WARNING: Take care when handling the column not to trap fingers if releasing the adjustment lever at any point during the removal procedure when the column is not in the vehicle. The balance springs will cause the column to rapidly

move to its upper-most position.

The column comprises a cast magnesium roof bracket which is attached to the in-vehicle crossbeam. Attached to the roof bracket is a pivot housing, a 'U' bracket, upper and lower shafts and a main body. The roof bracket has two hooks which locate in slots in the in-vehicle crossbeam. The hooks assist in supporting the weight of the column during removal or installation.

The pivot housing is attached to the forward end of the roof bracket with two pivot pins. The pivot housing allows for adjustment of the column rake and contains a bearing which supports the column lower shaft.

The 'U' bracket is attached to the roof bracket by a screw, bush and plastic washer assembly (third fixing) located in a slot in the top of the roof bracket. When the column is assembled into the vehicle, the shearing capsules, which are attached to the 'U' bracket, are clamped up against the roof bracket by the fixing screws, preventing movement of the 'U' bracket. The bolts also pass through rectangular section steel straps, which at one end, have coils that locate around a plastic bush (positioned on the shearing capsule). The straps are used to control the rate of column collapse, in the event of a high energy frontal impact.

The main body is positioned in the 'U' bracket via the lever bolt. The bolt is captive within the vertical slots in the 'U' bracket and the horizontal slots in the main body. The bolt also passes through the clamp plate assemblies (one on either side of the 'U' bracket). The body houses the middle and upper bearings through which the upper shaft is located. Two offset holes in the main body provide for the attachment of the electronic steering lock assembly.

The upper and lower shafts are located through the length of the column assembly. The upper shaft is supported in two bearings in the main body and the lower shaft is located in the upper shaft and supported in a bearing in the pivot housing. The lower shaft has a tubular section with external splines. These mate with the internal splines in the upper shaft. The purpose of the splines is to transmit rotational movement of the upper shaft to the lower shaft, but allowing the two components to telescope into each other in the event of a collision. The length of the splined sections allow for 120 mm (4.72 in) of linear movement. The lower shaft is fitted with a universal joint spider to which a swivel yoke is attached. The swivel yoke attaches to the intermediate shaft of the steering column on the interior side of the bulkhead using a special cam bolt and self-locking nut.

A steering angle sensor is attached to the pivot housing of the column and its centre gear is rotated by a drive collar which is attached to the lower shaft and rotates with movement of the steering wheel. The sensor transmits steering angle data on the high speed **CAN** bus which is used by various systems on the vehicle. The steering angle sensor is designed to become detached from the column in the event of a frontal impact. Care must be taken when handling the column assembly to prevent accidental damage to the sensor.

The upper steering column assembly houses the electronic column lock mechanism and control module.

The steering column is adjustable for reach and rake. The column can be adjusted for 40 mm (1.57 in) of reach adjustment and 6° of rake adjustment. The adjustment mechanism comprises an adjustment lever, a cam plate, a lever bolt and nut, two brake pads and two clamp plate assemblies.

A plastic adjustment lever is located on the underside of the column assembly and is attached to a cam plate. When the lever is pulled downwards, the cam plate rotates and releases tension in the lever bolt. The lever bolt also passes through two sets of clamp plate assemblies. When the lever is moved upwards, the cam plate rotates applying tension to the lever bolt, which applies pressure to the brake pads which in turn apply pressure to the clamp plate assemblies (which lock the column in the desired position). The lever bolt is retained by a self-locking lever nut, which abuts a thrust bearing.

WARNING: Under no circumstances should the lever nut torque be reduced, as this will reduce the clamping efficiency of the adjustment mechanism possibly affecting the stability of the column during a frontal impact.

The pivot housing is attached to the roof bracket with two pivot pins. When the rake adjustment is operated, the pivot housing rotates around the pivot pins to allow for the up and down adjustment, but maintains a positive location to the roof bracket. An adjustment spring is fitted between the 'U' bracket and the main body, to counteract the weight of the main body, upper shaft, steering wheel and airbag, preventing the steering wheel from dropping rapidly when the adjustment lever is released.

In the event of a high energy frontal impact, the upper column assembly is designed to axially collapse reducing impact injury to the driver. A number of components interact together to ensure that the collapse of the column is in a controlled manner. The following components control the column collapse:

- Pressure washer and bush (third fixing)
- Shearing capsules
- Straps
- Upper and lower shaft (splined) connection

The shearing capsules have a central hole through which the rearward attachment bolts pass through into the roof bracket. The capsules are located in the 'U' bracket by tapered slots, which have small cut-outs in the inside faces. The shearing capsules have a number of small holes which align with the cut-outs in the 'U' bracket. When the capsules are installed, plastic is injected into the holes and cut-outs. This plastic retention of the capsules provides the initial controlled break-out force for the column in the event of a collision. After 10 mm of displacement, the 'U' bracket is no longer located by the shearing capsules. When handling the column, care should be taken that the shearing capsules are not impacted or dislodged.

The tension in the 'Third Fixing' screw, applies a clamp load to the roof bracket (via the bush and compression washers). In the event of a collision, this clamp load (supplementary to the shearing capsules) must be overcome before the column can collapse. When this load has been exceeded (and the fixing has been displaced 20 mm (0.79 in)) it slides easily within the roof bracket slot, providing directional control to the column, as it collapses. Under no circumstances should the screw torque be adjusted.

The straps are rectangular section steel, which at one end, have coils that locate around a plastic bush (positioned on the shearing capsule). The other end is formed into a hook which locates within a slot in the 'U' bracket. When a collision has occurred, and the 'U' bracket has been displaced from the shearing capsules by 8 mm (0.3 in), the straps begin to un-roll due to the displacement of the 'U' bracket. The straps provide the main element for energy absorption as the column collapses. The cross section of the straps change after approximately 40 mm (1.6 in) of extension, changing the amount of

energy that they absorb.

Upper Column Assembly - Electric

E124336

Item	Part Number	Description
1	-	Pivot housing
2	-	Roof bracket
3	-	Locating hook
4	-	Electronic steering lock
5	-	Rake solenoid
6	-	Rake clutch
7	-	Reach solenoid
8	-	Reach clutch
9	-	Potentiometer
10	-	Electric motor
11	-	Outer profile
12	-	Rake lever
13	-	Electrical connector
14	-	Pivot pin
15	-	Steering angle sensor
16	-	Swing yoke

The steering column is attached to the in-vehicle crossbeam and secured with four, 8mm, thread forming, pan head Torx drive screws. In the event of a high energy frontal impact, a strap and shear pin on the underside of the column provides a controlled collapse of the outer housing on the inner housing, allowing the column to shorten axially (collapse), absorbing energy to reduce occupant loading.

The column comprises a cast magnesium roof bracket which is attached to the in-vehicle crossbeam. Attached to the roof bracket is a pivot housing, a outer housing and upper and lower shafts. The roof bracket has two hooks which locate in slots in the in-vehicle crossbeam. The hooks assist in supporting the weight of the column during removal or installation.

The rake lever locates the aluminum outer profile, into which is fixed the electronic steering lock adaptor. The inner profile is located within the outer profile, by 2 linear bearing assemblies, which allow a telescopic action for the reach adjustment.

The assembly of the upper and lower shafts is located within the column by the bearings in the electronic steering lock adaptor and the pivot housing. Both shafts are tubular. The lower shaft has external splines (which are over molded with nylon), and these mate with the internal splines in the upper shaft. The purpose of the splines is to transmit rotational movement of the upper shaft to the lower shaft, yet allow telescopic movement during column axial collapse. The lower shaft is fitted with a universal joint spider to which a swivel yoke is attached. The swivel yoke attaches to the intermediate shaft of the steering column on the interior side of the bulkhead using a special cam bolt and self-locking nut.

A steering angle sensor is attached to the pivot housing of the column and its centre gear is rotated by a drive collar which is attached to the lower shaft and rotates with movement of the steering wheel. The sensor transmits steering angle data on the high speed [CAN](#) bus which is used by various systems on the vehicle. The steering angle sensor is designed to become detached from the column in the event of a frontal impact. Care must be taken when handling the column assembly to prevent accidental damage to the sensor.

The upper steering column assembly houses the electronic column lock mechanism and control module.

The steering column is adjustable electrically for reach and rake. The adjustment mechanism comprises an electric adjustment motor, a lead screw, a rake solenoid, a reach solenoid, a rake clutch and a reach clutch.

The column adjustment is controlled by the driver using a joystick switch located on the left hand side of the column cowl. The joystick can be moved forward and backward to adjust the column reach in and out and moved up and down to adjust the rake. The single electric motor is used for both adjustment ranges. The switch selection uses the applicable solenoid, engaging the applicable clutch on the lead screw.

When the auto function is activated, the steering column will adjust to the uppermost tilt position with ignition off, and re-adjust to the previous set position, with ignition on.

For the reach adjustment, the lead screw drives the outer housing in or out as required. For the rake adjustment, the lead screw drives a rake lever which moves the column up or down as applicable.

The pivot housing is attached to the roof bracket with two pivot pins. When the rake adjustment is operated, the pivot housing rotates around the pivot pins to allow for the up and down adjustment, but maintains a positive location to the roof bracket.

The electric steering column is linked to and controlled by the memory control module. The memory control module provides storage of three separate memory positions which are stored against three individual vehicle keys. For additional information, refer to: Seats (501-10, Description and Operation).

. The electric column also has an easy egress feature which lifts the column to its maximum rake to allow easier access to the vehicle.

In the event of a high energy frontal impact, the upper column assembly is designed to collapse reducing impact injury to the driver. A number of components interact together to ensure that the collapse of the column is in a controlled manner. The following components control the column collapse:

- Shear pin
- Strap
- Upper and lower shaft (splined) connection

The strap is rectangular section steel, which is secured by two Allen screws to the outer housing and by a shear pin to the strap guide. The strap provides the main element for energy absorption as the column collapses. To initiate axial movement of the column, the shear pin has to be severed, friction between several column interfaces has to be overcome, and an axial load applied sufficient to initiate strap guide deformation. Once the column is telescoping, deformation of the strap guide, and sliding friction between column interfaces, absorbs the energy of the occupant in a controlled manner, as the column collapses.

WARNING: Do not attempt to dismantle the steering column. The crash safety of the unit will be compromised.

Intermediate Shaft

E124337

Item	Part Number	Description
1	-	Load limiter pins
2	-	Cam bolt
3	-	Self-locking nut
4	-	Retention spring
5	-	Attachment hole
6	-	Seal sleeve

⚠ CAUTION: Care should be taken when handling the intermediate shaft, to ensure that it is not subject to impacts or that the retention spring is not displaced.

The non-handed, intermediate shaft is attached at its upper end to the swivel yoke on the lower shaft of the steering column assembly. The intermediate shaft comprises two main parts; the upper and lower axis which are joined together with a shear joint.

The upper axis has a cut-out in the shaft which allows for the fitment of the cam bolt. Only when the shaft is located correctly in the swivel yoke, can the cam bolt be inserted. A self-locking nut is fitted to the cam bolt. The torque applied as the nut is tightened, rotates the bolt, forcing the cam against the shaft, positioning it correctly in the swivel yoke prior to the joint being clamped.

• **NOTE:** If the self-locking nut is removed for any reason, it is recommended that a new, correct nut is fitted to maintain the optimum torque on the cam bolt.

The lower axis is fitted with a plastic molded seal sleeve which provides a suitable surface for the location of the plastic bearings within the two bulkhead seals. The bottom of the lower axis is machined to a double 'D' shape which tapers at the end. One side of the taper has a slot which is used to align the intermediate shaft and the lower collapsible shaft to ensure that the correct orientation of the steering wheel to steering gear is maintained. A hole is drilled through the

double 'D' shape and provides for attachment of the intermediate shaft to the lower collapsible shaft.

The upper and lower axis, are joined together via a load limiter. The load limiter is designed to disconnect the upper and lower axis in the event of a high energy frontal impact preventing an excessive load being applied to the steering column (causing intrusion into the passenger compartment or an unstable airbag deployment).

The load limiter comprises two plates which are part of the upper and lower axis. The plates have a central 'guide' pin, and two retention pins, which pass through bushes in the plates, onto which a rubber and steel washer are staked in position. The size of the staking controls the load at which the lower axis separates from the upper axis. A wire 'retention' spring is also fitted to the load limiter.

Lower Collapsible Shaft

E124338

Item	Part Number	Description
1	-	Bolt
2	-	Heat shield
3	-	Female shaft
4	-	Male shaft
5	-	Plastic spacer
6	-	Flexible coupling
7	-	Universal joint
8	-	Torx bolt

The lower collapsible shaft is a handed component and the correct component must be fitted to ensure that the steering phase angle is maintained. The shaft is attached at its upper end to the intermediate shaft and at its lower end to the valve unit pinion on the steering gear. These attachment joints can only be fitted in one orientation to ensure the correct alignment of the steering wheel to the steering gear. The shaft comprises two female and male shafts which are a telescopic fit on each other. The male shaft can slide up to 77 mm (3.03 in) within the female shaft in the event of a

frontal impact, to minimize the effect of frontal intrusion. The sliding fit also allows for dynamic displacement between the chassis and the body during severe off-road driving. A plastic spacer is fitted to the male shaft which is only used as an assembly aid during vehicle production and serves no function once the shaft is assembled to the vehicle.

The female shaft is a triangular section tube which is formed to a double 'D' hole at its upper end which mates with the intermediate shaft. An indentation pressed in the wall of the tube ensures the correct alignment between the intermediate shaft and the lower collapsible shaft. A captive nut, clinched to one side of a hole in the double 'D' section, allows for the fitment of a patchlock bolt to secure the intermediate shaft. Clamped around the end of the female shaft is a dust seal which prevents the ingress of dirt and moisture into the sliding joint, and a heat sleeve is also fitted to reflect radiant heat from the exhaust.

The male shaft is a triangular section tube which is staked at its lower end into a flange. A cage and curved 'spring plates' are fitted to its upper end, which slide in the female shaft. A pin is fitted into the side of the female tube, to secure the male tube in the bore. The lower end of the male shaft is fitted with a flexible coupling to absorb vibration and steering 'kick back', transmitted from the steering gear. A 'stabilizing pin' is fitted through the coupling to prevent coupling articulation (acting as a universal joint), while still allowing rotational flexing and plunge movement. The coupling is a rubber molding within which are nylon fibres wound around the attachment holes to transmit torque applied to the steering. The coupling is attached to a drive flange (which is part of the male shaft), and to the 'U' yoke which in turn is connected to the pinion yoke, by the universal joint assembly.

Electronic Steering Column Lock

E124339

Item	Part Number	Description
1	-	Electronic steering column lock

With the passive start system, a conventional steering lock mechanism cannot be used. An electronic system was developed which comprises a steering column assembly locking unit with an integrated control module. The steering lock is operated with the door locks when the vehicle is locked or unlocked. A control module, located inside the steering column, controls a motor, releasing the steering lock when appropriate.

The upper steering column assembly houses the column lock mechanism and control module. The components are assembled with non-removable pins for security reasons and are therefore non-serviceable. Failure of any steering lock components will require replacement of the upper steering column assembly.

The steering column lock comprises a locking motor and locking bolt. The locking motor drives a cam, which moves the locking bolt into and out of engagement with the locking sleeve on the steering column. The locking motor is fitted with a Hall effect sensor, which informs the control module of the position (locked/unlocked) of the steering lock mechanism.

Steering Column - Steering Column

Removal and Installation

Removal

WARNING: Take care if releasing the adjustment lever when the column has been removed from the vehicle. The spring is under a high tension, and if released, could cause personal injury. Make sure fingers are clear from any areas, likely to be trapped.

CAUTION: Air tools **MUST NOT** be used on steering column bolts.

All vehicles

1. Fully extend the steering column for access.
2. Remove the steering wheel.
For additional information, refer to: [Steering Wheel](#) (211-04 Steering Column, Removal and Installation).
3. Remove the drivers side register trim panel.
For additional information, refer to: [Driver Side Register Trim Panel](#) (412-01 Air Distribution and Filtering, Removal and Installation).
4. Remove the driver side closing trim panel.
 - Release the clip.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

5. Remove the instrument panel access panel.
 - Release the 2 clips.

6. Remove the steering column upper shroud.

- Release the 6 clips.

7. Remove the steering column lower shroud.

- Remove the 3 Torx screws.
- Disconnect the electrical connector.

E50852

8. Remove the steering column side trim panel.

- Release the 4 clips.
- Disconnect 2 tabs.

E123222

9. Disconnect the 2 electrical connectors from the steering column multifunction switches.

E47072

10. Disconnect the 2 electrical connectors from the clockspring.

E47073

11. Remove the steering column switch assembly.

- Remove the 4 Torx bolts.

E47080

12. Remove the steering column gaiter panel.

- Remove the 2 Torx screws.
- Release the 2 clips.

E123681

13. Disconnect the smart key antenna.

E123823

14. Disconnect the steering column lock electrical connector.

15. Disconnect the steering angle sensor electrical connector.

Vehicles with electric steering column

16. Disconnect the steering column adjustment motor electrical connector.

17. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

18.  **WARNING:** Take care if releasing the adjustment lever when the column has been removed from the vehicle. The spring is under a high tension, and if released, could cause personal injury. Make sure fingers are clear from any areas, likely to be trapped.

 **CAUTION:** If the steering angle sensor is damaged upon removal of the steering column, the sensor **MUST** be replaced.

With assistance, remove the steering column.

- Remove the 4 Torx bolts.

19. Remove the steering angle sensor.

- Remove the 3 Torx screws.

Installation

Vehicles with electric steering column

1.  **CAUTION:** The potentiometer adjustment values are unique for each steering column. Failure to enter the correct code during calibration may result in damage to the vehicle.

Note the potentiometer hexadecimal code on the new steering column label for future reference.

All vehicles

2. Install the steering angle sensor.

- Tighten the Torx screws to 3 Nm (2.2 lb.ft).

3. CAUTIONS:

Make sure the bolt holes are clean and free of swarf.

The steering column bolts must be tightened by hand a minimum of 3 revolutions.

Air tools MUST NOT be used on steering column bolts.

With assistance, install the steering column.

- Tighten the bolts in sequence to 25 Nm (18 lb.ft).

4. Connect the steering column intermediate shaft.

- Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).

5. Secure the wiring harness to the steering column.

Vehicles with electric steering column

6. Connect the steering column adjustment motor electrical connector.

All vehicles

7. Connect the steering angle sensor electrical connector.

8. Connect the steering column lock electrical connector.

9. Connect the smart key antenna.

10. Install the steering column gaiter panel.

- Secure with the clips.
- Tighten the Torx screws.

11. Install the steering column switch assembly.

- Tighten the Torx bolts to 3 Nm (2 lb.ft).

12. Connect the clockspring and multifunction switch electrical connectors.

13. Install the steering column side trim panel.

- Secure with the clips.

14. Install the steering column shrouds.
15. Install the instrument panel access panel.
 - Secure with the clips.
16. Install the closing trim panel.
 - Connect the electrical connector.
 - Secure the clip.
 - Tighten the screws.
17. Install the steering wheel.

For additional information, refer to: [Steering Wheel](#) (211-04 Steering Column, Removal and Installation).
18. Install the drivers side register trim panel.

For additional information, refer to: [Driver Side Register Trim Panel](#) (412-01 Air Distribution and Filtering, Removal and Installation).
19. Calibrate the steering angle sensor using the Land Rover approved diagnostic tool.

Vehicles with electric steering column

20. If a new electric steering column is fitted re-calibrate the steering column potentiometer using the Land Rover approved diagnostic system.

Steering Column - Steering Column Shaft

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the driver side closing trim panel.
 - Release the clip.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

E47923

3. Disconnect the steering column intermediate shaft from the steering column.
 - Note the fitted position.
 - Remove the special bolt and discard the nut.

E49465

4. Disconnect the steering column intermediate shaft from the lower shaft.
 - Note the fitted position.
 - Remove and discard the bolt.

E47078

5. Remove the steering column intermediate shaft.
 - Release the 2 grommets.

E55128

6. NOTE: Do not disassemble further if the component is removed for access only.

• NOTE: Note the fitted position.

Remove the 2 intermediate shaft grommets.

Installation

1. Install the steering column intermediate shaft.
 - Install the grommets.
2. Connect the steering column intermediate shaft to the lower shaft.
 - Tighten the new bolt to 25 Nm (18 lb.ft).
3. Connect the steering column intermediate shaft to the steering column.
 - Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).
4. Install the driver side closing trim panel.
 - Connect the electrical connector.
 - Secure the clip.
 - Tighten the screws.
5. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Steering Column - Steering Column Lower Shaft

Removal and Installation

Removal

CAUTION: Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Turn the steering wheel to the straight ahead position.

3. CAUTIONS:

Make sure the steering wheel is in the straight ahead position.

Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

- **NOTE:** Note the fitted position.

Remove and discard the steering column lower shaft upper bolt.

4. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

CAUTION: Make sure that the brake hose and the wiring harnesses are not damaged during the removal and installation of the heat shields.

Remove the upper suspension arm heat shield for access.

- Remove the 3 nuts.

6. **CAUTION:** Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Disconnect the steering column lower shaft from the intermediate shaft.

7. Remove the fender splash shield lower trim.

- Remove the 4 clips.

8.  CAUTION: Make sure that the steering is correctly positioned using the road wheels. Do not turn the steering wheel. Failure to follow this instruction may result in damage to the vehicle.

Turn the steering until access can be gained to the steering column lower shaft bolt.

9.  CAUTION: Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Remove and discard the steering column lower shaft bolt.

10. Remove the steering column lower shaft.

- Disconnect the steering column lower shaft from the steering gear.

Installation

1. Clean the component mating faces.

2.  CAUTION: Make sure that the road wheels are in the straight ahead position.

Install the steering column lower shaft.

- Connect the steering column lower shaft to the steering gear.
- Connect the steering column intermediate shaft to the lower shaft.

3. Lower the vehicle on the lift.

4.  CAUTION: Make sure that a new bolt is installed.

Install the steering column lower shaft upper bolt.

- Install a new bolt and tighten to 30 Nm (22 lb.ft).

5. Raise the vehicle on the lift.

6. CAUTIONS:

 Do not turn the steering wheel with the steering column

lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Make sure that the steering is correctly positioned using the road wheels. Do not turn the steering wheel. Failure to follow this instruction may result in damage to the vehicle.

Turn the steering until access can be gained to the steering column lower shaft bolt.

7. Install the steering column lower shaft to steering gear bolt.

- Install a new bolt and tighten to 30 Nm (22 lb.ft).

8. Install the fender splash shield lower trim.

- Install the 4 clips.

9. Install the upper suspension arm heat shield.

- Install the 3 nuts.

10. Lower the vehicle on the lift.

Steering Column Switches - Steering Column Lock and Ignition Switch Housing

Removal and Installation

Removal

CAUTION: If the ignition lock cylinder and switch are both removed from the ignition switch assembly, the assembly shaft **MUST NOT** be rotated. Failure to comply will cause the incorrect operation of the lock, and the assembly must be replaced.

1. Fully extend the steering column for access.
2. Remove the steering wheel.
For additional information, refer to: Steering Wheel (211-04, Removal and Installation).
3. Remove the steering column upper shroud.
 - Release the 6 clips.

- Release the 6 clips.

4. Remove the steering column lower shroud.
 - Remove the 3 Torx screws.
 - Release the steering column adjustment lever.

5. Disconnect the 2 electrical connectors from the steering column multifunction switches.

6. Disconnect the 2 electrical connectors from the clockspring.

E47073

7. Remove the steering column switch assembly.

- Remove the 4 Torx bolts.

E47080

8. Remove the passive coil.

- Disconnect the electrical connector.
- Release the 2 clips.

E50853

9. Remove the ignition switch assembly.

- Remove and discard the 2 shear bolts.
- Disconnect the electrical connector.

E50482

10. NOTE: Do not disassemble further if the component is removed for access only.

Remove the ignition lock cylinder.

- Turn the ignition key to position 1.
- Insert a pin, not exceeding 2 mm diameter, through the access hole in the ignition lock cylinder housing to depress the plunger, and release the ignition lock cylinder.

E51363

11. Remove the ignition switch.

- Depress the 2 clips.

E51364

Installation

1. Install the ignition switch.

- Secure with the clips.

2. Install the ignition lock cylinder.

- Turn the ignition key to position 1.
- Locate into guides and depress the plunger.

E51372

3. Install the passive coil.

- Secure the clips.
- Connect the electrical connector.

4. Install the ignition switch assembly.

- Tighten the shear bolts until the heads shear off.
- Connect the electrical connector.

5. Install the steering column switch assembly.

- Tighten the Torx bolts to 3 Nm (2 lb.ft).

6. Connect the clockspring and multifunction switch electrical connectors.

7. Install the steering column shrouds.

8. Install the steering wheel.

For additional information, refer to: Steering Wheel (211-04, Removal and Installation).

Steering Column Switches - Ignition Switch

Removal and Installation

Removal

1. Fully extend the steering column for access.
2. Remove the steering column upper shroud.

- Release the 4 clips.

3. Remove the steering column lower shroud.

- Remove the 3 Torx screws.
- Release the steering column adjustment lever.

4.  **CAUTION:** The ignition key must be removed prior to the removal of the ignition switch.

Remove the ignition switch.

- Disconnect the electrical connector.
- Depress the 2 clips.

Installation

1. Install the ignition switch.
 - Secure with the clips.
 - Connect the electrical connector.
2. Install the steering column shrouds.
 - Tighten the Torx screws.
 - Secure the clips.
 - Secure the adjustment lever.

Steering Column Switches - Steering Column Multifunction Switch RH

Removal and Installation

Removal

1. Fully extend the steering column for access.
2. Remove the steering column upper shroud.
 - Release the 6 clips.

3. Remove the steering column lower shroud.

- Remove the 3 Torx screws.
- Disconnect the electrical connector.

E46949

4. Remove the steering column multifunction switch.

- Disconnect the electrical connector.
- Remove the 2 screws.

Installation

1. To install, reverse the removal procedure.

Steering Column Switches - Steering Column Multifunction Switch LH

Removal and Installation

Removal

1. Fully extend the steering column for access.
2. Remove the steering column upper shroud.
 - Release the 6 clips.

3. Remove the steering column lower shroud.

- Remove the 3 Torx screws.
- Disconnect the electrical connector.

4. Remove the steering column multifunction switch.

- Disconnect the electrical connector.
- Remove the 2 screws.

E46948

Installation

1. To install, reverse the removal procedure.

Engine System - General Information - Engine V6 4.0L Petrol

Diagnosis and Testing

Overview

Diagnosis of the different areas of the engine is covered in other specific sections of this workshop manual. This section is limited to an oil pressure test.

For a detailed description of the engine system and operation, refer to the relevant Description and Operation section of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.
3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

Engine Oil Pressure Test - 4.0L

• **NOTE:** Prior to checking the engine oil pressure, a road test of 6 miles (10 kilometres), must be carried out. Do not attempt to attain engine normal operating temperature by allowing the engine to idle.

1. **1.** Disconnect the battery ground cable.
2. • **WARNINGS:**

The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

Wear protective gloves.

2. **2.** Remove the engine oil pressure sensor.
REFER to: [Engine Oil Pressure \(EOP\) Sensor](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Removal and Installation).
3. **3.** Install the special tool.
4. **4.** Install the special tool gauge and tighten the union.

5. **5.** Check and top-up the engine oil if required.
6. **6.** Connect the battery ground cable.
7. **7.** Start and run the engine.
8. **8.** Note the oil pressure readings with the engine running at idle and 3500 RPM.
REFER to: [Specifications](#) (303-01C Engine - V6 4.0L Petrol, Specifications).
9. **9.** Turn off the engine.
10. **10.** Disconnect the battery ground cable.
11. **11.** Remove the special tools.
 1. Clean the components.
12. **12.** Install the oil pressure sensor.
REFER to: [Engine Oil Pressure \(EOP\) Sensor](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Removal and Installation).
13. **13.** Check and top-up the engine oil if required.

14. **14.** Connect the battery ground cable.

Engine System - General Information - EngineTDV6 2.7L Diesel

Diagnosis and Testing

Overview

Diagnosis of the different areas of the engine is covered in other specific sections of this workshop manual. This section is limited to an oil pressure test.

For a detailed description of the engine system and operation, refer to the relevant Description and Operation section of the workshop manual.

Inspection and Verification

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> ● Engine oil level ● Coolant level ● Transmission fluid level ● Fuel level ● Coolant leaks ● Oil leaks ● Fuel leaks ● Visibly damaged or worn parts ● Loose or missing nuts or bolts ● Fuel contamination/grade/quality ● Sensor fitment/condition ● Viscous fan and solenoid

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before carrying out the following procedure.
 - Make sure that all DTCs are cleared following rectification.

Oil Pressure check

• **NOTE:** Prior to checking the engine oil pressure, a road test of 6 miles (10 kilometers), must be carried out. Do not attempt to attain engine normal operating temperature by allowing the engine to idle.

1. • **WARNINGS:**

The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

Wear protective gloves.

1. 1. Remove the oil pressure sensor.
REFER to: [Engine Oil Pressure \(EOP\) Sensor](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Removal and Installation).
2. 2. Install the special tool to the oil filter housing.
3. 3. Install the special tool gauge and tighten the union.

4. 4. Check and top-up the engine oil, if required.

5. **5.** Start and run the engine.
6. **6.** Note the oil pressure readings with the engine running at idle and 3500 RPM.
REFER to: [Specifications](#) (303-01A Engine - TDV6 2.7L Diesel, Specifications).
7. **7.** Turn off the engine.
8. **8.** Remove the special tools.
9. **9.** Install the oil pressure sensor.
REFER to: [Engine Oil Pressure \(EOP\) Sensor](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Removal and Installation).
10. **10.** Check and top-up the engine oil, if required.

Engine System - General Information - EngineTDV6 3.0L Diesel

Diagnosis and Testing

Principle of Operation

For a detailed description of the 3.0L Diesel engine, refer to the relevant Description and Operation section in the workshop manual. REFER to: (303-01B Engine - TDV6 3.0L Diesel)

<ul style="list-style-type: none"> ○ Coolant level ○ Coolant leaks ○ Oil level ○ Oil leaks ○ Visibly damaged or worn parts ○ Loose or missing nuts or bolts 	<ul style="list-style-type: none"> ○ Wiring harness ○ Electrical connector(s) ○ Injectors ○ Glow plugs ○ 5 volt sensor supply ○ Sensor(s) ○ Cooling fan control module and motor ○ Engine Control Module (ECM)

2. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
3. If the concern is not visually evident, verify the symptom and refer to the relevant Symptom Chart. Symptom Charts have been separated into **Leaks** and **Noise Vibration and Harshness (NVH)** for ease of use. Alternatively, check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

Symptom Charts

Symptom Chart, Leaks

Symptom	Possible Cause	Action
External coolant leaks	<ul style="list-style-type: none"> ● Damaged hose(s) ● Damaged expansion tank ● Damaged radiator ● Leaking seals/gaskets ● Cracked/damaged casings 	Check cooling system.
Internal coolant leaks Note: This may be indicated by the production of white smoke from the exhaust	<ul style="list-style-type: none"> ● Leaking seals/gaskets ● Cracked/damaged casings 	Check cooling system.
Engine overheats	<ul style="list-style-type: none"> ● Insufficient coolant ● Insufficient oil ● Pressure cap fault ● Thermostat not opening ● Coolant pump failure ● Cooling fan failure 	Check cooling system.
Engine takes too long to reach operating temperature	<ul style="list-style-type: none"> ● Thermostat stuck open 	Check cooling system.
External oil leaks	<ul style="list-style-type: none"> ● Gaskets ● Seals ● Oil pipes ● Oil filter ● Oil cooler ● Damaged/cracked casings ● Crankcase ventilation system ● Piston ring blow-by 	Clean and confirm the area of the leak. Check the visual condition of oil carrying components. Check the crankcase ventilation system. Carry out a compression test, GO to Pinpoint Test A .
Internal oil leaks (leaks into coolant or combustion chamber) Note: This may be indicated by the production of blue smoke from the exhaust	<ul style="list-style-type: none"> ● Gaskets ● Seals ● Damaged/cracked casings ● Worn valve guides 	Check for traces of oil in the coolant. Check for evidence of oil in the combustion chambers (deposits on the glow plugs, etc). Confirm oil consumption and vehicle usage with the owner/driver. Carry out an oil consumption test, GO to Pinpoint Test B .

Symptom	Possible Cause	Action
	<ul style="list-style-type: none"> Worn cylinder bores/pistons Broken piston rings 	

Symptom Chart, NVH

• NOTE: As the checks suggested here are open to interpretation, they should be used as a guide only. Descriptions of noises, etc, are in general terms, so depend on a degree of experience on the part of the technician.

Symptom	Possible Cause	Action
Rattle/ticking from top of engine	<ul style="list-style-type: none"> Valve gear noise Camshaft bearing noise Camshaft chain noise Tensioner noise Vacuum pump noise High pressure fuel pump noise 	Check the engine oil pressure, GO to Pinpoint Test C... . Check the function of the hydraulic tappets and the camshaft condition. Check the camshaft bearings, chains and tensioners. Check the vacuum pump, and high pressure fuel pump
Growl from top of engine	<ul style="list-style-type: none"> High pressure fuel pump belt noise High pressure fuel pump belt tensioner noise 	Check the high pressure fuel pump belt and tensioner
Squeaking/Creaking/Squeal from front of engine	<ul style="list-style-type: none"> Front End Accessory Drive (FEAD) belt FEAD belt tensioner Driven components on FEAD belt 	Check the FEAD belt and driven components.
Whine/Slap/Growl from front of engine	<ul style="list-style-type: none"> Front End Accessory Drive (FEAD) belt FEAD belt tensioner Driven components on FEAD belt Timing belt noise Timing belt tensioner noise 	Check the FEAD belt and driven components. Check the timing belt and tensioners
Knock from lower half of engine (often worse with a cold engine)	<ul style="list-style-type: none"> Piston slap Piston pin noise Connecting rod bearing noise 	Check the engine oil pressure, GO to Pinpoint Test C... . Check piston, cylinder bore, piston pin and connecting rod bearing for excess wear
Knock/Rumble from lower half of engine (often worse on overrun)	<ul style="list-style-type: none"> Main bearing noise 	Check the engine oil pressure, GO to Pinpoint Test C... . Check connecting rod bearing for excess wear
Misfire/Rough running	<ul style="list-style-type: none"> Engine management system Fuel charging and controls Exhaust gas recirculation (EGR) system Burnt/sticking valves Worn valve guides Worn cylinder bores/pistons Broken piston rings Damaged/cracked casings 	Check engine management and fuel charging and controls systems for failure. Check EGR system for failures. Carry out a compression test, GO to Pinpoint Test A... Check for excess wear in engine components

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Pinpoint Tests

• NOTE: Where reference is made to 'suitable equipment', this refers to standard workshop equipment. Refer to the operating instructions for your own equipment when performing any tests.

PINPOINT TEST A : CHECK THE CYLINDER COMPRESSIONS	
 WARNING: Only compression testers able to read the higher compression pressures found in diesel engines should be used. Failure to follow this instruction may result in personal injury.	
• NOTE: Where possible, compression testing should be carried out on an engine at operating temperature.	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: CARRY OUT A DRY CYLINDER COMPRESSION TEST	
1	Make sure the parking brake is applied and that the selector lever is in park.
2	Set the ignition status to OFF .

3	Remove the starter relay.
4	Disconnect the starter motor solenoid connector.
5	Connect a suitable remote starter device to the starter motor solenoid.
6	Remove the glow plugs.
7	Install adaptor 303-1131 in place of the glow plug in the first cylinder to be tested.
8	Connect a suitable compression tester to the adaptor. See warning above.
9	Using the remote starter device, crank the engine a minimum of five revolutions.
10	Record the compression figure and the number of revolutions taken to reach it.
11	Repeat steps 7 - 10 above for the remaining cylinders, cranking the engine for a similar number of revolutions each time.
12	Compare the compression figures across all the cylinders.
	Are the compression figures within 10% of each other? Yes Unless the compression figures are universally very low (experience will indicate this), check for other causes for the customer complaint. No GO to A2.

A2: CARRY OUT A WET CYLINDER COMPRESSION TEST

 **CAUTION:** If engine oil is introduced into the cylinders, run the engine at 2,000 rpm for a minimum of ten minutes after completing testing to prevent damage to the catalytic converters. Failure to follow this instruction may result in damage to the vehicle.

• **NOTE:** There is a combustion chamber in the top of each piston. Make sure that the oil is not allowed to run into this chamber.

1	Using a suitable oil can with a flexible spout, introduce a small amount of clean engine oil into the cylinder just before testing, such that the oil is able to run between the piston and the cylinder bore.
2	Repeat steps 7 - 10 from the test above, introducing oil into each cylinder just before testing.
3	Compare the compression figures across all the cylinders.
	Is the compression figure higher than the dry test? Yes A higher figure following the introduction of oil may indicate a worn or damaged cylinder bore, piston and/or piston rings. Disassembly would be required to confirm this. No If the compression figure is unaffected by the introduction of oil, but the figure is still less than 90% of the other cylinders, this may indicate a burnt and/or sticking valve, leaking head gasket, etc. Disassembly would be required to confirm this. Clear any DTCs which may have been induced by the test.

PINPOINT TEST B : OIL CONSUMPTION TEST

• **NOTE:** Oil consumption will vary, depending on a number of factors. New engines will normally use more oil than 'run-in' engines, although a guideline would be to expect 16,000 Km (10,000 miles) per liter.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CHECK FOR EXCESSIVE OIL CONSUMPTION	
1	Start the engine and allow it to run until it reaches normal operating temperature.
2	Make sure the vehicle is parked on a level surface and set ignition status to OFF .
3	Allow to settle for at least five minutes.
4	Check the oil level.
5	Correct the level, if necessary, and record the reading and mileage in the vehicle history.
6	Make sure that the owner/driver is aware that a test is being carried out, and that they should not top-up their oil level for the duration of the test, but should check the level every 160-240 Km (100-150 miles).
7	When the oil level reaches the ADD mark, the customer should bring the vehicle in to be checked.
8	Top-up the oil to the level at the beginning of the test and record the amount of oil needed to do so, and the mileage covered in the course of the test.
9	From this, the consumption can be calculated, and a decision made as to whether or not the consumption is considered excessive.
	Is the consumption excessive for the mileage and/or use? Yes Disassembly will be required to check the components indicated in the symptom chart. No No further action is required.

PINPOINT TEST C : CHECK THE ENGINE OIL PRESSURE

• **NOTE:** Check and, if necessary, top-up the engine oil level before beginning this test.

• **NOTE:** Where reference is made to 'suitable equipment', this refers to standard workshop equipment. Refer to the operating instructions for your own equipment when performing any tests.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: CHECK FOR LOW ENGINE OIL PRESSURE	
1	Remove the oil pressure sensor.
2	Connect a suitable oil pressure gauge in place of the oil pressure sensor.
3	Start the engine and check for leaks at the gauge connection.
4	Allow the engine to idle and monitor the oil pressure.
5	Raise the engine speed to 2,500 rpm and monitor the oil pressure.

	<p>Is the oil pressure less than 0.50 bar (7.25 psi) between idle and 2,500 rpm?</p> <p>Yes GO to C2.</p> <p>No GO to C3.</p>
C2: CHECK FOR LOW ENGINE OIL PRESSURE AT ENGINE SPEEDS GREATER THAN 2,500 RPM	
	<p>1 Raise the engine speed to above 2,500 rpm and monitor the oil pressure.</p>
	<p>Is the oil pressure less than 1.0 bar (14.5 psi) at engine speeds greater than 2,500 rpm?</p> <p>Yes Pressure this low may indicate a problem with: oil pump, filtering, clearances within the engine. Check if there are any other indications of engine faults (noise, etc), refer to the symptom chart above.</p> <p>No GO to C3.</p>
C3: CHECK FOR HIGH ENGINE OIL PRESSURE	
	<p>1 Monitor the engine oil pressure at varying engine speeds.</p>
	<p>Does the oil pressure reach 4.0 bar (58 psi)?</p> <p>Yes Pressure this high may indicate a blockage in the lubrication system. If this is not resolved, high oil pressure will lead to engine oil leaks and other failures.</p> <p>No If the oil pressure stays in the band between 0.50 bar (7.25 psi) and 1.0 bar (14.5 psi) this would be considered normal.</p>

Engine System - General Information - Engine V8 5.0L Petrol

Diagnosis and Testing

Special Tool(s)	
 <p>303-1451</p> <p>E136285</p>	Oil pressure testing adaptor, 303-1451
 <p>303-871</p> <p>E57919</p>	Oil pressure testing gauge, 303-871

Principle of Operation

For a detailed description of the 5.0L engine, refer to the relevant Description and Operation sections in the workshop manual. REFER to: [Engine](#) (303-01D Engine - V8 5.0L Petrol, Description and Operation).

Inspection and Verification

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> <input type="checkbox"/> Coolant leaks <input type="checkbox"/> Oil leaks <input type="checkbox"/> Leaks in the fuel system <input type="checkbox"/> Visibly damaged or worn parts <input type="checkbox"/> Loose or missing fixings 	<ul style="list-style-type: none"> <input type="checkbox"/> Fuses <input type="checkbox"/> Loose or corroded electrical connectors <input type="checkbox"/> Harnesses <input type="checkbox"/> Sensors

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

Symptom Chart

• NOTE: If an engine is suspect, and the vehicle remains under the Manufacturers warranty refer to the Warranty Policy and Procedure manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new engine.

• NOTE: Due to the possibility of loose carbon, that has become trapped between the valve face and seat, effecting the pressure readings, when carrying out a compression test and some cylinders are found to have low pressures, install the spark plugs, road test the vehicle and re-test the suspect cylinders. If the correct pressures are restored, no further action is required.

Symptom	Action
All engine related issues	<ul style="list-style-type: none"> ● Check ECM for Diagnostic Trouble Codes (DTCs) and refer to DTC Index.
Difficult to start hot and cold	<ul style="list-style-type: none"> ● Carry out general engine checks: <ul style="list-style-type: none"> - Compression test. Refer to component tests in this section. - Valve clearances - Spark plug condition and color
Poor idle	<ul style="list-style-type: none"> ● Ensure the air intake system is free from leaks ● Carry out general engine checks: <ul style="list-style-type: none"> - Compression test. Refer to component tests in this section. - Valve clearances - Spark plug condition and color ● Check for collapsed catalytic converter/blocked exhaust system ● Check long and short term fuel trim datalogger signals <ul style="list-style-type: none"> - Readings up to 10%: may be considered as acceptable if the readings are equal bank to bank - Positive readings of between 10-20%: check for air leaks in air intake system - Negative readings of between 10-20%: check for over fuelling e.g. leaking

Symptom	Action
	injectors, high fuel pressure - Readings above 20%: check for DTCs and refer to DTC Index. ● Carry out a vacuum gauge check. Refer to component tests in this section
Insufficient power/Insufficient compression	● Ensure the air intake system is free from leaks ● Carry out general engine checks: - Compression test. Refer to component tests in this section. - Valve clearances - Spark plug condition and color ● Check for collapsed catalytic converter/blocked exhaust system ● Check long and short term fuel trim datalogger signals - Readings up to 10%: may be considered as acceptable if the readings are equal bank to bank - Positive readings of between 10-20%: check for air leaks in air intake system - Negative readings of between 10-20%: check for over fuelling e.g. leaking injectors, high fuel pressure - Readings above 20%: check for DTCs and refer to DTC Index. ● Carry out a vacuum gauge check. Refer to component tests in this section
Oil consumption	● Carry out oil leak check followed by an oil consumption test. Refer to the component tests in this section ● If oil consumption is excessive: ● Check the integrity of the engine breather system ● Carry out general engine checks: - Compression test. Refer to component tests in this section. - Valve clearances - Spark plug condition and color
Noise	● Refer to the Special Service Messages on the Electronic Product Quality Report (EPQR) system for sound files. If the symptom does NOT compare to any of the sound files, contact Dealer Technical Support (DTS)

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - V8 5.0L Petrol, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Component Tests

Engine Oil Leaks

- NOTE: Before installing new gaskets or oil seals, make sure that the fault is clearly established.

If the oil leak cannot be identified clearly by a visual inspection, carry out an Ultraviolet test:

Fluorescent Oil Additive Method

1. Clean the engine with a suitable cleaning fluid (brake cleaner).
2. Drain the engine oil and refill with recommended oil, premixed with Diesel Engine Oil Dye or equivalent. Use a minimum 14.8 ml (0.5 ounce) to a maximum 29.6 ml (1 ounce) of fluorescent additive to all engines. If oil is not premixed, fluorescent additive must first be added to the crankcase.
3. Run engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using a 12 Volt Master UV Diagnostic Inspection Kit or equivalent. A clear bright yellow or orange area will identify leak. For extremely small leaks, several hours may be required for the leak to appear.
4. As necessary, pressurize the main oil gallery system to locate leaks due to incorrectly sealed, loose or cocked plugs. If the flywheel bolts leak oil, look for sealer on the threads.
5. Repair all leaks as necessary.

Compression Test

General Remarks

• NOTE: Removing fuses and disconnecting electrical components may cause the Engine Control Module (ECM) to log Diagnostic Trouble Codes (DTCs). After the measurements have been carried out, DTCs should be cleared from memory by connecting to the Manufacturer Approved Diagnostic System.

- NOTE: Only check the compression pressure with the valves set to the prescribed clearance (if this can be adjusted).

The compression pressure should be checked with the engine at normal operating temperature.

Check the Compression Pressure

WARNING: Move gear selector lever to 'P' position. Failure to follow this instruction may result in personal injury.

1. Remove the fuel pump relay.

2. **2.** Start the engine - the engine will start, run for a few seconds then stall.
3. **3.** Remove the spark plugs.
4. **4.** Install the compression tester.
5. **5.** Install an auxiliary starter switch in the starting circuit. With the ignition switch OFF, using the auxiliary starter switch, crank the engine a minimum of five compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.
6. **6.** Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.
7. **7.** Install the removed components in reverse order, observing the specified tightening torques.
8. **8.** Clear all DTCs from the ECM.

Interpretation of the Results

• **NOTE:** Due to the possibility of loose carbon that has become trapped between the valve face and seat effecting the pressure readings, when carrying out a compression test and cylinders are found to have low pressures, install the spark plugs, road test the vehicle and re-test the suspect cylinders. If the correct pressures are restored, no further action is required.

The indicated compression pressures are considered within specification if the lowest reading cylinder is within 75% of the highest reading.

If the cylinder pressures are found to be low, carry out a leakdown test to determine the location of the fault (if any leakback can be heard through the engine breather system suspect the piston rings, if any leakback can be heard through the inlet system suspect the inlet valve or seat, if any leakback can be heard through the exhaust manifold suspect the exhaust valve or seat. If the measurements for two cylinders next to each other are both too low then it is very likely that the cylinder head gasket between them is burnt through. This can also be recognized by traces of engine oil in the coolant and/or coolant in the engine oil).

Oil Consumption Test

The amount of oil an engine uses will vary with the way the vehicle is driven in addition to normal engine-to-engine variation. This is especially true during the first 16,100 km (10,000 miles) when a new engine is being broken in or until certain internal components become conditioned. Vehicles used in heavy-duty operation may use more oil. The following are examples of heavy-duty operation:

- Trailer towing applications
- Severe loading applications
- Sustained high speed operation

Engines need oil to lubricate the following internal components:

- Cylinder block cylinder walls
- Pistons and piston rings
- Intake and exhaust valve stems
- Intake and exhaust valve guides
- All internal engine components

When the pistons move downward, a thin film of oil is left on the cylinder walls. As the vehicle is operated, some oil is also drawn into the combustion chambers past the intake and exhaust valve stem seals and burned.

The following are examples of conditions that can affect oil consumption rates:

- Engine size
- Operator driving habits
- Ambient temperatures
- Quality and viscosity of oil
- Engine is being run in an overfilled condition (check the oil level at least five minutes after a hot shutdown with the vehicle parked on a level surface. The oil level should not be above the top of the cross-hatched area and the letter "F" in FULL).

Operation under varying conditions can frequently be misleading. A vehicle that has been run for several thousand miles on short trips or in below-freezing ambient temperatures may have consumed a "normal" amount of oil. However, when checking the engine oil level, it may measure up to the full mark on the oil level indicator due to dilution (condensation and fuel) in the engine crankcase. The vehicle then might be driven at high speeds on the highway where the condensation and fuel boil off. The next time the engine oil is checked it may appear that a liter of oil was used in about 160 km (100 miles). Oil consumption rate is about one liter per 2,400 km (1,500 miles).

Make sure the selected engine oil meets Jaguar specification and the recommended API performance category "SG" and SAE viscosity grade as shown in the vehicle Owner's Guide. It is also important that the engine oil is changed at the intervals specified for the typical operating conditions.

The following diagnostic procedure is used to determine the source of excessive oil consumption.

• **NOTE:** Oil use is normally greater during the first 16,100 km (10,000 miles) of service. As mileage increases, oil use decreases. High speed driving, towing, high ambient temperature and other factors may result in greater oil use.

1. **1.** Define excessive consumption, such as the number of miles driven per liter of oil used. Also determine customers driving habits, such as sustained high speed operation, towing, extended idle and other considerations.
2. **2.** Verify that the engine has no external oil leaks as described under Engine Oil Leaks in this section.
3. **3.** Carry out an oil consumption test:

- Run the engine to normal operating temperature. Switch engine OFF and allow oil to drain back for at least five minutes .
- With vehicle parked on level surface, check the engine oil level.
- If required, add engine oil to set level exactly to the FULL mark.
- Record the vehicle mileage.
- Instruct the customer to return for a level check after driving the vehicle as usual for 1,610 km (1000 miles).
- Check the oil level under the same conditions and at the same location as the initial check.

• **NOTE:** If the oil consumption rate is unacceptable go to Step 4.

4. **4.** Check the Positive Crankcase Ventilation (PCV) system. Make sure the system is not plugged.
5. **5.** Check for plugged oil drain-back holes in the cylinder head and cylinder block.
6. **6.** If the condition still exists after carrying out the above tests go to step 9.
7. **7.** Carry out a cylinder compression test. Refer to the Compression Test procedure in this section. This can help determine the source of oil consumption such as valves, piston rings or other areas.
8. **8.** Check valve guides for excessive guide clearance. Install new valve stem seals after verifying valve guide clearance.
9. **9.** Worn or damaged internal engine components can cause excessive oil consumption. Small deposits of oil on the tips of the spark plugs can be a clue to internal oil consumption.

Intake Manifold Vacuum Test

Bring the engine to normal operating temperature. Connect a vacuum gauge or equivalent to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is performed. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 feet) of elevation above sea level.

The reading should be steady. As necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust damper until needle moves easily without excessive flutter.

Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.

VJJ0001694

1. **1.** NORMAL READING: Needle between 51-74 kPa (15-22 in-Hg) and holding steady.
2. **2.** NORMAL READING DURING RAPID ACCELERATION: When the engine is rapidly accelerated, the needle will drop

to a low (not to zero) reading. When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.

3. **3. NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP:** The needle will register as low as 51 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.
4. **4. WORN RINGS OR DILUTED OIL:** When the engine is accelerated, the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).
5. **5. STICKING VALVES:** When the needle remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.
6. **6. BURNED OR BENT VALVES:** A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or damaged valves. Insufficient hydraulic valve tappet or hydraulic lash adjuster clearance will also cause this reaction.
7. **7. POOR VALVE SEATING:** A small but regular downscale flicking can mean one or more valves are not seating correctly.
8. **8. WORN VALVE GUIDES:** When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.
9. **9. WEAK VALVE SPRINGS:** When the needle oscillation becomes more violent as engine RPM is increased, weak valve springs are indicated. The reading at idle could be relatively steady.
10. **10. LATE VALVE TIMING:** A steady but low reading could be caused by late valve timing.
11. **11. IGNITION TIMING RETARDED:** Retarded ignition timing will produce a steady but somewhat low reading.
12. **12. INSUFFICIENT SPARK PLUG GAP:** When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.
13. **13. INTAKE LEAK:** A low, steady reading can be caused by an intake manifold or throttle body gasket leak.
14. **14. BLOWN HEAD GASKET:** A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head to cylinder block surface.
15. **15. RESTRICTED EXHAUST SYSTEM:** When the engine is first started and is idled, the reading may be normal, but as the engine RPM is increased, the back pressure caused by a clogged muffler, kinked tail pipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.

When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory such as the power brake booster, the unit will not function correctly. Always repair vacuum leaks.

Engine Oil Pressure Check

• **NOTE:** Prior to checking the engine oil pressure, a road test of 6 miles (10 kilometres), must be carried out. Do not attempt to attain engine normal operating temperature by allowing the engine to idle.

1. **1.** Disconnect the battery ground cable. Refer to section 414-00 - Charging System - General Information of the workshop manual
2. • **WARNINGS:**

The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

Wear protective gloves.

2. Remove the engine oil filter element
REFER to: [Oil Filter Element](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

• **NOTE:** Ensure the oil filter element is not contaminated during this procedure

3. **3.** Install the oil filter element into special tool (Oil filter adapter number 303-1451)
4. **4.** Install the special tool (Oil filter adapter number 303-1451) to the engine. Torque: 25 Nm
5. **5.** Install the special tool (Oil pressure testing gauge, 303-871) and tighten the union
6. **6.** Connect the battery ground cable
7. **7.** Refer to owner hand book, check and top-up the engine oil if required
8. **8.** Start and run the engine
9. **9.** Note the oil pressure readings with the engine running at idle and 3500 RPM
10. **10.** Turn off the engine
11. **11.** Disconnect the battery ground cable
12. **12.** Remove the special tools
 1. Clean the components

13. **13.** Install the engine oil filter element
REFER to: [Oil Filter Element](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

• NOTE: Ensure the oil filter element is not contaminated during this procedure

14. **14.** Connect the battery ground cable

15. **15.** Refer to owner hand book, check and top-up the engine oil if required

Engine System - General Information - Bearing Inspection

General Procedures

1. Inspect bearings for the following defects.

1. Cratering - fatigue failure
2. Spot polishing - incorrect seating.
3. Imbedded dirt engine oil.
4. Scratching - dirty engine oil.
5. Base exposed - poor lubrication.
6. Both edges worn - journal damaged.
7. One edge worn - journal tapered or bearing not seated.

VUJ0002219

Engine System - General Information - Camshaft Bearing Journal Clearance

General Procedures

VUJ0001696

1. NOTE: Make sure that the following stages are followed exactly. The tappets or followers must be removed to carry out this measurement.

- **NOTE:** Make sure that the camshaft is to specification.
- **NOTE:** The bearing caps and journals should be free from engine oil and dirt.

Position on a length of plastigage on the bearing cap.

- Insert the camshaft, without lubrication, into the cylinder head.
- Position a plastigage strip, which should be equal to the width of the bearing cap, on the bearing journal.

2. Install the camshaft bearing caps.

- Follow the relevant tightening sequence.

3. NOTE: Do not strike the bearing caps.

Remove the camshaft bearing caps.

- Follow the relevant loosening sequence.

4. Using the special tool, read off the measurement.

- Compare the width of plastigage with the plastigage scale.
- The value that is read off is the bearing clearance.
- If the values are not to specification install a new camshaft.

VUJ0001697

Engine System - General Information - Camshaft Bearing Journal Diameter

General Procedures

1. Determine the diameter of the camshaft journals.

- Using a micrometer measure the diameter at 90 degree intervals to determine if the journals are out-of-round.
- Measure at two different points on the journal to determine if there is any tapering.
- If the measurements are out of the specified range, install a new camshaft.

VUJ0001695

Engine System - General Information - Camshaft End Play

General Procedures

VUJ0001698

1. NOTE: Make sure that the camshaft is to specification.

Using the special tool, measure the end play.

- Slide the camshaft in both directions. Read and note the maximum and minimum values on the dial indicator gauge.
 1. End play = maximum value minus minimum value.
- If the measurement is out of specification, install new components.

Engine System - General Information - Camshaft Lobe Lift

General Procedures

1. Measure the diameter (1) and diameter (2) with a vernier caliper. The difference in measurements is the lobe lift.

VUJ0001699

Engine System - General Information - Camshaft Surface Inspection

General Procedures

1. Inspect camshaft lobes for pitting or damage in the active area. Minor pitting is acceptable outside the active area.

VUJ0001700

Engine System - General Information - Connecting Rod Cleaning

General Procedures

VUJ0002224

1.  CAUTION: Do not use a caustic cleaning solution or damage to connecting rods may occur.

Mark and separate the parts and clean with solvent. Clean the oil passages.

Engine System - General Information - Connecting Rod Large End Bore

General Procedures

1. Measure the bearing bore in two directions. The difference is the connecting rod bore out-of-round. Verify the out-of-round is within specification.

VUJ0002223

2. Measure the bearing bore diameter in two directions. Verify the bearing bore is within specification.

VUJ0002222

Engine System - General Information - Crankshaft End Play

General Procedures

1. Using the Dial Indicator Gauge with Brackets, measure the end play.

- Measure the end play by lifting the crankshaft using a lever.
- If the value is out of the specification, install new thrust half rings to take up the end float and repeat the measurement.

VUJ0002235

Engine System - General Information - Crankshaft Main Bearing Journal Clearance

General Procedures

CAUTION: THESE PROCEDURES SHOULD NOT BE CARRIED OUT DURING THE MANUFACTURERS WARRANTY PERIOD.

1. NOTE: Example - *PJEAL* - Crankshaft Main Journal Diameter.

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crank journal at the front of the engine is grade P, and at the rear is grade L.

- The selection of main bearing shells is described in the following chart.

E33992

2. NOTE: Example - *ABAA* - Crankshaft (Big End Bearing) Crankpin Diameter

- NOTE: For vehicles built up to 2002 MY.
- NOTE: If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crankpin at the front of the engine is grade A and at the rear is also grade A.

- Grade A = 56,000 to 55,994 mm (Bearing Shell Color Code - Blue).
- Grade B = 55,994 to 55,988 mm (Bearing Shell Color Code - Green).
- Grade C = 55,988 to 55,982 mm (Bearing Shell Color Code - Yellow).

3. NOTE: Example - *ABAA* - Crankshaft (Big End Bearing) Crankpin Diameter

- NOTE: For vehicles built from 2002 MY.

- **NOTE: If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.**

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crankpin at the front of the engine is grade A and at the rear is also grade A.

- Grade A = 53,000 to 52,994 mm (Bearing Shell Color Code - Blue).
- Grade B = 52,994 to 52,988 mm (Bearing Shell Color Code - Green).
- Grade C = 52,988 to 52,982 mm (Bearing Shell Color Code - Yellow).

4. NOTE: Example - *21222122* - Cylinder Bore and Piston

The cylinder bore grades read from LEFT to RIGHT as follows:

- Bank 2 - Cylinder 1, Bank 2 - Cylinder 2, Bank 2 - Cylinder 3, Bank 2 - Cylinder 4, Bank 1 - Cylinder 4,
- Bank 1 - Cylinder 3, Bank 1 - Cylinder 2, Bank 1 - Cylinder 1.
- **(Note, in earlier publications Bank 1 was described as A-Bank and Bank 2 as B-Bank)**
- Grade 1 Bore = 85,990 to 86,000 mm.
- Grade 2 Bore = 86,000 to 86,010 mm.
- Grade 3 Bore = 86,010 to 86,020 mm.

5. NOTE: Example - *WPPNN* - Crankshaft Main Bearing Bore in Cylinder Block

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crank journal bore at the front of the engine is grade W, and at the rear is grade N.

- The selection of main bearing shells is described in the following **JOURNAL DIAMETER AND MAIN BEARING BORE CHART**.

6. JOURNAL DIAMETER AND MAIN BEARING BORE CHART

E94075

7. NOTE: THIS PROCEDURE SHOULD ONLY BE CARRIED OUT WHEN REPLACING MAIN BEARING SHELLS.

• NOTE: Refer to the **JOURNAL DIAMETER AND MAIN BEARING BORE CHART** in step 6 for tolerance and bearing information.

The number in each diagonal band represents a PAIR of color coded main bearing shells which must be used with a specific journal, depending on the combination of journal diameter and crankshaft bore diameter. The color codes for each band are as follows:

1. **Blue / Green and Blue / Green**
2. **Blue / Green and Blue**
3. **Blue and Blue**
4. **Blue and Green**
5. **Green and Green**
6. **Green and Yellow**
7. **Yellow and Yellow**

- Consider crankshaft journal 5 (from the example grade markings on the cylinder block) - the cylinder block bore is Grade N and the crankshaft journal diameter is Grade L.

From the chart, it will be seen that the point of intersection is in Band 4 which equates to one Blue shell and one Green shell.

- When the appropriate pair of color codes have been selected for a journal, either color may be installed to the cylinder block or to the bedplate, but, the shell which is to be installed to the cylinder block must have an oil groove and the shell which is to be installed to the bedplate must be plain.

8. NOTE: THIS PROCEDURE SHOULD ONLY BE CARRIED OUT WHEN A REPLACEMENT CRANKSHAFT OR CYLINDER BLOCK HAS BEEN FITTED.

- NOTE: Refer to the **JOURNAL DIAMETER AND MAIN BEARING BORE CHART** in step 6 for tolerance and bearing information.

The thickness grade of all main bearing shells are to be selected to give a total running clearance of not less than 0.022 mm or greater than 0.040 mm.

- Each bearing bore in the block/bedplate assembly should be measured at two mutually perpendicular diameters 45° to the vertical in the middle of the bearing.
- The minimum diameter of the two is to be used.
- Each crankshaft main bearing journal should be measured dynamically at a point in line with the middle of each bearing.
- When the appropriate pair of color codes have been selected for a journal, either color may be installed to the cylinder block or to the bedplate, but, the shell which is to be installed to the cylinder block must have an oil groove and the shell which is to be installed to the bedplate must be plain.

Engine System - General Information - Cylinder Bore Out-of-Round

General Procedures

1. NOTE: The main bearing caps or lower crankcase must be in place and tightened to the specified torque; however, the bearing shells should not be installed.

Measure the cylinder bore with an internal micrometer.

- Carry out the measurements in different directions and at different heights to determine if there is any out-of-roundness or tapering.
- If the measurement is out of the specified range, hone out the cylinder bore or install a new block.

VUJ0002234

Engine System - General Information - Cylinder Head Distortion

General Procedures

VUJ0001701

1. Measure the cylinder block/cylinder head distortion.

- Using the special tool, measure the mating face distortion.
- If the value is not to specification rework the mating face.

Engine System - General Information - Exhaust Manifold Cleaning and Inspection

General Procedures

1. Inspect the cylinder head joining flanges of the exhaust manifold for evidence of exhaust gas leaks.
2. Inspect the exhaust manifold for cracks, damaged gasket surfaces, or other damage that would make it unfit for further use.

Engine System - General Information - Piston Inspection

General Procedures

VUJ0002233

1.  CAUTION: Do not use any aggressive cleaning fluid or a wire brush to clean the piston.

Carry out a visual inspection.

- Clean the piston skirt, pin bush, ring grooves and crown and check for wear or cracks.
- If there are signs of wear on the piston skirt, check whether the connecting rod is twisted or bent.

Engine System - General Information - Piston Pin Diameter

General Procedures

VUJ0002225

1. NOTE: The piston and piston pin are a matched pair. Do not mix up the components.

Measure the piston pin diameter.

- Measure the diameter in two directions.
- If the values are not to specification, install a new piston and a new piston pin.

Engine System - General Information - Piston Pin to Bore Diameter

General Procedures

VUJ0002232

1. NOTE: The piston and piston pin form a matched pair. Do not mix up the components.

Measure the diameter of the piston pin bore.

- Measure the diameter in two directions.
- If the values are not to specification, install both a new piston and a new piston pin.

Engine System - General Information - Piston Ring End Gap

General Procedures

1.  CAUTION: Do not mix up the piston rings. Install the piston rings in the same position and location.

Using the Feeler Gauge, measure the piston ring gap.

- The values given in the specification refer to a gauge ring used during production.

Engine System - General Information - Piston Ring-to-Groove Clearance

General Procedures

1. NOTE: The piston ring must protrude from the piston groove. To determine the piston ring clearance, insert the Feeler Gauge right to the back of the groove, behind the wear ridge.

Using the Feeler Gauge, measure the piston ring clearance.

Engine System - General Information - Valve Spring Free Length

General Procedures

1. Using a vernier gauge, measure the free length of each valve spring. Verify the length is within specification.

VUJ0002221

Engine System - General Information - Valve Stem Diameter

General Procedures

1. Using a micrometer measure the diameter of the valve stems.

- If the measurements are not to specification, install a new valve.

VUJ0002220

Engine System - General Information - Leakage Test Using Smoke Test Equipment

General Procedures

CAUTION: The compressed air line supply pressure must be between 3.5 and 12 bar (50 and 175 psi) for the smoke test equipment to function correctly. Do not exceed this pressure. Failure to follow this instruction may result in damage to the smoke test equipment.

- **NOTE:** The vehicle battery must be in good condition and fully charged before carrying out this procedure.
- **NOTE:** On vehicles with 3.0L TDV6, it will be necessary to insert smoke at both air cleaner outlet pipes independently if the right hand turbocharger and associated hoses are to be tested.
- **NOTE:** In some cases it may be necessary to remove undertrays, trim or engine covers to obtain access to all potential leak locations.
- **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.
- **NOTE:** For further information regarding operation of the test equipment refer to the manufacturers operators manual supplied with the kit.

E136308

1. WARNING: Use an additional support to prevent the hood from falling if the smoke test equipment is secured to the hood. Failure to follow this instruction may result in personal injury.

Install the smoke test equipment to a suitable location under the hood.

2. Connect a suitable compressed air line to the smoke test equipment.
3. Connect the smoke test equipment positive power cable to the battery positive terminal.

4. WARNING: Do not connect the smoke test equipment negative cable to the battery negative terminal.

Connect the smoke test equipment negative cable to a suitable body ground point.

5. NOTE: A flashing green light indicates low battery voltage. In this case, place the battery on charge and make sure that the battery is fully charged before using the smoke test equipment.

Observe the power indicator lamp on the smoke test equipment. Make sure that a continuous green light is displayed.

6. NOTE: In some cases it may be necessary to remove the air cleaner(s) to allow access to the air cleaner outlet pipes.

- NOTE: In some cases it will be necessary to cap one of the air cleaner outlet pipes. Use the blanking caps supplied in the kit to cap the open orifice.

Disconnect the air cleaner outlet pipe(s).

7. NOTE: Make sure the smoke test equipment adapter is a good fit to the air cleaner outlet pipe. This must be an air tight seal.

Connect the smoke test equipment supply hose to the air cleaner outlet pipe.

1. Install the appropriate adapter to the air cleaner outlet pipe.
2. Connect the smoke test equipment supply hose to the adapter link hose.

E136311

8. NOTE: The flow control valve must be in the fully open position.

• NOTE: Smoke is produced for 5 minutes. The smoke test equipment will automatically switch off after this period of time.

Switch the smoke test equipment on.

E136312

9. Remove the oil filler cap, and observe until a constant flow of smoke is visible leaving the oil filler orifice. Install the oil filler cap.

10. NOTE: The longer smoke is allowed to exit from a leak, the more fluorescent dye will be deposited at a leak location.

Using the torch supplied in the kit set to white light, look for escaping smoke. Alternatively, use the ultraviolet light to look for fluorescent dye deposits at the source of a leak.

Engine System - General Information - Cylinder Head Gasket Selection TDV6

3.0L Diesel

General Procedures

Special Tool(s)

Check

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  CAUTION: Make sure that the surface is clean and free of foreign material.

Zero the gauge on the cylinder block machined face.

Special Tool(s): [303-979](#)

2.  CAUTION: Make sure that the surface is clean and free of foreign material.

- NOTE: Note the dial gauge readings.

Take 2 measurements on each piston crown.

3. Use the average piston protrusion measurement (taken from all

piston measurements), to select the correct thickness cylinder head gasket.

Refer to: [Specifications](#) (303-01B Engine - TDV6 3.0L Diesel, Specifications).

Engine - TDV6 2.7L Diesel -

Sealers

Description	Land Rover Part No.
Camshaft caps	8510302
'T' joints - ladder frame to engine block	STC 50550
Coolant plug - threaded	STC 50552
Oil pump upper middle retaining bolt	STC 50552

Lubricants

Description	Specification
Engine oil, SAE 5W-30	Use 5W/30 oil to specification WSS-M2C-913B meeting ACEA B1/B3

Note: WSS is a Ford prefix to the oil specification

Capacities

Engine Oil Capacity	Specification
Dry fill including filter for factory fitted engine	6.55 litres (11.5 pints) (6.9 US quarts)
Dry fill including filter for all new engines fitted in service	7.05 litres (12.4 pints) (7.4 US quarts)
Oil and filter change	5.54 litres (9.6 pints) (5.8 US quarts)
Amount of oil required to bring level from 'MIN' to 'MAX' mark on oil level indicator	1.5 litres (2.6 pints) (1.6 US quarts)

Dimensions

Item	Specification
Length	523 mm (20.59 in)
Width	717 mm (28.25 in)
Height	771 mm (30.35 in)

General Specifications

Item	Specification
Type	2.7 litre, 60 degree 'V', common rail direct injection, turbocharged and intercooled diesel, twin overhead camshafts, 4 valves per cylinder
Cylinder arrangement	V6, numbers 1 and 4 cylinders at front of engine when engine is viewed from rear
Cylinder numbering	Number 1 cylinder - right hand bank; Number 4 cylinder - left hand bank
Bore - nominal	81.0 mm (3.188 in)
Stroke	88.0 mm (3.464 in)
Capacity	2720 cm ³ (165.9 in ³)
Firing order	1 - 4 - 2 - 5 - 3 - 6
Compression ratio	17.3:1
Direction of rotation	Anti-clockwise viewed from rear of engine
Maximum power	147 kW (200 PS) (197 bhp) @ 4000 rev/min
Maximum torque	440 Nm (324 lb-ft) @ 1900 rev/min
Engine oil pressure:	
At idle	0.7 bar (70 kPa) (10 lb/in ²)
At 3500 rev/min	1.9 bar (190kPa) (27.5 lb/ft ²)
Maximum permissible cylinder head warp	
Total flame face	0.1 mm
150 mm x 150 mm square on flame face	0.05 mm
25 mm x 25 mm square on flame face	0.025 mm

² Do not apply lubricant to bolt threads

Engine - TDV6 2.7L Diesel - Engine

Description and Operation

External View

E44216

GENERAL

The TdV6 engine is a 2.7 litre, direct injection, six-cylinder diesel engine having two banks of three cylinders, arranged at 60 degrees to each other. There are 4 valves per cylinder, which are operated by two overhead camshafts per cylinder bank. The engine emission comply with ECD3 (European Commission Directive) legislative requirements and employs two catalytic converters, electronic engine management control, positive crankcase ventilation and exhaust gas recirculation to limit the emission of pollutants. The unit is water cooled and turbo-charged. The fuel injection system features common rail technology.

The cylinder block is manufactured in Compacted Graphite Iron (CGI) and is coupled with a separate aluminium ladder frame to provide a lightweight, compact and very stiff bottom end of the engine. The cylinder heads are cast aluminium with a moulded plastic camshaft cover. The single-piece oil sump is formed from stamped steel. The cast iron exhaust manifolds are unique for each cylinder bank and a moulded plastic acoustic cover is fitted over the upper engine to reduce engine-generated noise.

TECHNICAL FEATURES

The technical features include:

- 60 degree 'vee' 6 cylinder engine with a CGI cylinder block

- Plastic cylinder head cover
- Two light, high strength, aluminium cylinder heads
- 4-valve technology with centrally arranged fuel injectors
- Steel roller rockers with hydraulic lash adjusters
- Twin plenum intake system integrated with the camshaft cover
- Variable Geometry Turbocharger
- Common rail direct fuel injection system
- High pressure fuel pump
- Gallery cooled pistons with a central crown bowl
- Two electronically controlled Exhaust Gas Recirculation (EGR) valves
- Two EGR coolers
- Exhaust re-treatment by means of a diesel specific oxidation catalytic converter and primary catalytic converter
- Cooling fan with electro-viscous clutch drive.

ENGINE DATA

The technical data is detailed below:

DESCRIPTION	TYPE
Configuration	60 degree V6
Maximum power	147 kW at 4000 rpm
Maximum torque	440 Nm at 1900 rpm
Displacement	2720cc
Stroke/bore	81mm/88mm
Compression ratio	17.3:1
Firing order	1 4 2 5 3 6
Oil capacity	6.55 litres (initial fill) 5.45 litres (service fill, includes oil filter)
Engine weight (with oil)	235kg (Automatic) 260kg (Manual, inc. clutch plate and cover)

CYLINDER BLOCK COMPONENTS

Cylinder Block

The cylinders and crankcase are contained in the cylinder block, which is of single cast CGI construction with a hollow beam structure. With this type of construction less material is required than for a conventional cast iron block, therefore, reducing engine weight and length.

Piston Cooling Jets

E44219

Item	Part Number	Description
1	-	Bolt
2	-	Piston cooling jet

Jets located in the cylinder block provide piston and gudgeon pin lubrication and cooling. These jets spray oil on to the inside of the piston, the oil then flows through two internal wave shaped channels to help cool each piston crown.

Lubrication oil is distributed through the cylinder block, via the main oil gallery and channels bored in the block, to all critical moving parts. These channels divert oil to the main and big-end bearings via holes machined into the crankshaft.

A tapping at the rear RH side of the cylinder block, below the RH cylinder head, connects a pipe to the turbocharger by means of a banjo connection. Oil is supplied, under pressure, via this tapping, from the oil pump to provide lubrication for the turbocharger bearings.

Cylinder cooling is achieved by coolant circulating through chambers in the cylinder block casting.

Two hollow metal dowels are used to locate the cylinder heads to the cylinder block, one on each side at the rear of the unit.

A port is included at the rear LH side of the ladder frame, below the turbocharger, to connect the turbocharger oil return pipe to the sump.

A plug sealing the lubrication cross-drilling gallery is located at the front RH side of the cylinder block. Plugs for the main lubrication gallery are included at the front and rear of the cylinder block.

Engine Data Locations

E44217

Item	Part Number	Description
1	-	Engine data locations

Engine data is marked at two locations at the back of the cylinder block. Component diameters are represented by alphabetical and numerical codes; keys to the codes are in the Service Repair Procedures (SRP) Manual.

Connecting Rods and Pistons

E44220

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. The bearing caps are produced by fracturing the opposing sides of the connecting rod at the bearing horizontal centre-line. As well as being easier to manufacture, when reassembled the fractured surfaces interlock to form a strong seamless joint. The cylinder position is etched on adjoining sides of the joint to identify matching connecting rods and bearing caps. The selective connecting rod bearings are aluminium/tin split plain bearings. The connecting rod bearing is 'sputter coated', which is a manufacturing process that layers the bearing material to produce a higher load capacity for improved durability.

- NOTE: The connecting rods are not selective.

Connecting Rod Installation

E44221

Item	Part Number	Description
1	-	Piston and connecting rod assembly, cylinders 4-6
2	-	Piston and connecting rod assembly, cylinders 1-3
3	-	Bolts
4	-	Connecting rod bearing cap
5	-	Connecting rod lower bearing

When installing a connecting rod, ensure the back of the connecting rod faces the centre of the 'vee'.

The pistons are made from aluminium alloy and are fitted with three rings. The piston crown incorporates a pronounced bowl; this forms the combustion chamber, which promotes swirl and turbulence necessary for good combustion and improved emissions. In addition, the piston skirt has a molybdenum-coated surface, which counteracts scoring of the cylinder bore and piston.

The piston also incorporates a double wave gallery within the piston crown to enhance piston cooling. The pistons are supplied oil by means of spray jets located in the cylinder block oil gallery. These jets ensure optimum piston cooling to counteract the high temperatures generated by the combustion process.

Each piston is installed on a wrist pin located in a aluminium/tin bushing in the connecting rod.

Piston Installation

E44222

When installing pistons ensure the arrows on the piston crowns all point to the front of the engine and the pistons are located in the correct cylinder banks, i.e. cylinders 1, 2, 3 or cylinders 4, 5, 6.

- **NOTE:** All pistons are common single grade/single part number for all engines.

The piston top ring is a taper type and is fitted with the taper to the top of the piston. All rings marked 'top' are assembled with 'top' uppermost. All rings must be spaced evenly around the piston before installing. The circumference gap of the double bevelled oil control ring must be opposite the spiral control joint.

Crankshaft Position Sensor

The Crankshaft Position (CKP) sensor is located at the rear of the crankshaft, behind the flywheel in the LH side of the rear oil seal retainer. The sensor provides an input of engine crankshaft speed and position. The sensor works on the principle of the Hall effect and scans a trigger wheel (magnetic disc) on the crankshaft. An air gap of 0.4 to 1.5mm, between the trigger wheel and the CKP sensor, is achieved by the positional mounting of the sensor. For additional information, refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

Starter Motor

The engine starter motor is installed at the rear RH side of the ladder frame, at the cylinder block to ladder frame split line. For additional information, refer to: [Starting System](#) (303-06A Starting System - TDV6 2.7L Diesel, Description and Operation).

Coolant Drain Plug

Two coolant drain plugs are installed in the cylinder block, one is fitted in the rear RH side, and the other is fitted in the middle of the cylinder block on the LH side.

Cylinder Block Heater

On vehicles destined for cold climates, a cylinder block heater replaces a core plug in the middle of the cylinder block on the LH side.

Coolant Pump

E44224

Item	Part Number	Description
1	-	Bolts

2	-	Water pump
3	-	'O' ring seal

The coolant pump is installed on the LH side of the cylinder block front face and is secured and sealed via three bolts and an 'O' ring seal. The coolant pump is driven by a poly-vee belt via the crankshaft.

High-Pressure Fuel Pump

E44225

Item	Part Number	Description
1	-	Fuel pipe
2	-	Diverter rail assembly
3	-	Rear cover
4	-	Belt
5	-	Fuel pump pulley
6	-	Front cover

Crankshaft

The crankshaft is forged steel and fillet rolled with induction hardened journals, which run in four bearings with clamped two layer bearing shells.

The main bearing caps are double and cross-bolted, this adds to the strength and rigidity of the engine block.

The crankshaft drive pulley is not keyed onto the crankshaft; it is secured to the crankshaft by a single bolt.

- NOTE: Under no circumstances must the crankshaft pulley be tightened or loosened with the timing belt fitted.
- NOTE: Do not attempt to remove the crankshaft drive pulley unless you have the correct special crankshaft-locking tool.

E44227

Item	Part Number	Description
1	-	Housing
2	-	Seal
3	-	Crankshaft
4	-	Rear oil seal retainer
5	-	Bolt

The crankshaft rear oil seal is a press fit in the rear oil seal retainer. The rear oil seal retainer also houses the CKP sensor.

E44228

Item	Part Number	Description
1	-	CKP sensor trigger wheel

The trigger wheel is located on the rear of the crankshaft. It is pressed onto the crankshaft using a special tool, which also precisely aligns the trigger wheel for crankshaft position and timing. The trigger wheel consists of 60 magnets, minus 2 for ECM crankshaft position reference and synchronisation. The magnets cannot be seen on the trigger-wheel; therefore, it can only be positioned using the special tool.

The CKP sensor air gap is 0.4mm to 0.5mm there is no adjustment. The sensor bolts into the rear oil seal retainer and the tolerance on the retainer and sensor gives an air gap within the specified range.

• **NOTE:** If the trigger wheel is removed for any reason, a new trigger wheel must be fitted. Do not reuse the old trigger wheel.

Main Bearings

The main bearings are aluminium/tin split plain selective bearings. An oil groove in the top half of each bearing transfers oil into the crankshaft for lubrication of the connecting rod bearings. The upper and lower shells of bearing number four contain integral thrust washers, which limits the end float of the crankshaft.

Ladder Frame

E44229

Item	Part Number	Description
1	-	Ladder frame

The ladder frame is fitted to the lower cylinder block to stiffen the base structure thus helping to reduce Noise, Vibration and Harshness (NVH). The frame is made of high-pressure die cast aluminium and also incorporates an oil baffle plate to reduce oil foaming and slosh.

The ladder frame is secured to the cylinder block with 2 dowels, 2 locator pins for the gasket and 18 retaining bolts; three different lengths of bolts are used:

- M6 x 20, 6 of
- M8 x 75, 4 of
- M6 x 105, 8 of

Iron inserts, cast into the main bearing supports of the ladder frame, minimise main bearing clearance changes due to heat expansion.

A gasket seals the joint between the ladder frame and the cylinder block.

A port for the oil level gauge tube is included in the casting on the LH side of the ladder frame.

An oil pick-up pipe with integral strainer locates in the front of the ladder frame to provide oil to the crankshaft driven oil pump.

Sump

The sump consists of a pressed steel oil pan bolted to the aluminium alloy ladder frame with 14 M6 x 16 bolts. The engine oil drain plug and the oil temperature sensor are located at the rear left corner of the sump.

A reusable gasket seals the joint between the oil pan and the ladder frame; a bead of sealant seals the joint between the sump and the ladder frame.

Oil Temperature Sensor

The engine oil temperature sensor is located at the rear left corner of the sump. The sensor provides the ECM and the instrument pack with the engine oil temperature status.

The sensor circuit consists of an internal voltage divider circuit which, incorporates an Negative Temperature Coefficient (NTC) thermistor. As the engine oil temperature rises the resistance through the sensor decreases and visa versa. The output from the sensor is the change in voltage, as the thermistor allows more current to pass to earth relative to the temperature of the oil.

For additional information, refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

Rear Oil Seal Retainer

The crankshaft rear oil seal retainer is attached to the rear of the cylinder block by ten bolts and is sealed with a rubber seal. The retainer also houses the crankshaft position sensor.

Dual Mass Flywheel

On vehicles with manual transmission, the dual mass flywheel is bolted on the rear of the crankshaft with eight bolts. A dowel on the crankshaft flange ensures that the flywheel is correctly located. A ring gear is fitted on the outer diameter of the flywheel. The ring gear is not serviceable.

The dual mass flywheel is used to insulate the gearbox from torsional and transient vibrations produced by the engine. For additional information, refer to: [Clutch](#) (308-01 Clutch - TDV6 2.7L Diesel, Description and Operation).

CAMSHAFT TIMING COMPONENTS

E44232

Primary Drive

Primary drive is provided by a single toothed belt from the crankshaft to the exhaust camshaft gears of each cylinder bank via two idler pulleys and a tensioner.

Timing belt adjustment is carried out by an eccentric type tensioner mounted on the RH front face of the cylinder block.

Secondary Drive

E44233

Item	Part Number	Description
1	-	Timing chain
2	-	Bolts
3	-	Inlet camshaft
4	-	Exhaust camshaft
5	-	Tensioner firing pin

Secondary drive is provided by two short crossover chains, which transfer drive from the exhaust camshaft gears to the inlet camshaft gears. The crossover drives are located at the rear of the RH cylinder bank and the front of the LH cylinder bank. This allows for a much shorter and simpler run for the main camshaft drive belt at the front of the engine.

Each crossover chain is tensioned via an automatic chain tensioner, which acts directly on the chains via a guide rail. The tensioners are located between the exhaust and inlet camshafts at the front or rear of the cylinder head, depending on the cylinder bank.

Timing Cover

E44234

Item	Part Number	Description
A	-	Bolt (M6 x 32), 13 of
B	-	Bolt (M6 x 36), 2 of
C	-	Bolt (M6 x 30), 2 of

The plastic timing cover is bolted to the front of the cylinder block and cylinder heads with sixteen bolts and sealed with a rubber seal.

CYLINDER HEAD COMPONENTS

Cylinder Heads

E44236

The aluminium gravity die cast cylinder heads are unique to each cylinder bank. Eight deep-seated bolts, to reduce distortion, secure each cylinder head to the cylinder block. The cylinder head bolts are located beneath the camshafts, four under the inlet camshaft and four under the exhaust camshaft. Two hollow dowels align each cylinder head with the cylinder block.

- NOTE: The cylinder head bolts are not accessible with the camshafts fitted.
- NOTE: The cylinder head cannot be reworked.

The cylinder head has four ports machined at each cylinder location, two exhaust ports and two inlet ports. One of the inlet ports is helical and functions as a swirl port, the other is arranged laterally as a tangential port and functions as a charge port.

The six fuel injection nozzles are centrally mounted; one above each cylinder and each is fixed to the cylinder head by means of a clamp and two M6 x 35 bolts.

For additional information, refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation) / [Fuel Charging and Controls](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Description and Operation).

E44240

Item	Part Number	Description
1	-	Harness connector
2	-	Glow plugs

The glow plugs are arranged centrally on the inlet side of the cylinder head, between the two inlet ports of each cylinder. For additional information, refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

E44241

Item	Part Number	Description
1	-	Camshaft Position (CMP) sensor

The CMP sensor locates through a hole in a flange on the front LH side of the LH cylinder head. The exhaust camshaft gear of the LH cylinder head incorporates a trigger wheel, which is used in conjunction with the sensor to measure engine position.

For additional information, refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

The engine lifting eyes are bolted to the cylinder head, one at the front and two at the rear, one per cylinder head.

Camshaft Covers

E44237

Item	Part Number	Description
1	-	Stud bolt M6 x 40, 6 of
2	-	Bolt M6 x 40, 7 of
3	-	Oil filler aperture
4	-	RH camshaft cover assembly

The camshaft covers are manufactured from vinyl ester composite. The RH bank camshaft cover incorporates an outlet for the full load engine breather and the engine oil filler cap. The LH bank camshaft cover incorporates an outlet for the part load engine breather.

For additional information, refer to: [Engine Emission Control](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Description and Operation).

Silicon rubber in-groove gaskets seal the joints between the camshaft covers and the cylinder heads. Together with spacers and seals on the camshaft cover fasteners, they also isolate the covers from direct contact with the cylinder heads, to reduce noise.

Cylinder Head Gasket

The cylinder head gasket is a three-layer, laminated steel type and is available in five different thickness. The choice of gasket thickness is dependent on the maximum piston protrusion. Gasket thickness is identified by serrations cut into the front end of the gasket.

Gasket Selection Table

Piston Protrusion (mm)	Gasket Thickness (mm)	Identification
0.541 - 0.590	1.12	1
0.591 - 0.640	1.17	2
0.641 - 0.690	1.22	3
0.691 - 0.740	1.27	4

Piston Protrusion (mm)	Gasket Thickness (mm)	Identification
0.741 - 0.790	1.32	5

To calculate the correct cylinder head gasket thickness, each piston must be measured at two points, with an average of the two measurements taken to determine the piston protrusion. The highest of the three measurements will determine the gasket required for that particular cylinder head.

- NOTE: The difference between the maximum and minimum protrusion measurement in any one bank should not be greater than 0.1mm. It is permissible to have a different grade of gaskets between the LH and RH banks.

Camshafts

The camshafts are of a hollow steel tube construction, with pressed on sintered lobes. Each camshaft is retained by aluminium alloy caps, five for the exhaust camshafts and four for the inlet camshafts. Location letters, A to I for the intake camshaft and R to Z for the exhaust camshaft, are marked on the outer faces of the caps for each cylinder head.

The LH cylinder bank exhaust camshaft is machined to accept a rear camshaft gear. The rear camshaft gear provides drive for High Pressure (HP) fuel pump, located centrally at the rear of the 'vee', via a short-toothed belt and tensioner pulley.

The RH cylinder head exhaust camshaft is machined at the rear end to provide a drive connection for the vacuum pump.

- NOTE: The camshaft drive sprockets also form the thrust faces for the camshaft endfloat. In production the endfloat is 0.065mm to 0.185mm. In service, if the endfloat is out of specification, the camshaft(s) or cylinder head(s) may have to be replaced.

Camshaft Timing

Valve	Position
Inlet valve opens	8.5° BTDC
Inlet valve closes	35.5° ABDC
Exhaust valve opens	64° BBDC
Exhaust valve closes	12° ATDC

Inlet and Exhaust Valves

E44239

Item	Part Number	Description
1	-	Valve spring collets
2	-	Valve spring retainer
3	-	Valve spring
4	-	Valve stem seal
5	-	Inlet valve
6	-	Exhaust valve

Each cylinder head incorporates two overhead camshafts operating four valves per cylinder via steel roller rockers with hydraulic lash adjusters.

E44238

Item	Part Number	Description
1	-	Roller rocker
2	-	Hydraulic lash adjuster

The lightweight valve gear provides good economy and noise levels. Valve head diameters are 31mm (1.220 in) for the exhaust and 35mm (1.378 in) for the intake. All valves have 5mm (0.197 in) diameter stems supported in sintered metal seats and guide inserts. Collets, valve collars and spring seats locate single valve springs on both intake and exhaust valves. Valve stem seals are integrated into the spring seats.

Vacuum Pump

E44243

Item	Part Number	Description
1	-	Location dowels
2	-	Bracket
3	-	Vacuum pump
4	-	Bolt
5	-	Bolts
6	-	Nut
7	-	Bracket (transmission breather hose)
8	-	Stud

The vacuum pump is located at the rear of the RH side cylinder head and is driven from the exhaust camshaft.

Fuel Injectors

E44244

Item	Part Number	Description
1	-	Bolt, 2 per injector
2	-	Clamp
3	-	Injectors

The fuel injectors inject the quantity of fuel required for all the engine operating conditions into the combustion chambers. The quantity of fuel injected during each working cycle is composed of a noise-reducing pilot injection phase and a main injection phase.

The six, side fed, piezo electrically controlled fuel injectors are installed in the fuel rails. The start of fuel injection and the quantity of fuel injected is controlled directly by the ECM. Two O-rings seal each injector to the manifold interface. For additional information, refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation) / [Fuel Charging and Controls](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Description and Operation).

Water Outlet Assembly

Item	Part Number	Description
1	-	Bolt, 4 of
2	-	Water outlet assembly
3	-	Seals
A	-	Water outlet housing assembly, EGR outlet
B	-	Water outlet housing assembly, radiator outlet
C	-	Water outlet housing assembly, bleed valve

The water outlet assembly connects the cooling channels of the cylinder block to the cooling channels of the LH and RH cylinder heads and provides the coolant outlet for the EGR and coolant return.

LUBRICATION SYSTEM

General

Oil is drawn from the reservoir in the oil pan and pressurised by the oil pump. The output from the oil pump is then filtered and distributed through internal oil passageways.

All moving parts are lubricated by pressure or splash oil. Pressurised oil is also provided for operation of the hydraulic adjusters and the timing gear chain tensioners.

The engine is lubricated by a force-feed oil circulation system with a full flow oil filter. The oil cooler forms a unit with the oil filter and fuel cooler, which is mounted centrally in the middle of the cylinder block between the two banks of cylinders. The engine oil is cooled using the engine cooling system. This eliminates the need for an additional engine oil cooler remotely mounted.

The fuel cooler, which forms part of the oil filter body, is also cooled by engine coolant. In addition there is a further fuel cooler in the return line to the fuel tank.

The oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the quick return of the oil, reducing the volume of oil required and enabling an accurate check of the contents soon after the engine stops.

System replenishment is through the oil filler cap on the RH camshaft cover.

With the exception of the pump and level gauge, all oil system components are installed on the sump.

Oil Pick-up

The moulded composite oil pick-up is immersed in the oil reservoir to provide a supply to the oil pump during all normal vehicle attitudes. The castellated inlet allows the supply to be maintained even if the sump pan is deformed (e.g. by 'grounding'). A mesh screen in the inlet prevents debris from entering the oil system.

Oil Pump

E44230

Item	Part Number	Description
1	-	Oil pump
2	-	Bolt

The oil pump is a gear type pump and is bolted and dowelled to the front of the engine block. It is sealed by means of a rubber gasket, which is recessed into the oil pump housing. The pump inlet and outlet ports align with oil passages in the ladder frame.

The pumping element is an eccentric rotor, which is directly driven by flats on the crankshaft. An integral pressure relief valve regulates pump outlet pressure at 4.5 Bar (65.25 Psi).

The front crankshaft oil seal is housed in the oil pump casing and is fitted such that its front face is 1mm underflush with the machined front face of the oil pump.

- NOTE: The seal is not to be pushed all the way into the bore as this will block the seal drains.

Oil Filter

The oil filter is a replaceable cartridge installed on an adapter in the centre of the 'vee'. An internal bypass facility permits full flow bypass if the filter is blocked.

- NOTE: In service care must be taken when removing the oil filter to minimise oil drips and spillage into the engine 'vee' and cam covers:

- Do not use air/power tools
- Unscrew oil filter cap 4-5 turns
- Leave for a minimum of 1 minute to allow to drain
- Remove cap, ensuring minimal oil spillage
- Replace oil filter element into the cap (can only be fitted in one direction)
- Replace cap and torque to specification.

Oil Pressure Switch

E44247

Item	Part Number	Description
1	-	Oil pressure switch

The oil pressure switch, located in the 'vee' at the front of the LH cylinder head, connects a ground input to the instrument cluster when oil pressure is present. The switch operates at a pressure of 0.15 to 0.41 Bar (2.2 to 5.9 Psi).

Oil Level Gauge

The oil level gauge locates midway along the LH side of the oil pan, supported in a tube installed in the ladder frame. Two holes in the end of the gauge indicate the minimum and maximum oil levels. There is a difference of approximately 1 litre (1 US quart) between the two levels.

EXHAUST MANIFOLD

E44248

Item	Part Number	Description
1	-	LH exhaust manifold
2	-	RH exhaust manifold

The exhaust manifolds are cast from steel alloy and are unique for each cylinder bank. They are sealed to the cylinder head by means of a steel gasket. Sacrificial plastic sleeves are used to align the manifolds. These sleeves must be changed when refitting the manifolds. Spacers on the securing bolts allow the manifolds to expand and retract with changes of temperature while maintaining the clamping loads.

Each manifold has a connection for the EGR transfer pipe.

The engine is fitted with a Variable Geometry Turbocharger (VGT), which is fixed to the exhaust manifold by a three hole flange with a steel gasket.

Crossover Pipe

E44249

A crossover pipe carries the exhaust gasses from the RH exhaust manifold to the turbocharger on the LH exhaust manifold. The crossover pipe is located at the rear of the engine and is routed across the top of the transmissions bell housing.

Engine - TDV6 2.7L Diesel - Engine

Diagnosis and Testing

For additional information.

REFER to: [Engine - TDV6 2.7L Diesel](#) (303-00 Engine System - General Information, Diagnosis and Testing).

Engine - TDV6 2.7L Diesel - Engine Oil Draining and Filling

General Procedures

Special Tool(s)	
 <p>303-1128</p> <p>E54553</p>	<p>Oil filter element remover</p> <p>303-1128</p>

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

4.  **CAUTION:** When removing the oil filter assembly, make sure the fuel temperature sensor is not damaged.

Using the special tool, remove the oil filter element.

- Loosen the element cover 4 complete turns to allow engine oil to drain from the filter cover.
- Remove element cover.
- Remove and discard the O-ring seal.

5. Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

6. Remove the lubricant drain plug.

- Position a container to collect the fluid.
- Discard the oil pan drain plug seal.

7. Install the lubricant drain plug.

- Clean the component mating faces.
- Install a new sealing washer.
- Tighten the drain plug to 25 Nm (18 lb.ft).

8. Install the oil filter element.

- Clean the components.
- Make sure the oil filter element spigot aligns with the hole in the filter housing.
- Install a new O-ring seal.
- Tighten the element cover to 25 Nm (18 lb.ft).

9. Fill the engine with oil.

10. Install the engine undershield.

For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

11. Install the engine cover.

For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

12. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

13. Check and top-up the engine oil.

Engine - TDV6 2.7L Diesel - Camshaft RH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the camshaft front seal.
For additional information, refer to: [Camshaft Front Seal](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
3. Remove the brake vacuum pump.
For additional information, refer to: [Brake Vacuum Pump - TDV6 2.7L Diesel](#) (206-07 Power Brake Actuation, Removal and Installation).
4. Remove the RH valve cover.
For additional information, refer to: [Valve Cover RH](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
5. Retain the secondary timing chain tensioner piston.
 - Reposition the secondary timing chain tensioner.
 - Install a 1.5 mm (0.060 in.) diameter pin into the secondary timing chain tensioner piston.

E55065

6.  **CAUTION:** Evenly and progressively, release the camshaft bearing caps.

Remove the camshaft bearing caps.

- Remove the 18 retaining bolts.

E55059

7. Remove the camshafts and secondary timing chain tensioner assembly.

- Remove the two retaining bolts.
- Release the RH secondary timing chain tensioner.

E55061

8. Remove the secondary timing chain tensioner.

E55069

9. Remove the RH camshafts.

- Release the secondary timing chain from the RH camshafts.

E55070

Installation

1. Install the secondary timing chain onto the camshafts.

2.  **CAUTION:** Do not release the secondary timing chain tensioner locking pin until all of the camshaft bearing caps have been installed.

Install the secondary timing chain tensioner.

- Align the marks on the camshafts with the marks on the secondary timing chain.

E55062

3. Install the camshafts and secondary timing chain tensioner assembly.

- Lubricate the journals and camshaft lobes.

4. Attach the RH secondary timing chain tensioner.

- Tighten the two retaining bolts to 10 Nm (7 lb.ft).

E55063

5. Install the camshaft bearing caps.

- Do not install the two exhaust camshaft end bearing caps at this stage.
- Tighten the bolts evenly in three stages in the sequence shown.
- Stage one: Tighten to 1 Nm (1 lb.ft).
- Stage two: Tighten to 5 Nm (4 lb.ft).
- Stage three: Tighten to 10 Nm (7 lb.ft).

6. Apply sealant to the two exhaust camshaft end bearing caps at the positions shown.

For additional information, refer to: [Specifications](#) (303-01A Engine - TDV6 2.7L Diesel, Specifications).

E56492

7. Install the camshaft bearing caps.

- Tighten the bolts evenly in three stages in the sequence shown.
- Stage one: Tighten to 1 Nm (1 lb.ft).
- Stage two: Tighten to 5 Nm (4 lb.ft).
- Stage three: Tighten to 10 Nm (7 lb.ft).

E55064

8. Release the secondary timing chain tensioner piston.

- Remove the locking pin.

9. Install the RH valve cover.

For additional information, refer to: [Valve Cover RH](#) (303-01A

Engine - TDV6 2.7L Diesel, In-vehicle Repair).

10. Install the brake vacuum pump.

For additional information, refer to: [Brake Vacuum Pump - TDV6 2.7L Diesel](#) (206-07 Power Brake Actuation, Removal and Installation).

11. Install the camshaft front seal.

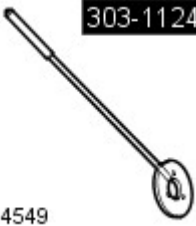

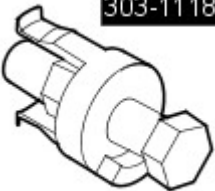

For additional information, refer to: [Camshaft Front Seal](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

12. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Camshaft Front Seal

In-vehicle Repair

Special Tool(s)	
 <p>303-1124</p> <p>E54549</p>	Holder - Camshaft Pulleys Front 303-1124
 <p>303-1119</p> <p>E54542</p>	Installer - Camshaft Oil Seal 303-1119
 <p>303-1118</p> <p>E54541</p>	Remover - Camshaft Oil Seal 303-1118
 <p>303-1126</p> <p>E54551</p>	Timing Pin - Camshaft Pulleys 303-1126

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Raise and support the vehicle.
3. Remove and discard the timing belt.
For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
4. Remove the special tool.
 - Stage one: Retain the camshaft pulley.
 - Stage two: Remove the special tool.

5. Remove the camshaft pulley.
- Remove the three retaining bolts.

E54321

6. Using the special tool, remove the camshaft pulley hub.
- Remove and discard the retaining bolt.

E54322

7. Install the special tool to the camshaft.

E55870

8.  CAUTION: Make sure the special tool is correctly seated behind the camshaft seal. Failure to follow this instruction may result in damage to the special tool.

Install the special tool into the camshaft front seal.

E55871

9. Install the special tool extracting bolt.

10. Install the special tool into the camshaft front seal.

11. Using the special tool, remove the camshaft front seal.

Installation

1. CAUTIONS:

 Make sure the seal is installed correctly.

 Do not use any lubricant on the camshaft front seal or the camshaft. Failure to follow this instruction may result in damage to the vehicle.

Using the special tool, install the camshaft front seal.

- Clean the component mating faces.
- Use the discarded camshaft pulley hub retaining bolt with the special tool.

2. Using the special tool, install the camshaft pulley hub.

- Install a new retaining bolt.
- Tighten the retaining bolt in two stages:
- Stage one: Tighten to 80 Nm (59 lb.ft).
- Stage two: Tighten a further 80 degrees.

3. Install the camshaft pulley.

- Install the bolts, but do not tighten fully at this stage.

4. Install the special tool.

- Stage one: Retain the camshaft pulley.
- Stage two: Install the special tool.

5. Install the new timing belt.

For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

6. Connect the battery ground cable.

For additional information, refer to: Specifications (414-00, Specifications).

Engine - TDV6 2.7L Diesel - Camshaft Rear Seal

In-vehicle Repair

Special Tool(s)	
 <p>303-1118 E54541</p>	Camshaft Seal Remover 303-1118
 <p>303-1119 E54542</p>	Camshaft Seal Installer 303-1119
 <p>303-1145/1 E60399</p>	Camshaft pulley holding tool 303-1145/1
 <p>303-1145/2 E60429</p>	Camshaft pulley bolt remover 303-1145/2
 <p>303-1145/3 E60430</p>	Camshaft pulley bolt socket 303-1145/3

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the fuel injection pump belt.
For additional information, refer to: [Fuel Injection Pump Belt - VIN Range: SALLA000304->END OF 06 MY](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

3. Install the special tool to the camshaft rear pulley.

- Rotate the crankshaft to align the special tool to the engine lifting bracket.
- Install the special tool retaining bolt.

4. Install the special tool to the camshaft rear pulley retaining bolt.

5. Using the special tools, remove and discard the camshaft rear pulley retaining bolt.

- Rotate the crankshaft clockwise to retain the camshaft rear pulley.

6. Remove the special tools.

7. Remove the camshaft rear pulley.

8. Install the special tool to the camshaft.

E55612

9.  CAUTION: Make sure the special tool is correctly seated behind the camshaft seal. Failure to follow this instruction may result in damage to the special tool.

E55613

Install the special tool into the camshaft rear seal.

10.  CAUTION: Make sure the special tool is correctly seated behind the camshaft seal. Failure to follow this instruction may result in damage to the special tool.

E55615

Install the special tool into the camshaft rear seal.

11. Using the special tool, remove and discard the camshaft rear seal.

E55616

Installation

1. Using the special tool, install the new camshaft rear seal.

2. Install the camshaft rear pulley.

- Install a new camshaft pulley retaining bolt.

3. Install the special tool to the camshaft rear pulley.

- Install the special tool retaining bolt.

4. Install the special tool to the camshaft rear pulley retaining bolt.

E37107

5.  **CAUTION:** Make sure the torque wrench setting procedure is followed correctly. Failure to follow this instruction may result in damage to the vehicle.

Calculate the setting for the torque wrench.

- Stage 1: Multiply the required torque by the effective length of the torque wrench (1).
- Stage 2: Add the effective length of the special tool (2) to the effective length of the torque wrench.
- Stage 3: Divide the total of stage 1 by the total of stage 2.
- Stage 4: Set the torque wrench to the figure arrived at in stage 3.

6.  **CAUTION:** Make sure the torque wrench setting procedure is followed correctly. Failure to follow this instruction may result in damage to the vehicle.

Using the special tools, tighten the camshaft rear pulley retaining bolt to 40 Nm (30 lb.ft).

7.  **CAUTION:** Make sure the torque wrench setting procedure is followed correctly. Failure to follow this instruction may result in damage to the vehicle.

- Rotate the crankshaft counter-clockwise to retain the camshaft rear pulley.
- Stage one: Tighten to 80 Nm (59 lb.ft).
- Stage two: Tighten a further 80 degrees.

8. Remove the special tools.

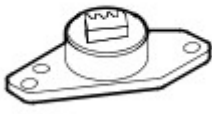

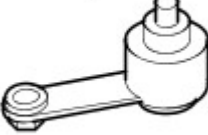

9.  **CAUTION:** Install a new fuel injection pump belt. Failure to follow this instruction may result in damage to the vehicle.

Install the fuel injection pump belt.
For additional information, refer to: [Fuel Injection Pump Belt - VIN Range: SALLA000304->END OF 06 MY](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

10. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

Engine - TDV6 2.7L Diesel - Crankshaft Front Seal

In-vehicle Repair

Special Tool(s)	
 <p>303-1123 E 54546</p>	Locking Tool - Flywheel 303-1123
 <p>303-1116 E 54539</p>	Timing Pin - Manual Transmission 303-1116

 <p>303-1122 E 54545</p>	Crankshaft Front Seal Sleeve 303-1122
 <p>303-1121 E 54544</p>	Crankshaft Front Seal Installer 303-1121

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove and discard the timing belt.
For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

Vehicles with automatic transmission

4. Remove the special tool.

Vehicles with manual transmission

5. Remove the special tool.

All vehicles

6. Install the special tool.

7. Loosen the crankshaft pulley retaining bolt.

8. Using a suitable tool, release the crankshaft pulley.

E54297

9. Remove the crankshaft pulley.

- Remove the crankshaft pulley retaining bolt.
- Discard the bolt.

E54298

10. Install the special tool to the crankshaft.

E54299

11. Using the special tool, remove the crankshaft front seal.

- Remove the special tool.
- Remove and discard the seal from the special tool.

Installation

All vehicles

E54300

1.  **CAUTION:** Do not use any lubricant on the crankshaft front seal, special tools or the crankshaft. Failure to follow this instruction may result in damage to the vehicle.

• **NOTE:** Make sure all component mating faces are clean.

Install a new crankshaft front seal to the special tool.

2. Reposition the crankshaft front seal along the special tool.

- Remove the sleeve from the special tool.

E54301

3. Install the special tool to the crankshaft.

E54302

4. Install the special tool to the crankshaft.

E54303

5.  CAUTION: Make sure the seal is installed correctly.

Using the special tool, install the crankshaft front seal.

- Use the discarded crankshaft bolt with the service tool.

E54304

6.  CAUTION: Make sure the seal is installed correctly.

Remove the special tool.

- Remove and discard the crankshaft pulley retaining bolt.

7. Install the crankshaft pulley.

- Install a new crankshaft pulley retaining bolt.
- Tighten the retaining bolt in two stages:
- Stage one: Tighten to 100 Nm (74 lb.ft).
- Stage two: Tighten a further 90 degrees.

8. Remove the special tool.

Vehicles with manual transmission

9. Install the special tool.

E54273

Vehicles with automatic transmission

10. Install the special tool.

E54272

All vehicles

11. Install the new timing belt.

For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

12. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Crankshaft Rear Seal with Retainer Plate

In-vehicle Repair

Removal

- NOTE: The crankshaft rear seal and retainer plate are supplied as an assembly and cannot be serviced separately.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the CKP sensor ring.
For additional information, refer to: [Crankshaft Position \(CKP\) Sensor Ring](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Removal and Installation).

4. Remove the crankshaft retainer plate.

- Remove the 14 bolts.

Installation

1. CAUTIONS:

Oil seals must be fitted dry.

Tighten the bolts securing the seal retainer to the cylinder block first.

Install the crankshaft retainer plate.

- Clean the component mating faces.
- Install the seal retainer with its protection sleeve onto the crankshaft.
- Locate the seal retainer onto the sump flange.
- Engage the seal retainer dowels with the cylinder block and lightly tighten 2 bolts on opposite sides of the retainer.
- Remove the seal protection sleeve.
- Install remaining bolts and tighten all bolts evenly to 10 Nm (7 lb.ft).

2. Install the CKP sensor ring to the crankshaft.
For additional information, refer to: [Crankshaft Position \(CKP\) Sensor Ring](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Cylinder Head LH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the LH bank camshafts.
3. Remove the LH exhaust manifold.
For additional information, refer to: [Exhaust Manifold LH](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
4. Disconnect the LH glow plug wiring harness electrical connector.

5. Remove the cylinder head coolant outlet connector.

6. Remove the hydraulic adjuster and rocker assemblies.

7. CAUTIONS:

-  Only use a plastic scraper to clean off the old gasket.
-  The cylinder head must not be placed mating face down. Failure to follow this instruction may result in damage to the vehicle.

Remove the LH cylinder head assembly.

- Remove and discard the eight cylinder head bolts.
- Remove and discard the cylinder head gasket.

Installation

1. Clean the component mating faces.
2. Check cylinder head face for distortion, across the center and from corner to corner.
3. **NOTE:** The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

Install a new cylinder head gasket.

4.  **CAUTION:** Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

- **NOTE:** Install a new cylinder head gasket.
- **NOTE:** The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.
- **NOTE:** Make sure the cylinder head is installed in its original position.
- **NOTE:** Tighten the retaining bolts in the indicated sequence in four stages.

Install the LH cylinder head assembly and install new cylinder head retaining bolts.

- Stage one: Tighten to 20 Nm (15 lb.ft).
- Stage two: Tighten to 40 Nm (30 lb.ft).
- Stage three: Tighten to 80 Nm (59 lb.ft).
- Stage four: Tighten a further 180 degrees.

5. Install the hydraulic adjuster and rocker assemblies.
6. Connect the LH glow plug wiring harness electrical connector.
7. **NOTE:** Install new O-ring seals.

Install the cylinder head coolant outlet connector.

- Install the four retaining bolts and tighten to 10 Nm (7 lb.ft).

8. Install the LH exhaust manifold.
For additional information, refer to: [Exhaust Manifold LH](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
9. Install the LH bank camshafts.
10. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Cylinder Head RH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the RH exhaust manifold.
For additional information, refer to: [Exhaust Manifold RH](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
3. Remove the RH camshafts.
4.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Release the engine breather tube.
 - Remove the retaining bolt.

E55043

6. Release the coolant bleed hose.
 - Release the retaining clip.

E54675

7. Remove the cylinder head coolant elbow.
 - Release the two retaining clips and disconnect the hoses.
 - Remove the four retaining bolts.
 - Remove and discard the O-ring seals.

E54674

8. Remove the hydraulic adjuster and rocker assemblies.

9. CAUTIONS:

The cylinder head must not be placed mating face down. Failure to follow this instruction may result in damage to the vehicle.

Only use a plastic scraper to clean off the old gasket.

Remove the RH cylinder head assembly.

- Remove and discard the eight cylinder head bolts.
- Remove and discard the cylinder head gasket.

Installation

1. Clean the component mating faces.
2. Check cylinder head face for distortion, across the center and from corner to corner.
For additional information, refer to: [Specifications](#) (303-01A Engine - TDV6 2.7L Diesel, Specifications).

CAUTION: The head gasket must be installed over the cylinder block dowels.

Install a new cylinder head gasket.

4. **NOTE:** Tighten the retaining bolts in the indicated sequence in four stages.

Install the RH cylinder head assembly

- Install new cylinder head retaining bolts.
- Tighten the bolts evenly in four stages to the sequence shown.
- Stage one: Tighten to 20 Nm (15 lb.ft).
- Stage two: Tighten to 40 Nm (30 lb.ft).
- Stage three: Tighten to 80 Nm (59 lb.ft).
- Stage four: Tighten a further 180 degrees.

5. Install the hydraulic adjuster and rocker assemblies.

6. Install the cylinder head coolant outlet elbow.

- Install new O-ring seals.
- Install the four retaining bolts and tighten to 10 Nm (7 lb.ft).
- Connect the hoses and secure with the clips.

7. Secure the coolant bleed hose.
8. Secure the engine breather tube.
 - Tighten the bolt to 10 Nm (7 lb.ft).
9. Install the RH camshafts.
10. Install the RH exhaust manifold.
For additional information, refer to: [Exhaust Manifold RH](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
11. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Valve Cover LH

In-vehicle Repair

Removal

• WARNINGS:

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the intake air shutoff throttle.
For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).
3. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).
4. Remove the accessory drive belt idler pulley.
 - Remove the retaining bolt.

E54284

5. Release the knock sensor (KS) harness from the valve cover.

6. Disconnect the KS electrical connector.

7. Release the glow plug harness from the valve cover.

8. Disconnect the engine oil pressure (EOP) sensor electrical connector.

9. Disconnect the valve cover breather hose.

10. Remove the fuel injector.
For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).
11. Remove the 2 remaining fuel injectors.

12. Release the high-pressure fuel supply line.

- Remove the retaining bolt.

13.  CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Remove and discard the high-pressure fuel supply line.

- Install blanking caps to the exposed ports.

14. Remove the fuel injection supply manifold.

- Remove the two retaining bolts.

15. Remove the fuel injection supply manifold securing bracket.

- Release the dipstick tube.
- Remove the three retaining bolts.

16. Remove the engine cover locating studs.

17. Release the timing belt cover.

- Reposition the timing cover to access the two front valve cover retaining bolts.
- Fully loosen the seven timing belt cover retaining bolts shown.

18. Remove the LH valve cover.

- Loosen the 13 valve cover retaining bolts.

Installation

1. Install the LH valve cover.

- Tighten the 13 retaining bolts to 10 Nm (7 lb.ft).

2. Attach the timing belt cover.

- Tighten the seven retaining bolts to 10 Nm (7 lb.ft).

3. Install the engine cover locating studs.

4. Install the fuel injection supply manifold securing bracket.

- Install the two retaining bolts.
- Tighten the bolts to 23 Nm (17 lb.ft).
- Secure the dipstick tube.

5. Install the fuel injection supply manifold.

- Install the two bolts, but do not fully tighten at this stage.

6. Install a new high-pressure fuel supply line.

- Remove the blanking caps from the ports.
- Install the new high-pressure fuel supply line, but do not tighten unions at this stage.
- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Tighten the fuel injection supply line unions in the sequence shown in four stages:
 - Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
 - Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 15 Nm (11 lb.ft).

- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 30 Nm (22 lb.ft).

7. Secure the high-pressure fuel supply line.

- Tighten the retaining bolt to 10 Nm (7 lb.ft).

8. Install the fuel injector.

For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

9. Install the 2 remaining fuel injectors.

10. Connect the valve cover breather hose.

11. Connect the EOP sensor electrical connector.

12. Connect the KS electrical connector.

13. Attach the glow plug harness and KS harness to the valve cover.

14. Install the accessory drive belt idler pulley.

- Install the retaining bolt and tighten to 47 Nm (35 lb.ft).

15. Install the accessory drive belt.

For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

16. Install the intake air shutoff throttle.

For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

17. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Valve Cover RH

In-vehicle Repair

Removal

• WARNINGS:

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the intake air shutoff throttle.
For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).
3. Release the glow plug harness from the valve cover.

4. Release the knock sensor (KS) harness from the valve cover.

5. Disconnect the KS electrical connector.

6. Disconnect the valve cover breather hose.

7. Remove the fuel injector.
For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).
8. Remove the remaining fuel injectors.
9. Release the high-pressure fuel supply line.
 - Remove the retaining bolt.

10.  **CAUTION:** Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Remove and discard the high-pressure fuel supply line.

- Install blanking caps to the exposed ports.

11. Remove the fuel injection supply manifold.

- Remove the two retaining bolts.

12. Detach the fuel lines.

13. Remove the fuel line securing bracket.

- Remove the retaining bolt.

14. Remove the fuel injection supply manifold securing bracket.

- Remove the two retaining bolts.

15. Remove the engine cover locating studs.

16. Remove the RH valve cover.

- Fully loosen the 14 valve cover retaining bolts.

Installation

1. Install the RH valve cover.
 - Tighten the 14 retaining bolts to 10 Nm (7 lb.ft).
2. Install the engine cover locating studs.
3. Install the fuel injection supply manifold securing bracket.
 - Install the two retaining bolts.
 - Tighten the bolts to 23 Nm (17 lb.ft).
4. Install the fuel line retaining bracket.
 - Tighten to 10 Nm (7 lb.ft).
5. Attach the fuel lines to the retaining bracket.
6. Install the fuel injection supply manifold.
 - Install the two bolts, but do not fully tighten at this stage.

7. Install a new high-pressure fuel supply line.

- Remove the blanking caps from the ports.
- Loosely install the new high-pressure fuel supply line.
- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Tighten the fuel injection supply line unions in the sequence shown in four stages:
 - Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
 - Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 15 Nm (11 lb.ft).
 - Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).
 - Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 30 Nm (22 lb.ft).

8. Secure the high-pressure fuel supply line.

- Tighten the bolt to 10 Nm (7 lb.ft).

9. Install the fuel injector.

For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

10. Install the remaining fuel injectors.

11. Connect the valve cover breather hose.

12. Connect the KS electrical connector.

13. Attach the glow plug harness and KS harness to the valve cover.

14. Install the intake air shutoff throttle.

For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

15. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Engine Mount LH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the turbocharger.
For additional information, refer to: [Turbocharger](#) (303-04B Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Removal and Installation).

3.  **CAUTION:** Protect the engine during this operation.

Support the engine.

- Raise the engine clear of its LH mount.

4. Remove the engine mount.

- Remove the retaining nut.
- Raise the engine clear of its LH mount.
- Remove and discard the two retaining bolts.

Installation

1. Install the engine mount.
 - Clean the component mating faces.
 - Install new retaining bolts.
 - Tighten the bolts to 45 Nm (33 lb.ft), then a further 60 degrees.
2.  **CAUTION:** Protect the engine during this operation.
Lower the engine onto its mount.
3. Install the engine mount retaining nut.
 - Tighten the nut to 90 Nm (66 lb.ft).
4. Install the turbocharger.
For additional information, refer to: [Turbocharger](#) (303-04B Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Removal and Installation).
5. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Camshafts LH

In-vehicle Repair

Special Tool(s)	
 <p>303-1145/1 E60399</p>	Camshaft pulley holding tool 303-1145/1
 <p>303-1145/2 E60429</p>	Camshaft pulley bolt remover 303-1145/2
 <p>303-1145/3 E60430</p>	Camshaft pulley bolt socket 303-1145/3
 <p>303-1119 E54542</p>	Installer - Camshaft Oil Seal 303-1119

Materials

Name	Specification
Loctite 242	ESK-M4G247-A1

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the camshaft front seal.
For additional information, refer to: [Camshaft Front Seal](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
3. Remove the LH valve cover.
For additional information, refer to: [Valve Cover LH](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
4. Remove the fuel injection pump belt.
For additional information, refer to: [Fuel Injection Pump Belt - VIN Range: SALLA000304->END OF 06 MY](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).
5. Install the special tool to the camshaft rear pulley.
 - Rotate the crankshaft to align the special tool to the engine lifting bracket.
 - Install the special tool retaining bolt.

6. Install the special tool to the camshaft rear pulley retaining bolt.

7. Using the special tools, remove and discard the camshaft rear pulley retaining bolt.

- Rotate the crankshaft clockwise to retain the camshaft rear pulley.

8. Remove the special tools.

9. Remove the camshaft rear pulley.

10. Remove the fuel injection pump belt rear cover.

- Remove the fuel injection pump belt rear cover retaining bolt.

11. Retain the secondary timing chain tensioner piston.

- Reposition the secondary timing chain tensioner.
- Install a 1.5 mm (0.060 in.) diameter pin into the secondary timing chain tensioner piston.

E55065

12.  **CAUTION:** Evenly and progressively, release the camshaft bearing caps.

Remove the camshaft bearing caps.

- Remove the 18 retaining bolts.

E61467

13. Remove the camshafts and secondary timing chain tensioner assembly.

- Remove the two retaining bolts.
- Release the LH secondary timing chain tensioner.

E61468

14. Remove the secondary timing chain tensioner.

E55069

15. Remove the LH camshafts.

- Release the secondary timing chain from the LH camshafts.
- Remove and discard the LH camshaft rear seal.

E55070

Installation

1. Install the secondary timing chain onto the camshafts.

2.  **CAUTION:** Do not release the secondary timing chain tensioner locking pin until all of the camshaft bearing caps have been installed.

Install the secondary timing chain tensioner.

- Align the marks on the camshafts with the marks on the secondary timing chain.

E55062

3. Install the camshafts and secondary timing chain tensioner assembly.

- Lubricate the journals and camshaft lobes.

4. Attach the LH secondary timing chain tensioner.

- Tighten the two retaining bolts to 10 Nm (7 lb.ft).

5. Install the camshaft bearing caps.

- Do not install the two exhaust camshaft end bearing caps at this stage.

- Tighten the bolts evenly in three stages in the sequence shown.

- Stage one: Tighten to 1 Nm (1 lb.ft).

- Stage two: Tighten to 5 Nm (4 lb.ft).

- Stage three: Tighten to 10 Nm (7 lb.ft).

E61469

6. Apply sealant to the two exhaust camshaft end bearing caps at the positions shown. For additional information, refer to: [Specifications](#) (303-01A Engine - TDV6 2.7L Diesel, Specifications).

E55072

7. Install the exhaust camshaft end bearing caps.

- Tighten the bolts evenly in three stages in the sequence shown.
- Stage one: Tighten to 1 Nm (1 lb.ft).
- Stage two: Tighten to 5 Nm (4 lb.ft).
- Stage three: Tighten to 10 Nm (7 lb.ft).

E61470

8. Release the secondary timing chain tensioner piston.

- Remove the locking pin.

9. Install the fuel injection pump belt rear cover.

- Install the fuel injection pump belt rear cover retaining bolt.

10. Using the special tool, install the new camshaft rear seal.

E55617

11. Install the camshaft rear pulley.

- Apply loctite 242 to the new camshaft pulley bolt.
- Install a new camshaft pulley retaining bolt.

E55611

12. Install the special tool to the camshaft rear pulley.

- Install the special tool retaining bolt.

E55610

13. Install the special tool to the camshaft rear pulley retaining bolt.

E60401

E37107

14.  **CAUTION:** Make sure the torque wrench setting procedure is followed correctly. Failure to follow this instruction may result in damage to the vehicle.

Calculate the setting for the torque wrench.

- Stage 1: Multiply the required torque by the effective length of the torque wrench (1).
- Stage 2: Add the effective length of the special tool (2) to the effective length of the torque wrench.
- Stage 3: Divide the total of stage 1 by the total of stage 2.
- Stage 4: Set the torque wrench to the figure arrived at in stage 3.

15.  **CAUTION:** Make sure the torque wrench setting procedure is followed correctly. Failure to follow this instruction may result in damage to the vehicle.

Using the special tools, tighten the camshaft rear pulley retaining bolt to 40 Nm (30 lb.ft).

16.  **CAUTION:** Make sure the torque wrench setting procedure is followed correctly. Failure to follow this instruction may result in damage to the vehicle.

Using the special tools, tighten the camshaft rear pulley bolt a further 75 Nm (56 lb.ft).

- Rotate the crankshaft counter-clockwise to retain the camshaft rear pulley.

17. Remove the special tools.

18. Install the fuel injection pump belt.

For additional information, refer to: [Fuel Injection Pump Belt - VIN Range: SALLA000304->END OF 06 MY](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

19. Install the LH valve cover.

For additional information, refer to: [Valve Cover LH](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

20. Install the camshaft front seal.

For additional information, refer to: [Camshaft Front Seal](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

21. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Engine Mount RH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the generator.
For additional information, refer to: [Generator](#) (414-02A Generator and Regulator - TDV6 2.7L Diesel, Removal and Installation).

4. Disconnect the ground cable.
 - Remove the ground cable retaining bolt.

5. Remove the engine mount bracket.
 - Remove the nut.

6.  **CAUTION:** Protect the engine during this operation.

Detach the engine mounting bracket.

- Support the engine.
- Remove the four retaining bolts.

7. Remove the engine mount.

- Remove and discard the two retaining bolts.

Installation

1. Install the engine mount.

- Clean the component mating faces.
- Install new retaining bolts.
- Tighten the two new bolts to 45 Nm (33 lb.ft), then a further 60 degrees.

2. Install the engine mount bracket.

- Clean the component mating faces.
- Tighten the four retaining bolts to 80 Nm (59 lb.ft).

3. Attach the engine mounting bracket.

- Lower the engine onto its mount.
- Tighten the nut to 90 Nm (66 lb.ft).

4. Connect the ground cable.

- Install the retaining bolt.

5. Install the generator.

For additional information, refer to: [Generator](#) (414-02A Generator and Regulator - TDV6 2.7L Diesel, Removal and Installation).

6. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Flywheel

In-vehicle Repair

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the pressure plate and clutch disc.
For additional information, refer to: [Clutch Disc and Pressure Plate](#) (308-01 Clutch - TDV6 2.7L Diesel, Removal and Installation).

3. **NOTE:** Prevent the flywheel from rotating.

Remove the flywheel.

- Remove the 8 Torx bolts.

Installation

1.  **CAUTION:** Tighten the bolts in a diagonal sequence.
- **NOTE:** Prevent the flywheel from rotating.

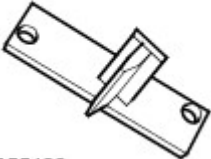

Install the flywheel.

- Clean the component mating faces.
- Tighten the retaining bolts in three stages.
- Tighten the Torx bolts to 45 Nm (33 lb.ft).
- Tighten the Torx bolts by 45 degrees.
- Tighten the Torx bolts by a further 45 degrees.

2. Install the clutch disc and pressure plate.
For additional information, refer to: [Clutch Disc and Pressure Plate](#) (308-01 Clutch - TDV6 2.7L Diesel, Removal and Installation).

Engine - TDV6 2.7L Diesel - Flexplate

In-vehicle Repair

Special Tool(s)	
 <p>303-947</p> <p>E55482</p>	<p>Flex plate locking tool (LRT-12-145)</p> <p>303-947</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the transmission.
For additional information, refer to: [Transmission](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, Removal and Installation).
4. Remove the torque converter flexplate.

- Using the special tool, lock the flexplate.
- Remove the 8 Torx bolts.

Installation

1.  **CAUTION:** Tighten the bolts in a diagonal sequence.

Install the torque converter flexplate.

- Clean the component mating faces.
- Using the special tool, lock the flexplate.
- Tighten the Torx bolts progressively in 3 stages.
- Tighten the Torx bolts to 50 Nm (37 lb.ft).
- Tighten the Torx bolts by 45 degrees.
- Tighten the Torx bolts by a further 45 degrees.

2. Install the transmission.
For additional information, refer to: [Transmission](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information,

Specifications).

Engine - TDV6 2.7L Diesel - Oil Pump

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the generator.
For additional information, refer to: [Generator](#) (414-02A Generator and Regulator - TDV6 2.7L Diesel, Removal and Installation).
3. Remove the accessory drive belt tensioner.
 - Remove the LH retaining bolt.

E54926

4. Remove the oil pan extension.
5. Remove the crankshaft front oil seal.
For additional information, refer to: [Crankshaft Front Seal](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
6. Remove the generator mounting bracket.
 - Remove the five retaining bolts.

E54914

7. Remove the timing belt idler pulley.
 - Remove the LH retaining bolt.

E54915

8.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

9. Release the battery positive cable.

- Remove the two retaining bolts.

10. Remove the oil pump lower retaining bolts.

- Remove the four retaining bolts.

11. Remove the oil pump.

- Remove the ten retaining bolts.
- Remove the timing belt cover sealing strips.
- Remove and discard the gasket.

Installation

1. Prime the oil pump.

- Fill the orifice shown with 20 ml of engine oil.
- Rotate the oil pump drive 2 complete turns.

E123911

2. CAUTIONS:

 Make sure that the mating faces are clean and free of foreign material.

 Make sure the gasket is installed correctly.

Install the oil pump.

- Clean the component mating faces.
- Install a new gasket.
- Lightly tighten the bolts in the position shown.

E123913

3.  CAUTION: Make sure the base of the oil pump is aligned within 0.2 mm of the base of the engine block. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: Vehicles fitted with oil pumps without dowels.

Check the oil pump to engine block alignment.

E123912

4. Secure the oil pump.

- Tighten the bolts in the sequence shown to 10 Nm .

5. Install the oil pump lower retaining bolts.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).
6. Install the battery positive cable.
 - Tighten the two retaining bolts to 10 Nm (7 lb.ft).
 7. Install the timing belt idler pulley.
 - Tighten the bolt to 45 Nm (33 lb.ft).
 8. Install the crankshaft front oil seal.
For additional information, refer to: [Crankshaft Front Seal](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
 9. Install the oil pan extension.
 10. Install the generator mounting bracket.
 - Tighten the bolts to 22 Nm (16 lb.ft).
 11. Install the accessory drive belt tensioner.
 - Tighten the bolt to 45 Nm (33 lb.ft).
 12. Install the generator.
For additional information, refer to: [Generator](#) (414-02A Generator and Regulator - TDV6 2.7L Diesel, Removal and Installation).
 13. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Oil Pressure Switch

In-vehicle Repair

1. Refer to Engine Oil Pressure (EOP) Sensor.
For additional information, refer to: [Engine Oil Pressure \(EOP\) Sensor](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Removal and Installation).

Engine - TDV6 2.7L Diesel - Oil Cooler

In-vehicle Repair

Removal

• WARNINGS:

-  Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
-  Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.
-  Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
-  This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.
-  Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

-  Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.
-  Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
-  Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
3. Remove the crankcase vent oil separator.
For additional information, refer to: Crankcase Vent Oil Separator (303-08, Removal and Installation).
4. Release the coolant bleed hose from the LH exhaust gas recirculation (EGR) coolant inlet hose.
 - Release the retaining clip.

E54674

5. Remove the cylinder head coolant elbow.
 - Release the two retaining clips and disconnect the hoses.
 - Remove the four retaining bolts.
 - Remove and discard the O-ring seals.

E54530

6. Disconnect the knock sensors (KS) electrical connector.
 - Release the KS harness from the valve cover.

E54677

7. Remove the LH KS.
 - Remove the retaining bolt.

E54676

8. **NOTE:** Some fluid spillage is inevitable during this operation.

Remove the oil cooler.

- Remove the eight retaining bolts.
- Remove and discard the gasket.
- Remove and discard the O-ring seal.

Installation

1.  **CAUTION:** Make sure the gasket is installed correctly.

- **NOTE:** Make sure all component mating faces are clean.

Install the oil cooler.

- Install a new gasket.
- Install a new O-ring seal.
- Install the eight retaining bolts and tighten to 10 Nm (7 lb.ft).

2. Install the LH KS.

- Install the retaining bolt and tighten to 20 Nm (15 lb.ft).
- Connect the knock sensor electrical connector.
- Attach the KS harness to the valve cover.

3. Install the cylinder head coolant outlet elbow.

- Install new O-ring seals.
- Install the four retaining bolts and tighten to 10 Nm (7 lb.ft).
- Connect the hoses and secure with the clips.

4. Secure the coolant bleed hose to the EGR coolant inlet hose.

5. Install the crankcase vent oil separator.

For additional information, refer to: Crankcase Vent Oil Separator (303-08, Removal and Installation).

6. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

7. Refill and bleed the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

8. Check and top-up the engine oil.

Engine - TDV6 2.7L Diesel - Oil Pump Screen and Pickup Tube

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the oil pan.
For additional information, refer to: [Oil Pan](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
4. Remove the oil pump screen and pickup tube.

- Remove the bolt.
- Remove and discard both O-ring seals.
- Clean the seal contact area.

Installation

1. **NOTE:** Lubricate new seals with clean engine oil.

Install the oil pump screen and pickup tube.

- Clean the components.
- Install new O-ring seals.
- Tighten the bolt to 10 Nm (7 lb.ft).

2. Install the oil pan.
For additional information, refer to: [Oil Pan](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Oil Pan

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Drain the engine oil.
For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures).

5. Remove the oil temperature sensor.

- Disconnect the engine oil temperature sensor electrical connector.
- Remove and discard the O-ring seal.

6. Disconnect the engine wiring harness.

- Release the engine wiring harness from the retaining bracket.

7. Remove the oil pan.

- Remove the 14 oil pan bolts.
- Remove and discard the gasket.

Installation

1. Install the oil pan.

- Clean the component mating faces.
- Install a new gasket.
- Evenly and progressively tighten the bolts to 10 Nm (7 lb.ft).

2. Connect the engine wiring harness.

- Attach the engine wiring harness to the retaining bracket.
3. Install the oil temperature sensor.
 - Install a new O-ring seal.
 - Tighten the sensor to 10 Nm (7 lb.ft).
 - Connect the electrical connector.
 4. Fill the engine with oil.

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures).
 5. Install the engine cover.

For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornammentation, Removal and Installation).
 6. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Oil Pan Extension

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine compartment upper heat shield.
 - Remove the screw.

3. Reposition the injector sound proofing.

4. Release the oil level indicator and tube from the oil pan extension.
 - Remove the bolt.
 - Remove and discard the O-ring seal.

5.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

6. Remove the front wheels and tires.
7. Remove the front axle tube.
For additional information, refer to: [Axle Tube](#) (205-03 Front Drive Axle/Differential, In-vehicle Repair).
8. Remove the oil pan.
For additional information, refer to: [Oil Pan](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

9. Remove the starter motor.
For additional information, refer to: [Starter Motor](#) (303-06A Starting System - TDV6 2.7L Diesel, Removal and Installation).

10. Remove the oil strainer pick-up assembly.

- Remove the bolt.
- Remove and discard the O-ring seal.

11. Remove the 3 bolts from the battery to starter motor solenoid cable.

12. Remove the bolt from the accessory drive belt tensioner bracket.

13. Remove the lower bolt from the air conditioning (A/C) compressor.

E93944

14. Release the turbocharger oil return tube.

- Release the wiring harness clip.
- Remove the bolt.

E93942

15. Remove the turbocharger oil return tube.

- Remove the 2 bolts.
- Remove and discard the gasket.
- Remove and discard the O-ring seals.
- Install blanking caps to the exposed ports.

E94397

16. Remove the 2 bolts from the turbocharger support bracket.

E94398

17. Remove the 3 lower bolts from the transmission to the engine.

18. Remove the front axle crossmember.

- Remove the 4 bolts.

E94489

19. Using a transmission jack, support the front axle assembly.

20. Remove the front axle assembly front mounting bolt.

- Carefully lower the front axle assembly.

E94490

21. NOTE: Note the fitted position of the retaining bolts prior to removal.

Remove the oil pan extension.

- Remove the 18 bolts.
- Remove and discard the gasket.

E93945

Installation

1. NOTE: Make sure that all the component mating faces are clean.

• NOTE: It is important that the oil pan extension is bolted to the crankshaft main bearing carrier within twenty minutes of applying the sealant.

Apply an 8 mm bead of sealant to the cylinder block in the areas shown.

- Use WSS-M4G323-A4-RTV sealant.

E93678

2. Install the oil pan extension.

- Install a new gasket.
- Loosely install all oil pan extension retaining bolts.

3. Tighten the retaining bolts in the sequence shown.

1. Tighten bolts A to 10 Nm (7 lb.ft). Tighten bolts B to 4 Nm (2 lb.ft).
2. Tighten bolts A to 24 Nm (18 lb.ft). Tighten bolts B to 10 Nm (7 lb.ft).

E93962

4. Align and secure the front axle assembly.

- Tighten the M14 bolt to 105 Nm (77 lb.ft).

5. Install the front axle crossmember.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).

6. Install the 3 lower bolts from the transmission to the engine.

- Tighten the bolts to 45 Nm (33 lb.ft).

7. Install the 2 bolts to the turbocharger support bracket.

- Tighten the 2 bolts to 23 Nm (17 lb.ft).

8. NOTE: Make sure that all the component mating faces are clean.

- NOTE: Remove and discard the blanking caps.

Install the turbocharger oil return tube.

- Install new O-ring seals.
- Install a new gasket.
- Tighten the 2 bolts to 10 Nm (7 lb.ft).

9. Install the bolt to the turbocharger oil return tube.

- Secure the wiring harness to the turbocharger oil return tube.

10. Install the lower bolt to the A/C compressor.

- Tighten the bolt to 24 Nm (18 lb.ft).

11. Install the bolt to the accessory drive belt tensioner bracket.

- Tighten the new bolt to 24 Nm (18 lb.ft).

12. Secure the battery to starter motor solenoid cable.

- Tighten the M8 bolt to 22 Nm (16 lb.ft).
- Tighten the M6 bolts to 10 Nm (7 lb.ft).

13. NOTE: Make sure that all the component mating faces are clean.

Install the oil strainer pick-up assembly.

- Install a new O-ring seal.
- Tighten the bolt to 10 Nm (7 lb.ft).

14. Install the starter motor.

For additional information, refer to: [Starter Motor](#) (303-06A Starting System - TDV6 2.7L Diesel, Removal and Installation).

15. Install the oil pan.

For additional information, refer to: [Oil Pan](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

16. Install the front axle tube.

For additional information, refer to: [Axle Tube](#) (205-03 Front Drive Axle/Differential, In-vehicle Repair).

17. Install the front wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

18. NOTE: Make sure that all the component mating faces are clean.

Secure the oil level indicator and tube into the oil pan extension.

- Install a new O-ring seal.
- Install the bolt.

19. Reposition the injector sound proofing.

20. Install the engine compartment upper heat shield.

- Install the screw.

21. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Timing Belt Cover

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Release the intake air shutoff throttle elbow.
 - Remove the retaining bolt.

4. Release the intake air shutoff throttle elbow.
 - Release the retaining clip.
 - Disconnect the electrical connector.

5. Remove the intake air shutoff throttle elbow support bracket.
 - Remove the three retaining bolts.

6. Remove the fan cowl.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

7. Remove the crankshaft damper.

- Remove the six retaining bolts.

8.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

9. Drain the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

10. Disconnect the coolant hose from the cylinder head coolant outlet elbow.

- Release the coolant hose retaining clip.
- Reposition the coolant top hose.

11. Remove the accessory drive belt idler.

- Remove the retaining bolt.

12. NOTE: Right-hand shown, left-hand similar.

Release the exhaust gas recirculation (EGR) valve outlet tube clamps from the timing cover.

- Remove the retaining bolt.

13. Disconnect the right-hand EGR coolant inlet hose from the EGR cooler.

- Release the coolant hose retaining clip.

14. Position the EGR coolant hose aside for access.

15. Remove the coolant pump and accessory drive belt idler pulleys.

- Remove the six retaining bolts.

16. Remove the timing belt cover.

- Fully loosen the 16 timing belt cover retaining bolts.
- Release the 2 wiring harness clips.

Installation

1. Install the timing belt cover.

- Attach the 2 wiring harness clips.
 - Tighten the 16 timing belt cover retaining bolts to 10 Nm (7 lb.ft).
2. Install the coolant pump and accessory drive belt idler pulleys.
 - Tighten the six retaining bolts to 23 Nm (17 lb.ft).
 3. Connect the right-hand EGR coolant inlet hose to the EGR cooler.
 - Install the coolant hose retaining clip.
 4. Secure the EGR valve outlet tube clamps to the timing cover.
 - Install the two retaining bolts.
 5. Connect the coolant hose to the cylinder head coolant outlet elbow.
 - Install the retaining clip.
 6. Install the accessory drive belt idler.
 - Install the retaining bolt and tighten to 47 Nm (35 lb.ft).
 7. Install the crankshaft damper.
 - Tighten the six retaining bolts to 23 Nm (17 lb.ft).
 8. Install the fan cowl.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
 9. Install the intake air shutoff throttle elbow support bracket.
 - Install the three retaining bolts and tighten to 10 Nm (7 lb.ft).
 10. Secure the intake air shutoff throttle elbow.
 - Install the retaining clip.
 - Install the retaining bolt.
 - Connect the electrical connector.
 11. Install the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 12. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
 13. Refill and bleed the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

Engine - TDV6 2.7L Diesel - Timing Belt

In-vehicle Repair

Special Tool(s)	
 <p>303-1132</p> <p>E54557</p>	<p>Check Pin - Camshaft Pulleys</p> <p>303-1132</p>
 <p>303-1126</p> <p>E54551</p>	<p>Timing Pin - Camshaft Pulleys</p> <p>303-1126</p>
 <p>303-1117</p> <p>E54540</p>	<p>Timing Pin - Automatic Transmission</p> <p>303-1117</p>
 <p>303-1116</p> <p>E54539</p>	<p>Timing Pin - Manual Transmission</p> <p>303-1116</p>

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the timing belt cover.
For additional information, refer to: [Timing Belt Cover](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
4. Remove the starter motor.
For additional information, refer to: [Starter Motor](#) (303-06A Starting System - TDV6 2.7L Diesel, Removal and Installation).
5. Remove the crankshaft timing alignment grommet from the engine block.
6. Rotate the crankshaft clockwise to align the crankshaft alignment hole in the flywheel or flexplate with the block aperture.

7. Check the camshaft pulley alignment holes are correctly aligned. If the alignment holes are not aligned, rotate the crankshaft one full turn clockwise.

E56582

Vehicles with automatic transmission

8. Using the special tool, lock the flexplate.

- Install a starter motor bolt to retain the special tool.

E54272

Vehicles with manual transmission

9. Using the special tool, lock the flywheel.

- Install a starter motor bolt to retain the special tool.

E54273

10. Install the special tools to the exhaust camshaft pulleys.

E54274

E54627

11.  **CAUTION:** Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

Loosen the six exhaust camshaft pulley damper retaining bolts.

- Using a suitable tool, counterhold the camshaft pulley center retaining bolts.

E54276

12. Remove and discard the timing belt tensioner.

- Remove and discard the bolt.

E 54277

13. Remove and discard the timing belt.

Installation

All vehicles

1. Rotate both camshaft pulleys clockwise.

E 54278

2. Install a new timing belt tensioner.

- Install a new bolt, but do not fully tighten at this stage.

3.  CAUTION: Make sure the camshaft pulleys remain in the clockwise position.

Install the new timing belt.

- Starting at the crankshaft pulley, install the timing belt in a counter-clockwise direction, in the sequence shown.
- Stage one: Attach the timing belt to the crankshaft pulley.
- Stage two: Attach the timing belt to the idler pulley.
- Stage three: Attach the timing belt to the left-hand camshaft pulley.
- Stage four: Attach the timing belt to the idler pulley.
- Stage five: Attach the timing belt to the RH camshaft pulley.
- Stage six: Attach the timing belt to the timing belt tensioner.

E54280

4.  CAUTION: Make sure the timing belt tensioner window is aligned with the groove.

Tension the timing belt.

- Rotate the tensioner assembly counterclockwise.
- Tighten to 24 Nm (18 lb.ft).

E54281

5.  CAUTION: Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

Using a suitable tool, counterhold the camshaft pulley center retaining bolts.

- Tighten the six exhaust camshaft pulley damper retaining bolts.
- Tighten the bolts to 23 Nm (17 lb.ft).

E54627

6. Remove the special tools from the camshaft pulleys.

E54274

Vehicles with manual transmission

7. Remove the special tool from the flywheel.

Vehicles with automatic transmission

8. Remove the special tool from the flexplate.

All vehicles

9. Rotate the engine two complete turns clockwise.

Vehicles with manual transmission

10. Using the special tool, lock the flywheel.

- Install a starter motor bolt to retain the special tool.

E54273

Vehicles with automatic transmission

11. Using the special tool, lock the flexplate.

- Install a starter motor bolt to retain the special tool.

E54272

12. Install the special tools to the exhaust camshaft pulleys.

- If the special tool does not fit correctly, repeat the timing belt installation procedure.
- Remove the special tools from the camshaft pulleys.

Vehicles with manual transmission

13. Remove the special tool from the flywheel.

- Install the grommet.

Vehicles with automatic transmission

14. Remove the special tool from the flexplate.

- Install the grommet.

All vehicles

15. Install the starter motor.

For additional information, refer to: [Starter Motor](#) (303-06A Starting System - TDV6 2.7L Diesel, Removal and Installation).

16. Install the timing belt cover.

For additional information, refer to: [Timing Belt Cover](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

17. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Exhaust Manifold LH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the turbocharger.
For additional information, refer to: [Turbocharger](#) (303-04B Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Removal and Installation).
3. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
4. Remove the battery tray.
For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
5. Remove the LH EGR valve outlet tube.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).
6. Disconnect the coolant outlet hose from the LH EGR valve.
 - Release the clip.

7. Release the LH EGR valve inlet tube.
 - Remove the two support bracket retaining bolts.
 - Remove the support bracket.
 - Remove and discard the retaining clip.

8. Remove the LH EGR valve inlet tube.

- Remove the two retaining bolts.
- Remove and discard the gasket.

E54523

9. Disconnect the LH EGR valve electrical connector.

E54522

10. Disconnect the coolant inlet hose from the LH EGR valve.

- Release the clip.

E54524

11. Remove the LH EGR valve.

- Remove the three retaining bolts.

E54936

12. Remove the LH exhaust manifold heat shield.

- Remove the two retaining bolts.

E54956

13. Remove the three exhaust cross-over pipe retaining nuts.

E54957

14. Remove the LH exhaust manifold.

- Remove the six retaining nuts.

E54958

15. Remove and discard the LH exhaust manifold gasket.

- Remove and discard the studs.

E54959

Installation

1. Tighten the LH exhaust manifold retaining studs to 13 Nm (10 lb.ft).

E56247

- Install a new gasket.

2. NOTE: Tighten the retaining nuts in the sequence shown.

Install the LH exhaust manifold.

- Tighten the nuts to 24 Nm (18 lb.ft).

3. Install the three exhaust cross-over pipe retaining nuts.

- Tighten the nuts to 24 Nm (18 lb.ft).

4. Install the LH exhaust manifold heat shield.

- Install the two retaining bolts and tighten to 10 Nm (7 lb.ft).

5. Install the LH EGR valve.

- Install the three EGR valve retaining bolts, but do not fully tighten at this stage.

6. NOTE: Do not fully close the retaining clip at this stage.

Install the LH EGR valve inlet tube.

- Install a new retaining clip.
- Install a new gasket.
- Loosely install the two EGR valve inlet tube retaining bolts.

7. Fully close the retaining clip.

8. Tighten the two EGR valve inlet tube retaining bolts to 10 Nm (7 lb.ft).

9. Tighten the three EGR valve retaining bolts to 10 Nm (7 lb.ft).

10. Install the support bracket.

- Tighten the two retaining bolts to 10 Nm (7 lb.ft).

11. Connect the coolant inlet hose to the LH EGR valve.

12. Connect the LH EGR valve electrical connector.

13. Connect the coolant outlet hose to the LH EGR valve.

14. Install the LH EGR valve outlet tube.

For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

15. Install the battery tray.

For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

16. Install the turbocharger.

For additional information, refer to: [Turbocharger](#) (303-04B Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Removal and Installation).

17. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

18. Refill and bleed the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

Engine - TDV6 2.7L Diesel - Exhaust Manifold RH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
4. Remove the auxiliary battery tray.
For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
5. Remove the RH exhaust gas recirculation (EGR) valve outlet tube.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).
6. Remove the fuel line bracket.
 - Release the fuel lines.
 - Remove the bolt.

7. Disconnect the EGR valve electrical connector.

8. Disconnect the coolant inlet hose from the EGR valve.

- Release the clip.

E54931

9. Disconnect the coolant outlet hose from the EGR valve.

- Remove the bolt.
- Release the clip.

E54932

10. Remove the EGR valve inlet tube.

- Release the clip.
- Remove the 2 bolts.
- Remove and discard the gasket.
- Remove and discard the clip.

E54933

11. Remove the RH front wheel and tire.

12. Remove the upper suspension arm and brake line heat shields for access.

E56537

13. Remove the RH EGR valve and cooler assembly.

- Remove the 3 bolts.

E54934

14. Remove the RH exhaust manifold heat shield.

- Remove the 3 bolts.

E55022

15. Remove the 2 exhaust cross-over pipe nuts.

E55024

16. Remove the remaining exhaust cross-over pipe nut.

E55025

17. Remove the RH exhaust manifold.

- Remove the 6 nuts.
- Remove and discard the gasket.
- Remove and discard the studs.

Installation

1. Tighten the exhaust manifold studs to 13 Nm (10 lb.ft).

- Install a new gasket.

2. **NOTE:** Tighten the retaining nuts in the sequence shown.

Install the RH exhaust manifold.

- Tighten the nuts to 24 Nm (18 lb.ft).

3. Tighten the exhaust cross-over pipe nut to 24 Nm (18 lb.ft).

4. Tighten the 2 exhaust cross-over pipe nuts to 24 Nm (18 lb.ft).

5. Install the RH exhaust manifold heat shield.

- Install the bolts and tighten to 10 Nm (7 lb.ft).

6. Install the RH EGR valve and cooler assembly.

- Install the EGR valve bolts, but do not fully tighten at this stage.

7. **NOTE:** Do not fully close the retaining clip at this stage.

Install the EGR valve inlet tube.

- Install a new gasket.
- Install a new clip.
- Loosely install the 2 EGR valve inlet tube bolts.

8. Fully close the clip.

9. Tighten the two EGR valve inlet tube bolts to 10 Nm (7 lb.ft).

10. Tighten the three EGR valve bolts to 10 Nm (7 lb.ft).

11. Install the upper suspension arm and brake line heat shields.

12. Install the wheel and tire.

13. Tighten the EGR valve bolt to 10 Nm (7 lb.ft).

14. Connect the coolant outlet hose to the EGR valve.

15. Connect the coolant inlet hose to the EGR valve.

16. Connect the EGR valve electrical connector.

17. Install the fuel line bracket.

- Install the fuel line retaining bracket bolt and tighten to 10 Nm (7 lb.ft).
- Secure the fuel lines.

18. Install the RH EGR valve outlet tube.

For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

19. Install the auxiliary battery tray.

For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

20. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

21. Fill and bleed the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

Engine - TDV6 2.7L Diesel - Oil Filter Housing

In-vehicle Repair

1. Refer to oil cooler.
For additional information, refer to: [Oil Cooler](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

Engine - TDV6 2.7L Diesel - Exhaust Manifold Crossover Pipe

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the transmission support crossmember.
For additional information, refer to: [Transmission Support Crossmember - V6 4.0L Petrol/TDV6 2.7L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).
4. Remove the exhaust system. For additional information, refer to: (309-00A Exhaust System - TDV6 2.7L Diesel)

[Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\)](#) (Removal and Installation),
[Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\)](#) (Removal and Installation).
5. Lower the rear of the transmission for access.
6. Remove the exhaust manifold crossover pipe LH support bracket.
 - Release the wiring harness.
 - Remove the 3 bolts.

7. Remove the exhaust manifold crossover pipe RH support bracket.
 - Remove the 3 bolts.

8. Remove the exhaust manifold crossover pipe center support bracket.

- Remove the 2 bolts.

9.  **CAUTION:** Take care when handling the crossover pipe as damage to the insulating material may occur.

Release the exhaust manifold crossover pipe from the turbocharger.

- Remove the turbocharger heat shield bolt.
- Remove and discard the 3 nuts.

10. Remove the RH exhaust manifold heat shield.

11. Remove the exhaust manifold crossover pipe.

- Remove and discard the 3 nuts.
- Remove and discard the 2 gaskets.

Installation

1. Install new exhaust manifold studs.
2. Install new turbocharger studs.

3.  **CAUTION:** Take care when handling the crossover pipe as damage to the insulating material may occur.

Install the exhaust manifold crossover pipe.

- Clean the component mating faces.
- Install new gaskets.
- Install new nuts.
- Tighten the 6 nuts to 24 Nm (18 lb. ft).

4. Install the exhaust manifold crossover pipe center support bracket.

- Loosely install the 2 bolts.

5. Install the exhaust manifold crossover pipe RH support bracket.

- Loosely install the 3 bolts.

6. Install the exhaust manifold crossover pipe LH support bracket.

- Loosely install the 3 bolts.

7. Tighten the exhaust manifold crossover pipe mounting bracket bolts in the following sequence.

- Tighten the 2 bolts marked 1 to 10 Nm (7 lb.ft).
- Loosen the 2 bolts by 90 degrees.
- Tighten the 2 bolts marked 3 to 10 Nm (7lb.ft).
- Loosen the 2 bolts by 90 degrees.
- Tighten the 4 bolts maked 2 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts maked 1 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts maked 3 to 25 Nm (18 lb. ft).
- Attach the wiring harness.

8. Install the RH exhaust manifold heat shield.

- Tighten the 3 bolts to 10 Nm (7 lb.ft).

9. Install the turbocharger heat shield.

- Tighten the bolt to 10 Nm (7 lb.ft).

10. Install the exhaust system. For additional information, refer to: (309-00A Exhaust System - TDV6 2.7L Diesel)

[Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\) \(Removal and Installation\)](#),
[Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\) \(Removal and Installation\)](#).

11. Install the transmission support crossmember.

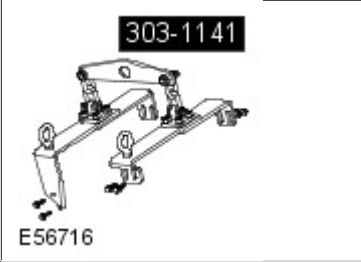

For additional information, refer to: [Transmission Support Crossmember - V6 4.0L Petrol/TDV6 2.7L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

12. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 2.7L Diesel - Engine Vehicles With: 6HP28 6-Speed Automatic Transmission/6HP26 6-Speed Automatic Transmission

Removal

Special Tool(s)	
	Engine lifting cradle 303-1141

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the wheels and tires.
4. Remove the body.
For additional information, refer to: [Body - TDV6 3.0L Diesel/TDV6 2.7L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).
5. Remove the cooling fan shroud.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
6. Remove the intake air shutoff throttle.
For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).
7. Remove the intake air shutoff throttle elbow support bracket.
 - Remove the 3 bolts.

E54283

E56395

8. Disconnect the upper coolant hose from the coolant distribution manifold.
 - Remove the clip.

9. Disconnect the RH exhaust gas recirculation (EGR) coolant hose.

- Release the clip.

10. Remove the accessory drive belt.

- Rotate the accessory drive belt tensioner counter-clockwise.

11. Remove the 2 LH upper suspension arm and brake line heat shields.

- Remove the 2 nuts.
- Remove the 3 bolts.

12. Disconnect the breather hose.

- Release the clip.

13. Release the charge air cooler inlet pipe.

- Remove the nut.
- Remove the 2 bolts.

14.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

Disconnect the air conditioning (A/C) compressor low-pressure line.

- Remove the bolt.
- Remove and discard the O-ring seal.

15. Disconnect the charge air cooler inlet hose.

- Loosen the clip.

16. Disconnect the charge air cooler inlet hose.

- Loosen the clip.

17. Disconnect the coolant lower hose.

- Release the clip.

E94146

18. Remove the power steering pump rear bolt.

E94147

19. Reposition the power steering pump.

- Remove the 3 bolts.

E91768

20. Remove the charge air cooler inlet pipe.

21.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

Disconnect the A/C compressor high-pressure pipe.

- Remove the bolt.
- Remove and discard the O-ring seal.

22. Reposition the lower coolant hose.

23. Remove the turbocharger intake tube.

- Loosen the clip.

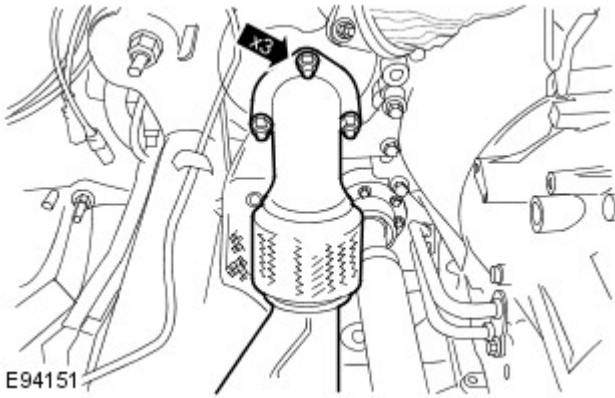

24. Release the transmission fluid lines.

- Remove the nut.

25. Release the battery positive cable.

- Release the clip.

26. Release the exhaust from the turbocharger.

- Remove and discard the 3 nuts.
- Remove and discard the gasket.

27. Remove the turbocharger support bracket.

- Remove the 2 bolts.
- Remove the nut.

28. Release the exhaust cross-over pipe bracket.

- Remove the 6 bolts.

29.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the 2 fuel lines.

30. Release the 2 fuel lines.

- Remove the bolt.
- Release from the 2 clips.

31. Release the transmission breather lines.

- Remove the bolt.

32. Release and reposition the fuel cooler.

- Remove the bolt.

33. Release the engine ground cable.

- Remove the bolt.

34. Remove the starter motor support bracket.

- Remove the 4 bolts.

35. Disconnect the 2 starter motor wiring harness connectors from the starter motor solenoid.

- Remove the rubber insulator.
- Remove the 2 nuts.

36. Remove the starter motor.

- Remove the 2 bolts.

37. Release the flexplate.

- Remove the access plug.
- Remove and discard the 4 bolts.

38. Remove the LH engine mount nut.

39. Remove the RH engine mount nut.

40. Install the special tool.

- Install and tighten the bolts.

41. Release the transmission from the engine.

- Remove the 14 bolts.

E61164

42. NOTE: Note the routing of the battery positive cable.

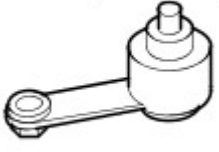

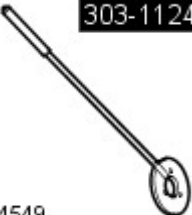

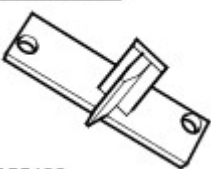

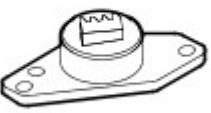

- NOTE: Note the routing of the transmission wiring harness.

With assistance, carefully remove the engine.

- Using a suitable hydraulic jack, support the transmission.
- Carefully guide the transmission wiring harness out as the engine is being removed.
- Carefully guide the battery positive cable out as the engine is being removed.

Engine - TDV6 2.7L Diesel - Engine

Disassembly

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Drain the engine oil.

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures).

4. Remove the engine.

For additional information, refer to: [Engine - Vehicles With: 6HP28 6-Speed Automatic Transmission/6HP26 6-Speed Automatic Transmission](#) (303-01A Engine - TDV6 2.7L Diesel, Removal) / [Engine - Vehicles With: Manual Transmission](#) (303-01 Engine - 2.7L Diesel, Removal).

5. Install the engine to a suitable engine stand.

6. Remove the power steering pump bracket.

- Remove the 3 bolts.

E96773

7. Remove the air conditioning (A/C) compressor.

- Disconnect the electrical connector.
- Remove the 3 bolts.

E96774

8. Remove the A/C compressor bracket.

- Remove the 2 bolts.

E96775

9. Remove the LH engine mount bracket.

- Remove the 4 bolts.

E96776

10.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the oil level indicator and tube.

- Release the wiring harness clip.
- Remove the bolt.
- Remove and discard the O-ring seal.

E96777

11. Remove the LH exhaust gas recirculation (EGR) valve and cooler assembly.

- Disconnect the electrical connector.
- Remove and discard the clip.
- Release the clip and disconnect the coolant hose.
- Remove the 5 bolts.
- Collect the bracket.

E96778

12. Remove the LH exhaust manifold heat shield.

- Remove the 2 bolts.

13. Remove the turbocharger heat shield.

- Remove the 2 bolts.

14.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

Remove the turbocharger oil return tube.

- Release the wiring harness clip.
- Remove the 3 bolts.
- Remove and discard the gasket.
- Remove and discard the O-ring seal.

15. Release the turbocharger support bracket.

- Remove the 4 bolts.

16.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

Disconnect the turbocharger oil supply tube.

- Remove the banjo bolt.
- Remove and discard the 2 sealing washers.

17. Release the exhaust cross-over pipe from the LH exhaust manifold.

- Remove and discard the 3 nuts.
- Remove and discard the gasket.

18. Remove the LH exhaust manifold and turbocharger assembly.

- Remove and discard the 6 nuts.
- Remove and discard the gasket.

19. Remove the cylinder block coolant inlet pipe.

- Remove the 2 bolts.
- Remove and discard the O-ring seal.

E96787

20. Remove the crankshaft position (CKP) sensor.

- Disconnect the electrical connector.
- Reposition the access cover.
- Remove the bolt.

E96788

21. Remove the RH EGR valve and cooler assembly.

- Disconnect the electrical connector.
- Remove and discard the clip.
- Release the clip and disconnect the coolant hose.
- Remove the 4 bolts.

E96789

22. Disconnect the generator electrical connectors.

- Reposition the rubber insulator.
- Remove the nut.

E96790

23. Remove the generator.

- Remove the 3 bolts.

24. Remove the RH exhaust manifold heat shield.

- Remove the 3 bolts.

25. Remove the RH engine mount bracket.

- Remove the 4 bolts.

26. Remove the generator bracket.

- Remove the 5 bolts.

27. Remove the RH exhaust manifold and exhaust cross-over pipe assembly.

- Remove and discard the 6 nuts.
- Remove and discard the gasket.

E96795

28. Remove the EGR valve coolant pipe.

- Remove the bolt.
- Disconnect the electrical connector.
- Release from the 2 clips.
- Release the clip.

E96796

29. Remove the coolant pump.

- Remove the 3 bolts.
- Remove and discard the O-ring seal.

E96797

30. Remove the accessory drive belt idler pulley.

- Remove the bolt.

E96798

31. Remove the cooling fan pulley.

- Remove the 3 bolts.

32. Remove the crankshaft pulley.

- Remove the 6 bolts.

33. Remove the timing belt cover.

- Fully loosen the 16 bolts.

34. NOTE: Note the fitted position.

Remove the 2 low pressure fuel pipes.

- Disconnect the 2 quick release connectors.

35. Disconnect the engine oil pressure (EOP) sensor electrical connector.

- Release the wiring harness clip.

36. NOTE: LH shown, RH is similar

Disconnect the 6 fuel injector electrical connectors.

- Release the 4 wiring harness clips.

37. Disconnect the camshaft position (CMP) sensor electrical connector.

- Release the wiring harness clip.

38. Disconnect the engine oil temperature sensor electrical connector.

- Release the wiring harness clip.

39. NOTE: LH shown, RH is similar.

Disconnect the 2 knock sensor (KS) electrical connectors.

40. Disconnect the fuel temperature sensor electrical connector.

E54697

41. Remove the crankcase vent oil separator.

- Disconnect and release the 2 breather hoses.

E96800

42. Disconnect the fuel rail pressure (FRP) sensor electrical connector.

E96801

43. Disconnect the 2 fuel injection pump electrical connectors.

E 96802

E96803

44. Remove the engine wiring harness.

- Remove the nut.
- Release the 2 clips.

Vehicles built up to 12/2006

E56427

45.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

- NOTE: RH shown, LH is similar

Remove and discard the 2 high-pressure fuel rail supply lines.

- Release the 2 clips.

E96804

46.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove and discard the high-pressure fuel diverter rail supply line.

Vehicles built 01/2007 onwards

E81856

47.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

- NOTE: LH shown, RH is similar

Remove and discard the 2 high-pressure fuel rail supply lines.

- Release the clip.

All vehicles

48. CAUTIONS:

 Make sure the high-pressure fuel supply line remains in contact with both the fuel injector and the fuel injection supply manifold until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

 Make sure that all openings are sealed. Use new blanking caps.

Remove and discard the 6 high-pressure fuel supply lines.

49. Disconnect the fuel return line from the fuel injectors.

- Remove and discard the 6 clips.

50. Remove the two fuel injector bolts.

51. Install the special tool studs.

52.  CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

Install the special tool remover legs to the studs.

53. Remove the fuel injector.

- Rotate the special tool bolts evenly, in a clockwise direction.
- Remove the special tool.
- Remove and discard the fuel injector clamp.
- Remove and discard the sealing washer.

54. Remove the remaining fuel injectors.

55. NOTE: LH shown, RH is similar.

Remove the 2 fuel rails.

- Remove the 4 bolts.

56. NOTE: RH shown, LH is similar

Remove the 2 fuel rail brackets.

- Remove the 4 bolts.

E54619

57. Remove the fuel injection pump belt cover.

- Release the 2 clips.

E96806

58. Remove and discard the fuel injection pump belt tensioner.

- Remove the bolt.

E82035

59. Remove and discard the fuel injection pump belt.

60. Install the special tool to the camshaft rear pulley.

- Rotate the crankshaft to align the special tool to the engine lifting bracket.
- Install and tighten the bolt.

E55610

61. NOTE: Discard the bolt.

Using the special tool, remove the camshaft rear pulley bolt.

62. Remove the special tool.

- Remove the bolt.

63. Remove the camshaft rear pulley.

64. Remove the fuel injection pump belt rear cover.

- Fully loosen the 2 bolts.

65. Remove the LH engine cover locating studs.

66. Remove the LH valve cover.

- Release the KS electrical connector from the valve cover.
- Fully loosen the 13 bolts.
- Remove the fuel line support bracket.
- Remove and discard the gasket.

67. Remove the RH engine cover locating studs.

- Remove the nut.
- Remove the bolt.
- Remove the bracket.

68. Remove the RH valve cover.

- Release the glow plug electrical connector from the valve cover.
- Release the KS electrical connector from the valve cover.
- Fully loosen the 13 bolts.
- Remove and discard the gasket.

69. Remove the brake vacuum pump.

- Remove the 3 bolts.
- Remove the bracket.
- Remove and discard the gasket.

70. Remove the breather line.

- Remove the bolt.
- Release the clip.

71. Remove the turbocharger oil supply line.

- Remove the bolt.
- Remove and discard the 2 O-ring seals.

72. Remove the cylinder head coolant outlet assembly.

- Remove the 4 bolts.
- Remove and discard the O-ring seal.

73.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

Disconnect the fuel pipe from the fuel cooler.

74.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

Remove and discard the fuel injector return line.

75. Rotate the crankshaft clockwise to align the crankshaft alignment hole in the flywheel or flexplate with the cylinder block aperture.

76. Check the camshaft pulley alignment holes are correctly aligned. If the alignment holes are not aligned, rotate the crankshaft one full turn clockwise.

Vehicles with automatic transmission

77. Using the special tool, lock the flexplate.

- Install a starter motor bolt to retain the special tool.

Vehicles with manual transmission

78. Using the special tool, lock the flywheel.

- Install a starter motor bolt to retain the special tool.

E54273

All vehicles

79.  CAUTION: Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

Loosen the 6 exhaust camshaft pulley bolts.

E54627

80. Remove and discard the timing belt tensioner.

- Remove the bolt.

E54276

81. Remove the 2 timing belt idler pulley's.

- Remove the 2 bolts.
- Collect the plastic shield from behind the upper idler pulley.

E96811

82. Remove and discard the timing belt.

83. NOTE: LH shown, RH is similar.

Remove the 2 camshaft pulleys.

- Remove the 6 bolts.

E54321

84. Using the special tool, remove the 2 camshaft pulley hubs.

- Remove and discard the 2 bolts.

E54322

85. Remove the cooling fan drive hub bearing.

- Remove the 3 bolts.

E96812

86. Retain the RH secondary timing chain tensioner piston.

- Reposition the secondary timing chain tensioner.
- Install a 1.5 mm (0.060 in.) diameter pin into the secondary timing chain tensioner piston.

E55065

87.  **CAUTION:** Evenly and progressively, release the camshaft bearing caps.

Remove the RH bank camshaft bearing caps.

- Remove the 18 bolts.

E55059

88. Remove the RH bank camshafts and secondary timing chain tensioner assembly.

- Remove the 2 bolts.
- Release the RH secondary timing chain tensioner.

E55061

89. Remove the RH bank secondary timing chain tensioner.

E55069

90. Remove the RH bank camshafts.

- Release the secondary timing chain from the RH camshafts.
- Remove and discard the seal.

E55070

91. CAUTIONS:

 The cylinder head must not be placed mating face down. Failure to follow this instruction may result in damage to the vehicle.

 Only use a plastic scraper to clean off the old gasket.

Remove the RH cylinder head assembly.

- Remove and discard the 8 bolts.
- Remove and discard the gasket.

E55042

92. Retain the LH secondary timing chain tensioner piston.

- Reposition the secondary timing chain tensioner.
- Install a 1.5 mm (0.060 in.) diameter pin into the secondary timing chain tensioner piston.

E55065

93.  CAUTION: Evenly and progressively, release the camshaft bearing caps.

Remove the LH bank camshaft bearing caps.

- Remove the 18 bolts.

E61467

94. Remove the LH bank camshafts and secondary timing chain tensioner assembly.

- Release the LH secondary timing chain tensioner.
- Remove the 2 bolts.

E61468

95. Remove the LH bank secondary timing chain tensioner.

E55069

96. Remove the LH bank camshafts.

- Release the secondary timing chain from the LH camshafts.
- Remove and discard the 2 seals.

E55070

97. CAUTIONS:

 The cylinder head must not be placed mating face down. Failure to follow this instruction may result in damage to the vehicle.

 Only use a plastic scraper to clean off the old gasket.

Remove the LH cylinder head assembly.

- Remove and discard the 8 bolts.
- Remove and discard the gasket.

E55637

Vehicles with automatic transmission

98. Remove the special tool from the flexplate.

E54272

99. Remove the flexplate.

- Using the special tool, lock the flexplate.
- Remove the 8 bolts.

Vehicles with manual transmission

100. Remove the special tool from the flexplate.

101. Install the special tool.

102.  CAUTION: Working in a diagonal sequence, progressively loosen the bolts.

- NOTE: Restrain the flywheel.

Remove the clutch disc and pressure plate.

- Remove the 6 bolts.

103. NOTE: Restrain the flywheel.

Remove the flywheel.

- Remove the 8 bolts.

104. Remove the special tool.

All vehicles

105. Remove the oil cooler assembly.

- Remove the 8 bolts.
- Remove and discard the gasket.

106. Remove the fuel injection pump.

- Remove the 4 bolts.

107. Remove the oil pan.

- Remove the 14 bolts.
- Remove and discard the gasket.

108. Remove the oil pump screen and pickup tube.

- Remove the bolt.
- Remove and discard the 2 O-ring seals.

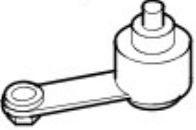

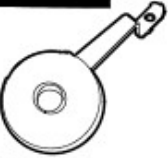

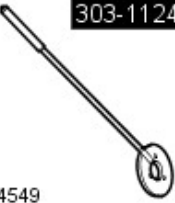

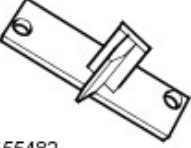

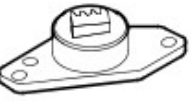

109. Remove the oil pan extension.

- Remove the 18 bolts.
- Remove and discard the gasket.

 <p>303-1126</p> <p>E54551</p>	Timing Pin - Camshaft Pulleys 303-1126

Assembly

All vehicles

1. NOTE: Clean the component mating faces.

• NOTE: It is important that the oil pan extension is bolted to the crankshaft main bearing carrier within twenty minutes of applying the sealant.

Apply an 8 mm bead of sealant to the cylinder block in the areas shown.

- Use WSS-M4G323-A4-RTV sealant.

E93678

2. NOTE: Clean the component mating faces.

Install the oil pan extension.

- Install a new gasket.
- Loosely install the bolts.

E93945

E93962

3.  CAUTION: Tighten the bolts in the indicated sequence in 2 stages.

Secure the oil pan extension.

1. Tighten bolts A to 10 Nm (7 lb.ft). Tighten bolts B to 4 Nm (2 lb.ft).
2. Tighten bolts A to 24 Nm (18 lb.ft). Tighten bolts B to 10 Nm (7 lb.ft).

4. NOTE: Lubricate the new seals with clean engine oil.

• NOTE: Clean the components.

Install the oil pump screen and pickup tube.

- Clean the components.
- Install new O-ring seals.
- Tighten the bolt to 10 Nm (7 lb.ft).

E54701

5. NOTE: Clean the component mating faces.

Install the oil pan.

- Install a new gasket.
- Evenly and progressively tighten the bolts to 10 Nm (7 lb.ft).

E54877

E96817

6. Install the fuel injection pump.

- Tighten the bolts to 23 Nm (17 lb.ft).

E96816

7.  CAUTION: Make sure the gasket is installed correctly.

- NOTE: Clean the component mating faces.

Install the oil cooler assembly.

- Install a new gasket.
- Install a new O-ring seal.
- Tighten the bolts to 10 Nm (7 lb.ft).

E96787

8. Install the crankshaft position (CKP) sensor.

- Tighten the bolt to 5 Nm (4 lb.ft).
- Connect the electrical connector.
- Reposition the access cover.

Vehicles with automatic transmission

9. CAUTIONS:

-  Tighten the bolts in a diagonal sequence.

-  Tighten the bolts in the stages shown.

- NOTE: Clean the component mating faces.

Install the flexplate.

- Using the special tool, lock the flexplate.
- Stage 1: Tighten the bolts to 50 Nm (37 lb.ft).
- Stage 2: Tighten the bolts 45 degrees.
- Stage 3: Tighten the bolts a further 45 degrees.
- Remove the special tool.

E61429

10. Using the special tool, lock the flexplate.

- Rotate the crankshaft clockwise to align the crankshaft alignment hole in the flywheel or flexplate with the cylinder block aperture.
- Install a starter motor bolt to retain the special tool.

Vehicles with manual transmission

11. Install the special tool.

12. CAUTIONS:

 Tighten the bolts in a diagonal sequence.

 Tighten the bolts in the stages shown.

• NOTE: Clean the component mating faces.

Install the flywheel.

- Stage 1: Tighten the bolts to 50 Nm (37 lb.ft).
- Stage 2: Tighten the bolts 45 degrees.
- Stage 3: Tighten the bolts a further 45 degrees.

13. CAUTIONS:

 Install the clutch disc with 'TRANSMISSION SIDE' marking against the clutch cover.

 Use the special tool to align the components.

 Working in a diagonal sequence, progressively tighten the bolts.

• NOTE: Clean the component mating faces.

Using the special tool, install the clutch disc and pressure plate.

- Tighten the bolts to 25 Nm (18 lb.ft).

14. Remove the special tool.

15. Using the special tool, lock the flywheel.

- Rotate the crankshaft clockwise to align the crankshaft alignment hole in the flywheel or flexplate with the cylinder block aperture.
- Install a starter motor bolt to retain the special tool.

All vehicles

16. Check the LH cylinder head face for distortion, across the center and from corner to corner.

17. NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

- NOTE: Clean the component mating faces.

Install a new LH cylinder head gasket.

18. CAUTIONS:

 Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

 Make sure that new bolts are installed.

• NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

• NOTE: Make sure the cylinder head is installed in its original position.

• NOTE: Tighten the bolts in the indicated sequence in 4 stages.

• NOTE: Clean the component mating face.

Install the LH cylinder head assembly.

- Stage 1: Tighten the bolts to 20 Nm (15 lb.ft).
- Stage 2: Tighten the bolts to 40 Nm (30 lb.ft).
- Stage 3: Tighten the bolts to 80 Nm (59 lb.ft).
- Stage 4: Tighten the bolts a further 180 degrees.

19. Check the RH cylinder head face for distortion, across the center and from corner to corner.

20. NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

- NOTE: Clean the component mating faces.

Install a new RH cylinder head gasket.

E55044

21. CAUTIONS:

 Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

 Make sure that new bolts are installed.

- NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.
- NOTE: Make sure the cylinder head is installed in its original position.
- NOTE: Tighten the bolts in the indicated sequence in four stages.

Install the RH cylinder head assembly.

- Stage 1: Tighten to 20 Nm (15 lb.ft).
- Stage 2: Tighten to 40 Nm (30 lb.ft).
- Stage 3: Tighten to 80 Nm (59 lb.ft).
- Stage 4: Tighten a further 180 degrees.

22. Install the secondary timing chain to the RH bank camshafts.

23.  **CAUTION:** Do not release the secondary timing chain tensioner locking pin until all of the camshaft bearing caps have been installed.

Install the RH bank secondary timing chain tensioner.

- Align the marks on the camshafts with the marks on the secondary timing chain.

E55062

24. NOTE: Clean the components.

- NOTE: Install a new seal.

Install the RH bank camshafts and secondary timing chain tensioner assembly.

- Lubricate the journals and camshaft lobes.

25. Secure the RH bank secondary timing chain tensioner.

- Tighten the bolts to 10 Nm (7 lb.ft).

E61468

26.  **CAUTION:** Tighten the bolts evenly in 3 stages in the sequence shown.

• **NOTE:** Do not install the two exhaust camshaft end bearing caps at this stage.

• **NOTE:** Clean the component mating faces.

Install the RH bank camshaft bearing caps.

- Stage 1: Tighten to 1 Nm (1 lb.ft).
- Stage 2: Tighten to 5 Nm (4 lb.ft).
- Stage 3: Tighten to 10 Nm (7 lb.ft).

27. Apply sealant to the RH exhaust camshaft end bearing cap at the positions shown.

E55064

28.  CAUTION: Tighten the bolts in the sequence shown.

• NOTE: Clean the component mating faces.

Install the RH bank exhaust camshaft end bearing caps.

- Stage 1: Tighten to 1 Nm (1 lb.ft).
- Stage 2: Tighten to 5 Nm (4 lb.ft).
- Stage 3: Tighten to 10 Nm (7 lb.ft).

E55065

29. Release the RH bank secondary timing chain tensioner piston.

- Remove the locking pin.

E55062

30. Install the secondary timing chain to the LH bank camshafts.

31.  CAUTION: Do not release the secondary timing chain tensioner locking pin until all of the camshaft bearing caps have been installed.

Install the LH bank secondary timing chain tensioner.

- Align the marks on the camshafts with the marks on the secondary timing chain.

32. NOTE: Clean the components.

• NOTE: Install new seals.

Install the LH bank camshafts and secondary timing chain tensioner assembly.

- Lubricate the journals and camshaft lobes.

33. Secure the LH bank secondary timing chain tensioner.

- Tighten the bolts to 10 Nm (7 lb.ft).

E61468

34.  **CAUTION:** Tighten the bolts evenly in 3 stages in the sequence shown.

• **NOTE:** Do not install the two exhaust camshaft end bearing caps at this stage.

• **NOTE:** Clean the component mating faces.

Install the LH bank camshaft bearing caps.

- Stage 1: Tighten to 1 Nm (1 lb.ft).
- Stage 2: Tighten to 5 Nm (4 lb.ft).
- Stage 3: Tighten to 10 Nm (7 lb.ft).

35. Apply sealant to the 2 LH exhaust camshaft end bearing caps at the positions shown.

36.  CAUTION: Tighten the bolts in the sequence shown.

• NOTE: Clean the component mating faces.

Install the LH bank exhaust camshaft end bearing caps.

- Stage 1: Tighten the bolt to 1 Nm (1 lb.ft).
- Stage 2: Tighten the bolt to 5 Nm (4 lb.ft).
- Stage 3: Tighten the bolt to 10 Nm (7 lb.ft).

37. Release the LH bank secondary timing chain tensioner piston.

- Remove the locking pin.

38. Install the fuel injection pump belt rear cover.

- Tighten the bolts to 10 Nm (7 lb.ft).

39. Install the camshaft rear pulley.

- Install a new camshaft pulley bolt.

40. Install the special tool to the camshaft rear pulley.

- Install and tighten the bolt.

41.  CAUTION: Tighten the bolts in the stages shown.

Secure the camshaft rear pulley.

- Stage 1: Tighten the bolt to 40 Nm (30 lb.ft).
- Stage 2: Tighten the bolt to 75 Nm (56 lb.ft).

42. Remove the special tools.

- Remove the bolt.

43.  CAUTION: Do not install the new fuel injection pump belt to the pulleys with the fuel pump belt tensioner installed. Failure to follow this instruction may result in damage to the fuel pump belt.

• NOTE: The fuel injection pump rotates in a counter-clockwise direction when viewed from the rear of the engine.

Install the new fuel injection pump belt.

44. CAUTIONS:

 Make sure that the fuel injection pump belt tensioner locking pin is not removed until the fuel injection pump belt tensioner is fully installed.

 Make sure that the fuel injection pump belt tensioner tang is correctly located to the fuel injection pump belt rear cover. Failure to follow this instruction may result in damage to the engine.

Install a new fuel injection pump belt tensioner.

- Locate the tang on the new fuel injection pump belt tensioner into the fuel injection pump rear cover.
- Tighten the bolt to 25 Nm (18 lb.ft).
- Remove and discard the fuel injection pump belt tensioner locking pin.

E82035

45. Install the fuel injection pump belt cover.

46. Install the cooling fan drive hub bearing.

- Tighten the bolts to 90 Nm (66 lb.ft).

47.  CAUTION: Make sure that new bolts are installed.

- NOTE: LH is shown, RH is similar.
- NOTE: Clean the component mating faces.

Using the special tool, install the 2 camshaft pulley hubs.

- Stage 1: Tighten to 80 Nm (59 lb.ft).
- Stage 2: Tighten a further 90 degrees.

48. Install the 2 exhaust camshaft pulleys.

- Install the bolts, but do not tighten fully at this stage.

49. Install the special tools.

- Rotate the camshafts.

E96811

50. Install the 2 timing belt idler pulleys.

- Install the plastic shield behind the upper idler pulley.
- Tighten the bolts to 45 Nm (33 lb.ft).

E54278

51. Rotate both camshaft pulleys clockwise.

E54276

52. Install a new timing belt tensioner.

- Install a new bolt, but do not fully tighten at this stage.

E54280

53.  **CAUTION:** Make sure the camshaft pulleys remain in the clockwise position.

Install the new timing belt.

- Starting at the crankshaft pulley, install the timing belt in a counter-clockwise direction, in the sequence shown.
- Stage 1: Attach the timing belt to the crankshaft pulley.
- Stage 2: Attach the timing belt to the idler pulley.
- Stage 3: Attach the timing belt to the left-hand camshaft pulley.
- Stage 4: Attach the timing belt to the idler pulley.
- Stage 5: Attach the timing belt to the RH camshaft pulley.
- Stage 6: Attach the timing belt to the timing belt tensioner.

E54281

54.  CAUTION: Make sure the timing belt tensioner window is aligned with the groove.

Tension the timing belt.

- Rotate the tensioner assembly counter-clockwise.
- Tighten the bolt to 24 Nm (18 lb.ft).

E54627

55.  CAUTION: Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

Secure the camshaft pulleys.

- Using a suitable tool, hold the camshaft pulley center bolts.
- Tighten the bolts to 23 Nm (17 lb.ft).

E54274

56. Remove the special tools.

Vehicles with automatic transmission

57. Remove the special tool.

- Remove the bolt.

E54272

Vehicles with manual transmission

58. Remove the special tool.

- Remove the bolt.

E54273

All vehicles

59. Rotate the engine two complete turns clockwise.

Vehicles with automatic transmission

60. Using the special tool, lock the flexplate.

- Install a starter motor bolt to retain the special tool.

E54272

Vehicles with manual transmission

61. Using the special tool, lock the flywheel.

- Install a starter motor bolt to retain the special tool.

E54273

All vehicles

62. Install the special tools to the exhaust camshaft pulleys.

- If the special tool does not fit correctly, repeat the timing belt installation procedure.
- Remove the special tools from the camshaft pulleys.

E54282

Vehicles with automatic transmission

63. Remove the special tool.

- Remove the bolt.

E54272

Vehicles with manual transmission

64. Remove the special tool.

- Remove the bolt.

E54273

All vehicles

65. NOTE: Remove and discard the blanking caps.

Install a new fuel injector return line.

E96810

66. NOTE: Remove and discard the blanking caps.

Connect the fuel pipe to the fuel cooler.

E96809

67. NOTE: Install new O-ring seals.

- NOTE: Clean the component mating faces.

Install the cylinder head coolant outlet assembly.

- Tighten the bolts to 10 Nm (7 lb.ft).

68. NOTE: Install new O-ring seals.

Install the turbocharger oil supply line.

- Tighten the bolts to 10 Nm (7 lb.ft).

69. Install the breather line.

- Secure the clip.
- Tighten the bolt to 10 Nm (7 lb.ft).

70. NOTE: Clean the component mating faces.

- NOTE: Install a new gasket.

Install the brake vacuum pump.

- Install the bracket.
- Tighten the bolts to 23 Nm (17 lb.ft).

71. NOTE: Clean the component mating faces.

- **NOTE:** Install a new gasket.

Install the RH valve cover.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure the glow plug electrical connector in the valve cover.
- Secure the knock sensor (KS) electrical connector in the valve cover.

72. Install the RH engine cover locating studs.

- Install the bracket.
- Tighten the nut to 10 Nm (7 lb.ft).
- Tighten the bolt to 10 Nm (7 lb.ft).

73. NOTE: Clean the component mating faces.

- **NOTE:** Install anew gasket.

Install the LH valve cover.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure the KS electrical connector in the valve cover.

74. Install the LH engine cover locating studs.

E54619

75. Install the fuel rail brackets.

- Tighten the bolts to 23 Nm (17 lb.ft).

E96805

76. Install the fuel rails.

- Install the bolts, but do not tighten fully at this stage.

Vehicles built up to 12/2007

77. NOTE: Remove and discard the blanking caps.

Install the new RH fuel rail high-pressure supply line.

- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel rail to 30 Nm (22 lb.ft).
- Secure the clip.

78. NOTE: Remove and discard the blanking caps.

Install the new LH fuel rail high-pressure supply line.

- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel rail to 15 Nm (11 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel rail to 30 Nm (22 lb.ft).
- Secure the clip.

E96804

79. NOTE: Remove and discard the blanking caps.

Install the new fuel diverter rail high-pressure supply line.

- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection pump to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection pump to 30 Nm (22 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).

Vehicles built 01/2007 onwards

80. NOTE: Remove and discard the blanking caps.

Install the new RH fuel rail high-pressure supply line.

- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection pump to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection pump to 30 Nm (22 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel rail to 30 Nm (22 lb.ft).
- Secure the clip.

81. NOTE: Remove and discard the blanking caps.

Install the new LH fuel rail high-pressure supply line.

- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection pump to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection pump to 30 Nm (22 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel rail to 30 Nm (22 lb.ft).
- Secure the clip.

All vehicles

E55238

82. CAUTIONS:

⚠ Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

⚠ Do not use tools to install the new fuel return line retaining clip. Failure to follow this instruction will result in damage to the retaining clip.

Install a new fuel injector clamp.

- 1. Install the fuel injector retaining clamp spacer.
- 2. Install a new fuel return line retaining clip.
- 3. Install a new sealing washer.

E55234

83. Install the fuel injector.

- Tighten the bolts to 10 Nm (7 lb.ft).

84. Install the remaining fuel injectors.

85. CAUTIONS:

 Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

 Maintain pressure on the high-pressure fuel supply lines to keep the olives in contact with the fuel injectors and the fuel rail cones while installing the unions.

 Do not use any aggressive cleaning fluid or a wire brush to clean the fluid injector nozzle.

• NOTE: Remove and discard the blanking caps.

Install new high-pressure fuel supply lines.

1. Install the new high-pressure fuel supply line, tighten the fuel supply line unions finger tight.

- Tighten the high-pressure fuel supply line in the sequence shown:
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 15 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 15 Nm.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 30 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 30 Nm.

E124889

86.  CAUTION: Make sure the fuel return line retaining clip is correctly installed to the fuel injector before installing the return line.

Connect the fuel return line to the fuel injectors.

- Apply a light coating of petroleum jelly to the fuel return line O-ring seals.

E55233

- 87.** Install the engine wiring harness.
- Tighten the nut to 10 Nm (7 lb.ft).
 - Secure the clips.

- 88.** Connect the fuel injection pump electrical connectors.

- 89.** Connect the fuel rail pressure (FRP) sensor electrical connector.

- 90.** Install the crankcase vent oil separator.
- Connect and secure the 2 breather hoses.

91. Connect the fuel temperature sensor electrical connector.

92. NOTE: LH shown, RH is similar.

Connect the 2 KS electrical connectors.

93. Connect the engine oil temperature sensor electrical connector.

- Secure the wiring harness clip.

94. Connect the camshaft position (CMP) sensor electrical connector.

- Secure the wiring harness clip.

95. NOTE: RH shown, LH is similar

Connect the 6 fuel injector electrical connectors.

- Secure the 4 wiring harness clips.

96. Connect the engine oil pressure (EOP) sensor electrical connector.

- Secure the wiring harness clip.

97. Install the 2 low pressure fuel pipes.

98. Install the timing belt cover.

- Tighten the bolts to 10 Nm (7 lb.ft).

99. Install the crankshaft pulley.

- Tighten the bolts to 14 Nm (10 lb.ft).

100. Install the cooling fan pulley.

- Tighten the bolts to 23 Nm (17 lb.ft).

101. Install the accessory drive belt idler.

- Tighten the bolt to 47 Nm (35 lb.ft).

102. NOTE: Clean the component mating faces.

- NOTE: Install a new O-ring seal.

Install the coolant pump.

- Tighten the bolts to 10 Nm (7 lb.ft).

E96795

103. Install the exhaust gas recirculation (EGR) valve coolant pipe.

- Install the bolt.
- Connect the electrical connector.
- Secure in the 2 clips.
- Secure the clip.

E96984

104.  CAUTION: Make sure that new nuts are installed.

- NOTE: Tighten the nuts in the sequence shown.
- NOTE: Install a new gasket.

Install the RH exhaust manifold and exhaust cross-over pipe assembly.

- Tighten the nuts to 24 Nm (18 lb.ft).

E96793

105. Install the generator bracket.

- Tighten the bolts to 23 Nm (17 lb.ft).

E96792

106. Install the RH engine mount bracket.

- Tighten the bolts to 110 Nm (81 lb.ft).

107. Install the RH exhaust manifold heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

108.  CAUTION: Tighten the bolts in the sequence shown.

Install the generator.

- Tighten the bolts to 47 Nm (35 lb.ft).

109. Connect the generator electrical connectors.

- Tighten the nut to 12 Nm (9 lb.ft).
- Reposition the rubber insulator.

110. Install the RH EGR valve and cooler assembly.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Connect the coolant hose and secure with the clip.
- Connect the electrical connector.
- Install and secure the new clip.

111. NOTE: Install a new O-ring seal.

Install the cylinder block coolant inlet pipe.

- Tighten the bolts to 10 Nm (7 lb.ft).

112.  **WARNING:** Make sure that new nuts are installed.

- NOTE: Tighten the nuts in the sequence shown.
- NOTE: Install a new gasket.

Install the LH exhaust manifold and turbocharger assembly.

- Tighten the nuts to 24 Nm (18 lb.ft).

113.  **CAUTION:** Make sure that new nuts are installed.

- NOTE: Install a new gasket.

Secure the exhaust cross-over pipe to the LH exhaust manifold.

- Tighten the nuts to 24 Nm (18 lb.ft).

114. NOTE: Remove and discard the blanking caps.

- NOTE: Install new sealing washers.

Connect the turbocharger oil supply tube.

- Tighten the banjo bolt to 30 Nm (22 lb.ft).

115. Secure the turbocharger support bracket.

- Tighten the bolts to 23 Nm (17 lb.ft).

116. NOTE: Remove and discard the blanking caps.

- NOTE: Install a new O-ring seal.

- NOTE: Install a new gasket.

Install the turbocharger oil return tube.

- Tighten the bolts to 10 Nm (7 lb.ft).

117. Install the turbocharger heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

118. Install the LH exhaust manifold heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

119. NOTE: Install a new clip.

Install the LH EGR valve and cooler assembly.

- Install the support bracket.
- Tighten the bolts to 10 Nm (7 lb.ft).
- Connect the coolant hose and secure with the clip.
- Connect the electrical connector.
- Install and secure the clip.

120. NOTE: Remove and discard the blanking caps.

• NOTE: Install a new O-ring seal.

Install the oil level indicator and tube.

- Tighten the bolt to 10 Nm (7 Lb.ft).
- Secure the wiring harness clip.

E96776

121. Install the LH engine mount bracket.
- Tighten the bolts to 110 Nm (81 lb.ft).

E96775

122. Install the air conditioning (A/C) compressor bracket.
- Tighten the bolts to 23 Nm (17 lb.ft).

E96774

123. Install the A/C compressor.
- Tighten the bolts to 23 Nm (17 lb.ft).
 - Connect the electrical connector.

E96773

124. Install the power steering pump bracket.
- Tighten the bolts to 23 Nm (17 lb.ft).

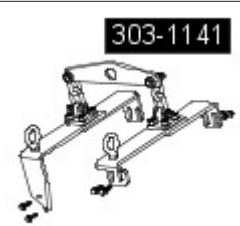

125. Remove the engine from the engine stand.

126. Install the engine.
 For additional information, refer to: [Engine - Vehicles With: 6HP28 6-Speed Automatic Transmission/6HP26 6-Speed Automatic Transmission](#) (303-01A Engine - TDV6 2.7L Diesel, Installation) / [Engine - Vehicles With: Manual Transmission \(303-01 Engine - 2.7L V6 - TdV6, Installation\)](#).

127. Fill the engine with the recommended oil to the correct level.
 For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures).

Engine - TDV6 2.7L Diesel - Engine Vehicles With: 6HP28 6-Speed Automatic Transmission/6HP26 6-Speed Automatic Transmission

Installation

Special Tool(s)	
 <p>303-1141</p> <p>E56716</p>	<p>Engine lifting Cradle</p> <p>303-1141</p>

Installation

1. CAUTIONS:

Apply grease of the correct specification to the torque converter spigot.

Make sure the torque converter is fully located into the oil pump drive.

With assistance, carefully install the engine.

- Clean the component mating faces.
- Carefully guide the transmission wiring harness in as the engine is being installed.
- Carefully guide the battery positive cable in as the engine is being installed.

CAUTION: Make sure the torque converter remains connected to the transmission.

Secure the engine to the transmission.

- Tighten the bolts to 45 Nm (33 lb.ft).
- Remove the jack supporting the transmission.

3. Secure both the LH and the RH engine mounts.

- Lower the engine onto its mounts.
- Tighten the nuts to 90 Nm (66 lb.ft).

4. Remove the special tool.

- Remove the bolts.

5. NOTE: Make sure that new bolts are installed.

6. Install the starter motor.

Secure the flexplate to the torque converter.

- Tighten the bolts to 48 Nm (35 lb.ft).
- Tighten the bolts to 45 Nm (33 lb.ft).

7. Connect the 2 starter motor wiring harness connectors to the starter solenoid.

- Install the cross plug.

- Tighten the solenoid terminal integral connector nut to 8 Nm (6 lb.ft).
- Tighten the battery positive cable nut to 11 Nm (8 lb.ft).
- Install the rubber insulator.

8. Install the starter motor support bracket.

- Tighten the bolts to 10 Nm (7 lb.ft).

9. Secure the engine ground cable.

- Tighten the bolt to 22 Nm (16 lb.ft).

10. Secure the fuel cooler.

- Tighten the bolt to 10 Nm (7 lb.ft).

11. NOTE: Remove and discard the blanking caps.

Connect the fuel lines.

12. Secure the fuel lines.

- Tighten the bolt to 22 Nm (16 lb.ft).
- Secure in the clips.

13. Secure the transmission breather lines.

- Tighten the bolt to 7 Nm (5 lb.ft).

14. Install the turbocharger support bracket.

- Tighten the bolts to 48 Nm (35 lb.ft).
- Tighten the nut to 22 Nm (16 lb.ft).

15. NOTE: Make sure that new nuts are installed.

• NOTE: Make sure that all the component mating faces are clean.

Secure the exhaust to the turbocharger.

- Install a new gasket.
- Tighten the nuts to 48 Nm (35 lb.ft).

16. Install the exhaust manifold crossover pipe center support bracket.

- Loosely install the 2 bolts.

17. Install the exhaust manifold crossover pipe RH support bracket.

- Loosely install the 3 bolts.

18. Install the exhaust manifold crossover pipe LH support bracket.

- Loosely install the 3 bolts.

19. Tighten the exhaust manifold crossover pipe mounting bracket bolts in the following sequence.

- Tighten the 2 bolts marked 1 to 10 Nm (7 lb.ft).
- Loosen the 2 bolts by 90 degrees.
- Tighten the 2 bolts marked 3 to 10 Nm (7lb.ft).
- Loosen the 2 bolts by 90 degrees.
- Tighten the 4 bolts marked 2 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts marked 1 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts marked 3 to 25 Nm (18 lb. ft).
- Attach the wiring harness.

20. Secure the battery positive cable.

- Secure with the clip.

21. Secure the transmission fluid lines.

- Tighten the nut to 10 Nm (7 lb.ft).

22. Install the turbocharger intake tube.

- Tighten the clip.

23. Reposition the lower coolant hose.

24. NOTE: Remove and discard the blanking caps.

Connect the A/C compressor high-pressure line.

- Install a new O-ring seal.
- Tighten the bolt to 9 Nm (7 lb.ft).

25. Install the charge air cooler inlet pipe.

26. Position the power steering pump to the power steering pump bracket.

- Loosely install the rear bolt.

27. Secure the power steering pump.

- Tighten the 3 front bolts to 22 Nm (16 lb.ft).
- Loosen the 3 front bolts by a quarter of a turn.
- Tighten the rear bolt to 22 Nm (16 lb.ft).
- Tighten the 3 front bolts to 22 Nm (16 lb.ft).

28. Connect the coolant lower hose.

- Secure with the clip.

29. Connect the charge air cooler inlet hoses.

- Tighten the clips.

30. NOTE: Remove and discard the blanking caps.

Connect the A/C compressor low-pressure pipe.

- Install a new O-ring seal.
- Tighten the bolt to 9 Nm (7 lb.ft).

31. Secure the charge air cooler inlet pipe.

- Tighten the bolts to 10 Nm (7 Lb.ft).
- Tighten the nut to 10 Nm (7 lb.ft).

33. Connect the breather hose
Install the LH upper suspension arm and brake line heat shields.

- Secure with the clip.

- Tighten the bolts to 10 Nm (7 Lb.ft).
 - Tighten the nuts to 10 Nm (7 Lb.ft).
- 34.** Install the accessory drive belt.
- Rotate the accessory drive belt tensioner counter-clockwise.
- 35.** Connect the RH EGR coolant hose.
- Secure with the clip.
- 36.** Connect the upper coolant hose to the coolant distribution manifold.
- Install the clip.
- 37.** Install the intake air shutoff throttle elbow support bracket.
- Tighten the bolts to 10 Nm (7 Lb.ft).
- 38.** Install the intake air shut off valve.
For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).
- 39.** Install the cooling fan shroud.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
- 40.** Install the body.

Engine - TDV6 3.0L Diesel - Engine - Overview

Description and Operation

OVERVIEW

The 3.0 liter diesel engine is a V6 configuration unit with 2 banks of 3 cylinders arranged at 60 degrees to each other. There are 4 valves per cylinder, which are operated by 2 overhead camshafts per cylinder bank.

The cylinder block is cast in compacted graphite iron, which uses less material to produce compared to a conventional cast iron block. This provides reduced weight and length with superior structural capabilities.

The cylinder heads are cast aluminum with a moulded plastic camshaft cover with an integral air intake. The single-piece structural oil pan is high pressure die cast from aluminum. The exhaust manifolds are cast from an iron alloy. A moulded plastic acoustic cover is fitted over the upper engine to absorb engine-generated noise.

A low compression ratio of 16:1 contributes to improved emissions quality, quieter combustion and compatibility with the engine's unique forced induction system. For additional information refer to Intake Air distribution and Filtering.

The low compression ratio also means less heat build-up in the piston bowl and more efficient fuel burn, resulting in the production of lower levels of pollutants. It also assists with cold starting allowing a faster cranking speed.

The engine is available in two power output forms. The power difference is achieved by changes to the engine calibration within the [ECM \(engine control module\)](#) and other vehicle control modules.

- NOTE: It is not possible to re-configure a lower power output engine to the higher output specification.

Engine - TDV6 3.0L Diesel - Engine - System Operation and Component Description

Description and Operation

System Operation

OPERATION

Operation of the engine is controlled by the [ECM \(engine control module\)](#). For additional information refer to 303-14A Electronic Engine Controls.

Component Description

ENGINE STRUCTURE

E120983

ItemDescription

- | | |
|---|----------------|
| 1 | Cylinder heads |
| 2 | Cylinder block |
| 3 | Oil pan |

CYLINDER BLOCK COMPONENTS

The cylinder block is a single cast construction with a hollow beam structure, cast from compact graphite iron. This type of construction provides outstanding strength and durability and uses less material than a conventional cast iron block, therefore reducing engine weight and length.

The use of compact graphite iron allows the cross sectional areas of the casting to be reduced, compared with a conventional gray cast iron block. This ensures reduced engine weight and length, with higher structural capabilities.

To maintain the stiffness of the bottom end of the cylinder block and crankshaft system, the cylinder block has a deep skirt and bearing cap design. Each of the main bearing caps is double bolted at each side of the crankshaft bearing and cross bolted back to the cylinder block.

Lubrication oil is distributed through the cylinder block, via a main oil gallery and channels bored in the block, to all critical moving parts. These channels divert oil to the main and connecting rod bearings via holes machined into the crankshaft.

A tapping at the rear of the cylinder block connects a pipe to the turbochargers by means of banjo connections. Oil is supplied, under pressure via this tapping, from the oil pump to provide lubrication for the bearings of the turbochargers.

Cylinder cooling is achieved by coolant circulating through chambers in the cylinder block casting.

Two hollow metal dowels are used to locate the cylinder heads to the cylinder block, 1 on each side at the rear of the unit.

A port is included at the **RH (right-hand)** and **LH (left-hand)** side of the cylinder block, below each of the turbochargers, to connect the turbochargers oil return pipe to the oil pan.

Two coolant drain plugs are installed in the cylinder block; one is fitted in the rear **RH** side, and the other is fitted in the middle of the cylinder block on the **LH** side.

Engine Data

E44217

NOTE: Arrow indicates front of engine

ItemDescription

1 Engine data locations

Engine data is marked at 2 locations at the back of the cylinder block. Component diameters are represented by alphabetical and numerical codes; keys to the codes are in the removal and installation section of this manual.

Piston Cooling Jets

E44219

ItemDescription

- 1 Bolt
- 2 Cooling jet

Jets located in the cylinder block provide piston and piston pin lubrication and cooling. These jets spray oil on to the inside of the piston, the oil then flows through 2 internal wave shaped channels to help cool each piston crown.

CRANKSHAFT

E52135

ItemDescription

- 1

Oil pump drive
2 Main bearing Journal
3 Connecting rod bearing journal
4 Rear drive flange
5 Rear oil seal location
6 Trigger wheel location

The crankshaft is forged steel and fillet rolled with induction hardened journals, which run in 4 bearings with clamped 2 layer bearing shells. The upper and lower shells of bearing number 4 are flanged, which limits the end float of the crankshaft. The main bearing caps are double bolted and cross bolted to increase the strength and rigidity of the engine block.

The main bearings are aluminum/tin split plain selective bearings. An oil groove in the top half of each bearing transfers oil into the crankshaft for lubrication of the connecting rod bearings. The upper and lower shells of bearing number 4 contain integral thrust washers, which limits the end float of the crankshaft.

Rear Crankshaft Oil Seal

E44227

ItemDescription

1	Housing
2	Seal
3	Crankshaft
4	Rear oil seal retainer
5	Bolt (10 off)

The rear main oil seal and retainer assembly is a one-piece unit and is supplied with its own plastic fitting sleeve. The seal and retainer have 2 locating dowels, 10 fixing bolts and a rubber seal. In addition, the retainer has a location for the crankshaft position sensor. For additional information refer to 303-14A Electronic Engine Controls.

A torsional vibration crankshaft damper pulley is bolted to the front of the crankshaft.

Crankshaft Trigger Wheel

E52137

ItemDescription

- | | |
|---|---------------|
| 1 | Special Tool |
| 2 | Trigger wheel |

The crankshaft trigger wheel is located on the rear of the crankshaft. It is pressed onto the crank using a special tool, which also precisely aligns the trigger wheel for crankshaft position and timing.

The trigger wheel consists of 60 magnets minus 2 for [ECM](#) crankshaft position reference and synchronization. The magnets cannot be seen on the trigger wheel, which therefore can only be positioned using a special tool. For additional information refer to 303-14A Electronic Engine Controls.

If the trigger is removed for any reason, then a new trigger wheel must be fitted.

OIL PAN COMPONENTS

E112394

ItemDescription

1	Oil scavenge reservoir
2	Oil level and temperature sensor
3	Oil pick-up pipe
4	Oil level and temperature sensor connector

The structural oil pan is of a single piece die cast aluminum construction and is fitted to the lower cylinder block to stiffen the base structure of the engine, helping to reduce noise, vibration and harshness. The oil pan also incorporates an oil baffle plate to reduce oil foaming and splash.

The oil pan is secured to the cylinder block with 2 dowels, 2 locator pins for the gasket and 18 retaining bolts; 3 different lengths of bolts are used:

- M6 x 20 (6 off)
- M8 x 75 (4 off)
- M6 x 105 (8 off).

Iron inserts, cast into the main bearing supports of the stiffening frame, minimize main bearing clearance changes due to heat expansion.

A gasket seals the joint between the oil pan and the cylinder block.

An oil pick-up pipe with integral strainer locates in the oil pan to provide oil to the crankshaft driven oil pump.

An ultrasonic sensor provides an electronic indication when the oil in the oil pan is low or high. This removes the requirement for the mechanical dipstick. An advantage in comparison with the static 'dipstick' method is that all marginal influences, for example vehicle being on a slope, lateral and longitudinal acceleration, are compensated for by averaging.

The values determined can be used to signal that the minimum oil level has been reached or to display the current oil level if required.

The sensor is mounted inside the oil pan where it sends an ultrasonic pulse vertically upward, it then measures the time for the pulse to be reflected back from the top surface of the oil.

Warnings will be displayed in the message center if the oil level is not maintained within the safe operating levels (minimum and maximum). A warning will also be displayed if there is a fault with the oil level monitoring system.

PISTON AND CONNECTING ROD ASSEMBLY

E52134

ItemDescription

1	Connecting rod bolts (2 off)
2	Connecting rod
3	Piston
4	Piston pin
5	Circlips
6	Connecting rod identification

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. The bearing caps are produced by fracturing the opposing sides of the connecting rod at the bearing horizontal centre-line. As well as being easier to manufacture, when reassembled the fractured surfaces interlock to form a strong seamless joint. The cylinder position is etched on adjoining sides of the joint to identify matching connecting rods and bearing caps. The selective connecting rod bearings are aluminum/tin split plain bearings. The connecting rod bearing is 'sputter coated', which is a manufacturing process that layers the bearing material to produce a higher load capacity for improved durability.

• NOTE: The connecting rods are not selective.

Piston and Connecting Rod Orientation

E44221

ItemDescription

1	Piston and connecting rod assembly, cylinders 4-6
2	Piston and connecting rod assembly, cylinders 1-3
3	Bolts (12 off)
4	Connecting rod bearing cap (6 off)
5	Connecting rod lower bearing (6 off)

When installing a connecting rod, ensure the back of the connecting rod faces the center of the 'vee'.

The pistons are made from aluminum alloy and are fitted with 3 rings. The piston crown incorporates a pronounced bowl; this forms the combustion chamber, which promotes swirl and turbulence necessary for good combustion and improved emissions. In addition, the piston skirt has a molybdenum-coated surface, which counteracts scoring of the cylinder bore and piston.

The piston also incorporates a double wave gallery within the piston crown to enhance piston cooling. The pistons are supplied oil by means of spray jets located in the cylinder block oil gallery. These jets ensure optimum piston cooling to counteract the high temperatures generated by the combustion process.

Each piston is installed on a piston pin located in a aluminum/tin bushing in the connecting rod.

Piston Ring Orientation

552133

ItemDescription

1	Ring gap oil control
2	Ring gap upper compression
3	Spiral joint oil control
4	Ring gap lower compression
5	Upper compression ring
6	Lower compression ring
7	Oil control ring

When installing pistons ensure the arrows on the piston crowns all point to the front of the engine. All pistons are common single grade/single part number for all engines.

The piston top ring is a taper type and is fitted with the taper to the top of the piston. All rings marked 'top' are assembled with 'top' uppermost. All rings must be spaced evenly around the piston before installing. The circumference gap of the double bevelled oil control ring must be opposite the spiral control joint.

CAMSHAFT TIMING COMPONENTS

E94884

ItemDescription

1	Rear engine accessory drive rear cover
2	Rear engine accessory drive tensioner
3	Bolt
4	Fuel pump pulley
5	Nut
6	Rear engine accessory drive camshaft pulley
7	Rear engine accessory drive belt
8	Bolt
9	Rear engine accessory drive front cover
10	RH chain tensioner
11	RH timing chain
12	RH intake camshaft
13	RH exhaust camshaft
14	LH intake camshaft
15	LH exhaust camshaft
16	LH chain tensioner
17	LH timing chain
18	Timing belt

Front cover bridge
20 Primary drive cover
21 Bolt
22 Tensioner
23 Bolt
24 Idler
25 Camshaft hub
26 LH camshaft timing pulley
27 Bolt (3 off)
28 Bolt
29 Idler
30 Bolt
31 Bolt (3 off)
32 Bolt
33 RH camshaft timing pulley
34 Camshaft hub

Primary drive is provided by a single toothed belt from the crankshaft to the exhaust camshaft gears of each cylinder bank via 2 idler pulleys and a tensioner.

Timing belt adjustment is carried out by an eccentric type tensioner mounted on the RH front face of the cylinder block.

A primary drive cover is made up from 3 separate plastic mouldings. The covers are secured to the front of the cylinder block and cylinder heads with 15 bolts and 1 stud and nut. The 2 upper covers are partially sealed with a rubber seal.

Secondary Drive

E44233

Item	Description
1	Timing chain
2	Bolts
3	Intake camshaft
4	Exhaust camshaft
5	Tensioner firing pin

Secondary drive is provided by 2 short crossover chains, which transfer drive from the exhaust camshaft gears to the intake camshaft gears. The crossover drives are located at the rear of the RH cylinder bank and the front of the LH cylinder bank. This allows for a much shorter and simpler run for the main camshaft drive belt at the front of the engine.

Each crossover chain is tensioned via an automatic chain tensioner, which acts directly on the chains via a guide rail. The

tensioners are located between the exhaust and intake camshafts at the front or rear of the cylinder head, depending on the cylinder bank.

The tensioner firing pin holds the automatic chain tensioner in a compressed state to aid installation.

CYLINDER HEAD COMPONENTS

• NOTE: [LH](#) cylinder head shown; [RH](#) cylinder head similar.

Cylinder Heads

E44236

ItemDescription

1	Studs
2	Bolts
3	Blanking plug

The aluminum gravity die cast cylinder heads are unique to each cylinder bank. Eight deep-seated bolts help reduce distortion and secure each cylinder head to the cylinder block. The cylinder head bolts are located beneath the camshafts, 4 under the intake camshaft and 4 under the exhaust camshaft. Two hollow dowels align each cylinder head with the cylinder block.

• **NOTE:** The cylinder heads cannot be reworked.

The cylinder head gasket is a 3-layer, laminated steel type and is available in 5 different thicknesses. The choice of gasket thickness is dependent on the maximum piston protrusion. Gasket thickness is identified by serrations cut into the front end of the gasket.

The cylinder head has 4 ports machined at each cylinder location, 2 exhaust ports and 2 intake ports. One of the intake ports is helical and functions as a swirl port, the other is arranged laterally as a tangential port and functions as a charge port.

The camshafts are of a hollow steel tube construction, with pressed on sintered lobes. Each camshaft is retained by aluminum alloy caps, 5 for the exhaust camshafts and 4 for the intake camshafts. Location letters, A to I for the intake camshaft and R to Z for the exhaust camshaft, are marked on the outer faces of the caps for each cylinder head.

The LH cylinder bank exhaust camshaft is machined to accept a rear camshaft gear. The rear camshaft gear provides drive for the high-pressure fuel pump. For additional information refer to 303-04A Fuel Charging and Controls.

The exhaust camshaft gear of the [LH](#) cylinder head also incorporates a trigger wheel, which is used in conjunction with the camshaft sensor to measure engine position. For additional information refer to 303-14A Electronic Engine Controls.

The [RH](#) cylinder head exhaust camshaft is machined at the rear end to provide a drive connection for the tandem pump.

The fuel injection nozzles are centrally mounted above each cylinder. For additional information refer to 303-04A Fuel Charging and Controls.

The glow plugs are arranged centrally on the intake side of the cylinder heads, between the 2 intake ports of each cylinder. For additional information refer to 303-07D Glow Plug System.

The engine lifting eyes are bolted to the cylinder head, 1 at the front and 2 at the rear, 1 per cylinder head.

Camshaft Covers

E117585

ItemDescription

1	Stud bolt M6 x 40 (6 off)
2	Bolt M6 x 40 (7 off)
3	Oil filler cap
4	RH camshaft cover assembly

The camshaft covers are manufactured from vinyl ester composite. The [RH](#) bank camshaft cover incorporates an outlet for the full load engine breather and the engine oil filler cap. The [LH](#) bank camshaft cover incorporates an outlet for the part load engine breather. For additional information refer to 303-08A engine Emission Control.

Silicon rubber in-groove gaskets seal the joints between the camshaft covers and the cylinder heads. Together with spacers and seals on the camshaft cover fasteners, they also isolate the covers from direct contact with the cylinder

heads, to reduce noise.

Intake and Exhaust Valves

E44239

ItemDescription

1	Valve spring collet (24 off, 12 per cylinder head)
2	Valve spring retainer (24 off, 12 per cylinder head)
3	Valve spring (24 off, 12 per cylinder head)
4	Valve stem seal (24 off, 12 per cylinder head)
5	Intake valve (12 off, 6 per cylinder head)
6	Exhaust valve (12 off, 6 per cylinder head)

Each cylinder head incorporates 2 overhead camshafts operating 4 valves per cylinder via steel roller rockers with hydraulic lash adjusters.

Roller Rockers with Hydraulic Lash Adjusters

E44238

ItemDescription

1 Roller rocker (24 off, 12 per cylinder head)

2 Hydraulic lash adjuster (24 off, 12 per cylinder head)

The lightweight valve gear provides good economy and noise levels. Valve head diameters are 31 mm (1.220 in) for the exhaust and 35 mm (1.378 in) for the intake. All valves have 5 mm (0.197 in) diameter stems supported in sintered metal seats and guide inserts. Collets, valve collars and spring seats locate single valve springs on both intake and exhaust valves. Valve stem seals are integrated into the spring seats.

Tandem Pump

E115534

ItemDescription

1	Tandem pump connections
2	Bolt (2 off)
3	Nut
4	Bracket (emission hose)
5	Stud

The tandem pump is a combined vacuum and oil scavenge pump. The scavenge pump is g-rotor type pump that drains oil from the secondary turbocharger to accommodate vehicle tilt. The pump is located at the rear of the [RH](#) side cylinder head and is driven from the exhaust camshaft.

Exhaust Manifolds

- NOTE: [LH](#) exhaust manifold shown; [RH](#) exhaust manifold similar.

E115531

ItemDescription

1	Cylinder head
2	Connecting pipe
3	Nut (2 off)
4	Nut (3 off)
5	Exhaust manifold
6	Bolt
7	Gasket
8	Turbocharger (primary turbocharger shown)
9	Manifold rear heat shield
10	Bolt
11	Bolt (2 off)
12	Manifold heat shield

The exhaust manifolds are cast from an iron alloy with a high nickel content giving excellent heat and corrosion resistance properties. They are sealed to the cylinder head by means of a steel gasket. Sacrificial plastic sleeves are used to align the manifolds. These sleeves must be changed when refitting the manifolds. Spacers on the securing bolts allow the manifolds to expand and retract with changes of temperature while maintaining the clamping loads.

Each manifold has a connection for the [EGR \(exhaust gas recirculation\)](#) transfer pipe.

The engine is fitted with twin variable geometry turbochargers, which fix to the exhaust manifolds by a 3-hole flange with a steel gasket.

LUBRICATION SYSTEM

E117573

ItemDescription

1	Inlet camshaft
2	Exhaust camshaft
3	Turbocharger oil supply
4	Primary turbocharger
5	Crankshaft and connecting rods
6	Oil level and temperature sensor
7	Oil pan
8	Oil pump
9	Oil cooler and filter assembly
10	Piston cooling jets
11	Secondary turbocharger

Oil is drawn from the oil pan and pressurized by the oil pump. The output from the oil pump is then filtered and distributed through internal oil passageways.

All moving parts are lubricated by pressure or splash oil. Pressurized oil is also provided for operation of the hydraulic adjusters and the timing gear chain tensioners.

Oil Cooler and Filter Assembly

E115533

ItemDescription

1	Filter housing
2	'O' ring seal
3	Paper element
4	Retaining bolt (6 off)
5	Coolant outlet connection
6	Cooler assembly

The engine is lubricated by a force-feed oil circulation system with a full flow oil filter. The oil cooler forms a unit with the oil filter, which is mounted centrally in the middle of the cylinder block between the 2 banks of cylinders. The engine oil is cooled using the engine cooling system. This eliminates the need for an additional engine oil cooler remotely mounted.

Oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the quick return of the oil, reducing the volume of oil required and enabling an accurate check of the contents soon after the engine stops.

System replenishment is through the oil filler cap on the [RH](#) camshaft cover.

The moulded composite oil pick-up is immersed in the oil reservoir to provide a supply to the oil pump during all normal vehicle attitudes. A mesh screen in the inlet prevents debris from entering the oil system.

• NOTE: Fuel cooling is facilitated by a blast air fuel cooler in the return line to the fuel tank.

Oil Pump

E44230

ItemDescription

1	Oil pump
2	Bolt (10 off)

The oil pump is a gear type pump and is bolted and dowelled to the front of the cylinder block. It is sealed by means of a rubber gasket, which is recessed into the oil pump housing. The pump inlet and outlet ports align with oil passages in the stiffening frame.

The pumping element is an eccentric rotor, which is directly driven by flats on the crankshaft. An integral pressure relief valve regulates pump outlet pressure at 4.5 bar (65.25 lb/in²).

The front crankshaft oil seal is housed in the oil pump casing and is fitted such that its front face is 1 mm (0.04 in) under flush with the machined front face of the oil pump.

• **NOTE:** The seal is not to be pushed all the way into the bore as this will block the seal drains.

Due to the wide range of inclines Land Rover vehicles operate across, the geometry of the oil pan has been configured to guarantee oil pick-up across all operating angles. An oil-scavenge system has been developed to guarantee excellent oil flow through the turbochargers on severe side-slopes. Whilst the 60-degree cylinder bank angle of a V6 engine allows the turbochargers to be packaged relatively higher in the vehicle, to obtain the best configuration for the V6 engine, the turbochargers must be sited much lower. At extreme angles, there is a risk they may be below the oil level on the oil pan, restricting oil return flow.

To overcome this, the engine uses:

- the oil pump to supply oil to the turbocharger bearings from the main oil reservoir (oil pan)
- a secondary reservoir to receive oil from the turbocharger bearings
- a tandem pump to urge oil to flow from the turbocharger bearings into the secondary reservoir and to pump the oil back from the secondary reservoir to the primary reservoir (oil pan)

E107569

ItemDescription

1	Turbocharger oil feed pipe
2	Tandem pump
3	Oil evacuation tube
4	Turbocharger oil return pipe
5	Oil scavenge pipe
6	Oil pan

An additional feature of this system is that the tandem pump used to pump oil back from the secondary reservoir can also be used as a source of vacuum for a vacuum operated system.

A semi-synthetic, low SAPS (sulphated ash, phosphorus and sulphur) oil is specified, which reduces the ash loading in the [DPF \(diesel particulate filter\)](#). Ash cannot be burnt off like soot so it remains in the [DPF](#) for life. Without the use of low SAPS oil, the [DPF](#) will not be a 'fit for life' component.

This low SAPS oil is also more resistant to temperature-related degradation than conventional mineral oil. It has lower viscosity at low temperatures and improved lubrication performance at higher temperatures.

Engine - TDV6 3.0L Diesel - Engine

Diagnosis and Testing

For additional information, refer to Diagnosis and Testing, Engine - 3.0L Diesel.

Engine - TDV6 3.0L Diesel - Engine Oil Draining and Filling

General Procedures

Draining

WARNING: The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

CAUTION: Make sure the engine is warm.

1. Refer to: [Oil Filter Element](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

2. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

4. **WARNING:** Observe due care when draining engine oil as the oil can be very hot.

• **CAUTIONS:**

Be prepared to collect escaping oil.

Discard the bolt.

Allow at least 10 minutes for the engine oil to drain.

Drain the engine oil.

Filling

1. **5. CAUTIONS:**

Make sure that the component is clean, free of foreign material and lubricant.

Make sure that a new bolt is installed.

Torque: 23 Nm

2. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

3. Lower the vehicle.

4. Refer to: [Oil Filter Element](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

5. Fill the engine with oil.

6. **10.**  **CAUTION:** Make sure that the vehicle is left for 5 minutes from filling with oil and that the engine oil level is reading at least minimum, before starting the engine. To check engine oil level follow steps 9-12.

Clean any residual engine oil from the oil filler cap area.

7.

- 8.
- Start the engine and allow to run for 10 minutes, stop the engine.
 - Check for leaks.

9. **13.** **CAUTIONS:**

 Make sure that the vehicle is parked on level ground.

 Make sure that the selector lever and the gearshift mechanism are in the park (P) position.

 Make sure that the hood is open.

• **NOTE:** Allow 10 minutes from the engine switch off for the engine oil level to stabilize.

- Turn the ignition on.

10.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

11.

- Press the right-hand OK button.

E123925

12.

- Press the right-hand directional button to access the Oil Level Display.

E123927

13.

- Press the right-hand OK button and follow the instructions.

E123928

E121008

14.

- Press the cruise control cancel button twice within 2 seconds.

15.

- The message center display will revert to the normal display in the trip computer.
- Press the right-hand OK button and follow the instructions.
- Check that the oil level display shows an oil level reading.
- Take a reading from the level display and, if necessary, top up with oil as instructed.

E123929

16. Turn the ignition off.

17. **21.** NOTE: Allow 10 minutes for the engine oil level to stabilize if there has been additional oil top up.

- Turn the ignition on.

18.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

19.

- Press the right-hand OK button.

E123925

20.

- Press the right-hand directional button to access the Oil Level Display.

E123927

21.

- Scroll through the trip menu to access the engine oil level display.

E123929

E121008

22.

- Press the cruise control cancel button twice within 2 seconds.

E123929

23. **27.** NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

- The message center display will revert to the normal display in the trip computer.
- Scroll through the trip menu to access the engine oil level display.
- This display is now the live reading of the engine oil level.
- Take a reading from the level display and, if necessary, top up with oil as instructed.

E121008

24.

- Press and hold the cruise control cancel button for more than 2 seconds.

25.

- The message center display will revert to the normal display in the trip computer.

26. Turn the ignition off.

27. Turn the ignition on.

28. **32.** NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

- Scroll through the trip menu to access the engine oil level display.
- Make sure that the average oil level value has now been updated.

E123929

29. Refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornammentation, Removal and Installation).

 <p>E129631</p>	<p>303-1484-01 Adapter for 303-1484</p>

Draining

WARNING: The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

- NOTE: Make sure that the vehicle is parked on level ground.
- NOTE: Clean the components general area prior to dismantling.

1. Refer to: [Oil Filter Element](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

2.

3.  **CAUTION:** Allow 10 minutes from turning the engine off before starting oil extraction.

4.
 - Using the oil vacuum pump drain the oil out through the oil extraction tube.

Special Tool(s): [303-1484](#), [303-1484-01](#)

5.
 - Remove the oil vacuum pump.

Filling

1. Refer to: [Oil Filter Element](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

- 2.

3. Fill the engine with oil.

4. **9.**  **CAUTION:** Make sure that the vehicle is left for 5 minutes from filling with oil and that the engine oil level is reading at least minimum, before starting the engine. To check engine oil level follow steps 8-10.

Clean any residual engine oil from the oil filler cap area.

5. **10.**  **CAUTION:** Correct installation of the oil filler cap can be obtained by tightening the cap until an audible click is heard.

- 6.
- Start the engine and allow to run for 10 minutes, stop the engine.
 - Check for leaks.

7. **12. CAUTIONS:**

Make sure that the vehicle is parked on level ground.

Make sure that the selector lever and the gearshift mechanism are in the park (P) position.

Make sure that the hood is open.

• **NOTE:** Allow 10 minutes from the engine switch off for the engine oil level to stabilize.

- Turn the ignition on.

Engine - TDV6 3.0L Diesel - Crankshaft Rear Seal

Removal and Installation

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-01 Battery, Mounting and Cables, Specifications).

2.  WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Crankshaft Position \(CKP\) Sensor Ring](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Removal and Installation).

- 4.

5.  CAUTION: Discard the seal.

Installation

1. CAUTIONS:

 Make sure that the crankshaft rear oil seal is correctly located.

 Make sure the crankshaft seal mating faces are clean and dry.

Apply an 8 mm bead of sealant to the cylinder block in the areas shown.

2.

- Lubricate the oil seal.

3. Torque: 10 Nm

4. Torque: 10 Nm

5. Torque: 10 Nm

6. Refer to: [Crankshaft Position \(CKP\) Sensor Ring](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Removal and Installation).

7. Connect the battery ground cable.

Refer to: [Specifications](#) (414-01 Battery, Mounting and Cables, Specifications).

Engine - TDV6 3.0L Diesel - Cylinder Head

Removal and Installation

Removal

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Camshaft LH](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

Removal and Installation

Removal

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the generator.

Refer to: [Generator](#) (414-02B Generator and Regulator - TDV6 3.0L Diesel, Removal and Installation).

3. Remove the accessory drive belt tensioner.

E54926

4. Remove the oil pan extension.

Refer to: [Oil Pan Extension](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

5. Remove the crankshaft front oil seal.

Refer to: [Crankshaft Front Seal](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

E54914

6. Remove the generator mounting bracket.

7. Remove the timing belt idler pulley.

8.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

9. Release the battery positive cable.

10. Remove the oil pump.

Installation

1. Prime the oil pump.

E123911

2. 2. CAUTIONS:

 Make sure that the mating faces are clean and free of foreign material.

 Make sure the gasket is installed correctly.

Install the oil pump.

E123913

3.  CAUTION: Make sure the base of the oil pump is aligned within 0.2 mm of the base of the engine block. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: Vehicles fitted with oil pumps without dowels.

Check the oil pump to engine block alignment.

E123912

4. Tighten the bolts in the sequence shown to 10 Nm .

5. Install the battery positive cable.

6. Install the timing belt idler pulley.

7. Install the crankshaft front oil seal.

Refer to: [Crankshaft Front Seal](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

8. Install the oil pan extension.

Refer to: [Oil Pan Extension](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

9. Install the generator mounting bracket.

10. Install the accessory drive belt tensioner.

11. Install the generator.

Refer to: [Generator](#) (414-02B Generator and Regulator - TDV6 3.0L Diesel, Removal and Installation).

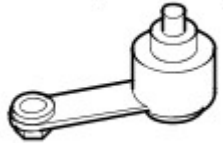

12. Connect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

10.  **CAUTION:** Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.
- **NOTE:** Do not loosen the bolts more than 2 turns.

11. **11. CAUTIONS:**

-  Discard the component.
-  Discard the bolt.

12. **12.**  **CAUTION:** Discard the component.

Installation

1.

2. CAUTIONS:

- ⚠ Make sure that a new bolt is installed.
- ⚠ Only tighten the bolts finger-tight at this stage.

3. ⚠ CAUTION: Make sure the camshaft pulleys remain in the clockwise position.
- Install the new timing belt.
 - Starting at the crankshaft pulley, install the timing belt in a counter-clockwise direction, in the sequence shown.
 - Stage one: Attach the timing belt to the crankshaft pulley.
 - Stage two: Attach the timing belt to the idler pulley.
 - Stage three: Attach the timing belt to the left-hand camshaft pulley.
 - Stage four: Attach the timing belt to the idler pulley.
 - Stage five: Attach the timing belt to the RH camshaft pulley.
 - Stage six: Attach the timing belt to the timing belt tensioner.

4. ⚠ CAUTION: Make sure the timing belt tensioner window is aligned with the groove as illustrated.
- Tension the timing belt.
 - Rotate the tensioner assembly counter-clockwise.
 - Torque: 26 Nm

5.  **CAUTION:** Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.
 - Using a suitable tool, counterhold the camshaft pulley center retaining bolts.
 - *Torque:* 23 Nm

6. *Special Tool(s):* [303-1126](#)

7. *Special Tool(s):* [303-1117](#)

8.  **CAUTION:** Only rotate the crankshaft clockwise.
Rotate the engine two complete turns clockwise.

9. *Special Tool(s):* [303-1117](#)

10.

- Install the special tools to the exhaust camshaft pulleys.
- If the special tool does not fit correctly, repeat the timing belt installation procedure.
- Remove the special tools from the camshaft pulleys.

Engine - V6 4.0L Petrol -

Sealers

Item	Land Rover Part No.
Engine timing cover to cylinder block	STC 50550
Rear main bearing cap to cylinder block	8510302

Lubricant - UK, Europe and ROW - Not NAS/Japan

Item	Specification
* Recommended lubricant	The use of 5W/30 oil to Specification WSS - M2C929-A is preferred. Where oil to this specification is not available, then 5W/30 oil meeting specifications ACEA A1/A3 or API SJ or SL may be used.

* **WSS is a Ford prefix to the oil specification**

Lubricant - NAS/Japan

Item	Specification
* Recommended lubricant	Use 5W/30 oil meeting Specification WSS-M2C929-A (GF4) and 'Certified for Gasoline Engines' by the American Petroleum Institute (API).

* **WSS is a Ford prefix to the oil specification**

Capacity

Item	Capacity
Dry fill including filter	6.4 litres (11.2 pints) (6.7 US quarts)
Oil and filter change - Maximum	5.7 litres (10.0 pints) (6.0 US quarts)
Amount of oil required to bring the level from the lower to the upper holes on the dipstick	1.4 litres (2.4 pints) (1.5 US quarts)

General Specification

Item	Specification
Type	4.0 litre, 60 degree 'V', petrol engine, single overhead camshaft per cylinder head, 2 valves per cylinder
Cylinder arrangement	V6, when looking towards the rear of the engine, cylinders 5 and 6 are at the rear.
Cylinder numbering	Number 1, 3, 5 cylinder - right hand bank; Number 2, 4, 6 cylinder - left hand bank
Bore - nominal	100.4 mm (3.952 in)
Stroke	84.4 mm (3.322 in)
Capacity	4009 cm ³ (244.5 in ³)
Firing order	1 - 2 - 3 - 4 - 5 - 6
Compression ratio	9.75:1
Direction of rotation	Anti-clockwise viewed from rear of engine
Maximum power	156 Kw (209 bhp) @ 4750 rev/min
Maximum torque	346 Nm (255 lb-ft) @ 3500 rev/min
Dimensions:	
Length	669 mm (26.3 in)
Width	712 mm (28.0 in)
Height	747 mm (29.4 in)
Maximum permissible cylinder head warp	0.08 mm (0.003 in)
Engine oil pressure:	
At Idle	1.8 - 2.0 bars (180 - 200 kPa) (26.0 - 29.0 lb/in ²)
At 3500 rev/min	3.3 to 3.6 bars (330 - 360 kPa) (48.0 - 52.0 lb/in ²)

*** New nuts/bolt(s) must be fitted**

**** New Torx bolts must be fitted**

+ Bolts/Torx bolts/studs must be tightened in sequence

++ Bolts must be tightened in a diagonal sequence commencing with the 2 centre bearing caps

Lubricate threads of bolts with engine oil prior to fitting

+ * Damage to internal components will result if this torque is exceeded

Engine - V6 4.0L Petrol - Engine

Description and Operation

External View

• NOTE: Variant without oil cooler shown.

E50486

GENERAL

The V6 petrol engine is a 4.0 litre, 6 cylinder, 60 degrees 'V' unit, with 2 valves per cylinder, operated by a single overhead camshaft. The engine emissions comply with ECD4 (European Commission Directive) and USA Tier 2 Bin 8 legislative requirements and employs catalytic converters, electronic engine management control, positive crankcase ventilation and exhaust gas recirculation to limit the emission of pollutants. The cooling system is a low volume, high velocity system. The fuel injection system is controlled by the Engine Control Module (ECM).

The cylinder block is of cast iron construction with a cast aluminum ladder frame and balance shaft assembly bolted to the bottom of the block. The cylinder heads are cast aluminum with vinyl ester composite camshaft covers. The single-piece oil sump is formed from pressed steel. The intake manifold is manufactured from cast aluminum and incorporates a central chamber with six inlet port tracts.

For additional information, refer to: [Intake Air Distribution and Filtering](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Description and Operation). The dual wall stainless steel exhaust manifolds are unique for each cylinder bank and a moulded plastic acoustic cover is fitted over the upper engine to reduce engine-generated noise.

Technical Features

The technical features include:

- A six cylinder, 60 degree 'V' configuration liquid cooled cast iron cylinder block
- Pistons comprise two compression rings and a three piece oil control ring
- Two aluminum cylinder heads, each incorporating a single hollow camshaft
- Rocker valve arms with hydraulic lash adjusters
- Engine front cover manufactured from aluminum which accommodates the coolant pump assembly
- Each camshaft is driven by a separate single row chain
- Electronically controlled vacuum operated Exhaust Gas Recirculation (EGR) valve
- Exhaust re-treatment by means of catalytic converters
- Cast aluminum engine ladder frame assembly
- A fully counter balanced cast iron crankshaft
- An advanced engine management system incorporating electronic throttle control
- Electronic Intake Manifold Tuning Valve (IMTV) with ECM control
- Emissions comply with ECD4 (European Commission Directive) and USA Tier 2 Bin 8 legislative requirements.

Engine Data

The technical data is detailed below.

	DESCRIPTION	TYPE
Configuration	60 degree V6	
Maximum power	156 kW at 4750 rpm	
Maximum torque	346 Nm at 3000 rpm	
Displacement	4009cc	
Stroke/bore	84.4mm/100.4mm	
Compression ratio	9.7:1	
Firing order	1 2 3 4 5 6	
Oil capacity	6.4 litres	

CYLINDER NUMBERING

The cylinders are numbered as shown below, with cylinders 1 and 2 at the front of the engine.

E133974

CYLINDER BLOCK COMPONENTS

• NOTE: Variant with oil cooler shown.

E50487

Item	Part Number	Description
1	-	Piston Rings
2	-	Piston
3	-	Piston pin
4	-	Connecting rod
5	-	Connecting rod bearing - upper
6	-	Connecting rod bearing - lower
7	-	Connecting rod cap
8	-	Oil filter
9	-	Oil cooler (if fitted)
10	-	Oil filter adapter mounting bolt
11	-	O ring
12	-	O ring
13	-	Oil filter adapter
14	-	O ring
15	-	Knock sensor
16	-	Cylinder block

18	-	Knock sensor
19	-	Oil pressure switch
20	-	Starter motor
21	-	Gasket
22	-	Front cover
23	-	Seal
24	-	Gasket
25	-	Water pump
26	-	Crankshaft pulley
27	-	Jackshaft shaft chain
28	-	Jackshaft shaft sprocket
29	-	Chain tensioner
30	-	Jackshaft shaft
31	-	Jackshaft thrust plate
32	-	Chain guide
33	-	Chain guide
34	-	Oil gallery plug
35	-	Plug
36	-	Spacer
37	-	Oil gallery plug

Cylinder Block

The cylinder block is a 'V' design, which provides an inherently rigid structure with good vibration levels. A low volume coolant jacket improves warm-up times and piston noise levels; the longitudinal flow design of the jacket, with a single cylinder head coolant transfer port in each bank, improves rigidity and head gasket sealing.

Engine Data Locations

Item	Part Number	Description
1	-	Engine data
2	-	Engine data
3	-	Vehicle Identification Number (primary location)
4	-	Vehicle Identification Number(secondary location)

Engine data is marked at three locations.

Pistons and Connecting Rod Assembly

Item	Part Number	Description
1	-	Piston ring, upper compression
2	-	Piston ring, lower compression
3	-	Piston rings, oil control
4	-	Piston
5	-	Piston pin
6	-	Connecting rod
7	-	Oil squirt hole
8	-	Connecting rod bearing, upper
9	-	Connecting rod bearing, lower
10	-	Connecting rod cap
11	-	Nut
12	-	Bolt

The aluminum alloy, thermal expansion, lightweight pistons, with semi-floating piston pins, are offset to the thrust side and are carried on forged steel connecting rods. Pistons are supplied in four grades, 1, 2, 3 and 4. The pistons are marked to ensure they are correctly oriented in the cylinder bore; the 'arrow' mark should be toward the front of the engine.

The V6 petrol engine utilizes forged steel H-sectioned connecting rods, with the piston pin being an interference fit in the small end of the connecting rod. The big ends are horizontally split.

Selective bearing shells with two grades of thickness; standard and 0.25 mm undersize, control big end bearing diametric clearance. The big-end upper and lower bearing shells are plain with locating tags.

Each piston is fitted with two compression rings and an oil control ring. The top compression ring has a nitrided surface, a process that involves the diffusion of nitrogen into the surface layers of a low carbon steel. The formation of nitrides provides an increased hardness. The 2nd compression ring is chrome-plated. The oil control rings have stainless steel top and bottom rails and integral expander rings.

Jackshaft Assembly

E50490

Item	Part Number	Description
1	-	Jackshaft
2	-	Thrust plate

The Jackshaft assembly is located centrally in the upper part of the cylinder block. The assembly is used to supply drive to each camshaft, via a chain. The LH camshaft is driven from the front of the Jackshaft and the RH camshaft is driven from the rear. The Jackshaft assembly is driven, via a chain, by the crankshaft gear at the front of the engine. The assembly is held in position by a thrust plate.

Front Cover and Water Pump Assembly

E50491

Item	Part Number	Description
1	-	Water pump assembly
2	-	Engine front cover
3	-	Gasket

The aluminum front cover assembly is secured to the engine block by five bolts and five studs and is sealed via a gasket. The front cover also houses the crankshaft front seal.

The water pump is attached to the engine front cover assembly and is secured and sealed, to the front cover, by twelve bolts and a gasket. A poly-vee belt drives the water pump via the crankshaft.

Oil Cooler (If Fitted) and Filter Assembly

- NOTE: Variant with oil cooler shown.

E50492

Item	Part Number	Description
1	-	O ring
2	-	Adapter
3	-	O ring
4	-	O ring
5	-	Adapter mounting bolt
6	-	Cooler assembly (if fitted)
7	-	Oil filter

A full-flow, disposable canister-type oil filter is attached to the oil cooler assembly (if fitted).

The oil filter and cooler assembly (if fitted) is attached the rear RH side of the cylinder block and consists a full-flow, disposable canister-type filter, cooler (if fitted) and an adapter.

The filter adapter-mounting bolt locates in the cylinder block oil gallery and is sealed by an 'O' ring. The filter adapter houses the adapter bolt and is also sealed to the cylinder block by an 'O' ring.

The oil cooler (if fitted) keeps the engine lubrication oil cool, under heavy loads and high ambient temperatures and is cooled by the engine cooling system.

Oil is delivered to and from the oil cooler (if fitted) through galleries in the cylinder block. Hoses from the engine cooling system are connected to two pipes on the oil cooler for the supply and return of coolant.

Knock Sensors

E50494

Item	Part Number	Description
1	-	RH knock sensor
2	-	LH knock sensor

The knock sensors are installed in the cylinder block in two different locations. One is located on the inboard of the RH cylinder bank and one is located at the front of the LH side of the cylinder block, next to the oil pressure switch. They are piezo-electric sensors that provide inputs to detect and locate detonation during combustion.

For additional information, refer to: [Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

Oil Pressure Switch

E50495

Item	Part Number	Description
1	-	Oil Pressure Switch

The oil pressure switch is located in a port at the front LH side of the cylinder block. It detects when a safe operating pressure has been reached during engine starting and initiates the illumination of a warning light in the instrument cluster if the oil pressure drops below a given value. The switch operates at a pressure of 0.15 to 0.41 bar (2.2 to 5.9 psi).

Engine Block Heater

E51510

For cold climate markets an engine block heater is fitted, which is located at the front of the LH side of the cylinder block.

CRANKSHAFT, SUMP AND OIL PUMP COMPONENTS

E50497

Item	Part Number	Description
1	-	Tensioner
2	-	Chain
3	-	Balance shaft assembly
4	-	Main bearing, upper
5	-	Main thrust bearing, upper
6	-	Crankshaft
7	-	Crankshaft oil seal, rear
8	-	Main thrust bearing, lower
9	-	Main bearing, lower
10	-	Main bearing cap, rear
11	-	Intermediate shaft
12	-	Oil pump
13	-	Pick-up pipe adapter
14	-	Ladder frame
15	-	Oil pick-up pipe
16	-	Sump
17	-	Crankshaft oil seal, front
18	-	Key

Crankshaft and Main Bearings

E50498

Item	Part Number	Description
1	-	Main bearing cap
2	-	Main bearing, lower
3	-	Key
4	-	Crankshaft
5	-	Main bearing, upper
6	-	Main bearing, thrust

The crankshaft is supported on four main bearings, with each pair of crankpins mutually offset by 30 degrees to give equal firing intervals. Cast in Spheroidal Graphite (SG) iron, the crankshaft has cold rolled fillets on all journals, except the outer mains, for toughness and failure resistance. The nine crankshaft counterweights increase smoothness and reduce bearing wear by splitting the loads evenly across the bearings. Thrust washer halves at the top and bottom of number three main bearing control end-float.

Oil grooves are provided in the upper and lower halves of all the main bearing shells to supply oil, via drillings in the crankshaft, to the connecting rod big-end bearings.

Balance Shaft Assembly

E50500

Item	Part Number	Description
1	-	Drive chain
2	-	Tensioner assembly
3	-	Balance assembly
4	-	Chain guide

A 60 degree V6 is often thought of inherently balanced, because its first-order forces can be compensated by crankshaft counter-weighting. However, the V6 4.0L engine generates a second-order unbalanced at twice the crank speed.

To achieve the desired smoothness, the V6 4.0L engine includes a unique counter-rotating balance shaft, which is chain driven by the crankshaft and runs at twice engine speed. The shaft produces an opposite second-order force, which cancels the inherent unbalance.

Since the balance shaft is positioned on the bottom the cylinder block, on the RH side and is secured by 4 bolts. Because the unit is near the engine oil level, it is encased in a steel tube to avoid aerating the oil. The balance shaft attaches to the engine as an assembled unit, including an integrated gear and lubrication system. The gear is needed to rotate the shaft in the same direction as the unbalanced force.

Crankshaft Oil Seals

E50499

Item	Part Number	Description
A	-	Rear
B	-	Front
1	-	Rear seal
2	-	Front cover
3	-	Front seal

The rear crankshaft oil seal is a press fit in the rear of the cylinder block. The front crankshaft oil seal is located in the engine front cover assembly, just below the water pump.

Oil Pump

E50501

Item	Part Number	Description
1	-	Oil pump
2	-	Pick-up pipe adapter assembly
3	-	Intermediate shaft
4	-	Clamp
5	-	Drive assembly

The oil pump is located on the RH rear underside of the cylinder block, contained within the ladder frame assembly, and is secured by two bolts. The unit is driven by the jackshaft, via an intermediate shaft, and receives its oil feed from the main gallery via drillings in the cylinder block. The intermediate shaft locates through the cylinder block and is connected to the drive assembly, which is situated in the 'V' at the rear of the engine and held in place via a clamp. The oil pump housing includes the oil pressure relief valve.

Engine Ladder Frame Assembly

E50502

Item	Part Number	Description
A	-	69.8 mm minimum
1	-	Engine bulkhead housing
2	-	Crankshaft main bearing cap adjustment screw

The ladder frame is fitted to the lower cylinder block, via 20 bolts and 2 studs and nuts, to stiffen the base structure thus helping to reduce Noise, Vibration and Harshness (NVH). The frame is made of high-pressure die cast aluminum.

Located in the bulkhead housing are eight crankshaft main bearing cap adjustment screws.

A gasket seals the joint between the bulkhead housing and the cylinder block.

A port for the oil level gauge tube is included in the casting on the LH side of the cylinder block.

Sump

E50503

Item	Part Number	Description
1	-	Sump

The pressed steel sump is a wet-type, sealed to the ladder frame using a gasket and 10 bolts.

Oil Pick-up

E50504

Item	Part Number	Description
1	-	Oil pick-up

The oil pick-up is a two-piece unit with strainer located in the center of the sump oil well, as a source for the supply of engine lubrication oil to the oil pump. Oil is drawn through the end of the pick-up and strained to prevent solid matter from entering the oil pump.

CAMSHAFT TIMING COMPONENTS

E50505

Item	Part Number	Description
A	-	Front of engine
1	-	LH camshaft drive assembly
2	-	RH camshaft drive assembly
3	-	Spacer
4	-	Jackshaft sprocket
5	-	Chain guide
6	-	Jackshaft chain tensioner
7	-	Tensioner pin
8	-	Jackshaft chain

Camshaft Drive Assembly

Each camshaft drive assembly comprises:

- A jackshaft gear
- A camshaft gear
- A drive chain
- A chain guide

The LH drive assembly is driven from the front of the jackshaft and the RH assembly from the rear.

CYLINDER HEAD COMPONENTS

E50506

Item	Part Number	Description
1	-	Hose, crankcase emissions, RH camshaft cover to intake manifold
2	-	End cover
3	-	RH Fuel rail
4	-	LH injectors (3 of)
5	-	Fuel supply line
6	-	Schrader valve
7	-	RH injectors (3 of)
8	-	Hose, crankcase emissions, LH camshaft cover to intake manifold
9	-	Electrically heated positive crankcase ventilation valve
10	-	Camshaft position (CMP) sensor
11	-	Oil filler cap
12	-	LH camshaft cover
13	-	LH valve rocker arm oil supply tube
14	-	LH camshaft bearing caps
15	-	LH camshaft
16	-	Valve rocker arm
17	-	Collet
18	-	Valve spring retainer seat
19	-	Hydraulic lash adjuster
20	-	Valve spring
21	-	Valve stem seal
22	-	LH cylinder head
23	-	LH exhaust manifold gasket
24	-	Valves
25	-	Cylinder head gasket
26	-	Volume reduction plug/valves
27	-	Timing chain tensioner
28	-	RH exhaust manifold gasket
29	-	Timing chain tensioner
30	-	RH cylinder head
31	-	RH camshaft
32	-	RH camshaft bearing caps
33	-	RH valve rocker arm oil supply tube
34	-	RH camshaft cover
35	-	Crankcase ventilation valve

Cylinder Heads

E50507

Item	Part Number	Description
1	-	RH cylinder head
2	-	LH cylinder head

The cross-flow cylinder heads are based on a twin valve, central spark plug combustion chamber, with the inlet ports designed to induce swirl and control the speed of the induction charge. This serves to improve combustion and hence fuel economy, performance and exhaust emissions.

LH and RH cylinder heads are identical castings.

Camshafts

E50508

Item	Part Number	Description
1	-	Bearing cap
2	-	Camshaft

A single camshaft on each cylinder bank is retained by a camshaft carrier, line bored with the cylinder head. The camshafts are located by a flange, which also controls end-float.

The LH camshaft incorporates a reluctor, which is used in conjunction with the Camshaft Position (CMP) sensor to measure engine position.

Valves and Hydraulic Lash Adjusters

E50509

Item	Part Number	Description
1	-	Valve stem seal
2	-	Valve spring
3	-	Valve spring retainer seat
4	-	Valve spring retainer key
5	-	Rocker arm
6	-	Hydraulic lash adjuster
7	-	Valve

The valve springs are made from spring steel and are of the parallel single-coil type. The bottom end of each spring rests on the flange of a spring retainer, which has an integral valve stem seal. The top end of the spring is held in place by a spring retainer, which is held in position at the top end of the valve stem by split taper collets. The taper collets have grooves on the internal bore that locate to grooves ground into the upper stems of the valves.

Valve seats and valve guides are an interference fit in the cylinder head.

The valves are operated through roller-type finger rockers and hydraulic lash adjusters, actuated by the camshaft lobes. When the camshaft lobe presses down on the top of a finger rocker, roller mechanism, the respective valve is forced down, opening the affected inlet or exhaust valve. The use of this type of actuation method helps reduce friction in the valve timing mechanism.

The body of the hydraulic lash adjusters contains a plunger and two chambers for oil feed and pressurized oil. The pressurized oil is supplied to the lash adjusters via the main oil galleries in the cylinder head and through a hole in the side of the lash adjuster body. The oil passes into a feed chamber in the lash adjuster and then through to a separate pressure chamber via a one way ball valve.

Oil flow from the pressure chamber is determined by the amount of clearance between the lash adjuster outer body and the center plunger. Oil escapes up the side of the plunger every time the lash adjuster is operated, the downward pressure on the plunger forcing a corresponding amount of oil in the lash adjuster body to be displaced. When the downward pressure from the camshaft and finger rocker is removed (i.e. after the trailing flank of the camshaft lobe has passed), oil pressure forces the lash adjuster's plunger up again. This pressure is not sufficient to effect the valve operation, but eliminates the clearance between the finger rocker and top of the valve stem.

Valve Rocker Arm Oil Supply Tube

E50510

Item	Part Number	Description
1	-	Valve rocker arm oil supply tube

The valve rocker arm oil supply tube locates on top of each camshaft and is secured by two bolts to the front and rear camshaft bearing caps. Oil is supplied to the tube via a gallery in the cylinder head and is distributed to each rocker arm through adjacent spray holes in the tube.

Cylinder Head Gasket

E50511

Item	Part Number	Description
1	-	LH cylinder head gasket
2	-	RH cylinder head gasket

The multi-layered steel cylinder head gasket has cylinder specific water flow cross-sections for uniform coolant flow.

Fuel Injectors

E50512

Item	Part Number	Description
1	-	Fuel rail
2	-	Injector
3	-	Adapter

The fuel injectors are installed in each of the two fuel rails, one per cylinder head. The injectors are electromagnetic solenoid valves controlled by the ECM. Each injector nozzle locates in the cylinder head via an injector insert adapter. An 'O' ring seals each injector to the fuel rail. The fuel jets from the injectors are directed onto the back of the intake valves.

For additional information, refer to: [Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

Camshaft Cover

E50513

Item	Part Number	Description
1	-	Crankcase ventilation valve
2	-	RH camshaft cover
3	-	LH camshaft cover
4	-	Oil filler cap and extension
5	-	Camshaft Position (CMP) sensor
6	-	Electrically heated positive crankcase ventilation valve

The camshaft covers are manufactured from thermo-plastic. The LH cover incorporates a hole, located directly above the camshaft reluctor, for the camshaft position sensor. The LH cover also incorporates the engine oil filler aperture.

Camshaft Position (CMP) Sensor

E50514

Item	Part Number	Description
1	-	CMP sensor

The CMP sensor is installed at the front of the LH camshaft cover. It is a variable reluctance sensor that provides an input to the ECM regarding the position of the camshaft.

For additional information, refer to: [Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

The reluctor for the camshaft position sensor is located at the front of the LH camshaft. A flat, machined surface near the front of each camshaft, enables the camshafts to be locked during the valve timing procedure.

LUBRICATION SYSTEM

- NOTE: Variant with oil cooler shown.

E50515

The lubrication system is of the full-flow filtration, force-fed type.

Oil is drawn, via a strainer and pick-up pipe in the sump into the jackshaft driven oil pump which has an integral pressure relief valve. The strainer in the pick-up pipe prevents any ingress of foreign particles from passing through to the inlet side of the oil pump and damaging the oil pump and restricting oil drillings. The oil pressure relief valve in the oil pump opens if the oil pressure becomes excessive and diverts oil back around the pump.

Pressurized oil is pumped through the oil filter, mounted on the oil pump housing. The lubrication system is designed so that a higher proportion of oil flow is directed to the cylinder block main oil gallery while a lower proportion of oil flow, (controlled by a restrictor in the oil filter housing), is directed to the engine oil cooler (if fitted). The remainder of the oil flow from the outlet side of the oil filter is combined with the return flow from the oil cooler (if fitted) before being passed into the cylinder block main oil gallery.

The main oil gallery has drillings that direct the oil to each cylinder head and the main bearings. Cross drillings in the crankshaft main bearings carry the oil to the connecting rod big-end bearings. Oil galleries in the cylinder head carry the oil to the camshafts and the hydraulic lash adjusters.

The oil pressure switch is located in the cylinder block to sense the oil pressure level before the oil flow enters the main gallery in the cylinder block. A warning lamp in the instrument cluster is illuminated if low oil pressure is detected.

Oil at reduced pressure is directed to each cylinder bank via two restrictors in the cylinder block/cylinder head locating dowels, one at the front on the LH bank and the other at the rear on the RH bank. Oil then passes through a drilling in the cylinder head to the camshaft carrier, where it is directed via separate galleries to the camshaft bearings and hydraulic tappet housings. Return oil from the cylinder head drains into the sump via the cylinder head bolt passages.

Oil Level Gauge

E50516

Item	Part Number	Description
1	-	Oil level gauge
2	-	Oil level gauge tube

The oil level gauge locates along the LH side of the cylinder block, supported in a tube installed in the sump. Two holes in the end of the gauge indicate the minimum and maximum oil levels. There is a difference of approximately 1.5 litres (1.58 US quart) between the two levels.

EXHAUST MANIFOLD

E50517

The dual wall stainless steel exhaust manifolds are unique for each cylinder bank.

The exhaust manifolds are sealed to the cylinder heads via metal gaskets.

Engine - V6 4.0L Petrol - Engine

Diagnosis and Testing

For additional information.

REFER to: [Engine - V6 4.0L Petrol](#) (303-00 Engine System - General Information, Diagnosis and Testing).

Engine - V6 4.0L Petrol - Engine Oil Draining and Filling

General Procedures

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

4. Remove the oil pan drain plug.
 - Position a container to collect the fluid.
 - Discard the oil drain plug seal.

5. Remove the oil filter.
 - Position a container to collect the fluid.
 - Discard the oil filter.

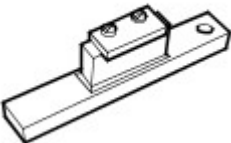

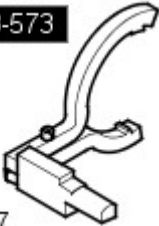

6. To install, reverse the removal procedure.
 - Lubricate the oil filter seal with clean engine oil and tighten to 18 Nm.
 - Install a new seal.
 - Tighten the drain plug to 37 Nm.

7. Fill the engine with oil.

8. Check and top-up the engine oil.

Engine - V6 4.0L Petrol - Camshaft Timing

General Procedures

Special Tool(s)	
<p>303-1146</p>  <p>E56552</p>	<p>Camshaft timing checking tool</p> <p>303-1146</p>
<p>303-573</p>  <p>E54427</p>	<p>Crankshaft TDC timing/locking tool</p> <p>303-573</p>
<p>303-575</p>  <p>E56553</p>	<p>Camshaft Bolt Tool</p> <p>303-575</p>
<p>303-565</p>  <p>E56554</p>	<p>Camshaft Bolt Socket</p> <p>303-565</p>
<p>303-576</p>  <p>E56555</p>	<p>Camshaft locking tool adaptor</p> <p>303-576</p>
<p>303-597-01</p>  <p>E56556</p>	<p>Camshaft sprocket adjusting/locking tool</p> <p>303-597-01</p>
<p>303-571</p>  <p>E56551</p>	<p>Camshaft timing chain tensioning tool</p> <p>303-571</p>

1. Check the camshaft timing.

2. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
3. Remove both valve covers.
4. Rotate the crankshaft clockwise, until number one cylinder is on TDC. Check the camshaft lobes are on the back of the cam.
5. Lock the crankshaft.
 - Install the special tool.
 - Tighten the screw.

E56557

6. Install the special tool to the slot in the camshaft, the base of the special tool must remain in contact with the cylinder head. If the special tool can be passed from one side of the cylinder head to the other without resistance then the camshaft is correctly timed. Repeat the procedure on the other camshaft. If both camshafts are found to be correct, then no further action is required.

E56558

7. If the camshaft timing is found to be incorrect, proceed with the adjustment. Note both camshafts must be re-timed with the camshaft roller followers removed.
8. Remove the camshaft roller followers.
For additional information, refer to: [Camshaft Roller Follower](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
9. Position the generator aside for access.
 - Remove the 3 bolts.

E47582

10. Remove the RH cylinder head harness carrier bolt.

- Position the harness carrier aside for access.

11. **⚠ CAUTION:** Damage to the camshaft will occur if the alignment tool is used to release the camshaft sprocket bolt.

- NOTE: The camshaft timing slot is off center. Correctly timed the slot will be horizontal and below the center line.

Install the camshaft alignment special tool.

- Clean the component mating faces.
- Tighten the bolts to 10 Nm (7 lb.ft).
- Lock the camshaft, tighten the special tool bolt to 45 Nm (33 lb.ft).

12. Install the special tool to the RH cylinder head.

- Clean the component mating faces.
- Tighten the bolts to 10 Nm (7 lb.ft).
- Tighten the saddle clamp bolts to 10 Nm (7 lb.ft).

13. **⚠ CAUTION:** The RH camshaft sprocket bolt has a left hand thread.

Using the special tool, loosen the RH camshaft sprocket bolt.

- Remove and discard the bolt.

14. Loosen the special tool saddle clamp bolts.

15.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the RH hydraulic timing chain tensioner.

16. Install the special tool.

- Clean the component mating faces.

17. Tighten the saddle clamp bolts to 10 Nm (7 lb.ft).

18. Using the special tool, tighten the camshaft sprocket bolt to 20 Nm (15 lb.ft), then a further 100 degrees.

19. Remove the special tools.
20. Install the RH hydraulic timing chain tensioner.
- Install a new seal.
 - Clean the component mating faces.
 - Tighten the tensioner to 44 Nm (32 lb.ft).

21. NOTE: If either camshaft is disturbed, both camshafts MUST be retimed.

- NOTE: The LH camshaft sprocket bolt has a right hand thread.

Repeat the above procedure to adjust the LH camshaft timing.

22. Install the camshaft roller followers.
For additional information, refer to: [Camshaft Roller Follower](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

23.  CAUTION: Tighten the bolts in the sequence shown.

Install the generator.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).

24. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Camshaft RH

In-vehicle Repair

Removal

- NOTE: Removal of the LH camshaft is similar to this procedure.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Refer to valve timing check and adjust.
For additional information, refer to: [Camshaft Timing](#) (303-01, In-vehicle Repair).

3. Remove the camshaft sprocket bolt.

- Position the sprocket and chain aside.

4. NOTE: Remove the camshaft bearing caps evenly and in stages.

- NOTE: Note the fitted position.

Remove the camshaft bearing caps.

- Remove the 8 bolts.
- Collect the camshaft oil supply line.

5. Remove the camshaft.

Installation

1. Install the camshaft.

- Clean the component mating faces.
- Lubricate the components with clean engine oil.

2. NOTE: Note the fitted position.

Install the camshaft bearing caps.

- Clean the component mating faces.
- Lubricate the components with clean engine oil.

3. NOTE: After installing the bolts check the camshaft is free to rotate.

Install the camshaft oil supply line.

- Thoroughly clean and inspect the oil supply line.
- Prime the oil supply line with clean engine oil.
- Working in a diagonal sequence, evenly and progressively tighten the bolts in 2 stages.
- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the bolts to 16 Nm (12 lb.ft).

4. Install the camshaft sprocket bolt.

- Install the bolt, but do not tighten fully at this stage.

5. Adjust the valve timing.

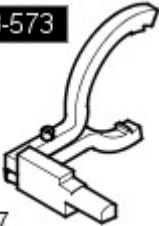

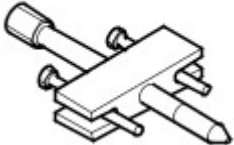

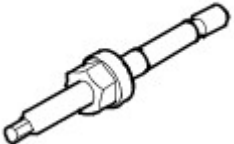

For additional information, refer to: Camshaft Timing (303-01, In-vehicle Repair).

6. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Crankshaft Pulley

In-vehicle Repair

Special Tool(s)	
 <p>303-573</p> <p>E54427</p>	<p>Crankshaft TDC timing/locking tool</p> <p>303-573</p>

 <p>303-102</p> <p>E54431</p>	<p>Installer - crankshaft damper pulley</p> <p>303-102</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).
3. Using the special tool, retain the crankshaft front pulley.

E54432

4. NOTE: The crankshaft pulley retaining bolt will be very tight.

Remove the crankshaft pulley retaining bolt.

- Discard the bolt.

E54433

5. Using the special tools, remove the crankshaft pulley.

- Collect the washer.
- Remove the special tools.

E54434

6. Using the special tool, remove the crankshaft front seal.

7. Check the crankshaft damper pulley and the washer for damage.

Installation

1. Clean all the crankshaft pulley mating faces.

2. Using the special tool, install the crankshaft front seal.

4.  **CAUTION:** The seal with head in the crankshaft pulley must be cleaned out before installing a new crankshaft pulley bolt.

- Remove the special tool.
- Install, but do not tighten, the new crankshaft pulley bolt.

E54436

5. Tighten the crankshaft pulley bolt.

- Install the special tool.
- Tighten the bolt to 55 Nm (40 lb.ft).
- Tighten the bolt a further 85 degrees.
- Remove the special tool.

6. Install the accessory drive belt.

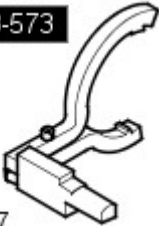

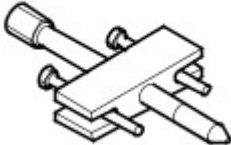

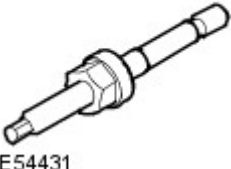

For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).

7. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

 <p>303-102</p> <p>E54431</p>	<p>Installer crankshaft damper pulley</p> <p>303-102</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).
3. Using the special tool, retain the crankshaft front pulley.

4. NOTE: The crankshaft pulley retaining bolt will be very tight.

Remove the crankshaft pulley retaining bolt.

- Discard the bolt.

5. Using the special tools, remove the crankshaft pulley.

- Collect the washer.

6. Remove the special tools from the crankshaft pulley.

7. Using the special tool, remove the crankshaft front seal.

8. Check the crankshaft damper pulley and the washer for damage.

Installation

1. Clean all the crankshaft pulley mating faces.

E54435

2. Using the special tool, install the crankshaft front seal.

- Lubricate the seal with clean engine oil.

E54436

3. Using the special tool, install the crankshaft pulley.

- Lubricate the seal with clean engine oil.
- Remove the special tool.

4.  **CAUTION:** The screw thread in the crankshaft pulley must be cleaned out before installing a new crankshaft pulley bolt.

Install, but do not tighten, a new crankshaft pulley bolt.

5. Tighten the crankshaft pulley bolt.

- Install the special tool.
- Tighten the bolt to 45 Nm (33 lb.ft).
- Tighten the bolt a further 85 degrees.
- Remove the special tool.

E54432

6. Install the accessory drive belt.

For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).

7. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Crankshaft Rear Seal

In-vehicle Repair

Special Tool(s)	
 <p>303-903 E50940</p>	<p>Oil seal remover 303-903 (LRT-12-092)</p>
 <p>303-527 E55109</p>	<p>Crankshaft rear oil seal installer 303-527</p>
 <p>303-525 E55110</p>	<p>Crankshaft rear oil seal installer 303-525</p>
 <p>303-579 E55111</p>	<p>Crankshaft rear oil seal installer 303-579</p>

Removal

- NOTE: The seal installation tools are available individually or as a set 303-S524

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the torque converter flexplate.
For additional information, refer to: [Flexplate](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

4. Remove the closing plate.

5.  **CAUTION:** Care must be taken to avoid damage to the seal register and running surface.

Using the special tools, remove and discard the crankshaft rear oil seal.

Installation

1. Install the special tool, 303-527.

- Make sure the components are clean and dry.
- Tighten the 2 Allen screws.

2.  **CAUTION:** Make sure the seal is installed parallel

Using the special tool, install the crankshaft rear oil seal.

- Lubricate the seal with clean engine oil.
- Partially install the crankshaft rear oil seal.
- Tighten the bolt to fully install the seal.

3. Install the closing plate.

- Clean the components.

4. Install the torque converter flexplate.

For additional information, refer to: [Flexplate](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

5. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

6. Check and top-up the engine oil.

Engine - V6 4.0L Petrol - Cylinder Block Cradle

In-vehicle Repair

Special Tool(s)	
 <p>303-596</p> <p>E54344</p>	<p>Cylinder block cradle insert adjustment tool</p> <p>303-596</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the RH front wheel and tire.
4. Position the starter motor to one side.
 - Remove the 2 bolts.
 - Remove the terminal upper cover.
 - Remove the terminal lower cover.
 - Remove the nut.
 - Disconnect the 2 electrical connectors.

5. Remove the front axle tube.
For additional information, refer to: [Axle Tube](#) (205-03 Front Drive Axle/Differential, In-vehicle Repair).
6. Remove the oil pan.
For additional information, refer to: [Oil Pan](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
7. Remove the front stabilizer bar.
8. Remove the radiator access panel.
 - Remove the 4 bolts.

9. Release the engine oil cooler lines.

- Remove the bolt.
- Remove the nut.
- Tie the lines aside.

10.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the oil temperature sensor.

- Disconnect the electrical connector.
- Remove and discard the O-ring seal.

11. Remove the oil strainer pick-up assembly.

- Remove the bolt.

12. Remove the dipstick.

13. Using suitable ties, secure the transmission fluid lines and the wiring harness clear of the cylinder block cradle flange.

14. **NOTE:** Note the fitted position of the 2 sealing washers.

Remove the 8 cylinder block cradle bolts.

- Remove and discard the 2 sealing washers.

15.  **CAUTION:** Failure to loosen the set screws may result in damage to the cylinder block cradle.

Using the special tool, loosen the 8 cylinder block cradle set screws.

16. Remove the cylinder block cradle.

- Remove the 2 rear bolts.
- Remove the 2 Torx screws.
- Remove the 2 nuts.
- Remove the 20 bolts.
- Remove and discard the gasket.

Installation

1. Clean the cylinder block cradle.

- Clean the component mating faces.
- Remove the sealant from the main bearing cap cavities.

2. **⚠ CAUTION:** Failure to loosen the set screws may result in damage to the cylinder block cradle.

Position the cylinder block cradle set screws.

- Using the special tool, adjust the set screws until they are below the cylinder block cradle boss face.

3. **NOTE:** The cradle must be installed within 20 minutes of the sealant application.

Apply sealant to the cylinder block cradle.

- Apply sealant to the 6 places shown.

4. **⚠ CAUTION:** Make sure the gasket is installed correctly.

Install the cylinder block cradle.

- Install a new gasket.
- Install, then evenly and progressively lightly tighten the outer bolts, nuts and Torx screws.

5. Align the cylinder block cradle to the cylinder block rear face.

- Install and tighten the 2 rear bolts.
- Loosen the 2 rear bolts.
- Lightly tighten the 2 rear bolts.

6. Evenly and progressively, tighten the outer bolts, nuts and Torx screws to 10 Nm (7 lb.ft).

7. Tighten the 2 rear bolts to 43 Nm (32 lb.ft).

8. Using the special tool, tighten the 8 cylinder block cradle set screws.

- Tighten the set screws in the sequence shown to 7 Nm (5 lb.ft).

9. NOTE: The sealing washers are fitted to the silver coloured bolts. The silver coloured bolts are fitted in the 2 forward holes.

Install the 8 cylinder block cradle bolts and tighten in 2 stages.

- Install 2 new sealing washers.
- Tighten the bolts in sequence to 15 Nm (11 lb.ft).
- Tighten the bolts in sequence to 34 Nm (25 lb.ft).

10. NOTE: Lubricate new seals with clean engine oil.

Install the oil strainer pick-up assembly.

- Clean the components.
- Tighten the bolt to 10 Nm (7 lb.ft).

11. Install the oil pan.

For additional information, refer to: [Oil Pan](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

12. Install the dipstick.

- Clean the component.

13. NOTE: Lubricate new seals with clean engine oil.

Install the oil temperature sensor.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the oil temperature sensor to 20 Nm (15 lb.ft).
- Connect the electrical connector.

14. Position the engine oil cooler lines.

- Tighten the bolt and the nut to 25 Nm (18 lb.ft).

15. Install the radiator access panel.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).

16. Install the front stabilizer bar.

17. Install the front axle tube.

For additional information, refer to: [Axle Tube](#) (205-03 Front Drive Axle/Differential, In-vehicle Repair).

18. Install the starter motor.

- Clean the component mating faces.

- Connect the electrical connectors.
- Tighten the nut to 10 Nm (7 lb.ft).
- Install the terminal lower cover.
- Install the terminal upper cover.
- Tighten the bolts to 45 Nm (33 lb.ft).

19. Install the RH front wheel and tire.

20. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Cylinder Head LH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Drain the coolant.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
3. Refer to camshaft timing. For additional information, refer to: [Camshaft Timing](#) (303-01C Engine - V6 4.0L Petrol, General Procedures).
4. Remove the exhaust manifold.
For additional information, refer to: [Exhaust Manifold LH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
5. Release the harness bridge for access.

- Remove the bolt.

E54665

6. Position the A/C compressor mounting bracket assembly aside.

- Remove the 4 bolts.
- Release the knock sensor electrical connector retaining clips.
- Tie the bracket aside.

E54666

7. Remove the LH hydraulic timing chain tensioner.

- Clean the component mating faces.

8. Remove the Torx bolt retaining the chain guide.

- Remove and discard the O-ring seal.

9. Remove the camshaft sprocket bolt.

- Remove the camshaft sprocket.
- Secure the chain to the guide with a cable tie.

10.  **CAUTION:** Working in a diagonal sequence, progressively loosen the bolts.

Remove the 10 cylinder head bolts.

- Discard the bolts.

11. Remove the cylinder head LH assembly.

- Release the KS electrical harness clip.
- Remove the bolt.

12. Remove and discard the cylinder head gasket.

- Clean the cylinder head locating dowels.
- Clean and inspect the cylinder head and cylinder block.

13. NOTE: Remove the camshaft bearing caps evenly and in stages.

- NOTE: Note the fitted position.
- NOTE: Do not disassemble further if the component is removed for access only.

Remove the camshaft bearing caps.

- Remove the 8 bolts.
- Collect the camshaft oil supply line.

14. Remove the camshaft.

Installation

1. Install the camshaft.

- Clean the component mating faces.
- Lubricate the components with clean engine oil.

2. NOTE: Note the fitted position.

Install the camshaft bearing caps.

- Clean the component mating faces.
- Lubricate the components with clean engine oil.

3. NOTE: After installing the bolts check the camshaft is free to rotate.

Install the camshaft oil supply line.

- Thoroughly clean and inspect the oil supply line.
- Prime the oil supply line with clean engine oil.
- Tighten the bolts evenly in 2 stages to the sequence shown.
- Tighten the bolts to 6 Nm (4 lb.ft).

- Tighten the bolts to 16 Nm (12 lb.ft).

4. Clean the component mating faces.

5. Check cylinder head face for distortion, across the center and from corner to corner.

For additional information, refer to: [Specifications](#) (303-01C Engine - V6 4.0L Petrol, Specifications).

E54642

6.  **CAUTION:** The head gasket must be installed over the cylinder block dowels.

Install a new cylinder head gasket.

7. Install the cylinder head LH assembly.

- Install the knock sensor bracket.
- Tighten the bolt to 10 Nm (7 lb.ft).

8. **NOTE:** Tighten the bolts 1 to 8 in the sequence shown. The M12 bolts are tightened in 3 stages.

Install the cylinder head bolts.

- Lubricate the new cylinder head bolt threads with clean engine oil.
- Tighten the M12 bolts to 30 Nm (22 lb.ft), then a further 80 degrees.
- Tighten the M12 bolts a further 80 degrees.
- Tighten the M8 bolts to 35 Nm (26 lb.ft).

E54672

9. Install the exhaust manifold.

For additional information, refer to: [Exhaust Manifold LH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

10. Install the Torx bolt retaining the chain guide.

- Install a new O-ring seal.
- Tighten the bolt to 10 Nm (7 lb.ft).
- Clean the component mating faces.

11. Install the A/C compressor mounting bracket assembly.

13. ~~Adjust the cable tension.~~ For additional information, refer to: [Camshaft Timing](#) (303-01C Engine - V6 4.0L Petrol, General Procedure) the bolts to 45 Nm (33 lb.ft).

14. Install the electrical harness bridge.

- Secure the wiring harness.
- Tighten the bolt to 45 Nm (33 lb.ft).
- Tighten the RS clip retaining bolt to 10 Nm (7 lb.ft).

15. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

16. Refill and bleed the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).

Engine - V6 4.0L Petrol - Cylinder Head RH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Drain the coolant.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
3. Refer to camshaft timing. For additional information, refer to: [Camshaft Timing](#) (303-01C Engine - V6 4.0L Petrol, General Procedures).
4. Remove the exhaust manifold.
For additional information, refer to: [Exhaust Manifold RH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
5. Position the generator mounting bracket aside.

- Remove the 3 bolts.
- Release the wiring harness clip.
- Disconnect the engine coolant temperature (ECT) sensor electrical connector.

6. Remove the cylinder block coolant outlet elbow.

- Disconnect the engine coolant temperature (ECT) sensor electrical connector.
- Release the clip securing the coolant pump hose.
- Remove the 3 bolts.

7. Remove the RH hydraulic timing chain tensioner.

8. Remove the camshaft sprocket bolt.

- Remove the camshaft sprocket.
- Secure the chain to the guide with a cable tie.

9.  **CAUTION:** Working in a diagonal sequence, progressively loosen the bolts.

Remove the 10 cylinder head bolts.

- Discard the bolts.

10. Remove the RH cylinder head assembly.

- Disconnect the cylinder head earth connector.
- Remove the bolt.

11. Remove and discard the cylinder head gasket.

- Clean the cylinder head locating dowels.
- Clean and inspect the cylinder head and cylinder block.

12. NOTE: Remove the camshaft bearing caps evenly and in stages.

- NOTE: Note the fitted position.
- NOTE: Do not disassemble further if the component is removed for access only.

Remove the camshaft bearing caps.

- Remove the 8 bolts.
- Collect the camshaft oil supply line.

13. Remove the camshaft.

Installation

1. Install the camshaft.

- Clean the component mating faces.
- Lubricate the components with clean engine oil.

2. NOTE: Note the fitted position.

Install the camshaft bearing caps.

- Clean the component mating faces.
- Lubricate the components with clean engine oil.

3. NOTE: After installing the bolts check the camshaft is free to rotate.

Install the camshaft oil supply line.

- Thoroughly clean and inspect the oil supply line.
- Prime the oil supply line with clean engine oil.
- Tighten the bolts evenly in 2 stages to the sequence shown.
- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the bolts to 16 Nm (12 lb.ft).

4. Clean the component mating faces.

E54642

5. Check cylinder head face for distortion, across the center and from corner to corner.
For additional information, refer to: [Specifications](#) (303-01C Engine - V6 4.0L Petrol, Specifications).

6.  **CAUTION:** The head gasket must be installed over the cylinder block dowels.

Install a new cylinder head gasket.

7. **NOTE:** Care must be taken when installing the ground connections. The engine will fail to start on either or both banks if the ground is poor.

Install the cylinder head RH assembly.

- Connect the cylinder head earth ground connector.
- Tighten the bolt to 10 Nm (7 lb.ft).

8. **NOTE:** Tighten the bolts 1 to 8 in the sequence shown. The M12 bolts are tightened in 3 stages.

Install the cylinder head bolts.

- Lubricate the new cylinder head bolt threads with clean engine oil.
- Tighten the M12 bolts to 30 Nm (22 lb.ft), then a further 80 degrees.
- Tighten the M12 bolts a further 80 degrees.
- Tighten the M8 bolts to 35 Nm (26 lb.ft).

E54643

9. Install the exhaust manifold.
For additional information, refer to: [Exhaust Manifold RH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

10. **NOTE:** The thread is left handed.

Install the camshaft sprocket bolt.

- Remove and discard the cable tie.
- Clean the component mating faces.
- Install and lightly tighten the camshaft sprocket bolt.

11. Install the RH hydraulic timing chain tensioner.

- Tighten the tensioner to 45 Nm (33 lb.ft).

12. Install the cylinder head coolant flange.

- Clean the component mating faces.
- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure the hose with the clip.
- Connect the ECT sensor electrical connector.

13. Install the generator mounting bracket.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).
- Secure the wiring harness.
- Connect the ECT sensor electrical connector.

14. Adjust the valve timing. For additional information, refer to: [Camshaft Timing](#) (303-01C Engine - V6 4.0L Petrol, General Procedures).

15. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

16. Refill and bleed the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).

Engine - V6 4.0L Petrol - Valve Cover LH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the fuel rail.
For additional information, refer to: [Fuel Rail](#) (303-04E Fuel Charging and Controls - V6 4.0L Petrol, Removal and Installation).
3. Position the injector harness aside.

- Release the 2 clips.
- Disconnect the 3 fuel injector electrical connectors.

4. Disconnect the 3 electrical connectors.

- Release the harness clip from the filler neck.
- Noting the installed position of the Knock sensor electrical harness in relation to the oil filler tube, remove and discard the cable tie.

5.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the valve cover.

- Remove the 3 bolts.
- Remove the 3 studs.

6. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove and discard the gasket.

7. NOTE: Note the fitted position.

Remove the bolts and studs. Remove and discard the seals.

E54169

8. Remove the camshaft position (CMP) sensor.

- Remove the bolt.
- Remove and discard the O-ring seal.

9. Remove the engine breather valve.

- Remove and discard the O-ring seal.

10. Remove the oil filler cap.

E54170

Installation

1. Install the oil filler cap.
2. Install the engine breather valve.
 - Install a new O-ring seal.
3. Install the CMP sensor.
 - Install a new O-ring seal.
 - Tighten the bolt to 6 Nm (4 lb.ft).
4. Install the bolts and studs.
 - Install the new O-ring seals.
 - Install the new gasket.
5. Install the valve cover.
 - Clean the component mating faces.
 - Evenly and progressively tighten the bolts and studs, in the sequence shown, to 10 Nm (7 lb.ft).
 - Secure the electrical harness with the clip.
6.  **CAUTION:** Make sure the knock sensor electrical harness is returned to the original fitted position.

Install the injector harness.

 - Secure with the clips.
 - Connect the fuel injector electrical connectors.
 - Connect the 3 electrical connectors.
 - Install a new cable tie.
7. Install the fuel rail.

For additional information, refer to: [Fuel Rail](#) (303-04E Fuel

Charging and Controls - V6 4.0L Petrol, Removal and Installation).

- 8.** Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Valve Cover RH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the fuel rail.
For additional information, refer to: [Fuel Rail](#) (303-04E Fuel Charging and Controls - V6 4.0L Petrol, Removal and Installation).
3. Position the injector harness aside.

- Release the 2 clips.
- Disconnect the 3 fuel injector electrical connectors.

4.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the valve cover.

- Release the wiring harness retaining clip.
- Remove the 2 bolts.
- Remove the 4 studs.

5. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove and discard the gasket.

6. **NOTE:** Note the fitted position.

Remove the bolts and studs. Remove and discard the seals.

Installation

1. Install the bolts and studs.

- Install the new O-ring seals.

- Install the new gasket.

2. Install the valve cover.

- Clean the component mating faces.

- Evenly and progressively tighten the bolts and studs, in the sequence shown, to 10 Nm (7 lb.ft).

- Secure the electrical harness with the clip.

3. Install the injector harness.

- Secure with the clips.

- Connect the fuel injector electrical connectors.

4. Install the fuel rail.

For additional information, refer to: [Fuel Rail](#) (303-04E Fuel Charging and Controls - V6 4.0L Petrol, Removal and Installation).

5. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Camshaft Roller Follower

In-vehicle Repair

Special Tool(s)	
	Camshaft roller follower remover/replacer
	303-581

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the LH valve cover.
For additional information, refer to: [Valve Cover LH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
3. Remove the RH valve cover.
For additional information, refer to: [Valve Cover RH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
4. Remove the viscous fan assembly.
For additional information, refer to: [Cooling Fan](#) (303-03C Engine Cooling - V6 4.0L Petrol, Removal and Installation).
5. **NOTE:** Make sure the camshaft lobe is opposite the camshaft roller follower, prior to removal.

- **NOTE:** Mark each camshaft roller follower and lash adjuster. Make sure each component is returned to its original fitted position.

Using the special tool, remove the camshaft roller followers.

- Depress the valve spring.

E54331

6. Rotate the engine as required to access the remaining camshaft roller followers.

E54332

7. Remove the hydraulic lash adjusters.

Installation

1. **NOTE:** Install the components to their original fitted positions.

Install the hydraulic lash adjusters.

- Clean the component mating faces.
- Lubricate the components with clean engine oil.

2. **NOTE:** Install the components to their original fitted positions.

Using the special tool, install the camshaft roller followers.

- Clean the component mating faces.
- Lubricate the components with clean engine oil.
- To install, reverse the removal procedure.

3. Rotate the engine as required to access the remaining camshaft roller followers.

4. Install the viscous fan assembly.

For additional information, refer to: [Cooling Fan](#) (303-03C Engine Cooling - V6 4.0L Petrol, Removal and Installation).

5. Install the RH valve cover.

For additional information, refer to: [Valve Cover RH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

6. Install the LH valve cover.

For additional information, refer to: [Valve Cover LH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

7. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Engine Mount LH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the LH exhaust manifold.
For additional information, refer to: [Exhaust Manifold LH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

4. Release the starter motor cable.

- Release the terminal cover.
- Remove the terminal nut insulator.
- Remove the nut.

E45827

5.  **CAUTION:** Protect the engine during this operation.

Remove the engine mount bracket.

- Support the engine.
- Remove the 4 bolts.

E55584

6. Remove the engine mount.

- Remove and discard the 2 bolts.

Installation

1. Install the engine mount.

- Clean the component mating faces.
- Tighten the new bolts to 45 Nm (33 lb.ft), then a further 60 degrees.

2. Install the engine mount bracket.

- Clean the component mating faces.
- Tighten the bolts to 80 Nm (59 lb.ft).
- Remove the engine support.

3. Connect the starter motor cable.

- Tighten the nut to 10 Nm (7 lb.ft).
- Install the terminal nut insulator.
- Install the cover.

4. Install the exhaust manifold.

For additional information, refer to: [Exhaust Manifold LH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

5. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Engine Mount RH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the RH exhaust manifold.
For additional information, refer to: [Exhaust Manifold RH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

4.  **CAUTION:** Protect the engine during this operation.

Remove the engine mount bracket.

- Support the engine.
- Remove the nut.
- Remove the 4 bolts.

E53759

5. Remove the engine mount.

- Remove and discard the 2 bolts.

E53760

Installation

1. Install the engine mount.
 - Clean the component mating faces.
 - Tighten the new bolts to 45 Nm (33lb.ft), then a further 60 degrees.
2. Install the engine mount bracket.
 - Clean the component mating faces.
 - Tighten the bolts to 80 Nm (59 lb.ft).
 - Remove the engine support.
 - Tighten the nut to 90 Nm (66 lb.ft).
3. Install the exhaust manifold.
For additional information, refer to: [Exhaust Manifold RH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
4. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Flexplate

In-vehicle Repair

Special Tool(s)	
 <p>303-947</p> <p>E55482</p>	<p>Flex plate locking tool</p> <p>303-947 (LRT-12-145)</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the transmission.
For additional information, refer to: [Transmission](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, Removal and Installation).

4. Flexplate alignment.

- Rotate the crankshaft until number 1 cylinder is at TDC. The timing hole in the flexplate will be horizontal as shown.
- Using the special tool, lock the flexplate.
- Remove the Torx bolt shown to reveal the timing notch.
- Mark the position of the bolt hole with the notch in relation to the crankshaft.

5. Remove the torque converter flexplate.
 - Remove the 7 remaining Torx bolts.
 - Remove the spacer.

Installation

1. Install the torque converter flexplate.

- Clean the component mating faces.
- Install the spacer.
- Align the bolt hole with the alignment notch, to the mark previously made on the crankshaft.
- Using the special tool, lock the flexplate.
- Tighten the Torx bolts evenly in 2 stages, in the sequence shown.
- Tighten the Torx bolts to 15 Nm (11 lb.ft).
- Tighten the Torx bolts to 72 Nm (53 lb.ft)

2. Install the transmission.
For additional information, refer to: [Transmission](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, Removal and Installation).

- 3.** Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Oil Pump

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the front wheels and tires.
4. Remove the cylinder block cradle.
For additional information, refer to: [Cylinder Block Cradle](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
5. Remove the oil pump assembly.
 - Remove the 2 Torx screws.
 - Remove the driveshaft.

E54293

6. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the oil pickup pipe.

- Remove the 3 Torx screws.
- Remove and discard the seal.

E54294

Installation

1. Install the oil pickup pipe.

- Clean the component mating faces.
- Install a new seal.
- Tighten the Torx screws to 10 Nm (7 lb.ft).

2.  CAUTION: The oil pump driveshaft is not symmetrical. The longer end shown, is fitted into the oil pump.

Install the oil pump assembly.

- Clean the component mating faces.
- Prime the oil pump.
- Install the driveshaft.
- Tighten Torx screws to 20 Nm (15 lb.ft).

E54292

3. Install the cylinder block cradle.
For additional information, refer to: [Cylinder Block Cradle](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
4. Install the front wheels and tires.
5. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Oil Pan

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Drain the engine oil.
For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01C Engine - V6 4.0L Petrol, General Procedures).
4. Release the harness bracket.

- Remove the 2 nuts.

5. Remove the oil pan.

- Remove the 10 bolts.
- Remove and discard the gasket.

Installation

1. Install the oil pan.
 - Clean the component mating faces.
 - Install a new gasket.
 - Evenly and progressively tighten the bolts to 10 Nm (7 lb.ft).
2. Install the harness bracket.
 - Tighten the nuts to 6 Nm (4 lb.ft).
3. Fill the engine with oil.
For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01C Engine - V6 4.0L Petrol, General Procedures).
4. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Oil Cooler

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the oil filter.

- Position a container to collect the fluid.

E55418

4. **NOTE:** Note the fitted position of the oil cooler assembly.

Remove the oil filter adapter.

- Release the cooler from the oil filter head.

5. Clamp, then disconnect the coolant hoses from the oil cooler.

E55419

6. Remove the oil cooler.

Installation

1. **NOTE:** Fill the oil cooler with coolant to eliminate the air, prior to connecting the coolant hoses.

To install, reverse the removal procedure.

- Tighten the adapter to 60 Nm (44 lb.ft)
- Lubricate the oil filter seal with clean engine oil and tighten to 18 Nm (13 lb.ft).

2. Check and top-up the engine oil.
3. Top-up and bleed the coolant.

Engine - V6 4.0L Petrol - Engine Front Cover

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
3. Remove the intake manifold.
For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
4. Remove the crankshaft pulley.
For additional information, refer to: [Crankshaft Pulley](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
5. Remove the cooling fan lower shroud.
 - Release 2 clips from the cooling fan lower shroud.
 - Release and remove the cooling fan lower shroud from the cooling pack.

E45533

6. Position the A/C compressor mounting bracket assembly aside.
 - Remove the 4 bolts.
 - Tie aside.

E55122

7. Disconnect the 2 hoses from the coolant pump.

- Release the cylinder head coolant flange, to aid coolant hose removal.
- Remove the 3 bolts.
- Position the coolant hoses aside for access.

8. Disconnect the engine ground cable.

- Remove the nut.

9. Release the transmission line support bracket.

- Remove the nut.
- Position aside.

10. Remove the engine front cover.

- Remove the 5 studs.
- Remove the 4 bolts.
- Remove the 5 cylinder cradle bolts.
- Remove and discard the gasket.

11. NOTE: Do not disassemble further if the component is removed for access only.

Remove the coolant pump.

- Remove the 12 bolts.
- Remove and discard the gasket.

E55127

Installation

1. Install the coolant pump.

- Clean the component mating faces.
- Install the new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

2.  **CAUTION:** Care must be taken when removing sealant from gasket faces, prevent damage to the mating faces.

• **NOTE:** The component must be installed within 20 minutes of the sealant application.

• **NOTE:** Make sure the cylinder block cradle gasket is located correctly around the front oil seal.

Install the engine front cover.

- Clean the component mating faces.
- Spirit wipe the gasket mating faces.
- Install a new gasket.
- Apply sealant to the 4 places shown.

3. NOTE: Tighten the bolts in two stages.

Install the engine front cover bolts.

- Evenly and progressively tighten the bolts and studs to 8 Nm (6 lb.ft).
- Tighten the M6 bolts to 10 Nm (7 lb.ft).
- Tighten the M8 bolts and studs to 20 Nm (15 lb.ft).

4. Install the transmission support bracket.

- Tighten the nut to 20 Nm (15 lb.ft).

5. NOTE: Care must be taken when installing the ground connections. The engine will fail to start on either or both banks if the ground is poor.

Connect the engine ground cable, make sure the mating faces are clean.

- Tighten the nut to 20 Nm (15 lb.ft).

6. Install the A/C compressor mounting bracket assembly.

- Release the cable tie.
- Tighten the bolts to 45 Nm (33 lb.ft).

7. Install the crankshaft pulley.

For additional information, refer to: [Crankshaft Pulley](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

8. Install the cooling fan shroud.

9. Install the intake manifold.

For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

10. Refill and bleed the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).

11. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Timing Drive Components

In-vehicle Repair

Special Tool(s)	
 <p>303-674</p> <p>E55101</p>	<p>Crankshaft rotating tool</p> <p>303-674</p>

Removal

• NOTE: This procedure covers the removal and installation of the following components: Primary timing chain tensioner, timing chain guide, jackshaft sprocket, crankshaft sprocket and timing chain.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine front cover.
For additional information, refer to: [Engine Front Cover](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
3. Remove the primary timing chain tensioner.
 - Remove the 2 bolts.

4. Remove the primary timing chain tensioner guide.
 - Remove the 2 bolts.

5. Install the special tool to the crankshaft.

6. Remove the jackshaft sprocket.

- Using an additional wrench and the special tool, restrain the jackshaft sprocket.
- Remove and discard the Torx bolt.

7. NOTE: Note the fitted position.

Remove the crankshaft sprocket.

- Remove the primary timing chain.

Installation

1. Install the primary timing chain.

- Clean the component mating faces.
- Install the crankshaft sprocket, the recessed face locates to the crankshaft side.
- Install the special tool to the crankshaft.

2. Install the jackshaft sprocket.

- Clean the component mating faces.
- Locate the primary timing chain to the sprockets.
- Install a new Torx bolt, lightly tighten at this stage.

3. Install the timing chain guide.

- Clean the component mating faces.
- Tighten the bolts to 20 Nm (15 lb.ft).

4. Install the timing chain tensioner.

- Clean the component mating faces.
- Tighten the bolts to 10 Nm (7 lb.ft).

5. Tighten the new Torx bolt to 45 Nm (33 lb.ft), then a further 70 degrees.

6. Install the engine front cover.

For additional information, refer to: [Engine Front Cover](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

7. Adjust the valve timing.

For additional information, refer to: [Camshaft Timing](#) (303-01C Engine - V6 4.0L Petrol, General Procedures).

8. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information,

Specifications).

Engine - V6 4.0L Petrol - Camshaft Drive Cassette LH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the cylinder head LH assembly.
For additional information, refer to: [Cylinder Head LH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
3. Remove the timing drive components.
For additional information, refer to: [Timing Drive Components](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
4. Remove the camshaft drive cassette assembly.
 - Remove the bolt retaining the chain guide.

5. **NOTE: Do not disassemble further if the component is removed for access only.**

Disassemble the cassette assembly.

- Release the cable tie.
- Remove the sprockets and the chain.
- Clean and inspect the components for deterioration.

Installation

1. Assemble the cassette assembly.
 - Install the chain and the sprockets.
 - Secure with a cable tie.
2. Install the camshaft drive cassette assembly.
 - Tighten the bolt to 25 Nm (18 lb.ft).
3. Install the timing drive components.
For additional information, refer to: [Timing Drive Components](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
4. Install the cylinder head LH assembly.
For additional information, refer to: [Cylinder Head LH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
5. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Camshaft Drive Cassette RH

In-vehicle Repair

Special Tool(s)	
 E55195	Sprocket holding tool RH rear cassette 303-643

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the RH cylinder head assembly.
For additional information, refer to: [Cylinder Head RH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
3. Remove the torque converter flexplate.
For additional information, refer to: [Flexplate](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
4. Remove the cylinder block jackshaft plug.
 - Drift to release.

5. Using the special tool, remove the RH cassette jackshaft drive, sprocket bolt.
 - Remove and discard the Torx bolt.

6. Remove the camshaft drive cassette assembly.

- Remove the bolt retaining the chain guide.
- Remove and discard the O-ring seal.

7. **NOTE:** Do not disassemble further if the component is removed for access only.

Disassemble the cassette assembly.

- Release the cable tie.
- Remove the sprockets and the chain.
- Clean and inspect the components for deterioration.

Installation

1. Assemble the cassette assembly.

- Install the chain and the sprockets.
- Secure with a cable tie.

2. Install the camshaft drive cassette assembly.

- Install a new O-ring seal.
- Tighten the bolt to 12 Nm (9 lb.ft).

3. Using the special tool, tighten the new jackshaft sprocket bolt to 40 Nm (30 lb.ft), then a further 45 degrees.

4. Install the cylinder block jackshaft plug.

- Clean the component mating faces.

5. Install the torque converter flexplate.

For additional information, refer to: [Flexplate](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

6. Install the cylinder head RH assembly.

For additional information, refer to: [Cylinder Head RH](#) (303-01C

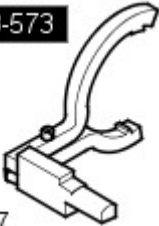

Engine - V6 4.0L Petrol, In-vehicle Repair).

7. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Engine Dynamic Balance Shaft

In-vehicle Repair

Special Tool(s)	
 <p>303-573</p> <p>E54427</p>	Crankshaft TDC timing/locking tool
	303-573

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the front wheels and tires.
4. Remove the cylinder block cradle.
For additional information, refer to: [Cylinder Block Cradle](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
5. Remove the balance shaft.
 - Remove the 4 Torx bolts.
 - Remove the drive chain tensioner.
 - Remove the tensioner blade.

E54644

Installation

E54645

1. NOTE: Vehicles fitted with early type balance shaft.

- NOTE: Due to the gear ratio, it may be necessary to rotate the balance shaft up to 7 complete turns to find the correct position.

Align the balance shaft.

- Clean the components.
- Lubricate the components.
- Install a 4 mm (0.16 in) pin to lock the shaft as shown.

E128709

2. NOTE: Vehicles fitted with later type balance shaft.

- NOTE: If a new balance shaft is being fitted make sure the timing pin is not removed prior to fitting.

- NOTE: Due to the gear ratio, it may be necessary to rotate the balance shaft up to 7 complete turns to find the correct position.

Align the balance shaft.

- Clean the components.
- Lubricate the components.
- Install a 4 mm (0.16 in) pin to lock the shaft as shown and that the shaft can not rotate.
- Make sure the drive gear timing marks are aligned as shown.

E54646

3. Rotate crankshaft clockwise until number one cylinder is at TDC and install the special tool.

4. Install the balance shaft.

- Clean the component mating faces.
- Engage the drive chain.
- Install the drive chain tensioner.
- Tighten the Torx bolts to 15 Nm (11 lb.ft).
- Tighten a further 90 degrees.
- Remove the locking pin.
- Remove the special tool.

5. Install the cylinder block cradle.

For additional information, refer to: [Cylinder Block Cradle](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

6. Install the front wheels and tires.

7. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Jackshaft

In-vehicle Repair

Special Tool(s)	
 <p>303-634</p> <p>E55195</p>	Sprocket holding tool RH rear cassette 303-643

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the torque converter flexplate.
For additional information, refer to: [Flexplate](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
3. Remove the cylinder block jackshaft plug.
 - Drift to release.

4. Using the special tool, remove the RH cassette jackshaft drive, sprocket bolt.
 - Remove and discard the Torx bolt.

5. Remove the camshaft drive cassette LH assembly.
For additional information, refer to: [Camshaft Drive Cassette LH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

6. Remove the oil pump drive gear.

- Remove the bolt.
- Remove the clamp.
- Remove and discard the O-ring seal.

7. Remove the jackshaft thrust plate.

- Remove the 2 Torx bolts.

E55202

8. Remove the jackshaft.

- Collect the spacer.

E55203

Installation

1. Install the jackshaft.

- Clean the component mating faces.
- Install the jackshaft spacer.
- Lubricate the components with clean engine oil.

2. NOTE: The groove in the thrust plate must face the cylinder block.

Install the jackshaft thrust plate.

- Clean the component mating faces.
- Lubricate the components with clean engine oil.
- Tighten the Torx bolts to 10 Nm (7 lb.ft).

E55204

3. Install the oil pump drive gear.

- Clean the components.
- Lubricate the components with clean engine oil.
- Install a new O-ring seal.
- Install the clamp.
- Tighten the bolt to 20 Nm (15 lb.ft).

4. Install the camshaft drive cassette LH assembly.

For additional information, refer to: [Camshaft Drive Cassette LH](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

5. Using the special tool, install the RH cassette jackshaft drive, sprocket bolt.

- Clean the component mating faces.
- Using the special tool, tighten the new jackshaft sprocket bolt to 40 Nm (30 lb.ft), then a further 45 degrees.

E55200

6. Install the cylinder block jackshaft plug.

- Clean the component mating faces.

7. Install the torque converter flexplate.

For additional information, refer to: [Flexplate](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

8. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Hydraulic Timing Chain Tensioner LH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the intake manifold.
For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).

3.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the LH hydraulic timing chain tensioner.

Installation

1. Install the LH hydraulic timing chain tensioner.
 - Clean the component mating faces.
 - Tighten the tensioner to 45 Nm (33 lb.ft).
2. Install the intake manifold.
For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Hydraulic Timing Chain Tensioner RH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the RH hydraulic timing chain tensioner.

Installation

1. Install the RH hydraulic timing chain tensioner.
 - Clean the component mating faces.
 - Tighten the tensioner to 45 Nm (33 lb.ft).
2. Install the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Intake Manifold

In-vehicle Repair

Special Tool(s)	
	Fuel spring lock decoupling tool
	310-044

Removal

• **NOTE:** Removal of the intake manifold on early vehicles will involve the partial dismantling of the fuel rail and the removal of the purge valve and mounting bracket. Once removed, it will also be necessary to remove some excess material from the intake manifold, see 'installation' steps 1 and 2.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Secure the hood in the service position.
 - Release the support struts.
3. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Remove the air intake resonator.
For additional information, refer to: [Intake Air Resonator](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Removal and Installation).
5. Disconnect the throttle body electrical connector.

6. Disconnect the intake manifold coolant hose.
 - Clamp the relevant hose, to minimise coolant loss.
 - Release the clip.

7. Disconnect the throttle body coolant hose.
 - Clamp the hose to minimise coolant loss.
 - Release the clip.

8.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the crankcase vent hose.

9. Remove the RH crankcase vent hose.

10. Disconnect the EGR valve electrical connector.

11. Disconnect the EGR valve feed pipe.

- Loosen the EGR valve feed pipe union nut, at the exhaust manifold.
- Disconnect the union nut, securing the EGR pipe to the valve.

12. Disconnect the intake manifold vacuum pipe assembly.

13. Disconnect the intake manifold tuning valve electrical connector.

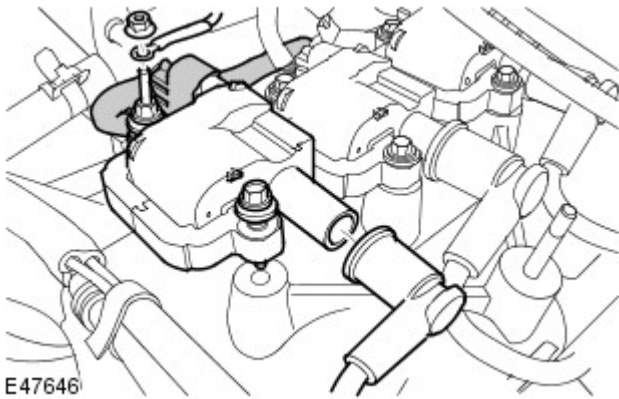

14. Release the purge line from the intake manifold.

- Remove the clip retaining bolt.
- Collect the spacer.

15. Release the coil wiring harness.

- Release the 6 clips.
- Remove the 2 coil harness ground nuts.

16. Disconnect the 6 coil electrical connectors.

17. NOTE: Note the fitted position of the fasteners.

Remove the 2 rear ignition coils.

- Disconnect the sparking plug lead elbows at the coils.
- Remove the 2 bolts and 2 studs.
- Discard the fastener O-rings to aid installation.

18. Disconnect the HT leads at the sparking plugs.

- Position the leads aside.

19. Position the engine wiring harness aside for access.

20. Remove the 8 intake manifold bolts.

21. NOTE: The type of clip may vary depending on the hand of drive.

Release the intake manifold wiring harness clip.

22. WARNINGS:

 Place the vehicle in a well ventilated, quarantined area and arrange 'No Smoking/Petrol Fumes' signs about the vehicle.

 The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

 Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

 If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Using the special tool, disconnect the fuel line.

- Remove the security clip.
- Early vehicles only: Remove 4 bolts and release the fuel rail and injectors.
- Early vehicles only: Disconnect the LH and RH cylinder head, rear fuel injector electrical connectors.
- Early vehicles only: Remove the bolt and release the valve cover fuel line clip.
- Early vehicles only: Cable tie the purge valve to the wiring harness.

E47657

23. CAUTIONS:

⚠ Early vehicles only: The purge valve and mounting bracket are bolted to the rear of the intake manifold and foul the fuel rail crossover link. Damage will occur if force is used when attempting to remove the intake manifold. If this occurs, remove the LH side, battery tray inner wall and base, for access to the purge valve bolt.

⚠ Care must be taken to avoid damaging the purge valve assembly during removal of the intake manifold.

• NOTE: Due to the lack of access it may be necessary to break the engine and transmission wiring harness clips, care must be taken not to damage the wiring harnesses.

Release and then remove the intake manifold.

- Discard the gaskets.
- Install blanking caps to the exposed ports.

24. NOTE: Do not disassemble further if the component is removed for access only.

Remove the throttle body.

- Remove the 4 bolts.
- Remove and discard the throttle body gasket.
- Disconnect the coolant hose.

E47221

25. Disconnect the EGR valve vacuum hose.

- Disconnect and remove the vacuum hose at the intake manifold.

E63832

26. Remove the EGR valve.

- Remove the 2 bolts.
- Collect and discard the gasket.

27. Remove the remaining ignition coils.

- Disconnect the sparking plug lead elbows at the coils.
- Remove the bolts and studs. Remove and discard the seals.

28. Remove the HT leads.

- Release the 6 plug lead clips.

29. Remove the intake manifold tuning valve.

- Remove the 2 bolts.
- Discard the O-ring seal.

Installation

E55731

1.  **WARNING:** Make sure there are no sharp edges after removing material.

Early vehicles only: Remove the center casting lug.

E55732

2. Early vehicles only: Remove excess material from the outside edges of the 6 intake manifold flange faces; file to within 2 mm of the gasket edge.

3. Early vehicles only: Install the fuel rail and injectors.

- Clean the component mating faces.
- Tighten the bolts to 25 Nm (18 lb.ft).
- Connect the fuel injector electrical connectors.
- Tighten the M6 bolt to 10 Nm (7 lb.ft).

4. Install the intake manifold tuning valve.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the bolts to 10 Nm (7 lb.ft).

5. Secure the HT leads to the intake manifold with clips.

6. **NOTE:** Note the fitted position of the fasteners.

Install the 4 ignition coils.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the studs to 6 Nm (4 lb.ft).
- Connect the HT electrical connections.

7. Install the EGR valve.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 25 Nm (18 lb.ft).

8. Connect the vacuum hose to the EGR valve.
9. Connect the EGR vacuum hose to the intake manifold.
 - Clean the component mating faces.
 - Connect the vacuum hose to the EGR valve.
10. Install the throttle body.
 - Clean the component mating faces.
 - Install a new gasket.
 - Tighten the 4 bolts to 10 Nm (7 lb.ft).
11. Install the throttle body coolant hose.
 - Secure the clip.
 - Remove the hose clamp.
12. Secure the wiring harness to the intake manifold.
 - Secure the wiring harness clip.

E47658

13.  **CAUTION:** Care must be taken prior to tightening the intake manifold bolts. Make sure the electrical harness, vacuum and purge valve lines are not trapped.

- **NOTE:** To aid installation: Position a Torx drive and extension, to the rear LH bank intake manifold Torx bolt, prior to installing the intake manifold. Retain with tape.
- **NOTE:** The ignition coils are removed from the illustration for clarity.

Install the intake manifold.

- Clean the component mating faces.
 - Install the gaskets.
 - Evenly and progressively tighten the bolts in the sequence shown to 10 Nm (7 lb.ft).
14. Install the remaining ignition coils.
 - Tighten the bolts to 6 Nm (4 lb.ft).
 - Tighten the studs to 6 Nm (4 lb.ft).
 - Connect the HT electrical connections.
 15. Connect the ignition coil electrical connectors.
 16. Connect the fuel line to the fuel rail.
 - Clean the component mating faces.
 - Install the clip.
 17. Secure the coil wiring harness.
 - Connect the coil harness ground cables.
 - Tighten the nuts to 6 Nm (4 lb.ft).
 - Position and secure the clips.
 18. Connect the intake manifold tuning valve electrical connector.
 19. Connect the vacuum pipe to the inlet manifold.
 20. Secure the purge line to the intake manifold.
 - Install the spacer.
 - Install the bolt.
 - Tighten the bolt to 6 Nm (4 lb.ft).
 21. Connect the crankcase vent hose.
 - Clean the component mating faces.

- Secure the clip.
- Remove the hose clamp.

23. Install the air intake resonator.

For additional information, refer to: [Intake Air Resonator](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Removal and Installation).

24. Install the engine cover.

For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

25. Connect the hood support struts.

26. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

27. Check and top-up the coolant.

Engine - V6 4.0L Petrol - Exhaust Manifold LH

In-vehicle Repair

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Right-hand drive vehicles

3. Release the battery positive cable.
 - Loosen the clamp.
 - Release the grommet.

Right-hand drive vehicles

4. Release the wiring harness clip.
 - Remove the bolt.

All vehicles

5.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

6. Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

7. Release the exhaust system from the exhaust manifold.

- Remove and discard the 2 bolts.

8. Lower the vehicle.

9.  CAUTION: Protect the engine during this operation.

Raise the engine clear of its LH mount.

- Remove the nut.

10.  CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the EGR pipe.

- Release the 2 union nuts.

11. Disconnect the high tension (HT) electrical connectors.

- Move the leads aside for access.

12.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the dipstick tube.

- Remove the dipstick.
- Remove the bolt.
- Discard the O-ring seal.

13. Remove the exhaust manifold.

- Remove the 6 nuts.
- Remove and discard the gasket.

Installation

All vehicles

1. **NOTE:** The exhaust manifold gasket connecting links must be positioned to the lower edge of the manifold.

Install the exhaust manifold.

- Install a new gasket.
- Clean the component mating faces.
- Tighten the nuts evenly in the sequence shown to 25 Nm (18 lb.ft).

E53884

2. Install the dipstick tube.

- Clean the component mating faces.
- Install a new O-ring seal.
- Lubricate the seal with clean engine oil.
- Tighten the bolt to 10 Nm (7 lb.ft).
- Install the dipstick.

3. Connect the HT electrical connectors.

4. Install the EGR pipe.

- Clean the component mating faces.
- Initially, finger tighten the nuts.
- Finally, tighten the nuts to 40 Nm (30 lb.ft).

5. Lower the engine onto its mount.
 - Tighten the nut to 90 Nm (66 lb.ft).
6. Raise the vehicle.
7. Install the exhaust system.
 - Clean the component mating faces.
 - Install new bolts and tighten to 40 Nm (30 lb.ft).
8. Install the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).
9. Lower the vehicle.

Right-hand drive vehicles

10. **NOTE:** Apply petroleum jelly to the battery terminals.

Connect the battery positive cable.

- Clean the component mating faces.
- Install the grommet.
- Tighten the clamp nut to 10 Nm (7 lb.ft).

Right-hand drive vehicles

11. Secure the wiring harness clip.
 - Tighten the bolt to 10 Nm (7 lb.ft).

All vehicles

12. Install the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
13. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Exhaust Manifold RH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Release the exhaust system from the exhaust manifold.
 - Remove and discard the 2 bolts.

E47760

5. Lower the vehicle.
6. Disconnect the high tension (HT) electrical connectors.
 - Move the leads aside for access.

E47761

7. Remove the exhaust manifold.
 - Remove the 6 nuts.
 - Remove and discard the gasket.

E47762

Installation

E47773

1. Install the exhaust manifold.

- Clean the component mating faces.
- Install a new gasket.
- Evenly and progressively, tighten the nuts to 25 Nm (18 lb.ft).

2. Connect the HT electrical connectors.

3. Raise the vehicle.

4. Install the exhaust system.

- Clean the component mating faces.
- Install new bolts and tighten to 40 Nm (30 lb.ft).

5. Lower the vehicle.

6. Install the engine cover.

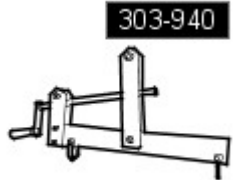

For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

7. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 4.0L Petrol - Engine

Removal

Special Tool(s)	
 <p>303-1147</p> <p>E55563</p>	<p>Engine lifting cradle - 4.0L</p> <p>303-1147</p>
 <p>303-940</p> <p>E61659</p>	<p>Engine lifting bracket</p> <p>303-940 (LRT-12-138)</p>
 <p>303-940/1</p> <p>E61731</p>	<p>Lifting chains</p> <p>303-940/1</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Secure the hood in the service position.
3. Raise and support the vehicle.
4. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
5. Drain the engine oil.
For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01C Engine - V6 4.0L Petrol, General Procedures).
6. **NOTE:** Early vehicles will require the partial release of the fuel rail, to allow the intake manifold to be removed.

Remove the intake manifold.
For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
7. Remove the battery tray.
For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

8. Disconnect the 2 ECM electrical connectors.

9. Release the wiring harness from the plenum.

- Release the 2 clips.
- Position the wiring harness aside.

10. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).

11. Remove the lower fan shroud.

- Release 2 clips from the cooling fan lower shroud.

12. Install a shield to protect the radiator core from damage.

13. Disconnect the generator electrical connectors.

- Disconnect the electrical connector.

E47581

14. Position the generator mounting bracket aside.

- Remove the 3 bolts.
- Release the wiring harness clip.
- Remove and discard the cable tie.

E54635

15.  CAUTION: The A/C system will remain fully charged during this procedure, care must be taken when positioning the assembly aside.

Position the A/C compressor mounting bracket assembly aside.

- Disconnect the A/C compressor electrical connector.
- Release the LH KS electrical connector retaining clip.
- Remove the 4 bolts.

E55565

16. Disconnect the engine oil pressure (EOP) sensor electrical connector.

E48092

17. Disconnect the engine ground cable.

- Remove the nut.

18. Release the transmission cooler pipes.

- Remove the nut.
- Position aside.

19. Remove the EGR pipe.

- Loosen the EGR union nut and release the pipe.

20. Check the road wheels are in the straight ahead position, then remove the upper clamp bolt.

- Discard the retaining bolt.

21. Remove the steering gear universal joint clamp bolt.

- Discard the retaining bolt.

22. Release the upper steering column shaft.

23. Release and remove the shaft and joint assembly.

24. Release the coolant pump hose.

- Position aside.
- Release from the clip.

25. Disconnect the 2 engine oil cooler, coolant hoses.

- Release the 2 clips.

26. Remove the transmission heat shield.

- Remove the 4 bolts.

27. Disconnect the LH catalyst monitor sensor electrical connector.

- Release HO2S harness from bracket.

28. Disconnect the LH catalytic converter from the exhaust manifold.

- Remove the 2 bolts.

29. Disconnect the RH catalyst monitor sensor electrical connector.

- Release HO2S harness from bracket.

30. Disconnect the RH catalytic converter from the exhaust manifold.

- Remove the 2 bolts.

31. Disconnect the engine oil temperature sensor electrical connector.

32. Release the starter motor.

- Remove the 2 bolts.

33. Release the harness bracket.

- Remove the 2 nuts.

34. Disconnect the crankshaft position (CKP) sensor electrical connector.

E63835

35. Install the engine lifting bracket.

- Tighten the bolts to 45 Nm (33 lb.ft).
- Evenly and progressively, tighten the nuts to 25 Nm (18 lb.ft).

E55570

36. Release the flexplate.

- Rotate the crankshaft to access the retaining bolts.
- Remove the 4 bolts.

E46536

37. Release the fuel pipe and purge line heat shield.

- Remove the 2 bolts.
- Position the fuel line shield aside for access.

38.  **WARNING:** Support the engine. The engine will fall forward when the transmission is removed.

Remove the transmission bolts.

- Connect the lifting chains.
- Support the transmission.
- Remove the 8 bolts.

39.  **WARNING:** Make sure the torque converter remains with the transmission.

Remove the engine.

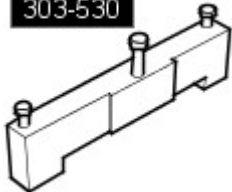

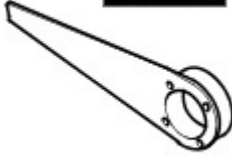

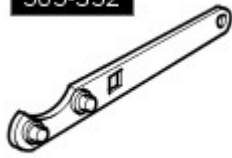

- Remove the 2 engine mount nuts.
- Remove the engine RH mount.
- Raise the engine.
- With assistance, carefully remove the engine.

40. Install the torque converter retainer.

Engine - V6 4.0L Petrol - Engine

Disassembly

Special Tool(s)	
<p>303-645</p>  <p>E46881</p>	<p>Timing Setting tool</p> <p>303-645</p>
<p>303-530</p>  <p>E46879</p>	<p>Camshaft setting/locking tool</p> <p>303-530</p>

<p>303-532</p>  <p>E46880</p>	<p>Timing chain tensioning tool</p> <p>303-532</p>

Disassembly

1. Remove the engine assembly.
2. Secure the engine to the engine stand.
 - Align the engine to the engine stand.
 - Adjust the engine stand legs into position.
 - Mount the engine to an engine stand.
 - Fully tighten the engine stand leg nuts.
3. Release the camshaft position (CMP) sensor connector block from the intake manifold assembly.

4. Remove the coolant manifold.
 - Remove the 4 bolts.
 - Disconnect the electrical connector.

5. Position the wiring harness support bracket aside for access.
 - Remove the 2 bolts.

6. NOTE: RH illustration shown, LH is similar.

Remove both the ignition coil-on-plug covers.

- Release from the 2 clips.

7. NOTE: RH illustration shown, LH is similar.

Disconnect the 8 ignition coil-on-plug electrical connectors.

8. Remove the 8 ignition coil-on-plugs.

- Remove the 8 bolts.

9. Disconnect the valve cover breather hose.

- Disconnect the variable camshaft timing (VCT) oil control solenoid electrical connector.
- Repeat the operation for the other side.

10. Disconnect the engine coolant temperature (ECT) sensor electrical connector.

11. Disconnect the CMP sensor electrical connector.

- Repeat the above procedure for the RH side.

12. Disconnect the cylinder head earth connector.

- Remove the bolt.
- Release the 3 clips.

13. Disconnect the knock sensors (KS) electrical connector.

14. Release the purge valve from the mounting bracket.

- Disconnect the quick release connector.
- Disconnect the electrical connector.
- Remove the bolt.

15. Release the 5 air conditioning (A/C) harness retaining clips.

16. Remove the crankshaft position (CKP) sensor.

- Disconnect the electrical connector.
- Remove the Torx screw.

17. Remove the power steering pump mounting bracket.

- Remove the 3 bolts.
- Release the transmission cooler pipe clips.

18. Remove the A/C compressor mounting bracket.

- Remove the 2 bolts.

19. Disconnect the starter motor connector.

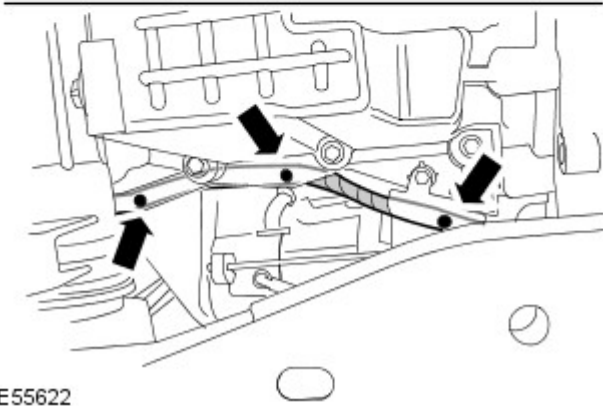

20. Disconnect the oil temperature and oil pressure sensors.

21. Disconnect the generator connector.

22. Release the 4 clips securing the generator harness.

E55622

23. Remove the 10 intake manifold bolts.

E45489

24.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the intake manifold.

- Disconnect the brake booster vacuum hose from the intake manifold.
- Discard the gaskets.
- Disconnect the manifold absolute pressure (MAP) sensor electrical connector.

E45490

25. Remove the accessory drive belt idler pulley.

- Remove the bolt.

26. Remove the coolant pump pulley.

- Remove the 3 bolts.

27. Remove the coolant pump.

28. Remove the generator.

- Disconnect the electrical connector.
- Remove the 3 bolts.

E58895

29. Remove the generator mounting bracket.

- Remove the 4 bolts.

E58798

30. Remove the oil level indicator and tube.

- Remove the nut.
- Discard the O-ring seal.

31. Remove the RH valve cover.

- Remove the 14 valve cover retaining bolts.
- Remove and discard the valve cover gasket.
- Remove and discard the valve cover plug aperture seals.
- Repeat the operation for the LH side.

32. Remove the engine front cover.

- Release the engine wiring harness clips.
- Remove the 24 bolts.
- Remove and discard the gasket.

33. Rotate the crankshaft until the flats on the camshafts are parallel with the cylinder head joint faces.

34. NOTE: The engine is now in the SAFE position.

Lock the crankshaft.

- Install the special tool.
- Install the screw.

E46858

35. Remove the RH VCT control unit.

- Remove the 3 bolts.
- Remove and discard the O-ring seals.

E46859

36. Install the special tool to the RH cylinder head.

- Install the 3 bolts.

E46861

37. Remove the RH primary timing chain tensioner assembly.

- Remove the 2 bolts.

E46862

38. Remove the RH primary timing chain tensioner guide.

- Remove the bolt.

39. Remove the RH primary timing chain.

E46863

40. Remove the LH VCT control unit.

- Remove the 2 bolts.
- Remove the nut.
- Remove and discard the O-ring seals.

E48360

41. Install the special tool to the LH cylinder head.

- Install the 3 bolts.

E46860

42. Remove the LH primary timing chain tensioner.

- Remove the 2 bolts.

E48361

43. Remove the LH upper and lower primary timing chain tensioner guides.

- Remove the stud.
- Remove the bolt.

44. Remove the LH primary timing chain.

45.  **CAUTION:** Discard the bolts.

Remove the camshaft sprockets.

- Remove the 2 bolts.

46. Remove the secondary timing chain tensioner and the secondary timing chain.

- Remove the 2 bolts.

47. Remove the special tool from the LH cylinder head.

- Remove the 3 bolts.

48.  **CAUTION:** Evenly and progressively, release the camshaft bearing caps.

• **NOTE:** Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Remove the camshaft bearing caps.

- Remove the 20 bolts.

49. Remove the camshafts.

50. Install the special tool to the RH cylinder head.

- Install the 3 bolts.

51.  **CAUTION:** Discard the bolts.

• **NOTE:** LH illustration shown, RH is similar.

Remove the camshaft sprockets.

- Remove the 2 bolts.

52. **NOTE:** LH illustration shown, RH is similar.

Remove the secondary timing chain tensioner and the secondary timing chain.

- Remove the 2 bolts.

53. ⚠ CAUTION: Evenly and progressively, release the camshaft bearing caps.

• NOTE: Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

• NOTE: LH illustration shown, RH is similar.

Remove the camshaft bearing caps.

- Remove the 20 bolts.

54. CAUTIONS:

⚠ Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be removed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

⚠ The bolts can only be used twice, mark the bolts with a center punch. If two punch marks are visible, discard the bolts.

Remove the LH cylinder head assembly.

- Remove the 12 cylinder head bolts.
- With assistance remove the cylinder head.
- Remove and discard the cylinder head gasket.
- Clean the cylinder head locating dowels.
- Clean the component mating faces.
- Repeat the operation for the RH side.

55. Remove 4 bolts securing the engine mount bracket to the cylinder block.

56. ⚠ CAUTION: Note the position of the bolt.

Remove the starter motor.

- Remove the remaining starter motor bolt.

E101701

57. Remove the KS.

58. Remove the flexplate.

- Remove and discard the 8 bolts.

59. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the oil pan.

- Remove the 18 bolts.
- Clean all the mating faces and reusable parts thoroughly and check for damage.

VUJ0002435

60. Remove the oil strainer pick-up assembly.

- Remove the 2 bolts.
- Remove and discard the O-ring seal.

E80960

61. Remove the baffle plate.

- Remove the 6 bolts.

E82656

62. Remove the oil pump assembly.

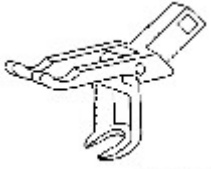

- Remove the 4 bolts.
- Remove and discard the gasket.
- Clean the component mating faces.

63. Remove the engine from the engine stand.

- With assistance, remove the engine block from the stand.

Engine - V6 4.0L Petrol - Cylinder Head

Disassembly and Assembly of Subassemblies

Special Tool(s)	
 <p>ST1330-A</p>	Compressor, Valve Spring 303-581 (T97T-6565-A)
 <p>ST1824-A</p>	Installer, Valve Stem Oil Seal 303-370 (T90T-6571-A)

Materials

Name	Specification
Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent	WSS-M2C153-G

Disassembly

1. Remove the spark plugs.
2. Using the special tool, remove the camshaft roller followers.

3. Using the special tool, remove the valve spring retainer keys, the valve spring and the retainer.

4. Remove the valve.
5. Repeat the procedure until all of the valves are removed.
6. Remove the valve stem seals.

7. NOTE: Mark the position of the camshaft bearing caps so they can be installed in the original position.

GA2294A

Remove the bolts in the sequence shown and remove the camshaft bearing caps.

8. Remove the camshaft.

GA2295-A

9. Inspect the cylinder head. For additional information, refer to For additional information, refer to: [Cylinder Head Distortion](#) (303-00 Engine System - General Information, General Procedures).

Assembly

• NOTE: Prior to assembly, coat all of the valve train components with clean engine oil.

1. Install the camshaft.

GA2295-A

2. NOTE: The camshaft bearing caps must be installed in the original position.

• NOTE: After installing the bolts, check the camshaft for free rotation.

Position the oil supply tube, the camshaft bearing caps, and bolts.

- Tighten in the sequence shown in two stages:
- Stage 1: Tighten to 6 Nm (53 lb-in).
- Stage 2: Tighten to 16 Nm (12 lb-ft).

E134851

3. Install the valve.

4. Using the special tool, install the valve stem seals.

5. Using the special tool, install the valve spring, the retainer and the retainer keys.

6. Repeat the procedure until all of the valves are installed.

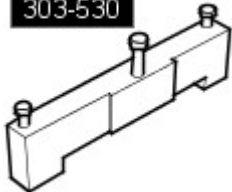

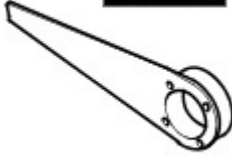

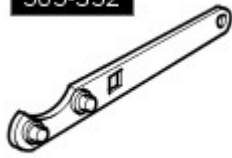

7. Install the spark plugs.

8. Install the camshaft roller followers only when the cylinder head is installed in the vehicle and the timing procedure has been carried out.

Engine - V6 4.0L Petrol - Engine

Assembly

Special Tool(s)	
 <p>303-645</p> <p>E46881</p>	<p>Timing Setting tool</p> <p>303-645</p>
 <p>303-530</p> <p>E46879</p>	<p>Camshaft setting/locking tool</p> <p>303-530</p>

 <p>303-191-03</p> <p>E46730</p>	<p>Adapter</p> <p>303-191-03</p>
 <p>303-893</p> <p>E46728</p>	<p>Holding Tool Crankshaft Pulley</p> <p>303-893(LRT-12-080)</p>
 <p>303-191-04</p> <p>E59251</p>	<p>Bolts and spacers</p> <p>303-191-04</p>
 <p>303-532</p> <p>E46880</p>	<p>Timing chain tensioning tool</p> <p>303-532</p>

Assembly

1. Secure the engine to the engine stand.

- Align the engine to the engine stand.
- Adjust the engine stand legs into position.
- Mount the engine to an engine stand.
- Fully tighten the engine stand leg nuts.

2. NOTE: Install a new gasket.

Install the oil pump assembly.

- Clean the component mating faces.
- Install the gasket.
- Tighten the bolts to 10 Nm.

3. Install the baffle plate.

- Tighten the 6 bolts to 6 Nm.

4. NOTE: Install a new O-ring seal.

Install the oil strainer pick-up assembly.

- Install the O-ring seal.
- Tighten the M6 bolt to 10 Nm.
- Apply sealant to the M5 bolts.
- Tighten the M5 bolts to 6 Nm.

5. Install the oil pan.

- Clean the component mating faces.
- Apply a 3 mm diameter bead of sealant, to the area indicated.
- Install the bolts, but do not tighten fully at this stage.

E48537

6. Tighten the oil pan bolts in the sequence shown to 20 Nm.

E61699

7. NOTE: Prevent the flexplate from rotating.

Install the flexplate.

- Clean the component mating faces.
- Tighten the bolts evenly in 2 stages to the sequence shown.
- Tighten the bolts to 15 Nm.
- Tighten the bolts to 110 Nm.

E53833

8. Install the coolant pump.

- Tighten the 5 bolts to 10 Nm.

9. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Install the knock sensors (KS).

- Tighten the bolts to 20 Nm.

10. Position the starter motor.

- Install the starter motor.

1. Tighten the bolt to 45 Nm.

11. Attach the engine mounting bracket.

12. NOTE: The cylinder head gaskets must be installed over the cylinder head to block dowels.

E46854

Install the RH cylinder head.

- Clean the component mating faces.
- Clean the cylinder head locating dowels.
- Install a new cylinder head gasket.
- With assistance install the cylinder head.
- Repeat the operation for the LH side.

13. ⚠ CAUTION: Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be installed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

- NOTE: Tighten the bolts 1 to 10 in the sequence shown.
- NOTE: LH illustration shown, RH is similar.

Install the cylinder head bolts.

- Tighten the bolts to 20 Nm.
- Tighten the bolts to 35 Nm.
- Tighten the bolts 1 to 10, a further 90 degrees.
- Tighten the bolts 1 to 10, a further 90 degrees.
- Tighten the M8 bolts 11 and 12, to 25 Nm.
- Repeat the operation for the LH side.

14. Install the LH camshafts.

- Clean the component mating faces.
- Lubricate the journals and camshaft lobes.

15. Install the camshaft bearing caps.

- Evenly and progressively tighten the bolts in the sequence shown to 10 Nm.

E46856

E48365

16. Install the sprocket retaining Torx bolts to the camshafts.

17.  **CAUTION:** Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

Measure and record the tappet clearances.

- Rotate the camshafts using the Torx bolts.

18. **NOTE:** Remove the camshaft bearing caps evenly and in stages.

• **NOTE:** Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Remove the camshafts.

- Remove the 20 bolts.

19. Remove the valve tappets, replace with selected tappets.

20. Install the camshafts.

- Lubricate the journals and camshaft lobes.
- Clean the component mating faces.

21. Install the camshaft bearing caps.

- Evenly and progressively tighten the bolts in the sequence shown to 10 Nm.

22.  CAUTION: Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

Check valve tappet clearances are correct.

- Rotate the camshafts using the Torx bolts.
- Remove the camshaft Torx bolts after the check is complete.

23. Repeat the operation for the RH camshafts.

24. Install the special tool to the LH cylinder head.

25. NOTE: RH illustration shown, LH is similar.

Depress the LH secondary timing chain tensioner piston.

- Using 1 mm diameter metal rod, retain the chain tensioner piston.

26. Install the LH secondary timing chain tensioner retaining bolts.

- Tighten the bolts to 12 Nm.

27. NOTE: Lightly tighten the camshaft sprocket Torx bolts, the sprockets **MUST** be free to move.

Install the LH secondary timing chain and sprockets to the camshafts.

- Install the sprocket retaining Torx bolts to the camshafts.

28. Tension the secondary timing chain.

- Remove the retaining rod.

29. Repeat the operation for the RH camshafts.

30. NOTE: RH illustration shown, LH is similar.

Install the LH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

31. Install the LH primary chain tensioner guide.

- Tighten the stud to 12 Nm.

32.  **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the LH primary timing chain tensioner.

- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Tighten the bolts to 12 Nm.
- Remove the retaining rod.

E53556

33. CAUTIONS:

 Using the special tool, apply force to the tool in a counter-clockwise direction, to tension the primary timing chain on its drive side.

 The intake camshaft sprocket retaining bolt **MUST** be tightened before the exhaust camshaft sprocket retaining bolt. Engine damage will occur if this procedure is not followed.

 Make sure that new bolts are installed.

Install the special tool to the exhaust camshaft sprocket.

- Tighten the intake camshaft sprocket bolt to 20 Nm then a further 90 degrees.
- Tighten the exhaust camshaft sprocket bolt to 20 Nm then a further 90 degrees.

E49920

34. Install the LH variable camshaft timing (VCT) oil control unit.

- Install the new O-ring seals.
- Tighten the new bolts to 22 Nm.
- Tighten the nut to 10 Nm.

E48360

35. Install the RH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

E46863

36. Install the RH primary timing chain tensioner guide.

- Tighten the bolts to 12 Nm.

E46862

37.  **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the RH primary timing chain tensioner.

- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Tighten the bolts to 12 Nm.
- Remove the retaining rod.

E46871

38. **CAUTIONS:**

 Using the special tool, apply force to the tool in a counter-clockwise direction, to tension the primary timing chain on its drive side.

 The intake camshaft sprocket retaining bolt **MUST** be tightened before the exhaust camshaft sprocket retaining bolt. Engine damage will occur if this procedure is not followed.

 Make sure that new bolts are installed.

Install the special tool to the exhaust camshaft sprocket.

- Tighten the intake camshaft sprocket bolt to 20 Nm then a further 90 degrees.
- Tighten the exhaust camshaft sprocket bolt to 20 Nm then a further 90 degrees.

39. Install the RH VCT oil control unit.

- Install the new O-ring seals.
- Tighten the new bolts to 22 Nm.

E49920

E46858

40. Remove the special tool from the LH cylinder head.

41. Remove the special tool from the RH cylinder head.

42. Remove the crankshaft locking tool.

- Remove the screw.

43. Install the engine front cover.

- Clean the component mating faces.
- Apply a bead of sealant 3 mm diameter, by 12 mm long, to the 8 places indicated.

E47101

44. Evenly and progressively tighten the bolts in the sequence shown to 12 Nm.

45. Using the special tools, install the crankshaft front seal.

- Clean the component mating faces.
- Lubricate the seal with clean engine oil.
- Use the discarded crankshaft bolt with the service tool.

46. Using the special tools, install the crankshaft front seal.

- Clean the component mating faces.

47. Install the crankshaft pulley.

- Lubricate the seal with clean engine oil.

48. Install the crankshaft pulley locking ring.

49.  **CAUTION:** The screw thread in the crankshaft pulley must be cleaned out before installing a new crankshaft pulley bolt.

Install, but do not tighten, the new crankshaft pulley bolt.

50. **⚠ CAUTION:** Under no circumstances should the crankshaft setting peg, 303-645, be used in the following operations, to restrain the crankshaft.

Using the special tools, retain the crankshaft pulley.

- Tighten the crankshaft pulley bolt to 380 Nm.

51. Remove the special tools.

52. Install new valve cover plug aperture gaskets.

- Install a new valve cover gasket.

53. **NOTE:** Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3mm diameter 12mm long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

Install the valve cover.

- Clean the component mating faces.

E49922

54. Install the valve cover retaining bolts.

- Install valve cover retaining bolts to their position previously noted.
- Complete the tightening sequence as illustrated.
- Tighten the bolts to 12 Nm.

55. Install new valve cover plug aperture gaskets.

- Install a new valve cover gasket.

56. NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3mm diameter 12mm long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

Install the valve cover.

- Clean the component mating faces.

57. Install the valve cover retaining bolts.

- Install valve cover retaining bolts to their position previously noted.
- Tighten the bolts to 12 Nm.
- Complete the tightening sequence as illustrated.

58. Install the 8 ignition coil-on-plugs.

- Install the 8 bolts.
- Tighten the bolts to 6 Nm.

59. Install the generator mounting bracket.

- Clean the locating dowels.
- Clean the component mating faces.
- Tighten the bolts to 45 Nm.

E58798

60. Install the A/C mounting bracket.

E56096

61. Install the coolant manifold.

- Tighten the bolts to 6 Nm.

62. Install the coolant pump pulley.

- Tighten the bolts to 10 Nm.

63. Install the accessory drive belt idler pulley.

- Tighten the bolt to 25 Nm.

64. With assistance, install the intake manifold.

- Install the gaskets.
- Evenly and progressively tighten the bolts to 20 Nm.

65. Install the purge valve.

- Secure the electrical harness with the clip.
- Tighten the bolt to 6 Nm.
- Connect and secure the electrical connector.

66. Connect the starter motor positive cable.

- Secure the cover.

67. Connect the oil temperature and oil pressure sensors.

68. Install the generator.

- Clean the component mating faces.
- Tighten the bolts to 48 Nm.
- Connect the generator electrical connector.
- Secure the clips.

69. Install the crankshaft position (CKP) sensor electrical connector.

- Connect the CKP sensor electrical connector.

70. Install the power steering pump mounting bracket.

- Clean the component mating faces.
- Tighten the bolts to 25 Nm.
- Secure the transmission cooler pipes into clips.

71. Connect and secure the CMP sensor electrical connectors.

- Repeat the operation for the RH side.

E55625

72. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Connect the KS electrical connector.

E45120

73. Connect the engine coolant temperature (ECT) sensor electrical connector.

E44468

74. Connect the ignition coil-on-plug electrical connections.

- Install the clips.
- Repeat the above procedure for the other side.

E46066

- 75.** Connect the VCT oil solenoid electrical connector.
- Repeat the above procedure for the other side.
 - Connect the valve cover breather hose.

- 76.** Connect the cylinder head earth ground connector.
- Install the bolt.
 - Secure the 3 clips.

- 77.** Install the ignition coil-on-plug cover.
- Secure the clips.
 - Repeat the above procedure for the other side.

- 78.** Remove the engine from the engine stand.
79. Install the engine assembly.

Engine - V6 4.0L Petrol - Engine

Installation

Installation

1. Remove the torque converter retainer.
2. Install the engine.
 - Connect the lifting chains.
 - Carefully lower the engine until approximately 35mm above engine mounts.
 - With assistance align the engine to the transmission and engine mounts.
3. Install the RH engine mount.
4. Install the transmission retaining bolts.
 - Clean the component mating faces.
 - Remove the guide pins.
 - Tighten the bolts to 45 Nm (33 lb.ft).
5. Tighten the engine mount nuts to 90 Nm (66 lb.ft).
6. Remove the engine lifting bracket.
 - Disconnect the lifting chains.
 - Remove the 7 bolts.
 - Remove the 12 nuts.
7. Attach the flexplate to the torque converter.
 - Rotate the crankshaft to access the retaining bolts.
 - Tighten the bolts to 45 Nm (33 lb.ft).
 - Install the grommet.
8. Connect the CKP sensor electrical connector.
 - Clean the component mating faces.
9. Connect the HO2S electrical connectors.
10. Install the engine wiring harness support bracket.
11. Connect the engine oil temperature sensor electrical connector.
12. Install the starter motor.
 - Clean the component mating faces.
 - Tighten the bolts to 45 Nm (33 lb.ft).
13. Position the fuel pipe and purge line heat shield and secure with bolts.
14. Position the RH catalytic converter to the exhaust manifold.
 - Clean the components.
 - Tighten the new bolts to 22 Nm (16 lb.ft).

15.  **CAUTION:** Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

16. Install the transmission heat shield.

17. Connect the engine oil cooler hoses.

- Secure with the clips.

18. Connect the coolant pump hose.

- Secure with the clip.

19. Install the steering column lower universal joint assembly.

- Install new patchlock bolts and tighten to 25 Nm (18 lb.ft).

20. Connect the ECT sensor electrical connector.

21. Install the EGR pipe.

- Clean the component mating faces.
- Install to the exhaust manifold, but do not fully tighten the union nut at this stage.

22. Install the transmission cooler pipes.

- Install the support bracket.
- Tighten the nut to 10 Nm (7 lb.ft).

23. Connect the engine ground cable, make sure the mating faces are clean.

- Tighten the nut to 25 Nm (18 lb.ft).
- Install the cover.

24. Install the A/C compressor mounting bracket assembly.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).
- Install the KS electrical connector clip.
- Connect the A/C compressor electrical connection.

25. Install the generator mounting bracket.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).
- Secure the clip.
- Install a new cable tie.

26. Connect the EOP sensor electrical connector.

27. Connect the generator electrical connectors.

28. Install the accessory drive belt.

For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).

- 29.** Install the cooling fan lower shroud.
 - Remove the radiator protection.
 - Position and secure in the clips.
- 30.** Install the wiring harness to the plenum.
 - Secure with the clips.
- 31.** Connect the ECM electrical connectors.
- 32.** Install the battery tray.

For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
- 33.** Install the intake manifold.

For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
- 34.** Tighten the nuts securing the EGR pipe to the exhaust manifold and EGR valve to 25 Nm (18 lb.ft).
- 35.** Fill the engine with oil.

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01C Engine - V6 4.0L Petrol, General Procedures).
- 36.** Refill and bleed the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
- 37.** Return the hood from the service position.
 - Release the 2 clips.
 - Connect the struts and secure with the clips.
- 38.** Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
- 39.** Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptations.

Engine - V8 5.0L Petrol -

Engine - V8 5.0L Petrol - Engine

Description and Operation

EXTERNAL VIEW

E122432

INTRODUCTION

The 5.0L NA (naturally aspirated) gasoline engine is a liquid cooled V8 unit featuring direct fuel injection, four overhead camshafts and four valves per cylinder. All four camshafts incorporate **VCT (variable camshaft timing)**. The intake camshafts and valves also incorporate CPS (camshaft profile switching).

The main structural components of the engine are all manufactured from aluminum alloy. The engine is built around a very stiff, lightweight, enclosed V, deep skirt cylinder block. A structural windage tray is bolted to the bottom of the cylinder block to further improve the block stiffness, minimize **NVH (noise, vibration and harshness)** and help reduce oil foaming. To further enhance the stiffness of the lower engine structure, a heavily ribbed sump is installed. The sump also helps to reduce engine noise.

Engine Structure

E121104

Item	Part Number	Description
1	-	LH (left hand) cylinder head (bank B)
2	-	Cylinder block
3	-	Windage tray
4	-	Sump
5	-	RH (right hand) cylinder head (bank A)

CYLINDER BLOCK

E106725

The cylinder block is a 90 degree configuration with cast-in iron cylinder liners and an open deck die-cast coolant jacket. The low volume coolant jacket gives good warm-up times and low piston noise levels. The longitudinal flow design of the coolant jacket, with a single cylinder head coolant transfer port in each bank, provides good rigidity and head gasket sealing.

Cylinder Numbering

The cylinders are numbered as shown below, with cylinders 1 and 2 at the front of the engine.

E133972

Engine Data Location

E108429

Item	Part Number	Description
1	-	Engine data location

Engine data is marked on the cylinder block at the rear of the [RH \(right-hand\)](#) cylinder bank.

CRANKSHAFT

E106729

The crankshaft is made from spheroidal graphite cast iron, which, compared with grey cast iron, has higher mechanical strength, ductility and increased shock resistance. The undercut and rolled fillets also improve strength. Eight counter-balance weights ensure low vibration levels and the large, cross-drilled main bearing journals are designed to contribute to stiffness.

An oil groove in the upper half of each main bearing transfers the oil into the crankshaft for lubrication of the connecting rod bearings. A thrust washer is installed each side of the top half of the center main bearing.

Crankshaft Data Location

E108430

Item	Part Number	Description
1	-	Pin journal classification and plant identification
2	-	Main journal classification
3	-	Date and time codes

The main bearings are numbered 1 to 5 starting from the front of the engine. There are five grades of main bearing available, each being color coded. Journal sizes are marked on the rear of the crankshaft.

For additional information, refer to: [Crankshaft Main Bearing Journal Clearance](#) (303-00 Engine System - General Information, General Procedures).

Crankshaft Installation

E122349

Item	Part Number	Description
1	-	Coolant drain plug
2	-	Torque converter access plug
3	-	Drive plate
4	-	Rear cover
5	-	Main bearing cap
6	-	Identification mark
7	-	Front cover
8	-	Front pulley

The main bearing caps are made from cast iron and are cross bolted to increase rigidity. An identification mark on the bearing cap faces the front of the engine.

At the front of the crankshaft, a tuned torsional vibration damper is incorporated into the crankshaft front pulley. At the rear of the crankshaft a pressed steel drive plate, with a steel starter ring gear, is installed to transfer drive from the engine to the transmission. The reluctor ring for the [CKP \(crankshaft position\)](#) sensor is integrated into the perimeter of the drive plate.

The crankshaft seals are located in the front and rear covers.

PISTONS AND CONNECTING RODS

E115619

The diameter of each piston is graded and precisely matched to each cylinder bore to help reduce noise. In the vertical plane, the pistons have a slight barrel form, which helps to ensure a reliable oil film is maintained between the piston and the cylinder bore. A solid film lubricant coating is applied to both reaction faces of the piston to reduce wear and improve fuel economy.

A three-ring piston-sealing system is used. The steel top ring is treated with a PVD (physical vapor deposition) peripheral coating. PVD is a coating technique where material can be deposited with improved properties to ensure good cylinder bore compatibility and wear resistance. A Napier center ring helps cylinder pressure and oil management, while the three-piece oil control lower ring is produced from nitrided steel.

The connecting rods are forged from high strength steel. The cap is fracture-split from the rod to ensure precision re-assembly for bearing shell alignment. There are three grades of large end bearing available, each being color coded. For additional information, refer to: [Connecting Rod Large End Bore](#) (303-00 Engine System - General Information, General Procedures).

Cap Alignment with Connecting Rod

E108438

Item	Part Number	Description
1	-	Alignment marks
2	-	Connecting rod
3	-	Cap
4	-	Bearings

The correct alignment of the cap with the connecting rod is indicated by marks on adjacent faces of the two components.

Connecting Rod and Piston Orientation

E108439

Item	Part Number	Description
A	-	Front of engine
1	-	Alignment mark
2	-	LH side (bank B)
3	-	Alignment mark
4	-	RH side (bank A)
5	-	Piston orientation arrow

The orientation of the connecting rods and pistons on the crankshaft are given below:

- Bank A - The arrow on the piston crown must face the front of the engine and the cap and connecting rod alignment marks must face the rear of the engine.
- Bank B - The arrow on the piston crown must face the front of the engine and the cap and connecting rod alignment marks must face the front of the engine.

CYLINDER HEADS

- NOTE: [RH](#) (A bank) cylinder head shown, [LH](#) (left-hand) (B bank) cylinder head similar.

E106732

The cylinder heads are manufactured in gravity die cast aluminum alloy and are unique for each cylinder bank. Deep-seated bolts reduce distortion and secure the cylinder heads to the cylinder block.

Each cylinder is served by four valves. To help achieve the required gas-flow characteristics, these are arranged asymmetrically around the cylinder bore. Each cylinder has a centrally mounted fuel injector and spark plug.

The cylinder head gasket is of a multi-layer steel construction.

EXHAUST MANIFOLD

- NOTE: [LH](#) (B bank) installation shown, [RH](#) (A bank) installation similar.

E118618

Item	Part Number	Description
1	-	Cylinder head
2	-	Gasket
3	-	Heat shield
4	-	Gasket
5	-	Exhaust manifold
6	-	Bolt (8 off)
7	-	Heat shield
8	-	Bolt (4 off)
9	-	Spacer (8 off)

The high SiMo (silicon molybdenum) cast iron exhaust manifolds are unique for each cylinder bank. Each exhaust manifold installation includes two metal gaskets and two heat shields. Spacers on the securing bolts allow the manifolds to expand and contract with changes of temperature while maintaining the clamping loads.

VALVE TRAIN

E106733

Item	Part Number	Description
1	-	VCT solenoids
2	-	CPS solenoids
3	-	Inverted tooth timing chain
4	-	Nylon chain guide

Camshafts

E108443

Item	Part Number	Description
1	-	Intake camshaft
2	-	Exhaust camshaft

The lightweight valve train provides good economy and noise levels and is chain driven from the crankshaft.

Double overhead camshafts on each cylinder head operate the valves. For each cylinder head, an inverted tooth timing chain transfers drive from the crankshaft to the [VCT](#) unit on the front of each camshaft. Graded tappets enable setting of exhaust valve clearances. Switchable tappets with hydraulic lash adjusters are installed on the intake valves.

Each timing chain has a hydraulic tensioner operated by engine oil pressure. The chain tensioners incorporate a ratchet mechanism, which maintains tension while the engine is stopped to eliminate start-up noise. The chains are lubricated with engine oil from jets located at the front of the engine block. Nylon chain guides control chain motion on the drive side.

Variable Camshaft Timing

E115928

Item	Part Number	Description
1	-	VCT units
2	-	Intake camshaft VCT solenoid
3	-	Camshaft position sensors
4	-	Exhaust camshaft VCT solenoid

The [VCT](#) system varies the timing of the intake and exhaust camshafts to deliver optimum engine power, efficiency and emissions. The timing of the intake camshafts has a range of 62 degrees of crankshaft angle. The timing of the exhaust camshafts has a range of 50 degrees of crankshaft angle.

In the base timing position:

- The intake camshafts are fully retarded.
- The exhaust camshafts are fully advanced.

VCT Operating Ranges

Camshaft	Valve Opens	Valve Closes
Intake - Low Lift	27 degrees BTDC (before top dead center) to 35 degrees ATDC (after top dead center)	187 to 249 degrees ATDC
Intake - High Lift	37 degrees BTDC to 25 degrees ATDC	213 to 275 degrees ATDC
Exhaust	244 to 194 degrees BTDC	6 to 56 degrees ATDC

The system consists of a [VCT](#) unit and a [VCT](#) solenoid for each camshaft. The [ECM](#) (engine control module) controls the system using [PWM](#) (pulse width modulation) signals to the [VCT](#) solenoids.

The torsional energy generated by the valve springs and the inertia of the valve train components are used to operate the system.

Variable Camshaft Timing Units

The [VCT](#) units change the position of the camshafts in relation to the timing chains.

E115930

Item	Part Number	Description
1	-	Bolt (3 off)
2	-	VCT unit
3	-	Filter
4	-	Camshaft
5	-	Inner plate
6	-	Housing and sprocket
7	-	Rotor assembly
8	-	Reed plate
9	-	Spring and lock pin
10	-	Spring (3 off)
11	-	Tip seal (3 off)
12	-	Spring (2 off)
13	-	Tip seal (2 off)
14	-	Spring

16	-	Bias spring
17	-	Snap ring
18	-	Reluctor ring
19	-	Center plate
20	-	Snap ring
21	-	Screw (6 off)
22	-	Spool valve
23	-	Outer plate

Each [VCT](#) unit is attached to the camshaft by three bolts. A rotor assembly and a reed plate are installed inside a sprocket

housing, which consists of a sprocket, an outer plate and an inner plate held together by six screws.

A reluctor ring, for the [CMP \(camshaft position\)](#) sensor, a center plate and a bias spring are installed at the front of the [VCT](#) unit. The ends of the bias spring locate on the center plate assembly and the sprocket housing, to give a turning moment to the camshaft in the advance direction. A snap ring locates the reluctor ring on to a sleeve installed in the center of the rotor assembly. The opposite end of the sleeve locates in a bore in the front face of the camshaft, which contains a filter.

A spring and spool valve are installed in the rotor assembly sleeve and retained by a snap ring. The spring keeps the spool valve in contact with the armature of the related [VCT](#) solenoid.

Each [VCT](#) unit is supplied with engine oil from an oil gallery in the cylinder head, through the camshaft front bearing cap and a bore in the center of the camshaft.

Variable Camshaft Timing Solenoids

The [VCT](#) solenoids control the position of the spool valves in the [VCT](#) units.

E115929

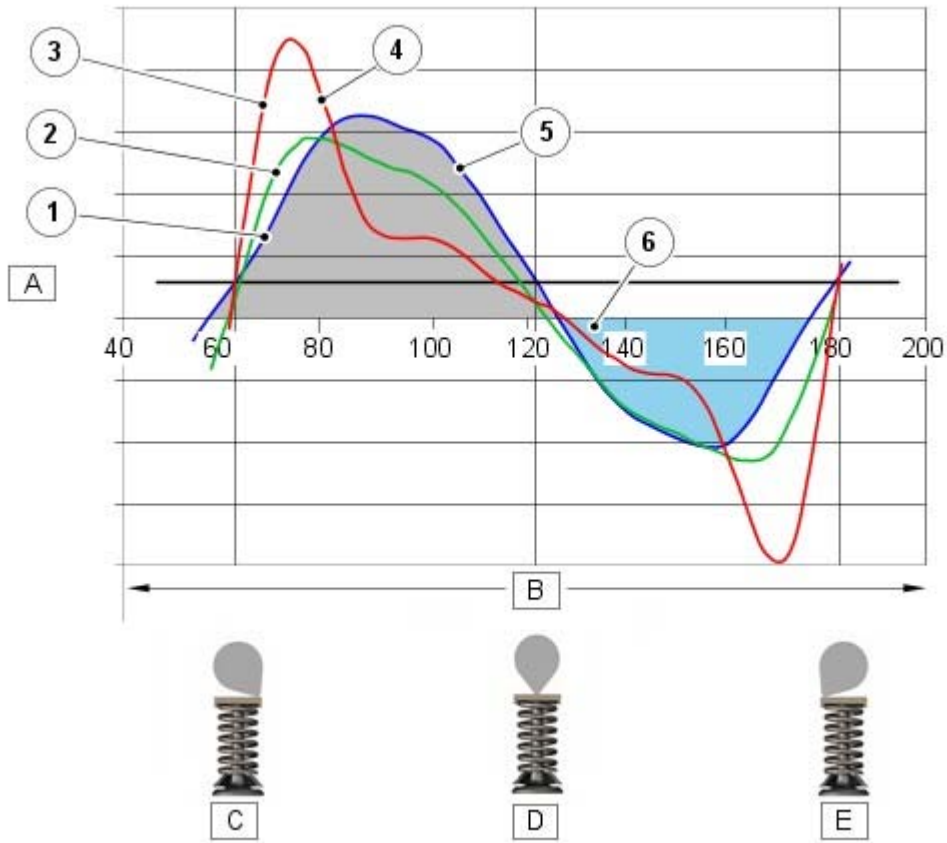

The [VCT](#) solenoids are installed in the front upper timing covers, immediately in front of their related [VCT](#) units. Each [VCT](#) solenoid is secured with two screws and sealed with an O-ring. A two pin electrical connector provides the interface with the engine harness.

Each [VCT](#) solenoid incorporates a spindle that acts on the spool valve in the related [VCT](#) unit to advance and retard the camshaft timing. The [VCT](#) solenoids operate independently and are controlled by a [PWM](#) signal from the [ECM](#).

Variable Camshaft Timing Operation

When the engine is running, the compression and expansion of the valve springs causes momentary increases and decreases in the torque acting on the camshafts. These momentary changes of torque are sensed in the [VCT](#) units and used to change the camshaft timing.

Camshaft Torsional Energy (For a Single Valve Event)

E112406

Item	Part Number	Description
A	-	Camshaft torque
B	-	Camshaft rotation (degrees)
C	-	Valve opening
D	-	Peak lift
E	-	Valve closing
1	-	1000 rev/min
2	-	4000 rev/min
3	-	7000 rev/min
4	-	Inertia effects from valve train rotating components
5	-	Force caused by valve spring
6	-	Bias torque from friction

Variable Camshaft Timing Unit Schematic - Base Timing

- NOTE: Intake camshaft [VCT](#) unit shown. For exhaust camshaft [VCT](#) unit, read advance for retard and retard for advance.

E115931

Item	Part Number	Description
1	-	Advance chamber
2	-	Retard chamber
3	-	Sprocket housing
4	-	Rotor assembly
5	-	Lock pin
6	-	Sleeve
7	-	Engine oil supply from camshaft
8	-	Inlet check valve
9	-	Lock pin drain
10	-	Spool valve
11	-	Advance check valve
12	-	Retard check valve

• NOTE: The following description is for intake camshaft [VCT](#) units. For exhaust camshaft [VCT](#) units, read advance for retard, and retard for advance.

At engine start-up, once the engine oil pressure in the camshaft is sufficient to open the inlet check valve, engine oil flows across the spool valve, through the advance and retard check valves and into the advance and retard chambers. During the start cycle, the [ECM](#) signals the [VCT](#) solenoid to move the spool valve into the sleeve and connect the lock pin to inlet oil pressure. The inlet oil pressure causes the lock pin to retract from the inner plate and unlock the rotor assembly and camshaft from the sprocket housing.

There is a constant supply of oil to the [VCT](#) to ensure the unit remains filled during operation.

Variable Camshaft Timing Unit Schematic - Advance

E115932

To advance the camshaft timing, the [ECM](#) adjusts the signal to the [VCT](#) solenoid to move the spool valve so that the advance chamber oil passage is closed and the retard chamber oil passage is connected to inlet oil.

Each momentary increase of the torque acting on the camshaft generates a pressure pulse in the retard chamber. Oil moves from the retard chamber, through the spool valve and the advance check valve to the advance chamber, to equalize the pressures in the two chambers. The displacement of oil from the retard chamber causes the rotor assembly to advance in relation to the sprocket housing. Each momentary decrease of torque acting on the camshaft also generates a pressure pulse in the advance chamber, but, with the advance chamber oil passage closed, no movement of oil between the advance and retard chambers occurs and the rotor assembly cannot move in the retard direction.

Variable Camshaft Timing Unit Schematic - Null

E115933

Once the camshaft has reached the required timing position the [ECM](#) adjusts the signal to the [VCT](#) solenoid to set the spool valve in the null position. In the null position, the advance and retard chamber oil passages are both closed by the spool valve and the rotor assembly is hydraulically locked to the sprocket housing.

Variable Camshaft Timing Unit Schematic - Retard

E115934

To retard the camshaft timing, the [ECM](#) adjusts the signal to the [VCT](#) solenoid to move the spool valve to close the retard chamber oil passage and connect the advance chamber oil passage to the inlet oil.

Each momentary decrease of the torque acting on the camshaft causes oil to transfer from the advance chamber, through the spool valve and the retard check valve to the retard chamber, and so retard the camshaft timing.

Camshaft Profile Switching

E106735

The CPS (camshaft profile switching) system switches the intake valves between two cam profiles which have different lift and period. The low lift profile improves driveability and emissions at lower engine speeds. The high lift profile improves power and torque output at higher engine speeds.

The intake camshafts have three lobes for each valve. The two outer lobes have identical profiles that produce the high lift of 10.53 mm (0.415 in.). The central lobe produces the low lift of 5.50 mm (0.217 in.). Switching between cam profiles is performed by a switchable tappet on each intake valve. The switchable tappets are operated by engine oil controlled by a CPS solenoid on each cylinder head. Operation of the CPS solenoids is controlled by the [ECM](#).

Camshaft Profile Switching Solenoids

E115935

The CPS solenoids control the supply of engine oil pressure to the locking pins in the switchable tappets, to switch the tappets between the two cam profiles.

A CPS solenoid is installed on the rear of each cylinder block. Each CPS solenoid has a pintle installed in a sleeve, which incorporates oil inlet and outlet holes. The sleeve is installed at the junction of oil galleries in the cylinder head, with the oil inlet and outlet holes aligned with the galleries. Movement of the pintle in the sleeve controls a connection between the oil galleries. When the CPS solenoid is energized, the pintle connects an oil supply gallery to the gallery along the outboard side of the switchable tappets. When the CPS solenoid is de-energized, the oil gallery along the outboard side of the switchable tappets is connected to drain.

The CPS solenoids receive a fused battery supply from the main relay. The [ECM](#) switches a ground connection to operate the solenoids.

Switchable Tappets

E89601

Item	Part Number	Description
1	-	Outer tappet
2	-	Outer locking pin
3	-	Inner locking pin
4	-	Return spring
5	-	Lash adjuster oil inlet
6	-	Lash adjuster
7	-	Lost motion spring
8	-	CPS oil inlet
9	-	Anti-rotation lug

The switchable tappets are installed on the intake valves, in bores in the cylinder heads. The cylinder heads incorporate engine oil galleries along the inboard and outboard sides of the bores. The inboard oil galleries (between the tappets and the spark plug/fuel injector bores) supply an oil feed to the locking pins in the switchable tappets. The outboard oil galleries (over the inlet ports) supply an oil feed to the hydraulic lash adjusters in the switchable tappets.

Each switchable tappet consists of inner and outer tappets, which can operate independently or be locked together by locking pins. A hydraulic lash adjuster on the bottom of the inner tappet locates on the intake valve stem.

In low lift, the intake valve lift is controlled by the inner tappets, which run on the center lobes of the intake camshafts. The outer tappets run on the outer lobes of the intake camshafts, and move up and down the inner tappets without affecting the valve lift. The lost motion springs keep the outer tappets in contact with the outer lobes. Movement of the inner tappets is transferred to the intake valves through the hydraulic lash adjusters.

In high lift, engine oil is supplied to the locking pins, which lock the outer tappets to the inner tappets. Intake valve lift is controlled by the outer tappets, which run on the outer lobes of the intake camshafts. Movement of the outer tappets is transferred to the intake valves through the locking pins, the inner tappets and the hydraulic lash adjusters.

E108445

Item	Part Number	Description

2	-	Inner tappet
3	-	Outer tappet
4	-	Outer cam profile (high lift)
5	-	Inner cam profile (low lift)
6	-	Locking pin oil pressure inlet
7	-	Outer locking pin
8	-	Inner locking pin
9	-	Outer tappet lost motion spring
10	-	Valve spring

Camshaft Profile Switching Operation

The switching point is speed and load dependent. This strategy ensures that switching occurs at air flow neutral points in the engine's operation and is imperceptible to the driver.

At engine speeds from idle up to the range of 2825 - 4250 rev/min (depending on engine load), the CPS solenoids are de-energized and the switchable tappets are set to low lift. At engine speeds above the 2825 - 4250 rev/min range, the CPS solenoids are energized by the [ECM](#) and the switchable tappets are set to high lift. There is a 200 rev/min hysteresis when switching from high lift to low lift with decreasing engine speed. Switching between lift settings occurs within one revolution of the camshaft.

Switching is only enabled at engine oil temperatures of 20 °C (68 °F) and above. At oil temperatures below 20 °C (68 °F), CPS operation is disabled and the switchable tappets remain in the low lift setting. CPS operation is also disabled if a CPS solenoid fails. When CPS operation is disabled, engine speed is limited to 5000 rev/min.

The [ECM](#) can diagnose the operation of the CPS solenoids and store fault related [DTC \(diagnostic trouble code\)](#) if it detects a failure.

LUBRICATION SYSTEM

E118619

Item	Part Number	Description
1	-	Oil pump outlet tube
2	-	Anti-drain valve
3	-	Oil cooler
4	-	Oil filter
5	-	Timing chain lubrication jet (2 off)
6	-	Oil evacuation tube
7	-	Oil pump
8	-	Oil pick-up
9	-	Oil temperature and level sensor

The oil pump is attached to the underside of the windage tray. The input shaft of the oil pump is driven from the front of the crankshaft, by the auxiliary chain, at 0.87 engine speed.

The oil pump draws oil from the sump through a centrally mounted pick-up pipe. The oil is pressurized and pumped through an output tube to the cylinder block. After passing through an anti-drain valve and a plate type oil cooler, the oil is filtered by a replaceable cartridge installed on the front of the [RH](#) cylinder head.

The output from the oil filter is distributed through oil galleries in the cylinder heads and cylinder block. All moving parts are lubricated by pressure or splash oil. Pressurized oil is also provided for the [VCT](#) system, the CPS system, the timing chain tensioners and the timing chain lubrication jets.

The oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the rapid return of the oil to the sump. System replenishment is through the oil filler cap on the [LH](#) cylinder head cover.

An oil evacuation tube is installed to allow oil to be drawn from the sump. The upper end of the oil evacuation tube is located under the oil filler cap.

An oil drain plug is installed in the [RH](#) side of the sump.

Oil Pump Nominal Operating Pressures

Engine Speed, rev/min	Temperature, °C (°F)	Pressure, bar (lbf/in ²)
Idle	20 (68)	2.0 (29.0)
1500	20 (68)	6.0 (87.0)
3000	40 (104)	6.2 (90.0)
3000	110 (230)	5.0 (72.5)
3000	130 (266)	4.0 (58.0)

Oil Level Monitoring

Oil level monitoring is provided by an oil level and temperature sensor that measures the oil level in the sump. The oil level can be displayed in the message center of the instrument cluster.

Oil Level and Temperature Sensor

E115936

The oil level and temperature sensor supplies the [ECM](#) with a signal containing the level and temperature of the oil in the sump. The oil level and temperature sensor is secured to the bottom of the sump with three screws and sealed with a gasket.

The oil level and temperature sensor sends an ultrasonic pulse vertically upward and measures the time taken for the pulse to be reflected back from the top surface of the oil. This time is compared with the time taken for an ultrasonic pulse to travel a reference distance within the oil level and temperature sensor to determine the oil level. The oil level reading is combined with the oil temperature reading and transmitted in a [PWM](#) signal to the [ECM](#).

Oil Level and Temperature Sensor Specifications

Feature	Details
Power Source	Battery Voltage
Level Accuracy	±2 mm (±0.08 in.) at temperatures of -30 °C (-22 °F) and above; (±4 mm (±0.16 in.) at temperatures below -30 °C (-22 °F))
Temperature Accuracy	±2 °C (±3.6 °F)
Operating Level Range	116 to 147 mm (4.57 to 5.79 in.)
Operating Temperature Range	-40 to 160 °C (-40 to 320 °F)

Oil Level Check

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01D Engine - V8 5.0L Petrol, General Procedures).

For accuracy, oil level checks should be performed with the vehicle on level ground when the oil is hot. The vehicle needs to stand for approximately 10 minutes, after the engine is switched off, to allow the oil to drain back into the sump and the oil level to stabilize. The oil level system will not give a reading until the oil level has stabilized.

To check the oil level, make sure that the ignition is on, the engine stopped and the transmission is in P (park). Access the vehicle information and settings menu, then select **Oil Level Display** from the **Service Menu**. An **Engine Oil Level** sight glass will be displayed in the message center. The current oil level will be displayed in the sight glass. One of the following messages will also be displayed:

- If the oil level is within acceptable limits, the message **Level OK** is displayed.
- If the oil level is less than acceptable, a message advising how much oil to add is displayed e.g. **Add 1 Litre**, or **Add 1 Quart**, depending on the market.
- If the message **Overfilled** is displayed, the oil level must be reduced to within acceptable limits before starting the engine again.
- If the message **Not available** is displayed, the oil level is still stabilizing. Wait 10 minutes and then recheck level.

E121582

REFER to: [Engine - V8 5.0L Petrol](#) (303-00 Engine System - General Information, Diagnosis and Testing).

Engine - V8 5.0L Petrol - Engine Oil Draining and Filling

General Procedures

Draining

 **WARNING:** The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

 **CAUTION:** Correct installation of the oil filler cap can be obtained by tightening the cap until hard stop.

• **NOTE:** Clean the components general area prior to dismantling.

1.  **CAUTION:** Make sure the engine is warm.

Start the engine and allow to run for 10 minutes, stop the engine.

2.

E119494

3. Refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

4.

- Loosen the element cover 4 complete turns to allow engine oil to drain from the filter cover.
- Make sure that the O-ring seal is exposed.

E119523

5. **NOTE:** Allow 10 minutes for the engine oil to drain from the oil filter housing.

6. Remove and discard the oil filter element.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always use the vehicle's safety stands.

Raise and support the vehicle.

8. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

E107394

9. **9. CAUTIONS:**

 Be prepared to collect escaping oil.

 Allow at least 10 minutes for the engine oil to drain.

• NOTE: Discard the sealing washer.

Filling

1.  **10. CAUTION:** Make sure that the area around the component is clean and free of foreign material.

• NOTE: Install a new sealing washer.

Torque: 24 Nm

2. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

3. **12. NOTE:** Install new O-ring seals.

Lubricate the oil filter element O-ring seal with clean engine oil.

4.  **13. CAUTION:** Tighten the component finger tight first.

• *Torque: 25 Nm*

5. **14.**  **CAUTION:** Make sure that the vehicle is left for 5 minutes from filling with oil and that the engine oil level is reading at least minimum (by following Steps 9-15), before starting the engine.

- Fill the engine with oil - for filling values on vehicles without supercharger:

Refer to: [Specifications](#) (303-01D Engine - V8 5.0L Petrol, Specifications).

- Fill the engine with oil - for filling values on vehicles with supercharger:

Refer to: [Specifications](#) (303-01D Engine - V8 5.0L Petrol, Specifications).

- Clean any residual engine oil from the oil filler cap area.

6.

7. **16.**  **CAUTION:** Make sure that the vehicle has been left for 5 minutes from filling with oil.

Follow the Steps 9-15 before starting the engine.

- 8.
- Start the engine and allow to run for 10 minutes, stop the engine.
 - Check for leaks.

9. **18.** **CAUTIONS:**

Make sure that the selector lever and the gearshift mechanism are in the park (P) position.

Make sure that the hood is open.

- Turn the ignition on.

10.

- Press the right-hand directional button to access the instrument cluster menu.

Removal and Installation

Removal

 **CAUTION:** Make sure that the orientation and code on the top of the camshaft bearing caps is noted (along with the bank - A or B), so that on installation the components are installed to their original position. Failure to follow this instruction may cause damage to the vehicle.

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Timing Drive Components - Assembly Part Number: INA Timing Drive](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

4. **4. CAUTIONS:**

 Rotate the camshafts until all the valves are at their minimum open point.

 Evenly and progressively, release the camshaft bearing caps.

- NOTE: Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Installation

1. **1. CAUTIONS:**

 Prior to installing the camshafts, position the crankshaft 45 degrees ATDC cylinder 1A to prevent valve/piston collision.

 Make sure that the camshafts and camshaft bearing caps are installed in their original locations.

 Evenly and progressively install and tighten the camshaft bearing caps.

- NOTE: Lubricate the camshafts and the camshaft bearing caps with EP90 oil (or 75/90 viscosity oil will suffice) prior to installation.

Torque: 3 Nm

E115942

2. **NOTE:** Tighten the bolts in the indicated sequence.

Torque: 12 Nm

3. **CAUTION:**  Only rotate the crankshaft clockwise.

Rotate the crankshaft until the camshaft lobe on the valve being checked is 180 degrees from the maximum opening position.

4. **NOTE:** If the valve clearance is incorrect, continue to the next step. If the valve clearance is correct, continue to step 8.

• **NOTE:** On vehicles without supercharger the inlet camshaft valve clearances cannot be checked.

Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.

5. **CAUTIONS:**

Do not use a magnet to remove the tappet.

Use the following formula to calculate the required bucket thickness. Original thickness + measured clearance - desired clearance = required bucket thickness.

Remove the tappet and measure the thickness.

6. **NOTE:** If a new tappet is installed then go back to step 1 of the install procedure.

Install a new tappet if required.

7. Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.

8. Refer to: [Timing Drive Components - Assembly Part Number: INA Timing Drive](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

9. Connect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V8 5.0L Petrol - Camshaft RH

Removal and Installation

Removal

! CAUTION: Make sure that the orientation and code on the top of the camshaft bearing caps is noted (along with the bank - A or B), so that on installation the components are installed to their original position. Failure to follow this instruction may cause damage to the vehicle.

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. **!** WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Timing Drive Components - Assembly Part Number: INA Timing Drive](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

4. 4. CAUTIONS:

! Rotate the camshafts until all the valves are at their minimum open point.

! Evenly and progressively, release the camshaft bearing caps.

- NOTE: Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Installation

1. 1. CAUTIONS:

! Prior to installing the camshafts, position the crankshaft 45 degrees ATDC cylinder 1A to prevent valve/piston collision.

! Make sure that the camshafts and camshaft bearing caps are installed in their original locations.

! Evenly and progressively install and tighten the camshaft bearing caps.

- NOTE: Lubricate the camshafts and the camshaft bearing caps with EP90 oil (or 75/90 viscosity oil will suffice) prior to installation.

Torque: 3 Nm

2. **2. NOTE:** Tighten the bolts in the indicated sequence.

Torque: 12 Nm

3. **3.**  **CAUTION:** Only rotate the crankshaft clockwise.

Rotate the crankshaft until the camshaft lobe on the valve being checked is 180 degrees from the maximum opening position.

4. **4. NOTE:** If the valve clearance is incorrect, continue to the next step. If the valve clearance is correct, continue to step 8.

• **NOTE:** On vehicles without supercharger the inlet camshaft valve clearances cannot be checked.

Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.

5. **5. CAUTIONS:**

Use the following formula to calculate the required bucket thickness. Original thickness + measured clearance - desired clearance = required bucket thickness.

Do not use a magnet to remove the tappet.

Remove the tappet and measure the thickness.

6. **6. NOTE:** If a new tappet is installed then go back to step 1 of the install procedure.

Install a new tappet if required.

7. Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.

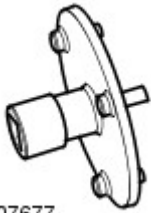

8. Refer to: [Timing Drive Components - Assembly Part Number: INA Timing Drive](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

- 15.

E107945

16. **16.**  CAUTION: Discard the friction washer.

Installation

E107945

1.  CAUTION: Install a new friction washer.

E107944

2. Torque: 12 Nm

E115446

3.
 - Install the special tool to each Camshaft.
 - *Special Tool(s):* [303-1452](#)
 - *Torque:* 10 Nm

E118546

4.

- Carefully rotate the camshafts if the position is not as shown.

E118541

5.

- Install the special tool 303-1445 to the rear of the camshafts making sure the key way's are correctly located into each slot on each of the camshafts.

6. **6. CAUTIONS:**

Do not overturn the camshafts.

Tighten the wing nuts finger tight. Failure to follow this instruction may result in damage to the components.

- Using a suitable tool, carefully rock the camshaft clockwise then anti-clockwise. Turn the special tool locking nuts until there is no movement left in camshafts.
- Repeat steps 3- 6 for the camshafts on the other cylinder head.

7. 7. CAUTIONS:

Do not allow the camshaft to rotate.

If the VVT is knocked or dropped then the VVT must be replaced.

• NOTE: Do not tighten at this stage.

- Install the timing chain with the variable valve timing (VVT) units.

8.

- Make sure that all the timing chain alignment marks are in the positions shown.

9. Torque: 25 Nm

E122505

10. Make sure the tensioner piston is fully extended. Then fully depress and lock the tensioner piston with the grenade pin before installation, failure to do this may result in damage to the engine.

E122503

11. **11.**  CAUTION: Do not release the timing chain tensioner locking pin at this stage.

Torque: 10 Nm

12. **12.** CAUTIONS:

 Do not allow the camshafts to rotate.

 If the VVT is knocked or dropped then the VVT must be replaced.

• NOTE: Do not tighten at this stage.

- Install the timing chain with the VVT units.

13.

- Make sure that all the timing chain alignment marks are in the positions shown.

Item	Specification
* Anti-freeze	Havoline Extended Life Coolant (XLC) or any ethylene glycol based anti-freeze containing no methanol with only Organic Acid Technology (OAT) corrosion inhibitors
Anti-freeze concentration - Will provide frost protection to -40°C (-40°F)	50%
Specific gravity of coolant at 20°C (68°F), to protect against frost down to -40°C (-40°F)	1.068
Amount of anti-freeze to use for 50% concentration:	
Without rear passenger compartment heater or fuel burning heater	4.7 litres (8.25 pints) (4.9 US quarts)
With rear passenger compartment heater but without fuel burning heater	6.0 litres (10.6 pints) (6.4 US quarts)
Without rear passenger compartment heater but with fuel burning heater	5.1 litres (9.1 pints) (5.4 US quarts)
With rear passenger compartment heater and fuel burning heater	6.5 litres (11.5 pints) (6.9 US quarts)

CAUTION: * No other anti-freeze should be used with Havoline Extended Life Coolant.

Capacity

Item	Capacity
Without rear passenger compartment heater or fuel burning heater	9.4 litres (16.5 pints) (9.9 US quarts)
With rear passenger compartment heater but without fuel burning heater	12.15 litres (21.4 pints) (12.8 US quarts)
Without rear passenger compartment heater but with fuel burning heater	10.35 litres (18.2 pints) (10.9 US pints)
With rear passenger compartment heater and fuel burning heater	13.1 litres (23.0 pints) (13.8 US quarts)

General Specifications

Item	Specification
Cooling system type	Pressurised, thermostatically controlled with remote header tank
Radiator	Cross flow with integral transmission fluid and charge air coolers
Expansion tank	Remote - fitted with a bleed screw and low coolant level sensor
Pressure cap rating	110 kPa (1.1 bar) (16 lbf/in ²)
Thermostat:	
Starts to open	88° C (190° F)
Fully open	95° C (203° F)
Cooling fan	Engine driven, viscous coupled with electronic control
Cooling fan diameter	500 mm (19.6 in)
Direction of rotation	Clockwise when viewed from front of engine
Coolant pump	Centrifugal flow impellor, belt driven from crankshaft

Torque Specifications

Description	Nm	lb-ft
Coolant expansion tank bolts	10	7
Radiator access panel	10	7
Coolant pump bolts	10	7
Coolant pump pulley bolts	25	18
Radiator securing bolts	25	18
Air Conditioning (A/C) condenser bolts	6	4
Charge air outlet hose clip	10	7
Charge air inlet hose clip	10	7
Cooling fan to viscous coupling bolts	10	7
* Cooling fan assembly	65	48
Coolant bleed screw(s)	3	2

* **Note:** Left-hand thread

Engine Cooling - TDV6 2.7L Diesel - Engine Cooling

Description and Operation

Cooling System Component Layout – Manual Gearbox Without Fuel Burning Heater (FBH)

E84134

Item	Part Number	Description
A	-	2007 model year onwards

1	-	Heater hose, in and out
2	-	Heater hose, in and out, for vehicles with rear heater (optional)
3	-	EGR valve

GENERAL

The cooling system employed is of the pressure relief by-pass type, which allows coolant to circulate around the engine and the heater circuit while the thermostat main valve is closed. The primary function of the cooling system is to maintain the engine within an optimum temperature range under changing ambient and engine operating conditions. Secondary functions are to provide heating for the passenger compartment and cooling for the transmission fluid and engine oil.

The cooling system comprises:

- A radiator
- An intercooler
- A passenger compartment heater matrix
- Two fuel coolers
- Two Exhaust Gas Recirculation (EGR) coolers
- A Fuel Burning Heater (FBH) (Market dependant)
- A coolant pump
- A Pressure Relief Thermostat (PRT)
- An expansion tank
- An electro-viscous fan
- Connecting hoses and pipes.

ENGINE COOLING SYSTEM

The coolant is circulated by a centrifugal type pump mounted on the front of the engine and driven by the ancillary drive 'polyvee' belt. The coolant pump circulates coolant around the cylinder block and cylinder heads via a chamber located in the 'vee' of the engine. Some of the coolant flow is diverted through the integrated fuel and engine oil coolers. Having passed through the engine and oil coolers, the coolant returns to the thermostat housing via the by-pass pipe. Coolant also circulates through the EGR coolers to the heater matrix and returns to the engine side of the PRT.

On vehicles fitted with FBH, the coolant circulates through the EGR coolers to the FBH unit (whether active or not) and then on to the heater matrix. The coolant then returns to the engine side of the PRT.

On vehicles from 2007 model year, there is a thermostat located in each EGR cooler outlet spigot. These thermostats control coolant flow through the EGR coolers benefitting both engine emissions and engine/heater warm-up.

The PRT housing contains a normal thermostat, which is positioned such that the wax's temperature is controlled by both the coolant from the radiator and the bypass. This results in the thermostat being able to vary its opening temperature dependant on ambient conditions. The PRT also contains a sprung loaded valve, which limits the amount flow using the bypass. This means that the engine can run without coolant flowing through the bypass temporarily, to improve heater performance.

The radiator is a cross flow type with an aluminium matrix and has a drain tap on the lower RH rear face. The lower radiator mountings are located part way up the end tanks. The mountings are fitted with rubber bushes, which sit on the upper chassis rails. The radiator upper is mounted by pins, which are pushed through rubber bushes mounted in the Front End Carrier (FEC) above the radiator.

The intercooler is attached to the bottom of the radiator by two pins, which locate into fittings in the radiator end tanks.

The radiator top hose is connected to the PRT by the bypass hose and the bottom hose is directly connected to the outlet side of the thermostat housing.

The expansion tank is fitted forward of the LH suspension turret in the engine compartment. The expansion tank allows for the expansion of the coolant as the engine gets hot and also supplies the engine with coolant as the coolant in the engine contracts. The tank also allows any air trapped in the coolant to be removed.

The liquid cooled transmission fluid cooler (automatic models only) is mounted in the cold side radiator end tank. It is positioned in the middle of the LH end tank.

The 2nd fuel cooler is fed from the cold side end tank of the radiator from a sub cooled section and returns into the PRT housing on the radiator side.

On vehicles fitted with a FBH, the unit is located forward of the LH suspension turret. Coolant flows through the FBH whether it is active or not. The exhaust from the burner is vented into the front LH wheel arch. For additional information, refer to: Auxiliary Heater (412-02B Auxiliary Heating, Description and Operation).

For additional airflow through the radiator matrix, particularly when the vehicle is stationary, there is an engine driven electro-viscous fan unit fitted to the rear of the radiator. The fan is used for engine cooling and for Air Conditioning (A/C) system cooling. This unit functions as a normal viscous fan, but with electronic control over the level engagement of the clutch. The Engine Control Module (ECM), which determines the required fan speed, controls the level of clutch

engagement. The ECM determines engagement based on the coolant, charge air, ambient and transmission oil temperatures and the A/C pressure. The fan is mounted using a left hand thread.

The viscous fan unit is electronically controlled by the ECM to optimise fan speed for all operating conditions.

• NOTE: If the electrical connections to the viscous fan are disconnected the fan will 'idle' and overheating may result. The ECM stores the appropriate fault codes in this case.

ENGINE COOLING SYSTEM OPERATION

E 43019

When the engine is running the coolant pump is driven by the ancillary drive belt. This forces coolant to circulate around the engine and heater, while the thermostat and bypass valve are shut. As the temperature and pressure increases the bypass valve is forced open allowing coolant to circulate through the bypass valve. When the temperature reaches 82°C (180°F) the main thermostat begins to open, allowing coolant to circulate through the main radiator. As the thermostat progressively opens (fully open at 95°C (203°F)), the bypass valve progressively closes forcing any coolant through the heater or radiator. Once coolant is allowed to circulate through the radiator, the transmission fluid (automatic models only) and fuel coolers begin to receive coolant flow.

The increased coolant volume, created by heat expansion, is directed to the expansion tank through a bleed hose from the top of the radiator. The expansion tank has an outlet hose which is connected into the coolant circuit. This outlet hose returns the coolant to the system when the engine cools.

Coolant flows through the radiator from the top right hand tank to the bottom left hand tank and is cooled by air passing through the matrix. The temperature of the cooling system is monitored by the ECM via the Engine Coolant temperature (ECT) sensor located in the cylinder head. The ECM uses signals from this sensor to control the cooling fan operation and adjust fuelling according to engine temperature.

For additional information, refer to: Electronic Engine Controls (303-14C Electronic Engine Controls - 2.7L Diesel, Description and Operation).

To control the cooling fan, the ECM sends a Pulse Width Modulated (PWM) signal to the cooling fan module (integral to the ECM). The frequency of the PWM signal is used by the cooling fan module to determine the output voltage supplied to the fan motor.

The ECM varies the duty cycle of the PWM signal between 0 and 100% to vary the fan speed. If the PWM signal is outside the 0 to 100% range, the cooling fan module interprets the signal as an open or short circuit and runs the fans at maximum speed to ensure the engine and gearbox do not overheat.

The ECM operates the fan in response to inputs from the ECT sensor, the transmission oil temperature sensor, the charge air temperature sensor, the A/C switch and the A/C pressure sensor.

For additional information, refer to: Air Conditioning (412-03A Air Conditioning - 4.0L, Description and Operation).

The speed of the cooling fan is also influenced by vehicle road speed. The ECM adjusts the speed of the cooling fans, to compensate for the ram effect of vehicle speed, using the Controller Area Network (CAN) road speed signal received from the Anti-lock Braking System (ABS) module.

Pressure Relief Thermostat (PRT)

The thermostat is exposed to 85% hot coolant from the engine on one side and 15% cold coolant returning from the radiator bottom hose on the other side. This allows the thermostat to react to the ambient conditions and provide coolant control for both winter and summer use. Hot coolant from the engine passes via holes in the by-pass flow valve into a tube which surrounds 85% of the thermostat sensitive area. Cold coolant from the radiator conducts through the remaining 15% of the sensitive area. In cold ambient conditions, the engine temperature is raised by approximately 10°C (50°F) to compensate for the heat loss of 15% exposure to the cold coolant returning from the bottom hose. This improves heater performance and engine warm-up.

The by-pass flow valve is held closed by a light spring and operates to further assist engine and heater warm-up. When the main valve is closed and the engine speed is at idle, the coolant pump does not produce sufficient flow and pressure to overcome the spring and open the valve. In this condition the valve prevents coolant circulating through the by-pass circuit and directs coolant through the heater matrix only. This provides a higher flow of coolant through the heater matrix improving passenger comfort in cold conditions.

When the engine speed increases above idle, the coolant pump produces a greater flow and pressure than the heater circuit can accommodate. The build up of pressure acts on the flow valve, overcoming the spring pressure, opening the valve and relieving the pressure in the heater circuit. The valve then modulates to provide maximum coolant flow through the heater matrix and allowing excess coolant to flow into the by-pass circuit to provide the engine's cooling requirements at higher engine speeds. The thermostat then regulates the flow through the radiator to maintain the engine at the optimum temperature. Maximum opening of the thermostat, and therefore maximum flow through the radiator, occurs if the coolant temperature reaches 95°C (203°F).

Engine Cooling - TDV6 2.7L Diesel - Engine Cooling

Diagnosis and Testing

Principle of Operation

For a detailed description of the engine cooling system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to:

Engine Cooling (303-03 Engine Cooling - 2.7L Diesel, Description and Operation),
[Engine Cooling](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Coolant leaks ● Coolant Hoses ● Coolant expansion tank ● Radiator ● Heater core ● Accessory drive belt ● Viscous fan 	<ul style="list-style-type: none"> ● Fuses ● Harnesses ● Loose or corroded connector(s) ● Engine Coolant Temperature (ECT) sensor

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Coolant loss	<ul style="list-style-type: none"> ● Hoses ● Hose connections ● Radiator ● Water pump ● Heater core ● Gaskets ● Engine casting cracks ● Engine block core plugs 	Carry out a visual inspection. If there are no obvious leaks, carry out a cooling system pressure test. Rectify any leaks as necessary.
Overheating	<ul style="list-style-type: none"> ● Low/Contaminated coolant ● Thermostat ● Viscous fan ● ECT sensor ● Restricted air flow over the radiator 	Check the coolant level and condition. Carry out a cooling system pressure test. Rectify any leaks as necessary. Check the thermostat and rectify as necessary. Check the viscous fan operation, make sure the viscous fan rotates freely. Check for obstructions to the air flow over the radiator. Rectify as necessary.
Engine not reaching normal temperature	<ul style="list-style-type: none"> ● Thermostat ● Viscous fan ● Thermostat ● Electric fan ● Fan speed module 	Check the thermostat operation. Check the viscous fan operation, make sure the viscous fan is not seized. Rectify as necessary.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - TDV6 2.7L Diesel, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Engine Cooling - TDV6 2.7L Diesel - Cooling System Draining, Filling and Bleeding

General Procedures

All vehicles

1. Position the vehicle on a lift.
2. Set the heater controls to maximum.
3. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
4. Remove the engine cover.
For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

5.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Remove the coolant expansion tank cap.

6. Remove the radiator access panel.

- Remove the 4 bolts.

E45739

7. Position a container to collect the fluid.

8.  **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Release the clip and disconnect the radiator lower hose, allow the coolant to drain.

E55052

9. Remove the container.

Vehicles with auxiliary climate control

10. Remove the spare wheel and tire.

- Remove the tool kit.
- Access the winch.

11. Position a container to collect the fluid.

12. Disconnect the rear heater coolant hoses.

- Release the 2 clips.
- Allow the coolant to drain.

13. Remove the container.

14. Connect the rear heater coolant hoses.

- Secure the two clips.

15. Install the spare wheel and tire.

- Stow the tool kit.

All vehicles

16. Connect and secure the radiator lower hose.

- Secure with the clip.

17. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

18. Connect exhaust extraction hoses to the tail pipes.

19. Loosen the coolant expansion tank bleed screw.

20. Loosen the cylinder head bleed hose bleed screw.

21. Refill the cooling system.

22. Tighten the bleed screws to 14 Nm (10 lb.ft).

23. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank, until a steady stream of coolant is seen returning to the tank.

24. NOTE: When the coolant bleed is complete and prior to installing the expansion tank cap, top up the expansion tank to 30mm above the maximum level.

Install the coolant expansion tank cap.

25.  WARNING: Release the cooling system pressure by slowly turning the expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

Start and run the engine.

- Hold the engine speed at 3,000 RPM for one minute.
- Return the engine to idle for five minutes.
- Hold the engine speed at 3,000 RPM for one minute.
- Run the engine until the thermostat opens.
- Remove coolant expansion tank cap, allow float to settle and top-up coolant if required. Install cap.

26. Switch the engine off and allow to cool.

27. Install the engine cover.

For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornammentation, Removal and Installation).

28. Clean any remaining coolant from the chassis and surrounding area.

29. Install the radiator access panel.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).

30. Check and top-up the coolant if required.

Engine Cooling - TDV6 2.7L Diesel - Cooling System Draining and Vacuum

Filling

General Procedures

⚠ WARNING: To avoid having scalding hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

⚠ The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the engine.

⚠ Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

1. Set the heater controls to maximum HOT.

2. **⚠ WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Remove the coolant expansion tank cap.

3. **⚠ WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the front LH splash shield.

- Remove the 4 clips.

5. Remove the radiator access panel.

- Remove the 4 bolts.

6. Position a container to collect the fluid.

7. Disconnect the coolant hose from the thermostat.

- Release the clip.
- Allow the coolant to drain.

8. Disconnect the coolant hose from the thermostat.

- Release the clip.
- Allow the coolant to drain.

9. Remove the spare wheel and tire.

- Remove the tool kit.
- Access the winch.

10. Position a container to collect the fluid.

11. Disconnect the rear heater coolant hoses.

- Release the 2 clips.
- Allow the coolant to drain.

12. Connect the rear heater coolant hoses.

- Secure the clips.

13. Install the spare wheel and tire.

- Stow the tool kit.

14. Connect the thermostat housing coolant hoses.

- Secure with the clip.

15. Prepare a sufficient amount of coolant to the specified concentration.

16. Install the cooling system vacuum refill adaptor to the expansion tank.

17. Install the vacuum filler gauge to the cooling system vacuum refill adaptor.

18. Install the venturi tube assembly to the vacuum filler gauge.

19. NOTE: Make sure both valves on gauge assembly are in the closed position.

- NOTE: The coolant vacuum fill tool needs an air pressure of 6 to 8 bar (87 to 116 psi) to operate correctly.

- NOTE: Small diameter or long airlines may restrict airflow to the coolant vacuum fill tool.

Connect a regulated compressed air supply to the venturi tube assembly.

20. NOTE: Make sure air cannot enter the hose.

Position the coolant pick-up pipe into a container of clean coolant.

21. Position the evacuated air hose into a container.

22. Open the air supply valve.

23. Open the coolant supply valve for 2 seconds to prime the coolant supply hose.

24. Apply air pressure progressively until the arrow on the vacuum filler gauge reaches the green segment.

25. Close the air supply valve.

26. Allow one minute to check the vacuum is held.

- Disconnect the compressed air supply.

27. NOTE: Close the coolant supply valve when the coolant expansion tank MAX mark is reached or coolant movement has ceased.

Open the coolant supply valve and allow the coolant to be drawn into the system.

28. Remove the vacuum filler gauge and cooling system vacuum refill adaptor assembly.

29. Connect exhaust extraction hoses to the tail pipes.

30. Check and top-up the coolant if required.

31. Install the coolant expansion tank cap.

32. Start and run the engine.

- Hold the engine speed at 3,000 RPM for one minute.
- Return the engine to idle for five minutes.
- Hold the engine speed at 3,000 RPM for one minute.
- Run the engine until the thermostat opens.

33. Switch the engine off and allow to cool.

34. Clean any spilt coolant from the vehicle.

35. Install the radiator access panel.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).

36. Install the front LH splash shield.

- Install the clips.

37.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Check and top-up the coolant if required.

Engine Cooling - TDV6 2.7L Diesel - Cooling System Pressure Test

General Procedures

• NOTE: The following procedure will enable the cooling system to be pressure tested for condition and leaks. Stage 1 will check the expansion tank cap register seal and the cap for leaks. Stage 2 will check the entire cooling system.

• NOTE: It will be necessary to use the cooling system test kit, Part Number LR-218, which is available under the equipment programme.

1. Examine the coolant hoses for signs of cracking, distortion and security of the hose connections.

2.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Disconnect the coolant expansion tank bleed hose.

- Release the clip.

3. Install the 'T' piece adaptor (part of the cooling system test kit) between the coolant expansion tank and the coolant bleed hose.

- Secure with the 2 clips.

4. Install the coolant pressure pump assembly.

- Connect to the 'T' piece.

5. Pressurize the cooling system.

- Slowly pressurize the cooling system to 1.0 bar (100 kPa) (14.5 psi).
- Check the pressure remains above 0.9 bar (90 kPa) (13 psi) after waiting for 30 seconds.
- During the pressure drop check, listen for a hissing noise from the expansion tank cap.

6. NOTE: If the coolant expansion tank cap is found to be leaking, replace the cap.

Depressurize the cooling system.

- Disconnect the 'T' piece.
- Connect the coolant expansion tank bleed hose.
- Secure the clip.

7.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Remove the coolant expansion tank cap.

8. NOTE: This adaptor is part of the cooling system test kit.

Install adaptor K83 to the coolant expansion tank.

- Clean the component mating faces.
- Lubricate the seal.

9. Install the coolant pressure pump assembly.

- Slowly pressurize the cooling system to 1.5 bar (150kPa) (22 psi), check the pressure over a 5 minute period. A small pressure decay of approximately 0.15 bar (15 »kPa) (1 psi) over the first minute is normal, as the air in the expansion tank cools.
- If the pressure continues to drop after the initial tolerance, there is a coolant leak.

10. Depressurize and remove the pressure pump and gauge.

- Install the coolant expansion tank cap.

Engine Cooling - TDV6 2.7L Diesel - Coolant Expansion Tank

Removal and Installation

Removal

1. Remove the LH headlamp assembly.
For additional information, refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).
2. Release the windshield washer reservoir filler neck.
3. Release the coolant expansion tank.
 - Remove the 2 bolts.

4. Release the power steering fluid reservoir.

5.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

 **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Disconnect the 2 hoses from the coolant expansion tank.

- Position an absorbent cloth to collect fluid spillage.
- Position a container to collect the fluid.
- Clamp the hoses
- Release the 2 clips.

6. Remove the coolant expansion tank.

- Disconnect the coolant low level sensor electrical connector.

7. NOTE: Do not disassemble further if the component is removed for access only.

Remove the coolant low level sensor.

- Remove the coolant expansion tank support bracket.

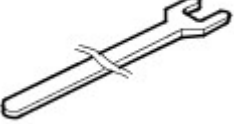

E47510

Installation

1. Install the bracket.
2. Install the coolant low level sensor.
3. Install the coolant expansion tank.
 - Connect the coolant low level sensor electrical connector.
4. Connect the coolant hoses to the expansion tank.
 - Secure with the clips.
5. Top-up the coolant.
 - Loosen the coolant expansion tank bleed screw.
 - Fill the coolant expansion tank until coolant emerges from the cooling system air bleed screw.
 - Remove the hose clamps.
 - Tighten the bleed screw to 8 Nm (6 lb.ft).
6. Secure the coolant expansion tank.
 - Tighten the bolts to 10 Nm (7 lb.ft).
7. Check and top-up the coolant.
 - Install the coolant expansion tank pressure cap.
8. Secure the power steering fluid reservoir.
 - Attach to the mounting bracket.
9. Secure the windshield washer reservoir filler neck.
 - Locate in clip.
10. Install the LH headlamp assembly.
For additional information, refer to: [Headlamp Assembly \(417-01 Exterior Lighting, Removal and Installation\)](#).

Engine Cooling - TDV6 2.7L Diesel - Cooling Fan

Removal and Installation

Special Tool(s)	
 <p>303-1142 E46076</p>	<p>Viscous coupling spanner 303-905 (LRT-12-094)</p>
 <p>303-1143 E55382</p>	<p>Viscous coupling pulley retaining tool 303-1143</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the air cleaner assembly.
For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).
3. Remove the cooling fan shroud.
 - Release the coolant hose.
 - Release the 3 clips.

4. **NOTE: The thread is left handed.**

Remove the cooling fan assembly.

- Disconnect the electrical connector.
- Use the special tools.

5. NOTE: Do not disassemble further if the component is removed for access only.

Remove the viscous coupling.

- Remove the 4 bolts.

Installation

1. Install the viscous coupling.
 - Clean the component mating faces.
 - Tighten the bolts to 10 Nm (7 lb.ft).
2. Install the cooling fan assembly.
 - Clean the component mating faces.
 - Tighten the cooling fan assembly to 65 Nm (48 lb.ft).
 - Connect the electrical connector.
3. Install the cooling fan shroud.
4. Install the air cleaner assembly.

For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).
5. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine Cooling - TDV6 2.7L Diesel - Cooling Fan Shroud

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the cooling fan assembly.
For additional information, refer to: [Cooling Fan](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

3. Remove the radiator access panel.

- Remove the 4 bolts.

4. Release the coolant pipes and hoses from the lower shroud.

5. Remove the cooling fan lower shroud.

- Release the 2 clips.
- Remove the screw.

E47631

Installation

1. Install the cooling fan lower shroud.

- Tighten the screw.
- Secure with the clips.

2. Install the coolant pipes and hoses to the lower shroud.

3. Install the radiator access panel.

- Tighten the bolts to 10 Nm (7 lb.ft).

4. Install the cooling fan assembly.

For additional information, refer to: [Cooling Fan](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

Engine Cooling - TDV6 2.7L Diesel - Engine Coolant Level Switch

Removal and Installation

Removal

1. Release the power steering fluid reservoir from the bracket.

2. Release the windshield washer reservoir filler neck.

3. Reposition the coolant expansion tank.
 - Remove the 2 bolts.

4. Remove the engine coolant level switch.

Installation

1. NOTE: Disconnect the engine coolant level switch electrical connector. **CAUTION: Make sure the click can be heard when the engine coolant level switch is correctly installed.**

Install the engine coolant level switch.

- Connect the engine coolant level switch electrical connector.

3. Secure the windshield washer reservoir filler neck.
2. **CAUTION: Make sure that the component is correctly located on the locating peg.** Secure the power steering fluid reservoir to the bracket.

Secure the coolant expansion tank.

- Tighten the bolts to 10 Nm (7 lb.ft).

Engine Cooling - TDV6 2.7L Diesel - Radiator

Removal and Installation

Removal

All vehicles

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
3.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
4. Remove the cooling fan lower shroud.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
5. Remove the radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
6. Remove the LH headlamp assembly.
For additional information, refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).
7. Release the coolant expansion tank.
 - Remove the 2 bolts.

8. Disconnect the radiator bleed hose.
 - Release the clip.

9. Remove the front RH splash shield.

- Remove the 4 retaining clips.

10.  CAUTION: Always plug any open connections to prevent contamination.

Disconnect the charge air cooler inlet hose.

- Loosen the clip.
- Tie aside.

11.  CAUTION: Always plug any open connections to prevent contamination.

Disconnect the charge air cooler outlet hose.

- Loosen the clip.
- Tie aside.

12. Disconnect the radiator upper hose.

- Release the clip.
- Tie aside.

13. Disconnect the radiator lower hose.

- Release the clip.
- Tie aside.

14. Tie the engine air intake duct towards the engine.

Vehicles with automatic transmission

15.  CAUTION: Always plug any open connections to prevent contamination.

Disconnect the 2 transmission fluid cooler pipes.

- Release the clips.
- Position a container to collect the fluid spillage.
- Tie aside.

All vehicles

16. Disconnect the fuel cooler line.

- Release the clip.

E49349

17. Remove the radiator securing pegs.

- Release the clips.

18. Remove the radiator upper deflector.

- Release the 2 clips.

E49351

19. Release the power steering fluid cooler.

- Release the 2 clips.
- Tie the line aside.

20. Release the front differential breather line.

21. Remove the power steering fluid cooler line retaining clip.

22. Release the A/C condenser.

- Remove the 3 bolts.
- Release the 2 clips.

23. Release the radiator.

- Remove the 2 bolts.
- Lift the radiator clear of its mountings.

E49354

24. Tie the A/C condenser forwards, clear of the radiator.

25. NOTE: Left-hand shown, right-hand similar.

Remove the 2 clips retaining the radiator to the charge air cooler.

E63130

26.  CAUTION: Protect the radiator during this operation.

- NOTE: Do not disassemble further if the component is removed for access only.

Carefully remove the radiator.

27. NOTE: Note the fitted position.

28. Remove the radiator lower deflector.

Remove the fuel cooler hose.

- Loosen the clip.

E49356

29. Remove the radiator rubber insulators.

E49357

Installation

All vehicles

1. Install the rubber insulators.
2. Install the radiator lower deflector.
3. Install the fuel cooler hose.
 - Tighten the clip.
4.  **CAUTION:** Protect the radiator during this operation.

Carefully install the radiator.

5. Install the 2 clips, to retain the charge air cooler to the radiator.
6. Position the radiator.
 - Lift the radiator onto its mountings.
 - Tighten the bolts to 25 Nm (18 lb.ft).
7. Attach the A/C condenser.
 - Remove and discard the 2 cable ties.
 - Lift it into the clips.
 - Tighten the bolt to 6 Nm (4 lb.ft).
8. Position the front differential breather line.
9. Attach the power steering fluid cooler.
 - Secure into the 3 clips.
10. Install the radiator upper deflector.
11. Install the radiator securing pegs.
12. Connect the fuel cooler line.
 - Secure with the clip.

Vehicles with automatic transmission

13. Connect the transmission fluid cooler coolant hoses.
 - Install the clips.

All vehicles

14. Install the radiator lower hose.
 - Secure with the clip.
15. Release the air intake duct.
 - Remove and discard the cable tie.
16. Connect the radiator upper hose.

- Remove and discard the cable tie.
 - Secure with the clip.
- 17.** Connect the radiator lower hose.
- Remove and discard the cable tie.
 - Secure with the clip.
- 18.** Connect the charge air outlet hose.
- Tighten the clip to 10 Nm (7 lb.ft).
- 19.** Connect the charge air inlet hose.
- Tighten the clip to 10 Nm (7 lb.ft).
- 20.** Install the front RH splash shield.
- Install the four clips.
- 21.** Secure the coolant expansion tank.
- Tighten the two retaining bolts to 10 Nm (7 lb.ft).
- 22.** Connect the radiator bleed hose.
- Secure with the clip.
- 23.** Install the LH headlamp assembly.
For additional information, refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).
- 24.** Install the radiator grille.

- 25.** Install the cooling fan lower shroud.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
- 26.** Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
- 27.** Refill the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

Vehicles with automatic transmission

- 28.** Check automatic transmission fluid level.

Engine Cooling - TDV6 2.7L Diesel - Thermostat

Removal and Installation

Removal

1. Drain the cooling system.
2. Position a container to collect the fluid spillage.
3. Disconnect the radiator upper hose from the thermostat.

- Release the clip.

E84960

4. Disconnect the heater hose from the thermostat.

- Release from the clip.

E84961

5. Disconnect the engine inlet hose from the thermostat.

- Release the clip.

E84962

6. Disconnect the radiator lower hose from the thermostat.

- Release the clip.

E84963

7. Disconnect the coolant expansion tank hose from the thermostat.

- Release the clip.

8. Remove the thermostat.

- Disconnect the coolant hose from the thermostat.

9. Remove the container.

Installation

1. Install the thermostat.

- Connect the coolant hose to the thermostat.
- Secure with the clip.

2. Connect the coolant expansion tank hose to the thermostat.

- Secure with the clip.

3. Connect the radiator lower hose to the thermostat.

- Secure with the clip.

4. Connect the engine inlet hose to the thermostat.

- Secure with the clip.

5. Connect the heater hose to the thermostat.

- Secure with the clip.

6. Connect the radiator upper hose to the thermostat.

- Secure with the clip.
- Position the radiator upper hose to the cooling fan shroud.

7. Refill and bleed the cooling system.

Engine Cooling - TDV6 2.7L Diesel - Thermostat Housing

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
3. Remove the cooling fan shroud.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
4. Remove the radiator access panel.
 - Remove the four retaining bolts.

5. Remove the front LH splash shield.
 - Remove the four clips.

6. Disconnect the fuel cooler return hose from the thermostat.
 - Release the clip.

7. Disconnect the heater return hose from the heater return pipe.

- Release from the clip.

E55056

8. Disconnect the thermostat to top hose 'T' piece hose.

- Release from the clip.

E55048

9. Disconnect the thermostat hose from the engine coolant rail.

- Release the clip.

E55050

10. Disconnect the thermostat to fuel fired heater hose from the fuel fired heater.

- Release the clip.

E55051

11. Disconnect the radiator lower hose from the radiator.

- Release the clip.

E55052

12. Release the securing straps.

E55054

13. Release the coolant hose retaining clip.

E55053

14. Release the coolant hose retaining clip.

E55055

15. Remove the thermostat and hose assembly.

Installation

1. Install the thermostat and hose assembly.

2. Install the coolant hose retaining clip.
3. Install the coolant hose retaining clip.
4. Install the securing straps.
5. Connect the radiator lower hose to the radiator.
6. Connect the thermostat to fuel fired heater hose to the fuel fired heater.
7. Connect the thermostat hose to the engine coolant rail.
8. Connect the thermostat to top hose 'T' piece hose.
9. Connect the heater return hose to the heater return pipe.
10. Connect the fuel cooler return hose to the thermostat.
11. Install the front LH splash shield.
 - Install the four clips.
12. Install the radiator access panel.
 - Install the four retaining bolts.
13. Install the cooling fan shroud.

For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
14. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
15. Refill and bleed the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

Engine Cooling - TDV6 2.7L Diesel - Coolant Pump

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
3. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).
4. **NOTE:** Loosen the bolts prior to removing the accessory drive belt.

Remove the coolant pump pulley.

- Remove the 3 bolts.

5. Remove the coolant pump.

- Remove the 3 bolts.
- Discard the O-ring seal.

Installation

1. Install the coolant pump.
 - Clean the component mating faces.
 - Install a new O-ring seal.
 - Tighten the bolts to 10 Nm (7 lb.ft).
2. Install the coolant pump pulley.
 - Clean the components.
 - Tighten the bolts to 25 Nm (18 lb.ft).
3. Install the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).
4. Refill and bleed the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

Diesel, General Procedures).

Engine Cooling - TDV6 2.7L Diesel - Water Pump

Removal and Installation

Removal

1. Disconnect the battery ground cable.

Engine Cooling - TDV6 3.0L Diesel - Engine Cooling - Overview

Description and Operation

OVERVIEW

The engine cooling system maintains the engine within an optimum temperature range under changing ambient and engine operating conditions. It also provides:

- Heating for the passenger compartment.
Refer to: [Heating and Ventilation](#) (412-02A Heating and Ventilation, Description and Operation).
- Cooling for:
 - The engine oil
 - The fuel
 - The [EGR \(exhaust gas recirculation\)](#) systemRefer to: [Engine Emission Control](#) (303-08B Engine Emission Control - TDV6 3.0L Diesel, Description and Operation).
- The transmission fluid.

Engine Cooling - TDV6 3.0L Diesel - Engine Cooling - System Operation and Component Description

Description and Operation

System Operation

COOLANT CIRCUIT FLOW

When the engine is running the coolant is circulated around the engine cooling system by the coolant pump. From the coolant pump, coolant flows through the cylinder block and the cylinder heads. Some of the coolant in the cylinder block is diverted through the engine oil cooler before returning to the 5-way connector via the water outlet.

From the 5-way connector, the majority of the coolant flows to the pressure relief thermostat, either directly or via the radiator, depending on the temperature of the coolant. From the outlet of the thermostat the coolant flows to the inlet of the coolant pump.

A separate hose from the radiator allows extra-cooled coolant from the radiator to flow through the transmission oil cooler. The coolant from the cooler is returned to the system via a branch in the bottom radiator hose.

Coolant from the water outlet also flows through the [EGR \(exhaust gas recirculation\)](#) coolers and then to the heater core. From the heater core outlet, the coolant flows to the outlet zone of the pressure relief thermostat.

The expansion tank allows expansion of coolant due to temperature increases to pass excess coolant back to the expansion tank. A small hose is connected from the water outlet to the expansion tank for this purpose. As the coolant cools, the coolant is allowed back into the system from the tank via a hose from the expansion tank into the radiator bottom hose.

PRESSURE RELIEF THERMOSTAT (PRT)

The thermostat is closed at temperatures below approximately 82°C (179°F). When the coolant temperature reaches approximately 82°C the thermostat starts to open and is fully open at approximately 96°C (204°F). In this condition the full flow of coolant is directed through the radiator. The thermostat is exposed to 90% hot coolant from the engine on one side and 10% cold coolant returning from the radiator bottom hose on the other side. Hot coolant from the engine passes from the by-pass pipe through four sensing holes in the flow valve into a tube surrounding 90% of the thermostat sensitive area. Cold coolant returning from the engine, cooled by the radiator, conducts through 10% of the sensitive area.

In cold ambient temperatures, the engine temperature is raised by approximately 10°C (50°F) to compensate for the heat loss of 10% exposure to the cold coolant returning from the bottom hose.

The by-pass flow valve is held closed by a light spring. It operates to further aid heater warm-up. When the main valve is closed and the engine speed is at idle, the coolant pump does not produce sufficient flow and pressure to open the valve. In this condition the valve prevents coolant circulating through the by-pass circuit and forces the coolant through the heater matrix only. This provides a higher flow of coolant through the heater matrix to improve passenger comfort in cold conditions. When the engine speed increases above idle, the coolant pump produces a greater flow and pressure than the heater circuit can take. The pressure acts on the by-pass flow valve and overcomes the valve spring pressure, opening the valve and limiting the pressure in the heater circuit. The valve modulates to provide maximum coolant flow through the heater core and yet allowing excess coolant to flow into the by-pass circuit to provide the engine's cooling needs at higher engine speeds.

COOLING FAN

For additional airflow through the radiator matrix, particularly when the vehicle is stationary, there is an engine driven electro-viscous fan unit fitted to the rear of the radiator. The fan is used for engine cooling and for [A/C \(air conditioning\)](#) system cooling. This unit functions as a normal viscous fan, but with electronic control over the level engagement of the clutch. The [ECM \(engine control module\)](#), which determines the required fan speed, controls the level of clutch engagement. The [ECM](#) determines engagement based on the coolant, charge air, ambient and transmission oil temperatures and the [A/C](#) pressure. The fan is mounted using a left hand thread.

The viscous fan unit is electronically controlled by the [ECM](#) to optimize fan speed for all operating conditions.

• **NOTE:** If the electrical connections to the viscous fan are disconnected the fan will 'idle' and overheating may result. The ECM stores the appropriate fault codes in this case.

Component Description

PRESSURE RELIEF THERMOSTAT (PRT)

E121136

ItemDescription

1	Connection to radiator top hose
2	PRT body
3	Connection from radiator bottom hose
4	Heater core return connection
5	Connection to cylinder block water inlet
6	Connection to expansion tank

A plastic thermostat housing is located behind the radiator. The housing has 5 connections which locate the radiator bottom hose, top hose from the 5-way connector, coolant pump feed hose to the cylinder block and return feed from the heater core. The housing contains a wax element and a spring loaded by-pass flow valve.

The thermostat is used to maintain the coolant at the optimum temperature for efficient combustion and to aid engine warm-up.

RADIATOR

E121137

ItemDescription

1	Coolant inlet
2	Coolant outlet to fuel cooler
3	Support - upper (2 off)
4	Support - lower (2 off)
5	Coolant outlet to transmission oil cooler
6	Coolant outlet to pressure relief thermostat

The radiator is a vertical-flow type with an aluminum core and plastic end tanks. The radiator is located in the vehicle by locating spigots and supports integrated into the cooling pack end frames. The lower supports are installed in rubber bushes in the upper chassis rails. The upper locating spigots are installed in rubber bushes in the front end carrier. Coolant inlet and outlet connections are incorporated into the upper and lower end tanks respectively.

The lower end tank also has a connection for coolant outlet to the transmission fluid cooler.

COOLANT PUMP

E97921

ItemDescription

1	Bolt (3 off)
2	Drive hub
3	Housing
4	Impeller
5	Pulley

The coolant pump has a housing that supports a shaft with an impeller attached to one end and a drive hub at the other. The housing is attached to the front of the cylinder block with the impeller located in a pumping chamber. The pump is driven by a pulley attached to the drive hub and driven by the accessory drive belt. For additional information refer to Accessory Drive 303-05B.

EXPANSION TANK

E121138

ItemDescription

1	Filler cap
2	Bleed screw
3	Vent hose connection
4	Expansion hose connection
5	Expansion tank

A pressurized expansion tank system is used which continuously separates the air from the cooling system and replenishes the system through a hose connected between the expansion tank and the heater return hose. A continuous vent into the expansion tank, through a hose connected to the engine's coolant outlet connector, prevents air locks from forming in the cooling system.

The expansion tank is installed behind the top right corner of the radiator. A filler cap, bleed screw and level sensor are incorporated into the expansion tank. MAX and MIN level markings are molded into the interior of the tank below the filler cap.

The expansion tank provides the following functions:

- Service fill
- Coolant expansion during warm-up
- Air separation during operation
- System pressurization by the filler cap

The expansion tank has an air space of approximately 0.5 to 1 liter (1.06 to 2,11 US pints), above the MAX level, to allow for coolant expansion.

COOLING FAN

E121139

ItemDescription

1	Shroud
2	Electrical connector
3	Fan
4	Viscous unit

To control the cooling fan, the [ECM](#) sends a [PWM \(pulse width modulation\)](#) signal to the cooling fan module (integral to the [ECM](#)). The frequency of the [PWM](#) signal is used by the cooling fan module to determine the output voltage supplied to the fan motor.

The [ECM](#) varies the duty cycle of the [PWM](#) signal between 0 and 100% to vary the fan speed. If the [PWM](#) signal is outside the 0 to 100% range, the cooling fan module interprets the signal as an open or short circuit and runs the fans at maximum speed to ensure the engine and transmission do not overheat.

The [ECM](#) operates the fan in response to inputs from the [ECT \(engine coolant temperature\)](#) sensor, the transmission oil temperature sensor, the charge air temperature sensor, the [A/C](#) switch and the [A/C](#) pressure sensor.

The speed of the cooling fan is also influenced by vehicle road speed. The [ECM](#) adjusts the speed of the cooling fans, to compensate for the ram effect of vehicle speed, using the [CAN \(controller area network\)](#) road speed signal received from the [ABS \(anti-lock brake system\)](#) module.

ENGINE OIL COOLER

E115007

ItemDescription

1	Coolant outlet
2	Engine oil filter
3	

Engine oil cooler

The engine oil cooler is attached to a common adapter assembly located in the vee of the cylinder block. Inlet and outlet ports for engine oil, and an inlet port for coolant, are incorporated into the cylinder block mating face of the adapter assembly. A metal gasket seals the joint between the adapter assembly and the cylinder block. From the cylinder block, coolant flows through the adapter assembly and into the cooler. After passing through the cooler, the coolant then flows into the engine coolant water outlet.

TRANSMISSION FLUID COOLER

E123878

ItemDescription

1	Coolant inlet from radiator
2	Mounting bracket
3	Fuel cooler
4	Transmission fluid cooler
5	Transmission fluid inlet
6	Coolant outlet to radiator bottom hose
7	Transmission fluid outlet

The transmission fluid cooler is located on chassis cross member behind the radiator, sharing a bracket with the fuel cooler. The cooler is connected to the cooling system with two hoses and receives cooled fluid from the lower section of the radiator, which flows through the cooler, reducing the temperature of the transmission fluid.

ENGINE COOLANT

The coolant is silicate free and must not be mixed with conventional engine coolant.

Engine Cooling - TDV6 3.0L Diesel - Engine Cooling

Diagnosis and Testing

Principle of Operation

For a detailed description of the engine cooling system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (303-03B Engine Cooling - TDV6 3.0L Diesel)

Engine Cooling - TDV6 3.0L Diesel - Cooling System Draining, Filling and Bleeding

General Procedures

Draining

• NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

4. Remove the 4 bolts.

5.

6.  CAUTION: Be prepared to collect escaping coolant.

Position a container to collect the fluid.

7. Connect the transmission fluid cooler coolant hose.

8.  CAUTION: Be prepared to collect escaping coolant.

9. Install the coolant hose.

10. Install the LH splash shield.

11.
 - Install the radiator access panel.
 - *Torque:* 10 Nm

12. Remove the spare wheel and tire.

13.  **CAUTION:** Be prepared to collect escaping coolant.

14. Install the coolant hoses.

15. Install the spare wheel and tire.

Filling

• NOTE: Removal steps in this procedure may contain installation details.

1. Lower the vehicle.

2.

3.

4.

5. **20. CAUTIONS:**

Anti-freeze concentration must be maintained at 50%.

Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

6. **21. CAUTION:** Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

7. Set the heater controls to maximum.

8. Start the engine and continue to fill the coolant until the maximum

level is reached.

9. **24.**  **CAUTION:** Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

10. Increase engine speed to 2500rpm and cycle between this and idle.

11. Continue to top-up with coolant with the engine at idle.

12. **27.**  **CAUTION:** Correct installation of the Coolant expansion tank cap can be obtained by tightening the cap until an audible click is heard.

13. Allow the engine to idle, until hot air is emitted at the face registers.

14. Once the front heater is warm, check if the rear heater is warm (if equipped). If no heat is felt, increase the engine speed to 3000 rpm for 30 seconds and return to idle.

15. **30.**  **CAUTION:** Switch off the engine and allow the coolant temperature to go cold.

16. Visually check the engine and cooling system for signs of coolant leakage.

17. **32.**  **WARNING:** When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

• **CAUTIONS:**

 Since injury such as scalding could be caused by escaping

steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure

Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

- NOTE: When the cooling system is warm, the coolant will be approximately 10mm above the upper level mark on the expansion tank with the cap removed.

Check and top-up the coolant if required.

18. Install the engine cover.

Refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Fluids

Item	Specification
* Anti-freeze	Havoline Extended Life Coolant (XLC) or any ethylene glycol based anti-freeze containing no methanol with only Organic Acid Technology (OAT) corrosion inhibitors
Anti-freeze concentration - Will provide frost protection to -40°C (-40°F)	50%
Specific gravity of coolant at 20°C (68°F), to protect against frost down to -40°C (-40°F)	1.068
Amount of anti-freeze to use for 50% concentration:	
Without rear passenger compartment heater	4.2 litres (6.7 pints) (4.0 US quarts)
With rear passenger compartment heater	5.6 litres (8.9 pints) (5.35 US quarts)

CAUTION: No other anti-freeze should be used with Havoline Extended Life Coolant.

Capacity

Item	Capacity
Without rear passenger compartment heater	8.4 litres (13.4 pints) (8.0 US quarts)
With rear passenger compartment heater	11.1 litres (17.8 pints) (10.7 US quarts)

General Specifications

Item	Specification
Cooling system type	Pressurised, thermostatically controlled with remote header tank
Radiator	Cross flow with integral transmission oil cooler
Expansion tank	Remote - fitted with a bleed screw and low coolant level sensor
Pressure cap rating	110 kPa (1.1 bar) (16 lbf/in ²)
Thermostat:	
Starts to open	88° C (190° F)
Fully open	95° C (203° F)
Cooling fan	Engine driven, viscous coupled with electronic control
Cooling fan diameter	470 mm (18.5 in)
Direction of rotation	Counter clockwise
Coolant pump	Centrifugal flow impellor, belt driven from crankshaft

GENERAL

The cooling system employed is of the pressure relief by-pass type, which allows coolant to circulate around the engine and the heater circuit while the thermostat main valve is closed. The primary function of the cooling system is to maintain the engine within an optimum temperature range under changing ambient and engine operating conditions. Secondary functions are to provide heating for the passenger compartment and cooling for the transmission fluid and engine oil.

The cooling system comprises:

- A radiator
- A passenger compartment heater matrix
- An Engine Oil Cooler (EOC)
- A coolant pump
- A Pressure Relief Thermostat (PRT)
- An expansion tank
- A viscous fan
- Connecting hoses and pipes.

ENGINE COOLING SYSTEM

The coolant is circulated by a centrifugal pump mounted on the front of the engine and driven by an ancillary drive 'polyvee' belt. The coolant pump circulates coolant through the cylinder block and cylinder heads via a chamber located in the 'vee' of the engine. Having passed through the engine the coolant returns to the thermostat housing via the bypass pipe. Coolant also circulates through the top hose to the heater matrix. The coolant returns via the EOC to the engine side of the PRT.

The PRT housing contains a normal thermostat, which is positioned such that the wax's temperature is controlled by both the coolant from the radiator and the bypass. This results in the thermostat being able to vary its opening temperature dependant on ambient conditions. The PRT also contains a sprung loaded valve, which limits the amount flow using the bypass. This means that the engine can run without coolant flowing through the bypass temporarily, to improve heater performance.

The radiator is a cross flow type with an aluminium matrix and has a drain tap on the lower right-hand rear face. The lower radiator mountings are located part way up the end tanks. The mountings are fitted with rubber bushes, which sit on the upper chassis rails. The radiator upper is mounted by pins, which are pushed through rubber bushes mounted in the Front End Carrier (FEC) above the radiator. The radiator also incorporates two connections for the transmission oil cooler pipes.

The radiator top hose is connected to the PRT by the bypass hose and the bottom hose is directly connected to the outlet side of the thermostat housing.

The expansion tank is fitted forward of the LH suspension turret in the engine compartment. The expansion tank allows for the expansion of the coolant as the engine gets hot and also supplies the engine with coolant as the coolant in the engine contracts. The tank also allows any air trapped in the coolant to be removed.

The liquid cooled transmission fluid cooler is mounted in the cold side radiator end tank. It is positioned in the middle of the LH end tank.

For additional airflow through the radiator matrix, particularly when the vehicle is stationary, there is an engine driven Viscous fan unit fitted to the rear of the radiator. The fan is used for engine cooling and for Air Conditioning (A/C) system cooling. The fan is mounted using a left hand thread.

The viscous fan unit is electronically controlled by the ECM to optimise fan speed for all operating conditions.

• **NOTE:** If the electrical connections to the viscous fan are disconnected the fan will 'idle' and overheating may result. The ECM stores the appropriate fault codes in this case.

ENGINE COOLING SYSTEM OPERATION

Cooling System Coolant Flow, Without Engine Oil Cooler

E43034

Cooling System Coolant Flow, With Engine Oil Cooler

E43035

When the engine is running the coolant pump is driven by the ancillary drive belt. This forces coolant to circulate around the engine, heater and EOC, while the thermostat and bypass valve are shut. As the temperature and pressure increases the bypass valve is forced open allowing coolant to circulate through the bypass valve. When the temperature reaches 82°C (180°F) the main thermostat begins to open, allowing coolant to circulate through the main radiator. As the thermostat progressively opens (fully open at 95°C (203°F)), the bypass valve progressively closes forcing any coolant through the heater or radiator. Once coolant is allowed to circulate through the radiator, the transmission fluid cooler begins to receive coolant flow.

The increased coolant volume, created by heat expansion, is directed to the expansion tank through a bleed hose from the top of the radiator. The expansion tank has an outlet hose which is connected into the coolant circuit. This outlet hose returns the coolant to the system when the engine cools.

Coolant flows through the radiator from the top right hand tank to the bottom left hand tank and is cooled by air passing through the matrix. The temperature of the cooling system is monitored by the Engine Control Module (ECM) via the Engine Coolant temperature (ECT) sensor located in the cylinder head. The ECM uses signals from this sensor to adjust fuelling according to engine temperature.

For additional information, refer to: [Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

To control the cooling fan, the ECM sends a Pulse Width Modulated (PWM) signal to the cooling fan module (integral to the ECM). The frequency of the PWM signal is used by the cooling fan module to determine the output voltage supplied to the fan motor.

The ECM varies the duty cycle of the PWM signal between 0 and 100% to vary the fan speed. If the PWM signal is outside the 0 to 100% range, the cooling fan module interprets the signal as an open or short circuit and runs the fans at maximum speed to ensure the engine and gearbox do not overheat.

The speed of the cooling fan is also influenced by vehicle road speed. The ECM adjusts the speed of the cooling fans, to compensate for the ram effect of vehicle speed, using the Controller Area Network (CAN) road speed signal received from

the Anti-lock Braking System (ABS) module.

Pressure Relief Thermostat (PRT)

The thermostat is exposed to 85% hot coolant from the engine on one side and 15% cold coolant returning from the radiator bottom hose on the other side. This allows the thermostat to react to the ambient conditions and provide coolant control for both winter and summer use. Hot coolant from the engine passes via holes in the by-pass flow valve into a tube which surrounds 85% of the thermostat sensitive area. Cold coolant from the radiator conducts through the remaining 15% of the sensitive area. In cold ambient conditions, the engine temperature is raised by approximately 10°C (50°F) to compensate for the heat loss of 15% exposure to the cold coolant returning from the bottom hose. This improves heater performance and engine warm-up.

The by-pass flow valve is held closed by a light spring and operates to further assist engine and heater warm-up. When the main valve is closed and the engine speed is at idle, the coolant pump does not produce sufficient flow and pressure to overcome the spring and open the valve. In this condition the valve prevents coolant circulating through the by-pass circuit and directs coolant through the heater matrix only. This provides a higher flow of coolant through the heater matrix improving passenger comfort in cold conditions.

When the engine speed increases above idle, the coolant pump produces a greater flow and pressure than the heater circuit can accommodate. The build up of pressure acts on the flow valve, overcoming the spring pressure, opening the valve and relieving the pressure in the heater circuit. The valve then modulates to provide maximum coolant flow through the heater matrix and allowing excess coolant to flow into the by-pass circuit to provide the engine's cooling requirements at higher engine speeds. The thermostat then regulates the flow through the radiator to maintain the engine at the optimum temperature. Maximum opening of the thermostat, and therefore maximum flow through the radiator, occurs if the coolant temperature reaches 95°C (203°F).

Engine Cooling - V6 4.0L Petrol - Engine Cooling

Diagnosis and Testing

Principle of Operation

For a detailed description of the engine cooling system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Engine Cooling](#) (303-03C Engine Cooling - V6 4.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Coolant leaks ● Coolant Hoses ● Coolant expansion tank ● Radiator ● Heater core ● Accessory drive belt ● Viscous fan 	<ul style="list-style-type: none"> ● Fuses ● Harnesses ● Loose or corroded connector(s) ● Engine Coolant Temperature (ECT) sensor

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Engine not reaching normal temperature	<ul style="list-style-type: none"> ● Thermostat ● Viscous fan ● Thermostat ● Electric fan ● Fan speed module 	Check the thermostat operation. Check the viscous fan operation, make sure the viscous fan is not seized. Rectify as necessary.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Engine Control Module \(PCM\) 4.0L V6](#) (100-00 General Information, Description and Operation).

Engine Cooling - V6 4.0L Petrol - Cooling System Draining, Filling and Bleeding

General Procedures

⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

All vehicles

1. Position the vehicle on a lift.
2. Set the heater controls to maximum.
3. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
4. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Remove the coolant expansion tank cap.

6. Remove the front LH splash shield.

- Remove the 4 clips.

7. Remove the radiator access panel.

- Remove the 4 bolts.

8. Position a container to collect the fluid.

9.  **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Release the clip and disconnect the radiator lower hose, allow the coolant to drain.

Vehicles with auxiliary climate control

10. Remove the spare wheel and tire.

- Remove the tool kit.
- Access the winch.

11. Position a container to collect the fluid.

12. Disconnect the rear heater coolant hoses.

- Release the 2 clips.
- Allow the coolant to drain.

Vehicles with auxiliary climate control

13. Connect the rear heater coolant hoses.

- Secure the clips.

14. Install the spare wheel and tire.

- Stow the tool kit.

15. Connect and secure the radiator lower hose.

- Secure with the clip.

All vehicles

16. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

17. Connect exhaust extraction hoses to the tail pipes.

18. Loosen the coolant expansion tank bleed screw.

19. Refill the cooling system.

20. Start and run the engine.

- Hold the engine speed at 2,500 RPM for 30 seconds.
- Return the engine to idle for 30 seconds.
- Repeat the above procedure a further four times.

21. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank until a steady stream of coolant is seen returning to the expansion tank. Tighten the expansion tank bleed screw.

- Hold the engine speed at 3,000 RPM for one minute.

22. NOTE: When the coolant bleed is complete and prior to installing the expansion tank cap, top-up the expansion tank to 30mm above the maximum level.

Install the coolant expansion tank cap.

23. Run the engine until the thermostat opens.

24. Switch the engine off and allow to cool.

25. Install the engine cover.

For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

26. Clean any remaining coolant from the chassis and surrounding area.

27. Install the radiator access panel.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).

28. Install the front LH splash shield.

29. Check and top-up the coolant if required.

Engine Cooling - V6 4.0L Petrol - Cooling System Draining and Vacuum

Filling

General Procedures

⚠ WARNING: To avoid having scalding hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

⚠ The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the vehicle.

⚠ Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

1. Set the heater controls to maximum HOT.

2. **⚠ WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Remove the coolant expansion tank cap.

3. **⚠ WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the front LH splash shield.

- Remove the 4 clips.

5. Remove the radiator access panel.

- Remove the 4 bolts.

6. Position a container to collect the fluid.

E93736

7. Disconnect the coolant hoses from the thermostat housing.

- Release the 2 clips.
- Allow the coolant to drain.

8. Remove the spare wheel and tire.

- Remove the tool kit.
- Access the winch.

9. Position a container to collect the fluid.

10. Disconnect the rear heater coolant hoses.

- Release the 2 clips.
- Allow the coolant to drain.

E537637

11. Connect the rear heater coolant hoses.

- Secure the clips.

12. Install the spare wheel and tire.

- Install the tool kit.

13. Connect the coolant hoses to the thermostat housing.

- Secure with the clips.

14. Prepare a sufficient amount of coolant to the specified concentration.

15. Install the cooling system vacuum refill adaptor to the expansion tank.

E93137

16. Install the vacuum filler gauge to the cooling system vacuum refill adaptor.

17. Install the venturi tube assembly to the vacuum filler gauge.

18. NOTE: Make sure both valves on gauge assembly are in the closed position.

- NOTE: Small diameter or long airlines may restrict airflow to the coolant vacuum fill tool.

- NOTE: The coolant vacuum fill tool needs an air pressure of 6 to 8 bar (87 to 116 psi) to operate correctly.

Connect a regulated compressed air supply to the venturi tube assembly.

19. NOTE: Make sure air cannot enter the hose.

Position the coolant pick-up pipe into a container of clean coolant.

20. Position the evacuated air hose into a container.

21. Open the air supply valve.

22. Open the coolant supply valve for 2 seconds to prime the coolant supply hose.

23. Apply air pressure progressively until the arrow on the vacuum filler gauge reaches the green segment.

24. Close the air supply valve.

25. Allow one minute to check the vacuum is held.

- Disconnect the compressed air supply.

26. NOTE: Close the coolant supply valve when the coolant expansion tank MAX mark is reached or coolant movement has ceased.

Open the coolant supply valve and allow the coolant to be drawn into the system.

27. Remove the vacuum filler gauge and cooling system vacuum refill adaptor assembly.

28. Connect exhaust extraction hoses to the tail pipes.

29. Start and run the engine.

- Hold the engine speed at 2,500 RPM for 30 seconds.
- Return the engine to idle for 30 seconds.
- Repeat the above procedure a further 4 times.

30. Keep the coolant level in the expansion tank at the maximum level mark until a steady stream of coolant can be seen returning.

31. NOTE: When the coolant bleed is complete and prior to installing the expansion tank cap, top-up the expansion tank to 30mm above the maximum level.

Install the coolant expansion tank cap.

32. Run the engine until the thermostat opens.

33. Switch the engine off and allow to cool.

34. Clean any spilt coolant from the vehicle.

35. Install the radiator access panel.

1. Tighten the 2 bolts to 10 Nm (7 lb.ft).
2. Tighten the 2 bolts to 62 Nm (46 lb.ft).

36. Install the front LH splash shield.

- Install the 4 clips.

37.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Check and top-up the coolant if required.

Engine Cooling - V6 4.0L Petrol - Cooling System Pressure Test

General Procedures

• NOTE: The following procedure will enable the cooling system to be pressure tested for condition and leaks. Stage 1 will check the expansion tank cap register seal and the cap for leaks. Stage 2 will check the entire cooling system.

• NOTE: It will be necessary to use the cooling system test kit, Part Number LR-218, which is available under the equipment programme.

1. Examine the coolant hoses for signs of cracking, distortion and security of the hose connections.

2.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Disconnect the coolant expansion tank bleed hose.

- Release the clip.

3. Install the 'T' piece adaptor (part of the cooling system test kit) between the coolant expansion tank and the coolant bleed hose.

- Secure with the 2 clips.

4. Install the coolant pressure pump assembly.

- Connect to the 'T' piece.

5. Pressurize the cooling system.

- Slowly pressurize the cooling system to 1.0 bar (100 kPa) (14.5 psi).
- Check the pressure remains above 0.9 bar (90 kPa) (13 psi) after waiting for 30 seconds.
- During the pressure drop check, listen for a hissing noise from the expansion tank cap.

6. NOTE: If the coolant expansion tank cap is found to be leaking, replace the cap.

Depressurize the cooling system.

- Disconnect the 'T' piece.
- Connect the coolant expansion tank bleed hose.
- Secure the clip.

7.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Remove the coolant expansion tank cap.

8. NOTE: This adaptor is part of the cooling system test kit.

Install adaptor K83 to the coolant expansion tank.

- Clean the component mating faces.
- Lubricate the seal.

9. Install the coolant pressure pump assembly.

- Slowly pressurize the cooling system to 1.5 bar (150kPa) (22 psi), check the pressure over a 5 minute period. A small pressure decay of approximately 0.15 bar (15 »kPa) (1 psi) over the first minute is normal, as the air in the expansion tank cools.
- If the pressure continues to drop after the initial tolerance, there is a coolant leak.

10. Depressurize and remove the pressure pump and gauge.

- Install the coolant expansion tank cap.

Engine Cooling - V6 4.0L Petrol - Coolant Expansion Tank

Removal and Installation

Removal

1. Remove the LH headlamp assembly.
For additional information, refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).
2. Release the windshield washer reservoir filler neck.
3. Release the coolant expansion tank.
 - Remove the 2 bolts.

4. Release the power steering fluid reservoir.

5.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

 **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Disconnect the 2 hoses from the coolant expansion tank.

- Position an absorbent cloth to collect fluid spillage.
- Position a container to collect the fluid.
- Clamp the hoses
- Release the 2 clips.

6. Remove the coolant expansion tank.

- Disconnect the coolant low level sensor electrical connector.

7. NOTE: Do not disassemble further if the component is removed for access only.

Remove the coolant low level sensor.

- Remove the coolant expansion tank support bracket.

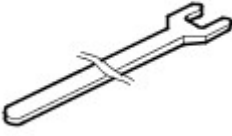

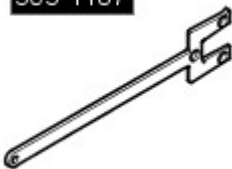

E47510

Installation

1. Install the bracket.
2. Install the coolant low level sensor.
3. Install the coolant expansion tank.
 - Connect the coolant low level sensor electrical connector.
4. Connect the coolant hoses to the expansion tank.
 - Secure with the clips.
5. Top-up the coolant.
 - Loosen the coolant expansion tank bleed screw.
 - Fill the coolant expansion tank until coolant emerges from the cooling system air bleed screw.
 - Remove the hose clamps.
 - Tighten the bleed screw to 8 Nm (6 lb.ft).
6. Secure the coolant expansion tank.
 - Tighten the bolts to 10 Nm (7 lb.ft).
7. Check and top-up the coolant.
 - Install the coolant expansion tank pressure cap.
8. Secure the power steering fluid reservoir.
 - Attach to the mounting bracket.
9. Secure the windshield washer reservoir filler neck.
 - Locate in clip.
10. Install the LH headlamp assembly.
For additional information, refer to: [Headlamp Assembly \(417-01 Exterior Lighting, Removal and Installation\)](#).

Engine Cooling - V6 4.0L Petrol - Cooling Fan

Removal and Installation

Special Tool(s)	
 <p>303-1142 E46076</p>	<p>Viscous coupling spanner 303-1142</p>
 <p>303-1167 E46075</p>	<p>Viscous coupling pulley retaining tool 303-1167</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the cooling fan shroud.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03C Engine Cooling - V6 4.0L Petrol, Removal and Installation).
3. Disconnect the cooling fan control electrical connector.

4. **NOTE:** The thread is right handed.

Using the special tools, remove the cooling fan.

- Remove the cooling fan assembly.

5. NOTE: Do not disassemble further if the component is removed for access only.

Remove the viscous coupling from the cooling fan.

- Remove the 4 bolts.

Installation

1. To install, reverse the removal procedure.

- Install the cooling fan to the viscous coupling, tighten the bolts to 10 Nm (7 lb.ft).
- Tighten the cooling fan assembly to 65 Nm (48 lb.ft).

Engine Cooling - V6 4.0L Petrol - Cooling Fan Shroud

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the air intake resonator.
For additional information, refer to: [Intake Air Resonator](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Removal and Installation).
3. Remove the upper fan shroud.
 - Release the coolant expansion hose.
 - Release the fan wiring harness clip.
 - Release the 4 fan shroud clips.

E47222

Installation

1. To install, reverse the removal procedure.

Engine Cooling - V6 4.0L Petrol - Engine Coolant Level Switch

Removal and Installation

Removal

1. Release the power steering fluid reservoir from the bracket.

2. Release the windshield washer reservoir filler neck.

3. Reposition the coolant expansion tank.
 - Remove the 2 bolts.

4. Remove the engine coolant level switch.

Installation

1. NOTE: Disconnect the engine coolant level switch electrical connector. **CAUTION: Make sure the click can be heard when the engine coolant level switch is correctly installed.**

Install the engine coolant level switch.

- Connect the engine coolant level switch electrical connector.

3. Secure the windshield washer reservoir filler neck.
2. **CAUTION: Make sure that the component is correctly located on the locating peg.** Secure the power steering fluid reservoir to the bracket.

Secure the coolant expansion tank.

- Tighten the bolts to 10 Nm (7 lb.ft).

Engine Cooling - V6 4.0L Petrol - Radiator

Removal and Installation

Removal

WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

• **NOTE:** Always protect the cooling pack elements to prevent accidental damage.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Disconnect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

3. Drain the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).

4. Remove the viscous fan assembly.

For additional information, refer to: [Cooling Fan](#) (303-03C Engine Cooling - V6 4.0L Petrol, Removal and Installation).

5. Remove the radiator grille.

For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).

6. Remove the lower fan shroud.

- Release the 4 clips.
- Release the coolant hose.

E45533

7. Disconnect the coolant expansion tank hose.

- Release the clip.

8. Disconnect the radiator upper hose.

- Release the clip.

E45535

9.  CAUTION: Always plug any open connections to prevent contamination.

- NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the transmission cooler hoses.

- Release the 2 clips.
- Position a container to collect the fluid.

E45536

10. Remove the radiator securing pegs.

11. Remove the radiator upper deflector.

- Release the 2 clips.

12. Release the power steering fluid cooler.

- Release the clips.
- Tie the line aside.

13. Release the front differential breather line.

14. Release the A/C condenser.

- Remove the 2 screws.
- Remove the bolt.
- Release from the 2 clips.

E49353

15. Remove the radiator.

- Protect the elements from damage.
- Remove the 2 radiator retaining bolts.

E45539

16. NOTE: Do not disassemble further if the component is removed for access only.

Remove the power steering fluid cooler line clip.

Installation

1. Install the power steering fluid cooler line clip.
2. Install the radiator.
 - Remove the element protection.
 - Tighten the bolts to 25 Nm (18 lb.ft).
3. Install the radiator upper deflector.
4. Install the A/C condenser.

- Secure in the clips.
 - Tighten the screws.
 - Tighten the bolt to 6 Nm (4 lb.ft).
5. Install the power steering fluid cooler.
- Secure in the 3 clips.
6. Install the radiator securing pegs.
7. Install the transmission cooler hoses.
- Install the clips.
8. Connect the radiator upper hose.
- Secure with the clip.
9. Connect the expansion tank hose.
- Secure with the clip.
10. Install the lower fan shroud.
- Secure in the clips.
 - Secure the coolant hose.
11. Install the radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
12. Install the viscous fan assembly.
For additional information, refer to: [Cooling Fan](#) (303-03C Engine Cooling - V6 4.0L Petrol, Removal and Installation).
13. Refill the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
14. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
15. Check automatic transmission fluid level.
For additional information, refer to: [Transmission Fluid Level Check](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

Engine Cooling - V6 4.0L Petrol - Thermostat

Removal and Installation

Removal

1. Drain the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03 Engine Cooling - 4.4L, General Procedures).

2. Remove the thermostat.

- Release the clips and disconnect the 4 remaining coolant hoses.

Installation

1. To install, reverse the removal procedure.

2. Refill the cooling system.

For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03 Engine Cooling - 4.4L, General Procedures).

3. **NOTE:** For NAS vehicles only.

If required, carry out a long drive cycle.

For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A, General Procedures).

Engine Cooling - V6 4.0L Petrol - Coolant Pump

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
4. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).
5. Remove the bolt from the power steering pipe clip.
 - Position the pipe aside when removing the coolant pump.
6. Remove the coolant pump.
 - Disconnect the coolant rail hose from the coolant pump.
 - Remove the 12 bolts.
 - Discard the gasket.

7. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the coolant pump drive pulley.

- Remove and discard the 4 bolts.
- Remove the coolant pump capping hose.

Installation

1. To install, reverse the removal procedure.
 - Tighten the coolant pump retaining bolts.
 - Install the coolant pump pulley.
 - Clean the component mating faces.
3. Tighten the coolant pump pulley retaining bolts.
 - Install a new gasket.

- Tighten to 25 Nm (18 lb.ft).
4. Install the power steering pipe.
 - Tighten the bolt to 10 Nm (7 lb.ft).
 5. Install the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).
 6. Refill the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
 7. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine Cooling - V6 4.0L Petrol - Water Pump

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
4. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).
5. Remove the bolt from the power steering pipe clip.
 - Position the pipe aside when removing the coolant pump.
6. Remove the coolant pump.
 - Disconnect the coolant rail hose from the coolant pump.
 - Remove the 12 bolts.
 - Discard the gasket.

E47519

7. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the coolant pump drive pulley.

- Remove the 4 bolts.
- Remove the coolant pump capping hose.

E47520

Installation

1. To install, reverse the removal procedure.
 - Tighten the coolant pump retaining bolts.
 - Install the coolant pump pulley.
 - Tighten the bolts to 10 Nm (7 lb.ft).
 - Clean the component mating faces.
3. Tighten the coolant pump pulley retaining bolts.
 - Install a new gasket.

- Tighten the bolts to 25 Nm (18 lb.ft).
4. Install the power steering pipe.
 - Tighten the bolt to 10 Nm (7 lb.ft).
 5. Install the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05C Accessory Drive - V6 4.0L Petrol, Removal and Installation).
 6. Refill the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
 7. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine Cooling - V8 5.0L Petrol - Engine Cooling

Description and Operation

COMPONENT LOCATION

E121152

Item	Part Number	Description
1	-	Radiator upper hose
2	-	Cooling fan
3	-	Heater system supply and return hoses
4	-	FFBH (fuel fired booster heater) supply and return connections (where fitted)
5	-	Heater manifold
6	-	Throttle body heater hose
7	-	Engine oil cooler
8	-	Engine block heater (230 V version shown) or drain plug
9	-	Transmission fluid cooler supply hose
10	-	Transmission fluid cooler
11	-	Bleed hoses
12	-	Radiator
13	-	Coolant pump
14	-	Bleed screw
15	-	Outlet tube
16	-	Coolant expansion tank
17	-	Transmission fluid cooler return hose

18	-	Radiator lower hose
19	-	Coolant supply/expansion hose
20	-	Thermostat
21	-	Throttle

INTRODUCTION

The engine cooling system maintains the engine within an optimum temperature range under changing ambient and engine operating conditions. The system is a pressurized expansion tank system with continuous bleeds to separate air from the coolant and prevent the formation of air locks. The engine cooling system also provides:

- Heating for:
 - The passenger compartment.
 - The throttle body.
- Cooling for:
 - The engine oil cooler.
 - The transmission fluid cooler.

The primary components of the engine cooling system are the:

- Coolant pump.
- Thermostat.
- Radiator.
- Cooling fan.
- Expansion tank.
- Outlet tube and heater manifold.
- Connecting hoses and pipes.

COOLANT PUMP

E115013

Item	Part Number	Description
1	-	Inlet connection
2	-	Pump body
3	-	Outlet flange to RH cylinder head
4	-	Outlet to engine oil cooler
5	-	Outlet flange to LH cylinder head
6	-	Pulley
7	-	Bleed pipe connection (containing check valve)

The body of the coolant pump contains an impeller attached to a shaft supported in a bearing assembly. The impeller is driven by a pulley, pressed on to the front of the shaft, which is driven by the accessory drive belt. For additional information, refer to: [Accessory Drive](#) (303-05D Accessory Drive - V8 5.0L Petrol, Description and Operation).

Two coolant outlet flanges attach the coolant pump to the front of the cylinder heads. A pipe connects a further coolant outlet to a pipe from the engine oil cooler. A bleed connector is installed in the front of the coolant pump, adjacent to the coolant inlet connection from the thermostat. A check valve is incorporated into the bleed connection.

THERMOSTAT

E115014

Item	Part Number	Description
1	-	Screw (3 off)
2	-	Lower body
3	-	Upper body
4	-	Thermostat
5	-	Seal

The thermostat is a multi-stage device located in the coolant pump inlet to provide fast response and control of the engine outlet temperature.

The thermostat allows rapid engine warm-up by preventing coolant flow through the radiator and by limiting coolant flow through the cylinder block when the engine is cold. During warm-up and at engine speeds above approximately 1800 rev/min, a by-pass valve opens to control the coolant flow and pressure, to protect the engine components. When the thermostat opening reaches 6 mm (0.24 in.), the by-pass flow is shut-off. When the thermostat opening exceeds 6 mm (0.24 in.), the radiator coolant flow is further controlled up to the point where the thermostat is fully open. At this point maximum radiator coolant flow is achieved to provide maximum cooling.

The thermostat begins to open at 88 - 90 °C (190 - 194 °F) and is fully open at 102 °C (216 °F).

RADIATOR

E121154

Item	Part Number	Description
1	-	Bleed hose connection
2	-	Upper hose connection
3	-	Transmission fluid cooler supply hose connection
4	-	Lower hose connection
5	-	Radiator lower support (2 off)
6	-	Radiator upper support (2 off)

The radiator is an aluminum cross flow type with plastic end tanks. Upper and lower supports locate the radiator in the radiator support assembly and the front crush siderails respectively.

Connections are incorporated into the end tanks for the upper and lower hoses, the supply hose of the transmission fluid cooler and a bleed hose.

COOLING FAN

E118879

Item	Part Number	Description
1	-	Securing nut
2	-	Harness
3	-	Electro-viscous drive unit

For additional airflow through the radiator, particularly when the vehicle is stationary or moving slowly, there is an engine driven electro-viscous cooling fan. The cooling fan functions as a normal viscous fan, but with electronic control over the level of engagement of the viscous clutch. The [ECM \(engine control module\)](#) controls the level of engagement to optimize fan speed for all operating conditions.

A securing nut attaches the cooling fan to a drive pulley, which is mounted on the front of the engine and driven by the accessory drive system.

- **NOTE:** The securing nut has a LH (left-hand) thread.

The blades of the cooling fan are located in a fan cowl attached to the rear of the radiator frame. Brushes around the circumference of the aperture in the fan cowl provide a seal with the blade shroud. An electrical connector in the top left corner of the fan cowl provides the interface between the cooling fan harness and the vehicle wiring.

EXPANSION TANK

E121155

Item	Part Number	Description
1	-	Bleed hose connection
2	-	Bleed screw
3	-	Level sensor
4	-	Coolant supply/expansion hose connection
5	-	Filler cap

The expansion tank is installed on the **LH** side of the cooling module, attached to the radiator support assembly and the floor sidemember. A filler cap, bleed screw and level sensor are incorporated into the expansion tank. MAX and MIN level markings are molded onto the exterior of the tank.

The expansion tank provides the following functions:

- Service fill.
- Coolant expansion during warm-up.
- Air separation during operation.
- System pressurization by the filler cap.

The expansion tank has an air space of approximately 1.1 liters (1.16 US quarts), above the MAX level, to allow for coolant expansion.

OUTLET TUBE AND HEATER MANIFOLD

Outlet Tube

E123842

Item	Part Number	Description
1	-	Bleed spigot (fitted with blanking plug)
2	-	Radiator upper hose connection
3	-	Cylinder block connections
4	-	Thermostat hose connection

Heater Manifold

E115021

Item	Part Number	Description
1	-	Throttle body heater hose connection
2	-	Heater core supply hose connection
3	-	RH cylinder head connection
4	-	Engine coolant temperature sensor
5	-	LH cylinder head connection

ENGINE COOLANT

The engine coolant is formulated to last for ten years or 240,000 km (150,000 miles). The coolant is silicate free and must not be mixed with conventional engine coolant.

CONTROL DIAGRAM

• NOTE: A = Hardwired; N = Medium speed CAN (controller area network).

E121156

Item	Part Number	Description
1	-	Battery
2	-	EJB (engine junction box)
3	-	ECM (engine control module)
4	-	Cooling fan
5	-	Instrument cluster
6	-	Coolant level sensor
7	-	CJB (central junction box)

OPERATION

Engine Cooling Flow Diagram

E121159

Item	Part Number	Description
1	-	Heater system
2	-	Bleed screw
3	-	RH cylinder head
4	-	Cylinder block
5	-	Throttle
6	-	Engine oil cooler
7	-	Heater manifold
8	-	LH cylinder head
9	-	Bleed screw
10	-	Expansion tank
11	-	Transmission fluid cooler
12	-	Thermostat
13	-	Check valve
14	-	Coolant pump
15	-	Radiator

When the engine is running, the coolant is circulated around the engine cooling system by the coolant pump. From the coolant pump, coolant flows through the cylinder heads and the engine oil cooler into the cylinder block and the heater manifold.

In the cylinder block, the coolant flows forwards to the outlet tube. When the coolant is cold, the thermostat is closed and the coolant flows direct from the outlet tube back to the coolant pump. Once the coolant reaches operating temperature the thermostat begins to open, to control system temperature, and coolant flows from the outlet tube to the coolant pump via the radiator. When the thermostat is open, the coolant flow through the radiator also generates a coolant flow through the transmission fluid cooler.

From the heater manifold the coolant flows through the electronic throttle and the heater core, in parallel circuits that are unaffected by the position of the thermostat. From the electronic throttle, the coolant merges with bleed coolant from the coolant pump and flows to the expansion tank. From the heater system, the coolant flows back to the inlet of the coolant pump.

Expansion and contraction of the coolant is accommodated by an air space in the expansion tank and the compliance of the flexible hoses.

If the coolant level in the expansion tank decreases below a predetermined value, the coolant level sensor connects a ground to the [CJB \(central junction box\)](#), which sends a message to the instrument cluster on the medium speed [CAN](#) bus to display the message COOLANT LEVEL LOW in the message center.

For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

To control the cooling fan, the [ECM](#) sends a [PWM \(pulse width modulation\)](#) signal to the cooling fan drive unit. The [ECM](#) varies the duty cycle of the [PWM](#) signal between 0 and 100% to vary the clutch engagement and thus fan speed. The [ECM](#) determines the required fan speed from:

- Coolant, ambient air and transmission fluid temperatures
- [A/C \(air conditioning\)](#) system condenser cooling fan demand
- Road speed
- Terrain optimization mode.

If the electrical connections to the viscous fan are disconnected the fan will idle and the engine may overheat. If the [ECM](#) detects a cooling fan fault it stores the appropriate [DTC \(diagnostic trouble code\)](#) and signals the instrument cluster on the medium speed [CAN](#) bus to display the message COOLING SYSTEM FAULT MONITOR GAUGE in the message center.

Engine Cooling - V8 5.0L Petrol - Engine Cooling

Diagnosis and Testing

Principle of Operation

For a detailed description of the engine cooling system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Engine Cooling](#) (303-03D Engine Cooling - V8 5.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Coolant leaks ● Coolant Hoses ● Coolant expansion tank ● Radiator ● Heater core ● Accessory drive belt ● Viscous fan 	<ul style="list-style-type: none"> ● Fuses ● Harnesses ● Loose or corroded connector(s) ● Engine Coolant Temperature (ECT) sensor

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Coolant loss	<ul style="list-style-type: none"> ● Hoses ● Hose connections ● Radiator ● Water pump ● Heater core ● Gaskets ● Engine casting cracks ● Engine block core plugs 	Carry out a visual inspection. If there are no obvious leaks, carry out a cooling system pressure test. Rectify any leaks as necessary.
Overheating	<ul style="list-style-type: none"> ● Low/Contaminated coolant ● Thermostat ● Viscous fan ● ECT sensor ● Restricted air flow over the radiator 	Check the coolant level and condition. Carry out a cooling system pressure test. Rectify any leaks as necessary. Check the thermostat and rectify as necessary. Check the viscous fan operation, make sure the viscous fan rotates freely. Check for obstructions to the air flow over the radiator. Rectify as necessary.
Engine not reaching normal temperature	<ul style="list-style-type: none"> ● Thermostat ● Viscous fan ● Thermostat ● Electric fan ● Fan speed module 	Check the thermostat operation. Check the viscous fan operation, make sure the viscous fan is not seized. Rectify as necessary.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - V8 5.0L Petrol, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Engine Cooling - V8 5.0L Petrol - Cooling System Draining and Vacuum Filling

General Procedures

Draining

1. Refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3.  **WARNING:** Release the cooling system pressure by slowly turning the coolant expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure

 Be prepared to collect escaping coolant.

4. Remove the 4 bolts.

5.

6.  CAUTION: Be prepared to collect escaping coolant.

Position a container to collect the fluid.

7. Install the lower coolant hose to the radiator.

8. Install the LH splash shield.

9. Torque: 10 Nm

Filling

1. Lower the vehicle.
2. **11.**  **CAUTION:** Anti-freeze concentration must be maintained at 50%.
 - Install the cooling system vacuum refill adaptor to the expansion tank.
 - Install the vacuum filler gauge to the cooling system vacuum refill adaptor.
 - Install the venturi tube assembly to the vacuum filler gauge.
3. **12.** **NOTE:** Make sure the coolant supply valve is in the closed position on the vacuum filler gauge assembly.
 - **NOTE:** The coolant vacuum fill tool needs an air pressure of 6 to 8 bar (87 to 116 psi) to operate correctly.
 - **NOTE:** Small diameter or long airlines may restrict airflow to the coolant vacuum fill tool.Connect a regulated compressed air supply to the venturi tube assembly.
4. Position the evacuated air hose into a container.
5. Open the air supply valve.

6. **15.** NOTE: Make sure the coolant supply hose is positioned into a container of fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water. Make sure no air can enter the coolant supply hose.

Open the coolant supply valve for 2 seconds to prime the coolant supply hose.

7. Apply air pressure progressively until the arrow on the vacuum filler gauge reaches the green segment.
8. Disconnect the compressed air supply line.
9. **18.** NOTE: Close the coolant supply valve when the coolant expansion tank MAX mark is reached or coolant movement has ceased.

Open the coolant supply valve and allow the coolant to be drawn into the system.

10. Remove the vacuum filler gauge and cooling system vacuum refill adaptor assembly.

11. **20.**  CAUTION: Correct installation of the Coolant expansion tank cap can be obtained by tightening the cap until an audible click is heard.

12. Set the heater controls to maximum.

13. **22.**  CAUTION: Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle

Start the engine and idle until hot air is emitted at the face registers.

14. Switch the heater off.

15. Raise the engine speed to 2000 RPM for eight minutes.

16. **25.**  CAUTION: Switch off the engine and allow the coolant temperature to go cold.

Switch the engine off.

17. Visually check the engine and cooling system for signs of coolant leakage.

18. **27.**  **WARNING:** When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

• **CAUTIONS:**

Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure

Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

• **NOTE:** When the cooling system is warm, the coolant will be approximately 10mm above the upper level mark on the expansion tank with the cap removed.

Check and top-up the coolant if required.

Engine Cooling - V8 5.0L Petrol - Cooling System Draining, Filling and Bleeding

General Procedures

Draining

1. Refer to: [Air Cleaner Outlet Pipe T-Connector](#) (303-12D Intake Air Distribution and Filtering - V8 5.0L Petrol, Removal and Installation).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

4.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

5. Remove the 4 bolts.

6.

7.  CAUTION: Be prepared to collect escaping coolant.

Position a container to collect the fluid.

8. Install the lower coolant hose to the radiator.

9.  CAUTION: Be prepared to collect escaping coolant.

10.  CAUTION: Be prepared to collect escaping coolant.

11.  CAUTION: Be prepared to collect escaping coolant.

12. **12.**  CAUTION: Install a new seal.
Torque: 50 Nm

13. Install the coolant hose.

14. Install the coolant hose.

15. Install the LH splash shield.

16. Torque: 10 Nm

17. Remove the spare wheel and tire.

E121368

18. **18.**  CAUTION: Be prepared to collect escaping coolant.

E121368

19. Install the coolant hoses.

E121341

20. Install the spare wheel and tire.

Filling

1. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).
2. Lower the vehicle.
3. Refer to: [Air Cleaner Outlet Pipe T-Connector](#) (303-12D Intake Air Distribution and Filtering - V8 5.0L Petrol, Removal and Installation).

4.

5. **25.** NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

6.

7. **27. CAUTIONS:**

Anti-freeze concentration must be maintained at 50%.

Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

8. **28. CAUTION:** Be prepared to collect escaping coolant.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Fill the coolant expansion tank until coolant appears through the bleed ports.

9. **29.**  **CAUTION:** Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

10. Set the heater controls to maximum.
11. Start the engine and continue to fill the coolant until the maximum level is reached.
12. Increase the engine speed to 1500 rpm.
13. Check if the front heater is warm after 2 minutes, if warm proceed to step 15.
14. If not, turn the engine off for 10 seconds and then start the engine and return to step 12.
15. Once the front heater is warm, check if the rear heater is warm (if equipped). If no heat is felt, increase the engine speed to 3000 rpm for 30 seconds and return to idle.
16. Once heat is felt at the rear heater, continue filling with coolant until the level stops dropping and top up to 65mm below rim (to top rib on back of the coolant expansion tank).

17. **37.**  **CAUTION:** Correct installation of the Coolant expansion tank cap can be obtained by tightening the cap until an audible click is heard.

18. Switch the heater off.
19. Raise the engine speed to 2000 RPM for eight minutes.

20. **40.**  **CAUTION:** Switch off the engine and allow the coolant temperature to go cold.

Switch the engine off and allow to cool.

21. Visually check the engine and cooling system for signs of coolant leakage.

22. **42.**  **WARNING:** When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

• **CAUTIONS:**

 Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure

 Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

• **NOTE:** When the cooling system is warm, the coolant will be approximately 10mm above the upper level mark on the expansion tank with the cap removed.

Check and top-up the coolant if required.

Engine Cooling - V8 5.0L Petrol - Coolant Expansion Tank

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

12	-	LH exhaust camshaft pulley

GENERAL

The TdV6 is equipped with a High-Pressure (HP) common rail fuel injection system. With this fuel injection process, a High-Pressure Pump (HPP) delivers a uniform level of pressure to the shared fuel lines (the common rails), which serve all six fuel injectors. Pressure is controllable, to the optimum level for smooth operation, up to 1650 bar.

The common rail system supports a pre-injection (pilot) phase, which reduces combustion noise and mechanical load.

Fuel injection pressure is generated independently of engine speed and fuel injection events.

The fuel injection timing and volume are calculated by the Engine Control Module (ECM), which then energizes the appropriate piezo actuated injector.

The common rail fuel injection system has the following features:

- High fuel injection pressures of up to 1650 bar for greater atomisation of fuel (increasing performance and lowering emissions)
- Variable injection to optimise combustion in all engine operating conditions
- Low tolerances and high precision throughout the life of the system

The fuel system is divided into 2 sub systems:

- Low-Pressure (LP) system
- HP system.

The LP system features the following components:

- In-tank fuel pump
- Fuel pressure regulator (integral to the fuel delivery module)
- Fuel filter
- Return pipes and fuel cooler
- Injector return pipes
- Fuel coolers (engine and vehicle)

The LP system pressure is regulated to 0.5 bar.

The HP system features the following components:

- HPP
- Common rails and diverter rail
- HP fuel pipes
- Injectors.

LP SYSTEM

In-tank Fuel Pump

The electric fuel pump is located inside the fuel tank. Fuel is pumped from the tank via the in-tank fuel pump, to the HPP via the fuel filter.

For additional information, refer to: [Fuel Tank and Lines](#) (310-01A Fuel Tank and Lines - TDV6 2.7L Diesel, Description and Operation).

Fuel Filter

The fuel filter is located in the engine compartment on the left hand side, packaged to be protected against damage. Incorporated in the fuel filter housing is a bimetallic temperature valve, which will start to close at 30°C (86°F) and will fully close at 50°C (122°F). This allows pre-heated diesel fuel to circulate inside the fuel filter to prevent waxing in cold operating conditions.

Fuel Cooler

Two fuel coolers are fitted to the vehicle. One is located in the 'vee' of the engine block, and has a coolant system connection to aid heat transfer. The second cooler is located in the fuel return line and is a fuel to air cooler. For additional information, refer to: [Fuel Tank and Lines](#) (310-01A Fuel Tank and Lines - TDV6 2.7L Diesel, Description and Operation).

HP SYSTEM

HPP

E50833

The HPP is a three-piston (120 degree apart) radial plunger pump with a HP displacement of 0.8 cc. As mentioned, it has the ability to produce a maximum pressure of 1650 bar. The housing is cast from iron, the flange is cast from aluminium.

The pump is driven from the camshaft via a toothed belt. It does not need to be timed to the engine during belt replacement in service.

The required supply pressure to the HPP is -0.3 bar to +0.5 bar gauge. The return pressure is -0.3 bar to +0.8 bar gauge.

The pump is sized to deliver sufficient fuel to the HP rails for all engine-operating conditions.

The HPP consists of the following components:

- Internal Transfer Pump (ITP)
- Volume Control Valve (VCV)
- HP pumping elements (3 of)
- Pressure Control Valve (PCV)

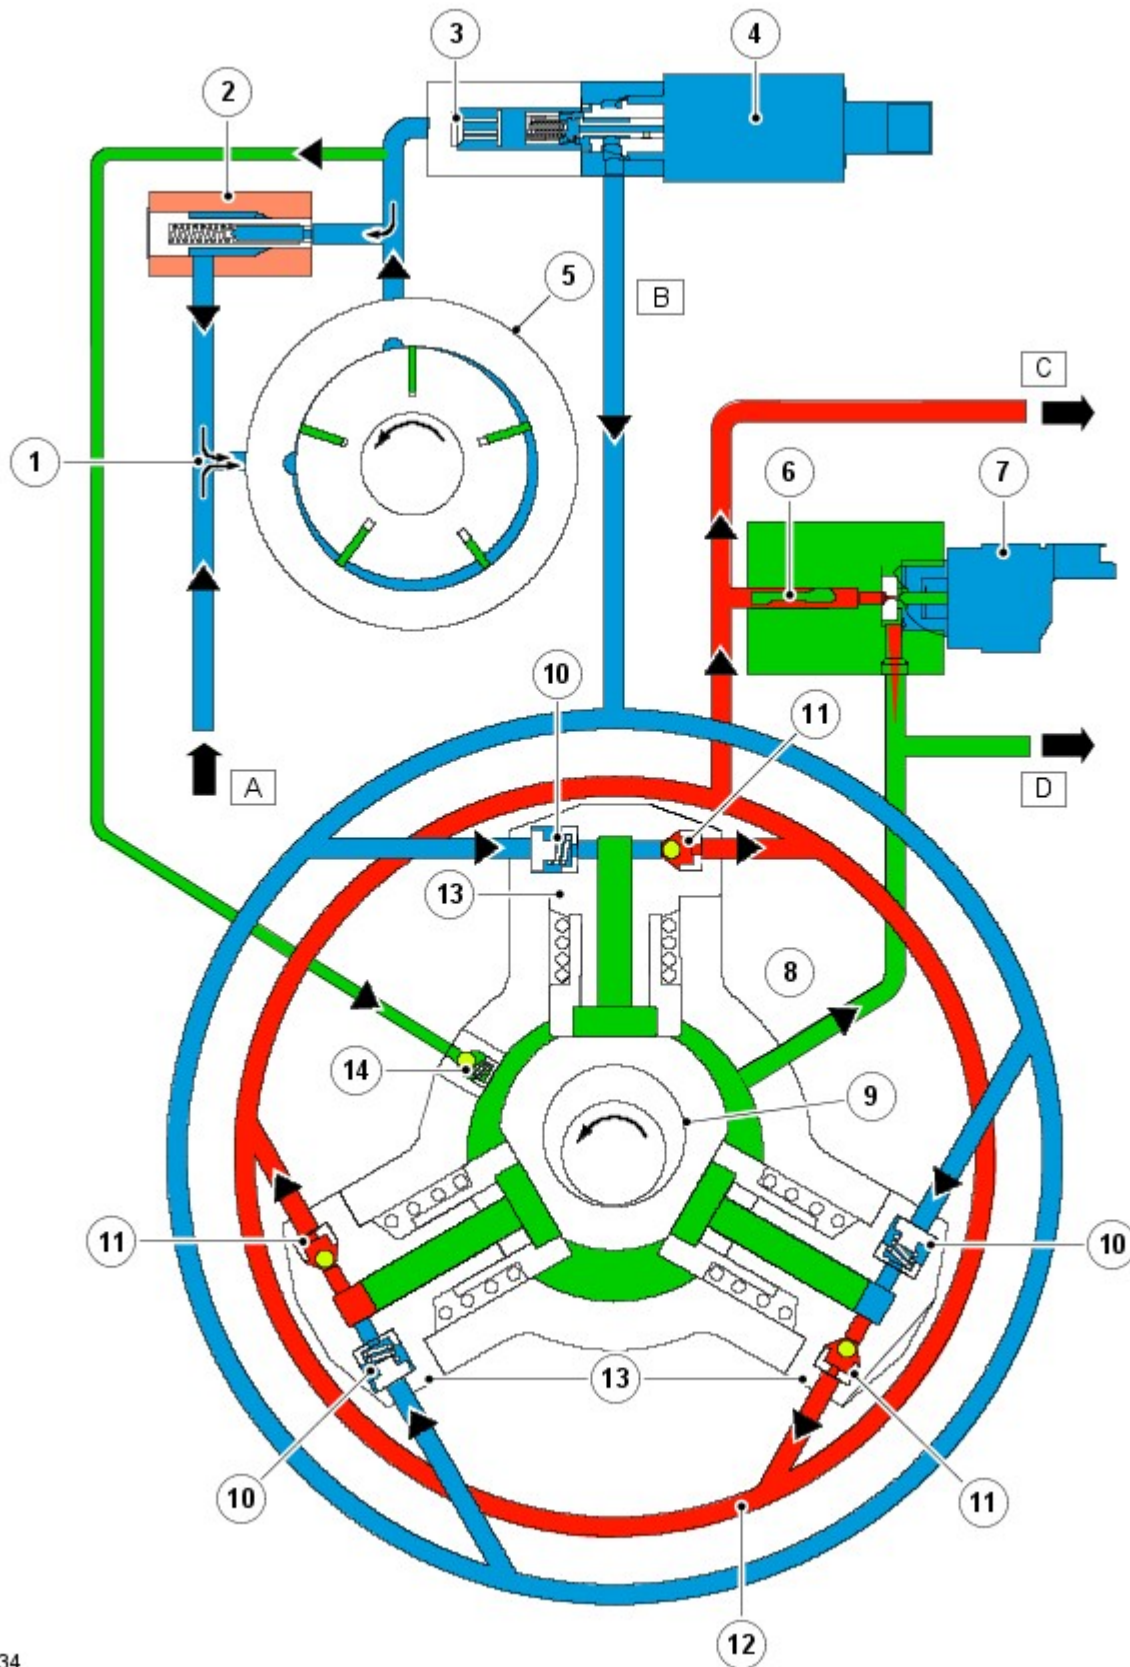

The ITP is a 5 vane pump. This conveys fuel to the VCV.

The VCV is a variable position solenoid valve electronically controlled by the ECM. The VCV is located between the ITP and the HP pumping elements. The VCV determines the amount of fuel that is delivered to the HP pumping elements. When there is no signal to the VCV the valve is closed, therefore no fuel delivery.

The 3 HP pumping elements are connected together in a fuel ring circuit within the pump. There is a single HP outlet connection for the HP pipe to the HP diverter rail.

The PCV is a variable position solenoid valve electronically controlled by the ECM. The PCV is located between the HP pumping elements and the HP outlet connection. The PCV regulates the amount of fuel pressure in the fuel rails and is controlled by the ECM. When there is no signal to the PCV the valve is open, therefore no rail pressure can be generated.

High Pressure Fuel Flow

E50834

Item	Part Number	Description
A	-	LP fuel supply
B	-	Fuel supply to the HP pumping elements
C	-	HP outlet connection to the HP diverter rail
D	-	LP fuel return (spill)
1	-	LP side of ITP
2	-	ITP pressure relief valve
3	-	Screen filter
4	-	VCV
5	-	ITP

6	-	Edge filter (to protect PCV)
7	-	PCV
8	-	N/A
9	-	Eccentric on HPP drive shaft
10	-	Pumping element inlet valve
11	-	Pumping element outlet valve
12	-	HP ring line
13	-	HPP elements (3 of)
14	-	Lubricating valve

The fuel induced by the ITP (5) is conveyed to the VCV (4) and the lubricating valve (14).

When the VCV is closed, the ITP pressure relief valve (2), lying parallel to the transfer pump, opens and conveys the fuel back to the LP side (1) of the transfer pump.

The fuel passes through the lubricating valve (14) into the interior of the HPP and from there to the fuel return (D). The fuel is used to lubricate the pump.

The VCV (4) determines the quantity of fuel (B) that is supplied to the pumping elements (13).

The fuel from the HP outlets (11) of the three pumping elements comes together in a ring line (12) and is conveyed through the HP outlet of the HPP (C) to the rails.

The PCV (7) regulates the fuel pressure in the fuel rails. Reducing rail pressure via the PCV results in fuel from the rail returning to the LP fuel return (D).

E50835

Item	Part Number	Description
A	-	Pump pressure (bar)
B	-	Pump speed (rpm)

The HPP can supply up to 1600 bar fuel pressure continuously with short excursions to 1650 bar. Pump speed is 5/6 engine speed. However it is calibrated to deliver fuel pressure dependant upon engine speed and load and is always under full control.

When the HPP is rotated, pressure is created when the VCV is open and the PCV is closed. The VCV and PCV are variable position to allow variable fuel delivery and pressure control.

When the ECM actuates the piezo actuators, the rail pressure drop is off-set by additional fuel being delivered to the HP rails by the PCV.

Pressure Reduction After Engine Has Stopped

The fuel pressure in the system is reduced within a few seconds after the engine has stopped as the PCV no longer has the holding current it requires, and therefore opens. No residual pressure remains in the system and the fuel is returned to the fuel return line (D) through the open PCV. The system is pressureless.

Function of High A Pressure Element

Fuel Induction

E50836

During the downward motion of the piston (3), a vacuum in the pump cylinder is generated, which opens the inlet valve (1) against the force exerted by the valve spring. The fuel (A), which is flowing past the VCV, is sucked in. At the same time the outlet valve (2) is closed due to the pressure difference between the pump cylinder and the HP fuel in the ring line.

Fuel Delivery

E50837

The eccentric on the HPP driveshaft (5) presses the piston (3) upwards. The inlet valve (1) is then closed through the force exerted by the valve spring and the pressure being built up in the pump cylinder. The outlet valve (2) opens when the pressure in the pump cylinder is greater than the fuel pressure in the ring line (B).

Volume Control Valve (VCV)

E50838

Item	Part Number	Description
1	-	Piston
2	-	Sleeve
3	-	Compression spring
4	-	Coil
5	-	Armature
6	-	VCV

The VCV is fixed directly to the HPP.

The VCV regulates the fuel supply (and hence the quantity of fuel) from the transfer pump to the HPP elements, depending on the fuel pressure in the rail.

This makes it possible to match the delivery of the HPP to the requirements of the engine from the low-pressure side. The quantity of fuel flowing back to the main fuel supply line is kept to a minimum.

In addition, this adjustment reduces the power consumption of the HPP, improving the efficiency of the engine.

- NOTE: The fuel volume control valve default is closed without electrical supply. An open circuit connector will prevent the engine from running.
- NOTE: The VCV cannot be replaced as a separate component in service.

E50839

Item	Part Number	Description
A	-	VCV not actuated
B	-	VCV actuated
1	-	Fuel supply from the transfer pump
2	-	Piston
3	-	Fuel supply to the HPP
4	-	Coil energised
5	-	Quantity of fuel
6	-	Control current
7	-	VCV at constant engine speed

VCV Not Actuated (A)

When there is no power supplied, the piston (2) closes the opening between the two connections (1) and (3) through the force of the compression spring. The fuel supply to the HPP is interrupted.

VCV Actuated (B)

The ECM energizes the coil (4) of the valve, according to the engines requirements. The armature force is proportional to the control current and counteracts the compression spring through the moving piston (2).

As a result, the opening between the two connections (1) and (3) and hence the quantity of fuel (5) supplied through the connector (3) to the HPP is also proportional to the control current (6). This means that the greater the opening cross-section, the greater the quantity of fuel supplied.

Pressure Control Valve (PCV)

E50840

The PCV is located on the HPP. It governs the fuel pressure at the HP outlet of the HPP and thus, the fuel pressure within the rail. In addition, the PCV dampens the fluctuations in the pressure, which occur during the delivery of fuel through the HPP and through the injection process.

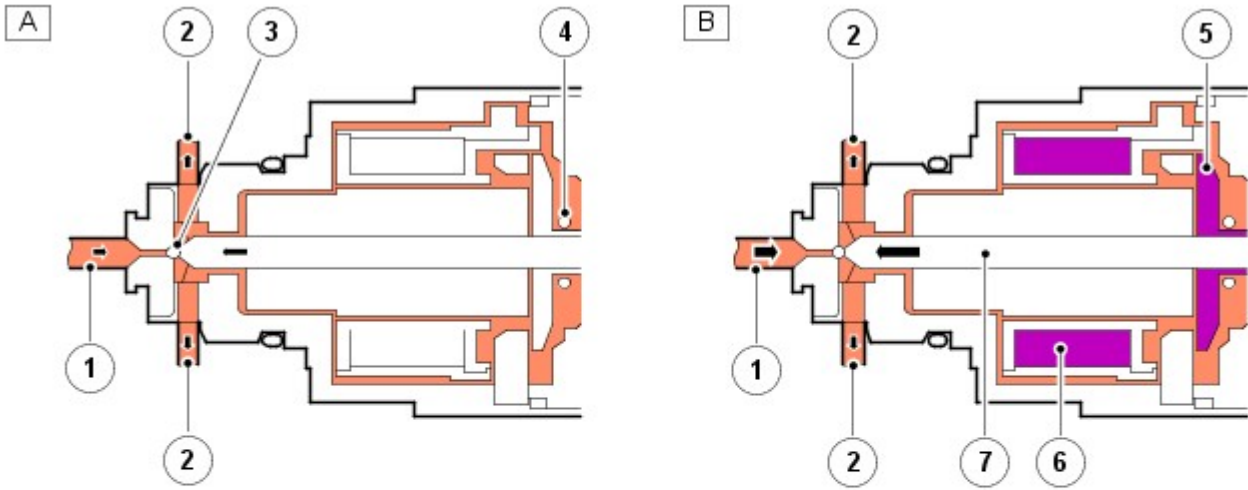

The PCV ensures that optimum pressure exists in the rail for every operating condition of the engine.

The PCV is an electro-magnetically operated valve with spring support.

The electrical current supplied by the ECM through the solenoid pulls back the control pin. This allows the diesel fuel to pass the ball valve and thus the fuel flow into the common rails.

The entire armature is coated with fuel for lubrication and cooling.

- NOTE: The PCV cannot be replaced as a separate component in service.

E50841

Item	Part Number	Description
A	-	PCV non-controlled
B	-	PCV controlled
1	-	Fuel from the HPP
2	-	To fuel return
3	-	Ball valve
4	-	Compression spring
5	-	Armature
6	-	Coil energised
7	-	Control pin
8	-	High pressure fuel
9	-	Control current
10	-	Characteristic of the PCV

PCV Non-controlled (A)

The ball valve (3) will only be operated through the force exerted upon it by the spring (4). Thereby, the PCV is classed as open.

PCV Controlled (B)

The current flowing through the solenoid (6) draws the pin (7) down. This in turn transfers the magnetic force via the pin to the ball valve (3). The pull of the pin, and the pressure on the ball valve, is proportional to the valve flow (9).

HP Common Fuel Rails

E50842

The fuel rails are manufactured from forged steel. They store the fuel at high pressure and prevent pressure fluctuations in the HP system.

All HP pipes have an internal diameter of 2.5mm except the pipes to the injectors, which are 3.0mm. Total rail volume is 33cc.

FUEL INJECTORS

E50843

Item	Part Number	Description
------	-------------	-------------

1	-	Harness connection
2	-	HP connection
3	-	Control piston
4	-	Nozzle needle
5	-	Nozzle HP chamber
6	-	Nozzle spray holes
7	-	Valve mushroom
8	-	Fuel return
9	-	Valve piston
10	-	Piezo actuator

The fuel injectors are operated directly by the ECM for fuel metering (start of injection and quantity of fuel injected).

The operating components of the piezo fuel injectors are:

- The piezo actuator
 - The injector body containing the hydraulic servo system
 - The fuel injector nozzle
- NOTE: New injectors can be installed in any cylinder and DO NOT have to be configured.
- NOTE: Each Injection event is controlled by a charge and discharge cycle allowing energy to dissipate in, and recover from, the injector. Never disconnect the wiring connector when the vehicle is running. The injector may remain open thus causing engine damage.
- NOTE: For safety reasons, the engine must be at standstill for 30 seconds before starting work on the HP fuel systems.

Fuel Injector Not Actuated (Not Injecting Fuel)

E50844

Item	Part Number	Description
1	-	Piezo actuator
2	-	HP connection
3	-	Hydraulic force applied on control piston
4	-	Hydraulic force acting on tip of nozzle
5	-	Control piston
6	-	Fuel return
7	-	Fuel return
8	-	Control piston
9	-	Nozzle needle
10	-	High pressure chamber of nozzle
11	-	Control chamber
12	-	Valve mushroom

The HP fuel from the fuel-rail passes through the HP connection (2) into the control chamber (11) and into the HP chamber (10) of the fuel injector nozzle.

The piezo actuator (1) is currentless and the valve mushroom (12) closes the bore to the fuel return (7) by means of spring

pressure.

There is however a continuous fuel return (6) to vent internal leakage within the injector.

The hydraulic force (3), which is now applied on the control piston by the fuel under high pressure in the control chamber (11) through the control piston (8), is greater than the hydraulic force (4) acting on the tip of the nozzle (since the area of the control piston in the control chamber is greater than the area of the tip of the nozzle).

Fuel Injector Actuated (Injecting Fuel)

E50845

Item	Part Number	Description
1	-	High pressure supply
2	-	Valve piston
3	-	Hydraulic force applied on control piston
4	-	Hydraulic force acting on tip of nozzle
5	-	Control piston
6	-	Fuel return
7	-	Piezo actuator
8	-	Fuel return
9	-	Valve piston
10	-	Valve mushroom
11	-	Control chamber
12	-	Control piston
13	-	Nozzle needle

The piezo actuator (7) energized by the ECM extends (charging phase) and presses on the valve piston (9). The valve mushroom (10) opens the bore, which connects the control chamber (11) to the fuel return (8 then 6).

As a result, the pressure in the control chamber drops, and the hydraulic force (4) acting on the tip of the nozzle needle is now greater than the force (3) acting on the control piston in the control chamber.

The nozzle needle (13) moves upwards and the fuel passes through the six spray holes into the combustion chamber.

Engine Starting

During starting, the fuel rail pressure must be at least 150 bar. Should the pressure be below this figure, the injectors will not operate, resulting in the vehicle not starting.

Engine Stopped

To stop the engine the ECM stops energising the piezo actuators, therefore, no fuel is injected and the engine speed drops to zero.

Fuel Charging and Controls - TDV6 2.7L Diesel - Fuel Charging and Controls

Diagnosis and Testing

Principle of Operation

For a detailed description of the fuel charging and controls system and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Fuel Charging and Controls](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

• WARNINGS:

Do **NOT** carry out any work on the fuel system with the engine running. The fuel pressure within the system can be as high as 1600 bar (23,206 lb/in²). Failure to follow this instruction may result in personal injury.

Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

After carrying out repairs, the fuel system must be checked visually for leaks. This should be done after the engine has been run, but with the engine switched **OFF**. Failure to follow this instruction may result in personal injury.

If taken internally, **DO NOT** induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

The fuel pipes between the injectors and the rail must be discarded after each use, and new pipes installed. Failure to follow this instruction may result in damage to the vehicle.

It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

Make sure that the workshop area in which the vehicle is being worked on is as clean and dust-free as possible. Areas in which work on clutches, brakes or where welding or machining are carried out are not suitable in view of the risk of contamination to the fuel system. Failure to follow this instruction may result in damage to the vehicle.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

Make sure that any protective gloves worn are new and are of the non-powdered latex type. Failure to follow this instruction may result in damage to the vehicle.

Make sure that clean, non-plated tools are used. Clean tools using a new brush that will not lose it's bristles and fresh cleaning fluid prior to starting work on the vehicle. Failure to follow this instruction may result in damage to the vehicle.

Use a steel-topped work bench and cover it with clean, lint-free, non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor

vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fuel level ● Contaminated fuel ● Fuel supply line(s) ● Fuel return line(s) ● High-pressure fuel supply line(s) ● Fuel tank filler pipe ● Fuel leak(s) ● Fuel tank ● Fuel filler cap ● Fuel filter ● Push connect fittings ● Fuel rail ● Fuel injection pump ● Exhaust Gas Recirculation (EGR) system 	<ul style="list-style-type: none"> ● Glow plug indicator ● Inertia switch ● Fuel pump module ● Sensor(s) ● Engine Control Module (ECM) ● Fuel volume control valve (FVCV) ● Fuel pressure control valve (FPCV) ● Fuel rail pressure (FRP) sensor ● Fuel temperature sensor ● Fuel injector(s) ● Exhaust Gas Recirculation (EGR) system

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not start	<ul style="list-style-type: none"> ● Inertia fuel shutoff switch ● Low/Contaminated fuel ● Air leakage ● Low-pressure fuel system fault ● Fuel pump module (lift pump) fault ● Blocked fuel filter ● Fuel volume regulator blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Fuel pump fault ● Crankshaft position (CKP) sensor 	Check that the inertia switch has not tripped. Check the fuel level and condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the lift pump operation, check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel pump. Check the CKP sensor circuits. Refer to the electrical guides.
Difficult to start	<ul style="list-style-type: none"> ● Glow plug system fault (very cold conditions) ● Low/Contaminated fuel ● Air leakage ● Fuel pump module (lift pump) fault ● Low-pressure fuel system fault ● Blocked fuel filter ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Exhaust gas recirculation (EGR) valve(s) fault 	Check the glow plug circuits. Refer to the electrical guides. Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - TDV6 2.7L Diesel, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Fuel Charging and Controls - TDV6 2.7L Diesel - Fuel Injector Balance and Spill Check

General Procedures

Special Tool(s)	
 <p>310-152</p> <p>E84154</p>	<p>Fuel Injector Spill Test Kit 310-152</p>
 <p>310-152-02</p> <p>E84153</p>	<p>Fuel Return Blanking Caps 310-152-02</p>

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: Engine Cover - 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the injector sound proofing.

4. Release the EGR coolant cross-over pipe.

- Remove the 2 bolts.

5. Release the fuel supply and fuel return clips from the heater hose.

6. Release the engine harness and heater hose from clip.

7. Release the coolant pipe on bulkhead and position aside. Do not disconnect the coolant pipe.

8. Disconnect the fuel injector electrical connectors.

9. Detach the fuel injection wiring harness.

10. Cut and remove cable ties securing harness to support tray.

11. Release the harness bracket clips and remove the support trays.

12. Disconnect the fuel return line from the fuel injectors.

13. Blank-off each spill return with plugs from kit.

14. Connect the fuel injector electrical connectors.

15. Connect spill bottle to each of the injectors.

16. Connect the battery ground cable.

17. Connect Land Rover approved diagnostic equipment to vehicle.

18. Run cylinder balance test from 'live data'.

- Injector balance limits are between 700 and 1.3 k.
- Note any injector that is outside of these figures (a figure below the limit will usually mean a reduction in fuelling, and a figure above will result in an increase to fuelling).

19.  **WARNING:** Before starting engine, ensure all connectors are properly secure.

 **CAUTION:** Do not reject any of the injectors if the spill rates are even but outside of the correct rates shown. The spill rate can be affected by varying fuel rail pressure and fuel temperature. Only suspect a faulty injector(s) if the amount of fuel collected is significantly higher than the others. A faulty injector could fill a bottle within 2 minutes.

- **NOTE:** The figures shown are to be used as a guide only.

Start the engine and immediately check the spill rate into the bottles. If possible, allow engine to run for 2 minutes. If any bottle is filling at a very fast rate and is likely to fill before 2 minutes is reached, stop engine and note which injector the fuel is coming from.

Time	Flow Rate
1 minute idle	Min rate 10 ml - Max rate 25 ml
4 minute idle	Min rate 15 ml - Max rate 26 ml

20. Disconnect the battery ground cable.

21. Disconnect all spill pipes and bottles. Replace an injector(s) that has either excessive spill or failed the balance check.

22. Remove blank-off plugs from spill return pipes.

23.  **CAUTION:** Make sure the fuel return line retaining clip is correctly installed to the fuel injector before installing the return line.

Connect the fuel return line to the fuel injector.

- Visually inspect the fuel return line O-ring seals for damage.
- Apply a light coating of petroleum jelly to the fuel return line O-ring seals.

24. Disconnect the injector electrical connectors and release the wiring harness.

25. Install the injector harness support trays and secure with cable ties.

26. Connect and secure the fuel injector wiring harness electrical connectors.

27. Secure the engine harness to heater hose clip.

28. Secure the fuel supply and fuel return to heater hose clips.

29. Refit coolant pipe to mounting at rear of engine.

30. Install the EGR coolant cross-over pipe.

- Tighten the bolts to 13 Nm (10 lb.ft).

31. Install the injector sound proofing.

32. Install the engine cover.

For additional information, refer to: Engine Cover - 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

33. Connect the battery ground cable.

For additional information, refer to: Specifications (414-00 Charging System - General Information, Specifications).

Fuel Charging and Controls - TDV6 2.7L Diesel - Fuel Injection Component Cleaning

General Procedures

• WARNINGS:

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1700 bar (24,656 lb-sq-in). Failure to follow this instruction may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Place the vehicle in a well ventilated, quarantined area and arrange 'No Smoking/Petrol Fumes' signs about the vehicle.

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

Before using the cleaning fluid, protect all electrical components and connectors with lint-free non-flocking material.

Make sure that all parts removed from the vehicle are placed on the lint-free non-flocking material.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material.

Make sure that clean non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid, prior to starting work on the vehicle.

Use a steel topped workbench and cover it with clean, lint-free non-flocking material.

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

• NOTE: Pneumatic vacuum gun

1. Using a new brush that will not lose its bristles, brush cleaning fluid onto the components being removed and onto the surrounding area.
2. Using a pneumatic vacuum gun, remove all traces of cleaning fluid and foreign material.
3. Dispose of any used cleaning fluid and the brush after completing the repair.

Fuel Charging and Controls - TDV6 2.7L Diesel - Fuel PumpVIN Range:**SALLA000304->END OF 06MY**

 <p>310-138 E54547</p>	<p>Reaction Arm - Fuel Pump Pulley 310-138</p>

Removal

• WARNINGS:

-  Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
-  Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.
-  Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
-  This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

-  Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.
-  Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
-  Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
-  Do not disassemble or clean inside the fuel pump, even with an ultrasonic cleaner. Always install a new fuel pump when required.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the crankcase vent oil separator.
For additional information, refer to: [Crankcase Vent Oil Separator](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

3. Remove the fuel injection pump belt cover.

- Reposition the engine wiring harness to allow access to the fuel injection pump belt cover.

E54442

4. NOTE: The fuel injection pump belt is not timed to the engine.

Remove and discard the fuel injection pump belt tensioner.

- Remove the LH retaining bolt.

E54443

5. NOTE: The fuel injection pump rotates in a counter-clockwise direction when viewed from the rear of the engine.

Remove and discard the fuel injection pump belt.

E54444

6. Remove the fuel injection pump belt rear cover retaining bolts.

E54445

7. Remove the crankcase vent oil separator locating stud.

E54450

8. NOTE: Left-hand shown, right-hand similar.

Release the high-pressure fuel supply lines.

- Remove the LH retaining bolt.

9.  CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

• NOTE: Left-hand shown, right-hand similar.

Remove and discard the high-pressure fuel supply lines.

- Install blanking caps to the exposed ports.

E56427

10. Release the fuel charging wiring harness.

- Remove the retaining nut.

E54455

11. Remove the fuel injection diverter rail.

- Remove the 2 studs.

E54457

12. Remove the fuel injection pump.
 - Remove the four retaining bolts.

13. NOTE: Do not disassemble further if the component is removed for access only.

Using the special tool, remove the fuel injection pump pulley retaining nut.

14. Using the special tool, remove the fuel injection pump pulley.

Installation

1. Using the special tool, install the fuel injection pump pulley.
 - Tighten to 50 Nm (37 lb.ft).

2. Install the fuel injection pump.
 - Tighten the bolts to 23 Nm (17 lb.ft).

3. Install the fuel injection diverter rail.
 - Install the two retaining studs, but do not fully tighten at this stage.
4. Attach the fuel charging wiring harness.
 - Install the retaining nut.
5. Install the new high-pressure fuel supply lines.
 - Remove the blanking caps from the ports.
 - Loosely install the new high-pressure fuel supply lines.
 - Tighten the fuel injection diverter rail retaining studs to 23 Nm (17 lb.ft).
 - Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 15 Nm (11 lb.ft).
 - Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
 - Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 35 Nm (26 lb.ft).
 - Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection pump to 35 Nm (26 lb.ft).

6. Attach the high-pressure fuel supply lines.
 - Install the two retaining bolts.
 - Tighten to 10 Nm (7 lb.ft).
7. Install the crankcase vent oil separator locating stud.
 - Tighten the stud to 10 Nm (7 lb.ft).
8. Install the fuel injection pump belt rear cover retaining bolts.
 - Tighten to 7 Nm (5 lb.ft).
9.  **CAUTION:** Do not install the new fuel injection pump belt to the pulleys with the fuel pump belt tensioner installed. Failure to follow this instruction may result in damage to the fuel pump belt.

• **NOTE:** The fuel injection pump rotates in a counter-clockwise direction when viewed from the rear of the engine.

Install the new fuel injection pump belt.

10.  **CAUTION:** Make sure that the fuel injection pump belt tensioner tang is correctly located to the fuel injection pump belt rear cover. Failure to follow this instruction may result in damage to the engine.

Install a new fuel injection pump belt tensioner.

- Locate the tang on the new fuel injection pump belt tensioner into the fuel injection pump rear cover.
- Tighten to 25 Nm (18 lb.ft).
- Remove and discard the fuel injection pump belt tensioner locking pin.

11. Install the fuel injection pump belt cover.

- Reposition the engine wiring harness to allow access to the fuel injection pump belt cover.

12. Install the crankcase vent oil separator.

For additional information, refer to: [Crankcase Vent Oil Separator](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

13. Connect the battery ground cable.

For additional information, refer to: Specifications (414-00, Specifications).

14. Bleed the fuel system.

For additional information, refer to: [Low-Pressure Fuel System Bleeding](#) (310-00 Fuel System - General Information, General Procedures).

Removal

• WARNINGS:

-  Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
-  Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.
-  Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
-  This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

-  Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.
-  Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
-  Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
-  Do not disassemble or clean inside the fuel pump, even with an ultrasonic cleaner. Always install a new fuel pump when required.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the crankcase vent oil separator.
For additional information, refer to: [Crankcase Vent Oil Separator](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

3. Release the fuel charging wiring harness.

- Release the 3 clips.
- Remove the 2 nuts.

4. Remove the fuel injection pump belt cover.

- Reposition the engine wiring harness to allow access to the fuel injection pump belt cover.
- Release the 3 clips.

5. NOTE: The fuel injection pump belt is not timed to the engine.

Remove and discard the fuel injection pump belt tensioner.

- Remove and discard the bolt.

6. NOTE: The fuel injection pump rotates in a counter-clockwise direction when viewed from the rear of the engine.

Remove and discard the fuel injection pump belt.

E82035

7. NOTE: Left-hand shown, right-hand similar.

Remove the injector sound proofing.

- Remove the 4 clips.

8. NOTE: Left-hand shown, right-hand similar.

Release the high-pressure fuel supply lines.

- Remove the bolt.

9.  CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection pump until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

● NOTE: Left-hand shown, right-hand similar.

Remove and discard the high-pressure fuel supply lines.

- Install blanking caps to the exposed ports.

10. Remove the timing belt rear cover access panel.

- Remove the 2 bolts.

11. Remove the fuel injection pump.

- Remove and discard the 2 Torx bolts.
- Remove and discard the 2 bolts.
- Release the electrical connector.

E81858

12. NOTE: Do not disassemble further if the component is removed for access only.

Using the special tool, remove the fuel injection pump pulley retaining nut.

E83082

13. Using the special tool, remove the fuel injection pump pulley.

E83083

Installation

1. Using the special tool, install the fuel injection pump pulley.

- Clean the component mating faces.
- Tighten the nut to 50 Nm (37 lb.ft).

2. Install the fuel injection pump.

- Clean the component mating faces.
- Loosely install the new bolts.
- Stage 1: Tighten the Torx bolts to 23 Nm (17 lb.ft).
- Stage 2: Tighten the M8 bolts to 23 Nm (17 lb.ft).
- Connect the electrical connector.

3. Install the timing belt rear cover access panel.

- Tighten the bolts to 10 Nm (7 lb.ft).

4. Install the new high-pressure fuel supply lines.

- Remove the blanking caps from the ports.
- Clean the components mating faces.
- Loosely install the new high-pressure fuel supply lines.
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection pump to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 35 Nm (26 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection pump to 35 Nm (26 lb.ft).

5. Attach the high-pressure fuel supply lines.

- Align the 2 clips.
- Tighten the bolts to 10 Nm (7 lb.ft).

6. Install the injector sound proofing.

- Secure the 4 clips.

E81861

7.  CAUTION: Make sure that the fuel injection pump belt tensioner tang is correctly located to the fuel injection pump belt rear cover. Failure to follow this instruction may result in damage to the engine.

• NOTE: Do not remove the fuel injection pump belt tensioner locking pin at this stage.

Install a new fuel injection pump belt tensioner.

- Clean the components mating faces.
- Locate the tang on the new fuel injection pump belt tensioner into the fuel injection pump rear cover.
- Tighten the bolt to 25 Nm (18 lb.ft).

8.  CAUTION: Do not install the new fuel injection pump belt to the pulleys with the fuel pump belt tensioner locking pin removed. Failure to follow this instruction may result in damage to the fuel pump belt.

• NOTE: The fuel injection pump rotates in a counter-clockwise direction when viewed from the rear of the engine.

Install the new fuel injection pump belt.

- Make sure the components are clean and dry.

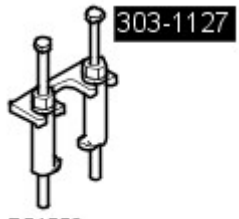

9. Remove and discard the fuel injection pump belt tensioner locking pin.

10. Install the fuel injection pump belt cover.
- Secure with the 3 clips.
 - Reposition the engine wiring harness to allow access to the fuel injection pump belt cover.
11. Attach the fuel charging wiring harness.
- Secure with the 3 clips.
 - Tighten the nuts to 10 Nm (7 lb.ft).
12. Install the crankcase vent oil separator.
For additional information, refer to: [Crankcase Vent Oil Separator](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).
13. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
14. Bleed the fuel system.
For additional information, refer to: [Low-Pressure Fuel System Bleeding](#) (310-00 Fuel System - General Information, General Procedures).

• WARNINGS:

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Do not disconnect the fuel injector electrical connectors with the engine running. Failure to follow this instruction may result in serious damage to the engine.

 Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Disconnect the low-pressure fuel lines.

- Install blanking caps to the exposed ports.

4. Disconnect both exhaust gas recirculation (EGR) coolant cross-over pipe hoses.

- Clamp the EGR coolant hoses to minimize coolant loss.

5. Remove the EGR coolant cross-over pipe.

- Remove the two retaining bolts.

6. Remove the battery.

For additional information, refer to: [Battery](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

7. NOTE: Right hand drive shown, for Left hand drive reverse the sequence.

Disconnect the three engine harness electrical connectors in the order shown.

8. Release the engine wiring harness from the bulkhead.

9. Remove the injector sound proofing.

10. Disconnect the fuel injector electrical connectors.

11. Release the engine wiring harness.

- Release the 4 clips.

12. CAUTIONS:

 Make sure that the high-pressure fuel supply line remains in contact with the fuel pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Do not use any aggressive cleaning fluid or a wire brush to clean the fuel injector nozzle.

Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply line, the fuel injector and the fuel injection supply manifold.
For additional information, refer to: [Fuel Injection Component Cleaning](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, General Procedures).

13. CAUTIONS:

⚠ Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

Loosen the high-pressure fuel supply line from the fuel injector and fuel rail.

14. **⚠** CAUTION: Make sure that all openings are sealed. Use new blanking caps.

• NOTE: Right-hand shown, left-hand similar.

Remove and discard the high-pressure fuel supply line.

15. Disconnect the fuel return line from the fuel injector.

- Remove and discard the fuel return line retaining clip.

16. Remove the two fuel injector retaining bolts.

- Remove the fuel injector retaining clamp spacer.

17. Install the special tool studs.

18.  CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

Install the special tool remover legs to the studs.

19.  CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

Remove the fuel injector.

- Rotate the special tool bolts evenly, in a clockwise direction.
- Remove the special tool.
- Remove and discard the fuel injector retaining clamp.
- Remove and discard the sealing washer.

Installation

E116294

1. CAUTIONS:

⚠ Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

⚠ Do not use tools to install the new fuel return line clip. Failure to follow this instruction will result in damage to the retaining clip.

Install a new fuel injector retaining clamp.

1. Install a new fuel injector retaining clamp.
2. Install the fuel injector retaining clamp spacer.
3. Install a new fuel return line retaining clip.
4. Install a new sealing washer.

2. Install the fuel injector.

- Install the two bolts and tighten to 10 Nm (7 lb.ft).

⚠ CAUTION: Make sure the fuel return line retaining clip is correctly installed to the fuel injector before installing the return line.

Connect the fuel return line to the fuel injector.

- Visually inspect the fuel return line O-ring seals for damage.
- Apply a light coating of petroleum jelly to the fuel return line O-ring seals.

4. CAUTIONS:

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

⚠ Maintain pressure on the high-pressure fuel supply lines to keep the olives in contact with the fuel rail and the fuel injector cones while installing unions.

- NOTE: Remove and discard the blanking caps.

Install the new high-pressure fuel supply lines.

- Install the new high-pressure fuel supply line, tighten the fuel supply line unions finger tight.
- Tighten the high-pressure fuel supply line in the shown sequence.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 15 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 15 Nm.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 35 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 35 Nm.

E124889

5. Attach the engine wiring harness.

6. Connect the fuel injector electrical connectors.

7. Install the injector sound proofing.

8. Attach the engine wiring harness to the bulkhead.

9. Connect the three engine harness electrical connectors.

10. Install the battery.

For additional information, refer to: [Battery](#) (414-01 Battery,

Mounting and Cables, Removal and Installation).

11. Install the EGR coolant cross-over pipe.

- Install the two retaining bolts.
- Tighten the bolts to 13 Nm (10 lb.ft).

12. Connect both EGR coolant cross-over pipe hoses.

- Remove the EGR coolant hose clamps.

13. Connect the low-pressure fuel lines.

- Remove the blanking caps from the ports.

14. Connect the battery ground cable.

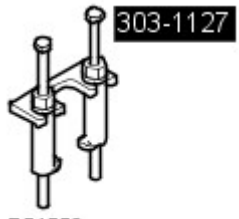

For additional information, refer to: Specifications (414-00, Specifications).

15. Check and top-up the coolant.

16. Bleed the fuel system.

8. Release the engine wiring harness from the bulkhead.

9. Remove the NVH pads from each cylinder bank.

10. Disconnect the fuel injector electrical connectors.

11. Release the engine wiring harness.

- Release the 4 clips.

12. CAUTIONS:

 Make sure that the high-pressure fuel supply line remains in contact with the fuel pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Do not use any aggressive cleaning fluid or a wire brush to clean the fuel injector nozzle.

Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply line, the fuel injector and the fuel injection supply manifold.

E124649

13. CAUTIONS:

⚠ Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

Loosen the high-pressure fuel supply line from the fuel injector and fuel rail.

E124649

14. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

• **NOTE:** Right-hand shown, left-hand similar.

Remove and discard the high-pressure fuel supply line.

E55233

15. Disconnect the fuel return line from the fuel injector.

- Remove and discard the fuel return line retaining clip.

16. Remove the two fuel injector retaining bolts.

- Remove the fuel injector retaining clamp spacer.

17. Install the special tool studs.

18.  CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

Install the special tool remover legs to the studs.

19.  CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

Remove the fuel injector.

- Rotate the special tool bolts evenly, in a clockwise direction.
- Remove the special tool.
- Remove and discard the fuel injector retaining clamp.
- Remove and discard the sealing washer.

Installation

E116294

1. CAUTIONS:

⚠ Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

⚠ Do not use tools to install the new fuel return line clip. Failure to follow this instruction will result in damage to the retaining clip.

Install a new fuel injector retaining clamp.

1. Install a new fuel injector retaining clamp.
2. Install the fuel injector retaining clamp spacer.
3. Install a new fuel return line retaining clip.
4. Install a new sealing washer.

2. Install the fuel injector.

- Install the two bolts and tighten to 10 Nm (7 lb.ft).

⚠ CAUTION: Make sure the fuel return line retaining clip is correctly installed to the fuel injector before installing the return line.

Connect the fuel return line to the fuel injector.

- Visually inspect the fuel return line O-ring seals for damage.
- Apply a light coating of petroleum jelly to the fuel return line O-ring seals.

4. CAUTIONS:

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

⚠ Maintain pressure on the high-pressure fuel supply lines to keep the olives in contact with the fuel rail and the fuel injector cones while installing unions.

- NOTE: Remove and discard the blanking caps.

Install the new high-pressure fuel supply lines.

- Install the new high-pressure fuel supply line, tighten the fuel supply line unions finger tight.
- Tighten the high-pressure fuel supply line in the shown sequence.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 15 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 15 Nm.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 35 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 35 Nm.

E124889

5. Attach the engine wiring harness.

6. Connect the fuel injector electrical connectors.

7. Install the NVH pads on the cylinder banks.

8. Attach the engine wiring harness to the bulkhead.

9. Connect the three engine harness electrical connectors.

10. Install the battery.

For additional information, refer to: [Battery](#) (414-01 Battery,

Mounting and Cables, Removal and Installation).

11. Install the EGR coolant cross-over pipe.

- Install the two retaining bolts.
- Tighten the bolts to 13 Nm (10 lb.ft).

12. Connect both EGR coolant cross-over pipe hoses.

- Remove the EGR coolant hose clamps.

13. Connect the low-pressure fuel lines.

- Remove the blanking caps from the ports.

14. Connect the battery ground cable.

For additional information, refer to: Specifications (414-00, Specifications).

15. Check and top-up the coolant.

16. Bleed the fuel system.

Fuel Charging and Controls - TDV6 2.7L Diesel - Intake Air Shutoff Throttle

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the three electrical connectors.
 - Release the fuel return line valve.

4. Remove the intake air shutoff throttle elbow retaining bolt.

5. Release the intake air shutoff throttle elbow.
 - Remove the intake air shutoff throttle retaining stud.

6. Release the LH EGR valve outlet tube retaining clip.
7. Release the RH EGR valve outlet tube retaining clip.

8. Reposition the intake air shutoff throttle.

9. Remove the intake air shutoff throttle.

10. NOTE: Do not disassemble further if the component is removed for access only.

Remove and discard the O-ring seals.

Installation

1.  CAUTION: The O-ring seals are to be reused unless damaged.

Install the intake air shutoff throttle.

2. Align the intake air shutoff throttle.

3. Secure the RH EGR valve outlet tube.

4. Secure the LH EGR valve outlet tube.

5. Secure the intake air shutoff throttle elbow.

- Tighten the intake air shutoff throttle retaining stud to 10 Nm (7 lb.ft).

6. Tighten the intake air shutoff throttle elbow retaining bolt to 10 Nm (7 lb.ft).

7. Connect the three electrical connectors.

- Secure the fuel line return valve.

8. Install the engine cover.

For additional information, refer to: [Engine Cover - TDV6 3.0L](#)

[Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

9. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Fuel Charging and Controls - TDV6 2.7L Diesel - Fuel Diverter Rail

Removal and Installation

General Equipment

Pneumatic vacuum gun

Removal

• WARNINGS:

 Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Do not remove the fuel rail pressure sensor from the fuel injection diverter rail.

• NOTE: If a new fuel rail pressure sensor is to be installed, a new fuel injection diverter rail and fuel rail pressure sensor must be installed as an assembly.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Oramentation, Removal and Installation).
3. Disconnect the low-pressure fuel lines.
 - Install blanking caps to the exposed ports.

E54441

4. Disconnect both exhaust gas recirculation (EGR) coolant cross-over pipe hoses.

- Clamp the EGR coolant hoses to minimize coolant loss.

5. Remove the EGR coolant cross-over pipe.

- Remove the two retaining bolts.

6. CAUTIONS:

⚠ Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

Loosen the high-pressure fuel supply line from the fuel injector and fuel rail.

7.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

• NOTE: Right-hand shown, left-hand similar.

Remove and discard the high-pressure fuel supply line.

8.  CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

• NOTE: Crankcase vent oil separator shown removed for clarity.

Remove and discard the high-pressure fuel supply line.

- Install blanking caps to the exposed ports.

9.  CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

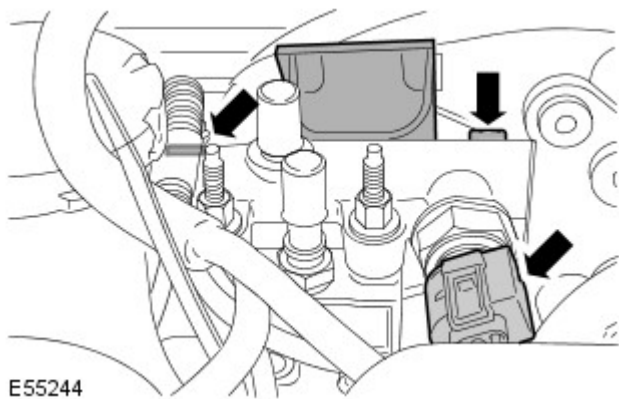

Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply line, the fuel injectors and the fuel rail.

For additional information, refer to: [Fuel Injection Component Cleaning](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, General Procedures).

10. Release the low-pressure fuel line.

- Disconnect the low-pressure fuel line.
- Install blanking caps to the exposed ports.

11. Disconnect the fuel rail pressure (FRP) sensor electrical connector.

- Release the fuel charging wiring harness.

12. Remove the FRP and fuel injection diverter rail assembly.

- Remove the 2 studs.

Installation

1. Install the FRP and fuel injection diverter rail assembly.

- Install the two retaining studs, but do not fully tighten at this stage.

2. Connect the FRP sensor electrical connector.

- Attach the fuel charging wiring harness.

3. CAUTIONS:

⚠ Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

⚠ Do not use any aggressive cleaning fluid or a wire brush to clean the fuel injector nozzle.

Install the new high-pressure fuel supply line.

- Install the new high-pressure fuel supply line, tighten the fuel supply line unions finger tight.
- Tighten the high-pressure fuel supply line in the shown sequence.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 15 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 15 Nm.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 35 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 35 Nm.

4. Attach the low-pressure fuel line.

- Remove the blanking caps from the ports.
- Connect the low-pressure fuel line.

5. Install the new high-pressure fuel supply lines.

- Remove the blanking caps from the ports.
- Loosely install the new high-pressure fuel supply lines.
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 35 Nm (26 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 35 Nm (26 lb.ft).

6. Secure the high-pressure fuel supply lines.

- Tighten the two retaining bolts to 10 Nm (7 lb.ft).

7. Install the EGR coolant cross-over pipe.

- Install the two EGR coolant cross-over pipe retaining bolts.
- Tighten to 13 Nm (10 lb.ft).

8. Connect both EGR coolant cross-over pipe hoses.

- Remove the EGR coolant hose clamps.

9. Connect the low-pressure fuel lines.

- Remove the blanking caps from the ports.

10. Install the engine cover.

For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

11. Connect the battery ground cable.

For additional information, refer to: Specifications (414-00, Specifications).

12. Bleed the fuel system.

For additional information, refer to: [Low-Pressure Fuel System](#)

[Bleeding](#) (310-00 Fuel System - General Information, General Procedures).

13. Check and top-up the coolant.

Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel - Turbocharger

Description and Operation

E50590

Item	Part Number	Description
1	-	Oil feed pipe
2	-	LH exhaust manifold
3	-	Actuator motor
4	-	Actuator lever
5	-	Oil return pipe
6	-	Turbocharger

The variable vane turbocharger, fitted to the LH exhaust manifold of the TdV6 engine, makes it possible to vary the exhaust gas flow of the turbine, dependent on engine operation. This improves the power transfer to the turbine wheel and compressor, particularly at low engine speeds, thus increasing the boost pressure. The guide vanes are opened progressively as the engine speed increases so that the power transfer always remains in balance with the required charger speed and the required boost pressure level. Variable vanes facilitate better use of the exhaust gas energy so as to further improve the efficiency of the turbocharger and thus of the engine, compared to the more conventional 'wastegate control'.

Advantages:

- High torque at both high and low engine speeds
- Continuous and optimum adjustment for all engine speeds
- No wastegate valve required, exhaust energy is better utilised, less back-pressure in conjunction with same compressor work
- Low thermal and mechanical load improves engine power output
- Low emissions
- Optimised fuel consumption over the entire engine speed range

The turbochargers construction is similar to the unit fitted to the Freelander Td4 engine. However, a stepper motor instead of a vacuum diaphragm electronically controls the variable vanes.

The DC rotary actuator motor operates a drive shaft. The drive shaft is connected to the vanes by an actuating lever. Adjustment of the vanes is achieved by moving the actuating lever. When the drive shaft is turned, a signal is created at the end of the drive shaft; this feedback signal is used to determine the angular position of the vanes. This information is transmitted to the Engine Control Module (ECM).

There is a temperature sensor in the control unit, which drives the stepper motor to a safe position (vanes fully opened) if the maximum temperature is exceeded. The ECM detects any malfunctions in the stepper motor and generates Diagnostic Trouble Codes (DTC).

Item	Part Number	Description
A	-	Closed (fast)
B	-	Open (slow), default position
1	-	Turbine
2	-	Vanes
3	-	Actuator lever

At low engine speeds, because of the flat setting of the vanes, the relatively low flow of exhaust gases are accelerated and routed in such a way that they meet the vanes of the turbine wheel at the outermost edge. Consequently, a high torque is produced at the turbine wheel, and a high turbine speed is therefore achieved.

At high engine speeds the vanes are progressively opened, so that a large flow of exhaust gas is delayed and is directed more and more towards the centre of the turbine wheel.

The torque at the turbine wheel is artificially lowered. In this way the turbine speed, and therefore the air quantity required by the engine, are matched to engine speed. Consequently, the boost pressure is approximately constant over the whole engine speed range.

The operating parameters are controlled electronically by the ECM using powertrain sensors and driver inputs. For additional information, refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

The turbocharger is designed for fail safe operation. If a fault occurs regarding the control of the unit, the vanes default to the fully open position so as to produce minimum boost.

Turbocharger

Diagnosis and Testing

Principles of Operation

For a detailed description of the fuel charging and controls system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Turbocharger](#) (303-04B Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

WARNING: The following tests may involve working in close proximity to hot components. Make sure adequate protection is used. Failure to follow this instruction may result in personal injury.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Intake air system ● Hose(s)/hose connections ● General engine condition. 	<ul style="list-style-type: none"> ● Circuit(s) ● Engine control module (ECM) ● Electrical connections and harnesses

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Poor performance	<ul style="list-style-type: none"> ● Low/Contaminated fuel ● Restricted air intake system ● General engine condition ● Engine control module failure 	Check the fuel level and condition. Check the air intake for restriction. Check the engine condition, compressions, etc. Refer to the relevant section of the workshop manual. Check for DTCs. Refer to the warranty policy and procedures manual if an engine control module is suspect.
No boost	<ul style="list-style-type: none"> ● Electrical connections and harnesses ● Restricted air intake system ● Charge air cooler restricted/leaking ● Engine control module failure 	Check the electrical connections and harnesses. Check the air intake for restriction/leakage (see visual inspection). Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if an engine control module is suspect.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - TDV6 2.7L Diesel, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Removal and Installation

Removal

All vehicles

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Open the hood.

Left-hand drive vehicles

3. CAUTIONS:

 Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

 Make sure the steering is in the straight ahead position.

- NOTE:** Note the fitted position.

Loosen the steering column lower shaft to steering column upper shaft bolt.

All vehicles

- Remove the LH front wheel and tire.
- Remove the transmission undershield.
 - Remove the 6 bolts.

- Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

Left-hand drive vehicles

7. Remove the radiator access panel.

- Remove the 2 bolts.

All vehicles

8. Release the downpipe catalytic converter support insulator.

9. Remove the transmission support insulator through-bolt.

- Using a transmission jack, support the transmission.

10. With assistance, remove the transmission support crossmember.

- Remove the 4 nuts and bolts.

11. With assistance, remove the downpipe catalytic converter.

- Loosen the clamp.
- Remove and discard the 3 nuts.
- Remove and discard the gasket.

12. Remove the exhaust front heat shield.

- Remove the 3 nuts.
- Remove the bolt.

13. Install the transmission support crossmember.

- Install but do not fully tighten at this stage the 2 transmission support crossmember bolts.
- Install but do not fully tighten at this stage the transmission support insulator through-bolt.
- Remove the transmission jack.

14. Remove the differential mounting bracket heat shield.

- Remove the 2 bolts.

E63865

15. Remove the turbocharger support bracket.

- Remove the 2 bolts.
- Remove the nut.

E54874

16. Remove the 2 bolts from the turbocharger support bracket.

E79232

17. Loosen the turbocharger lower nut.

E79235

18. Remove the LH upper arm.

For additional information, refer to: [Upper Arm](#) (204-01 Front Suspension, Removal and Installation).

19. Turn the ignition key to position I.

- Turn the steering wheel until the head of the steering column lower shaft bolt can be seen through the LH wheel

arch.

20.  **CAUTION:** Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Remove and discard the steering column lower shaft bolt.

21. Turn the steering wheel to the straight ahead position.

- Remove the ignition key.

22. Remove the steering column lower shaft.

- Remove and discard the steering column lower shaft upper bolt.

All vehicles

23. Remove the fender splash shield lower trim.

- Remove the 4 clips.

24. Remove the turbocharger heat shield.

- Remove the 2 bolts.

25.  CAUTION: Always plug any open connections to prevent contamination.

Disconnect the turbocharger oil supply tube.

- Remove the turbocharger banjo bolt.
- Remove and discard the sealing washers.

26.  CAUTION: Always plug any open connections to prevent contamination.

Remove the turbocharger oil return tube bolt.

- Release the wiring harness clip.

27. Remove the turbocharger oil return tube.

- Remove the 2 bolts.
- Remove and discard the gasket.
- Remove and discard the O-ring seal.

28. Remove the turbocharger support bracket.

- Remove the 2 bolts.

29. Loosen the turbocharger intake and outlet pipe clips.

30. Disconnect the turbocharger electrical connector.

31.  **WARNING:** Eye protection must be worn.

• **CAUTIONS:**

 Make sure that only the turbocharger studs are drilled.

 Make sure that the depth of the drill does not exceed 14 mm (0.6 inch).

Carefully drill the turbocharger 2 upper studs.

- Center punch the turbocharger 2 upper studs.
- Drill a pilot hole in the center of the turbocharger studs progressively drill out the studs until a 8 mm (0.3 inch) hole is achieved.

32. With assistance, remove the turbocharger.

- Loosen the turbocharger lower nut.

Installation

All vehicles

E55006

1. WARNINGS:

Eye protection must be worn.

Never direct a high-pressure nozzle at the skin as the high-pressure air may penetrate to the underlying tissue, and cause serious injury.

CAUTION: Always keep high-pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Drill two 8 mm (0.3 inches) holes in the turbocharger as shown.

- Clean the turbocharger and blow out with an air line.
2. Install a new stud to turbocharger lower hole.
 3. With assistance, install the turbocharger.
 - Clean the turbocharger mating faces.
 - Align the turbocharger intake and outlet pipes.
 4. With assistance, tighten the turbocharger upper nuts and bolts to 24 Nm (18 lb.ft).
 5. Tighten the turbocharger lower nut to 24 Nm (18 lb.ft).
 6. Connect the turbocharger electrical connector.
 7. Tighten the turbocharger intake and outlet pipe clips.
 8. Install the turbocharger support bracket.
 - Tighten the bolts to 23 Nm (17 lb.ft).
 9. Connect the turbocharger oil supply tube.
 - Install new sealing washers.
 - Tighten the turbocharger oil supply tube bolt to 30 Nm (22 lb.ft).
 10. Install the turbocharger heat shield.
 - Install the 2 bolts.
 11. Install the 2 turbocharger oil return tube bolts.
 - Install a new gasket.
 - Install a new O-ring seal.
 - Tighten the 2 bolts to 10 Nm (7 lb.ft).
 12. Install the turbocharger oil return tube bolt.
 - Attach the wiring harness clip.
 13. Install the fender splash shield lower trim.
 - Install the 4 clips.

Left-hand drive vehicles

14. Install the steering column lower shaft.
 - Connect the steering column lower shaft to the steering column upper shaft.
 - Connect the universal joint to the steering gear.
15. Install but do not fully tighten at this stage a new steering column lower shaft to steering column upper shaft bolt.

16.  **CAUTION:** Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Turn the ignition key to position I.

- Turn the steering wheel until the steering column lower shaft bolt hole can be seen through the LH wheel arch.

17. Install the steering column lower shaft to steering gear bolt.

- Install a new bolt and tighten to 30 Nm (22 lb.ft).

18. Turn the steering wheel to the straight ahead position.

- Remove the ignition key.

19. Tighten the steering column lower shaft to steering column upper shaft bolt to 30 Nm (22 lb.ft).

All vehicles

20. Install the LH upper arm.

For additional information, refer to: [Upper Arm](#) (204-01 Front Suspension, Removal and Installation).

21. Install the 2 turbocharger support bracket bolts.

- Tighten the 2 bolts to 23 Nm (17 lb.ft).

22. Install the turbocharger support bracket.

- Install the turbocharger support bracket stud.
- Tighten the 2 bolts to 48 Nm (35 lb.ft).
- Tighten the nut to 25 Nm (18 lb.ft).

23. Install the differential mounting bracket heat shield.

- Install the 2 bolts and tighten to 10 Nm (7 lb.ft).

24. Remove the transmission support crossmember.

- Using a transmission jack, support the transmission.

25. Install the exhaust front heat shield.

- Install the 3 nuts.
- Install the bolt.

26. With assistance, install the downpipe catalytic converter.

- Install new studs and nuts.
- Install a new gasket.
- Tighten the downpipe catalytic converter nuts and clamp to 48 Nm (35 lb.ft).

27. Install the transmission support crossmember.

- Tighten the nuts and bolts to 90 Nm (66 lb.ft).
- Install the transmission support insulator through-bolt and tighten to 175 Nm (129 lb.ft).
- Remove the transmission jack.

28. Attach the downpipe catalytic converter hanger.

Left-hand drive vehicles

29. Install the radiator access panel.

- Tighten the 2 bolts to 10 Nm (7 lb.ft).

All vehicles

30. Install the engine undershield.

For additional information, refer to: [Engine Undershield](#)
(501-02 Front End Body Panels, Removal and Installation).

31. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

32. Install the LH front wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

33. Check and top-up the engine oil.

34. Close the hood.

Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel - Turbocharger Intake Tube

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the power steering pump.
For additional information, refer to: Power Steering Pump - 2.7L Diesel (211-02, Removal and Installation).
3. Remove the support bracket.
 - Remove the two retaining bolts.

E54741

4.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle.

5. Disconnect the breather hose.
 - Release the clip.

E54742

6. Disconnect the turbocharger intake tube.
 - Loosen the clip.

E54743

7. Remove the charge air cooler intake pipe.

- With assistance, reposition the turbocharger intake tube.

8. With assistance, remove the turbocharger intake tube.

Installation

1. To install, reverse the removal procedure.

- Tighten the two retaining bolts to 10 Nm (7 lb.ft).

Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel - Turbocharger Actuator Rod

Removal and Installation

Removal

 **CAUTION:** Always plug any open connections to prevent contamination.

• **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

1. Remove the turbocharger. For additional information, refer to: [Turbocharger](#) (303-04B Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Removal and Installation).

2.  **CAUTION:** Make sure that no parts of the turbocharger actuator linkage are allowed to move beyond the normal operating limits. Failure to follow this instruction may result in damage to the vehicle.

Position the turbocharger actuator connecting rod to the mid point position.

E128338

3. Using a suitable marker, mark the mid point position of the actuator arm.

E128341

E128340

4.  CAUTION: Make sure that two spanners are used to remove the bolt. Failure to follow this instruction may result in damage to the vehicle.

Remove the bolt.

5. Remove the turbocharger actuator connecting rod.

E128339

Installation

1. CAUTIONS:

 Make sure that no parts of the turbocharger actuator linkage are allowed to move beyond the normal operating limits. Failure to follow this instruction may result in damage to the vehicle.

 Make sure that the marks are aligned. Failure to follow this instruction may result in damage to the vehicle.

 Make sure that two spanners are used to install the bolt. Failure to follow this instruction may result in damage to the vehicle.

To install, reverse the removal procedure.

2. Tighten the bolt to 5 Nm.

E128340

3. Install the turbocharger. For additional information, refer to: [Turbocharger](#) (303-04B Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Removal and Installation).

Fuel Charging and Controls - TDV6 3.0L Diesel - Fuel Charging and Controls

- Overview

Description and Operation

OVERVIEW

The 3.0L V6 diesel engine is equipped with a HP (high pressure) common rail fuel injection system. With this fuel injection process, a HP pump delivers a uniform level of pressure to the shared fuel lines (the common rails), which serve all 6 fuel injectors. Pressure is controlled to the optimum level for smooth operation.

The common rail system supports a pre and pilot injection depending on engine operating conditions, which reduces combustion noise levels, more commonly referred to as 'diesel knock'.

Fuel injection pressure is generated independently of engine speed and fuel injection events.

The fuel injection timing and volume are calculated by the [ECM \(engine control module\)](#), which then energizes the appropriate piezo actuated injector. The common rail fuel injection system has the following features:

- High fuel injection pressures of up to 2000 bar (29007 lbf/in²) for greater atomization of fuel (increasing performance and lowering emissions).
- Variable injection to optimize combustion in all engine operating conditions
- Low tolerances and high precision throughout the life of the system.

The fuel system is divided into two sub systems:

- LP (low pressure) system
- HP system.

The LP system features the following components:

- In-tank fuel pump
- Fuel pressure regulator (integral to the fuel delivery module)
- Fuel filter
- Return pipes
- Injector return pipes
- Fuel coolers (engine and vehicle).

The LP system is regulated to 0.5 bar (7.25 lbf/in²).

The HP system features the following components:

- HP pump
- Fuel rails and diverter rail
- HP fuel pipes
- Injectors.

Fuel Charging and Controls - TDV6 3.0L Diesel - Fuel Charging and Controls - System Operation and Component Description

Description and Operation

System Operation

ENGINE STARTING

During starting, the fuel rail pressure must be at least 150 bar (2175 lbf/in²). Should the pressure be below this figure, the injectors will not operate, resulting in the vehicle not starting.

ENGINE STOPPING

To stop the engine the [ECM \(engine control module\)](#) stops energizing the actuators in the fuel injectors, therefore, no fuel is injected and the engine speed drops to zero.

Refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Description and Operation).

HP FUEL PUMP

When the HP fuel pump is rotated, pressure is created when the volume control valve is open and the pressure control valve is closed. Both valves are electronically controlled by the [ECM](#) to allow variable fuel delivery and pressure control. When the [ECM](#) actuates the piezo actuators, the fuel rail pressure drop is off-set by additional fuel being delivered to the fuel rails by the pressure control valve. The fuel pressure in the system is reduced within a few seconds after the engine has stopped as the pressure control valve no longer has the holding current it requires, and therefore opens. No residual pressure remains in the system and the fuel is returned to the LP fuel return line to the fuel filter through the open pressure control valve.

Component Description

LOW PRESSURE (LP) SYSTEM

LP Fuel Pump

The electric fuel pump is located inside the fuel tank. Fuel is pumped from the tank via the in-tank fuel pump, to the HP pump via the fuel filter.

Refer to: Fuel Tank and Lines (310-01 Fuel Tank and Lines - 3.0L Diesel, Description and Operation).

Fuel Filter

The fuel filter assembly is located in front of the fuel tank and is mounted on a bracket which is attached to the top face of the transfer box chassis cross member.

Fuel returning from the HP pump passes through the fuel cooler before returning to the filter to maintain the fuel at an optimum temperature. The returning fuel is re-circulated through the filter to help prevent waxing in cold operating conditions. Fuel pressure and fuel delivery is maintained by the in-tank pump and regulator via the tank fuel feed line.

The filter has an air bleed return to the fuel tank which returns excess air and fuel to the tank.

The filter element has a capacity of 200cm³ (12.2in³). The filtration element has the capacity to filter particulate matter larger than 5 microns.

The fuel filter is also fitted with a water sensor to detect when moisture which has collected in the filter has reached an unacceptable level.

Refer to: Fuel Tank and Lines (310-01 Fuel Tank and Lines - 3.0L Diesel, Description and Operation).

Fuel Cooler

An air blast fuel cooler is located off the engine crossmember at the front of the engine oil pan. The fuel cooler has 2 connections; one is an inlet which allows heated fuel from the HP pump to be cooled, the second allows the cooled fuel to be fed from the cooler into the supply pipe from the LP fuel pump in the fuel tank, via a 'Y' connector back to the fuel filter.

HIGH PRESSURE (HP) SYSTEM

HP Fuel Pump

E108848

The HP pump is a 2 piston radial plunger pump. The pump has the ability to produce a maximum pressure of 2000 bar (29007 lbf/in²). The housing is cast from iron, the flange is cast from aluminum.

The HP pump is driven from the [LH \(left-hand\)](#) cylinder bank exhaust camshaft via a toothed belt. The drive from the belt rotates a cam within the pump which operates a plunger within each pumping element. A procedure and special tools are required for pump or belt replacement to time the pump.

The high-pressure pump comprises 2 high pressure pumping elements, a volume control valve, an internal transfer pump and a fuel temperature sensor.

The fuel is delivered to the internal transfer pump via the external fuel filter and an electric fuel pump which is located in the fuel tank.

The volume control valve is mounted on the high-pressure pump, and located in the feed port between the high pressure pump elements and the internal transfer pump. The volume control valve is a variable position solenoid-operated valve that is controlled by the [ECM](#). The volume control valve determines the amount of fuel that is delivered from the internal transfer pump to the HP pumping elements. When there is no signal to the volume control valve, the valve is closed and there is no fuel delivery.

The fuel from the internal transfer pump is passed to the HP pumping elements at a constant pressure known as transfer pressure. The transfer pressure is controlled by an internal pressure relief valve. Once the fuel enters each of the HP pump elements the pressure rises rapidly, with each element providing a HP supply to one of the fuel rails. The high pressure is controlled by the high pressure regulator valve and the fuel rail pressure sensor.

A controlled amount of fuel is allowed to leak-off from the internal transfer pump. This fuel is delivered to the pump internal components to provide cooling and lubrication and is passed back the fuel filter via the LP feed line.

The pressure control valve is located in one of the fuel rails. The fuel pressure is monitored by a pressure sensor located in the other fuel rail. The [ECM](#) controls the pressure control valve using the received signals from the pressure sensor.

Reducing the pressure in the fuel rails via the pressure control valve results in fuel returning from the fuel rails to the LP fuel return to the fuel filter.

The fuel temperature sensor is located on the rear of the HP pump. It measures the fuel temperature in the low-pressure side of the HP pump. The [ECM](#) continually monitors this signal to determine the fuel temperature to prevent overheating of the fuel system. The [ECM](#) will also make fine adjustments to fuel injection quantity to adjust for fuel temperature.

Fuel Rails

E115474

ItemDescription

1	LH fuel rail
2	Fuel pressure control valve
3	Fuel pressure sensor
4	RH (right-hand) fuel rail
5	HP fuel connection from HP pump
6	Fuel rail balance pipe

The fuel rails are steel fabrications and are similar in their construction. Two fuel rails are used with each rail supplying high pressure fuel to 3 fuel injectors.

Each rail has 5 threaded connections which provide for the attachment of the high pressure fuel supply from the HP pump, the balance pipe and connections for the 3 injectors supplied with fuel from that rail.

The fuel pressure in the rails is detected by a fuel pressure sensor which is located in the end of the [RH](#) rail. The [LH](#) rail houses a pressure control valve. The [ECM](#) controls the pressure control valve using signals from the pressure sensor.

The fuel rail pressure sensor is a piezo-resistive type sensor containing an actuating diaphragm. Deflection of the diaphragm provides a proportional signal (output) voltage to the [ECM](#), dependant on the fuel pressure within the fuel rail.

Both rails are connected together with a balance pipe which ensures the pressure in both rails is equal, even though each rail is supplied from a different pumping element in the HP pump.

Fuel Injectors

E115475

ItemDescription

1	Fuel return
2	O-ring seal
3	Piezo stack actuator
4	Hydraulic coupler
5	Control valve
6	Nozzle body
7	Copper sealing washer
8	Electrical connector
9	High pressure feed
10	Nozzle

Six fuel injectors are used in the fuel system. A piezo actuator in each injector is electronically controlled by the [ECM](#) to operate the injector in response to engine speed and load conditions.

Each injector has an electrical connector which connects the injector to the engine harness. A fuel connection on the top of the injector provides for the high pressure fuel inlet from the HP pump. A second fuel connection allows fuel leakage within the injector to return to the HP pump.

Each injector is located in a machined hole in the cylinder head and is sealed in the cylinder head with a copper sealing washer and an O-ring seal. The injector is retained in the cylinder head with a clamp plate and 2 bolts. If an injector is removed or replaced, a new copper sealing washer and a clamp plate must be used when refitting the injector.

The injector can operate up to 5 times during one combustion cycle depending on engine speed and load. The injection sequence can occur as follows:

E107577

- Pilot injection - occurs before the main injection and improves fuel and air mixing
- Pre-injection - shortens the main injection's ignition delay and therefore reduces the generation of nitrous oxides
- Main injection - delivers the required engine torque
- After injection - occurs after the Main injection and assists the re-burn of any remaining particulate matter
- Post injection - helps manage the temperature of the exhaust gas for more effective exhaust-gas after-treatment
- Injection delay 0.4 ms.

Each injector is calibrated to the [ECM](#) and applicable the cylinder to which it is fitted. Therefore, if an injector is removed it must be refitted to the cylinder from which it was removed. If a new injector is fitted, a calibration routine using Land Rover approved diagnostic equipment must be performed to calibrate the injector unique code to the [ECM](#).

The operating voltage of the injector is between 110 and 163 volts depending on engine speed and load and care must be taken when working in the vicinity of the injectors. The voltage increases linearly from 200 to 2000 bar.

Each injector has an electrical resistance value of between 150 - 250 kOhms.

CAUTION: Each injector operation is controlled by a charge and discharge cycle allowing energy to dissipate in, and recover from the injector. Never disconnect the wiring connection when the engine is running. The injector can remain open thus causing engine damage.

Fuel Charging and Controls - TDV6 3.0L Diesel - Fuel Charging and Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the fuel charging and controls system and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Fuel Charging and Controls](#) (303-04C Fuel Charging and Controls - TDV6 3.0L Diesel, Description and Operation).

Inspection and Verification

WARNING: Make sure that all suitable safety precautions are observed when carrying out any work on the fuel system. Failure to observe this warning may result in personal injury.

• CAUTIONS:

Make sure that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Low/Contaminated fuel ● Fuel supply/return line(s) ● Fuel tank and filler pipe ● Fuel leak(s) ● Fuel filler cap ● Fuel filter ● Push connect fittings ● Fuel rail ● Fuel pump ● Exhaust Gas Recirculation (EGR) system 	<ul style="list-style-type: none"> ● Fuses ● Glow plug indicator ● Inertia fuel shutoff switch ● Fuel pump module ● Sensor(s) ● Powertrain Control Module (PCM) ● Fuel volume control valve ● Fuel pressure control valve ● Fuel Rail Pressure (FRP) sensor ● Fuel temperature sensor ● Fuel injector(s) ● Exhaust Gas Recirculation (EGR) system

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not start	<ul style="list-style-type: none"> ● Inertia fuel shutoff switch ● Low/Contaminated fuel ● Air leakage ● Low-pressure fuel system fault ● Fuel pump module (lift pump) fault ● Blocked fuel filter ● Fuel volume regulator blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Fuel pump fault ● Crankshaft position (CKP) sensor 	Check that the inertia switch has not tripped. Check the fuel level and condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the lift pump operation, check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel pump. Check the CKP sensor circuits. Refer to the electrical guides.

Excessive fuel consumption	<ul style="list-style-type: none"> ● Low-pressure fuel system fault ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Fuel temperature sensor leak ● High pressure fuel leak ● Injector(s) fault ● Exhaust gas recirculation (EGR) valve(s) fault 	Check the low-pressure fuel system for leaks/damage. Check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel temperature sensor, fuel pump, etc for leaks. Check for injector DTCs. Check the EGR system.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Engine Control Module (PCM) 3.0L TdV6 (100-00, Description and Operation).

Fuel Charging and Controls - TDV6 3.0L Diesel - Fuel Injection Component Cleaning

General Procedures

• WARNINGS:

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1700 bar (24,656 lb-sq-in). Failure to follow this instruction may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Place the vehicle in a well ventilated, quarantined area and arrange 'No Smoking/Petrol Fumes' signs about the vehicle.

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

Before using the cleaning fluid, protect all electrical components and connectors with lint-free non-flocking material.

Make sure that all parts removed from the vehicle are placed on the lint-free non-flocking material.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material.

Make sure that clean non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid, prior to starting work on the vehicle.

Use a steel topped workbench and cover it with clean, lint-free non-flocking material.

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

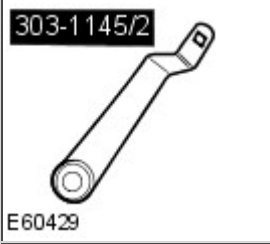

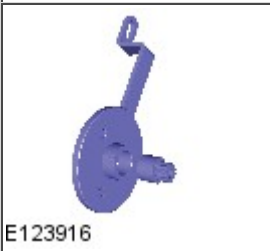

• NOTE: Pneumatic vacuum gun

1. Using a new brush that will not lose its bristles, brush cleaning fluid onto the components being removed and onto the surrounding area.
2. Using a pneumatic vacuum gun, remove all traces of cleaning fluid and foreign material.
3. Dispose of any used cleaning fluid and the brush after completing the repair.

Fuel Charging and Controls - Turbocharger - TDV6 3.0L Diesel - Turbocharger - Overview

Description and Operation

INTRODUCTION

The 3.0L V6 diesel engine uses two turbochargers; a fixed vane type (secondary) and a variable vane (primary) type. The fixed vane turbocharger is fitted to the **RH (right-hand)** cylinder bank and the variable vane turbocharger is fitted to the **LH (left-hand)** cylinder bank.

Both turbochargers are used in a parallel sequential turbocharging system which enables the engine to achieve quick throttle response at low engine speeds and efficient use of exhaust gas energy at high engine speeds.

The variable vane turbocharger has an **ECM (engine control module)** controlled electronic rotary actuator. The rotary actuator adjusts the turbine vanes to optimize the exhaust gas flow and velocity onto the turbine wheel to maintain the required boost pressure.

The parallel sequential turbocharging system comprises the two turbochargers and the **ECM**. The primary variable nozzle turbine operates through the entire engine speed range but is at its most efficient at engine speeds of up to 2800 rpm. At engine speeds above 2800 rpm under load, the fixed vane secondary turbine comes into operation, with both of the turbochargers now running in a parallel bi-turbo mode.

Fuel Charging and Controls - Turbocharger - TDV6 3.0L Diesel - Turbocharger - System Operation and Component Description

Description and Operation

System Operation

TURBOCHARGERS

The turbine wheel of the turbocharger uses the engine's exhaust gasses to drive the compressor wheel. The compressor wheel draws in fresh air which is supplied to the engine cylinders in a compressed form.

The primary variable vane turbocharger allows the optimum inlet geometry (inlet area and flow angle) to be used over a wide range of engine operating conditions. This allows a rapid speed of response and higher boost pressures at low engine speeds. The variable vane angle determines both the inlet area as well as the flow angle, as controlled by the [ECM \(engine control module\)](#). The variable vanes allow efficient use of the exhaust gas energy which in turn improves turbocharger and engine efficiency.

Principles of Variable Vane Operation

E107579

ItemDescription

A	Low engine speed
B	Intermediate engine speed
C	High engine speed
1	ECM
2	Electronic rotary actuator
3	Turbine housing
4	Variable vanes
5	Compressor wheel

The variable vanes in the primary turbocharger are controlled by the [ECM](#). The [ECM](#) controls a rotary electronic actuator attached to the primary turbocharger which is used to adjust the pitch angle of the vanes by rotating the turbine housing. The electronic rotary actuator also provides the [ECM](#) with a feedback signal to determine the pitch angle of the vanes.

The variable vanes in the primary turbocharger improve the exhaust gas power transfer to the turbine wheel which in turn drives the compressor wheel. At low engine speeds this greatly assists the increase in turbocharger boost pressure.

As engine speed, and therefore the exhaust gas velocity, increases, the vanes are opened. The amount of opening is determined by the [ECM](#) to ensure that the power transfer from the turbine wheel to the compressor wheel is within the turbocharger speed and boost pressure requirements.

At high engine speed and exhaust gas flow, the [ECM](#) increases the vane opening to avoid overspeed of the turbines and

provide a smooth high speed operation. At this point the dual mode boosting system comes into affect by utilizing the secondary (fixed vane) turbocharger.

The fixed vane turbocharger incorporates an outlet temperature sensor, which is located adjacent the oxygen sensor in the close coupled catalytic converter and, an outlet pressure sensor which receives inputs from the APP (accelerator pedal position) and ECM.

Refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Description and Operation).

Dual Mode Boosting

The dual mode boosting system comprises two turbochargers and software within the ECM. The two turbochargers can operate in two modes; mono turbocharger operation or bi-turbocharger operation.

Mono Turbocharger Schematic Diagram

Air filter

- 10 MAF (mass air flow) meter
- 11 Charge air cooler
- 12 Compressor shut-off valve
- 13 Recirculation valve

Fresh air is drawn through the air filter and the MAF meter to the primary turbocharger compressor. The compressed air is then passed through the charge air cooler and into the engine.

The turbine shut-off valve on the secondary turbocharger is closed and therefore exhaust gasses are unable to operate the secondary turbocharger turbine. In this condition all turbocharging boost pressure is produced by the primary turbocharger.

Bi-Turbocharger Switching Schematic Diagram

E107581

ItemDescription

- 6 Variable vane turbocharger
- 7 Engine
- 8 Throttle

Air filter

10 [MAF](#) meter

11 Charge air cooler

12 Compressor shut-off valve

13 Recirculation valve

When the engine operating parameters approach the limits (approximately 2800 rpm under load) of the primary turbocharger, dual mode boosting control software within the [ECM](#) begins the switch to parallel bi-turbocharger operation. The secondary turbocharger is brought into operation by the opening of the turbine shut-off valve which allows exhaust gasses to flow through the turbine.

Initially, the secondary turbocharger does not produce a boost pressure to equal that of the primary turbocharger. Therefore, the initial boost pressure from the secondary turbocharger is fed via the recirculation valve into the clean air inlet for the primary turbocharger. As the secondary turbocharger boost pressure output increases, the recirculation valve is then closed and the compressor shut-off valve is opened to increase the boost pressure from the secondary turbocharger which is directed into the charge air cooler.

Bi-Turbocharger Schematic Diagram

E107582

ItemDescription

1 Fixed vane turbine

2 Turbine shut-off valve

3 [DPF](#)

4 Flexible center resonators

5

Catalytic Converter
6 Variable vane turbocharger
7 Engine
8 Throttle
9 Air filter
10 MAF meter
11 Charge air cooler
12 Compressor shut-off valve
13 Recirculation valve

When the secondary turbocharger has reached the required operating parameters, the recirculation valve is closed and the compressor shut-off valve is opened. The [ECM](#) will maintain the engine operating in bi-turbocharger operation with both primary and secondary turbochargers contributing to the air charge induction. When the dual mode boosting software determines that the engine operating parameters no longer require the use of dual mode boosting, the system switches back to mono turbocharger operation.

If the engine idles for more than 3 minutes, the secondary turbocharger is actuated to ensure correct lubrication. This is achieved by pressurizing the turbine shaft bearing cavities through a pipe, which is connected to the air intake system and periodically opening the turbine shut-off valve to operate the turbocharger.

CAUTION: Ensure both ends of the pipe are securely connected to the secondary turbo and the air intake system to prevent damage to the turbo components.

Turbine and Compressor Shut-off Valve Control

The secondary turbocharger turbine shut-off valve and compressor shut-off valve are controlled by the [ECM](#) through a vacuum system. The secondary turbo turbine shut-off valve also incorporates a position sensor.

Secondary Turbocharger Turbine Shut-off Valve Vacuum Control

E117413

ItemDescription

1	Secondary turbine shut-off solenoid valve
2	Vacuum reservoir
3	Vacuum pump
4	Secondary turbine shut-off valve

If vacuum is lost to the shut-off valve it will default to the closed position. The position sensor will inform the [ECM](#), which will initiate mono-turbo mode, restricted performance and record [DTC \(diagnostic trouble code\)](#).

Compressor Shut-off Valve Vacuum Control

E117414

ItemDescription

1	Compressor shut-off valve solenoid valve
2	Vacuum reservoir
3	Vacuum pump

If the system develops a fault, for example an air leak, the compressor shut-off valve will default to the closed position. In the default position, mono-turbo operation and restricted engine torque is initiated.

• NOTE: When fault finding the vacuum system, always check for trapped/split/disconnected pipework. Any vacuum fault will cause the engine to default to limited torque mode.

Component Description

Each turbocharger consists of two turbo elements, a turbine wheel and compressor wheel, enclosed separately in cast housings and mounted on a common shaft, which rotates in two semi-floating bearings.

VARIABLE VANE TURBOCHARGER (PRIMARY)

The variable vane turbocharger is attached to the **LH (left-hand)** exhaust manifold and secured to 3 studs on a flange on the manifold with nuts. On production, no gasket is used to seal the joint between turbocharger and the manifold. In-service vehicles will require a service gasket to be fitted if the joint between the turbocharger and the manifold is disturbed.

A second flange on the turbocharger has 3 integral studs and provides for the attachment of the **LH** catalytic converter inlet pipe. Three nuts secure the inlet pipe to the flange studs and a gasket seals the joint between the components.

The compressor end of the turbocharger has two hose connections. The central connection provides a clean air supply from the air filter to the compressor. The second connection on the outside of the housing provides for a pipe connection from

the turbocharger to the charge air cooler

The turbocharger is a conventional design with both the turbine wheel and the compressor wheel sharing a common shaft which is supported on bearings. The turbocharger receives an engine oil feed via a pipe from the cylinder block. The pipe supplies both turbochargers with an oil supply for lubrication purposes. An oil drain pipe from the turbocharger allows oil to drain from the turbocharger into the cylinder block.

An integral bracket houses the variable vane electronic rotary actuator. The rotary actuator is connected to an eccentric lever which moves the turbine housing to adjust the position of the vanes. When the rotary actuator operates a boss is rotated, which in turn moves the lever and changes rotary motion into linear motion. The lever is connected to the outside of the turbine housing and the linear motion is converted back to rotary motion of the housing. Operation of the electronic rotary actuator is controlled by the [ECM](#).

FIXED VANE TURBOCHARGER (SECONDARY)

The fixed vane turbocharger is attached to the [RH \(right-hand\)](#) exhaust manifold and is secured to 3 studs on a flange on the manifold with nuts. On production, no gasket is used to seal the joint between turbocharger and the manifold. In-service vehicles will require a service gasket to be fitted if the joint between the turbocharger and the manifold is disturbed.

A second flange on the turbocharger has 2 integral studs and provides for the attachment of the [RH](#) exhaust system downpipe. Two nuts secure the downpipe to the flange studs and a gasket seals the joint between the downpipe and the turbocharger.

The compressor end of the turbocharger has two hose connections; the central connection provides the clean air supply from the air filter. The second connection on the outside of the turbocharger housing allows the connection from the turbocharger to the charge air cooler.

Attached to the rear of the turbocharger is a turbine shut-off valve. The valve is vacuum operated and electronically controlled by the [ECM](#). The valve is closed when the system is operating in mono-turbocharger mode, diverting exhaust gasses from the [RH](#) exhaust manifold, via the exhaust cross-over duct to the [LH](#) exhaust manifold. When bi-turbocharger operation is required, the [ECM](#) electronically operates the valve allow vacuum to open the shut-off valve allowing exhaust gasses from the [RH](#) exhaust manifold to drive the turbine of the fixed vane turbocharger.

Inspection and Verification

WARNING: The following tests may involve working in close proximity to hot components. Make sure adequate protection is used. Failure to follow this instruction may result in personal injury.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Intake air system ● Hose(s)/hose connections ● General engine condition. 	<ul style="list-style-type: none"> ● Circuit(s) ● Engine control module (ECM) ● Electrical connections and harnesses

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Poor performance	<ul style="list-style-type: none"> ● Low/Contaminated fuel ● Restricted air intake system ● General engine condition ● Engine control module failure 	Check the fuel level and condition. Check the air intake for restriction. Check the engine condition, compressions, etc. Refer to the relevant section of the workshop manual. Check for DTCs. Refer to the warranty policy and procedures manual if an engine control module is suspect.
No boost	<ul style="list-style-type: none"> ● Electrical connections and harnesses ● Restricted air intake system ● Charge air cooler restricted/leaking ● Engine control module failure 	Check the electrical connections and harnesses. Check the air intake for restriction/leakage (see visual inspection). Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if an engine control module is suspect.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Engine Control Module (PCM) 3.0L TdV6 (100-00, Description and Operation).

21. **⚠** WARNING: Make sure that new nuts are installed.

• CAUTIONS:

⚠ Discard the nuts.

⚠ Make sure that all openings are sealed. Use new blanking caps.

⚠ Make sure that the area around the component is clean and free of foreign material.

⚠ Install a new turbocharger to exhaust manifold gasket every time the turbocharger is removed.

• NOTE: Remove and discard the gasket.

Torque: 24 Nm

Installation

1. To install, reverse the removal procedure.
2. If a new unit is installed, configure the fixed vane turbocharger actuator using the approved diagnostic tool.

Fuel Charging and Controls - V6 4.0L Petrol - Fuel Charging and Controls

Description and Operation

Component Locations

E49725

Item	Part Number	Description
1	-	Throttle body
2	-	Intake manifold
3	-	Fuel rail
4	-	Fuel jump hose
5	-	Fuel injectors (6 of)

GENERAL

The major components of the fuel charging and control system comprise an intake manifold, a fuel pump, a fuel rail and six injectors. The fuel pump supplies fuel from the tank at a constant pressure, via a pipe routed along the underside of the vehicle, to the fuel rail. The fuel rail distributes the fuel equally to each of the six injectors.

INTAKE MANIFOLD

The intake manifold is located on top of the engine. The manifold is manufactured from a composite material with metal insert fixings. The manifold comprises a central chamber with six tracts leading to the inlet ports on the engine. For additional information, refer to: [Intake Air Distribution and Filtering](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Description and Operation).

FUEL PUMP

The submersible electric pump fuel pump and the fuel pressure regulator are located in the fuel tank. A pump module flange on top of the fuel tank allows access to the fuel pump for removal and installation.

The fuel pump, when running, outputs fuel at a constant pressure to the fuel rail. The pressure regulator controls the pressure. Excess fuel from the pressure regulator is directed to the front jet pump. The controlled pressure provides more fuel to the fuel rail than the maximum requirement of the engine; therefore a constant pressure is maintained in the rail under all operating conditions.

For additional information, refer to: [Fuel Tank and Lines](#) (310-01C Fuel Tank and Lines - V6 4.0L Petrol, Description and Operation).

The fuel pump is controlled by the ECM via a fuel pump relay, which is located in the Battery Junction Box (BJB).

When the ignition is switched to position II, the ECM provides an earth path for the coil of the fuel pump relay on pin 95 of ECM connector C0634. The relay is energised for a short period to pressurise the fuel system. When the ECM senses that the engine is being cranked by receipt of a valid signal from the Crankshaft Position (CKP) sensor, the ECM energises the fuel pump relay for as long as the engine is running.

For additional information, refer to: [Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol,

Description and Operation).

THROTTLE BODY

The throttle body is located centrally at the front of the intake manifold. The engine torque is controlled by the electronic throttle body. An electronic pedal assembly determines throttle opening. The signal from the pedal assembly is sent to the EMS and the throttle is opened to the correct angle by means of an electric motor integrated into the throttle body. Sensors in the throttle body are used to determine the position of the throttle plate and the rate of change in its angle. For additional information, refer to: [Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

FUEL RAIL

E 49726

Item	Part Number	Description
1	-	End cover
2	-	RH fuel rail
3	-	Fuel jump hose
4	-	Fuel supply pipe
5	-	LH fuel rail
6	-	Injector seat inserts
7	-	Schraeder valve
8	-	Injectors (6 of)

Each fuel rail maintains a constant fuel pressure of 4.5bar (65 psi) and is attached to each cylinder head with two bolts. Three fuel injectors are installed in each cylinder head and connected to the fuel rail. 'O' ring seals are used to seal the injectors in both the fuel rails and cylinder heads. A quick release coupling connects the feed pipe from the fuel tank to the fuel rail via the fuel jump hose.

A flange with two threaded holes on the rear of the LH and RH fuel rails provide attachment for the fuel supply pipe. The fuel supply pipe has two metal-flanged ends, which locate on the fuel rail. A seal prevents leakage and each flange is secured with two bolts.

A Schraeder valve is installed in the front end of the LH fuel rail to provide a pressure test connection for maintenance.

INJECTORS

Six injectors are held between the fuel rails and each cylinder head. The injectors are sealed to the fuel rail and cylinder head by 'O' ring seals, which should be renewed whenever an injector is refitted to an engine. A small amount of engine oil can be applied to the 'O' rings to aid installation. No other form of lubrication should be used. Each injector sits on an insert that also needs to be renewed each time an injector is replaced.

Each injector contains a solenoid-operated needle valve, which is closed while the solenoid winding is de-energised. The solenoid winding is connected to a power feed from the main relay and to an earth through the ECM. The ECM switches the earth to control the opening and closing of the needle valve. While the needle valve is open, fuel is sprayed into the cylinder inlet tract onto the back of the inlet valves. The ECM meters the amount of fuel injected by adjusting the time that the needle valve is open.

For additional information, refer to: [Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

Fuel Charging and Controls - V6 4.0L Petrol - Fuel Charging and Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the fuel charging and controls system and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Fuel Charging and Controls](#) (303-04E Fuel Charging and Controls - V6 4.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fuel leaks ● Damaged fuel lines ● Damaged push connect fittings ● Fuel level ● Fuel contamination/grade/quality ● Throttle body ● Damaged fuel tank filler pipe cap ● Damaged fuel tank filler pipe 	<ul style="list-style-type: none"> ● Fuses ● Inertia switch ● Loose or corroded electrical connectors ● Harnesses ● Sensor(s) ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Fuel Charging and Controls - V6 4.0L Petrol - Fuel Pressure Regulator

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the intake manifold.
For additional information, refer to: Intake Manifold Assembly (303-04, Removal and Installation).
3. Remove the fuel pressure regulator.
 - Remove the 2 Torx bolts.
 - Remove and discard the O-ring seal.

E47659

Installation

1. Install the fuel pressure regulator.
 - Clean the component mating faces.
 - Install a new O-ring seal.
 - Tighten the bolts to 6 Nm (4 lb.ft).
2. Install the intake manifold.
For additional information, refer to: Intake Manifold Assembly (303-04, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Fuel Charging and Controls - V6 4.0L Petrol - Fuel Rail

Removal

• WARNINGS:

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the intake manifold.
For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
3. Release the fuel supply line.
 - Remove the bolt.

4.  **WARNING:** The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

Using the special tool, disconnect the fuel line.

- Position an absorbent cloth to collect fluid spillage.
- Depress the quick release connector.

5.  **WARNING:** The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

Remove the fuel rail.

- Remove the 4 bolts.
- Position an absorbent cloth to collect fluid spillage.

6. Release and remove the fuel injectors.
 - Remove and discard the fuel injector O-ring seals.

7. Remove the schraeder valve.
 - Remove the 2 Torx bolts.
 - Discard the O-ring seal.

E47665

Installation

1. Install the schraeder valve.
 - Clean the component mating faces.
 - Install a new O-ring seal.
 - Tighten the bolts to 6 Nm (4 lb.ft).
2. Clean the components.
3. Install the fuel rail.
 - Install fuel injector O-ring seals.
 - Lubricate the O-ring seals.
 - Tighten the bolts to 25 Nm (18 lb.ft).
4. Connect the fuel line to the fuel rail.
 - Clean the component mating faces.
 - Install the clip.
 - Tighten the bolt to 6 Nm (4 lb.ft).
5. Install the intake manifold.
 For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
6. Connect the battery ground cable.
 For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Fuel Charging and Controls - V6 4.0L Petrol - Throttle Body Gasket

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the air intake resonator.
For additional information, refer to: [Intake Air Resonator](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Removal and Installation).
4. Remove the throttle body.

- Remove the 4 bolts.
- Remove and discard the throttle body gasket.

Installation

1. Install the throttle body.
 - Clean the components.
 - Install a new gasket.
 - Tighten the 4 bolts to 10 Nm (7 lb.ft).
2. Install the air intake resonator.
For additional information, refer to: [Intake Air Resonator](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Removal and Installation).
3. Install the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Fuel Charging and Controls - V8 5.0L Petrol - Fuel Charging and Controls

Description and Operation

COMPONENT LOCATION

E122433

Item	Part Number	Description
1	-	Crossover tube
2	-	LH (left hand) fuel rail
3	-	Fuel injector (8 off)
4	-	HP (high pressure) fuel lines
5	-	HP fuel pumps and covers
6	-	LP (low pressure) fuel lines
7	-	FRP (fuel rail pressure) sensor
8	-	RH (right hand) fuel rail

INTRODUCTION

The fuel charging and controls system is a gasoline DI (direct injection) system controlled by the [ECM \(engine control module\)](#).

The fuel charging and controls system consists of:

- LP and HP fuel lines.
- Two HP fuel pumps.

- Two fuel rails and a crossover tube.
- A FRP (fuel rail pressure) sensor.
- Eight fuel injectors.

LP fuel from the pump in the fuel tank is pressurized by the HP fuel pumps and supplied to the fuel injectors via the fuel rails and crossover tube. The ECM controls the fuel injectors and HP fuel pumps to inject the required volume of fuel into the combustion chambers.

LOW AND HIGH PRESSURE FUEL LINES

E122675

Item	Part Number	Description
A	-	LP fuel lines
B	-	HP fuel lines
1	-	Acoustic cover
2	-	Heat reflective and insulation sleeves

The LP fuel line connects the HP fuel pumps to the fuel delivery line from the fuel tank and lines system. A quick release connector at the start of the LP fuel line is held in a clip integrated into the LH (left-hand) ignition coils cover. P-clips secure the LP fuel line to the rear of each cylinder head and to the RH (right-hand) side of the cylinder block. A heat reflective and insulation sleeves are installed on the LP fuel line where it runs behind the RH exhaust manifold.

The HP fuel lines connect the HP fuel pumps to the RH fuel rail and the crossover tube. Two P-clips and a pipe clamp attach the HP fuel lines to the cylinder block and the RH cylinder head respectively. An integral bracket on the front HP fuel line is attached to a stud on the front-upper RH timing cover. An acoustic cover is installed on the bottom of the front HP fuel line.

HIGH PRESSURE FUEL PUMPS

E114701

Item	Part Number	Description
1	-	Crankshaft
2	-	Auxiliary drive chain
3	-	Auxiliary camshaft
4	-	Tappet
5	-	HP fuel pump
6	-	Acoustic cover

The two HP fuel pumps are identical mechanically-driven pumps installed on the **RH** side of the sump body, behind the generator. An O-ring seals each of the HP fuel pumps in the sump body. The front HP fuel pump is identified as No. 1 pump; the rear HP fuel pump is identified as No. 2 pump. An acoustic cover is installed on each of the HP fuel pumps.

The HP fuel pumps are single-plunger pumps. The plunger of each pump extends through the sump body and the carrier of the auxiliary camshaft. A tappet on the end each plunger is operated by a two-lobe cam on the auxiliary camshaft. A spring installed on the outside of the plunger ensures the plunger and tappet remain in contact with the cam.

The auxiliary camshaft is driven by the crankshaft, via the auxiliary drive chain, at engine speed. The auxiliary camshaft is timed to match the pump delivery strokes with crankshaft position.

HP Fuel Pump Schematic

E113516

Item	Part Number	Description
1	-	PRV (pressure relief valve)
2	-	To HP fuel lines
3	-	Check valve
4	-	Plunger
5	-	From LP fuel lines
6	-	Damper chamber
7	-	Fuel metering valve

In addition to the plunger, each HP fuel pump contains:

- A damper chamber
- A fuel metering valve
- A check valve
- A PRV.

The damper absorbs pressure pulses from the plunger when the fuel metering valve is open at the start of the delivery stroke.

The fuel metering valve regulates the output pressure from the HP fuel pump. The fuel metering valve is a normally open solenoid valve controlled by the [ECM](#). During the inlet stroke of the plunger the fuel metering valve is de-energized, which allows LP fuel into the pumping chamber. The [ECM](#) energizes the fuel metering valve closed during the delivery stroke of the plunger, which forces the fuel in the pumping chamber through the check valve into the HP lines. By changing the closing point of the fuel metering valve, the [ECM](#) can determine the volume of fuel output during the delivery stroke, and thus the pressure in the HP side of the system.

The check valve prevents the return of HP fuel to the pumping chamber during the inlet stroke of the plunger.

The PRV protects the HP side of the system from excessive pressure if there is a failure of the fuel metering valve. If the pump delivery pressure increases to 195 - 204 bar (2828 - 2959 lbf/in²), the PRV opens and returns fuel to the inlet side of the plunger.

FUEL RAILS AND CROSSOVER TUBE

E113522

Item	Part Number	Description
1	-	LH fuel rail
2	-	Crossover tube
3	-	Fuel injector
4	-	RH fuel rail
5	-	FRP sensor

The fuel rails and crossover tube are made from stainless steel. Bolts attach each fuel rail to the related cylinder head. The crossover tube connects the front high pressure line to the [LH](#) fuel rail, which ensures there is equal pressure in the two fuel rails. Two P-clips attach the crossover tube to the intake manifold.

The rear of the [RH](#) fuel rail incorporates a threaded boss for installation of the [FRP](#) sensor.

FUEL RAIL PRESSURE SENSOR

E113518

The [FRP](#) sensor provides the [ECM](#) with a continuous signal of fuel rail pressure. The [FRP](#) sensor is installed in the rear of the [RH](#) fuel rail. The [FRP](#) sensor is screwed into a threaded boss in the fuel rail. A flying lead and three pin connector provides the interface with the engine harness.

The [FRP](#) sensor contains a steel diaphragm fitted with strain gages, which are incorporated into a Wheatstone bridge. The output from the Wheatstone bridge is processed by the [ECM](#) to derive a pressure value.

FUEL INJECTORS

The fuel injectors spray fuel from the fuel rail directly into the combustion chambers. The fuel injectors are installed close to the center of the combustion chambers, between the inlet and exhaust valves and next to the spark plug.

The fuel injectors are a push fit in the fuel rails and the cylinder heads. On each fuel injector, a rubber O-ring seals the head of the fuel injector in the fuel rail. A teflon ring seals the nozzle of the fuel injector in the cylinder head. A clamp locks each fuel injector to the fuel rail.

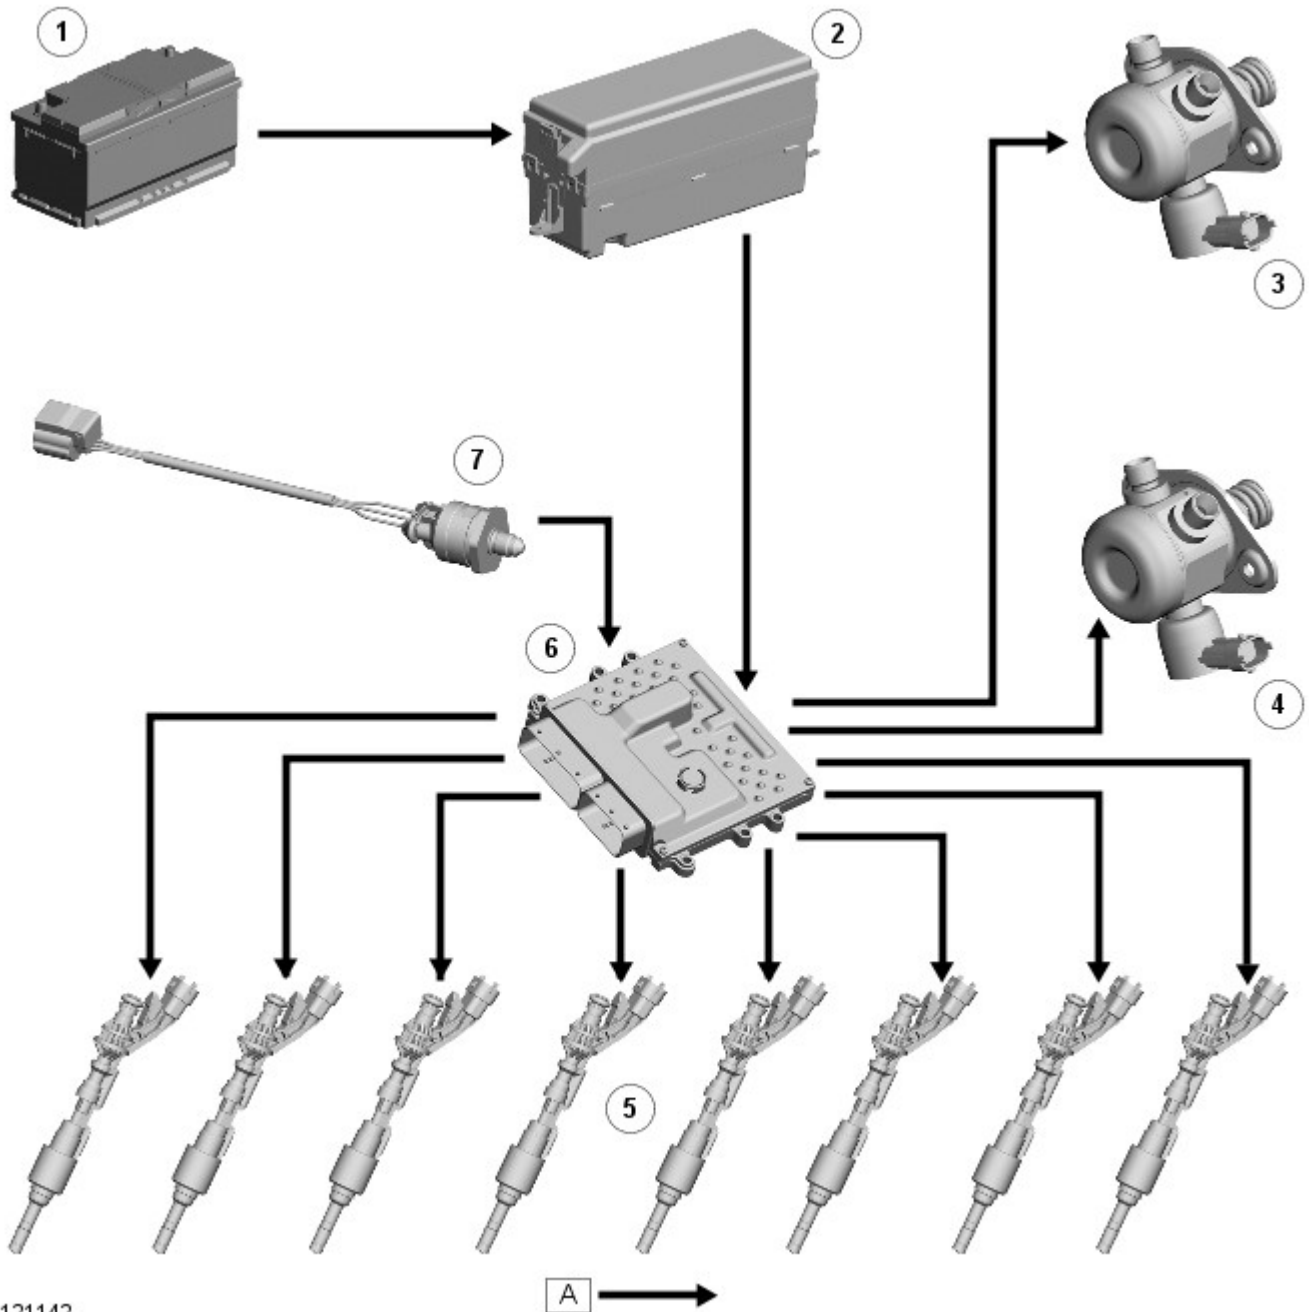

Each fuel injector contains a solenoid-operated needle valve, which opens when the solenoid winding is energized. While the needle valve is open, fuel is sprayed into the combustion chamber. The solenoid winding is connected to a power feed and a ground from the [ECM](#), which operates the fuel injectors with a two stage power supply. Initially the [ECM](#) supplies the fuel injectors with 65 V, then once the boost current reaches 11 A the power supply is switched to battery voltage. The [ECM](#) meters the amount of fuel injected into the combustion chambers by adjusting the time that the solenoid winding is energized.

There are six holes around the tip of the nozzle through which the fuel is sprayed. Two of the holes direct fuel below the spark plug. The other four holes direct fuel evenly around the remainder of the combustion chamber.

If a fuel injector fails, the engine will suffer from unstable idle speed, poor [NVH \(noise, vibration and harshness\)](#) and poor emissions performance.

CONTROL DIAGRAM

- NOTE: A = Hardwired

E121142

Item	Part Number	Description
1	-	Battery
2	-	EJB (engine junction box) (ECM relay)
3	-	No. 1 HP fuel pump
4	-	No. 2 HP fuel pump
5	-	Fuel injectors
6	-	ECM
7	-	FRP sensor

PRINCIPLES OF OPERATION

The [ECM](#) controls the output from the HP fuel pumps to deliver the required volume of fuel at pressures up to 150 bar (2175 lbf/in²).

The [ECM](#) also uses the signal from the [FRP](#) sensor to calculate the time the fuel injectors need to be energized to deliver the correct mass of fuel to the combustion chambers.

Fuel Charging and Controls - V8 5.0L Petrol - Fuel Charging and Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the fuel charging and controls system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Fuel Charging and Controls](#) (303-04F Fuel Charging and Controls - V8 5.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fuel level ● Fuel leaks ● Damaged fuel lines ● Damaged push connect fittings ● Fuel contamination/grade/quality ● Throttle body ● Damaged fuel tank filler pipe cap ● Damaged fuel tank filler pipe 	<ul style="list-style-type: none"> ● Fuses ● Loose or corroded electrical connectors ● Harnesses ● Sensor(s) ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not fire	<ul style="list-style-type: none"> ● Engine breather system disconnected/restricted ● Ignition system ● Fuel system ● Electronic engine control 	Ensure the engine breather system is free from restriction and is correctly installed. Check for ignition system, fuel system and electronic engine control DTCs and refer to the relevant DTC Index
Engine cranks and fires, but will not start	<ul style="list-style-type: none"> ● Evaporative emissions purge valve ● Fuel pump ● Spark plugs ● HT short to ground (tracking) check rubber boots for cracks/damage ● Ignition system 	Check for evaporative emissions, fuel system and ignition system related DTCs and refer to the relevant DTC Index
Difficult cold start	<ul style="list-style-type: none"> ● Engine coolant level/anti-freeze content ● Battery ● Electronic engine controls ● Exhaust Gas Recirculation (EGR) valve stuck open ● Fuel pump ● Purge valve 	Check the engine coolant level and condition. Ensure the battery is in a fully charged and serviceable condition. Check for electronic engine controls, engine emissions, fuel system and evaporative emissions system related DTCs and refer to the relevant DTC Index
Difficult hot start	<ul style="list-style-type: none"> ● Injector leak ● Electronic engine control ● Purge valve ● Fuel pump ● Ignition system ● EGR valve stuck open 	Check for injector leak, install new injector as required. Check for electronic engine controls, evaporative emissions, fuel system, ignition system and engine emission system related DTCs and refer to the relevant DTC Index
Difficult to start after hot soak (vehicle standing, engine off, after engine has reached operating temperature)	<ul style="list-style-type: none"> ● Injector leak ● Electronic engine control ● Purge valve ● Fuel pump ● Ignition system ● EGR valve stuck open 	Check for injector leak, install new injector as required. Check for electronic engine controls, evaporative emissions, fuel system, ignition system and engine emission system related DTCs and refer to the relevant DTC Index

Symptom	Possible Causes	Action
Engine stalls soon after start	<ul style="list-style-type: none"> ● Breather system disconnected/restricted ● ECM relay ● Electronic engine control ● Ignition system ● Air intake system restricted ● Air leakage ● Fuel lines 	Ensure the engine breather system is free from restriction and is correctly installed. Check for electronic engine control, ignition system and fuel system related DTCs and refer to the relevant DTC Index. Check for blockage in air filter element and air intake system. Check for air leakage in air intake system
Engine hesitates/poor acceleration	<ul style="list-style-type: none"> ● Fuel pressure, fuel pump, fuel lines ● Injector leak ● Air leakage ● Electronic engine control ● Throttle motor ● Restricted accelerator pedal travel (carpet, etc) ● Ignition system ● EGR valve stuck open ● Transmission malfunction 	Check for fuel system related DTCs and refer to the relevant DTC Index. Check for injector leak, install new injector as required. Check for air leakage in air intake system. Ensure accelerator pedal is free from restriction. Check for electronic engine controls, ignition, engine emission system and transmission related DTCs and refer to the relevant DTC Index
Engine backfires	<ul style="list-style-type: none"> ● Fuel pump/lines ● Air leakage ● Electronic engine controls ● Ignition system ● Sticking variable camshaft timing (VCT) hub 	Check for fuel system failures. Check for air leakage in intake air system. Check for electronic engine controls, ignition system and VCT system related DTCs and refer to the relevant DTC Index
Engine surges	<ul style="list-style-type: none"> ● Fuel pump/lines ● Electronic engine controls ● Throttle motor ● Ignition system 	Check for fuel system failures. Check for electronic engine controls, throttle system and ignition system related DTCs and refer to the relevant DTC Index
Engine detonates/knocks	<ul style="list-style-type: none"> ● Fuel pump/lines ● Air leakage ● Electronic engine controls ● Sticking VCT hub 	Check for fuel system failures. Check for air leakage in intake air system. Check for electronic engine controls and VCT system related DTCs and refer to the relevant DTC Index
No throttle response	<ul style="list-style-type: none"> ● Electronic engine controls ● Throttle motor 	Check for electronic engine controls and throttle system related DTCs and refer to the relevant DTC Index
Poor throttle response	<ul style="list-style-type: none"> ● Breather system disconnected/restricted ● Electronic engine control ● Transmission malfunction ● Traction control event ● Air leakage 	Ensure the engine breather system is free from restriction and is correctly installed. Check for electronic engine controls, transmission and traction control related DTCs and refer to the related DTC Index. Check for air leakage in intake air system

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - V8 5.0L Petrol, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Fuel Charging and Controls - V8 5.0L Petrol - Fuel Injection Component Cleaning

General Procedures

General Equipment

Pneumatic vacuum gun

Cleaning

• WARNINGS:

Do not carry out any repairs to the fuel system with the engine running. Failure to follow this instruction may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Place the vehicle in a well ventilated, quarantined area and arrange 'No Smoking/Petrol Fumes' signs about the vehicle.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

Before using the cleaning fluid, protect all electrical components and connectors with lint-free non-flocking material.

Make sure that all parts removed from the vehicle are placed on the lint-free non-flocking material.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material.

Make sure that clean non-plated tools are used. Clean tools using a new brush that will not lose its bristles, prior to starting work on the vehicle.

Use a steel topped workbench and cover it with clean, lint-free non-flocking material.

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

1. Using a new brush that will not lose its bristles, brush the components being removed and the surrounding area.
2. Using a pneumatic vacuum gun, remove all traces of foreign material.

General Equipment: [Pneumatic vacuum gun](#)

General Procedures

Cleaning

• WARNINGS:

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Place the vehicle in a well ventilated, quarantined area and arrange 'No Smoking/Petrol Fumes' signs about the vehicle.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material.

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

Before using the cleaning fluid, protect all electrical components and connectors with lint-free non-flocking material.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  CAUTION: Make sure the correct additive is used in this step. Failure to carry out this instruction may cause damage to the vehicle.
 - Open the fuel filler door and remove the cap.
 - Empty the fuel additive into the fuel filler pipe.
 - Install the fuel filler cap and close the fuel filler door.
2. Refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Release the breather from the air intake elbow.

E138648

4.  CAUTION: Make sure the correct additive is used in this step. Failure to carry out this instruction may cause damage to the vehicle.

Install the cleaning equipment to a suitable location under the hood.

E138649

E138651

- 5.
- Remove the cleaning equipment filler cap.
 - Empty the induction system cleaning fluid into the cleaning equipment.
 - Install the filler cap.

E138650

6. Position the intake system cleaning tool into intake elbow and secure with the clamp.

E138652

- 7.
- Connect a suitable compressed air line to the cleaning equipment.
 - Set the pressure to 4 bar.

8. Start and run the engine.

9.

- Open the ball valve on the cleaning equipment and allow the cleaning fluid to spray into the intake elbow.
- Raise the engine speed to 1200 rpm and hold until the cleaning fluid spray has stopped.

E138653

10.

- Close the ball valve.
- Release the air pressure in the cleaning equipment.
- Disconnect the air line.

11. Connect the breather to the air intake elbow.

E138648

12. Refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornammentation, Removal and Installation).

13.

- Start the engine.
- Allow the engine to idle for 30 seconds.

- Raise the engine speed to 1500 rpm and hold for 3 minutes until a temperature of 70°C is achieved.
- Allow the engine to idle for 30 seconds.
- Switch off the engine.

14. Connect the approved diagnostic equipment to the vehicle.

15. Follow on screen prompts and check for DTC's (Diagnostic Trouble Codes).

16. Clear the DTC's following the on screen procedure.

17. Disconnect the approved diagnostic equipment from the vehicle.

Removal and Installation

Removal

• CAUTIONS:

Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Make sure that tools and equipment are clean, free of foreign material and lubricant.

• NOTE: Removal steps in this procedure may contain installation details.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Refer to: [Petrol and Petrol-Ethanol Fuel Systems Health and Safety Precautions](#) (100-00 General Information, Description and Operation).
2. Refer to: [Fuel System Pressure Release - V8 5.0L Petrol](#) (310-00 Fuel System - General Information, General Procedures).
3. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-01 Battery, Mounting and Cables, Specifications).

4. Refer to: [Engine Oil Draining and Filling](#) (303-01D Engine - V8 5.0L Petrol, General Procedures).

5.  CAUTION: Be prepared to collect escaping fluids.

Fuel Charging and Controls - V8 5.0L Petrol - Throttle Body

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Refer to: [Air Cleaner Outlet Pipe T-Connector](#) (303-12D Intake Air Distribution and Filtering - V8 5.0L Petrol, Removal and Installation).

2. **2.** NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

3. **3.** NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Torque: 17 Nm

4. **4. CAUTIONS:**

 Do not attempt to clean the throttle body bore, build up of deposits reduces air leakage past the throttle plate at the fully closed position.

 Be prepared to collect escaping fluids.

- NOTE: Clamp the hose to minimize coolant loss.

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Installation

1. To install, reverse the removal procedure.
2. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptations.

Accessory Drive - TDV6 2.7L Diesel -**Torque Specifications**

Description	Nm	lb-ft
Accessory drive belt tensioner pulley Torx bolt	25	18
Accessory drive belt tensioner retaining bolt	45	33
Accessory drive belt idler retaining bolt	45	33
Fuel injection high pressure pump drive belt tensioner	25	18
EGR coolant cross over pipe	22	16

Accessory Drive - TDV6 2.7L Diesel - Accessory Drive

Description and Operation

E50593

Item	Part Number	Description
1	-	Generator
2	-	Engine cooling fan
3	-	Tensioner assembly
4	-	Accessory drive belt
5	-	Engine coolant pump
6	-	Power steering pump
7	-	A/C compressor
8	-	Torsional vibration damper
9	-	Tensioner assembly

The engine crankshaft pulley drives the accessory components, which comprise the torsional vibration damper, generator, power steering pump, A/C compressor and coolant pump, via the accessory drive belt.

The belt, which is maintenance free poly-V type belts, are automatically pre-loaded by the tensioning rollers and are routed over deflection pulleys in order to maintain sufficient adhesion about the drive wheels. This ensures slip-free drive of the accessory components.

Accessory Drive - TDV6 2.7L Diesel - Accessory Drive

Diagnosis and Testing

Principles of Operation

For a detailed description of the accessory drive system and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Accessory Drive](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> ● Drive belt condition (cracking/damage/contamination) ● Idler assembly ● Generator ● Engine cooling fan ● Tensioner assembly ● Engine coolant pump ● Power steering pump ● Air Conditioning (A/C) compressor ● Torsional vibration damper ● Dynamic response pump ● Tensioner assembly ● Accessory drive belt ● Security/Correct installation of the fuel injection pump cover ● Fuel injection pump belt condition (cracking/damage/contamination) ● Fuel injection pump belt tensioner assembly ● Fuel injection pump ● Fuel injection pump belt

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

CAUTION: If the engine is run without the accessory drive belts connected to eliminate driven components, diagnostic trouble codes, (DTCs) may be set which must be cleared before the vehicle is returned to the owner. The engine should not be run for more than 2-3 minutes with the belts disconnected. Failure to follow this instruction may result in damage to the vehicle.

4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart (accessory drive belt)

Symptom	Possible Causes	Action
Noise	<ul style="list-style-type: none"> ● Belt condition ● Belt tension ● Pulleys misaligned ● Driven components (including tensioners) 	Check the belt condition (see visual inspection). Check the tensioner function. Check the pulley alignment. Check the driven components for excessive resistance to rotation. Rectify as necessary.
Drive belt does not hold tension	<ul style="list-style-type: none"> ● Belt condition ● Tensioner fault 	Check the belt condition (see visual inspection). Check the tensioner function. Rectify as necessary.

Symptom Chart (fuel injection pump belt)

Symptom	Possible Causes	Action
Noise	<ul style="list-style-type: none"> ● Belt condition ● Belt fouling cover ● Tensioner bearing failure ● Fuel injection pump failure 	Check the belt condition (see visual inspection). Check the belt cover for indications of fouling (this may indicate a pump misalignment), refer to the relevant workshop manual section. The belt tensioner must be renewed if the belt is removed, making a check of the bearing impractical. Remove the belt, check the fuel injection pump pulley for security. Check the fuel injection pump for excessive resistance to rotation (excessive resistance in the pump will cause the pulley securing nut to loosen as a design feature). Check for diagnostic trouble codes (DTCs) indicating a pump malfunction.

Symptom	Possible Causes	Action
Drive belt does not hold tension	<ul style="list-style-type: none"> ● Belt condition ● Tensioner fault 	Check the belt condition (see visual inspection). Check the tensioner function. Rectify as necessary.
Loss of drive (with no drive to the fuel injection pump, the engine will not run)	<ul style="list-style-type: none"> ● Belt broken/stripped teeth ● Drive pulleys loose 	Investigate the cause of the belt breakage/damage (a belt broken at a 45 degree angle normally indicates a shear, a break straight across the belt normally indicates that the belt has been crimped). Check the fuel injection pump for excessive resistance to rotation (excessive resistance in the pump will cause the pulley securing nut to loosen as a design feature). Check for DTCs indicating a pump malfunction.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Accessory Drive - TDV6 2.7L Diesel - Fuel Injection Pump Belt VIN Range:

SALLA000304->END OF 06 MY

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3.  WARNING: The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

Disconnect the two fuel lines.

- Install blanking caps to the exposed ports.

E54441

4. Clamp the exhaust gas recirculation (EGR) coolant hoses to minimize coolant loss.

E53902

5. Disconnect the coolant hoses.

- Release the clips.

E53903

6. Remove the EGR coolant cross-over pipe.

- Remove the two retaining bolts.

E56136

7. Remove the fuel injection pump belt cover.

- Reposition the fuel charging wiring harness to allow access to the fuel injection pump belt cover.

E54442

8. NOTE: The fuel injection pump belt is not timed to the engine.

Remove and discard the fuel injection pump belt tensioner.

- Remove the retaining bolt.

E54443

9. NOTE: The fuel injection pump rotates in a counter-clockwise direction when viewed from the rear of the engine.

Remove and discard the fuel injection pump belt.

E54444

Installation

- 1. ⚠ CAUTION:** Do not install the new fuel injection pump belt to the pulleys with the fuel pump belt tensioner installed. Failure to follow this instruction may result in damage to the fuel pump

belt.

- NOTE: The fuel injection pump rotates in a counter-clockwise direction when viewed from the rear of the engine.

Install the new fuel injection pump belt.

2.  CAUTION: Make sure that the fuel injection pump belt tensioner tang is correctly located to the fuel injection pump belt rear cover. Failure to follow this instruction may result in damage to the engine.

Install a new fuel injection pump belt tensioner.

- Locate the tang on the new fuel injection pump belt tensioner into the fuel injection pump rear cover.
 - Tighten to 25 Nm (18 lb.ft).
 - Remove and discard the fuel injection pump belt tensioner locking pin.
3. Install the fuel injection pump belt cover.
- Reposition the fuel charging wiring harness back onto the diverter rail.
4. Install the EGR coolant cross-over pipe.
- Install the two retaining bolts.
 - Tighten the bolts to 22 Nm (16 lb.ft).
5. Connect the coolant hoses.
- Remove the hose clamps.
6. Attach the fuel lines.
- Connect the two fuel lines.
 - Remove the blanking caps from the ports.
7. Install the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
8. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
9. Check and top-up the coolant.

Accessory Drive - TDV6 2.7L Diesel - Fuel Injection Pump Belt VIN Range: 07 MODEL YEAR->CURRENT

Removal and Installation

Removal

• WARNINGS:

-  Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
-  Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.
-  Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
-  This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

-  Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.
-  Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
-  Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
-  Do not disassemble or clean inside the fuel pump, even with an ultrasonic cleaner. Always install a new fuel pump when required.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Clamp the exhaust gas recirculation (EGR) coolant hoses to minimize coolant loss.

4. Disconnect the coolant hoses.

- Release the clips.

5. Remove the EGR coolant cross-over pipe.

- Remove the two retaining bolts.

6. Remove the injector sound proofing.

- Remove the 2 clips.

7. Release the knock sensor (KS) harness from the valve cover.

8. Release the glow plug harness from the valve cover.

9. Disconnect the fuel injector electrical connectors.

10. Release the engine wiring harness.

- Release the four clips.

11. Release the fuel charging wiring harness.

- Release the 3 clips.
- Remove the 2 nuts.

12. Disconnect the breather line.

- Release the clip.

13. Remove the fuel injection pump belt cover.

- Reposition the engine wiring harness to allow access to the fuel injection pump belt cover.
- Release the 3 clips.

14. NOTE: The fuel injection pump rotates in a counter-clockwise direction when viewed from the rear of the engine.

Cut off and discard the fuel injection pump belt.

15. NOTE: The fuel injection pump belt is not timed to the engine.

Remove and discard the fuel injection pump belt tensioner.

- Remove and discard the bolt.

Installation

E81861

1.  CAUTION: Make sure that the fuel injection pump belt tensioner tang is correctly located to the fuel injection pump belt rear cover. Failure to follow this instruction may result in damage to the engine.

• NOTE: Do not remove the fuel injection pump belt tensioner locking pin at this stage.

Install a new fuel injection pump belt tensioner.

- Clean the components mating faces.
- Locate the tang on the new fuel injection pump belt tensioner into the fuel injection pump rear cover.
- Tighten the bolt to 25 Nm (18 lb.ft).

2.  CAUTION: Do not install the new fuel injection pump belt to the pulleys with the fuel pump belt tensioner locking pin removed. Failure to follow this instruction may result in damage to the fuel pump belt.

• NOTE: The fuel injection pump rotates in a counter-clockwise direction when viewed from the rear of the engine.

Install the new fuel injection pump belt.

- Make sure the components are clean and dry.

3. Remove and discard the fuel injection pump belt tensioner locking pin.

4. Install the fuel injection pump belt cover.
 - Secure with the 3 clips.
 - Reposition the engine wiring harness to allow access to the fuel injection pump belt cover.
5. Attach the fuel charging wiring harness.
 - Secure with the 3 clips.
 - Tighten the nuts to 10 Nm (7 lb.ft).
6. Secure the engine wiring harness.
7. Connect the fuel injector electrical connectors.
8. Secure the glow plug wiring harness.
9. Secure the KS wiring harness.
10. Install the injector sound proofing.
 - Secure with the 2 clips.
11. Connect the breather line.
 - Secure with the clip.
12. Install the EGR coolant cross-over pipe.
 - Install the two retaining bolts.
 - Tighten to 13 Nm (10 lb.ft).
13. Connect both EGR coolant cross-over pipe hoses.
 - Remove the EGR coolant hose clamps.
14. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
15. Check and top-up the coolant.

Accessory Drive - TDV6 2.7L Diesel - Accessory Drive Belt

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the cooling fan.
For additional information, refer to: [Cooling Fan](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
3. **NOTE:** Using a 3/8 square drive wrench, rotate the tensioner counter clockwise.

Remove the accessory drive belt.

- Release the tension from the belt.

Installation

1. To install, reverse the removal procedure.
 - Clean and inspect the drive pulleys for damage.

Accessory Drive - TDV6 2.7L Diesel - Accessory Drive Belt Tensioner

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).
3. Remove the accessory drive belt tensioner.
 - Remove the bolt.

E48480

4. Remove the accessory drive belt tensioner pulley.
 - Remove the Torx bolt.

E48481

Installation

1. Install the accessory drive belt tensioner pulley.
 - Clean the components.
 - Tighten the bolt to 25 Nm (18 lb.ft).
2. Install the accessory drive belt tensioner.
 - Clean the components.
 - Tighten the bolt to 45 Nm (33 lb.ft).
3. Install the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

Accessory Drive - TDV6 3.0L Diesel - Accessory Drive - Overview

Description and Operation

OVERVIEW

The crankshaft pulley drives a six ribbed poly V belt which in turn drives all of the engine mounted accessories.

Accessory Drive - TDV6 3.0L Diesel - Accessory Drive - System Operation and Component Description

Description and Operation

System Operation

OPERATION

The crankshaft pulley is attached to and rotates with the crankshaft. The pulley provides the drive for the accessory drive vee belt which in turn provides rotational power for the front mounted accessories such as the generator, power steering pump, coolant pump and the [A/C \(air conditioning\)](#) compressor.

The crankshaft pulley is a combined pulley and torsional vibration damper.

Component Description

DESCRIPTION

The accessory drive belt, which is a maintenance free poly-V type belt, is automatically pre-loaded by the belt tensioner and routed over idlers in order to maintain sufficient friction around the drive wheels. This ensures slip-free drive of the accessory components.

The torsional vibration damper incorporates compressed rubber between its inner and outer diameters to reduce peak levels of torsional vibration within the crankshaft.

The belt tensioner is calibrated to provide the correct amount of tension to the belt for a given drive system. Unless a spring within the tensioner assembly breaks, or some other mechanical part of the tensioner fails, there is no need to check the tensioner for correct tension.

The accessory drive belt should be inspected at every routine service for excessive wear and damage.

The belt tensioner consists of an idler pulley, which is free to rotate on a bearing located at the end of a spring-loaded pivot arm.

Accessory Drive - TDV6 3.0L Diesel - Accessory Drive

Diagnosis and Testing

Principles of Operation

For a detailed description of the accessory drive system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (303-05B Accessory Drive - TDV6 3.0L Diesel)

[Accessory Drive](#) (Description and Operation),
[Accessory Drive](#) (Description and Operation),

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> ● Drive belt condition (cracking/damage/contamination) ● Idler assembly ● Generator ● Engine cooling fan ● Tensioner assembly ● Engine coolant pump ● Power steering pump ● Air Conditioning (A/C) compressor ● Torsional vibration damper ● Dynamic response pump ● Tensioner assembly ● Accessory drive belt ● Security/Correct installation of the fuel injection pump cover ● Fuel injection pump belt condition (cracking/damage/contamination) ● Fuel injection pump belt tensioner assembly ● Fuel injection pump ● Fuel injection pump belt

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

CAUTION: If the engine is run without the accessory drive belts connected to eliminate driven components, diagnostic trouble codes, (DTCs) may be set which must be cleared before the vehicle is returned to the owner. The engine should not be run for more than 2-3 minutes with the belts disconnected. Failure to follow this instruction may result in damage to the vehicle.

4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart (accessory drive belt)

Symptom	Possible Causes	Action
Noise	<ul style="list-style-type: none"> ● Belt condition ● Belt tension ● Pulleys misaligned ● Driven components (including tensioners) 	Check the belt condition (see visual inspection). Check the tensioner function. Check the pulley alignment. Check the driven components for excessive resistance to rotation. Rectify as necessary.
Drive belt does not hold tension	<ul style="list-style-type: none"> ● Belt condition ● Tensioner fault 	Check the belt condition (see visual inspection). Check the tensioner function. Rectify as necessary.

Symptom Chart (fuel injection pump belt)

Symptom	Possible Causes	Action
Noise	<ul style="list-style-type: none"> ● Belt condition ● Belt fouling cover ● Tensioner bearing failure ● Fuel injection pump failure 	Check the belt condition (see visual inspection). Check the belt cover for indications of fouling (this may indicate a pump misalignment), refer to the relevant workshop manual section. The belt tensioner must be renewed if the belt is removed, making a check of the bearing impractical. Remove the belt, check the fuel injection pump pulley for security. Check the fuel injection pump for excessive resistance to rotation (excessive resistance in the pump will cause the pulley securing nut to loosen as a design feature). Check for diagnostic

Symptom	Possible Causes	Action
		trouble codes (DTCs) indicating a pump malfunction.
Drive belt does not hold tension	<ul style="list-style-type: none"> ● Belt condition ● Tensioner fault 	Check the belt condition (see visual inspection). Check the tensioner function. Rectify as necessary.
Loss of drive (with no drive to the fuel injection pump, the engine will not run)	<ul style="list-style-type: none"> ● Belt broken/stripped teeth ● Drive pulleys loose 	Investigate the cause of the belt breakage/damage (a belt broken at a 45 degree angle normally indicates a shear, a break straight across the belt normally indicates that the belt has been crimped). Check the fuel injection pump for excessive resistance to rotation (excessive resistance in the pump will cause the pulley securing nut to loosen as a design feature). Check for DTCs indicating a pump malfunction.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Removal

• WARNINGS:

 Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Do not disassemble or clean inside the fuel pump, even with an ultrasonic cleaner. Always install a new fuel pump when required.

1. Disconnect the battery ground cable.

6	-	A/C (air conditioning) compressor
7	-	Crankshaft pulley/torsional vibration damper
8	-	Idler pulley
9	-	Generator

INTRODUCTION

The accessory drive is a belt system powered by a pulley attached to the front of the crankshaft. The crankshaft pulley, which incorporates a torsional vibration damper, drives primary and secondary drive belts. An automatic belt tensioner in the primary belt run maintains the drive belt at the correct tension. Together with idler pulleys, the belt tensioner also guides the primary drive belt clear of obstructions and sets the correct 'wrap-around' of the accessory component drive pulleys to ensure a slip-free drive.

Primary Drive Belt

The primary drive belt is a six-ribbed poly-V belt that drives the:

- Coolant pump
- Power steering pump
- A/C (air conditioning) compressor
- Generator.

Secondary Drive Belt

The secondary drive belt is a six-ribbed poly-V belt that drives the pulley of the viscous cooling fan.

Belt Tensioner

The belt tensioner consists of an idler pulley on the end of a spring loaded pivot arm. The pivot arm can be turned for removal and installation of the belt.

The belt tensioner is calibrated to automatically maintain the correct tension in the drive belt.

Accessory Drive - V8 5.0L Petrol - Accessory Drive

Diagnosis and Testing

Principles of Operation

Accessory Drive - V8 5.0L Petrol - Cooling Fan Belt

Removal and Installation

Special Tool(s)

 E119168	303-1500 Installer, Stretchy Belt
--	--------------------------------------

Removal

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Refer to: [Cooling Fan](#) (303-03D Engine Cooling - V8 5.0L Petrol, Removal and Installation).

3.

Installation

1. *Special Tool(s):* [303-1500](#)

2. Install the cooling fan belt.

3.
 - Whilst rotating the engine, make sure that pressure is applied to the left hand side of the cooling fan belt to aid installation.
 - Rotate the engine until the special tool has reached the 9 o'clock position.
4. Remove the special tool.
5. Rotate the engine clockwise twice, making sure that the belt is seated on both pulleys correctly.
6. Refer to: [Cooling Fan](#) (303-03D Engine Cooling - V8 5.0L Petrol, Removal and Installation).
7. Connect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Starting System - TDV6 2.7L Diesel - Starting System

Description and Operation

GENERAL

E47033

The starter motor is rated as 2.0 kW and is a Denso level three sealed unit. It is a P76S type starter motor and is of conventional design with the motor in line and the drive pinion and solenoid mounted above. Each starter motor is of the pre-engaged type and comprises of a series wound motor, an overrunning clutch and an integral solenoid. This starter incorporates labyrinth breathing tubes to help with sealing and drainage.

The starter solenoid is energised by a signal from the ECM when the ignition switch is moved to the crank position. When engine cranking is requested, the ECM checks that a valid key code has been received before granting the crank request. The power for starter operation is supplied on a substantial single cable connected direct from the battery positive terminal. The cable is connected to the solenoid via a copper threaded stud and secured with a nut.

The starter motor is located on the rear RH side of the engine block and protrudes through an aperture to drive the flywheel via a ring gear. The motor is secured to the cylinder block by two bolts and to the ladder frame by four bolts and a support bracket. The bracket provides crucial support for the starter motor and must not be omitted when installing or reinstalling the unit.

Starting System - TDV6 2.7L Diesel - Starting System

Diagnosis and Testing

Principles of Operation

For a detailed description of the starting system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Starting System](#) (303-06A Starting System - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Gear selector lever cable adjustment (vehicles with automatic transmission) ● Starter motor ● Engine (turns freely) 	<ul style="list-style-type: none"> ● Battery ● Fuses ● Starter relay ● Wiring harness(es) ● Damaged, loose or corroded connectors ● Ignition switch ● Generator ● Transmission Control Module (TCM) ● Engine Control Module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
The engine does not crank (starter motor does not turn)	<ul style="list-style-type: none"> ● Gear selector not in P or N position (vehicles with automatic transmission) ● Battery ● Starter relay ● Invalid key code received by Central Junction Box (CJB) ● Harness/Connectors ● Starter motor ● Ignition switch ● Generator ● Transmission Control Module (TCM) ● Engine Control Module (ECM) ● Engine seized 	Make sure the gear selector is in the P or N position and correctly adjusted. Check the battery condition and state of charge. Check for DTCs indicating an immobilizer fault. Check the starter motor relay, ignition switch and generator circuits. Refer to the electrical guides. Check for TCM and ECM DTCs. Check that the engine turns freely.
The engine does not crank (starter motor does turn)	<ul style="list-style-type: none"> ● Starter motor installation ● Starter motor ● Flywheel/Drive plate ring gear 	Check the starter motor installation (fasteners tight, starter motor square to engine, etc). Engine cranks too fast	<ul style="list-style-type: none"> ● Low engine compression 	Check the engine compressions.
Excessive starter motor noise	<ul style="list-style-type: none"> ● Starter motor ● Flywheel/Drive plate ring gear ● Starter motor installation/casing 	Check the starter motor installation (fasteners tight, motor square to engine, etc). Check the starter motor casing condition. Check the flywheel/drive plate ring gear teeth for damage, foreign objects, etc.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: [Diagnostic Trouble Code \(DTC\) Index - TDV6 2.7L Diesel, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Starting System - TDV6 2.7L Diesel - Starting System Vehicles With: Smart Key

Diagnosis and Testing

Principles of Operation

For a detailed description of the starting system, refer to the relevant Description and Operation section in the workshop manual.

REFER to: Starting System (303-06A, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Steering column ● Brake pedal ● Smart key ● Steering Wheel 	<ul style="list-style-type: none"> ● Fuses ● Harnesses and connectors ● Warning lamp operation ● Smart key operation ● Engine start operation

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTC's) and refer to the DTC Index.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the warranty policy and procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system)

• NOTE: When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the digital multimeter leads into account

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion

• NOTE: If diagnostic trouble codes are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals

Symptom Chart

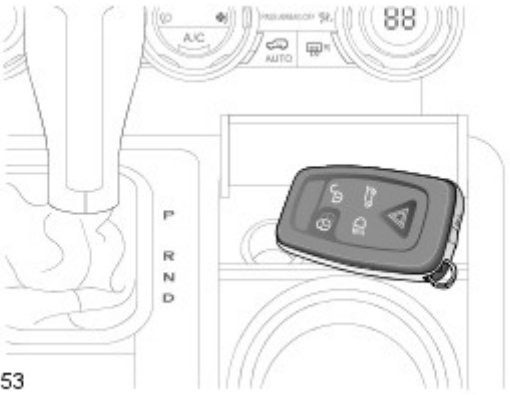

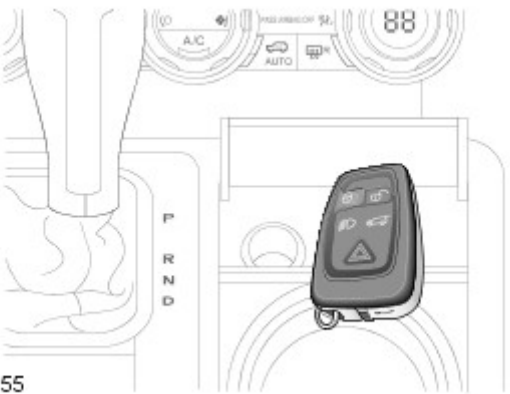

Symptom - Message Displayed	Symptom - Possible Cause	Action
Smart key not found - Refer to handbook	Ignition mode fails to switch on	GO to Pinpoint Test A.

If this process fails the first time, try repositioning the key around the immobilize antenna unit location, repeat the sequence again</p>
	Has the vehicle started? Yes No further action required No Contact dealer technical support

PINPOINT TEST C : PRESS START AND BRAKE

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: ENGINE FAILS TO CRANK	
<ul style="list-style-type: none"> NOTE: Conditions for starting in addition to pressing the start button are NOTE: For automatic transmission vehicles, ensure the brake pedal is depressed and the park or neutral selected NOTE: For manual transmission vehicles ensure the clutch is fully depressed NOTE: If the engine can be heard to crank there is no fault with the smart key NOTE: If the locking pin is still engaged, turn the steering wheel to overcome the side load NOTE: Start authorisation defined as Ignition functions, Steering column lock engagement, Engine immobilize and smart key authorisation 	
	<p>1 Check that there is sufficient brake pressure, (Automatic transmission only). Attempt another start making sure that the brake pedal is pressed firmly so the message is no longer displayed. In certain conditions this may require a more effort than usual</p>
	Has the vehicle started? Yes No further action required No Contact dealer technical support

PINPOINT TEST D : STEERING COLUMN LOCKED

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: IGNITION SWITCHES OFF AFTER 3 SECONDS	
• NOTE: Conditions for starting in addition to pressing the start button are	
• NOTE: For automatic transmission vehicles, ensure the brake pedal is depressed and the park or neutral selected	
• NOTE: For manual transmission vehicles ensure the clutch is fully depressed	
• NOTE: If the engine can be heard to crank there is no fault with the smart key	
• NOTE: If the locking pin is still engaged, turn the steering wheel to overcome the side load	
• NOTE: Start authorisation defined as Ignition functions, Steering column lock engagement, Engine immobilize and smart key authorisation	
	<ol style="list-style-type: none"> 1 Unlock the vehicle using the key fob, within 3 minutes of unlocking ensure the steering wheel can rotate freely. Perform a further lock and unlock check and attempt to start vehicle. If the steering 'column locked' message is still displayed, Lock the vehicle with the key fob and ensure the column is locked (If installed) by turning the steering wheel. Then unlock the vehicle ensuring the column Steering wheel can turn freely. Now perform another start attempt
	Did the engine start? Yes No further action required No Contact dealer technical support

PINPOINT TEST E : ENGINE STILL NOT CRANKING	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: AMBIENT TEMPERATURES BELOW ZERO	
	<ol style="list-style-type: none"> 1 Hold the start button down for at least 4 seconds while starting the vehicle
	<ol style="list-style-type: none"> 2 Switch the ignition on, wet the windscreen and activate the wipers. when the wipers are in operation press the start button, If the wipers stop, the Engine is allowed to start
	Did the engine start? Yes No further action required No Contact dealer technical support

Starting System - TDV6 2.7L Diesel - Starter Motor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

4. Release the fuel cooler.

- Remove the retaining bolt.

5. Reposition the fuel cooler and the fuel filter housing.

- Remove the two retaining bolts.

6. Remove the wiring harness retaining bolt.

7. Remove the starter motor retaining bracket.

- Remove the four retaining bolts.

8. Reposition the starter motor.

- Remove the two retaining bolts.

9. Remove the starter motor.

- Reposition the rubber insulator.
- Remove the two starter motor harness retaining nuts.

Installation

1. Install the starter motor.

- Tighten the battery positive terminal integral connector retaining nut to 11 Nm (8 lb.ft).
- Tighten the solenoid terminal integral connector nut to 7 Nm (5 lb.ft).
- Reposition the rubber insulator.

2. Reposition the starter motor.

- Install the two retaining bolts.
- Tighten the bolts to 48 Nm (35 lb.ft).

3. Install the wiring harness retaining bolt.

- Tighten the bolt to 10 Nm (7 lb.ft).

4.  CAUTION: The starter motor retaining bracket must be

installed. Failure to follow this instruction may result in damage to the vehicle.

Install the starter motor retaining bracket.

- Install the 4 bolts and tighten to 10 Nm (7 lb.ft).

5. Reposition the fuel cooler and the fuel filter housing.

- Install the two bolts and tighten to 10 Nm (7 lb.ft).

6. Attach the fuel cooler.

- Install the bolt and tighten to 10 Nm (7 lb.ft).

7. Install the engine undershield.

For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

8. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

ItemDescription

1	Battery
2	Starter motor
3	ECM (engine control module)
4	Stop/start switch
5	CJB (central junction box)
6	EJB (engine junction box)

System Operation

OPERATION

The starter solenoid is energised by a signal from the [ECM](#) when the stop/start switch is pressed and the driver has depressed the brake pedal. When engine cranking is requested, the [ECM](#) checks that a valid key code has been received

before granting the crank request.

Once engine cranking has been granted, the [ECM](#) energizes the starter motor relay located in the engine compartment fusebox. The closing of the starter motor relay contacts causes battery voltage to be applied to the starter motor solenoid. The solenoid is energised and the pinion gear is pushed to engage with the flywheel ring gear. Simultaneously, the starter solenoid contacts close, causing current to flow into the motor brushes and armature which operates the motor. The armature rotational force is transferred to the engine's ring gear through the pinion gear, rotates the flywheel and starts the engine.

Component Description

DESCRIPTION

The Denso starter motor is rated as 2.2 kW. It is a conventional design with the motor and pinion in line and the solenoid mounted above.

The starter motor is of the pre-engaged type and comprises a series wound motor, an overrunning clutch and an integral solenoid. This starter incorporates labyrinth-breathing tubes to help with sealing and drainage.

The power for starter operation is supplied on a substantial single cable connected direct from the battery positive terminal, via a megafuse. The cable is connected to the solenoid via a copper threaded stud and secured with a nut.

Description and Operation

STARTER MOTOR

E47031

The starter motor is rated as a 1.8kW and is a Denso level three sealed unit. It is an RA type starter motor, which is of the offset design with the solenoid being directly behind the pinion to give a more positive engagement to the ring gear. The motor is geared directly to the pinion. Each starter motor is of the pre-engaged type and comprises of a series wound motor and an overrunning clutch. This starter incorporates labyrinth breathing tubes to help with sealing and drainage.

The starter solenoid is energised by a signal from the ECM when the ignition switch is moved to the crank position. When engine cranking is requested, the ECM checks that a valid key code has been received before granting the crank request.

The power for starter operation is supplied on a substantial single cable connected direct from the battery positive terminal. The cable is connected to the solenoid via a copper threaded stud with an anti-rotational device and secured with a nut.

The starter motor is located on the rear LH side of the engine block. The motor is secured to the block and protrudes through an aperture to drive the flywheel via a ring gear.

Starting System - V6 4.0L Petrol - Starter Motor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).
4. Remove the starter motor.

- Remove the 2 bolts.
- Remove the terminal upper cover.
- Remove the terminal lower cover.
- Remove the nut.
- Disconnect the 2 electrical connectors.

Installation

1. Install the starter motor.
 - Clean the component mating faces.
 - Connect the electrical connectors.
 - Tighten the nut to 10 Nm (7 lb.ft).
 - Install the terminal lower cover.
 - Install the terminal upper cover.
 - Tighten the bolts to 45 Nm (33 lb.ft).
2. Install the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Starting System - V6 4.0L Petrol - Starter Solenoid

Removal and Installation

Removal

1. Remove the starter motor.
For additional information, refer to: [Starter Motor](#) (303-06C Starting System - V6 4.0L Petrol, Removal and Installation).
2. Release the starter motor terminal cover.

E92344

3. Release the starter motor terminal.
 - Remove the nut.

E92345

4. Remove the starter motor bolts.

E92220

5.  **CAUTION:** Make sure the starter motor armature remains located inside the motor housing.

Remove the starter motor from the gear housing.

E92346

6. Remove the starter solenoid screws.

E92221

7.  CAUTION: Make sure the gears and bearings remain located in the gear housing.

Remove the starter solenoid.

E92222

Installation

1.  CAUTION: Make sure the gears and bearings remain located in the gear housing.

Fit the starter solenoid to the gear housing.

2. Fit the starter solenoid screws.

- Tighten to 10 Nm (7 lb.ft).

3. Install the starter motor to the gear housing.

4. Install the starter motor bolts.

- Tighten to 10 Nm (7 lb.ft).

5. Secure the starter motor terminal.

- Tighten the nut to 5 Nm (4 lb.ft).

6. Secure the starter motor terminal cover.

7. Install the starter motor.

For additional information, refer to: [Starter Motor](#) (303-06C Starting System - V6 4.0L Petrol, Removal and Installation).

Starting System - V8 5.0L Petrol - Starting System

Description and Operation

COMPONENT LOCATION

E123712

INTRODUCTION

The starter motor is manufactured by Denso and is rated at 1.4 kW. The motor is geared directly to the pinion. The motor is a series wound motor with an overrunning clutch. The interior of the motor is ventilated through a breather tube attached to the rear of the engine.

The starter motor is located on the rear right side of the engine sump. The motor is installed in an aperture in the sump and the pinion is engaged with the ring gear of the crankshaft drive plate.

A heavy duty cable, which supplies the electrical power to turn the starter motor, is connected to the battery positive terminal via 500 A megafuse.

At the starter motor, the cable is connected to a terminal stud on the solenoid. The power feed from the starter relay, to energize the solenoid, is connected to a second terminal stud on the solenoid.

Starter Motor Assembly

E121596

Item	Part Number	Description
1	-	Battery
2	-	Terminal post megafuse (500 A)
3	-	Starter motor
4	-	EJB (engine junction box) (starter relay)
5	-	ECM (engine control module)

OPERATION

Engine crank requests are monitored by the passive anti-theft system and, if valid, passed on to the [ECM \(engine control module\)](#).

For additional information, refer to: [Anti-Theft - Passive](#) (419-01B Anti-Theft - Passive, Description and Operation).

When the [ECM](#) receives a crank request, it energizes the starter relay in the [EJB \(engine junction box\)](#). The energized starter relay supplies 12 V power to energize the pull-in coil of the starter solenoid. Once activated, the pull-in coil engages the solenoid plunger, which engages the pinion gear with the ring gear. The plunger then closes the solenoid circuit, feeding power from the 500 A megafuse on the battery positive terminal to the starter motor.

Description and Operation

COMPONENT LOCATIONS

E47681

Item	Part Number	Description
1	-	Spark plug
2	-	Ignition coil
3	-	Spark plug wire
4	-	Capacitor

GENERAL

The 4.0L engine ignition system has a single platinum tipped spark plug per cylinder, with each spark plug powered by a separate remote ignition coil. The three ignition coils for each cylinder bank are grouped together on the related side of the air inlet manifold. The ignition coils are directly driven by the Engine Control Module (ECM).

Power for the ignition coils is supplied from the main relay and a fuse in the Battery Junction Box (BJB).

Each ignition coil contains a power stage to switch the current in the primary circuit. The ECM controls the switching with a signal to the power stage. A capacitor is connected in parallel with the power supplies to the ignition coils, to suppress Radio Frequency Interference (RFI). The ECM monitors operation of the ignition coils using a feedback signal from each of the power stages. If a fault is detected the ECM stores an appropriate fault code.

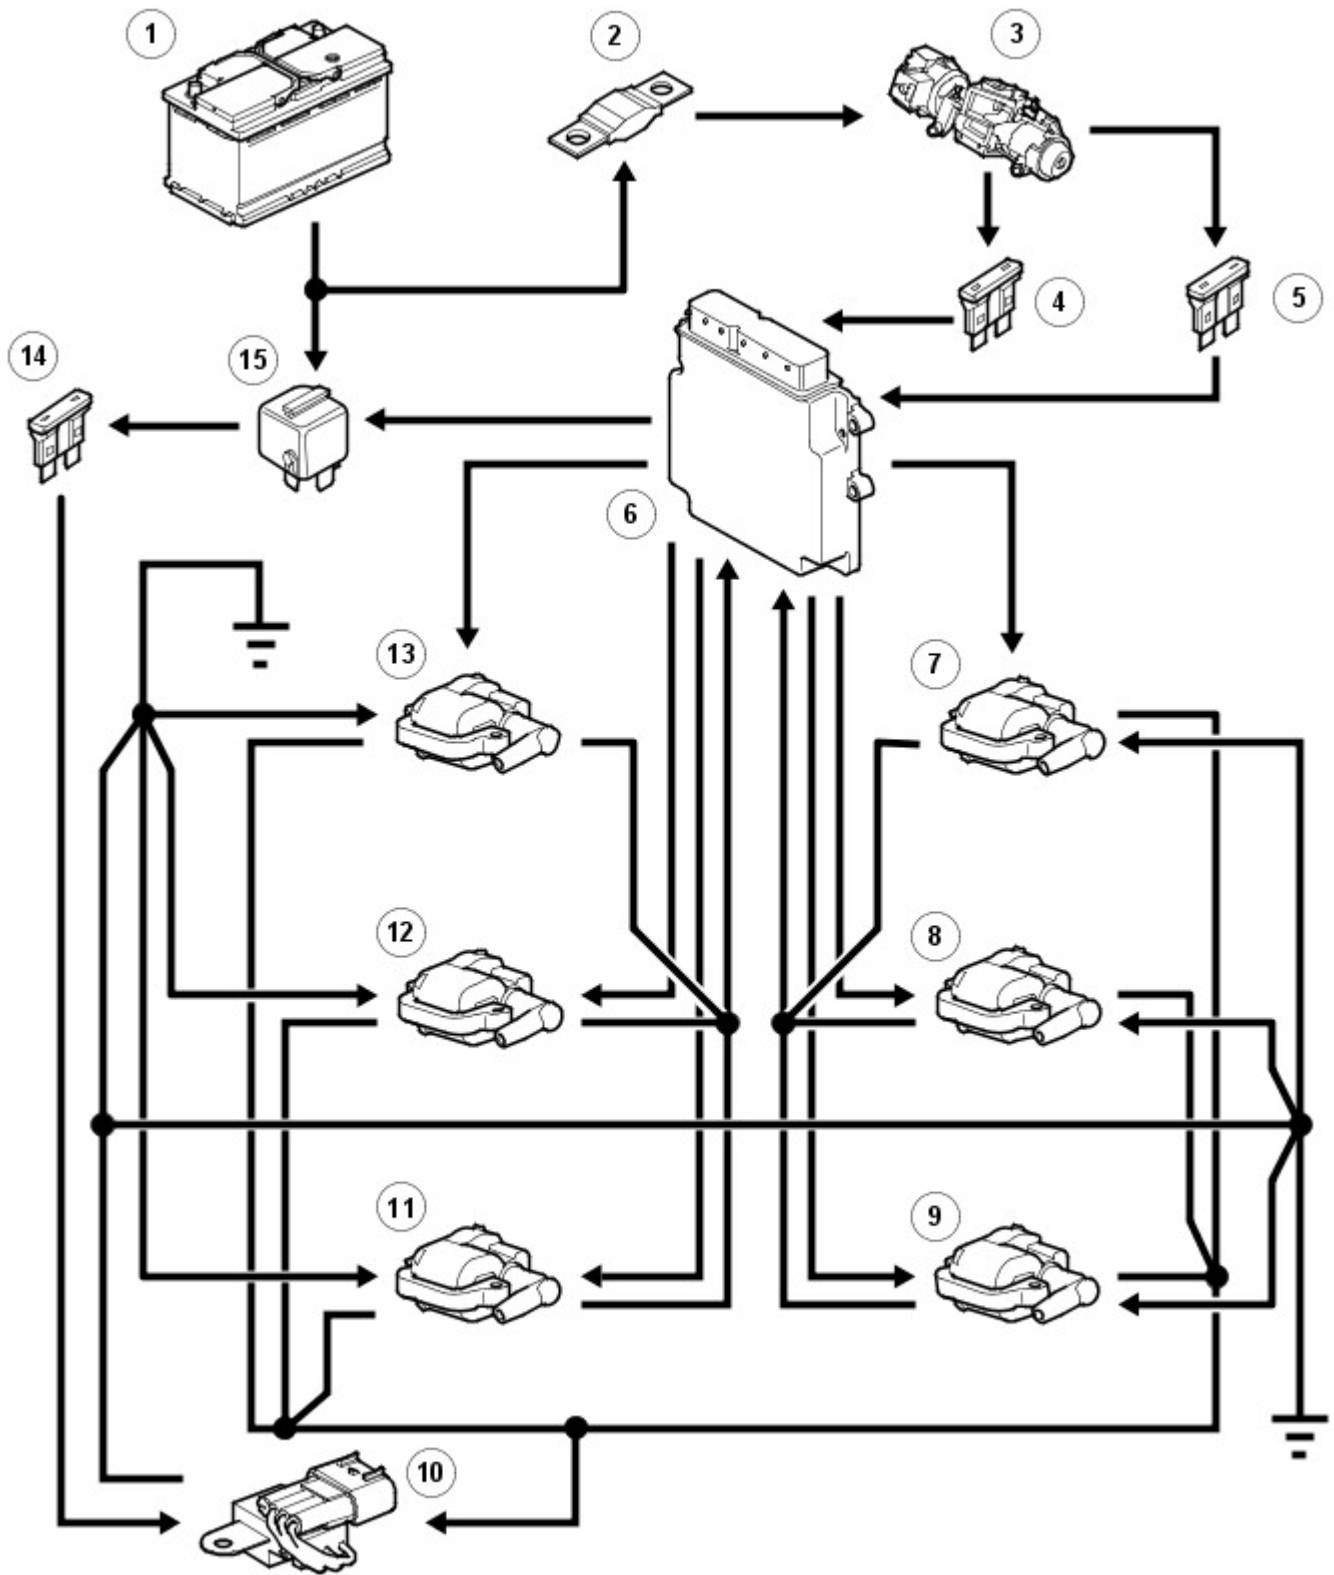

The ECM varies the dwell time of the ignition coils depending on battery voltage and engine speed, to ensure a constant energy level is produced in the secondary coil each time the power stage is switched. This ensures a good spark is always produced by the spark plug without excessive primary current flow, thus avoiding overheating or damage to the ignition coils.

The ECM calculates the ignition timing for individual cylinders from:

- Engine speed.
- Camshaft position.

Engine Ignition - V6 4.0L Petrol - Engine Ignition

Diagnosis and Testing

Principles of Operation

For a detailed description of the engine ignition system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Engine Ignition](#) (303-07A Engine Ignition - V6 4.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Engine oil level ● Cooling system coolant level ● Fuel level ● Fuel contamination/grade/quality ● Exhaust gas recirculation (EGR) valves 	<ul style="list-style-type: none"> ● Fuses ● Wiring harness ● Loose or corroded electrical connectors ● Ignition coils ● Sensor(s) ● Engine Control Module (ECM) ● Transmission Control Module (TCM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Engine Control Module \(PCM\) 4.0L V6](#) (100-00 General Information, Description and Operation).

Engine Ignition - V6 4.0L Petrol - Spark Plugs

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3.  **CAUTION:** It is important to twist the spark plug wire boot while pulling upward to avoid possible damage to the spark plug wire.

- **NOTE:** Note the fitted position.

Disconnect the high tension (HT) electrical connectors.

4.  **WARNING:** Eye protection must be worn.

- **NOTE:** Use compressed air to remove any foreign material from the spark plug wells.

Clean the area surrounding the spark plugs.

5. Remove the spark plugs.

Installation

1.  **CAUTION:** Prior to fitting new copper spark plugs, check that the electrode gaps are set to 1.4 mm, adjust if necessary. Existing platinum or copper spark plugs must not be re-gapped in service; if the electrode gap is incorrect new spark plugs must be fitted.

- **NOTE:** Do not apply lubricant to the threads.

Install the spark plugs.

- Check the spark plug gap, refer to specifications.
- Tighten the spark plugs to 18 Nm (13 lb.ft).

2.  **CAUTION:** Install spark plug wires to positions noted on removal. Do not cross wires.

Connect the HT electrical connectors.

- Apply silicone grease to inside of spark plug boot.

3. Install the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

4. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00

Battery and Charging System - General Information,
Specifications).

Engine Ignition - V6 4.0L Petrol - Ignition Coil

Removal and Installation

Removal

- NOTE: Note: Ignition coils 2 ,3, 5 & 6 have harness retaining clips that need to be detached before removal.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the ignition lead from the coil.
4. Remove the ignition coil.

- Disconnect the ignition coil electrical connector.
- Remove the nut.
- Remove the ground cable.
- Fully loosen the stud.
- Fully loosen the bolt.

Installation

1. To install, reverse the removal procedure.
 - Tighten the bolt to 6 Nm (4 lb.ft).
 - Tighten the stud to 6 Nm (4 lb.ft).
 - Install the ground cable.
 - Tighten the nut to 6 Nm (4 lb.ft).
 - Connect the ignition coil electrical connector.
 - Connect the ignition lead to the coil.

Description and Operation

COMPONENT LOCATION

E122131

Item	Part Number	Description
1	-	RFI (radio frequency interference) suppressor
2	-	ECM (engine control module)
3	-	Spark plug (8 off)
4	-	Ignition coil (8 off)

INTRODUCTION

The engine ignition system is a coil-on-plug, single spark system controlled by the [ECM \(engine control module\)](#). An iridium tipped spark plug is installed in each combustion chamber, between the inlet and exhaust valves, and an ignition coil is installed on each spark plug. A RFI (radio frequency interference) suppressor is connected to the power feed to the ignition coils.

IGNITION COILS

E116147

The ignition coils are installed in the cylinder head covers, under the [NVH \(noise, vibration and harshness\)](#) covers. Each ignition coil locates on a spark plug and is secured to the related cylinder head cover with a single screw. Each ignition coil incorporates a three pin electrical connector for connection to the engine harness.

Each ignition coil contains a primary and a secondary winding. The primary winding receives electrical power from the ignition relay in the power distribution box. A power stage in the primary winding allows the [ECM](#) to interrupt the power supply, to induce a voltage in the secondary winding and thus the spark plug. A diode in the ground side of the secondary winding reduces any undesirable switch-on voltage, to prevent misfiring into the intake manifold. The power stage limits the maximum voltage and current in the primary winding, to protect the power stage and limit the voltage in the secondary winding.

RFI SUPPRESSOR

E108416

The RFI (radio frequency interference) suppressor is installed on the engine harness carrier at the rear of the engine.

CONTROL DIAGRAM

- NOTE: A = Hardwired

2	-	EJB (engine junction box) (ECM relay)
3	-	RFI suppressor
4	-	LH (left hand) cylinder bank ignition coil (4 off)
5	-	RH (right hand) cylinder bank ignition coil (4 off)
6	-	ECM

OPERATION

The ignition coils are supplied with electrical power from the battery via the [ECM](#) relay in the [EJB](#) (engine junction box). The [ECM](#) controls the operation of the [ECM](#) relay.

The [ECM](#) sends a separate signal to each ignition coil to trigger the power stage switching. The [ECM](#) calculates the dwell time from the battery voltage and engine speed, to ensure a constant energy level is produced in the secondary coil each time the power stage is switched. This ensures sufficient spark energy is available without excessive primary current flow, which avoids overheating and damage to the ignition coils.

The [ECM](#) calculates the ignition timing for individual cylinders from:

- Engine speed
- Camshaft position
- Engine load
- Engine temperature
- The knock control function
- The shift control function
- The idle speed control function.

Engine Ignition - V8 5.0L Petrol - Engine Ignition

Diagnosis and Testing

Principles of Operation

1	-	B (LH) bank glow plug relay
2	-	A (RH) bank glow plug relay
3	-	Glow plug indicator
4	-	Glow plug (x 6)
5	-	Glow plug harness (x 2)

GENERAL

The glow plug system has a glow plug installed in the inlet side of each cylinder. The glow plugs heat the combustion chambers before and during cranking, to aid cold starting, and after the engine starts to reduce emissions and engine noise when idling with a cold engine.

A glow plug wiring harness on each bank of glow plugs is connected to a separate relay and fusible link in the Battery Junction Box (BJB). The individual glow plugs are grounded through their fixing in the cylinder head. Operation of the glow plug relays is controlled by the Engine Control Module (ECM), which also controls the illumination of the glow plug indicator in the instrument cluster.

Each glow plug is a tubular heating element which contains a spiral filament encased in magnesium oxide powder. At the tip of the tubular heating element is the heater coil. Behind the heater coil, and connected in series, is a control coil. The

control coil regulates the current to the heater coil to ensure that it does not overheat.

SYSTEM OPERATION

There are three phases of glow plug heating: Pre heating, crank heating and post heating. The ECM determines the heating times from the Engine Coolant Temperature (ECT). The lower the ECT, the longer the heating times.

When the ignition switch is turned to position II, the ECM calculates any required heating times and, if heating is required, energizes the glow plug relays in the BJB. When pre heating is required, the ECM also sends a message to the instrument cluster, on the high speed CAN bus, to request illumination of the glow plug indicator. The glow plug indicator remains illuminated for the duration of the pre heating phase, or until the ignition switch is turned to the crank position, whichever occurs first. If required, the ECM keeps the glow plug relays energized during cranking and for the duration of any post heating phase.

The ECM monitors the drive circuit of the glow plug relays for plausibility of operation, continuity, and short and open circuits. If a fault is detected, the ECM stores a related fault code and permanently illuminates the glow plug indicator while the ignition switch is in position II.

Glow Plug System - TDV6 3.0L Diesel - Glow Plug System - Overview

Description and Operation

OVERVIEW

The glow plug system includes a glow plug installed in the inlet side of each cylinder and a glow plug module. The glow plugs heat the combustion chambers before and during cranking, to aid cold starting, and after the engine starts to reduce emissions and engine noise when idling with a cold engine.

The glow plugs are connected for each bank by a common harness which is connected into the main engine harness. The harness for each bank connects into a connector block which attaches to each of the glow plugs for that bank. The glow plugs are connected directly to the glow plug module which is controlled by glow plug software contained within the [ECM \(engine control module\)](#).

System Operation

System Operation

There are three phases of glow plug heating:

- Pre heating
- Crank heating
- Post heating

The **ECM** determines the heating times from the **ECT (engine coolant temperature)**. The lower the engine coolant temperature, the longer the heating times.

When the ignition is switched to power mode 9, the **ECM** calculates any required heating times and, if heating is required, energizes the glow plug relays in the **CJB**. When pre heating is required, the **ECM** also sends a message to the instrument cluster, on the high speed **CAN**, to request illumination of the glow plug indicator. The glow plug indicator remains illuminated for the duration of the pre heating phase, or until the ignition is switched to crank, whichever occurs first. If required, the **ECM** keeps the glow plug relays energized during cranking and for the duration of any post heating phase.

The [ECM](#) monitors the drive circuit of the glow plug relay for plausibility of operation, continuity, and short and open circuits. If a fault is detected, the [ECM](#) stores a related fault code.

Pre Heating

Pre-heat is the length of time the glow plugs operate prior to engine cranking. The [ECM](#) controls the pre-heat time based on [ECT](#) sensor output and barometric pressure. If the [ECT](#) sensor fails, the [ECM](#) will use a predefined temperature as a default value. The pre-heat duration is extended if the coolant temperature is low.

The [ECM](#) receives the corresponding temperature signal from the [ECT](#) sensor.

The preheating period is dependent on the temperature signal (low temperature = longer preheating period).

The driver is informed that preheating is in operation by the glow plug indicator light in the instrument cluster coming on. The preheating times become longer as the coolant temperature falls.

The [BARO \(barometric pressure\)](#) also has an influence on activation and deactivation of the glow plugs in the event of large altitude differences.

Crank Heating

Crank heating is carried out at every start where the coolant temperature is below the predefined threshold of 20°C. Crank heating begins if the engine speed exceeds 80 rpm for longer than 50ms, or the starter is active for longer than 4 sec. If the coolant temperature sensor is defective, a default temperature of 0°C is used.

Post Heating

Post heat is the length of time the glow plugs operate after the engine starts. The [ECM](#) controls the post heating time based on [ECT](#) sensor output. The post heat phase reduces engine noise, improves idle quality and reduces hydrocarbon emissions.

Preheating is followed by the post heating phase once the engine has started. The post heating phase depends upon how the vehicle is driven.

In addition to [ECT](#), [BARO](#) and engine speed, the injected fuel quantity is significant in this context. For example, if the injected fuel quantity is less than 70 mg per piston stroke and the coolant temperature is below -20°C, post heating is performed.

Component Description

Glow Plug

The ceramic sheathed element glow plugs are made from a heat-resistant, electrically conductive ceramic material. The ceramic sheathed-element glow plugs outer layer is heated directly and is self regulating. The self regulation allows the resistance of the sheathed element to automatically increase as the heat increases preventing the glow plug from overheating. In addition, during the heating process and under the control of the glow plug relay, the glow plugs can be operated above their nominal voltages. This permits heat-up speeds of 1000°C per second. The sheathed-element glow plugs reach a maximum glow temperature of 1300°C and can hold a temperature of 1150°C for several minutes after the first-start glow or at intervening times.

Each cylinder bank has a separate harness connecting the three glow plugs. The harness connects into the engine wiring harness and each harness has a connector block which attaches to each of the glow plugs for that bank.

The glow plug module receives a battery voltage feed via a 250A fusible and a 60A fuse in the engine compartment fusebox. Operation of the glow plug module is controlled by the [ECM](#), which also controls the illumination of the glow plug indicator in the instrument cluster.

The system has been designed as a low-voltage glow system. At 7 volts, the nominal voltage of the sheathed-element glow plugs is significantly lower than the 12 volts of the main electrical circuit. The electronic glow plug module matches the voltage to the sheathed-element glow plugs and controls their glow temperature precisely to the specific requirements of the engine. This produces the optimum glow temperature even when the main circuit voltage is interrupted during engine starting. The lower power consumption of the ceramic glow plugs and their time-staggered activation reduce to a minimum the peak load on the main circuit during the cold start and immediate post-start periods.

In the event of glow plug failure, the engine may be difficult to start and excessive smoke emissions may be observed after starting.

Glow Plug System - TDV6 3.0L Diesel - Glow Plug System

Diagnosis and Testing

Principles of Operation

For a detailed description of the glow plug system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (303-07D Glow Plug System - TDV6 3.0L Diesel)

[Glow Plug System](#) (Description and Operation),

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of electrical damage.

Visual Inspection

Electrical
<ul style="list-style-type: none"> ● Glow plug lamp ● Fuses ● Glow plug relays ● Engine management control relay ● Wiring harness(es) ● Electrical connector(s) ● Glow plug(s) ● Engine Control Module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Poor starting (extreme weather conditions)	<ul style="list-style-type: none"> ● Glow plugs inoperative/inefficient ● Fuel temperature too low 	Check the glow plug harnesses at the glow plugs and at the connection to the main harness. Refer to the electrical guides. Check for glow plug DTCs. The fuel system recycles fuel until operating temperature is reached to reduce this possibility.
High cold-engine emissions	<ul style="list-style-type: none"> ● After-glow phase inoperative 	Check the glow plug harnesses at the glow plugs and at the connection to the main harness. Refer to the electrical guides. Check for glow plug DTCs. After-glow is designed to function at engine temperatures below 50 degrees C (122 degrees F), and below 2,500 rpm.
High cold-engine noise, vibration or harshness	<ul style="list-style-type: none"> ● After-glow phase inoperative 	Check the glow plug harnesses at the glow plugs and at the connection to the main harness. Refer to the electrical guides. Check for glow plug DTCs. After-glow is designed to function at engine temperatures below 50 degrees C (122 degrees F), and below 2,500 rpm.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Engine Control Module (PCM) 3.0L TdV6 (100-00, Description and Operation).

Glow Plug System - TDV6 3.0L Diesel - Glow Plugs

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-01 Battery, Mounting and Cables, Specifications).

2. Refer to: [Intake Air Shutoff Throttle](#) (303-04C Fuel Charging and Controls - TDV6 3.0L Diesel, Removal and Installation).

3. Refer to: [Crankcase Vent Oil Separator](#) (303-08B Engine Emission Control - TDV6 3.0L Diesel, Removal and Installation).

4. Refer to: [Oil Filter Element](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

5.

6.

7.  CAUTION: Take extra care not to damage the component.

- 8.

Installation

1. 1. CAUTIONS:

-  Take extra care when handling the component.
-  Fixings must be started by hand to avoid damaging threads.
-  If accidentally dropped or knocked install a new module.
-  Make sure the engine is cold before this procedure is carried out. Failure to follow this instruction may result in damage to the vehicle.

Torque: 10 Nm

2.  CAUTION: Take extra care not to damage the component.

3. Torque: 10 Nm

4. Torque: 10 Nm

5. Refer to: [Oil Filter Element](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).
6. Refer to: [Crankcase Vent Oil Separator](#) (303-08B Engine Emission Control - TDV6 3.0L Diesel, Removal and Installation).
7. Refer to: [Intake Air Shutoff Throttle](#) (303-04C Fuel Charging and Controls - TDV6 3.0L Diesel, Removal and Installation).
8. Connect the battery ground cable.

Refer to: [Specifications](#) (414-01 Battery, Mounting and Cables,

Specifications).

Engine Emission Control - TDV6 2.7L Diesel -**Torque Specifications**

Description	Nm	lb-ft
EGR valve outlet tube bolts	10	7
Wiring harness Torx screw	5	4
EGR valve inlet tube bolts	10	7
EGR valve bolts	10	7
Fuel line retaining bracket bolt	10	7
EGR valve support bracket bolts	10	7
Oil level indicator tube bolt	10	7

EGR valve to cooler retaining Torx screws	10	7

Engine Emission Control - TDV6 2.7L Diesel - Engine Emission Control

Description and Operation

E48444

Item	Part Number	Description
1	-	EGR modulator/ cooler assembly
2	-	Electric throttle
3	-	EGR thermostat (from 2007MY)
4	-	EGR to electric throttle tube
5	-	EGR cooler
6	-	EGR modulator valve
7	-	EGR modulator solenoid valve
8	-	EGR coolant hoses

EGR SYSTEM

The EGR system comprises:

- EGR modulator x 2
- EGR cooler x 2
- Associated connecting pipes

EGR Cooler and Modulator

E48446

Item	Part Number	Description
1	-	EGR modulator
2	-	EGR cooler
3	-	EGR thermostat (from 2007MY)

Electric Throttle Body

E48447

Item	Part Number	Description
1	-	Inlet air temperature sensor
2	-	Electric throttle body
3	-	Electric throttle flap
4	-	Electric throttle control motor
5	-	Gas inlet port

The EGR modulator and cooler are a combined unit.

The combined EGR modulator and cooler is located under each cylinder bank, between the exhaust manifold and the cylinder head. The cooler side of the EGR is connected to the vehicle cooling system, via hoses. The inlet exhaust side is connected directly into the exhaust manifolds on each side. The exhaust gas passes through the cooler and is expelled via the actuator and a metal pipe into the throttle housing. The EGR modulator is a solenoid operated valve which is controlled by the ECM. The ECM uses the EGR modulator to control the amount of exhaust gas being recirculated in order to reduce exhaust emissions and combustion noise. The EGR is enabled when the engine is at normal operating temperature and under cruising conditions.

On vehicles from 2007MY, a flow regulating, wax thermostat is fitted to the coolant outlet of the EGR cooler. The purpose of the thermostat is to promote faster engine warm-up, improve cabin heater performance and assist the emissions to comply with the requirements of EU4 regulations. The thermostat is closed when cold, starts to open at 75°C (167°F) and is fully open at normal operating temperatures. The thermostat has a small bleed hole which allows a small amount of leakage when cold.

The EGR modulator receives a 12V supply from the main relay. The ground for the solenoid is via the ECM and is controlled using a PWM signal. The PWM duty signal of the solenoid ground is varied to determine the precise amount of exhaust gas delivered to the cylinders.

The modulators are operated through their full range at each engine start-up, to clear any carbon deposits that may have built up whilst the engine was running

In the event of a failure of the EGR modulator, the EGR function will become inoperative. The ECM can monitor the EGR modulator solenoid for short circuits and store fault codes in the event of failure. The modulator can also be activated for testing using a Land Rover approved diagnostic system.

CRANKCASE VENTILATION

E48445

Item	Part Number	Description
1	-	Breather tube
2	-	Oil separator
3	-	Breather tube
4	-	Crankcase oil return connection
5	-	Oil return tube
6	-	Crankcase oil return valve
7	-	Breather flow

The crankcase ventilation system on the TdV6 ensures that all gasses emitted from the crankcase during engine running are separated from any oil particles.

Crankcase gasses are drawn into the oil separator unit from the crankcase and the cylinder head covers (both banks) where the gas and oil are separated. The gas is returned to the inlet side of the air induction system prior to the turbo charger. The oil is drained down to the sump via an oil return valve locate at the rear of the cylinder block.

Engine Emission Control - TDV6 2.7L Diesel - Engine Emission Control

Diagnosis and Testing

Principles of Operation

For a detailed description of the engine emission control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Engine Emission Control](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Engine breather system ● Oil separator ● Exhaust gas recirculation pipes/hoses (check for cracks) ● EGR valve(s) ● EGR cooler(s) ● Vacuum system 	<ul style="list-style-type: none"> ● Fuse(s) ● Wiring harness ● Loose or corroded electrical connector(s) ● Intake air shut off throttle ● Exhaust gas recirculation (EGR) valve(s) ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Difficult to start	<ul style="list-style-type: none"> ● Exhaust gas recirculation (EGR) valve stuck open 	Check the Exhaust gas recirculation (EGR) valve.
Poor/Erratic idle		
Lack of power when accelerating		
Engine stops/stalls	<ul style="list-style-type: none"> ● Exhaust gas recirculation (EGR) valve stuck open ● Breather system disconnected/restricted/blocked 	Check the Exhaust gas recirculation (EGR) valve. Check the engine breather system. Check the oil separator. Check for Exhaust gas recirculation (EGR) DTCs.
Excessive fuel consumption	<ul style="list-style-type: none"> ● Exhaust gas recirculation (EGR) valve stuck open ● Exhaust gas recirculation (EGR) not operating ● Breather system restricted/blocked 	
Excessive black smoke		
Excessive emissions		
Excessive blow-by	<ul style="list-style-type: none"> ● Breather system restricted/blocked 	Check the engine breather hoses. Check the oil separator.
Engine oil leaks	<ul style="list-style-type: none"> ● Breather system restricted/blocked 	Check the engine breather hoses. Check the oil separator.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - TDV6 2.7L Diesel, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Engine Emission Control - TDV6 2.7L Diesel - Crankcase Vent Oil Separator

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Disconnect the low-pressure fuel lines.

- Install blanking caps to the exposed ports.

E54441

3. Disconnect both exhaust gas recirculation (EGR) coolant cross-over pipe hoses.

- Clamp the EGR coolant hoses to minimize coolant loss.

E53903

4. Remove the EGR coolant cross-over pipe.

- Remove the two retaining bolts.

E56138

5. Disconnect the engine oil pressure (EOP) sensor electrical connector.

6.  CAUTION: The O-ring seal is to be reused unless damaged.

Using the special tool, remove the oil filter element.

- Loosen the element cover 4 complete turns to allow engine oil to drain from the filter cover.
- Remove element cover.
- Clean the immediate area.

7. NOTE: Left-hand shown, right-hand similar.

Remove the breather pipes.

8. Disconnect the glow plug electrical connectors.

9. Disconnect the low-pressure fuel lines.

- Install blanking caps to the exposed ports.

10.  **CAUTION:** Make sure that the high-pressure fuel supply line remains in contact with the fuel pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

- **NOTE:** Crankcase vent oil separator shown removed for clarity.

Remove and discard the high-pressure fuel supply line.

- Install blanking caps to the exposed ports.

11. Remove the low-pressure fuel line.

- Disconnect the low-pressure fuel line.
- Release the low-pressure fuel line.
- Install blanking caps to the exposed ports.

12. **NOTE:** Right-hand shown, left-hand similar.

Remove the glow plug wires.

13. Reposition the crankcase vent oil separator.

E56194

14. Disconnect the fuel injection pump electrical connectors.

E55248

15. Disconnect the fuel rail pressure (FRP) sensor electrical connector.

- Release the fuel charging wiring harness.

E55244

16.  CAUTION: The O-ring seals are to be reused unless damaged.

- NOTE: Remove the crankcase vent oil separator drain tube seal prior to the removal of the crankcase vent oil separator.
- NOTE: Using a suitable adhesive tape, protect the oil cooler.

Remove the crankcase vent oil separator.

E55249

Installation

1.  CAUTION: The O-ring seals are to be reused unless damaged.

Position the crankcase vent oil separator, but do not fully install at this stage.

- Clean the immediate area.

2. Connect the FRP sensor electrical connector.

- Attach the fuel charging wiring harness.

3. Install the crankcase vent oil separator.

4. Connect the fuel injection pump electrical connectors.

5. Install the glow plug wires.

6. Install the low-pressure fuel line.

- Remove the blanking caps from the ports.
- Connect the low-pressure fuel line.
- Attach the low-pressure fuel line.

7. Install the new high-pressure fuel supply line.

- Remove the blanking caps from the ports.
- Install the new high-pressure fuel supply line, but do not tighten unions at this stage.
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel pump to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel pump to 30 Nm (22 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).

8. Connect the low-pressure fuel lines.

- Remove the blanking caps from the ports.

9. Connect the glow plug electrical connectors.

10. Install the breather pipes.

11.  **CAUTION:** The O-ring seal is to be reused unless damaged.

Install the oil filter element.

- Clean the components.
- Tighten the oil filter element cover to 25 Nm (18 lb.ft).

12. Connect the EOP sensor electrical connector.

13. Install the EGR coolant cross-over pipe.

- Install the two retaining bolts.
- Tighten to 13 Nm (10 lb.ft).

14. Connect both EGR coolant cross-over pipe hoses.

- Remove the EGR coolant hose clamps.

E54441

15. Connect the low-pressure fuel lines.

- Remove the blanking caps from the ports.

16. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

17. Check and top-up the engine oil.

18. Check and top-up the coolant.

19. Bleed the fuel system.

Engine Emission Control - TDV6 2.7L Diesel - Exhaust Gas Recirculation (EGR) Valve LH Vehicles Without: Diesel Particulate Filter (DPF)

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the battery tray.
For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
3. Remove the LH exhaust gas recirculation (EGR) outlet tube.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).
4. Disconnect the LH EGR valve electrical connector.

5. Release the LH EGR cooler.

- Remove and discard the clip.
- Loosen the 2 bolts.

6. Release the LH EGR valve from the cylinder head.

- Remove the 3 bolts.

7. Remove the LH EGR valve.

- Remove the 2 bolts.
- Remove and discard the gasket.

Installation

1. Install the LH EGR valve.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

2. NOTE: Do not tighten at this stage.

Install the LH EGR valve bolts.

3. NOTE: Install a new clip.

Secure the LH EGR cooler.

1. Secure the clip.
2. Tighten the bolts to 10 Nm (7 lb.ft).

4. Secure the LH EGR valve.

- Tighten the bolts to 10 Nm (7 lb.ft).

5. Connect the LH EGR valve electrical connector.

6. Install the LH EGR valve outlet tube.

For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

7. Install the battery tray.

For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

8. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine Emission Control - TDV6 2.7L Diesel - Exhaust Gas Recirculation (EGR) Valve LH Vehicles With: Diesel Particulate Filter (DPF)

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the battery tray.
For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
3. Raise and support the vehicle.
4. Remove the exhaust heat shield.
 - Access through the LH wheel arch.
 - Remove the 3 nuts.

E102486

5. Remove the exhaust heat shield.
 - Access through the LH wheel arch.
 - Remove the bolt.

E102487

6. **NOTE:** Do not fully release the turbocharger outlet hose.
Release the turbocharger hose lower clip.

E102485

7. Lower the vehicle.
8. Remove the LH exhaust gas recirculation (EGR) outlet tube.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).
9. Release the oil level indicator tube.

10. **NOTE:** Make sure that the turbocharger outlet pipe is free to be repositioned and allow the oil level indicator tube to be repositioned against the vehicle body.

Reposition the oil level indicator tube.

- Using a suitable tie strap, reposition and secure the oil level indicator tube to the vehicle body.

11. Disconnect the LH EGR valve electrical connector.

12. Release the LH EGR cooler.

- Remove and discard the clip.
- Loosen the 2 bolts.

13. NOTE: RH illustration shown, LH is similar.

Disconnect LH EGR cooler rear coolant hose.

- Clamp the hoses to minimize coolant loss.
- Release the clip.

14. NOTE: The EGR valve front bolt cannot be removed with the EGR valve in its original orientation. The EGR valve must be removed before the front bolt can be removed.

Release the LH EGR valve from the cylinder head.

- Remove the 3 bolts.

15. NOTE: Reposition the EGR valve and EGR valve cooler assembly to gain access to the Torx bolts.

Remove the LH EGR valve.

- Remove the 2 bolts.
- Remove and discard the gasket.

Installation

1. NOTE: The EGR valve front bolt must be fitted to the EGR valve before the EGR valve is installed.

• **NOTE:** Reposition the EGR valve and EGR valve cooler assembly to gain access to the Torx bolts.

Install the LH EGR valve.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

2. NOTE: Do not tighten at this stage.

Install the LH EGR valve bolts.

3. NOTE: Install a new clip.

4: Secure the LH EGR valve.

Secure the LH EGR cooler.

- Tighten the bolts to 10 Nm (7 lb.ft).
 1. Secure the clip.
- 5.** Connect the LH EGR valve electrical connector.
 2. Tighten the bolts to 10 Nm (7 lb.ft).

6. Connect the coolant outlet hose to the LH EGR valve.
 - Position and secure the clip.
 - Remove the coolant hose clamps.
7. Secure the oil level indicator and tube.
 - Reposition the turbocharger outlet pipe.
 - Cut the cable tie.
 - Tighten the 2 bolts to 10 Nm (7 ib.ft).
8. Install the LH EGR valve outlet tube.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).
9. Raise the vehicle.
10. Secure the turbocharger outlet hose.
 - Secure the clip.
11. Install the heat shields.
12. Lower the vehicle.
13. Install the battery tray.
For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
14. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
15. Check and top-up the coolant.

Engine Emission Control - TDV6 2.7L Diesel - Exhaust Gas Recirculation (EGR) Valve RH Vehicles With: Diesel Particulate Filter (DPF)

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the auxiliary battery tray.
For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

3.  WARNING: This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

Disconnect the 2 fuel pipes.

- Release the 2 fuel pipe clips.

4. Remove the fuel line support bracket.

- Release the fuel pipe from the clips.
- Remove the bolt.

5. Remove the RH exhaust gas recirculation (EGR) valve outlet tube.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

6. Disconnect the RH EGR valve electrical connector.

E93721

7. Release the RH EGR cooler.

- Remove and discard the clip.
- Loosen the bolt.

E54934

8. Release the RH EGR valve from the cylinder head.

- Remove the 3 bolts.

E102488

9. NOTE: Reposition the EGR valve and EGR valve cooler assembly to gain access to the Torx bolts.

Remove the RH EGR valve.

- Remove the 2 bolts.
- Remove and discard the gasket.

Installation

1. NOTE: Reposition the EGR valve and EGR valve cooler assembly to gain access to the Torx bolts.

Install the RH EGR valve.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

2. NOTE: Do not tighten at this stage.

Install the RH EGR valve bolts.

3. NOTE: Install a new clip.

Secure the RH EGR cooler.

1. Secure the clip.
2. Tighten the bolt to 10 Nm (7 lb.ft).

4. Secure the RH EGR valve.
 - Tighten the bolts to 10 Nm (7 lb.ft).
5. Connect the RH EGR valve electrical connector.
6. Install the RH EGR valve outlet tube.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).
7. Install the fuel line support bracket.
8. Connect and secure the low-pressure fuel lines.
9. Install the auxiliary battery tray.
For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
10. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine Emission Control - TDV6 2.7L Diesel - Exhaust Gas Recirculation (EGR) Valve RH Vehicles Without: Diesel Particulate Filter (DPF)

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the auxiliary battery tray.
For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
3. Remove the RH exhaust gas recirculation (EGR) valve outlet tube.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).
4. Disconnect the RH EGR valve electrical connector.

5. Release the RH EGR cooler.

- Remove and discard the clip.
- Loosen the bolt.

6. Release the RH EGR valve from the cylinder head.

- Remove the 3 bolts.

7. Remove the RH EGR valve.

- Remove the 2 bolts.
- Remove and discard the gasket.

Installation

1. Install the RH EGR valve.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

2. NOTE: Do not tighten at this stage.

Install the RH EGR valve bolts.

3. NOTE: Install a new clip.

Secure the RH EGR cooler.

1. Secure the clip.
2. Tighten the bolt to 10 Nm (7 lb.ft).

4. Secure the RH EGR valve.

- Tighten the bolts to 10 Nm (7 lb.ft).

5. Connect the RH EGR valve electrical connector.

6. Install the RH EGR valve outlet tube.

For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

7. Install the auxiliary battery tray.

For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

8. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine Emission Control - TDV6 2.7L Diesel - Exhaust Gas Recirculation (EGR) Valve Outlet Tube

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. **NOTE:** Left-hand shown, right-hand similar.

Release the EGR valve outlet tube.

- Release the clip.

4. **NOTE:** Left-hand shown, right-hand similar.

Release the EGR valve outlet tube.

- Disconnect the engine wiring harness.
- Remove the Torx screw.

5. **NOTE:** Left-hand shown, right-hand similar.

- **NOTE:** Discard the gasket.
- **NOTE:** Discard the retaining clip.

Remove the EGR valve outlet tube.

- Remove the two bolts.

Installation

1. **NOTE:** Install a new retaining clip.
- **NOTE:** Install a new gasket.
- **NOTE:** Do not fully close the retaining clip at this stage.

Loosely install the EGR valve outlet tube.

- Install the two EGR valve outlet tube retaining bolts, but do not fully tighten at this stage.
2. Fully close the EGR valve outlet tube retaining clip.
 3. Tighten the EGR valve outlet tube retaining bolts to 10 Nm (7 lb.ft).
 4. Secure the engine wiring harness.
 - Install the Torx screw and tighten to 5 Nm (4 lb.ft).
 - Secure the engine wiring harness to the bracket with the clip.
 5. Install the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornammentation, Removal and Installation).
 6. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine Emission Control - TDV6 3.0L Diesel - Engine Emission Control -

Overview

Description and Operation

OVERVIEW

Exhaust Gas Recirculation (EGR) System

The [EGR \(exhaust gas recirculation\)](#) system is used to control the amount of exhaust gas being recirculated in order to reduce exhaust emissions and combustion noise. [EGR](#) is enabled when the engine is at normal operating temperature and under cruising conditions.

Crankcase Ventilation System

The crankcase ventilation system ensures that all gasses emitted from the crankcase when the engine is running are separated from any oil particles and recirculated via the clean air induction system.

Engine Emission Control - TDV6 3.0L Diesel - Engine Emission Control - System Operation and Component Description

Description and Operation

System Operation

EXHAUST GAS RECIRCULATION (EGR) SYSTEM OPERATION

If small volumes of fuel are injected into a combustion chamber full of pure air, the effect is to create a very lean mixture. This burns at a high temperature, which in turn causes the excess oxygen in the mixture to combine with the naturally occurring nitrogen in the air to create nitrogen oxides (NOx), a noxious class of pollutants associated with acid rain. This is a particular problem for diesel engines at low to medium loads (as the engine has no throttle, the cylinder is replenished with a full charge of 'air' at every induction stroke). Exhaust gas is blended into the intake air charge to create the cylinder charge. As the exhaust gas effectively contains no oxygen, it prevents the formation of a very lean mixture, so lowering combustion temperatures and minimizing the formation of NOx.

At low engine speeds and loads, over 50 percent of the cylinder charge can be made up of recycled exhaust gas. This is routed directly from the exhaust manifold and passes through a gas-water heat exchanger before being supplied to the inlet manifold. The volume of exhaust gas added to the intake charge is regulated by an electronically controlled [EGR \(exhaust gas recirculation\)](#) valve, actuated according to precise engine speed and load by the engine management system.

CRANKCASE VENTILATION SYSTEM OPERATION

Crankcase gasses are drawn into the oil separator unit from the crankcase and the cylinder head covers (both banks) by a vacuum created by a connection into the air induction system.

The crankcase gasses are circulated around the oil separator where the gas and oil are separated. The gas is returned to the inlet side of the air induction system prior to the primary turbocharger. The collected oil is drained down to the sump via the oil cooler and filter housing on the cylinder block.

Component Description

EXHAUST GAS RECIRCULATION (EGR) SYSTEM

EGR System Control Components

E121203

ItemDescription

1	Oxygen sensor
2	Exhaust gas temperature sensorLH (left-hand)
3	Exhaust pipe
4	EGR cooler
5	
6	
7	
8	
9	

By-pass valve vacuum actuator	
6	EGR outlet pipe
7	EGR cooler and valve housing
8	EGR inlet pipe
9	Exhaust system cross-over pipe

The EGR system comprises an EGR cooler and housing assembly which is bolted to the cylinder head, above the exhaust manifold. Each EGR assembly comprises an EGR cooler, a by-pass housing, a by-pass valve motor and a by-pass valve vacuum actuator.

A pipe is connected to the exhaust manifold and directs exhaust gasses into the by-pass housing. A second pipe from the by-pass housing connects to the throttle intake manifold and passes the cooled exhaust gasses into the intake manifold to mix with the clean air entering the engine from the air filter.

The EGR cooler is attached to the by-pass housing with a gasket and 5 screws. The by-pass housing has an engine coolant connection which allows coolant to flow from the engine oil cooler into the by-pass housing. Engine coolant flows from the by-pass housing into a water jacket within the cooler which in cools the exhaust gasses by heat transfer within the cooler. The engine coolant flows from the cooler through an outlet pipe and is passed back into the cooling system via the heater core.

The by-pass housing contains the EGR valve motor, the EGR valve and the by-pass valve.

By-pass Housing Components

E107585

Item	Description
1	By-pass valve vacuum actuator
2	EGR valve motor
3	EGR valve
4	By-pass valve

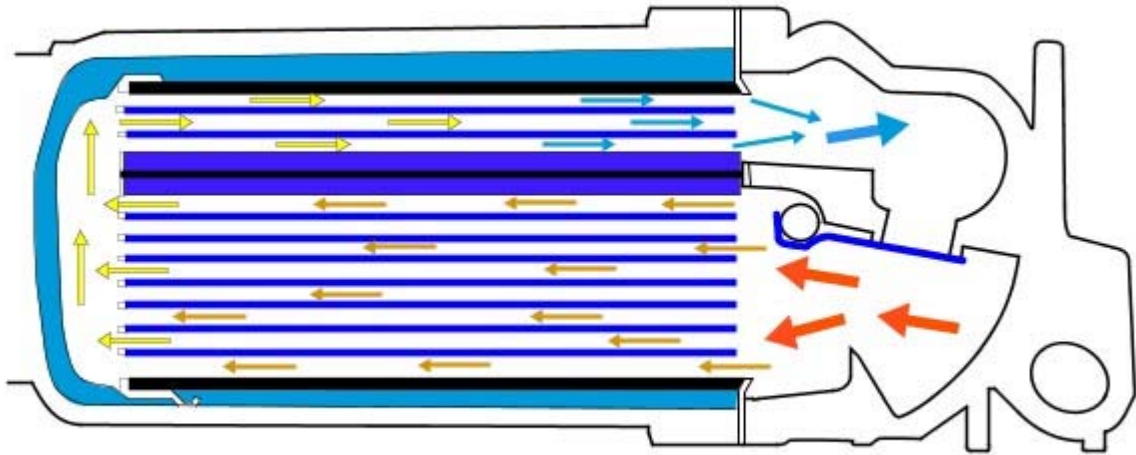

By-Pass Valve

The by-pass valve is a vacuum operated valve which directs the flow of exhaust gasses either through the EGR cooler or by-passes the cooler and directs the gasses directly to the intake manifold.

A vacuum actuator is located on a bracket attached to each EGR cooler. The actuator receives a vacuum which is produced by the vacuum pump located at the rear of the engine. The vacuum actuator is connected to the by-pass valve within the by-pass housing by a connecting rod.

The vacuum supply to the actuator is controlled by the ECM (engine control module). When by-pass control is required, the ECM energizes a vacuum solenoid valve which applies vacuum to the vacuum actuators. The vacuum causes the actuators to move the connecting rods in a linear direction. The linear movement of the rod is transferred to rotary movement of the by-pass valve within the by-pass housing.

By-Pass Valve Closed

E112407

When the by-pass valve is closed, exhaust gasses are directed through the cooler before being passed to the intake manifold.

By-Pass Valve Open

E112408

When the by-pass valve is open, exhaust gasses are passed directly through the by-pass housing into the intake manifold with no cooling applied to the gasses.

EGR Valve

The [EGR](#) valve motor is located on the by-pass housing. A 5 pin connector provides the power, ground and [ECM](#) signal and feedback connections for the motor.

The motor is secured to the by-pass housing with 4 torx screws. A pinion gear on the motor spindle drives a geared rack which is connected to the [EGR](#) valve in the by-pass housing.

The motor is controlled by the [ECM](#) which provides power supply to operate the motor as required. A 5 Volt feedback signal is passed to the [ECM](#) which is used to establish motor position for precise control.

CRANKCASE VENTILATION

The crankcase ventilation system comprises an oil breather and separator. The breather receives crankcase directly from the crankcase and also from the cylinder heads.

The breather is connected to the top of the cylinder block with two seals. Two scavenge pipes located on the top of the breather are connected to the cylinder head covers. A breather pipe is connected from the top of the breather to the clean air intake hose at a point prior to the primary turbocharger.

Clean air being drawn into the engine when it is running creates a vacuum in the breather pipe. This vacuum in turn creates a vacuum in the oil breather and separator which draws gasses from the crankcase and cylinder heads into the breather. These gasses are circulated around the breather, allowing oil particles to be separated from the gas. The gasses are drawn into the breather pipe and are mixed with the clean air being drawn into the turbocharger.

The oil particles separated from the gasses accumulate in the oil separator and drain through a third connection at the bottom of the oil breather and separator, through a connection on the oil cooler housing to the oil pan.

Engine Emission Control - TDV6 3.0L Diesel - Engine Emission Control

Diagnosis and Testing

Principles of Operation

For a detailed description of the engine emission control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (303-08B Engine Emission Control - TDV6 3.0L Diesel)

[Engine Emission Control](#) (Description and Operation),

Engine Emission Control - V6 4.0L Petrol - Engine Emission Control

Description and Operation

Exhaust Gas Recirculation Component Location

E48510

Item	Part Number	Description
1	-	Fuel rail damper
2	-	Vacuum control hoses
3	-	Exhaust manifold to Exhaust Gas Recirculation (EGR) hose
4	-	Exhaust manifold
5	-	ESM valve

Engine emissions on the V6 petrol engine are controlled by the Engine Control Module (ECM). The engine emission control system comprises:

- EGR system
- Crankcase emission system

EGR SYSTEM

ESM Valve

E48511

The EGR System Module (ESM) valve is located on the intake manifold with a pipe connecting the exhaust manifold to the valve. Connection between the sensor and the harness is via a six-way connector. The ESM valve is electrically controlled by a Pulse Width Modulated (PWM) signal. The ESM valve allows burned exhaust gas to be recirculated back into the engine. Since exhaust gas has much less oxygen than air, it is basically inert. The exhaust gas takes the place of air in the cylinder and reduces combustion temperature. As the combustion temperature is reduced, so are the oxides of nitrogen (NOx) emissions.

The ESM valve has an integrated Differential Pressure Feedback-Electronic/Manifold Absolute Pressure (DPFE/MAP) sensor. This pressure transducer monitors the pressure differential on either side of an orifice in the ESM system flow path and then transmits that information to the ECM. The pressure drop measured across this orifice is used to estimate the flow rate of recirculated exhaust gas. An Electronic Vacuum Regulator (EVR) is used to control the vacuum signal to the ESM valve based on the electrical signal from the ECM. The ECM monitors the ESM level based on the feedback from the DPFE/MAP sensor, which creates a closed loop system.

CRANKCASE VENTILATION SYSTEM

Crankcase Ventilation System Component Location

E48512

Item	Part Number	Description
1	-	Crankcase Ventilation (CCV) Hose and cam lock connector
2	-	Engine to evaporative emissions control tube
3	-	Evaporative emissions control valve
4	-	Crankcase Ventilation (CCV) hose
5	-	Positive Crankcase Ventilation(PCV) hose and PCV valve
6	-	PCV jump lead with integral thermistor

Positive Crankcase Ventilation (PCV) Valve

E48513

The crankcase ventilation system comprises:

- Positive Crankcase Ventilation (PCV) valve
- Positive Crankcase Ventilation (PCV) hose
- Crankcase Ventilation (CCV) hose

The PCV is an electrically heated control valve that allows the gas from left hand cylinder head to flow into the air intake. The PCV valve is electrically heated to allow it to remain operational in cold climates. The PCV heater power is fed from the fuel pump relay, therefore heating is always active while the engine is running. The current supplied is internally regulated by the PCV.

Engine Emission Control - V8 5.0L Petrol - Engine Emission Control

Description and Operation

COMPONENT LOCATION

E122438

Item	Part Number	Description
1	-	Part load breather
2	-	Full load breather

INTRODUCTION

The engine emission control system reduces the level of hydrocarbon emissions released to atmosphere from the engine. The engine emission control system consists of a **PCV (positive crankcase ventilation)** system with part and full load breathers. Piston blow-by gases are drawn through the breathers into the engine air intake and added to the air charge. The resultant depression in the engine sump, front covers and cylinder head covers reduces the load on the joint seals in those areas.

PART LOAD BREATHER

E113857

Item	Part Number	Description
1	-	Flexible hose
2	-	Baffle plate
3	-	Oil drain
4	-	PCV (positive crankcase ventilation) valve
5	-	Oil separator

The part load breather consists of an oil separator, two [PCV](#) valves and a flexible hose. The oil separator and the [PCV](#) valves are installed in the top of the [RH \(right-hand\)](#) cylinder head cover. The flexible hose connects the [RH](#) cylinder head cover to the inlet of the intake manifold.

The oil separator is installed in a channel in the top of the cylinder head cover. A baffle plate, which incorporates a gas inlet and an oil drain, is installed over the channel. The two [PCV](#) valves are installed on the outside of the cylinder head cover and connected in parallel in the gas outlet from the channel to the flexible hose. The [PCV](#) valves prevent reverse flow into the cylinder head cover when there is minimal depression in the intake manifold.

FULL LOAD BREATHER

E113867

Item	Part Number	Description
1	-	Flexible hose
2	-	Two-way valve
3	-	Oil drain
4	-	Baffle plate
5	-	Oil separator

The full load breather consists of an oil separator, a two-way valve and a flexible hose. The oil separator and the two-way valve are installed in the top of the **LH (left-hand)** cylinder head cover. The flexible hose connects the **LH** cylinder head cover to the **LH** air duct of the intake air distribution and filtering system.

The oil separator is installed in a channel in the top of the cylinder head cover. A baffle plate, which incorporates a gas inlet and an oil drain, is installed over the channel. The two-way valve is installed in the gas outlet from the channel. The two-way valve prevents reverse flow into the cylinder head cover when there is minimal depression in the air duct.

Engine Emission Control - V8 5.0L Petrol - Engine Emission Control

Diagnosis and Testing

Principles of Operation

For a detailed description of the engine emission control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Engine Emission Control](#) (303-08D Engine Emission Control - V8 5.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Exhaust gas recirculation system ● Breather hoses ● Positive crankcase ventilation valve ● Fuel level ● Fuel contamination/grade/quality ● Throttle body 	<ul style="list-style-type: none"> ● Fuses ● Loose or corroded electrical connectors ● Exhaust Gas Recirculation (EGR) valve ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - V8 5.0L Petrol, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation) / [Diagnostic Trouble Code \(DTC\) Index \(100-00, Description and Operation\)](#).

Intake Air Distribution and Filtering - TDV6 2.7L Diesel -**General Specification**

Item	Specification
Air cleaner	Mann and Hummel fitted with replaceable paper element, air flow meter and optional service indicator
Air flow meter:	
Make	Denso
Location	Air intake duct
Service indicator - Optional:	
Type	Transparent body giving visual indication of filter element condition
Location	In the filter housing adjacent to the air intake duct

Intake Air Distribution and Filtering - TDV6 2.7L Diesel - Intake Air Distribution and Filtering

Description and Operation

Intake Air Distribution

E45594

Item	Part Number	Description
1	-	Air filter box
2	-	Porous duct
3	-	Air intake duct
4	-	Air intake manifolds
5	-	Camshaft cover
6	-	Turbo charger
7	-	Air filter to turbo pipe
8	-	Turbo to charge air cooler pipe
9	-	Charge air cooler
10	-	Charge air cooler to intake manifold pipe
11	-	Filter minder (optional fit for dusty climates)

The 2.7 Liter Diesel air intake and distribution system comprises:

- Wing mounted intake duct
- A filter minder sensor
- Camshaft cover mounted intake manifolds (x2)
- Charge air cooler

- Turbo charger

Air is drawn in from the vehicle exterior via the wing mounted intake duct, along a porous duct inside the wing to the air filter box intake. Once the air has passed through the air filter it is drawn along a duct to the turbo charger. From the turbo charger the air is forced through the charge air cooler up to the electric throttle assembly and then to the inlet manifold assembly.

E45595

Item	Part Number	Description
1	-	Port deactivation control valves (not used)
2	-	Air intake manifolds
3	-	Cylinder head covers
4	-	Air intake ducts

Intake Air Distribution and Filtering - TDV6 2.7L Diesel - Intake Air Distribution and Filtering

Diagnosis and Testing

Principles of Operation

For a detailed description of the intake air distribution and filtering system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Intake Air Distribution and Filtering](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Hoses and ducts condition and installation ● Air cleaner element condition and installation ● Restricted air intake ● Vacuum hoses condition and installation ● Pipework to turbocharger condition and installation ● Turbocharger condition and installation ● Charge air coolers 	<ul style="list-style-type: none"> ● Fuse(s) ● Wiring harness ● Loose or corroded electrical connector(s) ● Mass Air Flow (MAF) sensor ● Air Charge Temperature (ACT) sensor ● Manifold absolute pressure (MAP) sensor ● Intake Air Temperature (IAT) sensor ● Intake air shut-off throttle solenoid

Check the joints between the throttle body outlets and the intake manifolds. Check the charge air cooler seals. Check the intake system and hoses for correct installation/damage.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - TDV6 2.7L Diesel, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Intake Air Distribution and Filtering - TDV6 2.7L Diesel - Air Cleaner

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. **CAUTION:** When removing the air cleaner outlet pipe, make sure the rubber seal, on the LH side lower air pipe, does not become dislodged. Make sure the seal is properly seated onto the lower pipe.

Remove the air cleaner outlet pipe.

- Remove the 2 screws.
- Loosen the clip.

3. Remove the air cleaner assembly.

- Disconnect the electrical connector.
- Release the air cleaner from the 2 grommets.

4. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the manifold absolute pressure (MAP) sensor.

- Remove the 2 Torx screws.
- Remove the O-ring seal.

Installation

1. **CAUTION:** When installing the air cleaner outlet pipe, make sure it is correctly seated onto the lower air pipe, so that an air-tight seal is made.

- **NOTE:** When installing the air cleaner, make sure the locating pegs fit securely into the grommets.

To install, reverse the removal procedure.

Intake Air Distribution and Filtering - TDV6 2.7L Diesel - Air Cleaner Element

Removal and Installation

Removal

1. Release the air cleaner housing cover.
 - Remove the 7 screws.
2. Remove the air cleaner element.

Installation

1. To install, reverse the removal procedure.
 - Clean the base of the air cleaner.
 - Check that the drain valve is clear.

Intake Air Distribution and Filtering - TDV6 2.7L Diesel - Charge Air Cooler

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
3. Remove the radiator.
For additional information, refer to: [Radiator](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
4. Remove the charge air cooler.
 - Remove the 2 retaining pins.

E49355

Installation

1. Install the charge air cooler.
 - Install the 2 retaining pins.
2. Install the radiator.
For additional information, refer to: [Radiator](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Intake Air Distribution and Filtering - TDV6 3.0L Diesel - Intake Air Distribution and Filtering - Overview

Description and Operation

Authoring Template

OVERVIEW

The intake air distribution and filtering system comprises:

- Two MAF (mass air flow) / IAT (intake air temperature) sensor
- Charge air temperature sensors
- Air cleaner and housing
- Charge air cooler
- Primary and secondary turbochargers.

The system cleans, cools and compresses the intake air. The turbochargers compress the air which is then cooled in the charge air cooler before being mixed with the injected fuel in the cylinder producing a high energy combustion increasing engine performance.

Intake Air Distribution and Filtering - TDV6 3.0L Diesel - Intake Air Distribution and Filtering - System Operation and Component Description

Description and Operation

System Operation

OPERATION

Air is drawn into the air intake system via the air intake vent located on the front [RH \(right-hand\)](#) fender of the vehicle. The air passes into the air cleaner housing and passes through the air cleaner. The air cleaner is a pleated, paper type filter which removes dust, pollen etc. from the intake air.

The filtered clean air passes from the air cleaner housing to the turbocharger inlet valve assembly. Depending on engine load and operating conditions, the intake air can be passed to only the primary turbocharger or to both the primary and secondary turbochargers.

Exhaust gasses leaving the exhaust manifolds are used to drive a turbine in the turbocharger which in turn drives a compressor. The rotational speed of the compressor is directly related to the speed of the exhaust gasses leaving the engine. Increased exhaust gas emission drives the turbine, and subsequently the compressor, faster, further compressing the intake air delivered to the engine.

The compression of the air by the turbocharger increases the air pressure. The intake air is passed into the charge air cooler which reduces the air temperature as it passes through the cooler. This in turn increases the volumetric efficiency by increasing intake air charge density. The cooled and compressed air is mixed with the injected fuel in the cylinder producing a high energy combustion increasing engine performance.

Component Description

DESCRIPTION

Air Cleaner and Housing

The air cleaner housing is located in the front [RH](#) side of the engine compartment. The housing has a water drain. Two [NVH \(noise, vibration and harshness\)](#) mounting grommets secure the air cleaner housing.

The air cleaner element is a pleated paper type element with a rubber seal around its perimeter. The seal locates in a groove in the housing and prevents air by-passing the element. The housing upper lid can be removed by removing 4 screws to release the lid.

Charge Air Cooler

The charge air cooler is located at the front of the engine compartment, between the [A/C \(air conditioning\)](#) condenser and the engine cooling radiator.

Turbochargers are designed to force more air mass into the engine intake manifold and combustion chambers. This compression process by the turbocharger produces heat which can reduce the performance gains of turbocharging due to reduced density of the intake air and an increase the cylinder combustion temperature. To counteract this, the charge air cooler is used to reduce the intake air temperature which increases the density of the air allowing more air molecules to be delivered to the combustion chamber.

The cooler is a cross flow type cooler and has inlet and outlet connections. The bottom [LH \(left-hand\)](#) and [RH](#) connections are the inlets for the compressed air delivered from the turbocharger compressors. The top [RH](#) connection is the outlet for the cooled compressed air to be delivered to the throttle intake manifold.

The charge air cooler is an air-to-air type cooler. Heated air from the turbochargers is passed through tubes in the cooler. Ambient air passing over the tubes cools the intake air as it passes through the cooler.

Air Intake Components

The air intake components comprise 3 main components; airbox, intake ducting and a throttle intake manifold.

Airbox

The airbox allows for the connection of the cooled intake air from the charge air cooler to the throttle intake manifold. The air cleaner housing houses a [MAF \(mass air flow\)](#) sensor incorporating a temperature sensor which measures the air entering the turbochargers and passes this information to the [ECM \(engine control module\)](#).

Refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Description and Operation).

There are two ducts from the airbox, one ducts air to the primary turbocharger and the other to the secondary turbocharger. Boost pressure is applied via the secondary ducting to the secondary turbocharger to maintain the correct lubrication during driving conditions where the secondary turbocharger is inactive.

Refer to: [Turbocharger](#) (303-04D Fuel Charging and Controls - Turbocharger - TDV6 3.0L Diesel, Description and Operation).

Throttle Intake Manifold

The throttle intake manifold is located between the 2 intake manifolds and the airbox. The manifold splits the air entering the engine between the 2 intake manifolds.

The throttle intake manifold houses a [DC \(direct current\)](#) electric throttle actuator which controls a flap in the body of the manifold. The flap is controlled by the [ECM](#) and is constantly adjusted in response to driver inputs via the throttle pedal to precisely control the amount of air allowed into the intake manifolds.

Refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Description and Operation).

Pipe connections on either side of the throttle intake manifold allow for the attachment of the exhaust gas outlet pipes from the [EGR \(exhaust gas recirculation\)](#) valves. The ends of the [EGR](#) pipes are specially designed to mix the recirculated exhaust gas with the intake air and provide an even distribution to each side of the engine.

Refer to: [Engine Emission Control](#) (303-08B Engine Emission Control - TDV6 3.0L Diesel, Description and Operation).

A boost pressure sensor is located on the top of the manifold where the air flow splits for the 2 intake manifolds. The pressure sensor measures the pressure of the intake air as delivered from the one or both of the turbochargers and passes this information to the [ECM](#) for turbocharger control.

Refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Description and Operation).

Intake Manifolds

The intake manifolds are an integral part of the cylinder head covers. Each intake manifold is connected to the throttle intake manifold via a push fit, sealed connection. The intake manifolds direct intake air to the inlet valves for each combustion chamber.

Intake Air Distribution and Filtering - TDV6 3.0L Diesel - Intake Air Distribution and Filtering

Diagnosis and Testing

Principles of Operation

For a detailed description of the intake air distribution and filtering system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (303-12B Intake Air Distribution and Filtering - TDV6 3.0L Diesel)

Location	Air intake duct
Service indicator - Optional:	
Type	Transparent body giving visual indication of filter element condition
Location	In the filter housing adjacent to the clean air duct

Intake Air Distribution and Filtering - V6 4.0L Petrol - Intake Air Distribution and Filtering

Description and Operation

4 Liter V6 Petrol Intake Air Distribution and Filtering Component Location

E45603

Item	Part Number	Description
1	-	Air filter box
2	-	Air intake
3	-	Intake manifold tuning valve (IMTV)
4	-	Intake manifold
5	-	Electronic throttle
6	-	Filter minder (optional fit)

The 4.0 Liter V6 engine air intake and distribution system comprises:

- Air filter box
- Air intake
- Intake manifold
- Electronic throttle

AIR FILTER BOX

The air filter box is located in the front of the engine bay on the inside of the RH front wing. Air is drawn from the air intake in the wing through the wing cavity and into the air filter box.

After the air filter box there is a resonator located after the Mass Air flow/ Intake Air Temperature (MAF/IAT) sensor.

INTAKE MANIFOLD

Air Intake Manifold

E45604

Item	Part Number	Description
1	-	Intake manifold
2	-	Electronic throttle
3	-	Inlet manifold tuning (IMTV)

The intake manifold is located on top of the engine between the two cylinder banks. The manifold is manufactured from an aluminium alloy. The intake manifold comprises a central chamber with six tracts leading to the inlet ports on the cylinder heads.

INTAKE MANIFOLD TUNING VALVE (IMTV)

Intake Manifold Tuning Valve

E45605

Item	Part Number	Description
1	-	Intake Manifold Tuning Valve (IMTV)

Intake Manifold Tuning Valve

The Intake Manifold Tuning Valve (IMTV) is located at the front right hand side of the air intake manifold. The IMTV is controlled by a PWM signal from the ECM

For additional information, refer to: [Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

. The IMTV moves a plate within the inlet manifold to allow or block sonic pulses between the split manifold halves. This, in effect, extends the inlet runners and optimises for better low rpm torque.

Intake Air Distribution and Filtering - V6 4.0L Petrol - Intake Air Distribution and Filtering

Diagnosis and Testing

Principles of Operation

For a detailed description of the intake air distribution and filtering system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Intake Air Distribution and Filtering](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Intake Air Distribution and Filtering - V8 5.0L Petrol - Intake Air Distribution and Filtering

Description and Operation

COMPONENT LOCATION

E123715

Item	Part Number	Description
1	-	Intake manifold
2	-	Air intakes, air cleaners and air ducts

INTRODUCTION

The intake air distribution and cleaning system comprises:

- Dual air intakes, air cleaners and air ducts.
- An intake manifold.

AIR INTAKES, AIR CLEANERS AND AIR DUCTS

E123716

Item	Part Number	Description
1	-	Resonators
2	-	Full load breather connector stub
3	-	Resonators
4	-	Clean air duct
5	-	Hose clamp
6	-	LH (left hand) clean air convolute
7	-	Hose clamp
8	-	LH air cleaner
9	-	LH dirty air duct
10	-	LH air intake hose
11	-	LH air intake
12	-	Hose clamp
13	-	RH (right hand) dirty air duct
14	-	RH air intake
15	-	RH air intake hose
16	-	RH air cleaner
17	-	Hose clamp
18	-	RH clean air convolute
19	-	Hose clamp

Air is supplied to the air cleaners through the air intakes, air intake hoses and dirty air ducts in the fenders.

The air cleaners are located in the engine compartment, forward of the suspension housings. Two isolators locate each air cleaner on the related front side member. Each air cleaner consists of an air cleaner element installed in a tray and enclosed with a cover secured by six screws. Air inlet and outlet connections are incorporated into the tray and cover respectively. The bottom of the tray incorporates a drain valve to prevent the accumulation of water in the air cleaner. The air outlet connection incorporates a **MAFT (mass air flow and temperature)** sensor.

Air Cleaner

E121098

Item	Part Number	Description
1	-	MAFT sensor
2	-	Cover
3	-	Screw (6 off)
4	-	Air cleaner element
5	-	Inlet connection
6	-	Drain valve
7	-	Isolators
8	-	Tray
9	-	Outlet connection

The clean air convolutes and the clean air duct direct the air from the air cleaners into the electric throttle. Hose clamps connect the clean air convolutes and the clean air duct together, and to the air cleaners and the electric throttle.

The clean air duct also incorporates the following:

- Resonators, to reduce air induction noise.
- A connector stub for the engine full load breather pipe.

INTAKE MANIFOLD

E112073

Item	Part Number	Description
1	-	Engine cover rear attachment points
2	-	Engine harness shield attachment points
3	-	Cover plate
4	-	Brake booster vacuum connection
5	-	Outlet ports
6	-	Evaporative emissions connection
7	-	Inlet port
8	-	MAP (manifold absolute pressure) sensor
9	-	Part load breather connection
10	-	Fuel crossover tube attachment points
11	-	Engine cover front attachment points

The intake manifold is installed between the cylinder heads and directs air from the electric throttle to the individual cylinders. The inlet port connects to a central chamber in the intake manifold. Eight separate tracts connect the central chamber to the outlet ports. A cover plate seals the rear of the intake manifold.

The intake manifold incorporates:

- A stub pipe for connection of the part load breather.
- A stub pipe for connection of the evaporative emissions system.
- A MAP (manifold absolute pressure) sensor.
- A vacuum connection for the brake booster.
- Threaded inserts to provide attachment points for the electric throttle, fuel crossover tube, engine cover and an engine harness shield.
- Compression limiters in the cylinder head attachment points.
- Seals in the inlet and outlet ports.
- A VIS (variable intake system).

Variable Intake System

E112074

Item	Part Number	Description
1	-	Cassette
2	-	Cover plate
3	-	RH pneumatic actuator
4	-	Vent cap
5	-	Electrical connector
6	-	Tuning valve
7	-	Vacuum connector
8	-	LH pneumatic actuator
9	-	Vacuum hoses
10	-	Drive shaft
11	-	Flap valve

The VIS changes the length of the tracts in the intake manifold to improve the air flow to the cylinders, which improves the engine power and torque.

A cassette in the intake manifold contains eight flap valves, each located in an opening part-way along one of the tracts. Two drive shafts connect the flap valves together in two groups of four. Each drive shaft is connected to a pneumatic actuator installed on the cover plate of the intake manifold.

A tuning valve, also installed on the cover plate, controls the application of vacuum pressure to the pneumatic actuators. The tuning valve is a normally-closed solenoid-operated valve installed in the vacuum line between the cover plate and the pneumatic actuators. A vent cap on the tuning valve allows atmospheric pressure into the vacuum line to the pneumatic actuators when the tuning valve is closed.

The [ECM \(engine control module\)](#) controls the operation of the tuning valve.

CONTROL DIAGRAM (VARIABLE INTAKE SYSTEM)

• NOTE: A = Hardwired

E121099

Item	Part Number	Description
1	-	Battery
2	-	EJB (engine junction box) (ECM relay)
3	-	Tuning valve
4	-	ECM

OPERATION

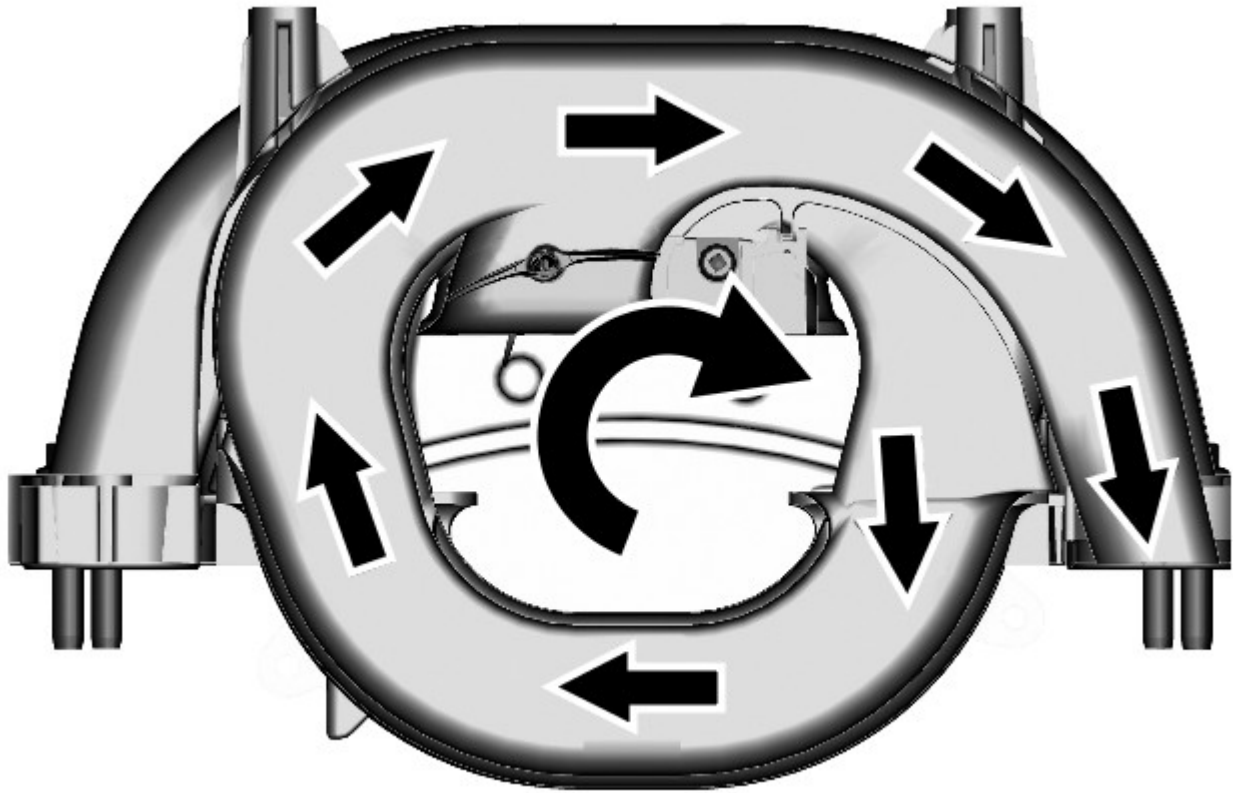

Variable Intake System

The flap valves can be set to one of two positions, to produce short or long intake tracts in the intake manifold. Long intake tracts are produced with the flap valves closed. Short intake tracts are produced with the flap valves open. The flap valves are closed at engine speeds up to 4700 rev/min and open at engine speeds of 4700 rev/min and above, with a hysteresis of 50 rev/min.

The tuning valve receives a power feed from the EMS relay in the **EJB (engine junction box)**, and is connected to ground through the **ECM**. To close the flap valves, the **ECM** connects the tuning valve to ground. The energized tuning valve blanks off the atmospheric vent and opens the vacuum line between the cover plate and the pneumatic actuators. The depression in the intake manifold is sensed at the pneumatic actuators, which turn the drive shafts and move the flap valves to the closed position.

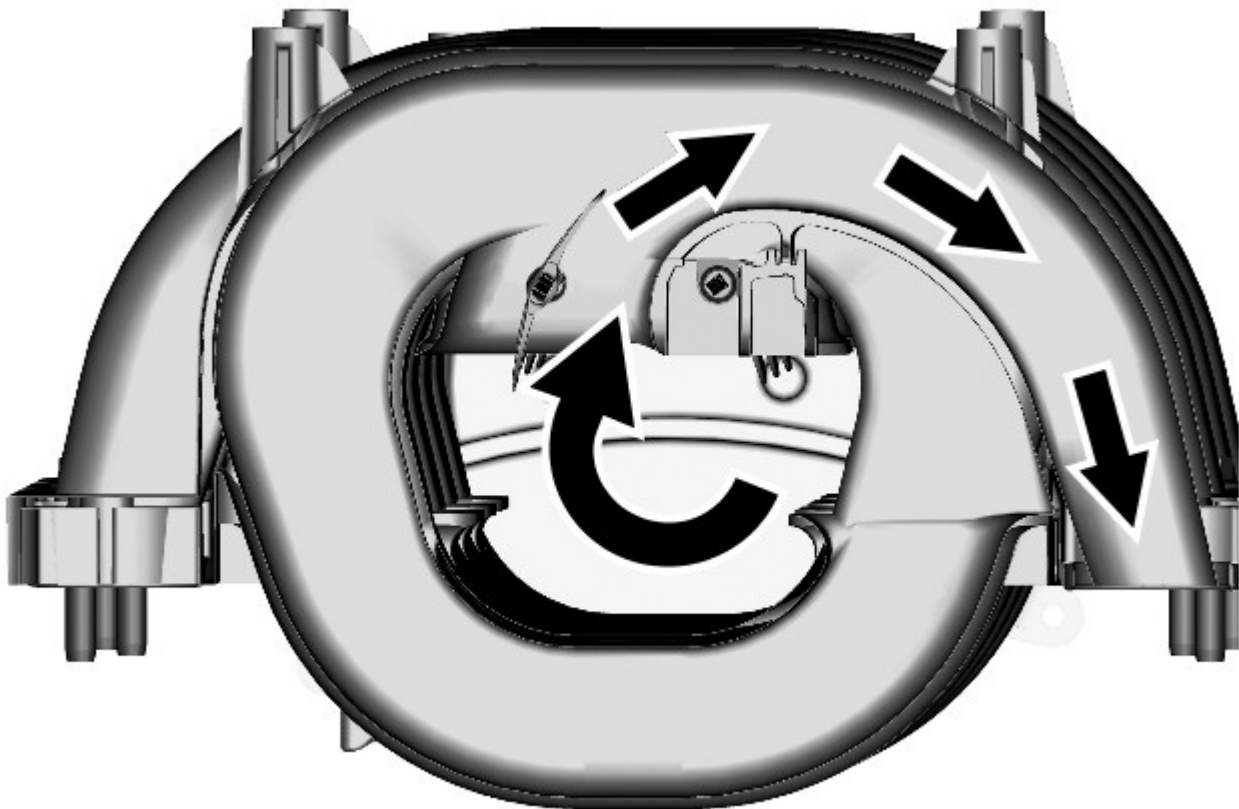

To open the flap valves, the **ECM** disconnects the ground connection and the tuning valve is de-energized closed. Atmospheric pressure is sensed at the pneumatic actuators through the vent cap on the intake manifold tuning valve and the flap valves move to the open position.

Intake Air Distribution and Filtering - V8 5.0L Petrol - Intake Air Distribution and Filtering

Diagnosis and Testing

Principles of Operation

For a detailed description of the intake air distribution and filtering system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Intake Air Distribution and Filtering](#) (303-12D Intake Air Distribution and Filtering - V8 5.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Hoses and ducts (damage/connections) ● Air cleaner element (contaminated/blocked) ● Restricted air intake ● Supercharger ● Supercharger (cooling fan) drive belt ● Supercharger seals and gaskets ● Charge air coolers (damage/connection) 	<ul style="list-style-type: none"> ● Mass Air Flow (MAF) sensor ● Manifold Absolute Pressure (MAP) sensor ● Manifold Absolute Pressure/Temperature (MAPT) sensor ● Throttle body ● Harness (security/damage) ● Connections (security/damage)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Vehicle does not start/hard starting/poor performance	<ul style="list-style-type: none"> ● Restricted/Blocked air intake ● Restricted/Blocked air cleaner element 	Clear the restriction. Replace the air cleaner element as necessary. Refer to the relevant workshop manual section.
Excessive intake noise	<ul style="list-style-type: none"> ● Intake pipe disconnected/damaged after the air cleaner ● Air cleaner assembly incorrectly assembled/damaged 	Check the intake system and hoses for correct installation/damage. Refer to the relevant workshop manual section.
Lack of boost	<ul style="list-style-type: none"> ● Supercharger drive belt broken/slipping ● Supercharger fault ● Supercharger air intake fault ● Major air leakage (after the supercharger) 	Check the supercharger and drive belt. Check the charge air coolers. Refer to the relevant workshop manual section.
Noise	<ul style="list-style-type: none"> ● Supercharger drive belt slipping ● Supercharger fault ● Major air leakage (after the supercharger) 	Check the supercharger and drive belt. Remove the supercharger drive belt and recheck for noise. Turn the supercharger by hand and check for excessive resistance. Check for excessive play at the supercharger pulley. Check the charge air coolers. Refer to the relevant workshop manual section.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - V8 5.0L Petrol, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Evaporative Emissions - V6 4.0L Petrol -

Torque Specifications

Description	Nm	lb-ft
Evaporative emissions canister bolts	23	17

Evaporative Emissions - V6 4.0L Petrol - Evaporative Emissions

Description and Operation

4.0L V6 Evaporative Emissions Component Layout

E44558

Item	Part Number	Description
1	-	Fuel filler head
2	-	DMTL pump filter (NAS only)
3	-	Fuel tank vent hose to canister
4	-	DMTL pump (NAS only)
5	-	Charcoal canister
6	-	Fuel tank breather hose from tank
7	-	Purge valve
8	-	Purge hose
9	-	Fuel tank
10	-	Charcoal canister vent hose (All except NAS) or DMTL pump vent hose (NAS)

GENERAL

The 4.0L V6 Evaporative emission (EVAP) control system reduces the level of hydrocarbons released into the atmosphere by fuel vapor venting from the fuel tank. The system comprises a charcoal canister, purge valve and interconnecting vent pipes and hoses. The vent pipes are connected to the system components using quick release connectors.

Fuel vapor is generated by the fuel in the tank and the amount of vapor produced increases as the fuel heats up. Fuel vapor can flow freely to the charcoal canister via the tank venting system. The venting system consists of roll over valves and a liquid vapor separator mounted internally in the tank and then externally via a breather line. The breather line allows the fuel vapor to flow to the charcoal canister via a 'Y' piece mounted on the filler head.

On NAS vehicles the vapor generated during refueling flows without restriction to the charcoal canister.

On all vehicles except NAS, the vapor is restricted in its path to the charcoal canister but can flow freely during the refueling operation to atmosphere, via the filler opening.

The vapor passes into the charcoal canister where it is absorbed and stored by the charcoal. Because there is a limit to the amount of vapor the canister can contain, the fuel vapor is purged from the canister when the engine is running and burned in the engine.

PURGE VALVE AND HOSES

E44559

Item	Part Number	Description
1	-	Electric throttle
2	-	Air intake manifold
3	-	Fuel feed jump hose (Ref. only)
4	-	Purge hose
5	-	Purge valve
6	-	Bracket
7	-	Hose clamp
8	-	Manifold to purge valve hose

The purge valve and purge hose are located on the air intake manifold, which is attached to the top of the engine and covered by the engine acoustic cover.

The purge hose is connected, at the right hand rear of the engine, from the purge valve with a quick release coupling to the purge line which runs parallel with the fuel feed line along the top of the fuel tank to the charcoal canister.

The purge hose is connected to the purge valve on the air intake manifold and is routed, via a hose clamp, to a connection on the manifold. The hose is connected to the air intake manifold with a quick release connector.

The purge valve is located on a bracket at the rear of the air intake manifold and secured with a single bolt. The purge valve is a solenoid operated valve which is closed when de-energised. The valve is controlled by the Engine Control Module (ECM) and is cycled when engine operating conditions are correct to allow purging of the charcoal canister.

The purge valve is Pulse Width Modulated (PWM) at 10Hz by the ECM. At this high frequency the pulses of purge gas flowing into the inlet manifold are almost a continuous flow. The valve operates between 5% and 100% duty or mark space ratio (% open time).

The ECM waits until the engine is running above 40°C (104°F) coolant with closed loop fuel operational. Under these conditions the engine

should be running smoothly with no warm up enrichment. The purge valve duty (and flow) is initially ramped slowly because the vapor concentration is unknown (a sudden increase in purge could cause the engine to flood). The concentration is then determined from the amount of adjustment that the closed loop fuelling is required to make to achieve the target Air Fuel Ratio (AFR). Once the concentration has been determined, the purge flow can be increased rapidly and the injected fuel can be proactively adjusted to compensate for the know purge vapor and the target AFR control is maintained.

When the purging process is active, fresh air is drawn into the charcoal canister via the DMTL pump atmospheric vent connection and its filter on NAS vehicles and via the vent hose connection and the spider trap on non NAS vehicles.

On NAS vehicles the system does not include a pressure test point. Pressure testing of the purge valve hose is achieved by disconnecting the purge valve joint on the underside of the vehicle, forward of the fuel tank and connecting a special tool to allow the system to be pressure tested. The test performs a pressure test on the purge hose connection forward of the fuel tank back to the charcoal canister. The special tool is then connected to the purge hose connection forward of the fuel tank to perform a pressure test on the purge hose to the purge valve.

CHARCOAL CANISTER

Charcoal Canister - All except NAS

E44560

Item	Part Number	Description
1	-	Charcoal canister
2	-	Charcoal canister atmospheric vent connection
3	-	Purge hose connection
4	-	Charcoal canister tank vent connection

Charcoal Canister - NAS

E44561

Item	Part Number	Description
1	-	Charcoal atmospheric vent connection (via DMTL pump)
2	-	DMTL pump
3	-	Charcoal canister
4	-	Electrical connector
5	-	Purge hose connection
6	-	Charcoal canister vent hose connection

The charcoal canister is located in a central position, forward of the spare wheel. It is attached at the rear with two bolts which screw into the spare wheel carrier. At the front, the canister has two lugs which locate in the parking brake module support bracket.

The canister on ROW vehicles has a capacity of 1400 cc (85.4 in³).

The canister on NAS vehicles has a capacity of 3000 cc (183 in³).

The canister has three ports which allow for the attachment of the atmospheric vent hose, the purge hose and the tank vent hose. On NAS vehicles the atmospheric vent hose connection allows for the attachment of the DMTL pump.

The canister contains a bed of activated charcoal or carbon. The charcoal is produced using special manufacturing techniques to treat the charcoal with oxygen. The oxygen treatment opens up millions of pores between the carbon atoms resulting in a highly porous charcoal with a

very large effective surface area which is capable of absorbing large quantities of fuel vapor. Once treated the charcoal is known as 'activated' carbon or charcoal. The charcoal canister on NAS vehicles uses a higher grade charcoal to meet the requirements of LEV2 emission regulations.

DIAGNOSTIC MONITORING OF TANK LEAKAGE (DMTL) - NAS ONLY

The DMTL system is a legislative requirement for NAS vehicles. The DMTL system periodically checks the EVAP system and the fuel tank for leaks when the ignition is switched off.

The DMTL system comprises the previously described components of the EVAP system with the following additional components: a DMTL pump and a DMTL filter.

The DMTL pump is connected to the atmospheric vent of the charcoal canister and incorporates an electric air pump, a Positive Temperature Co-efficient (PTC) heating element, a normally open valve and a reference orifice. The DMTL pump is only operated when the ignition is switched off and is controlled by the ECM. The ECM also monitors the electric air pump operation and the normally open valve for faults.

The DMTL filter protects the pump from dust being drawn into the system when the pump is being operated. The filter is located on the fuel filler head and is connected to the DMTL pump by a hose.

DMTL Operation

To check the fuel tank and the EVAP system for leaks, the ECM operates the DMTL pump and monitors the current draw. Initially, the ECM establishes a reference current by pumping air through the reference orifice and back to atmosphere. Once the reference current is determined, the ECM closes the normally open valve which seals the EVAP system. The purge valve remains de-energised and is therefore closed. The output from the air pump is diverted from the reference orifice and into the EVAP system.

When the normally open valve is closed, the load on the air pump falls to zero. Providing there are no leaks, the air pump will begin to pressurise the EVAP system and the load and current draw in the pump increases. By monitoring the rate and level of the current increase, the ECM can determine if there is a leak in the EVAP system.

During normal vehicle operation, the ECM energises the heating element in the pump to prevent condensation formation and possible incorrect current readings.

Leaks are classified as:

- Minor - equivalent to a hole diameter of 0.5 to 1.0 mm (0.02 to 0.04 in)
- Major - equivalent to hole diameter of 1.0 mm (0.04 in) or greater.

The ECM performs a check for major leaks each time the ignition is switched off, providing the following conditions are met:

- The vehicle speed is zero
- The engine speed is zero
- The pressure altitude (70kPa (10.15 lbf/in²) derived from engine load calculations) is below 3047 m (10,000 feet)
- The ambient temperature is between 0 and 40°C (32 and 104°F)
- The charcoal canister load factor is 2 or less (where the load factor is a measure, between -1 and +30, of the fuel vapor stored in the charcoal canister. Where -1 is 0% fuel vapor, 0 is stoichiometric fuel vapor level and +30 is 100% saturated with fuel vapor.
- The fuel tank level is valid and between 15 and 85% of nominal capacity
- The engine running time during the previous cycle was more than 10 minutes
- The battery voltage is between 10 and 15 volts
- The last engine off time was more than 180 minutes
- No errors are detected with the EVAP components, the ambient air temperature and the fuel level
- High range must be selected on the transfer box.

• NOTE: A leak test can be performed using T4. This overrides the above conditions and is useful for checking correct system and component operation.

The ECM performs a check for minor leaks after every 14th major leak check or after refuelling is detected.

When the leak check is complete, the ECM stops the DMTL pump and opens (de-energises) the normally open valve.

If the fuel filler cap is opened or refuelling is detected during the leak check, by a sudden drop in the current draw or a rise in the fuel level, the ECM aborts the leak check.

If a leak is detected during the check, the ECM stores an appropriate fault code in its memory. If a leak is detected on two consecutive checks, the ECM illuminates the Malfunction Indicator Lamp (MIL) in the instrument cluster on the next drive cycle.

The duration of a leak check can be between 40 and 270 seconds depending on the results and fuel tank level.

Evaporative Emissions - V6 4.0L Petrol - Evaporative Emissions

Diagnosis and Testing

Principles of Operation

For a detailed description of the evaporative emission system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Evaporative Emissions (303-13 Evaporative Emissions - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fuel filler cap and seal ● Fuel filler neck ● DMTL fresh air filter (restriction, etc) ● Fuel tank (leaks, damage, etc) ● Fuel lines and joints, etc ● Carbon canister ● Purge valve ● Diagnostic module fuel tank leak (DMTL) pump module 	<ul style="list-style-type: none"> ● Fuses ● Connectors ● Harness ● Purge valve ● Diagnostic module fuel tank leak (DMTL) pump

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.
5. 5. Where K-Line, Vacutec or other proprietary smoke test equipment is available, it should be utilized to assist with Evaporative Emissions System leak diagnosis.

Symptom Chart

Symptom	Possible Causes	Action
Difficulty in filling fuel tank	<ul style="list-style-type: none"> ● Restriction in the vapour line between the fuel tank and the carbon canister outlet/atmospheric port 	Check for restrictions/damage, etc (see visual inspection)
Fuel smell	<ul style="list-style-type: none"> ● System leak ● Purge valve inoperative 	Check for leaks, check the purge valve operation
'Check Fuel Filler Cap' displayed on Message Center	<ul style="list-style-type: none"> ● Fuel filler cap missing/not tightened after refuelling 	Check the fuel filler cap and seal

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Evaporative Leak OBD Fault Rectification Guide

Determine Which DTC Has Been Stored

Using the manufacturer approved diagnostic system, choose **diagnostic session**, then choose the following symptom paths : **Powertrain/engine system/fuel vapour and odor**, **Powertrain/engine system/fuel tank**, **Electrical/instruments /warning lamps/engine malfunction lamp/lamp illuminated**, **Powertrain/engine system/engine performance/fuel consumption high**

• **NOTE:** This guide covers DTCs that relate to evaporative leak monitoring, as listed in the table below

DTC	Description
P0442-00	DMTL small leak
P0447-00	DMTL COV electrical low (open)
P0448-00	DMTL COV electrical high
P0455-00	DMTL rough leak
P2401-00	DMTL pump electrical low (open)
P2402-00	DMTL pump electrical high
P2404-2F	DMTL noise fault
P2404-29	DMTL reference leak

DTC	Description
P2405-00	DMTL reference current low
P2406-00	DMTL reference current high
P2450-00	DMTL COV stuck open
P2451-00	DMTL COV stuck closed
P240B-00	DMTL heater electrical low (open)
P240C-00	DMTL heater electrical high

Attempt To Replicate The Fault Using The "Fuel Leak Check" Forced Test

1. Record any DTCs that has been logged
 2. Using the manufacturer approved diagnostic system, in the **Recommendations** tab run the **Fuel Leak Check** forced test
 3. For the test to run the fuel level must be between 15% and 85%
 4. During this procedure the engine must be off
 5. The possible responses from the test and the associated DTCs are listed below
 6. If again no fault is found it could suggest that the failure mode is a borderline condition (refer to section 3) or that it was caused by incorrect fitment of the fuel cap or the fuel filler neck is at fault therefore it is important not disturb the fuel cap
 7. Disconnect purge pipe from the purge valve, observe the condition of connection (the seating and condition of the "O" ring) and then reconnect. Using the manufacturer approved diagnostic system, run **Purge Valve Self Test** (to clean the purge valve) then run the **Fuel Leak Check**
 8. If the test failed, a smoke test is required to determine the cause of the leak
- NOTE: P240B & P240C are not included in the **Fuel Leak Check** forced test (these monitors run at every ignition on and complete within 30 seconds)

Response Description	ID	Equivalent DTC
Function running: Reference leak measurement	1	
Function running: Rough leak measurement	2	
Function running: Small leak measurement	3	
Function running: 2nd ref leak measurement	4	
Function running: COV Cleaning	5	
Function aborted due to conditions: Vbatt conditions not correct (too high/ low)	11	
Function aborted due to conditions: Variation Ref. I (reference current) too high	12	P2404-29
Function aborted due to conditions: DMTL electrical fault	13	P0447, P0448
Function aborted due to conditions: Maximum diagnostic time exceeded	14	
Function aborted due to conditions: Crash detected	15	
Function aborted due to conditions: Refuel detected	20	
Function aborted due to conditions: Filler cap opened	21	
Function aborted due to conditions: Engine start	23	
Function aborted due to conditions: Noisy current measurement	24	P2404-2F

Function aborted due to conditions: Ambient pressure outside range	27	
Function aborted due to conditions: Other conditions	29	
Function complete - Tight system, fault free	30	
Function complete - Fine leak detected	31	P0442
Function complete - Rough leak detected	32	P0455
Function complete - Module error	33	P2401, P2402, P2450, P2451, P2405, P2406, P2404-29
Function complete - Medium leak detected	34	P0442, P0455

Read The "Ranking values" To Determine How Far Away The Result Is From The Failure Threshold

9. When the **Fuel Leak Check** forced test has completed the test results (known as ranking values) will be displayed
10. These should be compared against the limits shown in the table below
11. If the test result is borderline then there is a risk that a failure will occur at a later date (during customer usage of the vehicle)
12. To avoid this the vehicle should be carefully checked for any small leaks

Ranking Value	Normal Result For Tight System	Leak Failure Condition
Rough Leak (40 thou+)	0 > = 50	>= 128
Small Leak (20 thou+)	0 > = 60	>= 128

TRACE THE ROOT CAUSE OF THE FAULT

The list below provides some suggested actions to help trace the root cause of the fault

Each action should be followed up with a **Fuel Leak Check** forced test (and ranking value check) in order to determine if any improvement has been made

DTC	Fault Description	Fault Rectification Actions after smoke test
-----	-------------------	--

DTC	Fault Description	Fault Rectification Actions after smoke test
P0442-00	DMTL small leak	<ul style="list-style-type: none"> ● 1. Inspect / refit filler cap after smoke test (inspect filler neck for correct fitment to pocket so that filler neck protrudes) ● 2. Run engine at idle; Using the manufacturer approved diagnostic system, run Purge Valve Self Test (to clean the purge valve) ● 3. Check that the DMTL module wiring connector has been installed correctly and that the seals around the connector body and individual wires are in good condition ● 4. Check all fuel system connections are correctly installed and secure ● 5. Visually inspect purge canister, purge pipes, fuel tank and filler neck for any obvious damage ● 6. Try isolating the purge valve by fitting a blanking plug to the purge pipe ● 7. Carry out a smoke test ● 8. Replace the DMTL module
P0447-00	DMTL COV electrical low (open)	<ul style="list-style-type: none"> ● 1. Check fuse ● 2. Check that fuse fits tightly into the fuse holder ● 3. Check that the DMTL module wiring connector has been fitted correctly ● 4. Check wiring harness continuity between DMTL module and ECU connectors ● 5. Replace DMTL module
P0448-00	DMTL COV electrical high	<ul style="list-style-type: none"> ● 1. Check wiring ● 2. Replace DMTL module
P0455-00	DMTL rough leak	<ul style="list-style-type: none"> ● 1. Inspect / refit filler cap after smoke test (inspect filler neck for correct fitment to pocket so that filler neck protrudes) ● 2. Run engine at idle; Using the manufacturer approved diagnostic system, run "Purge Valve Self Test" (to help clean the purge valve) ● 3. Check that the DMTL module wiring connector has been installed correctly and that the seals around the connector body and individual wires are in good condition (surprisingly, this is a potential leakage path!) ● 4. Check all fuel system connections are correctly installed and secure ● 5. Visually inspect purge canister, purge pipes, fuel tank and filler neck for any obvious damage ● 6. Try isolating the purge valve by fitting a blanking plug to the purge pipe ● 7. Carry out a smoke test ● 8. Replace DMTL module
P2401-00	DMTL pump electrical low (open)	<ul style="list-style-type: none"> ● 1. Check fuse ● 2. Check that fuse fits correctly into the fuse holder ● 3. Pre and 10MY Denso/Bosch PCM Systems

CAUTION: The Maximum pressure of the EVAP system is 0.07 bar **do not exceed**

• **NOTE:** Apart from the purge valve connection, it is recommended to smoke test the EVAP system without disturbing any joints associated with the system, this will determine the leak more accurately and quickly

- 1. Remove rear wheel arch liner to access fuel filler neck
- 2. On the fuel filler neck the DMTL filter will be visible as shown in picture. Unclip filter housing from fuel filler neck to gain better access to DMTL filter
- 3. Remove carefully the top of filter to expose filter and remove
- 4. Attach rubber adapter to tip of smoke machine nozzle to ensure tight seal to filter housing. Disconnect the purge pipe from purge valve; this will be an escape point for the smoke to exit
- 5. Allow tester to complete self-test and green READY light to turn ON 2. For best Tester performance; completely unwind Tester's supply hose
- 6. Press **Smoke** on control panel to fill EVAP system with smoke vapour. The control panel **Smoke** light will light indicating smoke production. The smoke setting is on a 15 minute timer. Pressing the **Smoke** button again turns Tester off. It is normal for the flow meter ball, while in the smoke mode, not to be as steady as when it is in the **Test** mode. Note: The pressure gauge is active only after smoke cycle is complete
- 7. Continue introducing smoke into the EVAP System until the flow meter's ball stops descending and this assures the system test pressure is met and smoke will appear from the purge pipe, then close off purge pipe with special tool (Test Adapter Hose/EVAP Port 310-142)

E139910

E139911

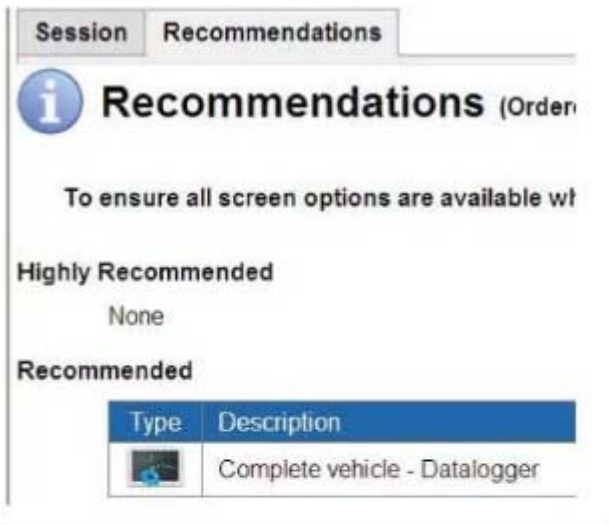

E139912

CAUTION: On some vehicles, the DMTL filter can not be removed, in these instances fill the system through the purge valve and smoke will appear from the filter

Pre 10MY Vehicles

On pre 10MY DMTL systems, Using the manufacturer approved diagnostic system, select **Measurement application** session then select the **Recommendations** tab which will give you access to **Datalogger**. Then select **Engine systems** then select the **Output state control** data-logger signal **Engine output 1 – diagnostic module – tank leakage -change over valve active** which will close the system. Then select **Engine output 1 – diagnostic module – tank leakage – pump active** this will pressurize the EVAP system

- Engine output 1 - engine management system warning lamp.
- Engine output 1 - malfunction indicator warning lamp.
- Engine output 1 - diagnostics module - tank leakage - test complete.
- Engine output 1 - diagnostics module - tank leakage - heater active.
- Engine output 1 - diagnostics module - tank leakage - pump active.
- Engine output 1 - diagnostics module - tank leakage - changeover valve active.
- Engine output 2 - heated exhaust gas oxygen heater active - bank 2.

E139916

E139913

10MY vehicles

On 10MY vehicles a smoke test application is available so therefore only smoke fill the system and then run the application

- 8. Follow the EVAP system path with the halogen light provided and looks for the smoke exiting the leak(s) or use the UV light provided and look for the dye deposited at the exact location of the leak(s)
- 9. Repair the leak(s) and perform the **Fuel Leak Check** application again or smoke test to verify repair, as well as to make sure there are no additional leaks in the EVAP system

The UltraTraceUV® smoke solution's dye feature is especially helpful when the leak is in an area that is not readily visible, as on the top of the fuel tank or behind a panel. Once you gain access to the area of the leak, wear the yellow UV glasses and shine the UV light provided to identify the exact location of the leak(s). Smoke exiting a very small leak is even easier to see with lower pressure. If you encounter smoke leaking out of an area but find it difficult to pinpoint exactly where the source of the leak is; try reducing the pressure in the system being tested by turning the Tester OFF and allow the pressure to dissipate. The longer a particular leak is allowed to leak, the more fluorescent dye material will be deposited

at that leak. With some vapour system leaks, the leak may only present itself under vacuum and not under pressure. If equipment permits, test the system in both states. Purge valve faults [P0441, P0444, P0458 and P0459] should all inhibit DMTL leak test and therefore need to be resolved prior to any DMTL issues. For this reason, when smoke testing the vapour system, it should be sufficient to enter the system at the connection up stream of the purge valve. If no leak is found then testing the remainder of the system up to the purge valve is recommended

• **NOTE:** It may be possible to search for small leaks using a gas analyzer and looking for HC (hydro carbon) spikes. This should enable leaks to be detected in areas of the vapor system that our out of sight of the technician. The solenoid should be deactivated after five minutes to prevent potential damage. Check that connector and individual terminals are sealed correctly

Phase-One – (quantifying the leak)

E139914

- 1. Connect the tester supply hose to vehicle EVAP system. > Refer to appropriate vehicle application
- 2. Determine if the vehicle's EVAP system you are testing is governed by a .020" (0.5 mm) or .040" (1 mm) acceptable leak standard. Press the appropriate calibration standard on the tester's control panel and observe the position of the flow meter ball. > This function automatically turns off in 10 seconds
- 3. Position the flow meter's pointer flag so that it aligns with the measurement observed in step 2 above. > This sets PASS / FAIL mark
- 4. Close vehicle's EVAP Vent Solenoid. > Refer to appropriate vehicle application
- 5. Press TEST on control panel and fill EVAP system. > This introduces 5-minutes of nitrogen gas
- 6. Look for flow meter ball to stop descending indicating that the vehicle system is full. > Fill time 1-4 minutes depending on system volume
- 7. Compare flow meter ball reading to pointer flag. > ABOVE flag = FAIL (go to Phase-Two). > BELOW flag = PASS (test complete)

Testing With Pressure and Vacuum Decay

In addition to quantifying the leak with the Phase-One flow test, the Tester allows you the flexibility of testing the vehicle's EVAP system by using either **Pressure Decay** or **Vacuum Decay** methods. Below are instructions for performing both decay tests

Pressure-Decay Test

• **NOTE:** The Pressure Decay test is best performed immediately after the Phase-one flow test, since the system has already built up pressure

At the completion of the Phase-one flow test, the EVAP system is fully pressurized, since the Phase-one test uses pressure to perform its flow test. Testing pressure decay with the Vacutec® 522B-J/LR is very simple. All you need to do is the following:

- 1. Allow tester to complete self-test and green **READY** light to turn ON
- 2. Connect Tester supply hose to vehicle EVAP system
- 3. Close vehicle's EVAP Vent solenoid > Refer to appropriate vehicle application
- 4. Press **VACUUM** switch on the tester control panel
 - NOTE: The vacuum switch is on a 30-second timer, which should be sufficient time to draw the appropriate vacuum from the EVAP system. Press **VACUUM** switch again if additional time is required
- 5. After vacuum timer turns off, observe the vacuum gauge for any decay (loss of vacuum) indicating a leak in the EVAP system

E139915

- NOTE: Disconnect the Tester from the vehicle after the Vacuum Decay Test. The fuel pressure in the vehicle's fuel tank is constantly changing due to the vehicle's fuel volatility and that could cause the Tester's pressure gauge to exceed its maximum reading limits

Evaporative Emissions - V6 4.0L Petrol - Evaporative Emission System Leak Test

General Procedures

Special Tool(s)	
 <p>310-142</p> <p>E67117</p>	EVAP tool 310-142

• NOTE: The following procedure allows a fuel leak, indicated by the Malfunction Indicator Lamp (MIL), to be accurately located. The test must only be carried out once it has been established that there are no obvious faults with any of the fuel system components.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Position the vehicle on a lift.

- Check the components in the fuel and EVAP system for obvious damage. Make sure all the connections are secure.
- Connect T4 to the vehicle.
 - Run the DMTL test.
 - Follow the on-screen prompts and force the DMTL to close.

4. WARNINGS:

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 Place the vehicle in a well ventilated, quarantined area and arrange 'No Smoking/Petrol Fumes' signs about the vehicle.

 **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Install the special tool to the purge line.

- Release the clip and disconnect the purge line.
- Clean the component mating faces.
- Connect the special tool.

E67118

-  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the purge line at the emission canister line.

- Release the clip.
6. Carry out the procedures in order, from the instruction sheet supplied with the EVAPS diagnostic testing station 310-115 (LRA-19-004) or (LRA-19-005A).
 7. When a leak is detected, replace the component as necessary and repeat the test to validate the repair.
 8. Connect the purge line to the emission canister line.
 - Clean the component mating faces.
 - Secure with the clip.
 9. Disconnect the special tool from the purge line.
 - Clean the component mating faces.
 - Connect the purge line.
 10. Disconnect T4 from the vehicle.

Evaporative Emissions - V6 4.0L Petrol - Evaporative Emission Canister

Removal and Installation

Removal

1. Remove the spare wheel and tire.

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the evaporative emissions canister.

- Remove the 2 bolts.
- Disconnect the 3 lines.
- Disconnect the electrical connector.

E50115

4. **NOTE:** Do not disassemble further if the component is removed for access only.

NAS vehicles: Remove the fuel tank leakage detection module.

- Remove the 3 screws.

E50116

Installation

1. NAS vehicles: Install the fuel tank leakage detection module.

- Install the screws.

2. Install the evaporative emissions canister.

- Connect the electrical connector.
- Connect the lines.

- Tighten the bolts to 23 Nm (17 lb.ft).

3. Install the spare wheel and tire.

Evaporative Emissions - V6 4.0L Petrol - Evaporative Emission Canister

Purge Valve

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the intake manifold casting.
For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
3. **NOTE:** Note the fitted position.

Release the purge valve from the mounting bracket.

- Remove the bolt.

4.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the purge valve.

- Disconnect the 2 hoses.
- Disconnect the electrical connector.

E56647

Installation

1. Connect the purge valve.
 - Connect the hoses.
 - Connect and secure the electrical connector.

2. **NOTE:** Align to the position noted on removal.

Install the purge valve, align the peg and tighten the bolt to 6 Nm (4 lb.ft).

3. Install the intake manifold casting.
For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
4. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Evaporative Emissions - V6 4.0L Petrol - Fuel Tank Leakage Monitoring Pump

Removal and Installation

Removal

1. Remove the spare wheel and tire.

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the evaporative emissions canister.

- Remove the 2 bolts.
- Disconnect the 3 lines.
- Disconnect the electrical connector.

E50115

4. Remove the fuel tank leakage detection module.

- Remove the 3 screws.

E50116

Installation

1. Install the fuel tank leakage detection module.

- Install the screws.

2. Install the evaporative emissions canister.

- Connect the electrical connector.

- Connect the lines.
- Tighten the bolts to 23 Nm (17 lb.ft).

3. Install the spare wheel and tire.

Pump Filter

Removal and Installation

Removal

1. Remove the spare wheel and tire.

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Position the vehicle on a lift.

3. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

4. Remove the RH rear wheel and tire.

5. Remove the fender moulding.
For additional information, refer to: [Rear Quarter Panel Moulding](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).

6. Release the fuel leak detection filter.

- Disconnect the breather hose from the fuel leak detection pump.

E84132

7. Remove the fuel leak detection filter and breather hose assembly.

- Release the breather hose from the clip.
- Remove and discard the cable tie.

E84133

Installation

1. Install the fuel leak detection filter and breather hose assembly.

- Secure with a cable tie.
- Secure the breather hose in the clip.

2. Attach the fuel leak detection filter breather hose to the

pump.

3. Install the fender moulding.

For additional information, refer to: [Rear Quarter Panel Moulding](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).

4. Install the RH rear wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

5. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

6. Install the spare wheel and tire.

Evaporative Emissions - V6 4.0L Petrol - Evaporative Emission Canister Ventilation Filter

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the RH rear wheel and tire.
3. Remove the RH rear quarter panel moulding.
For additional information, refer to: [Rear Quarter Panel Moulding](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).

4. **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Remove the RH rear fender splash shield.

- Remove the 2 screws.
- Remove the 6 retainers.
- Disconnect the electrical connector.

E48478

5. Release the evaporative emission canister ventilation filter from the fuel filler pipe.

- Cut the cable tie.

E114406

6. Position the evaporative emission canister ventilation filter to one side.

E114407

7. Release the evaporative emission ventilation filter from the clip.

E114408

8. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the evaporative emission canister ventilation filter.

- Release the evaporative emission canister ventilation filter from the evaporative emission canister.

Installation

1. To install reverse the removal procedure.

INTRODUCTION

The **EVAP (evaporative emission)** control system reduces the level of hydrocarbons released into the atmosphere by fuel vapor venting from the fuel tank. The system comprises a charcoal canister, purge valve and interconnecting vent pipes. The vent pipes are connected to the system components using quick release connectors.

Fuel vapor is generated by the fuel in the tank and the amount of vapor produced increases as the fuel heats up. Fuel vapor flows to the charcoal canister through the tank vent pipes, via a liquid/vapor separator.

The vapor from the liquid/vapor separator is absorbed and stored by the charcoal canister. Because there is a limit to the amount of vapor the canister can contain, the fuel vapor is purged from the canister when the engine is running and burned in the engine during the combustion cycle.

PURGE VALVE AND PIPES

E122118

Item	Part Number	Description
1	-	Pipe to engine
2	-	Pipe from charcoal canister
3	-	Purge valve

The purge valve is installed on a bracket attached to the **LH (left-hand)** cylinder head cover. The pipe to the engine from the purge valve is connected to the intake manifold (naturally aspirated vehicles), or **SC (supercharger)** front cover (**SC** vehicles), with a quick release connector. The pipe to the charcoal canister from the purge valve is installed between the **LH** cylinder head cover and ignition coil cover. From the rear of the **LH** cylinder head, the pipe then goes across the back of the engine, along the **RH (right-hand)** side of the transmission, along the fuel tank and rearwards of the tank to the charcoal canister.

The purge valve is a solenoid operated valve, which is closed when de-energized. The valve is controlled by the **ECM (engine control module)** and is operated when engine operating conditions are suitable for purging of the charcoal canister.

The purge valve is controlled by a **PWM (pulse width modulation)** signal at 10 Hz from the **ECM**. At this frequency, the pulses of purge gas flow into the engine in an almost continuous flow. The valve operates between 0% and 99% duty or mark space ratio (% open time).

The atmospheric pressure at the air intake vent of the system is higher than the inlet manifold pressure under all throttled engine running conditions. It is this pressure differential across the system that causes the air to flow through the air intake of the purge system and in to the engine. The operation of the supercharger does not affect the purging process.

The **ECM** waits until the engine is running with a coolant temperature of 55 °C (131 °F) or above and closed loop fuel operational before the purging process is activated. Under these conditions the engine should be running smoothly with no warm up enrichment. The purge valve duty (and flow) is initially ramped slowly because the vapor concentration is unknown (a sudden increase in purge could cause the engine to stall or loss of AFR (air fuel ratio) control to occur). The concentration is then determined from the amount of adjustment that the closed loop fueling is required to make to achieve the target AFR. Once the concentration has been determined, the purge flow can be increased and the injected fuel can be proactively adjusted to compensate for the known purge vapor and the target AFR control is maintained.

When the purging process is active, fresh air is drawn into the charcoal canister via the atmospheric vent filter and, on NAS vehicles, the DMTL pump.

CHARCOAL CANISTER

Charcoal Canister - All Except NAS

E44560

Item	Part Number	Description
1	-	Charcoal canister
2	-	Atmospheric vent pipe connection
3	-	Fuel tank vent pipe connection
4	-	Purge valve pipe connection

Charcoal Canister - NAS

E122119

Item	Part Number	Description
1	-	Charcoal canister
2	-	DMTL pump
3	-	Purge valve pipe connection
4	-	Fuel tank vent pipe connection
5	-	Atmospheric vent pipe connection

The charcoal canister is located in a central position, forward of the spare wheel. It is attached at the rear with two bolts which screw into the spare wheel carrier. At the front, the canister has two lugs which locate in the [EPB \(electronic parking brake\)](#) module support bracket.

The canister on all except NAS vehicles has a capacity of 1400 cc (85.4 in³).

The canister on NAS vehicles has a capacity of 3000 cc (183 in³).

The canister has three connections for attachment of the pipes from the atmospheric vent, the purge valve and the tank vent. On NAS vehicles, the DMTL pump is installed between the atmospheric vent connection and the atmospheric vent pipe.

The canister contains a bed of activated charcoal or carbon. The charcoal is produced using special manufacturing techniques to treat the charcoal with oxygen. The oxygen treatment opens up millions of pores between the carbon atoms resulting in a highly porous charcoal with a very large effective surface area which is capable of absorbing large quantities of fuel vapor. Once treated the charcoal is known as 'activated' carbon or charcoal. The charcoal canister on NAS vehicles uses a higher grade charcoal to meet the stricter emissions regulations.

A filter on the atmospheric vent prevents dust being drawn into the system. The filter is located by the fuel filler cap.

DIAGNOSTIC MODULE TANK LEAKAGE - NAS ONLY

The DMTL system is a legislative requirement for NAS vehicles. The DMTL system periodically checks the [EVAP](#) system and the fuel tank for leaks when the ignition is switched off.

The DMTL system comprises the previously described components of the [EVAP](#) system and a DMTL pump.

DMTL Pump

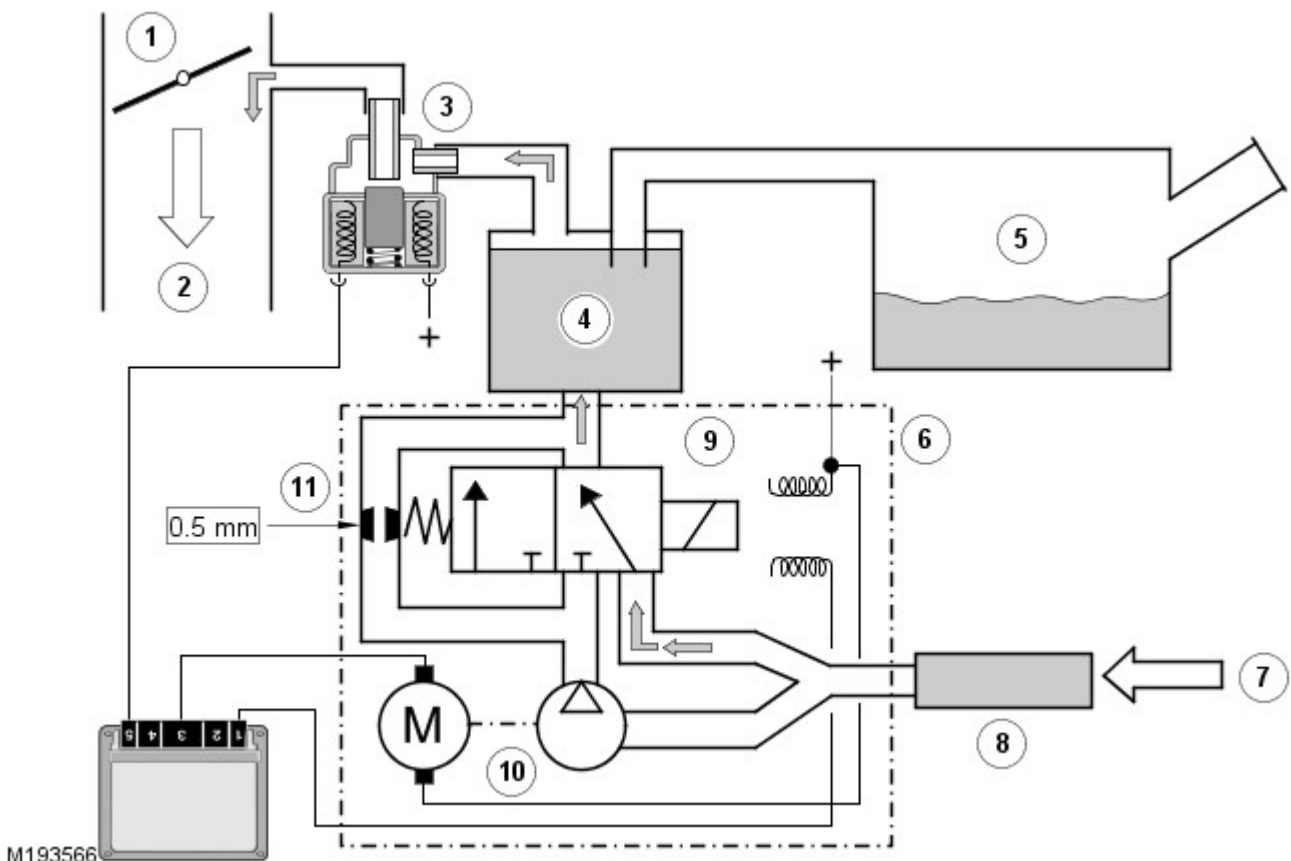

E122120

The DMTL pump is connected to the atmospheric vent of the charcoal canister and incorporates an electric air pump, a [PTC \(positive temperature coefficient\)](#) heating element, a normally open change-over valve and a reference orifice. The DMTL pump is only operated when the ignition is off and is controlled by the [ECM](#). The [ECM](#) also monitors the electric air pump operation and the change-over valve for faults.

DMTL Operation

To check the fuel tank and the [EVAP](#) system for leaks, the [ECM](#) operates the DMTL pump and monitors the current draw. Initially, the [ECM](#) establishes a reference current by pumping air through the reference orifice and back to atmosphere. Once the reference current is determined, the [ECM](#) closes the change-over valve, which seals the [EVAP](#) system. The purge valve remains de-energized and is therefore closed. The output from the air pump is diverted from the reference orifice and into the [EVAP](#) system.

DMTL System Inactive

M193566

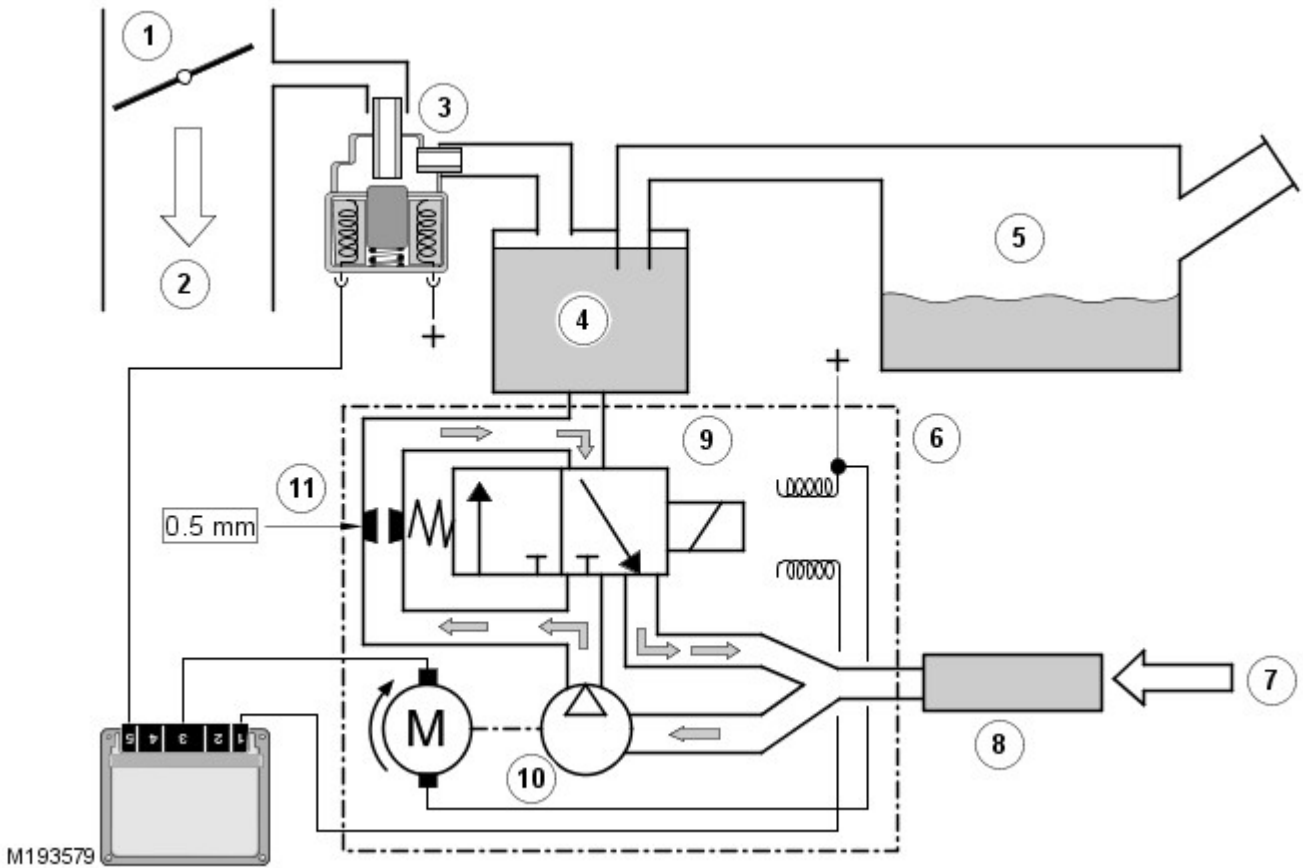

Item	Part Number	Description
1	-	Throttle plate

2	-	Air flow to engine
3	-	Purge valve
4	-	Charcoal canister
5	-	Fuel tank
6	-	DMTL pump assembly
7	-	Air intake
8	-	Air filter
9	-	Change-over valve
10	-	Pump
11	-	Reference orifice

In its inactive state, the DMTL pump motor and the change-over valve solenoid are not energized. When the [ECM](#) energizes the purge valve, filtered fresh air enters the evaporative system through the open change-over valve of the DMTL pump. The filtered air enters the system compensating for engine vacuum drawing on the hydrocarbon vapors stored in the charcoal canister.

DMTL System Active

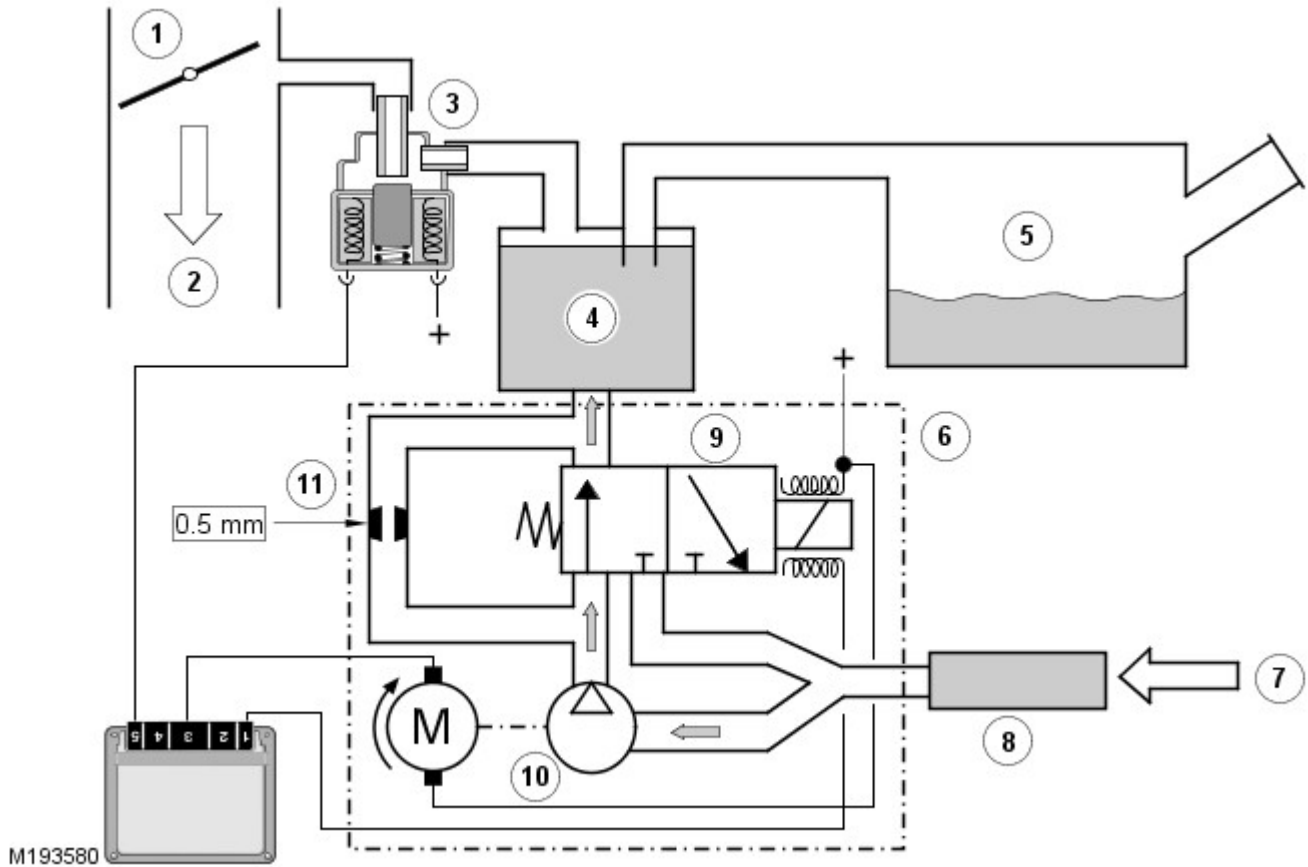

Phase 1 - Reference Measurement

Item	Part Number	Description
1	-	Throttle plate
2	-	Air flow to engine
3	-	Purge valve
4	-	Charcoal canister
5	-	Fuel tank
6	-	DMTL pump assembly
7	-	Air intake
8	-	Air filter
9	-	Change-over valve
10	-	Pump
11	-	Reference orifice

When the [ECM](#) activates the DMTL system, it first activates only the DMTL pump motor. This pumps air through a 0.5 mm (0.02 in) reference orifice, which causes the electric motor to draw a specific amperage value. This value equates to the size of the reference orifice.

Phase 2 - Leak Detection

Item	Part Number	Description
1	-	Throttle plate
2	-	Air flow to engine
3	-	Purge valve
4	-	Charcoal canister
5	-	Fuel tank
6	-	DMTL pump assembly
7	-	Air intake
8	-	Air filter
9	-	Change-over valve
10	-	Pump
11	-	Reference orifice

When the change-over valve solenoid is energized, the valve closes, sealing the [EVAP](#) system from atmosphere. Providing there are no leaks, the air pump will begin to pressurize the [EVAP](#) system and the load and current draw on the pump increases. By monitoring the rate and level of the current increase, the [ECM](#) can determine if there is a leak in the [EVAP](#) system.

During normal vehicle operation, the [ECM](#) energizes the heating element in the pump to prevent condensation formation and possible incorrect current readings.

Leaks are classified as:

- Minor - equivalent to a hole diameter of 0.5 to 1.0 mm (0.02 to 0.04 in)
- Major - equivalent to hole diameter of 1.0 mm (0.04 in) or greater.

The [ECM](#) performs a check for major leaks each time the ignition is switched off, providing the following conditions are met:

- The vehicle speed is zero
- The engine speed is zero
- The atmospheric pressure is above 70 kPa (10.15 lbf/in²), i.e. the altitude is less than approximately 3047 m (10000 feet)
- The ambient temperature is between 0 and 40 °C (32 and 104 °F)
- The charcoal canister vapor concentration factor is 5 or less (where 0 is no fuel vapor, 1 is stoichiometric fuel vapor and greater than 1 is rich fuel vapor)
- The fuel tank level is valid and between 15 and 85% of nominal capacity
- The engine running time during the previous cycle was more than 10 minutes
- The battery voltage is between 10 and 15 volts
- The last engine off time was more than 180 minutes
- No errors are detected with the [EVAP](#) components, the ambient air temperature and the fuel level
- High range is selected on the transfer box.

• **NOTE:** A leak test can be performed using the Land Rover approved diagnostic equipment. This overrides the above conditions and is useful for checking correct system and component operation.

The [ECM](#) performs a check for minor leaks after every 2nd major leak check.

When the leak check is complete, the [ECM](#) stops the DMTL pump and opens (de-energizes) the change-over valve.

If the fuel filler cap is opened or refueling is detected during the leak check, by a sudden drop in the current draw or a rise in the fuel level, the [ECM](#) aborts the leak check.

If a leak is detected during the check, the [ECM](#) stores an appropriate fault code in its memory. If a leak is detected on two consecutive checks, the [ECM](#) illuminates the [MIL \(malfunction indicator lamp\)](#) in the instrument cluster on the next drive cycle.

The duration of a leak check can be between 60 and 900 seconds depending on the test results (developed tank pressure amperage within a specific time period) and fuel tank level.

The following chart depicts the logic used to determine fuel system leaks:

Test Results

M193581

Item	Part Number	Description
A	-	Current stabilizes
B	-	Current drops
C	-	Current rises
D	-	No leak detected
E	-	0.5 mm leak
F	-	Leak >1.0 mm
G	-	Change-over valve energized
H	-	Pump motor energized
I	-	Motor current pressure
J	-	Reference measurement 0.5 mm
K	-	Time duration

Evaporative Emissions - V8 5.0L Petrol - Evaporative Emissions

Diagnosis and Testing

Principles of Operation

For a detailed description of the evaporative emission system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Evaporative Emissions (303-13 Evaporative Emissions - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fuel filler cap and seal ● Fuel filler neck ● DMTL fresh air filter (restriction, etc) ● Fuel tank (leaks, damage, etc) ● Fuel lines and joints, etc ● Carbon canister ● Purge valve ● Diagnostic module fuel tank leak (DMTL) pump module 	<ul style="list-style-type: none"> ● Fuses ● Connectors ● Harness ● Purge valve ● Diagnostic module fuel tank leak (DMTL) pump

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.
5. 5. Where K-Line, Vacutec or other proprietary smoke test equipment is available, it should be utilized to assist with Evaporative Emissions System leak diagnosis.

Symptom Chart

Symptom	Possible Causes	Action
Difficulty in filling fuel tank	<ul style="list-style-type: none"> ● Restriction in the vapour line between the fuel tank and the carbon canister outlet/atmospheric port 	Check for restrictions/damage, etc (see visual inspection)
Fuel smell	<ul style="list-style-type: none"> ● System leak ● Purge valve inoperative 	Check for leaks, check the purge valve operation
'Check Fuel Filler Cap' displayed on Message Center	<ul style="list-style-type: none"> ● Fuel filler cap missing/not tightened after refuelling 	Check the fuel filler cap and seal

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Evaporative Leak OBD Fault Rectification Guide

Determine Which DTC Has Been Stored

Using the manufacturer approved diagnostic system, choose **diagnostic session**, then choose the following symptom paths : **Powertrain/engine system/fuel vapour and odor**, **Powertrain/engine system/fuel tank**, **Electrical/instruments /warning lamps/engine malfunction lamp/lamp illuminated**, **Powertrain/engine system/engine performance/fuel consumption high**

• **NOTE:** This guide covers DTCs that relate to evaporative leak monitoring, as listed in the table below

DTC	Description
P0442-00	DMTL small leak
P0447-00	DMTL COV electrical low (open)
P0448-00	DMTL COV electrical high
P0455-00	DMTL rough leak
P2401-00	DMTL pump electrical low (open)
P2402-00	DMTL pump electrical high
P2404-2F	DMTL noise fault
P2404-29	DMTL reference leak

DTC	Description
P2405-00	DMTL reference current low
P2406-00	DMTL reference current high
P2450-00	DMTL COV stuck open
P2451-00	DMTL COV stuck closed
P240B-00	DMTL heater electrical low (open)
P240C-00	DMTL heater electrical high

Attempt To Replicate The Fault Using The "Fuel Leak Check" Forced Test

1. Record any DTCs that has been logged
 2. Using the manufacturer approved diagnostic system, in the **Recommendations** tab run the **Fuel Leak Check** forced test
 3. For the test to run the fuel level must be between 15% and 85%
 4. During this procedure the engine must be off
 5. The possible responses from the test and the associated DTCs are listed below
 6. If again no fault is found it could suggest that the failure mode is a borderline condition (refer to section 3) or that it was caused by incorrect fitment of the fuel cap or the fuel filler neck is at fault therefore it is important not disturb the fuel cap
 7. Disconnect purge pipe from the purge valve, observe the condition of connection (the seating and condition of the "O" ring) and then reconnect. Using the manufacturer approved diagnostic system, run **Purge Valve Self Test** (to clean the purge valve) then run the **Fuel Leak Check**
 8. If the test failed, a smoke test is required to determine the cause of the leak
- NOTE: P240B & P240C are not included in the **Fuel Leak Check** forced test (these monitors run at every ignition on and complete within 30 seconds)

Response Description	ID	Equivalent DTC
Function running: Reference leak measurement	1	
Function running: Rough leak measurement	2	
Function running: Small leak measurement	3	
Function running: 2nd ref leak measurement	4	
Function running: COV Cleaning	5	
Function aborted due to conditions: Vbatt conditions not correct (too high/ low)	11	
Function aborted due to conditions: Variation Ref. I (reference current) too high	12	P2404-29
Function aborted due to conditions: DMTL electrical fault	13	P0447, P0448
Function aborted due to conditions: Maximum diagnostic time exceeded	14	
Function aborted due to conditions: Crash detected	15	
Function aborted due to conditions: Refuel detected	20	
Function aborted due to conditions: Filler cap opened	21	
Function aborted due to conditions: Engine start	23	
Function aborted due to conditions: Noisy current measurement	24	P2404-2F
Function aborted due to conditions: Ambient temp outside range	26	
Function aborted due to conditions: Ambient pressure outside range	27	
Function aborted due to conditions: Other conditions	29	
Function complete - Tight system, fault free	30	
Function complete - Fine leak detected	31	P0442
Function complete - Rough leak detected	32	P0455
Function complete - Module error	33	P2401, P2402, P2450, P2451, P2405, P2406, P2404-29
Function complete - Medium leak detected	34	P0442, P0455

Read The "Ranking values" To Determine How Far Away The Result Is From The Failure Threshold

9. When the **Fuel Leak Check** forced test has completed the test results (known as ranking values) will be displayed
10. These should be compared against the limits shown in the table below
11. If the test result is borderline then there is a risk that a failure will occur at a later date (during customer usage of the vehicle)
12. To avoid this the vehicle should be carefully checked for any small leaks

Ranking Value	Normal Result For Tight System	Leak Failure Condition
Rough Leak (40 thou+)	0 > = 50	>= 128
Small Leak (20 thou+)	0 > = 60	>= 128

TRACE THE ROOT CAUSE OF THE FAULT

The list below provides some suggested actions to help trace the root cause of the fault

Each action should be followed up with a **Fuel Leak Check** forced test (and ranking value check) in order to determine if any improvement has been made

DTC	Fault Description	Fault Rectification Actions after smoke test
-----	-------------------	--

DTC	Fault Description	Fault Rectification Actions after smoke test
P0442-00	DMTL small leak	<ul style="list-style-type: none"> ● 1. Inspect / refit filler cap after smoke test (inspect filler neck for correct fitment to pocket so that filler neck protrudes) ● 2. Run engine at idle; Using the manufacturer approved diagnostic system, run Purge Valve Self Test (to clean the purge valve) ● 3. Check that the DMTL module wiring connector has been installed correctly and that the seals around the connector body and individual wires are in good condition ● 4. Check all fuel system connections are correctly installed and secure ● 5. Visually inspect purge canister, purge pipes, fuel tank and filler neck for any obvious damage ● 6. Try isolating the purge valve by fitting a blanking plug to the purge pipe ● 7. Carry out a smoke test ● 8. Replace the DMTL module
P0447-00	DMTL COV electrical low (open)	<ul style="list-style-type: none"> ● 1. Check fuse ● 2. Check that fuse fits tightly into the fuse holder ● 3. Check that the DMTL module wiring connector has been fitted correctly ● 4. Check wiring harness continuity between DMTL module and ECU connectors ● 5. Replace DMTL module
P0448-00	DMTL COV electrical high	<ul style="list-style-type: none"> ● 1. Check wiring ● 2. Replace DMTL module
P0455-00	DMTL rough leak	<ul style="list-style-type: none"> ● 1. Inspect / refit filler cap after smoke test (inspect filler neck for correct fitment to pocket so that filler neck protrudes) ● 2. Run engine at idle; Using the manufacturer approved diagnostic system, run "Purge Valve Self Test" (to help clean the purge valve) ● 3. Check that the DMTL module wiring connector has been installed correctly and that the seals around the connector body and individual wires are in good condition (surprisingly, this is a potential leakage path!) ● 4. Check all fuel system connections are correctly installed and secure ● 5. Visually inspect purge canister, purge pipes, fuel tank and filler neck for any obvious damage ● 6. Try isolating the purge valve by fitting a blanking plug to the purge pipe ● 7. Carry out a smoke test ● 8. Replace DMTL module
P2401-00	DMTL pump electrical low (open)	<ul style="list-style-type: none"> ● 1. Check fuse ● 2. Check that fuse fits correctly into the fuse holder ● 3. Check that the DMTL module wiring connector has been fitted correctly ● 4. Check wiring harness continuity between DMTL module and ECU connectors ● 5. Replace DMTL module
P2402-00	DMTL pump electrical high	<ul style="list-style-type: none"> ● 1. Check wiring ● 2. Replace DMTL module

P2404-29	DMTL reference leak	<ul style="list-style-type: none"> ● Replace DMTL module
P2405-00	DMTL reference current low	<ul style="list-style-type: none"> ● Replace DMTL module
P2406-00	DMTL reference current high	<ul style="list-style-type: none"> ● 1. Check for any blockages in the DMTL ventilation pipe & filter ● 2. Replace DMTL module
P2450-00	DMTL COV stuck open	<ul style="list-style-type: none"> ● Replace DMTL module
P2451-00	DMTL COV stuck close	<ul style="list-style-type: none"> ● Replace DMTL module
P240B-00	DMTL heater electrical low (open)	<ul style="list-style-type: none"> ● 1. Check fuse ● 2. Check that fuse fits tightly into the fuse holder ● 3. Check that the DMTL module wiring connector has been fitted correctly ● 4. Check wiring harness continuity between DMTL module and ECU connectors ● 5. Replace DMTL module
P240C-00	DMTL heater electrical high	<ul style="list-style-type: none"> ● 1. Check wiring ● 2. Replace DMTL module

Pre and 10MY Denso/Bosch PCM Systems

CAUTION: The Maximum pressure of the EVAP system is 0.07 bar **do not exceed**

• **NOTE:** Apart from the purge valve connection, it is recommended to smoke test the EVAP system without disturbing any joints associated with the system, this will determine the leak more accurately and quickly

- 1. Remove rear wheel arch liner to access fuel filler neck
- 2. On the fuel filler neck the DMTL filter will be visible as shown in picture. Unclip filter housing from fuel filler neck to gain better access to DMTL filter
- 3. Remove carefully the top of filter to expose filter and remove
- 4. Attach rubber adapter to tip of smoke machine nozzle to ensure tight seal to filter housing. Disconnect the purge pipe from purge valve; this will be an escape point for the smoke to exit
- 5. Allow tester to complete self-test and green READY light to turn ON 2. For best Tester performance; completely unwind Tester's supply hose
- 6. Press **Smoke** on control panel to fill EVAP system with smoke vapour. The control panel **Smoke** light will light indicating smoke production. The smoke setting is on a 15 minute timer. Pressing the **Smoke** button again turns Tester off. It is normal for the flow meter ball, while in the smoke mode, not to be as steady as when it is in the **Test** mode. Note: The pressure gauge is active only after smoke cycle is complete
- 7. Continue introducing smoke into the EVAP System until the flow meter's ball stops descending and this assures the system test pressure is met and smoke will appear from the purge pipe, then close off purge pipe with special tool (Test Adapter Hose/EVAP Port 310-142)

E139910

E139911

E139912

CAUTION: On some vehicles, the DMTL filter can not be removed, in these instances fill the system through the purge valve and smoke will appear from the filter

Pre 10MY Vehicles

On pre 10MY DMTL systems, Using the manufacturer approved diagnostic system, select **Measurement application** session then select the **Recommendations** tab which will give you access to **Datalogger**. Then select **Engine systems** then select the **Output state control** data-logger signal **Engine output 1 – diagnostic module – tank leakage -change over valve active** which will close the system. Then select **Engine output 1 – diagnostic module – tank leakage – pump active** this will pressurize the EVAP system

- Engine output 1 - engine management system warning lamp.
- Engine output 1 - malfunction indicator warning lamp.
- Engine output 1 - diagnostics module - tank leakage - test complete.
- Engine output 1 - diagnostics module - tank leakage - heater active.
- Engine output 1 - diagnostics module - tank leakage - pump active.
- Engine output 1 - diagnostics module - tank leakage - changeover valve active.
- Engine output 2 - heated exhaust gas oxygen heater active - bank 2.

E139916

E139913

10MY vehicles

On 10MY vehicles a smoke test application is available so therefore only smoke fill the system and then run the application

- 8. Follow the EVAP system path with the halogen light provided and looks for the smoke exiting the leak(s) or use the UV light provided and look for the dye deposited at the exact location of the leak(s)
- 9. Repair the leak(s) and perform the **Fuel Leak Check** application again or smoke test to verify repair, as well as to make sure there are no additional leaks in the EVAP system

The UltraTraceUV® smoke solution's dye feature is especially helpful when the leak is in an area that is not readily visible, as on the top of the fuel tank or behind a panel. Once you gain access to the area of the leak, wear the yellow UV glasses and shine the UV light provided to identify the exact location of the leak(s). Smoke exiting a very small leak is even easier to see with lower pressure. If you encounter smoke leaking out of an area but find it difficult to pinpoint exactly where the source of the leak is; try reducing the pressure in the system being tested by turning the Tester OFF and allow the pressure to dissipate. The longer a particular leak is allowed to leak, the more fluorescent dye material will be deposited

at that leak. With some vapour system leaks, the leak may only present itself under vacuum and not under pressure. If equipment permits, test the system in both states. Purge valve faults [P0441, P0444, P0458 and P0459] should all inhibit DMTL leak test and therefore need to be resolved prior to any DMTL issues. For this reason, when smoke testing the vapour system, it should be sufficient to enter the system at the connection up stream of the purge valve. If no leak is found then testing the remainder of the system up to the purge valve is recommended

• **NOTE:** It may be possible to search for small leaks using a gas analyzer and looking for HC (hydro carbon) spikes. This should enable leaks to be detected in areas of the vapor system that our out of sight of the technician. The solenoid should be deactivated after five minutes to prevent potential damage. Check that connector and individual terminals are sealed correctly

Phase-One – (quantifying the leak)

E139914

- 1. Connect the tester supply hose to vehicle EVAP system. > Refer to appropriate vehicle application
- 2. Determine if the vehicle's EVAP system you are testing is governed by a .020" (0.5 mm) or .040" (1 mm) acceptable leak standard. Press the appropriate calibration standard on the tester's control panel and observe the position of the flow meter ball. > This function automatically turns off in 10 seconds
- 3. Position the flow meter's pointer flag so that it aligns with the measurement observed in step 2 above. > This sets PASS / FAIL mark
- 4. Close vehicle's EVAP Vent Solenoid. > Refer to appropriate vehicle application
- 5. Press TEST on control panel and fill EVAP system. > This introduces 5-minutes of nitrogen gas
- 6. Look for flow meter ball to stop descending indicating that the vehicle system is full. > Fill time 1-4 minutes depending on system volume
- 7. Compare flow meter ball reading to pointer flag. > ABOVE flag = FAIL (go to Phase-Two). > BELOW flag = PASS (test complete)

Testing With Pressure and Vacuum Decay

In addition to quantifying the leak with the Phase-One flow test, the Tester allows you the flexibility of testing the vehicle's EVAP system by using either **Pressure Decay** or **Vacuum Decay** methods. Below are instructions for performing both decay tests

Pressure-Decay Test

• **NOTE:** The Pressure Decay test is best performed immediately after the Phase-one flow test, since the system has already built up pressure

At the completion of the Phase-one flow test, the EVAP system is fully pressurized, since the Phase-one test uses pressure to perform its flow test. Testing pressure decay with the Vacutec® 522B-J/LR is very simple. All you need to do is the following:

- 1. Allow tester to complete self-test and green **READY** light to turn ON
- 2. Connect Tester supply hose to vehicle EVAP system
- 3. Close vehicle's EVAP Vent solenoid > Refer to appropriate vehicle application
- 4. Press **VACUUM** switch on the tester control panel
 - NOTE: The vacuum switch is on a 30-second timer, which should be sufficient time to draw the appropriate vacuum from the EVAP system. Press VACUUM switch again if additional time is required
- 5. After vacuum timer turns off, observe the vacuum gauge for any decay (loss of vacuum) indicating a leak in the EVAP system

E139915

- NOTE: Disconnect the Tester from the vehicle after the Vacuum Decay Test. The fuel pressure in the vehicle's fuel tank is constantly changing due to the vehicle's fuel volatility and that could cause the Tester's pressure gauge to exceed its maximum reading limits

Evaporative Emissions - V8 5.0L Petrol - Evaporative Emission Canister

Removal and Installation

Removal

1. Remove the spare wheel and tire.

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the evaporative emissions canister.

- Remove the 2 bolts.
- Disconnect the 3 lines.
- Disconnect the electrical connector.

E50115

4. **NOTE:** Do not disassemble further if the component is removed for access only.

NAS vehicles: Remove the fuel tank leakage detection module.

- Remove the 3 screws.

E50116

Installation

1. NAS vehicles: Install the fuel tank leakage detection module.

- Install the screws.

2. Install the evaporative emissions canister.

- Connect the electrical connector.
- Connect the lines.

- Tighten the bolts to 23 Nm (17 lb.ft).

3. Install the spare wheel and tire.

Evaporative Emissions - V8 5.0L Petrol - Evaporative Emission Canister

Purge Valve

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Refer to: [Air Cleaner Outlet Pipe T-Connector](#) (303-12D Intake Air Distribution and Filtering - V8 5.0L Petrol, Removal and Installation).

3.

4.

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - TDV6 2.7L Diesel -

OVERVIEW

The TDV6 engine has an Electronic Diesel Control (EDC) engine management system supplied by Siemens. The system is controlled by an ECM and is able to monitor, adapt and precisely control the fuel injection. The ECM uses multiple sensor inputs and precision control of actuators to achieve optimum performance during all driving conditions.

The ECM controls fuel delivery to all six cylinders via a Common Rail (CR) injection system. The CR system uses a fuel rail to accumulate highly pressurized fuel and feed the six, electronically controlled injectors. The fuel rail is located in close proximity to the injectors, which assists in maintaining full system pressure at each injector at all times.

The ECM uses the drive by wire principle for acceleration control. There are no control cables or physical connections between the accelerator pedal and the engine. Accelerator pedal demand is communicated to the ECM by two potentiometers located in a throttle position sensor. The ECM uses the two signals to determine the position, rate of movement and direction of movement of the pedal. The ECM then uses this data, along with other engine information from other sensors, to achieve the optimum engine response.

The ECM processes information from the following input sources:

- CKP sensor
- CMP sensor
- Manifold air temperature and pressure
- Coolant temperature
- Oil temperature
- Inlet air flow and temperature
- Fuel rail temperature
- Knock sensors (one per cylinder bank).

The ECM outputs controlling signals to the following sensors and actuator:

- Fuel injectors
- Cooling fan solenoid
- Electronic Throttle
- Electronic vane controlled turbo
- Port deactivation
- Fuel pressure control valve
- Fuel volume control valve
- E-box fan
- Engine mounts
- Electronic EGR
- Glow plugs.

ENGINE CONTROL MODULE (ECM)

E46899

The ECM is located in the E-Box in the plenum area on the RH side of the engine compartment attached to the bulkhead.

E Box

E46913

Item	Part Number	Description
1		E box fan
2		ECM
3		Transfer box control module

Inputs

The ECM has the following inputs:

- Engine Coolant Temperature
- Clutch Switch (via electric park brake control module)
- Stop lamp switch (via ABS control module on CAN)
- Manifold Absolute Pressure
- Throttle Pedal Position 1
- Throttle Pedal Position 2
- Electronic throttle Position
- Viscous Fan Speed
- Engine speed and position sensor (crankshaft sensor)
- Camshaft position sensor
- Engine Oil Temperature
- Speed Control Switches (resistive ladders)
- Vehicle Speed (via CAN bus)
- Generator Monitor
- Restraints Control Module
- Manifold Absolute Pressure and Inlet Air Temperature

Outputs

The ECM outputs to the following:

- Throttle Actuator
- Fuel injectors (6)
- EGR Valves
- Engine Cooling Fan
- Fuel pump relay
- Starter Relay
- Air conditioning condenser fan module
- EMS Main Relay
- Viscous Fan Control
- Generator Control

The ECM connected to the vehicle harnesses via three connectors. The ECM contains data processors and memory microchips. The output signals to the actuators are in the form of ground paths provided by driver circuits within the ECM. The ECM driver circuits produce heat during normal operation and dissipate this heat via the casing. The fan in the E-box assists with the cooling process by maintaining a constant temperature with the E-box. The fan is controlled by a thermostatic switch located in the E-box. The E-box has pipe connections to the vehicle interior and receives additional cooled air via the A/C system. Some sensors receive a regulated voltage supplied by the ECM. This avoids incorrect signals caused by voltage drop during cranking.

The ECM performs self diagnostic routines and stores fault codes in its memory. These fault codes and diagnostics can be accessed using a Land Rover approved diagnostic system. If the ECM is to be replaced, the new ECM is supplied 'blank' and must be configured to the vehicle using a Land Rover approved diagnostic system. A 'flash' Electronic Erasable Programmable Read Only Memory (EEPROM) allows the ECM to be externally configured, using a Land Rover approved diagnostic system, with market specific or new tune information up to 14 times. If a fifteenth update is required the ECM must be replaced. The current engine tune data can be accessed and read using a Land Rover approved diagnostic system.

When a new ECM is fitted, it must also be synchronized to the immobilization control module using a Land Rover approved diagnostic system. ECM's cannot be 'swapped' between vehicles.

The ECM is connected to the engine sensors which allow it to monitor the engine operating conditions. The ECM processes these signals and decides the actions necessary to maintain optimum engine performance in terms of driveability, fuel efficiency and exhaust emissions. The memory of the ECM is programmed with instructions for how to control the engine, this known as the strategy. The memory also contains data in the form of maps which the ECM uses as a basis for fueling and emission control. By comparing the information from the sensors to the data in the maps, the ECM is able to calculate the various output requirements. The ECM contains an adaptive strategy which updates the system when components vary due to production tolerances or ageing.

The ECM receives a vehicle speed signal on a CAN bus connection from the ABS Control Module. Vehicle speed is an important input to the ECM strategies. The ABS control module derives the speed signal from the ABS wheel speed sensors. The frequency of this signal changes according to road speed. The ECM uses this signal to determine the following:

- How much to reduce engine torque during gear changes.
- When to permit speed control operation.
- To control the operation of the speed control system.
- Implementation of the idle strategy when the vehicle is stationary.

ECM Harness Connector C0872 Pin details

Pin No	Description	Input/Output

IMMOBILIZATION

The IMMOBILIZATION control module receives information from related systems on the vehicle and passes a coded signal to the ECM to allow starting if all starting parameters have been met. The information is decoded by the ECM which will allow the engine to run if the information is correct.

The information is on a rolling code system and both the immobilization control module and the ECM will require synchronisation if either component is renewed.

The ECM also protects the starter motor from inadvertent operation. The IMMOBILIZATION control module receives an engine speed signal from the ECM via the instrument cluster. When the engine speed exceeds a predetermined value, the immobilization control module prevents operation of the starter motor via an integral starter disable relay. For additional information, refer to: Anti-Theft - Passive (419-01B Anti-Theft - Passive, Description and Operation).

CAMSHAFT POSITION SENSOR (CMP)

E46902

The CMP is located on the front face of the left hand cylinder head. The sensor tip protrudes through the face to pick up on the reluctor behind the camshaft pulley. The CMP is a Hall effect type sensor

The ECM uses the CMP sensor signal to determine if the piston in No. 1 cylinder is at injection TDC or exhaust TDC. Once this has been established, the ECM can then operate the correct injector to inject fuel into the cylinder when the piston is at injection TDC.

The CMP sensor is a Hall effect sensor which used by the ECM at engine start-up to synchronize the ECM with the CKP sensor signal. The ECM does this by using the CMP sensor signal to identify number one cylinder to ensure the correct injector timing. Once the ECM has established the injector timing, the CMP sensor signal is no longer used.

The CMP sensor receives a 5V supply from the ECM. Two further connections to the ECM provide ground and signal output.

If a fault occurs, an error is registered in the ECM. Two types of failure can occur; camshaft signal frequency too high or total failure of the camshaft signal. The error recorded by the ECM can also relate to a total failure of the crankshaft signal or crankshaft signal dynamically implausible. Both components should be checked to determine the cause of the fault.

If a fault occurs with the CMP sensor when the engine is running, the engine will continue to run but the ECM will deactivate boost pressure control. Once the engine is switched off, the engine will crank but will not restart while the fault is present.

CRANKSHAFT POSITION SENSOR (CKP)

E46903

The CKP sensor is located at the rear of the engine block on the left hand side. The sensor tip is aligned with a magnetic trigger which is attached to the crankshaft. The reluctor is a press fit on the end of the crankshaft. The trigger wheel must be carefully aligned to the crankshaft to ensure correct timing. The sensor produces a square wave signal, the frequency of which is proportional to engine speed.

The ECM monitors the CKP sensor signal and can detect engine over-speed. The ECM counteracts engine over-speed by gradually fading out speed synchronized functions. The CKP is a Hall effect sensor. The sensor measures the magnetic field variation induced by the magnetized trigger wheel.

The trigger wheel has two missing teeth representing 6° of crankshaft rotation. The two missing teeth provide a reference point for the angular position of the crankshaft.

When the space with the two missing teeth pass the sensor tip, a gap in the signal is produced which the ECM uses to determine the crankshaft position. The air gap between the sensor tip and the ring is important to ensure correct signals are output to the ECM. The recommended air gap between the CKP and the trigger wheel is 0.4 mm- 1.5 mm.

The ECM uses the signal from the CKP sensor for the following functions:

- Synchronisation.
- Determine fuel injection timing.
- Enable the fuel pump relay circuit (after the priming period).
- Produce an engine speed signal which is broadcast on the CAN bus for use by other systems.

MASS AIR FLOW/INTAKE AIR TEMPERATURE (MAF/IAT) SENSOR

E46904

The MAF/IAT sensor is located on the inlet air duct directly after the air filter box. The sensor combines the two functions of a MAF sensor and an IAT sensor in one unit. The sensor is housed in a plastic molding which is connected between the intake manifold and the air intake pipe.

The MAF sensor works on the hot film principle. Two sensing elements are contained within a film. One element is maintained at ambient (air intake) temperature, e.g. 25°Celsius (77°F). The other element is heated to 200°Celsius (392°F) above the ambient temperature, e.g. 225°Celsius (437°F). Intake air entering the engine passes through the MAF sensor and has a cooling effect on the film. The ECM monitors the current required to maintain the 200°Celsius (392°F) differential between the two elements and uses the differential to provide a precise, non-linear, signal which equates to the volume of air being drawn into the engine.

The MAF sensor output is a digital signal proportional to the mass of the incoming air. The ECM uses this data, in conjunction with signals from other sensors and information from stored fueling maps, to determine the precise fuel quantity to be injected into the cylinders. The signal is also used as a feedback signal for the EGR system.

The IAT sensor incorporates a negative temperature coefficient (NTC) thermistor in a voltage divider circuit. The NTC thermistor works on the principle of decreasing resistance in the sensor as the temperature of the intake air increases. As the thermistor allows more current to pass to ground, the voltage sensed by the ECM decreases. The change in voltage is proportional to the temperature change of the intake air. Using the voltage output from the IAT sensor, the ECM can correct the fueling map for intake air temperature. The correction is an important requirement because hot air contains less oxygen than cold air for any given volume.

The MAF sensor receives a 12V supply from the battery junction box (BJB) and a ground connection via the ECM. Two further connections to the ECM provide a MAF signal and IAT signal.

The IAT sensor receives a 5V reference voltage from the ECM and shares a ground with the MAF sensor. The signal output from the IAT sensor is calculated by the ECM by monitoring changes in the supplied reference voltage to the IAT sensor voltage divider circuit.

The ECM checks the calculated air mass against the engine speed. If the calculated air mass is not plausible, the ECM uses a default air mass figure which is derived from the average engine speed compared to a stored characteristic map. The air mass value will be corrected using values for boost pressure, atmospheric pressure and air temperature.

If the MAF sensor fails the ECM implements the default strategy based on engine speed. In the event of a MAF sensor signal failure, any of the following symptoms may be observed:

- Difficult starting
- Engine stalls after starting
- Delayed engine response
- Emission control inoperative
- Idle speed control inoperative
- Reduced engine performance.

If the IAT sensor fails the ECM uses a default intake air temperature of -5°Celsius (23°F). In the event of an IAT sensor failure, any of the following symptoms may be observed:

- Over fueling, resulting black smoke emitting from the exhaust.
- Idle speed control inoperative.

ENGINE COOLANT TEMPERATURE SENSOR

E46905

The engine coolant temperature sensor is located in the top hose at the coolant manifold junction. The ECT sensor provides the ECM and the instrument cluster with engine coolant temperature status.

The ECM uses the temperature information for the following functions:

- Fueling calculations
- Limit engine operation if engine coolant temperature becomes too high
- Cooling fan operation
- Glow plug activation time.

The instrument cluster uses the temperature information for temperature gauge operation. The engine coolant temperature signal is also transmitted on the CAN bus by the instrument cluster for use by other systems.

The ECMECT sensor circuit consists of an internal voltage divider circuit which incorporates an NTC thermistor. As the coolant temperature rises the resistance through the sensor decreases and vice versa. The output from the sensor is the change in voltage as the thermistor allows more current to pass to earth relative to the temperature of the coolant.

The ECM compares the signal voltage to stored values and adjusts fuel delivery to ensure optimum driveability at all times. The engine will require more fuel when it is cold to overcome fuel condensing on the cold metal surfaces inside the combustion chamber. To achieve a richer air/fuel ratio, the ECM extends the injector opening time. As the engine warms up the air/fuel ratio is leaned off.

The input to the sensor is a 5V reference voltage supplied from the voltage divider circuit within the ECM. The ground from the sensor is also connected to the ECM which measures the returned current and calculates a resistance figure for the sensor which relates to the coolant temperature.

The following table shows engine coolant temperature values and the corresponding sensor resistance and voltage values.

Coolant Temperature Sensor Response

Temperature (Degrees Celsius)	Resistance (Kohms)	Voltage (Volts)
-40	925	4.54
-30	496	4.46
-20	277	4.34
-10	160	4.15
0	96	3.88
10	59	3.52
20	37	3.09
30	24	2.62
40	16	2.15
50	11	1.72

Temperature (Degrees Celsius)	Resistance (Kohms)	Voltage (Volts)
60	7.5	1.34
70	5.6	1.04
80	3.8	0.79
90	2.9	0.64
100	2.08	0.49
110	1.56	0.38
120	1.19	0.29
130	0.918	0.22
140	0.673	0.17
150	0.563	0.14

If the ECT sensor fails, the following symptoms may be observed:

- Difficult cold start.
- Difficult hot start.
- Engine performance compromised.
- Temperature gauge inoperative or inaccurate reading.

In the event of ECT sensor signal failure, the ECM applies a default value of 80°Celsius (176°F) coolant temperature for fueling purposes. The ECM will also permanently operate the cooling fan at all times when the ignition is switched on, to protect the engine from overheating.

ENGINE OIL TEMPERATURE SENSOR

E46906

The oil temperature sensor is located in the engine sump. The temperature sensor is a NTC type which operates in the -30 Degrees Celsius to +150 Degrees Celsius temperature range.

Oil Temperature Sensor Response

Temperature Degrees Celsius	Resistance Ohms
60	620
90	255
120	117
150	60

FUEL RAIL TEMPERATURE SENSOR

The fuel rail temperature sensor is located on the LP return line.

The sensor is an NTC sensor which is connected to the ECM by two wires. The ECM fuel temperature sensor circuit consists of an internal voltage divider circuit which incorporates an NTC thermistor. As the fuel temperature rises the resistance through the sensor decreases. The output from the sensor is the change in voltage as the thermistor allows more current to pass to earth relative to the temperature of the fuel.

The ECM monitors the fuel temperature constantly. If the fuel temperature exceeds 85°Celsius (185°F), the ECM invokes an engine 'derate' strategy. This reduces the amount of fuel delivered to the injectors in order to allow the fuel to cool. When this occurs, the driver may notice a loss of performance.

Further fuel cooling is available by a bi-metallic valve diverting fuel through the fuel cooler when the fuel reaches a predetermined temperature. In hot climate markets, an electrically operated cooling fan is positioned in the air intake ducting to the fuel cooler. This is controlled by a thermostatic switch, which switches the fan on and off when the fuel reaches a predetermined temperature.

The wires to the fuel sensor are monitored by the ECM for short and open circuit. The ECM also monitors the 5V supply. If a failure occurs a fault is recorded in the ECM memory and the ECM uses a default fuel pressure value.

If the ECM registers an 'out of range' deviation between the pressure signal from the sensor and the pre-programmed 'set point' a fault is stored in the ECM memory. Depending on the extent of the deviation, the ECM will reduce the injection quantity, stop the engine immediately or prevent further engine starting.

BRAKE LAMP SWITCH

E46910

The brake lamp switch is located on the brake box and is operated by the brake pedal. The switch has a normally open circuit switch which closes the circuit when the driver has applied the brakes. The switch is connected directly to the ECM and the ECM also receives a brake lamp signal on the CAN bus from the ABS module.

The ECM uses the brake signal for the following:

- To limit fueling during braking
- To inhibit/cancel Speed control if the brakes are applied.

In the event of a brake switch failure, the following symptoms may be observed:

- Speed control inactive
- Increased fuel consumption.

GLOW PLUGS

E46912

Three glow plugs are located in each of the cylinder heads, on the inlet side. The glow plugs and the glow plug relay are a vital part of the engine starting strategy. The glow plugs heat the air inside the cylinder during cold starts to assist combustion. The use of glow plugs helps reduce the amount of additional fuel required on start-up, and consequently reduces the emission of black smoke. The use of glow plugs also reduces the amount of injection advance required, which reduces engine noise, particularly when idling with a cold engine.

There are three phases of glow plug activity:

- Pre-heat
- During crank
- Post heat.

The main part of the glow plug is a tubular heating element which protrudes into the combustion chamber of the engine. The heating element contains a spiral filament encased in magnesium oxide powder. At the tip of the tubular heating element is the heater coil. Behind the heater coil, and connected in series, is a control coil. The control coil regulates the heater coil to ensure that it does not overheat.

Pre-heat is the length of time the glow plugs operate prior to engine cranking. The ECM controls the pre-heat time based on ECT sensor output and battery voltage. If the ECT sensor fails, the ECM will use the IAT sensor value as a default value. The pre-heat duration is extended if the coolant temperature is low and the battery is not fully charged.

Post heat is the length of time the glow plugs operate after the engine starts. The ECM controls the post heating time based on ECT sensor output. The post heat phase reduces engine noise, improves idle quality and reduces hydrocarbon emissions.

When the ignition is switched on to position II, the glow plug warning lamp illuminates and the instrument cluster displays 'PREHEATING' in the message center. The glow-lamp is activated separately from the glow-plugs, so is not illuminated during or after start. The plugs can still be ON when the lamp is off in these two phases.

In the event of glow plug failure, the engine may be difficult to start and excessive smoke emissions may be observed after starting.

The glow plug warning lamp also serves a second function within the EDC system. If a major EDC system fault occurs, the

glow plug warning lamp will be illuminated permanently and a message generated in the instrument cluster. The driver must seek attention to the engine management system at a Land Rover dealer as soon as possible.

INTAKE AIR TEMPERATURE (BOOST AIR TEMPERATURE) SENSOR

E53446

The IAT is located in the rear of the intake chamber immediately preceding the electric throttle. The sensor is used to measure the intake air temperature from the turbo in order to calculate the required amount of fueling.

BOOST PRESSURE CONTROL

The Boost Pressure (BP) sensor is located post turbo after the electric throttle valve. The sensor provides a voltage signal to the ECM relative to the intake manifold pressure. The BP sensor has a three pin connector which is connected to the ECM and provides a 5V reference supply from the ECM, a signal input to the ECM and a ground for the sensor.

The BP sensor uses diaphragm transducer to measure pressure. The ECM uses the BP sensor signal for the following functions:

- Maintain manifold boost pressure.
- Reduce exhaust smoke emissions when driving at high altitude.
- Control of the EGR system.
- Control of the vacuum control module.

If the BP sensor fails, the ECM uses a default pressure of 1013 mbar (14 lbf/in²). In the event of a BP sensor failure, the following symptoms may be observed:

- Altitude compensation inoperative (black smoke emitted from the exhaust).
- Active boost control inoperative.

Boost control is achieved by the use of a direct drive electric actuator. The actuator is attached to the side of the turbo unit and is connected with the control mechanism via a linkage. The electric actuator works on the torque motor principle and has integrated control module.

The electric actuator moves the control vanes through an 60 degree stroke and has the capability to learn its own maximum stroke positions. The electric actuator is controlled via PWM signals from the ECM. For additional information, refer to: Turbocharger (303-04D Fuel Charging and Controls - Turbocharger - 2.7L Diesel, Description and Operation).

FUEL RAIL PRESSURE CONTROL VALVE

E46984

Item	Part Number	Description
1	-	Fuel volume control valve
2	-	High pressure fuel pump
3	-	Fuel rail pressure control valve

The fuel rail pressure control valve is incorporated into the high pressure fuel pump. The control valve regulates the fuel pressure within the fuel rail and is controlled by the ECM. The control valve is a PWM controlled solenoid valve.

When the solenoid is de-energized, an internal spring holds an internal valve closed. At fuel pressure of 100 bar (1450 lbf/in²) or higher, the force of the spring is overcome, opening the valve and allowing fuel pressure to decay into the fuel return pipe. When the pressure in the fuel rail decays to approximately 100 bar (1450 lbf/in²) or less, the spring force overcomes the fuel pressure and closes the valve. When the ECM energizes the solenoid, the valve is closed allowing the fuel pressure to build. The pressure in the fuel rail in this condition can reach approximately 1300 bar (18854 lbf/in²).

The ECM controls the fuel rail pressure by operating the control valve solenoid using a PWM signal. By varying the duty cycle of the PWM signal, the ECM can accurately control the fuel rail pressure and hence the pressure delivered to the injectors according to engine load. This is achieved by the control valve allowing a greater or lesser volume of fuel to pass from the high pressure side of the pump to the un-pressurized fuel return line, regulating the pressure on the high pressure side.

The fuel rail pressure control valve receives a PWM signal from the ECM of between 0 and 12V. The ECM controls the operation of the control valve using the following information to determine the required fuel pressure:

- Fuel rail pressure
- Engine load
- Accelerator pedal position
- Engine temperature
- Engine speed.

In the event of a total failure of the fuel rail pressure control valve, the engine will not start.

In the event of a partial failure of the fuel rail pressure control valve, the ECM will activate the solenoid with the minimum duty cycle which results in the injection quantity being limited.

FUEL VOLUME CONTROL VALVE

The fuel rail volume control valve is incorporated into the high pressure fuel pump. The VCV spills unwanted fuel back to the tank (or LP system) or forwards it to the PCV. This avoids unused fuel being pressurized by the HP stage of the pump, only to be spilt back to LP by the PCV wasting energy and heating the fuel.

INJECTORS

There are six electronic fuel injectors (one for each cylinder) located in a central position between the four valves of each cylinder. The ECM divides the injectors into two banks of three with cylinders 1 to 3 being designated bank A and cylinders 4 to 6 designated bank B, with injector numbers 1 and 4 at the front of the engine. Although the injectors are numbered 1-6 the firing order determined by the ECM software is numbered 0-5.

Injector/Cylinder Numbering

Injector	Cylinder No
0	1
1	4
2	2
3	5
4	3
5	6

Each injector is supplied with pressurized fuel from the fuel rail and delivers finely atomized fuel directly into the combustion chambers. Each injector is individually controlled by the ECM which operates each injector in the firing order and controls the injector opening period via PWM signals. Each injector receives a 12V supply from the ECM and, using programmed injection/timing maps and sensor signals, determines the precise pilot and main injector timing for each cylinder. If battery voltage falls to between 6 and 9V, fuel injector operation is restricted, affecting emissions, engine speed range and idle speed. In the event of a failure of a fuel injector, the following symptoms may be observed:

- Engine misfire
- Idle irregular
- Reduced engine performance
- Reduced fuel economy
- Difficult starting
- Increased smoke emissions.

The ECM monitors the wires for each injector for short circuit and open circuit, each injector and the transient current within the ECM. If a defect is found, an error is registered in the ECM for the injector in question.

For additional information, refer to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - 2.7L Diesel, Description and Operation).

EGR SYSTEM

The EGR system comprises:

- EGR modulator x 2
- EGR cooler x 2
- Associated connecting pipes

EGR

E46914

The EGR modulator and cooler are a combined unit.

The combined EGR modulator and cooler is located under each cylinder bank, between the exhaust manifold and the cylinder head. The cooler side of the EGR is connected to the vehicle cooling system, via hoses. The inlet exhaust side is connected directly into the exhaust manifolds on each side. The exhaust gas passes through the cooler and is expelled via the actuator and a metal pipe into the throttle housing. The EGR modulator is a solenoid operated valve which is controlled by the ECM. The ECM uses the EGR modulator to control the amount of exhaust gas being re-circulated in order to reduce exhaust emissions and combustion noise. The EGR is enabled when the engine is at normal operating temperature and under cruising conditions.

The EGR modulator receives a 12V supply from the ECM and is controlled using a PWM signal. The PWM duty signal of the solenoid ground is varied to determine the precise amount of exhaust gas delivered to the cylinders.

The modulators are operated through their full range at each engine shut down, to clear any carbon deposits that may have built up whilst the engine was running

In the event of a failure of the EGR modulator, the EGR function will become inoperative. The ECM can monitor the EGR modulator solenoid for short circuits and store fault codes in the event of failure. The modulator can also be activated for testing using a Land Rover approved diagnostic system.

ACCELERATOR PEDAL POSITION (APP) SENSOR

E46901

The APP sensor is incorporated into the pedal assembly. The sensor is a twin track rotary potentiometer type.

The APP sensor is located in plastic housing which is integral with the throttle pedal. The housing is injection molded and provides location for the APP sensor. The sensor is mounted externally on the housing and is secured with two Torx screws. The external body of the sensor has a six pin connector which accepts a connector on the vehicle wiring harness.

The sensor has a spigot which protrudes into the housing and provides the pivot point for the pedal mechanism. The spigot has a slot which allows for a pin, which is attached to the sensor potentiometers, to rotate through approximately 90°, which relates to pedal movement. The pedal is connected via a link to a drum, which engages with the sensor pin, changing the linear movement of the pedal into rotary movement of the drum. The drum has two steel cables attached to it. The cables are secured to two tension springs which are secured in the opposite end of the housing. The springs provide 'feel' on the pedal movement and require an effort from the driver similar to that of a cable controlled throttle. A detente mechanism is located at the forward end of the housing and is operated by a ball located on the drum. At near maximum throttle pedal movement, the ball contacts the detente mechanism. A spring in the mechanism is compressed and gives the driver the feeling of depressing a 'kickdown' switch when full pedal travel is achieved.

ELECTRONIC THROTTLE

E46900

The electric throttle body is located in the inlet tract prior to where the inlet splits to divert air flow into the two separate air intake manifolds. The electric throttle controls the volume of air allowed into the inlet manifold by means of a DC motor which controls a flap in the body of the throttle. This is done in response to inputs from the engine management system.

Just after the throttle flap the tubes from the EGR valves/coolers are joined into the assembly.

DIESEL PARTICULATE FILTER (DPF) CONTROL - VEHICLES FROM 2008MY

Vehicles from 2008MY are fitted with a Diesel Particulate Filter (DPF) which collects the particulate matter produced during the combustion process and reduces the particulates entering the atmosphere.

The DPF is located in the exhaust system, downstream of the catalytic converter. A major feature of the DPF is its ability for regeneration. Regeneration is the burning of particulates trapped by the filter to prevent obstruction to the free flow of exhaust gasses. The regeneration process is controlled by the ECM and takes place at calculated intervals and is not noticeable by the driver of the vehicle.

For details of the DPF and the regeneration processes refer to the relevant exhaust system section. For additional information, refer to: Exhaust System (309-00C, Description and Operation).

Regeneration is most important, since an overfilled filter can damage the engine through excessive exhaust back pressure and can itself be damaged or destroyed.

The exhaust gas and DPF temperatures are controlled by the DPF software located in the ECM. The DPF software monitors the load status of the DPF based on driving style, distance travelled and signals from a differential pressure sensor and temperature sensors located before and after the DPF in the exhaust system. When the particulate loading of the DPF reaches predetermined levels, the DPF is actively regenerated by adjusting, in conjunction with the ECM, various engine control functions such as:

- fuel injection

- intake air throttle
- EGR
- turbocharger boost pressure control.

The regeneration process is possible because of the flexibility of the common-rail fuel injection engine which provides precise control of fuel flow, fuel pressure and injection timing which are essential requirements to promote the efficient regeneration process.

The ECM contains the DPF software which controls and monitors the DPF and the regeneration process. The software is broken down into three separate modules; a DPF supervisor module, a DPF fuel management module and a DPF air management module, which interact with each other to provide precise DPF control.

These three modules are controlled by a fourth software module known as the DPF co-ordinator module. The co-ordinator module manages the operation of the other modules when an active regeneration is requested. The DPF supervisor module is a sub-system of the DPF co-ordinator module.

DPF Co-Ordinator Module

The DPF co-ordinator module reacts to a regeneration request from the supervisor module by initiating and controlling the following DPF regeneration requests:

- EGR cut-off
- Turbocharger boost pressure control
- Engine load increase
- Control of air pressure and temperature in the intake manifold
- Fuel injection control.

When the supervisor module issues a regeneration request, the co-ordinator module requests EGR cut-off and a regeneration specific turbocharger boost pressure control. It then waits for a feedback signal from the EGR system confirming that the EGR valve is closed.

• **NOTE: The EGR valve is open at idle to allow reduced NO_x. EGR is not used during part load due to intake manifold contamination.**

When the EGR valve is closed, the co-ordinator module initiates requests to increase engine load by controlling the intake air temperature and pressure.

Once confirmation is received that intake conditions are controlled or a calibration time has expired, the co-ordinator module then changes to a state awaiting an accelerator pedal release manoeuvre from the driver. If this occurs or a calibration time has expired, the co-ordinator module generates a request to control fuel injections to increase exhaust gas temperature.

DPF Fuel Management Module

The DPF fuel management module controls the following functions:

- Timing and quantity of the four split injections per stroke (pilot, main and two post injections).
- Injection pressure and the transition between the three different calibration levels of injection.

The above functions are dependant on the condition of the catalytic converter and the DPF.

The controlled injection determines the required injection level in addition to measuring the activity of the catalytic converter and the DPF. The fuel management calculates the quantity and timing for the four split injections, for each of the three calibration levels for injection pressure, and also manages the transition between the levels.

The two post injections are required to separate the functionality of increasing in-cylinder gas temperatures and the production of hydrocarbons. The first post injection is used to generate the higher in-cylinder gas temperature while simultaneously retaining the same engine torque output produced during normal (non-regeneration) engine operation. The second post injection is used to generate hydrocarbons by allowing unburnt fuel into the catalytic converter without producing increased engine torque.

DPF Air Management Module

The DPF air management module controls the following functions:

- EGR control
- Turbocharger boost pressure control
- Intake air temperature and pressure control.

During active regeneration, the EGR operation is disabled and the closed-loop activation of the turbocharger boost controller is calculated. The air management module controls the air in the intake manifold to a predetermined level of pressure and temperature. This control is required to achieve the correct in-cylinder conditions for stable and robust combustion of the post injected fuel.

Restricting the air intake during DPF regeneration has the following functions:

- Increase in engine load
- Slower combustion
- Reduction in the mass of air taken in
- A reduction in the speed of the exhaust gases and therefore an increase in the time for which the gases are in the catalytic converter.

The module controls the intake air temperature by actuating the EGR throttle and by adjustment of the turbocharger boost pressure control.

DPF Temperature Sensors

E48497

Three temperature sensors are used in the DPF system. One is located in the turbocharger outlet elbow, the second sensor is after the catalytic converter and the third sensor is located after the DPF.

The sensors measure the temperature of exhaust gas exiting the turbocharger, before it passes through the DPF and after it has passed through the DPF and provides the information required by the ECM to calculate the DPF temperature. The information is used, in conjunction with other data, to estimate the amount of accumulated particulate and to control the DPF temperature.

The sensors are Negative Temperature Co-efficient (NTC) type resistors, which measure the temperature of the exhaust gases. The resistance, and subsequently the voltage at the sensor, will decrease as the exhaust gas temperature increases.

In the event of a fault in a temperature sensor, the ECM uses a substitute value of 350°C (1202°F).

Differential Pressure Sensor

E91611

Item	Part Number	Description
1	-	Low pressure connection
2	-	High pressure connection
3	-	Electrical connector

The differential pressure sensor is located on the rear of the transfer box, adjacent to the DPF.

The differential pressure sensor is used by the DPF software to monitor the condition of the DPF. Two pipe connections on the sensor are connected by pipes to the inlet and outlet ends of the DPF. The pipes allow the sensor to measure the inlet and outlet pressures of the DPF.

As the amount of particulates trapped by the DPF increases, the pressure at the inlet side of the DPF increases in comparison to the DPF outlet. The DPF software uses this comparison, in conjunction with other data, to calculate the accumulated amount of trapped particulates.

By measuring the pressure difference between the DPF inlet and outlet air flow and the DPF temperature, the DPF software can determine if the DPF is becoming blocked and requires regeneration.

A DPF is recognized as overloaded if the differential pressure under certain operating conditions exceeds the overload limit calculated by the ECM. The DPF software may start regeneration attempts but be unable to complete them. These attempts are counted by the ECM and, if the maximum number of regeneration attempts is reached, a fault entry is recorded in the ECM at the next ignition on cycle.

The DPF software performs the following checks using the DPF differential pressure sensor:

- Plausibility check
- Diesel particulate filter efficiency
- Diesel particulate filter overloaded
- Diesel particulate filter clogged
- Monitoring of the maximum regeneration attempts in the lower load range.

TERRAIN RESPONSE™

Terrain Response system allows the driver to select a program which will provide the optimum settings for traction and performance for prevailing terrain conditions.

As part of Terrain Response there will be different throttle pedal progression maps associated with different Terrain Response modes. The two extremes are likely to be a sand map (quick build up of torque with pedal travel) and grass/gravel/snow (very cautious build up of torque).

The TdV6 implementation of throttle progression is based on a fixed blend time. The torque will blend from that on one map to that on the new map (for the same pedal position) over a fixed time. This means blending will always take the same amount of time but when the torque change is small the torque increase over time will be small, whilst if the torque change is greater then the torque increase over time will be steeper. The resulting acceleration of the vehicle will depend on the torque difference between the two maps as well as on the gear and range selected. The worst case blending that could ever occur has been calibrated to match the blend rate for petrol derivatives as closely as possible, so as to give a transparent behavior to customers.

For additional information, refer to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Description and Operation).

CENTRAL JUNCTION BOX

E47607

The central junction box (CJB) initiates the power up and power down routines within the ECM. When the ignition is turned on 12V is applied to the Ignition Sense input. The ECM then starts its power up routines and turns on the ECM main relay; the main power to the ECM and it's associated system components. When the ignition is turned OFF the ECM will maintain its powered up state for up to 20 seconds while it initiates its power down routine and on completion will turn off the ECM main relay.

GENERATOR

E47591

The generator has a multifunction voltage regulator for use in a 14V charging system with 6÷12 zener diode bridge rectifiers.

The ECM monitors the load on the electrical system via PWM signal and adjusts the generator output to match the required load. The ECM also monitors the battery temperature to determine the generator regulator set point. This characteristic is necessary to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximize any rechargeability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing of the battery with consequent water loss.

For additional information, refer to: Generator (414-02C Generator and Regulator - 2.7L Diesel, Description and Operation).

The generator has a smart charge capability that will reduce the electrical load on the generator reducing torque requirements, this is implemented to utilize the engine torque for other purposes. This is achieved by monitoring three signals to the ECM:

- Generator sense (A sense), measures the battery voltage at the CJB.
- Generator communication (Alt Com) communicates desired generator voltage set point from ECM to generator.
- Generator monitor (Alt Mon) communicates the extent of generator current draw to ECM. This signal also transmits faults to the ECM which will then sends a message to the instrument cluster on the CAN bus to illuminate the charge warning lamp.

Electronic Engine Controls - TDV6 2.7L Diesel - Electronic Engine Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the electronic engine control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Engine oil level ● Cooling system coolant level ● Fuel level ● Fuel contamination/grade/quality ● Fuel leaks ● Accessory drive belt ● Sensor installation/condition ● Viscous fan and solenoid 	<ul style="list-style-type: none"> ● Fuses ● Wiring harness ● Electrical connector(s) ● 5 volt sensor supply ● Sensor(s) ● Engine Control Module (ECM) ● Transmission Control Module (TCM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not start	<ul style="list-style-type: none"> ● Inertia fuel shutoff switch ● Low/Contaminated fuel ● Air leakage ● Low-pressure fuel system fault ● Fuel pump module (lift pump) fault ● Blocked fuel filter ● Fuel volume regulator blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Fuel pump fault ● Crankshaft position (CKP) sensor 	Check that the inertia switch has not tripped. Check the fuel level and condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the lift pump operation, check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel pump. Check the CKP sensor circuits. Refer to the electrical guides.
Difficult to start	<ul style="list-style-type: none"> ● Glow plug system fault (very cold conditions) ● Low/Contaminated fuel ● Air leakage ● Fuel pump module (lift pump) fault ● Low-pressure fuel system fault ● Blocked fuel filter ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Exhaust gas recirculation (EGR) valve(s) fault 	Check the glow plug circuits. Refer to the electrical guides. Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the lift pump operation, check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. Check the EGR system.

Symptom	Possible Causes	Action
Rough idle	<ul style="list-style-type: none"> ● Intake air system fault ● Low/Contaminated fuel ● Low-pressure fuel system fault ● Blocked fuel filter ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Exhaust gas recirculation (EGR) valve(s) fault 	Check the intake air system for leaks. Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. Check the EGR system.
Lack of power when accelerating	<ul style="list-style-type: none"> ● Intake air system fault ● Restricted exhaust system ● Low fuel pressure ● Exhaust gas recirculation (EGR) valve(s) fault ● Turbocharger actuator fault 	Check the intake air system for leakage or restriction. Check for a blockage/restriction in the exhaust system, install new components as necessary. Check for DTCs indicating a fuel pressure fault. Check the EGR system. Check turbocharger actuator.

Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the fuel system for leaks/damage: Check for DTCs indicating a fuel volume or pressure control valve fault. Check the EGR system.
Engine judders	<ul style="list-style-type: none"> ● Low/Contaminated fuel ● Air ingress ● Low-pressure fuel system fault ● Fuel metering valve blocked/contaminated ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● High pressure fuel leak ● Fuel pump fault 	Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the low-pressure fuel system for leaks/damage. Check the high pressure fuel system for leaks, check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel pump.
Excessive fuel consumption	<ul style="list-style-type: none"> ● Low-pressure fuel system fault ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Fuel temperature sensor leak ● High pressure fuel leak ● Injector(s) fault ● Exhaust gas recirculation (EGR) valve(s) fault 	Check the low-pressure fuel system for leaks/damage. Check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel temperature sensor, fuel pump, etc for leaks. Check for injector DTCs. Check the EGR system.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - TDV6 2.7L Diesel, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Electronic Engine Controls - TDV6 2.7L Diesel - Brake Pedal Position (BPP) Switch Adjustment

General Procedures

Check

1. Remove the brake pedal rubber.
2. NOTE: Make sure that the dial test indicator (DTI) gauge is in line with the brake pedal movement.

Position the DTI gauge on a suitable mounting block, as illustrated.

3. With the aid of another technician, gently press the brake pedal until the stoplamps illuminate.
4. NOTE: The specification is that the stoplamps should illuminate at between 5.5mm and 8.5mm brake pedal travel.

Note the measurement of the brake pedal travel from rest position until the stoplamps illuminated.

Adjust

1. CAUTIONS:

The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

Remove the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).

2. CAUTIONS:

The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

Only use light finger pressure when installing the stoplamp switch. Failure to follow this instruction may result in an incorrectly adjusted stoplamp switch.

Install the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).

3. Check the adjustment of the stoplamp switch by following the **Check** procedure in this procedure and carry out the **Adjust** procedure if required.

Electronic Engine Controls - TDV6 2.7L Diesel - Engine Oil Pressure (EOP) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Oramentation, Removal and Installation).
3. Disconnect the engine oil pressure (EOP) sensor electrical connector.

4. Remove the EOP sensor.

Installation

1. To install, reverse the removal procedure.
 - Tighten the EOP sensor to 15 Nm (11 lb.ft).
2. Check and top-up the engine oil.

Electronic Engine Controls - TDV6 2.7L Diesel - Oil Temperature Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Drain the engine oil.
For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures).

3.  CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the oil temperature sensor.

- Disconnect the engine oil temperature sensor electrical connector.
- Position a container to collect the oil spillage.
- Remove and discard the O-ring seal.

Installation

1. **NOTE:** Lubricate new seals with clean engine oil.

Install the oil temperature sensor.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the oil temperature sensor to 20 Nm (15 lb.ft).
- Connect the engine oil temperature sensor electrical connector.

2. Fill the engine with oil.
For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Electronic Engine Controls - TDV6 2.7L Diesel - Engine Control Module (ECM)

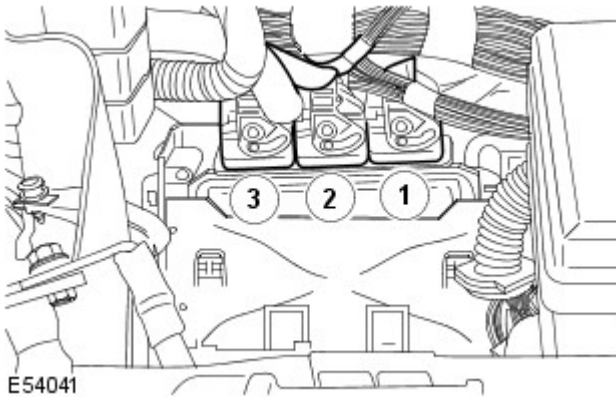

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the four-wheel drive control module.
For additional information, refer to: [Four-Wheel Drive \(4WD\) Control Module](#) (308-07A Four-Wheel Drive Systems, Removal and Installation).
3. **NOTE:** Right hand drive shown, for Left hand drive reverse the sequence.

Disconnect the three engine harness electrical connectors in the order shown.

- Position the three engine harness electrical connectors aside for access.

E54041

4. Remove the ECM securing plate.

- Remove the four ECM securing bolts

E54039

5. Remove the ECM.

- Remove the ECM top cover.

E54040

Installation

1. Install the ECM.
 - Install the ECM top cover.
2. Install the ECM securing plate.

- Install and tighten the four securing bolts.
3. Connect the three engine harness electrical connectors.
 4. Install the four-wheel drive control module.
For additional information, refer to: [Four-Wheel Drive \(4WD\) Control Module](#) (308-07A Four-Wheel Drive Systems, Removal and Installation).
 5. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
 6. **NOTE: Vehicles with DPF (Diesel Particulate Filter) installed only.**

Renew the engine oil and filter.
For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures).
 7. Connect T4 to calibrate a new ECM.

Electronic Engine Controls - TDV6 2.7L Diesel - Engine Coolant Temperature (ECT) Sensor

Removal and Installation

Removal

WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the engine coolant temperature sensor while the system is hot.

CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the ECT sensor electrical connector.

4. Remove the ECT sensor.

- Lift the tang and rotate the ECT sensor anti-clockwise.
- Remove and discard the O-ring seal.

Installation

1. Install the ECT sensor.
 - Clean the component mating faces.
 - Install a new O-ring seal.
2. Connect the ECT sensor electrical connector.
3. Check and top-up the coolant.
 - Clean any remaining coolant from around the hoses and pipes.
4. Install the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

5. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Electronic Engine Controls - TDV6 2.7L Diesel - Crankshaft Position (CKP) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the turbocharger.
For additional information, refer to: [Turbocharger](#) (303-04B Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Removal and Installation).
3. Disconnect the CKP sensor electrical connector.

4. Remove the CKP sensor blanking cover.

5. **NOTE:** The CKP sensor retaining bolt should not be removed from the CKP sensor.

Remove the CKP sensor.

- Fully loosen the CKP sensor retaining bolt.

Installation

1.  **CAUTION:** Install the CKP sensor correctly into the housing. Failure to follow this instruction may result in damage to the CKP sensor.

To install, reverse the removal procedure.

- Tighten the CKP sensor bolt to 5 Nm (4 lb.ft)

Electronic Engine Controls - TDV6 2.7L Diesel - Crankshaft Position (CKP) Sensor Ring

Removal and Installation

Special Tool(s)	
	Installer -Crankshaft Position (CKP) Sensor Ring 303-1130

Removal

- NOTE: The CKP sensor ring must always be discarded and replaced when removed.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Manual models: Remove the flywheel.
For additional information, refer to: [Flywheel](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
3. Automatic models: Remove the flexplate.
For additional information, refer to: [Flexplate](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).
4. Release the CKP sensor.

- Release the Allen screw.

5.  CAUTION: Care must be taken to avoid damage to the crankshaft.

Remove the CKP sensor ring.

- Carefully remove the CKP sensor ring.

Installation

1. Install the new CKP sensor ring to the special tool.

- Wind the special tool nut back to the end of the thread.
- Engage the CKP sensor ring to the locating pin.

2. Install the CKP sensor ring to the crankshaft.

- Clean the component mating faces.
- Align the dowel and install the special tool to the crankshaft.
- Tighten the 2 Allen screws.
- Tighten the special tool nut, to install the CKP sensor ring to the crankshaft.
- Remove the special tool.

3. Install the CKP sensor. For additional information, refer to: [Flywheel](#) (303-01A Engine - TDV6 2.7L Diesel, In-Vehicle Repair).

- Tighten the Allen screw to 6 Nm (4 lb.ft).

5. Automatic models: Remove the flexplate.
For additional information, refer to: [Flexplate](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

Electronic Engine Controls - TDV6 2.7L Diesel - Camshaft Position (CMP) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the LH exhaust gas recirculation (EGR) valve.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve LH - Vehicles Without Diesel Particulate Filter \(DPF\)](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).
3. Disconnect the CMP sensor electrical connector.

4. Remove and discard the CMP sensor.
 - Remove the CMP sensor retaining bolt.

Installation

1. **NOTE:** Only turn the engine in the normal direction of rotation.

Turn the engine until one of the three webs on the back of the camshaft pulley is visible through the CMP sensor housing.

- Timing belt cover shown removed for clarity.
- Use a mirror, to view the webs on the camshaft pulley through the CMP sensor locating hole.

2.  CAUTION: The Camshaft position (CMP) sensor tip must rest on one of the three webs on the back of the camshaft pulley. Incorrect installation may result in the CMP sensor being damaged.

Install a new CMP sensor

3. Install the retaining bolt.

- Tighten the bolt to 10 Nm (7 lb.ft).

4. Connect the CMP sensor electrical connector.

5. Install the LH EGR valve.

For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve LH - Vehicles Without Diesel Particulate Filter \(DPF\)](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

6. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Electronic Engine Controls - TDV6 2.7L Diesel - Manifold Absolute Pressure (MAP) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the MAP sensor electrical connector.

E51281

4. Remove the MAP sensor.
 - Remove the Torx screw.
 - Remove the O-ring seal.

E52414

Installation

1. To install, reverse the removal procedure.
 - Tighten the Torx screw to 3 Nm (2 lb.ft).

Electronic Engine Controls - TDV6 2.7L Diesel - Fuel Temperature Sensor

Removal and Installation

Removal

• WARNINGS:

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the fuel temperature sensor electrical connector.

E54697

4. Release the fuel temperature sensor locking tangs.

E54699

5.  CAUTION: Always plug any open connections to prevent contamination.

Remove the fuel temperature sensor from the fuel return line.

- Position an absorbent cloth to collect fluid spillage.
- Discard the O-ring seal.
- Clean the seal contact area.
- Install a clean blanking plug to the fuel return line.

E54698

Installation

1. To install, reverse the removal procedure.

- Clean the immediate area.

Electronic Engine Controls - TDV6 2.7L Diesel - Mass Air Flow (MAF) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Release the air outlet pipe.

- Remove the 2 screws.
- Loosen the clip.

E47624

3. Remove the RH air cleaner assembly.

- Disconnect the electrical connector.
- Release the air cleaner from the 2 grommets.

E47625

4. Remove the MAF sensor.

- Remove the 2 Torx screws.
- Remove the O-ring seal.

E47626

Installation

1. **NOTE:** When installing the air cleaner, make sure the locating pegs fit securely into the grommets.

To install, reverse the removal procedure.

Electronic Engine Controls - TDV6 2.7L Diesel - Fuel Rail Pressure (FRP) Sensor

Removal and Installation

Removal

CAUTION: The FRP sensor must not be removed from the fuel diverter rail.

• **NOTE:** If a new fuel rail pressure sensor is to be installed, a new FRP sensor and fuel diverter rail must be installed as an assembly.

1. Remove the fuel diverter rail.
For additional information, refer to: [Fuel Diverter Rail](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

Installation

1. Install the fuel diverter rail.
For additional information, refer to: [Fuel Diverter Rail](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

Electronic Engine Controls - TDV6 2.7L Diesel - Intake Air Temperature (IAT) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the intake air temperature (IAT) sensor.
 - Disconnect the electrical connector.

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - TDV6 2.7L Diesel - Engine Control Module (ECM) Cooling Fan

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the battery tray.
For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
3. Remove the engine control module (ECM).
For additional information, refer to: [Engine Control Module \(ECM\)](#) (303-14, Removal and Installation).
4. Remove the battery junction box (BJB) cover.
 - Release the clip.

E91996

- Release the clip.

5. Release the BJB from the bracket.
 - Remove the bolt.

E55296

6. Remove the central junction box (CJB).
For additional information, refer to: [Central Junction Box \(CJB\)](#) (418-00 Module Communications Network, Removal and Installation).

7. Release the CJB bracket.
 - Release the 3 upper wiring harness clips.
 - Remove the 2 bolts.

E55289

8. Remove the CJB bracket.

- Disconnect the 2 electrical connectors.
- Release the 3 lower wiring harness clips.
- Remove the 2 nuts.

9. Release the ECM housing.

- Release the insulation for access to the nuts.
- Remove the 2 nuts and 2 bolts.

10.  CAUTION: Note of the routing of the wiring harnesses.

Release and disconnect the ECM cooling fan electrical connector.

11. Remove the ECM housing lower panel.

- Remove the 4 screws.

12.  **CAUTION:** Note the fitted position of the component prior to removal.

Remove the cooling fan.

- Remove the 2 screws.

Installation

1.  **CAUTION:** Make sure that these components are installed to the noted removal position.

Install the cooling fan.

- Install the 2 screws.

2.  **CAUTION:** Make sure the seal is installed correctly.

Install the ECM housing lower panel.

- Install the 4 screws.

3.  **CAUTION:** Make sure that the wiring harnesses are correctly routed.

Connect and secure the cooling fan electrical connector.

4.  **CAUTION:** Make sure that the seal is correctly located.

Secure the ECM housing.

- Tighten the bolts and nuts to 10 Nm (7 lb.ft).

5. Install the CJB bracket.

- Tighten the nuts to 10 Nm (7 lb.ft).
- Secure the clips.
- Connect the electrical connectors.
- Tighten the bolts to 25 Nm (18 lb.ft).

6. Install the CJB.

For additional information, refer to: [Central Junction Box \(CJB\)](#) (418-00 Module Communications Network, Removal and Installation).

7. Secure the BJB to the bracket.

- Tighten the bolt to 6 Nm (4 lb.ft).

8. Install the BJB cover.

- Secure the clip.

9. Install the engine ECM.

For additional information, refer to: Engine Control Module (ECM) (303-14, Removal and Installation).

10. Install the battery tray.

For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

11. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Electronic Engine Controls - TDV6 2.7L Diesel - Exhaust Gas Temperature Sensor

Removal and Installation

Removal

WARNING: Observe due care when working near a hot exhaust system.

• **NOTE:** Pre-catalytic converter exhaust gas temperature sensor shown, post catalytic converter and post diesel particulate filter (DPF) sensors similar.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission undershield.

- Remove the 6 bolts.

3. NOTE: Discard the gasket.

Release the catalytic converter.

- Remove and discard the 3 nuts.

4. Loosen the catalytic converter to diesel particulate filter (DPF) clamp.

5. Remove the exhaust gas temperature sensor electrical connector heat shield.

- Remove the bolt.

6. Disconnect the exhaust gas temperature sensor electrical connector.

7. Remove the exhaust gas temperature sensor.

- Reposition the catalytic converter.

Installation

1. Install the exhaust gas temperature sensor.

- Tighten to 35 Nm (26 lb.ft).

2. Connect the exhaust gas temperature sensor electrical connector.

3. Install the exhaust gas temperature sensor connector heat shield.

- Tighten the bolt to 10 Nm (7 lb.ft).

4. **NOTE:** Install a new gasket.

Secure the LH catalytic converter.

- Tighten the nuts to 48 Nm (35 lb.ft).

5. Tighten the catalytic converter to DPF retaining clamp.

- Tighten the nut to 48 Nm (35 lb.ft).

6. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

Electronic Engine Controls - TDV6 3.0L Diesel - Electronic Engine Controls - Overview

Description and Operation

OVERVIEW

The 3.0L V6 diesel engine has an [ECM \(engine control module\)](#) controlled engine management system. Multiple sensor inputs and precision control of actuators are used by the [ECM](#) to achieve optimum performance during all driving conditions.

The [ECM](#) receives and processes information from the following input sources:

- Oil level sensor
- Secondary turbocharger shut-off sensor
- Secondary turbocharger boost pressure sensor
- Generator
- Differential pressure sensor
- [CMP \(camshaft position\)](#) sensor
- [CKP \(crankshaft position\)](#) sensor
- Fuel rail pressure sensor
- Fuel temperature sensor
- Air charge temperature sensor
- [ECT \(engine coolant temperature\)](#) sensor
- [TP \(throttle position\)](#) sensor
- [MAF \(mass air flow\)](#) sensor
- [MAF/IAT \(intake air temperature\)](#) sensor
- [MAP \(manifold absolute pressure\)](#) sensor
- [EGR \(exhaust gas recirculation\)](#) sensors
- [HO2S \(heated oxygen sensor\)](#)
- Catalyst and Diesel Particulate Filter (DPF) temperature sensors
- Brake lamp switch

The [ECM](#) outputs controlling signals to the following sensors and actuators:

- [A/C \(air conditioning\)](#) compressor clutch solenoid
- [A/C](#) compressor clutch
- Fuel injectors
- Glow plug relay
- Fuel pressure control valve
- Fuel volume control valve
- Fan control module
- Vacuum control valves (EGR cooler by-pass, secondary turbocharger compressor shut-off, secondary turbocharger turbine shut-off)
- [ABS \(anti-lock brake system\)](#) module
- [TCM \(transmission control module\)](#)
- Instrument cluster
- [RCM \(restraints control module\)](#)
- Primary turbocharger control module
- [EGR](#) recirculation valves
- Alternator
- Throttle actuator
- Secondary turbocharger compressor recirculation valve

System Operation

OPERATION

The 3.0L V6 diesel engine management system is controlled by an [ECM](#) and is able to monitor, adapt and precisely control the fuel injection. The [ECM](#) uses multiple sensor inputs and precision control of actuators to achieve optimum performance during all driving conditions.

The [ECM](#) controls fuel delivery to all six cylinders via a common rail injection system. The common rail system uses a fuel rail to accumulate highly pressurized fuel and feed the six, electronically controlled injectors. The fuel rail is located in close proximity to the injectors, which assists in maintaining full system pressure at each injector at all times.

The [ECM](#) uses the drive by wire principle for acceleration control. There are no control cables or physical connections between the accelerator pedal and the engine. Accelerator pedal demand is communicated to the [ECM](#) by two potentiometers located in an [APP](#) sensor. The [ECM](#) uses the two signals to determine the position, rate of movement and direction of movement of the pedal. The [ECM](#) then uses this data, along with other engine information from other sensors, to achieve the optimum engine response.

Component Description

DESCRIPTION

Engine Control Module (ECM)

E123673

The [ECM](#) is located on a bracket on the passenger side of the engine compartment bulkhead.

The [ECM](#) connected to the vehicle harnesses via 2 connectors. The [ECM](#) contains data processors and memory microchips. The output signals to the actuators are in the form of ground paths provided by driver circuits within the [ECM](#). The [ECM](#) driver circuits produce heat during normal operation and dissipate this heat via the casing. Some sensors receive a regulated voltage supplied by the [ECM](#). This avoids incorrect signals caused by voltage drop during cranking.

The [ECM](#) performs self diagnostic routines and stores fault codes in its memory. These fault codes and diagnostics can be accessed using Land Rover approved diagnostic equipment. If the [ECM](#) is to be replaced, the new [ECM](#) is supplied 'blank' and must be configured to the vehicle using Land Rover approved diagnostic equipment. A 'flash' [EEPROM \(electrically erasable programmable read only memory\)](#) allows the [ECM](#) to be externally configured, using Land Rover approved diagnostic equipment, with market specific or new tune information. The current engine tune data can be accessed and read using Land Rover approved diagnostic equipment.

When a new [ECM](#) is fitted, it must also be synchronized to other system control modules using Land Rover approved diagnostic equipment. [ECM](#)'s cannot be 'swapped' between vehicles as they must be 'matched' with security information to other system modules.

The [ECM](#) is connected to the engine sensors which allow it to monitor the engine operating conditions. The [ECM](#) processes these signals and decides the actions necessary to maintain optimum engine performance in terms of drive ability, fuel efficiency and exhaust emissions. The memory of the [ECM](#) is programmed with instructions for how to control the engine. The memory also contains data in the form of maps which the [ECM](#) uses as a basis for fueling and emission control. By

comparing the information from the sensors to the data in the maps, the [ECM](#) is able to calculate the various output requirements. The [ECM](#) contains an adaptive strategy which updates the system when components vary due to production tolerances or ageing.

The [ECM](#) is connected to other system control modules and receives data from these modules on the high speed [CAN](#) bus to enable precise engine control under all vehicle operating conditions.

Crankshaft Position (CKP) Sensor

E116415

The [CKP](#) sensor is located at the rear of the engine block on the [LH](#) side. The sensor lead passes through a cover in an aperture on the side of the engine block. The sensor is secured to a bracket on a plate which locates the rear crankshaft oil seal. The sensor tip is aligned with a magnetic trigger reluctor wheel which is attached to the end of the crankshaft. The trigger wheel is a press fit on the end of the crankshaft. The trigger wheel must be carefully aligned to the crankshaft to ensure correct timing. The sensor produces a square wave signal, the frequency of which is proportional to engine speed.

The [ECM](#) monitors the [CKP](#) sensor signal and can detect engine over-speed. The [ECM](#) counteracts engine over-speed by gradually fading out speed synchronized functions. The [CKP](#) is a Hall effect sensor. The sensor measures the magnetic field variation induced by the magnetized trigger wheel.

The trigger wheel has a 60 minus 2 tooth pattern. The missing teeth represent 12 degrees of crankshaft rotation and provide a reference point for the angular position of the crankshaft at 21 degrees [BTDC](#) (before top dead center) on cylinder 1.

When the space with the two missing teeth pass the sensor tip, a gap in the signal is produced which the [ECM](#) uses to determine the crankshaft position. The air gap between the sensor tip and the ring is important to ensure correct signals are output to the [ECM](#). The recommended air gap between the [CKP](#) and the trigger wheel is 0.4 mm- 1.5 mm.

The [ECM](#) uses the signal from the [CKP](#) sensor for the following functions:

- Synchronization
- Determine fuel injection timing
- Produce an engine speed signal which is broadcast on the high speed [CAN](#) bus for use by other systems.

Camshaft Position (CMP) Sensor

E46902

The [CMP](#) is located on the front face of the [LH](#) cylinder head. The sensor tip protrudes through an aperture in the front face of the cylinder head to pick up on a reluctor behind the camshaft pulley. The [CMP](#) sensor is a Hall effect type sensor.

The [ECM](#) uses the [CMP](#) sensor signal to determine if the piston in No. 1 cylinder is at injection [TDC](#) (top dead center) or exhaust [TDC](#). Once this has been established, the [ECM](#) can then operate the correct injector to inject fuel into the cylinder when the piston is at injection [TDC](#).

The [CMP](#) sensor is a Hall effect sensor which used by the [ECM](#) at engine start-up to synchronize the [ECM](#) with the [CKP](#) sensor signal. The [ECM](#) does this by using the [CMP](#) sensor signal to identify number one cylinder to ensure the correct injector timing. Once the [ECM](#) has established the injector timing, the [CMP](#) sensor signal is no longer used.

The [CMP](#) sensor receives a 5V supply from the [ECM](#). Two further connections to the [ECM](#) provide ground and signal output.

If a fault occurs, an error is registered in the [ECM](#). Two types of failure can occur; no [CMP](#) sensor signal or a synchronization error of the [CMP](#) and [CKP](#) sensors. The error recorded by the [ECM](#) can also relate to a total failure of the crankshaft signal or crankshaft signal dynamically implausible. Both components should be checked to determine the cause of the fault.

If a fault occurs with the [CMP](#) sensor when the engine is running, the engine will continue to run but the [ECM](#) will deactivate boost pressure control. Once the engine is switched off, the engine will crank but will not restart while the fault is present.

Mass Air Flow (MAF) and Inlet Air Temperature (IAT) Sensors

E123727

ItemDescription

1	MAF sensor
2	MAF/IAT sensor

The [MAF/IAT](#) sensors are located on the inlet air duct directly after the air filter box. Two sensors are fitted; the front sensor, located prior to the intake air to primary turbocharger pipe, is a combined [MAF/IAT](#) sensor (4-wire). The rear sensor, located prior to the intake air to secondary turbocharger pipe, is a [MAF](#) sensor (3-wire) only.

The [MAF](#) sensors work on the hot film principle. Each sensor has 2 sensing elements which are contained within a film. One element is maintained at ambient (air intake) temperature, e.g. 25°Celsius (77°F). The other element is heated to 200°Celsius (392°F) above the ambient temperature, e.g. 225°Celsius (437°F). Intake air entering the engine passes through the [MAF](#) sensors and has a cooling effect on the film. The [ECM](#) monitors the current required to maintain the 200°Celsius (392°F) differential between the two elements and uses the differential to provide a precise, non-linear, signal which equates to the volume of air being drawn into the engine.

The [MAF](#) sensor output is a digital signal proportional to the mass of the incoming air. The [ECM](#) uses this data, in conjunction with signals from other sensors and information from stored fueling maps, to determine the precise fuel quantity to be injected into the cylinders. The signal is also used as a feedback signal for the [EGR](#) system.

The [IAT](#) sensor in the front sensor incorporates a [NTC \(negative temperature coefficient\)](#) thermistor in a voltage divider circuit. The [NTC](#) thermistor works on the principle of decreasing resistance in the sensor as the temperature of the intake air increases. As the thermistor allows more current to pass to ground, the voltage sensed by the [ECM](#) decreases. The change in voltage is proportional to the temperature change of the intake air. Using the voltage output from the [IAT](#) sensor, the [ECM](#) can correct the fueling map for intake air temperature. The correction is an important requirement because hot air contains less oxygen than cold air for any given volume.

The [MAF](#) sensor receives a 12V supply from the [BJB \(battery junction box\)](#) and a ground connection via the [ECM](#). Two further connections to the [ECM](#) provide a [MAF](#) signal and [IAT](#) signal.

The [IAT](#) sensor receives a 3.3V reference voltage from the [ECM](#) and shares a ground with the [MAF](#) sensor. The signal output from the [IAT](#) sensor is calculated by the [ECM](#) by monitoring changes in the supplied reference voltage to the [IAT](#) sensor voltage divider circuit.

The [ECM](#) checks the calculated air mass against the engine speed. If the calculated air mass is not plausible, the [ECM](#) uses a default air mass figure which is derived from the average engine speed compared to a stored characteristic map. The air mass value will be corrected using values for boost pressure, atmospheric pressure and air temperature.

If one of the [MAF](#) sensors fails the [ECM](#) implements the default strategy based on engine speed. In the event of a [MAF](#) sensor signal failure, the following symptoms may be observed:

- [EGR](#) system off
- Delayed engine response
- Reduced engine performance.

If the [IAT](#) sensor fails the [ECM](#) uses a default intake air temperature of 40°Celsius (104°F). In the event of an [IAT](#) sensor failure, the following symptom may be observed:

- Under fueling, resulting in reduced engine performance.

Manifold Absolute Pressure (MAP) Sensor

E123688

The [MAP](#) sensor is located on top of the throttle intake manifold. The [MAP](#) sensor measures the absolute pressure in the intake manifold. The sensor is a semi-conductor type sensor which responds to pressure acting on a membrane within the sensor, altering the output voltage. The sensor receives a 5V reference voltage and a ground from the [ECM](#) and returns a signal of between 0.5 - 4.5V to the [ECM](#). A low pressure returns a low voltage signal to the [ECM](#) and a high pressure returns a high voltage.

The [MAP](#) sensor detects quick pressure changes in the intake manifold after the electric throttle. The signal is used in conjunction with the [MAF](#) sensor signal to calculate the injection period.

The [ECM](#) monitors the engine [MAP](#) sensor for faults and can store fault related codes. These can be retrieved using Land Rover approved diagnostic equipment. If the sensor fails, the [ECM](#) uses the [MAF/IAT](#) sensor signal value as a substitute.

Electronic Throttle Actuator

E116417

The electronic throttle actuator is located on the side of the throttle intake manifold.

The electronic throttle actuator controls the volume of air allowed into the inlet manifolds by means of a [DC \(direct current\)](#) motor which controls a flap in the body of the throttle. The actuator is controlled by the [ECM](#) which operates the actuator in response to driver inputs from the [APP](#) sensor and other engine related sensors to provide the correct air flow to the intake manifolds.

Engine Coolant Temperature (ECT) Sensor

E46905

The [ECT](#) sensor is located in the [LHEGR](#) cooler coolant inlet pipe, at the front of the engine. The [ECT](#) sensor provides the [ECM](#) and the instrument cluster with engine coolant temperature status.

The [ECM](#) uses the temperature information for the following functions:

- Fueling calculations
- Limit engine operation if engine coolant temperature becomes too high
- Cooling fan operation
- Glow plug activation time.

The instrument cluster uses the temperature information for generation of engine temperature messages. The engine coolant temperature signal is also transmitted on the medium speed [CAN](#) bus by the instrument cluster for use by other systems.
