Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all diagnostic trouble codes (DTCs) that could be logged in the Navigation Control Module (NCM) - India & Israel, for additional diagnosis and testing information refer to the relevant diagnosis and testing section.

For additional information, refer to: [Navigation System](#) (419-07 Navigation System, Diagnosis and Testing).

General Information - Diagnostic Trouble Code (DTC) Index DTC: Navigation Control Module (NCM) - Extended Markets

Description and Operation

Navigation Control Module (NCM)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Navigation Control Module (NCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

Clear DTC and retest • If the DTC is still logged suspect the parking aid control module
U3000-56	Control Module - Invalid / incomplete configuration	<ul style="list-style-type: none"> • Parking aid control module - Configuration error • No calibration file loaded 	<ul style="list-style-type: none"> • Using the manufacturers approved diagnostic system download and install the latest released calibration file for the vehicle. Clear DTC and retest • If the DTC is still logged suspect the parking aid control module
U3000-63	Control Module - Circuit/component protection time-out	<ul style="list-style-type: none"> • Parking aid control module internal circuit protection routine has deactivated the module following detection of repeated parking aid sensor short circuit faults 	 <p>NOTE: This DTC is only logged if the control module has detected persistent parking aid sensor short circuit faults. Ensure that all circuit faults have been resolved before proceeding with the reset short protection routine</p> <ul style="list-style-type: none"> • Check for related parking aid sensor circuit fault DTCs and ensure all parking aid sensor faults are resolved • Using the manufacturer approved diagnostic system, clear the DTCs and perform routine - Reset/Clear Specified Function (Reset Short Protection) (0x040E)

General Information - Diagnostic Trouble Code (DTC) Index DTC: Proximity Camera Control Module (PCCM)

Description and Operation

Proximity Camera Control Module (PCCM)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Proximity Camera Control Module (PCCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: [Parking Aid](#) (413-13 Parking Aid, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B100E-29	Video Input "A" signal - Signal invalid	<ul style="list-style-type: none"> Video out circuit short circuit to ground, open circuit, high resistance 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check the video out circuit for short circuit to ground, open circuit, high resistance

Refer to the electrical circuit diagrams and check the proximity camera control module power and ground circuits for open circuit, high resistance

General Information - Diagnostic Trouble Code (DTC) Index DTC: Rear Differential Control Module (RDCM)

Description and Operation

Rear Differential Control Module (RDCM)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Rear Differential Control Module (RDCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: [Rear Drive Axle and Differential](#) (205-02 Rear Drive Axle/Differential, Diagnosis and Testing).

General Information - Diagnostic Trouble Code (DTC) Index DTC: Rear Seat Entertainment Control Module (RSECM)

Description and Operation

Rear Seat Entertainment Control Module (RSECM)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Rear Seat Entertainment Control Module (RSECM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: [Information and Entertainment System](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B100F-29	Video Input "B" - Signal invalid	<p>NOTE: Circuit reference AUX PANEL VIDEO IN / AUX PANEL VIDEO GND</p> <ul style="list-style-type: none"> Auxiliary video in circuit short circuit to ground, short circuit to power, open circuit, high resistance Auxiliary device internal failure Rear seat entertainment control module internal failure 	<p>NOTE: This DTC can only set when routine - Test Composite Video Blanking and Synchronisation Input (0x6015) - is run and fails</p> <ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check the auxiliary video in circuit for short circuit to ground, short circuit to power, open circuit, high resistance Connect a known functional video signal source to the audio video input/output panel and select this source using the rear seat entertainment remote control. General Information - Diagnostic Trouble Code (DTC) Index DTC: Rear View Camera (RVC)

Description and Operation

Rear View Camera (RVC)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Rear View Camera (RVC). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: [Parking Aid](#) (413-13 Parking Aid, Diagnosis and Testing).

Description and Operation

Restraints Control Module (RCM)

WARNING: TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BACKUP POWER SUPPLY MUST BE DEPLETED BEFORE REPAIRING OR REPLACING ANY AIR BAG SUPPLEMENTAL RESTRAINT SYSTEM (SRS) COMPONENTS. TO DEplete THE BACKUP POWER SUPPLY ENERGY, DISCONNECT THE BATTERY GROUND CABLE AND WAIT ONE MINUTE. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN PERSONAL INJURY.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

Given the legal implications of a restraints system failure, harness repairs to the restraints control module circuits are not acceptable. Where the text refers to "REPAIR the circuit", this will normally mean the replacement of a harness.

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Restraints Control Module (RCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: [Air Bag Supplemental Restraint System \(SRS\)](#) (501-20B Supplemental Restraint System, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B0001-11	Driver Frontal Stage 1 Deployment Control - Circuit short to ground	<p>NOTE: Circuit reference DR AIRBAG F1 / DR AIRBAG R1</p> <ul style="list-style-type: none"> Driver airbag (stage 1) circuit short circuit to ground 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for short circuit to ground. General Information - Diagnostic Trouble Code (DTC) Index DTC: Satellite Radio Control Module (SRCM)

Description and Operation

Satellite Radio Control Module (SRCM)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Satellite Radio Control Module (SRCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: Information and Entertainment System (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

General Information - Diagnostic Trouble Code (DTC) Index DTC: Terrain Response Switchpack (TR)

Description and Operation

Terrain Response Switchpack (TR)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMS which may be valid for the specific customer complaint and carry out the recommendations as required.

There are references to "power latch" within the DTC index. This is where the module must be reset by means of a complete power down and power up.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Terrain Response Switchpack (TR). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: [Ride and Handling Optimization](#) (204-06 Ride and Handling Optimization, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
C1A00-46	Control Module - Calibration/parameter memory failure	<ul style="list-style-type: none"> The terrain response switchpack has indicated a calibration/parameter memory failure for embedded systems using FLASH memory. This is equivalent to EEPROM in RAM/ROM/EEPROM embedded systems Corruption in the non-volatile memory storage system (EEPROM) in the 	<ul style="list-style-type: none"> Rectify this DTC before attempting to rectify others. Record all DTCs logged and clear them. With ignition on select a terrain response special program, turn off the ignition, then turn back on the ignition and verify the selected special program is still active. If the selected terrain response special program is still not active and has returned to the general program, confirm if DTC has returned. Repeat procedure again once more. If DTC is still present install a new terrain response switchpack

		terrain response switchpack	
C1A01-96	LED - Component internal failure	<ul style="list-style-type: none"> • Terrain response switchpack internal failure 	 <p>NOTE: If the system is in 'failsafe default' mode due to another issue, no LEDs will illuminate. This fault does not cause the system to go to 'failsafe default' mode.</p> <ul style="list-style-type: none"> • Using the manufacturer approved diagnostic system, clear the DTCs. Operate the terrain response switchpack to select each special programme. Check each LED illuminates as appropriate. If the fault persists, install a new terrain response switchpack
C1A02-94	Rotary Encoder Stuck In Intermediate Position - Unexpected operation	<ul style="list-style-type: none"> • The terrain response switchpack is held in an intermediate position (between the special programmes) for more than 60 seconds • Foreign object preventing correct operation of terrain response switchpack • Mechanical damage to the terrain response switchpack 	 <p>NOTE: Suspect driver error do not replace the terrain response switchpack</p> <ul style="list-style-type: none"> • Check for foreign object preventing correct operation of terrain response switchpack. Start the vehicle engine, rotate the terrain response switchpack until it has located a genuine detent, wait 60 seconds. Stop the vehicle engine, clear the DTC and retest
U0001-88	High Speed CAN Communication Bus Off - Bus off	<ul style="list-style-type: none"> • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance 	<ul style="list-style-type: none"> • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. U2101-00	Control Module Configuration Incompatible - No sub type information	<ul style="list-style-type: none"> Car configuration file mismatch with vehicle specification Incorrect terrain response switchpack installed 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system, check and up-date the car configuration file as necessary Install a new terrain response switchpack as necessary

General Information - Diagnostic Trouble Code Index: Touch Screen DTC: Touch Screen (TS)

Description and Operation

Touch Screen (TS)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle

When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the warranty policy and procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system)

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the digital multimeter leads into account

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion

If diagnostic trouble codes are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals

Where an 'on demand self-test' is referred to, this can be accessed via the 'diagnostic trouble code monitor' tab on the manufacturers approved diagnostic system

The table below lists all diagnostic trouble codes (DTCs) that could be logged in the touch screen, for additional diagnosis and testing information refer to the relevant diagnosis and testing section.

For additional information, refer to: Information and Entertainment System (415-00, Diagnosis and Testing).

DTC	Description	Possible Cause	Action
B1087-83	LIN Bus "A" - Value of signal protection calculation incorrect	<ul style="list-style-type: none"> LIN bus to the rear view camera circuit short circuit to ground, short circuit to power, open circuit, high resistance 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and test the LIN bus circuit to the rear view camera for short circuit to ground, short circuit to power, open circuit, high resistance

Clear the DTC and retest the system
U0208-00	Lost Communication With "Seat Control Module A" - No sub type information	<ul style="list-style-type: none"> Lost communication with the driver seat module 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system, complete a CAN network integrity test Refer to the electrical circuit diagrams and test the power and ground connections to the driver seat module Refer to the electrical circuit diagrams and test the CAN circuit between the touch screen and the driver seat module for short circuit to ground, short circuit to power, open circuit, high resistance
U0209-00	Lost Communication With "Seat Control Module B" - No sub type information	<ul style="list-style-type: none"> Lost communication with the passenger seat module 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system, complete a CAN network integrity test Refer to the electrical circuit diagrams and test the power and ground connections to the passenger seat module Refer to the electrical circuit diagrams and test the CAN circuit between the touch screen and the passenger seat module for short circuit to ground, short circuit to power, open circuit, high resistance
U023B-00	Lost communication with image processing module B - No sub type information	<ul style="list-style-type: none"> Lost communication with the rear view camera 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system, complete a CAN network integrity test Refer to the electrical circuit diagrams and test the power and ground connections to the rear view camera Refer to the electrical circuit diagrams and test the CAN circuit between the touch screen and the rear view camera for short circuit to ground, short circuit to power, open circuit, high resistance
U025D-00	Lost communication with front controls interface module - No sub type information	<ul style="list-style-type: none"> Lost communication with the integrated control panel 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system, complete a CAN network integrity test Refer to the electrical circuit diagrams and test the power and ground connections to the integrated control panel Refer to the electrical circuit diagrams and test the CAN circuit between the touch screen and the integrated control panel for short circuit to ground, short circuit to power, open circuit, high resistance
U0300-00	Internal control module software incapability - No sub type information	<ul style="list-style-type: none"> Touch screen is not compatible with the vehicle 	<ul style="list-style-type: none"> Check the touch screen part number. Install the correct part as necessary. Check that the correct software is installed
U0300-51	Internal control module software incapability - Not programmed	<ul style="list-style-type: none"> Touch screen software incorrect or missing 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system, check the part numbers of the software installed. Re-configure the touch screen with the latest level software as necessary
U1A24-87	MOST ring complete. No Communication - Missing message	<ul style="list-style-type: none"> MOST ring complete MOST ring node internal fault 	<p> NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported an information and entertainment system concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis</p> <ul style="list-style-type: none"> Refer to the electrical circuit diagrams and test the MOST ring for fault, bypass each MOST module in turn to isolate faulty node
U2003-87	Fibre optic communication bus - Missing message	<ul style="list-style-type: none"> MOST ring incomplete 	<ul style="list-style-type: none"> Check MOST ring for disconnected modules or fibreoptic cable concerns

U3000-4B	Control module - Over temperature	<ul style="list-style-type: none"> • Touch screen panel backlight - High temperature detected 	<ul style="list-style-type: none"> • Allow the system to cool, clear the diagnostic trouble code and check/monitor system for re-occurrence, if DTC re-occurs, check and install a new touch screen as necessary
U3000-98	Control module - Component or system over temperature	<ul style="list-style-type: none"> • System shut down request from another module on MOST ring • MOST module - Internal temperature over limit 	<ul style="list-style-type: none"> • This DTC is logged if the touch screen display control module receives a system shut down request from another MOST module that is registering as over temperature. Allow the system to cool, clear the diagnostic trouble code and check/monitor system for re-occurrence • If DTC re-occurs, refer to the electrical circuit diagrams and check each MOST module for signs of overheating and related DTCs and refer to the relevant DTC index
U3003-62	Battery voltage - Signal compare failure	<ul style="list-style-type: none"> • Mis-match between the supply voltage to the touch screen and the battery voltage value broadcast on the CAN bus 	<ul style="list-style-type: none"> • Refer to the electrical circuit diagrams and test the power and ground circuits to the touch screen compared to battery voltage

General Information - Diagnostic Trouble Code (DTC) Index DTC: Transfer Case Control Module (TCCM)

Description and Operation

Transfer Case Control Module (TCCM)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Transfer Case Control Module (TCCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual

For additional information, refer to: [Transfer Case](#) (308-07C Transfer Case - Vehicles With: Twin Speed Transfer Case, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
P0560-00	System Voltage - No sub type information	<ul style="list-style-type: none"> Transfer case control module power or ground circuit open circuit, high resistance Battery/charging system fault Transfer case control module internal failure 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system, check datalogger signal - ECU Power Supply Voltage (0xD111). Refer to the electrical circuit diagrams and check the transfer case control module power and ground circuits for open circuit, high resistance Refer to the relevant section of the workshop manual and test the battery and charging system Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new transfer case control module and perform routine - Transfer Case Replacement
P0561-00	System Voltage Unstable - No sub type information	<ul style="list-style-type: none"> Transfer case control module power or ground circuit open circuit, high resistance Battery/charging 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system, check datalogger signal - ECU Power Supply Voltage (0xD111). If the fault persists, install a new transfer case control module and perform routine - Transfer Case Replacement
U3003-62	Battery Voltage - Signal compare failure	<ul style="list-style-type: none"> Mismatch between the voltage at the transfer case control module and the voltage value broadcast on the CAN bus 	<ul style="list-style-type: none"> Using the manufacturer approved diagnostic system, check datalogger signal - ECU Power Supply Voltage (0xD111) - and compare it to battery voltage. Refer to the electrical circuit diagrams and check the transfer case control module power and ground circuits for open circuit, high resistance

General Information - Diagnostic Trouble Code (DTC) Index DTC: Transmission Control Module (TCM)

Description and Operation

Transmission Control Module (TCM)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

If a failure condition is reported indicating the need to renew the transmission assembly on a vehicle that remains under manufacturer warranty, an authorisation request must first go through the warranty prior approval programme before any work is begun

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Transmission Control Module (TCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: Diagnostics (307-01A, Diagnosis and Testing).

DTC	Description	Possible Causes	Action

Refer to the electrical circuit diagrams and check the transmission control module power and ground circuits for open circuit, high resistance • Refer to the relevant section of the workshop manual and test the battery and charging system

General Information - Diagnostic Trouble Code (DTC) Index DTC: Transmission Control Switch (TCS)

Description and Operation

Transmission Control Switch (TCS)

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Transmission Control Switch (TCS). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: External Controls (307-05 Automatic Transmission/Transaxle External Controls - TDV6 3.0L Diesel/V8 5.0L Petrol, Vehicles With: 6HP28 6-Speed Automatic Transmission, Diagnosis and Testing).

Refer to the electrical circuit diagrams and check the transmission control switch power and ground circuits for open circuit, high resistance

General Information - Diagnostic Trouble Code (DTC) Index DTC: TV Control Module (TVCM) - Digital

Description and Operation

Television Control Module (TVCM) - Digital

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Television Control Module (TVCM) - Digital. For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: [Information and Entertainment System](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

General Information - Diagnostic Trouble Code (DTC) Index DTC: TV Control Module (TVCM) - Hybrid

Description and Operation

TV Control Module (TVCM) - Hybrid

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the TV Control Module (TVCM) - Hybrid. For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: [Information and Entertainment System](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

General Information - Diagnostic Trouble Code (DTC) Index DTC: TV Control Module (TVCM) - Conditional Access System

Description and Operation

TV Control Module (TVCM) - Conditional Access System

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

When probing connectors to take measurements in the course of the pinpoint tests, use the adapter kit, part number 3548-1358-00.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the TV Control Module (TVCM) - Conditional Access System. For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: [Information and Entertainment System](#) (415-00 Information and Entertainment System - General Information, Diagnosis and Testing).

General Information - Diagnostic Trouble Code (DTC) Index DTC: Wade Aid Control Module (WACM)

Description and Operation

General Proximity Sensor Module (GPSM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMS which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the General Proximity Sensor Module (GPSM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

DTC	Description	Possible Causes	Action

Refer to the electrical circuit diagrams and check the general proximity sensor module power and ground circuits for open circuit, high resistance Refer to the relevant section of the workshop manual and test the battery and charging system

Identification Codes - Identification Codes

Description and Operation

VIN Number

The VIN number will be found in three locations:

- **1.** Stamped on the side of the RH longitudinal member, rearward of the body front mounting.
- **2.** At the bottom of the windshield glass on the LH side of the vehicle and visible from the outside.
- **3. UK, Europe and ROW - Not NAS/Canada** - On the VIN plate attached to the bonnet locking platform.
- **4. NAS/Canada** - On the Tire Data/Specification label attached to the front of the LH B-pillar.

Longitudinal Member VIN

E54942

Windscreen VIN - ROW

Windscreen VIN - China

VIN number - UK, EU and ROW

VIN Position	Character	Identifies
1 - 3 - World identifier	SAL	Jaguar Land Rover Limited
4,5 - Vehicle type	LA	Land Rover - Discovery
6 - Class	A	Standard

3.0 litre V6 Diesel Engine Serial Number

E120570

3.0 Litre V6 Diesel Engine Serial Number is stamped on the RH side of the cylinder block.

2.7 Litre V6 Diesel Engine Serial Number

E54949

The 2.7 Litre V6 Diesel Engine Serial Number is stamped on the RH side of the cylinder block.

5.0 Litre NA V8 and 3.0 Litre SC Petrol Engine Serial Number

E124686

The 5.0 Litre NA V8 and 3.0 Litre SC Petrol Engine Serial Number is stamped on the LH side of the cylinder block.

Automatic Gearbox Serial Number

E120916

The Automatic Gearbox Serial Number is stamped on the rear LH side of the gearbox casing.

Front Differential Serial Number

E124738

The Front Differential Serial Number is stamped on the underside of the differential casing and is located above the removable cross member.

Rear Differential Serial Number

E124739

The Rear Differential Serial Number is stamped on the underside of the differential casing adjacent to the front mounting.

Twin Speed Transfer Case Serial Number

E120914

The twin speed transfer case serial number is stamped on the right side of the transfer case and may also be on a bar coded self-adhesive label attached to the case.

Single Speed Transfer Case Serial Number

The Single Speed Transfer Case serial number is stamped on the lower right side of the transfer case and may also be on a bar coded self-adhesive label attached to the case.

Identification Codes - Identification Codes

Description and Operation

Commission plate

E102702

The commission plate is mounted on the locking platform of the engine compartment lid.

The plate contains the:

- contact details for Land Rover Special Vehicles
- paint code
- contract number
- commission date of the vehicle.

Jacking and Lifting - Vehicle Recovery

Description and Operation

Towing/Lashing eyes

CAUTION: The single towing/lashing eyes at the front and rear of the vehicle are designed for vehicle recovery purposes only and **MUST** not be used to tow a trailer or caravan.

The front towing/lashing eye is accessible after releasing the 9 toggle fasteners securing the towing eye access panel and removing the panel.

CAUTION: Ensure that during towing, the towing attachment does not contact the bumper.

The rear towing/lashing eye 'A' is accessible after releasing the 2 fasteners securing the access panel to the bumper and removing the panel.

CAUTION: This towing/lashing eye should only be used for towing another vehicle or for recovery purposes to enable this vehicle to be positioned in order that the front towing eye may be used for recovery/towing.

4 Wheel Towing

CAUTIONS:

Suspended towing of this vehicle **MUST NOT** be attempted, if 4 wheel towing is not possible, vehicle must be recovered on a suitable trailer.

The vehicle may be towed for a maximum of 3 hours or 90 miles (150 km) at a maximum speed of 30 mph (50 km/h), these limits **MUST NOT** be exceeded.

The following procedures must be followed to ensure that the vehicle is towed in a safe condition and damage to the vehicle transmission system is prevented.

1. Remove the front towing/lashing eye access panel.
2. Secure the towing attachment from the recovery vehicle to the towing/lashing eye.

CAUTION: Ensure that the towing attachment will not contact the front bumper during towing.

3. Apply the parking brake.
4. Insert ignition key and turn the ignition switch to position 'II'.
5. **Manual gearbox:** Apply the footbrake and position the gear lever in 'N' - Neutral.

CAUTION: If 'N' - Neutral cannot be selected, front and rear propeller shafts must be removed before vehicle is towed.

6. **Automatic gearbox:** Apply the footbrake and move the selector lever to the 'N' Neutral position.

NOTE: If electrical power is not available, use the manual interlock release tab on the selector lever to move the selector lever to the Neutral position.

All vehicles

7. Select 'H' - HIGH on the transfer box.

CAUTION: If electrical power is not available, and 'H' - HIGH cannot be selected, the vehicle may not be towed but must be recovered on a suitable trailer. If, however, transfer box was in 'H' - HIGH when electrical power was lost, vehicle may still be towed.

8. Release the parking brake.

NOTE: If electrical power is not available, it will be necessary to release the parking brake manually using the following procedures:

NOTE: Left hand drive illustrated, right hand drive on opposite side of centre console.

9. Lift out the coin tray from the centre console
10. Remove the access panel from the centre console.
11. Locate the electric parking brake release cable, insert a suitable tool through the cable eye and pull the cable upwards to release the parking brake.

CAUTION: The electric parking brake will not function until electrical power is restored it will, therefore, be necessary to chock the wheels when vehicle is at a standstill.

WARNING: Do not release the parking brake until towing is about to commence. Whilst towing, do not attempt to remove the ignition key and do not turn the key to any position other than 'II'. With the engine switched off, the power assisted steering system and brake booster will be inoperative thereby resulting in an increase in the effort required to turn the steering wheel and apply the brakes.

CAUTION: The vehicle tow connections should only be used in normal road conditions, 'snatch' recovery must be avoided.

On completion of 4 wheel towing

1. Apply the parking brake or if electrical power is not available, securely chock the wheels.
2. Detach towing equipment from towing/lashing eyes.
3. Fit the towing eye access panel and secure the toggle fasteners.

Transporting by trailer

CAUTION: Use the towing/lashing eyes at the front and rear of the vehicle, DO NOT secure lashing hooks or restraints to any other part of the vehicle.

Position the vehicle, apply the parking brake and select 'N' - Neutral on the manual or automatic gearbox selector lever

CAUTION: If electrical power is not available and the parking brake is released, it will not be possible to re-apply the parking brake. It will, therefore be necessary to select 1st gear - manual gearbox or 'P' Park - automatic gearbox and ensure that the vehicle wheels are adequately chocked to prevent vehicle movement.

Jacking and Lifting - Jacking

Description and Operation

General

WARNING: The following instructions must be adhered to before raising the vehicle off the ground:

- Position vehicle on a solid, level surface.
- Apply the parking brake.
- Select 'P' - PARK on automatic transmission selector or 1st gear on manual transmission and 'H' High on transfer case.

WARNING: If the drive shaft(s) are to be disconnected, it will be necessary to raise all four wheels off the ground in order that the shaft(s) can be rotated. DO NOT use the customer jack and ensure that the vehicle is adequately supported on axle stands. With the vehicle raised, it will be necessary to release the park brake and select Neutral - 'N' in the main transmission to enable the drive shaft(s) to be rotated

CAUTIONS:

To avoid damage to the underbody components of the vehicle, the following instructions must be adhered to:

Do not position jacks or axle stands under the following components:

- Body structure other than any approved jacking or lifting points
- Bumpers
- Fuel lines
- Fuel tank
- Brake lines
- Front or rear suspension arms
- Steering linkage
- Transfer case
- Front or rear differential units
- Transmission
- Engine oil pan - See note below

NOTE: For certain repair operations, it may be necessary to support the engine under the oil pan. In this case, a block of hardwood or a rubber pad must be positioned on the jack lifting pad to protect the oil pan.

Vehicle jack

The jack provided with the vehicle is only intended for use in an emergency such as changing a tire. DO NOT use the jack for any other purpose. Refer to the Owner's Handbook for the vehicle jack location points and jacking procedures.

WARNING: Never work under a vehicle supported solely by the vehicle jack.

Hydraulic jack

A hydraulic jack with a minimum lifting capacity of 1500 kg, (3,300 lbs) must be used.

WARNINGS:

Do not commence work on the underside of the vehicle until suitable axle stands have been placed in the correct position.

Always chock the wheels when jacking. The parking brake may be ineffective when the wheel(s) are off the ground.

Raising and Supporting the Vehicle

To assist in raising the vehicle, jacking points are provided as shown in the following illustrations.

Raising the Front of the Vehicle

Apply the parking brake.

Select 'P' - PARK on automatic transmission selector.

WARNING: Always chock the rear wheels when jacking the front of the vehicle.

Position the lifting pad of the hydraulic jack in the centre of the recess in the engine undershield.

NOTE: If the engine undershield has been removed, position the jack lifting pad in the centre of the front cross beam.

With the vehicle raised to the desired height, position axle stands at positions shown.

E53784

CAUTION: Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

WARNING: Before commencing work on the underside of the vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Raising the Rear of the Vehicle

Select 'P' - PARK on automatic transmission selector.

WARNING: Always chock the front wheels when jacking the rear of the vehicle.

Position the lifting pad of the hydraulic jack under the centre of the rear cross member as shown.

! CAUTION: Take care that the lifting pad of the jack is of a suitable size to avoid damaging the heat shield. It is not advisable to use a spacer block between the lifting pad and the rear cross member as this may result in some vehicle instability.

E47486

With vehicle raised to desired height, position axle stands at positions shown.

! CAUTION: Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

! WARNING: Before commencing work on underside of vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Raising Vehicle - One Wheel/side

Apply the parking brake.

Select 'P' - PARK on automatic transmission selector.

! WARNING: Always chock the wheels which are not to be raised.

E47487

- **One front wheel** - position lifting pad of hydraulic jack beneath longitudinal member on the side to be raised at Point 'A'
- **One rear wheel** - position lifting pad of jack beneath longitudinal member on the side to be raised at Point 'B'
- **Front and rear wheels - ONE SIDE** - position lifting pad of jack beneath longitudinal member on the side to be raised at Point 'C'

NOTE: Point 'C' is in line with number 3 body mounting.

E47488

With vehicle at desired height, position axle stand(s) beneath longitudinal members and adjacent to the lifting pad of the jack at appropriate point(s) D.

CAUTION: Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

WARNING: Before commencing work on underside of vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Jacking and Lifting - Lifting

Description and Operation

Vehicle on Wheels - Four Post Ramp

WARNING: If the drive shaft(s) are to be disconnected, it will be necessary to raise all four wheels off the ramp in order that the shaft(s) can be rotated. If the wheel free facility is not to be used, raise the vehicle off the ramp using suitable equipment. With the vehicle raised, position axle stands in the positions shown for the front and rear support blocks - see illustration in Jacking. With the axle stands positioned, release the parking brake and select NEUTRAL 'N' in the transmission.

WARNING: Do not push the vehicle backwards and forwards along the ramp in order to gain access to the drive shaft fixings.

Position the vehicle on the ramp with the front and rear of the vehicle equidistant from the ends of the ramp. Chock the wheels, select NEUTRAL in the transmission and where practicable, apply the parking brake.

Wheel Free Lift - Four Post Ramp

NOTE: To enable the vehicle to be supported correctly on the wheel free longitudinals, it will be necessary to produce 2 off each of the support blocks to the dimensions given in the accompanying illustrations. The supporting part of each block must be manufactured from suitable hardwood or metal and the 'U' shaped base of each block must be manufactured from metal. Note that it is essential to ensure that the 'U' shaped base of each block is wide enough to fit over the wheel free longitudinals.

E48763

Front Support Block Dimensions

- 'A' = 127.0 mm (5.0 in)
- 'B' = 146.0 mm (5.75 in)
- 'C' = 89.0 mm (3.5 in)

E48764

Rear support block dimensions

- 'A' = 152.0 mm (6.0 in)
- 'B' = 101.0 mm (4.0 in)
- 'C' = 76.0 mm (3.0 in)

Raising and Supporting the Vehicle

1. Position vehicle on ramp.
2. Position suspension in 'off-road' height.
3. Apply parking brake.

4. Raise ramp to desired height.

E47489

5. Align the wheel free longitudinals beneath the body frame longitudinals and position the support blocks beneath the longitudinals in the positions shown.

CAUTION: Ensure that the front and rear support blocks are correctly oriented to front and rear of vehicle.

6. Engage wheel free and lower ramp slowly until weight of vehicle rests on support blocks and road wheels are just clear of ramp.

7. Ensure that the vehicle is correctly supported on all four support blocks, that blocks are still correctly positioned and are in full contact with the body frame longitudinals.

8. Lower the ramp.

WARNING: Make sure that the vehicle is stable before commencing work.

NOTE: Return the suspension to 'normal ride height' when the vehicle is removed from the ramp.

Two Post Lift

CAUTION: If the drive shaft(s) are to be removed, release the parking brake and select NEUTRAL 'N' in the transmission in order that the shaft(s) can be rotated when the vehicle is raised to the desired height.

1. Position the vehicle with the centre of the lift pillars aligned approximately with the front of the driver/passenger seat cushions.

E47489

2. Extend the lifting arms and position the pad of each lifting arm beneath the body frame longitudinal lifting points.

3. Raise the vehicle until the wheels are just clear of the ground and check that the pads of each lifting arm are still correctly positioned.

4. Raise the vehicle to the desired height.

5. Ensure that vehicle is correctly supported on all four lifting pads, that pads are still correctly positioned and are in full contact with the body frame longitudinals.

WARNING: Make sure that the vehicle is stable before commencing work.

Maintenance Schedules - Maintenance Schedules - Gasoline Engines

Description and Operation

CAUTIONS:

Always refer to the correct market Maintenance check sheet for the correct service scheduling.

Unless stated otherwise, the following operations must be carried out at every service interval. Note that the 'A' and 'B' Service Intervals listed on the 'Maintenance Check Sheet' for vehicles operating under arduous conditions, vary from those specified for vehicles operating under normal conditions. Reference must therefore, always be made to the 'Arduous Conditions Maintenance Check Sheet' for vehicles operating under these conditions.

NOTES:

Note that the A and B Services listed on the Maintenance Check Sheet, applicable to vehicles operating under arduous conditions, vary both in period and mileage (kilometres) to the intervals specified for those vehicles operating under normal conditions. Reference must therefore, always be made to the 'Arduous Conditions section' for vehicles operating under these conditions.

Some variation in the illustrations may occur, but the essential information is always correct.

Torque Specifications

Description	Nm	lb-ft
Seat frame fixing Torx screws	40	30
Seat belt fixing Torx screws	40	30
Road wheel nuts	140	103

Underbonnet View - 3.0 Litre

E162074

- 1. Engine oil filler cap
- 2. Brake fluid reservoir (LH drive illustrated - RH drive on opposite side)
- 3. Power steering fluid reservoir
- 4. Windshield washer reservoir
- 5. Coolant expansion tank

Maintenance Operations

Seats and Safety Belts

E45101

Front seat frame fixings

1. Carefully remove the trim panels covering the seat frame fixing Torx screws.
2. Check that the front seat frame fixing Torx screws are secure and that the seat frames show no signs of movement.
3. Reinstall the trim panels on completion.

E54837

Front seat frame fixings

4. Check that the rear seat frame front fixings are secure and that the seat frames show no signs of movement.

E54843

Front seat frame fixings

5. Fold the seat cushions forwards and check that the rear seat frame rear fixings are secure and that the seat frames show no signs of movement.

6. Fold the seat cushions back on completion.

Front seat controls

7. Check operation of all seat controls.

Safety belts

8. Fully extend each safety belt and check that it returns unassisted; repeat for all belts.

9. Check entire length of safety belt webbing for signs of fraying or damage; repeat for all belts.

10. Connect each safety belt to the correct buckle, check safety belt buckle and tongue are secure; check that buckle releases tongue correctly.

11. Check all safety belt and buckle mountings and fixings for security.

12. Check front safety belt height adjusters for correct operation.

Lamps, Horns and Warning Indicators

1. Check side, head, fog, reversing and tail lamps for correct operation.

2. Check operation of headlamp automatic levelling system - if installed.

3. Check turn signals and hazard warning lamps for correct operation.

4. Check brake (stop) lamps for correct operation.

5. Check all exterior lamp lenses for clarity and condition; pay particular attention to headlamp and fog lamp lenses for stone chips or damage.

6. Check horn for loud, clear sound.

7. Switch on headlamps and check that side/headlamp reminder warning sounds when door is opened.

8. Check operation of interior courtesy lamps.

9. Check operation of all instrument pack warning and indicator lamps.

Washers and Wipers

E54838

1. Check all wiper blades for condition and signs of splits or damage.
2. Check security of wiper arms.
3. Operate front and rear windshield washers, check that jets are clear and correctly aimed.
4. Operate front and rear wipers at all speeds and check for smooth, smear free operation.

Check High/Low Gear Engagement

1. Select LOW range gear, drive vehicle forwards 3 to 4 vehicle lengths, stop vehicle and select HIGH range gear - gears must engage smoothly.

Pollen Filter

1. Replace pollen filter.
For additional information, refer to: [Pollen Filter](#) (412-01 Air Distribution and Filtering, Removal and Installation).

Corrosion/Cosmetic Inspection

1. Carry out the annual corrosion/cosmetic inspection using the Annual Corrosion Inspection Sheet.

Wheels and Tires

1. Check that tires comply with manufacturer's specification.
For additional information, refer to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).
2. Check/adjust tire pressures including spare.
For additional information, refer to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).
3. **Vehicles with Uni-directional tires installed:** Mark the wheel to stud relationship of each road wheel and note location of each road wheel to its respective hub.
4. Loosen road wheel nuts. Raise vehicle to a wheel free condition.
For additional information, refer to: [Lifting](#) (100-02 Jacking and Lifting, Description and Operation).
5. Remove the road wheels.
6. Visually check tires for condition, lumps or bulges. Check tread depth across the width of the tire and around the circumference; make sure that remaining tread depth does not contravene local legislative requirements.

NOTE: Do not install wheels at this stage.

Braking System

E54872

1. Inspect front brake pads for wear.
For additional information, refer to: [Specifications](#) (206-03 Front Disc Brake, Specifications).
2. Inspect rear brake pads for wear.

For additional information, refer to: [Specifications](#) (206-04 Rear Disc Brake, Specifications).

3. Check brake calipers for signs of fluid leaks.
4. Check brake discs for condition.
5. Check all brake booster and brake system pipes and hoses for condition, chafing and leaks.
6. Clean road wheel hub spigots and apply grease, Land Rover Part Number RYL 105020 to the wheel mating surface of each spigot.
7. **Vehicles with Uni-directional tires installed:** Install road wheels to their respective hubs ensuring that stud to wheel relationship is maintained.
8. **Vehicles with NON uni-directional tires installed:** Install wheels on the opposite side of the vehicle but make sure that they on the same axle as they were originally installed.
9. Install road wheel nuts and tighten to 140 Nm (103 lb-ft).
10. Replace brake fluid.
For additional information, refer to: [Brake System Pressure Bleeding](#) (206-00 Brake System - General Information, General Procedures).

11. Replace all flexible brake hoses.

Electric Parking Brake

1. Check the adjustment of the electric parking brake.
For additional information, refer to: [Parking Brake Shoe and Lining Adjustment](#) (206-05 Parking Brake and Actuation, General Procedures).
2. **Vehicles operating under arduous conditions:** Check the condition of the electric parking brake system.

Road Wheel Speed Sensors

1. Inspect the road wheel speed sensor harnesses for damage.

Door Locks and Hinges

1. Check operation of all door locks, bonnet lock and fuel filler flap.
2. Lubricate all door check straps, bonnet catch and fuel filler flap catch.

Radiator and Cooling Fan

1. **Vehicles operating under arduous conditions:** Visually check radiator for external obstructions, check cooling fan blades for damage.

Cooling System

1. Check specific gravity of coolant using a hydrometer.

NOTE: A suitable hydrometer is available from the Equipment Programme under Part Number 511 3302 001 00.

2. Top-up cooling system if necessary.

For additional information, refer to: [Specifications](#) (303-03B Engine Cooling - V6 S/C 3.0L Petrol, Specifications).

CAUTION: Anti-freeze concentration must be maintained at 50%.

Cooling system - Check/Top-up

WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank whilst the system is hot.

CAUTION: Engine coolant will damage the paint finished surfaces. If coolant is spilled, immediately remove the coolant and wash the area with water.

1. Check the level of coolant in the expansion tank. With the engine cold, the coolant level must be to the '**UPPER LEVEL**' indicator mark above the '**COLD FILL RANGE**' text on the side of the expansion tank. Ignore any coolant which may be visible in the top section of the tank.

2. If topping-up is required, remove expansion tank filler cap and top-up coolant level to the '**UPPER LEVEL**' indicator mark.

For additional information, refer to: [Specifications](#) (303-03B Engine Cooling - V6 S/C 3.0L Petrol, Specifications).

CAUTION: Always top-up with a 50% mixture of anti-freeze and water.

3. Install expansion tank filler cap, tighten cap until ratchet is heard to 'click'.

Coolant - Replace

1. Replace the coolant.

For additional information, refer to: [Cooling System Partial Draining, Filling and Bleeding](#) (303-03B Engine Cooling - V6 S/C 3.0L Petrol, General Procedures).

Ignition System

1. Replace spark plugs.

For additional information, refer to: [Spark Plugs](#) (303-07B Engine Ignition - V6 S/C 3.0L Petrol, Removal and Installation).

Air Filtering

1. Replace the air filter element.

For additional information, refer to: [Air Cleaner Element](#) (303-12B Intake Air Distribution and Filtering - V6 S/C 3.0L Petrol, Removal and Installation).

Ancillary Drive Belt

1. Check the condition of the ancillary drive belt.

2. Remove all traces of mud and dirt from the drive belt and pulleys.

3. Check the drive belt for signs of splitting and wear.

4. Replace the ancillary drive belt.

For additional information, refer to: [Accessory Drive Belt](#) (303-05B Accessory Drive - V6 S/C 3.0L Petrol, Removal and Installation).

Fluid Levels

Brake fluid reservoir

E54845

1. Remove the auxiliary battery box cover.

2. Check the fluid level in the brake fluid reservoir, the level must be to the '**MAX**' mark on the reservoir; top-up if necessary.

3. Clean the area around the reservoir filler cap, remove cap.

4. If necessary, top-up using the recommended fluid to the '**MAX**' mark on the reservoir.

For additional information, refer to: [Specifications](#) (206-00 Brake System - General Information, Specifications).

5. Install the reservoir filler cap.

6. Install the auxiliary battery box cover.

Power steering fluid reservoir

E54846

! CAUTION: To prevent over filling, check/top-up the system with the engine switched off and the system cold. Make sure that the steering wheel is in the straight ahead position, do not turn the steering wheel prior to checking the fluid level.

1. Check that the fluid level is to the mid-way mark between the '**MAX**' and '**MIN**' marks on the fluid reservoir, top-up if necessary.
2. Clean the area around the reservoir filler cap, remove cap.
3. If necessary, top-up using the recommended fluid to the mid-way mark on the reservoir. For additional information, refer to: [Specifications](#) (211-02 Power Steering, Specifications).

! CAUTION: Do not fill reservoir above the '**MAX**' mark.

4. Install the reservoir filler cap.

Windshield washer reservoir

E54847

1. Remove the windshield washer reservoir filler cap.
2. Top-up the reservoir using a mixture of an approved windshield washer fluid and water until the level is to the bottom of the gauze filter in the reservoir filler neck.
3. Install the reservoir filler cap.

Engine Oil and Filter

1. Renew engine oil and filter - 3.0 litre engine.

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01B Engine - V6 S/C 3.0L Petrol, General Procedures) / [Specifications](#) (303-01B Engine - V6 S/C 3.0L Petrol, Specifications).

Automatic Transmission

1. Renew automatic transmission fluid.

For additional information, refer to: [Transmission Fluid Drain and Refill](#) (307-01 Automatic Transmission/Transaxle - TDV6 3.0L Diesel /V6 S/C 3.0L Petrol , Vehicles With: 8HP70 8-Speed Automatic Transmission AWD, General Procedures).

Transfer Case

1. Renew transfer case fluid.

For additional information, refer to: [Transfer Case Draining and Filling](#) (308-07B Transfer Case - Vehicles With: Single Speed Transfer Case, General Procedures) / [Transfer Case Draining and Filling](#) (308-07C Transfer Case - Vehicles With: Twin Speed Transfer Case, General Procedures).

Differential Assemblies

1. Renew front differential oil.

For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures) / [Specifications](#) (205-03 Front Drive Axle/Differential, Specifications).

2. Renew rear differential oil.

For additional information, refer to: [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures) / [Specifications](#) (205-02 Rear Drive Axle/Differential, Specifications).

Suspension and Body Mountings

1. Check for free play in all suspension and body mounting rubbers.

2. Check condition of suspension rubber boots and gaiters.

3. Lift the vehicle so that front wheels are clear of ground/ramp to enable insertion of a suitable lever (e.g. a 1200mm long steel tube). Check the lower ball joints for free play by placing the lever between the ground/ramp and the tire, and lifting the wheel assembly with the lever. A second person will be required to check simultaneously for any ball joint lift. If free play (knock) is noted in the ball joint, replacement is required.

Removable Tow Bar

1. Check condition of removable tow bar.

For additional information, refer to: [Tow Bar Mounting Check](#) (502-02 Full Frame and Body Mounting, General Procedures).

Fuel System

1. Check fuel system pipes, hoses and unions for chafing, leaks and corrosion.

Electrical Harnesses

1. Check all electrical harnesses for chafing.

Oil/Fluid Leaks

1. Check for oil/fluid leaks.

Exhaust System

1. Check exhaust system for leaks, security and damage.

Power Steering

1. Check power steering rod ball joint fixings, gaiters and condition of ball joints and dust covers.

2. Check power steering pipes, hoses and unions for chafing, leaks and corrosion.

Fault Lamp(s)

1. If fault lamp(s) are illuminated, test the associated system using approved Land Rover diagnostic equipment and report findings.

Road Test

1. Carry out road test of vehicle.

For additional information, refer to: [Road/Roller Testing](#) (100-00 General Information, Description and Operation).

General

1. Endorse Service Record.

2. Report any unusual features of vehicle condition and any additional work required.

Additional Items That May Require Attention

It is recommended that:

1. All brake fluid hydraulic seals are replaced.

NOTE: This is in addition to the maintenance requirement that flexible brake hoses **MUST** be replaced at this service interval.

2. After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry: The electric parking brake should be cleaned and inspected.

3. After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry: The ancillary drive belt should be cleaned and inspected.

4. Vehicles used in dusty or field conditions or deep wading: More frequent attention to the air cleaner will be required.

Maintenance Schedules - Maintenance Schedules - Diesel Engines

Description and Operation

CAUTIONS:

Always refer to the correct market Maintenance check sheet for the correct service scheduling.

Unless stated otherwise, the following operations must be carried out at every service interval. Note that the 'A' and 'B' Service Intervals listed on the 'Maintenance Check Sheet' for vehicles operating under arduous conditions, vary from those specified for vehicles operating under normal conditions. Reference must therefore, always be made to the 'Arduous Conditions Maintenance Check Sheet' for vehicles operating under these conditions.

NOTES:

Note that the A and B Services listed on the Maintenance Check Sheet, applicable to vehicles operating under arduous conditions, vary both in period and mileage (kilometres) to the intervals specified for those vehicles operating under normal conditions. Reference must therefore, always be made to the 'Arduous Conditions section' for vehicles operating under these conditions.

Some variation in the illustrations may occur, but the essential information is always correct.

Torque Specifications

Description	Nm	lb-ft
Seat frame fixing Torx screws	40	30
Seat belt fixing Torx screws	40	30
Road wheel nuts	140	103

Underbonnet View - 3.0 Litre

E123154

- 1. Brake/clutch fluid reservoir (RH drive illustrated - LH drive on opposite side)
- 2. Engine oil filler cap
- 3. Windshield washer reservoir
- 4. Coolant expansion tank
- 5. Power steering fluid reservoir

Maintenance Operations

Seats and Safety Belts

E45101

Front seat frame fixings

1. Carefully remove the trim panels covering the seat frame fixing Torx screws.
2. Check that the front seat frame fixing Torx screws are secure and that the seat frames show no signs of movement.
3. Reinstall the trim panels on completion.

E54837

Front seat frame fixings

4. Check that the rear seat frame front fixings are secure and that the seat frames show no signs of movement.

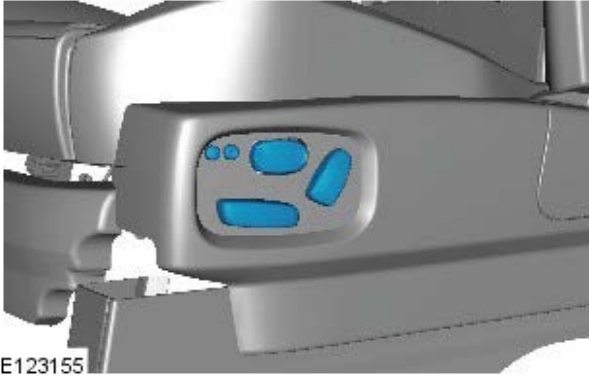

E54843

Front seat frame fixings

5. Fold the seat cushions forwards and check that the rear seat frame rear fixings are secure and that the seat frames show no signs of movement.

6. Fold the seat cushions back on completion.

Front seat controls

7. Check operation of all seat controls.

Safety belts

8. Fully extend each safety belt and check that it returns unassisted; repeat for all belts.

9. Check entire length of safety belt webbing for signs of fraying or damage; repeat for all belts.

10. Connect each safety belt to the correct buckle, check safety belt buckle and tongue are secure; check that buckle releases tongue correctly.

11. Check all safety belt and buckle mountings and fixings for security.

12. Check front safety belt height adjusters for correct operation.

Lamps, Horns and Warning Indicators

1. Check side, head, fog, reversing and tail lamps for correct operation.

2. Check operation of headlamp automatic levelling system - if installed.

3. Check turn signals and hazard warning lamps for correct operation.

4. Check brake (stop) lamps for correct operation.

5. Check all exterior lamp lenses for clarity and condition; pay particular attention to headlamp and fog lamp lenses for stone chips or damage.

6. Check horn for loud, clear sound.

7. Switch on headlamps and check that side/headlamp reminder warning sounds when door is opened.

8. Check operation of interior courtesy lamps.

9. Check operation of all instrument pack warning and indicator lamps.

Washers and Wipers

E54838

1. Check all wiper blades for condition and signs of splits or damage.
2. Check security of wiper arms.
3. Operate front and rear windshield washers, check that jets are clear and correctly aimed.
4. Operate front and rear wipers at all speeds and check for smooth, smear free operation.

Check High/Low Gear Engagement

1. Select LOW range gear, drive vehicle forwards 3 to 4 vehicle lengths, stop vehicle and select HIGH range gear - gears must engage smoothly.

Pollen Filter

1. Replace pollen filter.
For additional information, refer to: [Pollen Filter](#) (412-01 Air Distribution and Filtering, Removal and Installation).

Corrosion/Cosmetic Inspection

1. Carry out the annual corrosion/cosmetic inspection using the Annual Corrosion Inspection Sheet.

Wheels and Tires

1. Check that tires comply with manufacturer's specification.
For additional information, refer to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).
2. Check/adjust tire pressures including spare.
For additional information, refer to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).
3. **Vehicles with Uni-directional tires installed:** Mark the wheel to stud relationship of each road wheel and note location of each road wheel to its respective hub.
4. Loosen road wheel nuts. Raise vehicle to a wheel free condition.
For additional information, refer to: [Lifting](#) (100-02 Jacking and Lifting, Description and Operation).
5. Remove the road wheels.
6. Visually check tires for condition, lumps or bulges. Check tread depth across the width of the tire and around the circumference; make sure that remaining tread depth does not contravene local legislative requirements.

NOTE: Do not install wheels at this stage.

Braking System

E54872

1. Inspect front brake pads for wear.
For additional information, refer to: [Specifications](#) (206-03 Front Disc Brake, Specifications).
2. Inspect rear brake pads for wear.

For additional information, refer to: [Specifications](#) (206-04 Rear Disc Brake, Specifications).

3. Check brake calipers for signs of fluid leaks.
4. Check brake discs for condition.
5. Check all brake booster and brake system pipes and hoses for condition, chafing and leaks.
6. Clean road wheel hub spigots and apply grease, Land Rover Part Number RYL 105020 to the wheel mating surface of each spigot.
7. **Vehicles with Uni-directional tires installed:** Install road wheels to their respective hubs ensuring that stud to wheel relationship is maintained.
8. **Vehicles with NON uni-directional tires installed:** Install wheels on the opposite side of the vehicle but make sure that they are on the same axle as they were originally installed.
9. Install road wheel nuts and tighten to 140 Nm (103 lb-ft).
10. Replace brake fluid.
For additional information, refer to: [Brake System Pressure Bleeding](#) (206-00 Brake System - General Information, General Procedures).

11. Replace all flexible brake hoses.

Electric Parking Brake

1. Check the adjustment of the electric parking brake.
For additional information, refer to: [Parking Brake Shoe and Lining Adjustment](#) (206-05 Parking Brake and Actuation, General Procedures).
2. **Vehicles operating under arduous conditions:** Check the condition of the electric parking brake system.

Road Wheel Speed Sensors

1. Inspect the road wheel speed sensor harnesses for damage.

Fuel Filter Element

1. Replace fuel filter element. For additional information, refer to: [Fuel Filter Element](#) (310-01A Fuel Tank and Lines - TDV6 3.0L Diesel, Removal and Installation).

Fuel Sedimentor

1. Drain the fuel sedimentor.
For additional information, refer to: [Diesel Filter Water Drain-Off](#) (310-00 Fuel System - General Information, General Procedures).

Radiator/intercooler and Cooling Fan

1. Visually check the radiator/intercooler for external obstructions, check cooling fan blades for damage.
2. Remove any debris from the intercooler using a low pressure hose.

Door Locks and Hinges

1. Check operation of all door locks, bonnet lock and fuel filler flap.
2. Lubricate all door check straps, bonnet catch and fuel filler flap catch.

Cooling System

1. Check specific gravity of coolant using a hydrometer.

NOTE: A suitable hydrometer is available from the Equipment Programme under Part Number 511 3302 001 00.

2. Top-up cooling system if necessary.
For additional information, refer to: [Specifications](#) (303-03A Engine Cooling - TDV6 3.0L Diesel, Specifications).

CAUTION: Anti-freeze concentration must be maintained at 50%.

Cooling system - Check/Top-up

WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank whilst the system is hot.

CAUTION: Engine coolant will damage the paint finished surfaces. If coolant is spilled, immediately remove the coolant and wash the area with water.

1. Check the level of coolant in the expansion tank. With the engine cold, the coolant level must be to the **'UPPER LEVEL'** indicator mark above the **'COLD FILL RANGE'** text on the side of the expansion tank. Ignore any coolant which may be visible in the top section of the tank.

2. If topping-up is required, remove expansion tank filler cap and top-up coolant level to the **'UPPER LEVEL'** indicator mark.

For additional information, refer to: [Specifications](#) (303-03A Engine Cooling - TDV6 3.0L Diesel, Specifications).

CAUTION: Always top-up with a 50% mixture of anti-freeze and water.

3. Fit expansion tank filler cap, tighten cap until ratchet is heard to 'click'.

Coolant - Replace

1. Replace the coolant.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 3.0L Diesel, General Procedures).

Air Filtering

1. Replace the air filter element.

For additional information, refer to: [Air Cleaner Element](#) (303-12A Intake Air Distribution and Filtering - TDV6 3.0L Diesel, Removal and Installation).

Ancillary Drive Belt

1. Check the condition of the ancillary drive belt.

2. Remove all traces of mud and dirt from the drive belt and pulleys.

3. Check the drive belt for signs of splitting and wear.

4. Replace the ancillary drive belt.

For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 3.0L Diesel, Removal and Installation).

Camshaft Timing Belt and High Pressure Fuel Pump Drive Belt/Rear End Accessory Drive (READ) Belt

1. Replace camshaft timing belt.

For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 3.0L Diesel, Removal and Installation).

Replace the High pressure fuel pump drive belt.

For additional information, refer to: [Rear End Accessory Drive \(READ\)](#) (303-05A Accessory Drive - TDV6 3.0L Diesel, Removal and Installation).

Fluid Levels

Brake/clutch fluid reservoir

E54845

1. Remove the auxiliary battery box cover.
2. Check the fluid level in the brake/clutch fluid reservoir, the level must be to the '**MAX**' mark on the reservoir; top-up if necessary.
3. Clean the area around the reservoir filler cap, remove the cap.
4. If necessary, top-up using the recommended fluid to the '**MAX**' mark on the reservoir.
For additional information, refer to: [Specifications](#) (206-00 Brake System - General Information, Specifications).
5. Reinstall the reservoir filler cap.
6. Install the auxiliary battery box cover.

Power steering fluid reservoir

E54846

CAUTION: To prevent over filling, check/top-up the system with the engine switched off and the system cold. Make sure that the steering wheel is in the straight ahead position, do not turn the steering wheel prior to checking the fluid level.

1. Check that the fluid level is to the mid-way mark between the '**MAX**' and '**MIN**' marks on the fluid reservoir, top-up if necessary.
2. Clean the area around the reservoir filler cap, remove the cap.
3. If necessary, top-up using the recommended fluid to the mid-way mark on the reservoir.
For additional information, refer to: [Specifications](#) (211-02 Power Steering, Specifications).

CAUTION: Do not fill reservoir above the '**MAX**' mark.

4. Reinstall the reservoir filler cap.

Windshield washer reservoir

E54847

1. Remove the windshield washer reservoir filler cap.
2. Top-up the reservoir using a mixture of an approved windshield washer fluid and water until the level is to the bottom of the gauze filter in the reservoir filler neck.
3. Reinstall the reservoir filler cap.

Engine Oil and Filter

1. Renew engine oil and filter.

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 3.0L Diesel, General Procedures).

Automatic Transmission

1. Renew automatic transmission fluid.

For additional information, refer to: [Transmission Fluid Drain and Refill](#) (307-01 Automatic Transmission/Transaxle - TDV6 3.0L Diesel /V6 S/C 3.0L Petrol , Vehicles With: 8HP70 8-Speed Automatic Transmission AWD, General Procedures).

Transfer Case

1. Renew transfer case fluid.

For additional information, refer to: [Transfer Case Draining and Filling](#) (308-07B Transfer Case - Vehicles With: Single Speed Transfer Case, General Procedures) / [Transfer Case Draining and Filling](#) (308-07C Transfer Case - Vehicles With: Twin Speed Transfer Case, General Procedures).

Differential Assemblies

1. Renew front differential oil.

For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures) / [Specifications](#) (205-03 Front Drive Axle/Differential, Specifications).

2. Renew rear differential oil.

For additional information, refer to: [Differential Draining and Filling](#) (205-02 Rear Drive Axle/Differential, General Procedures) / [Specifications](#) (205-02 Rear Drive Axle/Differential, Specifications).

Suspension and Body Mountings

1. Check for free play in all suspension and body mounting rubbers.
2. Check condition of suspension rubber boots and gaiters.
3. Lift the vehicle so that front wheels are clear of ground/ramp to enable insertion of a suitable lever (e.g. a 1200mm long steel tube). Check the lower ball joints for free play by placing the lever between the ground/ramp and the tire, and lifting the wheel assembly with the lever. A second person will be required to check simultaneously for any ball joint lift. If free play (knock) is noted in the ball joint, replacement is required.

Removable Tow Bar

1. Check condition of removable tow bar.

For additional information, refer to: [Tow Bar Mounting Check](#) (502-02 Full Frame and Body Mounting, General Procedures).

Fuel System

1. Check fuel system pipes, hoses and unions for chafing, leaks and corrosion.

Electrical Harnesses

1. Check all electrical harnesses for chafing.

Oil/Fluid Leaks

1. Check for oil/fluid leaks.

Exhaust System

1. Check exhaust system for leaks, security and damage.

Power Steering

1. Check power steering rod ball joint fixings, gaiters and condition of ball joints and dust covers.
2. Check power steering pipes, hoses and unions for chafing, leaks and corrosion.

Clutch

1. Check clutch pipes and unions for chafing, leaks and corrosion.

Fault Lamp(s)

1. If fault lamp(s) are illuminated, test the associated system using approved Land Rover diagnostic equipment and report findings.

Road Test

1. Carry out road test of vehicle.

For additional information, refer to: [Road/Roller Testing](#) (100-00 General Information, Description and Operation).

General

1. Endorse Service Record.
2. Report any unusual features of vehicle condition and any additional work required.

Additional Items That May Require Attention

It is recommended that:

1. All brake fluid hydraulic seals are replaced.

NOTE: This is in addition to the maintenance requirement that flexible brake hoses **MUST** be replaced at this service interval.

2. After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry: The electric parking brake should be cleaned and inspected.

3. After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry: The ancillary drive belt should be cleaned and inspected.

4. Vehicles used in dusty or field conditions or deep wading: More frequent attention to the air cleaner will be required.

5. Vehicles used in areas where fuel quality is poor: Where vehicles are used in these areas, the fuel sedimentor may require draining at more frequent intervals.

Vehicle Transportation Aids and Vehicle Storage - New Vehicle Storage

Description and Operation

INTRODUCTION

Standards

Vehicles may require storage for varying periods of time before the customer takes delivery. It is essential that a new Land Rover vehicle is stored correctly, in order to ensure total customer satisfaction after the car is removed from storage and prepared for sale.

This document establishes the MINIMUM STANDARDS required of franchise holders and appointed vehicle storage companies by Land Rover for the storage of new vehicles, and may only be deviated from with the Company's agreement. Any concerns should be discussed with your Franchise Regional Manager.

This information should be used in conjunction with the relevant Pre-Delivery Inspection (PDI) information.

AREAS OF RESPONSIBILITY

Preventative Measures

Adequate preventative measures must be taken to ensure that each vehicle in stock is maintained in peak condition.

ARRIVAL

It is your responsibility to notify delivery companies immediately of any losses and/or transit damage identified on receipt of the vehicle.

Where applicable, Vehicle Condition Reports (VCR's) must be endorsed accordingly, otherwise it is unlikely that the transit insurance company will accept any claims for missing items or damage rectification.

STORAGE

Correct preparation of vehicles for storage is essential. The majority of new vehicles leaving Land Rover are provided with the appropriate protection for transit. It is your responsibility to ensure that a vehicle storage department, or specialist company, is sufficiently equipped to undertake the storage requirements endorsed in this publication.

Whilst vehicles are in storage, any deterioration or damage sustained is the sole responsibility of the storage operator and must NOT be made the subject of a warranty claim.

DISPATCH

When removing vehicles from storage, you are responsible for procedures that ensure they are in a safe and roadworthy condition.

VEHICLE STORAGE

VEHICLE IDENTIFICATION UPON ARRIVAL

1. **A New Vehicle Storage History Sheet must be raised for every new vehicle upon arrival and should remain inside the vehicle until despatch. This must contain a record of the vehicle condition and any rectification work carried out during the storage period (see Storage History Sheet).**
2. Vehicles must be checked for correct specification and/or shortages. Where this is incorrect the required parts should be procured through normal channels and costs claimed back via the DDW system using the appropriate shortage or misbuild program code.
 - Claims for rectifying incorrect specification items and/or shortages must be made in accordance with the conditions detailed in Section C of the Warranty Policy and Procedures Manual.
 - **NOTE:** All missing items should be recorded on the New Vehicle Storage History Sheet and countersigned by an authorized person.
3. Vehicles must be inspected for transit damage.
 - Delivery damage is not the responsibility of Land Rover and must not be made the subject of a warranty claim. It is the responsibility of the Dealer/Retailer or vehicle storage company to identify any such damage at the time of the new vehicle receipt and to ensure that the full details are recorded on the Delivery Receipt. Claims for rectification of such damage must be directed to the Delivery Company.
 - Failure to notify the Delivery Company of damage details at the time of vehicle delivery will result in claims for subsequent rectification being rejected.
 - Warranty claims for damage repairs may only be submitted where Land Rover's responsibility is clearly indicated. Examples falling into this category are paintwork damage during the fitment of trim or outward facing dents on the door skin.
 - Warranty claims will not be accepted for any transit damage repaired or identified after the vehicle has been placed into service.
4. A label should be suitably affixed to the inside of the windshield indicating the date of vehicle arrival. Labels must not be stuck directly to the windshield but placed in a transparent licence holder, or alternatively stuck to a piece of cling film and attached to the inside of the windshield. This will avoid damage to the windshield when removing labels.
5. Ignition and door keys must be suitably labelled and when the vehicle is locked, they must be held in a suitably identified and secure office. All key numbers must be recorded on the New Vehicle Storage History Sheet. All keys, including spares, must be removed from the vehicle during storage for security reasons.

VEHICLE INSPECTION

The entire vehicle exterior must be inspected and, if necessary, washed thoroughly, including the underside and

wheel arches, to remove all dirt and mud deposits.

Any defects found during inspection must be rectified before the vehicle is stored.

Ensure that bumper and body side protectors are correctly located.

There are two main methods of vehicle storage:

1. Collective storage of several vehicles in an open compound.
2. Collective storage of a small number of vehicles, normally at the dealership/retailer and possibly under cover.

IDEALLY ALL VEHICLES SHOULD BE STORED IN A WELL VENTILATED AND TEMPERATURE-CONTROLLED BUILDING.

However, it is recognised that the majority of all vehicle storage is done in an open compound. Therefore, the following site requirements must be observed and should be authorised with your Regional Manager.

1. The site should have a well-drained hard standing surface, preferably concrete or tarmac, which is free from undergrowth.
2. The site and driveways must be kept clean and clear of any obstruction at all times.
3. The site must be enclosed by a secure intruder-proof perimeter fence and the gates securely locked. The site should be under daily surveillance, with unauthorised access prevented at all times.
4. The site should be located away from areas subject to industrial fallout, sea spray or wind-blown dust and sand. Where fallout conditions are unavoidable it will be necessary to monitor the exterior condition of all cars and wash as necessary. Heavy contamination may require vehicles to have the transit protection coating removed and problems arising from the contamination rectified. Once the transit coating has been removed, the vehicle must not be returned to outdoor storage unless it is fully covered to provide the necessary protection against deterioration.
5. Mains water, tyre inflation and battery charging facilities must be available on site.
6. Hedges, shrubs and trees adjacent to the site should be kept trimmed and clear of parked vehicles.
7. Vehicles must not be parked under trees, overhead cables or other overhanging structures as bird droppings or other types of contamination could occur.

VEHICLE PARKING

Vehicles must be parked tidily with a minimum of 600 mm (2 feet) between bumpers, front and rear.

There must be a full doors width clearance between the driver's door and any adjacent vehicle or obstruction.

Vehicles must be parked at least 1.2 metres (4 feet) away from any interior wall or, for outside storage, at least 2 metres (6 feet) away from any perimeter fence.

Vehicles must be moved on a first-in-first-out basis, subject to specification.

Item	Part Number	Description
A	-	Storage Outside
B	-	Storage Inside

FACILITIES AND EQUIPMENT

Car wash facilities.

Tyre inflation equipment with calibrated gauge 0 - 4.05 bar (0 - 60lb/in²).

All equipment used must be functionally capable of meeting the compliance requirements. Please refer to the approved equipment document.

Jacking equipment.

Wheel brace.

The following materials must be available and must meet Land Rover specifications:

- Engine oil.
- Transmission fluid.
- Brake fluid.
- Distilled water.
- Windscreen washer fluid.
- Anti-freeze.

Access to trailer/recovery vehicle (Vehicles should not be towed).

Comprehensive filing system for vehicle records.

NOTE: Tools supplied with the vehicle must not be used for any rectification work prior to the prospective purchaser.

OPERATIONS REQUIRED DURING STORAGE PERIOD

REFERENCE CHART

The following chart gives a quick reference to the requirements necessary during the time a vehicle is in storage. A detailed explanation of each operation is provided on subsequent pages.

If a vehicle remains in storage after 150 days from receipt of vehicle, a new form must be started.

OPERATION	UPON RECEIPT	30 days from receipt	60 days from receipt	90 days from receipt	120 days from receipt	150 days from receipt
1. IDENTIFICATION	X
2. INSPECTION	X	X	X	X	X	X

10. WINDSHIELD WIPER BLADES	X	.	.	X	.	.
11. PAINTWORK
All markets	REMOVE 'WRAPGUARD' AFTER 180 DAYS					

STORAGE OPERATIONS

BATTERIES

To make sure the correct standard of battery care, please see the 'Battery Care Requirements for New Vehicles (Dealer and Retailer).

For requirements for receipt of a new vehicle, new vehicle storage and replacement batteries please see the battery care requirements for new vehicles (dealer and service)

Place a label on the vehicle (or on New Vehicle Storage History Sheet) to indicate when a recharge will be required. The battery condition should be checked prior to starting and/or moving the vehicle.

For additional information, refer to: [Battery Care Requirements](#) (414-00 Battery and Charging System - General Information, Description and Operation).

The storage, handling and charging of batteries is not dangerous provided that the relevant battery manufacturers' recommendations are followed. However, a suitable storage and charging facility must be available and should be in accordance with local legal requirements.

HYBRID ELECTRIC VEHICLE (HEV) BATTERY PACK

CAUTION: Always keep the high voltage battery charged, failure to do so may cause damage to the battery.

NOTE: In extreme cold climate conditions (circa -30°C), store the vehicle in a warmer area to protect it from the environment.

If the vehicle is not used for 30 days or more, it is essential that the high voltage battery is charged. For longer storage periods, charge the high voltage battery every 30 days.

Charge the HEV battery pack as follows:

- Start the vehicle (using the engine Start/Stop button and brake pedal sequence).
- To view the Tachometer, open the instrument cluster menu, then select Instrument Display, Hybrid Content and Reduced Hybrid Display.
- Raise the engine to approximately 1500 rpm.
- When the battery charge level has reached the position indicated in the following graphic, the vehicle may be switched off.

E161503

COOLING SYSTEM

It is ESSENTIAL to maintain the concentration of anti-freeze at the factory-fill condition. Failure to do so may cause oxidation of the cooling system leading to corrosion of the engine and heater.

The coolant mixture specification is 50% plain water and 50% Land Rover anti-freeze, Coolant and Corrosion Inhibitor for frost protection down to -36°C (-33°F).

Coolant specific gravity must be checked monthly using a high quality hydrometer with an appropriate range. At a coolant temperature of 15°C (60°F), the correct specific gravity reading is 1.074. If the coolant is above or below this temperature, the following corrections will enable accurate specific gravity readings to be taken:

- For higher temperatures: add 0.004 to the specific gravity for each 5°C (10°F).
- For lower temperatures: deduct 0.004 from the specific gravity for each 5°C (10°F).

If the specific gravity is correct but the cooling system requires additional coolant, mix anti-freeze and water to the correct proportions and to the correct volume, then add to the system. Examine for leaks from the radiator and hoses and rectify as necessary.

If the check shows that the coolant contains less than the required anti-freeze content, proceed as follows:

1. Carefully examine the radiator and all hoses for leaks and security of hose clamps.
2. Remove the header tank pressure cap and drain the cooling system as instructed in the relevant service manual.
3. Mix anti-freeze and water in the correct proportions and to the correct volume.
4. Close the drain plug and add the coolant until the level in the header tank is steady at 'MAX'.

WARNING: DO NOT REMOVE THE HEADER TANK PRESSURE CAP WHILE THE ENGINE IS HOT.

CAUTION: DO NOT use radiator anti-freeze solution in the windshield washer equipment or paint work will be damaged.

ENGINE OIL LEVEL

Where fitted, remove the dipstick and check the engine oil level. If necessary, top up with the approved grade of engine oil.

On vehicles with an electronic oil level and temperature sensor, check the engine oil level using the procedures described in the applicable Workshop Manual.

ENGINE AND AIR CONDITIONING SYSTEM

If the vehicle is stored for 30 days or more, the engine and air conditioning system should be operated using the following process:

- Set the ignition to power mode 6
- Ensure the air conditioning system is switched off
- Start the engine and run for 1 minutes at idle
- Raise the engine speed to 2000 RPM for 5 minutes
- Return the engine speed to idle
- Set the air conditioning temperature to 22° and the fan blower speed to 75% of the maximum blower speed
- Switch on the air conditioning system
- Ensure all the instrument panel air ducts are open
- Run the air conditioning system for minimum of 5 continuous minutes with the engine at idle

TIRES

For storage purposes, tires on fitted wheels must be inflated to and maintained at a maximum pressure of 3.60 bar

(52 lbf/in²).

NOTE: Wheels must be rotated through 90 degrees in the forward direction monthly, to ensure that the tread is rotated evenly during the storage period.

The spare wheel tire pressure must be maintained at the appropriate pressure specified in the Owners Handbook.

Tire condition should be inspected and defective tires replaced prior to removal from storage.

Guidance for Rotation of Tires

To ensure tires are rotated through a minimum of 90 degrees, apply a chalk mark on a front wheel tire wall at the current centre contact point with the road surface. Move the car forwards until the chalk mark is at the horizontal position. This process can be applied to a single car or to a row of vehicles and should ensure that all four wheels on each vehicle is rotated by 90 degrees.

PARKING BRAKE

Vehicles with Manual Park Brake

The parking brake must NOT remain 'on' during storage.

After parking:

- Manual transmission vehicles: select first or reverse gear and release the parking brake
- Automatic transmission vehicles: select 'P' and release the parking brake.

Vehicles with Electric Park Brake (EPB)

For vehicles with EPB, the park brake will remain locked onto the brake disc during storage. Refer to the Workshop Manual, General Procedures, Parking Brake and Actuation for EPB release procedure.

NOTE: For all vehicles with an Electronic Parking Brake (EPB), on manual transmission vehicles, first or reverse gear must be selected before releasing the EPB. On automatic transmission vehicles 'Park' (P) must be selected before releasing the EPB.

Where possible the EPB must not remain on during storage. If, for any reason, it is not possible to perform the release procedure, the operation of the EPB must be checked/monitored monthly during the road wheel rotation procedure.

AIR SUSPENSION (IF FITTED)

During storage the air suspension system should be left in the transit mode. No other checks are necessary during storage for this system.

DOORS, WINDOWS AND VEHICLE INTERIOR

Doors, windows, bonnet, boot lid and fuel filler flap must be closed and locked to prevent water and moisture ingress. A check should be done each month for any signs of water ingress into the cars interior and luggage compartment. Any water ingress points should be rectified immediately.

WINDSHIELD WIPER BLADES

Depending on the model, where possible move the wiper arms and blades away from the windshield and leave in the extended position.

PAINTWORK

Paintwork can be damaged if the protective coating remains on the vehicle for an extended period of time. In markets with high levels of ultraviolet light (tropical or semi-tropical conditions), the protective coating **MUST** be removed after six months. For all other markets the protective coating **MUST** be removed after nine months.

If storage is subsequently continued, the vehicle must be kept under cover and should be washed regularly (at least every month).

REMOVAL FROM STORAGE

PROCEDURES

Before removal from storage area, all fluid levels including coolant, hydraulic fluids and lubricating oils must be checked and replenished where necessary. Where a substantial loss has occurred the cause must be traced prior to moving the vehicle.

The New Vehicle Storage History Sheet must be checked and safety related faults rectified before the vehicle is moved from the storage site. These checks are essential to ensure that the vehicle is safe to drive.

Tires must be adjusted to the pressures recommended in the relevant service manual or owners handbook.

Reconnect the battery negative terminal (when applicable).

Check the operation of the lighting and signalling equipment.

TRANSIT PROTECTION COATING (WHERE FITTED)

REMOVAL OF TRANSIT PROTECTION COATING

During storage, the protective coating will collect airborne dirt and grit. Great care must be taken when removing the transit coating so that damage to the paint film and exterior trim is avoided.

Removal of the transit protection coating should be carried out in accordance with the procedure detailed in the Pre-Delivery Inspection (PDI) information.

When the vehicle is dispatched from the storage area, remove the New Vehicle Storage History Sheet and file in the vehicle records.

STORAGE HISTORY SHEET

E145630

STORAGE HISTORY SHEET (Continued)

E161502

Vehicle Transportation Aids and Vehicle Storage - New Vehicle Storage Form

Description and Operation

Before carrying out any battery assessments, refer to the battery care requirements.

For additional information, refer to: [Battery Care Requirements](#) (414-00 Battery and Charging System - General Information, Description and Operation).

NOTE: If the vehicle has been started within the previous 24 hours the surface charge must be removed prior to any battery assessment

This form is to be used to record the battery condition for vehicles and parts by the dealer / retailer prior to handover to the customer. If the vehicle is kept in storage longer than 150 days, a new form must be started.

For AGM batteries Midtronics EXP 1080 / GR1 tester must be used.

Follow the instructions on the Midtronics EXP 1080 / GR1 tester to assess battery condition.

TESTER RESULTS	ACTION
GOOD BATTERY	Return to service.
GOOD RE-CHARGE	Fully charge battery and return to service.
CHARGE AND RE-TEST	Fully charge battery. Remove surface charge. Re-test battery. If same result replace battery.
REPLACE BATTERY OR BAD CELL BATTERY	Verify surface charge removed. Disconnect battery from vehicle and re-test. If result repeats after surface charge removal, replace battery. DO NOT RECHARGE.
UNABLE TO DO TEST	Disconnect battery from vehicle and re-test.

		Voltage	Date	Signature

Pre-Delivery Inspection Manual - Preliminary

Description and Operation

1. Transportation: Make sure that the vehicle has arrived with the transportation seals intact. Remove and discard the transportation seals.

1.1 During production of the vehicle, a transportation relay is fitted to the battery positive terminal. This is to minimize battery drain during vehicle storage and delivery. To start the vehicle when a transit relay is fitted, press the hazard warning switch. This activates the transit relay to power-up and allow the engine to be started. If the ignition is turned on but the engine is not started the vehicle will return to transport mode after 15 seconds. After parking the vehicle in a work bay, remove the keys.

1.2 Check the integrity of factory fitted door and tailgate closure seals. Should a seal be broken or missing, make sure the tool kit and spare wheel are present. Also check that no internal damage to trim has occurred.

1.3 Remove door and tailgate closure seals.

1.4 Open bonnet for access.

2. Vehicle Transportation Relay: A transit relay is fitted to the battery. This allows the vehicle to be driven when necessary, but isolates the vehicle during transit and storage to prevent the battery becoming discharged.

E146014

E146013

2.1 To remove the transit relay:

2.1.1 Disconnect the battery negative lead from the battery negative terminal.

2.1.2 Disconnect the electrical connector (1) from the transit relay. Secure the electrical connector to the stowage position (2) provided on the main wiring harness.

2.1.3 Remove the bolt (3), that secures the battery positive cables to the top of the transit relay. Discard this

bolt.

2.1.4 Remove the two bolts (4), and (5), that secure the transit relay to the mega-fuse assembly (7). Discard the transit relay (6).

2.1.5 Replace the bolts (4), and (5), to the mega-fuse (7). Make sure that all the positive leads removed from the top of the transit relay (6), are reconnected to the top of the mega-fuse (7). Tighten the bolts finger tight at this point.

2.1.6 Loosen the battery positive terminal pinch bolt (8), twist the mega-fuse clockwise until it stops hard against the battery.

2.1.7 Torque the bolts (4), and (5), to 12 Nm (9 lb.ft).

2.1.8 Twist the mega-fuse back to the straight position, and torque the battery positive terminal pinch bolt (8), to 6 Nm (4 lb.ft).

2.1.9 Reconnect the battery negative terminal, and torque to 6 Nm (4 lb.ft). Make sure this is carried out in one clean connection, this will avoid creating electrical 'spikes' in the system.

2.1.10 After the transit relay has been removed and the battery re-connected, a Battery Monitor System (BMS), reset will need to be carried out using SDD.

NOTE: Information regarding the BMS reset can be found in the Battery Care Manual on GTR.

CAUTIONS:

Damage to battery. The battery terminal posts have a rotational torque threshold of 9 Nm (6 lb.ft). Extreme care MUST be observed when torquing the bolts (4), and (5), to 12 Nm (9 lb.ft).

Damage to equipment. Failure to remove the transit relay before carrying out the PDI checks may result in damage to the SDD equipment.

Damage to vehicle. Do not disconnect the battery while the ignition is switched on:

- Electrical modules will not be allowed to shut down correctly and will result in fault codes being stored and spurious faults being induced.
- Permanent damage to the instrument cluster may also result if the battery is disconnected with the ignition switched on.

3. Battery Care Requirements

Make sure the correct standard of battery care is applied to the battery, For additional information, refer to: [Battery Care Requirements](#) (414-00 Battery and Charging System - General Information, Description and Operation).

NOTES:

All equipment used must be functionally capable of meeting the compliance requirements.

The vehicle may need to be taken out of transit mode to carry out the preconditions.

3.1. Carry out the battery test process shown below.

It is recommended that this test is conducted at least 24 hours after the vehicle engine has been run or the battery charged to avoid the need of surface charge removal. If time constraints make this unacceptable then the surface charge must be removed.

Surface Charge Removal

A vehicle which has had its battery charged or been driven in a 24 hour period before the test, must have its surface charge removed.

- Turn on the ignition but do not start the vehicle
- Switch on the headlamps on high beam for a minimum 3 minutes
- Switch off the headlamps
- Wait a minimum of 5 minutes before recording test results for any battery measurements

Battery Test

The battery may be tested either on a bench or on the vehicle.

The battery condition must be checked in accordance with the battery test process utilizing an appropriate tester as outlined in **the equipment section (Section 5)**

For additional information, refer to: [Battery Care Requirements](#) (414-00 Battery and Charging System - General Information, Description and Operation).

NOTE: The midtronics code must be recorded on the form.

Any actions must be carried out in accordance with the table shown in the **determining battery condition section (Section 6)**

For additional information, refer to: [Battery Care Requirements](#) (414-00 Battery and Charging System - General Information, Description and Operation).

The details must be recorded on the New Vehicle Storage Form which is part of the new vehicle storage document.

For additional information, refer to: [New Vehicle Storage Form](#) (100-11 Vehicle Transportation Aids and Vehicle Storage, Description and Operation).

CAUTION: DO NOT connect the tester to any other circuit or chassis point other than the battery negative terminal.

3.2. If the battery is disconnected again after conducting the PDI, certain vehicle electrical systems that are calibrated during the PDI will lose the calibration and will require resetting again once the battery is reconnected. This may include the PDI application and Market configurations shown in section 11.

3.3. The battery must be tested to determine that the battery is in good condition, and there is sufficient charge to carry out the PDI. Certain electrical systems require a precise voltage to operate correctly.

- Check the battery positive terminal cable and BMS clamp pinch bolts are tightened to 6 Nm.

NOTE: It is imperative, to make sure correct vehicle functionality, that the battery terminal is pushed fully home and is tightened to the specified torque figure.

- Connect the Land Rover recommended battery tester to the battery.
- Check and record on the PDI check sheet, the battery condition as indicated by the Land Rover recommended battery tester.

NOTE: The voltage check must be carried out before connecting the diagnostic equipment. Failure to do this may result in vehicle configuration failure.

3.4. Check security of battery carrier clamp and that it is tightened to a torque of 5 Nm (4 lb.ft).

4. Check/top-up the level in the windscreen washer reservoir. Top-up the reservoir using a mixture of an approved windscreen washer fluid and water until the level is to the bottom of the gauze filter in the reservoir filler neck.

5. Check/top-up all under-hood fluid levels. Investigate cause of any low level readings.

5.1 The engine must be switched off and allowed to stand for a period of at least 10 minutes for petrol engines, and 20 minutes for diesel engines, before checking the oil level. Checking the oil level soon after the engine has been run will provide a false low level reading, which may result in overfilling. To allow for the actual oil level to be verified, a service mode exists to give access to live oil readings. In order to have a correct reading, the following conditions must be met:

- The vehicle **MUST** be parked on a level area of ground. The sensor installation is very sensitive to vehicle tilt in the fore-aft direction: 0.5 degree vehicle tilt corresponds to an up to 0.5 liter measurement error.
- The gear selector must be in the 'PARK' (P) position and the hood must be open.
- A minimum time of **10 minutes for petrol engines**, and **20 minutes for diesel engines**, **MUST** be allowed to pass after running the engine. This drain-down time is to allow the oil to return to the sump.

NOTE: If the Oil Level Display on the Message Center displays: 'not available', not enough time has elapsed to allow the oil to drain back into the sump.

To access service mode, the following procedure should be followed:

- 1 With the ignition 'ON', engine not running, use the controls on the steering wheel, select on the Message Center: Service Menu > Oil Level Display
- 2 Press the cruise control CANCEL button twice within 2 seconds.
- 3 The instrument pack display will revert back to the normal display in the trip computer.
- 4 Using the controls on the steering wheel, access the Oil Level Display again.

Messages to the right of the gauge will advise of any action that may need to be taken. If the oil level is below the required operating range, a message advising how much oil to add will be displayed; i.e., 'Add 0.5 liters'. If necessary, add the recommended quantity of oil then re-check the level.

CAUTION: Serious damage to the engine and components will result from overfilling engine with oil. When filling the engine with oil, make sure any spilt oil is immediately cleaned from the engine, components or bodywork.

- 5 With the ignition 'ON', engine not running, remove the oil filler cap.

NOTE: Petrol Engines: SAE 5W-20 meeting Land Rover specification WSS M2C925-A (Castrol SLX Professional OE 5W-20).

Diesel Engines: SAE 5W-30 meeting Land Rover specification WSS M2C934-B (Castrol SLX Professional OE 5W-20).

- 6 If the oil level is within the required operating range, the message 'Level OK' will be displayed.
- 7 If indicated by the Message Center oil level display, add the appropriate quantity of oil (as advised). Wait 5 minutes to let the oil level stabilise and re-check the level.
- 8 Clean up any oil spilt during the top-up process.
- 9 Install the oil filler cap.

CAUTION: The ignition must be left on during the top-up, so that the electronic dipstick can register and display the new oil level. This enables an accurate level recheck.

NOTE: Investigate the cause of any low fluid levels.

5.2 Remove the auxiliary battery box cover. Check the fluid level in the brake/clutch fluid reservoir. The level must be to the 'MAX' mark on the reservoir, top-up if necessary. Top-up the fluid level using Shell Donax YB DOT4 ESL brake/ clutch fluid to the 'MAX' mark on the reservoir. Install the auxiliary battery box cover.

NOTE: Investigate the cause of any low fluid levels.

5.3 Check that the power steering fluid level is midway between the 'MAX' and 'MIN' marks on the fluid reservoir, top-up if necessary. Top-up the fluid level using Texaco cold climate fluid 14315.

NOTE: Investigate the cause of any low fluid levels.

5.4 Check the coolant level in the expansion tank. With the engine cold, the coolant level must be to the upper level of the cold fill range indicator mark, above the text on the side of the expansion tank. Ignore any coolant which may be visible in the top section of the tank.

5.5 Top-up the coolant to the upper level mark on the tank using a 50% mixture of water and Havoline Extended Life Coolant (XLC) or any ethylene glycol based anti-freeze containing no methanol with only Organic Acid Technology (OAT) corrosion inhibitors. Install the expansion tank filler cap, tighten the cap until the ratchet is heard to 'click'.

NOTES:

Anti-freeze concentration MUST be maintained at 50%.

Investigate the cause of any low fluid levels.

5.6 Check/record the specific gravity of the coolant using a hydrometer. The specific gravity of the coolant at 20oC (68oF) must be 1.068:

- Loosen the expansion tank filler cap to relieve pressure in the cooling system.
- Tighten the expansion tank filler cap.

- Remove the expansion tank bleed screw.
- Extract enough coolant to enable the gravity to be checked.
- Install the expansion tank bleed screw.
- Top-up the coolant.

WARNING: Risk of injury. Since injury such as scalding could be caused by escaping steam or coolant, do not remove, or loosen, the filler cap from the coolant expansion tank while the system is hot.

NOTE: A suitable hydrometer is available from the Equipment Program, Part Number FT 2030.

6. Make sure that the cold air deflector has been fitted on vehicles with the 3.0L supercharged engines, that operate in severe cold markets: **(Russia and Nordic countries)**.

E145378

6.1 The cold air deflector should be secured to both of the multi-stage thermostat (MST) hoses and visually flat to the front of the engine. If necessary, push on the center of the deflector to firmly seat between both MST hoses. Make sure the deflector is retained, and is flat to the front of the engine.

E145377

7. Connect the approved Land Rover battery power supply, then connect the Land Rover approved diagnostic equipment to the vehicle diagnostic socket. Use the latest version of SDD available.

NOTE: To charge the battery, connect the positive booster cable to the positive terminal on the battery. The negative booster cable **MUST** be connected to a suitable earth point on the vehicle. The earth point should be at least 0.5 meters, (20 inches) away from the battery and as far away as possible from any fuel pipes, brake pipes and moving parts.

CAUTION: Damage to vehicle. Failure to charge the battery in this manner will cause the BMS, to NOT register the charge increase. This can cause certain systems to be inhibited during the first few days of driving while the BMS recalibrates.

8. Using the diagnostic equipment, run the PDI application:

- Switch the ignition ON.
- Enter VIN and vehicle details into diagnostic equipment.
- Select the correct model year.
- Select 'Vehicle Configuration' icon.

- Select 'Special Applications'.
- Select the 'Pre-delivery Inspection' Application.
- Follow the on-screen instructions. This will take the vehicle out of transit mode, sets the Service Interval Announcer (SIA), on petrol models 'flight recorder' data, and the EMS adaption values.

9. Using the diagnostic equipment, clear any fault codes:

- Select 'Diagnostic Trouble Code Monitor' icon.
- Confirm vehicle features.
- Select 'Diagnostic Trouble Code Monitor' icon.
- Select 'Complete Vehicle' to clear fault codes.

E146010

E146012

10. Check the doors, door locks and child safety locks for correct operation. Install the door lock cover.

10.1 Check operation of the internal 'master lock' and 'unlock switch' on the door pad.

10.2 Check the hood release and safety catch for correct operation.

10.3 Check the operation of every button on both the supplied key fobs, to make sure the expected functionality is carried out as indicated by each buttons legend.

To check the Passive Entry system, perform the following additional tests:

- Make sure both Smart Keys are taken at least 3 meters away from the vehicle.
- Lock the vehicle by pressing the lock button on one of the Smart Keys. Make sure that the locking process has been completed as evidenced by the door mirrors folding in.
- Wait 5 seconds.
- Take one Smart Key and bring it within close proximity (1 meter), of the drivers door, pull the door handle and make sure the vehicle unlocks.
- Close the drivers door and press the exterior lock button on the drivers door handle, whilst keeping the Smart Key in close proximity of the drivers door.
- Make sure the locking process has been completed as evidenced by the door mirrors folding in.

- Remove the Smart Key to at least 3 meters from the vehicle.
- Take the second Smart Key and bring it within close proximity (1 meter), of the drivers door, pull the door handle and make sure the vehicle unlocks.
- Enter the vehicle, place the first Smart Key on the center console and press both the start button and the brake pedal simultaneously. Repeat this process for the second Smart Key.
- If the vehicle starts with both Smart Keys, the Passive Entry and both Smart Keys are operating correctly.

E146009

10.4 Check for correct operation of the vehicle alarm system:

- Make sure all doors, windows and sunroofs are closed.
- Press the lock button on the Smart Key once. This will 'superlock' the vehicle (interior and exterior vehicle protection). Check that the indicator triple flashes for 10 seconds then continues to single flash.
- Press the unlock button and make sure the alarm has been disarmed.
- Press the lock button twice within three seconds. This will activate the perimetric alarm but **NOT** the interior space protection.
- Check that the indicator double flashes for 10 seconds, then continues to single flash.
- Press the unlock button and make sure the alarm has been disarmed.

NOTE: To carry out this procedure in the correct manner the battery charger should be removed.

Pre-Delivery Inspection Manual - Vehicle Interior

Description and Operation

NOTE: The battery charger should be reconnected whilst carrying out the sections 11- 23 of this PDI manual.

To charge the battery, connect the positive booster cable to the positive terminal on the battery. The negative booster cable **MUST** be connected to a suitable earth point on the vehicle. The earth point should be at least 0.5 meters, (20 inches) away from the battery and as far away as possible from any fuel pipes, brake pipes and moving parts.

CAUTION: Damage to vehicle. Failure to charge the battery in this manner will cause the BMS, to NOT register the charge increase. This can cause certain systems to be inhibited during the first few days of driving while the BMS recalibrates.

11. Touchscreen Audio System: Using the Touch Screen Display (TSD), set the clock, date, voice language and the Satellite Navigation, specific to the Market unless otherwise instructed on the Customer Configurations Sheet.

E146002

11.1 Clock Setting - With the vehicle ignition system switched on in convenience mode and the TSD switched on, select the HOME MENU by pressing the hard button on the left side of the audio controls:

1. Touch the **Audio settings** soft-button.
2. At the settings menu, touch the **Clock adjust** soft-button.
3. Touch the arrow up or arrow down softbuttons to adjust the hours or minutes.
4. Touch the **12/24** soft-buttons to set the hours for the 12 or 24 hour clock display. With the 12 hour display selected, am/pm is also displayed as appropriate.
5. Touch the **Set** soft-button to confirm the clock settings.
6. Return to the **Home menu** screen by touching the arrow soft-button at the top left of the screen, or press the **HOME MENU** hard-button on the audio controls.

NOTE: The displayed clock time will not be set and displayed correctly until the Set soft-button is touched. If the Set soft-button is not touched the clock will not be reset on exiting the Clock adjust screen.

11.2 Date Setting - With the vehicle ignition system switched on in convenience mode and the TSD switched on, select the HOME MENU by pressing the hard button on the left side of the audio controls:

1. Touch the **Audio settings** soft-button.
2. At the settings menu, touch the **Clock adjust** soft-button.
3. Touch the **Date** soft-button then touch the **arrow up** or **arrow down** soft-buttons to adjust the days or months.
4. Touch the **dd/mm** or **mm/dd** soft-buttons to set the date format setting.
5. Touch **Set** to confirm the date settings.
6. Return to the **Home menu** screen by touching the arrow soft-button at the top left of the screen, or press the **HOME MENU** hard-button on the audio controls.

NOTE: The displayed date will not be set and displayed correctly until the Set soft-button is touched. If the Set soft-button is not touched the date will not be reset on exiting the Clock Adjust screen.

11.3 Language Setting - With the vehicle ignition system switched on in convenience mode and the TSD switched on, select the HOME MENU by pressing the hard button on the left side of the audio controls:

1. Touch the **Audio settings** soft-button.
2. At the settings menu, touch the **Language** softbutton. Select and change the specified language on the customer configurations sheet.
3. Set the voice language (if option is available).
4. Set the system voice feedback, Male or Female (if option is available).
5. Return to the **Home menu** screen by touching the arrow soft-button at the top left of the screen, or press the **HOME MENU** hard-button on the audio controls.

12. Navigation system - Check the Navigation screen, make sure that the correct country map has been uploaded onto the Navigation hard drive. To set the Navigation search area the following must be done:

- Select 'Navigation'.
- Select 'Enter destination'.
- Select 'More'.
- Select 'Search area'.
- Then select the local country or state specific to the Market unless otherwise instructed on the Customer Configurations Sheet.

13. Bluetooth® - Using a Bluetooth® capable phone:

1 Switch the ignition ON and make sure that the Touch Screen is active.

2 From the **Home menu**, select **Phone**.

3 A menu will appear. If no phone is connected, select **Search new**, otherwise select **Change phone** and then select **Search new**.

4

NOTE: There are two ways of pairing the Bluetooth® device and the vehicle. Detailed below is pairing to the vehicle, the other method is using the vehicle 'Vehicle to device' to pair to the device. If you use the 'Vehicle to device' method, follow the instructions on screen. Select Device to vehicle option. The vehicles Bluetooth® system is discoverable for only 3 minutes.

5 Using the mobile phone, search for Bluetooth® devices. On some phones, this is referred to as new paired device. See your phone's operating instructions for further information.

6 When the vehicle's Bluetooth® system is discovered, begin the pairing process and follow the on-screen instructions.

7 When requested, enter the Land Rover Bluetooth® access pin (2121) into the phone and vehicle system.

8 Once your phone is paired it may automatically connect to the vehicle system. If not, use the device list shown on the touch screen or use the mobile phone.

NOTE: Make sure that the device is enabled for Bluetooth®

When the customer configures a Bluetooth® phone, this will overwrite the last configured phone.

14. Rear Seat Entertainment - The Rear Seat Entertainment headphones will be in the transit items bag and the Touchscreen Remote Control (TsRC) will be in the docking station. The following **MUST** be carried out:

- Fit the AAA batteries to both sets of headphones. Each set of headphones requires 2 AAA batteries.
- Place the headphones in the rear door cards - one in each side.
- Fit and connect the TsRC battery into the remote by removing the rear battery cover, and connecting the battery.
- Replace and re-secure the battery cover. Put the 2 black rubber bung screw head covers supplied directly over the screw heads on the battery cover.
- Dock the TsRC unit back into the docking station, observe until at least 2 charge segments are illuminated.

NOTE: The TsRC is docked by locating its bottom edge onto the locating pins in the docking station, then pushing down on the 'raised blip' on the top centre of the TsRC. A positive lock will be denoted by a 'click' from the TsRC and docking connector.

15. Satellite navigation

If prompted, insert the Navigation SD card into the Navigation unit.

For additional information, refer to: [SD Memory Card](#) (101-01 Pre-Delivery Inspection Manual, Removal and Installation).

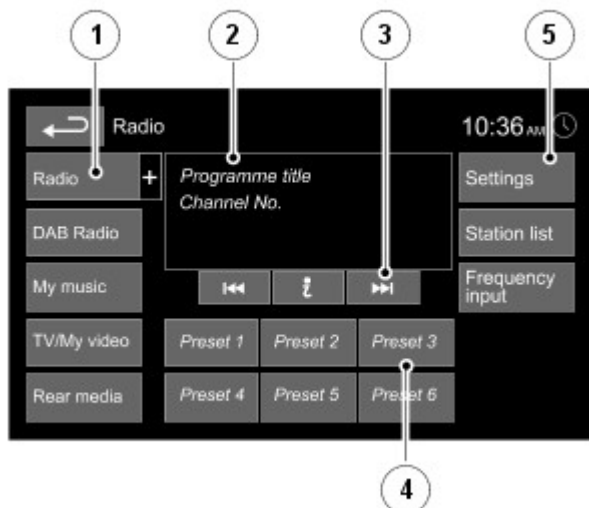

Place the SD card instructions into the literature pack.

Check operation of the system:

- Driving the vehicle will automatically establish global position.
- If global position has not been established, the navigation screen will display a 'GPS' icon with a line through it. Make sure no obstructions, such as tall buildings or trees, are close-by.

16. Set the Radio and DAB, specific to the Market unless otherwise instructed on the Customer Configurations

Sheet.

E145990

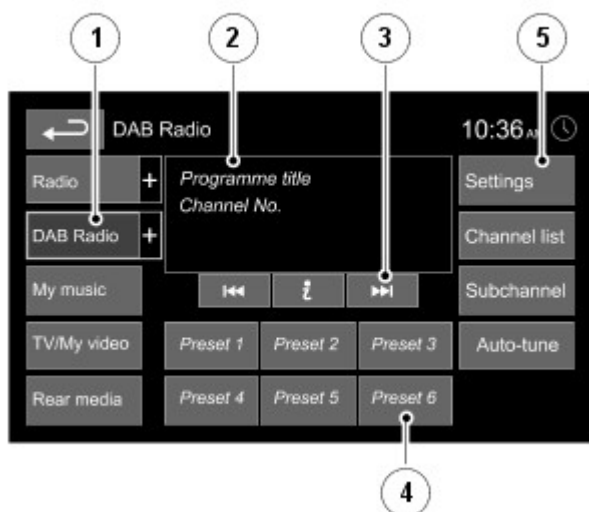

17. Radio system - With the vehicle ignition system switched on in convenience mode and the TSD switched on, select the **HOME MENU** by pressing the hard button on the left side of the audio controls:

1. Touch the **Audio settings** soft-button.
2. At the **Radio** menu, set 6 radio stations for each wavelength as specified on the customer configuration sheet. Touch the **Radio** (1) soft button to select a waveband.
3. Short touch the **Auto Seek** soft-button (3) to search for the next chosen radio station (Shown in the display (2)).
4. Touch and hold the **Preset** soft button (4) to store the current station on the chosen preset (the radio will mute while the station is stored then beep to confirm).
5. Repeat these steps until all wavelengths have 6 preset radio stations.
6. Touch the **Settings** soft-button (5) to activate/ deactivate the RDS, Traffic, News, AF and Reg functions; according to the Market unless otherwise specified on the 'New Vehicle Configurations Options' sheet.
7. Return to the **Home menu** screen by pressing the arrow soft-button at the top left of the screen, or, press the **HOME MENU** hard-button on the audio controls.

CAUTION: Due to radio reception constrains, it may be necessary to set the radio presets outside of the workshop.

18. DAB Radio system - With the vehicle ignition system switched on in convenience mode and the TSD switched on, select the **HOME MENU** by pressing the hard button on the left side of the audio controls:

E145991

1. Touch the **Audio settings** soft-button.
2. At the **DAB Radio** menu, set 6 radio stations for each DAB band (DAB 1, 2, or 3) as specified on the customer configuration sheet. Touch the **DAB Radio** (1) soft button to select a DAB band.
3. Short touch the **Auto Seek** soft-button (3) to search for the next chosen DAB radio station (Shown in the display (2)).
4. Touch and hold the **Preset** soft button (4) to store the current station on the chosen preset (the DAB

- radio will mute while the station is stored).
5. Repeat these steps until all DAB bands have 6 preset radio stations.
 6. Touch the **Settings** soft-button (5) to activate/ deactivate the FM Traffic, Announcements, Link DAB (auto search when signal strength drops), DAB format (DAB regions) and DAB country functions; according to the Market unless otherwise specified on the 'New Vehicle Configurations Options' sheet.
 7. Return to the **Home menu** screen by pressing the arrow soft-button at the top left of the screen, or, press the **HOME MENU** hard-button on the audio controls.

CAUTION: Due to radio reception constrains, it may be necessary to set the radio presets outside of the workshop.

19. For vehicles with the Standard Audio System: To set/change the time and date, turn ON the audio system using the ON/OFF button (2).

20. Time:

- Using the navigation up and down arrow buttons (3), navigate to 'Clock' on the menu display (1). Navigate to Set Time to set the time.
- Use the navigation buttons to increase or decrease the hours and minutes. Once the correct time has been set, press the 'OK' button (4), to confirm.
- Navigate to the '24h Mode' to select the time format, press the 'OK' button (4), to confirm the change.

21. Date:

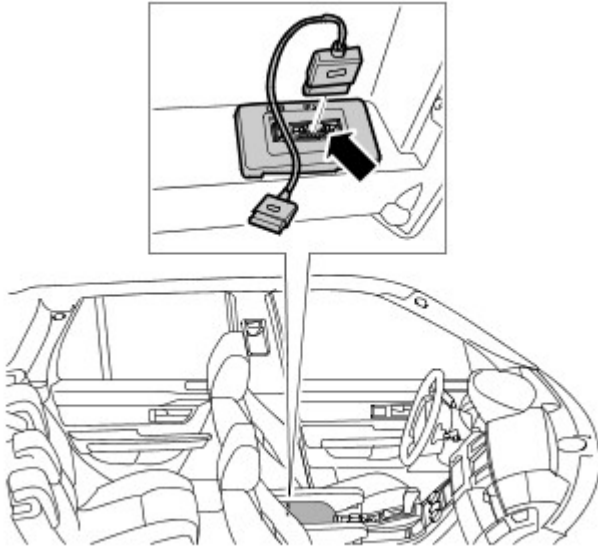

- Using the navigation up and down arrow buttons (3), navigate to 'Clock' on the menu display (1). Navigate to Set Date to set the date.
- Use the navigation buttons to increase or decrease the year, month and date. Once the correct date has been set, press the 'OK' button (4), to confirm.
- Navigate to 'Set Date Format' to select the date format, press the 'OK' button (4), to confirm the change.

22. For vehicles with the Standard Audio System: The radio seek up/down buttons (3) or (4), are used to

search for radio stations, and these can be stored as pre-sets.

- Select a waveband (1) and briefly press one of the seek buttons (3) or (4). The search will stop at the first radio station it finds in the direction chosen.
- Save the radio stations as pre-sets by holding down a numbered button (2), for approximately three seconds. After a short delay the station name will be displayed at that pre-set location.
- Manual tuning can be done if necessary by holding the seek up/down button (3) or (4), for more than 4 seconds. Manual tuning mode exits after a 10 second timeout period.
- Repeat this process for all the pre-set radio stations.

E146003

23. If requested on the 'New Vehicles Configurations Options' sheet, place the iPod™ lead into the glovebox.

E146005

24. The automatic headlamp system has an additional feature called HBA (High Beam Assist). The 'Hand of Traffic' must be set in the Message Center and the feature enabled to make sure of correct operation of the system. To set the HBA the following steps must be followed in order:

- With the ignition 'ON', engine not running, use the controls on the steering wheel to select on the instrument cluster menu:
- Main Menu > Vehicle Set-up > High Beam Assist.
- Configure the 'Hand of Traffic' setting by selecting the appropriate Drive on Left (of road) or Drive on Right (of road) to Market condition.
- 'Enable' the feature by setting Activate Assist.
- Carry out a visual check to make sure that there are no stickers, or labels, directly in view of the HBA camera sensor.

NOTE: The HBA feature can be enabled (or disabled) by selecting (or de-selecting) Activate Assist.

Enabling or disabling HBA will not affect previous 'Hand of Traffic' settings.

E146005

E146004

25. Reset the oil level indicator. To reset the oil level indicator the following steps must be followed in order:

- With the ignition 'ON', engine not running, use the controls on the steering wheel to select on the instrument cluster menu: Service Menu > Oil Level Display.
- Press the cruise control CANCEL button twice within 2 seconds.
- The instrument pack display will revert to the normal display in the trip computer.
- Using the controls on the steering wheel, access the Oil Level Display again.
- Press and hold the cruise control CANCEL button for 10 seconds to reset the oil level indicator.
- The trip menu display will revert to the normal display mode on the Message Center.
- Turn the ignition OFF.

E146018

26. Emergency Park Release System.

- In the event of a vehicle transmission failure, a mechanical means of selecting neutral is now available. An Emergency Park Release (EPR) provides this functionality.
- In an emergency, the EPR hand lever can be operated to release the park pawl within the transmission. The park pawl will not be allowed to re-engage until the hand lever is locked down in the closed position.
- The EPR lever is exposed while in transit. Actuation of the EPR requires the operator to be seated in the driver's seat with the foot brake applied. Turn the locking device 90 degrees anti-clockwise and lift using the pull strap.
- Ensure that the EPR lever locking device is locked down securely, then fit the finisher panel and cup

holders. The cup holders are despatched in the glovebox.

27. Remove battery charger: Disconnect the approved battery charger/power supply from the vehicle.

28. Make sure that the interior of the vehicle is undamaged. Refer to the **Cosmetic Standards Manual** on **Topix**.

Pre-Delivery Inspection Manual - Vehicle Exterior

Description and Operation

29. Check operation of fuel flap and lock.

30. Inspect the road wheels and tires for damage. Check the wheel retaining nuts for correct torque, 140 Nm (103 lb.ft).

31. The vehicle is delivered with the tire pressures set higher than the normal operating pressures. Set the tire pressures to 2.0 bar (29psi) for the road test.

CAUTION: When the tire pressures are reduced from the high transit / storage pressure to the road test pressures, the final pressure will rise. The initial high drop in pressure from transit / storage pressure to normal pressure will cause the tire pressure to rise after 2 minutes, giving incorrect tire pressures by up to 0.4 bar (6psi).

Initially drop each tire pressure to approximately 0.1-0.3 bar (2-4psi) below the recommended pressure and then inflate the tires to the desired pressure.

CAUTION: If the vehicle is returned to storage after the PDI, the tire pressures must be raised to 3.60 bar (52psi).

32. Remove all internal and external transit protection. Stow the rear outer seat belts in the stowage clips.

33. Check that the vehicle exterior is clean and undamaged. Refer to the 'Cosmetics Standards Manual' on TOPIx, for further details.

34. Apply lubricant to the door seals on vehicles that operate in severe cold markets: **(Russia and Nordic countries)**.

Front door seals

E92669

34.1 Vehicles operated in severe cold markets (Russia and Nordic countries): Apply the Carboflo pen, Land Rover Part No. CYK500010 to the primary and secondary front door seals as illustrated above.

Rear door seals

E92670

34.2 Vehicles operated in severe cold markets (Russia and Nordic countries): Apply the Carboflo pen, Land Rover Part No. CYK500010 to the primary and secondary rear door seals as illustrated above

Pre-Delivery Inspection Manual - Road Test

Description and Operation

NOTE: Before driving the vehicle, check the operation of:

- Lights, indicators, wipers, wash/wipe and hazard warning.
- Seats and seat belts.
- Fascia switches.
- Electric park brake.

35. Make sure that the automatic transmission starter isolator, operates in all gears with the exception of 'P' - Park and 'N' - Neutral.

36. Check for the correct operation of all the driver controls and systems. Including the Terrain Response indicators, wheel direction/ differential locking indicators and the low tire pressure monitoring system, if fitted.

36.1 Start vehicle and check operation of:

CAUTION: Make sure the climate control is set in the off position.

- Starter/Inhibitor switch.
- Electric mirrors, including power fold.

36.2 During the road test, make sure the transfer box range change functionality is tested by using the following method.

- With engine running and parking brake applied, select neutral on automatic gearbox.
- Request range change for low gear with switch - wait until change is complete.
- Request range change into high gear with switch - wait until change is complete.
- Repeat 5 times.
- Make sure high range is left selected.

36.3 Make sure the correct operation of the shift interlock (where applicable).

CAUTION: Risk of injury. Apply the parking brake, chock the wheels and make sure that all personnel are clear of the vehicle before carrying out the above procedure.

E145464

36.4 Check the electric windows for correct operation. Open and close all the windows fully. Check that the rear window isolation switch is operational.

36.5 If the battery is disconnected, becomes discharged or the power supply is interrupted, the one-touch 'window up' operation is disabled until the window position is reset.

To reset the window position:

- Close the window fully.
- Release the switch, the pull up and hold for one second.
- Repeat the procedure on each window.

36.6 Check the sunroof for correct operation. Make sure both sunroof open/close and sunroof tilt are fully operational.

36.7 Check operation of the air conditioning (A/C) system.

- When the vehicle is at operating temperature, set the heater control to 22°C and run the fan speed at 75%.
- Switch on the A/C system and run for 5 minutes.

36.8 Check for correct operation of the cruise control or adaptive cruise control (ACC) system.

 **WARNING:** Damage to vehicle. Adaptive cruise control is not a collision warning or avoidance system.

Risk of injury. It is the driver's responsibility to stay alert, drive safely and be in control of the vehicle at all times.

Only use cruise control when conditions are favourable, e.g. on straight, dry, open roads with light traffic.

36.9 The cruise control and ACC system are operated by switches mounted on the steering wheel. The driver can also intervene at any time by use of the brake or accelerator pedals. The Forward Alert function can be manually turned on or off in the Message Centre. Using the Message Centre steering wheel controls select: **Vehicle Set-up** and then **Forward Alert** from the menu; using the **OK** button will turn the function on or off.

36.10 Controls - all cruise control switches are located on the steering wheel switch-pack:

1. SET + : Set the speed (+) or increase.
2. SET - : Set the speed (-) or decrease.
3. GAP: Gap decrease (ACC only).
4. GAP: Gap increase (ACC only).
5. RESUME: Resume set speed.
6. CANCEL: Cancels without erasing memorised speed.

36.11 Setting a speed:

- Accelerate as normal until required speed is reached.
- Press the 'SET' button (1). The vehicle speed will be stored in the memory and cruise control should be engaged.
- The message centre will display the selected speed - 'SETSPEED 80KM/H 50MPH'.

36.12 Checking the ACC gap: After the ignition is switched on a default gap will be automatically selected (setting No 3). There are 4 gaps available to select.

- After selecting cruise control, check that the vehicle slows when a vehicle ahead is detected by the system.

! WARNING: If the adaptive cruise control system predicts that its maximum braking level will not be sufficient, then an audible warning will sound while the system continues to brake. 'DRIVER INTERVENE' will also be displayed on the message centre.

- When a vehicle ahead is detected the vehicle will be in 'follow mode'.

! WARNING: When in 'follow mode' the vehicle will not decelerate automatically to a stop, nor will the vehicle always decelerate quickly enough to avoid a collision without driver intervention.

- Check that when in 'follow mode' a warning light in the instrument pack is illuminated and the message centre displays 'CRUISE GAP'.

36.13 Altering the cruise gap to the vehicle ahead:

- Press, the top part of the switch (3) to decrease the gap, and the bottom part of the switch (4) to increase the gap.
- Check 'follow mode' functions correctly.

36.14 Check the operation of the 'Forward Alert' system. Make sure that the ACC system is disengaged: this will allow the GAP buttons to be used to adjust the Forward Alert.

Switch on 'Forward Alert'

- Set the 'Forward Alert' gap.
- Using the GAP increase button (4), on the steering wheel switch-pack, select the largest gap available.

Check that when a vehicle is detected close ahead, an audible warning sounds and the message centre displays: 'FORWARD ALERT'.

This is easiest to achieve by following a lead vehicle as it slows down.

! WARNING: The 'Forward Alert' system DOES NOT provide vehicle braking.

△ NOTE: The 'Forward Alert' system provides warnings if a vehicle is detected close ahead.

36.15 Set the 'Forward Alert' gap:

- Using the GAP decrease button (3), on the steering wheel switch-pack, select the smallest gap available.

- 36.16** Switch OFF the Forward Alert system so that the customer receives the vehicle set in this condition.
- 37.** Check for any unusual noises from the power train, suspension or braking systems.
- 38.** Check for any squeaks or rattles from the vehicle interior.
- 39.** Check the operation of the satellite navigation system (if fitted).

Pre-Delivery Inspection Manual - Quality Assurance Checks

Description and Operation

40. On completion of road test:

- Position the vehicle on lift.
- Raise the vehicle on lift.
- Visually check beneath the vehicle for leaks from the powertrain components.
- Lower the vehicle.

E146083

41. Install the front towing eye cover, secure with the 4 toggle fasteners. Install the rear towing eye cover, tighten the fixings.

42. Reconnect the approved Land Rover battery power supply and IDS, use SDD to read fault codes, rectify any logged faults.

43. Check the register of Service Action Bulletins - make sure a fault free delivery to the customer.

44. If fault lamp(s) are illuminated, interrogate that system using IDS, report findings and clear faults.

44.1 Disconnect IDS and the approved Land Rover battery power supply.

45. Retain copy of this schedule in the Customer/ Vehicle History file.

46. Make sure the vehicle details are included in the Service Portfolio and endorse with the dealer stamp.

47. Record locking wheel nut code and place in Customer/Vehicle History file, (If applicable).

48. Record the Bluetooth code and place in Customer/Vehicle History file, (If applicable).

49. Make sure vehicle literature pack and security item contents are correct.

50. Place vehicle literature pack, mats and security items in the vehicle, (If applicable).

51. Make sure the tire pressures are set to the correct pressure.

51.1 For vehicles that will be delivered to the customer: Set all tire pressures (including spare) with the tires cold to the recommended tire pressures for 'normal' conditions (up to 100mph [160kph]). The recommended tire pressures are provided on a label attached to the 'B' pillar.

51.2 For vehicles being returned to storage: Set all tire pressures with the tires cold to 3.6 bar (52psi).

52. Valet vehicle prior to customer release.

53. Attach correct type approval labels to the handsets (where applicable).

NOTE: A vehicle must not be left without a transportation switch/relay installed for longer than two days, prior to customer handover.

If the transit relay has been refitted prior to release to customer; step 2 will need to be repeated, to remove the transit relay. Step 9 will need to be repeated, using the necessary diagnostic equipment, to clear DTC's.

Pre-Delivery Inspection Manual - SD Memory Card

Removal and Installation

Removal

1.

E159881

2. Position the LH front seat fully forwards.

Installation

1.

Showroom Preparation - Showroom Preparation

Description and Operation

NOTE: The information given in this document is subject to change for different model years.

Prior to the vehicle being placed into the showroom, the following components must be removed.

Function	Fuse	Rating	Location
Starter motor (All variants)	14E	40amp	Engine junction box (EJB)
Horn	FE31	15amp	EJB
Wipers	29E	30amp	EJB
Washers	43P & 38P	15amp	Central junction box (CJB)
Power washers	7E	30amp	EJB

Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards - Introduction

Description and Operation

General

This document describes the processes and methodology that must be applied to carry out a quality inspection of the exterior body and paint on all Jaguar and Land Rover vehicles, except Defender, at Pre-Delivery Inspection (PDI). This quality inspection is required to determine if there are any defects (hereafter called exceptions) affecting the exterior finish of the vehicle. These exceptions can be attributed to factory related defects in materials or workmanship, damage in transit or damage in storage.

Defining exterior body and paint related exceptions requires a high level of technical expertise. This manual has been compiled so that an inspector can determine if an exception should be repaired or noted as Commercially/Customer Acceptable (CA).

Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards - Cosmetic Acceptance Standards

Description and Operation

General

This section defines the paint and body acceptance standards for each of the exterior surface zones.
For additional information, refer to: [Exterior Surface Zone Identification](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).

A Zone - Medium to High Visibility

Paint

Scratches

Characteristic	PDI
Scratch Not Down To Primer (Light Surface Scratch In Top Layer - Not Through To Color Coat)	
1 scratch greater than 20mm length	Not permissible
Cluster of scratches - more than 2 in an area of 10x10cm	Not permissible
Up to 2 scratches less than 20mm length	Acceptable if not easily visible from 1m viewing distance. Up to 2 per panel not greater than 20mm length
Scratch Down To Primer (Color Coat Visible)	
Any scratch where primer is visible	Unacceptable

Chips

Characteristic	PDI
Chip Not Down To Bare Metal But Primer (Color Coat Visible)	
Any chip where primer is visible	Not permissible

Dirt In Paint

NOTE: * Pieces of dirt that are less than 1mm in diameter that give a distinct tactile feedback should be classed as a repair.

Characteristic	PDI
Dirt Has same Color As Body Color	
2 or more small pieces of dirt less than 1mm, and less than 250mm apart	Unacceptable
1 or more pieces of dirt more than 1mm*	Unacceptable
Faint exceptions which are 250mm or greater apart. Exceptions must be 1mm or less diameter and not exceed four on any one panel	Acceptable

Flattening Marks

Characteristic	PDI
If easily visible from 1m viewing distance	Not permissible
If not easily visible from 1m viewing distance	Acceptable

Polishing Marks

Characteristic	PDI
If easily visible from 1m viewing distance	Not permissible
If not easily visible from 1m viewing distance	Acceptable

Polishing Compound

Characteristic	PDI
	Not permissible

Overspray - Color

Characteristic	PDI
	Not permissible

Overspray - Clear Coat

Characteristic	PDI
	Not permissible

Craters

Characteristic	PDI
	Not permissible

Runs and Sags

Characteristic	PDI
	Not permissible

Color Mismatch

Characteristic	PDI

	Not permissible
--	-----------------

Flaking/Peeling

Characteristic	PDI
	Not permissible

Poor Color/Poor Coverage/Thin Paint/Shady

Characteristic	PDI
	Not permissible

Body

Dent

Characteristic	PDI
	Not permissible

Ding

Characteristic	PDI
	Not permissible

Panel Profile, Gaps and Flushness

Characteristic	PDI
Under/over profile or flushness not greater than 1mm	Acceptable
Tapered gaps not greater than 1mm over a length of 1m	Acceptable

B Zone - Low to Hidden Visibility

Paint

Scratches

Characteristic	PDI
Scratch Not Down To Primer (Light Surface Scratch In Top Layer - Not Through To Color Coat)	
4 or more scratches greater than 60mm length	Not permissible
Cluster of scratches - more than 2 greater than 60mm length in an area of 100cm ² (10x10cm)	Not permissible
Up to 3 scratches less than 60mm length	Acceptable
Scratch Down To Primer (Color Coat Visible)	
Any scratch where primer is visible	Unacceptable

Chips

Characteristic	PDI
Chip Not Down To Bare Metal But Primer (Color Coat Visible)	
Any chip where primer is visible	Unacceptable

Dirt In Paint

Characteristic	PDI
Dirt Has same Color As Body Color	
1 or more large pieces of dirt 2mm to 4mm (diameter or length)	Unacceptable
6 or more small pieces of dirt 1 to 2mm	Unacceptable
High accumulation of clearly visible pieces of dirt less than 1mm in a square of 25cm ² (5cm x 5cm)	Unacceptable
Less than 5 small pieces of dirt 1 to 2mm in diameter more than 50mm apart	Acceptable

Flattening Marks

Characteristic	PDI
Any flattening mark greater than 50mm ² and not more than three in a 250mm radius. If easily visible from 1m viewing distance	Not permissible
Any flattening mark not greater than 50mm ² and not more than three in a 250mm radius. If not easily visible from 1m viewing distance	Acceptable

Polishing Marks

Characteristic	PDI
Any polishing mark greater than 50mm ² and not more than three in a 250mm radius. If easily visible from 1m viewing distance	Not permissible
Any polishing mark not greater than 50mm ² and not more than three in a 250mm radius. If not easily visible from 1m viewing distance	Acceptable

Polishing Compound

Characteristic	PDI
	Not permissible

Overspray - Color

Characteristic	PDI
	Not permissible

Overspray - Clear Coat

Characteristic	PDI

	Not permissible
--	-----------------

Craters

Characteristic	PDI
Any craters, not greater than 250mm apart, greater than 1.5mm in diameter and more than three in any panel	Not permissible
Any craters, greater than 250mm apart, not greater than 1.5mm in diameter and not more than three in any panel	Acceptable

Runs and Sags

Characteristic	PDI
A single run or sag more than 4mm long or wide	Not permissible
A single run or sag not more than 4mm long or wide	Acceptable

Color Mismatch

Characteristic	PDI
	Not permissible

Flaking/Peeling

Characteristic	PDI
	Not permissible

Poor Color/Poor Coverage/Thin Paint/Shady

Characteristic	PDI
If easily visible from 1m viewing distance	Not permissible
If not easily visible from 1m viewing distance	Acceptable

Body

Dent

Characteristic	PDI
	Not permissible

Ding

Characteristic	PDI
	Not permissible

Panel Profile, Gaps and Flushness

Characteristic	PDI
Under/over profile or flushness not greater than 1.5mm	Acceptable
Tapered gaps not greater than 1.5mm over a length of 1m	Acceptable

Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards - Exterior Surface Zone Identification

Description and Operation

E160640

A = Medium to High visibility; B = Low to Hidden visibility

Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards - Paint Exceptions And Associated Repair Procedures

Description and Operation

Fine Blistering

NOTE: Alternative Terminology: Micro-blisters, pimples, bubbles, pop-ups and snail trails.

Description

Fine blisters are from 0.5 to 1.0 mm (0.020 to 0.040 in.) in diameter and may appear in patches or cover large areas. Their disposition may resemble a ring formation, an irregular, wandering snail-like trail, or be presented in an unmistakable fingerprint outline.

Blisters may contain water and close inspection will reveal whether they are in the clear coat, color coats, intermediate coats or penetrate to bare metal. Color coat blisters are often very thin and more prominent than the flatter, larger to metal or to primer blisters. Recognition of depth or source is aided by breaking with a pin and viewing with a low-power magnifying lens.

Warranty Related Cause

- Fault(s) in vehicle manufacturer's or Original Equipment Manufacturer's (OEM) paint finish process or off-line repair process.

Non-warranty Related Cause(s)

- External contamination (for example: bird droppings, industrial fall-out, etc.)
- Contamination of the painted surfaces by airborne contaminants.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair not permissible exceptions as follows:
 - Fine blisters in clear coat only: Polish or flat and polish to remove concern.
 - Fine blisters extending down into color base coat, primer coats or bare metal: Flat to remove concern then re-paint as required.

Blowing

NOTE: Alternative Terminology: Bubbles and bridging.

E160645

Description

Large air bubbles or blisters formed by detachment of the surface paint film. This exception is generally associated with the application of paint across sealed seams, boxed-in corner panels, plastic substrates or where bridging has occurred.

Warranty Related Cause

- Surface contamination on bare metal panel or solvent retention in sealant prior to paint application.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by flattening, to remove blow/bubble down to the substrate, then re-painting as required.

Chipped Paint/Scratches

NOTE: Alternative Terminology: Stone-bruising.

E160646

Description

Broken surface finish of varying size and shape. Extent and severity will depend upon cause.

Warranty Related Cause

- Damage caused during manufacturing build process or in factory transit.
- Only considered to be warranty when found on door or other opening panel edges where transit labels are intact.

Non-warranty Related Cause(s)

- Vehicle transit damage.
- Damage resulting from inadequate security of vehicle during transit or storage.
- Accidental damage during vehicle movement at Port of Entry.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions as follows:
 - Most exceptions can be repaired using a brush touch up then polish.
 - For exceptions in high visibility areas, flat to remove evidence of exception and re-paint as required.

Cissing

NOTE: Alternative Terminology: Fish eyes, craters, pits, saucering, crackling and poor wetting.

E160647

Description

Cissing is identified by the presence of small crater-like depressions in the paint finish, which may vary in size and depth according to cause, from individual craters of **pin-hole** size in densely packed groups to isolated craters of up to 10 mm (0.4 in.) in diameter.

Craters will often reveal small impurities at base when inspected with a low-powered lens. The exception may be uniform and densely arrayed but in most cases occurs as individual **fish eye** type craters.

Warranty Related Cause

- Faults in vehicle manufacturer's original paint finish.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by flattening, to remove evidence of crater and any residual contaminate, then re-paint as required.

Contamination

NOTE: Alternative Terminology: Rust specks, industrial fallout, cement dust, airborne contamination, spotting, spots, specks and splashes.

E160648

Description

Any foreign substance or chemicals which adhere to the surface or become embedded in the paint by chemical action. Excessive exposure to unfavorable atmospheric conditions. Contamination may appear as spots, speckles or splash-like deposits, this is often associated with stains, especially on metallic paint films.

Industrial Fallout/Acid Spotting/Rust Specks:

Airborne particles from industrial activities can contaminate paint film surfaces and may consist of various deposits. The paint surface is usually dusted with particles, tiny colored spots, minute stains, greasy or tacky spots and feels 'gritty'. When closely examined with a low-powered magnifying lens the particles may be seen embedded into or adhering to the paint, possibly with a stain surrounding it or rust, if it is ferrous, from the particle.

Cement Deposit/Dust

Easily recognizable by the deposit. Severe staining in the form of spots or streaks will result if the deposits are allowed to remain on the paint film.

Leaves/Berries

Wet leaves, tree sap and resins allowed to remain on the paint film and exposed to strong sunlight will cause discoloration and staining of the surface. Berries or fruits will stain paints if they are allowed to decompose on the paint film.

Salt Deposits

Salt deposits from handling, water or other fluids allowed to remain on the paint surface can result in detachment of the paint film from the underlying surface.

Warranty Related Cause

- Not normally an exception arising from manufacturing process. This is not normally a warranty related exception, but should this exception be apparent at PDI report the exception through EPQR.

Non-warranty Related Cause(s)

- Poor storage of new vehicles.
- Failure to refinish vehicles properly.
- Refinished surfaces subjected to careless handling.
- Defective oven or drying room.

Prevention

- Store vehicles as detailed in the New Vehicle Storage Manual.
- Do not expose soft paint finishes to atmospheres likely to cause contamination

Rectification Process

1. Wash with a mild detergent solution.
2. Rinse with a 10% oxalic acid solution.
3. Remove any remaining stains by polishing, or by light compounding and polishing.

Dirt/Dust On Basecoat

NOTE: Alternative Terminology: Seediness, nibs, spikes, bits, specks, grains and dirt inclusions.

E160649

Description

Particles embedded below the clear coat at the surface of the basecoat color or in the basecoat become magnified or exaggerated. If the exception appears to be extensive, close examination will reveal whether it is dirt or dry-sprayed basecoat particles that have been re-dissolved into the clear coat resulting in a spiky effect.

Warranty Related Cause

- Condition arising during manufacture.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by flattening and polishing, or flattening and re-painting.

Dirt In Clear Coat

NOTE: Alternative Terminology: Grittiness, seediness, specks, nibs and dirt inclusions.

E160650

Description

Dirt embedded in the surface of the clear coat.

Warranty Related Cause

- Condition arising during manufacture.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by polishing, or flattening and polishing. If more than 50% of the clear coat film thickness has to be removed to clear the exception, re-paint the clear coat as required.

Dirt Under Basecoat

NOTE: Alternative Terminology: Dirt nibs, nibs, knobs, hills, lumps, coarse blisters, bumps and basecoat imperfections.

Description

Dirt under basecoat is often mistaken as blisters: the effect is similar, appearing as hard lumps or bumps in the finish. The exception will not deteriorate neither will it result in film failure. The contamination is of no defined size. The exception is hard and will not give way when probed with a blunt object or fingernail, unlike **soft** blisters.

Warranty Related Cause

- Condition arising during manufacture.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by polishing, or flattening and polishing. If dirt/inclusions are showing through the base color coat, re-paint as required.

Dull Finish/Abnormal Loss Of Gloss

NOTE: Alternative Terminology: dulling back, poor gloss, deadening, hazing, loss of gloss and low gloss.

Description

This exception relates to a paint surface which is smooth and evenly applied but lacks reflective ability. Unlike dry spray the surface will not be roughened. Close inspection may reveal whether it is the result of surface

contamination or a film defect. It may cover large or small areas. Small patches are often the result of contamination.

NOTE: Dulling will occur on exposure to strong sunlight over lengthy periods, resulting in **off-shading** of the color.

Warranty Related Cause

- Manufacturer's defect in paint material or process.

Non-warranty Related Cause(s)

- Airborne deposits such as water or salt staining.

Rectification Process

1. Polish only or clean and polish.

Etching

NOTE: Alternative Terminology: Bird droppings, acid attack, windshield-wash attack, strong detergent attack, industrial fallout, splashes and solvent attack.

Description

Small or large areas of the paint surface roughened and partly removed or disintegrated, often with traces of the cause and staining around the area. The severity of the exception will vary depending on the exposure and the nature of the attacking substance. In severe cases the paint film may exhibit signs of crazing.

Warranty Related Cause

- Not an exception arising from manufacturing process.

Non-warranty Related Cause(s)

- Incorrect or poor storage of new vehicles.
- Poor handling or carelessness with corrosive chemicals.
- Exposing soft or new paint finishes to strong chemicals or failure to protect from airborne contaminants.

Prevention

- Store vehicles as detailed in the New Vehicle Storage Manual.
- Take care with finishes and protect. Do not expose uncured or improperly hardened finishes to conditions likely to cause etching.
- Avoid washing recently finished areas or soft cellulose with detergents or allowing detergents to stay on the surface.

Rectification Process

1. Check severity of exception.
2. If mild, exception can be fine flatted and compounded/polished out.
3. If severe, exception will require local refinish. Make sure all traces of the contaminant are removed.

Flaking/Delaminationg

NOTE: Alternative Terminology: Peeling off, peel back, blowing off, shelling, poor bond, loss of adhesion, intercoat adhesion failure and poor adhesion.

Clear Coat and Basecoat Flaking From Surface

E160654

Clear Coat Flaking From Basecoat

E160655

Clear Coat Flaking From Clear Coat

E160656

Description

The clear coat or both basecoat and clear coat layers are partially or completely detached from the underlying surfaces over large or small areas depending on severity. The exception may exhibit flaking or may only be apparent from portions of the clear coat having previously been removed. The exception is confined to a clear coat only, or to both the clear coat and the basecoat layers.

Warranty Related Cause

- Defective original process or materials.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by flattening to the layer where the flaking has occurred, then re-painting as necessary.

Haloes

NOTE: Alternative Terminology: Contours, rings, edges, dry edges, peeling back, poor fade-out and poor wetting.

E160657

Description

Color transition of localized refinished area is not imperceptibly graduated into surrounding finish resulting in a dark edge, light shadow or difference in surface finish around the periphery of a repair.

Warranty Related Cause

- Manufacturer's defect in paint application process.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by re-painting as required.

Off Shade

NOTE: Alternative Terminology: Discoloration, mismatch, off-color and fading.

Description

Color shade of adjacent panels does not match or areas with break lines appear to be off-color or differing in shade. This term normally applies to off-color of complete adjacent panels. Local off-shade areas are likely to be the result of contaminants.

Warranty Related Cause

- Manufacturer's process fault.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by re-painting as required.

Opacity/Inadequate Color Coverage

NOTE: Alternative Terminology: Rub-through, grinning-through, poor hiding, poor coverage, thin paint, transparent film, undercoat showing through, undersprayed, lack of paint and poor build.

Description

This exception usually occurs in hard-to-spray areas, sharp contours/edges or lower panels and is evident as insufficient paint coverage and application. The exception will be more defined on dark colors and some metallic colors.

Warranty Related Cause

- Manufacturer's process defect, lack of paint application.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by re-painting as required.

Orange Peel

NOTE: Alternative Terminology: Pebbling, poor flow and poor leveling.

Description

A paint finish which has an undulated surface resembling an orange skin. Impaired reflective ability is characteristic of this defect.

Warranty Related Cause

- Manufacturer's paint application process.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by polishing, or flatting and polishing.

Overspray

NOTE: Alternative Terminology: Masking lines, inconsistency and hazing.

E160661

Description

Overspray may appear as areas of dust-like paint particles adhering to the paint surface, or as paint particles only partially absorbed into the finish, reducing the gloss and hazing or misting the reflective ability of the surface.

Warranty Related Cause

- Defective application process by manufacturer.

Non-warranty Related Cause(s)

- None.

Rectification Process - Overspray Clear Coat

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by polishing, or flatting and polishing.

Rectification Process - Overspray Color Coat Plus Clear Coat

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Not permissible exceptions must be repaired as follows:
 - Attempt removal of concern by either polishing or flat and polishing.
 - If polishing does not remove concern, flat and re-paint affected area.

Polishing Compound

NOTE: Alternative Terminology: Residue and debris.

Description

Polishing compound will take the form of either small round specks or hazy patches on body panels or trim components.

Warranty Related Cause

- Polishing compound on vehicles is the result of factory polish repairs done to rectify minor paint defects.

Appropriate protection and subsequent cleaning after polishing not carried out satisfactorily.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Clean affected area by applying an alcohol based spirit wipe on a soft cloth.

Polishing Witness Marks (Circular Fine Scratches)

NOTE: Alternative Terminology: Swirls, dull finish, blooming and haloing.

Description

Localized areas of circular fine scratching which may have a dull hazy appearance. This effect is a result of inadequate fine flatting and polishing to remove small surface defects.

Warranty Related Cause

- Defective application process by manufacturer.
- Final polishing has not been done effectively, therefore the area shows a low gloss appearance with a bloom/hazy finish.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Polish area to remove scratches and restore gloss.
2. De-bloom panel to remove all evidence of polishing.

Poor Metal Finish

NOTE: Alternative Terminology: Disc marks, blue marks, weld spatter and weld splashes.

Description

The paint film has sunk into and repeated the outlines of scratches, grooves or lines in the metal. This exception will be characterized by a pattern of short curved grooves, criss-cross lines or very short deep grooves at the surface. The marks in the finish will be more pronounced and severe than flatting marks. When the exception arises from weld spatter or pieces of metal under the finish, it will be seen as jagged intrusions in the paint or globules located adjacent to a welded seam.

Warranty Related Cause

- Poor metal finish in production process.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.

For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).

2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by polishing, or flatting and polishing. In severe cases re-paint as required.

Runs

NOTE: Alternative Terminology: Drips, gun spits and sags.

E160663

Description

An accumulation of paint which gathers to form a thickened fold, often accompanied by individual tear-like runs or a sagging drapery of runs.

Warranty Related Cause

- Incorrect paint application by manufacturer.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by polishing, or flatting and polishing.

Sanding Scratches

NOTE: Alternative Terminology: Sand scratches, scratches in basecoat, dark lines, flatting marks and lining up.

E160664

Description

Parallel scratch marks or fine dark lines apparent only in the basecoat color, following the direction and extent of the manual flattening operation. The severity and effect depends on the location and direction of view (i.e. the lines may not be apparent when viewed directly into the paint film).

Warranty Related Cause

- Defect occurring during manufacturer's process.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by polishing, or flattening and polishing. In severe cases, re-paint as required.

Shadiness/Sheary

NOTE: Alternative Terminology: Shear, sheariness, flotation, mottle, banding, streaks, gun streaking, shadows and blotches.

Description

The paint color appears variegated or in patches of darker and/or lighter shades, arranged in a cloud-like manner. The cloudy pattern usually follows the direction of application according to the stroke of the spray gun.

Warranty Related Cause

- Defect arising from manufacturer's process.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by re-painting as required.

Solvent Retention

NOTE: Alternative Terminology: Boil, pits, bubbles, pin-holes, boiling, solvent boil, solvent shock and air bubbles.

E160666

Description

Bubbles of solvent retained in the clear coat, usually close to the surface and in localized areas, of a size between 0.5 and 1 mm (0.020 and 0.040 in.) diameter. May initially be apparent as black dots, but close examination will reveal the depth at which they are held in the clear coat.

Warranty Related Cause

- Fault with manufacturing process.

Non-warranty Related Cause(s)

- None.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by re-painting as required.

Staining/Discoloration

NOTE: Alternative Terminology: Water spotting, tree sap/leaves/road tar/glue stains, bleeding, excess adhesive, darkening, rain spotting, brown spots and acid staining.

E160667

Description

Staining is a general term used to describe a condition where the paint surface is discolored or dyed. The stain may arise from under the film, i.e. bleeding, or penetrate into the film from external contamination. Traces of the contaminant will indicate the nature of the staining. Water spotting is recognized as a pattern of light colored spots or marks on the surface of the paint film. These may be accompanied by traces of salt or lime-like deposits. The exception is most common on horizontal surfaces and results from formation of water globules, which with subsequent evaporation leaves salt deposits to stain or attack the paint.

Warranty Related Cause

- Not a warranty related concern.

Non-warranty Related Cause(s)

- Poor storage conditions.
- Oil in air line.
- Contamination of surface by fumes from oven heating system.
- Alcohol or anti-freeze spillage.
- Road tar.
- Windshield-wash fluid attack.
- Acid attack.
- Water left to dry on surface.

Prevention

Store vehicles as detailed in the **New Vehicle Storage Manual**.

Rectification Process

1. Determine if exception is permissible or not permissible.
For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Permissible exception does not require a repair so should be passed as CA.
3. Repair any not permissible exceptions by polishing, or flatting and polishing.

Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards - General Requirements

Description and Operation

Facility Minimum Requirements (For PDI Centers)

NOTE: The maximum time taken to inspect the vehicle should not normally exceed 5 minutes.

1. A covered well ventilated area providing ample room to drive vehicles into and out of without restrictions.
2. A separate vehicle wash/dry area should be available.
3. Vehicles should be processed down a single line **flow** process.
4. The flow line should be clearly marked using floor marking set to a minimum required width.
5. Sidewalk ways should be clearly marked and must incorporate the provision for doors fully open down the line.
6. All inspection areas should be clearly marked with adequate natural tone florescent lighting that illuminates the vehicle in a consistent way across all exterior surfaces. The lighting levels should be between 1000 and 2000 lux.
7. The inspection area should consist of a box, line marked on the floor, clearly defining the inspection viewing position 1 m (39 in.) from the vehicle. The floor surface where possible should be finished in a light gray to reflect light. Use suitable stable platforms to allow the roof inspection of high sided vehicles.
8. All possible contact points down the line should be protected using soft foam. This foam should be regularly checked and renewed if required.
9. Portable/Mobile units should have soft foam protection installed to all edges. These should be checked regularly and installed if required.
10. No electrical cables, airlines or pipes should be used across the vehicles.
11. All accessory fitting should be done in an off-line location.
12. Personnel should wear appropriate clothing, which removes any risk of damaging the vehicles.
13. Personnel should be devoid of the following items, which could potentially cause vehicle damage:
 - Exposed metal items such as belt buckles, jean rivets, buttons or zippers.
 - Exposed jewellery, watches, chains or rings. Fully covering these items with soft protection is advisable.
 - Tools or other objects sticking out of pockets.
 - Grease, oil or solvents.
14. The line should be kept clean at all times. All dirt, debris or fluid spillages should be cleaned up immediately.

Exterior Inspection Viewing Position

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

E160668

Conduct Of Personnel

1. There should be no smoking in the working area. Areas where smoking is allowed should be clearly marked

- and be the only locations where smoking is permitted.
2. There should be no eating or drinking in the working area. Locations for taking refreshments should be allocated.
 3. Do not lean on or sit in or on vehicles.
 4. Do not place objects on, by or in vehicles.
 5. Do not operate the vehicle in any unnecessary manner, e.g. listening to the radio, unauthorized driving/moving of the vehicle, etc.
 6. When the vehicle is not being worked on make sure all windows, doors and other openings are kept closed.
 7. Do not use clipboards or any other writing materials by or on the vehicle. All written work associated with processing the vehicle should be done in an off-line location.

Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards - Identification Of Exceptions

Description and Operation

Exception Types

Exceptions identified while carrying out a vehicle exterior surface inspection fall into three cause categories:

- Transportation.
- Warranty.
- Internal.

Transportation

Where applicable, all of the transportation exceptions will have been already identified during the Marine Survey, also known as the First Point of Rest Survey. This survey must be carried out immediately after the cars leave the ship in an area on the dockside. Vehicles should not be moved to a holding compound and then inspected for transportation exceptions. If for any reason vehicles cannot be inspected on the dockside and have to be moved to a compound, prior agreement must be obtained from the carrier that they will still accept liability for any transit related damage found.

Examples of transportation exceptions:

- Damage caused by physical impact, abrasion or forced entry.
- Damage or soiling of the drivers area to include seat and interior components, door inner and apertures and door trims. Obvious vandalism or abuse of the interior.
- Wheel rim damage - the rim has rotary cut or abrasion marks.
- Damage to undercarriage.
- Vehicle exterior glass surface, scratched, chipped or broken.
- Paint chips noted on driver's door rear edge or the drivers side rear door leading edge. Any paint damage or trim damage found on doors whereby the transit door seal is broken.

Undercarriage exceptions must be declared within seven workings days from receipt of the vehicle.

Water, tire, glass and exterior body fallout damage are managed risks subject to separate negotiations.

Warranty

Warranty related exceptions are those that relate to the fit, functionality and workmanship of parts or materials. Determining warranty related exceptions is done via the PDI process. Please refer to the applicable vehicle line Warranty Policy and Procedures Manual for a more comprehensive explanation of the warranty process requirements.

Examples of warranty related exceptions:

- Poor metal condition on body panels such as distorted, wavy or creased. Only acceptable if outside of factory quality build standard.
- Poor finish on body panels such as file, grinder or weld marks. Only acceptable if outside of factory quality build standard.
- Outwards facing dents in body panels.
- Poor paint finish due to the following:
 - Dirt/Inclusions.
 - Runs/Sags.
 - Blisters, including solvent popping.
 - Peeling/Flaking
 - Base color coat bruising/blemishes.
 - Mottle/Shading of color coat.
 - Over spray or dry spray.
 - Chipped paint - only allowed on panels covered by transit coatings or where transit labels are applied.
 - Any defect found under the transit coating, except where there is evidence that the transit coating has been breached.
- Tire damage caused by production related debris (e.g. screws, bolts, etc.).
- Cracks in glass or plastic panels deemed to be defective material.
- Improperly installed or mis-aligned panels, mouldings, badges, emblems or weather strips.
- Wheel rim damage found inboard of the rim or noted in or around the wheel nut location holes.
- Water ingress/leakage - damaged or contaminated components due to poor body seam sealing or incorrectly installed/damaged body weather seals.

Internal

Any damage related exceptions found subsequent to the Marine Survey will be considered as internal. It is therefore the responsibility of the port processor to repair any such damages and absorb all associated costs. The only deviation from this is the possibility of finding hidden transportation damage during the PDI inspection.

Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards - Exterior Pre-Delivery Inspection (PDI) Process

Description and Operation

General

All exterior PDI should be carried out inside the PDI facility.

For additional information, refer to: [General Requirements](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).

Conducting the Inspection

All inspections should be undertaken in a manner that minimizes contact with the vehicles, to avoid damaging them.

The vehicle's outer surfaces should be clean, if necessary having been washed and dried prior to the inspection process.

All inspections shall be entirely impartial and be based on the following instructions, developed to make sure all vehicle inspections are conducted in a consistent systematic manner:

- All exterior surfaces and components not covered by transit protection should be inspected.
- All exterior surfaces and components not covered by transit protection should be inspected.
- Start inspection at center front of vehicle, then move down the right side, across the rear and up the left side, finishing at your start point.
- All exceptions noted must be clearly visible at 1 m (39 in.) standing upright at right angles to the inspected surface/component or up to 30 degrees each side of center. Most surface defects are visible at right angles to the vehicle. Dents/Dings are most visible when the surface of the vehicle is viewed at the 30 degrees angle offset.
- Close inspection, viewing surfaces/components at less than 1 m (39 in.), is not permitted when carrying out this inspection. Close inspection must only be used to confirm an exception is present. Close inspection is a means of exception verification, not a detection technique.
- Determine the acceptability of any exceptions found on the vehicle in accordance with the criteria given in the acceptance standards tables.

For additional information, refer to: [Cosmetic Acceptance Standards](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).

Inspection Process - Description Of the Work Element

1. View each panel as described above. You may occasionally have to lightly touch the surface of the vehicle to confirm the presence of an exception. At the end of the inspection all exceptions should be recorded on a worksheet. Include a fault code description and a vehicle silhouette.
For additional information, refer to: [Exterior Surface Zone Identification](#) (101-03 Exterior Body & Paint Pre-Delivery Inspection (PDI) Standards, Description and Operation).
2. Inspect the front area of the hood, the radiator grille, header panel, headlamps, front body panels, bumper assy. View across front of vehicle to make sure gaps and alignments are acceptable.
3. Using the reflection from the overhead lights, scan the panel to detect any dents/dings.
4. At the right side of the vehicle inspect the front fender, hood, bumper side and wheel assy. Viewing down the vehicle from a 30 deg angle check for dents/dings.
5. Inspect right side of windscreen, A-pillar, roof above front door, front door, door handle, door glass and sill area. Look down the vehicle from 30 degrees angle and check for dents/dings.
6. Inspect the roof above the rear door, rear door, door handle, door glass, B/C-pillar trim and sill area. Look down the vehicle from 30 degrees angle and check for dents/dings.
7. Inspect the right hand rear fender, luggage compartment, D/E-pillar, side bumper assembly and wheel assembly.
8. Look along the right hand side of the vehicle and check that all of the panel gaps and alignments are acceptable.
9. At the rear of the vehicle inspect the luggage compartment lid/tailgate to make sure panel gaps and alignments are correct. Inspect tail lamps and rear fender around lamp assemblies. Inspect the complete rear bumper assembly including any finishers, badges, emblems or lamps. Make sure their alignment is correct.
10. 10. In reverse order fully inspect the left side of the vehicle.

Reporting Warranty Inspection Data

Each warranty exception must be recorded by using the Jaguar or Land Rover warranty code system. Refer to the appropriate Repair Time Searcher (RTS) to find the correct warranty code. Direct reporting of exceptions found on vehicles should be done via the Electronic Product Quality Reporting (EPQR) system.

Suspension System - General Information -

Coil Spring Suspension

Item	Specification
Type:	
Front	Independent with single rate coil spring, twin tube damper and high stress anti-roll bar
Rear	Independent with dual rated coil spring, twin tube damper and anti-roll bar

Air Spring Suspension

Item	Specification
Type	Independent with twin tube damper, anti-roll bars and air springs with multiple, driver selectable ride heights - Standard, off-road and access.

Wheel Alignment Specification (All Markets) - Front - LHD

CAUTION: When checking or adjusting front or rear steering geometry, the vehicle must either have a full fuel tank or have sufficient weight placed in the vehicle's load space to give the equivalent weight of a full fuel tank. The weight must be evenly distributed at the front and the right hand side of the load space. The fuel tank capacity is 86.3 litres (18.9 Imperial gallons) (22.7 US gallons). Depending on the amount of fuel in the tank, calculate the amount of weight which must be added:

- 1 litre of fuel weighs 0.8 kg (1.7 pounds)
- 1 Imperial gallon of fuel weighs 3.6 kg (8.0 pounds)
- 1 US gallon of fuel weighs 3.0 kg (6.7 pounds)

NOTE: All figures are with vehicle at 'Showroom' ride height - full fluids, full tank of fuel, no occupants/luggage, tires inflated to normal pressures

Suspension System - General Information - Suspension System

Diagnosis and Testing

Principle of Operation

For a detailed description of the Suspension System and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to:

- Front Suspension (204-01 Front Suspension, Description and Operation),
- Rear Suspension (204-02 Rear Suspension, Description and Operation).

Inspection and Verification

WARNING: Before carrying out a road test, make sure the vehicle is safe to do so. Failure to follow this instruction may result in personal injury.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Gather as much information from the driver as possible and verify the customer concern by carrying out a road test, as closely as possible reproducing the conditions under which the fault occurs.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> • Tire pressures • Damaged wheels or tires • Wheel bearing(s) • Loose or damaged front or rear suspension components • Loose, damaged or missing suspension fastener(s) • Damaged or leaking air suspension components • Worn or damaged suspension bushing(s) • Loose, worn or damaged steering system components • Damaged axle components • Damaged chassis

3. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the symptom chart.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Crabbing	<ul style="list-style-type: none"> • Incorrect rear thrust angle • Front or rear suspension components 	<ul style="list-style-type: none"> • Check the rear alignment • Check the front and rear suspension for signs of damage or wear
Drift/pull/wander	<ul style="list-style-type: none"> • Tire pressures • Uneven tire wear • Damaged steering components • Wheel alignment • Brake drag • Unevenly loaded or overloaded vehicle 	<ul style="list-style-type: none"> • Check and adjust the tire pressures (see visual inspection) • Check for uneven tire wear, investigate the cause and rectify as necessary • Check the steering for wear/damage • Check and adjust the wheel alignment as necessary • Check for binding brakes, rectify as necessary • Advise the driver of the load issues
Front bottoming or riding low	<ul style="list-style-type: none"> • Damaged suspension components • Air spring fault 	<ul style="list-style-type: none"> • Check the suspension components for damage • Check the dynamic suspension
Uneven tire wear	<ul style="list-style-type: none"> • Incorrect tire pressure (rapid centre rib or inner and outer edge wear) • Incorrect front or rear toe (rapid inner or outer edge wear) 	<ul style="list-style-type: none"> • Check and adjust the tire pressures (see visual inspection) • Check and adjust the wheel alignment as necessary • Balance the wheels and tires as necessary

	<ul style="list-style-type: none"> • Incorrect camber (rapid inner or outer edge wear) • Tires out of balance (tires cupped or dished)

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Air Suspension Control Module (100-00, Description and Operation).

Suspension System - General Information - Four-Wheel Alignment

General Procedures

Special Tool(s)

CAUTIONS:

Make sure the vehicle is on a flat level surface.

Make sure the tire pressures are within specification.

Make sure that only the manufacturers' recommended four wheel alignment equipment is used.

Make sure the vehicles fuel tank is full, if not distribute extra weight evenly over the fuel tank area to represent a full tank of fuel.

Make sure there are no heavy objects in the vehicle.

Make sure the air suspension is set to NORMAL ride height.

Make sure the steering is in the straight ahead position.

Make sure the slip plates (turntables) are free to move before adjusting the geometry.

NOTE: This procedure can be used for vehicles with either air or coil spring suspension.

1. Check the tie rod ends, suspension joints, wheel bearings and wheels and tires for damage, wear and free play.
 - Adjust or repair any worn, damaged or incorrectly adjusted components.
2. Check and adjust tire pressures.
3. Position the vehicle on a calibrated, level, vehicle lift.
4. Release the vehicle parking brake.
5. Vehicles with dynamic suspension: Using the approved diagnostic tool, check the air suspension control module for fault codes and clear as required.
6. Vehicles with dynamic suspension: Using the diagnostic tool, set vehicle to 'Geometry Set Mode', using the instructions below. Putting the vehicle into this mode will make sure that the ride heights are controlled more accurately.
 1. Select the 'Configuration' tab
 2. Select 'Set up and Configure'.
 3. Select 'Air Suspension'.
 4. Select 'Suspension Geometry Set Up'.
 5. Select 'Tight Tolerance Mode'.
 6. Follow the on-screen instructions until the set up process has finished.

7.  NOTE: If rear camber adjustment is required, loosen

the rear camber adjustment bolts enough to allow adjustment before starting any other wheel alignment adjustments. Do not fully loosen the rear camber adjustment bolts.

Using only four wheel alignment equipment approved by Land Rover, check and adjust the wheel alignment.

8.  **CAUTION:** Make sure the toe link anti-rotation tang is fully seated in the integrated body frame before tightening the toe link retaining nut. Failure to follow this instruction will result in damage to the toe link or integrated body frame.

 **NOTE:** This step is only required if the toe links have been removed or replaced.

Adjust the rear bump steer.

- Loosen the toe link inner ball joint retaining nut.
- Set the gap, between the underside of the toe link rubber boot and the integrated body frame bracket, to 10 mm (0.473 in).
- Tighten the toe link inner ball joint retaining nut to 133 Nm (98 lb.ft)
- Repeat the above procedure for the other side.

9. Adjust the rear camber.

- Loosen the rear camber adjusting bolts.
- Rotate the rear camber adjusting bolt until the correct value is obtained.
- Repeat the above procedure for the other side.
- Tighten the rear camber adjusting bolts.

10. Install the special tool and a suitable socket to the rear camber adjusting bolt retaining nut.

E137182

E137185

E55925

11. NOTES:

 The torque wrench must be installed in a direct line with the special tool, as shown.

 Calculate the torque wrench setting using the formula below.

 Key to letters:

- **A** = Effective length of the torque wrench, measured in mm.

Formula:

- **Torque wrench setting (Nm) = $(133 \times A) / (A + 100)$**

Using the special tool, a suitable extension bar and a torque wrench, fully tighten the camber adjusting bolt retaining nut.

- Use the torque wrench setting calculated above.
- Repeat the above procedure for the other side.

12. Adjust the rear toe.

- Loosen the toe link adjustment locking nut.
- Rotate the toe link inner ball joint until the correct rear toe value is obtained.
- Tighten the toe link adjustment locking nut to 130 Nm (96 lb.ft).
- Repeat the above procedure for the other side.
- Repeat the rear toe measurement.

13.  CAUTION: Make sure the slip plates (turntables) are free to move before adjusting the geometry.

Adjust the front camber.

- Loosen the lower arm front camber adjusting bolt.
- Rotate the front camber adjusting bolt

- until the correct value is obtained.
- Tighten the lower arm front camber adjusting bolt to 275 Nm (203 lb.ft).
- Repeat the above procedure for the other side.

14. Adjust the front castor.
 - Loosen the lower arm rear castor adjusting bolt.
 - Rotate the castor adjusting bolt until the correct value is obtained.
 - Tighten the lower arm rear castor adjusting bolt.
 - Repeat the above procedure for the other side.
 - Repeat the castor measurement.
 - Repeat the above procedure until both castors achieve the correct value.
 - Tighten the lower arm rear castor adjusting bolts to 275 Nm (203 lb.ft).

15. Align the steering to straight ahead.
 - Measure the length of the exposed thread on each track rod.
 - If the exposed thread lengths differ by more than two millimetres:
 - Stage one: Loosen one track rod end locking nut.
 - Stage two: Rotate the track rod until the lengths of the exposed threads on both track rods are equal.
 - Stage three: Tighten the track rod end locking nut.
 - Stage four: Rotate the steering wheel until both front toe measurements are equal.

16. Adjust the front toe.
 - Loosen the track rod end locking nuts.
 - Rotate the track rods to adjust each individual front toe to the correct value.
 - Tighten the track rod end locking nuts to 53 Nm (39 lb.ft).

17. Vehicles with dynamic suspension: Using the diagnostic tool, return the vehicle to 'Normal Mode'.
 1. Select the 'Configuration' tab
 2. Select 'Set up and Configure'.
 3. Select 'Air Suspension'.
 4. Select 'Suspension Geometry Set Up'.
 5. Select 'Normal Mode'.
 6. Follow the on-screen instructions until the normal mode process has finished.

18. Calibrate the steering angle sensor using the diagnostic tool.

Suspension System - General Information - Front Wheel Bearing and Wheel Hub Runout Check

General Procedures

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

LH illustration shown, RH is similar.

-  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

- Remove the road wheel.

E119129

- CAUTIONS:**

Do not allow the brake caliper to hang on the brake hose.

LH side: Do not allow the brake caliper to hang on the brake pad wear warning sensor lead.

NOTE: Models with standard brakes shown, models with high performance brakes similar.

Release the brake caliper and tie aside.

E61629

- Remove the front brake disc.
 - Remove the Allen screw.

- Thoroughly clean the hub mounting face.

- Using special tool (100-053) mount a Dial Test Indicator (DTI) to and secure to the backplate using the upper backplate fixing.

7.  **CAUTION:** Make sure the DTI is positioned clear of the wheel studs.

Position the DTI probe on the outer edge of the hub face.

8. Zero the DTI and rotate the hub one complete revolution to measure hub runout.
 - The hub runout limit is 0.0135 mm.

9.  **NOTE:** If the hub runout exceeds the limit replace the hub.

For additional information, refer to: Front Wheel Bearing and Wheel Hub (204-01, Removal and Installation).

10. Remove the DTI.
11. Install the brake disc.
 - Tighten the Torx screw to 35 Nm (26 lb.ft).
12. Install the brake caliper and tighten the bolts. TORQUE: 275 Nm
13. Install the road wheel and tighten nuts to 140Nm (103 lb-ft).
14. Repeat the above procedure on the opposite side.
15. Depress the brake pedal several times to set brake pads.
16. Lower the vehicle.

Front Suspension -

Coil Spring Suspension

Item	Specification
Road spring color coding:	
	YELLOW/BLUE
	YELLOW/GREY
	YELLOW

Note: The first color indicates the fitted position of the spring on the vehicle i.e. front. The secondary color identifies the thickness of the isolator which is fitted to a particular spring to ensure that the vehicle ride height is maintained within specified limits. Replacement springs will be supplied with the appropriate isolator fitted.

OVERVIEW

The front suspension is a fully independent design which offers a reduction in unsprung weight over the beam axle design fitted to previous Land Rover models. The front suspension comprises an upper control arm, a lower control arm, a wheel knuckle and hub, an stabilizer bar and links assembly and a shock absorber assembly. The shock absorber can have a coil spring or air spring, both shock absorber types use a similar design. The suspension components are common to both coil and air spring versions.

The suspension control arms have been designed for maximum ground clearance and also allow for adjustment of the camber and castor using cam adjusters.

15	-	Air spring assembly*

NOTE: * shows service items

The shock absorber module comprises an air spring assembly, top mount and a shock absorber. The shock absorber and air spring are only serviceable as complete assemblies.

Shock Absorber

The shock absorber assembly is a twin tube design with the conventional coil spring replaced by the air spring. The lower end of the shock absorber is fitted with a bush and is attached to the lower control arm with a bolt and nut.

The shock absorber functions by restricting the flow of hydraulic fluid through internal galleries within the shock absorber. The shock absorber rod moves axially within the shock absorber, its movement limited by the flow of fluid through the galleries, providing damping of undulations in the terrain. The shock absorber rod is sealed at its exit point from the shock absorber body to maintain the fluid within the unit and to prevent the ingress of dirt and moisture. The seal also incorporates a wiper to keep the rod clean.

Air Spring

The air spring comprises an aluminium restraining cylinder, top mount, spring aid, air sleeve and an inner support sleeve.

The air sleeve is made from a flexible rubber material which allows the sleeve to roll up and down the air spring piston as the vehicle changes height. The air sleeve is attached to the restraining cylinder and support sleeve by crimp rings which provide an air tight seal. The support sleeve contains a seal carrier which has two O-rings sealing the support sleeve and two O-rings sealing to the shock absorber body. The top of the air sleeve is crimped to the top mount which attaches to the chassis frame with 3 integral studs and self-locking nuts.

A spring aid is fitted to the shock absorber rod and prevents the top mount contacting the top of the shock absorber during full suspension compression and assists the suspension tune. The lower end of the air spring is located over the shock absorber body and seats on a fabricated seat on the shock absorber body. The air sleeve is positively attached to the seat with a retaining pin. The shock absorber rod is located through a central hole in the top mount. The rod is threaded at its outer end. A self-locking nut secures the air spring to the shock absorber rod.

The top mount is an integral part of the air spring and is fitted with a bush and rebound washer. A bump washer is located between the top mount plate and the shock absorber rod. The top mount is secured to the shock absorber rod with a self-locking nut. The top mount attaches to a housing on the chassis with 3 integral studs and self-locking nuts. The top mount also incorporates a 6 mm Voss air fitting which allows for the attachment of the air harness.

A gaitor is available as a dealer fit component. The gaitor is similar to the one fitted to the rear air shock absorber module and is available if a customer experiences dirt and debris becoming trapped between the air sleeve and the restraining cylinder under certain terrain conditions.

Shock Absorber Assembly - Coil Spring Suspension

E150448

Item	Part Number	Description
1	-	Self-locking nut
2	-	Rebound washer
3	-	Top mount assembly
4	-	Spring spacer (selective)
5	-	Spring isolator
6	-	Bump washer
7	-	Spring aid
8	-	Dust tube
9	-	Bump cup
10	-	Coil spring
11	-	Shock absorber
12	-	Shock absorber rod
13	-	Self-locking nut (3 off)
14	-	Bush

The coil spring shock absorber assembly comprises a shock absorber, coil spring and top mount.

Shock Absorber

The shock absorber assembly is a twin tube design with the conventional coil spring located on a welded spring seat on the shock absorber tube. The lower end of the shock absorber is fitted with a bush and is attached to the lower control arm with a bolt and nut.

The shock absorber functions by restricting the flow of hydraulic fluid through internal galleries within the shock absorber. The shock absorber rod moves axially within the shock absorber, its movement limited by the flow of fluid through the galleries, providing damping of undulations in the terrain. The shock absorber rod is sealed at its exit

point from the shock absorber body to maintain the fluid within the unit and to prevent the ingress of dirt and moisture. The seal also incorporates a wiper to keep the rod clean.

The shock absorber rod is located through a central hole in the top mount. The rod is threaded at its outer end. A self-locking nut secures the top mount to the shock absorber rod.

A spring aid is fitted to the shock absorber rod and prevents the top mount contacting the top of the shock absorber during full suspension compression and also assists the suspension tune.

Spring and Top Mount

The coil spring fitted differs with vehicle specification. Each spring is color coded to identify its rating and fitment requirements.

The coil spring is located in a spring seat which is an integral part of the shock absorber body. The design of the spring seat prevents the spring rotating. The opposite end of the coil spring is located in a spring isolator which is fitted in the top mount. The spring isolator is made from rubber and prevents any noise produced during shock absorber and spring compression/extension from being transmitted to the vehicle body.

The top mount is fitted with a bush and rebound washer which are located between the top mount plate and the shock absorber rod, a self-locking nut secures the shock absorber rod to the top mount. The top mount attaches to a housing on the chassis with 3 integral studs and self-locking nuts.

The spring is fitted with spring spacers which are located between the spring isolator and the top mount. The spring spacers control the length of the spring to maintain the correct trim height. The spring spacers are color coded and are supplied with a replacement spring.

Stabilizer Bar

E150449

Item	Part Number	Description
------	-------------	-------------

- 1 - Nut - link to stabilizer bar (2 off)
- 2 - Link (2 off)
- 3 - Nut - link to upper control arm (2 off)
- 4 - Right upper control arm
- 5 - Nut (4 off)
- 6 - Bush (2 off)
- 7 - Left upper control arm
- 8 - Stabilizer bar
- 9 - Bracket (2 off)

The stabilizer bar is fabricated from induction hardened, solid spring steel bar. The stabilizer bar operates, via a pair of links, from their attachment to the upper control arm.

The stabilizer bar is attached to the forward face of the chassis front cross member. The stabilizer bar is attached to the cross member with two, Teflon lined bushes. Brackets, which are pressed onto the bushes, are attached to the cross member with nuts, screwed onto studs in the cross member. The stabilizer bar has crimped, 'anti-shuffle' collars pressed in position on the inside edges of the bushes. The collars prevent sideways movement of the stabilizer bar.

The ends of the stabilizer bar are attached to the upper control arms via links. This allows the stabilizer bar to move with the wheel travel providing maximum effectiveness. Each link has a ball joint at each end. The top ball joint is attached to the link, parallel with the link axis. The ball joint is located in a hole in the upper control arm and secured with a self-locking nut. The bottom ball joint is attached to the link at 90 degrees to the link axis. The ball joint is located in a hole in the end of the stabilizer bar and secured with a self-locking nut. The links are not handed and therefore can be fitted to either side of the stabilizer bar.

Upper Control Arm

Item	Part Number	Description
1	-	Flanged bolt
2	-	Bush
3	-	Self-locking nut
4	-	Flanged bolt
5	-	Bush
6	-	Self-locking nut
7	-	Stabilizer link attachment hole
8	-	Ball joint
9	-	Ball joint circlip
10	-	Self-locking nut
11	-	Timing marks
12	-	Upper control arm

The upper control arm assembly comprises, the control arm, two bushes and a ball joint. The upper control arm is a pressed steel fabrication. Its outer end has a hole to accept the ball joint. A small indentation is located adjacent to the ball joint hole and is used to obtain the correct orientation of the ball joint. A smaller hole near the ball joint provides for the attachment of the stabilizer link. The underside of the upper control arm has a bracket for attachment of the height sensor link arm and two further brackets which secure the brake hose, pad wear sensor and wheel speed sensor cables.

The inner end of the arm has two fabricated bush housings which are welded to the arm pressing. A bush is pressed into each housing. The bushes are located between lugs on the chassis and are secured with bolts and self-locking nuts through metal inserts in the center of the bushes.

The ball joint is pressed into the upper control arm. The ball joint is an interference fit in the hole which prevents the ball joint from moving. A circlip is fitted to the ball joint to retain it in the hole. The top face of the ball joint has two semi-circular cut-outs. One of these cut-outs must be aligned with the small indentation in the upper control arm to ensure the correct operation of the ball joint.

Lower Control Arm

E150451

Item	Part Number	Description
1	-	Self-locking nut
2	-	Cam washer
3	-	Bush
4	-	Special bolt
5	-	Cam washer - integral to bolt
6	-	Cam washer - integral to bolt
7	-	Special bolt
8	-	hydrabush
9	-	Cam washer
10	-	Self-locking nut
11	-	Jacking bracket (vehicles with coil springs only)
12	-	Self-locking nut - shock absorber lower attachment
13	-	Ball joint
14	-	Self-locking nut
15	-	Lower control arm
16	-	Bolt - shock absorber lower attachment

The lower control arm assembly comprises, the control arm, two bushes and a ball joint. The lower control arm is a pressed steel fabrication with a hole at its outer end to accept the ball joint.

The inner end of the arm has two fabricated bush housings which are welded to the arm pressing. A bush is pressed into each housing. The rear bush is a hydrabush which provides a progressive increase in the hardness of the bush as the deflection of the wheel increases. The bushes are located between lugs on the chassis and are secured with bolts and self-locking nuts through metal inserts in the center of the bushes. The forward bush, self-locking nut, has

a cam washer located beneath it. The cam washer is located between lugs on the chassis bracket and its orientation can be adjusted to set the front camber. The rear bush, self-locking nut, also has a cam washer located beneath it. The cam washer is located between lugs on the chassis bracket and its orientation can be adjusted to set the front castor.

On vehicles fitted with coil springs only, a jacking bracket is located on the lower control arm.

A central aperture in the arm provides for the attachment of the shock absorber module lower bush. The shock absorber is secured with a long bolt which is positioned through holes in the arm and secured with a self-locking nut.

The ball joint is pressed into the lower control arm. The ball joint is an interference fit in the hole which prevents the ball joint from moving. A circlip is fitted to the ball joint to retain it in the hole.

Wheel Knuckle, Hub and Bearing Assembly

E150452

Item	Part Number	Description
1	-	Upper control arm attachment
2	-	Brake caliper attachment holes
3	-	Brake hose bracket attachment point
4	-	Wheel speed sensor location
5	-	Wheels studs
6	-	Wheel hub
7	-	Brake disc dust shield attachment holes
8	-	Lower control arm ball joint attachment
9	-	Steering gear ball joint attachment
10	-	Wheel hub bolts (4 off)

The wheel knuckle is a machined casting which is located between the ball joints of the upper and lower control arms. The knuckle has four clearance holes which allow for the fitment of four bolts which secure the wheel hub housing. A cast boss on the forward edge of the knuckle provides for attachment of the steering gear, tie rod ball joint.

The wheel hub and bearing assembly comprises the wheel hub housing, wheel hub and taper roller bearing. The wheel hub and bearing assembly is a non-serviceable component. Five M14 studs are pressed into the wheel hub and provide for the attachment of the road wheel with wheel nuts.

The wheel hub housing is a machined forging which houses a taper roller bearing. The housing has four threaded holes which provide for the attachment to the wheel knuckle with four bolts.

The wheel hub has a splined center bore which mates with corresponding splines on the halfshaft. Rotation of the halfshaft is passed, via the splines, to the wheel hub which rotates on the taper roller bearing.

Front Suspension - Front Suspension

Description and Operation

In comparison with the standard vehicle, the additional weight of the armour and consequently the change in vehicle geometry has dictated the following changes to the front suspension of the armoured vehicle:

- new wheel knuckle
- new upper and lower control arms
- new stabilizer bar
- new stabilizer bar links
- modified air springs
- modified dampers.

New suspension components

E102745

Item	Part Number	Description
1	-	Upper control arm
2	-	Wheel knuckle
3	-	Lower control arm

Although visually similar to the standard vehicle, changes have been made internally to the air springs and dampers:

- The air springs incorporate a volume displacer which increases the spring rate in comparison to those fitted to the standard vehicle.
- The dampers feature revised internal valves to complement the revised spring rates and vehicle weight.

Software changes have also been made to the air suspension control module to restrict the 'Off-Road' height setting. For additional information, refer to: Vehicle Dynamic Suspension (204-05, Description and Operation).

The stabilizer bar features serviceable bushes, which are not bonded to the stabilizer bar. This allows the bushes to be replaced without removing the stabilizer bar from the vehicle. Clamp plates surrounding the bushes secure the stabilizer bar to the vehicle. Anti-shuffle collars are fitted to prevent lateral movement of the stabilizer bar.

Due to the additional weight of the armoured vehicle a reinforcement plate has been fitted to provide further rigid support to the right-hand-side clamp of the stabilizer bar.

Reinforcement plate for stabilizer bar right-hand clamp

Front Suspension - Front Stabilizer Bar

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

3. Disconnect both the stabilizer bar links from the stabilizer bar.
 - Remove and discard the 2 nuts.

4.  **NOTE:** RH side only.

Remove the fender splash shield lower extension panel.

- Remove the 2 screws.
- Remove the 2 clips.

5. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

6. Remove the front axle crossmember.
 - Remove the 4 bolts.

7. Remove the stabilizer bar bushing.
 - Remove the 4 nuts.
 - Remove the stabilizer bar clamps.

8. Remove the stabilizer bar.
 - Remove the stabilizer bar out through the LH side wheel arch.

Installation

1. Install the stabilizer bar.
 - Install the stabilizer bar through the LH side wheel arch.

2. Install the stabilizer bar bushing and clamps.
 - Tighten fixings 1 to 115 Nm (85 lb.ft).
 - Tighten fixings 2 to 115 Nm (85 lb.ft).
 - Tighten fixings 1 to 115 Nm (85 lb.ft).

3. Install the front axle crossmember.
 - Tighten the 4 bolts to 115 Nm (85 lb.ft).
4. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

5.  **NOTE: RH side only.**

Install the fender splash shield lower extension panel.

- Install the 2 screws.
- Install the 2 clips.

6. Connect both stabilizer bar links to the stabilizer bar.
 - Install new nuts and tighten to 115 Nm (85 lb.ft).
7. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Suspension - Front Stabilizer Bar Link

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link.

- Remove and discard the 2 nuts.

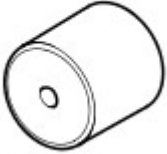

Installation

1. Install the stabilizer bar link.
 - Tighten the nuts to 115 Nm (85 lb.ft).
2. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

 <p>204-530-1 E50155</p>	<p>Ball joint installer 204-530-1</p>

Removal

NOTE: This procedure shows removal and installation of the upper arm ball joint.

1. Remove the upper arm.
For additional information, refer to: Upper Arm (204-01 Front Suspension, Removal and Installation).
2. Remove the dust seal.
 - Remove the seal retainer.
 - Remove the circlip.
3. Using the special tools, remove the ball joint.

E50160

Installation

E50172

1.  CAUTION: Make sure the timing marks are aligned.

Using the special tools, install the ball joint.

E50173

2.  CAUTION: Circlip holes to be 90 degrees rotated from timing marks.

Install the circlip.

3. Install the upper arm.
For additional information, refer to: Upper Arm (204-01 Front Suspension, Removal and Installation).

Front Suspension - Lower Arm Ball Joint

Removal and Installation

Special Tool(s)

 <p>204-531/3 E51733</p>	<p>Remover/installer front lower arm ball joint 204-531/3</p>
 <p>204-531/2 E51732</p>	<p>Remover/installer front lower arm ball joint 204-531/2</p>
 <p>204-531/1 E51731</p>	<p>Remover/installer front lower arm ball joint 204-531/1</p>
 <p>204-753 E104988</p>	<p>Remover/installer front lower arm ball joint 204-753</p>
 <p>204-754 E104989</p>	<p>Remover/installer front lower arm ball joint 204-754</p>

Removal

All vehicles

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
 Raise and support the vehicle.
- Remove the wheel and tire.
- Remove the lower arm.
 For additional information, refer to: Lower Arm (204-01, Removal and Installation).
- Remove the circlip.

E51734

5. Inspect the installed ball joint to determine if a radius is present.

E104990

Ball joint without radius

6. Using the special tools, remove the ball joint.

E51735

Ball joint with radius

7. Using the special tools, remove the ball joint.

E104983

Installation

All vehicles

1. Clean the components.
2. Inspect the new ball joint to determine if a radius is present.

E104990

Ball joint without radius

3. Using the special tools, install the ball joint.

E51736

Ball joint with radius

4. Using the special tools, install the ball joint.

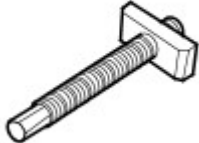

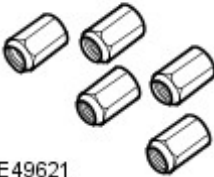

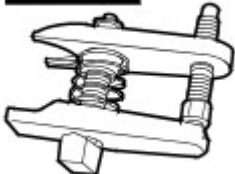

All vehicles

5. Install the circlip.
6. Install the lower arm.
For additional information, refer to: Lower Arm (204-01, Removal and Installation).
7. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Suspension - Wheel Knuckle

Removal and Installation

Special Tool(s)

 <p>205-754A E45276</p>	<p>Ball joint separator 205-754(LRT-54-027)</p>

Removal

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

- 
WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3. Loosen the halfshaft retaining nut.

4. Release the brake hose bracket from the wheel knuckle.

- Remove the bolt.

5. Release the wheel speed sensor from the wheel knuckle.

- Remove the bolt.

6. CAUTIONS:

 Do not allow the brake caliper to hang on the brake hose.

 LH side: Do not allow the brake caliper to hang on the brake pad wear warning sensor lead.

Remove the brake caliper and anchor plate.

- Remove the 2 bolts.
- Tie the brake caliper and brake caliper anchor plate assembly aside.

E119129

7. Remove the brake disc.
 - Remove the Torx screw.

E43758

8. Remove the halfshaft retaining nut.
 - Discard the nut.

9. Loosen the tie-rod end ball joint retaining nut.

10. Using the special tool, release the tie-rod end ball joint from the wheel knuckle.
 - Discard the nut.

E44665

11.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove and discard the stabilizer bar link nut.

12. Loosen the upper arm retaining nut.

13. Using the special tool, release the upper arm ball joint.

E44667

205-754

E49675

14.  **CAUTION:** Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the drive flange.

15. Remove the lower ball joint retaining nut.

16. Using the special tool, release the lower ball joint from the steering knuckle.

E44668

205-754

17.  **CAUTION:** The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

Remove the upper arm retaining nut.

- Discard the nut.

18.  **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the wheel knuckle.

19. Remove the brake disc dust shield.
- Remove the four retaining bolts.

20. Remove the wheel hub.
 - Remove the 4 bolts.

Installation

1. Clean the components.
2. Install the wheel hub.
 - Tighten the 4 bolts to 115 Nm (85 lb.ft).
3. Install the brake disc dust shield.
 - Tighten the 4 bolts to 10 Nm (7 lb.ft).
4.  **CAUTION:** The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

With assistance, install the wheel knuckle.

5. Using the special tools, install the halfshaft in the wheel hub.

6. Connect the upper arm and wheel knuckle.
 - Install a new nut and tighten to 70 Nm (52 lb.ft).
7. Secure the stabilizer bar link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).
8. Tighten the lower arm ball joint retaining nut to 115 Nm (85

lb.ft).

9. Connect the tie-rod end ball joint.
 - Install a new nut and tighten to 76 Nm (56 lb.ft).

10.  **CAUTION: Install the halfshaft nut finger tight.**
Install a new halfshaft retaining nut and lightly tighten.

11. Make sure the brake disc and hub mating surfaces are clean.

12. Install the brake disc.
 - Tighten the Torx screw to 35 Nm (26 lb.ft).

13. Install the brake caliper and anchor plate.
 - Clean the brake caliper anchor plate using brake cleaning fluid.
 - Tighten the bolts to 275 Nm (203 lb.ft).

14.  **CAUTION: Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.**

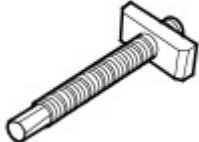

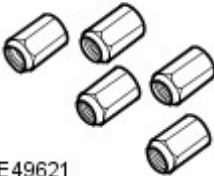

Tighten the new halfshaft retaining nut to 230 Nm (170 lb.ft).

- Stake the nut to the halfshaft.
15. Install the wheel speed sensor.
 - Tighten the bolt to 10 Nm (7 lb.ft).
 16. Secure the brake hose retaining bracket to the wheel knuckle.
 - Tighten the bolt to 22 Nm (16 lb.ft).
 17. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.
 18. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Suspension - Front Wheel Bearing and Wheel Hub

Removal and Installation

Special Tool(s)

 <p>204-506/1 E49618</p>	<p>Halfshaft remover/replacer 204-506/1(LRT-60-030/1)</p>
 <p>204-506/2 E49619</p>	<p>Halfshaft remover/replacer 204-506/2(LRT-60-030/2)</p>
 <p>204-506/3 E49620</p>	<p>Halfshaft remover/replacer 204-506/3(LRT-60-030/3)</p>
 <p>204-506/5 E49621</p>	<p>Retainers - halfshaft remover/replacer 204-506/5(LRT-60-030/5)</p>
 <p>204-506-01 E49622</p>	<p>Halfshaft installer adapter 204-506-01(LRT-60-030/4)</p>

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
2. Remove the wheel and tire.
3. Loosen the halfshaft retaining nut.

4. Release the brake hose bracket from the wheel knuckle.
 - Remove the bolt.

5. Remove the wheel speed sensor retaining bolt.

6.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Release the brake caliper anchor plate from the wheel knuckle and tie the caliper aside.

- Tie aside complete with the wheel speed sensor.

7. Remove the brake disc.
 - Remove the Torx screw.

8. Remove the halfshaft retaining nut.
 - Discard the nut.

9.  **CAUTION:** Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

E49675

10. Remove the wheel hub.
 - Remove the 4 bolts.

E44664

Installation

1. Clean the components.
2. Install the wheel hub.
 - Using the special tools, install the halfshaft in the wheel hub.
 - Tighten the 4 bolts to 115 Nm (85 lb.ft).

E49676

3. Install a new halfshaft retaining nut and lightly tighten.
4. Make sure the brake disc and hub mating surfaces are clean.
5. Install the brake disc.
 - Tighten the Torx screw to 35 Nm (26 lb.ft).
6. Install the brake caliper and anchor plate.
 - Install the wheel speed sensor.
 - Tighten the bolts to 275 Nm (203 lb.ft).
7. Install the wheel speed sensor retaining bolt.
8. Secure the brake hose retaining bracket to the wheel knuckle.
 - Tighten the bolt to 22 Nm (16 lb.ft).

9.  **CAUTION:** Do not use air tools to install the nut. Failure to follow this instruction may result in damage to

the component.

Tighten the new halfshaft retaining nut to 230 Nm (170 lb.ft).

- Stake the nut to the halfshaft.
10. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.
 11. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Suspension - Shock Absorber and Spring Assembly

Removal and Installation

Removal

1. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the wheel and tire.
4. Remove the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).

E44655

5. Disconnect the shock absorber and spring assembly from the lower arm.
 - Remove the nut and bolt.

E44656

6. Release the heat shield for access to the shock absorber and spring assembly upper mounting inner nut.
 - Remove the three retaining bolts.

E44657

7. Remove the shock absorber and spring assembly.
 - Remove the three retaining bolts.

Installation

1. Install the shock absorber and spring assembly.

- Make sure the spring and shock absorber assembly top mounting to body mating faces are clean.
 - Fit the nuts and tighten to 63 Nm (46 lb.ft).
2. Secure the heat shield.
 - Install the three retaining bolts and tighten to 10 Nm (7 lb.ft).
 3. Connect the shock absorber and spring assembly to the lower arm.
 - Tighten the nut and bolt to 300 Nm (221 lb.ft).
 4. Install the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).
 5. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
 6. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

Front Suspension - Upper Arm

Removal and Installation

Special Tool(s)

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** Do not use excessive force to disconnect the height sensor link.

Disconnect the height sensor link arm.

4. Remove the upper arm and brake line heat shields for access.
 - Remove the 3 nuts.
 - Remove the 3 bolts.

5.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link nut.

- Discard the nut.

E81567

6. Release the brake hose and wheel speed sensor leads from the upper arm.
 - Remove the bolt.

E81566

7.  **CAUTION:** To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.

E81568

8. Using the special tool, release the upper arm ball joint.
 - Remove and discard the nut.

E81569

9. Remove the upper arm.
 - Remove and discard the 2 nuts.

Installation

1. Install the upper arm.
 - Fit the bolts but do not fully tighten at this stage.
 - Install new nuts.
2. Connect the upper arm and wheel knuckle.
 - Install a new nut and tighten to 70 Nm (52 lb.ft).
3. Secure the brake hose and wheel speed sensor leads to the upper arm.
 - Tighten the bolt to 23 Nm (17 lb.ft).

4. Secure the stabilizer bar link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).
5. Install the upper arm and brake line heat shields.
 - Install the 3 bolts.
 - Install the 3 nuts.
6. Connect the height sensor link.
7. Set the height distance between the centre of the halfshaft end and the edge of the fender trim to 466 mm (18.34").

8. Tighten the 2 upper arm nuts and bolts to 175 Nm (129 lb.ft).
9. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
10. Using the Land Rover approved diagnostic system, calibrate the suspension ride height.
For additional information, refer to: Ride Height Adjustments (204-05, General Procedures).

Front Suspension - Upper Arm Bushing

Removal and Installation

Special Tool(s)

 <p>204-532/1 E55136</p>	<p>Receiver cup upper arm bushes 204-532/1</p>
 <p>204-532/2 E55137</p>	<p>Remover upper arm bushes 204-532/2</p>
 <p>204-532/3 E55138</p>	<p>Installer upper arm front bush 204-532/3</p>
 <p>204-532/4 E55139</p>	<p>Installer upper arm rear bush 204-532/4</p>

Removal

NOTE: The bushings must be replaced in pairs, LH and RH sides.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
2. Remove the front wheels and tires.
3. Remove the LH upper arm.
For additional information, refer to: Upper Arm (204-01, Removal and Installation).
4. Release the heat shield for access to the upper arm bolts.
 - Remove the nut.
 - Remove the forward bolt and loosen the rearward bolt.

5. Loosen the upper arm bolts.

6. Disconnect the height sensor link arm.

7.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link nut.

- Discard the nut.

8.  **CAUTION:** To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.

9. Using the special tool, release the upper arm ball joint.

- Remove and discard the retaining nut.

10. Release the brake hose from the upper arm.

11. Release the wheel speed sensor lead from the upper arm.

12. Remove the RH upper arm.

13. Note the position of the bushing in relation to the upper arm.

14.  **CAUTION:** The bush flanges need to be removed to allow bush removal.

Using a suitable tool, bend over the bush flanges.

15. Using a hacksaw, remove the flange from the bushing, making sure the upper arm is not damaged.

16. Using the special tools, remove and discard the upper arm bushings.

Installation

1.  **CAUTION:** Make sure the correct special tool is used to install the bushings to the correct depth.

Using the special tools, install the upper arm rear bushings.

- Align the arrow on the bush with the mark, previously made on the upper arm.

E55142

2. Using the special tools, install the upper arm front bushings.

- Align the arrow on the bush with the mark, previously made on the upper arm.

E55143

3. Install the RH upper arm.
 - Fit the bolts but do not fully tighten at this stage.
4. Secure the brake hose to the upper arm.
 - Tighten the bolt to 23 Nm (17 lb.ft).
5. Secure the wheel speed sensor lead to the upper arm.
6. Connect the upper arm and wheel knuckle.
 - Install a new nut and tighten to 70 Nm (52 lb.ft).
7. Secure the stabilizer bar link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).
8. Connect the height sensor link arm.
9. Set the height distance between the centre of the halfshaft end and the edge of the fender trim to 466 mm (18.34").
10. Tighten the 2 upper arm nuts and bolts to 175 Nm (129 lb.ft).
11. Secure the heat shield.
12. Install the LH upper arm.

For additional information, refer to: Upper Arm (204-01, Removal and Installation).
13. Install the front wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Suspension - Lower Arm

Removal and Installation

Special Tool(s)

Removal

1. Place vehicle into access mode.

E99855

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the wheel and tire.
4. Remove the lower ball joint retaining nut.
5. Using the special tool, release the lower ball joint from the steering knuckle.

6. Mark the position of the bolts in relation to the chassis brackets.
 - Remove the 2 bolts.

E99856

7. Disconnect the shock absorber and spring assembly from the lower arm.
 - Remove the nut and bolt.

E44655

8.  **CAUTION:** Only displace the wheel knuckle sufficiently outboard to release the lower arm past the undertray. This will prevent the inboard driveshaft joint from separating. Failure to follow this instruction may result in damage to the vehicle.

NOTE: Make sure the steering is in the straight ahead position.

Remove the lower arm.

- Release the lower arm from the subframe and reposition downwards.
- Rotate the lower arm and position forward to release from the wheel knuckle.

Installation

1. Install the lower arm.
 - Fit the bolts but do not fully tighten at this stage.
2.  **CAUTION:** The lower arm ball joint can be damaged by excessive articulation. Do not over articulate the ball joint. Failure to follow this instruction will result in damage to vehicle.

Connect the lower arm to the wheel knuckle.

- Tighten the lower arm ball joint retaining nut to 115 Nm (85 lb.ft).

3. Set the height distance between the centre of the halfshaft end and the edge of the fender trim to 466 mm (18.34").

E55181

4. Tighten the lower arm bolts to 275 Nm (203 lb.ft).
 - Align the bolts to the marks made previously.

E44655

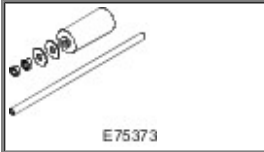

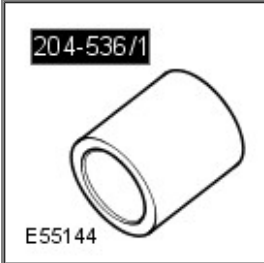

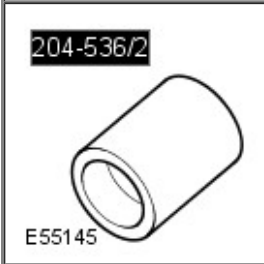

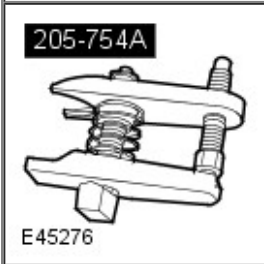

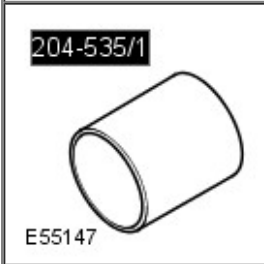

5. Connect the shock absorber and spring assembly to the lower arm.
 - Tighten the nut and bolt to 300 Nm (221 lb.ft).

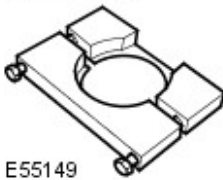

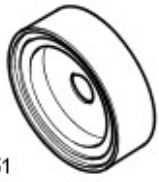

6. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
7. Carry out the wheel alignment procedure.

Front Suspension - Lower Arm Bushing

Removal and Installation

Special Tool(s)

 <p>E75373</p>	Hydraulic cylinder 10t 204-598
 <p>204-536/1 E55144</p>	Receiver front lower arm front bush 204-536/1
 <p>204-536/2 E55145</p>	Remover front lower arm front bush 204-536/2
 <p>204-535/2 E55148</p>	Remover front lower arm rear bush 204-535/2
 <p>204-536/3 E55146</p>	Installer front lower arm front bush 205-536/3
 <p>205-754A E45276</p>	Ball joint separator 205-754(LRT-54-027)
 <p>204-535/1 E55147</p>	Receiver lower arm rear bush 204-535/1

 <p>204-535/4 E55149</p>	
 <p>204-535/3 E55150</p>	<p>Installer lower arm rear bush 204-535/3</p>
 <p>204-535/5 E55151</p>	<p>Installer/depth setter front lower arm rear bush 204-535/5</p>

Removal

NOTES:

-  If installing the front bushes, both front bushes must be replaced.
-  If installing the rear bushes, both rear bushes must be replaced.
-  Note the orientation of the bush.
-  Removal steps in this procedure may contain installation details

1. Make sure that the tire pressures are correct and that the vehicle is at the correct ride height.
For additional information, refer to: [Ride Height Adjustments](#) (204-05 Vehicle Dynamic Suspension, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
3. Remove the clips and trim for access to the lower arm camber bolts

E154648

4. For additional information, refer to: [Lower Arm](#) (204-01 Front Suspension, Removal and Installation).
5. Secure lower arm in a suitable vice or similar to carry out the following steps.

6.  **NOTE:** Mark the new bush to aid correct orientation on installation.
Mark alignment of original bush prior to removal.

E156441

7.  **CAUTION:** The bush flanges need to be removed to allow bush removal.
Remove the lower arm front bushing flanges.

E156440

8.  **CAUTION:** Make sure correct alignment is maintained

whilst carrying out the step.

Using the special tools, remove the bush.

9. Mark alignment of original bush before removing, new bush to be installed with the same orientation

E154651

10.

E154652

Installation

1.  CAUTION: Make sure correct alignment is maintained whilst carrying out the step.

Using the special tools install the bush.

E156439

E154653

3. For additional information, refer to: [Lower Arm](#) (204-01 Front Suspension, Removal and Installation).

4. Refit the trim.

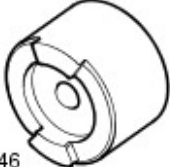

E154648

5. Carry out the wheel alignment procedure.

Front Suspension - Lower Arm Front Bushing

Removal and Installation

Special Tool(s)

 <p>E 75373</p>	Hydraulic cylinder 10t 204-598
 <p>204-536/1 E55144</p>	Receiver front lower arm front bush 204-536/1
 <p>204-536/2 E55145</p>	Remover front lower arm front bush 204-536/2
 <p>204-536/3 E55146</p>	Installer front lower arm front bush 204-536/3

Removal

NOTES:

If installing the front bushes, both front bushes must be installed.

Note orientation of the bush.

Removal steps in this procedure may contain installation details

1. Make sure that the tire pressures are correct and that the vehicle is at the correct ride height.
For additional information, refer to: [Ride Height Adjustments](#) (204-05 Vehicle Dynamic Suspension, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
3. Remove the clips and trim for access to the lower arm camber bolts.

E154648

4. For additional information, refer to: [Lower Arm](#) (204-01 Front Suspension, Removal and Installation).
5. Secure lower arm in a suitable vice or similar to carry out the following steps.

6.  **NOTE:** Mark the new bush to aid correct orientation on installation.
Mark alignment of original bush prior to removal.

E156441

7.  **CAUTION:** The bush flanges need to be removed to allow bush removal.
Remove the lower arm front bushing flanges.

E156440

8.  **CAUTION:** Make sure correct alignment is maintained

whilst carrying out the step.

Using the special tools, remove the bush.

Installation

1.  CAUTION: Make sure correct alignment is maintained whilst carrying out the step.

Using the special tools install the bush.

2. For additional information, refer to: [Lower Arm](#) (204-01 Front Suspension, Removal and Installation).

3. Refit the trim.

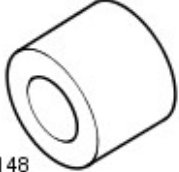

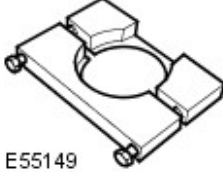

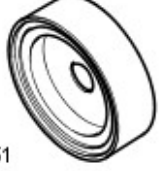

4. Carry out the wheel alignment procedure.

Removal

NOTES:

If installing the rear bushes, both rear bushes must be installed.

Take note of the fitted position of the bush.

Removal steps in this procedure may contain installation details

1. Make sure that the tire pressures are correct and that the vehicle is at the correct ride height.
For additional information, refer to: Ride Height Adjustments (204-05 Vehicle Dynamic Suspension, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the clips and trim for access to the lower arm camber bolts.

E154648

4. Mark the position of the bolts in relation to the chassis brackets making note of the original position.

E154658

5.  **CAUTION:** Make sure the lower arm is supported. Failure to follow this instruction may result in damage to the ball joint.

Remove lower arm camber bolts and the lower damper bolt and rotate arm downwards for access.

E154649

6. Using a suitable transmission jack, support the lower arm in the position illustrated.

E154650

7.  NOTE: Mark the new bush to aid correct orientation on installation.
Mark alignment of original bush prior to removal.

E154651

8.  CAUTION: Make sure correct alignment is maintained whilst carrying out the step.

Using the special tools, remove the bush.

E154652

Installation

1.  CAUTION: Make sure correct alignment is maintained whilst carrying out the step.

Using the special tools install the bush.

E154653

E154649

2.  **NOTE:** Do not tighten the bolts at this stage.
Install the lower front arm.

3. Set the height distance between the centre of the half shaft end and the edge of the fender trim to 466 mm (18.34") before tightening lower arm bolts.

E155108

4. Attach the lower arm.
 - Align the bolts to the marks made previously.
 - Tighten the lower arm camber bolts to 275 Nm.
 - Tighten the shock absorber and spring assembly to lower arm bolt to 300 Nm.

E154649

5. Refit the trim.

E154648

6. Carry out the wheel alignment procedure.

Front Suspension - Shock Absorber and Spring Assembly TDV6 2.7L Diesel

Disassembly and Assembly

Disassembly

WARNINGS:

Ensure the spring compressor Safe Working Load (SWL) meets or exceeds the spring rating quoted in the Specifications section.

For additional information, refer to: Specifications (204-00, Specifications).

Always follow the spring compressor manufacturer's instructions.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the shock absorber and spring assembly.
For additional information, refer to: Shock Absorber and Spring Assembly (204-01, Removal and Installation).
3. Install a suitable spring compressor in a vise.
4. Install the shock absorber and spring assembly in the spring compressor.
 - Compress the spring just sufficiently to relieve the spring tension.
5. Remove the shock absorber.
 - Restrain the shock absorber spindle, remove and discard the nut.
 - Remove the upper bush rebound plate and upper bush.
 - Remove the upper mounting assembly.
 - Remove the dust tube and rebound plate assembly.
 - Remove the spring aid.

E51728

6. Remove the spring from the spring compressor.
7. Clean and inspect the components for deterioration.
 - To aid reassembly, mark the position of the rubber insulator in relation to the upper mounting plate.

E51729

- Remove the rubber insulator.
- Remove the spacer.
- Remove the rebound plate from the dust tube.

Assembly

1. Install the spring in the spring compressor.
 - Make sure the spring is installed with the close coils positioned towards the top of the shock absorber.

E51726

2. Install the spring aid.
3. Install the dust tube.
 - Install the rebound plate into the dust tube.
4. Install the shock absorber.
 - Make sure the spring is correctly located in the spring seat.
5. Install the upper mounting.
 - Install the spacer and rubber insulator, making sure the spacer drops over the stud heads and the insulator is aligned with the mark made previously.
 - Install the upper bush and upper bush rebound plate.
 - Install a new nut and tighten to 98 Nm (72 lb.ft).
6. Install the shock absorber and spring assembly.
For additional information, refer to: Shock Absorber and Spring Assembly (204-01, Removal and Installation).

OVERVIEW

The independent rear suspension offers a reduction in unsprung weight over the beam axle design fitted to previous Land Rover models. The rear suspension comprises an upper control arm, a lower control arm, a wheel knuckle and wheel hub, two shock absorber assemblies and a stabilizer bar and links assembly. The shock absorber assemblies use a similar design of Shock absorber which can be fitted with either a coil spring or an air spring.

The rear suspension control arms have been designed to give maximum ground clearance and also allow for the adjustment of the camber using a cam bolt and adjustment of toe and bump steer via an adjustable transverse link.

NOTE: * Shows service items

The shock absorber assembly comprises an air spring assembly, top mount and a shock absorber assembly. The shock absorber and air spring are only serviceable as complete assemblies.

Shock Absorber

The shock absorber assembly is a twin tube design with the conventional coil spring replaced by the air spring. The lower end of the shock absorber is fitted with a bush and is attached to the lower control arm with a bolt and nut.

The shock absorber functions by restricting the flow of hydraulic fluid through internal galleries within the shock absorber. The shock absorber rod moves axially within the shock absorber, its movement limited by the flow of fluid through the galleries, providing damping of undulations in the terrain. The shock absorber rod is sealed at its exit point from the shock absorber body to maintain the fluid within the unit and to prevent the ingress of dirt and moisture. The seal also incorporates a wiper to keep the rod clean.

Air Spring

The air spring is similar in design to the air spring used on the front suspension.

The air spring comprises an aluminium restraining cylinder, top mount, spring aid, air sleeve and an inner support sleeve.

The air sleeve is made from a flexible rubber material which allows the sleeve to roll up and down the air spring piston as the vehicle changes height. The air sleeve is attached to the restraining cylinder and the support sleeve with crimp rings which provide an air tight seal. The support sleeve contains a seal carrier which has two O-rings sealing the support sleeve and two O-rings sealing to the Shock absorber body. The top of the air sleeve is crimped to the top mount which attaches to a mounting on the chassis with 3 integral studs and self-locking nuts.

A spring aid is fitted to the shock absorber rod and prevents the top mount contacting the top of the shock absorber during full suspension compression and assists the suspension tune. The lower end of the air spring is located over the shock absorber body and seats on a fabricated seat on the shock absorber body. The air sleeve is positively attached to the seat with a retaining pin. The shock absorber rod is located through a central hole in the top mount. The rod is threaded at its outer end and accepts a self-locking nut which secures the air spring to the shock absorber rod.

The top mount is an integral part of the air spring and is fitted with a bush and rebound washer which are located between the top mount plate and the shock absorber rod. A self-locking nut secures the Shock absorber rod to the top mount. The top mount attaches to a housing on the chassis with 3 integral studs and self-locking nuts. The top mount also incorporates a 6 mm Voss air fitting which allows for the attachment of the air harness.

The air spring is fitted with two gaitors. The upper gaitor is fitted between the top mount and the air spring restraining cylinder. The lower gaitor is secured to the lower end of the restraining cylinder and the Shock absorber body with metal straps. The gaitors prevent dirt and debris becoming trapped between the air sleeve and the restraining cylinder.

SHOCK ABSORBER ASSEMBLY - COIL SPRING SUSPENSION

E150576

Item	Part Number	Description
1	-	Self-locking nut
2	-	Rebound washer

10	-	Coil spring
11	-	Shock absorber
12	-	Shock absorber rod
13	-	Self-locking nut (3 off)
14	-	Bush

The coil spring shock absorber assembly comprises a shock absorber, a coil spring and a top mount.

Shock Absorber

The shock absorber assembly is a similar design to the front suspension shock absorber, with a twin tube design with a spring seat attached to the shock absorber body. The lower end of the shock absorber is fitted with a bush and is attached to the lower control arm with a bolt and self-locking nut. The shock absorber functions by restricting the flow of hydraulic fluid through internal galleries within the shock absorber.

The shock absorber rod moves axially within the Shock absorber, its movement limited by the flow of fluid through the galleries, providing damping of undulations in the terrain. The shock absorber rod is sealed at its exit point from the shock absorber body to maintain the fluid within the unit and to prevent the ingress of dirt and moisture. The seal also incorporates a wiper to keep the rod clean.

The shock absorber rod is located through a central hole in the top mount. The rod is threaded at its outer end and a self-locking nut secures the top mount to the Shock absorber rod.

A spring aid is fitted to the shock absorber rod and prevents the top mount contacting the top of the shock absorber during full suspension compression and assists the suspension tune.

Spring and Top Mount

The coil spring fitted differs with vehicle specification. Each spring is color coded to identify its rating and fitment requirements.

The coil spring is located in a spring seat which is an integral part of the shock absorber body. The design of the spring seat prevents the spring rotating. The opposite end of the coil spring is located in a spring isolator which is fitted in the top mount. The spring isolator is made from rubber and prevents any noise produced during spring and Shock absorber compression/extension from being transmitted to the vehicle body. Three types of spring isolator are available which allow for differences in vehicle specification.

The top mount is fitted with a bush and a rebound washer which are located between the top mount plate and the shock absorber rod. The top mount is secured to the shock absorber rod with a self-locking nut. The top mount attaches to a housing on the vehicle chassis with three integral studs and self-locking nuts.

The spring is fitted with spring spacers which are located between the spring isolator and the top mount. The spring spacers control the length of the spring to maintain the correct trim height. The spring spacers are color coded and are supplied with a replacement spring.

STABILIZER BAR

E150577

Item	Part Number	Description
1	-	Right stabilizer link
2	-	Stabilizer bar bush (2 off)
3	-	Left stabilizer link
4	-	Stabilizer bar bracket (2 off)
5	-	Bolt (Stabilizer bar bracket) (2 off)
6	-	Stabilizer bar

The stabilizer bar is fabricated from heat treated, solid, spring steel bar. The stabilizer bar operates, via a pair of links, from its attachment to the lower control arms.

The stabilizer bar is located on the upper face of a combined body mount and stabilizer bar bracket which is welded to each chassis side member. The stabilizer bar is attached to the brackets with two, Teflon lined bushes. The bushes are fitted with brackets, which are pressed onto the bushes and secured to the chassis brackets with bolts.

The stabilizer bar has crimped, 'anti-shuffle' collars pressed into position on the inside edges of the bushes. The collars prevent sideways movement of the stabilizer bar.

The ends of the stabilizer bar are attached to the lower control arms via links. This allows the stabilizer bar to move with the wheel travel providing maximum effectiveness. Each link has a ball joint at each end. The top ball joint is attached to the link at 90 degrees to the link axis and is located in a hole in the end of the stabilizer bar and secured with a self-locking nut. The bottom ball joint is also attached to the link at 90 degrees to the axis of the link and is located a hole in a bracket on the lower control and arm and secured with a self-locking nut. The links are not handed and therefore can be fitted to either side of the stabilizer bar.

UPPER CONTROL ARM

E150578

Item	Part Number	Description
1	-	Bolt
2	-	Bumpstop clip
3	-	Forward bush
4	-	Bumpstop clip
5	-	Rearward bush
6	-	Caged nut
7	-	Self-locking nut - upper wheel knuckle ball joint
8	-	Eccentric washer - upper wheel knuckle ball joint
9	-	Ball joint (Wheel knuckle upper)
10	-	Cam bolt - upper knuckle ball joint
11	-	Upper control arm

The upper control arm locates in brackets on the upper surface of each chassis side member. The upper control arm assembly comprises the control arm and two bushes. The upper control arm is a pressed and tubular steel fabrication. Its outer end has two brackets with slotted holes which locate the upper ball joint of the wheel knuckle. The ball joint is secured in the upper control arm with a cam bolt, eccentric washer and a self-locking nut. The cam bolt and the eccentric washer allow for the adjustment of the wheel camber.

Two fabricated tubular housings provide the location for the forward and rearward bushes. The bushes, which are pressed into the housings, locate between brackets on the chassis side members and are secured with bolts and caged nuts through metal inserts in the center of the bushes.

LOWER CONTROL ARM

E150579

Item	Part Number	Description
1	-	Self-locking nut
2	-	Forward bush
3	-	Lower control arm
4	-	Bumpstop clip
5	-	Bolt
6	-	Nut and retainer
7	-	Rearward bush
8	-	Bolt
9	-	Stabilizer link bracket
10	-	Self-locking nut - shock absorber assembly lower attachment
11	-	Bolt - shock absorber assembly lower attachment
12	-	Bumpstop clip

The lower control arm locates in brackets on the lower surface of each chassis side member. The lower control arm assembly comprises the control arm and two bushes. The lower control arm is a pressed steel fabrication. Its outer end has two brackets which locate the lower ball joint of the wheel knuckle. The ball joint is secured with a bolt and self-locking nut. The lower control arm also provides for the attachment of the shock absorber bush which is secured with a bolt and a self-locking nut.

A bracket, welded to the upper surface of the lower control arm, allows for the attachment of the stabilizer bar link, bottom ball joint which is secured with a self-locking nut.

Two fabricated tubular housings provide the location for the forward and rearward bushes. The bushes, which are pressed into the housings, locate between brackets on the chassis side members. The forward bush is secured to the chassis bracket with a bolt and self-locking nut. The rearward bush is secured to the chassis bracket with a bolt and a nut and retainer. The nut and retainer allows for easy installation or removal of the bolt by removing the

requirement to hold the self-locking nut when installing or removing the bolt.

On vehicles fitted with coil springs only, a jacking bracket is located on the lower control arm.

WHEEL KNUCKLE, WHEEL HUB AND BEARING ASSEMBLY

E150580

Item	Part Number	Description
1	-	Ball joint - upper
2	-	Wheel knuckle
3	-	Park brake assembly attachment holes
4	-	Brake caliper attachment holes
5	-	Wheel bearing
6	-	Circlip - wheel bearing retention
7	-	Wheel hub
8	-	Ball joint - lower
9	-	Circlip - lower ball joint
10	-	Wheel speed sensor location
11	-	Wheel speed sensor cable bracket attachment

The wheel knuckle is a machined casting which is located between the upper and lower control arms. The wheel knuckle is fitted with two ball joints which are pressed into the wheel knuckle, with the lower ball joint being secured with a circlip. The ball joints are positioned between brackets on the upper and lower control arms and secured to the arms with a bolt and self-locking nut.

The wheel knuckle provides the location for the rear wheel taper roller bearing, which is pressed into a machined bore and retained with a circlip. The wheel bearing is a serviceable item. The wheel knuckle has a machined bore which provides the location for the wheel speed sensor. Three threaded holes allow for the attachment of the park

brake assembly. A cast boss on the wheel knuckle provides positive location for the park brake assembly. Two bosses on the wheel knuckle casting provide the attachment points for the rear brake caliper.

The wheel hub is a machined forging which is pressed into the wheel bearing in the wheel knuckle. The hub has a splined center bore which mates with corresponding splines on the halfshaft. Five M14 studs are pressed into the wheel hub and provide for the attachment of the road wheel with wheel nuts. Rotation of the halfshaft is passed, via the splines, to the wheel hub which rotates on the taper roller bearing.

Rear Suspension - Rear Suspension

Description and Operation

In comparison with the standard vehicle, the additional weight of the armour and consequently change in vehicle geometry has dictated the following changes to the rear suspension:

- new wheel knuckle
- new stabilizer bar
- modified air springs
- modified dampers.

New wheel knuckle

E102785

Although visually similar to the standard vehicle, changes have been made internally to the air springs and dampers:

- The air springs incorporate a volume displacer which increases the spring rate in comparison to those fitted to the standard vehicle.
- The dampers feature revised internal valves to complement the revised spring rates and vehicle weight.

Software changes have also been made to the air suspension control module to restrict the 'Off-Road' height setting.

For additional information, refer to: Vehicle Dynamic Suspension (204-05, Description and Operation).

The stabilizer bar features serviceable bushes, which are not bonded to the stabilizer bar. This allows the bushes to be replaced without removing the stabilizer bar from the vehicle. Clamp plates surrounding the bushes secure the stabilizer bar to the vehicle. Anti-shuffle collars are fitted to prevent lateral movement of the stabilizer bar.

Rear Suspension - Upper Arm Ball Joint

Removal and Installation

Special Tool(s)

 <p>204-525-1 E49576</p>	Remover/installer rear upper arm ball joint 204-525/1
 <p>204-525-2 E49575</p>	Remover/installer rear upper arm ball joint 204-525/2
 <p>204-525-1 E49574</p>	Remover/installer rear upper arm ball joint 204-525/3

Removal

-  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

- Remove the wheel knuckle.
For additional information, refer to: Wheel Knuckle (204-02 Rear Suspension, Removal and Installation).

- Using the special tools, remove the ball joint.
 - Position machined face against the special tool.

E49577

Installation

- Clean the components.

- CAUTIONS:**

 Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

E49578

 If the push in force is less than 10 kN the wheel knuckle must be replaced.

Using the special tools, install the ball joint.

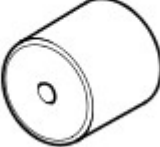

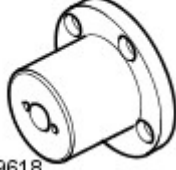

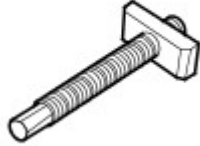

- Position machined face against the special tool.

3. Install the wheel knuckle.
For additional information, refer to: Wheel Knuckle (204-02 Rear Suspension, Removal and Installation).
4. Install the wheel and tire.

Removal

CAUTION: The bolt securing the toe link to the wheel knuckle must not be used more than 5 times. Mark the bolt head with a suitable centre punch.

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the wheel and tire.

- Loosen the halfshaft retaining nut.

E46796

- Disconnect the toe link.
 - Remove the bolt.

E46797

- Release the parking brake cable from the lower arm.

E49702

6. Remove the halfshaft retaining nut.

E46798

7. Release the knuckle from the lower arm.
• Remove the bolt.

E50560

8. Using the special tools, release the halfshaft from the wheel hub.

E46799

9. Using the special tool, remove the lower arm ball joint.
• Support the wheel knuckle to give access to the lower ball joint.
• Remove and discard the snap ring.

Installation

E46800

1. CAUTIONS:

 If the push in force is less than 17 kN the wheel knuckle must be replaced.

 Make sure the ball joint is installed from the chamfered side of the wheel knuckle.

Using the special tool, install the lower arm ball joint.

- Install the snap ring.

2. Using the special tools, install the halfshaft in the wheel hub.

E50561

3.  **CAUTION:** Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the lower arm to the wheel knuckle.

- Tighten the bolt to 175 Nm (129 lb.ft).

4. Install a new halfshaft retaining nut and lightly tighten.
5. Secure the parking brake cable.

6.  **CAUTION:** Do not use a bolt that has been installed more than 5 times. Check the bolt head for centre punch marks. A bolt head with 4 centre punch marks indicates the bolt has been installed 5 times and must be replaced.

Connect the toe link.

- Tighten the bolt to 175 Nm (129 lb.ft).
- Mark the bolt head with a centre punch, to indicate the number of times it has been used.

7. Tighten the halfshaft retaining nut to 350 Nm (258 lb.ft).
 - Stake the nut to the halfshaft.
8. Install the wheel and tire.
9. Carry out the wheel alignment procedure.

Removal

- 
WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel knuckle.
For additional information, refer to: Wheel Knuckle (204-02 Rear Suspension, Removal and Installation).

3. Remove the adjuster and return spring.

E50965

4. Remove the primary brake shoe.
 - Remove the hold-down spring and retaining pin.
 - Pivot the shoe to release it from the spreader plate and return spring.

E50966

5. Remove the spreader plate and spring.

6. Remove the return spring.

E50967

7. Remove the secondary brake shoe.
 - Remove the hold-down spring and retaining pin.
 - Disconnect the parking brake cable retaining spring from the brake shoe lever.

E50181

E49585

E49586

8. Using the special tools, remove the drive flange.

9. Remove the brake disc dust shield.

- Remove the 3 screws.

10. Using the special tools, remove the wheel bearing.

- Remove the circlip.

Installation

1. Clean the components.
2. Using the special tools, install the wheel bearing.

3.  **CAUTION:** Make sure that the bearing seal is not damaged when installing the circlip.

Install the circlip.

4. Install the brake disc dust shield.
 - Tighten the bolts to 9 Nm (7 lb.ft).

5.  **WARNING:** Do not use compressed air to clean brake

components. Dust from friction materials can be harmful if inhaled.

Clean the backing plate and apply grease to the brake shoe contacts.

6. Clean the adjuster and set it to its minimum extension.
7. Install the secondary brake shoe.
 - Connect the parking brake cable retaining spring to the brake shoe lever, making sure the spring is not twisted.
 - Install the hold-down spring and retaining pin.
8. Install the primary brake shoe.
 - Install the spreader plate and the spring.
 - Install the return spring.
 - Install the hold-down spring and retaining pin.
9. Install the return spring.
10. Install the brake shoe adjuster.
11. Using the special tools, install the drive flange.

12. Install the wheel knuckle.
For additional information, refer to: Wheel Knuckle (204-02 Rear Suspension, Removal and Installation).

Rear Suspension - Rear Stabilizer Bar

Removal and Installation

Removal

CAUTION: It is possible to install the stabilizer bar incorrectly. Note the position of the stabilizer bar before removal.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
4. Remove the spare wheel and tire.
5. Raise the vehicle.
6. Remove the rear wheels and tires.

E52216

7.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Release both stabilizer bar links.

- Remove and discard the 2 nuts.

8. Remove the body mount retaining bolts.
 - Remove the 8 bolts.

E52217

9.  **CAUTION:** Only raise the body sufficiently to remove the body mount.

Carefully raise the body.

- Using suitable stands, raise the body to release the body mounts.

10. Remove the 2 rear body mounts.

11. Remove the stabilizer bar bushing.
 - Remove the stabilizer bar clamps.
 - Remove the 4 bolts.

12.  CAUTION: Mark the position of the stabilizer bar.

Remove the stabilizer bar.

Installation

1.  CAUTION: Make sure the stabilizer bar is correctly installed.

Install the stabilizer bar.

2. Install the stabilizer bar bushing.

3. Install the stabilizer bar bushing and clamps.
 - Tighten fixings 1 to 62 Nm (46 lb.ft).
 - Tighten fixings 2 to 62 Nm (46 lb.ft).
 - Tighten fixings 1 to 62 Nm (46 lb.ft).

4. Install the body mounts.
5. Lower the body.
 - Remove the stands.
6. Install the body mount retaining bolts.
 - Tighten the 8 retaining bolts to 133 Nm (98 lb.ft).
7. Attach both stabilizer bar links.
 - Tighten the nuts to 115 Nm (85 lb.ft).
8. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
9. Lower the vehicle.
10. Install the spare wheel and tire.
11. Install the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

Rear Suspension - Upper Arm Bushing

Removal and Installation

Special Tool(s)

 <p>204-528-1</p> <p>E50585</p>	Remover/installer - rear suspension upper arm front bushing 204-528/1
 <p>204-528-2</p> <p>E50586</p>	Remover/installer - rear suspension upper arm front bushing 204-528/2
 <p>204-528-3</p> <p>E50587</p>	Remover/installer - rear suspension upper arm front bushing 204-528/3
 <p>204-527-1</p> <p>E50580</p>	Remover/installer rear suspension upper arm rear bushing 204-527/1
 <p>204-527-2</p> <p>E50581</p>	Remover/installer rear suspension upper arm rear bushing 204-527/2
 <p>204-527-3</p> <p>E50582</p>	Remover/installer rear suspension upper arm rear bushing 204-527/3

Removal

NOTE: The bushings must be replaced in pairs, LH and RH sides.

- 
WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

3.  **CAUTION:** Always plug any open connections to prevent contamination.

Remove the brake tube.

- Disconnect the 2 brake tube unions.
- Remove the brake hose clips and release the hoses.
- Release the brake tube from the clip.

4. Disconnect the height sensor link.

5. Release the wheel speed sensor lead.

6. Remove the LH upper arm.

- Loosen the upper arm bolts.
- Mark the position of the bolt in relation to the upper arm.
- Disconnect the upper arm from the wheel knuckle.
- Remove the upper arm bolts.

7. Remove the RH upper arm.

For additional information, refer to: Upper Arm (204-02 Rear Suspension, Removal and Installation).

8. Mark the position of the bushing in relation to the upper arm.

9. Using the special tools, remove and discard the rear upper arm front bushing.

- Using the special tools, remove and discard the rear upper arm rear bushing.

Installation

- CAUTIONS:

 Make sure the bush is correctly aligned.

 Make sure the correct special tool is used to install the bushings to the correct depth.

Using the special tools, install the rear upper arm front bushing.

-  CAUTION: Make sure the bush is correctly aligned.

Using the special tools, install the rear upper arm rear bushing.

-  CAUTION: Make sure that bumpstop inserts are fitted on both sides of the front bushing prior to installation of the arm. Failure to follow this instruction may result in damage to the bushing.

 NOTE: Bumpstop inserts are installed to both sides of the bushing.

Check the bumpstop inserts are correctly installed.

E155405

- Install the LH upper arm.
 - Fit the bolts but do not fully tighten at this stage.

- Set the height between the center of the halfshaft end and the edge of the fender trim to 485 mm (19.10").
 - Support with an axle stand.

E55163

-  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the upper arm and wheel knuckle.

- Align the bolt to the marks made previously.
- Tighten the bolt to 133 Nm (98 lb.ft).

7. Tighten the upper arm front bolt to 175 Nm (129 lb.ft).
8. Tighten the upper arm rear bolt to 275 Nm (203 lb.ft).
9. Secure the wheel speed sensor lead.
10. Secure the brake pad wear indicator sensor lead.
11. Connect the height sensor link.
12. Install the brake tube.
 - Tighten the brake tube unions to 18 Nm (13 lb.ft).
13. Install the RH upper arm.
For additional information, refer to: Upper Arm (204-02 Rear Suspension, Removal and Installation).
14. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Suspension - Rear Stabilizer Bar Link

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link.

- Remove and discard the 2 nuts.

Installation

1. Install the stabilizer bar link.
 - Tighten the nuts to 115 Nm (85 lb.ft).
2. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Suspension - Lower Arm

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Release the stabilizer bar link.

- Remove and discard the retaining nut.

E55171

4. Loosen the 2 lower arm bolts.
5. Disconnect the shock absorber and spring assembly from the lower arm.
 - Remove the nut and bolt.
6. Release the parking brake cable.
7. Remove the 2 lower arm bolts.

8.  **CAUTION:** Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the knuckle from the lower arm.

- Remove the bolt.

9. Remove the lower arm.

E55172

Installation

1.  **CAUTION:** Make sure that bumpstop inserts are fitted on both sides of the front bushing prior to installation of the arm. Failure to follow this instruction may result in damage to the bushing.

NOTE: Bumpstop inserts are installed to both sides of the bushing.

Check the bumpstop inserts are correctly installed.

E155405

2. Install the lower arm.
 - Fit the bolts but do not fully tighten at this stage.

3.  **CAUTION:** Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the lower arm to the wheel knuckle.

- Tighten the bolt to 175 Nm (129 lb.ft).
4. Connect the shock absorber and spring assembly to the lower arm.
 - Tighten the nut and bolt to 300 Nm (221 lb.ft).
 5. Set the height between the center of the halfshaft end and the edge of the fender trim to 485 mm (19.10").

E55163

6. Tighten the lower arm bolts to 275 Nm (203 lb.ft).
7. Secure the parking brake cable.
8. Connect the stabilizer link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).
9. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
10. Carry out the wheel alignment procedure.

Rear Suspension - Upper Arm

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3.  **CAUTION:** Always plug any open connections to prevent contamination.

Remove the brake tube.

- Disconnect the 2 brake tube unions.
- Remove the brake hose clips and release the hoses.
- Release the brake tube from the clip.

4. Disconnect the height sensor link.

5. Release the wheel speed sensor lead.

6. RH side only: Release the brake pad wear indicator sensor lead.

7. Remove the upper arm.
 - Loosen the upper arm bolts.
 - Mark the position of the bolt in relation to the upper arm.
 - Remove the nut and bolt, then release the upper arm from the wheel knuckle.
 - Remove the upper arm bolts.

E55166

Installation

1.  **CAUTION: Make sure that bumpstop inserts are fitted on both sides of the front bushing prior to installation of the arm. Failure to follow this instruction may result in damage to the bushing.**

E155405

-  **NOTE:** Bumpstop inserts are installed to both sides of the bushing.

Check the bumpstop inserts are correctly installed.

2. Install the upper arm.
 - Fit the bolts but do not fully tighten at this stage.
3. Set the height, between the center of the halfshaft end and the edge of the fender trim, to 463 mm (18.23 inches).
 - Support with an axle stand.

4.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the upper arm and wheel knuckle.

- Align the bolt to the marks made previously.
- Tighten the bolt to 133 Nm (98 lb.ft).

5. Tighten the upper arm front bolt to 175 Nm (129 lb.ft).
6. Tighten the upper arm rear bolt to 275 Nm (203 lb.ft).
7. Secure the wheel speed sensor lead.
8. Secure the brake pad wear indicator sensor lead.
9. Connect the height sensor link.
10. Install the brake tube.
 - Tighten the brake tube unions to 18 Nm (13 lb.ft).
11. Bleed the brake system.
For additional information, refer to: Component Bleeding (206-00 Brake System - General Information, General Procedures).
12. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
13. Carry out the wheel alignment procedure.

Rear Suspension - Toe Link

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Disconnect the toe link.
 - Remove and discard the bolt.
4. Remove the toe link.
 - Remove and discard the nut.

E47523

Installation

1.  **CAUTION:** Make sure the toe link anti-rotation tang is fully seated in the integrated body frame before tightening the toe link retaining nut. Failure to follow this instruction will result in damage to the toe link or integrated body frame.

Install the toe link.

- Install a new nut and lightly tighten.
2. Connect the toe link.
 - Using a M14 X 2 tap, clean the threads of the knuckle fixing hole. Blow out debris with an air-line.
 - Tighten the new bolt to 175 Nm (129 lb.ft).
 3. Set the gap, between the underside of the toe link rubber boot and the integrated body frame bracket, to 10 mm (0.473 in).
 - Tighten the toe link inner ball joint retaining nut to 133 Nm (98 lb.ft)

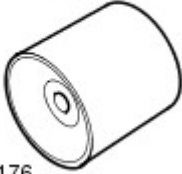

E47524

4. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
5. Carry out the wheel alignment procedure.

Rear Suspension - Lower Arm Bushing

Removal and Installation

Special Tool(s)

 <p>204-526/1 E55175</p>	<p>Receiver rear lower arm front bush 204-526/1</p>
 <p>204-526/2 E55176</p>	<p>Remover rear lower arm front bush 204-526/2</p>
 <p>204-526/3 E55177</p>	<p>Installer rear lower arm front bush 204-526/3</p>
 <p>204-532/1 E55178</p>	<p>Receiver rear lower arm rear bush 204-540/1</p>
 <p>204-540/2 E55179</p>	<p>Remover rear lower arm rear bush 204-540/2</p>
 <p>204-540/3 E55180</p>	<p>Installer rear lower arm rear bush 204-540/3</p>

Removal

NOTE: The bushings must be replaced in pairs, LH and RH sides.

- 
WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheels and tires.
3. Remove the LH lower arm.
For additional information, refer to: Lower Arm (204-02 Rear Suspension, Removal and Installation).
4. Remove the RH lower arm.
5. Note the position of the bushing in relation to the lower arm.

6.  **CAUTION:** The bush flanges need to be removed to allow bush removal.

NOTE: Take note of the fitted position of the bush.

Using a suitable tool, bend over the bush flanges.

7. Using a hacksaw, remove the flange from the bushing, making sure the upper arm is not damaged.

E55140

8. Using the special tools, remove and discard the lower arm rear bushings.

E55167

9. Using the special tools, remove and discard the lower arm front bushings.

E55168

Installation

E55169

1. CAUTIONS:

 Make sure the bush is correctly aligned.

 Make sure the correct special tool is used to install the bushings to the correct depth.

Using the special tools, install the lower arm front bushings

E55170

2.  CAUTION: Make sure the bush is correctly aligned.

Using the special tools, install the lower arm rear bushings.

E155405

3.  CAUTION: Make sure that bumpstop inserts are fitted on both sides of the front bushing prior to installation of the arm. Failure to follow this instruction may result in damage to the bushing.

 NOTE: Bumpstop inserts are installed to both sides of the bushing.

Check the bumpstop inserts are correctly installed.

4. Install the LH lower arm.
For additional information, refer to: Lower Arm (204-02 Rear Suspension, Removal and Installation).
5. Install the RH lower arm.
6. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
7. Carry out the wheel alignment procedure.

Rear Suspension - Shock Absorber and Spring Assembly TDV6 2.7L Diesel

Removal and Installation

Removal

1. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the wheel and tire.

4. Disconnect the shock absorber and spring assembly from the lower arm.
 - Using a jack and a block of wood, support the base of the shock absorber.
 - Remove the nut and bolt.

E49142

5. Remove the shock absorber and spring assembly retaining nuts.

E49143

6. Remove the shock absorber and spring assembly.

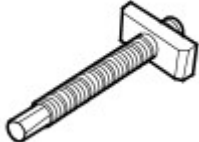

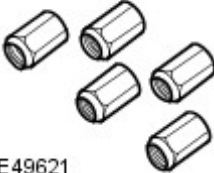

Installation

1. Install the shock absorber and spring assembly.
 - Make sure the spring and shock absorber assembly top mounting to body mating faces are clean.
 - Tighten the nuts to 63 Nm (46 lb.ft).
2. Connect the shock absorber and spring assembly to the lower arm.
 - Tighten the nut and bolt to 300 Nm (221 lb.ft).
3. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
4. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

Rear Suspension - Wheel Knuckle

Removal and Installation

Special Tool(s)

 <p>204-506/1 E49618</p>	<p>Halfshaft remover/replacer 204-506/1(LRT-60-030/1)</p>
 <p>204-506/2 E49619</p>	<p>Halfshaft remover/replacer 204-506/2(LRT-60-030/2)</p>
 <p>204-506/3 E49620</p>	<p>Halfshaft remover/replacer 204-506/3(LRT-60-030/3)</p>
 <p>204-506/5 E49621</p>	<p>Retainers - halfshaft remover/replacer 204-506/5(LRT-60-030/5)</p>
 <p>204-506-01 E49622</p>	<p>Halfshaft installer adapter 204-506-01(LRT-60-030/4)</p>

Removal

NOTE: If a new knuckle is installed a new wheel bearing must be installed.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
2. Remove the wheels and tires.
3. Loosen the halfshaft retaining nut.

E46796

4. Remove the brake disc.
For additional information, refer to: Brake Disc (206-04 Rear Disc Brake, Removal and Installation).

5. Release the parking brake cable.
 - Disconnect the parking brake cable from the brake shoe lever.
 - Disconnect the parking brake cable from the backplate.
 - Release the cable from the lower arm.

E49623

6. Release the wheel speed sensor from the wheel knuckle.

E49624

7. Disconnect the toe link.
 - Remove and discard the bolt.

E49626

8. Remove the halfshaft retaining nut.

E49628

9.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the knuckle from the lower arm.

- Remove the bolt.

E49625

10.  **CAUTION:** Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

E49627

11.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Disconnect the upper arm from the wheel knuckle.

- Mark the position of the bolt in relation to the upper arm.
- Remove the nut and bolt.
- Discard the nut.

12.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Remove the wheel knuckle.

Installation

1. Clean the components.
2.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Install the wheel knuckle.

- Locate the halfshaft.
3. Connect the upper arm and wheel knuckle.
 - Align the bolt to the marks made previously.
 - Install a new nut and tighten to 133 Nm (98 lb.ft).
 4. Using the special tools, install the halfshaft in the wheel hub.

5.  **CAUTION:** Install the halfshaft nut finger tight.
Install a new halfshaft retaining nut and lightly tighten.
6.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the lower arm to the wheel knuckle.

- Tighten the nut and bolt to 175 Nm (129 lb.ft).
7. Connect the toe link.
 - Tighten the new bolt to 175 Nm (129 lb.ft).
 8. Install the wheel speed sensor.
 - Tighten the bolt to 9 Nm (7 lb.ft).
 9. Locate the parking brake cable to the backplate.
 - Connect the cable to the brake shoe lever.
 - Tighten the coupling to 8 Nm (6 lb.ft).
 - Secure the parking brake cable to the lower arm.
 10. Install the brake disc.
For additional information, refer to: Brake Disc (206-04 Rear Disc Brake, Removal and Installation).

11.  **CAUTION:** Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 420 Nm (311 lb.ft).

- Stake the nut to the halfshaft.

12. Install the wheel and tire.
 - Tighten the wheel nuts in the sequence shown:
 1. Stage 1: 4 Nm
 2. Stage 2: 70 Nm
 3. Stage 3: 140 Nm

E74593

13. Carry out the wheel alignment procedure.

Rear Suspension - Shock Absorber and Spring Assembly TDV6 2.7L Diesel

Disassembly and Assembly

Disassembly

WARNING: Ensure the spring compressor Safe Working Load (SWL) meets or exceeds the spring rating quoted in the Specifications section.

1. Raise and support the vehicle.
2. Remove the wheel and tire.
3. Remove the shock absorber and spring assembly.
For additional information, refer to: Shock Absorber and Spring Assembly (204-02, Removal and Installation).
4. Install a suitable spring compressor in a vise.
5. Install the shock absorber and spring assembly in the spring compressor.
 - Compress the spring just sufficiently to relieve the spring tension.
6. Remove the shock absorber.
 - Restrain the shock absorber spindle, remove and discard the nut.
 - Remove the upper bush rebound plate and upper bush.
 - Remove the upper mounting assembly.
 - Remove the dust tube and rebound plate assembly.
 - Remove the spring aid.

E51737

7. Remove the spring from the spring compressor.

Assembly

1. Clean and inspect the components for deterioration.
 - Remove the rubber insulator.
 - Remove the spacer.
 - Remove the rebound plate from the dust tube.

E51738

E51740

2. Install the spring in the spring compressor.
 - Make sure the spring is installed with the close coils positioned towards the top of the shock absorber.

3. Install the spring aid.
4. Install the dust tube.
 - Install the rebound plate into the dust tube.
5. Install the shock absorber.
 - Make sure the spring is correctly located in the spring seat.

E51739

6. Install the upper mounting.
 - Install the spacer and rubber insulator, making sure the spacer drops over the stud heads.
 - Install the upper bush and upper bush rebound plate.
 - Install a new nut and tighten to 98 Nm (72 lb.ft).

7. Install the shock absorber and spring assembly.
For additional information, refer to: Shock Absorber and Spring Assembly (204-02, Removal and Installation).
8. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Wheels and Tires -

Wheels

Wheel type	Wheel size
Alloy wheel	7J x 17
Alloy wheel	8J x 18
Alloy wheel	8J x 19
Alloy wheel	8.5J x 20
Reduced size spare wheel - Steel	5.5J x 19

CAUTIONS:

With reduced size spare wheel fitted, do not exceed 50 mph (80 kph) and replace with standard size wheel at earliest opportunity.

Do not use power tools when operating the spare wheel winch, raise and lower winch manually using hand tools only.

Tire Sizes - Standard Fit

Wheel size	Tire size	Tire load index
7J x 17 - Alloy	235/70 R17H - All terrain	111
8J x 18 - Alloy	255/60 R18V - All terrain	112
8J x 19 - Alloy	255/55 R19V - All terrain	111
8.5J x 20 - Alloy	255/50 R20Y - All terrain	109

CAUTION: Inner tubes must not be fitted with any of these tires.

Tire Sizes - Accessory Fit

Wheel size	Tire size	Tire load index
8J x 19 - Alloy	255/55 R19 - Mud terrain	111
8J x 19 - Alloy	255/55 R19 - Sand	111

CAUTION: Inner tubes must not be fitted with any of these tires.

Tire Pressures - Not NAS/Gulf/Brazil Vehicles

Loading condition	bars	lbf/in ²	kPa
Normal operating conditions - Up to 4 people:			
Front	2.3	33	230
Rear	2.5	36	250
Vehicle loaded to maximum gross vehicle weight:			
Front	2.5	36	250
Rear	2.9	42	290
Reduced size spare wheel	4.2	60	420
* Standard size spare wheel	2.9	42	290

CAUTION: * The standard size spare wheel tire should be inflated to the maximum gross vehicle weight pressure and the pressure for the front or rear wheel locations must be adjusted accordingly if the wheel is to be used under conditions other than with the vehicle loaded to maximum gross vehicle weight.

Tire Pressures - NAS/Gulf/Brazil Vehicles

Loading condition	bars	lbf/in ²	kPa
All conditions			
Front	2.5	36	250
Rear	2.9	42	290
Reduced size spare wheel	4.2	60	420
* Standard size spare wheel	2.9	42	290

CAUTION: The standard size spare tyre should be inflated to the highest recommended pressure when stored on the vehicle. The inflation pressure must be adjusted to suit the axle location when the spare is used to replace a punctured road tyre."

General Specification

Item	Make	Location
Tire low pressure sensor	Continental/Siemens	On inside of wheel rim
Tire pressure sensor initiator:		
Front	Continental/Siemens	Attached to the fender splash shield adjacent to the front bumper
Rear	Continental/Siemens	Attached to the fender splash shield adjacent to the rear bumper

Recommended Lubricant

Application	Land Rover Part No.
Wheel hub spigot	RYL 105020

Torque Specifications

Description	Nm	lb-ft
* Road wheel nuts	140	103
Tire low pressure sensor	8	6

* **Wheel nuts must be tightened by diagonal selection**

Wheels and Tires - Wheels and Tires

Description and Operation

TIRES

NOTE: The TPMS valve should be serviced using the suitable service kit, each time the tyre is dismantled, to ensure an air tight seal. Attention should be made to the detail of fitting this kit.

Care must be taken when removing and refitting tires to ensure that the tire pressure sensor is not damaged.

E45549

Item	Part Number	Description
1	-	Tire valve and pressure sensor
2	-	Tire fitting/removal tool initial start position
3	-	High tire and bead tension area
4	-	Low tire and bead tension area

When removing the tire, the bead breaker must not be used within 90 degrees of the tire valve in each direction.

When using the tire removal machine, the fitting arm start position must be positioned as shown in the tire changing illustration. The wheel can then be rotated through 180 degrees in a counterclockwise direction. This will relieve the high tension from the tire bead allowing the remaining 180 degrees of the tire to be manually pulled from the rim.

When refitting the tire, position the fitting arm as shown. Rotate the tire and take care that the bead on the low tension side of the tire does not damage the sensor.

Tread Act - NAS Only

Vehicles supplied to the North American markets must comply with the legislation of the Transport Recall Enhancement, Accountability and Documentation (TREAD) act. Part of the requirement of the TREAD act is for the vehicle to display a label, positioned on the driver's side B-pillar, which defines the recommended tire inflation pressure, load limits and maximum load of passengers and luggage weight the vehicle can safely carry. This label will be specific to each individual vehicle and will be installed on the production line.

This label must not be removed from the vehicle. The label information will only define the specification of the vehicle as it came off the production line. It will not include dealer or owner fitted accessory wheels and tires of differing size from the original fitment.

NOTE: If tires and wheels of a non-standard size are fitted to the vehicle, the car configuration file must be updated using a Land Rover approved diagnostic system.

If the label is damaged or removed for body repair, it must be replaced with a new label specific to that vehicle. A new label is requested from Land Rover parts and will be printed specifically for the supplied VIN of the vehicle.

TIRE PRESSURE MONITORING SYSTEM (TPMS)

Tire Pressure Monitoring System - Component Location

E134243

Item	Part Number	Description
1	-	RH (right-hand) front initiator
2	-	Instrument cluster
3	-	TPMS RF receiver
4	-	RH rear tire pressure sensor
5	-	RH rear initiator
6	-	Spare tire pressure sensor
7	-	LH (left-hand) rear initiator
8	-	LH rear tire pressure sensor
9	-	CJB (central junction box)
10	-	EJB (engine junction box)
11	-	LH front tire pressure sensor
12	-	LH front initiator
13	-	RH front tire pressure sensor

The purpose of the Tire Pressure Monitoring System (TPMS) is to assist the driver in maintaining the vehicle's tire pressures at the optimum level in order to:

- improve fuel consumption
- maintain ride and handling characteristics
- reduce the risk of rapid tire deflation – which may be caused by under inflated tires
- comply with legislation in relevant markets.

The TPMS measures the pressure in each of the tires on the vehicle (including the spare, if required) and issues warnings to the driver if any of the pressures deviate from defined tolerances.

NOTES:

During a 'blow out' a very rapid reduction in pressure is experienced. The system is not intended to warn the driver of a 'blow out', since it is not possible to give the driver sufficient warning that such an event is occurring, due to its short duration. The design of the TPMS is to assist the driver in keeping the tires at the correct pressure, which will tend to reduce the likelihood of a tire 'blow out' occurring.

TPMS is inhibited when the vehicle is in Delivery mode. For more details on Delivery mode refer to the PDI manual.

A single TPMS hardware configuration is used. TPMS status information is relayed to the driver with a message displayed in the instrument cluster message center and a amber warning indicator.

Tire Location

Because of the requirement for different pressure targets and thresholds for the front and rear tires, the **CJB** can identify the location of the tires on the vehicle, and assign a received tire pressure sensor identification to a specific position on the vehicle (i.e. FL (front left), FR (front right), RL (rear left) or RR (rear right)).

Tire location is performed automatically by the **CJB** using an auto-location function. This function requires no manual intervention by the driver. The **CJB** can automatically learn the position of tires on the vehicle if the tire pressure sensors or their positions are changed on the vehicle.

The tire learn and location process is ready to commence when the vehicle has been stationary or is traveling at less than 12 mph (20 km/h) for 15 minutes. This is known as 'parking mode'. The learn/locate process requires the vehicle to be driven at speeds of more than 12 mph (20 km/h) for 15 minutes. If the vehicle speed reduces to below 12 mph (20 km/h), the learn process timer is suspended until the vehicle speed increases to more than 12 mph (20 km/h), after which time the timer is resumed. If the vehicle speed remains below 12 mph (20 km/h) for more than 15 minutes, the timer is set to zero and process starts again.

The **CJB** can automatically detect, under all operating conditions, the following:

- one or more tire pressure sensors have been replaced
- one or more tire pressure sensor identifications are missing
- one or more 'alien' identifications are being received, i.e. the **CJB** can reject identifications from tire pressure sensors that do not belong to the vehicle
- the spare tire and one of the tires in use on the vehicle have exchanged position on the vehicle.

If the tire pressure sensors fitted to the running wheels (not the spare) are changed, the **CJB** can learn the new sensor identifications automatically. The learn function requires no manual intervention by the driver.

If a new sensor is fitted to the spare tire it must have its identification code programmed into the **CJB** using a Land Rover approved diagnostic system, or used on the vehicle as a 'running' wheel and the vehicle driven for 15 minutes at more than 12.5 mph (20 km/h).

Spare Tire Identification

Depending on the vehicle specification, the spare tire may or may not be fitted with a tire pressure sensor.

NOTE: Tire pressure sensors cannot be fitted to steel space saver spare wheels.

If the spare tire is fitted with a tire pressure sensor, the **CJB** can detect it, determine that it is the spare tire and monitor its pressure and issue warnings to the driver accordingly. If the **CJB** expects the spare tire to be fitted with a tire pressure sensor and it does not, the **CJB** will not show a fault to the driver, however a fault code will be stored in the **CJB**.

If the spare tire is being monitored and the driver replaces a flat 'running' tire with the spare tire, the **CJB** will not continually warn the driver that the original flat tire (now in the spare position) is flat. This prevents distraction of the driver by constant pressure warnings being issued. The driver is reminded by a message displayed for 20 seconds at each ignition on cycle that the spare tire is flat.

System Operation

Each time the vehicle is driven, the **CJB** transmits a Low Frequency (LF) (125 KHz) signal to each initiator in turn. This is received by the tire pressure sensor which transmits a Radio Frequency (RF) (315 or 433 MHz depending on market) signal to the RF receiver. This signal contains coded data which corresponds to sensor identification, air pressure, air temperature and acceleration data. This signal is communicated to the **CJB** via a K-bus line.

The system enters 'parking mode' after the vehicle speed has been less than 12.5 mph (20 km/h) for 12 minutes. In parking mode the tire pressure sensors transmit a coded signal to the **CJB** once every 13 hours. If the tire pressure decreases by more than 1 lbf/in² (0.6 bar) the sensor will transmit more often if pressure is being lost.

The spare tire sensor transmits a signal every 13 hours in the same manner as the road wheels when in parking mode. If the tire pressure decreases by more than 1 lbf/in² (0.6 bar) the sensor will transmit more often if pressure is being lost.

As each wheel responds to the LF signal from the **CJB**, it is assigned a position on the vehicle and is monitored for the remainder of that drive cycle in that position.

When the vehicle has been parked for more than 15 minutes and then driven at a speed of more than 12.5 mph (20 km/h), the initiators fire in turn for 18 seconds in the following order:

- Front left
- 6 second pause (for the to detect a response from the tire pressure sensor)
- Front right
- 6 second pause
- Rear right
- 6 second pause
- Rear left
- 6 second pause.

Each tire pressure sensor responds in turn so the **CJB** can establish the sensor positions at the start of the drive cycle. This process is repeated up to three times but less if the sensor positions are already known in the **CJB**. The process is known as 'Auto Location' and takes 7 to 8 minutes to complete. During this period the tire sensors transmit at regular intervals, once every 15 seconds. For the remainder of the drive cycle the tire sensors transmit once every 60 seconds or if a change in tire pressure is sensed until the vehicle stops and the system returns to parking mode.

Once the wheel position is established, the initiators stop firing a signal and do not fire again until the vehicle has been parked for more than 15 minutes. The signal transmissions from each wheel sensor continue at 1 minute intervals whilst the vehicle is being driven. This transmission is to monitor the tire pressure.

At 25% deflation the amber warning indicator in the instrument cluster is illuminated and an appropriate message displayed in the message center.

RF Receiver

E73925

The RF receiver is mounted behind the overhead console and connects to the vehicle harness via a fly lead.

The RF receiver receives transmissions from each of the tire pressure sensors via an internal antenna. This information is then communicated to the **CJB** via a dedicated Local Interconnect Network (K-bus).

Initiator

E45552

The initiators are located at the front of the front wheel arches and at the rear of the rear wheel arches and are secured with two scrivenets. The TPMS has four initiators and each has a connector which connects with the body harness.

The initiator is a passive, Low Frequency (LF) transmitter. Each initiator provides an auto-location feature to identify tire positions on the vehicle and transmit that data to the **CJB**.

The **CJB** energizes each initiator in turn using LF drivers. The corresponding tire pressure sensor detects the resulting

LF transmission and responds by initiating an RF transmission of its data. This data is received by the RF receiver and communicated to the **CJB** via a K-bus. The **CJB** can then determine which sensor is transmitting and its location on the vehicle.

Tire Pressure Sensor

E45553

The TPMS system uses 'active' tire pressure sensors which are mounted on each wheel, inside the tire cavity. The sensor is retained in position by the valve attachment to the wheel structure. The sensors transmit their RF signals at either 315 MHz or 433 MHz dependent on market requirements.

The sensors periodically measure the pressure and temperature of the air inside the tire plus the centripetal acceleration acting on the sensor. These measurements are transmitted periodically to the RF receiver located behind the overhead console.

The tire pressure sensors are self-contained units which have no electrical connections into or out of the sensor.

The care points detailed in the 'Tires' section of this chapter must be followed to avoid damage to the sensor. If the sensor is replaced, the nut, seal and washer must also be replaced and the sensor tightened to the correct torque value as given in the Service Repair manual.

The RF transmission from the sensor contains a unique identification code in its transmission data, so that the **CJB** can identify the tire on the vehicle. If the sensor is replaced on a 'running' wheel, the new sensor identification will be learnt when the vehicle is first driven at a speed of more than 12.5 mph (20 km/h) for 15 minutes. If a new sensor is fitted to the spare wheel, the identification for that sensor must be programmed into the **CJB** using a Land Rover approved diagnostic system or that wheel will not be monitored. The code is provided on a label with the complete wheel and tire assembly when new and is also printed on the casing of each sensor.

The replacement spare wheel may also be programmed to the vehicle by using it as a 'running' wheel for 15 minutes at more than 12.5 mph (20 km/h), then replacing it to the spare wheel position.

In order to conserve battery power, the tire sensor module uses different transmission rates when the wheel is stationary or moving. The wheel speed required to change between the stationary and moving transmission rates is very low to allow for the requirement for slow off-road driving.

Instrument Cluster Indications

E134246

Item	Part Number	Description
1	-	Message center
2	-	Amber warning indicator

The warning indications to the driver are common on all vehicles fitted with TPMS. Warnings are conveyed by an amber light emitting diode (LED) warning indicator and a text message displayed in the message center.

The warning indicator and message center are driven by CAN messages from the **CJB**. The warning indicator is illuminated by the cluster software for 3 seconds when the vehicle is in power mode 6 for a bulb check.

For additional information, refer to: Information and Message Center (413-08, Description and Operation).

Controller Area Network (CAN)

The **CJB** sends and receives a number of digital messages via the medium speed controller area network (CAN). The received messages are used for the operation of the TPMS. The transmitted messages comprise of TPMS status and requests to the instrument cluster to illuminate warnings indicators and/or display messages in the message center.

Transmitted Messages

The **CJB** transmits the messages shown in the following table.

Message	Received By
TPMS diagnostic response	A Land Rover approved diagnostic system.
TPMS amber warning indicator request at 25% tire deflation	Instrument cluster
TPMS message display request	Instrument cluster

Diagnostics

The **CJB** has a diagnostic connection via the medium speed CAN to enable system status and faults to be retrieved using a Land Rover approved diagnostic system.

Additionally, an on-board diagnostic routine within the **CJB** constantly monitors the system and alerts the driver to system faults by illuminating the amber warning indicator and/or displaying a message in the instrument cluster message center.

Fault Detection

If a sensor fails, the amber warning indicator in the instrument cluster will be illuminated. A message 'XX Tyre Not Monitored' will be displayed in the message center in addition to the amber warning indicator.

NOTE: 'XX' is the tire position on the vehicle, e.g. FL (front left), FR (front right), RL (rear left) or RR (rear right).

If more than one sensor fails or the **CJB** develops a fault, the amber warning indicator will be illuminated. A message 'Tyre Monitoring System Fault' will be displayed in the message center in addition to the amber warning indicator. This fault could also be caused if RF interference near the vehicle affects the system signal reception. When the

interference has ceased, the fault will be automatically cancelled and the TPMS will operate normally.

If a tire pressure sensor battery voltage becomes low, the sensor transmits a message to the **CJB**. The **CJB** stores the low battery condition as a fault flag in its memory with no other visual warnings displayed. If the battery fails, the sensor will stop transmitting and the **CJB** will transmit a message to display 'FL Tyre Not Monitored' for example in the message center. The dealer should interrogate the **CJB** for the fault flag using a Land Rover approved diagnostic system to determine the cause of the message. If the battery has failed, the sensor must be replaced and the stored fault flags removed using a Land Rover approved diagnostic system. The **CJB** will learn the identification of the new sensor when the vehicle is driven. If the replaced sensor is fitted to the spare wheel (if fitted), its identification must be manually programmed into the **CJB** using a Land Rover approved diagnostic system or by using it as a 'running' wheel for 15 minutes at more than 12.5 mph (20 km/h), then replacing it to the spare wheel position.

Wheels and Tires - Wheels and Tires

Diagnosis and Testing

Principles of Operation

For a detailed description of the wheels and tires, refer to the relevant Description and Operation section in the workshop manual.

REFER to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation) / [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. Verify the customer complaint. As much information as possible should be gathered from the driver to assist in diagnosing the cause(s). Confirm which of the following two warning types (A or B) exist for the Tire Pressure Monitoring System when the ignition status is switched from 'OFF' to 'ON'
 - **(A) Check Tire Pressure Warnings.** A low tire pressure warning will **continuously** illuminate the low tire pressure warning lamp. This warning may be accompanied by a text message such as CHECK TIRE PRESSURE (refer to owner literature). The manufacturer approved diagnostic system does NOT need to be used. Diagnostic Trouble Codes (DTCs) are not generated with this type of warning. To extinguish this warning it is essential that, with the ignition 'ON', all vehicle tires (including the spare) are to be set to the correct pressure as stated in the vehicle handbook or as indicated on the placard label in the passenger/driver door aperture. **It is not necessary to drive the vehicle to clear 'check tire pressure' warnings - just changing the tire pressure causes the tire low pressure sensor to transmit new data.**

NOTES:

The tire pressures should be set by:

- Using a calibrated tire pressure gauge
- With 'cold' tires (vehicle parked in the ambient temperature for at least one hour, not in a garage with an artificial ambient temperature)

If the tire pressure warning does not clear within two minutes, it is likely that the gauge is not correctly calibrated or the tires are 'warm'. Carry out the following steps until the warning has cleared:

- Rotate wheels approximately 180 degrees
- Increase the tire pressures by 3psi
- Wait a further two minutes
- When the tires are at ambient temperature and a **calibrated** gauge is available, reset the tire pressures to the correct pressure.

Tire pressure adjustments are part of routine owner maintenance. Tire pressure adjustments that are required due to a lack of owner maintenance are not to be claimed under vehicle warranty.

- **(B) System Fault Warnings.** When a system fault is detected, the low tire pressure warning lamp will flash for approximately 75 seconds prior to being continuously illuminated. Visually inspect wheel arch Tire Pressure Monitoring System Antennas and check for system DTCs. External visual damage to the tire low pressure sensors and air leaks will not cause system fault warnings (note: nut and seal system should be replaced at each tyre change using the available service kit). Check for the presence of tire low pressure sensors on all four wheels (note: a tire low pressure sensor has a metal valve stem rather than a rubber one).

2. Check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Central Junction Box (CJB) (100-00 General Information, Description and Operation).

Pinpoint Tests

PINPOINT TEST A : U201F11 TIRE PRESSURE MONITORING SYSTEM EXTERNAL RECEIVER DATA LINE CIRCUIT SHORT TO GROUND	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: U201F11 VERIFY EXTERNAL RECEIVER DATA LINE CIRCUIT SHORT TO GROUND	
1	Ignition OFF.

	2 Disconnect the Tire Pressure Monitoring System Receiver electrical connector, C2875.				
	3 Measure the resistance between				
	<table border="1"> <thead> <tr> <th>C2875, harness side</th> <th>Battery</th> </tr> </thead> <tbody> <tr> <td>Pin 1</td> <td>Negative terminal</td> </tr> </tbody> </table>	C2875, harness side	Battery	Pin 1	Negative terminal
C2875, harness side	Battery				
Pin 1	Negative terminal				
	Is the resistance less than 5 Ohms? Yes GO to A2. No GO to A3.				
A2: U201F11 CHECK THE EXTERNAL RECEIVER DATA LINE CIRCUIT FOR SHORT CIRCUIT TO GROUND					
	1 Disconnect the Body Control Module electrical connector, C0580.				
	2 Measure the resistance between				
	<table border="1"> <thead> <tr> <th>C2875, harness side</th> <th>Battery</th> </tr> </thead> <tbody> <tr> <td>Pin 1</td> <td>Negative terminal</td> </tr> </tbody> </table>	C2875, harness side	Battery	Pin 1	Negative terminal

B3: U201F12 CHECK THE TIRE PRESSURE MONITORING SYSTEM EXTERNAL RECEIVER FOR SHORT CIRCUIT TO POWER					
	1 Reconnect the Tire Pressure Monitoring System Receiver electrical connector, C2875.				
	2 Using manufacturer approved diagnostic system run On Demand Self Test (0x0202) .				
	Is the DTC U201F12 set?				

	Yes Replace Tire Pressure Monitoring Receiver.
	No Investigate possible cause of intermittent failure.
B4: U201F12 CHECK THE BODY CONTROL MODULE FOR SHORT CIRCUIT TO POWER	
	1 Reconnect the Body Control Module electrical connector, C0580.
	2 Reconnect the Tire Pressure Monitoring System Receiver electrical connector, C2875.
	3 Using manufacturer approved diagnostic system run On Demand Self Test (0x0202) .
	Is the DTC U201F12 set?
	Yes Replace Body Control Module.
	No Investigate possible cause of intermittent failure.

PINPOINT TEST C : U201F87 TIRE PRESSURE MONITORING SYSTEM EXTERNAL RECEIVER DATA LINE MISSING MESSAGE					
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS				
C1: U201F87 VERIFY EXTERNAL RECEIVER DATA LINE MISSING MESSAGE					
	1 Using manufacturer approved diagnostic system run On Demand Self Test (0x0202).				
	Is the DTC U201F87 set?				
	Yes GO to C2.				
	No Investigate possible cause of intermittent failure.				
C2: U201F87 CHECK EXTERNAL RECEIVER DATA LINE CIRCUIT					
	1 Ignition OFF.				
	2 Disconnect the Tire Pressure Monitoring System Receiver electrical connector, C2875.				
	3 Disconnect the Body Control Module electrical connector, C0580.				
	4 Measure the resistance between				
	<table border="1" style="width: 100%;"> <tr> <td style="text-align: center;">C2875, harness side</td> <td style="text-align: center;">C0580, harness side</td> </tr> <tr> <td>Pin 1</td> <td>Pin 25</td> </tr> </table>	C2875, harness side	C0580, harness side	Pin 1	Pin 25
C2875, harness side	C0580, harness side				
Pin 1	Pin 25				
	Is the resistance less than 5 ohms?				
	Yes GO to C3.				
	No REPAIR the high resistance/open circuit in wiring harness.				
C3: U201F87 CHECK EXTERNAL RECEIVER					
	1 Reconnect the Body Control Module electrical connector, C0580.				
	2 Reconnect the Tire Pressure Monitoring System Receiver electrical connector, C2875.				
	3 Using manufacturer approved diagnostic system run On Demand Self Test (0x0202) .				
	Is the DTC U201F87 set?				
	Yes Replace Tire Pressure Monitoring Receiver. GO to C4.				
	No Investigate possible cause of intermittent failure.				
C4: U201F87 CHECK BODY CONTROL MODULE.					
	1 Using manufacturer approved diagnostic system run On Demand Self Test (0x0202) .				
	Is the DTC U201F87 set?				
	Yes Replace Body Control Module.				
	No Test is complete. No further action is required.				

PINPOINT TEST D : C1A5693, C1A5893, C1A6093, C1A6293 DEFECTIVE RUNNING TIRE LOW PRESSURE SENSOR OR RECEIVER	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: C1A5693, C1A5893, C1A6093, C1A6293 CHECK FOR ADDITIONAL DTCS	
	1 Using manufacturer approved diagnostic system check for additional DTCs C1A5693, C1A5893, C1A6093, C1A6293, with identical time stamps.
	Have all four DTCs logged with identical time stamps in the Body Control module?
	Yes Diagnose and fix DTCs related to the tire pressure monitoring receiver.
	No Using manufacturer approved diagnostic system, perform diagnostic routine to verify reception of all tire low pressure sensors, by carrying out 'TPMS wheel unit & receiver reception test' from set up and configuration application and complete remedial actions.

PINPOINT TEST E : C1D1800 LOCALIZATION FAILURE	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: C1D1800 ESTABLISH THE LOCATIONS OF THE TIRE LOW PRESSURE SENSOR LOCALIZATION	

FAILURES

	 <p>NOTE: To clear or reset information read in datalogger signal 'Unsuccessful wheel position triggering statistic' (0x4149) Use manufacturer approved diagnostic system and carry out 'Reset/Clear Specified Function' (0x040E) from Special Applications.</p> <p>1 Using manufacturer approved diagnostic system read datalogger signal 'Unsuccessful wheel position triggering statistic' (0x4149) to establish the locations of the tire low pressure sensor localization failures.</p>

PINPOINT TEST F : C1D2105 MISSING, INCOMPATIBLE OR DEFECTIVE RUNNING TIRE LOW PRESSURE SENSOR(S) OR RECEIVER

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: C1D2105 CHECK FOR CORRECT WHEEL AND TIRE ASSEMBLY AND TIRE LOW PRESSURE SENSORS	
	 NOTE: As a visual check, a tire low pressure sensor has a metal valve stem rather than a rubber one and cannot be installed to a mini or space saver spare wheel. 1 Check that all full size running wheel and tire assemblies have tire low pressure sensors installed.
	Is a full size wheel and tire assembly with tire low pressure sensor installed to all running wheel positions? Yes Using manufacturer approved diagnostic system, perform diagnostic routine to verify reception of all tire low pressure sensors, by carrying out 'TPMS wheel unit & receiver reception test' from set up and configuration application and complete remedial actions. No If agreed with the customer, install the correct wheel and tire assembly or tire low pressure sensor(s), of correct frequency, in accordance with that defined in the manufacturer approved diagnostic system new tire low pressure sensor application. <small>(Note: If the datalogger signal 'Number Of Missing Tire Pressure Wheel Units' is 4 and the Instrument Panel Cluster displays text message 'Tire Pressure Monitoring Unavailable', the system has detected winter tire installation, as detailed in the owner's manual. Confirm why the vehicle has non-TPMS wheel & tire assemblies installed before installing tire low pressure sensors, which are not to be claimed under vehicle warranty.)</small>

Component Tests

Wheels and Tires

For wheel and tire specification information (pressures, torques, etc).
REFER to: [Specifications](#) (204-04 Wheels and Tires, Specifications).

When replacing wheels or tires, local legislation regarding health and safety must be complied with.

If the vehicle has a Tire Pressure Monitoring System installed, only manufacturer approved wheels and tires should be used. If the wheel and tire size is changed (for example from R18 to R20) the Tire Pressure Monitoring System module should be updated with the correct pressure information appropriate to the new wheel and tire set. Update the Tire Pressure Monitoring System module using the manufacturer approved diagnostic system.

As a general guideline, only replace tires in pairs or as a set, and only with tires of equivalent size and specification.

Confirm the symptoms of the customer complaint.

As much information as possible should be gathered from the driver to assist in diagnosing the cause(s).

1. Before a road test, carry out a basic inspection to make sure the vehicle is safe and legal to drive.

Basic inspection

- Correct tire inflation.
REFER to: [Specifications](#) (204-04 Wheels and Tires, Specifications).
- Legal tire tread depth
- Cuts/Bulges in tire sidewall(s)
- Tire ply separation
- Embedded objects
- Wheel rim damage
- Correct tire installation (specification, direction of rotation, etc)
- Any obvious distortion of the tire (flat/high spots)
- Worn/Damaged steering or suspension components

Road test

If the results of the basic inspection are acceptable, carry out a road test to confirm the symptoms.

To reproduce the symptoms, test the vehicle on similar roads to those on which the fault occurs and at similar speeds (provided it is legal to do so).

If the vibration or noise can be reproduced, note the speed at which it occurs and see if it is possible to drive through the symptom, meaning, is it possible to alter the fault by driving faster or slower than the speed at which it occurs?

If it **is** possible, it is likely that the fault is caused by an imbalance in the wheel or tire.

If the vibration or noise gets worse as the vehicle speed increases, it is likely that the fault is caused by distortion in the wheel or tire, or worn or damaged components.

Distortion checks

Check for distortion by raising the vehicle so that the wheels are free and placing an axle stand or similar fixed object next to each wheel in turn.

If the stand is placed at the tread of the tire, the tire can be checked for ovality by turning the wheel by hand and checking for high or low spots where the gap between the tread and the stand increases or reduces.

If the stand is placed next to the wheel rim or tire sidewall, the wheel and tire can be checked for run-out in a similar way.

Wheels and Tires - Tire Low Pressure Sensor

Removal and Installation

Removal

NOTE: It is strongly recommended that the valve seal and steel washer is replaced each time a tire is changed to avoid a seal failure. The seal and washer must be replaced if the sensor is removed. Removal of the sensor retaining nut must be regarded as sensor removal. The valve cap must always be in place except when inflating, releasing pressure or checking pressure.

1. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3. **CAUTION:** To avoid damage to the tire low pressure sensor, release the tire bead from the rim, 180 degrees from the valve.

Remove the tire from the wheel.

E51446

4. **CAUTIONS:**

Do not push on the valve.

If the tire low pressure sensor is to be re-installed, a new washer, seal and nut must be installed.

If the tire low pressure sensor is to be re-installed, a new washer, seal, nut and silver coloured nickel valve core must be installed.

Remove the tire low pressure sensor.

- Remove the nut.
- Release and withdraw the sensor along the valve axis.

5. If necessary, install a new seal and washer.

- Remove and discard the seal and washer.
- Install a new washer and seal, making sure the valve remains pressed fully onto its seat.

E51447

Installation

1. **CAUTION:** Do not use compressed air to clean the sensor. Do not clean the sensor with solvents or cleaning agents of any type, use a clean dry cloth.

Clean the component mating faces.

2. **CAUTION:** Do not apply any lubricant to

E51449

the new valve.

 **NOTE:** If the sensor is replaced on a 'running' wheel, the new sensor identification will be learnt when the vehicle is first driven. If a new sensor is fitted to the spare wheel the identification for that sensor must be programmed into the Tire Pressure Monitoring System (TPMS) module using T4. The identification code is provided on a label with the complete assembly and is also printed on the casing of each sensor.

Install the tire low pressure sensor.

- Install and hand tighten the nut whilst keeping the sensor in place.
- Tighten the nut to 6.5 Nm (4.8 lb.ft).

3. Install the tire and balance the wheel.

4. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Wheels and Tires - Tire Pressure Monitoring System (TPMS) Front Antenna

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).

3. Remove the tire pressure antenna.
 - Remove the 2 retainers.

E46262

Installation

1. To install, reverse the removal procedure.
2. Initiate a new tire pressure antenna using T4.

Wheels and Tires - Tire Pressure Monitoring System (TPMS) Rear Antenna

Removal and Installation

Removal

1. Remove the fender moulding.
For additional information, refer to: Rear Quarter Panel Moulding (501-08, Removal and Installation).

2. Remove the fender splash shield.
 - Remove the 2 screws.
 - Remove the 6 retainers.
 - Disconnect the electrical connector.

E48478

3. Remove the tire pressure antenna.
 - Remove the 2 retainers.

E48479

Installation

1. To install, reverse the removal procedure.
2. Initiate a new tire pressure antenna using T4.

Vehicle Dynamic Suspension -

Air Suspension - General Specification

Item	Specification
Ride height:	
Off road	55 mm (2.1 in) above standard
Access - reselectable whilst vehicle is moving	50 mm (1.9 in) below standard
Trim height	Configured using approved diagnostic equipment
Height sensors:	
Location	4 per vehicle - one sensor for each wheel
Height sensor arm colour coding:	
Left hand side, front and rear	WHITE
Right hand side, front and rear	BLACK
Height sensor operating voltages:	
Supply voltage	5 volts - supplied by air suspension ECU
Output voltage	Left hand front and right hand rear - Decreases to 0.5 volts with bump travel. Right hand front and left hand rear - Decreases to 4.5 volts with bump travel
Spring/damper modules:	
Type	Guided air spring surrounding twin tube damper
Pressures:	
Normal - Front	800 to 1000 kPa (8.0 to 10.0 bar) (116.0 to 145.0 lbf/in ²)
Normal - Rear	500 to 800 kPa (5.0 to 8.0 bar) (72.5 to 116.0 lbf/in ²)
Burst pressure	3500 kPa (35 bar) (507.5 lbf/in ²)
Maximum spring pressure - Full bump at gross vehicle weight	Approximately 2700 kPa (27 bar) (391.5 lbf/in ²)
Air compressors:	Supplied with air drier, electrically switched, pilot operated exhaust valve and double temperature sensors
Old type	Hitachi
*New type	AMK
Controlled by	Electronic Control Unit (ECU)
Maximum pressure	1680 kPa (16.8 bar) (243.6 lbf/in ²)
Air reservoir:	
Volume	9 litres (0.31 cu.ft)
Working pressure	1750 kPa (17.5 bar) (253.75 lbf/in ²)
Maximum operating pressure	2300 kPa (23 bar) (333.5 lbf/in ²)
Reservoir valve block	Incorporates pressure sensor to monitor spring and air reservoir pressures
Valve blocks:	
Front	2 corner valves, 1 cross link valve - all mounted on front bumper armature
Rear	2 corner valves, 1 cross link valve - all mounted on left hand rear spring tower

*** If an AMK air compressor is installed to replace an Hitachi air compressor then a new corresponding air compressor relay must also be installed.**

General Specifications

AIR SUSPENSION

General Information

The air suspension system is a four corner system which is fitted to all models.

The system is electronically controlled by an air suspension control module which controls the air supply unit, reacts to inputs from four height sensors and distributes air around the system via valve blocks.

The main air suspension system components are:

- Air suspension control module
- Air supply unit
- Four height sensors
- Three valve block assemblies
- Reservoir
- Air harness
- Two front shock absorber assemblies incorporating dampers
- Two rear shock absorber assemblies incorporating dampers
- Air suspension switch

The four corner air suspension system maintains the vehicle height under all operating conditions by controlling the mass of air in the air springs. The air suspension control module uses signals from the four height sensors to maintain the correct suspension height, irrespective of vehicle load. Additionally, the system allows the driver to request ride height changes to improve off-road performance or ease access or loading. The system automatically adjusts the ride height to improve the vehicle handling and dynamics when speed increases or decreases. This is achieved by operating pneumatic control valves to increase or decrease the mass of air in the air springs.

The air suspension system has three driver selectable, pre-determined ride heights and an automated high speed ride height. A driver interface indicates the selected ride height and height change movement. Additional information is also relayed to the driver via the Instrument Cluster (IC) message center and by audible warnings also transmitted by the IC.

Most height changes can only be made when the engine is running and the driver and passenger doors are closed.

The air suspension can be controlled manually by the driver using a switch on the floor console to select the required height change.

The system will temporarily inhibit height adjustments when the vehicle is subject to cornering, heavy acceleration or heavy braking. The inhibit function prevents unsettling of the vehicle.

Height changes are also restricted for safety reasons, when a door is opened and the vehicle is stationary for example.

The air suspension system is controlled by the air suspension control module which is located on the driver side 'A' pillar. The control module monitors the height of each corner of the vehicle via four height sensors, which are mounted in-board of each road wheel. The control module also performs an 'on-board diagnostic' function to perform 'health checks' on the system. If faults are detected, codes are stored in the control module and can be retrieved using the Land Rover approved diagnostic system.

Ride Height Tolerance Control

The air suspension control module has two ride height tolerance bands; normal tolerance and tight tolerance.

The control module considers the vehicle to be at target height if the current height is within the appropriate tolerance band. Height adjustments are not made until the vehicle height falls outside of the tolerance band for a pre-determined time. The time period is different depending on if the vehicle is moving or stationary. The tolerance bands are as follows:

- Normal \pm 10 mm
- Tight \pm 3 mm.

The tight tolerance band is only used if set by the Land Rover approved diagnostic system for diagnostic purposes or when the vehicle has been stationary for more than 5 minutes.

OPERATING MODES

The driver can manually select, using the air suspension switch, one of four ride states:

- ON-ROAD - this height is the normal operating height of the vehicle
- OFF-ROAD - this height is higher than the on-road height and provides improved ground clearance, approach, departure and breakover angles
- ACCESS - this height is lower than the on-road height and makes entering and exiting the vehicle easier for the occupants
- CRAWL (Locked at access) - this mode allows the vehicle to be driven at the access height at low speeds to provide increased roof clearance in low car parks etc.

HIGH SPEED - A non-selectable, automatic high speed mode is provided which lowers the vehicle height to improve vehicle handling.

NOTE: Vehicle height changes are restricted if the air suspension control module receives a 'Door Open' signal and the speed is less than 5 mph (8 km/h).

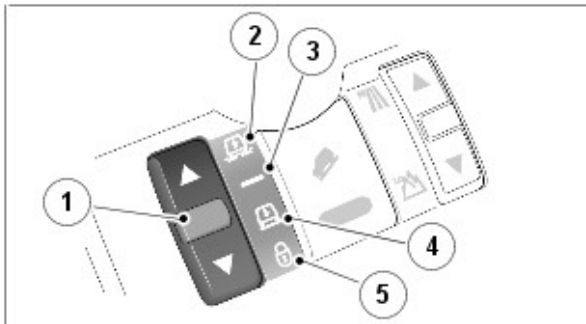

A complete vehicle delivery mode is available but is only selectable using the Land Rover approved diagnostic system. When this mode is active most vehicle systems, in addition to the air suspension, are inhibited or restricted to a minimal functionality. In this mode the air suspension is set to the Transit Mode.

If the air suspension control module senses that the vehicle has grounded and lost traction, the control module can temporarily increase and/or redistribute the volume of air supplied to the affected air spring(s) to maximize the available traction. This is known as extended mode and will be indicated to the driver by the lamps on the air suspension switch flashing and an 'EXTENDED MODE' message being displayed in the IC.

If a fault is detected by the air suspension control module, the control module will reduce the system functionality dependent on the type and severity of the fault. The control module will also store a fault code which can be retrieved using the Land Rover approved diagnostic system. If a severe fault occurs, the control module will attempt to put the vehicle in a safe condition. A fault is relayed to the driver by the IC message center and an audible warning emitted from the IC.

All information messages will be displayed for four seconds.

Air Suspension Switch Pack

E140306

Item	Part Number	Description
1	-	Raise/lower switch
2	-	Off-Road Mode
3	-	On-Road Mode

- 4 - Access Mode
- 5 - Crawl mode

The air suspension switchpack is located in the floor console, behind the transmission selector. The switch is a three position, non-latching switch which allows selection of the following driver selectable modes:

- Off-road mode
- On-road mode
- Access mode
- Crawl mode.

The air suspension switch can be rocked from its central position. The switch is non-latching and returns to the central position when released. The switch completes an earth path to the air suspension control module when operated. This earth path is completed on separate wires for the raise and lower switch positions, allowing the control module to determine which selection the driver has made.

The switch has six symbols which illuminate to show the current selected height and the direction of movement. The raise and lower symbols will flash and a warning tone will be emitted from the IC sounder when a requested height change is not allowed, i.e. vehicle speed too fast.

A flashing symbol indicates that the air suspension system is in a waiting state or that the system will override the driver selection because the speed threshold is too high.

The driver can also ignore the system's warnings signals and allow the height to change automatically. For example, increasing the vehicle speed to more than 25 mph (40 km/h) when locked to access height will cause the control module to automatically change the ride height from access mode to on-road mode.

Hill Descent Control and Transfer Case Control Switchpack

NOTE: Coil spring vehicles only.

E150641

Item	Part Number	Description
1	-	Hi range switch
2	-	Low range switch
3	-	HDC switch

On-Road Mode

This is the normal ride height for the vehicle.

Off-Road Mode

Off-road mode will only be selectable if the vehicle speed is less than 25 mph (40 km/h). The vehicle will be raised 55mm (2.2 inches) to provide additional body clearance and improved approach, departure and breakover angles. If the vehicle speed exceeds 31 mph (50 km/h), the air suspension control module will automatically lower the vehicle to the on-road mode height. At 25 to 28 mph (40 to 45 km/h) a message is displayed in the message center to warn the driver to slow down or the vehicle will lower.

Access Mode

Access mode lowers the vehicle body height and provides easier entry, exit and loading of the vehicle.

Access mode can be selected at any vehicle speed. When access mode is selected, the response of the air suspension system will depend on the vehicle speed:

- If the vehicle speed is more than 12.5 mph (20 km/h), the air suspension control module will wait for up to one minute for the vehicle speed to be reduced. The access mode light emitting diode (LED) and the lowering LED will flash while the air suspension control module waits for the vehicle speed to be reduced, the on-road mode lamp will remain illuminated. If the vehicle speed is not reduced sufficiently, the access mode request will be cancelled after 1 minute.
- If the vehicle speed is less than 12.5 mph (20 km/h), the air suspension control module will lower the suspension to a part lowered height and will remain at this height for up to one minute. The on-road mode lamp will extinguish as the air suspension control module lowers the suspension to the part lowered height. The access mode lamp and the lowering LED will illuminate. When part lowered is reached, the lowering LED will flash. If the vehicle speed is not reduced to less than 5 mph (8 km/h) in the one minute period, the access mode request will be cancelled.
- If the vehicle speed is less than 5 mph (8 km/h), the suspension will be lowered to access mode immediately. The access mode LED and the lowering LED will illuminate. When the access mode height is reached, the lowering LED will be extinguished.

Access height may be selected up to 40 seconds after the ignition is turned off, provided that the driver door has not been opened within this time.

The suspension will automatically rise from access mode when the vehicle speed exceeds 6.2 mph (10 km/h). If access mode was selected directly from off-road mode then the system will return to off-road mode when the vehicle speed exceeds 6.2 mph (10 km/h). Otherwise the system will lift the suspension to On-road height.

Selecting Access Mode Directly from Off-Road Mode

When the suspension is in off-road mode height, pressing the 'Access' height change switch once, or pressing the lowering switch twice before the lowering LED is extinguished, the control module will lower the suspension to access mode height. The control module will remember to return the suspension to off-road height automatically if the vehicle speed increases above 6.2 mph (10 km/h).

Crawl mode

Crawl mode allows the vehicle to be driven at low speeds with the suspension locked at the access mode height. This allows the vehicle to be driven in low car parks etc. with increased roof clearance.

Crawl mode can be selected up to 21.7 mph (35 km/h) with a long press of the switch in a down direction. The access mode lamp and the crawl mode lamp will be illuminated. When the control module is in crawl mode, on-road mode height will be selected automatically if the vehicle speed exceeds 24.8 mph (40 km/h). At 18.6 to 21.7 mph (30 to 35 km/h) a message is displayed in the message center to warn the driver to slow down or the vehicle will rise. Crawl mode can also be manually cancelled by moving the switch in the up direction for 1 second. The crawl mode lamp will now be extinguished.

High Speed Mode

High speed mode is a non-selectable, automatic mode which lowers the vehicle height to improve vehicle handling. This feature is fully automated and is 'invisible' to the driver.

If the vehicle speed exceeds 100 mph (160 km/h) for more than five seconds, the air suspension control module initiates the high speed mode. When the vehicle speed reduces to less than 80 mph (130 km/h) for more than 30 seconds, the vehicle returns to the On-Road height. This function is cancelled if a trailer is connected to the trailer socket.

Automatic Height Change Warnings

When the suspension is in off-road mode, access mode or crawl mode height, the air suspension control module will change the suspension height automatically when the vehicle speed exceeds a predetermined threshold.

When the suspension is at off-road mode or crawl mode height, the control module issues a warning to advise the driver that the vehicle is approaching the speed threshold. The IC sounder will emit a chime, a message will be displayed in the message center and the on-road mode LED and either the raising or lowering LED will flash.

The off-road mode or crawl mode height speed warning is removed when the vehicle speed is reduced.

SPECIAL MODES

Door Open Inhibit Mode

If one or more of the vehicle doors are opened during a height change when the vehicle is stationary, the air suspension control module will restrict further height change.

The LED on the air suspension LED display for the target mode height will remain illuminated and the raising or lowering LED will flash.

If all of the doors are closed within 90 seconds, the height change will resume. If the 90 second period is exceeded, the message 'CONFIRM REQUIRED SUSPENSION HEIGHT' will be displayed in the IC.

Extended Modes

Raise Inhibit Mode Raise inhibit mode is a reactive mode invoked when the following conditions are satisfied, vehicle speed below 10kph and vehicle raising very slowly. Raise inhibit mode is normally invoked when vehicle is

lifting against an obstacle, it can also be used when the vehicle is winching or is tethered down.

Jacking Mode Jacking mode is a reactive mode invoked when the following conditions are satisfied, vehicle stationary, system attempts to level the vehicle down and rate of vehicle lowering is below a predefined threshold for a predefined time. Jacking mode is normally invoked under the following conditions, vehicle jacking mode or vehicle grounded and stationary

Lower Inhibit Mode Lower inhibit mode is a reactive mode invoked when the following conditions are satisfied, vehicle stationary, rate of vehicle lowering is below a predefined threshold for a predefined time. Lower inhibit mode is normally invoked under the following conditions, vehicle lowered onto an obstacle during a height change.

Extended Mode Extended mode is a pro-active mode invoked when the following conditions are satisfied, vehicle moving and speed is below 50kph, traction activity is induced on axle pairs for fixed period of time and wheel heights above a predetermined threshold on coinciding axle pairs for the same fixed period of time. Extended mode is normally invoked under the following condition, vehicle is attempting to move and with low levels of traction and supported by an obstacle.

If the vehicle becomes grounded and the traction control becomes operational, the air suspension control module automatically increases the mass of air in the air springs to raise the vehicle clear of the obstruction. Extended mode is activated automatically and cannot be selected manually.

When the air suspension control module has activated the extended mode, the off-road mode lamp will flash if the suspension is above off-road mode height. The off-road mode and on-road mode lamps will flash if the suspension is between off-road mode and on-road mode heights. The on-road mode and access mode lamps will flash if the suspension is between on-road mode and access mode. A message will also be displayed in the message center.

To exit the extended mode, press the air suspension switch briefly in the up or down position or alternatively drive the vehicle at a speed of more than 2 mph (3 km/h) for 45 seconds.

Additional Lift in Extended Mode

When extended mode has been invoked and the automatic lifting of the vehicle is complete, the driver can request an additional lift of the vehicle. This can be particularly useful when extended mode has been activated on soft surfaces.

The additional lift can be requested once the height change LED has extinguished. Press and hold the air suspension switch in the up position for 3 seconds whilst simultaneously depressing the brake pedal. A chime from the IC will sound to confirm that the request has been accepted. The raising LED will be illuminated while the vehicle is being lifted.

Periodic Leveling Mode

When the vehicle is parked, the air suspension control module 'wakes up' two hours after the ignition was last switched off and then once every twenty four hours. The vehicle height is checked and if the vehicle is not level within a pre-set tolerance, small downwards height adjustments may be made automatically.

Transit Mode

Transit mode is a factory set mode which locks the suspension to enable the vehicle to be safely lashed to a transporter. The suspension transit mode is automatically set when the vehicle is configured for delivery mode using the Land Rover approved diagnostic system. Delivery mode also affects other vehicle systems which are inhibited or restricted to a minimal functionality.

When the ignition switch is switched off, the vehicle will be lowered to access mode. This ensures that the securing straps do not become loose should air leak from the air springs.

When transit mode is active, the air suspension switches are disabled. Periodic re-leveling is also disabled.

When the engine is started, the air suspension control module will cause the vehicle to rise allowing sufficient ground clearance for the vehicle to be loaded. While the height is changing, all the LED's in the air suspension switchpack will flash and a chime will be emitted by the IC. When the sufficient height reached, all the LED's will illuminate continuously and the chime will stop.

When the engine is switched off, the air suspension control module will cause the vehicle to lower allowing the vehicle to be strapped down. While the height is changing, all the LED's in the air suspension switchpack will flash. When the height of -50mm is reached, all the LED's will illuminate continuously.

Calibration Mode

This mode is used when the air suspension control module has been replaced or a height sensor or suspension component has been dismantled or replaced.

The following conditions apply when the vehicle is in calibration mode:

- The ride height is set to tight tolerance
- Fault reaction to vehicle identification number (VIN) mis-match with the Car Configuration File (CCF) is disabled
- The raise, lower, access and hold switches are disabled
- Message "Air suspension not in customer mode" is displayed in the instrument pack.

Remote Operation

E124947

Item	Part Number	Description
1	-	Hold
2	-	Raise vehicle
3	-	Lower vehicle

The switches on the smart key may be used to operate the air suspension system, allowing the vehicle to be raised or lowered remotely. This may be useful in attaching a trailer or loading the vehicle.

To change the suspension height using the smart key, the vehicle must be stationary, all the doors closed and the hazard warning lamps switched on.

To raise the vehicle suspension switches 1 and 2 to are to be press simultaneously.

To lower the vehicle suspension switches 1 and 3 to are to be press simultaneously

Air Harness

The air harness comprises ten separate nylon pipes which are connected between the system components with Voss connectors. The pipes have the following diameters:

Pipe	Diameter
High pressure pipes	6 mm
Compressor inlet pipe	8 mm
Inlet filter to silencer	8 mm
Compressor exhaust pipe	10 mm
Silencer exhaust pipe	19 mm

If a pipe becomes damaged, an in-line connector is available for repair purposes. The pipes are secured to the body and chassis with a number of plastic clips.

LEAK DETECTION

Leak detection can be carried out using a Land Rover approved leak detection spray.

If the vehicle appears to be leaking, perform a leak check on all aspects of the system, i.e.; air spring hose fittings and the associated connections on the valve blocks, air springs and reservoir. Failure to correctly diagnose leakage will result in unnecessary exchange of serviceable components and recurrence of original problem.

AIR SUSPENSION COMPONENTS

Valve Blocks

Front and Rear Valve Blocks

4	-	Electrical connector
5	-	Reservoir valve block, valves and solenoid assembly
6	-	Reservoir connection
7	-	Rear valve block connection
8	-	Front valve block connection
9	-	Air supply unit connection
10	-	Pressure sensor

Front and Rear Valve Blocks

The front and rear axle valve blocks are similar in their design and construction and control the air supply and distribution to the front or rear pairs of shock absorber assemblies respectively. The difference between the two valves is the connections from the valve block to the left and right hand shock absorber assemblies and the valve size. It is important that the correct valve block is fitted to the correct axle. Fitting the incorrect valve block will not stop the air suspension system from functioning but will result in slow raise and lower times and uneven raising and lowering between the front and rear axles.

The front valve block is attached to the right end of the front bumper armature assembly. The valve block has three attachment lugs which are fitted with isolation rubber mounts. The rubber mounts locate in slots in the armature. The valve lugs locate in the holes above the slots and are pushed downwards into positive location in the slots.

The rear valve block is located on the forward face of the left hand rear suspension turret. The valve block has three attachment lugs which are fitted with isolation rubber mounts which locate in a bracket with three slotted holes. The bracket is attached to the left hand side of the chassis. The isolation rubber mounts locate in the 'V' shaped slots and are pushed downwards into positive location in the slots.

The front and rear valve blocks each have three air pipe connections which use 'Voss' type air fittings. One connection is an air pressure inlet/outlet from the reservoir valve block. The remaining two connections provide the pressure connections to the left and right hand air springs.

Each valve block contains three solenoid operated valves; two corner valves and one cross-link valve. Each of the valve solenoids is individually controlled by the air suspension control module. The solenoids have a resistance value of 2 Ohms at a temperature of 20°C (68°F).

Reservoir Valve Block

The reservoir valve block is attached to a bracket on the outside of the left hand chassis rail, between the reservoir and the air supply unit. The valve block is located within the air supply unit air supply housing to protect it from dirt ingress and damage from stones. The valve block has three attachment lugs which are fitted with isolation rubber mounts. The rubber mounts locate in the chassis bracket which has three corresponding 'V' shaped slots. The rubber mounts are pushed downwards into positive location in the slots.

The reservoir valve block controls the storage and distribution of air from the reservoir. The reservoir valve block also contains the system's pressure sensor.

The valve block has four air pipe connections which use 'Voss' type air fittings. The connections provide for air supply from the air supply unit, air supply to and from the reservoir and air supply to and from the front and rear valve blocks. The connections from the air supply unit and the front and rear control valves are all connected via a common gallery within the valve and therefore are all subject to the same air pressures.

The valve block contains a solenoid operated valve which is controlled by the air suspension control module. The solenoid valve controls the pressure supply to and from the reservoir. The solenoid has a resistance value of 2 Ohms at a temperature of 20°C (68°F). When energized, the valve spool moves allowing air to pass to or from the reservoir.

The valve block also contains a pressure sensor which can be used to measure the system air pressure in the air springs and the reservoir. The pressure sensor is connected via a harness connector to the air suspension control module. The control module provides a 5V reference voltage to the pressure sensor and monitors the return signal voltage from the sensor.

Using this sensor, the control module controls the air supply unit operation and therefore limits the nominal system operating pressure to 244 lbf/in² (16.8 bar gage).

E61677

Item	Part Number	Description
A	-	Output voltage (V)
B	-	Pressure (kPa)

Removal of the reservoir valve block will require full depressurization of the reservoir. The valve block is a non-serviceable item and should not be disassembled other than for replacement of the pressure sensor.

Air Supply Unit

E45180

Item	Part Number	Description

9	-	Electric motor
10	-	Isolation mounting rubber (1 off)
11	-	Pilot air pipe

- 12 - High pressure supply to the air suspension system
- 13 - Compressor cylinder head temperature sensor
- 14 - Compressor

The air supply unit is located on the outside of the left hand chassis rail, forward of the upper control arm. The unit is attached to the chassis rail with three bolts and is protected by an air supply housing.

Air Supply Housing

Item	Part Number	Description
1	-	Upper cover
2	-	Lower cover
3	-	Air supply unit
4	-	Reservoir valve block

The air supply housing, which comprises of two parts; upper and lower, surrounds the air supply unit. The air supply housing is a plastic molding which is lined with an insulating foam which controls the operating noise of the air supply unit. The reservoir valve block is also located in the air supply housing, forward of the air supply unit.

The air supply unit comprises the following major components:

- A piston compressor
- A 12V electric motor
- A solenoid operated pilot valve
- An exhaust valve
- An air dryer unit

The air supply unit supplies dry, compressed air into the air suspension system where it is directed into the air springs or the reservoir by solenoid operated valves. Air can be exhausted from the system when required by the opening of an air spring or reservoir valve in addition to the exhaust valve which is part of the air supply unit.

The compressor operates to pressurize either the reservoir or to inflate one or more of the air springs. Height changes of less than 20 mm are achieved using the compressor alone. Height changes of more than 20 mm are achieved using the reservoir and the compressor. The compressor cannot operate without the engine running, with the following exceptions:

- During remote operation to raise the vehicle to allow for the attachment of a trailer
- When under control of a Land Rover approved diagnostic system.

The air supply unit can be serviced in the event of component failure, but is limited to the following components; air dryer, pilot exhaust pipe and the rubber mounts.

The air supply unit is attached to a bracket which is bolted to the chassis. The unit is mounted to the bracket with flexible isolation mounting rubbers which assist with preventing operating noise being transmitted to the chassis.

Removal of the air supply unit does not require the whole air suspension system to be depressurized. The front and rear valve blocks and the reservoir valve block are normally closed when de-energized, preventing air pressure in the air springs and the reservoir escaping when the unit is disconnected.

There are a number of conditions that will inhibit operation of the air supply unit. It is vitally important that these system inhibits are not confused with a system malfunction. A full list of air supply unit inhibits are given in the compressor section of this document.

Electric Motor

The electric motor is a 12V DC (direct current) motor with a nominal operating voltage of 13.5V. The motor drives a crank which has an eccentric pin to which the compressor connecting rod is attached.

The motor is fitted with a temperature sensor on the brush Printed Circuit Board (PCB) assembly. The sensor is connected to the air suspension control module which monitors the motor temperature and can suspend motor operation if the operating thresholds are exceeded.

The following graph shows motor temperature sensor resistance values against given temperatures.

NOTE: This graph is also applicable for the compressor cylinder head temperature sensor.

E61678

The following graph shows air suspension control module output voltages against motor temperature sensor temperatures.

NOTE: This graph is also applicable for the compressor cylinder head temperature sensor.

E61679

Item	Part Number	Description
A	-	Control module input voltage (V)

B - Temperature sensor (°C)

Compressor

The compressor is used to supply air pressure to the air suspension reservoir. The air suspension control module monitors the pressure within the reservoir and, when the engine is running, maintains a pressure of 16.8 bar gage (244 lbf/in²).

The compressor comprises a motor driven connecting rod and piston which operate in a cylinder with a separate cylinder head. The motor rotates the crank moving the piston up and down in the cylinder bore. The air in the cylinder is compressed with the up stroke and is passed via the delivery valve through the air dryer and into the system.

The cylinder head is fitted with a temperature sensor. The sensor is connected to the air suspension control module which monitors the cylinder temperature and can suspend motor and compressor operation if an overheat condition occurs.

The compressor will not be allowed to start if the pressure sensor reads greater than 4 bar (absolute).

The following table shows the control module operating parameters for the differing air supply unit functions and the allowed compressor cylinder head operating temperatures.

Compressor Cylinder Head Operating Temperatures

	Leveling	Reservoir Filling
OFF	140°C (284°F)	130°C (266°C)
ON	120°C (248°F)	110°C (230°F)

Refer to the motor temperature sensor graph for compressor cylinder head temperature sensor resistance values and the air suspension control module output voltage / temperature sensor graph.

Air Dryer

Attached to the compressor is the air dryer which contains a Desiccant for removing moisture from the compressed air. Pressurized air is passed through the air dryer which removes any moisture in the compressed air before it is passed into the reservoir and/or the system.

When the air springs are deflated, the exhaust air also passes through the air dryer, removing the moisture from the unit and regenerating the Desiccant.

The air dryer is an essential component in the system ensuring that only dry air is present in the system. If moist air is present, freezing can occur resulting in poor system operation or component malfunction or failure.

Pilot Exhaust Valve

Attached to the cylinder head is a solenoid operated exhaust pilot valve. This valve is opened when the air springs are to be deflated or when the system pressure needs to be reduced.

The pilot exhaust valve is connected to the air delivery gallery, downstream of the air dryer. The pilot valve, when opened, operates the compressor exhaust valve allowing the air springs to be deflated.

When the solenoid is energized, pilot air moves the exhaust valve plunger, allowing pressurized air from the air springs and/or the reservoir to pass through the air dryer to atmosphere.

Exhaust Valve

The exhaust valve operates when the pilot exhaust valve is opened, allowing air returning from the air springs and/or the reservoir to be exhausted quickly.

The pilot exhaust valve also provides the system pressure relief function which protects the air springs from over inflation. The valve is pneumatically operated, responding to air pressure applied to it to overcome pressure from its internal spring. The valve is connected into the main pressure gallery which is always subject to the system pressure available in either the air springs or the reservoir. The valve is controlled by a spring which restricts the maximum operating pressure to between 22 to 27 bar gage (319 to 391 lbf/in²).

The minimum pressure in the system is also controlled by the exhaust valve to ensure that, even when deflated, the air springs contain a positive pressure with respect to atmosphere. This protects the air spring by ensuring it can still 'roll' over the piston without creasing.

Air Supply Unit Specifications

Description	Value
Working pressure	16.8 bar gage
Maximum pressure (stabilized)	22.0 to 27.0 bar gage
Operating voltage	10 to 16.5 Volts (13.5 Volts nominal)
Running current consumption	20-50 Amps depending on load
Maximum start-up current	120 Amps
Pilot Exhaust Valve - Solenoid valve resistance at 20°C (68°F)	4 Ohms ± 10%

NOTE: Resistance values will vary with coil temperature. Resistance of test leads must be measured before any readings are taken. Resistance value of the test leads must be subtracted from final solenoid resistance value.

There are a number of conditions that will inhibit operation of the air suspension compressor. It is vitally important that these inhibits are not confused with a system malfunction. A full list of compressor inhibits is contained in the compressor section of this document.

Reservoir

E140311

Item	Part Number	Description
1	-	Front bracket
2	-	Reservoir
3	-	Air hose connection to reservoir valve block
4	-	Rear bracket

The reservoir is an air storage vessel which provides fast air suspension lift times by the immediate availability of pressurized air into the system.

The reservoir is a steel fabrication and is located on the outside of the left hand chassis rail, in front of the air supply unit. The reservoir has a bracket at each end which attach to the body mounting brackets on the chassis.

The rearward end of the reservoir has a 'Voss' air fitting which provides for the connection of the air hose between the reservoir and the reservoir valve block.

The reservoir has a capacity of 9 liters (550 in³0). The nominal working pressure of the reservoir is 16.8 bar gage (243.6 lbf/in²), with a maximum pressure of 35 bar gage (507 lbf/in²).

Air Springs

The air springs on the front and rear suspension are similar in construction. The air springs are manufactured from a flexible rubber and each air spring forms an air tight cavity which provides the required spring rate for each corner of the vehicle.

As the air spring is compressed, the rubber material compresses and rolls down the side of the vertical housing (piston) below the spring. An air connection port is located on the top of each spring and allows air to be added or removed from each spring. The port is connected via a Voss connector and a plastic tube to the axle valve block.

Replacement of an individual air spring does not require a full depressurization of the air suspension system. Only the corner concerned need be depressurized. This is achieved using a routine in the Land Rover approved diagnostic system.

When servicing of an air spring or a full system depressurization is required, the weight of the vehicle must be supported before the system is depressurized. On reassembly, the air spring must be fully pressurized before the weight of the vehicle is applied to it.

AIR SILENCER AND INLET AIR FILTER

E45185

Item	Part Number	Description
1	-	Exhaust (to atmosphere)
2	-	Inlet and exhaust silencer

- 3 - Air inlet filter
- 4 - Exhaust air from air supply unit
- 5 - Air inlet supply to air supply unit

The air silencer is required to limit any noise produced from the air supply unit during inflation or deflation of the air springs.

The silencer comprises two plastic molded cans, which are bonded together. A silencing foam in the large internal chamber forms the exhaust silencer. A pipe connection is molded onto each end of the silencer and provides for the attachment of the exhaust air to atmosphere pipe and the exhaust air pipe from the air supply unit.

A secondary chamber, located around the outside of the exhaust chamber forms the silencer for the inlet air. Pipe connections are molded onto each end of the intake silencer and provide for the attachment of the air inlet pipe from the inlet air filter and the air inlet pipe to the air supply unit. The intake air silencer is a hollow chamber with no noise reduction foam filling.

The air intake filter is connected via a pipe to the intake silencer chamber of the air silencer unit. The filter is located in the rear left corner of the body, away from possible sources of dirt and moisture.

The filter contains a foam element which removes particulate matter from the inlet air before it reaches the silencer or the air supply unit.

AIR SUSPENSION CONTROL MODULE

E 140307

Item	Part Number	Description
1	-	Air suspension control module
2	-	Connector C2321
3	-	Connector C2320
4	-	Connector C2030
5	-	Connector C0867

The air suspension system fitted is controlled by the air suspension control module which is located behind the instrument panel, on the driver side 'A' pillar.

The control module monitors the height of each corner of the vehicle via four height sensors, which are mounted in-board of each road wheel.

The control module has the following modes of operation:

- Calibration
- Normal
- Periodic Wake-Up.

When a new air suspension control module is fitted, the air suspension system will not function until the air suspension software is loaded and the system calibrated using the Land Rover approved diagnostic system.

Calibration

A calibration routine is performed using the Land Rover approved diagnostic system to access the position of each corner of the vehicle and record the settings in the control module memory. Once set, the calibration is not required to be performed unless the air suspension control module or adaptive damping module is removed or replaced, a height sensor or bracket is removed, replaced or disturbed or a suspension arm to which the sensor is connected is removed or replaced. If the removed height sensor is subsequently refitted, the calibration procedure will have to be performed to ensure the integrity of the system.

If the air supply unit, the reservoir, a valve block, a damper module or the air harness is removed or replaced, the system will not require recalibration.

Periodic Wake-Up Mode

When the vehicle is parked, the air suspension control module 'wakes up' two hours after the ignition was last switched off and once every twenty four hours thereafter. The vehicle height is checked and if the vehicle is not level within a pre-set tolerance, small downwards height adjustments may be made automatically.

SYSTEM OPERATION

Under normal operating conditions, the air suspension control module keeps the vehicle level at the 'current' ride

height. The incoming height signals from the sensors are passed through filters to remove irregular signals produced by road noise or other irregularities. When the vehicle is stationary or a height change is in progress, the signals are passed through a 'fast' filter, which tracks the true rate of change of height. When the vehicle is moving, the signals are passed through a 'slow' filter. The 'slow' filtered signals remove almost all road noise from the signals and output a true long term average for each corner height. The 'slow' filtered signals cannot be used to respond quickly during height changes.

The air suspension control module monitors each corner height signal using the fast filtered signals if the vehicle is stationary or the slow filtered signals if the vehicle is moving. If the height remains in a 'dead band' which is ± 10 mm from the target height, the control module does not implement any height adjustment changes. When the control module detects that a corner has moved outside of the 'dead band', the control module operates the compressor and/or the valves to raise or lower the corresponding corner(s) back into the target height.

SYSTEM INHIBITS

A number of conditions exist where a change in ride height is undesirable. To counter this, the air suspension control module is programmed with a number of system inhibits. If any of the conditions detailed below exist, the air suspension control module will suspend height changes and height corrections.

Compressor

System Pressure

The compressor will not start if the system pressure is greater than 4 bar (gauge)

Compressor Temperature

Two temperature sensors are located within the compressor to prevent overheating. If the temperature of the motor brush assembly or the compressor cylinder head rise above pre-set limits, the air suspension control module will inhibit the compressor operation. The limits are detailed in tables in the Air Supply Unit section of this manual.

Cornering

If the air suspension control module registers a cornering force greater than 0.2g it will inhibit all height changes and corrections. The system will remain inhibited until the cornering force falls to less than 0.15g. The air suspension control module receives a message from the lateral acceleration sensor (which is an integral part of the anti-lock brake system (ABS) yaw rate sensor) on the high speed controller area network (CAN) bus for the cornering force.

Rapid Acceleration

If the air suspension control module registers a rapid acceleration greater than 0.2g it will inhibit all height changes and corrections. The system will remain inhibited until the rapid acceleration falls to less than 0.15g. Acceleration is calculated by the control module from a vehicle speed signal received via the high speed CAN bus.

Rapid Deceleration

If the air suspension control module registers a rapid deceleration smaller than - 0.2g it will inhibit all height changes and corrections. The system will remain inhibited until the rapid deceleration rises above - 0.15g. Deceleration is calculated by the control module from a vehicle speed signal received via the high speed CAN bus.

Vehicle Jack

The air suspension control module will inhibit all height changes and corrections if it detects a corner lowering too slowly for more than 1.2 seconds. This is interpreted as the corner identified as moving too slowly being supported on a jack. In this situation, the corner height will not change when air is released from the air spring because the jack acts as a mechanical prop.

The system will remain inhibited until any of the following conditions exist:

- The air suspension rotary switch is moved to the up or down position
- The vehicle speed rises to more than 3 km/h (2 mph) for more than 45 seconds.

Door Open

The air suspension control module will stop all height change requests while any of the doors are open. Vehicle leveling continues with a door open by keeping the vehicle at the height when the door was opened if the vehicle load changes. Door open status is ignored when the vehicle speed is above 8 km/h (5 mph).

DIAGNOSTICS

The air suspension control module can store fault codes which can be retrieved using the Land Rover approved diagnostic system. The diagnostics information is obtained via the diagnostic socket which is located below the instrument panel, above the driver foot pedals. The socket is protected by a hinged cover.

The diagnostic socket allows the exchange of information between the various control modules on the bus systems and the Land Rover approved diagnostic system. This allows the fast retrieval of diagnostic information and programming of certain functions using the Land Rover approved diagnostic system.

Fault Messages

The air suspension has two methods which it can use to inform the driver of a fault in the air suspension system; the air suspension switchpack LED's and the IC message center.

If the air suspension control module suffers a major failure and there is no air suspension control, all the control switch LED's will remain unlit.

If a fault occurs and the control module can determine the ride height and the vehicle is not above on-road height, the driver will be notified via a message in the message center. If the control module cannot determine the height of the vehicle, or the vehicle is above on-road height and cannot be lowered, a message is displayed and accompanied with a maximum speed message.

If a fault is detected within the DSC (dynamic stability control) the message 'SUSPENSION LOWERED FOR SAFETY' and a chime will be emitted. This is not a fault with the air suspension system. The fault should be investigated and rectified as soon as possible.

For additional information, refer to: Information and Message Center (413-08, Description and Operation).

RESERVOIR

The air suspension control module assumes the reservoir has sufficient pressure, which is measured before a vehicle raise is started. The control module then uses a software model to operate the compressor as required.

SYSTEM PNEUMATIC CIRCUIT

The following schematic diagram shows the connection relationship between the air supply unit, the reservoir, the reservoir valve block, the cross-link valves and the air springs.

Vehicle Dynamic Suspension - Vehicle Dynamic Suspension

Description and Operation

The increased weight of the armoured vehicle has necessitated changes to the air suspension system. These changes include an increase in the pressure within the air springs and a change to the 'off-road' height setting. These changes have impacted on the air suspension air supply unit and control module.

Off-road height can be selected at speeds up to 20 km/h (12 mile/h). When the system is at off-road height, the system selects on-road height if the vehicle speed exceeds 25 km/h (15mile/h).

If a new control module is fitted to the vehicle, the air suspension system will require re-calibrating. The calibration routine is carried out using the Land Rover approved diagnostic system.

Vehicle Dynamic Suspension - Vehicle Dynamic Suspension

Diagnosis and Testing

Principle of Operation

For a detailed description of the Vehicle Dynamic Suspension System and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: Vehicle Dynamic Suspension (204-05 Vehicle Dynamic Suspension, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Air leakage • Air springs • Reservoir • Compressor • Compressor air filter • Pipework and unions • Sensor installation • Valve block(s) • Suspension components 	<ul style="list-style-type: none"> • Battery • Fuse(s) • Wiring harness physical damage or water ingress • Loose or corroded electrical connectors • Air suspension control switch • Controller Area Network (CAN) circuits • Sensors • Actuators • Valve block(s) • Air suspension control module

3. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the symptom chart.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Air Suspension Control Module (100-00 General Information, Description and Operation).

Air Suspension Deflation Exit Routine

1. Key on, engine off.
2. Key off.
3. Press and release raise switch.
4. Press and release lower switch.
5. Key on, engine off.
6. Key on, engine running.
7. Press and release raise switch twice.
8. Press and release lower switch twice.
9. Press and release raise switch.

Vehicle Dynamic Suspension - Air Suspension System Depressurize and Pressurize

General Procedures

WARNINGS:

A small amount of air pressure will be left in the air suspension system.

Eye protection must be worn.

Wear protective gloves.

CAUTIONS:

Make sure tailgate, hood and all doors are closed.

Make sure the vehicle is in a clear working area.

1.  **WARNING:** The air suspension is pressurised. Make sure dirt or grease does not enter the system. Always wear hand, eye and ear safety standard protection when working on the system.

Using the Land Rover approved diagnostic system, depressurize the air suspension.

- Follow the on-screen prompts.

2. Using the Land Rover approved diagnostic system, pressurize the air suspension.
 - Start and run the engine.

Vehicle Dynamic Suspension - Ride Height Adjustments

General Procedures

Special Tool(s)

	Gauge, Ride height 204-557B
---	--------------------------------

CAUTIONS:

Make sure the wheels and tires, tie rod ends, suspension joints and wheel bearings are free from damage, wear and free play.

Make sure there are no heavy objects in the vehicle.

The ride height must be measured with the vehicle weight supported by the suspension.

With the engine running and all vehicle doors closed, make sure the air suspension is functioning and the vehicle height can be raised and lowered using the air suspension switch.

Drive the vehicle on to a flat, level surface.

Make sure the steering wheel is in the straight ahead position.

NOTE: This procedure must be carried out after replacement of the air suspension control module, removal or replacement of a height sensor, removal or replacement of the front or rear suspension arms, replacement of body panels incorporating suspension fixing points.

-  **CAUTION:** Make sure the vehicle is not moved once it has been positioned to take measurements.

Position the vehicle on a flat level surface.

- Connect the diagnostic tool to the vehicle data link connector (DLC).
 - Connect the vehicle data link cable into the vehicle communications module.
 - Connect the diagnostic tool USB Lead into the vehicle communications module.
 - Connect the data link cable to the data link connector.
 - Connect the diagnostic tool USB lead to the diagnostic tool USB port.

-  **CAUTION:** Make sure the ignition switch is turned off, the park brake is on and the selector lever is in park.

NOTE: IDS already loaded with the latest issue of software.

Switch IDS on and navigate to the vehicle identification number (VIN) input screen.

- Enter the vehicle identification number (VIN) and navigate to the vehicle configuration menu.
 - Select setup and configuration.
 - Select air suspension height calibration and read all warnings and cautions.
 - Follow the on-screen prompts.

E95128

5.  CAUTION: The diagnostic tool will cause the vehicle height to change during some parts of the calibration process.

NOTES:

Do not install the special tool over a locking wheel nut.

Make sure the special tool is square to the wheel face with the measuring rod in a vertical position.

Take the measurement from the top edge of the slider on the special tool.

Make sure the fender splash shields are correctly fitted.

Once in the suspension height measurement screen, use the special tool to measure and record the height setting from each wheel center to the wheel arch.

- Follow the on-screen prompts.

6. After successful calibration of the air suspension switch off the diagnostic tool and return to its original position.

Vehicle Dynamic Suspension - Air Leaks

General Procedures

Special Tool(s)

	<p>Hose Cutter 204-494 (LRT 60-002)</p>
---	---

1.  **CAUTION:** Any leak detection spray used must have a corrosion inhibitor, and must not cause damage to paintwork, plastics, metals or plastic lines.

NOTE: The recommended leak detection spray is GOTEK LDS, Landrover part number STC 1090.

The recommended leak detection spray should be used to identify any suspected leaks. This procedure should also be used where any of the air suspension components have been disturbed.

2. Clean around the area of the suspected air leak.
3. Using the recommended leak detection spray, spray around all of the air suspension components, working systematically until the source of the air leak has been found.
4. If any of the air suspension components are found to be leaking e.g. air spring, compressor, reservoir or a solenoid valve block, repair is effected by replacement only.
5. Using T4, depressurize the air suspension system.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

6. CAUTIONS:

Different air lines in the air suspension system have different material properties and wall thicknesses. It is important, in order to prevent subsequent air line failure, that the new air line material and wall thicknesses are identical to those of the air line being removed.

Replacement air line must be cut from a new air line with the equivalent Land Rover part number as the one being replaced. Do not use air line cut from a roll or coil.

Any existing heatsleeves and abrasion sleeves must be replaced as part of the repair.

Air line connectors should be positioned in areas away from heat sources such as the exhaust system, and away from any section of air line with a heat shield installed.

Do not trim air line ends. If the end of the air line is damaged, the air line must be cut and a new section added using a Land

Rover approved air line connector, or the air line must be renewed completely.

NOTES:

Air lines must only be cut using either Hose cutter 204-494 (LRT 60-002), available from SPX LTD or Hose cutter YA1000A, available from Snap-On Tools. Make sure the cut air line end is free from damage or burrs.

Only Land Rover approved air lines have been tested to the correct pressure and temperature specifications.

Only the Land Rover approved air line connector, RYC500210, has been tested to the correct pressure and temperature specifications.

If the markings or tape adjacent to the air line connections are removed when cutting air lines, the cut end of the air line must be clearly marked with a suitable colored tape or paint mark.

If the source of the air leak is found to be an air line connection, renew the Voss connector and, if required, the end of the air line. Using the special tool, cut off the damaged end of the air line and replace with new Land Rover approved air line and air line connectors as required.

7. If the source of the air leak is found to be in a section of air line, either; renew the air line, or, using the special tool, cut out the damaged section of air line and replace with new Land Rover approved air line, and air line connectors, as required.

8. **NOTE:** If the repair has been unsuccessful repeat the above steps until the air leak is rectified.

Using T4, pressurize the air suspension system.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

Vehicle Dynamic Suspension - Suspension Height Sensor

Removal and Installation

Removal

NOTES:

This procedure covers removal and installation of both the front and rear suspension height sensors.

The right hand sensor has a black colored lever and the left hand sensor has a white colored lever.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2.  **CAUTION:** Do not use excessive force to disconnect the height sensor link.

Remove the suspension height sensor.

- Disconnect the height sensor link.
- Disconnect the electrical connector.
- Remove the 2 Torx screws.

Installation

1.  **CAUTION:** Make sure the Torx screw is not over tightened. Failure to follow this instruction will result in damage to the vehicle.

To install, reverse the removal procedure.

- Tighten the screws to 3 Nm (2 lb.ft).

2. Using Land Rover approved diagnostic equipment, calibrate the ride height.

Vehicle Dynamic Suspension - Air Suspension Reservoir

Removal and Installation

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Using T4, depressurize the air suspension. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

- CAUTIONS:**

 Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

 The air line must only be disconnected by removal of the Voss connector. Do not remove the air line retaining boss from the air suspension reservoir. Failure to follow this instruction may result in damage to the vehicle.

 Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

Disconnect the air line from the air suspension reservoir.

- Remove the air suspension reservoir.
 - Remove the 4 bolts.
- Remove the Voss connector from the air line.
 - Remove and discard the collet and the union.

Installation

-  **CAUTION:** Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

Install a new Voss connector to the air reservoir.

- Tighten the new Voss connector to 5 Nm (4 lb.ft).

- Install the air suspension reservoir.
 - Locate the air reservoir to the chassis brackets, fit the bolts and tighten to 23 Nm (17 lb.ft).
 - Fully seat the air line into the Voss connector.
 - Pull on the air line to make sure it is fully installed into the Voss connector.

3. Using T4, pressurize the air suspension.
For additional information, refer to: Air Suspension System
Depressurize and Pressurize (204-05 Vehicle Dynamic
Suspension, General Procedures).

Vehicle Dynamic Suspension - Air Suspension Control Module

Removal and Installation

Removal

1. Driver side: Remove the cowl side trim panel.
For additional information, refer to: Cowl Side Trim Panel (501-05, Removal and Installation).

E47923

2. Remove the closing trim panel.
 - Release the clip.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

E51589

3. Remove the air suspension control module.
 - Disconnect the 4 electrical connectors.
 - Remove the bolt.
 - Release from the 2 clips.

Installation

1. Install the air suspension control module.
 - Secure with the clips.
 - Connect the electrical connectors.
 - Tighten the bolt to 9 Nm (7 lb.ft).
2. Install the closing trim panel.
 - Connect the electrical connector.
 - Secure the clip.
 - Tighten the screws.
3. Install the cowl side trim panel.
For additional information, refer to: Cowl Side Trim Panel (501-05, Removal and Installation).
4. Initiate a new control module using T4.

Vehicle Dynamic Suspension - Air Suspension Reservoir Solenoid Valve Block

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Using T4, depressurize the air suspension. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

3. Remove the air suspension compressor lower cover.

- Remove the 3 bolts.
- Release the 5 clips.

4. Move the air compressor electrical connector aside.

- Release the 2 clips.

5. **CAUTIONS:**

 Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

 Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

 **NOTE:** Note the air line fitted positions.

Remove the air suspension reservoir solenoid valve block.

- Disconnect the 4 air lines.
- Disconnect the 2 electrical connectors.
- Release the valve block 3 rubber insulators.

6. Remove the Voss connectors.

- Remove and discard the collets and the unions.

Installation

1.  CAUTION: Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

NOTE: New air suspension components are supplied with new Voss connectors tightened to the correct torque. Do not install new voss connectors if a new component is being installed.

Install new Voss connectors to the air suspension reservoir solenoid valve block.

- Tighten to 2.5 Nm (1.7 lb.ft).

2.  NOTE: Make sure the valve block does not become detached during connection of the air lines.

Install the air suspension reservoir solenoid valve block.

- Secure the 3 valve block rubber insulators.
- Connect the electrical connectors.
- Connect the air lines into the Voss connector.
- Pull on each air line to make sure it is fully installed into the Voss connector.

3. Secure the air compressor electrical connector.
4. Install the air suspension compressor lower cover.
 - Install the bolts and tighten to 10 Nm (7 lb.ft).
5. Using T4, pressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

Vehicle Dynamic Suspension - Air Suspension Compressor Drier

Removal and Installation

Removal

CAUTION: If a new air suspension compressor, air compressor drier or air compressor delivery valve kit is installed due to failure, an air compressor relay must be installed. Failure to follow this instruction may result in damage to the air suspension system components.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05 Vehicle Dynamic Suspension, Removal and Installation).

3.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean and dry. Plug open connections to prevent contamination.

Disconnect the air line from the air suspension compressor drier.

- Release the air line from the retaining clip.

4.  **NOTE:** If equipped, note the position of the air suspension compressor retaining cable.

Remove the air suspension compressor drier.

- Remove the retaining screw.
- Remove and discard the O-ring seal.

E59815

Installation

1. Install a new O-ring seal.
 - Lubricate the O-ring with a lithium based grease.

2.  **NOTE:** If equipped, make sure the air suspension compressor retaining cable is correctly routed around the compressor cylinder head.

Install the air suspension compressor drier.

- Install the retaining screw and tighten to 3 Nm (2.2 lb.ft).

3. **CAUTIONS:**

Visually inspect the air line ends for damage or wear. Replace the air line as necessary.

Pull on the air line to make sure it is securely intalled in the connector.

Connect the air line to the air suspension compressor drier.

- Attach the air line to the retaining clip.

4. Install the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05 Vehicle Dynamic Suspension, Removal and Installation).

Vehicle Dynamic Suspension - Air Suspension Front Solenoid Valve Block

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
2. Remove the RH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).
3. Using T4, depressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

4. CAUTIONS:

 Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

 Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

 **NOTE:** Note the air line fitted positions.

Disconnect the 3 air lines from the air suspension front solenoid valve block.

5. Remove the air suspension front solenoid valve block.
 - Disconnect the electrical connector.
 - Release the valve block 3 rubber insulators.

6. Remove the Voss connectors from the air lines.
 - Remove and discard the collet and the union.

Installation

1.  **CAUTION:** Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

 **NOTE:** New air suspension components are supplied with new Voss connectors tightened to the correct torque. Do not install new voss connectors if a new component is being installed.

Install new Voss connectors to the air suspension front solenoid valve block.

- Tighten to 2.5 Nm (1.7 lb.ft).

2.  NOTE: Make sure the valve block does not become detached during connection of the air lines.

Install the air suspension front solenoid valve block.

- Secure the 3 valve block rubber insulators.
- Connect the air lines into the Voss connector.
- Pull on each air line to make sure it is fully installed into the Voss connector.
- Connect the electrical connector.

3. Using T4, pressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).
4. Install the RH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).

Vehicle Dynamic Suspension - Rear Air Spring

Removal and Installation

Removal

NOTE: Only the air spring being removed needs to be depressurised.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
2. Remove the wheel and tire.
3. Using T4, depressurise the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).
4. Disconnect the rear air spring from the lower arm.
 - Remove the nut and bolt.

E45341

5.  **CAUTION:** Always plug any open connections to prevent contamination.
Disconnect the air line.
6. Using a trolley jack, support the rear air spring assembly.
7. Remove 3 rear air spring retaining nuts.
8. Remove the rear air spring.
9. Remove the Voss connector from the air line.
 - Remove the collet and the union.

E45342

Installation

1. Install a new Voss connector to the air spring.
 - Tighten to 3.5 Nm (2.6 lb.ft)
2. Install the rear air spring.
 - Make sure the spring and shock absorber assembly

- top mounting to body mating faces are clean.
- Connect the air line into the Voss connector.
 - Fit the nuts and tighten to 63 Nm (46 lb.ft).
3. Connect the shock absorber and spring assembly to the lower arm.
 - Tighten the nut and bolt to 300 Nm (221 lb.ft).
 4. Using T4, pressurise the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).
 5. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Vehicle Dynamic Suspension - Air Suspension Muffler

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the muffler assembly.
For additional information, refer to: Muffler (309-00B Exhaust System - 4.4L, Removal and Installation).
3. Remove the evaporative emissions canister.
For additional information, refer to: Evaporative Emission Canister (303-13B, Removal and Installation).
4. Remove the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05, Removal and Installation).

5. Remove the air suspension compressor upper cover.

E54144

6. Disconnect the air suspension intake filter pipe.

E54145

7. Remove the air suspension muffler.
 - Release clip from the air suspension muffler pipe.
 - Release the air suspension compressor to air suspension silencer pipes.

Installation

1. Install the air suspension muffler.
 - Locate the air suspension muffler pipes.
 - Secure the clip.
2. Connect the air suspension intake filter.
3.  **CAUTION:** Make sure the air suspension compressor upper cover is correctly positioned.

Install the air suspension compressor upper cover.

4. Install the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05, Removal and Installation).
5. Install the evaporative emissions canister.
For additional information, refer to: Evaporative Emission Canister (303-13B, Removal and Installation).
6. Install the muffler assembly.
For additional information, refer to: Muffler (309-00B Exhaust System - 4.4L, Removal and Installation).

Vehicle Dynamic Suspension - Air Suspension Rear Solenoid Valve Block

Removal and Installation

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
- Remove the LH rear wheel and tire.
- Using T4, depressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

4. CAUTIONS:

 Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

 Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

 **NOTE:** Note the air line fitted positions.

Disconnect 3 air lines from the rear valve block.

- Disconnect the electrical connector.
- Remove the rear valve block.
 - Release the valve block 3 rubber insulators.
- Remove the Voss connectors from the air lines.
 - Remove and discard the collets and the unions.

E48266

Installation

-  **NOTE:** New air suspension components are supplied with new Voss connectors tightened to the correct torque. Do not install new voss connectors if a new component is being installed.

Install new Voss connectors to the rear valve block.

- Tighten to 2.5 Nm (1.7 lb.ft).

- Install the rear valve block.
 - Secure the 3 valve block rubber insulators.
 - Connect the electrical connector.
 - Connect the air lines into the Voss connector.
 - Pull on each air line to make sure it is fully installed

into the Voss connector.

3. Using T4, pressurize the air suspension.
For additional information, refer to: Air Suspension System
Depressurize and Pressurize (204-05, General Procedures).
4. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Vehicle Dynamic Suspension - Air Suspension Air Filter

Removal and Installation

Removal

1. Open the liftgate and tailgate.
2. Remove the spare wheel and tire.
3. Remove the 4 nuts securing the LH rear tail pipe heat shield.

E53885

4. Reposition the LH rear tail pipe heat shield.
5. Disconnect the air suspension intake filter pipe.

E53886

6. Detach the air suspension intake filter.
 - Release the grommet.
 - Release from the clip.

7. Remove the LH lower rear quarter trim access panel.

E53887

8. Remove the air suspension intake filter.

E53888

Installation

1. Install the air suspension intake filter.
 - Install the grommet.
2. Install the LH lower rear quarter trim access panel.
3. Attach the air suspension intake filter.

4. Connect the air suspension intake filter.
5. Reposition the LH rear tail pipe heat shield.
 - Install the nuts.
6. Install the spare wheel and tire.
7. Close the liftgate and tailgate.

Vehicle Dynamic Suspension - Front Air Shock Absorber

Removal and Installation

Special Tool(s)

 <p>204-538 E51385</p>	<p>Air spring tester 204-538</p>
 <p>204-700 E99789</p>	<p>Remover front air shocker absorber spindle nut 204-700</p>

Removal

NOTE: This procedure should also be used to remove the front air spring.

1. Remove the front shock absorber and air spring assembly. For additional information, refer to: Front Shock Absorber and Air Spring Assembly (204-05 Vehicle Dynamic Suspension, Removal and Installation).

2. **NOTE:** If no leak is detected, investigate other areas of the air suspension for faults.

Check the assembly for leaks.

- Inflate the module to 4 bar and check for pressure loss using leak detector spray.
- If a leak is suspected, immerse the shock absorber and air spring assembly in a tank of water to locate the source of the leak and mark the area.

3. Remove the nylon retaining pin.

4. Using the special tool, remove the nut.

5. Remove the rebound washer.

6. CAUTIONS:

 Make sure protective jaws are installed to the vice. Failure to follow this instruction may result in damage to the component.

 Do not clamp the shock absorber tube. Failure to follow this instruction may result in damage to the component.

Position the front shock absorber and air spring assembly in a vice.

7. Remove and discard the 3 spacers and 2 O-ring seals.

E96893

8. Remove the air spring.
 - Using a soft faced mallet, gently tap the sleeve support upwards to release it from the O-ring seals.

E96894

9.  NOTE: Note the fitted position.
Remove the bump plate and spring aid.

10. Remove and discard the 2 large black O-ring seals from the lower seal carrier.

11. Remove the front shock absorber and air spring assembly from the vice.

Installation

1. CAUTIONS:

 Make sure protective jaws are installed to the vice. Failure to follow this instruction may result in damage to the component.

 Do not clamp the shock absorber tube. Failure to follow this instruction may result in damage to the component.

E96892

Position the front shock absorber and air spring assembly in a vice.

2.  **CAUTION:** Use compressed air and lint free non-flocking material.

Clean the components.

E96897

3. Lift the seal carrier to expose the O-ring seal stack.
- Make sure that the damper body O-ring seals and spacers are fully seated to the spring seat.

4.  **CAUTION:** Take care not to damage the O-ring seals during installation.

Install new O-ring seals to the seal carrier.

- Apply loctite 8021 (silicon-based oil) to the O-ring seals.

E96898

5.  **NOTE:** Make sure that these components are installed to the noted removal position.

E96899

Install the bump plate and spring aid.

E99908

6. Install the air spring.

- Align the sleeve support with the first O-ring seal making sure that the location tag is correctly aligned with the spring seat cut-out.

7. CAUTIONS:

 Make sure that the threads of the front air shock absorber are covered with protective tape.

 Take care not to damage the O-ring seals during installation.

Install the components in the following order:

1. O-ring seal
2. Spacer
3. O-ring seal
4. Spacer
5. Spacer

E96893

E96900

8.  **NOTE:** The "T5" stamp on the upper face of the rebound washer must be visible after assembly.

Install the rebound washer.

E96891

9. Install a new nut and using the special tool, and tighten to 98 Nm (72 lb.ft).

10. **CAUTIONS:**

E51445

 The air supply must be free of any moisture.

 If during disassembly the air sleeve is unrolled, the air sleeve may inflate incorrectly (to one side). If this occurs, release the air pressure, and insert a suitable tool that will not damage the air sleeve or piston (a screw driver handle), into the side opposite the bulge. Inflate and deflate until the air sleeve inflates correctly (the air sleeve will be uniform inside the shroud).

 **NOTE:** To prevent damage when seating the sleeve support over the large black O-rings, compressed air should be used to inflate the air spring.

Using the special tool coupled to a tire inflator with a gauge, apply approximately 2 bar of air pressure to the air spring to fully seat the sleeve support over the O-ring seals.

11. Check the assembly for leaks.
 - Inflate the module to 4 bar and check for pressure loss using leak detector spray.
 - If a leak is suspected, immerse the shock absorber and air spring assembly in a tank of water to locate the source of the leak.
12. Depressurize and remove the special tool from the shock absorber and air spring assembly.
13. Install the nylon retaining pin.

E51387

14.  **NOTE:** Install a new air spring pipe connector.

Install the front shock absorber and air spring assembly. For additional information, refer to: Front Shock Absorber and Air Spring Assembly (204-05 Vehicle Dynamic Suspension, Removal and Installation).

Vehicle Dynamic Suspension - Rear Air Shock Absorber

Removal and Installation

Special Tool(s)

 <p>204-538 E51385</p>	<p>Air spring tester 204-538</p>
 <p>100-050 E57611</p>	<p>Band-it Thrift tool 100-050 (LRT-99-019)</p>

Removal

NOTE: This procedure should also be used to remove the rear air spring.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the shock absorber and spring assembly.
For additional information, refer to: Rear Shock Absorber and Air Spring Assembly (204-05, Removal and Installation).

4. Remove the gaiter.
 - Remove and discard the 2 straps.

5. Remove the nut, rebound washer and rubber bushing.
 - Discard the nut.

E51439

6. Remove and discard the O-ring seals and spacer.

E51440

7. Remove the nylon retaining pin.

E51441

8. Remove the rebound plate and spring aid.

9. Remove the air spring.
 - Using a soft faced mallet, gently tap the sleeve support upwards to release it from the O-ring seals.
 - Remove and discard the 2 O-ring seals.

E51442

10. Remove the shock absorber from the vise.

Installation

1. Install the shock absorber in the vise.
2. Clean the components.
3. Lubricate and install new O-rings to the seal carrier.
4. Install the spring aid and rebound plate.
5. Install the air spring.
 - Align the piston with the first O-ring seal, making sure the location tag is correctly aligned.

E51443

6. Install the new O-ring seals and spacer, taking care not to damage the seals.
7. Install the rubber bushing and rebound washer.
 - Make sure the formed insert on the bushing is located against the O-ring seal.

E51444

8. Install and lightly tighten the nut.

9. CAUTIONS:

The air supply must be free of any moisture.

If during disassembly the air sleeve is unrolled, the air sleeve may inflate incorrectly (to one side). If this occurs, release the air pressure, and insert a suitable tool that will not damage the air sleeve or piston (a screw driver handle), into the side opposite the bulge. Inflate and deflate until the air sleeve inflates correctly (the air sleeve will be uniform inside the shroud).

Install the air spring piston over the O-ring seals.

- Using the special tool coupled to a tire inflator with a gauge, apply approximately 2 bar of air pressure to the air spring to fully seat the piston over the O-ring seals.

10. Tighten the top nut to 98 Nm (72 lb.ft).

11. Check the assembly for leaks.

- Inflate the module to 4 bar and check for pressure loss.
- If a leak is suspected, immerse the spring and shock absorber assembly in a tank of water to locate the source of the leak.

12. Install the gaiter.

- Using the special tool, install new straps.

13. Install the shock absorber and spring assembly. For additional information, refer to: Rear Shock Absorber and Air Spring Assembly (204-05, Removal and Installation).

Vehicle Dynamic Suspension - Front Shock Absorber and Air Spring Assembly

Removal and Installation

Removal

NOTE: Only the air spring being removed needs to be depressurized.

1. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Using the Land Rover approved diagnostic system, depressurize the air suspension. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

E44655

4. Disconnect the shock absorber and air spring assembly from the lower arm.
 - Remove the nut and bolt.

E44657

5. Release the shock absorber and air spring assembly.
 - Remove the 3 nuts.

6. **CAUTION:** Always plug any open connections to prevent contamination.

Reposition the shock absorber and air spring assembly.

- Disconnect the air line.

E44658

7. Remove the shock absorber and air spring assembly.
8. Remove the Voss connector from the air line.
 - Remove and discard the collet and the union.

Installation

1.  **CAUTION:** Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

Install a new Voss connector to the air spring.

- Tighten to 3.5 Nm (2.6 lb.ft)

2. **NOTES:**

Remove and discard the blanking caps.

Clean the component mating faces.

Install the shock absorber and air spring assembly.

- Connect the air line into the Voss connector.
 - Pull on the air line to make sure it is fully installed into the Voss connector.
 - Install the nuts and tighten to 63 Nm (46 lb.ft).
3. Connect the shock absorber and air spring assembly to the lower arm.
 - Tighten the nut and bolt to 300 Nm (221 lb.ft).
 4. Using the Land Rover approved diagnostic system, pressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).
 5. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Vehicle Dynamic Suspension - Rear Shock Absorber and Air Spring Assembly

Removal and Installation

Removal

NOTE: RH illustration shown, LH is similar.

1. Using the Land Rover approved diagnostic system, depressurize the air suspension. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

2. Remove the loadspace floor panel.

E140848

3. Remove the jack and wheel brace.

E140849

4. Remove the spare wheel/tool compartment cover.

E140851

5. Lower the spare wheel and tire.

E140852

6. Remove the spare wheel.
 - Disconnect the spare wheel release strap and position aside.

E140853

7.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.

E140850

8.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.
Remove the Voss connector from the air line.
 - Remove and discard the collet and the union.
 - Disconnect the active damping wiring.

9. Remove the wheel and tire.

E140869

10. Disconnect the shock absorber and air spring assembly from the lower arm.
- Remove the nut and bolt.

E140868

11. Remove the three shock absorber and air spring retaining nuts.
- Remove the shock absorber and air spring assembly.

Installation

1. Install the shock absorber and air spring assembly.
 - Make sure the shock absorber and air spring assembly top mounting to body mating faces are clean.
 - Fit the nuts and tighten to 63 Nm (46 lb.ft).
 - Connect the air line into the Voss connector.
 - Pull on the air line to make sure it is fully installed into the Voss connector.
2. Connect the shock absorber and air spring assembly to the lower arm.
 - Do not fully tighten at this stage.
3. Using the Land Rover approved diagnostic system, pressurize the air suspension. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).
4. Tighten the shock absorber and air spring assembly to the lower arm.
 - Tighten the nut and bolt to 300 Nm (221 lb.ft).
5.  **CAUTION:** Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

Install a new Voss connector to the air spring.
 - Tighten to 3.5 Nm (2.6 lb.ft)
 - Attach the active damping wiring.
6. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
7. Lower the vehicle on the lift.
8. Connect the spare wheel release strap to the spare wheel and tire.
9. Install the spare wheel and tire.
 - Raise the spare wheel and tire.
10. Install the spare wheel/tool compartment cover.
11. Install the jack and wheel brace.
12. Install the loadspace floor panel.

Vehicle Dynamic Suspension - Air Suspension Pressure Sensor

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air compressor housing cover.
 - Remove the 3 bolts.
 - Release the 5 clips.

3. Using T4, depressurize the air suspension. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

4.  **NOTE:** Make sure the valve block does not become detached during removal of the air pressure sensor.

Disconnect the electrical connector.

5.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the air pressure sensor.

- Remove and discard the O-ring seal.

Installation

1.  **NOTE:** Make sure the valve block does not become detached during installation of the air pressure sensor.

Install the air pressure sensor.

- Install a new O-ring seal.
- Tighten to 5 Nm (4 lb.ft).

2. Connect the electrical connector.

3. Using T4, pressurize the air suspension. For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05, General Procedures).

4. **CAUTIONS:**

Make sure the air suspension compressor upper cover is correctly positioned.

Make sure the air suspension exhaust pipe is correctly located in to the air suspension upper cover.

Install the air compressor housing cover.

- Install the bolts and tighten to 9 Nm (7 lb.ft).

Vehicle Dynamic Suspension - Air Suspension Compressor

Removal and Installation

Removal

 **WARNING:** Steps 1 and 2 must be carried out within 10 minutes of each other. Failure to follow this instruction may result in personal injury.

 **CAUTION:** Before disconnecting or removing components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

 **NOTE:** Removal steps in this procedure may contain installation details.

-  **CAUTION:** Make sure the ignition switch is turned off, the park brake is on and the selector lever is in park.

Open the front door.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle. Make sure at least one of the wheels is off the ground.

3.

-  **CAUTION:** Always plug any open connections to prevent contamination.

-  **CAUTION:** Always plug any open connections to prevent contamination.

E138918

E139484

6.  NOTE: Note the orientation of the component prior to removal.

Installation

1.  NOTE: Check the air compressor type. If an AMK air compressor is installed to replace an Hitachi air compressor then a new corresponding relay must also be installed.

For additional information, refer to: [Specifications](#) (204-05 Vehicle Dynamic Suspension, Specifications).

2.  CAUTION: Using a suitable tap, cut a starting thread to align the self tapping bolts.

Ride and Handling Optimization - Ride and Handling Optimization

Description and Operation

Component Location

E150708

Item	Part Number	Description
1	-	Instrument Cluster (IC)
2	-	Hill Descent Control (HDC) and Range Control switchpack (coil spring vehicles)
3	-	Terrain Response (TR) switchpack (air suspension vehicles)
4	-	Rear differential
5	-	Rear Differential Control Module (RDCM)
6	-	Air suspension control module
7	-	Transfer case (center differential and high/low range)
8	-	Engine Control Module (ECM)
9	-	Anti-Lock Brake System (ABS) control module
10	-	Transfer Case Control Module (TCCM)

GENERAL

NOTE: Coil spring vehicle are not equipped with TR system.

The TR system allows the driver to select a program which aims to provide the optimum settings for traction and performance for the prevailing terrain conditions. The system cannot be switched off. The 'special programs off' is

the default program and covers all general driving conditions. Four specific terrain programs are selectable to cover all terrain surfaces.

The system is controlled by a rotary control located on the center console, rearward of the selector lever (automatic transmission) or gearshift lever (manual transmission). The rotary control allows the selection of one of the following five programs:

- Special programs off
- Grass/Gravel/Snow
- Mud-Ruts
- Sand
- Rock crawl.

The rotary control can be rotated through 360 degrees or more in either direction and selects each program in turn. When TR is fitted to a vehicle, a hi-line IC will also be fitted which will display the selected program in the message center.

The TR system uses a combination of a number of vehicle subsystems to achieve the required vehicle characteristics for the terrain selected. The following subsystems make up the TR system:

- Engine management system
- Automatic transmission (if fitted)
- Transfer case (center differential)
- Rear differential (electronically controlled)
- Brake system (ABS/DSC/ETC/HDC functions)
- Air suspension.

A TR control module is located below the rotary control. The control module detects the selection made on the rotary control and transmits a signal on the high speed [CAN \(controller area network\)](#) which is received by each of the subsystem control modules. Each of the affected control modules contain software which applies the correct operating parameters to their controlled system for the TR program selection made. Each control module also provides a feedback for the selected program so that the TR control module can check that all systems have changed to the correct operating parameters.

Information is displayed in the IC message center which informs the driver of improvements which can be made to the vehicle operating parameters to optimize the vehicle for the prevailing conditions. Inexperienced off-road drivers may benefit from the automatic assistance of the TR system and the driver information. Experienced off-road drivers can select the specific programs for extreme conditions to access control over the vehicle systems (e.g., throttle shift maps or traction settings) which are not accessible on vehicles without TR.

TERRAIN RESPONSE SWITCHPACK

NOTE: Air suspension vehicles.

E150769

Item	Part Number	Description
A	-	TR switchpack - Transmission Selector Lever
B	-	TR switchpack - Transmission Control Switch (TCS)
C	-	Air suspension switch
D	-	Hill Descent Control (HDC) switch
1	-	General program (special programs off)
2	-	Grass/Gravel/Snow
3	-	Mud-Ruts
4	-	Sand
5	-	Rock crawl
6	-	Raise/lower switch
7	-	Off-Road Mode
8	-	On-Road Mode
9	-	Access Mode
10	-	Crawl (Locked at Access) Mode
11	-	HDC switch

NOTE: Coil spring vehicles only.

E150641

Item	Part Number	Description
1	-	Hi range switch
2	-	Low range switch
3	-	HDC switch

Each program is denoted by a symbol which represents the terrain encountered. The rotary control can be rotated to select the required program. The control will only select the last program in its direction of rotation. Further rotation of the control once the last program in either direction has been selected, will have no effect, e.g. once rock crawl has been selected, further rotation in a clockwise direction will have no effect.

The TR control module is located below the rotary control. The module is connected via a harness connector which also contains the wiring for the HDC switch, the Transfer case high/low range switch, the air suspension switch and the switch illumination circuits. The control module and switch uses four of these wires for a 12V battery supply when the ignition switch is in ignition position II, a ground and high speed CAN positive and negative.

TERRAIN RESPONSE OPERATION

The following vehicle subsystem control modules are used for the TR system:

- Engine management (engine control module)
- Transmission control (TCM - automatic transmission only)
- Transfer case control (TCCM)
- Rear differential control (RDCM - if fitted)
- Air suspension control (air suspension control module)
- Brake system (ABS/DSC/ETC/HDC functions) (ABS (anti-lock brake system) control module)

Each subsystem operates in different ways in relation to the selected TR program to achieve the optimum traction, stability and ease of control for the terrain encountered. The system has a safety factor built in which ensures that any program can be safely used on any surface, even when an inappropriate program selection has been made.

ENGINE CONTROL MODULE

The ECM (engine control module) varies the throttle pedal response to control the engine torque output. The ECM can change the throttle maps to change the amount of torque per percentage of pedal travel. The ECM can also change the throttle response to control the allowed torque change relative to the percentage pedal travel.

Each terrain program uses a combination of operating parameters for each subsystem. Changing between terrain programs initiates a different set of operating characteristics which will be noticeable to the driver. The driver will notice differences in engine and throttle response when, for example, the throttle pedal is held in a constant position and the terrain program is changed from grass/gravel/snow to sand, the driver will notice the torque and engine speed increase. If the terrain program is changed from sand to grass/gravel/snow the driver will notice a reduction in torque and engine speed.

NOTE: The change in torque and engine speed can take approximately 30 seconds and care must be taken not to confuse the TR system operation with an ECM fault.

Transmission Control

The Transmission Control Module (TCM) changes the shift maps for the TR program selected. This changes the shift points providing early or late upshifts and downshifts.

On slippery surfaces the transmission will select 2nd gear in high range or 3rd gear in low range for starting from a standstill to minimize wheel slip. In muddy conditions the transmission will provide maximum torque output from the transmission. In sand the transmission will provide an output which passes maximum engine power from the transmission.

In rock crawl special program (low range) the transmission will select 1st gear for driving off.

Sport mode is only available when the general program is selected and the transfer case is in high range. Sport mode is disabled in low range and all TR special programs. CommandShift™ is available in any program and also in high or low range.

If the transmission is in 'Sport' mode and a special program is subsequently selected, the transmission will automatically change to manual 'CommandShift™' mode. If a special program is already selected and the transmission selector lever is moved from drive 'D' to the 'Sport' mode position, the transmission will automatically change to 'CommandShift™' mode.

Transfer case and Rear Differential Control

The Transfer case electronically controlled differential and the rear electronically controlled differential (if fitted) are treated as one system. The electronic rear differential is an optional fitment on vehicles fitted with the TR system. The differential control has two operating strategies; pre-emptive and reactive.

The pre-emptive strategy anticipates and predicts the locking torque value required for each differential to minimize slip and maximize stability. Each TR program has a different threshold and input criteria for the pre-emptive strategy. The pre-emptive strategy improves vehicle traction and composure by avoiding wheel spin. This is achieved by anticipating the amount of differential lock required for the program selected. For example, a high locking torque would be applied for rock crawl or slippery surfaces.

The reactive strategy varies the amount of locking torque in response to the actual slip level and the dynamic behavior of the vehicle. Each TR program has a different threshold and input for the reactive strategy. The reactive strategy improves vehicle traction and composure by eliminating any wheel spin which has occurred after the pre-emptive strategy was applied. The locking response applied is applicable to the terrain program selected, for example, very sensitive on slippery surfaces to provide maximum traction and minimize surface damage.

The locking torque calculations use various signals from other subsystems, for example, engine torque, throttle position, selected gear, steering angle, vehicle speed, lateral acceleration, yaw behavior.

The Dynamic Stability Control function of the [ABS](#) system can override the TR differential control and reduce any applied locking torque during DSC action.

For additional information, refer to: Anti-Lock Control - Traction Control (206-09A, Description and Operation).

Air Suspension Control

The air suspension control module contains a strategy which provides automatic switching between normal and off-road heights. Changes in vehicle height settings will be relayed to the driver via the IC message center and [LED \(light emitting diode\)](#) illuminated icons on the switch. The automatic selection and deselection of the vehicle height provides automatic increase and decrease in ground clearance and aims to provide maximum benefit to the selected terrain program.

On a vehicle fitted with a correctly installed, Land Rover approved trailer socket, if an electrical load is sensed on the trailer socket, height changes are prohibited and the message center displays a message advising that a trailer is connected and off-road height is not automatically selected. The driver can raise the suspension manually using the air suspension switch.

NOTE: The prohibiting of the automatic ride height selection is only operational if a Land Rover approved trailer socket is fitted and an electrical load is sensed on the socket.

Anti-Lock Brake System Control

The [ABS](#) control module controls several vehicle functions and adjusts the operating parameters of these functions to optimize the selected TR program.

Traction control uses different slip/acceleration thresholds to improve traction and vehicle composure. For example, the system sensitivity is increased on slippery surfaces to reduce wheel spin.

If DSC is switched off (with the DSC switch on the instrument panel) when using a TR special program, if the special program is subsequently changed for a different program DSC is automatically switched back on.

The stability control uses different threshold values for the selected program to automatically reduce DSC intervention, removing the requirement for the driver to disable the DSC system in order to reduce engine intervention which is sometimes induced in extreme off-road conditions. In extreme sand conditions, there may be an additional benefit of disabling the DSC function using the DSC switch on the instrument panel in addition to selecting the sand program.

HDC is automatically switched on or off and target speeds are adjusted in response to the TR program selected. The responsiveness of the HDC function is also increased where required.

Automatic operation of HDC aims to assist the driver by switching the system on or off when it is of most benefit. Target speeds for HDC operation are also adjusted according the vehicle operating conditions.

Incorrect Program Usage

Selection of an inappropriate program is discouraged in the following ways:

- The active program icon is continually displayed in the IC message center
- The TR control module 'locks' out certain functions in some programs, e.g.
 - cruise control is only available with the special programs off or grass/gravel/snow program
 - transmission 'Sport' mode is deactivated in all special programs.
- In any special program, except the grass/gravel/snow program, when the ignition has been in the off position continually for more than 6 hours, the TR system defaults to the Special Programs Off
- When in the grass/gravel/snow program, the TR system will never default to the Special Programs Off. This is to allow for drivers in cold climates where continuous use of the grass/gravel/snow program would be beneficial.
- The rock crawl program is only available with the Transfer case in low range.

Selection of an inappropriate program for the terrain conditions will not endanger the driver or cause damage to the vehicle. Continued use of an inappropriate program may reduce the life of some components. The driver may notice reduced vehicle response, with the engine and transmission being less responsive than in the special programs off. Also, in some programs, HDC will remain on, signified by illumination of the HDC indicator in the IC. The driver may also notice torque 'wind-up' in the center and rear differentials causing a 'braking' effect when the vehicle is maneuvered in some special programs.

The use of the special programs in the TR system is monitored by the TR control module which records the mileage and time the vehicle has operated in a specific program in high and low range. This information can be retrieved using T4 and used by the dealer technician to check customer concerns, e.g. high fuel consumption which may be due to continued use of a certain program.

Driver Information

The high specification IC fitted to all vehicles with TR, contains a message center which displays vehicle information to the driver. The message center contains the TR program icons which display the currently selected program. If no symbol is displayed, no special program is selected and the system is in special programs off.

Any required changes to the subsystems are also passed to the driver in the form of indicator illumination in the IC or appropriate messages in the message center, HDC off or air suspension height change for example.

In certain operating conditions, the TR system also displays advice or warning messages to ensure the driver is using the vehicle to its full potential, e.g.:

- steering angle is displayed in the message center to avoid driving in deep ruts with steering lock applied
- gear information is displayed to recommend a gear for slippery conditions
- if the system automatically provided off road ride height, but the driver subsequently lowers the vehicle to normal height, then the system may advise that this will cause a risk of grounding.

The messages which can be displayed in the IC message center are detailed in the Information and Message Center section.

For additional information, refer to: Information and Message Center (413-08, Description and Operation).

DIAGNOSTICS

The TR control module stores information on detected TR faults and CAN errors which can be interrogated using T4. The TR sub-systems and the IC also store fault information relating to CAN errors from the TR control module.

The control module also stores the miles travelled and time elapsed in high range for the individual programs and in low range for use of all programs which can also be retrieved using T4. This information aids diagnosis of the TR system and also provides an indication of TR system abuse by the driver which can lead to premature component failure.

Terrain Response System Fault Diagnosis

TR relies on the correct functionality of the five sub-systems. If one of the sub-systems develops a fault, the TR system will not function, even though the fault is not in the TR system. The TR control module and rotary control should only be investigated if there are no apparent faults in any of the sub-systems. If a fault in a sub-system is subsequently corrected, the TR system will function normally after an ignition on and off cycle.

Terrain Response Sub-System Faults

If a fault occurs in a sub-system, the driver is alerted by the illumination of a warning indicator and/or an appropriate message for that sub-system in the IC message center. There will be no warning of a TR system fault.

When a sub-system fault is present and the driver attempts to select a different TR program using the rotary control or at the next ignition on cycle, a message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' will appear in the message center. This implies that the TR system has a fault, but only because a sub-system fault is preventing its operation. This message will be displayed for 5 seconds per ignition cycle, but is repeated if a further selection is made by the driver using the TR rotary control or at the next ignition on cycle.

NOTE: The message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' can also be generated by a fault in the TR rotary control or control module. See following section for details of rotary control or control module faults.

It is not possible for the TR control module to cause any fault behavior (warning indicator illumination or message generation) in any of the five sub-systems. Illumination of a sub-system warning indicator and/or a sub-system related message will never be associated with a TR control module or TR system fault.

The sub-system control modules can detect a fault with the CAN signal from the TR control module. If a fault in the TR system is detected, the sub-system control modules will operate in the 'special programs off' setting. The sub-system control modules will record a fault code for a failure of the TR CAN signal. These faults can be retrieved using

T4 and will provide useful information to indicate investigation of the TR control module or the CAN network.

Terrain Response Rotary Control or Control Module Fault

If a fault occurs in the TR rotary control, all rotary control icon amber LED's will be turned off (background illumination will remain on) and rotation of the rotary control is ignored. The IC message center will display a message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' when the fault occurs, if the fault is present and the driver attempts to select a special program (if the control module is able to do this) or at the next ignition on cycle.

If a failure of a rotary control icon amber LED occurs, the TR system will still function. Any selected special program will default to 'special programs off' at every ignition on cycle, with the exception of the grass/gravel/snow program.

The TR rotary control and the control module are an integral unit. If a fault occurs in either component, the whole unit will require replacement.

CAN Faults

If a CAN fault exists and prevents TR system operation, all of the TR rotary control icon LEDs will be illuminated and rotation of the rotary control is ignored.

If the IC does not receive a TR system CAN message from the TR Control module, the message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' will be displayed when the fault occurs and will be repeated at every ignition on cycle.

User Error

The following incorrect usage of the system may be misinterpreted as a system fault:

- Engine not running - Program changes and driver advisory messages are only available with the engine running
- Rock crawl program selected but transfer case in high range
- Special program change attempted with DSC or ABS active (this includes ABS cycling which is operational when HDC is being used on slippery or loose surfaces).
- Special program change attempted with overheat condition present on center or rear differential.

Ride and Handling Optimization - Ride and Handling Optimization

Description and Operation

Terrain Response allows the driver to select a program which provides the optimum settings for traction and performance for the prevailing terrain conditions. The Terrain Response system fitted to armoured vehicle has reduced functionality compared to that of the standard vehicle.

The system is controlled by a rotary control located on the floor console, rearward of the transmission selector lever. The rotary control allows the selection of one of the following special programs:

- Grass/ gravel /snow (also includes ice)
- Mud / ruts
- Sand

The 'Rock Crawl' option has been disabled on the armoured vehicle and the icon deleted.

Rotary control minus 'Rock Crawl' option

NOTE: Do not fit a standard rotary control to an armoured vehicle.

The principles of operation of the Terrain Response system are the same as that for the standard vehicle. For additional information, refer to: Ride and Handling Optimization (204-06, Description and Operation).

Ride and Handling Optimization - Ride and Handling Optimization

Diagnosis and Testing

Principles of Operation

Ride and handling optimization incorporates the terrain response system which links a number of modules around the vehicle to give the best combination of settings in the different systems.

For a detailed description of the Ride and Handling System and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Tire condition, pressures, etc • Driveline components (correct installation, damage, etc) • Engine components (correct installation, damage, etc) • Transmission components (correct installation, damage, etc) • Suspension components (correct installation, damage, etc) 	<ul style="list-style-type: none"> • Fuses • Harnesses/connectors • Terrain response switchpack • Engine Control Module (ECM) • Transmission Control Module (TCM) • Transfer Case Control Module (TCCM) • Anti-lock Braking System control module (ABS) • Rear Differential Control Module (RDCM) • Controller Area Network (CAN) circuits

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Because the overall function of the system is dependent on sub-systems, it is possible to misinterpret displays in the message center as being terrain response faults when they are actually a result of a fault in one of the sub-systems.

Refer to the table below for help in deciding when to investigate terrain response faults and when the fault is likely to be in a sub-system.

Symptom	Description	Possible Causes	Action
Message centre display indicating a sub-system fault	The message centre indicates to the driver that a fault has occurred and in which sub-system	<ul style="list-style-type: none"> • Any sub-system fault supported by the message centre 	<ul style="list-style-type: none"> • For details of the available messages, refer to the relevant section of the workshop manual. Ride and Handling Optimization - Ride and Handling Optimization Switch

Removal and Installation

Removal

NOTE: Automatic transmission shown. Manual transmission is similar.

1.  **WARNING:** The gear lever knob will be released suddenly, keep face clear during removal.

Remove the selector lever knob.

- Pull the knob upwards.

2. Release the ride and handling optimization switch assembly.
 - Release the 4 clips.

3. Release the selector lever panel.
 - Release the 4 clips.

4. Remove the ride and handling optimization switch assembly.
 - Disconnect the 2 electrical connectors.

E53892

5. Remove the selector lever panel.

E53889

Installation

1. Install the selector lever panel.
2. Install the ride and handling optimization switch assembly.
 - Connect the electrical connectors.
 - Secure the selector lever trim panel.
3.  **CAUTION:** Only fit the selector knob when the selector lever is in the 'P' position.

Install the selector lever knob.

- Engage the locating tang of the knob with the slot in the selector lever.
- Push the knob fully onto the selector lever.

Ride and Handling Optimization - Ride and Handling Optimization Switch

Removal and Installation

Removal

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

Make sure that the gear selector lever is in position N before removing any components.

Driveshaft - Driveshaft

Description and Operation

Drive shaft Component Location

E46304

Item	Part Number	Description
1	-	Front drive shaft
2	-	Rear drive shaft

GENERAL

Drive shafts are used to transmit drive from the transfer box to the front and rear differentials.

The front drive shaft is a one-piece unit, connected to the transfer box and front differential unit via Constant Velocity (CV) joints.

The rear drive shaft is a two-piece unit, supported on a central bearing due to its increased length. The rear drive shaft is connected to the transfer box via a CV joint and the rear differential with a universal joint. These joints allow for angular deviations of the drive shaft due to acceleration and braking.

The front and rear drive shafts are not serviceable items and a failure will require the replacement of the complete drive shaft assembly.

FRONT DRIVE SHAFT

E46305

Item	Part Number	Description
1	-	CV joint
2	-	Front drive shaft

The front drive shaft is constructed from 1.7 mm wall tubular steel. A CV joint is attached to each end of the drive shaft (see 'Halfshaft Joint' section for more information on CV joints). The shaft has an overall nominal length of 713 mm.

Each CV joint has six holes, which allow for attachment to the input flange of the front differential and the front output flange of the transfer box. The CV joints are secured to the front differential and transfer box with six Torx head adhesive retained bolts.

Three compression link washers are fitted under each pair of bolts. The washers are required to prevent compression of the CV joints attachment flange.

A shroud is pressed over the CV joint. The shroud seals to the joint body using an internal gasket and to the front output flange of the transfer box using an end cap and internal gasket. This prevents the ingress of dirt and moisture. The CV joints allow for movement of the drive shaft caused by small movements in the transmission and transfer box mountings.

REAR DRIVE SHAFT ASSEMBLY

E46306

Item	Part Number	Description
1	-	CV joints
2	-	Collapsible crash section
3	-	Front shaft assembly
4	-	Support bearing
5	-	Rear shaft assembly
6	-	Universal joint

The rear drive shaft assembly comprises front and rear shaft assemblies and a centrally mounted shaft bearing. The rear drive shaft assembly has an overall nominal length of 1309 mm.

Front Shaft Assembly

The front shaft assembly incorporates a crash feature within the tube, which controls the collapse of the drive shaft during a crash.

The front shaft assembly comprises a CV joint at each end (see 'Halfshaft Joint' section for more information on CV joints).

The front CV joint (transfer box end) has six radial holes, which provide for the attachment to the transfer box rear output flange. The joint is secured to the output flange with six torx bolts, which screw into threaded holes in the flange. Three compression link washers are fitted under each pair of bolts. The rear splined shaft mates with splines in the rear shaft CV joint hub and is pressed in and fixed with Loctite. A machined surface on the shaft accepts the shaft bearing, which is a press fit.

Rear Shaft Assembly

The rear shaft assembly comprises a Hookes type universal joint at the rear (rear differential end).

The universal joint is welded to the rear shaft tube and is secured to the input shaft of the rear differential with four flanged nuts. The opposite end of the rear shaft tube is welded directly to the CV joint body.

Shaft Bearing Assembly

The shaft bearing assembly comprises a pressed steel housing, a rubber diaphragm and a ball bearing. The diaphragm is bonded into the housing. An internal metal ring, bonded to the bush, allows for the bearing to be press fitted into it. The rubber bush allows for small deviations in alignment and also absorbs vibrational forces. The shaft bearing assembly is located by screws, which pass through plain holes in the bearing assembly and locate into nuts welded on the inside face of the chassis cross-member.

Driveshaft - Universal Joints

Description and Operation

E46302

A Hookes type universal joint is used to connect the rear drive shaft assembly to the rear differential, allowing for angular deviations of the drive shafts due to acceleration and braking.

The joint is bolted to the input shaft of the rear differential with four flanged adhesive screws and is lubricated during manufacture and sealed for life.

Driveshaft - Front Driveshaft V6 S/C 3.0L Petrol

Removal and Installation

Removal

NOTES:

Note the orientation of the driveshaft to aid installation

A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Some variation in the illustrations may occur, but the essential information is always correct.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Refer to: [Transmission Support Crossmember - V6 S/C 3.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

3.

E161234

E151705

- CAUTIONS:**

Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Make sure that the driveshaft is supported with suitable retaining straps.

- Remove the 6 Torx bolts and washers, discard the bolts.

- CAUTIONS:**

 Mark the position of the driveshaft flange in relation to the drive pinion flange.

 To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

 Make sure that the driveshaft is supported with suitable retaining straps.

- Remove the 6 Torx bolts and washers, discard the bolts.

6.

- Compress the joints to disengage the drive flanges.

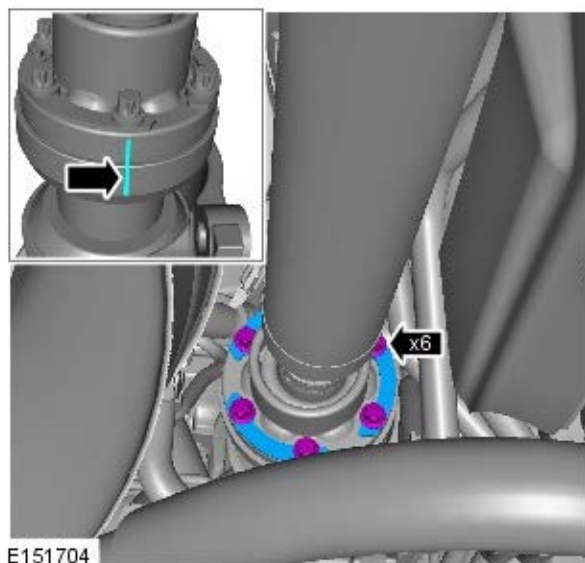

Installation

1. Clean all the mating faces and reusable parts thoroughly and check for damage.

2.  **NOTE:** A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

- Compress the joints to engage the drive flanges.

E151704

3. CAUTIONS:

- ⚠ Make sure that new bolts are installed.
- ⚠ The component must be aligned with the installation markings.
- ⚠ Tighten the bolts in a diagonal sequence.

Driveshaft - Front Driveshaft TDV6 3.0L Diesel

Removal and Installation

Removal

CAUTION: It is possible to fit the driveshaft incorrectly. Note the orientation before removal.

NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember - 3.0L Diesel (502-02, Removal and Installation).

3.  **NOTE:** If equipped.

Remove the transmission heat shield.

- Remove the 4 bolts.

4. **CAUTIONS:**

 Mark the position of the driveshaft flange in relation to the drive pinion flange.

 To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the transfer case drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.

5. **CAUTIONS:**

 Mark the position of the driveshaft flange in relation to the drive pinion flange.

 To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the front axle drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.

6. Remove the front driveshaft.

E83936

- Compress the joints to disengage the drive flanges.

Installation

1.  **NOTE:** A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Install the driveshaft.

- Clean the components.
- Compress the joints to engage the drive flanges.

2.  **CAUTION:** Make sure that new bolts are installed.

Secure the driveshaft to the front axle drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

3.  **CAUTION:** Make sure that new bolts are installed.

Secure the driveshaft to the transfer case drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

4. Install the transmission heat shield.
 - Tighten the bolts to 10 Nm (7 lb.ft).

5. Install the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember - 3.0L Diesel (502-02, Removal and Installation).

Driveshaft - Rear Driveshaft

Removal and Installation

Removal

NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the fuel tank heat shield.
 - Remove the 3 bolts and 2 nuts.

3. **CAUTIONS:**

Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the transfer case drive flange.

- Remove the 6 Torx bolts and washers.

4. **CAUTIONS:**

Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the rear axle drive flange.

- Remove and discard the 4 Torx bolts.

5. With assistance, remove the driveshaft.
 - Remove the 2 driveshaft center bearing mount bolts.

E44309

Installation

1.  NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Attach the driveshaft to the rear axle drive flange.

- Clean the component mating faces.
- Attach the driveshaft to the rear axle drive flange.
- Tighten the new Torx bolts to 150 Nm (110 lb.ft).

2.  NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Attach the driveshaft to the transfer case drive flange.

- Clean the component mating faces.
- Tighten the Torx bolts to 73 Nm (54 lb.ft).

3. CAUTIONS:

Align the driveshaft center bearing mount by moving the floating front section of the shaft backward or forwards until the bolt holes in the mount align with the holes in the chassis.

Make sure the center bearing mount is not under tension.

Install the driveshaft center bearing mount bolts.

- Align the center bearing mount.
- Tighten the driveshaft center bearing retaining bolts to 30 Nm (22 lb.ft).

4. Install the fuel tank heat shield.
 - Tighten the bolts to 6 Nm (4 lb.ft).
 - Tighten the nuts to 3 Nm (2 lb.ft).

40	-	Bolt, 12 of

The cast iron casing comprises two parts; a cover and a carrier. The carrier provides locations for all the internal components. The carrier is sealed to the cover via an O-ring seal and secured with twelve bolts. The cover and carrier have cast fins, which assist mobility. A breather tube is fitted to the top of the carrier. This allows a plastic tube to be fitted and routed to a high point under the vehicle body, preventing the ingress of water when the vehicle is wading.

The carrier contains an oil drain plug. The differential unit contains a specified oil.
For additional information, refer to: Specifications (205-02, Specifications).

The differential is a conventional design using a hypoid gear layout, similar to the front differential. The open rear differential is available in various ratios depending on engine installation.

For additional information, refer to: Specifications (205-02, Specifications).

Changing the number of teeth between the crown wheel drive gear and pinion gear changes the ratio.

The differential comprises a pinion shaft and hypoid pinion-gear and a crown wheel drive-gear with an integral cage, which houses two planet gears. Two sun wheels are also located in the cage and pass the rotational drive to the drive shafts.

The pinion shaft is mounted on two opposed taper roller bearings, with a collapsible spacer located between them. The spacer is used to hold the bearings in alignment and also collapses under the pressure applied to the pinion flanged nut. This allows the flanged nut to be tightened to a predetermined torque, which collapses the spacer, setting the correct bearing preload.

The pinion shaft has an externally splined outer end, which accepts and locates the input flange, which is retained by the pinion nut and retainer. The input flange has four threaded holes and mates with the rear drive shaft. Four bolts secure the rear drive shaft to the input flange. An oil seal is pressed into the pinion housing and seals the input flange to the pinion housing. The pinion shaft has a hypoid gear at its inner end, which mates with the crown wheel drive gear.

The crown wheel drive gear is located on the differential case and secured with ten screws. The differential case is mounted on taper roller bearings located in machined bores on each side of the pinion housing. Shims are retained in the casing behind the bearing cups, the shim thickness is selected to apply the correct bearing preload and hypoid backlash.

The differential carrier has a through hole, which provides location for the shaft. The shaft is supported by a sun gear and a needle roller bearing. The shaft is fitted with a snap ring at one end, which locates in a machined groove in the sun gear, locking the shaft in position.

The sun gears are located in pockets in the carrier cage and mesh with the planet gears. Spacers are fitted between the sun wheels and the carrier and set the correct mesh contact between the planet gears and the sun wheels. Each sun wheel has a machined bore with internal splines and machined groove near the splined end. The groove provides positive location for a snap ring fitted to the end of each output flange.

Each output shaft has a spline, which locates in each sun wheel. A snap ring fitted to the splined shaft locates in the groove the sun wheel bore and positively locates the output shaft. Oil seals are pressed into each side of the pinion housing and seal the seal the output shaft.

Differential Operation

The operating principles of the front and rear differentials are the same. Rotational input from the drive shaft is passed via the input flange to the pinion shaft and pinion gear. The angles of the pinion gear to the crown wheel drive gear moves the rotational direction through 90°.

The transferred rotational motion is now passed to the crown wheel drive gear, which in turn rotates the differential casing. The shaft, which is secured to the casing, also rotates at the same speed as the casing. The planet gears, which are mounted on the shaft, also rotate with the casing. In turn, the planet gears transfer their rotational motion to the left and right hand sun wheels, rotating the drive halfshafts.

When the vehicle is moving in a forward direction, the torque applied through the differential to each sun wheel is equal. In this condition both drive halfshafts rotate at the same speed. The planet gears do not rotate and effectively lock the sun wheels to the differential casing.

If the vehicle is turning, the outer wheel will be forced to rotate faster than the inner wheel by having a greater distance to travel. The differential senses the torque difference between the sun wheels. The planet gears rotate on their axes to allow the outer wheel to rotate faster than the inner one.

The electronic rear differential has the same functionality as the open rear differential but incorporates a locking feature.

An electronically controlled multi-plate clutch provides a rear differential lock and torque biasing function to give improved traction performance and vehicle dynamic stability.

A strategy to electronically control the rear differential multi-plate clutch assembly, has been developed to provide:

- a pre-loading function, increasing locking torque with increased driving torque
- a slip controller to increase locking torque under off-road conditions and decrease locking-torque for optimum comfort, for example when parking the vehicle.

The unit receives a torque input from the transfer box output-shaft, which is passed through the unit to two outputs for the rear drive halfshafts.

The unit detects wheel-slip via various vehicle system inputs to the differential locking module and locks the differential accordingly.

E51169

Item	Part Number	Description
1	-	Actuator
2	-	Clutch pack
3	-	Differential

The electronic rear differential locking and biasing feature is actuated via a DC motor, which is controlled by the differential locking module, via a [PWM \(pulse width modulation\)](#) signal.

Multi-plate Clutch Assembly

E51170

Item	Part Number	Description
1	-	Pressure disc

2	-	Clutch plate assembly
3	-	Pressure disc
4	-	Thrust race
5	-	Output actuator
6	-	Actuator balls
7	-	Input actuator
8	-	Bearing pre-load spacer
9	-	Reduction gearset
10	-	Actuator motor

The multi-plate clutch assembly for both centre (transfer box) and electronic rear differentials act in a similar way. The aim of the multi-plate clutch assembly is to prevent excessive differential slip and therefore maximize the traction performance of the vehicle. This is fundamentally different from the 'braked' traction control, which can only counter act differential slip when it occurs.

A certain amount of differential slip is required to allow the vehicle to turn corners and to remain stable under control of the [ABS \(anti-lock brake system\)](#). The transfer box control module monitors the driver's demands through primary vehicle controls and automatically sets the slip torque at the rear differential via the differential locking module. The system is completely automatic and does not require any special driver input.

The multi-plate clutch assembly actively controls the torque flow through the rear differential and optimizes the torque distribution in the driveline. The clutch assembly biases the torque from the differential to the wheels with the higher grip and prevents the wheels with the lower grip from spinning.

By turning the input actuator disc, via the motor shaft, the output actuator is rotated. This movement acts on 5 balls in a ramp mechanism between the input and output actuators and gives a defined axial movement. The movement forces the pressure disc to induce friction between the sun gear and differential case via the clutch plates supported by the sun gear and the plates supported by the clutch basket on the differential case. This frictional force inhibits the differential rotation; the differential case and left hand differential side gear are locked together.

Differential Locking Module

E140538

The differential locking module controls the multi-plate clutch actuation. The locking module is mounted on a bracket located on the LH C-pillar, behind the trim.

The module is connected on the high-speed [CAN \(controller area network\)](#) bus and controls the differential operation using [CAN](#) messages from other control modules on the network.

The module uses three connectors for all inputs and outputs. It receives a permanent power supply from the [EJB \(engine junction box\)](#), and an ignition supply from the [CJB \(central junction box\)](#).

The module memorizes the position of the differential actuator motor when the engine is switched off.

The locking module controls the closed-loop position sensing system within the motor and regulates the power supply to the motor.

If any of following components are replaced:

- differential locking module
- differential actuator motor
- differential assembly.

An approved diagnostic system must be connected to the vehicle and the differential locking module self-calibration procedure performed.

If a fault occurs with the electronic differential, the locking module or one of the required input signals, for example; road speed signal, the locking module records an error code and a warning lamp, in the instrument cluster, illuminates permanently.

CAN Bus Messages

The high-speed [CAN](#) is a broadcast network connected between various vehicle control modules. It allows the fast exchange of data between control modules every few microseconds.

The differential locking module is connected on the high-speed [CAN](#) bus, via the transfer box control module, and controls differential operation using [CAN](#) messages from other control units on the network. Wheel speed, steering

angle, automatic transmission speed, temperature information, vehicle configuration, axle ratios and mode inputs, are some of the main signals received by the locking module.

The locking module also sends messages via the CAN bus to tell other control modules on the network, the status of the electronic rear differential. The clutch torque and default mode status are some of the main signals sent out by the locking module.

The following table shows the messages that can be displayed in the message centre of a high-line instrument cluster relating to the electronic rear differential:

Message	Description	Chime
'TRANSMISSION OVERHEAT' 'SLOW DOWN'	Rear differential temperature has reached or is approaching the overheat threshold.	None
'TRANSMISSION FAULT' 'TRACTION REDUCED'	Transfer box control module has stopped transmitting CAN bus messages. Defaults to open centre differential. Message also displayed when fault occurs with electronic rear differential.	None
'TRANSMISSION FAULT' 'STOP SAFELY'	Fault has occurred with electronic rear differential. Stop vehicle at earliest opportunity.	Single

On vehicles fitted with the low line instrument cluster, in place of the message centre there will be a status lamp, which has the following logic:

- Amber - Over temperature
- Red - Failure, stop vehicle

DIAGNOSTICS

The electronic rear differential locking module can store fault codes, which can be retrieved using an approved diagnostic system.

The information is communicated via a diagnostic socket. The diagnostic socket allows the exchange of information between the various control modules on the bus systems and the diagnostic equipment. The information is communicated to the socket via the CAN bus. This allows the retrieval of diagnostic information and programming of certain functions using the diagnostic equipment.

The electronic differential locking module uses **DTC (diagnostic trouble code)**, which relate to electronic rear differential electrical faults.

ELECTRONIC DIFFERENTIAL CONTROL DIAGRAM

NOTE: A = Hardwired; D = high-speed CAN bus.

Rear Drive Axle/Differential - Rear Drive Axle and Differential

Diagnosis and Testing

Principles of Operation

For a detailed description of the Rear Drive Axle and Differential and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: Rear Drive Axle and Differential (205-02 Rear Drive Axle/Differential, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Differential oil leakage • Sensor installation 	<ul style="list-style-type: none"> • Power • Fuse(s) • Wiring harness physical damage or water ingress • Loose or corroded electrical connectors • Controller Area Network (CAN) circuits • Sensors • Rear Differential Control Module (RDCM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Message	Possible Other Warnings	Possible Causes	Action
Running at reduced capability with fault present	<ul style="list-style-type: none"> • Rear differential fault 	<ul style="list-style-type: none"> • Driveline overheat warning lamp illuminated • Rear differential/driveline fault warning lamp illuminated 	<ul style="list-style-type: none"> • Water ingress to wiring harness or connectors • Rear differential internal failure • Rear Differential Control Module (RDCM) internal failure 	<ul style="list-style-type: none"> • Visually inspect the wiring harness and connectors for water ingress • Install a new rear differential as necessary • Install a new Rear Differential Control Module (RDCM) as necessary
Rear differential overheat	<ul style="list-style-type: none"> • Rear differential overheat slow down 	<ul style="list-style-type: none"> • Driveline overheat warning lamp illuminated 	<ul style="list-style-type: none"> • Rear differential oil level incorrect • Rear differential oil incorrect specification • Rear differential temperature sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance • Rear Differential Control Module 	<ul style="list-style-type: none"> • Refer to the relevant section of the workshop manual and test the rear differential oil level • Refer to the relevant section of the workshop manual and test the rear differential oil specification • Refer to the electrical circuit diagrams and test the rear differential temperature sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Install a new Rear Differential Control Module (RDCM) as

			(RDCM) internal failure	necessary
--	--	--	----------------------------	-----------

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Rear Differential Control Module (RDCM) (100-00 General Information, Description and Operation).

Rear Drive Axle/Differential - Differential Draining and Filling

General Procedures

CAUTION: Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

NOTE: The only way to check the fluid level in the differential is to drain all the fluid out and refill with the correct quantity, shown in the specification section.

For additional information, refer to: Specifications (205-02, Specifications).

1. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. **CAUTION:** Do not undo or remove the large protruding hexagon on the differential casing.

Remove the differential case lubricant filler plug.

- Clean the area around the lubricant filler plug.
- Position container to collect fluid loss.

3. Drain the differential lubricant.
 - Clean the area around the drain plug.
 - Remove the fluid drain plug.

4. **CAUTION:** There has been 2 different types of fixings used for the drain plug. Note the type and make sure the correct torque is applied, see below.

Install the lubricant drain plug.

- Clean the drain plug.
- Up to differential serial number 254325: Tighten the hexagonal drive drain plug to 54 Nm (40 lb.ft).
- From differential serial number 254326: Tighten the 3/8" square drive drain plug to 28 Nm (21 lb.ft).

5. **CAUTIONS:**

There have been 2 different types of fixings used for the drain plug. Note the type and differential serial number, and make sure the correct torque is applied, see below.

Make sure the correct specification and quantity of oil is used.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: Specifications (205-02
Rear Drive Axle/Differential, Specifications).

6. Install the differential filler plug.
 - Clean the filler plug.
 - Tighten the filler plug to 34 Nm (25 lb.ft).

Rear Drive Axle/Differential - Differential Locking Motor

In-vehicle Repair

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the differential locking motor.
 - Disconnect the electrical connector.
 - Remove the 4 bolts.

3. Remove the 4 bolts.

4. Discard the motor.

E142054

5. Check the gear set for damage to the gears.

Installation

1. Clean the component mating faces.
 2. Install the new motor with new O ring seal.

E142055

3. Install the 4 bolts 12 Nm.

E142053

E52456

E142052

4. Clean the component mating faces and apply continuous bead of sealant to the motor mating face on the differential.

5. Install the differential locking motor.

- Tighten the bolts to 10 Nm.
- Connect the electrical connector.

6. Lower the vehicle.

7. Calibrate the differential locking motor using the diagnostic tool.

Rear Drive Axle/Differential - Rear Axle Oil Temperature Sensor

In-vehicle Repair

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Drain the differential lubricant.
For additional information, refer to: Differential Draining and Filling (205-02, General Procedures).

3. Disconnect the electrical connector.
 - Release the wiring harness retaining clip.

4. Remove the oil temperature sensor.
 - Remove and discard the O-ring seal.

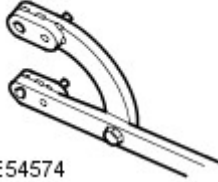

Installation

1. Clean the component mating faces.
2. Install the oil temperature sensor.
 - Tighten to 22 Nm (16 lb.ft).
3. Connect the electrical connector.
 - Secure the wiring harness clip.
4. Fill the differential with the correct amount of lubricant.
For additional information, refer to: Differential Draining and Filling (205-02, General Procedures).

Rear Drive Axle/Differential - Drive Pinion Seal

In-vehicle Repair

Special Tool(s)

<p>205-821</p>  <p>E54586</p>	<p>Installer drive pinion oil seal 205-821</p>
<p>205-824</p>  <p>E54587</p>	<p>Remover drive flange 205-824</p>
<p>205-823</p>  <p>E54700</p>	<p>Remover drive pinion seal 205-823</p>
<p>205-821-01</p>  <p>E112195</p>	<p>Seal installer, adaptor 205-821-01</p>

Removal

CAUTIONS:

 The input flange must not be change for one from another unit.

 The drive pinion seal must only be renewed for 1 repair.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Drain the differential lubricant.
For additional information, refer to: Differential Draining and Filling (205-02, General Procedures).

3. Remove the fuel tank heat shield.
 - Remove the 3 bolts and 2 nuts.

4.  **CAUTION:** Mark the position of the driveshaft flange in relation to the drive pinion flange.

Release the driveshaft from the rear axle drive pinion flange.

- Remove and discard the 4 Torx bolts.

5. Measure the depth of the pinion nut on the pinion shaft.
 - Note measurement for installation.

E112387

E54588

E54589

E54590

6.  **CAUTION:** This step must be carried out to make sure that the drive pinion nut is correctly tightened on assembly.

Accurately scribe a line to mark the drive pinion shaft to the drive pinion nut and pinion flange.

7. Remove the drive pinion flange retaining nut.
- Using the special tool, counter hold the drive pinion flange.
 - Note number of turns for installation.

8. Using the special tool, remove the drive pinion flange.
- Check flange seal journal for any damage.

9. Using the special tool, remove the drive pinion seal.

Installation

1. Clean the drive pinion flange.
2. Clean the drive pinion seal mating faces.
3. Using the special tool, install the new drive pinion seal.

4. Remove the special tool.
 - Install special tool 205-821-01 to the seal face.

5.  **CAUTION:** Make sure adaptor is removed or damage to the vehicle may occur.

Using the special tool, install the new drive pinion seal.

- Remove the special tools.

6.  **CAUTION:** Make sure the drive pinion flange scribed marks are aligned.

Install the drive pinion flange.

7. CAUTIONS:

-  Make sure the mark on the drive pinion nut is never tightened short of the scribed mark on the drive pinion shaft.
-  Make sure the drive pinion flange has no end float and is free to rotate.
-  Make sure the scribed mark on the drive pinion nut is no more than a maximum of 5 degrees past the scribed mark on the drive pinion shaft.

Install the drive pinion flange retaining nut.

- Using the special tool, counter hold the drive pinion flange.
- Install nut to previously noted number of turns.
- Measure the depth of the pinion nut on the pinion shaft.

8. Attach the driveshaft to the rear axle drive flange.
- Clean the component mating faces.
 - Attach the driveshaft to the rear axle drive flange.
 - Tighten the new Torx bolts to 150 Nm (110 lb.ft).

9. Install the fuel tank heat shield.
- Tighten the bolts and nuts to 10 Nm (7 lb.ft).

10.  CAUTION: Make sure the correct specification and quantity of oil is used.

Fill the differential with the correct amount of lubricant. For additional information, refer to: Differential Draining and Filling (205-02, General Procedures).

Rear Drive Axle/Differential - Differential Locking Module

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the rear quarter trim panel.
For additional information, refer to: Rear Quarter Trim Panel (501-05, Removal and Installation).
3. Release the parking aid module.
 - Remove the 2 nuts.

E54439

4. Remove the differential locking module.
 - Disconnect the 3 electrical connectors.
 - Remove the 3 bolts.

E54440

Installation

1. Install the differential locking module.
 - Install the bolts and tighten to 10 Nm (7 lb.ft).
 - Connect and secure the electrical connectors.
2. Install the parking aid module.
 - Tighten the nuts to 10 Nm (7 lb.ft).
3. Install the rear quarter trim panel.
For additional information, refer to: Rear Quarter Trim Panel (501-05, Removal and Installation).
4. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
5. Use T4 to calibrate a new differential locking module.

Rear Drive Axle/Differential - Axle Assembly

Removal and Installation

Removal

CAUTION: Do not undo or remove the large protruding hexagon on the differential casing.

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the rear wheels and tires.
3. Remove the muffler assembly.
For additional information, refer to: [Front Muffler](#) (309-00B Exhaust System - V6 S/C 3.0L Petrol, Removal and Installation) / [Front Muffler](#) (309-00A Exhaust System - TDV6 3.0L Diesel, Removal and Installation).
4. Remove the RH rear halfshaft.
For additional information, refer to: [Rear Halfshaft](#) (205-05 Rear Drive Halfshafts, Removal and Installation).

5.  **CAUTION:** Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the LH rear stabilizer bar link.

- Remove and discard the 2 nuts.

6. Release the parking brake cable from the lower arm.

7. Disconnect the LH rear toe link.
 - Remove the bolt.

E46797

E46798

E63938

8.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the LH rear wheel knuckle from the lower arm.

- Remove the bolt.
- Using a suitable stand, support the LH rear wheel knuckle.

9.  **NOTE:** RH illustration shown, LH is similar.

Release the LH rear halfshaft from the axle assembly.

- Remove and discard the snap ring.

10.  **CAUTION:** Mark the position of the driveshaft flange in relation to the drive pinion flange.

Release the driveshaft from the rear axle drive flange.

- Remove and discard the 4 bolts.
- Tie aside.

11. Vehicles with differential locking motor:
 - Disconnect the 2 electrical connectors.
 - Release the 2 wiring harness clips.

12. Using a transmission jack, support the rear axle assembly.

13.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

With assistance, remove the rear axle assembly.

- Remove the 3 bolts.
- Disconnect the breather line.

Installation

1. With assistance, install the rear axle assembly.
 - Connect the breather line.
 - Tighten the front mounting bolt to 275 Nm (203 lb.ft).
 - Tighten the rear mounting bolts to 175 Nm (129 lb.ft).

lb.ft).

2. Vehicles with differential locking motor: Connect the electrical connectors.
 - Secure the wiring harness clips.

3.  **CAUTION:** Make sure that new bolts are installed.

Secure the driveshaft to the rear axle drive flange.

- Clean the component mating faces.
- Tighten the bolts to 150 Nm (110 lb.ft).

4. Install a new snap ring to the LH halfshaft.

E93428

5.  **NOTE:** Do not fully engage the halfshaft until the oil seal protector has been removed.

Secure the LH halfshaft in the axle assembly.

1. Open the halfshaft seal protector and install the halfshaft.
2. Release the halfshaft seal protector from the halfshaft seal.
3. Break the halfshaft seal protector in to two pieces and remove the halfshaft seal protector.
4. Fully install the halfshaft.

6.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the LH rear wheel knuckle to the lower arm.

- Tighten the nut and bolt to 275 Nm (203 lb.ft).

7. Connect the LH rear toe link.
 - Tighten the bolt to 175 Nm (129 lb.ft).
8. Secure the parking brake cable to the lower arm.
9. Install the LH rear stabilizer bar link.
 - Tighten the nuts to 115 Nm (85 lb.ft).
10. Install the RH halfshaft.

For additional information, refer to: [Rear Halfshaft](#) (205-05 Rear Drive Halfshafts, Removal and Installation).
11. Install the muffler assembly.

For additional information, refer to: [Front Muffler](#) (309-00B Exhaust System - V6 S/C 3.0L Petrol, Removal and Installation) / [Front Muffler](#) (309-00A Exhaust System - TDV6 3.0L Diesel, Removal and Installation).

12. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Drive Axle/Differential - Axle Housing Bushing

Removal and Installation

Special Tool(s)

<p>502-009/2</p>  <p>E54205</p>	<p>Remover rear differential rear bush 502-009/2</p>

 <p>205-825/8 E55277</p>	<p>Nut for long 16mm bolt 205-825/8</p>

Removal

NOTE: Take note of the fitted position of the bush.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
- Remove the muffler assembly.
For additional information, refer to: Muffler (309-00, Removal and Installation).

- Remove the fuel tank heat shield.
 - Remove the 3 bolts and 2 nuts.

- CAUTIONS:

 Mark the position of the driveshaft flange in relation to the drive pinion flange.

 To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the rear axle drive flange.

- Remove and discard the 4 Torx bolts.

-  **CAUTION:** Make sure the weight of the axle is always supported.

Using a suitable jack, lower the front of the axle.

- Remove the axle front retaining bolt.

6. Using the special tools, remove the axle housing bushing.

Installation

1. Using the special tools, install the axle housing bushing.

2.  **CAUTION:** Make sure the weight of the axle is always supported.

Using a suitable jack, raise the front of the differential.

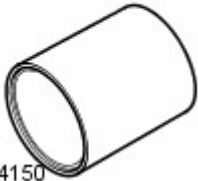

- Install the axle front retaining bolt.
- Tighten to 275 Nm (203 lb.ft).

3. Attach the driveshaft to the rear axle drive flange.
 - Clean the component mating faces.
 - Attach the driveshaft to the rear axle drive flange.
 - Tighten the new Torx bolts to 150 Nm (110 lb.ft).
4. Install the fuel tank heat shield.
 - Tighten the bolts and nuts to 10 Nm (7 lb.ft).
5. Install the muffler assembly.
For additional information, refer to: Muffler (309-00, Removal and Installation).

Rear Drive Axle/Differential - Rear Axle Housing Support Insulator

Removal and Installation

Special Tool(s)

 <p>502-009/5 E54148</p>	<p>Remover/Installer long 14mm bolt 502-009/5</p>
 <p>51203 E54149</p>	<p>Bearing set for 14mm and 16mm bolt, 51203</p>

 <p>502-009/2 E54151</p>	<p>Remover rear differential rear bush 502-009/2</p>
 <p>502-009/3 E54152</p>	<p>Installer rear differential rear bush 502-009/3</p>

Removal

NOTE: Take note of the fitted position of the bush.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
2. Remove the wheels and tires.
3. Remove the rear differential.
For additional information, refer to: Axle Assembly (205-02, Removal and Installation).

4.  **NOTE:** Take note of the fitted position of the bush.

Using the special tools, remove the rear axle housing support insulator.

Installation

1. Using the special tools, install the rear axle housing support insulator.

2. Install the rear differential.
For additional information, refer to: Axle Assembly (205-02, Removal and Installation).
3. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Axle/Differential -

Lubricants

NOTE: Do not use any lubricant other than that specified

Item	Specification
Recommended lubricant	Castrol SAF-XO - 75W/90

Front Drive Axle/Differential - Front Drive Axle and Differential

Description and Operation

GENERAL

E50981

Item	Part Number	Description
1	-	RH front drive halfshaft
2	-	Front differential assembly
3	-	Front driveshaft
4	-	LH front drive halfshaft

The front differential converts the 'angle of drive' through 90° and distributes drive, via the front drive halfshafts, to the front wheels.

The front differential for the V6 and V8 petrol variants have the same output ratio, but the output ratios for the TdV6 are different, depending on whether automatic or manual transmission is fitted.

The front differential is mounted on the LH side of the chassis.

45	-	Thrust washer
46	-	Mounting bush assembly

The casing comprises two halves with machined mating faces. When assembled, the cast iron casing halves are sealed with a thin film of Loctite 5999 sealant and secured together with fourteen bolts. A breather tube is fitted to the casings. This allows a plastic tube to be fitted and routed to a high point in the engine compartment, preventing the ingress of water when the vehicle is wading.

The RH casing is fitted with a drain plug. The front differential unit contains approximately 0.7 litre of oil for a dry fill.

The differential is a conventional design using a hypoid gear layout. This employs a hypoid bevel pinion gear and crown wheel, with the pinion offset above the centre line of the crown wheel. This design allows for a larger pinion gear to be used, which has the advantages of increased gear strength and reduced operating noise.

The front differential is available in three ratios. V8 and V6 petrol engine vehicles use a front differential with a final drive ratio of 3.73:1 and TdV6 diesel engine vehicles use a final drive ratio of 3.07:1, for vehicles with manual transmission, and 3.54:1 for vehicles with automatic transmission. Changing the number of teeth between the crown-wheel drive gear and pinion gear changes the ratio.

The differential comprises a pinion shaft and hypoid bevel gear, a crown wheel drive gear with an integral cage, which houses two planet gears. Two sun wheels are also located in the cage and pass the rotational drive to the drive shaft shafts.

The pinion shaft is mounted on two opposed taper roller bearings with a collapsible spacer located between them. The spacer is used to hold the bearings in alignment and also collapses under the pressure applied to the pinion nut. This allows the nut to be tightened to a predetermined torque, which collapses the spacer, setting the correct bearing preload.

The pinion shaft has an externally splined outer end which accepts and locates the input flange, which is retained by the pinion nut. The opposite end of the output flange has an internal spline which provides positive location for the front propeller shaft. The flange has an external O-ring seal which seals against the front propeller shaft shroud preventing the ingress of dirt and moisture into the splines. An oil seal is pressed into the LH casing and seals the input flange to the differential unit. The pinion shaft has a hypoid bevel gear at its inner end which mates with the crown wheel drive gear.

The crown wheel drive gear is located on the carrier and secured with ten screws. The carrier is mounted on taper roller bearings located in each casing half. The bearings are press fitted into the casing and a spacer is located on the outside face to set backlash and apply preload to the bearing.

The carrier is fitted with a shaft onto which the two planet gears are mounted. The shaft is secured in the carrier with a roll pin. The sun wheels are located in pockets within the carrier and mesh with the planet gears. Thrust washers

are located between the carrier and the sun wheels and hold the sun wheels in mesh with the planet gears. Each sun wheel has a machined, splined, bore to accept the drive shaft. A groove is machined in the bore to locate the snap ring fitted to the drive shaft, providing positive drive shaft location.

Differential Operation

The operating principles of the front and rear differentials are the same. Rotational input from the propeller shaft is passed via the input flange to the pinion shaft and pinion gear. The angles of the pinion gear to the crown wheel drive gear moves the rotational direction through 90°.

The transferred rotational motion is now passed to the crown wheel drive gear, which in turn rotates the carrier. The shaft, which is secured to the carrier, also rotates at the same speed as the carrier. The planet gears, which are mounted on the shaft, also rotate with the carrier. In turn, the planet gears transfer their rotational motion to the left and right hand sun wheels, rotating the drive shafts.

When the vehicle is moving in a forward direction, the torque applied through the differential to each sun wheel is equal. In this condition both drive shafts rotate at the same speed. The planet gears do not rotate and effectively lock the sun wheels to the carrier.

If the vehicle is turning, the outer wheel will be forced to rotate faster than the inner wheel by having a greater distance to travel. The differential senses the torque difference between the sun wheels. The planet gears rotate on their axes to allow the outer wheel to rotate faster than the inner one.

SERVICE

The oil used in the front differential is Castrol SAF-XO. The oil contains unique additives, which enhance the differentials operation. No other oil must be used in the front differential.

Front Differential Serviceable Components

- Halfshaft seals
- Needle roller bearing assemblies
- Chassis bush/fixings
- Lubricant.

Front Drive Axle/Differential - Differential Draining and Filling

General Procedures

CAUTION: Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, not to act as a level indicator.

NOTE: The only way to check the fluid level in the differential is to drain all the fluid out and refill with the correct quantity, shown in the specification section.

For additional information, refer to: Specifications (205-03, Specifications).

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

3. Remove the differential case lubricant filler plug.
 - Clean the area around the lubricant filler plug.
 - Position container to collect fluid loss.

4. Drain the differential lubricant.
 - Clean the area around the drain plug.
 - Remove the fluid drain plug.

5.  **CAUTION:** There have been 2 different types of fixings used for the drain plug. Note the type and differential serial number, and make sure the correct torque is applied, see below.

Install the lubricant drain plug.

- Clean the drain plug.
- Up to differential serial number 254845: Tighten the hexagonal drive drain plug to 54 Nm (40 lb.ft).
- From differential serial number 254846: Tighten the 3/8" square drive drain plug to 28 Nm (21 lb.ft).

6.  **CAUTION:** Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, not to act as a level indicator.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: Specifications (205-03
Front Drive Axle/Differential, Specifications).

7. Install the differential filler plug.
 - Tighten the filler plug to 34 Nm (25 lb.ft).
8. Install the engine undershield.
For additional information, refer to: Engine Undershield
(501-02 Front End Body Panels, Removal and Installation).

Front Drive Axle/Differential - Drive Pinion Seal

In-vehicle Repair

Special Tool(s)

 <p>205-053</p> <p>E54574</p>	<p>Flange holding tool 205-053</p>
 <p>205-824</p> <p>E54587</p>	<p>Remover drive flange 205-824</p>
 <p>205-820</p> <p>E54703</p>	<p>Installer - drive pinion oil seal 205-820</p>
 <p>100-012</p> <p>E54135</p>	<p>Impulse extractor 100-012(LRT-99-004)</p>

Removal

CAUTION: The drive pinion seal must only be renewed once.

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Drain the differential lubricant.
For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).
- Remove the front driveshaft.
For additional information, refer to: [Front Driveshaft - V6 S/C 3.0L Petrol](#) (205-01 Driveshaft, Removal and Installation) / [Front Driveshaft - TDV6 3.0L Diesel](#) (205-01 Driveshaft, Removal and Installation).

- Measure the depth of the pinion nut on the pinion shaft.
 - Note measurement for installation.

E114355

5.  **CAUTION:** This step must be carried out to make sure that the drive pinion nut is correctly tightened on assembly.

Accurately scribe a line to mark the drive pinion shaft to the drive pinion nut and pinion flange.

E114354

6. Remove the drive pinion flange retaining nut.
 - Using the special tool, counter hold the drive pinion flange.
 - Discard the drive pinion nut retainer.

E54579

7.  **CAUTION:** Make sure only a bolt is used with the special tool, to draw the drive pinion flange off the drive pinion shaft.

Using the special tool, remove the drive pinion flange.

E54580

8. Using the special tool, remove the drive pinion seal.

E54581

Installation

1. Clean the drive pinion flange.
2. Clean the drive pinion seal mating faces.
3. Using the special tool, install the new drive pinion seal.

E54582

4.  **CAUTION:** Make sure the drive pinion flange scribed marks are aligned.

Install the drive pinion flange.

5. **CAUTIONS:**

 Make sure the mark on the drive pinion nut is never tightened short of the scribed mark on the drive pinion shaft.

 Make sure the drive pinion flange has no end float and is free to rotate.

 Make sure the scribed mark on the drive pinion nut is no more than a maximum of 5

degrees past the scribed mark on the drive pinion shaft.

Install the drive pinion flange retaining nut.

- Using the special tool, counter hold the drive pinion flange.
- Install nut to previously noted number of turns.
- Measure the depth of the pinion nut on the pinion shaft.

6. Install the front driveshaft.

For additional information, refer to: [Front Driveshaft - V6 S/C 3.0L Petrol](#) (205-01 Driveshaft, Removal and Installation) / [Front Driveshaft - TDV6 3.0L Diesel](#) (205-01 Driveshaft, Removal and Installation).

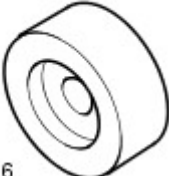

7.  **CAUTION:** Make sure the correct specification and quantity of oil is used.

Fill the differential with the correct amount of lubricant. For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).

Front Drive Axle/Differential - Front Axle Housing Support Insulator

In-vehicle Repair

Special Tool(s)

<p>502-009/6</p>  <p>E55285</p>	<p>Bearing Housing 502-009/6</p>

<p>205-825/3</p>  <p>E54216</p>	<p>Installer rear axle front bush 205-825/3</p>
<p>502-009/2</p>  <p>E54205</p>	<p>Remover rear differential rear bush 502-009/2</p>
<p>502-009/5</p>  <p>E54148</p>	<p>Remover/Installer long 14mm bolt 502-009/5</p>
<p>502-009/4</p>  <p>E55284</p>	<p>Nut for long 14mm bolt 502-009/4</p>
<p>205-825/1</p>  <p>E54219</p>	<p>Receiver cup front axle front bush 205-825/1</p>

Removal

 CAUTION: Make sure the bush is correctly aligned.

 NOTE: Take note of the fitted position of the bush.

-  WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
- Remove the front wheels and tires.
- Remove the front differential.
For additional information, refer to: Axle Assembly (205-03, Removal and Installation).

-  NOTE: Take note of the fitted position of the bush.

Using the special tools, remove the front axle housing support insulator.

Installation

-  CAUTION: Make sure the bush is correctly aligned.

Using the special tools, install the front axle housing support insulator.

- Install the front differential.
For additional information, refer to: Axle Assembly (205-03,

Removal and Installation).

3. Install the front wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Axle/Differential - Axle Tube

In-vehicle Repair

Removal

1. Remove the RH halfshaft.
For additional information, refer to: Front Halfshaft RH (205-04 Front Drive Halfshafts, Removal and Installation).
2. Remove the axle tube.
 - Remove the bolt from the bushing.
 - Remove the 4 bolts.
 - Rotate and remove the axle tube.
 - Early models: Remove and discard the O-ring seal.
 - Later models: Remove the sealant.

E54156

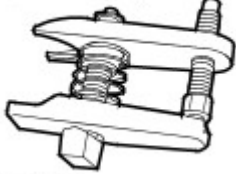

Installation

1. Install the axle tube.
 - Clean the component mating faces.
 - Early models: Install a new O-ring seal.
 - Later models: Apply sealant to the mating face.
For additional information, refer to: Specifications (205-03, Specifications).
 - Tighten the 4 axle tube bolts to 50 Nm (37 lb.ft).
 - Tighten the axle tube bushing bolt to 63 Nm (46 lb.ft).
2. Install the RH halfshaft.
For additional information, refer to: Front Halfshaft RH (205-04 Front Drive Halfshafts, Removal and Installation).

Front Drive Axle/Differential - Axle Assembly

Removal and Installation

Special Tool(s)

 <p>205-754A E45276</p>	<p>Ball joint separator 205-754(LRT-54-027)</p>
 <p>204-703 E99557</p>	<p>Front Stabilizer Bar Bushing Tightening Tool 204-703</p>
 <p>204-705 E99558</p>	<p>Front Stabilizer Bar Bushing Tightening Tool 204-705</p>

Removal

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

All vehicles

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the front wheels and tires.
3. Remove the axle tube.
For additional information, refer to: Axle Tube (205-03 Front Drive Axle/Differential, In-vehicle Repair).

4. Remove the LH splash shield.
 - Remove the 4 clips.

5. Release the LH stabilizer bar link.
 - Remove and discard the nut.

E50773

6. Release the LH brake hose bracket from the wheel knuckle.
 - Remove the bolt.

E45844

7.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the LH tie-rod end ball joint from the wheel knuckle.

- Remove and discard the nut.

E50780

8. **CAUTIONS:**

 Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

 The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

Using the special tool, release the LH upper arm ball joint.

- Remove and discard the nut.

E44661

9. Release the LH halfshaft from the axle assembly.
 - Remove and discard the snap ring.
 - Using a suitable tie strap, support the LH halfshaft.

10. CAUTIONS:

 Mark the position of the driveshaft flange in relation to the drive pinion flange.

 To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the front axle drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.
- Using a suitable tie strap, secure the driveshaft end plate.

Vehicles with Active Stabilization

11. Remove the stabilizer bar bushing.

- Remove the 3 bolts.
- Remove the clamp.
- Remove the stabilizer bar bushing.

Vehicles with diesel engine

12. Release the fuel cooler.

- Remove the bolt.

Vehicles with 5.0L engine

13. Release the automatic transmission fluid cooler.

- Remove the 4 bolts.

E123471

14. Remove the transmission fluid cooler mounting bracket.

- Release the transmission fluid cooler pipe bracket.
- Remove the nut.
- Remove the 3 bolts.

E123472

All vehicles

15. Remove the front axle crossmember.

- Remove the 4 bolts.

E56083

E44569

16.  **CAUTION:** Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the breather line.

- Release the clip.

17. Using a transmission jack, support the front axle assembly.

E56084

18. With assistance, remove the front axle assembly.
- Remove and discard the 3 axle assembly rear mounting bolts.
 - Remove the front axle assembly front mounting bolt.

Installation

All vehicles

1. With assistance, install the front axle assembly.
 - With assistance, raise and manoeuvre the front final drive unit.
 - Tighten the 3 new bolts in the front axle assembly to 80 Nm (59 lb.ft), then a further 60 degrees.
 - Tighten the front axle assembly front mounting bolt to 105 Nm (77 lb.ft).
2. Connect the breather line.
3. Install the front axle crossmember.
 - Tighten the 4 bolts to 115 Nm (85 lb.ft).

Vehicles with 5.0L engine

4. Install the transmission fluid cooler mounting bracket.
 - Tighten the 3 bolts to 25 Nm (18 lb.ft.).
 - Secure the transmission fluid cooler coolant pipe to the coolant hose bracket.
 - Tighten the nut to 15 Nm (11 lb.ft).

5. Install the automatic transmission fluid cooler.
 - Tighten the 4 bolts to 25 Nm (18 lb.ft.).

Vehicles with diesel engine

6. Secure the fuel cooler.
 - Tighten the bolt to 23 Nm (17 lb.ft).

Vehicles with Active Stabilization

7. Install the stabilizer bar bushing.
 - Install the clamp.
 - Install the bolts.
 - Tighten the bolts to 115 Nm (85 lb.ft).

All vehicles

8.  **NOTE:** Make sure that new bolts are installed.

Secure the driveshaft to the front axle drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.
- Remove and discard the tie strap.

9. Install a new snap ring to the LH halfshaft.
 - Remove and discard the tie strap.

E93428

10.  **NOTE:** Do not fully engage the halfshaft until the oil seal protector has been removed.

Secure the LH halfshaft in the axle assembly.

1. Open the halfshaft seal protector and install the halfshaft.
2. Release the halfshaft seal protector from the halfshaft seal.
3. Remove the halfshaft seal protector.
4. Fully install the halfshaft.

11.  **WARNING:** Make sure that a new nut is installed.

Secure the LH upper arm to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

12.  **WARNING:** Make sure that a new nut is installed.

Secure the LH tie-rod end ball joint to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

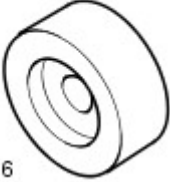

13. Secure the LH brake hose bracket to the wheel knuckle.
 - Tighten the bolt to 22 Nm (16 lb.ft).

14. Secure the LH stabilizer bar link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).
15. Install the LH splash shield.
 - Install the clips.
16. Install the axle tube.
For additional information, refer to: Axle Tube (205-03 Front Drive Axle/Differential, In-vehicle Repair).
17. If a new differential is installed, fill with the recommended fluid. For additional information, refer to: Differential Draining and Filling (205-03, General Procedures).
18. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Axle/Differential - Axle Carrier Bushing

Removal and Installation

Special Tool(s)

 <p>205-825/3</p> <p>E54216</p>	<p>Installer rear axle front bush 205-825/3</p>
 <p>205-825/5</p> <p>E54209</p>	<p>Receiver cup rear differential front bush 205-825/5</p>
 <p>502-009/2</p> <p>E54205</p>	<p>Remover rear differential rear bush 502-009/2</p>

Removal

CAUTION: Make sure the bush is correctly aligned.

NOTES:

Take note of the fitted position of the bush.

Some variation in the illustrations may occur, but the essential information is always correct.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
2. Remove the exhaust system.
For additional information, refer to: [Exhaust System](#) (309-00B Exhaust System - V6 S/C 3.0L Petrol, Removal and Installation) / [Exhaust System](#) (309-00A Exhaust System - TDV6 3.0L Diesel, Removal and Installation).
3. Using a jack, support the axle assembly.
4. Remove the axle carrier bushing heat shield.
 - Remove the two retaining bolts.

5.  **CAUTION:** The bolts must only be used once.

Remove the axle carrier.

- Remove and discard the three bolts retaining the axle carrier to the axle.
- Remove the axle carrier bushing bolt.

6.  **NOTE:** Take note of the fitted position of the bush.

Using the special tools, remove the axle carrier bushing.

Installation

1.  **CAUTION:** Make sure the bush is correctly aligned.

Using the special tools, install the axle carrier bushing.

E54226

2. Install the axle carrier.
 - Tighten the M14 bolt to 105 Nm (77 lb.ft).
 - Tighten the new axle carrier bracket bolts to 80 Nm (59 lb.ft), then a further 60 degrees.
3. Install the axle carrier bushing heat shield.
4. Remove the axle support.
5. Install the exhaust system.

For additional information, refer to: [Exhaust System](#) (309-00B Exhaust System - V6 S/C 3.0L Petrol, Removal and Installation) / [Exhaust System](#) (309-00A Exhaust System - TDV6 3.0L Diesel, Removal and Installation).

Front Drive Axle/Differential - Axle Tube Bushing

Removal and Installation

Special Tool(s)

 <p>308-625/1 E60582</p>	<p>Remover/installer - Front axle extension support bush 308-625/1</p>
 <p>308-625/2 E60583</p>	<p>Remover/installer - Front axle extension support bush 308-625/2</p>
 <p>308-625/3 E60584</p>	<p>Remover/installer - Front axle extension support bush 308-625/3</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Raise and support the vehicle.
3. Remove the axle tube.
For additional information, refer to: Axle Tube (205-03, In-vehicle Repair).

4.  **NOTE:** Note the fitted position.

Using the special tools, remove the bushing.

Installation

-  **NOTE:** Note the fitted position.
 Using the special tools, install the bushing.

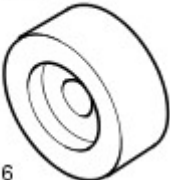

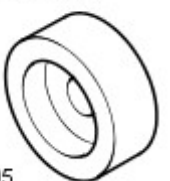

- Install the axle tube.
 For additional information, refer to: Axle Tube (205-03, In-vehicle Repair).
- Connect the battery ground cable.
 For additional information, refer to: Specifications (414-00, Specifications).

Front Drive Axle/Differential - Axle Cover Bushing

Removal and Installation

Removal

 CAUTION: Make sure the bush is correctly aligned.

 NOTE: Take note of the fitted position of the bush.

-  WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
- Remove the front wheels and tires.
- Remove the front differential.
For additional information, refer to: Axle Assembly (205-03, Removal and Installation).

-  NOTE: Take note of the fitted position of the bush.

Using the special tools, remove the front axle housing support insulator.

Installation

-  CAUTION: Make sure the bush is correctly aligned.

Using the special tools, install the front axle housing support insulator.

- Install the front differential.
For additional information, refer to: Axle Assembly (205-03,

Removal and Installation).

3. Install the front wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Halfshafts -

General Specification

Item	Specification
Type	Fully floating, fixed length, solid shafts incorporating constant velocity joints at each end of shaft

Lubricant

Item	Specification
Outboard joint	Use grease supplied with replacement boot kit (Optimol MS139G)
Inboard joint	Use grease supplied with replacement boot kit (1 Luber C MS132G)

General Specification

Item	Specification
Type	Fully floating, solid shafts incorporating 'plug-in' constant velocity joint at inboard end and fixed constant velocity joint at outboard end of shaft

Torque Specifications

Description	Nm	lb-ft
* Stabilizer bar link nut	115	85
* Stabilizer link nut	115	85
* Tie rod end ball joint nut	76	56
Brake hose retaining bracket to wheel knuckle bolt	25	18
* + Halfshaft retaining nut	230	169
Road wheel nuts	140	103

* **New nut must be fitted**

+ **Stake nut on completion**

Front Drive Halfshafts - Front Drive Halfshafts

Description and Operation

Front Drive Halfshaft Component Location

E46376

Item	Part Number	Description
1	-	RH front drive halfshaft
2	-	LH front drive halfshaft

GENERAL

The front drive shafts are handed components with the RH drive shaft being longer than the LH drive shaft. Both shafts are of similar construction with Constant Velocity (CV) joints at each end to allow for steering and suspension movement.

FRONT DRIVE HALFSHAFT ASSEMBLY

E46377

Item	Part Number	Description
1	-	RH outer CV joint
2	-	RH front drive halfshaft
3	-	RH inner CV joint
4	-	LH inner CV joint
5	-	LH front drive halfshaft
6	-	LH outer CV joint

The front drive shafts are similar in their construction. The only difference is the lengths of each shaft, the LH drive shaft is a longer shaft with an extended stem.

The outer CV joints have a target wheel on the outer diameter. This is used by the ABS wheel speed sensor for vehicle and wheel speed calculations.

Each drive shaft comprises two CV joints (inner and outer), boots, an outer tube and a solid barshaft, which is retained in the front differential by a circlip (see 'Halfshaft Joint' section for more information on CV joints).

Front Drive Halfshafts - Halfshaft Joint

Description and Operation

Front Drive HalfShaft – Sectional Views

E50637

Item	Part Number	Description
A	-	Front outboard halfshaft joint
B	-	Rear outboard halfshaft joint
C	-	Rear inboard halfshaft joint
D	-	Front inboard halfshaft joint

The outboard and rear inboard CV joints are of the Birfield design. This design uses longitudinal, elliptical grooves, which retain six steel balls. The balls are further retained by a cage. The constant velocity is achieved by the position of the steel balls. If a centre line is drawn through the balls and the driven hub or differential shaft, the two centre lines always bisect each other at the angle of drive. This condition allows the rotational speed of the driven shaft to be passed to the driven hub or differential shaft with no loss of rotational speed regardless of the shaft angle. The CV joints are packed with grease, which is retained in the joint by a synthetic rubber gaiter. The gaiter is retained at each end by a metal clamp, which provides a water tight seal to prevent the ingress of dirt and moisture. The CV joints are retained on their respective shaft or tube by an internal snap ring. The snap rings are located in a groove on each shaft or tube end and locate in a mating groove in the CV joint.

CAUTION: The inner hub is not retained in the joint body on this type of joint. The joint is held together in it's unfitted state only by the boot. Pulling on the barshaft can therefore pull the hub out of the joint body. For this reason care must be taken when handling and fitting the front driveshafts.

The shaft is a sliding fit inside the outer tube, which allows for the small length changes, which occur with articulation of the suspension. The shaft is located in a ball cage, which is retained inside the outer tube. The ball cage ensures that the shaft is held rigidly in the outer tube whilst allowing it to freely move in and out of the tube as necessary. A sealing plug is pressed into the outer tube and retains grease around the balls in the cage.

The inner CV joints are similar in design and operation to the outer joints except that the inner joints use rollers rather than balls to transmit the drive.

E46396

Item	Part Number	Description
A	-	Inner CV joint
B	-	Outer CV joint
1	-	Tulip outer race
2	-	Trunions (3 of)
3	-	Spider
4	-	Rollers (3 of)
5	-	Outer race
6	-	Steel balls (6 of)
7	-	Cage
8	-	Inner race

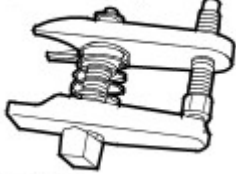

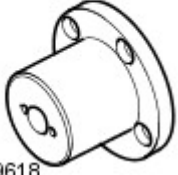

The front inboard joint is a 'tripode joint', having three 'feet' or 'podes'. The torque is transmitted from the outer race to the connecting shaft by means of rollers running on needle rollers around the trunions of the tripod spider. The roller tracks of the outer race enable the tripod assembly to move angularly and axially within the joint.

The inner CV joint shaft is splined and mates with splines in the front differential. There is no internal retaining mechanism for this type of joint so care must be taken during service as the shaft and CV joint can separate.

Front Drive Halfshafts - Front Halfshaft LH

 <p>100-012</p> <p>E54135</p>	<p>Impulse extractor 100-012(LRT-99-004)</p>
 <p>308-626/2</p> <p>E54137</p>	<p>Installer/Guide halfshaft oil seal 308-626/2</p>
 <p>308-626/1</p> <p>E54136</p>	<p>Installer halfshaft oil seal 308-626/1</p>

Removal

CAUTIONS:

Do not store or install halfshafts with joints at maximum articulation or damage may occur to the joint.

Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
2. Drain the differential lubricant.
For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).
3. Remove the wheel and tire.
4. Remove the halfshaft retaining nut.
 - Discard the nut.

E49697

5.  CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Disconnect the RH stabilizer bar link.

- Remove and discard the nut.

6.  CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link nut.

- Remove and discard the nut.

7. Release the brake hose bracket from the wheel knuckle.
- Remove the bolt.

8. Loosen the tie-rod end ball joint retaining nut.

9.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the tie-rod end ball joint from the wheel knuckle.

- Discard the nut.

10.  CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.

11.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the upper arm ball joint.

- Remove and discard the retaining nut.

12. **CAUTIONS:**

 The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

 Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

13. Release the halfshaft from the wheel knuckle.

14. Release the halfshaft from the differential housing.

15. Remove the halfshaft.
- Raise the stabilizer bar to allow removal of the halfshaft.
 - Remove and discard the snap ring.

16. Using the special tools, remove and discard the halfshaft oil seal.

E54138

Installation

1. Clean the components.

E54139

2. Using the special tools, install a new halfshaft oil seal.
 - The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

E51770

3.  **CAUTION:** Do not fully engage the halfshaft until the oil seal protector has been removed.

 **NOTE:** The oil seal protector is designed to break into two pieces.

Install the halfshaft.

- Install the snap ring.
- Lubricate the seal and the bearing running surfaces with clean axle oil.
- Open the halfshaft oil seal protector.
- Partially install the halfshaft.
- Remove and discard the halfshaft oil seal protector.
- Make sure the snap ring is fully engaged and retains the halfshaft.

4. **CAUTIONS:**

 The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

 Use tool 204-506-01 (LRT-60-030/4) for L319 up to VIN 671700, L320 up to VIN 810673. Use tool number JLR-204-506-01 for L319 from VIN 671701, L320 from VIN 810674. Failure to follow this instruction will result in damage to vehicle.

Using the special tools, install the halfshaft in the wheel hub.

5. Connect the upper arm and wheel knuckle.
 - Install a new nut and tighten to 70 Nm (52 lb.ft).
6. Secure the stabilizer bar link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).
7. Connect the tie-rod end ball joint.
 - Install a new nut and tighten to 76 Nm (56 lb.ft).

8.  **CAUTION:** Install the halfshaft nut finger tight.
Install a new halfshaft retaining nut and lightly tighten.

9. Secure the brake hose retaining bracket to the wheel knuckle.
 - Tighten the bolt to 22 Nm (16 lb.ft).
10. Secure the RH stabilizer link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).

11.  **CAUTION:** Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 230 Nm (170 lb.ft).

- Stake the nut to the halfshaft.
12. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

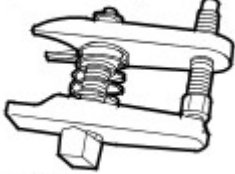

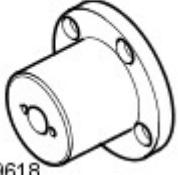

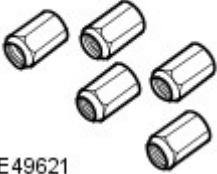

13.  **CAUTION:** Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

Fill the differential with the correct amount of lubricant. For additional information, refer to: [Differential Draining and Filling](#) (205-03 Front Drive Axle/Differential, General Procedures).

Removal

CAUTIONS:

Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

Do not store or install halfshafts with joints at maximum articulation or damage may occur to the joint.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
2. Drain the differential lubricant.
For additional information, refer to: Differential Draining and Filling (205-03 Front Drive Axle/Differential, General Procedures).
3. Remove the wheels and tires.
4. Remove the halfshaft retaining nut.
 - Discard the nut.

E45747

5.  CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Disconnect the stabilizer bar link.

- Remove and discard the nut.

E45748

6.  CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Remove the stabilizer bar link nut.

E45844

7. Release the brake hose bracket from the wheel knuckle.

- Remove the bolt.

E47918

8. Loosen the tie-rod end ball joint retaining nut.

9.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the tie-rod end ball joint from the wheel knuckle.

- Discard the nut.

10.  CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.

11.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the upper arm ball joint.

- Remove and discard the retaining nut.

12. **CAUTIONS:**

 The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

 Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

13. Release the halfshaft from the wheel knuckle.

14. Position a container to collect the oil spillage.

15. Release the halfshaft from the differential housing.

16.  **CAUTION:** Keep the halfshaft horizontal to avoid damaging the oil seal.

Remove the halfshaft.

- Raise the stabilizer bar to allow removal of the halfshaft.
- Remove and discard the snap ring.

17. Using the special tools, remove and discard the halfshaft oil seal.

Installation

1. Clean the components.

2. Using the special tools, install a new halfshaft oil seal.
- The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

3.  **NOTE:** Do not fully engage the halfshaft until the oil seal protector has been removed.

Install the halfshaft.

- Install the snap ring.
- Lubricate the seal and the bearing running surfaces with clean axle oil.
- Make sure the snap ring is fully engaged and retains the halfshaft.
- Open the halfshaft oil seal protector.

4.  **NOTE:** The oil seal protector is designed to break into two pieces.

Remove and discard the halfshaft oil seal protector.

E51770

E50782

5.  **CAUTION:** The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

Using the special tools, install the halfshaft in the wheel hub.

6. Connect the upper arm and wheel knuckle.
 - Install a new nut and tighten to 70 Nm (52 lb.ft).
7. Secure the stabilizer bar link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).
8. Connect the tie-rod end ball joint.
 - Install a new nut and tighten to 76 Nm (56 lb.ft).
9.  **CAUTION:** Install the halfshaft nut finger tight.

Install a new halfshaft retaining nut and lightly tighten.
10. Secure the brake hose retaining bracket to the wheel knuckle.
 - Tighten the bolt to 22 Nm (16 lb.ft).
11. Secure the LH stabilizer link.
 - Install a new nut and tighten to 115 Nm (85 lb.ft).
12.  **CAUTION:** Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 230 Nm (170 lb.ft).

 - Stake the nut to the halfshaft.
13. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
14.  **CAUTION:** Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

Fill the differential with the correct amount of lubricant. For additional information, refer to: Differential Draining and Filling (205-03 Front Drive Axle/Differential, General Procedures).

Front Drive Halfshafts - Outer Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
2. Remove the wheel and tire.
3. Remove the halfshaft.
For additional information, refer to: Front Halfshaft LH (205-04 Front Drive Halfshafts, Removal and Installation).
4. Clamp the halfshaft in a vise.
5. Remove and discard the CV joint boot retaining clamps.

6. Slide the CV joint boot along the halfshaft to gain access to the joint.
7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.
 - Remove and discard the snap ring.

E46875

8. Remove the outer CV joint boot.

Installation

1. Clean the components.
2. Install the CV joint boot.
3. Install the outer CV joint.
 - Install the snap ring.
 - Position the CV joint on the halfshaft, press the snap ring into its groove and push the CV joint fully on to the halfshaft.
 - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the CV joint with the grease supplied.

E137494

5. CAUTIONS:

 Make sure the CV boot is not pushed too far onto the drive shaft and the recess is exposed, failure to follow this instruction may result in damage to the component.

 After the clamps have been secured do not adjust them, failure to follow this instruction may result in damage to the component.

Install the CV joint boot to the CV joint.

- Using a suitable tool, secure the CV joint boot with the new clamps.

6. Install the halfshaft.

For additional information, refer to: Front Halfshaft LH (205-04 Front Drive Halfshafts, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Halfshafts - Outer Constant Velocity (CV) Joint

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
2. Remove the wheel and tire.
3. Remove the halfshaft.
For additional information, refer to: Front Halfshaft LH (205-04 Front Drive Halfshafts, Removal and Installation).
4. Clamp the halfshaft in a vise.
5. Remove and discard the CV joint boot retaining clamps.

6. Slide the CV joint boot along the halfshaft to gain access to the joint.
7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.
 - Remove and discard the snap ring.

E46875

8. Remove the outer CV joint boot.

Installation

1. Clean the components.
2. Install the CV joint boot.
3. Install the outer CV joint.
 - Install the snap ring.
 - Position the CV joint on the halfshaft, press the snap ring into its groove and push the CV joint fully on to the halfshaft.
 - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the CV joint with the grease supplied.

E137494

5. CAUTIONS:

 Make sure the CV boot is not pushed too far onto the drive shaft and the recess is exposed, failure to follow this instruction may result in damage to the component.

 After the clamps have been secured do not adjust them, failure to follow this instruction may result in damage to the component.

Install the CV joint boot to the CV joint.

- Using a suitable tool, secure the CV joint boot with the new clamps.

6. Install the halfshaft.

For additional information, refer to: Front Halfshaft LH (205-04 Front Drive Halfshafts, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Halfshafts - Inner Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the halfshaft.
For additional information, refer to: Halfshaft LH (205-04, Removal and Installation).

4. Clamp the halfshaft in a vise.

5. Remove and discard the CV joint boot retaining clamps.

6. Slide the CV joint boot along the halfshaft to gain access to the joint.

7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.
 - Remove and discard the snap ring.

E46875

8. Remove the inner joint boot.

Installation

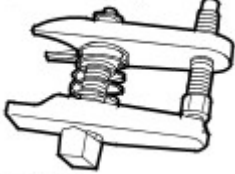

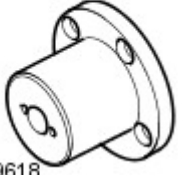

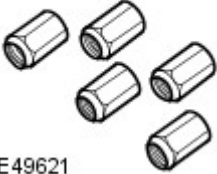

1. Clean the components.
2. Install the inner joint boot.
3. Install the inner joint.
 - Install a new snap ring.
 - Position the CV joint on the halfshaft, press the snap ring into its groove and push the CV joint fully on to the halfshaft.
 - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the joint with the grease supplied.
5. Install the CV joint boot to the CV joint.
 - Secure with the new clamps.
6. Install the halfshaft.

For additional information, refer to: Halfshaft LH (205-04, Removal and Installation).
7. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Drive Halfshafts - Halfshaft Seal LH

Removal and Installation

Removal

CAUTIONS:

Do not store or install halfshafts with joints at maximum articulation or damage may occur to the joint

Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

1. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the LH halfshaft.
For additional information, refer to: Halfshaft LH (205-04, Removal and Installation).
3. Using the special tools, remove and discard the halfshaft oil seal.

E54138

Installation

E54139

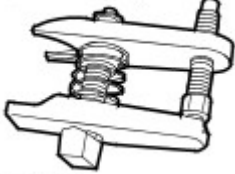

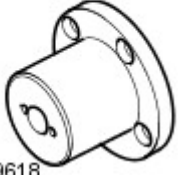

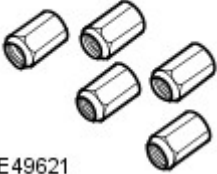

1. Using the special tools, install a new halfshaft oil seal.
 - The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

2. Install the LH halfshaft.
For additional information, refer to: Halfshaft LH (205-04, Removal and Installation).

* **New nut must be installed**

+ **Stake nut on completion**

Rear Drive Halfshafts - Rear Drive Halfshafts

Description and Operation

Rear Drive Halfshaft Component Locations

E46407

Item	Part Number	Description
1	-	RH rear drive halfshaft
2	-	LH rear drive halfshaft

GENERAL

The rear drive halfshafts are identical in their construction with a Constant Velocity (CV) joint at each end to allow for suspension movement.

REAR DRIVE SHAFT ASSEMBLY

E46408

Item	Part Number	Description
1	-	RH outer CV joint
2	-	RH rear drive halfshaft
3	-	RH inner CV joint
4	-	LH inner CV joint
5	-	LH rear drive halfshaft
6	-	LH outer CV joint

Each outer CV joint has a target wheel on the outer diameter. This target is used by the ABS wheel speed sensor for vehicle and wheel speed calculations.

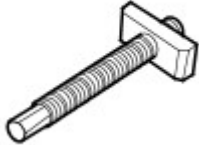

Each rear drive halfshaft comprises two CV joints (inner and outer), boots and a solid barshaft, which is retained in the rear differential by a circlip.

The CV joints used on the rear drive halfshafts share the same design and operating principles as the front drive halfshafts CV joints (see 'Halfshaft Joint' section for more information on CV joints). The rear drive halfshaft inner joint hubs are retained by peening over the lip of the joint body.

Rear Drive Halfshafts - Rear Halfshaft

---	---

Removal

CAUTIONS:

Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

Do not store or install halfshafts with joints at maximum articulation or damage may occur to the joint.

Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

Do not undo or remove the large protruding hexagon on the differential casing.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
2. Drain the differential lubricant.
For additional information, refer to: Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).
3. Remove the wheel and tire.
4. Loosen the halfshaft retaining nut.
 - Discard the nut.

E46796

5. Remove the stabilizer bar link.
For additional information, refer to: Rear Stabilizer Bar Link (204-02 Rear Suspension, Removal and Installation).
6. Release the parking brake cable from the lower arm.

E49702

7. Disconnect the toe link.
 - Remove the bolt.

E46797

8. Remove and discard the halfshaft retaining nut.

E46798

9.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the knuckle from the lower arm.

- Remove the bolt.

E50560

10.  **CAUTION:** Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

11. Position a container to collect the oil spillage.
12. Release the halfshaft from the differential housing.
13. With assistance, remove the halfshaft.
 - Remove and discard the snap ring.

E45752

14. Using the special tools, remove and discard the halfshaft oil seal.

E54138

Installation

1. Clean the components.
2. Using the special tools, install a new halfshaft oil seal.
 - The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

E54139

3. With assistance, install the halfshaft.
 - Install the snap ring.
 - Open the halfshaft oil seal protector.
 - Make sure the snap ring is fully engaged and retains the halfshaft.

E51770

4.  **NOTE:** The oil seal protector is designed to break into two pieces.

Remove and discard the halfshaft oil seal protector.

E50561

5. Using the special tools, install the halfshaft in the wheel hub.

6.  **CAUTION:** Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the lower arm to the wheel knuckle.

- Tighten to 275 Nm (203 lb.ft).
- Tighten the new nut to 275 Nm (203 lb.ft).

7.  **CAUTION:** Install the halfshaft nut finger tight.

Install a new halfshaft retaining nut and lightly tighten.

8. Connect the toe link.
- Tighten the bolt to 175 Nm (129 lb.ft).
9. Secure the parking brake cable to the lower arm.
10. Install the stabilizer bar link.
For additional information, refer to: Rear Stabilizer Bar Link (204-02 Rear Suspension, Removal and Installation).

11.  **CAUTION:** Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 420 Nm (311 lb.ft).

- Stake the nut to the halfshaft.

12. Install the wheel and tire.
- Tighten the wheel nuts in the sequence shown:

1. Stage 1: 4 Nm
2. Stage 2: 70 Nm
3. Stage 3: 140 Nm

E74593

13.  **CAUTION:** Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

Fill the differential with the correct amount of lubricant. For additional information, refer to: Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).

Rear Drive Halfshafts - Outer Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the halfshaft.
For additional information, refer to: Halfshaft (205-05, Removal and Installation).

4. Clamp the halfshaft in a vise.

5. Remove and discard the CV joint boot retaining clamps.

6. Slide the CV joint boot along the halfshaft to gain access to the joint.

7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.
 - Remove and discard the snap ring.

E46875

8. Remove the outer CV joint boot.

Installation

1. Clean the components.
2. Install the CV joint boot.
3. Install the outer CV joint.
 - Install the snap ring.
 - Position the CV joint on the halfshaft, press the snap ring into its groove and push the CV joint fully on to the halfshaft.
 - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the CV joint with the grease supplied.

5. Install the CV joint boot to the CV joint.
 - Secure with the new clamps.
6. Install the halfshaft.
For additional information, refer to: Halfshaft (205-05, Removal and Installation).
7. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Drive Halfshafts - Inner Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the halfshaft.
For additional information, refer to: Halfshaft (205-05, Removal and Installation).

4. Clamp the halfshaft in a vise.

5. Remove and discard the CV joint boot retaining clamps.

6. Slide the CV joint boot along the halfshaft to gain access to the joint.

7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.
 - Remove and discard the snap ring.

E46875

8. Remove the inner CV joint boot.

Installation

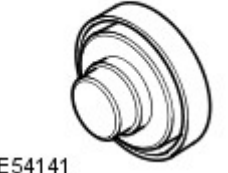

1. Clean the components.
2. Install the inner CV joint boot.
3. Install the inner joint.
 - Install a new snap ring.
 - Position the CV joint on the halfshaft, press the snap ring into its groove and push the CV joint fully on to the halfshaft.
 - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the joint with the grease supplied.

5. Install the boot to the joint.
 - Secure with the new clamps.
6. Install the halfshaft.
For additional information, refer to: Halfshaft (205-05, Removal and Installation).
7. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Drive Halfshafts - Halfshaft Bearing

Removal and Installation

Special Tool(s)

 <p>308-005</p> <p>E54134</p>	Axle oil seal remover 308-005 (LRT-37-004/2)
 <p>100-012</p> <p>E54135</p>	Impulse extractor 100-012 (LRT-99-004)
 <p>205-819</p> <p>E54141</p>	Halfshaft bearing installer 205-819

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove and discard the halfshaft oil seal.
For additional information, refer to: Halfshaft (205-05, Removal and Installation).
4. Using the special tool, remove and discard the halfshaft bearing.

E54138

Installation

1. Using the special tools, install a new halfshaft bearing.

E54143

2. Install a new halfshaft oil seal.
For additional information, refer to: Halfshaft (205-05, Removal and Installation).
3. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Brake System - General Information -

Brake Hydraulic Fluid

Item	Specification
* Recommended hydraulic fluid	SHELL DONAX YB DOT4 ESL FLUID

CAUTION: * If the above fluid is not available, use a low viscosity DOT 4 brake fluid meeting ISO 4925 Class 6 and Land Rover LRES22BF03 requirements.

General Specification

Item	Specification
Footbrake type:	
Vehicles without Brembo brakes	Hydraulic, servo assisted, self-adjusting with front/rear split hydraulic system, twin piston sliding calipers to the front and single piston sliding calipers to the rear
Vehicles with Brembo brakes	Hydraulic, servo assisted, self-adjusting with front/rear split hydraulic system, opposed six piston calipers to the front and single piston sliding calipers to the rear
Parking brake type	Twin shoe (leading/trailing) operating on rear wheels and controlled from park brake lever in floor console via twin cables

Brake System - General Information - Brake System

Diagnosis and Testing

Principles of Operation

For a detailed description of the Brake System and operation, refer to the relevant Description and Operation section of the workshop manual.REFER to:

Front Disc Brake (206-03, Description and Operation),
 Front Disc Brake (206-03, Description and Operation),
 Rear Disc Brake (206-04, Description and Operation),
 Rear Disc Brake (206-04, Description and Operation),
 Parking Brake (206-05, Description and Operation),
 Parking Brake (206-05, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
 - If a road test is necessary make sure the vehicle is safe to do so.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> • Brake pad(s) condition and installation • Brake caliper(s) condition and installation • Brake disc(s) condition and installation • Parking brake disc(s)/parking brake drum(s) condition and installation • Parking brake shoes condition and installation • Parking brake cable(s) condition and installation • Brake booster condition and installation • Brake booster vacuum hose condition and installation • Brake master cylinder condition and installation • Hydraulic Control Unit (HCU) • Brake fluid leaks • Brake warning indicator

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Brake noise	<ul style="list-style-type: none"> • Debris • Brake pads • Brake disc(s) 	<ul style="list-style-type: none"> • Remove the debris • Install new brake pads as necessary • Install new brake discs as necessary
Brake vibration	<ul style="list-style-type: none"> • Suspension components • Brake disc(s) 	<ul style="list-style-type: none"> • Check the installation of the suspension components • Refer to the relevant section of the workshop manual and test the brake disc runout
Excessive brake pedal travel/brake pedal spongy	<ul style="list-style-type: none"> • Brake pads <ul style="list-style-type: none"> - Worn brake pads may make the pedal travel excessive - New brake pads may make the pedal spongy • Air in the brake system <ul style="list-style-type: none"> - If the pedal "pumps-up", suspect air in the system • Brake master cylinder <ul style="list-style-type: none"> - If the pedal sinks to the floor when held under pressure when there are no external leaks, suspect 	<ul style="list-style-type: none"> • Install new brake pads as necessary. Road test to bed in the brake pads • Check for a cause for air ingress, rectify as necessary • Install a new brake master cylinder as necessary • Rectify the brake fluid leak as necessary

	<ul style="list-style-type: none"> • a master cylinder fault • Brake fluid leak (see visual inspection) 	
Excessive brake pedal effort/brake pedal hard	<ul style="list-style-type: none"> • Brake pipe(s) • Brake caliper slide(s) • Brake caliper piston(s) • Brake vacuum hose • Brake vacuum pump • Brake booster 	<ul style="list-style-type: none"> • Check for damaged brake pipes • Check the brake caliper slides • Check the brake caliper pistons • Check the brake vacuum hose for air leaks • Check the brake vacuum pump operation • Check the brake booster
Low foot brake efficiency / brakes pulling / sticking / binding	<ul style="list-style-type: none"> • Brake pipe(s) • Brake pads • Brake caliper piston(s) • Brake caliper slide(s) • Brake disc(s) 	<ul style="list-style-type: none"> • Check for damaged brake pipes • Check the brake pads • Check the brake caliper pistons • Check the brake caliper slides • Check the brake discs
Parking brake will not engage or release	<ul style="list-style-type: none"> • Electric park brake cables • Electric park brake shoes • Electric park brake adjusters • Rear brake disc(s)/drum(s) • Electric park brake actuator malfunction 	<ul style="list-style-type: none"> • Check the electric park brake cable(s) for operation/condition. Check that the cable end connector(s) are correctly installed to the operating lever(s) • Check the electric park brake shoes for wear • Check the electric park brake shoes for correct adjustment • Check the rear brake disc(s)/drum(s) • Check the electric park brake actuator for damage and/or excessive noise in normal operation
Low parking brake efficiency / parking brake sticking / binding		
Brake warning indicator staying illuminated	<ul style="list-style-type: none"> • Brake reservoir fluid level • Brake pads • Brake pad wear sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance • Brake fluid level sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance 	<ul style="list-style-type: none"> • Check the brake fluid level, top up if required • Check the brake pads • Refer to the electrical circuit diagrams and test the brake pad wear sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Refer to the electrical circuit diagrams and test the brake fluid level sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Brake System - General Information - Front Brake Disc Runout Check

General Procedures

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

LH illustration shown, RH is similar.

1. **WARNING:** Make sure to support the vehicle with axle stands.

Raise the front of the vehicle.

2. Remove the road wheel.

E119129

3. **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Release the brake caliper and tie aside.

E46955

4. **CAUTION:** Brake discs must be renewed in pairs, unless one disc requires changing before 1000 miles (1600 kilometers) from new.

At 4 points around disc, measure disc thickness using a micrometer; renew disc if less than service limit or if variation is exceeded: Disc thickness, NEW 30 mm, Service limit = 27 mm. Thickness variation maximum = 0.01.

5. Mount a Dial Test Indicator (DTI) to and secure to inboard side of hub using caliper assembly upper bolt hole

6. Position DTI probe 5 mm in from outer edge of disc.

7. Install spacer washers under the wheel nuts.
- Tighten the road wheel nuts to 140 Nm (103 lb.ft).

8. Zero DTI and rotate road wheel one complete revolution to measure disc runout. Disc runout must not exceed 0.05 mm (0.002 in).

9. If disc runout is outside limits:

10. Remove the wheel hub nuts.

- Remove the spacers.

11. Remove Allen screw securing brake disc to drive flange.

12. Remove the brake disc.

13. Ensure mating surfaces of disc and drive flange are clean.

14. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

15. Install spacer washers under the wheel nuts.

- Tighten the road wheel nuts to 140 Nm (103 lb.ft).

16. Check disc runout as detailed above.

17. If runout is still outside limits, renew disc and/or hub.

18. Remove the wheel hub nuts.

- Remove the spacers.

19. Remove the DTI.

20. Install the brake caliper and tighten the bolts. TORQUE: 275 Nm

21. Install the road wheel(s) and tighten nuts to 140Nm (103 lb-ft).

22. Depress brake pedal several times to set brake pads.

23. Lower the vehicle.

Brake System - General Information - Rear Brake Disc Runout Check

General Procedures

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

RH illustration shown, LH is similar.

It is not necessary to carry out the parking brake shoe 'bedding-in procedure' if the rear brake discs or parking brake shoes have been removed for access to other components.

-  **CAUTION:** Do not turn the ignition on when the parking brake service mode has been set, this will result in the parking brake being released from the service mode.

Enter the parking brake into the service mode.

- Turn the ignition on.
- Apply, and hold, the footbrake.
- Apply, and hold, the parking brake switch to the RELEASE position.
- Turn the ignition off.
- Release the footbrake.
- Release the parking brake switch.

-  **WARNING:** Make sure to support the vehicle with axle stands.

Raise rear of vehicle.

- Remove road wheel.

E121022

-  **CAUTION:** The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

RH side rear only: Disconnect the brake pad wear indicator sensor lead.

- Remove 2 bolts securing brake caliper to hub. Release caliper from hub and tie aside.

E119130

E46955

E46956

6.  **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

At 4 points around the disc, measure disc thickness using a micrometer; renew disc if less than service limit or if variation is exceeded: Disc thickness, NEW = 20 mm
Service limit = 18 mm. Thickness variation maximum = 0.01 mm.

7.  **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Mount a Dial Test Indicator (DTI) to and secure to inboard side of hub using caliper assembly upper bolt hole.

8. Position DTI probe 5 mm in from outer edge of disc.

E119132

9.  **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Tighten the wheel nuts to 140 Nm (103 lb.ft).
• Install spacer washers under the wheel nuts.

10. Zero DTI and rotate wheel one complete revolution to

measure disc runout. Disc runout must not exceed 0.09 mm (0.003 in).

11. If disc runout is outside limits:
12. Remove the wheel hub nuts.
 - Remove the spacer washers.
13. Remove Allen screw securing brake disc to drive flange.
14. Remove brake disc.
15. Ensure mating surfaces of disc and drive flange are clean.
16. Install the brake disc.
 - Tighten the Torx screw to 35 Nm (26 lb.ft).
17. Tighten the wheel nuts to 140 Nm (103 lb.ft).
 - Install spacer washers under the wheel nuts.
18. Check disc runout as detailed above.
19. If runout is still outside limits, renew disc and/or hub.
20. Remove the wheel hub nuts.
 - Remove the spacer washers.
21. Remove the DTI.
22. Install the brake caliper anchor bolts
 - Tighten the bolts to 115 Nm (85 lb.ft).

23. Tighten the wheel nuts to 140 Nm (103 lb.ft).
24. Depress brake pedal several times to set brake pads.
25. Remove stands and lower vehicle.

Brake System - General Information - Brake System Bleeding

General Procedures

WARNING: If any components upstream of the Hydraulic Control Unit (HCU), including the HCU itself are replaced, the brake system must be bled using Land Rover approved diagnostic equipment. This will ensure that all air is expelled from the new component(s).

NOTES:

Bleeding of the complete brake system must be carried out using Land Rover approved diagnostic equipment. Where only the primary or secondary brake circuits have been disturbed in isolation, it should only be necessary to bleed that circuit. Partial bleeding of the hydraulic system is only permissible if a brake tube or hose has been disconnected with only minimal loss of fluid.

Some variation in the illustrations may occur, but the essential information is always correct.

- WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

- Check that the brake fluid lines are secure and that there are no signs of a brake fluid leak. If a brake fluid leak is detected, investigate and rectify the cause of the leak before bleeding the brakes.

E62458

- WARNING:** Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

CAUTIONS:

Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

Fill the brake fluid reservoir to the MAX mark.

- Disconnect the brake fluid reservoir electrical connector.
- Remove the brake fluid reservoir cap.

- Conduct the bleed procedure with the engine running.
- Connect the diagnostic tool to the vehicle, select diagnostic and proceed as directed for bleeding the brake system.
- Starting at the brake caliper furthest away from the brake master cylinder, loosen the bleed screw by one-half to three-quarters of a turn.

E62462

RHD

7. Install the bleed tube to the brake caliper bleed screw and immerse the free end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.
 - Hold the bleed container at least 300 mm above the Caliper that is being bled.
8.  **CAUTION:** The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

With assistance, depress the brake pedal steadily through to 2/3 of its full stroke.

9. With the brake pedal held down, close bleed screw and then return the brake pedal to 1/3 of its full stroke and hold.
10. Repeat steps 8 and 9, 28 times for the rear brake and 10 times for the front brake.
11. At the end of the bleed process, depress and hold the brake pedal down.
12.  **CAUTION:** Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the brake pedal fully depressed, tighten the bleed screw to 10 Nm (7 lb.ft).

E62459

13. Fill the brake fluid reservoir to the MAX mark.

14.  **WARNING:** Braking efficiency may be seriously impaired if an incorrect bleed sequence is used.

Repeat the brake bleeding procedure for each brake caliper, following the above sequence.

15. Fill the brake fluid reservoir to the MAX mark.

16. Apply the brakes and check for leaks.

17. Install the brake fluid reservoir cap.

- Connect the brake fluid reservoir electrical connector.

18. On completion, road test the vehicle and check the brake pedal operation. The pedal travel should be short with a firm feel.

Brake System - General Information - Brake System Pressure Bleeding

General Procedures

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Check that the brake fluid lines are secure and that there are no signs of a brake fluid leak. If a brake fluid leak is detected, investigate and rectify the cause of the leak before bleeding the brakes.

3.  **WARNING:** Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

CAUTIONS:

Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

Fill the brake fluid reservoir to the MAX mark.

- Disconnect the brake fluid reservoir electrical connector.
- Remove the brake fluid reservoir cap.

4. Conduct the bleed procedure with the engine running.
5. Starting at the brake caliper furthest away from the brake master cylinder, loosen the bleed screw by one-half to three-quarters of a turn.

E59536

6.
 - Install the bleed tube to the brake caliper bleed screw and immerse the free end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.
 - Hold the bleed container at least 300 mm above the Caliper that is being bled.

7.  **CAUTION:** The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

With assistance, depress the brake pedal steadily through to 2/3 of its full stroke.

8. With the brake pedal held down, close bleed screw and then return the brake pedal to 1/3 of its full stroke and hold.
9. Repeat steps 7 and 8, 28 times for the rear brake and 10 times for the front brake.
10. At the end of the bleed process, depress and hold the brake pedal down.

11.  **CAUTION:** Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the brake pedal fully depressed, tighten the bleed screw.

- On vehicles with high performance brakes, tighten the front caliper bleed screw to 19 Nm (14 lb.ft).
 - On vehicles with standard brakes, tighten the front caliper bleed screw to 10 Nm (7 lb.ft).
 - Tighten the rear caliper bleed screws to 10 Nm (7 lb.ft).
12. Fill the brake fluid reservoir to the MAX mark.

13.  **WARNING:** Braking efficiency may be seriously

impaired if an incorrect bleed sequence is used.

Repeat the brake bleeding procedure for each brake caliper, following the above sequence.

14. Fill the brake fluid reservoir to the MAX mark.
15. Apply the brakes and check for leaks.
16. Install the brake fluid reservoir cap.
 - Connect the brake fluid reservoir electrical connector.
17. On completion, road test the vehicle and check the brake pedal operation. The pedal travel should be short with a firm feel.

Brake System - General Information - Component Bleeding

General Procedures

WARNING: If any components upstream of the Hydraulic Control Unit (HCU), including the HCU itself are replaced, the brake system must be bled using Land Rover approved diagnostic equipment. This will ensure that all air is expelled from the new component(s).

CAUTION: LH illustration shown, RH is similar.

NOTES:

Bleeding of the complete brake system must be carried out using Land Rover approved diagnostic equipment. The following manual procedure covers bleeding the brake system for components down stream of the HCU, where only the primary or secondary brake circuits have been disturbed in isolation. Partial bleeding of the hydraulic system is only permissible if a brake tube or hose has been disconnected with only minimal loss of fluid.

Some variation in the illustrations may occur, but the essential information is always correct.

- WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

- Check that the brake fluid lines are secure and that there are no signs of a brake fluid leak. If a brake fluid leak is detected, investigate and rectify the cause of the leak before bleeding the brakes.
- Pump the brake pedal until the brake vacuum assistance is exhausted.

E62458

- WARNING:** Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

CAUTIONS:

Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

Remove the brake fluid reservoir cap.

- Disconnect the brake fluid reservoir electrical connector.
- Fill the brake fluid reservoir to the MAX mark.

- Install the bleed tube to the brake caliper bleed screw and immerse the free end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.
 - Hold the bleed container at least 300 mm above the Caliper that is being bled.
- Loosen the bleed screw by one-half turn to three-quarters of a turn.

- CAUTION:** The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

With assistance, depress the brake pedal steadily through

to 2/3 of its full stroke.

8. With the brake pedal held down, close bleed screw and then return the brake pedal to 1/3 of its full stroke and hold.
9. Repeat steps 7 and 8, 28 times for the rear brake and 10 times for the front brake.
10. At the end of the bleed process, depress and hold the brake pedal down.

E62459

11.  **CAUTION:** Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the brake pedal fully depressed, tighten the bleed screw.

- On vehicles with high performance brakes, tighten the front caliper bleed screw to 19 Nm (14 lb.ft).
- On vehicles with standard brakes, tighten the front caliper bleed screw to 10 Nm (7 lb.ft).
- Tighten the rear caliper bleed screws to 10 Nm (7 lb.ft).

12. Fill the brake fluid reservoir to the MAX mark.
13. Apply the brakes and check for leaks.
14. Install the brake fluid reservoir cap.
 - Connect the brake fluid reservoir electrical connector.
15. On completion, road test the vehicle and check the brake pedal operation. The pedal travel should be short with a firm feel.

Brake System - General Information - Front Brake Disc Runout Check - With Wheel On

General Procedures

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

LH illustration shown, RH is similar.

- WARNING:** Make sure to support the vehicle with axle stands.

Raise the front of the vehicle.

- NOTES:

Take care not to contact back plate with DTI probe.

DTI probe extension maybe required.

Use magnetic base stand to mount [Dial Test Indicator \(DTI\) gauge](#) as shown 5 mm in from edge of disc.

- Zero DTI and rotate the wheel one full complete revolution to measure disc runout. Disc runout must not exceed 0.03 mm.

E74593

- NOTE:** The following steps must be followed if the runout exceeds 0.03 mm.

Remove and rotate the wheel 2 stud holes and install the wheel and tire in the new position.

- Tighten the road wheel nuts in sequence as shown above to the following:
 - Stage 1: 4 Nm.
 - Stage 2: 70 Nm.
 - Stage 3: 140 Nm.

- Check runout as detailed above.

NOTE: If the runout still exceeds 0.03

- Check hub drive flange runout. For additional information, refer to: Front Wheel Bearing and Wheel Hub Runout Check (204-00, General Procedures).

- Install the wheel and tire.

- Tighten the road wheel nuts in sequence as shown above to the following:
- Stage 1: 4 Nm.
- Stage 2: 70 Nm.
- Stage 3: 140 Nm.

E74593

Brake System - General Information - Rear Brake Disc Runout Check - With Wheel On

General Procedures

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

RH illustration shown, LH is similar.

It is not necessary to carry out the parking brake shoe 'bedding-in procedure' if the rear brake discs or parking brake shoes have been removed for access to other components.

1.  **CAUTION:** Do not turn the ignition on when the parking brake service mode has been set, this will result in the parking brake being released from the service mode.

Enter the parking brake into the service mode.

- Turn the ignition on.
- Apply, and hold, the footbrake.
- Apply, and hold, the parking brake switch to the RELEASE position.
- Turn the ignition off.
- Release the footbrake.
- Release the parking brake switch.

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise rear of vehicle.

3. Remove road wheel.

E121022

4.  **CAUTION:** The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

RH side rear only: Disconnect the brake pad wear indicator sensor lead.

5. Remove 2 bolts securing brake caliper to hub. Release caliper from hub and tie aside.

E119130

E46955

E46956

6. NOTES:

 Some variation in the illustrations may occur, but the essential information is always correct.

 Wheel and tire shown removed for clarity

At 4 points around the disc, measure disc thickness using a micrometer; renew disc if less than service limit or if variation is exceeded: Disc thickness, NEW = 20 mm
Service limit = 18 mm. Thickness variation maximum = 0.01 mm.

7.  NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Mount a Dial Test Indicator (DTI) to and secure to inboard side of hub using caliper assembly upper bolt hole.

8. Position DTI probe 5 mm in from outer edge of disc.

9.  CAUTION: Take care not to trap the calliper.

Install the wheel.

- Tighten the road wheel nuts in sequence to the following
- Stage 1: 4 Nm.
- Stage 2: 70 Nm.
- Stage 3: 140 Nm.

10. Zero DTI and rotate wheel one complete revolution to measure disc runout. Disc runout must not exceed 0.09 mm (0.003 in).

11. **If disc runout is outside limits:**

12. Remove the wheel.

13. Remove Allen screw securing brake disc to drive flange.
14. Remove brake disc.
15. Make sure the mating surfaces of disc and drive flange are clean.
16. Install the brake disc.

17.  **CAUTION:** Take care not to trap the calliper.

Install the wheel.

- Tighten the road wheel nuts in sequence to the following
- Stage 1: 4 Nm.
- Stage 2: 70 Nm.
- Stage 3: 140 Nm.

18. Check disc runout as detailed above.
19. If runout is still outside limits.

20.  **NOTE:** Take care not to trap the calliper.

Remove and rotate the wheel 120 degrees and install the wheel in the new position

- Tighten the road wheel nuts in sequence to the following:
- Stage 1: 4 Nm.
- Stage 2: 70 Nm.
- Stage 3: 140 Nm.

21. Zero DTI and rotate wheel one complete revolution to measure disc runout. Disc runout must not exceed 0.09 mm (0.003 in).

22. Remove the DTI.

23. Install the brake caliper anchor bolts
 - Tighten the bolts to 115 Nm (85 lb.ft).

E119130

24. Install the wheel.
 - Tighten the road wheel nuts in sequence to the following:
 - Stage 1: 4 Nm.
 - Stage 2: 70 Nm.
 - Stage 3: 140 Nm.

25. Depress brake pedal several times to set brake pads.

26. Remove stands and lower vehicle.

Brake System - General Information - Brake Pad Bedding-In

General Procedures

NOTE: This procedure is to gradually increase the temperature in the braking components without inducing thermal shock and to mate the brake pad and disc friction surfaces.

1. With the vehicle stationary, pump the brake pedal until the pedal is firm.
2. Drive the vehicle and make sure that the braking system operates correctly.

3. NOTE: The following steps must be done without excessive traffic.

Using light to medium deceleration and varying speeds, leave at least 0.5 mile (0.8 Km) between each brake application.

4. Drive the vehicle, performing 30 brake applications, with a duration of 3 seconds for each application.

Front Disc Brake -

Item	Specification

OVERVIEW

Each front brake each consists of a twin piston brake brake caliper, a ventilated brake disc and a dust shield. All models the same brake caliper, disc and dust shield.

The brake brake caliper is attached to the rear of the wheel knuckle. The brake pads are made from an asbestos free material. The inboard brake pad of the left front brake incorporates a wear sensor.

When hydraulic pressure is supplied to the brake caliper, the pistons extend and force the inner pad against the disc. The brake caliper reacts and slides on the guide pins to bring the outer pad into contact with the disc.

The front brake pad wear sensor is connected in series with the rear brake pad wear sensor, between the Instrument Cluster (IC) and ground. When a brake pad incorporating a brake pad wear sensor is approximately 75% worn, the brake pad wear sensor goes open circuit. When the IC detects the open circuit, it illuminates the amber Light Emitting Diode (LED) in the brake warning indicator and displays an appropriate warning in the message center and sound a warning chime.

For additional information, refer to: Instrument Cluster (413-01, Description and Operation).

At the beginning of each ignition cycle, the IC performs a bulb check on the brake warning indicator: the indicator is illuminated amber for 1.5 seconds, red for 1.5 seconds, then goes off.

Front Disc Brake - Front Disc Brake

Description and Operation

The braking system has been modified to compensate for the additional weight of the armoured vehicle.

Heavy-duty calipers are mated to larger diameter discs. The discs are ventilated with directionally curved veins for increased airflow and consequently optimum cooling. The inboard side of the disc is protected by a one piece dust-shield.

The front monobloc calipers are attached to the vehicle's wheel knuckles, and comprise three pairs of horizontally opposed pistons. With each pair of pistons being a different diameter to the other pairs of pistons:

- the smallest pair of pistons are at the leading edge of the pad, and
- the largest pair of pistons furthest from the leading edge.

This staggered piston arrangement provides a progressive braking force and even wear by reducing tapered wearing of the brake pads.

The brake pads also provide a firm consistent pedal with excellent cold performance for start-up and low-speed driving and are specially formulated for resistance to fade at high temperatures.

Heavy-duty caliper and large diameter brake disc

Front Disc Brake - Brake Disc Vehicles With: Standard Brakes

Removal and Installation

Removal

WARNING: If installing a new brake disc, install new brake pads.

CAUTION: Brake discs must be renewed in pairs.

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

The brake pad wear warning indicator sensor must be replaced each time the brake pads are serviced.

- WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
- Remove the front wheel and tire.

- CAUTIONS:**

Do not allow the brake caliper to hang on the brake hose.

LH side: Do not allow the brake caliper to hang on the brake pad wear warning sensor lead.

Remove the brake caliper and anchor plate.

- Remove the brake caliper anchor bolts.
- Tie the brake caliper aside.

- Remove the front brake disc.
 - Remove the Allen screw.

Installation

- Make sure the brake disc and hub mating surfaces are clean.
- Install the brake disc.
 - Tighten the Torx screw to 35 Nm (26 lb.ft).

3. Install the brake caliper and anchor plate.
 - Clean the component mating faces.
 - Tighten the bolts to 275 Nm (203 lb.ft).

4.  **NOTE:** Tighten the wheel nuts in the sequence shown:

Install the wheels and tires.

- Stage 1 : 4Nm
- Stage 2 : 70Nm
- Stage 3 : 140Nm

E74593

5. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.
6. For additional information, refer to: Brake Pad Bedding-In (206-00 Brake System - General Information, General Procedures).

Front Disc Brake - Brake Pads Vehicles With: Standard Brakes

Removal and Installation

Removal

WARNINGS:

Brake pads must be renewed in axle sets only, otherwise braking efficiency may be impaired.

If the brake pad wear warning light has been activated, the pad wear sensor must be replaced.

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

3. **CAUTION:** The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

LH side front: Disconnect the brake pad wear indicator sensor wiring harness.

4. **NOTE:** This step is only required if a new wear indicator harness is installed.

Remove the front LH fender splash shield.

For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).

5. **NOTE:** This step is only required if a new wear indicator harness is installed.

LH side front: Release and disconnect the brake pad wear indicator wiring harness.

6. **NOTE:** Use an additional wrench to prevent the component from rotating.

Remove the brake caliper lower bolt.

E121134

E61636

7.  **NOTE:** Note the orientation of the brake pads including the position of the small mass on the outer pad.

Remove the brake pads.

- Rotate the brake caliper upwards.
- Remove the 2 clips.

8. Repeat the above 2 steps for the other side.

Installation

1.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the brake caliper housing and anchor plate using brake cleaning fluid.

2. Inspect the caliper piston and slide pin seals for damage.

3. **CAUTIONS:**

The brake caliper should move freely on both slide

pins.

 If necessary, renew the components.

 **Make sure that the plain slide pin is installed to the upper part of the caliper and the bushed slide pin is installed to the lower part.**

Check the slide pins for correct operation.

4.  **CAUTION:** Check the brake fluid reservoir level before pushing the piston back, failure to follow this instruction may result in damage to the vehicle.

 **NOTE:** As the piston is pushed back into the caliper housing, the brake fluid level in the reservoir will rise. Do not allow the reservoir to overflow.

Press the pistons into the caliper housing.

5.  **CAUTION:** **Make sure that the plain clip is installed to the bottom part of the caliper and the rubber coated clip is installed to the upper part.**

Install the 2 clips

E147727

6. Apply a suitable amount of the supplied grease to the caliper, as illustrated.

E147730

7.  **NOTE:** Make sure the brake pads are installed in the correct orientation.

Install the brake pads.

8. Rotate the brake caliper downwards.
 - Tighten the bolt to 35 Nm.
9. Repeat the above procedure for the other side.

10.  NOTE: This step is only required if a new wear indicator harness is installed.

LH side front: Connect the brake pad wear indicator wiring harness electrical connection.

11.  NOTE: This step is only required if a new wear indicator harness is installed.

Install the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).

12. LH side front: Connect the brake pad wear indicator wiring harness.

13. Install the wheels and tires.
 - Tighten the wheel nuts in the sequence shown:

1. Stage 1: 4 Nm
2. Stage 2: 70 Nm
3. Stage 3: 140 Nm

E74593

14. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.
15. For additional information, refer to: Brake Pad Bedding-In (206-00 Brake System - General Information, General Procedures).

Front Disc Brake - Brake Caliper Vehicles With: Standard Brakes

Removal and Installation

Removal

CAUTION: LH illustration shown, RH is similar.

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

- WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

- Remove the wheel and tire.

E121135

- CAUTION:** The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

LH side only: Disconnect the brake pad wear indicator sensor.

E61652

- WARNING:** Be prepared to collect escaping fluid.

CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the brake hose from the brake caliper.

- Remove the union.
- Remove and discard the two sealing washers.
- Install blanking caps to the exposed ports.

- NOTE:** Note the orientation of the brake pads.

Remove the brake pads.

For additional information, refer to: Brake Pads - Vehicles With: Standard Brakes (206-03 Front Disc Brake, Removal and Installation).

E61654

6.  **NOTE:** Use an additional wrench to prevent the component from rotating.

Remove the brake caliper housing.

- Remove the brake caliper upper bolt.

Installation

1. **NOTES:**

 Use an additional wrench to prevent the component from rotating.

 Make sure the brake caliper guide pins are installed in the correct orientation.

Install the brake caliper.

- Tighten the brake caliper upper bolt to 35 Nm (26 lb.ft).

2.  **NOTE:** Make sure the brake pads are installed in the correct orientation.

Install the brake pads.

For additional information, refer to: Brake Pads - Vehicles With: Standard Brakes (206-03 Front Disc Brake, Removal and Installation).

- Apply a suitable amount of the supplied grease to the mating faces of the brake pads and brake calipers.

3. Connect the brake hose to the brake caliper.
- Clean the component mating faces.
 - Remove the blanking caps from the ports.
 - Install new sealing washers.
 - Tighten the brake hose union to 32 Nm (24 lb.ft).
4. LH side only: Connect the brake pad wear indicator sensor.
5. Bleed the brake caliper.
For additional information, refer to: Component Bleeding (206-00 Brake System - General Information, General Procedures).

6.  **NOTE:** Tighten the wheel nuts in the sequence shown:

Install the wheels and tires.

- Stage 1 : 4Nm
- Stage 2 : 70Nm
- Stage 3 : 140Nm

OVERVIEW

Each rear brake consists of a single piston brake caliper, a ventilated brake disc and a dust shield (integrated as part of the parking brake). TDV6 3.0L DIESEL models feature a different brake caliper and disc than the V6 3.0L S/C PETROL, TDV8 4.4L DIESEL and V8 S/C 5.0L PETROL models. The dust shield and parking brake are common on all derivatives.

The brake caliper is attached to the wheel knuckle. The brake pads are made from an asbestos free material. The inboard brake pad of the right rear brake incorporates a wear sensor.

When hydraulic pressure is supplied to the brake caliper, the piston extends and forces the inner pad against the disc. The brake caliper body reacts and slides on the guide pins to bring the outer pad into contact with the disc.

The rear brake pad wear sensor is connected in series with the front brake pad wear sensor, between the Instrument Cluster (IC) and ground. When a brake pad incorporating a brake pad wear sensor is approximately 75% worn, the brake pad wear sensor goes open circuit. When the IC detects the open circuit, it illuminates the amber Light Emitting Diode (LED) in the brake warning indicator and also displays an appropriate warning in the message center and sound a warning chime.

For additional information, refer to: Instrument Cluster (413-01, Description and Operation).

At the beginning of each ignition cycle, the IC performs a bulb check on the brake warning indicator: the indicator is illuminated amber for 1.5 seconds, then red for 1.5 seconds.

Rear Disc Brake - Rear Disc Brake

Description and Operation

The braking system has been modified to compensate for the additional weight of the armoured vehicle.

Heavy-duty calipers are mated to larger diameter discs. The discs are ventilated with directionally curved veins for increased airflow and consequently optimum cooling. The inboard side of the disc is protected by a one piece dust-shield.

The rear monobloc calipers are attached to the vehicle's wheel knuckles, and comprise two pairs of horizontally opposed pistons. With each pair of pistons being a different diameter to the other pair of pistons:

- the smallest pair of pistons are at the leading edge of the pad, and
- the largest pair of pistons furthest from the leading edge.

This staggered piston arrangement provides a progressive braking force and even wear by reducing tapered wearing of the brake pads.

The brake pads also provide a firm consistent pedal with excellent cold performance for start-up and low-speed driving and are specially formulated for resistance to fade at high temperatures.

Rear Disc Brake - Brake Disc

Removal and Installation

Removal

WARNING: If installing a new brake disc, install new brake pads.

CAUTION: Brake discs must be renewed in pairs.

NOTES:

If the parking brake shoes or the brake discs have been removed for access to other components then DO NOT carry out the bedding in procedure.

LH illustration shown, RH is similar.

The brake pad wear warning indicator sensor must be replaced each time the brake pads are serviced.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.

2. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Remove the rear wheel and tire.

4. Remove the brake caliper and anchor plate.

E119130

5.  **NOTE:** Rotate the rear brake disc to locate the parking brake shoe adjuster.

Release the parking brake shoe adjustment.

- Remove the parking brake shoe adjuster access plugs.
- Rotate the parking brake shoe adjuster.

E63919

6. Remove the rear brake disc.
 - Remove the Allen screw.

E63921

Installation

1. Make sure that the rear brake disc and hub mating surfaces are clean.
2. Install the rear brake disc.
 - Tighten the bolt to 35 Nm (26 lb.ft).
3. Install the brake caliper and anchor plate.
 - Tighten the bolts to 115 Nm (85 lb.ft).
4. Adjust the parking brake.

For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures).
5. Install the rear wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
6. For additional information, refer to: Brake Pad Bedding-In (206-00, General Procedures).

Rear Disc Brake - Brake Pads

Removal and Installation

Removal

WARNING: Brake pads must be renewed in axle sets only, otherwise braking efficiency may be impaired.

NOTES:

RH illustration shown, LH is similar.

The brake pad wear warning indicator sensor must be replaced each time the brake pads are serviced.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

3. RH side rear: Disconnect the brake pad wear indicator sensor wiring harness.

E121022

4. RH side rear: Disconnect the brake pad wear indicator sensor wiring harness.

E121536

5. RH side rear: Release and disconnect the brake pad wear indicator wiring harness electrical connector.

E121535

6.  **NOTE:** Use an additional wrench to prevent the component from rotating.

Remove the brake caliper lower bolt.

E121654

7. **NOTES:**

 **Note the orientation of the brake pads.**

 **Note the orientation of the clips.**

Remove the brake pads.

- Rotate the brake caliper upwards.
- Remove the 2 clips.

E66109

8. Repeat the above 2 steps for the other side.

Installation

1.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the brake caliper housing and anchor plate using brake cleaning fluid.

2. Inspect the caliper piston and slide pin seals for damage.

3. CAUTIONS:

The brake caliper should move freely on both slide pins.

If necessary, renew the components.

Check the slide pins for correct operation.

4.  CAUTION: Check the brake fluid reservoir level before pushing the piston back, failure to follow this instruction may result in damage to the vehicle.

NOTE: As the piston is pushed back into the caliper housing, the brake fluid level in the reservoir will rise. Do not allow the reservoir to overflow.

Press the piston into the caliper housing.

5.  CAUTION: If installed, the adhesive strips covering the outer brake pads must be removed before installation. Failure to follow this instruction may result in damage to the vehicle.

If installed, remove the adhesive strips from the 2 outer brake pads.

6. NOTES:

Make sure the brake pads are installed in the correct orientation.

Make sure that the clips are installed in the correct orientation.

Install the brake pads.

- Install the 2 clips.

7. Rotate the brake caliper downwards.

- Tighten the brake caliper lower bolt to 35 Nm (26 lb.ft).

8. Repeat the above procedure for the other side.

9. RH side rear: Connect the brake pad wear indicator wiring harness electrical connection.

Parking Brake and Actuation - Parking Brake

Description and Operation

COMPONENT LOCATION

E161667

Item	Part Number	Description
1	-	Parking brake indicators (NAS only)
2	-	Parking brake indicators (all except NAS (north American specification))
3	-	Parking brake module
4	-	Drum brake
5	-	Parking brake cable
6	-	Emergency release cable
7	-	Parking brake switch

GENERAL

The parking brake is an electrically actuated system that operates drum brakes integrated into the rear brake discs. The parking brake system consists of:

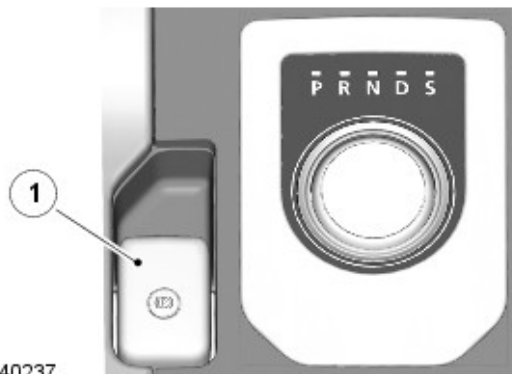

- A parking brake switch.
- Left and right drum brakes.
- Left and right brake cables.
- An emergency release cable.
- A clutch pedal position sensor (manual transmission models only).
- Two parking brake indicators.

A parking brake module.

The parking brake is operated by the parking brake module, which adjusts the tension of the brake cables to apply and release the drum brakes. Operation of the parking brake module is initiated by the parking brake switch.

PARKING BRAKE SWITCH

Parking Brake Switch - Electronic Transmission Shifter

E140237

The parking brake switch is used by the driver to apply and release the parking brake, and is installed in the center console adjacent to the gear lever.

Slots on the sides of the parking brake switch engage with the top panel of the center console, and a screw secures the parking brake switch in position. An electrical connector on the back of the switch provides the interface with the vehicle wiring. A brake symbol on the switch illuminates when the exterior lamps are selected on.

There are three states for the parking brake switch:

- Apply request, when the handle of the parking brake switch is pulled up.
- Release request, when the handle of the parking brake switch is pushed down.
- Idle, when the handle of the parking brake switch is in the central or rest position.

Microswitches, incorporated into the parking brake switch, are activated by the handle of the parking brake switch. To determine the operating state of the parking brake switch, the parking brake module scans the circuits containing the microswitches.

DRUM BRAKES

NOTE: LH (left-hand) brake shown, RH (right-hand) brake similar

E140238

Item	Part Number	Description
1	-	Wedge adjuster screw
2	-	Return spring
3	-	Cross strut
4	-	Backplate
5	-	Brake shoe
6	-	Shoe locating pin and clip
7	-	Adjuster spring
8	-	Toothed wheel adjuster
9	-	Dust shield
10	-	Rear brake disc
11	-	Adjuster access plug

Each drum brake consists of a pair of brake shoes installed on a backplate attached to the rear hub carrier. The brake shoes operate on the drum integrated into the rear brake disc. The orientation of the brake shoes differ by 180° between the LH and RH brakes.

When the parking brake module tensions the brake cables, the movement is transmitted to an operating lever on one of the brake shoes. The operating lever pivots against a cross strut, which forces the brake shoes apart and into contact with the drum in the rear brake disc. Brake shoe to drum clearance is set with two manual adjusters, which are accessed through a hole in the brake disc. One of the adjusters is a conventional toothed wheel adjuster. The second adjuster is a wedge adjuster operated by an Allen screw.

After replacement of the brake shoes or brake discs, a bedding in procedure must be performed to ensure the drum brakes operate satisfactorily.

Prior to removing a brake disc from a vehicle, power should be disconnected from the parking brake module.

Operation of the parking brake switch while a brake disc is removed can cause the actuating mechanism in the parking brake module to seize.

BRAKE CABLES

E49845

Item	Part Number	Description
1	-	Gearbox
2	-	Parking brake module housing
3	-	Cable nut
4	-	Sealing collar
5	-	Threaded connector
6	-	Spline shaft
7	-	Force sensor
8	-	Shoe
9	-	Locking cover
10	-	Sealing collar
11	-	Cable nut

The brake cables consist of Bowden cables installed between the parking brake module and the drum brakes. Nuts, on the ends of the outer cables, secure the brake cables to the parking brake module and the backplate of the related drum brake. In each drum brake, the inner cable is located in the guide spring and connected to the brake shoe operating lever by a nipple on the end of the cable. In the parking brake module, the two inner cables are joined together via the force sensor and the spline shaft.

The inner cable of the **RH** brake cable is connected to a nipple on the force sensor by a 'shoe' on the end of the cable; a locking cover keeps the shoe engaged with the nipple.

The inner cable of the LH brake cable is connected to the spline shaft by a threaded connector (LH thread); a squared flange at the end of the threaded connector locates in the housing of the parking brake module, to prevent the threaded connector from turning with the spline shaft.

When the spline shaft turns, the threaded connector of the LH brake cable is screwed into or out of the spline shaft, which changes the effective length of the inner cables and operates the drum brakes. The ability of the spline shaft to move axially in the gearbox equalizes the load applied by the inner cables to the two drum brakes.

Prior to disconnecting a brake cable, power should be disconnected from the parking brake module. Operation of the parking brake switch while a brake cable is disconnected can cause the actuating mechanism in the parking brake module to seize. In addition, the parking brake may not switch off until 20 minutes after Power mode 0 selected. Automatic re-apply cannot be eliminated until this period has expired.

EMERGENCY RELEASE CABLE

E49846

Item	Part Number	Description
1	-	Pull ring
2	-	Quick release fitting
3	-	Parking brake module
4	-	Sealing collar
5	-	Spring
6	-	Inner cable
7	-	Nipple
8	-	Pulley wheel

Emergency Park Brake Release

E140242

The emergency release cable allows the parking brake to be mechanically released if:

- The parking brake cannot be electrically released because of a system fault.
- The battery is disconnected or battery voltage decreases below 7.5 volts while the parking brake is applied, so that the parking brake cannot be electrically released.

The parking brake is mechanically released by disconnecting the force sensor from the spline shaft in the parking brake module. During normal operation, the force sensor and the spline shaft are locked together by a lever operated pawl on the end of the spline shaft, which engages with a spigot on the force sensor.

The emergency release cable is a Bowden cable installed between the parking brake module and the center console. The emergency release cable is held in clips along the underside of the vehicle and enters the passenger compartment below the center console through an aperture in the transmission tunnel. A quick release fitting seals the emergency release cable in the aperture. At the parking brake module, a sealing collar on the outer cable is a push fit in the housing of the parking brake module.

In the center console, a pull ring is installed on the end of the inner cable. The pull ring is designed to fit the hook on the end of the jack handle which, in combination with a screwdriver shaft, can be used to pull on the cable.

The pull required to release the latch is approximately 200 N (45 lbf). When the pull ring of the emergency release cable is released, the spring in the parking brake module retracts the inner cable and the nipple moves away from the pawl operating lever.

After the emergency release cable has been used to release the parking brake, the next time an apply selection is made with the parking brake switch, the parking brake module automatically runs through a latching procedure to reconnect the spline shaft with the force sensor. The parking brake module turns the spline shaft so that it moves towards the force sensor. The pawl of the spline shaft then re-engages with the spigot of the force sensor. A second apply selection with the parking brake switch is required to apply the parking brake.

PARKING BRAKE INDICATORS

E140240

Item	Part Number	Description
1	-	Red or amber warning indicator (NAS only)
2	-	Red or amber warning indicator (all except NAS)

The parking brake has two warning indicators, one amber and one red, located in the speedometer of the instrument cluster (same symbol, illuminated in either red, or amber).

Amber Parking Brake Warning Indicator

The amber parking brake warning indicator is continuously illuminated if there is a parking brake system fault. Operation of the indicator is controlled by a high speed **CAN (controller area network)** bus signal from the parking brake module to the instrument cluster.

Red Parking Brake Warning Indicator

When the parking brake is applied, the red parking brake warning indicator is continuously illuminated while the ignition is on and for 3 minutes after the ignition is switched off. If the system is unable to comply with an apply or release request, due to a system fault, the indicator flashes.

When the ignition is on and the indicator is not flashing, operation is controlled by a high speed **CAN** bus signal. When the ignition is off or when the indicator is flashing, operation is controlled by a hardwired signal from the parking brake module to the instrument cluster.

Text Messages

On vehicles with the high line instrument cluster, when there is a fault condition, illumination of the warning indicators is accompanied by a text message displayed in the message center.

PARKING BRAKE MODULE

The parking brake module monitors external and internal inputs and adjusts the tension of the brake cables to operate the drum brakes and provide the required parking brake function.

The parking brake module is installed on a support bracket attached to the front of the spare wheel carrier. Two rubber mounts, installed on lugs on the underside of the parking brake module, locate in holes in the support bracket. The top corners of the parking brake module are secured to the support bracket with rubber mounts and flanged nuts.

The main components of the parking brake module are:

- A PCB (printed circuit board) incorporating the ASIC (application specific integrated circuit) for control of the parking brake.
- An electric motor.
- A gearbox.
- A spline shaft.
- A force sensor.

The spline shaft and the force sensor are connected together by a latch on the end of the spline shaft. The spline shaft rotates on the latch and moves axially in the gearbox. The latch and the force sensor slide in a channel in the

body of the parking brake module.

To apply or release the drum brakes, the parking brake module runs the electric motor, which drives the gearbox. The gearbox turns the spline shaft to increase or decrease the tension in the brake cables. The parking brake module monitors the load exerted by the brake cables using the input from the force sensor.

Interior of Parking Brake Module

E49850

Item	Part Number	Description
1	-	Electrical connector
2	-	Housing
3	-	Electric motor
4	-	PCB (Printed Circuit Board)
5	-	Spline shaft
6	-	Gearbox
7	-	Force sensor

Inputs and Outputs

A 32 pin electrical connector on the **RH** side of the parking brake module provides the interface between the PCB and the vehicle wiring.

The parking brake module is powered by two permanent battery power feeds from the **EJB (engine junction box)**. Two connections with the **CJB (central junction box)** provide battery voltage signals in Power mode 0 and Power mode 6. Other hardwired inputs consist of those from the parking brake switch and, on manual transmission models, the clutch pedal position sensor.

In addition to the hardwired connections, the parking brake module is connected to the medium speed **CAN** bus to enable communication with other vehicle systems.

PARKING BRAKE OPERATION

The parking brake can be applied at any time provided sufficient battery power is available. For the parking brake to be released, various pre-conditions are required. The parking brake has manual and automatic operating modes, to cater for different operating circumstances, as detailed in the following table:

Operating Modes

Mode	Pre-Conditions	Driver Action
Static apply	Vehicle speed less than 2.5 km/h (1.6 mph).	Pull up parking brake switch.
Static release	1. Vehicle speed less than 2.5 km/h (1.6 mph). 2. Engine running. OR Ignition is ON and brake pedal or clutch pedal pressed (manual transmission). OR Ignition is ON and brake pedal or accelerator pedal pressed (automatic transmission).	Press down parking brake switch.
Ignition OFF apply	1. Vehicle speed less than 10 km/h (6.25 mph). 2. Ignition is OFF. 3. Selector lever is not in position 'P'. (automatic transmission).	Switch the ignition OFF.
Igniton OFF apply inhibit	1. Vehicle speed less than 2.5 km/h (1.6 mph). 2. Ignition is OFF. 3. Selector lever is not in position 'P'. (automatic transmission).	Switch the ignition OFF while pressing down parking brake switch.
Dynamic apply	Vehicle speed more than 2.5 km/h (1.6 mph).	Pull up parking brake switch as required.
Dynamic release	Vehicle speed more than 2.5 km/h (1.6 mph).	Release (to neutral position) or press down parking brake switch.
DAR (drive away release)	1. Ignition is ON.	None. Parking brake released

(automatic transmission only)	2. Transmission in gear 1, 2 or R (with high range selected) or 1, 2, 3 or R (with low range selected). 3. Accelerator pedal pressed more than 2%. 4. Seatbelt is fastened. 5. Drivers door is closed.	automatically on drive away.
-------------------------------	---	------------------------------

Operating Voltages

Actuation of the parking brake (apply or release) is only started if the power supply to the parking brake module is within 9 to 18 volts. At any voltage in this range, the parking brake module is able to tighten the brake cables to the maximum, to fully apply the parking brake, although at voltages between 9 and 10.5 volts the actuation time may exceed 1.0 second.

During a parking brake actuation:

- If the power supply to the parking brake module decreases to less than 8.3 volts, the parking brake module continues the actuation, but stores a related fault code. If the ignition is on, the parking brake module also signals the instrument cluster to illuminate the amber parking brake warning indicator and flash the red parking brake warning indicator. On vehicles with the high line instrument cluster, a message advising there is a parking brake fault is shown in the message center. The warning indications are discontinued if the power supply voltage increases to 8.3 volts or more.
- If the power supply voltage decreases to less than 7.5 volts, the parking brake module discontinues the actuation. Actuation is automatically resumed if the power supply voltage subsequently increases to 7.5 volts or more and the parking brake switch request is still valid.
- If the power supply voltage decreases below 6.5 volts, the parking brake function is disabled for the remainder of the ignition cycle.
- If the power supply voltage increases to more than 18.0 volts, the parking brake module immediately disables the parking brake function and stores a related fault code. If the ignition is on, the parking brake module also signals the instrument cluster to illuminate the amber parking brake warning indicator and flash the red parking brake warning indicator. On vehicles with the high line instrument cluster, a message advising that the parking brake has a fault and is not functioning is shown in the message center. The parking brake function remains disabled until the power supply voltage is within 9 to 18 volts again. When the power supply voltage is within 9 to 18 volts again, the warning indications are cancelled and actuation is automatically resumed if the parking brake module is in a dynamic mode of operation with a valid parking brake switch request.

NOTE: The instrument cluster shuts down below 8 volts, so warning indications and messages are not displayed below 8 volts. CAN transmission stops if battery voltage drops below 7.0 volts and re-starts when voltage goes above 7.5 volts.

Sleep Mode

To reduce quiescent drain on the vehicle battery, the parking brake module incorporates a sleep mode. The parking brake module enters the sleep mode, provided the ignition is off and there are no signals from the wheel speed sensors, when one of the following occurs:

- 20 minutes elapse after the last actuation of the parking brake.
- If no actuation occurred, 20 minutes elapse after the ignition is switched off.

The parking brake module wakes up from the sleep mode when one of the following occurs:

- An apply or release request is made with the parking brake switch.
- The ignition is switched on.
- A key out apply is activated.

The parking brake module wakes up within 500 ms. The high speed CAN bus is activated within 200 ms maximum.

When the parking brake module is woken with a release request from the parking brake switch, the parking brake module ignores the request but illuminates the red brake warning indicator. The parking brake module extinguishes the red brake warning indicator and goes back to sleep immediately the switch is released to the neutral position.

When the parking brake module is woken with an apply request from the parking brake switch, if the parking brake is already applied the parking brake module ignores the request but illuminates the red brake warning indicator. The parking brake module extinguishes the red brake warning indicator and goes back to sleep immediately the switch is released to the neutral position. If the parking brake is in the released condition when the apply request is made, the parking brake module illuminates the red brake warning indicator and applies the parking brake. The parking brake module extinguishes the red brake warning indicator and goes back to sleep 3 minutes after the apply activation, or immediately after the switch is released to the neutral position, whichever occurs last.

Dynamic Apply

In the dynamic apply mode, if the vehicle speed is more than 10 km/h (6.25 mph) when the parking brake switch is selected to apply, the parking brake module requests the **ABS (anti-lock brake system)** module to activate the disc brakes on all four wheels. When the vehicle comes to a standstill, the parking brake module statically applies the parking brake. Once the static load is achieved, the hydraulic pressure is removed. If the parking brake switch is released to the neutral position, or pressed down to the release position, during dynamic apply, braking is cancelled.

The **ABS** module monitors the deceleration rate using the wheel speed sensor signals, and adjusts the hydraulic pressure to the disc brakes as required to achieve the required rate. All of the anti-lock control - traction control system brake functions remain enabled in the dynamic apply mode.

The parking brake module incorporates two fallback functions for the dynamic apply mode.

- Fallback 1 is invoked if vehicle speed is between 2.5 km/h (1.25 mph) and V_{max} when the parking brake

switch is selected to apply and the **ABS** module is unable to fulfill a hydraulic request. When fallback 1 is invoked, the parking brake module decelerates the vehicle, using only the parking brake. The parking brake module monitors the deceleration rate using the wheel speed information from the **ABS** module, and adjusts the tension of the brake cables to achieve the required rate. During deceleration the parking brake module also uses the wheel speed inputs from the **ABS** module to operate an anti-lock function for the rear wheels. When vehicle speed decreases to 2.5 km/h (1.25 mph) the parking brake module switches to the static apply mode.

- Fallback 2 is invoked if there is a loss of communication between the parking brake module and the **ABS** module or the **CAN** bus has failed. When fallback 2 is invoked, the parking brake module decelerates the vehicle using only the parking brake. The parking brake module tightens the brake cables under the control of the driver, no anti-lock function is available.

While dynamic apply is active, including fallback 1 and fallback 2, the parking brake module also outputs high speed **CAN** bus signals to:

- The **ABS** module, to apply the stoplamps.
- The instrument cluster, to sound an intermittent warning buzzer, at 0.5 second on, 1.0 second off.
- The instrument cluster, to illuminate the red parking brake warning indicator. The indicator is permanently illuminated except in fallback 2, when it flashes.

DAR Pre-arming

The DAR pre-arming function operates when the transfer box is in high range to reduce the parking brake release time during DAR and to provide a smooth take-off. DAR pre-arming is invoked when:

- The ignition is ON.
- The transmission is in gear 1, 2 or R.
- The vehicle is stationary.
- No failsafe tighten actuation has occurred.

Automatic Load Adjustment

While the ignition is on, the parking brake module constantly monitors the input from the force sensor. If the tension of the brake cables goes outside the limits for a given operating mode, the parking brake module automatically restores the tension within limits.

Failsafe Tighten. If, during pre-arming, the vehicle moves, then the maximum cable force is reinstated for the remainder of that ignition cycle.

Automatic Apply. While the parking brake is applied, if the tension of the brake cables decreases by a prescribed amount from the initial setting, the parking brake module automatically restores the tension to the initial setting.

Automatic Release. While the parking brake is released, if the tension of the brake cables increase to a prescribed amount, the parking brake module automatically reduces the tension to zero.

Parking Brake Switch Monitoring

The parking brake module monitors for the following types of fault in the parking brake switch system. If a fault is detected, the parking brake module stores a related fault code:

- Short circuits between a pull-down transistor in the parking brake module and battery voltage.
- Broken wires and microswitches.
- Plausibility.

The parking brake switch has a degree of in-built redundancy. If a single microswitch fault is detected the parking brake module can still determine the operating state of the parking brake switch. Short circuits or multiple failures cause the parking brake module to disable the parking brake switch for the remainder of the ignition cycle. The parking brake module also disables the parking brake switch if a plausibility fault occurs. However, since plausibility faults are usually caused by incomplete operation of the parking brake switch, the parking brake switch is re-enabled if the parking brake module subsequently establishes a plausible operating state.

If a single microswitch fault is detected, the parking brake module signals the instrument cluster to illuminate the amber parking brake warning indicator. On vehicles with the high line instrument cluster, the parking brake module also signals the instrument cluster to display a message advising there is a parking brake fault. During an apply actuation, the parking brake module also signals the instrument cluster to flash the red parking brake warning indicator.

For all other fault types, the parking brake module signals the instrument cluster to illuminate the amber parking brake warning indicator, and, on vehicles with the high line instrument cluster, to display a message advising the parking brake has a fault and is not functioning. If it makes an apply actuation, the parking brake module signals the instrument cluster to flash the red parking brake warning indicator for the remainder of the ignition cycle.

On the next ignition cycle, the warning indicators and the messages are only activated if the fault is still present, although the fault code is retained by the parking brake module until cleared by T4.

Parking Brake and Actuation - Parking Brake

Description and Operation

Overview

The armoured vehicle has an electrically operated parking brake.

The parking brake is operated by the parking brake module, which adjusts the tension of the brake cables to apply and release the drum brakes. Operation of the parking brake module is initiated by the parking brake switch.

The parking brake system fitted to armoured vehicles is the same as that fitted to the standard vehicle. For additional information, refer to: Parking Brake (206-05, Description and Operation).

Parking Brake and Actuation - Parking Brake

Diagnosis and Testing

Principles of Operation

For a detailed description of the Parking Brake System and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (206-05)

Parking Brake (Description and Operation),
Parking Brake (Description and Operation).

Inspection and Verification

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

Please note this is a sealed unit and no attempt must be made to open the actuator as it will invalidate any warranty claim.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Electric park brake cable(s) condition and installation • Electric park brake shoes condition and fitment • Electric park brake drums (integrated into rear brake discs) • Electric park brake actuator module condition and installation 	<ul style="list-style-type: none"> • Electric park brake warning indicators • Fuses • Wiring harness / electrical connectors <ul style="list-style-type: none"> - Check for bent/corroded pins • Controller Area Network (CAN) circuits • Electric park brake switch • Electric park brake actuator

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Electric park brake will not engage or release	<ul style="list-style-type: none"> • Electric park brake cables fouled, trapped or damaged • Electric park brake cables incorrectly routed or fixed • Electric park brake shoes, linings worn/contaminated • Electric park brake drums (integrated into rear brake discs) • Electric park brake shoes incorrectly adjusted following replacement • Electric park brake actuator malfunction 	<ul style="list-style-type: none"> • Check the electric park brake cables for fouling, trapping or damage • Check the electric park brake cables for correct routing • Check that the electric park brake cable end fitting connector(s) are correctly installed to the operating lever(s) • Inspect the electric park brake shoes and drums for condition/wear/contamination • Check the electric park brake shoes for correct adjustment • Check the operation of the electric park brake actuator, check for damage and/or excessive noise during operation • Check for electric park brake control module DTCs
Low electric park brake efficiency / electric park brake sticking/binding		

DTC Index

For a complete list of all Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Electric Park Brake Control Module (EPBCM) (100-00, Description and Operation).

Brake Bedding Mode

Bedding mode is a special mode available in the Electric Park Brake Control Module (EPBCM) that disables the stability assist system and allows the parking brake to provide the braking force rather than the conventional braking system whilst the vehicle is moving at a velocity of >3kph. This mode is entered via a series of brake pedal presses and switch applications, full details on this procedure is available in the relevant section of the workshop manual. If brake bedding mode is entered accidentally by the driver the RED warning lamp will flash in the instrument cluster, the electric park brake control module will return to normal operational mode when the ignition has been cycled. This DTC (C1104-68) is intended to highlight the fact that although the RED lamp was illuminated there was no fault present in the control module.

Drive Cycles

Drive Cycle 1 Description

- Ignition On
- Make sure that no electric park brake activation (diagnostic command or switch input) is attempted for a minimum of 3 seconds
- Retest for functionality

Drive Cycle 2 Description

- Ignition On
- Drive vehicle at a constant speed of 20kph (13mph) or slightly above in 2nd gear
- At a constant speed of 20kph (13mph) or slightly above, apply the electric park brake via the electric park brake switch
- Press the brake pedal

Drive Cycle 3 Description

- Ignition On
- Make sure that the vehicle is stationary and that the electric park brake is released
- Operate the electric park brake switch to the apply position and hold in this position until the electric park brake motor has stopped (this may take up to 5 seconds)
- Release the electric park brake switch to the idle position, leave in the idle position for 2 seconds
- Operate the electric park brake switch to the release position (while pressing the brake pedal) and hold in this position until the parking brake motor has stopped (this may take up to 5 seconds)
- Release the electric park brake switch to the idle position

Parking Brake and Actuation - Parking Brake Shoe and Lining Adjustment

General Procedures

Check

NOTE: This procedure must be carried out if the vehicle has been mud wading (not water) for more than 50 miles or if the park brake is adjusted as part of a vehicle service.

1. Check the park brake for correct operation.

2. **CAUTIONS:**

When the vehicle is in the mounting position a red flashing light may appear on the instrument cluster. This indicates that the park brake actuator is in the mounting position. It does not indicate a vehicle fault.

The warning lamp on the instrument cluster will flash whilst the park brake is being driven into the mounting position.

Using Land Rover approved diagnostic equipment, drive the park brake to the mounting position.

3. Place the vehicles transmission into NEUTRAL.

WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Remove the wheels and tires.

6. **NOTES:**

LH shown.

Align the access hole in the position shown.

Locate the park brake lever cable attachment point.

- Remove the access plug.
- Rotate the brake disc.

E161325

7. **NOTES:**

RH shown.

Align the access hole in the position shown.

Locate the park brake lever cable attachment point.

- Remove the access plug.
- Rotate the brake disc.

E161326

E161327

8. CAUTIONS:

 The park brake shoe lever should be visible as shown.

 There should be clearance between the park brake shoe lever and the park brake cable cap as shown.

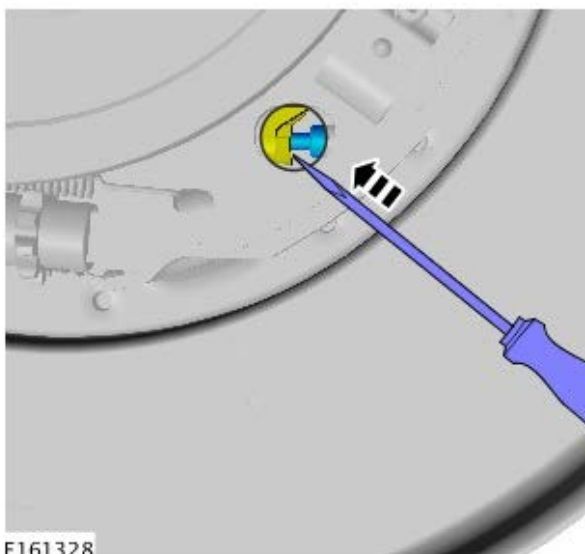

NOTES:

 LH shown.

 The step must be carried out on both sides.

Observe the position of the park brake shoe lever and the park brake cable cap.

- If the park brake shoe lever and park brake cable cap are not as shown, proceed to the next step.
- If the park brake shoe lever and park brake cable cap are as shown, proceed to step 11.

E161328

9. NOTES:

 LH shown.

 The step must be carried out on both sides.

Using a suitable tool, check that the park brake shoe lever will move easily in the direction shown and returns to its original position.

- If the park brake shoe lever moves easily, proceed to the next step.
- If the park brake shoe lever does not move easily, rectify any concerns before proceeding.

10. NOTES:

 LH shown.

E161336

 The step must be carried out on both sides.

Using a suitable tool, check that the park brake cable moves easily as shown.

- If the park brake cable does not move easily, rectify any concerns before proceeding.

Adjust

 NOTE: This procedure must be carried out if new park brake shoes are installed, new rear brake discs are installed, or if the vehicle has been mud wading (not water) for more than 50 miles or if the park brake is adjusted as part of a vehicle service.

1.  NOTE: Align the access hole with the indicators located on the back plate.

Locate the park brake shoe adjuster.

- Rotate the brake disc.

E161420

2.  CAUTION: Failure to follow this step may cause damage to the park brake system. Failure to displace the park brake shoes, as shown, will result in incorrect clearance when carrying out the adjustment step.

NOTES:

 The movement of the park brake shoe will be small and may not be felt when levering.

 LH shown.

Using a flat blade screwdriver, lever the brake shoes as indicated.

E129558

3.  **CAUTION:** Failure to follow this step may cause damage to the park brake system. Failure to displace the park brake shoes, as shown, will result in incorrect clearance when carrying out the adjustment step.

NOTES:

The movement of the park brake shoe will be small and may not be felt when levering.

RH Shown.

Using a flat blade screwdriver, lever the brake shoes as indicated.

E129557

4.  **CAUTION:** Do not apply excessive force on the park brake shoe adjuster. Failure to follow this instruction may result in damage to the park brake system.

Using a flat bladed screwdriver rotate the brake shoe adjuster to extend it until the brake disc is locked hand tight.

E134131

5.  **CAUTION:** The following steps sets the running clearance for the park brake shoes, failure to adhere to the paint marking process may cause damage to the park brake system when the adjustment steps are carried out.

Using suitable marker, mark the position of the park brake shoe adjuster.

E133307

6.  **CAUTION:** The park brake adjuster must be rotated back **EXACTLY one full revolution (10 clicks)**. Failure to follow this instruction may result in damage to the park brake system.

Rotate the adjuster back **one revolution (10 clicks)** until paint mark is visible.

E129607

7.  **CAUTION:** The wedge adjuster must be correctly seated to make sure the park brake cable is correctly adjusted. Failure to follow this instruction may result in damage to the park brake system.

Loosen the wedge adjuster Allen screw half a turn.

- Tap the brake disc lightly with a soft faced mallet, around the park brake shoe location within the brake disc.
- Tighten the wedge adjuster Allen screw to 6 Nm (5 lb.ft).

8. Repeat the above procedure for the other side.

9. Take the vehicle out of the mounting position by operating the park brake twice.

10.  **CAUTION: The next step should only be carried out when new park brake shoes or brake disc have been installed.**

Carry out the park brake shoe bedding-in procedure.
For additional information, refer to: [Parking Brake Shoes Bedding-In](#) (206-05 Parking Brake and Actuation, General Procedures).

Parking Brake and Actuation - Parking Brake Shoes Bedding-In

General Procedures

NOTE: This procedure must be carried out if, new parking brake shoes are fitted, new rear brake discs are fitted or if the vehicle has been mud wading (not water) for more than 50 miles.

1. Carry out the parking brake shoe bedding-in procedure.

2. **NOTE:** The electronic parking brake 'Service Bedding-in Procedure mode' will be active for the remainder of the ignition cycle, or until the vehicle speed exceeds 31 mph (50 kph). If the procedure needs to be re-entered, the entry actions must be repeated.

To enter 'Service Bedding-in Procedure' mode.

- Start and run the engine.
- Apply the footbrake 3 times within 10 seconds and hold applied after the 3rd application.
- Apply the electronic parking brake switch 4 times, followed by 3 release applications within 10 seconds.

3. Once the Service Bedding-in procedure mode has been entered, the electronic parking brake linings can be bedded-in by conducting 10 repeated stops from 30 - 35 kph (19 - 22 mph), followed by a 500 metre (547 yard) interval between each stop to allow the brakes to cool, using the electronic parking brake control switch.
 - The electronic parking brake brake force will be increased up to the dynamic maximum so long as the switch is held in the applied position.
 - If the switch is released to either the NEUTRAL or OFF positions, the electronic parking brake will be released.
 - The electronic parking brake MUST be allowed to cool between applications, either by driving at 19 mph (30 kph) for 500 metres (547 yards) or remaining stationary for 1 minute between each application.

Parking Brake and Actuation - Parking Brake Cable LH

Removal and Installation

Removal

CAUTION: To avoid accidental operation of the parking brake, and possible damage to the parking brake actuator, remove Fusible link 8, located in the engine compartment fuse box before commencing work.

NOTE: If the parking brake system has completed less than 50,000 cycles it is permissible to replace the parking brake cables. If over 50,000 cycles have been completed, then the cables can only be replaced as part of the parking brake actuator and cable assembly. The parking brake cycle count can be checked using the Land Rover approved diagnostic system, (ON/OFF = 1 cycle). If a cable breaks or becomes detached whilst the vehicle is being driven, a 'parking brake actuator unjamming procedure' may be required using the Land Rover approved diagnostic system.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.
2. Isolate the parking brake electrical circuit.
 - Remove fuse number 8 from the BJB.

3. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove both rear wheels and tires.
5. Release the parking brake shoe adjustment.
 - Loosen the screw.

E48749

6. **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Reposition the LH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.

7. Remove the LH rear brake disc.
 - Remove the screw.

8. Disconnect parking brake cable from the wheel hub.
 - Fully loosen the nut.
 - Release the cable from the lower arm.
 - Disconnect the inner cable from the brake shoe.

9. Release the LH parking brake cable.
 - Remove the 2 bolts.
 - Release the 3 wiring harness clips.
 - Release the cable from the clip on the chassis.

10. Release the LH parking brake cable.

11. Remove the LH parking brake cable.

- Release the retaining nut.
- Release and remove the cable.

Installation

1. Install the LH parking brake cable.
 - LH cable: Screw the cable in 5 complete turns.
 - Tighten the retaining nut.
2. Locate and secure the LH parking brake cable.
 - Tighten the bolts to 22 Nm (16 lb.ft).
 - Secure the wiring harness.
 - Secure the cable grommet to the integrated body frame bracket.

3.  **NOTE:** Make sure that the brake cable circlip is positioned as shown.

Connect the parking brake cable to the wheel hub.

- Connect the cable to the brake shoe lever.
- Locate the cable to the backplate.
- Tighten the nut to 8 Nm (6 lb.ft).

E100248

4.  **CAUTION:** Make sure that the component is clean, free of foreign material and lubricant.

Install the LH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

5. Secure the LH rear brake caliper.
 - Remove and discard the tie strap.
 - Tighten the bolts to 115 Nm (85 lb.ft).

6.  **NOTE:** The adjustment procedure must be carried out in full.

Adjust the parking brake shoes.

For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05, General Procedures).

7. Install the rear wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
8. Install fuse number 8 into the BJB.

Parking Brake and Actuation - Parking Brake Cable RH

Removal and Installation

Removal

CAUTION: To avoid accidental operation of the parking brake, and possible damage to the parking brake actuator, remove Fusible link 8, located in the engine compartment fuse box before commencing work.

NOTE: If the parking brake system has completed less than 50,000 cycles it is permissible to replace the parking brake cables. If over 50,000 cycles have been completed, then the cables can only be replaced as part of the parking brake actuator and cable assembly. The parking brake cycle count can be checked using the Land Rover approved diagnostic system, (ON/OFF = 1 cycle). If a cable breaks or becomes detached whilst the vehicle is being driven, a 'parking brake actuator unjamming procedure' may be required using the Land Rover approved diagnostic system.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.
2. Isolate the parking brake electrical circuit.
 - Remove fuse number 8 from the BJB.

3. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the wheels and tires.
5. Release the parking brake shoe adjustment.
 - Loosen the screw.

E48749

6. **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Reposition the RH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.

7. Remove the RH rear brake disc.
 - Remove the screw.

8. Disconnect parking brake cable from the wheel hub.
 - Fully loosen the nut.
 - Release the cable from the lower arm.
 - Disconnect the inner cable from the brake shoe.

9.  **CAUTION:** The fuel tank breather line bracket can be easily damaged when releasing it from the chassis.

- Release the fuel tank breather line bracket.
- Remove the plastic insert.

E93839

E49859

10. Release the RH parking brake cable.
 - Remove the 2 bolts.
 - Release the parking brake cable from the 2 pipe clips.
 - Release the cable from the clip on the chassis.

E49940

11. Release the RH parking brake cable.

E61820

12.  **CAUTION:** Make sure that no dirt or moisture enters the actuator during cable replacement.

- Remove the RH parking brake cable.
- Release the retaining nut.
 - Release the cable retaining clip.
 - Release and remove the cable.

Installation

1. Install the RH parking brake cable.
 - Install the cable.
 - Install the cable retaining clip.
 - Tighten the retaining nut.
2. Secure the fuel tank breather line bracket.
 - Install the plastic insert.
3. Locate and secure the RH parking brake cable.
 - Tighten the bolts to 22 Nm (16 lb.ft).
 - Secure the parking brake cable to the 2 pipe clips.
 - Secure the cable grommet to the integrated body frame bracket.

E100248

4.  **NOTE:** Make sure that the brake cable circlip is positioned as shown.

Connect the parking brake cable to the wheel hub.

- Connect the cable to the brake shoe lever.
- Locate the cable to the backplate.
- Tighten the nut to 8 Nm (6 lb.ft).

5.  **CAUTION:** Make sure that the component is clean, free of foreign material and lubricant.

Install the RH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

6. Secure the RH rear brake caliper.
 - Remove and discard the tie strap.
 - Tighten the bolts to 115 Nm (85 lb.ft).

7.  **NOTE:** The adjustment procedure must be carried out in full.

Adjust the parking brake shoes.

For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05, General Procedures).

8. Install the rear wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).

9. Install fuse number 8 into the BJB.

Parking Brake and Actuation - Parking Brake Actuator

Removal and Installation

Removal

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.
2. Isolate the parking brake electrical circuit.
 - Remove fuse number 8 from the BJB.

3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the rear wheels and tires.

5. Release the parking brake shoe adjustment.
 - Remove the plug from the access hole in the brake disc.
 - Using a suitable tool, rotate the brake shoe adjuster to release the adjustment.

E48748

E93861

6.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Reposition the RH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.

7. Remove the RH rear brake disc.
 - Remove the screw.

8.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Reposition the LH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.

9. Remove the LH rear brake disc.
- Remove the screw.

10. Disconnect both parking brake cables from the wheel hubs.
- Fully loosen the nut.
 - Release the cable from the lower arm.
 - Disconnect the inner cable from the brake shoe.

11. Release the LH parking brake cable.
 - Remove the 2 bolts.
 - Release the 3 wiring harness clips.
 - Release the cable from the clip on the chassis.

12. Release the LH parking brake cable.

13.  **CAUTION:** The fuel tank breather line bracket can be easily damaged when releasing it from the chassis.

- Release the fuel tank breather line bracket.
- Remove the plastic insert.

14. Raise the RH side of the rear stabilizer bar.
- Loosen the 2 bolts.

15. Release the RH parking brake cable.
- Remove the 2 bolts.
 - Release the parking brake cable from the 2 pipe clips.
 - Release the cable from the clip on the chassis.

16. Release the RH parking brake cable.

17. Remove the fuel tank heat shield.
- Remove the 3 bolts and 2 nuts.

18.  **CAUTION:** Inspect the parking brake emergency release cable to body seal and replace if damaged.

 **NOTE:** Note the fitted position of the parking brake emergency release cable to body seal.

Release the parking brake emergency release cable.

19.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

RH side rear: Disconnect the brake line.

- Position an absorbent cloth to collect fluid spillage.
- Disconnect the line union.
- Remove the clip.

20.  **NOTE:** Note the routing of the parking brake emergency release cable.

Displace the parking brake actuator and cable assembly.

- Disconnect the electrical connector.
- Remove the 2 nuts.

21.  **NOTE:** Brake cable shown removed for clarity.

Remove the parking brake actuator and cable assembly.

- Withdraw from the RH rear wheel arch aperture.

E114802

Installation

1.  **NOTE:** Note the routing of the parking brake emergency release cable.

Install the parking brake actuator and cable assembly.
 - Install the 2 nuts.
 - Connect the electrical connector.

2.  **NOTE:** Remove and discard the blanking caps.

RH side rear: Connect the brake line.
 - Clean the component mating faces.
 - Secure the clip.
 - Tighten the brake line union to 16 Nm (12 lb.ft).

3.  **CAUTION:** Make sure the parking brake emergency release cable to body seal is installed correctly.

Locate and secure the parking brake emergency release cable.

4. Install the fuel tank heat shield.
 - Tighten the bolts to 6 Nm (4 lb.ft).
 - Tighten the nuts to 3 Nm (2 lb.ft).

5. Secure the fuel tank breather line bracket.
 - Install the plastic insert.

6. Locate and secure the RH parking brake cable.
 - Tighten the bolts to 22 Nm (16 lb.ft).
 - Secure the parking brake cable to the 2 pipe clips.
 - Secure the cable grommet to the integrated body frame bracket.

7. Locate and secure the LH parking brake cable.
 - Tighten the bolts to 22 Nm (16 lb.ft).
 - Secure the wiring harness.
 - Secure the cable grommet to the integrated body frame bracket.

8.  **NOTE:** Make sure that the brake cable circlip is positioned as shown.

Connect the parking brake cables to the wheel hubs.
 - Connect the cable to the brake shoe lever.
 - Locate the cable to the backplate.

E100248

- Tighten the nut to 8 Nm (6 lb.ft).

9.  **CAUTION:** Make sure that the component is clean, free of foreign material and lubricant.

Install the LH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

10. Secure the LH rear brake caliper.
- Remove and discard the tie strap.
 - Tighten the bolts to 115 Nm (85 lb.ft).

11.  **CAUTION:** Make sure that the component is clean, free of foreign material and lubricant.

Install the RH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

12. Secure the RH rear brake caliper.
- Remove and discard the tie strap.
 - Tighten the bolts to 115 Nm (85 lb.ft).

13. Adjust the parking brake shoes.
For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05, General Procedures).

14. Bleed the brake system.
For additional information, refer to: Component Bleeding (206-00, General Procedures).

15. Install the wheels and tires.
- Tighten the wheel nuts to 140 Nm (103 lb.ft).

16. Install fuse number 8 into the BJB.

17. Using the Land Rover approved diagnostic system, calibrate the parking brake actuator on an even surface.

18. Apply and release hand brake to confirm operation.

Parking Brake and Actuation - Parking Brake Shoes

Removal and Installation

Removal

NOTE: If the parking brake shoes or the brake discs have been removed for access to other components then **DO NOT** carry out the bedding in procedure.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.
2. Isolate the parking brake electrical circuit.
 - Remove fuse number 8 from the BJB.

3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the wheels and tires.
5. Release the brake caliper.
 - Remove the brake caliper anchor bolts.

E83751

6.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Tie the brake caliper aside.

7. Release the park brake shoe adjustment.
 - Remove the plug from the access hole in the brake disc.
 - Using a suitable tool, rotate the brake shoe adjuster to release the adjustment.

E48748

E43893

8. Remove the brake disc.
 - Remove the Torx screw.

9. CAUTIONS:

Make sure that the green bias spring is installed to the right hand parking brake shoes and the red bias spring is installed to the left hand parking brake shoes.

Make sure the brake shoe spring is not over stretched.

NOTE: If equipped.

Remove the bias spring(s).

E136405

10. Remove the adjuster and return spring.
 - Release the parking brake shoe adjuster to the minimum adjustment.

E48999

11. Remove the primary brake shoe.
 - Remove the hold-down spring and retaining pin.
 - Pivot the shoe to release it from the spreader plate and return spring.

E49000

12. Remove the spreader plate and spring.

13. Remove the return spring.

E49001

14. Remove the secondary brake shoe.
 - Remove the hold-down spring and retaining pin.

- Disconnect the parking brake cable retaining spring from the brake shoe lever.
- Release the parking brake cable.

E49002

15. Repeat the above procedure for the other side.

Installation

1.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the backing plate and apply grease to the brake shoe contacts.

2. Clean the adjuster and set it to its minimum extension.

3. **CAUTIONS:**

 Make sure the brake shoe spring is not over stretched.

 Make sure the closed end of the retaining clip is installed facing the brake shoe adjuster. Failure to follow this instruction may result in damage to the vehicle.

 Illustration 'A' is the LH side and 'B' is the RH side.

Install the secondary brake shoe.

- Connect the parking brake cable.
- Connect the parking brake cable retaining spring to the brake shoe lever, making sure the spring is not twisted.
- Install the hold-down spring and retaining pin.

E66812

4. Install the spreader plate and the spring.
 - Using a tie strap, tie back the spreader plate spring.

E66812

5.  **WARNING:** Make sure the return spring and the adjuster spring are correctly installed to the primary shoe.

CAUTIONS:

 Make sure the brake shoe spring is not over stretched.

 Make sure the closed end of the retaining clip is installed facing the brake shoe adjuster. Failure to follow this instruction may result in damage to the vehicle.

 Illustration 'A' is the LH side and 'B' is the RH side.

Install the primary brake shoe.

- Install the return spring.
- Connect the primary brake shoe to the return spring.
- Locate the primary brake shoe to the spreader plate.
- Install the hold-down spring and retaining pin.

6.  **CAUTION:** Make sure the brake shoe spring is not over stretched.

Install the brake shoe adjuster and the retaining spring.

7. Remove and discard the spreader plate spring tie strap.

8. CAUTIONS:

 Make sure that the green bias spring is installed to the right hand parking brake shoes and the red bias spring is installed to the left hand parking brake shoes.

 Make sure the brake shoe spring is not over stretched.

 NOTE: **If equipped.**

Install the bias spring(s).

E136405

9. Make sure the brake disc and hub mating surfaces are clean.
10. Install the brake disc.
 - Tighten the Torx screw to 35 Nm (26 lb.ft).
11. Install the brake caliper.
 - Tighten the bolts to 115 Nm (85 lb.ft).
12. Repeat the above procedure for the other side.
13. Adjust the parking brake.
For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures).
14. Install the wheels and tires.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
15. Install fuse number 8 into the BJB.

Hydraulic Brake Actuation -

General Specifications

Item	Specification
Master cylinder bore diameter:	
Primary	27 mm (1.1 in)
Secondary	20.6 mm (0.8 in)
Stroke	36 mm (1.4 in)

Torque Specifications

Description	Nm	lb-ft
Brake pedal nut and bolt - Automatic gearbox	45	33
Brake pedal bracket Torx bolts - Automatic gearbox	10	7
Brake booster to brake pedal bracket nuts - Automatic gearbox	25	18
Brake master cylinder nuts	26	19
Brake pipe unions	18	13

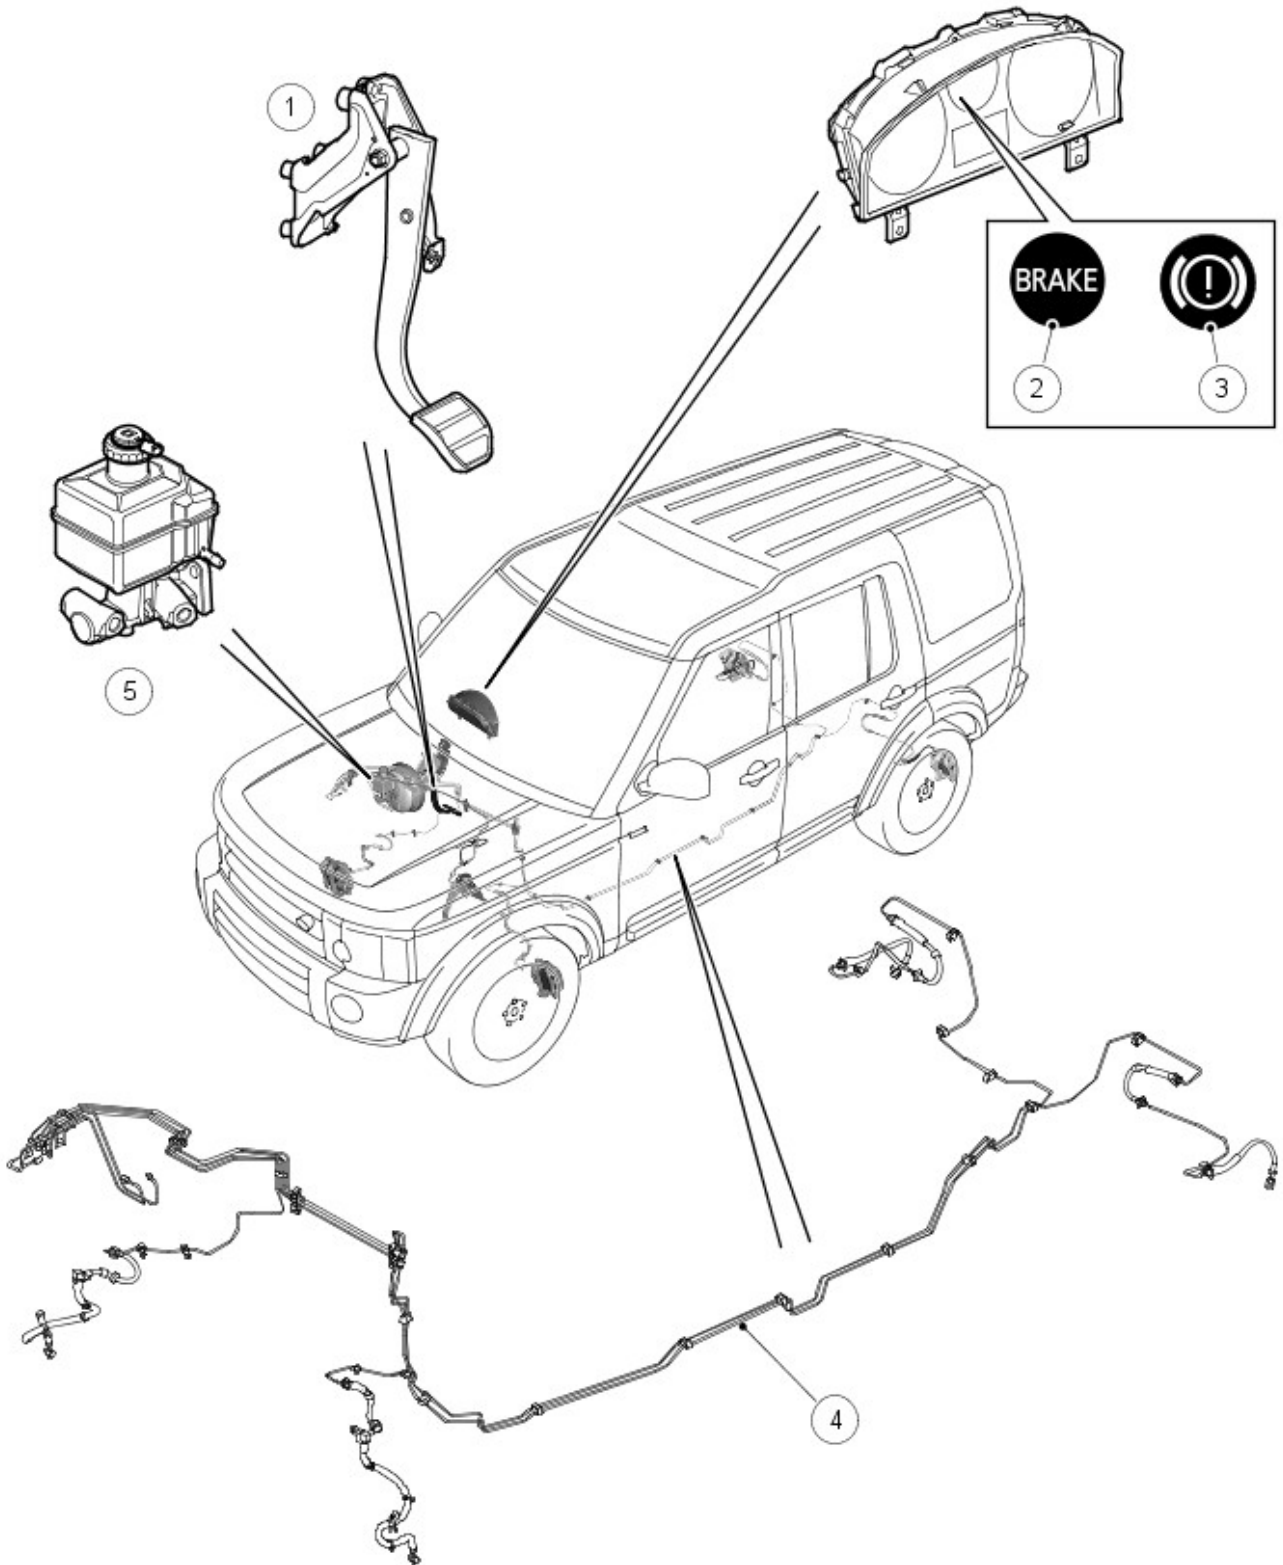

Hydraulic Brake Actuation - Hydraulic Brake Actuation

Description and Operation

COMPONENT LOCATIONS

NOTE: RHD shown, LHD similar

E48285

Item	Part Number	Description
1	-	Brake pedal (automatic shown)
2	-	Brake warning indicator (NAS)
3	-	Brake warning indicator (all except NAS)

- 4 - Brake pipes and hoses
- 5 - Brake master cylinder and reservoir

GENERAL

Hydraulic brake actuation consists of the brake pedal, the brake master cylinder and the hydraulic pipes and hoses.

BRAKE PEDAL

NOTE: Automatic gearbox model shown, manual gearbox model similar

E48286

Item	Part Number	Description
1	-	In-vehicle cross beam
2	-	Brake pedal buffer
3	-	Stoplamp switch
4	-	Brake pedal
5	-	Clevis pin and clip
6	-	Brake pedal bracket

The brake pedal is mounted in a bracket attached to the rear side of the engine bulkhead. On Left Hand Drive (LHD) manual gearbox models, the brake pedal shares a bracket and pivot bolt with the clutch pedal. On Right Hand Drive (RHD) manual gearbox models, the brake pedal has a separate bracket. A clevis pin and clip connect the brake pedal to the push rod of the brake booster. A brake pedal buffer is installed on the in-vehicle cross beam to restrain rearward movement of the brake pedal in an accident.

The stoplamp switch is mounted in the brake pedal bracket and operated by the brake pedal.

For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

BRAKE MASTER CYLINDER AND RESERVOIR

NOTE: RHD version shown, LHD version similar

E48287

Item	Part Number	Description
1	-	Reservoir
2	-	Clutch outlet spigot and sealing cap
3	-	Primary outlet spigot
4	-	Reservoir to master cylinder seal, primary inlet
5	-	Primary outlet port
6	-	Reservoir securing lug
7	-	Secondary outlet port
8	-	Cylinder housing
9	-	Reservoir to master cylinder seal, secondary inlet
10	-	Reservoir securing straps
11	-	Secondary outlet spigot
12	-	Filter
13	-	Float
14	-	Magnet
15	-	Reservoir cap and level switch

The brake master cylinder and reservoir is attached to the front of the brake booster, on the driver side of the engine compartment.

Master Cylinder

The brake master cylinder consists of a cylinder housing containing two pistons in tandem. The rear piston produces pressure for the primary circuit and the front piston produces pressure for the secondary circuit. The pistons incorporate center valves with a high flow rate to ensure there is always sufficient fluid available at the hydraulic control unit for stability control operations.

When the brake pedal is pressed, the front push rod in the brake booster pushes the primary piston along the bore of the cylinder housing. This produces pressure in the primary pressure chamber which, in conjunction with the primary spring, overcomes the secondary spring and simultaneously moves the secondary piston along the bore. The initial movement of the pistons, away from the piston stops, closes the primary and secondary center valves. Further movement of the pistons then pressurizes the fluid in the primary and secondary pressure chambers, and thus the brake circuits. The fluid in the chambers behind the pistons is unaffected by the movement of the pistons and can flow unrestricted through the feed holes between the chambers and the reservoir.

When the brake pedal is released, the primary and secondary springs push the pistons back down the bore of the cylinder housing. As the pistons contact the piston stops, the primary and secondary center valves open, which allows fluid to circulate unrestricted between the two hydraulic circuits and the reservoir, through the center valves, the chambers behind the pistons and the cylinder housing inlets.

Should a failure occur in one of the brake circuits, the remaining brake circuit will still operate effectively, although brake pedal travel and vehicle braking distances will increase.

Reservoir

The reservoir is installed on top of the master cylinder to provide a supply of brake fluid for the primary and secondary circuits of the brake system. On manual gearbox models, the reservoir also provides a supply of brake fluid for the clutch.

For additional information, refer to: Clutch Controls (308-02 Clutch Controls - 2.7L Diesel, Description and Operation).

Two straps, integrated onto the sides of the reservoir, engage with lugs on the master cylinder to secure the reservoir in position. Two outlet spigots on the underside of the reservoir locate in seals installed in the inlet ports of the master cylinder. An outlet spigot is installed on the left side of the reservoir for the clutch hydraulic circuit, if required. On automatic gearbox models, the clutch outlet spigot is sealed with a cap, formed during manufacture of the reservoir, which is only removed if the reservoir is installed on a manual gearbox model.

The reservoir is internally divided to isolate the circuits from each other at low fluid levels, and so prevent a leak in one circuit from disabling the other circuit(s). The dividing walls support a central well and divide the area around the well into a further eight separate compartments. The well forms an extension of the filler neck and contains the filter and the fluid level switch.

The well and the surrounding compartments are interconnected by slots in the dividing walls. The slots are positioned such that when the reservoir is full, fluid can move between the well and all of the surrounding compartments, but at low fluid levels the interior forms separate reservoirs for each circuit. The following figure shows the separate reservoirs for each circuit and the amount retained in each reservoir if there is a leak from one of the other circuits.

Reservoir Interior

NOTE: A = Clutch reservoir; B = Primary circuit reservoir; C = Secondary circuit reservoir

E48268

Item	Part Number	Description
1	-	Primary outlet

- 2 - Clutch outlet
- 3 - Secondary outlet

The filler neck of the reservoir is sealed with a cap incorporating the level switch. The level switch is operated by a magnet, which is installed in the float on the bottom of the switch. The switch reacts to the influence of the magnetic field surrounding the magnet.

When the reservoir is full, the float rests against the bottom of the switch and holds the level switch open. When the fluid level decreases, the float moves down and the switch closes to connect a ground to the instrument cluster. When the ground is made, the instrument cluster illuminates the red Light Emitting Diode (LED) in the brake warning indicator. Vehicles with the high line instrument cluster also display an appropriate warning in the message center. For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

At the beginning of each ignition cycle, the instrument cluster performs a bulb check on the brake warning indicator; the indicator is illuminated amber for 1.5 seconds, then red for 1.5 seconds.

The instrument cluster broadcasts the status of the brake fluid level, on the high speed Controller Area Network (CAN) bus, to the Anti-lock Brake System (ABS) module. For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

BRAKE PIPES AND HOSES

The brake pipes and hoses connect the master cylinder to the wheel brakes via the hydraulic control unit. The pipes are arranged to provide a front and rear split braking system. The brakes on the front axle are operated by the primary system; the brakes on the rear axle are operated by the secondary system.

Hydraulic Brake Actuation - Brake Fluid Reservoir

Removal and Installation

Removal

CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

All vehicles

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the cover.

3. Position an absorbent cloth to collect fluid spillage.
4. Disconnect the low brake fluid warning indicator switch electrical connector.

Vehicles with manual transmission

5.  **CAUTION:** Always plug any open connections to prevent contamination.

Disconnect the clutch master cylinder supply line.

All vehicles

6.  **CAUTION:** Always plug any open connections to prevent contamination.

Remove the brake fluid reservoir.

- Release the 2 clips.
- Remove and discard 2 brake fluid reservoir seals.

Installation

All vehicles

1. Clean the components.
2. Install the brake fluid reservoir.
 - Install new brake fluid reservoir seals.

Vehicles with manual transmission

3. Connect the clutch master cylinder supply line.

All vehicles

4. Connect the low brake fluid warning indicator switch electrical connector.
5. Bleed the brake system using T4.
For additional information, refer to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures).

Vehicles with manual transmission

6. Bleed the clutch system.
For additional information, refer to: Clutch System Bleeding (308-00 Manual Transmission/Transaxle and Clutch - General Information, General Procedures).

Hydraulic Brake Actuation - Brake Master Cylinder

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the brake fluid reservoir.
For additional information, refer to: Brake Fluid Reservoir (206-06 Hydraulic Brake Actuation, Removal and Installation).

3.  **CAUTION:** Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the brake master cylinder brake tubes.

4. Remove the brake master cylinder.
 - Remove the 2 nuts.
 - Remove and discard the O-ring seal.

Installation

1. Install the brake master cylinder.
 - Install a new O-ring seal.
 - Tighten the nuts to 23 Nm (17 lb.ft).
2. Connect the brake tubes.
 - Tighten the brake tube unions to 18 Nm (13 lb.ft).
3. Install the brake fluid reservoir.
For additional information, refer to: Brake Fluid Reservoir (206-06 Hydraulic Brake Actuation, Removal and Installation).

Hydraulic Brake Actuation - Brake Pedal

Removal and Installation

Removal

1. Remove the headlamp switch.
For additional information, refer to: Headlamp Switch (417-01, Removal and Installation).
2. Remove the stoplamp switch.
For additional information, refer to: Stoplamp Switch (417-01, Removal and Installation).
3. Remove the instrument panel access panel.
 - Release the 2 clips.

E51369

4. Remove the brake pedal bracket.
 - Release the wiring harness clip.
 - Remove the 4 Torx bolts.

E52543

5. Remove the brake pedal clevis pin.
 - Remove the clip.

E52544

6. Remove the brake pedal.
 - Remove the nut and bolt.

7.  **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the brake pedal pad.

Installation

1. Install the brake pedal pad.
2. Install the brake pedal.
 - Clean the component mating faces.
 - Tighten the nut and bolt to 45 Nm (33 lb.ft).
3. Install the brake pedal clevis pin.
 - Install the clip.
4. Install the brake pedal bracket.
 - Tighten the Torx bolts to 10 Nm (7 lb.ft).
 - Secure the wiring harness.
5. Install the instrument panel access panel.
 - Secure with the clips.
6. Install the stoplamp switch.
For additional information, refer to: Stoplamp Switch (417-01, Removal and Installation).
7. Install the headlamp switch.
For additional information, refer to: Headlamp Switch (417-01, Removal and Installation).

Hydraulic Brake Actuation - Brake Pedal and Bracket

Removal and Installation

Removal

1. Remove the headlamp switch.
For additional information, refer to: Headlamp Switch (417-01, Removal and Installation).
2. Remove the stoplamp switch.
For additional information, refer to: Stoplamp Switch (417-01, Removal and Installation).
3. Remove the instrument panel access panel.
 - Release the 2 clips.

E51369

4. Remove the brake pedal bracket.
 - Release the wiring harness clip.
 - Remove the 4 Torx bolts.

E52543

5. Remove the brake pedal clevis pin.
 - Remove the clip.

E52544

6. Release the stoplamp wiring harness.
 - Release the 2 clips.

7. Remove the brake pedal assembly.
 - Remove the 6 nuts.
 - Position the brake booster forward to aid the removal of the brake pedal assembly.

Installation

1. Install the brake pedal assembly.
 - Position the brake booster to the brake pedal bracket.
 - Tighten the nuts to 25 Nm (18 lb.ft).
2. Secure the wiring harness.
 - Secure the clips.
3. Install the brake pedal clevis pin.
 - Install the clip.
4. Install the brake pedal bracket.
 - Tighten the Torx bolt to 10 Nm (7 lb.ft).
 - Secure the wiring harness.
5. Install the instrument panel access panel.
 - Secure with the clips.
6. Install the stoplamp switch.
For additional information, refer to: Stoplamp Switch (417-01, Removal and Installation).
7. Install the headlamp switch.
For additional information, refer to: Headlamp Switch (417-01, Removal and Installation).

Power Brake Actuation -**Sealant**

Application	Land Rover Part No.
Brake vacuum pump - 2.7 Litre engine	8510302

General Specifications

Item	Specification
Brake booster type	Twin chamber 228 and 254 mm (9.0 and 10.0 in)
Boost ratio	7:1
Brake vacuum pump make and type:	
V6 - 2.7 litre diesel engine	Bosch 240cc SWP
V6 - 4.0 litre and V8 - 4.4 litre petrol engine	Hella UP28

Power Brake Actuation - Brake Booster

Description and Operation

COMPONENT LOCATIONS - 5.0L NA

NOTE: LHD shown, RHD similar

E154211

Item	Part Number	Description
1	-	Vacuum pipe connection to intake manifold
2	-	Brake Booster
3	-	Vacuum pump
4	-	Vacuum pipes

COMPONENT LOCATIONS - 3.0L DIESEL

NOTE: LHD shown, RHD similar

E154212

Item	Part Number	Description
1	-	Vacuum pipe connection to brake booster
2	-	Brake booster
3	-	Oil Scavenger pipe
4	-	Vacuum pump

GENERAL

Power assistance for the brakes is provided by a vacuum operated brake booster. The vacuum is supplied by an engine mounted vacuum pump.

VACUUM PIPES

Plastic vacuum pipes connect the brake booster to the vacuum source. Check valves are incorporated into the vacuum pipes. On petrol models there are two in-line check valves, to maintain the vacuum in the brake booster when the throttle is open and the vacuum pump is not running, and prevent fuel vapor entering the brake booster. On diesel models there is a single check valve integrated into the vacuum pipe connection with the brake booster, to maintain the vacuum in the brake booster when the vacuum pump is operating at less than the optimum.

BRAKE BOOSTER

E49905

The brake booster is installed in the driver side of the engine compartment, on the engine bulkhead.

The brake booster is a dual diaphragm unit with a boost ratio of 8.0 : 1 and 28 bar loop-in in all engine variants. The input push rod is connected to the brake pedal. The output push rod locates in the primary piston of the brake master cylinder. A vacuum pipe, installed in a grommet in the front face of the housing, connects the brake booster to the intake manifold and electric vacuum pump (petrol models) or the engine driven vacuum pump (diesel models).

VACUUM PUMP (5.0L NA)

E154213

Item	Part Number	Description
1	-	Air vent
2	-	Vacuum pump inlet
3	-	Pump drive

On 5.0L (NA) petrol models the vacuum pump supplements the main vacuum supply from the engine manifold.

The vacuum pump is a radial vane pump which is attached to the end of the auxiliary drive camshaft and driven by crankshaft via the auxiliary drive chain. The vacuum pipe from the brake booster connects to an elbow on the rim of the vacuum pump.

The vacuum pump is lubricated and cooled by engine oil supplied from the gallery in the block, through the auxiliary shaft, to the oil pick up tube (see small hole in green shaft in picture above!). The oil return is through twin outlet ports in the front face of the pump into a drain cavity in the sump. Air extracted from the brake booster is vented into the drain cavity along with the returning engine oil.

VACUUM PUMP (3.0L DIESEL)

E154214

Item	Part Number	Description
1	-	Vacuum connection (turbo control)
2	-	Vacuum connection for brake booster
3	-	Oil inlet port
4	-	Air vent
5	-	Drive dog
6	-	Oil return/scavenge pipe

The vacuum pump is a combined vacuum and oil scavenge pump. The scavenge pump is g-rotor type pump that drains oil from the secondary turbocharger to accommodate vehicle tilt. The pump is located at the rear of the RH side cylinder head and is driven from the exhaust camshaft.

The vacuum pump is a radial vane pump. The vacuum pipe from the brake booster connects to an elbow on the rim of the vacuum pump.

The vacuum pump is lubricated and cooled by engine oil supplied to a port in the front face of the vacuum pump from a gallery in the cylinder head. The oil return is through a vent in the front face of the pump into a drain cavity in the cylinder head. Air extracted from the brake booster is vented into the drain cavity with the returning engine oil.

Power Brake Actuation - Brake Booster

Removal and Installation

Removal

1. Pump the brake pedal until the brake vacuum assistance is exhausted.

2. Remove the auxiliary battery cover.
 - Release the 2 clips.

3. If installed, remove the auxiliary battery.

4. Detach the automatic transmission module bracket and position it to one side.
 - Remove the 2 bolts.

5. Remove the auxiliary battery compartment side wall.
 - Release the four clips.

6. Release the Air Conditioning (A/C) pipes.
 - Remove the retaining screw.

7. Remove the auxiliary battery tray.
 - Remove the 3 bolts.

8. Release the Anti-lock Brake System (ABS) module.
 - Remove the 3 nuts.
 - Release the brake tubes from the clip.

9. Disconnect the low brake fluid warning indicator switch electrical connector.

10.  **CAUTION:** Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Position an absorbent cloth to collect fluid spillage.

11. Disconnect the brake booster vacuum hose from the brake booster.

E118357

12. CAUTIONS:

 Make sure that excessive force is not used. Failure to follow this instruction may result in damage to the vehicle.

 Make sure the wings and trim panels are covered and protected, failure to follow this instruction may result in damage to the vehicle.

 Make sure the brake pipes are not damaged when displacing the brake master cylinder and ABS module. Failure to follow this instruction may result in damage to the vehicle.

Displace the brake master cylinder and ABS module as a complete assembly.

- Remove the 2 nuts.
- Discard the master cylinder seals.

13. Remove the outer plenum base.

- Remove the 3 nuts.

E118358

14. Remove the driver side closing trim panel.

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.

E47923

15.  NOTE: The cover is shown removed for clarity.

- Remove the brake booster push rod clevis pin.
- Remove the retaining clip.

16. Remove the brake booster.
- Remove the 4 nuts.

Installation

1. Install the brake booster.
 - Tighten the nuts to 23 Nm (17 lb.ft).
2. Install the brake booster push rod clevis pin.
 - Install the retaining clip.
3. Connect the brake booster vacuum hose.
4. Install the outer plenum base.
 - Carefully lift the anti-lock brake system modulator for access.
 - Install the 3 nuts.

5.  **CAUTION:** Make sure the master cylinder is correctly aligned.

NOTE: Install new seals and nuts.

Install the the brake master cylinder and ABS module.

- Tighten the nuts to 23 Nm (17 lb.ft).
6. Secure the anti-lock brake system modulator.
 - Install the 3 nuts.
 - Secure the brake tubes to the clip.
 7. Connect the low brake fluid warning indicator switch electrical connector.
 8. Install the auxiliary battery tray.
 - Install the 3 bolts.
 9. Install the auxiliary battery compartment side wall.
 - Secure with the four retaining clips.
 10. Secure the A/C pipes.
 - Install the retaining screw.

11. Secure the automatic transmission module bracket

- Install the 2 bolts.

12. If installed, install the auxiliary battery.

13.  NOTE: This step is to check the tightness of the retaining nuts after the initial tighten to make sure that torque has not relaxed.

Check the brake booster retaining nuts.

- Tighten the nuts to 23 Nm (17 lb.ft).

14. Install the closing trim panel.

- Connect the electrical connector.
- Secure the clip.
- Tighten the screws.

15. Start engine and check the brake booster operation.

Power Brake Actuation - Brake Vacuum Pump TDV6 3.0L Diesel

Removal and Installation

Removal

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Refer to: Body - Diesel (502-02, Removal and Installation).

2.

3.

4. Torque: 23 Nm

5. Torque: 13 Nm

6.  NOTE: Discard the O-ring seal.
Torque: 10 Nm

7. Torque: 23 Nm

- 8.

E124399

Installation

E116820

1. NOTES:

-  Install a new gasket.
-  Install a new O-ring seal.
-  Apply silicone gasket sealant or equivalent meeting Land Rover specification.
-  The application of sealant must be 10 mm square in two places. Install the brake vacuum pump immediately after applying the sealant.
-  The brake vacuum pump should be fitted directly to the engine without smearing the sealant.
-  Make sure that the drive coupling is aligned with camshaft coupling.

To install, reverse the removal procedure.

Power Brake Actuation - Brake Vacuum Pump V6 S/C 3.0L Petrol

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: Engine Undershield (501-02, Removal and Installation).

3. Refer to: Engine Oil Draining and Filling (303-01D, General Procedures).

4.

5. NOTES:

Discard the seal.

Some variation in the illustrations may occur, but the essential information is always correct.

Torque: 12 Nm

Installation

1.  NOTE: Install a new seal.

To install, reverse the removal procedure.

Anti-Lock Control - Traction Control -

General Specification

Item	Specification
System make/type	Bosch 8.0 Anti-lock braking system with Electronic Brake Distribution (EBD), Corner Brake Control (CBC), Electronic Traction Control (ETC), Hill Descent Control (HDC), Anti-roll Mitigation (ARM), Emergency Brake Assist (EBA), and Dynamic Stability Control (DSC)
Wheel speed sensors:	
Make/type	Bosch DF11i
Location	Front and rear knuckles with the active directional sensor acting on the driveshaft pole wheel
Yaw rate sensor make/type	Bosch DRS MM1.OR

Torque Specifications

Description	Nm	lb-ft
Front road wheel speed sensor bolt	9	7
Front brake caliper anchor plate bolts	275	203
Front brake caliper housing bolts	32	24
Front brake hose retaining bracket to wheel knuckle bolt	25	18
Rear road wheel speed sensor to wheel knuckle bolt	9	7
ABS module mounting bracket nuts	8	6
ABS module to mounting bracket nuts	23	17
M10 Brake tube union nuts	15	11
M12 Brake tube union nuts	15	11
M14 Brake tube union nut	17	13
Yaw rate sensor bolts	7	5
Road wheel nuts	140	103

Anti-Lock Control - Traction Control - Anti-Lock Control - Traction Control

Item	Part Number	Description
1	-	DSC (dynamic stability control) system active warning lamp
2	-	ABS warning lamp
3	-	EBA (emergency brake assist) warning lamp
4	-	DSC (dynamic stability control) system off warning lamp
5	-	HDC (hill decent control) warning indicator
6	-	DSC (dynamic stability control) system on/off switch
7	-	HDC (hill decent control) system on/off switch
8	-	Transmission selector.

OVERVIEW

The anti-lock control - traction control system features a modulator, which is an integrated four-channel [HCU \(hydraulic control unit\)](#) and [ABS \(anti-lock brake system\)](#) module.

The [ABS](#) module is connected to the high speed [CAN \(controller area network\)](#) bus, and actively interacts with other vehicle system control modules and associated sensors to receive and transmit current vehicle operating information.

When required, the [ABS](#) module will actively intervene and operate the [HCU](#) during braking or vehicle maneuvers to correct the vehicle attitude, stability, traction or speed. During incidents of vehicle correction, the [ABS](#) module may also request the [ECM \(engine control module\)](#) to control engine power in order to further stabilize and correct the vehicle.

To provide full system functionality, the anti-lock control - traction control system comprises the following components:

- DSC switch.
- HDC switch.

- Four wheel speed sensors.
- Steering angle sensor.
- Yaw rate and lateral acceleration sensor.
- Stoplamp switch.
- Instrument cluster warning indicators.
- Integrated HCU and ABS module.

The anti-lock control - traction control system provides the following brake functions that are designed to assist the vehicle or aid the driver:

- ABS.
- ARM (active roll mitigation).
- CBC (corner brake control).
- DSC.
- EBD (electronic brake force distribution).
- Electronic brake prefill.
- ETC (electronic traction control).
- EBA.
- EDC (engine drag-torque control).
- EUC (enhanced understeer control).
- Gradient acceleration control.
- Gradient release control.
- HDC.
- Hill start assist.
- Trailer stability assist.

The HDC function is enabled either manually using the HDC switch, or automatically by the terrain response system, in the ignition on and engine running power modes. All of the other brake functions are automatically enabled in the ignition on and engine running power modes. The DSC function can be selected off using the DSC switch.

DYNAMIC STABILITY CONTROL SWITCH

E140471

The DSC switch allows the DSC function to be selected off. Although Land Rover recommend that DSC is selected on for all normal driving conditions, it may be beneficial to de-select DSC to maximize traction under the following conditions:

- If the vehicle needs to be rocked out of a hollow or a soft surface.
- Driving on loose surfaces or with snow chains.
- Driving in deep sand, snow or mud.
- On tracks with deep longitudinal ruts.

The DSC switch is a non-latching switch installed in the center console switch pack. Pressing the DSC switch connects an ignition power feed to the ABS module. With the first press of the DSC switch, the ABS module disables the DSC functions. When the DSC switch is pressed again, the ABS module re-enables the DSC functions. The DSC switch must be pressed for a minimum of 0.3 s for the ABS module to react. The DSC function is re-enabled at the beginning of each ignition cycle.

The status of the DSC switch selection is shown by the DSC OFF warning indicator. The DSC OFF warning indicator is extinguished while DSC is selected on, and continuously illuminated while DSC is selected off.

A DSC switch request to disable DSC is ignored by the ABS module if the air suspension system has failed, or is in off-road height at speeds above 60 km/h (37.5 mph).

To guard against incorrect operation or a broken switch, if the input from the DSC switch is held high for more than one minute, a DTC (diagnostic trouble code) is stored in the ABS module.

Even if DSC is deselected, driving maneuvers with extreme yaw or lateral acceleration may trigger DSC activity to assist vehicle stability.

HILL DESCENT CONTROL SWITCH

E140473

Item	Part Number	Description
------	-------------	-------------

1	-	HDC switch
---	---	------------

The HDC switch controls the selection of the HDC function.

The HDC switch is a non-latching switch installed on the floor console, forward of the gear selector. Pressing and releasing the HDC switch momentarily connects an ignition power feed to the **ABS** module. With the first press and release of the HDC switch, the **ABS** module enables operation of the HDC function. When the HDC switch is pressed and released again, the **ABS** module disables operation of the HDC function.

To guard against incorrect operation or a broken switch, if the switch is pressed for more than 10 seconds no change of state occurs. If the input from the HDC switch is held high for more than one minute, a **DTC** is stored in the **ABS** module.

HDC RELAY

The HDC relay is used to illuminate the stoplamps when the brakes are activated during HDC operation and during dynamic application of the parking brake.

The HDC relay is a non-serviceable, solid state relay on the circuit board of the central junction box (CJB). Operation of the HDC relay is controlled by the ABS module switching the coil to ground. The ABS module monitors brake system hydraulic pressure and energizes the HDC relay during active braking. A pressure threshold and time filter prevent the stoplamps from flickering when HDC is braking.

STOPLAMP SWITCH

The stoplamp switch is mounted in the brake pedal bracket and operated by the brake pedal. The stoplamp switch is a two pole switch: The Brake Switch (BS) pole supplies a brake pedal status signal to the ABS module; the Brake Lamp Switch (BLS) pole operates the stoplamps and also supplies a brake pedal status signal to the ABS module and to the engine control module (ECM).

While the brake pedal is released:

- The BS contacts are closed, and connect an ignition power feed from the CJB to the ABS module.
- The BLS contacts are open.

When the brake pedal is pressed:

- The BS contacts open.
- The BLS contacts close, and connect an ignition power feed from the CJB to the three stoplamps, the ABS module and the ECM.

The ABS module monitors the status inputs from the stoplamp switch and broadcasts the brake pedal status and an associated quality factor on the high speed controller area network (CAN) bus.

WHEEL SPEED SENSORS

E50002

Item	Part Number	Description
1	-	Cable clip
2	-	Hub assembly
3	-	Wheel speed sensor
4	-	Screw

An active wheel speed sensor is installed in each wheel hub to provide the **ABS** module with a rotational speed signal from each road wheel. The head of each wheel speed sensor is positioned close to a toothed sensor ring on the outer diameter of the constant velocity joint of the drive halfshaft. A flying lead connects each sensor to the vehicle wiring.

The wheel speed sensors each have a power supply connection and a signal connection with the **ABS** module. When the ignition switch is on, the **ABS** module supplies power to the wheel speed sensors and monitors the return signals. Any rotation of the drive halfshafts induces current fluctuations in the return signals which are converted into individual wheel speeds and the overall vehicle speed by the **ABS** module.

The **ABS** module outputs the individual wheel speeds and the vehicle speed on the high speed **CAN** bus for use by other systems. The quality of the vehicle speed signal is also broadcast on the high speed **CAN** bus. If all wheel speed signals are available to calculate vehicle speed from, the quality of the vehicle speed signal is set to 'data calculated within specified accuracy'. If one or more wheel speed sensors is faulty, the quality of the vehicle speed signal is set to 'accuracy outside specification'.

The **ABS** module monitors the wheel speed sensor circuits for faults. If a fault is detected the **ABS** module stores a **DTC** and illuminates the appropriate warning indicators, depending on the system functions affected (**DSC/ETC**, **ABS**, **EBA/EBD**, **HDC**). A warning chime sounds and a related message is shown in the message center. For additional information, refer to: Information and Message Center (413-08, Description and Operation).

Since the wheel speed sensors are active devices, a return signal is available when the road wheels are not turning, which enables the **ABS** module to check the sensors while the vehicle is stationary. In addition, the direction of travel of each wheel can be sensed. This information is broadcast on the high speed **CAN** bus for use by other systems.

STEERING ANGLE SENSOR

E140546

Item	Part Number	Description
1	-	Gear wheel
2	-	Electrical connector

The steering angle sensor measures the steering wheel angle, and the rate of steering wheel angle speed. The measurements are output on the high speed **CAN** bus together with a quality factor signal, and are used by the **ABS** module and the rear differential control module for **ARM**, **CBC** and **DSC** operation.

The steering angle sensor is fixed to the pivot bracket of the steering column by three screws. A gear wheel in the steering angle sensor engages with a plastic drive collar fixed onto the lower shaft of the column. Inside the steering angle sensor, the gear wheel meshes with a gear train containing magnets. A multipin electrical connector provides the interface between the vehicle wiring and integrated circuits in the steering angle sensor.

The steering angle sensor operates with the MR (magneto resistive) effect to evaluate the direction of magnetic fields, and measure the angular position of the lower shaft to provide the steering wheel angle. When the steering wheel turns, the steering column lower shaft rotates the gear wheel within the steering angle sensor. The gear wheel drives the gear train and rotates the magnets located on the gears. The direction of the magnetic field is constantly

monitored by the steering angle sensor and is converted into a steering wheel angle, and steering wheel angle speed.

The steering angle sensor performs a plausibility check of the steering wheel angle each time the following conditions co-exist:

- The vehicle is traveling in a straight line.
- The vehicle speed is between 20 and 25 km/h (12.5 and 15.6 mph).
- The transfer box is in high range.
- The brake pedal is not pressed.
- There is no [ABS](#), DSC or ETC activity.

The steering angle sensor uses inputs of wheel speed, yaw rate and lateral acceleration to determine when the vehicle is traveling in a straight line. When all of the conditions co-exist, the steering angle sensor checks the steering angle is between $0 \pm 15^\circ$. If the steering angle is outside the limits on two successive checks, the steering angle sensor changes the quality factor signal to 'outside specification' for the remainder of the ignition cycle and stores a [DTC](#). At the beginning of each ignition cycle the quality factor signal is reset to 'within specified accuracy'.

The status of the steering angle sensor is able to be determined using Land Rover approved diagnostic equipment.

If the steering angle sensor is renewed, the new sensor must be calibrated using Land Rover approved diagnostic equipment. The steering angle sensor must also be re-calibrated any time it is disturbed from the steering column, or if the upper and lower steering columns are separated.

YAW RATE AND LATERAL ACCELERATION SENSOR

E132328

The yaw rate and lateral acceleration sensor is located beneath the floor console and provides information of vehicle yaw rate and lateral acceleration to the [ABS](#) module. The sensor is internally damped to isolate it from body vibrations and is secured to the transmission tunnel with two bolts.

When the ignition is on, the yaw rate and lateral acceleration sensor receives a power feed from the [CJB](#) ([central junction box](#)). Yaw rate and lateral acceleration values are transmitted to the [ABS](#) module on a private high speed [CAN](#) bus. In addition to using the inputs for brake control functions, the [ABS](#) module also broadcasts the yaw rate and lateral acceleration values on the vehicle high speed [CAN](#) bus for use by other systems.

The [ABS](#) module monitors the yaw rate and lateral acceleration sensor for faults and can be interrogated using Land Rover approved diagnostic equipment. If a fault is detected, the [ABS](#) module stores a related [DTC](#) and transmits a high speed [CAN](#) bus signal to the instrument cluster to illuminate the DSC, HDC and brake warning indicators. The instrument cluster will also sound a warning chime and display a DSC fault message in the message center. For additional information, refer to: Information and Message Center (413-08, Description and Operation).

STOPLAMP SWITCH

The stoplamp switch is mounted in the brake pedal bracket and operated by the brake pedal. The stoplamp switch is a hall effect switch with dual status outputs. Both of the outputs are supplied to the [ECM](#). One of the outputs is also supplied to the [CJB](#), for operation of the stoplamps. The [ECM](#) broadcasts the status of the stoplamp switch on the high speed [CAN](#) for use by other systems.

Power for the stoplamp switch is provided by an ignition feed from the [CJB](#). The power circuit is completed by a ground connection from the stoplamp switch to a ground on the body.

WARNING INDICATORS

E140475

Item	Part Number	Description
A	-	ROW instrument cluster
B	-	NAS instrument Cluster
1	-	Brake system warning indicator (amber)
2	-	DSC OFF warning indicator (amber)
3	-	Brake system warning indicator (red)
4	-	DSC warning indicator (amber)
5	-	HDC warning indicator (green)
6	-	HDC warning indicator (green)

The instrument cluster contains two types of warning indicator to display the operating status of the selected anti-lock control/traction control functions. The warning indicators provide a visual notification of either a system warning or system information to the driver.

HYDRAULIC CONTROL UNIT (HCU)

The [HCU](#) is a four-channel unit that modulates the supply of hydraulic pressure to the brakes under control of the [ABS](#) module.

The [HCU](#) is installed in the engine compartment. Hydraulic pipes connect the [HCU](#) to the master cylinder and the brake calipers.

For additional information, refer to: Hydraulic Brake Actuation (206-06, Description and Operation).

The primary and secondary outlets of the master cylinder are connected to the primary and secondary circuits within the [HCU](#). The primary circuit in the [HCU](#) has separate outlet ports to the front brakes. The secondary circuit in the [HCU](#) has separate outlet ports to the rear brakes. Each of the circuits in the [HCU](#) contains the following components to control the supply of hydraulic pressure to the brakes:

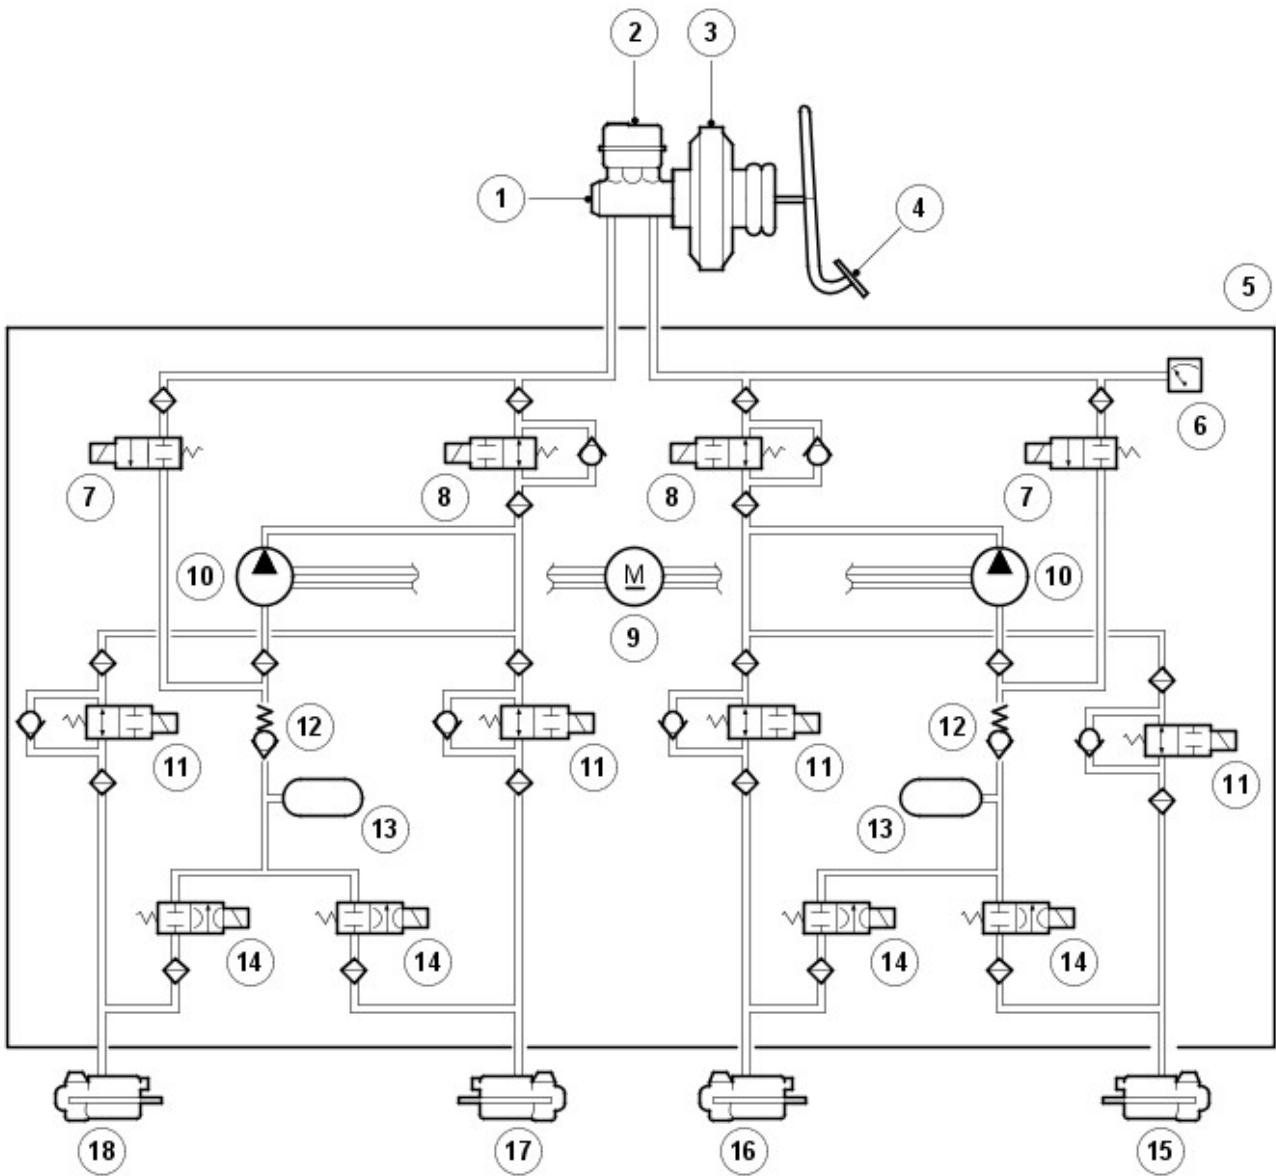

- A normally open, solenoid operated, pilot valve, to enable active braking.
- A normally closed, solenoid operated, priming valve, to connect the brake fluid reservoir to the return pump during active braking.
- A return pump to generate hydraulic pressure for active braking, and return brake fluid to the reservoir.
- Normally open, solenoid operated, inlet valves and normally closed, solenoid operated, outlet valves, to modulate the hydraulic pressure in the individual brakes.
- An accumulator and a relief valve to allow the fast release of pressure from the brakes.
- Filters to protect the components from contamination.

The primary circuit also incorporates a pressure sensor to provide the [ABS](#) module with a hydraulic pressure signal.

Contact pins on the [HCU](#) mate with contacts on the [ABS](#) module to provide the electrical connections from the [ABS](#) module to the return pump motor and the pressure sensor. The solenoids that operate the valves are installed in the [ABS](#) module.

A replacement [HCU](#) is supplied pre-filled. After installation on the vehicle, the Land Rover approved diagnostic system must be used to operate the solenoid valves and the return pump to ensure correct bleeding of the [HCU](#) and brake circuits.

Schematic of Hydraulic Control Unit

E50005

Item	Part Number	Description
1	-	Master cylinder
2	-	Reservoir
3	-	Brake booster
4	-	Brake pedal
5	-	HCU
6	-	Pressure sensor
7	-	Priming valve
8	-	Pilot valve
9	-	Return pump motor
10	-	Return pump
11	-	Inlet valve
12	-	Relief valve
13	-	Accumulator
14	-	Outlet valve
15	-	Left front brake
16	-	Right front brake
17	-	Right rear brake
18	-	Left rear brake

The HCU has three operating modes: Normal/EBD, ABS braking and active braking.

Normal Braking/Electronic Brake Force Distribution Mode

Initially, all of the solenoid operated valves are de-energized. Operating the brake pedal produces a corresponding increase or decrease of pressure in the brakes, through the open pilot valves and inlet valves. If the **ABS** module determines that **EBD** is necessary, it energizes the inlet valves for the brakes of the trailing axle, to isolate the brakes from any further increase in hydraulic pressure.

ABS Braking Mode

If the **ABS** module determines that **ABS** braking is necessary, it energizes the inlet and outlet valves of the related brake and starts the return pump. The inlet valve closes to isolate the brake from pressurized fluid; the outlet valve opens to release pressure from the brake into the accumulator and the return pump circuit. The reduced pressure allows the wheel to accelerate. The **ABS** module then operates the inlet and outlet valves to modulate the pressure in the brake to apply the maximum braking effort without locking the wheel. Control of the valves for each wheel takes place individually.

Active Braking Mode

The active braking mode is used to generate and control hydraulic pressure to the brakes for functions other than **ABS** braking, for example: **DSC**, **EBA**, **ETC**, **HDC** and dynamic application of the parking brake.

For active braking, the **ABS** module energizes the pilot valves and priming valves, starts the return pump and energizes all of the inlet valves. Brake fluid, drawn from the reservoir through the master cylinder and priming valve, is pressurized by the return pump and supplied to the inlet valves. The **ABS** module then operates the inlet valves and outlet valves, as required, to modulate the pressure in the individual brakes. Some noise may be generated during active braking.

ANTI -LOCK BRAKE SYSTEM MODULE

The **ABS** module controls the brake functions using the **HCU** to modulate hydraulic pressure to the individual wheel brakes.

The **ABS** module is attached to the **HCU**, on the driver side inner fender in the engine compartment. A multipin connector provides the electrical interface between the **ABS** module and the vehicle wiring.

OPERATION

Anti-lock Brake System

ABS controls the speed of all road wheels to ensure optimum wheel slip when braking at the adhesion limit. This prevents the wheels from locking in order to retain effective steering control of the vehicle.

On the front axle, the brake pressure is modulated separately for each wheel. On the rear axle, brake pressure is modulated by select low. Select low applies the same pressure to both rear brakes, with the pressure level being determined by the wheel on the lower friction surface. This maintains rear stability on split friction surfaces.

Active Roll Mitigation

The ARM function uses the brake system and engine torque control to attempt to restore vehicle stability if the vehicle is forced into such a harsh manoeuvre that it risks tipping over.

The **ABS** module monitors driver inputs and vehicle behavior using various powertrain signals and inputs from the wheel speed sensors, steering angle sensor and the yaw-rate and lateral acceleration sensor. These are compared with modeled behavior and, if vehicle behavior reaches a given risk level, the **ABS** module initiates a reduction in engine power, or brakes one or more wheels sufficiently to correct the vehicle stability and assist the driver remain in control.

While the ignition is on, ARM is permanently enabled, even when DSC is selected off.

Corner Brake Control

CBC influences the brake pressures, below the DSC and **ABS** thresholds, to counteract the yawing moment produced when braking in a corner. CBC produces a correction torque by limiting the brake pressure on one side of the vehicle.

Dynamic Stability Control

DSC uses the brakes and engine torque control to help maintain the lateral stability of the vehicle. While the ignition is on the DSC function is permanently enabled unless selected off by the DSC switch. Even if DSC is deselected, driving maneuvers with extreme yaw or lateral acceleration may trigger DSC activity to assist vehicle stability.

DSC enhances driving safety in abrupt maneuvers and in understeer or oversteer situations that may occur in a bend. The **ABS** module monitors the yaw-rate and lateral acceleration of the vehicle, and the steering input, then selectively applies individual brakes and signals for engine torque adjustments to reduce understeer or oversteer.

In general: in an understeering situation, the inner wheels are braked to counteract the yaw movement towards the outer edge of the bend. In an oversteering situation, the outer wheels are braked to prevent the rear end of the vehicle from pushing towards the outer edge of the bend.

The **ABS** module monitors the tracking stability of the vehicle using inputs from the wheel speed sensors, the steering angle sensor and the yaw-rate and lateral acceleration sensor. The tracking stability is compared with stored target data and, whenever the tracking stability deviates from the target data, the **ABS** module intervenes by applying the appropriate brakes. When the DSC function is active, the **ABS** module also signals the **TCM** to prevent gear shifts, and the instrument cluster to flash the DSC warning indicator.

If necessary, the **ABS** module also signals:

- The **ECM**, to reduce engine torque.
- The transfer box control module, to adjust the locking torque of the center differential.
- The active on-demand coupling module, to adjust the locking torque of the rear differential.

The DSC function overrides the differential locking torque requests from the terrain response system.

If DSC is selected off, a DSC system off message is displayed in the message center.

For additional information, refer to: Information and Message Center (413-08, Description and Operation).

Electronic Brake Force Distribution

EBD limits the brake pressure applied to the rear wheels. When the brakes are applied, the weight transfer of the vehicle reduces the adhesion of the rear wheels on the road surface. This may cause the rear wheels to slip and make the vehicle unstable.

EBD uses the **ABS** hardware to automatically optimize the pressure of the rear brakes, below the point where **ABS** intervention is normally invoked. Only the rear wheels are under **EBD** control.

Electronic Brake Prefill

Electronic brake prefill senses any rapid throttle lift off, activating a small brake hydraulic pressure build-up of approximately 3 to 5 bar (43.5 to 72.5 lbf/in²) in anticipation of the brakes being applied. This gives a quicker brake pedal response and consequently slightly shorter stopping distances.

When the **ABS** module detects rapid throttle lift off (from the signals received from the **ECM** over the high speed **CAN** bus), it controls the **HCU** to apply a low brake pressure to assist in a quicker brake application.

Electronic Traction Control

ETC attempts to optimize forward traction by reducing engine torque or braking a spinning wheel until traction is restored.

ETC is activated if an individual wheel speed is above that of the vehicle reference speed (positive slip) and the brake pedal is not pressed. The spinning wheel is braked, allowing the excess torque to be transmitted to the non spinning wheels through the drive line. If necessary, the **ABS** module also transmits a high speed **CAN** bus message to the **ECM** requesting a reduction in engine torque.

Torque reduction requests are for either a slow or fast response. A slow response requests a reduction of throttle angle; a fast response requests an ignition cut-off.

When the DSC function is selected off with the DSC switch, the engine torque reduction feature is disabled.

When the ETC function is active the [ABS](#) module also signals the [TCM](#) to prevent gear shifts.

Emergency Brake Assist

[EBA](#) assists the driver during emergency braking situations by automatically maximizing the braking effort. There are two situations when the [ABS](#) module will invoke [EBA](#):

- When the brake pedal is pressed very suddenly.
- When the brake pedal is pressed hard enough to bring the front brakes into [ABS](#) operation.

When the brake pedal is pressed very suddenly, the [ABS](#) module increases the hydraulic pressure to all of the brakes until the threshold for [ABS](#) operation is reached. This applies the maximum braking effort for the available traction. The [ABS](#) module monitors for the sudden application of the brakes using the stoplamp switch status broadcast on the high speed [CAN](#) by the [ECM](#), and from the pressure sensor within the [HCU](#). With the brake pedal pressed, if the rate of increase of hydraulic pressure exceeds the predetermined limit, the [ABS](#) module invokes emergency braking.

When the brake pedal is pressed hard enough to bring the front brakes into [ABS](#) operation, the [ABS](#) module increases the hydraulic pressure to the rear brakes up to the [ABS](#) threshold.

[EBA](#) operation continues until the driver releases the brake pedal enough for the hydraulic pressure in the [HCU](#) to fall below a pre-determined threshold value stored in the [ABS](#) module.

Engine Drag-torque Control

EDC prevents wheel slip caused by any of the following:

- A sudden decrease in engine torque when the accelerator is suddenly released.
- A downshift using the CommandShift™.

When the [ABS](#) module detects the onset of wheel slip without the brakes being applied, it transmits a message to the [ECM](#) via the high speed [CAN](#) bus to request a momentary increase in engine torque.

Enhanced Understeer Control

Understeer logic control monitors the vehicle for understeer by comparing signals from the yaw rate and lateral acceleration sensor with signals from the steering angle sensor and wheel speed sensors.

When the [ABS](#) module detects the onset of understeer, it signals the [ECM](#) via the high speed [CAN](#) bus to request a decrease in engine torque. If required the [ABS](#) module will control the [HCU](#) to apply brake pressure to the inside rear wheel to correct the understeer. If the vehicle continues to understeer, enhanced understeer control is activated and uses multiple brakes (maximum of three brakes) to rapidly reduce the vehicle speed.

Gradient Acceleration Control

Gradient acceleration control is an automatic feature and is always available when HDC is not selected.

When HDC is not selected, gradient acceleration control will intervene to limit downhill acceleration on a steep descent.

The feature uses generated brake pressure to control acceleration in situations where the driver could lose control of the vehicle on a steep incline.

Gradient acceleration control keeps the vehicle to a speed and throttle pedal dependant acceleration limit when the vehicle is moving in the intended direction of travel, for example:

- Descending an incline forwards, with D (drive) selected.
- Descending an incline backwards, with R (reverse) selected.

When the vehicle is moving against the intended direction of travel, for example: descending a slope, but facing uphill with D selected, gradient acceleration control will prevent the vehicle accelerating above 5 km/h (3 mph) for up to 20-30 seconds to aid the driver in re-establishing control of the vehicle.

Gradient Release Control

Gradient release control is an automatic feature which is always available when HDC is selected.

If the vehicle is brought to a standstill on a slope using the foot brake, gradient release control will become active (except in the terrain response, sand program). Subsequently, when the foot brake is released gradient release control will automatically delay and graduate the brake release. This allows time for the foot to be moved from the brake pedal to the accelerator pedal so that the vehicle can move smoothly away.

When descending a hill, a similar brake hold and gradual release is employed to provide a smooth transition into HDC. Gradient release control operates in forward and reverse gears and requires no driver intervention.

Hill Descent Control

HDC uses brake intervention to control vehicle speed and acceleration during low speed descents in off-road and low grip on-road conditions. Generally, equal pressure is applied to all four brakes, but pressure to individual brakes can be modified by the [ABS](#) and DSC functions to retain stability. Selection of the HDC function is controlled by the HDC switch and the terrain response rotary control located on the floor console. HDC operates in both high and low ranges, at vehicle speeds up to 50 km/h (31.3 mph).

WARNING: Incorrect use of the HDC function may compromise the stability of the vehicle, resulting in a dangerous and uncontrolled hill descent. Driving with the transmission in neutral while HDC is active will prevent engine braking from assisting the vehicle. The brakes will overheat and induce the HDC fade out strategy. In this condition there will be no control over the vehicle during a descent.

NOTE: With the HDC function selected, HDC is operative even when the transmission is in the neutral. It is not recommended to drive the vehicle further than is absolutely necessary with HDC selected and the transmission in neutral.

HDC may be used in D, R and CommandShift 1 in high range, and in D, R and all CommandShift gears in low range. When in D, the TCM will automatically select the most appropriate gear.

HDC can be selected at speeds up to 80 km/h (50 mph), but will only be enabled at speeds below 50 km/h (31.3 mph). When HDC is selected:

- At speeds up to 50 km/h (31.3 mph), the HDC information warning indicator is permanently illuminated if a valid gear is selected.
- At speeds from between 50 to 80 km/h (31 to 50 mph) the HDC information warning indicator flashes and a message advising that the speed is too high is displayed in the message center. If the HDC switch is pressed while vehicle speed is more than 80 km/h (50 mph), the HDC information warning indicator will not illuminate and HDC will not be selected.
- If the speed increases to 80 km/h (50 mph), the HDC function is switched off, the information warning indicator is extinguished, a warning chime sounds and a message advising that HDC has been switched off is displayed in the message center.

When HDC is enabled, the ABS module calculates a target deceleration value by comparing the set speed to the actual vehicle speed. The ABS module then operates the HCU in the active braking mode as required to achieve and maintain the target speed.

During active braking for HDC, the ABS module sends a high speed CAN message to the CJB to operate the stoplamps.

For additional information, refer to: Exterior Lighting (417-01, Description and Operation).

Applying the foot brake during active braking may result in a pulse through the brake pedal.

The target speed varies between minimum and maximum values for each gear and transmission range, depending on driver input with the accelerator pedal. If the accelerator pedal is not operated, the ABS module adopts a default target speed.

Low Range Target Speeds

Target Speed	Speed, km/h (mph)	
	Gears 1, R	Gears D, 2 to 6
Default	3.5 (2.19)	6 (3.75)
Minimum	3.5 (2.19)	3.5 (2.19)
Maximum	20 (12.5)	20 (12.5)

High Range Target Speeds

Target Speed	Speed, km/h (mph)	
	Gears 1, R	Gears D, 2 to 6
Default	6 (3.75)	10 (6.25)
Minimum	6 (3.75)	6 (3.75)
Maximum	20 (12.5)	20 (12.5)

As well as varying the target speed with the accelerator pedal, the target speed may also be varied by pressing the speed control '+' and '-' buttons (where fitted). For additional information, refer to:

- Speed Control (310-03A, Description and Operation),
- Speed Control (310-03B, Description and Operation).

During changes of target speed, the ABS module limits deceleration and acceleration to -0.5 m/s^2 (-1.65 ft/s^2) and $+0.5 \text{ m/s}^2$ ($+1.65 \text{ ft/s}^2$) respectively.

To provide a safe transition from active braking to brakes off, the ABS module invokes a fade out strategy that gradually releases the braking effort during active braking. The fade out strategy occurs if any of the following conditions are detected during active braking:

- HDC selected off with the HDC switch.
- Failure of a component used by HDC, but not critical to the fade out function.
- Accelerator pedal pressed when transmission is in neutral.
- Brake overheat.

If fade out is invoked because of deselection or component failure, the HDC function is cancelled by the ABS module. If fade out is invoked because the accelerator pedal is pressed with the transmission in neutral, or because of brake overheat, the HDC function remains in standby and resumes operation when the accelerator pedal is released or the brakes have cooled.

The fade out strategy increases the target speed, at a constant acceleration rate of 0.5 m/s^2 (1.65 ft/s^2), until the maximum target speed is reached or until no active braking is required for 0.5 s. If the accelerator pedal is positioned within the range that influences target speed, the acceleration rate is increased to 1.0 m/s^2 (3.3 ft/s^2).

When fade out is invoked because of component failure, a warning chime is sounded, the HDC information warning indicator is extinguished and a message advising there is a fault is displayed in the message center.

When fade out is invoked because of brake overheating, a message advising that HDC is temporarily unavailable is displayed. At the end of fade out, the HDC information warning indicator flashes. The message is displayed, while HDC remains selected, until the brakes have cooled.

To monitor for brake overheating, the [ABS](#) module monitors the amount of braking activity and, from this, estimates the temperature of each brake. If the estimated temperature of any brake exceeds a preset limit, the [ABS](#) module invokes the fade out strategy. After the fade out cycle, the HDC function is re-enabled when the [ABS](#) module estimates that all of the brake temperatures are at less than 64% of the temperature limit.

When HDC is selected off, the instrument cluster message center displays a system off message.

Hill Start Assist

Hill start assist is an automatic feature that operates in a similar manner to gradient release control, but does not require HDC to be active. The feature is not driver selectable and there is no indication to the driver when in operation.

On steep slopes, hill start assist will hold a portion of the driver generated brake pressure for a short time to allow the driver to move their foot from the brake pedal to the throttle pedal without the vehicle rolling back.

The system will release the brake pressure in a controlled manner, either after the timer has expired or if the driver has generated sufficient drive-torque to move the vehicle forward up the hill.

The timer function is controlled by the [ECM](#) and transmitted to the [ABS](#) module on the high speed [CAN](#) bus.

Trailer Stability Assist

When the trailer electrical socket is connected, trailer stability assist operates automatically to enhance the existing DSC and terrain response functions of the vehicle when towing. The system detects sway movements caused by trailer oscillations at speeds in excess of 60 km/h (37 mph) and acts to eliminate them. It does this through braking and engine management. Braking management counterbalances the sway movement through symmetric and asymmetric braking, thereby slowing the vehicle and eliminating the oscillations. Engine management adapts engine torque output to support the braking management in stabilizing the vehicle and trailer.

Typical conditions when sway can occur include:

- Changing highway lanes.
- Traversing a lengthy bend.
- Acceleration.
- Braking.

The capability of trailer stability assist to respond early to the beginning of trailer-sway makes the system almost unnoticeable under normal driving conditions and keeps the vehicle and trailer under safe control. Trailer stability assist requires no input from the driver and operates up to the maximum vehicle speed.

Trailer stability assist will not operate while DSC is switched off.

Anti-Lock Control - Traction Control - Anti-Lock Control - Traction Control

Diagnosis and Testing

Principles of Operation

For a detailed description of the Anti-Lock Control- Traction Control System and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: Anti-Lock Control - Traction Control (206-09 Anti-Lock Control - Traction Control, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Tire size, condition and installation • Wheel speed sensor condition and installation • Steering Angle Sensor Module (SASM) condition and installation • Yaw rate sensor and accelerometer condition and installation • Hydraulic control unit (with attached anti-lock brake system control module) condition and installation 	<ul style="list-style-type: none"> • Fuses • Harnesses and connectors • Warning indicator operation • Wheel speed sensors • Central Junction Box (CJB) • Hill Descent Control (HDC) switch • Dynamic Stability Control (DSC) switch • Brake pedal switch • Yaw rate sensor and accelerometer • Steering Angle Sensor Module (SASM) • Anti-lock Brake System control module (ABS) • Controller Area Network (CAN) circuits

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Anti-Lock Brake System Control Module (ABS) (100-00 General Information, Description and Operation).

Anti-Lock Control - Traction Control - Anti-Lock Brake System (ABS) Module

Removal and Installation

Removal

CAUTION: Make sure the ignition switch is in position 0.

1. Remove the cover.

2. Disconnect the electrical connector.

3. **CAUTIONS:**

Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the 6 brake tubes.

- Position an absorbent cloth to collect fluid spillage.

4. Remove the ABS module from the mounting bracket.
 - Loosen, but do not remove, the 2 nuts securing the ABS module to the bracket.

Installation

1. **NOTES:**

Make sure the ABS module locating grommet is correctly seated in the bracket before installing the ABS module.

Make sure the ABS module locating pin is correctly located in the grommet, and the 2 front isolators are fully seated in the bracket slots.

Install the ABS module.

- Tighten the 2 ABS module retaining nuts to 8 Nm (6 lb.ft).
- Remove the blanking caps from the ports.
- Tighten the two M10 and three M12 brake tube unions to 15 Nm (11 lb.ft).
- Tighten the M14 brake tube union to 17 Nm (13 lb.ft).
- Connect the electrical connector.
- Remove the ABS module from the mounting bracket.

2. Using T4, bleed the braking system.

For additional information, refer to: Brake System Pressure Bleeding (206-00, General Procedures).

3. Install the cover.

4. If a new ABS module has been installed, interrogate the ABS system using T4.

Anti-Lock Control - Traction Control - Front Wheel Speed Sensor

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).

3. Release the brake hose bracket from the wheel knuckle.
 - Remove the retaining bolt.

4.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

Release the brake caliper anchor plate from the wheel knuckle and tie the caliper aside.

- Remove the two retaining bolts.

5. Release the wheel speed sensor from the wheel knuckle.
 - Remove the bolt.

6. Remove the wheel speed sensor.
 - Disconnect the electrical connector.
 - Release the wiring harness from the 5 clips.

E56444

Installation

1. Make sure the wheel speed sensor location in the wheel knuckle is free of dirt.

2.  **NOTE:** Make sure the electrical connector retaining clip is attached to the body wiring harness.

Install the wheel speed sensor.

- Connect the electrical connector.
- Attach the wiring harness to the 5 clips.
- Tighten the bolt to 9 Nm (7 lb.ft).

3. Secure the brake caliper and anchor plate to the wheel knuckle.
 - Tighten the bolts to 275 Nm (203 lb.ft).
4. Secure the brake hose retaining bracket to the wheel knuckle.
 - Tighten the bolt to 25 Nm (18 lb.ft).
5. Install the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).
6. Install the wheel and tire.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
7. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.
8. If a new wheel speed sensor has been installed, interrogate the ABS system using T4.

Anti-Lock Control - Traction Control - Rear Wheel Speed Sensor

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.
3. Disconnect the anti-lock brake system (ABS) sensor electrical connector.
 - Release the wiring harness retaining clip.

E52454

4. Release the wheel speed sensor from the wheel knuckle.
 - Release the wiring harness.
 - Remove the retaining bolt.

E56445

5. Remove the wheel speed sensor.
 - Release the wiring harness from the 4 clips.

E56698

Installation

1. Make sure the wheel speed sensor location in the wheel knuckle is free of dirt.
2. Install the wheel speed sensor.
 - Attach the wiring harness to the 4 clips.
3. Secure the wheel speed sensor to the wheel knuckle.
 - Tighten the bolt to 9 Nm (7 lb.ft).
 - Attach the wiring harness to the clip.

4.  **NOTE:** Make sure the electrical connector retaining clip is attached to the body wiring harness.

Connect the ABS sensor electrical connector.

- Attach the wiring harness.
5. If a new wheel speed sensor has been installed, interrogate the ABS system using T4.

Anti-Lock Control - Stability Assist - Yaw Rate Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the floor console.
For additional information, refer to: Floor Console (501-12, Removal and Installation).
3. Remove the instrument panel center reinforcement.
For additional information, refer to: Instrument Panel Center Reinforcement (501-12, Removal and Installation).

4.

5.

6. Remove the yaw rate sensor.

Installation

1. Install the yaw rate sensor.
 - Install the 2 bolts and tighten to 7 Nm (5 lb.ft).

2.

3.

4. Install the instrument panel center reinforcement.
For additional information, refer to: Instrument Panel Center Reinforcement (501-12, Removal and Installation).
5. Install the floor console.
For additional information, refer to: Floor Console (501-12, Removal and Installation).
6. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Steering System - General Information - Steering System

Diagnosis and Testing

Principles of Operation

For a detailed description of the Steering System and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: Power Steering (211-02 Power Steering, Description and Operation) /
Steering Linkage (211-03 Steering Linkage, Description and Operation) /
Steering Column (211-04 Steering Column, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
 - If a road test is necessary make sure the vehicle is safe to do so.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Check the tires for correct pressure, size and tread pattern • Check for wheel rim and tire damage • Check road wheel security • Check the power steering fluid level and the hydraulic circuit for oil leaks • Check the power steering pump drive belt condition and tension • Check the power steering pump for security, wear, damage and excessive noise • Check the steering gear assembly for damage, wear and security • Check the hydraulic pipes and cooler lines for damage and correct routing • Check the steering joints for damage, excessive play, wear and security • Check the steering column and joints for damage, excessive play, wear and security 	<ul style="list-style-type: none"> • Steering Angle Sensor Module (SASM) and circuits • Controller Area Networks (CAN) circuits

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Steering System - General Information - Power Steering System Filling and Bleeding

General Procedures

1. Check the power steering fluid level.

2.  **CAUTION:** Fluid must always be present in the reservoir during bleeding.

Remove the filler cap and fill to the MAX level mark.

- Install the reservoir filler cap.

3. Start the engine and allow to run for 10 seconds, stop the engine.
 - Check the power steering fluid, if aerated, wait until fluid is free from bubbles then top-up reservoir to UPPER level mark with recommended fluid.

4.  **CAUTION:** Do not hold steering on full lock for longer than 10 seconds.

Start the engine and turn steering fully lock to lock, stop the engine.

- Check and top-up power steering fluid level.

5. Start and run the engine for 2 minutes, turn the steering fully lock to lock.
 - Check and top-up power steering fluid level.

Steering System - General Information - Power Steering System Flushing

General Procedures

NOTES:

If heavy steering or contamination within the power steering system is found, it is necessary to carry out the system flush procedure as detailed below. If any components have been replaced in the power steering system the procedure below must be carried out in full.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Remove the power steering fluid reservoir cap.
2. Using a suitable syringe, remove the power steering fluid from the power steering fluid reservoir.

3. **CAUTION:** Be prepared to collect escaping fluids.

NOTE: Note the orientation of the clip.

Detach the power steering fluid reservoir.

- Detach but do not remove the power steering fluid reservoir.
- Release the power steering fluid return hose from the power steering fluid reservoir.
- If a quick release coupling is fitted to the power steering return hose, release the power steering fluid return hose from the coupling by removing the clip.

4. **CAUTION:** Be prepared to collect escaping fluids.

NOTE: Make sure that all openings are sealed. Use new blanking caps.

Using a suitable blanking cap, cap the power steering reservoir return pipe.

5. **CAUTION:** Be prepared to collect escaping fluids.

NOTE: Make sure the extended pipe is not kinked or twisted and is correctly secured with hose clips.

Attach a suitable pipe to the power steering return hose to allow the fluid to drain.

E 100918

E94372

6. NOTES:

 The suitable funnel should have the a capacity of 4 litres and O-ring seal

 The suitable funnel must be tightly sealed to the power steering fluid reservoir to avoid fluid leakage.

Install a suitable funnel onto the power steering fluid reservoir.

7.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle with the wheels just clear of the ground.

8. CAUTIONS:

 Steps 8 and 9 must be carried out within 2 - 3 seconds of each other. Failure to follow this instruction may result in damage to the power steering system.

 Be prepared to collect escaping fluids.

Using the suitable funnel, top up the power steering system with the specified fluid. Make sure the fluid level is maintained at two thirds full in the funnel.

9. CAUTIONS:

 Be prepared to collect escaping fluids.

E94373

E94372

Do not allow the power steering fluid level in the power steering fluid reservoir to fall below the minimum power steering fluid level. Failure to follow this instruction may result in damage to the power steering system.

Make sure the engine is switched off as soon as the full 4 litres of power steering fluid has entered the power steering fluid reservoir.

Flush the power steering system.

- Start the engine
- With assistance turn the steering slowly lock to lock 3 times at approximately 1 revolution every 5 seconds.
- Continue to flush the power steering system until 4 litres of power steering fluid has been added to the power steering reservoir. This should take approximately 30 seconds.

10.  CAUTION: Be prepared to collect escaping fluids.

Remove the suitable funnel.

11.  CAUTION: Be prepared to collect escaping fluids.

Remove the suitable pipe to the power steering return hose.

E 100918

12.  **CAUTION:** Be prepared to collect escaping fluids.

NOTE: Note the orientation of the clip.

If a quick release coupling is fitted to the power steering return hose, connect the power steering fluid return hose to the coupling by installing the clip.

13. Install a new power steering fluid reservoir.
For additional information, refer to: Power Steering Fluid Reservoir (211-02, Removal and Installation).

GENERAL

The steering system comprises a TRW manufactured rack and pinion steering gear, a power steering pump, a reservoir, a fluid cooler and fluid hoses. The steering gear is a conventional end take-off rack and pinion power assisted unit.

The steering gear rack has a travel of 166 mm (6.53 in). Lock to lock requires 3.33 revolutions of the steering wheel, which gives a ratio of 45 mm (1.77 in)/revolution at the center position and 52.6 mm (2.07 in)/revolution at end of lock.

STEERING GEAR

E46942

Item	Part Number	Description
1	-	Tie-rod end
2	-	Locknut
3	-	Tie-rod
4	-	Gaitor
5	-	Pressure/return connection from/to pump
6	-	Valve unit housing
7	-	Input shaft
8	-	Pressure/return pipes
9	-	Steering gear casing attachment lugs
10	-	Pinion housing

The steering gear is located at the front of the engine, below the accessory belt drive. The gear is attached to two brackets on the chassis and is secured to the brackets with flanged bolts and caged nuts. The cage prevents the nuts from turning when the bolts are loosened or tightened. The cage nuts can only be used once and must be replaced when the gear is removed. For service, M12 Nylock nuts are available as a replacement for the cage nut.

The steering gear comprises an aluminium, cast, one piece housing which contains a mechanical steering rack, a valve unit and an integrated hydraulic power unit.

The steering gear uses a rack with an integrated piston which is guided on plain bearings within the rack housing. The pinion, which is attached to the valve unit, runs in bearings and meshes with the rack teeth. The rack is pressed against the pinion by a spring loaded yoke which ensures that the teeth mesh with the minimum of play. The pinion is connected to the valve unit via a torsion bar. The rotary motion of the steering wheel is converted into linear movement of the rack by the pinion and is initiated by the valve unit. This movement is transferred into movement of the road wheels by adjustable tie-rods.

The 49 mm (1.92 in) diameter piston of the hydraulic power unit is located at one end of the gear housing. Each side

of the piston is connected to fluid pressure or fluid return via external metal pipes which are connected to the valve unit.

Each end of the gear has a threaded hole which provides for the fitment of the tie-rod. The external ends of the gear are sealed with gaitors which prevent the ingress of dirt and moisture. The tie-rod has a long threaded area which allows for the fitment of the tie-rod end. The thread allows for the adjustment of the steering toe. When the correct toe is achieved, a locknut is tightened against the tie-rod end preventing inadvertent movement.

The gear has a central hole machined along its length. The hole allows the air in the gaitors to be balanced when the steering is turned. The gaitors are serviceable items and are retained on the gear housing and the tie-rod with zip ties.

Valve Unit

E46943

Item	Part Number	Description
1	-	Rack
2	-	Pinion shaft
3	-	Outer sleeve
4	-	Oil sleeve
5	-	Dirt seal
6	-	Input shaft
7	-	Torsion bar
8	-	Circlip
9	-	Oil seal

12	-	Slots
13	-	Pin - Pinion shaft to outer sleeve
14	-	Oil seal
15	-	Pinion shaft
16	-	Bearing
17	-	Pinion shaft nut

The valve unit is an integral part of the steering gear. The principle function of the valve unit is to provide maximum power assistance (i.e. when parking) with minimum effort required to turn the steering wheel.

The pinion housing of the valve is an integral part of the main steering gear casting. The pinion housing has four machined ports which provide connections for pressure feed from the power steering pump, return fluid to the reservoir and pressure feeds to each side of the cylinder piston.

The valve unit comprises an outer sleeve, an input shaft, a torsion bar and a pinion shaft. The valve unit is co-axial with the pinion shaft which is connected to the steering column via the input shaft. The valve unit components are located in the steering gear pinion housing which is sealed with a cap.

The outer sleeve is located in the main bore of the pinion housing. Three annular grooves are machined on its outer diameter. PTFE rings are located between the grooves and seal against the bore of the pinion housing. Holes are drilled radially in each annular groove through the wall of the sleeve. The bore of the outer sleeve is machined to accept the input shaft. Six equally spaced slots are machined in the bore of the sleeve. The ends of the slots are closed and do not continue to the end of the outer sleeve. The radial holes in the outer sleeve are drilled into each slot.

The input shaft has two machined flats at its outer end which allow for the attachment of the steering column intermediate shaft yoke. The flats ensure that the intermediate shaft is fitted in the correct position to maintain the optimum phase angle. The inner end of the input shaft forms a dog-tooth which mates with a slot in the pinion shaft. The fit of the dog-tooth in the slot allows a small amount of relative rotation between the input shaft and the pinion shaft before the dog-tooth contacts the wall of the slot. This ensures that, if the power assistance fails, the steering can be operated manually without over stressing the torsion bar. The central portion of the input shaft has equally spaced longitudinal slots machined in its circumference. The slots are arranged alternately around the input shaft.

The torsion bar is fitted inside the input shaft and is an interference fit in the pinion shaft. The torsion bar is connected to the input shaft by a drive pin. The central diameter of the torsion bar is machined to a smaller diameter in its central section. The smaller diameter allows the torsion bar to twist in response to torque applied from the steering wheel in relation to the grip of the tyres on the road surface.

The pinion shaft has machined upper teeth on its central diameter which mate with teeth on the steering gear rack. A slot, machined in the upper end of the pinion shaft mates with the dog-tooth on the input shaft. The pinion shaft locates in the pinion housing and rotates on ball and roller bearings.

Power Steering Hydraulic Operation

E46944

Item	Part Number	Description
1	-	Reservoir
2	-	Cooler
3	-	Valve unit
4	-	Steering rack and pinion
5	-	Flow control/pressure relief return
6	-	Flow control/Pressure relief valve
7	-	Output port
8	-	Power steering pump
9	-	Low pressure suction line

When the engine is started the power steering pump draws fluid from the reservoir into the low pressure suction line. The fluid passes through the pump and emerges as pressurised fluid at the outlet port. The attenuated high pressure hose passes the pressurised fluid to the steering gear valve unit.

If no steering effort is applied, there is minimal restriction within the system and the supply pressure from the pump is low. Minimal pressure is applied, via the valve unit, to each side of the piston in the hydraulic cylinder and the full flow from the power steering pump returns to the reservoir via the fluid cooler.

When steering effort is applied in either direction, the return flow of fluid to the reservoir is restricted, causing the

supply pressure from the pump to increase. The pressurised fluid is directed to the applicable side of the piston in the hydraulic cylinder, via the valve unit, providing the power assistance required to reduce the steering effort. Fluid displaced from the low pressure side of the cylinder is returned via the valve unit and fluid cooler to the reservoir. The fluid cooler reduces the fluid temperature which prolongs the life of hoses and seals in the system.

POWER STEERING PUMP

E131159

Item	Part Number	Description
1	-	4.0L V6
2	-	5.0L V8
3	-	2.7L, 3.0L TdV6

The power steering pumps used on the four engine variants are basically the same pump with different connection fittings. The pump is a positive displacement, vane type pump which supplies hydraulic pressure to the steering gear valve unit. The pump is driven by a Poly Vee belt from the crankshaft pulley and output from the pump increases proportionally with engine speed. A self-adjusting tensioner is fitted to maintain the correct tension on the belt.

The pump has an internal flow control valve which also incorporates a pressure relief valve. The pressure relief valve limits the maximum pressure supplied to the steering gear to 114 bar (1653 lbf in²) ± 4 bar (58 lbf in²) on V6 petrol engines, and 115 bar (1667 lbf in²) ± 4 bar (58 lbf in²) for V8 petrol, and V6 diesel models. The flow control valve regulates the flow to a constant value of 8.8 l/min (1.93 gal/min) ± 0.5 l/min (0.1 gal/min) regardless of engine speed. The pump has a displacement of 9.6 cc/rev (0.58 in³/rev) on V6 petrol, and V6 diesel, but 11 cc/rev (0.67 in³/rev) for V8 petrol.

A shaft runs longitudinally through the pump. One end of the shaft is fitted with a pressed-on drive pulley, the opposite end of the shaft is closed by a cover. The shaft runs in bearings located in the body and oil seals at each end of the shaft prevent leakage of hydraulic fluid.

The pump contains ten vanes on petrol models, and eleven vanes on diesel models which rotate within a cam ring and are driven by the shaft. As the vanes rotate, the cam ring causes the space between the vanes to increase. This causes a depression between the vanes and fluid is drawn from the reservoir via the suction hose into the space between the vanes.

As the shaft rotates, the inlet port is closed to the vanes which have drawn in fluid, trapping the fluid between the vanes. The cam ring causes the space between the vanes to reduce and consequentially compresses and pressurises the hydraulic fluid trapped between them.

Further rotation of the shaft moves the vanes to the outlet port. As the vanes pass the port plate the pressurised fluid passes from the pump outlet port into the pressure hose to the steering gear.

The pressurised fluid is subject to control by the flow control and pressure relief valve. The flow control valve maintains a constant flow of fluid supplied to the steering gear irrespective of engine speed variations. The pressure relief valve limits the pressure on the output side of the pump. A metering orifice is included in the discharge port of the pump. If the pressure in the orifice reaches a predetermined level, a spring loaded ball in the center of the flow control valve is lifted from its seat and allows pressurised fluid to recirculate within the pump.

The pressure relief valve will operate if the discharge from the pump is restricted, i.e.; steering held on full lock. If the output from the pump is blocked, all output is recirculated through the pump. In this condition, as no fresh fluid is drawn into the pump from the reservoir, the fluid temperature inside the pump will increase rapidly. Consequentially, periods of operation of the steering gear on full lock should be kept to a minimum to prevent overheating of the pump and the fluid within it.

RESERVOIR

E46941

The fluid reservoir is located on a bracket in the left hand side of the engine compartment, behind the radiator. The reservoir comprises a body, cap and filter. The purpose of the reservoir is to contain a surplus of the hydraulic fluid in the system to allow for expansion and contraction of the fluid due to temperature variations. The fluid level ensures that the supply connection on the bottom of the reservoir is covered with fluid at all operating vehicle attitudes. Any air which is present in the system is exhausted from the system in the reservoir.

The body is a plastic moulding with two ports at the bottom which provide for the connection of the suction supply and return hoses. Moulded markings on the side of the reservoir denote the upper and lower fluid levels. A non-serviceable, 100 micron nylon mesh filter is fitted in the body. The filter removes particulate matter from the fluid before it is drawn into the pump supply connection.

The cap is rotated counterclockwise for one quarter turn to release from the body. The cap is fitted with an O-ring to prevent fluid leakage. The cap incorporates a breather hole to allow for changes in fluid level during operation and prevent vacuum or pressurisation of the reservoir.

HIGH PRESSURE HOSE

The high pressure hose connecting the pump to the steering gear valve unit contains two attenuators. Each attenuator comprises a bullet shaped restrictor which is secured inside the hose. The restrictors damp pressure pulses from the pump, consequently reducing noise and strain on downstream components. The attenuators are an integral part of the hose and cannot be serviced separately.

FLUID COOLER

NOTE: Diesel engine vehicles are not fitted with a fluid cooler.

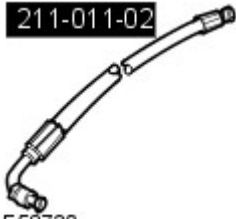

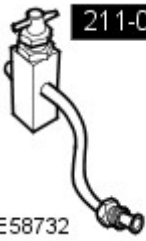

The fluid cooler is located in the return line from the steering gear to the reservoir. The cooler comprises a flexible hose and a solid pipe which connect between the reservoir and the return pipe from the steering gear. The cooler is an integral part of the pipe and cannot be replaced as a separate component.

The cooler is a fabricated aluminium tube, through which the power steering fluid passes. The outer diameter of the cooler tube has aluminium loops attached to it which dissipate heat. Cool air entering the front of the vehicle passes over the cooler and flows through the loops. The loops act as heat exchangers, conducting heat from the fluid as it passes through the tube.

 <p>211-287 E58733</p>	Hose and gauge - power steering pressure test 211-287(LRT-57-005)

CAUTION: If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

1. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Disconnect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

3. Siphon the fluid from the power steering reservoir.
 - Remove the filler cap.

E58865

E46253

4. Remove the front LH splash shield.
 - Remove the 4 clips.

E85740

5. Release the steering gear high-pressure line.
 - Remove the bolt.

6. Remove the front LH fender splash shield.
 For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

E86422

7. **CAUTIONS:**

 Make sure that all openings are sealed. Use new blanking caps.

 Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump supply hose.

- Release the clip.
- Position a container to collect the fluid.

8.  **CAUTION:** Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump high-pressure line.

- Remove the bolt.

9. Install the special tools.
 - Tie the pressure gauge aside.

10.  **NOTE:** Remove and discard the blanking caps.

Connect the power steering pump supply hose.

- Secure with the clip.

11. Fill the power steering reservoir.
12. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

13. **NOTES:**

 Make sure the steering components and test equipment are free from leaks.

 Maintain the maximum fluid level during the test.

 Make sure the steering is in the straight ahead position.

 Under no circumstances must the low pressure spigot be removed from the steering pump.

With the test valve open start the engine.

- Start the engine and turn steering fully lock to lock, stop the engine.
 - Top-up the power steering fluid reservoir.
 - Install the reservoir filler cap.
14. For correct power steering pressures, refer to the steering specification section.
For additional information, refer to: [Specifications](#) (211-02 Power Steering, Specifications).

15.  **CAUTION:** Do not hold steering at full lock for longer than 10 seconds.

With the engine at idle, slowly turn the steering wheel and hold on full lock.

- Record the pressure reading.
16. Repeat the above procedure for the other side.
 - Record the pressure reading.
 17. With the engine at idle, release the steering wheel. The pressure should be, at or below, the pressure specified.
 18. Pressure outside this tolerance, indicates a fault.

19.  CAUTION: Pump damage will occur if test valve is closed for longer periods.

To determine if the fault is in the steering pump or the steering rack, close the test valve for a maximum of 5 seconds.

20. If the pressures recorded fall outside the given values, replace the power steering pump.
21. If the maximum pump pressure is correct, check the hoses for correct routing and condition, if correct suspect the steering gear.
22. On completion of the test stop the engine, disconnect the battery ground cable and siphon the steering fluid from the reservoir.

23. CAUTIONS:

Make sure that all openings are sealed. Use new blanking caps.

Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump supply hose.

- Release the clip.

24. Disassemble the test equipment.
25. Connect the power steering pump high-pressure line.
- Tighten the bolt to 25 Nm (18 lb.ft).

26. NOTE: Remove and discard the blanking caps.

Connect the power steering pump supply hose.

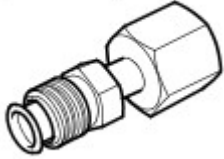

- Secure with the clip.
- Remove the container.

27. Secure the steering gear high-pressure line.
- Tighten the bolt to 10 Nm (7 lb.ft).
28. Install the front LH splash shield.
- Install the clips.
29. Install the front LH fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
30. Connect the battery ground cable.
31. Fill and bleed the power steering system.
For additional information, refer to: [Power Steering System Filling and Bleeding](#) (211-00 Steering System - General Information, General Procedures).

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
- Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

3. Remove the radiator access panel.
 - Remove the 4 bolts.

4. Remove the front LH splash shield.
 - Remove the 4 clips.

5. Remove the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).

6. Siphon the fluid from the power steering reservoir.
 - Remove the filler cap.
 - Install the filler cap.

7. Position an absorbent cloth to collect fluid spillage.

8.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

NOTES:

Some fluid spillage is inevitable during this operation.

Care must be taken to avoid contamination of the drive belt.

Disconnect the power steering high-pressure pipe union.

- Remove the bolt.
- Remove and discard the 2 sealing washers.
- Position a container to collect the fluid.

9. Install the special tools to the power steering high-pressure port.
 - Install the O-ring seal.
 - Tie the pressure gauge aside under the hood.

10. Install the special tool to the high-pressure union.
 - Install the O-ring seals.
 - Connect the special tool line, to the special tool valve block assembly.

11. Refill the power steering reservoir.
 - Remove the filler cap.
12. Connect the battery ground cable. For additional information, refer to: Specifications (414-00, Specifications).

13. **NOTES:**

 Ensure the steering components and test equipment are free from leaks.

 Maintain the maximum fluid level during the test.

 Make sure the steering is in the straight ahead position.

 Under no circumstances must the low pressure spigot be removed from the steering pump.

With the test valve open start the engine.

- Start the engine and turn steering fully lock to lock, stop the engine.
 - Top-up the power steering fluid reservoir.
 - Install the reservoir filler cap.
14. For correct power steering pressures, refer to the steering specification section. For additional information, refer to: Specifications (211-02, Specifications).
 15. With the engine at idle, slowly turn the steering wheel and hold on full lock.

- Record the pressure reading.
16. Repeat the above procedure for the other side.
 - Record the pressure reading.
 17. With the engine at idle, release the steering wheel. The pressure should be, at or below, the pressure specified.
 18. Pressure outside this tolerance, indicates a fault.
 19. To determine if the fault is in the steering pump or the steering rack, close the test valve for a maximum of 5 seconds.
 20. If the pressures recorded fall outside the given values, replace the power steering pump.
 21. If the maximum pump pressure is correct, then suspect the power steering rack.
 22. On completion of the test stop the engine, disconnect the battery ground cable and siphon the steering fluid from the reservoir.
 - Remove the filler cap.
 - Install the filler cap.
 23. Disassemble the test equipment.
 24. Connect the high-pressure line to the power steering pump.
 - Clean the component mating faces.
 - Install the new O-ring seals.
 - Tighten the bolt to 25 Nm (18 lb.ft).
 25. Install the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).
 26. Install the front LH splash shield.
 - Secure with the clips.
 27. Install the radiator access panel.
 - Tighten the M6 bolts to 10 Nm (7 lb.ft).
 - Tighten the M10 bolts to 45 Nm (33 lb.ft).
 28. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
 29. Refill and bleed the power steering.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00, General Procedures).

Removal

NOTES:

LHD illustration shown, RHD is similar.

Some variation in the illustrations may occur, but the essential information is always correct.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2.  **CAUTION:** Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Center the steering wheel.

3. Remove the radiator splash shield.
 - Remove the 4 bolts.

4. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02, Removal and Installation).

5. Remove the front RH splash shield.
 - Remove the 4 clips.

6. Remove the front LH splash shield.
 - Remove the 4 clips.

7.  **NOTE:** LH illustration shown, RH is similar.

Release both tie-rod end ball joints.

- Loosen the locknut.
- Release both track rods from tie rod ends, note the number of turns for installation.

8.  **NOTE:** Note the fitted position.

Disconnect the lower steering column from the steering gear.

- Remove and discard the bolt.

9. Remove the steering gear high-pressure line.
- Remove the bolts.

10. Disconnect the steering gear control valve actuator electrical connector.

11. Release the transmission fluid cooler.
 - Remove the 4 bolts.

12. Release the fuel cooler.
 - Remove the bolt.

13. CAUTIONS:

 Make sure that the area around the component is clean and free of foreign material.

 Make sure that all openings are sealed. Use new blanking caps.

Disconnect the power steering high pressure line and return line from the steering gear.

- Remove and discard the bolt.
- Remove and discard the 2 O-ring seals.

14. Release the steering gear.
 - Remove the 2 bolts.

E47922

15. Remove the transmission fluid cooler and fuel cooler support bracket.
 - Remove the bolt.
 - Release the coolant line.

E85755

16. Remove the steering gear.

Installation

1. Install the steering gear.
2. Install the transmission fluid cooler and fuel cooler support bracket.
 - Secure the coolant line.
 - Tighten the bolt to 23 Nm (17 lb.ft).
3. Secure the steering gear.
 - Tighten the bolts to 175 Nm (129 lb.ft).

4. NOTES:

Remove and discard the blanking caps.

Lubricate the seals with clean power steering fluid.

Connect the power steering high pressure line and return line to the steering gear.

- Install new O-ring seals.
 - Tighten the new bolt to 22 Nm (16 lb.ft).
5. Secure the fuel cooler.
 - Tighten the bolt to 23 Nm (17 lb.ft).
 6. Secure the transmission fluid cooler.
 - Tighten the nuts and bolts to 25 Nm (18 lb.ft).
 7. Connect the steering gear control valve actuator electrical connector.
 8. Install the power steering line support bracket.
 - Tighten the bolt to 10 Nm (7 lb.ft).
 9. Connect the lower steering column shaft to the steering gear.
 - Tighten the new bolt to 24 Nm (18 lb.ft).

10. Connect the tie-rod end ball joints.
 - Attach both tie rods to previously noted positions.
 - Tighten the tie-rod locking nut.
11. Install the front LH splash shield.
 - Install the clips.
12. Install the front RH splash shield.
 - Install the clips.
13. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02, Removal and Installation).
14. Install the radiator splash shield.
 - Tighten the bolts to 10 Nm (7 lb.ft).
15. Fill and bleed the power steering system.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00, General Procedures).
16. Adjust the front wheel alignment.

Item	Part Number	Description
1	-	Steering gear
2	-	Steering gear boot
3	-	Tie rod
4	-	Locknut
5	-	Tie rod end
6	-	Ball joint
7	-	Self-locking nut

GENERAL

The steering linkage comprises the tie rod which provides the connection between the steering gear and the front wheel knuckle.

Each end of the steering gear has a threaded hole which provides for the fitment of the tie rods. The external ends of the tie rods are sealed with steering gear boots to prevent the ingress of dirt and moisture into the steering gear.

The outer ends of the tie rods are threaded to allow the fitment of the tie rod ends. The tie rod ends are screwed onto the tie rods and locked with locknuts to prevent inadvertent movement. The thread on the tie rod allows the position of the tie rod end to be adjusted in order to set the correct toe angle for each front wheel.

The tie rod end comprises a forged housing with a threaded bore for attachment to the tie rod. The tie rod end incorporates a non-serviceable tapered ball joint which locates in a tapered hole in the front wheel knuckle and is secured with a self-locking nut. The ball joint has an internal hexagonal drive which enables the joint to be held stationary when the self-locking nut is tightened.

Steering Linkage - Tie Rod End

Removal and Installation

Special Tool(s)

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front wheel.
3. Loosen the tie rod end ball joint retaining nut.
4. Loosen the tie rod end lock nut.

5. Using the special tool, release the tie-rod end ball joint from the wheel knuckle.
 - Remove and discard the tie rod end retaining nut.

6. Remove the tie-rod end, note the number of turns for installation.

Installation

1. Install the tie rod end, note the number of turns until adjacent to the locknut.

2.  **CAUTION:** To prevent damage to the tie rods, use an additional wrench when loosening or tightening the components.

Connect the tie rod end ball joint.

- Clean the component mating faces.
 - For vehicles fitted with an M12 nut, install a new nut and tighten to 76 Nm (56 lb.ft).
 - For vehicles fitted with an M14 nut, install a new nut and tighten to 150 Nm (111 lb.ft).
3. Tighten the tie rod locking nut.
 - Clean the component mating faces.
 - Tighten the nut to 55 Nm (40 lb.ft).
 4. Install the front wheel.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
 5. Lower the vehicle.
 6. Using only four wheel alignment equipment approved by Land Rover, check and adjust the wheel alignment.

Steering Linkage - Steering Gear Boot

Removal and Installation

Removal

1. Remove the tie-rod end.
For additional information, refer to: Tie-Rod End (211-03, Removal and Installation).

2.  **NOTE:** Note the fitted position.

Remove the locknut.

3. Remove the steering gear boot.
 - Release the 2 clips.

E55694

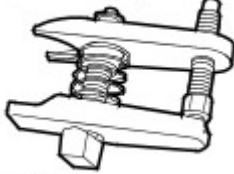

Installation

1. Install the steering gear boot.
 - Clean the component mating faces.
 - Secure with the clips.
2. Install the locknut.
3. Install the tie-rod end.
For additional information, refer to: Tie-Rod End (211-03, Removal and Installation).

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front wheel.
3. Loosen the outer tie-rod end ball joint retaining nut.
4. Loosen the outer tie-rod end lock nut.

5. Using the special tool, release the tie-rod end ball joint from the wheel knuckle.
 - Remove and discard the tie rod end retaining nut.

6. Remove the outer tie-rod end, note the number of turns for installation.

7. Remove the outer tie-rod end lock nut.

8. Remove the steering gear boot.
 - Release the 2 clips.

9. Remove the inner tie-rod end.
 - Loosen the nut.

Installation

1. Install the inner tie-rod end.
 - Tighten the nut to 100 Nm (74 lb.ft).
2. Install the steering gear boot.
 - Secure with the clips.
3. Install the outer tie-rod end lock nut.
4. Install the tie rod end, note the number of turns until adjacent to the locknut.
5.  **CAUTION:** To prevent damage to the tie rods, use an additional wrench when loosening or tightening the components.
 - Connect the tie-rod end ball joint.
 - Clean the component mating faces.
 - For vehicles fitted with an M12 nut, install a new nut and tighten to 76 Nm (56 lb.ft).
 - For vehicles fitted with an M14 nut, install a new nut and tighten to 150 Nm (111 lb.ft).
6. Tighten the tie-rod locking nut.
 - Clean the component mating faces.
 - Tighten the nut to 55 Nm (40 lb.ft).
7. Install the front wheel.
 - Tighten the wheel nuts to 140 Nm (103 lb.ft).
8. Lower the vehicle.
9. Using only four wheel alignment equipment approved by Land Rover, check and adjust the wheel alignment.

Steering Column -

General Specification

Item	Specification
Type	Two piece, articulated with flexible coupling to steering rack; fitted with energy absorption system and having a 120 mm (4.7 in) ride down capability with a 4.5 kN (0.45 ton force) maximum decoupling load on the intermediate shaft and a 77 mm (3.0 in) collapse stroke on the lower shaft.
Upper column adjustment:

7	-	Lower collapsible shaft
8	-	Intermediate shaft
9	-	Gaitor
10	-	Upper steering column assembly - Electric
11	-	Upper steering column assembly - Manual

Overview

The steering column comprises the upper column assembly, the intermediate shaft and the lower collapsible shaft. The three components are positively connected together to pass driver rotary input from the steering wheel to a linear output of the steering rack.

The upper steering column assembly is electronically adjustable for steering wheel reach and rake and is controlled by the **CJB (central junction box)**. The upper steering column assembly also provides the location for the electronic steering lock mechanism and the steering angle sensor.

10	-	Clamp plate assembly
11	-	Adjustment balance spring (2 off)
12	-	Shearing capsule (2 off)
13	-	Steering angle sensor
14	-	Swing yoke

The steering column is attached to the in-vehicle crossbeam and secured with four, 8 mm thread forming, pan head Torx drive screws. The two forward attachment screws are fixed through the column mounting bracket, the two rearward mounting screws also pass through the shearing capsules. In the event of a high energy frontal impact, the shearing capsules remain fixed to the crossbeam, but the 'U' bracket (with the main body) disengages from the capsules, allowing the column to shorten axially (collapse), with the coiled straps absorbing energy to reduce

occupant loading.

WARNING: Take care when handling the column not to trap fingers if releasing the adjustment lever at any point during the removal procedure when the column is not in the vehicle. The balance springs will cause the column to rapidly move to its upper-most position.

The column comprises a cast magnesium roof bracket which is attached to the in-vehicle crossbeam. Attached to the roof bracket is a pivot housing, a 'U' bracket, upper and lower shafts and a main body. The roof bracket has two hooks which locate in slots in the in-vehicle crossbeam. The hooks assist in supporting the weight of the column during removal or installation.

The pivot housing is attached to the forward end of the roof bracket with two pivot pins. The pivot housing allows for adjustment of the column rake and contains a bearing which supports the column lower shaft.

The 'U' bracket is attached to the roof bracket by a screw, bush and plastic washer assembly (third fixing) located in a slot in the top of the roof bracket. When the column is assembled into the vehicle, the shearing capsules, which are attached to the 'U' bracket, are clamped up against the roof bracket by the fixing screws, preventing movement of the 'U' bracket. The bolts also pass through rectangular section steel straps, which at one end, have coils that locate around a plastic bush (positioned on the shearing capsule). The straps are used to control the rate of column collapse, in the event of a high energy frontal impact.

The main body is positioned in the 'U' bracket via the lever bolt. The bolt is captive within the vertical slots in the 'U' bracket and the horizontal slots in the main body. The bolt also passes through the clamp plate assemblies (one on either side of the 'U' bracket). The body houses the middle and upper bearings through which the upper shaft is located. Two offset holes in the main body provide for the attachment of the electronic steering lock assembly.

The upper and lower shafts are located through the length of the column assembly. The upper shaft is supported in two bearings in the main body and the lower shaft is located in the upper shaft and supported in a bearing in the pivot housing. The lower shaft has a tubular section with external splines. These mate with the internal splines in the upper shaft. The purpose of the splines is to transmit rotational movement of the upper shaft to the lower shaft, but allowing the two components to telescope into each other in the event of a collision. The length of the splined sections allow for 120 mm (4.72 in) of linear movement. The lower shaft is fitted with a universal joint spider to which a swivel yoke is attached. The swivel yoke attaches to the intermediate shaft of the steering column on the interior side of the bulkhead using a special cam bolt and self-locking nut.

A steering angle sensor is attached to the pivot housing of the column and its centre gear is rotated by a drive collar which is attached to the lower shaft and rotates with movement of the steering wheel. The sensor transmits steering angle data on the high speed CAN bus which is used by various systems on the vehicle. The steering angle sensor is designed to become detached from the column in the event of a frontal impact. Care must be taken when handling the column assembly to prevent accidental damage to the sensor.

The upper steering column assembly houses the electronic column lock mechanism and control module.

The steering column is adjustable for reach and rake. The column can be adjusted for 40 mm (1.57 in) of reach adjustment and 6° of rake adjustment. The adjustment mechanism comprises an adjustment lever, a cam plate, a lever bolt and nut, two brake pads and two clamp plate assemblies.

A plastic adjustment lever is located on the underside of the column assembly and is attached to a cam plate. When the lever is pulled downwards, the cam plate rotates and releases tension in the lever bolt. The lever bolt also passes through two sets of clamp plate assemblies. When the lever is moved upwards, the cam plate rotates applying tension to the lever bolt, which applies pressure to the brake pads which in turn apply pressure to the clamp plate assemblies (which lock the column in the desired position). The lever bolt is retained by a self-locking lever nut, which abuts a thrust bearing.

WARNING: Under no circumstances should the lever nut torque be reduced, as this will reduce the clamping efficiency of the adjustment mechanism possibly affecting the stability of the column during a frontal impact.

The pivot housing is attached to the roof bracket with two pivot pins. When the rake adjustment is operated, the pivot housing rotates around the pivot pins to allow for the up and down adjustment, but maintains a positive location to the roof bracket. An adjustment spring is fitted between the 'U' bracket and the main body, to counteract the weight of the main body, upper shaft, steering wheel and airbag, preventing the steering wheel from dropping rapidly when the adjustment lever is released.

In the event of a high energy frontal impact, the upper column assembly is designed to axially collapse reducing impact injury to the driver. A number of components interact together to ensure that the collapse of the column is in a controlled manner. The following components control the column collapse:

- Pressure washer and bush (third fixing)
- Shearing capsules
- Straps
- Upper and lower shaft (splined) connection

The shearing capsules have a central hole through which the rearward attachment bolts pass through into the roof bracket. The capsules are located in the 'U' bracket by tapered slots, which have small cut-outs in the inside faces. The shearing capsules have a number of small holes which align with the cut-outs in the 'U' bracket. When the capsules are installed, plastic is injected into the holes and cut-outs. This plastic retention of the capsules provides the initial controlled break-out force for the column in the event of a collision. After 10 mm of displacement, the 'U' bracket is no longer located by the shearing capsules. When handling the column, care should be taken that the shearing capsules are not impacted or dislodged.

The tension in the 'Third Fixing' screw, applies a clamp load to the roof bracket (via the bush and compression washers). In the event of a collision, this clamp load (supplementary to the shearing capsules) must be overcome before the column can collapse. When this load has been exceeded (and the fixing has been displaced 20 mm (0.79

in)) it slides easily within the roof bracket slot, providing directional control to the column, as it collapses. Under no circumstances should the screw torque be adjusted.

The straps are rectangular section steel, which at one end, have coils that locate around a plastic bush (positioned on the shearing capsule). The other end is formed into a hook which locates within a slot in the 'U' bracket. When a collision has occurred, and the 'U' bracket has been displaced from the shearing capsules by 8 mm (0.3 in), the straps begin to un-roll due to the displacement of the 'U' bracket. The straps provide the main element for energy absorption as the column collapses. The cross section of the straps change after approximately 40 mm (1.6 in) of extension, changing the amount of energy that they absorb.

Upper Column Assembly - Electric

E124336

Item	Part Number	Description
1	-	Pivot housing
2	-	Roof bracket
3	-	Locating hook
4	-	Electronic steering lock
5	-	Rake solenoid
6	-	Rake clutch
7	-	Reach solenoid
8	-	Reach clutch
9	-	Potentiometer
10	-	Electric motor
11	-	Outer profile
12	-	Rake lever
13	-	Electrical connector

14	-	Pivot pin
15	-	Steering angle sensor
16	-	Swing yoke

The steering column is attached to the in-vehicle crossbeam and secured with four, 8mm, thread forming, pan head Torx drive screws. In the event of a high energy frontal impact, a strap and shear pin on the underside of the column provides a controlled collapse of the outer housing on the inner housing, allowing the column to shorten axially (collapse), absorbing energy to reduce occupant loading.

The column comprises a cast magnesium roof bracket which is attached to the in-vehicle crossbeam. Attached to the roof bracket is a pivot housing, a outer housing and upper and lower shafts. The roof bracket has two hooks which locate in slots in the in-vehicle crossbeam. The hooks assist in supporting the weight of the column during removal or installation.

The rake lever locates the aluminum outer profile, into which is fixed the electronic steering lock adaptor. The inner profile is located within the outer profile, by 2 linear bearing assemblies, which allow a telescopic action for the reach adjustment.

The assembly of the upper and lower shafts is located within the column by the bearings in the electronic steering lock adaptor and the pivot housing. Both shafts are tubular. The lower shaft has external splines (which are over molded with nylon), and these mate with the internal splines in the upper shaft. The purpose of the splines is to transmit rotational movement of the upper shaft to the lower shaft, yet allow telescopic movement during column axial collapse. The lower shaft is fitted with a universal joint spider to which a swivel yoke is attached. The swivel yoke attaches to the intermediate shaft of the steering column on the interior side of the bulkhead using a special cam bolt and self-locking nut.

A steering angle sensor is attached to the pivot housing of the column and its centre gear is rotated by a drive collar which is attached to the lower shaft and rotates with movement of the steering wheel. The sensor transmits steering angle data on the high speed CAN bus which is used by various systems on the vehicle. The steering angle sensor is designed to become detached from the column in the event of a frontal impact. Care must be taken when handling the column assembly to prevent accidental damage to the sensor.

The upper steering column assembly houses the electronic column lock mechanism and control module.

The steering column is adjustable electrically for reach and rake. The adjustment mechanism comprises an electric adjustment motor, a lead screw, a rake solenoid, a reach solenoid, a rake clutch and a reach clutch.

The column adjustment is controlled by the driver using a joystick switch located on the left hand side of the column cowl. The joystick can be moved forward and backward to adjust the column reach in and out and moved up and down to adjust the rake. The single electric motor is used for both adjustment ranges. The switch selection uses the applicable solenoid, engaging the applicable clutch on the lead screw.

When the auto function is activated, the steering column will adjust to the uppermost tilt position with ignition off, and re-adjust to the previous set position, with ignition on.

For the reach adjustment, the lead screw drives the outer housing in or out as required. For the rake adjustment, the lead screw drives a rake lever which moves the column up or down as applicable.

The pivot housing is attached to the roof bracket with two pivot pins. When the rake adjustment is operated, the pivot housing rotates around the pivot pins to allow for the up and down adjustment, but maintains a positive location to the roof bracket.

The electric steering column is linked to and controlled by the memory control module. The memory control module provides storage of three separate memory positions which are stored against three individual vehicle keys. For additional information, refer to: Seats (501-10, Description and Operation).

. The electric column also has an easy egress feature which lifts the column to its maximum rake to allow easier access to the vehicle.

In the event of a high energy frontal impact, the upper column assembly is designed to collapse reducing impact injury to the driver. A number of components interact together to ensure that the collapse of the column is in a controlled manner. The following components control the column collapse:

- Shear pin
- Strap
- Upper and lower shaft (splined) connection

The strap is rectangular section steel, which is secured by two Allen screws to the outer housing and by a shear pin to the strap guide. The strap provides the main element for energy absorption as the column collapses. To initiate axial movement of the column, the shear pin has to be severed, friction between several column interfaces has to be overcome, and an axial load applied sufficient to initiate strap guide deformation. Once the column is telescoping, deformation of the strap guide, and sliding friction between column interfaces, absorbs the energy of the occupant in a controlled manner, as the column collapses.

WARNING: Do not attempt to dismantle the steering column. The crash safety of the unit will be compromised.

Intermediate Shaft

E124337

Item	Part Number	Description
1	-	Load limiter pins
2	-	Cam bolt
3	-	Self-locking nut
4	-	Retention spring
5	-	Attachment hole
6	-	Seal sleeve

CAUTION: Care should be taken when handling the intermediate shaft, to ensure that it is not subject to impacts or that the retention spring is not displaced.

The non-handed, intermediate shaft is attached at its upper end to the swivel yoke on the lower shaft of the steering column assembly. The intermediate shaft comprises two main parts; the upper and lower axis which are joined together with a shear joint.

The upper axis has a cut-out in the shaft which allows for the fitment of the cam bolt. Only when the shaft is located correctly in the swivel yoke, can the cam bolt be inserted. A self-locking nut is fitted to the cam bolt. The torque applied as the nut is tightened, rotates the bolt, forcing the cam against the shaft, positioning it correctly in the swivel yoke prior to the joint being clamped.

NOTE: If the self-locking nut is removed for any reason, it is recommended that a new, correct nut is fitted to maintain the optimum torque on the cam bolt.

The lower axis is fitted with a plastic molded seal sleeve which provides a suitable surface for the location of the plastic bearings within the two bulkhead seals. The bottom of the lower axis is machined to a double 'D' shape which tapers at the end. One side of the taper has a slot which is used to align the intermediate shaft and the lower

collapsible shaft to ensure that the correct orientation of the steering wheel to steering gear is maintained. A hole is drilled through the double 'D' shape and provides for attachment of the intermediate shaft to the lower collapsible shaft.

The upper and lower axis, are joined together via a load limiter. The load limiter is designed to disconnect the upper and lower axis in the event of a high energy frontal impact preventing an excessive load being applied to the steering column (causing intrusion into the passenger compartment or an unstable airbag deployment).

The load limiter comprises two plates which are part of the upper and lower axis. The plates have a central 'guide' pin, and two retention pins, which pass through bushes in the plates, onto which a rubber and steel washer are staked in position. The size of the staking controls the load at which the lower axis separates from the upper axis. A wire 'retention' spring is also fitted to the load limiter.

Lower Collapsible Shaft

E124338

Item	Part Number	Description
1	-	Bolt
2	-	Heat shield
3	-	Female shaft
4	-	Male shaft
5	-	Plastic spacer
6	-	Flexible coupling
7	-	Universal joint
8	-	Torx bolt

The lower collapsible shaft is a handed component and the correct component must be fitted to ensure that the steering phase angle is maintained. The shaft is attached at its upper end to the intermediate shaft and at its lower end to the valve unit pinion on the steering gear. These attachment joints can only be fitted in one orientation to

ensure the correct alignment of the steering wheel to the steering gear. The shaft comprises two female and male shafts which are a telescopic fit on each other. The male shaft can slide up to 77 mm (3.03 in) within the female shaft in the event of a frontal impact, to minimize the effect of frontal intrusion. The sliding fit also allows for dynamic displacement between the chassis and the body during severe off-road driving. A plastic spacer is fitted to the male shaft which is only used as an assembly aid during vehicle production and serves no function once the shaft is assembled to the vehicle.

The female shaft is a triangular section tube which is formed to a double 'D' hole at its upper end which mates with the intermediate shaft. An indentation pressed in the wall of the tube ensures the correct alignment between the intermediate shaft and the lower collapsible shaft. A captive nut, clinched to one side of a hole in the double 'D' section, allows for the fitment of a patchlock bolt to secure the intermediate shaft. Clamped around the end of the female shaft is a dust seal which prevents the ingress of dirt and moisture into the sliding joint, and a heat sleeve is also fitted to reflect radiant heat from the exhaust.

The male shaft is a triangular section tube which is staked at its lower end into a flange. A cage and curved 'spring plates' are fitted to its upper end, which slide in the female shaft. A pin is fitted into the side of the female tube, to secure the male tube in the bore. The lower end of the male shaft is fitted with a flexible coupling to absorb vibration and steering 'kick back', transmitted from the steering gear. A 'stabilizing pin' is fitted through the coupling to prevent coupling articulation (acting as a universal joint), while still allowing rotational flexing and plunge movement. The coupling is a rubber molding within which are nylon fibres wound around the attachment holes to transmit torque applied to the steering. The coupling is attached to a drive flange (which is part of the male shaft), and to the 'U' yoke which in turn is connected to the pinion yoke, by the universal joint assembly.

Electronic Steering Column Lock

E124339

Item	Part Number	Description
1	-	Electronic steering column lock

With the passive start system, a conventional steering lock mechanism cannot be used. An electronic system was developed which comprises a steering column assembly locking unit with an integrated control module. The steering

lock is operated with the door locks when the vehicle is locked or unlocked. A control module, located inside the steering column, controls a motor, releasing the steering lock when appropriate.

The upper steering column assembly houses the column lock mechanism and control module. The components are assembled with non-removable pins for security reasons and are therefore non-serviceable. Failure of any steering lock components will require replacement of the upper steering column assembly.

The steering column lock comprises a locking motor and locking bolt. The locking motor drives a cam, which moves the locking bolt into and out of engagement with the locking sleeve on the steering column. The locking motor is fitted with a Hall effect sensor, which informs the control module of the position (locked/unlocked) of the steering lock mechanism.

Steering Column - Steering Column

Removal and Installation

Removal

WARNING: Take care if releasing the adjustment lever when the column has been removed from the vehicle. The spring is under a high tension, and if released, could cause personal injury. Make sure fingers are clear from any areas, likely to be trapped.

CAUTION: Air tools **MUST NOT** be used on steering column bolts.

All vehicles

1. Fully extend the steering column for access.
2. Remove the steering wheel.
For additional information, refer to: Steering Wheel (211-04, Removal and Installation).
3. Remove the drivers side register trim panel.
For additional information, refer to: Driver Side Register Trim Panel (412-01, Removal and Installation).
4. Remove the driver side closing trim panel.
 - Release the clip.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

5. Remove the instrument panel access panel.
 - Release the 2 clips.

6. Remove the steering column upper shroud.
 - Release the 6 clips.

7. Remove the steering column lower shroud.
 - Remove the 3 Torx screws.
 - Disconnect the electrical connector.

8. Remove the steering column side trim panel.
 - Release the 4 clips.
 - Disconnect 2 tabs.

E123222

9. Disconnect the 2 electrical connectors from the steering column multifunction switches.

E47072

10. Disconnect the 2 electrical connectors from the clockspring.

E47073

11. Remove the steering column switch assembly.
 - Remove the 4 Torx bolts.

E47080

12. Remove the steering column gaiter panel.
 - Remove the 2 Torx screws.
 - Release the 2 clips.

E123681

13. Disconnect the smart key antenna.

E123823

14. Disconnect the steering column lock electrical connector.

E124126

15. Disconnect the steering angle sensor electrical connector.

E47076

Vehicles with electric steering column

16. Disconnect the steering column adjustment motor electrical connector.

E51371

17. Disconnect the steering column intermediate shaft from the steering column.
 - Note the fitted position.
 - Remove the special bolt and discard the nut.

E49465

E47079

E47084

18.  **WARNING:** Take care if releasing the adjustment lever when the column has been removed from the vehicle. The spring is under a high tension, and if released, could cause personal injury. Make sure fingers are clear from any areas, likely to be trapped.

 **CAUTION:** If the steering angle sensor is damaged upon removal of the steering column, the sensor **MUST** be replaced.

With assistance, remove the steering column.

- Remove the 4 Torx bolts.

19. Remove the steering angle sensor.
- Remove the 3 Torx screws.

Installation

Vehicles with electric steering column

1.  **CAUTION:** The potentiometer adjustment values are unique for each steering column. Failure to enter the correct code during calibration may result in damage to the vehicle.

Note the potentiometer hexadecimal code on the new steering column label for future reference.

E102064

All vehicles

2. Install the steering angle sensor.
- Tighten the Torx screws to 3 Nm (2.2 lb.ft).

3. **CAUTIONS:**

 Make sure the bolt holes are clean and free of swarf.

 The steering column bolts must be tightened by hand a minimum of 3 revolutions.

 Air tools **MUST NOT** be used on steering column bolts.

With assistance, install the steering column.

- Tighten the bolts in sequence to 25 Nm (18 lb.ft).

4. Connect the steering column intermediate shaft.

Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).

5. Secure the wiring harness to the steering column.

Vehicles with electric steering column

6. Connect the steering column adjustment motor electrical connector.

All vehicles

7. Connect the steering angle sensor electrical connector.

8. Connect the steering column lock electrical connector.

9. Connect the smart key antenna.
10. Install the steering column gaiter panel.
 - Secure with the clips.
 - Tighten the Torx screws.
11. Install the steering column switch assembly.
 - Tighten the Torx bolts to 3 Nm (2 lb.ft).
12. Connect the clockspring and multifunction switch electrical connectors.
13. Install the steering column side trim panel.
 - Secure with the clips.
14. Install the steering column shrouds.
15. Install the instrument panel access panel.
 - Secure with the clips.
16. Install the closing trim panel.
 - Connect the electrical connector.
 - Secure the clip.
 - Tighten the screws.
17. Install the steering wheel.

For additional information, refer to: Steering Wheel (211-04, Removal and Installation).
18. Install the drivers side register trim panel.

For additional information, refer to: Driver Side Register Trim Panel (412-01, Removal and Installation).
19. Calibrate the steering angle sensor using the Land Rover approved diagnostic tool.

Vehicles with electric steering column

20. If a new electric steering column is fitted re-calibrate the steering column potentiometer using the Land Rover approved diagnostic system.

Steering Column - Steering Column Shaft

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

2. Remove the driver side closing trim panel.
 - Release the clip.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

3. Disconnect the steering column intermediate shaft from the steering column.
 - Note the fitted position.
 - Remove the special bolt and discard the nut.

4. Disconnect the steering column intermediate shaft from the lower shaft.
 - Note the fitted position.
 - Remove and discard the bolt.

5. Remove the steering column intermediate shaft.
 - Release the 2 grommets.

6. NOTES:

Do not disassemble further if the

E55128

component is removed for access only.

Note the fitted position.

Remove the 2 intermediate shaft grommets.

Installation

1. Install the steering column intermediate shaft.
 - Install the grommets.
2. Connect the steering column intermediate shaft to the lower shaft.
 - Tighten the new bolt to 25 Nm (18 lb.ft).
3. Connect the steering column intermediate shaft to the steering column.
 - Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).
4. Install the driver side closing trim panel.
 - Connect the electrical connector.
 - Secure the clip.
 - Tighten the screws.
5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

Steering Column - Steering Column Lower Shaft

Removal and Installation

Removal

CAUTION: Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Turn the steering wheel to the straight ahead position.

E80536

3. CAUTIONS:

Make sure the steering wheel is in the straight ahead position.

Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

NOTE: Note the fitted position.

Remove and discard the steering column lower shaft upper bolt.

4.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

E102486

5.  **CAUTION:** Make sure that the brake hose and the wiring harnesses are not damaged during the removal and installation of the heat shields.

Remove the upper suspension arm heat shield for access.

- Remove the 3 nuts.

6.  **CAUTION:** Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Disconnect the steering column lower shaft from the intermediate shaft.

7. Remove the fender splash shield lower trim.
 - Remove the 4 clips.

8.  **CAUTION:** Make sure that the steering is correctly positioned using the road wheels. Do not turn the steering wheel. Failure to follow this instruction may result in damage to the vehicle.

Turn the steering until access can be gained to the steering column lower shaft bolt.

9.  **CAUTION:** Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Remove and discard the steering column lower shaft bolt.

10. Remove the steering column lower shaft.
- Disconnect the steering column lower shaft from the steering gear.

Installation

1. Clean the component mating faces.

2.  **CAUTION:** Make sure that the road wheels are in the straight ahead position.

Install the steering column lower shaft.

- Connect the steering column lower shaft to the steering gear.
- Connect the steering column intermediate shaft to the lower shaft.

3. Lower the vehicle on the lift.

4.  **CAUTION:** Make sure that a new bolt is installed.

Install the steering column lower shaft upper bolt.

- Install a new bolt and tighten to 30 Nm (22 lb.ft).

5. Raise the vehicle on the lift.

6. **CAUTIONS:**

 Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the

clockspring and steering wheel switches may occur.

Make sure that the steering is correctly positioned using the road wheels. Do not turn the steering wheel. Failure to follow this instruction may result in damage to the vehicle.

Turn the steering until access can be gained to the steering column lower shaft bolt.

7. Install the steering column lower shaft to steering gear bolt.
 - Install a new bolt and tighten to 30 Nm (22 lb.ft).
8. Install the fender splash shield lower trim.
 - Install the 4 clips.
9. Install the upper suspension arm heat shield.
 - Install the 3 nuts.
10. Lower the vehicle on the lift.

Steering Column - Steering Wheel

Removal and Installation

Removal

1. Refer to: Important Safety Instructions (100-00, Description and Operation).

2. Disconnect the battery ground cable.

Refer to: Specifications (414-00, Specifications).

3.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplementary restraints system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

Refer to: Driver Air Bag Module (501-20, Removal and Installation).

Check the visual condition of oil carrying components • Check the crankcase ventilation system • Carry out a compression test, GO to Pinpoint Test A.

	by	
Internal oil leaks (leaks into coolant or combustion chamber) Note: This may be indicated by the production of blue smoke from the exhaust	<ul style="list-style-type: none"> • Gaskets • Seals • Damaged/cracked casings • Worn valve guides • Worn cylinder bores/pistons • Broken piston rings 	<ul style="list-style-type: none"> • Check for traces of oil in the coolant. Check for evidence of oil in the combustion chambers (deposits on the glow plugs, etc). Confirm oil consumption and vehicle usage with the owner/driver. Carry out an oil consumption test, GO to Pinpoint Test B.

Symptom Chart, NVH

NOTE: As the checks suggested here are open to interpretation, they should be used as a guide only. Descriptions of noises, etc, are in general terms, so depend on a degree of experience on the part of the technician.

Symptom	Possible Cause	Action
Rattle/ticking from top of engine	<ul style="list-style-type: none"> • Valve gear noise • Camshaft bearing noise • Timing belt noise • Tensioner noise • Vacuum pump noise • High pressure fuel pump noise 	<ul style="list-style-type: none"> • Check the engine oil pressure, GO to Pinpoint Test C. • Check the function of the hydraulic tappets and the camshaft condition. Check the camshaft bearings • Check the timing belt and tensioner • Check the vacuum pump • Check the high pressure fuel pump
Growl from top of engine	<ul style="list-style-type: none"> • High pressure fuel pump belt noise • High pressure fuel pump belt tensioner noise 	<ul style="list-style-type: none"> • Check the high pressure fuel pump belt • Check the high pressure fuel pump belt tensioner
Squeaking/creaking/squeal from front of engine	<ul style="list-style-type: none"> • Auxiliary drive belt • Auxiliary drive belt tensioner • Driven components on auxiliary drive belt 	<ul style="list-style-type: none"> • Check the auxiliary drive belt • Check the auxiliary drive belt tensioner • Check the driven components
Whine/slap/growl from front of engine	<ul style="list-style-type: none"> • Auxiliary drive belt • Auxiliary drive belt tensioner • Driven components on auxiliary drive belt • Timing belt noise • Timing belt tensioner noise 	<ul style="list-style-type: none"> • Check the auxiliary drive belt • Check the auxiliary drive belt tensioner • Check the driven components • Check the timing belt • Check the timing belt tensioner
Knock from lower half of engine (often worse with a cold engine)	<ul style="list-style-type: none"> • Piston slap • Piston pin noise • Connecting rod bearing noise 	<ul style="list-style-type: none"> • Check the engine oil pressure, GO to Pinpoint Test C. Check piston, cylinder bore, piston pin and connecting rod bearing for excess wear
Knock/rumble from lower half of engine (often worse on overrun)	<ul style="list-style-type: none"> • Main bearing noise 	<ul style="list-style-type: none"> • Check the engine oil pressure, GO to Pinpoint Test C. Check connecting rod bearing for excess wear
Misfire/rough running	<ul style="list-style-type: none"> • Engine management system • Fuel charging and controls • Exhaust Gas Recirculation (EGR) system • Burnt/sticking valves • Worn valve guides • Worn cylinder 	<ul style="list-style-type: none"> • Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index • Carry out a compression test, GO to Pinpoint Test A. Check for excess wear in engine components

- bores/pistons
- Broken piston rings
- Damaged/cracked casings

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - TDV6 3.0L Diesel, DTC: Engine Control Module (PCM) (100-00, Description and Operation).

Pinpoint Tests

NOTE: Where reference is made to 'suitable equipment', this refers to standard workshop equipment. Refer to the operating instructions for your own equipment when performing any tests.

PINPOINT TEST A : CHECK THE CYLINDER COMPRESSIONS

WARNING: Only compression testers able to read the higher compression pressures found in diesel engines should be used. Failure to follow this instruction may result in personal injury.

NOTE: Where possible, compression testing should be carried out on an engine at operating temperature.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: CARRY OUT A DRY CYLINDER COMPRESSION TEST	
	1 Make sure the parking brake is applied and that the selector lever is in park.
	2 Set the ignition status to OFF .
	3 Remove the starter relay.
	4 Disconnect the starter motor solenoid connector.
	5 Connect a suitable remote starter device to the starter motor solenoid.
	6 Remove the glow plugs.
	7 Install adaptor 303-1131 in place of the glow plug in the first cylinder to be tested.
	8 Connect a suitable compression tester to the adaptor. See warning above.
	9 Using the remote starter device, crank the engine a minimum of five revolutions.
	10 Record the compression figure and the number of revolutions taken to reach it.
	11 Repeat steps 7 - 10 above for the remaining cylinders, cranking the engine for a similar number of revolutions each time.
	12 Compare the compression figures across all the cylinders.
	Are the compression figures within 10% of each other? Yes Unless the compression figures are universally very low (experience will indicate this), check for other causes for the customer complaint. No GO to A2.

A2: CARRY OUT A WET CYLINDER COMPRESSION TEST

CAUTION: If engine oil is introduced into the cylinders, run the engine at 2,000 rpm for a minimum of ten minutes after completing testing to prevent damage to the catalytic converters. Failure to follow this instruction may result in damage to the vehicle.

NOTE: There is a combustion chamber in the top of each piston. Make sure that the oil is not allowed to run into this chamber.

	1 Using a suitable oil can with a flexible spout, introduce a small amount of clean engine oil into the cylinder just before testing, such that the oil is able to run between the piston and the cylinder bore.
	2 Repeat steps 7 - 10 from the test above, introducing oil into each cylinder just before testing.
	3 Compare the compression figures across all the cylinders.
	Is the compression figure higher than the dry test? Yes A higher figure following the introduction of oil may indicate a worn or damaged cylinder bore, piston and/or piston rings. Disassembly would be required to confirm this. No If the compression figure is unaffected by the introduction of oil, but the figure is still less than 90% of the other cylinders, this may indicate a burnt and/or sticking valve, leaking head gasket, etc. Disassembly would be required to confirm this. Clear any DTCs which may have been induced by the test.

PINPOINT TEST B : OIL CONSUMPTION TEST

NOTE: Oil consumption will vary, depending on a number of factors. New engines will normally use more

oil than 'run-in' engines, although a guideline would be to expect 16,000 Km (10,000 miles) per liter.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CHECK FOR EXCESSIVE OIL CONSUMPTION	
	1 Start the engine and allow it to run until it reaches normal operating temperature.
	2 Make sure the vehicle is parked on a level surface and set ignition status to OFF .
	3 Allow to settle for at least five minutes.
	4 Check the oil level.
	5 Correct the level, if necessary, and record the reading and mileage in the vehicle history.
	6 Make sure that the owner/driver is aware that a test is being carried out, and that they should not top-up their oil level for the duration of the test, but should check the level every 160-240 Km (100-150 miles).
	7 When the oil level reaches the ADD mark, the customer should bring the vehicle in to be checked.
	8 Top-up the oil to the level at the beginning of the test and record the amount of oil needed to do so, and the mileage covered in the course of the test.
	9 From this, the consumption can be calculated, and a decision made as to whether or not the consumption is considered excessive.
	Is the consumption excessive for the mileage and/or use? Yes Disassembly will be required to check the components indicated in the symptom chart. No No further action is required.

PINPOINT TEST C : CHECK THE ENGINE OIL PRESSURE

NOTES:

Check and, if necessary, top-up the engine oil level before beginning this test.

Where reference is made to 'suitable equipment', this refers to standard workshop equipment. Refer to the operating instructions for your own equipment when performing any tests.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: CHECK FOR LOW ENGINE OIL PRESSURE	
	1 Remove the oil pressure sensor.
	2 Connect a suitable oil pressure gauge in place of the oil pressure sensor.
	3 Start the engine and check for leaks at the gauge connection.
	4 Allow the engine to idle and monitor the oil pressure.
	5 Raise the engine speed to 2,500 rpm and monitor the oil pressure.
	Is the oil pressure less than 0.50 bar (7.25 psi) between idle and 2,500 rpm? Yes GO to C2. No GO to C3.
C2: CHECK FOR LOW ENGINE OIL PRESSURE AT ENGINE SPEEDS GREATER THAN 2,500 RPM	
	1 Raise the engine speed to above 2,500 rpm and monitor the oil pressure.
	Is the oil pressure less than 1.0 bar (14.5 psi) at engine speeds greater than 2,500 rpm? Yes Pressure this low may indicate a problem with: oil pump, filtering, clearances within the engine. Check if there are any other indications of engine faults (noise, etc), refer to the symptom chart above. No GO to C3.
C3: CHECK FOR HIGH ENGINE OIL PRESSURE	
	1 Monitor the engine oil pressure at varying engine speeds.
	Does the oil pressure reach 4.0 bar (58 psi)? Yes Pressure this high may indicate a blockage in the lubrication system. If this is not resolved, high oil pressure will lead to engine oil leaks and other failures. No If the oil pressure stays in the band between 0.50 bar (7.25 psi) and 1.0 bar (14.5 psi) this would be considered normal.

Engine System - General Information - Engine V6 S/C 3.0L Petrol

Diagnosis and Testing

Special Tool(s)

 <p>303-1451</p> <p>E136285</p>	Oil pressure testing adaptor, 303-1451
 <p>303-871</p> <p>E57919</p>	Oil pressure testing gauge, 303-871

Principle of Operation

For a detailed description of the 3.0L engine, refer to the relevant Description and Operation sections in the workshop manual. REFER to:

[Engine](#) (303-01B Engine - V6 S/C 3.0L Petrol, Description and Operation),
[Engine](#) (303-01D, Description and Operation),
[Engine](#) (303-01D, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> • Engine oil level • Coolant level • Transmission fluid level • Fuel level • Coolant leaks • Oil leaks • Fuel leaks • Visibly damaged or worn parts • Loose or missing nuts or bolts • Fuel contamination/grade/quality • Sensor installation/condition • Viscous fan and solenoid

3. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the symptom chart.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

NOTES:

If an engine is suspect, and the vehicle remains under the Manufacturers warranty refer to the Warranty Policy and Procedure manual (section B1.2), or determine if any prior approval programme is in operation, prior

to the installation of a new engine.

Due to the possibility of loose carbon, that has become trapped between the valve face and seat, effecting the pressure readings, when carrying out a compression test and some cylinders are found to have low pressures, install the spark plugs, road test the vehicle and re-test the suspect cylinders. If the correct pressures are restored, no further action is required.

Symptom	Action
All engine related issues	<ul style="list-style-type: none"> • Check ECM for Diagnostic Trouble Codes (DTCs) and refer to DTC Index.
Difficult to start hot and cold	<ul style="list-style-type: none"> • Carry out general engine checks: <ul style="list-style-type: none"> - Compression test. Refer to component tests in this section. - Valve clearances - Spark plug condition and color
Poor idle	<ul style="list-style-type: none"> • Ensure the air intake system is free from leaks • Carry out general engine checks: <ul style="list-style-type: none"> - Compression test. Refer to component tests in this section. - Valve clearances - Spark plug condition and color • Check for collapsed catalytic converter/blocked exhaust system • Check long and short term fuel trim datalogger signals <ul style="list-style-type: none"> - Readings up to 10%: may be considered as acceptable if the readings are equal bank to bank - Positive readings of between 10-20%: check for air leaks in air intake system - Negative readings of between 10-20%: check for over fuelling e.g. leaking injectors, high fuel pressure - Readings above 20%: check for DTCs and refer to DTC Index. • Carry out a vacuum gauge check. Refer to component tests in this section
Insufficient power/Insufficient compression	<ul style="list-style-type: none"> • Ensure the air intake system is free from leaks • Carry out general engine checks: <ul style="list-style-type: none"> - Compression test. Refer to component tests in this section. - Valve clearances - Spark plug condition and color • Check for collapsed catalytic converter/blocked exhaust system • Check long and short term fuel trim datalogger signals <ul style="list-style-type: none"> - Readings up to 10%: may be considered as acceptable if the readings are equal bank to bank - Positive readings of between 10-20%: check for air leaks in air intake system - Negative readings of between 10-20%: check for over fuelling e.g. leaking injectors, high fuel pressure - Readings above 20%: check for DTCs and refer to DTC Index. • Carry out a vacuum gauge check. Refer to component tests in this section
Oil consumption	<ul style="list-style-type: none"> • Carry out oil leak check followed by an oil consumption test. Refer to the component tests in this section • If oil consumption is excessive: • Check the integrity of the engine breather system • Carry out general engine checks: <ul style="list-style-type: none"> - Compression test. Refer to component tests in this section. - Valve clearances - Spark plug condition and color
Noise	<ul style="list-style-type: none"> • Refer to the Special Service Messages on the Electronic Product Quality Report (EPQR) system for sound files. If the symptom does NOT compare to any of the sound files, contact Dealer Technical Support (DTS)

DTC Index

For a complete list of all Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: V6 3.0L S/C Petrol, DTC: Engine Control Module \(ECM\)](#) (100-00 General Information, Description and Operation).

Component Tests

Engine Oil Leaks

NOTE: Before installing new gaskets or oil seals, make sure that the fault is clearly established.

If the oil leak cannot be identified clearly by a visual inspection, carry out an Ultraviolet test:

Fluorescent Oil Additive Method

1. Clean the engine with a suitable cleaning fluid (brake cleaner).

2. Drain the engine oil and refill with recommended oil, premixed with Diesel Engine Oil Dye or equivalent. Use a minimum 14.8 ml (0.5 ounce) to a maximum 29.6 ml (1 ounce) of fluorescent additive to all engines. If oil is not premixed, fluorescent additive must first be added to the crankcase.
3. Run engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using a 12 Volt Master UV Diagnostic Inspection Kit or equivalent. A clear bright yellow or orange area will identify leak. For extremely small leaks, several hours may be required for the leak to appear.
4. As necessary, pressurize the main oil gallery system to locate leaks due to incorrectly sealed, loose or cocked plugs. If the flywheel bolts leak oil, look for sealer on the threads.
5. Repair all leaks as necessary.

Compression Test

General Remarks

NOTES:

Removing fuses and disconnecting electrical components may cause the Engine Control Module (ECM) to log Diagnostic Trouble Codes (DTCs). After the measurements have been carried out, DTCs should be cleared from memory by connecting to the Manufacturer Approved Diagnostic System.

Only check the compression pressure with the valves set to the prescribed clearance (if this can be adjusted).

The compression pressure should be checked with the engine at normal operating temperature.

Check the Compression Pressure

WARNING: Move gear selector lever to 'P' position. Failure to follow this instruction may result in personal injury.

1. Remove the fuel pump relay.
2. Start the engine - the engine will start, run for a few seconds then stall.
3. Remove the spark plugs.
4. Install the compression tester.
5. Install an auxiliary starter switch in the starting circuit. With the ignition switch OFF, using the auxiliary starter switch, crank the engine a minimum of five compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.
6. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.
7. Install the removed components in reverse order, observing the specified tightening torques.
8. Clear all DTCs from the ECM.

Interpretation of the Results

NOTE: Due to the possibility of loose carbon that has become trapped between the valve face and seat effecting the pressure readings, when carrying out a compression test and cylinders are found to have low pressures, install the spark plugs, road test the vehicle and re-test the suspect cylinders. If the correct pressures are restored, no further action is required.

The indicated compression pressures are considered within specification if the lowest reading cylinder is within 75% of the highest reading.

If the cylinder pressures are found to be low, carry out a leakdown test to determine the location of the fault (if any leakback can be heard through the engine breather system suspect the piston rings, if any leakback can be heard through the inlet system suspect the inlet valve or seat, if any leakback can be heard through the exhaust manifold suspect the exhaust valve or seat. If the measurements for two cylinders next to each other are both too low then it is very likely that the cylinder head gasket between them is burnt through. This can also be recognized by traces of engine oil in the coolant and/or coolant in the engine oil).

Oil Consumption Test

The amount of oil an engine uses will vary with the way the vehicle is driven in addition to normal engine-to-engine variation. This is especially true during the first 16,100 km (10,000 miles) when a new engine is being broken in or until certain internal components become conditioned. Vehicles used in heavy-duty operation may use more oil. The following are examples of heavy-duty operation:

- Trailer towing applications
- Severe loading applications

- Sustained high speed operation

Engines need oil to lubricate the following internal components:

- Cylinder block cylinder walls
- Pistons and piston rings
- Intake and exhaust valve stems
- Intake and exhaust valve guides
- All internal engine components

When the pistons move downward, a thin film of oil is left on the cylinder walls. As the vehicle is operated, some oil is also drawn into the combustion chambers past the intake and exhaust valve stem seals and burned.

The following are examples of conditions that can affect oil consumption rates:

- Engine size
- Operator driving habits
- Ambient temperatures
- Quality and viscosity of oil
- Engine is being run in an overfilled condition (check the oil level at least five minutes after a hot shutdown with the vehicle parked on a level surface. The oil level should not be above the top of the cross-hatched area and the letter "F" in FULL).

Operation under varying conditions can frequently be misleading. A vehicle that has been run for several thousand miles on short trips or in below-freezing ambient temperatures may have consumed a "normal" amount of oil. However, when checking the engine oil level, it may measure up to the full mark on the oil level indicator due to dilution (condensation and fuel) in the engine crankcase. The vehicle then might be driven at high speeds on the highway where the condensation and fuel boil off. The next time the engine oil is checked it may appear that a liter of oil was used in about 160 km (100 miles). Oil consumption rate is about one liter per 2,400 km (1,500 miles).

Make sure the selected engine oil meets Jaguar specification and the recommended API Performance category "SG" and SAE viscosity grade as shown in the vehicle Owner's Guide. It is also important that the engine oil is changed at the intervals specified for the typical operating conditions.

The following diagnostic procedure is used to determine the source of excessive oil consumption.

NOTE: Oil use is normally greater during the first 16,100 km (10,000 miles) of service. As mileage increases, oil use decreases. High speed driving, towing, high ambient temperature and other factors may result in greater oil use.

1. Define excessive consumption, such as the number of miles driven per liter of oil used. Also determine customer's driving habits, such as sustained high speed operation, towing, extended idle and other considerations.
2. Verify that the engine has no external oil leaks as described under Engine Oil Leaks in this section.
3. Carry out an oil consumption test:
 - Run the engine to normal operating temperature. Switch engine OFF and allow oil to drain back for at least five minutes .
 - With vehicle parked on level surface, check the engine oil level.
 - If required, add engine oil to set level exactly to the FULL mark.
 - Record the vehicle mileage.
 - Instruct the customer to return for a level check after driving the vehicle as usual for 1,610 km (1000 miles).
 - Check the oil level under the same conditions and at the same location as the initial check.

NOTE: If the oil consumption rate is unacceptable go to Step 4.

4. Check the Positive Crankcase Ventilation (PCV) system. Make sure the system is not plugged.
5. Check for plugged oil drain-back holes in the cylinder head and cylinder block.
6. If the condition still exists after carrying out the above tests go to step 9.
7. Carry out a cylinder compression test. Refer to the Compression Test procedure in this section. This can help determine the source of oil consumption such as valves, piston rings or other areas.
8. Check valve guides for excessive guide clearance. Install new valve stem seals after verifying valve guide clearance.
9. Worn or damaged internal engine components can cause excessive oil consumption. Small deposits of oil on the tips of the spark plugs can be a clue to internal oil consumption.

Intake Manifold Vacuum Test

Bring the engine to normal operating temperature. Connect a vacuum gauge or equivalent to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is performed. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8

m (1,000 feet) of elevation above sea level.

The reading should be steady. As necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust damper until needle moves easily without excessive flutter.

Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.

VUJ0001694

1. **NORMAL READING:** Needle between 51-74 kPa (15-22 in-Hg) and holding steady.
2. **NORMAL READING DURING RAPID ACCELERATION:** When the engine is rapidly accelerated, the needle will drop to a low (not to zero) reading. When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.
3. **NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP:** The needle will register as low as 51 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.
4. **WORN RINGS OR DILUTED OIL:** When the engine is accelerated, the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).
5. **STICKING VALVES:** When the needle remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.
6. **BURNED OR BENT VALVES:** A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or damaged valves. Insufficient hydraulic valve tappet or hydraulic lash adjuster clearance will also cause this reaction.
7. **POOR VALVE SEATING:** A small but regular downscale flicking can mean one or more valves are not seating correctly.
8. **WORN VALVE GUIDES:** When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.
9. **WEAK VALVE SPRINGS:** When the needle oscillation becomes more violent as engine RPM is increased, weak valve springs are indicated. The reading at idle could be relatively steady.
10. **LATE VALVE TIMING:** A steady but low reading could be caused by late valve timing.
11. **IGNITION TIMING RETARDED:** Retarded ignition timing will produce a steady but somewhat low reading.
12. **INSUFFICIENT SPARK PLUG GAP:** When spark plugs are gapped too close, a regular, small pulsation of

the needle can occur.

13. INTAKE LEAK: A low, steady reading can be caused by an intake manifold or throttle body gasket leak.
14. BLOWN HEAD GASKET: A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head to cylinder block surface.
15. RESTRICTED EXHAUST SYSTEM: When the engine is first started and is idled, the reading may be normal, but as the engine RPM is increased, the back pressure caused by a clogged muffler, kinked tail pipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.

When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory such as the power brake booster, the unit will not function correctly. Always repair vacuum leaks.

Engine Oil Pressure Check

NOTE: Prior to checking the engine oil pressure, a road test of 6 miles (10 kilometres), must be carried out. Do not attempt to attain engine normal operating temperature by allowing the engine to idle.

1. Disconnect the battery ground cable. Refer to section 414-01 - Battery and Charging System. REFER to: [Battery](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
2. **WARNINGS:**

The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

Wear protective gloves.

Remove the engine oil filter element.

NOTE: Ensure the oil filter element is not contaminated during this procedure

3. Install the oil filter element into special tool (Oil filter adapter number 303-1451)
4. Install the special tool (Oil filter adapter number 303-1451) to the engine. Torque: 25 Nm
5. Install the special tool (Oil pressure testing gauge, 303-871) and tighten the union
6. Connect the battery ground cable
7. Refer to owner hand book, check and top-up the engine oil if required
8. Start and run the engine
9. Note the oil pressure readings with the engine running at idle and 3500 RPM
10. Turn off the engine
11. Disconnect the battery ground cable
12. Remove the special tools
 1. Clean the components
13. Install the engine oil filter element

NOTE: Ensure the oil filter element is not contaminated during this procedure

14. Connect the battery ground cable
15. Refer to owner hand book, check and top-up the engine oil if required

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: V6 3.0L S/C Petrol, DTC: Engine Control Module \(ECM\)](#) (100-00 General Information, Description and Operation).

Engine System - General Information - Bearing Inspection

General Procedures

1. Inspect bearings for the following defects.
 1. Cratering - fatigue failure
 2. Spot polishing - incorrect seating.
 3. Imbedded dirt engine oil.
 4. Scratching - dirty engine oil.
 5. Base exposed - poor lubrication.
 6. Both edges worn - journal damaged.
 7. One edge worn - journal tapered or bearing not seated.

Engine System - General Information - Camshaft Bearing Journal

Diameter

General Procedures

VUJ0001695

1. Determine the diameter of the camshaft journals.
 - Using a micrometer measure the diameter at 90 degree intervals to determine if the journals are out-of-round.
 - Measure at two different points on the journal to determine if there is any tapering.
 - If the measurements are out of the specified range, install a new camshaft.

Engine System - General Information - Camshaft End Play

General Procedures

VUJ0001698

1.  **NOTE:** Make sure that the camshaft is to specification.

Using the special tool, measure the end play.

- Slide the camshaft in both directions. Read and note the maximum and minimum values on the dial indicator gauge.
 1. End play = maximum value minus minimum value.
- If the measurement is out of specification, install new components.

Engine System - General Information - Camshaft Lobe Lift

General Procedures

1. Measure the diameter (1) and diameter (2) with a vernier caliper. The difference in measurements is the lobe lift.

VJJ0001699

Engine System - General Information - Camshaft Surface Inspection

General Procedures

1. Inspect camshaft lobes for pitting or damage in the active area. Minor pitting is acceptable outside the active area.

VJJ0001700

Engine System - General Information - Connecting Rod Cleaning

General Procedures

VUJ0002224

1.  **CAUTION:** Do not use a caustic cleaning solution or damage to connecting rods may occur.

Mark and separate the parts and clean with solvent. Clean the oil passages.

Engine System - General Information - Connecting Rod Large End Bore

General Procedures

1. Measure the bearing bore in two directions. The difference is the connecting rod bore out-of-round. Verify the out-of-round is within specification.

VUJ0002223

2. Measure the bearing bore diameter in two directions. Verify the bearing bore is within specification.

VUJ0002222

Engine System - General Information - Crankshaft End Play

General Procedures

VUJ0002235

1. Using the Dial Indicator Gauge with Brackets, measure the end play.
 - Measure the end play by lifting the crankshaft using a lever.
 - If the value is out of the specification, install new thrust half rings to take up the end float and repeat the measurement.

Engine System - General Information - Cylinder Bore Out-of-Round

General Procedures

1.  **NOTE:** The main bearing caps or lower crankcase must be in place and tightened to the specified torque; however, the bearing shells should not be installed.

Measure the cylinder bore with an internal micrometer.

- Carry out the measurements in different directions and at different heights to determine if there is any out-of-roundness or tapering.
- If the measurement is out of the specified range, hone out the cylinder block or install a new block.

VUJ0002234

Engine System - General Information - Exhaust Manifold Cleaning and Inspection

General Procedures

1. Inspect the cylinder head joining flanges of the exhaust manifold for evidence of exhaust gas leaks.
2. Inspect the exhaust manifold for cracks, damaged gasket surfaces, or other damage that would make it unfit for further use.

Engine System - General Information - Piston Inspection

General Procedures

VUJ0002233

1.  **CAUTION:** Do not use any aggressive cleaning fluid or a wire brush to clean the piston.

Carry out a visual inspection.

- Clean the piston skirt, pin bush, ring grooves and crown and check for wear or cracks.
- If there are signs of wear on the piston skirt, check whether the connecting rod is twisted or bent.

Engine System - General Information - Piston Pin Diameter

General Procedures

VUJ0002225

1.  **NOTE:** The piston and piston pin are a matched pair. Do not mix up the components.

Measure the piston pin diameter.

- Measure the diameter in two directions.
- If the values are not to specification, install a new piston and a new piston pin.

Engine System - General Information - Piston Pin to Bore Diameter

General Procedures

VUJ0002232

1.  **NOTE:** The piston and piston pin form a matched pair. Do not mix up the components.

Measure the diameter of the piston pin bore.

- Measure the diameter in two directions.
- If the values are not to specification, install both a new piston and a new piston pin.

Engine System - General Information - Piston Ring End Gap

General Procedures

1.  **CAUTION:** Do not mix up the piston rings. Install the piston rings in the same position and location.

Using the Feeler Gauge, measure the piston ring gap.

- The values given in the specification refer to a gauge ring used during production.

Engine System - General Information - Piston Ring-to-Groove Clearance

General Procedures

1.  NOTE: The piston ring must protrude from the piston groove. To determine the piston ring clearance, insert the Feeler Gauge right to the back of the groove, behind the wear ridge.

Using the Feeler Gauge, measure the piston ring clearance.

Engine System - General Information - Valve Spring Free Length

General Procedures

VJJ0002221

1. Using a vernier gauge, measure the free length of each valve spring. Verify the length is within specification.

Engine System - General Information - Valve Stem Diameter

General Procedures

1. Using a micrometer measure the diameter of the valve stems.
 - If the measurements are not to specification, install a new valve.

VUJ0002220

Engine System - General Information - Leakage Test Using Smoke Test Equipment

General Procedures

CAUTION: The compressed air line supply pressure must be between 3.5 and 12 bar (50 and 175 psi) for the smoke test equipment to function correctly. Do not exceed this pressure. Failure to follow this instruction may result in damage to the smoke test equipment.

NOTES:

The vehicle battery must be in good condition and fully charged before carrying out this procedure.

On vehicles with 3.0L TDV6, it will be necessary to insert smoke at both air cleaner outlet pipes independently if the right hand turbocharger and associated hoses are to be tested.

In some cases it may be necessary to remove undertrays, trim or engine covers to obtain access to all potential leak locations.

Some variation in the illustrations may occur, but the essential information is always correct.

For further information regarding operation of the test equipment refer to the manufacturers operators manual supplied with the kit.

- WARNING:** Use an additional support to prevent the hood from falling if the smoke test equipment is secured to the hood. Failure to follow this instruction may result in personal injury.

Install the smoke test equipment to a suitable location under the hood.

- Connect a suitable compressed air line to the smoke test equipment.
- Connect the smoke test equipment positive power cable to the battery positive terminal.

- WARNING:** Do not connect the smoke test equipment negative cable to the battery negative terminal.

Connect the smoke test equipment negative cable to a suitable body ground point.

- NOTE:** A flashing green light indicates low battery voltage. In this case, place the battery on charge and make sure that the battery is fully charged before using the smoke test equipment.

Observe the power indicator lamp on the smoke test equipment. Make sure that a

continuous green light is displayed.

6. NOTES:

 In some cases it may be necessary to remove the air cleaner(s) to allow access to the air cleaner outlet pipes.

 In some cases it will be necessary to cap one of the air cleaner outlet pipes. Use the blanking caps supplied in the kit to cap the open orifice.

Disconnect the air cleaner outlet pipe(s).

7.  NOTE: Make sure the smoke test equipment adapter is a good fit to the air cleaner outlet pipe. This must be an air tight seal.

Connect the smoke test equipment supply hose to the air cleaner outlet pipe.

1. Install the appropriate adapter to the air cleaner outlet pipe.
2. Connect the smoke test equipment supply hose to the adapter link hose.

8. NOTES:

 The flow control valve must be in the fully open position.

 Smoke is produced for 5 minutes. The smoke test equipment will automatically switch off after this period of time.

Switch the smoke test equipment on.

9. Remove the oil filler cap, and observe until a constant flow of smoke is visible leaving the oil filler orifice. Install the oil filler cap.

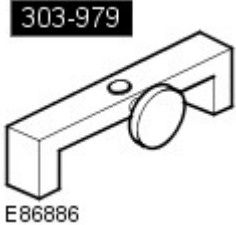

10.  **NOTE:** The longer smoke is allowed to exit from a leak, the more fluorescent dye will be deposited at a leak location.

Using the torch supplied in the kit set to white light, look for escaping smoke. Alternatively, use the ultraviolet light to look for fluorescent dye deposits at the source of a leak.

Engine System - General Information - Cylinder Head Gasket Selection TDV6 3.0L Diesel

General Procedures

Special Tool(s)

---	---

Check

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  CAUTION: Make sure that the surface is clean and free of foreign material.

Zero the gauge on the cylinder block machined face.

Special Tool(s): [303-979](#)

2.  CAUTION: Make sure that the surface is clean and free of foreign material.

 NOTE: Note the dial gauge readings.

Take 2 measurements on each piston crown.

E87025

3. Use the average piston protrusion measurement (taken from all piston measurements), to select the correct thickness cylinder head gasket.

Refer to: Specifications (303-01B, Specifications).

Engine System - General Information - Cylinder Head Distortion

General Procedures

Activation

1. Using a suitable metallic straight edge and feeler gauge, measure the cylinder head face in the areas illustrated. **Note the maximum value.**

E160359

2.  **CAUTION:** Machine the **minimum** thickness of material from the cylinder head to meet specification, then increase the thickness of the cylinder head gasket by one size.

NOTES:

Prior to having the cylinder head being machined, prior approval is required by Jaguar or Land Rover engineering.

If the cylinder head requires machining, this must be carried out by a local engineering company.

If the cylinder head exceeds the maximum value (0.2mm), the cylinder head must be machined.

Engine - TDV6 3.0L Diesel - Engine - Overview

Description and Operation

OVERVIEW

The 3.0 liter diesel engine is a V6 configuration unit with 2 banks of 3 cylinders arranged at 60 degrees to each other. There are 4 valves per cylinder, which are operated by 2 overhead camshafts per cylinder bank.

The cylinder block is cast in compacted graphite iron, which uses less material to produce compared to a conventional cast iron block. This provides reduced weight and length with superior structural capabilities.

The cylinder heads are cast aluminum with a moulded plastic camshaft cover with an integral air intake. The single-piece structural oil pan is high pressure die cast from aluminum. The exhaust manifolds are cast from an iron alloy. A moulded plastic acoustic cover is fitted over the upper engine to absorb engine-generated noise.

A low compression ratio of 16:1 contributes to improved emissions quality, quieter combustion and compatibility with the engine's unique forced induction system. For additional information refer to Intake Air distribution and Filtering.

The low compression ratio also means less heat build-up in the piston bowl and more efficient fuel burn, resulting in the production of lower levels of pollutants. It also assists with cold starting allowing a faster cranking speed.

The engine is available in two power output forms. The power difference is achieved by changes to the engine calibration within the [ECM \(engine control module\)](#) and other vehicle control modules.

NOTE: It is not possible to re-configure a lower power output engine to the higher output specification.

Engine - TDV6 3.0L Diesel - Engine - System Operation and Component Description

Description and Operation

System Operation

OPERATION

Operation of the engine is controlled by the [ECM \(engine control module\)](#). For additional information refer to 303-14A Electronic Engine Controls.

Component Description

ENGINE STRUCTURE

E120983

Item Description

- 1 Cylinder heads
- 2 Cylinder block
- 3 Oil pan

CYLINDER BLOCK COMPONENTS

The cylinder block is a single cast construction with a hollow beam structure, cast from compact graphite iron. This type of construction provides outstanding strength and durability and uses less material than a conventional cast iron block, therefore reducing engine weight and length.

The use of compact graphite iron allows the cross sectional areas of the casting to be reduced, compared with a conventional gray cast iron block. This ensures reduced engine weight and length, with higher structural capabilities.

To maintain the stiffness of the bottom end of the cylinder block and crankshaft system, the cylinder block has a deep skirt and bearing cap design. Each of the main bearing caps is double bolted at each side of the crankshaft bearing and cross bolted back to the cylinder block.

Lubrication oil is distributed through the cylinder block, via a main oil gallery and channels bored in the block, to all critical moving parts. These channels divert oil to the main and connecting rod bearings via holes machined into the crankshaft.

A tapping at the rear of the cylinder block connects a pipe to the turbochargers by means of banjo connections. Oil is supplied, under pressure via this tapping, from the oil pump to provide lubrication for the bearings of the turbochargers.

Cylinder cooling is achieved by coolant circulating through chambers in the cylinder block casting.

Two hollow metal dowels are used to locate the cylinder heads to the cylinder block, 1 on each side at the rear of the unit.

A port is included at the RH (right-hand) and LH (left-hand) side of the cylinder block, below each of the turbochargers, to connect the turbochargers oil return pipe to the oil pan.

Two coolant drain plugs are installed in the cylinder block; one is fitted in the rear RH side, and the other is fitted in the middle of the cylinder block on the LH side.

Engine Data

E44217

NOTE: Arrow indicates front of engine

Item Description

1 Engine data locations

Engine data is marked at 2 locations at the back of the cylinder block. Component diameters are represented by alphabetical and numerical codes; keys to the codes are in the removal and installation section of this manual.

Piston Cooling Jets

E44219

Item Description

- 1 Bolt
- 2 Cooling jet

Jets located in the cylinder block provide piston and piston pin lubrication and cooling. These jets spray oil on to the inside of the piston, the oil then flows through 2 internal wave shaped channels to help cool each piston crown.

CRANKSHAFT

E52135

Item Description

- 1 Oil pump drive
- 2 Main bearing Journal

- 3 Connecting rod bearing journal
- 4 Rear drive flange
- 5 Rear oil seal location
- 6 Trigger wheel location

The crankshaft is forged steel and fillet rolled with induction hardened journals, which run in 4 bearings with clamped 2 layer bearing shells. The upper and lower shells of bearing number 4 are flanged, which limits the end float of the crankshaft. The main bearing caps are double bolted and cross bolted to increase the strength and rigidity of the engine block.

The main bearings are aluminum/tin split plain selective bearings. An oil groove in the top half of each bearing transfers oil into the crankshaft for lubrication of the connecting rod bearings. The upper and lower shells of bearing number 4 contain integral thrust washers, which limits the end float of the crankshaft.

Rear Crankshaft Oil Seal

E44227

Item Description

- 1 Housing
- 2 Seal
- 3 Crankshaft
- 4 Rear oil seal retainer
- 5 Bolt (10 off)

The rear main oil seal and retainer assembly is a one-piece unit and is supplied with its own plastic fitting sleeve. The seal and retainer have 2 locating dowels, 10 fixing bolts and a rubber seal. In addition, the retainer has a location for the crankshaft position sensor. For additional information refer to 303-14A Electronic Engine Controls.

A torsional vibration crankshaft damper pulley is bolted to the front of the crankshaft.

Crankshaft Trigger Wheel

E52137

Item Description

- 1 Special Tool
- 2 Trigger wheel

The crankshaft trigger wheel is located on the rear of the crankshaft. It is pressed onto the crank using a special tool, which also precisely aligns the trigger wheel for crankshaft position and timing.

The trigger wheel consists of 60 magnets minus 2 for [ECM](#) crankshaft position reference and synchronization. The magnets cannot be seen on the trigger wheel, which therefore can only be positioned using a special tool. For additional information refer to 303-14A Electronic Engine Controls.

If the trigger is removed for any reason, then a new trigger wheel must be fitted.

OIL PAN COMPONENTS

E112394

Item Description

- 1 Oil scavenge reservoir
- 2 Oil level and temperature sensor
- 3 Oil pick-up pipe
- 4 Oil level and temperature sensor connector

The structural oil pan is of a single piece die cast aluminum construction and is fitted to the lower cylinder block to stiffen the base structure of the engine, helping to reduce noise, vibration and harshness. The oil pan also incorporates an oil baffle plate to reduce oil foaming and splash.

The oil pan is secured to the cylinder block with 2 dowels, 2 locator pins for the gasket and 18 retaining bolts; 3 different lengths of bolts are used:

- M6 x 20 (6 off)
- M8 x 75 (4 off)
- M6 x 105 (8 off).

Iron inserts, cast into the main bearing supports of the stiffening frame, minimize main bearing clearance changes due to heat expansion.

A gasket seals the joint between the oil pan and the cylinder block.

An oil pick-up pipe with integral strainer locates in the oil pan to provide oil to the crankshaft driven oil pump.

An ultrasonic sensor provides an electronic indication when the oil in the oil pan is low or high. This removes the requirement for the mechanical dipstick. An advantage in comparison with the static 'dipstick' method is that all marginal influences, for example vehicle being on a slope, lateral and longitudinal acceleration, are compensated for by averaging.

The values determined can be used to signal that the minimum oil level has been reached or to display the current oil level if required.

The sensor is mounted inside the oil pan where it sends an ultrasonic pulse vertically upward, it then measures the time for the pulse to be reflected back from the top surface of the oil.

Warnings will be displayed in the message center if the oil level is not maintained within the safe operating levels (minimum and maximum). A warning will also be displayed if there is a fault with the oil level monitoring system.

PISTON AND CONNECTING ROD ASSEMBLY

E52134

Item Description

- 1 Connecting rod bolts (2 off)
- 2 Connecting rod
- 3 Piston
- 4 Piston pin
- 5 Circlips
- 6 Connecting rod identification

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. The bearing caps are produced by fracturing the opposing sides of the connecting rod at the bearing horizontal centre-line. As well as being easier to manufacture, when reassembled the fractured surfaces interlock to form a strong seamless joint. The cylinder position is etched on adjoining sides of the joint to identify matching connecting rods and bearing caps. The selective connecting rod bearings are aluminum/tin split plain bearings. The connecting rod bearing is 'sputter coated', which is a manufacturing process that layers the bearing material to produce a higher load capacity for improved durability.

NOTE: The connecting rods are not selective.

Piston and Connecting Rod Orientation

E44221

Item Description

- 1 Piston and connecting rod assembly, cylinders 4-6
- 2 Piston and connecting rod assembly, cylinders 1-3
- 3 Bolts (12 off)
- 4 Connecting rod bearing cap (6 off)
- 5 Connecting rod lower bearing (6 off)

When installing a connecting rod, ensure the back of the connecting rod faces the center of the 'vee'.

The pistons are made from aluminum alloy and are fitted with 3 rings. The piston crown incorporates a pronounced bowl; this forms the combustion chamber, which promotes swirl and turbulence necessary for good combustion and improved emissions. In addition, the piston skirt has a molybdenum-coated surface, which counteracts scoring of the cylinder bore and piston.

The piston also incorporates a double wave gallery within the piston crown to enhance piston cooling. The pistons are supplied oil by means of spray jets located in the cylinder block oil gallery. These jets ensure optimum piston cooling to counteract the high temperatures generated by the combustion process.

Each piston is installed on a piston pin located in a aluminum/tin bushing in the connecting rod.

Piston Ring Orientation

E52133

Item Description

- 1 Ring gap oil control
- 2 Ring gap upper compression
- 3 Spiral joint oil control
- 4 Ring gap lower compression
- 5 Upper compression ring
- 6 Lower compression ring
- 7 Oil control ring

When installing pistons ensure the arrows on the piston crowns all point to the front of the engine. All pistons are common single grade/single part number for all engines.

The piston top ring is a taper type and is fitted with the taper to the top of the piston. All rings marked 'top' are assembled with 'top' uppermost. All rings must be spaced evenly around the piston before installing. The circumference gap of the double bevelled oil control ring must be opposite the spiral control joint.

CAMSHAFT TIMING COMPONENTS

E94884

Item Description

- 1 Rear engine accessory drive rear cover
- 2 Rear engine accessory drive tensioner
- 3 Bolt
- 4 Fuel pump pulley
- 5 Nut
- 6 Rear engine accessory drive camshaft pulley
- 7 Rear engine accessory drive belt
- 8 Bolt
- 9 Rear engine accessory drive front cover
- 10 RH chain tensioner
- 11 RH timing chain
- 12 RH intake camshaft
- 13 RH exhaust camshaft
- 14 LH intake camshaft
- 15 LH exhaust camshaft
- 16 LH chain tensioner
- 17 LH timing chain
- 18 Timing belt
- 19 Front cover bridge
- 20 Primary drive cover
- 21 Bolt

- 22 Tensioner
- 23 Bolt
- 24 Idler
- 25 Camshaft hub
- 26 LH camshaft timing pulley
- 27 Bolt (3 off)
- 28 Bolt
- 29 Idler
- 30 Bolt
- 31 Bolt (3 off)
- 32 Bolt
- 33 RH camshaft timing pulley
- 34 Camshaft hub

Primary drive is provided by a single toothed belt from the crankshaft to the exhaust camshaft gears of each cylinder bank via 2 idler pulleys and a tensioner.

Timing belt adjustment is carried out by an eccentric type tensioner mounted on the RH front face of the cylinder block.

A primary drive cover is made up from 3 separate plastic mouldings. The covers are secured to the front of the cylinder block and cylinder heads with 15 bolts and 1 stud and nut. The 2 upper covers are partially sealed with a rubber seal.

Secondary Drive

E44233

Item Description

- 1 Timing chain
- 2 Bolts
- 3 Intake camshaft
- 4 Exhaust camshaft
- 5 Tensioner firing pin

Secondary drive is provided by 2 short crossover chains, which transfer drive from the exhaust camshaft gears to the intake camshaft gears. The crossover drives are located at the rear of the RH cylinder bank and the front of the LH cylinder bank. This allows for a much shorter and simpler run for the main camshaft drive belt at the front of the engine.

Each crossover chain is tensioned via an automatic chain tensioner, which acts directly on the chains via a guide rail. The tensioners are located between the exhaust and intake camshafts at the front or rear of the cylinder head, depending on the cylinder bank.

The tensioner firing pin holds the automatic chain tensioner in a compressed state to aid installation.

CYLINDER HEAD COMPONENTS

NOTE: LH cylinder head shown; RH cylinder head similar.

Cylinder Heads

E44236

Item Description

- 1 Studs
- 2 Bolts
- 3 Blanking plug

The aluminum gravity die cast cylinder heads are unique to each cylinder bank. Eight deep-seated bolts help reduce distortion and secure each cylinder head to the cylinder block. The cylinder head bolts are located beneath the camshafts, 4 under the intake camshaft and 4 under the exhaust camshaft. Two hollow dowels align each cylinder head with the cylinder block.

NOTE: The cylinder heads cannot be reworked.

The cylinder head gasket is a 3-layer, laminated steel type and is available in 5 different thicknesses. The choice of gasket thickness is dependent on the maximum piston protrusion. Gasket thickness is identified by serrations cut into the front end of the gasket.

The cylinder head has 4 ports machined at each cylinder location, 2 exhaust ports and 2 intake ports. One of the intake ports is helical and functions as a swirl port, the other is arranged laterally as a tangential port and functions as a charge port.

The camshafts are of a hollow steel tube construction, with pressed on sintered lobes. Each camshaft is retained by aluminum alloy caps, 5 for the exhaust camshafts and 4 for the intake camshafts. Location letters, A to I for the intake camshaft and R to Z for the exhaust camshaft, are marked on the outer faces of the caps for each cylinder head.

The LH cylinder bank exhaust camshaft is machined to accept a rear camshaft gear. The rear camshaft gear provides drive for the high-pressure fuel pump. For additional information refer to 303-04A Fuel Charging and Controls.

The exhaust camshaft gear of the **LH** cylinder head also incorporates a trigger wheel, which is used in conjunction with the camshaft sensor to measure engine position. For additional information refer to 303-14A Electronic Engine Controls.

The **RH** cylinder head exhaust camshaft is machined at the rear end to provide a drive connection for the tandem pump.

The fuel injection nozzles are centrally mounted above each cylinder. For additional information refer to 303-04A Fuel Charging and Controls.

The glow plugs are arranged centrally on the intake side of the cylinder heads, between the 2 intake ports of each cylinder. For additional information refer to 303-07D Glow Plug System.

The engine lifting eyes are bolted to the cylinder head, 1 at the front and 2 at the rear, 1 per cylinder head.

Camshaft Covers

E117585

Item Description

- 1 Stud bolt M6 x 40 (6 off)
- 2 Bolt M6 x 40 (7 off)
- 3 Oil filler cap
- 4 **RH** camshaft cover assembly

The camshaft covers are manufactured from vinyl ester composite. The **RH** bank camshaft cover incorporates an outlet for the full load engine breather and the engine oil filler cap. The **LH** bank camshaft cover incorporates an outlet for the part load engine breather. For additional information refer to 303-08A engine Emission Control.

Silicon rubber in-groove gaskets seal the joints between the camshaft covers and the cylinder heads. Together with spacers and seals on the camshaft cover fasteners, they also isolate the covers from direct contact with the cylinder heads, to reduce noise.

Intake and Exhaust Valves

E44239

Item Description

- 1 Valve spring collet (24 off, 12 per cylinder head)
- 2 Valve spring retainer (24 off, 12 per cylinder head)
- 3 Valve spring (24 off, 12 per cylinder head)
- 4 Valve stem seal (24 off, 12 per cylinder head)
- 5 Intake valve (12 off, 6 per cylinder head)
- 6 Exhaust valve (12 off, 6 per cylinder head)

Each cylinder head incorporates 2 overhead camshafts operating 4 valves per cylinder via steel roller rockers with hydraulic lash adjusters.

Roller Rockers with Hydraulic Lash Adjusters

E44238

Item Description

- 1 Roller rocker (24 off, 12 per cylinder head)
- 2 Hydraulic lash adjuster (24 off, 12 per cylinder head)

The lightweight valve gear provides good economy and noise levels. Valve head diameters are 31 mm (1.220 in) for the exhaust and 35 mm (1.378 in) for the intake. All valves have 5 mm (0.197 in) diameter stems supported in sintered metal seats and guide inserts. Collets, valve collars and spring seats locate single valve springs on both intake and exhaust valves. Valve stem seals are integrated into the spring seats.

Tandem Pump

E115534

Item Description

- 1 Tandem pump connections
- 2 Bolt (2 off)
- 3 Nut
- 4 Bracket (emission hose)
- 5 Stud

The tandem pump is a combined vacuum and oil scavenge pump. The scavenge pump is g-rotor type pump that drains oil from the secondary turbocharger to accommodate vehicle tilt. The pump is located at the rear of the RH side cylinder head and is driven from the exhaust camshaft.

Exhaust Manifolds

NOTE: LH exhaust manifold shown; RH exhaust manifold similar.

E115531

Item Description

- 1 Cylinder head
- 2 Connecting pipe
- 3 Nut (2 off)
- 4 Nut (3 off)
- 5 Exhaust manifold
- 6 Bolt
- 7 Gasket
- 8 Turbocharger (primary turbocharger shown)
- 9 Manifold rear heat shield
- 10 Bolt
- 11 Bolt
- 12 Bolt
- 13 Tandem pump

11 Bolt (2 off)

12 Manifold heat shield

The exhaust manifolds are cast from an iron alloy with a high nickel content giving excellent heat and corrosion resistance properties. They are sealed to the cylinder head by means of a steel gasket. Sacrificial plastic sleeves are used to align the manifolds. These sleeves must be changed when refitting the manifolds. Spacers on the securing bolts allow the manifolds to expand and retract with changes of temperature while maintaining the clamping loads.

Each manifold has a connection for the [EGR \(exhaust gas recirculation\)](#) transfer pipe.

The engine is fitted with twin variable geometry turbochargers, which fix to the exhaust manifolds by a 3-hole flange with a steel gasket.

LUBRICATION SYSTEM

E117573

Item Description

- 1 Inlet camshaft
- 2 Exhaust camshaft
- 3 Turbocharger oil supply
- 4 Primary turbocharger
- 5 Crankshaft and connecting rods
- 6 Oil level and temperature sensor
- 7 Oil pan
- 8 Oil pump
- 9 Oil cooler and filter assembly
- 10 Piston cooling jets

11 Secondary turbocharger

Oil is drawn from the oil pan and pressurized by the oil pump. The output from the oil pump is then filtered and distributed through internal oil passageways.

All moving parts are lubricated by pressure or splash oil. Pressurized oil is also provided for operation of the hydraulic adjusters and the timing gear chain tensioners.

Oil Cooler and Filter Assembly

E115533

Item Description

- 1 Filter housing
- 2 'O' ring seal
- 3 Paper element
- 4 Retaining bolt (6 off)
- 5 Coolant outlet connection
- 6 Cooler assembly

The engine is lubricated by a force-feed oil circulation system with a full flow oil filter. The oil cooler forms a unit with the oil filter, which is mounted centrally in the middle of the cylinder block between the 2 banks of cylinders. The engine oil is cooled using the engine cooling system. This eliminates the need for an additional engine oil cooler remotely mounted.

Oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the quick return of the oil, reducing the volume of oil required and enabling an accurate check of the contents soon after the engine stops.

System replenishment is through the oil filler cap on the [RH](#) camshaft cover.

The moulded composite oil pick-up is immersed in the oil reservoir to provide a supply to the oil pump during all

normal vehicle attitudes. A mesh screen in the inlet prevents debris from entering the oil system.

NOTE: Fuel cooling is facilitated by a blast air fuel cooler in the return line to the fuel tank.

Oil Pump

E44230

Item Description

- 1 Oil pump
- 2 Bolt (10 off)

The oil pump is a gear type pump and is bolted and dowelled to the front of the cylinder block. It is sealed by means of a rubber gasket, which is recessed into the oil pump housing. The pump inlet and outlet ports align with oil passages in the stiffening frame.

The pumping element is an eccentric rotor, which is directly driven by flats on the crankshaft. An integral pressure relief valve regulates pump outlet pressure at 4.5 bar (65.25 lb/in²).

The front crankshaft oil seal is housed in the oil pump casing and is fitted such that its front face is 1 mm (0.04 in) under flush with the machined front face of the oil pump.

NOTE: The seal is not to be pushed all the way into the bore as this will block the seal drains.

Due to the wide range of inclines Land Rover vehicles operate across, the geometry of the oil pan has been configured to guarantee oil pick-up across all operating angles. An oil-scavenge system has been developed to guarantee excellent oil flow through the turbochargers on severe side-slopes. Whilst the 60-degree cylinder bank angle of a V6 engine allows the turbochargers to be packaged relatively higher in the vehicle, to obtain the best configuration for the V6 engine, the turbochargers must be sited much lower. At extreme angles, there is a risk they may be below the oil level on the oil pan, restricting oil return flow.

To overcome this, the engine uses:

- the oil pump to supply oil to the turbocharger bearings from the main oil reservoir (oil pan)
- a secondary reservoir to receive oil from the turbocharger bearings
- a tandem pump to urge oil to flow from the turbocharger bearings into the secondary reservoir and to pump the oil back from the secondary reservoir to the primary reservoir (oil pan)

E107569

Item Description

- 1 Turbocharger oil feed pipe
- 2 Tandem pump
- 3 Oil evacuation tube
- 4 Turbocharger oil return pipe
- 5 Oil scavenge pipe
- 6 Oil pan

An additional feature of this system is that the tandem pump used to pump oil back from the secondary reservoir can also be used as a source of vacuum for a vacuum operated system.

A semi-synthetic, low SAPS (sulphated ash, phosphorus and sulphur) oil is specified, which reduces the ash loading in the [DPF \(diesel particulate filter\)](#). Ash cannot be burnt off like soot so it remains in the [DPF](#) for life. Without the use of low SAPS oil, the [DPF](#) will not be a 'fit for life' component.

This low SAPS oil is also more resistant to temperature-related degradation than conventional mineral oil. It has lower viscosity at low temperatures and improved lubrication performance at higher temperatures.

Engine - TDV6 3.0L Diesel - Engine

Diagnosis and Testing

Overview

For specific areas of the engine, refer to the general procedures in this section and the relevant section of the manual.

For testing of excessive smoke from exhaust, please refer to the **Pinpoint Tests** list below and complete the **Test Results** section as required.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is NOT acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Engine oil level • Coolant level • Transmission fluid level • Fuel level • Coolant leaks • Oil leaks • Fuel leaks • Intake air system • Hose connections • Visibly damaged or worn parts • Loose or missing nuts or bolts • Fuel contamination/grade/quality • Sensor installation/condition • Viscous fan and solenoid • Active engine mounts, correct installation/damage • Charge air coolers • Turbochargers • General engine condition 	<ul style="list-style-type: none"> • Fuses • Wiring harness • Electrical connector(s) • Injectors • Glow plugs • Active engine mounts • 5 volt sensor supply • Sensor(s) • Turbocharger actuators • Viscous fan solenoid • Engine Control Module (ECM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Excessive smoke from exhaust	<ul style="list-style-type: none"> • Oil passing through the turbocharger 	<ul style="list-style-type: none"> • Carry out pinpoint tests GO to Pinpoint Test A.
Poor performance (off-boost)	<ul style="list-style-type: none"> • Low/contaminated fuel • Restricted intake air system • General engine condition • Engine Control Module (ECM) internal failure 	<ul style="list-style-type: none"> • Check the fuel level and condition. Draw off approximately 1L (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel • Check the intake air system for restriction • Check the engine condition, compressions, etc if there are indications of a mechanical fault • Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index
No boost	<ul style="list-style-type: none"> • Electrical connections and harnesses • Restricted intake air system • Charge air cooler restricted/leaking • Turbocharger actuator failure(s) 	<ul style="list-style-type: none"> • Check the electrical connections and harnesses • Check the intake air system for restriction/leakage • Check the charge air cooler for restriction/leakage • Check the turbocharger actuators and circuits • Check the turbochargers for wear. Disconnect the turbocharger intake and outlet pipework and turn the turbochargers by hand. Any roughness indicates a fault. Check any up and down movement in the turbocharger shafts. Excessive movement indicates a fault. If in doubt, compare the suspect unit with a

	<ul style="list-style-type: none"> • Turbocharger failure(s) • Engine Control Module (ECM) internal failure 	<ul style="list-style-type: none"> • new turbocharger • Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index
No boost/excessive noise	<ul style="list-style-type: none"> • Turbocharger failure(s) 	<ul style="list-style-type: none"> • Disconnect the turbocharger intake and outlet pipework and turn the turbochargers by hand. Any roughness indicates a fault. Check any up and down movement in the turbocharger shafts. Excessive movement indicates a fault. If in doubt, compare the suspect unit with a new turbocharger

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - TDV6 3.0L Diesel, DTC: Engine Control Module (PCM) (100-00 General Information, Description and Operation).

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer approved diagnostic system)

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals

Test Results

During the following pinpoint routine you will be asked to record certain information. The following table identifies the type of recorded information which will be required by dealer technical support for further advice if required. Please locally construct a template to record the information as shown in the table below

PINPOINT TEST A : TDV6 3.0L DIESEL EXCESSIVE SMOKE FROM EXHAUST	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: FOLLOW CUSTOMER INFORMATION TO REPRODUCE THE SYMPTOMS	
	1 Follow customer information. Carry out road test to reproduce the symptoms
	Can customer symptoms be reproduced? Yes If smoke is seen determine whether smoke is white, blue or blackProceed to next step No Proceed to next step
A2: ENGINE RELATED MESSAGES OR WARNING LAMPS	
	1 Check for engine related messages and warning lamps
	Are there engine related messages and warning lamps displayed? Yes Using the manufacturer approved diagnostic system check engine control module for additional DTCs and refer to relevant DTC index. Rectify these firstProceed to next step No Proceed to next step
A3: OIL VOLUME	
	1 Drain the engine oil into a measured container
	Record the total oil volume drainedRemove the oil filterCheck the oil filter element for damageRemove the oil filler capCheck the oil filler cap for damage. Replace if requiredCheck that the oil drain back valve is installed correctly and closes correctly. The oil drain back valve is situated in the bottom of the oil filter housingInstall new oil filter elementInstall new oil filter housing sealRefill engine oil with clean oil to the correct oil level. DO NOT OVERFILL Install oil filler capWere there any defects with the filter cap, filter element or oil drain back valve? Yes Rectify defects, then proceed to next step No Proceed to next step
A4: VACUUM CHECK	
	1 Vacuum check on the compressor shut off valve <ul style="list-style-type: none"> • Use a Mityvac device to apply a vacuum of at least 750 mmHg (1000 mbar or 15 psi) to the compressor shut off valve hose line • Observe the compressor shut-off valve arm for movement. It should move more than 10 mm. If compressor shut-off valve does not open install a new compressor shut-off valve • If vacuum decays over 10 seconds (or cannot generate a vacuum) use a smoke tester to find leak and repair • Remove Mityvac and return vacuum line to

	<p>standard</p> <ul style="list-style-type: none"> Using the manufacturer approved diagnostic system check datalogger signal compressor shut off valve Start the engine, allow to idle Allow engine to idle for a further 4 minutes, the during this time the datalogger signal compressor shut off valve value should change, indicating the secondary turbocharger is operating
	<p>Did the compressor shut-off valve operate during the above tests?</p> <p>Yes Proceed to next step</p> <p>No If it was not possible to create the required vacuum use a smoke tester to find leak and repairIf the compressor shut-off valve did not operate during the 4 minute idle test use the manufacturer approved diagnostic system check and install latest relevant level of software to the engine control moduleProceed to next step</p>
<p>A5: SMOKE TEST AIR INDUCTION SYSTEM</p>	
 <p>E148051</p>	<p>1 Using the manufacturer approved smoke leak detector, carry out a leak check of the air intake system</p>
	<p>Were air intake system leaks detected?</p> <p>Yes Refer to the workshop manual and rectify any leaks detected in the air intake systemThoroughly clean air induction system, remove intercooler, compressor shut off valve and clean & remove all oil from exhaust. Refer to TSB LTB00358. When the engine is restarted and run you must be satisfied that any smoke observed is not due to residual oil left in the system, (see below)Carry out a 30 minute road drive. Keep engine rpm below 1200 rpm and avoid hard acceleration. After 30 minutes stop the vehicle, switch off the engine and wait 15 minutes. Restart the engine drive away and, when safe to do so, accelerate uphill. During this acceleration it is important that the secondary turbo is activated. If a co-driver is available SDD may be used to monitor turbo shut off valve commanded position to ensure the valve opens. Otherwise engine speed will need to exceed 2800 rpm. Using manual gear selection may help to achieve higher engine speed without excessive road speed. Be aware of the rear view using mirrors. Look for excessive smoke from the exhaust. Return to the workshop and with the vehicle in Park raise the engine rpm to above 3200 rpm and hold it for 2 minutes. Observe whether or not there is smoke from the exhaust tail pipesContact dealer technical support for further advice if smoke still coming from the exhaust tail pipes</p> <p>No Proceed to next step</p>
<p>A6: INTAKE MANIFOLD BLOW-BY</p>	
	<p>1 Modify a spare oil filler cap by drilling a 6mm hole in the center and connecting a Mityvac tool or pressure gauge</p>

E148055

- This test needs to be carried out on the vehicle while the engine is still cold. The vehicle in PARK with the handbrake applied
- Connect the modified oil filler cap to the vehicle
- Using the manufacturer approved diagnostic system check datalogger signal compressor shut off valve
- Start the engine, allow to idle
- Record the pressure value from the pressure gauge
 - Value should be approx atmospheric pressure
- Allow engine to idle for a further 3 minutes, the during this time the datalogger signal compressor shut off valve value should change, indicating the secondary turbocharger is operating
- Record the pressure value from the pressure gauge
 - Value should be approx atmospheric pressure
- Raise the engine speed to 3000rpm
- Record the pressure value from the pressure gauge with engine speed at 3000rpm
 - Value should now show a slight vacuum
- Switch off the engine

Was there a positive pressure value from the pressure gauge with engine speed at 3000rpm

Yes

Install the correct oil filler cap. Check the engine for high manifold blow-by, check for low cylinder compression and restrictions in the breather system. Thoroughly clean air induction system, remove intercooler, compressor shut off valve and clean & remove all oil from exhaust. Refer to TSB LT B00358. When the engine is restarted and run you must be satisfied that any smoke observed is not due to residual oil left in the system, (see below). Carry out a 30 minute road drive. Keep engine rpm below 1200 rpm and avoid hard acceleration. After 30 minutes stop the vehicle, switch off the engine and wait 15 minutes. Restart the engine drive away and, when safe to do so, accelerate uphill. During this acceleration it is important that the secondary turbo is activated. If a co-driver is available SDD may be used to monitor turbo shut off valve commanded position to ensure the valve opens. Otherwise engine speed will need to exceed 2800 rpm. Using manual gear selection may help to achieve higher engine speed without excessive road speed. Be aware of the rear view using mirrors. Look for excessive smoke from the exhaust. Return to the workshop and with the vehicle in Park raise the engine rpm to above 3200 rpm and hold it for 2 minutes. Observe whether or not there is smoke from the exhaust tail pipes. Contact dealer technical support for further advice if smoke still coming from the exhaust tail pipes

No

Proceed to next step

A7: OIL SCAVENGE TANK

- 1 Check the oil scavenge pipe connector is correctly installed to the oil scavenge pump. Refer to picture, which shows the scavenge pipe fully disconnected

E148053

Was more than 500ml of oil collected from the oil scavenge tank?

Yes

If the oil scavenge pump **has** previously been replaced on this vehicle, check the scavenge pipes are not blocked or restricted. If the oil scavenge pump **has not** previously been replaced on this vehicle, replace the oil scavenge pump and check the scavenge pipes are not blocked or restricted. Thoroughly clean air induction system, remove intercooler, compressor shut off valve and clean & remove all oil from exhaust. Refer to TSB LTBO0358. When the engine is restarted and run you must be satisfied that any smoke observed is not due to residual oil left in the system, (see below). Carry out a 30 minute road drive. Keep engine rpm below 1200 rpm and avoid hard acceleration. After 30 minutes stop the vehicle, switch off the engine and wait 15 minutes. Restart the engine drive away and, when safe to do so, accelerate uphill. During this acceleration it is important that the secondary turbo is activated. If a co-driver is available SDD may be used to monitor turbo shut off valve commanded position to ensure the valve opens. Otherwise engine speed will need to exceed 2800 rpm. Using manual gear selection may help to achieve higher engine speed without excessive road speed. Be aware of the rear view using mirrors. Look for excessive smoke from the exhaust. Return to the workshop and with the vehicle in Park raise the engine rpm to above 3200 rpm and hold it for 2 minutes. Observe whether or not there is smoke from the exhaust tail pipes

No

Proceed to next step

A8: CHECK THE LATEST LEVEL CALIBRATION FILE IS LOADED TO THE ENGINE CONTROL MODULE.

1 Calibration Part Numbers **10MY**: AH22-12K532-PTK - High Power DPF, AH22-12K532-PSH - Low Power DPF, AH22-12K532-PCJ - High Power no DPF, **12MY**: CH22-12K532-PTD - Hi Flow DPF, CH22-12K532-PSD - Lo Flow DPF,

Is the latest level calibration file is loaded to the engine control module?

Yes

Proceed to next step

No

Using the manufacturer approved diagnostic system, update the engine control module calibration file to the latest level. Proceed to next step

A9: OIL IN EXHAUST OR CHARGED AIR SYSTEM

1 Check for oil contamination in the exhaust system and charged air system downstream of the primary turbocharger

- Confirm if a primary turbocharger has recently be installed

Is there oil contamination in the exhaust system and charged air system downstream of the primary turbocharger?

Yes

If a primary turbocharger **has** previously been replaced on this vehicle, contact dealer technical support for further advice. If a primary turbocharger **has not** previously been replaced on this vehicle, replace the primary turbocharger. Thoroughly clean air induction system, remove intercooler, compressor shut off valve and clean & remove all oil from exhaust. Refer to TSB LTB00358. When the engine is restarted and run you must be satisfied that any smoke observed is not due to residual oil left in the system, (see below). Carry out a 30 minute road drive. Keep engine rpm below 1200 rpm and avoid hard acceleration. After 30 minutes stop the vehicle, switch off the engine and wait 15 minutes. Restart the engine drive away and, when safe to do so, accelerate uphill. During this acceleration it is important that the secondary turbo is activated. If a co-driver is available SDD may be used to monitor turbo shut off valve commanded position to ensure the valve opens. Otherwise engine speed will need to exceed 2800 rpm. Using manual gear selection may help to achieve higher engine speed without excessive road speed. Be aware of the rear view using mirrors. Look for excessive smoke from the exhaust. Return to the workshop and with the vehicle in Park raise the engine rpm to above 3200 rpm and hold it for 2 minutes. Observe whether or not there is smoke from the exhaust tail pipes.

No

Allow an overnight drain of the oil from the oil scavenge tank. Carry out a 30 minute road drive. Keep engine rpm below 1200 rpm and avoid hard acceleration. After 30 minutes stop the vehicle, switch off the engine and wait 15 minutes. Restart the engine drive away and, when safe to do so, accelerate uphill. During this acceleration it is important that the secondary turbo is activated. If a co-driver is available SDD may be used to monitor turbo shut off valve commanded position to ensure the valve opens. Otherwise engine speed will need to exceed 2800 rpm. Using manual gear selection may help to achieve higher engine speed without excessive road speed. Be aware of the rear view using mirrors. Look for excessive smoke from the exhaust. Return to the workshop and with the vehicle in Park raise the engine rpm to above 3200 rpm and hold it for 2 minutes. Observe whether or not there is smoke from the exhaust tail pipes. Contact dealer technical support for further advice if smoke still coming from the exhaust tail pipes.

Engine - TDV6 3.0L Diesel - Engine Oil Draining and Filling

General Procedures

Draining

WARNING: The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

CAUTION: Make sure the engine is warm.

1. Refer to: Oil Filter Element (303-01 Engine - 3.0L Diesel, Removal and Installation).

2. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: Engine Undershield (501-02, Removal and Installation).

4. **WARNING:** Observe due care when draining engine oil as the oil can be very hot.

CAUTIONS:

Be prepared to collect escaping oil.

Discard the bolt.

Allow at least 10 minutes for the engine oil to drain.

Drain the engine oil.

Filling

1. **CAUTIONS:**

Make sure that the component is clean, free of foreign material and lubricant.

Make sure that a new bolt is installed.

Torque: 23 Nm

2. Refer to: Engine Undershield (501-02, Removal and Installation).

3. Lower the vehicle.

4. Refer to: Oil Filter Element (303-01 Engine - 3.0L Diesel, Removal and Installation).

5. Fill the engine with oil.

6.  CAUTION: Make sure that the vehicle is left for 5 minutes from filling with oil and that the engine oil level is reading at least minimum, before starting the engine. To check engine oil level follow steps 9-12.

Clean any residual engine oil from the oil filler cap area.

7.

- 8.
- Start the engine and allow to run for 10 minutes, stop the engine.
 - Check for leaks.

9. CAUTIONS:

 Make sure that the vehicle is parked on level ground.

 Make sure that the selector lever and the gearshift mechanism are in the park (P) position.

 Make sure that the hood is open.

 NOTE: Allow 10 minutes from the engine switch off for the engine oil level to stabilize.

- Turn the ignition on.

10.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

11.

- Press the right-hand OK button.

E123925

12.

- Press the right-hand directional button to access the Oil Level Display.

E123927

13.

- Press the right-hand OK button and follow the instructions.

E123928

14.

- Press the cruise control cancel button twice within 2 seconds.

E121008

E123929

15.

- The message center display will revert to the normal display in the trip computer.
- Press the right-hand OK button and follow the instructions.
- Check that the oil level display shows an oil level reading.
- Take a reading from the level display and, if necessary, top up with oil as instructed.

16. Turn the ignition off.

17.  **NOTE:** Allow 10 minutes for the engine oil level to stabilize if there has been additional oil top up.

- Turn the ignition on.

18.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

19.

- Press the right-hand OK button.

E123925

20.

- Press the right-hand directional button to access the Oil Level Display.

E123927

21.

- Scroll through the trip menu to access the engine oil level display.

E123929

22.

- Press the cruise control cancel button twice within 2 seconds.

E121008

E123929

23.  **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

- The message center display will revert to the normal display in the trip computer.
- Scroll through the trip menu to access the engine oil level display.
- This display is now the live reading of the engine oil level.
- Take a reading from the level display and, if necessary, top up with oil as instructed.

24.

- Press and hold the cruise control cancel button for more than 2 seconds.

E121008

25.
 - The message center display will revert to the normal display in the trip computer.
26. Turn the ignition off.
27. Turn the ignition on.

28.  **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.
 - Scroll through the trip menu to access the engine oil level display.
 - Make sure that the average oil level value has now been updated.

E123929

29. Refer to: Engine Cover - 3.0L Diesel (501-05, Removal and Installation).

Engine - TDV6 3.0L Diesel - Engine Oil Vacuum Draining and Filling

General Procedures

Special Tool(s)

 <p>E129630</p>	<p>303-1484 Vacuum Pump, Oil Drain</p>
 <p>E129631</p>	<p>303-1484-01 Adapter for 303-1484</p>

Draining

WARNING: The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

NOTES:

Make sure that the vehicle is parked on level ground.

Clean the components general area prior to dismantling.

1. Refer to: Oil Filter Element (303-01 Engine - 3.0L V6 - TdV6, Removal and Installation).

2.

3.  **CAUTION:** Allow 10 minutes from turning the engine off before starting oil extraction.

4.

- Using the oil vacuum pump drain the oil

out through the oil extraction tube.

Special Tool(s): [303-1484](#), [303-1484-01](#)

5.
 - Remove the oil vacuum pump.

Filling

1. Refer to: Oil Filter Element (303-01 Engine - 3.0L V6 - TdV6, Removal and Installation).
- 2.

3. Fill the engine with oil.

4.  **CAUTION:** Make sure that the vehicle is left for 5 minutes from filling with oil and that the engine oil level is reading at least minimum, before starting the engine. To check engine oil level follow steps 8-10.

Clean any residual engine oil from the oil filler cap area.

5.  **CAUTION:** Correct installation of the oil filler cap can be obtained by tightening the cap until an audible click is heard.

E121161

6.
 - Start the engine and allow to run for 10 minutes, stop the engine.
 - Check for leaks.

7. CAUTIONS:

 Make sure that the vehicle is parked on level ground.

 Make sure that the selector lever and the gearshift mechanism are in the park (P) position.

 Make sure that the hood is open.

 NOTE: Allow 10 minutes from the engine switch off for the engine oil level to stabilize.

- Turn the ignition on.

8.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

9.

- Press the right-hand OK button.

E123925

10.

- Press the right-hand directional button to access the Oil Level Display.

E123927

11.

- Press the right-hand OK button and follow the instructions.

E123928

E121008

12.

- Press the cruise control cancel button twice within 2 seconds.

13.

- The message center display will revert to the normal display in the trip computer.
- Press the right-hand OK button and follow the instructions.
- Check that the oil level display shows an oil level reading.
- Only after having started and run the engine for 10 minutes, switch off the engine, then stabilizing for 10 minutes, take a reading from the oil level display and, if necessary top up with engine oil.

E123929

14. Turn the ignition off.

15.  **NOTE:** Allow 10 minutes for the engine oil level to stabilize if there has been additional oil top up.

Turn the ignition on.

16.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

17.

E123925

- Press the right-hand OK button.

18.

- Press the right-hand directional button to access the Oil Level Display.

E123927

19.

- Press the right-hand OK button and follow the instructions.

E123928

E121008

20.

- Press and hold the cruise control cancel button for more than 2 seconds.

21.  **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

- The message center display will revert to the normal display in the trip computer.
- Press the right-hand OK button and follow the instructions.
- This display is now the live reading of the engine oil level.
- Take a reading from the level display and, if necessary, top up with oil as instructed.

E123929

E121008

22.

- Press and hold the cruise control cancel button for more than 2 seconds.

23. The message center display will revert to the normal display in the trip computer.

24. Turn the ignition off.

25. Turn the ignition on.

26.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

27.

- Press the right-hand OK button.

E123925

28.

- Press the right-hand directional button to access the Oil Level Display.

E123927

29.  NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

- Press the right-hand OK button and follow the instructions.
- Make sure that the average oil level value has now been updated.

Removal and Installation

Removal

1. Disconnect the battery ground cable.

Refer to: Specifications (414-00 Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: Camshaft LH (303-01 Engine - 3.0L V6 - TdV6, Removal and Installation).
4. Refer to: Glow Plugs (303-07 Glow Plug System - 3.0L V6 - TdV6, Removal and Installation).
5. Refer to: Exhaust Manifold (303-01 Engine - 3.0L V6 - TdV6, Removal and Installation).

6.

7.

8.

9.

10.

11.  CAUTION: Discard the bolts.

 NOTE: Discard the gasket.

Installation

1.  CAUTION: Make sure that the mating faces are clean and free of foreign material.

Clean and inspect the cylinder head and cylinder block.

E116920

2. CAUTIONS:

 Only tighten the bolts finger-tight at this stage.

 Make sure that new bolts are installed.

 Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

 The head gasket must be installed over the cylinder block dowels.

NOTES:

 Install a new gasket.

 No additional lubrication to the cylinder head bolts is required.

3.  NOTE: Tighten the bolts in the indicated sequence.

- Torque: 80 Nm

E116922

4.  NOTE: Tighten the bolts in the indicated sequence.

- Torque: 180°

E116922

Torque: 10 Nm

21. NOTES:

 Remove and discard the O-ring seals.

 Discard the gasket.

Torque: 10 Nm

Installation

1. CAUTIONS:

 Make sure that the mating faces are clean and free of corrosion and foreign material.

 Installation of the oil pan and tightening must be carried out within 7 minutes of applying the sealant.

Apply an 8 mm bead of sealant to the cylinder block in the areas shown.

2. To install, reverse the removal procedure.

Engine - TDV6 3.0L Diesel - Oil Pan Extension

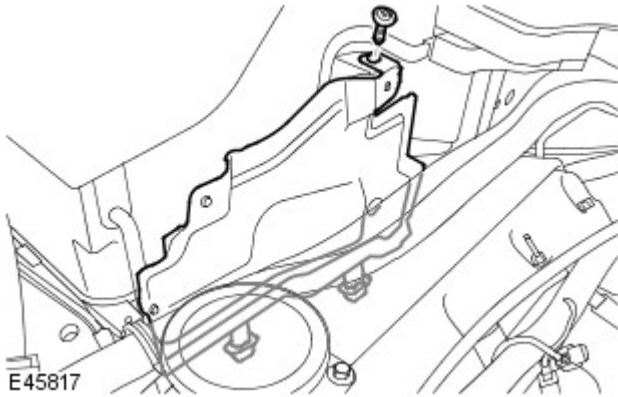

Removal and Installation

Removal

1. Disconnect the battery ground cable.

Refer to: Specifications (414-00, Specifications).

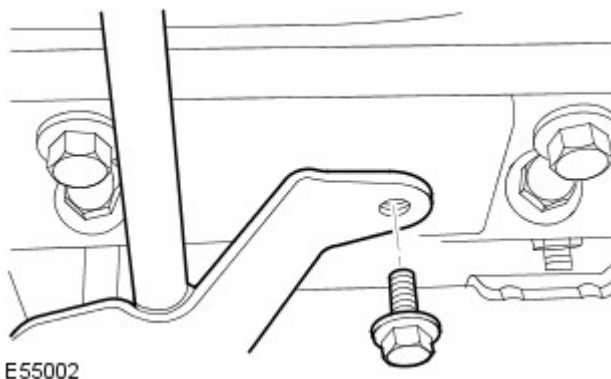

2. Remove the engine compartment upper heat shield.

3. Reposition the injector sound proofing.

4. Release the oil level indicator and tube from the oil pan extension.

5.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

6. Remove the front wheels and tires.
7. Remove the front axle tube.

Refer to: Axle Tube (205-03, In-vehicle Repair).

8. Remove the oil pan.

Refer to: Oil Pan (303-01, Removal and Installation).

9. Remove the starter motor.

Refer to: Starter Motor (303-06, Removal and Installation).

10. Remove the oil strainer pick-up assembly.

E94396

11. Remove the 3 bolts from the battery to starter motor solenoid cable.

E63135

12. Remove the bolt from the accessory drive belt tensioner bracket.

E93939

13. Remove the lower bolt from the air conditioning (A/C) compressor.

E93941

14. Release the turbocharger oil return tube.

E93944

15. Remove the turbocharger oil return tube.

E93942

16. Remove the 2 bolts from the turbocharger support bracket.

E94397

17. Remove the 3 lower bolts from the transmission to the engine.

E94398

18. Remove the front axle crossmember.

19. Using a transmission jack, support the front axle assembly.

20. Remove the front axle assembly front mounting bolt.

21.  **NOTE:** Note the fitted position of the retaining bolts prior to removal.

Remove the oil pan extension.

E93945

Installation

1. **NOTES:**

 Make sure that all the component mating faces are clean.

 It is important that the oil pan extension is bolted to the crankshaft main bearing carrier within twenty minutes of applying the sealant.

Apply an 8 mm bead of sealant to the cylinder block in the areas shown.

E93678

2. Install the oil pan extension.

3. Tighten the retaining bolts in the sequence shown.

E93962

4. Align and secure the front axle assembly.

5. Install the front axle crossmember.

6. Install the 3 lower bolts from the transmission to the engine.

7. Install the 2 bolts to the turbocharger support bracket.

8. NOTES:

Make sure that all the component mating faces are clean.

Remove and discard the blanking caps.

Install the turbocharger oil return tube.

9. Install the bolt to the turbocharger oil return tube.

10. Install the lower bolt to the A/C compressor.

11. Install the bolt to the accessory drive belt tensioner bracket.

12. Secure the battery to starter motor solenoid cable.

13. NOTE: Make sure that all the component mating faces are clean.

Install the oil strainer pick-up assembly.

14. Install the starter motor.

Refer to: Starter Motor (303-06, Removal and Installation).

15. Install the oil pan.

Refer to: Oil Pan (303-01, Removal and Installation).

16. Install the front axle tube.

Refer to: Axle Tube (205-03, In-vehicle Repair).

17. Install the front wheels and tires.

18. NOTE: Make sure that all the component mating faces are clean.

Secure the oil level indicator and tube into the oil pan extension.

19. Reposition the injector sound proofing.

20. Install the engine compartment upper heat shield.

21. Connect the battery ground cable.

Refer to: Specifications (414-00, Specifications).

Engine - TDV6 3.0L Diesel - Oil Pump

Removal and Installation

Removal

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the generator.

Refer to: [Generator](#) (414-02B Generator and Regulator - TDV6 3.0L Diesel, Removal and Installation).

3. Remove the accessory drive belt tensioner.

4. Remove the generator mounting bracket.

5. Refer to: [Timing Belt](#) (303-01A Engine - TDV6 3.0L Diesel, Removal and Installation).

6. Remove the crankshaft pulley.

E149538

7.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.

8. Release the battery positive cable.

E144765

9. Remove the oil pump lower retaining bolts.

E144767

10. Remove the timing belt cover sealing strips.

11. Remove the timing belt cover sealing strips.

12. Remove the oil pump.

13. Remove the alignment dowels (if equipped).

Installation

1. Install a new oil pump gasket.

2.  **NOTE: Prime the oil pump.**
 - Fill the orifice shown with 20 ml of engine oil.
 - Rotate the oil pump drive 2 complete turns.

E144763

E144758

3.  **CAUTION:** Make sure that the mating faces are clean and free of foreign material.

Apply sealant WSE-M4G323-A5 in an 3mm bead to the two areas shown, also apply a smear of sealant to the gasket face as illustrated.

4.  **CAUTION:** Make sure the base of the oil pump is aligned within 0.2 mm of the base of the engine block. Failure to follow this instruction may result in damage to the vehicle.

NOTE: Vehicles fitted with oil pumps without dowels.

Check the oil pump to engine block alignment.

5. Install two bolts to the oil pump, only finger tighten at this stage.

6. Install the oil pump lower retaining bolts.

E144767

E144769

E145329

7.  NOTE: Tighten the bolts in the sequence shown to 10 Nm .

Secure the oil pump.

8. Install the timing belt cover sealing strips.

9.  CAUTION: Do not use any lubricant on the crankshaft front seal, special tools or the crankshaft. Failure to follow this instruction may result in damage to the vehicle.

 NOTE: Make sure all component mating faces are clean.

E116752

Install a new crankshaft front seal to the special tool.

E116753

10.  **NOTE:** Remove the sleeve from the special tool.
Reposition the crankshaft front seal along the special tool.

E146178

11. Install the special tool to the crankshaft.

12. Remove the special tool from the crankshaft.

13. Install the special tool to the crankshaft.

14. NOTES:

 Make sure the seal is installed correctly.

 Use the crankshaft bolt with the service tool.

Install the special tool to the crankshaft.

15. NOTES:

 Make sure the seal is installed correctly.

 Wait 10 seconds before removing the crankshaft seal installation tool.

E149537

Remove and discard the crankshaft pulley retaining bolt.

E144765

16. Install the battery positive cable.

Torque: 10 Nm

E149538

17. CAUTIONS:

 Make sure that the pulley washer is correctly seated before installing the pulley.

 Do not lubricate the components.

 Make sure that a new bolt is installed.

Install the crankshaft pulley.

Torque:
 Stage 1: 150 Nm
 Stage 2: 300 Nm
 Stage 3: 90°

18. Refer to: [Timing Belt](#) (303-01A Engine - TDV6 3.0L Diesel, Removal and Installation).

19. Tighten the bolts in the sequence shown.

Torque: 22 Nm

20. Torque: 45 Nm

21. Remove the generator.

Refer to: [Generator](#) (414-02B Generator and Regulator - TDV6 3.0L Diesel, Removal and Installation).

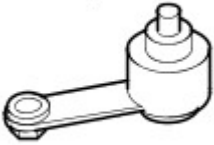

22. Connect the battery ground cable.

Refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Engine - TDV6 3.0L Diesel - Timing Belt

Removal and Installation

Special Tool(s)

 <p>303-1117</p> <p>E54540</p>	<p>303-1117 Timing Peg, Automatic Transmission</p>
 <p>303-1126</p> <p>E54551</p>	<p>303-1126 Timing Peg, Camshaft Pulley</p>

Removal

-  **WARNING:** Make sure to support the vehicle with axle stands.
 Raise and support the vehicle.
- Refer to: Timing Cover (303-01 Engine - 3.0L V6 - TdV6, Removal and Installation).
- Refer to: Starter Motor (303-06 Starting System - 3.0L V6 - TdV6, Removal and Installation).
-

- Rotate the crankshaft clockwise to align the crankshaft alignment hole in the flywheel or flexplate with the block aperture.
- Check the camshaft pulley alignment holes are correctly aligned. If the alignment holes are not aligned, rotate the crankshaft one full turn clockwise.

9. *Special Tool(s):* [303-1126](#)

10.  CAUTION: Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

 NOTE: Do not loosen the bolts more than 2 turns.

11. CAUTIONS:

 Discard the component.

 Discard the bolt.

12.  CAUTION: Discard the component.

Installation

- 1.

E116846

E116847

E116848

E116849

2. CAUTIONS:

 Make sure that a new bolt is installed.

 Only tighten the bolts finger-tight at this stage.

3.  CAUTION: Make sure the camshaft pulleys remain in the clockwise position.

- Install the new timing belt.
- Starting at the crankshaft pulley, install the timing belt in a counter-clockwise direction, in the sequence shown.
- Stage one: Attach the timing belt to the crankshaft pulley.
- Stage two: Attach the timing belt to the idler pulley.
- Stage three: Attach the timing belt to the left-hand camshaft pulley.
- Stage four: Attach the timing belt to the idler pulley.
- Stage five: Attach the timing belt to the RH camshaft pulley.
- Stage six: Attach the timing belt to the timing belt tensioner.

4.  CAUTION: Make sure the timing belt tensioner window is aligned with the groove as illustrated.

- Tension the timing belt.
- Rotate the tensioner assembly counter-clockwise.
- *Torque: 26 Nm*

5.  CAUTION: Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

- Using a suitable tool, counterhold the camshaft pulley center retaining bolts.
- *Torque:* 23 Nm

6. *Special Tool(s):* [303-1126](#)

7. *Special Tool(s):* [303-1117](#)

8.  **CAUTION:** Only rotate the crankshaft clockwise.
Rotate the engine two complete turns clockwise.

9. *Special Tool(s):* [303-1117](#)

E116840

10.

- Install the special tools to the exhaust camshaft pulleys.
- If the special tool does not fit correctly, repeat the timing belt installation procedure.
- Remove the special tools from the camshaft pulleys.

Engine - V6 S/C 3.0L Petrol - Engine

Description and Operation

COMPONENT LOCATION

V6 3.0L SC Petrol Engine

E152254

OVERVIEW

The V6 3.0L SC petrol engine is a liquid cooled V6 unit featuring direct fuel injection, four overhead camshafts and four valves per cylinder.

The main structural components of the engine are all manufactured from aluminum alloy. The engine is built around a very stiff, lightweight, enclosed V, deep skirt cylinder block. A structural windage tray is bolted to the bottom of the cylinder block to further improve the block stiffness, minimize **NVH (noise, vibration and harshness)** and help reduce oil foaming. To further enhance the stiffness of the lower engine structure, a heavily ribbed sump body is installed. The sump body also helps to reduce engine noise.

The engine uses a Bosch HP (high pressure) direct injection fuel system with fuel pressure provided by two, cam driven high pressure fuel pumps which are driven by a dedicated camshaft. The HP fuel pumps supply the fuel rails which in turn supply the three injectors for that bank with fuel at a controlled pressure.

The four camshafts incorporate **VCT (variable camshaft timing)**. The **VCT** allows the timing of the intake and exhaust valves to be adjusted independently of each other. The **VCT** system is controlled by the Bosch **ECM (engine control module)** using information from **CMP (camshaft position)** sensors.

The supercharger is located in the 'vee' of the engine and is driven from the crankshaft by a dedicated secondary auxiliary drive belt.

The engine meets EU5 emission regulations in Europe and Rest of World (ROW) and ULEV 70 emission regulations in North American Specification (NAS) markets.

The direct fuel injection system, advanced piston and combustion chamber design and the supercharger provide improved fuel consumption and emissions.

Various engine systems are located on the engine assembly and driven directly and indirectly by the engine operation. Refer to relevant section for the further information:

Major Structural Components

E152256

Item	Part Number	Description
1	-	Right Cylinder Head (bank 1)
2	-	Left Cylinder Head (bank 2)
3	-	Cylinder Block
4	-	Windage Tray
5	-	Oil Pan

Cylinder Block

E142779

The high pressure die-cast aluminum cylinder block is a 90 degree configuration with cast-in iron cylinder liners and an open deck die-cast coolant jacket. The low volume coolant jacket gives good warm-up times and low piston noise levels. The longitudinal flow design of the coolant jacket, with a single cylinder head coolant transfer port in each bank, provides good rigidity and head gasket sealing.

Engine Data Location

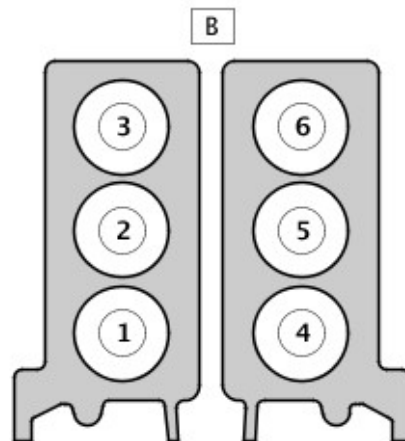

E142780

Item	Part Number	Description
1	-	Engine Data Location

Engine data is marked on the cylinder block at the rear of the right cylinder bank '1'.

Cylinder Numbering

E163885

Item	Part Number	Description
A	-	DIN standard cylinder numbering

DIN cylinder firing order 1.4.2.5.3.6

Crankshaft

E142781

Item	Part Number	Description
1	-	Upper main bearing (5 off)
2	-	Thrust Washer (2 off)
3	-	Drive Plate Location Dowel
4	-	Rear Dynamic Balancer Drive Sprocket
5	-	Lower Main Bearing (5 off)
6	-	Woodruff Key Locations

The crankshaft is manufactured from forged carbon steel C38 with induction hardened main and pin bearing journals. The fillets of the main journals are fillet rolled to improve strength. The fillets of the pins are induction hardened due to the split pin design, improving the strength of the crankshaft.

A six counterweight design has been used to balance the V6 split pin design ensuring less vibration.

An oil groove in the upper half of each main bearing transfers the oil into the crankshaft for lubrication of the connecting rod bearings.

Crankshaft Data Location

E108430

Item	Part Number	Description
1	-	Pin Journal Classification and Plant Identification
2	-	Main Journal Classification
3	-	Date and Time Codes

The main bearings are numbered 1 to 5 starting from the front of the engine. There are six grades of main bearing available, each being color coded. Journal sizes are marked on the rear of the crankshaft.

Crankshaft Installation

E142783

Item	Part Number	Description
1	-	Cross Cap M8 bolt (8 off - not fitted to rear main bearing cap)
2	-	Front Main Bearing Cap
3	-	Outer Main Bearing Cap M8 bolt (10 off)
4	-	Inner Main Bearing Cap M10 bolt (10 off)
5	-	Identification Mark (must face front of engine)
6	-	Main Bearing Caps (3 off)
7	-	Rear Main Bearing Cap

The main bearing caps are made from cast iron and are cross bolted to increase rigidity. An identification mark on each bearing cap must face the front of the engine.

There are five grades of main bearing available, each being color coded. Journal sizes are marked on the rear of the crankshaft.

The thickness grade of all main bearing shells are to be selected to give a total running clearance of not less than 0.029mm or not greater than 0.051mm.

The main bearing shells in the cylinder block have a central hole and an internal groove to allow for main journal lubrication. The bearing shells in the main bearing caps are plain with no grooves.

Special tools are required to ensure the correct alignment of the upper and lower main bearing shells.

Crankshaft Pulley / Vibration Damper

E142784

Item	Part Number	Description
1	-	Pulley Bolt
2	-	Crankshaft Pulley/Vibration Damper
3	-	Friction Washer
4	-	Timing Chain Drive Sprocket
5	-	Woodruff Keys
6	-	Crankshaft
7	-	Woodruff Key Slots
8	-	Oil Pump Drive Sprocket

At the front of the crankshaft, a tuned torsional vibration damper is incorporated into the crankshaft pulley.

The pulley is located on two woodruff keys which are located in slots in the crankshaft. The woodruff keys are a press fit in the slots and must be correctly aligned.

If the pulley is removed, a new friction washer must be located between the timing chain drive sprocket and the crankshaft pulley and a new pulley bolt must also be used.

The crankshaft pulley/vibration damper is not a serviceable component and must not be disassembled.

Drive Plate

E142785

Item	Part Number	Description
1	-	M10 Bolt (10 off)
2	-	Drive Plate
3	-	Dowel
4	-	Crankshaft
5	-	Reluctor Ring
6	-	Starter Motor
7	-	CKP (crankshaft position) Sensor

The drive plate is located at the rear of the crankshaft. The drive plate has three functions; to transfer drive from the crankshaft to the transmission, to transfer drive from the starter motor to the crankshaft and to provide the engine management system with crankshaft speed and position via a reluctor ring and a sensor.

The drive plate is secured to the crankshaft flange with 10 bolts and is located with a dowel to ensure the correct timing of the reluctor ring to the crankshaft orientation.

The drive plate is a pressed and cast steel fabrication, which comprises a cast steel starter ring gear and a pressed steel drive plate and reluctor ring. The two components are riveted together as one assembly.

Four holes in the drive plate provide for the attachment of the transmission torque converter to transfer drive from the crankshaft to the transmission.

The reluctor ring has 60 teeth with 2 teeth missing to provide a gap. A **CKP (crankshaft position)** sensor is located in the oil pan casting and measures speed and position as the reluctor ring rotates.

For additional information, refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - V6 S/C 3.0L Petrol, Description and Operation).

Pistons and Connecting Rods

E142786

Item	Part Number	Description
1	-	Circlip
2	-	Piston
3	-	Upper Compression Ring
4	-	Lower Compression Ring
5	-	Oil Control Ring
6	-	Separator
7	-	Oil Control Ring
8	-	Circlip
9	-	Gudgeon Pin
10	-	Connecting Rod
11	-	Alignment Marks
12	-	Connecting Rod Cap
13	-	Bolts
14	-	Lower Big End Shell Bearing
15	-	Upper Big End Shell Bearing
16	-	Little End Bearing

In the vertical plane, the pistons have a slight barrel form, which helps to ensure a reliable oil film is maintained between the piston and the cylinder bore. A solid film lubricant coating is applied to both reaction faces of the piston to reduce wear and improve fuel economy.

A three-ring piston-sealing system is used. The steel top ring is treated with a PVD (physical vapor deposition) peripheral coating. PVD is a coating technique where material can be deposited with improved properties to ensure

good cylinder bore compatibility and wear resistance. A Napier center ring helps cylinder pressure and oil management, while the three-piece oil control lower ring is produced from nitrided steel. The two upper rings are marked with an 'R' which must face upwards, towards the top of the piston.

The pistons are cooled with engine oil from three piston cooling jets installed under the valley of the cylinder block.

The connecting rods are forged from high strength steel. The connecting rod cap is fracture-split from the rod to ensure precision re-assembly for shell bearing alignment. There are three grades of big end bearing available, each being color coded.

For additional information, refer to: [Connecting Rod Cleaning](#) (303-00 Engine System - General Information, General Procedures).

The correct alignment of the cap with the connecting rod is indicated by marks on adjacent faces of the two components.

The pistons are attached to the connecting rods with a gudgeon pin, which is secured with 2 circlips. The gudgeon pin is located through the small end bearing in the connecting rod which allows the piston to articulate with the linear movement of the connecting rod. The circlips locate in grooves in the piston.

Connecting Rod and Piston Orientation

E142787

Item	Part Number	Description
A	-	Front of Engine
1	-	Alignment Mark
2	-	Left Side (bank 2)
3	-	Alignment Mark
4	-	Right Side (bank 1)
5	-	Piston Orientation Arrow

The orientation of the connecting rods and pistons on the crankshaft are given below:

- Bank 1 - The arrow on the piston crown must face the front of the engine and the cap and connecting rod alignment marks must face the rear of the engine.
- Bank 2 - The arrow on the piston crown must face the front of the engine and the cap and connecting rod alignment marks must face the front of the engine.

Piston Cooling Jets

E142788

Item	Part Number	Description
1	-	Piston Cooling Jets

Piston cooling jets, located in the cylinder block, provide piston and piston pin cooling and lubrication. Each piston cooling jet has two outlet nozzles which spray oil onto the underside of the two adjacent pistons, one from each cylinder bank. Each jet is located between the pair of cylinders and is secured with a bolt. The jets are supplied pressurized engine oil from the oil pump via a drilling in the cylinder block.

Each jet sprays oil onto the underside of the piston to help cool each piston crown. Additionally, oil lubricates the small end bearing and gudgeon pin.

Dynamic Balancers and Auxiliary Camshaft

E142789

Item	Part Number	Description
1	-	Crankshaft Rear Dynamic Balancer Drive Sprocket
2	-	Idler Sprocket
3	-	Rear Dynamic Balancer
4	-	Crankshaft Timing Chain Sprocket
5	-	Auxiliary Drive Tensioner
6	-	Front Dynamic Balancer
7	-	Auxiliary Drive Chain
8	-	Oil Pump Sprocket
9	-	Auxiliary Shaft Sprocket
10	-	Auxiliary Shaft
11	-	Drive Chain

Dynamic engine balancing is performed by two weighted dynamic balancers, located at the front and rear of the cylinder block. The dynamic balancers oppose and cancel out vibrations created by the engine's rotating components.

The front and rear dynamic balancers comprise a sprocket with an offset weight.

Both dynamic balancers are fitted with two needle roller bearings bolted to the rear main bearing cap for the rear dynamic balancer and the front main bearing cap for the front dynamic balancer by use of a threaded shaft. A shoulder on the shaft maintains the correct lateral position of the dynamic balance. Thrust bearings on either side of the dynamic balancer control lateral movement.

The rear dynamic balancer is driven by a dedicated drive chain which is driven by a sprocket which is integral with the crankshaft. An non-weighted idler sprocket, supported on needle roller bearings, is fitted in the same way on the opposite side of the crankshaft main bearing cap. The drive chain connects the two sprockets and the drive gear on

the crankshaft.

The front dynamic balancer is driven by the auxiliary drive chain which is driven off the crankshaft sprocket, which in turn drives the auxiliary camshaft used to operate the two high pressure fuel pumps.

The dynamic balancers rotate at crankshaft speed in the opposite directions to the crankshaft. The balancer weights are phased so that the inertia reaction to their counter-rotation cancels out vibration caused by the engine in both horizontal and vertical planes.

Both dynamic balancers must be timed to the crankshaft position by their position on the drive chain. Refer Engine - V6 3.0L SC Petrol - Removal and Installation for procedure.

The auxiliary camshaft is located on two machined bosses on the windage tray and secured with a camshaft carrier which is secured to windage tray with eight bolts. The auxiliary camshaft has two cam lobes, with each lobe operating a high pressure fuel pump, via a tappet. The camshaft is fitted with a drive sprocket which is a press fit on the camshaft. The sprocket is timed to the cam lobes to match the pump delivery strokes with crankshaft position and therefore must not be removed.

For additional information, refer to: [Fuel Charging and Controls](#) (303-04C Fuel Charging and Controls - V6 S/C 3.0L Petrol, Description and Operation).

Oil Pan

E152258

Item	Part Number	Description
1	-	Oil Pump Outlet Pipe to Cylinder Block
2	-	Oil Pump Pick-Up Pipe
3	-	Oil Evacuation Tube
4	-	Oil Pump
5	-	Oil Pan
6	-	Drain Plug with Washer
7	-	Oil Pan Retaining Bolts (16 off)
8	-	Bolts (3 off)
9	-	Oil Level and Temperature Sensor

The oil pan body is located on the underside of the cylinder block. It is sealed to the cylinder block with a 3 mm bead of RTV sealant and is secured with 16 bolts.

The oil pan covers the windage tray and the oil pump and also collects engine oil returning from the cylinder heads and crankshaft lubrication.

A drain plug and seal are located on the right side of the oil pan. The oil level and temperature sensor is located in the bottom of the oil pan and is sealed with a rubber gasket and secured with 3 screws.

The lower section of the oil pan remains full of engine oil and provides the location for the oil pump pick-up pipe and filter. The shape of the oil pan ensures that engine oil is always available at the oil pump pick-up and prevents oil starvation due to vehicle inclination and oil surge due to cornering, braking and acceleration.

An oil evacuation tube is installed to allow oil to be drawn from the sump pan. The upper end of the oil evacuation tube is located under the oil filler cap in the camshaft cover.

CYLINDER HEADS - DESCRIPTION

Cylinder Head Components

E142791

16	-	Valve Spring Seat and Stem Seal (12 off)
17	-	Valve Spring (12 off)
18	-	Valve Spring Retainer (12 off)
19	-	Valve Spring Collet (24 off)
20	-	Valve Tappet (12 off)
21	-	Camshaft Cover Gasket
22	-	Camshaft Cover Spark Plug/Injector Gasket (3 off)

Cylinder Heads

The cylinder heads are manufactured in gravity die cast aluminum alloy and are unique for each cylinder bank. Deep-seated head bolts reduce head lift and bore distortion and secure the cylinder heads to the cylinder block.

Each cylinder is served by four valves. To help achieve the required gas-flow characteristics, these are arranged asymmetrically around the cylinder bore. Each cylinder has a centrally mounted fuel injector and spark plug.

The valves are a conventional direct acting tappet arrangement, with a valve and spring assembly retained by two valve collets. The valve tappets are graded and selected on assembly to obtain the correct camshaft to tappet clearance dimensions.

E142792

Item	Part Number	Description
1	-	Exhaust Valves
2	-	Fuel Injector Location
3	-	Spark Plug Location
4	-	Inlet Valves

The cylinder head gasket is of a multi-layer steel construction.

The threads for the spark plugs are machined at a precise start point to ensure that each spark plug is orientated in the cylinder correctly. The benefits of this are optimum spark plug intrusion into the combustion chamber to improve combustion, idle stability, dilution tolerance and spark plug durability. The spark plug must be tightened to the specified torque to ensure the correct orientation.

The camshafts run on line bored journals in the cylinder head and camshaft caps. Therefore it is very important that the camshaft caps are maintained with their respective journal and the orientation is as marked on the cap.

A camshaft cover is fitted and sealed with a rubber seal and 3 smaller rubber seals. The cover is retained in position with 15 bolts which are located through a sleeve and a grommet for sealing and a single stud and nut.

Camshaft Covers

E142793

Item	Part Number	Description
A	-	Right Side Bank 1
B	-	Left Side Bank 2
1	-	Stud and Nut (2 off)
2	-	Bolt (15 off Bank 2, 14 off Bank 1)
3	-	Grommet (15 off per cover)
4	-	Spacer (15 off per cover)
5	-	Pressure Control Valve Spring
6	-	Pressure Control Valve Inlet
7	-	Twin Pressure Control Valve
8	-	Pressure Control Valve Cover
9	-	Two-Way Valve
10	-	Camshaft Cover - Left
11	-	Spiral Oil Separator
12	-	Baffle Plate
13	-	Camshaft Cover Gasket
14	-	Camshaft Cover Spark Plug/Injector Gasket (3 off)

15	-	O-Ring Seal
16	-	Oil Filler Cap Assembly
17	-	Camshaft Cover Spark Plug/Injector Gasket (3 off)
18	-	Camshaft Cover Gasket
19	-	Baffle Plate
20	-	Omega Flap Plate
21	-	Camshaft Cover - Right

Each camshaft cover is secured to the cylinder head with 15 bolts and 1 stud and nut. A grommet seals the holes in the cover and a sleeve controls the compression of the grommet.

Threaded inserts are fitted to each cover to allow for the attachment of the ignition coils. A rubber moulded NVH cover is fitted over the ignition coils and is secured with snaplock studs.

Each camshaft cover is fitted with a breather. The left side cover has a baffle plate which collects oil vapor and allows it drain back into the oil pan via the cylinder block. The left side breather provides for engine full load operation and vents cylinder block emissions into the left side air filter outlet. The right side cover is fitted with an omega plate and a pressure control valve. The right side breather provides for engine part load operation and vents cylinder block emissions into the throttle which is integral with the supercharger.

A groove in the outer edge of each cover provides the location for the re-useable camshaft cover gasket. Three separate gaskets, located in the center of the camshaft cover, prevent oil leaking into the area around the fuel injectors, spark plugs and coils.

Valves and Tappets

E142794

Item	Part Number	Description
1	-	Valve Tappet
2	-	Valve Collet
3	-	Valve Retainer
4	-	Valve Spring
5	-	Valve Stem Seal
6	-	Valve

The engine uses 24 mono metallic valves; 12 inlet and 12 exhaust. The inlet valve heads are 33.0 mm diameter and the exhaust valve heads are 28.0 mm diameter. The large valve size allows for large cylinder head port sizes which assist with engine performance and improved emissions. The valve stems are 5.4 mm diameter which allows for reduced flow interruption through the inlet and exhaust ports assisting with performance and improved emissions.

The valves are located in conventional, non-serviceable valve guides in the cylinder head. A valve guide and valve seat is located in the cylinder head. The valve spring is retained in a compressed states on the valve stem by a valve retainer and a pair of valve spring collects.

The valves are opened mechanically by a bucket design valve tappet which is operated directly by the associated

camshaft lobe. The valve clearance is set by selection of the appropriate valve tappet to achieve the required valve clearance.

Camshafts

E142795

Item	Part Number	Description
1	-	Inlet Camshaft
2	-	Exhaust Camshaft

Each cylinder head is fitted with 2 camshafts; inlet and exhaust. The lobes on the camshafts act on the valve tappets to open and close the valves.

The camshafts run on machined bearing journals in the cylinder heads and camshaft caps. The camshaft caps are marked with 'IN' and 'EX' to denote inlet and exhaust. The caps at the front of the engine are marked 'AB'. Before removal, each camshaft cap must be marked with its position to ensure correct re-assembly. Each camshaft cap is secured with 2 M6 screws.

Each camshaft is fitted with a **VCT** actuator. Each actuator contains a sprocket which drives the camshaft via a timing chain driven from the crankshaft. The **VCT** actuator can change the timing of the camshaft, increasing engine efficiency and performance.

Camshaft Timing Chain

E142796

Item	Part Number	Description
1	-	Timing Chain - Right Bank 1
2	-	Exhaust VCT (variable camshaft timing) Actuator
3	-	Inlet VCT Actuator
4	-	Exhaust Camshaft
5	-	Inlet Camshaft
6	-	Inlet VCT Actuator
7	-	Inlet Camshaft
8	-	Exhaust Camshaft
9	-	Exhaust VCT Actuator
10	-	Timing Chain - Left Bank 2
11	-	Tensioner Arm - Left
12	-	Timing Chain Guide - Left
13	-	Shoulder Bolt (3 off)
14	-	Shoulder Pivot Bolt
15	-	Timing Chain Tensioner Assembly - Left
16	-	Screw (2 off)
17	-	Screw (2 off)
18	-	Timing Chain Tensioner Assembly - Right
19	-	Shoulder Bolt (3 off)
20	-	Shoulder Pivot Bolt
21	-	Tensioner Arm - right

22	-	Timing Chain Guide - right
23	-	Crankshaft Sprocket

Two, endless, simplex roller timing chains are used to drive the camshafts; one chain for each cylinder bank. The timing chains are driven from a crankshaft sprocket and are passed over two sprockets which are integral with the [VCT](#) actuators.

A procedure is required to ensure that the correct crankshaft to camshaft timing is achieved. Refer Engine - V6 3.0L SC Petrol - Removal and Installation for procedure.

Each timing chain has a fixed timing chain guide which is secured to the cylinder block with three shoulder bolts. A tensioner arm is fitted to each timing chain which can rotate around a shoulder pivot bolt. Each timing chain has a mechanical tensioner operated by spring tension to apply a controlled tension to the timing chain. This maintains the timing chain at the correct tension and allows for and dampens backlash in the chain tension due to engine deceleration. The timing chains and tensioners are maintenance free components.

Each timing chain tensioner has a hole which allow for the locking of the tensioner to facilitate removal of the tensioner arm, guide or camshaft timing chain. The tensioner plunger can be pushed back into the housing and a pin inserted to lock the tensioner in the retracted position.

The timing chains are lubricated with engine oil from jets located at the front of the engine block.

VARIABLE CAMSHAFT TIMING (VCT)

Variable Camshaft Timing

E142797

Item	Part Number	Description
1	-	Inlet Camshaft VCT Actuator
2	-	Exhaust Camshaft VCT Actuator
3	-	Exhaust VCT Solenoid
4	-	CMP (camshaft position) Sensors
5	-	Inlet VCT Solenoid

The timing of the inlet and exhaust camshafts can be adjusted independently by an electro-hydraulic controlled [VCT](#) system. The [ECM](#) controls the system using information from the [CMP](#) sensors and the [CKP](#) sensor.

The [VCT](#) system varies the timing of the intake and exhaust camshafts to deliver optimum engine power, efficiency and emissions. The timing of the intake camshafts has a range of 62 degrees of crankshaft angle. The timing of the exhaust camshafts has a range of 50 degrees of crankshaft angle.

In the base timing position:

- The intake camshafts are fully retarded.
- The exhaust camshafts are fully advanced.

Camshaft	Valve Opens	Valve Closes
----------	-------------	--------------

Intake	33 degrees BTDC (before top dead center) to 29 degrees ATDC (after top dead center)	197 to 259 degrees ATDC
Exhaust	236 to 186 degrees BTDC	6 to 56 degrees ATDC

The system consists of a **VCT** unit and a **VCT** solenoid for each camshaft. The **ECM** controls the system using **PWM** (pulse width modulation) signals to the **VCT** solenoids.

The torsional energy generated by the valve springs and the inertia of the valve train components are used to operate the system.

Variable Camshaft Timing Units

The **VCT** units change the position of the camshafts in relation to the timing chains.

E142798

Item	Part Number	Description
1	-	Bolt (3 off)
2	-	VCT Unit
3	-	Filter
4	-	Camshaft
5	-	Inner Plate
6	-	Housing and Sprocket
7	-	Rotor Assembly
8	-	Reed Plate
9	-	Spring and Lock Pin
10	-	Spring (3 off)
11	-	Tip Seal (3 off)

12	-	Spring (2 off)
13	-	Tip Seal (2 off)
14	-	Spring
15	-	Dowel Pin
16	-	Bias Spring
17	-	Snap Ring
18	-	Sensor Wheel
19	-	Center Plate
20	-	Snap Ring
21	-	Screw (6 off)
22	-	Spool Valve
23	-	Outer Plate

Each **VCT** unit is attached to the camshaft by three bolts. A rotor assembly and a reed plate are installed inside a sprocket housing, which consists of a sprocket, an outer plate and an inner plate held together by six screws.

A sensor wheel, for the **CMP** sensor, a center plate and a bias spring are installed at the front of the **VCT** unit. The ends of the bias spring locate on the center plate assembly and the sprocket housing, to give a turning moment to the camshaft in the advance direction. A snap ring locates the sensor wheel on to a sleeve installed in the center of the rotor assembly. The opposite end of the sleeve locates in a bore in the front face of the camshaft, which contains a filter.

A spring and spool valve are installed in the rotor assembly sleeve and retained by a snap ring. The spring keeps the spool valve in contact with the armature of the related **VCT** solenoid.

Each **VCT** unit is supplied with engine oil from an oil gallery in the cylinder head, through the camshaft front bearing cap and a bore in the center of the camshaft.

Variable Camshaft Timing Solenoids

The **VCT** solenoids control the position of the spool valves in the **VCT** units.

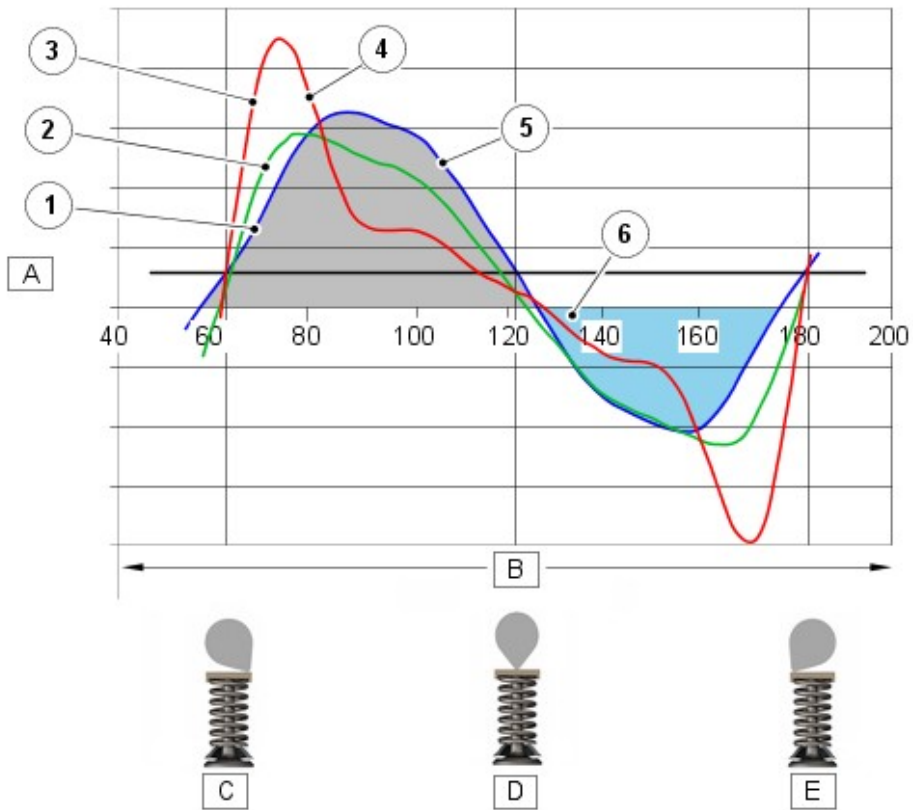

E 115929

The **VCT** solenoids are installed in the front upper timing covers, immediately in front of their related **VCT** units. Each **VCT** solenoid is secured with two screws and sealed with an O-ring. A two pin electrical connector provides the interface with the engine harness.

Each **VCT** solenoid incorporates a spindle that acts on the spool valve in the related **VCT** unit to advance and retard the camshaft timing. The **VCT** solenoids operate independently and are controlled by a **PWM** signal from the **ECM**.

Variable Camshaft Timing Operation

When the engine is running, the compression and expansion of the valve springs causes momentary increases and decreases in the torque acting on the camshafts. These momentary changes of torque are sensed in the **VCT** units and used to change the camshaft timing.

E112406

Item	Part Number	Description

Variable Camshaft Timing Unit Schematic - Base Timing

NOTE: Intake camshaft VCT unit shown. For exhaust camshaft VCT unit, read advance for retard and retard for advance.

E115931

Item	Part Number	Description
1	-	Advance Chamber
2	-	Retard Chamber
3	-	Sprocket Housing
4	-	Rotor Assembly
5	-	Lock Pin
6	-	Sleeve
7	-	Engine Oil Supply from Camshaft
8	-	Inlet Check Valve
9	-	Lock Pin Drain
10	-	Spool Valve
11	-	Advance Check Valve
12	-	Retard Check Valve

NOTE: The following description is for intake camshaft VCT units. For exhaust camshaft VCT units, read advance for retard, and retard for advance.

At engine start-up, once the engine oil pressure in the camshaft is sufficient to open the inlet check valve, engine oil flows across the spool valve, through the advance and retard check valves and into the advance and retard chambers. During the start cycle, the ECM signals the VCT solenoid to move the spool valve into the sleeve and connect the lock pin to inlet oil pressure. The inlet oil pressure causes the lock pin to retract from the inner plate and unlock the rotor assembly and camshaft from the sprocket housing.

There is a constant supply of oil to the VCT to ensure the unit remains filled during operation.

Variable Camshaft Timing Unit Schematic - Advance

E115932

To advance the camshaft timing, the **ECM** adjusts the signal to the **VCT** solenoid to move the spool valve so that the advance chamber oil passage is closed and the retard chamber oil passage is connected to inlet oil.

Each momentary increase of the torque acting on the camshaft generates a pressure pulse in the retard chamber. Oil moves from the retard chamber, through the spool valve and the advance check valve to the advance chamber, to equalize the pressures in the two chambers. The displacement of oil from the retard chamber causes the rotor assembly to advance in relation to the sprocket housing. Each momentary decrease of torque acting on the camshaft also generates a pressure pulse in the advance chamber, but, with the advance chamber oil passage closed, no movement of oil between the advance and retard chambers occurs and the rotor assembly cannot move in the retard direction.

Variable Camshaft Timing Unit Schematic - Null

E115933

Once the camshaft has reached the required timing position the [ECM](#) adjusts the signal to the [VCT](#) solenoid to set the spool valve in the null position. In the null position, the advance and retard chamber oil passages are both closed by the spool valve and the rotor assembly is hydraulically locked to the sprocket housing.

Variable Camshaft Timing Unit Schematic - Retard

E115934

To retard the camshaft timing, the **ECM** adjusts the signal to the **VCT** solenoid to move the spool valve to close the retard chamber oil passage and connect the advance chamber oil passage to the inlet oil.

Each momentary decrease of the torque acting on the camshaft causes oil to transfer from the advance chamber, through the spool valve and the retard check valve to the retard chamber, and so retard the camshaft timing.

LUBRICATION SYSTEM

E152257

Item	Part Number	Description
1	-	Oil Cooler
2	-	Oil Filter
3	-	Oil Evacuation Tube
4	-	Upper Timing Chain Lubrication Jet

Oil Pump

E152259

Item	Part Number	Description
1	-	Pressurized Oil Outlet to Cylinder Block
2	-	Pump Pressure Outlet
3	-	Pump Inlet
4	-	Oil Pump
5	-	Oil Pump Drive Sprocket
6	-	Oil Pick-Up Pipe

The oil pump is attached to the underside of the windage tray with 3 bolts. The input shaft of the oil pump is driven from the front of the crankshaft, by the auxiliary chain, at 0.87 engine speed.

The oil pump draws oil from the oil pan through a centrally mounted pick-up pipe. The oil is pressurized and pumped through an output tube to the cylinder block. After passing through an anti-drain valve and a plate type oil cooler, the oil is filtered by a replaceable cartridge installed on the front of the right (bank 1) cylinder head.

The output from the oil filter is distributed through oil galleries in the cylinder heads and the cylinder block. All moving parts are lubricated by pressure or splash oil. Pressurized oil is also provided for the VCT system, the piston cooling jets and the timing chain lubrication jets.

The oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the rapid return of the oil to the oil pan. System replenishment is through the oil filler cap on the left cylinder head cover.

An oil evacuation tube is installed to allow oil to be drawn from the oil pan. The upper end of the oil evacuation tube is located under the oil filler cap.

An oil drain plug is installed in the right side of the oil pan.

Oil Pump Nominal Operating Pressures

Engine Speed, rev/min	Temperature, °C (°F)	Pressure, bar (lbf/in ²)
Idle	20 (68)	2.0 (29.0)
1500	20 (68)	6.0 (87.0)
3000	40 (104)	6.2 (90.0)
3000	110 (230)	5.0 (72.5)
3000	130 (266)	4.0 (58.0)

Engine Oil Cooler

E142801

Item	Part Number	Description
1	-	Anti-Drain Valve Assembly
2	-	Gasket
3	-	Engine Oil Cooler
4	-	Screw (18 off)
5	-	Engine Coolant Inlet from Water Pump

The engine oil cooler is located on the top of the cylinder block, in the 'V' between the cylinder heads. The cooler is sealed to the cylinder block with a gasket and secured with 18 screws.

There are three ports on the underside of the cooler; an engine oil inlet and outlet and an engine coolant outlet. The engine coolant inlet is positioned on the side of the cooler. The engine oil cooler is an aluminum housing comprising louvered fins and plates. The plates allow a cross-flow of engine oil and engine coolant through the cooler but keeping the two fluids separate.

The engine coolant is directed from the engine coolant pump into the cooler via a plastic tube.

The plates are immersed in engine coolant from the engine coolant pump which provides cooling of the engine oil by the temperature differential between the engine oil and the engine coolant.

An anti-drain valve is located in the cylinder block and prevents the engine oil cooler draining of oil when the engine is not running.

Engine Oil Filter

E142804

Item	Part Number	Description
1	-	Cap
2	-	O-Ring Seal
3	-	By-Pass Valve
4	-	Filter Element
5	-	O-Ring Seal
6	-	Oil Filter Body

The oil filter assembly is located on a casting which is integral with the right cylinder head. The oil filter body is sealed with a gasket and secured to the cylinder head with 4 screws, 3 internal and 1 external.

A replaceable cartridge filter element is located in the oil filter body. An O-ring seal seals the filter element to the filter body.

The filter element is fitted with an integral by-pass valve. If the filter becomes contaminated, to the point that oil flow is restricted, the by-pass valve opens to allow oil to flow through the oil filter body to avoid starving the engine of engine oil.

Oil Level Monitoring

E115936

The oil level and temperature sensor supplies the [ECM](#) with a signal containing the level of the oil in the oil pan. The oil level and temperature sensor is secured to the bottom of the oil pan with three screws and sealed with a gasket.

NOTE: The temperature function of the oil level and temperature sensor is not operational on the [V6 3.0L SC engine](#).

The oil level and temperature sensor sends an ultrasonic pulse vertically upward and measures the time taken for the pulse to be reflected back from the top surface of the oil. This time is compared with the time taken for an ultrasonic pulse to travel a reference distance within the oil level and temperature sensor to determine the oil level. The oil level reading is transmitted in a [PWM](#) signal to the [ECM](#).

Oil Level and Temperature Sensor Specifications

Feature	Details
Power Source	Battery Voltage
Temperature Accuracy	± 2 °C (± 3.6 °F)
Operating Level Range	18 to 147 mm (0.71 to 5.79 in.)
Operating Temperature Range	-40 to 160 °C (-40 to 320 °F)

Oil Level Check

For accuracy, oil level checks should be performed with the vehicle on level ground when the oil is hot. The vehicle needs to stand for approximately 10 minutes, after the engine is switched off, to allow the oil to drain back into the oil pan and the oil level to stabilize. The oil level system will not give a reading until the oil level has stabilized.

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 3.0L Diesel, General Procedures).

For additional information, refer to: [Engine Oil Vacuum Draining and Filling](#) (303-01A Engine - TDV6 3.0L Diesel, General Procedures).

Exhaust Manifolds

E142802

Item	Part Number	Description
1	-	Cylinder Head
2	-	Bolt (3 off)
3	-	Layered Gasket
4	-	Threaded Insert (3 off)
5	-	Exhaust Manifold
6	-	Parallel Spacer (24 off)
7	-	Bolt (6 off)
8	-	Heat Shield
9	-	Forged Spacer (2 off)
10	-	Bolt (1 off)

The cast iron exhaust manifolds are unique for each cylinder bank. Each exhaust manifold installation includes a layered metal gasket and heat shields. The spacers limit the contraction of the individual ports over time.

OPERATION

Operation of the engine is controlled by the [ECM](#).

For additional information, refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - V6 S/C 3.0L Petrol, Description and Operation).

Engine - V6 S/C 3.0L Petrol - Engine

Diagnosis and Testing

For additional information, refer to Diagnosis and Testing, Engine - V6 3.0 Petrol.

Engine - V6 S/C 3.0L Petrol - Engine Oil Draining and Filling

General Procedures

Draining

WARNING: The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

CAUTIONS:

Correct installation of the oil filler cap can be obtained by tightening the cap until hard stop.

Make sure the engine is warm.

NOTE: Clean the components general area prior to dismantling.

1.
 - Start the engine and allow to run for 10 minutes, stop the engine.
2. Refer to: [Engine Cover - V6 S/C 3.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3.

4.  **NOTE:** Allow 10 minutes for the engine oil to drain from the oil filter housing.

5.  **CAUTION:** Remove and discard the O-ring seal.

E154312

E107394

6.  CAUTION: Remove and discard the element.

7.  WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

8. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

E119497

9.  WARNING: Observe due care when draining engine oil as the oil can be very hot.

CAUTIONS:

 Be prepared to collect escaping oil.

 Allow at least 10 minutes for the engine oil to drain.

 NOTE: Discard the sealing washer.

Filling

1.  CAUTION: Make sure that the area around the component is clean and free of foreign material.

 NOTE: Install a new sealing washer.

Torque: 24 Nm

2. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

3. Lower the vehicle.

4.  **NOTE:** Install new O-ring seals.

Lubricate the oil filter element O-ring seal with clean engine oil.

E107727

5.  **CAUTION:** Tighten the component finger tight first.

Torque: 25 Nm

6.  **CAUTION:** Make sure that the vehicle is left for 5 minutes from filling with oil and that the engine oil level is reading at least minimum (by following Steps 10-16), before starting the engine

Fill the engine with oil.

Refer to: [Specifications](#) (303-01B Engine - V6 S/C 3.0L Petrol, Specifications).

7. Clean any residual engine oil from the oil filler cap area.

8.  **CAUTION:** Make sure that the vehicle has been left for 5 minutes from filling with oil.
 - Start the engine and allow to run for 10 minutes, stop the engine.
 - Check for leaks.

9. **CAUTIONS:**

 Make sure that the selector lever is in the park (P) position.

 Make sure that the hood is open.

 **NOTE:** Allow 10 minutes from the engine switch off for the engine oil level to stabilize.

- Set the ignition to the ON position.

- 10.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

11.

- Press the right-hand OK button.

E123925

12.

- Press the right-hand directional button to access the Oil Level Display.

E123927

13.

- Press the right-hand OK button and follow the instructions.

E123928

14.

- Press the cruise control cancel button twice within 2 seconds.

E121008

E123929

15.

- The message center display will revert to the normal display in the trip computer.
- Press the right-hand OK button and follow the instructions.
- Check that the oil level display shows an oil level reading.
- Take a reading from the level display and, if necessary, top up with oil as instructed.

16. Turn the ignition off.

17.  **NOTE:** Allow 10 minutes for the engine oil level to stabilize if there has been additional oil top up.

- Turn the ignition on.

18.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

19.

- Press the right-hand OK button.

E123925

20.

- Press the right-hand directional button to access the Oil Level Display.

E123927

21.

- Scroll through the trip menu to access the engine oil level display.

E123929

22.

- Press the cruise control cancel button twice within 2 seconds.

- Press the left-hand directional button and select the Oil Level display.

32.

- Press the left-hand OK button and follow the instructions.

-  **NOTE:** If the message shows "Not available" wait for further 10 mins to allow the oil level to stabilize.

Make sure that the average oil level value has now been updated.

E147182

Engine - V6 S/C 3.0L Petrol - Valve Clearance Check

General Procedures

Check

1. Refer to: Specifications (414-00, Specifications).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
3. Refer to: [Valve Cover LH](#) (303-01B Engine - V6 S/C 3.0L Petrol, Removal and Installation).
4. Refer to: [Valve Cover RH](#) (303-01B Engine - V6 S/C 3.0L Petrol, Removal and Installation).

5. CAUTIONS:

Rotate the engine clockwise until the camshafts are positioned as shown.

Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

NOTE: Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.

- Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.
- Repeat this step for the remaining valve tappets.

Engine - V6 S/C 3.0L Petrol - Camshaft LH

Removal and Installation

Removal

CAUTION: Make sure that the orientation and code on the top of the camshaft bearing caps is noted (along with the bank - A or B), so that on installation the components are installed to their original position. Failure to follow this instruction may cause damage to the vehicle.

NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Timing Drive Components](#) (303-01B Engine - V6 S/C 3.0L Petrol, Removal and Installation).

4. **CAUTIONS:**

Rotate the camshafts until all the valves are at their minimum open point.

Evenly and progressively, release the camshaft bearing caps.

NOTE: Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Installation

1. **CAUTIONS:**

Prior to installing the camshafts, position the crankshaft 45 degrees ATDC cylinder 1A to prevent valve/piston collision.

Make sure that the camshafts and camshaft bearing caps are installed in their original locations.

Evenly and progressively install and tighten the camshaft bearing caps.

NOTE: Lubricate the camshafts and the camshaft bearing caps with EP90 oil (or 75/90 viscosity oil will suffice) prior to installation.

Torque: 3 Nm

2.  NOTE: Tighten the bolts in the indicated sequence.

Torque: 12 Nm

3.  CAUTION: Only rotate the crankshaft clockwise.

Rotate the crankshaft until the camshaft lobe on the valve being checked is 180 degrees from the maximum opening position.

4.  NOTE: If the valve clearance is incorrect, continue to the next step. If the valve clearance is correct, continue to step 8.

Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.

5. CAUTIONS:

 Do not use a magnet to remove the tappet.

 Use the following formula to calculate the required bucket thickness. Original thickness + measured clearance - desired clearance = required bucket thickness.

Remove the tappet and measure the thickness.

6.  NOTE: If a new tappet is installed then go back to

[step 1 of the install procedure.](#)

Install a new tappet if required.

7. Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.
8. Refer to: [Timing Drive Components](#) (303-01B Engine - V6 S/C 3.0L Petrol, Removal and Installation).
9. Connect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 S/C 3.0L Petrol - Camshaft RH

Removal and Installation

Removal

CAUTION: Make sure that the orientation and code on the top of the camshaft bearing caps is noted (along with the bank - A or B), so that on installation the components are installed to their original position. Failure to follow this instruction may cause damage to the vehicle.

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Timing Drive Components](#) (303-01B Engine - V6 S/C 3.0L Petrol, Removal and Installation).

4. **CAUTIONS:**

Rotate the camshafts until all the valves are at their minimum open point.

Evenly and progressively, release the camshaft bearing caps.

NOTE: Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Installation

1. **CAUTIONS:**

Prior to installing the camshafts, position the crankshaft 45 degrees ATDC cylinder 1A to prevent valve/piston collision.

Evenly and progressively install and tighten the camshaft bearing caps.

Make sure that the camshafts and camshaft bearing caps are installed in their original locations.

 NOTE: Lubricate the camshafts and the camshaft bearing caps with EP90 oil (or 75/90 viscosity oil will suffice) prior to installation.

Torque: 3 Nm

2.  NOTE: Tighten the bolts in the indicated sequence.

Torque: 12 Nm

3.  CAUTION: Only rotate the crankshaft clockwise.

Rotate the crankshaft until the camshaft lobe on the valve being checked is 180 degrees from the maximum opening position.

4.  NOTE: If the valve clearance is incorrect, continue to the next step. If the valve clearance is correct, continue to step 8.

Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.

5. CAUTIONS:

 Use the following formula to calculate the required bucket thickness. Original thickness + measured clearance - desired clearance = required bucket thickness.

 Do not use a magnet to remove the tappet.

Remove the tappet and measure the thickness.

Removal

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Refer to: [Exhaust System](#) (309-00B Exhaust System - V6 S/C 3.0L Petrol, Removal and Installation).
4. Refer to: [Accessory Drive Belt](#) (303-05B Accessory Drive - V6 S/C 3.0L Petrol, Removal and Installation).
5. Refer to: [Engine Mount LH](#) (303-01B Engine - V6 S/C 3.0L Petrol, Removal and Installation).

NOTES:

Discard the gasket.

Make sure that the position of the spacers is noted before removal of the manifold.

19. NOTE: Do not disassemble further if the component is removed for access only.

Installation

1. CAUTIONS:

If accidentally dropped or knocked install a new sensor.

Make sure that the mating faces are clean and free of foreign material.

Make sure the anti-seize compound does not contact the HO2S tip.

NOTE: If the original sensor is to be installed, apply lubricant meeting specification ESE-M12A4-A to the thread of the sensor.

Torque: 45 Nm

2. NOTE: Install a new gasket.

18.  **WARNING:** The wheel and tire assembly will be heavy.

 **CAUTION:** Apply a small amount of grease to the hub and wheel mating surfaces before installation. Make sure the grease does not come into contact with the vehicles braking components and the wheel stud threads. Failure to follow these instructions may result in personal injury.

NOTES:

Left-hand shown, right hand similar.

Make sure that the component is installed to the noted removal position.

Install the wheel and tire.

Torque:

Stage 1: 4 Nm

Stage 2: 70 Nm

Stage 3: 140 Nm

19. Connect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V6 S/C 3.0L Petrol - Flexplate

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Transmission - V6 S/C 3.0L Petrol](#) (307-01 Automatic Transmission/Transaxle - TDV6 3.0L Diesel /V6 S/C 3.0L Petrol , Vehicles With: 8HP70 8-Speed Automatic Transmission AWD, Removal).

4. **CAUTIONS:**

 Install all the bolts finger tight before final tightening.

 The bolts can only be used 3 times, mark the bolts with a center punch. If 2 punch marks are visible, discard the bolts.

 Make sure that no components fall off during removal.

 Install the bolts in the noted position.

NOTES:

 Make sure the crankshaft and flexplate mating faces are clean before installation.

 Make sure that the crankshaft is not rotated.

 Tighten the retaining bolts working diagonally.

Torque:

Stage 1: 45 Nm

Stage 2: 90°

Installation

1. To install, reverse the removal procedure.

Engine - V6 S/C 3.0L Petrol - Oil Cooler

Removal and Installation

Removal

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Engine Oil Draining and Filling](#) (303-01B Engine - V6 S/C 3.0L Petrol, General Procedures).

5.

6.

7. **CAUTIONS:**

Be prepared to collect escaping oil.

Be prepared to collect escaping coolant.

Torque: 13 Nm

8.  CAUTION: Make sure that these components are installed to the noted removal position.

 NOTE: Install a new gasket.

9. CAUTIONS:

 Make sure that these components are installed to the noted removal position.

 Install new o-ring seals

E113947

Installation

E106280

1. CAUTIONS:

 Install all the bolts finger tight before final tightening.

 Make sure that the area around the component is clean and free of foreign material.

 Install the new seals.

 NOTE: Tighten the bolts in the indicated sequence.

To install, reverse the removal procedure.

Engine - V6 S/C 3.0L Petrol - Oil Filter Element

Removal and Installation

Removal

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

Removal steps in this procedure may contain installation details.

1. Refer to: [Engine Cover - V6 S/C 3.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

2.  NOTE: Allow 10 minutes for the engine oil to drain from the oil filter housing.

3.  CAUTION: Remove and discard the O-ring seal.

4.  CAUTION: Remove and discard the element.

E107394

Installation

E107727

1.  CAUTION: Install new O-ring seals.

E154298

2.  CAUTION: Tighten the component finger tight first.

Torque: 25 Nm

3. Start and run the engine.

4.  NOTE: Allow 10 minutes from the engine switch off for the engine oil level to stabilize.

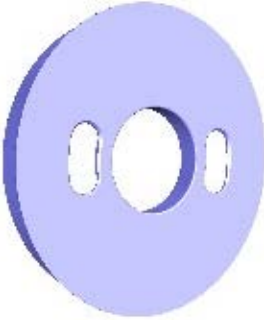

5. Check and top-up the engine oil.

6. Refer to: [Engine Cover - V6 S/C 3.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Engine - V6 S/C 3.0L Petrol - Oil Pan Extension

14.  CAUTION: If the VVT is knocked or dropped then the VVT must be replaced.
Remove the timing chain with the VVT units.

15.

16.  CAUTION: Discard the friction washer.

E107945

Installation

E107945

1.  CAUTION: Install a new friction washer.

E107944

2. Torque: 12 Nm

3.
 - Install the special tool to each Camshaft.
 - Special Tool(s): [303-1452](#)
 - Torque: 10 Nm

4.
 - Carefully rotate the camshafts if the position is not as shown.

5.
 - Install the special tool 303-1445 to the rear of the camshafts making sure the key way's are correctly located into each slot on each of the camshafts.

6. CAUTIONS:

 Do not overturn the camshafts.

 Tighten the wing nuts finger tight. Failure to follow this instruction may result in damage to the components.

- Using a suitable tool, carefully rock the camshaft clockwise then anti-clockwise. Turn the special tool locking nuts until there is no movement left in camshafts.
- Repeat steps 3- 6 for the camshafts on the other cylinder head.

7. CAUTIONS:

 Do not allow the camshaft to rotate.

E108810

 If the VVT is knocked or dropped then the VVT must be replaced.

 NOTE: Do not tighten at this stage.

- Install the timing chain with the variable valve timing (VVT) units.

8.

- Make sure that all the timing chain alignment marks are in the positions shown.

E107951

9. Torque: 25 Nm

E122505

10. Make sure the tensioner piston is fully extended. Then fully depress and lock the tensioner piston with the grenade pin before installation, failure to do this may result in damage to the engine.

E122503

11.  CAUTION: Do not release the timing chain tensioner locking pin at this stage.

Torque: 10 Nm

12. CAUTIONS:

Do not allow the camshafts to rotate.

If the VVT is knocked or dropped then the VVT must be replaced.

NOTE: Do not tighten at this stage.

- Install the timing chain with the VVT units.

13.

- Make sure that all the timing chain alignment marks are in the positions shown.

E107954

14. Torque: 25 Nm

E122512

15. Make sure the tensioner piston is fully extended. Then fully depress and lock the tensioner piston with the grenade pin before installation, failure to do this may result in damage to the engine.

E122503

E122513

16.  CAUTION: Do not release the timing chain tensioner locking pin at this stage.

Torque: 10 Nm

- 17.

18.  **CAUTION:** Do not use mechanical force.
Make sure that the tensioners are fully deployed.

- 19.
- Release and reposition the oil suction tube to one side.

- 20.
- Install the special tool.
 - *Special Tool(s):* [303-1482](#)

21. **CAUTIONS:**

⚠ Apply the torque to the end of the special tool.

⚠ Make sure that the torque wrench is aligned with the special tool as illustrated in the graphic.

- Install the torque wrench to the special tool.
- *Torque:* 35 Nm

22. ⚠ CAUTION: Make sure that the torque wrench does not move whilst tightening the VVT bolts.

⚠ NOTE: Make sure to tighten the exhaust VVT unit bolts first.

- *Torque:* 32 Nm
- *Special Tool(s):* 303-1482

23. • Install the oil suction tube.
• *Torque:* 10 Nm

24. • Install the special tool.
• *Special Tool(s):* 303-1482

E114879

E115108

25. CAUTIONS:

- ⚠ Apply the torque to the end of the special tool.
- ⚠ Make sure that the torque wrench is aligned with the special tool as illustrated in the graphic.
 - Install the torque wrench to the special tool.
 - Torque: 35 Nm

E114880

26. ⚠ CAUTION: Make sure that the torque wrench does not move whilst tightening the VVT bolts.

- ⚠ NOTE: Make sure to tighten the inlet VVT unit bolts first.

Torque: 32 Nm

Installation

E116295

7.

1. CAUTIONS:

 Use only a plastic scraper when removing the sealing material.

 Use lint free cloth.

 Make sure that the mating faces are clean and free of corrosion and foreign material.

 Installation of the valve cover and tightening must be carried out within 7 minutes of applying the sealant.

NOTES:

 Apply two beads of silicone gasket sealant (Loctite 5901) as shown on the illustration. The application of the sealant must be 1.5mm diameter 12mm long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head

without smearing the sealant or the seals.
