warranty policy and procedures manual if a module is suspect. Check the system is operating correctly and the DTC does not return
U0300-00	Internal Control Module Software Incompatibility - No sub type information	<ul style="list-style-type: none"> ● The Terrain response control module has failed to recognize a matching master configuration ID from the CAN data bus master ● The Terrain response control module has incorrect CAN configuration ● CAN Bus master not correctly configured ● Message containing configuration ID not received due to CAN Bus issue ● Message containing configuration ID not transmitted by CAN Bus master 	Using the manufacturer approved diagnostic system, check the CAN configuration in the Terrain response control module, check correct software versions installed and update as necessary. If similar DTCs from other modules exist suspect CAN Bus or CAN Bus master Control module. Check CAN Bus operation, check the CAN configuration in the CAN Bus master module, check correct software versions installed and update as necessary. Check the system is operating correctly and the DTC does not return
U0401-68	Invalid Data Received From The ECM/PCM 'A' - Event information	<ul style="list-style-type: none"> ● * The Terrain response control module has detected that the Engine Control Module had operated in a way or at a time that it had not been commanded to operate ● The engine management system, Engine Control Module is unable to support normal terrain response functionality, the terrain response system will go into default condition ● Engine management fault ● Engine Control Module failure 	Using the manufacturer approved diagnostic system, check the Engine Control Module for DTCs and refer to the relevant DTC index, rectify as required. Check the system is operating correctly and the DTC does not return. If the problem persists, suspect the Engine Control Module. Refer to the warranty policy and procedures manual if a module is suspect
U0403-68	Invalid Data Received From The Transfer Case Control Module - Event information	<ul style="list-style-type: none"> ● The Terrain response control module has detected that the Transfer Case Control Module had operated in a way or at a time that it had not been commanded to operate ● The Transfer Case Control Module is unable to support normal terrain response functionality, the terrain response system will go into default condition ● Transfer Case system fault ● Transfer Case Control Module failure 	Using the manufacturer approved diagnostic system, check the Transfer Case Control Module for DTCs and refer to the relevant DTC index, rectify as required. Check the system is operating correctly and the DTC does not return. If the problem persists, suspect the Transfer Case Control Module. Refer to the warranty policy and procedures manual if a module is suspect
U0415-68	Invalid Data Received From Anti-Lock Brake System (ABS) Control Module - Event information	<ul style="list-style-type: none"> ● The Terrain response control module has detected that the ABS Module had operated in a way or at a time that it had not been commanded to operate ● The ABS Module is unable to support normal terrain response functionality, the terrain response system will 	Using the manufacturer approved diagnostic system, check the ABS Module for DTCs and refer to the relevant DTC index, rectify as required. Check the system is operating correctly and the DTC does not return. If the problem persists, suspect the ABS Module. Refer to the warranty policy and procedures manual if a module is suspect

DTC	Description	Possible Causes	Action
		<ul style="list-style-type: none"> ● go into default condition ● ABS system fault ● ABS Module failure 	
U0421-68	Invalid Data Received From Suspension Control Module 'A' - Event information	<ul style="list-style-type: none"> ● The Terrain response control module has detected that the Suspension Control Module (Ride Level Module) had operated in a way or at a time that it had not been commanded to operate ● The Suspension Control Module is unable to support normal terrain response functionality, the terrain response system will go into default condition ● Suspension system fault ● Suspension Control Module failure 	Using the manufacturer approved diagnostic system, check the Suspension Control Module for DTCs and refer to the relevant DTC index, rectify as required. Check the system is operating correctly and the DTC does not return. If the problem persists, suspect the Suspension Control Module. Refer to the warranty policy and procedures manual if a module is suspect
U0422-68	Invalid Data Received From Body Control Module - Event information	<ul style="list-style-type: none"> ● The Terrain response control module has detected that the Central Junction Box had operated in a way or at a time that it had not been commanded to operate ● The Central Junction Box is unable to support normal terrain response functionality, the terrain response system will go into default condition ● Central Junction Box system fault ● Central Junction Box failure 	Using the manufacturer approved diagnostic system, check the Central Junction Box for DTCs and refer to the relevant DTC index, rectify as required. Check the system is operating correctly and the DTC does not return. If the problem persists, suspect the Central Junction Box. Refer to the warranty policy and procedures manual if a module is suspect
U043A-68	Invalid Data Received From Suspension Control Module "B" - Event information	<ul style="list-style-type: none"> ● The Terrain response control module has detected that the Suspension Control Module (Continuously Variable Damping) had operated in a way or at a time that it had not been commanded to operate ● The Suspension Control Module is unable to support normal terrain response functionality, the terrain response system will go into default condition ● Suspension system fault ● Suspension Control Module failure 	Using the manufacturer approved diagnostic system, check the Suspension Control Module for DTCs and refer to the relevant DTC index, rectify as required. Check the system is operating correctly and the DTC does not return. If the problem persists, suspect the Suspension Control Module. Refer to the warranty policy and procedures manual if a module is suspect
U2101-00	Control Module Configuration Incompatible - No sub type information	<ul style="list-style-type: none"> ● The Terrain response control module has detected a mismatch between the hardware connected and the hardware expected ● Vehicle not correctly configured ● Incorrect components installed for vehicle configuration 	Using the manufacturer approved diagnostic system, check the Car Configuration File, rectify as necessary. Check correct components for vehicle configuration are installed, rectify as necessary. Check the system is operating correctly and the DTC does not return

General Information - Diagnostic Trouble Code (DTC) Index DTC: Transfer Case Control Module (TCCM)

Description and Operation

Transfer box Control Module (TCCM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the transfer box control module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Transfer Case](#) (308-07B Transfer Case, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
P0560-00	System Voltage - No sub type information	<ul style="list-style-type: none"> Power or ground supply circuit fault Battery or charging system fault 	<ul style="list-style-type: none"> NOTE: This DTC may be logged due to battery voltage, suspect battery or charging system fault Check the battery condition and state of charge. Check the battery connections, power and ground cables. Refer to the relevant workshop manual section Using the manufacturer approved diagnostic system, check other modules, for related diagnostic trouble codes and refer to the relevant diagnostic trouble code index Clear the DTC and retest Using the manufacturer approved diagnostic system monitor supply voltage - Datalogger / section 308 manual transmission / transaxle and clutch /control module supply voltage = Pid D111 Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0561-00	System Voltage Unstable - No sub type information	<ul style="list-style-type: none"> Battery disconnected and reconnected Battery connections loose/corroded Battery ground cable intermittent high resistance Battery positive cable intermittent: high resistance 	<ul style="list-style-type: none"> Check the battery condition and state of charge. Check the battery connections, power and ground cables. Refer to the relevant section of the workshop manual Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0562-00	System Voltage Low - No sub type information	<ul style="list-style-type: none"> Battery voltage low Battery ground cable high resistance Battery connections loose/corroded Battery current drain 	<ul style="list-style-type: none"> Check the battery condition and state of charge. Check the battery connections, power and ground cables. Check the ignition power supply circuit connections and circuit. Refer to the relevant workshop manual section Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0563-00	System Voltage High - No sub type information	<ul style="list-style-type: none"> Vehicle battery boosted from high voltage starting aid Battery voltage high Generator over charge condition 	<ul style="list-style-type: none"> Check if the vehicle has been jump-started. Check the battery condition and state of charge. Check the battery connections, power and ground cables. Refer to the relevant workshop manual section
P0607-00	Control Module Performance - No sub type information	<ul style="list-style-type: none"> Transfer box control module - event information - CPU watch dog 	<ul style="list-style-type: none"> Check the transfer box control module circuits and connectors. Refer to the electrical circuit diagrams. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the transfer box control module. Refer to the warranty policy and procedures manual if a

DTC	Description	Possible Causes	Action
			module is suspect
P0634-00	PCM / ECM / TCM Internal Temperature A Too High - No sub type information	<ul style="list-style-type: none"> ● Transfer box motor, driver stage over-temperature deactivation ● Transfer box internal sensor error 	<ul style="list-style-type: none"> ● Consider atmospheric and customer driving conditions before carrying out any other action. Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box actuator hall effect sensor circuit. Refer to the warranty policy and procedures manual if a module is suspect
P0641-00	Sensor Reference Voltage A Circuit - No sub type information	<ul style="list-style-type: none"> ● Transfer box motor hall effect sensor supply circuit high resistance ● Transfer box motor hall effect sensor ground circuit high resistance ● Transfer box motor hall effect sensor failure ● Transfer box control module failure 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box actuator hall effect sensor circuit. Refer to the warranty policy and procedures manual if a module is suspect ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0642-00	Sensor Reference Voltage A Circuit Low - No sub type information	<ul style="list-style-type: none"> ● Transfer box motor hall effect sensor supply circuit short circuit to ground ● Transfer box motor hall effect sensor supply circuit high resistance ● Transfer box motor hall effect sensor failure ● Transfer box control module failure 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box actuator hall effect sensor circuit. P0643-00	Sensor Reference Voltage A Circuit High - No sub type information	<ul style="list-style-type: none"> ● Transfer box motor hall effect sensor supply circuit short circuit to power ● Transfer box motor hall effect sensor failure ● Transfer box control module failure 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box actuator hall effect sensor circuit. Refer to the warranty policy and procedures manual if a module is suspect ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0652-00	Sensor Reference Voltage B Circuit Low - No sub type information	<ul style="list-style-type: none"> ● Gear shift position sensor supply circuit short circuit to ground ● Gear shift position sensor supply circuit high resistance ● Gear shift position sensor failure 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box position sensor circuit (manual transmission x-sensor and manual transmission y-sensor). Renew the sensor ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0653-00	Sensor Reference Voltage B Circuit High - No sub type information	<ul style="list-style-type: none"> ● Gear shift position sensor supply circuit short circuit to power ● Gear shift position sensor failure 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box position sensor circuit (manual transmission x-sensor and manual transmission y-sensor). Renew the sensor ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0666-00	PCM/ECM/TCM Internal Temperature Sensor 'A' Circuit - No sub type information	<ul style="list-style-type: none"> ● Changeover solenoid, driver stage over-temperature deactivation 	<ul style="list-style-type: none"> ● Consider atmospheric and customer driving conditions before carrying out any other action. Refer to the electrical circuit diagrams and check the transfer box mode change solenoid circuit. Check for over-temperature DTCs in other modules
P0698-00	Sensor Reference Voltage C Circuit Low - No sub type information	<ul style="list-style-type: none"> ● Manual transmission output shaft speed sensor circuit short circuit to ground ● Manual transmission output shaft speed sensor circuit high resistance ● Manual transmission output shaft speed sensor failure 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the transmission circuits, especially the transmission output speed sensor circuit. Renew the sensor
P0699-00	Sensor Reference Voltage C Circuit High - No sub type information	<ul style="list-style-type: none"> ● Manual transmission output shaft speed sensor circuit short circuit to power ● Manual transmission output shaft speed 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the transmission circuits, especially the transmission output speed sensor circuit. Renew the sensor

DTC	Description	Possible Causes	Action
		sensor failure	
P0702-00	Transmission Control System Electrical - No sub type information	<ul style="list-style-type: none"> ● Unexpected reset ● Battery short circuit to ground ● Generator circuit short circuit to ground ● Transfer box control module supply short circuit to ground 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check for intermittent loss of power or ground of the main power supply circuits to the module. Check the battery connections, power and ground cables. Check the ignition power supply circuit connections and circuit
P0712-00	Transmission Fluid Temperature Sensor 'A' Circuit Low - No sub type information	<ul style="list-style-type: none"> ● Transfer box motor temperature sensor circuit short circuit to ground ● Transfer box motor temperature sensor failure 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the transfer box motor temperature sensor and circuits ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0713-00	Transfer box Motor Temperature Sensor A Circuit - No sub type information	<ul style="list-style-type: none"> ● Transfer box motor temperature sensor circuit short circuit to power ● Transfer box motor temperature sensor circuit high resistance ● Transfer box motor temperature sensor failure 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the transfer box motor temperature sensor and circuits ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0715-00	Turbine/Input Shaft Speed Sensor A Circuit - no sub type information	<ul style="list-style-type: none"> ● Clutch slip - transmission input and output speeds incorrect for selected gear ratio 	<ul style="list-style-type: none"> • NOTE: This DTC may be induced by the driver ● Confirm that the DTC has not been induced by the driving style of the driver (riding the clutch). Refer to the electrical circuit diagrams and check the circuit between gearbox secondary speed sensor and the transfer box control module. Check the gear selector mechanism for correct operation
P0716-00	Turbine/Input Shaft Speed Sensor A Circuit Range/Performance - no sub type information	<ul style="list-style-type: none"> ● Clutch slip - transmission input and output speeds incorrect for selected gear ratio 	<ul style="list-style-type: none"> • NOTE: This DTC may be induced by the driver ● Confirm that the DTC has not been induced by the driving style of the driver (riding the clutch). Refer to the electrical circuit diagrams and check the circuit between gearbox secondary speed sensor and the transfer box control module. Check the gear selector mechanism for correct operation
P0717-00	Turbine/Input Shaft Speed Sensor A Circuit No Signal - no sub type information	<ul style="list-style-type: none"> ● Clutch slip - transmission input and output speeds incorrect for selected gear ratio 	<ul style="list-style-type: none"> • NOTE: This DTC may be induced by the driver ● Confirm that the DTC has not been induced by the driving style of the driver (riding the clutch). Refer to the electrical circuit diagrams and check the circuit between gearbox secondary speed sensor and the transfer box control module. Check the gear selector mechanism for correct operation
P0780-00	Shift Malfunction - No sub type information	<ul style="list-style-type: none"> ● Gear shifting blocked (the transfer box motor movement and position does not correspond to the expected values) 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check transfer box motor circuit and transfer box motor hall effect sensor circuit. Check transfer box motor
P0806-00	Clutch Position Sensor Circuit Range/Performance - No sub type information	<ul style="list-style-type: none"> ● Clutch and range change mechanism calibration failure 	<ul style="list-style-type: none"> ● Calibrate the clutch and range change mechanism using the manufacturer approved diagnostic system. If fault is still present check the transfer box circuit, especially the transfer box motor circuit, transfer box motor hall effect sensor circuit and transfer box range position sensor circuit. In box of manual transmission variant also check x-sensor, y-sensor and manual transmission output speed sensor circuit ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0807-00	Clutch Position Sensor Circuit Low - No sub type information	<ul style="list-style-type: none"> ● Transfer box motor hall effect sensor signal circuit short circuit to ground ● Transfer box motor hall effect sensor failure 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the transfer box circuits, especially the transmission output speed sensor circuit. Repair/renew as necessary ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine

General Information - Diagnostic Trouble Code (DTC) IndexDTC: Transmission Control Module (TCM) - Bosch

Description and Operation

Transmission Control Module (TCM) - Bosch

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Transmission Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to:

[Automatic Transmission](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, Diagnosis and Testing),
[Diagnostics](#) (307-01C Automatic Transmission/Transaxle - V6 4.0L Petrol/TDV6 2.7L Diesel, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
P0121-86	Throttle/Pedal Position Sensor A Circuit Range/Performance - Signal invalid	<ul style="list-style-type: none"> Throttle position sensor wiring high resistance Throttle position sensor sensing circuits (Throttle position 1 or Throttle position 2) short circuit to power Throttle position sensor failure 	Refer to the electrical circuit diagrams and check the throttle position sensor circuit. Check for engine management DTCs. Renew the sensor
P0219-86	Engine Overspeed Condition - Signal invalid	<ul style="list-style-type: none"> Engine speed implausible (too high or too low) 	Check for related Engine Control Module DTCs
P0500-81	Vehicle Speed Sensor A - invalid serial data received	<ul style="list-style-type: none"> Vehicle speed signal not detected 	Check for related Anti-lock Braking System DTCs
P0501-81	Vehicle Speed Sensor A Range/Performance - invalid serial data received	<ul style="list-style-type: none"> Range/Performance 	Check for related Anti-lock Braking System DTCs
P0561-00	System Voltage Unstable - No sub type information	<ul style="list-style-type: none"> Power supply voltage is out of range when the engine is running 	Check the battery and charging system. Refer to the relevant workshop manual section
P0562-21	System Voltage Low - Signal amplitude < minimum	<ul style="list-style-type: none"> Supply voltage to TCM very low 	Check the battery condition and state of charge. Check the Transmission Control Module connector and supply circuits. Refer to the electrical circuit diagrams
P0563-22	System Voltage High - Signal amplitude > maximum	<ul style="list-style-type: none"> Power supply voltage is too high if the engine is running and there has been no jump-start or transmission limp-home event 	Check the battery and charging system. Refer to the relevant workshop manual section. Check if the vehicle has been jump-started
P0601-41	Internal Control Module Memory Check Sum Error - general checksum failure	<ul style="list-style-type: none"> Checksum error 	Check the Transmission Control Module connector and the power/ground circuits to the Transmission Control Module. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policies and procedures before renewing a Transmission Control Module
P0603-00	Internal Control Module Keep Alive Memory (KAM) Error - No sub type information	<ul style="list-style-type: none"> Keep-alive memory (KAM) error 	Check the Transmission Control Module connector and the power/ground circuits to the Transmission Control Module. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policies and procedures before renewing a Transmission Control Module

DTC	Description	Possible Causes	Action
P0605-41	Internal Control Module Read Only Memory (ROM) Error - General checksum failure	<ul style="list-style-type: none"> Read only memory (ROM) error 	Check the Transmission Control Module connector and the power/ground circuits to the module. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policy and procedures manual if a module is suspect
P0613-00	TCM Processor - No sub type information	<ul style="list-style-type: none"> No sub type information 	Check the Transmission Control Module connector and the power/ground circuits to the Transmission Control Module. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policies and procedures before renewing a Transmission Control Module
P0613-04	TCM Processor - system internal failures	<ul style="list-style-type: none"> Internal failure 	Check the Transmission Control Module connector and the power/ground circuits to the Transmission Control Module. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policies and procedures before renewing a Transmission Control Module
P0613-06	TCM Processor - algorithm based failures	<ul style="list-style-type: none"> Software algorithm based failures 	Check the Transmission Control Module connector and the power/ground circuits to the Transmission Control Module. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policies and procedures before renewing a Transmission Control Module
P0613-11	TCM Processor - Circuit short to ground	<ul style="list-style-type: none"> Internal circuit short to ground 	Check the Transmission Control Module connector and the power/ground circuits to the Transmission Control Module. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policies and procedures before renewing a Transmission Control Module
P0613-12	TCM Processor - Circuit short to battery	<ul style="list-style-type: none"> Internal circuit short to power 	Check the Transmission Control Module connector and the power/ground circuits to the Transmission Control Module. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policies and procedures before renewing a Transmission Control Module
P0613-13	TCM Processor - Circuit open	<ul style="list-style-type: none"> Internal circuit open circuit 	Check the Transmission Control Module connector and the power/ground circuits to the Transmission Control Module. U0300-55	Internal Control Module Software Incompatibility - not configured	<ul style="list-style-type: none"> ● Module is not configured 	Check for other modules reporting CAN Bus off or lost communication faults. If other modules report problems, check the software version in the Central Junction Box using the manufacturers approved diagnostic system. If no other modules report problems, check the software version in the Transmission Control Module. Update as necessary
U0401-86	Invalid Data Received from ECM/PCM A - Signal invalid	<ul style="list-style-type: none"> ● Signal invalid 	Check for engine management system (EMS/PCM) DTCs. Refer to the relevant section in the workshop manual. Check the correct software version in the Engine Control Module using the manufacturers approved diagnostic system. Update as necessary
U0416-86	Invalid Data Received From Vehicle Dynamics Control Module - Signal invalid	<ul style="list-style-type: none"> ● Signal invalid 	Check for other Anti-lock Braking System related DTCs. Check for other EMS related DTC faults (brake signal related). Check the Anti-lock Braking System control module installation/configuration and for correct software version using the manufacturers approved diagnostic system. Refer to the lost communication statement at the start of the Network Communications section in the workshop manual
U2023-86	Control Module Network Signal Calibration Data - Signal invalid	<ul style="list-style-type: none"> ● Engine torque information - Fault received from external node 	Check for engine management system (EMS/PCM) DTCs. Refer to the relevant section in the workshop manual. Check the control module for correct software version using the manufacturers approved diagnostic system
U3000-4A	Control Module - incorrect component installed	<ul style="list-style-type: none"> ● Incorrect component installed ● Mismatch between configuration data and read configuration 	Check for other modules reporting CAN Bus off or lost communication faults. If other modules report problems, check the software version in the Central Junction Box using the manufacturers approved diagnostic system. If no other modules report problems, check the software version in the Transmission Control Module. Update as necessary
U3000-81	Control Module - invalid serial data received	<ul style="list-style-type: none"> ● Invalid serial data received 	Check for other modules reporting CAN Bus off or lost communication faults. If other modules report problems, check the software version in the Central Junction Box using the manufacturers approved diagnostic system. If no other modules report problems, check the software version in the Transmission Control Module. Update as necessary

General Information - Diagnostic Trouble Code (DTC) IndexDTC: Transmission Control Module (TCM) - Siemens

Description and Operation

Transmission Control Module (TCM) - Siemens

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Transmission Control Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to:

[Automatic Transmission](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, Diagnosis and Testing),
[Automatic Transmission](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, Diagnosis and Testing),
[Diagnostics](#) (307-01C Automatic Transmission/Transaxle - V6 4.0L Petrol/TDV6 2.7L Diesel, Diagnosis and Testing),
[Diagnostics](#) (307-01D Automatic Transmission/Transaxle - V8 5.0L Petrol/TDV6 3.0L Diesel, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
P0121-86	Throttle/Pedal Position Sensor A Circuit Range/Performance - Signal invalid	<ul style="list-style-type: none"> Throttle position sensor sensing circuit signal invalid Throttle position sensor failure 	Check for Engine Control Module DTCs
P0219-86	Engine Overspeed Condition - Signal invalid	<ul style="list-style-type: none"> Engine speed implausible (signal invalid) 	Check for Engine Control Module DTCs
P0500-81	Vehicle Speed Sensor A - Invalid serial data received	<ul style="list-style-type: none"> Vehicle speed signal invalid serial data received 	Check for ABS related DTCs
P0501-81	Vehicle Speed Sensor A Range/Performance - Invalid serial data received	<ul style="list-style-type: none"> Vehicle speed signal invalid serial data received 	Check for ABS related DTCs
P0561-1C	System Voltage Unstable - Circuit voltage out of range	<ul style="list-style-type: none"> Power supply voltage is out of range when the engine is running 	Check the battery and charging system. Refer to the relevant workshop manual section
P0562-21	System Voltage Low - Signal amplitude < minimum	<ul style="list-style-type: none"> Supply voltage to TCM very low 	Check the battery condition and state of charge. Check the Transmission Control Module connector and power supply circuits. Refer to the electrical circuit diagrams
P0563-22	System Voltage High - Signal amplitude > maximum	<ul style="list-style-type: none"> Power supply voltage is too high if the engine is running and there has been no jump-start or transmission limp-home event 	Check the battery condition and state of charge. Check the Transmission Control Module connector and power supply circuits. Refer to the electrical circuit diagrams
P0601-41	Internal Control Module Memory Check Sum Error-General checksum failure	<ul style="list-style-type: none"> Checksum error 	Check the Transmission Control Module connector and the power/ground circuits to the module. Clear the DTC and retest. If the problem persists, renew the Transmission Control Module. Refer to the warranty policy and procedures manual if a module is suspect
P0604-92	Internal Control Module Random Access Memory (RAM) Error - Performance or incorrect operation	<ul style="list-style-type: none"> Control module internal memory error 	Check the Transmission Control Module connector and the power/ground circuits to the module. Clear the DTC and retest. If the problem persists, renew the Transmission Control Module. Refer to the warranty policy and procedures manual if a module is suspect

DTC	Description	Possible Causes	Action
P0613-06	TCM Processor - Algorithm Based Failures	<ul style="list-style-type: none"> Internal processor watchdog error 	Check the Transmission Control Module connector and the power/ground circuits to the module. Clear the DTC and retest. If the problem persists, renew the Transmission Control Module. Refer to the warranty policy and procedures manual if a module is suspect

Refer to the relevant section in the workshop manual. Check the control module for correct software version using the manufacturers approved diagnostic system
U0415-64	Invalid Data Received From Anti-Lock Brake System (ABS) Control Module - Signal plausibility failure	<ul style="list-style-type: none"> ● Signal plausibility failure 	Check for other module related DTCs. Refer to the relevant section in the workshop manual. Check the control module for correct software version using the manufacturers approved diagnostic system
U0415-68	Invalid Data Received From Anti-Lock Brake System (ABS) Control Module - Event information	<ul style="list-style-type: none"> ● Event information 	Check for other module related DTCs. Refer to the relevant section in the workshop manual. Check the control module for correct software version using the manufacturers approved diagnostic system
U0422-68	Invalid Data Received From Central Electronics Module - Event information	<ul style="list-style-type: none"> ● Event information 	Check the operation of the command shift switch. Check the electrical connections to the switch. Refer to the electrical circuit diagrams and check the circuit between the command shift switch and the Transmission Control Module. Check the power/ground circuits and the Central Junction Box connector. Refer to the lost communication statement in the network communication section of the workshop manual
U2101-00	Control Module Configuration Incompatible - No sub type information	<ul style="list-style-type: none"> ● No sub type information 	Check that the vehicle configuration is correctly set in the car configuration file using the manufacturer's approved diagnostic software. Check and update the Transmission Control Module software version if necessary
U3000-4B	Control Module - Over temperature	<ul style="list-style-type: none"> ● Module over temperature 	Check the Transmission Control Module connector and the power/ground circuits to the module. Refer to the electrical circuit diagrams and check the transmission cooling circuit. Clear the DTC and retest. If the problem persists, renew the Transmission Control Module Consider environmental conditions before condemning the module. Refer to the warranty policy and procedures manual if a module is suspect
U3001-94	Control Module Improper Shutdown - Unexpected operation	<ul style="list-style-type: none"> ● Event information 	DTC for information only. Clear the DTC and retest. If the problem persists, renew the Transmission Control Module. Refer to the warranty policy and procedures manual if a module is suspect

General Information - Diagnostic Trouble Code (DTC) Index DTC: Multifunction Display Module (FCDIM)

Description and Operation

Multifunction Display Module (FCDIM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Multifunction Display Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B10BD-11	Multifunctional Switch - circuit short to ground	<ul style="list-style-type: none"> Steering Wheel Module (LH) circuit short to ground Steering Wheel Module (LH) internal failure 	Refer to the electrical circuit diagrams and check the Steering Wheel Module (LH) circuit for short to ground. Check and install a new Steering Wheel Module (LH) as required. Refer to the warranty policy and procedures manual if a module is suspect
B10BD-13	Multifunctional Switch - circuit open	<ul style="list-style-type: none"> Steering Wheel Module (LH) circuit open. Steering Wheel Module (LH) internal failure 	Refer to the electrical circuit diagrams and check Steering Wheel Module (LH) circuit for open circuit. Check and install a new Steering Wheel Module (LH) as required. Refer to the warranty policy and procedures manual if a module is suspect
B10BD-23	Multifunctional Switch - Activation too long - signal stuck low	<ul style="list-style-type: none"> A constant Steering Wheel Module (LH) switch input has been received for more than two minutes Steering Wheel Module (LH) failure 	Clear DTC, cycle ignition if DTC returns suspect Steering Wheel Module (LH) internal fault. Check and install a new Steering Wheel Module (LH) as required. Refer to the warranty policy and procedures manual if a module is suspect
U0010-88	Medium Speed CAN Communication Bus - BMS Bus Off - bus off	<ul style="list-style-type: none"> CAN BUS off condition detected when the ECU required the BUS Medium Speed CAN BUS Circuit Fault CAN BUS circuit short to power, ground or open circuit 	Using the manufacturer approved diagnostic system, complete a Medium Speed CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network.
U0074-88	Control Module Communication Bus Off - IMS CAN - bus off	<ul style="list-style-type: none"> CAN BUS off condition detected when the ECU required the BUS Medium Speed CAN BUS Circuit Fault CAN BUS circuit, short to power, ground or open circuit 	Using the manufacturer approved diagnostic system, complete a Medium Speed CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network.
U0140-00	Lost communication with the BCM - no sub type information	<ul style="list-style-type: none"> Missing message from the Central Junction Box CAN network fault CAN BUS circuit, short to power, ground or open circuit 	Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Multifunction Display Module and the Central Junction Box
U0155-00	Lost communication with the ICP - no sub type information	<ul style="list-style-type: none"> Missing message from the Integrated Control Panel (Lower) CAN network fault CAN BUS circuit, short to power, ground or open circuit 	Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Multifunction Display Module and the Integrated Control Panel (Lower)

DTC	Description	Possible Causes	Action
U0184-00	Lost communication with Radio (IAM) - no sub type information	<ul style="list-style-type: none"> ● Lost Communications with the Audio Front Control Module ● CAN network fault ● CAN BUS circuit, short to power, ground or open circuit 	Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Multifunction Display Module and the Audio Front Control Module
U0195-00	Lost communication with Telephone Control Module (BVC) - no sub type information	<ul style="list-style-type: none"> ● Missing message from the Telephone Module 	Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Multifunction Display Module and Telephone Module
U0422-68	Invalid Data Received From Body Control Module (BCM) - event information	<ul style="list-style-type: none"> ● Invalid data received from Central Junction Box ● Multifunction Display Module internal failure 	Check for related DTCs within the Central Junction Box. Clear DTC and re-check, if DTC remains suspect a Multifunction Display Module internal fault. Check and install a new Multifunction Display Module as required. Refer to the warranty policy and procedures manual if a module is suspect
U2100-00	Initial Configuration Not Complete - no sub type information	<ul style="list-style-type: none"> ● Multifunction Display Module configuration not complete ● Multifunction Display Module internal failure 	Confirm the latest Strategy and Calibration software is installed, using the manufacturer approved diagnostic system carry out the new Multifunction Display Module application and update the Multifunction Display Module software if required
U2101-00	Control Module Configuration Incompatible - no sub type information	<ul style="list-style-type: none"> ● Invalid Car Configuration received from Central Junction Box ● Car Configuration parameter incorrect ● Multifunction Display Module internal failure 	Using the manufacturer approved diagnostic system check and amend the Car Configuration as required
U300-00	Control Module - no sub type information	<ul style="list-style-type: none"> ● Multifunction Display Module software corrupted ● Multifunction Display Module internal failure 	Suspect Multifunction Display Module internal fault. Clear the DTC, cycle ignition state to off then on. If the DTC returns replace the Multifunction Display Module. Refer to the warranty policy and procedures manual if a module is suspect
U3006-16	Control Module Input Power "A" - circuit voltage below threshold	<ul style="list-style-type: none"> ● The power supply to the Multifunction Display Module has been below 9 Volts for more than 1000 milliseconds 	Suspect Battery fault. Check the battery condition and state of charge. Check the vehicle charging system. Refer to the relevant workshop manual section. Clear the DTC, cycle ignition state to off then on if DTC returns refer to the electrical circuit diagrams and check power and ground circuit to the Multifunction Display Module
U3006-17	Control Module Input Power "A" - circuit voltage above threshold	<ul style="list-style-type: none"> ● The power supply to the Multifunction Display Module has been above 16 Volts for more than 1000 milliseconds 	Suspect Charging fault. Check the battery condition and state of charge. Check the vehicle charging system. Refer to the relevant workshop manual section

General Information - Diagnostic Trouble Code (DTC) Index DTC: Bluetooth Module - Mid Line (SPRM)

Description and Operation

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** If a module/component is suspected to have failed and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint checks, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Bluetooth® Telephone Control Module (TEL), for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section. For additional information, refer to: [Cellular Phone](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

Bluetooth® Telephone Control Module (TEL)

DTC	Description	Possible Causes	Action
B1D79-11	Microphone Input - circuit short to ground	<ul style="list-style-type: none"> Microphone circuit short to ground Microphone failure 	Refer to the electrical circuit diagrams and check the microphone circuit for short to ground. Check and install a new microphone as required.
B1D79-12	Microphone Input - circuit short to battery	<ul style="list-style-type: none"> Microphone circuit short to power Microphone failure 	Refer to the electrical circuit diagrams and check the microphone circuit for short to power. Check and install a new microphone as required.
B1D79-13	Microphone Input - circuit open	<ul style="list-style-type: none"> Microphone circuit open circuit, high resistance Microphone disconnected Microphone failure 	Refer to the electrical circuit diagrams and check the microphone circuit for open circuit, high resistance. Check the microphone electrical connector. Check and install a new microphone as required.
B1D79-1E	Microphone Input - circuit resistance out of range	<ul style="list-style-type: none"> Microphone circuit open circuit, high resistance Microphone disconnected Microphone failure 	Refer to the electrical circuit diagrams and check the microphone circuit for open circuit, high resistance. Check the microphone electrical connector. Check and install a new microphone as required.
U0010-88	Medium Speed CAN Communication Bus - bus off	<ul style="list-style-type: none"> Control Area Network (CAN) circuit short to ground, short to power, open circuit 	Refer to the electrical circuit diagrams and check the power and ground connections to the Bluetooth® Telephone Control Module (TEL). Using the manufacturer approved diagnostic system, complete a Control Area Network (CAN) integrity test. Refer to the electrical circuit diagrams and check the Control Area Network (CAN).

Identification Codes - Identification Codes

Description and Operation

VIN Number

The VIN number will be found in three locations:

- 1. Stamped on the side of the RH longitudinal member, rearward of the body front mounting.
- 2. At the bottom of the windshield glass on the LH side of the vehicle and visible from the outside.
- 3. **UK, Europe and ROW - Not NAS/Canada** - On the VIN plate attached to the bonnet locking platform.
- 4. **NAS/Canada** - On the Tire Data/Specification label attached to the front of the LH B-pillar.

Longitudinal Member VIN

E54942

Windscreen VIN

E54943

VIN number - UK, EU and ROW

VIN Position	Character	Identifies
1 - 3 - World identifier	SAL	Land Rover (UK)
4,5 - Vehicle type	LA	Land Rover - Discovery 4
6 - Class	A	Standard
6 - Class	J	Japan
7 - Body style	A	4 Door
7 - Body style	D	Commercial
7 - Body style	K	Armoured
8 - Engine	1	276DT - V6 2.7 Diesel
8 - Engine	4	406PN - V6 4.0 Petrol
8 - Engine	6	276DT - V6 2.7 Diesel with cDPF
8 - Engine	D	508PN - V8 5.0 NA Petrol
8 - Engine	F	306DT - V6 3.0 Diesel
8 - Engine	G	306DT - V6 3.0 Diesel with cDPF
9 - Transmission and steering	3	RHD Automatic
9 - Transmission and steering	4	LHD Automatic
9 - Transmission and steering	7	RHD Manual
9 - Transmission and steering	8	LHD Manual
10 - Model year	A	2010
11 - Plant	A	Solihull
11 - Plant	G	CKD Russia
12 - 17 - Serial number	1 2 3 4 5 6	Unique six digit serial number

VIN number - NAS and Canada

• NOTE: # Manual belts with driver and passenger frontal air bags and side inflatable restraint (1st,2nd (& 3rd) row when fitted).

VIN Position	Character	Identifies
1 - 3 - World identifier	SAL	Land Rover (UK)
4 - Make / Model	A	Land Rover - LR4
5 - Class / Nas restraint type	B	TL "S" / LR3 Base 5 Seats #
5 - Class / Nas restraint type	C	TL "S" / LR3 Base 7 Seats #
5 - Class / Nas restraint type	D	TL "SE" 5 Seats #
5 - Class / Nas restraint type	E	TL "SE" 7 Seats #
5 - Class / Nas restraint type	F	TL "HSE" 5 Seats #
5 - Class / Nas restraint type	G	TL "HSE" 7 Seats #
5 - Class / Nas restraint type	H	TL "HSE" Lux 5 Seats #
5 - Class / Nas restraint type	K	TL "HSE" Lux 7 Seats #
5 - Class / Nas restraint type	L	TL "HSE" Plus 5 Seats #
5 - Class / Nas restraint type	M	TL "HSE" Plus 7 Seats #
5 - Class / Nas restraint type	N	China
6 - Body style	2	4 Door Station Wagon
7 - Engine	1	276DT - V6 2.7 Diesel
7 - Engine	4	406PN - V6 4.0 Petrol

VIN Position	Character	Identifies
7 - Engine	D	508PN - V8 5.0 NA
7 - Engine	F	306DT - V6 3.0 Diesel
8- Transmission and steering	4	LHD Automatic
9 - Check digit	*	Derived by calculation
10- Model year	A	2010
11 - Plant	A	Solihull
12 -17 - Serial number	1 2 3 4 5 6	Unique six digit serial number

Bonnet locking platform VIN plate - Not NAS/Canada

E54941

The VIN plate contains the following information:

- **A** - Reserved
- **B** - Engine Description
- **C** - Country
- **D** - Diesel Indicator
- **E** - Reserved
- **F** - Headlamp Code/initial aim value - If shown
- **G** - Colour code/group
- **H** - Type/Approval Number - If shown
- **I** - VIN Number
- **J** - Gross Vehicle Weight
- **K** - Gross Train Weight
- **L** - Front Axle Weight
- **M** - Rear Axle Weight

VIN/Certification/Tire Data Label - NAS only

E54951

The Certification Label contains the following VIN information:

- **A** - * Vehicle VIN Number
- **B** - Bar code identification

VIN/Tire Pressure Specification Label - Canada only

E54950

The Tire Pressure Certification Label contains the following VIN information:

- **A** - Vehicle VIN Number
- **B** - Vehicle Type

Unit/Assembly Serial Number Locations

3.0 litre V6 Diesel Engine Serial Number

E120570

3.0 Litre V6 Diesel Engine Serial Number is stamped on the RH side of the cylinder block.

2.7 Litre V6 Diesel Engine Serial Number

E54949

The 2.7 Litre V6 Diesel Engine Serial Number is stamped on the RH side of the cylinder block.

4.0 Litre V6 Petrol Engine Serial Number

E54947

The 4.0 Litre V6 Petrol Engine Serial Number is stamped on the LH side of the cylinder block.

5.0 Litre NA V8 Petrol Engine Serial Number

E124686

The 5.0 Litre NA V8 Petrol Engine Serial Number is stamped on the LH side of the cylinder block.

Manual Gearbox Serial Number

E54953

The Manual Gearbox Serial Number is stamped on the rear LH side of the gearbox casing.

Automatic Gearbox Serial Number

E120916

The Automatic Gearbox Serial Number is stamped on the rear LH side of the gearbox casing.
Front Differential Serial Number

E124738

The Front Differential Serial Number is stamped on the underside of the differential casing and is located above the removable cross member.

Rear Differential Serial Number

E124739

The Rear Differential Serial Number is stamped on the underside of the differential casing adjacent to the front mounting.
Transfer Case Serial Number

E120914

The Transfer Case serial number is stamped on the RH side of the transfer case and may also be on a bar coded self-adhesive label attached to the case.

Jacking and Lifting - Jacking

Description and Operation

General

WARNING: The following instructions must be adhered to before raising the vehicle off the ground:

- Position vehicle on a solid, level surface.
- Apply the parking brake.
- Select 'P' - PARK on automatic transmission selector or 1st gear on manual transmission and 'H' High on transfer case.

WARNING: If the drive shaft(s) are to be disconnected, it will be necessary to raise all four wheels off the ground in order that the shaft(s) can be rotated. DO NOT use the customer jack and ensure that the vehicle is adequately supported on axle stands. With the vehicle raised, it will be necessary to release the park brake and select Neutral - 'N' in the main transmission to enable the drive shaft(s) to be rotated

• CAUTIONS:

To avoid damage to the underbody components of the vehicle, the following instructions must be adhered to:

Do not position jacks or axle stands under the following components:

- Body structure other than any approved jacking or lifting points
- Bumpers
- Fuel lines
- Fuel tank
- Brake lines
- Front or rear suspension arms
- Steering linkage
- Transfer case
- Front or rear differential units
- Transmission
- Engine oil pan - See note below

• NOTE: For certain repair operations, it may be necessary to support the engine under the oil pan. In this case, a block of hardwood or a rubber pad must be positioned on the jack lifting pad to protect the oil pan.

Vehicle jack

The jack provided with the vehicle is only intended for use in an emergency such as changing a tire. DO NOT use the jack for any other purpose. Refer to the Owner's Handbook for the vehicle jack location points and jacking procedures.

WARNING: Never work under a vehicle supported solely by the vehicle jack.

Hydraulic jack

A hydraulic jack with a minimum lifting capacity of 1500 kg, (3,300 lbs) must be used.

• WARNINGS:

Do not commence work on the underside of the vehicle until suitable axle stands have been placed in the correct position.

Always chock the wheels when jacking. The parking brake may be ineffective when the wheel(s) are off the ground.

Raising and Supporting the Vehicle

To assist in raising the vehicle, jacking points are provided as shown in the following illustrations.

Raising the Front of the Vehicle

Apply the parking brake.

Select 'P' - PARK on automatic transmission selector.

 **WARNING:** Always chock the rear wheels when jacking the front of the vehicle.

Position the lifting pad of the hydraulic jack in the centre of the recess in the engine undershield.

• **NOTE:** If the engine undershield has been removed, position the jack lifting pad in the centre of the front cross beam.

With the vehicle raised to the desired height, position axle stands at positions shown.

 **CAUTION:** Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

 **WARNING:** Before commencing work on the underside of the vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Raising the Rear of the Vehicle

Select 'P' - PARK on automatic transmission selector.

 **WARNING:** Always chock the front wheels when jacking the rear of the vehicle.

E47485

Position the lifting pad of the hydraulic jack under the centre of the rear cross member as shown.

CAUTION: Take care that the lifting pad of the jack is of a suitable size to avoid damaging the heat shield. It is not advisable to use a spacer block between the lifting pad and the rear cross member as this may result in some vehicle instability.

E47486

With vehicle raised to desired height, position axle stands at positions shown.

CAUTION: Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

WARNING: Before commencing work on underside of vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Raising Vehicle - One Wheel/side

Apply the parking brake.

Select 'P' - PARK on automatic transmission selector.

WARNING: Always chock the wheels which are not to be raised.

E47487

- **One front wheel** - position lifting pad of hydraulic jack beneath longitudinal member on the side to be raised at Point 'A'
 - **One rear wheel** - position lifting pad of jack beneath longitudinal member on the side to be raised at Point 'B'
 - **Front and rear wheels - ONE SIDE** - position lifting pad of jack beneath longitudinal member on the side to be raised at Point 'C'
- NOTE: Point 'C' is in line with number 3 body mounting.

E47488

With vehicle at desired height, position axle stand(s) beneath longitudinal members and adjacent to the lifting pad of the jack at appropriate point(s) D.

⚠ CAUTION: Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

⚠ WARNING: Before commencing work on underside of vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Jacking and Lifting - Lifting

Description and Operation

Vehicle on Wheels - Four Post Ramp

 **WARNING:** If the drive shaft(s) are to be disconnected, it will be necessary to raise all four wheels off the ramp in order that the shaft(s) can be rotated. If the wheel free facility is not to be used, raise the vehicle off the ramp using suitable equipment. With the vehicle raised, position axle stands in the positions shown for the front and rear support blocks - see illustration in Jacking. With the axle stands positioned, release the parking brake and select NEUTRAL 'N' in the transmission.

 **WARNING:** Do not push the vehicle backwards and forwards along the ramp in order to gain access to the drive shaft fixings.

Position the vehicle on the ramp with the front and rear of the vehicle equidistant from the ends of the ramp. Chock the wheels, select NEUTRAL in the transmission and where practicable, apply the parking brake.

Wheel Free Lift - Four Post Ramp

• **NOTE:** To enable the vehicle to be supported correctly on the wheel free longitudinal, it will be necessary to produce 2 off each of the support blocks to the dimensions given in the accompanying illustrations. The supporting part of each block must be manufactured from suitable hardwood or metal and the 'U' shaped base of each block must be manufactured from metal. Note that it is essential to ensure that the 'U' shaped base of each block is wide enough to fit over the wheel free longitudinal.

E48763

Front Support Block Dimensions

- 'A' = 127.0 mm (5.0 in)
- 'B' = 146.0 mm (5.75 in)
- 'C' = 89.0 mm (3.5 in)

E48764

Rear support block dimensions

- 'A' = 152.0 mm (6.0 in)
- 'B' = 101.0 mm (4.0 in)
- 'C' = 76.0 mm (3.0 in)

Raising and Supporting the Vehicle

1. Position vehicle on ramp.
2. Position suspension in 'off-road' height.
3. Apply parking brake.

4. Raise ramp to desired height.

E47489

5. Align the wheel free longitudinals beneath the body frame longitudinals and position the support blocks beneath the longitudinals in the positions shown.

CAUTION: Ensure that the front and rear support blocks are correctly oriented to front and rear of vehicle.

6. Engage wheel free and lower ramp slowly until weight of vehicle rests on support blocks and road wheels are just clear of ramp.

7. Ensure that the vehicle is correctly supported on all four support blocks, that blocks are still correctly positioned and are in full contact with the body frame longitudinals.

8. Lower the ramp.

WARNING: Make sure that the vehicle is stable before commencing work.

• **NOTE:** Return the suspension to 'normal ride height' when the vehicle is removed from the ramp.

Two Post Lift

CAUTION: If the drive shaft(s) are to be removed, release the parking brake and select NEUTRAL 'N' in the transmission in order that the shaft(s) can be rotated when the vehicle is raised to the desired height.

1. Position the vehicle with the centre of the lift pillars aligned approximately with the front of the driver/passenger seat cushions.

E47489

2. Extend the lifting arms and position the pad of each lifting arm beneath the body frame longitudinal lifting points.

3. Raise the vehicle until the wheels are just clear of the ground and check that the pads of each lifting arm are still

correctly positioned.

4. Raise the vehicle to the desired height.

5. Ensure that vehicle is correctly supported on all four lifting pads, that pads are still correctly positioned and are in full contact with the body frame longitudinals.

WARNING: Make sure that the vehicle is stable before commencing work.

Jacking and Lifting - Vehicle Recovery

Description and Operation

Towing/Lashing eyes

CAUTION: The single towing/lashing eyes at the front and rear of the vehicle are designed for vehicle recovery purposes only and **MUST** not be used to tow a trailer or caravan.

The front towing/lashing eye is accessible after releasing the 9 toggle fasteners securing the towing eye access panel and removing the panel.

CAUTION: Ensure that during towing, the towing attachment does not contact the bumper.

The rear towing/lashing eye 'A' is accessible after releasing the 2 fasteners securing the access panel to the bumper and removing the panel.

CAUTION: This towing/lashing eye should only be used for towing another vehicle or for recovery purposes to enable this vehicle to be positioned in order that the front towing eye may be used for recovery/towing.

4 Wheel Towing

• CAUTIONS:

Suspended towing of this vehicle **MUST NOT** be attempted, if 4 wheel towing is not possible, vehicle must be recovered on a suitable trailer.

The vehicle may be towed for a maximum of 3 hours or 90 miles (150 km) at a maximum speed of 30 mph (50 km/h), these limits **MUST NOT** be exceeded.

The following procedures must be followed to ensure that the vehicle is towed in a safe condition and damage to the vehicle transmission system is prevented.

1. Remove the front towing/lashing eye access panel.
2. Secure the towing attachment from the recovery vehicle to the towing/lashing eye.

CAUTION: Ensure that the towing attachment will not contact the front bumper during towing.

3. Apply the parking brake.
4. Insert ignition key and turn the ignition switch to position 'II'.
5. **Manual gearbox:** Apply the footbrake and position the gear lever in 'N' - Neutral.

CAUTION: If 'N' - Neutral cannot be selected, front and rear propeller shafts must be removed before vehicle is towed.

6. **Automatic gearbox:** Apply the footbrake and move the selector lever to the 'N' Neutral position.

- **NOTE:** If electrical power is not available, use the manual interlock release tab on the selector lever to move the selector lever to the Neutral position.

All vehicles

7. Select 'H' - HIGH on the transfer box.

CAUTION: If electrical power is not available, and 'H' - HIGH cannot be selected, the vehicle may not be towed but must be recovered on a suitable trailer. If, however, transfer box was in 'H' - HIGH when electrical power was lost, vehicle may still be towed.

8. Release the parking brake.

- **NOTE:** If electrical power is not available, it will be necessary to release the parking brake manually using the following procedures:

- **NOTE:** Left hand drive illustrated, right hand drive on opposite side of centre console.

9. Lift out the coin tray from the centre console
10. Remove the access panel from the centre console.
11. Locate the electric parking brake release cable, insert a suitable tool through the cable eye and pull the cable upwards to release the parking brake.

CAUTION: The electric parking brake will not function until electrical power is restored it will, therefore, be necessary to chock the wheels when vehicle is at a standstill.

WARNING: Do not release the parking brake until towing is about to commence. Whilst towing, do not attempt to remove the ignition key and do not turn the key to any position other than 'II'. With the engine switched off, the power assisted steering system and brake booster will be inoperative thereby resulting in an increase in the effort required to turn the steering wheel and apply the brakes.

CAUTION: The vehicle tow connections should only be used in normal road conditions, 'snatch' recovery must be avoided.

On completion of 4 wheel towing

1. Apply the parking brake or if electrical power is not available, securely chock the wheels.
2. Detach towing equipment from towing/lashing eyes.
3. Fit the towing eye access panel and secure the toggle fasteners.

Transporting by trailer

CAUTION: Use the towing/lashing eyes at the front and rear of the vehicle, DO NOT secure lashing hooks or restraints to any other part of the vehicle.

Position the vehicle, apply the parking brake and select 'N' - Neutral on the manual or automatic gearbox selector lever

CAUTION: If electrical power is not available and the parking brake is released, it will not be possible to re-apply the parking brake. It will, therefore be necessary to select 1st gear - manual gearbox or 'P' Park - automatic gearbox and ensure that the vehicle wheels are adequately chocked to prevent vehicle movement.

Jacking and Lifting - Jacking

Description and Operation

General

WARNING: The following instructions must be adhered to before raising the vehicle off the ground:

- Position vehicle on a solid, level surface.
- Apply the parking brake.
- Select 'P' - PARK on automatic transmission selector or 1st gear on manual transmission and 'H' High on transfer case.

WARNING: If the drive shaft(s) are to be disconnected, it will be necessary to raise all four wheels off the ground in order that the shaft(s) can be rotated. DO NOT use the customer jack and ensure that the vehicle is adequately supported on axle stands. With the vehicle raised, it will be necessary to release the park brake and select Neutral - 'N' in the main transmission to enable the drive shaft(s) to be rotated

• CAUTIONS:

To avoid damage to the underbody components of the vehicle, the following instructions must be adhered to:

Do not position jacks or axle stands under the following components:

- Body structure other than any approved jacking or lifting points
- Bumpers
- Fuel lines
- Fuel tank
- Brake lines
- Front or rear suspension arms
- Steering linkage
- Transfer case
- Front or rear differential units
- Transmission
- Engine oil pan - See note below

• NOTE: For certain repair operations, it may be necessary to support the engine under the oil pan. In this case, a block of hardwood or a rubber pad must be positioned on the jack lifting pad to protect the oil pan.

Vehicle jack

The jack provided with the vehicle is only intended for use in an emergency such as changing a tire. DO NOT use the jack for any other purpose. Refer to the Owner's Handbook for the vehicle jack location points and jacking procedures.

WARNING: Never work under a vehicle supported solely by the vehicle jack.

Hydraulic jack

A hydraulic jack with a minimum lifting capacity of 1500 kg, (3,300 lbs) must be used.

• WARNINGS:

Do not commence work on the underside of the vehicle until suitable axle stands have been placed in the correct position.

Always chock the wheels when jacking. The parking brake may be ineffective when the wheel(s) are off the ground.

Raising and Supporting the Vehicle

To assist in raising the vehicle, jacking points are provided as shown in the following illustrations.

Raising the Front of the Vehicle

Apply the parking brake.

Select 'P' - PARK on automatic transmission selector.

 **WARNING:** Always chock the rear wheels when jacking the front of the vehicle.

Position the lifting pad of the hydraulic jack in the centre of the recess in the engine undershield.

• **NOTE:** If the engine undershield has been removed, position the jack lifting pad in the centre of the front cross beam.

With the vehicle raised to the desired height, position axle stands at positions shown.

 **CAUTION:** Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

 **WARNING:** Before commencing work on the underside of the vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Raising the Rear of the Vehicle

Select 'P' - PARK on automatic transmission selector.

 **WARNING:** Always chock the front wheels when jacking the rear of the vehicle.

E47485

Position the lifting pad of the hydraulic jack under the centre of the rear cross member as shown.

CAUTION: Take care that the lifting pad of the jack is of a suitable size to avoid damaging the heat shield. It is not advisable to use a spacer block between the lifting pad and the rear cross member as this may result in some vehicle instability.

E47486

With vehicle raised to desired height, position axle stands at positions shown.

CAUTION: Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

WARNING: Before commencing work on underside of vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Raising Vehicle - One Wheel/side

Apply the parking brake.

Select 'P' - PARK on automatic transmission selector.

WARNING: Always chock the wheels which are not to be raised.

E47487

- **One front wheel** - position lifting pad of hydraulic jack beneath longitudinal member on the side to be raised at Point 'A'
 - **One rear wheel** - position lifting pad of jack beneath longitudinal member on the side to be raised at Point 'B'
 - **Front and rear wheels - ONE SIDE** - position lifting pad of jack beneath longitudinal member on the side to be raised at Point 'C'
- NOTE: Point 'C' is in line with number 3 body mounting.

E47488

With vehicle at desired height, position axle stand(s) beneath longitudinal members and adjacent to the lifting pad of the jack at appropriate point(s) D.

⚠ CAUTION: Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

⚠ WARNING: Before commencing work on underside of vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Jacking and Lifting - Lifting

Description and Operation

Vehicle on Wheels - Four Post Ramp

WARNING: If the drive shaft(s) are to be disconnected, it will be necessary to raise all four wheels off the ramp in order that the shaft(s) can be rotated. If the wheel free facility is not to be used, raise the vehicle off the ramp using suitable equipment. With the vehicle raised, position axle stands in the positions shown for the front and rear support blocks - see illustration in Jacking. With the axle stands positioned, release the parking brake and select NEUTRAL 'N' in the transmission.

WARNING: Do not push the vehicle backwards and forwards along the ramp in order to gain access to the drive shaft fixings.

Position the vehicle on the ramp with the front and rear of the vehicle equidistant from the ends of the ramp. Chock the wheels, select NEUTRAL in the transmission and where practicable, apply the parking brake.

Wheel Free Lift - Four Post Ramp

• **NOTE:** To enable the vehicle to be supported correctly on the wheel free longitudinals, it will be necessary to produce 2 off each of the support blocks to the dimensions given in the accompanying illustrations. The supporting part of each block must be manufactured from suitable hardwood or metal and the 'U' shaped base of each block must be manufactured from metal. Note that it is essential to ensure that the 'U' shaped base of each block is wide enough to fit over the wheel free longitudinals.

E48763

Front Support Block Dimensions

- 'A' = 127.0 mm (5.0 in)
- 'B' = 146.0 mm (5.75 in)
- 'C' = 89.0 mm (3.5 in)

E48764

Rear support block dimensions

- 'A' = 152.0 mm (6.0 in)
- 'B' = 101.0 mm (4.0 in)
- 'C' = 76.0 mm (3.0 in)

Raising and Supporting the Vehicle

1. Position vehicle on ramp.
2. Position suspension in 'off-road' height.
3. Apply parking brake.

4. Raise ramp to desired height.

E47489

5. Align the wheel free longitudinals beneath the body frame longitudinals and position the support blocks beneath the longitudinals in the positions shown.

CAUTION: Ensure that the front and rear support blocks are correctly oriented to front and rear of vehicle.

6. Engage wheel free and lower ramp slowly until weight of vehicle rests on support blocks and road wheels are just clear of ramp.

7. Ensure that the vehicle is correctly supported on all four support blocks, that blocks are still correctly positioned and are in full contact with the body frame longitudinals.

8. Lower the ramp.

WARNING: Make sure that the vehicle is stable before commencing work.

• **NOTE:** Return the suspension to 'normal ride height' when the vehicle is removed from the ramp.

Two Post Lift

CAUTION: If the drive shaft(s) are to be removed, release the parking brake and select NEUTRAL 'N' in the transmission in order that the shaft(s) can be rotated when the vehicle is raised to the desired height.

1. Position the vehicle with the centre of the lift pillars aligned approximately with the front of the driver/passenger seat cushions.

E47489

2. Extend the lifting arms and position the pad of each lifting arm beneath the body frame longitudinal lifting points.

3. Raise the vehicle until the wheels are just clear of the ground and check that the pads of each lifting arm are still

correctly positioned.

4. Raise the vehicle to the desired height.

5. Ensure that vehicle is correctly supported on all four lifting pads, that pads are still correctly positioned and are in full contact with the body frame longitudinals.

WARNING: Make sure that the vehicle is stable before commencing work.

Jacking and Lifting - Jacking

Description and Operation

WARNING: Make sure that any jacks or stands that are used to raise the vehicle have sufficient capacity to support the additional weight of the armoured vehicle.

CAUTION: Do not position jacks or axle stands under the following components:

- Body structure other than any approved jacking or lifting points
- Bumpers
- Fuel lines
- Fuel tank
- Brake lines
- Front or rear suspension arms
- Steering linkage
- Transfer case
- Front or rear differential units
- Transmission

For certain repair operations it may be necessary to support the engine under the oil pan. In this event, a block of hardwood or a rubber pad must be positioned on the jack lifting pad to protect the oil pan.

Vehicle Jack

• **WARNINGS:**

The trolley jack supplied with the vehicle is heavy and if handled incorrectly may cause injury. Use extreme caution when lifting or manoeuvring the jack.

Never work under a vehicle supported solely by the vehicle jack.

The vehicle jack is intended to be used in an emergency for changing a deflated tire. Never use the jack to raise the vehicle for any other purpose. Refer to the Driver Handbook when using the jack supplied with the vehicle. Failure to follow these instructions may result in personal injury.

The trolley jack and lever are stowed behind the rear seats under the hinged forward section of floor. The wheel changing tool kit is in a small bag, stowed in the same area.

Vehicle jack and tool kit stowage area

Safety Precautions

The following safety precautions must be observed when raising the vehicle with the vehicle jack:

- Never rely on a jack alone to support a vehicle. Always use suitable stands to provide rigid support.
- When working beneath a vehicle use a vehicle lift if possible, instead of a jack and stands.
- Make sure that the vehicle is standing on firm and level ground before using a jack.
- Do not rely on the parking brake alone; chock the wheels, and if possible put the automatic transmission into 'Park'.
- Check that any lifting equipment used has adequate capacity for the load being lifted and is in correct working order.

Spare Wheel

- WARNINGS:

The spare wheel is heavy and if handled incorrectly may cause injury. Use extreme caution when lifting or manoeuvring the wheels.

Remove the spare wheel before using the jack to avoid destabilising the vehicle when raised.

The spare wheel is stowed underneath the vehicle in the same position as on a standard vehicle. The winch used for lowering the spare wheel is accessed through the access port in the rear loadspace area.

Spare-wheel access port

E102720

Jacking Points

The jacking and lifting points for the armoured vehicle are the same as the standard vehicle.

Vehicle jacking points

E104286

Vehicle Weight

The weight of the vehicle is greater than the standard vehicle. Always make sure that any jacks or lifts are capable of supporting the additional loads.

Description	Front	Rear	Total
Unladen	-	-	3550 kg (minimum)
Gross Vehicle Weight	1850 kg	2350 kg	4050 kg

Jacking and Lifting - Lifting

Description and Operation

WARNING: Make sure that any lifts that are used to raise the vehicle have sufficient capacity to support the additional weight of the armoured vehicle.

The jacking and lifting points for the armoured vehicle are the same as the standard vehicle.

Four Post Lift

Four Post Lift – Vehicle on Wheels

Position the vehicle on the lift with the front and rear of the vehicle equidistant away from the ends of the lift. Chock the wheels; select Park 'P' in the transmission and where practicable, apply the parking brake.

WARNING: Do not push the vehicle backwards and forwards along the lift.

Four Post Lift – Wheel Free

WARNING: The armoured vehicle cannot be supported safely using the wheel-free facility of a four-post lift. Therefore, under no circumstances must this method be used.

Two Post Lift

CAUTION: If the drive shaft(s) are to be removed, release the parking brake and select Neutral 'N' in the transmission in order that the shaft(s) can be rotated when the vehicle is raised to the desired height.

Vehicle lifting points

E104286

- Position the vehicle with the centre of the lift pillars aligned approximately with the front of the driver and front passenger seat cushions.
- Extend the lifting arms and position the pad of each lifting arm beneath the body-frame longitudinal lifting points (arrowed above).
- Raise the vehicle until the wheels are just clear of the ground and check that the pads of each lifting arm are still correctly positioned.
- Raise the vehicle to the desired height.
- Ensure that the vehicle is correctly supported on all four lifting pads; that the pads are still correctly positioned and are in full contact with the body-frame longitudinal lifting points.

 **WARNING:** Ensure that the vehicle is stable before commencing work.

Vehicle Weight

The weight of the vehicle is greater than the standard vehicle. Always make sure that any jacks or lifts are capable of supporting the additional loads.

Description	Front	Rear	Total
Unladen	-	-	3550 kg (minimum)
Gross Vehicle Weight	1850 kg	2350 kg	4050 kg

Jacking and Lifting - Vehicle Recovery

Description and Operation

Refer to the Driver Handbook for vehicle recovery information.

CAUTION: Ensure that the transport company recovering the vehicle is aware that this is an armoured vehicle, as it may have a bearing on the type of recovery vehicle used.

Maintenance Schedules - Maintenance Schedules - Gasoline Engines

Description and Operation

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Torque Specifications

Description	Nm	lb-ft
Seat frame fixing Torx screws	40	30
Seat belt fixing Torx screws	40	30
Road wheel nuts	140	103

CAUTION: Unless stated otherwise, the following operations must be carried out at every service interval. Note that the 'A' and 'B' Service Intervals listed on the 'Maintenance Check Sheet' for vehicles operating under arduous conditions, vary from those specified for vehicles operating under normal conditions. Reference must therefore, always be made to the 'Arduous Conditions Maintenance Check Sheet' for vehicles operating under these conditions.

Maintenance Operations

Seats and Safety Belts

Front seat frame fixings - Every 2 years or 30,000 miles (48,000 km)

E45101

1. Carefully remove the trim panels covering the seat frame fixing Torx screws.
2. Check that the front seat frame fixing Torx screws are secure and that the seat frames show no signs of movement.
3. Install the trim panels on completion.

Front seat frame fixings - Every 2 years or 30,000 miles (48,000 km)

⚠ CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out every 1 year or 15,000 miles (24,000 km)

E54837

4. Check that the rear seat frame front fixings are secure and that the seat frames show no signs of movement.

Front seat frame fixings - Every 2 years or 30,000 miles (48,000 km)

⚠ CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out every 1 year or 15,000 miles (24,000 km)

E54843

5. Fold the seat cushions forwards and check that the rear seat frame rear fixings are secure and that the seat frames show no signs of movement.
6. Fold the seat cushions back on completion.

Front seat controls

E123155

7. Check operation of all seat controls.

Front seat frame fixings - Every 2 years or 30,000 miles (48,000 km)

⚠ CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out every 1 year or 15,000 miles (24,000 km)

8. Fully extend each Safety belt and check that it returns unassisted; repeat for all belts.
9. Check entire length of safety belt webbing for signs of fraying or damage; repeat for all belts.
10. Connect each safety belt to the correct buckle, check safety belt buckle and tongue are secure; check that buckle releases tongue correctly.
11. Check all safety belt and buckle mountings and fixings for security.

E54871

12. Check front safety belt height adjusters for correct operation.

Lamps, Horns and Warning Indicators

1. Check side, head, fog, reversing and tail lamps for correct operation.
2. Check operation of headlamp automatic levelling system - if installed.

3. Check turn signals and hazard warning lamps for correct operation.
4. Check brake (stop) lamps for correct operation.
5. Check all exterior lamp lenses for clarity and condition; pay particular attention to headlamp and fog lamp lenses for stone chips or damage.
6. Check horn for loud, clear sound.
7. Switch on headlamps and check that side/headlamp reminder warning sounds when door is opened.
8. Check operation of interior courtesy lamps.
9. Check operation of all instrument pack warning and indicator lamps.

Washers and Wipers

E54838

1. Check all wiper blades for condition and signs of splits or damage.
2. Check security of wiper arms.
3. Operate front and rear windshield washers, check that jets are clear and correctly aimed.
4. Operate front and rear wipers at all speeds and check for smooth, smear free operation.

Check High/Low Gear Engagement

1. Select LOW range gear, drive vehicle forwards 3 to 4 vehicle lengths, stop vehicle and select HIGH range gear - gears must engage smoothly.

Pollen Filter

1. Replace pollen filter.
For additional information, refer to: [Pollen Filter](#) (412-01 Air Distribution and Filtering, Removal and Installation).

Corrosion/Cosmetic Inspection

1. Carry out the annual corrosion/cosmetic inspection using the Annual Corrosion Inspection Sheet.

Wheels and Tires

1. Check that tires comply with manufacturer's specification.
For additional information, refer to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).
 2. Check/adjust tire pressures including spare.
For additional information, refer to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).
 3. **Vehicle with Uni-directional tires installed:** Mark the wheel to stud relationship of each road wheel and note location of each road wheel to its respective hub.
 4. Loosen road wheel nuts. Raise vehicle to a wheel free condition.
For additional information, refer to: [Lifting](#) (100-02 Jacking and Lifting, Description and Operation).
 5. Remove the road wheels.
 6. Visually check tires for condition, lumps or bulges. Check tread depth across the width of the tire and around the circumference; make sure that remaining tread depth does not contravene local legislative requirements.
- NOTE: Do not install wheels at this stage.

Braking System

CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out every 3 months or 3,750 miles (6,000 km)

1. Inspect front brake pads for wear.
For additional information, refer to: [Specifications](#) (206-03 Front Disc Brake, Specifications).
2. Inspect rear brake pads for wear.
For additional information, refer to: [Specifications](#) (206-04 Rear Disc Brake, Specifications).
3. Check brake calipers for signs of fluid leaks.

4. Check brake discs for condition.
5. Check all brake booster and brake system pipes and hoses for condition, chafing and leaks.
6. Clean road wheel hub spigots and apply grease, Land Rover Part Number RYL 105020 to the wheel mating surface of each spigot.
7. **Vehicles with Uni-directional tires installed:** Install road wheels on their respective hubs ensuring that stud to wheel relationship is maintained.
8. **Vehicles with NON uni-directional tires installed:** Install wheels on the opposite side of the vehicle but make sure that they are the same axle as they were originally installed.
9. Install road wheel nuts and tighten to 140 Nm (103 lb-ft).

CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out every 2 years or 30,000 miles (48,000 km)

10. **Every 3 years or 45,000 miles (72,000 km):** Replace brake fluid.
For additional information, refer to: [Brake System Bleeding](#) (206-00 Brake System - General Information, General Procedures).
11. **Every 6 years or 90,000 miles (144,000 km):** Replace all flexible brake hoses.

Electric Parking Brake

CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out every 3 months or 3,750 miles (6,000 km)

1. Check the adjustment of the electric parking brake.
For additional information, refer to: [Parking Brake Shoe and Lining Adjustment](#) (206-05 Parking Brake and Actuation, General Procedures).
2. **Vehicles operating under arduous conditions:** Check the condition of the electric parking brake system.

Road Wheel Speed Sensors

CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out every 3 months or 3,750 miles (6,000 km)

1. Inspect the road wheel speed sensor harnesses for damage.

Radiator and Cooling Fan

1. **Vehicles operating under arduous conditions:** Visually check radiator for external obstructions, check cooling fan blades for damage.

Air Suspension

1. **Every 5 years or 75,000 miles (120,000 km) - Vehicles operating under arduous conditions:** Replace air suspension compressor filter.
For additional information, refer to: [Air Suspension Air Filter](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

Door Locks and Hinges

1. Check operation of all door locks, bonnet lock and fuel filler flap.
2. Lubricate all door check straps, bonnet catch and fuel filler flap catch.

Cooling System

1. Check specific gravity of coolant using a hydrometer.

• **NOTE:** A suitable hydrometer is available from the Equipment Programme under Part Number 511 3302 001 00.

2. Top-up cooling system if necessary.

For additional information, refer to: [Specifications](#) (303-03C Engine Cooling - V6 4.0L Petrol, Specifications) / [Specifications](#) (303-03D Engine Cooling - V8 5.0L Petrol, Specifications).

CAUTION: Anti-freeze concentration must be maintained at 50%.

Cooling system - Check/Top-up

WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank whilst the system is hot.

CAUTION: Engine coolant will damage the paint finished surfaces. If coolant is spilled, immediately remove the coolant and wash the area with water.

1. Check the level of coolant in the expansion tank. With the engine cold, the coolant level must be to the '**UPPER LEVEL**' indicator mark above the '**COLD FILL RANGE**' text on the side of the expansion tank. Ignore any coolant which may be visible in the top section of the tank.

2. If topping-up is required, remove expansion tank filler cap and top-up coolant level to the '**UPPER LEVEL**' indicator mark.

For additional information, refer to: [Specifications](#) (303-03C Engine Cooling - V6 4.0L Petrol, Specifications) / [Specifications](#) (303-03D Engine Cooling - V8 5.0L Petrol, Specifications).

CAUTION: Always top-up with a 50% mixture of anti-freeze and water.

3. Install expansion tank filler cap, tighten cap until ratchet is heard to 'click'.

Coolant - Replace

1. **Every 10 years or 150,000 miles (240,000 km):** Replace the coolant.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures) / [Cooling System Draining, Filling and Bleeding](#) (303-03D Engine Cooling - V8 5.0L Petrol, General Procedures).

Ignition System

2. **Every 3 years or 45,000 miles (72,000 km) - Vehicles operating under arduous conditions:** Replace spark plugs.

For additional information, refer to: [Spark Plugs](#) (303-07A Engine Ignition - V6 4.0L Petrol, Removal and Installation) / [Spark Plugs](#) (303-07B Engine Ignition - V8 5.0L Petrol, Removal and Installation).

5. **Every 7 years or 105,000 miles (168,000 km):** Replace spark plugs.

For additional information, refer to: [Spark Plugs](#) (303-07A Engine Ignition - V6 4.0L Petrol, Removal and Installation) / [Spark Plugs](#) (303-07B Engine Ignition - V8 5.0L Petrol, Removal and Installation).

• **NOTE:** * 4.0 litre V6 engines may have either copper or platinum spark plugs installed.

Air Filtering

1. **Every 5 years or 75,000 miles (120,000 km):** Replace the air filter element.

For additional information, refer to: [Air Cleaner Element](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Removal and Installation) / [Air Cleaner Element](#) (303-12D Intake Air Distribution and Filtering - V8 5.0L Petrol, Removal and Installation).

Ancillary Drive Belt

1. Check the condition of the ancillary drive belt.
2. Remove all traces of mud and dirt from the drive belt and pulleys.
3. Check the drive belt for signs of splitting and wear.

CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out every 5 years or 75,000 miles (120,000 km).

4. **Every 7 years or 105,000 miles (168,000 km):** Replace the ancillary drive belt.

For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation) /

[Accessory Drive Belt](#) (303-05D Accessory Drive - V8 5.0L Petrol, Removal and Installation).

Fluid Levels

Brake fluid reservoir

1. Remove the auxiliary battery box cover.
2. Check the fluid level in the brake fluid reservoir, the level must be to the '**MAX**' mark on the reservoir; top-up if necessary.
3. Clean the area around the reservoir filler cap, remove cap.
4. If necessary, top-up using the recommended fluid to the '**MAX**' mark on the reservoir.
For additional information, refer to: [Specifications](#) (206-00 Brake System - General Information, Specifications).
5. Install the reservoir filler cap.
6. Install the auxiliary battery box cover.

Power steering fluid reservoir

CAUTION: To prevent over filling, check/top-up the system with the engine switched off and the system cold. Make sure that the steering wheel is in the straight ahead position, do not turn the steering wheel prior to checking the fluid level.

1. Check that the fluid level is to the mid-way mark between the '**MAX**' and '**MIN**' marks on the fluid reservoir, top-up if necessary.
2. Clean the area around the reservoir filler cap, remove cap.
3. If necessary, top-up using the recommended fluid to the mid-way mark on the reservoir.
For additional information, refer to: [Specifications](#) (211-02 Power Steering, Specifications).

 **CAUTION: Do not fill reservoir above the 'MAX' mark.**

4. Install the reservoir filler cap.

Windshield washer reservoir

E54847

1. Remove the windshield washer reservoir filler cap.

2. Top-up the reservoir using a mixture of an approved windshield washer fluid and water until the level is to the bottom of the gauze filter in the reservoir filler neck.

3. Install the reservoir filler cap.

Engine Oil and Filter

• CAUTIONS:

Rest of World Vehicles - Not UK and Europe: The following service items must be carried out every 6 months or 7,500 miles (12,000 km).

When vehicles are operating under arduous conditions, the following service items must be carried out every 3 months or 3,750 miles (6,000 km).

1. Renew engine oil and filter - 4.0 litre engine.

For additional information, refer to: [Specifications](#) (303-01C Engine - V6 4.0L Petrol, Specifications) / [Engine Oil Draining and Filling](#) (303-01C Engine - V6 4.0L Petrol, General Procedures).

2. Renew engine oil and filter - 5.0 litre engine.

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01D Engine - V8 5.0L Petrol, General Procedures).

Automatic Transmission

2. **Every 10 years or 150,000 miles (240,000 km):** Renew automatic transmission fluid.

For additional information, refer to: [Specifications](#) (307-01D, Specifications) / [Transmission Fluid Drain and Refill](#) (307-01D Automatic Transmission/Transaxle - V8 5.0L Petrol/TDV6 3.0L Diesel, General Procedures).

Transfer Case

1. **Every 5 years or 75,000 miles (120,000 km):** Renew transfer case oil.

For additional information, refer to: [Specifications](#) (308-07B Transfer Case, Specifications) / [Transfer Case Draining and Filling](#) (308-07B Transfer Case, General Procedures).

Differential Assemblies

1. **Every 10 years or 150,000 miles (240,000 km):** Renew front differential oil.

For additional information, refer to: [Specifications](#) (205-03 Front Drive Axle/Differential, Specifications) / [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).

2. **Every 5 years or 75,000 miles (120,000 km):** Renew rear 'Electronic Torque Managed (ETM)' differential oil.

For additional information, refer to: [Specifications](#) (205-02 Rear Drive Axle/Differential, Specifications) / [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).

3. **Every 10 years or 150,000 miles (240,000 km):** Renew rear 'OPEN' differential oil.

For additional information, refer to: [Specifications](#) (205-02 Rear Drive Axle/Differential, Specifications) / [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).

Suspension and Body Mountings

1. Check for free play in all suspension and body mounting rubbers.

2. Check condition of suspension rubber boots and gaiters.

3. Lift the vehicle so that front wheels are clear of ground/ramp to enable insertion of a suitable lever (e.g. a 1200mm long steel tube). Check the lower ball joints for free play by placing the lever between the ground/ramp and the tire, and lifting the wheel assembly with the lever. A second person will be required to check simultaneously for any ball joint lift. If free play (knock) is noted in the ball joint, replacement is required.

Fuel System

1. Check fuel system pipes, hoses and unions for chafing, leaks and corrosion.

Electrical Harnesses

1. Check all electrical harnesses for chafing.

Oil/Fluid Leaks

1. Check for oil/fluid leaks.

Exhaust System

1. Check exhaust system for leaks, security and damage.

Power Steering

1. Check power steering rod ball joint fixings, gaiters and condition of ball joints and dust covers.

2. Check power steering pipes, hoses and unions for chafing, leaks and corrosion.

Fault Lamp(s)

1. If fault lamp(s) are illuminated, test the associated system using approved Land Rover diagnostic equipment and report findings.

Road Test

1. Carry out road test of vehicle.

For additional information, refer to: [Road/Roller Testing](#) (100-00 General Information, Description and Operation).

General

1. Endorse Service Record.

2. Report any unusual features of vehicle condition and any additional work required.

Additional Items That May Require Attention

It is recommended that:

1. **Every 6 years:** All brake fluid hydraulic seals are replaced.

• **NOTE:** This is in addition to the maintenance requirement that flexible brake hoses **MUST** be replaced at this service interval.

2. **After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry:** The electric parking brake should be cleaned and inspected.

3. **After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry:** The ancillary drive belt should be cleaned and inspected.

4. **Vehicles with air suspension installed:** Vehicles used extensively in arduous or off road conditions will require the compressor air inlet filter to be renewed more frequently.

5. **Vehicles used in dusty or field conditions or deep wading:** More frequent attention to the air cleaner will be required.

Maintenance Schedules - Maintenance Schedules - Diesel Engines

Description and Operation

• **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Torque Specifications

Description	Nm	lb-ft
Seat frame fixing Torx screws	40	30
Seat belt fixing Torx screws	40	30
Road wheel nuts	140	103

CAUTION: Unless stated otherwise, the following operations must be carried out at every service interval. Note that the A and B Services listed on the Maintenance Check Sheet, applicable to vehicles operating under arduous conditions, vary both in period and mileage (kilometres) to the intervals specified for those vehicles operating under normal conditions. Reference must therefore, always be made to the 'Arduous Conditions Maintenance Check Sheet' for vehicles operating under these conditions.

Underbonnet View - 2.7 Litre

- 1. Engine oil level indicator
- 2. Engine oil filler cap
- 3. Power steering fluid reservoir
- 4. Brake/clutch fluid reservoir (LH drive illustrated - RH drive on opposite side)
- 5. Coolant expansion tank
- 6. Windshield washer reservoir

Underbonnet View - 3.0 Litre

E123154

- 1. Brake/clutch fluid reservoir (LH drive illustrated - RH drive on opposite side)
- 2. Engine oil filler cap
- 3. Windshield washer reservoir
- 4. Coolant expansion tank
- 5. Power steering fluid reservoir

Maintenance Operations

Seats and Safety Belts

E45101

Front seat frame fixings - Every 2 years or 30,000 miles (48,000 km) - vehicles with 2.7L diesel. Or 32,000 miles (52,000 km) - vehicles with 3.0L diesel

1. Carefully remove the trim panels covering the seat frame fixing Torx screws.
2. Check that the front seat frame fixing Torx screws are secure and that the seat frames show no signs of movement.
3. Reinstall the trim panels on completion.

E54837

Front seat frame fixings - Every 2 years or 30,000 miles (48,000 km) - vehicles with 2.7L diesel. Or 32,000 miles (52,000 km) - vehicles with 3.0L diesel

4. Check that the rear seat frame front fixings are secure and that the seat frames show no signs of movement.

E54843

Front seat frame fixings - Every 2 years or 30,000 miles (48,000 km) - vehicles with 2.7L diesel. Or 32,000 miles (52,000 km) - vehicles with 3.0L diesel

5. Fold the seat cushions forwards and check that the rear seat frame rear fixings are secure and that the seat frames show no signs of movement.
6. Fold the seat cushions back on completion.

E123155

Front seat controls

7. Check operation of all seat controls.

Safety belts - Every 2 years or 30,000 miles (48,000 km) - vehicles with 2.7L diesel. Or 32,000 miles (52,000 km) - vehicles with 3.0L diesel

8. Fully extend each safety belt and check that it returns unassisted; repeat for all belts.
9. Check entire length of safety belt webbing for signs of fraying or damage; repeat for all belts.
10. Connect each safety belt to the correct buckle, check safety belt buckle and tongue are secure; check that buckle releases tongue correctly.
11. Check all safety belt and buckle mountings and fixings for security.

E54871

12. Check front safety belt height adjusters for correct operation.

Lamps, Horns and Warning Indicators

1. Check side, head, fog, reversing and tail lamps for correct operation.
2. Check operation of headlamp automatic levelling system - if installed.

3. Check turn signals and hazard warning lamps for correct operation.
4. Check brake (stop) lamps for correct operation.
5. Check all exterior lamp lenses for clarity and condition; pay particular attention to headlamp and fog lamp lenses for stone chips or damage.
6. Check horn for loud, clear sound.
7. Switch on headlamps and check that side/headlamp reminder warning sounds when door is opened.
8. Check operation of interior courtesy lamps.
9. Check operation of all instrument pack warning and indicator lamps.

Washers and Wipers

E54838

1. Check all wiper blades for condition and signs of splits or damage.
2. Check security of wiper arms.
3. Operate front and rear windshield washers, check that jets are clear and correctly aimed.
4. Operate front and rear wipers at all speeds and check for smooth, smear free operation.

Check High/Low Gear Engagement

1. Select LOW range gear, drive vehicle forwards 3 to 4 vehicle lengths, stop vehicle and select HIGH range gear - gears must engage smoothly.

Pollen Filter

1. Replace pollen filter.
For additional information, refer to: [Pollen Filter](#) (412-01 Air Distribution and Filtering, Removal and Installation).

Corrosion/Cosmetic Inspection

1. Carry out the annual corrosion/cosmetic inspection using the Annual Corrosion Inspection Sheet.

Wheels and Tires

1. Check that tires comply with manufacturer's specification.
For additional information, refer to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).
2. Check/adjust tire pressures including spare.
For additional information, refer to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).
3. **Vehicles with Uni-directional tires installed:** Mark the wheel to stud relationship of each road wheel and note location of each road wheel to its respective hub.
4. Loosen road wheel nuts. Raise vehicle to a wheel free condition.
For additional information, refer to: [Lifting](#) (100-02 Jacking and Lifting, Description and Operation).
5. Remove the road wheels.
6. Visually check tires for condition, lumps or bulges. Check tread depth across the width of the tire and around the circumference; make sure that remaining tread depth does not contravene local legislative requirements.

• **NOTE:** Do not install wheels at this stage.

Braking System

E54872

⚠ CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out:

- Every 3 months or 3,750 miles (6,000 km) - vehicles with 2.7L diesel
- Every 3 months or 4,000 miles (6,500 km) - vehicles with 3.0L diesel

1. Inspect front brake pads for wear.
For additional information, refer to: [Specifications](#) (206-03 Front Disc Brake, Specifications).
2. Inspect rear brake pads for wear.
For additional information, refer to: [Specifications](#) (206-04 Rear Disc Brake, Specifications).
3. Check brake calipers for signs of fluid leaks.
4. Check brake discs for condition.
5. Check all brake booster and brake system pipes and hoses for condition, chafing and leaks.
6. Clean road wheel hub spigots and apply grease, Land Rover Part Number RYL 105020 to the wheel mating surface of each spigot.
7. **Vehicles with Uni-directional tires installed:** Install road wheels to their respective hubs ensuring that stud to wheel relationship is maintained.
8. **Vehicles with NON uni-directional tires installed:** Install wheels on the opposite side of the vehicle but make sure that they on the same axle as they were originally installed.
9. Install road wheel nuts and tighten to 140 Nm (103 lb-ft).

⚠ CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out:

- Every 2 years or 30,000 miles (48,000 km) - vehicles with 2.7L diesel
- Every 2 years or 32,000 miles (52,000 km) - vehicles with 3.0L diesel

10. **Every 2 years or 30,000 miles (48,000 km) - vehicles with 2.7L diesel. Or 32,000 miles (52,000 km) - vehicles with 3.0L diesel:** Replace brake fluid.
For additional information, refer to: [Brake System Bleeding](#) (206-00 Brake System - General Information, General Procedures).
11. **Every 6 years or 90,000 miles (144,000 km) - vehicles with 2.7L diesel. Or 96,000 miles (156,000 km) - vehicles with 3.0L diesel:** Replace all flexible brake hoses.

Electric Parking Brake

⚠ CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out:

- Every 3 months or 3,750 miles (6,000 km) - vehicles with 2.7L diesel
- Every 3 months or 4,000 miles (6,500 km) - vehicles with 3.0L diesel

1. Check the adjustment of the electric parking brake.
For additional information, refer to: [Parking Brake Shoe and Lining Adjustment](#) (206-05 Parking Brake and Actuation, General Procedures).
2. **Vehicles operating under arduous conditions:** Check the condition of the electric parking brake system.

Road Wheel Speed Sensors

⚠ CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out:

- Every 3 months or 3,750 miles (6,000 km) - vehicles with 2.7L diesel
- Every 3 months or 4,000 miles (6,500 km) - vehicles with 3.0L diesel

1. Inspect the road wheel speed sensor harnesses for damage.

Fuel Filter Element

• CAUTIONS:

When vehicles are operating under arduous conditions, the following service item must be carried out:

- Every 12 months or 15,000 miles (24,000 km) - vehicles with 2.7L diesel
- Every 12 months or 16,000 miles (26,000 km) - vehicles with 3.0L diesel

China and India markets only: The following service item must be carried out:

- Every 6 months or 7,500 miles (12,000 km) - vehicles with 2.7L diesel
- Every 6 months or 8,000 miles (13,000 km) - vehicles with 3.0L diesel

1. Every 2 years or 30,000 miles (48,000 km) - vehicles with 2.7L diesel. Or 32,000 miles (52,000 km) - vehicles with 3.0L diesel: Replace fuel filter element. For additional information, refer to:

[Fuel Filter Element - VIN Range: SALLA000304->END_OF_06MY](#) (310-01A Fuel Tank and Lines - TDV6 2.7L Diesel, Removal and Installation),

[Fuel Filter Element](#) (310-01B Fuel Tank and Lines - TDV6 3.0L Diesel, Removal and Installation).

Fuel Sedimentor

CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out:

- Every 3 months or 3,750 miles (6,000 km) - vehicles with 2.7L diesel
- Every 3 months or 4,000 miles (6,500 km) - vehicles with 3.0L diesel

1. Drain the fuel sedimentor.

For additional information, refer to: [Diesel Filter Water Drain-Off](#) (310-00 Fuel System - General Information, General Procedures).

Radiator/intercooler and Cooling Fan

CAUTION: Vehicles operating under arduous conditions:

1. Visually check the radiator/intercooler for external obstructions, check cooling fan blades for damage.
2. Remove any debris from the intercooler using a low pressure hose.

Air Suspension

1. Every 5 years or 75,000 miles (120,000 km) - vehicles with 2.7L diesel. Or 80,000 miles (129,000 km) - vehicles with 3.0L diesel - **On vehicles operating under arduous conditions:** Replace the air suspension compressor filter. For additional information, refer to: [Air Suspension Air Filter](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

Door Locks and Hinges

1. Check operation of all door locks, bonnet lock and fuel filler flap.
2. Lubricate all door check straps, bonnet catch and fuel filler flap catch.

Cooling System

1. Check specific gravity of coolant using a hydrometer.

• **NOTE:** A suitable hydrometer is available from the Equipment Programme under Part Number 511 3302 001 00.

2. Top-up cooling system if necessary.

For additional information, refer to: [Specifications](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Specifications) / [Specifications](#) (303-03B Engine Cooling - TDV6 3.0L Diesel, Specifications).

CAUTION: Anti-freeze concentration must be maintained at 50%.

Cooling system - Check/Top-up

WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank whilst the system is hot.

CAUTION: Engine coolant will damage the paint finished surfaces. If coolant is spilled, immediately remove the coolant and wash the area with water.

1. Check the level of coolant in the expansion tank. With the engine cold, the coolant level must be to the '**UPPER LEVEL**' indicator mark above the '**COLD FILL RANGE**' text on the side of the expansion tank. Ignore any coolant which may be visible in the top section of the tank.

2. If topping-up is required, remove expansion tank filler cap and top-up coolant level to the '**UPPER LEVEL**' indicator mark.

For additional information, refer to: [Specifications](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Specifications) / [Specifications](#) (303-03B Engine Cooling - TDV6 3.0L Diesel, Specifications).

CAUTION: Always top-up with a 50% mixture of anti-freeze and water.

3. Fit expansion tank filler cap, tighten cap until ratchet is heard to 'click'.

Coolant - Replace

1. **Every 10 years or 150,000 miles (240,000 km) - vehicles with 2.7L diesel. Or 160,000 miles (258,000 km) - vehicles with 3.0L diesel:** Replace the coolant.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures) / [Cooling System Draining, Filling and Bleeding](#) (303-03B Engine Cooling - TDV6 3.0L Diesel, General Procedures).

Air Filtering

CAUTION: When vehicles are operating under arduous conditions, the following service item must be carried out:

- Every 12 months or 15,000 miles (24,000 km) - vehicles with 2.7L diesel
- Every 12 months or 16,000 miles (26,000 km) - vehicles with 3.0L diesel

1. **Every 3 years or 45,000 miles (72,000 km) - vehicles with 2.7L diesel. Or 48,000 miles (77,000 km) - vehicles with 3.0L diesel:** Replace the air filter element.

For additional information, refer to: [Air Cleaner Element](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation) / [Air Cleaner Element](#) (303-12B Intake Air Distribution and Filtering - TDV6 3.0L Diesel, Removal and Installation).

Ancillary Drive Belt

1. Check the condition of the ancillary drive belt.

2. Remove all traces of mud and dirt from the drive belt and pulleys.

3. Check the drive belt for signs of splitting and wear.

CAUTION: When vehicles are operating under arduous conditions, the following service items must be carried out:

- Every 5 years or 75,000 miles (120,000 km) - vehicles with 2.7L diesel
- Every 5 years or 80,000 miles (129,000 km) - vehicles with 3.0L diesel

2. **Every 10 years or 150,000 miles (241,000 km) - vehicles with 2.7L diesel. Or 160,000 miles (258,000 km) - vehicles with 3.0L diesel:** Replace the ancillary drive belt.

For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation) / [Accessory Drive Belt](#) (303-05B Accessory Drive - TDV6 3.0L Diesel, Removal and Installation).

Camshaft Timing Belt and High Pressure Fuel Pump Drive Belt/Rear End Accessory Drive (READ) Belt

CAUTION: When vehicles are operating under arduous conditions, the following service item must be carried out:

- Every 4 years or 60,000 miles (96,000 km) - vehicles with 2.7L diesel
- Every 4 years or 56,000 miles (90,000 km) - vehicles with 3.0L diesel

3. Every 7 years or 105,000 miles (168,000 km) - vehicles with 2.7L diesel. Or 112,000 miles (180,000 km) - vehicles with 3.0L diesel: Replace camshaft timing belt.

For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair) / [Timing Belt](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

Replace the High pressure fuel pump drive belt.

For additional information, refer to: [Fuel Injection Pump Belt - VIN Range: SALLA000304->END OF 06 MY](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation) / [Rear End Accessory Drive \(READ\)](#) (303-05B Accessory Drive - TDV6 3.0L Diesel, Removal and Installation).

Fluid Levels

Brake/clutch fluid reservoir

1. Remove the auxiliary battery box cover.
2. Check the fluid level in the brake/clutch fluid reservoir, the level must be to the '**MAX**' mark on the reservoir; top-up if necessary.
3. Clean the area around the reservoir filler cap, remove the cap.
4. If necessary, top-up using the recommended fluid to the '**MAX**' mark on the reservoir.
For additional information, refer to: [Specifications](#) (206-00 Brake System - General Information, Specifications).
5. Reinstall the reservoir filler cap.
6. Install the auxiliary battery box cover.

Power steering fluid reservoir

CAUTION: To prevent over filling, check/top-up the system with the engine switched off and the system cold. Make sure that the steering wheel is in the straight ahead position, do not turn the steering wheel prior to checking the fluid level.

1. Check that the fluid level is to the mid-way mark between the '**MAX**' and '**MIN**' marks on the fluid reservoir, top-up if necessary.
2. Clean the area around the reservoir filler cap, remove the cap.

3. If necessary, top-up using the recommended fluid to the mid-way mark on the reservoir. For additional information, refer to: [Specifications](#) (211-02 Power Steering, Specifications).

 **CAUTION: Do not fill reservoir above the 'MAX' mark.**

4. Reinstall the reservoir filler cap.

Windshield washer reservoir

E54847

1. Remove the windshield washer reservoir filler cap.

2. Top-up the reservoir using a mixture of an approved windshield washer fluid and water until the level is to the bottom of the gauze filter in the reservoir filler neck.

3. Reinstall the reservoir filler cap.

Engine Oil and Filter

• CAUTIONS:

 **When vehicles are operating under arduous conditions, the following service items must be carried out:**

- Every 3 months or 3,750 miles (6,000 km) - vehicles with 2.7L diesel
- Every 3 months or 4,000 miles (6,500 km) - vehicles with 3.0L diesel

 **Rest of World Vehicles - Not UK and Europe: The following service items must be carried out:**

- Every 6 months or 7,500 miles (12,000 km) - vehicles with 2.7L diesel
- Every 6 months or 8,000 miles (13,000 km) - vehicles with 3.0L diesel

1. Renew engine oil and filter.

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures) /

[Engine Oil Draining and Filling](#) (303-01B Engine - TDV6 3.0L Diesel, General Procedures).

Automatic Transmission

1. **Every 10 years or 150,000 miles (241,000 km) - vehicles with 2.7L diesel:** Renew automatic transmission fluid.

For additional information, refer to: [Specifications](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, Specifications) /

[Transmission Fluid Drain and Refill](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

1. **Every 9 years or 144,000 miles (232,000 km) - vehicles with 3.0L diesel:** Renew automatic transmission fluid.

For additional information, refer to: [Specifications](#) (307-01D, Specifications) /

[Transmission Fluid Drain and Refill](#) (307-01D Automatic Transmission/Transaxle - V8 5.0L Petrol/TDV6 3.0L Diesel, General Procedures).

Transfer Case

1. **Every 5 years or 75,000 miles (120,000 km) - vehicles with 2.7L diesel. Or 80,000 miles (129,000 km) - vehicles with 3.0L diesel:** Renew transfer case fluid.

For additional information, refer to: [Specifications](#) (308-07B Transfer Case, Specifications) /

[Transfer Case Draining and Filling](#) (308-07B Transfer Case, General Procedures).

Differential Assemblies

1. **Every 10 years or 150,000 miles (241,000 km) - vehicles with 2.7L diesel. Or 160,000 miles (258,000 km) - vehicles with 3.0L diesel:** Renew front differential oil.

For additional information, refer to: [Specifications](#) (205-03 Front Drive Axle/Differential, Specifications) /

[Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).

2. **Every 5 years or 75,000 miles (120,000 km) - vehicles with 2.7L diesel. Or 80,000 miles (129,000 km) - vehicles**

with 3.0L diesel: Renew rear 'Electronic Torque Managed (ETM)' differential oil.
For additional information, refer to: [Specifications](#) (205-02 Rear Drive Axle/Differential, Specifications) / [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).

3. Every 10 years or 150,000 miles (241,000 km) - vehicles with 2.7L diesel. Or 160,000 miles (258,000 km) - vehicles with 3.0L diesel: Renew rear 'OPEN' differential oil.
For additional information, refer to: [Specifications](#) (205-02 Rear Drive Axle/Differential, Specifications) / [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).

Suspension and Body Mountings

1. Check for free play in all suspension and body mounting rubbers.
2. Check condition of suspension rubber boots and gaiters.
3. Lift the vehicle so that front wheels are clear of ground/ramp to enable insertion of a suitable lever (e.g. a 1200mm long steel tube). Check the lower ball joints for free play by placing the lever between the ground/ramp and the tire, and lifting the wheel assembly with the lever. A second person will be required to check simultaneously for any ball joint lift. If free play (knock) is noted in the ball joint, replacement is required.

Fuel System

1. Check fuel system pipes, hoses and unions for chafing, leaks and corrosion.

Electrical Harnesses

1. Check all electrical harnesses for chafing.

Oil/Fluid Leaks

1. Check for oil/fluid leaks.

Exhaust System

1. Check exhaust system for leaks, security and damage.

Power Steering

1. Check power steering rod ball joint fixings, gaiters and condition of ball joints and dust covers.
2. Check power steering pipes, hoses and unions for chafing, leaks and corrosion.

Clutch

1. Check clutch pipes and unions for chafing, leaks and corrosion.

Fault Lamp(s)

1. If fault lamp(s) are illuminated, test the associated system using approved Land Rover diagnostic equipment and report findings.

Road Test

1. Carry out road test of vehicle.
For additional information, refer to: [Road/Roller Testing](#) (100-00 General Information, Description and Operation).

General

1. Endorse Service Record.
2. Report any unusual features of vehicle condition and any additional work required.

Additional Items That May Require Attention

It is recommended that:

1. **Every 6 years:** All brake fluid hydraulic seals are replaced.
 - **NOTE:** This is in addition to the maintenance requirement that flexible brake hoses **MUST** be replaced at this service interval.
2. **After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry:** The electric parking brake should be cleaned and inspected.
3. **After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry:** The ancillary drive belt should be cleaned and inspected.
4. **Vehicles with air suspension installed:** Vehicles used extensively in arduous or off road conditions will require the compressor air inlet filter to be renewed more frequently.
5. **Vehicles used in dusty or field conditions or deep wading:** More frequent attention to the air cleaner will be required.

6. Vehicles used in areas where fuel quality is poor: Where vehicles are used in these areas, the fuel sedimentor may require draining at more frequent intervals.

Suspension System - General Information -

Coil Spring Suspension

Item	Specification
Type:	
Front	Independent with single rate coil spring, twin tube damper and high stress anti-roll bar
Rear	Independent with dual rated coil spring, twin tube damper and anti-roll bar

Air Spring Suspension

Item	Specification
Type	Independent with twin tube damper, anti-roll bars and air springs with multiple, driver selectable ride heights - Standard, off-road and access.

Steering Geometry - Front

CAUTION: When checking or adjusting front or rear steering geometry, the vehicle must either have a full fuel tank or have sufficient weight placed in the vehicle's load space to give the equivalent weight of a full fuel tank. The weight must be evenly distributed at the front and the right hand side of the load space. The fuel tank capacity is 86.3 litres (18.9 Imperial gallons) (22.7 US gallons). Depending on the amount of fuel in the tank, calculate the amount of weight which must be added:

- 1 litre of fuel weighs 0.8 kg (1.7 pounds)
- 1 Imperial gallon of fuel weighs 3.6 kg (8.0 pounds)
- 1 US gallon of fuel weighs 3.0 kg (6.7 pounds)

Suspension System - General Information - Suspension System

Diagnosis and Testing

Principle of Operation

For a detailed description of the Suspension System and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to:

[Front Suspension](#) (204-01 Front Suspension, Description and Operation),
[Rear Suspension](#) (204-02 Rear Suspension, Description and Operation).

Inspection and Verification

WARNING: Before carrying out a road test, make sure the vehicle is safe to do so. Failure to follow this instruction may result in personal injury.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Gather as much information from the driver as possible and verify the customer concern by carrying out a road test, as closely as possible reproducing the conditions under which the fault occurs.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> ● Tire pressures ● Damaged wheels or tires ● Wheel bearing(s) ● Loose or damaged front or rear suspension components ● Loose, damaged or missing suspension fastener(s) ● Damaged or leaking air suspension components ● Worn or damaged suspension bushing(s) ● Loose, worn or damaged steering system components ● Damaged axle components ● Damaged Chassis

3. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the symptom chart.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Crabbing	<ul style="list-style-type: none"> ● Incorrect rear thrust angle ● Front or rear suspension components 	Check the rear alignment. REFER to: Four-Wheel Alignment (204-00 Suspension System - General Information, General Procedures). Check the front and rear suspension for signs of damage or wear.
Drift/Pull/Wander	<ul style="list-style-type: none"> ● Tire pressures ● Uneven tire wear ● Damaged steering components ● Wheel alignment ● Brake drag ● Unevenly loaded or overloaded vehicle 	Check and adjust the tire pressures (see visual inspection). Check for uneven tire wear, investigate the cause and rectify as necessary. Check the steering for wear/damage. Check and adjust the wheel alignment as necessary. Check for binding brakes, rectify as necessary. Advise the driver of the load issues.
Front bottoming or riding low	<ul style="list-style-type: none"> ● Damaged suspension components ● Air spring fault 	Check the suspension components for damage. Check the dynamic suspension. REFER to: Vehicle Dynamic Suspension (204-05 Vehicle Dynamic Suspension, Diagnosis and Testing).
Uneven tire wear	<ul style="list-style-type: none"> ● Incorrect tire pressure (rapid center rib or inner and outer edge wear) ● Incorrect front or rear toe (rapid inner or outer edge wear) ● Incorrect camber (rapid inner or outer edge wear) ● Tires out of balance 	Check and adjust the tire pressures (see visual inspection). Check and adjust the wheel alignment as necessary. REFER to: Four-Wheel Alignment (204-00 Suspension System - General Information, General Procedures). Balance the wheels and tires as necessary.

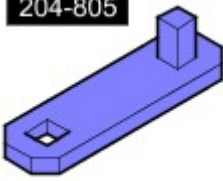

Symptom	Possible Causes	Action
	(tires cupped or dished)	
Harsh ride	<ul style="list-style-type: none"> ● Damaged suspension components ● Air spring fault 	Check the suspension components for damage. Check the dynamic suspension. REFER to: Vehicle Dynamic Suspension (204-05 Vehicle Dynamic Suspension, Diagnosis and Testing).
Shimmy or wheel tramp	<ul style="list-style-type: none"> ● Wheels/tires ● Loose wheel nut(s) ● Loose front suspension fasteners ● Front wheel bearing(s) fault ● Worn or damaged suspension component bushing ● Loose, worn or damaged ball joint(s) ● Loose, worn or damaged steering components ● Front wheel alignment 	Check the wheels and tires for condition and balance. Check and tighten the wheel nuts and suspension fasteners to specification. Check the front wheel bearings, suspension bushings, ball joints and steering components for wear or damage. Check and adjust the wheel alignment as necessary. REFER to: Four-Wheel Alignment (204-00 Suspension System - General Information, General Procedures).
Poor return ability of the steering (self-centering)	<ul style="list-style-type: none"> ● Steering column ● Ball joints ● Steering components 	Check the steering column universal joints, etc. Check the ball joints and other steering components
Sway or roll	<ul style="list-style-type: none"> ● Loose front or rear stabilizer bar ● Worn lower suspension arm stabilizer bar insulators ● Air spring fault 	Check the stabilizer bar security and condition. Rectify as necessary. Check the function of the active stabilization system (where installed). REFER to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Diagnosis and Testing). Check the air springs. REFER to: Vehicle Dynamic Suspension (204-05 Vehicle Dynamic Suspension, Diagnosis and Testing).
Vehicle leans to one side	<ul style="list-style-type: none"> ● Front or rear suspension components ● Air spring fault 	Check the front and rear suspension. Check the air springs. REFER to: Vehicle Dynamic Suspension (204-05 Vehicle Dynamic Suspension, Diagnosis and Testing).

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Suspension System - General Information - Four-Wheel Alignment

General Procedures

Special Tool(s)	
 <p>204-805</p> <p>E137184</p>	204-805

• CAUTIONS:

Make sure the vehicle is on a flat level surface.

Make sure the tire pressures are within specification.

Make sure that only the manufacturers' recommended four wheel alignment equipment is used.

Make sure the vehicles fuel tank is full, if not distribute extra weight evenly over the fuel tank area to represent a full tank of fuel.

Make sure there are no heavy objects in the vehicle.

Make sure the air suspension is set to NORMAL ride height.

Make sure the steering is in the straight ahead position.

Make sure the slip plates (turntables) are free to move before adjusting the geometry.

• NOTE: This procedure can be used for vehicles with either air or coil spring suspension.

1. Check the tie rod ends, suspension joints, wheel bearings and wheels and tires for damage, wear and free play.

- Adjust or repair any worn, damaged or incorrectly adjusted components.

2. Check and adjust tire pressures.

3. Position the vehicle on a calibrated, level, vehicle lift.

4. Release the vehicle parking brake.

5. Vehicles with dynamic suspension: Using the approved diagnostic tool, check the air suspension control module for fault codes and clear as required.

6. Vehicles with dynamic suspension: Using the diagnostic tool, set vehicle to 'Geometry Set Mode', using the instructions below. Putting the vehicle into this mode will make sure that the ride heights are controlled more accurately.

1. Select the 'Configuration' tab

2. Select 'Set up and Configure'.

3. Select 'Air Suspension'.

4. Select 'Suspension Geometry Set Up'.

5. Select 'Tight Tolerance Mode'.

6. Follow the on-screen instructions until the set up process has finished.

7. NOTE: If rear camber adjustment is required, loosen the rear camber adjustment bolts enough to allow adjustment before starting any other wheel alignment adjustments. Do not fully loosen the rear camber adjustment bolts.

Using only four wheel alignment equipment approved by Land

Over, check and adjust the wheel alignment.

8.  **CAUTION:** Make sure the toe link anti-rotation tang is fully seated in the integrated body frame before tightening the toe link retaining nut. Failure to follow this instruction will result in damage to the toe link or integrated body frame.

• **NOTE:** This step is only required if the toe links have been removed or replaced.

Adjust the rear bump steer.

- Loosen the toe link inner ball joint retaining nut.
- Set the gap, between the underside of the toe link rubber boot and the integrated body frame bracket, to 10 mm (0.473 in).
- Tighten the toe link inner ball joint retaining nut to 133 Nm (98 lb.ft)
- Repeat the above procedure for the other side.

E55923

9. Adjust the rear camber.

- Loosen the rear camber adjusting bolts.
- Rotate the rear camber adjusting bolt until the correct value is obtained.
- Repeat the above procedure for the other side.
- Tighten the rear camber adjusting bolts.

E55924

E137182

10. Install the special tool and a suitable socket to the rear camber adjusting bolt retaining nut.

E137185

11. NOTE: The torque wrench must be installed in a direct line with the special tool, as shown.

• NOTE: Calculate the torque wrench setting using the formula below.

• NOTE: Key to letters:

- **A** = Effective length of the torque wrench, measured in mm.

Formula:

- **Torque wrench setting (Nm) = $(133 \times A) / (A + 100)$**

Using the special tool, a suitable extension bar and a torque wrench, fully tighten the camber adjusting bolt retaining nut.

- Use the torque wrench setting calculated above.
- Repeat the above procedure for the other side.

E55925

12. Adjust the rear toe.

- Loosen the toe link adjustment locking nut.
- Rotate the toe link inner ball joint until the correct rear toe value is obtained.
- Tighten the toe link adjustment locking nut to 130 Nm (96 lb.ft).
- Repeat the above procedure for the other side.
- Repeat the rear toe measurement.

13.  **CAUTION:** Make sure the slip plates (turntables) are free to move before adjusting the geometry.

Adjust the front camber.

- Loosen the lower arm front camber adjusting bolt.
- Rotate the front camber adjusting bolt until the correct value is obtained.
- Tighten the lower arm front camber adjusting bolt to 275 Nm (203 lb.ft).
- Repeat the above procedure for the other side.

14. Adjust the front castor.

- Loosen the lower arm rear castor adjusting bolt.
- Rotate the castor adjusting bolt until the correct value is obtained.
- Tighten the lower arm rear castor adjusting bolt.
- Repeat the above procedure for the other side.
- Repeat the castor measurement.
- Repeat the above procedure until both castors achieve the correct value.
- Tighten the lower arm rear castor adjusting bolts to 275 Nm (203 lb.ft).

15. Align the steering to straight ahead.

- Measure the length of the exposed thread on each track rod.
- If the exposed thread lengths differ by more than two millimetres:
- Stage one: Loosen one track rod end locking nut.
- Stage two: Rotate the track rod until the lengths of the exposed threads on both track rods are equal.
- Stage three: Tighten the track rod end locking nut.
- Stage four: Rotate the steering wheel until both front toe measurements are equal.

16. Adjust the front toe.

- Loosen the track rod end locking nuts.
- Rotate the track rods to adjust each individual front toe to the correct value.
- Tighten the track rod end locking nuts to 53 Nm (39 lb.ft).

17. Vehicles with dynamic suspension: Using the diagnostic tool, return the vehicle to 'Normal Mode'.

1. Select the 'Configuration' tab
2. Select 'Set up and Configure'.
3. Select 'Air Suspension'.
4. Select 'Suspension Geometry Set Up'.
5. Select 'Normal Mode'.
6. Follow the on-screen instructions until the normal mode process has finished.

18. Calibrate the steering angle sensor using the diagnostic tool.

Suspension System - General Information - Front Wheel Bearing and Wheel Hub Runout Check

General Procedures

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.
- NOTE: LH illustration shown, RH is similar.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the road wheel.

3. CAUTIONS:

 Do not allow the brake caliper to hang on the brake hose.

 LH side: Do not allow the brake caliper to hang on the brake pad wear warning sensor lead.

- NOTE: Models with standard brakes shown, models with high performance brakes similar.

Release the brake caliper and tie aside.

E119129

4. Remove the front brake disc.

- Remove the Allen screw.

E61629

5. Thoroughly clean the hub mounting face.

6. Using special tool (100-053) mount a Dial Test Indicator (DTI) to and secure to the backplate using the upper backplate fixing.

7.  **CAUTION:** Make sure the DTI is positioned clear of the wheel studs.

Position the DTI probe on the outer edge of the hub face.

8. Zero the DTI and rotate the hub one complete revolution to measure hub runout.
9. Remove the DTI.
10. Install the brake disc.
 - Tighten the Torx screw to 35 Nm (26 lb.ft).
11. Install the brake caliper and tighten the bolts. TORQUE: 275 Nm
12. Install the road wheel and tighten nuts to 140Nm (103 lb-ft).
13. Repeat the above procedure on the opposite side.
14. Depress the brake pedal several times to set brake pads.
15. Lower the vehicle.

Front Suspension -

Coil Spring Suspension

Item	Specification
Road spring color coding:	
	YELLOW/BLUE
	YELLOW/GREY
	YELLOW

Note: The first color indicates the fitted position of the spring on the vehicle i.e. front. The secondary color identifies the thickness of the isolator which is fitted to a particular spring to ensure that the vehicle ride height is maintained within specified limits. Replacement springs will be supplied with the appropriate isolator fitted.

Torque Specifications

Description	Nm	lb-ft
* Stabilizer bar link nuts	115	85
Stabilizer bar clamp nuts	115	85
Front axle crossmember bolts	115	85
Shock absorber and spring assembly to lower arm bolt	300	221

37	-	Damper assembly (coil spring)

GENERAL

The front suspension is a fully independent design which offers a reduction in unsprung weight over the beam axle design fitted to previous Land Rover models. The front suspension comprises an upper control arm, a lower control arm, a wheel knuckle and hub, an anti-roll bar and links assembly and a damper assembly. The damper can have a coil spring or air spring, both damper types use a similar design. The suspension components are common to both coil and air spring versions.

The suspension control arms have been designed for maximum ground clearance and also allow for adjustment of the camber and castor using cam adjusters.

DAMPER MODULE - AIR SUSPENSION

E45851

Item	Part Number	Description
1	-	Rebound washer*
2	-	O-ring - damper rod (2 off)*
3	-	Self-locking nut*
4	-	Spacer - damper rod*
5	-	Bump washer
6	-	Spring aid*
7	-	O-ring - air spring sleeve support (2 off)*
8	-	Damper assembly*
9	-	Voss air fitting
10	-	Damper rod
11	-	Self-locking nut (3 off)
12	-	Top mount
13	-	Bush
14	-	Retaining pin - air spring assembly*
15	-	Air spring assembly*

• NOTE: * shows service items

The damper module comprises an air spring assembly, top mount and a damper assembly. The damper and air spring are only serviceable as complete assemblies.

Damper

The damper assembly is a twin tube design with the conventional coil spring replaced by the air spring. The lower end of the damper is fitted with a bush and is attached to the lower control arm with a bolt and nut.

The damper functions by restricting the flow of hydraulic fluid through internal galleries within the damper. The damper rod moves axially within the damper, its movement limited by the flow of fluid through the galleries, providing damping of undulations in the terrain. The damper rod is sealed at its exit point from the damper body to maintain the fluid within the unit and to prevent the ingress of dirt and moisture. The seal also incorporates a wiper to keep the rod clean.

Air Spring

The air spring comprises an aluminium restraining cylinder, top mount, spring aid, air sleeve and an inner support sleeve.

The air sleeve is made from a flexible rubber material which allows the sleeve to roll up and down the air spring piston as the vehicle changes height. The air sleeve is attached to the restraining cylinder and support sleeve by crimp rings which provide an air tight seal. The support sleeve contains a seal carrier which has two O-rings sealing the support sleeve and two O-rings sealing to the damper body. The top of the air sleeve is crimped to the top mount which attaches to the chassis frame with 3 integral studs and self-locking nuts.

A spring aid is fitted to the damper rod and prevents the top mount contacting the top of the damper during full suspension compression and assists the suspension tune. The lower end of the air spring is located over the damper body and seats on a fabricated seat on the damper body. The air sleeve is positively attached to the seat with a retaining pin. The damper rod is located through a central hole in the top mount. The rod is threaded at its outer end. A self-locking nut secures the air spring to the damper rod.

The top mount is an integral part of the air spring and is fitted with a bush and rebound washer. A bump washer is located between the top mount plate and the damper rod. The top mount is secured to the damper rod with a self-locking nut. The top mount attaches to a housing on the chassis with 3 integral studs and self-locking nuts. The top mount also incorporates a 6 mm Voss air fitting which allows for the attachment of the air harness.

A gaitor is available as a dealer fit component. The gaitor is similar to the one fitted to the rear air damper module and is available if a customer experiences dirt and debris becoming trapped between the air sleeve and the restraining cylinder under certain terrain conditions.

DAMPER MODULE - COIL SPRING SUSPENSION

E45852

Item	Part Number	Description
1	-	Self locking nut
2	-	Rebound washer
3	-	Top mount assembly
4	-	Spring spacer (selective)
5	-	Spring isolator
6	-	Bump washer
7	-	Spring aid
8	-	Dust tube
9	-	Bump cup
10	-	Coil spring
11	-	Damper
12	-	Damper rod
13	-	Self locking nut (3 off)
14	-	Bush

The coil spring damper module comprises a damper, coil spring and top mount.

Damper

The damper assembly is a twin tube design with the conventional coil spring located on a welded spring seat on the damper tube. The lower end of the damper is fitted with a bush and is attached to the lower control arm with a bolt and nut.

The damper functions by restricting the flow of hydraulic fluid through internal galleries within the damper. The damper rod moves axially within the damper, its movement limited by the flow of fluid through the galleries, providing damping of undulations in the terrain. The damper rod is sealed at its exit point from the damper body to maintain the fluid within the unit and to prevent the ingress of dirt and moisture. The seal also incorporates a wiper to keep the rod clean.

The damper rod is located through a central hole in the top mount. The rod is threaded at its outer end. A self-locking nut secures the top mount to the damper rod.

A spring aid is fitted to the damper rod and prevents the top mount contacting the top of the damper during full suspension compression and also assists the suspension tune.

Spring and Top Mount

The coil spring fitted differs with vehicle specification. Each spring is colour coded to identify its rating and fitment

requirements.

The coil spring is located in a spring seat which is an integral part of the damper body. The design of the spring seat prevents the spring rotating. The opposite end of the coil spring is located in a spring isolator which is fitted in the top mount. The spring isolator is made from rubber and prevents any noise produced during damper and spring compression/extension from being transmitted to the vehicle body.

The top mount is fitted with a bush and rebound washer which are located between the top mount plate and the damper rod, a self locking nut secures the damper rod to the top mount. The top mount attaches to a housing on the chassis with 3 integral studs and self-locking nuts.

The spring is fitted with spring spacers which are located between the spring isolator and the top mount. The spring spacers control the length of the spring to maintain the correct trim height. The spring spacers are colour coded and are supplied with a replacement spring.

ANTI-ROLL BAR

E45853

Item	Part Number	Description
1	-	Nut - link to anti-roll bar (2 off)
2	-	Link (2 off)
3	-	Nut - link to upper control arm (2 off)
4	-	RH upper control arm
5	-	Nut (4 off)
6	-	Bracket (2 off)
7	-	Bush (2 off)
8	-	LH upper control arm
9	-	Anti-roll bar

The anti-roll bar is fabricated from induction hardened, solid spring steel bar. The anti-roll bar operates, via a pair of links,

from their attachment to the upper control arm.

The anti-roll bar is attached to the forward face of the chassis front cross member. The anti-roll bar is attached to the cross member with two, Teflon lined bushes. Brackets, which are pressed onto the bushes, are attached to the cross member with nuts, screwed onto studs in the cross member. The anti-roll bar has crimped, 'anti-shuffle' collars pressed in position on the inside edges of the bushes. The collars prevent sideways movement of the anti-roll bar.

The ends of the anti-roll bar are attached to the upper control arms via links. This allows the anti-roll bar to move with the wheel travel providing maximum effectiveness. Each link has a ball joint at each end. The top ball joint is attached to the link, parallel with the link axis. The ball joint is located in a hole in the upper control arm and secured with a self-locking nut. The bottom ball joint is attached to the link at 90 degrees to the link axis. The ball joint is located in a hole in the end of the anti-roll bar and secured with a self-locking nut. The links are not handed and therefore can be fitted to either side of the anti-roll bar.

UPPER CONTROL ARM

E45854

Item	Part Number	Description
1	-	Flanged bolt
2	-	Bush
3	-	Self locking nut
4	-	Flanged bolt
5	-	Bush
6	-	Self locking nut
7	-	Self locking nut
8	-	Circlip
9	-	Timing marks
10	-	Ball joint
11	-	Anti-roll bar link attachment hole
12	-	Upper control arm

The upper control arm assembly comprises, the control arm, two bushes and a ball joint. The upper control arm is a pressed steel fabrication. Its outer end has a hole to accept the ball joint. A small indentation is located adjacent to the ball joint hole and is used to obtain the correct orientation of the ball joint. A smaller hole near the ball joint provides for the attachment of the anti-roll bar link. The underside of the upper control arm has a bracket for attachment of the height sensor link arm and two further brackets which secure the brake hose, pad wear sensor and wheel speed sensor cables.

The inner end of the arm has two fabricated bush housings which are welded to the arm pressing. A bush is pressed into each housing. The bushes are located between lugs on the chassis and are secured with bolts and self-locking nuts through metal inserts in the centre of the bushes.

The ball joint is pressed into the upper control arm. The ball joint is an interference fit in the hole which prevents the ball joint from moving. A circlip is fitted to the ball joint to retain it in the hole. The top face of the ball joint has two semi-circular cut-outs. One of these cut-outs must be aligned with the small indentation in the upper control arm to ensure the correct operation of the ball joint.

LOWER CONTROL ARM

E58421

Item	Part Number	Description
1	-	Self locking nut
2	-	Flat washer
3	-	Cam washer
4	-	Bush
5	-	Special bolt
6	-	Bolt
7	-	Hydrobush
8	-	Cam washer
9	-	Flat washer
10	-	Self locking nut
11	-	Self locking nut - damper lower attachment
12	-	Ball joint
13	-	Circlip
14	-	Self locking nut
15	-	Lower control arm
16	-	Bolt - damper lower attachment
17	-	Jacking bracket (Vehicles with coil springs only)

The lower control arm assembly comprises, the control arm, two bushes and a ball joint. The lower control arm is a pressed steel fabrication with a hole at its outer end to accept the ball joint.

The inner end of the arm has two fabricated bush housings which are welded to the arm pressing. A bush is pressed into each housing. The rear bush is a hydrobush which provides a progressive increase in the hardness of the bush as the deflection of the wheel increases. The bushes are located between lugs on the chassis and are secured with bolts and self-locking nuts through metal inserts in the centre of the bushes. The forward bush, self-locking nut, has a cam washer located beneath it. The cam washer is located between lugs on the chassis bracket and its orientation can be adjusted to set the front camber. The rear bush, self-locking nut, also has a cam washer located beneath it. The cam washer is located between lugs on the chassis bracket and its orientation can be adjusted to set the front castor.

On vehicles fitted with coil springs only, a jacking bracket is located on the lower control arm.

A central aperture in the arm provides for the attachment of the damper module lower bush. The damper is secured with a long bolt which is positioned through holes in the arm and secured with a self-locking nut.

The ball joint is pressed into the lower control arm. The ball joint is an interference fit in the hole which prevents the ball joint from moving. A circlip is fitted to the ball joint to retain it in the hole.

WHEEL KNUCKLE, HUB AND BEARING ASSEMBLY

E45856

Item	Part Number	Description
1	-	Upper control arm attachment
2	-	Brake caliper attachment holes
3	-	Brake hose bracket attachment point
4	-	Wheel speed sensor location
5	-	Wheels studs
6	-	Wheel hub
7	-	Brake disc dust shield attachment holes
8	-	Lower control arm ball joint attachment
9	-	Steering rack ball joint attachment
10	-	Wheel hub bolts (4 off)

The wheel knuckle is a machined casting which is located between the ball joints of the upper and lower control arms. The knuckle has four clearance holes which allow for the fitment of four bolts which secure the wheel hub housing. A cast boss on the forward edge of the knuckle provides for attachment of the steering gear, tie rod ball joint.

The wheel hub and bearing assembly comprises the wheel hub housing, wheel hub and taper roller bearing. The wheel hub and bearing assembly is a non-serviceable component. Five M14 studs are pressed into the wheel hub and provide for the attachment of the road wheel with wheel nuts.

The wheel hub housing is a machined forging which houses a taper roller bearing. The housing has four threaded holes which provide for the attachment to the wheel knuckle with four bolts.

The wheel hub has a splined centre bore which mates with corresponding splines on the half shaft. Rotation of the half shaft is passed, via the splines, to the wheel hub which rotates on the taper roller bearing.

Front Suspension - Front Stabilizer Bar

Removal and Installation

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the wheels and tires.
- Disconnect both the stabilizer bar links from the stabilizer bar.
 - Remove and discard the 2 nuts.

- NOTE:** RH side only.

Remove the fender splash shield lower extension panel.

- Remove the 2 screws.
- Remove the 2 clips.

- Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).
- Remove the front axle crossmember.
 - Remove the 4 bolts.

7. Remove the stabilizer bar bushing.

- Remove the 4 nuts.
- Remove the stabilizer bar clamps.

8. Remove the stabilizer bar.

- Remove the stabilizer bar out through the LH side wheel arch.

Installation

1. Install the stabilizer bar.

- Install the stabilizer bar through the LH side wheel arch.

2. Install the stabilizer bar bushing.

- Install the stabilizer bar clamps.
- Tighten the nuts to 115 Nm (85 lb.ft).

3. Install the front axle crossmember.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).

4. Install the engine undershield.

For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

5. NOTE: RH side only.

Install the fender splash shield lower extension panel.

- Install the 2 screws.
- Install the 2 clips.

6. Connect both stabilizer bar links to the stabilizer bar.

- Install new nuts and tighten to 115 Nm (85 lb.ft).

7. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Suspension - Front Stabilizer Bar Link

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link.

- Remove and discard the 2 nuts.

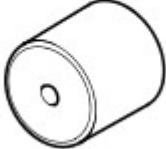

Installation

1. Install the stabilizer bar link.
 - Tighten the nuts to 115 Nm (85 lb.ft).
2. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Suspension - Upper Arm Ball Joint

Removal and Installation

Special Tool(s)

 <p>204-530-1 E50155</p>	Ball joint installer 204-530-1

Removal

- NOTE: This procedure shows removal and installation of the upper arm ball joint.

1. Remove the upper arm.
For additional information, refer to: [Upper Arm](#) (204-01 Front Suspension, Removal and Installation).
2. Remove the dust seal.
 - Remove the seal retainer.
 - Remove the circlip.
3. Using the special tools, remove the ball joint.

E50160

Installation

1.  CAUTION: Make sure the timing marks are aligned.

Using the special tools, install the ball joint.

E50172

2.  CAUTION: Circlip holes to be 90 degrees rotated from timing marks.

Install the circlip.

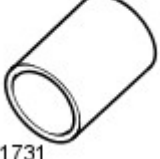

E50173

3. Install the upper arm.
For additional information, refer to: [Upper Arm](#) (204-01 Front Suspension, Removal and Installation).

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3. Loosen the halfshaft retaining nut.

4. Release the brake hose bracket from the wheel knuckle.

- Remove the bolt.

5. Release the wheel speed sensor from the wheel knuckle.

- Remove the bolt.

E119129

6. CAUTIONS:

Do not allow the brake caliper to hang on the brake hose.

LH side: Do not allow the brake caliper to hang on the brake pad wear warning sensor lead.

Remove the brake caliper and anchor plate.

- Remove the 2 bolts.
- Tie the brake caliper and brake caliper anchor plate assembly aside.

E43758

7. Remove the brake disc.

- Remove the Torx screw.

8. Remove the halfshaft retaining nut.

- Discard the nut.

9. Loosen the tie-rod end ball joint retaining nut.

10. Using the special tool, release the tie-rod end ball joint from the wheel knuckle.

- Discard the nut.

E44665

11. CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove and discard the stabilizer bar link nut.

12. Loosen the upper arm retaining nut.

13. Using the special tool, release the upper arm ball joint.

14.  CAUTION: Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the drive flange.

15. Remove the lower ball joint retaining nut.

16. Using the special tool, release the lower ball joint from the steering knuckle.

17.  CAUTION: The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

Remove the upper arm retaining nut.

- Discard the nut.

18. NOTE: Do not disassemble further if the component is removed for access only.

Remove the wheel knuckle.

19. Remove the brake disc dust shield.
- Remove the four retaining bolts.

20. Remove the wheel hub.
- Remove the 4 bolts.

Installation

1. Clean the components.
2. Install the wheel hub.
 - Tighten the 4 bolts to 115 Nm (85 lb.ft).
3. Install the brake disc dust shield.
 - Tighten the 4 bolts to 10 Nm (7 lb.ft).

4.  **CAUTION:** The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

With assistance, install the wheel knuckle.

5. Using the special tools, install the halfshaft in the wheel hub.

6. Connect the upper arm and wheel knuckle.
 - Install a new nut and tighten to 70 Nm (52 lb.ft).

7. Secure the stabilizer bar link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

8. Tighten the lower arm ball joint retaining nut to 115 Nm (85 lb.ft).

9. Connect the tie-rod end ball joint.

- Install a new nut and tighten to 76 Nm (56 lb.ft).

10.  **CAUTION:** Install the halfshaft nut finger tight.

Install a new halfshaft retaining nut and lightly tighten.

11. Make sure the brake disc and hub mating surfaces are clean.

12. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

13. Install the brake caliper and anchor plate.

- Clean the brake caliper anchor plate using brake cleaning fluid.
- Tighten the bolts to 275 Nm (203 lb.ft).

14.  **CAUTION:** Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 230 Nm (170 lb.ft).

- Stake the nut to the halfshaft.

15. Install the wheel speed sensor.

- Tighten the bolt to 10 Nm (7 lb.ft).

16. Secure the brake hose retaining bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

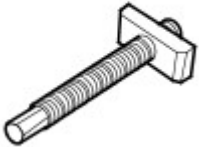

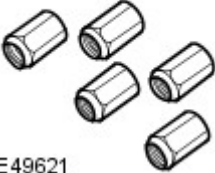

17. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

18. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Suspension - Front Wheel Bearing and Wheel Hub

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3. Loosen the halfshaft retaining nut.

E44663

4. Release the brake hose bracket from the wheel knuckle.

- Remove the bolt.

E44667

5. Remove the wheel speed sensor retaining bolt.

6.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Release the brake caliper anchor plate from the wheel knuckle and tie the caliper aside.

- Tie aside complete with the wheel speed sensor.

7. Remove the brake disc.

- Remove the Torx screw.

E43758

8. Remove the halfshaft retaining nut.

- Discard the nut.

9.  **CAUTION:** Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

10. Remove the wheel hub.

- Remove the 4 bolts.

Installation

1. Clean the components.
2. Install the wheel hub.

- Using the special tools, install the halfshaft in the wheel hub.
- Tighten the 4 bolts to 115 Nm (85 lb.ft).

3. Install a new halfshaft retaining nut and lightly tighten.
4. Make sure the brake disc and hub mating surfaces are clean.
5. Install the brake disc.
 - Tighten the Torx screw to 35 Nm (26 lb.ft).
6. Install the brake caliper and anchor plate.
 - Install the wheel speed sensor.
 - Tighten the bolts to 275 Nm (203 lb.ft).
7. Install the wheel speed sensor retaining bolt.
8. Secure the brake hose retaining bracket to the wheel knuckle.
 - Tighten the bolt to 22 Nm (16 lb.ft).

9.  **CAUTION:** Do not use air tools to install the nut. Failure

to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 230 Nm (170 lb.ft).

- Stake the nut to the halfshaft.

10. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

11. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Suspension - Shock Absorber and Spring Assembly

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
3. Disconnect the shock absorber and spring assembly from the lower arm.
 - Remove the nut and bolt.

E44655

4. Release the heat shield for access to the shock absorber and spring assembly upper mounting inner nut.

- Remove the three retaining bolts.

E44656

5. Remove the shock absorber and spring assembly.

- Remove the three retaining bolts.

E44657

Installation

1. Install the shock absorber and spring assembly.
 - Make sure the spring and shock absorber assembly top mounting to body mating faces are clean.
 - Fit the nuts and tighten to 70 Nm (52 lb.ft).

2. Secure the heat shield.

- Install the three retaining bolts and tighten to 10 Nm (7 lb.ft).

3. Connect the shock absorber and spring assembly to the lower arm.

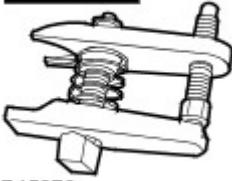

- Tighten the nut and bolt to 300 Nm (221 lb.ft).

4. Install the fender splash shield.

For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

Raise and support the vehicle.

- Remove the wheel and tire.

-  **CAUTION:** Do not use excessive force to disconnect the height sensor link.

Disconnect the height sensor link arm.

E81564

- Remove the upper arm and brake line heat shields for access.

- Remove the 3 nuts.
- Remove the 3 bolts.

E79233

-  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link nut.

- Discard the nut.

E81565

6. Release the brake hose and wheel speed sensor leads from the upper arm.

- Remove the bolt.

7.  CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.

8. Using the special tool, release the upper arm ball joint.

- Remove and discard the nut.

9. Remove the upper arm.

- Remove and discard the 2 nuts.

Installation

1. Install the upper arm.

- Fit the bolts but do not fully tighten at this stage.
- Install new nuts.

2. Connect the upper arm and wheel knuckle.

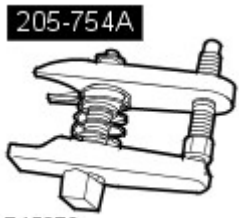

- Install a new nut and tighten to 70 Nm (52 lb.ft).
3. Secure the brake hose and wheel speed sensor leads to the upper arm.
 - Tighten the bolt to 23 Nm (17 lb.ft).
 4. Secure the stabilizer bar link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).
 5. Install the upper arm and brake line heat shields.
 - Install the 3 bolts.
 - Install the 3 nuts.
 6. Connect the height sensor link.
 7. Set the height distance between the centre of the halfshaft end and the edge of the fender trim to 466 mm (18.34").

8. Tighten the 2 upper arm nuts and bolts to 175 Nm (129 lb.ft).
9. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
10. Using the Land Rover approved diagnostic system, calibrate the suspension ride height.
For additional information, refer to: [Ride Height Adjustments](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

Front Suspension - Lower Arm

Removal and Installation

Special Tool(s)	
 <p>205-754A E45276</p>	<p>Ball joint separator 205-754(LRT-54-027)</p>

Removal

1. Place vehicle into access mode.

E99855

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the wheel and tire.
4. Remove the lower ball joint retaining nut.
5. Using the special tool, release the lower ball joint from the steering knuckle.

E44668

E99856

6. Mark the position of the bolts in relation to the chassis brackets.

- Remove the 2 bolts.

E44655

7. Disconnect the shock absorber and spring assembly from the lower arm.

- Remove the nut and bolt.

8.  **CAUTION:** Only displace the wheel knuckle sufficiently outboard to release the lower arm past the undertray. This will prevent the inboard driveshaft joint from separating. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** Make sure the steering is in the straight ahead position.

Remove the lower arm.

- Release the lower arm from the subframe and reposition downwards.
- Rotate the lower arm and position forward to release from the wheel knuckle.

Installation

1. Install the lower arm.

- Fit the bolts but do not fully tighten at this stage.

2.  **CAUTION:** The lower arm ball joint can be damaged by excessive articulation. Do not over articulate the ball joint. Failure to follow this instruction will result in damage to vehicle.

Connect the lower arm to the wheel knuckle.

- Tighten the lower arm ball joint retaining nut to 115 Nm (85 lb.ft).

3. Set the height distance between the centre of the halfshaft end and the edge of the fender trim to 466 mm (18.34").

4. Tighten the lower arm bolts to 275 Nm (203 lb.ft).

- Align the bolts to the marks made previously.

5. Connect the shock absorber and spring assembly to the lower arm.

- Tighten the nut and bolt to 300 Nm (221 lb.ft).

6. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

7. Carry out the wheel alignment procedure.

Front Suspension - Upper Arm Bushing

Removal and Installation

Special Tool(s)	
 204-532/1 E55136	Receiver cup upper arm bushes 204-532/1
 204-532/2 E55137	Remover upper arm bushes 204-532/2
 204-532/3 E55138	Installer upper arm front bush 204-532/3
 204-532/4 E55139	Installer upper arm rear bush 204-532/4

Removal

- NOTE: The bushings must be replaced in pairs, LH and RH sides.

1.  WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front wheels and tires.

3. Remove the LH upper arm.

For additional information, refer to: [Upper Arm](#) (204-01 Front Suspension, Removal and Installation).

4. Release the heat shield for access to the upper arm bolts.

- Remove the nut.
- Remove the forward bolt and loosen the rearward bolt.

E44656

5. Loosen the upper arm bolts.

6. Disconnect the height sensor link arm.

7.  CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link nut.

- Discard the nut.

8.  CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.

9. Using the special tool, release the upper arm ball joint.

- Remove and discard the retaining nut.

10. Release the brake hose from the upper arm.

11. Release the wheel speed sensor lead from the upper arm.

12. Remove the RH upper arm.

13. Note the position of the bushing in relation to the upper arm.

14.  **CAUTION:** The bush flanges need to be removed to allow bush removal.

Using a suitable tool, bend over the bush flanges.

15. Using a hacksaw, remove the flange from the bushing, making sure the upper arm is not damaged.

16. Using the special tools, remove and discard the upper arm bushings.

Installation

3. Using the special tools, install the upper arm front bushings.
 1.  **CAUTION:** Make sure the correct special tool is used to install the bushings to the correct depth.
 - Fit the bolts but do not fully tighten at this stage.
 - Align the arrow on the bush with the mark, previously made on the upper arm.
 2. Using the special tools, install the upper arm rear bushings.
4. Secure the brake hose to the upper arm.
 - Align the arrow on the bush with the mark, previously made on the upper arm.
 - Tighten the bolt to 23 Nm (17 lb.ft).

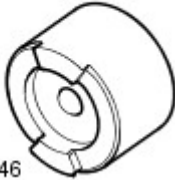

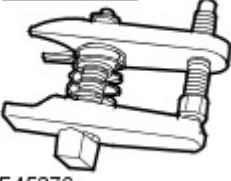

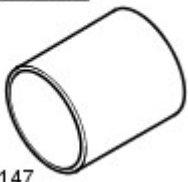

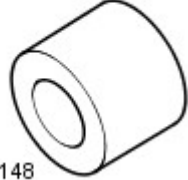

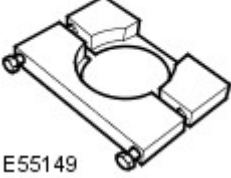

5. Secure the wheel speed sensor lead to the upper arm.
6. Connect the upper arm and wheel knuckle.
 - Install a new nut and tighten to 70 Nm (52 lb.ft).
7. Secure the stabilizer bar link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).

- 8.** Connect the height sensor link arm.
- 9.** Set the height distance between the centre of the halfshaft end and the edge of the fender trim to 466 mm (18.34").
- 10.** Tighten the 2 upper arm nuts and bolts to 175 Nm (129 lb.ft).
- 11.** Secure the heat shield.
- 12.** Install the LH upper arm.
For additional information, refer to: [Upper Arm](#) (204-01 Front Suspension, Removal and Installation).
- 13.** Install the front wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

<p>204-535/5</p>  <p>E55151</p>	<p>Installer/depth setter lower arm rear bush</p> <p>204-535/5</p>

Removal

- NOTE: If installing the front bushes, both front bushes must be replaced.
- NOTE: If installing the rear bushes, both rear bushes must be replaced.
- NOTE: Take note of the fitted position of the bush.

1. Make sure that the tire pressures are correct and that the vehicle is at the correct ride height.
For additional information, refer to: [Ride Height Adjustments](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

2. Mark the position of the bushing in relation to the lower arm.

E97998

1. Using a spirit level type engineers square, align through the center of the bolt head retaining the lower arm rear bush with a perpendicular drop.
2. Align the rule of the engineers square along the lowest point on the circumference of the lower arm rear bush boss.
3. Apply a piece of tape to the arm and mark a horizontal line along the underside of the lower arm rear bush boss (parallel with the bush axis).
4. Make sure that the process is carried out on both right-hand side and left-hand side.

3. ⚠️ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the wheels and tires.

5. Remove the RH lower arm.

For additional information, refer to: [Lower Arm](#) (204-01 Front Suspension, Removal and Installation).

6. Disconnect the shock absorber and spring assembly from the LH lower arm.

- Remove the nut and bolt.

7. Mark the position of the bolts in relation to the chassis brackets.

- Remove the 2 bolts.

8. Remove the LH lower ball joint retaining nut.

9. Using the special tool, release the LH lower ball joint from the steering knuckle.

10. Remove the LH lower arm.

11. Note the position of the bushing in relation to the lower arm.

12.  **CAUTION:** The bush flanges need to be removed to allow bush removal.

Remove the lower arm front bushing flanges.

13. Using the special tools, remove and discard the lower arm front bushings.

14. Apply alignment guide lines to installer tool (204-535/3).

1. Mark center line on installer tool.
2. Mark line across top surface 3 degrees to the left of center line.
3. Mark 'LH' on top surface.
4. Mark line across bottom surface 3 degrees to the left of the center line.
5. Mark 'RH' on bottom surface.

E97943

15. Using the special tools, remove and discard the lower arm rear bushings.

E55153

Installation

1.  CAUTION: Make sure the bush is correctly aligned.

Mark the position of the bushing in relation to the lower arm.

1. Make sure the correct marked side line 'RH' or 'LH' on the special tool (204-535/3) is aligned with the scribed line on the RH or LH bush to be installed.
2. Extend the line from the installer tool onto the bush using a marker pen. Using the marked line, align the bush to the lower arm before installing the bush.

E97944

2.  CAUTION: Make sure the correct special tool is used to install the bushings to the correct depth.

Using the special tools, install the lower arm rear bushings.

E55154

3.  CAUTION: Make sure the bush is correctly aligned.

Using the special tools, install the lower arm front bushings

E55156

4. Install the LH lower arm.

- Fit the bolts but do not fully tighten at this stage.

5. Connect the shock absorber and spring assembly to the lower arm.

- Tighten the nut and bolt to 300 Nm (221 lb.ft).

6. Set the height distance between the centre of the halfshaft end and the edge of the fender trim to 466 mm (18.34").

7. Tighten the lower arm bolts to 275 Nm (203 lb.ft).
 - Align the bolts to the marks made previously.
8. Connect the shock absorber and spring assembly to the lower arm.
 - Tighten the nut and bolt to 300 Nm (221 lb.ft).
9. Install the RH lower arm.
For additional information, refer to: [Lower Arm](#) (204-01 Front Suspension, Removal and Installation).
10. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
11. Carry out the wheel alignment procedure.

Front Suspension - Shock Absorber and Spring AssemblyTDV6 2.7L Diesel

Disassembly and Assembly

Disassembly

• WARNINGS:

Ensure the spring compressor Safe Working Load (SWL) meets or exceeds the spring rating quoted in the Specifications section.
For additional information, refer to: [Specifications](#) (204-00 Suspension System - General Information, Specifications).

Always follow the spring compressor manufacturer's instructions.

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the shock absorber and spring assembly.
For additional information, refer to: [Shock Absorber and Spring Assembly](#) (204-01 Front Suspension, Removal and Installation).
- Install a suitable spring compressor in a vise.
- Install the shock absorber and spring assembly in the spring compressor.
 - Compress the spring just sufficiently to relieve the spring tension.
- Remove the shock absorber.
 - Restrain the shock absorber spindle, remove and discard the nut.
 - Remove the upper bush rebound plate and upper bush.
 - Remove the upper mounting assembly.
 - Remove the dust tube and rebound plate assembly.
 - Remove the spring aid.

E51728

- Remove the spring from the spring compressor.

E51729

7. Clean and inspect the components for deterioration.

- To aid reassembly, mark the position of the rubber insulator in relation to the upper mounting plate.
- Remove the rubber insulator.
- Remove the spacer.
- Remove the rebound plate from the dust tube.

Assembly

E51726

1. Install the spring in the spring compressor.

- Make sure the spring is installed with the close coils positioned towards the top of the shock absorber.

2. Install the spring aid.

3. Install the dust tube.

- Install the rebound plate into the dust tube.

4. Install the shock absorber.

- Make sure the spring is correctly located in the spring seat.

5. Install the upper mounting.

- Install the spacer and rubber insulator, making sure the spacer drops over the stud heads and the insulator is aligned with the mark made previously.
- Install the upper bush and upper bush rebound plate.
- Install a new nut and tighten to 98 Nm (72 lb.ft).

6. Install the shock absorber and spring assembly.

For additional information, refer to: [Shock Absorber and Spring Assembly](#) (204-01 Front Suspension, Removal and Installation).

Rear Suspension -

GENERAL

The independent rear suspension offers a reduction in unsprung weight over the beam axle design fitted to previous Land Rover models. The rear suspension comprises an upper control arm, a lower control arm, a wheel knuckle and wheel hub, two spring damper modules and an anti-roll bar and links assembly. The damper modules use a similar design of damper which can be fitted with either a coil spring or an air spring.

The rear suspension control arms have been designed to give maximum ground clearance and also allow for the adjustment of the camber using a cam bolt and adjustment of toe and bump steer via an adjustable transverse link.

19	-	Bush
20	-	Voss connector

• NOTE: * Shows service items

The damper module comprises an air spring assembly, top mount and a damper assembly. The damper and air spring are only serviceable as complete assemblies.

Damper

The damper assembly is a twin tube design with the conventional coil spring replaced by the air spring. The lower end of the damper is fitted with a bush and is attached to the lower control arm with a bolt and nut.

The damper functions by restricting the flow of hydraulic fluid through internal galleries within the damper. The damper rod moves axially within the damper, its movement limited by the flow of fluid through the galleries, providing damping of undulations in the terrain. The damper rod is sealed at its exit point from the damper body to maintain the fluid within the unit and to prevent the ingress of dirt and moisture. The seal also incorporates a wiper to keep the rod clean.

Air Spring

The air spring is similar in design to the air spring used on the front suspension.

The air spring comprises an aluminium restraining cylinder, top mount, spring aid, air sleeve and an inner support sleeve.

The air sleeve is made from a flexible rubber material which allows the sleeve to roll up and down the air spring piston as the vehicle changes height. The air sleeve is attached to the restraining cylinder and the support sleeve with crimp rings which provide an air tight seal. The support sleeve contains a seal carrier which has two O-rings sealing the support sleeve

and two O-rings sealing to the damper body. The top of the air sleeve is crimped to the top mount which attaches to a mounting on the chassis with 3 integral studs and self-locking nuts.

A spring aid is fitted to the damper rod and prevents the top mount contacting the top of the damper during full suspension compression and assists the suspension tune. The lower end of the air spring is located over the damper body and seats on a fabricated seat on the damper body. The air sleeve is positively attached to the seat with a retaining pin. The damper rod is located through a central hole in the top mount. The rod is threaded at its outer end and accepts a self-locking nut which secures the air spring to the damper rod.

The top mount is an integral part of the air spring and is fitted with a bush and rebound washer which are located between the top mount plate and the damper rod. A self locking nut secures the damper rod to the top mount. The top mount attaches to a housing on the chassis with 3 integral studs and self-locking nuts. The top mount also incorporates a 6 mm Voss air fitting which allows for the attachment of the air harness.

The air spring is fitted with two gaitors. The upper gaitor is fitted between the top mount and the air spring restraining cylinder. The lower gaitor is secured to the lower end of the restraining cylinder and the damper body with metal straps. The gaitors prevent dirt and debris becoming trapped between the air sleeve and the restraining cylinder.

DAMPER MODULE - COIL SPRING SUSPENSION

Item	Part Number	Description
1	-	Self locking nut
2	-	Rebound washer
3	-	Top mount assembly
4	-	Spring spacer (selective)
5	-	Spring isolator
6	-	Bump washer
7	-	Spring aid
8	-	Dust tube
9	-	Bump cup
10	-	Coil spring
11	-	Damper
12	-	Damper rod
13	-	Self locking nut (3 off)
14	-	Bush

The coil spring damper module comprises a damper, a coil spring and a top mount.

Damper

The damper assembly is a similar design to the front suspension damper, with a twin tube design with an spring seat attached to the damper body. The lower end of the damper is fitted with a bush and is attached to the lower control arm with a bolt and self-locking nut. The damper functions by restricting the flow of hydraulic fluid through internal galleries within the damper.

The damper rod moves axially within the damper, its movement limited by the flow of fluid through the galleries, providing

damping of undulations in the terrain. The damper rod is sealed at its exit point from the damper body to maintain the fluid within the unit and to prevent the ingress of dirt and moisture. The seal also incorporates a wiper to keep the rod clean.

The damper rod is located through a central hole in the top mount. The rod is threaded at its outer end and a self-locking nut secures the top mount to the damper rod.

A spring aid is fitted to the damper rod and prevents the top mount contacting the top of the damper during full suspension compression and assists the suspension tune.

Spring and Top Mount

The coil spring fitted differs with vehicle specification. Each spring is color coded to identify its rating and fitment requirements.

The coil spring is located in a spring seat which is an integral part of the damper body. The design of the spring seat prevents the spring rotating. The opposite end of the coil spring is located in a spring isolator which is fitted in the top mount. The spring isolator is made from rubber and prevents any noise produced during spring and damper compression/extension from being transmitted to the vehicle body. Three types of spring isolator are available which allow for differences in vehicle specification.

The top mount is fitted with a bush and a rebound washer which are located between the top mount plate and the damper rod. The top mount is secured to the damper rod with a self-locking nut. The top mount attaches to a housing on the vehicle chassis with three integral studs and self-locking nuts.

The spring is fitted with spring spacers which are located between the spring isolator and the top mount. The spring spacers control the length of the spring to maintain the correct trim height. The spring spacers are colour coded and are supplied with a replacement spring.

ANTI-ROLL BAR

E45897

Item	Part Number	Description
1	-	RH lower control arm
2	-	Nut - link to lower control arm (2 off)
3	-	Link (2 off)
4	-	Nut - link to anti-roll bar (2 off)
5	-	LH lower control arm
6	-	Bush (2 off)
7	-	Bolt (4 off)
8	-	Bracket (2 off)

The anti-roll bar is fabricated from heat treated, solid, spring steel bar. The anti-roll bar operates, via a pair of links, from its attachment to the lower control arms.

The anti-roll bar is located on the upper face of a combined body mount and anti-roll bar bracket which is welded to each chassis side member. The anti-roll bar is attached to the brackets with two, Teflon lined bushes. The bushes are fitted with brackets, which are pressed onto the bushes and secured to the chassis brackets with bolts.

The anti-roll bar has crimped, 'anti-shuffle' collars pressed into position on the inside edges of the bushes. The collars prevent sideways movement of the anti-roll bar.

The ends of the anti-roll bar are attached to the lower control arms via links. This allows the anti-roll bar to move with the wheel travel providing maximum effectiveness. Each link has a ball joint at each end. The top ball joint is attached to the link at 90 degrees to the link axis and is located in a hole in the end of the anti-roll bar and secured with a self locking nut. The bottom ball joint is also attached to the link at 90 degrees to the axis of the link and is located in a hole in a bracket on the lower control and arm and secured with a self-locking nut. The links are not handed and therefore can be fitted to either side of the anti-roll bar.

UPPER CONTROL ARM

E45898

Item	Part Number	Description
1	-	Bolt
2	-	Bumpstop clip
3	-	Forward bush
4	-	Bumpstop clip
5	-	Caged nut
6	-	Bolt
7	-	Rearward bush
8	-	Caged nut
9	-	Self-locking nut - upper knuckle ball joint
10	-	Eccentric washer - upper knuckle ball joint
11	-	Cam bolt - upper knuckle ball joint
12	-	Upper control arm

The upper control arm locates in brackets on the upper surface of each chassis side member. The upper control arm assembly comprises the control arm and two bushes. The upper control arm is a pressed steel fabrication. Its outer end has two brackets with slotted holes which locate the upper ball joint of the knuckle. The ball joint is secured in the upper control arm with a cam bolt, eccentric washer and a self-locking nut. The cam bolt and the eccentric washer allow for the adjustment of the wheel camber.

Two fabricated tubular housings provide the location for the forward and rearward bushes. The bushes, which are pressed into the housings, locate between brackets on the chassis side members and are secured with bolts and caged nuts through metal inserts in the centre of the bushes.

LOWER CONTROL ARM

E45899

Item	Part Number	Description
1	-	Self-locking nut

5	-	Bolt
6	-	Nut and retainer
7	-	Rearward bush
8	-	Bolt
9	-	Anti-roll bar link bracket
10	-	Self-locking nut - damper lower attachment
11	-	Self-locking nut - knuckle upper ball joint attachment
12	-	Bolt - knuckle upper ball joint attachment
13	-	Bolt - damper lower attachment
14	-	Lower control arm
15	-	Jacking bracket (Vehicles with coil springs only)

The lower control arm locates in brackets on the lower surface of each chassis side member. The lower control arm assembly comprises the control arm and two bushes. The lower control arm is a pressed steel fabrication. Its outer end has two brackets which locate the lower ball joint of the knuckle. The ball joint is secured with a bolt and self-locking nut. The lower control arm also provides for the attachment of the damper bush which is secured with a bolt and a self-locking nut.

A bracket, welded to the upper surface of the lower control arm, allows for the attachment of the anti-roll bar link, bottom ball joint which is secured with a self-locking nut.

Two fabricated tubular housings provide the location for the forward and rearward bushes. The bushes, which are pressed into the housings, locate between brackets on the chassis side members. The forward bush is secured to the chassis bracket with a bolt and self-locking nut. The rearward bush is secured to the chassis bracket with a bolt and a nut and retainer. The nut and retainer allows for easy installation or removal of the bolt by removing the requirement to hold the self-locking nut when installing or removing the bolt.

On vehicles fitted with coil springs only, a jacking bracket is located on the lower control arm.

WHEEL KNUCKLE, WHEEL HUB AND BEARING ASSEMBLY

E45900

Item	Part Number	Description
1	-	Circlip - lower ball joint
2	-	Ball joint - lower
3	-	Park brake assembly attachment holes
4	-	Wheel speed sensor location
5	-	Wheel speed sensor cable bracket attachment
6	-	Ball joint - upper
7	-	Knuckle
8	-	Brake caliper attachment holes
9	-	Wheel bearing
10	-	Circlip - wheel bearing retention
11	-	Nut - halfshaft
12	-	Wheel hub
13	-	Wheel studs

The wheel knuckle is a machined forging which is located between the upper and lower control arms. The knuckle is fitted with two ball joints which are pressed into the knuckle, with the lower ball joint being secured with a circlip. The ball joints are positioned between brackets on the upper and lower control arms and secured to the arms with a bolt and self-locking nut.

The wheel knuckle provides the location for the rear wheel taper roller bearing, which is pressed into a machined bore and retained with a circlip. The wheel bearing is a serviceable item. The knuckle has a machined bore which provides the location for the wheel speed sensor. Four threaded holes allow for the attachment of the park brake assembly. A cast boss on the knuckle provides positive location for the park brake assembly. Two bosses on the knuckle casting provide the attachment points for the rear brake caliper.

The wheel hub is a machined casting which is pressed into the wheel bearing in the knuckle. The hub has a splined centre bore which mates with corresponding splines on the halfshaft. Five M14 studs are pressed into the wheel hub and provide for the attachment of the road wheel with wheel nuts. Rotation of the halfshaft is passed, via the splines, to the wheel hub which rotates on the taper roller bearing.

Rear Suspension - Upper Arm Ball Joint

Removal and Installation

Special Tool(s)	
 <p>204-525-1 E49576</p>	Remover/installer rear upper arm ball joint 204-525/1
 <p>204-525-2 E49575</p>	Remover/installer rear upper arm ball joint 204-525/2
 <p>204-525-1 E49574</p>	Remover/installer rear upper arm ball joint 204-525/3

Removal

-  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

- Remove the wheel knuckle.
For additional information, refer to: [Wheel Knuckle](#) (204-02 Rear Suspension, Removal and Installation).

- Using the special tools, remove the ball joint.

- Position machined face against the special tool.

E49577

Installation

- Clean the components.

E49578

2. CAUTIONS:

 Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

 If the push in force is less than 10 kN the wheel knuckle must be replaced.

Using the special tools, install the ball joint.

- Position machined face against the special tool.

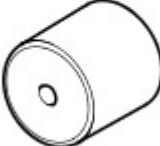

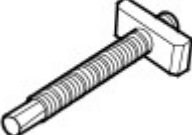

3. Install the wheel knuckle.

For additional information, refer to: [Wheel Knuckle](#) (204-02 Rear Suspension, Removal and Installation).

4. Install the wheel and tire.

Rear Suspension - Lower Arm Ball Joint

Removal and Installation

Special Tool(s)	
<p>204-516/1</p>  <p>E46795</p>	<p>Ball joint remover/installer 204-516/1 (LRT-64-026/1)</p>
<p>204-516/2</p>  <p>E50960</p>	<p>Ball joint remover/installer 204-516/2 (LRT-64-026/2)</p>
<p>204-516/3</p>  <p>E50961</p>	<p>Ball joint remover/installer 204-516/3 (LRT-64-026/3)</p>
<p>204-516/4</p>  <p>E50962</p>	<p>Ball joint remover/installer 204-516/4 (LRT-64-026/4)</p>
<p>204-506/1</p>  <p>E49618</p>	<p>Halfshaft remover/replacer 204-506/1 (LRT-60-030/1)</p>
<p>204-506/3</p>  <p>E49620</p>	<p>Halfshaft remover/replacer 204-506/3 (LRT-60-030/3)</p>
<p>204-506-01</p>  <p>E49622</p>	<p>Halfshaft installer adapter 204-506-01</p>

Removal

 **CAUTION:** The bolt securing the toe link to the wheel knuckle must not be used more than 5 times. Mark the bolt head with a suitable centre punch.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3. Loosen the halfshaft retaining nut.

E46796

4. Disconnect the toe link.

- Remove the bolt.

E46797

5. Release the parking brake cable from the lower arm.

E49702

6. Remove the halfshaft retaining nut.
7. Release the knuckle from the lower arm.

- Remove the bolt.

8. Using the special tools, release the halfshaft from the wheel hub.

9. Using the special tool, remove the lower arm ball joint.

- Support the wheel knuckle to give access to the lower ball joint.
- Remove and discard the snap ring.

Installation

1. CAUTIONS:

 If the push in force is less than 17 kN the wheel knuckle must be replaced.

 Make sure the ball joint is installed from the chamfered side of the wheel knuckle.

Using the special tool, install the lower arm ball joint.

- Install the snap ring.

2. Using the special tools, install the halfshaft in the wheel hub.

3.  CAUTION: Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the lower arm to the wheel knuckle.

- Tighten the bolt to 175 Nm (129 lb.ft).

4. Install a new halfshaft retaining nut and lightly tighten.

5. Secure the parking brake cable.

6.  CAUTION: Do not use a bolt that has been installed more than 5 times. Check the bolt head for centre punch marks. A bolt head with 4 centre punch marks indicates the bolt has been installed 5 times and must be replaced.

Connect the toe link.

- Tighten the bolt to 175 Nm (129 lb.ft).
- Mark the bolt head with a centre punch, to indicate the number of times it has been used.

7. Tighten the halfshaft retaining nut to 350 Nm (258 lb.ft).

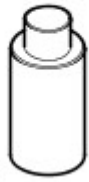

- Stake the nut to the halfshaft.

8. Install the wheel and tire.

9. Carry out the wheel alignment procedure.

Rear Suspension - Wheel Bearing and Wheel Hub

Removal and Installation

Special Tool(s)	
 <p>204-509/10 E49584</p>	<p>Rear wheel bearing remover/installer 204-509/10(LRT-60-033/10)</p>
 <p>205-802/1 E49579</p>	<p>Rear wheel bearing remover/installer 205-802/1</p>
 <p>205-802/2 E49580</p>	<p>Rear wheel bearing remover/installer 205-802/2</p>
 <p>205-802/3 E49581</p>	<p>Rear wheel bearing remover/installer 205-802/3</p>
 <p>205-802/4 E49582</p>	<p>Rear wheel bearing remover/installer 205-802/4</p>
 <p>205-802/5 E49583</p>	<p>Rear wheel bearing remover/installer 205-802/5</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the wheel knuckle.
For additional information, refer to: [Wheel Knuckle](#) (204-02 Rear Suspension, Removal and Installation).

3. Remove the adjuster and return spring.

E50965

4. Remove the primary brake shoe.

- Remove the hold-down spring and retaining pin.
- Pivot the shoe to release it from the spreader plate and return spring.

E50966

5. Remove the spreader plate and spring.

6. Remove the return spring.

E50967

7. Remove the secondary brake shoe.

- Remove the hold-down spring and retaining pin.
- Disconnect the parking brake cable retaining spring from the brake shoe lever.

E50181

8. Using the special tools, remove the drive flange.

E49585

9. Remove the brake disc dust shield.

- Remove the 3 screws.

E49586

10. Using the special tools, remove the wheel bearing.

- Remove the circlip.

E50182

Installation

1. Clean the components.
2. Using the special tools, install the wheel bearing.

E49588

3.  CAUTION: Make sure that the bearing seal is not damaged when installing the circlip.

Install the circlip.

E49587

4. Install the brake disc dust shield.

- Tighten the bolts to 9 Nm (7 lb.ft).

5.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the backing plate and apply grease to the brake shoe contacts.

6. Clean the adjuster and set it to its minimum extension.

7. Install the secondary brake shoe.

- Connect the parking brake cable retaining spring to the brake shoe lever, making sure the spring is not twisted.
- Install the hold-down spring and retaining pin.

8. Install the primary brake shoe.

- Install the spreader plate and the spring.
- Install the return spring.
- Install the hold-down spring and retaining pin.

9. Install the return spring.

10. Install the brake shoe adjuster.

11. Using the special tools, install the drive flange.

12. Install the wheel knuckle.

For additional information, refer to: [Wheel Knuckle](#) (204-02 Rear Suspension, Removal and Installation).

Rear Suspension - Rear Stabilizer Bar

Removal and Installation

Removal

CAUTION: It is possible to install the stabilizer bar incorrectly. Note the position of the stabilizer bar before removal.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the rear bumper cover.
For additional information, refer to: [Rear Bumper Cover](#) (501-19 Bumpers, Removal and Installation).
4. Remove the spare wheel and tire.
5. Raise the vehicle.
6. Remove the rear wheels and tires.

7. CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Release both stabilizer bar links.

- Remove and discard the 2 nuts.

E52216

8. Remove the body mount retaining bolts.

- Remove the 8 bolts.

E52217

9. CAUTION: Only raise the body sufficiently to remove the body mount.

Carefully raise the body.

- Using suitable stands, raise the body to release the body mounts.

10. Remove the 2 rear body mounts.

11. Remove the stabilizer bar bushing.

- Remove the stabilizer bar clamps.
- Remove the 4 bolts.

12.  CAUTION: Mark the position of the stabilizer bar.

Remove the stabilizer bar.

Installation

1.  CAUTION: Make sure the stabilizer bar is correctly installed.

Install the stabilizer bar.

2. Install the stabilizer bar bushing.

3. Install the stabilizer bar clamps.

- Tighten the 4 retaining bolts to 62 Nm (46 lb.ft).

4. Install the body mounts.

5. Lower the body.

- Remove the stands.

6. Install the body mount retaining bolts.

- Tighten the 8 retaining bolts to 133 Nm (98 lb.ft).

7. Attach both stabilizer bar links.

- Tighten the nuts to 115 Nm (85 lb.ft).

8. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

9. Lower the vehicle.

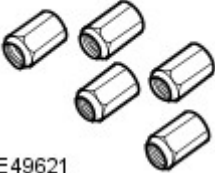

10. Install the spare wheel and tire.

11. Install the rear bumper cover.

For additional information, refer to: [Rear Bumper Cover](#)
(501-19 Bumpers, Removal and Installation).

 <p>204-506-01 E49622</p>	<p>Halfshaft installer adapter 204-506-01(LRT-60-030/4)</p>

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

3. Loosen the halfshaft retaining nut.

E46796

4. Remove the brake disc.

For additional information, refer to: [Brake Disc](#) (206-04 Rear Disc Brake, Removal and Installation).

5. Release the parking brake cable.

- Disconnect the parking brake cable from the brake shoe lever.
- Disconnect the parking brake cable from the backplate.
- Release the cable from the lower arm.

E49623

6. Release the wheel speed sensor from the wheel knuckle.

E49624

7. Disconnect the toe link.

- Remove and discard the bolt.

E49626

8. Remove the halfshaft retaining nut.

9.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the knuckle from the lower arm.

- Remove the bolt.

E49628

10.  CAUTION: Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

E49625

11.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Disconnect the upper arm from the wheel knuckle.

- Mark the position of the bolt in relation to the upper arm.
- Remove the nut and bolt.
- Discard the nut.

E49627

12.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Remove the wheel knuckle.

Installation

1. Clean the components.

2.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Install the wheel knuckle.

- Locate the halfshaft.

3. Connect the upper arm and wheel knuckle.

- Align the bolt to the marks made previously.
- Install a new nut and tighten to 133 Nm (98 lb.ft).

4. Using the special tools, install the halfshaft in the wheel hub.

5.  **CAUTION:** Install the halfshaft nut finger tight.

Install a new halfshaft retaining nut and lightly tighten.

6.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the lower arm to the wheel knuckle.

- Tighten the nut and bolt to 175 Nm (129 lb.ft).

7. Connect the toe link.

- Tighten the new bolt to 175 Nm (129 lb.ft).

8. Install the wheel speed sensor.

- Tighten the bolt to 9 Nm (7 lb.ft).

9. Locate the parking brake cable to the backplate.

- Connect the cable to the brake shoe lever.
- Tighten the coupling to 8 Nm (6 lb.ft).
- Secure the parking brake cable to the lower arm.

10. Install the brake disc.

For additional information, refer to: [Brake Disc](#) (206-04 Rear Disc Brake, Removal and Installation).

11.  **CAUTION:** Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the halfshaft retaining nut to 350 Nm (258 lb.ft).

- Stake the nut to the halfshaft.

12. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

13. Carry out the wheel alignment procedure.

Rear Suspension - Upper Arm Bushing

Removal and Installation

Special Tool(s)	
 <p>204-528-1</p> <p>E50585</p>	Remover/installer - rear suspension upper arm front bushing 204-528/1
 <p>204-528-2</p> <p>E50586</p>	Remover/installer - rear suspension upper arm front bushing 204-528/2
 <p>204-528-3</p> <p>E50587</p>	Remover/installer - rear suspension upper arm front bushing 204-528/3
 <p>204-527-1</p> <p>E50580</p>	Remover/installer rear suspension upper arm rear bushing 204-527/1
 <p>204-527-2</p> <p>E50581</p>	Remover/installer rear suspension upper arm rear bushing 204-527/2
 <p>204-527-3</p> <p>E50582</p>	Remover/installer rear suspension upper arm rear bushing 204-527/3

Removal

- NOTE: The bushings must be replaced in pairs, LH and RH sides.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

3.  **CAUTION:** Always plug any open connections to prevent contamination.

Remove the brake tube.

- Disconnect the 2 brake tube unions.
- Remove the brake hose clips and release the hoses.
- Release the brake tube from the clip.

4. Disconnect the height sensor link.

5. Release the wheel speed sensor lead.

6. Remove the LH upper arm.

- Loosen the upper arm bolts.
- Mark the position of the bolt in relation to the upper arm.
- Disconnect the upper arm from the wheel knuckle.
- Remove the upper arm bolts.

E55166

7. Remove the RH upper arm.

For additional information, refer to: [Upper Arm](#) (204-02 Rear Suspension, Removal and Installation).

8. Mark the position of the bushing in relation to the upper arm.

9. Using the special tools, remove and discard the rear upper arm front bushing.

10. Using the special tools, remove and discard the rear upper arm rear bushing.

Installation

1. CAUTIONS:

Make sure the bush is correctly aligned.

Make sure the correct special tool is used to install the bushings to the correct depth.

Using the special tools, install the rear upper arm front bushing.

CAUTION: Make sure the bush is correctly aligned.

Using the special tools, install the rear upper arm rear bushing.

3. Install the LH upper arm.

- Fit the bolts but do not fully tighten at this stage.

4. Set the height between the center of the halfshaft end and the edge of the fender trim to 485 mm (19.10").

- Support with an axle stand.

CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the upper arm and wheel knuckle.

- Align the bolt to the marks made previously.
- Tighten the bolt to 133 Nm (98 lb.ft).

6. Tighten the upper arm front bolt to 175 Nm (129 lb.ft).

7. Tighten the upper arm rear bolt to 275 Nm (203 lb.ft).

8. Secure the wheel speed sensor lead.

9. Secure the brake pad wear indicator sensor lead.

10. Connect the height sensor link.

11. Install the brake tube.

- Tighten the brake tube unions to 18 Nm (13 lb.ft).

12. Install the RH upper arm.

For additional information, refer to: [Upper Arm](#) (204-02 Rear Suspension, Removal and Installation).

13. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Suspension - Rear Stabilizer Bar Link

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link.

- Remove and discard the 2 nuts.

Installation

1. Install the stabilizer bar link.
 - Tighten the nuts to 115 Nm (85 lb.ft).
2. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Suspension - Lower Arm

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Release the stabilizer bar link.

- Remove and discard the retaining nut.

E55171

4. Loosen the 2 lower arm bolts.
5. Disconnect the shock absorber and spring assembly from the lower arm.

- Remove the nut and bolt.

6. Release the parking brake cable.

7. Remove the 2 lower arm bolts.

8.  **CAUTION:** Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the knuckle from the lower arm.

- Remove the bolt.

9. Remove the lower arm.

E55172

Installation

1. Install the lower arm.

- Fit the bolts but do not fully tighten at this stage.

2.  **CAUTION:** Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the lower arm to the wheel knuckle.

- Tighten the bolt to 175 Nm (129 lb.ft).

3. Connect the shock absorber and spring assembly to the lower arm.

- Tighten the nut and bolt to 300 Nm (221 lb.ft).

4. Set the height between the center of the halfshaft end and the edge of the fender trim to 485 mm (19.10").

5. Tighten the lower arm bolts to 275 Nm (203 lb.ft).

6. Secure the parking brake cable.

7. Connect the stabilizer link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

8. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

9. Carry out the wheel alignment procedure.

Rear Suspension - Upper Arm

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** Always plug any open connections to prevent contamination.

Remove the brake tube.

- Disconnect the 2 brake tube unions.
- Remove the brake hose clips and release the hoses.
- Release the brake tube from the clip.

4. Disconnect the height sensor link.

5. Release the wheel speed sensor lead.

E55164

6. RH side only: Release the brake pad wear indicator sensor lead.

E55165

E55166

7. Remove the upper arm.

- Loosen the upper arm bolts.
- Mark the position of the bolt in relation to the upper arm.
- Remove the nut and bolt, then release the upper arm from the wheel knuckle.
- Remove the upper arm bolts.

Installation

1. Install the upper arm.

- Fit the bolts but do not fully tighten at this stage.

2. Set the height, between the center of the halfshaft end and the edge of the fender trim, to 463 mm (18.23").

- Support with an axle stand.

E59036

3.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the upper arm and wheel knuckle.

- Align the bolt to the marks made previously.
- Tighten the bolt to 133 Nm (98 lb.ft).

4. Tighten the upper arm front bolt to 175 Nm (129 lb.ft).

5. Tighten the upper arm rear bolt to 275 Nm (203 lb.ft).

6. Secure the wheel speed sensor lead.

7. Secure the brake pad wear indicator sensor lead.

8. Connect the height sensor link.

9. Install the brake tube.

- Tighten the brake tube unions to 18 Nm (13 lb.ft).

10. Bleed the brake system.

For additional information, refer to: [Component Bleeding](#) (206-00 Brake System - General Information, General Procedures).

11. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

12. Carry out the wheel alignment procedure.

Rear Suspension - Toe Link

Removal and Installation

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the wheel and tire.
- Disconnect the toe link.
 - Remove and discard the bolt.
- Remove the toe link.
 - Remove and discard the nut.

E47523

Installation

-  **CAUTION:** Make sure the toe link anti-rotation tang is fully seated in the integrated body frame before tightening the toe link retaining nut. Failure to follow this instruction will result in damage to the toe link or integrated body frame.

Install the toe link.

- Install a new nut and lightly tighten.
- Connect the toe link.
 - Using a M14 X 2 tap, clean the threads of the knuckle fixing hole. Blow out debris with an air-line.
 - Tighten the new bolt to 175 Nm (129 lb.ft).
 - Set the gap, between the underside of the toe link rubber boot and the integrated body frame bracket, to 10 mm (0.473 in).
 - Tighten the toe link inner ball joint retaining nut to 133 Nm (98 lb.ft)

E47524

- Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
- Carry out the wheel alignment procedure.

Rear Suspension - Lower Arm Bushing

Removal and Installation

Special Tool(s)	
 204-526/1 E55175	Receiver rear lower arm front bush 204-526/1
 204-526/2 E55176	Remover rear lower arm front bush 204-526/2
 204-526/3 E55177	Installer rear lower arm front bush 204-526/3
 204-532/1 E55178	Receiver rear lower arm rear bush 204-540/1
 204-540/2 E55179	Remover rear lower arm rear bush 204-540/2
 204-540/3 E55180	Installer rear lower arm rear bush 204-540/3

Removal

- NOTE: The bushings must be replaced in pairs, LH and RH sides.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

3. Remove the LH lower arm.

For additional information, refer to: [Lower Arm](#) (204-02 Rear Suspension, Removal and Installation).

4. Remove the RH lower arm.

5. Note the position of the bushing in relation to the lower arm.

6.  **CAUTION:** The bush flanges need to be removed to allow bush removal.

• **NOTE:** Take note of the fitted position of the bush.

Using a suitable tool, bend over the bush flanges.

7. Using a hacksaw, remove the flange from the bushing, making sure the upper arm is not damaged.

8. Using the special tools, remove and discard the lower arm rear bushings.

9. Using the special tools, remove and discard the lower arm front bushings.

Installation

1. CAUTIONS:

 Make sure the bush is correctly aligned.

 Make sure the correct special tool is used to install the bushings to the correct depth.

Using the special tools, install the lower arm front bushings

2.  CAUTION: Make sure the bush is correctly aligned.

Using the special tools, install the lower arm rear bushings.

3. Install the LH lower arm.
For additional information, refer to: [Lower Arm](#) (204-02 Rear Suspension, Removal and Installation).
4. Install the RH lower arm.
5. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
6. Carry out the wheel alignment procedure.

Rear Suspension - Shock Absorber and Spring AssemblyTDV6 2.7L Diesel

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Loosen the 3 spring and shock absorber retaining nuts.

E49143

4. Disconnect the shock absorber and spring assembly from the lower arm.

- Using a jack and a suitable block of wood, support the base of the shock absorber.
- Remove the nut and bolt.

E49142

5. Remove the shock absorber and spring assembly retaining nuts.

E49143

6. Remove the shock absorber and spring assembly.

Installation

1. Install the shock absorber and spring assembly.
 - Make sure the spring and shock absorber assembly top mounting to body mating faces are clean.
 - Install the nuts but do not fully tighten at this stage.

2. Connect the shock absorber and spring assembly to the lower arm.

- Tighten the nut and bolt to 300 Nm (221 lb.ft).
- Tighten the three retaining nuts to 70 Nm (52 lb.ft).

3. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Suspension - Shock Absorber and Spring Assembly TDV6 2.7L Diesel

Disassembly and Assembly

Disassembly

WARNING: Ensure the spring compressor Safe Working Load (SWL) meets or exceeds the spring rating quoted in the Specifications section.

1. Raise and support the vehicle.
2. Remove the wheel and tire.
3. Remove the shock absorber and spring assembly.
For additional information, refer to: [Shock Absorber and Spring Assembly - TDV6 2.7L Diesel](#) (204-02 Rear Suspension, Removal and Installation).
4. Install a suitable spring compressor in a vise.
5. Install the shock absorber and spring assembly in the spring compressor.
 - Compress the spring just sufficiently to relieve the spring tension.

6. Remove the shock absorber.
 - Restrain the shock absorber spindle, remove and discard the nut.
 - Remove the upper bush rebound plate and upper bush.
 - Remove the upper mounting assembly.
 - Remove the dust tube and rebound plate assembly.
 - Remove the spring aid.

E51737

7. Remove the spring from the spring compressor.

Assembly

E51738

1. Clean and inspect the components for deterioration.

- Remove the rubber insulator.
- Remove the spacer.
- Remove the rebound plate from the dust tube.

E51740

2. Install the spring in the spring compressor.

- Make sure the spring is installed with the close coils positioned towards the top of the shock absorber.

3. Install the spring aid.

4. Install the dust tube.

- Install the rebound plate into the dust tube.

5. Install the shock absorber.

- Make sure the spring is correctly located in the spring seat.

6. Install the upper mounting.

- Install the spacer and rubber insulator, making sure the spacer drops over the stud heads.
- Install the upper bush and upper bush rebound plate.
- Install a new nut and tighten to 98 Nm (72 lb.ft).

E51739

7. Install the shock absorber and spring assembly.

For additional information, refer to: [Shock Absorber and Spring Assembly - TDV6 2.7L Diesel](#) (204-02 Rear Suspension, Removal and Installation).

8. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Wheels and Tires -

Wheels

Wheel type	Wheel size
Alloy wheel	7J x 17
Alloy wheel	8J x 18
Alloy wheel	8J x 19
Alloy wheel	8.5J x 20
Reduced size spare wheel - Steel	5.5J x 19

• CAUTIONS:

With reduced size spare wheel fitted, do not exceed 50 mph (80 kph) and replace with standard size wheel at earliest opportunity.

Do not use power tools when operating the spare wheel winch, raise and lower winch manually using hand tools only.

Tire Sizes - Standard Fit

Wheel size	Tire size	Tire load index
7J x 17 - Alloy	235/70 R17H - All terrain	111
8J x 18 - Alloy	255/60 R18V - All terrain	112
8J x 19 - Alloy	255/55 R19V - All terrain	111
8.5J x 20 - Alloy	255/50 R20Y - All terrain	109

CAUTION: Inner tubes must not be fitted with any of these tires.

Tire Sizes - Accessory Fit

Wheel size	Tire size	Tire load index
8J x 19 - Alloy	255/55 R19 - Mud terrain	111
8J x 19 - Alloy	255/55 R19 - Sand	111

CAUTION: Inner tubes must not be fitted with any of these tires.

Tire Pressures - Not NAS/Gulf/Brazil Vehicles

Loading condition	bars	lbf/in ²	kPa
Normal operating conditions - Up to 4 people:			
Front	2.3	33	230
Rear	2.5	36	250
Vehicle loaded to maximum gross vehicle weight:			
Front	2.5	36	250
Rear	2.9	42	290
Reduced size spare wheel	4.2	60	420
* Standard size spare wheel	2.9	42	290

CAUTION: * The standard size spare wheel tire should be inflated to the maximum gross vehicle weight pressure and the pressure for the front or rear wheel locations must be adjusted accordingly if the wheel is to be used under conditions other than with the vehicle loaded to maximum gross vehicle weight.

Tire Pressures - NAS/Gulf/Brazil Vehicles

Loading condition	bars	lbf/in ²	kPa
All conditions			
Front	2.5	36	250
Rear	2.9	42	290
Reduced size spare wheel	4.2	60	420
* Standard size spare wheel	2.9	42	290

CAUTION: The standard size spare tyre should be inflated to the highest recommended pressure when stored on the vehicle. The inflation pressure must be adjusted to suit the axle location when the spare is used to replace a punctured road tyre."

General Specification

Item	Make	Location
Tire low pressure sensor	Continental/Siemens	On inside of wheel rim
Tire pressure sensor initiator:		
Front	Continental/Siemens	Attached to the fender splash shield adjacent to the front bumper
Rear	Continental/Siemens	Attached to the fender splash shield adjacent to the rear bumper

Recommended Lubricant

Application	Land Rover Part No.
Wheel hub spigot	RYL 105020

Torque Specifications

Description	Nm	lb-ft
* Road wheel nuts	140	103
Tire low pressure sensor	8	6

* Wheel nuts must be tightened by diagonal selection

Wheels and Tires - Wheels and Tires

Description and Operation

TIRES

Care must be taken when removing and refitting tires to ensure that the tire pressure sensor is not damaged.

E45549

Item	Part Number	Description
1	-	Tire valve and pressure sensor
2	-	Tire fitting/removal tool initial start position
3	-	High tire and bead tension area
4	-	Low tire and bead tension area

When removing the tire, the bead breaker must not be used within 90 degrees of the tire valve in each direction.

When using the tire removal machine, the fitting arm start position must be positioned as shown in the tire changing illustration. The wheel can then be rotated through 180 degrees in a counterclockwise direction. This will relieve the high tension from the tire bead allowing the remaining 180 degrees of the tire to be manually pulled from the rim.

When refitting the tire, position the fitting arm as shown. Rotate the tire and take care that the bead on the low tension side of the tire does not damage the sensor.

Tread Act - NAS Only

Vehicles supplied to the North American markets must comply with the legislation of the Transport Recall Enhancement, Accountability and Documentation (TREAD) act. Part of the requirement of the TREAD act is for the vehicle to display a label, positioned on the driver's side B-pillar, which defines the recommended tire inflation pressure, load limits and maximum load of passengers and luggage weight the vehicle can safely carry. This label will be specific to each individual vehicle and will be installed on the production line.

This label must not be removed from the vehicle. The label information will only define the specification of the vehicle as it came off the production line. It will not include dealer or owner fitted accessory wheels and tires of differing size from the original fitment.

• **NOTE:** If tires and wheels of a non-standard size are fitted to the vehicle, the car configuration file must be updated using a Land Rover approved diagnostic system.

If the label is damaged or removed for body repair, it must be replaced with a new label specific to that vehicle. A new label is requested from Land Rover parts and will be printed specifically for the supplied VIN of the vehicle.

TIRE PRESSURE MONITORING SYSTEM (TPMS)

Tire Pressure Monitoring System - Component Location

E134243

Item	Part Number	Description
1	-	RH (right-hand) front initiator
2	-	Instrument cluster
3	-	TPMS RF receiver
4	-	RH rear tire pressure sensor
5	-	RH rear initiator
6	-	Spare tire pressure sensor
7	-	LH (left-hand) rear initiator
8	-	LH rear tire pressure sensor
9	-	CJB (central junction box)
10	-	EJB (engine junction box)
11	-	LH front tire pressure sensor
12	-	LH front initiator
13	-	RH front tire pressure sensor

The purpose of the Tire Pressure Monitoring System (TPMS) is to assist the driver in maintaining the vehicle's tire pressures at the optimum level in order to:

- improve fuel consumption
- maintain ride and handling characteristics
- reduce the risk of rapid tire deflation – which may be caused by under inflated tires
- comply with legislation in relevant markets.

The TPMS measures the pressure in each of the tires on the vehicle (including the spare, if required) and issues warnings to the driver if any of the pressures deviate from defined tolerances.

• **NOTE:** During a 'blow out' a very rapid reduction in pressure is experienced. The system is not intended to warn the driver of a 'blow out', since it is not possible to give the driver sufficient warning that such an event is occurring, due to its

short duration. The design of the TPMS is to assist the driver in keeping the tires at the correct pressure, which will tend to reduce the likelihood of a tire 'blow out' occurring.

• **NOTE:** TPMS is inhibited when the vehicle is in Delivery mode. For more details on Delivery mode refer to the PDI manual.

A single TPMS hardware configuration is used. TPMS status information is relayed to the driver with a message displayed in the instrument cluster message center and a amber warning indicator.

Tire Location

Because of the requirement for different pressure targets and thresholds for the front and rear tires, the [CJB](#) can identify the location of the tires on the vehicle, and assign a received tire pressure sensor identification to a specific position on the vehicle (i.e. FL (front left), FR (front right), RL (rear left) or RR (rear right)).

Tire location is performed automatically by the [CJB](#) using an auto-location function. This function requires no manual intervention by the driver. The [CJB](#) can automatically learn the position of tires on the vehicle if the tire pressure sensors or their positions are changed on the vehicle.

The tire learn and location process is ready to commence when the vehicle has been stationary or is traveling at less than 12 mph (20 km/h) for 15 minutes. This is known as 'parking mode'. The learn/locate process requires the vehicle to be driven at speeds of more than 12 mph (20 km/h) for 15 minutes. If the vehicle speed reduces to below 12 mph (20 km/h), the learn process timer is suspended until the vehicle speed increases to more than 12 mph (20 km/h), after which time the timer is resumed. If the vehicle speed remains below 12 mph (20 km/h) for more than 15 minutes, the timer is set to zero and process starts again.

The [CJB](#) can automatically detect, under all operating conditions, the following:

- one or more tire pressure sensors have been replaced
- one or more tire pressure sensor identifications are missing
- one or more 'alien' identifications are being received, i.e. the [CJB](#) can reject identifications from tire pressure sensors that do not belong to the vehicle
- the spare tire and one of the tires in use on the vehicle have exchanged position on the vehicle.

If the tire pressure sensors fitted to the running wheels (not the spare) are changed, the [CJB](#) can learn the new sensor identifications automatically. The learn function requires no manual intervention by the driver.

If a new sensor is fitted to the spare tire it must have its identification code programmed into the [CJB](#) using a Land Rover approved diagnostic system, or used on the vehicle as a 'running' wheel and the vehicle driven for 15 minutes at more than 12.5 mph (20 km/h).

Spare Tire Identification

Depending on the vehicle specification, the spare tire may or may not be fitted with a tire pressure sensor.

• **NOTE:** Tire pressure sensors cannot be fitted to steel space saver spare wheels.

If the spare tire is fitted with a tire pressure sensor, the [CJB](#) can detect it, determine that it is the spare tire and monitor its pressure and issue warnings to the driver accordingly. If the [CJB](#) expects the spare tire to be fitted with a tire pressure sensor and it does not, the [CJB](#) will not show a fault to the driver, however a fault code will be stored in the [CJB](#).

If the spare tire is being monitored and the driver replaces a flat 'running' tire with the spare tire, the [CJB](#) will not continually warn the driver that the original flat tire (now in the spare position) is flat. This prevents distraction of the driver by constant pressure warnings being issued. The driver is reminded by a message displayed for 20 seconds at each ignition on cycle that the spare tire is flat.

System Operation

Each time the vehicle is driven, the [CJB](#) transmits a Low Frequency (LF) (125 KHz) signal to each initiator in turn. This is received by the tire pressure sensor which transmits a Radio Frequency (RF) (315 or 433 MHz depending on market) signal to the RF receiver. This signal contains coded data which corresponds to sensor identification, air pressure, air temperature and acceleration data. This signal is communicated to the [CJB](#) via a K-bus line.

The system enters 'parking mode' after the vehicle speed has been less than 12.5 mph (20 km/h) for 12 minutes. In parking mode the tire pressure sensors transmit a coded signal to the [CJB](#) once every 13 hours. If the tire pressure decreases by more than 1 lbf/in² (0.6 bar) the sensor will transmit more often if pressure is being lost.

The spare tire sensor transmits a signal every 13 hours in the same manner as the road wheels when in parking mode. If the tire pressure decreases by more than 1 lbf/in² (0.6 bar) the sensor will transmit more often if pressure is being lost.

As each wheel responds to the LF signal from the [CJB](#), it is assigned a position on the vehicle and is monitored for the remainder of that drive cycle in that position.

When the vehicle has been parked for more than 15 minutes and then driven at a speed of more than 12.5 mph (20 km/h), the initiators fire in turn for 18 seconds in the following order:

- Front left
- 6 second pause (for the to detect a response from the tire pressure sensor)
- Front right
- 6 second pause
- Rear right
- 6 second pause
- Rear left
- 6 second pause.

Each tire pressure sensor responds in turn so the [CJB](#) can establish the sensor positions at the start of the drive cycle.

This process is repeated up to three times but less if the sensor positions are already known in the [CJB](#). The process is known as 'Auto Location' and takes 7 to 8 minutes to complete. During this period the tire sensors transmit at regular intervals, once every 15 seconds. For the remainder of the drive cycle the tire sensors transmit once every 60 seconds or if a change in tire pressure is sensed until the vehicle stops and the system returns to parking mode.

Once the wheel position is established, the initiators stop firing a signal and do not fire again until the vehicle has been parked for more than 15 minutes. The signal transmissions from each wheel sensor continue at 1 minute intervals whilst the vehicle is being driven. This transmission is to monitor the tire pressure.

At 25% deflation the amber warning indicator in the instrument cluster is illuminated and an appropriate message displayed in the message center.

RF Receiver

E73925

The RF receiver is mounted behind the overhead console and connects to the vehicle harness via a fly lead.

The RF receiver receives transmissions from each of the tire pressure sensors via an internal antenna. This information is then communicated to the [CJB](#) via a dedicated Local Interconnect Network (K-bus).

Initiator

E45552

The initiators are located at the front of the front wheel arches and at the rear of the rear wheel arches and are secured with two scrivenets. The TPMS has four initiators and each has a connector which connects with the body harness.

The initiator is a passive, Low Frequency (LF) transmitter. Each initiator provides an auto-location feature to identify tire positions on the vehicle and transmit that data to the [CJB](#).

The [CJB](#) energizes each initiator in turn using LF drivers. The corresponding tire pressure sensor detects the resulting LF transmission and responds by initiating an RF transmission of its data. This data is received by the RF receiver and communicated to the [CJB](#) via a K-bus. The [CJB](#) can then determine which sensor is transmitting and its location on the vehicle.

Tire Pressure Sensor

E45553

The TPMS system uses 'active' tire pressure sensors which are mounted on each wheel, inside the tire cavity. The sensor is retained in position by the valve attachment to the wheel structure. The sensors transmit their RF signals at either 315 MHz or 433 MHz dependent on market requirements.

The sensors periodically measure the pressure and temperature of the air inside the tire plus the centripetal acceleration acting on the sensor. These measurements are transmitted periodically to the RF receiver located behind the overhead console.

The tire pressure sensors are self-contained units which have no electrical connections into or out of the sensor.

The care points detailed in the 'Tires' section of this chapter must be followed to avoid damage to the sensor. If the sensor is replaced, the nut, seal and washer must also be replaced and the sensor tightened to the correct torque value as given in the Service Repair manual.

The RF transmission from the sensor contains a unique identification code in its transmission data, so that the [CJB](#) can identify the tire on the vehicle. If the sensor is replaced on a 'running' wheel, the new sensor identification will be learnt when the vehicle is first driven at a speed of more than 12.5 mph (20 km/h) for 15 minutes. If a new sensor is fitted to the spare wheel, the identification for that sensor must be programmed into the [CJB](#) using a Land Rover approved diagnostic system or that wheel will not be monitored. The code is provided on a label with the complete wheel and tire assembly when new and is also printed on the casing of each sensor.

The replacement spare wheel may also be programmed to the vehicle by using it as a 'running' wheel for 15 minutes at more than 12.5 mph (20 km/h), then replacing it to the spare wheel position.

In order to conserve battery power, the tire sensor module uses different transmission rates when the wheel is stationary or moving. The wheel speed required to change between the stationary and moving transmission rates is very low to allow for the requirement for slow off-road driving.

Instrument Cluster Indications

E134246

Item	Part Number	Description
1	-	Message center
2	-	Amber warning indicator

The warning indications to the driver are common on all vehicles fitted with TPMS. Warnings are conveyed by an amber light emitting diode (LED) warning indicator and a text message displayed in the message center.

The warning indicator and message center are driven by CAN messages from the [CJB](#). The warning indicator is illuminated by the cluster software for 3 seconds when the vehicle is in power mode 6 for a bulb check.

For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

Controller Area Network (CAN)

The [CJB](#) sends and receives a number of digital messages via the medium speed controller area network (CAN). The received messages are used for the operation of the TPMS. The transmitted messages comprise of TPMS status and requests to the instrument cluster to illuminate warnings indicators and/or display messages in the message center.

Transmitted Messages

The [CJB](#) transmits the messages shown in the following table.

Message	Received By
TPMS diagnostic response	A Land Rover approved diagnostic system.
TPMS amber warning indicator request at 25% tire deflation	Instrument cluster
TPMS message display request	Instrument cluster

Diagnostics

The [CJB](#) has a diagnostic connection via the medium speed CAN to enable system status and faults to be retrieved using a Land Rover approved diagnostic system.

Additionally, an on-board diagnostic routine within the [CJB](#) constantly monitors the system and alerts the driver to system faults by illuminating the amber warning indicator and/or displaying a message in the instrument cluster message center.

Fault Detection

If a sensor fails, the amber warning indicator in the instrument cluster will be illuminated. A message 'XX Tyre Not Monitored' will be displayed in the message center in addition to the amber warning indicator.

- **NOTE:** 'XX' is the tire position on the vehicle, e.g. FL (front left), FR (front right), RL (rear left) or RR (rear right).

If more than one sensor fails or the [CJB](#) develops a fault, the amber warning indicator will be illuminated. A message 'Tyre Monitoring System Fault' will be displayed in the message center in addition to the amber warning indicator. This fault could also be caused if RF interference near the vehicle affects the system signal reception. When the interference has ceased, the fault will be automatically cancelled and the TPMS will operate normally.

If a tire pressure sensor battery voltage becomes low, the sensor transmits a message to the [CJB](#). The [CJB](#) stores the low battery condition as a fault flag in its memory with no other visual warnings displayed. If the battery fails, the sensor will stop transmitting and the [CJB](#) will transmit a message to display 'FL Tyre Not Monitored' for example in the message center. The dealer should interrogate the [CJB](#) for the fault flag using a Land Rover approved diagnostic system to determine the cause of the message. If the battery has failed, the sensor must be replaced and the stored fault flags removed using a Land Rover approved diagnostic system. The [CJB](#) will learn the identification of the new sensor when the vehicle is driven. If the replaced sensor is fitted to the spare wheel (if fitted), its identification must be manually programmed into the [CJB](#) using a Land Rover approved diagnostic system or by using it as a 'running' wheel for 15 minutes at more than 12.5 mph (20 km/h), then replacing it to the spare wheel position.

Wheels and Tires - Wheels and Tires

Diagnosis and Testing

Principles of Operation

For a detailed description of the wheels and tires, refer to the relevant Description and Operation section in the workshop manual.

REFER to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation) / [Wheels and Tires](#) (204-04, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. **1.** Verify the customer complaint. As much information as possible should be gathered from the driver to assist in diagnosing the cause(s). Confirm which of the following two warning types (A or B) exist for the Tire Pressure Monitoring System when the ignition status is switched from 'OFF' to 'ON'
 - **(A) Check Tire Pressure Warnings.** A low tire pressure warning will **continuously** illuminate the low tire pressure warning lamp. This warning may be accompanied by a text message such as CHECK TIRE PRESSURE (refer to owner literature). The manufacturer approved diagnostic system does NOT need to be used. Diagnostic Trouble Codes (DTCs) are not generated with this type of warning. To extinguish this warning it is essential that, with the ignition 'ON', all vehicle tires (including the spare) are to be set to the correct pressure as stated in the vehicle handbook or as indicated on the placard label in the passenger/driver door aperture. **It is not necessary to drive the vehicle to clear 'check tire pressure' warnings - just changing the tire pressure causes the tire low pressure sensor to transmit new data.**
 - **NOTE:** The tire pressures should be set by:
 - Using a calibrated tire pressure gauge
 - With 'cold' tires (vehicle parked in the ambient temperature for at least one hour, not in a garage with an artificial ambient temperature)
 - **NOTE:** If the tire pressure warning does not clear within two minutes, it is likely that the gauge is not correctly calibrated or the tires are 'warm'. Carry out the following steps until the warning has cleared:
 - Rotate wheels approximately 180 degrees
 - Increase the tire pressures by 3psi
 - Wait a further two minutes
 - When the tires are at ambient temperature and a **calibrated** gauge is available, reset the tire pressures to the correct pressure.
 - **NOTE:** Tire pressure adjustments are part of routine owner maintenance. Tire pressure adjustments that are required due to a lack of owner maintenance are not to be claimed under vehicle warranty.
 - **(B) System Fault Warnings.** When a system fault is detected, the low tire pressure warning lamp will flash for approximately 75 seconds prior to being continuously illuminated. Visually inspect wheel arch Tire Pressure Monitoring System Antennas and check for system DTCs. External visual damage to the tire low pressure sensors and air leaks will not cause system fault warnings (note: nut and seal system should be replaced at each tyre change using the available service kit). Check for the presence of tire low pressure sensors on all four wheels (note: a tire low pressure sensor has a metal valve stem rather than a rubber one).
2. **2.** Check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Central Junction Box \(CJB\)](#) (100-00 General Information, Description and Operation).

C4: U201F87 CHECK BODY CONTROL MODULE.																	
	1 Using manufacturer approved diagnostic system run On Demand Self Test (0x0202) .																
	Is the DTC U201F87 set? Yes Replace Body Control Module. No Test is complete. No further action is required.																

PINPOINT TEST D : C1A5693, C1A5893, C1A6093, C1A6293 DEFECTIVE RUNNING TIRE LOW PRESSURE SENSOR OR RECEIVER

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: C1A5693, C1A5893, C1A6093, C1A6293 CHECK FOR ADDITIONAL DTCS	
	1 Using manufacturer approved diagnostic system check for additional DTCs C1A5693, C1A5893, C1A6093, C1A6293, with identical time stamps.
	Have all four DTCs logged with identical time stamps in the Body Control module? Yes Diagnose and fix DTCs related to the tire pressure monitoring receiver. No Using manufacturer approved diagnostic system, perform diagnostic routine to verify reception of all tire low pressure sensors, by carrying out 'TPMS wheel unit & receiver reception test' from set up and configuration application and complete remedial actions.

PINPOINT TEST E : C1D1800 LOCALIZATION FAILURE

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: C1D1800 ESTABLISH THE LOCATIONS OF THE TIRE LOW PRESSURE SENSOR LOCALIZATION FAILURES	
	<ul style="list-style-type: none"> NOTE: To clear or reset information read in datalogger signal 'Unsuccessful wheel position triggering statistic' (0x4149) Use manufacturer approved diagnostic system and carry out 'Reset/ Clear Specified Function' (0x040E) from Special Applications. 1 Using manufacturer approved diagnostic system read datalogger signal 'Unsuccessful wheel position triggering statistic' (0x4149) to establish the locations of the tire low pressure sensor localization failures.
	Have the locations of the tire low pressure sensor localization failures been identified? Yes GO to E2. No Investigate possible cause of intermittent failure.
E2: C1D1800 CHECK FOR ADDITIONAL LF INITIATOR CIRCUIT DTCS	
	1 Using manufacturer approved diagnostic system check for additional DTCs C1A5712, C1A5714, C1A5912, C1A5914, C1A6112, C1A6114, C1A6312, C1A6314.
	Are any of the following DTCs logged C1A5712, C1A5714, C1A5912, C1A5914, C1A6112, C1A6114, C1A6312, C1A6314? Yes Refer to the DTC Index. Check for possible causes for each of the logged DTCs and carry out the repair operations specified. No GO to E3.
E3: C1D1800 CHECK FOR ADDITIONAL TIRE LOW PRESSURE SENSOR DTCS	
	1 Using manufacturer approved diagnostic system check for additional DTCs C1A5693, C1A5893, C1A6093, C1A6293, C1D2105.

	<p>Are any of the following DTCs logged C1A5693, C1A5893, C1A6093, C1A6293, C1D2105?</p> <p>Yes Refer to the DTC Index. Check for possible causes for each of the logged DTCs and carry out the repair operations specified.</p> <p>No GO to E4.</p>
E4: C1D1800 CHECK INITIATORS ARE CORRECTLY INSTALLED	
	<p>1 Check for correct installation of Initiators for the locations identified. REFER to: (204-04 Wheels and Tires) Tire Pressure Monitoring System (TPMS) Front Antenna (Removal and Installation), Tire Pressure Monitoring System (TPMS) Rear Antenna (Removal and Installation).</p>
	<p>Are the Initiators correctly installed?</p> <p>Yes GO to E5.</p> <p>No Install Initiators to the correct locations.</p>
E5: C1D1800 CHECK FOR SHORT CIRCUIT IN INITIATOR HARNESS	
	1 Ignition OFF.
	2 Disconnect the Body Control Module electrical connector, C0584 (Front LF Initiators).
	3 Disconnect the Body Control Module electrical connector, C0586 (Rear LF Initiators).
	4 Measure the resistance of Front Right Hand Initiator.
	C0584, harness side
	C0584, harness side
	Pin 1
	Pin 2
	5 Measure the resistance of Front Left Hand Initiator.
	C0584, harness side
	C0584, harness side
	Pin 14
	Pin 15
	6 Measure the resistance of Rear Right Hand Initiator.
	C0586, harness side
	C0586, harness side
	Pin 30
	Pin 31
	7 Measure the resistance of Rear Left Hand Initiator.
	C0586, harness side
	C0586, harness side
	Pin 18
	Pin 19
	<p>Are any of the Initiator resistance measurements less than 1 Ohm?</p> <p>Yes REPAIR the short circuit as required.</p> <p>No Install the correct tire low pressure sensor, of correct frequency, in accordance with that defined in the manufacturer approved diagnostic system new tire low pressure sensor application, to the position(s) identified. REFER to: Tire Low Pressure Sensor (204-04 Wheels and Tires, Removal and Installation).</p>

PINPOINT TEST F : C1D2105 MISSING, INCOMPATIBLE OR DEFECTIVE RUNNING TIRE LOW PRESSURE SENSOR(S) OR RECEIVER

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: C1D2105 CHECK FOR CORRECT WHEEL AND TIRE ASSEMBLY AND TIRE LOW PRESSURE SENSORS	
	<ul style="list-style-type: none"> NOTE: As a visual check, a tire low pressure sensor has a metal valve stem rather than a rubber one and cannot be installed to a mini or space saver spare wheel.
	1 Check that all full size running wheel and tire assemblies have tire low pressure sensors installed.
	<p>Is a full size wheel and tire assembly with tire low pressure sensor installed to all running wheel positions?</p> <p>Yes Using manufacturer approved diagnostic system, perform diagnostic routine to verify reception of all tire low pressure sensors, by carrying out 'TPMS wheel unit & receiver reception test' from set up and configuration application and complete remedial actions.</p> <p>No If agreed with the customer, install the correct wheel and tire assembly or tire low pressure sensor(s), of correct frequency, in accordance with that defined in the manufacturer approved diagnostic system new tire low pressure sensor application. (Note: If the datalogger signal 'Number Of Missing Tire Pressure Wheel Units' is 4 and the Instrument Panel Cluster displays text message 'Tire Pressure Monitoring Unavailable', the system has detected winter tire installation, as detailed in the owner's manual. Confirm why the vehicle has non-TPMS wheel & tire assemblies installed before installing tire low pressure sensors, which are not to be claimed under vehicle warranty.)</p>

Component Tests

Wheels and Tires

For wheel and tire specification information (pressures, torques, etc).
REFER to: [Specifications](#) (204-04 Wheels and Tires, Specifications).

When replacing wheels or tires, local legislation regarding health and safety must be complied with.

If the vehicle has a Tire Pressure Monitoring System installed, only manufacturer approved wheels and tires should be used. If the wheel and tire size is changed (for example from R18 to R20) the Tire Pressure Monitoring System module should be updated with the correct pressure information appropriate to the new wheel and tire set. Update the Tire Pressure Monitoring System module using the manufacturer approved diagnostic system.

As a general guideline, only replace tires in pairs or as a set, and only with tires of equivalent size and specification.

Confirm the symptoms of the customer complaint.

As much information as possible should be gathered from the driver to assist in diagnosing the cause(s).

1. Before a road test, carry out a basic inspection to make sure the vehicle is safe and legal to drive.

Basic inspection

- Correct tire inflation.
REFER to: [Specifications](#) (204-04 Wheels and Tires, Specifications).
- Legal tire tread depth
- Cuts/Bulges in tire sidewall(s)
- Tire ply separation
- Embedded objects
- Wheel rim damage
- Correct tire installation (specification, direction of rotation, etc)
- Any obvious distortion of the tire (flat/high spots)
- Worn/Damaged steering or suspension components

Road test

If the results of the basic inspection are acceptable, carry out a road test to confirm the symptoms.

To reproduce the symptoms, test the vehicle on similar roads to those on which the fault occurs and at similar speeds (provided it is legal to do so).

If the vibration or noise can be reproduced, note the speed at which it occurs and see if it is possible to drive through the symptom, meaning, is it possible to alter the fault by driving faster or slower than the speed at which it occurs?

If it **is** possible, it is likely that the fault is caused by an imbalance in the wheel or tire.

If the vibration or noise gets worse as the vehicle speed increases, it is likely that the fault is caused by distortion in the wheel or tire, or worn or damaged components.

Distortion checks

Check for distortion by raising the vehicle so that the wheels are free and placing an axle stand or similar fixed object next to each wheel in turn.

If the stand is placed at the tread of the tire, the tire can be checked for ovality by turning the wheel by hand and checking for high or low spots where the gap between the tread and the stand increases or reduces.

If the stand is placed next to the wheel rim or tire sidewall, the wheel and tire can be checked for run-out in a similar way.

Wheels and Tires - Tire Low Pressure Sensor

Removal and Installation

Removal

• NOTE: It is strongly recommended that the valve seal and steel washer is replaced each time a tire is changed to avoid a seal failure. The seal and washer must be replaced if the sensor is removed. Removal of the sensor retaining nut must be regarded as sensor removal. The valve cap must always be in place except when inflating, releasing pressure or checking pressure.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** To avoid damage to the tire low pressure sensor, release the tire bead from the rim, 180 degrees from the valve.

Remove the tire from the wheel.

4. CAUTIONS:

-  Do not push on the valve.

-  If the tire low pressure sensor is to be re-installed, a new washer, seal and nut must be installed.

-  If the tire low pressure sensor is to be re-installed, a new washer, seal, nut and silver coloured nickel valve core must be installed.

Remove the tire low pressure sensor.

- Remove the nut.
- Release and withdraw the sensor along the valve axis.

5. If necessary, install a new seal and washer.

- Remove and discard the seal and washer.
- Install a new washer and seal, making sure the valve remains pressed fully onto its seat.

E51446

E51447

Installation

1.  **CAUTION:** Do not use compressed air to clean the sensor. Do not clean the sensor with solvents or cleaning agents of any type, use a clean dry cloth.

Clean the component mating faces.

E51449

2.  CAUTION: Do not apply any lubricant to the new valve.

• NOTE: If the sensor is replaced on a 'running' wheel, the new sensor identification will be learnt when the vehicle is first driven. If a new sensor is fitted to the spare wheel the identification for that sensor must be programmed into the Tire Pressure Monitoring System (TPMS) module using T4. The identification code is provided on a label with the complete assembly and is also printed on the casing of each sensor.

Install the tire low pressure sensor.

- Install and hand tighten the nut whilst keeping the sensor in place.
- Tighten the nut to 6.5 Nm (4.8 lb.ft).

3. Install the tire and balance the wheel.

4. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Wheels and Tires - Tire Pressure Monitoring System (TPMS) Front Antenna

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
3. Remove the tire pressure antenna.
 - Remove the 2 retainers.

E46262

Installation

1. To install, reverse the removal procedure.
2. Initiate a new tire pressure antenna using T4.

Wheels and Tires - Tire Pressure Monitoring System (TPMS) Rear Antenna

Removal and Installation

Removal

1. Remove the fender moulding.
For additional information, refer to: [Rear Quarter Panel Moulding](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).

2. Remove the fender splash shield.
 - Remove the 2 screws.
 - Remove the 6 retainers.
 - Disconnect the electrical connector.

E48478

3. Remove the tire pressure antenna.
 - Remove the 2 retainers.

E48479

Installation

1. To install, reverse the removal procedure.
2. Initiate a new tire pressure antenna using T4.

Vehicle Dynamic Suspension -

Air Suspension - General Specification

Item	Specification
Ride height:	
Off road	55 mm (2.1 in) above standard
Access - reselectable whilst vehicle is moving	50 mm (1.9 in) below standard
Trim height	Configured using T4 plus special tools
Height sensors:	
Location	4 per vehicle - one sensor for each wheel
Height sensor arm colour coding:	
Left hand side, front and rear	WHITE
Right hand side, front and rear	BLACK
Height sensor operating voltages:	
Supply voltage	5 volts - supplied by air suspension ECU
Output voltage	Left hand front and right hand rear - Decreases to 0.5 volts with bump travel. Right hand front and left hand rear - Decreases to 4.5 volts with bump travel
Spring/damper modules:	
Type	Guided air spring surrounding twin tube damper
Pressures:	
Normal - Front	800 to 1000 kPa (8.0 to 10.0 bar) (116.0 to 145.0 lbf/in ²)
Normal - Rear	500 to 800 kPa (5.0 to 8.0 bar) (72.5 to 116.0 lbf/in ²)
Burst pressure	3500 kPa (35 bar) (507.5 lbf/in ²)
Maximum spring pressure - Full bump at gross vehicle weight	Approximately 2700 kPa (27 bar) (391.5 lbf/in ²)
Air compressor:	Supplied with air drier, electrically switched, pilot operated exhaust valve and double temperature sensors
Controlled by	ECU
Maximum pressure	1680 kPa (16.8 bar) (243.6 lbf/in ²)
Air reservoir:	
Volume	9 litres (0.31 cu.ft)
Working pressure	1750 kPa (17.5 bar) (253.75 lbf/in ²)
Maximum operating pressure	2300 kPa (23 bar) (333.5 lbf/in ²)
Reservoir valve block	Incorporates pressure sensor to monitor spring and air reservoir pressures
Valve blocks:	
Front	2 corner valves, 1 cross link valve - all mounted on front bumper armature
Rear	2 corner valves, 1 cross link valve - all mounted on left hand rear spring tower

General Specifications

Item	Specification
Gap between underside of the toe link rubber boot and the chassis bracket	10.0 mm (0.393 in)

Torque Specifications

Description	Nm	lb-ft
Air suspension compressor bolts	10	7
Air suspension compressor lower cover bolts	10	7
Voss connector to the front solenoid valve block	2.5	1.7
Voss connector to the front and rear air springs	3.5	2.6
Voss connector to the rear solenoid valve block	2.5	1.7
Voss connector to the air suspension reservoir	5	4
Voss connector to the air suspension reservoir solenoid valve block	2.5	1.7
Air suspension control module bolt	10	7
Air suspension reservoir bolts	23	17
* Stabilizer bar link nuts	115	85
Toe link bolt	175	129
Toe link inner ball joint retaining nut	133	98
Toe link nut	103	76
Toe link adjustment locking nut	130	96
Lower front arm camber adjusting bolt	275	203
Lower arm rear castor adjusting bolts	275	203
Track rod end locking nuts	53	39
Rear camber adjusting bolts	133	98
Front and rear air spring/shock absorber to the suspension turret nuts	63	46
Front and rear air spring/shock absorber to the lower suspension arm nut and bolt	300	221
* Front and rear air spring/shock absorber top nut	98	72
Heat shield bolts	10	7
* + Halfshaft nut	350	258
Wheel speed sensor bolt	10	7
Brake disc dust shield bolts	10	7
Wheel hub bolts	115	85
* Lower arm ball joint retaining nut	115	85
* Tie-rod end ball joint	76	56
Suspension height sensor Torx bolts	2.2	1.5
Road wheel nuts	140	103

* New nut must be fitted

+ Stake nut on completion of tightening

GENERAL

- NOTE: This section covers the air suspension control system.

Front suspension is detailed in a separate section.

For additional information, refer to: [Front Suspension \(204-01 Front Suspension, Description and Operation\)](#).

Rear suspension is detailed in a separate section.

For additional information, refer to: [Rear Suspension \(204-02 Rear Suspension, Description and Operation\)](#).

Terrain Response™ is detailed in a separate section.

For additional information, refer to: [Ride and Handling Optimization \(204-06 Ride and Handling Optimization, Diagnosis and Testing\)](#).

The dynamic suspension system is a four corner air suspension system which is fitted to higher specification vehicles in place of the conventional damper and coil spring suspension used on non-air suspension models.

The dynamic suspension system is electronically controlled by an air suspension control module which controls the air supply unit, reacts to inputs from four height sensors and distributes air around the system via valve blocks.

The main air suspension system components are:

- Air suspension control module
- Air supply unit
- Four height sensors
- Three valve block assemblies
- Reservoir
- Air harness
- Four suspension air spring damper modules.

The four corner air suspension system maintains the vehicle height under all operating conditions by controlling the mass of air in the air springs. The air suspension control module uses signals from the four height sensors to maintain the correct suspension height. This is achieved by operating pneumatic control valves to increase or decrease the mass of air in the air spring damper modules.

The air suspension system has three driver selectable, pre-determined ride heights. A driver interface indicates the selected ride height and direction of movement. Additional information is also relayed to the driver via the instrument cluster message center (where fitted) and by audible warnings also transmitted by the instrument cluster.

Height changes can only be made when the engine is running and the driver's and passenger doors are closed.

Access height can be selected with the engine not running, within 40 seconds of moving the ignition switch to the off position provided the driver's door has not been opened in this time.

The air suspension can be controlled manually by the driver using a switch on the center console to select the required height change.

Schematic Pneumatic Circuit

25	-	Electric motor

OPERATING MODES

Using the air suspension switch, the driver is able to manually select one of four ride states:

- ON-ROAD - this height is the normal operating height of the vehicle
- OFF-ROAD - this height is higher than the on-road height and provides improved ground clearance, approach, departure and breakover angles
- ACCESS - this height is lower than the on-road height and makes entering and exiting the vehicle easier for the occupants
- CRAWL (Locked at access) - this height allows the vehicle to be driven at the access height at low speeds to provide increased roof clearance in low car parks etc.

• NOTE: Vehicle height changes are prevented if the air suspension control module receives a 'Door Open' signal from the Central Junction Box (CJB).

An additional 'TRANSPORTATION' mode is also available but is only selectable using the Land Rover approved diagnostic equipment.

An additional function allows the vehicle to be raised or lowered from outside of the vehicle when the vehicle is stationary. For example, this may assist with the attachment of a trailer and is achieved using the buttons on the remote handset and the ignition switch in the off position. The remote handset can be programmed to perform a number of additional functions. For additional information, refer to: [Handles, Locks, Latches and Entry Systems](#) (501-14 Handles, Locks, Latches and Entry Systems, Description and Operation).

If the air suspension control module senses that the vehicle has grounded and lost traction, the control module can temporarily increase and/or redistribute the volume of air supplied to the affected air spring(s) to maximize the available traction. This is known as extended mode and will be indicated to the driver by the lamps on the air suspension switch flashing, and messages displayed in the instrument cluster message center.

If the air suspension control module senses that the vehicle is prevented from moving upwards or downwards during a height change or leveling correction, the control module will adopt a safe state and further height changes will be suspended.

If a fault is detected by the air suspension control module, the control module will reduce the system functionality dependent on the type and severity of the fault. The control module will also store a fault code which can be retrieved using the Land Rover approved diagnostic equipment. If a severe fault occurs, the control module will attempt to put the vehicle in a safe condition. A fault is relayed to the driver by the illumination of the air suspension warning indicator, the instrument cluster message center and an audible warning emitted from the instrument cluster.

If the detected fault is minor and does not affect vehicle safety, the air suspension warning indicator in the instrument cluster will illuminate in an amber color and the fault should be rectified at the earliest opportunity. If a more severe fault is detected, the warning indicator will illuminate in a red color above 31 mph (50 km/h) vehicle speed, and the vehicle should be driven with care until the fault is rectified. An audible warning is emitted by the instrument cluster sounder when the warning indicator is illuminated. The indicator will change to an amber color and the audible warning will stop when the vehicle speed is reduced.

Air Suspension Switch Mode Lamps

E45177

Item	Part Number	Description
1	-	Crawl mode lamp
2	-	Access mode lamp
3	-	Lowering lamp
4	-	On-road mode lamp
5	-	Air suspension switch
6	-	Raising lamp
7	-	Off-road mode lamp
8	-	Terrain Response™ rotary control
9	-	Transfer box range switch
10	-	Hill Descent Control (HDC) switch

On-Road Mode

This is the normal ride height for the vehicle.

Off-Road Mode

Off-road mode will only be activated if the vehicle speed is less than 25 mph (40 km/h). The vehicle will be raised 55 mm (2.2 in) higher than the on-road mode to provide additional body clearance and improved approach, departure and breakover angles. If the vehicle speed exceeds 31 mph (50 km/h), the air suspension control module will automatically lower the vehicle to the on-road mode height. At 25 to 28 mph (40 to 45 km/h) a message is displayed in the message center to warn the driver to slow down or the vehicle will lower.

• **NOTE:** The suspension can be automatically set to off-road mode when some Terrain Response programs and low range are selected.

Access Mode

Access mode lowers the vehicle body height by 50 mm (2 in) and provides easier entry, exit and loading of the vehicle. Access mode can be pre-selected when the vehicle is moving. The vehicle will partly lower as the vehicle speed decreases, lowering to the full access mode height when the vehicle reaches 5 mph (8 km/h). If the required road speed is not reached within a predetermined time, the air suspension will return the vehicle to the previously selected height.

Access mode can be selected at any vehicle speed. When access mode is selected, the response of the air suspension system will depend on the vehicle speed:

- If the vehicle speed is more than 12.5 mph (20 km/h), the air suspension control module will wait for up to one minute for the vehicle speed to be reduced. The access mode lamp and the lowering lamp will flash while the air suspension control module waits for the vehicle speed to be reduced, the on-road mode lamp will remain illuminated. If the vehicle speed is not reduced sufficiently, the access mode request will be cancelled after 1 minute.
- If the vehicle speed is less than 12.5 mph (20 km/h), the air suspension control module will lower the suspension to a part lowered height and will remain at this height for up to one minute. The on-road mode lamp will extinguish as the air suspension control module lowers the suspension to the part lowered height. The access mode lamp and the lowering lamp will illuminate. When part lowered is reached, the 'lower' lower lamp will flash. If the vehicle speed is not reduced to less than 5 mph (8 km/h) in the one minute period, the access mode request will be cancelled.
- If the vehicle speed is less than 5 mph (8 km/h), the suspension will be lowered to access mode immediately. The access mode lamp and the lowering lamp will illuminate. When the access mode height is reached, the lowering lamp will be extinguished.

Access height may be selected up to 40 seconds after the ignition is turned off, provided that the driver's door has not been opened within this time.

The suspension will automatically rise from access mode when the vehicle speed exceeds 6.2 mph (10 km/h). If access mode was selected directly from off-road mode then the system will return to off-road mode when the vehicle speed exceeds 6.2 mph (10 km/h). Otherwise the system will lift the suspension to On-road height.

Selecting Access Mode Directly from Off-Road Mode

When the suspension is in off-road mode height, pressing the air suspension switch once and then a second time before the lowering lamp is extinguished, the control module will lower the suspension to access mode height. The control module will remember to return the suspension to off-road height automatically if the vehicle speed increases above 6.2 mph (10 km/h).

Crawl (Locked at Access) Mode

Crawl mode allows the vehicle to be driven at access height. The vehicle is locked in access height and can be selected at a speed of less than 21.7 mph (35 km/h) and can be driven at low speeds to improve clearance in areas with restricted headroom, i.e. car parks. If the vehicle exceeds 24.8 mph (40 km/h), crawl mode will be cancelled and the vehicle will return to on-road height.

Crawl mode allows the vehicle to be driven at low speeds with the suspension locked at the access mode height. This allows the vehicle to be driven in low car parks etc. with increased roof clearance.

Crawl mode can be selected from Normal or Access ride heights up to 21.7 mph (35 km/h), with a long press of the switch in the down direction. The access mode lamp and the crawl mode lamp will be illuminated. When the control module is in crawl mode, on-road mode height will be selected automatically if the vehicle speed exceeds 25 mph (40 km/h). At 18.6 to 21.7 mph (30 to 35 km/h) a message is displayed in the message center to warn the driver to slow down or the vehicle will raise. Crawl mode can also be manually cancelled by moving the switch in the up direction for 1 second. The crawl mode lamp will be extinguished.

Automatic Height Change Warnings

When the suspension is in off-road mode, access mode or crawl mode height, the air suspension control module will change the suspension height automatically when the vehicle speed exceeds predetermined thresholds.

When the suspension is at off-road mode or crawl mode height, the control module issues a warning to advise the driver that the vehicle is approaching the speed threshold. The instrument cluster sounder will emit a chime, a message will be displayed in the message center and the on-road mode lamp and either the raising or lowering lamp will flash.

The off-road mode or crawl mode height speed warning is removed when the vehicle speed is reduced.

SPECIAL MODES

Door Open Functionality

If one or more of the vehicle doors are opened during a height change when the vehicle is stationary, the air suspension control module will restrict further height change. The door open signal is transmitted by the CJB on the high speed CAN bus and received by the air suspension control module. This keeps the vehicle level to the set height when a door opens to allow for changes in loading conditions.

A hardwired door status signal is also transmitted from the CJB to the air suspension control module. This signal provides door status information when the high speed CAN bus is off, i.e.; during periodic re-leveling.

The lamp on the air suspension switch for the target mode height will remain illuminated and the raising or lowering lamp will

flash.

If all of the doors are closed within 90 seconds, the height change will resume. If the 90 second period is exceeded and all of the doors are not closed, the height change will be cancelled. The mode lamps showing the previously selected height and the target height will be illuminated. The mode height change can be reselected by operating the switch, however, if the vehicle is driven at speed of more than 5 mph (8 km/h) the control module will continue to raise or lower the vehicle to the target mode height.

Extended Mode

If the vehicle becomes grounded and the traction control becomes operational, the air suspension control module automatically increases the mass of air in the air springs to raise the vehicle clear of the obstruction. Extended mode is activated automatically and cannot be selected manually.

When the air suspension control module has activated the extended mode, the off-road mode lamp will flash if the suspension is above off-road mode height. The off-road mode and on-road mode lamps will flash if the suspension is between off-road mode and on-road mode heights. The on-road mode and access mode lamps will flash if the suspension is between on-road mode and access mode. A message will also be displayed in the message center.

To exit the extended mode, press the air suspension switch briefly in the up or down position or drive the vehicle at a speed of more than 2 mph (3 km/h) for 45 seconds.

Additional Lift in Extended Mode

In later software a feature is available to provide additional body clearance when in extended mode. When extended mode has been invoked and the automatic lifting of the vehicle is complete, the driver can request an additional lift of the vehicle. This can be particularly useful when extended mode has to be activated on soft surfaces.

The additional lift can be requested once the raising lamp has extinguished. Press and hold the switch in the up direction for 3 seconds whilst simultaneously depressing the brake pedal. A chime from the instrument cluster will sound to confirm that the request has been accepted. The raising symbol will be illuminated while the vehicle is being lifted.

Suspension Prevented From Moving

If the air suspension control module is attempting to change the suspension height and it detects that the suspension is prevented from moving, the control module will stop all suspension movement. This can be caused by jacking the vehicle, attempting to lower the vehicle onto an object or raising the vehicle against an obstruction.

The air suspension switch lamps operate as described for extended mode and the same message is displayed in the message center. To start the air suspension system operating, press the air suspension switch briefly in the up or down position, or drive the vehicle at a speed of more than 2 mph (3 km/h) for 45 seconds.

High Speed Mode

In later software a high speed mode is introduced. High speed mode is a non-selectable, automatic mode which lowers the vehicle height by 20 mm to improve vehicle handling. This feature is fully automated and is 'invisible' to the driver.

If the vehicle speed exceeds 100 mph (160 km/h) for more than 5 seconds, the air suspension control module initiates the high speed mode. When the vehicle speed reduces to less than 80 mph (130 km/h) for more than 30 seconds, the vehicle returns to 'on-road' height. This function is cancelled if a trailer is connected to the trailer socket.

Periodic Re-leveling

When the vehicle is parked, the air suspension control module 'wakes up' two hours after the ignition was last switched off and then once every six hours. The vehicle height is checked and if the vehicle is not level within a pre-set tolerance, small downwards height adjustments may be made automatically.

Transportation Mode

Transportation mode is a factory set mode which locks the suspension to enable the vehicle to be safely lashed to a transporter. Transportation mode can only be selected or deselected using the Land Rover approved diagnostic equipment.

When the ignition switch is switched off, the vehicle will be lowered onto the bump stops. This ensures that the securing straps do not become loose should air leak from the air springs.

When the engine is running, the air supply unit will operate to raise the vehicle height, allowing the vehicle to be loaded. When the ignition switch is subsequently switched off, the vehicle will again lower onto the bump stops. An audible warning will be emitted from the instrument cluster sounder until the vehicle has reached the higher transportation height.

AIR SUSPENSION CONTROL MODULE

E45176

Item	Part Number	Description
1	-	Air suspension control module
2	-	Connector C2321
3	-	Connector C2320
4	-	Connector C2030
5	-	Connector C0867

The air suspension control module is located behind the instrument panel, on the driver's side 'A' pillar. The control module is attached to the 'A' pillar with a single screw and two plastic clips.

Calibration

A calibration routine is performed using the Land Rover approved diagnostic equipment to access the position of each corner of the vehicle, and record the settings in the ECU memory. Once set, the calibration is not required to be performed unless the air suspension control module is removed or replaced, a height sensor is removed or replaced or a suspension arm to which the sensor is connected is removed or replaced. If the removed height sensor is subsequently refitted, the calibration procedure will have to be performed to ensure the integrity of the system.

If the air supply unit, the reservoir, a valve block, a damper module or the air harness is removed or replaced, the system will not require recalibration.

Inputs and Outputs

The air suspension control module uses four harness connectors for all inputs and outputs.

The air suspension control module uses inputs received on the CAN bus from other vehicle systems. The system uses longitudinal acceleration, lateral acceleration, steering angle and wheel speed data to control the suspension operation in differing driving conditions.

The system will react differently if one or more of these data inputs is missing or incorrect, for example, if the steering angle sensor is missing or incorrect, the air suspension control module assumes a default value of zero which may result in some unnecessary leveling activity.

Air Supply Unit Relay

The air supply unit relay is located in the battery junction box in the engine compartment. The relay is connected directly to the battery via fusible link 10E (60A). The relay coil is connected to and controlled by the air suspension control module. The relay is used by the air suspension control module to control the operation of the compressor.

When air supply unit operation is required, the air suspension control module supplies power and ground for the relay coil which energizes, closing the relay contacts. This allows battery voltage via the fusible link to pass through the relay and operate the air supply unit electric motor and the compressor.

The battery voltage is also passed from the relay, via a splice joint in the harness, to the air suspension control module and is used as a signal that the relay is operating.

System Inhibits

A number of conditions exist where a change of ride height is undesirable. To counter this, the air suspension control module is programmed with a number of system inhibits. If any of the conditions detailed below exist, the air suspension control module will suspend height changes and height corrections.

Compressor

The temperature sensors located within the compressor protect the compressor from overheating. If the compressor temperature rises above set limits, the air suspension control module will inhibit the compressor operation. These limits are shown in the following table:

Compressor Head Temperature Sensor

	Lifting	Filling Reservoir
Stop	140°C (284°F)	130°C (266°F)
Start	120°C (248°F)	110°C (230°F)

Compressor Brush Temperature Sensor

	Lifting	Filling Reservoir
Stop	140°C (284°F)	130°C (266°F)
Start	120°C (248°F)	110°C (230°F)

Cornering

If the air suspension control module registers a cornering force greater than 0.2g it will inhibit all height changes and corrections. The system will remain inhibited until the cornering force falls to less than 0.15g. The air suspension control module receives a message from the lateral acceleration sensor (which is an integral part of the ABS yaw rate sensor) on the high speed CAN bus for the cornering force.

Rapid Acceleration

If the air suspension control module registers a rapid acceleration greater than 0.2g it will inhibit all height changes and corrections. The system will remain inhibited until the rapid acceleration falls to less than 0.15g. Acceleration is calculated by the air suspension control module from a vehicle speed signal received via the high speed CAN bus.

Rapid Deceleration

If the air suspension control module registers a rapid deceleration smaller than -0.2g it will inhibit all height changes and corrections. The system will remain inhibited until the rapid deceleration rises above -0.15g. Deceleration is calculated by the air suspension control module from a vehicle speed signal received via the high speed CAN bus.

Vehicle Jack

The air suspension control module will inhibit all height changes and corrections if it detects a corner lowering too slowly for more than 1.2 seconds. This is interpreted as the corner identified as moving too slowly being supported on a jack. In this situation, the corner height will not change when air is released from the air spring because the jack acts as a mechanical prop. The system will remain inhibited until any of the following conditions exist:

- The air suspension switch is moved to the up or down position
- Vehicle speed rises to more than 2 mph (3 km/h) for more than 45 seconds.

Door Open

The air suspension control module will stop all height change requests while any of the doors are open. Vehicle leveling continues with a door open by keeping the vehicle at the height when the door was opened if the vehicle load changes.

Diagnostics

The air suspension control module can store fault codes which can be retrieved using the Land Rover approved diagnostic equipment. The diagnostic information is obtained via the diagnostic socket which is located in the lower instrument panel closing panel, on the driver's side, below the steering column.

The diagnostic socket allows the exchange of information between the various control modules on the bus systems, and the Land Rover approved diagnostic equipment. This allows the fast retrieval of diagnostic information and programming of certain functions using the Land Rover approved diagnostic equipment.

Fault Detection

The air suspension control module performs fault detection and plausibility checks. Fault detection is limited to faults that the control module can directly measure as follows:

- Sensor electrical hardware faults
- Valve electrical hardware faults
- Sensor and actuator supply faults
- Bus failures
- Control module hardware errors.

Plausibility checks are checks on signal behavior, as follows:

- Average height does not change correctly
 - Height changes too slowly
- Gallery pressure
 - Does not increase fast enough when reservoir filling requested
 - Increases when system is inactive
 - Too low when lifting is requested
 - Increases too rapidly when filling reservoir
 - Does not decrease when gallery is vented
 - Pressure varies too much when inactive.
- Compressor temperature
 - Sensor voltage too large - head and brush sensors (short circuit to battery)
 - Takes too long to be readable after suitable compressor run time - head and brush sensors
 - Does not increase when compressor active - head sensor only
- Sensor activity
 - Signal floating
 - Constant articulation when moving

When a fault is detected, the air suspension control module will attempt to maintain a comfortable ride quality and where possible will retain as much functionality as possible.

The system functionality depends on the severity of the fault.

Faults

Faults are categorized into order of severity and effect on the system as follows (with 1. being a minor fault and 5. being a major fault):

- Height sensor faults (hardware faults) and reservoir valve block failure
 - Retain full functionality with no 'refinements', e.g. cross-link valves inoperative, no compensation for uneven surfaces.
- Pressure sensor faults, compressor faults, corner valves stuck shut
 - Road speed signal not available
 - Vehicle returns to on-road mode height when next requested

- Levels at 'current' height.
- Reservoir valve stuck open, exhaust valve stuck shut if below on-road mode height, corner valves stuck open if above on-road mode height
 - Vehicle returns to on-road mode height when next requested
 - Does not level at 'current' height.
- Failure of multiple height sensors, cross-articulation when driving, calibration corrupted
 - Vehicle lowers to bump stops.
- ABS module failure, CAN bus failure
 - If the air suspension control module loses communications with the ABS module or the ABS module reports a fault, the air suspension control module immediately returns to the 'default' height, which is below the on-road ride height. Once at the default height, the control module will continue to level the vehicle at this height. It is unlikely that the fault will be in the air suspension control module. When the fault is repaired, the air suspension control module will resume full functionality but the error will remain in the control module memory.

For major faults the control module will not level the vehicle at the 'current' ride height. The control module freezes height changes until it receives a manual or automatic request for height change. The control module will return to standard height if possible and freezes once standard height is achieved.

If the suspension is above the on-road height and the air suspension control module cannot lower the suspension, all height changes will be frozen. The control module will issue a message on the high speed CAN bus which is received by the instrument cluster which displays a maximum advisable speed in the message center. An immediate 'freeze' of the vehicle height is caused by the following:

- Failure of more than one height sensor - vehicle on bump stops
- Implausible articulation symptoms detected - vehicle on bump stops
- Valve or solenoid failure - corner valve stuck open below on-road mode height or exhaust valve stuck shut above on-road mode height
- Stuck corner or whole vehicle (diagnosed using plausibility of the sensor inputs).

If height change is not possible, e.g. exhaust valve failed closed at off-road height or compressor failed at access height, the control module will not level or change height.

If the air suspension control module has a hardware fault, the control module will disable all air suspension functions. Detectable hardware errors include memory error, control module failure, calibrations errors.

Fault Messages

The air suspension has two methods which it can use to inform the driver of a fault in the air suspension system; the air suspension switch LED's and the instrument cluster message center.

When minor faults occur and the air suspension control module is able to level the vehicle to the 'current' ride height, the air suspension switch LED's will display the current ride height.

If the air suspension control module suffers a major failure and there is no air suspension control, all the control switch LED's will remain off.

If a fault occurs and the air suspension control module can determine the ride height and the vehicle is not above on-road mode height, the driver will be notified via an 'air suspension fault max speed 30 mph (50 km/h)' message, displayed in the message center.

If the control module cannot determine the height of the vehicle, or the vehicle is above on-road mode height, cannot be lowered and the vehicle speed is too high, an air suspension fault message is displayed.

If the vehicle is restricted to on-road mode height an air suspension fault normal height only message is displayed.

AIR SUSPENSION SWITCH

E45177

Item	Part Number	Description
1	-	Crawl mode lamp
2	-	Access mode lamp
3	-	Lowering lamp
4	-	On-road mode lamp
5	-	Air suspension switch
6	-	Raising lamp
7	-	Off-road mode lamp
8	-	Terrain Response™ rotary control
9	-	Transfer box range switch
10	-	Hill Descent Control (HDC) switch

The air suspension control switch is located in the center console, behind the manual or automatic transmission selector lever. The switch is a three position, non-latching switch which allows selection of the following driver selectable modes:

- Off-road mode
- On-road mode
- Access mode
- Crawl (locked at access) mode.

The air suspension switch can be moved forwards or backwards from its central position. The switch is non-latching and returns to the central position when released. The switch completes an earth path to the air suspension control module when operated. This earth path is completed on separate wires for the raise and lower switch positions, allowing the control module to determine which selection the driver has made.

The switch has six symbols which illuminate to show the current selected height and the direction of movement. The raise and lower symbols will flash and a warning tone will be emitted from the instrument cluster sounder when a requested height change is not allowed, i.e. vehicle speed too fast.

A flashing symbol indicates that the air suspension system is in a waiting state or that the system will override the driver's selection because the speed threshold is too high.

The driver can also ignore the system's warnings signals and allow the height to change automatically. For example, increasing the vehicle speed to more than 25 mph (40 km/h) will cause the control module to automatically change the ride height from off-road mode to on-road mode.

FRONT AND REAR AXLE VALVE BLOCKS

E45178

Item	Part Number	Description
1	-	Isolation rubber mounts (3 off)
2	-	Location slots
3	-	Front valve block, valves and solenoid assembly
4	-	Front bumper armature
5	-	Electrical connector
6	-	LH air spring damper module air harness connection
7	-	Air inlet/outlet connection
8	-	RH air spring damper module air harness connection
9	-	Rear valve block, valves and solenoid assembly
10	-	RH air spring damper module air harness connection
11	-	Air inlet/outlet connection
12	-	LH air spring damper module air harness connection
13	-	Rear suspension turret

The front and rear axle valve blocks are similar in their design and construction and control the air supply and distribution to the front or rear pairs of air spring damper modules respectively. The difference between the two valves is the connections from the valve block to the left and right hand air spring damper modules and the valve size. It is important that the correct valve block is fitted to the correct axle. Fitting the incorrect valve block will not stop the air suspension system from functioning but will result in slow raise and lower times and uneven raising and lowering between the front and rear axles.

The front valve block is attached to the right hand end of the front bumper armature assembly. The valve block has three attachment lugs which are fitted with isolation rubber mounts. The rubber mounts locate in slots in the armature. The valve lugs locate in the holes above the slots and are pushed downwards into positive location in the slots.

The rear valve block is located on the forward face of the left hand rear suspension turret. The valve block has three attachment lugs which are fitted with isolation rubber mounts which locate in a bracket with three slotted holes. The bracket is attached to the left hand side of the chassis. The isolation rubber mounts locate in the 'V' shaped slots and are pushed downwards into positive location in the slots.

The front and rear valve blocks each have three air pipe connections which use 'Voss' type air fittings. One connection is an air pressure inlet/outlet from the reservoir valve block. The remaining two connections provide the pressure connections to the left and right hand air springs.

Each valve block contains three solenoid operated valves; two corner valves and one cross-link valve. Each of the valve solenoids is individually controlled by the air suspension control module. The solenoids have a resistance value of 2 Ohms at a temperature of 20°C (68°F).

Corner Valves

The corner valves control the flow of air into and out of the individual air springs. When the solenoid is de-energized, the corner valves are held in a closed position by internal springs. When the solenoid is energized, the valve armature moves and allows air to flow into or out of the air spring.

Cross Link Valves

The cross-link valve provides a connection between the two air springs on the same axle. When de-energized, the cross-link valve prevents air passing from one air spring to another. When the solenoid is energized, the valve spool moves and allows air to pass from one air spring to the other. This increases wheel articulation and improves ride comfort at low vehicle speeds.

RESERVOIR VALVE BLOCK

E45179

Item	Part Number	Description
1	-	Chassis mounting bracket
2	-	Location slot
3	-	Isolation rubber mounts (3 off)
4	-	Electrical connector
5	-	Reservoir valve block, valves and solenoid assembly
6	-	Reservoir connection
7	-	Rear valve block connection
8	-	Front valve block connection
9	-	Air supply unit connection
10	-	Pressure sensor

The reservoir valve block controls the storage and distribution of air from the reservoir. The reservoir valve block also contains the system pressure sensor.

The reservoir valve block is attached to a bracket on the outside of the left hand chassis rail, between the reservoir and the air supply unit. The valve block is located within the air supply unit acoustic box to protect it from dirt ingress and damage from stones. The valve block has three attachment lugs which are fitted with isolation rubber mounts which locate in the chassis bracket which has three slotted holes. The isolation rubber mounts locate in the 'V' shaped slots and are pushed downwards into positive location in the slots.

The valve block has four air pipe connections which use 'Voss' type air fittings. The connections provide for air supply from the air supply unit, air supply to and from the reservoir and air supply to and from the front and rear valve blocks. The connections from the air supply unit and the front and rear control valves are all connected via a common gallery within the valve and therefore are all subject to the same air pressures.

The valve block contains a solenoid operated valve which is controlled by the air suspension control module. The solenoid valve controls the pressure supply to and from the reservoir. The solenoid has a resistance value of 2 Ohms at a temperature of 20°C (68°F). When energized, the valve spool moves allowing air to pass to or from the reservoir.

The valve block also contains a pressure sensor which can be used to measure the system air pressure in the air springs and the reservoir. The pressure sensor is connected via a harness connector to the air suspension control module. The control module provides a 5V reference voltage to the pressure sensor and monitors the return signal voltage from the sensor.

Using this sensor, the control module controls the air supply unit operation and therefore limits the nominal system operating pressure to 244 lbf/in² (16.8 bar gage).

AIR SUPPLY UNIT

E45180

Item	Part Number	Description
1	-	Mounting bracket
2	-	Air dryer
3	-	Pilot exhaust valve solenoid and temperature sensors harness connector
4	-	Motor harness connector
5	-	Intake port
6	-	Pilot exhaust valve
7	-	Exhaust valve
8	-	Isolation mounting rubber (2 off)
9	-	Electric motor
10	-	Isolation mounting rubber (1 off)
11	-	Pilot air pipe
12	-	High pressure supply to air suspension system
13	-	Compressor cylinder head temperature sensor
14	-	Compressor

The air supply unit is located on the outside of the left hand chassis rail, forward of the upper control arm. The unit is attached to the chassis rail with three bolts and is protected by an acoustic box.

Item	Part Number	Description
1	-	Upper cover
2	-	Lower cover
3	-	Air supply unit
4	-	Reservoir valve block

The acoustic box, which comprises of two parts: upper and lower, surrounds the air supply unit. The acoustic box is a plastic molding which is lined with an insulating foam which controls the operating noise of the air supply unit. The reservoir valve block is also located in the acoustic box, forward of the air supply unit.

The air supply unit comprises the following major components:

- A piston compressor
- A 12V electric motor
- A solenoid operated pilot valve
- An exhaust valve
- An air dryer unit

The air supply unit can be serviced in the event of component failure, but is limited to the following components; air dryer, pilot exhaust pipe and the rubber mounts.

The air supply unit is attached to a bracket which is bolted to the chassis. The unit is mounted to the bracket with flexible isolation mounting rubbers which assist with preventing operating noise being transmitted to the chassis.

Removal of the air supply unit does not require the whole air suspension system to be depressurized. The front and rear valve blocks and the reservoir valve block are normally closed when de-energized, preventing air pressure in the air springs and the reservoir escaping when the unit is disconnected.

There are a number of conditions that will inhibit operation of the air supply unit. It is vitally important that these system inhibits are not confused with a system malfunction. A full list of air supply unit inhibits are given in the air suspension control module section in this chapter.

Pilot Exhaust Valve

A solenoid operated pilot exhaust valve is connected to the air delivery gallery, downstream of the air dryer. The pilot valve, when opened, operates the main compressor exhaust valve. This allows the air springs to be deflated when required.

When the solenoid is energized, pilot air moves the exhaust valve plunger, allowing pressurized air from the air springs and/or reservoir to pass via the reservoir control valve to the air supply unit.

The solenoid has a resistance value of 4 Ohms at a temperature of 20°C (68°F).

Exhaust Valve

The exhaust valve has three functions. It operates in conjunction with the pilot exhaust valve to allow air to be exhausted from the air springs and/or the reservoir as described previously.

The valve also protects the system from over-pressure. The valve is connected into the main pressure gallery which is always subject to the system pressure available in either the air springs or the reservoir. The valve is controlled by a spring which restricts the maximum operating pressure to between 333.5 to 370 lbf/in² (23.0 to 25.5 bar).

The minimum pressure in the system is also controlled by the exhaust valve to ensure that, even when deflated, the air springs contain a positive pressure of approximately 14.5 lbf/in² (1 bar gage) with respect to atmosphere. This protects the air spring by ensuring it can still 'roll' over the piston without creasing.

Electric Motor

The electric motor is a 12V dc motor with a nominal operating voltage of 13.5V. The motor drives a crank which has an eccentric pin to which the compressor connecting rod is attached.

The motor is fitted with a temperature sensor on the brush PCB assembly. The sensor is connected to the air suspension control module which monitors the temperature and can suspend motor operation if an overheat condition occurs.

Compressor

The compressor comprises a motor driven connecting rod and piston which operate in a cylinder with a cylinder head. The motor rotates the crank moving the piston up and down in the cylinder bore. The air in the cylinder is compressed with the up stroke and is passed via delivery valve, through the air dryer into the system.

Air Dryer

The air dryer is an integral part of the air supply unit. The air dryer contains a desiccant which absorbs moisture. Pressurized air is passed through the air dryer which removes any moisture in the compressed air before it is passed to the reservoir and/or the system

When the air is exhausted from the system, the returning air is passed through the air dryer, regenerating the air dryer by removing moisture from the desiccant and expelling it to atmosphere via the exhaust.

The air dryer is an essential component in the system ensuring that only dry air is present in the system. If moist air is present in the system, freezing can occur, resulting in poor system operation or component malfunction/failure.

AIR RESERVOIR

E45182

Item	Part Number	Description
1	-	Front bracket
2	-	Reservoir
3	-	Air hose connection to reservoir valve block
4	-	Rear bracket

The reservoir is an air storage vessel which provides fast air suspension lift times by the immediate availability of pressurized air into the system.

The reservoir is a steel fabrication and is located on the outside of the left hand chassis rail, in front of the air supply unit. The reservoir has a bracket at each end which attach to the body mounting brackets on the chassis.

The rearward end of the reservoir has a 'Voss' air fitting which provides for the connection of the air hose between the reservoir and the reservoir valve block.

The reservoir has a capacity of 550 in³ (9 liters). The nominal working pressure of the reservoir is 243.6 lbf/in² (16.8 bar gage), with a maximum pressure of 333.5 lbf/in² (23 bar gage).

HEIGHT SENSORS

Front Height Sensor

E83612

Item	Part Number	Description
1	-	Sensor body
2	-	Electrical connector
3	-	Lever arm
4	-	Drop link

Rear Height Sensor

E45184

Item	Part Number	Description
1	-	Drop link
2	-	Electrical connector
3	-	Sensor body
4	-	Lever arm

A height sensor is fitted in each corner of the vehicle to monitor the ride height of the vehicle. The sensor bodies are attached with screws to brackets on the chassis rails.

Each sensor comprises a sensor body which contains a single track rotary potentiometer, a lever arm and a drop link.

The sensor lever arm has a drop link which provides the connection between the sensor and the suspension control arm. The drop link is a serviceable component and is a push fit to the lever arm and the suspension control arm.

The sensors are connected via their harness connector to the air suspension control module which receives the signal output from each sensor and, using preprogrammed information, converts the signal to a height for each sensor position.

The front and rear sensors are handed and are colored coded for identification as follows:

- Right hand front and rear - black colored lever
- Left hand front and rear - white colored lever.

Calibration

A calibration routine is performed using the Land Rover approved diagnostic equipment to read the position of each corner of the vehicle, and record the settings in the ECU memory. Once set, the calibration is not required to be performed unless the air suspension control module is removed or replaced, a height sensor is removed or replaced or a suspension arm to which the sensor is connected is removed or replaced. If the removed height sensor is subsequently refitted, the calibration procedure will have to be performed to ensure the integrity of the system.

If a replacement drop link is fitted, recalibration is not required providing the sensor body is not removed from its mounting bracket.

AIR SILENCER AND INLET AIR FILTER

E45185

Item	Part Number	Description
1	-	Exhaust (to atmosphere)
2	-	Inlet and exhaust silencer
3	-	Air inlet filter
4	-	Exhaust air from air supply unit
5	-	Air inlet supply to air supply unit

The air silencer is required to limit any noise produced from the air supply unit during inflation or deflation of the air springs.

The silencer comprises two plastic molded cans bonded together and contains two blocks of silencing foam. A pipe connection is molded onto each end of the silencer and provide for the attachment of the exhaust air to atmosphere pipe and the exhaust air pipe from the air supply unit.

A secondary chamber, located around the outside of the exhaust chamber forms the silencer for the inlet air. Pipe connections are molded onto each end of the intake silencer and provide for the attachment of the air inlet pipe from the inlet air filter and the air inlet pipe to the air supply unit. The intake air silencer is a hollow chamber with no noise reduction foam filling.

The air intake filter is connected via a pipe to the intake silencer chamber of the air silencer unit. The filter is located in the rear left hand corner of the body, away from possible sources of dirt and moisture.

The filter contains a foam element which removes particulate matter from the inlet air before it reaches the silencer or the air supply unit.

AIR HARNESS

E48418

Item	Part Number	Description
1	-	Front axle valve block
2	-	Pipe - Front axle valve block to front RH air spring damper module
3	-	Front RH air spring damper module
4	-	Front LH air spring damper module
5	-	Pipe - Reservoir valve block to front axle valve block
6	-	Pipe - Reservoir valve block to reservoir
7	-	Pipe - Exhaust
8	-	Rear RH air spring damper module
9	-	Pipe - Rear axle valve block to rear RH air spring damper module
10	-	Air silencer assembly
11	-	Air inlet filter
12	-	Pipe - Main inlet
13	-	Rear LH air spring damper module
14	-	Rear axle valve block
15	-	Pipe - Reservoir valve block to rear axle valve block
16	-	Pipe - Compressor inlet
17	-	Pipe - Compressor exhaust
18	-	Air supply unit
19	-	Pipe - Air supply unit to reservoir valve block
20	-	Reservoir valve block
21	-	Reservoir
22	-	Pipe - Front axle valve block to front LH air spring damper module

The air harness comprises ten separate nylon pipes which are connected between the system components with Voss connectors. The pipes have the following diameters:

Pipe	Diameter
High pressure pipes	6 mm
Compressor inlet pipe	8 mm
Inlet filter to silencer	8 mm
Compressor exhaust pipe	10 mm
Silencer exhaust pipe	19 mm

If a pipe becomes damaged, an in-line connector is available for repair purposes. The pipes are secured to the body and the chassis with a number of plastic clips.

CONTROL DIAGRAM

Vehicle Dynamic Suspension - Vehicle Dynamic Suspension

Diagnosis and Testing

Principle of Operation

For a detailed description of the Vehicle Dynamic Suspension System and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Vehicle Dynamic Suspension](#) (204-05 Vehicle Dynamic Suspension, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Air leakage ● Air springs ● Reservoir ● Compressor ● Compressor air filter ● Pipework and unions ● Sensor installation ● Valve block(s) ● Suspension components 	<ul style="list-style-type: none"> ● Battery ● Fuse(s) ● Wiring harness physical damage or water ingress ● Loose or corroded electrical connectors ● Air suspension control switch ● Controller Area Network (CAN) circuits ● Sensors ● Actuators ● Valve block(s) ● Air suspension control module

3. 3. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the symptom chart.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Message	Possible Other Warnings	Possible Causes	Action
Vehicle on bump stops	<ul style="list-style-type: none"> ● Suspension fault 	<ul style="list-style-type: none"> ● Two chimes repeated regularly Red indicator permanently illuminated 	<ul style="list-style-type: none"> ● Water ingress to wiring harness or connectors ● Air leak(s) ● Vehicle in transportation mode ● System not calibrated or calibration corrupt ● Implausible articulation symptoms detected ● Failure of multiple height sensors ● Air suspension control module failure 	Visually inspect the wiring harness and connectors for water ingress. Visually inspect the system for air leakage. Check the system mode and calibration using the approved diagnostic system. Check for implausible articulation symptoms, i.e. height sensor or linkage fault, deflated air spring, under inflated tire etc. Note implausible articulation symptoms may be caused by an un-calibrated height sensor. Check for height sensor DTCs and refer to the DTC index. Refer to the warranty policy and procedures manual if a module is suspect.
Vehicle does not sit level	<ul style="list-style-type: none"> ● Suspension fault 	<ul style="list-style-type: none"> ● Two chimes repeated regularly Red indicator permanently illuminated 	<ul style="list-style-type: none"> ● Water ingress to wiring harness or connectors ● Air leak(s) ● Calibration corrupt ● cross-link valve fault ● Height sensor fault ● Reservoir valve stuck open ● Exhaust valve stuck closed ● Corner valves stuck open ● Air suspension control module failure 	Visually inspect the wiring harness and connectors for water ingress. Visually inspect the system for air leakage and refer to the guided diagnostic routine on the approved diagnostic system. Check the system calibration using the approved diagnostic system. For front and rear cross link valve tests refer to the guided diagnostic routine on the approved diagnostic system. Check for height sensor DTCs and refer to the DTC index. For reservoir and exhaust valve tests refer to the guided diagnostic routine on the approved diagnostic system. Check for corner valve

Symptom	Possible Message	Possible Other Warnings	Possible Causes	Action
				DTCs and refer to the DTC index. Refer to the warranty policy and procedures manual if a module is suspect.
Vehicle sits too low	<ul style="list-style-type: none"> ● Suspension fault ● Hill descent control (HDC) fault, system not available ● Dynamic stability control (DSC) 	<ul style="list-style-type: none"> ● Two chimes, amber indicator permanently illuminated ● One chime ● DSC amber indicator permanently illuminated ● ABS indicator permanently illuminated 	<ul style="list-style-type: none"> ● Water ingress to wiring harness or connectors ● Air leak(s) ● Air suspension compressor temperature sensor fault ● Inlet air filter blockage/restriction ● Air suspension compressor fault ● Exhaust valve stuck/sticking ● Air suspension control module lost communication with ABS module ● ABS fault. ● Air suspension control module failure 	Visually inspect the wiring harness and connectors for water ingress. Visually inspect the system for air leakage. For air compressor temperature sensor, inlet air filter, exhaust valve and air compressor tests refer to the guided diagnostic routine on the approved diagnostic system. For Air suspension control module lost communication with ABS module, refer to the lost communication codes statement at the end of this table. Check for ABS DTCs, Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.
Vehicle sits too high	<ul style="list-style-type: none"> ● Suspension fault 	<ul style="list-style-type: none"> ● Two chimes, amber indicator permanently illuminated 	<ul style="list-style-type: none"> ● Reservoir valve stuck open ● Exhaust valve stuck closed ● Corner valves stuck open ● Air suspension control module failure 	For reservoir valve and exhaust valve tests refer to the guided diagnostic routine on the approved diagnostic system. Check for corner valve DTCs and refer to the DTC index. Refer to the warranty policy and procedures manual if a module is suspect.
System detects extended mode unnecessarily when lowering	<ul style="list-style-type: none"> ● - 	<ul style="list-style-type: none"> ● - 	<ul style="list-style-type: none"> ● Crossed gallery and air spring pipes ● Incorrect valve block installed to front or rear ● Damage or blockage in air harness 	Refer to the guided diagnostic routine on the approved diagnostic system.
Vehicle leans/tilts after being left over-night or for some days	<ul style="list-style-type: none"> ● - 	<ul style="list-style-type: none"> ● - 	<ul style="list-style-type: none"> ● Leaking air spring(s) ● Leak from corner valve to gallery ● Exhaust valve stuck open 	Refer to the guided diagnostic routine on the approved diagnostic system.
After vehicle left over-night or for some days system regularly indicates "Suspension vehicle raising slowly" when first driving off	<ul style="list-style-type: none"> ● Suspension vehicle raising slowly 	<ul style="list-style-type: none"> ● - 	<ul style="list-style-type: none"> ● Leaking air spring(s) ● Leaking reservoir 	Refer to the guided diagnostic routine on the approved diagnostic system.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Air Suspension Control Module \(RLM\)](#) (100-00 General Information, Description and Operation).

Air Suspension Deflation Exit Routine

1. Key on, engine off.
2. Key off.
3. Press and release raise switch.
4. Press and release lower switch.
5. Key on, engine off.
6. Key on, engine running.
7. Press and release raise switch twice.

8. **8.** Press and release lower switch twice.

9. **9.** Press and release raise switch.

Vehicle Dynamic Suspension - Air Suspension System Depressurize and Pressurize

General Procedures

• WARNINGS:

A small amount of air pressure will be left in the air suspension system.

Eye protection must be worn.

Wear protective gloves.

• CAUTIONS:

Make sure tailgate, hood and all doors are closed.

Make sure the vehicle is in a clear working area.

1.  **WARNING:** The air suspension system is pressurised up to 16.8 bar (244 lbf/in²). Make sure no dirt or grease enters the system. Always wear hand, eye and ear safety standard protection when working on the system.

Using T4, depressurize the air suspension.

2. Using T4, pressurize the air suspension.

- Start and run the engine.

Vehicle Dynamic Suspension - Ride Height Adjustments

General Procedures

Special Tool(s)	
 <p>204-557B</p> <p>E95131</p>	<p>Gauge, Ride height</p> <p>204-557B</p>

• CAUTIONS:

 Make sure the wheels and tires, tie rod ends, suspension joints and wheel bearings are free from damage, wear and free play.

 Make sure there are no heavy objects in the vehicle.

 The ride height must be measured with the vehicle weight supported by the suspension.

 With the engine running and all vehicle doors closed, make sure the air suspension is functioning and the vehicle height can be raised and lowered using the air suspension switch.

 Drive the vehicle on to a flat, level surface.

 Make sure the steering wheel is in the straight ahead position.

• NOTE: This procedure must be carried out after replacement of the air suspension control module, removal or replacement of a height sensor, removal or replacement of the front or rear suspension arms, replacement of body panels incorporating suspension fixing points.

1.  CAUTION: Make sure the vehicle is not moved once it has been positioned to take measurements.

Position the vehicle on a flat level surface.

2. Connect the diagnostic tool to the vehicle data link connector (DLC).

- Connect the vehicle data link cable into the vehicle communications module.
- Connect the diagnostic tool USB Lead into the vehicle communications module.
- Connect the data link cable to the data link connector.
- Connect the diagnostic tool USB lead to the diagnostic tool USB port.

3.  CAUTION: Make sure the ignition switch is turned off, the park brake is on and the selector lever is in park.

• NOTE: IDS already loaded with the latest issue of software.

Switch IDS on and navigate to the vehicle identification number (VIN) input screen.

4. Enter the vehicle identification number (VIN) and navigate to the vehicle configuration menu.

- Select setup and configuration.
- Select air suspension height calibration and read all warnings and cautions.
- Follow the on-screen prompts.

E95128

5.  CAUTION: The diagnostic tool will cause the vehicle height to change during some parts of the calibration process.

- NOTE: Do not install the special tool over a locking wheel nut.
- NOTE: Make sure the special tool is square to the wheel face with the measuring rod in a vertical position.
- NOTE: Take the measurement from the top edge of the slider on the special tool.
- NOTE: Make sure the fender splash shields are correctly fitted.

Once in the suspension height measurement screen, use the special tool to measure and record the height setting from each wheel center to the wheel arch.

- Follow the on-screen prompts.

6. After successful calibration of the air suspension switch off the diagnostic tool and return to its original position.

Vehicle Dynamic Suspension - Air Leaks

General Procedures

Special Tool(s)	
	Hose Cutter 204-494 (LRT 60-002)

1.  **CAUTION:** Any leak detection spray used must have a corrosion inhibitor, and must not cause damage to paintwork, plastics, metals or plastic lines.

• **NOTE:** The recommended leak detection spray is GOTEC LDS, Landrover part number STC 1090.

The recommended leak detection spray should be used to identify any suspected leaks. This procedure should also be used where any of the air suspension components have been disturbed.

2. Clean around the area of the suspected air leak.
3. Using the recommended leak detection spray, spray around all of the air suspension components, working systematically until the source of the air leak has been found.
4. If any of the air suspension components are found to be leaking e.g. air spring, compressor, reservoir or a solenoid valve block, repair is effected by replacement only.
5. Using T4, depressurize the air suspension system. For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

6. CAUTIONS:

 Different air lines in the air suspension system have different material properties and wall thicknesses. It is important, in order to prevent subsequent air line failure, that the new air line material and wall thicknesses are identical to those of the air line being removed.

 Replacement air line must be cut from a new air line with the equivalent Land Rover part number as the one being replaced. Do not use air line cut from a roll or coil.

 Any existing heatsleeves and abrasion sleeves must be replaced as part of the repair.

 Air line connectors should be positioned in areas away from heat sources such as the exhaust system, and away from any section of air line with a heat shield installed.

 Do not trim air line ends. If the end of the air line is damaged, the air line must be cut and a new section added using a Land Rover approved air line connector, or the air line must be renewed completely.

• **NOTE:** Air lines must only be cut using either Hose cutter 204-494 (LRT 60-002), available from SPX LTD or Hose cutter YA1000A, available from Snap-On Tools. Make sure the cut air line end is free from damage or burrs.

• **NOTE:** Only Land Rover approved air lines have been tested to the correct pressure and temperature specifications.

• **NOTE:** Only the Land Rover approved air line connector, RYC500210, has been tested to the correct pressure and temperature specifications.

- NOTE: If the markings or tape adjacent to the air line connections are removed when cutting air lines, the cut end of the air line must be clearly marked with a suitable colored tape or paint mark.

If the source of the air leak is found to be an air line connection, renew the Voss connector and, if required, the end of the air line. Using the special tool, cut off the damaged end of the air line and replace with new Land Rover approved air line and air line connectors as required.

7. If the source of the air leak is found to be in a section of air line, either; renew the air line, or, using the special tool, cut out the damaged section of air line and replace with new Land Rover approved air line, and air line connectors, as required.

8. NOTE: If the repair has been unsuccessful repeat the above steps until the air leak is rectified.

Using T4, pressurize the air suspension system.
For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

Vehicle Dynamic Suspension - Suspension Height Sensor

Removal and Installation

Removal

- NOTE: This procedure covers removal and installation of both the front and rear suspension height sensors.
- NOTE: The right hand sensor has a black colored lever and the left hand sensor has a white colored lever.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2.  **CAUTION:** Do not use excessive force to disconnect the height sensor link.

Remove the suspension height sensor.

- Disconnect the height sensor link.
- Disconnect the electrical connector.
- Remove the 2 Torx screws.

Installation

1.  **CAUTION:** Make sure the Torx screw is not over tightened. Failure to follow this instruction will result in damage to the vehicle.

To install, reverse the removal procedure.

- Tighten the screws to 3 Nm (2 lb.ft).
2. Using Land Rover approved diagnostic equipment, calibrate the ride height.

Vehicle Dynamic Suspension - Air Suspension Reservoir

Removal and Installation

Removal

- 1. ⚠ WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Using T4, depressurize the air suspension. For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

3. CAUTIONS:

⚠ Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

⚠ The air line must only be disconnected by removal of the Voss connector. Do not remove the air line retaining boss from the air suspension reservoir. Failure to follow this instruction may result in damage to the vehicle.

⚠ Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

Disconnect the air line from the air suspension reservoir.

- Remove the air suspension reservoir.
 - Remove the 4 bolts.
- Remove the Voss connector from the air line.
 - Remove and discard the collet and the union.

Installation

- ⚠ CAUTION:** Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

Install a new Voss connector to the air reservoir.

- Tighten the new Voss connector to 5 Nm (4 lb.ft).

- Install the air suspension reservoir.
 - Using T4, pressurize the air suspension. For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).
 - Locate the air reservoir to the chassis brackets. Fit the bolts and tighten to 23 Nm (17 lb.ft).
 - Fully seat the air line into the Voss connector.
 - Pull on the air line to make sure it is fully installed into the Voss connector.

Vehicle Dynamic Suspension - Air Suspension Control Module

Removal and Installation

Removal

1. Driver side: Remove the cowl side trim panel.
For additional information, refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Remove the closing trim panel.

E47923

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.

3. Remove the air suspension control module.

- Disconnect the 4 electrical connectors.
- Remove the bolt.
- Release from the 2 clips.

E51589

Installation

1. Install the air suspension control module.
 - Secure with the clips.
 - Connect the electrical connectors.
 - Tighten the bolt to 9 Nm (7 lb.ft).
2. Install the closing trim panel.
 - Connect the electrical connector.
 - Secure the clip.
 - Tighten the screws.
3. Install the cowl side trim panel.
For additional information, refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Initiate a new control module using T4.

Vehicle Dynamic Suspension - Air Suspension Reservoir Solenoid Valve Block

Removal and Installation

Removal

- 1.  WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- 2.** Using T4, depressurize the air suspension. For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

- 3.** Remove the air suspension compressor lower cover.

- Remove the 3 bolts.
- Release the 5 clips.

- 4.** Move the air compressor electrical connector aside.

- Release the 2 clips.

- 5. CAUTIONS:**

 Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

 Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

- **NOTE:** Note the air line fitted positions.

Remove the air suspension reservoir solenoid valve block.

- Disconnect the 4 air lines.
- Disconnect the 2 electrical connectors.
- Release the valve block 3 rubber insulators.

- 6.** Remove the Voss connectors.

- Remove and discard the collets and the unions.

Installation

1.  CAUTION: Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

• NOTE: New air suspension components are supplied with new Voss connectors tightened to the correct torque. Do not install new voss connectors if a new component is being installed.

Install new Voss connectors to the air suspension reservoir solenoid valve block.

- Tighten to 2.5 Nm (1.7 lb.ft).

2. NOTE: Make sure the valve block does not become detached during connection of the air lines.

Install the air suspension reservoir solenoid valve block.

- Secure the 3 valve block rubber insulators.
- Connect the electrical connectors.
- Connect the air lines into the Voss connector.
- Pull on each air line to make sure it is fully installed into the Voss connector.

3. Secure the air compressor electrical connector.

4. Install the air suspension compressor lower cover.

- Install the bolts and tighten to 10 Nm (7 lb.ft).

5. Using T4, pressurize the air suspension.

For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

Vehicle Dynamic Suspension - Air Suspension Compressor Drier

Removal and Installation

Removal

CAUTION: If a new air suspension compressor, air compressor drier or air compressor delivery valve kit is installed due to failure, an air compressor relay must be installed. Failure to follow this instruction may result in damage to the air suspension system components.

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the air suspension compressor.
For additional information, refer to: [Air Suspension Compressor](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

- CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean and dry. Plug open connections to prevent contamination.

Disconnect the air line from the air suspension compressor drier.

- Release the air line from the retaining clip.

- NOTE:** If equipped, note the position of the air suspension compressor retaining cable.

Remove the air suspension compressor drier.

- Remove the retaining screw.
- Remove and discard the O-ring seal.

E59815

Installation

- Install a new O-ring seal.
 - Lubricate the O-ring with a lithium based grease.
- NOTE:** If equipped, make sure the air suspension compressor retaining cable is correctly routed around the compressor cylinder head.

Install the air suspension compressor drier.

- Install the retaining screw and tighten to 3 Nm (2.2 lb.ft).

3. CAUTIONS:

Visually inspect the air line ends for damage or wear. Replace the air line as necessary.

Pull on the air line to make sure it is securely intalled in the connector.

Connect the air line to the air suspension compressor drier.

- Attach the air line to the retaining clip.

- Install the air suspension compressor.
For additional information, refer to: [Air Suspension Compressor](#)

(204-05 Vehicle Dynamic Suspension, Removal and Installation).

Vehicle Dynamic Suspension - Air Suspension Compressor

Removal and Installation

Removal

⚠ WARNING: Steps 1 and 2 must be carried out within 10 minutes of each other, failure to follow this instruction may result in personnel injury.

⚠ CAUTION: If a new air suspension compressor, air compressor drier or air compressor delivery valve kit is installed due to failure, an air compressor relay must be installed. Failure to follow this instruction may result in damage to the air suspension system components.

⚠ CAUTION: Make sure the ignition switch is turned off, the park brake is on and the selector lever is in park position.

Open the front door.

⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle, make sure at least one of the wheels is off the ground.

3. Remove the air suspension compressor lower cover.

- Remove the bolt.
- Release the 5 clips.

⚠ CAUTION: Always plug any open connections to prevent contamination.

• **NOTE:** Access to the top compressor fixing bolt is very restricted. It is advisable to use a 3/8 inch drive socket with a flexible coupling.

Remove the air suspension compressor.

- Disconnect the 3 air lines.
- Disconnect the 2 electrical connectors.
- Remove the 3 bolts.

Installation

1. CAUTIONS:

⚠ Make sure that the wiring harness and the air suspension pipes are not trapped behind the air suspension compressor bracket.

⚠ Make sure the air suspension compressor upper cover is correctly positioned.

• **NOTE:** Install the upper retaining bolt, but do not fully tighten, before installing the 2 lower retaining bolts.

Install the air suspension compressor.

- Tighten the bolts to 23 Nm (17 lb.ft).
- Connect the air lines.
- Connect the electrical connectors.

2. CAUTIONS:

Make sure the air suspension exhaust pipe is correctly located in to the air suspension upper cover.

Make sure the air suspension compressor upper cover is correctly positioned.

Install the air suspension compressor lower cover.

- Install the bolt and tighten to 9 Nm (7 lb.ft).

Vehicle Dynamic Suspension - Air Suspension Front Solenoid Valve Block

Removal and Installation

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the RH fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
- Using T4, depressurize the air suspension.
For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

4. CAUTIONS:

 Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

 Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

- **NOTE:** Note the air line fitted positions.

Disconnect the 3 air lines from the air suspension front solenoid valve block.

- Remove the air suspension front solenoid valve block.

- Disconnect the electrical connector.
- Release the valve block 3 rubber insulators.

E48265

- Remove the Voss connectors from the air lines.

- Remove and discard the collet and the union.

Installation

-  **CAUTION:** Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

- **NOTE:** New air suspension components are supplied with new Voss connectors tightened to the correct torque. Do not install new voss connectors if a new component is being installed.

Install new Voss connectors to the air suspension front solenoid valve block.

- Tighten to 2.5 Nm (1.7 lb.ft).

- NOTE:** Make sure the valve block does not become detached during connection of the air lines.

Install the air suspension front solenoid valve block.

- Secure the 3 valve block rubber insulators.
- Connect the air lines into the Voss connector.

- Pull on each air line to make sure it is fully installed into the Voss connector.
 - Connect the electrical connector.
3. Using T4, pressurize the air suspension.
For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).
 4. Install the RH fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

Vehicle Dynamic Suspension - Rear Air Spring

Removal and Installation

Removal

- NOTE: Only the air spring being removed needs to be depressurised.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Using T4, depressurise the air suspension.
For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).
4. Disconnect the rear air spring from the lower arm.
 - Remove the nut and bolt.

5.  **CAUTION:** Always plug any open connections to prevent contamination.

Disconnect the air line.

6. Using a trolley jack, support the rear air spring assembly.
7. Remove 3 rear air spring retaining nuts.
8. Remove the rear air spring.
9. Remove the Voss connector from the air line.
 - Remove the collet and the union.

Installation

1. Install a new Voss connector to the air spring.
 - Tighten to 3.5 Nm (2.6 lb.ft)
2. Install the rear air spring.
 3. Connect the shock absorber and spring assembly to the lower arm.
 - Make sure the spring and shock absorber assembly top mounting to body mating faces are clean.
 - Tighten the nut and bolt to 300 Nm (221 lb.ft).
 - Connect the air line into the Voss connector.
4. Using T4, pressurise the air suspension.
For additional information refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

[Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

5. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Vehicle Dynamic Suspension - Air Suspension Muffler

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the muffler assembly.
For additional information, refer to: Muffler (309-00B Exhaust System - 4.4L, Removal and Installation).
3. Remove the evaporative emissions canister.
For additional information, refer to: [Evaporative Emission Canister](#) (303-13B Evaporative Emissions - V8 5.0L Petrol, Removal and Installation).
4. Remove the air suspension compressor.
For additional information, refer to: [Air Suspension Compressor](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).
5. Remove the air suspension compressor upper cover.

6. Disconnect the air suspension intake filter pipe.

7. Remove the air suspension muffler.

- Release clip from the air suspension muffler pipe.
- Release the air suspension compressor to air suspension silencer pipes.

Installation

1. Install the air suspension muffler.

- Locate the air suspension muffler pipes.
- Secure the clip.

2. Connect the air suspension intake filter.

3.  **CAUTION:** Make sure the air suspension compressor upper cover is correctly positioned.

Install the air suspension compressor upper cover.

4. Install the air suspension compressor.
For additional information, refer to: [Air Suspension Compressor](#)

(204-05 Vehicle Dynamic Suspension, Removal and Installation).

5. Install the evaporative emissions canister.
For additional information, refer to: [Evaporative Emission Canister](#) (303-13B Evaporative Emissions - V8 5.0L Petrol, Removal and Installation).
6. Install the muffler assembly.
For additional information, refer to: Muffler (309-00B Exhaust System - 4.4L, Removal and Installation).

Vehicle Dynamic Suspension - Air Suspension Rear Solenoid Valve Block

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the LH rear wheel and tire.
3. Using T4, depressurize the air suspension.
For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

4. CAUTIONS:

 Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

 Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

- **NOTE:** Note the air line fitted positions.

Disconnect 3 air lines from the rear valve block.

5. Disconnect the electrical connector.
6. Remove the rear valve block.
 - Release the valve block 3 rubber insulators.
7. Remove the Voss connectors from the air lines.
 - Remove and discard the collets and the unions.

E48266

Installation

1. **NOTE:** New air suspension components are supplied with new Voss connectors tightened to the correct torque. Do not install new voss connectors if a new component is being installed.

Install new Voss connectors to the rear valve block.

- Tighten to 2.5 Nm (1.7 lb.ft).
2. Install the rear valve block.
 - Secure the 3 valve block rubber insulators.
 - Connect the electrical connector.
 - Connect the air lines into the Voss connector.
 - Pull on each air line to make sure it is fully installed into the Voss connector.
 3. Using T4, pressurize the air suspension.
For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

4. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Vehicle Dynamic Suspension - Air Suspension Air Filter

Removal and Installation

Removal

1. Open the liftgate and tailgate.
2. Remove the spare wheel and tire.
3. Remove the 4 nuts securing the LH rear tail pipe heat shield.

E53885

4. Reposition the LH rear tail pipe heat shield.
5. Disconnect the air suspension intake filter pipe.
6. Detach the air suspension intake filter.

E53886

- Release the grommet.
- Release from the clip.

7. Remove the LH lower rear quarter trim access panel.

E53887

8. Remove the air suspension intake filter.

E53888

Installation

1. Install the air suspension intake filter.
 - Install the grommet.

2. Install the LH lower rear quarter trim access panel.
3. Attach the air suspension intake filter.
4. Connect the air suspension intake filter.
5. Reposition the LH rear tail pipe heat shield.
 - Install the nuts.
6. Install the spare wheel and tire.
7. Close the liftgate and tailgate.

Vehicle Dynamic Suspension - Front Air Shock Absorber

Removal and Installation

Special Tool(s)	
 <p>204-538 E51385</p>	<p>Air spring tester 204-538</p>
 <p>204-700 E99789</p>	<p>Remover front air shocker absorber spindle nut 204-700</p>

Removal

- NOTE: This procedure should also be used to remove the front air spring.

1. Remove the front shock absorber and air spring assembly. For additional information, refer to: [Front Shock Absorber and Air Spring Assembly](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

2. NOTE: If no leak is detected, investigate other areas of the air suspension for faults.

Check the assembly for leaks.

- Inflate the module to 4 bar and check for pressure loss using leak detector spray.
- If a leak is suspected, immerse the shock absorber and air spring assembly in a tank of water to locate the source of the leak and mark the area.

3. Remove the nylon retaining pin.

4. Using the special tool, remove the nut.

5. Remove the rebound washer.

6. CAUTIONS:

 Make sure protective jaws are installed to the vice. Failure to follow this instruction may result in damage to the component.

 Do not clamp the shock absorber tube. Failure to follow this instruction may result in damage to the component.

Position the front shock absorber and air spring assembly in a vice.

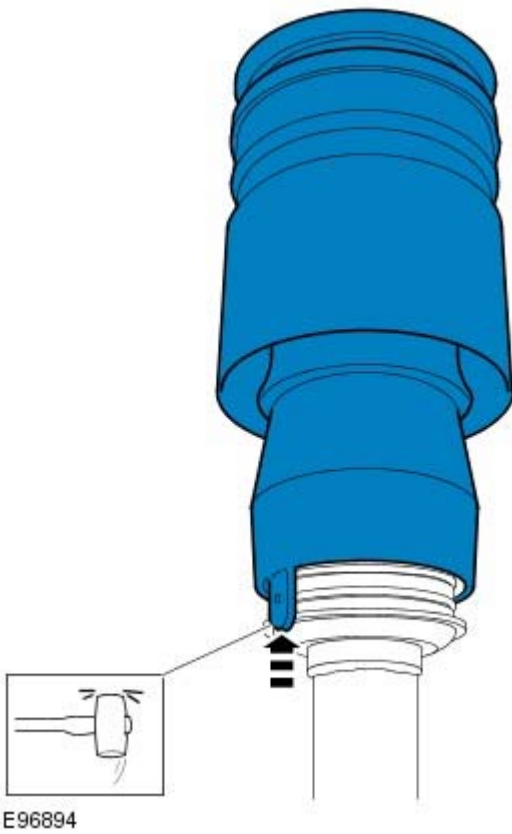

7. Remove and discard the 3 spacers and 2 O-ring seals.

8. Remove the air spring.

- Using a soft faced mallet, gently tap the sleeve support upwards to release it from the O-ring seals.

9. NOTE: Note the fitted position.

Remove the bump plate and spring aid.

10. Remove and discard the 2 large black O-ring seals from the lower seal carrier.

11. Remove the front shock absorber and air spring assembly from the vice.

Installation

E96892

1. CAUTIONS:

 Make sure protective jaws are installed to the vice. Failure to follow this instruction may result in damage to the component.

 Do not clamp the shock absorber tube. Failure to follow this instruction may result in damage to the component.

Position the front shock absorber and air spring assembly in a vice.

2.  CAUTION: Use compressed air and lint free non-flocking material.

Clean the components.

3. Lift the seal carrier to expose the O-ring seal stack.

- Make sure that the damper body O-ring seals and spacers are fully seated to the spring seat.

E96897

4.  CAUTION: Take care not to damage the O-ring seals during installation.

Install new O-ring seals to the seal carrier.

- Apply loctite 8021 (silicon-based oil) to the O-ring seals.

E96898

5. NOTE: Make sure that these components are installed to the noted removal position.

Install the bump plate and spring aid.

E96899

6. Install the air spring.

- Align the sleeve support with the first O-ring seal making sure that the location tag is correctly aligned with the spring seat cut-out.

E99908

E96893

7. CAUTIONS:

 Make sure that the threads of the front air shock absorber are covered with protective tape.

 Take care not to damage the O-ring seals during installation.

Install the components in the following order:

1. O-ring seal
2. Spacer
3. O-ring seal
4. Spacer
5. Spacer

E96900

8. NOTE: The "T5" stamp on the upper face of the rebound washer must be visible after assembly.

Install the rebound washer.

E96891

9. Install a new nut and using the special tool, and tighten to 98 Nm (72 lb.ft).

E51445

10. CAUTIONS:

The air supply must be free of any moisture.

If during disassembly the air sleeve is unrolled, the air sleeve may inflate incorrectly (to one side). If this occurs, release the air pressure, and insert a suitable tool that will not damage the air sleeve or piston (a screw driver handle), into the side opposite the bulge. Inflate and deflate until the air sleeve inflates correctly (the air sleeve will be uniform inside the shroud).

• **NOTE:** To prevent damage when seating the sleeve support over the large black O-rings, compressed air should be used to inflate the air spring.

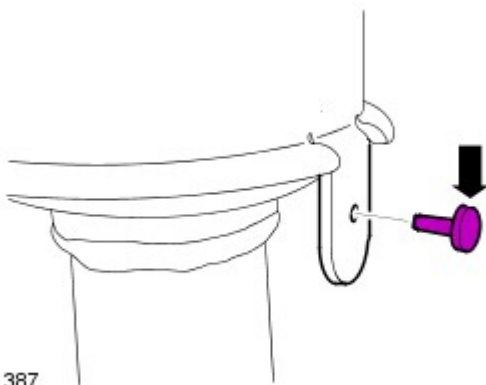

Using the special tool coupled to a tire inflator with a gauge, apply approximately 2 bar of air pressure to the air spring to fully seat the sleeve support over the O-ring seals.

11. Check the assembly for leaks.

- Inflate the module to 4 bar and check for pressure loss using leak detector spray.
- If a leak is suspected, immerse the shock absorber and air spring assembly in a tank of water to locate the source of the leak.

12. Depressurize and remove the special tool from the shock absorber and air spring assembly.

13. Install the nylon retaining pin.

E51387

14. NOTE: Install a new air spring pipe connector.

Install the front shock absorber and air spring assembly. For additional information, refer to: [Front Shock Absorber and Air Spring Assembly](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

Vehicle Dynamic Suspension - Rear Air Shock Absorber

Removal and Installation

Special Tool(s)	
 <p>204-538 E51385</p>	<p>Air spring tester 204-538</p>
 <p>100-050 E57611</p>	<p>Band-it Thrift tool 100-050 (LRT-99-019)</p>

Removal

- NOTE: This procedure should also be used to remove the rear air spring.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the shock absorber and spring assembly.
For additional information, refer to: [Rear Shock Absorber and Air Spring Assembly](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).
4. Remove the gaiter.
 - Remove and discard the 2 straps.

5. Remove the nut, rebound washer and rubber bushing.

- Discard the nut.

6. Remove and discard the O-ring seals and spacer.

E51440

7. Remove the nylon retaining pin.

E51441

8. Remove the rebound plate and spring aid.

9. Remove the air spring.

- Using a soft faced mallet, gently tap the sleeve support upwards to release it from the O-ring seals.
- Remove and discard the 2 O-ring seals.

E51442

10. Remove the shock absorber from the vise.

Installation

1. Install the shock absorber in the vise.
2. Clean the components.
3. Lubricate and install new O-rings to the seal carrier.
4. Install the spring aid and rebound plate.
5. Install the air spring.
 - Align the piston with the first O-ring seal, making sure the location tag is correctly aligned.

E51443

6. Install the new O-ring seals and spacer, taking care not to damage the seals.
7. Install the rubber bushing and rebound washer.
 - Make sure the formed insert on the bushing is located against the O-ring seal.

E51444

8. Install and lightly tighten the nut.

9. CAUTIONS:

The air supply must be free of any moisture.

If during disassembly the air sleeve is unrolled, the air sleeve may inflate incorrectly (to one side). If this occurs, release the air pressure, and insert a suitable tool that will not damage the air sleeve or piston (a screw driver handle), into the side opposite the bulge. Inflate and deflate until the air sleeve inflates correctly (the air sleeve will be uniform inside the shroud).

Install the air spring piston over the O-ring seals.

- Using the special tool coupled to a tire inflator with a gauge, apply approximately 2 bar of air pressure to the air spring to fully seat the piston over the O-ring seals.

10. Tighten the top nut to 98 Nm (72 lb.ft).

11. Check the assembly for leaks.

- Inflate the module to 4 bar and check for pressure loss.
- If a leak is suspected, immerse the spring and shock absorber assembly in a tank of water to locate the source of the leak.

12. Install the gaiter.

- Using the special tool, install new straps.

13. Install the shock absorber and spring assembly.
For additional information, refer to: [Rear Shock Absorber and Air Spring Assembly](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

Vehicle Dynamic Suspension - Front Shock Absorber and Air Spring Assembly

Assembly

Removal and Installation

Removal

- NOTE: Only the air spring being removed needs to be depressurized.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Using the Land Rover approved diagnostic system, depressurize the air suspension. For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).
4. Disconnect the shock absorber and air spring assembly from the lower arm.

- Remove the nut and bolt.

5. Release the shock absorber and air spring assembly.

- Remove the 3 nuts.

E44658

6.  **CAUTION:** Always plug any open connections to prevent contamination.

Reposition the shock absorber and air spring assembly.

- Disconnect the air line.

7. Remove the shock absorber and air spring assembly.

8. Remove the Voss connector from the air line.

- Remove and discard the collet and the union.

Installation

1.  **CAUTION:** Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

Install a new Voss connector to the air spring.

- Tighten to 3.5 Nm (2.6 lb.ft)

2. **NOTE:** Remove and discard the blanking caps.

- **NOTE:** Clean the component mating faces.

Install the shock absorber and air spring assembly.

- Connect the air line into the Voss connector.
- Pull on the air line to make sure it is fully installed into the Voss connector.
- Install the nuts and tighten to 63 Nm (46 lb.ft).

3. Connect the shock absorber and air spring assembly to the lower arm.

- Tighten the nut and bolt to 300 Nm (221 lb.ft).

4. Using the Land Rover approved diagnostic system, pressurize the air suspension.

For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

5. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Vehicle Dynamic Suspension - Rear Shock Absorber and Air Spring

Assembly

Removal and Installation

Removal

- NOTE: Only the air spring being removed needs to be depressurised.
- NOTE: RH illustration shown, LH is similar.

1. Using the Land Rover approved diagnostic system, depressurize the air suspension. For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).
2. Remove the loadspace floor panel.

3. Remove the jack and wheel brace.

4. Remove the spare wheel/tool compartment cover.

5. Lower the spare wheel and tire.

6. Remove the spare wheel.

- Disconnect the spare wheel release strap and position aside.

E140853

7.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

8.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

Remove the Voss connector from the air line.

- Remove and discard the collet and the union.
- Disconnect the active damping wiring.

E140850

9. Remove the wheel and tire.

10. Disconnect the shock absorber and air spring assembly from the lower arm.

- Remove the nut and bolt.

11. Remove the three shock absorber and air spring retaining nuts.

- Remove the shock absorber and air spring assembly.

Installation

1. Install the shock absorber and air spring assembly.

- Make sure the shock absorber and air spring assembly top mounting to body mating faces are clean.
- Fit the nuts and tighten to 63 Nm (46 lb.ft).
- Connect the air line into the Voss connector.
- Tug on the air line to make sure it is fully installed into the Voss connector.

2. Connect the shock absorber and air spring assembly to the lower arm.

- Tighten the nut and bolt to 300 Nm (221 lb.ft).

3. Install the wheel and tire.

CAUTION: Make sure the new Voss connector is installed and tightened to the correct torque (40 Nm (30 lb.ft)).

4. Install a new Voss connector to the air spring.

5. Lower the vehicle on the lift.

6. Connect the spare wheel release strap to the spare wheel and tire.

- Attach the active damping wiring.

7. Install the spare wheel and tire.

- Raise the spare wheel and tire.
8. Install the spare wheel/tool compartment cover.
 9. Install the jack and wheel brace.
 10. Install the loadspace floor panel.
 11. Using the Land Rover approved diagnostic system, pressurize the air suspension.
For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

Vehicle Dynamic Suspension - Air Suspension Pressure Sensor

Removal and Installation

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the air compressor housing cover.
 - Remove the 3 bolts.
 - Release the 5 clips.

- Using T4, depressurize the air suspension. For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).
- NOTE:** Make sure the valve block does not become detached during removal of the air pressure sensor.

Disconnect the electrical connector.

-  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the air pressure sensor.

- Remove and discard the O-ring seal.

Installation

- NOTE:** Make sure the valve block does not become detached during installation of the air pressure sensor.

Install the air pressure sensor.

- Install a new O-ring seal.
- Tighten to 5 Nm (4 lb.ft).

- Connect the electrical connector.

- Using T4, pressurize the air suspension. For additional information, refer to: [Air Suspension System Depressurize and Pressurize](#) (204-05 Vehicle Dynamic Suspension, General Procedures).

- CAUTIONS:**

-  Make sure the air suspension compressor upper cover is correctly positioned.

Make sure the air suspension exhaust pipe is correctly located in to the air suspension upper cover.

Install the air compressor housing cover.

- Install the bolts and tighten to 9 Nm (7 lb.ft).

Ride and Handling Optimization - Ride and Handling Optimization

Description and Operation

Terrain Response - Component Location

E47120

Item	Part Number	Description
1	-	Air suspension control module
2	-	Instrument cluster
3	-	Terrain Response rotary control and control module
4	-	Rear differential control module (if fitted)
5	-	Rear differential
6	-	Transfer box (center differential and high/low range)
7	-	Engine control module
8	-	Transfer box control module
9	-	Transmission control module (automatic transmission only)
10	-	ABS module

GENERAL

The Terrain Response™ system allows the driver to select a program which aims to provide the optimum settings for traction and performance for the prevailing terrain conditions. The system cannot be switched off. The 'special programs off' is the default program and covers all general driving conditions. Four specific terrain programs are selectable to cover all terrain surfaces.

The system is controlled by a rotary control located on the center console, rearward of the selector lever (automatic transmission) or gearshift lever (manual transmission). The rotary control allows the selection of one of the following five programs:

- Special programs off
- Grass/Gravel/Snow
- Mud/Ruts
- Sand
- Rock crawl.

The rotary control can be rotated through 360 degrees or more in either direction and selects each program in turn. When Terrain Response is fitted to a vehicle, a hi-line instrument cluster will also be fitted which will display the selected program in the message center.

The Terrain Response system uses a combination of a number of vehicle subsystems to achieve the required vehicle characteristics for the terrain selected. The following subsystems make up the Terrain Response system:

- Engine management system
- Automatic transmission (if fitted)
- Transfer box (center differential)
- Rear differential (electronically controlled)
- Brake system (ABS/DSC/ETC/HDC functions)
- Air suspension.

A Terrain Response control module is located below the rotary control. The control module detects the selection made on the rotary control and transmits a signal on the high speed CAN which is received by each of the subsystem control modules. Each of the affected control modules contain software which applies the correct operating parameters to their controlled system for the Terrain Response program selection made. Each control module also provides a feedback for the selected program so that the Terrain Response control module can check that all systems have changed to the correct operating parameters.

Information is displayed in the instrument cluster message center which informs the driver of improvements which can be made to the vehicle operating parameters to optimise the vehicle for the prevailing conditions. Inexperienced off-road drivers may benefit from the automatic assistance of the Terrain Response system and the driver information. Experienced off-road drivers can select the specific programs for extreme conditions to access control over the vehicle systems (e.g., throttle shift maps or traction settings) which are not accessible on vehicles without Terrain Response.

TERRAIN RESPONSE ROTARY CONTROL AND MODULE

E47121

Item	Part Number	Description
1	-	Terrain Response rotary control
2	-	Transfer box high/low range switch
3	-	Air suspension switch
4	-	Terrain Response control module
5	-	Special programs off
6	-	Grass/gravel/snow program
7	-	Mud/ruts program
8	-	Sand program
9	-	Rock/crawl program
10	-	HDC switch

The Terrain Response rotary control is located in the center console and allows the selection of five operating programs. Each program is denoted by a symbol which represents the terrain encountered. The rotary control can be rotated to select the required program. The control will only select the last program in its direction of rotation. Further rotation of the control once the last program in either direction has been selected, will have no effect, e.g. once rock crawl has been selected, further rotation in a clockwise direction will have no effect.

The Terrain Response control module is located below the rotary control. The module is connected via a harness connector which also contains the wiring for the HDC switch, the transfer box high/low range switch, the air suspension switch and the switch illumination circuits. The control module and switch uses four of these wires for a 12V battery supply when the ignition switch is in ignition position II, a ground and high speed CAN positive and negative.

TERRAIN RESPONSE OPERATION

The following vehicle subsystem control modules are used for the Terrain Response system:

- Engine management (engine control module)
- Transmission control (transmission control module - automatic transmission only)
- Transfer box control (transfer box control module)
- Rear differential control (rear differential control module - if fitted)
- Air suspension control (air suspension control module)
- Brake system (ABS/DSC/ETC/HDC functions) (ABS module)

Each subsystem operates in different ways in relation to the selected Terrain Response program to achieve the optimum traction, stability and ease of control for the terrain encountered. The system has a safety factor built in which ensures that any program can be safely used on any surface, even when an inappropriate program selection has been made.

Engine Management System (EMS)

The EMS varies the throttle pedal response to control the engine torque output. The EMS can change the throttle maps to change the amount of torque per percentage of pedal travel. The EMS can also change the throttle response to control the allowed torque change relative to the percentage pedal travel.

Each terrain program uses a combination of operating parameters for each subsystem. Changing between terrain programs initiates a different set of operating characteristics which will be noticeable to the driver. The driver will notice differences in engine and throttle response when, for example, the throttle pedal is held in a constant position and the terrain program is changed from grass/gravel/snow to sand, the driver will notice the torque and engine speed increase. If the terrain program is changed from sand to grass/gravel/snow the driver will notice a reduction in torque and engine speed.

• **NOTE:** The change in torque and engine speed can take approximately 30 seconds and care must be taken not to confuse the Terrain Response system operation with an EMS fault.

Transmission Control

The transmission control module changes the shift maps for the Terrain Response program selected. This changes the shift points providing early or late upshifts and downshifts.

On slippery surfaces the transmission will select 2nd gear in high range or 3rd gear in low range for starting from a standstill to minimise wheel slip. In muddy conditions the transmission will provide maximum torque output from the transmission. In sand the transmission will provide an output which passes maximum engine power from the transmission.

In rock crawl special program (low range) the transmission will select 1st gear for driving off.

Sport mode is only available when the general program is selected and the transfer box is in high range. Sport mode is disabled in low range and all Terrain Response special programs. CommandShift™ is available in any program and also in high or low range.

If the transmission is in 'Sport' mode and a special program is subsequently selected, the transmission will automatically change to manual 'CommandShift™' mode. If a special program is already selected and the transmission selector lever is moved from drive 'D' to the 'Sport' mode position, the transmission will automatically change to 'CommandShift™' mode.

Transfer Box and Rear Differential Control

The transfer box electronically controlled differential and the rear electronically controlled differential (if fitted) are treated as one system. The electronic rear differential is an optional fitment on vehicles fitted with the Terrain Response system. The differential control has two operating strategies; pre-emptive and reactive.

The pre-emptive strategy anticipates and predicts the locking torque value required for each differential to minimise slip and maximise stability. Each Terrain Response program has a different threshold and input criteria for the pre-emptive strategy. The pre-emptive strategy improves vehicle traction and composure by avoiding wheel spin. This is achieved by anticipating the amount of differential lock required for the program selected. For example, a high locking torque would be applied for rock crawl or slippery surfaces.

The reactive strategy varies the amount of locking torque in response to the actual slip level and the dynamic behaviour of the vehicle. Each Terrain Response program has a different threshold and input for the reactive strategy. The reactive strategy improves vehicle traction and composure by eliminating any wheel spin which has occurred after the pre-emptive strategy was applied. The locking response applied is applicable to the terrain program selected, for example, very sensitive on slippery surfaces to provide maximum traction and minimise surface damage.

The locking torque calculations use various signals from other subsystems, for example, engine torque, throttle position, selected gear, steering angle, vehicle speed, lateral acceleration, yaw behaviour.

The Dynamic Stability Control function of the ABS system can override the Terrain Response differential control and reduce any applied locking torque during DSC action. For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

Air Suspension Control

The air suspension control module contains a strategy which provides automatic switching between normal and off-road heights. Changes in vehicle height settings will be relayed to the driver via the instrument cluster message center and LED illuminated icons on the switch. The automatic selection and deselection of the vehicle height provides automatic increase and decrease in ground clearance and aims to provide maximum benefit to the selected terrain program.

On a vehicle fitted with a correctly installed, Land Rover approved trailer socket, if an electrical load is sensed on the trailer socket, height changes are prohibited and the message center displays a message advising that a trailer is connected and off-road height is not automatically selected. The driver can raise the suspension manually using the air suspension switch.

• **NOTE:** The prohibiting of the automatic ride height selection is only operational if a Land Rover approved trailer socket is fitted and an electrical load is sensed on the socket.

ABS Control

The ABS module controls several vehicle functions and adjusts the operating parameters of these functions to optimise the selected Terrain Response program.

Traction control uses different slip/acceleration thresholds to improve traction and vehicle composure. For example, the system sensitivity is increased on slippery surfaces to reduce wheel spin.

If DSC is switched off (with the DSC switch on the instrument panel) when using a Terrain Response special program, if the special program is subsequently changed for a different program DSC is automatically switched back on.

The stability control uses different threshold values for the selected program to automatically reduce DSC intervention, removing the requirement for the driver to disable the DSC system in order to reduce engine intervention which is sometimes induced in extreme off-road conditions. In extreme sand conditions, there may be an additional benefit of disabling the DSC function using the DSC switch on the instrument panel in addition to selecting the sand program.

HDC is automatically switched on or off and target speeds are adjusted in response to the Terrain Response program selected. The responsiveness of the HDC function is also increased where required.

Automatic operation of HDC aims to assist the driver by switching the system on or off when it is of most benefit. Target speeds for HDC operation are also adjusted according to the vehicle operating conditions.

Incorrect Program Usage

Selection of an inappropriate program is discouraged in the following ways:

- The active program icon is continually displayed in the instrument cluster message center
- The Terrain Response control module 'locks' out certain functions in some programs, e.g.,
 - cruise control is only available with the special programs off or grass/gravel/snow program
 - transmission 'Sport' mode is deactivated in all special programs.
- In any special program, except the grass/gravel/snow program, when the ignition has been in the off position continually for more than 6 hours, the Terrain Response system defaults to the Special Programs Off
- When in the grass/gravel/snow program, the Terrain Response system will never default to the Special Programs Off. This is to allow for drivers in cold climates where continuous use of the grass/gravel/snow program would be beneficial
- The rock crawl program is only available with the transfer box in low range.

Selection of an inappropriate program for the terrain conditions will not endanger the driver or cause damage to the vehicle. Continued use of an inappropriate program may reduce the life of some components. The driver may notice reduced vehicle response, with the engine and transmission being less responsive than in the special programs off. Also, in some programs, HDC will remain on, signified by illumination of the HDC indicator in the instrument cluster. The driver may also notice torque 'wind-up' in the center and rear differentials causing a 'braking' effect when the vehicle is manoeuvred in some special programs.

The use of the special programs in the Terrain Response system is monitored by the Terrain Response control module which records the mileage and time the vehicle has operated in a specific program in high and low range. This information can be retrieved using T4 and used by the dealer technician to check customer concerns, e.g. high fuel consumption which may be due to continued use of a certain program.

Driver Information

The high specification instrument cluster fitted to all vehicles with Terrain Response, contains a message center which displays vehicle information to the driver. The message center contains the Terrain Response program icons which display the currently selected program. If no symbol is displayed, no special program is selected and the system is in special programs off.

Any required changes to the subsystems are also passed to the driver in the form of indicator illumination in the instrument cluster or appropriate messages in the message center, HDC off or air suspension height change for example.

In certain operating conditions, the Terrain Response system also displays advice or warning messages to ensure the driver is using the vehicle to its full potential, e.g.,

- Steering angle is displayed in the message center to avoid driving in deep ruts with steering lock applied
- gear information is displayed to recommend a gear for slippery conditions
- if the system automatically provided off road ride height, but the driver subsequently lowers the vehicle to normal height, then the system may advise that this will cause a risk of grounding.

The messages which can be displayed in the instrument cluster message center are detailed in the Information and Message Center section.

For additional information, refer to: Information and Message Center (413-08, Description and Operation).

DIAGNOSTICS

The Terrain Response control module stores information on detected Terrain Response faults and CAN errors which can be interrogated using T4. The Terrain Response sub-systems and the instrument cluster also store fault information relating to CAN errors from the Terrain Response control module.

The control module also stores the miles travelled and time elapsed in high range for the individual programs and in low range for use of all programs which can also be retrieved using T4. This information aids diagnosis of the Terrain Response system and also provides an indication of Terrain Response system abuse by the driver which can lead to premature component failure.

Terrain Response System Fault Diagnosis

Terrain Response relies on the correct functionality of the five sub-systems. If one of the sub-systems develops a fault, the Terrain Response system will not function, even though the fault is not in the Terrain Response system. The Terrain

Response control module and rotary control should only be investigated if there are no apparent faults in any of the sub-systems. If a fault in a sub-system is subsequently corrected, the Terrain Response system will function normally after an ignition on and off cycle.

Terrain Response Sub-System Faults

If a fault occurs in a sub-system, the driver is alerted by the illumination of a warning indicator and/or an appropriate message for that sub-system in the instrument cluster message center. There will be no warning of a Terrain Response system fault.

When a sub-system fault is present and the driver attempts to select a different Terrain Response program using the rotary control or at the next ignition on cycle, a message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' will appear in the message center. This implies that the Terrain Response system has a fault, but only because a sub-system fault is preventing its operation. This message will be displayed for 5 seconds per ignition cycle, but is repeated if a further selection is made by the driver using the Terrain Response rotary control or at the next ignition on cycle.

• **NOTE:** The message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' can also be generated by a fault in the Terrain Response rotary control or control module. See following section for details of rotary control or control module faults.

It is not possible for the Terrain Response control module to cause any fault behaviour (warning indicator illumination or message generation) in any of the five sub-systems. Illumination of a sub-system warning indicator and/or a sub-system related message will never be associated with a Terrain Response control module or Terrain Response system fault.

The sub-system control modules can detect a fault with the CAN signal from the Terrain Response control module. If a fault in the Terrain Response system is detected, the sub-system control modules will operate in the 'special programs off' setting. The sub-system control modules will record a fault code for a failure of the Terrain Response CAN signal. These faults can be retrieved using T4 and will provide useful information to indicate investigation of the Terrain Response control module or the CAN network.

Terrain Response Rotary Control or Control Module Fault

If a fault occurs in the Terrain Response rotary control, all rotary control icon amber LEDs will be turned off (background illumination will remain on) and rotation of the rotary control is ignored. The instrument cluster message center will display a message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' when the fault occurs, if the fault is present and the driver attempts to select a special program (if the control module is able to do this) or at the next ignition on cycle.

If a failure of a rotary control icon amber LED occurs, the Terrain Response system will still function. Any selected special program will default to 'special programs off' at every ignition on cycle, with the exception of the grass/gravel/snow program.

The Terrain Response rotary control and the control module are an integral unit. If a fault occurs in either component, the whole unit will require replacement.

CAN Faults

If a CAN fault exists and prevents Terrain Response system operation, all of the Terrain Response rotary control icon LEDs will be illuminated and rotation of the rotary control is ignored.

If the instrument cluster does not receive a Terrain Response system CAN message from the Terrain Response Control module, the message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' will be displayed when the fault occurs and will be repeated at every ignition on cycle.

User Error

The following incorrect usage of the system may be misinterpreted as a system fault:

- Engine not running - Program changes and driver advisory messages are only available with the engine running
- Rock crawl program selected but transfer box in high range
- Special program change attempted with DSC or ABS active (this includes ABS cycling which is operational when HDC is being used on slippery or loose surfaces).
- Special program change attempted with overheat condition present on center or rear differential.

Ride and Handling Optimization - Ride and Handling Optimization

Diagnosis and Testing

Principles of Operation

Ride and handling optimization incorporates the terrain response system which links a number of modules around the vehicle to give the best combination of settings in the different systems.

For a detailed description of the Ride and Handling System and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Ride and Handling Optimization](#) (204-06 Ride and Handling Optimization, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Tire condition, pressures, etc ● Driveline components (correct installation, damage, etc) ● Engine components (correct installation, damage, etc) ● Transmission components (correct installation, damage, etc) ● Suspension components (correct installation, damage, etc) 	<ul style="list-style-type: none"> ● Fuses ● Harnesses/Connectors ● Terrain response module ● Engine Control Module (ECM) ● Transmission Control Module (TCM) ● Transfer case control module ● Anti-lock Braking (ABS) control module ● Rear differential control module ● Dynamic suspension control module ● Controller Area Network (CAN) circuits

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Because the overall function of the system is dependent on sub-systems, it is possible to misinterpret displays in the message center as being terrain response faults when they are actually a result of a fault in one of the sub-systems.

Refer to the table below for help in deciding when to investigate terrain response faults and when the fault is likely to be in a sub-system.

Symptom	Description	Possible Causes	Action
Message center display indicating a sub-system fault	The message center indicates to the driver that a fault has occurred and in which sub-system	<ul style="list-style-type: none"> ● Any sub-system fault supported by the message center 	For details of the available messages, refer to the relevant section of the workshop manual. Carry out a complete vehicle DTC read and follow the diagnostic routine(s) indicated.
Message center display: System fault special programs not available , terrain response switch operation normal	This message will display when a sub-system fault has occurred if the driver attempts to change the special program, and at each ignition on cycle for 5 seconds until the fault is rectified	<ul style="list-style-type: none"> ● Any sub-system fault supported by the message center 	For details of the available messages, refer to the relevant section of the workshop manual. Carry out a complete vehicle DTC read and follow the diagnostic routine(s) indicated.
Message center display: System fault special programs not available , ALL terrain response switch LEDs illuminated	CAN circuit errors	<ul style="list-style-type: none"> ● CAN circuit: short circuit to ground ● CAN circuit: short circuit to power ● CAN circuit: high resistance 	Carry out a complete vehicle DTC read and follow the diagnostic routine(s) indicated.

Driveshaft - Driveshaft

Description and Operation

Drive shaft Component Location

E46304

Item	Part Number	Description
1	-	Front drive shaft
2	-	Rear drive shaft

GENERAL

Drive shafts are used to transmit drive from the transfer box to the front and rear differentials.

The front drive shaft is a one-piece unit, connected to the transfer box and front differential unit via Constant Velocity (CV) joints.

The rear drive shaft is a two-piece unit, supported on a central bearing due to its increased length. The rear drive shaft is connected to the transfer box via a CV joint and the rear differential with a universal joint. These joints allow for angular deviations of the drive shaft due to acceleration and braking.

The front and rear drive shafts are not serviceable items and a failure will require the replacement of the complete drive shaft assembly.

FRONT DRIVE SHAFT

E46305

Item	Part Number	Description
1	-	CV joint
2	-	Front drive shaft

The front drive shaft is constructed from 1.7 mm wall tubular steel. A CV joint is attached to each end of the drive shaft (see 'Halfshaft Joint' section for more information on CV joints). The shaft has an overall nominal length of 713 mm.

Each CV joint has six holes, which allow for attachment to the input flange of the front differential and the front output flange of the transfer box. The CV joints are secured to the front differential and transfer box with six Torx head adhesive retained bolts.

Three compression link washers are fitted under each pair of bolts. The washers are required to prevent compression of the CV joints attachment flange.

A shroud is pressed over the CV joint. The shroud seals to the joint body using an internal gasket and to the front output flange of the transfer box using an end cap and internal gasket. This prevents the ingress of dirt and moisture. The CV joints allow for movement of the drive shaft caused by small movements in the transmission and transfer box mountings.

REAR DRIVE SHAFT ASSEMBLY

E46306

Item	Part Number	Description
1	-	CV joints
2	-	Collapsible crash section
3	-	Front shaft assembly
4	-	Support bearing
5	-	Rear shaft assembly
6	-	Universal joint

The rear drive shaft assembly comprises front and rear shaft assemblies and a centrally mounted shaft bearing. The rear drive shaft assembly has an overall nominal length of 1309 mm.

Front Shaft Assembly

The front shaft assembly incorporates a crash feature within the tube, which controls the collapse of the drive shaft during a crash.

The front shaft assembly comprises a CV joint at each end (see 'Halfshaft Joint' section for more information on CV joints).

The front CV joint (transfer box end) has six radial holes, which provide for the attachment to the transfer box rear output flange. The joint is secured to the output flange with six torx bolts, which screw into threaded holes in the flange. Three compression link washers are fitted under each pair of bolts. The rear splined shaft mates with splines in the rear shaft CV joint hub and is pressed in and fixed with Locktite. A machined surface on the shaft accepts the shaft bearing, which is a press fit.

Rear Shaft Assembly

The rear shaft assembly comprises a Hookes type universal joint at the rear (rear differential end).

The universal joint is welded to the rear shaft tube and is secured to the input shaft of the rear differential with four flanged nuts. The opposite end of the rear shaft tube is welded directly to the CV joint body.

Shaft Bearing Assembly

The shaft bearing assembly comprises a pressed steel housing, a rubber diaphragm and a ball bearing. The diaphragm is bonded into the housing. An internal metal ring, bonded to the bush, allows for the bearing to be press fitted into it. The rubber bush allows for small deviations in alignment and also absorbs vibrational forces. The shaft bearing assembly is located by screws, which pass through plain holes in the bearing assembly and locate into nuts welded on the inside face of the chassis cross-member.

Driveshaft - Universal Joints

Description and Operation

E46302

A Hookes type universal joint is used to connect the rear drive shaft assembly to the rear differential, allowing for angular deviations of the drive shafts due to acceleration and braking.

The joint is bolted to the input shaft of the rear differential with four flanged adhesive screws and is lubricated during manufacture and sealed for life.

Driveshaft - Front Driveshaft V8 5.0L Petrol

Removal and Installation

Removal

CAUTION: It is possible to fit the driveshaft incorrectly. Note the orientation before removal.

• **NOTE:** A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

3. Remove the transmission heat shield.

- Remove the 4 bolts.

4. **CAUTIONS:**

Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the transfer case drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.

5. **CAUTIONS:**

Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the front axle drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.

6. Remove the front driveshaft.

- Compress the joints to disengage the drive flanges.

E83936

Installation

1. **NOTE:** A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Install the driveshaft.

- Clean the components.
- Compress the joints to engage the drive flanges.

2.  **CAUTION:** Make sure that new bolts are installed.

Secure the driveshaft to the front axle drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

3.  **CAUTION:** Make sure that new bolts are installed.

Secure the driveshaft to the transfer case drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

4. Install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

5. Install the transmission crossmember.

For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

Driveshaft - Front DriveshaftV6 4.0L Petrol

Removal and Installation

Removal

CAUTION: It is possible to fit the driveshaft incorrectly. Note the orientation before removal.

• **NOTE:** A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).

4. CAUTIONS:

Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the transfer case drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.

5. CAUTIONS:

Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the front axle drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.

6. Remove the front driveshaft.

Installation

Compress the joints to disengage the drive flanges.
1. **NOTE:** A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Install the driveshaft.

- Clean the components.
- Compress the joints to engage the drive flanges.

2. Attach the driveshaft to the front axle drive flange.

- Tighten the new Torx bolts to 45 Nm (33 lb.ft), then a further 90 degrees.

3. Attach the driveshaft to the transfer case drive flange.

- Tighten the new Torx bolts to 45 Nm (33 lb.ft), then a further 90 degrees.

4. Install the exhaust system.

For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).

5. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

3. **NOTE:** If equipped.

Remove the transmission heat shield.

- Remove the 4 bolts.

4. **CAUTIONS:**

Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the transfer case drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.

5. **CAUTIONS:**

Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the front axle drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.

6. Remove the front driveshaft.

- Compress the joints to disengage the drive flanges.

E83936

Installation

1. **NOTE:** A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Install the driveshaft.

- Clean the components.
- Compress the joints to engage the drive flanges.

2.  **CAUTION:** Make sure that new bolts are installed.

Secure the driveshaft to the front axle drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

3.  **CAUTION:** Make sure that new bolts are installed.

Secure the driveshaft to the transfer case drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

4. Install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

5. Install the transmission crossmember.

For additional information, refer to: [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

Driveshaft - Rear Driveshaft

Removal and Installation

Removal

• NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the fuel tank heat shield.
 - Remove the 3 bolts and 2 nuts.

E44306

3. CAUTIONS:

 Mark the position of the driveshaft flange in relation to the drive pinion flange.

 To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the transfer case drive flange.

- Remove the 6 Torx bolts and washers.

E44307

4. CAUTIONS:

 Mark the position of the driveshaft flange in relation to the drive pinion flange.

 To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the rear axle drive flange.

- Remove and discard the 4 Torx bolts.

E44308

E44309

5. With assistance, remove the driveshaft.

- Remove the 2 driveshaft center bearing mount bolts.

Installation

1. NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Attach the driveshaft to the rear axle drive flange.

- Clean the component mating faces.
- Attach the driveshaft to the rear axle drive flange.
- Tighten the new Torx bolts to 150 Nm (110 lb.ft).

2. NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Attach the driveshaft to the transfer case drive flange.

- Clean the component mating faces.
- Tighten the Torx bolts to 73 Nm (54 lb.ft).

3. CAUTIONS:

 Align the driveshaft center bearing mount by moving the floating front section of the shaft backward or forwards until the bolt holes in the mount align with the holes in the chassis.

 Make sure the center bearing mount is not under tension.

Install the driveshaft center bearing mount bolts.

- Align the center bearing mount.
- Tighten the driveshaft center bearing retaining bolts to 30 Nm (22 lb.ft).

4. Install the fuel tank heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

Rear Drive Axle/Differential -

Sealers

Item	Land Rover Part No.
Input shaft flange nut	STC 50553
Input shaft splines	STC 50554
Differential (ETM) unit locking motor	STC 50550

Lubricants

Item	Specification
* Recommended lubricant:	
'Open' unit	Castrol SAF-XO - 75W/90
Electronic torque managed (ETM) unit	Castrol SAF Carbon Mod Plus

*** Do not use any lubricant other than that specified**

Capacities

Unit	Capacity
'Open' differential	1.1 litres (2.3 US pints) (1.16 US quarts)
Electronic torque managed (ETM) differential	1.5 litres (3.17 US pints) (1.6 US quarts)

Rear 'Open' Differential

Item	Specification
Reduction ratio:	
V6 Diesel engine - Manual transmission	3.07:1
V6 Diesel engine - Automatic transmission	3.54:1
V6 Petrol engine - Automatic transmission	3.73:1
V8 Petrol engine - Automatic transmission	3.54:1

Rear Electronic Torque Managed (ETM) Differential

Item	Specification
Electronic torque managed (ETM) range	Up to 2500 Nm (98.5 lbf/ft)
Electronic torque managed (ETM) motor	Operates the ball/ramp mechanism and wet clutch. Motor incorporates a temperature sensor and is controlled by an ECU
Differential type	4 pin
Reduction ratio:	
V6 Diesel engine - Manual transmission	3.07:1
V6 Diesel engine - Automatic transmission	3.54:1
V6 Petrol engine - Automatic transmission	3.73:1
V8 Petrol engine - Automatic transmission	3.54:1

Torque Specifications

Description	Nm	lb-ft
Oil drain plug, with Hexagonal drive plug	54	40
Oil drain plug, with 3/8" square drive plug	28	21
Oil filler plug	34	25
Oil temperature sensor	22	16
++ Differential locking motor	10	7
Differential front mounting bolt	275	203
Differential rear mounting bolts	175	129
* Driveshaft to rear axle drive flange Torx bolts	150	110
Lower arm to wheel knuckle	275	203
Toe link bolt	175	129
Stabilizer bar link nuts	115	85
**+ Halfshaft retaining nut	350	258
Fuel tank heat shield nuts and bolts	10	7
Road wheel nuts	140	103

*** New 'Patchlok' Torx bolts must be installed**

**** New nut must be installed**

+ Stake nut on completion of tightening operation

++ Apply sealant, Part No. STC 50550 to flange of locking motor

Rear Drive Axle/Differential - Rear Drive Axle and Differential

Description and Operation

GENERAL

E51166

Item	Part Number	Description
A	-	Electronic rear differential
B	-	Open rear differential
1	-	Rear driveshaft
2	-	Electronic rear differential
3	-	RH rear drive halfshaft
4	-	Actuator (locking) motor assembly
5	-	LH rear drive halfshaft
6	-	Rear differential

The open rear differential converts the 'angle of drive' through 90° and distributes drive, via the rear drive halfshafts, to the rear wheels.

The open rear differential for the V6 and V8 petrol variants has the same output ratio, but the output ratios for the TdV6 diesel are different, depending on whether automatic or manual transmission is fitted.

The open rear differential is located centrally in the rear of the chassis.

The units are mounted to the chassis via rubber bushes and bolts; two mounting points at the rear of the unit and one at the front.

40	-	Bolt, 12 of

The cast iron casing comprises two parts; a cover and a carrier. The carrier provides locations for all the internal components. The carrier is sealed to the cover via an O-ring seal and secured with twelve bolts. The cover and carrier have cast fins, which assist mobility. A breather tube is fitted to the top of the carrier. This allows a plastic tube to be fitted and routed to a high point under the vehicle body, preventing the ingress of water when the vehicle is wading.

The carrier contains an oil drain plug. The differential unit contains approximately 1.16 litres of oil from a dry fill. If oil is being replaced, a smaller quantity of oil will be required due to residual oil retained in the pinion housing.

The differential is a conventional design using a hypoid gear layout, similar to the front differential. The open rear differential is available in three ratios. V8 petrol engine vehicles use a differential with a final drive ratio of 3.73:1, V6 petrol engine vehicles use a differential with a final drive ratio of 3.73:1 and TdV6 engine vehicles use a final drive ratio of 3.54, for vehicles with automatic transmission and 3.07 for vehicles with manual transmission. Changing the number of teeth between the crown wheel drive gear and pinion gear changes the ratio.

The differential comprises a pinion shaft and hypoid pinion gear and a crown wheel drive gear with an integral cage, which houses two planet gears. Two sun wheels are also located in the cage and pass the rotational drive to the drive shafts.

The pinion shaft is mounted on two opposed taper roller bearings, with a collapsible spacer located between them. The spacer is used to hold the bearings in alignment and also collapses under the pressure applied to the pinion flanged nut. This allows the flanged nut to be tightened to a predetermined torque, which collapses the spacer, setting the correct bearing preload.

The pinion shaft has an externally splined outer end, which accepts and locates the input flange, which is retained by the pinion nut and retainer. The input flange has four threaded holes and mates with the rear drive shaft. Four bolts secure the rear drive shaft to the input flange. An oil seal is pressed into the pinion housing and seals the input flange to the pinion housing. The pinion shaft has a hypoid gear at its inner end, which mates with the crown wheel drive gear.

The crown wheel drive gear is located on the differential case and secured with ten screws. The differential case is mounted on taper roller bearings located in machined bores on each side of the pinion housing. Shims are retained in the casing behind the bearing cups, the shim thickness is selected to apply the correct bearing preload and hypoid backlash.

The differential carrier has a through hole, which provides location for the shaft. The shaft is supported by a sun gear and a needle roller bearing. The shaft is fitted with a snap ring at one end, which locates in a machined groove in the sun gear, locking the shaft in position.

The sun gears are located in pockets in the carrier cage and mesh with the planet gears. Spacers are fitted between the sun wheels and the carrier and set the correct mesh contact between the planet gears and the sun wheels. Each sun wheel has a machined bore with internal splines and machined groove near the splined end. The groove provides positive location for a snap ring fitted to the end of each output flange.

Each output shaft has a spline, which locates in each sun wheel. A snap ring fitted to the splined shaft locates in the groove the sun wheel bore and positively locates the output shaft. Oil seals are pressed into each side of the pinion housing and seal the seal the output shaft.

Differential Operation

The operating principles of the front and rear differentials are the same. Rotational input from the drive shaft is passed via the input flange to the pinion shaft and pinion gear. The angles of the pinion gear to the crown wheel drive gear moves the rotational direction through 90°.

The transferred rotational motion is now passed to the crown wheel drive gear, which in turn rotates the differential casing. The shaft, which is secured to the casing, also rotates at the same speed as the casing. The planet gears, which are mounted on the shaft, also rotate with the casing. In turn, the planet gears transfer their rotational motion to the left and right hand sun wheels, rotating the drive halfshafts.

When the vehicle is moving in a forward direction, the torque applied through the differential to each sun wheel is equal. In this condition both drive halfshafts rotate at the same speed. The planet gears do not rotate and effectively lock the sun wheels to the differential casing.

If the vehicle is turning, the outer wheel will be forced to rotate faster than the inner wheel by having a greater distance to travel. The differential senses the torque difference between the sun wheels. The planet gears rotate on their axes to allow the outer wheel to rotate faster than the inner one.

SERVICE

The oil used in the open rear differential is Castrol SAF-XO. The oil contains unique additives, which enhance the differentials operation. No other oil must be used in the open rear differential.

Open Rear Differential Serviceable Components

- Needle roller bearing assemblies
- Halfshaft seals
- Chassis bush/fixings
- Lubricant.

The electronic rear differential has the same functionality as the open rear differential but incorporates a locking feature.

An electronically controlled multi-plate clutch provides a rear differential lock and torque biasing function to give improved traction performance and vehicle dynamic stability.

A strategy, to electronically control the rear differential multi-plate clutch assembly, has been developed to provide:

- a pre-loading function, increasing locking torque with increased driving torque
- a slip controller to increase locking torque under off-road conditions and decrease locking torque for optimum comfort, e.g. parking.

The unit receives a torque input from the transfer box output shaft, which is passed through the unit to two outputs for the rear drive halfshafts.

The unit detects wheel slip via various vehicle system inputs to the electronic rear differential control module and locks the differential accordingly.

E51169

Item	Part Number	Description
1	-	Actuator

2	-	Clutch pack
3	-	Differential

The electronic rear differential locking and biasing feature is actuated via a DC motor, which is controlled by the electronic rear differential control module, via a Pulse Width Modulation (PWM) signal.

Multi-plate Clutch Assembly

E51170

Item	Part Number	Description
1	-	Pressure disc
2	-	Clutch plate assembly
3	-	Pressure disc
4	-	Thrust race
5	-	Output actuator
6	-	Actuator balls
7	-	Input actuator
8	-	Bearing pre-load spacer
9	-	Reduction gearset
10	-	Actuator motor

The multi-plate clutch assembly for both centre (transfer box) and electronic rear differentials act in a similar way. The aim of the multi-plate clutch assembly is to prevent excessive differential slip and therefore maximise the traction performance of the vehicle. This is fundamentally different from the 'braked' traction control, which can only counter act differential slip when it occurs.

A certain amount of differential slip is required to allow the vehicle to turn corners and to remain stable under control of the Anti-lock Braking System (ABS). The transfer box control module monitors the driver's demands through primary vehicle controls and automatically sets the slip torque at the rear differential via the electronic rear differential control module. The system is completely automatic and does not require any special driver input.

The multi-plate clutch assembly actively controls the torque flow through the rear differential and optimises the torque distribution in the driveline. The clutch assembly biases the torque from the differential to the wheels with the higher grip and prevents the wheels with the lower grip from spinning.

By turning the input actuator disc, via the motor shaft, the output actuator is rotated. This movement acts on 5 balls in a ramp mechanism between the input and output actuators and gives a defined axial movement. The movement forces the pressure disc to induce friction between the sun gear and differential case via the clutch plates supported by the sun gear and the plates supported by the clutch basket on the differential case. This frictional force inhibits the differential rotation; the differential case and left hand differential side gear are locked together.

Electronic Rear Differential Control Module

The electronic rear differential control module controls the multi-plate clutch actuation. The control module is mounted on a bracket located on the LH C-pillar, behind the trim.

E51171

Item	Part Number	Description
1	-	Electronic rear differential control module

The control module is connected on the Controller Area Network (CAN) bus and controls the differential operation using CAN messages from other control modules on the network.

The control module uses three connectors for all inputs and outputs. It receives a permanent power supply via a 40A fusible link located in the Battery Junction Box (BJB), and an ignition supply via fuse 24 located in the Central Junction Box (CJB).

The control module memorises the position of the electronic rear differential motor when the ignition is switched off.

The control module controls the closed loop position sensing system within the motor and regulates the power supply to the motor.

If the control module is replaced, T4 must be connected to the vehicle and the electronic rear differential control module self-calibration procedure must be performed. This procedure must also be performed if the motor or differential assembly is replaced.

If a fault occurs with the electronic rear differential, the control module records an error code and a warning lamp, in the instrument cluster, illuminates permanently.

CAN Bus Messages

The CAN bus is a high speed broadcast network connected between various vehicle control modules. It allows the fast exchange of data between control modules every few microseconds. The bus comprises two wires, which are twisted together to minimise electromagnetic interference (noise) produced by the CAN messages.

For additional information, refer to: Communications Network (418-00 Module Communications Network, Description and Operation).

The electronic rear differential control module is connected on the CAN bus, via the transfer box control module, and controls differential operation using CAN messages from other control units on the network. Wheel speed, steering angle, automatic transmission speed, temperature information, car configuration, axle ratios and mode inputs, are some of the main signals received by the control module.

The control module also sends messages via the CAN bus to tell other control modules on the network, the status of the electronic rear differential. The clutch torque and default mode status are some of the main signals sent out by the control module.

The following table shows the messages that can be displayed in the message centre of a high-line instrument cluster relating to the electronic rear differential:

Message	Description	Chime
'TRANSMISSION OVERHEAT' 'SLOW DOWN'	Rear differential temperature has reached or is approaching the overheat threshold.	None
'TRANSMISSION FAULT' 'TRACTION REDUCED'	Transfer box control module has stopped transmitting CAN bus messages. Defaults to open centre differential. Message also displayed when fault occurs with electronic rear differential.	None
'TRANSMISSION FAULT' 'STOP SAFELY'	Fault has occurred with electronic rear differential. Stop vehicle at earliest opportunity.	Single

On vehicles fitted with the low line instrument cluster, in place of the message centre there will be a status lamp, which has the following logic:

- Amber - Over temperature
- Red - Failure, stop vehicle

TERRAIN RESPONSE™

The Terrain Response™ system allows the driver to select a program, which will provide the optimum settings for traction and performance for the prevailing terrain conditions.

The system is controlled by a rotary control located on the centre console.

The system uses a combination of vehicle subsystems to achieve the required vehicle characteristics for the terrain selected. The following subsystems form the Terrain Response™ system:

- Engine management system
- Automatic transmission (if fitted)
- Transfer box
- Brake system
- Air suspension.

Each subsystem control module provides a feedback for the selected program so that the Terrain Response™ control module can check that all systems are controlling the system correctly. The exception to this is the electronic rear differential control module which does not provide feedback to the Terrain Response™ system as it is a slave to the transfer box control module.

For additional information, refer to: [Ride and Handling Optimization](#) (204-06 Ride and Handling Optimization, Description and Operation).

SERVICE

The oil used in the electronic rear differential is Castrol SAF-Carbon Mod Plus. The oil contains unique additives and friction modifiers, which enhance the differentials operation. No other oil must be used in the electronic rear differential.

Electronic Rear Differential Serviceable Components

- Halfshaft seals
- Needle roller bearing assembly
- Chassis bush/fixings
- Actuator motor
- Temperature sensor
- Control module and bracket
- Lubricant.

DIAGNOSTICS

The electronic rear differential control module can store fault codes, which can be retrieved using T4 or a diagnostic tool using ISO-14229 protocol.

The information is communicated via a diagnostic socket.

The diagnostic socket allows the exchange of information between the various control modules on the bus systems and T4 or another suitable diagnostic tool. The information is communicated to the socket via the CAN bus. This allows the retrieval of diagnostic information and programming of certain functions using T4 or another suitable diagnostic tool.

The electronic rear differential control module uses Diagnostic Trouble Codes (DTC), which relate to electronic rear differential electrical faults.

Rear Drive Axle/Differential - Rear Drive Axle and Differential

Diagnosis and Testing

Principles of Operation

For a detailed description of the Rear Drive Axle and Differential and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Rear Drive Axle and Differential](#) (205-02 Rear Drive Axle/Differential, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Differential oil leakage ● Sensor installation 	<ul style="list-style-type: none"> ● power ● Fuse(s) ● Wiring harness physical damage or water ingress ● Loose or corroded electrical connectors ● Controller Area Network (CAN) circuits ● Sensors ● Rear differential control module

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Message	Possible Other Warnings	Possible Causes	Action
Running at reduced capability with fault present	<ul style="list-style-type: none"> ● Rear differential fault 	<ul style="list-style-type: none"> ● Driveline overheat warning lamp illuminated ● Rear differential/driveline fault warning lamp illuminated 	<ul style="list-style-type: none"> ● Water ingress to wiring harness or connectors ● Reduced differential capability ● Differential increased tolerances ● Internal fault ● Rear differential control module fault (Rear differential control module) 	Visually inspect the wiring harness and connectors for water ingress. Refer to the warranty policy and procedures manual if a module is suspect.
Rear differential overheat	<ul style="list-style-type: none"> ● Rear Differential Overheat Slow Down 	<ul style="list-style-type: none"> ● Driveline overheat warning lamp illuminated 	<ul style="list-style-type: none"> ● Oil level incorrect ● Oil level incorrect specification ● Sensor fault ● Internal fault 	Check for correct oil quantity and specifications. Refer to the relevant section of the workshop manual.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Rear Differential Control Module \(RDCM\)](#) (100-00 General Information, Description and Operation).

Rear Drive Axle/Differential - Differential Draining and Filling

General Procedures

CAUTION: Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

• **NOTE:** The only way to check the fluid level in the differential is to drain all the fluid out and refill with the correct quantity, shown in the specification section.

For additional information, refer to: [Specifications](#) (205-02 Rear Drive Axle/Differential, Specifications).

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- CAUTION:** Do not undo or remove the large protruding hexagon on the differential casing.

Remove the differential case lubricant filler plug.

- Clean the area around the lubricant filler plug.
- Position container to collect fluid loss.

- Drain the differential lubricant.

- Clean the area around the drain plug.
- Remove the fluid drain plug.

- CAUTION:** There has been 2 different types of fixings used for the drain plug. Note the type and make sure the correct torque is applied, see below.

Install the lubricant drain plug.

- Clean the drain plug.
- Up to differential serial number 254325: Tighten the hexagonal drive drain plug to 54 Nm (40 lb.ft).
- From differential serial number 254326: Tighten the 3/8" square drive drain plug to 28 Nm (21 lb.ft).

5. CAUTIONS:

There have been 2 different types of fixings used for the drain plug. Note the type and differential serial number, and make sure the correct torque is applied, see below.

Make sure the correct specification and quantity of oil is used.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: [Specifications](#) (205-02 Rear Drive Axle/Differential, Specifications).

6. Install the differential filler plug.

- Clean the filler plug.
- Tighten the filler plug to 34 Nm (25 lb.ft).

Rear Drive Axle/Differential - Differential Locking Motor

In-vehicle Repair

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the differential locking motor.

- Disconnect the electrical connector.
- Remove the 4 bolts.

Installation

1. Clean the component mating faces.
2. Apply continuous bead of sealant to the motor mating face on the differential.

3. Install the differential locking motor.
 - Tighten the bolts to 10 Nm (7 lb.ft).
 - Connect the electrical connector.
4. Lower the vehicle.
5. Calibrate the differential locking motor using the diagnostic tool.

Rear Drive Axle/Differential - Rear Axle Oil Temperature Sensor

In-vehicle Repair

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Drain the differential lubricant.
For additional information, refer to: [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).
- Disconnect the electrical connector.
 - Release the wiring harness retaining clip.

- Remove the oil temperature sensor.

- Remove and discard the O-ring seal.

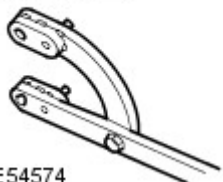

Installation

- Clean the component mating faces.
- Install the oil temperature sensor.
 - Tighten to 22 Nm (16 lb.ft).
- Connect the electrical connector.
 - Secure the wiring harness clip.
- Fill the differential with the correct amount of lubricant.
For additional information, refer to: [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).

Rear Drive Axle/Differential - Drive Pinion Seal

<p>205-823</p>  <p>E54700</p>	<p>Remover drive pinion seal</p> <p>205-823</p>
<p>205-821-01</p>  <p>E 112195</p>	<p>Seal installer, adaptor</p> <p>205-821-01</p>

Removal

• CAUTIONS:

The input flange must not be change for one from another unit.

The drive pinion seal must only be renewed for 1 repair.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Drain the differential lubricant.
For additional information, refer to: [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).

3. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.

4.  **CAUTION:** Mark the position of the driveshaft flange in relation to the drive pinion flange.

Release the driveshaft from the rear axle drive pinion flange.

- Remove and discard the 4 Torx bolts.

5. Measure the depth of the pinion nut on the pinion shaft.

- Note measurement for installation.

E112387

6.  CAUTION: This step must be carried out to make sure that the drive pinion nut is correctly tightened on assembly.

Accurately scribe a line to mark the drive pinion shaft to the drive pinion nut and pinion flange.

E54588

7. Remove the drive pinion flange retaining nut.

- Using the special tool, counter hold the drive pinion flange.
- Note number of turns for installation.

E54589

8. Using the special tool, remove the drive pinion flange.

- Check flange seal journal for any damage.

9. Using the special tool, remove the drive pinion seal.

Installation

1. Clean the drive pinion flange.
2. Clean the drive pinion seal mating faces.
3. Using the special tool, install the new drive pinion seal.

4. Remove the special tool.

- Install special tool 205-821-01 to the seal face.

5.  CAUTION: Make sure adaptor is removed or damage to the vehicle may occur.

Using the special tool, install the new drive pinion seal.

- Remove the special tools.

6.  CAUTION: Make sure the drive pinion flange scribed marks are aligned.

Install the drive pinion flange.

7. CAUTIONS:

 Make sure the mark on the drive pinion nut is never tightened short of the scribed mark on the drive pinion shaft.

 Make sure the drive pinion flange has no end float and is free to rotate.

 Make sure the scribed mark on the drive pinion nut is no more than a maximum of 5 degrees past the scribed mark on the drive pinion shaft.

Install the drive pinion flange retaining nut.

- Using the special tool, counter hold the drive pinion flange.
- Install nut to previously noted number of turns.
- Measure the depth of the pinion nut on the pinion shaft.

8. Attach the driveshaft to the rear axle drive flange.

- Clean the component mating faces.
- Attach the driveshaft to the rear axle drive flange.
- Tighten the new Torx bolts to 150 Nm (110 lb.ft).

9. Install the fuel tank heat shield.

- Tighten the bolts and nuts to 10 Nm (7 lb.ft).

10.  CAUTION: Make sure the correct specification and quantity of oil is used.

Fill the differential with the correct amount of lubricant. For additional information, refer to: [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).

Rear Drive Axle/Differential - Differential Locking Module

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the rear quarter trim panel.
For additional information, refer to: [Rear Quarter Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Release the parking aid module.
 - Remove the 2 nuts.

E54439

4. Remove the differential locking module.
 - Disconnect the 3 electrical connectors.
 - Remove the 3 bolts.

E54440

Installation

1. Install the differential locking module.
 - Install the bolts and tighten to 10 Nm (7 lb.ft).
 - Connect and secure the electrical connectors.
2. Install the parking aid module.
 - Tighten the nuts to 10 Nm (7 lb.ft).
3. Install the rear quarter trim panel.
For additional information, refer to: [Rear Quarter Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
5. Use T4 to calibrate a new differential locking module.

Rear Drive Axle/Differential - Axle Assembly

Removal and Installation

Removal

CAUTION: Do not loosen or remove the large protruding hexagon on the differential casing.

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the rear wheels and tires.
- Remove the muffler assembly.
For additional information, refer to: [Muffler](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation) / [Muffler](#) (309-00 Exhaust System - 4.4L, Removal and Installation) / [Muffler - Vehicles Without Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).
- Drain the differential fluid.
For additional information, refer to: [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).
- Remove the RH rear halfshaft.
For additional information, refer to: [Rear Halfshaft](#) (205-05 Rear Drive Halfshafts, Removal and Installation).

- CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the LH rear stabilizer bar link.

- Remove and discard the 2 nuts.

E49701

- Release the parking brake cable from the LH lower arm.

E49702

8. Release the LH rear toe link.

- Remove the bolt.

E46797

9.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the LH rear wheel knuckle from the lower arm.

- Remove the bolt.
- Using a suitable stand, support the LH rear wheel knuckle.

E46798

10. NOTE: RH illustration shown, LH is similar

Release the LH rear halfshaft from the axle assembly.

- Remove and discard the snap ring.

E63938

11.  **CAUTION:** Mark the position of the driveshaft flange in relation to the drive pinion flange.

Release the driveshaft from the rear axle drive flange.

- Remove and discard the 4 bolts.
- Support the driveshaft using a suitable tie strap.

12. Vehicles with differential locking motor: Disconnect the 2 electrical connectors.

- Release the 2 wiring harness clips.

13. Using a transmission jack, support the rear axle assembly.

14.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

With assistance, remove the rear axle assembly.

- Remove the 3 bolts.
- Disconnect the breather line.

Installation

1. With assistance, install the rear axle assembly.

- Tighten the front mounting bolt to 275 Nm (203 lb.ft).
- Tighten the rear mounting bolts to 175 Nm (129 lb.ft).
- Connect the breather line.

2. Vehicles with differential locking motor: Connect the electrical connectors.

- Secure the wiring harness clips.

3. **NOTE:** Install new bolts.

Secure the driveshaft to the rear axle drive flange.

- Clean the component mating faces.
- Tighten the bolts to 150 Nm (110 lb.ft).

4. Install a new snap ring to the LH halfshaft.

5. **NOTE:** Do not fully engage the halfshaft until the oil seal protector has been removed.

Secure the LH halfshaft in the axle assembly.

1. Open the halfshaft seal protector and install the halfshaft.
2. Release the halfshaft seal protector from the halfshaft seal.
3. Remove the halfshaft seal protector.
4. Fully install the halfshaft.
5. Make sure the snap ring is fully engaged and retains the halfshaft.

E93428

6.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Secure the LH rear wheel knuckle to the lower arm.

- Tighten the nut and bolt to 275 Nm (203 lb.ft).

7. Secure the LH rear toe link.

- Tighten the bolt to 175 Nm (129 lb.ft).

8. Secure the parking brake cable to the LH lower arm.

9. **NOTE:** Install new nuts.

Install the LH rear stabilizer bar link.

- Tighten the nuts to 115 Nm (85 lb.ft).

10. Install the RH rear halfshaft.

For additional information, refer to: [Rear Halfshaft](#) (205-05 Rear Drive Halfshafts, Removal and Installation).

11. Fill the differential with fluid.

For additional information, refer to: [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).

12. Install the muffler assembly.

For additional information, refer to: [Muffler](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation) / [Muffler](#) (309-00 Exhaust System - 4.4L, Removal and Installation) / [Muffler - Vehicles Without Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).

13. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Drive Axle/Differential - Axle Housing Bushing

Removal and Installation

 <p>205-825/8</p> <p>E55277</p>	<p>Nut for long 16mm bolt</p> <p>205-825/8</p>

Removal

- NOTE: Take note of the fitted position of the bush.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the muffler assembly.
For additional information, refer to: Muffler (309-00, Removal and Installation).

3. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.

4. CAUTIONS:

 Mark the position of the driveshaft flange in relation to the drive pinion flange.

 To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the rear axle drive flange.

- Remove and discard the 4 Torx bolts.

5.  CAUTION: Make sure the weight of the axle is always supported.

Using a suitable jack, lower the front of the axle.

- Remove the axle front retaining bolt.

6. Using the special tools, remove the axle housing bushing.

Installation

1. Using the special tools, install the axle housing bushing.

2.  CAUTION: Make sure the weight of the axle is always supported.

Using a suitable jack, raise the front of the differential.

- Install the axle front retaining bolt.
- Tighten to 275 Nm (203 lb.ft).

3. Attach the driveshaft to the rear axle drive flange.

- Clean the component mating faces.
- Attach the driveshaft to the rear axle drive flange.
- Tighten the new Torx bolts to 150 Nm (110 lb.ft).

4. Install the fuel tank heat shield.

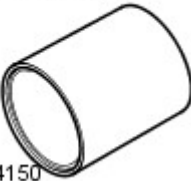

- Tighten the bolts and nuts to 10 Nm (7 lb.ft).

5. Install the muffler assembly.

For additional information, refer to: Muffler (309-00, Removal and Installation).

Rear Drive Axle/Differential - Rear Axle Housing Support Insulator

Removal and Installation

Special Tool(s)	
 <p>502-009/5 E54148</p>	<p>Remover/Installer long 14mm bolt 502-009/5</p>

 <p>502-009/2 E54151</p>	<p>Remover rear differential rear bush 502-009/2</p>
 <p>502-009/3 E54152</p>	<p>Installer rear differential rear bush 502-009/3</p>

Removal

- NOTE: Take note of the fitted position of the bush.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

3. Remove the rear differential.

For additional information, refer to: [Axle Assembly](#) (205-02 Rear Drive Axle/Differential, Removal and Installation).

4. NOTE: Take note of the fitted position of the bush.

Using the special tools, remove the rear axle housing support insulator.

Installation

1. Using the special tools, install the rear axle housing support insulator.

2. Install the rear differential.
For additional information, refer to: [Axle Assembly](#) (205-02 Rear Drive Axle/Differential, Removal and Installation).
3. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Axle/Differential - Front Drive Axle and Differential

Description and Operation

GENERAL

E50981

Item	Part Number	Description
1	-	RH front drive halfshaft
2	-	Front differential assembly
3	-	Front driveshaft
4	-	LH front drive halfshaft

The front differential converts the 'angle of drive' through 90° and distributes drive, via the front drive halfshafts, to the front wheels.

The front differential for the V6 and V8 petrol variants have the same output ratio, but the output ratios for the TdV6 are different, depending on whether automatic or manual transmission is fitted.

The front differential is mounted on the LH side of the chassis.

43	-	Shaft
44	-	Sunwheel
45	-	Thrust washer
46	-	Mounting bush assembly

The casing comprises two halves with machined mating faces. When assembled, the cast iron casing halves are sealed with a thin film of Loctite 5999 sealant and secured together with fourteen bolts. A breather tube is fitted to the casings. This allows a plastic tube to be fitted and routed to a high point in the engine compartment, preventing the ingress of water when the vehicle is wading.

The RH casing is fitted with a drain plug. The front differential unit contains approximately 0.7 litre of oil for a dry fill.

The differential is a conventional design using a hypoid gear layout. This employs a hypoid bevel pinion gear and crown wheel, with the pinion offset above the centre line of the crown wheel. This design allows for a larger pinion gear to be used, which has the advantages of increased gear strength and reduced operating noise.

The front differential is available in three ratios. V8 and V6 petrol engine vehicles use a front differential with a final drive ratio of 3.73:1 and TdV6 diesel engine vehicles use a final drive ratio of 3.07:1, for vehicles with manual transmission, and 3.54:1 for vehicles with automatic transmission. Changing the number of teeth between the crown-wheel drive gear and pinion gear changes the ratio.

The differential comprises a pinion shaft and hypoid bevel gear, a crown wheel drive gear with an integral cage, which houses two planet gears. Two sun wheels are also located in the cage and pass the rotational drive to the drive shaft shafts.

The pinion shaft is mounted on two opposed taper roller bearings with a collapsible spacer located between them. The spacer is used to hold the bearings in alignment and also collapses under the pressure applied to the pinion nut. This allows the nut to be tightened to a predetermined torque, which collapses the spacer, setting the correct bearing preload.

The pinion shaft has an externally splined outer end which accepts and locates the input flange, which is retained by the pinion nut. The opposite end of the output flange has an internal spline which provides positive location for the front propeller shaft. The flange has an external O-ring seal which seals against the front propeller shaft shroud preventing the ingress of dirt and moisture into the splines. An oil seal is pressed into the LH casing and seals the input flange to the differential unit. The pinion shaft has a hypoid bevel gear at its inner end which mates with the crown wheel drive gear.

The crown wheel drive gear is located on the carrier and secured with ten screws. The carrier is mounted on taper roller bearings located in each casing half. The bearings are press fitted into the casing and a spacer is located on the outside face to set backlash and apply preload to the bearing.

The carrier is fitted with a shaft onto which the two planet gears are mounted. The shaft is secured in the carrier with a roll pin. The sun wheels are located in pockets within the carrier and mesh with the planet gears. Thrust washers are located between the carrier and the sun wheels and hold the sun wheels in mesh with the planet gears. Each sun wheel has a machined, splined, bore to accept the drive shaft. A groove is machined in the bore to locate the snap ring fitted to the drive shaft, providing positive drive shaft location.

Differential Operation

The operating principles of the front and rear differentials are the same. Rotational input from the propeller shaft is passed via the input flange to the pinion shaft and pinion gear. The angles of the pinion gear to the crown wheel drive gear moves the rotational direction through 90°.

The transferred rotational motion is now passed to the crown wheel drive gear, which in turn rotates the carrier. The shaft,

which is secured to the carrier, also rotates at the same speed as the carrier. The planet gears, which are mounted on the shaft, also rotate with the carrier. In turn, the planet gears transfer their rotational motion to the left and right hand sun wheels, rotating the drive shafts.

When the vehicle is moving in a forward direction, the torque applied through the differential to each sun wheel is equal. In this condition both drive shafts rotate at the same speed. The planet gears do not rotate and effectively lock the sun wheels to the carrier.

If the vehicle is turning, the outer wheel will be forced to rotate faster than the inner wheel by having a greater distance to travel. The differential senses the torque difference between the sun wheels. The planet gears rotate on their axes to allow the outer wheel to rotate faster than the inner one.

SERVICE

The oil used in the front differential is Castrol SAF-XO. The oil contains unique additives, which enhance the differentials operation. No other oil must be used in the front differential.

Front Differential Serviceable Components

- Halfshaft seals
- Needle roller bearing assemblies
- Chassis bush/fixings
- Lubricant.

Front Drive Axle/Differential - Differential Draining and Filling

General Procedures

CAUTION: Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, not to act as a level indicator.

• **NOTE:** The only way to check the fluid level in the differential is to drain all the fluid out and refill with the correct quantity, shown in the specification section.

For additional information, refer to: [Specifications](#) (205-03 Front Drive Axle/Differential, Specifications).

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

- Remove the differential case lubricant filler plug.

- Clean the area around the lubricant filler plug.
- Position container to collect fluid loss.

- Drain the differential lubricant.

- Clean the area around the drain plug.
- Remove the fluid drain plug.

- CAUTION:** There have been 2 different types of fixings used for the drain plug. Note the type and differential serial number, and make sure the correct torque is applied, see below.

Install the lubricant drain plug.

- Clean the drain plug.
- Up to differential serial number 254845: Tighten the hexagonal drive drain plug to 54 Nm (40 lb.ft).
- From differential serial number 254846: Tighten the 3/8" square drive drain plug to 28 Nm (21 lb.ft).

- CAUTION:** Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, not to act as a level indicator.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: [Specifications](#) (205-03 Front Drive Axle/Differential, Specifications).

7. Install the differential filler plug.

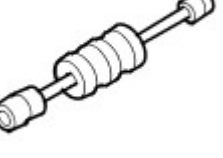

- Tighten the filler plug to 34 Nm (25 lb.ft).

8. Install the engine undershield.

For additional information, refer to: [Engine Undershield](#)
(501-02 Front End Body Panels, Removal and Installation).

Front Drive Axle/Differential - Drive Pinion Seal

In-vehicle Repair

Special Tool(s)	
 <p>205-053</p> <p>E54574</p>	<p>Flange holding tool</p> <p>205-053</p>
 <p>205-824</p> <p>E54587</p>	<p>Remover drive flange</p> <p>205-824</p>
 <p>205-820</p> <p>E54703</p>	<p>Installer - drive pinion oil seal</p> <p>205-820</p>
 <p>100-012</p> <p>E54135</p>	<p>Impulse extractor</p> <p>100-012(LRT-99-004)</p>

Removal

 **CAUTION:** The drive pinion seal must only be renewed once.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Drain the differential lubricant.

For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).

3. Remove the front driveshaft.

For additional information, refer to: [Front Driveshaft - V8 5.0L Petrol](#) (205-01 Driveshaft, Removal and Installation) / [Front Driveshaft - V6 4.0L Petrol](#) (205-01 Driveshaft, Removal and Installation) / [Front Driveshaft - TDV6 3.0L Diesel](#) (205-01 Driveshaft, Removal and Installation) / [Front Driveshaft - TDV6 2.7L Diesel](#) (205-01 Driveshaft, Removal and Installation).

4. Measure the depth of the pinion nut on the pinion shaft.

- Note measurement for installation.

E114355

5.  CAUTION: This step must be carried out to make sure that the drive pinion nut is correctly tightened on assembly.

Accurately scribe a line to mark the drive pinion shaft to the drive pinion nut and pinion flange.

E114354

6. Remove the drive pinion flange retaining nut.

- Using the special tool, counter hold the drive pinion flange.
- Discard the drive pinion nut retainer.

E54579

7.  CAUTION: Make sure only a bolt is used with the special tool, to draw the drive pinion flange off the drive pinion shaft.

Using the special tool, remove the drive pinion flange.

8. Using the special tool, remove the drive pinion seal.

Installation

1. Clean the drive pinion flange.
2. Clean the drive pinion seal mating faces.
3. Using the special tool, install the new drive pinion seal.

4.  CAUTION: Make sure the drive pinion flange scribed marks are aligned.

Install the drive pinion flange.

5. CAUTIONS:

-  Make sure the mark on the drive pinion nut is never tightened short of the scribed mark on the drive pinion shaft.
-  Make sure the drive pinion flange has no end float and is free to rotate.
-  Make sure the scribed mark on the drive pinion nut is no more than a maximum of 5 degrees past the scribed mark on the drive pinion shaft.

Install the drive pinion flange retaining nut.

- Using the special tool, counter hold the drive pinion flange.
- Install nut to previously noted number of turns.
- Measure the depth of the pinion nut on the pinion shaft.

6. Install the front driveshaft.

For additional information, refer to: [Front Driveshaft - V8 5.0L Petrol](#) (205-01 Driveshaft, Removal and Installation) / [Front Driveshaft - V6 4.0L Petrol](#) (205-01 Driveshaft, Removal and Installation) / [Front Driveshaft - TDV6 3.0L Diesel](#) (205-01 Driveshaft, Removal and Installation) / [Front Driveshaft - TDV6 2.7L Diesel](#) (205-01 Driveshaft, Removal and Installation).

7. CAUTION: Make sure the correct specification and quantity of oil is used.

Fill the differential with the correct amount of lubricant. For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).

Front Drive Axle/Differential - Axle Tube

In-vehicle Repair

Removal

1. Remove the RH halfshaft.
For additional information, refer to: [Front Halfshaft RH](#) (205-04 Front Drive Halfshafts, Removal and Installation).

2. Remove the axle tube.

- Remove the bolt from the bushing.
- Remove the 4 bolts.
- Rotate and remove the axle tube.
- Early models: Remove and discard the O-ring seal.
- Later models: Remove the sealant.

E54156

Installation

1. Install the axle tube.

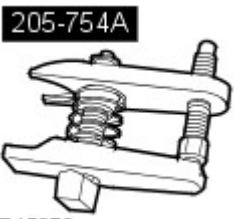

- Clean the component mating faces.
- Early models: Install a new O-ring seal.
- Later models: Apply sealant to the mating face.
For additional information, refer to: [Specifications](#) (205-03 Front Drive Axle/Differential, Specifications).
- Tighten the 4 axle tube bolts to 50 Nm (37 lb.ft).
- Tighten the axle tube bushing bolt to 63 Nm (46 lb.ft).

2. Install the RH halfshaft.

For additional information, refer to: [Front Halfshaft RH](#) (205-04 Front Drive Halfshafts, Removal and Installation).

Front Drive Axle/Differential - Axle Assembly

Removal and Installation

Special Tool(s)	
 <p>205-754A E45276</p>	Ball joint separator 205-754(LRT-54-027)
 <p>204-703 E99557</p>	Front Stabilizer Bar Bushing Tightening Tool 204-703
 <p>204-705 E99558</p>	Front Stabilizer Bar Bushing Tightening Tool 204-705

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

All vehicles

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the front wheels and tires.
3. Remove the axle tube.
For additional information, refer to: [Axle Tube](#) (205-03 Front Drive Axle/Differential, In-vehicle Repair).
4. Remove the LH splash shield.
 - Remove the 4 clips.

5. Release the LH stabilizer bar link.

- Remove and discard the nut.

6. Release the LH brake hose bracket from the wheel knuckle.

- Remove the bolt.

7.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the LH tie-rod end ball joint from the wheel knuckle.

- Remove and discard the nut.

8. CAUTIONS:

 Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

 The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

Using the special tool, release the LH upper arm ball joint.

- Remove and discard the nut.

9. Release the LH halfshaft from the axle assembly.

- Remove and discard the snap ring.
- Using a suitable tie strap, support the LH halfshaft.

10. CAUTIONS:

 Mark the position of the driveshaft flange in relation to the drive pinion flange.

 To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the front axle drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.
- Using a suitable tie strap, secure the driveshaft end plate.

Vehicles with Active Stabilization

11. Remove the stabilizer bar bushing.

- Remove the 3 bolts.
- Remove the clamp.
- Remove the stabilizer bar bushing.

Vehicles with diesel engine

12. Release the fuel cooler.

- Remove the bolt.

Vehicles with 5.0L engine

13. Release the automatic transmission fluid cooler.

- Remove the 4 bolts.

E123471

14. Remove the transmission fluid cooler mounting bracket.

- Release the transmission fluid cooler pipe bracket.
- Remove the nut.
- Remove the 3 bolts.

E123472

All vehicles

15. Remove the front axle crossmember.

- Remove the 4 bolts.

16.  **CAUTION:** Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the breather line.

- Release the clip.

17. Using a transmission jack, support the front axle assembly.

18. With assistance, remove the front axle assembly.

- Remove and discard the 3 axle assembly rear mounting bolts.
- Remove the front axle assembly front mounting bolt.

Installation

All vehicles

1. With assistance, install the front axle assembly.

- With assistance, raise and manoeuvre the front final drive unit.
- Tighten the 3 new bolts in the front axle assembly to 80 Nm (59 lb.ft), then a further 60 degrees.
- Tighten the front axle assembly front mounting bolt to 105 Nm (77 lb.ft).

2. Connect the breather line.

3. Install the front axle crossmember.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).

Vehicles with 5.0L engine

4. Install the transmission fluid cooler mounting bracket.

- Tighten the 3 bolts to 25 Nm (18 lb.ft.).
- Secure the transmission fluid cooler coolant pipe to the coolant hose bracket.
- Tighten the nut to 15 Nm (11 lb.ft.).

5. Install the automatic transmission fluid cooler.

- Tighten the 4 bolts to 25 Nm (18 lb.ft.).

Vehicles with diesel engine

6. Secure the fuel cooler.

- Tighten the bolt to 23 Nm (17 lb.ft.).

Vehicles with Active Stabilization

7. Install the stabilizer bar bushing.

- Install the clamp.
- Install the bolts.
- Tighten the bolts to 115 Nm (85 lb.ft.).

All vehicles

8. **NOTE:** Make sure that new bolts are installed.

Secure the driveshaft to the front axle drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft.).
- Stage 2: Tighten the bolts a further 90 degrees.
- Remove and discard the tie strap.

9. Install a new snap ring to the LH halfshaft.

- Remove and discard the tie strap.

10. **NOTE:** Do not fully engage the halfshaft until the oil seal protector has been removed.

Secure the LH halfshaft in the axle assembly.

1. Open the halfshaft seal protector and install the halfshaft.
2. Release the halfshaft seal protector from the halfshaft seal.
3. Remove the halfshaft seal protector.
4. Fully install the halfshaft.

11.  **WARNING:** Make sure that a new nut is installed.

Secure the LH upper arm to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

12.  **WARNING:** Make sure that a new nut is installed.

Secure the LH tie-rod end ball joint to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

13. Secure the LH brake hose bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

14. Secure the LH stabilizer bar link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

15. Install the LH splash shield.

- Install the clips.

16. Install the axle tube.

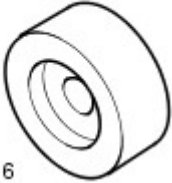

For additional information, refer to: [Axle Tube](#) (205-03 Front Drive Axle/Differential, In-vehicle Repair).

17. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Axle/Differential - Axle Carrier Bushing

Removal and Installation

Special Tool(s)	
 <p>205-825/3 E54216</p>	<p>Installer rear axle front bush 205-825/3</p>
 <p>205-825/5 E54209</p>	<p>Receiver cup rear differential front bush 205-825/5</p>
 <p>502-009/2 E54205</p>	<p>Remover rear differential rear bush 502-009/2</p>

Removal

CAUTION: Make sure the bush is correctly aligned.

- **NOTE:** Take note of the fitted position of the bush.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- 2.** Remove the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00D Exhaust System - V8 5.0L Petrol, Removal and Installation).
For additional information, refer to:

[Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation),
[Exhaust System](#) (309-00B Exhaust System - TDV6 3.0L Diesel, Removal and Installation),
[Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation),
[Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).

- 3.** Using a jack, support the axle assembly.

4. Remove the axle carrier bushing heat shield.

- Remove the two retaining bolts.

5.  CAUTION: The bolts must only be used once.

Remove the axle carrier.

- Remove and discard the three bolts retaining the axle carrier to the axle.
- Remove the axle carrier bushing bolt.

6. NOTE: Take note of the fitted position of the bush.

Using the special tools, remove the axle carrier bushing.

E54225

Installation

1.  **CAUTION:** Make sure the bush is correctly aligned.

Using the special tools, install the axle carrier bushing.

E54226

2. Install the axle carrier.
 - Tighten the M14 bolt to 105 Nm (77 lb.ft).
 - Tighten the new axle carrier bracket bolts to 80 Nm (59 lb.ft), then a further 60 degrees.
3. Install the axle carrier bushing heat shield.
4. Remove the axle support.
5. Install the exhaust system.

For additional information, refer to: [Exhaust System](#) (309-00D Exhaust System - V8 5.0L Petrol, Removal and Installation).
For additional information, refer to:

 - [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation),

<p>205-825/1</p>  <p>E54219</p>	<p>Receiver cup front axle front bush</p> <p>205-825/1</p>

Removal

 CAUTION: Make sure the bush is correctly aligned.

- NOTE: Take note of the fitted position of the bush.

1.  WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front wheels and tires.

3. Remove the front differential.

For additional information, refer to: [Axle Assembly](#) (205-03 Front Drive Axle/Differential, Removal and Installation).

4. NOTE: Take note of the fitted position of the bush.

Using the special tools, remove the front axle housing support insulator.

Installation

1.  CAUTION: Make sure the bush is correctly aligned.

Using the special tools, install the front axle housing support insulator.

2. Install the front differential.

For additional information, refer to: [Axle Assembly](#) (205-03 Front Drive Axle/Differential, Removal and Installation).

3. Install the front wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Halfshafts -

General Specification

Item	Specification
Type	Fully floating, fixed length, solid shafts incorporating constant velocity joints at each end of shaft

Lubricant

Item	Specification
Outboard joint	Use grease supplied with replacement boot kit (Optimol MS139G)
Inboard joint	Use grease supplied with replacement boot kit (1 Luber C MS132G)

General Specification

Item	Specification
Type	Fully floating, solid shafts incorporating 'plug-in' constant velocity joint at inboard end and fixed constant velocity joint at outboard end of shaft

Torque Specifications

Description	Nm	lb-ft
* Stabilizer bar link nut	115	85
* Stabilizer link nut	115	85
* Tie rod end ball joint nut	76	56
Brake hose retaining bracket to wheel knuckle bolt	25	18
*+ Halfshaft retaining nut	230	169
Road wheel nuts	140	103

* **New nut must be fitted**

+ **Stake nut on completion**

Front Drive Halfshafts - Front Drive Halfshafts

Description and Operation

Front Drive Halfshaft Component Location

E46376

Item	Part Number	Description
1	-	RH front drive halfshaft
2	-	LH front drive halfshaft

GENERAL

The front drive shafts are handed components with the RH drive shaft being longer than the LH drive shaft. Both shafts are of similar construction with Constant Velocity (CV) joints at each end to allow for steering and suspension movement.

FRONT DRIVE HALFSHAFT ASSEMBLY

E46377

Item	Part Number	Description
1	-	RH outer CV joint
2	-	RH front drive halfshaft
3	-	RH inner CV joint
4	-	LH inner CV joint
5	-	LH front drive halfshaft
6	-	LH outer CV joint

The front drive shafts are similar in their construction. The only difference is the lengths of each shaft, the LH drive shaft is a longer shaft with an extended stem.

The outer CV joints have a target wheel on the outer diameter. This is used by the ABS wheel speed sensor for vehicle and wheel speed calculations.

Each drive shaft comprises two CV joints (inner and outer), boots, an outer tube and a solid barshaft, which is retained in the front differential by a circlip (see 'Halfshaft Joint' section for more information on CV joints).

Front Drive Halfshafts - Halfshaft Joint

Description and Operation

Front Drive HalfShaft – Sectional Views

E50637

Item	Part Number	Description
A	-	Front outboard halfshaft joint
B	-	Rear outboard halfshaft joint
C	-	Rear inboard halfshaft joint
D	-	Front inboard halfshaft joint

The outboard and rear inboard CV joints are of the Birfield design. This design uses longitudinal, elliptical grooves, which retain six steel balls. The balls are further retained by a cage. The constant velocity is achieved by the position of the steel balls. If a centre line is drawn through the balls and the driven hub or differential shaft, the two centre lines always bisect each other at the angle of drive. This condition allows the rotational speed of the driven shaft to be passed to the driven hub or differential shaft with no loss of rotational speed regardless of the shaft angle. The CV joints are packed with grease, which is retained in the joint by a synthetic rubber gaiter. The gaiter is retained at each end by a metal clamp, which provides a water tight seal to prevent the ingress of dirt and moisture. The CV joints are retained on their respective shaft or tube by an internal snap ring. The snap rings are located in a groove on each shaft or tube end and locate in a mating groove in the CV joint.

⚠ CAUTION: The inner hub is not retained in the joint body on this type of joint. The joint is held together in it's unfitted state only by the boot. Pulling on the barshaft can therefore pull the hub out of the joint body. For this reason care must be taken when handling and fitting the front driveshafts.

The shaft is a sliding fit inside the outer tube, which allows for the small length changes, which occur with articulation of the suspension. The shaft is located in a ball cage, which is retained inside the outer tube. The ball cage ensures that the shaft is held rigidly in the outer tube whilst allowing it to freely move in and out of the tube as necessary. A sealing plug is pressed into the outer tube and retains grease around the balls in the cage.

The inner CV joints are similar in design and operation to the outer joints except that the inner joints use rollers rather than balls to transmit the drive.

E46396

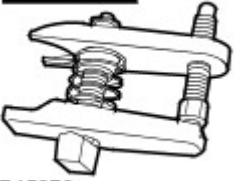

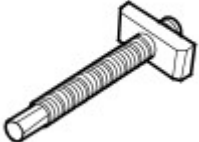

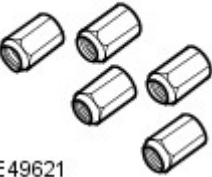

Item	Part Number	Description
A	-	Inner CV joint
B	-	Outer CV joint
1	-	Tulip outer race
2	-	Trunions (3 of)
3	-	Spider
4	-	Rollers (3 of)
5	-	Outer race
6	-	Steel balls (6 of)
7	-	Cage
8	-	Inner race

The front inboard joint is a 'tripode joint', having three 'feet' or 'podes'. The torque is transmitted from the outer race to the connecting shaft by means of rollers running on needle rollers around the trunions of the tripod spider. The roller tracks of the outer race enable the tripod assembly to move angularly and axially within the joint.

The inner CV joint shaft is splined and mates with splines in the front differential. There is no internal retaining mechanism for this type of joint so care must be taken during service as the shaft and CV joint can separate.

Front Drive Halfshafts - Front Halfshaft LH

<p>308-626/1</p>  <p>E54136</p>	<p>Installer halfshaft oil seal 308-626/1</p>

Removal

• CAUTIONS:

Do not store or install halfshafts with joints at maximum articulation or damage may occur to the joint.

Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Drain the differential lubricant.
For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).
- Remove the wheel and tire.
- Remove the halfshaft retaining nut.
 - Discard the nut.

E49697

5.  CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Disconnect the RH stabilizer bar link.

- Remove and discard the nut.

6.  CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link nut.

- Remove and discard the nut.

7. Release the brake hose bracket from the wheel knuckle.

- Remove the bolt.

8. Loosen the tie-rod end ball joint retaining nut.

9.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the tie-rod end ball joint from the wheel knuckle.

- Discard the nut.

10.  CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.

11.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the upper arm ball joint.

- Remove and discard the retaining nut.

12. CAUTIONS:

 The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

 Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

 Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

13. Release the halfshaft from the wheel knuckle.

14. Release the halfshaft from the differential housing.

15. Remove the halfshaft.

- Raise the stabilizer bar to allow removal of the halfshaft.
- Remove and discard the snap ring.

16. Using the special tools, remove and discard the halfshaft oil seal.

Installation

1. Clean the components.
2. Using the special tools, install a new halfshaft oil seal.

- The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

3. **NOTE:** Do not fully engage the halfshaft until the oil seal protector has been removed.

Install the halfshaft.

- Install the snap ring.
- Lubricate the seal and the bearing running surfaces with clean axle oil.
- Make sure the snap ring is fully engaged and retains the halfshaft.
- Open the halfshaft oil seal protector.

4. NOTE: The oil seal protector is designed to break into two pieces.

Remove and discard the halfshaft oil seal protector.

5. CAUTION: The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

Using the special tools, install the halfshaft in the wheel hub.

6. Connect the upper arm and wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

7. Secure the stabilizer bar link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

8. Connect the tie-rod end ball joint.

- Install a new nut and tighten to 76 Nm (56 lb.ft).

9. CAUTION: Install the halfshaft nut finger tight.

Install a new halfshaft retaining nut and lightly tighten.

10. Secure the brake hose retaining bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

11. Secure the RH stabilizer link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

12. CAUTION: Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 230 Nm (170 lb.ft).

- Stake the nut to the halfshaft.

13. Install the wheels and tires.

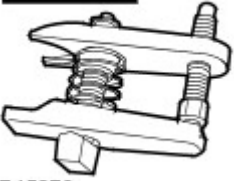

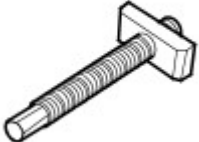

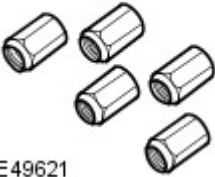

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

14. CAUTION: Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).

Removal

• CAUTIONS:

Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

Do not store or install halfshafts with joints at maximum articulation or damage may occur to the joint.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Drain the differential lubricant.
For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).
- Remove the wheels and tires.
- Remove the halfshaft retaining nut.
 - Discard the nut.

5.  CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Disconnect the LH stabilizer bar link.

- Remove and discard the nut.

6.  CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link nut.

7. Release the brake hose bracket from the wheel knuckle.

- Remove the bolt.

8. Loosen the tie-rod end ball joint retaining nut.

9.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the tie-rod end ball joint from the wheel knuckle.

- Discard the nut.

10.  CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.

11.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the upper arm ball joint.

- Remove and discard the retaining nut.

12. CAUTIONS:

 The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

 Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

13. Release the halfshaft from the wheel knuckle.

14. Position a container to collect the oil spillage.

15. Release the halfshaft from the differential housing.

16.  **CAUTION:** Keep the halfshaft horizontal to avoid damaging the oil seal.

Remove the halfshaft.

- Raise the stabilizer bar to allow removal of the halfshaft.
- Remove and discard the snap ring.

17. Using the special tools, remove and discard the halfshaft oil seal.

Installation

1. Clean the components.
2. Using the special tools, install a new halfshaft oil seal.

- The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

3. **NOTE:** Do not fully engage the halfshaft until the oil seal protector has been removed.

Install the halfshaft.

- Install the snap ring.
- Lubricate the seal and the bearing running surfaces with clean axle oil.
- Make sure the snap ring is fully engaged and retains the halfshaft.
- Open the halfshaft oil seal protector.

4. NOTE: The oil seal protector is designed to break into two pieces.

Remove and discard the halfshaft oil seal protector.

5. **CAUTION:** The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

Using the special tools, install the halfshaft in the wheel hub.

6. Connect the upper arm and wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

7. Secure the stabilizer bar link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

8. Connect the tie-rod end ball joint.

- Install a new nut and tighten to 76 Nm (56 lb.ft).

9. **CAUTION:** Install the halfshaft nut finger tight.

Install a new halfshaft retaining nut and lightly tighten.

10. Secure the brake hose retaining bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

11. Secure the LH stabilizer link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

12. **CAUTION:** Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 230 Nm (170 lb.ft).

- Stake the nut to the halfshaft.

13. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

14. **CAUTION:** Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).

Front Drive Halfshafts - Outer Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the halfshaft.
For additional information, refer to: [Front Halfshaft LH](#) (205-04 Front Drive Halfshafts, Removal and Installation).
4. Clamp the halfshaft in a vise.
5. Remove and discard the CV joint boot retaining clamps.

6. Slide the CV joint boot along the halfshaft to gain access to the joint.
7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.
 - Remove and discard the snap ring.

8. Remove the outer CV joint boot.

Installation

1. Clean the components.
2. Install the CV joint boot.
3. Install the outer CV joint.
 - Install the snap ring.
 - Position the CV joint on the halfshaft, press the snap ring into its groove and push the CV joint fully on to the halfshaft.
 - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the CV joint with the grease supplied.

E137494

5. CAUTIONS:

 Make sure the CV boot is not pushed too far onto the drive shaft and the recess is exposed, failure to follow this instruction may result in damage to the component.

 After the clamps have been secured do not adjust them, failure to follow this instruction may result in damage to the component.

Install the CV joint boot to the CV joint.

- Using a suitable tool, secure the CV joint boot with the new clamps.

6. Install the halfshaft.

For additional information, refer to: [Front Halfshaft LH](#) (205-04 Front Drive Halfshafts, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Halfshafts - Outer Constant Velocity (CV) Joint

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the halfshaft.
For additional information, refer to: [Front Halfshaft LH](#) (205-04 Front Drive Halfshafts, Removal and Installation).
4. Clamp the halfshaft in a vise.
5. Remove and discard the CV joint boot retaining clamps.

6. Slide the CV joint boot along the halfshaft to gain access to the joint.
7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.
 - Remove and discard the snap ring.

E46875

8. Remove the outer CV joint boot.

Installation

1. Clean the components.
2. Install the CV joint boot.
3. Install the outer CV joint.
 - Install the snap ring.
 - Position the CV joint on the halfshaft, press the snap ring into its groove and push the CV joint fully on to the halfshaft.
 - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the CV joint with the grease supplied.

E137494

5. CAUTIONS:

 Make sure the CV boot is not pushed too far onto the drive shaft and the recess is exposed, failure to follow this instruction may result in damage to the component.

 After the clamps have been secured do not adjust them, failure to follow this instruction may result in damage to the component.

Install the CV joint boot to the CV joint.

- Using a suitable tool, secure the CV joint boot with the new clamps.

6. Install the halfshaft.

For additional information, refer to: [Front Halfshaft LH](#) (205-04 Front Drive Halfshafts, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Halfshafts - Inner Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the halfshaft.
For additional information, refer to: [Front Halfshaft LH](#) (205-04 Front Drive Halfshafts, Removal and Installation).
4. Clamp the halfshaft in a vise.
5. Remove and discard the CV joint boot retaining clamps.

6. Slide the CV joint boot along the halfshaft to gain access to the joint.

7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.

- Remove and discard the snap ring.

8. Remove the inner joint boot.

Installation

1. Clean the components.
2. Install the inner joint boot.

3. Install the inner joint.
 - Install a new snap ring.
 - Position the CV joint on the halfshaft, press the snap ring into its groove and push the CV joint fully on to the halfshaft.
 - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the joint with the grease supplied.
5. Install the CV joint boot to the CV joint.
 - Secure with the new clamps.
6. Install the halfshaft.

For additional information, refer to: [Front Halfshaft LH](#) (205-04 Front Drive Halfshafts, Removal and Installation).
7. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Halfshafts - Halfshaft Seal LH

Removal and Installation

Special Tool(s)	
 <p>205-754A</p> <p>E45276</p>	Ball joint separator (LRT-54-027) 205-754
 <p>204-506/1</p> <p>E49618</p>	Halfshaft remover/replacer (LRT-60-030/1) 204-506/1

 <p>308-626/1</p> <p>E54136</p>	<p>Installer halfshaft oil seal 308-626/1</p>

Removal

• CAUTIONS:

 Do not store or install halfshafts with joints at maximum articulation or damage may occur to the joint

 Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

 Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

 **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the LH halfshaft.
For additional information, refer to: [Front Halfshaft LH](#) (205-04 Front Drive Halfshafts, Removal and Installation).
- Using the special tools, remove and discard the halfshaft oil seal.

Installation

1. Using the special tools, install a new halfshaft oil seal.

- The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

E54139

2. Install the LH halfshaft.

For additional information, refer to: [Front Halfshaft LH](#) (205-04 Front Drive Halfshafts, Removal and Installation).

Removal

• CAUTIONS:

 Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

 Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the RH halfshaft.
For additional information, refer to: [Front Halfshaft RH](#) (205-04 Front Drive Halfshafts, Removal and Installation).

3. Using the special tools, remove and discard the halfshaft oil seal.

Installation

1. Using the special tools, install a new halfshaft oil seal.

2. Install the RH halfshaft.
For additional information, refer to: [Front Halfshaft RH](#) (205-04 Front Drive Halfshafts, Removal and Installation).

Rear Drive Halfshafts -

Recommended Lubricant

Item	Specification
Outboard joint	Use grease supplied with replacement boot kit (Optimol MS139G)
Inboard joint	Use grease supplied with replacement boot kit (Thermax MS141G)

General Specification

Item	Specification
Type	Fully floating, solid shafts incorporating plunging constant velocity joint at inboard end and fixed constant velocity joint at outboard end of shaft

Torque Specifications

Description	Nm	lb-ft
* Lower arm to wheel knuckle nut	275	203
Toe link bolt	175	129
*+ Halfshaft nut	350	258
Road wheel nuts	140	103

* **New nut must be fitted**

+ **Stake nut on completion**

Rear Drive Halfshafts - Rear Drive Halfshafts

Description and Operation

Rear Drive Halfshaft Component Locations

E46407

Item	Part Number	Description
1	-	RH rear drive halfshaft
2	-	LH rear drive halfshaft

GENERAL

The rear drive halfshafts are identical in their construction with a Constant Velocity (CV) joint at each end to allow for suspension movement.

REAR DRIVE SHAFT ASSEMBLY

E46408

Item	Part Number	Description
1	-	RH outer CV joint
2	-	RH rear drive halfshaft
3	-	RH inner CV joint
4	-	LH inner CV joint
5	-	LH rear drive halfshaft
6	-	LH outer CV joint

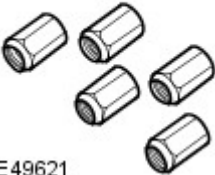

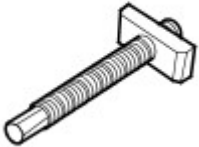

Each outer CV joint has a target wheel on the outer diameter. This target is used by the ABS wheel speed sensor for vehicle and wheel speed calculations.

Each rear drive halfshaft comprises two CV joints (inner and outer), boots and a solid barshaft, which is retained in the rear differential by a circlip.

The CV joints used on the rear drive halfshafts share the same design and operating principles as the front drive halfshafts CV joints (see 'Halfshaft Joint' section for more information on CV joints). The rear drive halfshaft inner joint hubs are retained by peening over the lip of the joint body.

Rear Drive Halfshafts - Rear Halfshaft

Removal and Installation

Special Tool(s)	
 <p>204-506/1 E49618</p>	Halfshaft remover/replacer 204-506/1(LRT-60-030/1)
 <p>204-506/5 E49621</p>	Retainers - halfshaft remover/replacer 204-506/5(LRT-60-030/5)
 <p>204-506/3 E49620</p>	Halfshaft remover/replacer 204-506/3(LRT-60-030/3)
 <p>204-506-01 E49622</p>	Halfshaft installer adapter 204-506-01(LRT-60-030/4)
 <p>308-005 E54134</p>	Axle oil seal remover 308-005(LRT-37-004/2)
 <p>100-012 E54135</p>	Impulse extractor 100-012(LRT-99-004)
 <p>308-626/1 E54136</p>	Installer halfshaft oil seal 308-626/1

Removal

• CAUTIONS:

Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

Do not store or install halfshafts with joints at maximum articulation or damage may occur to the joint.

Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

Do not undo or remove the large protruding hexagon on the differential casing.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Drain the differential lubricant.
For additional information, refer to: [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).
- Remove the wheel and tire.
- Loosen the halfshaft retaining nut.
 - Discard the nut.

E46796

- Remove the stabilizer bar link.
For additional information, refer to: [Rear Stabilizer Bar Link](#) (204-02 Rear Suspension, Removal and Installation).
- Release the parking brake cable from the lower arm.

E49702

7. Disconnect the toe link.

- Remove the bolt.

E46797

8. Remove and discard the halfshaft retaining nut.

9.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the knuckle from the lower arm.

- Remove the bolt.

E46798

10.  CAUTION: Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

E50560

11. Position a container to collect the oil spillage.

12. Release the halfshaft from the differential housing.

13. With assistance, remove the halfshaft.

- Remove and discard the snap ring.

E45752

14. Using the special tools, remove and discard the halfshaft oil seal.

E54138

Installation

1. Clean the components.
2. Using the special tools, install a new halfshaft oil seal.

- The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

E54139

3. With assistance, install the halfshaft.

- Install the snap ring.
- Open the halfshaft oil seal protector.
- Make sure the snap ring is fully engaged and retains the halfshaft.

4. NOTE: The oil seal protector is designed to break into two pieces.

Remove and discard the halfshaft oil seal protector.

5. Using the special tools, install the halfshaft in the wheel hub.

6. **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the lower arm to the wheel knuckle.

- Tighten to 275 Nm (203 lb.ft).
- Tighten the new nut to 275 Nm (203 lb.ft).

7. **CAUTION:** Install the halfshaft nut finger tight.

Install a new halfshaft retaining nut and lightly tighten.

8. Connect the toe link.

- Tighten the bolt to 175 Nm (129 lb.ft).

9. Secure the parking brake cable to the lower arm.

10. Install the stabilizer bar link.

For additional information, refer to: [Rear Stabilizer Bar Link](#) (204-02 Rear Suspension, Removal and Installation).

11. **CAUTION:** Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 350 Nm (258 lb.ft).

- Stake the nut to the halfshaft.

12. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

13. **CAUTION:** Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

Fill the differential with the correct amount of lubricant.

For additional information, refer to: [Differential Draining and](#)

[Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures).

Rear Drive Halfshafts - Outer Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the halfshaft.
For additional information, refer to: [Rear Halfshaft](#) (205-05 Rear Drive Halfshafts, Removal and Installation).
4. Clamp the halfshaft in a vise.
5. Remove and discard the CV joint boot retaining clamps.

6. Slide the CV joint boot along the halfshaft to gain access to the joint.
7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.
 - Remove and discard the snap ring.

8. Remove the outer CV joint boot.

Installation

1. Clean the components.
2. Install the CV joint boot.
3. Install the outer CV joint.
 - Install the snap ring.
 - Position the CV joint on the halfshaft, press the snap ring into its groove and push the CV joint fully on to the halfshaft.
 - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the CV joint with the grease supplied.
5. Install the CV joint boot to the CV joint.
 - Secure with the new clamps.

6. Install the halfshaft.

For additional information, refer to: [Rear Halfshaft](#) (205-05 Rear Drive Halfshafts, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Drive Halfshafts - Inner Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the halfshaft.
For additional information, refer to: [Rear Halfshaft](#) (205-05 Rear Drive Halfshafts, Removal and Installation).
4. Clamp the halfshaft in a vise.
5. Remove and discard the CV joint boot retaining clamps.

6. Slide the CV joint boot along the halfshaft to gain access to the joint.
7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.
 - Remove and discard the snap ring.

E46875

8. Remove the inner CV joint boot.

Installation

1. Clean the components.
2. Install the inner CV joint boot.
3. Install the inner joint.
 - Install a new snap ring.
 - Position the CV joint on the halfshaft, press the snap ring into its groove and push the CV joint fully on to the halfshaft.
 - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the joint with the grease supplied.
5. Install the boot to the joint.
 - Secure with the new clamps.

6. Install the halfshaft.

For additional information, refer to: [Rear Halfshaft](#) (205-05 Rear Drive Halfshafts, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Drive Halfshafts - Halfshaft Bearing

Removal and Installation

Special Tool(s)	
 <p>308-005</p> <p>E54134</p>	<p>Axle oil seal remover</p> <p>308-005 (LRT-37-004/2)</p>
 <p>100-012</p> <p>E54135</p>	<p>Impulse extractor</p> <p>100-012 (LRT-99-004)</p>
 <p>205-819</p> <p>E54141</p>	<p>Halfshaft bearing installer</p> <p>205-819</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the wheel and tire.
- Remove and discard the halfshaft oil seal.
For additional information, refer to: [Rear Halfshaft](#) (205-05 Rear Drive Halfshafts, Removal and Installation).

- Using the special tool, remove and discard the halfshaft bearing.

Installation

- Using the special tools, install a new halfshaft bearing.

- Install a new halfshaft oil seal.
For additional information, refer to: [Rear Halfshaft](#) (205-05 Rear Drive Halfshafts, Removal and Installation).
- Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Brake System - General Information -

Brake Hydraulic Fluid

Item	Specification
* Recommended hydraulic fluid	SHELL DONAX YB DOT4 ESL FLUID

CAUTION: * If the above fluid is not available, use a low viscosity DOT 4 brake fluid meeting ISO 4925 Class 6 and Land Rover LRES22BF03 requirements.

General Specification

Item	Specification
Footbrake type:	
Vehicles without Brembo brakes	Hydraulic, servo assisted, self-adjusting with front/rear split hydraulic system, twin piston sliding calipers to the front and single piston sliding calipers to the rear
Vehicles with Brembo brakes	Hydraulic, servo assisted, self-adjusting with front/rear split hydraulic system, opposed six piston calipers to the front and single piston sliding calipers to the rear
Parking brake type	Twin shoe (leading/trailing) operating on rear wheels and controlled from park brake lever in floor console via twin cables

Brake System - General Information - Brake System

Diagnosis and Testing

Principles of Operation

For a detailed description of the Brake System and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to:

- [Front Disc Brake](#) (206-03 Front Disc Brake, Description and Operation),
- [Rear Disc Brake](#) (206-04 Rear Disc Brake, Description and Operation),
- [Parking Brake](#) (206-05 Parking Brake and Actuation, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
 - If a road test is necessary make sure the vehicle is safe to do so.
2. **2.** Visually inspect for obvious signs of mechanical damage.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> ● Brake pad(s) condition and installation ● Brake caliper(s) condition and installation ● Brake disc(s) condition and installation ● Parking brake disc(s)/parking brake drum(s) condition and installation ● Parking brake shoes condition and installation ● Parking brake cable(s) condition and installation ● Brake booster condition and installation ● Brake booster vacuum hose condition and installation ● Brake master cylinder condition and installation ● Hydraulic Control Unit (HCU) ● Brake fluid leaks ● Brake warning indicator

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Brake noise	<ul style="list-style-type: none"> ● Debris ● Brake pads ● Brake disc(s) 	Refer to the relevant section of the workshop manual.
Brake vibration	<ul style="list-style-type: none"> ● Suspension components ● Brake disc(s) 	Refer to the relevant section of the workshop manual.
Excessive brake pedal travel/brake pedal spongy	<ul style="list-style-type: none"> ● Brake pads ● Air in the brake system ● Brake master cylinder ● Brake fluid leak (see visual inspection) 	Worn pads may make the pedal travel excessive, new pads may make the pedal spongy. Check after bedding in the pads. Check the pedal travel. If the pedal "pumps-up", suspect air in the system. Check for a cause for air ingress, rectify as necessary. If the pedal sinks to the floor when held under pressure when there are no external leaks, suspect a master cylinder fault. Refer to the relevant section of the workshop manual.
Excessive brake pedal effort/brake pedal hard	<ul style="list-style-type: none"> ● Brake pipe(s) ● Brake caliper slide(s) ● Brake caliper piston(s) ● Brake vacuum pipe ● Brake vacuum pump ● Brake booster 	Check for damaged brake pipes. Check the brake calipers. Check the brake vacuum pipe for air leaks, rectify as necessary. Check the brake vacuum pump operation. Refer to the relevant section of the workshop manual. Check the brake booster.

Symptom	Possible Causes	Action
Low foot brake efficiency/brakes pulling/sticking/binding	<ul style="list-style-type: none"> ● Brake pipe(s) ● Pads ● Brake caliper piston(s) ● Brake caliper slide(s) ● Brake disc(s) 	Check the vehicle for damaged brake pipes. Inspect the brake pads. Check the brake calipers. Check the brake discs. Refer to the relevant section of the workshop manual.
Parking brake will not engage or release	<ul style="list-style-type: none"> ● Parking brake cables ● Parking brake shoes ● Parking brake adjusters ● Rear brake disc(s)/parking brake drum(s) ● Parking brake actuator malfunction 	Check the parking brake cable(s) for operation/condition. Check that the cable end connector(s) are correctly installed to the operating lever(s). Inspect the parking brake shoes for wear. Check the parking brake shoes for correct adjustment. Check the rear brake disc(s)/parking brake drum(s). Check the parking brake actuator for damage and/or excessive noise in normal operation. Refer to the relevant section of the workshop manual.
Low parking brake efficiency/parking brake sticking/binding		
Brake warning indicator staying illuminated	<ul style="list-style-type: none"> ● Brake reservoir fluid level ● Brake pads ● Brake pad wear sensor leads ● Brake fluid level sensor 	Check the brake fluid level, top up if required. Inspect the brake pads. Check the brake pad sensor circuit. Refer to the electrical guides. Check the function of the brake fluid level sensor. Refer to the relevant section of the workshop manual.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Brake System - General Information - Rear Brake Disc Runout Check

General Procedures

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.
- NOTE: RH illustration shown, LH is similar.
- NOTE: It is not necessary to carry out the parking brake shoe 'bedding-in procedure' if the rear brake discs or parking brake shoes have been removed for access to other components.

1.  CAUTION: Do not turn the ignition on when the parking brake service mode has been set, this will result in the parking brake being released from the service mode.

Enter the parking brake into the service mode.

- Turn the ignition on.
- Apply, and hold, the footbrake.
- Apply, and hold, the parking brake switch to the RELEASE position.
- Turn the ignition off.
- Release the footbrake.
- Release the parking brake switch.

2.  WARNING: Make sure to support the vehicle with axle stands.

Raise rear of vehicle.

3. Remove road wheel.

4.  CAUTION: The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

RH side rear only: Disconnect the brake pad wear indicator sensor lead.

E121022

5. Remove 2 bolts securing brake caliper to hub. Release caliper from hub and tie aside.

E119130

6. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

At 4 points around the disc, measure disc thickness using a micrometer; renew disc if less than service limit or if variation is exceeded: Disc thickness, NEW = 20 mm Service limit = 18 mm. Thickness variation maximum = 0.01 mm.

E46955

7. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Mount a Dial Test Indicator (DTI) to and secure to inboard side of hub using caliper assembly upper bolt hole.

E46956

8. Position DTI probe 5 mm in from outer edge of disc.

E119132

9. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Tighten the wheel nuts to 140 Nm (103 lb.ft).

- Install spacer washers under the wheel nuts.

10. Zero DTI and rotate wheel one complete revolution to measure disc runout. Disc runout must not exceed 0.09 mm (0.003 in).

11. If disc runout is outside limits:

12. Remove the wheel hub nuts.

- Remove the spacer washers.

13. Remove Allen screw securing brake disc to drive flange.

14. Remove brake disc.

15. Ensure mating surfaces of disc and drive flange are clean.

16. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

17. Tighten the wheel nuts to 140 Nm (103 lb.ft).

- Install spacer washers under the wheel nuts.

18. Check disc runout as detailed above.

19. If runout is still outside limits, renew disc and/or hub.

20. Remove the wheel hub nuts.

- Remove the spacer washers.

21. Remove the DTI.

22. Install the brake caliper anchor bolts

- Tighten the bolts to 115 Nm (85 lb.ft).

E119130

23. Tighten the wheel nuts to 140 Nm (103 lb.ft).

24. Depress brake pedal several times to set brake pads.

25. Remove stands and lower vehicle.

Brake System - General Information - Brake System Bleeding

General Procedures

WARNING: If any components upstream of the Hydraulic Control Unit (HCU), including the HCU itself are replaced, the brake system must be bled using Land Rover approved diagnostic equipment. This will ensure that all air is expelled from the new component(s).

- **NOTE:** Bleeding of the complete brake system must be carried out using Land Rover approved diagnostic equipment. Where only the primary or secondary brake circuits have been disturbed in isolation, it should only be necessary to bleed that circuit. Partial bleeding of the hydraulic system is only permissible if a brake tube or hose has been disconnected with only minimal loss of fluid.
- **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

E62458

1. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Check that the brake fluid lines are secure and that there are no signs of a brake fluid leak. If a brake fluid leak is detected, investigate and rectify the cause of the leak before bleeding the brakes.

WARNING: Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

- **CAUTIONS:**

CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

CAUTION: The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

Fill the brake fluid reservoir to the MAX mark.

- Disconnect the brake fluid reservoir electrical connector.
 - Remove the brake fluid reservoir cap.
4. Conduct the bleed procedure with the engine running.
 5. Connect the diagnostic tool to the vehicle, select diagnostic and proceed as directed for bleeding the brake system.

- Starting at the brake caliper furthest away from the brake master cylinder, loosen the bleed screw by one-half to three-quarters of a turn.

E62462

RHD

- Install the bleed tube to the brake caliper bleed screw and immerse the free end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.

- Hold the bleed container at least 300 mm above the Caliper that is being bled.

-  **CAUTION:** The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

With assistance, depress the brake pedal steadily through to 2/3 of its full stroke.

- With the brake pedal held down, close bleed screw and then return the brake pedal to 1/3 of its full stroke and hold.
- Repeat steps 8 and 9, 28 times for the rear brake and 10 times for the front brake.
- At the end of the bleed process, depress and hold the brake pedal down.

12.  **CAUTION:** Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the brake pedal fully depressed, tighten the bleed screw to 10 Nm (7 lb.ft).

13. Fill the brake fluid reservoir to the MAX mark.

14.  **WARNING:** Braking efficiency may be seriously impaired if an incorrect bleed sequence is used.

Repeat the brake bleeding procedure for each brake caliper, following the above sequence.

15. Fill the brake fluid reservoir to the MAX mark.

16. Apply the brakes and check for leaks.

17. Install the brake fluid reservoir cap.

- Connect the brake fluid reservoir electrical connector.

18. On completion, road test the vehicle and check the brake pedal operation. The pedal travel should be short with a firm feel.

Brake System - General Information - Brake System Pressure Bleeding

General Procedures

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Check that the brake fluid lines are secure and that there are no signs of a brake fluid leak. If a brake fluid leak is detected, investigate and rectify the cause of the leak before bleeding the brakes.

3.  **WARNING:** Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

- CAUTIONS:

 Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

 The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

Fill the brake fluid reservoir to the MAX mark.

- Disconnect the brake fluid reservoir electrical connector.
- Remove the brake fluid reservoir cap.

4. Conduct the bleed procedure with the engine running.

E59536

- 6.

- Install the bleed tube to the brake caliper bleed screw and immerse the free end of the bleed tube in a bleed jar

containing a small quantity of approved brake fluid.

- Hold the bleed container at least 300 mm above the Caliper that is being bled.

7.  **CAUTION:** The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

With assistance, depress the brake pedal steadily through to 2/3 of its full stroke.

- 8.** With the brake pedal held down, close bleed screw and then return the brake pedal to 1/3 of its full stroke and hold.
- 9.** Repeat steps 7 and 8, 28 times for the rear brake and 10 times for the front brake.
- 10.** At the end of the bleed process, depress and hold the brake pedal down.

11.  **CAUTION:** Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the brake pedal fully depressed, tighten the bleed screw.

- On vehicles with high performance brakes, tighten the front caliper bleed screw to 19 Nm (14 lb.ft).
- On vehicles with standard brakes, tighten the front caliper bleed screw to 10 Nm (7 lb.ft).
- Tighten the rear caliper bleed screws to 10 Nm (7 lb.ft).

12. Fill the brake fluid reservoir to the MAX mark.

13.  **WARNING:** Braking efficiency may be seriously impaired if an incorrect bleed sequence is used.

Repeat the brake bleeding procedure for each brake caliper, following the above sequence.

- 14.** Fill the brake fluid reservoir to the MAX mark.
- 15.** Apply the brakes and check for leaks.
- 16.** Install the brake fluid reservoir cap.

- Connect the brake fluid reservoir electrical connector.

17. On completion, road test the vehicle and check the brake pedal operation. The pedal travel should be short with a firm feel.

Brake System - General Information - Component Bleeding

General Procedures

WARNING: If any components upstream of the Hydraulic Control Unit (HCU), including the HCU itself are replaced, the brake system must be bled using Land Rover approved diagnostic equipment. This will ensure that all air is expelled from the new component(s).

CAUTION: LH illustration shown, RH is similar.

• **NOTE:** Bleeding of the complete brake system must be carried out using Land Rover approved diagnostic equipment. The following manual procedure covers bleeding the brake system for components down stream of the HCU, where only the primary or secondary brake circuits have been disturbed in isolation. Partial bleeding of the hydraulic system is only permissible if a brake tube or hose has been disconnected with only minimal loss of fluid.

• **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

E62458

1. WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Check that the brake fluid lines are secure and that there are no signs of a brake fluid leak. If a brake fluid leak is detected, investigate and rectify the cause of the leak before bleeding the brakes.

3. Pump the brake pedal until the brake vacuum assistance is exhausted.

4. WARNING: Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

• **CAUTIONS:**

! Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

! The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

Remove the brake fluid reservoir cap.

- Disconnect the brake fluid reservoir electrical connector.
- Fill the brake fluid reservoir to the MAX mark.

5. Install the bleed tube to the brake caliper bleed screw and immerse the free end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.

- Hold the bleed container at least 300 mm above the Caliper that is being bled.

6. Loosen the bleed screw by one-half turn to three-quarters of a turn.

7. CAUTION: The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

With assistance, depress the brake pedal steadily through to 2/3 of its full stroke.

8. With the brake pedal held down, close bleed screw and then return the brake pedal to 1/3 of its full stroke and hold.

9. Repeat steps 7 and 8, 28 times for the rear brake and 10 times for the front brake.

10. At the end of the bleed process, depress and hold the brake pedal down.

11.  **CAUTION:** Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the brake pedal fully depressed, tighten the bleed screw.

- On vehicles with high performance brakes, tighten the front caliper bleed screw to 19 Nm (14 lb.ft).
- On vehicles with standard brakes, tighten the front caliper bleed screw to 10 Nm (7 lb.ft).
- Tighten the rear caliper bleed screws to 10 Nm (7 lb.ft).

12. Fill the brake fluid reservoir to the MAX mark.

13. Apply the brakes and check for leaks.

14. Install the brake fluid reservoir cap.

- Connect the brake fluid reservoir electrical connector.

15. On completion, road test the vehicle and check the brake pedal operation. The pedal travel should be short with a firm feel.

19	-	Brake disc
20	-	Hub bearing assembly
21	-	Dust shield screw (x 5)
22	-	Dust shield
23	-	Front knuckle

GENERAL

The front brakes each consist of a twin piston brake caliper, a ventilated brake disc and a dust shield. All models except 2.7L feature the same caliper, disc and dust shield.

The brake caliper is attached to the rear of the front knuckle. The brake pads are made from an asbestos free material. The inboard brake pad of the left front brake incorporates a wear sensor.

When hydraulic pressure is supplied to the caliper, the pistons extend and force the inner pad against the disc. The caliper body reacts and slides on the guide pins to bring the outer pad into contact with the disc.

The front brake pad wear sensor is connected in series with the rear brake pad wear sensor, between the instrument cluster and ground. When a brake pad incorporating a brake pad wear sensor is approximately 75% worn, the brake pad wear sensor goes open circuit. When the instrument cluster detects the open circuit, it illuminates the amber Light Emitting Diode (LED) in the brake warning indicator. Vehicles with the high line instrument cluster also display an appropriate warning in the message center and sound a warning chime.

For additional information, refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).

At the beginning of each ignition cycle, the instrument cluster performs a bulb check on the brake warning indicator: the indicator is illuminated amber for 1.5 seconds, red for 1.5 seconds, then goes off.

Front Disc Brake - Brake Disc Vehicles With: Standard Brakes

Removal and Installation

Removal

 **WARNING:** If installing a new brake disc, install new brake pads.

 **CAUTION:** Brake discs must be renewed in pairs.

- **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.
- **NOTE:** The brake pad wear warning indicator sensor must be replaced each time the brake pads are serviced.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the front wheel and tire.

3. **CAUTIONS:**

 Do not allow the brake caliper to hang on the brake hose.

 **LH side:** Do not allow the brake caliper to hang on the brake pad wear warning sensor lead.

Remove the brake caliper and anchor plate.

- Remove the brake caliper anchor bolts.
- Tie the brake caliper aside.

E120949

4. Remove the front brake disc.

- Remove the Allen screw.

E61629

Installation

1. Make sure the brake disc and hub mating surfaces are clean.
2. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

3. Install the brake caliper and anchor plate.

- Clean the component mating faces.
- Tighten the wheel nuts to 140 Nm (103 lb.ft).
- Tighten the bolts to 275 Nm (203 lb.ft).

5. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

Front Disc Brake - Brake Pads Vehicles With: Standard Brakes

Removal and Installation

Removal

• WARNINGS:

Brake pads must be renewed in axle sets only, otherwise braking efficiency may be impaired.

If the brake pad wear warning light has been activated, the pad wear sensor must be replaced.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

3. **CAUTION:** The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

LH side front: Disconnect the brake pad wear indicator sensor wiring harness.

E121532

4. **NOTE:** This step is only required if a new wear indicator harness is installed.

Remove the front LH fender splash shield.

For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

5. **NOTE:** This step is only required if a new wear indicator harness is installed.

LH side front: Release and disconnect the brake pad wear indicator wiring harness.

E121533

6. NOTE: Use an additional wrench to prevent the component from rotating.

Remove the brake caliper lower bolt.

E121134

7. NOTE: Note the orientation of the brake pads.

Remove the brake pads.

- Rotate the brake caliper upwards.
- Remove the 2 clips.

E61636

8. Repeat the above 2 steps for the other side.

Installation

1.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the brake caliper housing and anchor plate using brake cleaning fluid.

2. Inspect the caliper piston and slide pin seals for damage.

3. **CAUTIONS:**

The brake caliper should move freely on both slide pins.

If necessary, renew the components.

Check the slide pins for correct operation.

4. CAUTION: Check the brake fluid reservoir level before pushing the piston back, failure to follow this instruction may result in damage to the vehicle.

• NOTE: As the piston is pushed back into the caliper housing, the brake fluid level in the reservoir will rise. Do not allow the reservoir to overflow.

Press the pistons into the caliper housing.

5. NOTE: Make sure the brake pads are installed in the correct orientation.

Install the brake pads.

- Install the 2 clips.
- Apply a suitable amount of the supplied grease to the mating faces of the brake pads and brake calipers.

6. Rotate the brake caliper downwards.

- Tighten the bolt to 35 Nm (26 lb.ft).

7. Repeat the above procedure for the other side.

8. NOTE: This step is only required if a new wear indicator harness is installed.

LH side front: Connect the brake pad wear indicator wiring harness electrical connection.

9. NOTE: This step is only required if a new wear indicator harness is installed.

Install the front LH fender splash shield.

For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

10. LH side front: Connect the brake pad wear indicator wiring harness.

11. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

12. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

Front Disc Brake - Brake Caliper Vehicles With: Standard Brakes

Removal and Installation

Removal

 CAUTION: LH illustration shown, RH is similar.

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  CAUTION: The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

LH side only: Disconnect the brake pad wear indicator sensor.

E121135

4.  WARNING: Be prepared to collect escaping fluid.

 CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the brake hose from the brake caliper.

- Remove the union.
- Remove and discard the two sealing washers.
- Install blanking caps to the exposed ports.

E61652

5. NOTE: Note the orientation of the brake pads.

Remove the brake pads.

For additional information, refer to: [Brake Pads - Vehicles With: Standard Brakes](#) (206-03 Front Disc Brake, Removal and Installation).

6. NOTE: Use an additional wrench to prevent the component from rotating.

Remove the brake caliper housing.

- Remove the brake caliper upper bolt.

Installation

1. NOTE: Use an additional wrench to prevent the component from rotating.

• NOTE: Make sure the brake caliper guide pins are installed in the correct orientation.

Install the brake caliper.

- Tighten the brake caliper upper bolt to 35 Nm (26 lb.ft).

2. NOTE: Make sure the brake pads are installed in the correct orientation.

Install the brake pads.

For additional information, refer to: [Brake Pads - Vehicles With: Standard Brakes](#) (206-03 Front Disc Brake, Removal and Installation).

- Apply a suitable amount of the supplied grease to the mating faces of the brake pads and brake calipers.

3. Connect the brake hose to the brake caliper.

- Clean the component mating faces.
- Remove the blanking caps from the ports.
- Install new sealing washers.
- Tighten the brake hose union to 32 Nm (24 lb.ft).

4. LH side only: Connect the brake pad wear indicator sensor.

5. Bleed the brake caliper.

For additional information, refer to: [Component Bleeding](#) (206-00 Brake System - General Information, General Procedures).

6. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

GENERAL

The rear brakes each consist of a single piston brake caliper, a ventilated brake disc and a dust shield (integrated as part of the parking brake). 2.7L and 4.0L models feature a different caliper and disc than the 3.0L and 5.0L models. The dust shield and parking brake are common on all derivatives.

The brake caliper is attached to the rear knuckle. The brake pads are made from an asbestos free material. The inboard brake pad of the right rear brake incorporates a wear sensor.

When hydraulic pressure is supplied to the caliper, the piston extends and forces the inner pad against the disc. The caliper body reacts and slides on the guide pins to bring the outer pad into contact with the disc.

The rear brake pad wear sensor is connected in series with the front brake pad wear sensor, between the instrument cluster and ground. When a brake pad incorporating a brake pad wear sensor is approximately 75% worn, the brake pad wear sensor goes open circuit. When the instrument cluster detects the open circuit, it illuminates the amber Light Emitting Diode (LED) in the brake warning indicator. Vehicles with the high line instrument cluster also display an appropriate warning in the message center and sound a warning chime.

For additional information, refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).

At the beginning of each ignition cycle, the instrument cluster performs a bulb check on the brake warning indicator: the indicator is illuminated amber for 1.5 seconds, then red for 1.5 seconds.

Rear Disc Brake - Brake Disc

Removal and Installation

Removal

 **WARNING:** If installing a new brake disc, install new brake pads.

 **CAUTION:** Brake discs must be renewed in pairs.

• **NOTE:** If the parking brake shoes or the brake discs have been removed for access to other components then **DO NOT** carry out the bedding in procedure.

• **NOTE:** LH illustration shown, RH is similar.

• **NOTE:** The brake pad wear warning indicator sensor must be replaced each time the brake pads are serviced.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Remove the rear wheel and tire.

4. Remove the brake caliper and anchor plate.

5. NOTE: Rotate the rear brake disc to locate the parking brake shoe adjuster.

Release the parking brake shoe adjustment.

- Remove the parking brake shoe adjuster access plugs.
- Rotate the parking brake shoe adjuster.

E63919

6. Remove the rear brake disc.

- Remove the Allen screw.

E63921

Installation

1. Make sure that the rear brake disc and hub mating surfaces are clean.
2. Install the rear brake disc.
 - Tighten the bolt to 35 Nm (26 lb.ft).
3. Install the brake caliper and anchor plate.
 - Tighten the bolts to 115 Nm (85 lb.ft).
4. Adjust the parking brake.
For additional information, refer to: [Parking Brake Shoe and Lining Adjustment](#) (206-05 Parking Brake and Actuation, General Procedures).
5. Install the rear wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Disc Brake - Brake Pads

Removal and Installation

Removal

WARNING: Brake pads must be renewed in axle sets only, otherwise braking efficiency may be impaired.

- NOTE: RH illustration shown, LH is similar.
- NOTE: The brake pad wear warning indicator sensor must be replaced each time the brake pads are serviced.

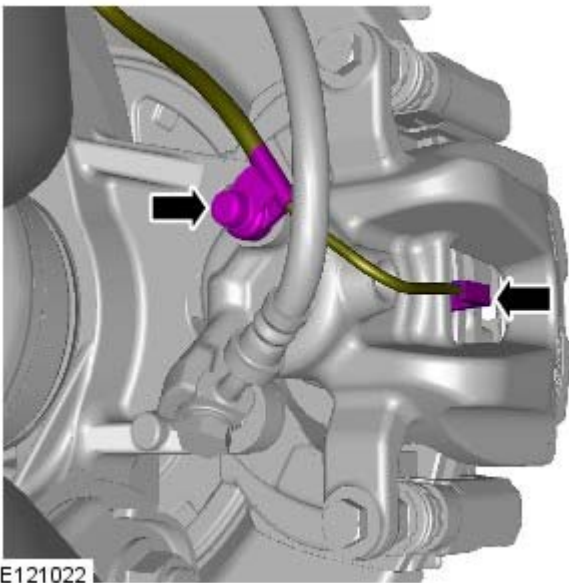

1. WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

3. RH side rear: Disconnect the brake pad wear indicator sensor wiring harness.

4. RH side rear: Disconnect the brake pad wear indicator sensor wiring harness.

5. RH side rear: Release and disconnect the brake pad wear indicator wiring harness electrical connector.

E121535

6. NOTE: Use an additional wrench to prevent the component from rotating.

Remove the brake caliper lower bolt.

E121654

7. NOTE: Note the orientation of the brake pads.

- NOTE: Note the orientation of the clips.

Remove the brake pads.

- Rotate the brake caliper upwards.
- Remove the 2 clips.

E66109

8. Repeat the above 2 steps for the other side.

Installation

1.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the brake caliper housing and anchor plate using brake cleaning fluid.

2. Inspect the caliper piston and slide pin seals for damage.

3. CAUTIONS:

The brake caliper should move freely on both slide pins.

If necessary, renew the components.

Check the slide pins for correct operation.

4. Position a bleed jar containing a small quantity of approved brake fluid. Connect the bleed tube to the bleed screw and loosen the screw.

5. Press the piston into the caliper housing.

- Tighten the rear caliper bleed screws to 10 Nm (7 lb.ft).

6. Disconnect the bleed tube and remove the jar.

7.  CAUTION: If installed, the adhesive strips covering the outer brake pads must be removed before installation. Failure to follow this instruction may result in damage to the vehicle.

If installed, remove the adhesive strips from the 2 outer brake pads.

8. NOTE: Make sure the brake pads are installed in the correct orientation.

• NOTE: Make sure that the clips are installed in the correct orientation.

Install the brake pads.

- Install the 2 clips.

9. Rotate the brake caliper downwards.

- Tighten the brake caliper lower bolt to 35 Nm (26 lb.ft).

10. Repeat the above procedure for the other side.

11. RH side rear: Connect the brake pad wear indicator wiring harness electrical connection.

12. RH side rear: Connect the brake pad wear indicator sensor wiring harness.

13. RH side rear: Connect the brake pad wear indicator sensor wiring harness.

14. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

15. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

Rear Disc Brake - Brake Caliper

Removal and Installation

Removal

- NOTE: RH illustration shown, LH is similar.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

RH side only: Disconnect the brake pad wear indicator sensor.

- Release from the clip.

E121022

4. Remove the rear brake pads.
For additional information, refer to: [Brake Pads](#) (206-04 Rear Disc Brake, Removal and Installation).
5. NOTE: Use an additional wrench to prevent the component from rotating.

Remove the brake caliper housing.

- Remove the brake caliper upper bolt.

E66184

6. Remove the brake caliper anchor plate.

E52889

7. NOTE: Note the orientation of the brake caliper guide pins.

Remove the guide pins and seals.

E53724

Installation

1. CAUTIONS:

The brake caliper should move freely on both slide pins.

If necessary, renew the components.

• NOTE: Make sure the brake caliper guide pins are installed in the correct orientation.

Install the brake caliper guide pins.

- Check the condition of the caliper guide pin seals.
- Check for correct operation.

2. Install the brake caliper anchor plate.

- Tighten the bolts to 115 Nm (85 lb.ft).

3. NOTE: Use an additional wrench to prevent the component from rotating.

Install the brake caliper.

- Tighten the brake caliper upper bolt to 35 Nm (26 lb.ft).

4. Install the rear brake pads.

For additional information, refer to: [Brake Pads](#) (206-04 Rear Disc Brake, Removal and Installation).

5. Connect the brake pad wear indicator sensor.

6. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Parking Brake and Actuation - Parking Brake

Description and Operation

COMPONENT LOCATIONS

E132052

Item	Part Number	Description
1	-	Clutch pedal position sensor (manual transmission models only)
2	-	Parking brake indicators (all except NAS (north American specification))
3	-	Parking brake indicators (NAS only)
4	-	Drum brake
5	-	Parking brake module
6	-	Parking brake cable
7	-	Emergency release cable
8	-	Parking brake switch

GENERAL

The parking brake is an electrically actuated system that operates drum brakes integrated into the rear brake discs. The parking brake system consists of:

- A parking brake switch.
- Left and right drum brakes.
- Left and right brake cables.
- An emergency release cable.
- A clutch pedal position sensor (manual transmission models only).

- Two parking brake indicators.
- A parking brake module.

The parking brake is operated by the parking brake module, which adjusts the tension of the brake cables to apply and release the drum brakes. Operation of the parking brake module is initiated by the parking brake switch.

PARKING BRAKE SWITCH

Item	Part Number	Description
1	-	Side stowage tray
2	-	Securing screw
3	-	Parking brake switch

The parking brake switch is used by the driver to apply and release the parking brake, and is installed in the center console adjacent to the gear lever.

Slots on the sides of the parking brake switch engage with the top panel of the center console, and a screw secures the parking brake switch in position. An electrical connector on the back of the switch provides the interface with the vehicle wiring. A brake symbol on the switch illuminates when the exterior lamps are selected on.

There are three states for the parking brake switch:

- Apply request, when the handle of the parking brake switch is pulled up.
- Release request, when the handle of the parking brake switch is pushed down.
- Idle, when the handle of the parking brake switch is in the central or rest position.

Microswitches, incorporated into the parking brake switch, are activated by the handle of the parking brake switch. To determine the operating state of the parking brake switch, the parking brake module scans the circuits containing the microswitches.

DRUM BRAKES

• NOTE: RH brake shown, LH brake similar

E49844

Item	Part Number	Description
1	-	Brake shoe
2	-	Shoe locating pin and clip
3	-	Adjuster spring
4	-	Toothed wheel adjuster
5	-	Backplate
6	-	Return spring
7	-	Cross strut
8	-	Wedge adjuster screw
9	-	Dust shield
10	-	Rear brake disc
11	-	Adjuster access plug

Each drum brake consists of a pair of brake shoes installed on a backplate attached to the rear hub carrier. The brake shoes operate on the drum integrated into the rear brake disc. The orientation of the brake shoes differ by 180° between the left-hand (LH) and right-hand (RH) brakes.

When the parking brake module tensions the brake cables, the movement is transmitted to an operating lever on one of the brake shoes. The operating lever pivots against a cross strut, which forces the brake shoes apart and into contact with the drum in the rear brake disc. Brake shoe to drum clearance is set with two manual adjusters, which are accessed through a hole in the brake disc. One of the adjusters is a conventional toothed wheel adjuster. The second adjuster is a wedge adjuster operated by an Allen screw.

After replacement of the brake shoes or brake discs, a bedding in procedure must be performed to ensure the drum brakes operate satisfactorily.

For additional information, refer to: [Parking Brake Shoe and Lining Adjustment](#) (206-05 Parking Brake and Actuation, General Procedures).

Prior to removing a brake disc from a vehicle, power should be disconnected from the parking brake module. Operation of the parking brake switch while a brake disc is removed can cause the actuating mechanism in the parking brake module to seize.

BRAKE CABLES

E49845

Item	Part Number	Description
1	-	Gearbox
2	-	Parking brake module housing
3	-	Cable nut
4	-	Sealing collar
5	-	Threaded connector
6	-	Spline shaft
7	-	Force sensor
8	-	Shoe
9	-	Locking cover
10	-	Sealing collar
11	-	Cable nut

The brake cables consist of Bowden cables installed between the parking brake module and the drum brakes. Nuts, on the ends of the outer cables, secure the brake cables to the parking brake module and the backplate of the related drum brake. In each drum brake, the inner cable is located in the guide spring and connected to the brake shoe operating lever

by a nipple on the end of the cable. In the parking brake module, the two inner cables are joined together via the force sensor and the spline shaft.

The inner cable of the RH brake cable is connected to a nipple on the force sensor by a 'shoe' on the end of the cable; a locking cover keeps the shoe engaged with the nipple.

The inner cable of the LH brake cable is connected to the spline shaft by a threaded connector (LH thread); a squared flange at the end of the threaded connector locates in the housing of the parking brake module, to prevent the threaded connector from turning with the spline shaft.

When the spline shaft turns, the threaded connector of the LH brake cable is screwed into or out of the spline shaft, which changes the effective length of the inner cables and operates the drum brakes. The ability of the spline shaft to move axially in the gearbox equalizes the load applied by the inner cables to the two drum brakes.

Prior to disconnecting a brake cable, power should be disconnected from the parking brake module. Operation of the parking brake switch while a brake cable is disconnected can cause the actuating mechanism in the parking brake module to seize. In addition, the parking brake may not switch off until 20 minutes after Power mode 0 selected. Automatic re-apply cannot be eliminated until this period has expired.

EMERGENCY RELEASE CABLE

E49846

Item	Part Number	Description
1	-	Pull ring
2	-	Quick release fitting
3	-	Parking brake module
4	-	Sealing collar
5	-	Spring

6	-	Inner cable
7	-	Nipple
8	-	Pulley wheel

The emergency release cable allows the parking brake to be mechanically released if:

- The parking brake cannot be electrically released because of a system fault.
- The battery is disconnected or battery voltage decreases below 7.5 volts while the parking brake is applied, so that the parking brake cannot be electrically released.

The parking brake is mechanically released by disconnecting the force sensor from the spline shaft in the parking brake module. During normal operation, the force sensor and the spline shaft are locked together by a lever operated pawl on the end of the spline shaft, which engages with a spigot on the force sensor.

The emergency release cable is a Bowden cable installed between the parking brake module and the center console. The emergency release cable is held in clips along the underside of the vehicle and enters the passenger compartment below the center console through an aperture in the transmission tunnel. A quick release fitting seals the emergency release cable in the aperture. At the parking brake module, a sealing collar on the outer cable is a push fit in the housing of the parking brake module.

In the center console, a pull ring is installed on the end of the inner cable. The pull ring is designed to fit the hook on the end of the jack handle which, in combination with a screwdriver shaft, can be used to pull on the cable.

The pull required to release the latch is approximately 200 N (45 lbf). When the pull ring of the emergency release cable is released, the spring in the parking brake module retracts the inner cable and the nipple moves away from the pawl operating lever.

After the emergency release cable has been used to release the parking brake, the next time an apply selection is made with the parking brake switch, the parking brake module automatically runs through a latching procedure to reconnect the spline shaft with the force sensor. The parking brake module turns the spline shaft so that it moves towards the force sensor. The pawl of the spline shaft then re-engages with the spigot of the force sensor. A second apply selection with the parking brake switch is required to apply the parking brake.

CLUTCH PEDAL POSITION SENSOR (MANUAL TRANSMISSION MODELS ONLY)

E49848

Item	Part Number	Description
1	-	Clutch master cylinder
2	-	Electrical connector
3	-	Clutch pedal position sensor

The clutch pedal position sensor supplies a signal of clutch pedal position to the parking brake module.

The clutch pedal position sensor is a Hall effect sensor which is attached to the side of the clutch master cylinder. The position of the piston in the clutch master cylinder effects a magnetic field in the sensor, and is translated by the sensor into an analogue voltage signal for the parking brake module. The parking brake module relates the signal to the position of the clutch pedal.

PARKING BRAKE INDICATORS

E49849

Item	Part Number	Description
1	-	Red warning indicator (all except NAS)
2	-	Amber warning indicator (all except NAS)
3	-	Red warning indicator (NAS only)
4	-	Amber warning indicator (NAS only)

The parking brake has two warning indicators, one amber and one red, located in the speedometer of the instrument cluster.

Amber Parking Brake Warning Indicator

The amber parking brake warning indicator is continuously illuminated if there is a parking brake system fault. Operation of the indicator is controlled by a high speed controller area network (CAN) bus signal from the parking brake module to the instrument cluster.

Red Parking Brake Warning Indicator

When the parking brake is applied, the red parking brake warning indicator is continuously illuminated while the ignition is on and for 3 minutes after the ignition is switched off. If the system is unable to comply with an apply or release request, due to a system fault, the indicator flashes.

When the ignition is on and the indicator is not flashing, operation is controlled by a high speed CAN bus signal. When the ignition is off or when the indicator is flashing, operation is controlled by a hardwired signal from the parking brake module to the instrument cluster.

Text Messages

On vehicles with the high line instrument cluster, when there is a fault condition, illumination of the warning indicators is accompanied by a text message displayed in the message center. For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

PARKING BRAKE MODULE

The parking brake module monitors external and internal inputs and adjusts the tension of the brake cables to operate the drum brakes and provide the required parking brake function.

The parking brake module is installed on a support bracket attached to the front of the spare wheel carrier. Two rubber mounts, installed on lugs on the underside of the parking brake module, locate in holes in the support bracket. The top corners of the parking brake module are secured to the support bracket with rubber mounts and flanged nuts.

The main components of the parking brake module are:

- A PCB (printed circuit board) incorporating the ASIC (application specific integrated circuit) for control of the parking brake.
- An electric motor.
- A gearbox.
- A spline shaft.
- A force sensor.

The spline shaft and the force sensor are connected together by a latch on the end of the spline shaft. The spline shaft rotates on the latch and moves axially in the gearbox. The latch and the force sensor slide in a channel in the body of the parking brake module.

To apply or release the drum brakes, the parking brake module runs the electric motor, which drives the gearbox. The gearbox turns the spline shaft to increase or decrease the tension in the brake cables. The parking brake module monitors the load exerted by the brake cables using the input from the force sensor.

Interior of Parking Brake Module

E49850

Item	Part Number	Description
1	-	Electrical connector
2	-	Housing
3	-	Electric motor
4	-	PCB
5	-	Spline shaft
6	-	Gearbox
7	-	Force sensor

Inputs and Outputs

A 32 pin electrical connector on the RH side of the parking brake module provides the interface between the PCB and the vehicle wiring.

The parking brake module is powered by two permanent battery power feeds from the battery junction box (BJB). Two connections with the central junction box (CJB) provide battery voltage signals in Power mode 0 and Power mode 6. Other hardwired inputs consist of those from the parking brake switch and, on manual transmission models, the clutch pedal position sensor.

In addition to the hardwired connections, the parking brake module is connected to the high speed CAN bus to enable communication with other vehicle systems.

PARKING BRAKE OPERATION

The parking brake can be applied at any time provided sufficient battery power is available. For the parking brake to be released, various pre-conditions are required. The parking brake has manual and automatic operating modes, to cater for different operating circumstances, as detailed in the following table:

Operating Modes

Mode	Pre-Conditions	Driver Action
Static apply	Vehicle speed less than 2.5 km/h (1.6 mph).	Pull up parking brake switch.
Static release	1. Vehicle speed less than 2.5 km/h (1.6 mph). 2. Engine running. OR Ignition is ON and brake pedal or clutch pedal pressed (manual transmission). OR Ignition is ON and brake pedal or accelerator pedal pressed (automatic transmission).	Press down parking brake switch.
Ignition OFF apply	1. Vehicle speed less than 10 km/h (6.25 mph). 2. Ignition is OFF. 3. Selector lever is not in position 'P'. (automatic transmission).	Switch the ignition OFF.
Igniton OFF apply inhibit	1. Vehicle speed less than 2.5 km/h (1.6 mph). 2. Ignition is OFF. 3. Selector lever is not in position 'P'. (automatic transmission).	Switch the ignition OFF while pressing down parking brake switch.
Dynamic apply	Vehicle speed more than 2.5 km/h (1.6 mph).	Pull up parking brake switch as required.
Dynamic release	Vehicle speed more than 2.5 km/h (1.6 mph).	Release (to neutral position) or press down parking brake switch.
DAR (drive away release) (automatic transmission only)	1. Ignition is ON. 2. Transmission in gear 1, 2 or R (with high range selected) or 1, 2, 3 or R (with low range selected). 3. Accelerator pedal pressed more than 2%. 4. Seatbelt is fastened. 5. Drivers door is closed.	None. Parking brake released automatically on drive away.

Operating Voltages

Actuation of the parking brake (apply or release) is only started if the power supply to the parking brake module is within 9 to 18 volts. At any voltage in this range, the parking brake module is able to tighten the brake cables to the maximum, to fully apply the parking brake, although at voltages between 9 and 10.5 volts the actuation time may exceed 1.0 second.

During a parking brake actuation:

- If the power supply to the parking brake module decreases to less than 8.3 volts, the parking brake module continues the actuation, but stores a related fault code. If the ignition is on, the parking brake module also signals the instrument cluster to illuminate the amber parking brake warning indicator and flash the red parking brake warning indicator. On vehicles with the high line instrument cluster, a message advising there is a parking brake fault is shown in the message center. The warning indications are discontinued if the power supply voltage increases to 8.3 volts or more.
- If the power supply voltage decreases to less than 7.5 volts, the parking brake module discontinues the actuation. Actuation is automatically resumed if the power supply voltage subsequently increases to 7.5 volts or more and the parking brake switch request is still valid.
- If the power supply voltage decreases below 6.5 volts, the parking brake function is disabled for the remainder of the ignition cycle.
- If the power supply voltage increases to more than 18.0 volts, the parking brake module immediately disables the

parking brake function and stores a related fault code. If the ignition is on, the parking brake module also signals the instrument cluster to illuminate the amber parking brake warning indicator and flash the red parking brake warning indicator. On vehicles with the high line instrument cluster, a message advising that the parking brake has a fault and is not functioning is shown in the message center. The parking brake function remains disabled until the power supply voltage is within 9 to 18 volts again. When the power supply voltage is within 9 to 18 volts again, the warning indications are cancelled and actuation is automatically resumed if the parking brake module is in a dynamic mode of operation with a valid parking brake switch request.

- **NOTE:** The instrument cluster shuts down below 8 volts, so warning indications and messages are not displayed below 8 volts. CAN transmission stops if battery voltage drops below 7.0 volts and re-starts when voltage goes above 7.5 volts.

Sleep Mode

To reduce quiescent drain on the vehicle battery, the parking brake module incorporates a sleep mode. The parking brake module enters the sleep mode, provided the ignition is off and there are no signals from the wheel speed sensors, when one of the following occurs:

- 20 minutes elapse after the last actuation of the parking brake.
- If no actuation occurred, 20 minutes elapse after the ignition is switched off.

The parking brake module wakes up from the sleep mode when one of the following occurs:

- An apply or release request is made with the parking brake switch.
- The ignition is switched on.
- A key out apply is activated.

The parking brake module wakes up within 500 ms. The high speed CAN bus is activated within 200 ms maximum.

When the parking brake module is woken with a release request from the parking brake switch, the parking brake module ignores the request but illuminates the red brake warning indicator. The parking brake module extinguishes the red brake warning indicator and goes back to sleep immediately the switch is released to the neutral position.

When the parking brake module is woken with an apply request from the parking brake switch, if the parking brake is already applied the parking brake module ignores the request but illuminates the red brake warning indicator. The parking brake module extinguishes the red brake warning indicator and goes back to sleep immediately the switch is released to the neutral position. If the parking brake is in the released condition when the apply request is made, the parking brake module illuminates the red brake warning indicator and applies the parking brake. The parking brake module extinguishes the red brake warning indicator and goes back to sleep 3 minutes after the apply activation, or immediately after the switch is released to the neutral position, whichever occurs last.

Dynamic Apply

In the dynamic apply mode, if the vehicle speed is more than 10 km/h (6.25 mph) when the parking brake switch is selected to apply, the parking brake module requests the ABS module to activate the disc brakes on all four wheels. When the vehicle comes to a standstill, the parking brake module statically applies the parking brake. Once the static load is achieved, the hydraulic pressure is removed. If the parking brake switch is released to the neutral position, or pressed down to the release position, during dynamic apply, braking is cancelled.

The anti-lock brake system (ABS) module monitors the deceleration rate using the wheel speed sensor signals, and adjusts the hydraulic pressure to the disc brakes as required to achieve the required rate. All of the anti-lock control - traction control system brake functions remain enabled in the dynamic apply mode.

The parking brake module incorporates two fallback functions for the dynamic apply mode.

- Fallback 1 is invoked if vehicle speed is between 2.5 km/h (1.25 mph) and V_{max} when the parking brake switch is selected to apply and the ABS module is unable to fulfil a hydraulic request. When fallback 1 is invoked, the parking brake module decelerates the vehicle, using only the parking brake. The parking brake module monitors the deceleration rate using the wheel speed information from the ABS module, and adjusts the tension of the brake cables to achieve the required rate. During deceleration the parking brake module also uses the wheel speed inputs from the ABS module to operate an anti-lock function for the rear wheels. When vehicle speed decreases to 2.5 km/h (1.25 mph) the parking brake module switches to the static apply mode.
- Fallback 2 is invoked if there is a loss of communication between the parking brake module and the ABS module or the CAN bus has failed. When fallback 2 is invoked, the parking brake module decelerates the vehicle using only the parking brake. The parking brake module tightens the brake cables under the control of the driver, no anti-lock function is available.

While dynamic apply is active, including fallback 1 and fallback 2, the parking brake module also outputs high speed CAN bus signals to:

- The ABS module, to apply the stoplamps.
- The instrument cluster, to sound an intermittent warning buzzer, at 0.5 second on, 1.0 second off.
- The instrument cluster, to illuminate the red parking brake warning indicator. The indicator is permanently illuminated except in fallback 2, when it flashes.

DAR Pre-arming

The DAR pre-arming function operates when the transfer box is in high range to reduce the parking brake release time during DAR and to provide a smooth take-off. DAR pre-arming is invoked when:

- The ignition is ON.
- The transmission is in gear 1, 2 or R.
- The vehicle is stationary.
- No failsafe tighten actuation has occurred.

Automatic Load Adjustment

While the ignition is on, the parking brake module constantly monitors the input from the force sensor. If the tension of the brake cables goes outside the limits for a given operating mode, the parking brake module automatically restores the tension within limits.

Failsafe Tighten. If, during pre-arming, the vehicle moves, then the maximum cable force is reinstated for the remainder of that ignition cycle.

Automatic Apply. While the parking brake is applied, if the tension of the brake cables decreases by a prescribed amount from the initial setting, the parking brake module automatically restores the tension to the initial setting.

Automatic Release. While the parking brake is released, if the tension of the brake cables increase to a prescribed amount, the parking brake module automatically reduces the tension to zero.

Parking Brake Switch Monitoring

The parking brake module monitors for the following types of fault in the parking brake switch system. If a fault is detected, the parking brake module stores a related fault code:

- Short circuits between a pull-down transistor in the parking brake module and battery voltage.
- Broken wires and microswitches.
- Plausibility.

The parking brake switch has a degree of in-built redundancy. If a single microswitch fault is detected the parking brake module can still determine the operating state of the parking brake switch. Short circuits or multiple failures cause the parking brake module to disable the parking brake switch for the remainder of the ignition cycle. The parking brake module also disables the parking brake switch if a plausibility fault occurs. However, since plausibility faults are usually caused by incomplete operation of the parking brake switch, the parking brake switch is re-enabled if the parking brake module subsequently establishes a plausible operating state.

If a single microswitch fault is detected, the parking brake module signals the instrument cluster to illuminate the amber parking brake warning indicator. On vehicles with the high line instrument cluster, the parking brake module also signals the instrument cluster to display a message advising there is a parking brake fault. During an apply actuation, the parking brake module also signals the instrument cluster to flash the red parking brake warning indicator.

For all other fault types, the parking brake module signals the instrument cluster to illuminate the amber parking brake warning indicator, and, on vehicles with the high line instrument cluster, to display a message advising the parking brake has a fault and is not functioning. If it makes an apply actuation, the parking brake module signals the instrument cluster to flash the red parking brake warning indicator for the remainder of the ignition cycle.

On the next ignition cycle, the warning indicators and the messages are only activated if the fault is still present, although the fault code is retained by the parking brake module until cleared by T4.

Parking Brake and Actuation - Parking Brake

Diagnosis and Testing

Principles of Operation

For a detailed description of the Parking Brake System and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Parking Brake](#) (206-05 Parking Brake and Actuation, Description and Operation).

Inspection and Verification

• CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

Please note this is a sealed unit and no attempt must be made to open the actuator as it will invalidate any warranty claim.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Parking brake cable(s) condition and installation ● Parking brake shoes condition and fitment ● Parking brake drums (integrated into rear brake discs) ● Parking brake actuator module condition and installation 	<ul style="list-style-type: none"> ● Parking brake indicators ● Fuses ● Wiring harness/electrical connectors <ul style="list-style-type: none"> - Check for bent/corroded pins ● Controller Area Network (CAN) circuits ● Parking brake switch ● Parking brake actuator module

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Parking brake will not engage or release	<ul style="list-style-type: none"> ● Parking brake cables fouled, trapped or damaged ● Parking brake cables incorrectly routed or fixed ● Parking brake shoes, linings worn/contaminated ● Parking brake drums (integrated into rear brake discs) ● Parking brake shoes incorrectly adjusted following replacement ● Parking brake actuator module malfunction 	<p>Check the parking brake cables for fouling, trapping or damage. Check the cables for correct routing. Check that the cable end fitting connector(s) are correctly fitted to the operating lever(s). Inspect the parking brake shoes and drums for condition/wear/contamination, REFER to: Rear Disc Brake (206-04 Rear Disc Brake, Description and Operation) / Parking Brake Shoes (206-05, Removal and Installation). Check the parking brake shoes for correct adjustment. REFER to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures). Check the operation of the parking brake actuator module, check for damage and/or excessive noise during operation. Check for parking brake actuator module DTCs.</p>
Low parking brake efficiency/parking brake sticking/binding		

DTC Index

For a complete list of all Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index (100-00, Description and Operation).

Brake Bedding Mode

Bedding mode is a special mode available in the parking brake module (PBM) that disables the stability assist system (ABS) and allows the parking brake to provide the braking force rather than the conventional braking system whilst the vehicle is moving at a velocity of >3kph. This mode is entered via a series of brake pedal presses and switch applications, full details on this procedure is available in the relevant section of the workshop manual. If brake bedding mode is entered accidentally by the driver the RED warning lamp will flash in the Instrument Pack, the module will return to normal operational mode when the ignition has been cycled. This DTC (C1104-68) is intended to highlight the fact that although the RED lamp was illuminated there was no fault present in the control module.

Drive Cycles

Drive Cycle 1 Description

- Ignition On
- Make sure that no parking brake activation (diagnostic command or switch input) is attempted for a minimum of 3 seconds
- Retest for functionality

Drive Cycle 2 Description

- Ignition On
- Drive vehicle at a constant speed of 20KPH (13MPH) or slightly above in 2nd gear
- At a constant speed of 20KPH (13MPH) or slightly above apply the parking brake via the parking brake switch
- Press the brake pedal

Drive Cycle 3 Description

- Ignition On
- Make sure that the vehicle is stationary and that the parking brake is released
- Pull the parking brake switch to the apply position and hold in this position until the parking brake motor has stopped (this may take up to 5 seconds)
- Release the parking brake switch to the idle position, leave in the idle position for 2 seconds
- Push the parking brake switch to the release position (while pressing the brake pedal) and keep in this position until the parking brake motor has stopped (this may take up to 5 seconds)
- Release the parking brake switch to the idle position

Parking Brake and Actuation - Parking Brake Shoe and Lining Adjustment

General Procedures

• NOTE: This procedure must be carried out if, new parking brake shoes are fitted, new rear brake discs are fitted or if the vehicle has been mud wading (not water) for more than 50 miles.

1. Check the parking brake for correct operation.

2. CAUTIONS:

 When the vehicle is in the mounting position a red flashing light may appear on the instrument cluster. This indicates that the parking brake actuator is in the mounting position. It does not indicate a vehicle fault.

 The warning lamp on the instrument cluster will flash whilst the parking brake is being driven into the mounting position.

Using the Land Rover approved diagnostic system, drive the parking brake to the mounting position.

3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the wheels and tires.

5. NOTE: Align the access hole with the indicators located on the back plate.

Locate the parking brake shoe adjuster.

- Remove the access plug.
- Rotate the brake disc.

E48748

6.  **CAUTION:** Failure to follow this step may cause damage to the parking brake system. Failure to displace the parking brake shoes, as shown, will result in incorrect clearance when carrying out the adjustment step.

• NOTE: The movement of the parking brake shoe will be small and may not be felt when levering.

• NOTE: LH shown.

Using a flat blade screwdriver, lever the brake shoes as indicated.

E129558

7.  CAUTION: Failure to follow this step may cause damage to the parking brake system. Failure to displace the parking brake shoes, as shown, will result in incorrect clearance when carrying out the adjustment step.

- NOTE: The movement of the parking brake shoe will be small and may not be felt when levering.
- NOTE: RH Shown.

Using a flat blade screwdriver, lever the brake shoes as indicated.

E129557

8.  **CAUTION:** Do not apply excessive force on the brake shoe adjuster. Failure to follow this instruction may result in damage to the parking brake system

Using a flat bladed screwdriver rotate the brake shoe adjuster to extend it until the brake disc is locked hand tight.

E134131

E133307

9. **⚠ CAUTION:** The following steps sets the running clearance for the parking brake shoes, failure to adhere to the paint marking process may cause damage to the park brake system when the adjustment steps are carried out.

Using suitable marker, mark the position of the brake shoe adjuster.

10. **⚠ CAUTION:** The parking brake adjuster must be rotated back EXACTLY one full revolution. Failure to follow this instruction may result in damage to the parking brake system.

Rotate the adjuster back one revolution until paint mark is visible.

11. **⚠ CAUTION:** The wedge adjuster must be correctly seated to make sure the parking brake cable is correctly adjusted. Failure to follow this instruction may result in damage to the parking brake system.

12. Repeat the above procedure for the other side.
13. **⚠ CAUTION:** If the parking brake shoes or the brake discs have been removed for access to other components then DO NOT carry out this procedure.

14. **⚠ CAUTION:** Loosen the wedge adjuster Allen screw half a turn.

Tap the brake disc lightly with a soft faced mallet, around the parking brake shoe location within the brake disc. Carry out the parking brake shoe bedding-in procedure. For additional information, refer to: [Parking Brake Shoes Bedding-In](#) (206-05 Parking Brake and Actuation General Procedures).

- Tighten the wedge adjuster Allen screw to 8 Nm (5 lb.ft).
- Install the access plug.

E129607

Parking Brake and Actuation - Parking Brake Shoes Bedding-In

General Procedures

• NOTE: This procedure must be carried out if, new parking brake shoes are fitted, new rear brake discs are fitted or if the vehicle has been mud wading (not water) for more than 50 miles.

1. Carry out the parking brake shoe bedding-in procedure.

2. NOTE: The electronic parking brake 'Service Bedding-in Procedure mode' will be active for the remainder of the ignition cycle, or until the vehicle speed exceeds 31 mph (50 kph). If the procedure needs to be re-entered, the entry actions must be repeated.

To enter 'Service Bedding-in Procedure' mode.

- Start and run the engine.
- Apply the footbrake 3 times within 10 seconds and hold applied after the 3rd application.
- Apply the electronic parking brake switch 4 times, followed by 3 release applications within 10 seconds.

3. Once the Service Bedding-in procedure mode has been entered, the electronic parking brake linings can be bedded-in by conducting 10 repeated stops from 30 - 35 kph (19 - 22 mph), followed by a 500 metre (547 yard) interval between each stop to allow the brakes to cool, using the electronic parking brake control switch.

- The electronic parking brake brake force will be increased up to the dynamic maximum so long as the switch is held in the applied position.
- If the switch is released to either the NEUTRAL or OFF positions, the electronic parking brake will be released.
- The electronic parking brake MUST be allowed to cool between applications, either by driving at 19 mph (30 kph) for 500 metres (547 yards) or remaining stationary for 1 minute between each application.

Parking Brake and Actuation - Parking Brake Cable LH

Removal and Installation

Removal

CAUTION: To avoid accidental operation of the parking brake, and possible damage to the parking brake actuator, remove Fusible link 8, located in the engine compartment fuse box before commencing work.

• **NOTE:** If the parking brake system has completed less than 50,000 cycles it is permissible to replace the parking brake cables. If over 50,000 cycles have been completed, then the cables can only be replaced as part of the parking brake actuator and cable assembly. The parking brake cycle count can be checked using the Land Rover approved diagnostic system, (ON/OFF = 1 cycle). If a cable breaks or becomes detached whilst the vehicle is being driven, a 'parking brake actuator unjamming procedure' may be required using the Land Rover approved diagnostic system.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.
2. Isolate the parking brake electrical circuit.
 - Remove fuse number 8 from the BJB.

WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove both rear wheels and tires.
5. Release the parking brake shoe adjustment.
 - Loosen the screw.

E48749

E93861

6.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Reposition the LH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.

E43893

7. Remove the LH rear brake disc.

- Remove the screw.

E49623

8. Disconnect parking brake cable from the wheel hub.

- Fully loosen the nut.
- Release the cable from the lower arm.
- Disconnect the inner cable from the brake shoe.

9. Release the LH parking brake cable.

- Remove the 2 bolts.
- Release the 3 wiring harness clips.
- Release the cable from the clip on the chassis.

10. Release the LH parking brake cable.

11. Remove the LH parking brake cable.

- Release the retaining nut.
- Release and remove the cable.

Installation

1. Install the LH parking brake cable.

- LH cable: Screw the cable in 5 complete turns.
- Tighten the retaining nut.

2. Locate and secure the LH parking brake cable.

- Tighten the bolts to 22 Nm (16 lb.ft).
- Secure the wiring harness.
- Secure the cable grommet to the integrated body frame bracket.

E100248

3. NOTE: Make sure that the brake cable circlip is positioned as shown.

Connect the parking brake cable to the wheel hub.

- Connect the cable to the brake shoe lever.
- Locate the cable to the backplate.
- Tighten the nut to 8 Nm (6 lb.ft).

4.  CAUTION: Make sure that the component is clean, free of foreign material and lubricant.

Install the LH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

5. Secure the LH rear brake caliper.

- Remove and discard the tie strap.
- Tighten the bolts to 115 Nm (85 lb.ft).

6. NOTE: The adjustment procedure must be carried out in full.

Adjust the parking brake shoes.

For additional information, refer to: [Parking Brake Shoe and Lining Adjustment](#) (206-05 Parking Brake and Actuation, General Procedures).

7. Install the rear wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

8. Install fuse number 8 into the BJB.

Parking Brake and Actuation - Parking Brake Cable RH

Removal and Installation

Removal

CAUTION: To avoid accidental operation of the parking brake, and possible damage to the parking brake actuator, remove Fusible link 8, located in the engine compartment fuse box before commencing work.

• **NOTE:** If the parking brake system has completed less than 50,000 cycles it is permissible to replace the parking brake cables. If over 50,000 cycles have been completed, then the cables can only be replaced as part of the parking brake actuator and cable assembly. The parking brake cycle count can be checked using the Land Rover approved diagnostic system, (ON/OFF = 1 cycle). If a cable breaks or becomes detached whilst the vehicle is being driven, a 'parking brake actuator unjamming procedure' may be required using the Land Rover approved diagnostic system.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.
2. Isolate the parking brake electrical circuit.
 - Remove fuse number 8 from the BJB.

WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the wheels and tires.
5. Release the parking brake shoe adjustment.
 - Loosen the screw.

E48749

E93861

6.  CAUTION: Do not allow the brake caliper to hang on the brake hose.

Reposition the RH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.

E43893

7. Remove the RH rear brake disc.

- Remove the screw.

E49623

8. Disconnect parking brake cable from the wheel hub.

- Fully loosen the nut.
- Release the cable from the lower arm.
- Disconnect the inner cable from the brake shoe.

E93839

9.  CAUTION: The fuel tank breather line bracket can be easily damaged when releasing it from the chassis.

Release the fuel tank breather line bracket.

- Remove the plastic insert.

E49859

10. Release the RH parking brake cable.

- Remove the 2 bolts.
- Release the parking brake cable from the 2 pipe clips.
- Release the cable from the clip on the chassis.

E49940

11. Release the RH parking brake cable.

12.  **CAUTION:** Make sure that no dirt or moisture enters the actuator during cable replacement.

Remove the RH parking brake cable.

- Release the retaining nut.
- Release the cable retaining clip.
- Release and remove the cable.

Installation

1. Install the RH parking brake cable.
 - Install the cable.
 - Install the cable retaining clip.
 - Tighten the retaining nut.
2. Secure the fuel tank breather line bracket.
 - Install the plastic insert.
3. Locate and secure the RH parking brake cable.
 - Tighten the bolts to 22 Nm (16 lb.ft).
 - Secure the parking brake cable to the 2 pipe clips.
 - Secure the cable grommet to the integrated body frame bracket.

4. **NOTE:** Make sure that the brake cable circlip is positioned as shown.

Connect the parking brake cable to the wheel hub.

- Connect the cable to the brake shoe lever.
- Locate the cable to the backplate.
- Tighten the nut to 8 Nm (6 lb.ft).

5.  **CAUTION:** Make sure that the component is clean, free of foreign material and lubricant.

Install the RH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

6. Secure the RH rear brake caliper.

NOTE: The adjustment procedure must be carried out in full.

- Remove and discard the tie strap.
- Adjust the parking brake shoes.
- Tighten the bolts to 115 Nm (85 lb.ft).

For additional information, refer to: [Parking Brake Shoe and](#)

[Lining Adjustment](#) (206-05 Parking Brake and Actuation, General Procedures).

8. Install the rear wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

9. Install fuse number 8 into the BJB.

Parking Brake and Actuation - Parking Brake Switch

Parking Brake and Actuation - Parking Brake Actuator

Removal and Installation

Removal

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.
2. Isolate the parking brake electrical circuit.
 - Remove fuse number 8 from the BJB.

3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the rear wheels and tires.
5. Release the parking brake shoe adjustment.

- Remove the plug from the access hole in the brake disc.
- Using a suitable tool, rotate the brake shoe adjuster to release the adjustment.

E48748

6.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Reposition the RH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.

E93861

7. Remove the RH rear brake disc.

- Remove the screw.

8.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Reposition the LH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.

9. Remove the LH rear brake disc.

- Remove the screw.

10. Disconnect both parking brake cables from the wheel hubs.

- Fully loosen the nut.
- Release the cable from the lower arm.
- Disconnect the inner cable from the brake shoe.

11. Release the LH parking brake cable.

- Remove the 2 bolts.
- Release the 3 wiring harness clips.
- Release the cable from the clip on the chassis.

12. Release the LH parking brake cable.

E93839

13.  **CAUTION:** The fuel tank breather line bracket can be easily damaged when releasing it from the chassis.

Release the fuel tank breather line bracket.

- Remove the plastic insert.

E93902

14. Raise the RH side of the rear stabilizer bar.

- Loosen the 2 bolts.

E49859

15. Release the RH parking brake cable.

- Remove the 2 bolts.
- Release the parking brake cable from the 2 pipe clips.
- Release the cable from the clip on the chassis.

E49940

16. Release the RH parking brake cable.

17. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.

E44306

18.  CAUTION: Inspect the parking brake emergency release cable to body seal and replace if damaged.

- NOTE: Note the fitted position of the parking brake emergency release cable to body seal.

Release the parking brake emergency release cable.

E49860

19.  CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

RH side rear: Disconnect the brake line.

- Position an absorbent cloth to collect fluid spillage.
- Disconnect the line union.
- Remove the clip.

E57294

20. NOTE: Note the routing of the parking brake emergency release cable.

Displace the parking brake actuator and cable assembly.

- Disconnect the electrical connector.
- Remove the 2 nuts.

E108521

21. NOTE: Brake cable shown removed for clarity.

Remove the parking brake actuator and cable assembly.

- Withdraw from the RH rear wheel arch aperture.

E114802

Installation

1. NOTE: Note the routing of the parking brake emergency release cable.

Install the parking brake actuator and cable assembly.

- Install the 2 nuts.
- Connect the electrical connector.

2. NOTE: Remove and discard the blanking caps.

RH side rear: Connect the brake line.

- Clean the component mating faces.
- Secure the clip.
- Tighten the brake line union to 16 Nm (12 lb.ft).

3. ⚠ CAUTION: Make sure the parking brake emergency release cable to body seal is installed correctly.

Locate and secure the parking brake emergency release cable.

4. Install the fuel tank heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

5. Secure the fuel tank breather line bracket.

- Install the plastic insert.

6. Locate and secure the RH parking brake cable.

- Tighten the bolts to 22 Nm (16 lb.ft).
- Secure the parking brake cable to the 2 pipe clips.
- Secure the cable grommet to the integrated body frame bracket.

7. Locate and secure the LH parking brake cable.

- Tighten the bolts to 22 Nm (16 lb.ft).
- Secure the wiring harness.
- Secure the cable grommet to the integrated body frame bracket.

E100248

8. NOTE: Make sure that the brake cable circlip is positioned as shown.

Connect the parking brake cables to the wheel hubs.

- Connect the cable to the brake shoe lever.
- Locate the cable to the backplate.
- Tighten the nut to 8 Nm (6 lb.ft).

9. ⚠ CAUTION: Make sure that the component is clean, free of foreign material and lubricant.

Install the LH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

10. Secure the LH rear brake caliper.

- Remove and discard the tie strap.
- Tighten the bolts to 115 Nm (85 lb.ft).

11. ⚠ CAUTION: Make sure that the component is clean, free of foreign material and lubricant.

Install the RH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

12. Secure the RH rear brake caliper.

- Remove and discard the tie strap.
- Tighten the bolts to 115 Nm (85 lb.ft).

13. Adjust the parking brake shoes.

For additional information, refer to: [Parking Brake Shoe and Lining Adjustment](#) (206-05 Parking Brake and Actuation, General Procedures).

14. Bleed the brake system.

For additional information, refer to: [Component Bleeding](#) (206-00 Brake System - General Information, General Procedures).

15. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

16. Install fuse number 8 into the BJB.

17. Using the Land Rover approved diagnostic system, calibrate the parking brake actuator on an even surface.

18. Apply and release hand brake to confirm operation.

Parking Brake and Actuation - Parking Brake Shoes

Removal and Installation

Removal

• NOTE: If the parking brake shoes or the brake discs have been removed for access to other components then DO NOT carry out the bedding in procedure.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.

2. Isolate the parking brake electrical circuit.

- Remove fuse number 8 from the BJB.

3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the wheels and tires.

5. Release the brake caliper.

- Remove the brake caliper anchor bolts.

E83751

6.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Tie the brake caliper aside.

7. Release the park brake shoe adjustment.

- Remove the plug from the access hole in the brake disc.
- Using a suitable tool, rotate the brake shoe adjuster to release the adjustment.

E48748

8. Remove the brake disc.

- Remove the Torx screw.

E43893

9. CAUTIONS:

 Make sure that the green bias spring is installed to the right hand parking brake shoes and the red bias spring is installed to the left hand parking brake shoes.

 Make sure the brake shoe spring is not over stretched.

• NOTE: **If equipped.**

Remove the bias spring(s).

E136405

10. Remove the adjuster and return spring.

- Release the parking brake shoe adjuster to the minimum adjustment.

E48999

11. Remove the primary brake shoe.

- Remove the hold-down spring and retaining pin.
- Pivot the shoe to release it from the spreader plate and return spring.

E49000

12. Remove the spreader plate and spring.

13. Remove the return spring.

E49001

14. Remove the secondary brake shoe.

- Remove the hold-down spring and retaining pin.
- Disconnect the parking brake cable retaining spring from the brake shoe lever.
- Release the parking brake cable.

E49002

15. Repeat the above procedure for the other side.

Installation

1.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the backing plate and apply grease to the brake shoe contacts.

2. Clean the adjuster and set it to its minimum extension.

E66812

3. CAUTIONS:

- ⚠ Make sure the brake shoe spring is not over stretched.
- ⚠ Make sure the closed end of the retaining clip is installed facing the brake shoe adjuster. Failure to follow this instruction may result in damage to the vehicle.
- ⚠ Illustration 'A' is the LH side and 'B' is the RH side.

Install the secondary brake shoe.

- Connect the parking brake cable.
- Connect the parking brake cable retaining spring to the brake shoe lever, making sure the spring is not twisted.
- Install the hold-down spring and retaining pin.

4. Install the spreader plate and the spring.

- Using a tie strap, tie back the spreader plate spring.

5. ⚠ WARNING: Make sure the return spring and the adjuster spring are correctly installed to the primary shoe.

• CAUTIONS:

- ⚠ Make sure the brake shoe spring is not over stretched.
- ⚠ Make sure the closed end of the retaining clip is installed facing the brake shoe adjuster. Failure to follow this instruction may result in damage to the vehicle.
- ⚠ Illustration 'A' is the LH side and 'B' is the RH side.

Install the primary brake shoe.

- Install the return spring.
- Connect the primary brake shoe to the return spring.
- Locate the primary brake shoe to the spreader plate.
- Install the hold-down spring and retaining pin.

E66812

6. ⚠ CAUTION: Make sure the brake shoe spring is not over

stretched.

Install the brake shoe adjuster and the retaining spring.

7. Remove and discard the spreader plate spring tie strap.

8. CAUTIONS:

 Make sure that the green bias spring is installed to the right hand parking brake shoes and the red bias spring is installed to the left hand parking brake shoes.

 Make sure the brake shoe spring is not over stretched.

• **NOTE: If equipped.**

Install the bias spring(s).

E136405

9. Make sure the brake disc and hub mating surfaces are clean.

10. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

11. Install the brake caliper.

- Tighten the bolts to 115 Nm (85 lb.ft).

12. Repeat the above procedure for the other side.

13. Adjust the parking brake.

For additional information, refer to: [Parking Brake Shoe and Lining Adjustment](#) (206-05 Parking Brake and Actuation, General Procedures).

14. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

15. Install fuse number 8 into the BJB.

Hydraulic Brake Actuation -

General Specifications

Item	Specification
Master cylinder bore diameter:	
Primary	27 mm (1.1 in)
Secondary	20.6 mm (0.8 in)
Stroke	36 mm (1.4 in)

Torque Specifications

Description	Nm	lb-ft
Brake pedal nut and bolt - Automatic gearbox	45	33
Brake pedal bracket Torx bolts - Automatic gearbox	10	7
Brake booster to brake pedal bracket nuts - Automatic gearbox	25	18
Brake master cylinder nuts	26	19
Brake pipe unions	18	13

Hydraulic Brake Actuation - Hydraulic Brake Actuation

Description and Operation

COMPONENT LOCATIONS

- NOTE: RHD shown, LHD similar

E48285

Item	Part Number	Description
1	-	Brake pedal (automatic shown)
2	-	Brake warning indicator (NAS)
3	-	Brake warning indicator (all except NAS)

4	-	Brake pipes and hoses
5	-	Brake master cylinder and reservoir

GENERAL

Hydraulic brake actuation consists of the brake pedal, the brake master cylinder and the hydraulic pipes and hoses.

BRAKE PEDAL

- NOTE: Automatic gearbox model shown, manual gearbox model similar

E48286

Item	Part Number	Description
1	-	In-vehicle cross beam
2	-	Brake pedal buffer
3	-	Stoplamp switch
4	-	Brake pedal
5	-	Clevis pin and clip
6	-	Brake pedal bracket

The brake pedal is mounted in a bracket attached to the rear side of the engine bulkhead. On Left Hand Drive (LHD) manual gearbox models, the brake pedal shares a bracket and pivot bolt with the clutch pedal. On Right Hand Drive (RHD) manual gearbox models, the brake pedal has a separate bracket. A clevis pin and clip connect the brake pedal to the push rod of the brake booster. A brake pedal buffer is installed on the in-vehicle cross beam to restrain rearward movement of the brake pedal in an accident.

The stoplamp switch is mounted in the brake pedal bracket and operated by the brake pedal.

For additional information, refer to: [Anti-Lock Control - Traction Control](#) (206-09A Anti-Lock Control - Traction Control, Description and Operation).

BRAKE MASTER CYLINDER AND RESERVOIR

- NOTE: RHD version shown, LHD version similar

E48287

Item	Part Number	Description
1	-	Reservoir
2	-	Clutch outlet spigot and sealing cap
3	-	Primary outlet spigot
4	-	Reservoir to master cylinder seal, primary inlet
5	-	Primary outlet port
6	-	Reservoir securing lug
7	-	Secondary outlet port
8	-	Cylinder housing
9	-	Reservoir to master cylinder seal, secondary inlet
10	-	Reservoir securing straps
11	-	Secondary outlet spigot
12	-	Filter
13	-	Float
14	-	Magnet
15	-	Reservoir cap and level switch

The brake master cylinder and reservoir is attached to the front of the brake booster, on the driver side of the engine compartment.

Master Cylinder

The brake master cylinder consists of a cylinder housing containing two pistons in tandem. The rear piston produces pressure for the primary circuit and the front piston produces pressure for the secondary circuit. The pistons incorporate center valves with a high flow rate to ensure there is always sufficient fluid available at the hydraulic control unit for stability control operations.

When the brake pedal is pressed, the front push rod in the brake booster pushes the primary piston along the bore of the cylinder housing. This produces pressure in the primary pressure chamber which, in conjunction with the primary spring, overcomes the secondary spring and simultaneously moves the secondary piston along the bore. The initial movement of the pistons, away from the piston stops, closes the primary and secondary center valves. Further movement of the pistons then pressurizes the fluid in the primary and secondary pressure chambers, and thus the brake circuits. The fluid in the chambers behind the pistons is unaffected by the movement of the pistons and can flow unrestricted through the feed holes between the chambers and the reservoir.

When the brake pedal is released, the primary and secondary springs push the pistons back down the bore of the cylinder housing. As the pistons contact the piston stops, the primary and secondary center valves open, which allows fluid to circulate unrestricted between the two hydraulic circuits and the reservoir, through the center valves, the chambers behind the pistons and the cylinder housing inlets.

Should a failure occur in one of the brake circuits, the remaining brake circuit will still operate effectively, although brake pedal travel and vehicle braking distances will increase.

Reservoir

The reservoir is installed on top of the master cylinder to provide a supply of brake fluid for the primary and secondary circuits of the brake system. On manual gearbox models, the reservoir also provides a supply of brake fluid for the clutch. For additional information, refer to: [Clutch Controls](#) (308-02 Clutch Controls - TDV6 2.7L Diesel, Description and Operation).

Two straps, integrated onto the sides of the reservoir, engage with lugs on the master cylinder to secure the reservoir in position. Two outlet spigots on the underside of the reservoir locate in seals installed in the inlet ports of the master cylinder. An outlet spigot is installed on the left side of the reservoir for the clutch hydraulic circuit, if required. On automatic gearbox models, the clutch outlet spigot is sealed with a cap, formed during manufacture of the reservoir, which is only removed if the reservoir is installed on a manual gearbox model.

The reservoir is internally divided to isolate the circuits from each other at low fluid levels, and so prevent a leak in one circuit from disabling the other circuit(s). The dividing walls support a central well and divide the area around the well into a further eight separate compartments. The well forms an extension of the filler neck and contains the filter and the fluid level switch.

The well and the surrounding compartments are interconnected by slots in the dividing walls. The slots are positioned such that when the reservoir is full, fluid can move between the well and all of the surrounding compartments, but at low fluid levels the interior forms separate reservoirs for each circuit and the amount retained in each reservoir if there is a leak from one of the other circuits.

Reservoir Interior

- NOTE: A = Clutch reservoir; B = Primary circuit reservoir; C = Secondary circuit reservoir

E48288

Item	Part Number	Description
1	-	Primary outlet
2	-	Clutch outlet
3	-	Secondary outlet

The filler neck of the reservoir is sealed with a cap incorporating the level switch. The level switch is operated by a magnet, which is installed in the float on the bottom of the switch. The switch reacts to the influence of the magnetic field surrounding the magnet.

When the reservoir is full, the float rests against the bottom of the switch and holds the level switch open. When the fluid level decreases, the float moves down and the switch closes to connect a ground to the instrument cluster. When the ground is made, the instrument cluster illuminates the red Light Emitting Diode (LED) in the brake warning indicator. Vehicles with the high line instrument cluster also display an appropriate warning in the message center. For additional information, refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).

At the beginning of each ignition cycle, the instrument cluster performs a bulb check on the brake warning indicator; the indicator is illuminated amber for 1.5 seconds, then red for 1.5 seconds.

The instrument cluster broadcasts the status of the brake fluid level, on the high speed Controller Area Network (CAN) bus, to the Anti-lock Brake System (ABS) module.

For additional information, refer to: [Anti-Lock Control - Traction Control](#) (206-09A Anti-Lock Control - Traction Control, Description and Operation).

BRAKE PIPES AND HOSES

The brake pipes and hoses connect the master cylinder to the wheel brakes via the hydraulic control unit. The pipes are arranged to provide a front and rear split braking system. The brakes on the front axle are operated by the primary system; the brakes on the rear axle are operated by the secondary system.

Hydraulic Brake Actuation - Brake Fluid Reservoir

Removal and Installation

Removal

CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

All vehicles

1. WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the cover.

3. Position an absorbent cloth to collect fluid spillage.

4. Disconnect the low brake fluid warning indicator switch electrical connector.

Vehicles with manual transmission

5. CAUTION: Always plug any open connections to prevent contamination.

Disconnect the clutch master cylinder supply line.

All vehicles

6.  CAUTION: Always plug any open connections to prevent contamination.

Remove the brake fluid reservoir.

- Release the 2 clips.
- Remove and discard 2 brake fluid reservoir seals.

Installation

All vehicles

1. Clean the components.
2. Install the brake fluid reservoir.
 - Install new brake fluid reservoir seals.

Vehicles with manual transmission

3. Connect the clutch master cylinder supply line.

All vehicles

4. Connect the low brake fluid warning indicator switch electrical connector.
5. Bleed the brake system using T4.
For additional information, refer to: [Brake System Bleeding](#) (206-00 Brake System - General Information, General Procedures).

Vehicles with manual transmission

6. Bleed the clutch system.
For additional information, refer to: [Clutch System Bleeding](#) (308-00 Manual Transmission/Transaxle and Clutch - General Information, General Procedures).

Hydraulic Brake Actuation - Brake Master Cylinder

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the brake fluid reservoir.
For additional information, refer to: [Brake Fluid Reservoir](#) (206-06 Hydraulic Brake Actuation, Removal and Installation).

3.  **CAUTION:** Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the brake master cylinder brake tubes.

4. Remove the brake master cylinder.

- Remove the 2 nuts.
- Remove and discard the O-ring seal.

Installation

1. Install the brake master cylinder.
 - Install a new O-ring seal.
 - Tighten the nuts to 23 Nm (17 lb.ft).
2. Connect the brake tubes.
 - Tighten the brake tube unions to 18 Nm (13 lb.ft).
3. Install the brake fluid reservoir.
For additional information, refer to: [Brake Fluid Reservoir](#) (206-06 Hydraulic Brake Actuation, Removal and Installation).

Hydraulic Brake Actuation - Brake Pedal Vehicles With: 6HP28 6-Speed Automatic Transmission/6HP26 6-Speed Automatic Transmission

Removal and Installation

Removal

1. Remove the headlamp switch.
For additional information, refer to: Headlamp Switch (417-01, Removal and Installation).
2. Remove the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).
3. Remove the instrument panel access panel.
 - Release the 2 clips.

E51369

4. Remove the brake pedal bracket.
 - Release the wiring harness clip.
 - Remove the 4 Torx bolts.

E52543

5. Remove the brake pedal clevis pin.
 - Remove the clip.

E52544

6. Remove the brake pedal.

- Remove the nut and bolt.

E52547

7. NOTE: Do not disassemble further if the component is removed for access only.

Remove the brake pedal pad.

E52548

Installation

1. Install the brake pedal pad.
2. Install the brake pedal.
 - Clean the component mating faces.
 - Tighten the nut and bolt to 45 Nm (33 lb.ft).
3. Install the brake pedal clevis pin.
 - Install the clip.
4. Install the brake pedal bracket.
 - Tighten the Torx bolts to 10 Nm (7 lb.ft).
 - Secure the wiring harness.
5. Install the instrument panel access panel.
 - Secure with the clips.
6. Install the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).
7. Install the headlamp switch.
For additional information, refer to: [Headlamp Switch](#) (417-01, Removal and Installation).

Hydraulic Brake Actuation - Brake Pedal and Bracket Vehicles With: S6-53 6-Speed Manual Transmission

Removal and Installation

Removal

• NOTE: The brake pedal, clutch pedal and bracket is serviced as a complete assembly. The procedure to remove and install the assembly is shown in the clutch pedal procedure.

1. Remove the clutch and brake pedal assembly.
For additional information, refer to: [Clutch Pedal](#) (308-02 Clutch Controls - TDV6 2.7L Diesel, Removal and Installation).

Installation

1. Install the clutch and brake pedal assembly.
For additional information, refer to: [Clutch Pedal](#) (308-02 Clutch Controls - TDV6 2.7L Diesel, Removal and Installation).

Hydraulic Brake Actuation - Brake Pedal and Bracket Vehicles With: 6HP28 6-Speed Automatic Transmission/6HP26 6-Speed Automatic Transmission

Removal and Installation

Removal

1. Remove the headlamp switch.
For additional information, refer to: Headlamp Switch (417-01, Removal and Installation).
2. Remove the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).
3. Remove the instrument panel access panel.
 - Release the 2 clips.

E51369

4. Remove the brake pedal bracket.
 - Release the wiring harness clip.
 - Remove the 4 Torx bolts.

E52543

5. Remove the brake pedal clevis pin.
 - Remove the clip.

E52544

6. Release the stoplamp wiring harness.

- Release the 2 clips.

7. Remove the brake pedal assembly.

- Remove the 6 nuts.
- Position the brake booster forward to aid the removal of the brake pedal assembly.

Installation

1. Install the brake pedal assembly.

- Position the brake booster to the brake pedal bracket.
- Tighten the nuts to 25 Nm (18 lb.ft).

2. Secure the wiring harness.

- Secure the clips.

3. Install the brake pedal clevis pin.

- Install the clip.

4. Install the brake pedal bracket.

- Tighten the Torx bolt to 10 Nm (7 lb.ft).
- Secure the wiring harness.

5. Install the instrument panel access panel.

- Secure with the clips.

6. Install the stoplamp switch.

For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).

7. Install the headlamp switch.

For additional information, refer to: [Headlamp Switch](#) (417-01, Removal and Installation).

Power Brake Actuation -**Sealant**

Application	Land Rover Part No.
Brake vacuum pump - 2.7 Litre engine	8510302

General Specifications

Item	Specification
Brake booster type	Twin chamber 228 and 254 mm (9.0 and 10.0 in)
Boost ratio	7:1

Item	Part Number	Description
1	-	Vacuum pump
2	-	Brake booster
3	-	Vacuum pipe connection to brake booster (includes check valve)
4	-	Vacuum pipe connection to vacuum pump
5	-	Vacuum pipes

GENERAL

Power assistance for the brakes is provided by a vacuum operated brake booster. On petrol models, the vacuum is produced by the intake manifold and an electric vacuum pump. On diesel models, the vacuum is produced by an engine driven vacuum pump.

VACUUM PIPES

Plastic vacuum pipes connect the brake booster to the vacuum source. Check valves are incorporated into the vacuum pipes. On petrol models there are two in-line check valves, to maintain the vacuum in the brake booster when the throttle is open and the vacuum pump is not running, and prevent fuel vapor entering the brake booster. On diesel models there is a single check valve integrated into the vacuum pipe connection with the brake booster, to maintain the vacuum in the brake booster when the vacuum pump is operating at less than the optimum.

BRAKE BOOSTER

E49905

The brake booster is installed in the driver side of the engine compartment, on the engine bulkhead.

The brake booster is a dual diaphragm unit with a boost ratio of 8.0 : 1 and 28 bar loop-in in all engine variants. The input push rod is connected to the brake pedal. The output push rod locates in the primary piston of the brake master cylinder. A vacuum pipe, installed in a grommet in the front face of the housing, connects the brake booster to the intake manifold and electric vacuum pump (petrol models) or the engine driven vacuum pump (diesel models).

VACUUM PUMP (4.0L AND 4.4L)

E49906

Item	Part Number	Description
1	-	Anti-vibration mount
2	-	Pump cover
3	-	Vacuum pump inlet
4	-	Rubber shroud for exhaust port
5	-	Motor cover
6	-	Electrical connector

On petrol models the electric vacuum pump supplements the main vacuum supply from the engine manifold.

The vacuum pump is installed on a mounting bracket in the front left corner of the engine compartment. Two anti-vibration mounts on the vacuum pump are located on studs on the mounting bracket and secured with nuts.

The vacuum pump consists of a radial vane pump driven by an electric motor. The rotor and vanes of the pump are made from a self-lubricating carbon based material. A stub pipe is installed in the inlet of the pump to provide a connection point for the vacuum pipe from the brake booster. A second stub pipe, which is covered by a rubber shroud, is installed in the outlet from the pump.

Operation of the vacuum pump is controlled by the Engine Control Module (ECM), which uses the brake vacuum pump relay in the Battery Junction Box (BJB) to switch power to the vacuum pump. The ECM controls the time for which the vacuum pump is switched on and has in-built safeguards to protect the pump from overuse, e.g. continuous running is not allowed so a minimum delay time is specified between applications.

VACUUM PUMP (2.7L DIESEL)

E49907

Item	Part Number	Description
1	-	Vacuum connection (not used)
2	-	Vacuum connection for brake booster
3	-	Drive dog
4	-	Seal
5	-	Oil inlet port
6	-	Oil return/air vent

A vacuum pump is installed on diesel models as the air inlet system does not produce sufficient vacuum for satisfactory operation of the brake booster.

The vacuum pump is a radial vane pump which is attached to the rear of the RH cylinder head and driven at half engine speed by the exhaust camshaft. The vacuum pipe from the brake booster connects to an elbow on the rim of the vacuum pump.

The vacuum pump is lubricated and cooled by engine oil supplied to a port in the front face of the vacuum pump from a gallery in the cylinder head. The oil return is through a vent in the front face of the pump into a drain cavity in the cylinder head. Air extracted from the brake booster is vented into the drain cavity with the returning engine oil.

Power Brake Actuation - Brake Booster

Removal and Installation

Removal

1. Pump the brake pedal until the brake vacuum assistance is exhausted.
2. Remove the auxiliary battery cover.

- Release the 2 clips.

3. If installed, remove the auxiliary battery.
4. Detach the automatic transmission module bracket and position it to one side.

- Remove the 2 bolts.

5. Remove the auxiliary battery compartment side wall.

- Release the four clips.

6. Release the Air Conditioning (A/C) pipes.

- Remove the retaining screw.

7. Remove the auxiliary battery tray.

- Remove the 3 bolts.

8. Release the Anti-lock Brake System (ABS) module.

- Remove the 3 nuts.
- Release the brake tubes from the clip.

9. Disconnect the low brake fluid warning indicator switch electrical connector.

10.  **CAUTION:** Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Position an absorbent cloth to collect fluid spillage.

11. Disconnect the brake booster vacuum hose from the brake booster.

12. CAUTIONS:

 Make sure that excessive force is not used. Failure to follow this instruction may result in damage to the vehicle.

 Make sure the wings and trim panels are covered and protected, failure to follow this instruction may result in damage to the vehicle.

 Make sure the brake pipes are not damaged when displacing the brake master cylinder and ABS module. Failure to follow this instruction may result in damage to the vehicle.

Displace the brake master cylinder and ABS module as a complete assembly.

- Remove the 2 nuts.
- Discard the master cylinder seals.

13. Remove the outer plenum base.

- Remove the 3 nuts.

E47923

14. Remove the driver side closing trim panel.

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.

E47926

15. NOTE: The cover is shown removed for clarity.

Remove the brake booster push rod clevis pin.

- Remove the retaining clip.

E47929

16. Remove the brake booster.

- Remove the 4 nuts.

Installation

1. Install the brake booster.

- Tighten the nuts to 23 Nm (17 lb.ft).

2. Install the brake booster push rod clevis pin.

- Install the retaining clip.

3. Connect the brake booster vacuum hose.

4. Install the outer plenum base.

- Carefully lift the anti-lock brake system modulator for access.

- Install the 3 nuts.

5.  CAUTION: Make sure the master cylinder is correctly aligned.

- NOTE: Install new seals and nuts.

Install the the brake master cylinder and ABS module.

- Tighten the nuts to 23 Nm (17 lb.ft).

6. Secure the anti-lock brake system modulator.

- Install the 3 nuts.
- Secure the brake tubes to the clip.

7. Connect the low brake fluid warning indicator switch electrical connector.

8. Install the auxiliary battery tray.

- Install the 3 bolts.

9. Install the auxiliary battery compartment side wall.

- Secure with the four retaining clips.

10. Secure the A/C pipes.

- Install the retaining screw.

11. Secure the automatic transmission module bracket

- Install the 2 bolts.

12. If installed, install the auxiliary battery.

13. NOTE: This step is to check the tightness of the retaining nuts after the initial tighten to make sure that torque has not relaxed.

Check the brake booster retaining nuts.

- Tighten the nuts to 23 Nm (17 lb.ft).

14. Install the closing trim panel.

- Connect the electrical connector.
- Secure the clip.
- Tighten the screws.

15. Start engine and check the brake booster operation.

Power Brake Actuation - Brake Vacuum Pump TDV6 2.7L Diesel

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornammentation, Removal and Installation).

3.  **CAUTION:** Always plug any open connections to prevent contamination.

Disconnect the brake booster vacuum line from the brake vacuum pump.

E55481

4.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Remove the exhaust system. For additional information, refer to: (309-00A Exhaust System - TDV6 2.7L Diesel)

[Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\)](#) (Removal and Installation),
[Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\)](#) (Removal and Installation).

6. Lower the rear of the transmission for access.
7. Remove the exhaust cross-over pipe LH support bracket.

- Release the wiring harness.
- Remove the 3 bolts.

E54854

8. Remove the exhaust cross-over pipe RH support bracket.

- Remove the 3 bolts.

9. Remove the exhaust cross-over pipe center support bracket.

- Remove the 2 bolts.

10.  CAUTION: Take care when handling the cross-over pipe as damage to the insulating material may occur.

Release the exhaust cross-over pipe from the turbocharger.

- Remove the turbocharger heat shield bolt.
- Remove and discard the 3 nuts.

11. Remove the RH exhaust manifold heat shield.

12. Remove the exhaust cross-over pipe.
- Remove and discard the 3 nuts.
 - Remove and discard the 2 gaskets.

13. Release the high-pressure fuel supply line.
- Remove the bolt.

14. Remove the brake vacuum pump nut.

15. Remove the brake vacuum pump.
- Remove the stud.
 - Remove the 2 bolts.

Installation

E56076

1.  **CAUTION:** Extreme care is required during assembly so that the sealant is not smeared. If the sealant is smeared, the mating faces must be cleaned and new sealant must be applied.

Apply sealant to the two places shown.

- Make sure the vacuum pump seal is clean and dry.
- Make sure that the dogs on the vacuum pump are aligned with the camshaft.
- Apply a 2mm square of Loctite 518 sealant in the 2 places shown.
- Install the brake vacuum pump immediately after applying the sealant.
- The brake vacuum pump should be fitted directly to the engine without smearing the sealant.

2. Install the brake vacuum pump.

- Install the 2 bolts.
- Tighten the bolts to 23 Nm (17 lb.ft).

3. Install the brake vacuum pump stud.

- Tighten to 13 Nm (10 lb.ft).

4. Install the brake vacuum pump nut.

- Tighten to 13 Nm (10 lb.ft).

5. Secure the high-pressure fuel supply line.

- Tighten the bolt to 10 Nm (7 lb.ft).

6. Install 3 new exhaust manifold studs.

- Tighten the 3 studs to 13 Nm (10 lb. ft).

7. Install 3 new turbocharger studs.

- Tighten the 3 studs to 13 Nm (10 lb. ft).

8.  **CAUTION:** Take care when handling the cross-over pipe as damage to the insulating material may occur.

Install the exhaust cross-over pipe.

- Clean the component mating faces.
- Install 2 new gaskets.
- Install 6 new nuts
- Tighten the 6 nuts to 24 Nm (18 lb. ft).

9. Install the exhaust cross-over pipe center support bracket.

- Loosely install the 2 bolts.

10. Install the exhaust cross-over pipe RH support bracket.

- Loosely install the 3 bolts.

11. Install the exhaust cross-over pipe LH support bracket.

- Loosely install the 3 bolts.

12. Tighten the exhaust cross-over pipe mounting bracket bolts in the following sequence.

- Tighten the 2 bolts marked 1 to 10 Nm (7 lb.ft).
- Undo the 2 bolts by 90 degrees.
- Tighten the 2 bolts marked 3 to 10 Nm (7 lb.ft).
- Undo the 2 bolts by 90 degrees.
- Tighten the 4 bolts marked 2 to 25 Nm (18 lb.ft).
- Tighten the 2 bolts marked 1 to 25 Nm (18 lb.ft).
- Tighten the 2 bolts marked 3 to 25 Nm (18 lb.ft).
- Attach the wiring harness.

13. Install the RH exhaust manifold heat shield.

- Tighten the 3 bolts to 10 Nm (7 lb.ft).

14. Install the turbocharger heat shield.

- Tighten the bolt to 10 Nm (7 lb.ft).

15. Install the exhaust system. For additional information, refer to: (309-00A Exhaust System - TDV6 2.7L Diesel)

[Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\) \(Removal and Installation\)](#),
[Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\) \(Removal and Installation\)](#).

16.  **CAUTION:** Always plug any open connections to prevent contamination.

Connect the brake booster vacuum line to the brake vacuum pump.

17. Install the engine cover.

For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornammentation, Removal and Installation).

18. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Power Brake Actuation - Brake Vacuum Pump TDV6 3.0L Diesel

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: **Some variation in the illustrations may occur, but the essential information is always correct.**

1. Refer to: [Body - TDV6 3.0L Diesel/TDV6 2.7L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

2.

3.

4. Torque: 23 Nm

5. Torque: 13 Nm

6. **6.** NOTE: Discard the O-ring seal.

Torque: 10 Nm

E124399

Installation

E116820

8.

1. **1.** NOTE: Install a new gasket.

- NOTE: Install a new O-ring seal.

- NOTE: Apply silicone gasket sealant or equivalent meeting Land Rover specification.

- NOTE: The application of sealant must be 10 mm square in two places. Install the brake vacuum pump immediately after applying the sealant.

- NOTE: The brake vacuum pump should be fitted directly to the engine without smearing the sealant.

- NOTE: Make sure that the drive coupling is aligned with camshaft coupling.

To install, reverse the removal procedure.

Power Brake Actuation - Brake Vacuum Pump V6 4.0L Petrol

Removal and Installation

Removal

1.  **CAUTION:** Always plug any open connections to prevent contamination.

Remove the brake vacuum pump.

- Release and disconnect the electrical connector.
- Disconnect the vacuum line.
- Remove the 2 nuts.

2. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the 2 rubber insulators.

Installation

1. To install, reverse the removal procedure.

- Tighten the nuts to 5 Nm (4 lb.ft).

Power Brake Actuation - Brake Vacuum Pump V8 5.0L Petrol

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
2. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).
3. Refer to: [Engine Oil Draining and Filling](#) (303-01D Engine - V8 5.0L Petrol, General Procedures).

4.

5. **NOTE:** Discard the seal.
 - NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Torque: 12 Nm

Installation

1. **NOTE:** Install a new seal.
To install, reverse the removal procedure.

Anti-Lock Control - Traction Control -

General Specification

Item	Specification
System make/type	Bosch 8.0 Anti-lock braking system with Electronic Brake Distribution (EBD), Corner Brake Control (CBC), Electronic Traction Control (ETC), Hill Descent Control (HDC), Anti-roll Mitigation (ARM), Emergency Brake Assist (EBA), and Dynamic Stability Control (DSC)
Wheel speed sensors:	
Make/type	Bosch DF11i
Location	Front and rear knuckles with the active directional sensor acting on the driveshaft pole wheel
Yaw rate sensor make/type	Bosch DRS MM1.OR

Torque Specifications

Description	Nm	lb-ft
Front road wheel speed sensor bolt	9	7
Front brake caliper anchor plate bolts	275	203

Anti-Lock Control - Traction Control - Anti-Lock Control - Traction Control

Description and Operation

COMPONENT LOCATIONS - SHEET 1 OF 2

E50000

Item	Part Number	Description
1	-	Hydraulic control unit with attached anti-lock brake system (ABS) module
2	-	Stoplamp switch
3	-	Right rear wheel speed sensor
4	-	Left rear wheel speed sensor

5	-	Yaw rate and lateral acceleration sensor
6	-	HDC (hill descent control) relay (non-serviceable, integrated into central junction box (CJB))
7	-	Steering angle sensor
8	-	Left front wheel speed sensor
9	-	Right front wheel speed sensor

COMPONENT LOCATIONS - SHEET 2 OF 2

E50001

Item	Part Number	Description
1	-	Brake warning indicator (NAS (north American specification) only)
2	-	ABS warning indicator
3	-	Brake warning indicator (all except NAS)
4	-	DSC (dynamic stability control) switch

5	-	HDC (hill descent control) switch
6	-	HDC warning indicator (low line instrument cluster only)
7	-	HDC information indicator
8	-	DSC warning indicator

GENERAL

The anti-lock control - traction control system is based on the 4 channel Bosch 8.0 system and provides the following brake functions:

- ABS.
- ARM (active roll mitigation).
- CBC (corner brake control).
- DSC.
- electronic brake force distribution (EBD).
- ETC (electronic traction control).
- emergency brake assist (EBA).
- EDC (engine drag-torque control).
- HDC.

The system consists of the following components:

- A DSC switch.
- An HDC switch.
- An HDC relay.
- A stoplamp switch.
- Four wheel speed sensors.
- A yaw rate and lateral acceleration sensor.
- A steering angle sensor.
- Warning indicators; four on vehicles with a high line instrument cluster and five on vehicles with a low line instrument cluster.
- A hydraulic control unit (HCU) with attached ABS module.

DSC SWITCH

The DSC switch allows the DSC function to be selected off. Although Land Rover recommend that DSC is selected on for all normal driving conditions, it may be beneficial to de-select DSC, to maximize traction, under the following conditions:

- If the vehicle needs to be rocked out of a hollow or a soft surface.
- Driving on loose surfaces or with snow chains.
- Driving in deep sand, snow or mud.
- On tracks with deep longitudinal ruts.

The DSC switch is a non-latching switch installed in the center switch pack on the instrument panel. Pressing the DSC switch connects an ignition power feed to the ABS module. With the first press of the DSC switch, the ABS module disables the DSC functions. When the DSC switch is pressed again, the ABS module re-enables the DSC functions. The DSC switch must be pressed for a minimum of 0.3 s for the ABS module to react. The DSC function is re-enabled at the beginning of each ignition cycle.

The status of the DSC switch selection is shown by the DSC warning indicator. The DSC warning indicator is off while DSC is selected on, and continuously illuminated while DSC is selected off.

A DSC switch request to disable DSC is ignored if the air suspension system has failed, or is in off-road height at speeds above 60 km/h (37.5 mph).

To guard against incorrect operation or a broken switch, if the input from the DSC switch is held high for more than one minute, a failure is stored in the ABS module.

Even if DSC is deselected, driving maneuvers with extreme yaw or lateral acceleration may trigger DSC activity to assist vehicle stability.

HDC SWITCH

The HDC switch controls the selection of the HDC function.

The HDC switch is a non-latching switch installed on the center console, to the rear of the gear shift lever. Pressing and releasing the HDC switch momentarily connects an ignition power feed to the ABS module. With the first press and release of the HDC switch, the ABS module enables operation of the HDC function. When the HDC switch is pressed and released again, the ABS module disables operation of the HDC function.

To guard against incorrect operation or a broken switch, if the switch is pressed for more than 10 seconds no change of state occurs. If the input from the HDC switch is held high for more than one minute, a failure is stored in the ABS module.

HDC RELAY

The HDC relay is used to illuminate the stoplamps when the brakes are activated during HDC operation and during dynamic application of the parking brake.

The HDC relay is a non-serviceable, solid state relay on the circuit board of the CJB. Operation of the HDC relay is controlled by the ABS module switching the coil to ground. The ABS module monitors brake system hydraulic pressure and energizes the HDC relay during active braking. A pressure threshold and time filter prevent the stoplamps from flickering when HDC is braking.

STOPLAMP SWITCH

The stoplamp switch is mounted in the brake pedal bracket and operated by the brake pedal. The stoplamp switch is a two pole switch: The Brake Switch (BS) pole supplies a brake pedal status signal to the ABS module; the Brake Lamp Switch (BLS) pole operates the stoplamps and also supplies a brake pedal status signal to the ABS module and to the engine control module (ECM).

While the brake pedal is released:

- The BS contacts are closed, and connect an ignition power feed from the CJB to the ABS module.
- The BLS contacts are open.

When the brake pedal is pressed:

- The BS contacts open.
- The BLS contacts close, and connect an ignition power feed from the CJB to the three stoplamps, the ABS module and the ECM.

The ABS module monitors the status inputs from the stoplamp switch and broadcasts the brake pedal status and an associated quality factor on the high speed controller area network (CAN) bus.

WHEEL SPEED SENSORS

E50002

Item	Part Number	Description
1	-	Knuckle assembly
2	-	Sensor ring
3	-	Halfshaft
4	-	Wheel speed sensor
5	-	Screw

An active wheel speed sensor is installed in each wheel hub to provide the ABS module with a rotational speed signal from each road wheel. The head of each wheel speed sensor is positioned close to a 48 tooth sensor ring on the outer diameter of the constant velocity joint of the halfshaft. A flying lead connects each sensor to the vehicle wiring.

The wheel speed sensors each have a power supply connection and a signal connection with the ABS module. When the ignition switch is in position II, the ABS module supplies power to the wheel speed sensors and monitors the return signals. Any rotation of the halfshafts induces current fluctuations in the return signals which are converted into individual wheel speeds and the overall vehicle speed by the ABS module.

The ABS module outputs the individual wheel speeds and the vehicle speed on the high speed CAN bus for use by other systems. The quality of the vehicle speed signal is also broadcast on the high speed CAN bus. If all wheel speed signals are available to calculate vehicle speed from, the quality of the vehicle speed signal is set to 'data calculated within specified accuracy'. If one or more wheel speed sensors is faulty, the quality of the vehicle speed signal is set to 'accuracy outside specification'.

The ABS module monitors the wheel speed sensor circuits for faults. If a fault is detected the ABS module stores a related fault code and illuminates the appropriate warning indicators, depending on the system functions affected (DSC/ETC, ABS, EBA/EBD, HDC). A warning chime sounds and, on vehicles with the high line instrument cluster, a related message is shown in the message center.

For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

Since the wheel speed sensors are active devices, a return signal is available when the road wheels are not turning, which enables the ABS module to check the sensors while the vehicle is stationary. In addition, the direction of travel of each wheel can be sensed. This information is broadcast on the high speed CAN bus for use by other systems.

YAW RATE AND LATERAL ACCELERATION SENSOR

The yaw rate and lateral acceleration sensor provides the ABS module with inputs of yaw rate and lateral acceleration.

The yaw rate and lateral acceleration sensor is installed under the center console and secured to the transmission tunnel with two bolts.

When the ignition switch is in position II, the yaw rate and lateral acceleration sensor receives an ignition power feed from the CJB. The sensor is self diagnosed by the ABS module and can be interrogated using T4. The ABS module broadcasts the yaw rate and lateral acceleration values, on the high speed CAN bus, for use by other systems.

The ABS module monitors the yaw rate and lateral acceleration sensor for faults. If a fault is detected the ABS module stores a related fault code and illuminates the DSC warning indicator and, on vehicles with the low line instrument cluster,

the HDC warning indicator. A warning chime sounds and, on vehicles with the high line instrument cluster, a message advising of an HDC fault is shown in the message center. For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

STEERING ANGLE SENSOR

E50003

Item	Part Number	Description
1	-	Gear wheel
2	-	Electrical connector

The steering angle sensor measures the steering wheel angle and the rate of change of the steering wheel angle (known as the steering wheel angle speed). These measurements are output on the high speed CAN bus, together with a quality factor signal, and used by the ABS module for CBC and DSC operation.

The steering angle sensor is fixed to the pivot bracket of the steering column by three screws. A gear wheel in the steering angle sensor engages with a plastic drive collar fixed onto the lower shaft of the column. Inside the steering angle sensor, the gear wheel meshes with a gear train containing magnets. An eight pin electrical connector provides the interface between the vehicle wiring and integrated circuits in the steering angle sensor.

The steering angle sensor uses the MR (magneto resistive) effect, which evaluates the direction of magnetic fields, to measure the angular position of the lower shaft, and thus the steering wheel angle. When the steering wheel turns, the steering column lower shaft rotates the gear wheel in the steering angle sensor, which drives the gear train and rotates the magnets on the gears. The direction of the magnetic fields is constantly monitored by the steering angle sensor and converted into a steering wheel angle and steering wheel angle speed.

The steering angle sensor performs a plausibility check of the steering wheel angle each time the following conditions co-exist:

- The vehicle is traveling in a straight line.
- The vehicle speed is between 20 and 25 km/h (12.5 and 15.6 mph).
- The transfer box is in high range.
- The brake pedal is not pressed.
- There is no ABS, DSC or ETC activity.

The steering angle sensor uses inputs of wheel speed, yaw rate and lateral acceleration to determine when the vehicle is traveling in a straight line. When all of the conditions co-exist, the steering angle sensor checks the steering angle, which should be $0 \pm 15^\circ$. If the steering angle is outside the limits on two successive checks, the steering angle sensor changes the quality factor signal to 'outside specification' for the remainder of the ignition cycle and stores a fault code. At the beginning of each ignition cycle the quality factor signal is reset to 'within specified accuracy'.

The status of the steering angle sensor can be determined using T4.

If the steering angle sensor is replaced, the new sensor must be calibrated using T4. The steering angle sensor must also be re-calibrated any time it is disturbed from the steering column, or if the upper and lower steering columns are separated.

Steering Angle Sensor Harness Connector C0862

8	Ground	-

WARNING INDICATORS

The following anti-lock control - traction control indicators are installed in the instrument cluster:

ABS Warning Indicator

The ABS warning indicator is an amber colored indicator located between the coolant temperature gage and the fuel level gage.

The ABS warning indicator is continuously illuminated if there is a fault that affects ABS performance or causes the ABS function to be disabled.

Operation of the ABS warning indicator is controlled by a high speed CAN bus message from the ABS module to the instrument cluster.

When the ignition switch is first turned to position II, the ABS warning indicator illuminates for approximately 3 seconds as a bulb check. During the bulb check, if a fault is stored in the memory of the ABS module, the ABS warning indicator goes off for 0.5 second, 0.5 second after the start of the bulb check. If a fault during the previous ignition cycle caused the ABS warning indicator to be illuminated, the ABS warning indicator may remain illuminated after the next bulb check, even if the fault has been rectified and cleared from the ABS module; the ABS warning indicator remains illuminated until vehicle speed reaches 15-20 km/h (9.5-12.5 mph) while additional checks of the related inputs are performed.

Brake Warning Indicator

The brake warning indicator is a dual colored indicator, located in the coolant temperature gage, that illuminates amber for EBA faults and red for EBD faults. The brake warning indicator is also used to give warnings of:

- Low brake fluid level (illuminates red).
For additional information, refer to: [Hydraulic Brake Actuation](#) (206-06 Hydraulic Brake Actuation, Description and Operation).
- Brake pad wear (illuminates amber).
For additional information, refer to: [Rear Disc Brake](#) (206-04 Rear Disc Brake, Description and Operation).

Operation of the brake warning indicator is controlled by a high speed CAN bus message from the ABS module to the instrument cluster.

When the ignition switch is first turned to position II, the brake warning indicator illuminates amber for approximately 1.5 seconds then red for approximately 1.5 seconds, as a bulb check.

DSC Warning Indicator

The DSC warning indicator is an amber colored warning indicator located in the tachometer.

Each time the DSC or the ETC function is active, the DSC warning indicator flashes at 2 Hz. If DSC has been selected off, or there is a fault that disables the DSC or the ETC function, the DSC warning indicator is continuously illuminated. If DSC has been selected off, vehicles with the high line instrument cluster also display a message, advising that DSC is switched off.

For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

Operation of the DSC warning indicator is controlled by a high speed CAN bus message from the ABS module to the instrument cluster.

When the ignition switch is first turned to position II, the DSC warning indicator illuminates for approximately 3 seconds as a bulb check. If a fault during the previous ignition cycle caused the DSC warning indicator to be illuminated, the DSC warning indicator may remain illuminated after the next bulb check, even if the fault has been rectified and cleared from the ABS module; the DSC warning indicator may remain illuminated during vehicle operation while additional checks of the related inputs are performed.

HDC Information Indicator

The HDC information indicator is a green colored indicator located in the tachometer.

The HDC information indicator is continuously illuminated while the HDC function is selected on and the vehicle is within the parameters for HDC operation; when the vehicle is outside the parameters for HDC operation, the HDC information indicator is flashed at 2 Hz.

Operation of the HDC information indicator is controlled by a high speed CAN bus message from the ABS module to the instrument cluster.

HDC Warning Indicator

On the low line instrument cluster, the HDC warning indicator is an amber colored indicator located between the tachometer and the speedometer. On vehicles with the high line instrument cluster, the HDC warning indicator consists of a message in the message center.

On the low line instrument cluster the HDC warning indicator is continuously illuminated if there is a fault that affects the

HDC function, and flashed at 2 Hz if the HDC function is temporarily unavailable because of brake overheat.

On the high line instrument cluster, appropriate messages are displayed in the message center if there is a fault that affects the HDC function, or if the HDC function is temporarily unavailable because of brake overheat.

For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

Operation of the HDC warning indicator is controlled by a high speed CAN bus message from the ABS module to the instrument cluster.

On the low line instrument cluster, when the ignition switch is first turned to position II, the HDC warning indicator illuminates for approximately 3 seconds as a bulb check.

HCU

The HCU is a 4 channel unit that modulates the supply of hydraulic pressure to the brakes under the control of the ABS module.

The HCU is attached by three mounting bushes to a bracket in the plenum box on the driver side of the engine compartment. Hydraulic pipes connect the HCU to the master cylinder and the brakes.

For additional information, refer to: [Hydraulic Brake Actuation](#) (206-06 Hydraulic Brake Actuation, Description and Operation).

The primary and secondary outlets of the master cylinder are connected to primary and secondary circuits within the HCU. The primary circuit in the HCU has separate outlet ports to the front brakes. The secondary circuit in the HCU has separate outlet ports to the rear brakes. Each of the circuits in the HCU contain the following components to control the supply of hydraulic pressure to the brakes:

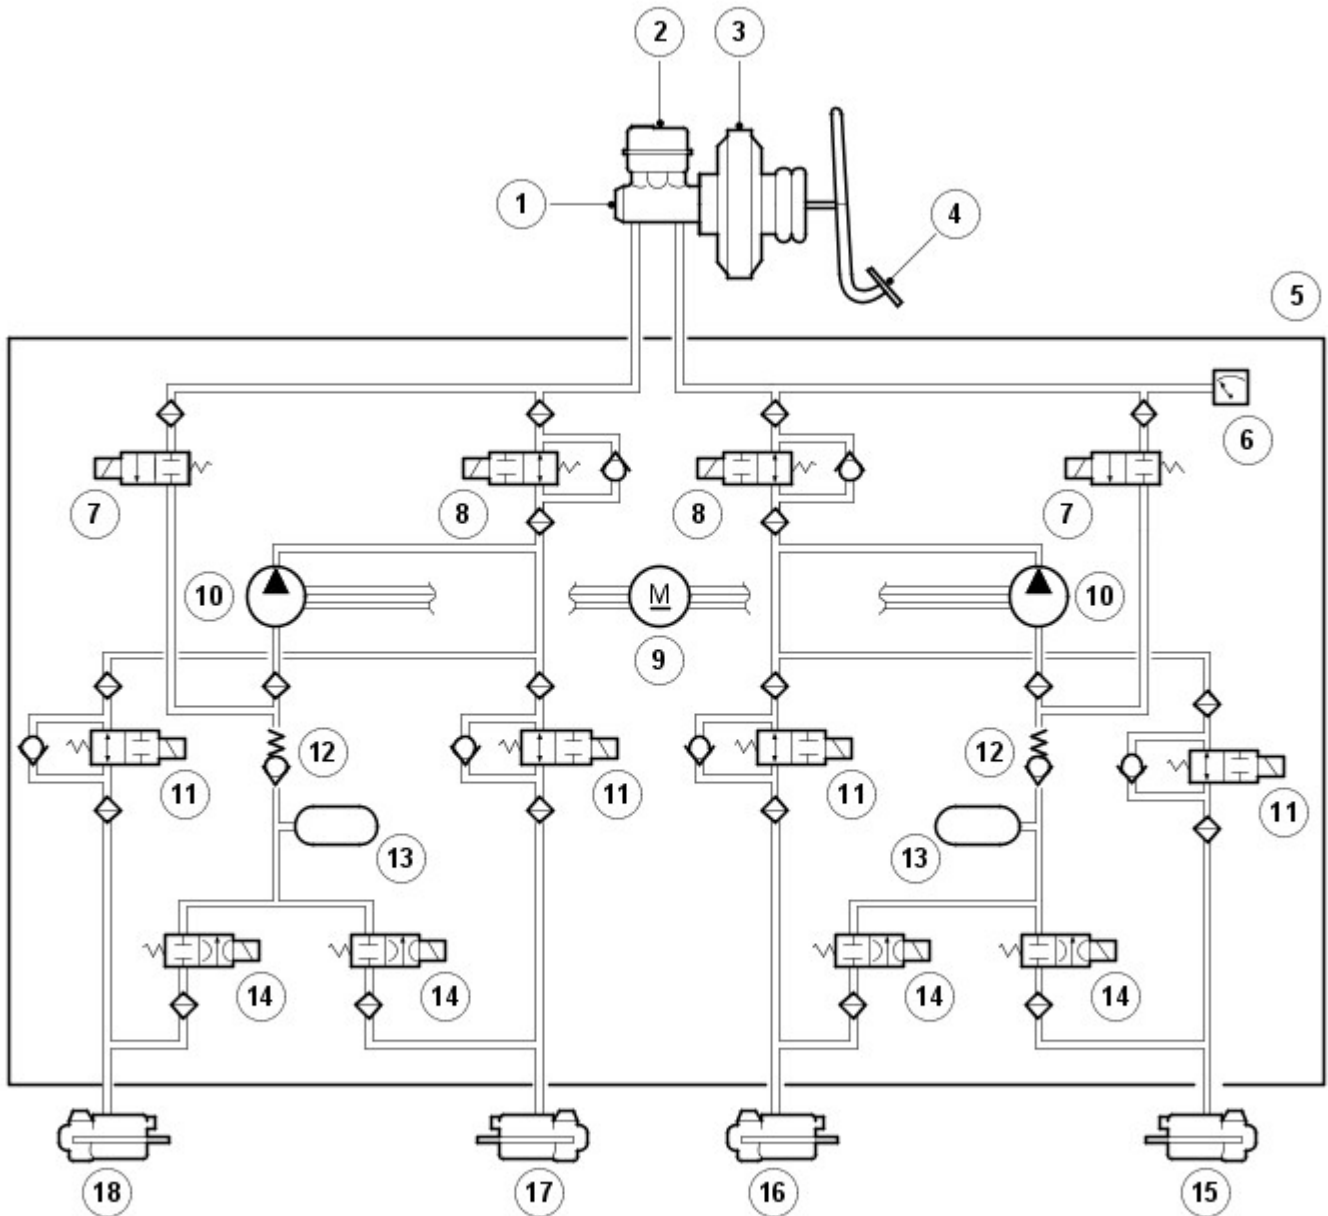

- A normally open, solenoid operated, pilot valve, to enable active braking.
- A normally closed, solenoid operated, priming valve, to connect the brake fluid reservoir to the return pump during active braking.
- A return pump, to generate hydraulic pressure for active braking and return brake fluid to the reservoir.
- Normally open, solenoid operated, inlet valves and normally closed, solenoid operated, outlet valves, to modulate the hydraulic pressure in the individual brakes.
- An accumulator and a relief valve, to allow the fast release of pressure from the brakes.
- Filters, to protect the components from contamination.

The primary circuit also incorporates a pressure sensor to provide the ABS module with a hydraulic pressure signal.

Contact pins on the HCU mate with contacts on the ABS module to provide the electrical connections from the ABS module to the return pump motor and the pressure sensor. The solenoids that operate the valves are installed in the ABS module.

Replacement HCU are supplied pre-filled. After installation on the vehicle, T4 must be used to operate the solenoid valves and the return pump to ensure correct bleeding of the HCU and brake circuits.

Schematic of HCU

E50005

Item	Part Number	Description
1	-	Master cylinder
2	-	Reservoir
3	-	Brake booster
4	-	Brake pedal
5	-	HCU
6	-	Pressure sensor
7	-	Priming valve
8	-	Pilot valve

16	-	Right front brake
17	-	Right rear brake
18	-	Left rear brake

The HCU has three operating modes: Normal braking/EBD, ABS braking and active braking.

Normal Braking/EBD Mode

Initially, all of the solenoid operated valves are de-energized. Operating the brake pedal produces a corresponding increase or decrease of pressure in the brakes, through the open pilot valves and inlet valves. If the ABS module determines that EBD is necessary, it energizes the inlet valves for the brakes of the trailing axle, to isolate the brakes

from any further increase in hydraulic pressure.

ABS Braking Mode

If the ABS module determines that ABS braking is necessary, it energizes the inlet and outlet valves of the related brake and starts the return pump. The inlet valve closes to isolate the brake from pressurized fluid; the outlet valve opens to release pressure from the brake into the accumulator and the return pump circuit; the reduced pressure allows the wheel to accelerate. The ABS module then operates the inlet and outlet valves to modulate the pressure in the brake to apply the maximum braking effort without locking the wheel. Control of the valves for each wheel takes place individually.

Active Braking Mode

The active braking mode is used to generate and control hydraulic pressure to the brakes for functions other than ABS braking, e.g. DSC, EBA, ETC, HDC and dynamic application of the parking brake.

For active braking, the ABS module energizes the pilot valves and priming valves, starts the return pump and energizes all of the inlet valves. Brake fluid, drawn from the reservoir through the master cylinder and priming valve, is pressurized by the return pump and supplied to the inlet valves. The ABS module then operates the inlet valves and outlet valves, as required, to modulate the pressure in the individual brakes. Some noise may be generated during active braking.

ABS MODULE

The ABS module controls the brake functions using the HCU to modulate hydraulic pressure to the individual wheel brakes.

The ABS module is attached to the HCU, in the plenum box on the driver side of the engine compartment. A 46 pin connector provides the electrical interface between the ABS module and the vehicle wiring.

SYSTEM OPERATION

ABS

ABS controls the speed of all road wheels to ensure optimum wheel slip when braking at the adhesion limit. This prevents the wheels from locking, which helps to retain effective steering control of the vehicle.

On the front axle, the brake pressure is modulated separately for each wheel. On the rear axle, brake pressure is modulated by select low. Select low applies the same pressure to both rear brakes, with the pressure level being determined by the wheel on the lower friction surface. This maintains rear stability on split friction surfaces.

ARM

The ARM function uses the brakes and the engine to attempt to restore stability if the vehicle is forced into such a harsh manoeuvre that it risks tipping over.

The ABS module monitors driver inputs and vehicle behavior using various powertrain signals and the inputs from the wheel speed sensors, the steering angle sensor and the yaw rate and lateral acceleration sensor. These are compared with modeled behavior and, if vehicle behavior reaches a given risk level, the ABS module cuts the engine power, or brakes one or more wheels, just enough to help the vehicle regain its poise and help the driver remain in control.

While the ignition is on, ARM is permanently enabled, even when DSC has been selected off.

CBC

CBC influences the brake pressures, below the DSC and ABS thresholds, to counteract the yawing moment produced when braking in a corner. CBC produces a correction torque by limiting the brake pressure on one side of the vehicle.

DSC

DSC uses the brakes and powertrain torque control to help maintain the lateral stability of the vehicle. While the ignition is on the DSC function is permanently enabled unless selected off by the DSC switch. Even if DSC is deselected, driving maneuvers with extreme yaw or lateral acceleration may trigger DSC activity to assist vehicle stability.

DSC enhances driving safety in abrupt maneuvers and in understeer or oversteer situations which may occur in a bend. The ABS module monitors the yaw rate and lateral acceleration of the vehicle, and the steering input, then selectively applies individual brakes and signals for powertrain torque adjustments to reduce understeer or oversteer.

In general: in an understeering situation, the inner wheels are braked to counteract the yaw movement towards the outer edge of the bend; in an oversteering situation, the outer wheels are braked to prevent the rear end of the vehicle from pushing towards the outer edge of the bend.

The ABS module monitors the tracking stability of the vehicle using inputs from the wheel speed sensors, the steering angle sensor and the yaw rate and lateral acceleration sensor. The tracking stability is compared with stored target data and, whenever the tracking stability deviates from the target data, the ABS module intervenes by applying the appropriate brakes. On vehicles with an automatic transmission, when the DSC function is active, the ABS module also signals the transmission control module (TCM) to prevent gear shifts. If necessary, the ABS module also signals:

- The ECM, to reduce engine torque.
- The transfer box control module, to adjust the locking torque of the center differential.
- The rear differential control module, to adjust the locking torque of the rear differential.

The DSC function overrides the differential locking torque requests from the terrain response system.

EBD

EBD limits the brake pressure applied to the rear wheels. When the brakes are applied, the weight of the vehicle transfers forwards, which reduces the ability of the rear wheels to transfer braking effort to the road surface. This can cause the rear wheels to slip and make the vehicle unstable.

EBD uses the anti-lock braking hardware to automatically optimize the pressure of the rear brakes, below the point where anti-lock braking would be invoked. Only the rear axle is under EBD control.

ETC

ETC attempts to optimize forward traction by reducing engine torque or braking a spinning wheel until it regains grip.

ETC is activated if an individual wheel speed is above that of the vehicle reference speed (positive slip) and the brake pedal is not pressed. The spinning wheel is braked, allowing the excess torque to be transmitted to the non spinning wheels through the drive line. If necessary, the ABS module also sends a high speed CAN bus message to the ECM to request a reduction in engine torque. Torque reduction requests are for either a slow or fast response: a slow response requests a reduction of throttle angle (4.0L and 4.4L only); a fast response requests an ignition cut-off (4.0L and 4.4L) or a fuel cut-off (2.7L Diesel).

When the DSC function is selected off with the DSC switch, the engine torque reduction feature is disabled.

On vehicles with an automatic transmission, when the ETC function is active the ABS module also signals the TCM to prevent gear shifts.

EBA

EBA assists the driver, in emergency braking situations, by automatically maximizing the braking effort. There are two situations when the ABS module will invoke EBA: when the brake pedal is pressed very suddenly and when the brake pedal is pressed hard enough to bring the front brakes into ABS operation.

When the brake pedal is pressed very suddenly, the ABS module increases the hydraulic pressure to all of the brakes until they reach the threshold for ABS operation, thus applying the maximum braking effort for the available traction. The ABS module monitors for the sudden application of the brakes using the inputs from the stoplamp switch and from the pressure sensor in the HCU. With the brake pedal pressed, if the rate of increase of hydraulic pressure exceeds the predetermined limit, the ABS module invokes emergency braking.

When the brake pedal is pressed hard enough to bring the front brakes into ABS operation, the ABS module increases the hydraulic pressure to the rear brakes up to the ABS threshold.

EBA operation continues until the driver releases the brake pedal enough for the hydraulic pressure in the HCU to drop below a threshold value stored in the ABS module.

EDC

EDC prevents wheel slip caused by any of the following:

- A sudden decrease in engine torque when the accelerator is suddenly released.
- The sudden engagement of the clutch after a downshift on manual transmission vehicles.
- A downshift using the CommandShift™ on automatic transmission vehicles.

When the ABS module detects the onset of wheel slip without the brakes being applied it signals the ECM, on the high speed CAN bus, to request a momentary increase in engine torque.

HDC

HDC uses brake intervention to control vehicle speed and acceleration during low speed descents in off-road and low grip on-road conditions. Generally, equal pressure is applied to all four brakes, but pressure to individual brakes can be modified by the ABS and DSC functions to retain stability. Selection of the HDC function is controlled by the HDC switch on the center console. HDC operates in both high and low ranges, at vehicle speeds up to 50 km/h (31.3 mph).

On manual transmission vehicles, HDC may be used in first and reverse gears in high range and all gears in low range. Once the vehicle is moving, the clutch pedal should be fully released. The vehicle should not be driven with HDC active and the transmission in neutral.

On automatic transmission vehicles, HDC may be used in D, R and CommandShift 1 in high range, and in D, R and all CommandShift gears in low range. When in D, the transmission control module will automatically select the most appropriate gear. The vehicle should not be driven with HDC active and the transmission in N.

HDC can be selected at speeds up to 80 km/h (50 mph), but will only be enabled at speeds below 50 km/h (31.3 mph). When HDC is selected:

- At speeds up to 50 km/h (31.3 mph), the HDC information indicator is permanently illuminated if a valid gear is selected and, on manual transmission vehicles, the clutch pedal is not depressed.
- At speeds from >50 to 80 km/h (>31.3 to 50 mph) the HDC information indicator flashes and, on vehicles with the high line instrument cluster, a message advising that the speed is too high is displayed in the message center. For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).
If the HDC switch is pressed while vehicle speed is more than 80 km/h (50 mph), the HDC information indicator will not illuminate and HDC will not be selected.
- If the speed reaches 80 km/h (50 mph) or more, a warning chime sounds, the HDC function is switched off, the information indicator goes off and, on vehicles with the high line instrument cluster, a message advising that HDC has been switched off is displayed in the message center.

When HDC is enabled, the ABS module calculates a target speed and compares this with the actual vehicle speed. The ABS module then operates the HCU, in the active braking mode, as required to achieve and maintain the target speed. During active braking for HDC, the ABS module also energizes the HDC relay to operate the stop lamps. Applying the foot brakes during active braking may result in a pulse through the brake pedal, which is normal.

The target speed varies, between minimum and maximum values for each gear and transmission range, depending on driver inputs through the foot pedals. If the foot pedals are not operated, the ABS module adopts a default target speed.

Low Range Target Speeds

Limit	Speed, km/h (mph)			
	Gear			
	1, R	Automatic Transmission		Manual Transmission 2 to 6
D, 2 to 6		1, R		
Default	3.5 (2.19)	6 (3.75)	3.5 (2.19)	6 (3.75)
Minimum	3.5 (2.19)	3.5 (2.19)	3.5 (2.19)	3.5 (2.19)
Maximum	20 (12.5)	20 (12.5)	20 (12.5)	20 (12.5)

High Range Target Speeds

Limit	Speed, km/h (mph)		
	Gear		
	1, R	Automatic Transmission	
D		1, R	
Default	6 (3.75)	10 (6.25)	6 (3.75)
Minimum	6 (3.75)	6 (3.75)	6 (3.75)
Maximum	20 (12.5)	20 (12.5)	20 (12.5)

The target speed is varied between the minimum and maximum values using the accelerator pedal.

The target speed can also be varied by pressing the speed control '+' and '-' buttons (where fitted). For additional information, refer to:

[Speed Control](#) (310-03C Speed Control - V6 4.0L Petrol, Description and Operation),
[Speed Control](#) (310-03A Speed Control - TDV6 2.7L Diesel, Description and Operation).

During changes of target speed, the ABS module limits deceleration and acceleration to -0.5 m/s^2 (-1.65 ft/s^2) and $+0.5 \text{ m/s}^2$ ($+1.65 \text{ ft/s}^2$) respectively.

On manual transmission models target speed changes are suspended during gear changes, to prevent unwanted braking when the accelerator pedal is released to change gear. The ABS module determines a gear change is occurring from:

- Gear position information on the high speed CAN bus.
- The rate of release of the accelerator pedal.
- The status of the clutch pedal.

To provide a safe transition from active braking to brakes off, the ABS module invokes a fade out strategy, which gradually discontinues the braking effort, if it detects any of the following during active braking:

- HDC selected off with the HDC switch.
- Failure of a component used by HDC, but not critical to fade out function.
- Accelerator pedal pressed when transmission is in neutral.
- Brake overheat.

If fade out is invoked because of deselection or component failure, the HDC function is cancelled by the ABS module. If fade out is invoked because the accelerator pedal is pressed with the transmission in neutral, or because of brake overheat, the HDC function remains in standby and resumes operation when the accelerator pedal is released or the brakes have cooled.

The fade out strategy increases the target speed, at a constant acceleration rate of 0.5 m/s^2 (1.65 ft/s^2), until the maximum target speed is reached or until no active braking is required for 0.5 s. If the accelerator pedal is positioned within the range that influences target speed, the acceleration rate is increased to 1.0 m/s^2 (3.3 ft/s^2).

When fade out is invoked because of component failure, a warning chime sounds and the HDC information indicator is extinguished. The HDC warning indicator is illuminated (low line instrument cluster) or a message advising there is a fault is displayed in the message center (high line instrument cluster).

When fade out is invoked because of brake overheat on vehicles with the high line instrument cluster, a message advising that HDC is temporarily unavailable is displayed. On vehicles with the low line instrument cluster, the HDC warning indicator flashes. At the end of fade out, the HDC information indicator flashes. The flashing indicators and/or message continue while HDC remains selected until the brakes have cooled.

To monitor for brake overheat, the ABS module monitors the amount of braking activity and, from this, estimates the temperature of each brake. If the estimated temperature of any brake exceeds a preset limit, the ABS module invokes the fade out strategy. After the fade out cycle, the HDC function is re-enabled when the ABS module estimates that all of the brake temperatures are at less than 64% of the temperature limit.

Anti-Lock Control - Traction Control - Anti-Lock Control - Traction Control

Diagnosis and Testing

Principles of Operation

For a detailed description of the Anti-Lock Control- Traction Control System and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Anti-Lock Control - Traction Control](#) (206-09A Anti-Lock Control - Traction Control, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Tire size, condition and installation ● Wheel speed sensor condition and installation ● Steering Angle Sensor (SAS) condition and installation ● Yaw rate sensor and accelerometer condition and installation ● Hydraulic control unit (with attached ABS module) condition and installation 	<ul style="list-style-type: none"> ● Fuses ● Harnesses and connectors ● Warning lamp operation ● Wheel speed sensors ● Central junction box ● HDC switch ● DSC switch ● Stop lamp switch ● Yaw rate sensor and accelerometer ● Steering Angle Sensor (SAS) ● Anti-lock Braking (ABS) module ● Controller Area Network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Anti-Lock Braking System \(ABS\)](#) (100-00 General Information, Description and Operation).

Anti-Lock Control - Traction Control - Anti-Lock Brake System (ABS) Module

Removal and Installation

Removal

 **CAUTION:** Make sure the ignition switch is in position 0.

1. Remove the cover.

2. Disconnect the electrical connector.

3. CAUTIONS:

 Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

 Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the 6 brake tubes.

- Position an absorbent cloth to collect fluid spillage.

4. Remove the ABS module from the mounting bracket.

- Loosen, but do not remove, the 2 nuts securing the ABS module to the bracket.

Installation

1. **NOTE:** Make sure the ABS module locating grommet is correctly seated in the bracket before installing the ABS module.

• **NOTE:** Make sure the ABS module locating pin is correctly located in the grommet, and the 2 front isolators are fully seated in the bracket slots.

Install the ABS module.

- Tighten the 2 ABS module retaining nuts to 8 Nm (6 lb.ft).
- Remove the blanking caps from the ports.
- Tighten the two M10 and three M12 brake tube unions to 15 Nm (11 lb.ft).

- Tighten the M14 brake tube union to 17 Nm (13 lb.ft).
- Connect the electrical connector.
- Remove the ABS module from the mounting bracket.

2. Using T4, bleed the braking system.

For additional information, refer to: Brake System Pressure Bleeding (206-00, General Procedures).

3. Install the cover.

4. If a new ABS module has been installed, interrogate the ABS system using T4.

Anti-Lock Control - Traction Control - Front Wheel Speed Sensor

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
3. Release the brake hose bracket from the wheel knuckle.

- Remove the retaining bolt.

4.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Release the brake caliper anchor plate from the wheel knuckle and tie the caliper aside.

- Remove the two retaining bolts.

5. Release the wheel speed sensor from the wheel knuckle.

- Remove the bolt.

6. Remove the wheel speed sensor.

- Disconnect the electrical connector.
- Release the wiring harness from the 5 clips.

E56444

Installation

1. Make sure the wheel speed sensor location in the wheel knuckle is free of dirt.
2. **NOTE:** Make sure the electrical connector retaining clip is attached to the body wiring harness.

Install the wheel speed sensor.

- Connect the electrical connector.
 - Attach the wiring harness to the 5 clips.
 - Tighten the bolt to 9 Nm (7 lb.ft).
3. Secure the brake caliper and anchor plate to the wheel knuckle.
 - Tighten the bolts to 275 Nm (203 lb.ft).
 4. Secure the brake hose retaining bracket to the wheel knuckle.
 - Tighten the bolt to 25 Nm (18 lb.ft).
 5. Install the fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
 6. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
 7. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.
 8. If a new wheel speed sensor has been installed, interrogate the ABS system using T4.

Anti-Lock Control - Traction Control - Rear Wheel Speed Sensor

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Disconnect the anti-lock brake system (ABS) sensor electrical connector.
 - Release the wiring harness retaining clip.

E52454

4. Release the wheel speed sensor from the wheel knuckle.
 - Release the wiring harness.
 - Remove the retaining bolt.

E56445

5. Remove the wheel speed sensor.

- Release the wiring harness from the 4 clips.

E56698

Installation

1. Make sure the wheel speed sensor location in the wheel knuckle is free of dirt.

2. Install the wheel speed sensor.

- Attach the wiring harness to the 4 clips.

3. Secure the wheel speed sensor to the wheel knuckle.

- Tighten the bolt to 9 Nm (7 lb.ft).
- Attach the wiring harness to the clip.

4. **NOTE:** Make sure the electrical connector retaining clip is attached to the body wiring harness.

Connect the ABS sensor electrical connector.

- Attach the wiring harness.

5. If a new wheel speed sensor has been installed, interrogate the ABS system using T4.

Anti-Lock Control - Stability Assist - Yaw Rate Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the floor console.
For additional information, refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).

3.  **CAUTION:** Make sure the wiring harness is protected when cutting the carpet.

Remove the yaw rate sensor.

- Cut the carpet for access.
- Position the wiring harness aside.
- Disconnect the electrical connector.
- Remove the two retaining bolts.

Installation

1. Install the yaw rate sensor.
 - Tighten the bolts to 7 Nm (5 lb.ft).
 - Connect the electrical connector.
 - Attach the wiring harness.
 - Attach the carpet.
2. Install the floor console.
For additional information, refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
4. If a new yaw rate sensor has been installed, interrogate the ABS system using T4.

Anti-Lock Control - Stability Assist - Yaw Rate Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the floor console.
For additional information, refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).

3.  **CAUTION:** Make sure the wiring harness is protected when cutting the carpet.

Remove the yaw rate sensor.

- Cut the carpet for access.
- Position the wiring harness aside.
- Disconnect the electrical connector.
- Remove the two retaining bolts.

Installation

1. Install the yaw rate sensor.
 - Tighten the bolts to 7 Nm (5 lb.ft).
 - Connect the electrical connector.
 - Attach the wiring harness.
 - Attach the carpet.
2. Install the floor console.
For additional information, refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
4. If a new yaw rate sensor has been installed, interrogate the ABS system using T4.

Steering System - General Information - Steering System

Diagnosis and Testing

Principles of Operation

For a detailed description of the Steering System and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Power Steering](#) (211-02 Power Steering, Description and Operation) / [Steering Linkage](#) (211-03 Steering Linkage, Description and Operation) / [Steering Column](#) (211-04 Steering Column, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
 - If a road test is necessary make sure the vehicle is safe to do so.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Check the tires for correct pressure, size and tread pattern ● Check for wheel rim and tire damage ● Check road wheel security ● Check the power steering fluid level and the hydraulic circuit for oil leaks ● Check the power steering pump drive belt condition and tension ● Check the power steering pump for security, wear, damage and excessive noise ● Check the steering gear assembly for damage, wear and security ● Check the hydraulic pipes and cooler lines for damage and correct routing ● Check the steering joints for damage, excessive play, wear and security ● Check the steering column and joints for damage, excessive play, wear and security 	<ul style="list-style-type: none"> ● Steering Angle Sensor Module (SASM) and circuits ● Controller Area Networks (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Steering System - General Information - Power Steering System Filling and Bleeding

General Procedures

1. Check the power steering fluid level.

2.  **CAUTION:** Fluid must always be present in the reservoir during bleeding.

Remove the filler cap and fill to the MAX level mark.

- Install the reservoir filler cap.

3. Start the engine and allow to run for 10 seconds, stop the engine.

- Check the power steering fluid, if aerated, wait until fluid is free from bubbles then top-up reservoir to UPPER level mark with recommended fluid.

4.  **CAUTION:** Do not hold steering on full lock for longer than 10 seconds.

Start the engine and turn steering fully lock to lock, stop the engine.

- Check and top-up power steering fluid level.

5. Start and run the engine for 2 minutes, turn the steering fully lock to lock.

- Check and top-up power steering fluid level.

Steering System - General Information - Power Steering System Flushing

General Procedures

- NOTE: If heavy steering or contamination within the power steering system is found, it is necessary to carry out the system flush procedure as detailed below. If any components have been replaced in the power steering system the procedure below must be carried out in full.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Remove the power steering fluid reservoir cap.
2. Using a suitable syringe, remove the power steering fluid from the power steering fluid reservoir.

E94370

3.  CAUTION: Be prepared to collect escaping fluids.

- NOTE: Note the orientation of the clip.

Detach the power steering fluid reservoir.

- Detach but do not remove the power steering fluid reservoir.
- Release the power steering fluid return hose from the power steering fluid reservoir.
- If a quick release coupling is fitted to the power steering return hose, release the power steering fluid return hose from the coupling by removing the clip.

E100917

4.  CAUTION: Be prepared to collect escaping fluids.

- NOTE: Make sure that all openings are sealed. Use new blanking caps.

Using a suitable blanking cap, cap the power steering reservoir return pipe.

5.  CAUTION: Be prepared to collect escaping fluids.

• NOTE: Make sure the extended pipe is not kinked or twisted and is correctly secured with hose clips.

Attach a suitable pipe to the power steering return hose to allow the fluid to drain.

E 100918

6. NOTE: The suitable funnel should have the a capacity of 4 litres and O-ring seal

• NOTE: The suitable funnel must be tightly sealed to the power steering fluid reservoir to avoid fluid leakage.

Install a suitable funnel onto the power steering fluid reservoir.

E94372

7.  WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle with the wheels just clear of the ground.

8. CAUTIONS:

 Steps 8 and 9 must be carried out within 2 - 3 seconds of each other. Failure to follow this instruction may result in damage to the power steering system.

 Be prepared to collect escaping fluids.

Using the suitable funnel, top up the power steering system with the specified fluid. Make sure the fluid level is maintained at two thirds full in the funnel.

9. CAUTIONS:

Be prepared to collect escaping fluids.

Do not allow the power steering fluid level in the power steering fluid reservoir to fall below the minimum power steering fluid level. Failure to follow this instruction may result in damage to the power steering system.

Make sure the engine is switched off as soon as the full 4 litres of power steering fluid has entered the power steering fluid reservoir.

Flush the power steering system.

- Start the engine
- With assistance turn the steering slowly lock to lock 3 times at approximately 1 revolution every 5 seconds.
- Continue to flush the power steering system until 4 litres of power steering fluid has been added to the power steering reservoir. This should take approximately 30 seconds.

E94373

10. CAUTION: Be prepared to collect escaping fluids.

Remove the suitable funnel.

E94372

11.  CAUTION: Be prepared to collect escaping fluids.

Remove the suitable pipe to the power steering return hose.

E 100918

12.  CAUTION: Be prepared to collect escaping fluids.

- NOTE: Note the orientation of the clip.

If a quick release coupling is fitted to the power steering return hose, connect the power steering fluid return hose to the coupling by installing the clip.

13. Install a new power steering fluid reservoir.
For additional information, refer to: [Power Steering Fluid Reservoir - V6 4.0L Petrol/V8 5.0L Petrol/TDV6 3.0L Diesel](#) (211-02 Power Steering, Removal and Installation).

GENERAL

The steering system comprises a TRW manufactured rack and pinion steering gear, a power steering pump, a reservoir, a fluid cooler and fluid hoses. The steering gear is a conventional end take-off rack and pinion power assisted unit.

The steering gear rack has a travel of 166 mm (6.53 in). Lock to lock requires 3.33 revolutions of the steering wheel, which gives a ratio of 45 mm (1.77 in)/revolution at the center position and 52.6 mm (2.07 in)/revolution at end of lock.

STEERING GEAR

E46942

Item	Part Number	Description
1	-	Tie-rod end
2	-	Locknut
3	-	Tie-rod
4	-	Gaitor
5	-	Pressure/return connection from/to pump
6	-	Valve unit housing
7	-	Input shaft
8	-	Pressure/return pipes
9	-	Steering gear casing attachment lugs
10	-	Pinion housing

The steering gear is located at the front of the engine, below the accessory belt drive. The gear is attached to two brackets on the chassis and is secured to the brackets with flanged bolts and caged nuts. The cage prevents the nuts from turning when the bolts are loosened or tightened. The cage nuts can only be used once and must be replaced when the gear is removed. For service, M12 Nylock nuts are available as a replacement for the cage nut.

The steering gear comprises an aluminium, cast, one piece housing which contains a mechanical steering rack, a valve unit and an integrated hydraulic power unit.

The steering gear uses a rack with an integrated piston which is guided on plain bearings within the rack housing. The pinion, which is attached to the valve unit, runs in bearings and meshes with the rack teeth. The rack is pressed against the pinion by a spring loaded yoke which ensures that the teeth mesh with the minimum of play. The pinion is connected to the valve unit via a torsion bar. The rotary motion of the steering wheel is converted into linear movement of the rack by the pinion and is initiated by the valve unit. This movement is transferred into movement of the road wheels by adjustable tie-rods.

The 49 mm (1.92 in) diameter piston of the hydraulic power unit is located at one end of the gear housing. Each side of the piston is connected to fluid pressure or fluid return via external metal pipes which are connected to the valve unit.

Each end of the gear has a threaded hole which provides for the fitment of the tie-rod. The external ends of the gear are sealed with gaitors which prevent the ingress of dirt and moisture. The tie-rod has a long threaded area which allows for the fitment of the tie-rod end. The thread allows for the adjustment of the steering toe. When the correct toe is achieved, a locknut is tightened against the tie-rod end preventing inadvertent movement.

The gear has a central hole machined along its length. The hole allows the air in the gaitors to be balanced when the steering is turned. The gaitors are serviceable items and are retained on the gear housing and the tie-rod with zip ties.

Valve Unit

E46943

Item	Part Number	Description
1	-	Rack
2	-	Pinion shaft
3	-	Outer sleeve
4	-	Oil sleeve
5	-	Dirt seal
6	-	Input shaft
7	-	Torsion bar
8	-	Circlip
9	-	Oil seal
10	-	PTFE ring
11	-	Steering gear casting
12	-	Slots
13	-	Pin - Pinion shaft to outer sleeve
14	-	Oil seal
15	-	Pinion shaft
16	-	Bearing
17	-	Pinion shaft nut

The valve unit is an integral part of the steering gear. The principle function of the valve unit is to provide maximum power assistance (i.e. when parking) with minimum effort required to turn the steering wheel.

The pinion housing of the valve is an integral part of the main steering gear casting. The pinion housing has four machined ports which provide connections for pressure feed from the power steering pump, return fluid to the reservoir and pressure feeds to each side of the cylinder piston.

The valve unit comprises an outer sleeve, an input shaft, a torsion bar and a pinion shaft. The valve unit is co-axial with the pinion shaft which is connected to the steering column via the input shaft. The valve unit components are located in the steering gear pinion housing which is sealed with a cap.

The outer sleeve is located in the main bore of the pinion housing. Three annular grooves are machined on its outer diameter. PTFE rings are located between the grooves and seal against the bore of the pinion housing. Holes are drilled radially in each annular groove through the wall of the sleeve. The bore of the outer sleeve is machined to accept the input shaft. Six equally spaced slots are machined in the bore of the sleeve. The ends of the slots are closed and do not continue to the end of the outer sleeve. The radial holes in the outer sleeve are drilled into each slot.

The input shaft has two machined flats at its outer end which allow for the attachment of the steering column intermediate shaft yoke. The flats ensure that the intermediate shaft is fitted in the correct position to maintain the optimum phase angle. The inner end of the input shaft forms a dog-tooth which mates with a slot in the pinion shaft. The fit of the dog-tooth in the slot allows a small amount of relative rotation between the input shaft and the pinion shaft before the dog-tooth contacts the wall of the slot. This ensures that, if the power assistance fails, the steering can be

operated manually without over stressing the torsion bar. The central portion of the input shaft has equally spaced longitudinal slots machined in its circumference. The slots are arranged alternately around the input shaft.

The torsion bar is fitted inside the input shaft and is an interference fit in the pinion shaft. The torsion bar is connected to the input shaft by a drive pin. The central diameter of the torsion bar is machined to a smaller diameter in its central section. The smaller diameter allows the torsion bar to twist in response to torque applied from the steering wheel in relation to the grip of the tyres on the road surface.

The pinion shaft has machined upper teeth on its central diameter which mate with teeth on the steering gear rack. A slot, machined in the upper end of the pinion shaft mates with the dog-tooth on the input shaft. The pinion shaft locates in the pinion housing and rotates on ball and roller bearings.

Power Steering Hydraulic Operation

E46944

Item	Part Number	Description
1	-	Reservoir
2	-	Cooler
3	-	Valve unit
4	-	Steering rack and pinion
5	-	Flow control/pressure relief return
6	-	Flow control/Pressure relief valve
7	-	Output port
8	-	Power steering pump
9	-	Low pressure suction line

When the engine is started the power steering pump draws fluid from the reservoir into the low pressure suction line. The fluid passes through the pump and emerges as pressurised fluid at the outlet port. The attenuated high pressure hose passes the pressurised fluid to the steering gear valve unit.

If no steering effort is applied, there is minimal restriction within the system and the supply pressure from the pump is low. Minimal pressure is applied, via the valve unit, to each side of the piston in the hydraulic cylinder and the full flow from the power steering pump returns to the reservoir via the fluid cooler.

When steering effort is applied in either direction, the return flow of fluid to the reservoir is restricted, causing the supply pressure from the pump to increase. The pressurised fluid is directed to the applicable side of the piston in the hydraulic cylinder, via the valve unit, providing the power assistance required to reduce the steering effort. Fluid displaced from the low pressure side of the cylinder is returned via the valve unit and fluid cooler to the reservoir. The fluid cooler reduces the fluid temperature which prolongs the life of hoses and seals in the system.

POWER STEERING PUMP

E131159

Item	Part Number	Description
1	-	4.0L V6
2	-	5.0L V8
3	-	2.7L, 3.0L TdV6

The power steering pumps used on the four engine variants are basically the same pump with different connection fittings. The pump is a positive displacement, vane type pump which supplies hydraulic pressure to the steering gear valve unit. The pump is driven by a Poly Vee belt from the crankshaft pulley and output from the pump increases proportionally with engine speed. A self-adjusting tensioner is fitted to maintain the correct tension on the belt.

The pump has an internal flow control valve which also incorporates a pressure relief valve. The pressure relief valve limits the maximum pressure supplied to the steering gear to 114 bar (1653 lbf in²) ± 4 bar (58 lbf in²) on V6 petrol engines, and 115 bar (1667 lbf in²) ± 4 bar (58 lbf in²) for V8 petrol, and V6 diesel models. The flow control valve regulates the flow to a constant value of 8.8 l/min (1.93 gal/min) ± 0.5 l/min (0.1 gal/min) regardless of engine speed. The pump has a displacement of 9.6 cc/rev (0.58 in³/rev) on V6 petrol, and V6 diesel, but 11 cc/rev (0.67 in³/rev) for V8 petrol.

A shaft runs longitudinally through the pump. One end of the shaft is fitted with a pressed-on drive pulley, the opposite end of the shaft is closed by a cover. The shaft runs in bearings located in the body and oil seals at each end of the shaft prevent leakage of hydraulic fluid.

The pump contains ten vanes on petrol models, and eleven vanes on diesel models which rotate within a cam ring and are driven by the shaft. As the vanes rotate, the cam ring causes the space between the vanes to increase. This causes a depression between the vanes and fluid is drawn from the reservoir via the suction hose into the space between the vanes.

As the shaft rotates, the inlet port is closed to the vanes which have drawn in fluid, trapping the fluid between the vanes. The cam ring causes the space between the vanes to reduce and consequentially compresses and pressurises the hydraulic fluid trapped between them.

Further rotation of the shaft moves the vanes to the outlet port. As the vanes pass the port plate the pressurised fluid passes from the pump outlet port into the pressure hose to the steering gear.

The pressurised fluid is subject to control by the flow control and pressure relief valve. The flow control valve maintains a constant flow of fluid supplied to the steering gear irrespective of engine speed variations. The pressure relief valve limits the pressure on the output side of the pump. A metering orifice is included in the discharge port of the pump. If the pressure in the orifice reaches a predetermined level, a spring loaded ball in the center of the flow control valve is lifted from its seat and allows pressurised fluid to recirculate within the pump.

The pressure relief valve will operate if the discharge from the pump is restricted, i.e.; steering held on full lock. If the output from the pump is blocked, all output is recirculated through the pump. In this condition, as no fresh fluid is drawn into the pump from the reservoir, the fluid temperature inside the pump will increase rapidly. Consequentially, periods of operation of the steering gear on full lock should be kept to a minimum to prevent overheating of the pump and the fluid within it.

RESERVOIR

E46941

The fluid reservoir is located on a bracket in the left hand side of the engine compartment, behind the radiator. The reservoir comprises a body, cap and filter. The purpose of the reservoir is to contain a surplus of the hydraulic fluid in the system to allow for expansion and contraction of the fluid due to temperature variations. The fluid level ensures that the supply connection on the bottom of the reservoir is covered with fluid at all operating vehicle attitudes. Any air which is present in the system is exhausted from the system in the reservoir.

The body is a plastic moulding with two ports at the bottom which provide for the connection of the suction supply and return hoses. Moulded markings on the side of the reservoir denote the upper and lower fluid levels. A non-serviceable, 100 micron nylon mesh filter is fitted in the body. The filter removes particulate matter from the fluid before it is drawn into the pump supply connection.

The cap is rotated counterclockwise for one quarter turn to release from the body. The cap is fitted with an O-ring to prevent fluid leakage. The cap incorporates a breather hole to allow for changes in fluid level during operation and prevent vacuum or pressurisation of the reservoir.

HIGH PRESSURE HOSE

The high pressure hose connecting the pump to the steering gear valve unit contains two attenuators. Each attenuator comprises a bullet shaped restrictor which is secured inside the hose. The restrictors damp pressure pulses from the pump, consequently reducing noise and strain on downstream components. The attenuators are an integral part of the hose and cannot be serviced separately.

FLUID COOLER

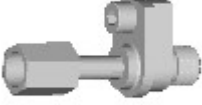

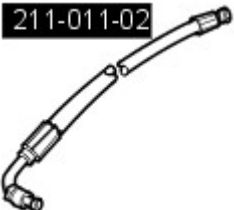

- **NOTE:** Diesel engine vehicles are not fitted with a fluid cooler.

The fluid cooler is located in the return line from the steering gear to the reservoir. The cooler comprises a flexible hose and a solid pipe which connect between the reservoir and the return pipe from the steering gear. The cooler is an integral part of the pipe and cannot be replaced as a separate component.

The cooler is a fabricated aluminium tube, through which the power steering fluid passes. The outer diameter of the cooler tube has aluminium loops attached to it which dissipate heat. Cool air entering the front of the vehicle passes over the cooler and flows through the loops. The loops act as heat exchangers, conducting heat from the fluid as it passes through the tube.

Power Steering - Power Steering Pressure Test TDV6 2.7L Diesel

General Procedures

 <p>E58733</p>	<p>Hose and gauge - power steering pressure test</p> <p>211-287(LRT-57-005)</p>

CAUTION: If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

• **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

3. Siphon the fluid from the power steering reservoir.

- Remove the filler cap.

4. Remove the front LH splash shield.

- Remove the 4 clips.

5. Release the steering gear high-pressure line.

- Remove the bolt.

6. Remove the front LH fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

7. CAUTIONS:

 Make sure that all openings are sealed. Use new blanking caps.

 Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump supply hose.

- Release the clip.
- Position a container to collect the fluid.

E94170

8.  **CAUTION:** Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump high-pressure line.

- Remove the bolt.

9. Install the special tools.

- Tie the pressure gauge aside.

10. **NOTE:** Remove and discard the blanking caps.

Connect the power steering pump supply hose.

- Secure with the clip.

11. Fill the power steering reservoir.

12. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

13. **NOTE:** Make sure the steering components and test equipment are free from leaks.

- **NOTE:** Maintain the maximum fluid level during the test.
- **NOTE:** Make sure the steering is in the straight ahead position.
- **NOTE:** Under no circumstances must the low pressure spigot be removed from the steering pump.

With the test valve open start the engine.

- Start the engine and turn steering fully lock to lock, stop the engine.
- Top-up the power steering fluid reservoir.
- Install the reservoir filler cap.

14. For correct power steering pressures, refer to the steering specification section.

For additional information, refer to: [Specifications](#) (211-02 Power Steering, Specifications).

15.  **CAUTION:** Do not hold steering at full lock for longer than 10 seconds.

With the engine at idle, slowly turn the steering wheel and hold on full lock.

- Record the pressure reading.

16. Repeat the above procedure for the other side.

- Record the pressure reading.

17. With the engine at idle, release the steering wheel. The pressure should be, at or below, the pressure specified.

18. Pressure outside this tolerance, indicates a fault.

19.  **CAUTION:** Pump damage will occur if test valve is closed for longer periods.

To determine if the fault is in the steering pump or the steering rack, close the test valve for a maximum of 5 seconds.

20. If the pressures recorded fall outside the given values, replace the power steering pump.

21. If the maximum pump pressure is correct, check the hoses for correct routing and condition, if correct suspect the steering gear.

22. On completion of the test stop the engine, disconnect the battery ground cable and siphon the steering fluid from the reservoir.

23. **CAUTIONS:**

Make sure that all openings are sealed. Use new blanking caps.

Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump supply hose.

- Release the clip.

24. Disassemble the test equipment.

25. Connect the power steering pump high-pressure line.

- Tighten the bolt to 25 Nm (18 lb.ft).
- Install a new O-ring seal.

26. **NOTE:** Remove and discard the blanking caps.

Connect the power steering pump supply hose.

- Secure with the clip.
- Remove the container.

27. Secure the steering gear high-pressure line.

- Tighten the bolt to 10 Nm (7 lb.ft).

28. Install the front LH splash shield.

- Install the clips.

29. Install the front LH fender splash shield.

For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

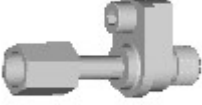

30. Connect the battery ground cable.

31. Fill and bleed the power steering system.

For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).

Power Steering - Steering Gear V6 4.0L Petrol

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the radiator access panel.

- Remove the 4 bolts.

3. Remove the front RH splash shield.

- Remove the 4 clips.

4. Remove the front LH splash shield.

- Remove the 4 clips.

5. NOTE: Make sure the steering is in the straight ahead position.

Release the universal joint from the steering gear.

- Remove and discard the bolt.

6. NOTE: LH illustration shown, RH is similar.

Release both tie-rod end ball joints.

- Loosen the locknut.
- Release both track rods from tie rod ends, note the number of turns for installation.

7. Disconnect the pressure lines from the power steering gear.

- Remove the bolt.
- Position an absorbent cloth to collect fluid spillage.
- Remove and discard the O-ring seals.

8. Remove the steering gear high-pressure line.

- Remove the bolt.

E47922

9. Remove the steering gear.

- Remove the 2 bolts and discard the cage nuts.
- With assistance, carefully rotate and release the steering gear.

Installation

1. With assistance, install the steering gear.

- Clean the component mating faces.
- Tighten the bolts to 175 Nm (129 lb.ft).

2. NOTE: Do not install the support bracket bolt until the steering gear connections are tightened.

Install the steering gear high pressure line.

3. NOTE: Lubricate the seals with clean power steering fluid.

Connect the steering gear pressure lines.

- Clean the component mating faces.
- Install new O-ring seals.

4. Install the power steering line support bracket.

- Tighten the bolt to 10 Nm (7 lb.ft).

5. Connect the tie-rod end ball joints.

- Attach both tie rods to previously noted positions.
- Tighten the tie-rod locking nut.

6. Connect the universal joint to the steering gear.

- Install a new patchlock bolt and tighten to 25 Nm (18 lb.ft).

7. Install the radiator access panel.

- Install the 4 bolts and tighten to 10 Nm (7 lb.ft).

8. Install the front LH splash shield.

9. Install the front RH splash shield.

10. Fill and bleed the power steering system.

For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).

11. Adjust the front wheel alignment.

Power Steering - Steering Gear TDV6 3.0L Diesel

Removal and Installation

Removal

- NOTE: LHD illustration shown, RHD is similar.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2.  **CAUTION:** Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Center the steering wheel.

3. Remove the radiator splash shield.

- Remove the 4 bolts.

4. Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

5. Remove the front RH splash shield.

- Remove the 4 clips.

6. Remove the front LH splash shield.

- Remove the 4 clips.

7. NOTE: LH illustration shown, RH is similar.

Release both tie-rod end ball joints.

- Loosen the locknut.
- Release both track rods from tie rod ends, note the number of turns for installation.

E98679

8. NOTE: Note the fitted position.

Disconnect the lower steering column from the steering gear.

- Remove and discard the bolt.

E47917

9. Remove the steering gear high-pressure line.

- Remove the bolts.

E47921

10. Disconnect the steering gear control valve actuator electrical connector.

E60776

11. Release the transmission fluid cooler.

- Remove the 4 bolts.

E85751

12. Release the fuel cooler.

- Remove the bolt.

E85753

13. CAUTIONS:

Make sure that the area around the component is clean and free of foreign material.

Make sure that all openings are sealed. Use new blanking caps.

Disconnect the power steering high pressure line and return line from the steering gear.

- Remove and discard the bolt.
- Remove and discard the 2 O-ring seals.

E85754

14. Release the steering gear.

- Remove the 2 bolts.

E47922

15. Remove the transmission fluid cooler and fuel cooler support bracket.

- Remove the bolt.
- Release the coolant line.

16. Remove the steering gear.

Installation

1. Install the steering gear.

2. Install the transmission fluid cooler and fuel cooler support bracket.

- Secure the coolant line.
- Tighten the bolt to 23 Nm (17 lb.ft).

3. Secure the steering gear.

- Tighten the bolts to 175 Nm (129 lb.ft).

4. **NOTE:** Remove and discard the blanking caps.

• **NOTE:** Lubricate the seals with clean power steering fluid.

Connect the power steering high pressure line and return line to the steering gear.

- Install new O-ring seals.
- Tighten the new bolt to 22 Nm (16 lb.ft).

5. Secure the fuel cooler.

- Tighten the bolt to 23 Nm (17 lb.ft).

6. Secure the transmission fluid cooler.

- Tighten the nuts and bolts to 25 Nm (18 lb.ft).

7. Connect the steering gear control valve actuator electrical connector.

8. Install the power steering line support bracket.

- Tighten the bolt to 10 Nm (7 lb.ft).

9. Connect the lower steering column shaft to the steering gear.

- Tighten the new bolt to 24 Nm (18 lb.ft).

10. Connect the tie-rod end ball joints.

- Attach both tie rods to previously noted positions.
- Tighten the tie-rod locking nut.

11. Install the front LH splash shield.

- Install the clips.

12. Install the front RH splash shield.

- Install the clips.

13. Install the engine undershield.

For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

14. Install the radiator splash shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

15. Fill and bleed the power steering system.

For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).

16. Adjust the front wheel alignment.

Power Steering - Steering Gear V8 5.0L Petrol

Removal and Installation

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.
- NOTE: LHD illustration shown, RHD is similar.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the radiator access panel.

- Remove the 4 bolts.

3. Remove the front RH splash shield.

- Remove the 4 clips.

4. Remove the front LH splash shield.

- Remove the 4 clips.

5.  **CAUTION:** Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

• **NOTE:** Make sure the steering is in the straight ahead position.

Release the universal joint from the steering gear.

- Remove and discard the bolt.

6. **NOTE:** LH illustration shown, RH is similar.

Release both tie-rod end ball joints.

- Loosen the locknut.
- Release both track rods from tie rod ends, note the number of turns for installation.

7. Disconnect the pressure lines from the power steering gear.

- Remove the bolt.
- Position an absorbent cloth to collect fluid spillage.
- Remove and discard the O-ring seals.

8. Remove the steering gear high-pressure line.

- Remove the bolts.

9. Disconnect the steering gear electrical connector.

10. Remove the steering gear.

- Remove the 2 bolts and discard the cage nuts.
- Release the steering gear.

Installation

1. Clean the component mating faces.
2. Install the steering gear.
 - Tighten the bolts to 175 Nm (129 lb.ft).
3. Connect the electrical connector.
4. **NOTE: Do not install the support bracket bolt until the steering gear connections are tightened.**

Install the steering gear high pressure line.
5. **NOTE: Lubricate the seals with clean power steering fluid.**

Connect the steering gear pressure lines.

 - Clean the component mating faces.
 - Install new O-ring seals.
 - Tighten the bolt to 22 Nm (16 lb.ft).
6. Install the power steering line support bracket.
 - Tighten the bolt to 10 Nm (7 lb.ft).
7. Connect the tie-rod end ball joints.
 - Attach both tie rods to previously noted positions.
 - Tighten the tie-rod locking nut.
8. Connect the universal joint to the steering gear.
 - Install a new patchlock bolt and tighten to 25 Nm (18 lb.ft).
9. Install the radiator access panel.
 - Install the 4 bolts and tighten to 10 Nm (7 lb.ft).
10. Install the front LH splash shield.

- 11.** Install the front RH splash shield.
- 12.** Fill and bleed the power steering system.
For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).
- 13.** Adjust the front wheel alignment.

Power Steering - Steering Gear TDV6 2.7L Diesel

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. **NOTE:** Make sure the steering is in the straight ahead position.

Release the universal joint from the steering gear.

- Remove and discard the bolt.

3. Remove the front RH and LH splash shields.

- Remove the 8 clips.

4. **NOTE:** LH illustration shown, RH is similar.

Release both tie-rod end ball joints.

- Loosen the locknut.
- Release both track rods from tie rod ends, note the number of turns for installation.

5. Remove the radiator access panel.

- Remove the 4 bolts.

6. Release the power steering line support mount.

- Remove the bolt.

7.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** Some fluid spillage is inevitable during this operation.

Disconnect the power steering fluid lines.

- Position a container to collect spillage.
- Remove the clip.
- Remove and discard the bolt.
- Discard the O-ring seals.

8. Remove the steering gear.

- Remove the 2 bolts and discard the nuts.

Installation

1. Install the steering gear.

- Clean the component mating faces.

- Use new nuts and tighten the nuts and bolts to 175 Nm (129 lb.ft).
2. Install the power steering fluid lines.
 - Clean the component mating faces.
 - Install new O-ring seals.
 - Install the clip.
 - Tighten the new bolt to 25 Nm (18 lb.ft).
 3. Secure the power steering line support mount.
 - Install the bolt.
 4. Connect the universal joint to the steering gear.
 - Install a new patchlock bolt and tighten to 25 Nm (18 lb.ft).
 5. Install the radiator access panel.
 - Tighten the bolts to 10 Nm (7 lb.ft).
 6. Install the splash shields.
 - Install the clips.
 7. Connect the tie-rod end ball joints.
 - Attach both tie rods to previously noted positions.
 - Tighten the tie-rod locking nut.
 8. Fill and bleed the power steering system.
For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).
 9. Adjust the front wheel alignment.

Power Steering - Power Steering Fluid Reservoir V6 4.0L Petrol/V8 5.0L Petrol/TDV6 3.0L Diesel

Removal and Installation

Removal

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Siphon the fluid from the power steering reservoir.
3. Release the power steering fluid reservoir from the bracket.

4.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Remove the power steering fluid reservoir.

- Position an absorbent cloth to collect fluid spillage.
- Release the hose clips and disconnect the hoses.

Installation

1. To install, reverse the removal procedure.
2. Fill and bleed the power steering system.
For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).

Power Steering - Power Steering Fluid Reservoir TDV6 2.7L Diesel

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the air cleaner assembly.
For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).
3. Remove the cooling fan shroud.

- Release the coolant hose.
- Release the 3 clips.

4.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** Some fluid spillage is inevitable during this operation.

Remove the power steering reservoir.

- Position a container to collect spillage.
- Release the 2 clips.
- Disconnect the 2 hoses.

Installation

1. Install the power steering fluid reservoir.
 - Clean the component mating faces.
 - Connect the hoses.
 - Secure with the 2 clips.
2. Install the cooling fan shroud.
 - Secure the coolant hose.
3. Install the air cleaner assembly.
For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).
4. Fill and bleed the power steering system.
For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).

Power Steering - Power Steering Fluid Cooler V6 4.0L Petrol/V8 5.0L Petrol

Removal and Installation

Special Tool(s)	
 <p>310-044</p> <p>E50921</p>	Spring lock decoupler
	310-044

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the front radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
3. Remove the coolant expansion tank.
For additional information, refer to: [Coolant Expansion Tank](#) (303-03D Engine Cooling - V8 5.0L Petrol, Removal and Installation) / [Coolant Expansion Tank](#) (303-03C Engine Cooling - V6 4.0L Petrol, Removal and Installation).
4. Siphon the fluid from the power steering reservoir.

5. ⚠ CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the steering reservoir return hose.

- Position an absorbent cloth to collect fluid spillage.
- Release the clip.

6. Release the LH radiator air deflector lower clip, position the deflector aside.

Vehicles with 4.0L engine

7. Position the LH horn aside for access.

- Remove the nut.

Vehicles with 5.0L engine

8. Position the horns to one side for access.

- Remove the 2 bolts.

All vehicles

9.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** Some fluid spillage is inevitable during this operation.

Using the special tool, disconnect the cooler line.

- Position an absorbent cloth to collect fluid spillage.

10. Remove the cooler line separating clip.

11. NOTE: Care must be taken to prevent damage to the cooler elements during removal and installation.

Remove the power steering fluid cooler.

- Release the 3 clips.

E53605

Installation

All vehicles

1. Install the power steering fluid cooler.
 - Position and secure in the clips.
2. Install the power steering fluid line and hose.
 - Clean the component mating faces.
 - Secure the hose with the clip.
3. Install the cooler line separating clip.

Vehicles with 4.0L engine

4. Install the horn assembly.
 - Tighten the nut to 10 Nm (7 lb.ft).

Vehicles with 5.0L engine

5. Install the horn assemblies.
 - Tighten the 2 bolts to 10 Nm (7 lb.ft).

All vehicles

6. Install the radiator deflector.
 - Secure with the clip.
7. Install the coolant expansion tank.
For additional information, refer to: [Coolant Expansion Tank \(303-03D Engine Cooling - V8 5.0L Petrol, Removal and Installation\)](#) / [Coolant Expansion Tank \(303-03C Engine Cooling - V6 4.0L Petrol, Removal and Installation\)](#).
8. Install the radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08

Exterior Trim and Ornamentation, Removal and Installation).

9. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

10. Fill and bleed the power steering system.

For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).

Power Steering - Power Steering Fluid Cooler TDV6 2.7L Diesel

Removal and Installation

Special Tool(s)	
 E50921	Spring lock decoupler
	310-044

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
- Remove the cooling fan lower shroud.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
- Remove the radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
- Remove the radiator securing pegs.
- Remove the radiator upper deflector.
 - Release the 2 clips.

7. Release the coolant expansion tank.

- Remove the 2 bolts.

8. Tie the engine air intake duct towards the engine.

9. Tie the fuel fired booster heater coolant lines towards the engine.

10. NOTE: Note the position of the differential breather line.

Release the power steering fluid cooler.

- Release it from 3 clips.

11. Release the power steering fluid reservoir.

12.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

• **NOTE:** Some fluid spillage is inevitable during this operation.

Disconnect the power steering cooler line from the fluid reservoir.

- Release the clip.
- Allow the fluid to drain into a container.

13.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

• **NOTE:** Some fluid spillage is inevitable during this operation.

Remove the power steering fluid cooler.

- Using the special tool, release the clip.

Installation

1. Install the power steering fluid cooler.
 - Clean the component mating faces.
 - Secure the clip.
2. Connect the power steering cooler line to the fluid reservoir.
 - Clean the component mating faces.
 - Secure with the clip.
3. Install the power steering fluid reservoir.
4. Position the front differential breather line.
5. Secure the power steering fluid cooler line.
 - Secure in the 3 clips.
6. Secure the coolant expansion tank.
 - Tighten the 2 bolts to 10 Nm (7 lb.ft).

7. Install the radiator upper deflector.
8. Install the radiator securing pegs.
9. Connect the A/C condenser refrigerant lines.
 - Clean the component mating faces.
 - Install new O-ring seals.
 - Tighten the bolts to 25 Nm (18 lb.ft).
10. Install the radiator grille.

For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
11. Install the cooling fan lower shroud.

For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
12. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
13. Fill and bleed the power steering system.

For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).

Power Steering - Power Steering Pump VIN Range: 07 MODEL

YEAR->CURRENT

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the cooling fan shroud.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
4. Recover the air conditioning (A/C) refrigerant.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
5. Remove the auxiliary battery tray.
For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
6. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).
7.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

8. Remove the LH front wheel and tire.
9. Remove the fender splash shield lower trim panel.

- Remove the 4 clips.

10. Remove the front LH fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

11. Remove the upper arm and brake line heat shields for access.
12. Disconnect the charge air cooler inlet hose.

- Remove the two retaining bolts.
Remove the 3 nuts.
- Remove the retaining nut.
- Remove the 3 bolts.

14. Disconnect the charge air cooler inlet hose.

- Loosen the clip.

15. CAUTIONS:

 Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

 Care must be taken to avoid damage to the mating surfaces.

Release the A/C low pressure pipe from the compressor.

- Remove and discard the O-ring seal.
- Using a suitable tie strap, secure the A/C low-pressure pipe aside.

E94169

16. Remove the power steering pump rear fixing bracket retaining bolt.

- Reposition the charge air cooler inlet pipe to gain access to the power steering pump retaining bolt.

17.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Lower the vehicle.

18.  **CAUTION:** If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

Disconnect the high pressure line from the power steering gear.

- Remove and discard the O-ring seal.
- Install blanking caps to the exposed ports.
- Allow the fluid to drain into a container.

E94170

19.  **CAUTION:** If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

Disconnect the power steering pump supply hose.

- Clamp the power steering pump supply hose to minimise fluid loss.
- Install blanking caps to the exposed ports.

20. Remove the power steering pump.

- Remove the 3 power steering pump front retaining bolts.

Installation

1. Install the power steering pump and bracket.

- Install the 3 power steering pump front bolts and lightly tighten, then back off each bolt a 1/4 turn.

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle.

3. Install the power steering pump rear fixing bracket retaining bolt.

- Reposition the charge air cooler inlet pipe to gain access to the power steering pump retaining bolt.
- Tighten the bolt to 25 Nm (18 lb.ft).

4.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Lower the vehicle.

5. Tighten power steering pump front retaining bolts to 24 Nm (18 lb.ft).

6. Connect the power steering supply hose.

- Remove the blanking caps from the ports.
- Remove the hose clamp.

7. **NOTE:** Lubricate the seals with clean power steering fluid.

Connect the power steering high-pressure pipe union.

- Remove the blanking caps from the ports.
- Install a new O-ring seal.
- Tighten the Torx bolt to 25 Nm (18 lb.ft).
- Remove the container.

8.  **CAUTION:** Lubricate the new seals with clean refrigerant oil.

Install the A/C low pressure pipe to the compressor.

- Remove the blanking caps from the ports.
- Install a new O-ring seal.
- Tighten the bolt to 9 Nm (7 lb.ft).

9.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle.

10. Connect the charge air cooler inlet hose.

- Tighten the clips.

11. Secure the charge air cooler inlet pipe.

- Install the two retaining bolts.
- Install the retaining nut.
- Tighten to 10 Nm (7 lb.ft).

12. Install the upper arm and brake line heat shields.

- Install the 3 bolts.
- Install the 3 nuts.

13. Install the fender splash shield lower trim panel.

- Install the 4 clips.

14. Install the front LH fender splash shield.

For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

15. Install the wheel and tire.

16.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Lower the vehicle.

17. Install the accessory drive belt.

For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

18. Install the auxiliary battery tray.

For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

19. Recharge the A/C system

For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

20. Install the cooling fan shroud.

For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

21. Check and top-up power steering fluid level.

For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).

22. Install the engine cover.

For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

23. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Power Steering - Power Steering Pump TDV6 3.0L Diesel

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

4. Refer to: [Accessory Drive Belt](#) (303-05B Accessory Drive - TDV6 3.0L Diesel, Removal and Installation).

5. Remove the LH front wheel and tire.

Power Steering - Power Steering Pump V6 4.0L Petrol

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).
3.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.
 - **NOTE:** Some oil spillage is inevitable during this operation.

Clamp the power steering pump supply hose to minimise fluid loss.
4. Disconnect the high pressure line at the steering pump union.
 - Position an absorbent cloth to collect fluid spillage.
5. Disconnect the power steering pump supply hose.
 - Release the clip.
6. Remove the power steering pump.
 - Remove the 3 bolts.

Installation

1. Install the power steering pump.
 - Clean the component mating faces.
 - Install and tighten the bolts to 25 Nm (18 lb.ft).
2. Connect the power steering supply hose to the steering pump.
 - Clean the component mating faces.
 - Secure with the clip.
3. Connect the high pressure line to the steering pump.
 - Clean the component mating faces.
 - Install new seals.
 - Tighten the union to 25 Nm (18 lb.ft).
4. Install the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).
5. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Specifications).

6. Fill and bleed the power steering system.

Power Steering - Steering Angle Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the driver side closing trim panel.

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.

E47923

3. Disconnect the steering angle sensor electrical connector.

E47076

4. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

E49465

E47084

5. Remove the steering angle sensor.

- Remove the 3 Torx screws.

Installation

1. Install the steering angle sensor.

- Tighten the Torx screws to 3 Nm (2 lb.ft).

2. Connect the steering column intermediate shaft.

- Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).

3. Connect the steering angle sensor electrical connector.

4. Install the closing trim panel.

- Connect the electrical connector.
- Secure the clip.
- Tighten the screws.

5. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

6. Initiate a new steering angle sensor using T4.

Power Steering - Power Steering Pump to Steering Gear Pressure Line

Removal and Installation

Removal

- NOTE: RHD shown, LHD is similar.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

All vehicles

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the front RH splash shield.

- Remove the 4 clips.

3. Remove the front LH fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

4. Remove the radiator access panel.

- Remove the 4 bolts.

E72350

5.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the high pressure line from the power steering pump.

- Loosen and release the power steering pump line.
- Allow the fluid to drain into a container.
- Remove and discard the 2 sealing washers.

Vehicles with 5.0L engine

6. Release the power steering line support brackets.

- Remove the 2 nuts.
- Release the hose.

E122517

All other engine types

7. Release the power steering line support bracket.

- Remove the nut.
- Release the hose.

E72352

All vehicles

8.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the high pressure line from the power steering gear.

- Remove the bolt.
- Release the power steering gear line.
- Remove and discard the O-ring seal.

9. Remove the steering gear high-pressure line.

Installation

All vehicles

1. Install the steering gear high-pressure line.
2. Connect the high-pressure line to the power steering gear.
 - Install the O-ring seal.
 - Attach the power steering gear high-pressure line.
 - Tighten the bolt to 25 Nm (18 lb.ft).

Vehicles with 5.0L engine

3. Install the power steering line support brackets.
 - Tighten the nuts to 10 Nm (7 lb.ft).
 - Secure the hose with the clip.

All other engine types

4. Install the power steering line support bracket.
 - Tighten the nut to 10 Nm (7 lb.ft).
 - Secure the hose with the clip.

All vehicles

5. Connect the high-pressure line to the power steering pump.
 - Install new sealing washers.
 - Connect the power steering pump high-pressure line.
6. Install the radiator access panel.
 - Tighten the bolts to 10 Nm (7 lb.ft).
7. Install the front LH fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
8. Install the front RH splash shield.
 - Secure with the clips.
9. Fill and bleed the power steering system.
For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).

Steering Linkage -

Torque Specifications

Description	Nm	lb-ft
* Tie-rod end nut - Vehicles fitted with an M12 nut	76	56
* Tie-rod end nut - Vehicles fitted with an M14 nut	150	111
Tie-rod locking nut	55	40
Road wheel nuts	140	103

* **New nut must be installed**

Steering Linkage - Steering Linkage

Description and Operation

Steering Linkage Component Location

E46659

Item	Part Number	Description
1	-	Steering gear
2	-	Steering gear boot
3	-	Tie rod
4	-	Locknut
5	-	Tie rod end
6	-	Ball joint
7	-	Self-locking nut

GENERAL

The steering linkage comprises the tie rod which provides the connection between the steering gear and the front wheel knuckle.

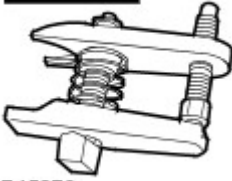

Each end of the steering gear has a threaded hole which provides for the fitment of the tie rods. The external ends of the tie rods are sealed with steering gear boots to prevent the ingress of dirt and moisture into the steering gear.

The outer ends of the tie rods are threaded to allow the fitment of the tie rod ends. The tie rod ends are screwed onto the tie rods and locked with locknuts to prevent inadvertent movement. The thread on the tie rod allows the position of the tie rod end to be adjusted in order to set the correct toe angle for each front wheel.

The tie rod end comprises a forged housing with a threaded bore for attachment to the tie rod. The tie rod end incorporates a non-serviceable tapered ball joint which locates in a tapered hole in the front wheel knuckle and is secured with a self-locking nut. The ball joint has an internal hexagonal drive which enables the joint to be held stationary when the self-locking nut is tightened.

Steering Linkage - Tie Rod End

Removal and Installation

Special Tool(s)	
 <p>205-754A E45276</p>	<p>Ball joint separator 205-754 (LRT-54-027)</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the front wheel.
- Loosen the tie rod end ball joint retaining nut.
- Loosen the tie rod end lock nut.
- Using the special tool, release the tie-rod end ball joint from the wheel knuckle.

- Remove and discard the tie rod end retaining nut.

- Remove the tie-rod end, note the number of turns for installation.

Installation

- Install the tie rod end, note the number of turns until adjacent to the locknut.
-  **CAUTION:** To prevent damage to the tie rods, use an additional wrench when loosening or tightening the components.

Connect the tie rod end ball joint.

- Clean the component mating faces.
- For vehicles fitted with an M12 nut, install a new nut and tighten to 76 Nm (56 lb.ft).

- For vehicles fitted with an M14 nut, install a new nut and tighten to 150 Nm (111 lb.ft).
3. Tighten the tie rod locking nut.
 - Clean the component mating faces.
 - Tighten the nut to 55 Nm (40 lb.ft).
 4. Install the front wheel.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
 5. Lower the vehicle.
 6. Using only four wheel alignment equipment approved by Land Rover, check and adjust the wheel alignment.

Steering Linkage - Steering Gear Boot

Removal and Installation

Removal

1. Remove the tie-rod end.
For additional information, refer to: [Tie Rod End](#) (211-03 Steering Linkage, Removal and Installation).

2. **NOTE:** Note the fitted position.

Remove the locknut.

3. Remove the steering gear boot.

- Release the 2 clips.

E55694

Installation

1. Install the steering gear boot.

- Clean the component mating faces.
- Secure with the clips.

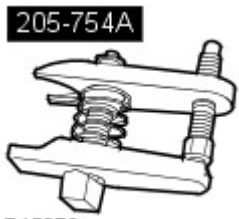

2. Install the locknut.

3. Install the tie-rod end.

For additional information, refer to: [Tie Rod End](#) (211-03 Steering Linkage, Removal and Installation).

Steering Linkage - Tie Rod

Removal and Installation

Special Tool(s)	
 <p>205-754A</p> <p>E45276</p>	<p>Ball joint separator</p> <p>205-754(LRT-54-027)</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the front wheel.
- Loosen the outer tie-rod end ball joint retaining nut.
- Loosen the outer tie-rod end lock nut.
- Using the special tool, release the tie-rod end ball joint from the wheel knuckle.

- Remove and discard the tie rod end retaining nut.

- Remove the outer tie-rod end, note the number of turns for installation.

- Remove the outer tie-rod end lock nut.

8. Remove the steering gear boot.

- Release the 2 clips.

9. Remove the inner tie-rod end.

- Loosen the nut.

Installation

1. Install the inner tie-rod end.
 - Tighten the nut to 100 Nm (74 lb.ft).
2. Install the steering gear boot.
 - Secure with the clips.
3. Install the outer tie-rod end lock nut.
4. Install the tie rod end, note the number of turns until adjacent to the locknut.

5.  **CAUTION:** To prevent damage to the tie rods, use an additional wrench when loosening or tightening the components.

Connect the tie-rod end ball joint.

- Clean the component mating faces.
 - For vehicles fitted with an M12 nut, install a new nut and tighten to 76 Nm (56 lb.ft).
 - For vehicles fitted with an M14 nut, install a new nut and tighten to 150 Nm (111 lb.ft).
6. Tighten the tie-rod locking nut.
 - Clean the component mating faces.
 - Tighten the nut to 55 Nm (40 lb.ft).
 7. Install the front wheel.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

8. Lower the vehicle.

9. Using only four wheel alignment equipment approved by Land Rover, check and adjust the wheel alignment.

Steering Column -

General Specification

Item	Specification
Type	Two piece, articulated with flexible coupling to steering rack; fitted with energy absorption system and having a 120 mm (4.7 in) ride down capability with a 4.5 kN (0.45 ton force) maximum decoupling load on the intermediate shaft and a 77 mm (3.0 in) collapse stroke on the lower shaft.
Upper column adjustment:	
Reach	40 mm (1.57 in)
Rake	6°

Torque Specifications

Description	Nm	lb-ft
Steering angle sensor Torx screws	3	2
* Steering column intermediate shaft to lower shaft bolts	30	22
* Steering column intermediate shaft to steering column nut	22	16
Steering column switch assembly Torx bolts	3	2
Steering wheel bolt	63	46

* **New bolts/nut must be installed**

Steering Column - Steering Column

Description and Operation

Component Location

E124335

Item	Part Number	Description
1	-	Steering wheel
2	-	Electronic steering lock
3	-	Electric motor
4	-	Steering angle sensor
5	-	Bulkhead mounting
6	-	Lower collapsible shaft yoke
7	-	Lower collapsible shaft
8	-	Intermediate shaft
9	-	Gaitor
10	-	Upper steering column assembly - Electric
11	-	Upper steering column assembly - Manual

Overview

The steering column comprises the upper column assembly, the intermediate shaft and the lower collapsible shaft. The three components are positively connected together to pass driver rotary input from the steering wheel to a linear output of the steering rack.

Upper Column Assembly - Manual

E124395

Item	Part Number	Description
1	-	Attachment holes
2	-	Roof bracket
3	-	Screw
4	-	Locating hook
5	-	'U' bracket
6	-	Steering wheel splines
7	-	Main body
8	-	Electronic steering lock
9	-	Adjustment lever
10	-	Clamp plate assembly
11	-	Adjustment balance spring (2 off)
12	-	Shearing capsule (2 off)
13	-	Steering angle sensor
14	-	Swing yoke

The steering column is attached to the in-vehicle crossbeam and secured with four, 8 mm thread forming, pan head Torx drive screws. The two forward attachment screws are fixed through the column mounting bracket, the two rearward mounting screws also pass through the shearing capsules. In the event of a high energy frontal impact, the shearing capsules remain fixed to the crossbeam, but the 'U' bracket (with the main body) disengages from the capsules, allowing the column to shorten axially (collapse), with the coiled straps absorbing energy to reduce occupant loading.
