The [ECT](#) sensor circuit consists of an internal voltage divider circuit which incorporates an [NTC](#) thermistor. As the coolant temperature rises the resistance through the sensor decreases and vice versa. The output from the sensor is the change in voltage as the thermistor allows more current to pass to ground relative to the temperature of the coolant.

The [ECM](#) compares the signal voltage to stored values and adjusts fuel delivery to ensure optimum drive ability at all times. The engine will require more fuel when it is cold to overcome fuel condensing on the cold metal surfaces inside the combustion chamber. To achieve a richer air/fuel ratio, the [ECM](#) extends the injector opening time. As the engine warms up the air/fuel ratio is leaned off.

The input to the sensor is a 3.3V reference voltage supplied from the voltage divider circuit within the [ECM](#). The ground from the sensor is also connected to the [ECM](#) which measures the returned current and calculates a resistance figure for the sensor which relates to the coolant temperature.

If the [ECT](#) sensor fails, the following symptoms may be observed:

- Difficult cold start
- Difficult hot start
- Engine performance compromised
- Temperature gauge inoperative or inaccurate reading.

In the event of [ECT](#) sensor signal failure, the [ECM](#) applies a default value of 80°Celsius (176°F) coolant temperature for fueling purposes. The [ECM](#) will also permanently operate the cooling fan at all times when the ignition is switched on, to protect the engine from overheating.

The table that follows shows [ECT](#) sensor values and the corresponding sensor resistance and voltage values.

Temperature (Degrees Celsius)	Resistance (KOhms)	Voltage (Volts)
- 40	925	3.23
- 30	496	3.16
- 20	277	3.06
- 10	160	2.91
-0	96	2.70
10	59	2.42
20	37	2.09
30	24	1.75
40	16	1.41
50	11	1.11
60	7.55	0.86
70	5.34	0.66
80	3.84	0.50
90	2.80	0.38
100	2.08	0.29
110	1.56	0.22
120	1.19	0.17
130	0.918	0.14

Temperature (Degrees Celsius)	Resistance (KOhms)	Voltage (Volts)
140	0.715	0.11
150	0.563	0.08

Engine Oil Level and Oil Temperature Sensor

E112394

ItemDescription

1	Oil scavenge reservoir
2	Engine oil level and temperature sensor
3	Oil pick-up pipe
4	Engine oil level and temperature sensor electrical connector

The 3.0L V6 diesel engine is not fitted with a conventional dipstick. The dipstick is replaced with an ultrasonic oil level and temperature sensor which is located with 3 bolts on the inside of the oil pan.

The sensor uses ultrasonic pulses to determine the oil level in the oil pan. The level sensor sends an ultrasonic pulse vertically upward and measures the time taken for the pulse to be reflected back to the sensor from the upper surface of the oil. A second reference pulse is also transmitted across a reference distance. The time periods of the first and second pulses are compared and the sensor calculates the oil height in the oil pan. The sensor then converts the results into a [PWM \(pulse width modulation\)](#) signal to the [ECM](#) which converts the frequency of the signal into an oil level height.

The sensor uses an [NTC](#) type sensor to determine the oil temperature. The sensor measures the oil temperature and converts the sensor signal into a [PWM](#) signal to the [ECM](#) which converts the frequency of the signal into an oil temperature.

If the oil level is incorrect or a system fault occurs, a warning message is displayed in the instrument cluster message center. The messages that follow can be displayed in the message center:

Warning	System Status
ENGINE OIL LOW (Amber warning triangle displayed)	The oil is at the minimum level for safe operation. Top-up with 2 liters (3.5 pints) of oil.
ENGINE OIL HIGH (Amber warning triangle displayed)	This warning is displayed when the engine is started, if the oil is above the maximum level for safe operation. Stop the vehicle as soon as safety permits and seek qualified assistance to have the engine oil drained, before driving the vehicle.
ENGINE OIL CRITICALLY LOW (Red warning triangle displayed)	The oil is below the minimum level for safe operation. Stop the vehicle as soon as safety permits and top-up with 2.5 liters (4.4 pints) of oil. Wait for 10 minutes, re-check the oil level reading and top-up again if necessary.
ENGINE OIL LEVEL MONITOR SYSTEM FAULT (Amber warning triangle displayed)	A fault with the oil level monitoring system is indicated. Seek qualified assistance as soon as possible.

Oil Level Check

Check the oil level weekly, when the engine is hot and with the vehicle resting on level ground.

• **NOTE:** Switch off the engine and let the vehicle stand for ten minutes to allow the oil drain back to the oil pan. Do not start the engine.

The oil level can be viewed in the message centre when the ignition is on (power mode 6), the engine stopped and the transmission in Park (P).

- **NOTE:** The system will not give a reading until the oil level has stabilized.

E124193

An indication of the oil level is displayed on the gauge. Messages to the right of the gauge give advice of any action that may need to be taken.

If the oil level is within the required operating range, the message '**Level OK**' will be displayed. Do not add any additional oil to the engine.

If the oil level is below the required operating range, a message advising how much oil to add will be displayed. Add the recommended quantity of oil then re-check the level.

If '**Overfilled**' is displayed, seek qualified assistance immediately. Do not drive the vehicle as this will cause serious damage to the engine.

Engine Oil Top-Up

- **CAUTIONS:**

Failure to use oil that meets the required specification, could cause excessive engine wear, a build-up of sludge and deposits and increase pollution. It could also lead to engine failure and invalidation of vehicle warranty.

Overfilling with oil could result in severe engine damage.

Use the procedure that follows to replenish the engine oil level:

- With the ignition on, but the engine not running, unscrew the oil filler cap.
 - Add the appropriate quantity of oil (as indicated by the message center oil level display). Wait 10 minutes to allow the oil level stabilize and re-check the level. Clean up any oil spilled during topping up
 - Once the correct level is achieved, refit the filler cap and hand-tighten securely until one click is heard.
- **NOTE:** The approximate quantity of oil required to raise the level from the minimum level of safe operation to the maximum, is 2.0 liters (3.5 pints).
 - **NOTE:** The ignition must be left on during the top-up, so that the electronic dipstick can register and display the new oil level. This enables an accurate level re-check.

Live Reading/Average Reset

A procedure is available to allow the technician to access the actual engine oil level, rather than the average engine oil level which is available to the driver. An additional procedure is also available to reset the average engine oil level. Refer to Engine - 3.0L Diesel - General Procedures - Engine Oil Draining and Filling 303-01B.

Brake Lamp/Brake Test Switch

E46910

The brake lamp/brake test switch is located on the pedal box and is operated by the brake pedal. The 2 pole switch has a normally open circuit switch connected to battery voltage which closes the circuit when the driver has depressed the brake pedal and a normally closed circuit which is connected to ground when the driver depresses the brake pedal. The switch contacts are connected directly to the [ECM](#) and the [ECM](#) also receives a brake pressure signal on the high speed [CAN](#) bus from the [ABS](#) module.

The [ECM](#) uses the brake signal for the following:

- To limit fueling during braking
- To inhibit/cancel Speed control if the brakes are applied.

In the event of a brake switch failure, the following symptoms may be observed:

- Speed control inactive
- Increased fuel consumption.

Fuel Pressure Control Valve

E116419

The fuel pressure control valve is incorporated into the forward end of the common fuel rail for the [LH](#) cylinder bank. The control valve regulates the fuel pressure within the fuel rails and is controlled by the [ECM](#). The control valve is a [PWM](#) controlled solenoid valve.

When the solenoid is de-energized, an internal spring holds an internal valve closed. At fuel pressure of 100 bar (1450 lbf/in²) or higher, the force of the spring is overcome, opening the valve and allowing fuel pressure to decay into the fuel return pipe. When the pressure in the fuel rail decays to approximately 100 bar (1450 lbf/in²) or less, the spring force overcomes the fuel pressure and closes the valve. When the [ECM](#) energizes the solenoid, the valve is closed allowing the fuel pressure to build. The pressure in the fuel rail in this condition can reach approximately 2000 bar (29000 lbf/in²).

The [ECM](#) constantly monitors the fuel pressure and activates the fuel pressure control valve accordingly to control the fuel rail pressure within the required parameters. Relieved fuel from the fuel rails is directed through the fuel rail leak-off pipe to the fuel filter return circuit.

The [ECM](#) controls the fuel rail pressure by operating the control valve solenoid using a [PWM](#) signal. By varying the duty cycle of the [PWM](#) signal, the [ECM](#) can accurately control the fuel rail pressure and hence the pressure delivered to the injectors according to engine load. This is achieved by the control valve allowing a greater or lesser volume of fuel to pass from the high pressure side of the pump to the un-pressurized fuel return line, regulating the pressure on the high pressure side.

The fuel pressure control valve receives a [PWM](#) signal from the [ECM](#) of between 0 and 12V. The [ECM](#) controls the operation of the control valve using the following information to determine the required fuel pressure:

- Fuel rail pressure
- Engine load
- [APP](#) sensor position
- Engine coolant temperature
- Engine speed.

In the event of a total failure of the fuel pressure control valve, the engine will not start. In the event of a partial failure of the fuel pressure control valve, the [ECM](#) will activate the solenoid with the minimum duty cycle which results in the injection quantity being limited.

Fuel Pressure Sensor

E116418

The fuel pressure sensor is located in the forward end of the common fuel rail for the [RH](#) cylinder bank. The sensor is screwed into a threaded port in the end of the fuel rail.

The fuel pressure sensor is a piezo-resistive type sensor containing an actuating diaphragm. Deflection of the diaphragm provides a proportional signal (output) voltage to the [ECM](#), dependant on the fuel pressure within the fuel rails.

Accelerator Pedal Position (APP) Sensor

E116420

The [APP](#) sensor allows the [ECM](#) to determine the driver requests for vehicle speed, acceleration and deceleration. The [ECM](#) uses this information to determine the torque demand from the engine via injection control.

The [APP](#) sensor is installed on the pedal box and secured to a bracket with 3 screws.

The [APP](#) sensor is incorporated into the pedal box assembly. The [APP](#) sensor is a twin track rotary potentiometer type sensor which is integral with the throttle pedal housing.

A six pin electrical connector provides the interface with the vehicle harness. The accelerator pedal is connected to a spindle on the [RH](#) side of the [APP](#) sensor. The [APP](#) sensor receives two separate electrical supplies and generates two different outputs.

Both tracks are analogue output signals connected to the [ECM](#). Both signals contain the same positional information, but the secondary track has half the voltage output of the primary track.

If there is a fault with the primary track, the secondary track is used and the vehicle/engine response to pedal demand will be sluggish. If both analogue signals have a fault, the engine adopts a constant high speed of 1300 rpm to allow the vehicle to move. Torque application and reduction of engine speed back to normal idle speed can be subsequently controlled via brake lamp/brake test switch operation.

The [ECM](#) constantly checks the range and plausibility of the two signals and stored a fault code if it detects a fault.

EGR Cooler Bypass Vacuum Solenoid Valve

E116421

The [EGR](#) cooler bypass solenoid valve is located on a bracket at the rear of the engine, adjacent to the vacuum pump.

The solenoid valve has a vacuum pipe connection to the vacuum pump which provides the vacuum when the engine is running. Two outlets from the solenoid valve each connect to an [EGR](#) bypass vacuum actuator.

When the [EGR](#) cooler bypass solenoid valve is energized, vacuum created by the vacuum pump is applied to each [EGR](#)

bypass vacuum actuator and exhaust gasses by-pass the [EGR](#) cooler. The default position is for exhaust gas cooling. The actuators move under the influence of the vacuum and move a valve within the [EGR](#) cooler to divert the exhaust gasses straight through the cooler. This system is used when the engine management system determines that exhaust gas cooling is not required.

The [EGR](#) cooler bypass solenoid valve receives a 12 volt supply from the [EJB](#). The [ECM](#) controls the operation of the solenoid valve by controlling the ground path for the solenoid.

Exhaust Gas Recirculation (EGR) Valve Motor

E116422

The [EGR](#) valve motors each receive a 12 volt supply and ground from the [ECM](#).

The 12 volt power supply from the [ECM](#) operates the [EGR](#) valve motor. Three further wires connect the [EGR](#) valve to the [ECM](#) a 5 volt reference voltage, a ground and a position signal feedback.

The valve is used to direct a calculated proportion of exhaust gas back into the combustion chamber.

Engine Oil Pressure Sensor

E116423

The engine oil pressure sensor is located in a threaded port in the [LH](#) cylinder head. The sensor is connected directly to the instrument cluster.

The sensor is not connected to the [ECM](#) but is supplied with a reference voltage from the instrument cluster. The sensor ground is through the sensor body and the engine. When the oil pressure falls to below a predetermined threshold, the sensor internal switch contacts close, completing a circuit from the instrument cluster. This circuit is sensed by the instrument cluster which displays an appropriate warning message and warning lamp to alert the driver.

Differential Pressure Sensor

E123690

ItemDescription

1	Electrical connector
2	Low pressure connection
3	High pressure connection

The differential pressure sensor is located on the rear of the transfer box, adjacent to the [DPF \(diesel particulate filter\)](#).

The differential pressure sensor is used by the [DPF](#) software to monitor the condition of the [DPF](#). Two pipe connections on the sensor are connected by pipes to the inlet and outlet ends of the [DPF](#). The pipes allow the sensor to measure the inlet and outlet pressures of the [DPF](#).

As the amount of particulates trapped by the [DPF](#) increases, the pressure at the inlet side of the [DPF](#) increases in comparison to the [DPF](#) outlet. The [DPF](#) software uses this comparison, in conduction with other data, to calculate the accumulated amount of trapped particulates.

By measuring the pressure difference between the [DPF](#) inlet and outlet air flow the [DPF](#) software can determine if the [DPF](#) is becoming blocked and requires regeneration.

A [DPF](#) is recognized as overloaded if the differential pressure under certain operating conditions exceeds the overload limit calculated by the [ECM](#). The [DPF](#) software may start regeneration attempts but be unable to complete them. These attempts are counted by the [ECM](#) and, if the maximum number of regeneration attempts is reached, a fault entry is recorded in the [ECM](#) at the next ignition on cycle.

The [DPF](#) software performs the following checks using the [DPF](#) differential pressure sensor:

- Sensor plausibility check
- [DPF](#) efficiency
- [DPF](#) overloaded
- [DPF](#) clogged
- Circuit range checks (max. and min.)
- [DPF](#) hose lines (dropped, crossed and blocked)
- [DPF](#) dislodged/damaged
- Monitoring of the maximum regeneration attempts in the lower load range

Glow Plugs

E107586

ItemDescription

1	Glow plug
---	-----------

Three glow plugs are located in each of the cylinder heads, on the inlet side. The glow plugs and the glow plug module are a vital part of the engine starting strategy. The glow plugs heat the air inside the cylinder during cold starts to assist combustion. The use of glow plugs helps reduce the amount of additional fuel required on start-up, and consequently reduces the emission of black smoke. The use of glow plugs also reduces the amount of injection advance required, which reduces engine noise, particularly when idling with a cold engine.

There are three phases of glow plug activity:

- Pre-heat

- During crank
- Post heat.

The ceramic sheathed element glow plugs are made from a heat-resistant, electrically conductive ceramic material. The ceramic sheathed-element glow plugs outer layer is heated directly and is self regulating. The self regulation allows the resistance of the sheathed element to automatically increase as the heat increases preventing the glow plug from overheating. In addition, during the heating process and under the control of the glow plug module, the glow plugs can be operated above their nominal voltages. This permits heat-up speeds of 1000°C per second. The sheathed-element glow plugs reach a maximum glow temperature of 1300°C and can hold a temperature of 1150°C for several minutes after the first-start glow or at intervening times.

The glow plugs are controlled by the [ECM](#) using the glow plug module and external sensor values to control the glow plug operation via internal software.

Fuel Injectors

E 115475

ItemDescription

1	Fuel return
2	O-ring seal
3	Piezo stack actuator
4	Hydraulic coupler
5	Control valve
6	Nozzle body
7	Copper sealing washer
8	Electrical connector
9	High pressure feed
10	Nozzle

Six fuel injectors are used in the fuel system. A piezo actuator in each injector is electronically controlled by the [ECM](#) to operate the injector in response to engine speed and load conditions.

Each injector is calibrated to the [ECM](#) and applicable the cylinder to which it is fitted. Therefore, if an injector is removed it must be refitted to the cylinder from which it was removed. If a new injector is fitted, a calibration routine using a Land Rover approved diagnostic equipment must be performed to calibrate the injector unique code to the [ECM](#).

The operating voltage of the injector is between 110 and 163 volts depending on engine speed and load and care must be taken when working in the vicinity of the injectors. The voltage increases linearly with the injector operating pressure from 200 to 2000 bar.

Each injector has an electrical resistance value of between 150 - 250 kOhms.

CAUTION: Each injector operation is controlled by a charge and discharge cycle allowing energy to dissipate in, and recover from the injector. Never disconnect the wiring connection when the engine is running. The injector can remain open

causing engine damage.

Refer to: [Fuel Charging and Controls](#) (303-04C Fuel Charging and Controls - TDV6 3.0L Diesel, Description and Operation).

Charge Air Temperature Sensor

E116759

The charge air temperature sensor is located in the rear of the intake chamber immediately preceding the throttle intake manifold. The sensor is used to measure the intake air temperature from the turbochargers in order to calculate the required amount of fueling.

The charge air temperature sensor incorporates a [NTC](#) thermistor in a voltage divider circuit. The [NTC](#) thermistor works on the principle of decreasing resistance in the sensor as the temperature of the charge air increases. As the thermistor allows more current to pass to ground, the voltage sensed by the [ECM](#) decreases. The change in voltage is proportional to the temperature change of the charge air. Using the voltage output from the charge air temperature sensor, the [ECM](#) can correct the fueling map for charge air temperature. The correction is an important requirement because hot air contains less oxygen than cold air for any given volume.

The charge air temperature sensor receives a 3.3V reference voltage from the [ECM](#). The signal output from the charge air temperature sensor is calculated by the [ECM](#) by monitoring changes in the supplied reference voltage to the charge air temperature sensor voltage divider circuit.

If the charge air temperature sensor fails the [ECM](#) uses a default charge air temperature of -5°C (23°F). In the event of a charge air temperature sensor failure, any of the following symptoms may be observed:

- Over fueling, resulting black smoke emitting from the exhaust
- Idle speed control inoperative.

High Pressure Fuel Pump Volume Control Valve

E116761

The high pressure fuel pump volume control valve is mounted on the high pressure pump, and located in the feed port between the high-pressure pump elements and the internal transfer pump. The high pressure fuel pump volume control valve is a variable position solenoid-operated valve that is controlled by the [ECM](#).

The high pressure fuel pump volume control valve is controlled by a [PWM](#) signal from the [ECM](#) to allow a defined amount of 'leak off' from the high pressure fuel pump. The leak off fuel provides cooling and lubrication for the high-pressure pump internal components. The fuel is returned through a leak off pipe to the fuel filter, where it cools and is returned into the fuel filter via the low pressure return line.

The high pressure fuel pump volume control valve determines the amount of fuel that is delivered from the internal transfer pump to the high pressure pumping elements. When there is no signal to the high pressure fuel pump volume control valve, the valve is closed and there is no fuel delivery. The [ECM](#) applies a varying [PWM](#) signal of between 0 to 100% to control the required fuel volume.

High Pressure Fuel Pump Inlet Temperature Sensor

E116762

The high pressure fuel pump inlet temperature sensor is located on the rear of the high pressure fuel pump. It measures the fuel temperature in the low-pressure side of the high pressure fuel pump.

The [ECM](#) continually monitors this signal to determine the fuel temperature to prevent overheating of the fuel system. The [ECM](#) will also make fine adjustments to fuel injection quantity to adjust for fuel temperature.

The inlet temperature sensor is an [NTC](#) thermistor. As the fuel temperature rises the resistance through the sensor decreases and visa versa. The [ECM](#) measures the change in voltage as the thermistor allows more current to pass to ground relative to the fuel temperature.

Primary Turbocharger Control Module

E116424

The primary turbocharger control module is attached to a bracket which is an extension of the turbocharger body.

The primary turbocharger control module comprises a stepper motor which electronically controls the primary turbocharger variable vanes by moving an actuating lever. When the stepper motor drive shaft turns, a position signal is created. The [ECM](#) receives the position signal to determine the angular position of the vanes.

The stepper motor is connected to an output shaft. The output shaft has a connecting rod attached eccentrically which converts the rotary motion of the shaft into linear motion of the connecting rod. The opposite end of the connecting rod is attached to an actuating lever. The actuating lever moves with the connecting rod and adjusts the variable vanes mechanically.

The [ECM](#) provides the stepper motor with a power and ground for stepper motor operation and also a reference voltage, ground and position signal connections for variable vane position control.

Secondary Turbocharger Boost Pressure Sensor

E116425

The secondary turbocharger boost pressure sensor is located on the steering pump mounting bracket on the [RH](#) side of the engine. The sensor is connected via a hose to the charge air outlet pipe from the secondary turbocharger compressor.

The sensor provides a voltage signal to the [ECM](#) relative to the output charge air pressure from the secondary turbocharger. The boost pressure sensor has a 3 pin connector which is connected to the [ECM](#) and provides a 5V reference supply from the [ECM](#), a signal input to the [ECM](#) and a ground for the sensor.

The boost pressure sensor uses a diaphragm transducer to measure pressure. The [ECM](#) uses the boost pressure sensor signal for the following functions:

- Maintain manifold boost pressure
- Reduce exhaust smoke emissions when driving at high altitude
- Control of the [EGR](#) system
- To help smooth control of the mono to bi and bi to mono turbo transitions
- To aid the air path diagnostics.

Secondary Turbocharger Turbine Shut-off Solenoid Valve

E123687

The secondary turbocharger turbine shut-off solenoid valve is located on a bracket at the front of the engine, above the [LH](#) front cylinder cover assembly. The bracket is shared with the secondary turbocharger compressor shut-off solenoid valve. The secondary turbocharger turbine shut-off solenoid valve is the innermost of the two solenoid valves.

The secondary turbocharger turbine shut-off solenoid valve receives a vacuum supply from the vacuum pump. The valve is connected by a pipe to the turbine shut-off valve vacuum actuator which is located on the rear of the secondary turbocharger. A position sensor is attached to the turbine shut-off valve vacuum actuator to inform the [ECM](#) of the turbine shut-off position.

Operation of the valve vacuum actuator is controlled by a [PWM](#) signal from the [ECM](#) and the secondary turbocharger turbine shut-off solenoid valve. When the shut-off solenoid is energized by the [ECM](#) a 4.5V [PWM](#) current is applied to operate the solenoid, vacuum is then applied to the shut-off valve vacuum actuator. The valve is opened allowing the secondary turbocharger turbine to be driven by the exhaust gasses for as long as the valve is open. When the valve is to be closed the [ECM](#) applies a 0.5V [PWM](#) current to the solenoid.

Secondary Turbocharger Compressor Shut-off Solenoid Valve

E123687

The secondary turbocharger compressor shut-off solenoid valve is located on a bracket at the front of the engine, above the [LH](#) front cylinder cover assembly. The bracket is shared with the secondary turbocharger turbine shut-off solenoid valve. The secondary turbocharger compressor shut-off solenoid valve is the outermost of the two solenoid valves.

The secondary turbocharger compressor shut-off solenoid valve receives a vacuum supply from the vacuum pump. The valve is connected by a pipe to the compressor shut-off vacuum actuator located on the charge air intake manifold tube. When the vacuum is applied to the vacuum actuator, the actuator operates to open the shut-off valve allowing charge air to flow into the air intake pipe.

Operation of the secondary turbocharger compressor shut-off solenoid valve is controlled by a [PWM](#) signal from the [ECM](#); 0% is off and 100% is on (solenoid activated). The solenoid valve is opened when bi-turbocharger operation is required allowing compressed charge air from the secondary turbocharger compressor to enter the air intake system.

Secondary Turbocharger Compressor Recirculation Valve

E116426

The secondary turbocharger compressor recirculation valve motor is located on the compressor recirculation valve housing, adjacent to the compressor shut-off valve. The solenoid valve is attached to the compressor recirculation valve with 3 screws.

The secondary turbocharger compressor recirculation valve motor is controlled by the [ECM](#). The valve is used during operation of the secondary turbocharger. When the [ECM](#) is switching to bi-turbocharger operation, the valve motor is operated which opens the recirculation path to the primary turbocharger. This allows the secondary turbocharger to increase its speed. When the secondary turbocharger has reached its optimum operating speed the recirculation valve motor is operated, closing the recirculation path to the primary turbocharger.

Secondary Turbocharger Turbine Shut-off Valve and Position Sensor

E116760

The secondary turbocharger turbine shut-off valve and position sensor is located on the turbine vacuum shut-off valve. The sensor has three connections to the [ECM](#); a 5V reference voltage, a ground and a signal return.

The sensor is connected to the turbine shut-off vacuum actuator and senses when the actuator has operated. The sensor returns a 0 - 5V analogue position signal to the [ECM](#) to confirm that the vacuum actuator has operated.

Water-in-fuel Sensor

E123689

The fuel filter element has a water sensor located in its base. The sensor is screwed into a threaded hole in the base of the element. When the filter is replaced at service, the sensor can be unscrewed from the element and installed in the new element. The sensor has an electrical connector located at the side of the element which can be disconnected to assist element removal.

The water-in-fuel sensor is connected to the [ECM](#). When the water in the element reaches 64 cm³ (3.9 in³) the [ECM](#) issues a high speed [CAN](#) bus message to the instrument cluster to display a 'WATER IN FUEL' message in the message center.

Electronic Engine Controls - TDV6 3.0L Diesel - Electronic Engine Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the electronic engine control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (303-14B Electronic Engine Controls - TDV6 3.0L Diesel)

[Electronic Engine Controls](#) (Description and Operation),

Lack of power when accelerating	<ul style="list-style-type: none"> ● Intake air system fault ● Restricted exhaust system ● Low fuel pressure ● Exhaust gas recirculation (EGR) valve(s) fault ● Turbocharger actuator fault 	Check the intake air system for leakage or restriction. Check for a blockage/restriction in the exhaust system, install new components as necessary. Check for DTCs indicating a fuel pressure fault. Check the EGR system. Check turbocharger actuator.
Engine stops/stalls	<ul style="list-style-type: none"> ● Air leakage ● Low/Contaminated fuel ● Low-pressure fuel system fault ● High pressure fuel leak ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Exhaust gas recirculation (EGR) valve fault 	Check the intake air system for leaks. Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the fuel system for leaks/damage: Check for DTCs indicating a fuel volume or pressure control valve fault. Check the EGR system.
Engine judders	<ul style="list-style-type: none"> ● Low/Contaminated fuel ● Air ingress ● Low-pressure fuel system fault ● Fuel metering valve blocked/contaminated ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● High pressure fuel leak ● Fuel pump fault 	Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the low-pressure fuel system for leaks/damage. Check the high pressure fuel system for leaks, check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel pump.
Excessive fuel consumption	<ul style="list-style-type: none"> ● Low-pressure fuel system fault ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Fuel temperature sensor leak ● High pressure fuel leak ● Injector(s) fault ● Exhaust gas recirculation (EGR) valve(s) fault 	Check the low-pressure fuel system for leaks/damage. Check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel temperature sensor, fuel pump, etc for leaks. Check for injector DTCs. Check the EGR system.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Engine Control Module (PCM) 3.0L TdV6 (100-00, Description and Operation).

Electronic Engine Controls - TDV6 3.0L Diesel - Brake Pedal Position (BPP) Switch Adjustment

General Procedures

Check

1. Remove the brake pedal rubber.
2. NOTE: Make sure that the dial test indicator (DTI) gauge is in line with the brake pedal movement.

Position the DTI gauge on a suitable mounting block, as illustrated.

E135356

3. With the aid of another technician, gently press the brake pedal until the stoplamps illuminate.
4. NOTE: The specification is that the stoplamps should illuminate at between 5.5mm and 8.5mm brake pedal travel.

Note the measurement of the brake pedal travel from rest position until the stoplamps illuminated.

Adjust

1. CAUTIONS:

The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

Remove the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).

2. CAUTIONS:

The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

Only use light finger pressure when installing the stoplamp switch. Failure to follow this instruction may result in an incorrectly adjusted stoplamp switch.

Install the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).

3. Check the adjustment of the stoplamp switch by following the **Check** procedure in this procedure and carry out the **Adjust** procedure if required.

Electronic Engine Controls - TDV6 3.0L Diesel - Camshaft Position (CMP) Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: [Cooling Fan](#) (303-03D Engine Cooling - V8 5.0L Petrol, Removal and Installation).

3. Remove the LH front wheel and tire.

Torque: 140 Nm

4. Refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

- 5.

E121858

6.

7.

Installation

1. CAUTIONS:

 Make sure that the mating faces are clean and free of foreign material.

 The Camshaft position (CMP) sensor tip must rest on one of the three webs on the back of the camshaft pulley. Incorrect installation may result in the CMP sensor being damaged.

- NOTE: Only turn the engine in the normal direction of rotation.

- NOTE: Timing belt left hand cover shown removed for clarity.

Turn the engine until one of the three webs on the back of the camshaft pulley is visible through the CMP sensor housing.

Torque: 10 Nm

2. To install, reverse the removal procedure.

Electronic Engine Controls - TDV6 3.0L Diesel - Crankshaft Position (CKP) Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
2. Remove the left-hand front wheel and tire.

Torque: 140 Nm
3. Refer to: [Engine Oil Vacuum Draining and Filling](#) (303-01B Engine - TDV6 3.0L Diesel, General Procedures).
4. Refer to: [Suspension Height Sensor](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

5. *Torque: 9 Nm*

E121844

6. *Torque: 9 Nm*

E121845

7. **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

8. **NOTE:** Remove and discard the gasket.

Torque: 10 Nm

9. **NOTE:** Remove and discard the gasket.

Torque: 10 Nm

- 10.

11.  CAUTION: Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

- NOTE: Engine shown removed for clarity.

- NOTE: The CKP sensor retaining bolt should not be removed from the CKP sensor.

Torque: 5 Nm

Installation

1.  CAUTION: Install the CKP sensor correctly into the housing. Failure to follow this instruction may result in damage to the CKP sensor.

To install, reverse the removal procedure.

Electronic Engine Controls - TDV6 3.0L Diesel - Crankshaft Position (CKP) Sensor Ring

Sensor Ring

Removal and Installation

Special Tool(s)

	<p>303-1130 Installer - Crankshaft Position (CKP) Sensor Ring</p>
---	---

Removal

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Flexplate](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

4.  **CAUTION:** Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

• **NOTE:** The CKP sensor retaining bolt should not be removed from the CKP sensor.

5.

Installation

E116306

1.  **CAUTION:** Make sure that the CKP sensor ring is aligned correctly with the special tool pip and that both mating surfaces are fully seated.

- *Special Tool(s):* [303-1130](#)

2. Install the special tool.

Special Tool(s): [303-1130](#)

3.

4.

5. Remove the special tool.

Special Tool(s): [303-1130](#)

6. **6. CAUTIONS:**

 Install the CKP sensor correctly into the housing. Failure to follow this instruction may result in damage to the CKP sensor.

 Make sure that the mating faces are clean and free of foreign material.

 Make sure that the component is clean, free of foreign material and lubricant.

- *Torque:* 5 Nm

7. Refer to: [Flexplate](#) (303-01B Engine - TDV6 3.0L Diesel, Removal and Installation).

8. Connect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Electronic Engine Controls - TDV6 3.0L Diesel - Diesel Particulate Filter (DPF) Differential Pressure Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2.

3.

E122104

4.

E114350

5.

Installation

1. To install, reverse the removal procedure.
2. **NOTE:** This step is only necessary when installing a new component.
 1. Using the diagnostic tool, clear diagnostic trouble codes (DTCs) from the engine control module (ECM).
 2. Using the data logger, check the engine oil temperature.
 3. Make sure the selector lever is in the 'P' position.
 4. Start and run the engine.
 5. Make sure that the engine oil is at a minimum temperature of 50 degrees C.
 6. Allow the engine to idle for 2 minutes and 30 seconds.
 7. Make sure that the engine cooling fan is not running.
 8. Turn off the ignition.
 9. Wait for 30 seconds.
 10. Repeat steps 4 to 9, a further 5 times.
 11. Disconnect the Jaguar approved diagnostic system.

Electronic Engine Controls - TDV6 3.0L Diesel - Engine Coolant Temperature (ECT) Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

2.

3. **3. CAUTIONS:**

Be prepared to collect escaping fluids.

The seal is to be reused unless damaged.

Make sure that the mating faces are clean and free of foreign material.

- NOTE: Release the locking tang to remove the ECT sensor.

Installation

1. **1. NOTE:** Make sure that all the component mating faces are clean.

To install, reverse the removal procedure.

2. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank.

Electronic Engine Controls - TDV6 3.0L Diesel - Engine Control Module (ECM)

Removal and Installation

Removal

GENERAL

The V6 4.0 Liter engine is controlled by an ECM manufactured by DENSO. The Engine Management System (EMS) controls the following:

- Engine fueling
- Ignition timing
- Closed loop fueling
- Knock control
- Idle speed control
- Emission control
- On board diagnostic
- Interface with the immobilization system
- Speed control

ENGINE CONTROL MODULE (ECM)

E42610

The ECM is located in the E-Box in the plenum area on the passenger side of the engine compartment attached to the bulkhead.

Inputs

The ECM has the following inputs:

- Central Junction Box
- Engine Coolant Temperature
- Brake Switch
- Manifold Absolute Pressure
- Accelerator Pedal Position 1
- Accelerator Pedal Position 2
- Throttle Position 1
- Throttle Position 2
- Engine cooling fan Speed
- Engine speed and position sensor (crankshaft sensor)
- Camshaft position sensor
- Engine Oil Temperature
- IAT sensor (integrated into MAF)
- MAF
- Knock sensors (2)
- Speed Control Switches (resistive ladders)
- Oxygen sensors (4)
- Vehicle Speed (via CAN)
- EGR Differential Pressure

- EGRMAP
- Generator Monitor

Outputs

The ECM outputs to the following:

- Throttle Actuator
- Ignition coils (6)
- Oxygen sensor heaters (4)
- Fuel injectors (6)
- EGR Valve
- IMT valve
- Purge Valve
- Fuel pump relay
- Starter Relay
- Air conditioning condenser fan module (CAN)
- EMS Main Relay
- Viscous Fan Control
- Generator Control

The ECM controls the engine fueling by providing sequential fuel injection to all cylinders. Ignition is controlled by a direct ignition system, provided by six plug top coils. The ECM is able to detect and correct for ignition knock on each cylinder and adjust the ignition timing for each cylinder to achieve optimum performance.

The ECM uses a torque-based strategy to generate the torque required by the driver and other vehicle ECU's. The EMS uses various sensors to determine the torque required from the engine. These include:

- Mass Air Flow meter
- Accelerator Pedal Position sensor
- Engine temperatures
- Oxygen sensors

The EMS processes these signals and decides how much torque to generate. Torque is then generated by using various actuators to supply air, fuel and spark to the engine (electronic throttle, injectors, coils, etc.)The EMS also interfaces with other vehicle ECU's, via CAN, to obtain additional information, these include

- ABS control module
- TCM
- Transfer box control module

ELECTRONIC THROTTLE

E42611

The V6 engine torque is regulated via an electronic throttle body which is located on the intake manifold in the engine compartment. An APP determines the driver demand to control throttle opening. This value is input into the EMS and the throttle is opened to the correct angle by means of an electric motor integrated into the throttle body. Sensors in the throttle body are used to determine the position of the throttle plate and the rate of change in its angle. A software strategy within the ECM enables the throttle position to be calibrated each ignition cycle. When the ignition is turned 'ON', the ECM opens and closes the throttle fully, thus performing a self-diagnostic and calibration. The throttle body is connected to the ECM via a pair of twisted wires to avoid electrical interference.

For additional information, refer to: [Acceleration Control](#) (310-02B Acceleration Control - V6 4.0L Petrol, Description and Operation).

6	Actuator -	-

ACCELERATOR PEDAL POSITION SENSOR (APP)

E42612

The APP is used in conjunction with the electronic throttle body to provide a drive-by-wire system. The sensor is a resistive

type. Sensors in the accelerator pedal are used to determine the driver's request for vehicle speed, acceleration and deceleration. This value is input into the EMS and the throttle is opened to the correct angle by means of an electric motor integrated into the throttle body.

The APP sensor signals are checked for range, and for plausibility. Two separate reference voltages are supplied to the pedal. If one sensor fails, the other can be used as a 'limp – home' input.

The wires that connect the ground and signal from both potentiometers to the EMS are twisted together into two pairs, avoiding having to use a screen wire.

If signal failure occurs, the ECM enters limp home mode. The APP Sensor is located at the accelerator pedal .

OXYGEN SENSORS

Oxygen Sensor-Upstream

E42613

Oxygen Sensor-Downstream

E42614

There are four oxygen sensors located in the exhaust system. Two upstream (UHEGO) before the catalytic converter and two down stream (HEGO) after the catalytic converter. The sensors monitor the level of oxygen in the exhaust gases and is used to control the fuel/air mixture. Positioning a sensor in the stream of exhaust gasses from each bank enables the ECM to control the fueling on each bank independently of the other, allowing much closer control of the air/fuel ratio and catalyst conversion efficiency.

The Oxygen Sensor needs to operate at high temperatures in order to function correctly. To achieve the high temperatures required, the sensors are fitted with heater elements that are controlled by a pulse width modulation (PWM) signal from the ECM. The heater elements are operated immediately following engine start and also during low load conditions when the temperature of the exhaust gases is insufficient to maintain the required sensor temperatures. A non-functioning heater delays the sensor's readiness for closed loop control and influences emissions. The PWM duty cycle is carefully controlled to prevent thermal shock to cold sensors.

UHEGO (Universal Heated Exhaust Gas Oxygen) sensors also known as Linear or "Wide Band" sensors produces a constant voltage, with a variable current that is proportional to the oxygen content. This allows closed loop fueling control to a target lambda, i.e. during engine warm up (after the sensor has reached operating temperature and is ready for operation). This improves emission control.

The HEGO sensor uses Zirconium technology that produces an output voltage dependant upon the ratio of exhaust gas

oxygen to the ambient oxygen. The device contains a Galvanic cell surrounded by a gas permeable ceramic, the voltage of which depends upon the level of O₂ diffusing through. Nominal output voltage of the device for $I = 1$ is 300 to 500m volts. As the fuel mixture becomes richer ($I < 1$) the voltage tends towards 900m volts and as it becomes leaner ($I > 1$) the voltage tends towards 0 volts. Maximum tip temperature is 1,000 Degrees Celsius for a maximum of 100 hours.

Sensors age with mileage, increasing their response time to switch from rich to lean and lean to rich. This increase in response time influences the ECM closed loop control and leads to progressively increased emissions. Measuring the period of rich to lean and lean to rich switching monitors the response rate of the upstream sensors.

Diagnosis of electrical faults is continually monitored in both the upstream and downstream sensors. This is achieved by checking the signal against maximum and minimum threshold, for open and short circuit conditions.

Oxygen sensors must be treated with the utmost care before and during the fitting process. The sensors have ceramic material within them that can easily crack if dropped/banged or over-torqued. The sensors must be torqued to the required figure, (40-50Nm), with a calibrated torque wrench. Care should be taken not to contaminate the sensor tip when anti-seize compound is used on the thread.

Failure Modes

- Mechanical fitting & integrity of the sensor.
- Sensor open circuit/disconnected.
- Short circuit to vehicle supply or ground.
- Lambda ratio outside operating band.
- Crossed sensors Bank A & B.
- Contamination from leaded fuel or other sources.
- Change in sensor characteristic.
- Harness damage.
- Air leak into exhaust system.

Failure Symptoms

- Default to Open Loop fueling for the particular cylinder bank
- High CO reading.
- Strong smell of H₂S (rotten eggs) till default condition.
- Excess emissions.

It is possible to fit front and rear sensors in their opposite location. However the harness connections are of different gender and color to ensure that the sensors cannot be incorrectly connected. In addition to this the upstream sensors have two holes in the sensor tip, whereas the down stream sensors have four holes in the sensor tip for the gas to pass through.

KNOCK SENSORS

The ECM uses active knock control, which serves to prevent engine damaging pre-ignition or detonation under all operating conditions enabling the engine to operate without additional safety margins. For the ECM to be able to determine the point at which a cylinder is pre-detonating, 2 piezo-ceramic sensors are mounted on the engine block. Each sensor monitors engine knock by converting the engine block noise into a suitable electrical signal, which is then transmitted back to the ECM via a twisted pair cable. The signal is then processed within the ECM to identify the data that characterizes knocking.

This information is compared to known signal profiles to determine whether knock is present. If so, the closed loop control system then retards the ignition on that cylinder, for a number of cycles, after which it gradually moves back towards its original setting.

Failure Symptoms

The following describes the failure symptoms of the knock sensors:

- Knock control disabled and a default "safe ignition map" are used.
- Possible rough running and reduced engine performance.

One sensor is located in the center of the engine valley and the other is located on the front RH side of the cylinder block.

CRANKSHAFT SPEED AND POSITION SENSOR

E42616

The CKP is located on the top of the transmission bell housing just to the left of the center line with the sensor tip adjacent to the flywheel rim. The sensor is a variable reluctance type with a resistance of 1100 Ohms +/- 150 Ohms.

The sensor produces the signal which enables the ECM to determine the angle of the crankshaft, and the engine RPM. From this, the point of ignition, fuel injection, etc. is calculated. If the signal wires are reversed a 3° advance in timing will occur, as the ECM uses the falling edge of the signal waveform as its reference/timing point for each tooth.

The sensor picks up its signal from a reluctor ring machined into the diameter of the drive plate. The reluctor ring has 36 teeth at 10° intervals and 3° wide. One of the teeth is removed to provide a reference mark which is 60 degrees BTDC No.1 cylinder.

The sensor operates by generating an output voltage caused by the change in magnetic field that occurs as the teeth pass in front of the sensor. The output voltage varies with the speed of the teeth passing the sensor. The higher the engine speed, the higher the output voltage.

The ECM transmits the engine speed over the CAN bus.

If the CKP sensor fails while the engine is running the engine will stall, misfire or run poorly and a relevant fault code will be stored. If the engine is not running when a fault occurs then the engine will not start.

CMP SENSOR

E42617

The CMP is a variable reluctance type sensor located at the front of the engine in the valve cover above number 4 cylinder.

The CMP sensor produces one pulse for every two engine revolutions. The sensor picks up on a reluctor on the LH camshaft.

ECT SENSOR

E42618

The ECT sensor is a negative temperature coefficient (NTC) type sensor. As coolant temperature rises the resistance of the

sensor falls.

The sensor is located at the front of the engine behind and below the throttle body.

Should the sensor fail the ECM use the oil temperature sensor signal as a backup coolant temperature signal.

ENGINE OIL TEMPERATURE SENSOR

E42632

Oil temperature is monitored through a sensor mounted in the engine sump.

The sensor operates in the range -40 TO 150 degrees Celsius.

MAF/IAT) SENSOR

E42634

The MAF and IAT sensor is located in the air duct between the air filter and throttle body.

The air mass flow is determined by the cooling effect of inlet air passing over a "hot film" element contained within the device. The higher the air flow the greater the cooling effect and the lower the electrical resistance of the element. The signal from the device is then calculated by the ECM to determine the mass air flow into the engine.

The measured air mass flow is used in determining the fuel quantity to be injected in order to maintain the stoichiometric air/fuel mixture required for correct operation of the engine and exhaust catalysts. Should the device fail there is a software backup strategy that will be evoked once a fault has been diagnosed.

The IAT sensor is integrated into the Mass Air Flow meter. It is a temperature dependent resistor (thermistor), i.e. the resistance of the sensor varies with temperature. This thermistor is a NTC type element meaning that the sensor resistance decreases as the sensor temperature increases. The sensor forms part of a voltage divider chain with an additional resistor in the ECM. The voltage from this network changes as the sensor resistance changes, thus relating the air temperature to the voltage measured by the ECM.

The fixed default value for air temperature is 35°C

MAP SENSOR

E48511

The MAP sensor provides a voltage proportional to the absolute pressure in the intake manifold.

This signal allows the load on the engine to be calculated and used within the internal calculations of the ECM.

The sensor is located in the EGR valve at the front LH side of the engine.

DIFFERENTIAL PRESSURE FEEDBACK-ELECTRONIC/MANIFOLD ABSOLUTE PRESSURE SENSOR (DPFE/MAP)

This pressure transducer monitors the pressure differential on either side of an orifice in the EGR system flow path and transmits that information to the ECM. The pressure drop measured across this orifice is used to estimate the flow rate of recirculated exhaust gas. An Electronic Vacuum Regulator (EVR) is used to control the vacuum signal to the EGR valve based on the electrical signal from the ECM. The ECM monitors the EGR level based on the feedback from the DPFE/MAP transducer, which creates a closed loop system.

EXHAUST GAS RECIRCULATION VALVE (EGR)

The EGR Valve is a PWM controlled valve that allows burned exhaust gas to be recirculated back into the engine. Since exhaust gas has much less oxygen than air, it is basically inert. It takes the place of air in the cylinder and reduces combustion temperature. As the combustion temperature is reduced, so are the oxides of nitrogen (NOx) emissions.

SPEED CONTROL

E47030

Item	Part Number	Description
1	-	Suspend/resume switch
2	-	Resume/Accelerate/Decelerate (+/-) Switches
3	-	Active speed control time gap switches (for future release)
4	-	Clock spring
5	-	Wiper control column switch

The V6 ECM incorporates a speed control function. The EMS uses a set of resistive ladders to interface with the driver speed control requirements. The speed control is operated from the steering wheel mounted switches. There are three illuminated rocker switches on a resistive ladder.

For additional information, refer to: [Speed Control](#) (310-03C Speed Control - V6 4.0L Petrol, Description and Operation).

The speed control does not have a master switch, it is enabled by pressing the set switch.

GENERATOR

E47591

The Generator has a multi function voltage regulator for use in a 14V charging system with 6÷12 zener diode bridge rectifiers.

The ECM monitors the load on the electrical system via PWM signal and adjusts the generator output to match the required load. The ECM also monitors the battery temperature to determine the generator regulator set point. This characteristic is necessary to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximize any recharge ability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing of the battery with consequent water loss.

For additional information, refer to: Generator (414-02A Generator and Regulator - 4.0L, Description and Operation).

The Generator has a smart charge capability that will reduce the electrical load on the Generator reducing torque requirements, this is implemented to utilize the engine torque for other purposes. This is achieved by monitoring three signals to the ECM:

- Generator sense (A sense), measures the battery voltage at the central junction box (CJB).
- Generator communication (Alt Com) communicates desired Generator voltage set point from ECM to Generator.
- Generator monitor (Alt Mon) communicates the extent of Generator current draw to ECM. This signal also transmits faults to the ECM which will then sends a message to the instrument pack on the CAN bus to illuminate the charge warning lamp.

FUEL INJECTORS

E42640

The ECM controls six fuel injectors located on the cylinder head. The injectors are fed from a common fuel rail as part of a 'returnless' fuel system.

Fuel rail pressure is constant at 4.5 bar (59 psi) and is regulated by a regulator that is integral to the fuel pump module. The ECM monitors the output power stages of the injector drivers for electrical faults. The injector has a default resistance of 14.5 Ohms at 20 Degrees Celsius.

For additional information, refer to: Fuel Charging and Controls (303-04A Fuel Charging and Controls - 4.0L, Description and Operation).

SPARK PLUGS

It is essential that only factory-approved spark plugs be used in service. DO NOT attempt to use 'equivalent' spark plugs. Use of unapproved spark plugs may cause the misfire detection system to malfunction, and the ECM to store misfire faults.

IGNITION COILS

E42644

The Land Rover V6 engine is fitted with ignition coils that are driven directly by the ECM. The coils are mounted on top of the inlet manifold and are connected to the spark plugs by High Tension (HT) leads. The positive supply to the coil is fed from fuse 19 in the battery junction box (BJB). Each coil contains a power stage to trigger the primary current. The ECM sends a signal to each of the coils power stage to trigger the power stage switching. Each bank has a feedback signal that is connected to each power stage. If the coil power stage fails the feedback signal is not sent, causing the ECM to store a fault code.

FUEL PUMP RELAY

The V6 engine has a return less fuel system. The system pressure is maintained at a constant 4.5 bar , with no reference to intake manifold pressure. The fuel is supplied to the injectors from a fuel pump located within the fuel tank. The electrical supply to this fuel pump is controlled by the ECM via the fuel pump relay, in the event of a vehicle impact the ECM will receive a crash signal from the restraints control module and will cut the power supply to the fuel pump relay. The fuel system is pressurized as soon as the ECM is powered up, the pump is then switched off until engine start has been achieved.

The fuel pump relay is located in the CJB. The Fuel pump is contained within the fuel tank.

For additional information, refer to: [Fuel Tank and Lines](#) (310-01C Fuel Tank and Lines - V6 4.0L Petrol, Description and Operation).

VISCOUS FAN CONTROL

The ECM controls an electronically controlled viscous coupled fan to provide engine cooling. The ECM supplies the fan with a PWM signal that controls the amount of slippage of the fan, thus providing the correct amount of cooling fan speed and airflow. The EMS uses a Hall Effect sensor to determine the fan speed.

STARTER RELAY

The starter relay is supplied with power from fuseable link 19 in the Battery Junction Box.

The ECM controls the starter relay by supplying a 12 volt signal to the relay coil when the ignition is in crank position. This relies on the transmission gear position being either P or N.

CONDENSER FAN CONTROL

The ECM receives CAN messages from the ATC control module for idle speed adjustment and for cooling fan.

AirConCoolingRequest

This signal defines the level of cooling (from engine cooling fan(s)) required by the ATC system. Calibration within the EMS determines the fan speed required, and which fans will be used, at each requested level.

AirConIdleSpeedRequest

This signal defines whether or not an increase in the engine idle speed is required by the ATC system. The amount of idle speed increase is defined in the EMS calibration.

IMT valve

E42646

The IMT valve moves a plate within the inlet manifold to allow or block sonic pulses between the split manifold halves. This, in effect, extends the inlet tracts for better low rpm torque. The IMT valve is a two position valve and is either fully open or fully closed.

For additional information, refer to: [Intake Air Distribution and Filtering](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Description and Operation).

ECM ADAPTIONS

The ECM has the ability to adapt the values it uses to control certain outputs. This capability ensures the EMS can meet emissions legislation and improve the refinement of the engine throughout its operating range.

The components which have adaptions associated with them are:

- The APP sensor
- The HO2S
- The MAF/IAT sensor
- The CKP sensor
- Electric throttle body.

UHEGO/HEGO and MAF/IAT Sensor

There are several adaptive maps associated with the fueling strategy. Within the fueling strategy the ECM calculates short-term adaptions and long term adaptions. The ECM will monitor the deterioration of the HO2S over a period of time. It will also monitor the current correction associated with the sensors.

The ECM will store a fault code in circumstances where an adaption is forced to exceed its operating parameters. At the same time, the ECM will record the engine speed, engine load and intake air temperature.

CKP Sensor

The characteristics of the signal supplied by the CKP sensor are learned by the ECM. This enables the ECM to set an adaption and support the engine misfire detection function. Due to the small variation between different flywheels and different CKP sensors, the adaption must be reset if either component is renewed, or removed and refitted. It is also necessary to reset the flywheel adaption if the ECM is renewed or replaced. The ECM supports four flywheel adaptions for the CKP sensor. Each adaption relates to a specific engine speed range. The engine speed ranges are detailed in the table below:

Adaptions	Engine Speed, rev/min
1	1800 - 3000
2	3001 - 3800
3	3801 - 4600
4	4601 - 5400

Misfire Detection

Legislation requires that the ECM must be able to detect the presence of an engine misfire. It must be able to detect misfires at two separate levels. The first level is a misfire that could lead to the vehicle emissions exceeding 1.5 times the Federal Test Procedure (FTP) requirements for the engine. The second level is a misfire that may cause catalyst damage.

The ECM monitors the number of misfire occurrences within two engine speed ranges. If the ECM detects more than a predetermined number of misfire occurrences within either of these two ranges, over two consecutive journeys, the ECM will record a fault code and details of the engine speed, engine load and engine coolant temperature. In addition, the ECM monitors the number of misfire occurrences that happen in a 'window' of 200 engine revolutions. The misfire occurrences are assigned a weighting according to their likely impact on the catalysts. If the number of misfires exceeds a certain value, the ECM stores catalyst-damaging fault codes, along with the engine speed, engine load and engine coolant temperature.

The signal from the crankshaft position sensor indicates how fast the poles on the flywheel are passing the sensor tip. A sine wave is generated each time a pole passes the sensor tip. The ECM can detect variations in flywheel speed by monitoring the sine wave signal supplied by the crankshaft position sensor.

By assessing this signal, the ECM can detect the presence of an engine misfire. At this time, the ECM will assess the amount of variation in the signal received from the crankshaft position sensor and assigns a roughness value to it. This roughness value can be viewed within the real time monitoring feature, using T4. The ECM will evaluate the signal against a number of factors and will decide whether to count the occurrence or ignore it. The ECM can assign a roughness and misfire signal for each cylinder, (i.e. identify which cylinder is misfiring).

T4 Diagnostics

The ECM stores faults as diagnostic trouble code (DTC), referred to as 'P' codes. The 'P' codes are defined by on-board diagnostic (OBD) legislation and, together with their associated environmental and freeze frame data, can be read using a third party scan tool or T4. T4 can also read real time data from each sensor, the adaptive values currently being employed and the current fueling, ignition and idle settings.

CENTRAL JUNCTION BOX

The Central Junction box is used to initiate the power up and power down routines within the ECM. When the ignition is turned on, 12V is applied to the Ignition Sense input to pin 30 of connector C0635. The ECM then starts its power up routines and turns on the ECM main relay.

When the ignition is turned OFF the ECM will maintain its powered up state for several seconds (this may be up to 20 minutes in extreme cases when cooling fans are required) while it initiates its power down routine and on completion will turn off the ECM main relay.

POWER SUPPLIES

The ECM requires a permanent battery level voltage supply and a switched battery level voltage supply. The switched voltage supply is controlled by the ECM via a relay based on the condition of the Central Junction Box input (key position 2).

At key "OFF", the ECM will maintain the switched supply active until internal self checks have been completed. The Main Supply fuse is located in the engine compartment fuse box.

PURGE VALVE

Purge Valve and Hoses

E44559

Item	Part Number	Description
1	-	Electric throttle
2	-	Air intake manifold
3	-	Fuel feed jump hose
4	-	Purge hose connector
5	-	Purge valve
6	-	Purge valve bracket
7	-	Hose clamp
8	-	Manifold to purge valve hose

To meet increasing legislation in fuel evaporative loss the Evaporative Emissions Loss Control System has been introduced to minimize the evaporative loss of fuel vapor from the fuel system to the atmosphere. This is achieved by venting the fuel system through a vapor trap (charcoal canister). The charcoal acts like a sponge and stores the vapor until the canister is purged under the control of the ECM.

The charcoal canister is connected with the inlet manifold, after the throttle body, via a purge valve. This valve is opened and closed according to a PWM signal from the ECM. The canister is purged by drawing clean air through the charcoal, which carries the hydrocarbons into the engine where they are burnt. To maintain drivability and emission control purging must be closely controlled as a 1% concentration of fuel vapor from the canister in the air intake may shift the air/fuel ratio by as much as 20%. Purging must be carried out at regular intervals, to regenerate the charcoal, as its storage capacity is limited, and is cycled with the Fueling Adaption, as both cannot be active at the same time.

The ECM alters the PWM signal to the purge valve to control the rate of purging of the canister. The purging of the canister is done in a controlled manner in order to maintain the correct Stoichiometric air/fuel mixture for the engine. It also ensures the canister itself is purged frequently enough to prevent fuel saturation of the charcoal leading to an excessive build up of fuel vapor (and hence vapor pressure) in the system which could increase the likelihood of vapor leaks. For additional information, refer to: [Evaporative Emissions](#) (303-13A Evaporative Emissions - V6 4.0L Petrol, Description and Operation).

Electronic Engine Controls - V6 4.0L Petrol - Electronic Engine Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the electronic engine control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Engine oil level ● Cooling system coolant level ● Fuel level ● Fuel contamination/grade/quality ● Fuel leaks ● Accessory drive belt ● Sensor installation/condition ● Viscous fan and solenoid ● Air cleaner condition 	<ul style="list-style-type: none"> ● Fuses ● Wiring harness ● Electrical connector(s) ● 5 volt sensor supply ● Sensor(s) ● Engine Control Module (ECM) ● Transmission Control Module (TCM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not fire	<ul style="list-style-type: none"> ● Engine breather system disconnected/restricted ● Ignition system ● Fuel system ● Electronic engine control 	Ensure the engine breather system is free from restriction and is correctly installed. Check for ignition system, fuel system and electronic engine control DTCs and refer to the relevant DTC Index
Engine cranks and fires, but will not start	<ul style="list-style-type: none"> ● Evaporative emissions purge valve ● Fuel pump ● Spark plugs ● HT short to ground (tracking) check rubber boots for cracks/damage ● Ignition system 	Check for evaporative emissions, fuel system and ignition system related DTCs and refer to the relevant DTC Index
Difficult cold start	<ul style="list-style-type: none"> ● Engine coolant level/anti-freeze content ● Battery ● Electronic engine controls ● Exhaust Gas Recirculation (EGR) valve stuck open ● Fuel pump ● Purge valve 	Check the engine coolant level and condition. Ensure the battery is in a fully charged and serviceable condition. Check for electronic engine controls, engine emissions, fuel system and evaporative emissions system related DTCs and refer to the relevant DTC Index
Difficult hot start	<ul style="list-style-type: none"> ● Injector leak ● Electronic engine control ● Purge valve ● Fuel pump ● Ignition system ● EGR valve stuck open 	Check for injector leak, install new injector as required. Check for electronic engine controls, evaporative emissions, fuel system, ignition system and engine emission system related DTCs and refer to the relevant DTC Index
Difficult to start after hot engine off, after engine has reached operating temperature	<ul style="list-style-type: none"> ● Injector leak ● Electronic engine control ● Purge valve ● Fuel pump ● Ignition system ● EGR valve stuck open 	Check for injector leak, install new injector as required. Check for electronic engine controls, evaporative emissions, fuel system, ignition system and engine emission system related DTCs and refer to the relevant DTC Index

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to the relevant Diagnostic Trouble Code (DTC) Index (PCM) 4.0L V6 (100-00 General Information, Description and Operation).

Electronic Engine Controls - V6 4.0L Petrol - Brake Pedal Position (BPP) Switch Adjustment

General Procedures

Check

1. Remove the brake pedal rubber.
2. NOTE: Make sure that the dial test indicator (DTI) gauge is in line with the brake pedal movement.

Position the DTI gauge on a suitable mounting block, as illustrated.

E135356

3. With the aid of another technician, gently press the brake pedal until the stoplamps illuminate.
4. NOTE: The specification is that the stoplamps should illuminate at between 5.5mm and 8.5mm brake pedal travel.

Note the measurement of the brake pedal travel from rest position until the stoplamps illuminated.

Adjust

1. CAUTIONS:

The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

Remove the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).

2. CAUTIONS:

The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

Only use light finger pressure when installing the stoplamp switch. Failure to follow this instruction may result in an incorrectly adjusted stoplamp switch.

Install the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).

3. Check the adjustment of the stoplamp switch by following the **Check** procedure in this procedure and carry out the **Adjust** procedure if required.

Electronic Engine Controls - V6 4.0L Petrol - Engine Oil Pressure (EOP) Sensor

Removal and Installation

Removal

1. Raise and support the vehicle.
2.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

3. Remove the radiator access panel.

- Remove the 4 bolts.

E45739

4. Remove the EOP sensor.

- Disconnect the electrical connector.
- Position a container to collect the fluid.

E48092

Installation

1. To install, reverse the removal procedure.
 - Clean the component mating faces.
 - Tighten the oil pressure sensor to 13 Nm (10 lb.ft).
2. Check and top-up the engine oil.

Electronic Engine Controls - V6 4.0L Petrol - Oil Temperature Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

4.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the oil temperature sensor.

- Disconnect the electrical connector.
- Position a container to collect spillage.
- Remove and discard the O-ring seal.

Installation

1. **NOTE:** Lubricate new seals with clean engine oil.

Install the oil temperature sensor.
 - Clean the component mating faces.
 - Install a new O-ring seal.
 - Tighten the oil temperature sensor to 20 Nm (15 lb.ft).
 - Connect the electrical connector.
2. Install the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
4. Check and top-up the engine oil.

Electronic Engine Controls - V6 4.0L Petrol - Engine Control Module (ECM)

Removal and Installation

Removal

• **NOTE:** If the ECM is to be replaced, the T4 must be connected prior to battery disconnection and on-screen instructions must be followed.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the four-wheel drive control module.
For additional information, refer to: [Four-Wheel Drive \(4WD\) Control Module](#) (308-07A Four-Wheel Drive Systems, Removal and Installation).
3. Remove the ECM cover.
 - Disconnect 2 electrical connectors for access.
 - Disconnect the 2 ECM electrical connectors.
 - Remove the 4 Torx screws.

4. Remove the ECM.
 - Remove the ECM top cover.

Installation

1. Install the ECM.
 - Install the ECM cover and secure with Torx screws.
 - Install the ECM upper cover.
2. Connect the ECM electrical connectors.
3. Connect the 2 electrical connectors disconnected for access.
4. Install the four-wheel drive control module.
For additional information, refer to: [Four-Wheel Drive \(4WD\) Control Module](#) (308-07A Four-Wheel Drive Systems, Removal and Installation).
5. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
6. Connect T4 to calibrate a new ECM.

Electronic Engine Controls - V6 4.0L Petrol - Engine Coolant Temperature (ECT) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the throttle body gasket.
For additional information, refer to: [Throttle Body Gasket](#) (303-04E Fuel Charging and Controls - V6 4.0L Petrol, Removal and Installation).
3. Remove the ECT sensor.

- Position an absorbent cloth to collect fluid spillage.
- Disconnect the electrical connector.
- Remove and discard the O-ring seal.

Installation

1. To install, reverse the removal procedure.
 - Clean the components.
 - Tighten the ECT sensor to 18 Nm (13 lb.ft).
 - Top-up the coolant.

Electronic Engine Controls - V6 4.0L Petrol - Crankshaft Position (CKP) Sensor

Removal and Installation

Removal

- NOTE: The CKP sensor is located on the LH side of the torque converter housing.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).

4.  **CAUTION:** Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the CKP sensor.

- Disconnect the electrical connector.
- Remove the bolt.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.
- Tighten the Torx screw to 8 Nm (6 lb.ft).

2. Install the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).

3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

4. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptations.

Electronic Engine Controls - V6 4.0L Petrol - Throttle Position (TP) Sensor

Removal and Installation

Removal

- NOTE: The TP sensor is part of the throttle body and cannot be serviced separately.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the air intake resonator.
For additional information, refer to: Resonator (303-12, Removal and Installation).
4. Disconnect the TP sensor electrical connector.

5.  **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Disconnect the coolant hoses from the throttle body.

- Clamp the throttle body coolant hoses to minimize coolant loss.
- Release the throttle body hose clips

6. Remove the throttle body.

- Remove the 4 bolts.
- Remove and discard the throttle body gasket.

Installation

1. Install the throttle body.
 - Clean the component mating faces.
 - Install a new gasket.
 - Tighten the 4 bolts to 10 Nm (7 lb.ft).
2. Connect the coolant hoses to the throttle body.

- Secure the throttle body hoses clips.
 - Remove the hose clamps from the throttle body hoses.
3. Install the TP sensor electrical connector.
 4. Install the air intake resonator.
For additional information, refer to: Resonator (303-12, Removal and Installation).
 5. Install the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 6. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
 7. Check and top-up the coolant.
 8. Use T4 to re-calibrate a new TP sensor.

Electronic Engine Controls - V6 4.0L Petrol - Camshaft Position (CMP)

Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the CMP sensor.
 - Disconnect the electrical connector.
 - Remove the bolt.

Installation

1. To install, reverse the removal procedure.
 - Clean the component mating faces.
 1. Lubricate a new O-ring seal with clean engine oil.
 - Tighten the bolt to 6 Nm (4 lb.ft)

Electronic Engine Controls - V6 4.0L Petrol - Knock Sensor (KS) LH

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the KS.

- Disconnect the electrical connector.
- Release the knock sensor electrical connector retaining clips.
- Remove the bolt.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.
- Tighten the bolt to 20 Nm (15 lb.ft).

Electronic Engine Controls - V6 4.0L Petrol - Knock Sensor (KS) RH

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the intake manifold.
For additional information, refer to: [Intake Manifold](#) (303-01C Engine - V6 4.0L Petrol, In-vehicle Repair).
3. Remove the KS.

- Disconnect the electrical connector.
- Release the RH KS electrical connector retaining clip.
- Remove the bolt.

Installation

1. To install, reverse the removal procedure.
 - Clean the component mating faces.
 - Tighten the bolt to 20 Nm (15 lb.ft).

Electronic Engine Controls - V6 4.0L Petrol - Heated Oxygen Sensor (HO2S)

LH

Removal and Installation

Special Tool(s)	
 <p>310-121</p> <p>E53465</p>	<p>Wrench, HO2S</p> <p>310-121 (LRT-19-014)</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the LH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.

- Disconnect the RH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.

4. Using the special tool, remove the HO2S.

- Release the wiring harness.
- Disconnect the electrical connector.

Installation

1. CAUTIONS:

 Make sure the anti-seize compound does not contact the HO2S tip.

 Make sure the HO2S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Using the special tool, install the HO2S.

- Clean the components.
- Apply an anti-seize compound to the thread of the sensor.
- Tighten the HO2S to 45 Nm (33 lb.ft).
- Connect the electrical connector.
- Attach the wiring harness.

2. Position the RH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

3.  CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

4. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptations.

Electronic Engine Controls - V6 4.0L Petrol - Mass Air Flow (MAF) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the MAF sensor.

- Remove the 2 Torx screws.
- Disconnect the electrical connector.

E46528

Installation

1. To install, reverse the removal procedure.

- Tighten Torx screws to 2 Nm (1.5 lb.ft).

2. NOTE: [Federal market vehicles only](#).

If required, carry out a short drive cycle.

For additional information, refer to: [Powertrain Control Module \(PCM\) Short Drive Cycle Self-Test](#) (303-14D Electronic Engine Controls - V8 5.0L Petrol, General Procedures).

3. NOTE: [Non federal market vehicles only](#).

Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptations.

Electronic Engine Controls - V6 4.0L Petrol - Intake Manifold Tuning (IMT) Valve

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the intake manifold tuning valve.

- Disconnect the electrical connector.
- Remove the 2 bolts.
- Discard the O-ring seal.

Installation

1. Install the intake manifold tuning valve.
 - Clean the component mating faces.
 - Install a new O-ring seal.
 - Tighten the bolts to 10 Nm (7 lb.ft).
2. Connect the electrical connector.
3. Install the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Electronic Engine Controls - V6 4.0L Petrol - Catalyst Monitor Sensor LH

Removal and Installation

Special Tool(s)	
 <p>310-121</p> <p>E53465</p>	Wrench, HO2S
	310-121 (LRT-19-014)

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the LH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.

- Disconnect the RH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.

- Remove the catalyst monitor sensor electrical connector heat shield.

- Remove the 2 bolts.

5. Using the special tool, remove the catalyst monitor sensor.

- Release the wiring harness.
- Disconnect the electrical connector.

E44719

Installation

1. CAUTIONS:

 Make sure the anti-seize compound does not contact the catalyst monitor sensor tip.

 Make sure the catalyst monitor sensor wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Using the special tool, install the catalyst monitor sensor.

- Clean the components.
- Apply an anti-seize compound to the thread of the sensor.
- Tighten the catalyst monitor sensor to 45 Nm (33 lb.ft).
- Connect the electrical connector.
- Attach the wiring harness.

2. Install the heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

3. Position the RH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

4.  CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

E49975

5. NOTE: For NAS vehicles only.

If required, carry out a long drive cycle.
For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A, General Procedures).

Cooling Fan

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the battery tray.
For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
3. Remove the engine control module (ECM).
For additional information, refer to: [Engine Control Module \(ECM\)](#) (303-14, Removal and Installation).
4. Remove the battery junction box (BJB) cover.
 - Release the clip.

E91996

5. Release the BJB from the bracket.
 - Remove the bolt.

E55296

6. Remove the central junction box (CJB).
For additional information, refer to: [Central Junction Box \(CJB\)](#) (418-00 Module Communications Network, Removal and Installation).

7. Release the CJB bracket.
 - Release the 3 upper wiring harness clips.
 - Remove the 2 bolts.

E55289

8. Remove the CJB bracket.

- Disconnect the 2 electrical connectors.
- Release the 3 lower wiring harness clips.
- Remove the 2 nuts.

9. Release the ECM housing.

- Release the insulation for access to the nuts.
- Remove the 2 nuts and 2 bolts.

10.  CAUTION: Note of the routing of the wiring harnesses.

Release and disconnect the ECM cooling fan electrical connector.

11. Remove the ECM housing lower panel.

- Remove the 4 screws.

12.  **CAUTION:** Note the fitted position of the component prior to removal.

Remove the cooling fan.

- Remove the 2 screws.

Installation

1.  **CAUTION:** Make sure that these components are installed to the noted removal position.

Install the cooling fan.

- Install the 2 screws.

2.  **CAUTION:** Make sure the seal is installed correctly.

Install the ECM housing lower panel.

- Install the 4 screws.

3.  **CAUTION:** Make sure that the wiring harnesses are correctly routed.

Connect and secure the cooling fan electrical connector.

4.  **CAUTION:** Make sure that the seal is correctly located.

Secure the ECM housing.

- Tighten the bolts and nuts to 10 Nm (7 lb.ft).

5. Install the CJB bracket.

- Tighten the nuts to 10 Nm (7 lb.ft).
- Secure the clips.
- Connect the electrical connectors.
- Tighten the bolts to 25 Nm (18 lb.ft).

6. Install the CJB.

For additional information, refer to: [Central Junction Box \(CJB\)](#) (418-00 Module Communications Network, Removal and Installation).

7. Secure the BJB to the bracket.

- Tighten the bolt to 6 Nm (4 lb.ft).

8. Install the BJB cover.

- Secure the clip.

9. Install the engine ECM.

For additional information, refer to: Engine Control Module (ECM) (303-14, Removal and Installation).

10. Install the battery tray.

For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

11. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

INTRODUCTION

The [EEC \(electronic engine control\)](#) system operates the engine to generate the output demanded by the accelerator pedal and loads imposed by other systems. The [EEC](#) system has an [ECM \(engine control module\)](#) that uses a torque-based strategy to evaluate inputs from sensors and other systems, then produces outputs to engine actuators to produce the required torque.

The [EEC](#) system controls the following:

- Charge air
- Fueling
- Ignition timing
- Valve timing
- Cylinder knock
- Idle speed
- Engine cooling fan
- Evaporative emissions
- On-board diagnostics
- Immobilization system interface
- Speed control.

ENGINE CONTROL MODULE

E121381

Item	Part Number	Description
1	-	ECM and cooling fan mounting bracket
2	-	Cooling fan
3	-	Screw (2 off)
4	-	Nut (2 off)
5	-	ECM

The [ECM](#) is installed in the passenger side protective box in the engine compartment, on a bracket attached to the engine bulkhead. The bracket also contains an electric cooling fan. The [ECM](#), which has an internal temperature sensor, controls the operation of the cooling fan. While the ignition is on, the cooling fan receives a power supply from the [ECM](#) relay in the [EJB](#) ([engine junction box](#)). When cooling is required, the [ECM](#) connects the cooling fan to ground.

The [ECM](#) has the capability of adapting its fuel and ignition control outputs in response to several sensor inputs.

The [ECM](#) receives inputs from the following:

- [CKP \(crankshaft position\)](#) sensor.
- [CMP \(camshaft position\)](#) sensors (4 off).
- [ECT \(engine coolant temperature\)](#) sensors (2 off).
- Knock sensors (4 off).
- [MAP \(manifold absolute pressure\)](#) sensor.
- [MAFT \(mass air flow and temperature\)](#) sensors (2 off).
- Throttle position sensor.
- Heated oxygen sensors (4 off).
- [APP \(accelerator pedal position\)](#) sensor.
- Ambient air temperature sensor.
- [FRP \(fuel rail pressure\)](#) sensor.
- For additional information, refer to: [Fuel Charging and Controls](#) (303-04F Fuel Charging and Controls - V8 5.0L Petrol, Description and Operation).
- Engine cooling fan.
- For additional information, refer to: [Engine Cooling](#) (303-03D Engine Cooling - V8 5.0L Petrol, Description and Operation).
- Stoplamp switch.

- DMTL (diagnostic module - tank leakage) (NAS only).
For additional information, refer to: [Evaporative Emissions](#) (303-13B Evaporative Emissions - V8 5.0L Petrol, Description and Operation).

CRANKSHAFT POSITION SENSOR

E116086

The [CKP](#) sensor is an inductive sensor that allows the [ECM](#) to determine the angular position of the crankshaft and the engine speed.

The [CKP](#) sensor is installed in the rear left side of the sump body, in line with the engine drive plate. The sensor is secured with a single screw and sealed with an O-ring. A two pin electrical connector provides the interface with the engine harness.

The head of the [CKP](#) sensor faces a reluctor ring pressed into the outer circumference of the engine drive plate. The reluctor ring has a 60 minus 2 tooth pattern. There are 58 teeth at 6° intervals, with two teeth removed to provide a reference point with a centerline that is 21° [BTDC \(before top dead center\)](#) on cylinder 1 of bank A.

If the [CKP](#) sensor fails, the [ECM](#):

- Uses signals from the [CMP](#) sensors to determine the angular position of the crankshaft and the engine speed
- Adopts a limp home mode where engine speed is limited to a maximum of 3000 rev/min.

With a failed [CKP](#) sensor, engine starts will require a long crank time while the [ECM](#) determines the angular position of the crankshaft.

CAMSHAFT POSITION SENSORS

E116087

The [CMP](#) sensors are MRE (magneto resistive element) sensors that allow the [ECM](#) to determine the angular position of the camshafts. MRE sensors produce a digital output which allows the [ECM](#) to detect speeds down to zero.

The four [CMP](#) sensors are installed in the front upper timing covers, one for each camshaft.

Each [CMP](#) sensor is secured with a single screw and sealed with an O-ring. On each [CMP](#) sensor, a three pin electrical connector provides the interface with the engine harness.

The head of each [CMP](#) sensor faces a sensor wheel attached to the front of the related [VCT](#) unit.

If an exhaust [CMP](#) sensor fails, the [ECM](#) disables the [VCT](#) of both exhaust camshafts.

If an intake [CMP](#) sensor fails, the [ECM](#) disables the [VCT](#) of both intake camshafts. This can result in the engine being slow, or failing, to start.

ENGINE COOLANT TEMPERATURE SENSORS

E108397

The [ECT](#) sensors are [NTC \(negative temperature coefficient\)](#) thermistors that allow the [ECM](#) to monitor the engine coolant temperature.

There are two identical [ECT](#) sensors installed, which are identified as ECT 1 and ECT 2. Each sensor is secured with a twist-lock and latch mechanism, and is sealed with an O-ring. A two pin electrical connector provides the interface between the sensor and the engine harness.

ECT 1

ECT 1 is installed in the heater manifold, at the rear of the [RH \(right-hand\)](#) cylinder head. The input from this sensor is used in calibration tables and by other systems.

If there is an ECT 1 fault, the [ECM](#) adopts an estimated coolant temperature. On the second consecutive trip with an ECT 1 fault, the [ECM](#) illuminates the [MIL \(malfunction indicator lamp\)](#).

ECT 2

ECT 2 is installed in the lower hose connector which attaches to the bottom of the thermostat. The input from this sensor is used for [OBD \(on-board diagnostic\)](#) 2 diagnostics and, in conjunction with the input from ECT 1, to confirm that the thermostat is functional.

If there is an ECT 2 fault, the [ECM](#) illuminates the [MIL](#) on the second consecutive trip.

KNOCK SENSORS

E108400

The knock sensors are piezo-ceramic sensors that allow the [ECM](#) to employ active knock control and prevent engine damage from pre-ignition or detonation.

Two knock sensors are installed on the inboard side of each cylinder head, one mid-way between cylinders 1 and 2, and one mid-way between cylinders 3 and 4. Each knock sensor is secured with a single screw. On each knock sensor, a two pin electrical connector provides the interface with the engine harness.

The [ECM](#) compares the signals from the knock sensors with mapped values stored in memory to determine when detonation occurs on individual cylinders. When detonation is detected, the [ECM](#) retards the ignition timing on that cylinder for a number of engine cycles, then gradually returns it to the original setting.

The [ECM](#) cancels closed loop control of the ignition system if the signal received from a knock sensor becomes implausible. In these circumstances the [ECM](#) defaults to base mapping for the ignition timing. This ensures the engine will not become damaged if low quality fuel is used. The [MIL](#) will not illuminate, although the driver may notice that the engine 'pinks' in some driving conditions and displays a drop in performance and smoothness.

The ECM calculates the default value if one sensor fails on each bank of cylinders.

MANIFOLD ABSOLUTE PRESSURE SENSOR

E108402

The [MAP](#) sensor allows the [ECM](#) to calculate the load on the engine, which is used in the calculation of fuel injection time.

The [MAP](#) sensor is installed in the air inlet of the intake manifold. The sensor is secured with a single screw and sealed with an O-ring. A three pin electrical connector provides the interface with the engine harness.

If the [MAP](#) sensor fails, the [ECM](#) adopts a default value of 1 bar (14.5 lbf/in.²).

With a failed [MAP](#) sensor, the engine will suffer from poor starting, rough running and poor driveability.

MASS AIR FLOW AND TEMPERATURE SENSORS

E116091

The [MAFT](#) sensors allow the [ECM](#) to measure the mass flow and the temperature of the air flow into the engine. The mass air flow is measured with a hot film element in the sensor. The temperature of the air flow is measured with a [NTC](#) thermistor in the sensor. The mass air flow is used to determine the fuel quantity to be injected in order to maintain the target air/fuel mixture required for correct operation of the engine and the catalytic converters.

There are two [MAFT](#) sensors installed, one in each air cleaner outlet duct. Each [MAFT](#) sensor is secured with two screws and sealed with an O-ring. On each [MAFT](#) sensor, a five pin electrical connector provides the interface with the engine harness.

If the hot film element signal fails the [ECM](#) invokes a software backup strategy to calculate the mass air flow from other inputs. Closed loop fuel control, closed loop idle speed control and evaporative emissions control are discontinued. The engine will suffer from poor starting, poor throttle response and, if the failure occurs while driving, the engine speed may dip and surging may occur before recovering.

If the [NTC](#) thermistor signal fails the [ECM](#) adopts a default value of 25 °C (77 °F) for the intake air temperature.

THROTTLE POSITION SENSORS

The [TP](#) (throttle position) sensors allow the [ECM](#) to determine the position and angular rate of change of the throttle blade.

There are two [TP](#) sensors located in the electronic throttle. See below for details of the electronic throttle.

If a [TP](#) sensor fails, the [ECM](#):

- Adopts a limp home mode where engine speed is limited to a maximum of approximately 2000 rev/min
- Discontinues evaporative emissions control
- Discontinues closed loop control of engine idle speed.

With a failed [TP](#) sensor, the engine will suffer from poor running and throttle response.

HEATED OXYGEN SENSORS

E119261

The heated oxygen sensors allow the [ECM](#) to measure the oxygen content of the exhaust gases, for closed loop control of the fuel:air mixture and for catalytic converter monitoring.

An upstream heated oxygen sensor is installed in the outlet of each exhaust manifold, which enables independent control of the fuel:air mixture for each cylinder bank. A downstream heated oxygen sensor is installed in each catalytic converter, which enables the performance of the catalytic converters to be optimized and monitored.

Oxygen sensors need to operate at high temperatures in order to function correctly. To achieve the high temperatures required, the sensors are fitted with heater elements that are controlled by a [PWM](#) (pulse width modulation) signal from the [ECM](#). The heater elements are operated after each engine start, once it has been calculated that there is no moisture in the exhaust (between 0 and 2 minutes delay), and also during low load conditions when the temperature of the exhaust gases is insufficient to maintain the required sensor temperature. The [PWM](#) duty cycle is carefully controlled to prevent thermal shock to cold sensors. A non-functioning heater delays the sensor's readiness for closed loop control and increases emissions.

The upstream heated oxygen sensors produce a constant voltage, with a variable current that is proportional to the lambda ratio. The downstream heated oxygen sensors produce an output voltage dependant on the ratio of the exhaust gas oxygen to the ambient oxygen.

The heated oxygen sensors age with mileage, increasing their response time to switch from rich to lean and lean to rich. This increase in response time influences the [ECM](#) closed loop control and leads to progressively increased emissions. Measuring the period of rich to lean and lean to rich switching monitors the response rate of the upstream sensors.

Diagnosis of electrical faults is continually monitored in both the upstream and downstream sensors. This is achieved by checking the signal against maximum and minimum threshold, for open and short circuit conditions.

If a heated oxygen sensor fails:

- The [ECM](#) defaults to open loop fueling for the related cylinder bank
- The CO (carbon monoxide) and emissions content of the exhaust gases may increase
- The exhaust may smell of rotten eggs (hydrogen sulphide).

With a failed heated oxygen sensor, the engine will suffer from reduced refinement and performance.

ACCELERATOR PEDAL POSITION SENSOR

E118973

The [APP](#) sensor allows the [ECM](#) to determine the driver requests for vehicle speed, acceleration and deceleration. The [ECM](#) uses this information, together with information from the [ABS \(anti-lock brake system\)](#) module and the [TCM \(transmission control module\)](#), to determine the setting of the electronic throttle.

Three screws attach the [APP](#) sensor and integrated accelerator pedal to a bracket on the lower dash panel. A six pin electrical connector provides the interface with the vehicle harness.

The [APP](#) sensor is a twin track potentiometer. Each track receives an independent power supply from the [ECM](#) and returns an independent analog signal to the [ECM](#). Both signals contain the same positional information, but the signal from track 2 is half the voltage of the signal from track 1 at all positions.

If both signals have a fault, the [ECM](#) adopts a limp home mode, which limits the engine speed to 2000 rev/min maximum.

The [ECM](#) constantly checks the range and plausibility of the two signals and stores a fault code if it detects a fault.

AMBIENT AIR TEMPERATURE SENSOR

E43580

The AAT (ambient air temperature) sensor is a [NTC](#) thermistor that allows the [ECM](#) to monitor the temperature of the air around the vehicle. The [ECM](#) uses the AAT input for a number of functions, including engine cooling fan control. The [ECM](#) also transmits the ambient temperature on the high speed [CAN \(controller area network\)](#) bus for use by other control modules.

The AAT sensor is installed on a bracket in the front bumper ducting, on the vehicle centerline.

The [ECM](#) supplies the sensor with a 5 V reference voltage and a ground, and translates the return signal voltage into a temperature.

If there is a fault with the AAT sensor, the [ECM](#) calculates the AAT from the temperature inputs of the [MAFT](#) sensors. If the AAT sensor and the temperature inputs of the [MAFT](#) sensors are all faulty, the [ECM](#) adopts a default ambient temperature of 25 °C (77 °F).

ELECTRONIC THROTTLE

E116090

The [ECM](#) uses the electronic throttle to help regulate engine torque.

The electronic throttle is attached to the intake manifold.

For additional information, refer to: [Intake Air Distribution and Filtering](#) (303-12D Intake Air Distribution and Filtering - V8 5.0L Petrol, Description and Operation).

The throttle plate is operated by an electric DC (direct current) motor integrated into the throttle body. The [ECM](#) uses a [PWM](#) signal to control the DC motor. The [ECM](#) compares the [APP](#) sensor inputs against an electronic request or value to determine the required position of the throttle plate. The [ECM](#) and electronic throttle are also required to:

- Monitor requests for cruise control operation
- Automatically operate the electronic throttle for accurate cruise control
- Perform all dynamic stability control engine interventions
- Monitor and carry out maximum engine speed and road speed cut outs
- Provide different engine maps for the ride and handling optimization system.

A software strategy within the [ECM](#) calibrates the position of the throttle plate at the beginning of each ignition cycle. When the ignition is turned on, the [ECM](#) performs a self test and calibration routine by fully closing the throttle plate and then opening it again. This tests the default position springs and allows the [ECM](#) to learn the fully closed position.

ECM RELAY

The [ECM](#) relay is used to initiate the power up and power down routines within the [ECM](#). The [ECM](#) relay is installed in the [EJB](#).

When the ignition is turned on, battery voltage is applied to the ignition sense input. The [ECM](#) then starts its power up routines and energizes the [ECM](#) relay.

When the ignition is turned off, the [ECM](#) maintains its powered up state while it conducts the power down routines. This can be for:

- Up to 20 minutes in extreme cases, when the DMTL system is running (NAS markets) or the [TCM](#) is 'kept awake' because of a 'not in park' condition
- Up to 5 minutes when cooling fans are required.

On completion of the power down routines the [ECM](#) de-energizes the [ECM](#) relay.

OPERATION

ECM Adaptions

The [ECM](#) has the ability to adapt the input values it uses to control certain outputs. This capability maintains engine refinement and ensures the engine emissions remain within the legislated limits. The components which have adaptions associated with them are:

- The [APP](#) sensor
- The heated oxygen sensors

- The [MAFT](#) sensors
- The [CKP](#) sensor
- Electronic throttle
- Knock sensors.

Oxygen and MAFT Sensors

There are several adaptive maps associated with the fueling strategy. Within the fueling strategy the [ECM](#) calculates short-term adaptations and long term adaptations. The [ECM](#) will monitor the deterioration of the heated oxygen sensors over a period of time. It will also monitor the current correction associated with the sensors.

The [ECM](#) will store a fault code in circumstances where an adaptation is forced to exceed its operating parameters. At the same time, the [ECM](#) will record the engine speed, engine load and intake air temperature.

Crankshaft Position Sensor

The characteristics of the signal supplied by the [CKP](#) sensor are learned by the [ECM](#). This enables the [ECM](#) to set an adaptation and support the engine misfire detection function. Due to the small variation between different drive plates and different [CKP](#) sensors, the adaptation must be reset if either component is renewed, or removed and refitted. It is also necessary to reset the drive plate adaptation if the [ECM](#) is renewed or replaced. The [ECM](#) supports four drive plate adaptations for the [CKP](#) sensor. Each adaptation relates to a specific engine speed range. The engine speed ranges are detailed in the table below:

Adaption	Engine Speed, rev/min
1	1800 - 3000
2	3001 - 3800
3	3801 - 4600
4	4601 - 5400

Misfire Detection

Legislation requires that the [ECM](#) must be able to detect the presence of an engine misfire. It must be able to detect misfires at two separate levels. The first level is an amount of misfire that could lead to the legislated emissions limit being exceeded by a given amount. The second level is a misfire rate that causes degradation in catalytic converter efficiency.

The [ECM](#) monitors the number of misfire occurrences within two engine revolution ranges. If the [ECM](#) determines a misfire failure within either of these two ranges, over two consecutive journeys, it will record a fault code and details of the engine speed, engine load and engine coolant temperature. In addition, if the second level of misfire occurs, on any trip, the [ECM](#) flashes the [MIL](#) while the fault is occurring.

The signal from the [CKP](#) sensor indicates how fast the poles on the drive plate are passing the sensor tip. A sine wave is generated each time a pole passes the sensor tip. The [ECM](#) can detect variations in drive plate speed by monitoring the sine wave signal supplied by the crankshaft position sensor. By assessing this signal, the [ECM](#) can detect the presence of an engine misfire. The [ECM](#) will evaluate the signal against a number of factors and will decide whether to record the occurrence or ignore it. The [ECM](#) can assign a misfire judgement to an individual cylinder, which can be viewed on Land Rover approved diagnostic equipment.

Diagnostics

The [ECM](#) stores each fault as a [DTC \(diagnostic trouble code\)](#). The [DTC](#) and associated environmental and freeze frame data can be read using Land Rover approved diagnostic equipment, which can also read real time data from each sensor, the adaptation values currently being employed and the current fueling, ignition and idle speed settings.

Electronic Engine Controls - V8 5.0L Petrol - Electronic Engine Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the electronic engine control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Electronic Engine Controls](#) (303-14D Electronic Engine Controls - V8 5.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Engine oil level ● Cooling system coolant level ● Fuel level ● Fuel contamination/grade/quality ● Fuel leaks ● Accessory drive belt ● Sensor installation/condition ● Viscous fan and solenoid ● Air cleaner condition 	<ul style="list-style-type: none"> ● Fuses ● Wiring harness ● Electrical connector(s) ● 5 volt sensor supply ● Sensor(s) ● Engine Control Module (ECM) ● Transmission Control Module (TCM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not fire	<ul style="list-style-type: none"> ● Engine breather system disconnected/restricted ● Ignition system ● Fuel system ● Electronic engine control 	Ensure the engine breather system is free from restriction and is correctly installed. Check for ignition system, fuel system and electronic engine control DTCs and refer to the relevant DTC Index
Engine cranks and fires, but will not start	<ul style="list-style-type: none"> ● Evaporative emissions purge valve ● Fuel pump ● Spark plugs ● HT short to ground (tracking) check rubber boots for cracks/damage ● Ignition system 	Check for evaporative emissions, fuel system and ignition system related DTCs and refer to the relevant DTC Index
Difficult cold start	<ul style="list-style-type: none"> ● Engine coolant level/anti-freeze content ● Battery ● Electronic engine controls ● Exhaust Gas Recirculation (EGR) valve stuck open ● Fuel pump ● Purge valve 	Check the engine coolant level and condition. Ensure the battery is in a fully charged and serviceable condition. Check for electronic engine controls, engine emissions, fuel system and evaporative emissions system related DTCs and refer to the relevant DTC Index
Difficult hot start	<ul style="list-style-type: none"> ● Injector leak ● Electronic engine control ● Purge valve ● Fuel pump ● Ignition system ● EGR valve stuck open 	Check for injector leak, install new injector as required. Check for electronic engine controls, evaporative emissions, fuel system, ignition system and engine emission system related DTCs and refer to the relevant DTC Index
Difficult to start after hot engine off, after engine has reached operating temperature	<ul style="list-style-type: none"> ● Injector leak ● Electronic engine control ● Purge valve ● Fuel pump ● Ignition system ● EGR valve stuck open 	Check for injector leak, install new injector as required. Check for electronic engine controls, evaporative emissions, fuel system, ignition system and engine emission system related DTCs and refer to the relevant DTC Index

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to the relevant Diagnostic Trouble Code (DTC) Index for [V8 5.0L Petrol, DTC Index](#) and [Electronic Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Electronic Engine Controls - V8 5.0L Petrol - Powertrain Control Module (PCM) Long Drive Cycle Self-Test

General Procedures

WARNING: Where possible, all road tests should be on well surfaced and dry roads. Always comply with speed limits and local traffic regulations.

• **NOTE:** This procedure is an overcheck only. If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

• **NOTE:** The vehicle must exceed 50mph (80 km/h) during the road test.

1. Connect the diagnostic equipment to the vehicle.
2. Follow on screen prompts and check for engine management fault codes.
3. Clear the fault codes following the on screen procedure.
4. Disconnect the diagnostic equipment from the vehicle.
5. **NOTE:** Make sure cruise control is not engaged.

Make sure the engine temperature is above 60 °C (140 °F).

Carry out a road test and perform the following operations.

1. Accelerate to 55 mph (88 km/h) in 5th gear and cruise for 2 minutes with the engine speed at or above 1800rpm.
 2. Lift off the throttle and allow the vehicle to decelerate until the engine speed is less than 1000 rpm.
 3. Stop the vehicle.
 4. Release brake, allow the vehicle to move with no throttle for 1 minute.
 5. Road test is now complete.
6. Connect the diagnostic equipment to the vehicle.
 7. **NOTE:** If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

Follow on screen prompts and check for engine management fault codes.
 8. Disconnect the diagnostic equipment from the vehicle.

Electronic Engine Controls - V8 5.0L Petrol - Powertrain Control Module (PCM) Short Drive Cycle Self-Test

General Procedures

• NOTE: This procedure is an overcheck only. If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

1. Connect the diagnostic equipment to the vehicle.
2. Follow on screen prompts and check for engine management fault codes.
3. Clear the fault codes following the on screen procedure.
4. Start the engine.
 - Allow the engine to idle for 30 seconds.
 - Raise the engine speed to 1500 rpm and hold for 3 minutes until a temperature of 70°C (158 °F) is achieved.
 - Allow the engine to idle for 30 seconds.
 - Switch off the engine.

5. NOTE: If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

Follow on screen prompts and check for engine management fault codes.

6. Disconnect the diagnostic equipment from the vehicle.

Electronic Engine Controls - V8 5.0L Petrol - Brake Pedal Position (BPP) Switch Adjustment

General Procedures

Check

1. Remove the brake pedal rubber.
2. NOTE: Make sure that the dial test indicator (DTI) gauge is in line with the brake pedal movement.

Position the DTI gauge on a suitable mounting block, as illustrated.

3. With the aid of another technician, gently press the brake pedal until the stoplamps illuminate.
4. NOTE: The specification is that the stoplamps should illuminate at between 5.5mm and 8.5mm brake pedal travel.

Note the measurement of the brake pedal travel from rest position until the stoplamps illuminated.

Adjust

1. CAUTIONS:

The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

Remove the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).

2. CAUTIONS:

The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

Only use light finger pressure when installing the stoplamp switch. Failure to follow this instruction may result in an incorrectly adjusted stoplamp switch.

Install the stoplamp switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).

3. Check the adjustment of the stoplamp switch by following the **Check** procedure in this procedure and carry out the **Adjust** procedure if required.

Electronic Engine Controls - V8 5.0L Petrol - Camshaft Position (CMP)

Sensor LH

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
2. Refer to: [Thermostat Housing](#) (303-03D Engine Cooling - V8 5.0L Petrol, Removal and Installation).

3.
 - Torque: 10 Nm

Installation

1. **CAUTIONS:**
 -  Make sure that the mating faces are clean and free of foreign material.
 -  Make sure that the sensor tip is clean and free of foreign material.
- NOTE: Lubricate the O-ring seal with clean engine oil.
- To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Camshaft Position (CMP)

Sensor RH

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
2. Refer to: [Thermostat Housing](#) (303-03D Engine Cooling - V8 5.0L Petrol, Removal and Installation).

3.
 - Torque: 10 Nm

Installation

1. **CAUTIONS:**
 -  Make sure that the mating faces are clean and free of foreign material.
 -  Make sure that the sensor tip is clean and free of foreign material.
- NOTE: Lubricate the O-ring seal with clean engine oil.
- To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Catalyst Monitor Sensor LH

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Torque: 10 Nm

- 3.

4.  **CAUTION:** Make sure that the mating faces are clean and free of foreign material.

Torque: 48 Nm

Installation

1. **CAUTIONS:**

If accidentally dropped or knocked install a new sensor.

Make sure the HO2S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

- NOTE: If the original sensor is to be installed, apply lubricant meeting specification ESE-M12A4-A to the thread of the sensor.
- NOTE: Make sure the anti-seize compound does not contact the HO2S tip.

To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Catalyst Monitor Sensor RH

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Torque: 10 Nm

- 3.

- 4.

5.  CAUTION: Make sure that the mating faces are clean and free of foreign material.

Torque: 48 Nm

Installation

1. 1. CAUTIONS:

 Make sure the anti-seize compound does not contact the HO2S tip.

 If accidentally dropped or knocked install a new sensor.

 Make sure the HO2S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

• NOTE: If the original sensor is to be installed, apply lubricant meeting specification ESE-M12A4-A to the thread of the sensor.

To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Crankshaft Position (CKP) Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

4.  CAUTION: Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Torque: 10 Nm

Installation

1. 1. CAUTIONS:

Make sure that the mating faces are clean and free of foreign material.

Make sure that the component is clean, free of foreign material and lubricant.

To install, reverse the removal procedure.

2. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptations.

Electronic Engine Controls - V8 5.0L Petrol - Engine Control Module (ECM)

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. Remove the battery.

Refer to: [Battery](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

2.  CAUTION: Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

3. Torque: 7 Nm

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Engine Coolant Temperature (ECT) Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
2. Disconnect the battery ground cable.
Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
3. Refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Engine Oil Level Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: [Engine Oil Draining and Filling](#) (303-01D Engine - V8 5.0L Petrol, General Procedures).

3. **3. CAUTIONS:**

 Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

 Remove and discard the O-ring seal.

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Torque: 12 Nm

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Front Knock Sensor (KS) LH

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Intake Manifold](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

4. Torque: 20 Nm

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Front Knock Sensor (KS) RH

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Intake Manifold](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

4. Torque: 20 Nm

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Fuel Rail Pressure (FRP)

Sensor

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Petrol and Petrol-Ethanol Fuel Systems Health and Safety Precautions](#) (100-00 General Information, Description and Operation).
2. Refer to: [Fuel System Pressure Release - V8 5.0L Petrol](#) (310-00 Fuel System - General Information, General Procedures).
3. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

4. Refer to: [Fuel Injection Component Cleaning](#) (303-04F Fuel Charging and Controls - V8 5.0L Petrol, General Procedures).
5. Refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

6. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

7. CAUTIONS:

Be prepared to collect escaping fluids.

Make sure that all openings are sealed. Use new blanking caps.

- Torque: 32 Nm

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Heated Oxygen Sensor (HO2S)

LH

Removal and Installation

Special Tool(s)

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
2. Refer to: [Exhaust System](#) (309-00D Exhaust System - V8 5.0L Petrol, Removal and Installation).

3. *Torque: 11 Nm*

4.

5.  CAUTION: Make sure that the mating faces are clean and free of foreign material.

Special Tool(s): [310-121](#)
Torque: [48 Nm](#)

Installation

1. CAUTIONS:

 Make sure the anti-seize compound does not contact the HO2S tip.

 If accidentally dropped or knocked install a new sensor.

 Make sure the HO2S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

• NOTE: If the original sensor is to be installed, apply lubricant meeting specification ESE-M12A4-A to the thread of the sensor.

To install, reverse the removal procedure.

2. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptations.

Electronic Engine Controls - V8 5.0L Petrol - Heated Oxygen Sensor (HO2S)

RH

Removal and Installation

Special Tool(s)

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: [Exhaust System](#) (309-00D Exhaust System - V8 5.0L Petrol, Removal and Installation).

3. Torque: 9 Nm

- 4.

5.  CAUTION: Make sure that the mating faces are clean and free of foreign material.

Special Tool(s): [310-121](#)
Torque: [48 Nm](#)

Installation

1. CAUTIONS:

 Make sure the anti-seize compound does not contact the HO2S tip.

 If accidentally dropped or knocked install a new sensor.

 Make sure the HO2S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

• NOTE: If the original sensor is to be installed, apply lubricant meeting specification ESE-M12A4-A to the thread of the sensor.

To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Manifold Absolute Pressure (MAP) Sensor

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Air Cleaner Outlet Pipe T-Connector](#) (303-12D Intake Air Distribution and Filtering - V8 5.0L Petrol, Removal and Installation).

2. **2.** NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

• Torque: 5 Nm

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Mass Air Flow (MAF) Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. NOTE: Right-hand shown, left-hand similar.

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Torque: 1.2 Nm

Installation

1. To install reverse the removal procedure.
2. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptations.

Electronic Engine Controls - V8 5.0L Petrol - Rear Knock Sensor (KS) LH

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Intake Manifold](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

4. Torque: 20 Nm

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Rear Knock Sensor (KS) RH

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Intake Manifold](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

4. Torque: 20 Nm

Installation

1. To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Variable Valve Timing (VVT) Oil Control Solenoid LH

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
2. Refer to: [Thermostat Housing](#) (303-03D Engine Cooling - V8 5.0L Petrol, Removal and Installation).

3. **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Torque: 10 Nm

4.  **CAUTION:** Evenly and progressively, remove the VVT units from each side.
• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Installation

1.  **CAUTION:** Make sure that the mating faces are clean and free of foreign material.
• NOTE: Lubricate the O-ring seal with clean engine oil.
To install, reverse the removal procedure.

Electronic Engine Controls - V8 5.0L Petrol - Variable Valve Timing (VVT) Oil Control Solenoid RH

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: [Thermostat Housing](#) (303-03D Engine Cooling - V8 5.0L Petrol, Removal and Installation).

3. **3.** NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

4. **4.** NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Torque: 10 Nm

5.  CAUTION: Evenly and progressively, remove the VVT units from each side.
 - NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Installation

1.  CAUTION: Make sure that the mating faces are clean and free of foreign material.

- NOTE: Lubricate the O-ring seal with clean engine oil.

To install, reverse the removal procedure.

Automatic Transmission/Transaxle - TDV6 2.7L Diesel -

Item	Specification
* Recommended lubricant	Shell M13754
+ Torque converter nose	Molybdenum disulphide grease to specification FB180

• **CAUTIONS:**

* Do not use any lubricant other than that specified.

+ Do not over lubricate.

Capacity

Item	Capacity
+ Initial dry fill	9.5 litres (16.7 pints) (10.0 US qts)

**CAUTION:** + A final oil level check/drain down/top-up must be carried out when the unit has been installed.**General Specification**

Item	Specification
Automatic transmission	ZF 6HP26
Speeds	6 Forward, 1 Reverse
Gear ratios:	
First	4.17:1
Second	2.340:1
Third	1.521:1
Fourth	1.143:1
Fifth	0.867:1
Sixth	0.691:1
Reverse	3.403:1
Torque converter	Sachs W255 2GWK with turbine torsional damper and slip controlled, dual friction faced lock-up clutch
Transmission control module:	
Location	Located in gearbox casing
Type	1904

Torque Specifications

Description	Nm	lb-ft

Exhaust manifold heat shield retaining bolts	10	7

*** New nuts must be installed**

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Automatic Transmission

Description and Operation

For additional information, refer to: [Automatic Transmission](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, Description and Operation).

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Automatic Transmission

Diagnosis and Testing

Principle of Operation

For detailed description of the automatic transmission system and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Automatic Transmission](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

This section is intended to provide a means for the technician to diagnose transmission component faults, rather than replacing the entire unit.

However, there are a number of situations where the replacement of the unit is the only practical solution, and this section will cover the diagnosis necessary to gather the information required for transmission replacement to be authorized by the warranty prior approval program (WPAP) where it applies, as well as covering the diagnostic trouble codes (DTCs) stored by the control module.

The basic checks of the transmission (fluid condition and level, etc) should be carried out first, and this will mean using the approved diagnostic system or other equipment with data logging facility to monitor temperatures, etc.

For information on the operation of the transmission, refer to the relevant workshop manual section.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fluid condition ● Fluid level ● Fluid leaks ● Fluid cooler ● External linkages ● Gear selector lever 	<ul style="list-style-type: none"> ● Fuses ● Wiring harnesses ● Electrical connector(s) ● Transmission control module (TCM) ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the DTC index.
 - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
 - Make sure that all DTCs are cleared following rectification.

Preliminary Inspection

1. **1.** As much information as possible should be obtained from the owner/driver about the fault in order to assist with the diagnosis. Time spent on this will reduce the necessity for extensive road testing and possible missed diagnosis.
 - The information required for WPAP is still useful as an aid to diagnosis, even where the system is not in operation

Required information for WPAP (where applicable)

- The nature of the fault (loss of drive, slip, judder, gear shift quality, noise, etc)
 - The frequency with which the fault occurs
 - The conditions under which the fault occurs, including temperature (coolant and ambient), selected gear, road speed, engine speed, and any specific conditions
 - Check and rectify non-transmission related DTCs before continuing with transmission diagnosis
2. **2.** Record the vehicle details, including:
 - Service history
 - The transmission serial number
 - The transmission software level
 3. **3.** Visually inspect the transmission for fluid leaks, damage, etc.
 4. **4.** Check the transmission fluid condition.

• **NOTE:** Fluid condition is a good indicator of the transmission internal condition. If the fluid is burnt and/or contaminated, this would usually mean the internal damage to the transmission is at such a level that unit replacement is the best option. Compare the fluid drained from the transmission with fresh fluid for color and odor.

5. **5.** Check the transmission fluid level. Refer to the relevant workshop manual section.

• **NOTE:** This is crucial to the operation of the transmission, and the procedure must be closely followed to avoid inaccurate diagnosis, with the resultant possible rejection of a warranty claim.

6. **6.** Check the engine idle speed and throttle sensor using the approved diagnostic system or a scan tool.
7. **7.** Check the transmission selector cable adjustment. Refer to the relevant workshop manual section.
8. **8.** Check the transmission range sensor adjustment.

- A comprehensive procedure for transmission range sensor setting is accessible through the approved diagnostic system.

If any faults are found and rectified in the above sequence, clear any DTCs and test the vehicle for normal operation.

If a failure condition is found indicating the need to renew the transmission assembly, the request must go through the warranty prior approval program (where applicable) before work is begun.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Transmission Control Module \(TCM\) - Bosch](#) (100-00 General Information, Description and Operation).

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Transmission Fluid Drain and Refill

General Procedures

• WARNINGS:

Observe due care when draining transmission fluid as the fluid can be very hot.

Observe due care when working near a hot exhaust system.

All vehicles

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transmission undershield.
 - Remove the 6 bolts.

- If installed, remove the transmission heat shield.
 - Remove the 4 bolts.

Vehicles with 4.0L engine

- Remove the transmission support insulator through-bolt.
 - Raise the transmission to gain access to the fluid drain plug.

All vehicles

5. Clean the area around the transmission fluid drain and filler plugs.
6. Place a container under the transmission.

7. WARNINGS:

Observe due care when draining transmission fluid as the fluid can be very hot.

Observe due care when working near a hot exhaust system.

Remove the transmission fluid filler/level plug.

- Remove and discard the sealing washer.

8. Remove the transmission fluid drain plug.

- Remove and discard the sealing washer.
- Allow the fluid to drain.

9. Install the transmission fluid drain plug and tighten to 9 Nm (7 lb.ft).

- Install a new sealing washer.

Vehicles with 4.0L engine

10. Install the transmission support insulator through-bolt and tighten to 175 Nm (129 lb.ft).

- Lower the transmission.

All vehicles

11. Add 3.5 to 4 litres of the correct transmission fluid, or until a small thread of fluid runs from the filler/level hole.

12. Check and top-up the transmission fluid level.

For additional information, refer to: [Transmission Fluid Level Check](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Transmission Fluid Level Check

General Procedures

• WARNINGS:

Observe due care when draining transmission fluid as the fluid can be very hot.

Observe due care when working near a hot exhaust system.

CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

1. The following steps must be observed before starting the transmission fluid level check and top-up.

- The vehicle must be on a horizontal ramp.
- The parking brake must be applied.
- The wheels must be chocked.

CAUTION: Make sure the transmission fluid temperature is below 30 degrees before starting the fluid level check.

Using the approved Land Rover diagnostic equipment, monitor the transmission fluid temperature.

E53729

3. Start the engine. Move the selector lever from 'P' through all gear positions, pausing in each gear position for 2-3 seconds and return to the 'P' position.

WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Remove the transmission undershield.

- Remove the 6 bolts.

E44595

6. If installed, remove the transmission heat shield.

- Remove the 4 bolts.

7. Place a container under the transmission.

8. WARNINGS:

 Observe due care when draining transmission fluid as the fluid can be very hot.

 Observe due care when working near a hot exhaust system.

 CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

Remove the transmission fluid filler/level plug.

- Clean the area around the filler/level plug.
- Remove and discard the sealing washer.

9. If no fluid loss is apparent when the filler/level plug is removed, with the engine at idle, continue to fill the transmission until a small thread of oil runs from oil filler/level hole.

10. Install the transmission fluid filler/level plug and tighten to 35 Nm (26 lb.ft).

- Install a new sealing washer.
- Remove the container.

11. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

12. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

13. Disconnect the approved Land Rover diagnostic equipment from the vehicle.

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Selector Shaft Seal

In-vehicle Repair

Special Tool(s)	
 <p>307-509-1</p> <p>E50766</p>	<p>ZF Automatic transmission selector shaft seal remover</p> <p>307-509-1 (LRT-44-033/1)</p>
 <p>307-509-2</p> <p>E50767</p>	<p>ZF Automatic transmission selector shaft seal remover</p> <p>307-509-2 (LRT-44-033/2)</p>
 <p>307-509-3</p> <p>E50768</p>	<p>ZF Automatic transmission selector shaft seal installer</p> <p>307-509-3 (LRT-44-033/3)</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- LH selector shaft seal only: Remove the exhaust system. For additional information, refer to: [Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation) / [Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).
- Remove the transmission heat shield.
 - Remove the 4 bolts.

E50769

4. Release the selector cable and lever.

- Remove the nut.
- Compress the latch and release the cable.

E50770

5.  **CAUTION:** Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the selector shaft seal.

- Install 307-509-1 to the seal.
- Install 307-509-2 to 307-509-1 and extract the seal.

Installation

1. **NOTE:** Clean the components.

Using 307-509-3, install the selector shaft seal.

E50771

2. Install the selector cable and bracket.

- Secure with the clip.
- Tighten the nut to 12 Nm (9 lb.ft).

3. Install the transmission heat shield.

- Install the bolts.

4. LH selector shaft seal only: Install the exhaust system.
For additional information, refer to: [Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation) / [Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Transmission Control Module (TCM)

In-vehicle Repair

Special Tool(s)	
 <p>307-492</p> <p>E48903</p>	Seal extractor 307-492 (LRT-44-005)

Removal

- NOTE: The transmission control module (TCM) is part of the main control valve body and cannot be serviced separately.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the fluid pan.
For additional information, refer to: [Fluid Pan, Gasket and Filter](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, In-vehicle Repair).
- Disconnect the electrical connector.

- Remove and discard the electrical connector sleeve.

- Release the retainer.

5. Remove the valve body.

- Position a container to collect spillage.
- Remove the 10 Torx screws.

6. Using the special tool, remove the 4 seals.

7. Remove the seal block.

Installation

1. CAUTIONS:

 Make sure that when fully fitted, all seals protrude by the same amount.

 Engage the selector lever with the groove in the piston rod.

Install the valve body.

- Clean the component mating faces.
- Install new seals.
- Install a new seal block.
- Tighten the Torx screws to 8 Nm (6 lb.ft).

2. Install a new electrical connector sleeve.

- Secure with retainer.

3. Connect the electrical connector.

4. Install the fluid pan.

For additional information, refer to: [Fluid Pan, Gasket and Filter](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, In-vehicle Repair).

5. Using T4, calibrate a new TCM.

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Output Shaft Seal

In-vehicle Repair

Special Tool(s)	
 <p>303-903 E50940</p>	<p>Oil seal remover 303-903 (LRT-12-092)</p>
 <p>307-520 E52536</p>	<p>Oil seal installer 307-520</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transfer case.
For additional information, refer to: [Transfer Case - TDV6 3.0L Diesel](#) (308-07B Transfer Case, Removal).

-  **CAUTION:** Care must be taken to avoid damage to the seal register and running surface.

Remove the transmission output shaft oil seal.

- Use the special tool.

Installation

-  **CAUTION:** Oil seals must be fitted dry.

Install a new transmission output shaft oil seal.

- Clean the seal register.
- Use the special tool.

- Install the transfer case.
For additional information, refer to: [Transfer Case - TDV6 3.0L](#)

[Diesel](#) (308-07B Transfer Case, Removal).

3. Check and top-up the transmission fluid level.
For additional information, refer to: [Transmission Fluid Level Check](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Fluid Pan, Gasket and Filter

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the transmission heat shield.
 - Remove the four retaining bolts.

4. Release the selector cable from its abutment bracket.

5. Remove the transmission heat shield bracket.
 - Remove the four retaining bolts.

6. Drain the transmission fluid.
For additional information, refer to: [Transmission Fluid Drain and Refill](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

7.  CAUTION: Protect the engine during this operation.

Raise the RH side of the engine by approximately 35 mm (1.38 in).

- Use a transmission jack.
- Remove and discard the two retaining bolts.

8. Remove the fluid pan, gasket and filter.

- Position a container to collect the fluid spillage.
- Remove the 21 Torx screws.
- Remove and if necessary, discard the seal.
- Discard the O-ring seal.

Installation

1. Install the fluid pan, gasket and filter.
 - Clean the components mating faces.
 - Install a new O-ring seal.
 - Tighten the Torx screws to 8 Nm (6 lb.ft).
2. Lower the RH side of the engine.
 - Remove the transmission jack.
 - Install new engine mounting retaining bolts and tighten to 45 Nm (33 lb.ft).
3. Install the transmission heat shield bracket.
 - Install the four retaining bolts and tighten to 10 Nm (7 lb.ft).
4. Install the selector cable to its abutment bracket.
5. Install the transmission heat shield.
 - Install the four retaining bolts and tighten to 10 Nm (7 lb.ft).
6. Connect the battery ground cable.
 For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
7. Refill the transmission with fluid.
 For additional information, refer to: [Transmission Fluid Drain and Refill](#) (307-01A Automatic Transmission/Transaxle - TDV6

2.7L Diesel, General Procedures).

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Main Control Valve Body

In-vehicle Repair

Special Tool(s)	
	Seal extractor
	307-492(LRT-44-005)

Removal

- NOTE: The transmission control module (TCM) is part of the main control valve body and cannot be serviced separately.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Drain the transmission fluid.
For additional information, refer to: [Transmission Fluid Drain and Refill](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

4. Remove the transmission support crossmember.

- Support the transmission on a jack.
- Remove the transmission mounting securing bolt.
- Remove the 4 bolts.
- Remove the transmission support insulator through-bolt.

5. Release the fuel filter from its bracket.

- Tie aside.

6. Release the support bracket.

- Remove the bolt closest to the engine.
- Release but do not remove the second bolt.

E87981

7. Release the oil pan.

- Position a container to collect the oil spillage.
- Remove the 21 Torx screws.

E48876

8. Release and disconnect the electrical connector.

E48870

E48871

9. Remove and discard the electrical connector sleeve.

- Release the retainer.

E48872

10. Remove the valve block and oil pan.

- Remove the 7 Torx bolts.
- Discard the O-ring seal.

E48873

11. Using the special tool, remove the 4 seals.

12. Remove the seal block.

Installation

E48892

1. CAUTIONS:

Make sure that when fully fitted, all seals protrude by the same amount.

Engage the selector lever with the groove in the piston rod.

Install the valve block and oil pan.

- Clean the component mating faces.
- Install new seals.
- Install a new seal block.
- Tighten the Torx screws to 8 Nm (6 lb.ft).

2. Install a new electrical connector sleeve.

- Secure with retainer.

3. Connect the electrical connector.

4. Secure the oil pan.

- Tighten the Torx screws to 8 Nm (6 lb.ft).

5. Install the fuel filter support bracket.

6. Install the fuel filter.

7. Install the transmission support crossmember.

- Install the transmission support insulator through-bolt and tighten to 175 Nm (129 lb.ft).
- Install the 4 bolts.
- Tighten the nuts and bolts to 90 Nm (66 lb.ft).
- Remove the transmission jack.

8. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

9. Fill the transmission with fluid.

For additional information, refer to: [Transmission Fluid Drain and Refill](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

10. Using the Land Rover approved diagnostic equipment, calibrate the control valve body.

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Transmission Support Insulator

In-vehicle Repair

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

3. **NOTE:** 4.4L illustration shown, 4.0L and 2.7L Diesel are similar.

Remove the transmission support insulator.

- Remove the 4 bolts.

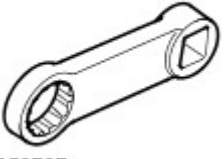

E44567

Installation

1. To install, reverse the removal procedure.
 - Clean the component mating faces.
 - Tighten the bolts to 60 Nm (44 lb.ft).

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Transmission

Removal and Installation

Special Tool(s)	
 <p>303-1069</p> <p>E53727</p>	<p>Wrench adaptor</p> <p>303-1069</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the front driveshaft.
For additional information, refer to: [Front Driveshaft - TDV6 2.7L Diesel](#) (205-01 Driveshaft, Removal and Installation).
4. Remove the exhaust system.
For additional information, refer to: [Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation) / [Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).
5. Remove the rear driveshaft.
For additional information, refer to: [Rear Driveshaft](#) (205-01 Driveshaft, Removal and Installation).
6. Remove the starter motor.
For additional information, refer to: [Starter Motor](#) (303-06A Starting System - TDV6 2.7L Diesel, Removal and Installation).
7. Release the selector cable.
 - Using an additional wrench, restrain the clamping bush and loosen the locknut.
 - Compress the latch and release the cable.

E 55385

8.  **CAUTION:** Always plug any open connections to prevent contamination.

Disconnect the transmission fluid lines.

- Remove the bolt.
- Release the clip.
- Remove and discard the 2 O-ring seals.

9. Remove the turbocharger support bracket.

- Remove the nut and 2 bolts.

10. Remove the exhaust heat shield.

- Remove the 7 nuts.

11. Remove the exhaust cross-over pipe LH support bracket.

- Remove the 3 bolts.
- Release the transmission wiring harness.

12. Remove the exhaust cross-over pipe RH support bracket.

- Remove the 3 bolts.

13. Remove the exhaust cross-over pipe center support bracket.

- Remove the 2 bolts.

14. Release the wiring harness from the LH side of the transmission.

- Remove the 2 bolts.
- Release the clip.

15. Release the wiring harness from the RH side of the transmission.

- Remove the bolt.
- Disconnect the electrical connector.

E44568

16. Disconnect the transfer case electrical connectors.

- Disconnect the 3 electrical connectors.

E56515

17.  CAUTION: Always plug any open connections to prevent contamination.

- NOTE: Transmission shown removed for clarity.

Disconnect the breather line.

- Depress the locking ring.

E54416

18. Release the wiring harness from the transfer case.

- Remove the 3 bolts.
- Release the clip.

19. Remove the radiator access panel.

- Remove the 4 bolts.

20. Release the flexplate.

- Remove the access plug.
- Rotate the crankshaft in a clockwise direction to access the retaining bolts.
- Remove the 4 bolts.

21. Using a transmission jack, support the transmission.

22. WARNINGS:

Secure the transmission to the transmission jack.

Support the engine. The engine will move forward when the transmission is removed.

CAUTION: Make sure the torque converter remains connected to the transmission.

- NOTE: Transmission shown removed for clarity.

With assistance, remove the transmission.

- Remove the 15 transmission bolts.

23. Using a suitable tool, retain the torque converter.

24. NOTE: Do not disassemble further if the component is removed for access only.

Remove the transmission from the transmission jack.

25. Drain the transmission fluid.

26. With assistance, remove the transfer case.

- Remove the 8 bolts.
- Remove and discard the O-ring seal.

27. Remove the selector cable bracket.

- Remove the bolts.

28. Remove the selector lever.

- Remove the nut.

29. Release the fuel filter housing and support bracket.

Installation

CAUTION: If the automatic transmission fluid is very dirty or it contains metallic particles, then along with a new transmission, install a new automatic transmission fluid cooler and lines.

E53728

1. NOTE: Clean the component mating faces.

• NOTE: Install a new O-ring seal.

With assistance, install the transfer case.

- Lubricate input shaft splines with 'Weicon TL7391' grease.
- Install the 8 bolts.
- Using the special tool, tighten the bolts to 45 Nm (33 lb.ft).

2. Secure the selector lever.

- Tighten the nut to 12 Nm (9 lb.ft).

3. Attach the selector cable bracket.

- Install the 2 bolts and tighten to 10 Nm (7 lb.ft).

4. Secure the wiring harness to the transmission.

- Repeat the above procedure for the other side.
- Tighten the bolt to 10 Nm (7 lb.ft).

5. Using a suitable tool, retain the torque converter.

6. Position the transmission to the transmission jack.

7. Remove the torque converter retainer.

8. NOTE: Apply grease of the correct specification to the torque converter spigot.

• NOTE: Clean the component mating faces.

With assistance, install the transmission.

- Tighten the 15 bolts to 45 Nm (33 lb.ft).

9. Connect the breather line.

10. Secure the wiring harness to the transmission.

- Connect the electrical connector.
- Tighten the screws.
- Secure the wiring harness to the transmission.

11. NOTE: Clean the component mating faces.

• NOTE: Install the new O-ring seals.

Attach the transmission fluid lines.

- Secure the transmission fluid lines to the clip.
- Tighten the bolt to 10 Nm (7 lb.ft).

12. Attach the flexplate to the torque converter.

- Rotate the crankshaft to access the bolts.
- Install the access plug.
- Tighten the 4 bolts to 45 Nm (33 lb.ft).

13. Install the starter motor.

For additional information, refer to: [Starter Motor](#) (303-06A Starting System - TDV6 2.7L Diesel, Removal and Installation).

14. Install the radiator access panel.

- Install the 4 bolts and tighten to 10 Nm (7 lb.ft).

15. Install the exhaust manifold crossover pipe center support

bracket.

- Loosely install the 2 bolts.

16. Install the exhaust manifold crossover pipe RH support bracket.

- Loosely install the 3 bolts.

17. Install the exhaust manifold crossover pipe LH support bracket.

- Loosely install the 3 bolts.

18. Tighten the exhaust manifold crossover pipe mounting bracket bolts in the following sequence.

- Tighten the 2 bolts marked 1 to 10 Nm (7 lb.ft).
- Loosen the 2 bolts by 90 degrees.
- Tighten the 2 bolts marked 3 to 10 Nm (7lb.ft).
- Loosen the 2 bolts by 90 degrees.
- Tighten the 4 bolts marked 2 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts marked 1 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts marked 3 to 25 Nm (18 lb. ft).
- Attach the wiring harness.

19. Install the exhaust heat shield.

20. Install the turbocharger support bracket.

- Tighten the nut and 2 bolts to 22 Nm (16 lb.ft).

21. Install the rear driveshaft.

For additional information, refer to: [Rear Driveshaft](#) (205-01 Driveshaft, Removal and Installation).

22. Install the front driveshaft.

For additional information, refer to: [Front Driveshaft - TDV6 2.7L Diesel](#) (205-01 Driveshaft, Removal and Installation).

23. Install the exhaust system.

For additional information, refer to: [Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation) / [Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).

24. NOTE: Do not fully tighten the locking nut at this stage.

Connect the selector cable to the transmission.

- Engage the inner cable with the lever clamping bush.
- Install the selector cable to its abutment bracket.

25. Adjust the selector cable.

For additional information, refer to: [Selector Lever Cable Adjustment](#) (307-05B Automatic Transmission/Transaxle External Controls - V6 4.0L Petrol, General Procedures).

26. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

27. Check and top-up the transfer case fluid level.

28. Check and top-up the transmission fluid level.

For additional information, refer to: [Transmission Fluid Level Check](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, General Procedures).

29. Lower the vehicle.

Automatic Transmission/Transaxle - V6 4.0L Petrol -

Lubricants

Item	Specification
* Recommended lubricant	ATF Shell M13754
+ Torque converter nose	Molybdenum disulphide grease to specification FB180

• CAUTIONS:

* Do not use any lubricant other than that specified.

+ Do not over lubricate.

Capacity

Item	Capacity
+ Initial dry fill	9.5 litres (16.7 pints) (10.0 US qts)

CAUTION: + A final oil level check/top-up must be carried out when the unit has been installed.

General Specification

Item	Specification
Automatic transmission	ZF 6HP26
Speeds	6 Forward, 1 Reverse
Gear ratios:	
First	4.17:1
Second	2.340:1
Third	1.521:1
Fourth	1.143:1
Fifth	0.867:1
Sixth	0.691:1
Reverse	3.403:1
Torque converter	Sachs W260 2GWK with slip controlled, dual friction faced lock-up clutch
Transmission control module:	
Location	Located in gearbox casing
Type	1904

Torque Specifications

Description	Nm	lb-ft

Transmission fluid lines clip bolt	10	7

Automatic Transmission/Transaxle - V6 4.0L Petrol - Automatic Transmission

Description and Operation

ZF 6HP26 Automatic Transmission Component Location

E42389

Item	Part Number	Description
1	-	PRND LCD display
2	-	M/S LCD display
3	-	Selector lever assembly
4	-	Instrument cluster
5	-	Automatic transmission
6	-	Transmission fluid cooler

GENERAL

The ZF 6HP26 transmission is an electronically controlled, six speed unit. The transmission is manufactured by ZF Transmissions GmbH in Saarbrücken, Germany. This transmission represents the latest in automatic transmission technology and incorporates new features to enhance the transmission functionality:

- The hydraulic and electronic control elements of the transmission are now incorporated in a single unit located inside the transmission and is known as 'Mechatronic'
- Another new strategy is Adaptive Shift Strategy (ASIS). ASIS represents the continuous adaptation of shift changes to suit the driving style of the driver which can vary from sporting to economical. Further details of the ASIS

function are contained in the 'Driving Modes' section.

The transmission is controlled by an Transmission Control Module (TCM) which contains software to provide operation as a semi-automatic 'CommandShift™' transmission. The TCM allows the transmission to be operated as a conventional automatic unit by selecting P, R, N, D on the selector lever. Movement of the selector lever across the gate to the 'M/S' position puts the transmission into electronic 'Sport' mode. Further movement of the lever in a lateral direction to the + or – position puts the transmission into electronic manual 'CommandShift™' mode.

The 6HP26 transmission has the following features:

- Designed to be maintenance free
- Transmission fluid is 'fill for life'
- The torque converter features a controlled slip feature with electronically regulated control of lock-up, creating a smooth transition to the fully locked condition
- Shift programs controlled by the TCM
- Connected to the ECM via the High Speed CAN for communications
- Default mode if major faults occur
- Diagnostics available from the TCM via the CAN.

ZF 6HP26 Automatic Transmission – Exploded View

- NOTE: The transmission shown is exploded to the extent of the serviceable items

E42390

Item	Part Number	Description
1	-	Breather tube
2	-	Plug
3	-	Seal sleeves
4	-	Seal - Selector shaft (2 off)
5	-	Gasket
6	-	Drain plug
7	-	Fluid pan
8	-	Torx screws
9	-	Mechatronic valve block
10	-	Element seal
11	-	Electrical connector – guide sleeve

12	-	O-ring
13	-	O-ring
14	-	Pump housing (not a serviceable component)
15	-	Input shaft seal
16	-	Torque converter

The gearbox comprises the main casing which houses all of the transmission components. The main case also incorporates an integral bell housing.

A fluid pan is bolted to the lower face of the main case and is secured with bolts. The fluid pan is sealed to the main case with a gasket. Removal of the fluid pan allows access to the Mechatronic valve block. The fluid pan has a magnet located around the drain plug which collects any metallic particles present in the transmission fluid.

A fluid filter is located inside the fluid pan. If the transmission fluid becomes contaminated or after any service work, the fluid pan with integral filter must be replaced.

CAUTION: Take care when removing the fluid pan and/or replacing the Mechatronic valve block that neither the fluid pan gasket or the mating face on the transmission casing is damaged or leakage may occur. Do not use metal tools to prise the fluid pan from the transmission casing. Take care when positioning a new mechatronic unit to ensure it does not contact the casing face.

The integral bell housing provides protection for the torque converter assembly and also provides the attachment for the gearbox to the engine cylinder block. The torque converter is a non-serviceable assembly which also contains the lock-up clutch mechanism. The torque converter drives a crescent type pump via drive tangs. The fluid pump is located in the main case, behind the torque converter.

The main case contains the following major components:

- Input shaft
- Output shaft
- Mechatronic valve block which contains the solenoids, speed sensors and the TCM
- Three rotating multiplate drive clutches
- Two fixed multiplate brake clutches
- A single planetary gear train and a double planetary gear train.

The torque converter is the coupling element between the engine and the gearbox and is located in the transmission housing, on the engine side of the transmission. The driven power from the engine crankshaft is transmitted hydraulically and mechanically through the torque converter to the transmission. The torque converter is connected to the engine by a drive plate.

The torque converter comprises an impeller, a stator and a turbine. The torque converter is a sealed unit with all components located between the converter housing cover and the impeller. The two components are welded together to form a sealed, fluid filled housing. With the impeller welded to the converter housing cover, the impeller is therefore driven at engine crankshaft speed.

The converter housing cover has threaded bosses which provide for attachment of the engine drive plate which is connected to the engine crankshaft. The threaded bosses also provide for location of special tools which are required to remove the torque converter from the bell housing.

The torque converter used on TdV6 models is similar in construction to the torque converter on petrol models but contains a torsional vibration damper. The damper smooths the output from the engine and prevents unwanted vibration from being passed to the transmission.

Impeller

Fluid Flow

- NOTE: Typical torque converter shown

E42397

Item	Part Number	Description
1	-	Turbine
2	-	Stator
3	-	Impeller

When the engine is running the rotating impeller acts as a centrifugal pump, picking up fluid at its centre and discharging it at high velocity through the blades on its outer rim. The design and shape of the blades and the curve of the impeller body cause the fluid to rotate in a clockwise direction as it leaves the impeller. This rotation improves the efficiency of the fluid as it contacts the outer row of blades on the turbine.

The centrifugal force of the fluid leaving the blades of the impeller is passed to the curved inner surface of the turbine via the tip of the blades. The velocity and clockwise rotation of the fluid causes the turbine to rotate.

Turbine

The turbine is similar in design to the impeller with a continuous row of blades. Fluid from the impeller enters the turbine through the tip of the blades and is directed around the curved body of the turbine to the root of the blades. The curved surface redirects the fluid back in the opposite direction to which it entered the turbine, effectively increasing the turning force applied to the turbine from the impeller. This principle is known as torque multiplication.

When engine speed increases, turbine speed also increases. The fluid leaving the inner row of the turbine blades is rotated in an anti-clockwise direction due to the curve of the turbine and the shape of the blades. The fluid is now flowing in the opposite direction to the engine rotation and therefore the impeller. If the fluid was allowed to hit the impeller in this condition, it would have the effect of applying a brake to the impeller, eliminating the torque multiplication effect. To prevent this, the stator is located between the impeller and the turbine.

Stator

The stator is located on the splined transmission input shaft via a freewheel clutch. The stator comprises a number of blades which are aligned in an opposite direction to those of the impeller and turbine. The main function of the stator is to redirect the returning fluid from the turbine, changing its direction to that of the impeller.

The redirected fluid from the stator is directed at the inner row of blades of the impeller, assisting the engine in turning the impeller. This sequence increases the force of the fluid emitted from the impeller and thereby increases the torque multiplication effect of the torque converter.

Stator Functions

- NOTE: Typical stator shown

E 42398

Item	Part Number	Description
1	-	Blades
2	-	Stator held – fluid flow redirected
3	-	Stator rotates freely
4	-	Roller
5	-	Converter at coupling speed
6	-	Fluid flow from turbine
7	-	Converter multiplying
8	-	Fluid flow from impeller
9	-	Drive from engine
10	-	Impeller
11	-	Stator
12	-	Turbine
13	-	Output to transmission

Refer to the 'Stator Functions' illustration

Fluid emitted from the impeller acts on the turbine. If the turbine is rotating at a slower speed than the fluid from the impeller, the fluid will be deflected by the turbine blades in the path 'A'. The fluid is directed at and deflected by the stator blades from path 'B' to path 'C'. This ensures that the fluid is directed back to the pump in the optimum direction. In this condition the sprag clutch is engaged and the force of the fluid on the stator blades assists the engine in rotating the impeller

As the rotational speed of the engine and therefore the turbine increases, the direction of the fluid leaving the turbine changes to path 'D'. The fluid is now directed from the turbine to the opposite side of the stator blades, rotating the stator in the opposite direction. To prevent the stator from resisting the smooth flow of the fluid from the turbine, the sprag clutch releases, allowing the stator to rotate freely on its shaft.

When the stator becomes inactive, the torque converter no longer multiplies the engine torque. When the torque converter reaches this operational condition it ceases to multiply the engine torque and acts solely as a fluid coupling, with the impeller and the turbine rotating at approximately the same speed.

The stator uses a sprag type, one way, freewheel clutch. When the stator is rotated in a clockwise direction the sprags twist and are wedged between the inner and outer races. In this condition the sprags transfer the rotation of the outer race to the inner race which rotates at the same speed.

One Way Free Wheel Clutch – Typical

E 42712

Item	Part Number	Description
1	-	Sprags
2	-	Inner race
3	-	Outer race
4	-	Sprag and cage assembly
5	-	Sprag outer race
6	-	Sprag inner race
7	-	Retaining ring

The free wheel clutch can perform three functions; hold the stator stationary, drive the stator and free wheel allowing the stator to rotate without a drive output. The free wheel clutch used in the 6HP26 transmission is of the sprag type and comprises an inner and outer race and a sprag and cage assembly. The inner and outer races are pressed into their related components with which they rotate. The sprag and cage assembly is located between the inner and outer races.

The sprags are located in a cage which is a spring which holds the sprags in the 'wedge' direction and maintains them in contact with the inner and outer races.

Referring to the illustration, the sprags are designed so that the dimension 'B' is larger than the distance between the inner and outer race bearing surfaces. When the outer race rotates in a clockwise direction, the sprags twist and the edges across the dimension 'B' wedge between the races, providing a positive drive through each sprag to the inner race. The dimension 'A' is smaller than the distance between the inner and outer race bearing surfaces. When the outer race rotates in an anti-clockwise direction, the dimension 'A' is too small to allow the sprags to wedge between the races, allowing the outer race to rotate freely.

On the illustration shown, when the outer race is rotated in a clockwise direction, the sprags twist and are 'wedged' between the inner and outer races. The sprags then transfer the rotation of the outer race to the inner race, which rotates at the same speed.

Lock-Up Clutch Mechanism

The Torque Converter Clutch (TCC) is hydraulically controlled by an electronic pressure regulating solenoid (EPRS6) which is controlled by the TCM. This allows the torque converter to have three states of operation as follows:

- Fully engaged
- Controlled slip variable engagement
- Fully disengaged

The TCC is controlled by two hydraulic spool valves located in the valve block. These valves are actuated by pilot pressure supplied via a solenoid valve which is also located in the valve block. The solenoid valve is operated by PWM signals from the TCM to give full, partial or no lock-up of the torque converter.

E 42399

Item	Part Number	Description
A	-	Unlocked condition
B	-	Locked condition
1	-	Clutch plate
2	-	Clutch piston
3	-	Torque converter body
4	-	Turbine
5	-	Impeller
6	-	Stator
7	-	Piston chamber
8	-	Turbine chamber

The lock-up clutch is a hydro-mechanical device which eliminates torque converter slip, improving fuel consumption. The engagement and disengagement is controlled by the TCM to allow a certain amount of controlled 'slip'. This allows a small difference in the rotational speeds of the impeller and the turbine which results in improved shift quality. The lock-up clutch comprises a piston and a clutch friction plate.

In the unlocked condition, the oil pressure supplied to the piston chamber and the turbine chamber is equal. Pressurised fluid flows through a drilling in the turbine shaft and through the piston chamber to the turbine chamber. In this condition the clutch plate is held away from the torque converter body and torque converter slip is permitted.

In the locked condition, the TCC spool valves are actuated by the electronic pressure regulating solenoid (EPRS6). The fluid flow in the unlocked condition is reversed and the piston chamber is vented. Pressurised fluid is directed into the turbine chamber and is applied to the clutch piston. The piston moves with the pressure and pushes the clutch plate against the torque converter body. As the pressure increases, the friction between the clutch plate and the body increases, finally resulting in full lock-up of the clutch plate with the body. In this condition there is direct mechanical drive from the engine crankshaft to the transmission planetary gear train.

FLUID PUMP

The fluid pump is an integral part of the transmission. The fluid pump is used to supply hydraulic pressure for the operation of the control valves and clutches and also to pass the fluid through the transmission cooler.

The 6HP26 fluid pump is a crescent type pump and is located between the intermediate plate and the torque converter. The pump has a delivery rate of 16cm³ per revolution.

E42400

Item	Part Number	Description
1	-	Securing ring
2	-	Shaft oil seal
3	-	O-ring seal
4	-	Pump housing
5	-	Ring gear
6	-	Crescent spacer
7	-	Roller bearing
8	-	Impeller
9	-	Centring pin
10	-	Spring washer
11	-	Outlet port (high pressure)
12	-	Inlet port (low pressure)

The pump comprises a housing, a crescent spacer, an impeller and a ring gear. The housing has inlet and outlet ports to direct flow and is located in the intermediate plate by a centring pin. The pump action is achieved by the impeller, ring gear and crescent spacer.

The crescent spacer is fixed in its position by a pin and is located between the ring gear and the impeller. The impeller is driven by drive from the torque converter which is located on a needle roller bearing in the pump housing. The impeller teeth mesh with those of the ring gear. When the impeller is rotated, the motion is transferred to the ring gear which rotates in the same direction.

The rotational motion of the ring gear and the impeller collects fluid from the intake port in the spaces between the teeth. When the teeth reach the crescent spacer, the oil is trapped in the spaces between the teeth and is carried with the rotation of the gears. The spacer tapers near the outlet port. This reduces the space between the gear teeth causing a build up of fluid pressure as the oil reaches the outlet port. When the teeth pass the end of the spacer the pressurised fluid is passed to the outlet port.

The fluid emerging from the outlet port is passed through the fluid pressure control valve. At high operating speeds the pressure control valve maintains the output pressure to the gearbox at a predetermined maximum level. Excess fluid is relieved from the pressure control valve and is directed, via the main pressure valve in the valve block, back to the pump inlet port. This provides a pressurised feed to the pump inlet which prevents cavitation and reduces pump noise.

MECHATRONIC VALVE BLOCK

The Mechatronic valve block is located in the bottom of the transmission and is covered by the fluid pan. The valve block houses the TCM, electrical actuators, speed sensors and control valves which provide all electro-hydraulic control for all transmission functions. The Mechatronic valve block comprises the following components:

- TCM
- Six pressure regulator solenoids
- One shift control solenoid
- One damper
- Twenty one hydraulic spool valves
- Manually operated selector valve
- Temperature sensor

- Turbine speed sensor
- Output shaft speed sensor.

A radio interference suppressor is located on a bracket on the right hand side of the transmission, forward of the selector shaft lever. The suppressor is connected into the transmission wiring harness and prevents solenoid operating noise affecting the audio system.

Electronic Pressure Regulator Solenoids (EPRS)

E42713

Six Electronic Pressure Regulator Solenoids (EPRS) are located in the valve block. The solenoids are controlled by Pulse width Modulation (PWM) signals from the TCM. The solenoids convert the electrical signals into hydraulic control pressure proportional to the signal to actuate the spool valves for precise transmission operation.

The following table shows EPRS and their associated functions:

EPRS	Function
1	Clutch A
2	Clutch B
3	Clutch C
4	Brake clutches D and E
5	System pressure control
6	Torque converter lock-up control

Solenoids EPRS 1, 3 and 6 supply a lower control pressure as the signal amperage increases and can be identified by a black connector cap. The TCM operates the solenoids using PWM signals. The TCM monitors engine load and clutch slip and varies the solenoid duty cycle accordingly. The solenoids have a 12V operating voltage and a pressure range of 0 - 4.6 bar (0 - 67 lbf.in²).

Solenoids EPRS 2, 4 and 5 supply a higher control pressure as the signal amperage increases and can be identified by a green connector cap. The solenoids are normally open, regulating flow solenoid valves. The TCM operates the solenoids using a PWM earth proportional to the required increasing or decreasing clutch pressures. The solenoids have a 12V operating voltage and a pressure range of 4.6 - 0 bar (67 - 0 lbf.in²).

The resistance of the coil winding for the EPRS solenoids is 5.05 ohms at 20°C (68°F).

Control Solenoid

E42714

A shift control Solenoid Valve (SV) is located in the valve block. The solenoid is controlled by the TCM and converts electrical signals into hydraulic control signals to control clutch application.

The shift control solenoid is an open/closed, on/off solenoid which is controlled by the TCM switching the solenoid to earth. The TCM also supplies power to the solenoid. The TCM energises the solenoid in a programmed sequence for clutch application for gear ratio changes and shift control.

The resistance of the solenoid coil winding for solenoid is between 26 to 30.4 ohms at 20°C (68°F).

Sensors

Speed Sensors

The turbine speed sensor and the output shaft speed sensor are Hall effect type sensors located in the Mechatronic valve block and are not serviceable items. The TCM monitors the signals from each sensor to determine the input (turbine) speed and the output shaft speed.

The turbine speed is monitored by the TCM to calculate the slip of the torque converter clutch and internal clutch slip. This signal allows the TCM to accurately control the slip timing during shifts and adjust clutch application or release pressure for overlap shift control.

The output shaft speed is monitored by the TCM and compared to engine speed signals received on the CAN bus from the ECM. Using a comparison of the two signals the TCM calculates the transmission slip ratio for plausibility and maintains adaptive pressure control.

Temperature Sensor

The temperature sensor is also located in the Mechatronic valve block. The TCM uses the temperature sensor signals to determine the temperature of the transmission fluid. These signals are used by the TCM to control the transmission operation to promote faster warm-up in cold conditions or to assist with fluid cooling by controlling the transmission operation when high fluid temperatures are experienced. If the sensor fails, the TCM will use a default value and a fault code will be stored in the TCM.

Damper

There is one damper located in the valve housing. The damper is used to regulate and dampen the regulated pressure supplied via EPRS 5. The damper is load dependent through modulation of the damper against return spring pressure.

The damper comprises a piston, a housing bore and a spring. The piston is subject to the pressure applied by the spring. The bore has a connecting port to the function to which it applies. Fluid pressure applied to the applicable component (i.e. a clutch) is also subjected to the full area of the piston, which moves against the opposing force applied by the spring. The movement of the piston creates an action similar to a shock absorber, momentarily delaying the build up of pressure in the circuit. This results in a more gradual application of clutches improving shift quality.

Spool Valves

The valve block contains twenty one spool valves which control various functions of the transmission. The spool valves are of conventional design and are operated by fluid pressure.

Each spool valve is located in its spool bore and held in a default (unpressurised) position by a spring. The spool bore has a number of ports which allow fluid to flow to other valves and clutches to enable transmission operation. Each spool has a piston which is waisted to allow fluid to be diverted into the applicable ports when the valve is operated.

When fluid pressure moves a spool, one or more ports in the spool bore are covered or uncovered. Fluid is prevented from flowing or is allowed to flow around the applicable waisted area of the spool and into another uncovered port. The fluid is either passed through galleries to actuate another spool, operate a clutch or is returned to the fluid pan.

DRIVE CLUTCHES

Multiplate Drive or Brake Clutch – Typical

E42715

Item	Part Number	Description
1	-	Input shaft
2	-	Main pressure supply port
3	-	Piston
4	-	Cylinder – External plate carrier
5	-	Clutch plate assembly
6	-	Baffle plate
7	-	Diaphragm spring
8	-	Output shaft
9	-	Bearing

10	-	Dynamic pressure equalisation chamber
11	-	Piston chamber
12	-	Lubrication channel

There are three drive clutches and two brake clutches used in the 6HP26 transmission. Each clutch comprises one or more friction plates dependent on the output controlled. A typical clutch consists of a number of steel outer plates and inner plates with friction material bonded to each face.

The clutch plates are held apart mechanically by a diaphragm spring and hydraulically by dynamic pressure. The pressure is derived from a lubrication channel which supplies fluid to the bearings etc. The fluid is passed via a drilling in the output shaft into the chamber between the baffle plate and the piston. To prevent inadvertent clutch application due to pressure build up produced by centrifugal force, the fluid in the dynamic pressure equalisation chamber overcomes any pressure in the piston chamber and holds the piston off the clutch plate assembly.

When clutch application is required, main pressure from the fluid pump is applied to the piston chamber from the supply port. This main pressure overcomes the low pressure fluid present in the dynamic pressure equalisation chamber. The piston moves, against the pressure applied by the diaphragm spring, and compresses the clutch plate assembly. When the main pressure falls, the diaphragm spring pushes the piston away from the clutch plate assembly, disengaging the clutch.

PLANETARY GEAR TRAINS

The planetary gear trains used on the 6HP26 transmission comprise a single web planetary gear train and a double web planetary gear train. These gear trains are known as Lepelletier type gear trains and together produce the six forward gears and the one reverse gear.

Single Web Planetary Gear Train

The single web planetary gear train comprises:

- One sunwheel
- Three planetary gears
- One planetary gear carrier
- One ring gear or annulus

E42716

Item	Part Number	Description
1	-	Cylinder
2	-	Baffle plate
3	-	Ring gear
4	-	Planetary gear carrier
5	-	Planetary gear spider
6	-	Torque converter input shaft

Double Web Planetary Gear Train

E42717

Item	Part Number	Description
1	-	Planetary gear spider
2	-	Planetary gears (short)
3	-	Ring gear
4	-	Output shaft
5	-	Planetary gear
6	-	Sunwheel
7	-	Double planetary gears (long)
8	-	Sunwheel

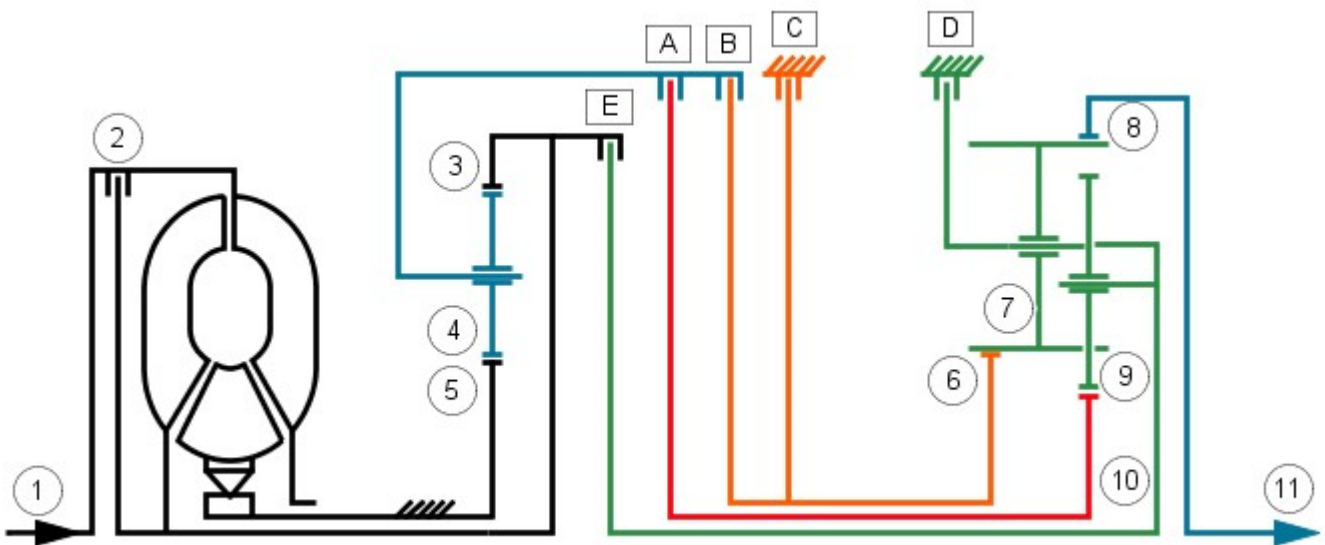

The double planetary gear train comprises:

- Two sunwheels
- Three short planetary gears
- Three long planetary gears
- One planetary gear carrier
- One ring gear or annulus

POWER FLOWS

Operation of the transmission is controlled by the TCM which electrically activates various solenoids to control the transmission gear selection. The sequence of solenoid activation is based on programmed information in the module memory and physical transmission operating conditions such as vehicle speed, throttle position, engine load and selector lever position.

Powerflow Schematic

E42718

Item	Part Number	Description
1	-	Torque input from engine

19	-	Single web planetary gear carrier
20	-	Sunwheel 1

The shift elements are three rotating multiplate clutches (A, B and E) and two fixed multiplate brakes © and D). All shifts from 1st to 6th gears are power-on overlapping shifts. Overlapping shifts can be described as one of the clutches continuing to transmit drive at a lower main pressure until the next required clutch is able to accept the input torque.

The shift elements, clutches and brakes are actuated hydraulically. Fluid pressure is applied to the required clutch and/or brake, pressing the plates together and allowing drive to be transmitted through the plates. The purpose of the shift elements is to perform power-on shifts with no interruption to traction and smooth transition between gear ratios.

Power Flow 1st Gear

The gear selector lever and the manual selector valve spool are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

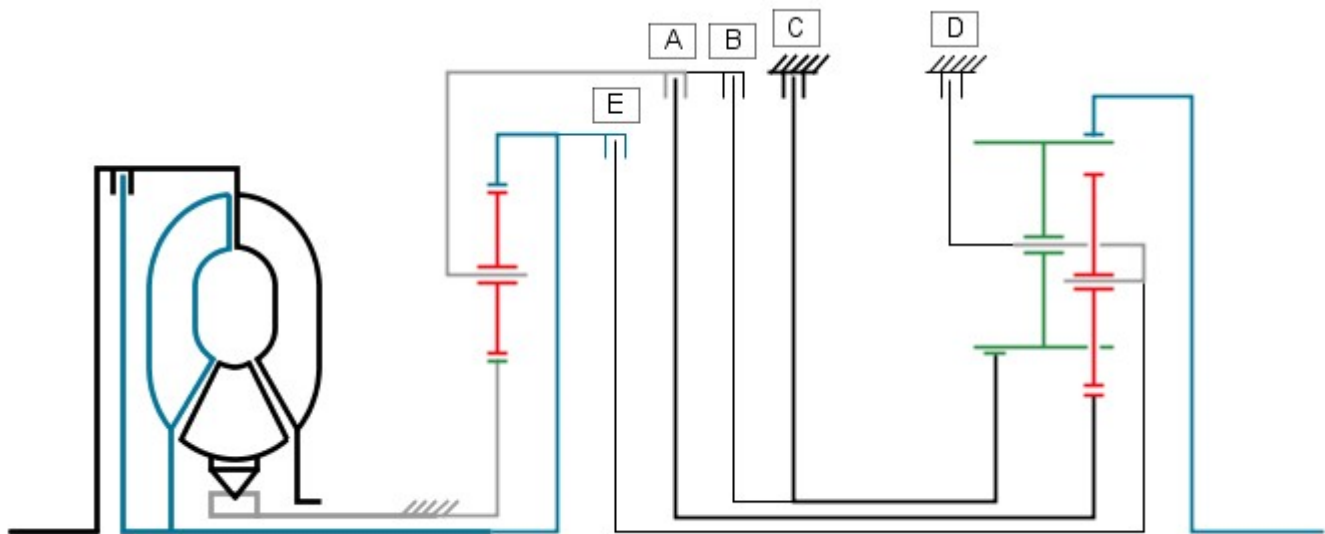

The double web planetary gear train is locked against the transmission housing by brake 'D'. This allows ring gear 2 (output shaft) to be driven in the same direction as the engine via the long planetary gears.

• NOTE: Refer to 'Shift Elements' illustration for key

E42721

Power Flow 2nd Gear

E42722

The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

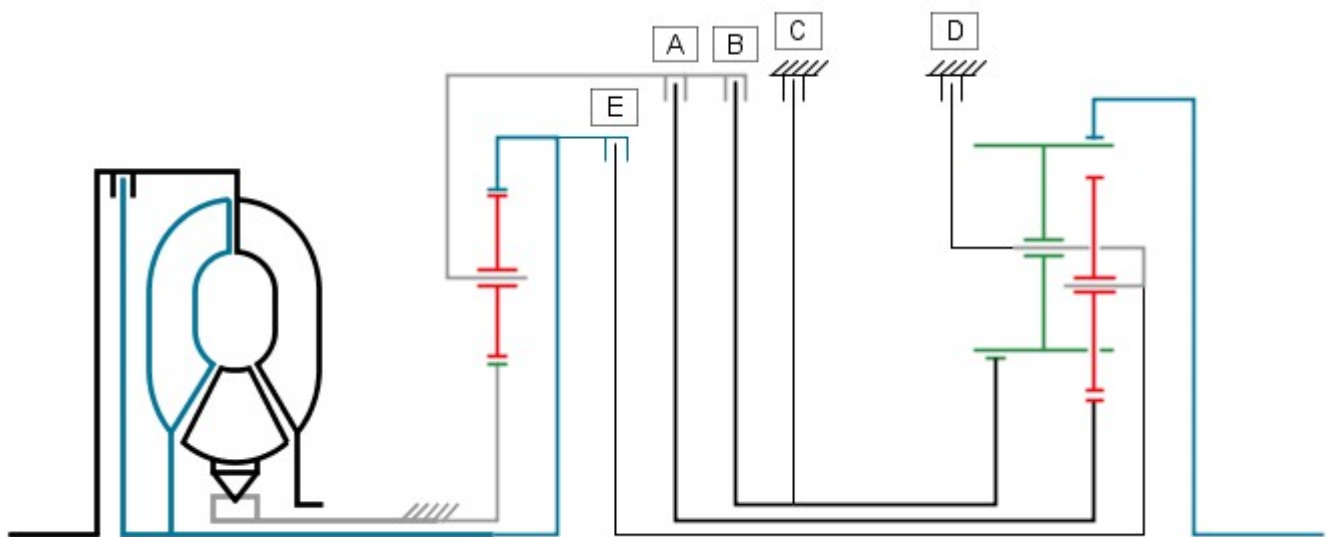

Sunwheel 2 is locked to the transmission housing by brake clutch 'C'. The long planetary gears, which are also meshed with the short planetary gears, roll around the fixed sunwheel 2 and transmit drive to the double web planetary gear train carrier and ring gear 2 in the direction of engine rotation.

• NOTE: Refer to 'Shift Elements' illustration for key

E42723

Power Flow 3rd Gear

E 42724

The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

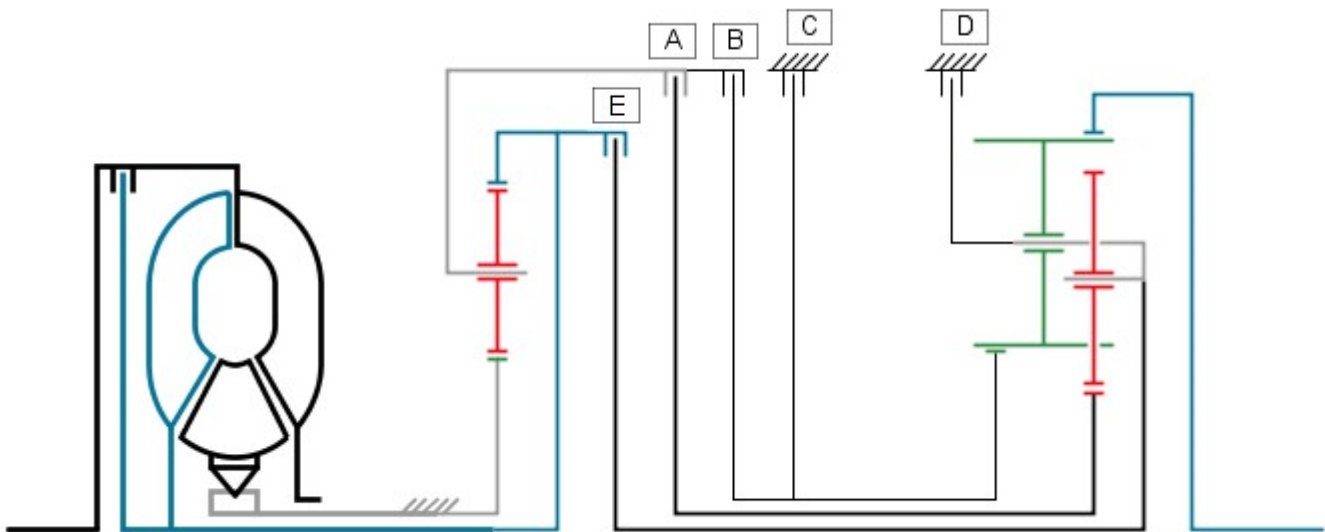

Sunwheel 2 is driven via clutch 'B' which is engaged. The long planetary gears, which are also meshed with the short planetary gears, cannot roll around the fixed sunwheel 2 and transmit drive to the locked double web planetary gear train carrier in the direction of engine rotation.

• NOTE: Refer to 'Shift Elements' illustration for key

E42725

Power Flow 4th Gear

E42726

The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

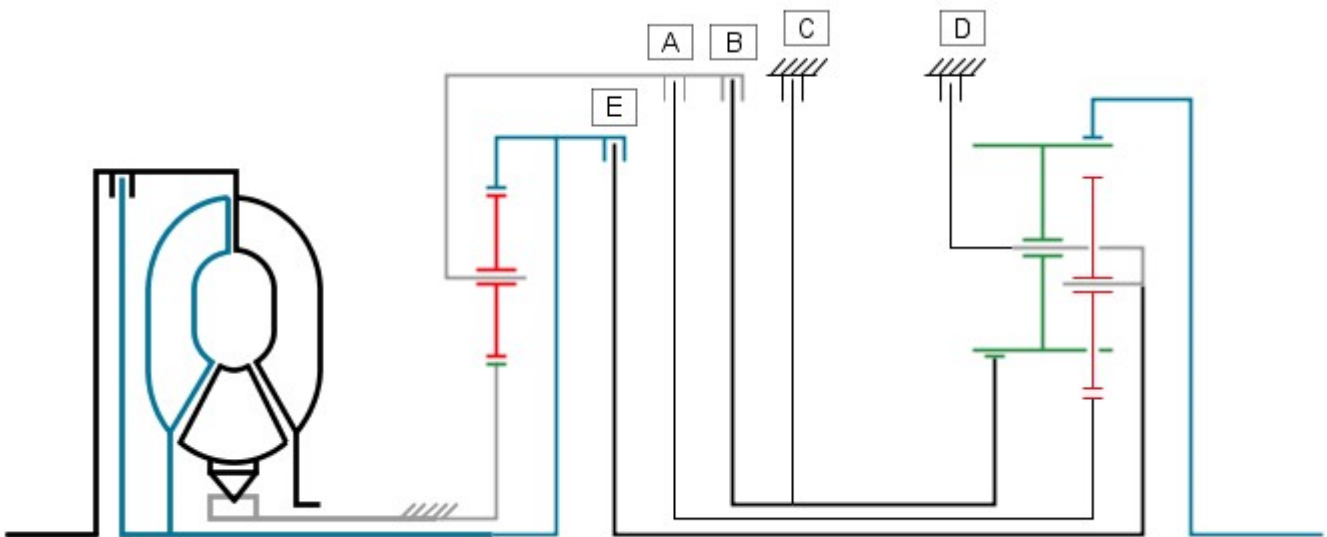

The double web planetary gear carrier is driven via clutch 'E' which is engaged. The long planetary gears, which are also meshed with the short planetary gears, and the double web planetary gear carrier, drive ring gear 2 in the direction of engine rotation.

• NOTE: Refer to 'Shift Elements' illustration for key

E42727

Power Flow 5th Gear

E42728

The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

The long planetary gears, which are also meshed with the short planetary gears, and the double web planetary gear carrier, drive ring gear 2 in the direction of engine rotation.

• NOTE: Refer to 'Shift Elements' illustration for key

E42729

Power Flow 6th Gear

E42730

The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Clutches 'A' and 'B' are released, removing the effect of the single web planetary gear train.

Clutch brake 'C' is applied which locks sunwheel 2 to the transmission housing.

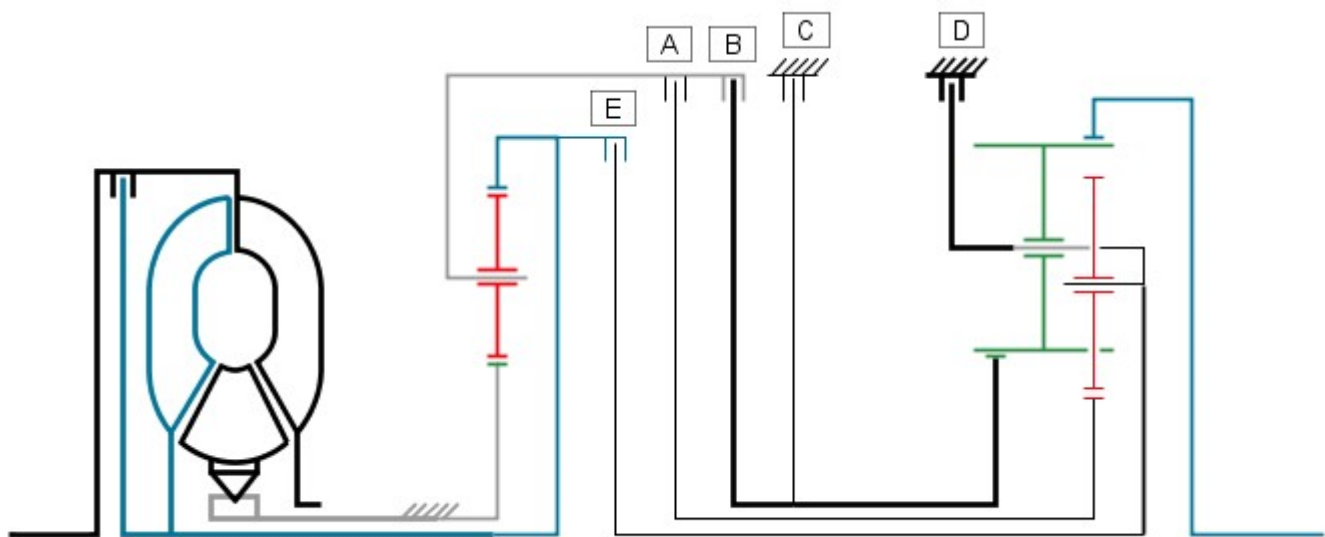

Clutch 'E' is engaged and drives the double web planetary gear carrier. This causes the long planetary gears to rotate around the fixed sunwheel 2 and transmit drive to ring gear 2 which is driven in the direction of engine rotation.

• NOTE: Refer to 'Shift Elements' illustration for key

E42731

Power Flow Reverse Gear

E42732

The gear selector lever and the manual selector spool valve are in the 'R' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears of the single web planetary gear train which rotate around the fixed sunwheel 1. This transmits the drive to the single web planetary gear carrier, the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

With clutch 'B' applied, sunwheel 2 in the double web planetary gear train is driven and meshes with the long planetary gears.

The double web planetary gear carrier is locked to the transmission housing by brake clutch 'D'. This allows ring gear 2 to be driven in the opposite direction to engine rotation by the long planetary gears.

• NOTE: Refer to 'Shift Elements' illustration for key

E42733

SELECTOR POSITION SWITCH

The Mechatronic valve block contains a position switch which is mechanically connected to the selector spool valve. The selector spool valve is connected by a selector shaft to the selector lever via a 'Bowden' selector cable.

The signals from the position switch are used by the TCM to determine the P, R, N or D selection made by the driver.

FLUID COOLING

The transmission fluid cooler is an integral part of the engine cooling radiator. The transmission is connected to the fluid cooler via flexible hoses and metal pipes.

- NOTE: 4.0L V6 Petrol shown, 4.4L V8 and TdV6 similar

E42898

Item	Part Number	Description
1	-	Transmission cooler
2	-	Return pipe (To transmission)
3	-	Feed pipe (From transmission)

The transmission cooler is integrated into the left hand end tank of the engine cooling radiator. The transmission fluid is cooled by the temperature differential between the transmission fluid and the engine coolant and also by airflow over cooling fins on the end tank.

Fluid is supplied from the transmission fluid pump into the lower connection of the cooler. After passing through the cooler, the fluid passes out of the upper connection and is returned to transmission fluid pan.

GEAR SELECTOR LEVER ASSEMBLY

E42734

Item	Part Number	Description
1	-	Selector lever
2	-	Finisher
3	-	PRND display
4	-	M/S display
5	-	Switch pack and finisher
6	-	Shutter
7	-	Selector assembly
8	-	Interlock emergency release lever
9	-	Mounting plate
10	-	Seal

11	-	Selector cable
----	---	----------------

The gear selector lever assembly is located in a central position on the transmission tunnel, between the front driver and passenger seats and is secured to the transmission tunnel closure plate. The selector lever comprises a moulded plastic housing which provides for the location of the selector components.

The lever is connected to a crosspiece which allows for the selection of P, R, N, D in a forward or backward direction and selection between automatic and manual/sport mode in a left/right transverse direction.

When manual/sport mode is selected the lever can be moved in a forward or backward direction to select + or - for manual (CommandShift™) operation. If left in Sport mode all gear changes are performed automatically.

If Manual (CommandShift™) mode is selected, all gear changes are based on inputs received by the TCM from the manual +/- hall effect sensors located on the PCB.

The selector lever mechanism houses the following components:

- Electronic Printed Circuit Board (PCB)
- Shift Interlock solenoid
- Park and Neutral locking levers.

There are four selector lever positions and two additional positions for manual/sport operation:

- P (Park) - Prevents the vehicle from moving by locking the transmission
- R (Reverse) - Select only when the vehicle is stationary and the engine is at idle
- N (Neutral) - No torque transmitted to drive wheels
- D (Drive) - This position uses all six forward gears in high and low ranges
- M/S (Sport Mode) - This position uses all forward gears in 'D' but will upshift at higher engine speeds to improve acceleration
- + and - (Manual 'CommandShift™' mode) - Movement of the selector lever in the +/- positions, when the lever is in the M/S position, will operate the transmission in manual (CommandShift™) mode allowing the driver to manually select all six forward gears

The selector lever position is displayed to the driver on the selector position LED display and in the instrument cluster. In 'CommandShift™' mode, if a gear is selected but the TCM logic prevents selection of that gear, the requested gear will be initially displayed. The TCM will engage the next allowed gear and then display that gear.

Sport/Manual +/- CommandShift™ Switch

The PCB contains the hall effect sensors to activate the sport/manual mode and also the sensors which provide the +/- signals. When the selector lever is moved to the manual/sport position, the lower magnet located in the selector lever is moved within proximity of the M/S hall effect sensor on the PCB. This provides the momentary signal which is received by the TCM, which in turn initiates sport mode.

When the lever is moved to the + or - position, the magnet is moved within proximity of one of the hall effect sensors positioned either side of the M/S hall effect sensor. When an input from either the + or - sensors is received, manual CommandShift™ mode will be initiated. In this position a spring will move the selector lever back to the centre position when released. To leave the CommandShift™ mode, return the lever to the 'D' position.

Selector Position LED Display

The P, R, N, D LED display is located on the right hand side of the selector lever and the M/S (MANUAL/SPORT) +/- LED display is located on the left hand side of the selector lever. Each LED display is connected via a separate harness to the selector lever position switch. When the lever is moved to the required position, the switch contact for that position is made and the LED is illuminated.

P, R, N, D Position Switch

The P, R, N, D position switch is located within the Mechatronic valve block in the transmission. The switch is operated by movement of the selector lever to the P, R, N or D positions via the Bowden cable which is connected between the selector lever and the transmission selector shaft.

The switch is electrically connected to the TCM which outputs a common power supply to each of the four switch contacts. This power supply is also used by the two speed sensors and the fluid temperature sensor. Each of the four switch contacts have a separate feed input to the TCM which can detect which selector lever position has been selected.

Shift Interlock Solenoid

The shift interlock solenoid is located on the side of the selector lever assembly. The solenoid operates two locking levers which engage in the lower lever and lock it in the Park (P) and Neutral (N) positions. When the ignition is on or the engine is running, the solenoid is de-energised and prevents the lever from moving.

When energised, by the depression of the footbrake, the solenoid is energised and the selector lever may be moved from the P position. If the selector lever is left in the N position for more than 800m/s the solenoid will be energised and the selector lever will become locked in the N position. To move the selector lever from the N position in this condition the footbrake must be applied. This prevents the selector lever from being moved to the 'D' or 'R' position unintentionally and the application of the brakes also prevents the vehicle 'creeping' when the gear is engaged.

Movement of the selector lever from the 'P' or 'N' positions is also prevented if the TCM senses the engine speed is above 2500 rev/min, even if the brake pedal is depressed.

In the event of an electrical failure of the vehicle or failure of the interlock solenoid or its associated wiring, it is possible to move the selector lever from the Park 'P' position by removing the coin tray on left hand drive vehicles or the trim panel behind the park brake switch on right hand drive vehicles and lifting the white coloured tab on the rear of the selector lever assembly. Whilst holding the tab in this position move the selector lever from the 'P' position.

The selector lever will also be locked in the N position during the transfer box changing range from high to low or vice

versa.

Selector Cable

A selector cable is used as a mechanical connection between the selector lever and the transmission. The cable is a Bowden type cable which is connected to the selector lever. Movement of the lever in the P, R, N or D positions moves the cable. Movement of the cable is prevented when the selector lever is in the Manual/Sport position.

The cable is passed through a sealing grommet in the floorpan and is attached to a bracket on the transmission. The inner cable is connected to a lever which is positively attached to the transmission selector shaft.

Movement of the selector lever in the P, R, N or D positions moves the inner cable which in turn moves the lever. The lever transforms the linear movement of the cable into rotary movement of the selector shaft. The rotation of the shaft moves the position switch located within the Mechatronic valve block and also moves the manual spool valve to the applicable position.

Inputs and Outputs

Connector C2658

E42931

The following table shows the connector pin details for the connector on the selector lever assembly.

Pin No.	Description	Input/Output
1	Ground	-
2	Park lock confirmation	Input
3	Ground	-
4	Sport/Manual switch	Output
5	CommandShift™ + (up shift)	Output
6	CommandShift™ - (down shift)	Output
7	Ignition position II supply 12V	Input
8	Permanent power supply 12V	Input
9	Shift Interlock solenoid +	Input
10	Shift Interlock solenoid -	Input
11	Selector indicator PARK LED	Output
12	Selector indicator REVERSE LED	Output
13	Selector indicator NEUTRAL LED	Output
14	Selector indicator DRIVE LED	Output
15	Selector indicator SPORT/MANUAL LED	Output
16	Selector indicator backlight	Output - PWM
17 - 18	Not used	-

INSTRUMENT CLUSTER

E42905

Item	Part Number	Description
1	-	Malfunction Indicator Lamp (MIL)
2	-	Message centre
3	-	Selector lever position indicator
4	-	Mode display

The instrument cluster is connected to the TCM via the high speed CAN bus. Transmission status is transmitted by the TCM and displayed to the driver in one of two displays in the instrument cluster. For additional information, refer to: Instrument Cluster (413-01, Description and Operation).

Malfunction Indicator Lamp (MIL)

The MIL is located in the tachometer in the instrument cluster. Transmission related faults which may affect the vehicle emissions output will illuminate the MIL.

The MIL is illuminated by the ECM on receipt of a relevant fault message from the TCM on the high speed CAN. The nature of the fault can be diagnosed using T4 which reads the fault codes stored in the TCM memory.

Transmission Status Display

The transmission status display is located in a Liquid Crystal Display (LCD) within the speedometer housing. The LCD shows the selector lever position and the selected transmission mode. When the selector lever is in the manual CommandShift™ position, the selector lever position display will show the selected gear ratio.

The following table shows the displays and their descriptions.

Symbol	Description
P	Park selected
R	Reverse selected
N	Neutral selected
D	Drive selected
1	1st gear selected (Manual CommandShift™ mode)
2	2nd gear selected (Manual CommandShift™ mode)
3	3rd gear selected (Manual CommandShift™ mode)
4	4th gear selected (Manual CommandShift™ mode)
5	5th gear selected (Manual CommandShift™ mode)
6	6th gear selected (Manual CommandShift™ mode)

Message Centre Display

The message centre is located in the lower centre of the instrument cluster. The message centre is a LCD to relay vehicle status and operating information to the driver. The message centre can display messages relating to a number of the vehicle systems. The following list shows the possible transmission related messages:

- TRANSMISSION FAULT LIMITED GEARS AVAILABLE
- TRANSMISSION FAULT AND OVERHEAT
- TRANSMISSION FAULT

- TRANSMISSION OVERHEAT

TRANSMISSION CONTROL MODULE (TCM)

The TCM is an integral part of the Mechatronic valve block which is located at the bottom of the transmission, behind the fluid pan. The TCM is the main controlling component of the transmission.

The TCM processes signals from the transmission speed and temperature sensors, engine control module and other vehicle systems. From the received signal inputs and pre-programmed data, the module calculates the correct gear, torque converter clutch setting and optimum pressure settings for gear shift and lock-up clutch control.

The TCM outputs signals to control the shift control solenoid valve and the Electronic Pressure Regulator Solenoids (EPRS) to control the hydraulic operation of the transmission.

The ECM supplies the engine management data on the high speed CAN bus system. The TCM requires engine data to efficiently control the transmission operation, for example; flywheel torque, engine speed, accelerator pedal angle, engine temperature etc.

The steering angle sensor and the ABS module also supply data to the TCM on the high speed CAN bus system. The TCM uses data from these systems to suspend gear changes when the vehicle is cornering and/or the ABS module is controlling braking or traction control.

The selector lever is connected to the automatic transmission and the position switch in the transmission by a Bowden cable. Movement of the selector lever moves the position switch via the Bowden cable and the switch position informs the TCM of the selected position. The sport/manual +/- CommandShift switch passes manual/sport selections to the TCM. An additional switch provides a selector lever in park position signal. Once the selector lever position is confirmed, the TCM outputs appropriate information which is received by the instrument cluster to display the gear selection information in the message centre.

The Mechatronic valve block also contains the speed and temperature sensors. These are integral with the Mechatronic valve block and cannot be serviced individually. The speed sensors measure the transmission input and output speeds and pass signals to the TCM. The fluid temperature sensor is also located in the valve block and measures the fluid temperature of the transmission fluid in the fluid pan.

The TCM is connected to the starter relay coil. When the selector lever is in PARK or NEUTRAL, the module provides a ground for the coil allowing the starter relay to be energised and allow starter motor operation. If the selector lever is in any other position, the module will not provide the ground preventing starter motor operation.

Inputs and Outputs

Connector C0193

E42922

The following table shows the connector pin details for the connector on the transmission.

Pin No.	Description	Input/Output
1	Manual/sport shift programme selection	Input
2	CAN low	Input/Output
3	Diagnostic ISO9141 K Line bus	Input/Output
4	CommandShift™ - (downshift)	Input
5	CommandShift™ + (upshift)	Input
6	CAN high	Input/Output
7	Shiftlock power supply	Output
8	Not used	-
9	Ignition position II supply 12V	Input
10	Park/Neutral signal (starter inhibit)	Input
11	Shiftlock ground	Output
12	Selector lever in park position confirmation signal	Input
13	Ground 1	-
14	Permanent power supply 12V	Input
15	Not used	-
16	Ground 2	-

DIAGNOSTICS

The diagnostic socket is located in the lower instrument panel closing panel, on the driver's side, below the steering

column.

The diagnostic socket allows the exchange of information between the various modules on the bus systems and T4 or a diagnostic tool using ISO14229 protocol. The information is communicated to the socket via the high speed CAN bus from the TCM. This allows the retrieval of diagnostic information and programming of certain functions using T4 or a suitable diagnostic tool.

The TCM uses a P code strategy which stores industry standard Diagnostic Trouble Codes (DTC) relating to faults.

P Code	Component/Signal	Fault Description
P012100	Kickdown	Signal not plausible
P021900	Stall speed/engine overspeed	Signal not plausible
P050000	Wheel speeds plausible signal	General fault type
P050100	Wheels speeds plausible signal	Signal not plausible
P056100	Power supply (battery)	General fault type
P056200	Power supply (battery)	Signal voltage too low
P056300	Power supply (battery)	Signal voltage too high
P060100	EPROM/FLASH Checksum	Signal not plausible
P060300	Battery buffered RAM	Signal not plausible
P060500	EPROM/FLASH Checksum after software verification	Signal not plausible
P061300	Watchdog locking mechanism	General fault type Signal not plausible Short circuit to power supply Short circuit to ground Circuit break Short circuit to ground or power break Signal voltage too high Signal voltage too low Function specific, see monitoring function
P061300	Micro controller components	General fault type No change in signal Function specific, see monitoring function
P062F00	EEPROM communication	General fault type
P064100	Sensor supply voltage	Signal voltage too high or too low
P065700	Power supply pressure regulators and solenoids	Signal not plausible Circuit break
P065800	Power supply pressure regulators and solenoids	Short circuit to ground
P065900	Power supply pressure regulators and solenoids	Short circuit to power supply
P066800	Micro processor chip temperature sensor	Signal voltage too low
P066900	Micro processor chip temperature sensor	Signal voltage too high
P070000	Combination of impossible substitute functions	General fault type Signal not plausible Signal voltage too high
P070500	Selector position switch	Signal not plausible
P071000	Transmission oil temperature	Circuit break
P071100	Transmission oil temperature	General fault type Signal voltage too high
P071200	Transmission oil temperature	Short circuit to ground
P071300	Transmission oil temperature	Short circuit to power supply
P071600	Transmission turbine speed sensor	Short circuit to ground or power break Signal voltage too high Signal voltage too low
P071700	Transmission turbine speed sensor	Short circuit to power supply
P072000	Transmission output shaft speed sensor	Short circuit to power supply Short circuit to ground or power break
P072100	Transmission output shaft speed sensor	Signal voltage too high Signal not plausible
P072100	Falling gradient on output speed	Signal not plausible
P072900	Gear ratio - 6th gear	Signal not plausible
P073000	Gear ratio symptom	Signal not plausible
P073100	Gear ratio - 1st gear	Signal not plausible
P073200	Gear ratio - 2nd gear	Signal not plausible
P073300	Gear ratio - 3rd gear	Signal not plausible
P073400	Gear ratio - 4th gear	Signal not plausible
P073500	Gear ratio - 5th gear	Signal not plausible
P073600	Gear ratio - reverse gear	Signal not plausible General fault type
P074000	EPRS 6	Circuit break
P074100	Torque converter clutch permanently open	General fault type

P276300	EPRS 6	Short circuit to power supply
P276400	EPRS 6	Short circuit to ground

CONTROLLER AREA NETWORK (CAN)

The high speed CAN broadcast bus network is used to connect the powertrain modules. The CAN bus is connected between the following electronic units:

High Speed CAN Bus

- TCM
- Instrument cluster
- Air suspension module
- Steering angle sensor
- Rear differential module
- Centre console switch pack
- Electric park brake module
- Restraints control module
- Engine Control Module (ECM)
- ABS control module
- Adaptive front lighting control module
- Transfer box control module
- Adaptive cruise control module

- Diagnostic socket.

The CAN bus allows a fast exchange of data between modules. The CAN bus comprises two wires which are identified as CAN high (H) and CAN low (L). The two wires are coloured yellow/black (H) and yellow/brown (L) and are twisted together to minimise electromagnetic interference (noise) produced by the CAN bus messages. For additional information, refer to: Communications Network (418-00, Description and Operation).

In the event of CAN bus failure, the following symptoms may be observed:

- Transmission operates in default mode
- Torque converter lock-up clutch control is disabled
- Gear position indication in instrument cluster message centre inoperative (this will also occur with any transmission fault).

DRIVING MODES

There are a number of different driving modes of operation. Some can be selected by the driver and some are automatically initiated by the TCM during driving:

- Normal mode
- Sport mode
- Manual (CommandShift™) mode
- Adaptive Shift Strategy (ASIS)
- Hill Descent Control (HDC) mode
- Cruise mode
- Hill mode
- Default (Limp home) mode
- Reverse lock-out mode
- Cooling strategy.
- Curve recognition mode
- Fast off recognition

Normal Mode

Normal mode is automatically selected by the TCM on power up. In this mode all automatic and adaptive modes are active. Normal mode uses gear shift and lock-up maps to allow for vehicle operation which offers fuel consumption and emissions or driveability depending on the driving style. If the transmission is operated in sport or manual mode and the selector lever is moved to the 'D' position, normal mode is automatically resumed.

Sport Mode

The sport mode operates in high range only and provides enhanced acceleration and responsiveness. In sport mode the TCM uses shift maps which allow the transmission to downshift more readily, hold gears for longer at higher engine speeds, and limits the transmission to the first five gears (6th gear is not used).

Sport mode is selected by moving the selector lever to the left into the 'M/S' position. When the sport mode is first selected, 'SPORT' is displayed in the message centre for 6 seconds and, if 6th gear is currently engaged, the TCM downshifts to 5th.

Manual (CommandShift™) Mode

Manual mode allows the transmission to operate as a semi-automatic 'CommandShift™' unit. The driver can change up and down the six forward gears with the freedom of a manual transmission.

Shift maps are provided for manual mode to protect the engine at high engine speeds. The TCM will automatically change up to a higher gear ratio to prevent engine overspeed and change down to a lower gear ratio to avoid engine labouring and stalling.

When kickdown is requested the TCM downshifts at least 2 gears.

When the vehicle is stationary, to drive off the driver can select 1st, 2nd or 3rd gear in low and high range. Any other gear selection will be rejected by the TCM.

When driving off, upshifts can be pre-selected by making + selections with the selector lever for the number of upshifts required. The TCM then automatically performs a corresponding number of upshifts when the appropriate shift points are reached. So, for example, when starting off in 1st gear, if three + selections are made in quick succession, the TCM will automatically change up through the box to 4th gear as the vehicle accelerates, without any further selections being made.

In manual mode a low gear can be selected to provide engine braking for descending a slope without HDC or continuous use of the brake pedal. The driver can prepare for the end of the descent by moving the selector lever to D. The TCM will maintain the low gear and only revert to automatic shift control when the throttle is opened and vehicle speed increases.

Adaptive Shift Strategy (ASIS)

The ASIS system is a new feature on automatic transmissions. With the TCM linked via the CAN bus to other vehicle systems, signals are received which can allow the TCM to calculate the way in which the vehicle is being driven. The type of signals include the following:

- Longitudinal and lateral acceleration
- Engine speed
- Engine torque
- Oil temperature
- Accelerator pedal position
- Wheel speed.

Using these signals, additional transmission control can be obtained. The TCM can calculate when the vehicle is cornering, all wheels are gripping, the driver is braking or if the driver is accelerating. This is the conventional 'Adaptive' transmission control. ASIS uses this system but adds the continuous adaptation of the gear changes to the individual driving style of the driver.

HDC Mode

The HDC mode assists the ABS module in controlling the downhill speed of the vehicle. When HDC is selected on, the ABS module selects the most appropriate gear for the descent, to maximise engine braking.

Cruise Mode

When speed control is activated, the TCM receives a cruise active message on the CAN bus. The TCM activates a speed control map which prevents locking and unlocking of the torque converter clutch and minimises up and down shifts.

Hill Mode

Hill mode is initiated by the TCM when the engine torque, via ECM signals on the CAN bus, exceeds the theoretical load curve for normal operation. The TCM monitors this signal to determine when the vehicle is travelling up or down a steep gradient.

In hill mode the TCM adopts one of four shift maps, three uphill and one downhill. The shift map chosen depends on the severity of the slope as determined from the engine signals and the appropriate gear is selected to assist with the ascent or descent.

Hill mode can also be initiated when the vehicle is at very high altitudes or ambient temperatures, and also when the vehicle is towing.

Default (Limp Home) Mode

If a transmission fault is detected by the TCM, the TCM adopts a limp home mode strategy. 'TRANS. FAILSAFE' is displayed in the message centre and, if the fault has an effect on engine emissions, the MIL will also be illuminated.

In default mode, P, R and N functions operate normally (if the fault allows these selections) and the TCM locks the transmission in 3rd or 5th gear to allow the driver to take the vehicle to the nearest dealer. The torque converter lock-up clutch is disabled and reverse lock-out will not function.

If the vehicle is stopped and subsequently restarted in the default mode condition, the TCM operates normally until the fault which caused the condition is detected again.

When limp home mode is active, the gear position indicator will show one of the following letters which defines the fault type:

- 'F' - transmission is operating in limp home mode
- 'H' - transmission has reached overheat threshold temperature and transmission is operating in limp home mode
- 'E' - CAN bus is off and transmission is operating in limp home mode.

If electrical power is lost and the transmission is operating in mechanical limp home mode, the selector lever will not be locked in the 'N' position by the shift interlock solenoid. The lever will be locked in the 'P' position and can only be released by using the interlock emergency release lever or by correcting the electrical fault.

Reverse Lock-Out Mode

When the vehicle is travelling forwards, selecting reverse could cause transmission damage. To protect against this, reverse gear is prohibited if the vehicle is travelling forwards at a road speed above 5 mph (8 km/h).

Cooling Strategy

The purpose of the cooling strategy is to reduce engine and transmission temperatures during high load conditions, when towing a trailer for example. Under these conditions the engine and transmission may generate excessive heat.

If the transmission fluid temperature increases to 125°C (257°F) or higher, the TCM employs the cooling strategy. The message 'TRANSMISSION OVERHEAT' is displayed in the message center.

The strategy uses a specific shift and torque converter lock-up clutch map. This map allows torque converter clutch lock-up and gear shifts to operate outside of their normal operation. This will reduce the engine speed and/or slip in the torque converter, therefore reducing heat generated by the engine and the transmission.

If the transmission fluid temperature increases to 137°C (278°F) or higher, the transmission will use the default (limp home mode). 'H' is displayed in the gear position indicator. If the temperature exceeds 140°C (284°F), CAN bus transmission is disabled and 'E' is displayed in the gear position indicator.

The cooling strategy is cancelled when the transmission fluid temperature decreases to less than 120°C (248°F) or below.

Curve Recognition

Curve recognition is activated when high levels of lateral acceleration and/or steering angle are detected via the ABS module and steering angle sensor signals on the CAN bus. When this condition is detected, the TCM prevents the transmission from changing to a higher gear to assist with cornering. When the vehicle completes its manoeuvre, the transmission will shift to the correct ratio.

Fast Off Recognition

Fast off recognition is activated when the TCM detects that the driver has backed off the accelerator pedal quickly in a 'change of mind' manoeuvre. This is detected by monitoring for a high level of negative pedal angle from the engine

control module signal on the CAN bus. If this condition is detected, the TCM holds the current gear ratio to allow the driver to complete his original action without the need for a downshift. The mode remains active for a predetermined time period or if the driving style remains passive.

Terrain Response™ Mode

If the vehicle has the Terrain Response system fitted, the following additional modes are available. For additional information, refer to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Description and Operation).

Grass/Gravel/Snow

When the driver selects the Terrain Response grass/gravel/snow special program with the transfer box in either high or low range, the TCM uses a specific set of shift and torque converter maps to optimise the delivery of torque to the wheels and to minimise wheel slip in these terrains. To assist with the vehicle moving from a standstill, the TCM automatically selects 2nd gear in high range and 3rd gear in low range. This special program is fully integrated with hill mode to enhance vehicle control during ascents and descents.

Mud/Ruts

When the driver selects the Terrain Response mud/ruts special program with the transfer box in either high or low range, the TCM uses a specific set of shift and torque converter maps to optimise vehicle traction in this terrain.

Sand

When the driver selects the Terrain Response sand special program with the transfer box in either high or low range, the TCM uses a specific set of shift and torque converter maps to optimise the tractive performance in sand by holding onto gears longer and downshifting more readily. This mode is fully integrated with the hill mode to further enhance performance during ascents.

Rock Crawl

When the driver selects the Terrain Response rock crawl special program, which is only available with the transfer box in low range, the TCM uses a specific shift map which maximises torque delivery at slow speeds associated with this type of terrain.

TRANSMISSION FAULT STATUS

If the TCM detects a fault with the transmission system, it will enter a default mode to prevent further damage to the transmission and allow the vehicle to be driven.

When a fault is detected a CAN message is sent from the TCM and is received by the instrument cluster. The instrument cluster illuminates the MIL and displays 'TRANS. FAILSAFE' in the message centre.

Some transmission faults may not illuminate the MIL or display a fault message, but the driver may notice a reduction in shift quality.

ENGINE SPEED AND TORQUE MONITORING

The ECM constantly supplies the TCM with information on engine speed and torque through messages on the CAN bus. The TCM uses this information to calculate the correct and appropriate timing of shift changes.

If the messages are not received by the ECM, the TCM will implement a back-up strategy to protect the transmission from damage and allow the vehicle to be driven.

In the event of an engine speed or torque signal failure, the transmission will adopt the electrical limp home mode with the transmission operating in a fixed gear.

TOWING FOR RECOVERY

The following procedure must be used to ensure that the vehicle is towed in a safe condition and damage to the vehicle transmission systems is prevented.

- Secure the towing attachment from the recovery vehicle to the towing eye of the vehicle to be recovered.
- Make sure that the hand brake is on. Turn the ignition key to the ignition position II.
- Apply the footbrake and move the automatic transmission selector lever to the neutral position. If electrical power is not available, use the manual interlock release tab on the selector lever to move the lever to the neutral position.
- Make sure that the ignition is in the auxiliary position I or, if the stop lamps and turn signal indicators are required, in the ignition position II.
- Make sure that the hand brake is released before the vehicle is towed.
- The vehicle can only be towed for a maximum of 31 miles (50 km) at a maximum speed of 30 mph (50 km/h). Towing the vehicle for longer distances and/or faster speeds will damage the transmission.

WARNING: Do not remove the key or move the ignition switch to position 'O' when the vehicle is being towed. The steering lock will be engaged preventing the steering from being turned.

With the engine not running, the brake booster and power steering pump will be inoperative. Care must be taken to ensure the vehicle is manoeuvred and driven accordingly.

CONTROL DIAGRAM

- NOTE: **A** = Hardwired; **D**= High Speed CAN Bus

E42395

Item	Part Number	Description
1	-	Diagnostic socket
2	-	Mechatronic Valve (including TCM, sensors and solenoids)

14	-	Fuse 4E (10A) – Permanent feed
15	-	Starter relay

Automatic Transmission/Transaxle - V6 4.0L Petrol - Automatic Transmission

Diagnosis and Testing

Principle of Operation

For detailed description of the automatic transmission system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Automatic Transmission](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, Description and Operation).

Inspection and Verification

This section is intended to provide a means for the technician to diagnose transmission component faults, rather than replacing the entire unit.

However, there are a number of situations where the replacement of the unit is the only practical solution, and this section will cover the diagnosis necessary to gather the information required for transmission replacement to be authorized by the warranty prior approval program (WPAP) where it applies, as well as covering the diagnostic trouble codes (DTCs) stored by the control module.

The basic checks of the transmission (fluid condition and level, etc) should be carried out first, and this will mean using the approved diagnostic system or other equipment with data logging facility to monitor temperatures, etc.

For information on the operation of the transmission, refer to the relevant workshop manual section.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fluid condition ● Fluid level ● Fluid leaks ● Fluid cooler ● External linkages ● Gear selector lever 	<ul style="list-style-type: none"> ● Fuses ● Wiring harnesses ● Electrical connector(s) ● Transmission control module (TCM) ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the DTC index.
 - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
 - Make sure that all DTCs are cleared following rectification.

Preliminary Inspection

1. **1.** As much information as possible should be obtained from the owner/driver about the fault in order to assist with the diagnosis. Time spent on this will reduce the necessity for extensive road testing and possible missed diagnosis.
 - The information required for WPAP is still useful as an aid to diagnosis, even where the system is not in operation

Required information for WPAP (where applicable)

- The nature of the fault (loss of drive, slip, judder, gear shift quality, noise, etc)
 - The frequency with which the fault occurs
 - The conditions under which the fault occurs, including temperature (coolant and ambient), selected gear, road speed, engine speed, and any specific conditions
 - Check and rectify non-transmission related DTCs before continuing with transmission diagnosis
2. **2.** Record the vehicle details, including:
 - Service history
 - The transmission serial number
 - The transmission software level
 3. **3.** Visually inspect the transmission for fluid leaks, damage, etc.
 4. **4.** Check the transmission fluid condition.

• **NOTE:** Fluid condition is a good indicator of the transmission internal condition. If the fluid is burnt and/or contaminated, this would usually mean the internal damage to the transmission is at such a level that unit replacement is the best option. Compare the fluid drained from the transmission with fresh fluid for color and odor.

5. **5.** Check the transmission fluid level. Refer to the relevant workshop manual section.

• **NOTE:** This is crucial to the operation of the transmission, and the procedure must be closely followed to avoid inaccurate diagnosis, with the resultant possible rejection of a warranty claim.

6. **6.** Check the engine idle speed and throttle sensor using the approved diagnostic system or a scan tool.
7. **7.** Check the transmission selector cable adjustment. Refer to the relevant workshop manual section.
8. **8.** Check the transmission range sensor adjustment.

- A comprehensive procedure for transmission range sensor setting is accessible through the approved diagnostic system.

If any faults are found and rectified in the above sequence, clear any DTCs and test the vehicle for normal operation.

If a failure condition is found indicating the need to renew the transmission assembly, the request must go through the warranty prior approval program (where applicable) before work is begun.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Transmission Control Module \(TCM\) - Bosch](#) (100-00 General Information, Description and Operation).

Automatic Transmission/Transaxle - V6 4.0L Petrol - Transmission Fluid Drain and Refill

General Procedures

• **WARNINGS:**

Observe due care when draining transmission fluid as the fluid can be very hot.

Observe due care when working near a hot exhaust system.

All vehicles

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transmission undershield.
 - Remove the 6 bolts.

- If installed, remove the transmission heat shield.
 - Remove the 4 bolts.

Vehicles with 4.0L engine

- Remove the transmission support insulator through-bolt.
 - Raise the transmission to gain access to the fluid drain plug.

All vehicles

5. Clean the area around the transmission fluid drain and filler plugs.
6. Place a container under the transmission.

7. WARNINGS:

Observe due care when draining transmission fluid as the fluid can be very hot.

Observe due care when working near a hot exhaust system.

Remove the transmission fluid filler/level plug.

- Remove and discard the sealing washer.

8. Remove the transmission fluid drain plug.

- Remove and discard the sealing washer.
- Allow the fluid to drain.

9. Install the transmission fluid drain plug and tighten to 9 Nm (7 lb.ft).

- Install a new sealing washer.

Vehicles with 4.0L engine

10. Install the transmission support insulator through-bolt and tighten to 175 Nm (129 lb.ft).

- Lower the transmission.

All vehicles

11. Add 3.5 to 4 litres of the correct transmission fluid, or until a small thread of fluid runs from the filler/level hole.

12. Check and top-up the transmission fluid level.

For additional information, refer to: [Transmission Fluid Level Check](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

Automatic Transmission/Transaxle - V6 4.0L Petrol - Transmission Fluid Level Check

General Procedures

• **WARNINGS:**

Observe due care when draining transmission fluid as the fluid can be very hot.

Observe due care when working near a hot exhaust system.

CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

1. The following steps must be observed before starting the transmission fluid level check and top-up.

- The vehicle must be on a horizontal ramp.
- The parking brake must be applied.
- The wheels must be chocked.

CAUTION: Make sure the transmission fluid temperature is below 30 degrees before starting the fluid level check.

Using the approved Land Rover diagnostic equipment, monitor the transmission fluid temperature.

E53729

3. Start the engine. Move the selector lever from 'P' through all gear positions, pausing in each gear position for 2-3 seconds and return to the 'P' position.

WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Remove the transmission undershield.

- Remove the 6 bolts.

E44595

6. If installed, remove the transmission heat shield.

- Remove the 4 bolts.

7. Place a container under the transmission.

8. WARNINGS:

 Observe due care when draining transmission fluid as the fluid can be very hot.

 Observe due care when working near a hot exhaust system.

 CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

Remove the transmission fluid filler/level plug.

- Clean the area around the filler/level plug.
- Remove and discard the sealing washer.

9. If no fluid loss is apparent when the filler/level plug is removed, with the engine at idle, continue to fill the transmission until a small thread of oil runs from oil filler/level hole.

10. Install the transmission fluid filler/level plug and tighten to 35 Nm (26 lb.ft).

- Install a new sealing washer.
- Remove the container.

11. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

12. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

13. Disconnect the approved Land Rover diagnostic equipment from the vehicle.

Automatic Transmission/Transaxle - V6 4.0L Petrol - Selector Shaft Seal

In-vehicle Repair

Special Tool(s)	
 <p>307-509-1</p> <p>E50766</p>	<p>ZF Automatic transmission selector shaft seal remover</p> <p>307-509-1 (LRT-44-033/1)</p>
 <p>307-509-2</p> <p>E50767</p>	<p>ZF Automatic transmission selector shaft seal remover</p> <p>307-509-2 (LRT-44-033/2)</p>
 <p>307-509-3</p> <p>E50768</p>	<p>ZF Automatic transmission selector shaft seal installer</p> <p>307-509-3 (LRT-44-033/3)</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- LH selector shaft seal only: Remove the exhaust system. For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).
- Remove the transmission heat shield.
 - Remove the 4 bolts.

E50769

4. Release the selector cable and lever.

- Remove the nut.
- Compress the latch and release the cable.

E50770

5.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the selector shaft seal.

- Install 307-509-1 to the seal.
- Install 307-509-2 to 307-509-1 and extract the seal.

Installation

1. Using 307-509-3, install the selector shaft seal.

- Clean the components.

E50771

2. Install the selector cable and bracket.

- Secure with the clip.
- Tighten the nut to 12 Nm (9 lb.ft).

3. Install the transmission heat shield.

- Install the bolts.

4. LH selector shaft seal only: Install the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).

Automatic Transmission/Transaxle - V6 4.0L Petrol - Transmission Control Module (TCM)

In-vehicle Repair

Special Tool(s)	
 <p>E48903</p>	ZF Automatic transmission valve block seals remover 307-492 (LRT-44-005)

Removal

- NOTE: The transmission control module (TCM) is part of the main control valve body and cannot be serviced separately.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the fluid pan.
For additional information, refer to: [Fluid Pan, Gasket and Filter](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, In-vehicle Repair).
3. Disconnect the electrical connector.

4. Remove and discard the electrical connector sleeve.

- Release the retainer.

5. Remove the valve body.

- Position a container to collect spillage.
- Remove the 10 Torx screws.

6. Using the special tool, remove the 4 seals.
7. Remove the seal block.

Installation

1. CAUTIONS:

 Make sure that when fully fitted, all seals protrude by the same amount.

 Engage the selector lever with the groove in the piston rod.

Install the valve body.

- Clean the component mating faces.
- Install new seals.
- Install a new seal block.
- Tighten the Torx screws to 8 Nm (6 lb.ft).

2. Install a new electrical connector sleeve.

- Secure with retainer.

3. Connect the electrical connector.

4. Install the fluid pan.

For additional information, refer to: [Fluid Pan, Gasket and Filter](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, In-vehicle Repair).

5. Calibrate a new main control valve body using T4.

Automatic Transmission/Transaxle - V6 4.0L Petrol - Output Shaft Seal

In-vehicle Repair

Special Tool(s)	
 <p>303-903 E50940</p>	<p>Oil seal remover 303-903 (LRT-12-092)</p>
 <p>307-520 E52536</p>	<p>Oil seal installer 307-520</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transfer case.
For additional information, refer to: [Transfer Case - V6 4.0L Petrol](#) (308-07B Transfer Case, Removal).

-  **CAUTION:** Care must be taken to avoid damage to the seal register and running surface.

Remove the transmission output shaft oil seal.

- Use the special tool.

Installation

-  **CAUTION:** Oil seals must be fitted dry.

Install a new transmission output shaft oil seal.

- Clean the seal register.
- Use the special tool.

- Install the transfer case.
For additional information, refer to: [Transfer Case - V6 4.0L](#)

[Petrol](#) (308-07B Transfer Case, Removal).

3. Check and top-up the transmission fluid level.
For additional information, refer to: [Transmission Fluid Level Check](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

Automatic Transmission/Transaxle - V6 4.0L Petrol - Fluid Pan, Gasket and Filter

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).
5. Remove the transmission support insulator.

- Remove the 4 bolts.

E54739

6. Remove the transmission heat shield.

- Remove the 4 bolts.

E44596

7. Release the selector cable from its abutment bracket.
8. Drain the transmission.
9. Remove the transmission heat shield bracket.
For additional information, refer to: [Transmission Fluid Drain and Refill](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

- Remove the 4 bolts.

E46530

E54740

10.  **CAUTION:** Protect the engine during this operation.

Raise the RH side of the engine by approximately 15 mm.

- Remove the nut.
- Use a transmission jack.

E48876

11. Remove the fluid pan.

- Position a container to collect the fluid spillage.
- Remove the 21 Torx screws.
- Remove and if necessary, discard the seal.
- Discard the O-ring seal.

Installation

1. Install the fluid pan.
 - Clean the components.
 - Install the seal.
 - Install a new O-ring seal.
 - Tighten the Torx screws to 8 Nm (6 lb.ft).
2. Lower the RH side of the engine.
 - Remove the engine support.
 - Tighten the nut to 90 Nm (66 lb.ft).
3. Install the transmission heat shield bracket.
 - Tighten the 4 bolts to 10 Nm (7 lb.ft).
 - Install the selector cable to its abutment bracket.
4. Install the selector cable to its abutment bracket.
5. Install the transmission heat shield.
 - Tighten the bolts to 10 Nm (7 lb.ft).
6. Install the transmission support insulator.
 - Clean the component mating faces.
 - Tighten the bolts to 60 Nm (44 lb.ft).

- 7.** Install the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).
- 8.** Install the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
- 9.** Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
- 10.** Refill the transmission with fluid.
For additional information, refer to: [Transmission Fluid Drain and Refill](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

Automatic Transmission/Transaxle - V6 4.0L Petrol - Main Control Valve

Body

In-vehicle Repair

Special Tool(s)	
 <p>E48903</p>	ZF Automatic transmission valve block seals remover 307-492 (LRT-44-005)

Removal

- NOTE: The transmission control module (TCM) is part of the main control valve body and cannot be serviced separately.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the fluid pan.
For additional information, refer to: [Fluid Pan, Gasket and Filter](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, In-vehicle Repair).
- Disconnect the electrical connector.

- Remove and discard the electrical connector sleeve.

- Release the retainer.

5. Remove the valve body.
 - Position a container to collect spillage.
 - Remove the 10 Torx screws.

6. Using the special tool, remove the 4 seals.

7. Remove the seal block.

Installation

E48892

1. CAUTIONS:

Make sure that when fully fitted, all seals protrude by the same amount.

Engage the selector lever with the groove in the piston rod.

Install the valve body.

- Clean the component mating faces.
- Install new seals.
- Install a new seal block.
- Tighten the Torx screws to 8 Nm (6 lb.ft).

2. Install a new electrical connector sleeve.

- Secure with retainer.

3. Connect the electrical connector.

4. Install the fluid pan.

For additional information, refer to: [Fluid Pan, Gasket and Filter](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, In-vehicle Repair).

5. Calibrate a new main control valve body using T4.

Automatic Transmission/Transaxle - V6 4.0L Petrol - Transmission Support Insulator

In-vehicle Repair

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

3. **NOTE:** 4.4L illustration shown, 4.0L and 2.7L Diesel are similar.

Remove the transmission support insulator.

- Remove the 4 bolts.

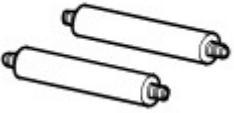

E44567

Installation

1. To install, reverse the removal procedure.
 - Clean the component mating faces.
 - Tighten the bolts to 60 Nm (44 lb.ft).

Automatic Transmission/Transaxle - V6 4.0L Petrol - Transmission

Removal and Installation

Special Tool(s)

 <p>307-497</p> <p>E46738</p>	<p>Torque converter support handles 307-497 (LRT-44-010)</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transfer case.
For additional information, refer to: [Transfer Case - V6 4.0L Petrol](#) (308-07B Transfer Case, Removal).
- Remove the transmission heat shield.

- Remove the 4 bolts.

- Release the selector cable.

- Using an additional wrench, restrain the clamping bush and loosen the locknut.
- Compress the latch and release the cable.

5. Remove the transmission heat shield bracket.

- Remove the 4 bolts.

6. Remove the fuel pipe heat shield.

- Remove the 2 bolts.
- Release the fuel pipes from the 3 clips.

7. Remove the radiator access panel.

- Remove the 4 bolts.

8. **⚠ CAUTION:** Always plug any open connections to prevent contamination.

Release the transmission fluid lines.

- Remove the bolt.
- Release the clip.
- Remove and discard both O-ring seals.

9. Release the wiring harness from the LH side of the transmission.

- Remove the 3 Torx screws.
- Release the 2 clips.

10. Release the wiring harness from the RH side of the transmission.

- Remove the Torx screw.
- Disconnect the electrical connector.

11. Release the transmission breather line clip.

- Remove the bolt.

12. Release the starter motor.

- Remove the 2 bolts.
- Tie the starter motor aside.

13. Release the flexplate.

- Rotate the crankshaft to access the bolts.
- Remove the 4 bolts.

E55586

14. Remove the crankshaft position (CKP) sensor.

- Disconnect the electrical connector.
- Remove the bolt.

E55587

15. Remove the access hole plug.

E55588

E55589

16. WARNINGS:

-  Support the engine. The engine will fall forward when the transmission is removed.
-  Secure the transmission to the transmission jack.
-  Make sure the torque converter remains with the transmission.

With assistance, remove the transmission.

- Using a transmission jack, support the transmission.
- Remove the 8 bolts.

17. Install the torque converter retainer.

18. NOTE: Do not disassemble further if the component is removed for access only.

Remove the transmission from the transmission jack.

19. Remove the torque converter retainer.

20. Using the special tools, remove the torque converter.

E46538

E48465

21. Carefully remove and discard the torque converter fluid seal.

22. Remove the selector cable bracket.

- Remove the 2 bolts.

23.  **CAUTION:** Always plug any open connections to prevent contamination.

Remove the transmission breather lines.

- Depress the locking ring.

24. Remove the selector lever.

- Remove the nut.

Installation

 **CAUTION:** If the automatic transmission fluid is very dirty or it contains metallic particles, then along with a new transmission, install a new automatic transmission fluid cooler and lines.

1. Attach the selector lever.

- Tighten the nut to 12 Nm (9 lb.ft).

2. Attach the transmission breather lines.

- Secure with the clip.

3. Attach the selector cable bracket.

- Tighten the bolts to 10 Nm (7 lb.ft).

E46739

4. Using the special tool, install a new torque converter oil seal.

- Clean the seal register.

5.  **CAUTION:** Make sure the torque converter is fully located into the oil pump drive.

Install the torque converter.

- Clean the seal contact area.
- Remove the special tools.

6. Install the torque converter retainer.

7.  **WARNING:** Secure the transmission to the transmission jack.

Position the transmission to the transmission jack.

8. Remove the torque converter retainer.

9.  **CAUTION:** Apply grease of the correct specification to the torque converter spigot.

With assistance, install the transmission.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).

10. Attach the flexplate to the torque converter.

- Rotate the crankshaft to access the bolts.
- Tighten the bolts to 45 Nm (33 lb.ft).

11. Attach the transmission breather pipe clip.

- Tighten the bolt to 25 Nm (18 lb.ft).

12. Attach the wiring harness.

- Tighten the Torx screws.
- Connect the electrical connector.

13. Attach the transmission fluid lines.

- Clean the components.
- Install the new O-ring seals.
- Secure with the clip.
- Tighten the bolt to 10 Nm (7 lb.ft).

14. Install the fuel pipe heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure with the clips.

15. Install the transmission heat shield bracket.

16. Attach the selector cable.

17. Tighten the transmission case bolts to 10 Nm (7 lb.ft).

For additional information, refer to: [Transfer Case - V6 4.0L Petrol](#) (308-07B Transfer Case, Removal).

18. Adjust the selector cable.

For additional information, refer to: [Selector Lever Cable Adjustment](#) (307-05B Automatic Transmission/Transaxle External Controls - V6 4.0L Petrol, General Procedures).

19. Check and top-up the transmission fluid level.

For additional information, refer to: [Transmission Fluid Level Check](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, General Procedures).

20. Install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

21. NOTE: For NAS vehicles only.

If fitting new or exchange components, carry out long drive cycle.

For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A, General Procedures).

Automatic Transmission/Transaxle - V6 4.0L Petrol/TDV6 2.7L Diesel - Diagnostics

Diagnosis and Testing

Principle of Operation

For a detailed description of the automatic transmission/transaxle system and operation, refer to the relevant Description and Operation sections in the workshop manual.

Fluid Level and Condition Check

CAUTION: The vehicle should not be driven if the fluid level is low as internal failure can result.

• **NOTE:** The transmission fluid temperature must not be allowed to exceed 50°C (122°F) whilst checking level. Should the temperature rise above this figure, abort the check and allow the transmission fluid to cool to below 30°C (86°F).

This vehicle is not equipped with a fluid level indicator. An incorrect level may affect the transmission operation and could result in transmission damage. To correctly check and add fluid to the transmission. Refer to the relevant section in the workshop manual.

High Fluid Level

A fluid level that is too high may cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission damage. If an overfill condition is identified, with the engine at idle ensure the fluid temperature is within the specified range and allow the excess fluid to drain until a small thread of fluid runs from the filler/level plug hole.

Low Fluid Level

A low fluid level could result in poor transmission engagement, slipping, or damage. This could also indicate a leak in one of the transmission seals or gaskets.

Adding Fluid

CAUTION: The use of any other type of transmission fluid other than that specified can result in transmission damage.

If fluid needs to be added, add fluid in 0.50 liter increments through the fill hole opening. Do not overfill the fluid. For fluid type, refer to the Specification section in the workshop manual.

Fluid Condition Check

1. **1.** Check the fluid level.
2. **2.** Observe the color and the odor of the fluid. The color under normal circumstances should be like honey, not dark brown or black.
3. **3.** Allow the fluid to drip onto a facial tissue and examine the stain.
4. **4.** If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.

NOTE: In the event of a transmission unit replacement for internal failure, the oil cooler and pipes must also be replaced.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical	Hydraulic
<ul style="list-style-type: none"> ● Damaged/stuck shift mechanism ● Damaged automatic transmission casing 	<ul style="list-style-type: none"> ● Blown fuse(s) ● Damaged, loose or corroded connectors ● Wiring harness 	<ul style="list-style-type: none"> ● Fluid level too high/low ● Poor condition of fluid ● Fluid leak

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Transmission Control Module \(TCM\) - Bosch](#) (100-00 General Information, Description and Operation).

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission assembly.

Refer to: [Transmission](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, Removal and Installation).

Refer to: [Transmission](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, Removal and Installation).

Refer to: [Transmission](#) (307-01A Automatic Transmission/Transaxle - TDV6 2.7L Diesel, Removal and Installation).

E106843

3.  **WARNING:** Do not let the torque converter drop out of the transmission. Failure to follow this instruction may result in personal injury.

Using the special tools, remove the torque converter. Drain any remaining fluid into a suitable container.

E30836

4.  **WARNING:** Make sure the transmission housing seal face is not damaged when removing the torque converter seal. Failure to follow this instruction may result in damage to the vehicle.

Using the special tools, remove the input shaft seal.

E 30837

5. **NOTE:** Using a suitable metal surface cleaner meeting Jaguar specification, clean the seal face on the housing before fitting the new seal.

Clean and inspect the transmission housing seal face.

Installation

1. Using the special tool, install a new input shaft seal.

2.  **WARNING:** Do not let the torque converter drop out of the transmission. Failure to follow this instruction may result in personal injury.

- **NOTE:** The torque converter hub must engage fully in the oil pump drive gear.

Using the special tools, install the torque converter. Remove the special tools.

3. Install the transmission assembly.

Refer to: [Transmission](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, Removal and Installation).
Refer to: [Transmission](#) (307-01B Automatic Transmission/Transaxle - V6 4.0L Petrol, Removal and Installation).

Automatic Transmission/Transaxle - V8 5.0L Petrol/TDV6 3.0L Diesel - Transmission Description

Description and Operation

COMPONENT LOCATION

E122443

INTRODUCTION

The ZF 6HP28 transmission is an electronically controlled, hydraulically operated, six speed automatic unit. The hydraulic and electronic control elements of the transmission, including the [TCM \(transmission control module\)](#), are incorporated in a single unit located inside the transmission and is known as 'Mechatronic'.

3.0L diesel models use an updated derivative of the ZF 6HP28 transmission used in the 5.0L naturally aspirated models.

The ZF 6HP28 transmission has the following features:

- Designed to be maintenance free
- Transmission fluid is 'fill for life'
- The torque converter features a controlled slip feature with electronically regulated control of lock-up, creating a smooth transition to the fully locked condition
- Shift programs controlled by the [TCM](#)
- ASIS (adaptive shift strategy), to provide continuous adaptation of shift changes to suit the driving style of the driver, which can vary from sporting to economical
- Connected to the [ECM \(engine control module\)](#) via the high speed [CAN \(controller area network\)](#) bus for communications
- Default mode if major faults occur
- Diagnostics available from the [TCM](#) via the high speed [CAN](#) bus.

The transmission selections are made using the selector lever in the floor console and two paddle switches on the steering wheel.

For additional information, refer to: [External Controls](#) (307-05C Automatic Transmission/Transaxle External Controls - V8 5.0L Petrol/TDV6 3.0L Diesel, Description and Operation).

TRANSMISSION

The transmission comprises the main casing which houses all of the transmission components. The main casing also incorporates an integral bell housing.

A fluid pan is attached to the lower face of the main casing and is secured with bolts. The fluid pan is sealed to the main casing with a gasket. Removal of the fluid pan allows access to the Mechatronic valve block. The fluid pan has a magnet located around the drain plug which collects any metallic particles present in the transmission fluid.

A fluid filter is located inside the fluid pan. If the transmission fluid becomes contaminated or after any service work, the fluid pan with integral filter must be replaced.

On the [RH \(right-hand\)](#) side of the transmission, a gear change lever is installed on the end of a selector shaft. The selector shaft operates a selector spool valve and a selector switch in the transmission. A selector cable, connected between the gear change lever and the selector lever in the floor console, controls the position of the selector shaft.

The integral bell housing provides protection for the torque converter assembly and also provides the attachment for the gearbox to the engine. The torque converter is a non-serviceable assembly which also contains the lock-up clutch mechanism. The torque converter drives a crescent type pump via drive tangs. The fluid pump is located in the main casing, behind the torque converter.

The main casing contains the following major components:

- Input shaft
- Output shaft
- Mechatronic valve block which contains the solenoids, speed sensors and the [TCM](#)
- Three rotating multiplate drive clutches
- Two fixed multiplate brake clutches
- A single planetary gear train and a double planetary gear train.

TORQUE CONVERTER

Item	Part Number	Description
1	-	Impeller
2	-	Turbine
3	-	Stator
4	-	Freewheel clutch
5	-	Torque converter hub
6	-	Stator shaft
7	-	Turbine shaft
8	-	Drive plate
9	-	Journal - Drive plate/crankshaft location
10	-	Torque converter cover
11	-	Lock-up clutch piston
12	-	Lock-up clutch plate

The torque converter is the coupling element between the engine and the transmission and is located in the bell housing, on the engine side of the transmission. The driven power from the engine crankshaft is transmitted hydraulically and mechanically through the torque converter to the transmission. The torque converter is connected to the engine by a drive plate attached to the rear of the crankshaft.

The torque converter comprises an impeller, a stator and a turbine. The torque converter is a sealed unit with all components located between the converter housing cover and the impeller. The two components are welded together to form a sealed, fluid filled housing. With the impeller welded to the converter housing cover, the impeller is therefore driven at engine crankshaft speed.

The converter housing cover has four threaded bosses, which provide for attachment of the engine drive plate. The threaded bosses also provide for location of special tools which are required to remove the torque converter from the bell housing.

Impeller

Fluid Flow

E42397

Item	Part Number	Description
1	-	Turbine
2	-	Stator
3	-	Impeller

When the engine is running the rotating impeller acts as a centrifugal pump, picking up fluid at its center and discharging it at high velocity through the blades on its outer rim. The design and shape of the blades and the curve of the impeller body cause the fluid to rotate in a clockwise direction as it leaves the impeller. This rotation improves the efficiency of the fluid as it contacts the outer row of blades on the turbine.

The centrifugal force of the fluid leaving the blades of the impeller is passed to the curved inner surface of the turbine via the tip of the blades. The velocity and clockwise rotation of the fluid causes the turbine to rotate.

Turbine

The turbine is similar in design to the impeller with a continuous row of blades. Fluid from the impeller enters the turbine through the tip of the blades and is directed around the curved body of the turbine to the root of the blades. The curved surface redirects the fluid back in the opposite direction to which it entered the turbine, effectively increasing the turning force applied to the turbine from the impeller. This principle is known as torque multiplication.

When engine speed increases, turbine speed also increases. The fluid leaving the inner row of the turbine blades is rotated in a counter-clockwise direction due to the curve of the turbine and the shape of the blades. The fluid is now flowing in the opposite direction to the engine rotation and therefore the impeller. If the fluid was allowed to hit the impeller in this condition, it would have the effect of applying a brake to the impeller, eliminating the torque multiplication effect. To prevent this, the stator is located between the impeller and the turbine.

Stator

The stator is located on the splined transmission input shaft via a freewheel clutch. The stator comprises a number of blades which are aligned in an opposite direction to those of the impeller and turbine. The main function of the stator is to redirect the returning fluid from the turbine, changing its direction to that of the impeller.

The redirected fluid from the stator is directed at the inner row of blades of the impeller, assisting the engine in turning the impeller. This sequence increases the force of the fluid emitted from the impeller and thereby increases the torque multiplication effect of the torque converter.

Stator Functions

- NOTE: The following illustration shows a typical stator

E 42398

Item	Part Number	Description
1	-	Blades
2	-	Stator held – fluid flow redirected
3	-	Stator rotates freely
4	-	Roller
5	-	Converter at coupling speed
6	-	Fluid flow from turbine
7	-	Converter multiplying
8	-	Fluid flow from impeller
9	-	Drive from engine
10	-	Impeller
11	-	Stator
12	-	Turbine
13	-	Output to transmission

Fluid emitted from the impeller acts on the turbine. If the turbine is rotating at a slower speed than the fluid from the impeller, the fluid will be deflected by the turbine blades in the path 'A'. The fluid is directed at and deflected by the stator blades from path 'B' to path 'C'. This ensures that the fluid is directed back to the pump in the optimum direction. In this condition the sprag clutch is engaged and the force of the fluid on the stator blades assists the engine in rotating the impeller.

As the rotational speed of the engine and therefore the turbine increases, the direction of the fluid leaving the turbine changes to path 'D'. The fluid is now directed from the turbine to the opposite side of the stator blades, rotating the stator in the opposite direction. To prevent the stator from resisting the smooth flow of the fluid from the turbine, the sprag clutch releases, allowing the stator to rotate freely on its shaft.

When the stator becomes inactive, the torque converter no longer multiplies the engine torque. When the torque converter reaches this operational condition it ceases to multiply the engine torque and acts solely as a fluid coupling, with the impeller and the turbine rotating at approximately the same speed.

The stator uses a sprag type, one way, freewheel clutch. When the stator is rotated in a clockwise direction the sprags twist and are wedged between the inner and outer races. In this condition the sprags transfer the rotation of the outer race to the inner race which rotates at the same speed.

One Way Free Wheel Clutch – Typical

E 42712

Item	Part Number	Description
1	-	Sprags
2	-	Inner race
3	-	Outer race
4	-	Sprag and cage assembly
5	-	Sprag outer race
6	-	Sprag inner race
7	-	Retaining ring

The free wheel clutch can perform three functions; hold the stator stationary, drive the stator and free wheel allowing the stator to rotate without a drive output. The free wheel clutch used in the ZF 6HP28 transmission is of the sprag type and comprises an inner and outer race and a sprag and cage assembly. The inner and outer races are pressed into their related components with which they rotate. The sprag and cage assembly is located between the inner and outer races.

The sprags are located in a cage which is a spring which holds the sprags in the 'wedge' direction and maintains them in contact with the inner and outer races.

Referring to the illustration, the sprags are designed so that the dimension 'B' is larger than the distance between the inner and outer race bearing surfaces. When the outer race rotates in a clockwise direction, the sprags twist and the edges across the dimension 'B' wedge between the races, providing a positive drive through each sprag to the inner race. The dimension 'A' is smaller than the distance between the inner and outer race bearing surfaces. When the outer race rotates in an anti-clockwise direction, the dimension 'A' is too small to allow the sprags to wedge between the races, allowing the outer race to rotate freely.

On the illustration shown, when the outer race is rotated in a clockwise direction, the sprags twist and are 'wedged' between the inner and outer races. The sprags then transfer the rotation of the outer race to the inner race, which rotates at the same speed.

Lock-Up Clutch Mechanism

The [TCC \(torque converter clutch\)](#) is hydraulically controlled by an EPRS (electronic pressure regulating solenoid), which is controlled by the [TCM](#). This allows the torque converter to have three states of operation as follows:

- Fully engaged
- Controlled slip variable engagement
- Fully disengaged.

The [TCC](#) is controlled by two hydraulic spool valves located in the valve block. These valves are actuated by pilot pressure supplied via a solenoid valve which is also located in the valve block. The solenoid valve is operated by [PWM \(pulse width modulation\)](#) signals from the [TCM](#) to give full, partial or no lock-up of the torque converter.

E 42399

Item	Part Number	Description
A	-	Unlocked condition
B	-	Locked condition
1	-	Clutch plate
2	-	Clutch piston
3	-	Torque converter body
4	-	Turbine
5	-	Impeller
6	-	Stator
7	-	Piston chamber
8	-	Turbine chamber

The lock-up clutch is a hydro-mechanical device which eliminates torque converter slip, improving fuel consumption. The engagement and disengagement is controlled by the [TCM](#) to allow a certain amount of controlled 'slip'. This allows a small difference in the rotational speeds of the impeller and the turbine which results in improved shift quality. The lock-up clutch comprises a piston and a clutch friction plate.

In the unlocked condition, the oil pressure supplied to the piston chamber and the turbine chamber is equal. Pressurized fluid flows through a drilling in the turbine shaft and through the piston chamber to the turbine chamber. In this condition the clutch plate is held away from the torque converter body and torque converter slip is permitted.

In the locked condition, the [TCC](#) spool valves are actuated by the EPRS. The fluid flow in the unlocked condition is reversed and the piston chamber is vented. Pressurized fluid is directed into the turbine chamber and is applied to the clutch piston. The piston moves with the pressure and pushes the clutch plate against the torque converter body. As the pressure increases, the friction between the clutch plate and the body increases, finally resulting in full lock-up of the clutch plate with the body. In this condition there is direct mechanical drive from the engine crankshaft to the transmission planetary gear train.

FLUID PUMP

The fluid pump is an integral part of the transmission. The fluid pump is used to supply hydraulic pressure for the operation of the control valves and clutches, to pass the fluid through the transmission cooler and to lubricate the gears and shafts.

The ZF 6HP28 fluid pump is a crescent type pump and is located between the intermediate plate and the torque converter. The pump has a delivery rate of 16 cm³ per revolution.

E42400

Item	Part Number	Description
1	-	Securing ring
2	-	Shaft oil seal
3	-	O-ring seal
4	-	Pump housing
5	-	Ring gear
6	-	Crescent spacer
7	-	Roller bearing
8	-	Impeller
9	-	Centering pin
10	-	Spring washer
11	-	Outlet port (high pressure)
12	-	Inlet port (low pressure)

The pump comprises a housing, a crescent spacer, an impeller and a ring gear. The housing has inlet and outlet ports to direct flow and is located in the intermediate plate by a centering pin. The pump action is achieved by the impeller, ring gear and crescent spacer.

The crescent spacer is fixed in its position by a pin and is located between the ring gear and the impeller. The impeller is driven by drive from the torque converter hub which is located on a needle roller bearing in the pump housing. The impeller teeth mesh with those of the ring gear. When the impeller is rotated, the motion is transferred to the ring gear which rotates in the same direction.

The rotational motion of the ring gear and the impeller collects fluid from the intake port in the spaces between the teeth. When the teeth reach the crescent spacer, the oil is trapped in the spaces between the teeth and is carried with the rotation of the gears. The spacer tapers near the outlet port. This reduces the space between the gear teeth causing a build up of fluid pressure as the oil reaches the outlet port. When the teeth pass the end of the spacer the pressurized fluid is released into the outlet port.

The fluid emerging from the outlet port is passed through the fluid pressure control valve. At high operating speeds the pressure control valve maintains the output pressure to the gearbox at a predetermined maximum level. Excess fluid is relieved from the pressure control valve and is directed, via the main pressure valve in the valve block, back to the pump inlet port. This provides a pressurized feed to the pump inlet which prevents cavitation and reduces pump noise.

MECHATRONIC VALVE BLOCK

The Mechatronic valve block is located in the bottom of the transmission and is covered by the fluid pan. The valve block houses the [TCM](#), electrical actuators, speed sensors and control valves which provide all electro-hydraulic control for all transmission functions. The Mechatronic valve block comprises the following components:

- [TCM](#)
- Six pressure regulator solenoids
- One shift control solenoid
- One damper
- Twenty one hydraulic spool valves
- Manually operated selector valve
- Temperature sensor

- Turbine speed sensor
- Output shaft speed sensor.

Electronic Pressure Regulator Solenoids

E42713

Six EPRS are located in the valve block. The solenoids are controlled by [PWM](#) signals from the [TCM](#). The solenoids convert the electrical signals into hydraulic control pressure proportional to the signal to actuate the spool valves for precise transmission operation.

The following table shows EPRS and their associated functions:

EPRS	Function
1	Clutch A
2	Clutch B
3	Clutch C
4	Brake clutches D and E
5	System pressure control
6	Torque converter lock-up control

Solenoids EPRS 1, 3 and 6 supply a lower control pressure as the signal amperage increases and can be identified by a black connector cap. The [TCM](#) operates the solenoids using PWM signals. The TCM monitors engine load and clutch slip and varies the solenoid duty cycle accordingly. The solenoids have a 12 V operating voltage and a pressure range of 0 - 4.6 bar (0 - 67 lbf.in²).

Solenoids EPRS 2, 4 and 5 supply a higher control pressure as the signal amperage increases and can be identified by a green connector cap. The solenoids are normally open, regulating flow solenoid valves. The operates the solenoids using a [PWM](#) earth proportional to the required increasing or decreasing clutch pressures. The solenoids have a 12 V operating voltage and a pressure range of 4.6 - 0 bar (67 - 0 lbf.in²).

The resistance of the solenoid coil winding for solenoid is between 26 to 30.4 ohms at 20 °C (68 °F).

Control Solenoid

E42714

A shift control SV (solenoid valve) is located in the valve block. The solenoid is controlled by the [TCM](#) and converts electrical signals into hydraulic control signals to control clutch application.

The shift control solenoid is an open/closed, on/off solenoid which is controlled by the [TCM](#) switching the solenoid to earth. The [TCM](#) also supplies power to the solenoid. The [TCM](#) energizes the solenoid in a programmed sequence for clutch application for gear ratio changes and shift control.

The resistance of the solenoid coil winding for solenoid is between 26 to 30.4 ohms at 20 °C (68 °F).

Sensors

Speed Sensors

The turbine speed sensor and the output shaft speed sensor are Hall effect type sensors located in the Mechatronic valve block and are not serviceable items. The [TCM](#) monitors the signals from each sensor to determine the input (turbine) speed and the output shaft speed.

The turbine speed is monitored by the [TCM](#) to calculate the slip of the torque converter clutch and internal clutch slip. This signal allows the [TCM](#) to accurately control the slip timing during shifts and adjust clutch application or release pressure for overlap shift control.

The output shaft speed is monitored by the [TCM](#) and compared to engine speed signals received on the [CAN](#) bus from the [ECM](#). Using a comparison of the two signals the [TCM](#) calculates the transmission slip ratio for plausibility and maintains adaptive pressure control.

Temperature Sensor

The temperature sensor is also located in the Mechatronic valve block. The [TCM](#) uses the temperature sensor signals to determine the temperature of the transmission fluid. These signals are used by the [TCM](#) to control the transmission operation to promote faster warm-up in cold conditions or to assist with fluid cooling by controlling the transmission operation when high fluid temperatures are experienced. If the sensor fails, the [TCM](#) will use a default value and a fault code will be stored in the [TCM](#).

Damper

There is 1 damper located in the valve housing. The damper is used to regulate and dampen the regulated pressure supplied via EPRS 5. The damper is load dependent through modulation of the damper against return spring pressure.

The damper comprises a piston, a housing bore and a spring. The piston is subject to the pressure applied by the spring. The bore has a connecting port to the function to which it applies. Fluid pressure applied to the applicable component (i.e. a clutch) is also subjected to the full area of the piston, which moves against the opposing force applied by the spring. The movement of the piston creates an action similar to a shock absorber, momentarily delaying the build up of pressure in the circuit. This results in a more gradual application of clutches improving shift quality.

Spool Valves

The valve block contains 21 spool valves which control various functions of the transmission. The spool valves are of conventional design and are operated by fluid pressure.

Each spool valve is located in its spool bore and held in a default (unpressurized) position by a spring. The spool bore has a number of ports which allow fluid to flow to other valves and clutches to enable transmission operation. Each spool has a piston which is waisted to allow fluid to be diverted into the applicable ports when the valve is operated.

When fluid pressure moves a spool, 1 or more ports in the spool bore are covered or uncovered. Fluid is prevented from flowing or is allowed to flow around the applicable waisted area of the spool and into another uncovered port. The fluid is either passed through galleries to actuate another spool, operate a clutch or is returned to the fluid pan.

DRIVE CLUTCHES

Multiplate Drive or Brake Clutch – Typical

E42715

Item	Part Number	Description
1	-	Input shaft
2	-	Main pressure supply port
3	-	Piston
4	-	Cylinder – external plate carrier
5	-	Clutch plate assembly
6	-	Baffle plate
7	-	Diaphragm spring
8	-	Output shaft
9	-	Bearing

10	-	Dynamic pressure equalization chamber
11	-	Piston chamber
12	-	Lubrication channel

There are three drive clutches and two brake clutches used in the ZF 6HP28 transmission. Each clutch comprises one or more friction plates dependent on the output controlled. A typical clutch consists of a number of steel outer plates and inner plates with friction material bonded to each face.

On 3.0L diesel models, the updated transmission includes additional clutch plates to enable the transmission to manage the additional power output from these engines.

The clutch plates are held apart mechanically by a diaphragm spring and hydraulically by dynamic pressure. The pressure is derived from a lubrication channel which supplies fluid to the bearings etc. The fluid is passed via a drilling in the output shaft into the chamber between the baffle plate and the piston. To prevent inadvertent clutch application due to pressure build up produced by centrifugal force, the fluid in the dynamic pressure equalization chamber overcomes any pressure in the piston chamber and holds the piston off the clutch plate assembly.

When clutch application is required, main pressure from the fluid pump is applied to the piston chamber from the supply port. This main pressure overcomes the low pressure fluid present in the dynamic pressure equalization chamber. The piston moves, against the pressure applied by the diaphragm spring, and compresses the clutch plate assembly. When the main pressure falls, the diaphragm spring pushes the piston away from the clutch plate assembly, disengaging the clutch.

PLANETARY GEAR TRAINS

The planetary gear trains used on the ZF 6HP28 transmission comprise a single web planetary gear train and a double web planetary gear train. These gear trains are known as Lepelletier type gear trains and together produce the six forward gears and the one reverse gear.

Single Web Planetary Gear Train

The single web planetary gear train comprises:

- Sunwheel
- Four planetary gears
- Planetary gear carrier (spider)
- Ring gear or annulus.

E42716

Item	Part Number	Description
1	-	Cylinder
2	-	Baffle plate
3	-	Ring gear
4	-	Sun gear
5	-	Planetary gear spider
6	-	Torque converter input shaft

Torque Converter Input Shaft

E42717

Item	Part Number	Description
1	-	Planetary gear spider
2	-	Planetary gears (short)
3	-	Ring gear
4	-	Output shaft
5	-	Planetary gear carrier
6	-	Sunwheel
7	-	Double planetary gears (long)
8	-	Sunwheel

The double planetary gear train comprises:

- Two sunwheels
- Three short planetary gears
- Three long planetary gears
- Planetary gear carrier
- Ring gear or annulus

TRANSMISSION CONTROL MODULE

The [TCM](#) is an integral part of the Mechatronic valve block which is located at the bottom of the transmission, within the fluid pan. The [TCM](#) is the main controlling component of the transmission.

The [TCM](#) processes signals from the transmission speed and temperature sensors, [ECM](#) and other vehicle systems. From the received signal inputs and pre-programmed data, the module calculates the correct gear, torque converter clutch setting and optimum pressure settings for gear shift and lock-up clutch control.

CONTROL DIAGRAM

- NOTE: A = Hardwired; B = K bus; D = High speed [CAN](#) bus O = LIN (local interconnect network) bus.

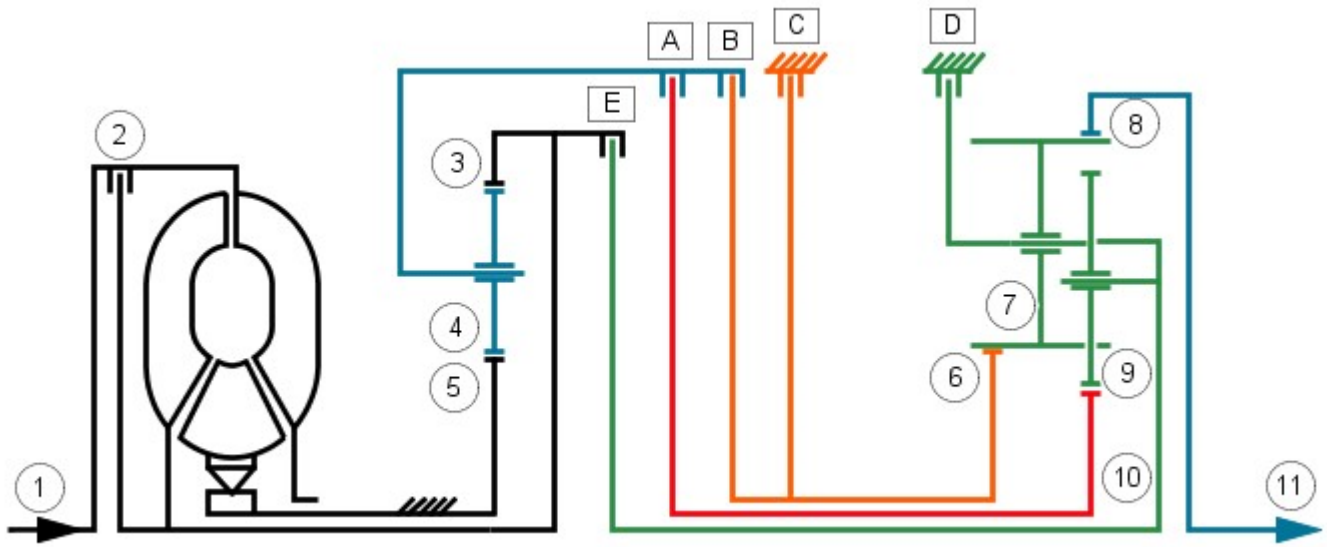

E121494

Item	Part Number	Description
1	-	Battery
2	-	EJB (engine junction box)
3	-	Selector lever
4	-	ECM (engine control module)
5	-	TCM
6	-	To other systems
7	-	Diagnostic socket
8	-	Instrument cluster
9	-	Clockspring
10	-	Steering angle sensor
11	-	CJB (central junction box)
12	-	ABS module
13	-	Steering wheel LH switchpack
14	-	Upshift paddle switch
15	-	Downshift paddle switch

OPERATION

Power Flows

Operation of the transmission is controlled by the [TCM](#), which electrically activates various solenoids to control the transmission gear selection. The sequence of solenoid activation is based on programmed information in the [TCM](#) memory and physical transmission operating conditions such as vehicle speed, throttle position, engine load and selector lever position.

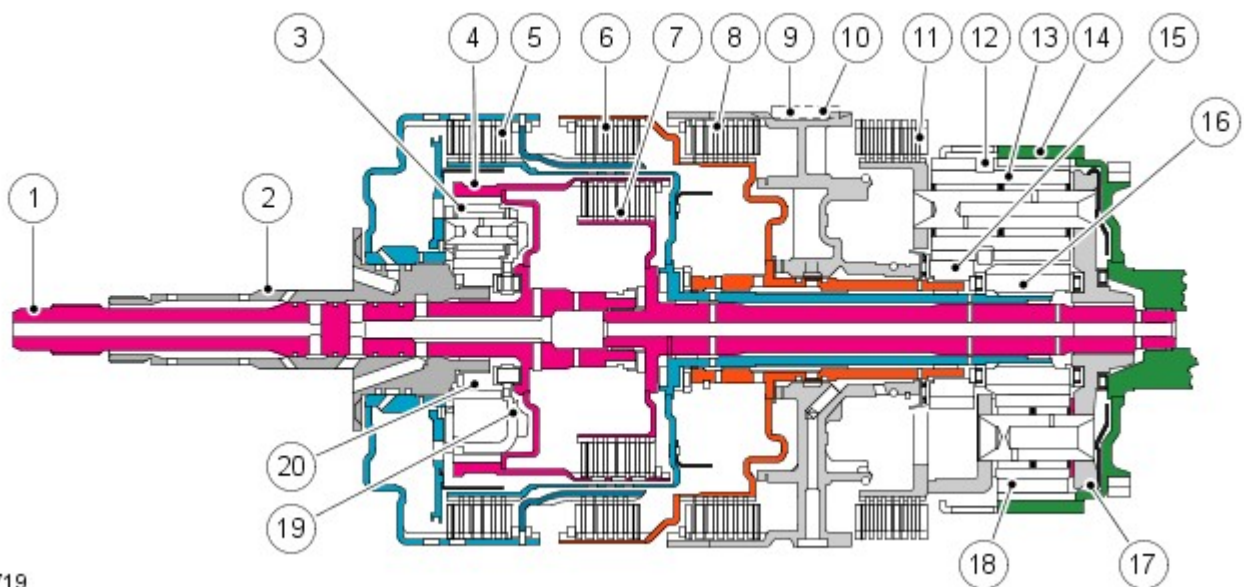

E42718

Item	Part Number	Description
1	-	Torque input from engine
2	-	Torque converter lock-up clutch
3	-	Single web planetary gear carrier
4	-	Single web planetary gears
5	-	Single web sunwheel 1
6	-	Double web sunwheel 2
7	-	Double web planetary gears - long
8	-	Double web planetary gear carrier
9	-	Double web planetary gears - short
10	-	Double web sunwheel 3
11	-	Torque output from transmission
A	-	Multiplate clutch
B	-	Multiplate clutch
C	-	Multiplate brake
D	-	Multiplate brake
E	-	Multiplate clutch

Engine torque is transferred, via operation of single or combinations of clutches to the 2 planetary gear trains. Both gear trains are controlled by reactionary inputs from brake clutches to produce the 6 forward gears and 1 reverse gear. The ratios are as follows:

Gear	1st	2nd	3rd	4th	5th	6th	Reverse
Ratio	4.171	2.340	1.521	1.143	0.867	0.691	3.403

Shift Elements

E42719

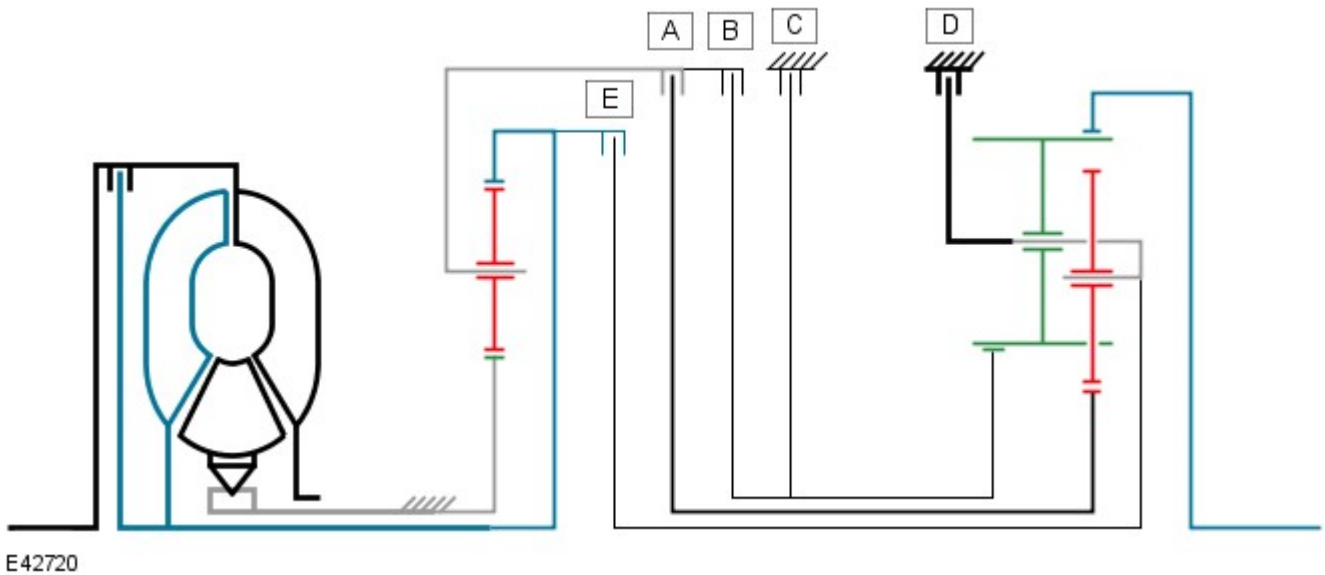

Item	Part Number	Description
1	-	Turbine shaft
2	-	Stator shaft
3	-	Single web planetary gear train

4	-	Ring gear 1
5	-	Clutch A
6	-	Clutch B
7	-	Clutch E
8	-	Brake clutch C
9	-	Fixed connection to transmission housing
10	-	Shaft key
11	-	Brake clutch D
12	-	Double web planetary gear train
13	-	Planetary gears - long
14	-	Ring gear 2
15	-	Sunwheel 2
16	-	Sunwheel 3
17	-	Double web planetary gear carrier
18	-	Planetary gears - short
19	-	Single web planetary gear carrier
20	-	Sunwheel 1

The shift elements are three rotating multiplate clutches (A, B and E) and two fixed multiplate brakes (C and D). All shifts from 1st to 6th gears are power-on overlapping shifts. Overlapping shifts can be described as one of the clutches continuing to transmit drive at a lower main pressure until the next required clutch is able to accept the input torque.

The shift elements, clutches and brakes are actuated hydraulically. Fluid pressure is applied to the required clutch and/or brake, pressing the plates together and allowing drive to be transmitted through the plates. The purpose of the shift elements is to perform power-on shifts with no interruption to traction and smooth transition between gear ratios.

Power Flow 1st Gear

The selector lever and the selector valve spool are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

The double web planetary gear train is locked against the transmission housing by brake 'D'. This allows ring gear 2 (output shaft) to be driven in the same direction as the engine via the long planetary gears.

• NOTE: Refer to 'Shift Elements' illustration for key

E42721

Power Flow 2nd Gear

E42722

The selector lever and the selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

Sunwheel 2 is locked to the transmission housing by brake clutch 'C'. The long planetary gears, which are also meshed with the short planetary gears, roll around the fixed sunwheel 2 and transmit drive to the double web planetary gear train carrier and ring gear 2 in the direction of engine rotation.

• NOTE: Refer to 'Shift Elements' illustration for key

E42723

Power Flow 3rd Gear

E 42724

The selector lever and the selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

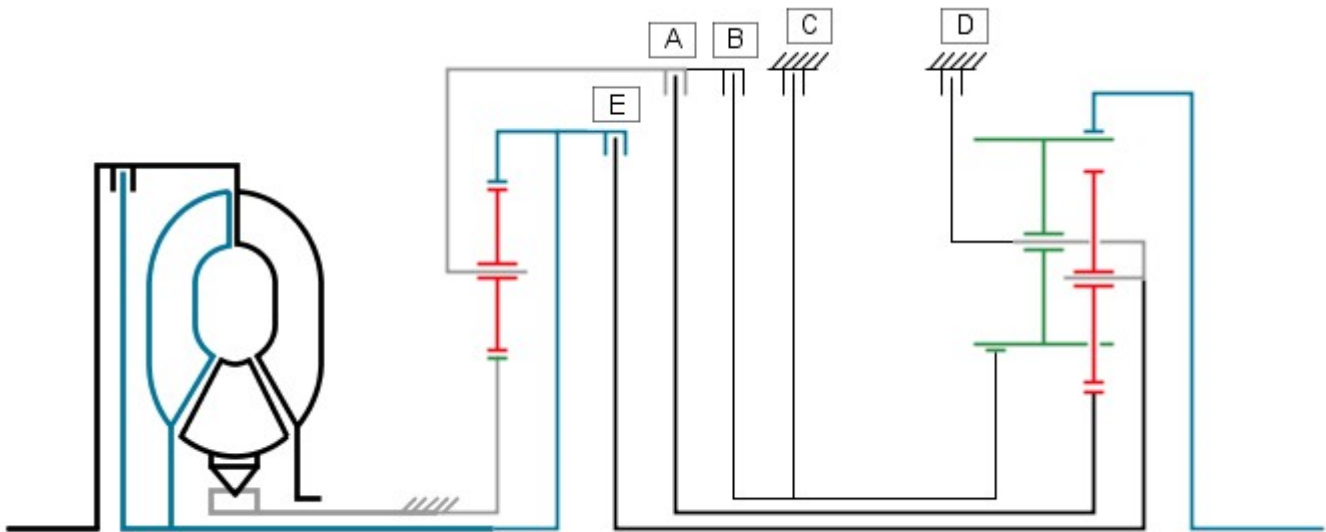

Sunwheel 2 is driven via clutch 'B' which is engaged. The long planetary gears, which are also meshed with the short planetary gears, cannot roll around the fixed sunwheel 2 and therefore transmit drive to the locked double web planetary gear train carrier in the direction of engine rotation.

• NOTE: Refer to 'Shift Elements' illustration for key

E42725

Power Flow 4th Gear

E42726

The selector lever and the selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

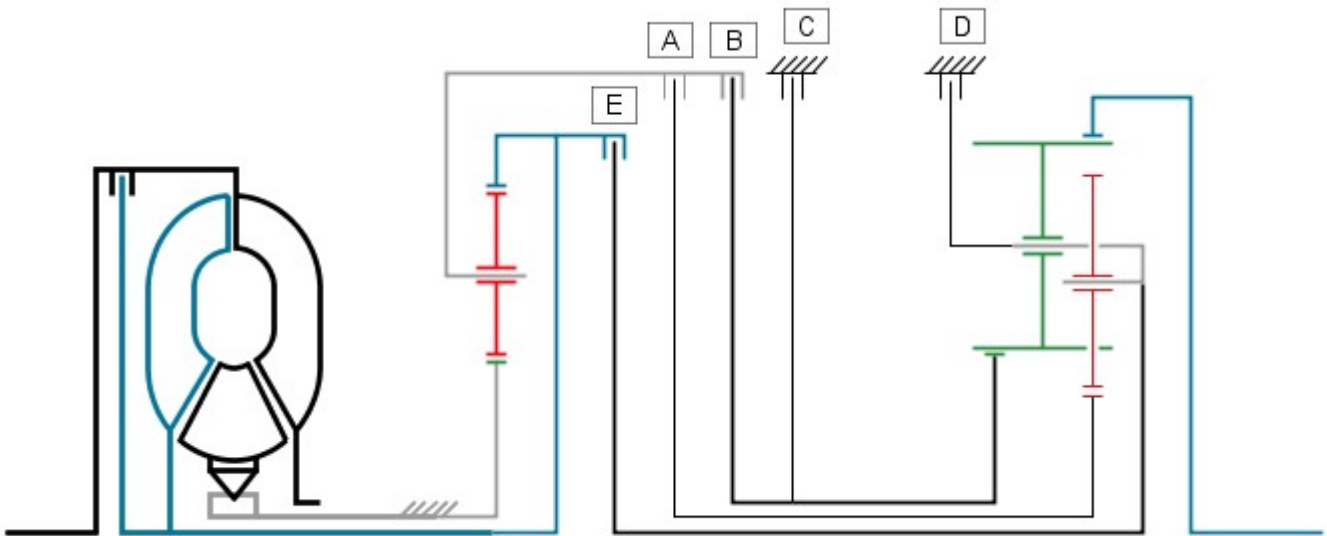

The double web planetary gear carrier is driven via clutch 'E' which is engaged. The long planetary gears, which are also meshed with the short planetary gears and the double web planetary gear carrier, drive ring gear 2 in the direction of engine rotation.

• NOTE: Refer to 'Shift Elements' illustration for key

E42727

Power Flow 5th Gear

E42728

The selector lever and the selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

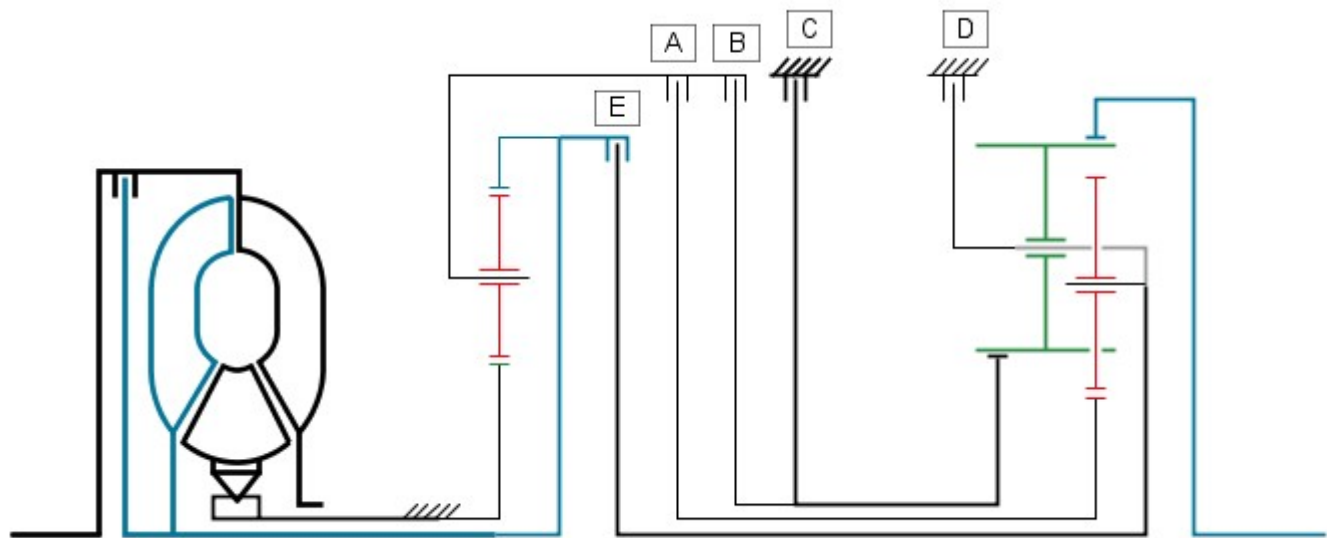

The long planetary gears, which are also meshed with the short planetary gears and the double web planetary gear carrier, drive ring gear 2 in the direction of engine rotation.

• NOTE: Refer to 'Shift Elements' illustration for key

E42729

Power Flow 6th Gear

E42730

The selector lever and the selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Clutches 'A' and 'B' are released, removing the effect of the single web planetary gear train.

Clutch brake 'C' is applied which locks sunwheel 2 to the transmission housing.

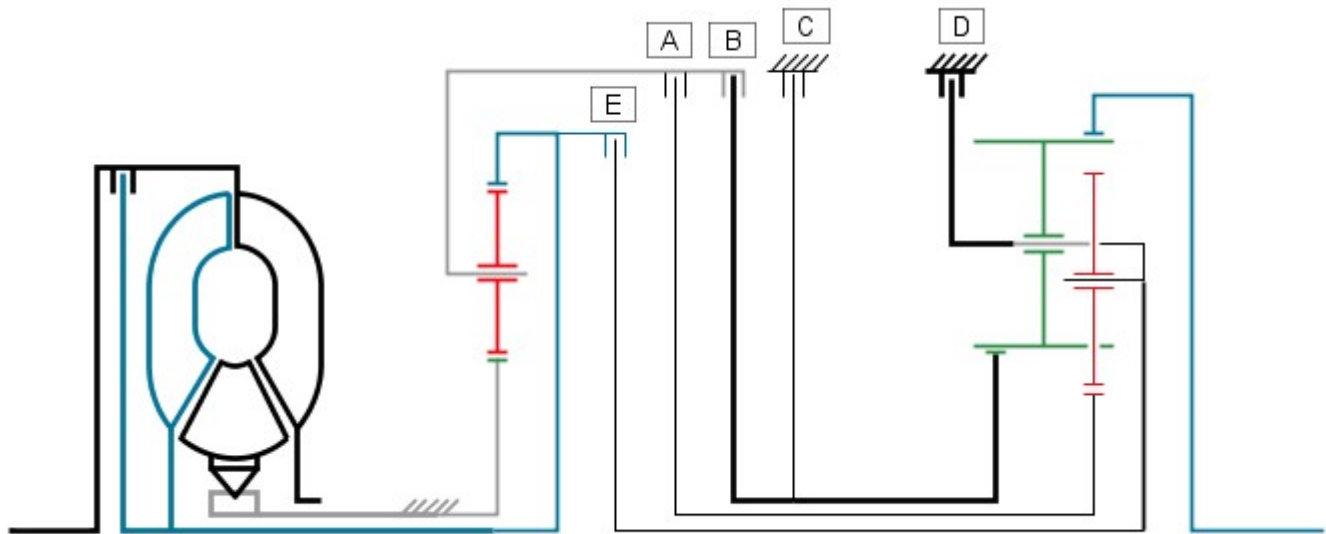

Clutch 'E' is engaged and drives the double web planetary gear carrier. This causes the long planetary gears to rotate around the fixed sunwheel 2 and transmit drive to ring gear 2 which is driven in the direction of engine rotation.

• NOTE: Refer to 'Shift Elements' illustration for key

E42731

Power Flow Reverse Gear

E42732

The selector lever and the selector spool valve are in the 'R' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears of the single web planetary gear train which rotate around the fixed sunwheel 1. This transmits the drive to the single web planetary gear carrier, the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

With clutch 'B' applied, sunwheel 2 in the double web planetary gear train is driven and meshes with the long planetary gears.

The double web planetary gear carrier is locked to the transmission housing C by brake clutch 'D'. This allows ring gear 2 to be driven in the opposite direction to engine rotation by the long planetary gears.

• NOTE: Refer to 'Shift Elements' illustration for key

E42733

Instrument Cluster

E121495

Item	Part Number	Description
1	-	MIL (malfunction indicator lamp)
2	-	Message center
3	-	Transmission status display

The instrument cluster is connected to the [TCM](#) via the high speed [CAN](#) bus. Transmission status is transmitted by the [TCM](#) and displayed to the driver in one of two displays in the instrument cluster. For additional information, refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).

Malfunction Indicator Lamp

The [MIL \(malfunction indicator lamp\)](#) is located in the tachometer of the instrument cluster. Transmission related faults which may affect the vehicle emissions will illuminate the [MIL](#).

The [MIL](#) is illuminated by the [ECM](#) on receipt of a relevant fault message from the [TCM](#) on the high speed [CAN](#). The nature of the fault can be diagnosed using Land Rover approved diagnostic equipment which reads the fault codes stored in the [TCM](#) memory.

Transmission Status Display

The transmission status display is located in the tachometer of the instrument cluster. The display shows the selector lever position or the selected gear when in manual and sport modes.

The following table shows the displays and their descriptions.

Symbol	Description
P	Park selected
R	Reverse selected
N	Neutral selected
D	Drive selected
s*	Sport mode selected (* = current gear)
1	1st gear selected (manual CommandShift mode)
2	2nd gear selected (manual CommandShift mode)
3	3rd gear selected (manual CommandShift mode)
4	4th gear selected (manual CommandShift mode)
5	5th gear selected (manual CommandShift mode)
6	6th gear selected (manual CommandShift mode)

Message Center

The message center is located in the center of the instrument cluster. The message center is a [LCD \(liquid crystal display\)](#) that relays vehicle status and operating information to the driver and can display messages relating to a number of vehicle systems. If a transmission fault occurs, the message GEARBOX FAULT is displayed in the message center.

For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

Transmission Control Module

The [TCM](#) outputs signals to control the shift control solenoid valve and the EPRS to control the hydraulic operation of the transmission.

The [TCM](#) processes signals from the transmission speed and temperature sensors, the selector lever, the [ECM](#) and other vehicle systems. From the received signal inputs and pre-programmed data, the [TCM](#) calculates the correct gear, torque converter clutch setting and optimum pressure settings for gear shift and lock-up clutch control.

The [ECM](#) supplies the engine management data over the high speed [CAN](#) bus. The [TCM](#) requires engine data to efficiently control the transmission operation, for example; flywheel torque, engine speed, accelerator pedal angle, engine temperature. The steering angle sensor and the [ABS \(anti-lock brake system\)](#) module also supply data to the [TCM](#) on the high speed [CAN](#) bus. The [TCM](#) uses data from these systems to suspend gear changes when the vehicle is cornering and/or the [ABS](#) module is controlling braking or traction control.

Using the signal inputs and the memorized data, the [TCM](#) control program computes the correct gear and torque converter lock-up clutch setting and the optimum pressure settings for gear shift and lock-up clutch control. Special output-side modules (power output stages, current regulator circuits), allow the [TCM](#) to control the solenoid valves and pressure regulators and consequently precisely control the hydraulics of the automatic transmission. In addition, the amount and duration of engine interventions are supplied to the engine management by way of the [CAN](#) bus.

The [TCM](#) determines the position of the selector lever using signals from:

- The selector switch in the transmission.
- The park lock and M/S (manual/sport) 'CommandShift' switches on the selector lever.

When the driver operates the steering wheel paddle switches the selections are sensed by the [TCM](#), which then operates in the manual CommandShift mode. If the selector lever is in D, the CommandShift mode is temporary and will cancel after a time period or can be cancelled by pressing and holding the + paddle for approximately 2 seconds. If the selector lever is in the M/S position, the CommandShift mode is permanent and can only be cancelled by pressing and holding the + paddle for approximately 2 seconds or by moving the selector lever to the D position.

The [TCM](#) transmits the position of the selector lever and the selected gear on the high speed [CAN](#) bus. This information is shown in the gear selector display in the instrument cluster.

Engine Stall

If the vehicle stalls it will coast down in gear, with the transmission providing drive to the engine. A restart can be attempted at this point and the engine may start and the driver can continue.

If the coast down speed reduces such that the speed of the engine is less than 600 rev/min, the transmission will go to neutral, D illumination will flash in the instrument cluster. The driver needs to select neutral or park and then press the brake pedal to restart the engine.

If the start/stop button is pressed when driving, the message ENGINE STOP BUTTON PRESSED is displayed in the message center but there will be no change to the ignition state. If the driver requires to switch off the engine, the start/stop button must be pressed for a second time. The engine will be stopped and will be back driven by the transmission as the vehicle coasts down.

Automatic Transmission/Transaxle - V8 5.0L Petrol/TDV6 3.0L Diesel - Diagnostics

Diagnosis and Testing

Principle of Operation

For a detailed description of the automatic transmission/transaxle system and operation, refer to the relevant Description and Operation sections in the workshop manual.

Fluid Level and Condition Check

CAUTION: The vehicle should not be driven if the fluid level is low as internal failure can result.

• **NOTE:** The transmission fluid temperature must not be allowed to exceed 50°C (122°F) whilst checking level. Should the temperature rise above this figure, abort the check and allow the transmission fluid to cool to below 30°C (86°F).

This vehicle is not equipped with a fluid level indicator. An incorrect level may affect the transmission operation and could result in transmission damage. To correctly check and add fluid to the transmission. Refer to the relevant section in the workshop manual.

High Fluid Level

A fluid level that is too high may cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission damage. If an overfill condition is identified, with the engine at idle ensure the fluid temperature is within the specified range and allow the excess fluid to drain until a small thread of fluid runs from the filler/level plug hole.

Low Fluid Level

A low fluid level could result in poor transmission engagement, slipping, or damage. This could also indicate a leak in one of the transmission seals or gaskets.

Adding Fluid

CAUTION: The use of any other type of transmission fluid other than that specified can result in transmission damage.

If fluid needs to be added, add fluid in 0.50 liter increments through the fill hole opening. Do not overfill the fluid. For fluid type, refer to the Specification section in the workshop manual.

Fluid Condition Check

1. Check the fluid level.
2. Observe the color and the odor of the fluid. The color under normal circumstances should be like honey, not dark brown or black.
3. Allow the fluid to drip onto a facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.

NOTE: In the event of a transmission unit replacement for internal failure, the oil cooler and pipes must also be replaced.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. Verify the customer concern.
2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical	Hydraulic
<ul style="list-style-type: none"> ● Damaged/stuck shift mechanism ● Damaged automatic transmission casing 	<ul style="list-style-type: none"> ● Blown fuse(s) ● Damaged, loose or corroded connectors ● Wiring harness 	<ul style="list-style-type: none"> ● Fluid level too high/low ● Poor condition of fluid ● Fluid leak

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Transmission Control Module \(TCM\) - Siemens](#) (100-00 General Information, Description and Operation).

Automatic Transmission/Transaxle - V8 5.0L Petrol/TDV6 3.0L Diesel - Transmission Fluid Level Check

General Procedures

Special Tool(s)

Check

• WARNINGS:

Observe due care when draining, as the fluid can be very hot.

Observe due care when working near a hot exhaust system.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.
 - The following steps must be observed before starting the transmission fluid level check.
 - The vehicle must be on a horizontal ramp.
 - The parking brake must be applied.
 - The engine must be running for 2 minutes with the transmission control switch (TCS) in the "P" position.

2.  **CAUTION:** Make sure that the transmission fluid temperature is below 30 degrees before starting the fluid level check.

Connect the diagnostic tool to the vehicle.

3.
 - Start the engine.
 - Apply, and hold, the footbrake.
 - Move the selector lever from 'P' through all gear positions, pausing in each gear position for 2-3 seconds and return to the 'P' position.

4.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

5. Torque: 9 Nm

6. Torque: 9 Nm

7. Place a suitable container under the transmission fluid fill plug.

8. **8. WARNINGS:**

 Observe due care when draining, as the fluid can be very hot.

 Observe due care when working near a hot exhaust system.

• **CAUTIONS:**

 The transmission fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

 Discard the seal.

- *Special Tool(s):* [307-452](#)
- Clean the area around the transmission fluid level plug.

Adjustment

• **WARNINGS:**

 Observe due care when draining, as the fluid can be very hot.

 Observe due care when working near a hot exhaust system.

• **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

1. **9. NOTE:** Use transmission fluid meeting Land Rover specification.

If the transmission fluid does not come out of the transmission fluid fill plug hole the transmission fluid level is insufficient. If this is the case add the transmission fluid in 0.5 liter units into the transmission fluid fill plug hole until fluid comes out.

2. **10.** NOTE: Make sure the transmission fluid temperature does not exceed 50 °C (122 °F). If the transmission fluid temperature does exceed 50 °C (122 °F) stop the transmission fluid level check and allow the transmission fluid to cool until the temperature is below 30 °C (86 °F).

Allow the transmission fluid to drain from the transmission fluid filler plug hole until the flow almost stops.

3. **11.** NOTE: Install a new sealing washer.

Using the special tool, install the new transmission fluid fill plug.

E37107

4. **12.**  CAUTION: Make sure the transmission fluid fill plug is tightened to the correct specification. Failure to follow this instruction may result in damage to the vehicle.

- To make sure the transmission fill plug is torqued to the correct specification. Using the special tool and torque wrench the following calculation steps must be followed.
- Step 1. Multiply 35 Nm by the effective length of the torque wrench (1).
- Step 2. Add the effective length of the special tool (2) to the effective length of the torque wrench (1).
- Step 3. Divide the total of step 1 by the total of step 2.
- Step 4. Set the torque wrench to the figure arrived at in step 3.
- Tighten the transmission fluid fill plug to the torque given by the calculation.

5. Remove the special tool.

6. Remove the container.

7. Torque: 9 Nm

8. Torque: 9 Nm

9. Lower the vehicle.

10. Disconnect the diagnostic tool from the vehicle.

Automatic Transmission/Transaxle - V8 5.0L Petrol/TDV6 3.0L Diesel - Transmission Fluid Drain and Refill

General Procedures

Special Tool(s)

Drain

- WARNINGS:

 Observe due care when draining, as the fluid can be very hot.

 Observe due care when working near a hot exhaust system.

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

11.  CAUTION: Be prepared to collect escaping fluids.

- NOTE: The component cannot be removed at this stage.

Detach the transmission fluid pan from the transmission.

12.

13.

14. **14.**  CAUTION: Discard the component.

15. **15.**  **CAUTION:** Be prepared to collect escaping fluids.
- **NOTE:** Note the position of the manual park brake release.
 - **NOTE:** Transmission fluid pan shown removed for clarity.

Remove the transmission control module and the transmission fluid pan.

16.

17.

18. Remove the transmission fluid pan and the transmission control module.

19. Remove and discard the gasket.

Installation

1. 1. CAUTIONS:

 Make sure that when fully fitted, all seals protrude by the same amount.

-  Install the new seals.
- Install a new seal block.

2. 2. CAUTIONS:

 Install the new seals.

 Make sure that when fully fitted, all seals protrude by the same amount.

3. Install the new gasket.

4. Install the transmission fluid pan and the transmission control module.

5.  CAUTION: Make sure the manual park release is correctly engaged.

- NOTE: Transmission fluid pan shown removed for clarity.

Tighten to 8 Nm.

6.  CAUTION: Make sure that a new component is installed.

38. **38. CAUTIONS:**

Make sure the correct specification of oil is used.

Make sure the transmission fluid fill plug is tightened to the correct specification. Failure to follow this instruction may result in damage to the vehicle.

• **NOTE:** Install a new fluid level filler plug.

- Carry out a transmission fluid level check.
- To make sure the transmission fill plug is torqued to the correct specification. Using the special tool and torque wrench the following calculation steps must be followed.
- Step 1. Multiply 35 Nm by the effective length of the torque wrench (1).
- Step 2. Add the effective length of the special tool (2) to the effective length of the torque wrench (1).
- Step 3. Divide the total of step 1 by the total of step 2.
- Step 4. Set the torque wrench to the figure arrived at in step 3.
- Tighten the transmission fluid fill plug to the torque given by the calculation.

Transmission/Transaxle Cooling - TDV6 2.7L Diesel - Transmission Cooling

Diagnosis and Testing

Principle of Operation

For a detailed description of the automatic transmission cooling system, refer to the relevant Description and Operation sections in the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern by operating the system.
2. **2.** Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> ● Feed and return tubes ● Connections to the automatic transmission and the automatic transmission fluid cooler ● Automatic transmission fluid level

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Condition	Possible Causes	Action
Over heating of the automatic transmission	Obstruction in the automatic transmission fluid cooler	Flush out the automatic transmission fluid cooler with new automatic transmission fluid. If the flushing is unsuccessful, install a new transmission fluid cooler. REFER to: Transmission Fluid Cooler (307-02A Transmission/Transaxle Cooling - TDV6 2.7L Diesel, Removal and Installation).
Over heating of the automatic transmission	Obstruction in the automatic transmission fluid tubes	Flush out the automatic transmission fluid cooler tubes with new automatic transmission fluid. If the flushing is unsuccessful install new automatic transmission fluid cooler tubes.
Loss of automatic transmission fluid	Connections to the automatic transmission and the automatic transmission fluid cooler	Check the integrity of the tubes, connections and seals. Check the torque of the tube fixings.
Loss of automatic transmission fluid	Leak at oil cooler	Check the integrity of tubes, connections and seals. Check the torque of the tube fixings.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Transmission Control Module \(TCM\) - Bosch](#) (100-00 General Information, Description and Operation).

Transmission/Transaxle Cooling - V8 5.0L Petrol/TDV6 3.0L Diesel - Transmission Cooling

Description and Operation

E122434

Item	Part Number	Description
1	-	Latch-plate
2	-	Return hose and pipe (to transmission)
3	-	Feed hose and pipe (from transmission)
4	-	Mounting bracket
5	-	Transmission fluid cooler
6	-	Engine coolant hose connections

INTRODUCTION

Transmission cooling is provided by a transmission fluid cooler, which transfers heat from the transmission to the engine cooling system. The transmission fluid cooler is installed in the engine compartment, on a mounting bracket attached to the crossmember of the secondary loadpath frame.

Two hose and pipe assemblies connect the transmission fluid cooler to the automatic transmission. Two engine coolant hose connections are incorporated into the transmission fluid cooler for the supply and return of coolant from the engine cooling system.

For additional information, refer to: [Engine Cooling](#) (303-03D Engine Cooling - V8 5.0L Petrol, Description and Operation).

Fluid from the pump in the automatic transmission flows through the feed hose and pipe to the transmission fluid cooler. The fluid then flows through the transmission fluid cooler, and the return hose and pipe, to the sump of the automatic transmission.

Transmission/Transaxle Cooling - V8 5.0L Petrol/TDV6 3.0L Diesel - Transmission Cooling

Diagnosis and Testing

Principle of Operation

For a detailed description of the automatic transmission cooling system, refer to the relevant Description and Operation sections in the workshop manual.

Inspection and Verification

1. 1. Verify the customer concern by operating the system.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> ● Feed and return tubes ● Connections to the automatic transmission and the automatic transmission fluid cooler ● Automatic transmission fluid level

Automatic Transmission/Transaxle External Controls - TDV6 2.7L Diesel - Selector Lever Cable Adjustment

General Procedures

1.  **WARNING:** The hand brake and foot brake **MUST BE** applied.

Check for correct cable adjustment.

- Move the selector lever from 'P' position, check engagement in each position and return to 'P'.
- Check that the engine will start in 'P' and 'N' positions and that the engine start is inhibited when drive positions are selected.

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the transmission undershield.

- Remove the 6 bolts.

4. If installed, remove the transmission heat shield.

- Remove the 4 bolts.

5. Adjust the selector cable.

- Using an additional wrench, restrain the clamping bush and loosen the locknut.
- Move the selector lever on the gearbox fully forward and release it. The lever will return to the 'P' position.
- Make sure the selector lever is in the 'P' position.
- Push the cable inner rearward then release it.
- Tighten the locknut to 14 Nm (10 lb.ft).

6.  **WARNING:** The hand brake and foot brake **MUST BE** applied.

Check for correct cable adjustment.

- Move the selector lever from 'P' position, check engagement in each position and return to 'P'.
- Check that the engine will start in 'P' and 'N' positions and that the engine start is inhibited when drive positions are selected.

7. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

8. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

Automatic Transmission/Transaxle External Controls - TDV6 2.7L Diesel - Selector Lever Assembly

Removal and Installation

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- If installed, remove the transmission undershield.
 - Remove the 6 bolts.

- Remove the transmission heat shield.
 - Remove the 4 bolts.

- Release the selector cable.
 - Using an additional wrench, restrain the clamping bush and loosen the locknut.
 - Compress the latch and release the cable.

5. Release the selector cable from its guide bracket.

6. Remove the floor console upper trim panel.

7. Remove the transmission selector lever.

- Remove the 3 nuts.
- Disconnect the electrical connector.
- Release the selector cable from the body.

Installation

1. Install the transmission selector lever.

- Secure the cable to the floor.
- Connect the electrical connector.
- Tighten the nuts to 8 Nm (6 lb.ft). Before VIN257100, discard old fixings.

2. **NOTE:** Do not tighten the locking nut at this stage.

Connect the selector cable to the transmission.

- Engage the inner cable with the lever clamping bush.
- Connect the selector cable to its abutment bracket.

3. Position the selector cable to its guide bracket.

4. Install the floor console upper trim panel.

5. Adjust the selector cable.

6. Install the transmission heat shield.

- Tighten the bolts to 10 Nm (8 lb.ft).

7. If installed, install the transmission undershield.

- Tighten the bolts to 10 Nm (8 lb.ft).

Automatic Transmission/Transaxle External Controls - TDV6 2.7L Diesel - Selector Lever Knob

Removal and Installation

Removal

1.  **WARNING:** The gear lever knob will be released suddenly, keep face clear during removal.

Remove the selector lever knob.

- Pull the knob upwards.

Installation

1.  **CAUTION:** Only fit the selector knob when the selector lever is in the 'P' position.

Install the selector lever knob.

- Engage the locating tang of the knob with the slot in the selector lever.
- Push the knob fully onto the selector lever.

Automatic Transmission/Transaxle External Controls - TDV6 2.7L Diesel - Selector Lever Cable

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Automatic Transmission/Transaxle External Controls - V8 5.0L Petrol/TDV6 3.0L Diesel - External Controls

Description and Operation

COMPONENT LOCATION

E122602

Item	Part Number	Description
1	-	Selector lever assembly
2	-	M/S (manual/sport) display
3	-	Selector lever position display
4	-	Selector cable

INTRODUCTION

The external controls for the transmission consist of a selector lever assembly and a selector cable.

The selector cable transmits the position of the selector lever to the transmission.

The selector lever position is displayed on the selector lever position display and the M/S (manual/sport) display. The selector lever position and current forward gear are also displayed in the instrument cluster.

For additional information, refer to: [Transmission Description](#) (307-01D Automatic Transmission/Transaxle - V8 5.0L Petrol/TDV6 3.0L Diesel, Description and Operation).

SELECTOR LEVER ASSEMBLY

E123732

Item	Part Number	Description
1	-	Selector lever
2	-	Selector lever position display
3	-	Console panel and bezel
4	-	M/S display
5	-	Shutter
6	-	Mounting plate
7	-	Screw (8 off)
8	-	Seal
9	-	Selector cable
10	-	Screw and washer (4 off)
11	-	Interlock emergency release lever and selector assembly

The selector lever assembly is located in the floor console and is secured to the transmission tunnel closure plate. The selector lever assembly comprises a moulded plastic housing which provides for the location of the selector components.

The lever is connected to a crosspiece which allows for the selection of P, R, N, D in a forward and backward direction and selection between D and M/S in a left/right direction.

When M/S (sport) mode is selected the lever can be moved in a forward or backward direction to select + or - for manual (CommandShift®) operation. If left in sport mode, all gear changes are performed automatically.

If manual (CommandShift®) mode is selected, all gear changes are based on inputs received by the [TCM \(transmission control module\)](#) from manual +/- Hall effect sensors located in the selector lever assembly.

The selector lever assembly houses the following components:

- PCB (printed circuit board)
- Shift Interlock solenoid
- Park and Neutral locking levers.

The selector lever positions are as follows:

- P (park) : no torque transmitted to the drive wheels and prevents the vehicle from moving by locking the transmission
- R (reverse) : selects reverse gear - only to be selected when the vehicle is stationary and the engine is at idle
- N (neutral) : no torque transmitted to the drive wheels - allows the vehicle to roll, so ensure the [EPB \(electronic parking brake\)](#) is applied before leaving the vehicle in this state
- D (drive) : this position uses all six forward gears in automatic operation
- M/S : this position engages the sport mode, which uses all six forward gears as in D, but will upshift at higher engine speeds improving acceleration
- + and - : initiates upshifts and downshifts respectively, allowing the transmission to be used as a sequential manual transmission (CommandShift® mode) with six forward gears.

The selector lever position is displayed to the driver on the selector lever position display, M/S display and in the instrument cluster.

Manual/Sport and +/- CommandShift® Sensors

The PCB in the selector lever assembly contains Hall effect sensors to activate the M/S mode and provide the +/- signals.

When the selector lever is moved to the M/S position, the lower magnet located in the selector lever is moved close to the M/S Hall effect sensor on the PCB. This provides a signal for the [TCM](#), which initiates sport mode.

When the selector lever is moved to the + or - position, the magnet is moved close to one of the Hall effect sensors positioned either side of the M/S Hall effect sensor. When an input from either the + or - sensor is received, manual CommandShift® mode is initiated by the [TCM](#). A spring moves the selector lever back to the center position when released. When the selector lever is moved back to the D position, the [TCM](#) returns to normal automatic operation.

Selector Lever Position and Manual/Sport Displays

The displays are incorporated into the console panel on the selector lever assembly. The selector lever position display is located on the [RH \(right-hand\)](#) side of the selector lever and the M/S display is located on the [LH \(left-hand\)](#) side of the selector lever. The two displays are connected to the PCB of the selector lever assembly. An [LED \(light emitting diode\)](#) is installed under the P, R, N and D of the selector lever position display and the M/S of the M/S display. The position of the selector lever is sensed by the PCB, which illuminates the related [LED](#) in the displays.

P, R, N, D Position Switch

The P, R, N, D position switch is located within the Mechatronic valve block in the transmission. The switch is operated by movement of the selector lever to the P, R, N or D positions via the selector cable, which is connected between the selector lever and the transmission selector shaft.

The switch is electrically connected to the [TCM](#), which outputs a common power supply to each of the four switch contacts. This power supply is also used by the two speed sensors and the fluid temperature sensor in the transmission. Each of the four switch contacts have a separate output to the [TCM](#), which enables the [TCM](#) to detect the position of the selector lever.

Shift Interlock Solenoid

The shift interlock solenoid is located on the side of the selector lever assembly. The solenoid is connected to two locking levers, which engage with the base of the selector lever and lock it in the P and N positions when the solenoid is de-energized. Operation of the solenoid is controlled by the [TCM](#).

When the ignition is on and the brake pedal is pressed, the [TCM](#) energizes the solenoid and the selector lever can be moved from the P or N position. This prevents the selector lever from being moved to the D or R position unintentionally, and the application of the brakes prevents the vehicle 'creeping' when the transmission engages gear.

Movement of the selector lever from the P or N positions is prevented if the [TCM](#) senses the engine speed is above 2500 rev/min, even if the brake pedal is pressed.

The selector lever is locked in the N position during the transfer box changing range from high to low or vice versa.

If there is a vehicle electrical failure, or failure of the interlock solenoid or associated wiring, it is possible to move the selector lever from the P position by removing the selector lever, and the switch pack and finisher, and lifting the white tab on the rear of the selector lever assembly. While holding the tab in this position, the selector lever can be moved from the P position.

SELECTOR CABLE

The selector cable is used as a mechanical connection between the selector lever and the transmission. The cable is a Bowden cable. Movement of the selector lever between the P, R, N and D positions moves the cable. Movement of the cable is prevented when the selector lever is in the M/S position.

A seal is installed on the cable where it passes through the mounting plate. The outer cable is attached to a bracket on the transmission. The inner cable is connected to a lever attached to the transmission selector shaft.

Movement of the selector lever between the P, R, N and D positions moves the inner cable, which moves the lever. The lever transforms the linear movement of the cable into rotary movement of the selector shaft, which operates the P, R, N, D position switch and a spool valve in the Mechatronic valve block.

CONTROL DIAGRAM

• NOTE: A = Hardwired; D = High speed CAN (controller area network) bus.

Manual Transmission/Transaxle and Clutch - General Information -**Torque Specifications**

Description	NM	lb-ft
Clutch bleed screw	10	7
Transmission heat shield bolts	10	7

Manual Transmission/Transaxle and Clutch - General Information - Clutch System Bleeding

General Procedures

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission undershield.

- Remove the 6 bolts.

3. Check that all the clutch line connections are tight and that there are no signs of leaks.

4. Remove the brake master cylinder cover.

- Release the 3 clips.

5.  **WARNING:** Do not allow dirt or foreign liquids to enter the reservoir. Use only new Shell DOT 4 ESL brake fluid from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

 **CAUTION:** Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Fill the brake fluid reservoir.

- Remove the filler cap.

6. Attach the bleed tube to the clutch bleed screw and immerse the free end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.

7. Loosen the bleed screw by one-half turn.

8.  CAUTION: The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

• NOTE: It may be necessary to physically return the pedal to the start position.

Depress the clutch pedal steadily through its full stroke and return to the rest position. Repeat the procedure until a flow of clean, air-free fluid is being pumped into the bleed jar.

9.  CAUTION: Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the clutch pedal fully depressed, tighten the bleed screw to 10 Nm (7 lb.ft).

10. Fill the brake fluid reservoir.

- Install the filler cap.

11. Operate the clutch pedal and check for leaks.

12. Install the cover.

13. Install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

Clutch - TDV6 2.7L Diesel -**Hydraulic fluid**

Item	Specification
* Recommended hydraulic fluid	SHELL DONAX YB DOT4 ESL FLUID

CAUTION: * If the above fluid is not available, use a low viscosity DOT 4 brake fluid meeting ISO 4925 Class 6 and Land Rover LRES22BF03 requirements.

General Specifications

Item	Specification
Type	Diaphragm spring, hydraulically operated self-adjusting clutch with lead free friction facings coupled to a dual mass flywheel
Drive plate diameter	258 mm (10.15 in)
Pressure plate diameter	258 mm (10.15 in)
Clutch plate friction material	Raybestos 5088
Clutch plate thickness - Measured from outer face of plate to rivet:	
Drive plate - New	3.2 mm (0.125 in)
Service limit	0.2 mm (0.007 in)
Pressure plate - New	3.2 mm (0.125 in)
Service limit	0.2 mm (0.007 in)
Master cylinder	Integral with brake master cylinder
Slave cylinder	Incorporates quick release hydraulic pipe coupling and bleed valve

9	-	Concentric slave cylinder outlet

GENERAL

The clutch system is based on the established principle of a single driven plate and diaphragm spring clutch cover assembly hydraulically actuated from the clutch pedal. Depressing the clutch pedal transfers hydraulic fluid through the master cylinder, pipework, and slave cylinder ultimately actuating the clutch fingers to release the clutch and thus disengage drive from the crankshaft. When your foot is off the pedal, the spring pushes the pressure plate against the clutch disc, which in turn presses against the flywheel, this locks the engine to the transmission input shaft, causing them to rotate at the same speed.

The clutch system is of conventional design comprising the following major components:

- Clutch master cylinder
- Clutch pressure pipes
- Release bearing/slave cylinder
- Clutch Cover assembly
- Clutch driven plate
- Dual mass flywheel

CLUTCH MASTER CYLINDER

E50628

Item	Part Number	Description
1	-	Clutch master cylinder

The clutch master cylinder is attached directly to the pedal box assembly, located in the driver's footwell.

The cylinder contains a piston assembly, with a push rod connected to the clutch pedal and spring. When the clutch pedal is depressed, it pushes on the piston, via a linkage. Pressure builds in the cylinder and lines as the clutch pedal is depressed further.

The cylinder has two hydraulic connections:

- A low pressure feed pipe (providing fluid supply from the brake fluid reservoir)
- A high pressure pipe

The cylinder also contains a linear transducer type sensor, which provides signals to various vehicle systems, for example, the electric park brake, engine calibration and the slip control system.

For additional information, refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

The pedal travel is constrained by an 'up-stop', and a 'down-stop' contained within the master cylinder.

LOW-PRESSURE PIPE

The low-pressure pipe is a plastic pipe running between the master cylinder and the common brake fluid reservoir. The pipes function is to ensure the hydraulic system remains full. The pipes connections are of the push type and are located at each end.

HIGH-PRESSURE PIPES

The high-pressure pipes run from the clutch master cylinder to a point adjacent to the gearbox clutch housing, on the RH side of vehicle. The assembly consists a steel tubing and a flexible pipe. The flexible pipe is used to absorb movement between the metal tube, which is fixed to the vehicle body, and the transmission.

A vibration absorber is fitted in the pipe. The absorber is located at the front end of the transmission tunnel on RH side of vehicle and is fixed to a bracket on the body.

All high-pressure connections are of the 'quickfit' design utilising a 'U' shaped spring clip for retention.

CONCENTRIC SLAVE CYLINDER OUTLET ASSEMBLY

E50629

The concentric slave cylinder outlet assembly connects the external pipes with the release system contained within the clutch housing. A securing bracket locates the assembly in the correct orientation and a seal is provided between the assembly and the clutch housing. The bleed screw is also located at this point.

CONCENTRIC SLAVE CYLINDER

E50630

The concentric slave cylinder assembly contains the release bearing and the hydraulic slave cylinder. The assembly is attached to the front end of the transmission via 3 bolts. These bolts are asymmetrically positioned to ensure correct angular location of the slave cylinder, which is also spigot-mounted for positional fit. In its free condition the slave cylinder is fully extended, but it positions itself automatically as the clutch housing is fitted to the engine. The assembly requires no setting or adjustment.

CLUTCH COVER ASSEMBLY

The clutch cover assembly is known as a self-adjusting clutch with a nominal diameter of 260mm.

Self Adjusting Clutch

E50631

Item	Part Number	Description
A	-	Conventional clutch
B	-	Self adjusting clutch
1	-	Sensor spring
2	-	Adjuster ring
3	-	Diaphragm spring

The self-adjusting clutch contains a mechanism, which improves operation and driver comfort by enabling a more consistent pedal load as the friction faces wear, unlike conventional types of clutch which exhibit increasing pedal load with wear.

With a conventional clutch, facing wear causes the angle of the actuating diaphragm spring to change as the pressure plate moves axially towards the engine, requiring a greater force to operate the clutch (diaphragm actuating force varies with diaphragm angle). The self-adjusting clutch reduces this problem by allowing the diaphragm spring to follow the axial movement of the pressure plate thus maintaining the diaphragm spring at the same angle throughout the life of the clutch. As well as maintaining a more consistent pedal load, the clamp force on the pressure plate also remains constant with wear.

The diaphragm spring is not fixed at its rotation point like the conventional system but pivots between a sensor spring and an adjuster ring. The sensor spring provides a counter force, which is just sufficient to retain the diaphragm spring axially against the cover via the adjuster ring and during normal actuation of the clutch. As the linings wear, the tendency of the diaphragm angle to change causes an increase in the actuation force required to operate the clutch. When this increased effort exceeds the counter force of the sensor spring, the diaphragm spring moves axially towards the pressure plate until the original angle is restored. At this point the actuation force required drops to the level of the opposing sensor spring force, restoring equilibrium with the diaphragm spring at its new location.

During the axial movement of the diaphragm spring, the adjuster ring takes up the increased distance between the spring and cover. This ring contains raised segments, each having a ramp profile, which fits into a corresponding shape in the clutch cover. When the diaphragm spring moves axially for wear compensation, three pre-loaded coil springs in the clutch cover cause the adjuster ring to rotate, moving up the ramps and taking up the extra distance between the diaphragm spring and clutch cover.

• NOTE: During operation, the adjuster ring rotates in a clockwise direction, as viewed from the transmission. If, for any reason, a worn driven plate is replaced in service but the clutch cover assembly is to be reused, the adjuster ring must be rotated back to its pre-loaded position. This operation requires the use of a press to release load on the clutch whilst the adjuster ring is repositioned and is not recommended as a service action. However, it is recommended that a complete clutch cover assembly and driven plate are used together in any service repair.

• NOTE: If, for any reason, the clutch cover and driven plate are removed and the driven plate is found to be capable of further use, then the original cover/driven plate can be re-installed without the need for any adjustment.

CLUTCH DRIVE PLATE

E47715

Item	Part Number	Description
1	-	Dual mass flywheel
2	-	Drive plate
3	-	Pressure plate

The clutch driven plate is of conventional design with a splined hub for locating the gearbox input spline. Lubricant is not required on this interface. The friction material, which is lead and asbestos free, is connected to the hub by a spring pack, which reduces torsional inputs into the transmission.

DUAL MASS FLYWHEEL

E47716

Item	Part Number	Description
1	-	Ring gear
2	-	Primary flywheel
3	-	Inner drive plate
4	-	Spring housing
5	-	Cover
6	-	Mounting hole
7	-	Splined hub
8	-	Damper springs
9	-	Inner drive plate
10	-	Spring housing
11	-	Secondary flywheel

As the name implies, this assembly consists of two main assemblies; the primary side, which is secured to the crankshaft with eight fixing's, and the secondary side to which the clutch cover assembly is secured.

The primary side carries the starter ring gear, and a roller bearing into which the long gearbox input shaft is supported.

The secondary side provides the surface to which the clutch friction material contacts, and is fitted with three dowels and 6 fixing holes, which are used to secure the clutch cover to the flywheel.

It is recommended that new crankshaft fixing's are used when removing or replacing a flywheel.

The secondary side is supported by the primary side on a bearing and radial springs.

The freedom of rotational movement between the primary and secondary masses acts as a damper, reducing torsional vibration levels between the crankshaft and the transmission.

Clutch - TDV6 2.7L Diesel - Pilot Bearing

Removal and Installation

Special Tool(s)	
 <p>303-1096</p> <p>E48531</p>	Pilot (spigot) bearing installer/clutch alignment
	303-1096

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the flywheel.
For additional information, refer to: [Flywheel](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

- Remove the pilot bearing.

- With the flywheel supported, use a drift.

E48532

Installation

- Using the special tool, install the pilot bearing.

- Clean the component mating faces.

E48533

- Install the flywheel.
For additional information, refer to: [Flywheel](#) (303-01A Engine - TDV6 2.7L Diesel, In-vehicle Repair).

Clutch - TDV6 2.7L Diesel - Clutch Disc and Pressure Plate

Removal and Installation

Special Tool(s)	
 <p>303-1096</p> <p>E48531</p>	Pilot (spigot) bearing installer/clutch alignment
	303-1096

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transmission.
For additional information, refer to: [Transmission](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Removal).

-  **CAUTION:** Working in a diagonal sequence, progressively loosen the bolts.

- NOTE:** Restrain the flywheel.

Remove the pressure plate and clutch disc.

- Remove the 6 bolts.

Installation

1. NOTE: The clutch cover is self adjusting. It is recommended that a clutch disc and clutch cover is replaced as an assembly. If a used clutch cover is assembled with a new clutch disc, the clutch cover adjustment must be reset prior to assembly. With the clutch cover supported under its outside edge, press down evenly on the diaphragm fingers as shown, until the clutch cover adjustment ring can be rotated fully counterclockwise. With the adjustment ring held in this position, release the pressure on the diaphragm fingers. The adjustment ring will be held in this position until self adjustment on the application of the clutch pedal.

Check, and if necessary, reset the clutch pressure plate.

E54194

2. CAUTIONS:

 Examine the flywheel for signs of scoring or overheating. Renew if worn or damaged.

 Examine the clutch release bearing for signs of wear or damage. Renew if necessary.

 Examine the spigot bearing for signs of wear or damage. Renew if necessary.

Clean the component mating faces.

3. CAUTIONS:

 Install the clutch disc with 'TRANSMISSION SIDE' marking against the clutch cover.

 Use the special tool to align the components.

 Working in a diagonal sequence, progressively tighten the bolts.

• NOTE: Restrain the flywheel.

Install the clutch disc and pressure plate.

- Tighten the bolts to 25 Nm (18 lb.ft).

E52452

4. Install the transmission.

For additional information, refer to: [Transmission](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Removal).

Description and Operation

For additional information, refer to: [Clutch](#) (308-01 Clutch - TDV6 2.7L Diesel, Description and Operation).

Clutch Controls - TDV6 2.7L Diesel - Clutch Master Cylinder

Removal and Installation

Removal

CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

E47923

1. Remove the driver side closing trim panel.

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.

2. Release the clutch master cylinder clevis pin.

- Remove the clip.

3. Remove clutch pedal spring assister.

4. **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Release the clutch master cylinder.

- Position a container to collect the fluid.
- Disconnect the electrical connector.
- Remove the 2 bolts.
- Remove the clip.

E52539

5. Remove the clutch master cylinder.

- Disconnect the fluid supply line and discard the O-ring seal.

Installation

1. Install the clutch master cylinder.

- Using a new seal, connect the fluid supply line.
- Install the clip.
- Tighten the bolts to 10 Nm (7 lb.ft).
- Connect the electrical connector.
- Remove the container.

2. Install the clutch pedal spring assister.

3. Secure the clevis pin.

- Fit the clip.

4. Install the closing trim panel.

- Connect the electrical connector.
- Secure the clip.
- Tighten the screws.

5. Raise and support the vehicle.

6. Bleed the clutch system.

For additional information, refer to: [Clutch System Bleeding](#) (308-00 Manual Transmission/Transaxle and Clutch - General Information, General Procedures).

Clutch Controls - TDV6 2.7L Diesel - Clutch Pedal

Removal and Installation

Removal

1. Remove the brake booster.
For additional information, refer to: Brake Booster (206-07, Removal and Installation).
2. Remove the headlamp switch.
For additional information, refer to: Headlamp Switch (417-01, Removal and Installation).
3. Remove the driver side closing trim panel.

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.

E47923

4. Remove the instrument panel access panel.

- Release the 2 clips.

E51369

5. Remove the brake pedal bracket.

- Release the wiring harness clip.
- Remove the 4 Torx bolts.

E52543

6. Release the stoplamp wiring harness.

- Disconnect the electrical connector.

- Release the 2 clips.

7. Remove the stoplamp switch.

8. Remove clutch pedal spring assister.

9. Release the clutch master cylinder.

- Release the clutch master cylinder clevis pin.
- Remove the 2 nuts.

10. Remove the pedal assembly.

- Remove the 2 nuts.

11. NOTE: Do not disassemble further if the component is removed for access only.

Remove the brake pedal pad.

12. Remove the clutch pedal pad.

E53198

13. Remove the pedals.

- Carefully release the spring tension.
- Remove the bolt and discard the nut.

14. Remove the 3 pedal bushings.

E53199

Installation

1. Install the bushing.
 - Clean the component mating faces.
 - Lubricate the components.
2. Install the pedals.
 - Install the return spring.
 - Tighten the nut and bolt to 45 Nm (33 lb.ft).
3. Install the clutch pedal pad.
4. Install the brake pedal pad.
5. Install the stoplamp switch.
6. Install the pedal assembly.
 - Tighten the nuts to 25 Nm (18 lb.ft).
7. Install the clutch master cylinder.
 - Tighten the nuts to 10 Nm (7 lb.ft).
 - Install the clevis pin.
8. Install the clutch pedal spring assister.
9. Secure the wiring harness.
 - Secure the clips.
 - Connect the electrical connector.

10. Install the brake pedal bracket.

- Tighten the Torx bolt to 10 Nm (7 lb.ft).
- Secure the wiring harness.

11. Install the instrument panel access panel.

- Secure with the clips.

12. Install the closing trim panel.

- Connect the electrical connector.
- Secure the clip.
- Tighten the screws.

13. Install the headlamp switch.

For additional information, refer to: Headlamp Switch (417-01, Removal and Installation).

14. Install the brake booster.

For additional information, refer to: Brake Booster (206-07, Removal and Installation).

Clutch Controls - TDV6 2.7L Diesel - Clutch Slave Cylinder

Removal and Installation

Removal

- NOTE: The clutch release bearing is included with the slave cylinder assembly.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission.
For additional information, refer to: [Transmission](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Removal).

3.  **CAUTION:** Always plug any open connections to prevent contamination.

- NOTE: Position cloth to collect fluid spillage.

Remove the fluid pipe.

- Remove the clip.
- Remove the bolt.
- Remove the clamp.
- Remove and discard the O-ring seal.

E48208

4. Remove the clutch slave cylinder and release bearing assembly.

- Remove the 3 bolts.

E48209

Installation

1. Install the clutch slave cylinder and release bearing assembly.

- Clean the component mating faces.
- Tighten the bolts to 10 Nm (7 lb.ft).

2. Install the fluid pipe.

- Clean the component mating faces.
- Install a new O-ring seal.
- Install the clip.
- Install the clamp.
- Tighten the bolt to 10 Nm (7 lb.ft).

3. Install the transmission.

For additional information, refer to: [Transmission](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Removal).

10	-	Input shaft

GENERAL

The ZF S6-53 all synchromesh transmission has six forward gears and a reverse. It is mounted longitudinally and has a maximum torque capacity of 472Nm. The aluminium die-cast front housing is bolted to the front of the transmission and the DD295 transfer box is mounted at the rear.

The sixth gear has been set up as an economic overdrive to ensure comfortable travel at higher vehicle speeds. Optimum

gear steps ensure highly fuel-efficient utilisation of the engine torque.

The idler gears of the 1st, 2nd, 6th and reverse gears are located on the main shaft, while the 3rd and 4th gears are located on the layshaft. The mating gears are solidly attached to the opposite shaft. Changing direction, via the reverse gear, is achieved with the assistance of an intermediate gear situated between the layshaft and main shaft. The layshaft and main shaft are hollow to reduce weight.

The transmission is a fill for life unit and no level check is required at service unless a leak is present.

INTERNAL SHIFTING SYSTEM

E47703

Item	Part Number	Description
1	-	Gear selector shaft
2	-	Locking bracket (interlock)
3	-	Swing fork reverse gear
4	-	Swing fork 1st/2nd speed
5	-	Swing fork 3rd/4th speed
6	-	Swing fork 5th/6th speed
7	-	X-gate bias load detent, forward gears
8	-	Central detent
9	-	X-gate bias load detent, reverse gear
10	-	Gate

In contrast to a traditional manual transmission where there are typically three forks, fixed to and controlled by three shafts, that are engaged by the shift lever, the ZF S6-53 transmission utilises a single central gear selector shaft and aluminium die-cast swing forks to generate the axial motion needed in the sliding sleeve for changing gears. This reduces friction in the internal shifting system.

The central gear selector shaft transfers the selection and shifting motion to the transmission. The gear shift fingers, located at different angles on the central control shaft, mesh with one of the swing fork engaging pieces.

E47704

Item	Part Number	Description
A	-	Neutral position
B	-	6th gear position
1	-	Gear shift fingers
2	-	Swing fork engaging pieces
3	-	Swing fork 5th/6th
4	-	Swing fork 3rd/4th
5	-	Swing fork 1st/2nd
6	-	Swing fork reverse

The axial displacement of the central gear selector shaft leads to a tilting motion of the swing fork above the corresponding engaging piece. This tilting motion of the swing fork is forwarded, via two sliding pads, as an axial motion to the sliding sleeve guided by the synchroniser body. The sliding sleeve is moved from the neutral position towards the free-wheeling gear and, once synchronisation is complete, connects the free-wheeling gear to the main and/or layshafts.

INTERLOCK

The interlock prevents the simultaneous engagement of several gears.

E47705

Item	Part Number	Description
A	-	Neutral position
B	-	6th gear position
1	-	Locking bracket
2	-	Locking lever
3	-	Locking pins

Two locking levers, attached to a locking bracket, control the interlock. The locking system works passively, i.e. the locking mechanism is actuated through the swing fork motion itself. The swing forks are therefore designed with locking pins.

During gear engagement, the locking levers are turned by the locking pins on the swing forks in the direction of the selected gear and the locking bracket is shifted axially. The shifted swing fork remains moveable and all other swing forks are fixed in place by their respective locking pins and the recesses at the locking levers and/or locking bracket.

GATE

An exact H-shifting pattern is used through the gear change shaft guide in the gate.

E47706

Item	Part Number	Description
1	-	Gate guide
2	-	Finger

A finger attached to the gear change shaft ensures alignment of the corresponding guide groove in the gate, depending upon the selected shift gate. In the engaged gear, the gate limits the side-to-side freeplay at the shift lever.

SYNCHRONISATION

The purpose of a synchromesh is to allow the collar and the gear to make frictional contact before the dogteeth make contact. This lets the collar and the gear synchronize their speeds before the teeth need to engage. The cone/s on the gear fits into the cone-shaped area in the collar, and friction between the cone and the collar synchronize the collar and the gear. The outer portion of the collar then slides so that the dogteeth can engage the gear.

Fast and easy shift engagement of the transmission is achieved by single, double and triple cone synchroniser mechanisms.

Gear	Synchro
1st	Triple
2nd	Dual
3rd	Dual
4th	Dual
5th	Single
6th	Single
Reverse	Dual

GEAR POSITION SENSOR

E47707

Item	Part Number	Description
1	-	Sensor body
2	-	Magnet assembly

A gear position sensor, located on top of the front housing, is used to enable the transfer box to determine which gear the transmission is in. This information is used for both instrumentation and range change functions.

The transfer box control module receives a gear position signal and publishes the status on the CAN bus. The selected gear is shown in the information display of the instrument cluster. The transfer box also uses the status message to check the vehicle is in neutral before attempting a range change.

The gear position sensor is a Permanent Linear Contact less Displacement (PLCD) type sensor. It uses the 'X' axis as the left and right position of the lever and the 'Y' axis as the forward and backward position. The sensor gives a voltage in 'X' and 'Y' directions, which is used to deduce the gear position.

The PLCD sensor uses the electromagnetic induction principle, which has a primary winding around a soft magnetic core. On each end of the core is a second short coil winding and when a permanent magnet is in the vicinity of the sensor, the core is interrupted at that point and two separate transformers are created. Each transformer generates an induced voltage in the secondary coils. The induced voltage of 0 to 5 V in turn provides proportional feedback to the transfer box control module relative to the position of the magnet assembly.

SPEED SENSOR

E47708

Item	Part Number	Description
1	-	Speed sensor

The transfer box is designed to allow range changes when the vehicle is moving, providing the transmission speed complies with the preset thresholds determined by the transfer box control module.

For additional information, refer to: [Four-Wheel Drive Systems](#) (308-07A Four-Wheel Drive Systems, Description and Operation).

The transmission speed sensor is a Hall effect sensor and is located at the rear of the transmission. The sensor measures the speed of the transmission output shaft from a single tooth reluctor on the output shaft.

Hall effect sensors require a supply current, which allows the sensor to detect zero movement. Hall sensors use the principle of a voltage, which is generated across a semiconductor carrying an electric current. The voltage is generated when the transmission output shaft reluctor is exposed to magnetic flux.

When the semiconductor is exposed to a magnetic flux, the electron flow through the semiconductor is deflected creating a potential difference across the semiconductor. This difference in voltage is called the Hall effect. It is this voltage that the transfer box control module uses to establish the speed of the transmission output shaft.

When the reluctor is near the sensor, the sensor produces a low voltage output. When the reluctor is away from the sensor, the sensor produces a high output voltage (battery voltage).

The sensor connector has three wires; one is used for sensor earth, one is supply current, from the transfer box control module, and the other is the signal output to the transfer box control module.

SERVICE

The ZF S6-53 manual transmission is a black box unit. Therefore the repairs permitted are limited to:

- Oil drain plug
- Oil filler plug
- Layshaft sealing cap
- Input shaft seal
- Gear position sensor and magnet assembly
- Selector shaft seal
- Speed sensor
- Output shaft and output shaft seal.

Manual Transmission/Transaxle - TDV6 2.7L Diesel - Transmission Draining and Filling

General Procedures

 **CAUTION:** The fluid filler plug is not a fluid level plug.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. If installed, remove the transmission undershield.

- Remove the 6 bolts.

3. Clean the area around the transmission fluid drain and filler plugs.

4. Place a container under the transmission.

5. Remove the transmission fluid filler plug.

6. Remove the transmission fluid drain plug.

- Drain the transmission.

7. Install a new transmission fluid drain plug and tighten it to 35 Nm (26 lb.ft).

8.  **CAUTION:** The fluid filler plug is not a fluid level plug.

Fill transmission with 1.6 litres of the correct transmission fluid.

For additional information, refer to: [Specifications](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Specifications).

9. Install a new transmission fluid filler plug and tighten it to 35 Nm (26 lb.ft).
 - Remove the container.
10. If installed, install the transmission undershield.
 - Tighten the bolts to 10 Nm (7 lb.ft).

Manual Transmission/Transaxle - TDV6 2.7L Diesel - Output Shaft Speed (OSS) Sensor

In-vehicle Repair

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- If installed, remove the transmission undershield.
 - Remove the 6 bolts.

- Remove the OSS sensor.
 - Disconnect the electrical connector.
 - Remove the Torx screw.

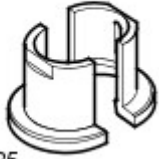

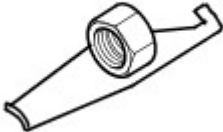

Installation

- Install the OSS sensor.
 - Clean the component mating faces.
 - Tighten the Torx screw to 10 Nm (7 lb.ft).
 - Connect the electrical connector.
- If installed, install the transmission undershield.
 - Tighten the bolts to 10 Nm (7 lb.ft).

Manual Transmission/Transaxle - TDV6 2.7L Diesel - Output Shaft Seal

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transfer case.
For additional information, refer to: [Transfer Case - TDV6 3.0L Diesel](#) (308-07B Transfer Case, Removal).

- Remove the Allen bolt retaining the adaptor shaft.

- Use the special tool to hold the adaptor shaft.

- Remove the adaptor shaft.

- Use the special tools.

- Remove the output shaft seal.

- Use the special tool.

Installation

1.  CAUTION: Oil seals must be fitted dry.

Install a new output shaft seal.

- Clean the component mating faces.
- Use the special tool.

2.  WARNING: Wear protective gloves.

Install the adaptor shaft.

- Clean the component mating faces.
- Heat the adaptor shaft evenly to 120 degrees Centigrade before fitting the adaptor shaft to the splines.

3. Install the Allen bolt.

- Use the special tool to hold the adaptor shaft.
- Apply sealant to the Allen bolt thread.
- Tighten the Allen bolt to 68 Nm (50 lb.ft).

4. Install the transfer case.

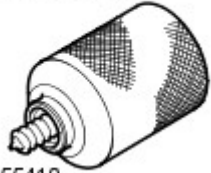

For additional information, refer to: [Transfer Case - TDV6 3.0L Diesel](#) (308-07B Transfer Case, Removal).

5. Drain and refill the transmission.

For additional information, refer to: [Transmission Draining and Filling](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

Manual Transmission/Transaxle - TDV6 2.7L Diesel - Countershaft Seal

In-vehicle Repair

Special Tool(s)	
 <p>308-617</p> <p>E55409</p>	Seal extractor drill 308-617
 <p>308-615</p> <p>E55410</p>	Seal extractor 308-615
 <p>100-012</p> <p>E54135</p>	Impulse extractor 100-012 (LRT-99-004)
 <p>308-620</p> <p>E55411</p>	Seal installer 308-620

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transmission.
For additional information, refer to: [Transmission](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Removal).

-  **CAUTION:** Use a drill stop. Do not drill deeper than 5 mm.

Using the special tool, drill a 3 mm hole in the seal as shown.

4. Remove the countershaft seal.

- Install the extractor.

Installation

1. Install the countershaft seal.

- Clean the component mating faces.
- Use the special tool.

2. Install the transmission.

For additional information, refer to: [Transmission](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Removal).

3. Drain and refill the transmission.

For additional information, refer to: [Transmission Draining and Filling](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the clutch slave cylinder and release bearing assembly.
For additional information, refer to: [Clutch Slave Cylinder](#) (308-02 Clutch Controls - TDV6 2.7L Diesel, Removal and Installation).
- NOTE:** The screw holes are located through the rubber membrane.

Locate the hole for the extraction tool screw.

4. Remove the input shaft seal.

- Install the special tool.

Installation

1. Install the input shaft seal.

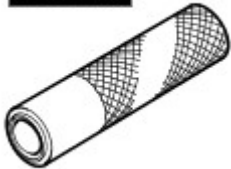

- Clean the component mating faces.
- Use the special tool.

2. Install the clutch slave cylinder and release bearing assembly.
For additional information, refer to: [Clutch Slave Cylinder](#) (308-02 Clutch Controls - TDV6 2.7L Diesel, Removal and Installation).
3. Drain and refill the transmission.
For additional information, refer to: [Transmission Draining and Filling](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transfer case.
For additional information, refer to: [Transfer Case - TDV6 3.0L Diesel](#) (308-07B Transfer Case, Removal).
- Release the gearshift rod.
 - Remove the clip.
 - Remove and discard both O-ring seals.

- Remove the selector rod coupling.
 - Release the clip.
 - Remove the link pin.

5. Remove the gearshift control shaft seal.

- Use the special tool.

Installation

1. Install the gearshift control shaft seal.

- Clean the component mating faces.
- Use the special tool.

2. Install the selector rod coupling.

- Install the link pin.
- Secure with the clip.

3. Install the gearshift rod.

- Clean the components.
- Lubricate the components.
- Install new O-ring seals.
- Install the clip.

4. Install the transfer case.

For additional information, refer to: [Transfer Case - TDV6 3.0L Diesel](#) (308-07B Transfer Case, Removal).

5. Drain and refill the transmission.

For additional information, refer to: [Transmission Draining and Filling](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, General Procedures).

Manual Transmission/Transaxle - TDV6 2.7L Diesel - Gear Position Sensor

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the transmission.
For additional information, refer to: [Transmission](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Removal).

4.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the gear position sensor.

- Remove the 2 Torx screws.
- Remove and discard the O-ring seal.

Installation

1. Install the gear position sensor.
 - Clean the component mating faces.
 - Install a new O-ring seal.
 - Apply sealant to the Torx screw thread.
 - Tighten the Torx screws to 10 Nm (7 lb.ft).
2. Install the transmission.
For additional information, refer to: [Transmission](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Removal).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Manual Transmission/Transaxle - TDV6 2.7L Diesel - Transmission

Removal

Removal

1. Position the vehicle on a lift.
2. Disconnect the battery ground cable.
For additional information, refer to: Battery Charging (414-00, General Procedures).
3. Remove the ride and handling optimization switch.
For additional information, refer to: Ride and Handling Optimization Switch (204-06, Removal and Installation).
4. Release the gearshift mounting bracket.
 - Remove the 2 gearshift mounting bracket bolts.
 - Release the gearshift lever gaiter.

E76793

5.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

6. Remove the fuel tank heat shield.
 - Remove the 3 bolts and 2 nuts.

E44306

7. CAUTIONS:

 Mark the position of the driveshaft flange in relation to the drive pinion flange.

 To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the transfer case drive flange.

- Remove the 6 Torx bolts and washers.

8. Remove the 2 driveshaft center bearing mount bolts.

9.  CAUTION: To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Using a suitable tie strap, reposition and secure the driveshaft to the exhaust system.

10. Remove the engine undershield.

For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

11. Remove the front driveshaft.

For additional information, refer to: [Front Driveshaft - TDV6 3.0L Diesel](#) (205-01 Driveshaft, Removal and Installation).

12. Remove the exhaust heat shield.

1. Remove the 2 exhaust heat shield front nuts.

2. Release the bulkhead heat shield.

3. Remove the 5 remaining exhaust heat shield nuts.

13. Remove the 2 turbocharger support bracket bolts.

14. Loosen the turbocharger support bracket nut and reposition the turbocharger support bracket.

15. Release and reposition the fuel cooler.

16. Release the fuel filter housing and support bracket.

- Remove the 2 bolts.

17. Secure the vacuum hose to the forward edge of the chassis cross member.

- Release from the 6 clips.
- Secure with adhesive tape.
- Remove the 2 clips.

E48051

18. CAUTIONS:

An approved hose clamp must be used.

Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the clutch fluid hose.

- Remove the clip.
- Clamp the hose.
- Remove and discard the O-ring seal.

19. Release the gearshift rod.

- Remove the clip.
- Remove and discard the O-ring seals.

E47234

20. Release the wiring harness from the transfer case.

1. Disconnect the transfer case 3 electrical connectors.
2. Remove the wiring harness bolt.
3. Release the wiring harness from the clip.

21. Position the special tool to the transmission.

- Secure the transmission to the special tool.

22. Lower the rear of the transmission for access.

23. Release the wiring harness from the transmission.

- Disconnect the 2 electrical connectors.
- Remove the 2 bolts.
- Release the wiring harness from the clip.

24.  CAUTION: Always plug any open connections to prevent contamination.

Disconnect the gearbox breather line.

25.  CAUTION: Always plug any open connections to prevent contamination.

Disconnect the transfer case breather line.

E44569

26. Remove the exhaust cross-over pipe LH support bracket.

- Remove the 3 bolts.

E48054

27. Remove the exhaust cross-over pipe RH support bracket.

- Remove the 3 bolts.

E48055

28. Reposition the wiring harness to allow access to exhaust cross-over pipe center support bracket.

29. Remove the exhaust cross-over pipe center support bracket.

- Remove the 2 bolts.

E48056

30. Remove the 14 transmission bolts.

31.  CAUTION: Make sure the transmission remains level.

Release the transmission from the engine and move the transmission 40mm (1.57 inches) rearwards.

32. Using the transmission jack, rotate the transmission to gain access to the gearshift mechanism.

33. NOTE: Transfer case shown removed for clarity.

Release the gearshift mechanism from the transmission.

- Release the clip.
- Release the pin.

34.  CAUTION: Make sure the transmission remains level.

With assistance, remove the transmission.

35. Remove the transmission from the transmission jack.

Manual Transmission/Transaxle - TDV6 2.7L Diesel - Transmission

Installation

Installation

1. Position the transmission to the transmission jack.

2. CAUTIONS:

Make sure the transmission remains level.

Make sure the clutch assembly is not damaged as the transmission is installed.

• NOTE: Do not install the transmission fully to the engine, a 40mm (1.57 inches) gap must be maintained.

With assistance, install the transmission.

- Clean the component mating faces.

3. Using the transmission jack, rotate the transmission to gain access to the gearshift mechanism.

E78391

4. Attach the gearshift mechanism to the transmission.

5. CAUTION: Make sure the clutch assembly is not damaged as the transmission is installed.

Align the transmission to the engine and install the transmission.

E78392

6. NOTE: Transfer case shown removed for clarity.

Install the 14 transmission bolts.

- Tighten the bolts to 40 Nm (30 lb.ft).

7. Install the exhaust manifold crossover pipe center support bracket.

- Loosely install the 2 bolts.

8. Install the exhaust manifold crossover pipe RH support bracket.

- Loosely install the 3 bolts.

9. Install the exhaust manifold crossover pipe LH support bracket.

- Loosely install the 3 bolts.

10. Tighten the exhaust manifold crossover pipe mounting bracket bolts in the following sequence.

- Tighten the 2 bolts marked 1 to 10 Nm (7 lb.ft).
- Loosen the 2 bolts by 90 degrees.
- Tighten the 2 bolts marked 3 to 10 Nm (7lb.ft).
- Loosen the 2 bolts by 90 degrees.
- Tighten the 4 bolts marked 2 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts marked 1 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts marked 3 to 25 Nm (18 lb. ft).
- Attach the wiring harness.

11. Reposition the wiring harness to the transmission.

12. Connect the transmission and transfer case breather lines.

13. Secure the wiring harness to the transmission.

- Attach the wiring harness to the clip.
- Connect the electrical connectors.
- Install and tighten the 2 bolts.

14. Raise the transmission jack.

15. Secure the wiring harness to the transfer case.

- Tighten the bolt to 25 Nm (18 lb.ft).
- Attach the wiring harness to the clip.

16. Connect the transfer case electrical connectors.

17. Attach the gearshift rod.

- Clean the components.
- Lubricate the components.
- Install new O-ring seals.
- Install the clip.

18. Connect the clutch fluid hose.

- Clean the components.
- Install a new O-ring seal.
- Install the clip.
- Remove the hose clamp.

19. Install the vacuum hose to the clips.

- Remove the adhesive tape.
- Install the retaining clips.

20. Attach the fuel filter support bracket.

- Install the 2 bolts and tighten to 10 Nm (7 lb.ft).

21. Attach the fuel cooler.

- Install the bolt and tighten to 10 Nm (7 lb.ft).

22. Install the 2 turbocharger support bracket bolts.

- Tighten the bolts to 25 Nm (18 lb.ft).

23. Tighten the turbocharger support bracket nut.

- Tighten the nut to 25 Nm (18 lb.ft).

24. Install the exhaust heat shield.

25. Bleed the clutch system.
26. Install the front driveshaft.
For additional information, refer to: [Front Driveshaft - TDV6 2.7L Diesel](#) (205-01 Driveshaft, Removal and Installation).
27. Remove the transmission jack.
28. Install the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).
29.  **CAUTION:** To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Attach the driveshaft to the transfer case drive flange.
 - Remove the securing strap.
 - Tighten the Torx bolts to 55 Nm (40 lb.ft).
30. Install the driveshaft center bearing mount bolts.
 - Align the center bearing mount.
 - Tighten the 2 driveshaft center bearing bolts to 30 Nm (22 lb.ft).
31. Install the fuel tank heat shield.
 - Tighten the bolts to 6 Nm (4 lb.ft).
 - Tighten the nuts to 3 Nm (2 lb.ft).
32. Lower the vehicle.
33. Attach the gearshift lever gaiter.
34. Install the 2 gearshift mechanism mounting bracket bolts.
 - Tighten the bolts to 25 Nm (18 lb.ft).
35. Install the ride and handling optimization switch.
For additional information, refer to: Ride and Handling Optimization Switch (204-06 Ride and Handling Optimization, Removal and Installation).
36. Connect the battery ground cable.

Manual Transmission/Transaxle External Controls - TDV6 2.7L Diesel -**Lubricant**

Item	Specification
* Gearshift linkage grease	Land Rover Part Number UYL 500010 (Kluebersynth LI 44-22)

CAUTION: * Do not use any grease other than that specified

General Specifications

Item	Specification
Gearshift linkage type	Rod shifter enabling selection of six forward gears and one reverse gear with 'knock over' selection of reverse

Torque Specifications

Description	Nm	lb-ft
Gearshift mechanism mounting bracket bolts	25	18

Manual Transmission/Transaxle External Controls - TDV6 2.7L Diesel - External Controls

Description and Operation

Gear Change Mechanism

E47713

Item	Part Number	Description
1	-	Gear knob
2	-	Gear lever
3	-	Gaiter
4	-	Shift rod
5	-	Clevis pin
6	-	Roll pin
7	-	Steady rod
8	-	Floater bracket

The gear change assembly is bolted to the transmission tunnel via a floater bracket. A pin and retainer connects the shift rod to the transmissions selector shaft. A steady rod is fitted between the gear change mechanism and the rear of the transmission casing. The rod is held in place by means of a clevis pin for added strength and rigidity.

The gear lever incorporates a vibration attenuator to reduce any Noise Vibration and Harshness (NVH) generated by the powertrain components.

E47714

Bias springs within the transmission provide a positive return of the gear lever to the neutral position with selection of 1st/2nd, 5th/6th and reverse gears being against bias spring pressure. Spring-loaded detents on the selector rod and x-gate butterfly within the transmission, provide positive gear and neutral selection.

Manual Transmission/Transaxle External Controls - TDV6 2.7L Diesel - Gearshift Lever

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the floor console upper trim panel.
For additional information, refer to: [Floor Console Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
3. Remove the transfer case.
For additional information, refer to: [Transfer Case - TDV6 2.7L Diesel](#) (308-07B Transfer Case, Removal).
4. Release the gearshift mounting bracket.
 - Remove the acoustic pad.
 - Release the gaiter.
 - Remove the 2 bolts.

E47231

5. Release the gearshift rod.
 - Remove the clip.
 - Remove and discard the O-ring seals.

E47232

6. Remove the gearshift mechanism.
 - Release the clip.
 - Remove and discard the pin.

E47233

7. NOTE: Do not disassemble further if the component is removed for access only.

E47234

Remove the gearshift rod.

- Remove and discard the clip.
- Remove and discard the O-ring seals.

8. Remove the gaiter.

- Release the gaiter from the gearshift lever ball socket.

E47235

9. Remove the gearshift lever.

- Release the gearshift lever ball socket from the steady rod.

E47236

10. Remove the gearshift lever ball socket.

- Remove the dust seal.
- Remove the 2 clips.

Installation

1. Install the gearshift lever ball socket.

- Clean the components.
- Lubricate the components.
- Install the 2 clips.
- Install the dust seal.

2. Install the gearshift lever.

- Secure the gearshift lever ball socket.

3. Install the gearshift lever gaiter.

- Install the gaiter to the gearshift lever and ball socket.
4. Install the gearshift rod to the lever.
 - Clean the components.
 - Lubricate the components.
 - Install new O-ring seals.
 - Install the new clip.
 5. Install the gearshift mechanism.
 - Clean the components.
 - Lubricate the components.
 - Install the new pin.
 - Secure the clip.
 6. Install the gearshift rod.
 - Clean the components.
 - Lubricate the components.
 - Install new O-ring seals.
 - Install the clip.
 7. Install the gearshift mechanism mounting bracket.
 - Tighten the bolts to 25 Nm (18 lb.ft).
 - Install the gearshift lever gaiter.
 - Install the acoustic pad.
 8. Install the transfer case.
For additional information, refer to: [Transfer Case - TDV6 2.7L Diesel](#) (308-07B Transfer Case, Removal).
 9. Install the floor console upper trim panel.
For additional information, refer to: [Floor Console Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).

GENERAL

The DD295 transfer box is a full time, permanent four-wheel-drive unit, with 50/50 torque distribution to the front and rear driveshafts. The unit is manufactured by Magna Steyr Powertrain in Graz, Austria and supports the following features:

- Permanent four-wheel-drive with a bevel gear centre differential, providing a 50:50 torque split
- Selectable high and low range for optimum on-road and off-road performance
- Two-speed, fully synchronized 'shift-on-the-move' system allows the driver to change the range without having to stop the vehicle
- Electronically controlled multi-plate clutch providing a centre differential lock and torque biasing function to give improved traction performance and vehicle dynamic stability.

A strategy, to electronically control the centre differential multi plate clutch assembly, has been developed to provide:

- a pre-loading function, increasing locking torque with increased driving torque
- a slip controller to increase locking torque under off-road conditions and decrease locking torque for optimum comfort, e.g. parking.

The unit is located under the vehicle and is mounted on the cross-member, behind the transmission. The unit is identical for all engine derivatives.

The transfer box receives a torque input from the transmission output shaft, which is passed through the unit to two outputs for the front and rear drive shafts.

The input torque is equally distributed via a bevel gear type differential. In order to provide an optimal torque distribution to each wheel in all driving conditions, the unit is equipped with an electronically controlled locking and torque-biasing device. This device detects wheel slip via various vehicle system inputs to the transfer box control module and locks the differential accordingly. The locking torque is applied through a multi-plate clutch assembly.

A planetary gear set, located in the differential assembly, allows the driver to select high or low range whilst driving, this is known as 'shift on the move'. When in low range, the planetary gear set provides a ratio of 2.93:1, which gives the vehicle an extremely low crawl speed for off road driving and trailer towing. High range is a direct drive from the transmission output shaft and provides a 1:1 ratio.

Both the centre differential locking and biasing and the 'shift on the move' features are actuated via a DC transfer box motor, which is controlled by the transfer box control module, via a Pulse Width Modulation (PWM) signal.

Transfer Box - Sectional View

8	-	Chain drive
9	-	Front output flange
10	-	Transfer box motor levers
11	-	Sprocket
12	-	Oil pump assembly
13	-	Input shaft
14	-	Front housing assembly

Transfer Box Power Flow

E49192

The input torque, from the transmission, is transferred to the input shaft of the transfer box and then onto the planetary sun gear and planetary pinion gears. The planetary pinion gears are held in place by the planet pinion shafts, which are connected to the differential carrier, and drive the differential pinion gears. The torque is then distributed to both the front and rear carriers, which are connected to the outputs of the transfer box. The rear carrier is connected directly to the rear output flange; the front carrier is connected to the sprocket and therefore to the chain drive, which provides the front output flange rotation.

TRANSFER BOX CASINGS

The front and rear casing assemblies are manufactured from cast aluminium.

Front Casing Assembly

The front casing assembly provides the location for the input shaft bearing and the front output flange bearing. It is also equipped with threaded holes to mount the chassis mounting bush, two lifting eyes and a breather cartridge for the transfer box breather pipe. The breather pipe allows an equalisation between atmospheric and internal transfer box pressure.

Rear Casing Assembly

The rear casing assembly provides the location for the rear output flange bearing, the transfer box motor and the oil fill and drain plug. Fins are cast into the rear casing assembly to improve the heat dissipation. The unit number is also stamped into the rear housing.

OIL PUMP

An oil pump assembly is located in the front casing to provide lubrication for the bearings and rotary components through cross-drillings in the input shaft. A flat-sectioned coupling on the input shaft drives the rotor of the pump; the stator is fixed to the front housing assembly. A tube is attached to the pump, which leads into a calm suction area at the bottom of the two casing assemblies. The collector magnet in the suction area of the pump collects any metallic debris.

CHAIN DRIVE

The chain-drive transfers drive from the centre differential to the front output flange. A 3/8" pitch chain connects the sprocket on the transfer box input shaft with the sprocket on the front output flange. As both sprockets have the same number of teeth, the rotational speed of both sprockets is identical.

TRANSFER BOX MOTOR

One motor operates both the high/low range change and the differential locking and torque-biasing device (multi-plate clutch). The motor solenoid switches between the two functions, while the motor provides the rotational movement for both operations.

Transfer Box Motor Position For Clutch Control Mode

E49193

Item	Part Number	Description
1	-	Motor shaft
2	-	Solenoid shift fork
3	-	Solenoid
4	-	Clutch control disc
5	-	Shifting sleeve

To actuate the multi-plate clutch, the transfer box control module energizes the solenoid (3). The solenoid pin pivots the solenoid shift fork (2), which engages the shifting sleeve (5) into the dogteeth on the clutch control disc (4). The rotational movement of the motor shaft (1) is then linked to the clutch control disc via the shifting sleeve.

This is the normal operating mode of the transfer box. In this position, the range change function is disengaged and mechanically locked.

Transfer Box Motor Position For High/Low Range Mode

E49194

Item	Part Number	Description
1	-	Motor shaft
2	-	Solenoid shift fork
3	-	Solenoid
4	-	Shifting sleeve
5	-	Actuation cam

To actuate the high/low range change, the transfer box control module de-energizes the solenoid (3). A spring in the solenoid retracts the solenoid pin and rotates the solenoid shift fork (2). This engages the shifting sleeve (4) to the dogteeth on the high/low actuation cam (5). The rotational movement of the motor shaft (1) is then linked to the cam.

In this position, the multi-plate clutch is open, the differential cannot be locked and torque cannot be biased. Once the range change is complete the system returns to clutch control mode. In the event of an electrical failure, the motor will default to this position.

CENTRE DIFFERENTIAL ASSEMBLY

E49195

Item	Part Number	Description
1	-	Synchronisation cup and spring
2	-	Planetary ring gear
3	-	Differential carrier
4	-	Pinion gears
5	-	Pinion gear shafts
6	-	Planetary pinion gears
7	-	Planetary pinion gear shafts
8	-	Planetary sun gear
9	-	Differential cover
10	-	Differential side gears
11	-	Multi-plate clutch basket
12	-	Dogteeth

The centre differential assembly is the primary feature of the transfer box. Torque is transmitted through the centre differential carrier and distributed to the differential gears and the front and rear output flanges. The planetary gear set, for the high/low range change function, is also an integral part of the centre differential assembly.

The assembly comprises 3 differential pinion gears (4) and shafts (5), which are equally spaced within the centre differential carrier (3). The differential shafts have a rigid connection to the differential carrier. Located between the pinion gears are 3 planetary pinion gears (6) and shafts (7). The planetary sun gear (8) and two differential side gears (10) are located in the centre line of the carrier.

The planetary ring gear (2) is supported in both directions by the differential casing and the differential cover (9). The planetary ring gear is connected to a shifting sleeve, which is engaged in either high or low range.

The multi-plate clutch basket (11), which is welded to the differential casing, supports the friction plates, the dogteeth (12) for high range engagement and the synchronisation cup and spring (1) for the 'shift-on-the-move' function.

A

B

E49196

Item	Part Number	Description
A	-	High range position
B	-	Low range position
1	-	Dogteeth
2	-	Planetary pinion gears
3	-	Planetary ring gear
4	-	Shifting sleeve
5	-	Low range dogteeth
6	-	Rear carrier assembly

When high range is engaged, the shifting sleeve (4) connects to the differential carrier via dogteeth (1). The planetary ring gear (3), via the shifting sleeve, and the planetary pinion gears (5), via the planetary shafts, are also attached to the differential carrier. The planetary gear set rotates as one unit and therefore turns the differential side gear with a 1:1 ratio.

In low range the motor moves the shifting sleeve (4) in the direction of the low range dogteeth (5). The low range dogteeth, with the synchronisation cup and spring, are fixed to the rear carrier assembly (6). When the shifting sleeve is engaged with the low range dogteeth, the planetary ring gear (3), via the shifting sleeve, is stationary and the planetary pinion gears (2), via the planetary bolts, turn the differential side gears with 2.93: 1 ratio.

High range actuation sequence

E49197

Item	Part Number	Description
1	-	Shifting sleeve
2	-	High/low shifting fork
3	-	Shifting cam

The rotational movement of the motor shaft turns the shifting cam (3) to high range position. The shifting cam then moves the shifting sleeve (1), via the high/low shifting fork (2), into the high range position. After the synchronisation sequence, the planetary ring gear is connected to the high range dogteeth, via the shifting sleeve, on the differential carrier. In this position, the input speed equals the output speed, which equates to a high range ratio of 1:1.

Low range actuation sequence

E49198

Item	Part Number	Description
1	-	Shifting sleeve
2	-	High/low shifting fork
3	-	Shifting cam
4	-	Motor shaft

The rotational movement of the motor shaft (4) turns the shifting cam (3) into low range position. The shifting cam then moves the shifting sleeve (1) of the centre differential assembly via the high/low shifting fork (2) into low range position. After the synchronisation sequence, the planetary ring gear is connected to the low range dogteeth, via the shifting sleeve, on the rear carrier assembly. The output speed is then reduced to a ratio of 2.93:1.

MULTI-PLATE CLUTCH ASSEMBLY

E49199

Item	Part Number	Description
1	-	Clutch hub
2	-	Cup springs
3	-	Clutch plates
4	-	Clutch piston
5	-	Motor levers
6	-	Ball ramp mechanism
7	-	Sprocket

The multi-plate clutch assembly for both centre and rear differentials act in a similar way. The aim of the multi-plate clutch assembly is to prevent excessive differential slip and therefore maximise the traction performance of the vehicle. This is fundamentally different from the 'braked' traction control, which can only counter act differential slip when it occurs.

A certain amount of differential slip is required to allow the vehicle to turn corners and to remain stable under control of the Anti-lock Braking System (ABS). The transfer box control module monitors the driver's demands through primary vehicle controls and automatically sets the slip torque at the differentials. The system is completely automatic and does not require any special driver input.

The multi-plate clutch assembly actively controls the torque flow through the centre differential and optimises the torque distribution in the driveline. The clutch assembly biases the torque from the transmission to the axle and wheels with the higher grip and prevents the wheels with the lower grip from spinning.

The multi-plate clutch assembly comprises the sprocket (7), which is connected to the front differential side gear, the motor levers (5) with the ball ramp mechanism (6), the clutch hub (1) as support for the clutch plates (3), the clutch piston (4) to generate friction between the clutch plates, and a pack of cup springs (2) to return the clutch piston into its original position.

One set of friction plates are connected to the clutch hub; the other set of friction plates are connected to the multi-plate clutch basket, which is welded to the centre differential housing.

Multi-plate Clutch Actuation

Transfer box motor levers in initial position, multi-plate clutch open condition

E49200

Transfer box motor in end position, multi-plate clutch closed condition

E49201

Item	Part Number	Description
1	-	Clutch piston
2	-	Motor shaft
3	-	Clutch control disc
4	-	Motor levers
5	-	Ramp mechanism balls

By turning the clutch control disc (3), via the motor shaft (2), the motor levers (4) are rotated relative to each other. This relative movement acts on 5 balls (5) in a ramp mechanism between the two levers and give a defined axial movement. The movement forces the clutch piston (1) to induce friction between the plates supported by the clutch hub and the plates supported by the clutch basket on the differential carrier. This frictional force inhibits the differential rotation; the differential carrier and front differential side gear are locked together.

TRANSFER BOX CONTROL MODULE

The transfer box control module controls the high/low 'shift-on-the-move' actuation and the multi-plate clutch actuation. The control module is located in the E-box, next to the Engine Control Module (ECM), behind the battery in the engine compartment. The position of the control module changes with LH and RH drive vehicles.

E49202

Item	Part Number	Description
A	-	RH drive
B	-	LH drive
1	-	Battery Junction Box (BJB)
2	-	Battery
3	-	Engine Control Module (ECM)
4	-	Transfer box control module

The control module is connected to the Controller Area Network (CAN) bus and controls the transfer box operation using CAN messages from other control modules on the network.

The control module memorises the position of the transfer box motor when the ignition is switched off.

The transfer box control module uses the same actuator to control both range change function and application of centre differential locking torque. The module uses position feed back from the actuator to provide smooth range changing capability and graduated application of locking torque appropriate for the current driving conditions. Range change can be carried out while moving providing the transmission is in neutral and the vehicle is below the speed necessary for the requested range change.

The control module uses three connectors for all inputs and outputs. It receives a permanent power supply via a 30A fusible link located in the Battery Junction Box (BJB), and an ignition supply via fuse 24 in the Central Junction Box (CJB).

The control module uses a series of programmed shift maps to control the synchronisation speed and ensure that a maximum shift time of approximately one second is achieved.

If the control module is replaced, T4 must be connected to the vehicle and the transfer box control module self-calibration procedure must be performed. This procedure must also be performed if the transfer box motor assembly is replaced.

Default/Limp-home Strategy

If a fault occurs with the transfer box, the transfer box control module or one of the required input signals i.e. road speed signal, the control module records an error code and will respond appropriately to provide the highest level of system capability under the specific fault conditions. The following fault states are possible:

Fault state	System response	Driver warning
No reduction in capability	Diagnostic Trouble Code (DTC) will be recorded but no effect on performance	Non
Clutch control not possible. Temporary over temperature condition	The tractive capability of the vehicle, off road, is reduced.	Driveline over temperature warning lamp or "CENTRE DIFF OVER TEMP REDUCE SPEED" on message centre
Clutch control not possible. Permanent fault	The tractive capability of the vehicle, off road, is reduced.	Driveline fault warning lamp or "CENTRE DIFF FAULT TRACTION REDUCED" on message centre
Range change not possible	The system inhibits the driver from making a range change	Driveline fault warning lamp or "TRANSMISSION RANGE CHANGE NOT AVAILABLE" on message centre
Stuck in Transfer box neutral	The transfer box is stuck between high and low range resulting in no drive to wheels	Flash low range indicator plus "APPLY HANDBRAKE (PARK BRAKE in USA and Canada)". The message will only display at times when it is deemed safe or necessary. It will not display during normal driving for example.

If a driveline over temperature condition has occurred, after the driveline has been allowed to cool, clutch control will be re-enabled and the warnings will disappear. There is no need to seek service assistance following an over temperature event.

If clutch control or Range change is not possible due to a permanent fault the driver must seek service assistance at the earliest opportunity.

If the system suffers a fault, which causes the transfer box to fail in neutral, the control module is designed to continue attempting to engage the requested range or return to its original range for a fixed number of attempts. If this has not been successful and the low range lamp is still flashing the driver should bring the vehicle to a halt and attempt the range change again while stationary. If this does not work after a number of attempts, key off for 30 seconds, restart engine and request range change again while stationary. The driver must seek service assistance at the earliest opportunity.

Transfer Box Control Module Pin Out Details

Connector 1-C1319

Pin No.	Description	Input/output
1	Not used	-
2	Not used	-
3	CAN bus low	Data (input and output)
4	Range change selection switch - High	Input
5	Range change selection switch - Low	Input
6	CAN bus high	Data (input and output)
7	Key interlock solenoid	Output
8	LED-high	Output
9	LED-low	Output

Connector 2-C1854

Pin No.	Description	Input/output
1	CAN bus low	Data (input and output)
2	Not used	-
3	Ignition power supply	Input
4	CAN bus high	Data (input and output)
5	Ground	-

16	Manual transmission output shaft speed signal	Input
17	Manual transmission output shaft speed sensor ground	-
18	Motor supply/ground	Input/output

TRANSFER BOX CONTROL MODULE INPUTS

The transfer box control module receives the following inputs:

- Range change selection switch

- High/low position sensor
- Transfer box actuator motor temperature
- Transfer box actuator motor position sensor
- CAN bus messages
- Gear position sensor (manual transmission only)
- Transmission output shaft speed sensor (manual transmission only).

CAN Bus Messages

The CAN bus is a high speed broadcast network connected between various vehicle control modules. The CAN network carries an extensive list of messages between the different control modules enabling more sophisticated control with reduced complexity. Data on the network is packaged for efficient communication and prioritised according to the urgency and importance of the Messages. The bus comprises two wires, which are twisted together to minimise electromagnetic interference (noise) produced by the CAN messages.

For additional information, refer to: Communications Network (418-00, Description and Operation).

The transfer box control module is connected on the CAN bus and controls transfer box operation using CAN messages from other control units on the network. Wheel speed, vehicle acceleration, engine torque and speed, gear information, from the automatic transmission, temperature information, car configuration, axle ratios and Terrain Response™ mode inputs, are some of the main signals received by the control module.

In the event of a CAN bus failure the following symptoms may be observed:

- Shift from high to low or low to high inoperative
- Instrument cluster low range warning lamp inoperative
- warning messages or lamps displayed in instrument cluster.

Gear Position Sensor (Manual Transmission Only)

E49203

The transfer box control module uses positional information from the manual gear position sensor to determine which gear the transmission is in. This information is broadcast on the CAN bus for display on the instrument cluster and for use by other vehicle systems. Vehicles fitted with automatic transmission use a similar message broadcast by the Transmission Control Module (TCM). Vehicles fitted with manual transmission have a learning function, which compares the positional information from the sensor with the gear ratio calculated from the ratio of engine speed to transmission output shaft speed. The transmission learning is carried out at end of manufacture. If a new transmission is fitted during the life of the vehicle the learning algorithm needs to learn the characteristics of the new transmission.

The instrument cluster displays the selected gear as determined by the transfer box. The transfer box also uses this to check the vehicle is in neutral before attempting a range change.

For additional information, refer to: [Manual Transmission](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Description and Operation).

Manual Transmission Output Shaft Speed Sensor

E49204

The output shaft speed sensor is located at the rear of the transmission and measures the speed of the transmission output shaft.

The transfer box is designed to allow range changes when the vehicle is moving, providing the transmission speed complies with the preset thresholds determined by the control module. The control module calculates the optimised synchronization timing through the speed of the transmission output shaft and the wheel speed of the vehicle. For additional information, refer to: [Manual Transmission](#) (308-03 Manual Transmission/Transaxle - TDV6 2.7L Diesel, Description and Operation).

Range Change Selection Switch

E49205

The range change selection switch is located behind the main transmission selection lever, in the centre console. The switch is a 3-position momentary action centre sprung device. The driver pushes the lever forward to select high range and back to select low range.

The switch comprises a housing, which provides the location for a sliding contact. When the switch is moved to the high or low position, it completes a momentary connection to 12V with one of two micro-switches located at each end of the range change selection switch. These micro-switches correspond to the high or low range positions.

The transfer box control module receives this momentary signal and selects the requested range.

In this position, a spring will move the selector lever to the centre position when released.

High/Low Position Sensor

E49209

The high/low position sensor converts the pivotal movement of the high/low fork into a PWM signal on the input. The PWM signal of the position sensor differs between high range and low range. The control module checks this signal and informs the driver, via the instrument cluster and the range change selection switch LED's, if a range change is in progress or has been completed.

The high/low position sensor is connected to the transfer box control module via a three-pin connector.

TRANSFER BOX CONTROL MODULE OUTPUTS

The transfer box control module sends the following outputs:

- CAN bus messages
- Key interlock solenoid
- High/low range change LED
- Transfer box motor
- Solenoid.

CAN Bus Messages

The control module also sends messages via the CAN bus to tell other control modules on the network, the status of the transfer box. The high/low status, clutch torque and default mode status are some of the main signals sent out by the transfer box control module.

Key Interlock Solenoid

The transfer box control module is able to send a signal to the key interlock solenoid. This signal locks the key in the ignition barrel to prevent it from being removed if the automatic transmission is not in the 'Park' position.

High/Low Range Change LED

E49206

Item	Part Number	Description
1	-	High range LED
2	-	Low range LED

The control module is responsible for illuminating the 2 'high/low' range change LED's adjacent to the range change lever. One LED indicates high range and the other indicates low range.

One LED will be on continuously when in the corresponding range.

When changing range, the current range LED will remain on until the new range status has been achieved.

The new range LED will start flashing only when the range change has commenced (i.e. speed and neutral conditions have been met). The new range LED will be illuminated continuously at the same instant that the current range (now the old range) LED turns off.

The flash rate is 2 Hz with a 50% duty cycle.

The LED's have 2 levels of intensity, high when the vehicle lights are switch off and low when they are switched on.

If both lights are flashing at 0.5 Hz, this would indicate a transfer box fault or that the transfer box is in undefined range and may require calibration.

Transfer Box Motor

E49207

The transfer box motor provides the necessary movement to perform the high/low range change and the multi-plate clutch actuation. The motor is located on the rear casing assembly and secured with four bolts.

The motor is a PWM controlled, DC motor with an integrated worm gear reduction drive. It is connected to the transfer box control module with an eight-pin connector; the power supply of the motor is maintained through two large diameter cables on the motor connector. An internal position sensor checks the rotational movement of the motor.

There is an temperature sensor located within the motor housing.

Solenoid

E49208

The solenoid switches the power flow on the actuation system between high/low range change mode and clutch control mode. When the solenoid is energized, the solenoid pin deploys and activates the clutch control mode. When the solenoid is de-energized, the internal spring rejects the solenoid pin and activates the high/low range change mode.

- **NOTE:** In order to replace the solenoid in service, the solenoid must be energized using the diagnostic tool.

The solenoid is connected to the transfer box control module with a two-pin connector.

Status Indication

Instrument Cluster

E49210

Item	Part Number	Description
A	-	High-line instrument cluster
B	-	Low-line instrument cluster
1	-	Low-range status indicator
2	-	Message centre text (high-line only)
3	-	Driveline fault lamp
4	-	Driveline over temperature

On vehicles fitted with the high line instrument cluster there will be one low range status indicator. This indicator will take the form of a mountain symbol and has the following logic:

- Lamp on = low range
- Lamp off = high range
- Lamp flashing = range change in progress/range undefined/range fault.

There will also be a message displayed in the message centre, on vehicles with high-line instrument cluster, which will inform the driver of any faults with the transfer box.

The following table shows the messages that can be displayed in the message centre of a high-line instrument cluster relating to the transfer box:

Message	Description	Chime
'LOW RANGE ENGAGED'	Transfer case has engaged low range after a range change request	Single
'HIGH RANGE ENGAGED'	Transfer case has engaged high range after a range change request	Single
'SPEED TOO HIGH FOR RANGE CHANGE'	Range change request when vehicle speed too high	Single
'SELECT NEUTRAL FOR RANGE CHANGE'	Range change request when lever not in neutral	Single
'APPLY HANDBRAKE' (PARK BRAKE in USA and Canada)	This alerts the driver that the automatic transmission park lock function is inoperative due to transfer box out of high or low range. Transfer box control module has stopped transmitting on the CAN bus during a range change or while in neutral mode and as a result the automatic transmission park lock function is inoperative	One per second for three seconds
'TRANSMISSION RANGE CHANGE NOT AVAILABLE'	Transfer box has detected a fault inhibiting a new range change. Control unit has shut down due to thermal overload	Single
'CENTRE DIFF OVER TEMP REDUCE SPEED'	Centre differential temperature is approaching the over heated threshold	Single
'CENTRE DIFF FAULT – TRACTION REDUCED'	Centre differential has failed - operating as an open differential	Single
'CENTRE DIFF FAULT – TRACTION REDUCED'	Transfer box control module has stopped transmitting on the CAN bus and defaults to open centre differential	Single

The transfer box control module receives a gear position signal from the manual transmission gear position sensor and publishes the status on the CAN bus. This is displayed in the odometer display, similar to how the automatic transmission displays gear information.

Odometer Display	Description
------------------	-------------

Odometer Display	Description
N	Transmission is in neutral
1	Transmission is in first gear
2	Transmission is in second gear
3	Transmission is in third gear
4	Transmission is in fourth gear
5	Transmission is in fifth gear
6	Transmission is in sixth gear
R	Transmission is in reverse gear (Japan only)
Blank display	Transmission is between neutral and a gear
E	Transmission gear position sensor has a fault

On vehicles fitted with the low line instrument cluster, in place of the message centre there will be a status lamp, which has the following logic:

- Amber - Over temperature
- Red - Failure, stop vehicle

The following table shows the faults that could possibly illuminate the transfer box status lamp on vehicles fitted with the low-line instrument cluster:

Indication	Description
OFF	Transfer box is operating at normal working temperature
YELLOW WARNING LAMP ON	Transfer box temperature is approaching the over heated threshold
YELLOW WARNING LAMP ON	Transfer box has detected a fault, which affects the range change function (current range is still maintained) or the centre differential has failed to open.
RED WARNING LAMP ON	Transfer box has detected a fault which renders the transmission park lock function inoperative due to out of range condition, OR centre differential has failed with a non-zero locking torque
YELLOW WARNING LAMP ON	Transfer box control module has stopped transmitting on the CAN bus and defaults to open centre differential
RED WARNING LAMP ON	Transfer box control module has stopped transmitting on the CAN bus during a range change or while in neutral mode and as a result the automatic transmission park lock function is inoperative

SERVICE

Basic Dimensions (Millimetres)

The transfer box weighs 40.30 kg without oil and 41.55 kg with oil. The unit requires 1500 ml \pm 2% of oil from empty.

The oil used in the transfer box is Shell TF 0753, which has been specially developed by Magna Steyr and Shell. The oil contains unique additives, which enhance the transfer box operation. No other oil must be used in the transfer box.

There is a unique type of grease, Weicon anti-seize montagepaste grau TL 7391, that needs to be applied the units input shaft spline when installing or reinstalling the transfer box.

E49212

Item	Part Number	Description
1	-	Input shaft spline

DIAGNOSTICS

The transfer box control module can store fault codes, which can be retrieved using T4 or a diagnostic tool using KW2000* protocol.

The information is communicated via a diagnostic socket.

The diagnostic socket allows the exchange of information between the various control modules on the bus systems and T4 or another suitable diagnostic tool. The information is communicated to the socket via the CAN bus. This allows the retrieval of diagnostic information and programming of certain functions using T4 or another suitable diagnostic tool.

The transfer box control module uses Diagnostic Trouble Codes (DTC), which relate to transfer box electrical faults.

Clutch and Range Change Mechanism Calibration

In order for the range change mechanism to function correctly, the transfer box control module must be calibrated to the mechanical dimensions of the transfer box that it is connected to.

This procedure will need to be followed if one of the following occurs:

- The switch is changed
- The transfer box control module is changed
- The transfer box or range position sensor is changed
- Vehicle or transfer box control module fault has caused the transfer box to revert to an undefined range.

Calibration can be carried out using T4.

Manual Transmission Gear Learning Procedure

The transfer box control module contains an adaption that enables it to recognize which gear the driver has selected. The adaption has to be reset, by performing the gear learning procedure, if one of the following occurs:

- The transfer box control module is reprogrammed or replaced
- The manual transmission is replaced
- The gear position sensor is replaced

During the gear learning procedure the vehicle must be driven smoothly in all gears, with the clutch fully released in each gear, in a single drive cycle. The procedure can be performed with the transfer box in either high or low range.

Gear Learning Procedure

- If the gear learning procedure is to be performed because the manual transmission or the gear position sensor has been replaced, use T4 to set the gear adaption status to 0 in the transfer box control module.
- Start the vehicle.
- Drive in reverse gear and fully remove your foot from the clutch, drive in reverse with your foot off the clutch for 3 seconds and ensure that R is displayed in the instrument cluster.
- Drive in 1st gear and, when gear position 1 is displayed in the instrument cluster, change to the next gear. Continue driving, and changing up to the next gear once the current gear is displayed in the instrument cluster, until gear 6 is displayed in the instrument cluster, then stop the vehicle.
- Stop the engine, remove the ignition key and wait for a minimum of 60 seconds (for the transfer box control module to power down).
- Insert the ignition key and turn the ignition switch to position II (ignition).
- Select each gear in turn. If the appropriate gear position is displayed in the instrument cluster as soon as each gear is selected, the gear learning procedure has been successful. If the gear position is not displayed in the instrument cluster, the gear learning procedure has failed and must be repeated.
 - NOTE: T4 can also be used to check if the gear learning procedure has been successful.

SYSTEM OPERATION

The selection of high/low range is achieved by using a switch located behind the main transmission selection lever in the centre console. A range change can only be performed when the transmission selector lever is in neutral (position 'N' for vehicles with automatic transmission). The accelerator pedal must not be depressed when a range change is in progress.

If high or low range is requested and the transmission selector lever is in a position other than neutral, or 'N' or 'P' on a

vehicle with an automatic transmission, the instrument cluster message centre, if fitted, will display 'SELECT NEUTRAL FOR RANGE CHANGE'.

• **NOTE:** On vehicles with an automatic transmission, if the transmission selector lever is in the 'P' position, the range change will not take place and the 'SELECT NEUTRAL FOR RANGE CHANGE' message will not be displayed in the message centre.

When low range is selected, the low range 'mountain' symbol will flash when the range change is taking place and then remain illuminated when the range change is complete. The instrument cluster message centre, if fitted, will display 'LOW RANGE' for approximately 3 seconds followed by a chime from the instrument cluster to confirm that the range change has been completed. On vehicles with automatic transmission, only 'D' and 'Manual mode' are available, the 'Sport mode' selection is not available.

When high range is selected, the low range 'mountain' symbol will flash when the range change is taking place and then extinguish when the range change is complete. The instrument cluster message centre, if fitted, will display 'HIGH RANGE' for approximately 3 seconds followed by a chime from the instrument cluster to confirm that the range change has been completed.

The design of the transfer box allows range changes when the vehicle is moving, within set limitations as follows:

- High to Low – at speeds not exceeding 25 mph (40 km/h) for vehicles with automatic transmission, and 12 mph (20 km/h) for vehicles with manual transmission
- Low to High – at speeds not exceeding 37 mph (60 km/h).

If the vehicle speed is higher than the parameters given, the instrument cluster message centre, if fitted, will display 'SLOW DOWN'. When the correct speed range is reached, the message will be deleted and the range change will commence.

The transfer box control module interprets a road speed of less than 2 mph (3 km/h) as a static shift (vehicle not moving). In this instance, on vehicles with automatic transmission, the driver must use the shift lock procedure of operating the brake pedal to allow the selector lever to be moved from 'N' to 'D' after the range change has been performed.

High range should be used for all normal road driving and also for off-road driving across dry, level terrain. Low range should only be required where low speed manoeuvring is necessary, such as reversing a trailer, negotiating steep slippery surfaces or boulder-strewn terrain. Low range should also be used for extreme off-road conditions where progress in high range cannot be maintained. Low range should never be used for normal road driving.

Terrain Response™

The Terrain Response™ system allows the driver to select a program, which will provide the optimum settings for traction and performance for the prevailing terrain conditions.

The system is controlled by a rotary control located on the centre console. The rotary control allows the selection of one of the following five programs:

- Special programs off (general driving conditions)
- Grass/Gravel/Snow
- Mud/Ruts
- Sand
- Rock crawl.

The Terrain Response™ system uses a combination of vehicle subsystems to achieve the required vehicle characteristics for the terrain selected. The following subsystems form the Terrain Response™ system:

- Engine management system
- Automatic transmission (if fitted)
- Transfer box
- Rear locking differential (if fitted)
- Brake system
- Air suspension.

Each subsystem control module provides a feedback for the selected program so that the Terrain Response™ control module can check that all systems are controlling the system correctly. For additional information, refer to: Ride and Handling Optimization (204-06, Description and Operation).

HIGH RANGE OPERATION

In high range, the torque input from the transmission is passed to the transfer box input shaft. The position of the

synchroniser sleeve couples the shaft directly to the differential housing. The differential splits the torque between the two side gears. One side gear is connected by splines and passes the torque to the rear output flange. The second side gear is connected to the chain drive sprocket and passes the torque, via the chain, to the front output flange.

LOW RANGE OPERATION

In low range, the torque input from the transmission is passed to the transfer box input shaft. The synchroniser sleeve is moved and connects the planetary carrier to the differential housing. The torque from the transmission is now directed through the sun gear of the epicyclic gearset and, via the pinion gears and pinion gear shafts, into the planetary carrier. The annulus gear of the epicyclic gearset is secured inside the casing and generates the low range ratio of 2.93:1. The torque is then passed, via the synchroniser sleeve, to the differential housing where it is split between the two side gears. One side gear is connected by splines and passes the torque to the rear output flange. The second side gear is connected to the chain drive sprocket and passes the torque, via the chain, to the front output flange.

HIGH/LOW RANGE GEARS WITH SHIFT-ON-THE-MOVE

The driver is able to change between high and low range gears while the vehicle is moving, or if the vehicle is stationary.

Pushing the range change lever makes a range change requests. This lever is located on the centre console behind and to one side of the main transmission lever.

The driver requests a high to low range change by pushing the range change lever towards the rear of the vehicle and, conversely, a low to high request by pushing the lever towards the front of the vehicle. The range change lever is centre sprung and therefore does not latch in the forward or rear positions.

The driver is informed of the range status via a green lamp (mountain symbol) in the instrument cluster and LED's next to the range change lever. The lamp will not be illuminated in high range, illuminated in low range and flashing during a range change. There are two LED's on the range change lever one for high and one for low. During a range change the new range LED will flash.

The vehicle will remain in the selected range unless the driver requests a change, i.e. it will not automatically revert to high range following a key off/key on sequence.

RANGE CHANGE PROCEDURE (AUTOMATIC VEHICLES ONLY)

Neutral must be selected on the main transmission before requesting a range change and then select the appropriate gear following completion of the range change. During the range change the main transmission will be locked in neutral.

If neutral is not selected when a range change is requested then the request is denied and the driver will be advised to select neutral via the instrument cluster message centre (if fitted).

The range change process can take up to one second to complete following a request being accepted.

There is a limit set on the maximum speed at which a range change can be achieved. The maximum speed for a high to low range change is 25 mph (40 km/h) for vehicles with automatic transmission, and 12 mph (20 km/h) for vehicles with manual transmission. The maximum speed for a low to high range change is 37 mph (60 km/h). If the vehicle speed is over the limit when a range change is selected then the request is denied and the instrument cluster message centre (if fitted) will display a 'SLOW DOWN' message.

RANGE CHANGE PROCEDURE (MANUAL VEHICLES ONLY)

Neutral must be selected on the main transmission before requesting a range change and then select the appropriate gear following completion of the range change. During the range change the driver must not attempt to move the main transmission out of neutral. If the lever is moved out of neutral then the range change will stop and will be completed only when the driver re-selects neutral on the main transmission. This must be done to prevent damage to the transfer box mechanism.

The speed limit for shift-on-the-move for the manual vehicle is set lower than for the auto, at around 12 mph (20 km/h) for high to low and 37 mph (60 km/h) for low to high. The lower limits are set so that, if the driver tries to select too lower gear following a range change, no damage is caused to the vehicle.

Four-Wheel Drive Systems - Four-Wheel Drive (4WD) Control Module

Removal and Installation

Removal

• NOTE: LHD illustration shown, RHD is similar.

1. Remove drivers side plenum box lid.

2. Remove the four-wheel drive control module cover.

• Remove the 2 bolts.

3. Release and remove the four-wheel drive control module.

• Disconnect the 3 electrical connectors.

Installation

1. To install, reverse the removal procedure.
2. Using the diagnostic tool, configure the new units using the Programmable Module Installation Routine.

Four-Wheel Drive Systems - Transfer Case Shift Motor

Removal and Installation

Removal

-  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

- Remove the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - V6 4.0L Petrol/TDV6 2.7L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

3. CAUTIONS:

 To avoid damage to the joints or gaiters, do not allow the transmission to hang on the driveshafts.

 Discard the bolts.

Remove the shift motor.

- Lower the rear of the transmission for access.
- Disconnect the electrical connector.
- Remove the 4 Torx bolts.

Installation

-  **CAUTION:** Make sure that new bolts are installed.

Install the shift motor.

- Clean the components.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).
- Connect the electrical connector.

- Install the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - V6 4.0L Petrol/TDV6 2.7L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).
- Calibrate a new transfer case shift motor using the diagnostic tool.

Four-Wheel Drive Systems - Transfer Case Clutch Solenoid

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. CAUTIONS:

Connect the diagnostic tool, prior to removal of the solenoid.

Discard the bolts.

- **NOTE:** Some fluid spillage is inevitable during this operation.

Remove the transfer case clutch solenoid.

- Position a container to collect the fluid spillage.
- Remove the 3 Torx screws.
- Use the diagnostic tool to energise the solenoid.
- Detach from the selector lever.
- Disconnect the electrical connector.

Installation

1.  **WARNING:** The transfer case clutch solenoid must be energised prior to installation to the selector lever. Failure to follow this instruction may result in damage to the transfer case.

• CAUTIONS:

Make sure the seal is installed correctly.

Make sure that new bolts are installed.

Install the transfer case clutch solenoid.

- Clean the components.
- Connect the electrical connector.
- Use the diagnostic tool to energise the solenoid.
- Install to the selector lever.
- Tighten the Torx screws to 10 Nm (7 lb.ft).

2. Check and top-up the transfer case fluid level.

3. Using the diagnostic tool, calibrate the new transfer case control solenoid.

Four-Wheel Drive Systems - High/Low Range Sensor

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - V6 4.0L Petrol/TDV6 2.7L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

3. CAUTIONS:

 To avoid damage to the joints or gaiters, do not allow the transmission to hang on the driveshafts.

 Discard the bolts.

Remove the high/low range sensor.

- Lower the rear of the transmission for access.
- Disconnect the electrical connector.
- Remove the 2 Torx bolts.

Installation

1.  **CAUTION:** Make sure that new bolts are installed.

To install, reverse the removal procedure.

- Clean the components.
- Install the high/low range sensor.
- Tighten the Torx bolts to 10 Nm (7 lb.ft).

2. Install the crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - V6 4.0L Petrol/TDV6 2.7L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).
3. Using the diagnostic tool, calibrate a new high/low range sensor.

Transfer Case -

Sealers and Lubricants

Item	Specification
* Recommended oil	Shell TF 0753
Capacity - Wet and dry fill	1.5 litres, (2.6 pints) (1.5 US quarts)
Input shaft splines grease	Weicon TL7391
Sealant	STC 50550 or Loctite 5900

* **CAUTION:** Do not use any lubricant other than that specified

General Specification

Item	Specification
Make	Magna Steyr
Model	DD295
Type	Two speed, permanent four wheel drive transfer box having synchronised shift on the move facility with an actively controlled wet clutch and 50/50 torque split across the centre differential
Clutch type	Wet, multi-plate
Maximum torque capacity	2500 Nm (1842.5 lb.ft)
Ratios:	
<ul style="list-style-type: none"> ● High ● Low 	<ul style="list-style-type: none"> ● 1:1 ● 2.93:1
Maximum shift speeds, Manual Gearbox:	
<ul style="list-style-type: none"> ● High to low ratio ● Low to high ratio 	<ul style="list-style-type: none"> ● 20 kph (12.4 mph) ● 60 kph (37.2 mph)
Maximum shift speeds, Automatic Transmission:	
<ul style="list-style-type: none"> ● High to low ratio ● Low to high ratio 	<ul style="list-style-type: none"> ● 40 kph (24.8 mph) ● 60 kph (37.2 mph)

Torque Specifications

• NOTE: ** New 'Patchlock' Torx bolts must be fitted.

Description	Nm	lb-ft
Transfer case fluid drain plug	22	16
Transfer case fluid level/filler plug	22	16
Fuel tank heat shield nuts/bolts	10	7
** Rear drive shaft M12 Torx screws	150	111
Rear drive shaft M10 Torx screws	73	54
** Front driveshaft Torx screws		
Stage 1	45	33

Drive shaft centre bearing bolts	30	22
Transmission support insulator	60	44
Wiring harness securing bolts	10	7
Fuel line support bracket bolts	10	7
Transfer case retaining bolts	45	33
Earth cable bolt (2010 Model Year onwards)	15	11

Transfer Case - Transfer Case

Description and Operation

For additional information, refer to: [Four-Wheel Drive Systems](#) (308-07A Four-Wheel Drive Systems, Description and Operation).

Transfer Case - Transfer Case

Diagnosis and Testing

Principle of Operation

For a detailed description of the transfer case system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Transfer Case](#) (308-07B Transfer Case, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Transfer case ● Oil leaks ● Driveshafts ● Halfshafts ● Constant velocity (CV) joints 	<ul style="list-style-type: none"> ● Fuse(s) ● Wiring harness/electrical connectors ● Controller area network (CAN) circuits ● Instrument cluster ● Range change selection switch ● Transfer case control module

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Message	Possible Causes	Action
Loss of drive due to transfer case stuck in neutral and transmission park lock function is inoperative	'PARK LOCK FAILURE APPLY HANDBRAKE'	<ul style="list-style-type: none"> ● Transfer case control module CAN bus - off bus during range change ● Transfer case changeover solenoid fault ● Transfer case motor fault ● Transfer case internal obstruction 	Check for Transfer Case Control Module DTCs and refer to the relevant DTC Index
Loss of drive	-	<ul style="list-style-type: none"> ● Half shaft failure ● Driveshaft failure ● Front or rear axle: differential failure ● Transfer case center differential failure 	Check the condition of the driveshafts, half shafts and CV joints, differential
Range change inhibited	'TRANSMISSION RANGE CHANGE INOPERATIVE'	<ul style="list-style-type: none"> ● Transfer case control module has shut down due to thermal overload ● Transfer case internal obstruction ● Transfer case changeover solenoid fault ● Transfer case motor fault ● Transfer case control module failure 	Check for Transfer Case Control Module DTCs and refer to the relevant DTC Index
Off road traction reduced	'TRANSMISSION OVER HEAT SLOW DOWN'	<ul style="list-style-type: none"> ● Center differential temperature is approaching the over heated threshold 	Check for over-temperature DTCs
	'TRANSMISSION FAULT – TRACTION REDUCED'	<ul style="list-style-type: none"> ● Center differential has failed - operating as an open differential ● Transfer case control module has stopped transmitting on the CAN bus and defaults to open center differential 	Check for lost communication and bus off DTCs

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Transfer Case Control Module \(TCCM\)](#) (100-00 General Information, Description and Operation).

Transfer Case - Transfer Case Draining and Filling

General Procedures

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Position a container to collect the fluid.

- Remove the fluid drain plug.

- Clean the immediate area.
- Remove and discard the sealing washer.

- Allow the fluid to drain.

- Install the drain plug and tighten it to 22 Nm (16 lb.ft).

- Clean the component mating faces.
- Install a new sealing washer.

- Remove the fluid filler/level plug.

- Clean the immediate area.
- Remove and discard the sealing washer.

- Refill transfer case with the recommended fluid, until the fluid is level with bottom of filler/level plug hole.

For additional information, refer to: [Specifications](#) (308-07B Transfer Case, Specifications).

- Install the fluid filler/level plug and tighten to 22 Nm (16 lb.ft).

- Clean the component mating faces.
- Install a new sealing washer.

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Drain the transfer case fluid.
For additional information, refer to: [Transfer Case Draining and Filling](#) (308-07B Transfer Case, General Procedures).
4. Remove the transfer case.
For additional information, refer to: [Transfer Case - V6 4.0L Petrol](#) (308-07B Transfer Case, Removal).
5. With assistance, secure the transfer case with its transmission mating face down on a flat surface.
 - Secure with 2 bolts.

E62553

6.  **WARNING:** Eye protection must be worn.

Remove the shift motor.

- Remove the 4 bolts.
- Remove any debris from the bolt holes.

E62554

7.  **WARNING:** Eye protection must be worn.

Remove 17 Torx bolts securing the transfer casings.

- The two bolts indicated remain fully tightened.
- Remove any debris from the bolt holes.

8. With assistance, release the transfer case and secure with the rear face of the transfer case facing down on a flat surface.

E62555

9.  **WARNING:** Eye protection must be worn.

 **CAUTION:** Care must be taken to avoid damage to the mating surfaces.

Remove the front half of the transfer case.

- Remove the remaining 2 Torx bolts.
- Remove any debris from the bolt holes.
- Use a soft faced mallet.

E62556

10.  **CAUTION:** Note the fitted position of the special washers.

Remove the 2 special washers.

11. Remove the input shaft and oil pump assembly.

- Release the fluid pump pickup line.

E62557

12. Remove the front output flange.

- Compress the snap ring.
- Press the flange through the bearing.
- Remove and discard the snap ring.

E62558

E62559

13.  CAUTION: Care must be taken to avoid damage to the seal register and running surface.

Remove the output flange seal.

E62560

14. Remove the output flange bearing.

Installation

1. Remove the sealant from the transfer case mating faces.
2. Clean the magnetic filter.

3.  CAUTION: The chamfer on the bearing inner track must face the seal.

Using the special tool, install the output flange bearing.

- Clean the components mating faces.

E62561

E62562

4. Using the special tool, install a new oil seal.

- Clean the component mating faces.
- Grease the new seal.

E62563

5. CAUTIONS:

 Centralise the snap ring in the snap ring groove before installing the output flange.

 Extreme care is necessary to make sure the snap ring enters the bearing squarely.

Using the special tool and with assistance, install the drive flange.

- Clean the component mating faces.
- Install a new snap ring.
- Make sure the snap ring is fully engaged and retains the drive flange.

6.  CAUTION: Make sure the washers are installed correctly.

Install the 2 special washers.

- Clean the components.

7.  CAUTION: Make sure the oil pump is installed over its location peg.

Install the input shaft and oil pump assembly.

- Clean the components.
- Secure the fluid pickup line.

E62564

8. Apply a 2 mm bead of sealant to one surface of the transfer case mating face, as shown.

- Clean the component mating faces.
- Clean the dowels and dowel holes.

E62568

9. Install the front half of the transfer case.

- Evenly tighten the 2 Torx bolts shown to 35 Nm (26 lb.ft).

E62697

10. With assistance, release the transfer case and secure with its transmission mating face down on a flat surface.

11. Tighten the remaining Torx bolts to 35 Nm (26 lb.ft).

12. Install the shift motor.

- Clean the components.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).

13. With assistance, release the transfer case.

- Remove the 2 bolts.

14. Install the transfer case.

For additional information, refer to: [Transfer Case - V6 4.0L Petrol](#) (308-07B Transfer Case, Removal).

15. Refill the transfer case with the recommended fluid.

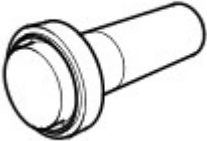

For additional information, refer to: [Transfer Case Draining and Filling](#) (308-07B Transfer Case, General Procedures).

16. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

5. With assistance, secure the transfer case with its transmission mating face down on a flat surface.
 - Secure with 2 bolts.

E62553

6.  **WARNING:** Eye protection must be worn.

Remove the shift motor.

- Remove the 4 bolts.
- Remove any debris from the bolt holes.

E62554

7.  **WARNING:** Eye protection must be worn.

Remove 17 Torx bolts securing the transfer casings.

- The two bolts indicated remain fully tightened.
- Remove any debris from the bolt holes.

8. With assistance, release the transfer case and secure with the rear face of the transfer case facing down on a flat surface.

E62555

9.  **WARNING:** Eye protection must be worn.

 **CAUTION:** Care must be taken to avoid damage to the mating surfaces.

Remove the front half of the transfer case.

- Remove the remaining 2 Torx bolts.
- Remove any debris from the bolt holes.
- Use a soft faced mallet.

E62556

10.  **CAUTION:** Note the fitted position of the special washers.

Remove the 2 special washers.

11. Remove the input shaft and oil pump assembly.

- Release the fluid pump pickup line.

E62557

12. Remove the front output flange.

- Compress the snap ring.
- Press the flange through the bearing.
- Remove and discard the snap ring.

E62558

E62559

13.  CAUTION: Care must be taken to avoid damage to the seal register and running surface.

Remove the output flange seal.

E62560

14. Remove the output flange bearing.

Installation

1. Remove the sealant from the transfer case mating faces.
2. Clean the magnetic filter.

3.  CAUTION: The chamfer on the bearing inner track must face the seal.

Using the special tool, install the output flange bearing.

- Clean the components mating faces.

E62561

E62562

4. Using the special tool, install a new oil seal.

- Clean the component mating faces.
- Grease the new seal.

E62563

5. CAUTIONS:

 Centralise the snap ring in the snap ring groove before installing the output flange.

 Extreme care is necessary to make sure the snap ring enters the bearing squarely.

Using the special tool and with assistance, install the drive flange.

- Clean the component mating faces.
- Install a new snap ring.
- Make sure the snap ring is fully engaged and retains the drive flange.

6.  CAUTION: Make sure the washers are installed correctly.

Install the 2 special washers.

- Clean the components.

7.  CAUTION: Make sure the oil pump is installed over its location peg.

Install the input shaft and oil pump assembly.

- Clean the components.
- Secure the fluid pickup line.

E62564

8. Apply a 2 mm bead of sealant to one surface of the transfer case mating face, as shown.

- Clean the component mating faces.
- Clean the dowels and dowel holes.

E62568

9. Install the front half of the transfer case.

- Evenly tighten the 2 Torx bolts shown to 35 Nm (26 lb.ft).

10. With assistance, release the transfer case and secure with its transmission mating face down on a flat surface.

11. Tighten the remaining Torx bolts to 35 Nm (26 lb.ft).

12. Install the shift motor.

- Clean the components.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).

13. With assistance, release the transfer case.

- Remove the 2 bolts.

14. Install the transfer case.

For additional information, refer to: [Transfer Case - V8 5.0L Petrol](#) (308-07B Transfer Case, Removal).

15. Refill the transfer case with the recommended fluid.

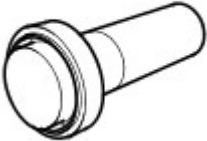

For additional information, refer to: [Transfer Case Draining and Filling](#) (308-07B Transfer Case, General Procedures).

16. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

 <p>205-818 E55429</p>	Installer 205-818

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Drain the transfer case fluid.
For additional information, refer to: [Transfer Case Draining and Filling](#) (308-07B Transfer Case, General Procedures).
4. Remove the transfer case.
For additional information, refer to: [Transfer Case - TDV6 3.0L Diesel](#) (308-07B Transfer Case, Removal).
5. With assistance, secure the transfer case with its transmission mating face down on a flat surface.
 - Secure with 2 bolts.

E62553

6.  **WARNING:** Eye protection must be worn.

Remove the shift motor.

- Remove the 4 bolts.
- Remove any debris from the bolt holes.

E62554

7.  **WARNING:** Eye protection must be worn.

Remove 17 Torx bolts securing the transfer casings.

- The two bolts indicated remain fully tightened.
- Remove any debris from the bolt holes.

8. With assistance, release the transfer case and secure with the rear face of the transfer case facing down on a flat surface.

E62555

9.  **WARNING:** Eye protection must be worn.

 **CAUTION:** Care must be taken to avoid damage to the mating surfaces.

Remove the front half of the transfer case.

- Remove the remaining 2 Torx bolts.
- Remove any debris from the bolt holes.
- Use a soft faced mallet.

E62556

10.  **CAUTION:** Note the fitted position of the special washers.

Remove the 2 special washers.

11. Remove the input shaft and oil pump assembly.

- Release the fluid pump pickup line.

E62557

12. Remove the front output flange.

- Compress the snap ring.
- Press the flange through the bearing.
- Remove and discard the snap ring.

E62558

E62559

13.  CAUTION: Care must be taken to avoid damage to the seal register and running surface.

Remove the output flange seal.

E62560

14. Remove the output flange bearing.

Installation

1. Remove the sealant from the transfer case mating faces.
2. Clean the magnetic filter.

3.  CAUTION: The chamfer on the bearing inner track must face the seal.

Using the special tool, install the output flange bearing.

- Clean the components mating faces.

E62561

E62562

4. Using the special tool, install a new oil seal.

- Clean the component mating faces.
- Grease the new seal.

E62563

5. CAUTIONS:

 Centralise the snap ring in the snap ring groove before installing the output flange.

 Extreme care is necessary to make sure the snap ring enters the bearing squarely.

Using the special tool and with assistance, install the drive flange.

- Clean the component mating faces.
- Install a new snap ring.
- Make sure the snap ring is fully engaged and retains the drive flange.

6.  CAUTION: Make sure the washers are installed correctly.

Install the 2 special washers.

- Clean the components.

7.  CAUTION: Make sure the oil pump is installed over its location peg.

Install the input shaft and oil pump assembly.

- Clean the components.
- Secure the fluid pickup line.

E62564

8. Apply a 2 mm bead of sealant to one surface of the transfer case mating face, as shown.

- Clean the component mating faces.
- Clean the dowels and dowel holes.

E62568

9. Install the front half of the transfer case.

- Evenly tighten the 2 Torx bolts shown to 35 Nm (26 lb.ft).

E62697

10. With assistance, release the transfer case and secure with its transmission mating face down on a flat surface.

11. Tighten the remaining Torx bolts to 35 Nm (26 lb.ft).

12. Install the shift motor.

- Clean the components.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).

13. With assistance, release the transfer case.

- Remove the 2 bolts.

14. Install the transfer case.

For additional information, refer to: [Transfer Case - TDV6 3.0L Diesel](#) (308-07B Transfer Case, Removal).

E62554

7.  WARNING: Eye protection must be worn.

Remove 17 Torx bolts securing the transfer casings.

- The two bolts indicated remain fully tightened.
- Remove any debris from the bolt holes.

E62667

8.  **WARNING:** Eye protection must be worn.

 **CAUTION:** Care must be taken to avoid damage to the mating surfaces.

Remove the rear half of the transfer case.

- Remove the remaining 2 Torx bolts.
- Remove any debris from the bolt holes.
- Use a soft faced mallet.

9. Remove the differential module.

- Remove the spacer.

E62668

10. NOTE: Remove as an assembly.

Remove the clutch, chain and sprocket.

E62669

11. Remove the rear output flange.

- Compress the snap ring.
- Press the flange through the bearing.
- Remove and discard the snap ring.

E62670

12.  CAUTION: Care must be taken to avoid damage to the seal register and running surface.

Remove the output flange seal.

E62671

13. Remove the output flange bearing.

- Remove the circlip.

E62672

14. Release the front half of the transfer case from the flat surface.

- Remove the 2 bolts.

Installation

1. Remove the sealant from the transfer case mating faces.

2. Clean the magnetic filter.

3.  **CAUTION:** The chamfer on the bearing inner track must face the seal.

Using the special tool, install the output flange bearing.

- Clean the components mating faces.
- Install the circlip.

E62673

4. Using the special tool, install a new oil seal.

- Clean the component mating faces.
- Grease the new seal.

E62674

E62675

5. CAUTIONS:

 Centralise the snap ring in the snap ring groove before installing the output flange.

 Extreme care is necessary to make sure the snap ring enters the bearing squarely.

Using the special tool and with assistance, install the drive flange.

- Clean the component mating faces.
- Install a new snap ring.
- Make sure the snap ring is fully engaged and retains the drive flange.

6. Secure the rear half of the transfer case with its rear face down on a flat surface.

7. NOTE: Rotate the differential to engage the splines.

Install the differential module.

- Clean the components.
- Install the spacer.

E62676

8. NOTE: Rotate the assembly to engage the clutch plates.

• **NOTE:** Use circlip pliers to open the actuator levers.

Install the clutch.

- Clean the components.
- Engage the actuator levers.

E62677

E62678

9.  CAUTION: The dark links in the chain face up as shown.

• NOTE: The relieved splined inner diameter of the sprocket must face up as shown.

Install the chain and sprocket.

- Clean the components.

E62568

10. Apply a 2 mm bead of sealant to one surface of the transfer case mating face, as shown.

- Clean the component mating faces.
- Clean the dowels and dowel holes.

11. Install the front half of the transfer case.

- Evenly tighten the 2 Torx bolts shown to 35 Nm (26 lb.ft).

E62697

12. Tighten the remaining Torx bolts to 35 Nm (26 lb.ft).

13. Install the shift motor.

14. Install the transfer case from the flat

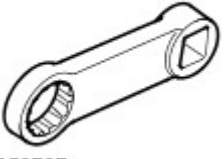

For additional information, refer to: [Transfer Case - TDV6 3.0L Diesel \(308-07B Transfer Case, Removal\)](#).

- Remove the 2 bolts
- Tighten the Torx bolts to 25 Nm (18 lb.ft).

- 16.** Refill the transfer case with the recommended fluid.
For additional information, refer to: [Transfer Case Draining and Filling](#) (308-07B Transfer Case, General Procedures).
- 17.** Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

TDV6 EXHAUST SYSTEM COMPONENT LOCATION - WITH OPTIONAL DIESEL PARTICULATE FILTER - FROM 2008 MY (WHERE FITTED)

E91409

Item	Part Number	Description
1	-	Inlet flange
2	-	Flexible de-coupler
3	-	Catalytic converter
4	-	Clamp
5	-	Differential pressure sensor
6	-	Mounting rubber (6 off)
7	-	Silencer - Centre
8	-	Silencer - Rear Left Hand (LH)
9	-	Silencer - Rear Right Hand (RH)
10	-	Flange joint and gasket
11	-	DPF

OVERVIEW

The TdV6 exhaust system is fabricated from stainless steel and is supplied as two separate assemblies; a front section incorporating a catalytic converter and a rear section incorporating a centre silencer and two rear silencers.

The system is attached to the underside of the body with five mounting rubbers which are located on mild steel hanger bars that are welded to the system. The mounting rubbers locate on corresponding hangers which are welded to the underside of the vehicle body.

The system has service repair items available. Indentations in the rear section between the center and the rear silencers show the cut points for the service replacement rear silencers or front section. When a service repair section is used, the joint is connected using a sleeve and two clamps to connect the pipes at the cut points.

On vehicles from 2008MY, an optional Diesel Particulate Filter (DPF) is available. The non-DPF exhaust system is also

available on vehicles from 2008MY as the DPF is not required to comply with EU4 emission regulations.

• **CAUTIONS:**

The use of bio-fuels can seriously contaminate and destroy the coatings used on the catalytic converter. The DPF and the catalytic converter can become irreversibly contaminated if non-specified oils or fuels are used. This will result in the vehicle being unable to regenerate the DPF, becoming non-compliant with tailpipe emission regulations and replacement of the catalytic converter and DPF will be required.

If the vehicle is waded in deep water and the engine is stopped with the tailpipes submerged, the water, which can enter the system, can also contaminate both the DPF and the catalytic converter. This again can result in catalytic converter damage and damaging the ability for the DPF to regenerate therefore requiring both components to be replaced.

FRONT SECTION

The front section has a welded flange with three holes which provide for the attachment to three studs on the turbocharger. The flange is sealed with a metal gasket. This is secured to the turbocharger studs with three nuts.

The flange is welded to a fabricated elbow which in turn is welded to the de-coupler. Fabricated pressings are welded between the de-coupler and the body of the catalytic converter. The converter outlet pipe is a 60 mm (2.2 in) diameter tube, with a 2.0 mm (0.079 in) wall thickness, which is welded to the converter body. The outlet pipe has hanger bar which provides for the location of a mounting rubber.

Vehicles without DPF

The rear of the outlet pipe from the catalytic converter locates into the rear section. When the front section is inserted into the flared end, a clamp is used to compress and secure the joint.

Vehicles with Optional DPF - From 2008MY

The rear outlet pipe from the catalytic converter has a flared end which slides onto the DPF inlet pipe and is secured with a clamp. The outlet pipe of the DPF has a triangular shaped flange which mates with a similar flange on the rear section of the exhaust. The 2 flanges are sealed with a metal gasket and are secured using 3 locknuts screwed onto captive studs located in the DPF flange.

REAR SECTION

Vehicles without DPF

On vehicles without DPF, the rear section has a short 70 mm (2.75 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which provides location for the front section as previously mentioned. The tube is welded to the centre silencer assembly.

Vehicles with Optional DPF - From 2008MY

On vehicles from 2008MY fitted with the optional DPF, the rear section has a short 70 mm (2.75 in) with a triangular flange which mates with a similar flange on the front section as previously mentioned.

All Vehicles

The centre silencer comprises two pressed stainless steel shells which are welded together to give a capacity of 25.2 liters (1537 in³). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gases pass through the silencer. Hanger bars are welded to the front right hand side and left hand side of the silencer and provide for the location of mounting rubbers.

The silencer has two 50 mm (2.0 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which are curved to pass around the rear suspension components.

Each outlet pipe terminates in a welded joint with the rear silencers. The outlet pipes have a hanger bar which provides for the location of a mounting rubber.

A hanger bar is welded to the front face of each rear silencer and provides for the location of a mounting rubber. The silencer is a circular fabrication with a baffle tube which is surrounded with glass fiber to provide further noise suppression. Each silencer has a capacity of 2.7 liters (165 in³).

The silencers each have an outlet pipe which is 55 mm (2.16 in) diameter, with a wall thickness of 1.2 mm (0.05 in). Each outlet pipe is curved downwards to direct exhaust gasses away from the rear of the vehicle.

CATALYTIC CONVERTER

The engine management system provides accurately metered quantities of fuel to the combustion chambers to ensure the most efficient use of fuel and to minimise the exhaust emissions.

To further reduce the carbon monoxide and hydrocarbons content of the exhaust gases, a catalytic converter (Diesel Oxidation Catalyst) is integrated into the front pipe of the exhaust system. In the catalytic converter the exhaust gases are passed through honeycombed ceramic elements coated with a special surface treatment called 'washcoat'. The washcoat increases the surface area of the ceramic elements by a factor of approximately 7000. On top of the washcoat is a coating containing platinum on vehicles without a DPF or platinum and palladium on vehicles with a DPF, which are the active constituents for converting harmful emissions into inert by-products. The platinum and palladium adds oxygen to the carbon monoxide and the hydrocarbons in the exhaust gases, to convert them into carbon dioxide and water.

DIESEL PARTICULATE FILTER (DPF) - VEHICLES FROM 2008MY (WHERE FITTED)

On vehicles from 2008MY, an optional Diesel Particulate Filter (DPF) is available.

• NOTE: The non-DPF exhaust system is also available on vehicles from 2008MY.

The DPF system reduces diesel particulate emissions to negligible levels.

DPF System Components

E91610

Item	Part Number	Description
1	-	Exhaust gas temperature sensor (pre catalyst)
2	-	Exhaust gas temperature sensor (post catalyst)
3	-	High pressure sensor pipe
4	-	Differential pressure sensor
5	-	Low pressure sensor pipe
6	-	Exhaust gas temperature sensor (Post DPF)
7	-	Diesel particulate filter
8	-	Catalytic converter

The particulate emissions are the black fumes emitted from the diesel engine under certain load conditions. The emissions are a complex mixture of solid and liquid components with the majority of the particulates being carbon microspheres on which hydrocarbons from the engine's fuel and lubricant condense.

The DPF system comprises the following components:

- Diesel particulate filter
- DPF control software incorporated into the Engine Control Module (ECM)
- Differential pressure sensor.

Diesel Particulate Filter

The DPF is located in the exhaust system, downstream of the catalytic converter. A major feature of the DPF is its ability for regeneration. Regeneration is the burning of particulates trapped by the filter to prevent obstruction to the free flow of exhaust gasses. The regeneration process takes place at calculated intervals and is not noticeable by the driver of the vehicle.

Regeneration is most important, since an overfilled filter can damage the engine through excessive exhaust back pressure and can itself be damaged or destroyed. The material trapped in the filter is in the most part carbon particles with some absorbed hydrocarbons.

Item	Part Number	Description
A	-	Front face showing alternate closed cells
B	-	Side view showing exhaust gas flow through the filter and particulate build up
C	-	Rear face showing alternate closed cells

The DPF uses a filter technology based on a filter with a catalytic coating. The DPF is made from silicon carbide housed in a steel container and has excellent thermal shock resistance and thermal conductivity properties. The DPF is designed for the engine's operating requirements to maintain the optimum back pressure requirements.

The porous surface of the filter consists of a number of small parallel channels positioned in the longitudinal direction of the exhaust system. Adjacent channels in the filter are alternately plugged at the end. This design forces the exhaust gasses to flow through the porous filter walls, which act as the filter medium. Particulate matter which are too big to pass through the porous surface are collected and stored in the channels.

The collected particulate matter, if not removed, can create an obstruction to exhaust gas flow. The particles are removed by a regeneration process which oxidizes the particles.

DPF regeneration is controlled by the temperature of the exhaust gasses and the DPF. The DPF includes a wash coat to the filter surface which comprises platinum and other active components and is similar to the catalytic converter. At certain exhaust gas and DPF temperatures the wash coat promotes combustion of the particles in addition to oxidizing carbon monoxide and hydrocarbon emissions.

The exhaust gas and DPF temperatures are controlled by the DPF software located in the ECM. The DPF software monitors the load status of the DPF based on driving style, distance travelled and signals from the differential pressure sensor and temperature sensors. When the particulate loading of the DPF reaches predetermined levels, the DPF is actively regenerated by adjusting, in conjunction with the ECM, various engine control functions such as:

- fuel injection
- intake air throttle
- exhaust gas recirculation
- turbocharger boost pressure control.

The regeneration process is possible because of the flexibility of the common-rail fuel injection engine which provides precise control of fuel flow, fuel pressure and injection timing which are essential requirements to promote the efficient regeneration process.

Two processes are used to regenerate the DPF; passive and active.

Passive Regeneration

Passive regeneration requires no special engine management intervention and occurs during normal engine operation. The passive regeneration involves a slow conversion of the particulate matter deposited in the DPF into carbon dioxide. This process is active when the DPF temperature reaches 250°C (482°F) and is a continuous process when the vehicle is being driven at higher engine loads and speeds.

During passive regeneration, only a portion of the particulate matter is converted into carbon dioxide. This is due to the chemical reaction process which is only effective within the normal operating temperature range of 250°C to 500°C (482°F to 932°F).

Above this temperature range the conversion efficiency of the particulates into carbon dioxide increases as the DPF temperature is raised. These temperatures can only be achieved using the active regeneration process.

Active Regeneration

Active regeneration starts when the particulate loading of the DPF reaches a threshold as monitored or determined by the DPF control software. The threshold calculation is based on driving style, distance travelled and back pressure signals from the differential pressure sensor.

Active regeneration generally occurs every 450 miles (725 km) although this is highly dependant on how the vehicle is driven. For example, if the vehicle is driven at low loads in urban traffic regularly, active regeneration will occur more

often. This is due to the rapid build-up of particulates in the DPF than if the vehicle is driven at high speeds when passive regeneration will have occurred.

The DPF software incorporates a mileage trigger which is used as back-up for active regeneration. If active regeneration has not been initiated by a back pressure signal from the differential pressure sensor, regeneration is requested based on distance travelled.

Active regeneration of the DPF is commenced when the temperature of the DPF is increased to the combustion temperature of the particles. The DPF temperature is raised by increasing the exhaust gas temperature. This is achieved by introducing post-injection of fuel after the pilot and main fuel injections have occurred.

This is determined by the DPF software monitoring the signals from the two DPF temperature sensors to establish the temperature of the DPF. Depending on the DPF temperature, the DPF software requests the ECM to perform either one or two post-injections of fuel:

- The first post-injection of fuel retards combustion inside the cylinder which increases the temperature of the exhaust gas.
- The second post-injection of fuel is injected late in the power stroke cycle. The fuel partly combusts in the cylinder, but some unburnt fuel also passes into the exhaust where it creates an exothermic event within the catalytic converter, further increasing the temperature of the DPF.

The active regeneration process takes approximately 20 minutes to complete. The first phase increases the DPF temperature to 500°C (932°F). The second phase further increases the DPF temperature to 600°C (1112°F) which is the optimum temperature for particle combustion. This temperature is then maintained for 15-20 minutes to ensure complete incineration of the particles within the DPF. The incineration process converts the carbon particles to carbon dioxide and water.

The active regeneration temperature of the DPF is closely monitored by the DPF software to maintain a target temperature of 600°C (1112°F) at the DPF inlet. The temperature control ensures that the temperatures do not exceed the operational limits of the turbocharger and the catalytic converter. The turbocharger inlet temperature must not exceed 830°C (1526°F) and the catalytic converter brick temperature must not exceed 800°C (1472°F) and the exit temperature must remain below 750°C (1382°F).

During the active regeneration process the following ECM controlled events occur:

- The turbocharger is maintained in the fully open position. This minimizes heat transmission from the exhaust gas to the turbocharger and reduces the rate of exhaust gas flow allowing optimum heating of the DPF. If the driver demands an increase in engine torque, the turbocharger will respond by closing the vanes as necessary.
- The throttle is closed as this assists in increasing the exhaust gas temperature and reduces the rate of exhaust gas flow which has the effect of reducing the time for the DPF to reach the optimum temperature.
- The Exhaust Gas Recirculation (EGR) valve is closed. The use of EGR decreases the exhaust gas temperature and therefore prevents the optimum DPF temperature being achieved.

If, due to vehicle usage and/or driving style, the active regeneration process cannot take place or is unable to regenerate the DPF, the dealer can force regenerate the DPF. This is achieved by either driving the vehicle until the engine is at its normal operating temperature and then driving for a further 20 minutes at speeds of not less than 30 mph (48 km/h) or by connecting a Land Rover approved diagnostic system to the vehicle which will guide the technician through an automated regeneration procedure to clean the DPF.

Diesel Particulate Filter Control

The DPF requires constant monitoring to ensure that it is operating at its optimum efficiency and does not become blocked. The ECM contains DPF software which controls the monitoring and operation of the DPF system and also monitors other vehicle data to determine regeneration periods and service intervals.

The DPF software can be divided into three separate control software modules; a DPF supervisor module, a DPF fuel management module and a DPF air management module.

These three modules are controlled by a fourth software module known as the DPF co-ordinator module. The co-ordinator module manages the operation of the other modules when an active regeneration is requested. The DPF supervisor module is a sub-system of the DPF co-ordinator module.

DPF Fuel Management Module

The DPF fuel management module controls the following functions:

- Timing and quantity of the four split injections per stroke (pilot, main and two post injections).
- Injection pressure and the transition between the three different calibration levels of injection.

The above functions are dependant on the condition of the catalytic converter and the DPF.

The controlled injection determines the required injection level in addition to measuring the activity of the catalytic converter and the DPF. The fuel management calculates the quantity and timing for the four split injections, for each of the three calibration levels for injection pressure, and also manages the transition between the levels.

The two post injections are required to separate the functionality of increasing in-cylinder gas temperatures and the production of hydrocarbons. The first post injection is used to generate the higher in-cylinder gas temperature while simultaneously retaining the same engine torque output produced during normal (non-regeneration) engine operation. The second post injection is used to generate hydrocarbons by allowing unburnt fuel into the catalytic converter without producing increased engine torque.

DPF Air Management Module

The DPF air management module controls the following functions:

- EGR control

- Turbocharger boost pressure control
- Intake air temperature and pressure control.

During active regeneration, the EGR operation is disabled and the closed-loop activation of the turbocharger boost controller is calculated. The air management module controls the air in the intake manifold to a predetermined level of pressure and temperature. This control is required to achieve the correct in-cylinder conditions for stable and robust combustion of the post injected fuel.

The module controls the intake air temperature by actuating the EGR throttle and by adjustment of the turbocharger boost pressure control.

DPF Co-ordinator Module

The DPF co-ordinator module reacts to a regeneration request from the supervisor module by initiating and co-ordinating the following DPF regeneration requests:

- EGR cut-off
- Turbocharger boost pressure control
- Engine load increase
- Control of air pressure and temperature in the intake manifold
- Fuel injection control.

When the supervisor module issues a regeneration request, the co-ordinator module requests EGR cut-off and a regeneration specific turbocharger boost pressure control. It then waits for a feedback signal from the EGR system confirming that the EGR valve is closed.

When the EGR valve is closed, the co-ordinator module initiates requests to increase engine load by controlling the intake air temperature and pressure.

Once confirmation is received that intake conditions are controlled or a calibration time has expired, the co-ordinator module then changes to a state awaiting an accelerator pedal release manoeuvre from the driver. If this occurs or a calibration time has expired, the co-ordinator module generates a request to control fuel injections to increase exhaust gas temperature.

Differential Pressure Sensor

Item	Part Number	Description
1	-	Low pressure connection
2	-	High pressure connection
3	-	Electrical connector

The differential pressure sensor is located on a bracket which is attached to the transfer case.

The differential pressure sensor is used by the DPF software to monitor the condition of the DPF. Two pipe connections on the sensor are connected by pipes to the inlet and outlet ends of the DPF. The pipes allow the sensor to measure the inlet and outlet pressures of the DPF

As the amount of particulates trapped by the DPF increases, the pressure at the inlet side of the DPF increases in comparison to the DPF outlet. The DPF software uses this comparison, in conjunction with other data, to calculate the accumulated amount of trapped particulates.

By measuring the pressure difference between the DPF inlet and outlet and the DPF temperature, the DPF software can determine if the DPF is becoming blocked and requires regeneration.

Differential Particulate Filter Temperature Sensors

Three temperature sensors are used in the DPF system. The first is located just after the turbocharger in the catalytic converter inlet pipe, the second located in the catalytic converter outlet pipe and the third in the DPF outlet cone pipe work.

The sensors measure the temperature of exhaust gas exiting the turbocharger, after the catalyst and after it passes through the DPF to provide the information needed to calculate the DPF temperature.

The information is used, in conjunction with other data, to estimate the amount of accumulated particulates and to control

the DPF temperature.

Instrument Cluster Indications

For drivers who make regular short journeys at low speeds, it may not be possible to efficiently regenerate the DPF. In this case, the DPF software will detect a blockage of the DPF from signals from the differential pressure sensor and will alert the driver as follows.

Item	Part Number	Description
1	-	'DPF FULL VISIT DEALER' message
2	-	'DPF FULL' message

Vehicles with DPF use a high-line instrument cluster to alert the driver to the condition of the DPF via messages in the message centre.

When the DPF becomes full the driver will be alerted to this condition by a message 'DPF FULL' accompanied by a handbook symbol. As detailed in the Owners Handbook, the driver should drive the vehicle until the engine is at its normal operating temperature and then drive for a further 20 minutes at speeds of not less than 30 mph (48 km/h). Successful regeneration of the DPF is indicated to the driver by the 'DPF FULL' message no longer being displayed.

If the DPF software detects that the DPF is still blocked, the message will change to 'DPF FULL VISIT DEALER', the driver should take the vehicle to an authorized dealer to have the DPF force regenerated.

Diesel Particulate Filter Side Effects

The following section details some side effects caused by the active regeneration process.

Engine Oil Dilution

Engine oil dilution can occur due to small amounts of fuel entering the engine crankcase during the post-injection phases. This has made it necessary to introduce a calculation based on driving style to reduce oil service intervals if necessary. The driver is alerted to the oil service by a message in the instrument cluster.

The DPF software monitors the driving style, the frequency of the active regeneration and duration. Using this information a calculation can be made on the engine oil dilution. When the DPF software calculates the engine oil dilution has reached a predetermined threshold (fuel being 7% of engine oil volume) a service message is displayed in the instrument cluster.

Depending on driving style, some vehicles may require an oil service before the designated interval. If an service message is displayed, the vehicle will be required have a full service and the service interval counter will be reset.

Fuel Consumption

During the active regeneration process of the DPF, there will be an increase in fuel consumption. However, because active regeneration occurs infrequently and for limited periods of time, the overall effect on fuel consumption is approximately 2%. The additional fuel used during the active regeneration process is accounted for in the instantaneous and average fuel consumption displays in the instrument cluster.

Exhaust System - TDV6 2.7L Diesel - Exhaust System

Diagnosis and Testing

Principle of Operation

For a detailed description of the exhaust system, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Exhaust System](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Leaks ● Metal fatigue ● Pipes ● Catalytic converter ● Muffler(s) ● Joints ● Mountings ● Clearance around components 	<ul style="list-style-type: none"> ● Fuses ● Wiring harness ● Electrical connector(s) ● Sensor(s) ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Noisy or leaking exhaust	<ul style="list-style-type: none"> ● Exhaust system/components 	Install new components as necessary. Refer to the relevant section of the workshop manual.
Lack of power	<ul style="list-style-type: none"> ● Air intake system fault ● Restricted exhaust system ● Low fuel pressure ● Exhaust Gas Recirculation (EGR) valve(s) fault ● Turbocharger fault 	Check the air intake system. Check for a blocked catalytic converter or muffler, install new components as necessary. Check the fuel pressure. For EGR and turbocharger tests, refer to the relevant section of the workshop manual.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Exhaust System - TDV6 2.7L Diesel - Catalytic Converter Vehicles Without: Diesel Particulate Filter (DPF)

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the exhaust system.
For additional information, refer to: [Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).
4. Remove the catalytic converter.
 - Remove the nut and release the retaining clamp.

Installation

1. **NOTE:** Do not tighten the retaining clamp at this stage.

Position the catalytic converter to the front muffler.
 - Clean the components.
 - Install the nut.
2. Install the exhaust system.
For additional information, refer to: [Exhaust System - Vehicles Without: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).
3. Tighten the catalytic converter retaining clamp to 55 Nm (40 lb.ft).
4. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Exhaust System - TDV6 2.7L Diesel - Catalytic Converter Vehicles With: Diesel Particulate Filter (DPF)

Removal and Installation

Removal

WARNING: Observe due care when working near a hot exhaust system.

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the exhaust system.
For additional information, refer to: [Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).
- Remove the diesel particulate filter (DPF) heat shield.
 - Remove the 3 bolts.

E98041

- Remove the catalytic converter.
 - Remove the nut.
 - Remove and discard the clamp.

E98042

- NOTE:** Do not disassemble further if the component is removed for access only.

Remove the catalytic converter temperature sensors.

E98043

Installation

- Install the catalytic converter temperature sensors.

- Tighten to 35 Nm (26 lb.ft).

2.  CAUTION: Make sure that the mating faces are clean and free of foreign material.

- NOTE: Do not fully tighten the clamp at this stage.

Install the catalytic converter.

- Install a new clamp.

3. Install the exhaust system.

For additional information, refer to: [Exhaust System - Vehicles With: Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).

4. Install the DPF heat shield.

- Tighten the 2 bolts to 10 Nm (7 lb.ft).

Exhaust System - TDV6 2.7L Diesel - Diesel Particulate Filter (DPF)

Removal and Installation

Removal

 **WARNING:** Observe due care when working near a hot exhaust system.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Disconnect the diesel particulate filter (DPF), differential pressure sensor electrical connector.

3. Release the DPF differential pressure sensor.

- Release the clip.

4. Disconnect the DPF exhaust gas temperature sensor electrical connector.

5.  CAUTION: Make sure that the exhaust system is supported with a suitable stand.

Release the 6 exhaust hangers.

E98050

6. Remove the DPF rear heat shield.

- Remove the 4 bolts.

E98044

7. NOTE: Discard the gasket.

Reposition the muffler and tailpipe assembly.

- Remove the 3 nuts.
- Remove the bracket.

E98047

8. Remove the DPF front heat shield.

- Remove the 3 bolts.

E98045

9. Remove the DPF.
 - Remove the nut.

10. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the DPF exhaust gas temperature sensor.

- Release the wiring harness from the 2 clips.

Installation

1. Install the DPF exhaust gas temperature sensor.
 - Tighten to 35 Nm (26 lb.ft).
 - Secure the wiring harness in the clips.
2. **NOTE:** Do not fully tighten the clamp at this stage.
Install the DPF.
3. **NOTE:** Install a new gasket.
Secure the muffler and tailpipe assembly.
 - Install the bracket.
 - Tighten the nuts to 48 Nm (35 lb.ft).
 - Secure the exhaust hangers.
4. Tighten the catalytic converter to DPF clamp.
 - Tighten the nut to 48 Nm (35 lb.ft).
5. Install the DPF heat shields.
 - Tighten the bolts to 10 Nm (7 lb.ft).
6. Secure the DPF differential pressure sensor.
7. Connect the DPF differential pressure sensor electrical connector.
8. Connect the DPF exhaust gas temperature sensor electrical connector.

Exhaust System - TDV6 2.7L Diesel - Diesel Particulate Filter (DPF) Differential Pressure Sensor

Removal and Installation

Removal

WARNING: Observe due care when working near a hot exhaust system.

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the diesel particulate filter (DPF), differential pressure sensor electrical connector.

- Release the DPF differential pressure sensor.
 - Release the clip.

- CAUTION:** Make a note of the connection orientation of the high and low pressure hoses to the sensor ports. Make sure the hoses are located to the correct sensor port when installed. Failure to follow these instructions may result in damage to the vehicle.

Disconnect the high and low pressure hoses from the DPF differential pressure sensor.

- Release the 2 clips.

Installation

- Connect the high and low pressure hoses to the DPF differential pressure sensor.

- Secure the clips.

2. Secure the DPF differential pressure sensor.

- Secure with the clip.

3. Connect the DPF differential pressure sensor electrical connector.

Exhaust System - TDV6 2.7L Diesel - Exhaust System Vehicles Without: Diesel Particulate Filter (DPF)

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).
4. Remove the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).
5. Disconnect the catalytic converter from the exhaust manifold.
 - Remove the 3 nuts.
 - Discard the gasket.

6. With assistance, remove the exhaust system.
 - Disconnect the 5 exhaust hangers.

Installation

1. With assistance, install the exhaust system.
 - Attach the exhaust hangers.
2. Position the catalytic converter to the exhaust manifold.
 - Clean the components.
 - Install a new gasket.
 - Tighten the nuts to 48 Nm (35 lb.ft).
3. Install the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body

Mounting, Removal and Installation).

4. Install the engine undershield.

For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

5. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Exhaust System - TDV6 2.7L Diesel - Exhaust System Vehicles With: Diesel Particulate Filter (DPF)

Removal and Installation

Removal

 **WARNING:** Observe due care when working near a hot exhaust system.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

3. Disconnect the diesel particulate filter (DPF), differential pressure sensor electrical connector.

4.

5. Release the DPF differential pressure sensor.

- Release the clip.

6. Disconnect the post-catalytic converter exhaust gas temperature sensor electrical connector.

- Release the 2 clips.

7. Disconnect the DPF exhaust gas temperature sensor electrical connector.

8. Loosen the catalytic converter to DPF clamp.

9. NOTE: Discard the gasket.

Release the catalytic converter from the turbocharger.

- Remove and discard the 3 nuts.

10. Remove the exhaust gas temperature sensor electrical connector heat shield.

- Remove the bolt.

11. Disconnect the pre-catalytic converter exhaust gas temperature sensor electrical connector.

12. With assistance, remove the exhaust system.

- Release the 6 exhaust hangers.

13. NOTE: Do not disassemble further if the component is removed for access only.

- NOTE: Make a note of the fitted positions of the sensors before removal.

Remove the 3 exhaust gas temperature sensors.

14. Remove the 6 exhaust hangers.

15. Remove the 2 DPF heat shields.

- Remove the bolts.

Installation

1. Install the 2 DPF heat shields.

- Tighten to 10 Nm (7 lb.ft).
2. Install the exhaust hangers.
 3. Install the exhaust gas temperature sensors.
 - Tighten to 35 Nm (26 lb.ft).
 4. With assistance, install the exhaust system.
 - Secure the exhaust hangers.
 5. Connect the pre-catalytic converter exhaust gas temperature sensor electrical connector.
 6. Install the exhaust gas temperature sensor electrical connector heat shield.
 - Tighten to 10 Nm (7 lb.ft).

7.  CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

- NOTE: Install a new gasket.

Secure the catalytic converter to the turbocharger.

- Tighten the nuts to 48 Nm (35 lb.ft).
8. Secure the catalytic converter to DPF clamp.
 - Tighten to 48 Nm (35 lb.ft).
 9. Connect the DPF exhaust gas temperature sensor electrical connector.
 10. Connect the post-catalytic converter exhaust gas temperature sensor electrical connector.
 11. Secure the DPF differential pressure sensor.
 12. Connect the DPF differential pressure sensor electrical connector.
 13. Install the transmission crossmember.

For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

OVERVIEW

The 3.0L V6 TdV6 exhaust system is fabricated from stainless steel and is supplied as four separate assemblies; 2 front sections, one incorporating a catalytic converter, a connecting section or Diesel Particulate Filter (DPF) and a rear section incorporating a centre silencer and two rear silencers.

The system is attached to the underside of the body with 6 mounting rubbers which are located on mild steel hanger bars that are welded to the system. The mounting rubbers locate on corresponding hangers which are welded to the underside of the vehicle body.

The system has service repair items available. Indentations in the rear section between the center and the rear silencers show the cut points for the service replacement rear silencers or front section. When a service repair section is used, the joint is connected using a sleeve and two clamps to connect the pipes at the cut points.

Two variants of the exhaust system are available; a non DPF system and a system incorporating a DPF. The DPF is required to comply with EU5 emission regulations

CAUTION: The use of bio-fuels can seriously contaminate and destroy the coatings used on the catalytic converter. The DPF and the catalytic converter can become irreversibly contaminated if non-specified oils or fuels are used. This will result in the vehicle being unable to regenerate the DPF, becoming non-compliant with tailpipe emission regulations and replacement of the catalytic converter and DPF will be required.

If the vehicle is waded in deep water and the engine is stopped with the tailpipes submerged, the water, which can enter the system, can also contaminate both the DPF and the catalytic converter. This again can result in catalytic converter damage and damaging the ability for the DPF to regenerate therefore requiring both components to be replaced.

DESCRIPTION

FRONT SECTION

The front section comprises 1 catalytic converter for the LH (left-hand) bank of cylinders. The catalytic converter has a welded inlet pipe which is curved through 90 degrees. The RH (right-hand) bank also has a curved inlet pipe which connects to a pipe to the DPF (if fitted) or catalytic converter assembly (vehicles without DPF).

The outer end of each inlet pipe is fitted with a flange which mates with the turbocharger for each bank of cylinders. Three bolts in the LH flange and two bolts in the RH flange locate in threaded holes in the mating flange on the turbocharger. Each flange is sealed with a gasket. The inlet pipes are 55 mm (2.16 in) diameter and are fitted with a flexible coupling.

The base of the catalytic converter has a connection with the LH bank outlet pipe and is secured with a clamp. The outlet connection from the LH bank catalytic converter and the outlet connection from the RH bank, merge into one single pipe which then connects to the DPF (if fitted) or catalytic converter assembly (vehicles without DPF).

The DPF (if fitted) or catalytic converter assembly (vehicles without DPF) is connected at its rearward end to the center silencer with a flange connection with the rear exhaust section. Three studs in the DPF (if fitted) or catalytic converter assembly (vehicles without DPF) mate with the center silencer rear section flange and are secured with 3 nuts and sealed with a gasket.

REAR SECTION

The centre silencer comprises two pressed stainless steel shells which are welded together to give a capacity of 25.2 liters (1537 in³). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gases pass through the silencer.

Hanger bars are welded to the front right hand side and left hand side of the silencer and provide for the location of mounting rubbers. The silencer has two 60 mm (2.3 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which are curved to pass around the rear suspension components. Each outlet pipe terminates in a welded joint with the rear silencers. The outlet pipes have a hanger bar which provides for the location of a mounting rubber. A hanger bar is welded to the front face of each rear silencer and provides for the location of a mounting rubber.

The silencer is a circular fabrication with a baffle tube which is surrounded with glass fiber to provide further noise suppression. Each silencer has a capacity of 2.7 liters (165 in³). The silencers each have an outlet pipe which is 65 mm (2.55 in) diameter, with a wall thickness of 1.2 mm (0.05 in). Each outlet pipe is curved downwards to direct exhaust gasses away from the rear of the vehicle.

CATALYTIC CONVERTER

The oxidizing catalytic converter is fitted in the front section of the LH bank outlet pipe from the turbocharger, after the pre-catalyst exhaust gas temperature sensor (vehicles with DPF only) and the Heated Oxygen Sensor (HO2S).

• **NOTE:** On vehicles fitted with a DPF: The pre and post catalyst exhaust gas temperature sensors are used by the engine management system to monitor the DPF for regeneration purposes.

On vehicles without a DPF, a second smaller catalytic converter is fitted in place of the DPF to further improve emissions.

The engine management system provides accurately metered quantities of fuel to the combustion chambers to ensure the most efficient use of fuel and to minimise the exhaust emissions. To further reduce the carbon monoxide and hydrocarbons content of the exhaust gases, a catalytic converter is integrated into the LH bank front pipe of the exhaust system. In the catalytic converter the exhaust gases are passed through honeycombed ceramic elements coated with a special surface treatment called 'washcoat'. The washcoat increases the surface area of the ceramic elements by a factor of approximately 7000. On top of the washcoat is a coating containing platinum and palladium, which are the active constituents for converting harmful emissions into inert by-products. The platinum and palladium add oxygen to the carbon monoxide and the hydrocarbons in the exhaust gases, to convert them into carbon dioxide and water respectively.

DIESEL PARTICULATE FILTER (DPF)

E121762

Item	Part Number	Description
1	-	Exhaust gas temperature sensor (2 off)
2	-	HO2S
3	-	Catalytic converter
4	-	Pre DPF temperature sensor
5	-	Differential pressure sensor
6	-	High pressure pipe
7	-	Low pressure pipe
8	-	Post DPF temperature sensor
9	-	DPF

The DPF system reduces diesel particulate emissions to negligible levels to meet European Stage 5 emission standards. The particulate emissions are the black fumes emitted from the diesel engine under certain load conditions. The emissions are a complex mixture of solid and liquid components with the majority of the particulates being carbon microspheres on which hydrocarbons from the engine's fuel and lubricant condense.

The DPF is located in the exhaust system, downstream of the catalytic converters. A major feature of the DPF is its ability for to trap carbon particles before they are emitted to the atmosphere and then to oxidize the carbon at an opportune time. Regeneration is the oxidation of particulates trapped by the filter. The regeneration process takes place at calculated intervals and is not noticeable by the driver of the vehicle. Regeneration is most important, since an overfilled filter can damage the engine through excessive exhaust back pressure and can itself be damaged. The material trapped in the filter is in the most part carbon particles with some absorbed hydrocarbons.

The DPF system comprises the following components:

- • Diesel particulate filter (silicone carbide ceramic)
- • DPF control software incorporated into the Engine Control Module (ECM)
- • Exhaust gas temperature sensors
- • Differential pressure sensor.

E68716

Item	Part Number	Description
A	-	A. Front face showing alternate closed cells
B	-	B. Side view showing exhaust gas flow through the filter and particulate build up
C	-	C. Rear face showing alternate closed cells

The DPF uses a technology based on a filter with a catalytic coating. The DPF is made from silicon carbide housed in a steel container and has excellent thermal shock resistance and thermal conductivity properties. The DPF is designed for the engine's operating requirements to maintain the optimum back pressure requirements.

The porous surface of the filter consists of a number of small parallel channels positioned in the longitudinal direction of the exhaust system. Adjacent channels in the filter are alternately plugged at the end. This design forces the exhaust gasses to flow through the porous walls, which act as the filter medium. Particulate matter which are too big to pass through the porous surface are collected and stored in the channels.

The collected particulate matter, if not removed, can create an obstruction to exhaust gas flow. The particles are removed by a regeneration process which oxidizes the particles.

DPF regeneration is controlled by the temperature of the exhaust gasses and the DPF. The DPF includes a wash coat to the filter surface which comprises platinum and other active components and is similar to the catalytic converter. At certain exhaust gas and DPF temperatures the assembly promotes oxidation of the particles in addition to oxidizing carbon monoxide and hydrocarbon emissions.

The exhaust gas and DPF temperatures are controlled by the DPF software located in the ECM. The DPF software monitors the load status of the DPF based on driving style, distance travelled and signals from the differential pressure sensor and temperature sensors. When the particulate loading of the DPF reaches predetermined levels, the DPF is actively regenerated by adjusting, in conjunction with the ECM, various engine control functions such as:

- • fuel injection
- • intake air throttle
- • exhaust gas recirculation
- • turbocharger boost pressure control.

The regeneration process is possible because of the flexibility of the common-rail fuel injection engine which provides precise control of fuel flow, fuel pressure and injection timing which are essential requirements to promote the efficient regeneration process.

Differential Pressure Sensor

E121763

Item	Part Number	Description
1	-	Differential pressure sensor
2	-	Bracket (attached to transfer box)
3	-	Electrical connector
4	-	Low pressure pipe
5	-	High pressure pipe

The differential pressure sensor is located on a bracket which is attached to the transfer case.

The differential pressure sensor is used by the DPF software to monitor the condition of the DPF. Two pipe connections on the sensor are connected by pipes to the inlet and outlet ends of the DPF. The pipes allow the sensor to measure the inlet (high) and outlet (low) pressures of the DPF

As the amount of particulates trapped by the DPF increases, the pressure at the inlet side of the DPF increases in comparison to the DPF outlet. The DPF software uses this comparison, in conjunction with other data, to calculate the accumulated amount of trapped particulates.

By measuring the pressure difference between the DPF inlet and outlet and the DPF temperature, the DPF software can determine if the DPF is becoming blocked and requires regeneration.

Diesel Particulate Filter Temperature Sensors

Four temperature sensors are used in the DPF system. Two temperature sensors are located in the inlet pipes from each cylinder bank, just before the flexible couplings. A third is located in the inlet pipe to the DPF and the fourth sensor is located in the DPF outlet pipe to the center silencer.

The sensors measure the temperature of exhaust gas leaving the turbochargers, the temperature of the exhaust gas before it passes through the DPF and the temperature of the exhaust gas exiting the DPF. The 4 sensors provide the information needed to calculate the DPF temperature.

The information is used, in conjunction with other data, to estimate the amount of accumulated particulates and to control the DPF temperature.

Instrument Cluster Indications

For drivers who make regular short journeys at low speeds, it may not be possible to efficiently regenerate the DPF. This condition will be detected by the DPF software and will alert the driver as follows:

When the DPF becomes full the driver will be alerted to this condition by a message 'DPF FULL' accompanied by a handbook symbol. As detailed in the Owners Handbook, the driver should drive the vehicle until the engine is at its normal operating temperature and then drive for a further 20 minutes at speeds of between 45 and 70 mph (72 and 112 km/h). Successful regeneration of the DPF is indicated to the driver by the 'DPF FULL' message no longer being displayed. It should be noted that this condition is not a fault in the hardware. The message is intended to provide feedback to the driver that the current driving style may not be optimal for DPF regeneration and that high oil dilution may occur (refer to the following section 'Engine Oil Dilution').

A further DPF loading state may occur in which the DPF software detects that the DPF is still blocked, the message will change to 'DPF FULL VISIT DEALER', the driver should take the vehicle to an authorized dealer to have the DPF force regenerated. This message may imply that the DPF requires replacement - refer to service documentation for service regeneration options before replacing the DPF.

DIESEL PARTICULATE FILTER - SIDE EFFECTS

The following section details some side effects caused by the active regeneration process.

Engine Oil Dilution

Engine oil dilution can occur due to small amounts of fuel entering the engine crankcase during the post-injection phases. This has made it necessary to introduce a calculation based on driving style to reduce oil service intervals if necessary.

The driver is alerted to the oil service by a message in the instrument cluster.

The DPF software monitors the driving style, the frequency of the active regeneration and duration. Using this information a calculation can be made on the engine oil dilution. When the DPF software calculates the engine oil dilution has reached a predetermined threshold (fuel being 7% of engine oil volume) a service message is displayed in the instrument cluster.

Depending on driving style, some vehicles may require an oil service before the designated interval. If an service message is displayed, the vehicle will be required to have a full service and the service interval counter will need to be reset.

Fuel Consumption

During the active regeneration process of the DPF, there will be an increase in fuel consumption. However, because active regeneration occurs infrequently and for limited periods of time, the overall effect on fuel consumption is less than 1%. The additional fuel used during the active regeneration process is accounted for in the instantaneous (where applicable) and average fuel consumption displays in the instrument cluster.

OPERATION

Passive Regeneration

Passive regeneration requires no special engine management intervention and occurs during normal engine operation. The passive regeneration involves a slow conversion of the particulate matter deposited in the DPF into carbon dioxide. This process is active when the DPF temperature reaches 250°C (482°F) and is a continuous process when the vehicle is being driven at higher engine loads and speeds.

During passive regeneration, the oxidation rate is low. This is due to the chemical reaction process and is only effective within the normal operating temperature range of 250°C to 500°C (482°F to 932°F).

Above this temperature range the conversion efficiency of the particulates into carbon dioxide increases as the DPF temperature is raised. These temperatures can normally be achieved using the active regeneration process.

Active Regeneration

Active regeneration starts when the particulate loading of the DPF reaches a threshold as monitored or determined by the DPF control software. The threshold calculation is based on driving style, distance travelled and back pressure signals from the differential pressure sensor.

Active regeneration generally occurs every 450 miles (725 km) although this is highly dependant on how the vehicle is driven. For example, if the vehicle is driven at low loads in urban traffic regularly, active regeneration will occur more often. This is due to the rapid build-up of particulates in the DPF than if the vehicle is driven at high speeds when passive regeneration will have occurred.

The DPF software incorporates a mileage trigger which is used as back-up for active regeneration. If active regeneration has not been initiated by a back pressure signal from the differential pressure sensor, regeneration is requested based on distance traveled.

Active regeneration of the DPF is commenced when the temperature of the DPF is increased to the oxidation temperature of the particles. The DPF temperature is raised by increasing the exhaust gas temperature. This is achieved by introducing post-injection of fuel after the pilot and main fuel injections have occurred.

This is determined by the DPF software monitoring the signals from the two DPF temperature sensors to establish the temperature of the DPF. Depending on the DPF temperature, the DPF software requests the ECM to perform either one or two post-injections of fuel:

- The first post-injection of fuel retards combustion inside the cylinder which increases the temperature of the exhaust gas
- The second post-injection of fuel is injected late in the power stroke cycle. The fuel partly combusts in the cylinder, but some unburnt fuel also passes into the exhaust where it creates an exothermic event within the catalytic converter, further increasing the temperature of the DPF.

The active regeneration process takes approximately 20 minutes to complete. The first phase increases the DPF temperature to 500°C (932°F). The second phase further increases the DPF temperature to 600°C (1112°F) which is the optimum temperature for particle combustion. This temperature is then maintained for 15-20 minutes to ensure complete oxidation of the particles within the DPF. The process converts the carbon particles to carbon dioxide and water.

The active regeneration temperature of the DPF is closely monitored by the DPF software to maintain a target temperature of 600°C (1112°F) at the DPF inlet. The temperature control ensures that the temperatures do not exceed the operational limits of the turbocharger and the catalytic converter. The turbocharger inlet temperature must not exceed 830°C (1526°F) and the catalytic converter brick temperature must not exceed 800°C (1472°F) and the exit temperature must remain below 750°C (1382°F).

During the active regeneration process the following ECM controlled events occur:

- The turbocharger is adjusted to reduce boost pressure. This minimizes heat transmission from the exhaust gas to the turbocharger and reduces the rate of exhaust gas flow allowing optimum heating of the DPF. If the driver demands an increase in engine torque, the turbocharger will respond by closing the vanes as necessary
- The intake throttle is adjusted as this assists in increasing the exhaust gas temperature and reduces the rate of exhaust gas flow which has the effect of reducing the time for the DPF to reach the optimum temperature
- The Exhaust Gas Recirculation (EGR) valve is closed. The use of EGR decreases the exhaust gas temperature and therefore prevents the optimum DPF temperature being achieved.

If, due to vehicle usage and/or driving style, the active regeneration process cannot take place or is unable to regenerate the DPF, the dealer can force regenerate the DPF. This is achieved by either driving the vehicle until the engine is at its normal operating temperature and then driving for a further 20 minutes at speeds of between 45 and 70 mph (72 and 112 km/h) or by connecting a Jaguar approved diagnostic system to the vehicle which will guide the technician through an automated regeneration procedure to clean the DPF.

Diesel Particulate Filter Control

The DPF requires constant monitoring to ensure that it is operating at its optimum efficiency and does not become blocked. The ECM contains DPF software which controls the monitoring and operation of the DPF system and also monitors other vehicle data to determine regeneration periods and service intervals.

The DPF software can be divided into three separate control software modules; a DPF supervisor module, a DPF fuel management module and a DPF air management module.

These three modules are controlled by a fourth software module known as the DPF co-ordinator module. The co-ordinator module manages the operation of the other modules when an active regeneration is requested. The DPF supervisor module is a sub-system of the DPF co-ordinator module.

DPF Fuel Management Module

The DPF fuel management module controls the following functions:

- • Timing and quantity of the four split injections per stroke (pilot, main and two post injections)
- • Injection pressure and the transition between the three different calibration levels of injection.

The above functions are dependant on the condition of the catalytic converter and the DPF.

The controlled injection determines the required injection level in addition to measuring the activity of the catalytic converter and the DPF. The fuel management calculates the quantity and timing for the four split injections, for each of the three calibration levels for injection pressure, and also manages the transition between the levels.

The two post injections are required to separate the functionality of increasing in-cylinder gas temperatures and the production of hydrocarbons. The first post injection is used to generate the higher in-cylinder gas temperature while simultaneously retaining the same engine torque output produced during normal (non-regeneration) engine operation. The second post injection is used to generate hydrocarbons by allowing unburnt fuel into the catalytic converter without producing increased engine torque.

DPF Air Management Module

The DPF air management module controls the following functions:

- • EGR control
- • Turbocharger boost pressure control
- • Intake air temperature and pressure control.

During active regeneration, the EGR operation is disabled and the closed-loop activation of the turbocharger boost controller is calculated. The air management module controls the air in the intake manifold to a predetermined level of pressure and temperature. This control is required to achieve the correct in-cylinder conditions for stable and robust combustion of the post injected fuel.

The module controls the intake air temperature by actuating the EGR throttle and by adjustment of the turbocharger boost pressure control.

DPF Co-ordinator Module

The DPF co-ordinator module reacts to a regeneration request from the supervisor module by initiating and co-ordinating the following DPF regeneration requests:

- EGR cut-off
- Turbocharger boost pressure control
- Engine load increase
- Control of air pressure and temperature in the intake manifold
- Fuel injection control.

When the supervisor module issues a regeneration request, the co-ordinator module requests EGR cut-off and a regeneration specific turbocharger boost pressure control. It then waits for a feedback signal from the EGR system confirming that the EGR valve is closed.

When the EGR valve is closed, the co-ordinator module initiates requests to increase engine load by controlling the intake air temperature and pressure.

Once confirmation is received that intake conditions are controlled or a calibration time has expired, the co-ordinator module then changes to a state awaiting an accelerator pedal release manoeuvre from the driver. If this occurs or a calibration time has expired, the co-ordinator module generates a request to control fuel injections to increase exhaust gas temperature.

Exhaust System - TDV6 3.0L Diesel - Exhaust System

Diagnosis and Testing

Principle of Operation

For a detailed description of the exhaust system, refer to the relevant Description and Operation section of the workshop manual.

REFER to: Exhaust System (309-00A, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

1. 1. Verify the customer concern
2. 2. Visually inspect for obvious signs of mechanical or electrical damage

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Leaks ● Metal fatigue ● Pipes ● Catalytic converter ● Muffler(s) ● Joints ● Mountings ● Clearance around components 	<ul style="list-style-type: none"> ● Fuses ● Wiring harness ● Electrical connector(s) ● Sensor(s) ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for DTCs and refer to the DTC Index

Symptom Chart

Symptom	Possible Causes	Action
Noisy or leaking exhaust	<ul style="list-style-type: none"> ● Exhaust system/components 	Install new components as necessary. Refer to the relevant section of the workshop manual
Lack of power	<ul style="list-style-type: none"> ● Air intake system fault ● Restricted exhaust system ● Low fuel pressure ● Exhaust Gas Recirculation (EGR) valve(s) fault ● Turbocharger fault 	Check the air intake system. Check for a blocked catalytic converter or muffler, install new components as necessary. Check the fuel pressure. For EGR and turbocharger tests, refer to the relevant section of the workshop manual

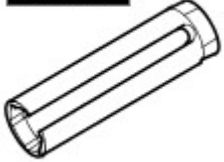

DTC Index

For a complete list of all diagnostic trouble codes that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - TDV6 3.0L Diesel, DTC: Engine Control Module \(PCM\)](#) (100-00 General Information, Description and Operation).

Exhaust System - V6 4.0L Petrol - Exhaust System

Description and Operation

4.0L V6 Exhaust System Component Location

E43789

Item	Part Number	Description
1	-	Flange - manifold to front section
2	-	Pre catalyst heated oxygen sensor location
3	-	Catalyst
4	-	Post catalyst heated oxygen sensor location
5	-	Flange - RH front section to rear section
6	-	Mounting rubber (5 off)
7	-	Silencer - Front
8	-	Silencer - Centre
9	-	Silencer - Rear
10	-	Clamp - LH front section to rear section
11	-	LH manifold
12	-	RH manifold
13	-	Mass damper

GENERAL

The 4.0L V6 exhaust system is fabricated from stainless steel and is supplied as three separate assemblies; a LH front section incorporating a catalytic converter, a RH front section incorporating a catalytic converter and a rear section

incorporating a front silencer (non-NAS only), a centre silencer and two rear silencers.

The system is attached to the underside of the body with five mounting rubbers which are located on mild steel hanger bars that are welded to the system. The mounting rubbers locate on corresponding hangers which are welded to the underside of the vehicle body. The system is routed mainly on the inside of the LH chassis longitudinal before splitting near the rear differential to exit at each side of the rear of the vehicle.

The system has service repair items available. Indentations in the rear section, between the center and the rear silencers, show the cut points for the service replacement rear silencers or front section. When a service repair section is used, the joint is connected using a sleeve and two clamps to connect the pipes at the cut points.

FRONT SECTION

Both front sections have a welded flange with two holes which provide for the attachment with two bolts to the LH and RH exhaust manifolds. The flange is sealed by a tapered seat in the flange and a machined cone on the manifold.

The flange is welded to a short, straight pipe, which in turn is welded to the body of the catalytic converter. The pipe has a threaded boss which is welded over a hole in the pipe to provide location for the pre catalyst heated oxygen sensor (HO2S).

On the LH front section, the converter outlet pipe is a 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is welded to the converter body. The rear of the outlet pipe is inserted into the flared end of the rear section. A clamp is used to compress and secure the joint.

On the RH front section, the converter outlet pipe is a 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is welded to the converter body. The rear of the pipe curves left, under the transmission and then curves again to run parallel to the LH pipe. The end of the pipe has a welded flange with two holes which locate on two studs on the rear section and is secured with nuts. A metal gasket is used to seal the joint between the front and rear section flanges.

Both the LH and RH converter outlet pipes have a threaded boss which is welded over a hole in the pipe to provide location for the post catalyst HO2S.

REAR SECTION

The rear section has a short 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is flared to an inside diameter of 55 mm (2.16 in) to locate the LH front section. The tube is welded to the front silencer assembly. A second short 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, has a welded flange with captive studs to provide attachment for the flange on the RH front section. This tube is also welded to the front silencer assembly.

The front silencer comprises a single skin and two end plates which are welded together which give a capacity of 6.4 litres (390.5 in³). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gases pass through the silencer. A hanger bar is welded to the front of the silencer and provides for the location of a mounting rubber.

The silencer has two short 55 mm (2.16 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which connect to the centre silencer.

The centre silencer comprises two pressed stainless steel shells which are welded together to give a capacity of 25.2 litres (1538 in³). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gasses pass through the silencer. A hanger bar is welded to the front right hand side of the silencer and provides location for a mounting rubber.

The silencer has two 55 mm (2.16 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which are curved to pass around the rear suspension components.

Each outlet pipe terminates in a welded joint with the tail silencers. The outlet pipes have a hanger bar which provides for the location of a mounting rubber.

A hanger bar is welded to the front face of each rear silencer and provides for the location of a mounting rubber. The silencer is a circular fabrication with a baffle tube which is surrounded with glass fibre to provide further noise suppression. Each silencer has a capacity of 2.7 litres (165 in³).

The silencers each have an outlet pipe which is 55 mm (2.2 in) diameter, with a wall thickness of 1.2 mm (0.05 in). Each outlet pipe is curved downwards to direct exhaust gasses away from the rear of the vehicle.

CATALYTIC CONVERTER

The engine management system provides accurately metered quantities of fuel to the combustion chambers to ensure the most efficient use of fuel and to minimise the exhaust emissions.

To further reduce the carbon monoxide and hydrocarbons content of the exhaust gases, a catalytic converter is integrated into the front pipe of the exhaust system. In the catalytic converter the exhaust gases are passed through honeycombed ceramic elements coated with a special surface treatment called 'washcoat'. The washcoat increases the surface area of the ceramic elements by a factor of approximately 7000. On top of the washcoat is a coating containing metals, which are the active constituent for converting harmful emissions into inert by-products. The metals add oxygen to the carbon monoxide and the hydrocarbons in the exhaust gases, to convert them into carbon dioxide and water respectively.

Exhaust System - V6 4.0L Petrol - Exhaust System

Diagnosis and Testing

Principle of Operation

For a detailed description of the exhaust system, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Leaks ● Metal fatigue ● Pipes ● Catalytic converter ● Muffler(s) ● Joints ● Mountings ● Clearance around components 	<ul style="list-style-type: none"> ● Fuses ● Wiring harness ● Electrical connector(s) ● Sensor(s) ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

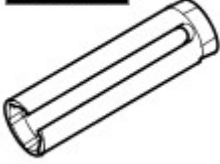

Symptom	Possible Causes	Action
Noisy or leaking exhaust	<ul style="list-style-type: none"> ● Exhaust system/components 	Install new components as necessary. Refer to the relevant section of the workshop manual.
Lack of power	<ul style="list-style-type: none"> ● Air intake system fault ● Restricted exhaust system ● Low fuel pressure 	Check the air intake system. Check for a blocked catalytic converter or muffler, install new components as necessary. Check the fuel pressure. Refer to the relevant section of the workshop manual.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Exhaust System - V6 4.0L Petrol - Catalytic Converter LH

Removal and Installation

Special Tool(s)	
 <p>310-121</p> <p>E53465</p>	Wrench, HO2S
	310-121 (LRT-19-014)

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).
4. Remove the catalytic converter.
 - Remove the nut and release the retaining clamp.
5. **NOTE:** Do not disassemble further if the component is removed for access only.

Using the special tool, remove both HO2S from the catalytic converter.

Installation

1.  **CAUTION:** Make sure the anti-seize compound does not contact the HO2S tip.

Using the special tool, install the HO2S to the catalytic converter and tighten to 45 Nm (33 lb.ft).
 - Clean the components.
 - Apply an anti-seize compound to the thread of the HO2S.
2. **NOTE:** Do not tighten the retaining clamp at this stage.

Position the catalytic converter to the front muffler.
 - Clean the components.
 - Install the nut.
3. Install the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00C Exhaust System - V6 4.0L Petrol, Removal and Installation).
4. Tighten the catalytic converter retaining clamp to 55 Nm (40

lb.ft).

5. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

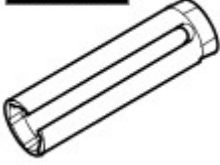

6. NOTE: For NAS vehicles only.

If required, carry out a long drive cycle.

For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A, General Procedures).

Exhaust System - V6 4.0L Petrol - Catalytic Converter RH

Removal and Installation

Special Tool(s)	
 <p>310-121</p> <p>E53465</p>	<p>Wrench, HO2S</p> <p>310-121 (LRT-19-014)</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).
4. Release the RH rear HO2S wiring harness.
 - Disconnect the electrical connector.

5. Disconnect the catalytic converter from the exhaust manifold.
 - Remove and discard the 2 bolts.

6. Remove the catalytic converter.
 - Remove the 2 nuts.
 - Discard the gasket.

E44411

7. NOTE: Do not disassemble further if the component is removed for access only.

Using the special tool, remove both HO2S from the catalytic converter.

Installation

1. ⚠ CAUTION: Make sure the anti-seize compound does not contact the HO2S tip.

Using the special tool, install the HO2S to the catalytic converter and tighten to 45 Nm (33 lb.ft).

- Clean the components.
- Apply an anti-seize compound to the thread of the HO2S.

2. Position the catalytic converter to the front muffler.

- Clean the components.
- Install a new gasket.
- Tighten the nuts to 55 Nm (40 lb.ft).

3. Position the catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

4. Install the transmission crossmember.

For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

5. ⚠ CAUTION: Make sure the HO2S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Connect the HO2S electrical connector.

- Attach the HO2S wiring harness.

6. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

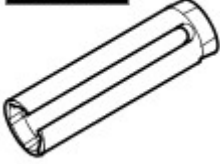

7. NOTE: For NAS vehicles only.

If required, carry out a long drive cycle.

For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A, General Procedures).

 <p>310-121</p> <p>E53465</p>	<p>Wrench, HO2S</p> <p>310-121 (LRT-19-014)</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the engine undershield.
For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).
4. Remove the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).
5. Release the LH front HO2S wiring harness.
 - Disconnect the electrical connector.

6. Release the RH front HO2S wiring harness.
 - Disconnect the electrical connector.

7. Release the LH rear HO2S wiring harness.
 - Disconnect the electrical connector.

8. Release the RH rear HO2S wiring harness.

- Disconnect the electrical connector.

9. Disconnect the LH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.

10. Disconnect the RH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.

11. With assistance, remove the exhaust system.

- Disconnect the 5 exhaust hangers.

12. NOTE: Do not disassemble further if the component is removed for access only.

Using the special tool, remove the 4 HO2S from the catalytic converters.

E44459

Installation

1.  CAUTION: Make sure the anti-seize compound does not contact the HO2S tip.

Using the special tool, install the HO2S to the catalytic converters and tighten to 45 Nm (33 lb.ft).

- Clean the components.
- Apply an anti-seize compound to the thread of the HO2S.

2. With assistance, install the exhaust system.

- Attach the exhaust hangers.

3. Position the RH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

4.  CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

E49975

5.  CAUTION: Make sure the HO2S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Connect the HO2S electrical connectors.

- Attach the HO2S wiring harnesses.

6. Install the transmission crossmember.

For additional information, refer to: [Transmission Support Crossmember - V8 5.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

7. Install the engine undershield.

For additional information, refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

8. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information,

Specifications).

Exhaust System - V6 4.0L Petrol - Muffler

Removal and Installation

Special Tool(s)	
	Pipe cutter-exhaust
	100-051 (LRT-99-027)

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the RH catalytic converter from the muffler assembly.
 - Remove the 2 nuts.
 - Discard the gasket.
- Disconnect the LH catalytic converter from the muffler assembly.
 - Remove the nut and release the retaining clamp.

- With assistance, remove the muffler assembly.
 - Disconnect the 5 exhaust hangers.

- NOTE:** Do not disassemble further if the component is removed for access only.

Remove the LH tail pipe.

- Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.

6. Remove the RH tail pipe.

- Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.

Installation

1. NOTE: Do not tighten the retaining clamp at this stage.

Position the RH tail pipe to the muffler assembly.

- Clean the components.
- Install the retaining clamp.

2. NOTE: Do not tighten the retaining clamp at this stage.

Position the LH tail pipe to the muffler assembly.

- Clean the components.
- Install the retaining clamp.

3. With assistance, install the muffler assembly.

- Attach the exhaust hangers.
- Install a new gasket.
- Tighten the catalytic converter nuts and clamp to 48 Nm (35 lb.ft).

4. Align both tail pipes and tighten the retaining clamps to 55 Nm (40 lb.ft).

EXHAUST SYSTEM

The 5.0L V8 exhaust system is fabricated from stainless steel and is supplied as three separate assemblies; a Left Hand (LH) front section incorporating a catalytic converter, a Right Hand (RH) front section incorporating a catalytic converter

and a rear section incorporating a front silencer, a centre silencer and two rear silencers.

The system is attached to the underside of the body with 5 mounting rubbers which are located on mild steel hanger bars that are welded to the system. The mounting rubbers locate on corresponding hangers which are welded to the underside of the vehicle body. The system is routed mainly on the inside of the LH chassis longitudinal before splitting near the rear differential to exit at each side of the rear of the vehicle.

The system has service repair items available. Indentations in the rear section, between the center and the rear silencers, show the cut points for the service replacement rear silencers or front section. When a service repair section is used, the joint is connected using a sleeve and two clamps to connect the pipes at the cut points.

FRONT SECTION

Both front sections have a loose flange with two holes which provide for the attachment with two bolts onto the LH and RH exhaust manifolds. The flange is sealed by a tapered seat in the flange and a machined cone on the manifold.

Each flange is located on a short, straight pipe, which in turn is welded to the body of the catalytic converter. The pipe has a threaded boss which is welded over a hole to provide location for the Heated Oxygen Sensor (HO2S) in a position between the pre-catalyst and the main catalyst.

On the LH front section, the converter outlet pipe is a 60 mm (2.36 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is welded to the converter body. The rear of the outlet pipe is inserted into the flared end of the rear section. A clamp is used to compress and secure the joint.

On the RH front section, the converter outlet pipe is a 60 mm (2.36 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is welded to the converter body. The rear of the pipe curves left, under the transmission and then curves again to run parallel to the LH pipe. The end of the pipe has a welded flange with two holes which locate on two studs on the rear section and is secured with nuts. A metal gasket is used to seal the joint between the front and rear section flanges.

REAR SECTION

The rear section has a short 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is flared to an inside diameter of 61 mm (2.4 in) to locate the LH front section. The tube is welded to the front silencer assembly. A second short 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, has a welded flange with captive studs to provide attachment for the flange on the RH front section. This tube is also welded to the front silencer assembly.

The front silencer comprises a double skin and two end plates which are rolled together to give a capacity of 7.0 litres (427 in³). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gases pass through the silencer. A hanger bar is welded to the front of the silencer and provides for the location of a mounting rubber.

The silencer has two short 55 mm (2.16 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which connect to the centre silencer.

The centre silencer comprises two pressed stainless steel shells which are welded together to give a capacity of 25.2 litres (1538 in³). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gasses pass through the silencer. A hanger bar is welded to the front right hand side of the silencer and provides location for a mounting rubber.

The silencer has two 55 mm (2.16 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which are curved to pass around the rear suspension components.

Each outlet pipe terminates in a welded joint with the tail silencers. The outlet pipes have a hanger bar which provides for the location of a mounting rubber.

A hanger bar is welded to the front face of each rear silencer and provides for the location of a mounting rubber. The silencer is a rectangular fabrication with a baffle tube which is surrounded with glass fibre to provide further noise suppression. Each silencer has a capacity of 4 litres (244 in³).

The silencers each have an outlet pipe which is 60 mm (2.36 in) diameter, with a wall thickness of 1.2 mm (0.05 in). Each outlet pipe is curved downwards to direct exhaust gasses away from the rear of the vehicle.

EXHAUST MANIFOLDS

The cast exhaust manifolds are unique for each cylinder bank. Spacers on the securing bolts allow the manifolds to expand and retract with changes of temperature while maintaining the clamping loads. Heat shields are integrated into the exhaust manifold gaskets. Each manifold has a threaded port near to its outlet which allows for the fitment of the pre-catalyst HO2S.

CATALYTIC CONVERTERS

The engine management system provides accurately metered quantities of fuel to the combustion chambers to ensure the most efficient use of fuel and to minimise the exhaust emissions. A threaded boss is located on each manifold and a and another threaded boss is located between the starter and the main catalyst to house the pre and post catalyst oxygen sensors. The engine management system monitors the sensors and uses the information to further improve the fuelling and exhaust emissions.

To further reduce the carbon monoxide and hydrocarbons content of the exhaust gases, two catalytic converters are integrated into the front down pipe from each exhaust manifold. In the catalytic converter the exhaust gases are passed through honeycombed ceramic elements coated with a special surface treatment called 'washcoat'. The washcoat increases the surface area of the ceramic elements by a factor of approximately 7000. On top of the washcoat is a coating containing metals, which are the active constituent for converting harmful emissions into inert by-products. The metals add oxygen to the carbon monoxide and the hydrocarbons in the exhaust gases, to convert them into carbon dioxide and water respectively.

Two catalytic converters are used in each cylinder bank down pipe. A starter and main catalyst are located below the downpipe flange. The starter catalyst is monitored by two HO2S's. The main catalyst is not monitored.

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Refer to: [Exhaust System](#) (309-00D Exhaust System - V8 5.0L Petrol, Removal and Installation).

3. *Torque:* 48 Nm

Installation

1. **CAUTIONS:**

Make sure the anti-seize compound does not contact the heated oxygen sensor (HO2S) tip.

If accidentally dropped or knocked install a new sensor.

Make sure the HO2S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

- NOTE: If the original sensor is to be installed, apply lubricant meeting specification ESE-M12A4-A to the thread of the sensor.

To install, reverse the removal procedure.

E121681

E121679

E121678

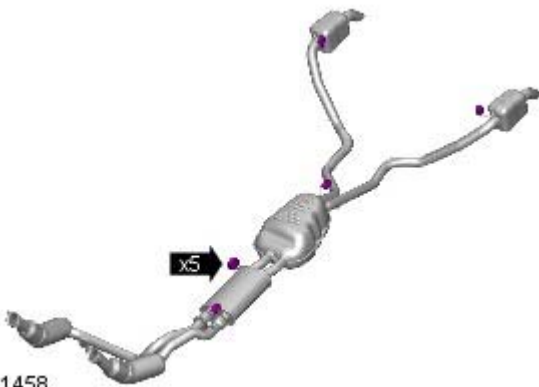

- 5.

- 6.

8. **8.** NOTE: Right-hand shown, left-hand similar.

Torque: 22 Nm

9. **9.**  CAUTION: Make sure that the exhaust system is supported with suitable retaining straps.

With assistance, remove the exhaust system.

General Equipment: [Transmission jack](#)

10. **10.** NOTE: Do not disassemble further if the component is removed for access only.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Torque: 45 Nm

Installation

1. To install, reverse the removal procedure.

2.  CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Exhaust System - V8 5.0L Petrol - Front Muffler

Removal and Installation

Special Tool(s)

	100-051 Cutter, Exhaust Pipe
---	---------------------------------

General Equipment

Transmission jack

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2.

3. Discard the gasket.

4. With assistance, remove the muffler assembly.

General Equipment: [Transmission jack](#)

5. Using the special tool, cut the exhaust pipe at the marked position.

Special Tool(s): [100-051](#)

Installation

1. **1. NOTE: Do not tighten the retaining clamp at this stage.**
Position the RH tail pipe to the muffler assembly.
2. **2. NOTE: Do not tighten the retaining clamp at this stage.**
Position the LH tail pipe to the muffler assembly.
3. **3. NOTE: Install a new gasket.**
With assistance, install the muffler assembly.
4. Align both tail pipes and tighten the retaining clamps to 55 Nm (40 lb.ft).
5. Tighten the catalytic converter nuts and clamp to 48 Nm (35 lb.ft).

Exhaust System - V8 5.0L Petrol - Rear Muffler

Removal and Installation

Special Tool(s)

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. **2.** NOTE: Right-hand shown, left-hand similar.

- NOTE: Using the special tool, cut the exhaust pipe at the marked position.

Remove the tail pipe.

Special Tool(s): [100-051](#)

Installation

1. **1.** NOTE: Do not tighten the retaining clamp at this stage.

- NOTE: Clean the components.
- NOTE: Install the retaining clamp.

Install the tail pipe.

2. Align the tail pipe and tighten the retaining clamp to 55 Nm (40 lb.ft).

Fuel System - General Information - Diesel Filter Water Drain-Off

General Procedures

• WARNINGS:

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

 If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

 Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

 The spilling of fuel is unavoidable during this operation. Make sure that all necessary precautions are taken to prevent fire and explosion.

• CAUTIONS:

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission undershield.

- Remove the 6 bolts.

E86483

3.  **WARNING:** Observe due care when working near a hot exhaust system.

Remove the fuel filter heat shield.

- Remove the 3 bolts.

E88183

4. Drain the fuel filter element.

- Attach a suitable drain tube to the water-in-fuel drain port.
- Loosen the water-in-fuel drain port 2 complete turns and allow the fluid to drain into a container.
- Turn the ignition to position 2 until 100ml of fluid is drained, then turn to position O.
- Remove the drain tube.

5. Tighten the water-in-fuel drain port.

6. Install the fuel filter heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).

7. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

Fuel System - General Information - Fuel System Pressure Check V6 4.0L

Petrol

General Procedures

Special Tool(s)	
 <p>310-116-01</p> <p>E66951</p>	<p>Gauge fuel pressure</p> <p>310-116-01</p>
 <p>310-116</p> <p>E56747</p>	<p>Adapter - fuel pressure check</p> <p>310-116(LRT-19-006A)</p>

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Release the clip and disconnect the purge line.
4. Remove the fuel rail Schraeder valve cap.

5. Install the special tool to the fuel rail Schraeder valve.

6. Connect the purge line.

7. WARNINGS:

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

Start and run the engine.

- Open the valve on the special tool.
- Note the fuel pressure readings.

8. For fuel pressure data, refer to specifications.
For additional information, refer to: [Specifications](#) (303-01C Engine - V6 4.0L Petrol, Specifications).
9. Close the special tool valve.
10. Release the clip and disconnect the purge line.
11. Disconnect the special tool from the Schraeder valve.
12. Install the Schraeder valve cap.
13. Connect the purge line.
14. Install the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
15. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

• NOTE: This procedure only checks the supply pressure to the high pressure pump.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornementation, Removal and Installation).
3. Remove the fuel rail Schraeder valve cap.
4. Install the special tool to the fuel rail Schraeder valve.

5. WARNINGS:

 Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

Start and run the engine.

- Open the valve on the special tool.

- Note the fuel pressure readings.
6. For fuel pressure data, refer to specifications.
For additional information, refer to: [Specifications](#) (303-01A Engine - TDV6 2.7L Diesel, Specifications).
 7. Close the special tool valve.
 8. Disconnect the special tool from the Schraeder valve.
 9. Install the Schraeder valve cap.
 10. Install the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 11. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Fuel System - General Information - Low-Pressure Fuel System Bleeding

General Procedures

Special Tool(s)	
	Adaptor fuel rail pressure check 310-116 (LRT-19-006A)

• WARNINGS:

-  Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.
-  Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.
-  Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
-  After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow this instruction may result in personal injury.
-  If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.
-  If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.
-  Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.
-  This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

-  Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
-  This procedure must be carried out before the engine is attempted to be started, following removal or replacement of any fuel system component involving fuel line intrusion. Failure to follow this instruction will result in damage to the fuel injection pump.

1. This procedure is necessary if any of the following fuel system components are removed, disconnected or replaced: Fuel tank, fuel lines, fuel filter element, fuel coolers, fuel injection pump or fuel rail pressure sensor.
2. Remove the engine cover. For additional information, refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Install the special tool to the fuel rail Schraeder valve.
 - Remove the fuel rail Schraeder valve cap.

4. Position a container to collect spillage.

- Open the valve on the special tool.

E56749

5. Turn the ignition switch to the ON position for 25 seconds. The fuel pump in the fuel tank will be audible.

6. Repeat the above procedure until clean, air free fuel is seen escaping from the special tool.

- While the pump is still running, close the valve on the special tool to prevent air entering the fuel system.

7. Remove the special tool from the Schraeder valve.

- Install the Schraeder valve protective cap.

E56748

8. Remove the container.

9.  **CAUTION:** If a new fuel injection pump is fitted, the following step must be carried out to make sure the fuel injection pump is fully primed. Failure to follow this instruction may result in damage to the vehicle.

Repeat Step 5 four times.

10. **NOTE:** The engine must be allowed to idle for two minutes to allow air in the fuel injection supply manifolds and fuel injectors to purge.

Start the engine and allow to idle.

11. Install the engine cover. For additional information, refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Fuel System - General Information - Fuel Tank Draining

General Procedures

- WARNINGS:

Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

1. Open the fuel filler door and remove the cap.
2. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
3. Connect the fuel tank drain equipment ground cable to the vehicle.
4. Remove the fuel from the fuel tank, via the filler neck, using the fuel tank draining equipment. Follow the manufacturer's operating instructions.
5. To install, reverse the removal procedure.

Fuel System - General Information - Fuel System Pressure Release V6 4.0L Petrol

General Procedures

Special Tool(s)	
	Adaptor fuel rail pressure check 310-116 (LRT-19-006A)

⚠ WARNING: The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Release the clip and disconnect the purge line.

4. Remove the fuel rail Schraeder valve cap.
5. Install the special tool to the fuel rail Schraeder valve.
6. **WARNINGS:**

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Open the valve on the special tool, release the fuel pressure and allow the fuel to drain into a container.

7. Close the special tool valve.

E57799

8. Remove the special tool from the Schraeder valve.

- Remove the container.

9. Install the Schraeder valve cap.

10. Connect the purge line.

- Clean the component mating faces.

11. Install the engine cover.

For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

12. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Fuel System - General Information - Fuel System Pressure ReleaseV8 5.0L

Petrol

General Procedures

Draining

1.  **WARNING:**
Refer to: [Petrol and Petrol-Ethanol Fuel Systems Health and Safety Precautions](#) (100-00 General Information, Description and Operation).
2. Remove the fuel pump fuse.
3. Remove the fuel filler cap.
4. Start the engine and allow it to idle until the engine stalls.
5. Crank the engine for approximately five seconds to make sure that the fuel rail pressure is released.

Filling

1. **6. NOTE:** Make sure all repairs have been carried out before proceeding to the following steps.
Install the fuel pump fuse.
2. Install the fuel filler cap.
3. Read and clear stored DTC fault codes.

Fuel Tank and Lines - TDV6 2.7L Diesel -

Capacity

Fuel tank	84.0 litres (18.5 gallons) (22.19 US gallons)
-----------	---

General Specification

Item	Specification
System type	Mechanical - returnless
Fuel delivery module	Located in the fuel tank
High pressure fuel pump:	
Location	Located at rear of engine between the cylinder heads, belt driven from the camshafts
Maximum operating pressure	165000 kPa (1650 bar) (23925 lb/in ²)
Advance delivery fuel pump:	
Location	Located in the fuel tank
Operating pressure	50 kPa (0.5 bar) (7.35 lb/in ²)
Maximum output @12.3 volts	70 litres/hour (15.4 gallons/hour) (18.4 US gallons/hour)
Fuel pressure regulator:	
Type/location	In-line, within fuel tank
Operating pressure	50 kPa (0.5 bar) (7.25) lb/in ²
Fuel filter	Remotely mounted on the inside of the longitudinal member - fitted with a renewable element and having a 178 cc (6 fl-oz) water separation capacity
Fuel tank sender units	Two - Front and rear - Front unit is mounted remotely within the fuel tank, rear is mounted on the body of the advance delivery fuel pump

Torque Specifications

Description	Nm	lb-ft
Fuel tank bracket bolts	10	7
Fuel pump module access flange clamp screw	4	3
Fuel tank bolts	45	33
Fuel tank heat shield, bolts	5	4
Fuel tank heat shield, nuts	3	2
Fuel filter to retaining bracket bolt	10	7
Transmission undershield bolts	10	7

Fuel Tank and Lines - TDV6 2.7L Diesel - Fuel Tank and Lines

Diagnosis and Testing

Principle of Operation

For a detailed description of the fuel tank and lines system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Fuel Tank and Lines](#) (310-01A Fuel Tank and Lines - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

• WARNINGS:

Do **NOT** carry out any work on the fuel system with the engine running. The fuel pressure within the system can be as high as 1600 bar (23,206 lb/in²). Failure to follow this instruction may result in personal injury.

Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

After carrying out repairs, the fuel system must be checked visually for leaks. This should be done after the engine has been run, but with the engine switched **OFF**. Failure to follow this instruction may result in personal injury.

If taken internally, **DO NOT** induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

The fuel pipes between the injectors and the rail must be discarded after each use, and new pipes installed. Failure to follow this instruction may result in damage to the vehicle.

It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

Make sure that the workshop area in which the vehicle is being worked on is as clean and dust-free as possible. Areas in which work on clutches, brakes or where welding or machining are carried out are not suitable in view of the risk of contamination to the fuel system. Failure to follow this instruction may result in damage to the vehicle.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

Make sure that any protective gloves worn are new and are of the non-powdered latex type. Failure to follow this instruction may result in damage to the vehicle.

Make sure that clean, non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid prior to starting work on the vehicle. Failure to follow this instruction may result in damage to the vehicle.

Use a steel-topped work bench and cover it with clean, lint-free, non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor

vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fuel level ● Contaminated fuel ● Fuel supply line(s) ● Fuel return line(s) ● High-pressure fuel supply line(s) ● Fuel tank filler pipe ● Fuel leak(s) ● Fuel tank ● Fuel filler cap ● Fuel filter ● Push connect fittings ● Fuel rail ● Fuel injection pump ● Exhaust Gas Recirculation (EGR) system 	<ul style="list-style-type: none"> ● Battery charge and condition ● Fuse(s) ● Inertia fuel shutoff (IFS) switch ● Fuel pump module relay ● Fuel pump module ● Electrical connector(s) ● Damaged or corroded wiring harness ● Fuel Volume Control Valve (FVCV) ● Fuel Pressure Control Valve (FPCV) ● Engine Control Module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not start	<ul style="list-style-type: none"> ● Inertia fuel shutoff switch ● Low/Contaminated fuel ● Air leakage ● Low-pressure fuel system fault ● Fuel pump module (lift pump) fault ● Blocked fuel filter ● Fuel volume regulator blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Fuel pump fault ● Crankshaft position (CKP) sensor 	Check that the inertia switch has not tripped. Check the fuel level and condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the lift pump operation, check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel pump. Check the CKP sensor circuits. Refer to the electrical guides.
Difficult to start	<ul style="list-style-type: none"> ● Glow plug system fault (very cold conditions) ● Low/Contaminated fuel ● Air leakage ● Fuel pump module (lift pump) fault ● Low-pressure fuel system fault ● Blocked fuel filter ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Exhaust gas recirculation (EGR) valve(s) fault 	Check the glow plug circuits. Refer to the electrical guides. Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the lift pump operation, check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. Check the EGR system.
Rough idle	<ul style="list-style-type: none"> ● Intake air system fault ● Low/Contaminated fuel ● Low-pressure fuel system fault ● Blocked fuel filter ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Exhaust gas recirculation (EGR) 	Check the intake air system for leaks. Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. Check the EGR system.

Symptom	Possible Causes	Action
	valve(s) fault	
Lack of power when accelerating	<ul style="list-style-type: none"> ● Intake air system fault ● Restricted exhaust system ● Low fuel pressure ● Exhaust gas recirculation (EGR) valve(s) fault ● Turbocharger actuator fault 	Check the intake air system for leakage or restriction. Check for a blockage/restriction in the exhaust system, install new components as necessary. Check for DTCs indicating a fuel pressure fault. Check the EGR system. Check turbocharger actuator.
Engine stops/stalls	<ul style="list-style-type: none"> ● Air leakage ● Low/Contaminated fuel ● Low-pressure fuel system fault ● High pressure fuel leak ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Exhaust gas recirculation (EGR) valve fault 	Check the intake air system for leaks. Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the fuel system for leaks/damage: Check for DTCs indicating a fuel volume or pressure control valve fault. Check the EGR system.
Engine judders	<ul style="list-style-type: none"> ● Low/Contaminated fuel ● Air ingress ● Low-pressure fuel system fault ● Fuel metering valve blocked/contaminated ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● High pressure fuel leak ● Fuel pump fault 	Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the low-pressure fuel system for leaks/damage. Check the high pressure fuel system for leaks, check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel pump.
Excessive fuel consumption	<ul style="list-style-type: none"> ● Low-pressure fuel system fault ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Fuel temperature sensor leak ● High pressure fuel leak ● Injector(s) fault ● Exhaust gas recirculation (EGR) valve(s) fault 	Check the low-pressure fuel system for leaks/damage. Check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel temperature sensor, fuel pump, etc for leaks. Check for injector DTCs. Check the EGR system.

Fuel Gauge Diagnosis

1. Using the manufacturer approved diagnostic system monitor, "active fuel level sensor(A)" and "passive fuel level sensor(B)" data logger signals located within the body control module subsection.

Customer Complaint	Possible Concern	Fuel Pressure	Active Fuel Level Sensor Voltage Reading A	Passive Fuel Level Sensor Voltage Reading B	Action
Fuel gauge switches on and off intermittently and / or fuel gauge indicates empty whilst there is fuel still available in the fuel tank	Open circuit	Yes	>3.6v	>3.6v	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check for backed out terminals and circuit faults between, ● C0390-18 and C0114-1 ● If no fault is evident then check C0376-18 to C0586R-8, ● If no fault is evident with the above, remove the fuel pump module and two fuel senders from the fuel tank and check for backed out terminals and circuit faults. Refer to the warranty policy and procedures manual if a module/component is suspect

Customer Complaint	Possible Concern	Fuel Pressure	Active Fuel Level Sensor Voltage Reading A	Passive Fuel Level Sensor Voltage Reading B	Action
Fuel gauge switches on and off intermittently and / or fuel gauge indicates empty whilst there is fuel still available in the fuel tank	Open circuit	Yes	<3.0v	>3.6v	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check for backed out terminals and circuit faults between, C0390-2 and C0114-6, If no fault is evident then check C0376-2 to C0586R-20 If no fault is evident with the above, remove the fuel sender B (front) from the fuel tank and check for backed out terminals and circuit faults
Fuel gauge switches on and off intermittently and / or fuel gauge indicates empty whilst there is fuel still available in the fuel tank	Open circuit	Yes	>3.6v	<3.0v	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check for backed out terminals and circuit faults between, C0390-3 and C0114-2 If no fault is evident then check C0376-3 to C0586R-21 If no fault can be found with the above check then the active fuel sender A (rear) will need to be removed and the wiring carefully inspected
Fuel gauge switches on and off intermittently and / or fuel gauge indicates empty whilst there is fuel still available in the fuel tank	Electric parkbrake fault (EPB)	Yes	0.35v to 3.06v	0.35v to 3.06v	<ul style="list-style-type: none"> NOTE: Check for correct EPB operation prior to carrying out the following checks. NOTE: The EPB module is calibrated to allow fuel gauge correction for varying gradients (via CAN Bus). Refer to the electrical circuit diagrams and check for backed out terminals and circuit faults at connectors, C2178-31, C2178-32 C2178-9, C2178-10, C2178-15 and C2178-16 Check Earth Point (LH D Post) C2570S (Discovery 4/LR4) C2570T (Range Rover Sport)
Fuel gauge indicating fuel present	No fuel present inside tank	No	0.35v to 3.06v	0.35v	<ul style="list-style-type: none"> Check active sender A (rear) for potential hang up/fouling inside of the fuel tank

Fuel Tank and Lines - TDV6 2.7L Diesel - Fuel Pump Module

Removal and Installation

Removal

• WARNINGS:

Place the vehicle in a well ventilated, quarantined area and arrange 'No Smoking/Petrol Fumes' signs about the vehicle.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

• NOTE: The fuel pump module comprises of a rear fuel level sender and a fuel pressure regulator. These components cannot be serviced separately.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the fuel tank.
For additional information, refer to: [Fuel Tank](#) (310-01A Fuel Tank and Lines - TDV6 2.7L Diesel, Removal and Installation).

CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Note the fitted position.

Release the fuel pump module access flange.

- Loosen the screw.
- Remove the clamp.

E51519

5. Remove the fuel pump module access flange.

- Disconnect the vent line.
- Disconnect the fuel supply line.
- Disconnect the 3 electrical connectors.
- Remove and discard the seal.

E51526

6. Remove the fuel pump module.

- Release the strap.
- Release the fuel pressure regulator.
- Disconnect the 2 fuel lines.

Installation

1. Install the fuel pump module.

- Connect the fuel lines.
- Secure with the strap.
- Secure the fuel pressure regulator.

2. Install the fuel pump module access flange.

- Clean the component mating faces.
- Install a new seal.
- Connect the 3 electrical connectors.
- Connect the fuel supply line.
- Connect the vent line.

3.  **CAUTION:** Make sure the seal is correctly fitted.

- **NOTE:** Align to the position noted on removal.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

4. Install the fuel tank.

For additional information, refer to: [Fuel Tank](#) (310-01A Fuel Tank and Lines - TDV6 2.7L Diesel, Removal and Installation).

5. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Drain the fuel tank.
For additional information, refer to: [Fuel Tank Draining](#) (310-00 Fuel System - General Information, General Procedures).

3. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the fuel tank heat shield.
 - Remove the 3 bolts and 2 nuts.

E44306

5. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the fuel filler neck from the fuel tank.

- Remove the tamper proof cover.
- Remove and discard the hose clip.

E51521

6.  **WARNING:** Secure the component to the transmission jack.

Using a transmission jack, lower the fuel tank.

- Remove the 5 bolts.

7. Release the parking brake emergency release cable.

- Release it from the 4 clips

8. **NOTE:** Note the fitted position.

Release the fuel tank vent and fuel lines.

- Remove the retainers.
- Release from the clips.
- Remove the adhesive pad.

9.  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the 2 fuel tank vent lines.

- Release the clip.

Vehicles with fuel fired heater

10.  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the fuel fired booster heater fuel line.

- Release the clip.

All vehicles

- 11.**  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the 2 fuel lines.

- Release the 2 clips.

- 12.** Disconnect the fuel pump module electrical connector.

- 13.** Remove the fuel tank.

- 14.** **NOTE:** Do not disassemble further if the component is removed for access only.

With assistance, remove the fuel tank from the transmission jack.

- 15.**  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

- **NOTE:** Note the fitted position.

Release the fuel pump module access flange.

- Loosen the screw.
- Remove the clamp.

- 16.**  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the fuel pump module access flange.

- Disconnect the vent line.
- Disconnect the fuel supply line.
- Disconnect the 3 electrical connectors.
- Remove and discard the seal.

E51520

17. Remove the fuel pump module.

- Release the strap.
- Release the fuel pressure regulator.
- Disconnect the 2 fuel lines.

E51528

18. Remove the fuel tank front fuel level sender unit.

- Release the lead.
- Release the clip.

E51529

19. Remove the fuel tank bracket.

- Remove the 2 clips.
- Remove the 2 bolts.
- Remove the retaining plate.

Installation

All vehicles

1. Install the fuel tank bracket.

- Install the retaining plate.
 - Install the clips.
 - Tighten the bolts to 10 Nm (7 lb.ft).
2. Install the fuel tank front fuel level sender unit.
 - Secure the clip.
 - Secure the lead.
 3. Install the fuel pump module.
 - Connect the fuel lines.
 - Secure with the strap.
 - Secure the fuel pressure regulator.
 4. Install the fuel pump module access flange.
 - Clean the component mating faces.
 - Install a new seal.
 - Connect the 3 electrical connectors.
 - Connect the fuel supply line.
 - Connect the vent line.

5.  **CAUTION:** Make sure the seal is installed correctly.

• **NOTE:** Align to the position noted on removal.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

6. With assistance, install the fuel tank to the transmission jack.
7. Position the fuel tank to the vehicle.
8. Connect the fuel lines.
 - Secure with the clip.

Vehicles with fuel fired heater

9. Connect the fuel fired booster heater fuel line.
 - Secure with the clip.

All vehicles

10. Connect the vent lines.
 - Secure with the clip.
11. Connect the electrical connector.
12. Secure the fuel and vent lines.
 - Secure in the clips.
 - Install the retainers.
 - Install the adhesive pad.
13. Secure the parking brake emergency release cable.

- Secure in the 4 clips.

14. Install the fuel tank.

- Tighten the bolts to 45 Nm (33 lb.ft).

15.  **CAUTION:** Tighten the new tamper proof clip until the hexagon shears.

Connect the fuel filler neck.

- Install a new retaining clip.

16. Install the fuel tank heat shield.

- Tighten the bolts to 5 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

Removal and Installation

Removal

- WARNINGS:

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

- NOTE: Removal steps in this procedure may contain installation details.

1. Remove the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Fuel Tank Draining](#) (310-00 Fuel System - General Information, General Procedures).

4. Refer to: [Fuel Filler Door Assembly](#) (501-03 Body Closures, Removal and Installation).

5. Remove the RH rear wheel and tire.

Torque: 140 Nm

E48478

6. Remove the fender splash shield.

E119747

7.

E121205

8. **8.** NOTE: Discard the retaining clip.

Remove the tamper proof cover from the fuel tank filler pipe hose clip.

9.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

10. Torque: 4 Nm

11. Torque: 4 Nm

Installation

1. To install, reverse the removal procedure.

• WARNINGS:

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

 If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

 If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

 Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

• CAUTIONS:

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

 Make sure the fuel lines are connected to the correct fuel line connector on the fuel filter. Failure to follow these instructions may result in damage to the engine or fuel injection system.

• NOTE: Before disconnecting the battery, make sure all text and cautions in the battery disconnect section are observed.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the transmission undershield.

- Remove the 6 bolts.

6.  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** Note the fitted position of the fuel lines to the fuel filter connections.

Release and disconnect the fuel supply line from the tank, (yellow connector number 1) and the fuel tank vent line, (small blue connector number 4) from the fuel filter.

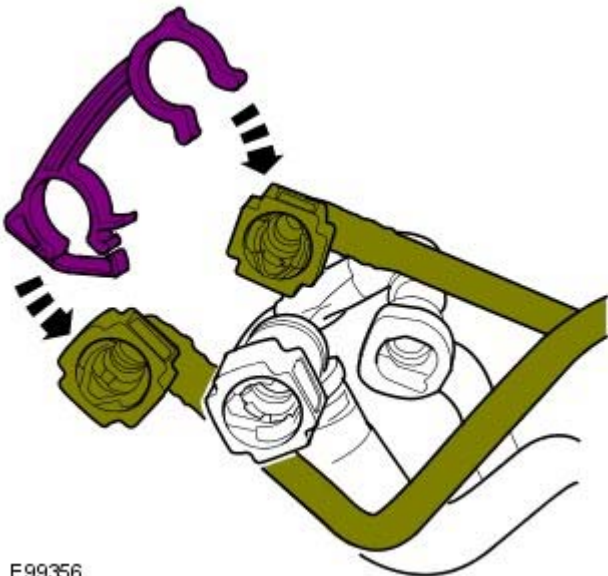

- Position a container to collect the fuel spillage.

7. Remove and discard the clip.

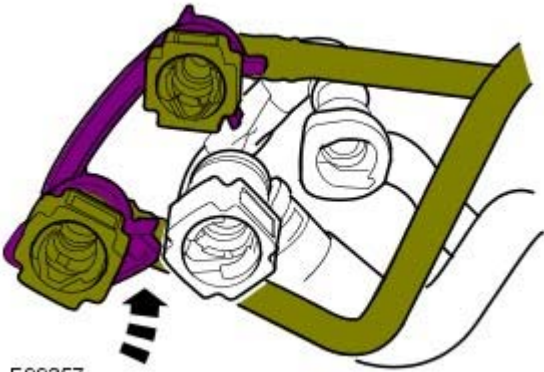

E99355

8. Install the new clip to fuel lines 1 and 4.

E99356

9. Secure the clip.

E99357

10.  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** Note the fitted position of the fuel lines to the fuel filter connections.

Remove the fuel filter.

- Release and disconnect the high-pressure fuel pump supply line. (Large blue connector number 3).
- Release and disconnect the fuel cooler return line. (White connector number 2).

E87984

Installation

1.  **CAUTION:** Make sure that the colors of the connectors match the colors on the disc supplied with the new fuel filter.

Install the fuel filter.

- Connect the fuel cooler return line. (White connector number 2).
- Connect the high-pressure fuel pump supply line. (Large blue connector number 3).

E99538

2. CAUTIONS:

 Make sure that the colors of the connectors match the colors on the disc supplied with the new fuel filter.

 Make sure that the clip is correctly fitted.

Connect the 2 remaining lines to the fuel filter.

- Connect the fuel supply line from the fuel tank. (Yellow connector number 1).
- Connect the vent line from the fuel tank. (Small blue connector number 4).

E99539

3. Correct connector and line installation shown.

E99540

4. Install the fuel filter bracket.

- Install the 2 bolts and tighten to 10 Nm (7 lb.ft).

6

E99358

5. Secure the fuel filter in its bracket.

- Align the fuel filter to the bracket.
- Install the bolt and tighten to 10 Nm (7 lb.ft).
- Remove the container.

6. Install the transmission undershield.

- Install the 6 bolts and tighten to 10 Nm (7 lb.ft).

7. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

16	-	Pipe - HP pump to fuel cooler (fuel return)
17	-	Pipe - Filter to HP pump (fuel feed)

GENERAL

The major components of the 3.0L TdV6 fuel system comprises a fuel tank, a fuel pump module, a fuel filter, a fuel cooler, a fuel filler pipe and cap assembly and two fuel level sensors. The fuel system is a high pressure common rail system which uses an engine mounted and driven high pressure pump to deliver a uniform level of pressure to the common fuel rails which supply all 6 fuel injectors.

The fuel tank houses an internal fuel lift pump, located in the fuel pump module. The lift pump is employed to provide a low-pressure supply to the common rail high pressure fuel system.

Two fuel level sensors are installed in the front and rear of the fuel tank. The sensors are a MAGnetic Passive Position Sensor (MAPPS) which provide a variable resistance to ground for the output from the fuel gauge.

A fuel cooler is located in the low pressure side of the system in the fuel return line and is a fuel to water type cooler.

The fuel tank breather system consists of a fuel cut-off elbow. No Roll Over Valves (ROV's) are fitted.

The fuel filter is a disposable canister type and is located on a bracket at the front of the fuel tank.

DESCRIPTION

FUEL TANK ASSEMBLY

E122446

Item	Part Number	Description
1	-	Fuel return from filter to tank
2	-	Fuel supply from fuel pump to filter
3	-	Pipe - return from fuel cooler
4	-	Pipe - Fuel supply to HP pump
5	-	Pipe - Fuel burning heater supply
6	-	Pad (2 off)
7	-	Pipe - Fuel tank breather
8	-	Fuel tank filler inlet hose
9	-	Fuel pump module assembly
10	-	Pipe - Fuel return
11	-	Pipe - Fuel burning heater supply
12	-	Pipe - Fuel supply from pump
13	-	Heat shield
14	-	Cover
15	-	Cradle

The fuel tank is located on the right hand side of the vehicle, between the transmission and the right hand chassis longitudinal. The tank is located on a mounting cradle which secures the whole fuel tank assembly to the vehicle. The tank is blow moulded from HDPE (high density polyethylene) and has a useable capacity of 82.0 liters (18 gallons).

The cradle is attached to the chassis with six screws. When the cradle is attached to the chassis, the tank is positively secured via foam pads which bear against the central chassis cross beam. A protective cover is fitted to the front right

hand corner of the tank and provides additional protection.

The fuel tank is manufactured from moulded plastic which is a minimum of 3 mm thick. The tank is a sealed unit with the only internal access being via the pump module flange aperture on the top of the tank.

The flange is fitted with a locking ring and seal. The seal locates in a groove on the tank. The locking ring locates and clamps on the encapsulated ring that is moulded into the fuel tank. The flange has a tag which locates in the top of the tank to ensure correct orientation.

The flange has six pin internal and external connectors which provide for electrical connections for the level sensors and the fuel pump. Two quick release connectors provide for the connection of the fuel feed and return pipes and the vent pipes. The fuel return connection contains a non return valve which prevents fuel escaping from the connection in the event of a vehicle roll over and the pipe becoming detached. On vehicles with a fuel burning heater, a third connection provides the connection for the fuel feed supply to the fuel burning heater.

The fuel pump module is mounted on a bayonet lock ring which is welded inside the fuel tank. A carrier within the tank provides for the mounting of the fuel suction jet, front fuel sensor and the fuel cut-off elbow.

The fuel pump module contains a number of components. The module comprises the fuel pump, the rear fuel level sensor, the rear jet pump, the pump inlet filter and the fuel pressure regulator. Only the pump module assembly, the fuel level sensors and the flange are available as serviceable components, the individual assembly components are not available separately.

Fuel Tank Internal Components

E122447

Item	Part Number	Description
1	-	Fuel pump module assembly
2	-	Fuel cut-off elbow
3	-	Carrier
4	-	Forward fuel level sensor
5	-	Suction port filter
6	-	Suction port pipe
7	-	Level sensor float
8	-	Swirl pot

Fuel Pump Module

The low pressure fuel lift pump is located in the fuel pump module. The lift pump is employed to provide a low pressure supply at approximately 0.5 bar, to the common-rail high pressure fuel system and to allow the jet pump assemblies to maintain a full swirl pot.

The lift pump operation is controlled by the Engine Control Module (ECM), via the fuel pump relay located in the Engine Junction Box (EJB). When the ignition is switched on, the fuel pump operates for 25 seconds to build up fuel pressure. As engine cranking commences the fuel pump stops running until the engine starts. This function is employed to decrease load on the battery.

In cold conditions, 'waxing' of the fuel can occur. For this reason a coarse mesh filter is attached to the swirl pot inlet port at the bottom of the pump module.

A three way connection is located on the top of the module. Two outlets supply the jet pumps, the other outlet is the pressure feed through the pressure regulating valve to the fuel delivery line. The module incorporates a jet pump which draws fuel from the front of the tank and delivers it directly into the swirl pot.

Fuel Level Sensors

Two fuel level sensors are installed at either end of the tank. One is mounted on the fuel pump module, the other is mounted in a central position on the internal carrier within the tank. The sensors are a MAPPS (magnetic passive position sensor) which provide a variable resistance to ground for the output from the fuel gauge. The sensor is sealed from the fuel preventing contamination of the contacts, increasing reliability. The fuel level sensors are connected to an electrical connector on the underside of the fuel pump module flange.

The sensor comprises a series of 51 film resistors mounted in an arc on a ceramic surface. The resistors are wired in series with individual contacts. A soft magnetic foil with 51 flexible contacts is mounted a small distance above the film resistors. A magnet, located below the ceramic surface, is attached to the sender unit float arm. As the float arm moves, the magnet follows the same arc as the film resistors. The magnet pulls the flexible contacts onto the opposite film resistor contacts forming an electrical circuit.

E44504

Item	Part Number	Description
1	-	Magnetic foil
2	-	Spacer
3	-	Ceramic surface
4	-	Magnet
5	-	Resistance film

The film resistors are arranged in a linear arc with resistance ranging from 51.2 to 992.11 Ohms. The electrical output signal is proportional to the amount of fuel in the tank and the position of the float arm. The measured resistance is processed by the instrument cluster to implement an anti-slosh function. This monitors the signal and updates the fuel gauge pointer position at regular intervals, preventing constant pointer movement caused by fuel movement in the tank due to cornering or braking.

A warning lamp is incorporated in the instrument cluster and illuminates when the fuel level is low.

The fuel level sender signal is converted into a CAN (controller area network) message by the instrument cluster as a direct interpretation of the fuel tank contents in liters.

In the event that fuel is allowed to run too low, signals transmitted from the fuel level sensors initiate the fuel run-dry strategy. The driver will be notified before the tank is run critically low on fuel. Although this is a simulated run-dry procedure, it provides the symptoms of the vehicle running out of fuel and the driver will perceive it as such. The engine will stop when there is approximately 4 liters (0.87 gallons) of fuel remaining in the fuel tank.

Jet Pumps

The fuel system incorporates twin jet pumps which are integral with the fuel pump module. One jet pump collects fuel from the rear of the tank, and the other draws additional fuel from the front of the tank through a suction line that is mounted on the carrier. The jet pump operates on a venturi effect created by the fuel at pump output pressure passing through the jet pump.

The prime function of the jet pump is to collect fuel from the front of the tank and transfer it into the fuel pump module swirl pot at the rear of the tank. The jet pump feature ensures that fuel is drained from the front of the tank before fuel run-out at the rear of the tank.

Fuel Cut-Off Elbow

The fuel cut-off elbow is located in the upper half of the tank on the carrier and is connected to the tank breather. The main purpose of the fuel cut-off elbow is to control the fill volume of the tank. During filling air, trapped inside the tank and a small amount of vapor is passed via the fuel cut-off elbow to the tank breather. The air and vapor mix then vents to atmosphere through the breather. During filling, when the tank reaches its full level, the fuel cut-off elbow closes and prevents air/vapor passing through to the tank breather. The resulting back pressure causes refueling to stop automatically.

The fuel cut-off elbow is always open when the fuel tank is below full, providing an unrestricted air/vapor outlet to the tank breather.

FUEL FILTER

E122448

Item	Part Number	Description
1	-	Mounting bracket
2	-	Pipe - Fuel return from fuel cooler
3	-	Pipe - Fuel supply to high pressure fuel pump
4	-	Pipe - Fuel supply to Fuel Burning Heater (FBH)
5	-	Electrical connector
6	-	Water drain
7	-	Fuel filter
8	-	Fuel return to tank connection
9	-	Fuel supply from tank connection

The fuel filter assembly is located in front of the fuel tank and is mounted on a bracket which is attached to the top face of the transfer box chassis cross member. The fuel filter assembly comprises a bracket, filter housing and the filtration element. The filter housing is secured to the bracket with 3 bolts. The bracket is secured to the cross member with 2 bolts which are screwed into threaded holes in the cross member.

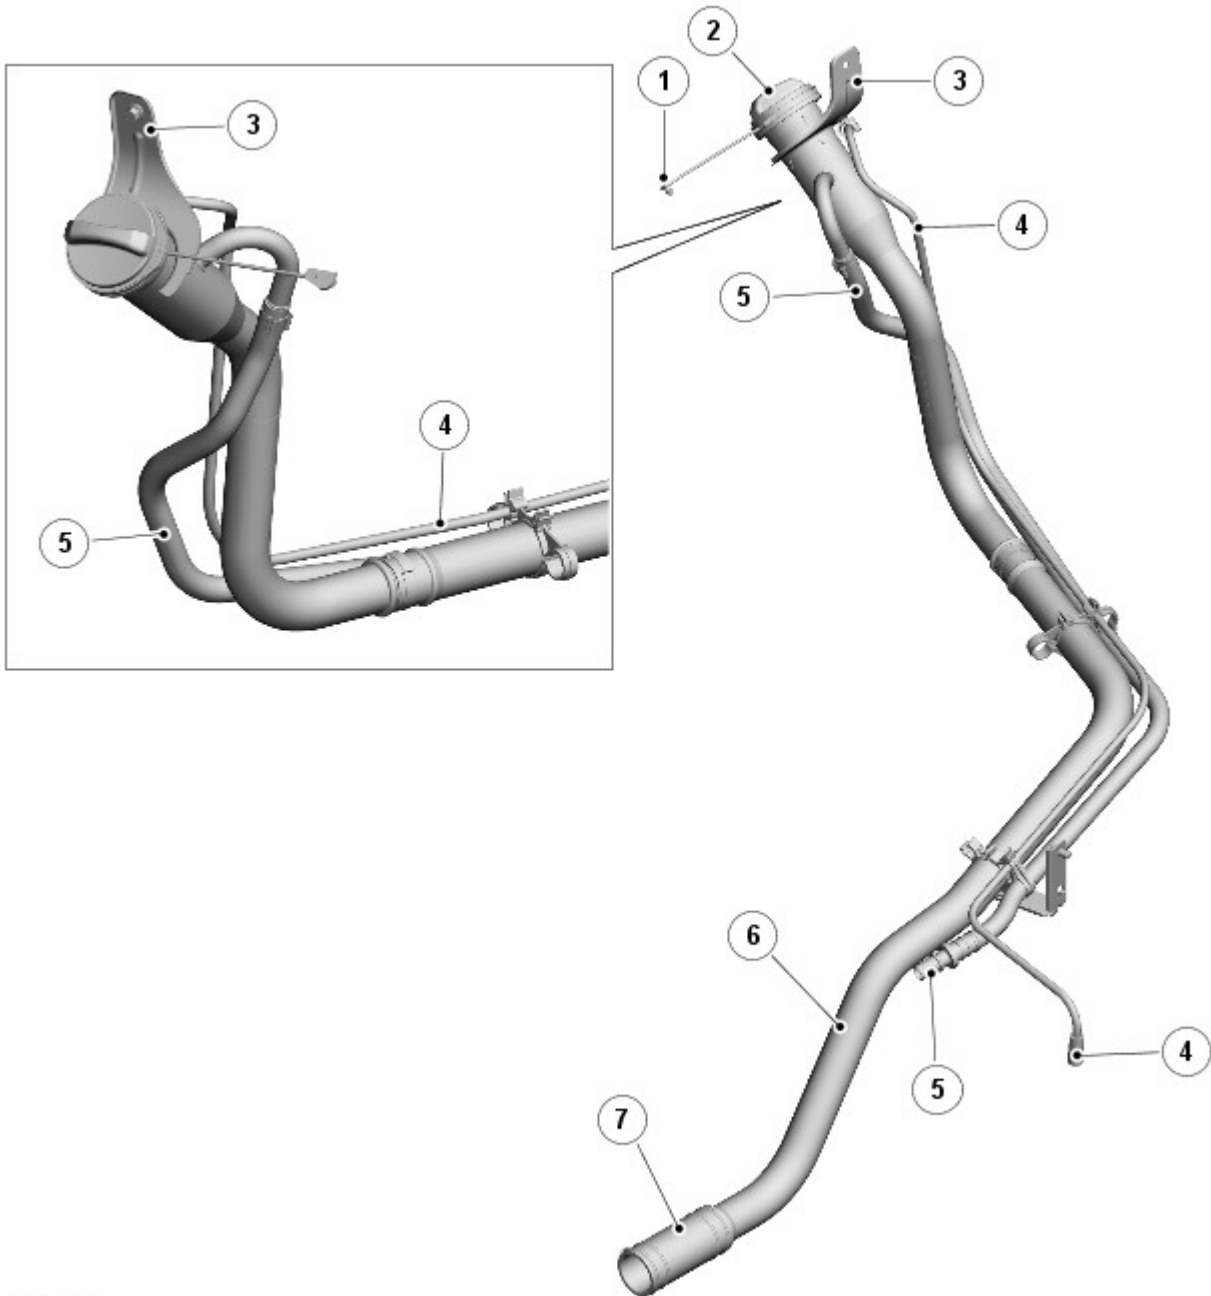

The filter housing has an inlet and outlet which allow for the attachment of hoses using quick release connectors. The filter element is located on the underside of the housing and can be removed by rotating one quarter turn to release from the housing.

The filter element has a capacity of 200 cm³ (12.2 in³). The filtration element can filter particulate matter larger than 15 microns. A water drain valve is located on the base of the filter. The filter can be purged of water by partially unscrewing the drain valve and allowing at least 84 cm³ (5.12 in³) of fuel to drain into a suitable container. The drain plug has a centre outlet which allows for the attachment of a drain hose.

The filter element also has a water sensor located in its base. The sensor is screwed into a threaded hole in the base of the element. When the filter is replaced at service, the sensor can be unscrewed from the element and installed in the new element. The sensor has an electrical connector located at the side of the element which can be disconnected to assist element removal.

The water sensor is connected to the Engine Control Module (ECM). When the water in the element reaches 64 cm³ (3.9 in³) the ECM issues a high speed Controller Area Network (CAN) bus message to the instrument cluster to display a 'WATER IN FUEL' message in the message center.

FUEL FILLER PIPE

E122449

Item	Part Number	Description
1	-	Lanyard
2	-	Filler cap
3	-	Bracket
4	-	Pipe - Rear differential breather (Reference only)
5	-	Pipe - Fuel vapor vent
6	-	Fuel filler pipe
7	-	Hose - connection to fuel tank

The stainless steel filler neck has a wide bore neck specially designed to reduce diesel frothing while the fuel tank is being replenished. The filler pipe is connected at its lower end to the fuel tank by a hose which is secured to the pipe with a worm drive clamp. The opposite end of the hose is connected to the fuel tank inlet check valve and secured with another worm drive clamp.

A fuel vapor vent pipe is attached to the filler pipe and connects between the fuel level vent valve in the fuel tank and fuel filler pipe neck.

The filler head incorporates the Fuel Guard system to prevent accidental filling of the tank with petrol (gasoline).

Fuel Guard System

E117721

Item	Part Number	Description
1	-	Filler neck
2	-	Flap
3	-	Reset slots
4	-	Spigots
5	-	Reset tool
6	-	Spring

The fuel guard system comprises a mechanically operated flap which is triggered when the smaller diameter filler nozzle tube, used on petrol (gasoline) pumps, is inserted in the filler neck. The flap is actuated and blocks the sensor port on the fuel pump nozzle, causing it to automatically switch off. The flap is locked in this position by a latch mechanism.

A reset tool is provided and stored in the luggage compartment. The tool is used to reset the fuel guard device if triggered and release the latch. Two spigots on the tool locate in slots in the filler neck which release a latch and the flap is opened by its own spring. The tool is located in the filler neck and once the two spigots on the tool are located in the slots it can be pulled outwards, releasing a latch and allowing the flap to be opened by its own spring pressure. The tool is stored on the battery mounting clamp.

The flap is colored yellow so that it is clearly visible when activated and has a 'Handbook' symbol on it.

A diesel fuel pump nozzle will not activate the fuel guard because the nozzle stops against two molded lugs. However, if an unleaded gasoline pump nozzle is inserted into the housing, its smaller diameter allows it to pass the two molded lugs. The nozzle strikes two pins on the inside of the filler housing which move forward. This movement rotates the shut-off flap which is then held in place when the nozzle is removed by the latch mechanism.

• NOTE: Russian markets do not use the fuel guard system and are fitted with a conventional filler neck.

FUEL COOLER

E122450

Item	Part Number	Description
1	-	Coolant outlet
2	-	Pipe - cooler to fuel filter
3	-	Pipe - HP pump to cooler
4	-	Coolant inlet
5	-	Fuel cooler

The fuel cooler uses engine coolant, direct from the lower part of the radiator, to cool fuel returning to the tank from the HP injection pump.

The fuel cooler is located on the right hand side of the chassis, at the rear of the engine, near to transmission cooler. A bracket, which is attached to the right hand chassis rail, provides for the attachment of the cooler. The bracket has two slots which accept two plastic pegs which are attached to the cooler. A bolt is inserted through a hole in the bracket and screws into a captive nut on the cooler to positively secure the cooler to the bracket.

The cooler has four quick fit connector pipes which provide for the attachment of the fuel inlet hose from the HP injection pump, the fuel outlet hose to the fuel filter, the coolant inlet hose from the radiator and the coolant outlet hose to the coolant thermostat housing. The coolant pipes can be identified by their smaller diameter.

OPERATION

Diesel fuel is drawn from the tank by the internal electric lift pump. The fuel pressure regulator located in the fuel pump module assembly regulates the delivery pressure at approximately 0.5 bar to the transfer pump housed in the High Pressure (HP) pump. A VCV (volume control valve) governs the amount of fuel supplied to the HP pump.

The transfer and high pressure pump are driven directly by the engine. Due to the storage volume of the common rail, the injection pressure will remain practically constant over the complete duration of the injection process.

The HP pump has a return pipe circuit which is separate from the injector return pipes.

For additional information, refer to: [Fuel Charging and Controls](#) (303-04C Fuel Charging and Controls - TDV6 3.0L Diesel, Description and Operation).

Fuel Tank and Lines - TDV6 3.0L Diesel - Fuel Tank and Lines

Diagnosis and Testing

Principle of Operation

For a detailed description of the fuel tank and lines system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to:

[Fuel Tank and Lines](#) (310-01A Fuel Tank and Lines - TDV6 2.7L Diesel, Description and Operation),
[Fuel Tank and Lines](#) (310-01B Fuel Tank and Lines - TDV6 3.0L Diesel, Description and Operation),
[Fuel Tank and Lines](#) (310-01B Fuel Tank and Lines - TDV6 3.0L Diesel, Description and Operation).

Inspection and Verification

• WARNINGS:

Do **NOT** carry out any work on the fuel system with the engine running. The fuel pressure within the system can be as high as 2000 bar (29,008 lb/in²). Failure to follow this instruction may result in personal injury.

Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

After carrying out repairs, the fuel system must be checked visually for leaks. This should be done after the engine has been run, but with the engine switched **OFF**. Failure to follow this instruction may result in personal injury.

If taken internally, **DO NOT** induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

The fuel pipes between the injectors and the rail must be discarded after each use, and new pipes installed. Failure to follow this instruction may result in damage to the vehicle.

It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

Make sure that the workshop area in which the vehicle is being worked on is as clean and dust-free as possible. Areas in which work on clutches, brakes or where welding or machining are carried out are not suitable in view of the risk of contamination to the fuel system. Failure to follow this instruction may result in damage to the vehicle.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

Make sure that any protective gloves worn are new and are of the non-powdered latex type. Failure to follow this instruction may result in damage to the vehicle.

Make sure that clean, non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid prior to starting work on the vehicle. Failure to follow this instruction may result in damage to the vehicle.

Use a steel-topped work bench and cover it with clean, lint-free, non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Fuel Tank and Lines - TDV6 3.0L Diesel - Fuel Cooler

Removal and Installation

Removal

- WARNINGS:

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install new blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 CAUTION: Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

- NOTE: Removal steps in this procedure may contain installation details.

1.  WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

3.  WARNING: Fluid loss is unavoidable, use absorbent cloth or a container to collect the fluid.

4.  CAUTION: Always plug any open connections to prevent contamination.

Torque: 23 Nm

Installation

1.  CAUTION: Remove and discard all blanking caps.

To install, reverse the removal procedure.

2. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank.

Removal

• WARNINGS:

After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow this instruction may result in personal injury.

After the fuel tank drain is complete always fit the sealing covers over the drain ports. Failure to do so will mean that fuel vapor can escape.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

CAUTION: Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

• NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Fuel Tank Draining](#) (310-00 Fuel System - General Information, General Procedures).

4. *Torque:*
Bolts 6 Nm
Nuts 3 Nm

5.

6.  CAUTION: Discard the retaining clip.
Remove the tamper proof cover.

7.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

8.  **WARNING:** Be prepared to collect escaping fuel.

 **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

9.  **WARNING:** Secure the component to the transmission jack.

 **CAUTION:** Do not lower the fuel tank more than 250 mm.

• **NOTE:** Note the orientation of the two rear retaining bolts and washers.

Using a suitable transmission jack, lower the fuel tank sufficiently only to access the top of the fuel tank.

General Equipment: [Transmission jack](#)

Removal

• WARNINGS:

After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow this instruction may result in personal injury.

After the fuel tank drain is complete always fit the sealing covers over the drain ports. Failure to do so will mean that fuel vapor can escape.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

CAUTION: Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

• NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Fuel Tank Draining](#) (310-00 Fuel System - General Information, General Procedures).

Fuel Tank and Lines - TDV6 3.0L Diesel - Fuel Filter Element

Removal and Installation

Removal

• WARNINGS:

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

 If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

 Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

 The spilling of fuel is unavoidable during this operation. Make sure that all necessary precautions are taken to prevent fire and explosion.

• CAUTIONS:

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission undershield.

- Remove the 6 bolts.

E86483

3.  **WARNING:** Observe due care when working near a hot exhaust system.

Remove the fuel filter heat shield.

- Remove the 3 bolts.

E88183

4.  **CAUTION:** Make sure the water-in-fuel sensor remains in the aligned position.

Drain the fuel filter element.

- Position a container to collect the fluid spillage.
- Loosen the nut.
- Attach a suitable drain tube to the water-in-fuel sensor drain port.
- Remove the drain tube.
- Tighten the nut.

E86484

5.  **CAUTION:** Make sure that the area around the component is clean and free of foreign material.

Remove the fuel filter element.

- Disconnect the water-in-fuel sensor electrical connector.

6. Remove the water-in-fuel sensor.

- Discard the fuel filter element.

E138939

7. Remove and discard the O ring seals.

E138941

Installation

1. Install new O ring seals.

E138940

E138603

2.  CAUTION: Make sure that the mating faces are clean and free of foreign material.

• NOTE: Make sure that the water-in-fuel sensor is aligned with the drain arrow.

Install the water-in-fuel sensor.

- Remove and discard the water-in-fuel drain plug from the new fuel filter element.

E138939

3.  CAUTION: Make sure the water-in-fuel sensor remains in the aligned position.

Tighten the plastic nut to 1.6 Nm.

4. NOTE: Make sure that the fuel filter element is correctly aligned. Failure to follow this instruction may result in damage to the vehicle.

Install the fuel filter element.

1. Insert the fuel filter with the the lock symbol arrow aligned with the inlet pipe on the fuel filter housing.

5. NOTE: Make sure that the fuel filter element is correctly aligned. Failure to follow this instruction may result in damage to the vehicle.

Rotate to tighten and seal the fuel filter element.

1. When tightened correctly, the lock symbol arrow should be aligned with the arrow symbol on the fuel filter housing.

- Connect the water-in-fuel sensor electrical connector.
- Remove the container.

6. Install the fuel filter heat shield.

- Tighten the bolts to 6 Nm.

7. Install the transmission undershield.

- Tighten the bolts to 10 Nm.

8. Carry out the low-pressure fuel system bleeding.

Fuel Tank and Lines - V6 4.0L Petrol -

Capacity

Fuel tank	86.3 litres (18.9 gallons) (22.7 US gallons)

GENERAL

The major components of the 4.0L V6 fuel system comprise a fuel tank, a fuel pump module, a fuel filler assembly and two fuel level sensors.

The 4.0L V6 fuel system uses a fuel pump module mounted in the fuel tank to deliver a uniform level of pressure to the fuel rails which supply fuel to all fuel injectors. The fuel rails and the injectors are described in Fuel & Charging Controls – 4.0L V6.

For additional information, refer to: Fuel Charging and Controls (303-04A Fuel Charging and Controls - 4.0L, Description and Operation).

Fuel system emission control is described in Engine Emission Control - 4.0L V6.

For additional information, refer to: [Engine Emission Control](#) (303-08C Engine Emission Control - V6 4.0L Petrol, Description and Operation).

FUEL TANK ASSEMBLY

E44503

Item	Part Number	Description
1	-	Pipe - purge valve to charcoal canister
2	-	Tank breather pipe
3	-	Fuel pump module flange
4	-	Pump module clamp
5	-	Pump module collar
6	-	Pump module seal
7	-	Cover
8	-	Pipe connection - purge valve
9	-	Pipe connection - fuel feed
10	-	Cradle

11	-	Fuel tank
12	-	Pipe - fuel feed
13	-	Mounting screws (6 off)
14	-	Fuel filler hose
15	-	Heat shield
16	-	Scrivet
17	-	Screw M6
18	-	Clip cover

The fuel tank is located on the right hand side of the vehicle, between the transmission and the right hand chassis longitudinal. The tank is located on a mounting cradle which secures the whole fuel tank assembly to the vehicle. The tank has a useable capacity of 86.3 litres (22.8 US gallons).

The cradle is attached to the chassis with six screws. When the cradle is attached to the chassis, the tank is positively secured via foam pads which bear against the central chassis cross beam. A protective cover is fitted to the front left hand corner of the tank and provides additional protection.

The fuel tank is manufactured from moulded plastic which is a minimum of 3 mm thick. The tank is a sealed unit with the only internal access being via the pump module flange aperture on the top of the tank.

The flange assembly comprises a pump module flange which contains all external pipe and electrical connections for the tank internal components, a collar and a clamp. The flange is fitted with a seal which locates in the tank aperture. An arrow on the flange must be aligned between two moulded lines on the tank, adjacent to the pump module flange aperture, to obtain the correct orientation of the flange. The collar is located over the flange and is secured with the clamp. The flange, seal, collar and clamp arrangement meets the sealing requirements of LEV2 emissions.

The flange has a six pin external connector which provides for electrical connections for the level sensors and the fuel pump. This connector is wired to three push fit connectors on the underside of the flange. A quick release connector provides for the connection of the fuel feed pipe and breather.

A tank carrier assembly is attached inside the tank and is used to locate the internal tank components. The carrier provides location for the fuel pump module, the front level sensor, the Roll Over Valves (ROV's), the front jet pump and the Fuel Level Vent Valve (FLVV).

The fuel pump module contains a number of components. The module comprises the fuel pump, the rear fuel level sensor, the rear jet pump, the pump inlet filter, a second fine mesh filter and the fuel pressure regulator which is housed in a manifold that is mounted in the carrier. Only the pump module assembly and fuel level sensors are available as serviceable components, the individual assembly components are not available separately.

Fuel Tank Internal Components

E50099

Item	Part Number	Description
1	-	Front right hand Roll Over Valve (ROV)
2	-	Carrier assembly
3	-	Fuel Level Vent Valve (FLVV) breather corrugated tube
4	-	Front ROV corrugated tube
5	-	Liquid Vapor Separator (LVS)

6	-	Rear right hand ROV
7	-	Rear left hand ROV
8	-	Fuel pump module
9	-	Rear fuel level sensor
10	-	Tank breather tube
11	-	Connector
12	-	Fuel Level Vent Valve (FLVV)
13	-	Front fuel level sensor
14	-	Front left hand ROV
15	-	Front jet pump

The 4.0L V6 vent system is identical to the system used on the 4.4L V8 models. The vent system comprises:

- four Roll Over Valves (ROV)
- one Fuel Level Vent Valve (FLVV)
- one Liquid Vapor Separator (LVS)

The vent system is mounted on the fuel tank internal carrier which is assembled outside of the tank and inserted into the tank during the blow moulding process. None of the internal tank venting components are serviceable.

The two rear ROVs are mounted directly onto the LVS with a rubber grommet and secured with clips.

The two front ROVs are located in the front of the tank and are attached to the main beam of the carrier by a moulded clip. Both ROVs are connected to the LVS with a plastic corrugated tube.

The four ROVs vent directly into the LVS. Any liquid fuel is separated from the vapor in the LVS and drains back into the tank via the FLVV. The LVS is connected by a corrugated tube to the fuel pump module flange. This allows fuel vapor to exit the tank during venting.

The main purpose of the FLVV is to control the fill volume of the tank. During filling, vapor is passed via the FLVV to the LVS. The vapor then passes from the LVS to the fuel pump module flange vent connection via a corrugated tube. The flange vent connection is connected to the charcoal canister which stores the fuel vapor. During filling, when the tank reaches its full level, the FLVV closes and prevents fuel vapor passing through to the LVS. This causes the pressure in the tank to rise which in turn causes the pump filling nozzle to turn off.

Fuel Pump Module

The fuel pump is attached to the carrier and is located in the bottom of the swirl pot. The pump and the fuel level sensors are connected to the external electrical connector via the connectors on the underside of the fuel pump module flange.

The pump module has a rated flow of 122 litres/hour (32.2 US gallons/hour) at a voltage of 12.3V and an output pressure of 4.5 bar (65.2 lbf/in²).

The fuel pump is energised by the fuel pump relay which is located in the battery junction box. The relay is controlled by the engine control module and energises the relay at all times when the ignition switch is in ignition position II.

A pump inlet filter is attached to pump inlet port at the bottom of the pump. The filter has a 'winged' section which is located vertically at the side of the pump to ensure that a portion of the filter is off the base of the swirl pot, to prevent premature blocking of the filter. The filter has a 31 micron fine mesh filter with a surface area of 70 cm² (10.8 in²).

A second fine mesh filter is located around the top of the fuel pump. This provides additional filtration to the fuel before it is passed into the manifold and onto the fuel rail. The filter has an electrical connection which is attached to ground. The ground is required to dissipate electrostatic charges that can build up on the fine filter.

The fuel filter incorporates a non-return valve which prevents fuel returning to the pump when the engine is not running. This ensures that system pressure is maintained in the fuel feed line to the fuel rail when the engine is not running.

Fuel Level Sensors

The sensor is a Magnetic Passive Position Sensor (MAPPS) which provides a variable resistance to earth for the output from the fuel gauge. The sensor is sealed from the fuel preventing contamination of the contacts, increasing reliability. The front and rear fuel level sensors are connected to the external electrical connector on the flange via the connectors on the underside of the fuel pump module flange.

The front sensor is attached to the front of the carrier and is accessible via the fuel pump flange aperture. The rear sensor is attached to the side of the swirl pot and is also accessible via the flange aperture.

- **NOTE:** When a service replacement tank is ordered the tank is supplied with the front level sensor fitted.

The sensor comprises a series of 51 film resistors mounted in an arc on a ceramic surface. The resistors are wired in series with individual contacts. A soft magnetic foil with 51 flexible contacts is mounted a small distance above the film resistors. A magnet, located below the ceramic surface, is attached to the sender unit float arm. As the float arm moves, the magnet follows the same arc as the film resistors. The magnet pulls the flexible contacts onto the opposite film resistor contacts forming an electrical circuit.

Sensor Operating Principle

E44504

Item	Part Number	Description
1	-	Magnetic foil
2	-	Spacer
3	-	Ceramic surface
4	-	Magnet
5	-	Resistance film

The film resistors are arranged in a linear arc with resistance ranging from 51.2 to 992.11 Ohms. The electrical output signal is output proportional to the amount of fuel in the tank and the position of the float arm. The measured resistance is processed by the instrument pack to implement an anti-slosh function. This monitors the signal and updates the fuel gauge pointer position at regular intervals, preventing constant pointer movement caused by fuel movement in the tank due to cornering or braking.

A warning lamp is incorporated in the instrument cluster and illuminates when the fuel level is at or below 10 litres (2.64 US gallons).

The fuel level sender signal is converted into a CAN message by the instrument pack as a direct interpretation of the fuel tank contents in litres. The ECM uses the CAN message to store additional OBD P Codes for misfire detection when the fuel level is below a predetermined capacity.

Front Fuel Level Sensor Resistance/Fuel Gauge Read out Table

• NOTE: These figures are with the vehicle on level ground. Sensor readings will differ with varying vehicle inclinations.

Sender Unit Resistance, Ohms	Nominal Gauge Reading
51	Empty
51	Low fuel level illumination
294	Half full
798	Full

Rear Fuel Level Sensor Resistance/Fuel Gauge Read out Table

• NOTE: These figures are with the vehicle on level ground. Sensor readings will differ with varying vehicle inclinations.

Sender Unit Resistance, Ohms	Nominal Gauge Reading
75.5	Empty
120	Low fuel level illumination
280	Half full
675	Full

Fuel Pressure Regulator

The fuel pressure regulator is located in the manifold inside the fuel tank. The regulator controls the fuel pressure in the feed pipe to the fuel rail by allowing some fuel to be diverted to the front jet pump.

The regulator is subject to pump output pressure and controls the pressure of the fuel delivered to the fuel rail to 4.5 bar (65.2 lbf/in²). At pressures above this figure, the regulator opens, decaying the pressure supplied to the fuel rail by allowing fuel to pass to the front jet pump. The regulator is required to maintain the fuel pressure at the optimum pressure for correct fuel injection.

Swirl Pot

The swirl pot is located at the rear of the fuel tank and provides for the attachment or location of most of the fuel pump assembly components.

The swirl pot acts as a fuel reserve, providing a constant supply of fuel to the fuel pump irrespective of fuel quantity or vehicle attitude. When the vehicle is level the swirl pot contains approximately 400 cm³ (24.4 in³) of fuel when the engine is running. The two jet pumps ensure that fuel is constantly supplied to the swirl pot to provide a sufficient fuel supply for the pump.

A one way valve is located in the base of the swirl pot. The valve allows fuel from the tank to enter the swirl pot, but prevents it from escaping.

Jet Pumps

The fuel system incorporates two jet pumps. The front jet pump is located on the carrier near the front of the fuel tank. The rear jet pump is located in the swirl pot below the fuel pump. Both jet pumps operate on a venturi effect created by fuel at pump output pressure passing through the jet pump. This draws additional fuel from the tank through ports in the jet pump body, delivering additional fuel to the swirl pot.

The front jet pump is mainly used when the vehicle is driving downhill. The jet pump is connected via a pipe from the fuel manifold and receives fuel diverted from the fuel feed pipe by the pressure regulator. The front jet pump collects fuel from the front of the tank and transfers it into the swirl pot, ensuring a constant supply of fuel to the pump. The jet pump has a jet nozzle of 2.1 mm diameter.

The rear jet pump operates at pump output pressure and delivers some of the fuel at pump pressure from the rear of the tank back into the swirl pot.

Roll Over Valves (ROVs)

Four ROVs are located on the carrier and are connected via pipes to a liquid vapour separator. The separator, which is also attached to the carrier, is connected via a pipe to the tank breather outlet in the pump module flange. The ROVs contain non-return valves which close in the event of the vehicle overturning, preventing liquid fuel escaping from the tank via the breather pipe.

FUEL FILLER

Fuel Filler - ROW

E44505

Item	Part Number	Description
1	-	Filler cap
2	-	Bracket
3	-	Screw M6
4	-	Filler cap lanyard
5	-	Charcoal canister breather hose
6	-	Charcoal canister vent hose to atmosphere
7	-	Charcoal canister (ROW)
8	-	Rear differential breather pipe
9	-	Tank breather pipe
10	-	Clamp - filler hose
11	-	Fuel filler pipe
12	-	Screw M8
13	-	Lower mounting bracket to EPB bracket

Fuel Filler - NAS

E48711

Item	Part Number	Description
1	-	Filler cap
2	-	DMTL pump filter
3	-	Screw M6
4	-	Bracket
5	-	Filler cap lanyard
6	-	Charcoal canister breather hose
7	-	DMTL pump vent hose to filter
8	-	DMTL pump
9	-	Charcoal canister (NAS)
10	-	Rear differential breather pipe
11	-	Tank breather pipe
12	-	Clamp - filler hose
13	-	Fuel filler pipe
14	-	Screw M8
15	-	Lower mounting bracket to EPB bracket

The fuel filler head is positioned at the rear of the vehicle, above the right hand rear wheel. The filler head is covered by a moulded plastic cover which is electrically locked when the vehicle is locked. The filler cap is a conventional screw in type which is secured to the vehicle with a lanyard.

• **NOTE:** The fuel filler head plastic cover does not lock on NAS vehicles.

The filler head is a stainless steel fabrication. Two brackets provide for the attachment of the filler to the vehicle body and the chassis electronic park brake bracket.

Connections on the rear of the filler head allow for the connection of the fuel tank breather pipe from the fuel tank flange, the fuel filler pipe to the tank and the charcoal canister breather pipe.

The fuel tank breather pipe has a quick release fitting and connects to the breather pipe from the fuel tank flange.

The fuel filler pipe locates in a short flexible hose attached to the tank and is secured with worm drive clamps. The canister vent pipe is routed alongside the fuel filler pipe and attaches to the canister with a quick release coupling.

A charcoal canister to atmosphere pipe is also routed alongside the fuel filler pipe and provides air ventilation for the charcoal canister. On all petrol vehicles, except NAS vehicles, the pipe is connected to the air port on the charcoal canister with a quick release coupling and connects to an insect trap at the fuel filler head. On NAS vehicles fitted with a DMTL pump, the pipe connects to the pump vent port and is also connected to a filter which is attached to the filler head.

A smaller pipe, which is not associated with the fuel system, is attached to the side of the fuel filler pipe. This pipe connects to the rear differential and provides breathing for the differential case. The pipe terminates near the fuel filler head.

Fuel Tank and Lines - V6 4.0L Petrol - Fuel Tank and Lines

Diagnosis and Testing

Principle of Operation

For a detailed description of the fuel tank and lines system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to:

[Fuel Tank and Lines](#) (310-01A Fuel Tank and Lines - TDV6 2.7L Diesel, Description and Operation),
[Fuel Tank and Lines](#) (310-01A Fuel Tank and Lines - TDV6 2.7L Diesel, Description and Operation),
[Fuel Tank and Lines](#) (310-01B Fuel Tank and Lines - TDV6 3.0L Diesel, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fuel level ● Fuel leaks ● Damaged fuel lines ● Damaged push connect fittings ● Fuel contamination/grade/quality ● Throttle body ● Damaged fuel tank filler pipe cap ● Damaged fuel tank filler pipe 	<ul style="list-style-type: none"> ● Fuses ● Loose or corroded electrical connectors ● Harnesses ● Sensor(s) ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Removal and Installation

Removal

• **WARNINGS:**

Place the vehicle in a well ventilated, quarantined area and arrange 'No Smoking/Petrol Fumes' signs about the vehicle.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

• **NOTE:** The fuel pump module comprises of a rear fuel level sender, filter and a fuel pressure regulator. These components cannot be serviced separately.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the fuel tank.
For additional information, refer to: Fuel Tank (310-01, Removal and Installation).

CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** Note the fitted position.

Release the fuel pump module access flange.

- Loosen the screw.
- Remove the clamp.

E51525

5. Remove the fuel pump module access flange.

- Disconnect the vent line.
- Disconnect the fuel supply line.
- Disconnect the 3 electrical connectors.
- Remove and discard the seal.

E51526

6. Remove the fuel pump module.
 - Release the strap.
 - Release the fuel pressure regulator.
 - Disconnect the 2 fuel lines.

Installation

1. Install the fuel pump module.
 - Connect the fuel lines.
 - Secure with the strap.
 - Secure the fuel pressure regulator.
2. Install the fuel pump module access flange.
 - Clean the component mating faces.
 - Install a new seal.
 - Connect the 3 electrical connectors.
 - Connect the fuel supply line.
 - Connect the vent line.

3.  **CAUTION:** Make sure the seal is correctly fitted.

• **NOTE:** Align to the position noted on removal.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

4. Install the fuel tank.
For additional information, refer to: Fuel Tank (310-01, Removal and Installation).

5. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

E57667

7.  CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the fuel tank vent line.

- 8. Release the fuel tank harness.
- 9. Release the parking brake emergency release cable.
 - Release from the 4 clips.
- 10. Remove the 2 emergency release cable clips.

E57674

E51522

11.  WARNING: Secure the component to the transmission jack.

• CAUTIONS:

 Do not lower the fuel tank more than 250 mm (9.75 in)

 Note the rear bolt is fitted with 2 washers.

Using a transmission jack, lower the fuel tank sufficiently only to access the top of the fuel tank.

- Remove the 6 bolts.

12. Disconnect the fuel pump module electrical connector.

E57673

13. Release the purge line from the top of the fuel tank.

- Remove the adhesive pad.
- Release from the 5 clips.

E51523

14. Remove the fuel tank.

15. NOTE: Do not disassemble further if the component is removed for access only.

With assistance, remove the fuel tank from the transmission jack.

CAUTION: Before disconnecting or removing the component, be sure to disconnect the joint and clean the area. Plug open connectors to prevent contamination.

- Remove the fuel tank vent line.
NOTE: Note the fitted position.
- Disconnect the quick release connector.
Release the fuel pump module access frame.
- Remove from the 3 clips.
Loosen the screw.
- Remove the clamp.

E51525

E51526

19.  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the fuel pump module access flange.

- Disconnect the vent line.
- Disconnect the fuel supply line.
- Disconnect the 3 electrical connectors.
- Remove and discard the seal.

E51527

20. Remove the fuel pump module.

- Release the strap.
- Release the fuel pressure regulator.
- Disconnect the 2 fuel lines.

E51528

21. Remove the fuel tank front fuel level sender unit.

- Release the lead.
- Release the clip.

E57681

22.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the fuel filler hose.

- Remove the tamper proof cover.
- Remove and discard the hose clip.

E51529

23. Remove the fuel tank bracket.

- Remove the 2 clips.
- Remove the 2 bolts.
- Remove the retaining plate.

Installation

1. Install the fuel tank bracket.

- Install the retaining plate.
- Install the clips.
- Tighten the bolts to 3.5 Nm (2.5 lb.ft).

2.  **CAUTION:** Tighten the new tamper proof clip until the hexagon shears.

Install the fuel filler hose.

- Install a new retaining clip.

3. Install the fuel tank front fuel level sender unit.

- Secure the clip.
- Secure the lead.

4. Install the fuel pump module.

- Connect the fuel lines.
- Secure with the strap.
- Secure the fuel pressure regulator.

5. Install the fuel pump module access flange.

- Clean the component mating faces.
- Install a new seal.
- Connect the 3 electrical connectors.
- Connect the fuel supply line.
- Connect the vent line.

6.  **CAUTION:** Make sure the seal is installed correctly.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

7. Install the fuel supply line.

- Connect the quick release connector.
- Secure in the 2 clips.

8. Install the vent line.

- Connect the quick release connector.
- Secure in the 3 clips.

9. With assistance, install the fuel tank to the transmission jack.

10. Position the fuel tank to the vehicle.

11. Secure the purge line to the fuel tank.

- Secure with the clips.
- Install the adhesive pad.

12. Connect the electrical connector.

13.  **CAUTION:** Note the rear bolt is fitted with 2 washers.

Install the fuel tank.

- Tighten the bolts to 45 Nm (33 lb.ft).

14. Install the 2 emergency release cable clips.

15. Secure the parking brake emergency release cable.

- Secure in the 4 clips.

16. Secure the fuel tank harness.

17. Connect the vent line.

18. Connect the fuel supply and purge lines.

19.  **CAUTION:** Tighten the new tamper proof clip until the hexagon shears.

Connect the fuel filler neck.

- Install a new retaining clip.

20. Install the fuel tank heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

21. Refill the fuel tank.

For additional information, refer to: [Fuel Tank Draining](#) (310-00 Fuel System - General Information, General Procedures).

GENERAL

The major components of the 5.0L V8 fuel system comprises a fuel tank, a fuel delivery module, a fuel filler assembly and

two fuel level sensors.

The 5.0L V8 fuel system uses a returnless fuel system which comprises a fuel pump mounted in the fuel tank to deliver fuel at a variable flow and pressure to the engine mounted high pressure fuel pumps which supply fuel to the fuel rails and to all the fuel injectors.

The fuel pump operation is regulated by a Fuel Pump Driver Module (FPDM) which is controlled by the engine management system. The driver module regulates the flow and pressure supplied by controlling the operation of the fuel pump using a Pulse Width Modulation (PWM) output.

The fuel rails and the injectors are described in Fuel Charging and Controls – 5.0L V8.

For additional information, refer to: [Fuel Charging and Controls](#) (303-04C Fuel Charging and Controls - TDV6 3.0L Diesel, Description and Operation) /

[Turbocharger](#) (303-04D Fuel Charging and Controls - Turbocharger - TDV6 3.0L Diesel, Description and Operation).

Fuel system emission control is described in Engine Emission Control - 5.0L V8

For additional information, refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Description and Operation) /

[Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

FUEL TANK

The fuel tank is located on the right hand side of the vehicle, between the transmission and the right hand chassis longitudinal. The tank is located on a mounting cradle which secures the whole fuel tank assembly to the vehicle. The tank is blow moulded from HDPE (high density polyethylene) and has a useable capacity of 86.0 liters (19 gallons).

The cradle is attached to the chassis with six screws. When the cradle is attached to the chassis, the tank is positively secured via foam pads which bear against the central chassis cross beam. A protective cover is fitted to the front right hand corner of the tank and provides additional protection.

The fuel tank is manufactured from moulded plastic which is a minimum of 3 mm thick. The tank is a sealed unit with the only internal access being via the pump module flange aperture on the top of the tank.

The flange is fitted with a locking ring and seal. The seal locates in a groove on the tank. The locking ring locates and clamps on the encapsulated ring that is moulded into the fuel tank. The flange has a tag which locates in the top of the tank to ensure correct orientation.

The flange has six pin internal and external connectors which provide for electrical connections for the level sensors and the fuel pump. A quick release connector provides for the connection of the fuel supply pipe.

A carrier within the tank provides for the mounting of the fuel suction tube, vent valve, and the front fuel level sensor.

The fuel delivery module is mounted on a bayonet lock ring which is welded inside the fuel tank. The fuel delivery module comprises the fuel pump, jet pumps, the pump inlet filter and the fuel pressure relief valve. The rear fuel level sensor is also mounted on the side of the pump module body.

The pressure relief valve assists engine starting by retaining a pre-set fuel pressure in the fuel supply pipe and the fuel rails. The valve also limits fuel rail pressure due to temporary vapor increase in hot conditions and pressure caused by sudden load changes; a fully open to closed throttle transition, for example.

Only the pump module assembly, the fuel level sensors and the flange are available as serviceable components, the individual assembly components are not available separately.

FUEL DELIVERY MODULE

E122738

Item	Part Number	Description
1	-	Fuel supply outlet connection
2	-	Vent pipe connection
3	-	Electrical connector
4	-	Locking ring
5	-	Pressure relief valve
6	-	Suction pipe connection
7	-	Fuel pick-up filter
8	-	Fuel pump
9	-	Rear fuel level sensor
10	-	Fuel filter

The fuel delivery module is a new design for 5.0L V8 2010MY vehicles. The module is located inside the fuel tank and comprises three main components; a fuel pump, a remote fuel pick-up and a top flange assembly.

Fuel Pump

The fuel pump is a variable-speed rotary-vane type, which operates in a fuel pump module located at the rear of the fuel tank. A venturi transfer pump is also located in the rear of the tank. The fuel pump module is secured in the fuel tank with a bayonet style locking ring that is welded into the tank structure. The fuel pump module has an integral top plate for the external pipe work and electrical connectors.

The fuel pump delivers fuel at a maximum pressure of 630 kPa (6.3 bar; 91.4 lbf/in.²) to the filter bowl in the top flange.

The electric pump is located in a plastic swirl pot which collects fuel from the base of the fuel tank via a filter. The swirl pot acts as a fuel reserve, providing a constant supply of fuel to the fuel pump irrespective of fuel quantity or vehicle attitude. When the vehicle is level the swirl pot contains approximately 275 cm³ (16.8 in³) of fuel when the engine is

running. The jet pump ensures that fuel is constantly supplied to the swirl pot to provide a sufficient fuel supply for the pump. A one way valve is located in the base of the swirl pot. The valve allows fuel from the tank to enter the swirl pot, but prevents it from escaping.

The fuel level sensor for the rear of the tank is attached to the outside of the swirl pot.

The fuel pump module is a serviceable component and access to the pump is by removal of the top flange.

Remote Fuel Suction Jet and Level Sensor Assembly

The remote fuel suction jet is located in the front of the fuel tank. The fuel suction jet is attached to the internal carrier which is secured inside the fuel tank.

The fuel system incorporates 2 jet pumps. The jet pumps are integrated into the fuel pump module and draw fuel from the front and rear of the fuel tank. A suction pipe is connected to the fuel suction jet that is located in the front of the tank that allows fuel to be drawn from the front of the tank, delivering fuel into the swirl pot via the suction pipe connection on the pump body. The jet pump operates on a venturi effect created by the fuel at pump output pressure passing through the jet pump.

The fuel level sensor for the front of the fuel tank is attached to the carrier frame. The fuel suction jet and the level sensor are serviceable components and access is by removal of the flange cover on the top rear of the fuel tank.

Top Flange Assembly

The top flange is located on the top of the fuel tank. The flange assembly is sealed in the tank with a with a sealing ring. A locking ring secures the flange assembly in the tank and requires a special tool for removal.

The outer surface of the flange has 1 fuel feed outlet with a quick-fit connection. The connection is for the fuel supply pressure outlet to the engine mounted fuel pumps. An electrical connector is located adjacent to the pipe connections and provides the electrical interface to the fuel pump and the level sensors. A breather connection allows the fuel tank to breathe and connects the fuel tank to the fuel filler and charcoal canister systems.

On the underside of the flange, inside the tank, is a moulded housing which contains the non-serviceable fuel filter. Fuel from the fuel pump enters the base of the housing and passes through the filter before exiting the tank to the engine mounted fuel pumps. An electrical connection on the base of the filter housing provides a ground for the filter.

FUEL PUMP DRIVER MODULE (FPDM)

E122739

Item	Part Number	Description
1	-	Fuel Pump Driver Module (FPDM)
2	-	Mounting bracket

The FPDM is located in the LH side of the luggage compartment, above the LH wheel arch, behind the trim panel. The FPDM is located on a bracket and secured with 2 bolts and nuts.

The fuel pump operation is regulated by the FPDM which is controlled by the Engine Control Module (ECM). The FPDM regulates the flow and pressure supplied by controlling the operation of the fuel pump using a PWM output.

The FPDM is powered by a supply from the fuel pump relay in the Engine Junction Box (EJB). The fuel pump relay is energized on opening the driver's door or when power mode 9 engine crank is initiated using the stop/start button. The FPDM supplies power to the fuel pump, and adjusts the power to control the speed of the fuel pump and thus the pressure and flow in the fuel delivery line.

A Pulse Width Modulation (PWM) signal from the ECM tells the FPDM the required speed for the fuel pump. The on time of the PWM signal represents half the fuel pump speed, e.g. if the PWM signal has an on time of 50%, the FPDM drives the pump at 100%.

The FPDM will only energize the fuel pump if it receives a valid PWM signal, with an on time of between 4% and 50%. To switch the fuel pump off, the ECM transmits a PWM signal with an on time of 75%.

The output pressure from the fuel pump will change with changes of engine demand and fuel temperature. The ECM monitors the input from the Low Pressure (LP) fuel sensor and the fuel rail pressure sensor and adjusts the speed of the fuel pump as necessary to maintain a nominal output pressure of 450 kPa (4.5 bar; 65.3 lbf/in.²), except during engine start-up. At engine start-up the target pressure for the fuel delivery line is 630 kPa (6.3 bar; 91.4 lbf/in.²).

If the Supplemental Restraint System (SRS) outputs a crash signal on the high speed Controller Area Network (CAN) bus, the ECM de-energizes the fuel pump relay to prevent any further fuel being pumped to the engine.

If the ECM does not detect pressure in the fuel delivery line, it stops, or refuses to start the engine and stores the appropriate Diagnostic Trouble Code (DTC).

The ECM receives a monitoring signal from the FPDM. Any DTC's produced by the FPDM are stored by the ECM.

DTC's can be retrieved from the ECM using an approved Land Rover diagnostic system. The FPDM itself cannot be interrogated by the approved Land Rover diagnostic system.

FUEL LEVEL SENSORS

Two fuel level sensors are used in the fuel tank to measure the amount of remaining fuel in the front and rear of the fuel tank. The front level sensor is attached to the internal carrier and the rear level sensor is attached to the fuel pump swirl pot. The sensors are connected to the vehicle wiring harness via a connector on the outer face of the top flange assembly.

The sensors are a MAGnetic PASSive Position Sensor (MAPPS) which provides a variable resistance to ground for the output from the fuel gauge. The sensor is sealed from the fuel preventing contamination of the contacts and increasing reliability. The front and rear fuel level sensors are connected to the external electrical connector on the flange via the connectors on the underside of the fuel pump module flange.

The sensor comprises a series of 51 film resistors mounted in an arc on a ceramic surface. The resistors are wired in series with individual contacts. A soft magnetic foil with 51 flexible contacts is mounted a small distance above the film resistors. A magnet, located below the ceramic surface, is attached to the sender unit float arm. As the float arm moves, the magnet follows the same arc as the film resistors. The magnet pulls the flexible contacts onto the opposite film resistor contacts forming an electrical circuit.

Sensor Operating Principle

E44504

Item	Part Number	Description
1	-	Magnetic foil
2	-	Spacer
3	-	Ceramic surface
4	-	Magnet
5	-	Resistance film

The film resistors are arranged in a linear arc with resistance ranging from 51.2 to 992.11 Ohms. The electrical output signal output is proportional to the amount of fuel in each side of the tank and the position of the float arms. The measured resistance is processed by the instrument cluster to implement an anti-slosh function. This monitors the signal and updates the fuel gauge pointer position at regular intervals, preventing constant pointer movement caused by fuel movement in the tank due to cornering or braking.

A warning indicator is incorporated in the instrument cluster and illuminates when the fuel level is at or below 10 liters (2.64 US gallons).

The fuel level sender signals are converted into a CAN bus message by the instrument cluster as a direct interpretation of the fuel tank contents in liters. The ECM uses the CAN bus message to store additional On-Board Diagnostic (OBD) P Codes for misfire detection when the fuel level is below a predetermined capacity.

FUEL FILLER PIPE AND TANK BREATHER ASSEMBLY

Fuel Filler Pipe Assembly (All Except NAS)

E122740

Item	Part Number	Description
1	-	Liquid Vapor Separator (LVS)
2	-	Pipe - fuel vapor vent
3	-	Filler cap lanyard
4	-	Filler cap
5	-	Bracket
6	-	Charcoal canister breather/dust filter
7	-	Pipe - breather
8	-	Pipe - fuel vapor vent
9	-	Pipe - fuel vapor to charcoal canister
10	-	Charcoal canister
11	-	Pipe - rear differential breather (Reference only)
12	-	Pipe - fuel vapor connection
13	-	Hose - fuel filler pipe to fuel tank spit back flap
14	-	Pipe - fuel filler

Fuel Filler Pipe Assembly (NAS Only)

E122741

Item	Part Number	Description
1	-	Liquid Vapor Separator (LVS)
2	-	Pipe - fuel vapor vent
3	-	Filler cap lanyard
4	-	Filler cap
5	-	Bracket
6	-	Charcoal canister breather/dust filter
7	-	Pipe - breather
8	-	Pipe - fuel vapor vent
9	-	Pipe - fuel vapor to charcoal canister
10	-	Charcoal canister
11	-	Pipe - rear differential breather (Reference only)
12	-	Pipe - fuel vapor connection
13	-	Hose - fuel filler pipe to fuel tank spit back flap
14	-	Pipe - fuel filler
15	-	Pipe - fuel vapor to purge valve (part of fuel tank assembly)
16	-	Diagnostic Tank Monitoring Leakage (DMTL) pump

The fuel filler head is positioned at the rear of the vehicle, above the right hand rear wheel. The filler head and cap is covered by a moulded plastic cover which is electrically locked when the vehicle is locked.

The filler cap is a conventional screw in type which is secured to the vehicle with a lanyard. The filler cap must be securely fitted to ensure that the tank venting system is sealed. The cap has a locking mechanism which gives an audible click when the cap is correctly tightened.

Failure to correctly secure the filler cap will result in vapor being lost from the system. On NAS Vehicles, if the cap is incorrectly secured when the engine management system operates the Diagnostic Monitoring Tank Leakage (DMTL)

system, the loss of vapor will be detected as a leak and the MIL lamp will be illuminated.

The filler head is a stainless steel fabrication. A bracket provides for the attachment of the filler head to the vehicle body.

A connection on the rear of the filler head allows for the connection of the fuel tank breather pipe from the vapor separator on ROW vehicles and from the roll over valves on NAS vehicles.

The fuel filler pipe locates in the tank and incorporates a spitback flap in the tank end of the pipe. The flap is a spring loaded cover which acts as a 1-way valve, allowing the tank to be filled but preventing fuel leaving the tank into the filler pipe.

All vehicles have a charcoal canister breather pipe which is connected from the charcoal canister and is routed alongside the fuel filler pipe to the filler head. The filler head end of this pipe is connected differently depending on market as follows:

- On ROW vehicles the breather pipe is fitted with a mesh and allows fresh air to be drawn into the charcoal canister when fuel vapor is being purged from the system.
- On NAS vehicles the breather pipe is connected to the DMTL pump. Fresh air is drawn into the pipe via a DMTL filter integral with the pump when fuel vapor is being purged from the system. When the DMTL system is active, the breather pipe is closed by the pump, sealing the system and allowing the system to be pressure checked for leakage.

For information on the charcoal canister and purging system refer to the evaporative emissions section.

For additional information, refer to: [Evaporative Emissions](#) (303-13A Evaporative Emissions - V6 4.0L Petrol, Description and Operation).

A second pipe is routed alongside the charcoal canister breather pipe. On ROW vehicles, this pipe is the fuel tank breather pipe from the vapor separator and is connected into the fuel filler pipe near to the filler head. On NAS vehicles, this pipe is smaller in diameter and also serves as the fuel tank breather pipe. The pipe is not connected to the vapor separator but allows fuel vapor from the right hand roll over valve to vent into the connection with the fuel filler pipe near to the filler head.

A pipe is routed across the top of the tank in front of the vapor separator. This pipe connects the charcoal canister to the purge valve located in the engine compartment.

FUEL LOW PRESSURE (LP) SENSOR

E112870

The fuel LP sensor supplies a pressure signal to the Engine Control Module (ECM) to enable closed loop control of the fuel pump. The fuel LP sensor is installed in a manifold in the fuel supply line. The manifold is located in the rear of the front Right Hand (RH) wheelarch, behind the splash shield.

OPERATION

The fuel pump is a variable-speed rotary-vane type, which operates in a fuel delivery module located in the fuel tank. The fuel delivery module is secured in the fuel tank with a bayonet style locking ring that is welded into the tank structure. The fuel pump module has an integral top plate for the external pipe work and electrical connectors.

Fuel level is biased towards the rear of the fuel tank by drawing fuel from the front of the tank via the jet pump, which serves to deliver a constant supply of fuel to the swirl pot. High pressure fuel from the fuel pump is directed through the jet pump's orifice, creating a low pressure area to be formed in the cross over pipe. The fuel is drawn into this low pressure area in the cross over pipe and directed into the swirl pot delivery pipe.

Fuel is pumped from the fuel pump to the two engine mounted HP fuel pumps via the integral filter and pressure relief valve.

The pressure relief valve assists engine starting by retaining a pre-set fuel pressure in the supply pipe and fuel rail. The pressure relief valve also limits fuel rail pressure due to temporary vapor increase in hot conditions and pressure caused by sudden load changes, for example, a fully open to closed throttle transition.

To meet emission requirements, the fuel tank and associated components are designed to minimize fuel vapor loss during refueling. This is achieved by preventing fuel vapor from the fuel tank venting directly to the atmosphere. Instead fuel vapor is directed into the charcoal canister where it is stored before being purged at intervals to the engine's intake manifold.

North American Specification (NAS) vehicles feature additional connections and pipes at the rear of the filler head and also incorporates a Diagnostic Monitoring Tank Leakage (DMTL) pump for leak detection requirements.

Fuel Tank and Lines - V8 5.0L Petrol - Fuel Tank and Lines

Diagnosis and Testing

Principle of Operation

For a detailed description of the fuel tank and lines system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Fuel Tank and Lines](#) (310-01D Fuel Tank and Lines - V8 5.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fuel level ● Fuel leaks ● Damaged fuel lines ● Damaged push connect fittings ● Fuel contamination/grade/quality ● Throttle body ● Damaged fuel tank filler pipe cap ● Damaged fuel tank filler pipe 	<ul style="list-style-type: none"> ● Fuses ● Loose or corroded electrical connectors ● Harnesses ● Sensor(s) ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not fire	<ul style="list-style-type: none"> ● Engine breather system disconnected/restricted ● Ignition system ● Fuel system ● Electronic engine control 	Ensure the engine breather system is free from restriction and is correctly installed. Check for ignition system, fuel system and electronic engine control DTCs and refer to the relevant DTC Index

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Fuel Tank and Lines - V8 5.0L Petrol - Fuel Tank Filler Pipe

Removal and Installation

Removal

• **WARNINGS:**

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• **NOTE:** Removal steps in this procedure may contain installation details.

1. Remove the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.
3. For additional information, refer to: [Fuel Tank Draining](#) (310-00 Fuel System - General Information, General Procedures).
4. For additional information, refer to: [Fuel Filler Door Assembly](#) (501-03 Body Closures, Removal and Installation).
5. Remove the RH rear wheel and tire.
 - TORQUE: 140 Nm
6. Remove the fender splash shield.

E48478

7.

8. NOTE: Discard the retaining clip.

Remove the tamper proof cover from the fuel tank filler pipe hose clip.

9.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

10.

Acceleration Control - TDV6 2.7L Diesel -**Torque Specifications**

Description	Nm	lb-ft
Accelerator pedal bracket nuts and bolts	10	7
Accelerator pedal assembly nuts	25	18

Acceleration Control - TDV6 2.7L Diesel - Acceleration Control

Description and Operation

Acceleration control for the diesel engine is achieved via an electronic throttle drive by wire system. The throttle is electronically connected to the ECM and the ECM then controls the fuelling for the relevant throttle demand signal from the Accelerator Pedal Position sensor (APP).

For additional information, refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

ELECTRONIC THROTTLE

Electronic Throttle

E46900

The electric throttle controls the air flow into the engine. In addition to the normal engine power control function, the electric throttle allows the cruise control, idle speed control and engine speed limiting functions to be performed without the need for additional hardware.

The electric throttle consists of a throttle body which incorporates a throttle plate driven by a DC motor via reduction gears. A return spring biases the throttle plate in the closed direction.

Operation of the DC motor is controlled by the ECM, which outputs two Pulse Width Modulated (PWM) signals to an H bridge drive circuit in the motor. The ECM varies the speed and direction of the motor by varying the duty cycle of the PWM signals.

To enable closed loop control, the position of the throttle plate is supplied to the ECM by two feedback Hall effect sensors in the throttle body. The feedback sensors have a common 5 volt supply and a common ground connection from the ECM, and produce separate linear signal voltages to the ECM proportional to the position of the throttle plate. The ECM uses the signal from feedback sensor 1 as the primary signal of throttle plate position, and the signal from feedback sensor 2 for plausibility checks.

- The signal from feedback sensor 1 varies between 0.5 volt (0% throttle open) and 4.5 volts (100% throttle open)
- The signal from feedback sensor 2 varies between 4.5 volts (0% throttle open) and 0.5 volt (100% throttle open)

While the ignition is on, the ECM continuously monitors the two feedback sensors for short and open circuits and checks the feedback sensor signals, against each other and the inputs from the Accelerator Pedal Position (APP) sensor, for plausibility. If a fault is detected in the feedback sensor signals or the DC motor, the ECM:

- Stores a related fault code in memory.
- Illuminates the SERVICE ENGINE warning lamp in the instrument pack.
- Adopts a throttle limp home mode or disables throttle control, depending on the nature of the fault.

The throttle limp home mode adopted depends on the nature of the fault:

- If there is a fault with one feedback sensor, or the throttle position controller in the ECM, the ECM limits vehicle acceleration by limiting throttle plate opening.
- If there is a fault with both feedback sensors, the ECM uses fuel injection cut-off to limit engine speed to 1300 rev/min maximum.

C0272 Electronic Throttle Pinout Details

Pin No	Description	Input/ Output
1	Supply voltage	Input
2	Throttle position	Output
3	Throttle position +	Input
4	Throttle position -	Input
5	N/C	-
6	Signal ground	-

ACCELERATOR PEDAL POSITION SENSOR

E46901

The Accelerator Pedal Position Sensor (APP) is integral to the accelerator pedal assembly.

The APP sensor enables the ECM to determine the throttle position requested by the driver on the accelerator pedal.

The APP sensor is installed on the pedal box and consists of a twin track potentiometer with wipers driven by a linkage connected to the accelerator pedal. Each potentiometer track has a 5 volt supply and ground connection from the ECM, and produces a linear signal voltage to the ECM proportional to the position of the accelerator pedal. The signal voltage from track 1 of the potentiometer is approximately double that of the signal voltage from track 2.

From the sensor signals, the ECM determines driver demand as a percentage of pedal travel, where 0% is with the pedal released and 100% is with the pedal fully depressed. Driver demand is then used to calculate throttle angle, fuel quantity and ignition timing. The ECM also outputs driver demand on the CAN system, for use by the brake and gearbox control systems.

The ECM stores the signal values that correspond with closed and wide open throttle, and adapts to new values to accommodate component wear or replacement.

The signals from the APP sensor are monitored by the ECM for short and open circuits and plausibility. If a fault is detected, the ECM:

- Stores a related fault code in memory.
- Illuminates the SERVICE ENGINE warning lamp in the instrument pack.
- Inhibits the driver demand message on the CAN bus, which disables the Hill Descent Control (HDC) function of the ABS modulator and reduces the performance of the automatic gearbox (harsh gear changes and loss of kick down).
- Adopts a throttle limp home mode.

The throttle limp home mode adopted depends on the nature of the fault:

- If a fault is detected with one potentiometer track, the ECM limits vehicle acceleration by limiting throttle plate opening.
- If a fault is detected with both potentiometer tracks, the ECM uses the throttle plate to run the engine at a fixed speed of 1472 rev/min while the brake pedal is released, and idle speed (750 rev/min) while the brake pedal is pressed or if there is a brake pedal sensor fault.
- If there is a process fault in the ECM, the ECM either uses fuel injection cut-off to limit engine speed to 1300 rev/min or disables fuel injection to stop the engine.

2	-	ECM
3	-	Speed control switches
4	-	Clock spring Brake switch
5	-	APP
6	-	Electric throttle
7	-	Brake light switch
8	-	Diagnostic socket
9	-	Instrument cluster
10	-	transmission control module (TCM)
11	-	ABS Control Module

The speed control system is integrated with the engine management system and uses fueling intervention to automatically maintain a set vehicle speed. Once engaged, the system can also be used to accelerate the vehicle without using the accelerator pedal. The speed control system comprises the following components:

- Suspend/resume switch
- '+' and '-' (set/accelerate and decelerate)
- Clock spring
- Speed control warning lamp (in the instrument cluster)

The speed control system also uses inputs from the brake pedal switch, the APP sensor, the ECM and the ABS control module.

The speed control is operated by the driver using only the steering wheel switches. When speed is active, the ECM regulates the pulse width modulation (PWM) signals to the fuel injectors to adjust the fuel supply as required to maintain the set speed.

CONTROL SWITCHES

E47030

Item	Part Number	Description
1	-	Suspend/resume switch
2	-	Accelerate/decelerate (+/-) Switches
3	-	Adaptive speed control time gap switches (where fitted)
4	-	Clock spring
5	-	Wiper control column switch

The speed control switches are located on the left-hand (LH) side of the steering wheel. The switches are connected via fly leads directly to the clock spring. All of the speed control switches are non-latching momentary rocker switches. The minimum set speed for speed control is 18 mph (30 km/h). Speed control is automatically suspended if the vehicle speed falls below 15 mph (24 km/h).

The speed control switches are resistive ladder type switches. There are three switches associated with speed control, two of which are for active speed control (where specified). The switches vary the resistance of a signal voltage sent to the ECM. The switches receive a 5 volt reference supply which is varied in response to which switches are pressed.

Suspend/Resume Switch

The suspend/resume switch controls the selection of speed control. When the ignition is in position II, a press of the suspend switch will activate the suspend mode which temporarily switches off the speed control system, but retains the previously set speed in the ECM memory.

Resume Switch

The resume switch re-activates the previously set speed after the speed control has been suspended by pressing the suspend switch or by depressing the brake pedal.

Accelerate/Decelerate (+/-) Switches

When the speed control system is active, pressing the '+' switch set the controlled speed to the current road speed of the vehicle. Subsequent momentary presses of the switch increase the set road speed by 0.6 mph (1 km/h) with each press. If the switch is pressed and held the road speed will continue to increase until the switch is released. Momentarily pressing the '-' switch, decreases the set speed by 0.6 mph (1 km/h) with each press. If the switch is pressed and held, the set speed is decreased until the switch is released.

Speed Control - TDV6 3.0L Diesel - Speed Control

Description and Operation

3.0L V6 DIESEL SPEED CONTROL COMPONENT LOCATION

E124127

Item	Part Number	Description
1	-	Anti-lock Brake System (ABS) module
2	-	Accelerator Pedal Position (APP) sensor
3	-	Brake switch
4	-	Instrument cluster
5	-	Speed control switches
6	-	Engine Control Module (ECM)
7	-	Electric throttle
8	-	Transfer box control module

GENERAL

The speed control system maintains a set speed selected by the driver until operation is suspended or cancelled by a further input from the driver and is controlled by the Engine Control Module (ECM).

The system has the following components:

- A set + switch
- A - switch

- A RESUME switch
- A CANCEL switch.

The system uses the following vehicle systems:

- The ECM
- The brake switch
- The Accelerator Pedal Position (APP) sensor.

DESCRIPTION

Speed Control Switches

E124128

Item	Part Number	Description
1	-	Set '+' increase the speed
2	-	Decrease '-' the speed
3	-	Resume set speed
4	-	Cancels without erasing memorized speed

Instrument Cluster Warning Indicator

E124129

Item	Part Number	Description
1	-	Speed control warning indicator

The speed control switches are located on the Left Hand (LH) side of the steering wheel. The switches are connected via fly leads to the clock spring. The speed control switches are resistive ladder type switches which vary the resistance of a 5 volt signal sent to them. The signal is returned along a Local Interconnect Network (LIN) bus to the instrument cluster. The instrument cluster routes the control signals to the Engine Control Module (ECM) on the high speed Controller Area Network (CAN) bus.

Speed control is engaged by pressing the set/increase switch. Once engaged the speed can be varied by the speed adjustment switches. Each press of the speed adjustment switches (+/-) will increase or decrease the set speed in steps of 1 mph (2 kph).

Accelerate/Decelerate (+/-) Switches

The Set + switch is used to activate the speed control system and set the speed control at the current vehicle speed. A speed control warning indicator will illuminate on the instrument cluster to advise the driver that the system is active. The switch can be pressed to adjust the set speed. Each single press of the switch increases the vehicle speed by 1 mph (2 km/h). If the switch is pressed and held the vehicle speed will increase and the once the switch is released the attained vehicle speed will be maintained.

The vehicle speed can be increased by using the accelerator pedal. When the accelerator pedal is released the vehicle speed will reduce to the previously set speed. When the vehicle speed is increased by use of the accelerator pedal, the message 'Cruise Override' will be displayed in the instrument cluster message center. This method can also be used to increase the vehicle set speed; once the required increase in speed is achieved, a single press of the Set + switch will maintain that speed as the new set speed.

• **NOTE:** If the accelerator pedal is pressed for more than 5 minutes, the speed control is cancelled.

The '-' switch can be used to decrease the vehicle set speed. The speed can be reduced by pressing and holding the switch until the required set speed is reached. When the switch is released the current speed will become the new set speed. A single press of the '-' switch will decrease the vehicle speed by 1 mph (2 km/h).

Cancel Switch

Speed control can be suspended temporarily or switched off by a single press of the Cancel switch. When the switch is pressed the speed control warning indicator in the instrument cluster is extinguished and the message 'Cruise Cancelled' is displayed in the message center.

Speed control can also be suspended if the brake pedal is pressed, if the transmission selector lever is moved to the neutral position or if Hill Descent Control (HDC) or Dynamic Stability Control (DSC) become active.

Once suspended, the cruise control can be resumed at the previously set speed by pressing the resume switch.

• **NOTE:** The set speed is not removed from the memory when the cancel switch is pressed. The set speed is only erased when the ignition is off.

Resume Switch

The resume speed is used to re-activate the speed control system at the previously set speed after the speed control has been cancelled or suspended.

OPERATION

Speed Control

The speed control system is integrated with the engine management system and uses fueling intervention to automatically maintain a set vehicle speed. Once engaged, the system can also be used to accelerate the vehicle without using the accelerator pedal. The speed control system comprises the following components:

- '+' and '-' (set/accelerate and decelerate) steering wheel switches
- Resume switch
- Cancel switch
- Clock spring
- Speed control warning lamp.

The speed control system also uses inputs from the brake pedal switch, the APP sensor, the ECM and the ABS module.

The speed control is operated by the driver using only the steering wheel switches. When speed control is active, the ECM regulates the Pulse Width Modulation (PWM) signals to the fuel injectors to adjust the fuel supply as required to maintain the set speed.

During speed control operation, the ECM controls vehicle speed by adjusting fuel injection duration and timing. When the accelerator pedal is pressed with speed control active, the ECM outputs a calculated throttle angle signal in place of the actual throttle angle signals produced by the APP sensor. The calculated throttle angle is derived from fuel demand.

The minimum set speed for speed control is 20 mph (32 km/h). Speed control is automatically suspended if the following conditions apply:

- Vehicle speed falls below 20 mph (32 km/h).
- The brake pedal is pressed
- The cancel button is pressed
- Neutral, park or reverse gear is selected
- Certain Terrain Modes are selected (i.e. Rock crawl)
- Low range gear selected
- The difference between actual speed and the set speed is too great
- When the vehicle speed reaches a maximum speed of 150 mph (240 kph)
- If the accelerator pedal is used to accelerate beyond the set speed for too long
- Stability control system intervention
- System error causes shut-off.

Removal and Installation

Removal

- WARNINGS:

 To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

 Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

 To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

 To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

 To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

 Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

 Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

- NOTE: Removal steps in this procedure may contain installation details.

1. Make the air bag supplemental restraint system (SRS) safe.

Refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).

2. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

3. Refer to: [Driver Air Bag Module](#) (501-20B Supplemental Restraint System, Removal and Installation).

4. Torque: 1.5 Nm

5.

SPEED CONTROL

The speed control system is integrated with the engine management system and uses fuelling intervention to automatically maintain a set vehicle speed. Once engaged, the system can also be used to accelerate the vehicle without using the accelerator pedal. The speed control system comprises the following components:

- Suspend switch/Resume
- '+' and '-' (set/accelerate and decelerate)
- Resume switch
- Clock spring
- Speed control warning lamp (in the instrument cluster)

The speed control system also uses inputs from the brake pedal switch, the APP sensor, the ECM and the ABS control module.

The speed control is operated by the driver using only the steering wheel switches. When speed is active, the ECM regulates the engine torque to maintain the set speed.

CONTROL SWITCHES

E47030

Item	Part Number	Description
1	-	Suspend/Resume switch
2	-	Accelerate/Decelerate (+/-) Switches
3	-	Active cruise control time gap switches
4	-	Clock spring
5	-	Wiper control column switch

The speed control switches are located on the LH side of the steering wheel. The switches are connected via fly leads directly to the clock spring. All of the speed control switches are non-latching momentary rocker switches. The minimum set speed for speed control is 18 mph (30 km/h). Speed control is automatically suspended if the vehicle speed falls below 15 mph (24 km/h).

The speed control switches are resistive ladder type switches. There are three switches associated with speed control, two of which are for active speed control (where specified). The switches vary the resistance of a signal voltage sent to the ECM. The switches receive a 5 volt reference supply which is varied in response to which switches are pressed.

Suspend/Resume Switch

The suspend/resume switch controls the selection of speed control. When the ignition is in position II, a press of the suspend switch will activate the suspend mode which temporarily switches off the speed control system, but retains the previously set speed in the ECM memory.

Resume Switch

The resume switch re-activates the previously set speed after the speed control has been suspended by pressing the suspend switch or by depressing the brake pedal.

Accelerate/Decelerate (+/-) Switches

When the speed control system is active, pressing the '+' switch set the controlled speed to the current road speed of the vehicle. Subsequent momentary presses of the switch increase the set road speed by 0.6 mph (1 km/h) with each press. If the switch is pressed and held the road speed will continue to increase until the switch is released. Momentarily pressing the '-' switch, decreases the set speed by 0.6 mph (1 km/h) with each press. If the switch is pressed and held, the set speed is decreased until the switch is released.

6	-	Engine Control Module (ECM)
7	-	Electric throttle
8	-	Transfer box control module

GENERAL

The speed control system maintains a set speed selected by the driver until operation is suspended or cancelled by a further input from the driver and is controlled by the Engine Control Module (ECM).

The system has the following components:

- A set + switch
- A - switch

- A RESUME switch
- A CANCEL switch.

The system uses the following vehicle systems:

- The ECM
- The brake switch
- The Accelerator Pedal Position (APP) sensor.

DESCRIPTION

Speed Control Switches

E124128

Item	Part Number	Description
1	-	Set '+' increase the speed
2	-	Decrease '-' the speed
3	-	Resume set speed
4	-	Cancels without erasing memorized speed

Instrument Cluster Warning Indicator

E124129

Item	Part Number	Description
1	-	Speed control warning indicator

The speed control switches are located on the Left Hand (LH) side of the steering wheel. The switches are connected via fly leads to the clock spring. The speed control switches are resistive ladder type switches which vary the resistance of a 5 volt signal sent to them. The signal is returned along a Local Interconnect Network (LIN) bus to the instrument cluster. The instrument cluster routes the control signals to the Engine Control Module (ECM) on the high speed Controller Area Network (CAN) bus.

Speed control is engaged by pressing the set/increase switch. Once engaged the speed can be varied by the speed adjustment switches. Each press of the speed adjustment switches (+/-) will increase or decrease the set speed in steps of 1 mph (2 kph).

Accelerate/Decelerate (+/-) Switches

The Set + switch is used to activate the speed control system and set the speed control at the current vehicle speed. A speed control warning indicator will illuminate on the instrument cluster to advise the driver that the system is active. The switch can be pressed to adjust the set speed. Each single press of the switch increases the vehicle speed by 1 mph (2 km/h). If the switch is pressed and held the vehicle speed will increase and the once the switch is released the attained vehicle speed will be maintained.

The vehicle speed can be increased by using the accelerator pedal. When the accelerator pedal is released the vehicle speed will reduce to the previously set speed. When the vehicle speed is increased by use of the accelerator pedal, the message 'Cruise Override' will be displayed in the instrument cluster message center. This method can also be used to increase the vehicle set speed; once the required increase in speed is achieved, a single press of the Set + switch will maintain that speed as the new set speed.

- **NOTE: If the accelerator pedal is pressed for more than 5 minutes, the speed control is cancelled.**

The '-' switch can be used to decrease the vehicle set speed. The speed can be reduced by pressing and holding the switch until the required set speed is reached. When the switch is released the current speed will become the new set speed. A single press of the '-' switch will decrease the vehicle speed by 1 mph (2 km/h).

Cancel Switch

Speed control can be suspended temporarily or switched off by a single press of the Cancel switch. When the switch is pressed the speed control warning indicator in the instrument cluster is extinguished and the message 'Cruise Cancelled' is displayed in the message center.

Speed control can also be suspended if the brake pedal is pressed, if the transmission selector lever is moved to the neutral position or if Hill Descent Control (HDC) or Dynamic Stability Control (DSC) become active.

Once suspended, the cruise control can be resumed at the previously set speed by pressing the resume switch.

- **NOTE: The set speed is not removed from the memory when the cancel switch is pressed. The set speed is only erased when the ignition is off.**

Resume Switch

The resume speed is used to re-activate the speed control system at the previously set speed after the speed control has been cancelled or suspended.

OPERATION

Speed Control

The speed control system is integrated with the engine management system and uses fueling intervention to automatically maintain a set vehicle speed. Once engaged, the system can also be used to accelerate the vehicle without using the accelerator pedal. The speed control system comprises the following components:

- '+' and '-' (set/accelerate and decelerate) steering wheel switches
- Resume switch
- Cancel switch
- Clock spring
- Speed control warning lamp.

The speed control system also uses inputs from the brake pedal switch, the APP sensor, the ECM and the ABS module.

The speed control is operated by the driver using only the steering wheel switches. When speed control is active, the ECM regulates the Pulse Width Modulation (PWM) signals to the fuel injectors to adjust the fuel supply as required to maintain the set speed.

During speed control operation, the ECM controls vehicle speed by adjusting fuel injection duration and timing. When the accelerator pedal is pressed with speed control active, the ECM outputs a calculated throttle angle signal in place of the actual throttle angle signals produced by the APP sensor. The calculated throttle angle is derived from fuel demand.

The minimum set speed for speed control is 20 mph (32 km/h). Speed control is automatically suspended if the following conditions apply:

- Vehicle speed falls below 20 mph (32 km/h).
- The brake pedal is pressed
- The cancel button is pressed
- Neutral, park or reverse gear is selected
- The difference between actual speed and the set speed is too great
- When the vehicle speed reaches a maximum speed of 150 mph (240 kph)
- If the accelerator pedal is used to accelerate beyond the set speed for too long
- Stability control system intervention
- System error causes shut-off.

Removal and Installation

Removal

- WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

- NOTE: Removal steps in this procedure may contain installation details.

1. Make the air bag supplemental restraint system (SRS) safe.

Refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).

2. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

3. Refer to: [Driver Air Bag Module](#) (501-20B Supplemental Restraint System, Removal and Installation).

4. Torque: 1.5 Nm

5.

 Control Components (412-04 Control Components, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Coolant level ● Air vents (contaminated/blocked) ● Auxiliary drive belt condition and tension ● Air conditioning compressor 	<ul style="list-style-type: none"> ● Fuses ● Harnesses ● Electrical connector(s) ● Relays ● Control module(s) ● Control panel(s) ● Air conditioning compressor

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Distribution motor self-test

The motor and flap operation can be checked using the on-board distribution motor self-test function.

The self-test can be initiated by pressing and holding the **ECON** and **RECIRC** buttons while turning the ignition switch to the **ON** position.

The control module will then compare the current motor position with the values stored in the module and will indicate an error by flashing the **ECON** LED (light emitting diode).

If there are no errors, the LED will go out and the system will function normally.

To confirm that there are no errors, turn the ignition switch to the **OFF** position, then back to the **ON** position.

Observe the operation of the **programmed defrost** LED.

If there are errors present, the **programmed defrost** LED will flash and the system will attempt to calibrate itself.

Symptom Chart

Symptom	Possible Causes	Action
No climate control function, flashing LED at start-up	<ul style="list-style-type: none"> ● The system is in calibration mode 	Check the motors and levers at the heating and ventilation assembly for damage/foreign objects jamming the movement of the flaps. Climate Control System - General Information - Air Conditioning (A/C) System Recovery, Evacuation and Charging

General Procedures

WARNING: Servicing must be carried out by personnel familiar with both vehicle system and the charging and testing equipment. All operations must be carried out in a well ventilated area away from open flame and heat sources.

• **NOTE:** The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure); the system is leaking and refrigerant has been lost to atmosphere; refrigerant circuit has been open more than 24 hours due to repair.

1. Refrigerant recovery: Remove the dust covers from the high and low pressure connections.

2. Connect the high and low pressure lines to the appropriate connections.
3. Open the valves on the connections.
4. Turn the valves on the station to the correct positions.
5. Turn the process switch to the correct position.
6. Turn the main switch to 'ON'.

7. WARNING: Refrigerant must always be recycled before re-use to ensure that the purity of the refrigerants high enough for safe use in the air conditioning system. Recycling should always be carried out with equipment which is design certified by Underwriter Laboratory Inc. for compliance with SEA J1991. Other equipment may not recycle refrigerant to the required level of purity. R143a Refrigerant Recover Recycling Recharging station must not be used with any other type of refrigerant. Refrigerant R134a from domestic and commercial sources must not be used in motor vehicles air conditioning systems.

Allow the system to recover the refrigerant from the system.

8. Close the valves on the refrigerant station.
9. Turn the main switch 'OFF'.
10. Close the valves on the connections.
11. Disconnect the high and low pressure connections.
12. Install the dust covers to the connectors.
13. Open the tap at the rear of the station to drain the refrigerant oil.
14. Measure and record the quantity of refrigerant oil recovered from the system.
15. Close the tap at the rear of the station.
16. **Evacuation:** Remove the dust covers from the high and low pressure connections.
17. Connect the high and low pressure lines to the appropriate connections.
18. Open the valves on the connections.
19. Turn the valves on the station to the correct positions.
20. Turn the process switch to the correct position.
21. Turn the main switch to 'ON'.
22. Allow the station to evacuate the A/C system.

23.  CAUTION: The system must be evacuated immediately before recharging commences. Delay between evacuation and recharging is not permitted

Recharging: Close the valves on the refrigerant station.

24. Close the valve on the oil charger.
25. Disconnect the yellow line from the refrigerant station.
26. Remove the cover from the oil charger.
27. Pour the correct quantity of refrigerant oil into the oil charger.
28. Install the cover to the oil charger.
29. Connect the yellow line to the refrigerant station.
30. Open the valve on the oil charger.
31. Move the pointer on the refrigerant gauge to mark the position of the refrigerant drop.
32. Slowly open the correct valve on the refrigerant to allow the vacuum to pull the refrigerant into the system.
33. Close the valve on the refrigerant station when the correct amount of refrigerant has been drawn into the air conditioning system.
34. Turn the main switch 'OFF'.
35. Close the valves on the connections.
36. Disconnect the high and low pressure connections.

Air Distribution and Filtering - Air Distribution and Filtering

Description and Operation

16	-	Windshield duct

GENERAL

The air distribution and filtering system controls the distribution and quality of air supplied to the vehicle interior. The system consists of:

- Air ducts.
- Air registers and vents.
- A cabin air filter.

AIR DUCTS

The air ducts distribute the air from the heater to the various registers and air vents around the vehicle interior. The air ducts for the instrument panel registers, the driver lap register and the second row registers are connected to the heater outlet manifold on top of the heater. The air ducts for the front and second row footwells are connected direct to outlet ports on the heater. The air ducts for the windshield vents and the side window vents form part of the structure of the instrument panel.

AIR REGISTERS AND VENTS

The air registers allow occupants to control the flow and direction of air from the air ducts. The driver lap register has moveable vanes to regulate the flow and direction of the air. The instrument panel and second row registers each have a thumbwheel to regulate flow, and moveable vanes to control direction.

The air vents are fixed outlets either integrated into the end of the air duct or installed in the trim panel connected to the air duct.

CABIN AIR FILTER

E47042

The cabin air filter is installed in the air inlet duct and is either a pollen filter or a pollen and odor filter. The pollen filter removes particulates, and the pollen and odor filter removes particulates and unpleasant odors, from the fresh and recirculated air entering the blower.

Air Distribution and Filtering - Driver Side Register Trim Panel

Removal and Installation

Removal

1. Remove the driver side register trim panel.

- Release the 2 clips.
- Disconnect the electrical connector.

E53866

2. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the register.

- Release the 4 clips.

E53867

3. Remove the headlamp switch.

- Remove the 4 Torx screws.

E49996

Installation

1. Install the headlamp switch.

- Tighten the Torx screws.

2. Install the register.

- Secure with the clips.

3. Install the driver side register trim panel.

- Connect the electrical connector.
- Secure with the clips.

Air Distribution and Filtering - Passenger Side Register Trim Panel

Removal and Installation

Removal

1. Remove the passenger side register trim panel.

- Release the 2 clips.

E49996

2. NOTE: Do not disassemble further if the component is removed for access only.

Remove the register.

- Release the 4 clips.

E53870

3. Remove the cup holder.

- Remove the 4 Torx screws.

E49997

Installation

1. Install the cup holder.

- Tighten the Torx screws.

2. Install the register.

- Secure with the clips.

3. Install the passenger side register trim panel.

- Secure with the clips.

Air Distribution and Filtering - Pollen Filter

Removal and Installation

Removal

1. Open the glove compartment to the service condition.

- Release the glove compartment latch stops.

E44782

2. Remove the pollen filter housing cover.

E44783

3. Remove the pollen filter.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.

Air Distribution and Filtering - Plenum Chamber

Removal and Installation

Removal

1. Remove the A-pillar mouldings.
For additional information, refer to: [A-Pillar Moulding LH](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
2. Remove the windshield wiper arms.
For additional information, refer to: [Front Wiper Pivot Arm](#) (501-16 Wipers and Washers, Removal and Installation).
3. Release the hood seal from the plenum chamber.

4. Remove the plenum chamber panel.

- Release the 8 clips.

5. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the clips from the plenum chamber panel.

Installation

1. To install, reverse the removal procedure.

Heating and Ventilation - Heating and Ventilation

Description and Operation

COMPONENT LOCATIONS

- NOTE: right-hand drive (RHD) installation shown, left-hand drive (LHD) similar

E47348

Item	Part Number	Description
1	-	Blower relay
2	-	Blower control module
3	-	Blower

4	-	Air inlet duct
5	-	Heater
6	-	Ventilation outlets

GENERAL

The heating and ventilation system controls the temperature and flow of air supplied to the vehicle interior. The system consists of:

- An air inlet duct.
- A blower.
- A blower control module.
- A blower relay.
- A heater.
- Two ventilation outlets.

Fresh or recirculated air flows into the heater assembly from the inlet duct. The blower, and ram effect when the vehicle is moving, forces the air through the heater assembly. Air from the cabin exhausts through the ventilation outlets.

AIR INLET DUCT

- NOTE: RHD version shown, LHD mirror image

E47349

Item	Part Number	Description
1	-	Recirculation door motor
2	-	Recirculation door arm
3	-	Recirculation motor arm
4	-	Evaporator drain tube
5	-	Blower
6	-	Air inlet duct
7	-	Recirculation air inlet

The air inlet duct is installed behind the instrument panel, on the front passenger side, and connected between the plenum chamber below the windshield and the heater.

The plenum chamber is formed by the upper and lower cowl and a plenum molding. Grilles in the plenum molding allow fresh air into the plenum chamber. From the plenum chamber, the air passes through a water separator and into the fresh air inlet of the air inlet duct.

The air inlet duct incorporates a grille to provide the inlet for recirculated air from the vehicle interior. The air inlet duct also accommodates:

- The cabin air filter.
For additional information, refer to: [Air Distribution and Filtering](#) (412-01 Air Distribution and Filtering, Description and Operation).
- The blower.
- The blower control module.

The outlet from the air inlet duct forms the rear wall of the heater, enclosing the evaporator and incorporating the two evaporator drain outlets. Drain tubes connect the evaporator drain outlets to the transmission tunnel, to direct the water that condenses on the evaporator overboard.

A recirculation door is installed between the fresh and recirculated air inlets, to control the source of incoming air. A lever on the recirculation door is driven by the recirculation door motor. Operation of the recirculation door motor is automatically controlled by the automatic temperature control (ATC) module and manually controlled by a switch on the ATC module control panel.

For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

Fresh or recirculated air enters the air inlet duct and passes through the cabin air filter to the hub of the blower. From the blower, the air flows to the outlet of the air inlet duct and into the heater. The blower, and ram effect from the forward motion of the vehicle, forces the air through the air inlet duct.

Air Flow Through Air Inlet Duct

E47350

Item	Part Number	Description
1	-	Upper cowl
2	-	Water separator
3	-	Recirculation door
4	-	Cabin air filter
5	-	Blower
6	-	Air inlet duct casing
7	-	Lower cowl
8	-	Plenum molding

BLOWER

The blower is installed in the air inlet duct, below the cabin air filter, and consists of an open hub, centrifugal fan powered by an electric motor. Operation of the blower is controlled by the ATC module, using the blower relay in the battery junction box (BJB) and the blower control module. The blower control module is installed in the air inlet duct downstream of the blower, where any heat generated during operation is dissipated by the air flow. A wiring harness on the air inlet duct connects the recirculation door motor, blower and blower control module to the vehicle wiring.

When the blower is required, the ATC module energizes the coil of the blower relay. The energized blower relay supplies battery power to the blower motor, which is connected to ground through the blower control module. The speed of the blower is controlled by the blower control module, which regulates the blower motor voltage in response to a pulse width modulation (PWM) signal from the ATC module. To vary the blower motor voltage the ATC module varies the duty cycle of the PWM signal.

When the blower is in the automatic mode the ATC module determines the blower speed required from the comfort algorithms. When the blower is in the manual mode, the ATC module operates the blower at one of seven fixed speeds as selected on the control panel.

For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

HEATER

• NOTE: RHD unit shown, LHD units similar

E47351

Item	Part Number	Description
1	-	Coolant outlet pipe
2	-	Coolant inlet pipe
3	-	Windshield distribution door motor
4	-	right-hand (RH) temperature blend motor
5	-	Heater core
6	-	Heater casing
7	-	left-hand (LH) temperature blend motor (automatic system only)
8	-	Evaporator
9	-	Face and feet distribution door motor

The heater controls the temperature of the air supplied to the distribution ducts, as directed by the ATC module. The heater is installed on the vehicle center-line, between the instrument panel and the engine bulkhead. The heater consists of a casing, formed from a series of plastic molding, which contains an evaporator, heater core and control doors. Internal passages integrated into the casing guide the air through the casing and separate it into two flows, one for the LH outlets and one for the RH outlets.

When the air conditioning (A/C) system is operating, the evaporator cools the air entering the heater.

The heater core provides the heat source to warm the air being supplied to the distribution ducts. The heater core is an aluminum two pass, fin and tube heat exchanger, installed across the width of the heater housing. Two aluminum tubes attached to the heater core extend through the engine bulkhead to connect with the engine cooling system. When the engine is running, coolant is constantly circulated through the heater matrix by the coolant pump. On vehicles with a FFBH (fuel fired booster heater), when the FFBH is active the coolant flow is assisted by an electric circulation pump. For additional information, refer to: [Auxiliary Heater](#) (412-02B Auxiliary Heating, Description and Operation).

Two temperature blend doors, one LH and one RH, regulate the flow of air through the heater core to control the temperature of the air leaving the heater. On the automatic system, the two temperature blend doors operate independently to allow different temperatures to be set for the LH and RH outlets. On the manual system, the temperature blend doors are coupled together and produce a common temperature for the LH and RH outlets.

Air Flow Through Heater

E47352

Item	Part Number	Description
1	-	Windshield distribution door
2	-	Face and feet distribution door
3	-	Heater casing
4	-	Front footwell outlet
5	-	Rear footwell outlet
6	-	Heater core
7	-	Temperature blend door
8	-	Air inlet duct casing
9	-	Evaporator

Stepper Motors

On the automatic system, separate stepper motors operate the RH and the LH side temperature blend doors. On the manual system, a single stepper motor operates both the RH and the LH temperature blend doors.

The distribution doors in the heater are also operated by stepper motors. One for the windshield distribution door and one for the face and feet distribution door.

If a stepper motor is to be replaced, ensure it is replaced with the correct replacement part. Although similar in appearance, each of the stepper motors is different and faults will occur if an incorrect motor is fitted.

Operation of the distribution and temperature blend door stepper motors is controlled by the ATC module, which is connected to the stepper motors by a LIN (local interconnect network) bus.

All of the stepper motors contain microprocessors, which store positional information. To enable the ATC module to move the stepper motors correctly it requires the following information:

- The travel range, end to end, of each motor.
- Where each motor is on its range.

Approximately 2 minutes after the vehicle ignition is switched off, the climate control system powers down. At this point, the ATC module stores the position of each stepper motor in its memory. Each of the stepper motors also stores its own position in its memory. When the Ignition is next switched on, all of the stepper motors send positional information to the ATC module via the LIN bus. This information is compared with the positional information stored within the ATC module memory.

In normal circumstances, the information sent by the stepper motors matches that held in the ATC module memory. In this instance, the ATC module recognizes there are no problems with the system and starts normally. If however, there are differences, the ATC module carries out a calibration routine.

The stepper motor calibration routine will normally take about 15 seconds to complete, but can take up to approximately 2 minutes in certain circumstances. During this period:

- The programmed de-frost light emitting diode (LED) on the ATC module panel will flash.
- All other climate control operations will be suspended.

The programmed de-frost LED will stop flashing after 2 minutes, regardless of whether the exercise was successful or not

so it is important to check that calibration has been carried out successfully. To do this:

- Switch the ignition off.
- Switch the ignition back on.
- Check for a flashing programmed de-frost LED.

If calibration has been successful, the programmed de-frost LED will not flash and the system will return to normal operation. If flashing does occur, more investigation will be required .

Automatic Calibration: The ATC module will automatically initiate a calibration routine every 175 hours of vehicle life. This occurs approximately 1 minute after the ignition has been switched off once 175 hours is reached. In this instance, the programmed de-frost LED will not blink.

Forced Calibration: The ATC module can be manually forced to carry out a calibration routine on the stepper motors. This can be carried out by holding down the ECON and recirculation buttons on the ATC module panel while simultaneously switching the ignition on. The ATC module will now carry out a calibration routine on the stepper motors, but will flash the ECON LED rather than the programmed de-frost LED.

Stepper Motor Diagnostics

Fault diagnosis on the heater stepper motors falls into two main groups:

- Electrical fault: A diagnostic trouble code (DTC) will be raised and logged in the ATC module memory.
- Mechanical fault: The programmed de-frost LED will blink to indicate the ATC module is attempting to carry out a calibration routine.

A calibration routine will be initiated by the ATC module if any of the following occur:

- One or more of the stepper motors is replaced.
- The ATC module is replaced.
- A foreign object enters the system and causes a stepper motor to stall.

Stepper motor related DTCs are stored in the ATC module memory and can be retrieved using T4. For additional information, refer to: [Climate Control System](#) (412-00 Climate Control System - General Information, Diagnosis and Testing).

VENTILATION OUTLETS

The ventilation outlets promote the free flow of air through the passenger compartment. The outlets are installed in the LH and RH rear quarter body panels, behind the tail lamps.

Each ventilation outlet consists of a grille covered by soft rubber flaps and is effectively a non-return valve. The flaps open and close automatically depending on the differential between cabin and outside air pressures.

Heating and Ventilation - Heating and Ventilation

Diagnosis and Testing

Principles of Operation

For a detailed description of the heating and ventilation system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Heating and Ventilation](#) (412-02A Heating and Ventilation, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Auxiliary Heating - Auxiliary Heater

Description and Operation

COMPONENT LOCATIONS

E43568

Item	Part Number	Description
1	-	Fuel line connection with fuel tank
2	-	Auxiliary fuel pump
3	-	FFBH (fuel fired booster heater)

GENERAL

Auxiliary heating is provided by a FFBH, which boosts the temperature of the coolant supplied to the heater from the engine. Fuel for the FFBH is taken from the vehicle fuel tank, through a fuel line attached to the fuel pump module. An auxiliary fuel pump supplies the fuel at low pressure to the FFBH. In the FFBH, the fuel is burned and the resultant heat output is used to heat the engine coolant.

Operation of the FFBH is enabled and disabled by the automatic temperature control (ATC) module.

AUXILIARY FUEL PUMP

The auxiliary fuel pump regulates the fuel supply to the FFBH. The pump is installed in a rubber mounting attached to the chassis, below the right-hand (RH) front seat. The pump is a self-priming, solenoid operated plunger pump, controlled by a pulse width modulation (PWM) signal from the control module in the FFBH. When the pump is de-energized, it provides a positive shut-off of the fuel supply.

Sectioned View of Auxiliary Fuel Pump

E43569

Item	Part Number	Description
1	-	Fuel line connector
2	-	Non return valve
3	-	Solenoid coil
4	-	Plunger
5	-	Filter insert
6	-	Fuel line connector
7	-	O-ring seal
8	-	Spring
9	-	Piston
10	-	Bush

The solenoid coil of the auxiliary fuel pump is installed around a housing which contains a plunger and piston. The piston locates in a bush, and a spring is installed on the piston between the bush and the plunger. A filter insert and a fuel line connector are installed in the inlet end of the housing. A non return valve and a fuel line connector are installed in the fuel outlet end of the housing.

While the solenoid coil is de-energized, the spring holds the piston and plunger in the closed position at the inlet end of the housing. An O-ring seal on the plunger provides a fuel tight seal between the plunger and the filter insert, preventing any flow through the pump. When the solenoid coil is energized, the piston and plunger move towards the outlet end of the housing, until the plunger contacts the bush; fuel is then drawn in through the inlet connection and filter. The initial movement of the piston also closes transverse drillings in the bush and isolates the pumping chamber at the outlet end of the housing. Subsequent movement of the piston then forces fuel from the pumping chamber through the non return valve and into the line to the FFBH. When the solenoid de-energizes, the spring moves the piston and plunger back towards the closed position. As the piston and plunger move towards the closed position, fuel flows past the plunger and through the annular gaps and transverse holes in the bush to replenish the pumping chamber.

FFBH

E43570

Item	Part Number	Description
1	-	Electrical connectors
2	-	Air inlet muffler
3	-	Exhaust pipe
4	-	Coolant outlet connection
5	-	Coolant inlet connection
6	-	Exhaust muffler
7	-	Fuel supply line

The FFBH is installed in the front left corner of the engine compartment. It is connected in series with the coolant supply to the heater assembly. Two electrical connectors on the FFBH connect it to the vehicle wiring.

The FFBH unit consists of:

- A circulation pump.
- A combustion air fan.
- A burner housing.
- A heat exchanger.
- An air inlet hose and muffler.
- An exhaust pipe and muffler.
- A control module.

Sectioned View of FFBH

E43571

Item	Part Number	Description
1	-	Combustion air fan
2	-	Coolant outlet
3	-	Coolant inlet
4	-	Burner insert
5	-	Heat exchanger
6	-	Temperature sensor
7	-	Exhaust
8	-	Fuel inlet
9	-	Evaporator
10	-	Air inlet

Remote Handset

Remote Handset Pairing

Each remote handset must be 'paired' to the receiver to enable communications. Each handset has a unique identification number which is stored by the receiver. The receiver can store up to 3 handset identification numbers. If a fourth handset is paired to the receiver, the receiver will replace the first paired handset number with that for the fourth handset in the receiver memory. Subsequently, the first paired handset will no longer be paired and will not be recognized by the receiver.

The following procedure details the pairing process:

• **NOTE:** The pairing process relies on the FFBH receiver having the power supply removed and then the power supply re-instated. The fuse method is the easiest method but it can also be achieved by battery disconnection or removal of the harness connector from the receiver unit.

- Remove minifuse F2 5A (telestart fuse) from the [BJB \(battery junction box\)](#)
- Wait for a minimum of 5 seconds
- Replace fuse to position F2 5A in the [BJB](#)
- Within 5 seconds of replacing the fuse (and restoring the receiver power supply), press and hold the remote handset OFF button
- Confirmation of successful pairing is displayed by the remote handset [LED \(light emitting diode\)](#) illuminating in a red color for 2 seconds.

Circulation Pump

The circulation pump is installed at the coolant inlet to the FFBH to assist the coolant flow through the FFBH and the vehicle heater core. The circulation pump runs continuously while the FFBH is in standby or active operating modes. While the FFBH is inactive, coolant flow is reliant on the engine coolant pump. Operation of the circulation pump is controlled by a power feed direct from the control module.

Combustion Air Fan

The combustion air fan regulates the flow of air into the FFBH to support combustion of the fuel supplied by the auxiliary fuel pump and to purge and cool the FFBH.

Burner Housing

The burner housing contains the burner insert and also incorporates connections for the exhaust pipe, the coolant inlet from the circulation pump and the coolant outlet to the vehicle heater core.

The burner insert incorporates the fuel combustion chamber, an evaporator and a glow pin and flame sensor. Fuel from the auxiliary fuel pump is supplied to a venturi, where it evaporates and enters the combustion chamber to mix with air from the combustion air fan. The glow pin and flame sensor provides the ignition source of the fuel:air mixture and, once combustion is established, monitors the flame.

Heat Exchanger

The heat exchanger transfers heat generated by combustion to the coolant. Two sensors are installed in the heat exchanger casing to provide the control module with inputs of coolant temperature. The control module uses the temperature inputs to control system operation.

Air Inlet Hose and Muffler

A canister type muffler is included in the air inlet supply line. The muffler reduces the noise caused by induction roar.

Exhaust Pipe and Muffler

The exhaust pipe and muffler directs exhaust combustion gases to atmosphere below the front left corner of the engine. Exhaust vapor may be visible when the FFBH is running, depending on atmospheric conditions.

Control Module

The control module controls and monitors operation of the FFBH system. An internal flow of air from the combustion air fan ventilates the control module to prevent it overheating.

The control module communicates with other systems on the vehicle over the medium speed Controller Area Network (CAN) bus.

Pin No.	Description	Input/Output
1	Permanent battery power supply	Input
2	Ground	Output

Operation of the FFBH is controlled by a status message from the ATC module to the control module. A similar status message, from the control module to the ATC module, advises the ATC module of the current operating status of the FFBH.

While the engine is running, if the ambient air temperature is less than 9 °C (48 °F) and the engine coolant temperature (ECT) is less than 75 °C (167 °F) the ATC module changes the status message from 'heater off' to 'supplemental heat'. The control module then changes the status message it sends the ATC module to 'supplemental heat' and starts the FFBH. The control module will not start the FFBH, or will discontinue operation, if any of the following occur:

- The control module is in the error lockout mode (see Diagnostics, below).
- A crash message is received from the restraints control module (RCM). For additional information, refer to: Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (descop 501-20B).
- A low fuel level message is received from the instrument cluster. For additional information, refer to: Information and Message Center (descop 413-08).
- The engine is not running, or stops running for approximately 4 seconds. The time delay is included for stall protection.

If the control module does not start the FFBH, or discontinues operation, the status message to the ATC module remains at, or changes to, 'heater off'. If the ambient air temperature increases to 9 °C (48 °F), or the ECT increases to 75 °C (167 °F), the ATC module cancels supplementary heating, by changing the status message to the control module back to 'heater off'. The control module then cancels FFBH operation and changes the status message to the ATC module to 'heater off'.

The FFBH is controlled at one of two heat output levels, 2.8 kW at part load combustion and 5 kW at full load combustion. The control module transmits the amount of fuel used by the FFBH to the instrument cluster, and the FFBH coolant temperature to the ATC module.

Start Sequence: At the beginning of a start sequence, the control module energizes the glow pin function of the glow pin and flame sensor, to pre heat the combustion chamber, starts the combustion air fan at slow speed and energizes the coolant circulation pump. After approximately 30 seconds, the control module energizes the auxiliary fuel pump at the starting sequence speed. The fuel delivered by the auxiliary fuel pump evaporates in the combustion chamber, mixes with air from the combustion air fan and is ignited by the glow pin and flame sensor. The control module then progressively increases the speed of the auxiliary fuel pump and the combustion air fan. Once combustion is established the control module switches the glow pin and flame sensor from the glow pin function to the flame sensing function to monitor combustion. From the beginning of the start sequence to stable combustion at full load takes approximately 150 seconds.

Coolant Temperature Control: While the FFBH is running, the control module cycles the FFBH between full load combustion, part load combustion and a control idle phase of operation, depending on the temperature of the coolant in the heat exchanger.

Switching Point Diagram

E56856

Switching Point		Temperature, °C (°F)
Figure Item No.	Description	
1	Full load to part load	87 (188)
2	Part load to control idle	90 (194)

Switching Point		Temperature, °C (°F)
Figure Item No.	Description	
3	Control idle to part load	79 (174)
4	Part load to full load	76 (168)

After the start sequence, the control module maintains full load combustion until the coolant temperature reaches switching point temperature 1. At this temperature, the control module decreases the speed of the auxiliary fuel pump and the combustion air fan to half speed, to produce part load combustion. The control module maintains part load combustion while the coolant temperature remains between switching point temperatures 2 and 4. At part load combustion the temperature of the coolant will increase or decrease depending on the amount of heat required to heat the vehicle interior. If the coolant temperature decreases to switching point temperature 4, the control module increases the speed of the auxiliary fuel pump and the combustion air fan to full speed, to return to full load combustion. If the coolant temperature increases to switching point temperature 2, the control module enters a control idle phase of operation.

On entering the control idle phase, the control module immediately switches the auxiliary fuel pump off, to stop combustion, and starts a timer for the combustion air fan. After a 2 minute cool down period, the control module switches the combustion air fan off and then remains in the control idle phase while the coolant temperature remains above switching point temperature 3. If the coolant temperature decreases to switching point temperature 3, the control module initiates a start to part load combustion. A start to part load combustion takes approximately 90 seconds.

In order to limit the build up of carbon deposits on the glow pin and flame sensor, the control module also enters the control idle phase if continuous combustion time exceeds 72 minutes (at part load, full load or a combination of both). After the cool down period, if the coolant is still in the temperature range that requires additional heat, the control module restarts the FFBH.

Shutdown: To stop the FFBH, the control module de-energizes the auxiliary fuel pump to stop combustion, but continues operation of the combustion air fan and the circulation pump for a time, to cool down the FFBH. The cool down time is 100 seconds if the FFBH was operating at part load combustion and 175 seconds if the FFBH was operating at full load combustion.

Diagnostics

The control module monitors the FFBH system for faults. Any faults detected are stored in a volatile memory in the control module, which can be interrogated by T4 via the medium speed CAN bus. A maximum of three faults and associated freeze frame data can be stored at any one time. If a further fault is detected, the oldest fault is overwritten by the new fault.

The control module also incorporates an error lockout mode of operation that inhibits operation to prevent serious faults from causing further damage to the system. In the error lockout mode, the control module immediately stops the auxiliary fuel pump, and stops the combustion air fan and circulation pump after a cool down time of approximately 2 minutes. Error lockout occurs for start sequence failures, combustion flameouts, heat exchanger casing overheat and if battery voltage is out of limits. The error lockout mode can be cleared using T4, or by disconnecting the battery power supply (connector C0926) for a minimum of 10 seconds.

Start Failure and Flameout: If a start sequence fails to establish combustion, or a flameout occurs after combustion is established, the control module immediately initiates another start sequence. The start failure or flameout is also recorded by an event timer in the control module. The event timer is increased by one after each start failure or flameout, and decreased by one if a subsequent start is successful. If the event timer increases to three (over any number of drive cycles), the control module enters the error lockout mode.

Heat Exchanger Casing Overheat: To protect the system from excessive temperatures, the control module enters the error lockout mode if the heat exchanger coolant temperature exceeds 125 °C (257 °F).

Battery Voltage Limits: 10.25 - 15.5 volts.

Auxiliary Heating - Fuel Fired Booster Heater

Diagnosis and Testing

Principles of Operation

For a detailed description of the fuel fired booster heater system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Auxiliary Heater](#) (412-02B Auxiliary Heating, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Fuel fired heater assembly <ul style="list-style-type: none"> - Coolant inlet/outlet - Exhaust - Fuel inlet - Air inlet ● Auxiliary fuel pump and lines ● Auxiliary coolant pump 	<ul style="list-style-type: none"> ● Fuses ● Harnesses ● Electrical connector(s) ● Control module(s)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Fuel Fired Booster Heater Module \(AHCM\)](#) (100-00 General Information, Description and Operation).

Auxiliary Heating - Auxiliary Heater Remote Transmitter Programming

General Procedures

Activation

- NOTE: A second or third hand held transmitter can be programmed using this method.

E135001

1. NOTE: Use a coin or similar implement to remove and install the battery cover.

- NOTE: Make sure that correct battery polarity is maintained.

Remove and install the transmitter battery.

E134981

- 2.

3.

4. Remove fuse 2 (5 Amp) from the battery junction box (BJB).

5. **5. NOTE:** This completes the programming procedure.

Install fuse 2 (5 Amp), and within 5 seconds press the OFF button on the transmitter for at least 1 second.

6. To confirm whether the programming procedure has completed correctly, push the off button. If a continuous red light is displayed on the transmitter, the programming procedure was successful. If a flashing red light is displayed, the procedure was unsuccessful, or the transmitter is not in range. In this case, make sure the transmitter is within the recommended range and repeat the above procedure from step 4.

Auxiliary Heating - Fuel Fired Booster Heater TDV6 2.7L Diesel

Removal and Installation

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. NOTE: Wheel shown removed for clarity.

Carefully release the wheel arch liner, to allow access to the fuel fired burner heater (FFBH) exhaust clamp retaining bolt.

E131518

4. NOTE: Components removed for clarity.

Release the exhaust clamp.

E125162

6. Lower the vehicle.
5.  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.
7. Release the power steering fluid reservoir.

Disconnect the fuel fired booster heater fuel line.

- Release the clip.

E47753

E125164

8. Disconnect the fuel fired booster heater inlet and outlet coolant hoses.

- Clamp the hoses to minimise coolant loss.
- Release the 2 clips.

9. Remove the fuel fired booster heater.

- Disconnect the 2 electrical connectors.
- Remove the 3 bolts.
- Release the fuel pipe from the clip.

Installation

1. Install the fuel fired booster heater.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Connect the electrical connectors.
- Secure the fuel pipe in the clip.

2. Connect the fuel fired booster heater coolant hoses.

- Secure with the clips.
- Remove the clamps.

3. Connect the fuel fired booster heater fuel hose.

- Secure with the clip.

4. Raise the vehicle.

5. Tighten the exhaust clamp.

- Tighten to 10 Nm (7 lb.ft).

6. Secure the wheel arch liner.

- Install the two retaining screws.
- Install the clip.

7. Lower the vehicle.

8. Install the power steering fluid reservoir.

9. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

10. Connect exhaust extraction hoses to the tail pipes.

11. Remove the engine cover.

For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornamentation, Removal and

Installation).

12. Loosen the coolant expansion tank bleed screw.

13. Loosen the cylinder head bleed hose bleed screw.

14. Refill the cooling system.

15. Tighten the bleed screws to 14 Nm (10 lb.ft).

16. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank, until a steady stream of coolant is seen returning to the tank.

17. NOTE: When the coolant bleed is complete and prior to installing the expansion tank cap, top up the expansion tank to 30mm above the maximum level.

Install the coolant expansion tank cap.

18.  **WARNING:** Release the cooling system pressure by slowly turning the expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

Start and run the engine.

- Hold the engine speed at 3,000 RPM for one minute.
- Return the engine to idle for five minutes.
- Hold the engine speed at 3,000 RPM for one minute.
- Run the engine until the thermostat opens.
- Remove coolant expansion tank cap, allow float to settle and top-up coolant if required. Install cap.

19. Switch the engine off and allow to cool.

20. Install the engine cover.

For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

21. Check and top-up the coolant if required.

E46247

Auxiliary Heating - Fuel Fired Booster Heater TDV6 3.0L Diesel

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
 - NOTE: Some variation in the illustrations may occur, but the essential information is always correct.
1. Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. **NOTE:** Wheel shown removed for clarity.

- Carefully release the wheel arch liner, to allow access to the fuel fired burner heater (FFBH) exhaust clamp retaining bolt.

E131518

4.
 - NOTE: Components removed for clarity.

Torque: 10 Nm

E125162

5.

6.  CAUTION: Be prepared to collect escaping coolant.

- Clamp the hoses to minimize coolant loss.

7.

8.

9.  CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

10. Torque: 10 Nm

Installation

1. To install, reverse the removal procedure.

2. Refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3.

4.

5.

6. **6. CAUTIONS:**

 Anti-freeze concentration must be maintained at 50%.

 Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

7. **7.  CAUTION: Be prepared to collect escaping coolant.**

Fill the coolant expansion tank until coolant appears through the bleed ports.

8.

- Set the heater controls to maximum.

9.

- Start the engine and continue to fill the coolant until the maximum level is reached.

10. **10.  CAUTION: Be prepared to collect escaping coolant.**

Fill the coolant expansion tank until coolant appears through the bleed ports.

11. Increase engine speed to 2500rpm and cycle between this and idle.

12.

- Continue to top-up with coolant with the engine at idle.

13.  **CAUTION:** Correct installation of the Coolant expansion tank cap can be obtained by tightening the cap until an audible click is heard.

14. Allow the engine to idle, until hot air is emitted at the face registers.
15. Once the front heater is warm, check if the rear heater is warm (if equipped). If no heat is felt, increase the engine speed to 3000 rpm for 30 seconds and return to idle.

16.  **CAUTION:** Switch off the engine and allow the coolant temperature to go cold.

17. Visually check the engine and cooling system for signs of coolant leakage.

18.  **WARNING:** When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

• **CAUTIONS:**

 Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure

 Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

• **NOTE:** When the cooling system is warm, the coolant will be approximately 10mm above the upper level mark on the expansion tank with the cap removed.

Check and top-up the coolant if required.

19. Refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornammentation, Removal and Installation).

GENERAL

The A/C system transfers heat from the vehicle interior to the outside atmosphere to provide the heater assembly with dehumidified cool air. The system consists of:

- A compressor.
- A condenser.
- A receiver drier.
- A thermostatic expansion valve.
- An evaporator.
- Low and high pressure refrigerant lines.

The system is a sealed, closed loop, filled with a charge weight of R134a refrigerant as the heat transfer medium. Oil is added to the refrigerant to lubricate the internal components of the compressor.

Operation of the air conditioning system is controlled by the automatic temperature control (ATC) module. The A/C compressor circulates the refrigerant around the system by compressing low pressure, low temperature vapor from the evaporator and discharging the resultant high pressure, high temperature vapor to the condenser.

The A/C compressor is a variable displacement unit which is driven by the engine accessory drive belt. On 2.7L/4.0L and 5.0L vehicles, the [A/C \(air conditioning\)](#) compressor is permanently driven directly from the pulley. On 3.0L diesel vehicles the [A/C](#) compressor is driven via an electro-magnetic clutch.

To protect the refrigerant system from excessive pressure, a pressure relief valve is installed in the outlet side of the A/C compressor. The pressure relief valve vents excess pressure into the engine compartment.

For additional information, refer to: Control Components (412-04, Description and Operation).

A/C COMPRESSOR

2.7L TdV6

E131577

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 2.7L TdV6 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC \(automatic temperature control\)](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 171 cm³/rev (10.43 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.3 MPa (508 to 623 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.01 MPa (436 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

3.0L TdV6

E131579

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector
6	-	electromagnetic clutch connector

The [A/C](#) compressor fitted to 3.0L TdV6 diesel vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley and an electromagnetic clutch. Operation of the clutch is controlled by a power feed from the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 163 cm³/rev (9.95 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.1 MPa (508 to 595 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.1 MPa (449 lbf/in²).

The clutch of the [A/C](#) compressor incorporates a thermal cut-off fuse, which disconnects the power feed from the [ATC](#) module if the temperature increases to 182 ± 5 °C (360 ± 9 °F).

4.0L NA V6

E131581

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 4.0L NA V6 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 171 cm³/rev (10.43 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.3 MPa (508 to 623 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.01 MPa (437 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

5.0L NA V8

E131337

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 5.0L V8 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 163 cm³/rev (9.95 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.1 MPa (508 to 595 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.1 MPa (449 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

CONDENSER

- NOTE: 5.0L NA V8 version shown other installations similar

E46920

Item	Part Number	Description
1	-	right-hand (RH) end tank
2	-	Condenser core
3	-	left-hand (LH) end tank
4	-	High pressure line connector block
5	-	Condenser attachment brackets
6	-	Receiver drier pipes
7	-	Receiver drier attachment bracket

The condenser transfers heat from the refrigerant to the surrounding air to convert the high pressure vapor from the compressor into a liquid. The condenser is installed immediately in front of the radiator. Two brackets on each end tank of the condenser attach the condenser to clips on the end tanks of the radiator.

The condenser is classified as a sub-cooling condenser and consists of a fin and tube heat exchanger core installed between two end tanks. Divisions in the end tanks separate the heat exchanger into a four pass upper (condenser) section and a two pass lower (sub-cooler) section. A connector block on the left end tank of the condenser provides connections for the high pressure lines from the A/C compressor and the evaporator. Two pipes at the bottom of the right end tank of the condenser provide connections for the receiver drier.

RECEIVER DRIER

E46921

Item	Part Number	Description
1	-	Receiver drier
2	-	Clamp
3	-	Condenser RH end tank
4	-	O-ring seals
5	-	Inlet pipe
6	-	Outlet pipe
7	-	Collar
8	-	Bolt

The receiver drier removes solid impurities and moisture from the refrigerant, and provides a reservoir for liquid refrigerant to accommodate changes of heat load at the evaporator.

The receiver drier is attached to the two stub pipes on the right end tank of the condenser. A collar, located on lands on the stub pipes and secured with a bolt, attaches the stub pipes to the receiver drier. A clamp secures the body of the receiver drier to a bracket welded to the right end tank of the condenser. The inlet and outlet ports of the receiver drier are the same size, so care must be taken to install the receiver drier the correct way round on the stub pipes; to assist with installation, the inlet port is identified with the word IN etched into the receiver drier.

Refrigerant entering the receiver drier passes through a filter and a desiccant pack, then collects in the base of the unit before flowing through the outlet stub pipe back to the condenser. The desiccant and the filter are non-serviceable; the complete unit must be replaced when a change of desiccant is required.

THERMOSTATIC EXPANSION VALVE

E46922

Item	Part Number	Description
1	-	Metering valve
2	-	Housing

3	-	Diaphragm
4	-	Temperature sensitive tube
5	-	Outlet passage from evaporator
6	-	Inlet passage to evaporator

The thermostatic expansion valve meters the flow of refrigerant into the evaporator, to match the refrigerant flow with the heat load of the air passing through the evaporator.

The thermostatic expansion valve is a block type valve located behind the heater assembly, and attached to the inlet and outlet ports of the evaporator. The thermostatic expansion valve consists of an aluminum housing containing inlet and outlet passages. A ball and spring metering valve is installed in the inlet passage and a temperature sensor is installed in the outlet passage. The temperature sensor consists of a temperature sensitive tube connected to a diaphragm. The bottom end of the temperature sensitive tube acts on the ball of the metering valve. Pressure on top of the diaphragm is controlled by evaporator outlet temperature conducted through the temperature sensitive tube. The bottom of the diaphragm senses evaporator outlet pressure.

Liquid refrigerant flows through the metering valve into the evaporator. The restriction across the metering valve reduces the pressure and temperature of the refrigerant. The restriction also changes the liquid stream of refrigerant into a fine spray, to improve the evaporation process. As the refrigerant passes through the evaporator, it absorbs heat from the air flowing through the evaporator. The increase in temperature causes the refrigerant to vaporize and increase in pressure.

The temperature and pressure of the refrigerant leaving the evaporator act on the diaphragm and temperature sensitive tube, which regulate the metering valve opening and so control the volume of refrigerant flowing through the evaporator. The warmer the air flowing through the evaporator, the more heat available to evaporate refrigerant and thus the greater the volume of refrigerant allowed through the metering valve.

EVAPORATOR

E46923

The evaporator is installed in the heater assembly between the blower and the heater matrix, to absorb heat from the exterior or recirculated air. Low pressure, low temperature refrigerant changes from liquid to vapor in the evaporator, absorbing large quantities of heat as it changes state.

Most of the moisture in the air passing through the evaporator condenses into water, which drains out of the heater and through the floorpan, to the underside of the vehicle, through two drain tubes.

REFRIGERANT LINES

To maintain similar flow velocities around the system, the diameter of the refrigerant lines varies to suit the two pressure/temperature regimes. The larger diameters are installed in the low pressure/temperature regime and the smaller diameters are installed in the high pressure/temperature regime.

Low and high pressure charging connections are incorporated into the refrigerant lines for system servicing. Where auxiliary A/C is installed, connections for the auxiliary refrigerant lines are incorporated near the engine bulkhead.

Under normal operating conditions, the smaller diameter pipes (A/C compressor discharge, liquid refrigerant) are hot to the touch and the larger diameter pipes (A/C compressor suction, gaseous refrigerant) are cold to the touch.

SYSTEM OPERATION

To accomplish the transfer of heat, the refrigerant is circulated around the system, where it passes through two pressure/temperature regimes. In each of the pressure/temperature regimes, the refrigerant changes state, during which process maximum heat absorption or release occurs. The low pressure/temperature regime is from the thermostatic expansion valve, through the evaporator to the compressor; the refrigerant decreases in pressure and temperature at the thermostatic expansion valve, then changes state from liquid to vapor in the evaporator, to absorb heat. The high pressure/temperature regime is from the compressor, through the condenser and receiver drier to the thermostatic expansion valve; the refrigerant increases in pressure and temperature as it passes through the compressor, then releases heat and changes state from vapor to liquid in the condenser.

A/C SYSTEM SCHEMATIC

Air Conditioning - TDV6 2.7L Diesel - Air Conditioning

Diagnosis and Testing

Principle of Operation

For a detailed description of the air conditioning system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Air Conditioning](#) (412-03A Air Conditioning - TDV6 2.7L Diesel, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Auxiliary drive belt condition and tension ● Compressor condition and installation ● Condenser condition and installation/blockage ● Air conditioning hoses and pipes ● Receiver/drier condition and installation ● Cooling fan 	<ul style="list-style-type: none"> ● Fuses ● Harnesses ● Electrical connector(s) ● Relays ● Sensors ● Control panel(s) ● Air conditioning compressor

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Poor or no cooling	<ul style="list-style-type: none"> ● Drive belt fault ● Compressor fault ● Distribution motor/flap fault ● Refrigerant leak ● In-vehicle temperature sensor fault ● Refrigerant pressure sensor fault 	Check the drive belt condition and tension (see visual inspection). Check the compressor operation (observe the compressor as the engine is idling with the air conditioning switched on. If the compressor runs erratically or does not run. Carry out the distribution motor self test. Refer to the relevant workshop manual section. Check for sensor DTCs. Refer to the DTC index. Check the refrigerant system using your charging station.
Noise	<ul style="list-style-type: none"> ● Drive belt fault ● Compressor fault ● Compressor pulley fouling ● Refrigerant overcharged 	Confirm the air conditioning as the source of the noise by listening for the noise with the air conditioning switched off. Refer to the relevant workshop manual section. Check the refrigerant system using your charging station.
Water entry into cabin	<ul style="list-style-type: none"> ● Heater matrix leak ● Blocked evaporator drain tubes 	Check for coolant loss. Pressure test the cooling system as necessary. Check and clear the evaporator drain tubes as necessary.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Climate Control Module \(HVAC\)](#) (100-00 General Information, Description and Operation).

Air Conditioning - TDV6 2.7L Diesel - Air Conditioning (A/C) Compressor

Removal and Installation

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

For additional information, refer to: [Jacking](#) (100-02 Jacking and Lifting, Description and Operation).

- Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
- Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
- Recover the air conditioning (A/C) refrigerant.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
- Remove the auxiliary battery tray.
For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
- Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).
- Remove the LH front wheel and tire.
- Remove the front LH fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
- Remove the fender splash shield lower trim panel.

- Remove the 4 clips.

- Remove the upper arm and brake line heat shields for access.

- Remove the 3 nuts.
- Remove the 3 bolts.

11. Release the charge air cooler inlet pipe.

- Remove the two retaining bolts.
- Remove the retaining nut.

12. Disconnect the charge air cooler inlet hose.

- Loosen the clip.

13. Disconnect the charge air cooler inlet hose.

- Loosen the clip.

14. CAUTIONS:

 Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

 Care must be taken to avoid damage to the mating surfaces.

Release the A/C low-pressure pipe from the compressor.

- Remove and discard the O-ring seal.
- Using a suitable tie strap, secure the A/C low-pressure pipe aside.

15. Release the power steering pump support bracket.

- Reposition the charge air cooler inlet pipe to gain access to the power steering pump retaining bolts.
- Remove the 2 bolts.

16. CAUTIONS:

 Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

 Care must be taken to avoid damage to the mating surfaces.

Disconnect the A/C compressor high-pressure pipe.

- Remove the LH retaining bolt.
- Remove and discard the O-ring seal.

17. Reposition the A/C compressor high-pressure pipe.

18. Release the power steering pump.

- Collect the support bracket.

19. Using a suitable tie strap, secure the power steering pump.

E55019

20. Remove the A/C compressor.

- Disconnect the A/C compressor electrical connector.
- Remove the three retaining bolts.

Installation

- 1.**  **CAUTION:** Lubricate the new seals with clean refrigerant oil.

Install the A/C compressor.

- Install the three retaining bolts.
 - Tighten the bolts to 23 Nm (17 lb.ft).
 - Connect the A/C compressor electrical connector.
- 2. Secure the power steering pump.**
- Remove and discard the tie strap.
 - Install the support bracket.
- 3. Reposition the A/C compressor high-pressure pipe.**
- 4. Connect the A/C compressor high-pressure pipe.**
- Remove the blanking caps from the ports.
 - Install a new O-ring seal.
 - Tighten the retaining bolt to 9 Nm (7 lb.ft).
- 5. Install the power steering pump rear bolts.**
- Reposition the charge air cooler inlet pipe to gain access to the power steering pump retaining bolts.
 - Tighten the bolts to 22 Nm (16 lb.ft).
- 6. Connect the A/C compressor low-pressure pipe.**
- Remove the blanking caps from the ports.
 - Install a new O-ring seal.
 - Tighten the retaining bolt to 9 Nm (7 lb.ft).

7. Connect the charge air cooler inlet hose.
 - Tighten the clips.
8. Secure the charge air cooler inlet pipe.
 - Install the two retaining bolts.
 - Install the retaining nut.
 - Tighten to 10 Nm (7 lb.ft).
9. Install the upper arm and brake line heat shields.
 - Install the 3 bolts.
 - Install the 3 nuts.
10. Install the fender splash shield lower trim panel.
 - Install the 4 clips.
11. Install the front LH fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
12. Install the wheel and tire.
 - Tighten nuts to 140 Nm (103 lb.ft).
13. Install the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).
14. Install the auxiliary battery tray.
For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
15. Recharge the A/C system
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
16. Install the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
17. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Air Conditioning - TDV6 2.7L Diesel - Air Conditioning (A/C) Pressure Transducer

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Recover the A/C refrigerant.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

3. CAUTIONS:

Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

To prevent damage to components, use an additional wrench when loosening or tightening unions.

Remove the A/C pressure transducer.

- Disconnect the electrical connector.
- Remove and discard the seal.

E53157

Installation

1. Install the A/C pressure transducer.
 - Clean the component mating faces.
 - Install a new seal.
 - Tighten the transducer to 10 Nm (7 lb.ft).
 - Connect the electrical connector.
2. Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Air Conditioning - TDV6 2.7L Diesel - Condenser Core

Removal and Installation

Removal

• NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
3. Recover the A/C refrigerant.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
4. Remove the cooling fan lower shroud.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
5. Remove the radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
6. Release the coolant expansion tank.

- Remove the 2 bolts.

7.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Disconnect the A/C condenser refrigerant lines.

- Remove the 2 bolts.
- Discard the O-ring seals.

8. Remove the radiator securing pegs.

9. Remove the radiator upper deflector.

- Release the 2 clips.

10. Release the power steering fluid cooler.

- Release it from 3 clips.

11. Release the front differential breather line.

12. Remove the power steering fluid cooler line clip.

13. Tie the engine air intake duct towards the engine.

14. Tie the fuel fired booster heater coolant lines towards the engine.

15. Move the radiator towards the engine.

- Remove the 2 bolts.
- Lift it clear of its mountings.
- Tie the radiator towards the engine.

E49354

16. Remove the A/C condenser.

- Remove the bolt.
- Release it from the 4 clips

Installation

1. Install the A/C condenser.

2. Position the radiator.

- Lift the radiator onto its mountings.
- Tighten the bolts to 25 Nm (18 lb.ft).

3. Position the front differential breather line.

4. Install the power steering fluid cooler line clip.

5. Secure the power steering fluid cooler line.

- Secure in the 3 clips.

6. Install the radiator upper deflector.

7. Install the radiator securing pegs.

8. Secure the coolant expansion tank.

- Tighten the 2 bolts to 10 Nm (7 lb.ft).

9. Connect the A/C condenser refrigerant lines.

- Clean the component mating faces.
- Install new O-ring seals.
- Tighten the bolts to 25 Nm (18 lb.ft).

10. Install the radiator grille.

For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).

11. Install the cooling fan lower shroud.

For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

12. Fill the A/C system.

For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

Air Conditioning - TDV6 2.7L Diesel - Evaporator Core

Removal and Installation

Removal

1. Remove the engine cover.
For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Evacuate the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
5. Remove the driver side front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
6. Remove the floor console.
For additional information, refer to: [Floor Console](#) (501-12 Instrument Panel and Console, Removal and Installation).
7. Remove the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
8. Release the 3 ground cables from the driver side lower A-pillar.
 - Remove the 2 nuts.

9. Disconnect the 5 electrical connectors from the driver side lower A-pillar.

10. Disconnect the 3 electrical connectors.

11. Release the 3 ground cables from the passenger side lower A-pillar.

- Remove the 2 nuts.

12. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.

13. Disconnect the central junction box (CJB) three electrical connectors.

14. Disconnect 2 electrical connectors from the instrument panel center reinforcement.

15.  **CAUTION:** Cover fiber optic cable connectors to minimize dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

16. Remove the heater housing center ducts.

17. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

18. Release the heater housing from the instrument panel carrier.

- Remove the 7 Torx screws.

19. Remove the plenum chamber panel.
For additional information, refer to: [Plenum Chamber](#) (412-01 Air Distribution and Filtering, Removal and Installation).

20. Remove the instrument panel carrier to bulkhead Torx bolt.

E51204

21. With assistance, remove the instrument panel.

- Remove the 6 Torx bolts.

E52190

22.  CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect 2 heater hoses from the bulkhead.

- Release the 2 clips.

E51205

23.  CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Release the 2 A/C refrigerant lines.

- Remove the nut and bolt.
- Remove and discard the O-ring seals.

E51206

24. Remove the 2 adapter panels.

- Remove the 4 nuts.

25. Disconnect 2 drain tubes from the heater housing.

26. Remove the driver side footwell duct.

- Remove the 2 Torx screws.

27. Remove the passenger side footwell duct.

- Remove the 2 Torx screws.

E52192

28. Driver side: Remove the heater housing to bulkhead Torx bolt.

E52193

29. Passenger side: Remove the heater housing to bulkhead Torx bolt.

- With assistance, remove the heater and evaporator core housing.

E52194

30. Remove the A/C control module.

31. Disconnect the evaporator core temperature sensor electrical connector.

32. Disconnect the electrical connector.

33. Detach the wiring harness.

34. Remove the bolt from the support bracket.

35. Remove the heater and evaporator core housing.

- Remove the 8 clips.
- Carefully release the 2 clips.

36. Remove the thermostatic expansion valve.

E124172

37. Remove the evaporator core.

- Release the temperature sensor.

E124171

Installation

1. Install the evaporator core.
 - Secure the temperature sensor.
2. Secure the heater core housing.
 - Install the clips.
3. Install the thermostatic expansion valve.
 - Tighten the bolts to 3.5 Nm (2.5 lb.ft).
4. Install the wiring harness.
5. Install and tighten the bolt.
6. Connect the temperature sensor electrical connector.
7. Install the CC module.
 - Tighten the bolts.
8. Passenger side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
 - With assistance, install the heater and evaporator core housing.
9. Driver side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
10. Install the footwell ducts.
 - Tighten the Torx screws.
11. Connect the drain tubes to the heater housing.
12. Install the adapter panels.
 - Tighten the nuts to 6 Nm (4 lb.ft).
13. Secure the A/C refrigerant lines.

- Clean the components.
 - Install new O-ring seals.
 - Tighten the bolt to 5 Nm (4 lb.ft).
 - Tighten the nut to 6 Nm.
- 14.** Connect the bulkhead heater hoses.
- 15.** With assistance, install the instrument panel.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).
- 16.** Install the instrument panel carrier to bulkhead Torx bolt and tighten to 25 Nm (18 lb.ft).
- 17.** Install the plenum chamber panel.
For additional information, refer to: [Plenum Chamber](#) (412-01 Air Distribution and Filtering, Removal and Installation).
- 18.** Secure the heater housing.
- Tighten the screws.
- 19.** Connect the steering column intermediate shaft.
- Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).
- 20.** Install the heater housing center ducts.
- 21.** Connect the instrument panel center reinforcement fibre optic cables.
- 22.** Connect the instrument panel center reinforcement electrical connectors.
- 23.** Connect the CJB electrical connectors.
- 24.** Connect the electrical connectors to the passenger side lower A-pillar.
- 25.** Connect the ground cables to the passenger side lower A-pillar.
- Tighten the nuts to 10 Nm (7 lb.ft).
- 26.** Connect the electrical connectors to the driver side lower A-pillar.
- 27.** Connect the ground cables to the driver side lower A-pillar.
- Tighten the nuts to 10 Nm (7 lb.ft).
- 28.** Connect the 3 electrical connectors.
- 29.** Install the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
- 30.** Install the floor console.
For additional information, refer to: [Floor Console](#) (501-12 Instrument Panel and Console, Removal and Installation).
- 31.** Install the front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
- 32.** Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
- 33.** Refill the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
- 34.** Install the engine cover.
For additional information, refer to: [Engine Cover - 2.7L V6 - TdV6](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Air Conditioning - TDV6 2.7L Diesel - Thermostatic Expansion Valve

Removal and Installation

Removal

1. Evacuate the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
2. Remove the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).

3.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Remove the thermostatic expansion valve.

- Remove the cover.
- Remove the 2 Allen bolts.
- Remove and discard the 4 O-ring seals.

E54829

Installation

1. Install the thermostatic expansion valve.
 - Clean the components.
 - Install the new O-ring seals.
 - Tighten the Allen bolts to 5 Nm (4 lb.ft).
 - Install the cover.
2. Install the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
3. Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

Air Conditioning - TDV6 2.7L Diesel - Air Conditioning (A/C) Compressor

Pulley

Removal and Installation

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.
- NOTE: Components removed for clarity.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the cooling fan.
For additional information, refer to: [Cooling Fan](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
3. Using a suitable tool, release the hub locking stud.

- Rotate the fixing clockwise to release the hub.
- If required, use a suitable tool to prevent the hub from rotating.

E131552

4. NOTE: Using a 3/8 square drive wrench, rotate the tensioner counter clockwise.

Release the accessory drive belt from the A/C compressor pulley.

5. Remove and discard the hub assembly.

- Rotate the pulley counter-clockwise, until the hub is released from the pulley.
- Discard the rubber dampers.

6. Remove and discard the spacer.

7. Remove and discard the drive pulley.

- Remove and discard the circlip.
- Clean the compressor mating surface.

Installation

1.  CAUTION: Make sure the circlip is fitted in the correct orientation.

Install the drive pulley.

- Install the circlip.

E132005

2. Install the spacer.

- Make sure the spacer is fully seated.

3. Install the 6 rubber dampers to the hub assembly.

- Make sure the dampers are installed in the correct orientation.

E131556

4. NOTE: Apply a suitable water based lubricant to the rubber dampers and to the mating surfaces on pulley.

Install the hub assembly.

- Push the hub assembly onto the pulley, and rotate clockwise to screw it onto the compressor shaft.

5. NOTE: Tighten counterclockwise.

Using a suitable tool, tighten the hub locking stud.

- Prevent the pulley rotating by hand.
- Tighten to 3.5 Nm (2.6 lb.ft)

6. Install the auxiliary drive belt.

7. Install the cooling fan.

For additional information, refer to: [Cooling Fan](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

8. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

GENERAL

The A/C system transfers heat from the vehicle interior to the outside atmosphere to provide the heater assembly with dehumidified cool air. The system consists of:

- A compressor.
- A condenser.
- A receiver drier.
- A thermostatic expansion valve.
- An evaporator.
- Low and high pressure refrigerant lines.

The system is a sealed, closed loop, filled with a charge weight of R134a refrigerant as the heat transfer medium. Oil is added to the refrigerant to lubricate the internal components of the compressor.

Operation of the air conditioning system is controlled by the automatic temperature control (ATC) module. The A/C compressor circulates the refrigerant around the system by compressing low pressure, low temperature vapor from the evaporator and discharging the resultant high pressure, high temperature vapor to the condenser.

The A/C compressor is a variable displacement unit which is driven by the engine accessory drive belt. On 2.7L/4.0L and 5.0L vehicles, the [A/C \(air conditioning\)](#) compressor is permanently driven directly from the pulley. On 3.0L diesel vehicles the [A/C](#) compressor is driven via an electro-magnetic clutch.

To protect the refrigerant system from excessive pressure, a pressure relief valve is installed in the outlet side of the A/C compressor. The pressure relief valve vents excess pressure into the engine compartment.

For additional information, refer to: Control Components (412-04, Description and Operation).

A/C COMPRESSOR

2.7L TdV6

E131577

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 2.7L TdV6 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC \(automatic temperature control\)](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 171 cm³/rev (10.43 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.3 MPa (508 to 623 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.01 MPa (436 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

3.0L TdV6

E131579

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector
6	-	electromagnetic clutch connector

The [A/C](#) compressor fitted to 3.0L TdV6 diesel vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley and an electromagnetic clutch. Operation of the clutch is controlled by a power feed from the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 163 cm³/rev (9.95 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.1 MPa (508 to 595 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.1 MPa (449 lbf/in²).

The clutch of the [A/C](#) compressor incorporates a thermal cut-off fuse, which disconnects the power feed from the [ATC](#) module if the temperature increases to 182 ± 5 °C (360 ± 9 °F).

4.0L NA V6

E131581

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 4.0L NA V6 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 171 cm³/rev (10.43 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.3 MPa (508 to 623 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.01 MPa (437 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

5.0L NA V8

E131337

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 5.0L V8 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 163 cm³/rev (9.95 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.1 MPa (508 to 595 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.1 MPa (449 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

CONDENSER

- NOTE: 5.0L NA V8 version shown other installations similar

E46920

Item	Part Number	Description
1	-	right-hand (RH) end tank
2	-	Condenser core
3	-	left-hand (LH) end tank
4	-	High pressure line connector block
5	-	Condenser attachment brackets
6	-	Receiver drier pipes
7	-	Receiver drier attachment bracket

The condenser transfers heat from the refrigerant to the surrounding air to convert the high pressure vapor from the compressor into a liquid. The condenser is installed immediately in front of the radiator. Two brackets on each end tank of the condenser attach the condenser to clips on the end tanks of the radiator.

The condenser is classified as a sub-cooling condenser and consists of a fin and tube heat exchanger core installed between two end tanks. Divisions in the end tanks separate the heat exchanger into a four pass upper (condenser) section and a two pass lower (sub-cooler) section. A connector block on the left end tank of the condenser provides connections for the high pressure lines from the A/C compressor and the evaporator. Two pipes at the bottom of the right end tank of the condenser provide connections for the receiver drier.

RECEIVER DRIER

E46921

Item	Part Number	Description
1	-	Receiver drier
2	-	Clamp
3	-	Condenser RH end tank
4	-	O-ring seals
5	-	Inlet pipe
6	-	Outlet pipe
7	-	Collar
8	-	Bolt

The receiver drier removes solid impurities and moisture from the refrigerant, and provides a reservoir for liquid refrigerant to accommodate changes of heat load at the evaporator.

The receiver drier is attached to the two stub pipes on the right end tank of the condenser. A collar, located on lands on the stub pipes and secured with a bolt, attaches the stub pipes to the receiver drier. A clamp secures the body of the receiver drier to a bracket welded to the right end tank of the condenser. The inlet and outlet ports of the receiver drier are the same size, so care must be taken to install the receiver drier the correct way round on the stub pipes; to assist with installation, the inlet port is identified with the word IN etched into the receiver drier.

Refrigerant entering the receiver drier passes through a filter and a desiccant pack, then collects in the base of the unit before flowing through the outlet stub pipe back to the condenser. The desiccant and the filter are non-serviceable; the complete unit must be replaced when a change of desiccant is required.

THERMOSTATIC EXPANSION VALVE

E46922

Item	Part Number	Description
1	-	Metering valve
2	-	Housing

3	-	Diaphragm
4	-	Temperature sensitive tube
5	-	Outlet passage from evaporator
6	-	Inlet passage to evaporator

The thermostatic expansion valve meters the flow of refrigerant into the evaporator, to match the refrigerant flow with the heat load of the air passing through the evaporator.

The thermostatic expansion valve is a block type valve located behind the heater assembly, and attached to the inlet and outlet ports of the evaporator. The thermostatic expansion valve consists of an aluminum housing containing inlet and outlet passages. A ball and spring metering valve is installed in the inlet passage and a temperature sensor is installed in the outlet passage. The temperature sensor consists of a temperature sensitive tube connected to a diaphragm. The bottom end of the temperature sensitive tube acts on the ball of the metering valve. Pressure on top of the diaphragm is controlled by evaporator outlet temperature conducted through the temperature sensitive tube. The bottom of the diaphragm senses evaporator outlet pressure.

Liquid refrigerant flows through the metering valve into the evaporator. The restriction across the metering valve reduces the pressure and temperature of the refrigerant. The restriction also changes the liquid stream of refrigerant into a fine spray, to improve the evaporation process. As the refrigerant passes through the evaporator, it absorbs heat from the air flowing through the evaporator. The increase in temperature causes the refrigerant to vaporize and increase in pressure.

The temperature and pressure of the refrigerant leaving the evaporator act on the diaphragm and temperature sensitive tube, which regulate the metering valve opening and so control the volume of refrigerant flowing through the evaporator. The warmer the air flowing through the evaporator, the more heat available to evaporate refrigerant and thus the greater the volume of refrigerant allowed through the metering valve.

EVAPORATOR

E46923

The evaporator is installed in the heater assembly between the blower and the heater matrix, to absorb heat from the exterior or recirculated air. Low pressure, low temperature refrigerant changes from liquid to vapor in the evaporator, absorbing large quantities of heat as it changes state.

Most of the moisture in the air passing through the evaporator condenses into water, which drains out of the heater and through the floorpan, to the underside of the vehicle, through two drain tubes.

REFRIGERANT LINES

To maintain similar flow velocities around the system, the diameter of the refrigerant lines varies to suit the two pressure/temperature regimes. The larger diameters are installed in the low pressure/temperature regime and the smaller diameters are installed in the high pressure/temperature regime.

Low and high pressure charging connections are incorporated into the refrigerant lines for system servicing. Where auxiliary A/C is installed, connections for the auxiliary refrigerant lines are incorporated near the engine bulkhead.

Under normal operating conditions, the smaller diameter pipes (A/C compressor discharge, liquid refrigerant) are hot to the touch and the larger diameter pipes (A/C compressor suction, gaseous refrigerant) are cold to the touch.

SYSTEM OPERATION

To accomplish the transfer of heat, the refrigerant is circulated around the system, where it passes through two pressure/temperature regimes. In each of the pressure/temperature regimes, the refrigerant changes state, during which process maximum heat absorption or release occurs. The low pressure/temperature regime is from the thermostatic expansion valve, through the evaporator to the compressor; the refrigerant decreases in pressure and temperature at the thermostatic expansion valve, then changes state from liquid to vapor in the evaporator, to absorb heat. The high pressure/temperature regime is from the compressor, through the condenser and receiver drier to the thermostatic expansion valve; the refrigerant increases in pressure and temperature as it passes through the compressor, then releases heat and changes state from vapor to liquid in the condenser.

A/C SYSTEM SCHEMATIC

- NOTE: A = Refrigerant liquid; B = Refrigerant vapor; C = Air flow

E46924

Item	Part Number	Description
1	-	Evaporator
2	-	Thermostatic expansion valve
3	-	High pressure connection with auxiliary climate control (where fitted)

Air Conditioning - TDV6 3.0L Diesel - Air Conditioning (A/C) Pressure Transducer

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Recover the A/C refrigerant.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

3. CAUTIONS:

Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

To prevent damage to components, use an additional wrench when loosening or tightening unions.

Remove the A/C pressure transducer.

- Disconnect the electrical connector.
- Remove and discard the seal.

E53157

Installation

1. Install the A/C pressure transducer.
 - Clean the component mating faces.
 - Install a new seal.
 - Tighten the transducer to 10 Nm (7 lb.ft).
 - Connect the electrical connector.
2. Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Removal and Installation

Removal

1. Evacuate the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03B Engine Cooling - TDV6 3.0L Diesel, General Procedures).
4. Remove the driver side front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
5. Remove the floor console.
For additional information, refer to: [Floor Console](#) (501-12 Instrument Panel and Console, Removal and Installation).
6. Remove the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
7. Release the 3 ground cables from the driver side lower A-pillar.
 - Remove the 2 nuts.

8. Disconnect the 5 electrical connectors from the driver side lower A-pillar.

9. Disconnect the 3 electrical connectors.

10. Release the 3 ground cables from the passenger side lower A-pillar.

- Remove the 2 nuts.

11. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.

12. Disconnect the central junction box (CJB) three electrical connectors.

13. Disconnect 2 electrical connectors from the instrument panel center reinforcement.

14.  **CAUTION:** Cover fiber optic cable connectors to minimize dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

15. Remove the heater housing center ducts.

16. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

17. Release the heater housing from the instrument panel carrier.

- Remove the 7 Torx screws.

18. Remove the plenum chamber panel.
For additional information, refer to: [Plenum Chamber](#) (412-01 Air Distribution and Filtering, Removal and Installation).

19. Remove the instrument panel carrier to bulkhead Torx bolt.

E51204

20. With assistance, remove the instrument panel.

- Remove the 6 Torx bolts.

E52190

21. Disconnect both exhaust gas recirculation (EGR) coolant cross-over pipe hoses.

- Release the 2 clips.

E53901

22. Remove the EGR coolant cross-over pipe.

- Remove the 2 bolts.
- Release the 2 clips.

E55561

23.  CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect 2 heater hoses from the bulkhead.

- Release the 2 clips.

24.  CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Release the 2 A/C refrigerant lines.

- Remove the nut and bolt.
- Remove and discard the O-ring seals.

25. Remove the 2 adapter panels.

- Remove the 4 nuts.

26. Disconnect 2 drain tubes from the heater housing.

E51199

27. Remove the driver side footwell duct.

- Remove the 2 Torx screws.

E52191

28. Remove the passenger side footwell duct.

- Remove the 2 Torx screws.

E52192

29. Driver side: Remove the heater housing to bulkhead Torx bolt.

30. Passenger side: Remove the heater housing to bulkhead Torx bolt.

- With assistance, remove the heater and evaporator core housing.

31. Remove the A/C control module.

32. Disconnect the evaporator core temperature sensor electrical connector.

33. Disconnect the electrical connector.

34. Detach the wiring harness.

35. Remove the bolt from the support bracket.

36. Remove the heater and evaporator core housing.

- Remove the 8 clips.
- Carefully release the 2 clips.

37. Remove the thermostatic expansion valve.

E124171

38. Remove the evaporator core.

- Release the temperature sensor.

Installation

1. Install the evaporator core.
 - Secure the temperature sensor.
2. Secure the heater core housing.
 - Install the clips.
3. Install the thermostatic expansion valve.
 - Tighten the bolts to 3.5 Nm (2.5 lb.ft).
4. Install the wiring harness.
5. Install and tighten the bolt.
6. Connect the temperature sensor electrical connector.
7. Install the CC module.
 - Tighten the bolts.
8. Passenger side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
 - With assistance, install the heater and evaporator core housing.
9. Driver side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
10. Install the footwell ducts.
 - Tighten the Torx screws.
11. Connect the drain tubes to the heater housing.
12. Install the adapter panels.
 - Tighten the nuts to 6 Nm (4 lb.ft).
13. Secure the A/C refrigerant lines.
 - Clean the components.
 - Install new O-ring seals.
 - Tighten the bolt to 5 Nm (4 lb.ft).
 - Tighten the nut to 6 Nm.
14. Connect the bulkhead heater hoses.
15. Install the EGR coolant cross-over pipe.
 - Tighten the bolts to 10 Nm (7 lb.ft).
 - Secure the clips.
 - Connect the hoses and secure with the clips.
16. With assistance, install the instrument panel.

- Tighten the Torx bolts to 25 Nm (18 lb.ft).
17. Install the instrument panel carrier to bulkhead Torx bolt and tighten to 25 Nm (18 lb.ft).
 18. Install the plenum chamber panel.
For additional information, refer to: [Plenum Chamber](#) (412-01 Air Distribution and Filtering, Removal and Installation).
 19. Secure the heater housing.
 - Tighten the screws.
 20. Connect the steering column intermediate shaft.
 - Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).
 21. Install the heater housing center ducts.
 22. Connect the instrument panel center reinforcement fibre optic cables.
 23. Connect the instrument panel center reinforcement electrical connectors.
 24. Connect the CJB electrical connectors.
 25. Connect the electrical connectors to the passenger side lower A-pillar.
 26. Connect the ground cables to the passenger side lower A-pillar.
 - Tighten the nuts to 10 Nm (7 lb.ft).
 27. Connect the electrical connectors to the driver side lower A-pillar.
 28. Connect the ground cables to the driver side lower A-pillar.
 - Tighten the nuts to 10 Nm (7 lb.ft).
 29. Connect the 3 electrical connectors.
 30. Install the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
 31. Install the floor console.
For additional information, refer to: [Floor Console](#) (501-12 Instrument Panel and Console, Removal and Installation).
 32. Install the front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
 33. Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
 34. Refill the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03B Engine Cooling - TDV6 3.0L Diesel, General Procedures).

Air Conditioning - TDV6 3.0L Diesel - Thermostatic Expansion Valve

Removal and Installation

Removal

1. Evacuate the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
2. Remove the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).

3.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Remove the thermostatic expansion valve.

- Remove the cover.
- Remove the 2 Allen bolts.
- Remove and discard the 4 O-ring seals.

E54829

Installation

1. Install the thermostatic expansion valve.
 - Clean the components.
 - Install the new O-ring seals.
 - Tighten the Allen bolts to 5 Nm (4 lb.ft).
 - Install the cover.
2. Install the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
3. Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

GENERAL

The A/C system transfers heat from the vehicle interior to the outside atmosphere to provide the heater assembly with dehumidified cool air. The system consists of:

- A compressor.
- A condenser.
- A receiver drier.
- A thermostatic expansion valve.
- An evaporator.
- Low and high pressure refrigerant lines.

The system is a sealed, closed loop, filled with a charge weight of R134a refrigerant as the heat transfer medium. Oil is added to the refrigerant to lubricate the internal components of the compressor.

Operation of the air conditioning system is controlled by the automatic temperature control (ATC) module. The A/C compressor circulates the refrigerant around the system by compressing low pressure, low temperature vapor from the evaporator and discharging the resultant high pressure, high temperature vapor to the condenser.

The A/C compressor is a variable displacement unit which is driven by the engine accessory drive belt. On 2.7L/4.0L and 5.0L vehicles, the [A/C \(air conditioning\)](#) compressor is permanently driven directly from the pulley. On 3.0L diesel vehicles the [A/C](#) compressor is driven via an electro-magnetic clutch.

To protect the refrigerant system from excessive pressure, a pressure relief valve is installed in the outlet side of the A/C compressor. The pressure relief valve vents excess pressure into the engine compartment.

For additional information, refer to: Control Components (412-04, Description and Operation).

A/C COMPRESSOR

2.7L TdV6

E131577

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 2.7L TdV6 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC \(automatic temperature control\)](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 171 cm³/rev (10.43 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.3 MPa (508 to 623 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.01 MPa (436 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

3.0L TdV6

E131579

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector
6	-	electromagnetic clutch connector

The [A/C](#) compressor fitted to 3.0L TdV6 diesel vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley and an electromagnetic clutch. Operation of the clutch is controlled by a power feed from the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 163 cm³/rev (9.95 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.1 MPa (508 to 595 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.1 MPa (449 lbf/in²).

The clutch of the [A/C](#) compressor incorporates a thermal cut-off fuse, which disconnects the power feed from the [ATC](#) module if the temperature increases to 182 ± 5 °C (360 ± 9 °F).

4.0L NA V6

E131581

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 4.0L NA V6 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 171 cm³/rev (10.43 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.3 MPa (508 to 623 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.01 MPa (437 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

5.0L NA V8

E131337

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 5.0L V8 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 163 cm³/rev (9.95 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.1 MPa (508 to 595 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.1 MPa (449 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

CONDENSER

- NOTE: 5.0L NA V8 version shown other installations similar

E46920

Item	Part Number	Description
1	-	right-hand (RH) end tank
2	-	Condenser core
3	-	left-hand (LH) end tank
4	-	High pressure line connector block
5	-	Condenser attachment brackets
6	-	Receiver drier pipes
7	-	Receiver drier attachment bracket

The condenser transfers heat from the refrigerant to the surrounding air to convert the high pressure vapor from the compressor into a liquid. The condenser is installed immediately in front of the radiator. Two brackets on each end tank of the condenser attach the condenser to clips on the end tanks of the radiator.

The condenser is classified as a sub-cooling condenser and consists of a fin and tube heat exchanger core installed between two end tanks. Divisions in the end tanks separate the heat exchanger into a four pass upper (condenser) section and a two pass lower (sub-cooler) section. A connector block on the left end tank of the condenser provides connections for the high pressure lines from the A/C compressor and the evaporator. Two pipes at the bottom of the right end tank of the condenser provide connections for the receiver drier.

RECEIVER DRIER

E46921

Item	Part Number	Description
1	-	Receiver drier
2	-	Clamp
3	-	Condenser RH end tank
4	-	O-ring seals
5	-	Inlet pipe
6	-	Outlet pipe
7	-	Collar
8	-	Bolt

The receiver drier removes solid impurities and moisture from the refrigerant, and provides a reservoir for liquid refrigerant to accommodate changes of heat load at the evaporator.

The receiver drier is attached to the two stub pipes on the right end tank of the condenser. A collar, located on lands on the stub pipes and secured with a bolt, attaches the stub pipes to the receiver drier. A clamp secures the body of the receiver drier to a bracket welded to the right end tank of the condenser. The inlet and outlet ports of the receiver drier are the same size, so care must be taken to install the receiver drier the correct way round on the stub pipes; to assist with installation, the inlet port is identified with the word IN etched into the receiver drier.

Refrigerant entering the receiver drier passes through a filter and a desiccant pack, then collects in the base of the unit before flowing through the outlet stub pipe back to the condenser. The desiccant and the filter are non-serviceable; the complete unit must be replaced when a change of desiccant is required.

THERMOSTATIC EXPANSION VALVE

E46922

Item	Part Number	Description
1	-	Metering valve
2	-	Housing

3	-	Diaphragm
4	-	Temperature sensitive tube
5	-	Outlet passage from evaporator
6	-	Inlet passage to evaporator

The thermostatic expansion valve meters the flow of refrigerant into the evaporator, to match the refrigerant flow with the heat load of the air passing through the evaporator.

The thermostatic expansion valve is a block type valve located behind the heater assembly, and attached to the inlet and outlet ports of the evaporator. The thermostatic expansion valve consists of an aluminum housing containing inlet and outlet passages. A ball and spring metering valve is installed in the inlet passage and a temperature sensor is installed in the outlet passage. The temperature sensor consists of a temperature sensitive tube connected to a diaphragm. The bottom end of the temperature sensitive tube acts on the ball of the metering valve. Pressure on top of the diaphragm is controlled by evaporator outlet temperature conducted through the temperature sensitive tube. The bottom of the diaphragm senses evaporator outlet pressure.

Liquid refrigerant flows through the metering valve into the evaporator. The restriction across the metering valve reduces the pressure and temperature of the refrigerant. The restriction also changes the liquid stream of refrigerant into a fine spray, to improve the evaporation process. As the refrigerant passes through the evaporator, it absorbs heat from the air flowing through the evaporator. The increase in temperature causes the refrigerant to vaporize and increase in pressure.

The temperature and pressure of the refrigerant leaving the evaporator act on the diaphragm and temperature sensitive tube, which regulate the metering valve opening and so control the volume of refrigerant flowing through the evaporator. The warmer the air flowing through the evaporator, the more heat available to evaporate refrigerant and thus the greater the volume of refrigerant allowed through the metering valve.

EVAPORATOR

E46923

The evaporator is installed in the heater assembly between the blower and the heater matrix, to absorb heat from the exterior or recirculated air. Low pressure, low temperature refrigerant changes from liquid to vapor in the evaporator, absorbing large quantities of heat as it changes state.

Most of the moisture in the air passing through the evaporator condenses into water, which drains out of the heater and through the floorpan, to the underside of the vehicle, through two drain tubes.

REFRIGERANT LINES

To maintain similar flow velocities around the system, the diameter of the refrigerant lines varies to suit the two pressure/temperature regimes. The larger diameters are installed in the low pressure/temperature regime and the smaller diameters are installed in the high pressure/temperature regime.

Low and high pressure charging connections are incorporated into the refrigerant lines for system servicing. Where auxiliary A/C is installed, connections for the auxiliary refrigerant lines are incorporated near the engine bulkhead.

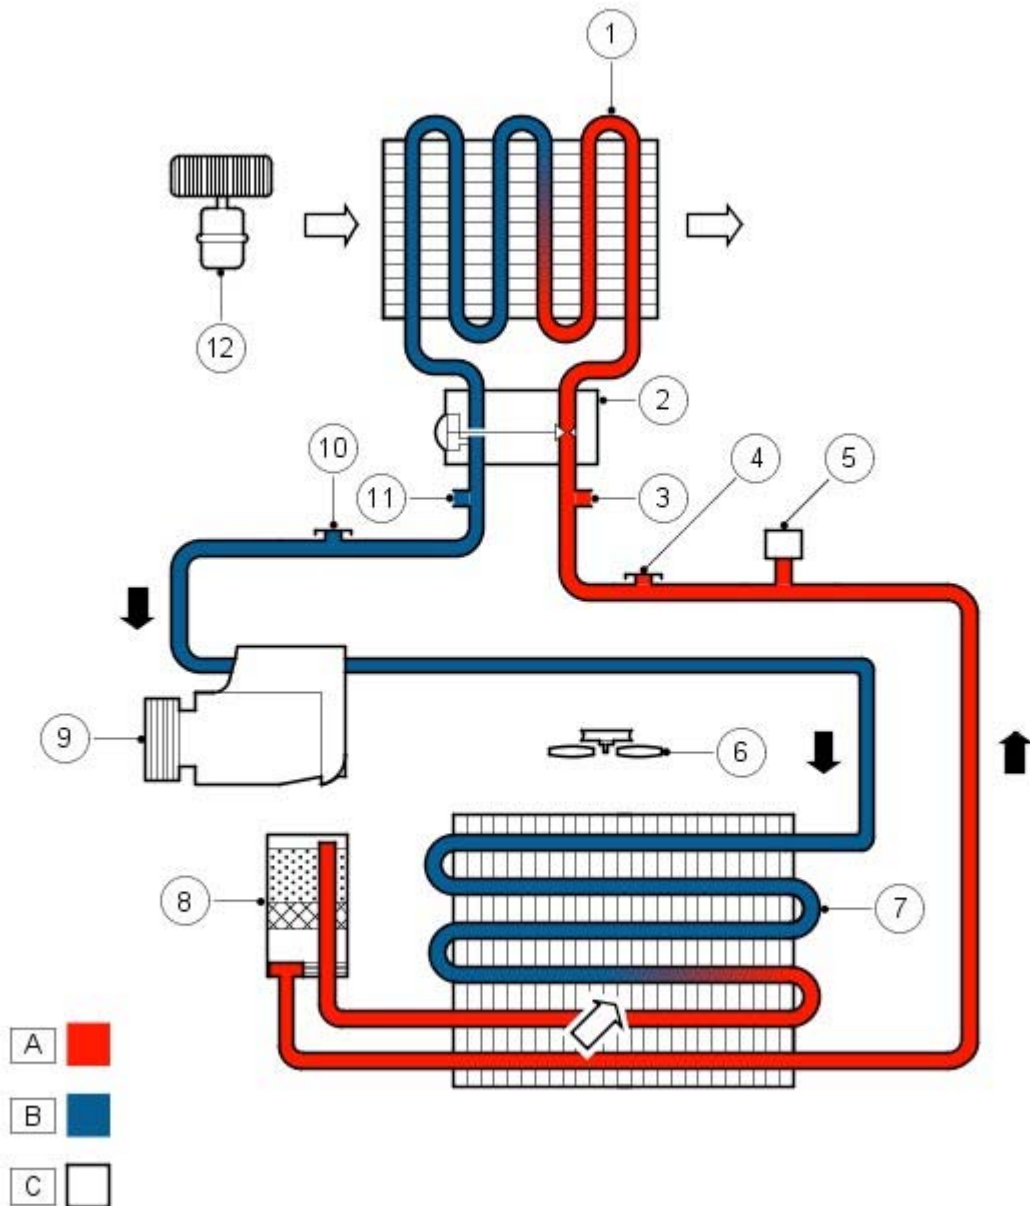

Under normal operating conditions, the smaller diameter pipes (A/C compressor discharge, liquid refrigerant) are hot to the touch and the larger diameter pipes (A/C compressor suction, gaseous refrigerant) are cold to the touch.

SYSTEM OPERATION

To accomplish the transfer of heat, the refrigerant is circulated around the system, where it passes through two pressure/temperature regimes. In each of the pressure/temperature regimes, the refrigerant changes state, during which process maximum heat absorption or release occurs. The low pressure/temperature regime is from the thermostatic expansion valve, through the evaporator to the compressor; the refrigerant decreases in pressure and temperature at the thermostatic expansion valve, then changes state from liquid to vapor in the evaporator, to absorb heat. The high pressure/temperature regime is from the compressor, through the condenser and receiver drier to the thermostatic expansion valve; the refrigerant increases in pressure and temperature as it passes through the compressor, then releases heat and changes state from vapor to liquid in the condenser.

A/C SYSTEM SCHEMATIC

- NOTE: A = Refrigerant liquid; B = Refrigerant vapor; C = Air flow

E46924

Item	Part Number	Description
1	-	Evaporator
2	-	Thermostatic expansion valve

Air Conditioning - V6 4.0L Petrol - Air Conditioning

Diagnosis and Testing

Principle of Operation

For a detailed description of the air conditioning system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Air Conditioning (412-03 Air Conditioning - 4.0L, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Auxiliary drive belt condition and tension ● Compressor condition and installation ● Condenser condition and installation/blockage ● Air conditioning hoses and pipes ● Receiver/drier condition and installation ● Cooling fan 	<ul style="list-style-type: none"> ● Fuses ● Harnesses ● Electrical connector(s) ● Relays ● Sensors ● Control panel(s) ● Air conditioning compressor

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Poor or no cooling	<ul style="list-style-type: none"> ● Drive belt fault ● Compressor fault ● Distribution motor/flap fault ● Refrigerant leak ● In-vehicle temperature sensor fault ● Refrigerant pressure sensor fault 	Check the drive belt condition and tension (see visual inspection). Check the compressor operation (observe the compressor as the engine is idling with the air conditioning switched on. If the compressor runs erratically or does not run. Carry out the distribution motor self test. Refer to the relevant workshop manual section. Check for sensor DTCs. Refer to the DTC index. Check the refrigerant system using your charging station.
Noise	<ul style="list-style-type: none"> ● Drive belt fault ● Compressor fault ● Compressor pulley fouling ● Refrigerant overcharged 	Confirm the air conditioning as the source of the noise by listening for the noise with the air conditioning switched off. Refer to the relevant workshop manual section. Check the refrigerant system using your charging station.
Water entry into cabin	<ul style="list-style-type: none"> ● Heater matrix leak ● Blocked evaporator drain tubes 	Check for coolant loss. Pressure test the cooling system as necessary. Check and clear the evaporator drain tubes as necessary.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Climate Control Module \(HVAC\)](#) (100-00 General Information, Description and Operation).

Air Conditioning - V6 4.0L Petrol - Air Conditioning (A/C) Compressor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Recover the A/C refrigerant.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
4. Remove the accessory drive belt.
For additional information, refer to: Accessory Drive Belt (303-05, Removal and Installation).
5. Remove the accessory drive belt tensioner.
 - Remove the bolt.

E57990

6. Remove the oil level indicator and tube.
For additional information, refer to: Oil Level Indicator and Tube (303-01, In-vehicle Repair).
7. Remove the LH front wheel.

8.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Disconnect the refrigerant lines from the A/C compressor.

- Remove the 2 bolts.
- Remove and discard the 2 O-ring seals.

E57997

9. Disconnect the A/C clutch electrical connector.

10. NOTE: 1 A/C compressor bolt will remain captive until the mounting bracket is removed.

Release the A/C compressor.

- Remove the 3 bolts.

11. Remove the A/C compressor mounting bracket.

- Remove the 2 bolts.

12. Remove the A/C compressor.

Installation

1. Position the A/C compressor to the engine.

- If a new compressor is being installed, the required amount of refrigerant oil must be drained from it.

2. Install the A/C compressor mounting bracket.

- Tighten the bolts to 25 Nm (18 lb.ft).

3. Secure the A/C compressor.

- Tighten the bolts to 25 Nm (18 lb.ft).

4. Connect the A/C clutch electrical connector.

5.  **CAUTION:** Lubricate the new seals with clean refrigerant oil.

Connect the refrigerant lines.

- Clean the component mating faces.
- Install the new O-ring seals.
- Tighten the bolts to 10 Nm (7 lb.ft).

6. Install the front wheel.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

7. Lower the vehicle.

8. Install the oil level indicator and tube.

For additional information, refer to: Oil Level Indicator and Tube (303-01, In-vehicle Repair).

9. Install the accessory drive belt tensioner.

- Tighten the bolt to 40 Nm (30 lb.ft).

10. Install the accessory drive belt.

For additional information, refer to: Accessory Drive Belt (303-05, Removal and Installation).

11. Fill the A/C system.

For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

12. Connect the battery ground cable.

For additional information, refer to: Specifications (414-00, Specifications).

Air Conditioning - V6 4.0L Petrol - Air Conditioning (A/C) Pressure Transducer

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Recover the A/C refrigerant.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

3. CAUTIONS:

Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

To prevent damage to components, use an additional wrench when loosening or tightening unions.

Remove the A/C pressure transducer.

- Disconnect the electrical connector.
- Remove and discard the seal.

E53157

Installation

1. Install the A/C pressure transducer.
 - Clean the component mating faces.
 - Install a new seal.
 - Tighten the transducer to 10 Nm (7 lb.ft).
 - Connect the electrical connector.
2. Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Air Conditioning - V6 4.0L Petrol - Air Conditioning (A/C) Compressor

Pulley

Removal and Installation

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.
- NOTE: Components removed for clarity.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Using a suitable tool, release the hub locking stud.

- Rotate the fixing clockwise to release the hub.
- If required, use a suitable tool to prevent the hub from rotating.

3. NOTE: This step requires the aid of another technician.

- NOTE: Using a 3/8 square drive wrench, rotate the tensioner counter clockwise.

Release the accessory drive belt from the A/C compressor pulley.

4. Remove and discard the hub assembly.

- Rotate the pulley counter-clockwise, until the hub is released from the pulley.
- Discard the rubber dampers.

5. Remove and discard the spacer.

6. Remove and discard the drive pulley.

- Remove and discard the circlip.
- Clean the compressor mating surface.

Installation

1.  **CAUTION:** Make sure the circlip is fitted in the correct orientation.

Install the drive pulley.

- Install the circlip.

2. Install the spacer.

- Make sure the spacer is fully seated.

3. Install the 6 rubber dampers to the hub assembly.

- Make sure the dampers are installed in the correct orientation.

E131556

4. NOTE: Apply a suitable water based lubricant to the rubber dampers and to the mating surfaces on pulley.

Install the hub assembly.

- Push the hub assembly onto the pulley, and rotate clockwise to screw it onto the compressor shaft.

5. NOTE: Tighten counterclockwise.

Using a suitable tool, tighten the hub locking stud.

- Prevent the pulley rotating by hand.
- Tighten to 3.5 Nm (2.6 lb.ft)

6. Install the auxiliary drive belt.

7. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Air Conditioning - V6 4.0L Petrol - Condenser Core

Removal and Installation

Removal

• **NOTE:** The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Recover the A/C refrigerant.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

3.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Disconnect the A/C pipes.

- Remove the 2 bolts.
- Discard the O-ring seals.
- Install blanking caps to the exposed ports.

E45672

4. Remove the viscous fan assembly.
For additional information, refer to: [Cooling Fan](#) (303-03C Engine Cooling - V6 4.0L Petrol, Removal and Installation).
5. Remove the lower fan shroud.
 - Release it from the 4 clips
 - Release the coolant hose.

E45533

6. Remove the radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).

7. Remove the radiator securing pegs.

8. Remove the radiator air deflector.

- Release the 2 clips.

9. NOTE: Always protect the cooling pack elements to prevent accidental damage.

Release the radiator for access.

- Remove the 2 bolts.

10. Remove the power steering fluid cooler.

- Release the 3 clips.

E53605

11. Remove the condenser core.

- Remove the 2 screws.
- Remove the bolt.

E55033

Installation

1. Install the condenser core.

- Secure in the clips.

- Tighten the screws.
 - Install the bolt and tighten to 10 Nm (7 lb.ft).
2. Install the power steering fluid cooler.
 - Secure the clips.
 3. Install the reflector air deflector.
 4. Install the radiator.
 - Tighten the bolts to 25 Nm (18 lb.ft).

5.  **CAUTION:** Lubricate the new seals with clean refrigerant oil.

Connect the A/C pipes.

- Remove the blanking caps from the ports.
 - Install new O-ring seals.
 - Install the bolts and tighten to 10 Nm (7 lb.ft).
6. Install the radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
 7. Install the radiator securing pegs.
 8. Install the lower fan shroud.
 - Position the locating pegs.
 - Secure in the clips.
 - Secure the hose to the fan cowl.
 9. Install the viscous fan assembly.
For additional information, refer to: [Cooling Fan](#) (303-03C Engine Cooling - V6 4.0L Petrol, Removal and Installation).
 10. Fill the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
 11. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Air Conditioning - V6 4.0L Petrol - Evaporator Core

Removal and Installation

Removal

1. Remove the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Evacuate the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
5. Remove the driver side front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
6. Remove the floor console.
For additional information, refer to: [Floor Console](#) (501-12 Instrument Panel and Console, Removal and Installation).
7. Remove the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
8. Release the 3 ground cables from the driver side lower A-pillar.
 - Remove the 2 nuts.

9. Disconnect the 5 electrical connectors from the driver side lower A-pillar.

10. Disconnect the 3 electrical connectors.

11. Release the 3 ground cables from the passenger side lower A-pillar.

- Remove the 2 nuts.

12. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.

13. Disconnect the central junction box (CJB) three electrical connectors.

14. Disconnect 2 electrical connectors from the instrument panel center reinforcement.

15.  **CAUTION:** Cover fiber optic cable connectors to minimize dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

16. Remove the heater housing center ducts.

17. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

18. Release the heater housing from the instrument panel carrier.

- Remove the 7 Torx screws.

19. Remove the plenum chamber panel.
For additional information, refer to: [Plenum Chamber](#) (412-01 Air Distribution and Filtering, Removal and Installation).

20. Remove the instrument panel carrier to bulkhead Torx bolt.

E51204

21. With assistance, remove the instrument panel.

- Remove the 6 Torx bolts.

E52190

22.  CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect 2 heater hoses from the bulkhead.

- Release the 2 clips.

E51205

23.  CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Release the 2 A/C refrigerant lines.

- Remove the nut and bolt.
- Remove and discard the O-ring seals.

E51206

24. Remove the 2 adapter panels.

- Remove the 4 nuts.

25. Disconnect 2 drain tubes from the heater housing.

26. Remove the driver side footwell duct.

- Remove the 2 Torx screws.

27. Remove the passenger side footwell duct.

- Remove the 2 Torx screws.

E52192

28. Driver side: Remove the heater housing to bulkhead Torx bolt.

E52193

29. Passenger side: Remove the heater housing to bulkhead Torx bolt.

- With assistance, remove the heater and evaporator core housing.

E52194

30. Remove the A/C control module.

31. Disconnect the evaporator core temperature sensor electrical connector.

32. Disconnect the electrical connector.

33. Detach the wiring harness.

34. Remove the bolt from the support bracket.

35. Remove the heater and evaporator core housing.

- Remove the 8 clips.
- Carefully release the 2 clips.

36. Remove the thermostatic expansion valve.

E124172

37. Remove the evaporator core.

- Release the temperature sensor.

E124171

Installation

1. Install the evaporator core.
 - Secure the temperature sensor.
2. Secure the heater core housing.
 - Install the clips.
3. Install the thermostatic expansion valve.
 - Tighten the bolts to 3.5 Nm (2.5 lb.ft).
4. Install the wiring harness.
5. Install and tighten the bolt.
6. Connect the temperature sensor electrical connector.
7. Install the CC module.
 - Tighten the bolts.
8. Passenger side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
 - With assistance, install the heater and evaporator core housing.
9. Driver side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
10. Install the footwell ducts.
 - Tighten the Torx screws.
11. Connect the drain tubes to the heater housing.
12. Install the adapter panels.
 - Tighten the nuts to 6 Nm (4 lb.ft).
13. Secure the A/C refrigerant lines.

- Clean the components.
 - Install new O-ring seals.
 - Tighten the bolt to 5 Nm (4 lb.ft).
 - Tighten the nut to 6 Nm.
- 14.** Connect the bulkhead heater hoses.
- 15.** With assistance, install the instrument panel.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).
- 16.** Install the instrument panel carrier to bulkhead Torx bolt and tighten to 25 Nm (18 lb.ft).
- 17.** Install the plenum chamber panel.
For additional information, refer to: [Plenum Chamber](#) (412-01 Air Distribution and Filtering, Removal and Installation).
- 18.** Secure the heater housing.
- Tighten the screws.
- 19.** Connect the steering column intermediate shaft.
- Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).
- 20.** Install the heater housing center ducts.
- 21.** Connect the instrument panel center reinforcement fibre optic cables.
- 22.** Connect the instrument panel center reinforcement electrical connectors.
- 23.** Connect the CJB electrical connectors.
- 24.** Connect the electrical connectors to the passenger side lower A-pillar.
- 25.** Connect the ground cables to the passenger side lower A-pillar.
- Tighten the nuts to 10 Nm (7 lb.ft).
- 26.** Connect the electrical connectors to the driver side lower A-pillar.
- 27.** Connect the ground cables to the driver side lower A-pillar.
- Tighten the nuts to 10 Nm (7 lb.ft).
- 28.** Connect the 3 electrical connectors.
- 29.** Install the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
- 30.** Install the floor console.
For additional information, refer to: [Floor Console](#) (501-12 Instrument Panel and Console, Removal and Installation).
- 31.** Install the front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
- 32.** Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
- 33.** Refill the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03C Engine Cooling - V6 4.0L Petrol, General Procedures).
- 34.** Install the engine cover.
For additional information, refer to: [Engine Cover - V6 4.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Air Conditioning - V6 4.0L Petrol - Thermostatic Expansion Valve

Removal and Installation

Removal

1. Evacuate the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
2. Remove the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).

3.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Remove the thermostatic expansion valve.

- Remove the cover.
- Remove the 2 Allen bolts.
- Remove and discard the 4 O-ring seals.

E54829

Installation

1. Install the thermostatic expansion valve.
 - Clean the components.
 - Install the new O-ring seals.
 - Tighten the Allen bolts to 5 Nm (4 lb.ft).
 - Install the cover.
2. Install the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
3. Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

GENERAL

The A/C system transfers heat from the vehicle interior to the outside atmosphere to provide the heater assembly with dehumidified cool air. The system consists of:

- A compressor.
- A condenser.
- A receiver drier.
- A thermostatic expansion valve.
- An evaporator.
- Low and high pressure refrigerant lines.

The system is a sealed, closed loop, filled with a charge weight of R134a refrigerant as the heat transfer medium. Oil is added to the refrigerant to lubricate the internal components of the compressor.

Operation of the air conditioning system is controlled by the automatic temperature control (ATC) module. The A/C compressor circulates the refrigerant around the system by compressing low pressure, low temperature vapor from the evaporator and discharging the resultant high pressure, high temperature vapor to the condenser.

The A/C compressor is a variable displacement unit which is driven by the engine accessory drive belt. On 2.7L/4.0L and 5.0L vehicles, the [A/C \(air conditioning\)](#) compressor is permanently driven directly from the pulley. On 3.0L diesel vehicles the [A/C](#) compressor is driven via an electro-magnetic clutch.

To protect the refrigerant system from excessive pressure, a pressure relief valve is installed in the outlet side of the A/C compressor. The pressure relief valve vents excess pressure into the engine compartment.

For additional information, refer to: Control Components (412-04, Description and Operation).

A/C COMPRESSOR

2.7L TdV6

E131577

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 2.7L TdV6 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC \(automatic temperature control\)](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 171 cm³/rev (10.43 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.3 MPa (508 to 623 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.01 MPa (436 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

3.0L TdV6

E131579

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector
6	-	electromagnetic clutch connector

The [A/C](#) compressor fitted to 3.0L TdV6 diesel vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley and an electromagnetic clutch. Operation of the clutch is controlled by a power feed from the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 163 cm³/rev (9.95 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.1 MPa (508 to 595 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.1 MPa (449 lbf/in²).

The clutch of the [A/C](#) compressor incorporates a thermal cut-off fuse, which disconnects the power feed from the [ATC](#) module if the temperature increases to 182 ± 5 °C (360 ± 9 °F).

4.0L NA V6

E131581

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 4.0L NA V6 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 171 cm³/rev (10.43 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the [ATC](#) module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the [A/C](#) compressor. The pressure relief valve is set to open at 3.5 to 4.3 MPa (508 to 623 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.01 MPa (437 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

5.0L NA V8

E131337

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The [A/C](#) compressor fitted to 5.0L V8 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the [A/C](#) compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the [ATC](#) module.

The [A/C](#) compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 163 cm³/rev (9.95 in³/rev). The [ATC](#) module automatically adjusts the displacement of the [A/C](#) compressor between the minimum and maximum values, to match the thermal load of the evaporator. The pressure relief valve is set to open at 3.5 to 4.1 MPa (508 to 595 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.1 MPa (449 lbf/in²).

The pulley of the [A/C](#) compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

CONDENSER

- NOTE: 5.0L NA V8 version shown other installations similar

E46920

Item	Part Number	Description
1	-	right-hand (RH) end tank
2	-	Condenser core
3	-	left-hand (LH) end tank
4	-	High pressure line connector block
5	-	Condenser attachment brackets
6	-	Receiver drier pipes
7	-	Receiver drier attachment bracket

The condenser transfers heat from the refrigerant to the surrounding air to convert the high pressure vapor from the compressor into a liquid. The condenser is installed immediately in front of the radiator. Two brackets on each end tank of the condenser attach the condenser to clips on the end tanks of the radiator.

The condenser is classified as a sub-cooling condenser and consists of a fin and tube heat exchanger core installed between two end tanks. Divisions in the end tanks separate the heat exchanger into a four pass upper (condenser) section and a two pass lower (sub-cooler) section. A connector block on the left end tank of the condenser provides connections for the high pressure lines from the A/C compressor and the evaporator. Two pipes at the bottom of the right end tank of the condenser provide connections for the receiver drier.

RECEIVER DRIER

E46921

Item	Part Number	Description
1	-	Receiver drier
2	-	Clamp
3	-	Condenser RH end tank
4	-	O-ring seals
5	-	Inlet pipe
6	-	Outlet pipe
7	-	Collar
8	-	Bolt

The receiver drier removes solid impurities and moisture from the refrigerant, and provides a reservoir for liquid refrigerant to accommodate changes of heat load at the evaporator.

The receiver drier is attached to the two stub pipes on the right end tank of the condenser. A collar, located on lands on the stub pipes and secured with a bolt, attaches the stub pipes to the receiver drier. A clamp secures the body of the receiver drier to a bracket welded to the right end tank of the condenser. The inlet and outlet ports of the receiver drier are the same size, so care must be taken to install the receiver drier the correct way round on the stub pipes; to assist with installation, the inlet port is identified with the word IN etched into the receiver drier.

Refrigerant entering the receiver drier passes through a filter and a desiccant pack, then collects in the base of the unit before flowing through the outlet stub pipe back to the condenser. The desiccant and the filter are non-serviceable; the complete unit must be replaced when a change of desiccant is required.

THERMOSTATIC EXPANSION VALVE

E46922

Item	Part Number	Description
1	-	Metering valve
2	-	Housing

3	-	Diaphragm
4	-	Temperature sensitive tube
5	-	Outlet passage from evaporator
6	-	Inlet passage to evaporator

The thermostatic expansion valve meters the flow of refrigerant into the evaporator, to match the refrigerant flow with the heat load of the air passing through the evaporator.

The thermostatic expansion valve is a block type valve located behind the heater assembly, and attached to the inlet and outlet ports of the evaporator. The thermostatic expansion valve consists of an aluminum housing containing inlet and outlet passages. A ball and spring metering valve is installed in the inlet passage and a temperature sensor is installed in the outlet passage. The temperature sensor consists of a temperature sensitive tube connected to a diaphragm. The bottom end of the temperature sensitive tube acts on the ball of the metering valve. Pressure on top of the diaphragm is controlled by evaporator outlet temperature conducted through the temperature sensitive tube. The bottom of the diaphragm senses evaporator outlet pressure.

Liquid refrigerant flows through the metering valve into the evaporator. The restriction across the metering valve reduces the pressure and temperature of the refrigerant. The restriction also changes the liquid stream of refrigerant into a fine spray, to improve the evaporation process. As the refrigerant passes through the evaporator, it absorbs heat from the air flowing through the evaporator. The increase in temperature causes the refrigerant to vaporize and increase in pressure.

The temperature and pressure of the refrigerant leaving the evaporator act on the diaphragm and temperature sensitive tube, which regulate the metering valve opening and so control the volume of refrigerant flowing through the evaporator. The warmer the air flowing through the evaporator, the more heat available to evaporate refrigerant and thus the greater the volume of refrigerant allowed through the metering valve.

EVAPORATOR

E46923

The evaporator is installed in the heater assembly between the blower and the heater matrix, to absorb heat from the exterior or recirculated air. Low pressure, low temperature refrigerant changes from liquid to vapor in the evaporator, absorbing large quantities of heat as it changes state.

Most of the moisture in the air passing through the evaporator condenses into water, which drains out of the heater and through the floorpan, to the underside of the vehicle, through two drain tubes.

REFRIGERANT LINES

To maintain similar flow velocities around the system, the diameter of the refrigerant lines varies to suit the two pressure/temperature regimes. The larger diameters are installed in the low pressure/temperature regime and the smaller diameters are installed in the high pressure/temperature regime.

Low and high pressure charging connections are incorporated into the refrigerant lines for system servicing. Where auxiliary A/C is installed, connections for the auxiliary refrigerant lines are incorporated near the engine bulkhead.

Under normal operating conditions, the smaller diameter pipes (A/C compressor discharge, liquid refrigerant) are hot to the touch and the larger diameter pipes (A/C compressor suction, gaseous refrigerant) are cold to the touch.

SYSTEM OPERATION

To accomplish the transfer of heat, the refrigerant is circulated around the system, where it passes through two pressure/temperature regimes. In each of the pressure/temperature regimes, the refrigerant changes state, during which process maximum heat absorption or release occurs. The low pressure/temperature regime is from the thermostatic expansion valve, through the evaporator to the compressor; the refrigerant decreases in pressure and temperature at the thermostatic expansion valve, then changes state from liquid to vapor in the evaporator, to absorb heat. The high pressure/temperature regime is from the compressor, through the condenser and receiver drier to the thermostatic expansion valve; the refrigerant increases in pressure and temperature as it passes through the compressor, then releases heat and changes state from vapor to liquid in the condenser.

For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
8. Release the 3 ground cables from the driver side lower A-pillar.
 - Remove the 2 nuts.

9. Disconnect the 5 electrical connectors from the driver side lower A-pillar.

10. Disconnect the 3 electrical connectors.

11. Release the 3 ground cables from the passenger side lower A-pillar.

- Remove the 2 nuts.

12. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.

13. Disconnect the central junction box (CJB) three electrical connectors.

14. Disconnect 2 electrical connectors from the instrument panel center reinforcement.

15.  **CAUTION:** Cover fiber optic cable connectors to minimize dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

16. Remove the heater housing center ducts.

17. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

18. Release the heater housing from the instrument panel carrier.

- Remove the 7 Torx screws.

19. Remove the plenum chamber panel.
For additional information, refer to: [Plenum Chamber](#) (412-01 Air Distribution and Filtering, Removal and Installation).

20. Remove the instrument panel carrier to bulkhead Torx bolt.

E51204

21. With assistance, remove the instrument panel.

- Remove the 6 Torx bolts.

E52190

22.  CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect 2 heater hoses from the bulkhead.

- Release the 2 clips.

E51205

23.  CAUTION: Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Release the 2 A/C refrigerant lines.

- Remove the nut and bolt.
- Remove and discard the O-ring seals.

E51206

24. Remove the 2 adapter panels.

- Remove the 4 nuts.

25. Disconnect 2 drain tubes from the heater housing.

26. Remove the driver side footwell duct.

- Remove the 2 Torx screws.

27. Remove the passenger side footwell duct.

- Remove the 2 Torx screws.

28. Driver side: Remove the heater housing to bulkhead Torx bolt.

29. Passenger side: Remove the heater housing to bulkhead Torx bolt.

- With assistance, remove the heater and evaporator core housing.

30. Remove the A/C control module.

31. Disconnect the evaporator core temperature sensor electrical connector.

32. Disconnect the electrical connector.

33. Detach the wiring harness.

34. Remove the bolt from the support bracket.

35. Remove the heater and evaporator core housing.

- Remove the 8 clips.
- Carefully release the 2 clips.

36. Remove the thermostatic expansion valve.

E124172

37. Remove the evaporator core.

- Release the temperature sensor.

E124171

Installation

1. Install the evaporator core.
 - Secure the temperature sensor.
2. Secure the heater core housing.
 - Install the clips.
3. Install the thermostatic expansion valve.
 - Tighten the bolts to 3.5 Nm (2.5 lb.ft).
4. Install the wiring harness.
5. Install and tighten the bolt.
6. Connect the temperature sensor electrical connector.
7. Install the CC module.
 - Tighten the bolts.
8. Passenger side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
 - With assistance, install the heater and evaporator core housing.
9. Driver side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
10. Install the footwell ducts.
 - Tighten the Torx screws.
11. Connect the drain tubes to the heater housing.
12. Install the adapter panels.
 - Tighten the nuts to 6 Nm (4 lb.ft).
13. Secure the A/C refrigerant lines.

- Clean the components.
 - Install new O-ring seals.
 - Tighten the bolt to 5 Nm (4 lb.ft).
 - Tighten the nut to 6 Nm.
- 14.** Connect the bulkhead heater hoses.
- 15.** With assistance, install the instrument panel.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).
- 16.** Install the instrument panel carrier to bulkhead Torx bolt and tighten to 25 Nm (18 lb.ft).
- 17.** Install the plenum chamber panel.
For additional information, refer to: [Plenum Chamber](#) (412-01 Air Distribution and Filtering, Removal and Installation).
- 18.** Secure the heater housing.
- Tighten the screws.
- 19.** Connect the steering column intermediate shaft.
- Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).
- 20.** Install the heater housing center ducts.
- 21.** Connect the instrument panel center reinforcement fibre optic cables.
- 22.** Connect the instrument panel center reinforcement electrical connectors.
- 23.** Connect the CJB electrical connectors.
- 24.** Connect the electrical connectors to the passenger side lower A-pillar.
- 25.** Connect the ground cables to the passenger side lower A-pillar.
- Tighten the nuts to 10 Nm (7 lb.ft).
- 26.** Connect the electrical connectors to the driver side lower A-pillar.
- 27.** Connect the ground cables to the driver side lower A-pillar.
- Tighten the nuts to 10 Nm (7 lb.ft).
- 28.** Connect the 3 electrical connectors.
- 29.** Install the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).

Air Conditioning - V8 5.0L Petrol - Air Conditioning (A/C) Pressure Transducer

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Recover the A/C refrigerant.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

3. CAUTIONS:

Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

To prevent damage to components, use an additional wrench when loosening or tightening unions.

Remove the A/C pressure transducer.

- Disconnect the electrical connector.
- Remove and discard the seal.

E53157

Installation

1. Install the A/C pressure transducer.
 - Clean the component mating faces.
 - Install a new seal.
 - Tighten the transducer to 10 Nm (7 lb.ft).
 - Connect the electrical connector.
2. Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2	-	ACCM (auxiliary climate control module)
3	-	Air distribution ducts
4	-	Auxiliary climate control assembly

5	-	Refrigerant lines
6	-	Rear blower relay

GENERAL

The auxiliary climate control system provides additional air conditioning for the second and third row seat occupants. The auxiliary climate control system consists of:

- An auxiliary climate control assembly.
- A refrigerant circuit.
- A heating circuit.
- A distribution system.
- An ACCM.

The automatic temperature control (ATC) module, of the main air conditioning system, is also used in the control of the auxiliary climate control system.

For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

Cabin air is recirculated through the auxiliary climate control assembly, where the air is temperature regulated and then directed through the distribution system to registers in the roof, on the C pillars and on the left side of the loadspace. The volume, temperature and distribution of the air from the auxiliary climate control assembly can be manually controlled by the ACCM or automatically controlled by the ATC module.

16	-	Evaporator inlet pipe
17	-	Heater core
18	-	Temperature blend door motor
19	-	Face level outlet

The auxiliary climate control assembly is a reheat unit, which cools the air to a constant value then reheats it as necessary to produce the required temperature. The assembly is installed on the left side of the loadspace, behind the rear quarter panel. A grille in the rear quarter panel allows air to flow from the loadspace into the auxiliary climate control assembly.

The auxiliary climate control assembly consists of a casing, formed from a series of plastic molding, which contains:

- A blower
- A blower control module
- An evaporator
- A heater core
- A temperature blend door
- A distribution door
- An evaporator temperature sensor.

Refrigerant and coolant lines from the engine compartment are connected to pipes from the evaporator and the heater core immediately below the loadspace floor. Where the pipes, and the evaporator drain tube, pass through the loadspace floor, the aperture is sealed by a seal plate.

Internal passages, integrated into the casing of the auxiliary climate control assembly, guide the air from the blower through the evaporator and heater core to the distribution outlets.

The temperature blend door regulates the flow of air through the heater core to control the temperature of the air leaving the auxiliary climate control assembly. A stepper motor installed on the rear of the casing operates the temperature blend door.

The distribution door regulates the flow of air through the face level outlet and the foot level outlet. A stepper motor installed on the top of the casing operates the distribution door.

The temperature blend stepper motor and the distribution stepper motor are both connected to a Local Interconnect (LIN) bus, which also connects the ACCM with the ATC module. Each stepper motor incorporates a microprocessor which operates the motor in response to LIN bus messages from the ACCM. The stepper motors are powered by a feed from the ATC module, and share a ground connection with the rear blower control module.

The ACCM determines the positions of the distribution and temperature blend doors by using either their closed or open position as a datum and memorizing the steps that it drives the individual stepper motors. Each time the ACCM is activated by the ATC module, it checks the memorized position of the stepper motors against fixed values for the current distribution and temperature settings on the control panel. If there is an error, the ACCM calibrates the applicable stepper motor, to re-establish the datums, by driving them fully closed or open before re-setting them to their nominal selected position. A calibration run can also be invoked using T4.

Air Flow Through Auxiliary Climate Control Assembly

E47876

Item	Part Number	Description
1	-	Temperature blend door
2	-	Auxiliary climate control assembly casing
3	-	Face level outlet
4	-	Distribution door
5	-	Heater core
6	-	Evaporator
7	-	Evaporator drain tube
8	-	Blower

The blower is in the air inlet of the auxiliary climate control assembly, and consists of an open hub, centrifugal fan powered by an electric motor. Operation of the blower is controlled by the ACCM, using the rear blower relay in the battery junction box (BJB) and the blower control module. The blower control module is installed in the auxiliary climate control assembly downstream of the blower, where any heat generated during operation is dissipated by the air flow. A wiring harness on the auxiliary climate control assembly connects the blend door motor, distribution door motor, blower and blower control module to the vehicle wiring.

Blower Control Module

E47886

When the blower is required, the ACCM energizes the coil of the rear blower relay. The energized rear blower relay supplies battery power to the blower motor, which is connected to ground through the blower control module. The speed of the blower is controlled by the blower control module, which regulates the blower motor voltage in response to a pulse width modulation (PWM) signal from the ACCM. To vary the blower motor voltage the ACCM varies the duty cycle of the signal.

Evaporator Temperature Sensor

E47884

The evaporator temperature sensor is a negative temperature coefficient (NTC) thermistor installed in the auxiliary climate control assembly on the downstream side of the evaporator. The evaporator temperature sensor supplies a temperature signal to the ACCM.

REFRIGERANT CIRCUIT

Two refrigerant lines, low pressure and high pressure, connect the evaporator in the auxiliary climate control assembly to the front air conditioning (A/C) refrigerant system. On the auxiliary climate control assembly, a solenoid valve and a thermostatic expansion valve control the flow of refrigerant through the evaporator.

Refrigerant Lines

E47877

Item	Part Number	Description
1	-	In-line connections
2	-	Auxiliary climate control assembly
3	-	Connections to auxiliary climate control assembly

The refrigerant lines are routed around the left rear wheel arch and along the left-hand (LH) underside of the vehicle, and connected to the front A/C refrigerant system at the rear of the engine compartment. The refrigerant lines consist of sections of aluminum alloy pipes. All except the front section of the pipes are insulated with foam rubber sleeving.

Solenoid Valve

E47885

The solenoid valve allows the auxiliary climate control assembly to be isolated from the front A/C refrigerant system. Operation of the solenoid valve is controlled by the ACCM switching a ground.

Thermostatic Expansion Valve

E47878

Item	Part Number	Description
1	-	Thermostatic expansion valve
2	-	Capillary tube
3	-	Temperature bulb

The thermostatic expansion valve meters the flow of refrigerant into the evaporator, to match the heat load of the air passing through the auxiliary climate control assembly.

The thermostatic expansion valve is installed in the inlet line to the evaporator. Liquid refrigerant flows through the valve to the evaporator. The restriction across the valve reduces the pressure and temperature of the refrigerant and changes it to a fine spray, which improves the evaporation process. Valve opening is controlled by the pressure in a capillary tube containing a temperature sensitive fluid. One end of the capillary tube is connected to a diaphragm housing on the thermostatic expansion valve, the other end of the capillary tube is sealed and attached to the refrigerant outlet line of the evaporator. As the temperature of the refrigerant leaving the evaporator changes, a corresponding change of capillary tube pressure and valve opening are produced. The warmer the refrigerant leaving the evaporator becomes, the greater the volume of refrigerant allowed through the valve.

Evaporator

The evaporator is installed in the auxiliary climate control assembly between the blower and the heater matrix, to absorb heat from the recirculated air. Low pressure, low temperature refrigerant changes from liquid to vapor in the evaporator, absorbing large quantities of heat as it changes state. Most of the moisture in the air passing through the evaporator condenses into water, which drains out of the auxiliary climate control assembly through the evaporator drain tube.

E47880

Item	Part Number	Description
1	-	Second row left face level air duct
2	-	Cross-car air duct
3	-	Second row right face level air duct
4	-	Right C pillar air duct
5	-	Third row right face level register
6	-	Second row face level registers
7	-	Third row foot level air duct
8	-	Third row foot level registers
9	-	Third row left face level register
10	-	Left C pillar air duct

The distribution system consists of a network of air ducts that supply air from the outlets of the auxiliary climate control assembly to registers installed in:

- The headliner, to the left and right of the second row interior lamp, to provide face level ventilation for second row seat occupants
- The left and right C pillar finishers, to provide face level ventilation for third row seat occupants
- The loadspace left side molding, to provide foot level ventilation for third row passengers.

The registers can all be adjusted to control the direction and volume of the air flow.

ACCM

E47883

Item	Part Number	Description
1	-	Electrical connector
2	-	Blower switch
3	-	Distribution switch
4	-	Temperature switch

The ACCM allows manual adjustment of the output from the auxiliary climate control assembly. The ACCM is installed in the headliner immediately behind the row 2 interior lamp. An integral control panel contains separate rotary switches for temperature, distribution and blower speed. When the ACCM is in manual mode, amber light emitting diode (LED)s in the switch surrounds illuminate to indicate the current settings of the system and function symbols in the switch surrounds are illuminated when the side lamps or headlamps are on.

The ACCM is disabled when the auxiliary climate control switch on the ATC module is selected off. When the auxiliary climate control switch is selected to automatic or manual, the ACCM is enabled by the connection of a power feed from the ATC module. The same power feed also supplies the stepper motors in the auxiliary climate control assembly.

When it is enabled, the ACCM operates as a slave unit to the ATC module. The ACCM sends status signals on the LIN (local interconnect network) bus to the ATC module, which replies with command signals of the required temperature, distribution and blower settings. The ACCM then outputs the necessary drive signals to the auxiliary climate control assembly:

- In the automatic mode, the command signals are derived from the comfort strategy in the ATC module. The temperature setting is calculated from the mean of the two temperature settings on the ATC module.
- In the manual mode, the command signals reflect the temperature, distribution and blower speed set by the switches on the ACCM control panel. Temperature control by the auxiliary climate control system may be compromised if the temperature settings on the ATC module are set to maximum hot or cold.

ACCM Harness Connector C0695

Auxiliary Climate Control - Auxiliary Climate Control

Diagnosis and Testing

Principle of Operation

For a detailed description of the auxiliary climate control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Auxiliary Climate Control](#) (412-03E Auxiliary Climate Control, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Auxiliary drive belt condition and tension ● Compressor condition and installation ● Condenser condition and installation/blockage ● Air conditioning hoses and pipes ● Receiver/drier condition and installation ● Cooling fan 	<ul style="list-style-type: none"> ● Fuses ● Harnesses ● Electrical connector(s) ● Relays ● Sensors ● Control panel(s) ● Air conditioning compressor

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Poor or no cooling	<ul style="list-style-type: none"> ● Drive belt fault ● Compressor fault ● Distribution motor/flap fault ● Refrigerant leak ● In-vehicle temperature sensor fault ● Refrigerant pressure sensor fault 	Check the drive belt condition and tension (see visual inspection). Check the compressor operation (observe the compressor as the engine is idling with the air conditioning switched on. If the compressor runs erratically or does not run. Carry out the distribution motor self test. Refer to the relevant workshop manual section. Check for sensor DTCs. Refer to the DTC index. Check the refrigerant system using your charging station.
Noise	<ul style="list-style-type: none"> ● Drive belt fault ● Compressor fault ● Compressor pulley fouling ● Refrigerant overcharged 	Confirm the air conditioning as the source of the noise by listening for the noise with the air conditioning switched off. Refer to the relevant workshop manual section. Check the refrigerant system using your charging station.
Water entry into cabin	<ul style="list-style-type: none"> ● Heater matrix leak ● Blocked evaporator drain tubes 	Check for coolant loss. Pressure test the cooling system as necessary. Check and clear the evaporator drain tubes as necessary.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Climate Control Module \(HVAC\)](#) (100-00 General Information, Description and Operation).

Auxiliary Climate Control - Thermostatic Expansion Valve

Removal and Installation

Removal

 **WARNING:** Eye protection must be worn.

1. Remove the climate control assembly.
For additional information, refer to: [Auxiliary Climate Control Assembly](#) (412-03E Auxiliary Climate Control, Removal and Installation).

 **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

Remove the TXV assembly.

- Disconnect the electrical connector.
- Remove the 2 bolts.
- Remove the 2 screws.
- Discard the O-ring seals.

Installation

1. Install the TXV assembly.
 - Install new O-ring seals.
 - Install the bolts and tighten to 10 Nm (7 lb.ft).
 - Tighten the screws.
2. Install the climate control assembly.
For additional information, refer to: [Auxiliary Climate Control Assembly](#) (412-03E Auxiliary Climate Control, Removal and Installation).

Auxiliary Climate Control - Heater Core

Removal and Installation

Removal

 **WARNING:** Eye protection must be worn.

1. Remove the climate control assembly.
For additional information, refer to: [Auxiliary Climate Control Assembly](#) (412-03E Auxiliary Climate Control, Removal and Installation).

 **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

Remove the TXV assembly.

- Disconnect the electrical connector.
- Remove the 2 bolts.
- Remove the 2 screws.
- Discard the O-ring seals.

 **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Remove the heater core.

- Carefully release the clips.

4. NOTE: Do not disassemble further if the component is removed for access only.

Remove the heater core, inlet and outlet pipes.

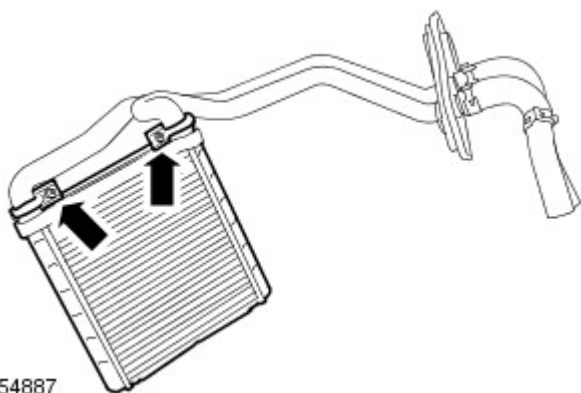

- Release the 2 clips.
- Discard the O-ring seals.

E54885

E54886

E54887

Installation

1. Connect the heater core inlet and outlet pipes.
 - Install the new O-ring seals.
 - Position and secure in the clips.

2. Install the heater core.

- Install the heater core.
- Secure in the 2 clips.

3. Install the TXV assembly.

- Install new O-ring seals.
- Install the bolts and tighten to 10 Nm (7 lb.ft).
- Tighten the screws.

4. Install the climate control assembly.

For additional information, refer to: [Auxiliary Climate Control Assembly](#) (412-03E Auxiliary Climate Control, Removal and Installation).

Auxiliary Climate Control - Evaporator Core

Removal and Installation

Removal

 **WARNING:** Eye protection must be worn.

1. Remove the climate control assembly.
For additional information, refer to: [Auxiliary Climate Control Assembly](#) (412-03E Auxiliary Climate Control, Removal and Installation).

 **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

Remove the TXV assembly.

- Remove the 2 bolts.
- Remove the 2 screws.
- Discard the O-ring seals.
- Disconnect the electrical connector.

 **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Remove the heater core.

- Carefully release the clips.

E54885

E54886

E54889

4. Remove 1 screw from the air distribution servo.

5. Separate the climate control unit.

- Remove the 11 screws.
- Remove the 6 clips.
- Release the 7 clips.

6. Remove the evaporator core.

- Remove the evaporator end trim.

Installation

1. Install the evaporator core.

- Install the evaporator end trim

2. Assemble the climate control unit.

- Secure the clips.
- Install the screws.
- Install the clips.

3. Install the distribution motor.

- Tighten the screw.

4. Install the heater core.

- Install the heater core.
- Secure in the 2 clips.

5. Install the TXV assembly.

- Install new O-ring seals.
- Install the bolts and tighten to 10 Nm (7 lb.ft).
- Tighten the screws.

6. Install the climate control assembly.

For additional information, refer to: [Auxiliary Climate Control Assembly](#) (412-03E Auxiliary Climate Control, Removal and Installation).

Auxiliary Climate Control - Auxiliary Climate Control Assembly

Removal and Installation

Removal

⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the LH C-pillar lower trim panel
For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Evacuate the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Support the exhaust system. Release the center, left and right rear mountings.

6. Remove the exhaust heat shield.

- Remove the 4 nuts.

7. Remove the spare wheel and tire.
8. Clamp the relevant hose, to minimise coolant loss.

⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

Disconnect the A/C pipes.

- Remove the 2 bolts.
- Discard the O-ring seals.

10.  **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

• **NOTE:** Some fluid spillage is inevitable during this operation.

Disconnect the 2 coolant hoses.

- Position a container to collect the fluid.
- Release the 2 clips.

11. Release the sealing plate.

- Remove the 3 bolts.

12. Remove the climate control assembly.

- Disconnect the 2 electrical connectors.
- Remove the 3 bolts.

Installation

1. Install the climate control assembly.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Connect and secure the electrical connectors.

2. Install the sealing plate.

- Tighten the bolts to 10 Nm (7 lb.ft).

3. Connect and secure the coolant hoses.

- Secure the clips.
- Remove the hose clamps.

4. Connect the A/C pipes.
 - Clean the component mating faces.
 - Install the O-ring seals.
 - Tighten the 2 bolts to 10 Nm (7 lb.ft).
 5. Install the heat shield.
 - Tighten the 4 nuts.
 6. Secure the exhaust mountings.
 7. Fill the A/C system.

For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
 8. Install the C-pillar lower trim panel.

For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 9. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
 10. Install the spare wheel and tire.
 - Stow the tool kit.
 11. Connect the exhaust extraction hoses to the tail pipes.
 12. Remove the coolant expansion tank cap.
 - Top-up the coolant.
 13. Start and run the engine.
 - Hold the engine speed at 2,500 RPM for 30 seconds.
 - Return the engine to idle for 30 seconds.
 - Repeat the above procedure a further four times.
 14. **NOTE:** When the coolant bleed is complete and prior to installing the expansion tank cap, top up the expansion tank 30mm above the maximum level.
- Install the coolant expansion tank cap.
15. Run the engine until the thermostat opens.
 16. Switch the engine off and allow to cool.
 17. Check and top-up the coolant if required.

Auxiliary Climate Control - Auxiliary Blower Motor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the LH C-pillar lower trim panel
For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. **NOTE: Note the fitted position.**

Remove the blower motor.

- Disconnect the electrical connector.
- Remove the 3 screws.

Installation

1. Install the blower motor.
 - Tighten the screws.
 - Connect and secure the electrical connector.
2. Install the C-pillar lower trim panel.
For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Auxiliary Climate Control - Auxiliary Temperature Blend Door Actuator

Removal and Installation

Removal

 **WARNING:** Eye protection must be worn.

1. Remove the climate control assembly.
For additional information, refer to: [Auxiliary Climate Control Assembly](#) (412-03E Auxiliary Climate Control, Removal and Installation).
2. **NOTE:** Note the fitted position.

Remove the blend door motor.

- Disconnect the electrical connector.
- Remove the 3 screws.

Installation

1. **NOTE:** Align to the position noted on removal.

Install the blend motor.

- Tighten the screws.
- Connect and secure the electrical connector.

2. Install the climate control assembly.
For additional information, refer to: [Auxiliary Climate Control Assembly](#) (412-03E Auxiliary Climate Control, Removal and Installation).

Auxiliary Climate Control - Auxiliary Blend Door Actuator

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the LH C-pillar lower trim panel
For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. **NOTE:** Note the fitted position.

Remove the air distribution motor.

- Disconnect the electrical connector.
- Remove the 3 screws.

Installation

1. **NOTE:** Align to the position noted on removal.

Install the distribution motor.

- Tighten the screws.
 - Connect and secure the electrical connector.
2. Install the C-pillar lower trim panel.
For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Auxiliary Climate Control - Auxiliary Blower Motor Control Module

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the LH C-pillar lower trim panel
For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. **NOTE:** Note the fitted position.

Remove the blower motor resistor.

- Disconnect the electrical connector.
- Remove the 2 screws.

Installation

1. **NOTE:** Align to the position noted on removal.

Install the resistor.

- Tighten the screws.
 - Connect and secure the electrical connector.
2. Install the C-pillar lower trim panel.
For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Control Components - Control Components

Description and Operation

COMPONENT LOCATIONS

E 132921

Item	Part	Description
------	------	-------------

	Number	
1	-	Pollution sensor (Japan only)
2	-	Sunlight sensor
3	-	automatic temperature control (ATC) module
4	-	Center instrument panel switch pack
5	-	Evaporator temperature sensor
6	-	In-vehicle temperature sensor (all except Japan), or in-vehicle temperature and humidity sensor (Japan only)
7	-	Refrigerant pressure sensor
8	-	Ambient air temperature sensor

GENERAL

The control system operates the air conditioning (A/C) system and the heating and ventilation system to control the temperature, volume and distribution of air from the heater.

The system is a dual zone system that automatically adjusts the temperature, volume and distribution of the air from the heater to maintain the individual temperature levels selected for the left-hand (LH) and right-hand (RH) sides of the passenger compartment. The system also has manual overrides for the intake air source, blower speed and air distribution. The system includes:

- An ATC module.
- Center instrument panel switch pack
- An ambient temperature sensor.
- A refrigerant pressure sensor.
- An evaporator temperature sensor.
- An in-vehicle temperature sensor.
- A sunlight sensor.

Vehicles in the Japan market also incorporate:

- A pollution sensor.
- A humidity sensor.

ATC MODULE

E128058

The [ATC \(automatic temperature control\)](#) module is mounted on the outboard end of the air inlet duct, behind the front passenger side of the instrument panel.

The ATC module processes inputs from the center instrument panel switch pack, system sensors and the medium speed controller area network (CAN) bus, then outputs the appropriate control signals to the A/C system and the heating and ventilation system. In addition to controlling the A/C system and the heating and ventilation system, the ATC module also controls the following:

- The front seat heaters.
For additional information, refer to: [Seats \(501-10, Description and Operation\)](#).
- The rear window heater.
For additional information, refer to: [Glass, Frames and Mechanisms \(501-11 Glass, Frames and Mechanisms, Description and Operation\)](#).
- The windshield heater.
For additional information, refer to: [Glass, Frames and Mechanisms \(501-11 Glass, Frames and Mechanisms, Description and Operation\)](#).
- The windshield washer jets and exterior mirror heaters.
For additional information, refer to: [Rear View Mirrors \(501-09 Rear View Mirrors, Description and Operation\)](#).

CENTER INSTRUMENT PANEL SWITCH PACK

E132922

Item	Part Number	Description
1	-	LH temperature switch
2	-	LH front seat heater switch
3	-	Automatic mode switch
4	-	RH front seat heater switch
5	-	RH temperature switch
6	-	Heated windshield switch
7	-	Heated rear window switch
8	-	Defrost program switch
9	-	Air recirculation switch
10	-	A/C (air conditioning) control switch
11	-	Blower control switch
12	-	Windshield and side window distribution switch
13	-	Rear environment
14	-	Footwell distribution switch
15	-	Face distribution switch

The switches on the **Center instrument panel switch pack** have the following functions:

- **LH and RH Temperature Switches:** Adjusts the nominal temperature settings of the LH and RH sides of the passenger compartment. The switch can rotate through 270°, between full cold and full hot. The switch surrounds are graduated in 2° increments between 16 and 28 °C. Minor detents define 1 °C steps over the range of the switch. Amber light emitting diode (LED)s in the switch surround illuminate to indicate the temperature setting. When maximum cold is selected, the ATC module also automatically sets the air source to recirculated air, blower speed to maximum and distribution to face. When maximum hot is selected, the ATC module also automatically sets the air source to fresh air, blower speed to maximum and distribution to footwell.
- **LH and RH Seat Heater Switches:** Activates the heater elements in the seat cushion and seat back at one of two heat levels. The first press of the switch energizes the heater elements at the higher heat setting and illuminates two LEDs in the switch. A second press of the switch sets the heater elements to the lower heat setting and extinguishes one of the LEDs. A further press of the switch de-energizes the heater elements and extinguishes the second LED. The seat heaters remain on until selected off or the engine is turned off.
- **Blower Switch:** For manual adjustment of blower speed. The switch can rotate through 240°, from off to maximum speed. Eight primary detents define the off position and seven blower speeds. Minor detents define small steps between the primary detents. When blower speed is manually adjusted, amber LEDs in the switch surround illuminate to indicate the selected blower speed. The LEDs remain off when blower speed is under automatic control.
- **Automatic Mode Switch:** Activates the automatic modes for the A/C system, blower speed and distribution. Separate amber LEDs in the automatic mode switch illuminate to show when the blower and the distribution are in automatic mode. Manually selecting the blower speed or a distribution switch extinguishes the related LED.
- **A/C control switch:** Controls activation of the [A/C](#) compressor. Allows the [A/C](#) compressor to be selected off for economy operation. A [LED \(light emitting diode\)](#) switch is illuminated when the [A/C](#) compressor is selected on.
- **Defrost program switch:** Activates a program that automatically selects: inlet air to fresh air; distribution to screen only; blower to speed 5; rear screen heater on; windshield heater on (where fitted), A/C system to automatic mode. An amber LED in the switch is illuminated while the defrost program is active.
- **Heated windshield switch:** Energizes the windshield heater for a set time period, until the switch is pressed again or until the engine stops, whichever occurs first. An amber LED in the switch is illuminated while the heater is on.
- **Heated rear window switch:** Enabled only with the engine running. Pressing the switch energizes the rear window

heater for a set time period, until the switch is pressed again or until the engine stops, whichever occurs first. An amber LED in the switch is illuminated while the heater is on.

- **Air recirculation switch:** For selection of fresh or recirculated air. On models without pollution sensing, an amber LED in the switch is illuminated when recirculated air is selected. On models with pollution sensing, the recirculation switch incorporates two amber LED. The first press of the switch sets the recirculation flaps to automatic mode and illuminates one LED. A second press of the switch manually selects recirculated air and illuminates the second LED. A further press of the switch manually selects fresh air and extinguishes the two LEDs.
- **Distribution Switches (Windshield, Face and Footwell):** For manual selection of air distribution in any combination of windshield, face and footwell outlets. Each switch has a LED which illuminates when the related distribution mode is selected.

AMBIENT AIR TEMPERATURE SENSOR

E43580

The ambient air temperature sensor is a negative temperature coefficient (NTC) thermistor that provides the ATC module with an input of external air temperature. The sensor is attached to a bracket on the rear of the bumper beam, on the vehicle center-line.

REFRIGERANT PRESSURE SENSOR

E43581

The refrigerant pressure sensor provides the ATC module with a pressure input from the high pressure side of the refrigerant system. The refrigerant pressure sensor is located in the refrigerant line between the condenser and the thermostatic expansion valve.

The ATC module supplies a 5 V reference voltage to the refrigerant pressure sensor and receives a return signal voltage, between 0 and 5 V, related to system pressure.

The ATC module uses the signal from the refrigerant pressure sensor to protect the refrigerant system from extremes of pressure and to calculate A/C compressor load on the engine. The ATC module also transmits the A/C compressor load value to the engine control module (ECM), via the medium speed CAN bus, instrument cluster and high speed CAN bus, for use in controlling the speed of the engine cooling fan.

To protect the system from extremes of pressure, the ATC module sets the A/C compressor to the minimum flow position if the pressure:

- Decreases to 1.9 ± 0.2 bar (27.5 ± 3 lbf/in²); the ATC module loads the A/C compressor again when the pressure increases to 2.8 ± 0.2 bar (40.5 ± 3 lbf/in²).
- Increases to 33 ± 1 bar (479 ± 14.5 lbf/in²); the ATC module loads the A/C compressor again when the pressure decreases to 23.5 ± 1 bar (341 ± 14.5 lbf/in²).

EVAPORATOR TEMPERATURE SENSOR

E43582

The evaporator temperature sensor is a NTC thermistor that provides the ATC module with a temperature signal from the downstream side of the evaporator. The evaporator temperature sensor is installed in the right side of the heater assembly casing.

The ATC module uses the input from the evaporator temperature sensor to control the load of the A/C compressor and thus, the operating temperature of the evaporator.

IN-VEHICLE TEMPERATURE SENSOR

E43583

The in-vehicle temperature sensor is a NTC thermistor installed behind a grill in the instrument panel, on the inboard side of the steering column. The sensor is connected to a tube, the other end of which is connected to a venturi on the side casing of the heater. An air bleed from the heater, through the venturi, induces a flow of air down the tube, which draws cabin air through the grill and over the sensor.

HUMIDITY SENSOR (WHERE FITTED)

The humidity sensor is a capacitive device integrated into the in-vehicle temperature sensor (see above).

The humidity sensor element is constructed from film capacitors on different substrates. The dielectric is a polymer which absorbs or releases water proportional to the relative humidity of the air being drawn through the sensor, and thus changes the capacitance of the capacitor. For protection, the sensor element is contained in a nylon mesh cover.

The humidity sensor and the in-vehicle temperature sensor are connected to a PCB (printed circuit board) inside the sensor housing. The PCB is powered by a 5V feed from the ATC module. Separate signals of temperature and relative humidity are transmitted from the PCB to the ATC module.

SUNLIGHT SENSOR

E132923

The sunlight sensor consists of two photoelectric cells that provide the ATC module with inputs of light intensity, one as sensed coming from the left of the vehicle and one as sensed coming from the right. The inputs are a measure of the solar heating effect on vehicle occupants, and are used by the ATC module to adjust blower speed, temperature and distribution to improve comfort. The sensor is installed in the center of the instrument panel upper surface and is powered by a 5V feed from the ATC module.

POLLUTION SENSOR (WHERE FITTED)

E43588

The pollution sensor allows the ATC module to monitor the ambient air for the level of hydrocarbons and oxidized gases such as nitrous oxides, sulphur oxides and carbon monoxide. The sensor is attached to a bracket on the front-end carrier, at the top left corner of the condenser.

The pollution sensor is powered by a battery voltage feed from the ATC module, and returns separate signals of hydrocarbon and oxidized gases.

If there is a fault with the pollution sensor, the ATC module disables the automatic operation of the recirculation door.

SYSTEM OPERATION

A/C Compressor Control

The variable displacement A/C compressor is permanently driven by the engine. The flow of refrigerant through the A/C compressor, and the resultant system pressure and evaporator operating temperature, is regulated by the refrigerant solenoid valve. Operation of the refrigerant solenoid valve is controlled by the ATC module using a 400 Hz pulse width modulation (PWM) signal. The duty cycle of the PWM signal is calculated using the following parameters:

- A/C compressor torque.
- A/C compressor torque maximum.
- A/C cooling status.
- A/C demand.
- A/C refrigerant pressure.
- Ambient air temperature.
- Blower speed.
- Engine cranking status.
- Evaporator temperature.
- Transmission gear status.

When A/C is selected, the ATC module maintains the evaporator at an operating temperature that varies with the in-vehicle cooling requirement. The ATC module increases the evaporator operating temperature, by reducing the refrigerant flow, as the requirement for air cooling decreases, and vice versa. During an increase of evaporator operating

temperature, to avoid compromising the dehumidification function, the ATC module controls the rate of temperature increase, which keeps the cabin humidity at a comfortable level.

When the economy mode is selected, the PWM signal holds the refrigerant solenoid valve in the minimum flow position, effectively switching off the A/C function.

The ATC module incorporates limits for the operating pressure of the refrigerant system. When the system approaches the high pressure limit, the duty cycle of the PWM signal is progressively reduced until the system pressure decreases. When the system pressure falls below the low pressure limit, the duty cycle of the PWM signal is held at its lowest setting, so that the A/C compressor is maintained at the minimum stroke, to avoid depletion of lubricant from the A/C compressor. The protection algorithm is calculated at a high rate, to enable early detection of the rapid pressure changes possible if a system fault develops.

A/C Compressor Torque

The ATC module uses refrigerant pressure, evaporator temperature and engine speed to calculate the torque being used to drive the A/C compressor. The calculated value is broadcast on the medium speed CAN bus for the ECM, which uses the calculated value for idle speed control and fueling control. The ATC module also compares the calculated value with a maximum A/C compressor torque value received from the ECM over the medium speed CAN bus. If the calculated value exceeds the maximum value, the ATC module signals the refrigerant solenoid valve to reduce the refrigerant flow and so reduce the torque being used to drive the A/C compressor. By reducing the maximum A/C compressor torque value, the ECM is able to reduce the load on the engine when it needs to maintain vehicle performance or cooling system integrity.

Idle Speed Control

In order to maintain A/C cooling performance, the ATC module requests an increase in engine idle speed if the evaporator temperature starts to rise while the refrigerant solenoid valve is already set to the maximum flow rate. The increase in engine idle speed is requested in three stages, using a medium speed CAN bus message to the ECM. For additional information, refer to:

[Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation),
[Electronic Engine Controls](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Description and Operation),
[Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

The need for a change in idle speed is determined as follows:

- If the evaporator temperature increases by 3 °C (5.4 °F), or to 6 °C (10.8 °F) above the target operating temperature, over a 10 seconds period, the first stage of idle speed increase is requested.
- When the first stage of idle speed increase is set, if the evaporator temperature increases by 3 °C (5.4 °F), or increases to 12 °C (21.6 °F) above the target operating temperature, over a 9 seconds period, the second stage of idle speed increase is requested.
- When the second stage of idle speed increase is set, if the evaporator temperature increases by 3 °C (5.4 °F), or increases to 15 °C (27 °F) above the target operating temperature, over a 10 seconds period, the third stage of idle speed increase is requested.
- When an idle speed increase is set, if the evaporator temperature decreases by 3 °C (5.4 °F) over a 10 seconds period, the next stage down of idle speed increase is requested.

Electrical Load Management

The ATC module manages the vehicle electrical loads to:

- Maintain the vehicle battery in a healthy state of charge.
- Ensure adequate power is available for defrost demisting during engine warm-up.
- Ensure adequate power is available for A/C during extended periods with the engine at idle speed.
- To maintain system voltage within acceptable limits.
- To provide adequate power to meet customer expectations.

Electrical load management is achieved by increasing the engine idle speed and controlling the electrical load of systems that do not affect the driveability or safety of the vehicle.

During the engine warm-up period, the ATC module manages the electrical load to make sure that the battery voltage is maintained above a pre-determined level. The battery voltage level that is maintained and the duration of the start period varies with ambient air temperature and engine coolant temperature (ECT). After the engine warm-up period, the ATC module manages the electrical load to make sure that the requested electrical load does not exceed the generator output.

The duration of the engine warm-up period depends on the ambient air temperature and the ECT, as detailed in the following table:

Engine Warm-up Times

Ambient Air Temperature, °C (°F)	ECT, °C (°F)			
	<10 (<50)	>10 to <30 (>50 to <86)	>30 to <60 (>86 to <140)	>60 (>140)
	Warm-up Period, Minutes			
>10 (>50)	15	15	15	15
>5 to <10 (>41 to <50)	15	15	15	15
>0 to <5 (>32 to <41)	10	15	15	15
>-10 to <0 (>14 to <32)	10	10	15	15
<-10 (<14)	5	5	10	15

The ATC module calculates the electrical load from the battery voltage and generator output voltage, and compares the result against the maximum load available from the generator. The calculation is averaged across the first 20 seconds after the engine starts, and subsequently averaged every 60 seconds. When the engine is turned off, the ATC module stores the status of the electrical load management for 20 seconds. If the engine is re-started within the 20 seconds, the ATC module resumes electrical load management using the stored status. If the engine is re-started after the 20 seconds, the timers are reset and the ATC module re-calculates the status.

If the electrical load is more than the maximum load available, the ATC module requests an increase of engine idle speed

using the medium speed CAN bus message to the ECM. If an electrical load imbalance remains after an increase in engine idle speed, or if the electrical load is more than the capacity of the charging system, the ATC module reduces the electrical load by reducing the power of some vehicle systems or inhibiting their operation. The number of systems controlled depends on the electrical load reduction required. The systems controlled and the order in which their power is reduced or they are inhibited are contained in three priority tables. The table used depends on the ambient air temperature, battery temperature and ECT:

- The cold start table is used when the ambient air temperature is less than 5 °C (41 °F) and the ECT is less than 30 °C (86 °F).
- The hot start table is used when the ambient air temperature is 5 °C (41 °F) or more and the ECT is less than 30 °C (86 °F).
- The continuous table is used when battery temperature is more than 5 °C (41 °F) and the ECT is more than 50 °C (122 °F).
- If none of the above conditions are met, the ATC module adopts the last used table.

Cold Start Electrical Load Management

Priority		System
Power Reduction	Inhibited	
1	-	Air suspension
2	-	Front seat heaters
3	-	Entertainment system
-	4	Front seat heaters
5	-	Rear window heater
6	-	Windshield washer jet and exterior mirror heaters
-	7	Windshield washer jet and exterior mirror heaters
8	-	Windshield heater
9	-	Climate control blower
-	10	Rear window heater
-	11	Windshield heater

Hot Start Electrical Load Management

Priority		System
Power Reduction	Inhibited	
-	1	Front seat heaters; windshield washer jet and exterior mirror heaters
2	-	Windshield heater
3	-	Rear window heater
4	-	Air suspension
5	-	Entertainment system
-	6	Windshield heater
-	7	Rear window heater

Continuous Electrical Load Management

Priority		System
Power Reduction	Inhibited	
-	1	Front seat heaters
2	-	Windshield heater
3	-	Rear window heater
4	-	Air suspension
5	-	Entertainment system

Engine idle speed changes, and electrical load changes of systems not under direct control of the ATC module (air suspension and entertainment), are initiated using the appropriate medium speed CAN bus message. When partial operation is requested:

- The air suspension system still performs height changes but reduces air compressor operation by not replenishing the reservoir.
- The entertainment system restricts the maximum volume level and reduces the output frequency bandwidth.

Cooling Fan Control

The ATC module determines the amount of condenser cooling required from the refrigerant pressure, since there is a direct relationship between the temperature and pressure of the refrigerant. The cooling requirement is transmitted to the ECM in a medium speed CAN bus message. The ECM controls the condenser cooling using the cooling fan. For additional information, refer to:

[Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation),
[Electronic Engine Controls](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, Description and Operation),
[Electronic Engine Controls](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, Description and Operation).

Air Temperature Control

Air from the evaporator enters the heater assembly, where temperature blend doors direct a proportion of the air through the heater core to produce the required discharge air temperature. The two temperature blend doors operate independently to enable independent temperature selection for the left and right sides of the vehicle interior. The temperature blend doors are operated by stepper motors. The stepper motors are controlled by the ATC module.

The ATC module calculates the stepper motor position required to achieve the selected temperature and compares it against the current position, which is stored in memory. If there is any difference, the ATC module signals the stepper motor to adopt the new position.

Air temperature is controlled automatically unless maximum heating or maximum cooling is selected. The required air temperature may be adjusted between 16 °C (61 °F) and 28 °C (82 °F) using the air temperature control switches. The control algorithms then attempt to maintain the desired set temperature.

Turning the temperature switches fully counterclockwise gives maximum available cooling. Turning the temperature switches fully clockwise gives maximum available heating. When maximum cooling or maximum heating is selected, the comfort algorithm adopts an appropriate strategy for the air distribution, blower speed,

A/C and air source functions, except where a function is under manual control.

The temperature control of one zone can be compromised by the other zone being set to maximum heating or maximum cooling. True maximum heating or maximum cooling can only be obtained with both controls set to the same maximum state.

When the economy mode is selected, the automatic temperature control function still operates, but with no cooling capability the minimum discharge temperature achievable will be ambient air temperature plus any heat pick up in the air intake path.

Air Distribution Control

When the A/C is in the automatic mode, the ATC module automatically controls air distribution according to a comfort strategy. Automatic control is overridden when one of the manual modes is selected. Air distribution remains manually controlled until the automatic mode is selected again. The distribution doors are operated by two stepper motors, which are controlled by the ATC module.

Blower Control

When A/C is selected or the blower speed is manually selected, the ATC module energizes the coil of the blower relay in the battery junction box (BJB). The energized blower relay supplies battery power to the blower motor, which is grounded through the blower control module. The speed of the blower is controlled by a PWM signal from the ATC module to the blower control module. The blower control module regulates the blower motor voltage in relation to the PWM signal.

When the blower is in the automatic mode the ATC module determines the blower speed required from the comfort algorithms. When the blower is in the manual mode, the ATC module operates the blower at one of seven fixed speeds as selected on the center instrument panel switch pack.

Maximum Defrost

The maximum defrost function automatically provides the maximum defrosting of the vehicle. When the maximum defrost function is selected, the ATC module configures the control system as follows:

- Automatic mode off.
- Air inlet to fresh air, manual control.
- Selected temperature unchanged, automatic control.
- Air distribution set to screen mode, manual control.
- Blower speed set to speed 5, manual control.
- Rear screen heater and windshield heater (if applicable) selected on.
- A/C mode in automatic.

The maximum defrost function is cancelled by one of the following:

- Selecting any distribution switch. The system response will be identical to the normal manual distribution control operation.
- Selecting the automatic switch. This will restore the system to fully automatic operation.
- Selecting the maximum defrost switch again. This returns the system to the state in use immediately before the maximum defrost function was first selected.
- Turning the engine off.

The blower speed can be adjusted manually without terminating the maximum defrost function.

Intake Air Control

The source of intake air is automatically controlled unless overridden by manual selection of recirculation. Under automatic control the ATC module determines the required position of the recirculation door from the comfort strategy and the input from the pollution sensor (if fitted). The recirculation door is operated by an electric motor, which is controlled by hardwired analogue signals from the ATC module. A potentiometer in the motor supplies the ATC module with a position feedback signal for closed loop control.

Provided the intake air has not been manually selected to recirculation, the ATC module adjusts the recirculation door to reduce the ram effect produced by the forward motion of the vehicle.

When the ignition switch is turned off, the ATC module evaluates the ambient air temperature. If the ambient air temperature is less than a pre-determined value, the intake air source is set to recirculation, to prevent the ingress of damp air while the vehicle is parked.

When the vehicle is in the transportation mode, the ATC module sets the intake door to recirculation every time the engine is turned off, regardless of the ambient air temperature.

Pollution Sensing

With a pollution sensor fitted to the vehicle, the ATC module controls the intake air source to reduce contamination of the intake air by external pollutants. This function is fully automatic, but can be overridden by manual selection of the intake air source.

Humidity Sensing

With a humidity sensor fitted, the ATC module controls the moisture content of the air in the vehicle. This is achieved by raising the evaporator temperature to increase the humidity of the air entering the vehicle, and reducing the evaporator temperature to reduce the humidity of the air entering the vehicle.

Front Seat Heaters

The front seat heaters are enabled when Power mode 6 engaged, and operate at one of two temperature settings. With the first press of a front seat heater switch the ATC module adopts the higher temperature setting, supplies a power feed to the related front seat heater elements and illuminates two amber LEDs in the switch. At the second press of the switch the ATC module adopts the lower temperature setting and extinguishes one of the LEDs. At the third press of the switch the ATC module de-energizes the heater elements and extinguishes the second LED. The seat heaters remain on until selected off or the engine is turned off.

The ATC module receives an input from a temperature sensor in each front seat, and regulates the power feed of the heater elements to control the seat temperature at the appropriate temperature setting between 35 and 45 °C (95 and 113 °F). The actual temperature settings vary with the type of seat covering, to allow for the different heat conduction properties of the different materials.

When the front seat heaters are activated at the higher temperature setting, the ATC module automatically resets them to the lower temperature after a time delay. The length of the time delay depends on the in-vehicle temperature.

Temperature Reset Time Delay

In-vehicle Temperature, °C (°F)	<-15 (5)	-15 to -10 (5 to 14)	-10 to 0 (14 to 32)	0 to 15 (32 to 59)	15 to 25 (59 to 77)	>25 (77)
Time Delay, minutes	Remains at higher temperature until manually de-selected	20	15	10	5	3

To protect the heater elements, the ATC module disables front seat heating if battery voltage exceeds 16.5 ± 0.3 V for more than 5 seconds. Front seat heating is re-enabled when battery voltage decreases to 16.2 ± 0.3 V.

The ATC module monitors the power feeds to the heater elements and disables the applicable front seat heating if a short or open circuit is detected. The ATC module also disables seat heating if the seat temperature rises significantly above the target temperature setting.

The plausibility of the temperature sensor inputs is also monitored by the ATC module. When seat heating is selected, if one of the temperature sensor inputs is within 5 °C (9 °F) below the target temperature, the ATC module monitors the sensor input for a temperature increase and checks that it is between the minimum and maximum working temperatures. If a temperature sensor input is at the high end of the working range, while the ambient air temperature and the engine temperature are within 10 °C (18 °F) of each other, the ATC module disables front seat heating until the input decreases below the target temperature setting. The ATC module interprets a temperature sensor input value of -45 °C (-49 °F) or below as an open circuit, and temperature sensor input value of 100 °C (212 °F) or more as a short circuit.

Rear Window Heater

The ATC module controls operation of the rear window heater using medium speed CAN messages to operate the rear window heater relay in the central junction box (CJB). The control module in the CJB interprets the CAN messages and switches the ground connection of the relay coil to operate the rear window heater. While the rear window heater relay is energized, a battery power feed is connected to the rear window heater elements. Rear window heater operation is only enabled when the engine is running.

The ATC module operates the rear window heater in heating cycles of varying power and time. The heating cycle used depends on the ambient air temperature and whether it is the initial or subsequent operation during the current Power mode cycle.

When the rear window heater switch is pressed, the ATC module illuminates an LED in the switch and initiates the appropriate heating cycle. The LED remains illuminated until the rear window heater is selected off, the heating cycle is completed or the engine stops. If the engine stalls or turned off, rear window heating resumes if the engine is re-started within 20 seconds.

On the initial selection of rear window heating, the ATC module uses a short or long defrost phase at full power, followed by a low power phase. The defrost phase used depends on the ambient temperature. During the low power phase, the rear window heater relay is cycled off for 80 seconds and on for 40 seconds.

On subsequent operations, during the same Power mode cycle, the ATC module operates the rear window heater at full power for a fixed time period.

Rear Window Heating Phases

Phase	Time, minutes
Short defrost (-5°C (23°F) and above)	10
Long defrost (less than -5°C (23°F))	15
Low power	20
Subsequent operation	10

Windshield Heater

The ATC module controls operation of the windshield heater using the windshield heater relay in the BJB. The ATC module switches the ground connection of the relay coil to operate the windshield heater. While the windshield heater relay is energized, a battery power feed is connected to each of the two windshield heater elements. Windshield heater operation is only enabled when the engine is running.

The ATC module operates the windshield heater in heating cycles of varying power and time. The heating cycle used depends on the ambient air temperature and whether it is the initial or subsequent operation during the current Power mode cycle.

When the windshield heater switch is pressed, the ATC module illuminates a LED in the switch and initiates the appropriate heating cycle. The LED remains illuminated until the windshield heater is selected off, the heating cycle is completed or the engine stops. If the engine stalls or turned off, windshield heating resumes if the engine is re-started within 20 seconds.

On the initial selection of the windshield heater, the ATC module uses a short or long defrost phase at full power, followed by a low power phase. The defrost phase used depends on the ambient temperature. During the low power phase, the

windshield heater relay is cycled off for 80 seconds and on for 40 seconds.

On subsequent operations, during the same Power mode cycle, the ATC module operates the windshield heater at full power for a fixed time period.

Windshield Heating Phases

Phase	Time, minutes
Short defrost (-5 °C (23 °F) and above)	3
Long defrost (less than -5 °C (23 °F))	5
Low power	10
Subsequent operation	3

Control Components - Control Components

Diagnosis and Testing

Principle of Operation

For a detailed description of the climate control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Control Components (412-04 Control Components, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Front End Accessory Drive (FEAD) belt ● Refrigerant ● Heater control flaps ● Ducting ● Cabin air filter ● Coolant level ● Compressor ● Cooling fan 	<ul style="list-style-type: none"> ● Fuses ● Electrical harnesses ● Harness connectors ● Blower motor ● Cooling fan ● Actuators

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Climate Control Module \(HVAC\)](#) (100-00 General Information, Description and Operation).

Control Components - Ambient Air Temperature Sensor

Removal and Installation

Removal

1. Remove the front spoiler.
For additional information, refer to: [Front Bumper Lower Cover](#) (501-19 Bumpers, Removal and Installation).
2. Remove the ambient air temperature sensor.

- Disconnect the electrical connector.
- Release the clip.

Installation

1. To install, reverse the removal procedure.

Control Components - Climate Control Assembly

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: **Some variation in the illustrations may occur, but the essential information is always correct.**
- NOTE: Make sure that the gear selector lever is in position N before removing any components.

1. Refer to: [Floor Console Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).

2. Torque: 2.5 Nm

3.  CAUTION: When installing the lower locating tang of the trim panel, make sure the floor console is not damaged. If necessary protect the surrounding areas using masking tape.

3. Remove the passenger side footwell duct.
 - Remove the clip.

E54707

4. Remove the passenger side footwell duct elbow.
 - Remove the 2 Torx screws.

E54708

5. Remove the defrost vent/register blend door actuator.

- Disconnect the electrical connector.
- Remove the 2 screws.

Installation

1. Install the defrost vent/register blend door actuator.

- Tighten the screws to 1 Nm.
- Connect the electrical connector.

2. Install the passenger side footwell duct elbow.

- Tighten the screws.

3. Install the passenger side footwell duct.

- Install the clip.

4. Install the passenger side closing trim panel.

- Install the interior lamp.
- Connect the electrical connector.
- Secure the clip.

5. Install the glove compartment.

For additional information, refer to: [Glove Compartment](#) (501-12 Instrument Panel and Console, Removal and Installation).

Control Components - Defrost Vent/Register Blend Door Actuator RHD AWD

Removal and Installation

Removal

1. Remove the instrument panel driver side reinforcement.
For additional information, refer to: [Instrument Panel Driver Side Reinforcement](#) (501-12 Instrument Panel and Console, Removal and Installation).
2. Remove the driver side footwell duct.
 - Remove the 2 Torx screws.

3. Remove the defrost door actuator.
 - Disconnect the electrical connector.
 - Remove the 2 screws.

Installation

1. Install the defrost door actuator.
 - Tighten the screws.
 - Connect the electrical connector.
2. Install the driver side footwell duct.
 - Tighten the screws.
3. Install the instrument panel driver side reinforcement.
For additional information, refer to: [Instrument Panel Driver Side Reinforcement](#) (501-12 Instrument Panel and Console, Removal and Installation).

Control Components - Driver Side Temperature Blend Door ActuatorLHD

AWD

Removal and Installation

Removal

1. Remove the instrument panel driver side reinforcement.
For additional information, refer to: [Instrument Panel Driver Side Reinforcement](#) (501-12 Instrument Panel and Console, Removal and Installation).

2. NOTE: RHD illustration shown, LHD is similar.

Remove the driver side footwell duct.

- Remove the 2 Torx screws.

3. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the temperature blend door actuator.

- Disconnect the electrical connector.
- Remove the 3 screws.

Installation

1. Install the temperature blend door actuator.
 - Tighten the screws to 1 Nm.
 - Connect the electrical connector.
2. Install the driver side footwell duct.
 - Tighten the screws.
3. Install the instrument panel driver side reinforcement.
For additional information, refer to: [Instrument Panel Driver Side Reinforcement](#) (501-12 Instrument Panel and Console, Removal and Installation).

Removal and Installation

Removal

1. Remove the glove compartment.
For additional information, refer to: [Glove Compartment](#) (501-12 Instrument Panel and Console, Removal and Installation).
2. Remove the passenger side closing trim panel.

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.

E47530

3. Remove the passenger side footwell duct.

- Remove the clip.

E54648

4. Remove the passenger side footwell duct elbow.

- Remove the 2 Torx screws.

E54649

5. Remove the instrument panel blend door actuator.

- Disconnect the electrical connector.
- Remove the 2 screws.

Installation

1. Install the instrument panel blend door actuator.

- Tighten the screws.
- Connect the electrical connector.

2. Install the passenger side footwell duct elbow.

- Tighten the screws.

3. Install the passenger side footwell duct.

- Install the clip.

4. Install the passenger side closing trim panel.

- Install the interior lamp.
- Connect the electrical connector.
- Secure the clip.

5. Install the glove compartment.

For additional information, refer to: [Glove Compartment](#) (501-12 Instrument Panel and Console, Removal and Installation).

Control Components - In-Vehicle Temperature Sensor

Removal and Installation

Removal

1. Fully extend the steering column for access.
2. Remove the instrument panel access panel.

- Release the 2 clips.

E51369

3. Remove the steering column upper shroud.

- Release the 6 clips.

E46946

4. Remove the steering column lower shroud.

- Remove the 3 Torx screws.
- Release the steering column adjustment lever.

E46947

5. Remove the center console upper finisher trim.

E123215

6. Remove the audio unit bezel.

Instrument Cluster - Instrument Cluster

Description and Operation

OVERVIEW

A new instrument cluster is introduced where in addition to the larger speedometer and tachometer gauges the cluster also incorporates a Thin Film Transistor (TFT) 5" high-definition display unit.

Instrument cluster overview

E123742

Item	Part Number	Description
1	-	Tachometer
2	-	Clock
3	-	Message center
4	-	External temperature
5	-	Speedometer
6	-	Fuel gauge
7	-	Total distance odometer and trip recorder
8	-	Gear selector position display
9	-	Temperature gauge

The TFT display incorporates a 'Message Center' that communicates vehicle information and status data to the driver. Menus displayed in the message center allow access to a number of vehicle functions through the guidance of the message center menus. The driver operates the message center using the 'menu control' located on the right-hand-side of the steering wheel. Refer to the 'Information and Message Center' section for further information.

The instrument cluster features a number of warning indicators, where in addition to those located within the speedometer and tachometer gauges, another six indicators are positioned within the TFT unit above the message center.

DESCRIPTION

Warning Indicators – ROW Diesel Shown

11	-	Charge indicator - red
12	-	Oil pressure warning - red
13	-	Critical warning - red
14	-	Right-hand turn signal indicator - green
15	-	Side lamps - green
16	-	Seat belt warning - red
17	-	Adaptive Speed Control active - amber
18	-	Adaptive Front lighting System (AFS) warning - amber
19	-	Rear fog lamps active - amber
20	-	Tire pressure monitoring warning - amber
21	-	Speed control active - green
22	-	Ambient light sensor (reference only)
23	-	Forward alert active - green
24	-	Hill Descent Control (HDC) active - green
25	-	Airbag warning secondary - amber
26	-	Front fog lamps active - green
27	-	High beam warning - blue
28	-	Dynamic Stability Control (DSC) off warning - amber
29	-	Low range selected - green
30	-	Security Light Emitting Diode (LED) - red
31	-	Trailer warning - green
32	-	Dynamic Stability Control (DSC) active warning - amber

Stepper motors are used to actuate the mechanical speedometer and tachometer gauges to provide a smooth and progressive response.

The warning indicators above the message center are functioned using Thin Film Transistor (TFT) technology. LEDs are used to illuminate the warning indicators in the speedometer and tachometer gauges and provide backlight illumination of the instrument cluster.

A single ambient light sensor is used to measure cabin lighting and adjust the backlight brightness of the instrument cluster accordingly. The instrument cluster also incorporates an anti-glare coating.

When the vehicle is locked the TFT unit goes off. When the vehicle is unlocked, a welcome screen is displayed featuring a

Land Rover logo and an image of the vehicle, together with the current date and odometer information.

The coolant temperature and fuel quantity gauges are the default display when the stop/start button is pressed. These can be overwritten by different permutations of screens which are available to cover numerous vehicle functions through a menu selection. Refer to the 'Information and Message Center' section for further information.

Thin Film Transistor Display Unit

E123746

Item	Part Number	Description

2	-	Message Center – this area can be overwritten by other information
3	-	Gear Selection and Digital Speedometer Display - this area cannot be overwritten by other information

OPERATION

Control Diagram

- NOTE: **A** = Hardwired; **D** = High Speed CAN; **N** = Medium Speed CAN; **O** = LIN Bus;

E123747

Item	Part Number	Description
1	-	Battery
2	-	Battery Junction Box (BJB)
3	-	Steering-column-lock module
4	-	Clockspring
5	-	Medium-speed CAN bus connection to other vehicle systems
6	-	Instrument cluster
7	-	High-speed CAN bus connection to other vehicle systems
8	-	Tailgate ajar switch
9	-	Engine coolant level sensor
10	-	Fuel level sensor
11	-	Front brake-pad wear sensor
12	-	Rear brake-pad wear sensor
13	-	Central Junction Box (CJB)
14	-	Washer fluid level sensor
15	-	Brake fluid level sensor
16	-	Safety belt – occupant detection pressure sensor
17	-	Exterior light control switch

The instrument cluster receives a permanent fused supply from the Battery Junction Box (BJB).

The cluster is connected to other vehicle systems and control modules via the:

- medium speed CAN bus,
- high speed CAN bus and
- LIN bus connections

However, some vehicle sensors are hardwired directly to the instrument cluster.

The steering lock control module is connected to a hardwired connection to the instrument cluster. Security information from other control modules is passed via the network buses and when the conditions are correct the instrument cluster instructs the steering lock control module to unlock the steering column.

The clockspring is connected to the instrument cluster on a LIN bus connection. The LIN bus passes driver selections made on the steering wheel mounted switches to the instrument cluster for processing and transmission to other control modules.

Instrument Cluster - Instrument Cluster

Diagnosis and Testing

Principles of Operation

For a detailed description of the instrument cluster system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage.

Visual Inspection

Electrical
<ul style="list-style-type: none"> ● Battery ● Fuses ● Wiring harness ● Damaged, loose or corroded connectors ● Controller Area Network (CAN) circuits ● Instrument Cluster (IPC) ● Central Junction Box (CJB) ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Instrument Cluster \(IPC\)](#) (100-00 General Information, Description and Operation).

Instrument Cluster - Instrument Cluster

Removal and Installation

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Fully extend the steering column for access.
2. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-01 Battery, Mounting and Cables, Specifications).
3. Remove the steering wheel.
For additional information, refer to: [Steering Wheel](#) (211-04 Steering Column, Removal and Installation).
4. Remove the driver side register trim panel.
For additional information, refer to: [Driver Side Register Trim Panel](#) (412-01 Air Distribution and Filtering, Removal and Installation).
5. Remove the instrument panel access panel.

- Release the 2 clips.

E51369

6. Remove the steering column upper shroud.

- Release the 4 clips.

E46958

7. Remove the steering column lower shroud.

- Remove the 3 Torx screws.
- Disconnect the electrical connectors.

E122693

8. Remove the audio unit control trim panel.

- Remove the 2 retaining screws.

E122690

9. NOTE: Remove in the sequence shown.

Remove the steering column side trim panel.

- Release the clips.
- Disconnect the electrical connector.

E122691

10. Disconnect the 2 electrical connectors from the steering column multifunction switches.

E47072

11. Disconnect the 2 electrical connectors from the clockspring.

E47073

12. Remove the steering column switch assembly.

- Remove the 4 Torx bolts.

E47115

13. Remove the steering column gaiter panel.

- Remove the 2 Torx screws.
- Release the 2 clips.

E47118

14. Remove the instrument cluster trim panel.

- Release the 2 clips.

E122724

15. Remove the instrument cluster.

- Remove the 2 Torx screws.
- Remove the 2 retaining screws.
- Disconnect the electrical connector.

Installation

1. Install the instrument cluster.
 - Connect the electrical connector.
 - Tighten the screws.
 2. Install the instrument cluster trim panel.
 - Secure the 2 clips.
 3. Install the steering column gaiter panel.
 - Secure with the clips.
 - Tighten the Torx screws.
 4. Install the steering column switch assembly.
 - Tighten the Torx bolts to 3 Nm (2 lb.ft).
 5. Connect the clockspring and multifunction switch electrical connectors.
 6.  **CAUTION:** When installing the lower locating tang of the trim panel, make sure the floor console is not damaged. If necessary protect the surrounding areas using masking tape.
 - **NOTE:** To install, reverse the removal sequence.
 - **NOTE:** Make sure that all the clips are correctly installed.
- Install the steering column side trim panel.
- Connect the electrical connector.
 - Secure with the clip.
7. Install the audio unit control trim panel.
 - Install the 2 retaining screws.
 8. Install the steering column shrouds.
 - Tighten the Torx screws.
 9. Install the instrument panel access panel.
 - Secure with the clips.
 10. Install the driver side register trim panel.
 For additional information, refer to: [Driver Side Register Trim Panel](#) (412-01 Air Distribution and Filtering, Removal and

Installation).

11. Install the steering wheel.

For additional information, refer to: [Steering Wheel](#) (211-04 Steering Column, Removal and Installation).

12. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-01 Battery, Mounting and Cables, Specifications).

13. Using the diagnostic tool, configure the instrument cluster.

Horn - Horn

Description and Operation

E49450

Item	Part Number	Description
1	-	Steering wheel horn switches
2	-	Central Junction Box (CJB)
3	-	Fuse 12
4	-	Horn - Low tone
5	-	Horn - High tone

GENERAL

Two horns are fitted to the vehicle; a high tone and a low tone. The horns are mounted on brackets, which are attached to the front end carrier assembly, on each side of the radiator.

The horns are operated by pressing one of the two horn switches, located on each side of the driver airbag, on the steering wheel.

The horns are also used by the vehicle alarm system. When the alarm system requires the horns to operate, the Central Junction Box (CJB) provides a ground to the horn relay solenoid, closing the relay contact which in turn supplies battery voltage to operate the horns.

For additional information, refer to: [Anti-Theft - Active](#) (419-01A Anti-Theft - Active, Description and Operation).

The horn circuit is permanently connected to battery voltage and therefore the horns can be operated at any time, irrespective of ignition switch position.

The horns are controlled by a relay which is an integral part of the CJB. The relay contact and solenoid is connected to the vehicle battery via a fusible link (Link 17) in the battery junction box and a fuse (F12) in the CJB. The horn switches, when pressed, complete a ground to the relay which energises the solenoid. The energised solenoid closes the relay contact and battery voltage is supplied to each of the horns. When the horn switch is released, the ground for the solenoid is broken, the solenoid is de-energised and the relay contact opens, cutting the voltage supply to the horns.

Horn - Horn

Diagnosis and Testing

Principles of Operation

For a detailed description of the horn system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Horn](#) (413-06 Horn, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Information and Message Center - Information and Message Center

Description and Operation

OVERVIEW

A new instrument cluster is introduced where in addition to the larger speedometer and tachometer gauges the cluster also incorporates a TFT (Thin Film Transistor) 5" high-definition display unit.

Instrument Cluster Overview

E123742

Item	Part Number	Description
1	-	Tachometer
2	-	Clock
3	-	Message center
4	-	External temperature
5	-	Speedometer
6	-	Fuel gauge
7	-	Total distance odometer and trip recorder
8	-	Gear selector position display
9	-	Engine temperature gauge

The TFT display incorporates a 'Message Center' that communicates vehicle information and status data to the driver. Menus displayed in the message center allow access to a number of vehicle functions through the guidance of the message center menus. The driver operates the message center using the 'menu control' located on the right-hand-side of the steering wheel.

The instrument cluster also features a number of warning indicators, where in addition to those located within the speedometer and tachometer gauges, another six indicators are positioned within the TFT unit above the message center. Refer to the 'Instrument Cluster' section for further information.

The TFT display unit comprises three distinct areas, as shown below:

Thin Film Transistor Display Unit

E123746

Item	Part Number	Description
1	-	Warning Indicators – this area is fixed and cannot be overwritten
2	-	Message Center – this area can be overwritten by other information
3	-	Gear Selection and Digital Speedometer Display - this area is fixed and cannot be overwritten

MESSAGE CENTER

The coolant temperature and fuel quantity gauges are the default display in the message center when the stop/start button is pressed. These can be overwritten through the guidance of message center menus, to obtain different permutations of screens which are available to communicate vehicle information and status data to the driver.

Menu Control

E123791

The driver operates the message center using the 'menu control' located on the right-hand-side of the steering wheel. A preference menu is available which allows the driver to personalize certain features and functions in the message center.

Messages displayed in the message center are mainly generated by the instrument cluster which monitors system status via the medium-speed and high-speed [CAN \(controller area network\)](#) bus systems. Other system control modules are also capable of generating messages to communicate system status. Some messages are accompanied by a chime, which is requested by the control module generating the message and functioned by the instrument cluster via the integral sounder.

The driver can view system status messages which are current in the instrument cluster [RAM \(random access memory\)](#), by pressing and releasing the menu control to display current messages in priority order; refer to 'Warning Messages'.

Vehicle Information and Settings Menu

Menu selections are made using the menu control to highlight the required menu option. Once the required option is highlighted that option can be selected by pressing the 'OK' button. The screen will then display a sub-menu, or activate the selected item where applicable.

Vehicle Information and Settings Menu

E123790

Scroll arrows to the left of the menu indicate that there are further menu items either above or below the currently viewed menu items. If the arrow is displayed brightly there are additional menu items available. If the arrows appear dim, there are no additional items. For example, the engine oil level display by can be accessed by selecting 'Service Manual' and then selecting 'Oil Level Display'.

Engine Oil Level Display

E124084

To close the main menu, press the left button on the menu control. To close sub-menus press and hold the left button on the menu control.

The menu will close automatically if:

- no action is taken with the main menu within 10 seconds
- action is taken with the main menu and it is then left for 4 minutes

If a further action is taken within the four minutes period, the timer will reset and a further four minutes will have to elapse before the menu closes automatically.

The following table contains an overview of the information and settings menu and option displays:

Close Menu	-	Close the vehicle settings and information menu.
Show Warnings	-	Display all active warning messages.
Vehicle Set-up	Forward Alert	Enable/disable the forward alert feature of the adaptive cruise control system.
	Speed Warning	Enable/disable over speed warning and set the monitored speed.
	High Beam Assist	Enable/disable the operation of the automatic headlamp high beam feature. Configure system for driving on the alternate side of road. Note: Headlamps still need to be manually adjusted.
	Alarm Sensors	This setting allows you to temporarily disable the vehicle's interior space protection and tilt sensor the next time the vehicle is locked with Smart Key. This setting is automatically enabled when the vehicle is unlocked with the Smart Key.
	Reverse-dip Mirror	Enable/disable automatic dipping of exterior mirrors when reverse gear is selected.
	Drive-away Locking	Enable/disable automatic locking off the doors when the vehicle speed exceeds 8 km/h (5 mph).
	2-Stage Unlocking	Enable/disable the single-point entry door unlocking feature.
	Headlamp Delay	Enable/disable the headlamp delay feature. Configure the amount of time the headlamps will remain on: 30, 60, 120 or 240 seconds.
	TPM Load Setting	Change the monitored tire pressures for the vehicle loading conditions: <ul style="list-style-type: none"> ● Heavy Load ● Light Load
Trip Computer	Trip A	Enable/disable display of Trip A readings.
	Trip B	Enable/disable display of Trip B readings.
	Trip Auto	Enable/disable display of Trip Auto readings.
	Units	Select the units to be displayed by the trip computer: <ul style="list-style-type: none"> ● Miles, MPH, MPG ● Miles, MPH, MPL ● Km, km/h, l/100 km
Display Settings	Language	Select the language for text displayed in the message center.
	Temperature	Select the units for the external temperature reading: <ul style="list-style-type: none"> ● Celsius ● Fahrenheit
Service Menu	VIN Display	Displays the Vehicle Identification Number.
	Oil Level Display	Displays the oil level display.
	HBA Sensitivity	Change sensitivity of High Beam Assist system: <ul style="list-style-type: none"> ● Normal Mode ● Alternate Mode

Warning Messages

Warning messages are displayed in the message center when a fault is detected or an alert state is triggered. There are three categories of messages that may be displayed in the message center; the driver is made aware of the message by an accompanying warning indicator illuminating.

The warning indicators illuminate in one of three colors, which indicate the level of importance of the warning as follows:

- Critical = red indicator accompanied with and audible alert
- Warning = amber indicator
- Information = green indicator.

• **NOTE:** Messages are displayed in order of importance with 'Critical' messages taking priority.

Priority Group 'P1' **Critical** - This group includes messages which have a direct affect on the driving ability and safety of the vehicle. This type of message requires an urgent and immediate reaction from the driver in response to the message. P1 messages are also accompanied by an appropriate warning indicator symbol and an audible alert. If more than one P1 message is present, each message is displayed in turn at 3 second intervals. Critical messages are displayed in the message center until either the fault condition that caused the message has been rectified or the message is suppressed by using the menu control on the steering wheel. Critical messages can also be recalled by using the menu control. If a critical message has been suppressed the accompanying warning symbol will remain illuminated to indicate that a problem exists.

Priority Group 'P2' **Warning** - This group includes messages which do not directly affect driving ability or safety of the vehicle. P2 messages are also accompanied by appropriate warning indicator symbol. This message must be noted by the driver and the cause rectified as soon as possible. Each message is indicated once for a maximum of 23 seconds. Warning messages are displayed in the message center until either the fault condition that caused the message has been rectified or the message is suppressed by using the menu control on the steering wheel. Warning messages can also be recalled by using the menu control. If a warning message has been suppressed the warning symbol will remain illuminated to indicate that a problem exists.

Priority Group 'P3' **Information** – This group displays messages which relate to fluid levels 'LOW WASHER FLUID' for example, or when an alert state is triggered when driving the vehicle. For example, cancelling cruise control will display the message 'CRUISE CANCELLED'. Depending on the message, some are only displayed at the end of a journey to avoid irritation to the driver. Information messages are displayed for four seconds before extinguishing.

Information Message

E123786

The messages are displayed in a language applicable to the vehicle market configuration and can be changed using the instrument cluster menu. The following list shows the possible messages which can be displayed.

- **NOTE:** If the instruction given in the 'Action' column does not resolve the message display, use the [Workshop Manual Diagnosis and Testing](#) section for the applicable vehicle system to determine the fault and perform any additional action required.

AMBIENT TEMPERATURE

The ambient temperature is displayed in the right-hand position at the top of the message center. The temperature can be displayed in Fahrenheit or Centigrade and this is selectable by the driver using the instrument cluster menu.

ODOMETER AND TRIP METER

Trip Meter

E123787

The odometer is located in a central position at the bottom of the message center. In addition to displaying the total distance the vehicle has traveled. Short presses of the 'i' button, on the end of the 'left-hand' steering column multifunction switch will scroll through the following statistics:

- Odometer
- Trip distance
- Trip average speed
- Trip average fuel consumption
- Instantaneous, short term average, fuel consumption
- Range available from remaining fuel
- Blank display

There are three trip memories available: A, B and Auto. The instrument cluster menu is used to select which trip recording is displayed.

The Auto trip is always available and is reset each time the engine is started and the vehicle moves. Previous trips can be added to form a continuous trip recording by pressing and holding the trip button when the automatic trip information is displayed. The message center will confirm that the previous journey information has been added and pressing and holding the trip button for 1 second will add the data. The previous trip information can also be deleted by pressing and holding the trip button when the automatic trip information is displayed. The message center will confirm deletion of the previous journey data and pressing and holding the trip button for 1 second will delete the previous trip information.

Trip A and B can be reset by the driver at any time. When the required trip information is displayed, pressing and holding the trip button for 2 seconds will erase the previous trip information stored. Resetting trip A or B will not affect the other trip information, for example, if trip A is reset, trip B will retain its information until it is reset.

GEAR POSITION DISPLAY

Gear Position Display

E123789

The gear position shows the current selector position: P, R, N, D or S.

When the transmission is in manual 'CommandShift' mode, the display will show the currently selected gear S1, S2, S3, S4, S5 or S6.

The gear position is illuminated in response to 'CAN' bus messages from the [TCM \(transmission control module\)](#).

The instrument cluster has no control over the gear position display and obtains the information by monitoring the controlling CAN bus messages. If the instrument cluster detects ten incorrect CAN bus messages, 'TRANS. FAILSAFE PROG' is illuminated in the message center.

If a correct CAN bus message is received when the ignition is next switched on, the error is erased and the message removed.

SERVICE INTERVAL INDICATOR

A service interval message will automatically appear in the message center when a pre-determined distance or time before a scheduled service is reached. The kilometer or mileage countdown is controlled by the engine management system and is adjusted to allow for driving style and conditions to gauge when the appropriate service becomes necessary.

Service Interval Message

E123788

The service indicator displays information calculated by the [ECM \(engine control module\)](#) to the remaining distance to the next service based on the amount of fuel used since the last service interval indicator reset.

The ECM counts down the distance to engine service and the instrument cluster rounds this down to the nearest 50 miles. The fuel used based count down starts from 3200 miles displaying the required figure in the trip computer message center, for example 'Service Required in 1950 miles'.

When the ECM has calculated the distance to service is 0 miles, the ECM will request the instrument cluster to display 'Service Required' in the message center.

The ECM also monitors and calculates when the time to the next oil service is required, 'Service Required' is displayed in the message center. This message takes priority over the distance to service calculation.

The service information is displayed in the message center for 4 seconds at each ignition cycle. There is no minus figure if the service distance is exceeded, 'Service Required' is displayed until the ECM service counter is reset using an approved diagnostic system.

Information and Message Center - Information and Message Center

Diagnosis and Testing

Principles of Operation

For a detailed description of the information and entertainment system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Multi-Media Remote Control Switch ● Multifunction Display Screen 	<ul style="list-style-type: none"> ● Fuses ● Wiring harness ● Electrical connector(s) ● Battery condition, state of charge ● Multi-Media Remote Control Switch ● Multifunction Display Module

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Instrument Cluster \(IPC\)](#) (100-00 General Information, Description and Operation).

Removal and Installation

Removal

• NOTE: If the tire pressure module is to be replaced then T4 must be connected and the correct procedures adhered to, prior to battery disconnection.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the LH A-pillar upper trim panel.
For additional information, refer to: [A-Pillar Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the LH B-pillar upper trim panel.
For additional information, refer to: [B-Pillar Upper Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Remove the LH C-pillar upper trim panel.
For additional information, refer to: [C-Pillar Upper Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
5. Remove the LH sun visor.
 - Remove the cover.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

E49766

6. Remove the sun visor retaining clip.
 - Release the screw cover.
 - Remove the screw.

E49688

7. Remove the LH passenger assist handles.
 - Carefully release the 6 screw covers.
 - Remove the 6 screws.

E49689

8. Release the LH side of the headliner.

- Release the 6 clips.

9. Remove the low tire pressure module.

- Disconnect the 2 electrical connectors.
- Remove the 2 bolts.

Installation

1. Install the low tire pressure module.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Connect the electrical connectors.

2. Secure the LH side of the headliner.

- Carefully secure the clips.

3. Install the LH passenger assist handles.

- Install the screws.
- Install the screw covers.

4. Install the sun visor retaining clip.

- Install the screw.
- Install the screw cover.

5. Install the LH sun visor.

- Install the screws.
- Install the screw covers.
- Connect the electrical connector.

6. Install the LH C-pillar upper trim panel.

For additional information, refer to: [C-Pillar Upper Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

7. Install the LH B-pillar upper trim panel.

For additional information, refer to: [B-Pillar Upper Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

8. Install the LH A-pillar upper trim panel.

For additional information, refer to: [A-Pillar Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

9. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Description and Operation

Parking Aid Component Location

E123187

Item	Part Number	Description
1	-	Front sensors
2	-	Parking aid sounder
3	-	Rear sensors
4	-	Parking aid module
5	-	Parking aid switch

OVERVIEW

A proximity camera system has been introduced as an optional fit. The system provides additional guidance to the driver when maneuvering at low-speeds and parking the vehicle. The proximity camera system is discussed in detail after the 'Parking Aid' section.

The camera system has also been developed to aid the driver when towing and reversing a trailer; refer to 'Tow Assist' for further information.

PARKING AID OVERVIEW

The parking aid provides an audible warning to the driver when any obstacles are in the path of the vehicle during a forward (if front sensors fitted) or reversing manoeuvre. The purpose of the system is to assist the driver when parking or

maneuvering in restricted space. It is not designed as a crash avoidance system or a replacement for visual interpretation by the driver.

The parking aid system is not standard on all vehicles and some vehicles may be fitted with rear sensors only. Higher specification vehicles may be fitted with both front and rear sensors.

The system comprises 4 ultrasonic sensors in the rear bumper, 4 ultrasonic sensors in the front bumper (if fitted), a control module, a fascia mounted control switch, a rear sounder unit and a front sounder unit (integral with the instrument cluster).

The system operates using ultrasonic signals which are transmitted by the sensors. The reflected echo from this output is received by the sensors and used by the parking aid module to calculate the distance from an object.

The fascia mounted switch allows the driver to deactivate the rear and front (if fitted) parking aid system, if operation is not required.

Parking Aid Module

The parking aid module is located in the rear left hand side of the luggage compartment, behind the side trim panel.

E44157

The parking aid module uses a single microprocessor to perform the following tasks:

- Control of the ultrasonic sensors
- Monitoring of the sensors
- Evaluation of received echo signals from the sensors
- Noise and disturbance suppression
- Control of the parking aid sounders
- Monitoring of the sounders and associated wiring
- Control and monitoring of the switch status **LED (light emitting diode)** and associated wiring
- Evaluation and monitoring of the control inputs
- Management of diagnostic and test functions
- Monitoring of power supply
- Communication via diagnostic link.

Inputs and Outputs

Three connectors on vehicles with front and rear sensors and two connectors on vehicles with rear sensors only provide the interface between the parking aid module and the external parking aid components.

The module receives inputs from the following:

- Reverse selected - **CAN (controller area network)** message from transmission control module (automatic transmission) or transfer box control module (manual transmission)
- Forward gear selected (not in reverse or neutral) - CAN message from transmission control module (automatic transmission) or transfer box control module (manual transmission)
- Parking aid switch
- Parking brake applied - CAN message
- Trailer fitted - CAN message for **CJB (central junction box)**
- Ignition - power supply

The module outputs signals to the following:

- Sensors - power and ground connections
- Sensors - digital signal - transmit and receive signals
- Rear sounder - varying frequency output
- Front sounder - CAN message to instrument cluster
- Parking aid switch - power supply for switch LED operation

Controller Area Network (CAN) Signals

The parking aid module sends and receives a number of digital signals via the medium speed CAN. The received signals are used for operation of the parking aid system.

The parking aid module receives the messages shown in the following table which are used to control the parking aid system.

Message	Transmitted by
Vehicle speed	ABS (anti-lock brake system) module
Selected gear position - Automatic transmission	Transmission control module
Selected gear position - Manual transmission	Transfer case control module
Electric park brake on/off	Electric park brake module
Vehicle movement status	ABS module
Trailer connected	CJB
Ambient temperature	ATC (automatic temperature control) module
Engine running status	Diesel engine control module
Stored odometer reading	Instrument cluster
Vehicle voltage level	Instrument cluster
Minute counter	Instrument cluster
Car configuration	Instrument cluster
Diagnostic physical request	A Land Rover approved diagnostic system via diagnostic socket
Diagnostic functional request	A Land Rover approved diagnostic system via diagnostic socket
Master configuration identification	Instrument cluster

Diagnostics

The parking aid module has a diagnostic connection via the medium speed CAN to enable faults to be retrieved using a Land Rover approved diagnostic system. Additionally, an on-board diagnostic routine within the parking aid module constantly monitors the system and alerts the driver to a system fault by emitting a tone from the front or rear sounder, depending on the fault.

If a parking aid system fault has occurred, the parking aid module will relay the occurrence of the fault to the driver in the following ways:

- The status LED will flash at a frequency of 2Hz if the system is active and fault is detected in the sensors, sounders, related wiring or the module.
- The front sounder will emit an error tone for 3 seconds at a frequency of 1500Hz if a fault is detected with the front sensors or the rear sounder develops a fault.
- The rear sounder will emit an error tone for 3 seconds at a frequency of 1500Hz if a fault is detected with the rear sensors, the switch, the LED in the switch or if there is a CAN bus error.

Sensors

E125149

Item	Part Number	Description
1	-	Front sensor housing
2	-	Front sensor
3	-	Rear sensor housing
4	-	Rear sensor

Four sensors are positioned in the rear bumper and the front bumper (if fitted). Each sensor housing has two raised location keys which locate in corresponding grooves in the bumper mounting hole and sets the correct orientation for the sensor bodies. The housings are clipped into the bumper from the front. The sensors are then clipped into the housings from the rear.

Each sensor has a three pin connector which connects into a common harness linking all four sensors. This harness is connected to the main vehicle body harness for the rear sensors or the engine compartment harness for the front sensors. The three pins are for sensor negative and positive feeds and a signal line.

Each sensor comprises a plastic housing which contains a piezoelectric disc. The disc resonates at a frequency of 38.4 kHz, producing an ultrasonic signal output. The disc also receives the reflected echo signal.

The parking aid module controls the operating mode of each sensor by the output of a digital signal on the signal line. Each sensor has two modes of operation; combined transmitter and receiver mode or receiver mode only.

In the combined mode, the sensor emits a series of ultrasonic impulses and then switches to receiver mode to receive the echo reflected by an obstacle in the detection range. These echo signals are amplified and converted from an analogue signal to a digital signal by the sensor. The digital signal is then transmitted to the parking aid module and compared with

preprogrammed data stored in an **EEPROM (electrically erasable programmable read only memory)** within the module. The module receives this data via the signal line from the sensor and calculates the distance to the obstacle according to the elapsed time between the transmitted and received impulse. The duration of the impulse transmission is determined by the module. The frequency of the impulse is determined by the sensor.

In the receiver mode, the sensor will receive impulses that were emitted by adjacent sensors. The module uses this information to precisely determine position and distance of the obstacle.

Parking Aid Switch

E 122823

The parking aid switch, located in the center console, is non-latching with an integral LED. The switch receives a 12V output to drive the LED when required. The switch is also connected to ground. When the switch is operated, the momentary completion of the ground is interpreted by the parking aid module as a signal to enable or disable the parking aid system.

Parking Aid Sounder

E44161

The parking aid sounder is controlled by the parking aid module and emits a series of tones of varying frequency to inform the driver of the distance between the vehicle and a detected object.

The rear parking aid sounder is located in the left-hand side of the luggage compartment, behind the side trim panel, below the window. The sounder is secured with two, self tapping screws into the body. The sounder is connected to the parking aid module via a harness connector.

The front parking aid uses the instrument cluster sounder and is activated by CAN messages from the parking aid module to the instrument cluster.

PARKING AID OPERATION AND DISTANCE CALCULATION

On vehicles with rear only parking aid sensors, when reverse gear is selected, the parking aid sensors are automatically activated. The parking aid module only activates the system if reverse is selected for more than 1 second. This avoids nuisance audible warnings when the gear selector lever is being moved between Drive and Park.

When the rear system is activated, the parking aid module illuminates the indicator LED in the parking aid switch, switches on the ultrasonic sensors and generates a single chime on the parking aid sounder to indicate the system is active. If an object is in the range of the sensors when the system is activated, a series of audible warnings are emitted by the parking aid sounder immediately.

If parking aid operation is not required, it can be suspended temporarily by pressing the parking aid switch. On vehicles with rear only parking aid sensors, the system can be enabled again by pressing the switch again or switching the ignition

'off' then 'on'. The parking aid will then automatically become active again in reverse gear. The system also remains on when going from reverse gear to neutral. The assumption being that the driver may still want to manoeuvre the vehicle going backwards in neutral.

The parking aid module receives a signal on the CAN from the CJB when a trailer is fitted. When this signal is detected, the parking aid module suspends operation of the rear parking aid sensors.

On vehicles with front and rear systems, the front system is activated when the ignition is 'on', the vehicle is out of Park and the EPB (electronic parking brake) is off. If the vehicle speed subsequently goes above approximately 10 mph (16 km/h), the front system will switch off. When the speed drops below approximately 6 mph (16 km/h), the front system activates again. If the EPB is applied or Park is selected, the Parking Aid system is deactivated.

Sensor Operation

The parking aid module processes the distance readings from the ultrasonic sensors to determine if there are any objects within the detection areas. If there are no objects in the detection areas, there are no further audible warnings. If an object is detected, repeated audible warnings are produced on the parking aid sounder.

The maximum detection range is 1800 mm (70 in). When an object is detected, the time delay between the audible warning tones decreases as the distance between the detected object and the vehicle decreases until, at approximately 350 mm (13.7 in), the audible warning tone is continuous.

After the initial detection of an object, if there is no decrease in the distance between an object and the central sensors, the time delay between the audible warnings remains constant. If an object is detected by one of the corner sensors only, the audible warnings stop after about 5 seconds if there is no change in the distance between the object and the corner sensor.

Detection Area

E57204

Item	Part Number	Description
A	-	Intermittent Warning Tone
B	-	Continuous Warning Tone

Detection Calculation

When operating in the combined transmitter and receiver mode, the sensor outputs a number of ultrasonic pulses and receives the reflected echo signal. The parking aid module amplifies the received echo signals and compares them with a preprogrammed threshold to calculate the distance to the object. This is achieved by determining the elapsed time between the transmission and reception of the ultrasonic signal.

When operating in receiver mode, the sensor receives echo signals transmitted by an adjacent sensor. This mode is used to improve the accuracy of the system.

The detection cycle consists of the parking aid module operating one sensor in the combined transmitter and receiver mode and transmitting a number of ultrasonic pulses. The module then switches the transmitting sensor and the adjacent sensor(s) to receiver mode. After a short time delay, this sequence is repeated using a different sensor to transmit the ultrasonic pulse and continues until all four sensors have output an ultrasonic signal. This sequence is completed in 100ms. The module uses several measurements of the same sensors to remove errors from the calculation.

If the object is directly behind a sensor, the distance is calculated using the time between the transmission and reception of the signal. If the object is positioned between two sensors, the parking aid module uses both signals to determine the correct distance using triangulation.

To perform the triangulation calculation, the parking aid module must know the distance between the individual sensors in the bumper. This information is stored in the module memory. From the received distance from each sensor and using the known distance between adjacent sensors, the module can calculate the minimum distance from the vehicle to the object.

When approaching several objects, the module recognizes the distance from the vehicle to the nearest object.

2	-	Rear view camera
3	-	Left-hand mirror camera
4	-	Control module
5	-	Left-hand-front bumper camera
6	-	Right-hand-front bumper camera

OVERVIEW

The proximity camera system provides the driver with a visual-aid when maneuvering the vehicle at low speeds. The

system uses a dedicated control module to capture the camera data and display the resulting images on the TSD (Touch Screen Display), providing the driver with a 360° view around the vehicle. The camera system is also supported by various driving-aid features where graphical information and warnings are superimposed onto the images displayed on the TSD.

The proximity camera system uses five VGA (Video Graphic Array) resolution cameras:

- two mounted in the front bumper
- one mounted in each door mirror
- one mounted in the rear tailgate handle assembly.

Camera Coverage Zones

SYSTEM DESCRIPTION

Proximity Camera Control Module

E117975

Item	Part Number	Description
1	-	Power supply, ground and BUS connector
2	-	Connection to touch screen display
3	-	Five camera connections

The proximity camera control module is located under the left-hand-front seat; connections to the module include:

- medium speed CAN network
- five camera inputs
- video signal output to the TSD
- power supply and ground.

The control module gathers the camera images and analyses and alters them by adjusting perspectives and applying corrections. The resulting processed images are then relayed to the touch screen display via the NTSC (National Television System Committee) analogue video line.

The control module also adds guidance and warning overlays to the camera images to create the various driving-aid features supported by the camera proximity system; for example, visual direction is made available when reversing the vehicle.

The module communicates with each individual camera via the LIN (local interconnect network) bus connection. This data link transmits diagnostic information, for example camera serial numbers and fault notifications to the control module. Camera adjustments, for instance a correction to color-balance are also communicated via the LIN bus link to the camera.

Image signals are relayed to the control module via the LVDS (Low Voltage Differential Signal) lines. The system uses the LVDS communication protocol to enable fast, interference-free data transmission. Data transmission speeds run in the region of 800 Mbps, this however is dependant on image content.

This LVDS communication link features a twisted pair of wires carrying a 'high' signal and a 'low' signal, similar to the high speed CAN with regard to a 'mirrored' signal. The voltage differential level operates between 250 - 450 mV.

LVDS Signal

E118323

Item	Part Number	Description
1	-	LVDS 'low' signal
2	-	LVDS 'high' signal
3	-	250 – 450 mV Differential

In addition to the data lines the camera receives a power supply and a ground from the control module.

- NOTE: Care must be taken when routing, disconnecting and reconnecting the camera harnesses.

Cameras

E117977

The system uses five VGA resolution cameras, permanently powered whenever the ignition is 'on'. Each camera provides an image covering a zone approximately 130° wide by 112° deep and is capable of capturing approximately thirty frames per second.

The cameras employ high-quality digital, HDR (High Dynamic Range) imaging, which is a set of techniques that allows a greater range of luminance between light and dark areas of an image scene. This allows HDR to more accurately represent the varying intensity levels found in the image scenes that can range from direct sunlight to deep shadows.

HDR Image Comparisons

E123186

Item	Part Number	Description
1	-	Shadow without HDR
2	-	Shadow with HDR
3	-	Sunlight without HDR
4	-	Sunlight with HDR

• NOTE: Reversing lights are crucial to successful night operation of the rear view camera.

Camera mounting

E117979

Item	Part Number	Description
1	-	Camera 'break free' bracket
2	-	Camera

To reduce the cost of accident repair the mounting of the front bumper cameras feature a 'snap free' bracket. On impact, the bracket will release the camera preventing damage to the camera itself. Depending on the severity of the accident it may also be possible to reuse the brackets as they are manufactured from a memory type plastic.

The front cameras are not 'handed' so therefore interchangeable. This is also applicable for the door-mirror cameras, although these cameras do feature the approach lighting LED integral within the camera body.

The positioning accuracy of all the cameras is crucial for the successful operation of the proximity camera system. The

8	-	Mirror camera
9	-	Rear view camera
10	-	Touch Screen Display (TSD)
11	-	Central Junction Box (CJB)

SYSTEM OPERATION

Automatic Operation

- With the ignition 'on' and either 'Park' or 'Neutral' selected the screen displays images of the area surrounding the vehicle.
- When either 'Drive' or 'Reverse' are selected the relevant camera view for the direction of movement is shown.
- Once the vehicle speed exceeds 18 km/h (11 mile/h) the images will automatically switch off.
- Once automatically switched off, the camera view will be disabled until:
 - another ignition cycle occurs and the system is automatically functioned, or
 - the camera system is manually selected on the Touch Screen Display (TSD).

Manual Operation

- The camera home page is accessed using the 'Cameras' icon on the 'Navigation' home screen on the TSD
- Camera views can be accessed when the vehicle is stationary with either 'Park' or 'Neutral' selected.
- Camera views can also be accessed when either 'Drive' or 'Reverse' are selected and will remain viewable when the vehicle is in motion.

Selecting Views

E123183

- Displayed on the home page are real-time images transmitted from each of the five cameras.
- Any two of the images can be selected and enlarged to view side-by-side on the screen.
- When viewing any two images, any single image can then be selected to view as a full screen image which can be zoomed and panned around using the magnifier and arrow icons.

Manual Proximity View

- Selecting proximity view from the camera home screen will display a combination of three images from the front passenger side cameras. These images provide the driver with an enhanced view of the area forward and opposite the driver.

Rear View Camera

E123188

The rear view camera provides additional information to the driver when reversing the vehicle. When reverse gear is selected the camera integrated into the tailgate handle assembly, automatically displays a wide-angle color image of the view from the rear of the vehicle onto the TSD.

The rear view images are overlaid with:

- Dashed lines representing the perimeter of the vehicle.
- Solid lines representing the predicted trajectory of the vehicle; calculated from the steering wheel angle sensor.
- Colored bars represent the amount of distance between the vehicle and the object being approached. Working in conjunction with the standard 'rear parking aid' this adds a visual representation to the existing audible warning. The distance data is received from the parking aid module via the medium speed CAN.

The reversing-aid graphics can be disabled for the current drive cycle in the settings menu.

Reversing Visual Warnings

E117982

Item	Part Number	Description
1	-	Object being approached - 'yellow strip' with steady intermittent warning tone
2	-	Object being approached - 'orange strip' with faster intermittent warning tone
3	-	Object being approached - 'red strip' with continuous warning tone

The rear view image will not be displayed when any of the following apply:

- Drive is selected for longer than 15 seconds.
- Drive is selected and the vehicle speed is greater than 18 km/h (11 mile/h).

Special Views

E124989

The special views are a selection of pre-set views that provide the driver with some useful driving aids. These can be considered as a shortcut to some pre-determined images that have been developed to assist the driver in various situations:

- Curb view: downward view from the two door mirror cameras.
- Junction view: outward view from the two front cameras.
- Trailer view: rear camera view of trailer being towed.

System Calibration

To achieve viewing accuracy from the proximity cameras, strict tolerances are calibrated into the system when the vehicle is static. Continual dynamic adaptation of the system then takes place when the vehicle is in motion. This is an automated process performed by the proximity camera control module.

This level of accuracy must be maintained after any service procedures are performed on the vehicle that affects the proximity camera system. Should the control module or any one of the cameras require replacement, static re-calibration must be carried out using the approved Land Rover diagnostic equipment.

Camera replacement is detected by the proximity camera control module, through the recognition of a new serial number during the 'camera count' procedure that takes place during the 'ignition on' phase via the [LIN](#). This detection will log a [DTC \(diagnostic trouble code\)](#) advising a calibration routine should be performed.

Alignment adjustments to the cameras are performed using the diagnostic equipment and the vehicle's TSD (touch screen display). During the calibration procedure, setup software in the control module overlays fine colored lines on the TSD highlighting reference points on the bodywork. For example, the mirror camera image must capture the side repeater indicator, the shut-line of the doors and the lower sill trim.

Direction arrows are pressed to shift the image in the desired direction to meet the reference points viewed on the TSD.

Adjustments include:

- Up
- Down
- Left
- Right
- Rotation

When the reference points correspond exactly, the setting is saved and the calibration procedure is complete for that camera.

• **NOTE:** If body repairs are performed that affect the camera system, a calibration procedure must be executed after the repairs are completed.

System Fault

There are two possible types of fault relative to the cameras:

- Camera fault (no communication).

- Camera view obscured (see 'Camera Obstruction Detection' section for further information).

In the event of camera fault, a [DTC](#) is logged in the proximity camera control module and an icon is presented to the driver on the TSD (touch screen display) where the camera image would normally be viewed.

Each camera view has an orientation icon displayed in the top left hand corner and has two color states:

- Blue – ok
- Amber – camera problem

TOW HITCH ASSIST

The rear view camera provides additional information to the driver when hitching a trailer to the vehicle. When reverse gear is selected the camera integrated into the tailgate handle assembly, automatically displays a wide-angle color image of the view from the rear of the vehicle onto the TSD (touch screen display).

Within the settings menu the driver can activate the Hitch Guidance and Auto-towball Zoom feature. Hitch guidance provides a trajectory line indicating the path of the towball in relation to the steering angle applied to the vehicle. 'Auto-towball Zoom' initiates an automatic image zoom when the trailer is within 60cm of the towball to allow more accurate alignment of vehicle to trailer.

E125150

Item	Part Number	Description
1	-	Touch Screen Display – Auto towball Zoom feature
2	-	Tow ball trajectory line
3	-	Automatic zoom

TOW ASSIST

Tow Assist aids the driver with the reversing of a trailer by displaying information on the TSD (touch screen display).

The system uses a tracking target sticker attached to the trailer to monitor and predict the direction of the trailer. Calculations are made by the proximity camera control module, based on the relationship of angles between the vehicle and trailer and the current steering wheel position.

Tow Assist becomes active when a trailer is attached to the vehicle and the trailer electrical plug is attached to the vehicle socket. The [CJB](#) detects the connection has been made and sends a message via the medium speed [CAN](#) to the proximity camera control module.

- **NOTE:** If the connection is not detected, setup can be manually prompted by touching the 'Tow Assist' icon on the 'Camera' menu.

Tow Assist – New Trailer

When the CJB detects the trailer electrical plug has been connected, the trailer setup screen is displayed automatically on the TSD with the question: 'Has a trailer been connected?'

Selecting 'Yes' will bring up the first of a number of trailer setup screens. On first use the setup screens take the user

through a series of configuration options for the connected trailer. To configure a new trailer select 'Add New' and then 'OK'.

Trailer Setup – Step 1 of 6

- Choose from the list of generic trailer descriptive names for the trailer attached, then select 'Next'.

Trailer Setup – Step 2 of 6

- Position the trailer straight behind the vehicle, to allow more accurate positioning of the target. Stick the self adhesive tracking target to the front of the trailer within the orange highlighted zone as displayed, then select 'Next'.
- The highlighted zone will turn green when the target sticker is correctly positioned.

Tracking target sticker

E125745

Trailer Setup – Step 3 of 6

- Select the correct number of axles for the chosen trailer, then select 'Next'.

Trailer Setup – Step 4 of 6

- Select the preferred camera view for use with this trailer, then select 'Next'.
- **NOTE:** The Side Cameras view is more suited to tall and/or long trailers for example caravans. The Reverse Camera view is more suited to small and/or short trailers.

Trailer Setup – Step 5 of 6

- Using the numeric pad, enter the Hitch Length of the trailer, then select 'Next'.
- **NOTE:** Hitch Length is the distance from the hitch point to the pivot point of the trailer. The pivot point will vary depending on the number of axles, and will be:
 - the center-line of the axle on a single axle trailer,
 - the mid-point between the axles on a twin axle trailer,
 - the center line of the center axle on a triple axle trailer.

Trailer Setup – Step 6 of 6

- Using the distance adjustment buttons, set the orange overlay graphics at the width of the trailer wheels, or trailer edges when a tall trailer is to be used, then select 'Finish'.
- **NOTE:** The orange overlay graphics determine the position of the trailer reverse guidance lines.

A confirmation message will appear to show that the trailer information has been retained.

Finally, highlight the trailer that has been memorized, and select 'OK'.

- **NOTE:** In order to learn the central position of the trailer, the vehicle must be driven forwards at less than 15mph with the steering wheel in the straight-ahead position. There is currently no confirmation for when this process has completed, however the status can be derived by selecting Reverse gear and noting the presence of message 'Trailer tracking in progress'. Whilst tracking feature is learning the central position, the trailer trajectory lines will appear in a light blue color, when process is complete they will change to a dark purple color.

The Tow Assist feature is now ready to use.

Tow Assist – Previously Saved Trailer

When the CJB detects the trailer electrical plug has been connected, the trailer setup screen is displayed automatically on the TSD with the question: 'Has a trailer been connected?'

Selecting 'Yes' from the previous screen brings a list of pre-set, or previously saved, trailers. Highlight the required trailer, and select 'OK'.

- **NOTE:** In order to learn the central position of the trailer, the vehicle must be driven forwards at less than 15mph with the steering wheel in the straight-ahead position. There is currently no confirmation for when this process has completed, however the status can be derived by selecting Reverse gear and noting the presence of message 'Trailer tracking in progress'. Whilst tracking feature is learning the central position, the trailer trajectory lines will appear in a light blue

color, when process is complete they will change to a dark purple color.

The Tow Assist feature is now ready to use.

Parking Aid - Parking Aid

Diagnosis and Testing

Principle of Operation

For a detailed description of the parking aid system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Parking Aid](#) (413-13 Parking Aid, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
 - NOTE: Do not change sensors under warranty that have damage to the sensor face.
1. **1.** Verify the customer concern.
 2. **2.** Ensure that the sensor face is clear of contamination that could effect the performance of the sensor.
 3. **3.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Sensor condition and installation ● Sounder(s) ● Switch 	<ul style="list-style-type: none"> ● Fuses ● Harnesses and connectors ● Sensor(s) ● Parking aid switch ● Parking Aid Module (PAM)

4. **4.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
5. **5.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

On-Board Self-test

As part of the strategy of the system, the self-test will inform the driver of any faults by a combination of the LED and tones:

- The status LED will flash if the system is active and a fault is detected in the sensors, sounders, wiring or module
- The front sounder will emit an error tone for 3 seconds if a fault is detected with the front sensors or if the rear sounder develops a fault
- The rear sounder will emit an error tone for 3 seconds if a fault is detected with the rear sensors, the switch, or the LED in the switch, or if there is a Controller Area Network (CAN) bus error

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Parking Aid Module \(PAM\)](#) (100-00 General Information, Description and Operation).

Parking Aid - Parking Aid Camera

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: The ignition must be switched off.

1. Refer to: [Liftgate Trim Panel](#) (501-05 Interior Trim and Oramentation, Removal and Installation).

2. Torque: 10 Nm

E124412

E124413

3.  CAUTION: Take extra care not to damage the wiring harnesses.

Installation

1. To install, reverse the removal procedure.

Parking Aid - Parking Aid Camera Module

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).

3.  CAUTION: Take extra care not to damage the wiring harnesses.

Torque: 5 Nm

Installation

1.  CAUTION: If a new component has been installed, configure using Land Rover approved diagnostic equipment.

To install, reverse the removal procedure.

Parking Aid - Parking Aid Module

Removal and Installation

Removal

1. Remove the C-pillar lower trim panel.
For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Remove the parking aid module.

- Disconnect the 3 electrical connectors.
- Remove the 2 nuts.

Installation

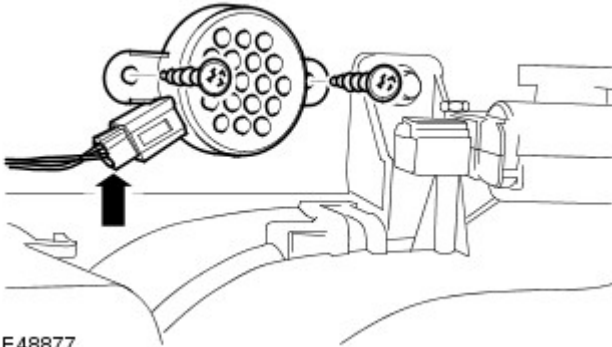

1. Install the parking aid module.
 - Tighten the nuts to 5 Nm (4 lb.ft).
 - Connect the electrical connectors.
2. Install the C-pillar lower trim panel.
For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Parking Aid - Parking Aid Speaker

Removal and Installation

Removal

1. Remove the C-pillar lower trim panel.
For additional information, refer to: [C-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Remove the loadspace trim mounting bracket.
 - Remove the 2 screws.
 - Release the 2 clips.
3. Remove the rear parking aid speaker.
 - Disconnect the electrical connector.
 - Remove the 2 screws.

E48877

Installation

1. To install, reverse the removal procedure.

Parking Aid - Front Parking Aid Camera

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: The ignition must be switched off.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: [Front Bumper Cover](#) (501-19 Bumpers, Removal and Installation).

3. **3. CAUTIONS:**

LH illustration shown, RH is similar.

Make sure that the component is correctly located on the locating dowels.

Take extra care not to damage the wiring harnesses.

Installation

1.  **CAUTION:** If a new component has been installed, configure using Land Rover approved diagnostic equipment.

To install, reverse the removal procedure.

Parking Aid - Front Inner Parking Aid Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Front Bumper Cover](#) (501-19 Bumpers, Removal and Installation).

- 4.

Installation

1. To install, reverse the removal procedure.

Parking Aid - Front Outer Parking Aid Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: RH illustration shown, LH is similar.
- NOTE: The ignition must be switched off.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Remove the front wheel and tire.

2. Refer to: [Front Fender Moulding](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).

3. Torque: 1 Nm

- 4.

Installation

1. To install, reverse the removal procedure.

Parking Aid - Rear Inner Parking Aid Sensor

Removal and Installation

Removal

1. Remove the rear bumper cover.
For additional information, refer to: Rear Bumper (501-19, Description and Operation).
2. Remove the parking aid sensor.
 - Release the 2 clips.

E45116

3. Remove the parking aid sensor trim panel.
 - Release the 3 clips.

E45117

Installation

1. Install the parking aid sensor trim panel.
2. Install the parking aid sensor.
3. Install the rear bumper cover.
For additional information, refer to: Rear Bumper (501-19, Description and Operation).

Parking Aid - Rear Outer Parking Aid Sensor

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Release the 5 exhaust hangers.
 - Support the exhaust assembly.

3. Remove the parking aid sensor.
 - Disconnect the electrical connector.
 - Release the 2 clips.

4. Remove the parking aid sensor trim panel.
 - Release the 3 clips.

Installation

1. To install, reverse the removal procedure.

Parking Aid - Side Parking Aid Camera

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: RH illustration shown, LH is similar.
- NOTE: The ignition must be switched off.

1. Refer to: [Exterior Mirror Cover](#) (501-09 Rear View Mirrors, Removal and Installation).

2. **2. CAUTIONS:**

Take extra care not to damage the component.

Take extra care not to damage the wiring harnesses.

Torque: 0.5 Nm

Installation

1.  **CAUTION:** If a new component has been installed, configure using Land Rover approved diagnostic equipment.

To install, reverse the removal procedure.

Battery and Charging System - General Information -

Battery

Item	Specifications
All Gasoline (Petrol) Models:	
Type	Maintenance free lead-calcium
Capacity	690 amps - 75 amp/hour
Reserve capacity	150 minutes @ 25 amps
Diesel Models:	
Type	Maintenance free lead-calcium
Capacity	825 amps - 90 amp/hour
Reserve capacity	190 minutes @ 25 amps

Battery Disconnect/Connect

CAUTION: The vehicle status and battery condition must be established before attempting battery disconnect/connect. Reference must be then made to the following table to establish the relevant procedure to be followed.

Vehicle status	Battery charged Procedure	Battery discharged Procedure
Engine running	1	
Vehicle powered down, locked and alarmed	2	3
Vehicle unlocked	4	5

Procedure 1

Disconnect battery	Connect battery
1. If possible, apply parking brake or alternatively, chock wheels	1. Ensure that all electrical loads are switched OFF
2. Switch off ignition	2. Connect battery leads - GROUND lead last
3. Wait 2 minutes for engine management system to 'power down'	3. Switch on ignition
4. Open the hood	4. Operate parking brake switch several times until parking brake warning lamp is extinguished
5. Disconnect battery - GROUND lead first	5. Reset electric window one-touch facility. Power window up to hard stop, release switch, reapply and hold for 1 second (relay in door will click). One touch should now work

Procedure 2

Disconnect battery	Connect battery
1. Unlock the vehicle and disarm the alarm using the 'plip' button	1. Ensure that all electrical loads are switched OFF
2. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	2. Connect battery leads - GROUND lead last
3. Wait 2 minutes for engine management system to 'power down'	3. Switch on ignition
4. Open the hood	4. Operate parking brake switch several times until parking brake warning lamp is extinguished
5. Disconnect battery - GROUND lead first	5. Reset electric window one-touch facility. Power window up to hard stop, release switch, reapply and hold for 1 second (relay in door will click). One touch should now work

• NOTE: 1. **Disconnect battery** - The door unlock process initialises the ICE system.

Procedure 3

Disconnect battery	Connect battery
1. Unlock the vehicle from the left hand front door using the key	1. Ensure that all electrical loads are switched OFF
2. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	2. Connect battery leads - GROUND lead last
3. Wait 2 minutes for engine management system to 'power down'	3. Switch on ignition
4. Open the hood	4. Operate parking brake switch several times until parking brake warning lamp is extinguished
5. Disconnect battery - GROUND lead first	5. Reset electric window one-touch facility. Power window up to hard stop, release switch, reapply and hold for 1 second (relay in door will click). One touch should now work

• NOTE: 1. - **Disconnect battery** - The door unlock process initialises the ICE system

• NOTE: 1. **Connect battery** - If there is insufficient capacity in the battery to disarm the alarm, the alarm may sound on reconnection of the battery - Step 3 will disarm the alarm

Procedure 4

Disconnect battery	Connect battery
--------------------	-----------------

1. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	1. Ensure that all electrical loads are switched OFF
2. Wait 2 minutes for engine management system to 'power down'	2. Connect battery leads - GROUND lead last
3. Open the hood	3. Switch on ignition
4. Disconnect battery - GROUND lead first	4. Operate parking brake switch several times until parking brake warning lamp is extinguished
	5. Reset electric window one-touch facility. Power window up to hard stop, release switch, reapply and hold for 1 second (relay in door will click). One touch should now work

Procedure 5

Disconnect battery	Connect battery
1. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	1. Ensure that all electrical loads are switched OFF
2. Wait 2 minutes for engine management system to 'power down'	2. Connect battery leads - GROUND lead last
3. Open the hood	3. Switch on ignition
4. Disconnect battery - GROUND lead first	4. Operate parking brake switch several times until parking brake warning lamp is extinguished
	5. Reset electric window one-touch facility. Power window up to hard stop, release switch, reapply and hold for 1 second (relay in door will click). One touch should now work

• **NOTE: 1. Disconnect battery** - If the remote control module (RCM) is not functioning, it will be necessary to manually unlock the vehicle using the key.

Vehicle Jump (Emergency) Starting - Using Another Vehicle

Carry out the following operations in the sequence given
1. Connect one end of the BLACK (-) booster cable to the GROUND (-) battery terminal of the DONOR vehicle
2. Connect the other end of the BLACK (-) booster cable to a good earth point e.g. unpainted metal surface or engine mounting at least 0.5 m (20.0 in) from the battery or fuel lines on the DISABLED vehicle
3. Connect one end of the RED (+) booster cable to the positive (+) battery terminal of the DONOR vehicle
4. Connect the other end of the RED (+) booster cable to the positive (+) battery terminal of the DISABLED vehicle
5. Start the engine of the DONOR vehicle and allow it to idle for a few minutes
6. Start the engine of the DISABLED vehicle
7. Allow engines of both vehicles to idle for a few minutes then switch off the engine of the DONOR vehicle
8. Disconnect the RED (+) booster cable from the battery of the PREVIOUSLY DISABLED vehicle
9. Disconnect the RED (+) booster cable from the battery of the DONOR vehicle
10. Disconnect the BLACK (-) booster cable from the earth point of the PREVIOUSLY DISABLED vehicle
11. Disconnect the BLACK (-) booster cable from the battery of the DONOR vehicle

• **WARNINGS:**

 During normal use, batteries emit explosive hydrogen gas sufficient to cause severe explosions and capable of causing serious injury - keep sparks and naked lights away from the engine compartment.

 DO NOT attempt to start the disabled vehicle if it is suspected that the electrolyte in the battery is frozen.

 Suitable eye protection must be worn when working in the vicinity of the battery.

 Take care when working near rotating parts of the engine.

 Prior to attempting to start the disabled vehicle, ensure that the parking brake is applied or suitably chock the wheels. Ensure that 'P' - PARK - Automatic Gearbox or NEUTRAL - Manual Gearbox is selected.

• **CAUTIONS:**

 Ensure that all electrical loads are switched OFF prior to connecting booster cables and disconnect booster cables prior to using any electrical equipment.

 Ensure that the battery of the DONOR vehicle is of 12 volt capacity and that all electrical loads on the disabled vehicle are switched OFF prior to connecting booster cables.

 Ensure that there is no physical contact between the donor and disabled vehicles other than the booster cables.

Vehicle Jump (Emergency) Starting - Using a Slave Battery/Starting Aid

Carry out the following operations in the sequence given
1. Connect the end of the BLACK (-) booster cable to the ground (-) battery terminal of the vehicle
2. Connect the end of the RED (+) booster cable to the positive (+) battery terminal of the vehicle

Carry out the following operations in the sequence given

3. Start the engine of the vehicle and allow it to idle
4. Disconnect the RED (+) booster cable from the battery terminal of the vehicle
5. Disconnect the BLACK (-) booster cable from the battery terminal of the vehicle

• WARNINGS:

During normal use, batteries emit explosive hydrogen gas sufficient to cause severe explosions and capable of causing serious injury - keep sparks and naked lights away from the engine compartment.

DO NOT attempt to start the disabled vehicle if it is suspected that the electrolyte in the battery is frozen.

Suitable eye protection must be worn when working in the vicinity of the battery.

Take care when working near rotating parts of the engine.

Prior to attempting to start the disabled vehicle, ensure that the parking brake is applied or suitably chock the wheels. Ensure that 'P' - PARK - Automatic Gearbox or NEUTRAL - Manual Gearbox is selected.

• CAUTIONS:

Ensure that all electrical loads are switched OFF prior to connecting booster cables and disconnect booster cables prior to using any electrical equipment.

Ensure that the slave battery/starting aid are of 12 volt capacity and that all electrical loads on the disabled vehicle are switched OFF prior to connecting booster cables.

Battery and Charging System - General Information - Battery Care

Description and Operation

12V LEAD ACID BATTERY CARE MANUAL FOR DEALER / RETAILER USE

1. INTRODUCTION

2. GENERAL RULES FOR BATTERY CARE

3. EQUIPMENT (MINIMUM STANDARD)

4. HEALTH AND SAFETY PRECAUTIONS

5. DETERMINING BATTERY CONDITION

6. BATTERY CHARGING AND MAINTENANCE

7. CHARGING SYSTEM TEST AND DIAGNOSIS

8. VEHICLE QUIESCENT CURRENT TESTING

APPENDIX A: BATTERY TEST PROCESS

APPENDIX B: BATTERY REPORT FORM - IN SERVICE BATTERIES ONLY

1. INTRODUCTION

This publication sets out, for the benefit of dealers / retailers worldwide, requirements for the care and maintenance of batteries, from the vehicles hand-over to the dealer / retailer to the handover to the customer or in the case of a spare part battery from its delivery to the dealer / retailer to its fitment to a customer vehicle.

It applies to all types of 12 volt Lead Acid Batteries used, whether they are conventional flooded technology or Absorbed Glass Mat (AGM) technology and also applies to both Primary and Secondary or Auxiliary Batteries.

The clearly laid out and illustrated sections guide dealers / retailers through each stage of the vehicles or spare parts receipt, storage, pre-delivery and customer hand-over. This publication can be used as a guide to the handling and care of batteries in service. It is vital to appreciate that unless each process is rigorously applied on all vehicles, the customer will receive a vehicle with a battery or a spare part battery which will not provide a satisfactory service life.

It is very important that all tests quoted throughout this publication are adhered to. If they are applied incorrectly batteries could be scrapped unnecessarily. Refer to the battery testing section for detailed information.

It is equally important therefore to note the following key points:

- Most new vehicles leave the factory with either a transit relay installed and/or have a transit mode programmed into the vehicle control modules. The transit relay must be removed and the transit mode disabled (where applicable) using an approved diagnostic system, **NOT MORE THAN 24 HOURS** before the customer takes delivery.
- 12 Volt Lead Acid Batteries rely on internal chemical processes to create a voltage and deliver current. These processes and the internal chemical structure of the battery can be damaged if the battery is allowed to discharge over a number of weeks / months, or is left in a discharged state for a lengthy time period. For this reason the battery must be tested / re-charged if necessary every month, and **MUST BE** re-charged after every three month period of storage. Refer to the vehicle storage manual and update the vehicle history sheet.
- Under no circumstances should the battery be disconnected with the engine running because under these conditions the alternator can give a very high output voltage. This high transient voltage will damage the electronic components in the vehicle. Loose or incomplete battery connections may also cause high transient voltage.
- On vehicles with conventional ignition keys, these must not be left in the ignition lock barrel when the transit relay has been removed, otherwise quiescent current will increase and the battery will discharge more rapidly.
- Two types of Lead acid batteries are used; standard Flooded type and AGM (Absorbed Glass Mat) or VRLA (Valve regulated Lead Acid) types. AGM batteries offer improved resistance to cycling as seen in stop start applications. AGM Batteries are fully sealed and cannot have the electrolyte level topped up.

Dealers and retailers involved in the storage, handling of vehicles and spare parts batteries have a responsibility to ensure that only vehicles and spare parts having a fully satisfactory battery may be processed further through the distribution selling chain.

• **NOTE:** It is very important that test processes quoted throughout this publication are adhered to.

If they are not adhered to correctly batteries could be scrapped unnecessarily or a battery with an issue remains in use. Refer to the battery testing section for detailed information.

2. GENERAL RULES FOR BATTERY CARE

Frequency of Battery Condition Checks.

Any battery in storage whether it is in a vehicle or in spare parts inventory must have its charge status checked every 30 days as described in Appendix A, and must be recharged every 90 days as described in the "Battery Charging and Maintenance" section of this manual.

Dealer Demonstration Vehicles

Due to the high depth of discharge a dealer demonstration vehicle battery may experience, batteries that are fitted to vehicles used as dealer demonstration vehicles must be connected to a power supply / charger capable of delivering 50 Amps or more whilst the vehicle is being demonstrated and the engine is not running. This will prevent the battery from being damaged from "energy throughput " wear out during a demonstration.

Software Reflash, SDD work or Ignition On related Workshop Activities.

Due to the high electrical current demand and high depth of Discharge that can occur during vehicle software re-flash activities, SDD work or ignition on related work in the workshop, vehicles that are undergoing such activities MUST have the electrical system on the vehicle supported with a power supply / charger / vehicle maintainer capable of delivering 50 Amps or more.

Jump Starting New vehicles Before They Have Been Delivered to the Customer.

- It is the dealer / retailers responsibility to ensure the battery is not allowed to go flat by following the instructions and processes defined in this manual.
- However if circumstances dictate that a new vehicle must be jump started due to a flat battery whilst the vehicle is in the dealer / retailers care, the battery on this vehicle must be replaced with a new one prior to delivery to the customer at the dealer / retailers liability.
- The vehicle should also undergo investigation as to why the battery went flat.
- Do not connect the jump starting cable to the negative (-) terminal of the battery. Always connect to the recommended earthing point. As defined in the owners handbook or service documentation for that vehicle.

Jump Starting or Boost Charging Vehicles in Service

Do not connect the jump starting cable to the negative (-) terminal of the battery. Always connect to the recommended earthing point. As defined in the owners handbook or service documentation for that vehicle.

Charging AGM Batteries

AGM batteries must not be charged with voltages above 14.8 Volts. Doing so will damage them.

Testing AGM Batteries

Midtronics 393, 394, 493 and 494 testers are not capable of testing AGM batteries. Doing so can give an incorrect result.

When it is necessary to test an AGM battery use the Midtronics EXP1080 tester or the GR1 Diagnostics Charger.

3. EQUIPMENT (MINIMUM STANDARD) (pictures are for illustration only)

Midtronics GR-1 Diagnostic Charger

E138129

4. HEALTH AND SAFETY PRECAUTIONS

• WARNINGS:

BATTERY CELLS CONTAIN SULPHURIC ACID AND EXPLOSIVE MIXTURES OF HYDROGEN AND OXYGEN GASES. IT IS THEREFORE ESSENTIAL THAT THE FOLLOWING SAFETY PRECAUTIONS ARE OBSERVED.

Batteries emit highly explosive hydrogen at all times, particularly during charging. To prevent any potential form of ignition occurring when working in the vicinity of a battery:

- Do not smoke when working near batteries.
- Avoid sparks, short circuits or other sources of ignition in the battery vicinity.
- Switch off current before making or breaking electrical connections.
- Ensure battery charging area is well ventilated.
- Ensure the charger is switched off when: a) connecting to a battery; b) disconnecting from the battery.
- Always disconnect the ground cable from the battery terminal first and reconnect it last.

Batteries contain poisonous and highly corrosive acid. To prevent personal injury, or damage to clothing or the vehicle, the following working practices should be followed when topping up, checking electrolyte specific gravity, removal, refitting or carrying batteries:

- Always wear suitable protective clothing (an apron or similar), safety glasses, a face mask and suitable gloves.
- If acid is spilled or splashed onto clothing or the body, it must be neutralized immediately and then rinsed with clean water. A solution of baking soda or household ammonia and water may be used as a neutralizer.
- In the event of contact with the skin, drench the affected area with water. In the case of contact with the eyes, bathe the affected area with cool clean water for approximately 15 minutes and seek urgent medical attention.
- If battery acid is spilled or splashed on any surface of a vehicle, it should be neutralized and rinsed with clean water.
- Heat is generated when acid is mixed with water. If it becomes necessary to prepare electrolyte of a desired specific gravity, SLOWLY pour the concentrated acid into water (not water into acid), adding small amounts of acid while stirring. Allow the electrolyte to cool if noticeable heat develops. With the exception of lead or lead-lined containers, always use non-metallic receptacles or funnels. Do not store acid in excessively warm locations or in direct sunlight.

Due to their hazardous contents, the disposal of batteries is strictly controlled. When a battery is scrapped, ensure it is disposed of safely, complying with local environmental regulations. If in doubt, contact your local authority for advice on disposal facilities.

5. DETERMINING BATTERY CONDITION

The tools used for determining the condition of the battery will depend upon whether it is installed in a vehicle or in spare parts inventory. Concerning an installed battery, procedures will vary if the vehicle is new, or already in service with a

customer.

• NOTE: The term 'New Vehicle' refers to a vehicle at any part of the delivery process from leaving the factory to arriving at a port of entry, dealership, retailer, including any storage facilities en route or a vehicle being stored prior to sale at dealership / retailer.

• NOTE: Midtronics 393, 394, 493 and 494 testers must not be used to test AGM batteries as these testers are not capable of correctly testing AGM batteries and can give an incorrect result. For AGM battery testing use the EXP1080 tester or the GR1 Diagnostics charger.

NEW VEHICLES

A Midtronics tester should be used to assess the condition of the battery for new vehicles. The test results should be recorded on the Storage History Sheet (see Vehicle Storage manual).

Scenario 1 - Dealership / Retailer (Responsibility: Dealer / Retailer)

1. Within 24 hours of arrival at the dealer / retailer proceed as follows:

- Perform a Midtronics battery test (See Appendix A.)
- Carry out the recommended actions accordingly.

2. If the Midtronics result is "Good Battery" the vehicle may be stored.

- For all new vehicles in storage the transit relay MUST be fitted, or the Transit Mode enabled where used. For vehicles without a transit relay or a Transit Mode, the battery negative cable MUST BE DISCONNECTED from the battery.

3. The battery must be tested and/or re-charged every month and MUST be re-charged after every three month period.

4. Record your test results on the Storage History Sheet (see Vehicle Storage Manual) to indicate when a re-charge will be necessary.

Scenario 2 - Delivery to the Customer (Responsibility: Dealer / Retailer)

• NOTE: It is essential that the following actions are conducted in the 24 hours prior to the agreed hand over time:

1. Perform a Midtronics Battery test (See Appendix A).

2. Carry out the recommended actions accordingly.

3. The vehicle should only be released to the customer if Midtronics has tested the battery as "Good Battery"

Spare Part Batteries

Lead acid batteries will, as a result of natural chemical processes, slowly self discharge themselves over a period of time (even when open circuit and no electrical load applied).

In the case of spare parts batteries, a Midtronics tester should be used to assess the condition of new spare parts batteries.

The batteries must be stored such that they cannot get wet and are not in direct sunlight.

Any batteries which are dropped must be scrapped. This applies even if no external damage is apparent.

Scenario 1 - Spare Part Batteries Within Dealer Stock But Not Yet Fitted To A Vehicle (Responsibility: Dealer / Retailer)

1. For a battery in the Dealer parts or in ready to use stock but not yet fitted to a vehicle the following rules must be followed:

- Check the battery condition on receipt by performing a Midtronics battery test (See Appendix A).
- Batteries should only be returned to storage if the Midtronics tester indicates "Good Battery".
- The battery condition should be rechecked every 30 days by performing a Midtronics battery test (See Appendix A).
- If required batteries should be recharged as described in the "Battery Charging and Maintenance" section of this manual.

2. All batteries must be controlled via a FIFO (First In First Out) process to ensure aged batteries are not held and the batteries are not allowed to age unnecessarily.

VEHICLES IN SERVICE

The Midtronics hand-held tester or the Midtronics Diagnostic Charger are the preferred tools to assess battery condition for vehicles in service. The test results should be recorded on the In-Service Battery Report Form (See Appendix B).

Midtronics Testing - In-Service Testing Only

• NOTE: The battery surface charge must be removed before this test in accordance with the procedure in Appendix A. Ensure that the battery terminal connectors are clean. When connecting the Midtronics testing equipment, connect the RED clip to the positive (+) battery terminal first, and then connect the BLACK clip to the negative (-) battery terminal. Rock the clips backward and forward to ensure a good connection to the battery.

1. Perform a Midtronics battery test (See Appendix A).

2. Carry out the recommended actions accordingly.

6. BATTERY CHARGING AND MAINTENANCE

BATTERY CHARGING

E138130

It is essential that a suitably ventilated defined area exists in each dealership / retailer for battery charging. Likewise, an area should be allotted for scrap batteries, and clearly indicated as such. It is recommended that dealers / retailers always have fully charged batteries ready for use. However the battery **MUST BE** tested and charged if necessary every month, and charged after three months irrespective of any test.

• CAUTIONS:

Batteries must be re-charged after a maximum of 3 months storage (see Storage History sheet in the New Vehicle Storage Manual).

It is very important that when charging batteries using the traction charger or other stand-alone chargers that the charger is set for the correct type of battery before charging commences. If the wrong switch is selected the result would be a battery that is not charged fully and / or overheating can occur. Follow the manufacturers operating instructions.

Do not charge AGM batteries with voltages over 14.8 volts as this will damage the battery.

To bring a serviceable but discharged battery back to a fully charged condition proceed as follows:

- Check and if necessary top-up the battery electrolyte level.
- Charge the battery using the Midtronics Diagnostic Charger (USA) or Traction Charger (all other markets) following the manufacturers operating instructions.

• **NOTE:** When using the Midtronics Diagnostic Charger, automatic mode must always be used. After charging and analysis, the charger may display 'Top-Off Charging', press STOP to end. Do not stop charging until the current falls to 5A or less, otherwise the battery will not be fully charged.

POST-CHARGE TEST METHODS

New Batteries, Batteries in Storage and In-Service Batteries

The purpose of this test is to ensure that the charging process has fully charged the battery.

• **NOTE: IT IS RECOMMENDED THAT THIS TEST IS CONDUCTED AT LEAST 24 HOURS AFTER THE CHARGE CYCLE IS COMPLETED.**

E138131

 **CAUTION:** DO NOT connect the tester to any other circuit or chassis point.

1. Attach the Midtronics Tester to the battery.
2. Follow the instructions on the tester to test the battery. Ensure the correct battery type and size is selected.
3. Perform the action based on the tester results (see the tester results chart in the Vehicles in Service sub -section of Determining Battery Condition Section).
4. Enter the readings and test code obtained on the In Service Battery Report Form.

• **NOTE:** Midtronics 393, 394, 493 and 494 testers must not be used to test AGM batteries as these testers are not capable of correctly testing AGM batteries and can give an incorrect result. For AGM battery testing use the EXP1080 tester or the GR1 Diagnostics charger.

BATTERY REPLACEMENT

If it is determined that a battery requires replacement, always refer to the appropriate section of the workshop manual for instructions on removing and installing the battery from the vehicle.

On in service vehicles fitted with a Battery Monitoring System (BMS), the BMS module must be reset following the installation of a new battery. The BMS module reset procedure must be performed using an approved diagnostic system.

CHECK/TOP-UP BATTERY ELECTROLYTE – Only Applicable to certain Flooded Types of Battery.

• **WARNINGS:**

 **AGM TECHNOLOGY BATTERIES ARE FULLY SEALED FOR LIFE AND NO ATTEMPT SHOULD BE MADE TO CHECK OR TOP UP THE ELECTROLYTE LEVEL.**

 **BEFORE CHECKING AND TOPPING-UP THE BATTERY ELECTROLYTE, REFER TO THE HEALTH AND SAFETY PRECAUTIONS SECTION.**

Check to ensure the battery is of a type suitable for topping up. These types of batteries will have cell plugs visible on the top face of the battery or a removable access panel to allow access to the cells.

On batteries with a clear or opaque case and level marks, check the electrolyte level by visual inspection of the maximum level indicator mark on the battery casing indicating adequate level above the battery separators.

On batteries with black cases, remove the cell plugs or access panel and ensure the electrolyte level is level with the indicator in the cell hole. A flashlight may be required to see the electrolyte level on this type of battery.

 **CAUTION:** DO NOT overfill.

If the electrolyte level is low, top-up using distilled water.

Maintenance free and Valve Regulated (AGM) batteries are sealed and therefore cannot be topped up.

CHARGING SYSTEM TEST AND DIAGNOSIS

For all vehicles, refer to the Charging System - Diagnosis and Testing in section 414-00 of the Workshop Manual.

VEHICLE QUIESCENT CURRENT TESTING

• NOTE: On vehicles fitted with a Battery Monitoring System (BMS), the diagnostic routine for quiescent drain testing in the approved diagnostic system should be utilized.

• NOTE: If a customer complains of a vehicle battery that discharges continuously or when left for a prolonged period of time, it is recommended that a quiescent drain test is performed as described below.

• NOTE: The battery drain should be measured using an approved diagnostic system or a Digital Multi-Meter (DVOM).

The vehicle should be in the locked/armed state (for example vehicle alarm fully armed), all doors, engine and luggage compartment lids are open and latched (so as to appear closed from an electrical point of view). The test should take place after the vehicle has entered shutdown mode. The time taken for this to occur after the ignition is switched off varies according to model - Refer to Quiescent Drain in section 414-00 of the Workshop Manual.

• NOTE: When the vehicle is armed, the effect of the security system Light Emitting Diode (LED) flashing is to cause a pulsation in the measured current drain. In this case, either the average current should be taken (using a Digital Multi-Meter (DVOM) with an averaging system) or the current reading taken, ignoring the brief high current peaks.

EQUIPMENT

Approved diagnostic system with current probe or Digital Multi-Meter (DVOM) with current probe.

METHOD OF MEASUREMENT

Using an Approved Diagnostic System

1. Switch off all electrical loads and ensure that the ignition is off.
2. Connect the current probe to the approved diagnostic system.
3. Calibrate the probe.
4. Install a clamp around the battery lead/junction box lead.
5. Go to the Quiescent Current Testing section.

Using a Digital Multi-Meter (DVOM)

• NOTE: Do not use an in-line DVOM to measure the quiescent drain on vehicles fitted with an electronic throttle. The current exceeds the maximum amount the fuse in the DVOM is capable of handling.

1. Switch off all electrical loads and ensure that the ignition is off.
2. Connect the current probe to the DVOM.
3. Calibrate the probe.
4. Install a clamp around the battery lead/junction box lead.
5. Go to the following Quiescent Current Testing section.

QUIESCENT CURRENT TESTING

1. Switch ignition to 'on' or select ignition mode in keyless vehicles and switch to 'off' (do not crank).
2. Remove key from ignition switch (where applicable).
3. Open and latch all doors, hood and luggage compartment lid.
4. Lock the vehicle using the remote function on the remote handset. (Single lock only to avoid volumetric alarm arming).
5. Remove any other potential electrical drains such as accessories plugged into accessory sockets.
6. Record the amperage readings after the shutdown period. The model specific Amperage readings for quiescent drain are referenced in Quiescent Drain in section 414-00 of the Workshop Manual
7. Record the final reading on the battery report form Appendix B.

• NOTE: The preferred method of testing following an excessive current consumption figure is to use a current probe around individual junction box leads to the various suspected circuits to identify a potential cause. This is in preference to the old method of removing fuses for the following reasons:

- Many modules take a considerable time to power down. Each time a fuse is removed and re-fitted, the quiescent drain current may take an extended period of time to return to normal (typically up to 45 minutes).
- The drain may be caused by a module remaining active and preventing the quiescent drain from reducing to normal levels.
- The drain may be caused by a relay winding that is activated. Pulling the fuse can allow this to 'reset' and the drain will be lost and go un-diagnosed.

General Information	YES / NO		YES / NO

Battery and Charging System - General Information - Quiescent Drain

Description and Operation

QUIESCENT DRAIN - TYPICAL VALUES

- NOTE: The quiescent drain after the initial shutdown period should not exceed the value shown in the table.

Land Rover Quiescent Drain Values

MODEL	SHUT DOWN PERIOD (minutes)	TYPICAL VALUES BATTERY DRAIN (mA)
Range Rover (LM) - Up to 2009MY	30	16.0 - 18.0
Range Rover (LM) - From 2010MY	20 (after lock/arm condition) ²	<30
	33 (unlocked)	<30
Range Rover Sport (LS) - Up to 2007MY	20	<22
Range Rover Sport (LS) - From 2007MY to 2010MY	30	<25
Range Rover Sport (LS) - From 2010MY	3 (after lock/arm condition) ²	<30
	33 (unlocked)	<30
Range Rover Evoque (LV) - From 2012MY	20 (after lock and arm condition)	<20
Discovery 3/LR3 (LA) - Up to 2007MY	20	<22
Discovery 3/LR3 (LA) - From 2007MY to 2010MY	30	<25
Discovery 4/LR4 (LA) - From 2010MY	3 (after lock/arm condition) ²	<30
	33 (unlocked)	<30
Freelander 2/LR2 (LF) - From 2007MY	35 (single locked or unlocked)	<23.6
	12 (double locked)	<23.6
Freelander (LN) - Up to 2007MY	10	24-25 - without Becker Navigation system
	10	27-28 - with Becker Navigation system
Defender (LD) - 1998MY to 2007MY	30	<21
Defender (LD) - from 2007MY	<30	<30
Discovery Series 2 (LT)	30	<30

- NOTE:

1. The total current drain will be higher if certain approved accessories are fitted (for example: tracker, trailer module, etc.)

2. Applies to vehicles without Tire Pressure Monitoring System (TPMS). Vehicle shut-down period with TPMS is approximately 15 minutes.

Battery and Charging System - General Information - Charging System

Diagnosis and Testing

Principle of Operation

For a detailed description of the charging system and operation, refer to the relevant Description and Operation section of the workshop manual.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Generator ● Drive belt ● Drive belt tensioner ● Generator pulley ● Check the security of the generator fittings 	<ul style="list-style-type: none"> ● Generator ● Battery ● Battery connections ● Starter motor ● Harnesses and connectors ● Fuses ● Charge warning lamp function ● Engine Control Module (ECM)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Charge warning lamp does not come on	<ul style="list-style-type: none"> ● Bulb/Circuit fault ● Generator fault ● CAN circuit fault ● Engine control module fault 	Check the warning lamp function with the ignition on and the engine off. Replace bulbs or repair the circuit(s) as necessary. Check for DTCs indicating a generator, CAN or engine control module fault.
Charge warning lamp stays on/battery discharges	<ul style="list-style-type: none"> ● Accessory drive belt broken ● Generator pulley slipping on shaft ● Generator fault ● Battery cable fault ● CAN circuit fault ● Engine control module fault 	Check the battery and generator cables. Refer to the electrical guides. Check for DTCs indicating a generator fault. Check the accessory drive belt condition and tension. Check that the pulley does not rotate independently of the generator. Check for DTCs indicating a CAN or engine control module fault.
Charge warning lamp intermittent	<ul style="list-style-type: none"> ● Accessory drive belt slipping ● Battery cable fault ● Generator wiring fault ● Generator fault ● CAN circuit fault 	Check the accessory drive belt condition and tension. Check the battery and generator cables. Refer to the electrical guides. Check for DTCs indicating a generator or CAN circuit fault. Note that the use of a power pack or boost charger may bring the warning lamp on until disconnected.
Battery discharges without the charge warning lamp staying on	<ul style="list-style-type: none"> ● Battery fault ● Battery quiescent drain ● Intermittent generator fault 	Check the battery condition, check for battery quiescent drain. Check for DTCs indicating a generator fault. It is possible for the altcom circuit to short circuit to ground without setting a DTC. If no other reason for discharge can be found, check this circuit. Refer to the electrical guides.
Noise (mechanical)	<ul style="list-style-type: none"> ● Accessory drive belt slipping ● Generator fault 	Check the accessory drive belt condition and tension. Disconnect the accessory drive belt and check that the generator rotates freely.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Battery, Mounting and Cables -

Torque Specifications

Description	Nm	lb-ft
Battery clamp bolts	10	7
Battery terminal nuts	10	7
Battery tray nuts	12	9
Auxiliary battery tray nuts	12	9

Battery, Mounting and Cables - Battery and Cables

Description and Operation

E133243

Item	Part Number	Description
1	-	-VE battery cable
2	-	Battery monitoring module
3	-	Battery
4	-	Transit relay
5	-	+VE battery cable

GENERAL

The battery is located between the bulkhead and the secondary bulkhead, in a protective box, on the passenger side. It sits in a tray and is secured with clamp plates and bolts.

The battery terminal posts allow for the battery cables to be connected with clamp type connections. The battery positive terminal uses a pyrotechnic attachment, which detaches the battery cable in the event of a crash of a severity to trigger the airbags. For additional information, refer to: Air Bag and Safety Pretensioner Supplemental Restraint System (SRS) (descop 501-20B).

All models are fitted with Delphi lead-calcium, maintenance free battery. Each battery is similar in construction with the battery rating varying according to application. There are two different battery sizes:

- H7 - All petrol variants
- H8 - TdV6

The battery uses 'calcium expanded' technology, which has both positive and negative plates with grids expanded from a strip lead-calcium alloy.

The battery is semi-sealed. Each casing has a vent to allow for thermal expansion and to vent oxygen and hydrogen gases, which are produced under certain charging conditions.

The battery incorporates an integral, temperature compensated hydrometer to provide a visual indication of the relative density and level of the electrolyte. The indicator shows different colours to show battery condition as follows:

- GREEN – shows that the battery is charged and in a serviceable condition
- DARK (turning to black) – shows that the battery is in a low state of charge and requires recharging
- CLEAR or YELLOW – the battery is no longer serviceable and must be replaced.

If the battery shows CLEAR or YELLOW the battery has an internal fault. Do not attempt to charge or jump-start the vehicle with the battery in this condition.

When removing the battery, ensure that the alarm is disarmed and that the ignition is switched off. Always disconnect the negative terminal first and then the positive terminal. When refitting the battery, always fit the positive terminal first followed by the negative terminal.

If the battery requires recharging, always use an approved constant current charger, designed for lead-calcium batteries. DO NOT use a fast charger, permanent damage to the battery may occur.

Delivery Mode

The vehicle is fitted with a transit relay. This is a disposable device and **NOT** for use by the customer. This relay fits in series with the battery and ground; it disconnects the battery from the vehicle's ground and thus eliminates quiescent current during delivery. The relay must be removed before delivery to the customer.

Battery Monitoring System

E115177

Optimal battery health is a fundamental factor in the correct operation of the Stop/Start system, therefore to calculate and communicate the battery status a Battery Monitoring System (BMS) module is introduced.

Battery, Mounting and Cables - Battery

Diagnosis and Testing

For further information refer to the battery care manual and,
REFER to: [Charging System](#) (414-00 Battery and Charging System - General Information, Diagnosis and Testing).

Battery, Mounting and Cables - Battery Tray

Removal and Installation

Removal

1. Remove the battery.
For additional information, refer to: [Battery](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

2. Remove the engine compartment upper heat shield.

- Remove the screw.
- Release the 2 clips.

3. Remove the battery compartment side wall.

- Release the battery positive cable and grommet.
- Release the four clips.

4. Release the heater pipes.

- Remove the retaining screw.

5. Remove the battery tray.

- Remove the three retaining nuts.

Installation

1. To install, reverse the removal procedure.

- Tighten the nuts to 12 Nm (9 lb.ft).

Battery, Mounting and Cables - Auxiliary Battery Tray

Removal and Installation

Removal

1. Remove the battery cover.

- Release the 2 clips.

E48702

2. Disconnect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

3. If installed, remove the auxiliary battery.

4. Remove the engine compartment upper heat shield.

- Remove the screw.
- Release the 2 clips.

E48703

5. Remove the auxiliary battery compartment side wall.

- Release the battery positive cable and grommet.
- Release the four clips.

E48704

6. Release the A/C pipes.

- Remove the retaining screw.

7. Remove the auxiliary battery tray.

- Remove the three retaining nuts.

Installation

1. To install, reverse the removal procedure.

- Tighten the nuts to 12 Nm (9 lb.ft).

Battery, Mounting and Cables - Battery

Removal and Installation

Removal

1. Secure the hood in the service position.

- Release the support struts.

2. Remove the battery cover.

3. Disconnect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

4. Disconnect the battery positive cable.

5. Remove 2 bolts securing the battery clamp and remove the clamp.

6. Remove the battery.

Installation

1. **NOTE:** Apply petroleum jelly to the battery terminals.

To install, reverse the removal procedure.

- Tighten the battery clamp bolts to 5 Nm (4 lb.ft).
- Tighten the battery terminals to 5 Nm (4 lb.ft).

Generator and Regulator - TDV6 2.7L Diesel -

CAUTION: * Damage to the internal connections will result if this torque is exceeded

Generator and Regulator - TDV6 2.7L Diesel - Generator

Description and Operation

E50141

GENERAL

The generator is located at the front RH side of the engine, in front of the RH cylinder head. The generator has an output of 85/150 Amps and is manufactured by Denso. An eight-ribbed polyvee belt drives the generator pulley, which in turn is driven from the engine crankshaft pulley.

The generator pulley incorporates a one-way clutch mechanism, which allows the pulley to free wheel, reducing the amount of inertia applied to the engine during deceleration (coast).

The generator comprises a stator, a rotor, a rectifier pack and a regulator. There is a three-pin connector (C0053) on the generator:

- Pin 1 – Voltage reference line to the battery via the Battery Junction Box (BJB)
- Pin 2 – Pulse Width Modulated (PWM) signal from the Engine Control Module (ECM) to the generator (generator control)
- Pin 3 – PWM signal from the generator to the ECM (generator monitoring)

The generator is connected to earth via its mountings.

The rotor comprises a field winding, wound around an iron core and mounted on a shaft. The iron core has extensions at each end, which form North and South poles as current flows through the field winding. The rotor is located inside the stator and is mounted on bearings for smooth running and to support the rotor due to the high side loading applied by the drive belt tension.

The stator has three sets of coils made from copper wire. The three coil windings are connected in a 'star' connection, where one end of the winding is connected to the other two windings. The output current is supplied from the opposite end of each winding. Rotation of the rotor causes ac current to be produced in the coils.

The rectifier converts the ac current produced in the stator coils into dc (rectified) current required by the vehicle electrical system. The rectifier comprises semi-conductor diodes mounted on a heatsink to dissipate heat. An equal number of the diodes are on the negative and positive side, with an additional diode in the regulator to control feedback through the battery voltage signal line. The rectifier also prevents current flow from the battery to the generator when the output voltage is less than the battery voltage.

The 'smart' regulator controls the output voltage from the generator to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximise any re-chargeability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing with consequent water loss. The EMS, which controls the regulator, will calculate the voltage set point required for the ensuing conditions. The 'traditional' regulator controls voltage against generator temperature, which means the battery temperature will lag a long way behind so there will be significant periods of operation when battery charging is compromised. With this system, the EMS can set the voltage by inferring the battery temperature from information received from its various sensors, hence voltage will follow the battery's needs a lot more accurately.

The regulator has transistors, which rapidly switch on and off to regulate the voltage output according to the voltage sensed internally. The regulator also provides a PWM signal output to the ECM, which uses the signal to adjust the idle speed under varying electrical loads.

Initially, the ignition switch supply provides an excitation current to the rotor at low generator speeds via brushes, which contact slip rings at the end of the rotor shaft. As the generator speed increases the generator becomes self-exciting.

The charge warning lamp function is transmitted to the EMS and then on to the Controller Area Network (CAN) bus to the instrument pack.

LOAD MANAGEMENT SYSTEM

The load management system comprises software resident in the Automatic Temperature Control Module (ATCM). For additional information, refer to: Control Components (412-04 Control Components, Description and Operation). Its purpose is to protect battery state-of-charge during abnormal usage of the vehicle. The system will request the Media Orientated System Transport (MOST) ring and the air suspension to go into 'power save' mode, and will modulate features such as seat heating and screen heating to prevent the battery being dragged down to a point where the car becomes unoperational. A 'WARNING - LOW BATTERY' message will be displayed in the message centre.

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the cooling fan shroud.
For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
3. Release the accessory drive belt.

4. Disconnect the generator harness.
 - Reposition the rubber insulator.
 - Remove the retaining nut.

5. Remove the three generator retaining bolts.

E53874

6. Remove the generator.

- Reposition the generator.
- Disconnect the electrical connector.

E53876

Installation

1. Install the generator.

- Connect the electrical connector.
- Reposition the generator.

2. NOTE: Tighten the retaining bolts in the sequence shown.

Install the three generator retaining bolts.

- Tighten to 47 Nm (35 lb.ft).

3. Connect the generator harness.

- Tighten the retaining nut to 12 Nm (9 lb.ft).
- Reposition the rubber insulator.

4. Attach the accessory drive belt.

5. Install the cooling fan shroud.

For additional information, refer to: [Cooling Fan Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

6. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Generator and Regulator - TDV6 3.0L Diesel - Generator - Overview

Description and Operation

OVERVIEW

The charging system consists of a 180 Amp output generator and regulator assembly. The generator and regulator assembly generates electrical power for the vehicle electrical system and maintains the battery in a charged state. When the engine is running the generator produces an alternating current, which is converted to a direct current internally. The output from the generator is controlled by the voltage regulator (located inside the generator) and then supplied to the battery through the main battery positive cable.

The generator is mounted on the front right side of the engine and driven at approximately 3 times engine speed by the accessory drive belt.

ItemDescription

1	Battery monitoring system module
2	Battery
3	BJB (battery junction box)
4	Generator and regulator
5	ECM (engine control module)
6	Instrument cluster
7	RJB (rear junction box)

System Operation

OPERATION

The output voltage required from the generator and regulator is calculated by the battery monitoring system. Refer to: Battery and Cables (414-01, Description and Operation).

The battery monitoring system signals the calculated voltage to the [ECM](#) via the [RJB](#) and the instrument cluster. The [ECM](#) then transmits the calculated voltage to the generator and regulator on the [LIN \(local interconnect network\)](#) bus connection.

The [ECM](#) will over-ride the voltage value requested by the battery monitoring system if it detects a fault in the generator and regulator. The [ECM](#) also signals the instrument cluster to display a warning message if it detects a fault with the generator and regulator. Refer to: Instrument Cluster (413-01, Description and Operation).

Component Description

DESCRIPTION

The regulator provides a controlled variable voltage output from the generator. Two electrical terminals are provided on the outer casing of the generator. One terminal supplies the [DC \(direct current\)](#) voltage output from the generator to the battery positive terminal. The second terminal provides the [LIN](#) bus connection between the regulator and the [ECM](#).

Generator and Regulator - V6 4.0L Petrol -

General Specification

Item	Specification
Generator:	
Make/Type	Denso SC2
Output	90/150 amps @ 25° C
Voltage control	By Power Control Module (PCM)
Voltage setpoint regulation	Controlled by Engine Management System (EMS)

Torque Specifications

Description	Nm	lb-ft
* Battery harness connection nut	10	7

CAUTION: * Damage to the internal connections will result if this torque is exceeded

Generator and Regulator - V6 4.0L Petrol - Generator

Description and Operation

E50139

The generator is located at the front RH side of the engine, in front of the RH cylinder head. The generator has an output of 85/150 Amps and is manufactured by Denso. A six-ribbed polyvee belt drives the generator pulley, which in turn is driven from the engine crankshaft pulley.

The generator comprises a stator, a rotor, a rectifier pack and a regulator. There is a three-pin connector (C0053) on the generator:

- Pin 1 – Pulse Width Modulated (PWM) signal from the generator to the Engine Control Module (ECM) (generator monitoring)
- Pin 2 – PWM signal from the ECM to the generator (generator control)
- Pin 3 – Voltage reference line to the battery via the Battery Junction Box (BJB).

The generator is connected to ground via its mountings.

The rotor comprises a field winding, wound around an iron core and mounted on a shaft. The iron core has extensions at each end, which form North and South poles as current flows through the field winding. The rotor is located inside the stator and is mounted on bearings for smooth running and to support the rotor due to the high side loading applied by the drive belt tension.

The stator has three sets of coils made from copper wire. The three coil windings are connected in a 'star' connection, where one end of the winding is connected to the other two windings. The output current is supplied from the opposite end of each winding. Rotation of the rotor causes ac current to be produced in the coils.

The rectifier converts the ac current produced in the stator coils into dc (rectified) current required by the vehicle electrical system. The rectifier comprises semi-conductor diodes mounted on a heatsink to dissipate heat. An equal number of the diodes are on the negative and positive side, with an additional diode in the regulator to control the feedback through the battery voltage signal line. The rectifier also prevents current flow from the battery to the generator when the output voltage is less than the battery voltage.

The 'smart' regulator controls the output voltage from the generator to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximise any re-chargeability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing at the battery with consequent water loss. The EMS, which controls the regulator, will calculate the voltage set point required for the ensuing conditions. The 'traditional' regulator controls voltage against generator temperature, which means the battery temperature will lag a long way behind so there will be significant periods of operation when battery charging is compromised. With this system, the EMS can set the voltage by inferring the battery temperature from information received from its various sensors, hence voltage will follow the battery's needs a lot more accurately.

The regulator has transistors, which rapidly switch on and off to regulate the voltage output according to the voltage sensed internally. The regulator also provides a PWM signal output to the ECM, which uses the signal to adjust the idle speed under varying electrical loads.

Initially, the ignition switch supply provides an excitation current to the rotor at low generator speeds via brushes, which

contact slip rings at the end of the rotor shaft. As the generator speed increases the generator becomes self-exciting.

The charge warning lamp function is transmitted to the EMS and then on to the Controller Area Network (CAN) bus to the instrument pack.

LOAD MANAGEMENT SYSTEM

The load management system comprises software resident in the Automatic Temperature Control Module (ATCM). For additional information, refer to: Control Components (412-04 Control Components, Description and Operation). Its purpose is to protect battery state-of-charge during abnormal usage of the vehicle. The system will request the Media Orientated System Transport (MOST) ring and the air suspension to go into 'power save' mode, and will modulate features such as seat heating and screen heating to prevent the battery being dragged down to a point where the car becomes unoperational. A 'WARNING - LOW BATTERY' message will be displayed in the message centre.

Generator and Regulator - V8 5.0L Petrol - Generator - Overview

Description and Operation

OVERVIEW

On 5.0L V8 vehicles (naturally aspirated and supercharger), the charging system consists of a 150 Amp output generator and regulator assembly. The generator and regulator assembly generates electrical power for the vehicle electrical system and maintains the battery in a charged state.

When the engine is running the generator produces an alternating current, which is converted to a direct current internally. The output from the generator is controlled by the voltage regulator (located inside the generator) and then supplied to the battery through the main battery positive cable. The generator is mounted on the front right side of the engine and driven at approximately 3 times engine speed by the accessory drive belt.

System Operation

GENERAL

The output voltage required from the generator and regulator is calculated by the battery monitoring system. For additional information refer to Battery, Mounting and Cables 414-01.

The battery monitoring system signals the calculated voltage to the [ECM](#) via the [RJB](#) and the instrument cluster. The [ECM](#) then transmits the calculated voltage to the generator and regulator on the [LIN](#) bus connection.

The [ECM](#) will over-ride the voltage value requested by the battery monitoring system if it detects a fault in the generator and regulator. The [ECM](#) also signals the instrument cluster to display a warning message if it detects a fault with the generator and regulator. For additional information refer to Instrument Cluster 413-01.

Component Description

GENERATOR AND REGULATOR

The regulator provides a controlled variable voltage output from the generator. Two electrical terminals are provided on the outer casing of the generator. One terminal supplies the [DC \(direct current\)](#) voltage output from the generator to the battery positive terminal. The second terminal provides the [LIN](#) bus connection between the regulator and the [ECM](#).

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Torque: 62 Nm

- 4.

5. **5. NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

6.  CAUTION: Take extra care not to damage the wiring harnesses.

Torque: 47 Nm

7. *Torque:* 12 Nm

Installation

1. To install, reverse the removal procedure.

Information and Entertainment System - General Information - Cellular Phone

Diagnosis and Testing

Principle of Operation

For a detailed description of the Cellular phone system and operation, refer to the relevant Diagnosis and Testing section of the workshop manual. REFER to:

Audio System (415-01 Audio Unit, Description and Operation),
[Antenna](#) (415-02 Antenna, Description and Operation),
 Speakers (415-03 Speakers, Description and Operation),
 Video System (415-07 Video System, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Check all information and entertainment system modules ● Speakers ● Switch(s) stuck or damaged ● Touch screen display 	<ul style="list-style-type: none"> ● Fuses ● Electrical harnesses ● Harness connectors ● Battery condition, state of charge

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, refer to the Symptom Chart below, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Action
Unable to pair	● GO to Pinpoint Test A .
Not Auto Connecting	● GO to Pinpoint Test B .
Poor Quality Audio	● GO to Pinpoint Test C .
No Audio to 3rd Party	● GO to Pinpoint Test D .
No Audio from 3rd Party	● GO to Pinpoint Test E .
No Audio	● GO to Pinpoint Test E .

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Bluetooth Module - High Line \(TEL\)](#) (100-00 General Information, Description and Operation).

Pinpoint Tests

PINPOINT TEST A : UNABLE TO PAIR	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: 'NO PHONE FITTED' DISPLAY	
• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the bluetooth function is activated and the telephone handset is placed within the vehicle cabin area.	
	1 Carry out checks to determine if 'No Phone Fitted' is shown on vehicle display.
	Is 'No Phone Fitted' displayed? Yes GO to A2.
	No Locate the connected telephone and if not Customer telephone, disconnect from the system.
A2: TELEPHONE BLUETOOTH DEVICE SEARCH	

	<p>1 Carry out Bluetooth device search using Customer handset.</p>
	<p>Is 'Land Rover' identified in Bluetooth device list?</p> <p>Yes Select device from list, then continue with diagnosis. GO to A3.</p> <p>No Carry out further Bluetooth device search, to a maximum of 4 times, waiting approximately 20 seconds between searches. If 'Land Rover' still not identified in Bluetooth device list, set ignition status to OFF, wait approximately 30 seconds and set ignition status to ON. Carry out further Bluetooth device search, to a maximum of 4 times, waiting approximately 20 seconds between searches. If 'Land Rover' still not identified in Bluetooth device list, contact your local in market support for further assistance.</p>
A3: TELEPHONE HANDSET ERROR	
	<p>1 Check for any error shown on the telephone handset when 'Land Rover' is selected from the Bluetooth device list.</p>
	<p>Was an error immediately shown on the telephone handset?</p> <p>Yes Wait approximately 10 seconds then re-attempt selection, to a maximum of 4 times, waiting approximately 10 seconds between each attempt. If error still being displayed, contact your local in market support for assistance.</p> <p>No Enter PIN '2121' then continue with diagnosis. GO to A4.</p>
A4: PIN ENTRY STATUS	
	<p>1 Check for successful PIN entry.</p>
	<p>Was PIN entry successful?</p> <p>Yes GO to A5.</p> <p>No Wait approximately 10 seconds then re-attempt PIN entry, to a maximum of 4 times, waiting approximately 10 seconds between each attempt. If PIN entry is still un-successful, contact your local in market support for assistance.</p>
A5: 'NO PHONE FITTED' DISPLAY	
	<p>1 Carry out checks to determine if 'No Phone Fitted' is still shown on vehicle display.</p>
	<p>Is 'No Phone Fitted' still displayed?</p> <p>Yes From the telephone handset, select the connect option for the 'Land Rover' device identified in the Bluetooth device list. If 'No Phone Fitted' is still displayed, suspect a telephone handset fault. Carry out Pinpoint test again using known good telephone handset.</p> <p>No The telephone is paired and connected to the system. No further action is required for this symptom.</p>

PINPOINT TEST B : NOT AUTOMATICALLY CONNECTING

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CUSTOMER TELEPHONE IN POSITION 1	
<p>• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the bluetooth and auto connect functions are activated and the telephone handset is placed within the vehicle cabin area.</p>	
	<p>1 Carry out checks to determine if the Customer telephone is in position 1 in the Bluetooth Module device list.</p>
	<p>Is the Customer telephone in position 1?</p> <p>Yes GO to B2.</p> <p>No Advise Customer that delays in connection will occur if telephone is not listed in position 1.</p>
B2: BLUETOOTH CONNECTION	
	<p>1 Carry out checks to determine if Bluetooth connection to the vehicle has been achieved.</p>
	<p>Has Bluetooth connection to the vehicle been achieved?</p> <p>Yes No further action is required for this symptom.</p> <p>No GO to B3.</p>
B3: 'NO PHONE FITTED' DISPLAY	
	<p>1 Carry out checks to determine if 'Land Rover' is shown in the Customer Bluetooth telephone device display.</p>
	<p>Is 'Land Rover' identified in the Customer Bluetooth device list?</p> <p>Yes Select the device to connect then follow pairing instructions.</p> <p>No Carry out the 'Unable to Pair' Pinpoint Test. GO to A.</p>

PINPOINT TEST C : POOR QUALITY AUDIO

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: SIGNAL STRENGTH	
<p>• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.</p>	
	<p>1 Check the signal strength displayed on the telephone handset.</p>
	<p>Are at least two signal strength bars shown on the telephone handset display?</p> <p>Yes GO to C2.</p> <p>No Suspect GSM Network issue. This can explain intermittent audio and dropped calls, and the inability to initiate calls.</p>

C2: POOR AUDIO FROM THIRD PARTY ONLY	
	1 Establish from Customer feedback/symptom if there is poor audio from the Third Party only.
	Is the poor audio from the Third Party only? Yes Suspect GSM Network issue. This can explain intermittent audio and dropped calls, and the inability to initiate calls. No GO to C3.
C3: POOR AUDIO TO THIRD PARTY ONLY	
	1 Establish from Customer feedback/symptom if there is poor audio to the Third Party only.
	Is the poor audio to the Third Party only? Yes Check and install a new microphone as necessary. No GO to C4.
C4: POOR AUDIO WITH VEHICLE STATIONARY	
	1 Establish from Customer feedback/symptom if there is poor audio when the vehicle is stationary only.
	Is the poor audio when the vehicle is stationary only? Yes Check and install a new microphone as necessary. No GO to C5.
C5: THIRD PARTY MOVING VEHICLE	
	1 Establish from Customer feedback/symptom if the Third Party is in a moving vehicle.
	Is the Third Party in a moving vehicle? Yes There are limitations to the way the system can improve audio, and in this situation it is not possible to determine the source of the audio degradation. No GO to C6.
C6: CUSTOMER HEARING ECHO	
	1 Establish from Customer feedback/symptom if the Customer is hearing an echo.
	Is the Customer hearing an echo? Yes Echo from the Third Party is not vehicle failure, it is the Third Party set-up. No further action is required for this symptom. No Contact your local in market support for assistance.

PINPOINT TEST D : NO AUDIO TO THIRD PARTY	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: MICROPHONE DIAGNOSTIC TROUBLE CODES (DTCs)	
• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.	
	1 Using the Manufacturer approved diagnostic system, check for any logged microphone DTCs in Audio Front Control module.
	Is DTC B1D79-01 logged? Yes Carry out diagnosis of electrical failure as advised in Action column of DTC Index. No Contact your local in market support for assistance.

PINPOINT TEST E : NO AUDIO FROM THIRD PARTY	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: 'IN CALL' DISPLAY	
• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.	
	1 Carry out checks to determine if 'In Call' is shown on the vehicle display.
	Is vehicle display showing 'In Call'? Yes Contact your local in market support for assistance. No Call has ended. No further action is required for this symptom.

PINPOINT TEST F : NO AUDIO	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: AUDIO FROM THIRD PARTY	
• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.	
	1 Establish from Customer feedback/symptom if there is Audio from the Third Party.
	Is there Audio from the Third Party? Yes GO to F2. No Refer to the 'No Audio From Third Party' Pinpoint test. GO to E.
F2: AUDIO TO THIRD PARTY	

	<p>1 Establish from Customer feedback/symptom if there is Audio to the Third Party.</p> <p>Is there Audio to the Third Party?</p> <p>Yes GO to F3.</p> <p>No Refer to the 'No Audio To Third Party' Pinpoint test.GO to D.</p>
F3: CD OR RADIO AUDIO	
	<p>1 Establish from Customer feedback/symptom if there is Audio from the CD or Radio.</p> <p>Is there Audio from the CD or Radio?</p> <p>Yes GO to F4.</p> <p>No Suspect MOST ring fault, refer to electrical circuit diagrams and check/rectify MOST ring as necessary.</p>
F4: TELEPHONE HANDSET AUDIO	
	<p>1 Establish from Customer feedback/symptom if there is Audio from the telephone handset.</p> <p>Is there Audio from the telephone handset?</p> <p>Yes Ensure vehicle is parked. Disconnect and reconnect handset. If issue not resolved, contact your local in market support for assistance.</p> <p>No Contact you local in market support for assistance.</p>

Information and Entertainment System - General Information - Information and Entertainment System

Diagnosis and Testing

Principles of Operation

For a detailed description of the information and entertainment system and operation, refer to the relevant Diagnosis and Testing section of the workshop manual. REFER to:

Audio System (415-01 Audio Unit, Description and Operation),
[Antenna](#) (415-02 Antenna, Description and Operation),
 Speakers (415-03 Speakers, Description and Operation),
 Video System (415-07 Video System, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Check all information and entertainment system modules ● Compact disc player jammed, not loading ● Scratched/dirty compact discs ● Speakers ● Switch(s) stuck or damaged 	<ul style="list-style-type: none"> ● Fuses ● Electrical harnesses ● Harness connectors ● Battery condition, state of charge

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Satellite Digital Audio Radio Service (SDARS) Diagnosis

The following information is intended to aid in the diagnosis of basic faults with the satellite radio system.

The diagnostic trouble codes are the main source of information in diagnosing other than basic faults.

There are five conditions which may affect the available channels:

A: No signal available

The signal is not reaching the module.

The vehicle must have clear line of sight to a satellite, which means being outside and having no blockages between the vehicle and the satellite.

• **NOTE:** If the vehicle is outside America, this is the only condition which will be possible.

B: More than 6 months without subscribing

There is a 6 month free period of channel 184 being broadcast to allow testing of the system.

After this period, no channels can be received, and an **unsubscribed** message will be displayed.

C: Less than 6 months without subscribing

This will allow the vehicle to receive channel 184 only, all other channels will display **unsubscribed**.

D: Subscribed to the family package

All channels should be audible, but adult content channels will be blocked, and the message **unsubscribed** will be shown on these channels.

E: Subscribed to the full package

All channels should be available, with the exception of some pay channels.

In this case, the message **unsubscribed** will be shown on these channels.

System testing

Tune to channel 184 (this is usually the default channel for all presets).

Select the direct channel input feature by pressing the "#" key.

This will allow the audio to be routed to the speakers if condition C, D or E exist.

If condition B exists, a subscription will have to be made.

1. **1.** Are other systems affected?
 - The most common symptom would be the loss of audio from other entertainment features, although the display sticking on the logo screen is a good indicator of a MOST issue.
 - If other systems **are** affected, check the entertainment circuits for loose or broken connectors, etc. Refer to the electrical guides.
2. **2.** If only the satellite radio system is affected, retrieve the DTCs from the module using the approved diagnostic system or a scan tool.

Symptom Chart

Display	Symptom	Possible Causes	Action
No signal or Acquiring signal	No channels available	<ul style="list-style-type: none"> ● Antenna connections 	Check for DTCs. Check the connections from the module to the antenna and the antenna to the harness. Rectify as necessary.
	No audio	<ul style="list-style-type: none"> ● MOST connection 	Check for DTCs. Check the function of other audio system components. Check the connections to other MOST components.
Unsubscribed	No channels available	<ul style="list-style-type: none"> ● The free period has expired 	Carry out the checks above.
Weather/Emergency	No audio on CD or other component	<ul style="list-style-type: none"> ● Other audio component may be faulty 	Check for DTCs. Check the function of other audio system components.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: (100-00 General Information)

Information and Entertainment System - General Information - Navigation System

Diagnosis and Testing

Principles of Operation

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.
3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart.

Principles of Operation

The information in this section is intended to help with basic diagnosis of the navigation system.

For a detailed description of the Navigation System, refer to the relevant Description and Operation section in the Workshop Manual.

Touch Screen Display (TSD) and Navigation Diagnostics

The TSD and the navigation module both have built in self tests that allow the technician to diagnose fault conditions. Fault codes and diagnostics can also be retrieved/achieved using the manufacturer approved diagnostic system.

TSD Diagnostics

The TSD has in built diagnostics to aid the diagnosis of system faults. The diagnostics allow the technician to interrogate the following:

- Hard Key Test
- Touch Switch Test
- DTC Information
- Vehicle Configurations
- Configurations
- Vehicle Signals
- Video Inputs Test
- Self Test
- MOST Test
- Colour bar
- Loading
- HDD information
- Vehicle information
- Microphone
- Voice output check

The built in diagnostics are accessed as follows:

- Once the system is powered up enter the 'Home' menu page
- Press and hold the TSD in the centre at the top of the screen for approximately 5 seconds and then press and hold the TSD at the top left corner of the screen for approximately 5 seconds.
- A 'Diag PIN Entry' box will appear' Type in the access code 753
- Once this code has been accepted the Diagnostic Menu screen will be displayed

Hard Key Test

The hard key test is used to check the operation of the hard switches.

If switch operation is normal, the switch colour on the screen will change when a hard switch is pressed. (Power switch operation cannot be checked on this screen.)

Touch Switch Test

The touch switch test calibrates the touch switch coordinates and checks touch switch operation.

Start Calibration - Calibrates the switch coordinates. Calibrate the coordinates by touching each of the "+" marks in the four corners of the screen.

- **NOTE: Do not touch any locations other than the "+" marks. (Touching other locations may invalidate the calibration.)**

Touch Switch Check - Checks for deviation in the coordinates. Check the coordinates of the touched location by verifying the displayed values. Touch and hold "press here" to return to the previous screen. If there is a large deviation in the coordinates, calibrate the touch switch using the "Start Calibration" function.

DTC Information

Search for the meaning of the displayed DTC.

Vehicle Configurations

Display the status of each vehicle system.

Speed Lock Configuration - Display the status of compulsory navigation settings (setting status of switches that cannot be operated) when driving.

Configurations

Display primary system information.

Vehicle Signals

Display the status of vehicle signals inputted to the Touch Screen Display (TSD). These signals include:

- Lights (on or off)
- Ambient light sensor voltage
- Backlight dimming duty
- Graphic illumination dimming duty
- Vehicle speed, GPS speed, MOST km/h
- Battery voltage
- Reverse gear / Parking brake position (electric park brake on or off)
- Speed inhibit
- MOST Fibre Optic Transceiver (FOT) temperature
- Output audio allocation

Video Inputs Test

This screen will allow the testing of video inputs that are connected to the Touch Screen Display (TSD). These include:

- Companion camera
- Rear view / Proximity camera
- TV/DVD

Self Test

Performs system self-diagnosis and displays the diagnostic results.

If an abnormality is present, a DTC is displayed.

MOST Test

Display the MOST connection status, and reception/transmission messages related to MOST.

"Mpr" displays the number of MOST devices existing on MOST. When "0" or "1" is displayed, communication is not possible.

Colour bar

This function allows the technician to test the colours generated by the TSD. A second screen displays six solid colours, selecting the colour will fill the screen with the chosen colour and pressing the TSD again will revert back to the colour test screen.

Loading

Update the navigation program.

For details on the update method, refer to the "Navigation Update Tool" operation manual.

HDD information

Display information on the Hard Disc Drive (HDD).

SMART test (Self-Monitoring Analysis and Reporting Technology) is initiated from this screen

Vehicle information

Display information on the vehicle.

- Car configuration - Displays information on vehicle environment settings.
 - Unit (distance) - Units of distance
 - Unit (time) - Units of time
 - Language - Displayed language
 - Fuel information - Remaining fuel quantity
 - Mileage information - Vehicle mileage display
 - Time information - Current time display
 - Override information - Status of switch operation inhibitions (Setting status of switches that cannot be operated.)
- GPS information - Display GPS related information.
 - Received position - Displays the latitude and longitude (displayed in degrees, minutes, and seconds) for the position information calculated by GPS.
 - Map matched position - Displays the latitude and longitude (displayed in degrees, minutes, and seconds) for the position information being used for map matching.
 - Satellites - Number of acquired satellites.
 - Current address - Address of the current location.
 - Satellite Information - Displays satellite information for up to 12 GPS satellite search targets.
 - Measurement HDOP - Positioning accuracy.
 - Status - Positioning status.
 - Date - Displays the current date and time in the following order: day, month, year, hour, minute, second. The

- year is displayed using the four-digit western calendar; time is displayed in Greenwich Mean Time (GMT).
- Vehicle sensor - Display vehicle signals inputted to the Touch Screen Display (TSD).
 - REV - Reverse signal status.
 - Speed - Current vehicle speed.
 - Speed pulse count - Speed pulse count value.
 - Distance calibration - Learning information for distance calibration.
 - Voltage/Offset - Gyro sensor output voltage value/voltage correction value.
 - Relative bearing - Relative bearing (0° when navigation is started.)
 - Gyro sense - Learning value for gyro sensitivity.
 - Reset - Resets the gyro sensor relative bearing value.
- RDS-TMC information - Display RDS-TMC related information.
 - Date/time (GMT) - Date and time for the TMC signal.
 - Frequency - TMC signal frequency.
 - PI code - Personal identification code for the broadcast station.
 - PS name - Broadcast station name.
 - Country code - Database country code.
 - LTN - Database location number (location table number.)
 - Service ID - Service provider identification number.
 - Air data - TMC data.

Microphone

Check the volume for the voice recognition microphone inputted to the Touch Screen Display (TSD). These include:

- PTT switch status - Checks the PTT switch connection. When the PTT switch is pressed, a signal will be outputted, and the indicator displays in green.
- Microphone input level judging - If a sampling of the user's voice command is at or above the threshold value, the indicator displays in blue.
- Microphone level - Displays the microphone input level.

Voice output check

Check the audio output.

- ON (Normal) - Outputs ADPCM voice (1 kHz sine wave) for five seconds.
- ON (Max) - Outputs ADPCM voice (maximum 1 kHz sine wave) for five seconds.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of damage, water ingress and system integrity.
3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Visual Inspection

Visual Inspection	Electrical
<ul style="list-style-type: none"> ● Battery ● Fuses <ul style="list-style-type: none"> - Central and Battery Junction Boxes - Megafuses ● Wiring harness ● Damaged, loose or corroded connectors ● Touch Screen Display (TSD) ● GPS antenna ● TV antenna ● Satellite antenna ● FM antenna ● Companion camera ● Rear view camera ● Microphone ● Accessory USB Unit (AUU) ● Steering wheel controls ● Clock spring ● Integrated Head Unit (IHU) ● Audio amplifier ● Anti-lock Brake System (ABS) module ● Wheel speed sensors ● Vehicle Information and Communication System (VICS Japan only) receiver ● VICS beacon antenna (Japan only) ● Controller Area Network (CAN) circuits ● Media Oriented System Transport (MOST) system ● Gigabit Video Interface (GVIF) ● Central Junction Box (CJB) ● Terrain Response ● Mobile Telephone 	

Symptom Chart

Symptom	Possible Cause	Action
Black screen (navigation and audio screens do not	● Temperature in passenger	GO to Pinpoint Test A.

Symptom	Possible Cause	Action
display.)	<ul style="list-style-type: none"> compartment too low ● Condensation in passenger compartment ● Electrical harness open/short circuit, dis-connected ● Component failure 	
The navigation screen does not display, even when the "NAVIGATION" button is pressed (screen does not change.)	<ul style="list-style-type: none"> ● Electrical harness open/short circuit, dis-connected ● Component failure 	GO to Pinpoint Test B.
The hard switches do not respond.	<ul style="list-style-type: none"> ● Component failure ● Switch failure 	GO to Pinpoint Test C.
The audio screen cannot be operated (does not display.)	<ul style="list-style-type: none"> ● Media Oriented System Transport (MOST) system ● Electrical harness open/short circuit, dis-connected 	GO to Pinpoint Test D.
The screen does not dim.	<ul style="list-style-type: none"> ● Electrical harness open/short circuit, dis-connected ● Component failure 	GO to Pinpoint Test E.
Noise on the screen, screen colour is abnormal.	<ul style="list-style-type: none"> ● Electrical harness open/short circuit, dis-connected ● Component failure 	GO to Pinpoint Test F.
The touch switches do not respond.	<ul style="list-style-type: none"> ● Electrical harness open/short circuit, dis-connected ● Component failure 	GO to Pinpoint Test G.
There is considerable deviation between the displayed vehicle position and the actual position.	<ul style="list-style-type: none"> ● Electrical harness open/short circuit, dis-connected ● Component failure 	GO to Pinpoint Test H.
The GPS no reception mark does not disappear.	<ul style="list-style-type: none"> ● Electrical harness open/short circuit, dis-connected ● Component failure ● No reception from satellite 	GO to Pinpoint Test I.
No sound is emitted.	<ul style="list-style-type: none"> ● Electrical harness open/short circuit, dis-connected ● Component failure ● Incorrect system settings 	GO to Pinpoint Test J.
There is no navigation voice guidance.	<ul style="list-style-type: none"> ● Volume level set too low ● The amplifier and speakers are incorrectly connected 	GO to Pinpoint Test K.
Voice recognition does not function.	<ul style="list-style-type: none"> ● Electrical harness open/short circuit, dis-connected ● Component failure 	GO to Pinpoint Test L.
The vehicle position rotates randomly.	<ul style="list-style-type: none"> ● Electrical harness open/short circuit, dis-connected ● Component failure ● Vehicle on a turntable in a parking building 	GO to Pinpoint Test M.
The vehicle mark display is unstable.	<ul style="list-style-type: none"> ● Electrical harness open/short circuit, dis-connected ● Component failure ● No reception from satellite 	GO to Pinpoint Test N.
The vehicle position does not update.	<ul style="list-style-type: none"> ● HDD contaminated/damaged ● Electrical harness open/short circuit, dis-connected ● Component failure 	GO to Pinpoint Test O.
The map display is incomplete.	<ul style="list-style-type: none"> ● HDD contaminated/damaged ● Electrical harness open/short circuit, dis-connected ● Component failure 	GO to Pinpoint Test P.
Calls cannot be received or placed with Bluetooth; Bluetooth cannot connect with the vehicle.	<ul style="list-style-type: none"> ● Incompatible bluetooth telephone ● Incorrect initial connection settings ● Electrical harness open/short circuit, dis-connected ● Component failure 	GO to Pinpoint Test Q.
The map cannot be updated.	<ul style="list-style-type: none"> ● Refer to the "Navigation Update Tool" operation manual 	Refer to the "Navigation Update Tool" operation manual

Symptom	Possible Cause	Action
An error screen displays on the navigation screen.	<ul style="list-style-type: none"> ● Access to the map data has not been granted 	GO to Pinpoint Test R .
The dual view cannot be switched.	<ul style="list-style-type: none"> ● Incorrect car configuration data received ● Media Oriented System Transport (MOST) system ● Component failure 	GO to Pinpoint Test S .

Pinpoint Tests

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval Program is in operation, prior to the installation of a new module/component.

• NOTE: The built in diagnostics are accessed as follows:

- 1. With the vehicle at rest, place the ignition switch "ON", or start the engine.
- 2. Press and hold the TSD in the centre at the top of the screen for approximately 5 seconds and then press and hold the TSD at the top left corner of the screen for approximately 5 seconds.
- 3. A 'Diag PIN Entry' box will appear. Type in the access code 753.
- 4. Once this code has been accepted the Diagnostic Menu screen will be displayed.

PINPOINT TEST A : BLACK SCREEN (NAVIGATION AND AUDIO SCREENS DO NOT DISPLAY.)	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: THE SCREEN SAVER FUNCTION WORKS	
	1 Check the screen saver function works.
	Does the screen saver function work? Yes Operation is normal. No Proceed to the next step. GO to A2.
A2: THE DISPLAY BACKLIGHT EMITS LIGHT	
	1 Check the display backlight emits light.
	Does the display backlight emits light? Yes Proceed to the next step. No GO to A12.
A3: THE SCREEN IS TURNED OFF	
	1 Check the screen is not turned off.
	Do the navigation and audio screens display when the screen is turned on? Yes Operation is normal. No GO to A4.
A4: THE VEHICLE INTERIOR TEMPERATURE IS -20°C OR LESS	
	1 Check the cabin internal temperature.
	Is the cabin internal temperature -20°C or lower? Yes Raise the cabin internal temperature, re-test the vehicle. No GO to A5.
A5: CONDENSATION IS FORMING INSIDE THE VEHICLE	
	1 Check for condensation occurring inside the passenger compartment.
	Is condensation occurring inside the passenger compartment? Yes Dry out the passenger compartment, re-test the vehicle. No GO to A6.
A6: THE LED FOR THE POWER SUPPLY BUTTON IS FLASHING. (RANGE ROVER ONLY)	
	1 Check the status of the audio power button LED.
	Is the audio power button flashing? Yes Carry out MOST Ring diagnostics to locate fault. No GO to A7.
A7: ONLY THE NAVIGATION SCREEN OR AUDIO SCREEN IS BLACK	
	1 Check to see if only the navigation screen is blank.
	Is only the navigation screen blank? Yes Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index. No GO to A8.
A8: ONLY THE BACK MONITOR SCREEN IS BLACK	
	1 Check to see if only the audio screen is blank.

	Is only the audio screen blank? Yes Proceed to the next step. No GO to A10.
A9: AFTER INITIATING THE "VIDEO INPUT TEST" DIAGNOSIS, VIDEO CAN BE DISPLAYED	
	1 Carry out the "Video Input Test" diagnosis' (PIN code 753).
	Are the results of the "Video Input Test" diagnosis' normal? Yes Re-check the system. No Refer to the electrical circuit diagrams and check the cameras control module.
A10: ONLY THE TV SCREEN IS BLACK	
	1 Check to see if only the TV screen is black.
	Is only the TV screen blank? Yes Proceed to the next step. No GO to A12.
A11: AFTER INITIATING THE "VIDEO INPUT TEST" DIAGNOSIS, VIDEO CAN BE DISPLAYED	
	1 Carry out the "Video Input Test" diagnosis' (PIN code 753).
	Are the results of the "Video Input Test" diagnosis' normal? Yes Re-check the system. No Refer to the electrical circuit diagrams and check the TV control module.
A12: THE CONNECTIONS BETWEEN THE VISUAL NAVIGATION AND POWER SUPPLY WIRING HARNESS AND CONNECTORS ARE CORRECT	
	1 Check the display and power supply harness, power, auxiliary and ground circuits, for short, open circuits and are correctly connected.
	Was a fault identified with the display and power supply harness, power auxiliary and ground connections? Yes Rectify the fault and re-test the vehicle. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST B : THE NAVIGATION MAP SCREEN DOES NOT DISPLAY, EVEN WHEN THE "NAVIGATION" BUTTON IS PRESSED (SCREEN DOES NOT CHANGE.)

• NOTE: When re-confirming the symptoms after inspecting the wiring harness/connector, turn the ignition status to OFF, wait for the Audio power button LED on the display to turn OFF, then turn the ignition status to ON and run the diagnosis again from the beginning.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: NO RESPONSE TO PRESSING NAVIGATION MENU	
• NOTE: 15 minutes are required for the program to update. If the ignition is accidentally turned OFF, turn the ignition ON again, and wait for 15 minutes.	
	1 Check that the ignition was not turned 'OFF' during a navigation software update.
	Was the ignition turned 'OFF' during a navigation software update? Yes Wait for 15 minutes with the ignition ON. Then turn the ignition to OFF then ignition ON. No Refer to electrical circuit diagrams and check integrity of navigation system wiring harness and connectors. GO to B2.
B2: NO RESPONSE TO PRESSING NAVIGATION MENU	
	1 Wait for 15 minutes with the ignition ON. Then turn the ignition to OFF then ignition ON.
	Does the navigation screen displays when the "NAVIGATION" button is pressed. Yes Operation is normal. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST C : THE HARD SWITCHES DO NOT RESPOND.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: CHECK FOR FOREIGN OBJECTS	
	1 Check for foreign objects near to the button.
	Are there any foreign objects close to the button causing it to be pressed? Yes Remove foreign objects and re-test vehicle. No GO to C2.
C2: DISPLAY DIAGNOSTICS CHECK	
	1 Check to see if the display diagnostics can be displayed.

	Can the display diagnostics be displayed? Yes Proceed to the next step. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.
--	---

C3: HARD KEY TEST

	1 Carry out the display diagnostics hard key test.
--	---

	Is the operation normal when carrying out the display diagnostics hard key test? Yes Operation is normal. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.
--	---

PINPOINT TEST D : THE AUDIO SCREEN CANNOT BE OPERATED (DOES NOT DISPLAY.)

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

D1: CD CHANGER CHECK

	1 Check to see if a CD changer is installed.
--	---

	Is a CD changer installed? Yes Proceed to the next step. No Normal operation, CD screen will not be displayed when there is no CD changer installed.
--	--

D2: THE AUDIO SCREEN DISPLAYS WHEN THE "AUDIO VIDEO" HARD SWITCH IS PRESSED.

	1 The audio screen displays when the "AUDIO VIDEO" hard switch is pressed.
--	---

	Does the audio screen displays when the "AUDIO VIDEO" hard switch is pressed? Yes Proceed to the next step. No Refer to the hard switches do not respond diagnosis.
--	---

D3: THE AUDIO SCREEN DISPLAYS WHEN "AUDIO VIDEO" ON THE "HOME MENU" IS PRESSED.

	1 The audio screen displays when "Audio Video" on the "Home Menu" is pressed.
--	--

	Does the audio screen displays when "Audio Video" on the "Home Menu" is pressed? Yes Proceed to the next step. No Refer to the touch switches do not respond diagnosis.
--	---

D4: EACH SWITCH (AM FM, CD, IPOD/USB, TV/DVD.) ON THE AUDIO SCREEN RESPONDS.

	1 Each switch (AM FM, CD, iPod/USB, TV/DVD.) on the audio screen responds.
--	---

	Does each switch (AM FM, CD, iPod/USB, TV/DVD.) on the audio screen respond? Yes Carry out MOST Ring diagnostics to locate fault. No GO to D5.
--	--

D5: THE IGNITION IS TURNED FROM IGNITION ON TO OFF, AND AFTER WAITING FOR APPROXIMATELY 30 SECONDS, THE TOUCH SCREEN DISPLAY (TSD) POWER SUPPLY LED WENT OUT. WHEN THE IGNITION IS TURNED ON, THE AUDIO SCREEN CAN BE OPERATED.

	1 The ignition is turned from Ignition ON to OFF, and after waiting for approximately 30 seconds, the Touch Screen Display (TSD) power supply LED went out.
--	--

	When the ignition is turned to ON, can the audio screen be operated? Yes Operation is normal. No Carry out MOST Ring diagnostics to locate fault.
--	---

PINPOINT TEST E : THE SCREEN DOES NOT DIM.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

E1: CHECK FOR FOREIGN OBJECTS

	1 Check for foreign objects adhered to the display light sensor. <ul style="list-style-type: none">● Range Rover - Top right of display● Discovery/Range Rover Sport - Instrument panel
--	--

	Are there any foreign objects adhered to the display light sensor? Yes Remove foreign objects and re-test vehicle. No GO to E2.
--	---

E2: DISPLAY LIGHT SENSOR CHECK

	1 Check to see if display screen switches to low light when sensor is covered.
--	---

	Does the display screen switch to low light when the sensor is covered? Yes Operation is normal. No GO to E3.
--	---

E3: VEHICLE LIGHT SWITCH TESTS

	1 Check to see if display screen switches to low light when the vehicle light switch is pressed.
--	---

	2 When the vehicle exterior lights are switched on, check diagnostic menu "Vehicle Signals" lights on the diagnostics screen is "ON."
	Does the display screen switch to low light when the vehicle light switch is pressed? Yes Operation is normal. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST F : NOISE ON THE SCREEN; SCREEN COLOUR IS ABNORMAL.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: DISPLAY POWER AND GROUND CHECKS	
	1 Refer to electrical circuit diagrams and check battery power and power ON relay voltage, and ground resistance.
	Is the battery power and power ON relay voltage between 10.5 and 16 volts, and continuity to ground? Yes Proceed to the next step. No Check and rectify the vehicle wiring harness and connectors.
F2: CONTRAST CHECK	
	1 Check to see if the screen colour is normal when the screen setting (contrast) is re-ret to the default values.
	Is the screen colour normal with the default values? Yes Operation is normal. No GO to F3.
F3: CABIN INTERNAL TEMPERATURE CHECK	
	1 Check the cabin internal temperature.
	Is the cabin internal temperature -20°C or lower? Yes Raise the cabin internal temperature and re-test. No GO to F4.
F4: ADDITIONAL SCREEN CHECKS	
	1 Check all other screens.
	Are all other screens beside the navigation display screen normal? Yes Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index. No GO to F5.
F5: COLOUR BAR CHECK	
	1 Carry out the display diagnostics colour bar check test.
	Are the results of the display diagnostics colour bar check normal? Yes Operation is normal. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST G : THE TOUCH SWITCHES DO NOT RESPOND.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
G1: TOUCH SWITCH TEST	
	1 The touch switches not responding on the navigation screen only
	Are the touch switches not responding on the navigation screen only? Yes Proceed to the next step. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.
G2: TOUCH SWITCH CHECK	
	1 Carry out the touch switch check in the display diagnostics.
	Are the results of the display diagnostics touch switch check normal? Yes Check the symptoms again. Operation is normal. No GO to G3.
G3: START CALIBRATION ROUTINE	
	1 Carry out the start calibration routine from the display diagnostics touch switch test.
	Is normal operation resumed after correction? Yes Operation is normal. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST H : THERE IS CONSIDERABLE DEVIATION BETWEEN THE DISPLAYED VEHICLE

POSITION AND THE ACTUAL POSITION.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
H1: GPS MARK DISPLAY CHECK	
1	The GPS no reception mark is displayed.
	Is the GPS no reception mark displayed on the display screen? Yes Refer to GPS no reception mark does not disappear diagnosis. No GO to H2.
H2: LOCATION CHECK	
1	Check for symptom occurring in particular locations - parallel roads, elevated roads, loop roads, parking centres (buildings) etc.
	Does the symptom occur in a particular location? Yes In places where the vehicle position is hard to specify, the vehicle position may be matched incorrectly and result in position discrepancies. Additionally, a new road layout will mean the Gyro does not match the map position. No Proceed to the next step.
H3: DISTANCE CALIBRATION CHECK	
• NOTE: Refer to diagnostic menu "Vehicle Sensor" – Distance Calibration, this value should be approximately 200mm, a large deviation from this value indicates a speed signal fault or incorrect wheel size.	
1	Check to see if distance calibration is being performed.
	Is distance calibration being performed? Yes Monitor the condition until distance calibration is complete (drive for over 10km/6.2 miles) No GO to H4.
H4: VEHICLE SIGNAL INSPECTION	
1	Check vehicle sensor display screen, from vehicle information diagnostics menu for the following: vehicle speed signal, REV: ON is indicated when the gear shift lever is in the REV position and gyro sensor input status are normal.
	Are the vehicle speed signal, REV signal, and gyro sensor input status normal? Yes GO to H5. No Refer to the electrical circuit diagrams and check the integrity of the wiring harness and connectors, and CAN circuit, to the Touch Screen Display (TSD).
H5: TIRE CHECK	
1	Check to see if new tires have recently been installed.
	Have new tires been recently installed? Yes From the navigation map screen, enter the navigation menu, select navigation setup then select calibration, press 'Distance' then drive the vehicle for 10 to 20 km. Operation will return to normal after performing distance calibration and driving the vehicle for 10 to 20 km. No Adjust the current location, and after the GPS no signal mark has disappeared, drive the vehicle for a while to monitor conditions.

PINPOINT TEST I : THE GPS NO RECEPTION MARK DOES NOT DISAPPEAR.

- NOTE: Move the vehicle to an open area, radio waves from satellites may not be received inside buildings.
- NOTE: Correct the vehicle cursor to the current location.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
I1: RETRO-INSTALL INSTALLATIONS CHECK	
1	Check to see if there are any retro-install installations (anti-theft, radar, etc.)
	Are there any retro-install installations? Yes GO to I2. No GO to I3.
I2: RETRO-INSTALL INSTALLATIONS RF CHECK	
1	Turn power supply (including back-up power) to OFF status.
	Does the GPS no reception mark disappear? Yes GPS reception may deteriorate when devices receiving radio waves are retro-installed. Alter the position of the retro-install device, and re-test vehicle. No GO to I4.
I3: SATELLITE RECEPTION CHECKS	
1	Check to see if a 'P' or 'T' is displayed in the 'STS' column of the navigation diagnostics GPS information screen after 10 minutes have passed.
	Is a 'P' or a 'T' displayed? Yes Wait for reception of another satellite so that position calculation can be performed. No Refer to the electrical circuit wiring diagrams and check the integrity of the wiring harness and connectors to the GPS antenna. Proceed to the next step.
I4: GPS ANTENNA REPLACEMENT	

	1 Install a new GPS antenna.
	Does the GPS no signal mark disappears when the GPS antenna is replaced. Yes Fault has been rectified. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST J : NO SOUND IS EMITTED.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
J1: SOUND OUTPUT CHECK	
	1 Check sound output across all systems.
	Is there no sound output across all systems? Yes GO to J2. No GO to J3.
J2: VOLUME LEVEL CHECK	
	1 Check the volume level is not set too low.
	Is the volume level set too low? Yes Increase the volume level and re-test vehicle. No GO to J3.
J3: INTEGRITY OF AMPLIFIER AND SPEAKER WIRING.	
	1 The amplifier and speaker wiring harnesses are correctly connected.
	Are the amplifier and speaker wiring harnesses correctly connected? Yes Check the MOST devices. GO to J4. No Refer to the electrical circuit diagrams and check integrity of amplifier and speaker wiring harness and connections.
J4: ONLY VOICE RECOGNITION DOES NOT OUTPUT	
	1 Check to see if only voice recognition does not output.
	Is there no output only from the voice recognition? Yes GO to J5. No Proceed to step 8.
J5: VOICE GUIDANCE	
	1 Check the volume level for voice guidance is not set too low.
	Is the volume level for voice guidance set too low? Yes Increase the volume level and re-test vehicle. No GO to J6.
J6: VOICE GUIDANCE SETTINGS	
	1 Check to see if the voice guidance is set to 'OFF' in the navigation settings.
	Is the voice guidance set to 'OFF' in the navigation settings? Yes Set to 'ON' and re-test the vehicle. No GO to J7.
J7: ADDITIONAL ITEMS	
	1 Check to see if the following items apply. <ul style="list-style-type: none"> ● There is no destination set ● There is no movement along the route
	Do the two items apply? Yes Normal operation, confirm customer symptom and re-test vehicle. No Check MOST connection at the Touch Screen Display (TSD), check the MOST devices.Proceed to the next step.
J8: ONLY VOICE RECOGNITION DOES NOT OUTPUT	
	1 Check to see if only voice recognition does not output.
	Is there no output only from the voice recognition? Yes Refer to the there is no navigation voice guidance diagnosis. No GO to J9.
J9: SOUND IS ONLY ABSENT WHEN USING THE AUDIO SYSTEM OR TELEPHONE.	
	1 Check to see if sound is only absent when using the audio system or telephone.
	Does only the audio system or telephone sound not output? Yes Check MOST connection at the Touch Screen Display (TSD), check the MOST devices. No Refer to the electrical circuit diagrams and check integrity of wiring harness and connections.

PINPOINT TEST K : THERE IS NO NAVIGATION VOICE GUIDANCE.	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
K1: SOUND MISSING AUDIO SYSTEM ONLY	
	1 Sound is only absent from the audio system (CD, radio.)
	Is sound only absent from the audio system (CD, radio.)? Yes GO to K4. No Proceed to the next step.
K2: VOICE MISSING NAVIGATION SYSTEM ONLY	
	1 Voice is only absent from the navigation system.
	Is voice only absent from the navigation system? Yes GO to K3. No GO to K3.
K3: NAVIGATION VOICE GUIDANCE CANNOT BE HEARD	
	1 Operate the navigation replay switch and raise the volume.
	Can navigation voice guidance be heard after pressing the navigation replay switch, and raising the volume? Yes Operation is normal. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.
K4: INTEGRITY OF AMPLIFIER AND SPEAKER WIRING.	
	1 The amplifier and speaker wiring harnesses are correctly connected.
	Are the amplifier and speaker wiring harnesses correctly connected? Yes GO to K5. No Refer to the electrical circuit diagrams and check integrity of amplifier and speaker wiring harness and connections.
K5: VOLUME LEVEL CHECK	
	1 Check the volume level is not set too low.
	Is the volume level set too low? No Increase the volume level and re-test vehicle. No Refer to the electrical circuit diagrams and check integrity of complete audio system.

PINPOINT TEST L : VOICE RECOGNITION DOES NOT FUNCTION.	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
L1: AUDIO SOUND IS MUTED WHEN PTT SWITCH IS DEPRESSED	
	1 Check to see if the audio sound is muted when the PTT switch is depressed.
	Is the audio sound muted? Yes GO to L3. No GO to L2.
L2: PTT SWITCH STATUS	
	1 Check to see if the PTT switch status is ok in the navigation diagnostics, manual check, microphone test.
	Is the PTT switch status, in navigation diagnostics, ok? Yes Check MOST connection at the Touch Screen Display (TSD), check the MOST devices. No Replace the MOST master, or the gateway module.
L3: TALK BACK	
	1 Check to see if there is talk back when other voice recognition demands are executed.
	Is there talk back? Yes System operation is normal, (advise change in manner of speech, as incorrect recognition is occurring). No GO to L4.
L4: HARNESS/CONNECTOR CHECKS	
	1 Refer to the electrical circuit diagrams and check integrity of Touch Screen Display (TSD) harness and connections.
	Has a fault been identified with the Touch Screen Display (TSD) harness or connections? Yes Rectify the fault and re-test the vehicle. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST M : THE VEHICLE POSITION ROTATES RANDOMLY.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
M1: VEHICLES CURRENT POSITION MARK TURNS ON ITS OWN	
	1 Determine if the ignition status was turned to Auxiliary or On, while the vehicle was on a turntable in a parking building etc.
	Was ignition status set to Auxiliary or On? Yes The angular speed of the vehicle at the time of the ignition status change will be logged as the standard value. To re-set the standard value, turn ignition status to 'OFF' then to 'Auxiliary' or 'On' with the vehicle stationary. Re-test the vehicle. No Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST N : THE VEHICLE MARK DISPLAY IS UNSTABLE.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
N1: VEHICLE SPEED SIGNAL	
	1 The vehicle speed signal is being properly inputted under "Vehicle Sensor" on the "Vehicle information" diagnostics screen.
	Is the vehicle speed input correctly? Note: MOST and navigation system module speeds are approximately the same. Yes GO to N2. No Carry out MOST ring circuit checks. Check the Anti-Lock Brake System Module for related DTCs and refer to the relevant DTC Index. Carry out network integrity tests using the manufacturer approved diagnostic system. Refer to electrical circuit diagrams and check CAN circuits if required. Repair wiring harness as required. Rectify the fault and re-test the vehicle.

N2: CHECK NUMBER OF SATELLITES

	1 "0" is displayed in the "Satellites" column under "GPS Information" (on the "Vehicle information" diagnostics screen.)
	Is the number of satellites displayed on the screen 0? Yes Refer to GPS no reception mark does not disappear diagnosis. No GO to N3.

N3: CHECK IF SYMPTOMS ARE OCCURRING IN PARTICULAR LOCATIONS

	1 Confirm if the 'car current position not stable' symptom is occurring in particular locations.
	Is the 'car current position not stable' symptom occurring in particular locations? Yes System operation is normal. Signal reflections from buildings or a particular location may be responsible. No Refer to GPS no reception mark does not disappear diagnosis.

PINPOINT TEST O : THE VEHICLE POSITION DOES NOT UPDATE.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
O1: VEHICLE POSITION DOES NOT UPDATE	
	1 Check the GPS no reception mark.
	Has the GPS no reception mark disappeared? Yes GO to O2. No Refer to GPS no reception mark does not disappear diagnosis.

O2: VEHICLE POSITION DOES NOT UPDATE

	1 Check the map screen scroll function.
	Can the map screen be touched scrolled? Yes GO to O3. No Initiate the "SMART test" on the "HDD information" diagnostics screen.

O3: VEHICLE POSITION DOES NOT UPDATE

	1 The vehicle speed signal is being properly inputted under "Vehicle Sensor" on the "Vehicle information" diagnostics screen.
	Is the vehicle speed input correctly? Note: MOST and navigation system module speeds are approximately the same. Yes Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index. No Carry out MOST ring circuit checks. Check the Anti-Lock Brake System Module for related DTCs and refer to the relevant DTC Index. Carry out network integrity tests using the manufacturer approved diagnostic system. Refer to electrical circuit diagrams and check CAN circuits if required. Repair wiring harness as required. Rectify the fault and re-test the vehicle.

PINPOINT TEST P : THE MAP DISPLAY IS INCOMPLETE.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
P1: MAP DISPLAY IS INCOMPLETE	

	1 Check to see if the map screen displays correctly when it is touch scrolled.
	Does the map screen display correctly when it is touch scrolled? Yes GO to P2. No Initiate the "SMART test" on the "HDD information" diagnostics screen.
P2: MAP DISPLAY IS INCOMPLETE	
	1 Check to see if the map screen scale can be reduced.
	Can the map screen scale be reduced? Yes GO to P3. No Initiate the "SMART test" on the "HDD information" diagnostics screen.
P3: MAP DISPLAY IS INCOMPLETE	
	1 Check to see if a point of interest search can be performed.
	Can a point of interest search be performed? Yes Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index. No Initiate the "SMART test" on the "HDD information" diagnostics screen.

PINPOINT TEST Q : CALLS CANNOT BE RECEIVED OR PLACED WITH BLUETOOTH; BLUETOOTH CANNOT CONNECT WITH THE VEHICLE.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
Q1: DISPLAY CHECK	
	1 Press the telephone button.
	Is 'Telephone not connected' displayed on the screen? Yes GO to Q2. No Proceed to step 7.
Q2: BLUETOOTH COMPATIBILITY CHECK	
	1 Check to see if the telephone handset is Bluetooth compatible.
	Is the telephone handset Bluetooth compatible? Yes GO to Q3. No Use a Bluetooth compatible telephone handset.
Q3: HANDSET POWER CHECK	
	1 Check to see if the handset is switched 'ON'.
	Is the telephone handset switched 'ON'? Yes GO to Q4. No Switch handset 'ON' and re-test.
Q4: INITIAL CONNECTION SETTINGS	
	1 Check to see if the initial connection settings to the in-vehicle system have been performed.
	Have the initial connection settings to the in-vehicle system been performed? Yes GO to Q5. No Perform the initial connection settings.
Q5: HANDSET COMMUNICATION CHECK	
	1 Check to see if the telephone handset recognizes the in-vehicle system.
	Does the telephone handset recognize the in-vehicle system? Yes GO to Q6. No Re-test using a different Bluetooth compatible telephone handset. If the fault is still evident, suspect the telephone module. Refer to the new module/component installation note at the top of this procedure.
Q6: HANDSET COMMUNICATION CHECK	
	1 Switch the Bluetooth telephone handset 'OFF' then back 'ON' again.
	Does the telephone handset recognize the in-vehicle system? Yes Operation is normal. No Suspect the telephone module. Refer to the new module/component installation note at the top of this procedure.
Q7: HANDSET COMMUNICATION CHECK	
	1 Check to see if the telephone is within communications range.
	Is the telephone within a 10 metre range of the bluetooth telephone module? Yes GO to Q8. No Move the telephone handset to within a 10 metre range of the bluetooth telephone module.
Q8: HANDSET COMMUNICATION CHECK	
	1 Check to see if when transmitting, the telephone handset is also receiving.

	When transmitting, is the telephone handset also receiving? Yes Check MOST connection at the Touch Screen Display (TSD), check the MOST devices. No Replace the telephone handset.
--	--

PINPOINT TEST R : AN ERROR SCREEN DISPLAYS ON THE NAVIGATION SCREEN.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
R1: MAP DATA CANNOT BE READ	
	1 Access to the map data has not been granted.
	Has new Touch Screen Display (TSD) been installed? Yes Initiate the "Map Lock routine." No Check that a valid activation code for the particular map version installed is available and is being used, it may be necessary to purchase a new activation code from Navteq. If the activation code is valid but map cannot be activated, check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index. Initiate the "Map Lock routine."

PINPOINT TEST S : THE DUAL VIEW CANNOT BE SWITCHED.

• NOTE: Prior to troubleshooting, verify that the vehicle and the Touch Screen Display (TSD) are compatible with Dual Directional View.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
S1: AUDIO VIDEO HARD SWITCH CHECK	
	1 The audio screen displays when the "AUDIO VIDEO" hard switch is pressed.
	Does the audio screen displays when the "AUDIO VIDEO" hard switch is pressed? Yes GO to S2. No Refer to the hard switches do not respond diagnosis.
S2: AUDIO SOURCE	
	1 TV or DVD is the audio source.
	Does TV or DVD display? Yes GO to S3. No Switch the audio source to TV or DVD and carry out diagnosis again.
S3: VIDEO AND SOUND CORRECTLY DISPLAYED	
	1 Video with sound is displayed on the passenger side from the audio screen after the "AUDIO VIDEO" hard switch is pressed.
	Is video with sound displayed on the passenger side from the audio screen after the "AUDIO VIDEO" hard switch is pressed? Yes Operation is normal. No GO to S4.
S4: VIDEO AND SOUND INCORRECTLY DISPLAYED	
	1 Video with sound is incorrectly displayed on the passenger side from the audio screen after the "AUDIO VIDEO" hard switch is pressed
	Is video with sound incorrectly displayed on the passenger side from the audio screen after the "AUDIO VIDEO" hard switch is pressed? Yes Refer to the black screen (navigation and audio screens do not display) diagnosis. No GO to S5.
S5: VEHICLE CONFIGURATION	
	1 The following set values are present on the "Vehicle Configuration" diagnostics screen. <ul style="list-style-type: none"> ● HLDF = Dual view ● HLDF is fitted ● Hand of Drive is correct for vehicle being tested
	Are values present on the "Vehicle Configuration" diagnostics screen. Yes Check and install a new Touch Screen Display (TSD) as required. Refer to the new module/component installation note at top of DTC Index. No Contact dealer technical support to assist in re-configuring the Car Configuration File (CCF) using the manufacturers approved diagnostic system. Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. Check MOST connection at the Touch Screen Display (TSD), check the MOST devices.

DTC Index

For a complete list of all Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Navigation Control Module \(NAV\)](#) (100-00 General Information, Description and Operation).

Torque: 2.5 Nm

E122787

Installation

1. To install, reverse the removal procedure.

Audio Unit - Audio Amplifier

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the RH front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).

3.  **CAUTION:** Cover fiber optic cable connectors to minimize dust ingress and avoid bending the cables in a radius of less than 30 mm.

Remove the amplifier.

- Remove the 4 bolts.
- Disconnect the 5 electrical connectors.

E54204

Installation

1. Install the amplifier.
 - Install the bolts and tighten to 10 Nm (7 lb.ft).
 - Connect and secure the electrical connectors.
2. Install the front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
4. Using the Land Rover approved diagnostic equipment, follow the on-screen instructions and configure the audio unit amplifier.

Information and Entertainment System - Audio System

Description and Operation

LOW/MID LINE AUDIO SYSTEM - COMPONENT LOCATION

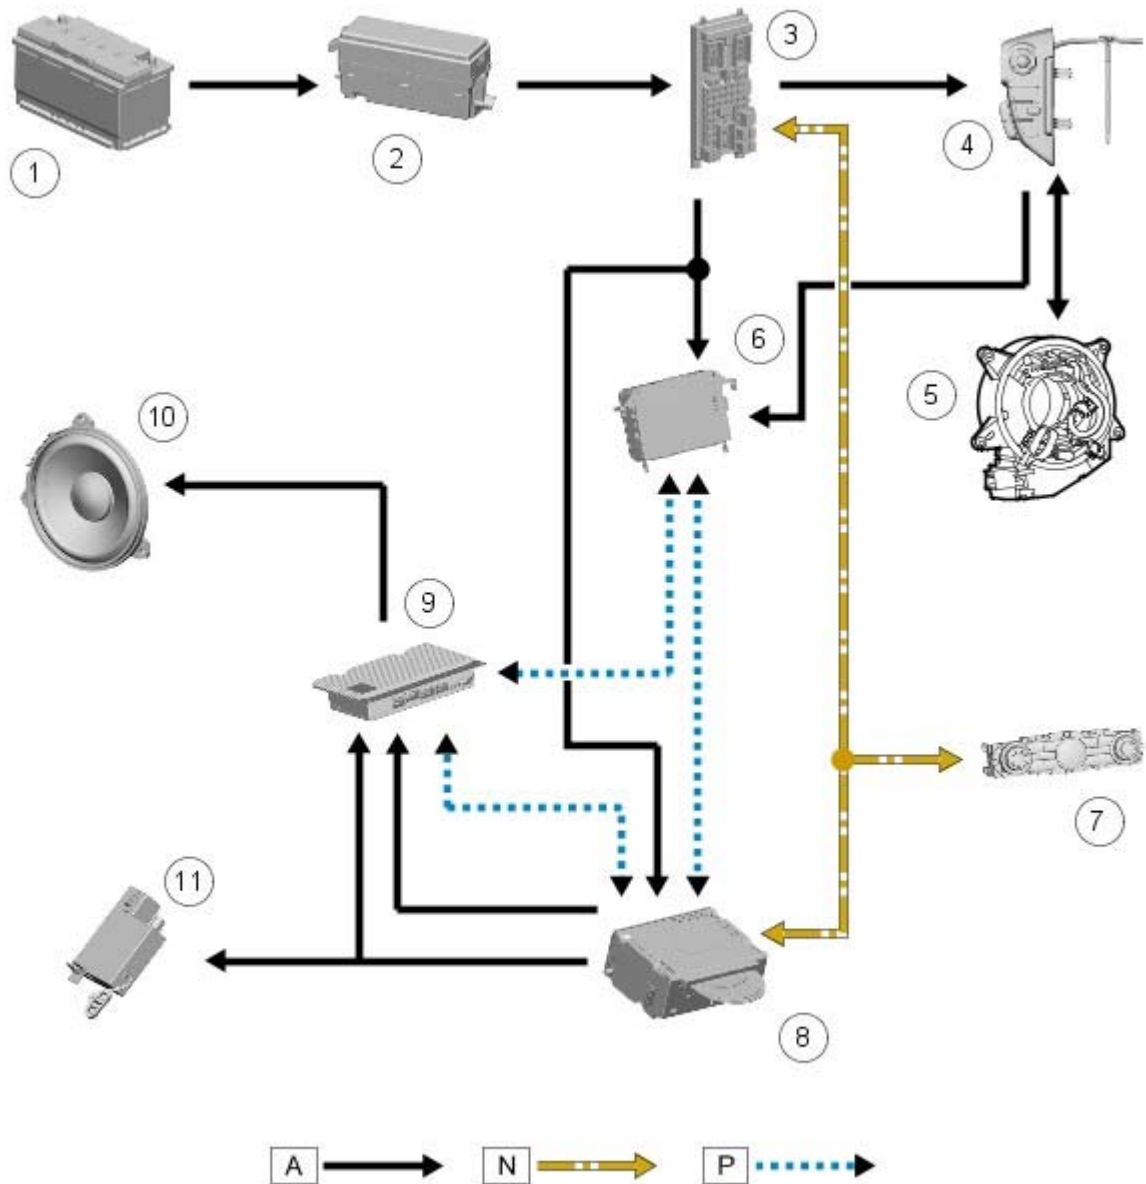

E132315

Item	Part Number	Description
1	-	Audio control switches

17	-	Audio control switches

COMPONENT DESCRIPTION

Head Units

The audio systems have three levels: low line, mid line and high line versions. All the audio systems (low, mid, high) are based around a head unit which communicates on the Media Orientated System Transport (MOST) ring and the medium

speed controller area network (CAN) bus.

Low/Mid Line Head Unit

E121832

The Head Unit (HU) is located in the instrument panel and incorporates the following systems:

- HD Radio (where fitted)
- Bluetooth® receiver (telephone and audio streaming)
- 40 Gb Hard drive
- USB controller (front)
- Audio AUX
- CD player

The low line HU contains the following functionality:

- Radio tuner
- Single disc compact disc (CD) player
- Amplifier

The HU communicates with other vehicle systems on the CAN bus.

Transit Mode

Transit mode is used to reduce the vehicle battery current drain whilst the vehicle is being stored or transported. Transit mode is entered/exited via a CAN signal from T4. In transit mode the following circuits will be disabled:

- Amplifiers
- Aux and phone call
- Clock
- Antenna power
- light emitting diode (LED) illumination

In transit mode the CAN port and the ON/OFF switch are the only circuits that are left active.

The CAN port is left open to allow the EXIT from transit mode signal to be received. The ON/OFF switch is left active to allow feedback to the driver via the HU liquid crystal display (LCD), that the unit is in Transit mode should the driver attempt to power up the HU. This will only occur when the vehicle engine is running and the battery is above 12.3 Volts.

Radio Function

The radio tuner is located in the head unit. The radio is capable of receiving AM and FM waveband and can store 18 FM pre-sets and 12 amplitude modulation (AM) pre-sets. The AM presets are stored as follows:

European AM Preset Storage

- 6 MW
- 6 MWa
- 6 LW
- 6LWa

NAS AM Preset Storage

- 6 MW1
- 6 MW2
- 6 MWa

CD Function

The HU includes single play CD player. The CD player has all the usual functions of a CD player:

- CD play
- Previous/next track
- Shuffle tracks
- Load/eject CD
- Scan
- Repeat

High Line Head Unit

E132910

The high line HU contains the following functionality:

- Radio tuner.
- CD player (Six disc in dash changer).
- Integrated telephone control.
- Auxiliary input (for any device featuring a 3.5mm jack plug output).

The HU is woken up by CAN bus activity and is not woken up from the ignition aux position.

The HU is the Bus Master for the MOST system and contains the timing master for the MOST system.

Tuner

The HU incorporates a AM/frequency modulation (FM) tuner which allows for 18 FM pre-sets and 12 AM (6 MW and 6 LW) pre-set stations to be stored in the HU memory. The radio tuner also incorporates the following radio functions:

- Auto tune
- Traffic announcements (TA)
- radio data system (RDS) EON function
- Seek station
- Tune up/down

CD Player

The CD player is a 6 disc in dash mounted device. The CD multi changer is capable of playing commercial CDs, CDRs, CDRWs and MP3 discs.

Random Play

The Random feature only works on the CD, which has been selected. The Random feature plays all the tracks on the selected CD in a random order. All the tracks on that disc will be played before a new random sequence is played. If a new CD is selected while in random mode, the random mode will be cancelled and play will commence from track 1.

Repeat

The Repeat feature allows the current track to be repeated in an endless loop, when selected by the user.

MP3

The CD player has the capability to play MP3 files. The MP3 discs follow a format of folders and files within the folder. It is also possible to place all the files in the root directory on the CD.

The random and repeat features follow the normal CD random and repeat feature functions.

Scan

Scan allows the user to play the first 10 seconds of each track on the CDs in the unit.

Automatic Volume Control-AVC

The AVC feature is designed to adjust output volume to compensate for the rising level noise of the vehicle as the vehicle travels faster.

There are 10 settings for AVC, where 0 = off, 1 is the lowest setting (minimum volume change with speed and 9 the maximum).

The vehicle speed signal is used to enable the HU to calculate the volume adjustment required. The vehicle speed signal is received over the CAN from the anti-lock brake system (ABS) control module. The signal is an average of the four wheel speed sensor signals.

Control of the AVC is carried out by the audio amplifier.

Should an invalid speed signal be received the AVC will not alter the output volume.

ICP (Integrated Control Panel)

E131563

The ICP duplicates many of the touch-screen audio user control features. Any volume setting made whilst in audio, TV, phone, navigation or voice activation mode will be memorized for that system. The ICP communicates with the IAM on the medium speed CAN (controller area network) . The IAM converts control/command signals from the ICP and then distributes the information onto the MOST system to the audio system and other information and entertainment systems. No configuration procedure is required if the ICP is replaced. There is no option to calibrate the ICP using the Land Rover approved diagnostic equipment.

Touch Screen Displays

Low/mid line display

E132909

High line display

E131562

The Touch Screen Display (TSD) is located in the center of the instrument panel and is the driver control interface for the infotainment system. The TSD is connected to the MOST ring and communicates with the other components in the audio/infotainment system.

The TSD also provides driver display and control of the audio system, telephone, the rear view camera, proximity cameras, the Traffic Message Channel (TMC) and the navigation system.

The RSE and other systems are operated by 'virtual' buttons displayed on the touch screen.

Care should be taken with the TSD to ensure its correct operation

- The screen should be cleaned with a lightly, water moistened cloth. Do not use chemical agents or domestic products to clean the screen or any part of the surround.
- Only use your finger to operate the touch screen. Ensure you only use one finger to avoid incorrect entries.
- A short light press of the touch screen is sufficient. Excessive pressure can damage the screen.

Remote Audio Controls

E48224

The second and third row seat passenger can use standard headphones to listen to audio from any of the sources fitted to the vehicle. These include:

- Television
- Compact Disc (CD)
- Radio
- DVD
- AUX Input

There are four remote audio control modules, two in the rear doors incorporating the rear window switches and two in the rear load space each side of the third row seats.

The remote audio control modules allow the user to select which source to listen to. The remote controls cannot override what the driver has selected to listen to. If the driver is listening to a CD the rear passenger cannot control the CD player.

The remote audio control modules allow the user to alter the volume in the head phones, change track/disc up/down or repeat on a CD, change pre-set radio stations or tune up/down on the radio and television.

AMPLIFIERS

Harman Kardon High Line/Logic 7 Amplifier

E47726

The audio system has three amplification options:

- Internal amplification
- Harman Kardon
- Harman Kardon Logic 7

The amplifier is located under the right-hand (RH) front seat and is connected to the audio system via the MOST bus.

STEERING WHEEL CONTROLS

Steering Wheel Audio Controls

E132140

Item	Part Number	Description
1	-	Search down
2	-	Volume up
3	-	Mode select
4	-	Search up
5	-	Volume down
6	-	Gap decrease
7	-	Gap increase
8	-	Set or increase the speed
9	-	Resume set speed
10	-	Cancels without erasing memorised speed
11	-	Decrease the speed
12	-	Heated steering wheel
13	-	Answer call/dial switch
14	-	End/reject call switch
15	-	Voice control

The HU can be remotely controlled via steering wheel mounted controls. The steering wheel controls are mounted to the right hand side of the steering wheel.

The switches are a resistive ladder type. The HU supplies a reference voltage to the switches, which then return an altered voltage to the HU depending on which switch is pressed.

The controls allow the user to adjust the volume, change CD tracks/radio pre-sets, answer and end a phone call (where a phone is fitted) and use the voice recognition system.

SATELLITE DIGITAL AUDIO RADIO SERVICE (SDARS NAS only)

The SDARS systems operate in the S-Band frequency range (2.3 GHz) and, as a result of the use of satellite transmission have the ability to provide CD quality audio broadcasts over very large areas (typically continents). SDARS service providers transmit a signal from their up-link facility (which is the original point of transmission of data, voice or other information through an antenna system) to a satellite where the signal is then down linked to both the terrestrial repeater network and the individual SDARS car radios. The radio switches between the satellite signal and the repeater signal depending on the strength of the signal at any given time.

Land Rover will be using the Sirius Satellite Radio service provider in the USA.

The Sirius SDARS systems comprise:

- Satellites
- Ground repeaters
- Up-link ground stations
- Radio receiver systems

The Sirius SDARS system uses three satellites on an inclined elliptical orbit. This ensures that each satellite spends approximately 16 hours a day over the continent of the USA, with at least one satellite over the country at any one time.

The satellites beam their signals down to the ground where the signal is picked up by receivers or is transmitted to repeater stations to cover built up areas where the signal is obscured.

TRAFFIC MESSAGE CHANNEL (TMC)

The TMC system is a European only system whereby traffic information is received by the TMC tuner and used by the navigation computer to recalculate the route being used to avoid the traffic disruption. This system information is broadcast on the RDS data carriers.

Information and Entertainment System - Speakers

Description and Operation

The speaker configuration depends on the level of audio and head unit fitted to the vehicle. The following details the speaker configuration and control for each system.

LOW LINE AUDIO SYSTEM

Low Line Audio System Speaker Component Location

E132119

Item	Part Number	Description
1	70451	Front RH door mid/bass speaker
2	-	Front RH door tweeter
3	-	Rear RH door full range speaker
4	-	Rear LH door full range speaker
5	-	Front LH door tweeter
6	-	Front LH door mid/bass speaker
7	-	Head unit
8	-	Rear RH door tweeter
9	-	Rear LH door tweeter

Low Line Audio System Speaker Control Diagram

Item	Part Number	Description
1	-	Front LH tweeter
2	-	Head unit
3	-	Front RH tweeter
4	-	Front RH mid/bass speaker
5	-	Rear RH full range speaker
6	-	Rear LH full range speaker
7	-	Front LH mid/bass speaker
8	-	Rear LH tweeter
9	-	Rear RH tweeter

The low line audio speaker system is driven directly from the audio head unit. For additional information, refer to: [Audio System](#) (415-01B Information and Entertainment System, Description and Operation).

The system comprises:

- Head unit
- Two front door mounted mid/bass speakers (one per side)
- Two front door mounted tweeters (one per side)
- Two rear door mounted full range speakers (one per side)
- Two rear door mounted tweeters (one per side)

HIGH LINE-HARMAN/KARDON AUDIO SYSTEM

High line-Harman/Kardon Audio System Speaker Component Location

E49743

Item	Part Number	Description
1	-	Front RH mid/bass speaker
2	-	Front RH tweeter
3	-	Rear RH mid/bass range
4	-	Rear RH tweeter

6	-	Rear RH mid/bass speaker
7	-	Sub-woofer
8	-	Rear LH mid/bass speaker
9	-	Rear LH tweeter
10	-	Front LH mid/bass speaker

The High line-Harman/Kardon audio speaker system is driven by an amplifier located under the RH front seat. The amplifier is controlled by the Integrated Head Unit (IHU) on the MOST bus and supplies 6x50 watts output, giving a total system power rating of 300 watts

For additional information, refer to: [Audio System](#) (415-01B Information and Entertainment System, Description and Operation).

. The system comprises:

- Integrated Head Unit (IHU) Head unit.
- Two front door mounted mid/bass range speakers (one per side).
- Two front door mounted tweeters (one per side).
- Two rear door mounted mid/bass range speakers (one per side).
- Two rear door mounted tweeters (one per side).
- A sub-woofer located in the lower tailgate.
- An audio amplifier located under the front RH seat.

12	-	Rear LH mid/bass range speaker
13	-	Rear LH tweeter
14	-	Front LH bass speaker
15	-	Front LH mid range speaker

The Premium Audio - Harman/Kardon LOGIC7 audio speaker system is driven by an amplifier located under the RH front seat. The amplifier is controlled by the Integrated Head Unit (IHU) on the MOST bus and supplies 12x50 watts output, giving a total system power rating of 600 watts. The system comprises:

- Integrated Head Unit (IHU) Head unit
- Two front door mounted mid range speakers (one per side)
- Two front door mounted bass speakers (one per side)
- Two front door mounted tweeters (one per side)
- Two rear door mounted mid/bass range speakers (one per side)
- Two rear door mounted tweeters (one per side)
- A sub-woofer located in the lower tailgate
- Two rear surround speakers in the E post (one per side)
- One centre fill speaker located in the centre of the instrument panel
- Premium amplifier

Antenna - Antenna

Description and Operation

12	-	VICS/TMC tuner
13	-	VICS/TMC antenna amplifier
14	-	TV antenna amplifier
15	-	VICS antenna amplifier
16	-	VICS tuner

The antenna systems fitted to the vehicle comprise:

- AM (glass mounted)
- FM (glass mounted)
- FM diversity (glass mounted, where fitted)
- TV (glass mounted, where fitted)
- Multiband telephone antenna (roof mounted, where fitted)
- GPS antenna (rear spoiler mounted, where fitted)
- SDARS (roof mounted NAS only)
- VICS antenna and beacon antenna (Japan only where fitted)

FM ANTENNAS

FM Antenna Amplifier

E48084

The AM/FM antennas are located in the side and rear window. ON vehicles with the low line audio system the AM/FM antenna is located in the RH rear side screen. On vehicles with a high line audio systems the system will be equipped with FM diversity tuning. This system ensures that the strongest of two signals is used by the radio system to ensure the best possible FM reception. The standard AM/FM antenna is screen mounted in the RH rear side window and is connected to an antenna amplifier located above the screen. The diversity system uses the same side window antenna and amplifier but also uses a rear heated screen element antenna and an FM antenna amplifier mounted at the top of the rear screen in the tail gate.

TMC ANTENNA AMPLIFIER

E48087

The Traffic Message Channel (TMC) signals are received through the normal radio signals via the RDS network. The signals are routed separately from the radio signals via a separate antenna amplifier located on the RH rear side window. For additional information, refer to: [Navigation System](#) (419-07 Navigation System, Description and Operation).

GPS ANTENNA

E48086

The GPS antenna is located in the RH side of the upper tailgate mounted spoiler. The GPS antenna is connected to the navigation computer by a coaxial cable. For additional information, refer to: [Navigation System](#) (419-07 Navigation System, Description and Operation).

TV ANTENNA

TV Antenna Amplifier

E48088

Where a television system is specified there are four TV antenna elements two in each of the rear side windows. Each element has an antenna amplifier which is connected to the TV tuner module by a coaxial cable. For additional information, refer to: Video System (415-07 Video System, Description and Operation).

MULTIBAND TELEPHONE ANTENNA

Multiband Telephone Antenna

E48085

The multiband telephone antenna is located in the roof mounted pod, which is located in the centre of the roof at the rear of the vehicle and is connected directly to the Telephone Control Module (TCM) via a single coaxial cable. For additional information, refer to: [Cellular Phone](#) (419-08 Cellular Phone, Description and Operation).

SATELLITE DIGITAL AUDIO RADIO SYSTEM (SDARS) ANTENNA (NAS ONLY)

SDARS antenna

E48085

The SDARS antenna is located in the roof mounted pod, which is located in the centre of the roof at the rear of the vehicle. The SDARS antenna has two connections to the SDARS tuner, one for satellite transmissions the other for terrestrial transmissions from repeater stations.

The antenna comprises two antenna elements:

- A printed dipole antenna for receiving satellite signals
- A printed monopole antenna for receiving terrestrial signals

The two antennas allow the system to receive SDARS transmissions in built up areas where signals from satellites would normally be blocked.

For additional information, refer to: Audio System (415-01 Audio Unit, Description and Operation).

VICS ANTENNAS (Japan only)

VICS Beacon Antenna

E48091

The VICS control module uses the rear RH side window antenna to receive VICS information. The Control module also uses an infra red beacon antenna located in the middle on top of the instrument panel adjacent to the sunlight sensor. For additional information, refer to: Navigation System (419-07 Navigation System, Diagnosis and Testing).

Antenna - Antenna

Diagnosis and Testing

Diagnosis and Testing

For additional information.

REFER to: [Information and Entertainment System](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

Speakers - Front Door Speaker

Removal and Installation

Removal

1. Remove the front door trim panel.
For additional information, refer to: Front Door Trim Panel (501-05, Removal and Installation).
2. Remove the front door speaker wiring harness.
3. Remove the front door speaker.
 - Remove the 4 screws.
 - Disconnect the electrical connector.

Installation

1. Install the front door speaker.
 - Connect the electrical connector.
 - Install the screws.
2. Install the front door speaker wiring harness.
3. Install the front door trim panel.
For additional information, refer to: Front Door Trim Panel (501-05, Removal and Installation).

Speakers - Rear Door Speaker

Removal and Installation

Removal

1. Remove the rear door trim panel.
For additional information, refer to: Rear Door Trim Panel (501-05, Removal and Installation).

2. Remove the speaker.

- Disconnect the electrical connector.
- Remove the 4 screws.

Installation

1. Install the speaker

- Tighten the screws.
- Connect the electrical connector.

2. Install the rear door trim panel.

For additional information, refer to: Rear Door Trim Panel (501-05, Removal and Installation).

Speakers - Instrument Panel Speaker

Removal and Installation

Removal

1. Remove the instrument panel speaker.

- Remove the speaker grille.
- Remove the 3 screws.
- Disconnect the electrical connector.

E47228

Installation

1. To install, reverse the removal procedure.

Speakers - Quarter Panel Speaker

Removal and Installation

Removal

- NOTE: The procedure to remove the quarter panel speaker is shown in the D-pillar trim panel procedure.

1. Remove the D-pillar trim panel.
For additional information, refer to: [D-Pillar Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Installation

1. Install the D-pillar trim panel.
For additional information, refer to: [D-Pillar Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Speakers - Tailgate Speaker

Removal and Installation

Removal

1. Remove the tailgate trim panel.
For additional information, refer to: [Tailgate Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Remove the tailgate speaker assembly.

E46293

- Remove the 10 Torx bolts.
- Disconnect the 2 electrical connectors.

3. **NOTE: Do not disassemble further if the component is removed for access only.**

Remove the tailgate speaker.

- Remove the 6 bolts.

E46294

Installation

1. Install the tailgate speaker.
 - Tighten the bolts to 10 Nm (7 lb.ft).
2. Install the tailgate speaker assembly.
 - Connect the electrical connectors.
 - Tighten the Torx bolts to 10 Nm (7 lb.ft).
3. Install the tailgate trim panel.

For additional information, refer to: [Tailgate Trim Panel](#)
(501-05 Interior Trim and Ornamentation, Removal and
Installation).

18	-	Rear entertainment module
19	-	Touch screen display (TSD)

The Video system comprises:

- Front screen (Navigation Touch screen Display TSD)
- Television tuner module
- Television antennas
- Rear remote control headphone modules

TELEVISION

The television system receives television signals from television antennas in the rear side screens. The antennas are connected to the television tuner via coaxial leads.

For additional information, refer to: [Antenna](#) (415-02 Antenna, Description and Operation).

COMPONENT DESCRIPTION

Touch Screen Display

E131562

The Touch Screen Display (TSD) is located in the center of the instrument panel and is the driver control interface for the infotainment system. The TSD is connected to the MOST ring and communicates with the other components in the audio/infotainment system.

The TSD communicates with the RSE module via a co-axial cable. The TSD processes its own video for system operation but receives the video image data from the RSE via the co-axial cable.

The TSD also provides driver display and control of the audio system, telephone, the rear view camera, proximity cameras, the Traffic Message Channel (TMC) and the navigation system.

The RSE and other systems are operated by 'virtual' buttons displayed on the touch screen.

Care should be taken with the TSD to ensure its correct operation

- The screen should be cleaned with a lightly, water moistened cloth. Do not use chemical agents or domestic products to clean the screen or any part of the surround.
- Only use your finger to operate the touch screen. Ensure you only use one finger to avoid incorrect entries.
- A short light press of the touch screen is sufficient. Excessive pressure can damage the screen.

IAM (Integrated Audio Module)

E121832

The IAM is located in the Instrument panel and incorporates the following systems:

- HD Radio (where fitted)
- Bluetooth® receiver (telephone and audio streaming)
- 40 Gb Hard drive
- USB controller (front)
- Audio AUX
- CD player

ICP (Integrated Control Panel)

E131563

The ICP duplicates many of the touch-screen audio user control features. Any volume setting made whilst in audio, TV, phone, navigation or voice activation mode will be memorized for that system. The ICP communicates with the IAM on the medium speed CAN (controller area network) . The IAM converts control/command signals from the ICP and then distributes the information onto the MOST system to the audio system and other information and entertainment systems.

No configuration procedure is required if the ICP is replaced. There is no option to calibrate the ICP using the Land Rover approved diagnostic equipment.

Rear Seat Entertainment Module

M866142

The Rear Seat Entertainment (RSE) module is located in the rear RH side of the luggage compartment. The RSE module is an interface between the video and audio inputs from other system components and the video display and audio outputs.

The RSE module communicates with the audio systems via the MOST connection. Audio output from the DVD autochanger or the AVIO panel is processed by the RSE module and passed on the MOST ring to the audio amplifier to allow audio output to be played through the vehicle speakers or the headphones.

Video input from the TV tuner, DVD (digital versatile disc) autochanger and the Audio Video Input/Output (AVIO) panel is also processed by the module and passed to the two RSE LCD (liquid crystal display) screens and the TSD on separate video connections. The RSE module also controls the power supplies to the RSE LCD (liquid crystal display) screens and relays the infra-red remote control signals received by the RSE LCD (liquid crystal display) screen infra-red sensors to the DVD (digital versatile disc) autochanger. The infra-red signals are passed from the RSE LCD (liquid crystal display) screens to the RSE module on a bus system known as the IS bus.

The RSE module has two modes of operation; engine running mode and reduced operation mode. With the engine running the RSE module has full functionality. When the engine is not running the RSE module has reduced functionality to prevent excessive drain on the vehicle battery. The reduced functionality comprises a reduced audio volume and time limit on system operation.

The reduced audio volume is only active when the engine is not running. The audio volume is limited reduce battery consumption. If the volume was set at a higher level than this when the engine was running, when the engine is subsequently started, the volume level will gradually increase to the previously selected setting. This prevents the user being distracted by a sudden increase in volume.

The time limit operation is active when the ignition is off and the system is manually switched on using the TSD. The system will operate for a maximum of one hour. The battery voltage is continually monitored by the IHU. If the IHU detects that the battery voltage has fallen to a predetermined level, the IHU will shut the infotainment system down to prevent further battery drain. Once the system has shut down due to low battery voltage, it can only be restarted when the engine is running and the battery voltage has risen above the threshold level for more than one minute.

Television Tuner

E128344

The television tuner module is located in the rear RH side of the luggage compartment. The television tuner is connected to the rest of the video system on the MOST bus. Audio and control signals are passed on the MOST bus while video is transmitted via a coaxial cable to the Touch Screen Display (TSD).

Television audio can be heard through the vehicle speakers and the remote control rear headphone modules. The audio will continue to be heard whilst the vehicle is moving, however the television picture will stop displaying once the vehicle starts to move.

- **NOTE:** The television tuner module is located beneath the RH front seat on Japanese specification vehicles.

DVD Autochanger

M866141

The DVD (digital versatile disc) autochanger is located in the rear RH side of the luggage compartment. The DVD (digital versatile disc) player is a six disc design which will accept DVD (digital versatile disc) movies, video CD (compact disc) (VCD) and music CD (compact disc) on CD-R or CD-RW. The discs are housed in a magazine to allow six discs to be stored in the unit. Additional magazines can be purchased to allow greater flexibility. The magazine is accessible via a sliding

door on the front of the unit. An eject button, located behind the door automatically ejects the magazine from the unit when pressed.

The DVD (digital versatile disc) autochanger is operated using a remote control unit supplied with the vehicle. The remote control is an infra-red unit which transmits the infra-red signal to receivers located in each RSE LCD (liquid crystal display) screen.

The DVD (digital versatile disc) autochanger receives the remote control information from the RSE LCD (liquid crystal display) screens.

A Sony Philips Digital Interface Format (SPDIF) is used to output the audio from the DVD (digital versatile disc) autochanger to the audio amplifier. The SPDIF is an optical system connected between the DVD (digital versatile disc) autochanger and the audio amplifier. SPDIF is a standard audio file transfer format which allows the transfer of digital audio signals from one device to another without having to be converted first to an analog format which maintains the viability of the digital audio signal.

LCD Screens

M866194

The RSE LCD screens are located in the rear of the front seat head restraints. The screen is secured in the head restraint with three screws which are covered by a removable surround. The screen is a 6.5 inch, auto dimming, high resolution LCD (liquid crystal display) monitor, manufactured by Alpine

An infra-red receiver sensor is located centrally in the upper screen surround. The receiver sensor receives infra-red transmissions from the DVD (digital versatile disc) remote control and passes them to the DVD (digital versatile disc) autochanger, via the RSE module on a bus system known as the IS bus. All screen settings can be changed using the RSE remote control.

The screen should be cleaned with a lightly, water moistened cloth. Do not use chemical agents or domestic products to clean the screen or any part of the surround.

Each RSE LCD (liquid crystal display) screen is connected to the infotainment system using a 20 pin harness connector.

Remote Control

M866143

The remote control for operation of the DVD autochanger is a universal type. A switch on the rear of the control selects either the LH (left-hand) or RH (right-hand) screens and allows the individual settings for each screen to be changed as required. The switch has a central position which disables the remote control and prevents battery drain.

The remote control transmits an infra-red signal in response to operation of a button. The infra-red signal is received by a receiver sensor located on each RSE LCD (liquid crystal display) screen and is passed, via an IS bus to the RSE module and from the RSE module on an Alpine proprietary bus known as the Ai Net, to the DVD (digital versatile disc) autochanger. The remote control also allows selection of an auxiliary input from the AVIO panel (video or games console) or selection of audio (radio or CD (compact disc)).

The remote control is powered by two 'AAA' batteries located in the rear of the control and are accessible by removing a sliding cover. When inserting the batteries it is important that the battery polarity is observed as marked in the battery compartment. LED (light emitting diode) at the top left and right hand corner of the control indicates that the remote control is operating when a button is pressed. Only one LED (light emitting diode) will illuminate depending on which screen is selected. If the LED (light emitting diode) fails to illuminate when a button is pressed, the battery voltage may be low or the switch on the rear of the control may be set in the central 'off' position.

Remote Audio Controls

E48224

The second and third row seat passenger can use standard headphones to listen to audio from any of the sources fitted to the vehicle. These include:

- Television
- compact disc (CD)
- Radio
- DVD
- AUX Input

There are four remote audio control modules, two in the rear doors incorporating the rear window switches and two in the

rear load space each side of the third row seats.

The remote audio control modules allow the user to select which source to listen to. The remote controls cannot override what the driver has selected to listen to. If the driver is listening to a CD the rear passenger cannot control the CD player.

The remote audio control modules allow the user to alter the volume in the head phones, change track/disc up/down or repeat on a CD, change pre-set radio stations or tune up/down on the radio and television.

Video System - Video System

Diagnosis and Testing

Principle of Operation

For a detailed description of the video system and operation, refer to the relevant Diagnosis and Testing section of the workshop manual. REFER to: Video System (415-07 Video System, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Front touch screen display (TSD) installation and condition ● Rear seat entertainment (RSE) screen installation and condition ● Digital versatile disc (DVD) multi-changer installation and condition ● Television antennae (two in each rear side window) 	<ul style="list-style-type: none"> ● Fuses ● Electrical harnesses ● Fibre optic cable harnesses ● Infotainment relay ● Display screens ● DVD multi-changer ● Television tuner module ● RSE module ● Television antenna amplifiers (4) ● Remote control and batteries

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
The DVD does not operate	<ul style="list-style-type: none"> ● DVD multi-changer fuse blown ● No power to display screens ● Condensation 	Check the DVD circuits for a short circuit causing fuse failure and rectify as necessary. Refer to the electrical guides. Check for power to the display screens, rectify as necessary. Refer to the electrical guides. Wait at least one hour for the condensation to dry out.
Remote control operation is unstable	<ul style="list-style-type: none"> ● Handset batteries low on power ● Remote control receiver sensor or transmitter is dirty 	Check and renew the batteries as necessary. Check and clean the receiver and transmitter as necessary.
There is no picture	<ul style="list-style-type: none"> ● The display screen is set to an incorrect mode 	Use the switch on the back of the handset to select the correct mode.
Playback does not start	<ul style="list-style-type: none"> ● Disc is loaded upside-down ● An incorrect format of disc is loaded ● Parental lock is set ● The setup menu is displayed 	Check that the disc is correctly loaded. Check that the disc format is compatible. Cancel parental lock or check the rating of the disc. Press SET for at least 2 seconds to turn the setup menu off.
The picture is unclear or noisy	<ul style="list-style-type: none"> ● The disc is being fast forwarded or rewind ● The vehicle battery power is low 	The picture may be slightly distorted in fast forward or rewind modes. Check the vehicle battery condition and state of charge.
The image "freezes"	<ul style="list-style-type: none"> ● The disc is scratched 	Load an undamaged disc.
NO MAG is displayed	<ul style="list-style-type: none"> ● There is no magazine loaded into the DVD multi-changer 	Load a magazine.
NO DISC is displayed	<ul style="list-style-type: none"> ● There is no disc loaded into the magazine ● The disc is dirty 	Load a disc into the magazine. Clean the disc as necessary.

Symptom	Possible Causes	Action
REGIONAL CODE VIOLATION is displayed	<ul style="list-style-type: none"> The disc loaded does not match the regional code number 	Load a disc which matches the regional code number.
VIDEO SIGNAL IS NOT CORRECT is displayed	<ul style="list-style-type: none"> An NTSC disc is loaded into a PAL system, or vice versa 	Load a disc of the correct format.
HI TEMP is displayed	<ul style="list-style-type: none"> The system protective circuit is activated as it has detected a high temperature 	Turn the power OFF on the unit and then back on again. If the display does not clear, leave the power off until the temperature decreases and turn the power ON again.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Television Control Module \(TVM\)](#) (100-00 General Information, Description and Operation).

Video System - Digital Versatile Disc (DVD) Player

Removal and Installation

Removal

1. Remove the RH rear quarter trim panel.
For additional information, refer to: [Loadspace Trim Panel RH](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Release the rear quarter trim panel mounting bracket.

- Remove the 2 screws.

3. Remove the rear quarter trim panel mounting bracket.

- Release the 2 clips.

E114548

4.  CAUTION: Make sure that the fiber optic cables are not bent to a radius of less than 25 mm.

Release the rear seat entertainment module.

- Remove the 3 nuts. TORQUE: 10 Nm
- Position aside.

E114549

5. Release the DVD player from the body.

- Remove the 4 Torx bolts.

6. CAUTIONS:

 Make sure that the fiber optic cables are not bent to a radius of less than 25 mm.

 Make sure that the optical connectors are clean and free of foreign material.

Remove the DVD player.

- Disconnect the 3 electrical connectors.

E114550

7. Remove the DVD player mounting bracket.

- Remove the 8 screws.

E114551

Installation

1. To install, reverse the removal procedure.

Video System - Video Display

Removal and Installation

Removal

1. Remove the screen surround.

E93458

2. Release the video display.

- Remove the 3 Torx screws.

E93459

3. Remove the video display.

- Disconnect the electrical connector.

E93460

Installation

1. To install, reverse the removal procedure.

Exterior Lighting -

Sealants

Item	Land Rover Kit Part No.	
High mounted stop lamp (HMSL) sealant	BHM 705L	
Bulb	Type	Rating
* Halogen headlamps - Low beam	Halogen H7	55W
* Halogen headlamps - High beam	Halogen H7	55W
+ * Xenon headlamps - Low/High beam	Xenon D2S	35W
Front fog lamps	Halogen H11	55W
Rear fog lamps	Bayonet	21W
Turn signal indicators - Front	Bayonet	21W
Turn signal indicators - Rear	Bayonet	21W
Turn signal indicators - Side Repeaters	Capless	5W
Side lamps - Front	Bayonet	5W
** Stop/Tail lamps	Bayonet - Twin filament	21W/5W
High mounted stop lamp (HMSL)	LED's	-
License plate lamps	Festoon	5W
Reverse lamps	Bayonet	21W
Cornering lamp/Static bending lamp	Halogen H8	35W
NAS - Side marker lamps - front/rear	Capless	3W

WARNING: + Refer to the General Information - Electrical Precautions section of this manual prior to carrying out any procedures on the Xenon headlamp system fitted to certain vehicles.

- NOTE: * NAS vehicles - Cornering lamps are not fitted to these vehicles.
- NOTE: ** Note: 21W filament is not functional on lower tail lamp.

Exterior Lighting - Exterior Lighting

Description and Operation

Exterior Lighting Component Location

E121548

Item	Part Number	Description
1	-	Instrument cluster
2	-	Lighting control switch
3	-	Left Hand (LH) steering column multifunction switch
4	-	Rain/light sensor
5	-	Auto high beam control module and image sensor
6	-	Hazard warning lamp switch
7	-	Side repeater turn signal indicator lamp
8	-	Central Junction Box (CJB)
9	-	High mounted stop lamp
10	-	License plate lamps
11	-	Reflector
12	-	Rear lamp assembly
13	-	Front fog lamp
14	-	Headlamp assembly
15	-	Stop lamp switch
16	-	Adaptive Front lighting System (AFS) control module

GENERAL

The exterior lighting system comprises the following exterior lamps:

- Front and rear side lamps
- License plate lamps
- Side marker lamps (if fitted)
- Front and rear turn signal indicator lamps
- Side turn signal indicator lamps
- Stoplamps and high mounted stop lamp
- Reversing lamps
- Rear fog lamps
- Front fog lamps (if fitted)
- Cornering/Static bending lamps (if fitted) - All except NAS
- Low and high beam headlamps.

Exterior Bulb Type/Rating and LED Table

The following table shows the bulbs/LED's used for the exterior lighting system and their type and specification (where applicable).

Bulb	Type	Rating
Halogen Headlamps - Low beam	Halogen H7	55W
Xenon headlamps - Low/High Beam	Xenon D3S	35W
Headlamps - High Beam	Halogen H7	55W
Front fog lamps	Halogen H11	55W
Rear fog lamps	Bayonet P21	21W
Turn signal indicator lamps - Front	PY24W	24W
Side repeater turn signal indicator lamps	Capless W5W	5W
Turn signal indicator lamps - Rear	12 LED's	-
Side lamps - Front - Xenon headlamps	10 LED's	-
Side lamps - Front - Halogen headlamps	Capless W5W	5W
Stop lamps	12 LED's	-
Side lamps - Rear	12 LED's (each side lamp)	-
High mounted stop lamp	LED's	-
License plate lamps	Capless W5W	5W
Reverse lamps	Bayonet P21	21W
Cornering lamp/Static bending lamp	Halogen H8	35W
NAS - Side marker lamp - Front	Capless W3W	3W
NAS - Side marker lamp - Rear	Capless W5W Rear	5W

The bulbs and the Light Emitting Diode (LED)'s are driven by Metal Oxide Semiconductor Field Effect Transistors (MOSFET's) within the Central Electronics Module (CEM) which is an integral component of the Central Junction Box (CJB). An exception to this is the front and rear position lamps, front fog lamps and the reversing lamps which are supplied with power via relays within the CJB and are protected by conventional fuses.

CENTRAL JUNCTION BOX

The CJB is located behind the glove compartment and is connected to the vehicle wiring harness with 8 multiplugs.

The CJB receives four permanent battery power supplies via the Engine Junction Box (EJB).

The lighting circuits are not all protected by conventional fuses as some are protected by MOSFET's. The control circuitry within the CJB for each individual circuit can detect and isolate a problem circuit.

Failure of a lamp is not notified to the driver. If a turn signal indicator fails the turn signal warning indicator in the instrument cluster will flash at double speed.

Input Signals for Lamp Control

The CJB receives inputs from the following switches:

- Lighting control switch for side lamps, headlamps and auto headlamps (if fitted)
- Momentary push switches for front and rear fog lamps
- Left hand steering column multifunction switch for turn signal indicators and high beam/headlamp flash and Auto High Beam system
- Brake pedal switch
- Momentary push switch for hazard warning.

The switches are supplied with a 10mA supply from the CJB and switch to ground when operated. The CJB detects that a switch has been operated (ON) when its closing resistance is less than 100 Ohm and is detected as OFF when its resistance is more than 10K Ohm.

The lighting control switch uses a binary system which is detected by the CJB which determines the selected position. The output from the lighting control switch is shown in the following table:

Switch State	Switch 1	Switch 2
Off	1	1
Side lamps	1	0
Headlamps	0	0
Auto headlamps	0	1

The CJB also receives ignition status via hard wired connections from the stop/start switch.

A reverse gear engaged signal is also received on the high speed Controller Area Network (CAN) bus from the Transmission Control Module (TCM) to enable the CJB to activate the reverse lamps.

The CJB can receive a hazard warning indicator activation message from the Restraints Control Module (RCM), via the high speed CAN bus, in the event of a crash. The CJB can also activate the hazard warning indicators to signify vehicle locking to the driver.

On vehicles with Auto High Beam, the auto high beam control module outputs signals on the medium speed CAN bus to the CJB to control the high beam headlamps. Power for the auto high beam control module is supplied via a relay located in the EJB.

Circuit Protection

Operation of the lamps is performed using overload proof Metal Oxide Semiconductor Field Effect Transistors (MOSFETs). The MOSFETs can detect overload, load interruption with the lamps switched on and short circuit to positive with the lamps switched off.

The MOSFETs are protected against short circuits, removing the requirement for the lamps circuits to be protected by fuses. The MOSFETs respond to heat generated by increased current flow caused by a short circuit. Normally this would cause the fuse to blow. The MOSFETs react to the heat increase and cut the supply to the affected circuit. Once the fault has been rectified or the MOSFET has cooled, the MOSFET will automatically reset and operate the circuit normally.

If an overload occurs, the current flow is dependant on the temperature of the related MOSFET and can be up to 20 times the rated current of the lamp. The MOSFET heats up and deactivates the load applied to the circuit. When the MOSFET cools the circuit is once again reactivated. This thermal cycling occurs continuously in the event of an overload occurring.

A number of lamps are controlled by relays and these circuits are protected by conventional fuses.

Bulb Monitoring

Bulb failure monitoring is performed by the CJB processor. The lamps are cold and warm monitored by the MOSFETs in order to detect bulb failure.

- **NOTE: Relay controlled lamps have no diagnostic monitoring.**

The CJB processor provides outputs to each MOSFET. The output switches the MOSFET to supply the required output to power the applicable lighting circuit. The microprocessor evaluates the circuits by detecting the returned signals from the controlling MOSFET.

When the bulb or LED is functioning normally, the output signal voltage from the controlling MOSFET is 0V. If a bulb or LED in the circuit fails, an open circuit occurs and the MOSFET outputs a signal of 5V to the processor. The signal is interpreted as a bulb or LED failure and generates a Diagnostic Trouble Code (DTC) which can be retrieved using an approved Land Rover diagnostic system.

Warm monitoring is performed continuously when the lights are switched on by evaluating the diagnostic output of the MOSFET switches. Cold monitoring is performed at 32 second intervals when the lights are switched off. The MOSFETs briefly switch on the lights for approximately 1 millisecond (this is insufficient to illuminate the bulb or LED) and checks the bulb or LED as per warm monitoring.

Cold monitoring is not possible for the low/high beam headlamps of vehicles using xenon bulbs. On these vehicles the cold monitoring of the low/high beam headlamps is switched off in the CJB. The CJB detects a failed xenon bulb via a reduction in current flow to the affected headlamp's xenon control module.

When a xenon bulb fails, the control module's current consumption falls to 60mA, which the CJB detects as unsuccessful bulb illumination.

Alarm Indications

The CJB can also display alarm visual indications for alarm arm, disarm and triggered conditions.

If the hazard warning lamps are active when a lock or unlock request is made, the hazard warning cycle is interrupted to allow the visual indication of the requested lock cycle. When visual indication is completed, the hazard warning operation will continue.

If the vehicle is involved in crash of a severity for the RCM to initiate deployment of the airbags, the control module outputs a hazard warning lamps on request on the medium speed CAN bus to the CJB. The hazard warning lamps will be activated and will continue until the RCM outputs a message to deactivate the hazard warning lamps.

Redundant Data Storage

The CJB stores data relating to the Vehicle Identification Number (VIN), total mileage and service interval indicator. This data is received by the CJB from the instrument cluster and used as a back-up in the event of instrument cluster replacement.

If the CJB is to be replaced, an approved Land Rover diagnostic system must be connected to the vehicle and the CJB replacement procedure followed to ensure that the stored data is transferred to the new unit.

Low Voltage Operation

If the battery voltage falls below 11.2V, the CJB operates the minimum lighting to preserve the remaining battery charge.

Crash Signal Activation

In the event of an accident of a severity to activate and deploy the airbags, the RCM requests various electrical operations to assist with the crash situation. The RCM requests via the bus systems to the CJB to activate the hazard warning lamps.

Security System Activation

In the event of the security system being triggered, the CJB requests activation of the hazard warning lamps.

Instrument Panel and Switch Illumination Dimming

The CJB controls the instrument cluster backlighting illumination and also illumination of all instrument panel switches.

The CJB supplies a power output to all switch illumination bulbs at a voltage determined by the position of the manual dimmer rheostat. The switch illumination is activated when the lighting control switch is in the side lamp or headlamp position.

LIGHTING CONTROL SWITCH

The lighting control switch is located in the driver's side of the instrument panel, below the outer fresh air vent. The switch contains a rotary switch for selecting the vehicle exterior lighting functions, a rheostat for instrument illumination dimmer, a front fog lamp switch and a rear fog lamp switch.

E121549

Item	Part Number	Description
1	-	Lighting rotary control switch
2	-	OFF position
3	-	Side lamps position
4	-	Headlamps position
5	-	Instrument illumination dimmer control
6	-	Headlamp leveling control (if fitted)
7	-	Rear fog lamp switch
8	-	Front fog lamp switch
9	-	Auto headlamps position

The rotary side and headlamp control switch has 2 connections to the CJB. These 2 connections supply a hardwired binary code to the CJB which correspond to the switch position selection made.

The front and rear fog lamp switches operate by completing earth paths for a reference voltage from the CJB when the switch is pressed. The fog lamp switches are momentary, non-latching switches which briefly complete an earth path which is sensed by the CJB.

Lighting Control Switch Illumination

The switch legends on the lighting control switch are illuminated at the same brightness as the instrument panel switches when the lighting control switch is moved from the 'O' (off) position to the side, headlamp or AUTO position.

Manual Headlamp Leveling Control (if fitted)

The manual headlamp leveling control is only available on vehicles with coil spring suspension and is used to lower the headlamps when an excessive load is placed on the rear of the vehicle, altering the vehicle attitude and raising the headlamp beam.

The control uses a rotary thumbwheel which is connected to a rheostat which gives a variable output to the leveling Direct Current (DC) motors. The motors respond to the output and move to adjust the headlamp position as required.

The control has three marked positions; 0 to 3. The rotary wheel moves in 6, half positions to give fine adjustment control over the headlamp position. The positions relate to vehicle loading or driving conditions as follows: Position 0 is the normal position for unladen driving. Positions 1 to 3 lower the headlamp beam to compensate for a drop in height of the rear of the vehicle.

- 0 = Driver only or driver and front seat passenger
- 0.5 = Driver, front seat passenger
- 1 = All seats occupied
- 1.5 = All seats occupied and maximum rear axle loading
- 2 = Driver only and maximum rear axle loading
- 3 = Can be used under certain driving conditions, i.e. off-road

Dimmer Control

The CJB provides a Pulse Width Modulation (PWM) output to control the illumination brightness of the instrument panel and other fascia illumination. The dimmer switch operates using a rotary thumbwheel which is connected to a rheostat.

The rheostat is a variable resistor which provides a high or low resistance according to its set position. The CJB provides an output to the rheostat measure the voltage passing through to ground. The CJB measures this voltage and uses it to calculate a PWM output of between 8 and 12V to determine the brightness of the illumination.

Automatic Headlamps

Refer to Automatic Headlamps in this section.

HEADLAMP ASSEMBLY

E121550

Item	Part Number	Description
1	-	Low beam headlamp
2	-	Turn signal indicator lamp
3	-	Side marker lamp (NAS only)
4	-	Side lamp (halogen headlamps), cornering lamp (Xenon headlamps) or cornering/static bending lamp (AFS headlamps)
5	-	Side lamp LED's (xenon headlamps only)
6	-	High beam halogen 'fill-in' headlamp
7	-	Locking plate
8	-	Low beam halogen bulb (halogen headlamps) or xenon bulb (xenon headlamps)
9	-	Vertical adjuster
10	-	Waterproof breather
11	-	High beam 'fill-in' lamp bulb
12	-	Xenon control module (not fitted to halogen headlamps)
13	-	Electrical connector
14	-	Horizontal adjuster
15	-	Side lamp or cornering/static bending lamp cover (hidden)
16	-	Turn signal indicator lamp access cover (hidden)

Three types of headlamp are available; Halogen, Xenon or Xenon with Adaptive Front lighting System (AFS). The headlamps share a common, clear lens.

The headlamps are located behind the front carrier assembly. Each headlamp is secured to the front carrier assembly with two locking plates. The locking plate slides in grooves in the rear of the headlamp and two holes in each plate locate on pins on the carrier. Each locking plate is pressed down to lock the pins in the locking plate holes. The locking plates allow removal of the headlamp from the carrier for bulb changing without the requirement for special tools.

The rear of the headlamp unit has removable access panels which allow access to the bulbs for replacement. A large rubber cover allows access to the low/high beam bulb on both halogen and xenon headlamps. Another removable rubber cover provides access to the high beam only halogen bulb which is retained by a push fit. A smaller cover can also be rotated anti-clockwise to provide access to the turn signal indicator lamp bulb. The indicator bulb is a PH24WY orange bulb and is clipped into the cover and is pulled to remove. Below this cover is a removable cover which provides access to the side lamp bulb on halogen headlamps or the cornering lamp/static bending lamp bulb on xenon headlamps and the side marker lamp bulb on NAS models. On xenon headlamps the side lamps are LED's and therefore are not serviceable components.

The headlamps have two adjustment screws on the rear which allow for the manual setting of the vertical and horizontal alignment. On NAS vehicles the headlamp is regarded as Visual Optically Left (VOL) aiming. The adjustment screws have to be turned equal amounts to maintain the correlation in the vertical axis only. There is no horizontal adjustment. Refer to the Service Repair Procedures manual for headlamp alignment data.

Each headlamp has an integral sixteen pin connector which provides inputs and outputs for the various functions of the headlamp assembly. The usage of the pins differs between model variants, refer to the Electrical Reference Library (ERL) for pin details.

The low beam headlamps are switched on when the ignition is in ignition mode 6 and:

- the lighting control switch is in the headlamp position
- the lighting control switch is in the AUTO position and a 'lights on' signal is received by the CJB from the rain/light sensor.

The low beam headlamps can also be operated by the headlamp delay feature.

The high beam headlamps are switched on when the ignition is in ignition mode 6 and:

- the low beam headlamps are selected on in the headlamp position or activated via the AUTO feature
- The left hand steering column multifunction switch is pushed forward away from the driver
- The auto high beam system (if fitted) has switched on the high beam headlamps.

The high beam headlamps will be switched off when:

- The left hand steering column multifunction switch is moved rearward towards the driver
- The low beam headlamps are switched off
- The ignition mode is changed to the accessory mode 4 or ignition off
- The auto high beam system (if fitted) has switched off the high beam headlamps.

Common Headlamp Features

Turn Signal Indicator Lamp

The turn signal indicator lamp is incorporated into the outer part of the headlamp assembly. The lamp is located above the side lamp on halogen headlamps and the static bending/cornering lamp on Xenon headlamps. The turn signal indicator lamp uses an PH24W orange colored bulb module. The module is fitted into a holder which is connected via contacts on the headlamp housing to the main connector in the headlamp housing. The module is a snap fit in the holder and needs to be pulled sharply to remove. The holder is fitted with a seal and is located into an aperture in the headlamp housing and rotated to lock into position. Access to the holder requires removal of the headlamp from the front carrier assembly and removal of the outer locking plate from the headlamp.

The turn signal indicator lamps are operated by the left hand steering column multifunction switch or by the hazard flasher switch. The steering column multifunction switch is only active with the ignition in ignition mode 6, the hazard flasher switch is active at all times. When active, the turn signal indicator lamps will flash at a frequency cycle of 400ms on and 400ms off.

If a bulb fails, the remaining turn signal indicator lamps bulbs continue to flash at normal speed. The turn signal indicators in the instrument cluster will flash at double speed to indicate the failure to the driver.

Side Lamp - Halogen Headlamps

The side lamp is incorporated into the outer part of the headlamp assembly and is located below the turn signal indicator lamp.

The side lamp uses a capless W5W wedge fitting bulb which locates into a holder which is connected via wires to the main connector on the headlamp housing. The holder is a push fit into a receptacle in the headlamp housing. The bulb is accessible via a removable cover at the rear of the headlamp housing. Access to the cover requires removal of the headlamp from the front carrier assembly and removal of the outer locking plate from the headlamp.

The side lamps are operated by selecting side lamps or headlamps on the lighting control switch. The side lamps are operational at all times and are not dependant on the ignition switch position. The side lamps will also be illuminated when the lighting control switch is in the AUTO position and a 'lights on' signal is received by the CJB from the rain/light sensor.

Side Lamp - Xenon Headlamps

The side lamps on all Xenon headlamps are LED's. The 10 LED's are arranged around the outer part of the halogen fill-in lamp and the xenon projector module.

The side lamps are operated by selecting side lamps or headlamps on the lighting control switch. The side lamps are operational at all times and are not dependant on the ignition switch position. The side lamps will also be illuminated when the lighting control switch is in the AUTO position and a 'lights on' signal is received by the CJB from the rain/light sensor.

Cornering Lamp - Xenon (non-AFS headlamps only)

- **NOTE:** The cornering lamps are not fitted to NAS market vehicles

The cornering lamps are an optional feature designed to illuminate the direction of travel when cornering at low speeds. The design of the lens projects a spread of light from the vehicle at approximately 45 degrees to the vehicle axis.

The cornering lamp is incorporated into the outer part of the headlamp assembly and shares the same housing and reflector as the side lamp.

The cornering lamp uses a 35W Halogen H8 bulb which locates in a holder which is connected on the headlamp housing. The holder is located in an aperture in the headlamp housing and rotated to lock. The bulb is accessible via a removable cover at the rear of the headlamp housing.

The cornering lamps are controlled by the left hand steering column multifunction switch with the lighting control switch in the headlamp position and the ignition in ignition power mode 6. The cornering lamps are supplied power via the ignition circuit to ensure that they do not function with the headlamp delay feature. The cornering lamps are deactivated if the vehicle speed exceeds 25 mph (40 km/h).

Only one cornering lamp will illuminate at any one time. If the left hand turn signal indicators are selected on, the left hand cornering lamp will be illuminated and visa versa, providing the vehicle speed and lighting control switch positions are correct. Cornering lamps are disabled when reverse gear is selected.

Cornering/Static Bending Lamps (Xenon AFS headlamps only)

- **NOTE:** The cornering/static bending lamps are not fitted to NAS market vehicles

The cornering/static bending lamps are a standard feature on AFS headlamps designed to illuminate the direction of travel when cornering at low speeds. The design of the lens projects a spread of light from the vehicle at approximately 45 degrees to the vehicle axis. The static bending lamps are powered by the CJB and controlled by the AFS control module. The cornering lamp functionality is controlled by the CJB as described for non-AFS headlamps.

The cornering lamp and static bending lamp is incorporated into the outer part of the headlamp assembly.

The cornering/static bending lamp uses a 35W Halogen H8 bulb which locates in a holder which is connected via wires to the main connector on the headlamp housing. The holder is located in an aperture in the headlamp housing and rotated to lock. The bulb is accessible via a removable cover at the rear of the headlamp housing.

AFS Control

On headlamps with AFS, the cornering lamp function is as described previously for the Xenon non-AFS headlamps.

The static bending lamps operate with a steering angle sensor signal which is received by the AFS control module. The AFS control module sends a static bending lamp on request to the CJB which activates the static bending lamp bulb.

The static bending lamp operation is variable with the speed of the vehicle and the steering wheel angle. The static bending lamps illuminate at 0 mph (0 km/h) when the steering wheel rotation reaches 20 degrees. At 43 mph (70 km/h) the static bending lamps will illuminate when the steering wheel angle reaches 10 degrees. The static bending lamps will be switched off when the vehicle speed exceeds 43 mph (70 km/h).

The operation of the static bending lamps is controlled by the AFS control module. When the operation parameters of the lamp are reached, the CJB fades the static bending lamp bulb on using a PWM voltage over a period of approximately 2 seconds. When the lamp is switched off, the CJB fades the bulb off by decreasing the PWM voltage.

Halogen Headlamps

The halogen headlamps use a projector module for the low beam headlamp and a complex surface reflector for the halogen high beam lamp. The low and high beam bulbs are quartz halogen H7, with a rating of 55W. The bulbs are retained in the headlamp unit with conventional wire retaining clips.

The projector module comprises a reflector, the lens and the halogen bulb. The projector module only operates as a low beam halogen headlamp.

The high beam lamp reflector is divided into separate parabolic segments, with each segment having a different focal length.

The halogen headlamp uses a side lamp bulb which is located in the position used by the cornering/static bending lamp on xenon headlamps. The lens pattern for the side lamp in this position differs from the lens pattern used for the cornering/static bending lamp.

The halogen headlamps do not require adhesive decals to be applied to the clear outer lens to mask the beam cut-off when driving in opposite drive hand markets. A tourist lever mechanism is located on the right hand side of the projector module. This mechanism moves to blank off a portion of the beam spread to enable the vehicle to be driven in opposite drive hand markets without applying blanking decals to the headlamp lens. The beam is changed by removing the access cover at the rear of the lamp assembly and moving a small lever located near the bulb holder, at the side of the projector module. Make sure that the headlamps are off before removing the access cover.

CAUTION: This lever can be very hot if the lamps have been operating. Allow sufficient time to cool before operating the lever.

Xenon Headlamps

Safety Precautions

⚠ WARNING: The Xenon system generates up to 28000 volts and contact with this voltage could lead to fatality. Make sure that the headlamps are switched off before working on the system.

The following safety precautions must be followed when working on the xenon headlamp system:

- **DO NOT** attempt any procedures on the xenon headlamps when the lights are switched on.
- Handling of the D3S Xenon bulb must be performed using suitable protective equipment, e.g. gloves and goggles. The glass part of the bulb must not be touched.
- Only operate the lamp in a mounted condition in the reflector.

The xenon headlamps use a complex surface reflector for the Halogen fill in high beam lamp only lighting unit, which is of the same design as the high beam unit used on the Halogen headlamps. This type of reflector has the reflector divided into separate parabolic segments, with each segment having a different focal length.

The high beam bulbs are quartz halogen H7, with a rating of 55W. The bulbs are retained in the headlamp unit with conventional wire retaining clips.

The Bi-Xenon™ (the Bi-Xenon™ trademark is the property of Hella KGaA Hueck & Co., Germany) projector module headlamp operates as both low beam and high beam headlamp unit. The Xenon lamp (or High Intensity Discharge (HID) lamp), comprises an ellipsoidal lens with a solenoid controlled shutter to change the beam output from low to high beam. The bulb is retained with a locking ring which must be rotated to facilitate removal of the D3S bulb.

• **NOTE:** If the lighting control switch is in the OFF position, the xenon lamps do not operate when the high beam 'flash' function is operated. If the lighting switch is in the headlamps position or AUTO position with the low beam lamps active, the xenon low beam will remain on when the high beam 'flash' function is operated.

The xenon headlamp system is controlled by the CJB using a control module for each headlamp and an igniter. The control modules and the igniters provide the regulated power supply required to illuminate the xenon bulbs through their start-up phases of operation.

Xenon/Halogen Headlamp Beam Comparison

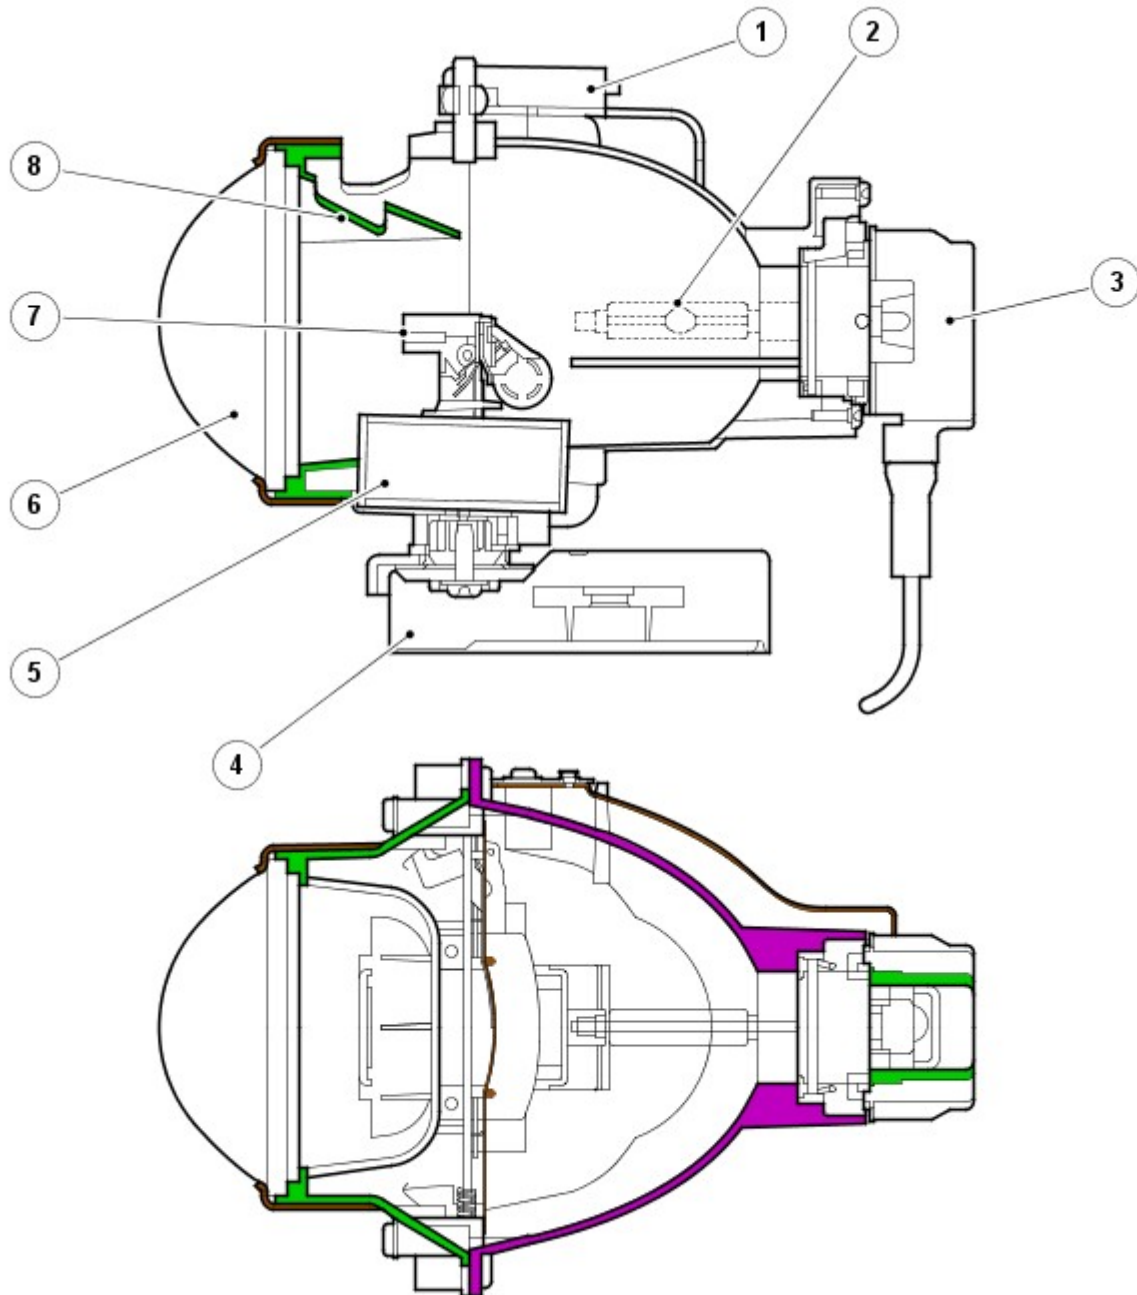

Item	Part Number	Description
A	-	Xenon
B	-	Halogen

The Xenon low/high beam headlamps use ellipsoidal technology for the lens and reflector providing improved night time visibility compared to conventional halogen headlamps. The Xenon headlamps provide the following benefits when compared to halogen headlamps:

- Longer bulb life - Approximately 3 to 5 times longer than a halogen bulb
- Increased light output - Xenon headlamps output 3 to 4 times more light on the road surface than halogen headlamps
- Blue/White light which is closer to natural daylight - Xenon lamps produce a blue/white light compared to a yellow light produced by a halogen bulb
- Improved night time driving visibility - Xenon lamps produce a wider and brighter beam in front of the vehicle than

- conventional halogen bulbs
- Lower running temperatures
- Lower power consumption
- Mercury free.

Xenon Headlamp Construction

E43261

Item	Part Number	Description
1	-	Bracket
2	-	D3S xenon bulb
3	-	D3S connector
4	-	Swivel actuator (AFS lamp only)
5	-	Solenoid
6	-	Aspheric lens
7	-	Shade
8	-	Shade
9	-	Lens support

The Xenon headlamp is a self contained unit located within the headlamp assembly. The unit comprises a reflector, an adaptor ring, the lens, a shutter controller and the Xenon 35W D3S bulb, which as an assembly is known as the projector module.

The reflector is curved and provides the mounting for the xenon bulb. The bulb locates in a keyway to ensure correct alignment in the reflector and is secured by rotating a locking ring on the projector module to lock. The bulb has a pin connector which is a push to lock fitting.

The shutter controller is a solenoid which operates the shutter via a lever mechanism. The shutter is used to change the beam projection from low beam to high beam and visa versa.

A tourist lever mechanism is located on the right hand side of the projector module. This mechanism moves to blank off a portion of the beam spread to enable the vehicle to be driven in opposite drive hand markets without applying blanking decals to the headlamp lens. The beam is changed by removing the access cover at the rear of the lamp assembly and moving a small lever located near the bulb holder, at the side of the projector module. Make sure that the headlamps are off before removing the access cover.

The Xenon bulbs illuminate when an arc of electrical current is established between two electrodes within the bulb. The xenon gas sealed in the bulb reacts to the electrical excitation and the heat generated by the current flow. The xenon gas reaction to the controlled current flow between the electrodes produces the blue/white light.

To operate at full efficiency, the xenon bulb goes through three stages of operation before full output for continuous operation is achieved. The three phases are; start-up phase, warm-up phase and continuous phase.

In the start-up phase, the bulb requires an initial high voltage starting pulse of 18000 to 28000 volts to establish the arc. This is produced by the igniters. The warm-up phase begins once the arc is established. The Xenon control modules regulate the supply to the bulbs to 2.6A which gives a lamp output of 75W. During this phase, the Xenon gas begins to illuminate brightly and the environment within the bulb stabilizes ensuring a continual current flow between the electrodes. When the warm-up phase is complete, the xenon control modules change to continuous phase. The supply voltage to the bulb is reduced and the operating power required for continual operation is reduced to 35W.

The Xenon system is controlled by the CJB, the two xenon control modules and the two igniters. The xenon control modules (one per headlamp) receive an operating voltage from the CJB when the headlamps are switched on. The modules regulate the power supply required through the phases of start-up.

The igniters (one per headlamp) generate the initial high voltage required to establish the arc. The igniters have integral coils which generate high voltage pulses required for start-up. Once the xenon bulbs are operating, the igniters provide a closed circuit for regulated power supply from the control modules.

ADAPTIVE FRONT LIGHTING SYSTEM (AFS)

The AFS is a system to improve driver visibility under differing driving conditions. AFS provides a larger visible area which is illuminated when cornering by adjusting the position of the beam distribution on the road. Horizontal adjustment is made automatically to the most suitable orientation for the driving conditions using steering angle and information from other vehicle sensors.

AFS is only available with adaptive Bi-Xenon™ headlamps. The 'Xenon' module within the headlamp is controlled by actuator motors which rotate the projector module on its horizontal axis to adjust the beam output to suit the cornering conditions and vehicle inclination. Only the adaptive bi-xenon™ lamp projector module swivels, the non adaptive xenon and halogen high beam lamp units remains static.

The AFS system is controlled by an AFS control module which is located at the bottom of the passenger side 'A' pillar. The control module controls the horizontal alignment of the adaptive Bi-Xenon™ projector module. The operation of the static bending lamp is controlled by the AFS control module, but powered by the CJB.

AFS Concept

E43466

Item	Part Number	Description
A	-	Conventional headlamp beam distribution
B	-	AFS swivel headlamp beam distribution

AFS Control Module

The AFS control module is connected to the high speed CAN bus and receives inputs from other vehicle systems on the status of the following parameters:

- Steering angle - from steering angle sensor
- Vehicle speed - from ABS module
- Low beam status - from instrument cluster
- Suspension height - from air suspension control module
- Odometer value - for diagnostics only

- Engine running - from ECM
- Gear position - From transmission control module or transfer box control module
- Engine crank - from ECM
- Exterior/interior temperature - for diagnostics only.

The AFS will only operate when the AFS control module receives an engine running signal on the CAN bus. When the engine running signal is received, the AFS control module performs an initialization routine which is only performed at engine crank (power mode 9).

The AFS will also function when the lighting control switch is in the AUTO position and the AFS control module receives a lights on signal from the rain/light sensor and an engine running signal.

The AFS control module then monitors the inputs from the other vehicle systems to control the AFS functionality according to cornering angles and vehicle speed.

The AFS control module is connected to each headlamp on a private Local Interconnect Network (LIN) bus. The AFS control module then drives the DC motor actuators inside the headlamp assembly.

The AFS control module controls the swiveling angle of each projector module using speed and steering angle signals. The angles of each projector module differ to give the correct spread of light, For example, when turning left, the Left Hand (LH) projector module will have a greater swiveling angle than the Right Hand (RH) projector module

Reverse mode disables the swivel function when reverse gear is selected. The AFS projector modules move to their central straight ahead position and the static bending lamp, if active, will go off. When reverse gear is deselected, the AFS projector modules will move to a position to match the steering angle and the static bending lamp will illuminate if the operating conditions are correct (for example vehicle speed above 1.86 mph (3 km/h)).

Xenon Headlamp Assembly with AFS Construction

The AFS xenon headlamp construction is similar to the non-AFS xenon headlamp assembly. The AFS assembly contains an additional carrier frame which provides the location for the AFS components. The remaining lamps are as described previously for the Xenon headlamp assembly. The functionality of the static bending lamp on the AFS headlamp is different from the functionality of the cornering lamp on the xenon headlamp.

The carrier frame has a radial bearing at the top and a thrust washer at the bottom which provide the horizontal pivot points for the xenon projector module. The lamp module lower pivot has a splined end which locates in the mating splines of the AFS horizontal actuator motor. The carrier frame is suspended on two flexible mountings at the top which provide for the vertical pivot points for the xenon projector module which allow for the vertical adjustment of the projector module. The bottom of the carrier frame is attached to the AFS vertical actuator motor.

The AFS actuator motors are dc motors which are driven by a power output from the CJB in response to signals from the AFS control module.

The actuators contain a potentiometer which is connected via wires with gold plated connector pins to the AFS control module. The two wires to each actuator provide a feedback signal to the AFS control module to give the precise position of the xenon projector module.

The AFS control module receives vehicle speed signals from the ABS module to adjust the projector module vertically to increase the beam range as the vehicle speed increases.

Initialization

When the AFS control module receives an engine running signal, the control module performs the initialisation procedure which ensures that the headlamps are correctly aligned on their horizontal axis.

The AFS swivel initialization is completed in less than 1 second. The LH and RH AFS motors flick the headlamps to calibrate the centre position of the headlamps.

Failure Mode

In the event of a failure of the AFS system, a warning indicator in the instrument cluster is illuminated to warn the driver. The AFS warning indicator illuminates when the ignition is in accessory power mode 4 or ignition power mode 6 and will flash continuously until the fault is rectified. The AFS warning indicator will also be illuminated if a failure of the steering angle sensor or the vehicle speed signal is detected.

Illumination of the AFS warning indicator does not necessarily mean that there is a fault with the AFS system. The fault may be caused by a failure of another system preventing the AFS system operating correctly.

The AFS control module performs a diagnostic routine every time AFS is requested. If any fault is found, the AFS control module will suspend the operation of the AFS function.

If the AFS system has failed with the xenon projector module in a position other than the correct straight ahead position, the AFS control module will attempt to drive the xenon projector module to the zero (straight ahead) position. If this is not possible, the AFS control module will lower the projector module using the leveling actuator motors to prevent excess glare to oncoming vehicles.

The AFS control module software can detect an internal failure of the control module control circuits. The control module will power the projector modules to the zero position and prevent further operation.

Faults can be investigated by interrogating the AFS control module using an approved Land Rover diagnostic system to check for fault codes.

AUTOMATIC HEADLAMP OPERATION

The automatic headlamp function is a driver assistance system. The driver can override the system operation by selection of side lamp or headlamp on if the ambient light conditions require front and rear lighting to be active. The automatic

headlamp system uses a light sensor and the CJB, which are connected via the LIN bus to control the headlamp functionality.

A light sensor is incorporated in the rain/light sensor located on the inside of the windshield, below the rear view mirror. The wiper system also uses the rain/light sensor for automatic wiper operation.

For additional information, refer to: [Wipers and Washers](#) (501-16 Wipers and Washers, Description and Operation). The light sensor measures the ambient light around the vehicle in a vertical direction and also the angular light level from the front of the vehicle. The rain/light sensor uses vehicle speed signals, wiper switch position and the park position of the front wipers to control the system.

The automatic headlamp operation uses ambient light levels which are monitored by photodiode incorporated in the rain/light sensor. The rain/light sensor sends a lights on/off request to the CJB on the LIN bus, which responds by switching on the low beam headlamps, front side lamps and rear tail lamps.

The automatic headlamps are activated under the following conditions:

- Twilight
- Darkness
- Rain
- Snow
- Tunnels
- Underground or multistoried car parks.

Operation of the automatic headlamps requires the ignition to be in ignition mode 6, the lighting control switch to be in the 'AUTO' position and a lights on request signal from the light sensor.

HEADLAMP LEVELING

Headlamp leveling provides for the adjustment of the vertical aim of the headlamps. The leveling system is primarily required to minimise glare to other road users when a heavy load is in the rear of the vehicle.

Two systems of headlamp leveling are available; manual and static.

Manual Headlamp Leveling

Manual headlamp leveling is only available on vehicles with halogen headlamps and coil spring suspension.

The manual system comprises the following components:

- Two headlamp leveling motors
- Headlamp leveling rheostat rotary control.

When the ignition is in ignition mode 6, power is supplied to the lighting control switch via the ignition relay in the battery junction box and to the headlamp leveling motor in each headlamp assembly via the CJB. When the lighting control rotary switch is moved to the side lamp or headlamp position, the supply from the ignition relay is passed to the leveling rotary control.

Movement of the leveling rotary control produces a variable voltage output, which is sensed by the motors. The motors react to the supplied voltage and move the headlamp to the requested position which relates to the supplied voltage from the leveling rotary control.

The headlamps can only be lowered from their unladen position to compensate for changes in vehicle attitude due to loading.

Vehicle Headlamp Leveling

Vehicle headlamp leveling is only available on vehicles with air suspension.

Vehicle headlamp leveling is performed by the air suspension system and the air suspension control module. The suspension system constantly monitors the vehicle attitude and adjusts the height of the front and/or rear of the vehicle accordingly. This maintains the correct vehicle attitude and consequently maintains the correct headlamp beam alignment.

The vehicle leveling system is fully automatic, therefore the lighting control switch does not have the manual leveling rotary control.

HIGH BEAM ASSIST

E117701

Item	Part Number	Description
1	-	Rear view mirror calibration bracket
2	-	Ambient light sensor (High beam assist)
3	-	Rain/light sensor (Auto headlamps)
4	-	Image sensor
5	-	High beam assist control module (inside mirror body)

High beam assist is a driving aid which automatically controls the high beam function. If required, the system can be overridden by the driver.

⚠ CAUTION: The high beam assist system is designed as a driving aid only. Should the road conditions require, it is the driver's responsibility to consider other road users and operate the high beam headlamps in a safe manner. In certain circumstances the driver will be required to intervene.

High Beam Assist Warning Indicator

E117699

Item	Part Number	Description
1	-	Warning indicator (green)

The high beam assist system is controlled by a high beam assist control module which is located in the interior rear view mirror body and by the CJB. The module and the CJB are connected via the medium speed CAN bus.

The high beam assist control module receives a power supply from the CJB when the ignition is in power mode 6 (ignition on). The rear view mirror also includes a low resolution camera (image) sensor which detects headlamps and tail lamps of preceding vehicles. The sensor is connected to the control module which evaluates the image data, checking for light intensity and location.

If conditions are correct, the control module will activate the high beam assist by sending a high or low beam request message to the CJB via the medium speed CAN bus. The CJB then controls the shutter in the Xenon projector module

together with the high beam fill-in lamp.

High Beam Assist Operation

The high beam assist operates as part of the automatic headlight system. When driving at night with the lighting control switch in the automatic position and the LH steering column multifunction switch in the central position, with sufficient darkness (approximately 1 lux or less) and a suitable road speed, the high beam assist will automatically operate the high beam lighting when necessary. A warning symbol in the instrument cluster confirms to the driver when the high beam assist system is selected and enabled.

• **NOTE:** The function of the normal 'blue' high beam indicator remains unchanged and it always reflects the actual status of the high beam lamps

• **NOTE:** The exterior lighting 'on' threshold for the auto headlamps system is approximately 100 lux which is measured by the rain/light sensor. At light levels below this value the low beam headlamps and exterior lights will be switched on. The high beam assist will not function until the light level has reached approximately 1 lux. At light levels above 1 lux high beam is not required and therefore is not activated.

Activation (system ready)

High beam assist will only activate and illuminate the warning indicator to show system is ready or 'primed' for high beam control, when the following conditions are met:

- High beam assist has been first 'enabled' via the instrument cluster menu
- Lighting control switch is in the 'Auto' position
- LH steering column multifunction switch in the central position
- The ambient light level is below 100 lux – refer to 'Light Levels' section that follows
- The system has not been overridden or cancelled – refer to 'Override' section that follows
- The camera (image) sensor view is not blocked.

High Beam Control

When activated, high beam assist will switch the headlamps to high beam when all the following conditions occur:

- No relevant oncoming traffic
- No relevant preceding traffic
- In non-urban environment, i.e. with no street lighting
- Ambient light level is below 1 lux – refer to 'Light Levels' section that follows
- Road speed is suitable – refer to 'Road Speed' section that follows.

Low Beam Control

When activated, high beam assist will switch the headlamps to low beam when any of the following conditions occur:

- Relevant Oncoming traffic is present
- Relevant Preceding traffic is present
- In urban environment, i.e. with street lighting
- Ambient light level is above 1 lux – refer to 'Light Levels' section that follows
- Road speed is not suitable – refer to 'Road Speed' section that follows
- Unrecognisable reflective inputs from road signs or markings – refer to 'System Limitations' section that follows.

Light Levels

The exterior lighting 'on' threshold for the normal 'auto headlamps' feature is approximately 100 lux and is measured by the windscreen mounted 'rain/light' sensor. When the light level falls to this value the low beam headlamps and exterior lights will be switched on together with the high beam assist warning indicator.

This warns the driver that the system is activated and ready to automatically switch on the high beam headlamps when the light level falls a little further to approximately 1 lux, as measured by the 'ambient light sensor' located in the mirror body. High beam is generally not required with light levels above 1 lux.

Road Speed

A road speed signal is received by the CJB from the Anti-lock Braking System (ABS) module via the high speed CAN bus. When the other activation conditions are correct, the CJB will switch the headlamps to high beam when the road speed has increased above 40 km/h (25 mph).

When the road speed falls to below 24 km/h (15mph), the CJB will switch the headlamps to low beam. The 10 mph (15 km/h) difference between the on and off road speed thresholds prevents the system continually switching between high and low beam at low speeds.

Override

The driver can manually override the high beam assist system at any time. When the high beam assist system is activated, pulling the LH steering column multifunction switch to the high beam 'flash' position or pushing it forward to the high beam position will de-activate the system and the high beam assist warning indicator in the instrument cluster will extinguish.

When the multifunction switch is returned to the central position, from a forward high beam position, the system is re-activated and the high beam assist warning indicator will illuminate again.

Correct Performance

In addition, high beam assist will only exhibit best performance if all of the following conditions are met:

- No false inputs are received by the camera (image) sensor, such as reflected light from certain static signs – refer to 'System Limitations' section that follows

- Headlamps are correctly aligned
- High beam assist system has been set for correct 'hand of traffic' via the driver menu settings – refer to 'Setting Hand of Traffic' section that follows
- Headlamps have been set for correct 'hand of traffic' via the mechanical tourist lever in headlamp casing – refer to 'Setting Hand of Traffic' section that follows
- Camera (image) sensor has been through a self learning 'auto aim' calibration procedure if any components have been replaced – refer to 'Calibration' section that follows
- There are no large reflective items, white papers, etc., sitting on top of the dash board in near view of the camera (image) sensor, or stickers placed directly in front of the camera (image) sensor

Driver Menu Features

The high beam assist feature must first be enabled using the configuration menu available in the instrument cluster. However if required, the high beam assist system can be permanently disabled leaving the basic 'Auto Lamps' system still operative.

Within this menu the system can also be configured for driving on the alternate side of the road (Hand of Traffic). This enables the system to be used in different regions and it's setting is important for correct operation.

Setting 'Hand of Traffic' and High Beam Assist 'Enable'

To set the high beam assist options the following steps must be sequenced:

- With the ignition in power mode 6 (ignition on), and the engine not running, use the controls on the steering wheel to select on the instrument cluster menu:
 - Menu > Vehicle Set-up > High Beam Assist
 - Configure the 'Hand of Traffic' setting by selecting the appropriate 'Drive on Left' (of road) or 'Drive on Right' (of road) to the applicable Market condition
 - Enable the feature by setting 'Activate Assist' if not already selected.
- NOTE: Enabling or disabling high beam assist will not affect the 'Hand of Traffic' settings once set.
- NOTE: The headlamps still require manual adjustment using the tourist lever for driving abroad in countries where the alternate side of the road is used.

The instrument cluster menu also includes a 'High Beam Assist Sensitivity' selection. This is a requirement option for NAS market vehicles only but it is not recommended for normal use and has been superseded.

- NOTE: In other markets the 'Sensitivity' selection is greyed out and cannot be selected.

For additional information, refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).

System Limitations

The high beam assist system can occasionally have difficulty distinguishing between light from other vehicles or reflected light from static highly reflective road signs.

These situations may cause the high beam assist system to undesirably operate the high beam headlamps or take no action at all. Examples of these situations are as follows:

- Dips, hollows or crests in the road
- Highly reflective static Road signs
- Tight bends
- Poorly illuminated vehicles e.g. cyclists or small mopeds
- Motorway central barriers
- Extreme weather conditions e.g. Fog, heavy snow
- Exterior domestic or industrial lighting

Reflective Static Signs

E117702

Item	Part Number	Description
1	-	Red reflective signs could be detected as rear tail lamps
2	-	Large reflective signs could affect the system

Manual Deactivation

E117703

Item	Part Number	Description
1	-	Vehicle equipped with high beam assist
2	-	Oncoming vehicle headlamps can be seen by the driver before the high beam assist image sensor detects the oncoming light input

There are situations when a driver is able to judge if a high beam deactivation is desirable before the high beam assist system actually operates, for example over a crest of a hill. Headlamps from an oncoming vehicle can sometimes be seen on the horizon prior to the detection sensor receiving an input. It is the driver's preference to determine if early intervention is desired in this and similar situations.

System Diagnosis

- NOTE: Windshield stickers, stone chips, dirt and general road film will affect the successful operation of the image sensor if sufficient blocking is present. Avoid placing reflective objects on the instrument panel, for example white paper which can affect the image sensor.

High beam assist has a self diagnosis capability by comparing data from the ambient light sensor input (located in the rear view mirror) to light levels detected by the image sensor. If a deviation is detected it is assumed that the ambient light available to the image sensor is being restricted by dirt or other blockage and the system will be deactivated. Diagnostic Trouble Code (DTC)'s are stored in the control module's memory and can be accessed using an approved Land Rover diagnostic system. Within the diagnostic system is a procedure to test the basic operation of the camera function.

In the event of a fault, the warning strategy to the driver is as follows:

- Image sensor internal fault - green icon will extinguish with no additional message to driver
- CJB has lost all communication with image sensor - green icon will extinguish with no additional message to driver
- Image sensor blocked - green icon will extinguish with an additional "High Beam Assist Sensor Blocked" message within the message centre

System Calibration

To achieve effective operation of the high beam assist system, a calibration routine is performed on vehicle build and system tolerances are set to an accuracy of +/- 0.2 degrees.

This initial calibration is a 'one time only' procedure. Should the high beam assist components or the windshield require replacement at the dealership, an automatic calibration routine will be performed. This 'auto aim' calibration procedure is a continual process that takes place during a normal drive cycle at night and could take between 10 - 30 minutes dependant on the following driving conditions:

- If sufficient road markings (lane markings) are visible to the image sensor - approximately 10 minutes
 - If insufficient road markings are visible, the system uses the tail lights of preceding vehicles - approximately 30 minutes.
- NOTE: Until this calibration is complete the system may not react correctly during operation. This should be made clear to the customer before vehicle handover. During any calibration or rectification work the headlamps should be checked for correct alignment.
- NOTE: Due to mechanical calibration tolerance the correct mirror assembly must be used for the vehicle model types in question and it is not exchangeable with other vehicle model types.
- NOTE: After any rectification work and before any calibration drives, the headlamps should be checked for correct alignment.

DAYTIME RUNNING LAMPS (DRL)

For additional information, refer to: [Daytime Running Lamps \(DRL\)](#) (417-04 Daytime Running Lamps (DRL), Description and Operation).

FRONT FOG LAMP (If Fitted)

E120184

Item	Part Number	Description
1	-	Vertical adjustment wheel
2	-	Electrical connector

Front fog lamps are an optional fitment on low specification vehicles and a standard fitment on high specification vehicles.

Two front fog lamps are located in apertures in the front bumper. The front fog lamps are located in the front bumper. Each lamp is secured to three lugs in the bumper and retained with self tapping screws and fasteners. Each lamp has an adjustment wheel which provide for the vertical alignment of the beam. Access to the adjustment wheel requires removal of the lamp bezel.

The fog lamp uses a 55W halogen H11 bulb which is located in a holder. The holder is located in a hole in the rear of the fog lamp housing and is turned to lock in position.

The front fog lamps are controlled by the lighting control switch. When the ignition is in ignition mode 6 and the lighting control switch is in the side lamp or headlamp position, the lighting control fog lamp switch can be pushed to activate the front fog lamps.

If the switch is pushed a second time the front fog lamps are switched off. A front fog lamp warning indicator is illuminated in the instrument cluster when the front fog lamps are active.

If the fog lamps are active when the lighting control switch is moved to the off position or the ignition is switched off, the fog lamps are de-activated and will need to be reselected on (if required) when the side lamps or headlamps are next selected on.

Front Fog Lamps Functionality (NAS and Canadian Markets Only)

The front fog lamps are powered by an additional relay (relay 5) which is located in the EJB in the engine compartment.

The front fog lamps operate as described previously but with the following differences which cover local laws governing lamp usage.

If the low beam headlamps and the front fog lamps are on at the same time, when the high beam headlamps are switched on, the front fog lamps will be automatically switched off. When the high beam headlamps are switched off, the front fog lamps will be switched back on automatically.

- NOTE: The front fog lamps will also be switched off if the headlamp high beam flash function is operated.

REAR LAMP ASSEMBLY

E121551

Item	Part Number	Description
1	-	Turn signal indicator lamp LED's
2	-	Stop lamp LED's
3	-	Side lamp LED's
4	-	Side marker lamp (NAS only)
5	-	Reverse lamp
6	-	Fog lamp
7	-	Side marker lamp bulb holder (NAS only)
8	-	Location studs
9	-	Attachment hole
10	-	Attachment hole
11	-	Electrical connector
12	-	Reverse lamp bulb holder
13	-	Fog lamp bulb holder

The rear lamp assembly is a one piece unit which contains a stop lamp, a rear side lamp, a turn signal indicator lamp, a second rear side lamp, a reversing lamp and a fog lamp. Light Emitting Diode (LED)'s are used for the tail lamp, stop lamp and turn signal indicator lamp. Reversing lamp and fog lamp use bayonet fitting bulbs. These are located in holders which fit into the applicable hole in the lamp housing and are locked by rotating. Each bulb holder is connected by wires to a connector on the rear of the lamp housing.

The rear lamp assembly is located in a recess in the vehicle body. Two studs on the outer edge of the lamp housing locate in the vehicle body. The lamp is secured with two screws which are located on the inner edge of the lamp housing, near the tailgate aperture.

Rear Stop Lamp

The upper lamp is the inner section of the upper of the two main lamps and uses 12 LED's.

The stop lamp is activated when the ignition is in ignition mode 6 and the brake pedal switch is active (by depressing the brake pedal). The high mounted stop lamp will also be activated when the brake pedal is pressed.

The stop lamps can also be activated by the ABS when Hill Descent Control (HDC) is active. A signal from the ABS module energises a relay which supplies power to the stop lamps and high mounted stop lamp. For additional information, refer to: [Anti-Lock Control - Traction Control](#) (206-09A Anti-Lock Control - Traction Control, Description and Operation).

Turn Signal Indicator Lamp

The turn signal indicator lamp is the inner section of the lower of the two main lamps and uses 12 LED's.

The turn signal indicator lamps are operated by the LH steering column multifunction switch or by the hazard flasher switch. The steering column multifunction switch is only active with the ignition switch is in ignition mode 6, the hazard flasher switch is active at all times. When active, the turn signal indicator lamps will flash at a frequency cycle of 400ms on and 400ms off.

Side Lamp

The side lamp is the outer ring of both upper lamps and use 12 LED's in each lamp.

The lamps are operated by selecting side lamps or headlamps on the lighting control switch. The lamps are operational at all times and are not dependant on the Ignition switch position. The lamps will also be illuminated when the lighting control switch is in the AUTO position and a 'lights on' signal is received by the CJB from the rain/light sensor.

On NAS market vehicles a side marker lamp is incorporated into the side of the lamp assembly and uses a 5W capless wedge bulb.

Reversing Lamp

The reversing lamp is located below the tail lamp and uses a 21W bayonet fitting bulb.

The reverse lamp is active when the ignition is in ignition mode 6 and the CJB receives a reverse selected signal on the CAN bus. Both manual and automatic transmissions have a reverse switch which senses when reverse is selected.

Rear Fog Lamp

The rear fog lamp is located at the bottom of the rear lamp and uses a 21W bayonet fitting bulb.

The rear fog lamp is controlled by a non-latching switch on the lighting control switch. When the ignition is in ignition mode 6 and the lighting control switch is in the side lamp or headlamp position, the rear fog lamp switch can be pressed to activate the rear fog lamps. A second press of the switch will de-activate the rear fog lamps. A rear fog lamp warning indicator is illuminated in the instrument cluster when the rear fog lamps are active.

If the rear fog lamps are active when the lighting control switch is moved to the off position or the ignition is switched off, the fog lamps are de-activated and will need to be reselected on (if required) when the side lamps or headlamps are next selected on.

SIDE REPEATER LAMP

E43272

Item	Part Number	Description
1	-	Side repeater
2	-	Bulb holder
3	-	Clip

The side repeater turn signal indicator lamps are located in the driver and passenger doors, below each door mirror. The lamps are clipped into an aperture in the door panel and can be removed by sliding rearwards and releasing the front edge of the lamp from the door. The side repeater lamps use a W5W capless bulb which is located in a holder.

The side repeater lamps have the same functionality as the front and rear turn signal indicator lamps and are operated by the LH steering column multifunction switch or by the hazard flasher switch. The steering column multifunction switch is only active with the ignition is in ignition mode 6, the hazard flasher switch is active at all times. When active, the side repeater lamps will flash at a frequency cycle of 400ms on and 400ms off. If a lamp bulb fails, the remaining turn signal indicator lamps continue to flash at the normal rate.

LEFT HAND STEERING COLUMN MULTIFUNCTION SWITCH

E43273

Item	Part Number	Description
1	-	RH turn signal lamp
2	-	Headlamp flash
3	-	LH turn signal lamp
4	-	Headlamp high beam

The steering column multifunction switch is located on the left hand side of the steering column and controls the following functions:

- Headlamp low/high beam
- Auto high beam function
- Headlamp high beam flash
- Left/right turn signal indicator lamps
- Trip computer functions.

For additional information, refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

The high beam on and flash functions are connected on separate wires to the CJB. When the switch is operated in either position an earth path is completed which is sensed by the CJB which activates the selected function.

The turn signal indicator lamps are connected and operate in a similar way with the earth path completed through a separate wire which is sensed by the CJB which activates the applicable turn signal indicator lamps. The turn signal indicators have a 'lane change' feature which operates the turn signal indicators 3 times when the LH steering column switch is operated against spring pressure and released. This feature is controlled by the CJB.

HAZARD FLASHERS

The hazard flashers are controlled by a non-latching switch in the centre of the instrument panel. The hazard flashers operate at all times when selected and are not dependant on ignition mode.

When the hazard flashers are selected on, all of the front, rear and side turn signal indicator lamps operate as previously described and both left and right turn signal warning indicator in the instrument cluster also flash. The hazard warning flashers flash at a rate of 380ms on and 380ms off. When the hazard flashers are active, they override any request for turn signal indicator lamp operation.

If a trailer is fitted, the trailer turn signal indicator lamps will flash at the same frequency as the vehicle indicators. The trailer warning indicator in the instrument cluster will also flash. If a trailer bulb is defective, the trailer warning indicator will not flash.

The hazard flashers can also be activated by a crash signal from the Restraints Control Module (RCM). This is received by the CJB which activates the hazard flashers. The hazard flashers can be cancelled by changing the ignition mode to accessory mode 4 or off or the crash mode is cancelled by the RCM.

For additional information, refer to: [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) (501-20B Supplemental Restraint System, Description and Operation).

LICENSE PLATE LAMPS

E43274

Two license plate lamps are fitted in the tailgate handle, above the license plate in the upper tailgate. Each lamp uses a 5W capless wedge type bulb. The lamps are secured in the upper tail gate handle with integral clips. The lamps can be released from the handle using a small, flat blade screwdriver.

The license plate lamps are active at all times when the side lamps or headlamps are switched on.

HIGH MOUNTED STOP LAMP

E43275

Item	Part Number	Description
1	-	High mounted stop lamp
2	-	Housing

The high mounted stop lamp is located in the upper tailgate. The stop lamp housing also provides location for the tail door window washer jet.

The lamp comprises a plastic housing with a red coloured lens. The lamp is illuminated by a number of LED's.

The high mounted stop lamp is activated, along with the stop lamps, when the ignition is in ignition mode 6 and the brake pedal switch is active (by depressing the brake pedal).

The high mounted stop lamp and the stop lamps can also be activated by the ABS when Hill Descent Control (HDC) is active. A signal from the ABS module energises a relay which supplies power to the stop lamps.

For additional information, refer to: [Anti-Lock Control - Traction Control](#) (206-09A Anti-Lock Control - Traction Control, Description and Operation).

TRAILER LIGHTING

Several different types of trailer socket can be fitted to the vehicle depending on market specifications. Refer to the Electrical Reference Library for specific socket details.

The CJB monitors the turn signal lamps and can detect if more than two lamps are fitted (the side repeater turn signal indicator lamps are not monitored). When a trailer is detected, the trailer warning indicator in the instrument cluster will flash in synchronisation with the turn signal indicators.

If one or more of the turn signal indicator lamps on the vehicle or the trailer are defective, the trailer warning indicator will not flash to alert the driver to the bulb failure.

DIAGNOSTICS

The diagnostic socket is located in the lower instrument panel closing panel, on the driver's side, below the steering column. Various lighting system functions are monitored by different systems which can store fault information. This can be retrieved using an approved Land Rover diagnostic system or other suitable scan tool.

AFS Control Module Fault Monitoring

The AFS control module has the capability to monitor faults within the AFS. The control module can store Diagnostic Trouble Codes (DTC's) relating to the symptoms shown in the following table.

DTC Symptom Description	Customer Symptom	Possible Cause
LH or RH AFS actuator - Communication failure	Swivelling does not function	Open circuit or short circuit to earth
LH or RH AFS Actuator failure	Swivelling does not function	Open circuit or short circuit to earth
LH or RH Leveling Motor Failure	Leveling does not function	Open circuit or short circuit to earth or 12V
CAN bus failure	Swivelling and leveling do not function. Other vehicle system functions perhaps also inoperative	Open circuit or short circuit to earth or 12V

Central Junction Box (CJB)

The CJB monitors the status of the lighting circuits, relays and switches. If a fault occurs, the CJB stores a fault code applicable to the specific fault which can be retrieved using an approved Land Rover diagnostic system or other suitable scan tool.

CONTROL DIAGRAM

- NOTE: **A** = Hardwired; **D** = High Speed CAN Bus; **N** = Medium speed CAN bus; **O** = LIN Bus

Item	Part Number	Description
1	-	Battery
2	-	LH side repeater turn signal indicator
3	-	RH side repeater turn signal indicator
4	-	LH Door module
5	-	RH Door module
6	-	License plate lamps (2 off)
7	-	High mounted stop lamp
8	-	LH rear lamp assembly
9	-	RH rear lamp assembly
10	-	LH headlamp assembly
11	-	RH headlamp assembly
12	-	Central Junction Box (CJB)
13	-	AFS control module
14	-	Transfer box control module
15	-	Transmission reverse switch (manual transmission only)
16	-	Transmission Control Module (TCM) (Automatic transmission only)
17	-	Instrument cluster
18	-	Engine Control Module (ECM)
19	-	Stop lamp switch
20	-	Auto high beam image sensor and control module
21	-	Rain/light sensor
22	-	Lighting control switch
23	-	LH steering column multifunction switch
24	-	Hazard warning indicators switch

25	-	Engine Junction Box (EJB)
26	-	Auto high beam relay

AUTO HIGH BEAM CONTROL DIAGRAM

• NOTE: **A** = Hardwired; **D** = High Speed CAN; **N** = Medium Speed CAN; **O** = LIN Bus

E121553

Item	Part Number	Description
1	-	Lighting control switch
2	-	LH steering column multifunction switch
3	-	Anti-lock Brake System (ABS) module
4	-	Wheel speed sensor
5	-	Rain/light sensor (Ref)
6	-	Auto high beam control module and image sensor
7	-	Instrument cluster
8	-	High beam warning indicator
9	-	Auto high beam warning indicator
10	-	LH headlamp assembly
11	-	RH headlamp assembly
12	-	Central Junction Box (CJB)
13	-	Battery
14	-	Engine Junction Box (EJB)
15	-	Auto high beam relay

Exterior Lighting - Headlamps

Diagnosis and Testing

Principle of Operation

For a detailed description of the exterior lighting system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Exterior Lighting](#) (417-01 Exterior Lighting, Description and Operation).

Safety Information

WARNING: The xenon headlamp system generates up to 28,000 volts. Make sure that the headlamps are switched off before working on the system. Failure to follow this instruction may result in personal injury.

The following safety precautions must be followed when working on the xenon headlamp system:

1. **1.** DO NOT attempt any procedures on the xenon headlamps when the lights are switched on.
2. **2.** Handling of the xenon bulb must be performed using suitable protective equipment, e.g. gloves and goggles. The glass part of the bulb must not be touched.
3. **3.** Xenon bulbs must be disposed of as hazardous waste.
4. **4.** Only operate the lamp in a mounted condition in the reflector.

There are comprehensive instructions on the correct procedures for xenon headlamp system repairs in the workshop manual, refer to section 100-00 - General Information, Standard Workshop Procedures.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Headlamp(s) condition and installation ● Bulb(s) and installation ● Bulb holder(s) and installation ● Lighting control switch and installation ● Left-hand steering column multifunction switch and installation 	<ul style="list-style-type: none"> ● Fuses ● Relays ● Wiring harness ● Loose or corroded connector(s) ● Battery Junction Box (BJB) ● Central Junction Box (CJB) ● Adaptive Front Lighting System (AFS) module ● Headlamp power modules ● Instrument Cluster (IPC) ● Steering Angle Sensor Module (SASM) ● Transmission Control Module (TCM) ● Engine Control Module (ECM) ● Anti-lock Brake System (ABS) control module ● Air Suspension Control module ● Local Interconnect Network (LIN) circuits ● Controller Area Network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Low beam lamp(s) inoperative	<ul style="list-style-type: none"> ● Bulb failure ● Fuse(s) blown ● Circuit fault ● Lighting control switch fault 	Check the bulb and fuse condition. Check the headlamp circuits. Check the lighting control switch function. Check the left-hand steering column multifunction switch operation. Refer to the electrical guides. Check for DTCs indicating a headlamp or related circuit fault.
High beam lamp(s) inoperative	<ul style="list-style-type: none"> ● Left-hand steering column multifunction switch fault 	

Symptom	Possible Causes	Action
Low beam lamp(s) dim	<ul style="list-style-type: none"> ● Incorrect bulb rating ● Tourist lever set in the wrong position ● Circuit fault ● Lighting control switch fault ● Left-hand steering column multifunction switch fault 	Check the bulb condition and rating. Check the tourist lever is set correctly. Check the headlamp circuits. Check the lighting control switch function. Check the left-hand steering column multifunction switch function. Refer to the electrical guides.
High beam lamp(s) dim		
Low beam lamp(s) stuck on	<ul style="list-style-type: none"> ● Circuit fault ● Lighting control switch fault ● Left-hand steering column multifunction switch fault ● Headlamp timer function fault 	Check the headlamp circuits. Check the lighting control switch function. Check the left-hand steering column multifunction switch operation. Check the headlamp timer function. Refer to the electrical guides. Check for DTCs indicating a headlamp circuit fault.
High beam lamp(s) stuck on		
Headlamp low/high beam switching function inoperative	<ul style="list-style-type: none"> ● Circuit fault ● Left-hand steering column multifunction switch fault ● Xenon lamp shutter mechanism fault 	Check the headlamp circuits. Check the left-hand steering column multifunction switch operation. Check the xenon lamp shutter mechanism operation. Refer to the electrical guides. Check for DTCs indicating a headlamp circuit fault.
Warning lamp(s) inoperative	<ul style="list-style-type: none"> ● Fuse(s) blown ● Lighting control switch fault ● Left-hand steering column multifunction switch inoperative ● Circuit fault ● Instrument cluster fault 	Check the fuse(s). Check the lighting control switch function. Check the left-hand steering column multifunction switch function. Check the warning lamp circuits. Refer to the electrical guides. Check for DTCs indicating an instrument cluster or CAN system fault.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Headlamp Control Module A \(HCM\)](#) (100-00 General Information, Description and Operation) / [Diagnostic Trouble Code \(DTC\) Index - DTC: Headlamp Control Module B \(HCM2\)](#) (100-00 General Information, Description and Operation).

Exterior Lighting - Headlamp Leveling

Diagnosis and Testing

Principle of Operation

For a detailed description of the headlamp leveling system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Exterior Lighting](#) (417-01 Exterior Lighting, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Headlamp leveling motor(s) and linkage(s) condition and installation ● Lighting control switch and installation ● Left-hand steering column multifunction switch and installation 	<ul style="list-style-type: none"> ● Fuses ● Wiring harness ● Loose or corroded connector(s) ● Battery Junction Box (BJB) ● Central Junction Box (CJB) ● Adaptive Front Lighting System (AFS) module ● Headlamp power modules ● Engine Control Module (ECM) ● Anti-lock Brake System (ABS) control module ● Air suspension control module ● Local Interconnect Network (LIN) circuits ● Controller Area Network (CAN) circuits

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Headlamp leveling system inoperative	<ul style="list-style-type: none"> ● Fuse(s) blown ● Leveling motor/linkage fault 	Check the fuse(s) condition. Check the headlamp leveling motor and linkage condition. Check the headlamp leveling circuit. Refer to the electrical guides. Check for DTCs indicating headlamp leveling circuit and air suspension system fault(s).
Headlamp alignment incorrect	<ul style="list-style-type: none"> ● Headlamp leveling circuit fault ● Air suspension system fault 	

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. Warning lamp(s) inoperative	<ul style="list-style-type: none"> ● Fuse(s) blown ● Circuit fault ● Instrument cluster fault 	Check the fuse(s). Check the warning lamp circuit. Refer to the electrical guides. Check for DTCs indicating an instrument cluster or CAN system fault.
Trailer socket battery feed missing	<ul style="list-style-type: none"> ● Fuse(s) blown ● Circuit fault 	Check the fuse condition. Check the trailer battery feed circuit. Refer to the electrical guides.
Trailer socket ignition feed missing	<ul style="list-style-type: none"> ● Fuse(s) blown ● Circuit fault ● Trailer socket relay faulty 	Check the fuse condition. Check the trailer ignition feed circuit. Check the trailer ignition feed relay operation. Refer to the electrical guides.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Central Junction Box \(CJB\)](#) (100-00 General Information, Description and Operation).

Exterior Lighting - Autolamps

Diagnosis and Testing

Principle of Operation

For a detailed description of the exterior lighting system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: [Exterior Lighting](#) (417-01 Exterior Lighting, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Lighting control switch and installation ● Rain/Light sensor condition and installation ● Wiper control switch and installation 	<ul style="list-style-type: none"> ● Fuses ● Relays ● Wiring harness ● Loose or corroded connector(s) ● Battery Junction Box (BJB) ● Central Junction Box (CJB) ● Rain/Light sensor control module ● Local Interconnect Network (LIN) circuits ● Controller Area Network (CAN) circuits

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Side and headlamp(s) inoperative when the automatic headlamp switch option is selected	<ul style="list-style-type: none"> ● Fuse(s) blown ● Lighting control switch fault ● Wiper control switch fault ● Circuit fault ● Rain/Light sensor fault ● LIN circuit fault 	Check the fuse(s). Check the lighting and wiper control switch functions. Check the automatic headlamp circuit. Refer to the electrical guides. Check for DTCs indicating a rain/light sensor or LIN system fault.
Automatic headlamp switch illumination inoperative	<ul style="list-style-type: none"> ● Fuse(s) blown ● Lighting control switch fault ● Circuit fault ● Automatic headlamp relay fault 	Check the fuse(s). Check the lighting control switch function. Check the automatic headlamp relay circuit. Refer to the electrical guides. Check for DTCs indicating an automatic headlamp fault.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Central Junction Box \(CJB\)](#) (100-00 General Information, Description and Operation).

Exterior Lighting - Brake Pedal Position (BPP) Switch Adjustment

General Procedures

1. Adjust the brake pedal position (BPP) switch.
 - For vehicles with petrol engine,
For additional information, refer to: [Brake Pedal Position \(BPP\) Switch Adjustment](#) (303-14C Electronic Engine Controls - V6 4.0L Petrol, General Procedures) / [Brake Pedal Position \(BPP\) Switch Adjustment](#) (303-14D Electronic Engine Controls - V8 5.0L Petrol, General Procedures).
 - For vehicles with diesel engine,
For additional information, refer to: [Brake Pedal Position \(BPP\) Switch Adjustment](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, General Procedures) / [Brake Pedal Position \(BPP\) Switch Adjustment](#) (303-14B Electronic Engine Controls - TDV6 3.0L Diesel, General Procedures).

Exterior Lighting - Headlamp Adjustment

General Procedures

- NOTE: With self leveling suspension, make sure the vehicle is at the standard ride height.
- NOTE: The headlamp setting is 1.2 % below horizontal and parallel.
- NOTE: NAS vehicles have vertical adjustment only.

1. Align the headlamp beam setting equipment to one headlamp.
2. Switch the headlamps on and to dipped beam.
3. NOTE: NAS vehicles have vertical adjustment only.

Adjust the headlamps with a Philips screwdriver.

- Rotate the adjusters A and B by an equal amount for vertical alignment.
- Rotate the adjusters A or B for horizontal alignment.

E49806

4. To adjust the second headlamp, repeat the above procedure.

Exterior Lighting - Front Fog Lamp Adjustment

General Procedures

Check

- NOTE: With self leveling suspension, make sure the vehicle is at the standard ride height.

1. 1. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

- NOTE: The fog lamp setting is 2% below horizontal.

E123793

Adjustment

- NOTE: With self leveling suspension, make sure the vehicle is at the standard ride height.

1. 2. NOTE: The procedure must be carried out on both sides.

E123499

Exterior Lighting - Stoplamp Switch

Removal and Installation

Removal

1. Remove the closing trim panel.

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.

E47923

2.  CAUTION: The brake pedal MUST NOT be depressed during this operation. Failure to comply will result in damage to the stoplamp switch.

Remove the stoplamp switch.

- Disconnect the electrical connector.
- Rotate the switch clockwise.

E53580

Installation

1. CAUTIONS:

 The brake pedal MUST NOT be depressed during this operation. Failure to comply will result in damage to the stoplamp switch.

 Make sure that excessive force is not used when installing the stoplamp switch. Failure to follow this instruction may result in damage to the stoplamp switch.

Install the stoplamp switch.

- Rotate the switch counterclockwise.
- Connect the electrical connector.

2. Install the closing trim panel.

- Connect the electrical connector.
- Secure the clip.
- Tighten the screws.

Exterior Lighting - Headlamp Assembly

Removal and Installation

Removal

⚠ WARNING: Vehicles fitted with Xenon headlamps, the following precautions must be observed. Failure to comply may result in exposure to ultra violet rays, severe electric shock, burns or the risk of explosion. Ensure the headlamps are switched off at all times. Eye and hand protection must be worn. Never switch on the lamps or test the bulbs with the lamp holder released from the headlamp.

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
3. Remove the headlamp assembly.
 - Release the 2 clips.
 - Disconnect the electrical connector.

E49565

4. NOTE: High intensity discharge lamp bulb illustrated.
- NOTE: Do not disassemble further if the component is removed for access only.
 - NOTE: If installed, leave the Silica Gel sachet in place.

Remove the headlamp bulb.

- Remove the cover.
- Disconnect the electrical connector.
- Release the clip.

E49566

5. Remove the headlamp inner bulb.

- Remove the cover.
- Disconnect the electrical connector.
- Release the clip.

E49567

6. Remove the headlamp outer bulb.

- Remove the headlamp outer retaining clip.
- Remove the cover.
- Release the electrical connector.

E49568

7. Remove the side lamp bulb.

- Release the bulb holder.

E49569

8. Remove the side marker bulb.

- Release the bulb holder.

E49570

9. Remove the turn signal indicator bulb.

- Remove the cover.
- Release the bulb holder.

10. Remove the gas discharge module cover.

- Remove the 4 screws.
- Remove the seal.

11. Remove the gas discharge module.

- Remove the 2 screws.
- Disconnect the electrical connector.

Installation

1. Install the gas discharge module.
 - Connect the electrical connector.
 - Tighten the 2 screws.
2. Install the gas discharge module cover.
 - Install the seal.
 - Tighten the screws.
3. Install the turn signal indicator bulb.
 - Secure the bulb holder.
 - Install the cover.
4. Install the side marker bulb.
 - Install the bulb holder.

5. Install the side lamp bulb.

- Install the bulb holder.

6. Install the headlamp outer bulb.

- Connect the electrical connector.
- Install the cover.
- Install the headlamp outer retaining clip.

7.  CAUTION: Make sure the seal is installed correctly.

Install the headlamp inner bulb.

- Secure with the clip.
- Connect the electrical connector.
- Install the cover.

8.  CAUTION: Make sure the seal is installed correctly.

Install the headlamp bulb.

- Secure with the clip.
- Connect the electrical connector.
- Install the cover.

9. Install the headlamp assembly.

- Connect the electrical connector.
- Secure with the 2 clips.

10. Install the radiator grille.

For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).

11. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

12. NOTE: The headlamp setting is 1.2 % below horizontal and parallel.

Check the headlamp beam alignment.

Exterior Lighting - Side Turn Signal Lamp

Removal and Installation

Removal

1. Remove the side turn signal lamp.

- Push the lamp forwards to release it from the door.
- Disconnect the electrical connector.

Installation

1. To install, reverse the removal procedure.

Exterior Lighting - Rear Lamp Assembly

Removal and Installation

Removal

1. Open the liftgate and tailgate.

2.  **CAUTION:** Always protect paintwork and glass when removing exterior components.

Remove the rear lamp assembly.

- Remove the 2 screws.
- Release the 2 clips.
- Disconnect the electrical connector.

E45436

3. **NOTE:** Do not disassemble further if the component is removed for access only.

- **NOTE:** Note the fitted position.

Remove the wiring harness.

- Release the wiring harness from the 2 clips.
- Release the 6 bulb holders.
- Release the electrical connector.

E45437

Installation

1. Install the wiring harness.

- Install the 6 bulb holders.
- Install the electrical connector.
- Secure the wiring harness in the clips.

2. Install the rear lamp assembly.

- Connect the electrical connector.
- Secure with the 2 clips.
- Tighten the screws.

Exterior Lighting - Front Fog Lamp

Removal and Installation

Removal

1. **NOTE:** Release each clip individually. Clips may fall off if care is not taken.

Remove the front fog lamp bezel.

- Release the 6 clips.

E47034

2. Release the front fog lamp.

- Remove the 3 screws.

E47035

3. Remove the front fog lamp.

- Disconnect the front fog lamp electrical connector.

E47036

Installation

1. Connect the front fog lamp electrical connector.

2. Install the front fog lamp.

- Tighten the screws.

3. Install the front fog lamp bezel.

- Secure the clips.

4. Check the fog lamp beam alignment.

Exterior Lighting - High Mounted Stoplamp

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **CAUTION:** Always protect paintwork and glass when removing exterior components.

Remove the high mounted stoplamp.

- Carefully cut through the sealant using a glazing knife.
- Disconnect the electrical connector.
- Disconnect the washer jet hose.

E55173

3. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the washer jet.

E55174

Installation

1. Install the washer jet.
2. Carefully remove the sealant from the body to leave a smooth surface.
3. Install the high mounted stoplamp.
 - Check for correct alignment.
4. Remove the high mounted stoplamp.
5. Apply etch primer to any bare metal.
6. Apply primer over the etch primer.
7. Apply activator to the high mounted stoplamp.
8. Fit a pre-cut nozzle to the sealer cartridge, remove the lid, shake out the crystals and fit the cartridge to the applicator gun.

9. Apply an 8.0 mm (0.30 in) wide continuous bead of sealant, 15.0 mm (0.60 in) in, from the outer edge of the high mounted stoplamp as shown.

E55183

10. Install the high mounted stoplamp.

- Connect the washer jet hose.
- Connect and secure the electrical connector.

11. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Exterior Lighting - Adaptive Front Lighting Module

Removal and Installation

Removal

1. Passenger side: Remove the cowl side trim panel.
For additional information, refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Remove the CJB.
For additional information, refer to: [Central Junction Box \(CJB\)](#) (418-00 Module Communications Network, Removal and Installation).
3. Remove the adaptive front lighting module.
 - Disconnect the electrical connector.
 - Remove the bolt.

E55696

Installation

1. Install the adaptive front lighting module.
 - Tighten the bolt to 10 Nm (7 lb.ft).
 - Connect the electrical connector.
2. Install the CJB.
For additional information, refer to: [Central Junction Box \(CJB\)](#) (418-00 Module Communications Network, Removal and Installation).
3. Install the cowl side trim panel.
For additional information, refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Exterior Lighting - Headlamp Switch

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  CAUTION: Protect the surrounding trim to avoid damage.

- NOTE: The ignition must be switched off.

Installation

1. To install, reverse the removal procedure.

Exterior Lighting - Approach Lamp Vehicles With: Parking Aid Camera

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: RH illustration shown, LH is similar.
- NOTE: The ignition must be switched off.

1. Refer to: [Exterior Mirror Cover](#) (501-09 Rear View Mirrors, Removal and Installation).

2. **2. CAUTIONS:**

 Take extra care not to damage the component.

 Take extra care not to damage the wiring harnesses.

Torque: 0.5 Nm

E123783

Installation

1. To install, reverse the removal procedure.

Interior Lighting -

Lamp bulbs

Bulb	Type	Rating
Puddle lamps	Capless	W5W
Footwell lamps	Capless	W5W
Map lamps	Capless	W5W
Courtesy lamps	Capless	W5W
Interior lamps	Capless	W5W
Loadspace lamps	Capless	W5W

Interior Lighting - Interior Lighting

Description and Operation

Interior Lighting Component Location

E131968

Item	Part Number	Description
1	-	Glove compartment lamp and switch
2	-	Vanity mirror lamps
3	-	1st row interior lamp and map reading lamps
4	-	2nd row interior lamp and map reading lamps
5	-	Luggage compartment lamp
6	-	3rd row map lamps (if fitted)
7	-	Puddle lamps
8	-	Ignition push button illumination
9	-	Driver footwell lamp
10	-	Passenger footwell lamp

GENERAL

The interior lighting system comprises the following interior lamps:

- Interior lamps
- Map reading lamps
- Glove compartment lamp
- Luggage compartment lamps

- Vanity mirror lamps
- Footwell lamps
- Puddle lamps
- Ignition push button illumination

Interior Bulb/Type Rating

The following table shows the bulbs used for the interior lighting system and their type and specification.

Bulb	Type	Rating
Front and rear interior lamps	Capless	5W
Front and rear map reading lamps	Capless	5W
Luggage compartment lamp	Capless	5W
Vanity mirror lamps	Festoon	14V 0.1A (1.4W)
Door puddle lamps	Capless	5W
Lower instrument panel footwell lamps	Capless	5W
Glove compartment lamp	Festoon	5W

CENTRAL JUNCTION BOX

The Central Junction Box (CJB) is an integrated unit located behind the instrument panel on the passenger side of the bulkhead. The CJB contains fuses, relays and a number of microprocessors which control the power supply and functionality of the interior lighting system and other vehicle systems.

The interior lamps are controlled by the CJB and have two types, Courtesy (switched by the doors; key; etc) and Demand lighting (controlled by the user). The Courtesy mode divided into Manual (the interior lamps can be switched on and off using the momentary and latching switches adjacent to each lamp or disabled completely using the same switches) and Automatic (the interior lamp functionality is controlled by the CJB on receipt of various input signals).

Input signals

The CJB receives the following inputs which affect the operation of the interior lamps:

- Ignition mode
- Door switches
- Tailgate switch
- Glove compartment lamp switch
- Lock/unlock signal
- Interior lamp switches
- Map reading lamp switches
- Battery saver relay
- Vanity mirror lamp switches

Circuit Protection

The CJB provides circuit protection for all interior lamp circuits. The following interior lamp circuits are protected by Field Effect Transistors (FETs):

- Luggage compartment lamps
- Footwell lamps
- Courtesy lights
- Ignition push button illumination
- Puddle lamps.

The above components are protected by FETs which can detect overloads and short circuits. The FETs respond to heat generated by increased current flow caused by a short circuit. On a normal circuit this would cause the fuse to blow, rendering that component and circuit inoperative. The FETs respond to the heat increase and disconnect the supply to the affected circuit. When the fault is rectified or the FET has cooled, the FET will reset and operate the circuit normally.

The following interior lamps circuits are protected by Fuse 57P (10A) in the CJB and part of the Battery Saver mode:

- Glove compartment lamp
- Map reading lamps
- Vanity mirror lamps.

Interior Lamp Time-out

The interior lamps are controlled by a timer within the CJB which allows a 60 second delay period for the lamps to remain on after the ignition mode has been changed to off power mode 0 or when the vehicle is unlocked. The following interior lamps are subject to the delay period:

- Interior lamps
- Footwell lamps
- Luggage compartment lamps
- Puddle lamps

The time-out delay is activated when the CJB receives one of the following signals:

- An unlock signal from the Smart Key via the keyless vehicle module.
- Ignition mode is changed from the crank power mode 9 or ignition power mode 6 to the accessory power mode 4 to the off power mode 0.

If a second occurrence of one of the above actions occurs within the time-out period, the timer will be reset and the delay period will start again.

The time-out delay is deactivated when the CJB receives one of the following signals:

- A lock signal from the Smart Key via the keyless vehicle module
- Ignition mode is changed from the off power mode 0 to the accessory power mode 4 or ignition power mode 6.
- The CJB receives a door opened signal (even if door is subsequently closed)

Battery Saver

The battery saver feature provides automatic shut-off of the interior lamps after a period of 15 minutes in order to prevent excessive drain on the battery. The lamp(s) fade off as described in the 'Interior Lighting' section that follows.

The battery saver feature is additional to the time-out delay feature and prevents battery drain when an lamp is accidentally left switched on, e.g. glove compartment left open.

When the ignition mode is changed from the ignition power mode 6 or accessory power mode 4 to the off power mode 0, the CJB starts a timer which automatically switches off all interior lamps when the 15 minute period has expired.

Once the timer has expired and the lamps are off, any one of the following will 'wake-up' the battery saver and the interior lamps will function again. The timer will be restarted as soon as an input from one of the following is received by the CJB:

- Ignition mode changed from off power mode 0 to accessory power mode 4, ignition power mode 6 or crank power mode 9.
- Any door, including the tailgate is opened
- An unlock request is received from the Smart Key via the keyless vehicle module
- Front interior lamp switch is pressed.

DELIVERY MODE

Delivery mode is set at the factory on vehicles to minimise battery drain. The modes enables the switching off of non-critical electrical components, including the interior lighting. The delivery mode feature can be cancelled by the dealer at pre-delivery inspection using T4.

CRASH ILLUMINATION

When a crash signal is received from the restraints control module, the central junction box activates the interior lamps once the vehicle speed has reduced to 5 km/h (3.1 mph). The lamps remain on until they are switched off manually or the crash signal no longer exists.

For additional information, refer to: [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) (501-20B Supplemental Restraint System, Description and Operation).

INTERIOR LIGHTING

Interior lighting is lighting provided to enable the safe entry and departure from the vehicle for the driver and passengers in low ambient light conditions, without any manual switching of the interior lamps.

- **NOTE:** The term interior lamps also includes the door mirror approach lamps.

When the interior lighting system switches the interior lamps on, the central junction box ramps the lamps on up to full power over period of 1.3 seconds. When the system switches the lamps off, after the time-out delay period has expired, the central junction box fades the lamps off over a period of 2.6 seconds.

The interior lighting system will illuminate the interior lamps when one of the following events occurs:

- The CJB receives an unlock signal from the Smart Key via the keyless vehicle module
- Any door is opened including the tailgate
- The ignition mode is changed from ignition power mode 6 or accessory power mode 4 to off power mode 0.

The interior lighting system will turn off the interior lamps when one of the following events occurs:

- Once the delay time-out timer has expired since the lamps were either activated or the last door is closed and the vehicle is not locked
- The ignition is in off power mode 0 and an external lock is requested (using either the door lock buttons or the Smart Key) with all doors closed
- The ignition mode is changed from the off power mode 0 or the accessory power mode 4 to the ignition power mode 6
- The last door is closed while or after the vehicle is externally locked using the key or the remote handset
- The last door is closed and the vehicle is externally locked on receipt of an unlock request from the Smart Key or door handle when the time-out timer is still active.
- The last door is closed when the ignition is in power mode 6.

The interior lamps can be permanently switched off, preventing automatic operation when a door is opened or the vehicle is unlocked using the remote handset. This is achieved by pressing and holding the central switch of the 1st row interior lamp for 3 seconds. The interior lamps will remain off until the procedure is repeated.

ROW 1 AND 2 INTERIOR LAMP ASSEMBLY

Row 1 Interior Lamp

E49155

Item	Part Number	Description
1	-	Microphone
2	-	Sunroof switch
3	-	Map reading lamp
4	-	Map reading lamp switch
5	-	Interior lamp switch
6	-	Map reading lamp switch
7	-	Waterfall lighting LED
8	-	Interior lamp
9	-	Map reading lamp
10	-	Map reading lamp bulb holder
11	-	LED connector
12	-	Interior lamp bulb holder
13	-	Map reading lamp bulb holder

Row 2 Interior Lamp (Low line shown)

E49156

Item	Part Number	Description
1	-	Map reading lamp
2	-	Map reading lamp switch
3	-	Interior lamp switch
4	-	Map reading lamp switch
5	-	Map reading lamp
6	-	Map reading lamp bulb holder
7	-	Interior lamp bulb holder
8	-	Map reading lamp bulb holder

The row 1 and 2 interior lamp assemblies are common to all models, however, their location can differ between model specification. Both lamp assemblies have three switches; one for the main interior lamp and two for the map reading lamps.

On low line specification vehicles, the interior lamps are located directly into apertures in the headlining with a bezel finish

surround.

On high line specification vehicles, the row 1 (front) interior lamp is located in a housing which can also contain the sunroof switch and/or the voice activation microphones, depending on specification. The row 2 (rear) interior lamp is also located in a housing which contains the rear heating controls.

The main interior lamps operate as part of the automatic interior lighting system. The map reading lamps only operate manually.

Both the interior and map reading lamps use 5W capless bulbs.

The row 1 interior lamp unit also contains an LED for the waterfall lighting. Waterfall lighting is part of the lighting control switch functionality which also controls the brightness of the switch and instrument cluster display illumination. Waterfall lighting provides very limited illumination for the center of the fascia and the center console, when the vehicle is being driven, without affecting the driver's night vision.

Main Interior Lamp

The main interior lamps operate independently of the ignition mode and can be operated automatically by one of a number of inputs to the CJB or manually by pressing the central switch on the lamp assembly. The switch is a momentary switch which is connected directly to and completes a circuit to the CJB. This completed circuit is a signal for the CJB to activate or deactivate the row 1 interior lamp (and also the row 2 interior lamp, if fitted). The lamps will remain on until the switch is pressed a second time.

The interior lamps can be permanently switched off as previously described by pressing and holding the central switch for at least 3 seconds. The 3 second completion of the circuit is sensed by the CJB which grants the permanent off request.

Map Reading Lamps

Both row 1 and 2 interior lamp assemblies contain map reading lamps which are located adjacent to the main interior lamp. The lamps are operated by two momentary switches on the lamp unit, which are located on either side of the main interior lamp switch.

ROW 3 MAP READING LAMPS

The row 3 map reading lamps are located in the headlining, above the rear side windows. These map reading lamps are only fitted to vehicles fitted with the seven seat, third row seating option.

The lamps operate independently of the ignition mode. The lamps have a latching rocker switch which allows the lamps to be manually switched on and off. The map reading lamps have a non-adjustable beam.

The lamps are not part of the automatic interior lighting system and therefore can only be switched on manually.

The map reading lamps use 5W capless bulbs.

GLOVE COMPARTMENT LAMP

The glove compartment lamp is located inside the glove compartment and contains an integral switch. The switch is operated when the glove compartment lid is opened and closed, switching the lamp on and off.

The glove compartment lamp uses a 5W festoon bulb.

PUDDLE LAMPS

Each door is fitted with a puddle lamp which illuminates the ground below the door when the door is opened. The puddle lamps are located in the bottom of the door trim panel on each front and rear door.

The puddle lamps are part of the automatic interior lighting functionality. Each lamp uses a 5W capless bulb.

FOOTWELL LAMPS

Two footwell lamps are located under the instrument panel, one on each side, to illuminate the footwell area. The footwell lamps are controlled by the CJB and operate as part of the interior lighting functionality.

The footwell lamps use a 5W capless bulb.

LUGGAGE COMPARTMENT LAMP

A luggage compartment lamp is located in a central position in the rear header trim panel at the rear of the vehicle, above the tail gate aperture. The luggage compartment lamp is controlled by the CJB and operates as part of the interior lighting functionality.

The luggage compartment lamp uses a 5W capless bulb.

VANITY MIRROR LAMPS

Four vanity mirror lamps are fitted, two in each vanity mirror. The lamps are illuminated when the mirror cover is raised. The vanity mirror lamps operate independently of the ignition mode and separately to the interior lighting functionality, although they are subject to the battery saver feature of the CJB.

The vanity mirrors use low voltage, 1.4W festoon type bulbs.

Interior Lighting - Interior Lighting

Diagnosis and Testing

Principle of Operation

For a detailed description of the interior lighting system and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Interior Lighting](#) (417-02 Interior Lighting, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Main interior lamp condition and installation ● Map reading lamp(s) condition and installation ● Vanity mirror lamp(s) condition and installation ● Glove compartment lamp condition and installation ● Footwell lamp(s) condition and installation ● Ignition switch glow ring condition and installation ● Door mirror approach lamp(s) condition and installation ● Puddle lamp(s) condition and installation ● Luggage compartment lamp condition and installation 	<ul style="list-style-type: none"> ● Bulbs ● Fuses ● Battery Junction Box (BJB) ● Central Junction Box (CJB) ● Wiring harness ● Loose or corroded connector(s) ● Main interior lamp switch ● Map reading lamp switches ● Vanity mirror lamp switches ● Glove compartment lamp switch ● Waterfall lighting LED ● Tailgate lamp switch

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Main interior lamp inoperative	<ul style="list-style-type: none"> ● Bulb(s) failure ● Fuse(s) blown ● Circuit fault ● Switch fault 	Check the bulb(s) condition. Check the fuse(s). Check the lamp circuits. Check the switch function. Refer to the electrical guides.
Waterfall lighting LED inoperative	<ul style="list-style-type: none"> ● LED failure ● Fuse(s) blown ● Circuit fault 	Check the LED condition. Check the LED connector. Check the fuse(s). Check the lamp circuits. Refer to the electrical guides.
Map reading lamp(s) inoperative	<ul style="list-style-type: none"> ● Bulb(s) failure ● Fuse(s) blown ● Circuit fault ● Switch fault 	Check the bulb(s) condition. Check the fuse(s). Check the lamp circuits. Check the switch function. Refer to the electrical guides.
Vanity mirror lamp(s) inoperative	<ul style="list-style-type: none"> ● Bulb failure ● Fuse(s) blown ● Circuit fault ● Switch fault 	Check the bulb condition. Check the fuse(s). Check the lamp circuits. Check the switch function. Refer to the electrical guides.
Glove compartment lamp inoperative	<ul style="list-style-type: none"> ● Bulb failure ● Fuse(s) blown ● Circuit fault ● Switch fault 	Check the bulb condition. Check the fuse(s). Check the lamp circuits. Check the switch function. Refer to the electrical guides.
Footwell lamp inoperative	<ul style="list-style-type: none"> ● Bulb failure ● Fuse(s) blown ● Circuit fault 	Check the bulb condition. Check the fuse(s). Check the lamp circuits. Refer to the electrical guides.
Ignition switch glow ring inoperative	<ul style="list-style-type: none"> ● Bulb/Glow ring failure ● Fuse(s) blown ● Circuit fault 	Check the bulb/glow ring condition. Check the fuse(s). Check the lamp circuits. Refer to the electrical guides.

Symptom	Possible Causes	Action
Door mirror approach lamp(s) inoperative	<ul style="list-style-type: none"> ● Bulb failure ● Fuse(s) blown ● Circuit fault 	Check the bulb condition. Check the fuse(s). Check the lamp circuits. Refer to the electrical guides.
Puddle lamp(s) inoperative	<ul style="list-style-type: none"> ● Bulb failure ● Fuse(s) blown ● Circuit fault 	Check the bulb condition. Check the fuse(s). Check the lamp circuits. Refer to the electrical guides.
Luggage compartment lamp inoperative	<ul style="list-style-type: none"> ● Bulb failure ● Fuse(s) blown ● Circuit fault ● Switch fault 	Check the bulb condition. Check the fuse(s). Check the lamp circuits. Check the switch function. Refer to the electrical guides.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Central Junction Box \(CJB\)](#) (100-00 General Information, Description and Operation).

Daytime Running Lamps (DRL) - Daytime Running Lamps (DRL)

Description and Operation

DRL use the full intensity low beam headlamps which are permanently illuminated when the vehicle is being driven. DRL are used in a number of markets and there are two systems to cover these markets.

DRL CANADIAN MARKET

DRL for this market use full intensity low beam headlamps. The side marker lamps and license plate lamps will be on, but instrument cluster illumination will be off. DRL are active when the following parameters are met:

- Parking brake is off on vehicles with manual transmission or PARK is not selected on vehicles with automatic transmission
 - Ignition switch is in the ignition position (II)
 - The central junction box receives an engine running signal
 - The lighting control switch is in the off or side lamps position.
- NOTE: If the lighting control switch is moved to the headlamp position, DRL are deactivated and normal side lamp and headlamp functionality is operational.
 - NOTE: Adaptive Front Lighting System (AFS) (where fitted) is not available when the DRL are active.
 - NOTE: When DRL are active, the headlamp flash function using the left hand steering column multifunction switch will operate normally. The high beam headlamp function using the left hand steering column multifunction switch will be deactivated.

When the parking brake is applied on manual transmission vehicles or the selector lever is in the PARK position on automatic transmission vehicles, DRL are turned off. This is to reduce battery discharge during long periods of engine idling in cold climate conditions. When the parking brake is released or the selector lever is moved from the PARK position, normal DRL functionality is restored.

DRL DENMARK, HOLLAND, NORWAY, SWEDEN, FINLAND & POLAND

DRL for these markets use full intensity low beam headlamps. Side lamps and license plate lamps will be on, but instrument cluster illumination will be off. DRL are active when the following parameters are met:

- Ignition switch is in the ignition position (II)
 - The central junction box receives an engine running signal
 - The lighting control switch is in the off position.
- NOTE: When DRL are active, the headlamp flash function using the left hand steering column multifunction switch will operate normally. The high beam headlamp function using the left hand steering column multifunction switch will be deactivated.

If the lighting control switch is moved to the side lamp or headlamp positions, DRL are deactivated and normal side lamp and headlamp functionality is operational.

Module Communications Network -**Torque Specifications**

Description	Nm	lb-ft
Central junction box bracket retaining nuts	10	7
Central junction box bracket retaining bolts	25	18
Engine compartment ground cable nuts	25	18
Body panel ground cable nuts	25	18
Vehicles with auxiliary heating - Heater pipes to body panel nut	10	7
Wiring harness to plenum chamber nuts	4	3
Vehicles with auxiliary climate control - A/C lines to body panel nut	10	7
Battery ground cable to body nut	25	18
Battery junction box retaining bolt	6	4
Ground cables to the lower A-pillar nut	10	7
Battery positive cable to the battery junction box (BJB) nut	25	18

Module Communications Network - Communications Network

Diagnosis and Testing

Principles of Operation

For a detailed description of the Communications Network, refer to the relevant Description and Operation section in the workshop manual. REFER to: Communications Network (418-00 Module Communications Network, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Electrical
<ul style="list-style-type: none"> ● Fuses (refer to electrical guide) ● Wiring harness ● Correct engagement of electrical connectors ● Loose or corroded connections ● Routing of fibre optic harnesses ● Correct engagement of optical connectors ● Correct placement of optical connectors (ring order) ● Correct assembly of optical connectors (backout, etc) ● Damage to fibre (chafing, abrasion, kinking, cuts, etc)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

CAN Network Integrity Checks

In the event that one or more control modules are not communicating on either the Medium Speed (MS) or High Speed (HS) CAN Buses, checks can be performed to confirm the integrity of the CAN harness.

The following information is applicable to HS and MS CAN Buses accessible via the J1962 diagnostic connector.

Module Connections to the CAN Harness

Modules are connected to the CAN harness either in a 'loop' or 'spur' configuration. In the 'loop' type configuration the CAN harness loops into the module (via two connector pins) and then loops out of the module (via another two connector pins). In the 'spur' type configuration, a harness spur is spliced into the main 'backbone' of the CAN harness and the module is connected to the harness spur via two connector pins.

CAN Harness Architecture

For a detailed description of the CAN Networks and architecture, refer to the relevant Description and Operation section in the Workshop Manual.

REFER to: Communications Network (418-00 Module Communications Network, Description and Operation).

IDS Vehicle Integrity Test

If a control module is suspected of non-communication, the Network Integrity test application available on the manufacturer approved diagnostic system can be used to confirm if communication is possible between the control modules on the vehicle and the manufacturer approved diagnostic system (via the J1962 diagnostic connector). The results from the test can be used to determine if either a single module or multiple modules are failing to communicate.

CAN Terminating Modules

If the Network Integrity test indicates that one or more module on one of the CAN networks (HS or MS) are failing to communicate, there are several checks that can be made. The first step is to identify if both of the CAN terminating modules on each individual CAN Bus are communicating. If both CAN terminating modules for each individual CAN Bus are communicating (identified via the Network Integrity test), then it can be confirmed that the main 'backbone' of the CAN harness is complete. The main 'backbone' of the CAN harness consists of all the modules connected to the CAN harness via a 'loop' configuration and also includes the two terminating modules.

Communication with both CAN terminating modules via the Network Integrity test confirms the physical integrity of the main 'backbone' of the CAN harness (and the harness spur to the J1962 diagnostic connector). This means that there is no requirement to check the resistance of the CAN Network. This is because the standard check for 60 ohms across the CAN High and CAN Low lines will not provide any additional information regarding the physical condition of the CAN harness, beyond what has already been determined from the Network Integrity test.

Non-Communication of a Terminating Module

If a Network Integrity test reveals a terminating module is failing to communicate it can indicate a break in the main 'backbone' of the CAN harness. The first checks should always be to confirm the power and ground supplies to the non-communicating module are correct. Providing these are correct, the resistance between the CAN High and CAN Low lines at the J1962 connector can be checked to determine the integrity of the main 'backbone' of the CAN harness. After disconnecting the battery a reading of 120 ohms would indicate an open circuit in the main 'backbone' of the CAN harness. Alternatively, a reading of 60 ohms would indicate that there is no open circuit fault with the main 'backbone' of the CAN harness.

It is worth noting that even if one of the terminating modules is disconnected from the CAN harness, communications between the modules still connected may still be possible. Therefore communication between the manufacturer approved diagnostic system and the connected modules may also be possible.

Locating CAN Harness Open Circuits

In the case where multiple modules, including a terminating module, are failing to communicate, having first confirmed the power and ground supplies are correct, the approximate location of the open circuit can be identified from analysis of the Network Integrity test results and reference to the relevant CAN network circuit diagrams. For example, if an open circuit existed in a certain position on the CAN harness, any module positioned on the Network between the J1962 connector and the open circuit should return a response during the Network Integrity test. No responses would be returned from any modules past the open circuit fault in the Network.

CAN Harness 'Spur' Type Configuration Circuits

If, after the initial checks (Network Integrity test using the manufacturer approved diagnostic system, and power and ground supplies to the module have been checked and confirmed as correct), a module that is connected to the CAN harness via a 'spur' type configuration is suspected of not communicating, then the physical integrity of the CAN harness 'spur' can be checked.

This is most easily undertaken by individually checking the continuity of the CAN High and CAN Low lines between the non-communicating module connector (with the module disconnected) and the J1962 diagnostic connector.

'Lost Communications' DTCs

As well as the methods described so far in this document, which can be used to determine the location of an open circuit in the CAN harness, 'Lost Communications' DTCs can also be used for this purpose. Lost communication DTCs mean that a module is not receiving CAN information from another module.

For example, if a global DTC read were to be carried out, only DTCs stored in the modules that the manufacturer approved diagnostic system could communicate with would be displayed. If there was an open circuit fault in a certain position on the CAN harness, the modules that could display DTCs would all be prior to the open circuit on the Network, and these modules should display 'Lost Communications' DTCs with all the modules located on the Network past the open circuit fault.

'Bus off' DTCs

The references to bus and its condition refer to the network concerned and the modules on that network.

If a module logs a 'Bus Off' DTC, it means that the module has detected CAN transmission errors and has disabled its own CAN transmissions and disconnected itself from the network in an attempt to allow the rest of the network to function. At this point the 'Bus Off' DTC is set. A common cause of 'Bus Off' DTCs can be a short circuit in the CAN network.

Media oriented systems transport (MOST) diagnosis

Overview

The basic guidelines are covered in the description and operation section, such as not attempting to repair fibre optic cables, but additional precautions include:

- Do not touch the exposed ends of the optical fibres (grease from skin can contaminate the fibre)
- Whenever the fibre optic cable is disconnected, cover the connectors to prevent dust contamination
- Do not expose the fibre optic cable to heat
- Do not bend the fibre optic cable through less than a 25 mm (one inch) radius
- Do not use laser pens to test the fibre optic cable's ability to pass light
 - There is a dedicated tester to use with the MOST network modules and fibre optic harness to assist with diagnosis and to test the fibre optic cable's ability to pass light

MOST tester

Before connecting the tester to the network, turn on the unit and check that the red **power on** indicator is illuminated.

If not, the battery should be replaced before using the tester.

2+0 Self-test

1. Set the connector selector switch to 2+0.
2. Select **beep** or **LED** on the tester, depending on your choice of indicator.
3. Turn the tester ON and check the operation of the power indicator.
4. Using the 2+0 loop-back lead from the kit, push it into the 2+0 connector housing in the tester until it clicks into place.
5. Press the red **test** button in the center of the tester.
6. Depending on your choice in step 2, the tester will give either an audible tone or a green light.

- If the tester continues to give a tone or light after the test button is released this does not indicate a fault, only that there is a signal feed-back within the tester which will stop when the loop-back lead is removed.

2+4 Self-test

Carry out the self-test in the same way as for 2+0, but using the 2+4 loop-back lead and select 2+4 on the connector selector switch.

Vehicle diagnosis

CAUTION: Make sure the tester is not connected to the MOST network when either switching the tester on or switching between 2+0 and 2+4, as the tester emits a brief pulse of light which could introduce a fault into the network.

7. **7.** Use the approved diagnostic system or a scan tool to retrieve any DTCs.
8. **8.** Set the connector selector switch to **2+0**.
9. **9.** Disconnect the intermediate fibre optic cable connector and connect the male half to the tester connector at the top of the unit using the adaptor in the kit.
10. **10.** Turn the tester on and check the operation of the power indicator.
11. **11.** Set the **LED/beep** selector to **LED**.
12. **12.** Turn the ignition switch to the **ON** position.
13. **13.** If the green LED is active, a signal has been received indicating that the first half of the optical ring is functioning.
14. **14.** If the green LED is **NOT** active, no signal has been received indicating that the first half of the optical ring is **NOT** functioning.
 - A ring break code should be set as a result of this. Use the approved diagnostic system to trace the fault and clear the code.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Module Communications Network - Battery Junction Box (BJB)V6 4.0L

Petrol

Removal and Installation

Removal

- NOTE: The BJB is an integral component of the engine compartment wiring harness and cannot be removed separately.

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Make the SRS system safe.
For additional information, refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).
3. Remove both inboard ignition coils.
For additional information, refer to: [Ignition Coil](#) (303-07A Engine Ignition - V6 4.0L Petrol, Removal and Installation).
4. Remove the radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
5. Remove the air cleaner assembly.
For additional information, refer to: [Air Cleaner](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Removal and Installation).
6. Remove the four-wheel drive control module.
For additional information, refer to: [Four-Wheel Drive \(4WD\) Control Module](#) (308-07A Four-Wheel Drive Systems, Removal and Installation).
7. Remove the battery tray.
For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
8. Remove the auxiliary battery tray.
For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
9. Remove the ECM cover.
 - Disconnect 2 electrical connectors for access.
 - Disconnect the 2 ECM electrical connectors.
 - Remove the 4 Torx screws.

10. Remove the ECM.
 - Remove the ECM top cover.

11. Remove the BJB cover.

- Release the clip.

12. Disconnect the battery positive cable from the BJB.

- Remove the nut.

13. Remove both cowl side trim panels.

For additional information, refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

14. Remove the CJB.

For additional information, refer to: [Central Junction Box \(CJB\)](#) (418-00 Module Communications Network, Removal and Installation).

15. Release the CJB bracket.

- Release the 3 upper wiring harness clips.
- Remove the 2 bolts.

16. Remove the CJB bracket.

- Disconnect the 2 electrical connectors.
- Release the 3 lower wiring harness clips.
- Remove the 2 nuts.

17. Release the 2 ground cables from the lower A-pillar.

- Remove the nut.

E55292

18. Disconnect the heater motor electrical connector.

E55293

19. Release the BJB from the bracket.

- Remove the bolt.

E55296

20. Remove the battery ground cable.

- Remove the nut.
- Release the additional ground cable.

21. Release the BJB wiring harness from the bulkhead.

- Disconnect the 6 electrical connectors.
- Release the grommet.

E55297

22. Raise and support the vehicle.

23. Remove both front fender splash shields.

For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

24. Remove both headlamps.

For additional information, refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).

25. Passenger side: Disconnect the engine wiring harness electrical connector.

26. Passenger side: Disconnect the transfer case electrical connector.

27. LH side: Disconnect the washer jet hose.

28. LH side: Disconnect the adaptive front lighting control module electrical connector.

Vehicles with auxiliary climate control

29. LH side: Release the A/C lines from the body panel.

- Remove the nut.

All vehicles

30. LH side: Disconnect the 3 body panel electrical connectors.

31. LH side: Release the 3 body panel ground cables.

- Remove the nut.

32. LH side: Release the 2 air suspension pipes from the wiring harness.

- Release the 7 clips.

33. LH side: Disconnect the ABS electrical connector.

34. LH side: Release 3 engine compartment ground cables.

- Remove the 3 nuts.
- Release the 2 clips.

E55302

35. LH side: Release the washer reservoir wiring harness.

- Disconnect the 3 electrical connectors.
- Disconnect the 2 washer jet hoses.

E55303

36. LH side: Disconnect the coolant expansion tank level switch electrical connector.

E55304

37. LH side: Disconnect the brake pad wear sensor electrical connector.

38. LH side: Release the wiring harness.

- Release the grommet.
- Release the 4 clips.

E55306

39. Remove the windshield wiper motor.

For additional information, refer to: [Windshield Wiper Motor](#) (501-16 Wipers and Washers, Removal and Installation).

40. Remove the hood pad.

- Remove the 11 clips.

E49941

41. Release the hood wiring harness.

- Disconnect the 2 washer jet hoses.
- Disconnect the 2 electrical connectors.
- Release the 10 clips.
- Remove the wiring harness cover.
- Release the grommet.

E55307

42. Disconnect the brake booster vacuum pump electrical connector.

E55308

43. Disconnect the A/C pressure transducer electrical connector.

44. Disconnect the battery to engine compartment wiring harness electrical connector.

45. Release the wiring harness from the plenum.

- Release the 2 clips.
- Remove the 3 nuts.

46. Disconnect the brake fluid reservoir electrical connector.

47. Disconnect the ABS module electrical connector.

48. Remove the air suspension control module.
For additional information, refer to: [Air Suspension Control Module](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

- 49.** Driver side: Disconnect 2 electrical connectors from the lower A-pillar.

- 50.** Driver side: Release the wiring harness from the bulkhead.

- Release the grommet.

Vehicles with auxiliary heating

- 51.** RH side: Release the heater pipes from the body panel.

- Remove the nut.

All vehicles

- 52.** RH side: Disconnect the 3 body panel electrical connectors.

53. RH side: Release the 3 body panel ground cables.

- Remove the nut.

54. RH side: Disconnect the ABS electrical connector.

55. RH side: Release the air suspension pipe from the wiring harness clip.

56. RH side: Release 2 engine compartment ground cables.

- Remove the 2 nuts.

57. Disconnect the ambient air temperature sensor electrical connector.

58. Disconnect both front impact severity sensor electrical connectors.

- Release the 3 clips.

59. RH side: Release the wiring harness.

- Release the 9 clips.

E55320

60. Disconnect the hood switch electrical connector.

61. Disconnect both horn electrical connectors.

E55331

62. If installed, disconnect the speed control module electrical connector.

63. If installed, disconnect the pollution sensor electrical connector.

- Release the clip.
- Release the grommet.

64. Release the hood release cable.

- Release from the 3 clips.

65. Disconnect the front bumper wiring harness electrical connector.

66. With assistance, remove the BJB and wiring harness.

Installation

All vehicles

1. With assistance, install the BJB and wiring harness.
2. Connect the front bumper wiring harness electrical connector.
3. Attach the hood release cable.
 - Secure with the clips.
4. If installed, connect the pollution sensor electrical connector.
 - Install the grommet.
 - Secure the clip.
5. If installed, connect the speed control module electrical connector.
6. Connect the horn electrical connectors.
7. Connect the hood switch electrical connector.
8. RH side: Secure the wiring harness.
 - Secure the clips.
9. Connect both front impact electrical connectors.
 - Secure the clips.
10. RH side: Attach the air suspension pipe.
11. Connect the ambient air temperature sensor electrical connector.
12. RH side: Attach the engine compartment ground cables.

- Tighten the nuts to 25 Nm (18 lb.ft).

13. RH side: Connect the ABS electrical connector.

14. RH side: Attach the body panel ground cables.

- Tighten the nut to 25 Nm (18 lb.ft).

15. RH side: Connect the body panel electrical connectors.

Vehicles with auxiliary heating

16. RH side: Secure the heater pipes to the body panel.

- Tighten the nut to 10 Nm (7 lb.ft).

All vehicles

17. Driver side: Attach the wiring harness to the bulkhead.

- Install the grommet.

18. Driver side: Connect the lower A-pillar electrical connectors.

19. Install the air suspension control module.

For additional information, refer to: [Air Suspension Control Module](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

20. Connect the ABS module electrical connector.

21. Connect the brake fluid reservoir electrical connector.

22. Attach the wiring harness to the plenum.

- Secure the clips.
- Tighten the nuts to 4 Nm (3 lb.ft).

23. Connect the battery to engine compartment wiring harness electrical connector.

24. Connect the A/C pressure transducer electrical connector.

25. Connect the brake booster vacuum pump electrical connector.

26. Attach the hood wiring harness.

- Install the grommet.
- Install the cover.
- Secure with the clips.
- Connect the electrical connectors.
- Connect the washer jet hoses.

27. Install the hood pad.

- Install the clips.

28. Install the windshield wiper motor.

For additional information, refer to: [Windshield Wiper Motor](#) (501-16 Wipers and Washers, Removal and Installation).

29. LH side: Attach the wiring harness.

- Install the grommet.
- Secure the clips.

30. LH side: Connect the brake pad wear sensor electrical connector.

31. LH side: Connect the coolant expansion tank level switch electrical connector.

32. LH side: Attach the washer reservoir wiring harness.

- Connect the washer jet hoses.
- Connect the electrical connectors.

33. LH side: Attach the engine compartment ground cables.

- Secure the clips.

- Tighten the nuts to 25 Nm (18 lb.ft).
34. LH side: Connect the ABS electrical connector.
 35. LH side: Attach the air suspension pipes.
 - Secure the clips.
 36. LH side: Attach the body panel ground cables.
 - Tighten the nut to 25 Nm (18 lb.ft).
 37. LH side: Connect the body panel electrical connectors.

Vehicles with auxiliary climate control

38. LH side: Secure the A/C lines to the body panel.
 - Tighten the nut to 10 Nm (7 lb.ft).

All vehicles

39. LH side: Connect the adaptive front lighting control module electrical connector.
40. LH side: Connect the washer jet hose.
41. Passenger side: Connect the transfer case electrical connector.
42. Passenger side: Connect the engine wiring harness electrical connector.
43. Install the headlamps.
For additional information, refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).
44. Install the fender splash shields.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
45. Attach the BJB wiring harness to the bulkhead.
 - Connect the electrical connectors.
 - Install the grommet.
46. Install the battery ground cable.
 - Attach the additional ground cable.
 - Tighten the nut to 25 Nm (18 lb.ft).
47. Secure the BJB to the bracket.
 - Tighten the bolt to 6 Nm (4 lb.ft).
48. Connect the heater motor electrical connector.
49. Connect the ground cables to the lower A-pillar.
 - Tighten the nut to 10 Nm (7 lb.ft).
50. Install the CJB bracket.
 - Tighten the nuts to 10 Nm (7 lb.ft).
 - Secure the clips.
 - Connect the electrical connectors.
 - Tighten the bolts to 25 Nm (18 lb.ft).
51. Install the CJB.
For additional information, refer to: [Central Junction Box \(CJB\)](#) (418-00 Module Communications Network, Removal and Installation).
52. Connect the battery positive cable to the BJB.
 - Tighten the nut to 25 Nm (18 lb.ft).
53. Install the BJB cover.
 - Secure the clip.

- 54.** Install the ECM.
 - Install the ECM top cover.
- 55.** Install the ECM cover.
 - Tighten the Torx screws.
 - Connect the electrical connectors.
- 56.** Install the auxiliary battery tray.

For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
- 57.** Install the battery tray.

For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
- 58.** Install the four-wheel drive control module.

For additional information, refer to: [Four-Wheel Drive \(4WD\) Control Module](#) (308-07A Four-Wheel Drive Systems, Removal and Installation).
- 59.** Install the air cleaner assembly.

For additional information, refer to: [Air Cleaner](#) (303-12C Intake Air Distribution and Filtering - V6 4.0L Petrol, Removal and Installation).
- 60.** Install the radiator grille.

For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
- 61.** Install the ignition coils.

For additional information, refer to: [Ignition Coil](#) (303-07A Engine Ignition - V6 4.0L Petrol, Removal and Installation).
- 62.** Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
- 63.** Check the headlamp beam alignment.

For additional information, refer to: [Headlamp Adjustment](#) (417-01 Exterior Lighting, General Procedures).

Installation

1. To install, reverse the removal procedure.

Module Communications Network - Battery Junction Box (BJB)TDV6 2.7L Diesel

Removal and Installation

Removal

- NOTE: The BJB is an integral component of the engine compartment wiring harness and cannot be removed separately.

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).
2. Make the SRS system safe.
For additional information, refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).
3. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 3.0L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Remove the radiator grille.
For additional information, refer to: [Radiator Grille](#) (501-08 Exterior Trim and Ornamentation, Removal and Installation).
5. Remove the air cleaner assembly.
For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).
6. Remove the four-wheel drive control module.
For additional information, refer to: [Four-Wheel Drive \(4WD\) Control Module](#) (308-07A Four-Wheel Drive Systems, Removal and Installation).
7. Remove the battery tray.
For additional information, refer to: [Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
8. Remove the auxiliary battery tray.
For additional information, refer to: [Auxiliary Battery Tray](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
9. Remove the ECM cover.
 - Disconnect 2 electrical connectors for access.
 - Disconnect the 2 ECM electrical connectors.
 - Remove the 4 Torx screws.

10. Remove the ECM.
 - Remove the ECM top cover.
 - Release the clip.

12. Disconnect the battery positive cable from the BJB.

- Remove the nut.

13. Remove both cowl side trim panels.

For additional information, refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

14. Remove the CJB.

For additional information, refer to: [Central Junction Box \(CJB\)](#) (418-00 Module Communications Network, Removal and Installation).

15. Release the CJB bracket.

- Release the 3 upper wiring harness clips.
- Remove the 2 bolts.

16. Remove the CJB bracket.

- Disconnect the 2 electrical connectors.
- Release the 3 lower wiring harness clips.
- Remove the 2 nuts.

17. Release the 2 ground cables from the lower A-pillar.

- Remove the nut.

E55292

18. Disconnect the heater motor electrical connector.

E55293

19. Release the BJB from the bracket.

- Remove the bolt.

E55296

20. Remove the battery ground cable.

- Remove the nut.
- Release the additional ground cable.

21. Release the BJB wiring harness from the bulkhead.

- Disconnect the 6 electrical connectors.
- Release the grommet.

22. Raise and support the vehicle.

23. Remove both front fender splash shields.

For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

24. Remove both headlamps.

For additional information, refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).

25. Passenger side: Disconnect the engine wiring harness electrical connector.

26. Passenger side: Disconnect the transfer case electrical connector.

27. LH side: Release the wiring harness from the fuel fired heater.

- Disconnect the 3 electrical connectors.
- Release the 3 clips.

28. LH side: Disconnect the washer jet hose.

29. LH side: Disconnect the adaptive front lighting control module electrical connector.

Vehicles with auxiliary climate control

30. LH side: Release the A/C lines from the body panel.
All vehicles

- Remove the nut.

31. LH side: Disconnect the 3 body panel electrical connectors.

32. LH side: Release the 3 body panel ground cables.

- Remove the nut.

33. LH side: Release the 2 air suspension pipes from the wiring harness.

- Release the 7 clips.

34. LH side: Disconnect the ABS electrical connector.

35. LH side: Release 3 engine compartment ground cables.

- Remove the 3 nuts.
- Release the 2 clips.

E55302

36. LH side: Release the washer reservoir wiring harness.

- Disconnect the 3 electrical connectors.
- Disconnect the 2 washer jet hoses.

E55303

37. LH side: Disconnect the coolant expansion tank level switch electrical connector.

E55304

38. LH side: Disconnect the brake pad wear sensor electrical connector.

39. LH side: Release the wiring harness.

- Release the grommet.
- Release the 4 clips.

40. Remove the windshield wiper motor.
For additional information, refer to: [Windshield Wiper Motor](#) (501-16 Wipers and Washers, Removal and Installation).

41. Remove the hood pad.

- Remove the 11 clips.

42. Release the hood wiring harness.

- Disconnect the 2 washer jet hoses.
- Disconnect the 2 electrical connectors.
- Release the 10 clips.
- Remove the wiring harness cover.
- Release the grommet.

43. NOTE: 4.0L illustration shown, 2.7L Diesel is similar.

Disconnect the A/C pressure transducer electrical connector.

44. NOTE: 4.0L illustration shown, 2.7L Diesel is similar.

Disconnect the battery to engine compartment wiring harness electrical connector.

45. NOTE: 4.0L illustration shown, 2.7L Diesel is similar.

Release the wiring harness from the plenum.

- Release the 2 clips.
- Remove the 3 nuts.

46. Disconnect the brake fluid reservoir electrical connector.

47. Disconnect the ABS module electrical connector.

48. Remove the air suspension control module.

For additional information, refer to: [Air Suspension Control Module](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

49. Driver side: Disconnect 2 electrical connectors from the lower A-pillar.

50. Driver side: Release the wiring harness from the bulkhead.

- Release the grommet.

Vehicles with auxiliary heating

51. RH side: Release the heater pipes from the body panel.

- Remove the nut.

All vehicles

52. RH side: Disconnect the 3 body panel electrical connectors.

53. RH side: Release the 3 body panel ground cables.

- Remove the nut.

54. RH side: Disconnect the ABS electrical connector.

55. RH side: Release the air suspension pipe from the wiring harness clip.

56. RH side: Release 2 engine compartment ground cables.

- Remove the 2 nuts.

57. Disconnect the ambient air temperature sensor electrical connector.

58. Disconnect both front impact severity sensor electrical connectors.

- Release the 3 clips.

59. RH side: Release the wiring harness.

- Release the 9 clips.

E55320

60. Disconnect the hood switch electrical connector.

61. Disconnect both horn electrical connectors.

E55331

62. If installed, disconnect the speed control module electrical connector.

63. If installed, disconnect the pollution sensor electrical connector.

- Release the clip.
- Release the grommet.

64. NOTE: 4.0L illustration shown, 2.7L Diesel is similar.

Release the hood release cable.

- Release from the 3 clips.

65. Disconnect the front bumper wiring harness electrical connector.

66. With assistance, remove the BJB and wiring harness.

Installation

All vehicles

1. With assistance, install the BJB and wiring harness.
2. Connect the front bumper wiring harness electrical connector.
3. Attach the hood release cable.
 - Secure with the clips.
4. If installed, connect the pollution sensor electrical connector.
 - Install the grommet.
 - Secure the clip.
5. If installed, connect the speed control module electrical connector.
6. Connect the horn electrical connectors.
7. Connect the hood switch electrical connector.
8. RH side: Secure the wiring harness.
 - Secure the clips.
9. Connect both front impact electrical connectors.
 - Secure the clips.
10. RH side: Attach the air suspension pipe.
11. Connect the ambient air temperature sensor electrical connector.
12. RH side: Attach the engine compartment ground cables.

- Tighten the nuts to 25 Nm (18 lb.ft).

13. RH side: Connect the ABS electrical connector.

14. RH side: Attach the body panel ground cables.

- Tighten the nut to 25 Nm (18 lb.ft).

15. RH side: Connect the body panel electrical connectors.

Vehicles with auxiliary heating

16. RH side: Secure the heater pipes to the body panel.

- Tighten the nut to 10 Nm (7 lb.ft).

All vehicles

17. Driver side: Attach the wiring harness to the bulkhead.

- Install the grommet.

18. Driver side: Connect the lower A-pillar electrical connectors.

19. Install the air suspension control module.

For additional information, refer to: [Air Suspension Control Module](#) (204-05 Vehicle Dynamic Suspension, Removal and Installation).

20. Connect the ABS module electrical connector.

21. Connect the brake fluid reservoir electrical connector.

22. Attach the wiring harness to the plenum.

- Secure the clips.
- Tighten the nuts to 4 Nm (3 lb.ft).

23. Connect the battery to engine compartment wiring harness electrical connector.

24. Connect the A/C pressure transducer electrical connector.

25. Attach the hood wiring harness.

- Install the grommet.
- Install the cover.
- Secure with the clips.
- Connect the electrical connectors.
- Connect the washer jet hoses.

26. Install the hood pad.

- Install the clips.

27. Install the windshield wiper motor.

For additional information, refer to: [Windshield Wiper Motor](#) (501-16 Wipers and Washers, Removal and Installation).

28. LH side: Attach the wiring harness.

- Install the grommet.
- Secure the clips.

29. LH side: Connect the brake pad wear sensor electrical connector.

30. LH side: Connect the coolant expansion tank level switch electrical connector.

31. LH side: Attach the washer reservoir wiring harness.

- Connect the washer jet hoses.
- Connect the electrical connectors.

33. LH side: Attach the engine compartment ground cables.

33. LH side: Connect the ABS electrical connector.

34. LH side: Attach the air suspension pipes.

35. LH side: Attach the body panel ground cables.

- Secure the clips to 25 Nm (18 lb.ft).

- Tighten the nut to 25 Nm (18 lb.ft).

36. LH side: Connect the body panel electrical connectors.

Vehicles with auxiliary climate control

37. LH side: Secure the A/C lines to the body panel.

- Tighten the nut to 10 Nm (7 lb.ft).

All vehicles

38. LH side: Connect the adaptive front lighting control module electrical connector.

39. LH side: Connect the washer jet hose.

40. LH side: Attach the wiring harness to the fuel fired heater.

- Connect the electrical connectors.
- Secure with the clips.

41. Passenger side: Connect the transfer case electrical connector.

42. Passenger side: Connect the engine wiring harness electrical connector.

43. Install the headlamps.

For additional information, refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).

44. Install the fender splash shields.

For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

45. Attach the BJB wiring harness to the bulkhead.

- Connect the electrical connectors.
- Install the grommet.

46. Install the battery ground cable.

- Attach the additional ground cable.
- Tighten the nut to 25 Nm (18 lb.ft).

47. Secure the BJB to the bracket.
