Engine Cooling - TDV6 3.0L Diesel - Engine Cooling - Overview

Description and Operation

OVERVIEW

The engine cooling system maintains the engine within an optimum temperature range under changing ambient and engine operating conditions. It also provides:

- Heating for the passenger compartment.
Refer to: Heating and Ventilation (412-02A, Description and Operation).
- Cooling for:
 - The engine oil
 - The fuel
 - The [EGR \(exhaust gas recirculation\)](#) system
Refer to: Engine Emission Control (303-08B, Description and Operation).
 - The transmission fluid.

Engine Cooling - TDV6 3.0L Diesel - Engine Cooling - System Operation and Component Description

Description and Operation

System Operation

COOLANT CIRCUIT FLOW

When the engine is running the coolant is circulated around the engine cooling system by the coolant pump. From the coolant pump, coolant flows through the cylinder block and the cylinder heads. Some of the coolant in the cylinder block is diverted through the engine oil cooler before returning to the 5-way connector via the water outlet.

From the 5-way connector, the majority of the coolant flows to the pressure relief thermostat, either directly or via the radiator, depending on the temperature of the coolant. From the outlet of the thermostat the coolant flows to the inlet of the coolant pump.

A separate hose from the radiator allows extra-cooled coolant from the radiator to flow through the transmission oil cooler. The coolant from the cooler is returned to the system via a branch in the bottom radiator hose.

Coolant from the water outlet also flows through the [EGR \(exhaust gas recirculation\)](#) coolers and then to the heater core. From the heater core outlet, the coolant flows to the outlet zone of the pressure relief thermostat.

The expansion tank allows expansion of coolant due to temperature increases to pass excess coolant back to the expansion tank. A small hose is connected from the water outlet to the expansion tank for this purpose. As the coolant cools, the coolant is allowed back into the system from the tank via a hose from the expansion tank into the radiator bottom hose.

PRESSURE RELIEF THERMOSTAT (PRT)

The thermostat is closed at temperatures below approximately 82°C (179°F). When the coolant temperature reaches approximately 82°C the thermostat starts to open and is fully open at approximately 96°C (204°F). In this condition the full flow of coolant is directed through the radiator. The thermostat is exposed to 90% hot coolant from the engine on one side and 10% cold coolant returning from the radiator bottom hose on the other side. Hot coolant from the engine passes from the by-pass pipe through four sensing holes in the flow valve into a tube surrounding 90% of the thermostat sensitive area. Cold coolant returning from the engine, cooled by the radiator, conducts through 10% of the sensitive area.

In cold ambient temperatures, the engine temperature is raised by approximately 10°C (50°F) to compensate for the heat loss of 10% exposure to the cold coolant returning from the bottom hose.

The by-pass flow valve is held closed by a light spring. It operates to further aid heater warm-up. When the main valve is closed and the engine speed is at idle, the coolant pump does not produce sufficient flow and pressure to open the valve. In this condition the valve prevents coolant circulating through the by-pass circuit and forces the coolant through the heater matrix only. This provides a higher flow of coolant through the heater matrix to improve passenger comfort in cold conditions. When the engine speed increases above idle, the coolant pump produces a greater flow and pressure than the heater circuit can take. The pressure acts on the by-pass flow valve and overcomes the valve spring pressure, opening the valve and limiting the pressure in the heater circuit. The valve modulates to provide maximum coolant flow through the heater core and yet allowing excess coolant to flow into the by-pass circuit to provide the engine's cooling needs at higher engine speeds.

COOLING FAN

For additional airflow through the radiator matrix, particularly when the vehicle is stationary, there is an engine driven electro-viscous fan unit fitted to the rear of the radiator. The fan is used for engine cooling and for [A/C \(air conditioning\)](#) system cooling. This unit functions as a normal viscous fan, but with electronic control over the level of engagement of the clutch. The [ECM \(engine control module\)](#), which determines the required fan speed, controls the level of clutch engagement. The [ECM](#) determines engagement based on the coolant, charge air, ambient and transmission oil temperatures and the [A/C](#) pressure. The fan is mounted using a left hand thread.

The viscous fan unit is electronically controlled by the [ECM](#) to optimize fan speed for all operating conditions.

NOTE: If the electrical connections to the viscous fan are disconnected the fan will 'idle' and overheating may result. The [ECM](#) stores the appropriate fault codes in this case.

Component Description

PRESSURE RELIEF THERMOSTAT (PRT)

E121136

Item Description

- 1 Connection to radiator top hose
- 2 PRT body
- 3 Connection from radiator bottom hose
- 4 Heater core return connection
- 5 Connection to cylinder block water inlet
- 6 Connection to expansion tank

A plastic thermostat housing is located behind the radiator. The housing has 5 connections which locate the radiator bottom hose, top hose from the 5-way connector, coolant pump feed hose to the cylinder block and return feed from the heater core. The housing contains a wax element and a spring loaded by-pass flow valve.

The thermostat is used to maintain the coolant at the optimum temperature for efficient combustion and to aid engine warm-up.

RADIATOR

E121137

Item Description

- 1 Coolant inlet
- 2 Coolant outlet to fuel cooler
- 3 Support - upper (2 off)
- 4 Support - lower (2 off)
- 5 Coolant outlet to transmission oil cooler
- 6 Coolant outlet to pressure relief thermostat

The radiator is a vertical-flow type with an aluminum core and plastic end tanks. The radiator is located in the vehicle by locating spigots and supports integrated into the cooling pack end frames. The lower supports are installed in rubber bushes in the upper chassis rails. The upper locating spigots are installed in rubber bushes in the front end carrier. Coolant inlet and outlet connections are incorporated into the upper and lower end tanks respectively.

The lower end tank also has a connection for coolant outlet to the transmission fluid cooler.

COOLANT PUMP

E97921

Item Description

- 1 Bolt (3 off)
- 2 Drive hub
- 3 Housing
- 4 Impeller
- 5 Pulley

The coolant pump has a housing that supports a shaft with an impeller attached to one end and a drive hub at the other. The housing is attached to the front of the cylinder block with the impeller located in a pumping chamber. The pump is driven by a pulley attached to the drive hub and driven by the accessory drive belt. For additional information refer to Accessory Drive 303-05B.

EXPANSION TANK

E121138

Item Description

- 1 Filler cap
- 2 Bleed screw
- 3 Vent hose connection
- 4 Expansion hose connection
- 5 Expansion tank

A pressurized expansion tank system is used which continuously separates the air from the cooling system and replenishes the system through a hose connected between the expansion tank and the heater return hose. A continuous vent into the expansion tank, through a hose connected to the engine's coolant outlet connector, prevents air locks from forming in the cooling system.

The expansion tank is installed behind the top right corner of the radiator. A filler cap, bleed screw and level sensor are incorporated into the expansion tank. MAX and MIN level markings are molded into the interior of the tank below the filler cap.

The expansion tank provides the following functions:

- Service fill
- Coolant expansion during warm-up
- Air separation during operation
- System pressurization by the filler cap

The expansion tank has an air space of approximately 0.5 to 1 liter (1.06 to 2,11 US pints), above the MAX level, to allow for coolant expansion.

COOLING FAN

E121139

Item Description

- 1 Shroud
- 2 Electrical connector
- 3 Fan
- 4 Viscous unit

To control the cooling fan, the **ECM** sends a **PWM (pulse width modulation)** signal to the cooling fan module (integral to the **ECM**). The frequency of the **PWM** signal is used by the cooling fan module to determine the output voltage supplied to the fan motor.

The **ECM** varies the duty cycle of the **PWM** signal between 0 and 100% to vary the fan speed. If the **PWM** signal is outside the 0 to 100% range, the cooling fan module interprets the signal as an open or short circuit and runs the fans at maximum speed to ensure the engine and transmission do not overheat.

The **ECM** operates the fan in response to inputs from the **ECT (engine coolant temperature)** sensor, the transmission oil temperature sensor, the charge air temperature sensor, the **A/C** switch and the **A/C** pressure sensor.

The speed of the cooling fan is also influenced by vehicle road speed. The **ECM** adjusts the speed of the cooling fans, to compensate for the ram effect of vehicle speed, using the **CAN (controller area network)** road speed signal received from the **ABS (anti-lock brake system)** module.

ENGINE OIL COOLER

E115007

Item Description

- 1 Coolant outlet
- 2 Engine oil filter
- 3 Engine oil cooler

The engine oil cooler is attached to a common adapter assembly located in the vee of the cylinder block. Inlet and

outlet ports for engine oil, and an inlet port for coolant, are incorporated into the cylinder block mating face of the adapter assembly. A metal gasket seals the joint between the adapter assembly and the cylinder block. From the cylinder block, coolant flows through the adapter assembly and into the cooler. After passing through the cooler, the coolant then flows into the engine coolant water outlet.

TRANSMISSION FLUID COOLER

E123878

Item Description

- 1 Coolant inlet from radiator
- 2 Mounting bracket
- 3 Fuel cooler
- 4 Transmission fluid cooler
- 5 Transmission fluid inlet
- 6 Coolant outlet to radiator bottom hose
- 7 Transmission fluid outlet

The transmission fluid cooler is located on chassis cross member behind the radiator, sharing a bracket with the fuel cooler. The cooler is connected to the cooling system with two hoses and receives cooled fluid from the lower section of the radiator, which flows through the cooler, reducing the temperature of the transmission fluid.

ENGINE COOLANT

The coolant is silicate free and must not be mixed with conventional engine coolant.

Engine Cooling - TDV6 3.0L Diesel - Engine Cooling

Diagnosis and Testing

Principle of Operation

For a detailed description of the engine cooling system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (303-03 Engine Cooling - TDV6 3.0L Diesel)

Engine Cooling (Description and Operation),
 Engine Cooling (Description and Operation),
 Engine Cooling (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Coolant leaks • Coolant hoses • Coolant expansion tank • Radiator • Heater core • Accessory drive belt • Viscous fan 	<ul style="list-style-type: none"> • Fuses • Harnesses • Loose or corroded connector(s) • Engine Coolant Temperature (ECT) sensor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Coolant loss	<ul style="list-style-type: none"> • Hoses • Hose connections • Radiator • Water pump • Heater core • Gaskets • Engine casting cracks • Engine block core plugs 	<ul style="list-style-type: none"> • Carry out a visual inspection. If there are no obvious leaks, carry out a cooling system pressure test. Rectify any leaks as necessary
Overheating	<ul style="list-style-type: none"> • Low/contaminated coolant • Thermostat • Viscous fan • ECT sensor • Restricted air flow over the radiator 	<ul style="list-style-type: none"> • Check the coolant level and condition. Carry out a cooling system pressure test. Rectify any leaks as necessary • Test the thermostat and rectify as necessary • Test the viscous fan operation, make sure the viscous fan rotates freely. Rectify as necessary • Check for obstructions to the air flow over the radiator. Rectify as necessary
Engine not reaching normal temperature	<ul style="list-style-type: none"> • Thermostat • Viscous fan • Thermostat • Electric fan • Fan speed module 	<ul style="list-style-type: none"> • Test the thermostat and rectify as necessary • Test the viscous fan operation, make sure the viscous fan rotates freely

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - TDV6 3.0L Diesel, DTC: Engine Control Module (PCM) (100-00,

Description and Operation).

Engine Cooling - TDV6 3.0L Diesel - Cooling System Draining, Filling and Bleeding

General Procedures

Draining

NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: Engine Cover - 3.0L Diesel (501-05, Removal and Installation).

2.  WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3.  WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

E121325

4. Remove the 4 bolts.

E122094

- 5.

6.  CAUTION: Be prepared to collect escaping coolant.

Position a container to collect the fluid.

7. Connect the transmission fluid cooler coolant hose.

8.  CAUTION: Be prepared to collect escaping coolant.

9. Install the coolant hose.

10. Install the LH splash shield.

11.

- Install the radiator access panel.
- *Torque: 10 Nm*

12. Remove the spare wheel and tire.

13.  CAUTION: Be prepared to collect escaping coolant.

14. Install the coolant hoses.

15. Install the spare wheel and tire.

Filling

NOTE: Removal steps in this procedure may contain installation details.

1. Lower the vehicle.

2.

3.

4.

E121691

E121695

E121324

E121694

5. CAUTIONS:

 Anti-freeze concentration must be maintained at 50%.

 Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

6.  CAUTION: Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

7. Set the heater controls to maximum.

8. Start the engine and continue to fill the coolant until the maximum level is reached.

9.  CAUTION: Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

10. Increase engine speed to 2500rpm and cycle between this and idle.

11. Continue to top-up with coolant with the engine at idle.

12.  CAUTION: Correct installation of the Coolant expansion tank cap can be obtained by tightening the cap until an audible click is heard.

13. Allow the engine to idle, until hot air is emitted at the face registers.

14. Once the front heater is warm, check if the rear heater is warm (if equipped). If no heat is felt, increase the engine speed to 3000 rpm for 30 seconds and return to idle.

15.  CAUTION: Switch off the engine and allow the coolant temperature to go cold.

16. Visually check the engine and cooling system for signs of coolant leakage.

17.  WARNING: When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

CAUTIONS:

 Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure

 Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

 NOTE: When the cooling system is warm, the coolant will be approximately 10mm above the upper level mark on the expansion tank with the cap removed.

Check and top-up the coolant if required.

18. Install the engine cover.

Refer to: Engine Cover - 3.0L Diesel (501-05, Removal and Installation).

Engine Cooling - TDV6 3.0L Diesel - Auxiliary Radiator

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

Engine Cooling - V6 S/C 3.0L Petrol - Engine Cooling

Description and Operation

COMPONENT LOCATION

E160385

Item	Part Number	Description
1	-	Coolant expansion tank
2	-	Bleed hose
3	-	Viscous cooling fan
4	-	Connections for supercharger charge air coolers
5	-	Electric throttle
6	-	Radiator
7	-	Radiator upper hose
8	-	Connections for supercharger charge air coolers
9	-	Bleed screw
10	-	Heater system supply and return hoses
11	-	Fuel Fired Booster Heater (FFBH) supply and return connections (where fitted)
12	-	Heater manifold
13	-	Outlet tube
14	-	Electric throttle heater hose
15	-	Transmission oil cooler
16	-	Engine oil cooler Thermostat

17	-	Coolant Pump Expansion Tank
18	-	Transmission oil cooler supply hose
19	-	Transmission oil cooler return hose
20	-	Radiator lower hose
21	-	Coolant supply/expansion hose

OVERVIEW

The engine cooling system maintains the engine within an optimum temperature range under changing ambient and engine operating conditions. The system is a pressurized expansion tank system with continuous bleeds to separate air from the coolant and prevent the formation of air locks. The engine cooling system also provides:

- Heating for:
 - The passenger compartment.
 - The throttle body.
- Cooling for:
 - The engine oil cooler.
 - The transmission fluid cooler.

The primary components of the engine cooling system are the:

- Coolant pump.
- Thermostat.
- Radiator.
- Cooling fan.
- Expansion tank.
- Outlet tube and heater manifold.
- Connecting hoses and pipes.

DESCRIPTION

Coolant Pump

E115013

Item	Part Number	Description
1	-	Inlet connection
2	-	Coolant pump body
3	-	Outlet flange to right cylinder head
4	-	Outlet to engine oil cooler
5	-	Outlet flange to left cylinder head
6	-	Pulley
7	-	Bleed pipe connection (containing check valve)

The body of the coolant pump contains an impeller attached to a shaft supported in a bearing assembly. The impeller is driven by a pulley, pressed on to the front of the shaft, which is driven by the accessory drive belt. For additional information, refer to: [Accessory Drive](#) (303-05B Accessory Drive - V6 S/C 3.0L Petrol, Description and Operation).

Two coolant outlet flanges attach the coolant pump to the front of the cylinder block. A pipe connects a further coolant outlet to a pipe from the engine oil cooler. A bleed connector is installed in the front of the coolant pump, adjacent to the coolant inlet connection from the thermostat. A check valve is incorporated into the bleed connection.

Thermostat

E115014

Item	Part Number	Description
1	-	Bolt (3 off)
2	-	Upper body
3	-	Lower body
4	-	Thermostat
5	-	Seal

The thermostat is a multi-stage device located in the coolant pump inlet to provide fast response and control of the engine outlet temperature.

The thermostat allows rapid engine warm-up by preventing coolant flow through the radiator and by limiting coolant flow through the cylinder block when the engine is cold. During warm-up and at engine speeds above approximately 1800 rev/min, a by-pass valve opens to control the coolant flow and pressure, to protect the engine components. When the thermostat opening reaches 6 mm (0.24 in.), the by-pass flow is shut-off. When the thermostat opening exceeds 6 mm (0.24 in.), the radiator coolant flow is further controlled up to the point where the thermostat is fully open. At this point maximum radiator coolant flow is achieved to provide maximum cooling.

Radiator

E121154

Item	Part Number	Description
1	-	Bleed hose connection
2	-	Upper hose connection
3	-	Transmission fluid cooler supply hose connection
4	-	Lower hose connection
5	-	Radiator lower support (2 off)
6	-	Radiator upper support (2 off)

The radiator is an aluminum cross flow type with plastic end tanks. Upper and lower supports locate the radiator in the radiator support assembly and the front crush siderails respectively.

Connections are incorporated into the end tanks for the upper and lower hoses, the supply hose of the transmission fluid cooler and a bleed hose.

Cooling Fan

E118879

Item	Part Number	Description
1	-	Securing nut
2	-	Harness
3	-	Electro-viscous drive unit

For additional airflow through the radiator, particularly when the vehicle is stationary or moving slowly, there is an engine driven electro-viscous cooling fan. The cooling fan functions as a normal viscous fan, but with electronic control over the level of engagement of the viscous clutch. The [ECM \(engine control module\)](#) controls the level of engagement to optimize fan speed for all operating conditions.

A securing nut attaches the cooling fan to a drive pulley, which is mounted on the front of the engine and driven by the accessory drive system.

NOTE: The securing nut has a LH (left-hand) thread.

The blades of the cooling fan are located in a fan cowl attached to the rear of the radiator frame. Brushes around the circumference of the aperture in the fan cowl provide a seal with the blade shroud. An electrical connector in the top left corner of the fan cowl provides the interface between the cooling fan harness and the vehicle wiring.

Expansion Tank

E145082

Item	Part Number	Description
1	-	Filler cap
2	-	MAX and MIN level markings
3	-	Mounting lug
4	-	Supply hose connection
5	-	Coolant level sensor
6	-	Mounting lugs
7	-	Bleed screw
8	-	Vent hose connection

A pressurized expansion tank system is used which continuously separates the air from the cooling system and replenishes the system through a hose connected between the expansion tank and the thermostat. A continuous vent into the expansion tank, through a hose connected to the radiator, prevents air locks from forming in the cooling system.

The expansion tank is attached to the front end carrier in the front left corner of the engine compartment. A filler cap, bleed screw and level sensor are incorporated into the expansion tank. MAX and MIN level markings are molded into the exterior of the tank.

The expansion tank provides the following functions:

- Service fill.
- Coolant expansion during warm-up.
- Air separation during operation.
- System pressurization by the filler cap.

The expansion tank has an air space of approximately 0.5 to 1 liter (1.06 to 2,11 US pints), above the MAX level, to allow for coolant expansion.

Outlet Tube and Heater Manifold

Outlet Tube

E152317

Item	Part Number	Description
1	-	Bleed spigot (fitted with blanking plug)
2	-	Radiator upper hose connection
3	-	Cylinder block connections
4	-	Thermostat hose connection

Heater Manifold

E152341

Item	Part Number	Description
1	-	Electric throttle heater Hose connection
2	-	Heater core supply hose connection
3	-	Right cylinder head connection
4	-	Engine coolant temperature sensor
5	-	Left cylinder head connection

The coolant is silicate free and must not be mixed with conventional engine coolant.

Coolant Circuit Flow

When the engine is running, the coolant is circulated around the engine cooling system by the coolant pump. From the coolant pump, coolant flows through the cylinder heads and the engine oil cooler into the cylinder block and the heater manifold.

In the cylinder block, the coolant flows forwards to the outlet tube. When the coolant is cold, the thermostat is closed and the coolant flows direct from the outlet tube back to the coolant pump. Once the coolant reaches operating temperature the thermostat begins to open, to control system temperature, and coolant flows from the outlet tube to the coolant pump via the radiator. When the thermostat is open, the coolant flow through the radiator also generates a coolant flow through the transmission fluid cooler.

From the heater manifold the coolant flows through the electric throttle and the heater core, in parallel circuits that are unaffected by the position of the thermostat. From the electric throttle, the coolant merges with bleed coolant from the coolant pump and the outlet tube and flows to the expansion tank. From the heater core, the coolant flows back to the inlet of the coolant pump.

Expansion and contraction of the coolant is accommodated by an air space in the expansion tank and the compliance of the flexible hoses.

Engine Cooling Flow Diagram

E145207

Item	Part Number	Description
1	-	Expansion tank
2	-	Bleed screw
3	-	Heater system
4	-	Bleed screw
5	-	Right cylinder head
6	-	Cylinder block
7	-	Electric throttle
8	-	Engine oil cooler
9	-	Heater manifold
10	-	Left cylinder head
11	-	Transmission oil cooler
12	-	Check valve
13	-	Thermostat
14	-	Radiator
15	-	Coolant pump
16	-	Connections to supercharger charge air coolers

OPERATION

Thermostat

The thermostat begins to open at 95 - 97 °C (203 - 207 °F) and is fully open at 109 °C (228 °F).

Coolant Level Sensor

If the coolant level in the expansion tank decreases below a predetermined value, the coolant level sensor connects a ground to the **CJB (central junction box)**, which sends a message to the IC (instrument cluster) on the high speed **CAN (controller area network)** bus to display a warning message.

Engine Cooling Fan

The **ECM** determines when to operate the cooling fan from the **ECT (engine coolant temperature)** sensor input and a cooling fan request from the ATCM (automatic temperature control module). The **ECM** also adjusts the fan speed to compensate for the ram effect of vehicle speed.

Viscous Cooling Fan

To control the viscous cooling fan, the **ECM** sends a **PWM (pulse width modulation)** signal to the fan control module. The **ECM** varies the duty cycle of the **PWM** signal between 0 and 100% to vary the clutch engagement and thus fan speed. If the **PWM** signal is outside the 0 to 100% range, the fan control module interprets the signal as an open or short circuit and runs the fan at minimum speed to ensure the fan does not overspeed.

If the electrical connections to the viscous fan are disconnected the fan will idle and the engine may overheat. If **ECM** detects a cooling fan fault it stores the appropriate **DTC (diagnostic trouble code)** and signals the IC on the high speed **CAN** powertrain bus to display a warning message.

Engine Cooling - V6 S/C 3.0L Petrol - Engine Cooling

Diagnosis and Testing

Principles of Operation

For a detailed description of the engine cooling system and operation, refer to the relevant Description and Operation section in the workshop manual. REFER to:

[Engine Cooling](#) (303-03B Engine Cooling - V6 S/C 3.0L Petrol, Description and Operation),
[Engine Cooling](#) (303-03 Engine Cooling - V6 S/C 3.0L Petrol, Description and Operation),
[Engine Cooling](#) (303-03 Engine Cooling - V6 S/C 3.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Coolant leaks • Coolant hoses • Coolant expansion tank • Radiator • Heater core • Primary drive belt • Viscous fan 	<ul style="list-style-type: none"> • Fuses • Harnesses • Loose or corroded connector(s) • Engine coolant temperature (ECT) sensor

3. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the symptom chart.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Cause	Action
Coolant loss	<ul style="list-style-type: none"> • Hoses • Hose connections • Radiator • Water pump • Heater core • Gaskets • Engine casting cracks • Engine block core plugs 	Carry out a visual inspection. If there are no obvious leaks, carry out a pressure test. Rectify as necessary. Refer to the relevant section of the workshop manual
Overheating	<ul style="list-style-type: none"> • Low/contaminated coolant • Thermostat • Viscous fan • Engine coolant temperature sensor • Restricted air flow over the radiator 	Check the coolant level and condition. Check the thermostat and rectify as necessary. Carry out a cooling system pressure test. Refer to the relevant section of the workshop manual. Check the viscous fan operation, make sure the viscous fan rotates freely. Check for obstructions to the air flow over the radiator
Engine not reaching normal temperature	<ul style="list-style-type: none"> • Thermostat • Viscous fan • Thermostat • Electric fan • Fan speed module 	Check the thermostat operation. Check the viscous fan operation, make sure the viscous fan is not seized

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-

00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: V6 3.0L S/C Petrol, DTC: Engine Control Module \(ECM\)](#)
(100-00 General Information, Description and Operation).

Engine Cooling - V6 S/C 3.0L Petrol - Cooling System Draining and Vacuum Filling

General Procedures

Draining

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. **WARNINGS:**

 Release the cooling system pressure by slowly turning the coolant expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

 Be prepared to collect escaping fluids.

 Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure.

- 3.

4.  **CAUTION:** Be prepared to collect escaping coolant.

5.

6.

Filling

1. Lower the vehicle.

2.  CAUTION: Anti-freeze concentration must be maintained at 50%.
- Install the cooling system vacuum refill adaptor to the expansion tank.
 - Install the vacuum filler gauge to the cooling system vacuum refill adaptor.
 - Install the venturi tube assembly to the vacuum filler gauge.

3. NOTES:

Make sure the coolant supply valve is in the closed position on the vacuum filler gauge assembly.

The coolant vacuum fill tool needs an air pressure of 6 to 8 bar (87 to 116 psi) to operate correctly.

Small diameter or long airlines may restrict airflow to the coolant vacuum fill tool.

- Connect a regulated compressed air supply to the venturi tube assembly.

4. Position the evacuated air hose into a container.

5. Open the air supply valve.

6. NOTE: Make sure the coolant supply hose is positioned into a container of fifty percent mixture of Land Rover Premium Cooling System Fluid or equivalent, meeting Land Rover specification Halvoline XLC and fifty percent water. Make sure no air can enter the supply hose.

Open the coolant supply valve for 2 seconds to prime the coolant supply hose.

7. Apply air pressure progressively until the arrow on the vacuum filler gauge reaches the green segment.

8. Disconnect the compressed air supply line.

9. NOTE: Close the coolant supply valve when the coolant expansion tank MAX mark is reached or coolant movement has ceased.

Open the coolant supply valve and allow the coolant to be drawn into the system.

10. Remove the vacuum filler gauge and cooling system vacuum refill adaptor assembly.

11. CAUTION: Correct installation of the coolant expansion tank cap can be obtained by tightening the cap until an audible click is heard.

12. Set the heater controls to maximum.

13.  **CAUTION:** Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle

Start the engine and idle until hot air is emitted at the face registers.

14. Switch the heater off.

15. Raise the engine speed to 2000 RPM for eight minutes.

16.  **CAUTION:** Switch off the engine and allow the coolant temperature to go cold.

Switch the engine off.

17. Visually check the engine and cooling system for signs of coolant leakage.

18.  **WARNING:** When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

CAUTIONS:

 Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure.

 Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

 **NOTE:** When the cooling system is warm, the coolant will be approximately 10mm above the upper level mark on the expansion tank with the cap removed.

Check and top-up the coolant if required.

Engine Cooling - V6 S/C 3.0L Petrol - Cooling System Draining, Filling and Bleeding

General Procedures

Draining

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. **WARNINGS:**

 Release the cooling system pressure by slowly turning the coolant expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

 Be prepared to collect escaping fluids.

 Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure.

E143108

9.  **CAUTION:** Anti-freeze concentration must be maintained at 50%.

- Fill the coolant expansion tank to the rim and continue until coolant is visible from the outlet.
- Once coolant is visible from the outlet, close the bleeding point.

E160394

- 10.
- Fill the coolant expansion tank to the rim and continue until coolant is visible from the outlet.
 - Once coolant is visible from the outlet, close the bleeding point.

11. Close the bleeding point.

12. Refer to: [Air Cleaner Outlet Pipe T-Connector](#) (303-12B Intake Air Distribution and Filtering - V6 S/C 3.0L Petrol, Removal and Installation).

13.

- Start and run the engine.
- Continue to top-up with coolant with the engine at idle.
- Once coolant is visible from the outlet, close the bleeding point.

14. Switch off the engine and wait for a minimum of 1 minute.

15. Set the heater controls to maximum.
16.
 - Start and run the engine.
 - Hold the engine speed at 2000 rpm until the coolant level in the expansion tank drops.
17. Increase the engine speed from idle to 3500 rpm until hot air is emitted from the front and rear face vents.
18. Continue filling the cooling system expansion tank until the coolant level becomes static within the COLD FILL RANGE.
19. Add coolant to the expansion tank until the coolant level is 40 mm (1.57 inch) above the COLD FILL RANGE upper mark.

20.  **CAUTION:** Correct installation of the coolant expansion tank cap can be obtained by tightening the cap until an audible click is heard.

21. Run the at engine at idle, until hot air is emitted from the front and rear face vents.

22.  **CAUTION:** Switch off the engine and allow the coolant temperature to go cold.

Switch the engine off and allow to cool.

23. Install the coolant expansion tank.

24.  **WARNING:** When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

 **CAUTION:** Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure.

Check and top up the coolant to the COLD FILL RANGE upper mark.

25. Install the left headlamp.

Refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).

Engine Cooling - V6 S/C 3.0L Petrol - Cooling System Partial Draining, Filling and Bleeding

General Procedures

Draining

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. **WARNINGS:**

 Release the cooling system pressure by slowly turning the coolant expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

 Be prepared to collect escaping fluids.

 Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure.

2	-	Supercharger charge air coolers
3	-	Hose - coolant feed to air charge coolers
4	-	Bleed screw
5	-	Charge air radiator inlet connection
6	-	Charge air coolant pump
7	-	Charge air radiator outlet connection

OVERVIEW

The supercharger cooling system uses engine coolant to cool the pressurized charge air from the supercharger. The supercharger cooling system consists of:

- A charge air coolant pump.
- A charge air radiator.
- Two charge air coolers.
- Connecting hoses and pipes.

The supercharger cooling system is operationally independent of the engine cooling system, but connected to it at the

radiator upper hose. The connection with the engine cooling system accommodates thermal expansion and retraction of the coolant in the supercharger cooling system, and enables filling and draining of the supercharger cooling system.

DESCRIPTION

Charge Air Coolant Pump

E120372

Item	Part Number	Description
1	-	Coolant Intake Connection
2	-	Coolant Outlet Connection
3	-	Electrical Connector

The charge air coolant pump is an electric pump attached to the rear left side of the engine cooling fan shroud. Hoses connect the intake of the charge air coolant pump to the left charge air radiator, and the outlet to the charge air coolers. An electrical connector provides the interface between the motor of the charge air coolant pump and the vehicle wiring.

Charge Air Radiators

E160405

Item	Part Number	Description
1	-	Charge air radiator
2	-	Charge air radiator outlet connection
3	-	Charge air radiator inlet connection

The charge air radiator is located at the front of the cooling pack. The charge air radiator is attached to the radiator using four fixing screws.

Charge Air Coolers

A charge air cooler is installed in each intake manifold.

For additional information, refer to: [Intake Air Distribution and Filtering](#) (303-12A Intake Air Distribution and Filtering - TDV6 3.0L Diesel, Description and Operation).

OPERATION

Supercharger Cooling Flow Diagram

E160403

Item	Part Number	Description
1	-	Right charge air cooler
2	-	Engine
3	-	Left charge air cooler
4	-	Charge air coolant pump
5	-	Charge air radiator
6	-	Radiator upper hose

Electrical power for the charge air coolant pump is supplied from the charge air coolant pump relay in the [EJB \(engine junction box\)](#). When the relay is energized, it connects power from the battery to the charge air coolant pump. Operation of the relay is controlled by the [ECM \(engine control module\)](#). The charge air coolant pump relay is energized continuously while the ignition is in power mode 6.

When the charge air coolant pump is running, coolant flows from the pump outlet through the charge air coolers, the charge air radiators and back to the pump intake.

Diagnosis and Testing

Principle of Operation

For a detailed description of the supercharger cooling system and operation, refer to the relevant Description and Operation section in the workshop manual. REFER to:

[Supercharger Cooling](#) (303-03C Supercharger Cooling - V6 S/C 3.0L Petrol, Description and Operation),
[Supercharger Cooling](#) (303-03 Supercharger Cooling - V6 S/C 3.0L Petrol, Description and Operation),
[Supercharger Cooling](#) (303-03 Supercharger Cooling - V6 S/C 3.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Coolant leaks • Coolant hoses • Coolant expansion tank • Radiator • Heater core • Primary drive belt • Viscous fan 	<ul style="list-style-type: none"> • Fuses • Harnesses • Loose or corroded connector(s) • Engine coolant temperature (ECT) sensor

3. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the symptom chart.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: V6 3.0L S/C Petrol, DTC: Engine Control Module \(ECM\)](#) (100-00 General Information, Description and Operation).

Fuel Charging and Controls - TDV6 3.0L Diesel - Fuel Charging and Controls - Overview

Description and Operation

OVERVIEW

The 3.0L V6 diesel engine is equipped with a High Pressure (HP) common rail fuel injection system. With this fuel injection process, a HP pump delivers a uniform level of pressure to the shared fuel lines (the common rails), which serve all 6 fuel injectors. Pressure is controlled to the optimum level for smooth operation.

The common rail system supports a pre and pilot injection depending on engine operating conditions, which reduces combustion noise levels, more commonly referred to as 'diesel knock'.

Fuel injection pressure is generated independently of engine speed and fuel injection events.

The fuel injection timing and volume are calculated by the Engine Control Module (ECM), which then energizes the appropriate piezo actuated injector. The common rail fuel injection system has the following features:

- High fuel injection pressures of up to 2000 bar (29007 lbf/in²) for greater atomization of fuel (increasing performance and lowering emissions).
- Variable injection to optimize combustion in all engine operating conditions
- Low tolerances and high precision throughout the life of the system.

The fuel system is divided into two sub systems:

- Low Pressure (LP) system
- HP system.

The LP system features the following components:

- In-tank fuel pump
- Fuel pressure regulator (integral to the fuel delivery module)
- Fuel filter
- Return pipes
- Injector return pipes
- Fuel coolers (engine and vehicle).

The LP system is regulated to 0.5 bar (7.25 lbf/in²).

The HP system features the following components:

- HP pump
- Fuel rails and diverter rail
- HP fuel pipes
- Injectors.

Fuel Charging and Controls - TDV6 3.0L Diesel - Fuel Charging and Controls - System Operation and Component Description

Description and Operation

System Operation

ENGINE STARTING

During starting, the fuel rail pressure must be at least 150 bar (2175 lbf/in²). Should the pressure be below this figure, the injectors will not operate, resulting in the vehicle not starting.

ENGINE STOPPING

To stop the engine the ECM stops energizing the actuators in the fuel injectors, therefore, no fuel is injected and the engine speed drops to zero.

Refer to: Electronic Engine Controls (303-14 Electronic Engine Controls - TDV6 3.0L Diesel, Description and Operation).

HP FUEL PUMP

When the HP fuel pump is rotated, pressure is created when the volume control valve is open and the Pressure Control Valve (PCV) is closed. Both valves are electronically controlled by the ECM to allow variable fuel delivery and pressure control. When the [ECM \(engine control module\)](#) actuates the piezo actuators, the fuel rail pressure drop is off-set by additional fuel being delivered to the fuel rails by the PCV. The fuel pressure in the system is reduced within a few seconds after the engine has stopped as the pressure control valve no longer has the holding current it requires, and therefore opens. No residual pressure remains in the system and the fuel is returned to the LP fuel return line to the fuel filter through the open PCV.

Component Description

LOW PRESSURE (LP) SYSTEM

LP Fuel Pump

E150521

The electric fuel pump is located inside the fuel tank. Fuel is pumped from the tank via the in-tank fuel pump, to the HP pump via the fuel filter.

Refer to: Fuel Tank and Lines (310-01 Fuel Tank and Lines - TDV6 3.0L Diesel, Description and Operation).

Fuel Filter

The fuel filter assembly is located in front of the fuel tank and is mounted on a bracket which is attached to the top face of the transfer box chassis cross member.

Fuel returning from the HP pump passes through the fuel cooler before returning to the filter to maintain the fuel at an optimum temperature. The returning fuel is re-circulated through the filter to help prevent waxing in cold operating conditions. Fuel pressure and fuel delivery is maintained by the in-tank pump and regulator via the tank fuel feed line.

The filter has an air bleed return to the fuel tank which returns excess air and fuel to the tank.

The filter element has a capacity of 200cm³ (12.2in³). The filtration element has the capacity to filter particulate matter larger than 5 microns.

The fuel filter is also fitted with a water sensor to detect when moisture which has collected in the filter has reached an unacceptable level.

Refer to: Fuel Tank and Lines (310-01 Fuel Tank and Lines - TDV6 3.0L Diesel, Description and Operation).

Fuel Cooler

An air blast fuel cooler is located off the engine crossmember at the front of the engine oil pan. The fuel cooler has 2 connections; one is an inlet which allows heated fuel from the HP pump to be cooled, the second allows the cooled fuel to be fed from the cooler into the supply pipe from the LP fuel pump in the fuel tank, via a 'Y' connector back to the fuel filter.

HIGH PRESSURE (HP) SYSTEM

HP Fuel Pump

The HP pump is a 2 piston radial plunger pump. The pump has the ability to produce a maximum pressure of 2000 bar (29007 lbf/in²). The housing is cast from iron, the flange is cast from aluminum.

The HP pump is driven from the left cylinder bank exhaust camshaft via a toothed belt. The drive from the belt rotates a cam within the pump which operates a plunger within each pumping element. A procedure and special tools are required for pump or belt replacement to time the pump.

The HP pump comprises 2 HP pumping elements, a fuel volume control valve, an internal transfer pump and a fuel temperature sensor.

The fuel is delivered to the internal transfer pump via the external fuel filter and an electric fuel pump which is located in the fuel tank.

The fuel volume control valve is mounted on the HP pump, and located in the feed port between the HP pump elements and the internal transfer pump. The fuel volume control valve is a variable position solenoid-operated valve that is controlled by the ECM. The fuel volume control valve determines the amount of fuel that is delivered from the internal transfer pump to the HP pumping elements. When there is no signal to the fuel volume control valve, the valve is closed and there is no fuel delivery.

The fuel from the internal transfer pump is passed to the HP pumping elements at a constant pressure known as transfer pressure. The transfer pressure is controlled by an internal pressure relief valve. Once the fuel enters each of the HP pump elements the pressure rises rapidly, with each element providing a HP supply to one of the fuel rails. The HP is controlled by the HP regulator valve and the Fuel Rail Pressure and Temperature sensor FRPT.

A controlled amount of fuel is allowed to leak-off from the internal transfer pump. This fuel is delivered to the pump internal components to provide cooling and lubrication and is passed back the fuel filter via the LP feed line.

The fuel pressure control valve is located in one of the fuel rails. The fuel pressure is monitored by a pressure sensor located in the other fuel rail. The ECM controls the fuel pressure control valve using the received signals from the pressure sensor. Reducing the pressure in the fuel rails via the pressure control valve results in fuel returning from the fuel rails to the LP fuel return to the fuel filter.

The fuel temperature sensor is located on the rear of the HP pump. It measures the fuel temperature in the LP side of the HP pump. The ECM continually monitors this signal to determine the fuel temperature to prevent overheating of the fuel system. The ECM will also make fine adjustments to fuel injection quantity to adjust for fuel temperature.

Fuel Rails

E115474

Item Description

- 1 Left fuel rail
- 2 Fuel pressure control valve
- 3 Fuel pressure sensor
- 4 Right fuel rail

5 HP fuel connection from HP pump

6 Fuel rail balance pipe

The fuel rails are steel fabrications and are similar in their construction. Two fuel rails are used with each rail supplying high pressure fuel to 3 fuel injectors.

Each rail has 5 threaded connections which provide for the attachment of the high pressure fuel supply from the HP pump, the balance pipe and connections for the 3 injectors supplied with fuel from that rail.

The fuel pressure in the rails is detected by a fuel pressure sensor which is located in the end of the right rail. The left rail houses a pressure control valve. The ECM controls the pressure control valve using signals from the pressure sensor.

The FRPT is a piezo-resistive type sensor containing an actuating diaphragm. Deflection of the diaphragm provides a proportional signal (output) voltage to the ECM, dependant on the fuel pressure within the fuel rail.

Both rails are connected together with a balance pipe which ensures the pressure in both rails is equal, even though each rail is supplied from a different pumping element in the HP pump.

Fuel Injectors

E115475

Item Description

- 1 Fuel return
- 2 O-ring seal
- 3 Piezo stack actuator
- 4 Hydraulic coupler
- 5 Control valve
- 6 Nozzle body
- 7 Copper sealing washer
- 8 Electrical connector
- 9 HP feed
- 10 Nozzle

Six fuel injectors are used in the fuel system. A piezo actuator in each injector is electronically controlled by the ECM to operate the injector in response to engine speed and load conditions.

Two variants of fuel injector are installed on the 3.0 TDV6 engine, 155kW vehicles have a unique low flow fuel injector installed. Injectors should not be swapped between 155kW and 188kW engines due to the injector nozzles being different. Low flow fuel injector nozzles are not capable of sufficient fuel supply to the 188kW engine.

Each injector has an electrical connector which connects the injector to the engine harness. A fuel connection on the top of the injector provides for the HP fuel inlet from the HP pump. A second fuel connection allows fuel leakage within the injector to return to the HP pump.

Each injector is located in a machined hole in the cylinder head and is sealed in the cylinder head with a copper sealing washer and an O-ring seal. The injector is retained in the cylinder head with a clamp plate and 2 bolts. If an injector is removed or replaced, a new copper sealing washer and a clamp plate must be used when refitting the

injector.

The injector can operate up to 5 times during one combustion cycle depending on engine speed and load. The injection sequence can occur as follows:

E107577

1. Pilot injection - occurs before the main injection and improves fuel and air mixing
2. Pre-injection - shortens the main injection's ignition delay and therefore reduces the generation of nitrous oxides
3. Main injection - delivers the required engine torque
4. After injection - occurs after the Main injection and assists the re-burn of any remaining particulate matter
5. Post injection - helps manage the temperature of the exhaust gas for more effective exhaust-gas after-treatment
6. Injection delay 0.4 ms.

Each injector is calibrated to the [ECM](#) and applicable the cylinder to which it is fitted. Therefore, if an injector is removed it must be refitted to the cylinder from which it was removed. If a new injector is fitted, a calibration routine using Land Rover approved diagnostic equipment must be performed to calibrate the injector unique code to the [ECM](#).

The operating voltage of the injector is between 110 and 163 volts depending on engine speed and load and care must be taken when working in the vicinity of the injectors. The voltage increases linearly from 200 to 2000 bar.

Each injector has an electrical resistance value of between 150 - 250 kOhms.

CAUTION: Each injector operation is controlled by a charge and discharge cycle allowing energy to dissipate in, and recover from the injector. Never disconnect the wiring connection when the engine is running. The injector can remain open thus causing engine damage.

Fuel Charging and Controls - TDV6 3.0L Diesel - Fuel Charging and Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the fuel charging and controls system and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: Fuel Charging and Controls (303-04 Fuel Charging and Controls - TDV6 3.0L Diesel, Description and Operation).

Inspection and Verification

WARNING: Make sure that all suitable safety precautions are observed when carrying out any work on the fuel system. Failure to observe this warning may result in personal injury.

CAUTIONS:

Make sure that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Low/contaminated fuel • Fuel supply/return line(s) • Fuel tank and filler pipe • Fuel leak(s) • Fuel filler cap • Fuel filter • Push connect fittings • Fuel rail • Fuel pump • Exhaust Gas Recirculation (EGR) system 	<ul style="list-style-type: none"> • Fuses • Glow plug indicator • Inertia fuel shutoff switch • Fuel pump module • Sensor(s) • Engine Control Module (ECM) • Fuel volume control valve • Fuel pressure control valve • Fuel Rail Pressure (FRP) sensor • Fuel temperature sensor • Fuel injector(s) • Exhaust Gas Recirculation (EGR) system

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not start	<ul style="list-style-type: none"> • Inertia fuel shutoff switch • Low/contaminated fuel • Air leakage • Low-pressure fuel system fault • Fuel pump module (lift pump) fault • Blocked fuel filter • Fuel volume regulator blocked/contaminated • Fuel pressure control valve blocked/contaminated • Fuel pump fault 	<ul style="list-style-type: none"> • Check that the inertia switch has not tripped <ul style="list-style-type: none"> - Using the manufacturer approved diagnostic system, check the Restraints Control Module (RCM) for related DTCs and refer to the relevant DTC index • Check the fuel level and condition. Draw off approximately 1L (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel • Check the intake air system for leaks • Check the lift pump operation • Check the low-pressure fuel system for leaks/damage • Check the fuel filter • Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index • Check the fuel pump

	<ul style="list-style-type: none"> • Crankshaft position (CKP) sensor 	<ul style="list-style-type: none"> • Refer to the electrical circuit diagrams and test the CKP sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
Difficult to start	<ul style="list-style-type: none"> • Glow plug system fault (very cold conditions) • Low/contaminated fuel • Air leakage • Fuel pump module (lift pump) fault • Low-pressure fuel system fault • Blocked fuel filter • Fuel volume control valve blocked/contaminated • Fuel pressure control valve blocked/contaminated • Exhaust Gas Recirculation (EGR) valve(s) fault 	<ul style="list-style-type: none"> • Refer to the electrical circuit diagrams and test the glow plug circuits for short circuit to ground, short circuit to power, open circuit, high resistance • Check the fuel level and condition. Fuel Charging and Controls - TDV6 3.0L Diesel - Fuel Injection

Component Cleaning

General Procedures

WARNINGS:

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1700 bar (24,656 lb-sq-in). Failure to follow this instruction may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

CAUTIONS:

Before using the cleaning fluid, protect all electrical components and connectors with lint-free non-flocking material.

Make sure that all parts removed from the vehicle are placed on the lint-free non-flocking material.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material.

Make sure that clean non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid, prior to starting work on the vehicle.

Use a steel topped workbench and cover it with clean, lint-free non-flocking material.

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

NOTE: Pneumatic vacuum gun

1. Using a new brush that will not lose its bristles, brush cleaning fluid onto the components being removed and onto the surrounding area.
2. Using a pneumatic vacuum gun, remove all traces of cleaning fluid and foreign material.
3. Dispose of any used cleaning fluid and the brush after completing the repair.

Fuel Charging and Controls - Turbocharger - TDV6 3.0L Diesel - Turbocharger - Overview

Description and Operation

INTRODUCTION

The 3.0L V6 diesel engine uses two turbochargers; a fixed vane type (secondary) and a variable vane (primary) type. The fixed vane turbocharger is fitted to the **RH (right-hand)** cylinder bank and the variable vane turbocharger is fitted to the **LH (left-hand)** cylinder bank.

Both turbochargers are used in a parallel sequential turbocharging system which enables the engine to achieve quick throttle response at low engine speeds and efficient use of exhaust gas energy at high engine speeds.

The variable vane turbocharger has an **ECM (engine control module)** controlled electronic rotary actuator. The rotary actuator adjusts the turbine vanes to optimize the exhaust gas flow and velocity onto the turbine wheel to maintain the required boost pressure.

The parallel sequential turbocharging system comprises the two turbochargers and the **ECM**. The primary variable nozzle turbine operates through the entire engine speed range but is at its most efficient at engine speeds of up to 2800 rpm. At engine speeds above 2800 rpm under load, the fixed vane secondary turbine comes into operation, with both of the turbochargers now running in a parallel bi-turbo mode.

Fuel Charging and Controls - Turbocharger - TDV6 3.0L Diesel - Turbocharger - System Operation and Component Description

Description and Operation

System Operation

TURBOCHARGERS

The turbine wheel of the turbocharger uses the engine's exhaust gasses to drive the compressor wheel. The compressor wheel draws in fresh air which is supplied to the engine cylinders in a compressed form.

The primary variable vane turbocharger allows the optimum inlet geometry (inlet area and flow angle) to be used over a wide range of engine operating conditions. This allows a rapid speed of response and higher boost pressures at low engine speeds. The variable vane angle determines both the inlet area as well as the flow angle, as controlled by the [ECM \(engine control module\)](#). The variable vanes allow efficient use of the exhaust gas energy which in turn improves turbocharger and engine efficiency.

Principles of Variable Vane Operation

E107579

Item Description

- A Low engine speed
- B Intermediate engine speed
- C High engine speed
- 1 [ECM](#)
- 2 Electronic rotary actuator
- 3 Turbine housing
- 4 Variable vanes
- 5 Compressor wheel

The variable vanes in the primary turbocharger are controlled by the [ECM](#). The [ECM](#) controls a rotary electronic actuator attached to the primary turbocharger which is used to adjust the pitch angle of the vanes by rotating the turbine housing. The electronic rotary actuator also provides the [ECM](#) with a feedback signal to determine the pitch angle of the vanes.

The variable vanes in the primary turbocharger improve the exhaust gas power transfer to the turbine wheel which in turn drives the compressor wheel. At low engine speeds this greatly assists the increase in turbocharger boost pressure.

As engine speed, and therefore the exhaust gas velocity, increases, the vanes are opened. The amount of opening is determined by the [ECM](#) to ensure that the power transfer from the turbine wheel to the compressor wheel is within the turbocharger speed and boost pressure requirements.

At high engine speed and exhaust gas flow, the [ECM](#) increases the vane opening to avoid overspeed of the turbines and provide a smooth high speed operation. At this point the dual mode boosting system comes into affect by

utilizing the secondary (fixed vane) turbocharger.

The fixed vane turbocharger incorporates an outlet temperature sensor, which is located adjacent the oxygen sensor in the close coupled catalytic converter and, an outlet pressure sensor which receives inputs from the APP (accelerator pedal position) and ECM.

Refer to: Electronic Engine Controls (303-14 Electronic Engine Controls - 3.0L Diesel, Description and Operation).

Dual Mode Boosting

The dual mode boosting system comprises two turbochargers and software within the ECM. The two turbochargers can operate in two modes; mono turbocharger operation or bi-turbocharger operation.

Mono Turbocharger Schematic Diagram

E107580

Item Description

- 1 Fixed vane turbine
- 2 Turbine shut-off valve
- 3 DPF (diesel particulate filter)
- 4 Flexible center resonators
- 5 Catalytic converter
- 6 Variable vane turbocharger
- 7 Engine
- 8 Throttle
- 9 Air filter
- 10 MAF (mass air flow) meter
- 11 Charge air cooler

12 Compressor shut-off valve

13 Recirculation valve

Fresh air is drawn through the air filter and the MAF meter to the primary turbocharger compressor. The compressed air is then passed through the charge air cooler and into the engine.

The turbine shut-off valve on the secondary turbocharger is closed and therefore exhaust gasses are unable to operate the secondary turbocharger turbine. In this condition all turbocharging boost pressure is produced by the primary turbocharger.

Bi-Turbocharger Switching Schematic Diagram

E107581

Item Description

- 1 Fixed vane turbine
- 2 Turbine shut-off valve
- 3 DPF
- 4 Flexible center resonators
- 5 Catalytic Converter
- 6 Variable vane turbocharger
- 7 Engine
- 8 Throttle
- 9 Air filter
- 10 MAF meter
- 11 Charge air cooler
- 12 Compressor shut-off valve
- 13 Recirculation valve

When the engine operating parameters approach the limits (approximately 2800 rpm under load) of the primary turbocharger, dual mode boosting control software within the ECM begins the switch to parallel bi-turbocharger operation. The secondary turbocharger is brought into operation by the opening of the turbine shut-off valve which allows exhaust gasses to flow through the turbine.

Initially, the secondary turbocharger does not produce a boost pressure to equal that of the primary turbocharger. Therefore, the initial boost pressure from the secondary turbocharger is fed via the recirculation valve into the clean air inlet for the primary turbocharger. As the secondary turbocharger boost pressure output increases, the recirculation valve is then closed and the compressor shut-off valve opened to increase the boost pressure from the secondary turbocharger which is directed into the charge air cooler.

Bi-Turbocharger Schematic Diagram

E107582

Item Description

- 1 Fixed vane turbine
- 2 Turbine shut-off valve
- 3 DPF
- 4 Flexible center resonators
- 5 Catalytic Converter
- 6 Variable vane turbocharger
- 7 Engine
- 8 Throttle
- 9 Air filter
- 10 MAF meter
- 11 Charge air cooler
- 12 Compressor shut-off valve

13 Recirculation valve

When the secondary turbocharger has reached the required operating parameters, the recirculation valve is closed and the compressor shut-off valve is opened. The ECM will maintain the engine operating in bi-turbocharger operation with both primary and secondary turbochargers contributing to the air charge induction. When the dual mode boosting software determines that the engine operating parameters no longer require the use of dual mode boosting, the system switches back to mono turbocharger operation.

If the engine idles for more than 3 minutes, the secondary turbocharger is actuated to ensure correct lubrication. This is achieved by pressurizing the turbine shaft bearing cavities through a pipe, which is connected to the air intake system and periodically opening the turbine shut-off valve to operate the turbocharger.

CAUTION: Ensure both ends of the pipe are securely connected to the secondary turbo and the air intake system to prevent damage to the turbo components.

Turbine and Compressor Shut-off Valve Control

The secondary turbocharger turbine shut-off valve and compressor shut-off valve are controlled by the ECM through a vacuum system. The secondary turbo turbine shut-off valve also incorporates a position sensor.

Secondary Turbocharger Turbine Shut-off Valve Vacuum Control

E117413

Item Description

- 1 Secondary turbine shut-off solenoid valve
- 2 Vacuum reservoir
- 3 Vacuum pump
- 4 Secondary turbine shut-off valve

If vacuum is lost to the shut-off valve it will default to the closed position. The position sensor will inform the ECM,

which will initiate mono-turbo mode, restricted performance and record **DTC (diagnostic trouble code)**.

Compressor Shut-off Valve Vacuum Control

E117414

Item Description

- 1 Compressor shut-off valve solenoid valve
- 2 Vacuum reservoir
- 3 Vacuum pump

If the system develops a fault, for example an air leak, the compressor shut-off valve will default to the closed position. In the default position, mono-turbo operation and restricted engine torque is initiated.

NOTE: When fault finding the vacuum system, always check for trapped/split/disconnected pipework. Any vacuum fault will cause the engine to default to limited torque mode.

Component Description

Each turbocharger consists of two turbo elements, a turbine wheel and compressor wheel, enclosed separately in cast housings and mounted on a common shaft, which rotates in two semi-floating bearings.

VARIABLE VANE TURBOCHARGER (PRIMARY)

The variable vane turbocharger is attached to the **LH (left-hand)** exhaust manifold and secured to 3 studs on a flange on the manifold with nuts. On production, no gasket is used to seal the joint between turbocharger and the manifold. In-service vehicles will require a service gasket to be fitted if the joint between the turbocharger and the manifold is disturbed.

A second flange on the turbocharger has 3 integral studs and provides for the attachment of the **LH** catalytic converter inlet pipe. Three nuts secure the inlet pipe to the flange studs and a gasket seals the joint between the

components.

The compressor end of the turbocharger has two hose connections. The central connection provides a clean air supply from the air filter to the compressor. The second connection on the outside of the housing provides for a pipe connection from the turbocharger to the charge air cooler.

The turbocharger is a conventional design with both the turbine wheel and the compressor wheel sharing a common shaft which is supported on bearings. The turbocharger receives an engine oil feed via a pipe from the cylinder block. The pipe supplies both turbochargers with an oil supply for lubrication purposes. An oil drain pipe from the turbocharger allows oil to drain from the turbocharger into the cylinder block.

An integral bracket houses the variable vane electronic rotary actuator. The rotary actuator is connected to an eccentric lever which moves the turbine housing to adjust the position of the vanes. When the rotary actuator operates a boss is rotated, which in turn moves the lever and changes rotary motion into linear motion. The lever is connected to the outside of the turbine housing and the linear motion is converted back to rotary motion of the housing. Operation of the electronic rotary actuator is controlled by the [ECM](#).

FIXED VANE TURBOCHARGER (SECONDARY)

The fixed vane turbocharger is attached to the [RH \(right-hand\)](#) exhaust manifold and is secured to 3 studs on a flange on the manifold with nuts. On production, no gasket is used to seal the joint between turbocharger and the manifold. In-service vehicles will require a service gasket to be fitted if the joint between the turbocharger and the manifold is disturbed.

A second flange on the turbocharger has 2 integral studs and provides for the attachment of the [RH](#) exhaust system downpipe. Two nuts secure the downpipe to the flange studs and a gasket seals the joint between the downpipe and the turbocharger.

The compressor end of the turbocharger has two hose connections; the central connection provides the clean air supply from the air filter. The second connection on the outside of the turbocharger housing allows the connection from the turbocharger to the charge air cooler.

Attached to the rear of the turbocharger is a turbine shut-off valve. The valve is vacuum operated and electronically controlled by the [ECM](#). The valve is closed when the system is operating in mono-turbocharger mode, diverting exhaust gasses from the [RH](#) exhaust manifold, via the exhaust cross-over duct to the [LH](#) exhaust manifold. When bi-turbocharger operation is required, the [ECM](#) electronically operates the valve allow vacuum to open the shut-off valve allowing exhaust gasses from the [RH](#) exhaust manifold to drive the turbine of the fixed vane turbocharger.

Inspection and Verification

WARNING: The following tests may involve working in close proximity to hot components. Make sure adequate protection is used. Failure to follow this instruction may result in personal injury.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Intake air system • Hose(s) / hose connections • Turbochargers • General engine condition 	<ul style="list-style-type: none"> • Circuit(s) • Engine Control Module (ECM) • Turbocharger actuators • Electrical connections and harnesses

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Poor performance (off-boost)	<ul style="list-style-type: none"> • Low/contaminated fuel • Restricted intake air system • General engine condition • Engine Control Module (ECM) failure 	<ul style="list-style-type: none"> • Check the fuel level and condition. Draw off approximately 1L (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel • Check the intake air system for restriction • Check the engine condition, compressions, etc, if there are indications of a mechanical fault • Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index
No boost	<ul style="list-style-type: none"> • Electrical connections and harnesses • Restricted intake air system • Charge air cooler restricted/leaking • Turbocharger actuator failure(s) • Turbocharger failure(s) • Engine Control Module (ECM) failure 	<ul style="list-style-type: none"> • Check the electrical connections and harnesses • Check the intake air system for restriction/leakage • Check the turbocharger actuators and circuits • Check the turbochargers for wear. Disconnect the turbocharger intake and outlet pipework and turn the turbochargers by hand. Any roughness indicates a fault. Check any up and down movement in the turbocharger shafts. Excessive movement indicates a fault. If in doubt, compare the suspect unit with a new turbocharger • Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index
No boost/excessive	<ul style="list-style-type: none"> • Turbocharger failure(s) 	<ul style="list-style-type: none"> • Disconnect the turbocharger intake and outlet pipework and turn the turbochargers by hand. Any roughness indicates a

noise		fault. Check any up and down movement in the turbocharger shafts. Excessive movement indicates a fault. If in doubt, compare the suspect unit with a new turbocharger

Fuel Charging and Controls - V6 S/C 3.0L Petrol -

WARNINGS:

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

CAUTION: Before disconnecting or removing components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

NOTE: Tighten the fuel rail high pressure fuel pump fuel line unions and fuel rail crossover pipe unions as it is instructed in service manual.

Fuel Charging and Controls - V6 S/C 3.0L Petrol - Fuel Charging and Controls

Description and Operation

COMPONENT LOCATION

E160292

Item	Part Number	Description
1	-	Low Pressure (LP) fuel line
2	-	Fuel Rail Pressure and Temperature (FRPT) sensor
3	-	Crossover tube
4	-	Left fuel rail

5	-	Fuel injector (6 off)
6	-	High Pressure (HP) fuel lines
7	-	HP fuel pumps
8	-	Right fuel rail

OVERVIEW

The fuel charging and controls system is a petrol DI (direct injection) system controlled by the [ECM \(engine control module\)](#).

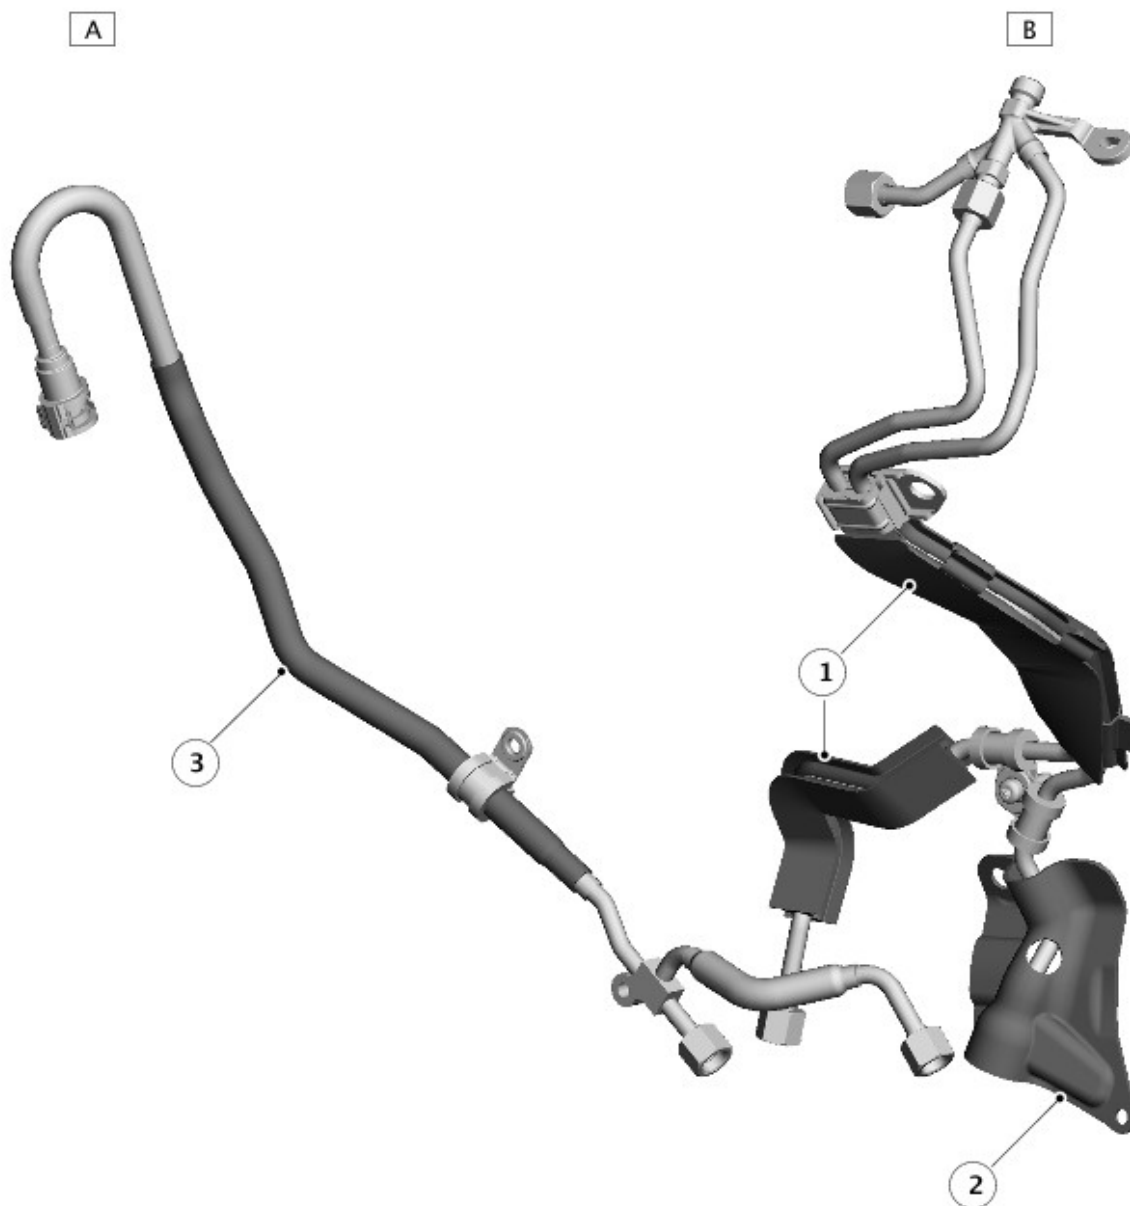

The fuel charging and controls system consists of:

- LP (low pressure) and HP (high pressure) fuel lines.
- Two HP fuel pumps.
- Two fuel rails and a crossover tube.
- A FRPT (fuel rail pressure and temperature) sensor.
- Six fuel injectors.

LP fuel from the pump in the fuel tank is pressurized by the HP fuel pumps and supplied to the fuel injectors via the fuel rails and crossover tube. The [ECM](#) controls the fuel injectors and HP fuel pumps to inject the required volume of fuel into the combustion chambers.

COMPONENT DESCRIPTION

Low and High Pressure Fuel Lines

E160293

A = LP fuel lines, B = HP fuel lines.

Item	Part Number	Description
------	-------------	-------------

- 1 - Acoustic covers
- 2 - Fuel pipe cover
- 3 - Heat reflective and insulation sleeve

The LP fuel line connects the HP fuel pumps to the fuel delivery line from the fuel tank and lines system. A double latch quick release connector at the start of the LP fuel line connects with the fuel line from the fuel tank mounted fuel pump module. The connector is secured to a bracket on the charge air cooler. P-clips secure the LP fuel line to the rear of each cylinder head and to the right side of the cylinder block. A heat reflective and insulation sleeve is installed on the LP fuel line where it runs behind the right exhaust manifold.

The HP fuel lines connect the HP fuel pumps to the right fuel rail and the crossover tube. Two P-clips and a pipe clamp attach the HP fuel lines to the cylinder block and the right cylinder head respectively. An integral bracket on the front HP fuel line is attached to a stud on the front-upper right camshaft cover. A pipe cover is installed on the bottom of the front HP fuel line and acoustic covers are fitted to both HP fuel lines.

High Pressure Fuel Pumps

E143649

Item	Part Number	Description
1	-	Crankshaft
2	-	Auxiliary drive chain
3	-	Auxiliary shaft
4	-	Tappet
5	-	HP fuel pump
6	-	Acoustic cover

The two HP (high pressure) fuel pumps are identical mechanically-driven pumps installed on the right side of the oil pan body, behind the generator. An O-ring seal, seals each of the HP fuel pumps in the oil pan. The front HP fuel pump is identified as No. 1 pump; the rear HP fuel pump is identified as No. 2 pump. An acoustic cover is installed on each of the HP fuel pumps.

The HP fuel pumps are single-plunger pumps. The plunger of each pump extends through the sump body and the carrier of the auxiliary shaft. A tappet on the end each plunger is operated by a two-lobe cam on the auxiliary shaft. A spring installed on the outside of the plunger ensures the plunger and tappet remain in contact with the cam.

The auxiliary shaft is driven by the crankshaft, via the auxiliary drive chain, at engine speed. The auxiliary shaft is timed to match the pump delivery strokes with crankshaft position.

Item	Part Number	Description
1	-	Pressure Relief Valve (PRV)
2	-	To HP fuel lines
3	-	Check valve
4	-	Plunger
5	-	From LP fuel lines
6	-	Damper chamber
7	-	Fuel metering valve

In addition to the plunger, each HP fuel pump contains:

- A damper chamber.
- A fuel metering valve.
- A check valve.
- A PRV.

The damper absorbs pressure pulses from the LP fuel system.

The fuel metering valve regulates the output pressure from the HP fuel pump. The fuel metering valve is a normally open solenoid valve controlled by the ECM. During the inlet stroke of the plunger the fuel metering valve is de-energized, which allows LP (low pressure) fuel into the pumping chamber. The ECM energizes the fuel metering valve closed during the delivery stroke of the plunger, which forces the fuel in the pumping chamber through the check valve into the HP (high pressure) lines. By changing the closing point of the fuel metering valve, the ECM can determine the volume of fuel output during the delivery stroke, and thus the pressure in the HP side of the system.

The check valve prevents the return of HP fuel to the pumping chamber during the inlet stroke of the plunger.

The PRV (pressure relief valve) protects the HP side of the system from excessive pressure if there is a failure of the fuel metering valve. If the pump delivery pressure increases to 250 bar (3625 lbf/in²), the PRV opens and returns fuel to the inlet side of the plunger.

Fuel Rails and Crossover Tube

E143650

Item	Part Number	Description
1	-	Left fuel rail
2	-	Crossover tube
3	-	Right fuel rail
4	-	Fuel Rail Pressure and Temperature (FRPT) sensor
5	-	Fuel injector (6 off)
6	-	Hold down spring (6 off)

The fuel rails and crossover tube are made from stainless steel. Bolts attach each fuel rail to the related cylinder head. The crossover tube connects the front high pressure line to the left fuel rail, which ensures there is equal pressure in the two fuel rails. Four P-clips attach the crossover tube to the top of the charge air cooler.

The rear of the right fuel rail incorporates a threaded boss for installation of the FRPT (fuel rail pressure and temperature) sensor.

Fuel Rail Pressure and Temperature Sensor

E143651

The FRPT (fuel rail pressure and temperature) sensor provides the [ECM](#) with a continuous signal of fuel rail pressure. The FRPT sensor is installed in the rear of the right fuel rail. The FRPT sensor is screwed into a threaded boss in the fuel rail.

The FRPT sensor contains a steel diaphragm fitted with strain gages, which are incorporated into a Wheatstone bridge. The output from the Wheatstone bridge is processed by the ECM to determine a pressure value and [NTC \(negative temperature coefficient\)](#).

Fuel Injectors

E113519

The fuel injectors spray fuel from the fuel rail directly into the combustion chambers. The fuel injectors are installed close to the center of the combustion chambers, between the inlet and exhaust valves and next to the spark plug.

The fuel injectors are a push fit in the fuel rails and the cylinder heads. On each fuel injector, an O-ring seal, seals the head of the fuel injector in the fuel rail. A teflon ring seals the nozzle of the fuel injector in the cylinder head.

Each fuel injector contains a solenoid-operated needle valve, which opens when the solenoid winding is energized. While the needle valve is open, fuel is sprayed into the combustion chamber. The solenoid winding is connected to a power feed and a ground from the **ECM**, which operates the fuel injectors with a two stage power supply. Initially the ECM supplies the fuel injectors with 65 V, then once the boost current reaches 11 A the power supply is switched to battery voltage. The ECM meters the amount of fuel injected into the combustion chambers by adjusting the time that the solenoid winding is energized.

There are six holes around the tip of the nozzle through which the fuel is sprayed. Two of the holes direct fuel below the spark plug. The other four holes direct fuel evenly around the remainder of the combustion chamber.

If a fuel injector fails, the engine will suffer from unstable idle speed, poor **NVH (noise, vibration and harshness)** and poor emissions performance.

OPERATION

The **ECM** controls the output from the HP (high pressure) fuel pumps to deliver the required volume of fuel at pressures up to 200 bar (2900 lbf/in²).

The ECM uses the signal from the FRPT (fuel rail pressure and temperature) sensor to calculate the time the fuel injectors need to be energized to deliver the correct mass of fuel to the combustion chambers.

Fuel Charging and Controls - V6 S/C 3.0L Petrol - Fuel Charging and Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the fuel charging and controls system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to:

[Fuel Charging and Controls](#) (303-04C Fuel Charging and Controls - V6 S/C 3.0L Petrol, Description and Operation),
[Fuel Charging and Controls](#) (303-04E, Description and Operation),
[Fuel Charging and Controls](#) (303-04E, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Fuel level • Fuel leaks • Damaged fuel lines • Damaged push connect fittings • Fuel contamination/grade/quality • Throttle body • Damaged fuel tank filler pipe cap • Damaged fuel tank filler pipe 	<ul style="list-style-type: none"> • Fuses • Loose or corroded electrical connectors • Harnesses • Sensor(s) • Engine Control Module (ECM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not fire	<ul style="list-style-type: none"> • Engine breather system disconnected/restricted • Ignition system • Fuel system • Electronic engine control 	Ensure the engine breather system is free from restriction and is correctly installed. Check for ignition system, fuel system and electronic engine control DTCs and refer to the relevant DTC Index
Engine cranks and fires, but will not start	<ul style="list-style-type: none"> • Evaporative emissions purge valve • Fuel pump • Spark plugs • HT short to ground (tracking) check rubber boots for cracks/damage • Ignition system 	Check for evaporative emissions, fuel system and ignition system related DTCs and refer to the relevant DTC Index
Difficult cold start	<ul style="list-style-type: none"> • Engine coolant level/anti-freeze content • Battery • Electronic engine controls • Fuel pump • Purge valve 	Check the engine coolant level and condition. Ensure the battery is in a fully charged and serviceable condition. Fuel Charging and Controls - V6 S/C 3.0L Petrol - Fuel Injection Component Cleaning

General Procedures

General Equipment

Pneumatic vacuum gun

Cleaning

WARNINGS:

Do not carry out any repairs to the fuel system with the engine running. Failure to follow this instruction may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Place the vehicle in a well ventilated, quarantined area and arrange 'No Smoking/Petrol Fumes' signs about the vehicle.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

CAUTIONS:

Before using the cleaning fluid, protect all electrical components and connectors with lint-free non-flocking material.

Make sure that all parts removed from the vehicle are placed on the lint-free non-flocking material.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material.

Make sure that clean non-plated tools are used. Clean tools using a new brush that will not lose its bristles, prior to starting work on the vehicle.

Use a steel topped workbench and cover it with clean, lint-free non-flocking material.

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

1. Using a new brush that will not lose its bristles, brush the components being removed and the surrounding area.
2. Using a pneumatic vacuum gun, remove all traces of foreign material.

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

-  CAUTION: Make sure the correct additive is used in this step. Failure to carry out this instruction may cause damage to the vehicle.
 - Open the fuel filler door and remove the cap.
 - Empty the fuel additive into the fuel filler pipe.
 - Install the fuel filler cap and close the fuel filler door.
2. Refer to: Engine Cover - V8 5.0L Petrol/V8 S/C 5.0L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Release the breather from the air intake elbow.

E138648

E138649

4.  **CAUTION:** Make sure the correct additive is used in this step. Failure to carry out this instruction may cause damage to the vehicle.

Install the cleaning equipment to a suitable location under the hood.

5.
 - Remove the cleaning equipment filler cap.
 - Empty the induction system cleaning fluid into the cleaning equipment.
 - Install the filler cap.

6. Position the intake system cleaning tool into intake elbow and secure with the clamp.

7.
 - Connect a suitable compressed air line to the cleaning equipment.
 - Set the pressure to 4 bar.

8. Start and run the engine.

9.
 - Open the ball valve on the cleaning equipment and allow the cleaning fluid

E138653

- to spray into the intake elbow.
- Raise the engine speed to 1200 rpm and hold until the cleaning fluid spray has stopped.

10.

- Close the ball valve.
- Release the air pressure in the cleaning equipment.
- Disconnect the air line.

11. Connect the breather to the air intake elbow.

E138648

12. Refer to: Engine Cover - V8 5.0L Petrol/V8 S/C 5.0L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

13.

- Start the engine.
- Allow the engine to idle for 30 seconds.
- Raise the engine speed to 1500 rpm and hold for 3 minutes until a temperature of 70°C is achieved.
- Allow the engine to idle for 30 seconds.
- Switch off the engine.

14. Connect the approved diagnostic equipment to the vehicle.

15. Follow on screen prompts and check for DTC's (Diagnostic Trouble Codes).
16. Clear the DTC's following the on screen procedure.
17. Disconnect the approved diagnostic equipment from the vehicle.

 E107682	310-200-01 Fuel Rail Installation Guide Pins - Threaded

Removal

CAUTIONS:

Make sure that tools and equipment are clean and free of foreign material and lubricant.

Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

Some components shown removed for clarity.

Removal steps in this procedure may contain installation details.

1. Refer to: [Petrol and Petrol-Ethanol Fuel Systems Health and Safety Precautions](#) (100-00 General Information, Description and Operation).
2. Refer to: [Fuel System Pressure Release - V6 S/C 3.0L Petrol](#) (310-00 Fuel System - General Information, General Procedures).
3. Refer to: [Engine Cover - V6 S/C 3.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

- Refer to: [Air Cleaner Outlet Pipe T-Connector](#) (303-12B Intake Air Distribution and Filtering - V6 S/C 3.0L Petrol, Removal and Installation).

6.

- Refer to: [Air Cleaner RH](#) (303-12B Intake Air Distribution and Filtering - V6 S/C 3.0L Petrol, Removal and Installation).

8.

-  NOTE: Left-hand drive vehicles.

Refer to: [Battery](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

-  NOTE: Right-hand drive vehicles.

19.

E160484

20.  **WARNING:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

CAUTIONS:

 Make sure that the fuel line union does not rotate.

 Be prepared to collect escaping fluids.

 Make sure that all openings are sealed. Use new blanking caps.

21.

22. CAUTIONS:

 Be prepared to collect escaping fluids.

 Make sure that all openings are sealed. Use new blanking caps.

23.  NOTE: If equipped.

24.  NOTE: LH illustration shown, RH is similar.

25.  NOTE: LH illustration shown, RH is similar.

26.  CAUTION: Make a note of the fuel injector clamp alignment to the fuel rail prior to removal.

 NOTE: LH illustration shown, RH is similar.

E148711

27.  CAUTION: Be prepared to collect escaping fuel.

 NOTE: Do not disassemble further if the component is removed for access only.

E145603

28. NOTES:

 Do not disassemble further if the component is removed for access only.

 If equipped.

E145604

29. CAUTIONS:

 Make sure that the special tool is located correctly to the fuel injector prior to removing the fuel injector.

 Make sure that the special tool is held square

E115056

to the fuel injector during removal.

 Make sure that all open ports are covered to prevent any foreign material ingress.

Special Tool(s): [310-197](#)

E115057

30.  CAUTION: If the fuel injector is being removed without a new component being installed, the fuel injector clamp must remain with the fuel injector it is removed with.

E115058

31. CAUTIONS:

 Do not use a knife to remove the Teflon seal as damage could occur to the fuel injector.

 Do not cut the Teflon seal too deep as damage could occur to the fuel injector.

 Pinch the Teflon seal to allow the tool to cut the Teflon seal without damaging the fuel injector.

32.  CAUTION: Do not use any sharp tools to remove the O-ring seal as damage could occur to the fuel injector.

E115059

33.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

34.

40.

41.

42.

43.

44.  CAUTION: Use a wooden block to protect the oil pan when supporting the engine.
Using a suitable hydraulic jack, support the engine.

45.

46.  WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

CAUTIONS:

 Remove and discard the high-pressure fuel supply lines.

 Be prepared to collect escaping fluids.

 Make sure that all openings are sealed. Use new blanking caps.

 NOTE: Engine shown removed for clarity.

Installation

-  CAUTION: Lubricate only the union threads with clean engine oil.

NOTES:

 Engine shown removed for clarity.

 Install the bolts and unions finger tight before final tightening.

 Remove and discard the blanking caps.

- Torque:
 - Stage 1: 45 Nm

Fuel Charging and Controls - V6 S/C 3.0L Petrol - Throttle Body

Removal and Installation

Removal

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Cooling System Partial Draining, Filling and Bleeding](#) (303-03B Engine Cooling - V6 S/C 3.0L Petrol, General Procedures).

4.

5.

6. Torque: 10 Nm

7.

8. Torque: 10 Nm

9. CAUTIONS:

 Do not attempt to clean the throttle body bore, build up of deposits reduces air leakage past the throttle plate at the fully closed position.

 Take extra care when removing the throttle body, failure to follow this instruction may result in damage to the manifold absolute pressure (MAP) sensor.

- Remove and discard the gasket.
- Install a new gasket.
- Clean the components mating faces.

Installation

1. To install, reverse the removal procedure.
2. Using the approved diagnostic equipment, clear the

powertrain control module (PCM) adaptations.

Accessory Drive - TDV6 3.0L Diesel - Accessory Drive - Overview

Description and Operation

OVERVIEW

The crankshaft pulley drives a six ribbed poly V belt which in turn drives all of the engine mounted accessories.

Accessory Drive - TDV6 3.0L Diesel - Accessory Drive - System Operation and Component Description

Description and Operation

System Operation

OPERATION

The crankshaft pulley is attached to and rotates with the crankshaft. The pulley provides the drive for the accessory drive vee belt which in turn provides rotational power for the front mounted accessories such as the generator, power steering pump, coolant pump and the [A/C \(air conditioning\)](#) compressor.

The crankshaft pulley is a combined pulley and torsional vibration damper.

Component Description

DESCRIPTION

The accessory drive belt, which is a maintenance free poly-V type belt, is automatically pre-loaded by the belt tensioner and routed over idlers in order to maintain sufficient friction around the drive wheels. This ensures slip-free drive of the accessory components.

The torsional vibration damper incorporates compressed rubber between its inner and outer diameters to reduce peak levels of torsional vibration within the crankshaft.

The belt tensioner is calibrated to provide the correct amount of tension to the belt for a given drive system. Unless a spring within the tensioner assembly breaks, or some other mechanical part of the tensioner fails, there is no need to check the tensioner for correct tension.

The accessory drive belt should be inspected at every routine service for excessive wear and damage.

The belt tensioner consists of an idler pulley, which is free to rotate on a bearing located at the end of a spring-loaded pivot arm.

Accessory Drive - TDV6 3.0L Diesel - Accessory Drive

Diagnosis and Testing

Principles of Operation

For a detailed description of the accessory drive system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (303-05 Accessory Drive - TDV6 3.0L Diesel)

- Accessory Drive (Description and Operation),
- Accessory Drive (Description and Operation),
- Accessory Drive (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> • Auxiliary drive belt condition (cracking/damage/contamination) • Idler assembly • Generator • Engine cooling fan • Tensioner assembly • Engine coolant pump • Power steering pump • Air Conditioning (A/C) compressor • Torsional vibration damper • Tensioner assembly • Auxiliary drive belt • Security/correct installation of the fuel injection pump cover • Fuel injection pump belt condition (cracking/damage/contamination) • Fuel injection pump belt tensioner assembly • Fuel injection pump • Fuel injection pump belt

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

CAUTION: If the engine is run without the accessory drive belts connected to eliminate driven components, diagnostic trouble codes, (DTCs) may be set which must be cleared before the vehicle is returned to the owner. The engine should not be run for more than 2-3 minutes with the belts disconnected. Failure to follow this instruction may result in damage to the vehicle.

4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart (accessory drive belt)

Symptom	Possible Causes	Action
Noise	<ul style="list-style-type: none"> • Auxiliary drive belt condition • Auxiliary drive belt tension • Pulleys misaligned • Driven components (including tensioners) 	<ul style="list-style-type: none"> • Check the auxiliary drive belt condition (see visual inspection) • Check the auxiliary drive belt tensioner function • Check the pulley alignment • Check the driven components for excessive resistance to rotation
Auxiliary drive belt does not hold tension	<ul style="list-style-type: none"> • Belt condition • Tensioner fault 	<ul style="list-style-type: none"> • Check the auxiliary drive belt condition (see visual inspection) • Check the auxiliary drive belt tensioner function

Symptom Chart (fuel injection pump belt)

Symptom	Possible Causes	Action
Noise	<ul style="list-style-type: none"> • Fuel injection pump belt condition • Fuel injection pump belt fouling cover • Fuel injection pump belt tensioner bearing failure • Fuel injection pump failure 	<ul style="list-style-type: none"> • Check the fuel injection pump belt condition (see visual inspection) • Check the fuel injection pump belt cover for indications of fouling (this may indicate a pump misalignment), refer to the relevant workshop manual section • The fuel injection pump belt tensioner must be renewed if the belt is removed, making a check of the bearing impractical • Remove the fuel injection pump belt, check the fuel injection pump pulley for security. Check the fuel injection pump for excessive resistance to rotation (excessive resistance in the pump will cause the pulley securing nut to loosen as a design feature). Check for diagnostic trouble codes (DTCs) indicating a pump malfunction
Fuel injection pump belt does not hold tension	<ul style="list-style-type: none"> • Fuel injection pump belt condition • Tensioner fault 	<ul style="list-style-type: none"> • Check the fuel injection pump belt condition (see visual inspection) • Check the tensioner function
Loss of drive (with no drive to the fuel injection pump, the engine will not run)	<ul style="list-style-type: none"> • Fuel injection pump belt broken / stripped teeth • Drive pulleys loose 	<ul style="list-style-type: none"> • Investigate the cause of the fuel injection pump belt breakage/damage (a belt broken at a 45 degree angle normally indicates a shear, a break straight across the belt normally indicates that the belt has been crimped). • Check the fuel injection pump for excessive resistance to rotation (excessive resistance in the pump will cause the pulley securing nut to loosen as a design feature). Check for DTCs indicating a pump malfunction

WARNINGS:

 Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

CAUTIONS:

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Do not disassemble or clean inside the fuel pump, even with an ultrasonic cleaner. Always install a new fuel pump when required.

1. Disconnect the battery ground cable.

15	-	Secondary drive belt tensioner
16	-	Idler pulley
17	-	Secondary drive belt

OVERVIEW

The accessory drive is a belt system powered by a pulley attached to the front of the crankshaft. The crankshaft pulley, which incorporates a torsional vibration damper, drives primary and secondary drive belts. A belt tensioner is incorporated into each belt run to maintain the drive belts at the correct tension. Together with idler pulleys, the belt tensioners also guide the drive belts clear of obstructions and set the correct 'wrap-around' of the accessory component drive pulleys to ensure a slip-free drive.

Primary Drive Belt

The primary drive belt is a six-ribbed poly-V belt that drives the:

- Coolant pump.
- [A/C \(air conditioning\)](#) compressor.
- Generator.

Secondary Drive Belt

The secondary drive belt is an eight-ribbed poly-V belt that drives the pulley of the viscous cooling fan. In addition, the secondary drive belt also drives the supercharger.

Belt Tensioners

Each belt tensioner consists of an idler pulley on the end of a spring loaded pivot arm. The pivot arm can be turned for removal and installation of the belt. Each belt tensioner is calibrated to automatically maintain the correct tension in the related drive belt.

Accessory Drive - V6 S/C 3.0L Petrol - Accessory Drive

Diagnosis and Testing

Principles of Operation

For a detailed description of the accessory drive belts and operation, refer to the relevant Description and Operation section in the Workshop Manual. REFER to:

[Accessory Drive](#) (303-05B Accessory Drive - V6 S/C 3.0L Petrol, Description and Operation),

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is NOT acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> • Drive belt condition (cracking/damage/contamination) • Idler assembly • Generator • Engine cooling fan • Tensioner assembly • Engine coolant pump • Air conditioning (A/C) compressor • Torsional vibration damper • Dynamic response pump • Tensioner assembly • Accessory drive belt

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

CAUTION: If the engine is run without the accessory drive belts connected to eliminate driven components, diagnostic trouble codes, (DTCs) may be set which must be cleared before the vehicle is returned to the owner. The engine should not be run for more than 2-3 minutes with the belts disconnected. Failure to follow this instruction may result in damage to the vehicle.

Symptom	Possible Causes	Action
Noise	<ul style="list-style-type: none"> • Belt condition • Belt tension • Pulleys misaligned • Driven components (including tensioners) 	Check the belt condition (see visual inspection). Check the tensioner function. Check the pulley alignment. Check the driven components for excessive resistance to rotation. Rectify as necessary.
Drive belt does not hold tension	<ul style="list-style-type: none"> • Belt condition • Tensioner fault 	Check the belt condition (see visual inspection). Check the tensioner function. Rectify as necessary.

CAUTION: Diagnosis by substitution from a donor vehicle is NOT acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Starter motor • Engine (turns freely) 	<ul style="list-style-type: none"> • Battery • Fuses • Starter relay • Wiring harness • Damaged, loose or corroded connectors • Ignition switch • Generator • Transmission control module • Engine control module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for diagnostic trouble codes (DTCs) and refer to the DTC index
5. Check DDW for open campaigns. Refer to the corresponding bulletins and SSM's which may be valid for the specific customer complaint and carry out the recommendations as needed.

Symptom Chart

Symptom	Possible Causes	Action
The engine does not crank (starter motor does not turn)	<ul style="list-style-type: none"> • Gear selector not in P or N position (vehicles with automatic transmission) • Battery • Starter relay • Invalid key code received by central junction box • Brake pedal switch failure • Harness/connectors • Starter motor • Ignition switch • Generator • Transmission control module • Engine control module • Engine seized 	Make sure the gear selector is in the P or N position and correctly adjusted. Check the battery condition and state of charge. Check for DTCs indicating an immobilizer or brake pedal switch failure. Check the starter motor relay, ignition switch and generator circuits. Refer to the electrical guides. Check for TCM and ECM DTCs. Check that the engine turns freely
The engine does not crank (starter motor does turn)	<ul style="list-style-type: none"> • Starter motor installation • Starter motor • Flywheel/drive plate ring gear 	Check the starter motor installation (fasteners tight, starter motor square to engine, etc). Check the flywheel/drive plate ring gear teeth for damage, foreign objects, etc
Engine	<ul style="list-style-type: none"> • Battery 	Check the battery condition and state of charge. Check the starter motor

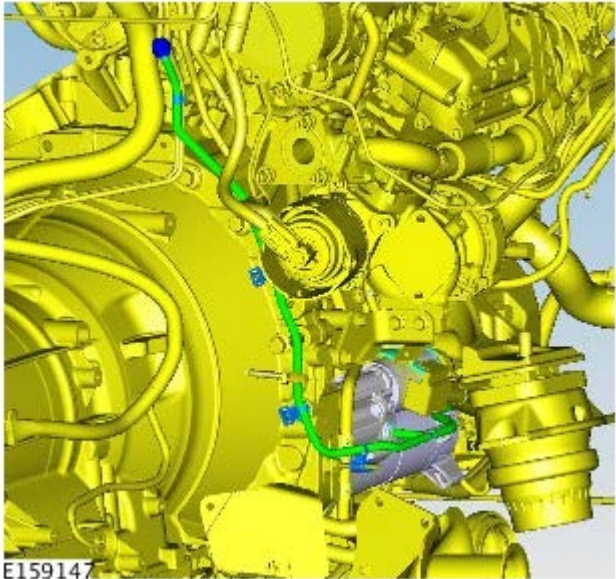

cranks too slowly	<ul style="list-style-type: none"> • Harness/connectors • Starter motor • Oil grade 	circuits. Refer to the electrical guides. Check the engine oil grade and condition
Engine cranks too fast	<ul style="list-style-type: none"> • Low engine compression 	Check the engine compressions
Excessive starter motor noise	<ul style="list-style-type: none"> • Starter motor • Flywheel/drive plate ring gear • Starter motor installation/casing 	Check the starter motor installation (fasteners tight, motor square to engine, etc). Check the starter motor casing condition. Check the flywheel/drive plate ring gear teeth for damage, foreign objects, etc
The engine does not crank (starter motor 'clicks')	<ul style="list-style-type: none"> • Low battery voltage • Battery failure • Water ingress starter motor breather tube • High resistance through connectors, terminals, megafuses, cables, and installation to the starter motor • Failure of starter motor ring gear • Failure of flywheel ring gear 	GO to Pinpoint Test A .

DTC index

For a list of diagnostic trouble codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - TDV6 3.0L Diesel](#), [DTC: Engine Control Module \(ECM\)](#) (100-00 General Information, Description and Operation).

PINPOINT TEST A : STARTER MOTOR PRIOR APPROVAL TEST PROCEDURE	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: PRE CHECKS (MANUFACTURER APPROVED BATTERY TESTER)	
	1 Please refer to workshop manual section 414-01 and carry out the diagnosis and testing using the manufacturer approved test equipment. Record the information using the battery care report sheet
	Have the battery care routines using the manufacturer approved test equipment been carried out and has the information using the battery care report sheet been recorded? Yes Proceed to next step No Carry out the battery care routines using the manufacturer approved test equipment. Record the information using the battery care report sheet Proceed to next step
A2: PRE CHECKS (GENERAL WEATHER CONDITIONS)	
	 NOTE: The results of this test step may be required by dealer technical support
	1 Confirm with the customer and record the weather conditions and ambient temperature (as accurately as possible) at the time of failure
	2 Confirm and record the weather conditions and ambient temperature (as accurately as possible) at the time of test
	Have the weather conditions and ambient temperature been recorded Yes Proceed to next step No Record the weather conditions and ambient temperature Proceed to next step
A3: CHECK FOR RELATED STARTER MOTOR, IMMOBILIZER DIAGNOSTIC TROUBLE CODES	

	<p>1 Using the manufacturer approved diagnostic system, check for starter motor or immobilizer, related DTCs and refer to the relevant DTC index</p>
	<p>Are starter motor or immobilizer, related DTCs logged? Yes Carry out any repair action as required Clear the DTC and retest No Proceed to next step</p>
<p>A4: CHECK INSTALLATION OF STARTER MOTOR BREATHER TUBE</p>	
 <p>E159147</p>	<p>1 Please refer to workshop manual and check the starter motor breather tube is installed and routed correctly. The shepherds crook needs to be positioned correctly to prevent water ingress to the starter motor</p>
	<p>Is the starter motor breather tube installed and routed correctly? Yes Proceed to next step No Install the breather tube and route it correctly Attempt 10 starts to the vehicle. If the vehicle does NOT start during any of the 10 attempts. Install new starter motor If the vehicle DOES start during all of the 10 attempts Proceed to next step</p>
<p>A5: STARTER MOTOR CHECKS</p>	
<p> NOTE: This test will require the technician to listen for audible result, high surrounding noise may hinder the outcome</p>	
	<p>1 Set the ignition ON</p>
	<p>2 Depress the brake pedal</p>
	<p>3 Depress the start button</p>
	<p>Was there an audible click when the start button was pressed and did the vehicle start? (Audible click will not be heard if the vehicle starts) Yes Proceed to next step No Set the ignition OFF. Repeat this starter motor check a further 10 times. Record the result for number of none click tests If there was an audible click when the start button was pressed during the 10 test cycle. Proceed to next step</p>
<p>A6: CHECK CONNECTIONS ON THE STARTER MOTOR</p>	
	<p>1 Please refer to workshop manual section 303-06 specification section</p>

E158114

	2 Gain access to the starter motor
	3 Refer to the electrical circuit diagrams and check the battery power supply and terminal to the starter motor (battery positive cable nut T30 permanent feed B1)
	4 Refer to the electrical circuit diagrams and check the operating supply and terminal to the starter motor (switch lead to the starter motor solenoid nut T50)
	5 Refer to the electrical circuit diagrams and check the power feed stud on the starter motor (T45 terminal)
	6 Refer to the electrical circuit diagrams and inspect connections for signs of becoming loose, water ingress, and terminals/stud for damage and/or corrosion
	Are terminal/stud connections to starter motor, loose, damaged or corroded? Yes Rectify as required Re-check the system is operating correctly Return vehicle to the customer No Proceed to next step

A7: VOLTAGE DROP GROUND CIRCUIT

WARNING: During this test be aware of hot or moving parts. Failure to follow this instruction may result in personal injury

NOTES:

You will require assistance during this test

You may require extended test leads for the multimeter

	1 Connect the multimeter between the battery negative terminal and the starter motor ground (where bolted to the bell housing)
	2 Set the multimeter to read DC voltage. Set the ignition ON. Depress the brake pedal. Depress the start button and record the reading
	Is reading equal to or below 0.6 volts? Yes Proceed to next step No Refer to the electrical circuit diagrams and check ground circuit between battery negative terminal and starter motor for corrosion and high resistance Rectify as required Re-check the system is operating correctly Return vehicle to the customer

A8: VOLTAGE DROP POWER CIRCUIT

WARNING: During this test be aware of hot or moving parts. Failure to follow this instruction may result in

personal injury

NOTES:

You will require assistance during this test

You may require extended test leads for the multimeter

	1 Connect the multimeter between the battery positive terminal and the power feed stud on the starter motor (T45 terminal)
	2 Set the multimeter to read DC voltage. Set the ignition ON. Depress the brake pedal. Depress the start button and record the reading
	Is reading equal to or below 0.8 volts? Yes Proceed to next step No Refer to the electrical circuit diagrams and check power circuit between battery positive terminal and the power feed stud on the starter motor (T45 terminal) including mega fuses, for corrosion and high resistanceRectify as requiredRe-check the system is operating correctlyReturn vehicle to the customer

A9: VOLTAGE AT STARTER MOTOR (T50)

WARNING: During this test be aware of hot or moving parts. Failure to follow this instruction may result in personal injury

NOTES:

You will require assistance during this test

You may require extended test leads for the multimeter

	1 Check the operating supply voltage to the starter motor (T50)
	2 Connect the multimeter between the starter motor (T50) terminal and ground
	3 Set the multimeter to read DC voltage. Set the ignition ON. Depress the brake pedal. Depress the start button and record the reading
	Is the reading between 9 & 12 volts during cranking? Yes Proceed to next step No Refer to the electrical circuit diagrams and check starter relay circuit for open circuit, high resistanceRectify as requiredRe-check the system is operating correctlyReturn vehicle to the customer

A10: VOLTAGE AT STARTER MOTOR SOLENOID (T45)

WARNING: During this test be aware of hot or moving parts. Failure to follow this instruction may result in personal injury

NOTE: You will require assistance during this test

	1 Check the operating supply voltage to the starter motor (T45)
	2 Connect the multimeter between the starter motor (T45) terminal and ground
	3 Set the multimeter to read DC voltage. Set the ignition ON. Depress the brake pedal. Depress the start button and record the reading
	Is the reading between 6 & 9 volts during cranking? Yes Proceed to next step No Check and install new starter motor and breather tube

A11: STARTER MOTOR VISUAL INSPECTION

WARNING: During this test isolate the vehicle battery. Failure to follow this instruction may result in personal injury

	1 Remove the starter motor
	2 Visually inspect the starter motor ring gear for failure
	3 Visually inspect the flywheel ring gear for failure
	<p>Was there evidence of failure to the starter motor of flywheel ring gear</p> <p>Yes</p> <p>Check and install new parts as required Re-check the system is operating correctly Return vehicle to the customer</p> <p>No</p> <p>Contact dealer technical support with all of the recorded values from the above tests</p>

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Stop/Start System

E160453

Item	Part Number	Description
1	-	Stop/start switch
2	-	ECO switch
3	-	Engine Control Module (ECM).

OVERVIEW

The starting system consists of an electric starter motor that engages with the ring gear on the crankshaft drive plate. Operation of the starter motor is controlled by the [ECM \(engine control module\)](#).

In some markets the starting system incorporates a stop/start system. The system is controlled by the ECM using [CAN \(controller area network\)](#) messages and signals from other system components and modules to determine the correct conditions for system operation. The stop/start system automatically stops and re-starts the engine when appropriate conditions are met. This reduces the amount of time the engine is running at idle speed which improves economy and reduces engine emissions.

The stop/start system is automatically enabled each time the ignition is switched on. The driver can disable the system using an ECO switch.

The stop/start system stops the engine when it is not needed, this is known as ECO stop. The engine will restart automatically when vehicle parameters are met and the driver releases the brake pedal, this is known as ECO start.

To accommodate the increased electrical loads, vehicles fitted with the stop/start system are equipped with two batteries.

For additional information, refer to: [Battery and Cables](#) (414-01 Battery, Mounting and Cables, Description and Operation).

DESCRIPTION

Vehicles without the stop/start system use a conventional starter motor. Vehicles with the stop/start system use a TSS (tandem solenoid starter) motor. The TSS motor can restart the engine if it is still rotating, allowing the engine to be started quickly in any situation.

The starter motor is located on the rear right side of the oil pan. The rear of the starter motor is attached to a support bracket on the oil pan. The starter motor incorporates a snorkel breather pipe to assist with ventilation and sealing, during water submergence.

VEHICLES WITHOUT STOP/START

The starter motor is rated at 1.4 kW and comprises a series wound motor, an overrunning clutch and pinion, and a solenoid.

Power to operate the motor is supplied a 400 A megafuse. Power to operate the solenoid is supplied from the starter relay in the [EJB \(engine junction box\)](#).

VEHICLES WITH STOP/START

The TSS motor is rated at 2.0 kW and comprises a series wound motor, an overrunning clutch and pinion, a pinion gear shift solenoid and a motor rotation solenoid.

Power to operate the motor is supplied from a 400A megafuse.. Power to operate the solenoids is supplied from the starter motor relay and the starter pinion relay in the EJB.

ECO Switch

On vehicles with stop/start, the ECO switch is integrated into the Terrain Response® switchpack in the floor console. An amber [LED \(light emitting diode\)](#) in the ECO switch remains illuminated while the stop/start system is active. Selection of the ECO switch is transmitted from the Terrain Response® switchpack to the [ECM](#) on the HS (high speed) [CAN](#) bus.

Warning Indicator

E147783

On vehicles with stop/start, an ECO warning indicator is located in the IC (instrument cluster). The warning indicator comes on when the engine stops during a stop/start cycle, then goes off when the engine restarts. The warning indicator is controlled by a HS CAN bus message from the ECM.

OPERATION

Vehicles Without Stop/Start

When the engine stop/start switch is pressed, if the KVM (keyless vehicle module) detects a valid smart key in the vehicle the [CJB \(central junction box\)](#) transmits a hardwired crank request to the [ECM](#).

For additional information, refer to: [Passive Anti-Theft System \(PATS\) Module](#) (419-01B Anti-Theft - Passive, Removal and Installation).

When the ECM receives a crank request from the CJB it energizes the starter relay, provided the [TCS \(transmission control switch\)](#) is in P (park) or N (neutral) and the brake pedal is pressed. The energized starter relay supplies battery power to the starter solenoid, which energizes and causes the pinion gear to engage with the ring gear. When the starter solenoid is energized it also closes high-current contacts, which connects battery power via 400 A megafuse to the motor to turn the engine.

Vehicles With Stop/Start

At the beginning of a drive cycle, when the engine stop/start switch is pressed the starting system operates in the same way as on vehicles without stop/start, up to the point that the [ECM](#) energizes the starter relay. At that point, on the stop/start system, the ECM energizes both the starter pinion relay and the starter motor relay. The energized starter motor relay supplies battery power to the pinion gear shift solenoid in the starter, which energizes and causes the pinion gear to engage with the ring gear. The energized starter pinion relay supplies battery power to the motor rotation solenoid in the starter, which energizes and closes high-current contacts, which connects battery power via

400 A megafuse to the motor to turn the engine.

During a drive cycle, with the stop/start system enabled and the TCS in D (drive) or S (sport), the ECM performs an ECO stop when one of the following occurs:

- The vehicle stops from a speed greater than 4 km/h (2.5 mph) and sufficient brake pressure is applied to the brake pedal to ensure the vehicle is stationary
- The vehicle is stationary and N is selected on the TCS.

NOTE: On a gradient an ECO stop will only occur if the driver applies a minimum of 7 bar (101.5 lbf/in²) + / - 3 bar (43.5 lbf/in²) brake pressure and will not occur at all on gradients about in excess of 1 in 4.34 (23%).

The green ECO warning indicator in the IC (instrument cluster) illuminates to advise that the engine has shut down. Other warning indicators normally associated with an engine shut down, for example the ignition and low oil pressure warning indicators, are suppressed so will not illuminate during an ECO stop.

The following conditions will prevent an ECO stop:

- A steering wheel paddle switch has been used to select a gear (transmission command shift mode).
- The ambient air temperature is outside the range of 0 to 40 °C (32 to 104 °F).
- The engine coolant temperature is outside the range of 20 to 110 °C (68 to 230 °F).
- Brake vacuum is less than the threshold value.
- The pressure altitude derived from the barometric pressure sensor in the ECM is more than approximately 2800 m (9150 feet).
- The hood is open.
- The driver door is open.
- The driver seatbelt is not fastened.
- High demand from the climate control system requires the engine to be running, for example windshield demist selected.
- The battery charge is low.
- A Terrain Response® special program is active.
- Hill descent control is active.
- The level in the fuel tank is too low.
- ECO stop/start is disabled using the ECO switch.

While the vehicle is stationary, if a condition that prevented an ECO stop is removed the ECM automatically performs an ECO stop. The ECM automatically restarts the engine when one of the following occurs:

NOTE: When the brake pedal is released during an ECO restart the ABS (anti-lock brake system) control module briefly applies the brakes to hold the vehicle stationary until the engine has restarted.

- The brake pedal is released with D or S selected on the TCS.
- The accelerator pedal is pressed.
- A paddle switch is used to select a gear.
- R (reverse) is selected on the TCS.
- Climate control system demand increases.
- The vehicle speed exceeds approximately 1 km/h (0.5 mph).
- The battery charge becomes low.
- Brake vacuum reduces below the threshold value.
- ECO stop/start is disabled using the ECO switch.

The following will prevent an ECO restart, and require use of the engine stop/start switch to restart the engine:

- The hood is open.
- The driver door is open.
- The driver seatbelt is not fastened.

STOP/START STRATEGY

Operating the motor and the pinion gear individually allows meshing of the pinion gear with the drive plate ring gear, even if the engine is still turning. This allows instant restarts under all conditions.

Engine speed 250 rev/min or more: When an ECO stop is initiated and the ECM then detects an engine restart parameter, it operates the starter motor to first accelerate the pinion gear up to the ring gear speed, then engages the pinion gear with the ring gear and energizes the motor to rotate the engine up to starting speed. The ECM also activates the fueling and engine systems to restart the engine.

Engine speed less than 250 rev/min: When an ECO stop is initiated and the ECM then detects an engine restart parameter, it operates the starter motor to first engage the pinion gear with the ring gear, then energizes the motor to rotate the engine up to starting speed. The ECM also activates the fueling and engine systems to restart the engine.

Glow Plug System - TDV6 3.0L Diesel - Glow Plug System - Overview

Description and Operation

OVERVIEW

The glow plug system includes a glow plug installed in the inlet side of each cylinder and a glow plug module. The glow plugs heat the combustion chambers before and during cranking, to aid cold starting, and after the engine starts to reduce emissions and engine noise when idling with a cold engine.

The glow plugs are connected for each bank by a common harness which is connected into the main engine harness. The harness for each bank connects into a connector block which attaches to each of the glow plugs for that bank. The glow plugs are connected directly to the glow plug module which is controlled by glow plug software contained within the [ECM \(engine control module\)](#).

Glow Plug System - TDV6 3.0L Diesel - Glow Plug System - System Operation and Component Description

Description and Operation

- 8 Glow plug
- 9 [ECM \(engine control module\)](#)
- 10 Instrument cluster (glow plug warning indicator)
- 11 [CJB \(central junction box\)](#)

System Operation

System Operation

There are three phases of glow plug heating:

- Pre heating
- Crank heating
- Post heating

The [ECM](#) determines the heating times from the [ECT \(engine coolant temperature\)](#). The lower the engine coolant temperature, the longer the heating times.

When the ignition is switched to power mode 9, the [ECM](#) calculates any required heating times and, if heating is required, energizes the glow plug relays in the [CJB](#). When pre heating is required, the [ECM](#) also sends a message to the instrument cluster, on the high speed [CAN](#), to request illumination of the glow plug indicator. The glow plug indicator remains illuminated for the duration of the pre heating phase, or until the ignition is switched to crank, whichever occurs first. If required, the [ECM](#) keeps the glow plug relays energized during cranking and for the duration of any post heating phase.

The **ECM** monitors the drive circuit of the glow plug relay for plausibility of operation, continuity, and short and open circuits. If a fault is detected, the **ECM** stores a related fault code.

Pre Heating

Pre-heat is the length of time the glow plugs operate prior to engine cranking. The **ECM** controls the pre-heat time based on **ECT** sensor output and barometric pressure. If the **ECT** sensor fails, the **ECM** will use a predefined temperature as a default value. The pre-heat duration is extended if the coolant temperature is low.

The **ECM** receives the corresponding temperature signal from the **ECT** sensor.

The preheating period is dependent on the temperature signal (low temperature = longer preheating period).

The driver is informed that preheating is in operation by the glow plug indicator light in the instrument cluster coming on. The preheating times become longer as the coolant temperature falls.

The **BARO (barometric pressure)** also has an influence on activation and deactivation of the glow plugs in the event of large altitude differences.

Crank Heating

Crank heating is carried out at every start where the coolant temperature is below the predefined threshold of 20°C. Crank heating begins if the engine speed exceeds 80 rpm for longer than 50ms, or the starter is active for longer than 4 sec. If the coolant temperature sensor is defective, a default temperature of 0°C is used.

Post Heating

Post heat is the length of time the glow plugs operate after the engine starts. The **ECM** controls the post heating time based on **ECT** sensor output. The post heat phase reduces engine noise, improves idle quality and reduces hydrocarbon emissions.

Preheating is followed by the post heating phase once the engine has started. The post heating phase depends upon how the vehicle is driven.

In addition to **ECT**, **BARO** and engine speed, the injected fuel quantity is significant in this context. For example, if the injected fuel quantity is less than 70 mg per piston stroke and the coolant temperature is below -20°C, post heating is performed.

Component Description

Glow Plug

The ceramic sheathed element glow plugs are made from a heat-resistant, electrically conductive ceramic material. The ceramic sheathed-element glow plugs outer layer is heated directly and is self regulating. The self regulation allows the resistance of the sheathed element to automatically increase as the heat increases preventing the glow plug from overheating. In addition, during the heating process and under the control of the glow plug relay, the glow plugs can be operated above their nominal voltages. This permits heat-up speeds of 1000°C per second. The sheathed-element glow plugs reach a maximum glow temperature of 1300°C and can hold a temperature of 1150°C for several minutes after the first-start glow or at intervening times.

Each cylinder bank has a separate harness connecting the three glow plugs. The harness connects into the engine wiring harness and each harness has a connector block which attaches to each of the glow plugs for that bank.

The glow plug module receives a battery voltage feed via a 250A fusible and a 60A fuse in the engine compartment fusebox. Operation of the glow plug module is controlled by the **ECM**, which also controls the illumination of the glow plug indicator in the instrument cluster.

The system has been designed as a low-voltage glow system. At 7 volts, the nominal voltage of the sheathed-element glow plugs is significantly lower than the 12 volts of the main electrical circuit. The electronic glow plug module matches the voltage to the sheathed-element glow plugs and controls their glow temperature precisely to the specific requirements of the engine. This produces the optimum glow temperature even when the main circuit voltage is interrupted during engine starting. The lower power consumption of the ceramic glow plugs and their time-staggered activation reduce to a minimum the peak load on the main circuit during the cold start and immediate post-start periods.

In the event of glow plug failure, the engine may be difficult to start and excessive smoke emissions may be observed after starting.

Item	Part Number	Description
1	-	Radio Frequency Interference (RFI) suppressor
2	-	Engine Control Module (ECM)
3	-	Spark plug (6 off)
4	-	Ignition coil (6 off)

OVERVIEW

The engine ignition system is a coil-on-plug, single spark system controlled by the [ECM \(engine control module\)](#). The spark plugs are installed one per cylinder, between the inlet and exhaust valves. The spark plugs feature an iridium-tripped (IR) centre electrode (CE), and a platinum-tripped (PT) ground electrode (GE). The energy stored in the ignition coil, manifests itself on the spark plug in terms of a voltage differential between the electrodes. When the voltage differential equals the required voltage, then the spark plugs and the stored energy is dissipated. An ignition coil is installed on each spark plug. A RFI (radio frequency interference) suppressor is connected to the power feed to the ignition coils.

DESCRIPTION

Ignition Coils

The ignition coils are installed in the cylinder head covers, under the [NVH \(noise, vibration and harshness\)](#) covers.

Each ignition coil locates on a spark plug and is secured to the related cylinder head cover with a single screw. Each ignition coil incorporates a three pin electrical connector for connection to the engine harness.

Each ignition coil contains a primary and a secondary winding. The primary winding receives electrical power from the ignition relay in the **EJB (engine junction box)**. A power stage in the primary winding allows the ECM to interrupt the power supply, to induce a voltage in the secondary winding and thus the spark plug. A diode in the ground side of the secondary winding reduces any undesirable switch-on voltage, to prevent misfiring into the intake manifold. The power stage limits the maximum voltage and current in the primary winding, to protect the power stage and limit the voltage in the secondary winding.

RFI Suppressor

E108416

The RFI suppressor is installed on the engine harness carrier at the rear of the engine.

OPERATION

The ignition coils are supplied with electrical power from the **ECM** relay in the **EJB**. The ECM controls the operation of the ECM relay.

The ECM sends a separate signal to each ignition coil to trigger the power stage switching. The ECM calculates the dwell time from the battery voltage and engine speed, to ensure a constant energy level is produced in the secondary coil each time the power stage is switched. This ensures sufficient spark energy is available without excessive primary current flow, which avoids overheating and damage to the ignition coils.

The ECM calculates the ignition timing for individual cylinders from:

- Engine speed
- Camshaft position
- Engine load
- Engine temperature
- The knock control function
- The shift control function
- The idle speed control function

Engine Emission Control - TDV6 3.0L Diesel - Engine Emission Control - Overview

Description and Operation

OVERVIEW

Exhaust Gas Recirculation (EGR) System

The [EGR \(exhaust gas recirculation\)](#) system is used to control the amount of exhaust gas being recirculated in order to reduce exhaust emissions and combustion noise. [EGR](#) is enabled when the engine is at normal operating temperature and under cruising conditions.

Crankcase Ventilation System

The crankcase ventilation system ensures that all gasses emitted from the crankcase when the engine is running are separated from any oil particles and recirculated via the clean air induction system.

Engine Emission Control - TDV6 3.0L Diesel - Engine Emission Control - System Operation and Component Description

Description and Operation

System Operation

EXHAUST GAS RECIRCULATION (EGR) SYSTEM OPERATION

If small volumes of fuel are injected into a combustion chamber full of pure air, the effect is to create a very lean mixture. This burns at a high temperature, which in turn causes the excess oxygen in the mixture to combine with the naturally occurring nitrogen in the air to create nitrogen oxides (NOx), a noxious class of pollutants associated with acid rain. This is a particular problem for diesel engines at low to medium loads (as the engine has no throttle, the cylinder is replenished with a full charge of 'air' at every induction stroke). Exhaust gas is blended into the intake air charge to create the cylinder charge. As the exhaust gas effectively contains no oxygen, it prevents the formation of a very lean mixture, so lowering combustion temperatures and minimizing the formation of NOx.

At low engine speeds and loads, over 50 percent of the cylinder charge can be made up of recycled exhaust gas. This is routed directly from the exhaust manifold and passes through a gas-water heat exchanger before being supplied to the inlet manifold. The volume of exhaust gas added to the intake charge is regulated by an electronically controlled [EGR \(exhaust gas recirculation\)](#) valve, actuated according to precise engine speed and load by the engine management system.

CRANKCASE VENTILATION SYSTEM OPERATION

Crankcase gasses are drawn into the oil separator unit from the crankcase and the cylinder head covers (both banks) by a vacuum created by a connection into the air induction system.

The crankcase gasses are circulated around the oil separator where the gas and oil are separated. The gas is returned to the inlet side of the air induction system prior to the primary turbocharger. The collected oil is drained down to the sump via the oil cooler and filter housing on the cylinder block.

Component Description

EXHAUST GAS RECIRCULATION (EGR) SYSTEM

EGR System Control Components

E121203

Item Description

- 1 Oxygen sensor
- 2 Exhaust gas temperature sensor [LH \(left-hand\)](#)
- 3 Exhaust pipe
- 4 [EGR](#) cooler
- 5 By-pass valve vacuum actuator [EGR](#) valve motor

- 6 EGR outlet pipe
- 7 EGR cooler and valve housing
- 8 EGR inlet pipe
- 9 Exhaust system cross-over pipe

The EGR system comprises an EGR cooler and housing assembly which is bolted to the cylinder head, above the exhaust manifold. Each EGR assembly comprises an EGR cooler, a by-pass housing, a by-pass valve motor and a by-pass valve vacuum actuator.

A pipe is connected to the exhaust manifold and directs exhaust gasses into the by-pass housing. A second pipe from the by-pass housing connects to the throttle intake manifold and passes the cooled exhaust gasses into the intake manifold to mix with the clean air entering the engine from the air filter.

The EGR cooler is attached to the by-pass housing with a gasket and 5 screws. The by-pass housing has an engine coolant connection which allows coolant to flow from the engine oil cooler into the by-pass housing. Engine coolant flows from the by-pass housing into a water jacket within the cooler which in cools the exhaust gasses by heat transfer within the cooler. The engine coolant flows from the cooler through an outlet pipe and is passed back into the cooling system via the heater core.

The by-pass housing contains the EGR valve motor, the EGR valve and the by-pass valve.

By-pass Housing Components

E107585

Item Description

- 1 By-pass valve vacuum actuator
- 2 EGR valve motor
- 3 EGR valve
- 4 By-pass valve

By-Pass Valve

The by-pass valve is a vacuum operated valve which directs the flow of exhaust gasses either through the EGR cooler or by-passes the cooler and directs the gasses directly to the intake manifold.

A vacuum actuator is located on a bracket attached to each EGR cooler. The actuator receives a vacuum which is produced by the vacuum pump located at the rear of the engine. The vacuum actuator is connected to the by-pass valve within the by-pass housing by a connecting rod.

The vacuum supply to the actuator is controlled by the ECM (engine control module). When by-pass control is required, the ECM energizes a vacuum solenoid valve which applies vacuum to the vacuum actuators. The vacuum causes the actuators to move the connecting rods in a linear direction. The linear movement of the rod is transferred to rotary movement of the by-pass valve within the by-pass housing.

By-Pass Valve Closed

E112407

When the by-pass valve is closed, exhaust gasses are directed through the cooler before being passed to the intake manifold.

By-Pass Valve Open

E112408

When the by-pass valve is open, exhaust gasses are passed directly through the by-pass housing into the intake manifold with no cooling applied to the gasses.

EGR Valve

The EGR valve motor is located on the by-pass housing. A 5 pin connector provides the power, ground and ECM signal and feedback connections for the motor.

The motor is secured to the by-pass housing with 4 torx screws. A pinion gear on the motor spindle drives a geared rack which is connected to the EGR valve in the by-pass housing.

The motor is controlled by the ECM which provides power supply to operate the motor as required. A 5 Volt feedback signal is passed to the ECM which is used to establish motor position for precise control.

CRANKCASE VENTILATION

The crankcase ventilation system comprises an oil breather and separator. The breather receives crankcase directly from the crankcase and also from the cylinder heads.

The breather is connected to the top of the cylinder block with two seals. Two scavenge pipes located on the top of the breather are connected to the cylinder head covers. A breather pipe is connected from the top of the breather to the clean air intake hose at a point prior to the primary turbocharger.

Clean air being drawn into the engine when it is running creates a vacuum in the breather pipe. This vacuum in turn creates a vacuum in the oil breather and separator which draws gasses from the crankcase and cylinder heads into the breather. These gasses are circulated around the breather, allowing oil particles to be separated from the gas. The gasses are drawn into the breather pipe and are mixed with the clean air being drawn into the turbocharger.

The oil particles separated from the gasses accumulate in the oil separator and drain through a third connection at the bottom of the oil breather and separator, through a connection on the oil cooler housing to the oil pan.

Engine Emission Control - V6 S/C 3.0L Petrol - Engine Emission Control

Description and Operation

COMPONENT LOCATION

E153321

Item	Part Number	Description
1	-	Part load breather
2	-	Full load breather

OVERVIEW

The engine emission control system reduces the level of hydrocarbon emissions released to atmosphere from the engine. The engine emission control system consists of a **PCV (positive crankcase ventilation)** system with part and full load breathers. Piston blow-by gases and metered fresh air are drawn through the breathers into the engine air intake and added to the air charge. The resultant depression in the engine sump, front covers and cylinder head covers reduces the load on the joint seals in those areas.

DESCRIPTION

Part Load Breather

E144022

Item	Part Number	Description
A	-	Gas/Oil vapor
B	-	Gas vapor
C	-	Oil
1	-	Positive Crankcase Ventilation (PCV) valve
2	-	Oil separator
3	-	Flexible hose
4	-	Baffle plate
5	-	Oil drain

The part load breather consists of an oil separator, a [PCV](#) valve and a flexible hose. The oil separator and the PCV valve are installed in the top of the right camshaft cover. The flexible hose connects the right camshaft cover to the inlet of the supercharger.

The oil separator is installed in a channel in the top of the camshaft cover. A baffle plate, which incorporates a gas inlet and an oil drain, is installed over the channel. The PCV valve is installed on the outside of the camshaft cover and connected to the gas outlet from the channel to the flexible hose. The PCV valve regulates the crankcase pressure and crank case flow to optimize engine performance.

Full Load Breather

E144023

Item	Part Number	Description
A	-	Gas/Oil vapor
B	-	Gas vapor
C	-	Oil
1	-	Flexible hose
2	-	Two-way valve
3	-	Oil drain
4	-	Oil separator
5	-	Baffle plate

The full load breather consists of an oil separator, a two-way valve and a flexible hose. The oil separator and the two-way valve are installed in the top of the left camshaft cover. The flexible hose connects the left camshaft cover to the left air duct of the intake air distribution and filtering system.

The oil separator is installed in a channel in the top of the camshaft cover. A baffle plate, which incorporates a gas inlet and an oil drain, is installed over the channel. The two-way valve is installed in the gas outlet from the channel. The two-way valve regulates fresh air flow and improves idle stability.

Intake Air Distribution and Filtering - TDV6 3.0L Diesel - Intake Air Distribution and Filtering - Overview

Description and Operation

Authoring Template

OVERVIEW

The intake air distribution and filtering system comprises:

- Two [MAF \(mass air flow\)](#) / [IAT \(intake air temperature\)](#) sensor
- Charge air temperature sensors
- Air cleaner and housing
- Charge air cooler
- Primary and secondary turbochargers.

The system cleans, cools and compresses the intake air. The turbochargers compress the air which is then cooled in the charge air cooler before being mixed with the injected fuel in the cylinder producing a high energy combustion increasing engine performance.

Intake Air Distribution and Filtering - TDV6 3.0L Diesel - Intake Air Distribution and Filtering - System Operation and Component Description

Description and Operation

System Operation

OPERATION

Air is drawn into the air intake system via the air intake vent located on the front **RH (right-hand)** fender of the vehicle. The air passes into the air cleaner housing and passes through the air cleaner. The air cleaner is a pleated, paper type filter which removes dust, pollen etc. from the intake air.

The filtered clean air passes from the air cleaner housing to the turbocharger inlet valve assembly. Depending on engine load and operating conditions, the intake air can be passed to only the primary turbocharger or to both the primary and secondary turbochargers.

Exhaust gasses leaving the exhaust manifolds are used to drive a turbine in the turbocharger which in turn drives a compressor. The rotational speed of the compressor is directly related to the speed of the exhaust gasses leaving the engine. Increased exhaust gas emission drives the turbine, and subsequently the compressor, faster, further compressing the intake air delivered to the engine.

The compression of the air by the turbocharger increases the air pressure. The intake air is passed into the charge air cooler which reduces the air temperature as it passes through the cooler. This in turn increases the volumetric efficiency by increasing intake air charge density. The cooled and compressed air is mixed with the injected fuel in the cylinder producing a high energy combustion increasing engine performance.

Component Description

DESCRIPTION

Air Cleaner and Housing

The air cleaner housing is located in the front **RH** side of the engine compartment. The housing has a water drain. Two **NVH (noise, vibration and harshness)** mounting grommets secure the air cleaner housing.

The air cleaner element is a pleated paper type element with a rubber seal around its perimeter. The seal locates in a groove in the housing and prevents air by-passing the element. The housing upper lid can be removed by removing 4 screws to release the lid.

Charge Air Cooler

The charge air cooler is located at the front of the engine compartment, between the **A/C (air conditioning)** condenser and the engine cooling radiator.

Turbochargers are designed to force more air mass into the engine intake manifold and combustion chambers. This compression process by the turbocharger produces heat which can reduce the performance gains of turbocharging due to reduced density of the intake air and an increase the cylinder combustion temperature. To counteract this, the charge air cooler is used to reduce the intake air temperature which increases the density of the air allowing more air molecules to be delivered to the combustion chamber.

The cooler is a cross flow type cooler and has inlet and outlet connections. The bottom **LH (left-hand)** and **RH** connections are the inlets for the compressed air delivered from the turbocharger compressors. The top **RH** connection is the outlet for the cooled compressed air to be delivered to the throttle intake manifold.

The charge air cooler is an air-to-air type cooler. Heated air from the turbochargers is passed through tubes in the cooler. Ambient air passing over the tubes cools the intake air as it passes through the cooler.

Air Intake Components

The air intake components comprise 3 main components; airbox, intake ducting and a throttle intake manifold.

Airbox

The airbox allows for the connection of the cooled intake air from the charge air cooler to the throttle intake manifold. The air cleaner housing houses a **MAF (mass air flow)** sensor incorporating a temperature sensor which measures the air entering the turbochargers and passes this information to the **ECM (engine control module)**. Refer to: Electronic Engine Controls (303-14 Electronic Engine Controls - 3.0L Diesel, Description and Operation).

There are two ducts from the airbox, one ducts air to the primary turbocharger and the other to the secondary turbocharger. Boost pressure is applied via the secondary ducting to the secondary turbocharger to maintain the correct lubrication during driving conditions where the secondary turbocharger is inactive.

Refer to: Turbocharger (303-04 Fuel Charging and Controls - Turbocharger - 3.0L Diesel, Description and Operation).

Throttle Intake Manifold

The throttle intake manifold is located between the 2 intake manifolds and the airbox. The manifold splits the air entering the engine between the 2 intake manifolds.

The throttle intake manifold houses a [DC \(direct current\)](#) electric throttle actuator which controls a flap in the body of the manifold. The flap is controlled by the [ECM](#) and is constantly adjusted in response to driver inputs via the throttle pedal to precisely control the amount of air allowed into the intake manifolds.
Refer to: Electronic Engine Controls (303-14 Electronic Engine Controls - 3.0L Diesel, Description and Operation).

Pipe connections on either side of the throttle intake manifold allow for the attachment of the exhaust gas outlet pipes from the [EGR \(exhaust gas recirculation\)](#) valves. The ends of the [EGR](#) pipes are specially designed to mix the recirculated exhaust gas with the intake air and provide an even distribution to each side of the engine.
Refer to: Engine Emission Control (303-08 Engine Emission Control - 3.0L Diesel, Description and Operation).

A boost pressure sensor is located on the top of the manifold where the air flow splits for the 2 intake manifolds. The pressure sensor measures the pressure of the intake air as delivered from the one or both of the turbochargers and passes this information to the [ECM](#) for turbocharger control.
Refer to: Electronic Engine Controls (303-14 Electronic Engine Controls - 3.0L Diesel, Description and Operation).

Intake Manifolds

The intake manifolds are an integral part of the cylinder head covers. Each intake manifold is connected to the throttle intake manifold via a push fit, sealed connection. The intake manifolds direct intake air to the inlet valves for each combustion chamber.

Intake Air Distribution and Filtering - TDV6 3.0L Diesel - Intake Air Distribution and Filtering

Diagnosis and Testing

Principles of Operation

Intake Air Distribution and Filtering - V6 S/C 3.0L Petrol - Intake Air Distribution and Filtering

Description and Operation

COMPONENT LOCATION

E160709

Item	Part Number	Description
1	-	Right intake grilles
2	-	Right dirty air duct
3	-	Right air cleaner
4	-	Clean air ducts
5	-	Left air cleaner
6	-	Left dirty air duct
7	-	Left intake grilles
8	-	Electric throttle
9	-	Supercharger and intake manifolds

OVERVIEW

The intake air distribution and filtering system comprises:

- Two dirty air ducts.
- Two air cleaners.
- Clean air ducts.

- An electric throttle.
- Supercharger and intake manifolds.

Air flows through the dirty air ducts, air cleaners, clean air ducts and electric throttle to the supercharger. The supercharger compresses the air, which is then directed through charge air coolers in the intake manifolds and into the cylinders.

DESCRIPTION

Dirty Air Ducts

E160710

Item	Part Number	Description
1	-	Retaining bracket
2	-	Dirty air duct
3	-	Intake grille

The dirty air ducts are installed in the front fenders to transfer ambient air from under the edges of the hood to the air cleaners.

Each dirty air duct locates in the intake of the related air cleaner. The intake of each dirty air duct is attached to two intake grilles on side of each front fender.

A porous section, covered by a non-porous sleeve to prevent moisture ingress, is incorporated into each dirty air duct to reduce induction noise.

Air Cleaners

E160711

Item	Part Number	Description
1	-	Mass Air Flow and Temperature (MAFT) sensor
2	-	Lid
3	-	Screw (6 off)
4	-	Air intake
5	-	Drain valve
6	-	Isolater
7	-	Base

An air cleaner is located in each front corner of the engine compartment. Two spigots fitted with isolator bushes locate each air cleaner in holes in the related front suspension housing.

Each air cleaner consists of a filter element installed in a base and enclosed with a lid secured by six screws. The filter element is a pleated, paper type with an integral seal. Air intake and outlet connections are incorporated into the base and lid respectively. The bottom of the base incorporates a drain valve to prevent the accumulation of water in the air cleaner.

The air outlet connection of each air cleaner incorporates a [MAFT \(mass air flow and temperature\)](#) sensor. The sensors are connected to the [ECM \(engine control module\)](#). For additional information, refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - V6 S/C 3.0L Petrol, Description and Operation).

Clean Air Ducts

E153550

Item	Part Number	Description
1	-	Resonators
2	-	Right convolute
3	-	Right air intake
4	-	Support bracket
5	-	Resonator
6	-	Air outlet
7	-	Resonator
8	-	Full load breather connector stub
9	-	Left convolute
10	-	Left air intake

The clean air ducts transfers air from the air cleaner outlets to the electric throttle. Two convolute sections in the clean air ducts accommodate the relative movement between the engine mounted electric throttle and the body mounted air cleaners.

The clean air duct also incorporates the following:

- Resonators, to reduce air induction noise.
- A connector stub for the engine full load breather pipe.

The clean air duct is supported by a bracket attached to the right cylinder head.

Electric Throttle

E144601

Item	Part Number	Description
1	-	Electric motor
2	-	Air intake
3	-	Air outlet
4	-	Coolant supply connection
5	-	Coolant return connection

The electric throttle regulates the air flow into the supercharger.

The electric throttle is installed at the front of the engine, between the cylinder heads.

The throttle plate is operated by a **DC (direct current)** electric motor attached to the throttle body. The motor is controlled by the **ECM** and is constantly adjusted in response to driver inputs with the throttle pedal to precisely control the amount of air allowed into the intake manifold.

For additional information, refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - V6 S/C 3.0L Petrol, Description and Operation).

To prevent icing, coolant is circulated across the throttle body through coolant supply and return connections.

Supercharger and Intake Manifolds - Assembled

E144794

Item	Part Number	Description
1	-	Coolant outlet connections
2	-	Coolant inlet connections
3	-	Charge air cooler tank top
4	-	Intake manifolds
5	-	Supercharger bypass valve actuator
6	-	Inlet port
7	-	Manifold Absolute Pressure (MAP) sensor
8	-	Supercharger pulley
9	-	Noise, Vibration and Harshness (NVH) pads
10	-	Dowel
11	-	Manifold Absolute Pressure and Temperature (MAPT) sensor
12	-	Vacuum connector stub
13	-	Outlet ports

Supercharger and Intake Manifolds - Exploded

E144795

Item	Part Number	Description
1	-	Screw M8 x 35 mm (15 off)
2	-	Screw M8 x 150 mm (2 off)
3	-	Screw M8 x 65 mm (4 off)
4	-	Charge air cooler tank top
5	-	Gasket
6	-	Screw M8 x 45 mm (6 off)
7	-	Charge air cooler tank with Manifold Absolute Pressure and Temperature (MAPT) sensor.
8	-	Vacuum outlet hose connector
9	-	Left intake manifold
10	-	Screw M8 x 35 mm (6 off)
11	-	Gasket
12	-	Screw M8 x 50 mm
13	-	Noise, Vibration and Harshness (NVH) pad (2 off)
14	-	Supercharger bypass Valve
15	-	Supercharger bypass valve actuator
16	-	Noise, Vibration and Harshness (NVH) pad rear (2 off)
17	-	Supercharger pulley
18	-	Gasket
19	-	Electric throttle
20	-	Screw and bush (4 off)
21	-	Right intake manifold

22	-	Manifold Absolute Pressure (MAP) sensor
23	-	Charge air temperature sensor

The supercharger increases the pressure, and thus mass, of the air supplied to the engine, to increase the engine's power output. Two separate intake manifolds direct air from the supercharger to the cylinder intake ports.

The intake manifolds are attached to their related cylinder heads and the sides of the supercharger. Two dowels locate the supercharger in position on the cylinder block. A charge air cooler tank top is installed on top of the supercharger and intake manifolds to form the air duct from the supercharger outlet to the intake manifolds. A charge air cooler is installed in each intake manifold.

A **NVH (noise, vibration and harshness)** pad is attached to the side of each intake manifold. The rear of the right intake manifold incorporates a connection port for the symposer intake pipe. The rear of the left intake manifold incorporates:

- A connector stub for the brake vacuum system.
- A MAPT (manifold absolute pressure and temperature) sensor.

The supercharger is a roots blower with high angle helix rotors driven at 2.5 times engine speed by the secondary belt of the accessory drive.

The two rotors of the supercharger are contained in a housing. The ends of the rotors are supported in bearings in the front cover and the bearing plate. A rear cover seals the bearing plate. A pulley transfers power from the accessory drive to the shaft of one of the rotors.

A **DC** electric actuator on the front cover is attached to the supercharger bypass valve in the housing. The supercharger bypass valve allows air to bypass the rotors, to control the outlet pressure of the supercharger. Operation of the actuator is controlled by a **PWM (pulse width modulation)** signal from the **ECM**. A hall effect position sensor in the actuator returns a 0.5 to 4.5 V signal to the ECM. This allows the ECM to identify the position of the supercharger bypass valve for closed-loop control.

The front cover also incorporates:

- The supercharger air intake and mounting face for the electric throttle.
- A connector stub for the part load breather.
- A MAP (manifold absolute pressure) sensor.
- A connector stub for a hose from the **EVAP (evaporative emission)** canister purge valve.

OPERATION

At closed or partially open throttle positions, the bypass valve is fully open, allowing intake air to bypass the supercharger. This results in little or no pressure increase across the supercharger. Progressive opening of the throttle reduces the depression downstream of the electric throttle. This is sensed by the **ECM** from the **MAP (manifold absolute pressure)** sensor input. The ECM then signals the supercharger bypass valve actuator to progressively close the bypass valve. As the bypass valve closes there is a corresponding increase in the outlet pressure from the supercharger, which increases engine power output.

Intake Air Distribution and Filtering - V6 S/C 3.0L Petrol - Intake Air Distribution and Filtering

Diagnosis and Testing

Principles of Operation

For a detailed description of the intake air distribution and filtering system and operation, refer to the relevant Description and Operation section in the workshop manual.

REFER to: [Intake Air Distribution and Filtering](#) (303-12B Intake Air Distribution and Filtering - V6 S/C 3.0L Petrol, Description and Operation) /

Intake Air Distribution and Filtering (303-12C, Description and Operation) /

Evaporative Emissions - V6 S/C 3.0L Petrol - Evaporative Emissions

Diagnosis and Testing

Principles of Operation

For a detailed description of the evaporative emission system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (303-13A)

Evaporative Emissions (Description and Operation),
Evaporative Emissions (Description and Operation),
Evaporative Emissions (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Fuel filler cap and seal • Fuel filler neck • DMTL fresh air filter (restriction, etc) • Fuel tank (leaks, damage, etc) • Fuel lines and joints, etc • Carbon canister • Purge valve • Diagnostic module fuel tank leak (DMTL) pump module 	<ul style="list-style-type: none"> • Fuses • Connectors • Harness • Purge valve • Diagnostic module fuel tank leak (DMTL) pump

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.
5. Where K-Line, Vacutec or other proprietary smoke test equipment is available, it should be utilized to assist with Evaporative Emissions System leak diagnosis.

Symptom Chart

Symptom	Possible Causes	Action
Difficulty in filling fuel tank	<ul style="list-style-type: none"> • Restriction in the vapour line between the fuel tank and the carbon canister outlet/atmospheric port 	Check for restrictions/damage, etc (see visual inspection)
Fuel smell	<ul style="list-style-type: none"> • System leak • Purge valve inoperative 	Check for leaks, check the purge valve operation
'Check Fuel Filler Cap' displayed on Message Center	<ul style="list-style-type: none"> • Fuel filler cap missing/not tightened after refuelling 	Check the fuel filler cap and seal

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Evaporative Leak OBD Fault Rectification Guide

Determine Which DTC Has Been Stored

Using the manufacturer approved diagnostic system, choose **diagnostic session**, then choose the following symptom paths : **Powertrain/engine system/fuel vapour and odor, Powertrain/engine system/fuel tank, Electrical/instruments/warning lamps/engine malfunction lamp/lamp illuminated, Powertrain/engine system/engine performance/fuel consumption high**

NOTE: This guide covers DTCs that relate to evaporative leak monitoring, as listed in the table below

DTC	Description
P0442-00	DMTL small leak
P0447-00	DMTL COV electrical low (open)
P0448-00	DMTL COV electrical high
P0455-00	DMTL rough leak
P2401-00	DMTL pump electrical low (open)
P2402-00	DMTL pump electrical high
P2404-2F	DMTL noise fault
P2404-29	DMTL reference leak
P2405-00	DMTL reference current low
P2406-00	DMTL reference current high
P2450-00	DMTL COV stuck open
P2451-00	DMTL COV stuck closed
P240B-00	DMTL heater electrical low (open)
P240C-00	DMTL heater electrical high

Attempt To Replicate The Fault Using The "Fuel Leak Check" Forced Test

- Record any DTCs that has been logged
- Using the manufacturer approved diagnostic system, in the **Recommendations** tab run the **Fuel Leak Check** forced test
- For the test to run the fuel level must be between 15% and 85%
- During this procedure the engine must be off
- The possible responses from the test and the associated DTCs are listed below
- If again no fault is found it could suggest that the failure mode is a borderline condition (refer to section 3) or that it was caused by incorrect fitment of the fuel cap or the fuel filler neck is at fault therefore it is important not disturb the fuel cap
- Disconnect purge pipe from the purge valve, observe the condition of connection (the seating and condition of the "O" ring) and then reconnect. Using the manufacturer approved diagnostic system, run **Purge Valve Self Test** (to clean the purge valve) then run the **Fuel Leak Check**
- If the test failed, a smoke test is required to determine the cause of the leak

NOTE: P240B & P240C are not included in the **Fuel Leak Check** forced test (these monitors run at every ignition on and complete within 30 seconds)

Response Description	ID	Equivalent DTC
Function running: Reference leak measurement	1	
Function running: Rough leak measurement	2	
Function running: Small leak measurement	3	
Function running: 2nd ref leak measurement	4	
Function running: COV Cleaning	5	
Function aborted due to conditions: Vbatt conditions not correct (too high/ low)	11	
Function aborted due to conditions: Variation Ref. I (reference current) too high	12	P2404-29
Function aborted due to conditions: DMTL electrical fault	13	P0447, P0448
Function aborted due to conditions: Maximum diagnostic time exceeded	14	
Function aborted due to conditions: Crash detected	15	
Function aborted due to conditions: Refuel detected	20	
Function aborted due to conditions: Filler cap opened	21	
Function aborted due to conditions: Engine start	23	
Function aborted due to conditions: Noisy current measurement	24	P2404-2F
Function aborted due to conditions: Ambient temp outside range	26	
Function aborted due to conditions: Ambient pressure outside range	27	
Function aborted due to conditions: Other conditions	29	
Function complete - Tight system, fault free	30	
Function complete - Fine leak detected	31	P0442
Function complete - Rough leak detected	32	P0455
Function complete - Module error	33	P2401, P2402, P2450, P2451, P2405, P2406, P2404-29
Function complete - Medium leak detected	34	P0442, P0455

Read The "Ranking values" To Determine How Far Away The Result Is From The Failure Threshold

- When the **Fuel Leak Check** forced test has completed the test results (known as ranking values) will be

displayed

10. These should be compared against the limits shown in the table below

11. If the test result is borderline then there is a risk that a failure will occur at a later date (during customer usage of the vehicle)

12. To avoid this the vehicle should be carefully checked for any small leaks

Ranking Value	Normal Result For Tight System	Leak Failure Condition
Rough Leak (40 thou+)	0 > = 50	> = 128
Small Leak (20 thou+)	0 > = 60	> = 128

TRACE THE ROOT CAUSE OF THE FAULT

The list below provides some suggested actions to help trace the root cause of the fault

Each action should be followed up with a **Fuel Leak Check** forced test (and ranking value check) in order to determine if any improvement has been made

DTC	Fault Description	Fault Rectification Actions after smoke test
P0442-00	DMTL small leak	<ul style="list-style-type: none"> 1. Inspect / refit filler cap after smoke test (inspect filler neck for correct fitment to pocket so that filler neck protrudes) 2. Run engine at idle; Using the manufacturer approved diagnostic system, run Purge Valve Self Test (to clean the purge valve) 3. Check that the DMTL module wiring connector has been installed correctly and that the seals around the connector body and individual wires are in good condition 4. Check all fuel system connections are correctly installed and secure 5. Visually inspect purge canister, purge pipes, fuel tank and filler neck for any obvious damage 6. Try isolating the purge valve by fitting a blanking plug to the purge pipe 7. Carry out a smoke test 8. Replace the DMTL module
P0447-00	DMTL COV electrical low (open)	<ul style="list-style-type: none"> 1. Check fuse 2. Check that fuse fits tightly into the fuse holder 3. Check that the DMTL module wiring connector has been fitted correctly 4. Check wiring harness continuity between DMTL module and ECU connectors 5. Replace DMTL module
P0448-00	DMTL COV electrical high	<ul style="list-style-type: none"> 1. Check wiring 2. Replace DMTL module
P0455-00	DMTL rough leak	<ul style="list-style-type: none"> 1. Inspect / refit filler cap after smoke test (inspect filler neck for correct fitment to pocket so that filler neck protrudes) 2. Run engine at idle; Using the manufacturer approved diagnostic system, run "Purge Valve Self Test" (to help clean the purge valve) 3. Check that the DMTL module wiring connector has been installed correctly and that the seals around the connector body and individual wires are in good condition (surprisingly, this is a potential leakage path!) 4. Check all fuel system connections are correctly installed and secure 5. Visually inspect purge canister, purge pipes, fuel tank and filler neck for any obvious damage 6. Try isolating the purge valve by fitting a blanking plug to the purge pipe 7. Carry out a smoke test 8. Replace DMTL module
P2401-00	DMTL pump electrical low (open)	<ul style="list-style-type: none"> 1. Check fuse 2. Check that fuse fits correctly into the fuse holder 3. Check that the DMTL module wiring connector has been fitted correctly 4. Check wiring harness continuity between DMTL module and ECU connectors 5. Replace DMTL module
P2402-00	DMTL pump electrical high	<ul style="list-style-type: none"> 1. Check wiring 2. Replace DMTL module
P2404-2F	DMTL noise fault	<ul style="list-style-type: none"> Replace DMTL module
P2404-29	DMTL reference leak	<ul style="list-style-type: none"> Replace DMTL module
P2405-00	DMTL reference current low	<ul style="list-style-type: none"> Replace DMTL module
P2406-00	DMTL reference current high	<ul style="list-style-type: none"> 1. Check for any blockages in the DMTL ventilation pipe & filter 2. Replace DMTL module
P2450-	DMTL COV	<ul style="list-style-type: none"> Replace DMTL module

00	stuck open	
P2451-00	DMTL COV stuck close	<ul style="list-style-type: none"> • Replace DMTL module
P240B-00	DMTL heater electrical low (open)	<ul style="list-style-type: none"> • 1. Check fuse • 2. Check that fuse fits tightly into the fuse holder • 3. Check that the DMTL module wiring connector has been fitted correctly • 4. Check wiring harness continuity between DMTL module and ECU connectors • 5. Replace DMTL module
P240C-00	DMTL heater electrical high	<ul style="list-style-type: none"> • 1. Check wiring • 2. Replace DMTL module

Pre and 10MY Denso/Bosch PCM Systems

CAUTION: The Maximum pressure of the EVAP system is 0.07 bar **do not exceed**

NOTE: Apart from the purge valve connection, it is recommended to smoke test the EVAP system without disturbing any joints associated with the system, this will determine the leak more accurately and quickly

- 1. Remove rear wheel arch liner to access fuel filler neck
- 2. On the fuel filler neck the DMTL filter will be visible as shown in picture. Unclip filter housing from fuel filler neck to gain better access to DMTL filter
- 3. Remove carefully the top of filter to expose filter and remove
- 4. Attach rubber adapter to tip of smoke machine nozzle to ensure tight seal to filter housing. Disconnect the purge pipe from purge valve; this will be an escape point for the smoke to exit
- 5. Allow tester to complete self-test and green READY light to turn ON 2. For best Tester performance; completely unwind Tester's supply hose
- 6. Press **Smoke** on control panel to fill EVAP system with smoke vapour. The control panel **Smoke** light

will light indicating smoke production. The smoke setting is on a 15 minute timer. Pressing the **Smoke** button again turns Tester off. It is normal for the flow meter ball, while in the smoke mode, not to be as steady as when it is in the **Test** mode. Note: The pressure gauge is active only after smoke cycle is complete

- 7. Continue introducing smoke into the EVAP System until the flow meter's ball stops descending and this assures the system test pressure is met and smoke will appear from the purge pipe, then close off purge pipe with special tool (Test Adapter Hose/EVAP Port 310-142)

E147697

NOTE: Special tool (Test Adapter Hose/EVAP Port 310-142)

E139910

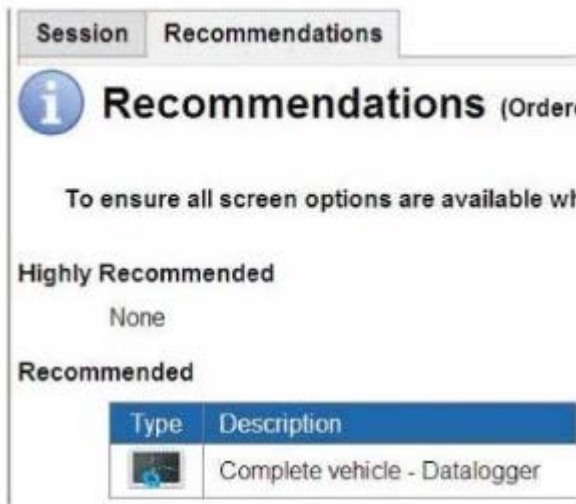

E139911

CAUTION: On some vehicles, the DMTL filter can not be removed, in these instances fill the system through the purge valve and smoke will appear from the filter

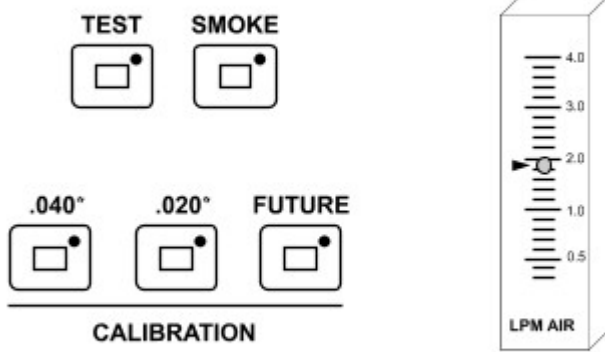

Pre 10MY Vehicles

On pre 10MY DMTL systems, Using the manufacturer approved diagnostic system, select **Measurement application** session then select the **Recommendations** tab which will give you access to **Datalogger**. Then select **Engine systems** then select the **Output state control** data-logger signal **Engine output 1 – diagnostic module – tank leakage -change over valve active** which will close the system. Then select **Engine output 1 – diagnostic module – tank leakage – pump active** this will pressurize the EVAP system

- Engine output 1 - engine management system warning lamp.
- Engine output 1 - malfunction indicator warning lamp.
- Engine output 1 - diagnostics module - tank leakage - test complete.
- Engine output 1 - diagnostics module - tank leakage - heater active.
- Engine output 1 - diagnostics module - tank leakage - pump active.
- Engine output 1 - diagnostics module - tank leakage - changeover valve active.
- Engine output 2 - heated exhaust gas oxygen heater active - bank 2.

E139916

E139913

10MY vehicles

On 10MY vehicles a smoke test application is available so therefore only smoke fill the system and then run the application

- 8. Follow the EVAP system path with the halogen light provided and looks for the smoke exiting the leak(s) or use the UV light provided and look for the dye deposited at the exact location of the leak(s)
- 9. Repair the leak(s) and perform the **Fuel Leak Check** application again or smoke test to verify repair, as well as to make sure there are no additional leaks in the EVAP system

The UltraTraceUV® smoke solution's dye feature is especially helpful when the leak is in an area that is not readily visible, as on the top of the fuel tank or behind a panel. Once you gain access to the area of the leak, wear the yellow UV glasses and shine the UV light provided to identify the exact location of the leak(s). Smoke exiting a very small leak is even easier to see with lower pressure. If you encounter smoke leaking out of an area but find it difficult to pinpoint exactly where the source of the leak is; try reducing the pressure in the system being tested by turning the Tester OFF and allow the pressure to dissipate. The longer a particular leak is allowed to leak, the more fluorescent dye material will be deposited at that leak. With some vapour system leaks, the leak may only present itself under vacuum and not under pressure. If equipment permits, test the system in both states. Purge valve faults [P0441, P0444, P0458 and P0459] should all inhibit DMTL leak test and therefore need to be resolved prior to any DMTL issues. For this reason, when smoke testing the vapour system, it should be sufficient to enter the system at the connection up stream of the purge valve. If no leak is found then testing the remainder of the system up to the purge valve is recommended

NOTE: It may be possible to search for small leaks using a gas analyzer and looking for HC (hydro carbon) spikes. This should enable leaks to be detected in areas of the vapor system that our out of sight of the technician. The solenoid should be deactivated after five minutes to prevent potential damage. Check that connector and individual terminals are sealed correctly

Phase-One – (quantifying the leak)

E139914

- 1. Connect the tester supply hose to vehicle EVAP system. > Refer to appropriate vehicle application

- 2. Determine if the vehicle's EVAP system you are testing is governed by a .020" (0.5 mm) or .040" (1 mm) acceptable leak standard. Press the appropriate calibration standard on the tester's control panel and observe the position of the flow meter ball. > This function automatically turns off in 10 seconds
- 3. Position the flow meter's pointer flag so that it aligns with the measurement observed in step 2 above. > This sets PASS / FAIL mark
- 4. Close vehicle's EVAP Vent Solenoid. > Refer to appropriate vehicle application
- 5. Press TEST on control panel and fill EVAP system. > This introduces 5-minutes of nitrogen gas
- 6. Look for flow meter ball to stop descending indicating that the vehicle system is full. > Fill time 1-4 minutes depending on system volume
- 7. Compare flow meter ball reading to pointer flag. > ABOVE flag = FAIL (go to Phase-Two). > BELOW flag = PASS (test complete)

Testing With Pressure and Vacuum Decay

In addition to quantifying the leak with the Phase-One flow test, the Tester allows you the flexibility of testing the vehicle's EVAP system by using either **Pressure Decay** or **Vacuum Decay** methods. Below are instructions for performing both decay tests

Pressure-Decay Test

NOTE: The Pressure Decay test is best performed immediately after the Phase-one flow test, since the system has already built up pressure

At the completion of the Phase-one flow test, the EVAP system is fully pressurized, since the Phase-one test uses pressure to perform its flow test. Testing pressure decay with the Vacutec® 522B-J/LR is very simple. All you need to do is the following:

1. Allow tester to complete self-test and green **READY** light to turn ON
2. Connect Tester supply hose to vehicle EVAP system
3. Close vehicle's EVAP Vent solenoid > Refer to appropriate vehicle application
4. Press **VACUUM** switch on the tester control panel
 - NOTE: The vacuum switch is on a 30-second timer, which should be sufficient time to draw the appropriate vacuum from the EVAP system. Press VACUUM switch again if additional time is required
5. After vacuum timer turns off, observe the vacuum gauge for any decay (loss of vacuum) indicating a leak in the EVAP system

E139915

NOTE: Disconnect the Tester from the vehicle after the Vacuum Decay Test. The fuel pressure in the vehicle's fuel tank is constantly changing due to the vehicle's fuel volatility and that could cause the Tester's pressure gauge to exceed its maximum reading limits

Electronic Engine Controls - TDV6 3.0L Diesel - Electronic Engine Controls - Overview

Description and Operation

OVERVIEW

The 3.0L V6 diesel engine has an [ECM \(engine control module\)](#) controlled engine management system. Multiple sensor inputs and precision control of actuators are used by the [ECM](#) to achieve optimum performance during all driving conditions.

The [ECM](#) receives and processes information from the following input sources:

- Oil level sensor
- Secondary turbocharger shut-off sensor
- Secondary turbocharger boost pressure sensor
- Generator
- Differential pressure sensor
- [CMP \(camshaft position\)](#) sensor
- [CKP \(crankshaft position\)](#) sensor
- Fuel rail pressure sensor
- Fuel temperature sensor
- Air charge temperature sensor
- [ECT \(engine coolant temperature\)](#) sensor
- [TP \(throttle position\)](#) sensor
- [MAF \(mass air flow\)](#) sensor
- [MAF/IAT \(intake air temperature\)](#) sensor
- [MAP \(manifold absolute pressure\)](#) sensor
- [EGR \(exhaust gas recirculation\)](#) sensors
- [HO2S \(heated oxygen sensor\)](#)
- Catalyst and Diesel Particulate Filter (DPF) temperature sensors
- Brake lamp switch

The [ECM](#) outputs controlling signals to the following sensors and actuators:

- [A/C \(air conditioning\)](#) compressor clutch solenoid
- [A/C](#) compressor clutch
- Fuel injectors
- Glow plug relay
- Fuel pressure control valve
- Fuel volume control valve
- Fan control module
- Vacuum control valves (EGR cooler by-pass, secondary turbocharger compressor shut-off, secondary turbocharger turbine shut-off)
- [ABS \(anti-lock brake system\)](#) module
- [TCM \(transmission control module\)](#)
- Instrument cluster
- [RCM \(restraints control module\)](#)
- Primary turbocharger control module
- [EGR](#) recirculation valves
- Alternator
- Throttle actuator
- Secondary turbocharger compressor recirculation valve

System Operation

OPERATION

The 3.0L V6 diesel engine management system is controlled by an ECM and is able to monitor, adapt and precisely control the fuel injection. The ECM uses multiple sensor inputs and precision control of actuators to achieve optimum performance during all driving conditions.

The ECM controls fuel delivery to all six cylinders via a common rail injection system. The common rail system uses a fuel rail to accumulate highly pressurized fuel and feed the six, electronically controlled injectors. The fuel rail is located in close proximity to the injectors, which assists in maintaining full system pressure at each injector at all times.

The ECM uses the drive by wire principle for acceleration control. There are no control cables or physical connections between the accelerator pedal and the engine. Accelerator pedal demand is communicated to the ECM by two potentiometers located in an APP sensor. The ECM uses the two signals to determine the position, rate of movement and direction of movement of the pedal. The ECM then uses this data, along with other engine information from other sensors, to achieve the optimum engine response.

Component Description

DESCRIPTION

Engine Control Module (ECM)

E123673

The ECM is located on a bracket on the passenger side of the engine compartment bulkhead.

The ECM connected to the vehicle harnesses via 2 connectors. The ECM contains data processors and memory microchips. The output signals to the actuators are in the form of ground paths provided by driver circuits within the ECM. The ECM driver circuits produce heat during normal operation and dissipate this heat via the casing. Some sensors receive a regulated voltage supplied by the ECM. This avoids incorrect signals caused by voltage drop during cranking.

The ECM performs self diagnostic routines and stores fault codes in its memory. These fault codes and diagnostics can be accessed using Land Rover approved diagnostic equipment. If the ECM is to be replaced, the new ECM is supplied 'blank' and must be configured to the vehicle using Land Rover approved diagnostic equipment. A 'flash' EEPROM (electrically erasable programmable read only memory) allows the ECM to be externally configured, using Land Rover approved diagnostic equipment, with market specific or new tune information. The current engine tune data can be accessed and read using Land Rover approved diagnostic equipment.

When a new ECM is fitted, it must also be synchronized to other system control modules using Land Rover approved diagnostic equipment. ECM's cannot be 'swapped' between vehicles as they must be 'matched' with security information to other system modules.

The ECM is connected to the engine sensors which allow it to monitor the engine operating conditions. The ECM processes these signals and decides the actions necessary to maintain optimum engine performance in terms of drive ability, fuel efficiency and exhaust emissions. The memory of the ECM is programmed with instructions for how to control the engine. The memory also contains data in the form of maps which the ECM uses as a basis for fueling and emission control. By comparing the information from the sensors to the data in the maps, the ECM is able to calculate the various output requirements. The ECM contains an adaptive strategy which updates the system when components vary due to production tolerances or ageing.

The ECM is connected to other system control modules and receives data from these modules on the high speed CAN bus to enable precise engine control under all vehicle operating conditions.

Crankshaft Position (CKP) Sensor

E116415

The **CKP** sensor is located at the rear of the engine block on the **LH** side. The sensor lead passes through a cover in an aperture on the side of the engine block. The sensor is secured to a bracket on a plate which locates the rear crankshaft oil seal. The sensor tip is aligned with a magnetic trigger reluctor wheel which is attached to the end of the crankshaft. The trigger wheel is a press fit on the end of the crankshaft. The trigger wheel must be carefully aligned to the crankshaft to ensure correct timing. The sensor produces a square wave signal, the frequency of which is proportional to engine speed.

The **ECM** monitors the **CKP** sensor signal and can detect engine over-speed. The **ECM** counteracts engine over-speed by gradually fading out speed synchronized functions. The **CKP** is a Hall effect sensor. The sensor measures the magnetic field variation induced by the magnetized trigger wheel.

The trigger wheel has a 60 minus 2 tooth pattern. The missing teeth represent 12 degrees of crankshaft rotation and provide a reference point for the angular position of the crankshaft at 21 degrees **BTDC** (before top dead center) on cylinder 1.

When the space with the two missing teeth pass the sensor tip, a gap in the signal is produced which the **ECM** uses to determine the crankshaft position. The air gap between the sensor tip and the ring is important to ensure correct signals are output to the **ECM**. The recommended air gap between the **CKP** and the trigger wheel is 0.4 mm - 1.5 mm.

The **ECM** uses the signal from the **CKP** sensor for the following functions:

- Synchronization
- Determine fuel injection timing
- Produce an engine speed signal which is broadcast on the high speed **CAN** bus for use by other systems.

Camshaft Position (CMP) Sensor

E46902

The **CMP** is located on the front face of the **LH** cylinder head. The sensor tip protrudes through an aperture in the front face of the cylinder head to pick up on a reluctor behind the camshaft pulley. The **CMP** sensor is a Hall effect type sensor.

The **ECM** uses the **CMP** sensor signal to determine if the piston in No. 1 cylinder is at injection **TDC** (top dead center) or exhaust **TDC**. Once this has been established, the **ECM** can then operate the correct injector to inject fuel into the cylinder when the piston is at injection **TDC**.

The **CMP** sensor is a Hall effect sensor which used by the **ECM** at engine start-up to synchronize the **ECM** with the **CKP** sensor signal. The **ECM** does this by using the **CMP** sensor signal to identify number one cylinder to ensure the correct injector timing. Once the **ECM** has established the injector timing, the **CMP** sensor signal is no longer used.

The **CMP** sensor receives a 5V supply from the **ECM**. Two further connections to the **ECM** provide ground and signal output.

If a fault occurs, an error is registered in the **ECM**. Two types of failure can occur; no **CMP** sensor signal or a synchronization error of the **CMP** and **CKP** sensors. The error recorded by the **ECM** can also relate to a total failure of the crankshaft signal or crankshaft signal dynamically implausible. Both components should be checked to determine the cause of the fault.

If a fault occurs with the **CMP** sensor when the engine is running, the engine will continue to run but the **ECM** will deactivate boost pressure control. Once the engine is switched off, the engine will crank but will not restart while the fault is present.

Mass Air Flow (MAF) and Inlet Air Temperature (IAT) Sensors

E123727

Item Description

- 1 MAF sensor
- 2 MAF/IAT sensor

The MAF/IAT sensors are located on the inlet air duct directly after the air filter box. Two sensors are fitted; the front sensor, located prior to the intake air to primary turbocharger pipe, is a combined MAF/IAT sensor (4-wire). The rear sensor, located prior to the intake air to secondary turbocharger pipe, is a MAF sensor (3-wire) only.

The MAF sensors work on the hot film principle. Each sensor has 2 sensing elements which are contained within a film. One element is maintained at ambient (air intake) temperature, e.g. 25°Celsius (77°F). The other element is heated to 200°Celsius (392°F) above the ambient temperature, e.g. 225°Celsius (437°F). Intake air entering the engine passes through the MAF sensors and has a cooling effect on the film. The ECM monitors the current required to maintain the 200°Celsius (392°F) differential between the two elements and uses the differential to provide a precise, non-linear, signal which equates to the volume of air being drawn into the engine.

The MAF sensor output is a digital signal proportional to the mass of the incoming air. The ECM uses this data, in conjunction with signals from other sensors and information from stored fueling maps, to determine the precise fuel quantity to be injected into the cylinders. The signal is also used as a feedback signal for the EGR system.

The IAT sensor in the front sensor incorporates a NTC (negative temperature coefficient) thermistor in a voltage divider circuit. The NTC thermistor works on the principle of decreasing resistance in the sensor as the temperature of the intake air increases. As the thermistor allows more current to pass to ground, the voltage sensed by the ECM decreases. The change in voltage is proportional to the temperature change of the intake air. Using the voltage output from the IAT sensor, the ECM can correct the fueling map for intake air temperature. The correction is an important requirement because hot air contains less oxygen than cold air for any given volume.

The MAF sensor receives a 12V supply from the BJB (battery junction box) and a ground connection via the ECM. Two further connections to the ECM provide a MAF signal and IAT signal.

The IAT sensor receives a 3.3V reference voltage from the ECM and shares a ground with the MAF sensor. The signal output from the IAT sensor is calculated by the ECM by monitoring changes in the supplied reference voltage to the IAT sensor voltage divider circuit.

The ECM checks the calculated air mass against the engine speed. If the calculated air mass is not plausible, the ECM uses a default air mass figure which is derived from the average engine speed compared to a stored characteristic map. The air mass value will be corrected using values for boost pressure, atmospheric pressure and air temperature.

If one of the MAF sensors fails the ECM implements the default strategy based on engine speed. In the event of a MAF sensor signal failure, the following symptoms may be observed:

- EGR system off
- Delayed engine response
- Reduced engine performance.

If the IAT sensor fails the ECM uses a default intake air temperature of 40°Celsius (104°F). In the event of an IAT

sensor failure, the following symptom may be observed:

- Under fueling, resulting in reduced engine performance.

Manifold Absolute Pressure (MAP) Sensor

E123688

The MAP sensor is located on top of the throttle intake manifold. The MAP sensor measures the absolute pressure in the intake manifold. The sensor is a semi-conductor type sensor which responds to pressure acting on a membrane within the sensor, altering the output voltage. The sensor receives a 5V reference voltage and a ground from the ECM and returns a signal of between 0.5 - 4.5V to the ECM. A low pressure returns a low voltage signal to the ECM and a high pressure returns a high voltage.

The MAP sensor detects quick pressure changes in the intake manifold after the electric throttle. The signal is used in conjunction with the MAF sensor signal to calculate the injection period.

The ECM monitors the engine MAP sensor for faults and can store fault related codes. These can be retrieved using Land Rover approved diagnostic equipment. If the sensor fails, the ECM uses the MAF/IAT sensor signal value as a substitute.

Electronic Throttle Actuator

E116417

The electronic throttle actuator is located on the side of the throttle intake manifold.

The electronic throttle actuator controls the volume of air allowed into the inlet manifolds by means of a DC (direct current) motor which controls a flap in the body of the throttle. The actuator is controlled by the ECM which operates the actuator in response to driver inputs from the APP sensor and other engine related sensors to provide the correct air flow to the intake manifolds.

Engine Coolant Temperature (ECT) Sensor

E46905

The **ECT** sensor is located in the **LHEGR** cooler coolant inlet pipe, at the front of the engine. The **ECT** sensor provides the **ECM** and the instrument cluster with engine coolant temperature status.

The **ECM** uses the temperature information for the following functions:

- Fueling calculations
- Limit engine operation if engine coolant temperature becomes too high
- Cooling fan operation
- Glow plug activation time.

The instrument cluster uses the temperature information for generation of engine temperature messages. The engine coolant temperature signal is also transmitted on the medium speed **CAN** bus by the instrument cluster for use by other systems.

The **ECT** sensor circuit consists of an internal voltage divider circuit which incorporates an **NTC** thermistor. As the coolant temperature rises the resistance through the sensor decreases and vice versa. The output from the sensor is the change in voltage as the thermistor allows more current to pass to ground relative to the temperature of the coolant.

The **ECM** compares the signal voltage to stored values and adjusts fuel delivery to ensure optimum drive ability at all times. The engine will require more fuel when it is cold to overcome fuel condensing on the cold metal surfaces inside the combustion chamber. To achieve a richer air/fuel ratio, the **ECM** extends the injector opening time. As the engine warms up the air/fuel ratio is leaned off.

The input to the sensor is a 3.3V reference voltage supplied from the voltage divider circuit within the **ECM**. The ground from the sensor is also connected to the **ECM** which measures the returned current and calculates a resistance figure for the sensor which relates to the coolant temperature.

If the **ECT** sensor fails, the following symptoms may be observed:

- Difficult cold start
- Difficult hot start
- Engine performance compromised
- Temperature gauge inoperative or inaccurate reading.

In the event of **ECT** sensor signal failure, the **ECM** applies a default value of 80°Celsius (176°F) coolant temperature for fueling purposes. The **ECM** will also permanently operate the cooling fan at all times when the ignition is switched on, to protect the engine from overheating.

The table that follows shows **ECT** sensor values and the corresponding sensor resistance and voltage values.

Temperature (Degrees Celsius)	Resistance (KOhms)	Voltage (Volts)
- 40	925	3.23
- 30	496	3.16
- 20	277	3.06
- 10	160	2.91
-0	96	2.70
10	59	2.42

Engine Oil Level and Oil Temperature Sensor

E 112394

Item Description

- 1 Oil scavenge reservoir
- 2 Engine oil level and temperature sensor
- 3 Oil pick-up pipe
- 4 Engine oil level and temperature sensor electrical connector

The 3.0L V6 diesel engine is not fitted with a conventional dipstick. The dipstick is replaced with an ultrasonic oil level and temperature sensor which is located with 3 bolts on the inside of the oil pan.

The sensor uses ultrasonic pulses to determine the oil level in the oil pan. The level sensor sends an ultrasonic pulse vertically upward and measures the time taken for the pulse to be reflected back to the sensor from the upper surface of the oil. A second reference pulse is also transmitted across a reference distance. The time periods of the first and second pulses are compared and the sensor calculates the oil height in the oil pan. The sensor then converts the results into a **PWM (pulse width modulation)** signal to the **ECM** which converts the frequency of the signal into an oil level height.

The sensor uses an **NTC** type sensor to determine the oil temperature. The sensor measures the oil temperature and converts the sensor signal into a **PWM** signal to the **ECM** which converts the frequency of the signal into an oil temperature.

If the oil level is incorrect or a system fault occurs, a warning message is displayed in the instrument cluster message center. The messages that follow can be displayed in the message center:

Warning	System Status
ENGINE OIL LOW (Amber warning triangle displayed)	The oil is at the minimum level for safe operation. Top-up with 2 liters (3.5 pints) of oil.
ENGINE OIL HIGH (Amber warning triangle displayed)	This warning is displayed when the engine is started, if the oil is above the maximum level for safe operation. Stop the vehicle as soon as safety permits and seek qualified assistance to have the engine oil drained, before driving the vehicle.
ENGINE OIL CRITICALLY LOW (Red warning triangle displayed)	The oil is below the minimum level for safe operation. Stop the vehicle as soon as safety permits and top-up with 2.5 liters (4.4 pints) of oil. Wait for 10 minutes, re-check the oil level reading and top-up again if necessary.
ENGINE OIL LEVEL MONITOR SYSTEM FAULT (Amber warning triangle displayed)	A fault with the oil level monitoring system is indicated. Seek qualified assistance as soon as possible.

Oil Level Check

Check the oil level weekly, when the engine is hot and with the vehicle resting on level ground.

NOTE: Switch off the engine and let the vehicle stand for ten minutes to allow the oil drain back to the oil pan. Do not start the engine.

The oil level can be viewed in the message centre when the ignition is on (power mode 6), the engine stopped and the transmission in Park (P).

NOTE: The system will not give a reading until the oil level has stabilized.

An indication of the oil level is displayed on the gauge. Messages to the right of the gauge give advice of any action that may need to be taken.

If the oil level is within the required operating range, the message **'Level OK'** will be displayed. Do not add any additional oil to the engine.

If the oil level is below the required operating range, a message advising how much oil to add will be displayed. Add the recommended quantity of oil then re-check the level.

If **'Overfilled'** is displayed, seek qualified assistance immediately. Do not drive the vehicle as this will cause serious damage to the engine.

Engine Oil Top-Up

CAUTIONS:

Failure to use oil that meets the required specification, could cause excessive engine wear, a build-up of sludge and deposits and increase pollution. It could also lead to engine failure and invalidation of vehicle warranty.

Overfilling with oil could result in severe engine damage.

Use the procedure that follows to replenish the engine oil level:

- With the ignition on, but the engine not running, unscrew the oil filler cap.
- Add the appropriate quantity of oil (as indicated by the message center oil level display). Wait 10 minutes to allow the oil level stabilize and re-check the level. Clean up any oil spilled during topping up
- Once the correct level is achieved, refit the filler cap and hand-tighten securely until one click is heard.

NOTES:

The approximate quantity of oil required to raise the level from the minimum level of safe operation to the maximum, is 2.0 liters (3.5 pints).

The ignition must be left on during the top-up, so that the electronic dipstick can register and display the new oil level. This enables an accurate level re-check.

Live Reading/Average Reset

A procedure is available to allow the technician to access the actual engine oil level, rather than the average engine oil level which is available to the driver. An additional procedure is also available to reset the average engine oil level. Refer to Engine - 3.0L Diesel - General Procedures - Engine Oil Draining and Filling 303-01B.

Brake Lamp/Brake Test Switch

E46910

The brake lamp/brake test switch is located on the pedal box and is operated by the brake pedal. The 2 pole switch has a normally open circuit switch connected to battery voltage which closes the circuit when the driver has depressed the brake pedal and a normally closed circuit which is connected to ground when the driver depresses the brake pedal. The switch contacts are connected directly to the **ECM** and the **ECM** also receives a brake pressure signal on the high speed **CAN** bus from the **ABS** module.

The **ECM** uses the brake signal for the following:

- To limit fueling during braking
- To inhibit/cancel Speed control if the brakes are applied.

In the event of a brake switch failure, the following symptoms may be observed:

- Speed control inactive
- Increased fuel consumption.

Fuel Pressure Control Valve

E116419

The fuel pressure control valve is incorporated into the forward end of the common fuel rail for the **LH** cylinder bank. The control valve regulates the fuel pressure within the fuel rails and is controlled by the **ECM**. The control valve is a **PWM** controlled solenoid valve.

When the solenoid is de-energized, an internal spring holds an internal valve closed. At fuel pressure of 100 bar (1450 lbf/in²) or higher, the force of the spring is overcome, opening the valve and allowing fuel pressure to decay into the fuel return pipe. When the pressure in the fuel rail decays to approximately 100 bar (1450 lbf/in²) or less, the spring force overcomes the fuel pressure and closes the valve. When the **ECM** energizes the solenoid, the valve is closed allowing the fuel pressure to build. The pressure in the fuel rail in this condition can reach approximately 2000 bar (29000 lbf/in²).

The **ECM** constantly monitors the fuel pressure and activates the fuel pressure control valve accordingly to control the fuel rail pressure within the required parameters. Relieved fuel from the fuel rails is directed through the fuel rail leak-off pipe to the fuel filter return circuit.

The **ECM** controls the fuel rail pressure by operating the control valve solenoid using a **PWM** signal. By varying the duty cycle of the **PWM** signal, the **ECM** can accurately control the fuel rail pressure and hence the pressure delivered to the injectors according to engine load. This is achieved by the control valve allowing a greater or lesser volume of fuel to pass from the high pressure side of the pump to the un-pressurized fuel return line, regulating the pressure on the high pressure side.

The fuel pressure control valve receives a **PWM** signal from the **ECM** of between 0 and 12V. The **ECM** controls the operation of the control valve using the following information to determine the required fuel pressure:

- Fuel rail pressure
- Engine load
- **APP** sensor position
- Engine coolant temperature
- Engine speed.

In the event of a total failure of the fuel pressure control valve, the engine will not start. In the event of a partial failure of the fuel pressure control valve, the **ECM** will activate the solenoid with the minimum duty cycle which

results in the injection quantity being limited.

Fuel Pressure Sensor

E116418

The fuel pressure sensor is located in the forward end of the common fuel rail for the RH cylinder bank. The sensor is screwed into a threaded port in the end of the fuel rail.

The fuel pressure sensor is a piezo-resistive type sensor containing an actuating diaphragm. Deflection of the diaphragm provides a proportional signal (output) voltage to the ECM, dependant on the fuel pressure within the fuel rails.

Accelerator Pedal Position (APP) Sensor

E116420

The APP sensor allows the ECM to determine the driver requests for vehicle speed, acceleration and deceleration. The ECM uses this information to determine the torque demand from the engine via injection control.

The APP sensor is installed on the pedal box and secured to a bracket with 3 screws.

The APP sensor is incorporated into the pedal box assembly. The APP sensor is a twin track rotary potentiometer type sensor which is integral with the throttle pedal housing.

A six pin electrical connector provides the interface with the vehicle harness. The accelerator pedal is connected to a spindle on the RH side of the APP sensor. The APP sensor receives two separate electrical supplies and generates two different outputs.

Both tracks are analogue output signals connected to the ECM. Both signals contain the same positional information, but the secondary track has half the voltage output of the primary track.

If there is a fault with the primary track, the secondary track is used and the vehicle/engine response to pedal demand will be sluggish. If both analogue signals have a fault, the engine adopts a constant high speed of 1300 rpm to allow the vehicle to move. Torque application and reduction of engine speed back to normal idle speed can be subsequently controlled via brake lamp/brake test switch operation.

The ECM constantly checks the range and plausibility of the two signals and stored a fault code if it detects a fault.

EGR Cooler Bypass Vacuum Solenoid Valve

E116421

The **EGR** cooler bypass solenoid valve is located on a bracket at the rear of the engine, adjacent to the vacuum pump.

The solenoid valve has a vacuum pipe connection to the vacuum pump which provides the vacuum when the engine is running. Two outlets from the solenoid valve each connect to an **EGR** bypass vacuum actuator.

When the **EGR** cooler bypass solenoid valve is energized, vacuum created by the vacuum pump is applied to each **EGR** bypass vacuum actuator and exhaust gasses by-pass the **EGR** cooler. The default position is for exhaust gas cooling. The actuators move under the influence of the vacuum and move a valve within the **EGR** cooler to divert the exhaust gasses straight through the cooler. This system is used when the engine management system determines that exhaust gas cooling is not required.

The **EGR** cooler bypass solenoid valve receives a 12 volt supply from the **EJB**. The **ECM** controls the operation of the solenoid valve by controlling the ground path for the solenoid.

Exhaust Gas Recirculation (EGR) Valve Motor

E116422

The **EGR** valve motors each receive a 12 volt supply and ground from the **ECM**.

The 12 volt power supply from the **ECM** operates the **EGR** valve motor. Three further wires connect the **EGR** valve to the **ECM** a 5 volt reference voltage, a ground and a position signal feedback.

The valve is used to direct a calculated proportion of exhaust gas back into the combustion chamber.

Engine Oil Pressure Sensor

E116423

The engine oil pressure sensor is located in a threaded port in the **LH** cylinder head. The sensor is connected directly to the instrument cluster.

The sensor is not connected to the **ECM** but is supplied with a reference voltage from the instrument cluster. The

sensor ground is through the sensor body and the engine. When the oil pressure falls to below a predetermined threshold, the sensor internal switch contacts close, completing a circuit from the instrument cluster. This circuit is sensed by the instrument cluster which displays an appropriate warning message and warning lamp to alert the driver.

Differential Pressure Sensor

E123690

Item Description

- 1 Electrical connector
- 2 Low pressure connection
- 3 High pressure connection

The differential pressure sensor is located on the rear of the transfer box, adjacent to the [DPF \(diesel particulate filter\)](#).

The differential pressure sensor is used by the [DPF](#) software to monitor the condition of the [DPF](#). Two pipe connections on the sensor are connected by pipes to the inlet and outlet ends of the [DPF](#). The pipes allow the sensor to measure the inlet and outlet pressures of the [DPF](#).

As the amount of particulates trapped by the [DPF](#) increases, the pressure at the inlet side of the [DPF](#) increases in comparison to the [DPF](#) outlet. The [DPF](#) software uses this comparison, in conjunction with other data, to calculate the accumulated amount of trapped particulates.

By measuring the pressure difference between the [DPF](#) inlet and outlet air flow the [DPF](#) software can determine if the [DPF](#) is becoming blocked and requires regeneration.

A [DPF](#) is recognized as overloaded if the differential pressure under certain operating conditions exceeds the overload limit calculated by the [ECM](#). The [DPF](#) software may start regeneration attempts but be unable to complete them. These attempts are counted by the [ECM](#) and, if the maximum number of regeneration attempts is reached, a fault entry is recorded in the [ECM](#) at the next ignition on cycle.

The [DPF](#) software performs the following checks using the [DPF](#) differential pressure sensor:

- Sensor plausibility check
- [DPF](#) efficiency
- [DPF](#) overloaded
- [DPF](#) clogged
- Circuit range checks (max. and min.)
- [DPF](#) hose lines (dropped, crossed and blocked)
- [DPF](#) dislodged/damaged
- Monitoring of the maximum regeneration attempts in the lower load range

Glow Plugs

E107586

Item Description

1 Glow plug

Three glow plugs are located in each of the cylinder heads, on the inlet side. The glow plugs and the glow plug module are a vital part of the engine starting strategy. The glow plugs heat the air inside the cylinder during cold starts to assist combustion. The use of glow plugs helps reduce the amount of additional fuel required on start-up, and consequently reduces the emission of black smoke. The use of glow plugs also reduces the amount of injection advance required, which reduces engine noise, particularly when idling with a cold engine.

There are three phases of glow plug activity:

- Pre-heat
- During crank
- Post heat.

The ceramic sheathed element glow plugs are made from a heat-resistant, electrically conductive ceramic material. The ceramic sheathed-element glow plugs outer layer is heated directly and is self regulating. The self regulation allows the resistance of the sheathed element to automatically increase as the heat increases preventing the glow plug from overheating. In addition, during the heating process and under the control of the glow plug module, the glow plugs can be operated above their nominal voltages. This permits heat-up speeds of 1000°C per second. The sheathed-element glow plugs reach a maximum glow temperature of 1300°C and can hold a temperature of 1150°C for several minutes after the first-start glow or at intervening times.

The glow plugs are controlled by the [ECM](#) using the glow plug module and external sensor values to control the glow plug operation via internal software.

Fuel Injectors

E115475

Item Description

- 1 Fuel return
- 2 O-ring seal
- 3 Piezo stack actuator
- 4 Hydraulic coupler
- 5 Control valve
- 6 Nozzle body
- 7 Copper sealing washer
- 8 Electrical connector
- 9 High pressure feed
- 10 Nozzle

Six fuel injectors are used in the fuel system. A piezo actuator in each injector is electronically controlled by the [ECM](#) to operate the injector in response to engine speed and load conditions.

Each injector is calibrated to the [ECM](#) and applicable the cylinder to which it is fitted. Therefore, if an injector is removed it must be refitted to the cylinder from which it was removed. If a new injector is fitted, a calibration routine using a Land Rover approved diagnostic equipment must be performed to calibrate the injector unique code to the [ECM](#).

The operating voltage of the injector is between 110 and 163 volts depending on engine speed and load and care must be taken when working in the vicinity of the injectors. The voltage increases linearly with the injector operating pressure from 200 to 2000 bar.

Each injector has an electrical resistance value of between 150 - 250 kOhms.

⚠ CAUTION: Each injector operation is controlled by a charge and discharge cycle allowing energy to dissipate in, and recover from the injector. Never disconnect the wiring connection when the engine is running. The injector can remain open causing engine damage.

Refer to: [Fuel Charging and Controls](#) (303-04A Fuel Charging and Controls - TDV6 3.0L Diesel, Description and Operation).

Charge Air Temperature Sensor

E116759

The charge air temperature sensor is located in the rear of the intake chamber immediately preceding the throttle intake manifold. The sensor is used to measure the intake air temperature from the turbochargers in order to calculate the required amount of fueling.

The charge air temperature sensor incorporates a **NTC** thermistor in a voltage divider circuit. The **NTC** thermistor works on the principle of decreasing resistance in the sensor as the temperature of the charge air increases. As the thermistor allows more current to pass to ground, the voltage sensed by the **ECM** decreases. The change in voltage is proportional to the temperature change of the charge air. Using the voltage output from the charge air temperature sensor, the **ECM** can correct the fueling map for charge air temperature. The correction is an important requirement because hot air contains less oxygen than cold air for any given volume.

The charge air temperature sensor receives a 3.3V reference voltage from the **ECM**. The signal output from the charge air temperature sensor is calculated by the **ECM** by monitoring changes in the supplied reference voltage to the charge air temperature sensor voltage divider circuit.

If the charge air temperature sensor fails the **ECM** uses a default charge air temperature of -5°C (23°F). In the event of a charge air temperature sensor failure, any of the following symptoms may be observed:

- Over fueling, resulting black smoke emitting from the exhaust
- Idle speed control inoperative.

High Pressure Fuel Pump Volume Control Valve

E116761

The high pressure fuel pump volume control valve is mounted on the high pressure pump, and located in the feed

port between the high-pressure pump elements and the internal transfer pump. The high pressure fuel pump volume control valve is a variable position solenoid-operated valve that is controlled by the [ECM](#).

The high pressure fuel pump volume control valve is controlled by a [PWM](#) signal from the [ECM](#) to allow a defined amount of 'leak off' from the high pressure fuel pump. The leak off fuel provides cooling and lubrication for the high-pressure pump internal components. The fuel is returned through a leak off pipe to the fuel filter, where it cools and is returned into the fuel filter via the low pressure return line.

The high pressure fuel pump volume control valve determines the amount of fuel that is delivered from the internal transfer pump to the high pressure pumping elements. When there is no signal to the high pressure fuel pump volume control valve, the valve is closed and there is no fuel delivery. The [ECM](#) applies a varying [PWM](#) signal of between 0 to 100% to control the required fuel volume.

High Pressure Fuel Pump Inlet Temperature Sensor

E116762

The high pressure fuel pump inlet temperature sensor is located on the rear of the high pressure fuel pump. It measures the fuel temperature in the low-pressure side of the high pressure fuel pump.

The [ECM](#) continually monitors this signal to determine the fuel temperature to prevent overheating of the fuel system. The [ECM](#) will also make fine adjustments to fuel injection quantity to adjust for fuel temperature.

The inlet temperature sensor is an [NTC](#) thermistor. As the fuel temperature rises the resistance through the sensor decreases and visa versa. The [ECM](#) measures the change in voltage as the thermistor allows more current to pass to ground relative to the fuel temperature.

Primary Turbocharger Control Module

E116424

The primary turbocharger control module is attached to a bracket which is an extension of the turbocharger body.

The primary turbocharger control module comprises a stepper motor which electronically controls the primary turbocharger variable vanes by moving an actuating lever. When the stepper motor drive shaft turns, a position signal is created. The [ECM](#) receives the position signal to determine the angular position of the vanes.

The stepper motor is connected to an output shaft. The output shaft has a connecting rod attached eccentrically which converts the rotary motion of the shaft into linear motion of the connecting rod. The opposite end of the connecting rod is attached to an actuating lever. The actuating lever moves with the connecting rod and adjusts the variable vanes mechanically.

The **ECM** provides the stepper motor with a power and ground for stepper motor operation and also a reference voltage, ground and position signal connections for variable vane position control.

Secondary Turbocharger Boost Pressure Sensor

E116425

The secondary turbocharger boost pressure sensor is located on the steering pump mounting bracket on the **RH** side of the engine. The sensor is connected via a hose to the charge air outlet pipe from the secondary turbocharger compressor.

The sensor provides a voltage signal to the **ECM** relative to the output charge air pressure from the secondary turbocharger. The boost pressure sensor has a 3 pin connector which is connected to the **ECM** and provides a 5V reference supply from the **ECM**, a signal input to the **ECM** and a ground for the sensor.

The boost pressure sensor uses a diaphragm transducer to measure pressure. The **ECM** uses the boost pressure sensor signal for the following functions:

- Maintain manifold boost pressure
- Reduce exhaust smoke emissions when driving at high altitude
- Control of the **EGR** system
- To help smooth control of the mono to bi and bi to mono turbo transitions
- To aid the air path diagnostics.

Secondary Turbocharger Turbine Shut-off Solenoid Valve

E123687

The secondary turbocharger turbine shut-off solenoid valve is located on a bracket at the front of the engine, above the **LH** front cylinder cover assembly. The bracket is shared with the secondary turbocharger compressor shut-off solenoid valve. The secondary turbocharger turbine shut-off solenoid valve is the innermost of the two solenoid valves.

The secondary turbocharger turbine shut-off solenoid valve receives a vacuum supply from the vacuum pump. The valve is connected by a pipe to the turbine shut-off valve vacuum actuator which is located on the rear of the secondary turbocharger. A position sensor is attached to the turbine shut-off valve vacuum actuator to inform the **ECM** of the turbine shut-off position.

Operation of the valve vacuum actuator is controlled by a **PWM** signal from the **ECM** and the secondary turbocharger turbine shut-off solenoid valve. When the shut-off solenoid is energized by the **ECM** a 4.5V **PWM** current is applied to operate the solenoid, vacuum is then applied to the shut-off valve vacuum actuator. The valve is opened allowing the secondary turbocharger turbine to be driven by the exhaust gasses for as long as the valve is open. When the valve is to be closed the **ECM** applies a 0.5V **PWM** current to the solenoid.

Secondary Turbocharger Compressor Shut-off Solenoid Valve

E123687

The secondary turbocharger compressor shut-off solenoid valve is located on a bracket at the front of the engine, above the LH front cylinder cover assembly. The bracket is shared with the secondary turbocharger turbine shut-off solenoid valve. The secondary turbocharger compressor shut-off solenoid valve is the outermost of the two solenoid valves.

The secondary turbocharger compressor shut-off solenoid valve receives a vacuum supply from the vacuum pump. The valve is connected by a pipe to the compressor shut-off vacuum actuator located on the charge air intake manifold tube. When the vacuum is applied to the vacuum actuator, the actuator operates to open the shut-off valve allowing charge air to flow into the air intake pipe.

Operation of the secondary turbocharger compressor shut-off solenoid valve is controlled by a PWM signal from the ECM; 0% is off and 100% is on (solenoid activated). The solenoid valve is opened when bi-turbocharger operation is required allowing compressed charge air from the secondary turbocharger compressor to enter the air intake system.

Secondary Turbocharger Compressor Recirculation Valve

E 116426

The secondary turbocharger compressor recirculation valve motor is located on the compressor recirculation valve housing, adjacent to the compressor shut-off valve. The solenoid valve is attached to the compressor recirculation valve with 3 screws.

The secondary turbocharger compressor recirculation valve motor is controlled by the [ECM](#). The valve is used during operation of the secondary turbocharger. When the [ECM](#) is switching to bi-turbocharger operation, the valve motor is operated which opens the recirculation path to the primary turbocharger. This allows the secondary turbocharger to increase its speed. When the secondary turbocharger has reached its optimum operating speed the recirculation valve motor is operated, closing the recirculation path to the primary turbocharger.

Secondary Turbocharger Turbine Shut-off Valve and Position Sensor

E 116760

The secondary turbocharger turbine shut-off valve and position sensor is located on the turbine vacuum shut-off valve. The sensor has three connections to the [ECM](#); a 5V reference voltage, a ground and a signal return.

The sensor is connected to the turbine shut-off vacuum actuator and senses when the actuator has operated. The sensor returns a 0 - 5V analogue position signal to the [ECM](#) to confirm that the vacuum actuator has operated.

Water-in-fuel Sensor

E123689

The fuel filter element has a water sensor located in its base. The sensor is screwed into a threaded hole in the base of the element. When the filter is replaced at service, the sensor can be unscrewed from the element and installed in the new element. The sensor has an electrical connector located at the side of the element which can be disconnected to assist element removal.

The water-in-fuel sensor is connected to the [ECM](#). When the water in the element reaches 64 cm³ (3.9 in³) the [ECM](#) issues a high speed [CAN](#) bus message to the instrument cluster to display a 'WATER IN FUEL' message in the message center.

Electronic Engine Controls - TDV6 3.0L Diesel - Electronic Engine Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the electronic engine control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (303-14 Electronic Engine Controls - TDV6 3.0L Diesel)

Electronic Engine Controls (Description and Operation),
Electronic Engine Controls (Description and Operation),
Electronic Engine Controls (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Engine oil level • Cooling system coolant level • Fuel level • Fuel contamination/grade/quality • Fuel leaks • Auxiliary drive belt • Sensor installation/condition • Viscous fan and solenoid 	<ul style="list-style-type: none"> • Fuses • Wiring harness • Electrical connector(s) • 5V sensor supply • Sensor(s) • Engine Control Module (ECM) • Transmission Control Module (TCM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not start	<ul style="list-style-type: none"> • Inertia fuel shutoff switch • Low/contaminated fuel • Air leakage • Low-pressure fuel system fault • Fuel pump module (lift pump) fault • Blocked fuel filter • Fuel volume regulator blocked/contaminated • Fuel pressure control valve blocked/contaminated • Fuel pump fault • Crankshaft position (CKP) sensor 	<ul style="list-style-type: none"> • Check that the inertia switch has not tripped <ul style="list-style-type: none"> - Using the manufacturer approved diagnostic system, check the Restraints Control Module (RCM) for related DTCs and refer to the relevant DTC index • Check the fuel level and condition. Draw off approximately 1L (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel • Inspect the intake air system for leaks • Inspect the low-pressure fuel system for leaks/damage • Test the lift pump operation • Check the fuel filter • Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index • Check the fuel pump • Refer to the electrical circuit diagrams and test the CKP sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
Difficult to start	<ul style="list-style-type: none"> • Glow plug system fault (very cold conditions) • Low/contaminated fuel • Air leakage • Fuel pump module (lift pump) fault 	<ul style="list-style-type: none"> • Refer to the electrical circuit diagrams and test the glow plug circuits for short circuit to ground, short circuit to power, open circuit, high resistance • Check the fuel level and condition. DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - TDV6 3.0L Diesel, DTC: Engine Control Module (PCM) (100-00, Description and Operation).

Electronic Engine Controls - TDV6 3.0L Diesel - Camshaft Position (CMP) Sensor

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: Cooling Fan (303-03D, Removal and Installation).
3. Remove the LH front wheel and tire.

Torque: 140 Nm

4. Refer to: Fender Splash Shield (501-02, Removal and Installation).

5.

E121858

6.

E121859

7.

Installation

1. CAUTIONS:

-  Make sure that the mating faces are clean and free of foreign material.
-  The Camshaft position (CMP) sensor tip must rest on one of the three webs on the back of the camshaft pulley. Incorrect installation may result in the CMP sensor being damaged.

NOTES:

 Only turn the engine in the normal direction of rotation.

 Timing belt left hand cover shown removed for clarity.

Turn the engine until one of the three webs on the back of the camshaft pulley is visible through the CMP sensor housing.

Torque: 10 Nm

2. To install, reverse the removal procedure.

Electronic Engine Controls - TDV6 3.0L Diesel - Crankshaft Position (CKP) Sensor

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the left-hand front wheel and tire.

Torque: 140 Nm

3. Refer to: Engine Oil Vacuum Draining and Filling (303-01B, General Procedures).

4. Refer to: Suspension Height Sensor (204-05, Removal and Installation).

5. *Torque:* 9 Nm

6. *Torque:* 9 Nm

7.  NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

8.  NOTE: Remove and discard the gasket.
Torque: 10 Nm

9.  NOTE: Remove and discard the gasket.
Torque: 10 Nm

10.

11.  CAUTION: Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

NOTES:

 Engine shown removed for clarity.

 The CKP sensor retaining bolt should not be removed from the CKP sensor.

Torque: 5 Nm

Installation

1.  **CAUTION:** Install the CKP sensor correctly into the housing. Failure to follow this instruction may result in damage to the CKP sensor.

To install, reverse the removal procedure.

Electronic Engine Controls - TDV6 3.0L Diesel - Crankshaft Position (CKP) Sensor Ring

Removal and Installation

Special Tool(s)

 <p>303-1130 Installer - Crankshaft Position (CKP) Sensor Ring</p> <p>E49378</p>

3.

4.

E122104

5.

E114350

Installation

1. To install, reverse the removal procedure.

2.  **NOTE:** This step is only necessary when installing a new component.

1. Using the diagnostic tool, clear diagnostic trouble codes (DTCs) from the engine control module (ECM).
2. Using the data logger, check the engine oil temperature.
3. Make sure the selector lever is in the 'P' position.
4. Start and run the engine.
5. Make sure that the engine oil is at a minimum temperature of 50 degrees C.
6. Allow the engine to idle for 2 minutes and 30 seconds.
7. Make sure that the engine cooling fan is not running.
8. Turn off the ignition.
9. Wait for 30 seconds.
10. Repeat steps 4 to 9, a further 5 times.
11. Disconnect the Jaguar approved diagnostic system.

Electronic Engine Controls - TDV6 3.0L Diesel - Engine Coolant Temperature (ECT) Sensor

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: Engine Cover - 3.0L Diesel (501-05, Removal and Installation).

2.

3. CAUTIONS:

Be prepared to collect escaping fluids.

The seal is to be reused unless damaged.

Make sure that the mating faces are clean and free of foreign material.

NOTE: Release the locking tang to remove the ECT sensor.

Installation

1. NOTE: Make sure that all the component mating faces are clean.

To install, reverse the removal procedure.

2. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank.

Electronic Engine Controls - TDV6 3.0L Diesel - Engine Control Module (ECM)

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

All vehicles

1. Remove the battery.

E121855

Installation

1.  **CAUTION:** If accidentally dropped or knocked install a new sensor.

NOTE: If the original sensor is to be installed, apply lubricant meeting specification ESE-M12A4-A to the thread of the sensor.

To install, reverse the removal procedure.

Electronic Engine Controls - TDV6 3.0L Diesel - Pre DPF Exhaust Gas Temperature Sensor

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
2. Refer to: Diesel Particulate Filter (DPF) (309-00, Removal and Installation).

3.  **CAUTION:** Make sure that the mating faces are clean and free of foreign material.

Torque: 35 Nm

E121857

Installation

1.  **CAUTION:** If accidentally dropped or knocked install a new sensor.

NOTE: If the original sensor is to be installed, apply lubricant meeting specification ESE-M12A4-A to the thread of the sensor.

To install, reverse the removal procedure.

OVERVIEW

The electronic engine control system operates the engine to generate the output demanded by the accelerator pedal and loads imposed by other systems. The electronic engine control system has an [ECM \(engine control module\)](#) that uses a torque-based strategy to evaluate inputs from sensors and other systems, then produces outputs to engine actuators to produce the required torque.

The electronic engine control system controls the following:

- Charge air
- Fueling
- Ignition timing
- Valve timing
- Cylinder knock
- Idle speed
- Engine cooling fan
- Evaporative emissions
- On-board diagnostics
- Immobilization system interface
- Speed control.

DESCRIPTION

Engine Control Module

E148512

The ECM is installed in the rear left corner of the engine compartment, behind the secondary bulkhead panel. The ECM is attached to brackets on the wheel housing and the fender outer support panel.

The ECM has the capability of adapting its fuel and ignition control outputs in response to several sensor inputs.

The ECM receives inputs from the following:

- [CKP \(crankshaft position\)](#) sensor.
- [CMP \(camshaft position\)](#) sensors (4 off).
- [ECT \(engine coolant temperature\)](#) sensors (2 off).
- Knock sensors (2 off).
- [MAP \(manifold absolute pressure\)](#) sensor.
- [MAPT \(manifold absolute pressure and temperature\)](#) sensor.
- [MAFT \(mass air flow and temperature\)](#) sensors (2 off).
- Charge air temperature sensor.
- TPS (throttle position sensor).
- [HO2S \(heated oxygen sensor\)](#) sensors (6 off).
- [APP \(accelerator pedal position\)](#) sensor.
- AAT (ambient air temperature) sensor.
- Supercharger bypass valve actuator.
For additional information, refer to: [Intake Air Distribution and Filtering](#) (303-12B Intake Air Distribution and Filtering - V6 S/C 3.0L Petrol, Description and Operation).
- FRPT (fuel rail pressure and temperature) sensor.
For additional information, refer to: [Fuel Charging and Controls](#) (303-04C Fuel Charging and Controls - V6 S/C 3.0L Petrol, Description and Operation).
- Engine cooling fan.
For additional information, refer to: [Engine Cooling](#) (303-03B Engine Cooling - V6 S/C 3.0L Petrol, Description and Operation).

- [DMTL \(diagnostic module tank leakage\)](#) pump (where fitted).
For additional information, refer to: [Evaporative Emissions](#) (303-13 Evaporative Emissions - V6 S/C 3.0L Petrol, Description and Operation).

Crankshaft Position Sensor

E148504

The **CKP** sensor is an inductive sensor that allows the **ECM** to determine the angular position of the crankshaft and the engine speed.

The CKP sensor is installed in the rear left side of the oil pan, in line with the engine drive plate. The sensor is secured with a single screw and sealed with an O-ring. A two pin electrical connector provides the interface with the engine harness.

The head of the CKP sensor faces a reluctor ring pressed into the outer circumference of the engine drive plate. The reluctor ring has a 60 minus 2 tooth pattern. There are 58 teeth at 6° intervals, with two teeth removed to provide a reference point with a centerline that is 21° **BTDC** (before top dead center) on cylinder 1.

If the CKP sensor fails, the ECM:

- Uses signals from the **CMP** sensors to determine the angular position of the crankshaft and the engine speed
- Adopts a limp home mode where engine speed is limited to a maximum of 3000 rev/min.

With a failed CKP sensor, engine starts will require a long crank time while the ECM determines the angular position of the crankshaft.

Camshaft Position Sensors

E116087

The **CMP** sensors are MRE (magneto resistive element) sensors that allow the **ECM** to determine the angular position of the camshafts. MRE sensors produce a digital output which allows the ECM to detect speeds down to zero.

The four CMP sensors are installed in the front upper timing covers, one for each camshaft.

Each CMP sensor is secured with a single screw and sealed with an O-ring. On each CMP sensor, a three pin electrical connector provides the interface with the engine harness.

The head of each CMP sensor faces a reluctor ring attached to the front of the related **VCT** actuator.

If an exhaust CMP sensor fails, the ECM disables the VCT of both exhaust camshafts.

If an intake CMP sensor fails, the ECM disables the VCT of both intake camshafts. This can result in the engine being slow, or failing, to start.

Engine Coolant Temperature Sensors

E108397

The ECT sensors are NTC (negative temperature coefficient) thermistors that allow the ECM to monitor the engine coolant temperature.

There are two identical ECT sensors installed, which are identified as ECT 1 and ECT 2. Each sensor is secured with a twist-lock and latch mechanism, and is sealed with an O-ring. A two pin electrical connector provides the interface between the sensor and the engine harness.

ECT 1

ECT 1 is installed in the heater manifold, at the rear of the Bank1 cylinder head. The input from this sensor is used in calibration tables and by other systems.

If there is an ECT 1 fault, the ECM adopts an estimated coolant temperature. On the second consecutive trip with an ECT 1 fault, the ECM illuminates the MIL (malfunction indicator lamp).

ECT 2

ECT 2 is installed in the lower hose connector which attaches to the bottom of the thermostat. The input from this sensor is used for OBD (on-board diagnostic) 2 diagnostics and, in conjunction with the input from ECT 1, to confirm that the thermostat is functional.

If there is an ECT 2 fault, the ECM illuminates the MIL on the second consecutive trip.

Knock Sensors

E108400

The knock sensors are piezo-ceramic sensors that allow the ECM to employ active knock control and prevent engine damage from pre-ignition or detonation.

Two knock sensors are installed on the inboard side of each cylinder head, one the midway of Bank 1, and one midway of Bank 2 cylinders. Each knock sensor is secured with a single screw. On each knock sensor, a two pin electrical connector provides the interface with the engine harness.

The ECM compares the signals from the knock sensors with mapped values stored in memory to determine when detonation occurs on individual cylinders. When detonation is detected, the ECM retards the ignition timing on that cylinder for a number of engine cycles, then gradually returns it to the original setting.

The ECM cancels closed loop control of the ignition system if the signal received from a knock sensor becomes implausible. In these circumstances the ECM defaults to base mapping for the ignition timing. This ensures the engine will not become damaged if low quality fuel is used. The MIL will not illuminate, although the driver may notice that the engine 'pinks' in some driving conditions and displays a drop in performance and smoothness.

The ECM calculates the default value if one sensor fails on each bank of cylinders.

Manifold Absolute Pressure Sensor

E148520

The **MAP** sensor allows the **ECM** to calculate the load on the engine, which is used in the calculation of fuel injection time.

The MAP sensor is installed in the air inlet of the supercharger. The sensor is secured with a single screw and sealed with an O-ring. A three pin electrical connector provides the interface with the engine harness.

If the MAP sensor fails, the ECM adopts a default value of 1 bar (14.5 lbf/in.²).

With a failed MAP sensor, the engine will suffer from poor starting, rough running and poor driveability.

Manifold Absolute Pressure and Temperature Sensor

E116088

The **MAPT** sensor allows the **ECM** to calculate the charge air density immediately before it enters the cylinders. This is used to adjust the ignition timing relative to the boost pressure, and to monitor the performance of the charge air coolers.

The MAPT sensor is installed in the rear of the left intake manifold. The sensor is secured with a single screw and sealed with an O-ring. A four pin electrical connector provides the interface with the engine harness.

Mass Air Flow and Temperature Sensors

E153646

The **MAFT** sensors allow the **ECM** to measure the mass flow and the temperature of the air flow into the engine. The mass air flow is measured with a hot film element in the sensor. The temperature of the air flow is measured with a **NTC** thermistor in the sensor. The mass air flow is used to determine the fuel quantity to be injected in order to maintain the stoichiometric air:fuel mixture required for correct operation of the engine and the catalytic converters.

Identical MAFT sensors are attached to each of the air cleaner outlets. On each MAFT sensor, a five pin electrical connector provides the interface with the engine harness.

If the hot film element signal fails the ECM invokes a software backup strategy to calculate the mass air flow from other inputs. Closed loop fuel control, closed loop idle speed control and evaporative emissions control are discontinued. The engine will suffer from poor starting, poor throttle response and, if the failure occurs while driving, the engine speed may dip before recovering.

If the NTC thermistor signal fails the ECM adopts a default value of 25 °C (77 °F) for the intake air temperature.

Charge Air Temperature Sensor

E149162

The charge air temperature sensor is installed in the supercharger intercooler top cover. A two pin electrical connector provides the interface between the sensor and the engine harness. The sensor contains an **NTC** thermistor with supply and return connections to the **ECM**.

The ECM supplies the charge air temperature sensor with a 5 V reference voltage and translates the return voltage into a temperature. The ECM uses the input:

- To monitor operation of the charge air coolant pump
- For air mass calculations used in control of the supercharger bypass valve, as part of the charge air strategy that co-ordinates operation of the electric throttle and the bypass valve, and predicts the air mass delivered to the cylinders.

NOTE: The charge air temperature sensor is introduced together with the electric actuator for the **SC** (supercharger) bypass valve (in place of the vacuum actuator), which enables more accurate control of the bypass air flow.

If the charge air temperature sensor fails, the ECM substitutes the input with a modeled temperature. Failure of the sensor is unlikely to be noticeable to the driver.

Throttle Position Sensors

The TPS (throttle position sensor)'s allows the **ECM** to determine the position and angular rate of change of the throttle blade.

There are two TPS sensors located in the electric throttle. See below for details of the electric throttle.

If a TPS sensor fails, the **ECM**:

- Adopts a limp home mode where engine speed is limited to a maximum of approximately 2000 rev/min.
- Discontinues **EVAP** control.
- Discontinues closed loop control of engine idle speed.

With a failed TPS sensor, the engine will suffer from poor running and throttle response.

Heated Oxygen Sensors

E148505

A pre catalyst **HO2S** is installed in the outlet of each exhaust manifold, which enables independent closed loop control of the air:fuel mixture for each cylinder bank.

NOTE: A mid catalyst and a post catalyst **HO2S** is installed in each branch of the exhaust system. Together with the pre catalyst sensors, these are used by the **ECM** to monitor the performance of the catalytic converters.

The heater elements of the pre catalyst **HO2S** are controlled by a **PWM** (pulse width modulation) signal from the **ECM**. The heater elements are operated after each engine start, once it has been calculated that there is no moisture in the exhaust (between 0 and 2 minutes delay), and also during low load conditions when the temperature of the exhaust gases is insufficient to maintain the required sensor temperature. The **PWM** duty cycle is carefully controlled to prevent thermal shock to cold sensors. A non-functioning heater delays the sensor's readiness for closed loop control and increases emissions.

The heated oxygen sensors age with mileage, increasing their response time to switch from rich to lean and lean to rich. This increase in response time influences the ECM closed loop control and leads to progressively increased emissions. Measuring the period of rich to lean and lean to rich switching monitors the response rate of the pre catalyst sensors.

The pre catalyst HO2S sensor produces a constant voltage, with a variable current that is proportional to the lambda ratio. The ECM monitors the pre catalyst HO2S by checking the signal against maximum and minimum threshold, for open and short circuit conditions. If a HO2S fails:

- The ECM defaults to open loop fueling for the related cylinder bank.
- The **CO (carbon monoxide)** and emissions content of the exhaust gases increases.
- The exhaust smells of rotten eggs (hydrogen sulphide).

With a failed pre catalyst HO2S the engine will suffer from unstable operation and reduced performance.

Accelerator Pedal Position Sensor

E141165

The **APP** sensor allows the **ECM** to determine the driver requests for vehicle speed, acceleration and deceleration. The ECM uses this information, together with information from the **ABS (anti-lock brake system)** and the **TCM (transmission control module)**, to determine the setting of the electric throttle.

The APP sensor is integrated into the accelerator pedal, which is attached to the lower dash panel. A six pin electrical connector provides the interface with the vehicle harness.

The APP sensor is a twin track potentiometer. Each track receives an independent power supply from the ECM and returns an independent analog signal to the ECM. Both signals contain the same positional information, but the signal from track 2 is half the voltage of the signal from track 1 at all positions.

If both signals have a fault, the ECM adopts a limp home mode, which limits the engine speed to 2000 rev/min maximum.

The ECM constantly checks the range and plausibility of the two signals and stores a fault code if it detects a fault.

Ambient Air Temperature Sensor

E116093

The AAT (ambient air temperature) sensor is a [NTC](#) thermistor that allows the [ECM](#) to monitor the temperature of the air around the vehicle. The ECM uses the AAT input for a number of functions, including engine cooling fan control. The ECM also transmits the ambient temperature on the HS (high speed) [CAN \(controller area network\)](#) bus for use by other control modules.

The AAT sensor is installed in the left exterior mirror, with the bulb of the sensor positioned over a hole in the bottom of the mirror casing.

The ECM supplies the sensor with a 5 V reference voltage and a ground, and translates the return signal voltage into a temperature.

If there is a fault with the AAT sensor, the ECM calculates the AAT from the temperature inputs of the [MAFT](#) sensors. If the AAT sensor and the temperature inputs of the MAFT sensors are all faulty, the ECM adopts a default ambient temperature of 25 °C (77 °F).

Electric throttle

E153645

The [ECM](#) uses the electric throttle to regulate engine torque.

The electric throttle is installed between the clean air duct and the supercharger.

For additional information, refer to: [Intake Air Distribution and Filtering](#) (303-12B Intake Air Distribution and Filtering - V6 S/C 3.0L Petrol, Description and Operation).

The throttle plate is operated by an electric [DC \(direct current\)](#) motor integrated into the throttle body. The ECM uses a [PWM](#) signal to control the DC motor. The ECM compares the [APP](#) sensor inputs against an electronic map to determine the required position of the throttle plate. The ECM and electric throttle are also required to:

- Monitor requests for cruise control operation.
- Automatically operate the electric throttle for accurate cruise control.
- Perform all dynamic stability control engine interventions.
- Monitor and carry out maximum engine speed and road speed cut outs.
- Provide different engine maps for the ride and handling optimization system.

A software strategy within the ECM calibrates the position of the throttle plate at the beginning of each ignition cycle. When the ignition is turned on, the ECM performs a self test and calibration routine by fully closing the throttle plate and then opening it again. This tests the default position springs and allows the ECM to learn the fully closed position.

OPERATION

Engine Control Module Relay

The [ECM](#) relay is used to initiate the power up and power down routines within the ECM. The ECM relay is installed in the [EJB \(engine junction box\)](#).

When the ignition is turned on, battery voltage is applied to the ignition sense input from the [CJB \(central junction box\)](#). The ECM then starts its power up routines and energizes the ECM relay.

When the ignition is turned off, the ECM maintains its powered up state while it conducts the power down routines. This can be for:

- Up to 20 minutes in extreme cases, when the DMTL system is running (NAS markets).
- Up to 5 minutes when cooling fans are required.

On completion of the power down routines the ECM de-energizes the ECM relay.

Engine Control Module Adaptions

The ECM has the ability to adapt the input values it uses to control certain outputs. This capability maintains engine refinement and ensures the engine emissions remain within the legislated limits. The components which have adaptions associated with them are:

- The APP sensor.
- The HO2S sensors.
- The MAFT sensors.
- The CKP sensor.
- Electric throttle
- Knock sensors.

Oxygen and Mass Air Flow and Temperature Sensors

There are several adaptive maps associated with the fueling strategy. Within the fueling strategy the ECM calculates short-term adaptions and long term adaptions. The ECM will monitor the deterioration of the HO2S's over a period of time. It will also monitor the current correction associated with the sensors.

The ECM will store a fault code in circumstances where an adaption is forced to exceed its operating parameters. At the same time, the ECM will record the engine speed, engine load and intake air temperature.

Crankshaft Position Sensor

The characteristics of the signal supplied by the CKP sensor are learned by the ECM. This enables the ECM to set an adaption and support the engine misfire detection function. Due to the small variation between different drive plates and different CKP sensors, the adaption must be reset if either component is renewed, or removed and refitted. It is also necessary to reset the drive plate adaption if the ECM is renewed or replaced. The ECM supports four drive plate adaptions for the CKP sensor. Each adaption relates to a specific engine speed range. The engine speed ranges are detailed in the table below:

Adaption	Engine Speed, rev/min
1	1800 - 3000
2	3001 - 3800
3	3801 - 4600
4	4601 - 5400

Misfire Detection

Legislation requires that the ECM must be able to detect the presence of an engine misfire. It must be able to detect misfires at two separate levels. The first level is an amount of misfire that could lead to the legislated emissions limit being exceeded by a given amount. The second level is a misfire rate that causes degradation in catalytic converter efficiency.

The ECM monitors the number of misfire occurrences within two engine revolution ranges. If the ECM determines a misfire failure within either of these two ranges, over two consecutive journeys, it will record a fault code and details of the engine speed, engine load and engine coolant temperature. In addition, if the second level of misfire occurs, on any trip, the ECM flashes the MIL while the fault is occurring.

The signal from the CKP sensor indicates how fast the poles on the drive plate are passing the sensor tip. A sine wave is generated each time a pole passes the sensor tip. The ECM can detect variations in drive plate speed by monitoring the sine wave signal supplied by the CKP sensor. By assessing this signal, the ECM can detect the presence of an engine misfire. The ECM will evaluate the signal against a number of factors and will decide whether to record the occurrence or ignore it. The ECM can assign a misfire judgment to an individual cylinder, which can be viewed on Land Rover approved diagnostic equipment.

Electronic Engine Controls - V6 S/C 3.0L Petrol - Electronic Engine Controls

Diagnosis and Testing

Principle of Operation

For a detailed description of electronic engine controls, refer to the relevant description and operation section of the workshop manual. REFER to:

[Electronic Engine Controls](#) (303-14B Electronic Engine Controls - V6 S/C 3.0L Petrol, Description and Operation),
[Electronic Engine Controls](#) (303-14D, Description and Operation),
[Electronic Engine Controls](#) (303-14D, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

1. Verify the customer concern
2. Visually inspect for obvious signs of mechanical or electrical damage

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Engine oil level and condition • Cooling system coolant level • Fuel level/fuel leaks • Fuel contamination/grade/quality • Throttle body • Accessory drive belt • Sensor installation/condition • Cooling fan • Air cleaner condition 	<ul style="list-style-type: none"> • Fuses • Wiring harness • Electrical connector(s) • 5 volt sensor supply • Sensor(s) • Engine control module • Transmission control module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, verify the symptom and refer to the symptom chart, alternatively check for diagnostic trouble codes (DTCs) and refer to the DTC index

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: V6 3.0L S/C Petrol, DTC: Engine Control Module \(ECM\)](#) (100-00 General Information, Description and Operation).

Electronic Engine Controls - V6 S/C 3.0L Petrol - Brake Pedal Position (BPP) Switch Adjustment

General Procedures

Check

1. Remove the brake pedal rubber.

E135356

2.  **NOTE:** Make sure that the dial test indicator (DTI) gauge is in line with the brake pedal movement.

Position the DTI gauge on a suitable mounting block, as illustrated.

3. With the aid of another technician, gently press the brake pedal until the stop lamps illuminate.

4.  **NOTE:** The specification is that the stop lamps should illuminate at between 5.5mm and 8.5mm brake pedal travel.

Note the measurement of the brake pedal travel from rest position until the stop lamps illuminated.

Adjust

NOTE: The Brake Pedal Position Switch is self adjusting when removed and installed.

1. Remove and install Brake Pedal Position Switch.
For additional information, refer to: [Stoplamp Switch](#) (417-01 Exterior Lighting, Removal and Installation).
2. Check the adjustment of the stop lamp switch by following the **Check** procedure in this procedure and carry out the **Adjust** procedure if required.

Electronic Engine Controls - V6 S/C 3.0L Petrol - Camshaft Position (CMP) Sensor LH

Removal and Installation

Removal

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

Removal steps in this procedure may contain installation details.

-  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
- Refer to: [Thermostat Housing](#) (303-03B Engine Cooling - V6 S/C 3.0L Petrol, Removal and Installation).
- Torque: 10 Nm*

Installation

- CAUTIONS:

Make sure that the mating faces are clean and free of foreign material.

Make sure that the sensor tip is clean and free of foreign material.

NOTE: Lubricate the O-ring seal with clean engine oil.

To install, reverse the removal procedure.

Electronic Engine Controls - V6 S/C 3.0L Petrol - Camshaft Position (CMP) Sensor RH

Removal and Installation

Removal

Item	Part Number	Description
1	-	Electronic Transmission Selector (ETS)
2	-	Emergency park release lever
3	-	Automatic transmission
4	-	Torque converter

INTRODUCTION

The ZF 8HP70 transmission is an electronically controlled, hydraulically operated, eight-speed automatic unit. The hydraulic and electronic control elements of the transmission, including the [TCM \(transmission control module\)](#), are incorporated in a single unit located inside the transmission and is known as 'Mechatronic'.

The ZF 8HP70 transmission has the following features:

- Designed to be maintenance free
- Transmission fluid is 'fill for life'
- The torque converter features a controlled slip feature with electronically regulated control of lock-up, creating a smooth transition to the fully locked condition
- Shift programs controlled by the [TCM](#)

ASIS (adaptive shift strategy), to provide continuous adaptation of shift changes to suit the driving style of the driver, which can vary from sporting to economical

- Connected to the **ECM (engine control module)** via the high-speed **CAN (controller area network)** bus for communications
- Default mode if major faults occur
- Diagnostics available from the **TCM** via the high speed **CAN** bus.

The higher fuel efficiency of the ZF 8HP70 automatic transmission is mainly due to the following modifications:

- a wider ratio spread and more gears for better adaptation to ideal engine operating points
- significantly reduced drag torque in the shift elements (only two open shift elements per gear)
- use of a more efficient **ATF (automatic transmission fluid)** pump (double-stroke vane pump)
- decoupling of the transmission when the vehicle is at standstill
- improved torsion damping in the converter.

The transmission selections are made using the Electronic Transmission Selector (ETS) in the floor console. For additional information, refer to: External Controls (307-05 Automatic Transmission/Transaxle External Controls - TDV6 3.0L Diesel, Vehicles With: 8HP70 8-Speed Automatic Transmission AWD, Description and Operation).

TRANSMISSION

The transmission comprises the main casing which houses all of the transmission components. The main casing also incorporates an integral torque converter housing.

A fluid pan is attached to the lower face of the main casing and is secured with bolts. The fluid pan is sealed to the main casing with a gasket. Removal of the fluid pan allows access to the Mechatronic valve block. The fluid pan has magnets located at the rear which collects any ferrous metallic particles present in the transmission fluid.

A fluid filter is located inside the fluid pan. If the transmission fluid becomes contaminated or after any service work, the fluid pan with integral filter must be replaced.

The transmission does not have a Bowden cable for park lock operation. This is initiated electronically when the ETS is moved to the 'P' park position. An emergency park interlock release mechanism is provided to release the park interlock if a failure occurs.

A new feature of the 8 speed transmission is decoupling of the transmission when the vehicle is at a standstill. Normally the transmission remains in gear with the torque converter slipping and the vehicle is prevented from moving by applying the brake. The new system disengages one of the transmission clutches and only a minimum rotating load remains. This has the effect of further reducing fuel consumption.

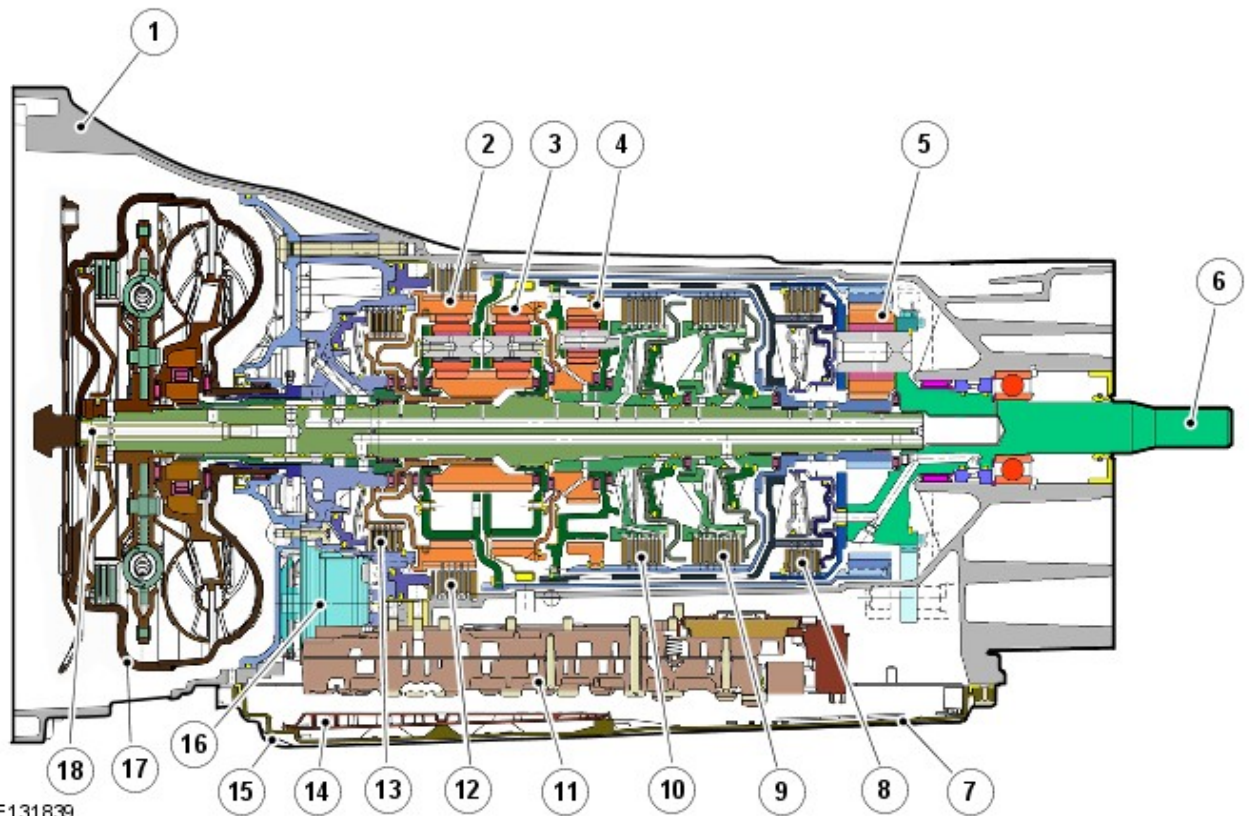

The internal oil pump is driven by a simplex chain and two drive gears from the input shaft. The oil pump is a double stroke vane cell pump which delivers 50 cm² of transmission fluid per revolution.

The integral torque converter housing provides protection for the torque converter assembly and also provides the attachment for the gearbox to the engine. The torque converter is a non-serviceable assembly which also contains the lock-up clutch mechanism.

The main casing contains the following major components:

- Input shaft
- Output shaft
- Mechatronic valve block which contains the solenoids, speed sensors and the **TCM**
- Three rotating multiplate drive clutches
- Two fixed multiplate brake clutches
- Four planetary gear trains.

12	-	Disc carrier
13	-	Drive plate/disc carrier

The torque converter is the coupling element between the engine and the transmission and is located in the torque converter housing, on the engine side of the transmission. The driven power from the engine crankshaft is transmitted hydraulically and mechanically through the torque converter to the transmission. The torque converter is connected to the engine by a flex plate attached to the rear of the crankshaft.

The torque converter comprises an impeller, a stator and a turbine. The torque converter is a sealed unit with all components located between the converter housing cover and the impeller. The two components are welded together to form a sealed, fluid filled housing. With the impeller brazed to the converter housing cover, the impeller is therefore driven at engine crankshaft speed.

The converter housing drive plate has four threaded bosses, which provide for attachment of the engine flex plate. The threaded bosses also provide for location of special tools which are required to remove the torque converter from the torque converter housing.

Impeller

Fluid Flow

NOTE: The following illustration shows a typical turbine, stator and impeller.

E42397

Item	Part Number	Description
1	-	Turbine
2	-	Stator
3	-	Impeller

When the engine is running the rotating impeller acts as a centrifugal pump, picking up fluid at its center and discharging it at high velocity through the blades on its outer rim. The design and shape of the blades and the curve of the impeller body cause the fluid to rotate in a clockwise direction as it leaves the impeller. This rotation improves the efficiency of the fluid as it contacts the outer row of blades on the turbine.

The centrifugal force of the fluid leaving the blades of the impeller is passed to the curved inner surface of the turbine via the tip of the blades. The velocity and clockwise rotation of the fluid causes the turbine to rotate.

Turbine

The turbine is similar in design to the impeller with a continuous row of blades. Fluid from the impeller enters the turbine through the tip of the blades and is directed around the curved body of the turbine to the root of the blades. The curved surface redirects the fluid back in the opposite direction to which it entered the turbine, applying a turning force to the turbine from the impeller.

The fluid leaving the inner row of the turbine blades is rotated in a counter-clockwise direction due to the curve of the turbine and the shape of the blades. The fluid is now flowing in the opposite direction to the engine rotation and therefore the impeller. If the fluid was allowed to hit the impeller in this condition, it would have the effect of applying a brake to the impeller. To prevent this, the stator is located between the impeller and the turbine.

Stator

The stator is located on the splined transmission stator shaft via a freewheel clutch. The stator comprises a number of blades which are aligned in an opposite direction to those of the impeller and turbine. The main function of the stator is to redirect the returning fluid from the turbine, changing its direction to that of the impeller.

The redirected fluid from the stator is directed at the inner row of blades of the impeller, assisting the engine in turning the impeller. This sequence increases the force of the fluid emitted from the impeller and thereby produces the torque multiplication effect of the torque converter.

Stator Functions

NOTE: The following illustration shows a typical stator

E 42398

Item	Part Number	Description
1	-	Blades
2	-	Stator held – fluid flow redirected
3	-	Stator rotates freely
4	-	Roller freewheel
5	-	Converter at coupling speed
6	-	Fluid flow from turbine
7	-	Converter multiplying
8	-	Fluid flow from impeller
9	-	Drive from engine
10	-	Impeller
11	-	Stator
12	-	Turbine
13	-	Output to transmission

Fluid emitted from the impeller acts on the turbine. If the turbine is rotating at a slower speed than the fluid from the impeller, the fluid will be deflected by the turbine blades in the path 'A'. The fluid is directed at and deflected by the stator blades from path 'B' to path 'C'. This ensures that the fluid is directed back to the pump in the optimum direction. In this condition the roller clutch is engaged and the force of the fluid on the stator blades assists the engine in rotating the impeller.

As the rotational speed of the transmission and therefore the turbine increases, the direction of the fluid leaving the turbine changes to path 'D'. The fluid is now directed from the turbine to the opposite side of the stator blades, rotating the stator in the opposite direction. To prevent the stator from resisting the smooth flow of the fluid from the turbine, the freewheel clutch releases, allowing the stator to rotate freely on its shaft.

When the stator becomes inactive, the torque converter no longer multiplies the engine torque. When the torque converter reaches this operational condition it ceases to multiply the engine torque and acts solely as a fluid coupling, with the impeller and the turbine rotating at approximately the same speed.

One Way Free Wheel Clutch

The free wheel clutch can perform two functions; hold the stator stationary and free wheel allowing the stator to rotate without a drive output. The free wheel clutch used is of the roller type and comprises an inner and outer race and a roller and cage assembly. The inner and outer races are pressed into their related components with which they rotate. The roller and cage assembly is located between the inner and outer races.

The rollers are located in a cage which is a spring which holds the rollers in the 'wedge' direction and maintains them in contact with the inner and outer races. The outer race has a series of ramps which allow the rollers to lock the inner and outer races together.

When the outer race is rotated in a clockwise direction, the rollers are 'wedged' between the inner and outer races. The rollers then prevent the rotation of the outer race by holding it to the inner race, which is held stationary.

Lock-Up Clutch Mechanism

The **TCC (torque converter clutch)** is hydraulically controlled by an Electronic Pressure Regulating Solenoid (EPRS), which is controlled by the **TCM**. This allows the torque converter to have three states of operation as follows:

- Fully engaged
- Controlled slip variable engagement
- Fully disengaged.

The torque converter pressure valve reduces system pressure and guarantees the pressure needed for the torque converter. It also limits the maximum torque converter pressure, to prevent the torque converter from expanding.

The solenoid valve is operated by **PWM (pulse width modulation)** signals from the **TCM** to give full, partial or no lock-up

of the torque converter.

The lock-up clutch is a hydro-mechanical device which eliminates torque converter slip, improving fuel consumption. The engagement and disengagement is controlled by the TCM to allow a certain amount of controlled 'slip'. This allows a small difference in the rotational speeds of the impeller and the turbine which results in improved shift quality. The lock-up clutch comprises a piston and a clutch friction plate.

In the unlocked condition, the oil pressure supplied to the piston chamber is reduced and the pressure in the turbine chamber is allowed to push the piston back. In this condition the clutch plate are released and torque converter slip is permitted.

In the locked condition, the TCC spool valves are actuated by the EPRS. Pressurized fluid is directed into the lock-up clutch piston. The piston moves with the pressure and pushes the clutch plates together. As the pressure increases, the friction between the clutch plates increases, finally resulting in full lock-up of the clutch plates. In this condition there is direct mechanical drive from the engine crankshaft to the transmission planetary gear train.

The standstill decoupling feature is new for the 8 speed transmission. When the vehicle comes to a standstill (with the brakes applied), the converter is disconnected from the driveline so that only a slight residual load remains. This further reduces fuel consumption. Decoupling is by actuating clutch B in the transmission, and is dependent on load and output speed.

FLUID PUMP

The fluid pump is an integral part of the transmission. The fluid pump is used to supply hydraulic pressure for the operation of the control valves and clutches, to pass the fluid through the transmission cooler and to lubricate the gears and shafts.

The ZF 8HP70 fluid pump is a double stroke, vane type pump and is located below the transmission input shaft. The pump is driven by a chain drive from a sprocket located on the input shaft. The pump has a delivery rate of 50 cm³ per revolution. The drive sprocket is driven at engine speed through a splined connection in the torque converter shell.

Double Vane Fluid Pump Location

E137697

Item	Part Number	Description
1	-	Vane pump
2	-	Chain drive from torque converter cover

Double Vane Fluid Pump Schematic Diagram

E131109

Item	Part Number	Description
1	-	System pressure valve
2	-	Vane pump
3	-	Intake pipe
4	-	Oil pan
5	-	Pressure pipe
6	-	Recycling of redundant fluid

The pump comprises a sprocket, a rear cover with bearing, a front cover with bearing, a cylinder, a rotor shaft and a rotor with vanes. A pressure relief valve is fitted in the pressure outlet gallery from the pump but is not an integral part of the pump itself.

A sprocket is located around the transmission input shaft. Splines on the torque converter nose and the sprocket ensure a positive drive. A simplex chain transmits the rotation of the torque converter cover into rotation of the pump rotor shaft via a second sprocket fitted to the rotor shaft. The gearing of the two sprockets rotates the pump rotor shaft at a speed slightly higher than the Revolutions Per minute (RPM) of the torque converter cover which is directly connected to the engine crank.

The pump contains 7 vanes which are attached to the rotor and rotate within the cam shaped cylinder. As the vanes rotate, the eccentricity of the central hole in the cylinder causes the space between the vanes to increase. This causes a depression between the vanes and fluid is drawn into the space between the vanes via a suction port connected to the fluid pan. The fluid passes through the fluid pan filter before it is drawn into the pump.

As the rotor shaft rotates further, the inlet port is closed by the vanes which have drawn in fluid, trapping the fluid in the space between the vanes. The eccentric hole in the cylinder causes the space between the vanes to decrease and consequentially compresses and pressurizes the fluid trapped between them.

Further rotation of the rotor shaft moves the vanes towards the outlet port. As the vanes pass the outlet port the pressurized fluid passes from the space between the vanes into the pressure gallery to the pressure relief valve.

As the pump is a double stroke vane pump, this sequence is repeated twice per revolution of the rotor shaft.

The pressure relief valve controls the pressure and flow of fluid delivered to the transmission valve block, torque converter and other components. Pressure is controlled by a relief valve which limits the maximum system pressure to 32 bar (464 lbf/in²). The pressure control maintains a constant pressure of fluid irrespective of torque converter input shaft rotational speed. A metering orifice is subject to the pump output pressure. If the pressure in the orifice reaches a predetermined level, a spring loaded ball in the flow control valve is lifted from its seat and pressurized fluid is allowed to recirculate through the pump.

MECHATRONIC VALVE BLOCK

The Mechatronic valve block is located in the bottom of the transmission and is covered by the fluid pan. The valve block houses the TCM, electrical actuators, speed sensors and control valves which provide all electro-hydraulic control for all transmission functions. The Mechatronic valve block comprises the following components:

- TCM
- Seven pressure regulator solenoids
- Two park lock solenoids

- Twenty one hydraulic spool valves
- Temperature sensor
- Turbine speed sensor
- Output shaft speed sensor.

Mechatronic Valve Block

E131253

Item	Part Number	Description
1	-	EPRS A - A brake valve
2	-	EPRS D - D clutch valve
3	-	EPRS B - B brake valve
4	-	EPRS E - E clutch valve
5	-	MV 2 - magnet-valve 2 for electrical park interlock (hold out of park)
6	-	MV 1 - pressure reducing valve
7	-	EPRS SYS - system pressure valve
8	-	EPRS WK - Torque converter lock-up clutch valve
9	-	EPRS C - C clutch valve
10	-	Transmission input shaft speed sensor
11	-	Electrical connector
12	-	Transmission Control Module (TCM) - hidden

Electronic Pressure Regulator Solenoids (EPRS)

E42713

Seven EPRS are located in the valve block. The solenoids are controlled by **PWM** signals from the **TCM**. The solenoids convert the electrical signals into hydraulic control pressure proportional to the signal to actuate the spool valves for precise transmission operation.

Solenoids EPRS A, B, D, E and WK supply a higher control pressure as the signal amperage increases and can be identified by an orange connector cap. The **TCM** operates the solenoids using **PWM** signals. The **TCM** monitors engine load and clutch slip and varies the solenoid duty cycle accordingly. The solenoids have a 12 V operating voltage and a pressure range of 0 - 4.7 bar (0 - 68 lbf.in²).

Solenoids EPRS C and SYS supply a lower control pressure as the signal amperage increases and can be identified by a gray connector cap. The **TCM** monitors engine load and clutch slip and varies the solenoid duty cycle accordingly. The solenoids have a 12 V operating voltage and a pressure range of 4.7 - 0 bar (68 - 0 lbf.in²).

The resistance of the solenoid coil winding for EPRS solenoids is 5.05 Ohms at 20 °C (68 °F).

Control Solenoid (MV 1)

E42714

A shift control solenoid MV1 (Magnetic Valve 1) is located in the valve block. The solenoid is controlled by the **TCM** and converts electrical signals into hydraulic control signals to control clutch application.

The shift control solenoid is an open/closed, on/off solenoid which is controlled by the **TCM** switching the solenoid to earth. The **TCM** also supplies power to the solenoid. The **TCM** energizes the solenoid in a programmed sequence for clutch application for gear ratio changes and shift control.

The resistance of the solenoid coil winding for solenoid is between 10 to 11 Ohms at 20 °C (68 °F).

Control Solenoid (MV 2)

E 131254

Item	Part Number	Description
A	-	Solenoid in locked (energized) condition - park lock released
B	-	Solenoid in unlocked (deenergized) condition - park lock engaged
1	-	Solenoid
2	-	Claw - locked
3	-	Piston
4	-	Claw - unlocked

A control solenoid MV 2 (Magnetic Valve 2) is located in the valve block. The solenoid is controlled by the TCM and converts electrical signals into hydraulic control signals to control the electronic park lock function

The control solenoid is an on/off solenoid which is controlled by the TCM by switching the solenoid to earth.

When the park position is deselected, control solenoid MV2 resets the parking lock valve in the Mechatronic valve block. This is achieved by the TCM providing the ground for the solenoid which is energized, releasing the claws from retaining the park lock piston. Main fluid pressure acting on the parking lock piston, pushes the piston back to release the lock.

When the park position is selected, control solenoid MV2 is deenergized. The fluid pressure at the parking lock cylinder piston is vented and the mechanical interlock of the piston is opened. A pre-tensioned torsion spring at the park lock disc pulls the piston into the "park" position where the piston engages with the control solenoid claws and is locked in the park position. An emergency release wire cable can be used to release the parking lock manually if an electrical failure occurs.

The resistance of the solenoid coil winding for solenoid is 25 Ohms at 20 °C (68 °F).

When the neutral "N" position is selected and the engine is turned off, the fluid pressure at the park lock cylinder piston is released. The current supply to the control solenoid MV2 remains. The park lock cylinder piston is still held in the unlocked position by the spring force acting on the park lock disc, preventing the park lock plate from engaging the parking lock. This allows the vehicle to be moved when the engine is not running for a short time. Should the battery voltage fall below the level required to maintain the solenoid in the energized condition, the park lock will be engaged.

Sensors

Speed Sensors

The turbine speed sensor and the output shaft speed sensor are Hall effect type sensors located in the Mechatronic valve block and are not serviceable items. The TCM monitors the signals from each sensor to determine the input (turbine) speed and the output shaft speed.

The turbine speed is monitored by the TCM to calculate the slip of the torque converter clutch and internal clutch slip. This signal allows the TCM to accurately control the slip timing during shifts and adjust clutch application or release pressure for overlap shift control.

The output shaft speed is monitored by the TCM and compared to engine speed signals received on the CAN bus from the ECM. Using a comparison of the two signals the TCM calculates the transmission slip ratio for plausibility and maintains adaptive pressure control.

Temperature Sensor

The temperature sensor is also located in the Mechatronic valve block. The TCM uses the temperature sensor signals to determine the temperature of the transmission fluid. These signals are used by the TCM to control the transmission operation to promote faster warm-up in cold conditions or to assist with fluid cooling by controlling the transmission operation when high fluid temperatures are experienced. If the sensor fails, the TCM will use a default value and a fault code will be stored in the TCM.

Spool Valves

The valve block contains spool valves which control various functions of the transmission. The spool valves are of conventional design and are operated by fluid pressure.

Each spool valve is located in its spool bore and held in a default (unpressurized) position by a spring. The spool bore has a number of ports which allow fluid to flow to other valves and clutches to enable transmission operation. Each spool has a piston which is waisted to allow fluid to be diverted into the applicable ports when the valve is operated.

When fluid pressure moves a spool, 1 or more ports in the spool bore are covered or uncovered. Fluid is prevented from flowing or is allowed to flow around the applicable waisted area of the spool and into another uncovered port. The fluid is either passed through galleries to actuate another spool, operate a clutch or is returned to the fluid pan.

DRIVE CLUTCHES

Multiplate Clutch or Brake – Typical

E42715

Item	Part Number	Description
1	-	Input shaft
2	-	Main pressure supply port
3	-	Piston
4	-	Cylinder – external plate carrier
5	-	Clutch plate assembly
6	-	Baffle plate (for clutch, not brake)
7	-	Diaphragm spring
8	-	Output shaft
9	-	Bearing
10	-	Dynamic pressure equalization chamber
11	-	Piston chamber
12	-	Lubrication channel

There are three drive clutches and two brakes used in the transmission. Each clutch comprises a number of friction plates dependent on the output controlled. A typical clutch consists of a number of alternating steel plates and plates with friction material bonded to each face.

The clutch plates are held apart mechanically by a diaphragm spring and hydraulically by dynamic pressure. The pressure is derived from a lubrication channel which supplies fluid to the bearings and clutch cooling. The fluid is passed via a drilling in the input shaft into the chamber between the baffle plate and the piston. To prevent inadvertent clutch application due to pressure build up produced by centrifugal force, the fluid in the dynamic pressure equalization chamber overcomes any centrifugal pressure in the piston chamber and holds the piston off the clutch plate assembly.

When clutch application is required, main pressure from the fluid pump is applied to the piston chamber from the supply port. This main pressure overcomes the low pressure fluid present in the dynamic pressure equalization chamber. The piston moves, against the pressure applied by the diaphragm spring, and compresses the clutch plate assembly. When the main pressure falls, the diaphragm spring pushes the piston away from the clutch plate assembly, disengaging the clutch.

PLANETARY GEAR TRAINS

The 8 forward gears and the reverse gear are produced by a combination of four simple planetary gear sets, 3 clutches

and 2 brakes. The front two gear sets share a common sun gear. Power is output always through the planetary carrier of the fourth gearset.

Five shift elements comprising 3 clutches and 2 brakes, are responsible for all 8 forward and reverse gears. High efficiency is achieved by the use of only 2 shift elements disengaged in each gear which reduces drag and so increases the efficiency.

Planetary Gear Sets 1, 2 and 3

The planetary gear sets 1 and 2 comprise:

- Sunwheel - shared by both gear sets
- 4 planetary gears per gear set
- Planetary gear carrier (spider) per gear set
- Ring gear per gear set.

The planetary gear set 3 comprises:

- Sunwheel
- 3 planetary gears
- Planetary gear carrier (spider)
- Ring gear.

E131255

Item	Part Number	Description
1	-	Planetary gears - gear set 1
2	-	Ring gear - gear set 1
3	-	Planetary gear carrier (spider)
4	-	Planetary gears - gear set 2
5	-	Ring gear - gear set 2
6	-	Planetary gears - gear set 3
7	-	Ring gear - gear set 3
8	-	Sun wheel - gear set 3
9	-	Sun wheel - joint gear sets 1 and 2

Planetary Gear Set 4

The planetary gear set 4 comprises:

- Sunwheel
- 4 planetary gears
- Planetary gear carrier (spider) - output shaft
- Ring gear.

E131256

Item	Part Number	Description
1	-	Ring gear
2	-	Planetary gears
3	-	Output shaft / gear carrier
4	-	Sun wheel

TRANSMISSION CONTROL MODULE

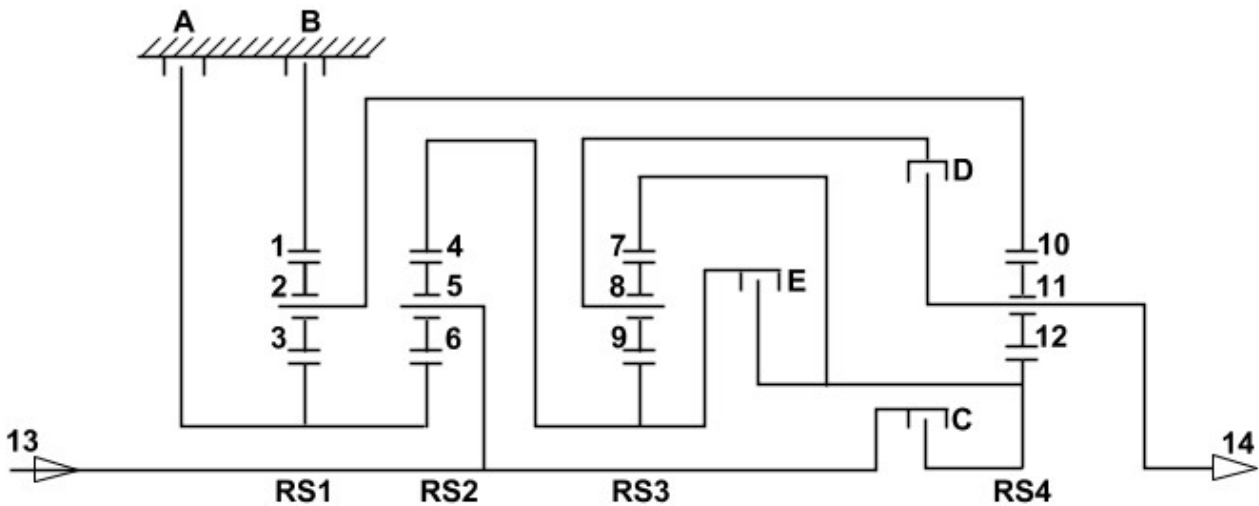

The **TCM** is an integral part of the Mechatronic valve block which is located at the bottom of the transmission, within the fluid pan. The **TCM** is the main controlling component of the transmission.

The **TCM** processes signals from the transmission speed and temperature sensors, **ECM** and other vehicle systems. From the received signal inputs and pre-programmed data, the module calculates the correct gear, torque converter clutch setting and optimum pressure settings for gear shift and lock-up clutch control.

CONTROL DIAGRAM

NOTE: **A** = Hardwired; **D** = High speed CAN bus.

E131258

Item	Part Number	Description
A	-	Multiplate brake
B	-	Multiplate brake
C	-	Multiplate clutch
D	-	Multiplate clutch
E	-	Multiplate clutch
1	-	Ring gear of planetary gear set 1
2	-	Planetary gears of planetary gear set 1
3	-	Sun gear of planetary gear set 1
4	-	Ring gear of planetary gear set 2
5	-	Planetary gears of planetary gear set 2
6	-	Sun gear of planetary gear set 2
7	-	Ring gear of planetary gear set 3
8	-	Planetary gears of planetary gear set 3
9	-	Sun gear of planetary gear set 3
10	-	Ring gear of planetary gear set 4
11	-	Planetary gears of planetary gear set 4
12	-	Sun gear of planetary gear set 4
13	-	Power input from torque converter
14	-	Power output to output shaft

Engine torque is transferred, via operation of single or combinations of clutches to the 4 planetary gear trains. All gear trains are controlled by reactionary inputs from brake clutches to produce the 8 forward gears and 1 reverse gear. The ratios are as follows:

Gear	1st	2nd	3rd	4th	5th	6th	7th	8th	Reverse
Ratio	4.714	3.143	2.106	1.667	1.285	1.000	0.839	0.667	3.317

Shift Elements

E131259

Item	Part Number	Description
1	-	Brake A
2	-	Brake B
3	-	Gear set 1
4	-	Gear set 2
5	-	Gear set 3
6	-	Clutch E
7	-	Clutch C
8	-	Clutch D
9	-	Gear set 4

The shift elements, clutches and brakes are actuated hydraulically. Fluid pressure is applied to the required clutch and/or brake, pressing the plates together and allowing drive to be transmitted through the plates. The purpose of the shift elements is to perform power-on shifts with no interruption to traction and smooth transition between gear ratios.

Instrument Cluster

E137706

Item	Part Number	Description
1	-	MIL (malfunction indicator lamp)
2	-	Message center
3	-	Transmission status display

The instrument cluster is connected to the TCM via the high speed CAN bus. Transmission status is transmitted by the TCM and displayed to the driver in one of two displays in the instrument cluster. For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

Malfunction Indicator Lamp

Transmission related faults which may affect the vehicle emissions will illuminate the MIL (malfunction indicator lamp).

The MIL is illuminated by the ECM on receipt of a relevant fault message from the TCM on the high speed CAN. The nature of the fault can be diagnosed using Land Rover approved diagnostic equipment which reads the fault codes stored in the TCM memory.

Transmission Status Display

The transmission status display is located in the tachometer of the instrument cluster. The display shows the selector lever position or the selected gear when in manual and sport modes.

The following table shows the displays and their descriptions.

Symbol	Description
P	Park selected
R	Reverse selected
N	Neutral selected
D*	Drive and temporary manual mode selected (* = current gear)
S*	Sport mode selected (* = current gear)
1	1st gear selected (manual CommandShift mode)
2	2nd gear selected (manual CommandShift mode)
3	3rd gear selected (manual CommandShift mode)
4	4th gear selected (manual CommandShift mode)
5	5th gear selected (manual CommandShift mode)
6	6th gear selected (manual CommandShift mode)
7	7th gear selected (manual CommandShift mode)
8	8th gear selected (manual CommandShift mode)

Message Center

The message center relays vehicle status and operating information to the driver and display's messages relating to a number of vehicle systems. If a transmission fault occurs, the message GEARBOX FAULT is displayed in the message center.

For additional information, refer to: Information and Message Center (413-08 Information and Message Center, Description and Operation).

Transmission Control Module

The **TCM** outputs signals to control the shift control solenoid valves and the EPRS's to control the hydraulic operation of the transmission.

The **TCM** processes signals from the transmission speed and temperature sensors, the Electronic Transmission Selector (ETS), the **ECM** and other vehicle systems. From the received signal inputs and pre-programmed data, the **TCM** calculates the correct gear, torque converter clutch setting and optimum pressure settings for gear shift and lock-up clutch control.

The **ECM** supplies the engine management data over the high speed **CAN** bus. The **TCM** requires engine data to efficiently control the transmission operation, for example; flywheel torque, engine speed, accelerator pedal angle, engine temperature. The steering angle sensor and the **ABS (anti-lock brake system)** module also supply data to the **TCM** on the high speed **CAN** bus. The **TCM** uses data from these systems to suspend gear changes when the vehicle is cornering and/or the **ABS** module is controlling braking or traction control.

The **CJB (central junction box)** supplies steering wheel paddle data over the high speed **CAN** bus. The **TCM** uses this to schedule driver requested upshifts and downshifts.

Using the signal inputs and the memorized data, the **TCM** control program computes the correct gear and torque converter lock-up clutch setting and the optimum pressure settings for gear shift and lock-up clutch control. Special output-side modules (power output stages, current regulator circuits), allow the **TCM** to control the solenoid valves and pressure regulators and consequently precisely control the hydraulics of the automatic transmission. In addition, the amount and duration of engine interventions are supplied to the engine management by way of the **CAN** bus.

The **TCM** determines the position of the selector lever using signals from the electronic transmission selector on the high speed **CAN** bus and Local **LIN (local interconnect network)** bus

The **TCM** transmits the position of the electronic transmission selector and any manual gear selected on the high speed **CAN** bus. This information is shown in the gear selector display in the instrument cluster.

Engine Stall

If the vehicle stalls it will coast down in gear, with the transmission providing drive to the engine. A restart can be attempted at this point and the engine may start and the driver can continue.

If the coast down speed reduces such that the speed of the engine is less than 400 rev/min, the transmission will go to neutral, 'D' illumination will flash in the instrument cluster. The driver needs to select neutral or park and then press the brake pedal to restart the engine.

If the start/stop button is pressed when driving, the message ENGINE STOP BUTTON PRESSED is displayed in the message center but there will be no change to the ignition state. If the driver requires to switch off the engine, the start/stop button must be pressed for a second time. The engine will be stopped and will be back driven by the transmission as the vehicle coasts down.

Automatic Transmission/Transaxle - TDV6 3.0L Diesel /V6 S/C 3.0L Petrol , Vehicles With: 8HP70 8-Speed Automatic Transmission AWD - Diagnostics TDV6 3.0L Diesel /V6 S/C 3.0L Petrol , Vehicles With: 8HP70 8-Speed Automatic Transmission AWD

Diagnosis and Testing

Principle of Operation

For a detailed description of the automatic transmission/transaxle system and operation, refer to the relevant Description and Operation sections in the workshop manual. REFER to: Transmission Description (307-01B, Description and Operation).

Fluid Level and Condition Check

CAUTION: The vehicle should not be driven if the fluid level is low as internal failure can result

NOTE: The transmission fluid temperature must not be allowed to exceed 50°C (122°F) whilst checking level. Should the temperature rise above this figure, abort the check and allow the transmission fluid to cool to below 30°C (86°F)

This vehicle is not equipped with a fluid level indicator. An incorrect level may affect the transmission operation and could result in transmission damage. To correctly check and add fluid to the transmission REFER to: Transmission Fluid Level Check (307-01B, General Procedures).

High Fluid Level

A fluid level that is too high may cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission damage. If an overfill condition is identified, with the engine at idle ensure the fluid temperature is within the specified range and allow the excess fluid to drain until a small thread of fluid runs from the filler/level plug hole

Low Fluid Level

A low fluid level could result in poor transmission engagement, slipping, or damage. This could also indicate a leak in one of the transmission seals or gaskets
REFER to: Transmission Fluid Level Check (307-01B, General Procedures).

Adding Fluid

CAUTION: The use of any other type of transmission fluid other than that specified can result in transmission damage

If fluid needs to be added, add fluid in 0.50 liter increments through the fill hole opening. Do not overfill the fluid. For fluid type, refer to the general specification chart in this section
REFER to: Specifications (307-01B, Specifications).

Fluid Condition Check

1. Check the fluid level
2. Observe the color and the odor of the fluid. The color under normal circumstances should be like honey, not dark brown or black
3. Allow the fluid to drip onto a facial tissue and examine the stain
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection

NOTE: In the event of a transmission unit replacement for internal failure, the oil cooler and pipes must also be replaced

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle

1. Verify the customer concern
2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Mechanical	Electrical	Hydraulic

Damaged/stuck shift mechanism <ul style="list-style-type: none"> • Damaged automatic transmission casing 	Blown fuse(s) <ul style="list-style-type: none"> • Damaged, loose or corroded connectors • Wiring harness 	Fluid level too high/low <ul style="list-style-type: none"> • Poor condition of fluid • Fluid leak

WARNINGS:

Observe due care when draining, as the fluid can be very hot.

Observe due care when working near a hot exhaust system.

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.
 - The following steps must be observed before starting the transmission fluid level check.
 - The vehicle must be on a horizontal ramp.
 - The parking brake must be applied.
 - Place the transmission control switch (TCS) knob in the N position.
2.
 - Start the engine.
 - Apply, and hold, the footbrake.
 - Move the TCS to the 'R' position and wait for 5 seconds.
 - Move the TCS to the 'D' position and wait for 5 seconds.
 - Engage second gear and wait for 5 seconds.
 - Move the TCS back to the 'N' position.
3. Make sure that the torque converter is full of oil by holding the engine speed at 2,000 rpm for a minimum of 30 seconds. Move the TCS to the park position and allow the engine to idle between 600rpm and 750 rpm.
4. Connect the diagnostic tool to the vehicle.
5. Make sure that the transmission oil has exceeded a temperature of 69 degrees celsius so that the thermostat has fully opened allowing full circulation of the transmission fluid. Allow the temperature to drop below 30 degrees celsius before checking the transmission oil level.
6.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

7.

8.  CAUTION: Make sure that the transmission fluid temperature is below 30 degrees before starting the fluid level check.

Place a suitable container under the transmission fluid fill plug.

9. CAUTIONS:

 The transmission fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

 Discard the component.

- *Special Tool(s)*: [307-452](#)
- Clean the area around the transmission fluid level plug.

Adjustment

1.  CAUTION: Make sure the correct specification of oil is used.

Refer to: Specifications (307-01B, Specifications).

E138154

E98770

E98771

2. If the transmission fluid does not come out of the transmission fluid fill plug hole the transmission fluid level is insufficient. If this is the case add the transmission fluid in 0.5 liter units into the transmission fluid fill plug hole until fluid comes out.

3. Allow the transmission fluid to drain from the transmission fluid filler plug hole until the flow almost stops.

4.  **WARNING:** Make sure to support the vehicle with axle stands.

 **NOTE:** Install a new fluid level filler plug.

- Using the special tool, install the new transmission fluid fill plug.
- Lower the vehicle on the lift.
- Switch off the engine.
- Raise and support the vehicle.

5.  **CAUTION:** Make sure the transmission fluid fill plug is tightened to the correct specification. Failure to follow this instruction may result in damage to the vehicle.

E37107

- To make sure the transmission fill plug is torqued to the correct specification. Using the special tool and torque wrench the following calculation steps must be followed.
- Step 1. Multiply 35 Nm by the effective length of the torque wrench (1).
- Step 2. Add the effective length of the special tool (2) to the effective length of the torque wrench (1).
- Step 3. Divide the total of step 1 by the total of step 2.
- Step 4. Set the torque wrench to the figure arrived at in step 3.
- Tighten the transmission fluid fill plug to the torque given by the calculation.

6. Remove the special tool.

7. Remove the container.

8. **Torque:** 10 Nm

9. Lower the vehicle.

10. Disconnect the diagnostic tool.

8	-	Fluid return flow
9	-	Fluid supply flow
10	-	Spring
11	-	Thermostatic valve body
12	-	Valve

DESCRIPTION

The transmission fluid cooler is a separate cooling unit located behind the engine cooling radiator. The unit is attached, via a bracket, to the cooling pack protection subframe. The transmission is connected to the fluid cooler via flexible hoses and metal pipes.

The transmission fluid cooler is a dedicated cooler which is connected into the engine cooling system circuit. The transmission fluid is cooled by the temperature differential between the transmission fluid and the engine coolant flowing through the cooler.

Fluid is supplied from the transmission fluid pump, through the thermostatic valve (if open) into the cooler. After passing through the cooler, the fluid passes out of the cooler and is returned to the transmission fluid pan.

The thermostatic valve is located in the transmission cooler fluid supply and return lines. The valve contains a bi-metallic spring and valve which is closed when the transmission fluid temperature is below 69 °C (156.2 °F). At a temperature of 69 °C (156.2 °F) and above, the valve begins to open allowing the fluid to flow around the cooler. The valve is fully open at 79 °C (174.2 °F) .

Transmission/Transaxle Cooling - TDV6 3.0L Diesel /V6 S/C 3.0L Petrol , Vehicles With: 8HP70 8-Speed Automatic Transmission AWD - Transmission Cooling

Diagnosis and Testing

Principle of Operation

For a detailed description of the automatic transmission cooling system and operation, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (307-02 Transmission/Transaxle Cooling)

Transmission Cooling (Description and Operation),
Transmission Cooling (Description and Operation),
Transmission Cooling (Description and Operation).

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical
<ul style="list-style-type: none"> • Feed and return tubes • Connections to the automatic transmission and the automatic transmission fluid cooler • Automatic transmission fluid level

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Condition	Possible Causes	Action
Over heating of the automatic transmission	Obstruction in the automatic transmission fluid cooler	Flush out the automatic transmission fluid cooler with new automatic transmission fluid. If the flushing is unsuccessful, install a new transmission fluid cooler.
Over heating of the automatic transmission	Obstruction in the automatic transmission fluid tubes	Flush out the automatic transmission fluid cooler tubes with new automatic transmission fluid. If the flushing is unsuccessful install new automatic transmission fluid cooler tubes.
Loss of automatic transmission fluid	Connections to the automatic transmission and the automatic transmission fluid cooler	Check the integrity of the tubes, connections and seals. Check the torque of the tube fixings.
Loss of automatic transmission fluid	Leak at oil cooler	Check the integrity of tubes, connections and seals. Check the torque of the tube fixings.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

TRANSMISSION EXTERNAL CONTROLS COMPONENT LOCATION

E138170

Item	Part Number	Description
1	-	Downshift paddle switch
2	-	Upshift paddle switch
3	-	Electronic Transmission Selector (ETS)
4	-	Emergency park lock lever
5	-	Mounting bracket
6	-	Cable
7	-	Emergency park lock transmission lever

OVERVIEW

The external controls for the transmission consist of an ETS (Electronic Transmission Selector), two steering wheel mounted paddle switches and an emergency park lock release-lever and cable. The ETS transmits driver transmission selections to the [TCM \(transmission control module\)](#). The paddle switches allow the driver to initiate gear shifts in all transmission modes; 'D' (Drive), 'S' (Sport) and 'S' (Sport) manual CommandShift.

The emergency park release allows the transmission park-lock to be disengaged during vehicle recovery operations.

DESCRIPTION

The ETS (Electronic Transmission Selector) is a rotary selector installed in the floor console and controls the driver transmission selections.

The TCM allows the transmission to be operated as a conventional automatic unit by selecting: 'P' (Park), 'R' (Reverse), 'N' (Neutral), 'D' (Drive) on the ETS. Rotation of the ETS allows the selection of P, R, N and D. By depressing the ETS and rotating clockwise from the D position, S mode can be selected. The ETS is a fully electronic rotary transmission-selector with no mechanical connection to the transmission.

The ETS rises once the engine is running. When the engine is stopped with the ETS in any position other than 'N', it retracts into the console again. If the ETS is in position 'N' when the engine is stopped, it remains in the raised position for up to 10 minutes; for use in a drive-through car wash for example. After 10 minutes the ETS automatically retracts. The ETS also retracts if 'P' is selected within the 10 minute period of 'N' selection. If the ETS does not rise from the console when the engine is started, but electrical power is supplied to the ETS, the retracted ETS can still be rotated to make selections.

If electrical power to the ETS is lost, the ETS will not rise from the console when the engine is started and the retracted selector will not rotate. The ETS contains an internal interlock solenoid to prevent the selector from being rotated when the engine is not running.

The engine can be stopped with the ETS in any position. Once the engine is stopped the selector will automatically reset to the 'P' position and the transmission park-lock will be engaged, except if the selector is in the 'N' position when the engine is stopped.

PADDLE SWITCHES

Two gear change paddle-switches are fitted at the rear of the steering wheel and allow the driver to operate the transmission as a semi-automatic manual gearbox using the 'Commandshift' feature. Each paddle switch has three connections; ground, illumination PWM (pulse width modulation) supply and ground switch signal.

EMERGENCY PARK RELEASE

WARNING: The vehicle must be suitably restrained either by use of the EPB (electronic parking brake) or wheel chocks before operation of the emergency park-release mechanism in order to prevent vehicle roll-away.

If the vehicle requires recovery/transportation, the emergency park-release mechanism is used to manually disengage the park-lock and position the transmission in neutral. The emergency park release mechanism consists of an operating lever that is connected to a park interlock lever on the transmission by a cable assembly. The operating lever is installed in the floor console, under the drinks holder. To access lever remove the drinks holder. The park interlock lever is attached to the transmission selector shaft via a Bowden cable.

OPERATION

Rotation of the ETS (Electronic Transmission Selector) selector to any of the five positions is sensed by the TCM via the high-speed CAN (controller area network). The TCM then reacts according to the selected position.

PARK INTERLOCK AND NEUTRAL LOCK

Neutral lock is a requirement for the ETS. The selector is always locked at ignition 'on' when the engine is not running, except after an engine stall when the selector is not in 'P' or 'N'. If, when driving with the ETS in 'S', 'D' or 'R' at a speed of more than 5 km/h (3 mph), and the driver selects 'P' or 'N'; without the brake pedal pressed, the ETS will be immediately locked once the vehicle speed falls to below 5 km/h (3 mph).

With the brake pedal pressed, the ETS will remain unlocked for as long as the brake pedal remains pressed, regardless of vehicle speed. The transmission will only engage park once the vehicle speed is less than 2 km/h (1 mph). If the driver selects 'N' and releases the brake pedal with a vehicle speed of less than 5 km/h (3 mph), the ETS will be locked 2 seconds after 'N' is selected. The selector will remain locked until the driver presses the brake pedal again.

To ensure that a driver request to change from a non-driving range ('N' for example) to a driving range ('D' for example), the park interlock and neutral lock features are used in conjunction with the intermediate position. If the transmission receives a range change request without the brake pedal pressed, the TCM initiates a soft lock function. The transmission will remain in park or neutral, depending on the starting position.

The ETS is a magnetic system using Hall effect sensors to determine the position of the selector. The 'S' (sport) position selection allows the TCM to operate the transmission using the semi-automatic 'Commandshift' system. Gear selections are sensed by the TCM when the driver operates the steering wheel paddle-switches. Once the ETS position is confirmed, the TCM outputs appropriate information on the high-speed CAN bus which is received by the instrument cluster to display the gear selection information in the message center. The paddles can also be used on a temporary basis when the ETS is in the 'D' position to override the automatic gear selection if required.

If a transmission position letter is flashing in the message center and the vehicle has no drive, the driver must:

- Press the brake pedal
- Reselect 'N' or 'P' on the ETS
- Select the required driving range, ensuring that the brake pedal is pressed.

Rocking Function

The rocking function compliments the neutral lock function. For all changes from a non-driving range to a driving range, it is necessary to press the brake pedal (to release either the park interlock or neutral lock). In situations where the driver will require to change the gear selection from 'R' to 'D', or from 'D' to 'R', without brake pedal input

(car park maneuvering, 3 point turns or 'rocking' the vehicle from a slippery surface for example), the rocking function gives a 2 second lock delay when 'N' is selected on the ETS and the brake pedal is not pressed.

Intermediate Position

If the ETS is rotated slowly from 'P' to 'S' and back to position 'P' with the brake pedal pressed, the 'R' or 'D' position display letter in the message center will flash and the transmission will remain in park or neutral depending on the previous starting position of the selector. If the brake pedal is released when 'R' or 'D' is flashing in the message center and the ETS is rotated to the 'R' or 'D' position, the required range will not be selected and the transmission will remain in park or neutral, depending on the previous starting position. This feature is known as soft lock. If the driving range letter in the message center is flashing and the vehicle has no drive, the driver should depress the brake pedal to reselect 'N' or 'P', and then select the required driving range while the brake pedal remains pressed.

PADDLE SWITCHES

The paddle switches are hardwired to the steering wheel audio and via the clockspring to the instrument cluster. The instrument cluster converts the signal into a high-speed CAN bus signal to the TCM.

Pulling the LH (left-hand) downshift (-) paddle provides down changes and pulling the RH (right-hand) upshift (+) paddle provides up changes. The first operation of either paddle, after sport mode is selected, puts the transmission into permanent manual Commandshift. Rotation of the ETS back to the 'D' position, returns the transmission to conventional automatic operation. Temporary operation of Commandshift mode can also be operated with the ETS in the 'D' position. Operation of either the upshift or downshift paddles activates the manual mode operation. If the ETS is in 'D', Commandshift will cancel after a time period or can be cancelled by pressing and holding the (+) paddle for approximately 2 seconds.

EMERGENCY PARK RELEASE

One end of the operating lever is attached to a base by a hinge pin. A locking cylinder is installed in the other end of the operating lever, to secure the operating lever to the base. The operating lever is raised by pulling on a strap. When operated, the emergency park release mechanism turns the transmission selector shaft.

WARNING: Before disengaging the park lock, apply the EPB if electrical power is available or apply restraints to the vehicle, for example wheel chocks, to prevent vehicle roll-away. Ensure that the ignition is turned off.

To disengage the park lock: Remove the drinks holders. Rotate the locking mechanism of the emergency park release lever 90 degrees counterclockwise. Apply the footbrake, pull the operating lever upwards and ensure it locks in the vertical position. Raising the operating lever causes the emergency park release cable to rotate the park interlock lever on the transmission, which disengages the parking pawl and engages neutral. This allows the vehicle to freewheel.

To re-engage the park lock: Hold the strap on the operating lever, release the latch and lower the operating lever to the horizontal position. Lock the operating lever by turning the locking mechanism 90 degrees clockwise. Install the drink holders.

Automatic Transmission/Transaxle External Controls - TDV6 3.0L Diesel /V6 S/C 3.0L Petrol , Vehicles With: 8HP70 8-Speed Automatic Transmission AWD - External Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the transmission external controls, refer to the relevant description and operation sections in the workshop manual.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. Verify the customer concern
2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Check for stuck/jammed switches and buttons • Visibly damaged or worn components • Loose or missing fasteners 	<ul style="list-style-type: none"> • Fuse(s) • Loose or corroded electrical connector(s)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, check for diagnostic trouble codes (DTCs) and refer to the DTC index

GENERAL

The DD295 transfer box is a full time, permanent four-wheel-drive unit, with 50/50 torque distribution to the front and rear driveshafts. The unit is manufactured by Magna Steyr Powertrain in Graz, Austria and supports the following features:

- Permanent four-wheel-drive with a bevel gear centre differential, providing a 50:50 torque split
- Selectable high and low range for optimum on-road and off-road performance
- Two-speed, fully synchronized 'shift-on-the-move' system allows the driver to change the range without having to stop the vehicle
- Electronically controlled multi-plate clutch providing a centre differential lock and torque biasing function to give improved traction performance and vehicle dynamic stability.

A strategy, to electronically control the centre differential multi plate clutch assembly, has been developed to provide:

- a pre-loading function, increasing locking torque with increased driving torque
- a slip controller to increase locking torque under off-road conditions and decrease locking torque for optimum comfort, e.g. parking.

The unit is located under the vehicle and is mounted on the cross-member, behind the transmission. The unit is identical for all engine derivatives.

The transfer box receives a torque input from the transmission output shaft, which is passed through the unit to two outputs for the front and rear drive shafts.

The input torque is equally distributed via a bevel gear type differential. In order to provide an optimal torque distribution to each wheel in all driving conditions, the unit is equipped with an electronically controlled locking and torque-biasing device. This device detects wheel slip via various vehicle system inputs to the transfer box control module and locks the differential accordingly. The locking torque is applied through a multi-plate clutch assembly.

A planetary gear set, located in the differential assembly, allows the driver to select high or low range whilst driving, this is known as 'shift on the move'. When in low range, the planetary gear set provides a ratio of 2.93:1, which gives the vehicle an extremely low crawl speed for off road driving and trailer towing. High range is a direct drive from the transmission output shaft and provides a 1:1 ratio.

Both the centre differential locking and biasing and the 'shift on the move' features are actuated via a DC transfer box motor, which is controlled by the transfer box control module, via a Pulse Width Modulation (PWM) signal.

Transfer Box - Sectional View

E49191

Item	Part Number	Description
1	-	Planetary gear set
2	-	Rear output flange
3	-	Centre differential assembly
4	-	Multi-plate clutch
5	-	Transfer box motor module
6	-	Rear housing assembly

8	-	Chain drive
9	-	Front output flange
10	-	Transfer box motor levers
11	-	Sprocket
12	-	Oil pump assembly
13	-	Input shaft
14	-	Front housing assembly

Transfer Box Power Flow

E49192

The input torque, from the transmission, is transferred to the input shaft of the transfer box and then onto the planetary sun gear and planetary pinion gears. The planetary pinion gears are held in place by the planet pinion shafts, which are connected to the differential carrier, and drive the differential pinion gears. The torque is then distributed to both the front and rear carriers, which are connected to the outputs of the transfer box. The rear carrier is connected directly to the rear output flange; the front carrier is connected to the sprocket and therefore to the chain drive, which provides the front output flange rotation.

TRANSFER BOX CASINGS

The front and rear casing assemblies are manufactured from cast aluminium.

Front Casing Assembly

The front casing assembly provides the location for the input shaft bearing and the front output flange bearing. It is also equipped with threaded holes to mount the chassis mounting bush, two lifting eyes and a breather cartridge for the transfer box breather pipe. The breather pipe allows an equalisation between atmospheric and internal transfer box pressure.

Rear Casing Assembly

The rear casing assembly provides the location for the rear output flange bearing, the transfer box motor and the oil fill and drain plug. Fins are cast into the rear casing assembly to improve the heat dissipation. The unit number is also stamped into the rear housing.

OIL PUMP

An oil pump assembly is located in the front casing to provide lubrication for the bearings and rotary components through cross-drillings in the input shaft. A flat-sectioned coupling on the input shaft drives the rotor of the pump; the stator is fixed to the front housing assembly. A tube is attached to the pump, which leads into a calm suction area at the bottom of the two casing assemblies. The collector magnet in the suction area of the pump collects any

metallic debris.

CHAIN DRIVE

The chain-drive transfers drive from the centre differential to the front output flange. A 3/8" pitch chain connects the sprocket on the transfer box input shaft with the sprocket on the front output flange. As both sprockets have the same number of teeth, the rotational speed of both sprockets is identical.

TRANSFER BOX MOTOR

One motor operates both the high/low range change and the differential locking and torque-biasing device (multi-plate clutch). The motor solenoid switches between the two functions, while the motor provides the rotational movement for both operations.

Transfer Box Motor Position For Clutch Control Mode

E49193

Item	Part Number	Description
1	-	Motor shaft
2	-	Solenoid shift fork
3	-	Solenoid
4	-	Clutch control disc
5	-	Shifting sleeve

To actuate the multi-plate clutch, the transfer box control module energizes the solenoid (3). The solenoid pin pivots the solenoid shift fork (2), which engages the shifting sleeve (5) into the dogteeth on the clutch control disc (4). The rotational movement of the motor shaft (1) is then linked to the clutch control disc via the shifting sleeve.

This is the normal operating mode of the transfer box. In this position, the range change function is disengaged and mechanically locked.

Transfer Box Motor Position For High/Low Range Mode

E49194

Item	Part Number	Description
1	-	Motor shaft
2	-	Solenoid shift fork
3	-	Solenoid
4	-	Shifting sleeve
5	-	Actuation cam

To actuate the high/low range change, the transfer box control module de-energizes the solenoid (3). A spring in the solenoid retracts the solenoid pin and rotates the solenoid shift fork (2). This engages the shifting sleeve (4) to the dogteeth on the high/low actuation cam (5). The rotational movement of the motor shaft (1) is then linked to the cam.

In this position, the multi-plate clutch is open, the differential cannot be locked and torque cannot be biased. Once the range change is complete the system returns to clutch control mode. In the event of an electrical failure, the motor will default to this position.

CENTRE DIFFERENTIAL ASSEMBLY

E49195

Item	Part Number	Description
1	-	Synchronisation cup and spring
2	-	Planetary ring gear
3	-	Differential carrier
4	-	Pinion gears
5	-	Pinion gear shafts
6	-	Planetary pinion gears
7	-	Planetary pinion gear shafts
8	-	Planetary sun gear
9	-	Differential cover
10	-	Differential side gears
11	-	Multi-plate clutch basket
12	-	Dogteeth

The centre differential assembly is the primary feature of the transfer box. Torque is transmitted through the centre differential carrier and distributed to the differential gears and the front and rear output flanges. The planetary gear set, for the high/low range change function, is also an integral part of the centre differential assembly.

The assembly comprises 3 differential pinion gears (4) and shafts (5), which are equally spaced within the centre differential carrier (3). The differential shafts have a rigid connection to the differential carrier. Located between the pinion gears are 3 planetary pinion gears (6) and shafts (7). The planetary sun gear (8) and two differential side gears (10) are located in the centre line of the carrier.

The planetary ring gear (2) is supported in both directions by the differential casing and the differential cover (9). The planetary ring gear is connected to a shifting sleeve, which is engaged in either high or low range.

The multi-plate clutch basket (11), which is welded to the differential casing, supports the friction plates, the dogteeth (12) for high range engagement and the synchronisation cup and spring (1) for the 'shift-on-the-move' function.

A

B

E49196

Item	Part Number	Description
A	-	High range position
B	-	Low range position
1	-	Dogteeth
2	-	Planetary pinion gears
3	-	Planetary ring gear
4	-	Shifting sleeve
5	-	Low range dogteeth
6	-	Rear carrier assembly

When high range is engaged, the shifting sleeve (4) connects to the differential carrier via dogteeth (1). The planetary ring gear (3), via the shifting sleeve, and the planetary pinion gears (5), via the planetary shafts, are also attached to the differential carrier. The planetary gear set rotates as one unit and therefore turns the differential side gear with a 1:1 ratio.

In low range the motor moves the shifting sleeve (4) in the direction of the low range dogteeth (5). The low range dogteeth, with the synchronisation cup and spring, are fixed to the rear carrier assembly (6). When the shifting sleeve is engaged with the low range dogteeth, the planetary ring gear (3), via the shifting sleeve, is stationary and the planetary pinion gears (2), via the planetary bolts, turn the differential side gears with 2.93: 1 ratio.

High range actuation sequence

E49197

Item	Part Number	Description
1	-	Shifting sleeve
2	-	High/low shifting fork
3	-	Shifting cam

The rotational movement of the motor shaft turns the shifting cam (3) to high range position. The shifting cam then moves the shifting sleeve (1), via the high/low shifting fork (2), into the high range position. After the synchronisation sequence, the planetary ring gear is connected to the high range dogteeth, via the shifting sleeve, on the differential carrier. In this position, the input speed equals the output speed, which equates to a high range ratio of 1:1.

Low range actuation sequence

E49198

Item	Part Number	Description
1	-	Shifting sleeve
2	-	High/low shifting fork
3	-	Shifting cam
4	-	Motor shaft

The rotational movement of the motor shaft (4) turns the shifting cam (3) into low range position. The shifting cam then moves the shifting sleeve (1) of the centre differential assembly via the high/low shifting fork (2) into low range position. After the synchronisation sequence, the planetary ring gear is connected to the low range dogteeth, via the shifting sleeve, on the rear carrier assembly. The output speed is then reduced to a ratio of 2.93:1.

MULTI - PLATE CLUTCH ASSEMBLY

E49199

Item	Part Number	Description
1	-	Clutch hub
2	-	Cup springs
3	-	Clutch plates
4	-	Clutch piston
5	-	Motor levers
6	-	Ball ramp mechanism
7	-	Sprocket

The multi-plate clutch assembly for both centre and rear differentials act in a similar way. The aim of the multi-plate clutch assembly is to prevent excessive differential slip and therefore maximise the traction performance of the vehicle. This is fundamentally different from the 'braked' traction control, which can only counter act differential slip when it occurs.

A certain amount of differential slip is required to allow the vehicle to turn corners and to remain stable under control of the Anti-lock Braking System (ABS). The transfer box control module monitors the driver's demands through primary vehicle controls and automatically sets the slip torque at the differentials. The system is completely automatic and does not require any special driver input.

The multi-plate clutch assembly actively controls the torque flow through the centre differential and optimises the torque distribution in the driveline. The clutch assembly biases the torque from the transmission to the axle and wheels with the higher grip and prevents the wheels with the lower grip from spinning.

The multi-plate clutch assembly comprises the sprocket (7), which is connected to the front differential side gear, the motor levers (5) with the ball ramp mechanism (6), the clutch hub (1) as support for the clutch plates (3), the clutch piston (4) to generate friction between the clutch plates, and a pack of cup springs (2) to return the clutch piston into its original position.

One set of friction plates are connected to the clutch hub; the other set of friction plates are connected to the multi-plate clutch basket, which is welded to the centre differential housing.

Multi-plate Clutch Actuation

Transfer box motor levers in initial position, multi-plate clutch open condition

E49200

Transfer box motor in end position, multi-plate clutch closed condition

E49201

Item	Part Number	Description
1	-	Clutch piston
2	-	Motor shaft
3	-	Clutch control disc
4	-	Motor levers
5	-	Ramp mechanism balls

By turning the clutch control disc (3), via the motor shaft (2), the motor levers (4) are rotated relative to each other. This relative movement acts on 5 balls (5) in a ramp mechanism between the two levers and give a defined axial movement. The movement forces the clutch piston (1) to induce friction between the plates supported by the clutch hub and the plates supported by the clutch basket on the differential carrier. This frictional force inhibits the differential rotation; the differential carrier and front differential side gear are locked together.

TRANSFER BOX CONTROL MODULE

The transfer box control module controls the high/low 'shift-on-the-move' actuation and the multi-plate clutch actuation. The control module is located in the E-box, next to the Engine Control Module (ECM), behind the battery in the engine compartment. The position of the control module changes with LH and RH drive vehicles.

E49202

Item	Part Number	Description
A	-	RH drive
B	-	LH drive
1	-	Battery Junction Box (BJB)
2	-	Battery
3	-	Engine Control Module (ECM)
4	-	Transfer box control module

The control module is connected to the Controller Area Network (CAN) bus and controls the transfer box operation using CAN messages from other control modules on the network.

The control module memorises the position of the transfer box motor when the ignition is switched off.

The transfer box control module uses the same actuator to control both range change function and application of centre differential locking torque. The module uses position feed back from the actuator to provide smooth range changing capability and graduated application of locking torque appropriate for the current driving conditions. Range change can be carried out while moving providing the transmission is in neutral and the vehicle is below the speed necessary for the requested range change.

The control module uses three connectors for all inputs and outputs. It receives a permanent power supply via a 30A fusible link located in the Battery Junction Box (BJB), and an ignition supply via fuse 24 in the Central Junction Box (CJB).

The control module uses a series of programmed shift maps to control the synchronisation speed and ensure that a maximum shift time of approximately one second is achieved.

If the control module is replaced, T4 must be connected to the vehicle and the transfer box control module self-calibration procedure must be performed. This procedure must also be performed if the transfer box motor assembly is replaced.

Default/Limp-home Strategy

If a fault occurs with the transfer box, the transfer box control module or one of the required input signals i.e. road speed signal, the control module records an error code and will respond appropriately to provide the highest level of system capability under the specific fault conditions. The following fault states are possible:

Fault state	System response	Driver warning
No reduction in capability	Diagnostic Trouble Code (DTC) will be recorded but no effect on performance	Non
Clutch control not possible. Temporary over temperature condition	The tractive capability of the vehicle, off road, is reduced.	Driveline over temperature warning lamp or "CENTRE DIFF OVER TEMP REDUCE SPEED" on message centre
Clutch control not possible. Permanent fault	The tractive capability of the vehicle, off road, is reduced.	Driveline fault warning lamp or "CENTRE DIFF FAULT TRACTION REDUCED" on message centre
Range change not possible	The system inhibits the driver from making a range change	Driveline fault warning lamp or "TRANSMISSION RANGE CHANGE NOT AVAILABLE" on message centre
Stuck in Transfer box neutral	The transfer box is stuck between high and low range resulting in no drive to wheels	Flash low range indicator plus "APPLY HANDBRAKE (PARK BRAKE in USA and Canada)". The message will only display at times when it is deemed safe or necessary. It will not display during normal driving for example.

If a driveline over temperature condition has occurred, after the driveline has been allowed to cool, clutch control will be re-enabled and the warnings will disappear. There is no need to seek service assistance following an over temperature event.

If clutch control or Range change is not possible due to a permanent fault the driver must seek service assistance at the earliest opportunity.

If the system suffers a fault, which causes the transfer box to fail in neutral, the control module is designed to continue attempting to engage the requested range or return to its original range for a fixed number of attempts. If this has not been successful and the low range lamp is still flashing the driver should bring the vehicle to a halt and attempt the range change again while stationary. If this does not work after a number of attempts, key off for 30 seconds, restart engine and request range change again while stationary. The driver must seek service assistance at the earliest opportunity.

Transfer Box Control Module Pin Out Details

Connector 1-C1319

Pin No.	Description	Input/output
1	Not used	-
2	Not used	-
3	CAN bus low	Data (input and output)
4	Range change selection switch - High	Input
5	Range change selection switch - Low	Input
6	CAN bus high	Data (input and output)
7	Key interlock solenoid	Output
8	LED-high	Output
9	LED-low	Output

17	Manual transmission output shaft speed sensor ground	-
18	Motor supply/ground	Input/output

TRANSFER BOX CONTROL MODULE INPUTS

The transfer box control module receives the following inputs:

- Range change selection switch
- High/low position sensor
- Transfer box actuator motor temperature
- Transfer box actuator motor position sensor
- CAN bus messages
- Gear position sensor (manual transmission only)
- Transmission output shaft speed sensor (manual transmission only).

CAN Bus Messages

The CAN bus is a high speed broadcast network connected between various vehicle control modules. The CAN network carries an extensive list of messages between the different control modules enabling more sophisticated control with reduced complexity. Data on the network is packaged for efficient communication and prioritised according to the urgency and importance of the Messages. The bus comprises two wires, which are twisted together to minimise electromagnetic interference (noise) produced by the CAN messages.

For additional information, refer to: Communications Network (418-00, Description and Operation).

The transfer box control module is connected on the CAN bus and controls transfer box operation using CAN messages from other control units on the network. Wheel speed, vehicle acceleration, engine torque and speed, gear information, from the automatic transmission, temperature information, car configuration, axle ratios and Terrain Response™ mode inputs, are some of the main signals received by the control module.

In the event of a CAN bus failure the following symptoms may be observed:

- Shift from high to low or low to high inoperative
- Instrument cluster low range warning lamp inoperative
- warning messages or lamps displayed in instrument cluster.

Gear Position Sensor (Manual Transmission Only)

E49203

The transfer box control module uses positional information from the manual gear position sensor to determine which gear the transmission is in. This information is broadcast on the CAN bus for display on the instrument cluster and for use by other vehicle systems. Vehicles fitted with automatic transmission use a similar message broadcast by the Transmission Control Module (TCM). Vehicles fitted with manual transmission have a learning function, which compares the positional information from the sensor with the gear ratio calculated from the ratio of engine speed to transmission output shaft speed. The transmission learning is carried out at end of manufacture. If a new transmission is fitted during the life of the vehicle the learning algorithm needs to learn the characteristics of the new transmission.

The instrument cluster displays the selected gear as determined by the transfer box. The transfer box also uses this to check the vehicle is in neutral before attempting a range change.
For additional information, refer to: Manual Transmission (308-03, Description and Operation).

Manual Transmission Output Shaft Speed Sensor

E49204

The output shaft speed sensor is located at the rear of the transmission and measures the speed of the transmission output shaft.

The transfer box is designed to allow range changes when the vehicle is moving, providing the transmission speed complies with the preset thresholds determined by the control module. The control module calculates the optimised synchronization timing through the speed of the transmission output shaft and the wheel speed of the vehicle.
For additional information, refer to: Manual Transmission (308-03, Description and Operation).

Range Change Selection Switch

E49205

The range change selection switch is located behind the main transmission selection lever, in the centre console. The switch is a 3-position momentary action centre sprung device. The driver pushes the lever forward to select high range and back to select low range.

The switch comprises a housing, which provides the location for a sliding contact. When the switch is moved to the high or low position, it completes a momentary connection to 12V with one of two micro-switches located at each end of the range change selection switch. These micro-switches correspond to the high or low range positions.

The transfer box control module receives this momentary signal and selects the requested range.

In this position, a spring will move the selector lever to the centre position when released.

High/Low Position Sensor

E49209

The high/low position sensor converts the pivotal movement of the high/low fork into a PWM signal on the input. The PWM signal of the position sensor differs between high range and low range. The control module checks this signal and informs the driver, via the instrument cluster and the range change selection switch LED's, if a range change is in progress or has been completed.

The high/low position sensor is connected to the transfer box control module via a three-pin connector.

TRANSFER BOX CONTROL MODULE OUTPUTS

The transfer box control module sends the following outputs:

- CAN bus messages
- Key interlock solenoid
- High/low range change LED
- Transfer box motor
- Solenoid.

CAN Bus Messages

The control module also sends messages via the CAN bus to tell other control modules on the network, the status of the transfer box. The high/low status, clutch torque and default mode status are some of the main signals sent out by the transfer box control module.

Key Interlock Solenoid

The transfer box control module is able to send a signal to the key interlock solenoid. This signal locks the key in the ignition barrel to prevent it from being removed if the automatic transmission is not in the 'Park' position.

High/Low Range Change LED

E49206

Item	Part Number	Description
1	-	High range LED
2	-	Low range LED

The control module is responsible for illuminating the 2 'high/low' range change LED's adjacent to the range change lever. One LED indicates high range and the other indicates low range.

One LED will be on continuously when in the corresponding range.

When changing range, the current range LED will remain on until the new range status has been achieved.

The new range LED will start flashing only when the range change has commenced (i.e. speed and neutral conditions have been met). The new range LED will be illuminated continuously at the same instant that the current range (now the old range) LED turns off.

The flash rate is 2 Hz with a 50% duty cycle.

The LED's have 2 levels of intensity, high when the vehicle lights are switch off and low when they are switched on.

If both lights are flashing at 0.5 Hz, this would indicate a transfer box fault or that the transfer box is in undefined range and may require calibration.

Transfer Box Motor

E49207

The transfer box motor provides the necessary movement to perform the high/low range change and the multi-plate clutch actuation. The motor is located on the rear casing assembly and secured with four bolts.

The motor is a PWM controlled, DC motor with an integrated worm gear reduction drive. It is connected to the transfer box control module with an eight-pin connector; the power supply of the motor is maintained through two large diameter cables on the motor connector. An internal position sensor checks the rotational movement of the motor.

There is an temperature sensor located within the motor housing.

Solenoid

E49208

The solenoid switches the power flow on the actuation system between high/low range change mode and clutch control mode. When the solenoid is energized, the solenoid pin deploys and activates the clutch control mode. When the solenoid is de-energized, the internal spring rejects the solenoid pin and activates the high/low range change mode.

NOTE: In order to replace the solenoid in service, the solenoid must be energized using the diagnostic tool.

The solenoid is connected to the transfer box control module with a two-pin connector.

Status Indication

Instrument Cluster

E49210

Item	Part Number	Description
A	-	High-line instrument cluster
B	-	Low-line instrument cluster
1	-	Low-range status indicator
2	-	Message centre text (high-line only)
3	-	Driveline fault lamp
4	-	Driveline over temperature

On vehicles fitted with the high line instrument cluster there will be one low range status indicator. This indicator will take the form of a mountain symbol and has the following logic:

- Lamp on = low range
- Lamp off = high range
- Lamp flashing = range change in progress/range undefined/range fault.

There will also be a message displayed in the message centre, on vehicles with high-line instrument cluster, which will inform the driver of any faults with the transfer box.

The following table shows the messages that can be displayed in the message centre of a high-line instrument cluster relating to the transfer box:

Message	Description	Chime
'LOW RANGE ENGAGED'	Transfer case has engaged low range after a range change request	Single
'HIGH RANGE ENGAGED'	Transfer case has engaged high range after a range change request	Single
'SPEED TOO HIGH FOR RANGE CHANGE'	Range change request when vehicle speed too high	Single
'SELECT NEUTRAL FOR RANGE CHANGE'	Range change request when lever not in neutral	Single
'APPLY HANDBRAKE' (PARK BRAKE in USA and Canada)	This alerts the driver that the automatic transmission park lock function is inoperative due to transfer box out of high or low range. Transfer box control module has stopped transmitting on the CAN bus during a range change or while in neutral mode and as a result the automatic transmission park lock function is inoperative	One per second for three seconds
'TRANSMISSION RANGE CHANGE NOT AVAILABLE'	Transfer box has detected a fault inhibiting a new range change. Control unit has shut down due to thermal overload	Single
'CENTRE DIFF OVER TEMP REDUCE SPEED'	Centre differential temperature is approaching the over heated threshold	Single
'CENTRE DIFF FAULT - TRACTION REDUCED'	Centre differential has failed - operating as an open differential	Single
'CENTRE DIFF FAULT - TRACTION REDUCED'	Transfer box control module has stopped transmitting on the CAN bus and defaults to open centre differential	Single

The transfer box control module receives a gear position signal from the manual transmission gear position sensor and publishes the status on the CAN bus. This is displayed in the odometer display, similar to how the automatic transmission displays gear information.

Odometer Display	Description
N	Transmission is in neutral
1	Transmission is in first gear
2	Transmission is in second gear
3	Transmission is in third gear
4	Transmission is in fourth gear
5	Transmission is in fifth gear
6	Transmission is in sixth gear
R	Transmission is in reverse gear (Japan only)
Blank display	Transmission is between neutral and a gear
E	Transmission gear position sensor has a fault

On vehicles fitted with the low line instrument cluster, in place of the message centre there will be a status lamp, which has the following logic:

- Amber - Over temperature
- Red - Failure, stop vehicle

The following table shows the faults that could possibly illuminate the transfer box status lamp on vehicles fitted with the low-line instrument cluster:

Indication	Description
OFF	Transfer box is operating at normal working temperature
YELLOW WARNING LAMP ON	Transfer box temperature is approaching the over heated threshold
YELLOW WARNING LAMP ON	Transfer box has detected a fault, which affects the range change function (current range is still maintained) or the centre differential has failed to open.
RED WARNING LAMP ON	Transfer box has detected a fault which renders the transmission park lock function inoperative due to out of range condition, OR centre differential has failed with a non-zero locking torque
YELLOW WARNING LAMP ON	Transfer box control module has stopped transmitting on the CAN bus and defaults to open centre differential
RED WARNING LAMP ON	Transfer box control module has stopped transmitting on the CAN bus during a range change or while in neutral mode and as a result the automatic transmission park lock function is inoperative

SERVICE

Basic Dimensions (Millimetres)

The transfer box weighs 40.30 kg without oil and 41.55 kg with oil. The unit requires 1500 ml \pm 2% of oil from empty.

The oil used in the transfer box is Shell TF 0753, which has been specially developed by Magna Steyr and Shell. The oil contains unique additives, which enhance the transfer box operation. No other oil must be used in the transfer box.

There is a unique type of grease, Weicon anti-seize montagepaste grau TL 7391, that needs to be applied the units input shaft spline when installing or reinstalling the transfer box.

E49212

Item	Part Number	Description
1	-	Input shaft spline

DIAGNOSTICS

The transfer box control module can store fault codes, which can be retrieved using T4 or a diagnostic tool using KW2000* protocol.

The information is communicated via a diagnostic socket.

The diagnostic socket allows the exchange of information between the various control modules on the bus systems and T4 or another suitable diagnostic tool. The information is communicated to the socket via the CAN bus. This allows the retrieval of diagnostic information and programming of certain functions using T4 or another suitable diagnostic tool.

The transfer box control module uses Diagnostic Trouble Codes (DTC), which relate to transfer box electrical faults.

Clutch and Range Change Mechanism Calibration

In order for the range change mechanism to function correctly, the transfer box control module must be calibrated to the mechanical dimensions of the transfer box that it is connected to.

This procedure will need to be followed if one of the following occurs:

- The switch is changed
- The transfer box control module is changed
- The transfer box or range position sensor is changed
- Vehicle or transfer box control module fault has caused the transfer box to revert to an undefined range.

Calibration can be carried out using T4.

Manual Transmission Gear Learning Procedure

The transfer box control module contains an adaption that enables it to recognize which gear the driver has selected. The adaption has to be reset, by performing the gear learning procedure, if one of the following occurs:

- The transfer box control module is reprogrammed or replaced
- The manual transmission is replaced
- The gear position sensor is replaced

During the gear learning procedure the vehicle must be driven smoothly in all gears, with the clutch fully released in each gear, in a single drive cycle. The procedure can be performed with the transfer box in either high or low range.

Gear Learning Procedure

1. If the gear learning procedure is to be performed because the manual transmission or the gear position sensor has been replaced, use T4 to set the gear adaption status to 0 in the transfer box control module.
2. Start the vehicle.
3. Drive in reverse gear and fully remove your foot from the clutch, drive in reverse with your foot off the clutch for 3 seconds and ensure that R is displayed in the instrument cluster.
4. Drive in 1st gear and, when gear position 1 is displayed in the instrument cluster, change to the next gear. Continue driving, and changing up to the next gear once the current gear is displayed in the instrument cluster, until gear 6 is displayed in the instrument cluster, then stop the vehicle.
5. Stop the engine, remove the ignition key and wait for a minimum of 60 seconds (for the transfer box control module to power down).
6. Insert the ignition key and turn the ignition switch to position II (ignition).
7. Select each gear in turn. If the appropriate gear position is displayed in the instrument cluster as soon as each gear is selected, the gear learning procedure has been successful. If the gear position is not displayed in the instrument cluster, the gear learning procedure has failed and must be repeated.
 - NOTE: T4 can also be used to check if the gear learning procedure has been successful.

SYSTEM OPERATION

The selection of high/low range is achieved by using a switch located behind the main transmission selection lever in the centre console. A range change can only be performed when the transmission selector lever is in neutral (position 'N' for vehicles with automatic transmission). The accelerator pedal must not be depressed when a range change is in progress.

If high or low range is requested and the transmission selector lever is in a position other than neutral, or 'N' or 'P' on a vehicle with an automatic transmission, the instrument cluster message centre, if fitted, will display 'SELECT NEUTRAL FOR RANGE CHANGE'.

NOTE: On vehicles with an automatic transmission, if the transmission selector lever is in the 'P' position, the range change will not take place and the 'SELECT NEUTRAL FOR RANGE CHANGE' message will not be displayed in the message centre.

When low range is selected, the low range 'mountain' symbol will flash when the range change is taking place and then remain illuminated when the range change is complete. The instrument cluster message centre, if fitted, will display 'LOW RANGE' for approximately 3 seconds followed by a chime from the instrument cluster to confirm that the range change has been completed. On vehicles with automatic transmission, only 'D' and 'Manual mode' are available, the 'Sport mode' selection is not available.

When high range is selected, the low range 'mountain' symbol will flash when the range change is taking place and then extinguish when the range change is complete. The instrument cluster message centre, if fitted, will display 'HIGH RANGE' for approximately 3 seconds followed by a chime from the instrument cluster to confirm that the range change has been completed.

The design of the transfer box allows range changes when the vehicle is moving, within set limitations as follows:

- High to Low – at speeds not exceeding 25 mph (40 km/h) for vehicles with automatic transmission, and 12 mph (20 km/h) for vehicles with manual transmission
- Low to High – at speeds not exceeding 37 mph (60 km/h).

If the vehicle speed is higher than the parameters given, the instrument cluster message centre, if fitted, will display 'SLOW DOWN'. When the correct speed range is reached, the message will be deleted and the range change will commence.

The transfer box control module interprets a road speed of less than 2 mph (3 km/h) as a static shift (vehicle not moving). In this instance, on vehicles with automatic transmission, the driver must use the shift lock procedure of operating the brake pedal to allow the selector lever to be moved from 'N' to 'D' after the range change has been performed.

High range should be used for all normal road driving and also for off-road driving across dry, level terrain. Low range should only be required where low speed manoeuvring is necessary, such as reversing a trailer, negotiating steep slippery surfaces or boulder-strewn terrain. Low range should also be used for extreme off-road conditions where progress in high range cannot be maintained. Low range should never be used for normal road driving.

Terrain Response™

The Terrain Response™ system allows the driver to select a program, which will provide the optimum settings for traction and performance for the prevailing terrain conditions.

The system is controlled by a rotary control located on the centre console. The rotary control allows the selection of one of the following five programs:

- Special programs off (general driving conditions)
- Grass/Gravel/Snow
- Mud/Ruts
- Sand
- Rock crawl.

The Terrain Response™ system uses a combination of vehicle subsystems to achieve the required vehicle characteristics for the terrain selected. The following subsystems form the Terrain Response™ system:

- Engine management system
- Automatic transmission (if fitted)
- Transfer box
- Rear locking differential (if fitted)
- Brake system
- Air suspension.

Each subsystem control module provides a feedback for the selected program so that the Terrain Response™ control module can check that all systems are controlling the system correctly.

For additional information, refer to: Ride and Handling Optimization (204-06, Description and Operation).

HIGH RANGE OPERATION

In high range, the torque input from the transmission is passed to the transfer box input shaft. The position of the synchroniser sleeve couples the shaft directly to the differential housing. The differential splits the torque between the two side gears. One side gear is connected by splines and passes the torque to the rear output flange. The second side gear is connected to the chain drive sprocket and passes the torque, via the chain, to the front output flange.

LOW RANGE OPERATION

In low range, the torque input from the transmission is passed to the transfer box input shaft. The synchroniser sleeve is moved and connects the planetary carrier to the differential housing. The torque from the transmission is now directed through the sun gear of the epicyclic gearset and, via the pinion gears and pinion gear shafts, into the planetary carrier. The annulus gear of the epicyclic gearset is secured inside the casing and generates the low range ratio of 2.93:1. The torque is then passed, via the synchroniser sleeve, to the differential housing where it is split between the two side gears. One side gear is connected by splines and passes the torque to the rear output flange. The second side gear is connected to the chain drive sprocket and passes the torque, via the chain, to the front output flange.

HIGH/LOW RANGE GEARS WITH SHIFT-ON-THE-MOVE

The driver is able to change between high and low range gears while the vehicle is moving, or if the vehicle is stationary.

Pushing the range change lever makes a range change requests. This lever is located on the centre console behind and to one side of the main transmission lever.

The driver requests a high to low range change by pushing the range change lever towards the rear of the vehicle and, conversely, a low to high request by pushing the lever towards the front of the vehicle. The range change lever is centre sprung and therefore does not latch in the forward or rear positions.

The driver is informed of the range status via a green lamp (mountain symbol) in the instrument cluster and LED's next to the range change lever. The lamp will not be illuminated in high range, illuminated in low range and flashing during a range change. There are two LED's on the range change lever one for high and one for low. During a range change the new range LED will flash.

The vehicle will remain in the selected range unless the driver requests a change, i.e. it will not automatically revert to high range following a key off/key on sequence.

RANGE CHANGE PROCEDURE (AUTOMATIC VEHICLES ONLY)

Neutral must be selected on the main transmission before requesting a range change and then select the appropriate gear following completion of the range change. During the range change the main transmission will be locked in neutral.

If neutral is not selected when a range change is requested then the request is denied and the driver will be advised to select neutral via the instrument cluster message centre (if fitted).

The range change process can take up to one second to complete following a request being accepted.

There is a limit set on the maximum speed at which a range change can be achieved. The maximum speed for a high to low range change is 25 mph (40 km/h) for vehicles with automatic transmission, and 12 mph (20 km/h) for vehicles with manual transmission. The maximum speed for a low to high range change is 37 mph (60 km/h). If the vehicle speed is over the limit when a range change is selected then the request is denied and the instrument cluster message centre (if fitted) will display a 'SLOW DOWN' message.

RANGE CHANGE PROCEDURE (MANUAL VEHICLES ONLY)

Neutral must be selected on the main transmission before requesting a range change and then select the appropriate gear following completion of the range change. During the range change the driver must not attempt to move the main transmission out of neutral. If the lever is moved out of neutral then the range change will stop and will be completed only when the driver re-selects neutral on the main transmission. This must be done to prevent damage to the transfer box mechanism.

The speed limit for shift-on-the-move for the manual vehicle is set lower than for the auto, at around 12 mph (20 km/h) for high to low and 37 mph (60 km/h) for low to high. The lower limits are set so that, if the driver tries to select too lower gear following a range change, no damage is caused to the vehicle.

Four-Wheel Drive Systems - Transfer Case Clutch Solenoid

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Drain the transfer case.

Refer to: [Transfer Case Draining and Filling](#) (308-07C Transfer Case - Vehicles With: Twin Speed Transfer Case, General Procedures).

3.  **CAUTION:** Connect the diagnostic tool, prior to removal of the solenoid. Carry out the diagnostic service function **transfer case – solenoid replacement**.

NOTES:

 Some fluid spillage is inevitable during this operation.

 Note the orientation of the electrical connector prior to removal.

4.

Installation

1. CAUTIONS:

 Failure to energise the solenoid to aid installation of the arm, may result in damage to the shift fork once the component is installed and the system is operated.

 Make sure the seal is installed correctly.

 Make sure that new bolts are installed.

 Make sure that the electrical connector is installed in the correct orientation as noted in the removal step.

 Make sure that the component sits flush to the transfer case.

 **NOTE: Tighten the retaining bolts evenly and progressively.**

Connect the electrical connector and energise the solenoid (use the service function **transfer case – solenoid replacement** to assist with energising the solenoid) to allow the arm to extend and correctly locate into the shift fork.

Torque: 5 Nm

2.

3. Fill the transfer case.

Refer to: [Transfer Case Draining and Filling](#) (308-07C Transfer Case - Vehicles With: Twin Speed Transfer Case, General Procedures).

4. Using the approved diagnostic equipment, clear all diagnostic trouble code(s) (DTCs) and check for correct operation.

Four-Wheel Drive Systems - High/Low Range Sensor

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the crossmember.
For additional information, refer to: [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - V6 S/C 3.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

3. **CAUTIONS:**

 To avoid damage to the joints or gaiters, do not allow the transmission to hang on the driveshafts.

 Discard the bolts.

Remove the high/low range sensor.

- Lower the rear of the transmission for access.
- Disconnect the electrical connector.
- Remove the 2 Torx bolts.

Installation

1.  **CAUTION:** Make sure that new bolts are installed.

To install, reverse the removal procedure.

- Clean the components.
- Install the high/low range sensor.
- Tighten the Torx bolts to 5 Nm (4 lb.ft).

2. Install the crossmember.
For additional information, refer to: [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - V6 S/C 3.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).
3. Connect the Land Rover approved diagnostic equipment.
 1. Start the service function "transfer case-absolute position sensor replacement"
 2. Clear any Diagnostic Trouble Codes (DTCs) after calibration and check for correct operation.

Four-Wheel Drive Systems - Four-Wheel Drive (4WD) Control Module

Removal and Installation

Removal

NOTES:

LHD shown, RHD is similar.

Some variation in the illustrations may occur, but the essential information is always correct.

Removal steps in this procedure may contain installation details.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. Remove drivers side plenum box lid.

3. Torque: 9 Nm

4.  NOTE: Some components shown removed for clarity.

Torque: 9 Nm

5.

6. Torque: 1.6 Nm

7.

8.

 4. Carry out the transfer case calibration procedure.
 5. Clear any DTCs after calibration and check for correct function.

Four-Wheel Drive Systems - Transfer Case Shift Motor

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - V6 S/C 3.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

3. **CAUTIONS:**

 To avoid damage to the joints or gaiters, do not allow the transmission to hang on the driveshafts.

 Discard the bolts.

Remove the shift motor.

- Lower the rear of the transmission for access.
- Disconnect the electrical connector.
- Remove the 4 Torx bolts.

Installation

1.  **CAUTION:** Make sure that new bolts are installed.

Install the shift motor.

- Clean the components.
- Tighten the Torx bolts to 35 Nm (26 lb.ft).
- Connect the electrical connector.

2. Install the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation) / [Transmission Support Crossmember - V6 S/C 3.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).
3. Connect the Land Rover approved diagnostic equipment.
 1. Start the diagnostic service function "transfer case-transfer case replacement".
 2. Clear any Diagnostic Trouble Codes (DTCs) after calibration and check for correct operation.

Transfer Case - Vehicles With: Single Speed Transfer Case - Transfer Case

Description and Operation

COMPONENT LOCATION

E164178

Item	Part Number	Description
1	-	Single speed transfer case

OVERVIEW

The new Single speed Transfer Case is standard fitted for V6 Petrol and V6 Diesel engines. (Twin speed Transfer Case is optional.)

The Single speed transfer case is full time, permanent four-wheel-drive unit, with 40/60 torque distribution to the front and rear driveshafts.

Common components with Twin-speed Transfer Case:

- Front and Rear Flanges
- Main Seals
- Main Bearings
- Fill/Drain Plugs
- Fixings and Torques
- Breather
- Tachograph encoder (optional)

The improvements of the new Single speed Transfer Case are the following:

- Different oil specification - Castrol BOT850 with friction modifier
- Reduced Complexity
- No electronic controls
- Optimized dynamic vehicle behavior

The Single speed TC consists of 25 components, the weight and inertia were reduced for improved economy.

A unique type of grease, Weicon anti-seize montagepaste grau TL 7391, must be applied to the transfer case input shaft spline when installing the transfer case.

Item	Part Number	Description
1	-	Input shaft spline

SYSTEM OPERATION

The torque input from the transmission is passed to the transfer case input shaft. The input shaft connected directly to the differential coupling. The differential coupling connects to the housing which splits the torque between the internal gear and the sun gear by the six planetary gears. The internal gear is connected and passes the torque to the rear output flange. The sun gear is connected to the chain drive sprocket and passes the torque to the front output flange via the chain.

The center differential responds to the torque changes at the axles. The basic torque distribution between the front and rear axles is 40/60% at normal drive conditions. If an axle loses traction, the driving torque is redirected instantaneously to the other axle between 65/35% Front/Rear and 20/80% Front/Rear.

DESCRIPTION

Transfer Case - Sectional View

E164179

12	-	Drive chain sprocket - Front output
13	-	Front output flange
14	-	Front housing assembly

Transfer Case Power Flow

E164180

Input torque from the transmission is transferred to the input shaft of the transfer case and then onto the differential coupling. The coupling is connected to the differential housing. The planetary gears are held in place by the differential housing, which are connected to the differential internal gear, and the sun gear. The torque is then distributed to both the differential internal gear, and the sun gear, which are connected to the outputs of the transfer case. The internal gear is connected directly to the rear output flange, the sun gear is connected directly to the drive chain sprocket and therefore to the chain drive, which provides front output flange rotation.

Front Casing Assembly

The front casing assembly provides the location for the input shaft bearing and the front output flange bearing. It is also equipped with threaded holes to mount the chassis mounting bush, 2 lifting eyes and a breather cartridge for the transfer case breather pipe. The breather pipe allows equalization between atmospheric and internal transfer case pressure.

The front casing has an additional boss cast on the inside. The boss is used to mount two snubbers - one on drive side of the chain and one on the coast side - which are secured with 2 screws. The snubbers are suppressing chain vibrations which can occur under medium acceleration conditions, therefore improving NVH (Noise, Vibration and Harshness) issues. During normal operation the chain does not contact the snubbers.

Rear Casing Assembly

The rear casing assembly provides the location for the rear output flange bearing, the oil fill and drain plug. Fins are cast into the rear casing assembly to improve heat dissipation. The part number & serial number are printed on a bar code label.

Chain Drive

The chain-drive transfers drive from the center differential to the front output flange. A 3/8" pitch chain connects the sprocket on the transfer case input shaft with the sprocket on the front output flange. As both sprockets have the same number of teeth, the rotational speed of both sprockets is identical. During the vehicle operation the chain delivers the oil upwards and provides the lubrication for the input shaft, the output flange bearings, and the center

differential assembly.

NOTE: When installing or replacing the chain, the BLUE guide links must be facing the center differential, towards the rear output flange.

Center differential

E164177

Item	Part Number	Description
1	-	Drive chain
2	-	Center differential cover
3	-	Fixing nut
4	-	Planetary gear (6 off)
5	-	Center differential internal gear
6	-	Center differential housing
7	-	Coupling
8	-	Rear output shaft
9	-	Center differential sun gear
10	-	Drive chain sprocket
11	-	Friction washer
12	-	Input shaft

The center differential assembly is the primary feature of the transfer case. Torque is transmitted through the center differential coupling and housing, and distributed by the planetary gear set to the differential gears and the front and rear output flanges.

The assembly comprises 6 planetary gears, which are equally spaced within the center differential housing. The

planetary gears are supported in both directions by the differential casing and the differential cap.

The different basic torque distribution results from the different circle diameters of the internal gear and the sun gear. If an axle loses traction, the bias between the casing, the planetary gears and the cap generates internal friction inside the differential, and the torque directed to the other axle.

Transfer Case - Vehicles With: Single Speed Transfer Case - Transfer Case

Diagnosis and Testing

Principles of Operation

For a detailed description of the Transfer Case - Single speed, refer to the relevant Description and Operation section in the workshop manual.

REFER to: [Transfer Case](#) (308-07B Transfer Case - Vehicles With: Single Speed Transfer Case, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern
2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Mechanical
<ul style="list-style-type: none"> • Transfer case • Driveshafts • Differentials • Halfshafts • Fluid leaks

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index
5. Check DDW for open campaigns. Refer to the corresponding bulletins and SSMS which may be valid for the specific customer complaint and carry out the recommendations as required

Transfer Case - Vehicles With: Single Speed Transfer Case - Transfer Case Draining and Filling

General Procedures

Draining

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Position a container to collect the fluid.

3. **CAUTION:** Make sure that the area around the component is clean and free of foreign material.

NOTE: Remove and discard the sealing washer.

4. Allow the fluid to drain.

5. **NOTES:**

Make sure that all the component mating faces are clean.

Install a new sealing washer.

Torque: 28 Nm

Filling

1. **CAUTION:** Make sure that the area around the component is clean and free of foreign material.

 NOTE: Remove and discard the sealing washer.

2. Refill transfer case with the recommended fluid, until the fluid is level with bottom of filler/level plug hole.

3. NOTES:

 Make sure that all the component mating faces are clean.

 Install a new sealing washer.

Torque: 28 Nm

NOTES:

** New 'Patchlock' Torx bolts must be installed.

+ New bolts must be used when a new component is installed.

Description	Nm	lb-ft
Transfer case fluid drain plug	28	21
Transfer case fluid level/filler plug	28	21
Fuel tank heat shield nuts/bolts	10	7
** Rear drive shaft M12 Torx screws	150	111
Rear drive shaft M10 Torx screws	73	54
** Front driveshaft Torx screws		
Stage 1	45	33
Stage 2	Further 90°	Further 90°
Drive shaft centre bearing bolts	30	22
Transmission support insulator	60	44
Wiring harness securing bolts	10	7
Fuel line support bracket bolts	10	7
Transfer case retaining bolts	45	33
Earth cable bolt (2010 Model Year onwards)	15	11
+ Transfer case shift motor bolts	35	26
+ Transfer case clutch control solenoid bolts	5	4
+ Transfer case high / low range position sensor bolts	5	4

Transfer Case - Vehicles With: Twin Speed Transfer Case - Transfer Case

Description and Operation

For additional information, refer to: Four-Wheel Drive Systems (308-07A Four-Wheel Drive Systems, Description and Operation).

Transfer Case - Vehicles With: Twin Speed Transfer Case - Transfer Case

Diagnosis and Testing

Principle of Operation

For a detailed description of the transfer case system and operation, refer to the relevant Description and Operation section of the workshop manual.

REFER to: [Transfer Case](#) (308-07C Transfer Case - Vehicles With: Twin Speed Transfer Case, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern
2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Transfer case • Driveshafts • Differentials • Halfshafts • Fluid leaks 	<ul style="list-style-type: none"> • Fuse(s) • Wiring harnesses and connectors • Controller Area Network (CAN) circuits • Instrument Cluster (IC) • High/low range switch • Transfer Case Control Module (TCCM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index
5. Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required

Symptom Chart

Symptom	Message	Possible Causes	Action
Loss of drive due to transfer case being stuck in neutral	PARK LOCK FAILURE APPLY HANDBRAKE	<ul style="list-style-type: none"> • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance • Transfer case range change mechanism obstruction 	<ul style="list-style-type: none"> • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and test the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the transfer case control module for related DTCs and refer to the relevant DTC index
Automatic transmission park lock function inoperative due to transfer case stuck in neutral			
Loss of drive	-	<ul style="list-style-type: none"> • Front/rear driveshaft failure • Front/center/rear 	<ul style="list-style-type: none"> • Check the integrity of the front and rear driveshafts • Check the integrity of the front, center and rear

		<ul style="list-style-type: none"> differential failure • Front/rear left/right halfshaft failure • Transfer case system failure 	<ul style="list-style-type: none"> differentials • Check the integrity of the halfshafts • Using the manufacturer approved diagnostic system, check the transfer case control module for related DTCs and refer to the relevant DTC index
Range change inhibited	TRANSMISSION RANGE CHANGE INOPERATIVE	<ul style="list-style-type: none"> • Transfer case control module has shut down due to thermal overload • Transfer case range change mechanism obstruction • Transfer case control module internal failure 	<ul style="list-style-type: none"> • Using the manufacturer approved diagnostic system, check the transfer case control module for related DTCs and refer to the relevant DTC index
Off road traction reduced	TRANSMISSION OVERHEAT SLOW DOWN	<ul style="list-style-type: none"> • Center differential temperature is approaching the overheat threshold 	<ul style="list-style-type: none"> • Using the manufacturer approved diagnostic system, check the transfer case control module for related DTCs and refer to the relevant DTC index
	TRANSMISSION FAULT – TRACTION REDUCED	<ul style="list-style-type: none"> • Center differential clutch has failed - Operating as an open differential • Transfer case control module has stopped transmitting on the CAN bus and defaults to open center differential 	<ul style="list-style-type: none"> • Using the manufacturer approved diagnostic system, check the transfer case control module for related DTCs and refer to the relevant DTC index • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance
Judder during low speed manoeuvring with high steering inputs (front and rear driveshafts rotating at different speeds)	-	<ul style="list-style-type: none"> • Transfer case clutch not disengaged fully due to water contamination of the transfer case fluid 	<ul style="list-style-type: none"> • Refer to the relevant section of the workshop manual and check the transfer case fluid level/condition. If water is present in the fluid (white coloration/emulsification), check the integrity of the transfer case breather and drain and refill the transfer case fluid. Using the manufacturer approved diagnostic system, perform routine - Transfer Case Replacement. Clear the DTCs and re-test. If the fault persists, install a new transfer case and perform routine - Transfer Case Replacement
Clunk during transfer case range change Clunk when ignition is set to off (transfer case cycles to rest position)	-	<ul style="list-style-type: none"> • Transfer case clutch not calibrated correctly • Transfer case fluid contaminated due to water ingress 	<ul style="list-style-type: none"> • Using the manufacturer approved diagnostic system, perform routine - Transfer Case Replacement. Check the transfer case control module for related DTCs and refer to the relevant DTC index • Refer to the relevant section of the workshop manual and check the transfer case fluid level/condition. If water is present in the fluid (white coloration/emulsification), check the integrity of the transfer case breather and drain and refill the transfer case fluid. Using the manufacturer approved diagnostic system, perform routine - Transfer Case Replacement. If the fault persists, install a new transfer case and perform routine - Transfer Case Replacement
Whine from the transfer case	-	<ul style="list-style-type: none"> • Transfer case chain wear 	 NOTE: VIN LA572494 to LA650630 <ul style="list-style-type: none"> • For vehicles within the VIN range listed above, refer to the relevant section of the workshop manual and install a new transfer case chain • For vehicles outside of the VIN range listed above, install a new transfer case and perform routine - Transfer Case Replacement
	-	<ul style="list-style-type: none"> • Transfer case bearing wear 	 NOTE: VIN pre-LA572494

			<p>For vehicles within the VIN range listed above, install a new transfer case front/rear output shaft bearing and seal</p> <ul style="list-style-type: none"> For vehicles outside of the VIN range listed above, install a new transfer case and perform routine - Transfer Case Replacement
Transfer case fluid burnt (darker color than normal)	-	<ul style="list-style-type: none"> Excessive off-road driving Transfer case clutch worn/burnt 	<ul style="list-style-type: none"> Refer to the relevant section of the workshop manual and drain and refill the transfer case fluid. Using the manufacturer approved diagnostic system, perform routine - Transfer Case Replacement. Check the transfer case control module for related DTCs and refer to the relevant DTC index Check the integrity of the driveshafts, differentials and halfshafts. Rectify as necessary. Check the vehicle history for driveline failures. If no driveline failures have occurred, refer to the relevant section of the workshop manual and drain and refill the transfer case fluid, and using the manufacturer approved diagnostic system, perform routine - Transfer Case Replacement. Clear the DTCs and re-test. If a driveline failure has occurred, drain and refill the transfer case fluid, and perform routine - Transfer Case Replacement. Clear the DTCs and re-test. If the fault persists, install a new transfer case and perform routine - Transfer Case Replacement
Vibration through the steering wheel, front seat or floor at 2400rpm to 2800rpm during medium to heavy acceleration	-	<ul style="list-style-type: none"> Transfer case is torsioning/twisting on the rear of the transmission 	 <p>NOTE: This Action applies to 5.0L petrol vehicles only.</p> <ul style="list-style-type: none"> Install a mass damper (part number IAI500100) to the vacant threaded hole in the transfer case. Torque the fixing (part number IYP500080) to 75Nm

Repairs

Transfer Case Adaptions

When new transfer case components are installed, the relevant routine must be performed using the manufacturer approved diagnostic system:

- Transfer case control module - Transfer Case Replacement routine
- Transfer case motor - Transfer Case Replacement routine
- Transfer case - Transfer Case Replacement routine
- Transfer case mode selector solenoid - Solenoid Replacement routine
- Transfer case mode selector position sensor - Absolute Position Sensor Replacement routine

Drive Cycle

To validate a transfer case repair, the following drive cycle must be completed:

- Drive the vehicle a short distance and halt and drive away at least twice
- Select low range and then select high range (vehicle not moving)
- Select low range and then select high range (vehicle moving at appropriate speed)
- Halt the vehicle and select Neutral (manual transmission) or Park (automatic transmission)
- Set the ignition to off
- Wait until the transmission control switch Park LED has extinguished (automatic transmission)
- Drive the vehicle until the engine, transmission and transfer case are at normal operating temperature
- Repeat steps 1 to 6

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Transfer Case Control Module \(TCCM\)](#) (100-00 General Information, Description and Operation).

Transfer Case - Vehicles With: Twin Speed Transfer Case - Transfer Case Draining and Filling

General Procedures

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Position a container to collect the fluid.

3. Remove the fluid drain plug.
 - Clean the immediate area.
 - Remove and discard the sealing washer.

4. Allow the fluid to drain.

5. Install the drain plug and tighten it to 28 Nm (21 lb ft).
 - Clean the component mating faces.
 - Install a new sealing washer.

6. Remove the fluid filler/level plug.
 - Clean the immediate area.
 - Remove and discard the sealing washer.

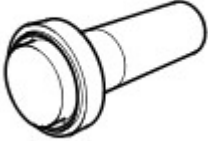

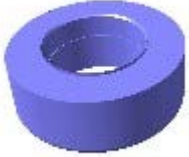

7. Refill transfer case with the recommended fluid, until the fluid is level with bottom of filler/level plug hole. For additional information, refer to: [Specifications](#) (308-07C Transfer Case - Vehicles With: Twin Speed Transfer Case, Specifications).

8. Install the fluid filler/level plug and tighten to 28 Nm (21 lb ft).
 - Clean the component mating faces.
 - Install a new sealing washer.

Installation

Special Tool(s)

 <p>303-1069</p> <p>E53727</p>	<p>Wrench adaptor</p> <p>303-1069</p>
---	---------------------------------------

Installation

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

All vehicles

1. With assistance, install the transfer case.
 - Clean the component mating faces.
 - Lubricate input shaft splines with 'Weicon TL7391' grease.
 - Install the O-ring seal.
 - Align the fuel hose support bracket.
 - Using the special tool, tighten the bolts to 45 Nm (33 lb.ft).

2. Connect the breather line.

3. Secure the fuel line support bracket.
 - Tighten the bolts to 10 Nm (7 lb.ft).

4. Connect the electrical connectors.

E44568

5. Secure the wiring harness to the transfer case.
 - Tighten the bolts to 25 Nm (18 lb.ft).

E123726

6. Install the transmission support insulator.
 - Clean the component mating faces.
 - Tighten the bolts to 60 Nm (44 lb.ft).

E44567

7. Secure the transmission wiring harness.

E123725

8. Secure the rear driveshaft to the transfer case drive flange.
 - Install the washers.
 - Tighten the Torx bolts to 55 Nm (40 lb.ft).

9. Secure the front driveshaft to the transfer case drive flange.
 - Install the washers.
 - Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
 - Stage 2: Tighten the bolts a further 90 degrees.
10. Install the ground cable to the transfer box.
 - Tighten the bolt to 15Nm (11 lb.ft).

11. Install the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - TDV6 3.0L Diesel](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

Vehicles with diesel particulate filter (DPF)

12. Install the DPF.
For additional information, refer to: [Diesel Particulate Filter \(DPF\)](#) (309-00A Exhaust System - TDV6 3.0L Diesel, Removal and Installation).

All vehicles

13.  **NOTE:** Do not carry out this step if the component removed for access only.

Fill the transfer case with the recommended fluid.
For additional information, refer to: [Transfer Case Draining and Filling](#) (308-07C Transfer Case - Vehicles With: Twin Speed Transfer Case, General Procedures).

14. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

15.

 **NOTE:** Do not carry out this step if the component removed for access only.

1. Connect the Land Rover approved diagnostic equipment.
2. Start the diagnostic service function **transfer case-transfer case replacement**.
3. Clear any Diagnostic Trouble Codes (DTCs) after calibration and check for correct operation.

Transfer Case - Vehicles With: Twin Speed Transfer Case - Transfer Case V6 S/C 3.0L Petrol

Installation

Special Tool(s)

	<p>Wrench adaptor 303-1069</p>
---	------------------------------------

Installation

1. With assistance, install the transfer case.
 - Clean the component mating faces.
 - Lubricate input shaft splines with 'Weicon TL7391' grease.
 - Install the O-ring seal.
 - Using the special tool, tighten the bolts to 45 Nm (33 lb.ft).
2. Connect the breather line.
3. Position the fuel line support bracket.
 - Tighten the bolts to 10 Nm (7 lb.ft).
 - Secure the fuel lines.
4. Connect the electrical connectors.
5. Secure the wiring harness to the transfer case.
 - Secure with the clip.
 - Tighten the bolts to 25 Nm (18 lb.ft).
6. Secure the front driveshaft to the transfer case drive flange.
 - Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
 - Stage 2: Tighten the bolts a further 90 degrees.
7. Secure the rear driveshaft to the transfer case drive flange.
 - Clean the component mating faces.
 - Tighten the Torx bolts to 55 Nm (40 lb.ft).
8. **CAUTIONS:**

Align the driveshaft center bearing mount by moving the floating front section of the shaft backward or forwards until the bolt holes in the mount align with the holes in the chassis.

Make sure the center bearing mount is not under tension.

Install the driveshaft center bearing mount bolts.

- Align the center bearing mount.
 - Tighten the driveshaft center bearing retaining bolts to 30 Nm (22 lb.ft).
9. Install the fuel tank heat shield.
 - Tighten the bolts to 6 Nm (4 lb.ft).
 - Tighten the nuts to 3 Nm (2 lb.ft).
 10. Install the ground cable to the transfer box.
 - Tighten the bolt to 15Nm (11 lb.ft).
 11. Install the transmission heat shield.
 - Tighten the bolts to 10 Nm (7 lb.ft).

12. Install the transmission crossmember.
For additional information, refer to: [Transmission Support Crossmember - V6 S/C 3.0L Petrol](#) (502-02 Full Frame and Body Mounting, Removal and Installation).

13.  NOTE: Do not carry out this step if the component removed for access only.

Fill the transfer case with the recommended fluid.
For additional information, refer to: [Transfer Case Draining and Filling](#) (308-07C Transfer Case - Vehicles With: Twin Speed Transfer Case, General Procedures).

14. Connect the battery ground cable.
For additional information, refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

- 15.

NOTE: Do not carry out this step if the component removed for access only.

1. Connect the Land Rover approved diagnostic equipment.
2. Start the diagnostic service function **transfer case-transfer case replacement**.
3. Clear any Diagnostic Trouble Codes (DTCs) after calibration and check for correct operation.

OVERVIEW

The 3.0L V6 TdV6 exhaust system is fabricated from stainless steel and is supplied as four separate assemblies; 2 front sections, one incorporating a catalytic converter, a connecting section or Diesel Particulate Filter (DPF) and a rear section incorporating a centre silencer and two rear silencers.

The system is attached to the underside of the body with 6 mounting rubbers which are located on mild steel hanger bars that are welded to the system. The mounting rubbers locate on corresponding hangers which are welded to the underside of the vehicle body.

The system has service repair items available. Indentations in the rear section between the center and the rear silencers show the cut points for the service replacement rear silencers or front section. When a service repair section is used, the joint is connected using a sleeve and two clamps to connect the pipes at the cut points.

Two variants of the exhaust system are available; a non DPF system and a system incorporating a DPF. The DPF is required to comply with EU5 emission regulations

CAUTION: The use of bio-fuels can seriously contaminate and destroy the coatings used on the catalytic converter. The DPF and the catalytic converter can become irreversibly contaminated if non-specified oils or fuels are used. This will result in the vehicle being unable to regenerate the DPF, becoming non-compliant with tailpipe emission regulations and replacement of the catalytic converter and DPF will be required.

If the vehicle is waded in deep water and the engine is stopped with the tailpipes submerged, the water, which can enter the system, can also contaminate both the DPF and the catalytic converter. This again can result in catalytic converter damage and damaging the ability for the DPF to regenerate therefore requiring both components to be

replaced.

DESCRIPTION

FRONT SECTION

The front section comprises 1 catalytic converter for the LH (left-hand) bank of cylinders. The catalytic converter has a welded inlet pipe which is curved through 90 degrees. The RH (right-hand) bank also has a curved inlet pipe which connects to a pipe to the DPF (if fitted) or catalytic converter assembly (vehicles without DPF).

The outer end of each inlet pipe is fitted with a flange which mates with the turbocharger for each bank of cylinders. Three bolts in the LH flange and two bolts in the RH flange locate in threaded holes in the mating flange on the turbocharger. Each flange is sealed with a gasket. The inlet pipes are 55 mm (2.16 in) diameter and are fitted with a flexible coupling.

The base of the catalytic converter has a connection with the LH bank outlet pipe and is secured with a clamp. The outlet connection from the LH bank catalytic converter and the outlet connection from the RH bank, merge into one single pipe which then connects to the DPF (if fitted) or catalytic converter assembly (vehicles without DPF).

The DPF (if fitted) or catalytic converter assembly (vehicles without DPF) is connected at its rearward end to the center silencer with a flange connection with the rear exhaust section. Three studs in the DPF (if fitted) or catalytic converter assembly (vehicles without DPF) mate with the center silencer rear section flange and are secured with 3 nuts and sealed with a gasket.

REAR SECTION

The centre silencer comprises two pressed stainless steel shells which are welded together to give a capacity of 25.2 liters (1537 in³). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gases pass through the silencer.

Hanger bars are welded to the front right hand side and left hand side of the silencer and provide for the location of mounting rubbers. The silencer has two 60 mm (2.3 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which are curved to pass around the rear suspension components. Each outlet pipe terminates in a welded joint with the rear silencers. The outlet pipes have a hanger bar which provides for the location of a mounting rubber. A hanger bar is welded to the front face of each rear silencer and provides for the location of a mounting rubber.

The silencer is a circular fabrication with a baffle tube which is surrounded with glass fiber to provide further noise suppression. Each silencer has a capacity of 2.7 liters (165 in³). The silencers each have an outlet pipe which is 65 mm (2.55 in) diameter, with a wall thickness of 1.2 mm (0.05 in). Each outlet pipe is curved downwards to direct exhaust gasses away from the rear of the vehicle.

CATALYTIC CONVERTER

The oxidizing catalytic converter is fitted in the front section of the LH bank outlet pipe from the turbocharger, after the pre-catalyst exhaust gas temperature sensor (vehicles with DPF only) and the Heated Oxygen Sensor (HO2S).

NOTE: On vehicles fitted with a DPF: The pre and post catalyst exhaust gas temperature sensors are used by the engine management system to monitor the DPF for regeneration purposes.

On vehicles without a DPF, a second smaller catalytic converter is fitted in place of the DPF to further improve emissions.

The engine management system provides accurately metered quantities of fuel to the combustion chambers to ensure the most efficient use of fuel and to minimise the exhaust emissions. To further reduce the carbon monoxide and hydrocarbons content of the exhaust gases, a catalytic converter is integrated into the LH bank front pipe of the exhaust system. In the catalytic converter the exhaust gases are passed through honeycombed ceramic elements coated with a special surface treatment called 'washcoat'. The washcoat increases the surface area of the ceramic elements by a factor of approximately 7000. On top of the washcoat is a coating containing platinum and palladium, which are the active constituents for converting harmful emissions into inert by-products. The platinum and palladium add oxygen to the carbon monoxide and the hydrocarbons in the exhaust gases, to convert them into carbon dioxide and water respectively.

Exhaust System - TDV6 3.0L Diesel - Exhaust System

Description and Operation

Exhaust pipe anti-tamper grill

E102908

To prevent the engine being stalled by forcefully restricting the flow of exhaust gases, an anti-tamper grill is fitted to the end of each exhaust tail-pipe to prevent an obstruction being inserted.

Exhaust System - TDV6 3.0L Diesel - Diesel Particulate Filter - Component Location

Description and Operation

- 1 Low pressure connection
- 2 High pressure connection
- 3 Electrical connector

Exhaust System - TDV6 3.0L Diesel - Diesel Particulate Filter - System Operation and Component Description

Description and Operation

System Operation

DIESEL PARTICULATE FILTER (DPF)

Two processes are used to regenerate the DPF; passive and active.

Passive Regeneration

Passive regeneration requires no special engine management intervention and occurs during normal engine operation. The passive regeneration involves a slow conversion of the particulate matter deposited in the DPF into carbon dioxide. This process occurs when the DPF temperature exceeds 250°C (482°F) and is a continuous process when the vehicle is being driven at higher engine loads and speeds.

During passive regeneration, only a portion of the particulate matter is converted into carbon dioxide. This is because the chemical reaction, which utilises nitrogen dioxide, is slower than the rate of engine production of particulate matter and is effective from 250°C (482°F).

Above 580°C the conversion efficiency of the particulates into carbon dioxide rapidly increases. These temperatures are generally only be achieved using the active regeneration process.

Active Regeneration

Active regeneration starts when the particulate loading of the DPF reaches a threshold as monitored or determined by the DPF control software. The threshold calculation is based on driving style, distance travelled and back pressure signals from the differential pressure sensor.

Active regeneration generally occurs every 250 miles (400 km) although this is dependant on how the vehicle is driven. For example, if the vehicle is driven at low loads in urban traffic regularly, active regeneration will occur more often. This is due to the rapid build-up of particulates in the DPF than if the vehicle is driven at high speeds when passive regeneration will have occurred.

The DPF software incorporates a mileage trigger which is used as back-up for active regeneration. If active regeneration has not been initiated by a back pressure signal from the differential pressure sensor, regeneration is requested based on distance travelled.

Active regeneration of the DPF is commenced when the temperature of the DPF is increased to the combustion temperature of the particles. The DPF temperature is raised by increasing the exhaust gas temperature. This is achieved by introducing post-injection of fuel after the pilot and main fuel injections have occurred.

It is determined by the DPF software monitoring the signals from the two DPF temperature sensors to establish the temperature of the DPF. Depending on the DPF temperature, the DPF software requests the [ECM \(engine control module\)](#) to perform either one or two post-injections of fuel:

- The first post-injection of fuel retards combustion inside the cylinder which increases the temperature of the exhaust gas.
- The second post-injection of fuel is injected late in the power stroke cycle. The fuel partly combusts in the cylinder, but some unburnt fuel also passes into the exhaust where it creates an exothermic event within the catalytic converter, further increasing the temperature of the DPF.

The active regeneration process takes up to 20 minutes to complete. The first phase increases the DPF temperature to 500°C (932°F). The second phase further increases the DPF temperature to 600°C (1112°F) which is the optimum temperature for particle combustion. This temperature is then maintained for 15-20 minutes to ensure complete oxidation of the particles within the DPF. The oxidation process converts the carbon particles to carbon dioxide.

The active regeneration temperature of the DPF is closely monitored by the DPF software to maintain a target temperature of 600°C (1112°F) at the DPF inlet. The temperature control ensures that the temperatures do not exceed the operational limits of the turbocharger and the catalytic converter. The turbocharger inlet temperature must not exceed 830°C (1526°F) and the catalytic converter brick temperature must not exceed 800°C (1472°F) and the exit temperature must remain below 875°C (1382°F).

During the active regeneration process the following [ECM](#) controlled events occur:

- The turbocharger is maintained in the fully open position. This minimizes heat transmission from the exhaust gas to the turbocharger and reduces the rate of exhaust gas flow allowing optimum heating of the DPF. If the driver demands an increase in engine torque, the turbocharger will respond by closing the vanes as necessary.
- The throttle is closed as this assists in increasing the exhaust gas temperature and reduces the rate of exhaust gas flow which has the effect of reducing the time for the DPF to reach the optimum temperature.
- The [EGR \(exhaust gas recirculation\)](#) valve is closed. The use of [EGR](#) decreases the exhaust gas temperature and therefore prevents the optimum DPF temperature being achieved.

If, due to vehicle usage and/or driving style, the active regeneration process cannot take place or is unable to regenerate the DPF, the dealer can force regenerate the DPF. This is achieved by either driving the vehicle until the engine is at its normal operating temperature and then driving for a further 20 minutes at speeds of not less

than 30 mph (48 km/h).

DPF Control

The DPF requires constant monitoring to ensure that it is operating at its optimum efficiency and does not become blocked. The **ECM** contains DPF software which controls the monitoring and operation of the DPF system and also monitors other vehicle data to determine regeneration periods and service intervals.

The DPF software can be divided into three separate control software modules; a DPF supervisor module, a DPF fuel management module and a DPF air management module.

These three modules are controlled by a fourth software module known as the DPF co-ordinator module. The co-ordinator module manages the operation of the other modules when an active regeneration is requested.

DPF Fuel Management Module

The DPF fuel management module controls the following functions:

- Timing and quantity of the four split injections per stroke (pilot, main and two post injections).
- Injection pressure and the transition between the three different calibration levels of injection.

The above functions are dependant on the condition of the catalytic converter and the DPF.

The controlled injection determines the required injection level in addition to measuring the activity of the catalytic converter and the DPF. The fuel management calculates the quantity and timing for the four split injections, for each of the three calibration levels for injection pressure, and also manages the transition between the levels.

The two post injections are required to separate the functionality of increasing in-cylinder gas temperatures and the production of hydrocarbons. The first post injection is used to generate the higher in-cylinder gas temperature while simultaneously retaining the same engine torque output produced during normal (non-regeneration) engine operation. The second post injection is used to generate hydrocarbons by allowing unburnt fuel into the catalytic converter without producing increased engine torque.

DPF Air Management Module

The DPF air management module controls the following functions:

- **EGR** control
- Turbocharger boost pressure control
- Intake air temperature and pressure control.

During active regeneration, the **EGR** operation is disabled -except for overrun conditions - and the closed-loop activation of the turbocharger boost controller is calculated. The air management module controls the air in the intake manifold to a predetermined level of pressure and temperature. This control is required to achieve the correct in-cylinder conditions for stable and robust combustion of the post injected fuel.

The module controls the intake air temperature by actuating the **EGR** throttle and by adjustment of the turbocharger boost pressure control.

DPF Co-ordinator Module

The DPF co-ordinator module reacts to a regeneration request from the supervisor module by initiating and co-ordinating the following DPF regeneration requests:

- **EGR** cut-off - except for overrun condition
- Turbocharger boost pressure control
- Engine load increase
- Control of air pressure and temperature in the intake manifold
- Fuel injection control.

When the supervisor module issues a regeneration request, the co-ordinator module requests **EGR** cut-off and a regeneration specific turbocharger boost pressure control. It then waits for a feedback signal from the **EGR** system confirming that the **EGR** valve is closed.

When the **EGR** valve is closed, the co-ordinator module initiates requests to increase engine load by controlling the intake air temperature and pressure.

Once confirmation is received that intake conditions are controlled or a calibration time has expired, the co-ordinator module then changes to a state awaiting an accelerator pedal release manoeuvre from the driver. If this occurs or a calibration time has expired, the co-ordinator module generates a request to control fuel injections to increase exhaust gas temperature.

DIFFERENTIAL PRESSURE SENSOR

As the amount of particulates trapped by the DPF increases, the pressure at the inlet side of the DPF increases in comparison to the DPF outlet. The DPF software uses this comparison, in conjunction with other data, to calculate the accumulated amount of trapped particulates.

By measuring the pressure difference between the DPF inlet and outlet and the DPF temperature, the DPF software can determine if the DPF is becoming blocked and requires regeneration.

Component Description

DIESEL PARTICULATE FILTER (DPF)

The DPF system reduces diesel particulate emissions to negligible levels to meet current European stage 5 emission standards.

The particulate emissions are the black fumes emitted from the diesel engine under certain load conditions. The emissions are a complex mixture of solid and liquid components with the majority of the particulates being carbon microspheres on which hydrocarbons from the engine's fuel and lubricant condense.

The DPF system comprises the following components:

- Diesel Particulate Filter (DPF)
- DPF control software incorporated in the [ECM](#)
- Differential pressure sensor.

The DPF is located in the exhaust system, downstream of the catalytic converter. Its function is to trap particulate matter in the exhaust gases leaving the engine. A major feature of the DPF is its ability for regeneration. Regeneration is the burning of particulates trapped by the filter to prevent obstruction to the free flow of exhaust gasses. The regeneration process takes place at calculated intervals and is not noticeable by the driver of the vehicle.

Regeneration is most important, since an overfilled filter can damage the engine through excessive exhaust back pressure and can itself be damaged or destroyed. The material trapped in the filter is in the most part carbon particles with some absorbed hydrocarbons.

The DPF uses a filter technology based on a filter with a catalytic coating. The DPF is made from silicon carbide housed in a steel container and has excellent thermal shock resistance and thermal conductivity properties. The DPF is designed for the engine's operating requirements to maintain the optimum back pressure requirements.

The porous surface of the filter consists of thousands of small parallel channels positioned in the longitudinal direction of the exhaust system. Adjacent channels in the filter are alternately plugged at the end. This design forces the exhaust gasses to flow through the porous filter walls, which act as the filter medium. Particulate matter which are too big to pass through the porous surface are collected and stored in the channels.

The collected particulate matter, if not removed, can create an obstruction to exhaust gas flow. The stored particles are removed by a regeneration process which incinerates the particles.

Diesel Particulate Filter Temperature Sensors

The sensors measure the temperature of exhaust gas exiting the turbocharger and before it passes through the DPF and provides the information needed to calculate the DPF temperature.

The information is used, in conjunction with other data, to estimate the amount of accumulated particulates and to control the DPF temperature.

Instrument Cluster (IC) Indications

For drivers who make regular short journeys at low speeds, it may not be possible to efficiently regenerate the DPF. In this case, the DPF software will detect a blockage of the DPF from signals from the differential pressure sensor and will alert the driver as follows:

The driver will be alerted to this condition by a message 'EXHAUST FILTER NEARLY FULL'. See 'HANDBOOK'. As detailed in the Owners Handbook, the driver should drive the vehicle until the engine is at its normal operating temperature and then drive for a further 20 minutes at speeds of not less than 30 mph (48 km/h). Successful regeneration of the DPF is indicated to the driver by the 'EXHAUST FILTER NEARLY FULL' message no longer being displayed. If the DPF software detects that the DPF is still blocked, the message will continue to be displayed or an additional message 'EXHAUST FILTER FULL VISIT DEALER' will be displayed. The driver should take the vehicle to an authorized dealer to have the DPF force regenerated using an approved diagnostic system.

Diesel Particulate Filter Side Effects

The following section details some side effects caused by the active regeneration process.

Engine Oil Dilution

Engine oil dilution can occur due to small amounts of fuel entering the engine crankcase during the post-injection phases. This has made it necessary to introduce a calculation based on driving style to reduce oil service intervals if necessary. The driver is alerted to the oil service by a message in the instrument cluster.

The DPF software monitors the driving style and the frequency of the active regeneration and duration. Using this information a calculation can be made on the engine oil dilution. When the DPF software calculates the engine oil dilution has reached a predetermined threshold (fuel being 7% of engine oil volume) a service message is displayed in the IC.

Depending on driving style, some vehicles may require an oil service before the designated interval. If a service message is displayed, the vehicle will be required have a full service and the service interval counter will be reset.

Fuel consumption

During the active regeneration process of the DPF, there will be an increase in fuel consumption.

However, because active regeneration occurs infrequently, the overall effect on fuel consumption is

approximately 2%. The additional fuel used during the active regeneration process is accounted for in the instantaneous and average fuel consumption displays in the instrument cluster.

DIFFERENTIAL PRESSURE SENSOR

The differential pressure sensor is used by the DPF software to monitor the condition of the DPF. Two pipe connections on the sensor are connected by pipes to the inlet and outlet ends of the DPF. The pipes allow the sensor to measure the inlet and outlet pressures of the DPF.

Aftermarket DPF cleaning fluids

Recent years have seen the introduction of 'DPF cleaning fluids' to (non JLR approved) aftermarket sales. These products claim to reduce the temperature that the soot reaction takes place. It should be stressed that, during the vehicle development activity, every effort is made to generate DPF regeneration temperatures whilst maintaining safe levels for all other vehicle components. Unauthorized use of the aftermarket fluids produces a significant risk to soot burn rates and DPF peak temperatures real world driving conditions. These fluids are not authorised for JLR use.

Exhaust System - TDV6 3.0L Diesel - Diesel Particulate Filter

Diagnosis and Testing

Principle of Operation

For a detailed description of the exhaust system, refer to the relevant Description and Operation section of the workshop manual.

REFER to: Exhaust System (309-00B, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

1. Verify the customer concern
2. Visually inspect for obvious signs of mechanical or electrical damage

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Diesel particulate filter • Differential pressure sensor hoses • Differential pressure sensor metal pipes and unions • Differential pressure sensor mounting position integrity • Metal fatigue • Joints • Mountings • Clearance around components • Damaged diesel particulate filter 	<ul style="list-style-type: none"> • Differential pressure sensor • Differential pressure sensor connector • Differential pressure sensor wiring harness • Electrical connector(s) • Sensor(s) • Engine Control Module (ECM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for DTCs and refer to the DTC Index

Symptom Chart

Symptom	Possible Causes	Action
Amber warning message on instrument cluster - DPF FULL REFER TO HANDBOOK -	<ul style="list-style-type: none"> • Blocked regeneration • Customer driving routine does not allow the system to clean the particulate filter 	If DTC is P2459-65 or AMBER DPF FULL REFER TO HANDBOOK message is displayed with no other reported messages. No repair is required, if the vehicle is driven on a highway AS DIRECTED IN THE HANDBOOK then the light will be extinguished and the system self healed, nothing more than this is required
Lack of power	<ul style="list-style-type: none"> • Air intake system fault • Restricted exhaust system • Low fuel pressure • Exhaust Gas Recirculation (EGR) valve(s) fault • Turbocharger fault • Diesel Particulate filter fault 	Check the air intake system. Check for a blocked catalytic converter or muffler, install new components as necessary. Check the fuel pressure. For EGR and turbocharger tests, refer to the relevant section of the workshop manual

DTC Index

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer approved diagnostic system)

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals

Pinpoint Tests

PINPOINT TEST A : DTC P244A-96 IS STORED	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: CHECK FOR OTHER DTCs	
	<p>1 Using the manufacturer approved diagnostic system, check if any of the following DTCs are stored</p> <ul style="list-style-type: none"> P2456-00 P2226-62 P2452-95 P2453-00
	<p>Are any of the additional DTCs stored?</p> <p>Yes Refer to the relevant DTC Index and carry out the relevant repair procedure. Only after the repair, using the manufacturer approved diagnostic system clear the DTC and re-test</p> <p>No Proceed to next step</p>
A2: EXHAUST PIPE AND JOINTS	
	1 Check all exhaust pipes and joints for leaks
	2 Check for external damage to the diesel particulate filter metalwork
	<p>Are any of the exhaust pipes leaking, or is there external damage to the diesel particulate filter metalwork?</p> <p>Yes Repair leaking exhaust joints as required Check and install a new diesel particulate filter as required Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component</p> <p>No Proceed to next step</p>
A3: DIESEL PARTICULATE FILTER PRESSURE SENSOR PIPES	
	1 Check differential pressure sensor pipes for cracks, mis-routing or hoses crossed
	Are any of the differential pressure sensor pipes cracked, mis-routed or hoses crossed?

	<p>Yes Repair as required, clear DTC and retest</p> <p>No Proceed to next step</p>
A4: HARNESS DIFFERENTIAL PRESSURE SENSOR	
	<p>1 Check wiring harness to the differential pressure sensor, include any inline connectors</p>
	<p>Was the wiring harness to the differential pressure sensor damaged?</p> <p>Yes Repair wiring harness as required, clear DTC and retest</p> <p>No Proceed to next step</p>
A5: CONNECTOR INTEGRITY DIFFERENTIAL PRESSURE SENSOR	
	<p>1 Check differential pressure sensor connector for damage and terminal corrosion</p>
	<p>Was the differential pressure sensor connector damaged or terminal corrosion present?</p> <p>Yes Refer to the electrical circuit diagrams and check connections are secure and wiring integrity. Repair as required, clear DTC and retest</p> <p>No Proceed to next step</p>
A6: FUNCTIONAL CHECK DIFFERENTIAL PRESSURE SENSOR	
	<p>NOTES:</p> <p> The Particulate Filter Differential Pressure Sensor measured voltage with the ignition on checks the sensor output with no variation/pressure in the exhaust system, checking the Particulate Filter Differential Pressure Sensor adaption is working. The measured voltages at engine idle and 4000 RPM will be considerably different depending on the diesel particulate filter soot loading. The idle value tells us that the Particulate Filter Differential Pressure Sensor is working if it goes up from the ignition on value. The 4000 RPM value tells us how much soot is in the diesel particulate filter. A diesel particulate filter which is recoverable measures less than 1.5volts / 300mbar at 4000 RPM</p> <p> If a new differential pressure sensor or hose lines have been installed, incorrectly routed, or any differential pressure sensor circuit repairs carried out, the Engine Control Module must learn and store the new differential pressure sensor offset value. The following conditions must be met to allow the differential pressure sensor offset value to be learnt and stored: Using the manufacturer approved diagnostic system, clear DTCs from Engine Control Module, then monitor the datalogger signal 'sump oil temperature - measured' ensuring a minimum of 50 degrees C is achieved. Start engine, run above 500RPM for 2 minutes, then a further 30 seconds at idle. Ensure the engine cooling fan is not running. Set vehicle in park and set ignition status to off. Wait 30 seconds for the Engine Control Module to power down, learn and store differential pressure sensor offset value. This process must be carried out six times, to allow a large negative offset value to adapt back to 0 Hpa</p> <p>1 Using the manufacturer approved diagnostic system check datalogger signal - Particulate Filter Differential Pressure Sensor Voltage - Bank 1 - (0x03DB) under the conditions described below. Allow the voltage to stabilize before recording the value for approximately 7 seconds</p> <ul style="list-style-type: none"> • Ignition is ON and engine speed is 0 RPM • Engine idle speed • Engine speed is 4000 RPM
	<p>Was datalogger signal - Particulate Filter Differential Pressure Sensor Voltage - Bank 1 - (0x03DB) - value approximately than 0.75 Volts when ignition ON and engine speed is 0 RPM? Was datalogger signal - Particulate Filter Differential Pressure Sensor Voltage - Bank 1 - (0x03DB) - value less than 1 Volt when engine speed at idle? Was datalogger signal - Particulate Filter Differential Pressure Sensor Voltage - Bank 1 - (0x03DB) - value less than 1.5 Volts when engine speed at 4000 RPM? (1volt = 100mbar, 1.5volts = 300mbar at 4000RPM)</p> <p>Yes Proceed to next step</p> <p>No Check and install a new differential pressure sensor as required Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component Using the manufacturer approved diagnostic system clear the DTC and re-test</p> <p>NOTE: If a new differential pressure sensor or hose lines have been installed, incorrectly routed, or any differential pressure sensor circuit repairs carried out, the Engine Control Module must learn and store the new differential pressure sensor offset value. The following conditions must be met to allow the differential pressure sensor offset value to be learnt and stored: Using the manufacturer approved diagnostic system, clear DTCs from Engine Control Module, then monitor the datalogger signal 'sump oil temperature - measured' ensuring a minimum of 50 degrees C is achieved. Start engine, run above 500RPM for 2 minutes, then a further 30 seconds at idle. Ensure the engine cooling fan is not running. Set vehicle in park</p>

and set ignition status to off. Wait 30 seconds for the Engine Control Module to power down, learn and store differential pressure sensor offset value. This process must be carried out six times, to allow a large negative offset value to adapt back to 0 Hpa

A7: ACCELERATION SMOKE TEST

	 <p>NOTE: Ensure the engine is at normal operating temperature</p>
	<p>1 Increase the engine speed momentarily to 4000RPM and allow the engine to settle back to idle</p>
	<p>2 Carry out above step 3 times</p>
	<p>3 Carry out visual check for excessive black smoke leaving the tailpipe during each of the 3 tests</p>
	<p>Is excessive black smoke visible leaving the tailpipe during each of the 3 tests?</p> <p>Yes Note: Only install a new diesel particulate filter if black smoke is visible leaving the tailpipe. Check and install a new diesel particulate filter as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component. Using the manufacturer approved diagnostic system clear the DTC and re-test. Return vehicle to the customer.</p> <p>No Check and install a new differential pressure sensor as required. Carry out differential pressure sensor adaption process.</p>

PINPOINT TEST B : RED WARNING MESSAGE DPF FULL VISIT DEALER IS DISPLAYED AND DTC P2463-00 IS LOGGED

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: VIN INFORMATION	
	<p>1 Record the full vehicle identification number for the vehicle under test, as this information may later be required by dealer technical support</p>
	<p>Has the vehicle identification number been recorded?</p> <p>Yes Proceed to the next step</p> <p>No Record the vehicle identification number and proceed to the next step</p>
B2: VEHICLE MILEAGE	
	<p>1 Record the full mileage for the vehicle under test, as this information may later be required by dealer technical support</p>
	<p>Has the mileage been recorded?</p> <p>Yes Proceed to the next step</p> <p>No Record the mileage and proceed to the next step</p>
B3: VEHICLE SOFTWARE PART NUMBER	
	 <p>NOTE: Known software issue on PD software level where Lambda sensor adaption is not complete and the assumed value of O2 in air is 0%, PE software level corrected to 21%. This can lead to non recognition of good regenerations of the diesel particulate filter</p> <p>1 Using the manufacturer approved diagnostic system, record the software part number for the Engine Control Module (ECM)</p>
	<p>Has the software part number been recorded? Is the software installed to the vehicle to the latest relevant level?</p> <p>Yes Proceed to the next step</p> <p>No Record the software part number and proceed to the next step</p>
B4: RECORD ALL ENGINE CONTROL MODULE (ECM) DTCs	
	<p>1 Using the manufacturer approved diagnostic system, check Engine Control Module (ECM), for related DTCs</p>
	<p>Are other DTCs logged?</p> <p>Yes Proceed to the next step</p> <p>No Proceed to step 7</p>
B5: DTC P2459-65 IS LOGGED	
	<p>1 Using the manufacturer approved diagnostic system, the logged mileage for DTCs can be seen by viewing the snapshot data</p>
	<p>Was DTC P2459-65 logged at a mileage up to 625 miles (1000KM) before the diagnostic trouble P2463-00 was logged?</p> <p>Yes Suspect the customer has ignored the AMBER DPF FULL REFER TO HANDBOOK message. The customer should be advised of this and the repair may become chargeable. Proceed to step 7</p> <p>No</p>

Proceed to the next step

B6: OTHER RELATED ENGINE CONTROL MODULE (ECM) DTCs

1 Related Engine Control Module (ECM) DTCs other than P2459-65 and P2463-00 are logged

Are related Engine Control Module (ECM) DTCs other than P2459-65 and P2463-00 logged?

Yes

Refer to the relevant DTC Index. Repair as required. Using the manufacturer approved diagnostic system clear the DTCs and re-test

No

Proceed to step 7

B7: DIESEL PARTICULATE FILTER REGENERATION CYCLE

NOTE: Using the manufacturer approved diagnostic system begin to perform a service regeneration cycle, **DO NOT** drive the cleaning cycle. **Record the grams of soot only**

1 With the engine at running temperature check the pre catalyst oxygen sensor operation as follows: -

2 Using the manufacturer approved diagnostic system check datalogger signals - Oxygen Sensor Voltage - (0xF424)

- Idle vehicle and record, should be (0.9 ~ 1 volt)
- Idle to 100% pedal, during acceleration record, should be 0 volts
- Accelerate to 4500RPM (stationary) and close throttle, should read 1.2 ~ 1.3 volts

Does the pre catalyst oxygen sensor meets this criteria?

Yes

Pre catalyst oxygen sensor is operating correctly
Note: DO NOT carry out the adaption process on the pre catalyst oxygen sensor, as this resets the adaption to 0
Proceed to step 8

No

Pre catalyst oxygen sensor adaption cycle is required

Pre catalyst oxygen sensor adaption cycle is **NOT** possible while DTCs are logged
Using the manufacturer approved diagnostic system, carry out FIT NEW PARTICULATE FILTER PROCESS only and clear the DTCs
After completing FIT NEW PARTICULATE FILTER PROCESS continue with pre catalyst oxygen sensor adaption cycle as follows: -
1. Idle vehicle for 10 minutes
2. Set car in command shift 3rd gear
3. Accelerate to 3800RPM (where achievable) and overrun / coastdown without braking until revs drop below 1500 RPM
4. Repeat step 3 a further 3 times
5. Check for any DTCs, if adaption failed a DTC will be evident and the sensor will require replacement
6. Check oxygen sensor adaption is now complete by returning to B7 item 27. Using the manufacturer approved diagnostic system clear the DTC and re-test.
Return vehicle to the customer

B8: SOOT ESTIMATOR IS ACCURATE AND THE DIFFERENTIAL PRESSURE SENSOR READING IS WORKING CORRECTLY

1 Using the manufacturer approved diagnostic system check datalogger signal - Particulate Filter Differential Pressure Sensor Voltage - Bank 1 - (0x03DB)

- Record value with ignition ON
- Idle engine record value
- Hold engine speed at 4000RPM and record value
- Note: 1volt = 100mbar, 1.5volts = 300mbar at 4000RPM

Have the values been recorded for each of the conditions?

Yes

Proceed to step 9

No

Record values for each of the conditions and proceed to step 9

B9: EXHAUST GAS TEMPERATURES

1 Using the manufacturer approved diagnostic system check datalogger signals

- Exhaust Gas Temperature Bank 1 Sensor 2 - (0x03F5)
- Exhaust Gas Temperature Bank 1 Sensor 3 - (0x03F6)
- Exhaust Gas Temperature Bank 2 Sensor 1 - (0x03F7)
- Exhaust Gas Temperature Bank 2 Sensor 2 - (0x03F8)

2 Hold engine speed at 2000RPM for 5 minutes and record values

(By doing this we are trying to establish if the system can recognize heat in the exhaust during regeneration)

Are all of the exhaust gas temperature sensors showing reasonable values between 120°C and 400°C?

Yes

Proceed to step 10

No

Check and install new exhaust gas temperature sensors as required. Refer to the new module/component installation note at the top of the DTC Index
Using the manufacturer approved diagnostic system clear the DTCs and re-test

B10: COMPARISON OF SOOT MASS IN DIESEL PARTICULATE FILTER AND PARTICULATE FILTER DIFFERENTIAL PRESSURE SENSOR VOLTAGE

NOTE: Using the results from steps 7 and 8 establish if the Soot Mass estimator and the differential pressure sensor are aligned, in terms of their assessment of soot in the filter. If the soot mass is less than 54 grams the diesel particulate filter is recoverable.

	1 Using the results from step 7 check soot mass is less than 54 grams
	2 Using the results from step 8 check particulate filter differential pressure sensor voltage at 4000RPM is less than 1.5Volts (300mbar)
	Is diesel particulate filter soot mass value less than 54 grams and particulate filter differential pressure sensor voltage at 4000RPM less than 1.5Volts (300mbar)? Yes If the diesel particulate filter soot mass value is greater than 50 grams and the differential pressure sensor voltage is between 0.5Volts and 1.1Volts then the diesel particulate filter is low on soot but has not been driven to allow pressure correction of the diesel particulate filter, if other issue from the tests performed are evident. Proceed to next step No If the diesel particulate filter soot mass value is greater than 50 grams and the differential pressure sensor voltage greater than 1.5Volts then the diesel particulate filter has a high soot content. If no other issue from the tests performed are evident then the vehicle has a soot generated fault not detected by DTCs. Refer to the relevant section of the workshop manual and check for boost pressure leakage using the manufacturer approved leak check tool. Contact dealer technical support for further advice
B11: SOOT MASS REDUCTION	
	1 With the vehicle fully up to temperature and in Park maintain 2500RPM for 10 minutes
	2 Return to step 7, check diesel particulate filter soot mass value
	Has the diesel particulate filter soot mass reduced from the original recorded value? Yes Proceed to next step No Proceed to step 13
B12: DRIVE VEHICLE	
	 CAUTION: At all times during this procedure you should observe all relevant speed limits, laws, and regulations 1 Drive the vehicle until the engine reaches normal operating temperature. The engine should NOT be left idling to achieve working temperature. Drive the vehicle for a further twenty minutes, keeping the vehicle at a constant speed between 75 km/h (45 mph) and 120 km/h (75 mph). Keeping a constant speed enables the diesel particulate filter to regenerate more efficiently. It is therefore recommended that cruise control is used to achieve this, if possible (Do NOT carry out diesel particulate filter service regeneration)
	Is the diesel particulate filter soot mass less than 20 grams? Yes Using the manufacturer approved diagnostic system clear the DTC and re-test. Return vehicle to the customer No Contact dealer technical support with all of the recorded values from the above tests
B13: CARRY OUT FIT NEW PARTICULATE FILTER PROCESS	
	 WARNING: DO NOT carry out this process on any other occasion without first installing a new diesel particulate filter 1 Using the manufacturer approved diagnostic system, select SPECIAL APPLICATIONS ~ POWERTRAIN ~ carry out FIT NEW PARTICULATE FILTER PROCESS
	2 Carry out diesel particulate filter service regeneration. Record grams of soot following diesel particulate filter service regeneration
	Is the diesel particulate filter soot mass less than 20 grams? Yes Using the manufacturer approved diagnostic system clear the DTC and re-test. Return vehicle to the customer No Contact dealer technical support with all of the recorded values from the above tests

Diesel particulate filter regeneration procedure

If DPF FULL SEE HANDBOOK appears in the message center, carry out the following procedure

CAUTIONS:

The regeneration procedure produces high temperatures in the diesel particulate filter. Heat can be felt radiating from beneath the vehicle, which is normal and not a cause for concern. However, the vehicle should not be parked over combustible material, particularly during dry weather. The heat generated could be sufficient to start a fire when in close proximity to combustible material such as long dry grass, paper etc

At all times during this procedure you should observe all relevant speed limits, laws, and regulations

NOTES:

The ideal speed and conditions for regeneration are 100 km/h (62 mph) ~ 120 km/h (75 mph), in Drive. Keeping a constant speed enables the diesel particulate filter to regenerate more efficiently. It is therefore

recommended that cruise control is used to achieve this, if possible

When driving off-road during the regeneration process, greater accelerator pedal use may be required

1. Drive the vehicle until the engine reaches normal operating temperature. The engine should **NOT** be left idling to achieve working temperature
2. Drive the vehicle for a further twenty minutes, keeping the vehicle at a constant speed between 75 km/h (45 mph) and 120 km/h (75 mph)
3. If regeneration is successful the warning message will be extinguished, once the message is extinguished please keep driving for 10 minutes to ensure that the diesel particulate filter is completely clean
4. If the message remains repeat the process

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - TDV6 3.0L Diesel, DTC: Engine Control Module (PCM) (100-00, Description and Operation).

Exhaust System - TDV6 3.0L Diesel - Exhaust System

Diagnosis and Testing

Principle of Operation

For a detailed description of the exhaust system, refer to the relevant Description and Operation section of the workshop manual.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

1. Verify the customer concern
2. Visually inspect for obvious signs of mechanical or electrical damage

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Leaks • Metal fatigue • Pipes • Catalytic converter • Muffler(s) • Joints • Mountings • Clearance around components 	<ul style="list-style-type: none"> • Fuses • Wiring harness • Electrical connector(s) • Sensor(s) • Engine control module (ECM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for DTCs and refer to the DTC Index

Symptom Chart

Symptom	Possible Causes	Action
Noisy or leaking exhaust	<ul style="list-style-type: none"> • Exhaust system/components 	Install new components as necessary. Refer to the relevant section of the workshop manual
Lack of power	<ul style="list-style-type: none"> • Air intake system fault • Restricted exhaust system • Low fuel pressure • Exhaust gas recirculation (EGR) valve(s) fault • Turbocharger fault 	Check the air intake system. Check for a blocked catalytic converter or muffler, install new components as necessary. Check the fuel pressure. For EGR and turbocharger tests, refer to the relevant section of the workshop manual

OVERVIEW

The V6 3.0L SC (supercharged) petrol engine exhaust system is supplied as three separate assemblies; a left front section incorporating a catalytic converter, a right front section incorporating a catalytic converter and a rear section incorporating a front silencer, a centre silencer and two rear silencers.

The system is attached to the underside of the body with 5 mounting rubbers which are located on mild steel hanger bars that are welded to the system. The mounting rubbers locate on corresponding hangers which are welded to the underside of the vehicle body. The system is routed mainly on the inside of the left chassis longitudinal before splitting near the rear differential to exit at each side of the rear of the vehicle.

The system has service repair items available. Indentations in the rear section, between the center and the rear silencers, show the cut points for the service replacement rear silencers or front section. When a service repair section is used, the joint is connected using a sleeve and two clamps to connect the pipes at the cut points.

DESCRIPTION

Front Section

Both front sections have a loose flange with two holes which provide for the attachment with two bolts onto the left and right exhaust manifolds. The flange is sealed by a tapered seat in the flange and a machined cone on the manifold.

Each flange is located on a short, straight pipe, which in turn is welded to the body of the catalytic converter. The

pipe has a threaded boss which is welded over a hole to provide location for the mid - catalyst **HO2S (heated oxygen sensor)** in a position between the pre-catalyst and the main catalyst.

Both outlet pipes from the catalytic converters, have a threaded boss which provide location for the post-catalyst HO2S.

The mid and post catalyst HO2S monitor the exhaust gasses leaving the engine. The **ECM (engine control module)** uses this information to provide accurately metered quantities of fuel to the combustion chambers to ensure the most efficient use of fuel and to minimize the exhaust emissions.

The front section also has a mass damper which will absorb resonance from the system.

Rear Section

The rear section comprises of a front silencer, center silencer and two rear silencers.

The front silencer comprises a double skin and two end plates which are rolled together to give a capacity of 7.0 litres (427 in³). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gasses pass through the silencer. A hanger bar is welded to the front of the silencer and provides for the location of a mounting rubber.

The centre silencer comprises two pressed stainless steel shells which are welded together to give a capacity of 25.2 litres (1538 in³). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gasses pass through the silencer. A hanger bar is welded to the front right side of the silencer and provides location for a mounting rubber.

Each outlet pipe terminates in a welded joint with the tail silencers. The outlet pipes have a hanger bar which provides for the location of a mounting rubber.

A hanger bar is welded to the front face of each rear silencer and provides for the location of a mounting rubber. The silencer is a rectangular fabrication with a baffle tube which is surrounded with glass fibre to provide further noise suppression. Each silencer has a capacity of 4 litres (244 in³).

Each outlet pipe is curved downwards to direct exhaust gasses away from the rear of the vehicle.

Exhaust Manifolds

The cast exhaust manifolds are unique for each cylinder bank. Spacers on the securing bolts allow the manifolds to expand and retract with changes of temperature while maintaining the clamping loads. Heat shields are integrated into the exhaust manifold gaskets. Each manifold has a threaded port near to its outlet which allows for the fitment of the pre-catalyst **HO2S**.

OPERATION

Catalytic Converters

In the catalytic converters, the exhaust gases are passed through honeycombed ceramic elements coated with a special surface treatment called 'washcoat'. The washcoat increases the surface area of the ceramic elements by a factor of approximately 7000°. On top of the washcoat is a coating containing palladium and rhodium, which are the active constituents for converting harmful emissions into inert by-products. The palladium and rhodium take oxygen from nitrogen oxides, to leave nitrogen, and combine the oxygen with carbon monoxide and hydrocarbons to leave carbon dioxide and water.

Fuel System - General Information - Diesel Filter Water Drain-Off

General Procedures

WARNINGS:

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

The spilling of fuel is unavoidable during this operation. Make sure that all necessary precautions are taken to prevent fire and explosion.

CAUTIONS:

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transmission undershield.
 - Remove the 6 bolts.

-  **WARNING:** Observe due care when working near a hot exhaust system.

Remove the fuel filter heat shield.

- Remove the 3 bolts.

4. Drain the fuel filter element.
 - Attach a suitable drain tube to the water-in-fuel drain port.
 - Loosen the water-in-fuel drain port 2 complete turns and allow the fluid to drain into a container.
 - Turn the ignition to position 2 until 100ml of fluid is drained, then turn to position O.
 - Remove the drain tube.

5. Tighten the water-in-fuel drain port.
6. Install the fuel filter heat shield.
 - Tighten the bolts to 6 Nm (4 lb.ft).
7. Install the transmission undershield.
 - Tighten the bolts to 10 Nm (7 lb.ft).

Fuel System - General Information - Low-Pressure Fuel System Bleeding

General Procedures

Special Tool(s)

WARNINGS:

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow this instruction may result in personal injury.

If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

CAUTIONS:

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

This procedure must be carried out before the engine is attempted to be started, following removal or replacement of any fuel system component involving fuel line intrusion. Failure to follow this instruction will result in damage to the fuel injection pump.

1. This procedure is necessary if any of the following fuel system components are removed, disconnected or replaced: Fuel tank, fuel lines, fuel filter element, fuel coolers, fuel injection pump or fuel rail pressure sensor.
2. Remove the engine cover. For additional information, refer to: Engine Cover - 3.0L V6 - TdV6 (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Install the special tool to the fuel rail Schraeder valve.
 - Remove the fuel rail Schraeder valve cap.

4. Position a container to collect spillage.
 - Open the valve on the special tool.

5. Turn the ignition switch to the ON position for 25 seconds. The fuel pump in the fuel tank will be audible.
6. Repeat the above procedure until clean, air free fuel is seen escaping from the special tool.
 - While the pump is still running, close the valve on the special tool to prevent air entering the fuel system.

7. Remove the special tool from the Schraeder valve.
 - Install the Schraeder valve protective cap.

8. Remove the container.

9.  **CAUTION:** If a new fuel injection pump is fitted, the following step must be carried out to make sure the fuel injection pump is fully primed. Failure to follow this instruction may result in damage to the vehicle.

Repeat Step 5 four times.

10.  **NOTE:** The engine must be allowed to idle for two minutes to allow air in the fuel injection supply manifolds and fuel injectors to purge.

Start the engine and allow to idle.

11. Install the engine cover. For additional information, refer to: Engine Cover - 3.0L V6 - TdV6 (501-05 Interior Trim and Ornamentation, Removal and Installation).

Fuel System - General Information - Fuel Tank Draining

General Procedures

WARNINGS:

Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

1. Open the fuel filler door and remove the cap.
2. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
3. Connect the fuel tank drain equipment ground cable to the vehicle.
4. Remove the fuel from the fuel tank, via the filler neck, using the fuel tank draining equipment. Follow the manufacturer's operating instructions.
5. To install, reverse the removal procedure.

Fuel System - General Information - Fuel System Pressure Release V6 S/C 3.0L Petrol

General Procedures

Draining

1.  **WARNING:**

Refer to: [Petrol and Petrol-Ethanol Fuel Systems Health and Safety Precautions](#) (100-00 General Information, Description and Operation).

2. Remove the fuel pump fuse.
3. Remove the fuel filler cap.
4. Start the engine and allow it to idle until the engine stalls.
5. Crank the engine for approximately five seconds to make sure that the fuel rail pressure is released.

Filling

1.  **NOTE:** Make sure all repairs have been carried out before proceeding to the following steps.

Install the fuel pump fuse.

2. Install the fuel filler cap..
3. Read and clear stored DTC fault codes.

GENERAL

The major components of the 3.0L TdV6 fuel system comprises a fuel tank, a fuel pump module, a fuel filter, a fuel cooler, a fuel filler pipe and cap assembly and two fuel level sensors. The fuel system is a high pressure common rail system which uses an engine mounted and driven high pressure pump to deliver a uniform level of pressure to the common fuel rails which supply all 6 fuel injectors.

The fuel tank houses an internal fuel lift pump, located in the fuel pump module. The lift pump is employed to provide a low-pressure supply to the common rail high pressure fuel system.

Two fuel level sensors are installed in the front and rear of the fuel tank. The sensors are a MAGnetic Passive Position Sensor (MAPPS) which provide a variable resistance to ground for the output from the fuel gauge.

A fuel cooler is located in the low pressure side of the system in the fuel return line and is a fuel to water type cooler.

The fuel tank breather system consists of a fuel cut-off elbow. No Roll Over Valves (ROV's) are fitted.

The fuel filter is a disposable canister type and is located on a bracket at the front of the fuel tank.

DESCRIPTION

FUEL TANK ASSEMBLY

E122446

Item	Part Number	Description
1	-	Fuel return from filter to tank
2	-	Fuel supply from fuel pump to filter
3	-	Pipe - return from fuel cooler
4	-	Pipe - Fuel supply to HP pump
5	-	Pipe - Fuel burning heater supply
6	-	Pad (2 off)
7	-	Pipe - Fuel tank breather
8	-	Fuel tank filler inlet hose
9	-	Fuel pump module assembly
10	-	Pipe - Fuel return
11	-	Pipe - Fuel burning heater supply
12	-	Pipe - Fuel supply from pump
13	-	Heat shield
14	-	Cover
15	-	Cradle

The fuel tank is located on the right hand side of the vehicle, between the transmission and the right hand chassis

longitudinal. The tank is located on a mounting cradle which secures the whole fuel tank assembly to the vehicle. The tank is blow moulded from HDPE (high density polyethylene) and has a useable capacity of 82.0 liters (18 gallons).

The cradle is attached to the chassis with six screws. When the cradle is attached to the chassis, the tank is positively secured via foam pads which bear against the central chassis cross beam. A protective cover is fitted to the front right hand corner of the tank and provides additional protection.

The fuel tank is manufactured from moulded plastic which is a minimum of 3 mm thick. The tank is a sealed unit with the only internal access being via the pump module flange aperture on the top of the tank.

The flange is fitted with a locking ring and seal. The seal locates in a groove on the tank. The locking ring locates and clamps on the encapsulated ring that is moulded into the fuel tank. The flange has a tag which locates in the top of the tank to ensure correct orientation.

The flange has six pin internal and external connectors which provide for electrical connections for the level sensors and the fuel pump. Two quick release connectors provide for the connection of the fuel feed and return pipes and the vent pipes. The fuel return connection contains a non return valve which prevents fuel escaping from the connection in the event of a vehicle roll over and the pipe becoming detached. On vehicles with a fuel burning heater, a third connection provides the connection for the fuel feed supply to the fuel burning heater.

The fuel pump module is mounted on a bayonet lock ring which is welded inside the fuel tank. A carrier within the tank provides for the mounting of the fuel suction jet, front fuel sensor and the fuel cut-off elbow.

The fuel pump module contains a number of components. The module comprises the fuel pump, the rear fuel level sensor, the rear jet pump, the pump inlet filter and the fuel pressure regulator. Only the pump module assembly, the fuel level sensors and the flange are available as serviceable components, the individual assembly components are not available separately.

Fuel Tank Internal Components

E122447

Item	Part Number	Description
1	-	Fuel pump module assembly
2	-	Fuel cut-off elbow
3	-	Carrier
4	-	Forward fuel level sensor
5	-	Suction port filter
6	-	Suction port pipe
7	-	Level sensor float
8	-	Swirl pot

Fuel Pump Module

The low pressure fuel lift pump is located in the fuel pump module. The lift pump is employed to provide a low pressure supply at approximately 0.5 bar, to the common-rail high pressure fuel system and to allow the jet pump assemblies to maintain a full swirl pot.

The lift pump operation is controlled by the Engine Control Module (ECM), via the fuel pump relay located in the

Engine Junction Box (EJB). When the ignition is switched on, the fuel pump operates for 25 seconds to build up fuel pressure. As engine cranking commences the fuel pump stops running until the engine starts. This function is employed to decrease load on the battery.

In cold conditions, 'waxing' of the fuel can occur. For this reason a coarse mesh filter is attached to the swirl pot inlet port at the bottom of the pump module.

A three way connection is located on the top of the module. Two outlets supply the jet pumps, the other outlet is the pressure feed through the pressure regulating valve to the fuel delivery line. The module incorporates a jet pump which draws fuel from the front of the tank and delivers it directly into the swirl pot.

Fuel Level Sensors

Two fuel level sensors are installed at either end of the tank. One is mounted on the fuel pump module, the other is mounted in a central position on the internal carrier within the tank. The sensors are a MAPPS (magnetic passive position sensor) which provide a variable resistance to ground for the output from the fuel gauge. The sensor is sealed from the fuel preventing contamination of the contacts, increasing reliability. The fuel level sensors are connected to an electrical connector on the underside of the fuel pump module flange.

The sensor comprises a series of 51 film resistors mounted in an arc on a ceramic surface. The resistors are wired in series with individual contacts. A soft magnetic foil with 51 flexible contacts is mounted a small distance above the film resistors. A magnet, located below the ceramic surface, is attached to the sender unit float arm. As the float arm moves, the magnet follows the same arc as the film resistors. The magnet pulls the flexible contacts onto the opposite film resistor contacts forming an electrical circuit.

E44504

Item	Part Number	Description
1	-	Magnetic foil
2	-	Spacer
3	-	Ceramic surface
4	-	Magnet
5	-	Resistance film

The film resistors are arranged in a linear arc with resistance ranging from 51.2 to 992.11 Ohms. The electrical output signal is proportional to the amount of fuel in the tank and the position of the float arm. The measured resistance is processed by the instrument cluster to implement an anti-slosh function. This monitors the signal and updates the fuel gauge pointer position at regular intervals, preventing constant pointer movement caused by fuel movement in the tank due to cornering or braking.

A warning lamp is incorporated in the instrument cluster and illuminates when the fuel level is low.

The fuel level sender signal is converted into a CAN (controller area network) message by the instrument cluster as a direct interpretation of the fuel tank contents in liters.

In the event that fuel is allowed to run too low, signals transmitted from the fuel level sensors initiate the fuel run-dry strategy. The driver will be notified before the tank is run critically low on fuel. Although this is a simulated run-dry procedure, it provides the symptoms of the vehicle running out of fuel and the driver will perceive it as such. The engine will stop when there is approximately 4 liters (0.87 gallons) of fuel remaining in the fuel tank.

Jet Pumps

The fuel system incorporates twin jet pumps which are integral with the fuel pump module. One jet pump collects fuel from the rear of the tank, and the other draws additional fuel from the front of the tank through a suction line that is mounted on the carrier. The jet pump operates on a venturi effect created by the fuel at pump output pressure passing through the jet pump.

The prime function of the jet pump is to collect fuel from the front of the tank and transfer it into the fuel pump module swirl pot at the rear of the tank. The jet pump feature ensures that fuel is drained from the front of the tank before fuel run-out at the rear of the tank.

Fuel Cut-Off Elbow

The fuel cut-off elbow is located in the upper half of the tank on the carrier and is connected to the tank breather. The main purpose of the fuel cut-off elbow is to control the fill volume of the tank. During filling air, trapped inside the tank and a small amount of vapor is passed via the fuel cut-off elbow to the tank breather. The air and vapor mix then vents to atmosphere through the breather. During filling, when the tank reaches its full level, the fuel cut-off elbow closes and prevents air/vapor passing through to the tank breather. The resulting back pressure causes refueling to stop automatically.

The fuel cut-off elbow is always open when the fuel tank is below full, providing an unrestricted air/vapor outlet to the tank breather.

FUEL FILTER

E122448

Item	Part Number	Description
1	-	Mounting bracket
2	-	Pipe - Fuel return from fuel cooler
3	-	Pipe - Fuel supply to high pressure fuel pump
4	-	Pipe - Fuel supply to Fuel Burning Heater (FBH)
5	-	Electrical connector
6	-	Water drain
7	-	Fuel filter
8	-	Fuel return to tank connection
9	-	Fuel supply from tank connection

The fuel filter assembly is located in front of the fuel tank and is mounted on a bracket which is attached to the top face of the transfer box chassis cross member. The fuel filter assembly comprises a bracket, filter housing and the filtration element. The filter housing is secured to the bracket with 3 bolts. The bracket is secured to the cross member with 2 bolts which are screwed into threaded holes in the cross member.

The filter housing has an inlet and outlet which allow for the attachment of hoses using quick release connectors. The filter element is located on the underside of the housing and can be removed by rotating one quarter turn to release from the housing.

The filter element has a capacity of 200 cm³ (12.2 in³). The filtration element can filter particulate matter larger than 15 microns. A water drain valve is located on the base of the filter. The filter can be purged of water by partially unscrewing the drain valve and allowing at least 84 cm³ (5.12 in³) of fuel to drain into a suitable container. The drain plug has a centre outlet which allows for the attachment of a drain hose.

The filter element also has a water sensor located in its base. The sensor is screwed into a threaded hole in the base of the element. When the filter is replaced at service, the sensor can be unscrewed from the element and installed in the new element. The sensor has an electrical connector located at the side of the element which can be disconnected to assist element removal.

The water sensor is connected to the Engine Control Module (ECM). When the water in the element reaches 64 cm³ (3.9 in³) the ECM issues a high speed Controller Area Network (CAN) bus message to the instrument cluster to display a 'WATER IN FUEL' message in the message center.

FUEL FILLER PIPE

E122449

Item	Part Number	Description
1	-	Lanyard
2	-	Filler cap
3	-	Bracket
4	-	Pipe - Rear differential breather (Reference only)
5	-	Pipe - Fuel vapor vent
6	-	Fuel filler pipe
7	-	Hose - connection to fuel tank

The stainless steel filler neck has a wide bore neck specially designed to reduce diesel frothing while the fuel tank is being replenished. The filler pipe is connected at its lower end to the fuel tank by a hose which is secured to the pipe with a worm drive clamp. The opposite end of the hose is connected to the fuel tank inlet check valve and secured with another worm drive clamp.

A fuel vapor vent pipe is attached to the filler pipe and connects between the fuel level vent valve in the fuel tank and fuel filler pipe neck.

The filler head incorporates the Fuel Guard system to prevent accidental filling of the tank with petrol (gasoline).

Fuel Guard System

E117721

Item	Part Number	Description
1	-	Filler neck
2	-	Flap
3	-	Reset slots
4	-	Spigots
5	-	Reset tool
6	-	Spring

The fuel guard system comprises a mechanically operated flap which is triggered when the smaller diameter filler nozzle tube, used on petrol (gasoline) pumps, is inserted in the filler neck. The flap is actuated and blocks the sensor port on the fuel pump nozzle, causing it to automatically switch off. The flap is locked in this position by a latch mechanism.

A reset tool is provided and stored in the luggage compartment. The tool is used to reset the fuel guard device if triggered and release the latch. Two spigots on the tool locate in slots in the filler neck which release a latch and the flap is opened by its own spring. The tool is located in the filler neck and once the two spigots on the tool are located in the slots it can be pulled outwards, releasing a latch and allowing the flap to be opened by its own spring pressure. The tool is stored on the battery mounting clamp.

The flap is colored yellow so that it is clearly visible when activated and has a 'Handbook' symbol on it.

A diesel fuel pump nozzle will not activate the fuel guard because the nozzle stops against two molded lugs. However, if an unleaded gasoline pump nozzle is inserted into the housing, its smaller diameter allows it to pass the two molded lugs. The nozzle strikes two pins on the inside of the filler housing which move forward. This movement rotates the shut-off flap which is then held in place when the nozzle is removed by the latch mechanism.

NOTE: Russian markets do not use the fuel guard system and are fitted with a conventional filler neck.

FUEL COOLER

E122450

Item	Part Number	Description
1	-	Coolant outlet
2	-	Pipe - cooler to fuel filter
3	-	Pipe - HP pump to cooler
4	-	Coolant inlet
5	-	Fuel cooler

The fuel cooler uses engine coolant, direct from the lower part of the radiator, to cool fuel returning to the tank from the HP injection pump.

The fuel cooler is located on the right hand side of the chassis, at the rear of the engine, near to transmission cooler. A bracket, which is attached to the right hand chassis rail, provides for the attachment of the cooler. The bracket has two slots which accept two plastic pegs which are attached to the cooler. A bolt is inserted through a hole in the bracket and screws into a captive nut on the cooler to positively secure the cooler to the bracket.

The cooler has four quick fit connector pipes which provide for the attachment of the fuel inlet hose from the HP injection pump, the fuel outlet hose to the fuel filter, the coolant inlet hose from the radiator and the coolant outlet hose to the coolant thermostat housing. The coolant pipes can be identified by their smaller diameter.

OPERATION

Diesel fuel is drawn from the tank by the internal electric lift pump. The fuel pressure regulator located in the fuel pump module assembly regulates the delivery pressure at approximately 0.5 bar to the transfer pump housed in the High Pressure (HP) pump. A VCV (volume control valve) governs the amount of fuel supplied to the HP pump.

The transfer and high pressure pump are driven directly by the engine. Due to the storage volume of the common rail, the injection pressure will remain practically constant over the complete duration of the injection process.

The HP pump has a return pipe circuit which is separate from the injector return pipes. For additional information, refer to: Fuel Charging and Controls (303-04C, Description and Operation).

Fuel Tank and Lines - TDV6 3.0L Diesel - Fuel Tank and Lines

Description and Operation

WARNING: The weight of the armoured components fitted to the vehicle are far in excess of those fitted to the standard vehicle. Therefore, always be aware of the weight of components and have suitable lifting equipment available before attempting to remove any component from the vehicle.

Fuel tank armoured casing

E102919

To protect the vehicle's fuel supply the fuel tank is enclosed in an armoured casing. The casing can be removed to gain access to the fuel tank.

Fuel Tank and Lines - TDV6 3.0L Diesel - Fuel Tank and Lines

Diagnosis and Testing

Principle of Operation

For a detailed description of the fuel tank and lines system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Fuel Tank and Lines (310-01 Fuel Tank and Lines - TDV6 3.0L Diesel, Description and Operation).

Inspection and Verification

WARNINGS:

Do **NOT** carry out any work on the fuel system with the engine running. The fuel pressure within the system can be as high as 2000 bar (29,008 lb/in²). Failure to follow this instruction may result in personal injury.

Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

After carrying out repairs, the fuel system must be checked visually for leaks. This should be done after the engine has been run, but with the engine switched **OFF**. Failure to follow this instruction may result in personal injury.

If taken internally, **DO NOT** induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

CAUTIONS:

Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

The fuel pipes between the injectors and the rail must be discarded after each use, and new pipes installed. Failure to follow this instruction may result in damage to the vehicle.

It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

Make sure that the workshop area in which the vehicle is being worked on is as clean and dust-free as possible. Areas in which work on clutches, brakes or where welding or machining are carried out are not suitable in view of the risk of contamination to the fuel system. Failure to follow this instruction may result in damage to the vehicle.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

Make sure that any protective gloves worn are new and are of the non-powdered latex type. Failure to follow this instruction may result in damage to the vehicle.

Make sure that clean, non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid prior to starting work on the vehicle. Failure to follow this instruction may result in damage to the vehicle.

Use a steel-topped work bench and cover it with clean, lint-free, non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern
2. Visually inspect for obvious signs of damage and system integrity

Removal and Installation

Removal

WARNINGS:

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install new blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 CAUTION: Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 NOTE: Removal steps in this procedure may contain installation details.

-  WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

- Refer to: Engine Undershield (501-02, Removal and Installation).

-  WARNING: Fluid loss is unavoidable, use absorbent cloth or a container to collect the fluid.

-  CAUTION: Always plug any open connections to prevent contamination.

Torque: 23 Nm

Installation

-  CAUTION: Remove and discard all blanking caps.

To install, reverse the removal procedure.

2. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank.

Fuel Tank and Lines - TDV6 3.0L Diesel - Fuel Filter Element

Removal and Installation

Removal

WARNINGS:

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

 If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

 Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

 The spilling of fuel is unavoidable during this operation. Make sure that all necessary precautions are taken to prevent fire and explosion.

CAUTIONS:

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the transmission undershield.
 - Remove the 6 bolts.

-  **WARNING:** Observe due care when working near a hot exhaust system.

Remove the fuel filter heat shield.

- Remove the 3 bolts.

4.  **CAUTION:** Make sure the water-in-fuel sensor remains in the aligned position.

Drain the fuel filter element.

- Position a container to collect the fluid spillage.
- Loosen the nut.
- Attach a suitable drain tube to the water-in-fuel sensor drain port.
- Remove the drain tube.
- Tighten the nut.

5.  **CAUTION:** Make sure that the area around the component is clean and free of foreign material.

Remove the fuel filter element.

- Disconnect the water-in-fuel sensor electrical connector.

6. Remove the water-in-fuel sensor.

- Discard the fuel filter element.

7. Remove and discard the O ring seals.

E138941

Installation

1. Install new O ring seals.

E138940

2.  CAUTION: Make sure that the mating faces are clean and free of foreign material.

 NOTE: Make sure that the water-in-fuel

E138603

sensor is aligned with the drain arrow.

Install the water-in-fuel sensor.

- Remove and discard the water-in-fuel drain plug from the new fuel filter element.

E138939

3.  CAUTION: Make sure the water-in-fuel sensor remains in the aligned position.

Tighten the plastic nut to 1.6 Nm.

4.  NOTE: Make sure that the fuel filter element is correctly aligned. Failure to follow this instruction may result in damage to the vehicle.

Install the fuel filter element.

1. Insert the fuel filter with the the lock symbol arrow aligned with the inlet pipe on the fuel filter housing.

E138604

E138605

5.  **NOTE:** Make sure that the fuel filter element is correctly aligned. Failure to follow this instruction may result in damage to the vehicle.

Rotate to tighten and seal the fuel filter element.

1. When tightened correctly, the lock symbol arrow should be aligned with the arrow symbol on the fuel filter housing.
- Connect the water-in-fuel sensor electrical connector.
- Remove the container.

6. Install the fuel filter heat shield.
 - Tighten the bolts to 6 Nm.
7. Install the transmission undershield.
 - Tighten the bolts to 10 Nm.
8. Carry out the low-pressure fuel system bleeding.

OVERVIEW

The major components of the V6 3.0L SC (supercharged) fuel system comprises of a fuel tank, a fuel pump module, a fuel filler assembly and two fuel level sensors.

The V6 3.0L SC fuel system uses a returnless fuel system which comprises a fuel pump mounted in the fuel tank to deliver fuel at a variable flow and pressure to the engine mounted HP (high pressure) fuel pumps which supply fuel to the fuel rails and to all the fuel injectors.

The fuel pump operation is regulated by a [FPDM \(fuel pump driver module\)](#) which is controlled by the [ECM \(engine control module\)](#). The FPDM regulates the flow and pressure supplied by controlling the operation of the fuel pump using a [PWM \(pulse width modulation\)](#) output.

The fuel rails and the injectors are described in Fuel Charging and Controls – V6 3.0L SC

For additional information, refer to: [Fuel Charging and Controls](#) (303-04C Fuel Charging and Controls - V6 S/C 3.0L Petrol, Description and Operation).

Fuel system evaporative emission control is described in Evaporative emissions - V6 3.0L SC

For additional information, refer to: [Evaporative Emissions](#) (303-13 Evaporative Emissions - V6 S/C 3.0L Petrol, Description and Operation).

COMPONENT DESCRIPTION

Fuel Tank

The fuel tank is located on the right side of the vehicle, between the transmission and the right chassis longitudinal. The tank is located on a mounting cradle which secures the whole fuel tank assembly to the vehicle. The tank has a useable capacity of 86.0 liters (19 gallons).

The tank is a sealed unit with the only internal access being via the fuel pump module flange aperture on the top of the tank.

The flange is fitted with a locking ring and seal. The seal locates in a groove on the tank. The locking ring locates and clamps on the encapsulated ring that is moulded into the fuel tank. The flange has a tag which locates in the top of the tank to ensure correct orientation.

The flange has six pin internal and external connectors which provide for electrical connections for the level sensors and the fuel pump. A quick release connector provides for the connection of the fuel delivery line.

A carrier within the tank provides for the mounting of the fuel suction tube, vent valve, and the front fuel level sensor.

The fuel pump module is mounted on a bayonet lock ring which is welded inside the fuel tank. The fuel pump module comprises the fuel pump, jet pumps, the pump inlet filter and the fuel PRV (pressure relief valve). The rear fuel level sensor is also mounted on the side of the pump module body.

The PRV (pressure relief valve) assists engine starting by retaining a pre-set fuel pressure in the fuel supply pipe and the fuel rails. The valve also limits fuel rail pressure due to temporary vapor increase in hot conditions and pressure caused by sudden load changes; a fully open to closed throttle transition, for example.

Only the fuel pump module assembly, the fuel level sensors and the flange are available as serviceable components, the individual assembly components are not available separately.

Fuel Pump Module

E 122738

Item	Part Number	Description
1	-	Fuel delivery outlet connection
2	-	Vent pipe connection
3	-	Electrical connector
4	-	Locking ring
5	-	Pressure relief valve
6	-	Suction pipe connection
7	-	Fuel pick-up filter
8	-	Fuel pump
9	-	Rear fuel level sensor
10	-	Fuel filter

The fuel pump module is located inside the fuel tank and comprises three main components; a fuel pump, a remote fuel pick-up and a top flange assembly.

Fuel Pump

The fuel pump is a variable-speed rotary-vane type, which operates in a fuel pump module located at the rear of the fuel tank. A venturi transfer pump is also located in the rear of the tank. The fuel pump module is secured in the fuel tank with a bayonet style locking ring that is welded into the tank structure. The fuel pump module has an integral top plate for the external pipe work and electrical connectors.

The fuel pump delivers fuel at a maximum pressure of 630 kPa (6.3 bar; 91.4 lbf/in.²) to the filter bowl in the top flange.

The electric pump is located in a plastic swirl pot which collects fuel from the base of the fuel tank via a filter. The swirl pot acts as a fuel reserve, providing a constant supply of fuel to the fuel pump irrespective of fuel quantity or

vehicle attitude. When the vehicle is level the swirl pot contains approximately 275 cm³ (16.8 in³) of fuel when the engine is running. The jet pump ensures that fuel is constantly supplied to the swirl pot to provide a sufficient fuel delivery for the pump. A one way valve is located in the base of the swirl pot. The valve allows fuel from the tank to enter the swirl pot, but prevents it from escaping.

The fuel level sensor for the rear of the tank is attached to the outside of the swirl pot.

The fuel pump module is a serviceable component and access to the pump is by removal of the top flange.

Remote Fuel Suction Jet and Level Sensor Assembly

The remote fuel suction jet is located in the front of the fuel tank. The fuel suction jet is attached to the internal carrier which is secured inside the fuel tank.

The fuel system incorporates 2 jet pumps. The jet pumps are integrated into the fuel pump module and draw fuel from the front and rear of the fuel tank. A suction pipe is connected to the fuel suction jet that is located in the front of the tank that allows fuel to be drawn from the front of the tank, delivering fuel into the swirl pot via the suction pipe connection on the pump body. The jet pump operates on a venturi effect created by the fuel at pump output pressure passing through the jet pump.

The fuel level sensor for the front of the fuel tank is attached to the carrier frame. The fuel suction jet and the level sensor are serviceable components and access is by removal of the flange cover on the top rear of the fuel tank.

Top Flange Assembly

The top flange is located on the top of the fuel tank. The flange assembly is sealed in the tank with a with a sealing ring. A locking ring secures the flange assembly in the tank and requires a special tool for removal.

The outer surface of the flange has 1 fuel feed outlet with a quick-fit connection. The connection is for the fuel delivery line outlet to the engine mounted fuel pumps. An electrical connector is located adjacent to the pipe connections and provides the electrical interface to the fuel pump and the level sensors. A breather connection allows the fuel tank to breathe and connects the fuel tank to the fuel filler and charcoal canister systems.

On the underside of the flange, inside the tank, is a moulded housing which contains the non-serviceable fuel filter. Fuel from the fuel pump enters the base of the housing and passes through the filter before exiting the tank to the engine mounted fuel pumps. An electrical connection on the base of the filter housing provides a ground for the filter.

Fuel Pump Driver Module (FPDM)

E122739

Item	Part Number	Description
1	-	Fuel Pump Driver Module (FPDM)
2	-	Mounting bracket
3	-	Electric connector

The **FPDM** is located in the left side of the luggage compartment, above the left wheel arch, behind the trim panel. The FPDM is located on a bracket and secured with 2 bolts and nuts.

The fuel pump operation is regulated by the FPDM which is controlled by the **ECM**. The FPDM regulates the flow and pressure supplied by controlling the operation of the fuel pump using a **PWM** output.

The FPDM is powered by a supply from the fuel pump relay in the [EJB \(engine junction box\)](#). The fuel pump relay is energized on opening the driver's door or when power mode 9 engine crank is initiated using the stop/start button. The FPDM supplies power to the fuel pump, and adjusts the power to control the speed of the fuel pump and thus the pressure and flow in the fuel delivery line.

A [PWM](#) signal from the ECM tells the FPDM the required speed for the fuel pump. The on time of the PWM signal represents half the fuel pump speed, e.g. if the PWM signal has an on time of 50%, the FPDM drives the pump at 100%.

The FPDM will only energize the fuel pump if it receives a valid PWM signal, with an on time of between 4% and 50%. To switch the fuel pump off, the ECM transmits a PWM signal with an on time of 75%.

The output pressure from the fuel pump will change with changes of engine demand and fuel temperature. The ECM monitors the input from the LP (low pressure) fuel sensor and the FRPT (fuel rail pressure and temperature) sensor and adjusts the speed of the fuel pump as necessary to maintain a nominal output pressure of 450 kPa (4.5 bar; 65.3 lbf/in.²), except during engine start-up. At engine start-up the target pressure for the fuel delivery line is 630 kPa (6.3 bar; 91.4 lbf/in.²).

If the [SRS \(supplemental restraint system\)](#) outputs a crash signal on the HS (high speed) [CAN \(controller area network\)](#) bus, the ECM de-energizes the fuel pump relay to prevent any further fuel being pumped to the engine.

If the ECM does not detect pressure in the fuel delivery line, it stops, or refuses to start the engine and stores the appropriate [DTC \(diagnostic trouble code\)](#).

The ECM receives a monitoring signal from the FPDM. Any DTC's produced by the FPDM are stored by the ECM.

DTC's can be retrieved from the ECM using an approved Land Rover diagnostic system. The FPDM itself cannot be interrogated by the approved Land Rover diagnostic system.

Fuel Level Sensors

Two fuel level sensors are used in the fuel tank to measure the amount of remaining fuel in the front and rear of the fuel tank. The front level sensor is attached to the internal carrier and the rear level sensor is attached to the fuel pump swirl pot. The sensors are connected to the vehicle wiring harness via a connector on the outer face of the top flange assembly.

The sensors are a MAPPS (MAGnetic Passive Position Sensor) which provides a variable resistance to ground for the output from the fuel gauge. The sensor is sealed from the fuel preventing contamination of the contacts and increasing reliability. The front and rear fuel level sensors are connected to the external electrical connector on the flange via the connectors on the underside of the fuel pump module flange.

The sensor comprises a series of 51 film resistors mounted in an arc on a ceramic surface. The resistors are wired in series with individual contacts. A soft magnetic foil with 51 flexible contacts is mounted a small distance above the film resistors. A magnet, located below the ceramic surface, is attached to the sender unit float arm. As the float arm moves, the magnet follows the same arc as the film resistors. The magnet pulls the flexible contacts onto the opposite film resistor contacts forming an electrical circuit.

Sensor Operating Principle

E44504

Item	Part Number	Description
1	-	Magnetic foil
2	-	Spacer
3	-	Ceramic surface
4	-	Magnet
5	-	Resistance film

The film resistors are arranged in a linear arc with resistance ranging from 51.2 to 992.11 Ohms. The electrical output signal output is proportional to the amount of fuel in each side of the tank and the position of the float arms. The measured resistance is processed by the instrument cluster to implement an anti-slosh function. This monitors the signal and updates the fuel gauge pointer position at regular intervals, preventing constant pointer movement caused by fuel movement in the tank due to cornering or braking.

A warning indicator is incorporated in the instrument cluster and illuminates when the fuel level is at or below 10 liters (2.64 US gallons).

The fuel level sender signals are converted into a CAN bus message by the IC (nstrument cluster) as a direct

interpretation of the fuel tank contents in liters. The ECM uses the CAN bus message to store additional OBD (on-board diagnostic) P Codes for misfire detection when the fuel level is below a predetermined capacity.

Fuel Filler Pipe and Tank Breather Assembly

Fuel Filler Pipe Assembly - NAS Vehicles Only

E 122741

Item	Part Number	Description
1	-	Liquid Vapor Separator (LVS)
2	-	Pipe - fuel vapor vent
3	-	Filler cap lanyard
4	-	Filler cap
5	-	Bracket
6	-	Charcoal canister breather/dust filter
7	-	Pipe - breather
8	-	Pipe - fuel vapor vent
9	-	Pipe - fuel vapor to charcoal canister
10	-	Charcoal canister
11	-	Pipe - rear differential breather (Reference only)
12	-	Pipe - fuel vapor connection
13	-	Hose - fuel filler pipe to fuel tank spit back flap
14	-	Pipe - fuel filler
15	-	Pipe - fuel vapor to purge valve (part of fuel tank assembly)
16	-	Diagnostic Tank Monitoring Leakage (DMTL) pump

The fuel filler head is positioned at the rear of the vehicle, above the right rear wheel. The filler head and cap is covered by a moulded plastic cover which is electrically locked when the vehicle is locked.

The filler cap is a conventional screw in type which is secured to the vehicle with a lanyard. The filler cap must be securely fitted to ensure that the tank venting system is sealed. The cap has a locking mechanism which gives an audible click when the cap is correctly tightened.

Failure to correctly secure the filler cap will result in vapor being lost from the system. On NAS Vehicles, if the cap is incorrectly secured when the ECM operates the DMTL (diagnostic monitoring tank leakage) system, the loss of vapor will be detected as a leak and the MIL (malfunction indicator lamp) lamp will be illuminated.

A connection on the rear of the filler head allows for the connection of the fuel tank breather pipe from the vapor separator on ROW vehicles and from the roll over valves on NAS vehicles.

The fuel filler pipe locates in the tank and incorporates a spitback flap in the tank end of the pipe. The flap is a spring loaded cover which acts as a 1-way valve, allowing the tank to be filled but preventing fuel leaving the tank into the filler pipe.

All vehicles have a charcoal canister breather pipe which is connected from the charcoal canister and is routed alongside the fuel filler pipe to the filler head. The filler head end of this pipe is connected differently depending on market as follows:

- On ROW vehicles the breather pipe is fitted with a mesh and allows fresh air to be drawn into the charcoal canister when fuel vapor is being purged from the system.
- On NAS vehicles the breather pipe is connected to the DMTL pump. Fresh air is drawn into the pipe via a DMTL filter integral with the pump when fuel vapor is being purged from the system. When the DMTL system is active, the breather pipe is closed by the pump, sealing the system and allowing the system to be pressure checked for leakage.

For information on the charcoal canister and purging system refer to the evaporative emissions section.

For additional information, refer to: [Evaporative Emissions](#) (303-13 Evaporative Emissions - V6 S/C 3.0L Petrol, Description and Operation).

A second pipe is routed alongside the charcoal canister breather pipe. On ROW vehicles, this pipe is the fuel tank breather pipe from the vapor separator and is connected into the fuel filler pipe near to the filler head. On NAS vehicles, this pipe is smaller in diameter and also serves as the fuel tank breather pipe. The pipe is not connected to the vapor separator but allows fuel vapor from the right hand roll over valve to vent into the connection with the fuel filler pipe near to the filler head.

A pipe is routed across the top of the tank in front of the vapor separator. This pipe connects the charcoal canister to the purge valve located in the engine compartment.

Low Pressure (LP) Fuel Sensor

E112870

The LP (low pressure) fuel sensor supplies a pressure signal to the ECM to enable closed loop control of the fuel pump. The LP fuel sensor is installed in a manifold in the fuel delivery line. The manifold is mounted to the rear chassis rail, in front of the fuel tank.

OPERATION

The fuel pump is a variable-speed rotary-vane type, which operates in a fuel pump module located in the fuel tank. The fuel pump module has an integral top plate for the external pipe work and electrical connectors.

Fuel level is biased towards the rear of the fuel tank by drawing fuel from the front of the tank via the jet pump, which serves to deliver a constant supply of fuel to the swirl pot. High pressure fuel from the fuel pump is directed through the jet pump's orifice, creating a low pressure area to be formed in the cross over pipe. The fuel is drawn into this low pressure area in the cross over pipe and directed into the swirl pot delivery pipe.

Fuel is pumped from the fuel pump to the two engine mounted HP fuel pumps via the integral filter and pressure relief valve.

The pressure relief valve assists engine starting by retaining a pre-set fuel pressure in the supply pipe and fuel rail. The pressure relief valve also limits fuel rail pressure due to temporary vapor increase in hot conditions and pressure caused by sudden load changes, for example, a fully open to closed throttle transition.

To meet emission requirements, the fuel tank and associated components are designed to minimize fuel vapor loss during refueling. This is achieved by preventing fuel vapor from the fuel tank venting directly to the atmosphere. Instead fuel vapor is directed into the charcoal canister where it is stored before being purged at intervals to the engine's intake manifold.

North American Specification (NAS) vehicles feature additional connections and pipes at the rear of the filler head and also incorporates a Diagnostic Monitoring Tank Leakage (DMTL) pump for leak detection requirements.

Diagnosis and Testing

Principle of Operation

For a detailed description of the fuel tank and lines system and operation, refer to the relevant description and operation section of the workshop manual. REFER to: Fuel Tank and Lines (310-01A, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

1. Verify the customer concern
2. Visually inspect for obvious signs of mechanical or electrical damage

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Fuel level • Fuel leaks • Damaged fuel lines • Damaged push connect fittings • Fuel contamination/grade/quality • Throttle body • Damaged fuel tank filler pipe cap • Damaged fuel tank filler pipe 	<ul style="list-style-type: none"> • Fuses • Loose or corroded electrical connectors • Harnesses • Sensor(s) • Engine control module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, check for diagnostic trouble codes (DTCs) and refer to the DTC index

Symptom Chart

Symptom	Possible Causes	Action
Engine cranks, but does not fire	<ul style="list-style-type: none"> • Engine breather system disconnected/restricted • Ignition system • Fuel system • Electronic engine control 	Ensure the engine breather system is free from restriction and is correctly installed. Removal and Installation

Removal

WARNINGS:

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

NOTE: Removal steps in this procedure may contain installation details.

1. Remove the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

2. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. For additional information, refer to: Fuel Tank Draining (310-00, General Procedures).
4. For additional information, refer to: Fuel Filler Door Assembly (501-03, Removal and Installation).
5. Remove the RH rear wheel and tire.
 - TORQUE: 140 Nm

6. Remove the fender splash shield.

E48478

7.

8.  **NOTE:** Discard the retaining clip.

Remove the tamper proof cover from the fuel tank filler pipe hose clip.

9.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

WARNINGS:

After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow this instruction may result in personal injury.

After the fuel tank drain is complete always fit the sealing covers over the drain ports. Failure to do so will mean that fuel vapor can escape.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

CAUTION: Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: Petrol and Petrol-Ethanol Fuel Systems Health and Safety Precautions (100-00, Description and Operation).

2. Disconnect the battery ground cable.

Refer to: Specifications (414-00, Specifications).

Speed Control - TDV6 3.0L Diesel - Speed Control

Description and Operation

3.0L V6 DIESEL SPEED CONTROL COMPONENT LOCATION

E124127

Item	Part Number	Description
1	-	Anti-lock Brake System (ABS) module
2	-	Accelerator Pedal Position (APP) sensor
3	-	Brake switch
4	-	Instrument cluster
5	-	Speed control switches
6	-	Engine Control Module (ECM)
7	-	Electric throttle
8	-	Transfer box control module

GENERAL

The speed control system maintains a set speed selected by the driver until operation is suspended or cancelled by a further input from the driver and is controlled by the Engine Control Module (ECM).

The system has the following components:

- A set + switch
- A - switch
- A RESUME switch

- A CANCEL switch.

The system uses the following vehicle systems:

- The ECM
- The brake switch
- The Accelerator Pedal Position (APP) sensor.

DESCRIPTION

Speed Control Switches

E 124128

Item	Part Number	Description
1	-	Set '+' increase the speed
2	-	Decrease '-' the speed
3	-	Resume set speed
4	-	Cancels without erasing memorized speed

Instrument Cluster Warning Indicator

E124129

Item	Part Number	Description
1	-	Speed control warning indicator

The speed control switches are located on the Left Hand (LH) side of the steering wheel. The switches are connected via fly leads to the clock spring. The speed control switches are resistive ladder type switches which vary the resistance of a 5 volt signal sent to them. The signal is returned along a Local Interconnect Network (LIN) bus to the instrument cluster. The instrument cluster routes the control signals to the Engine Control Module (ECM) on the high speed Controller Area Network (CAN) bus.

Speed control is engaged by pressing the set/increase switch. Once engaged the speed can be varied by the speed adjustment switches. Each press of the speed adjustment switches (+/-) will increase or decrease the set speed in

steps of 1 mph (2 kph).

Accelerate/Decelerate (+/-) Switches

The Set + switch is used to activate the speed control system and set the speed control at the current vehicle speed. A speed control warning indicator will illuminate on the instrument cluster to advise the driver that the system is active. The switch can be pressed to adjust the set speed. Each single press of the switch increases the vehicle speed by 1 mph (2 km/h). If the switch is pressed and held the vehicle speed will increase and once the switch is released the attained vehicle speed will be maintained.

The vehicle speed can be increased by using the accelerator pedal. When the accelerator pedal is released the vehicle speed will reduce to the previously set speed. When the vehicle speed is increased by use of the accelerator pedal, the message 'Cruise Override' will be displayed in the instrument cluster message center. This method can also be used to increase the vehicle set speed; once the required increase in speed is achieved, a single press of the Set + switch will maintain that speed as the new set speed.

NOTE: If the accelerator pedal is pressed for more than 5 minutes, the speed control is cancelled.

The '-' switch can be used to decrease the vehicle set speed. The speed can be reduced by pressing and holding the switch until the required set speed is reached. When the switch is released the current speed will become the new set speed. A single press of the '-' switch will decrease the vehicle speed by 1 mph (2 km/h).

Cancel Switch

Speed control can be suspended temporarily or switched off by a single press of the Cancel switch. When the switch is pressed the speed control warning indicator in the instrument cluster is extinguished and the message 'Cruise Cancelled' is displayed in the message center.

Speed control can also be suspended if the brake pedal is pressed, if the transmission selector lever is moved to the neutral position or if Hill Descent Control (HDC) or Dynamic Stability Control (DSC) become active.

Once suspended, the cruise control can be resumed at the previously set speed by pressing the resume switch.

NOTE: The set speed is not removed from the memory when the cancel switch is pressed. The set speed is only erased when the ignition is off.

Resume Switch

The resume speed is used to re-activate the speed control system at the previously set speed after the speed control has been cancelled or suspended.

OPERATION

Speed Control

The speed control system is integrated with the engine management system and uses fueling intervention to automatically maintain a set vehicle speed. Once engaged, the system can also be used to accelerate the vehicle without using the accelerator pedal. The speed control system comprises the following components:

- '+' and '-' (set/accelerate and decelerate) steering wheel switches
- Resume switch
- Cancel switch
- Clock spring
- Speed control warning lamp.

The speed control system also uses inputs from the brake pedal switch, the APP sensor, the ECM and the ABS module.

The speed control is operated by the driver using only the steering wheel switches. When speed control is active, the ECM regulates the Pulse Width Modulation (PWM) signals to the fuel injectors to adjust the fuel supply as required to maintain the set speed.

During speed control operation, the ECM controls vehicle speed by adjusting fuel injection duration and timing. When the accelerator pedal is pressed with speed control active, the ECM outputs a calculated throttle angle signal in place of the actual throttle angle signals produced by the APP sensor. The calculated throttle angle is derived from fuel demand.

The minimum set speed for speed control is 20 mph (32 km/h). Speed control is automatically suspended if the following conditions apply:

- Vehicle speed falls below 20 mph (32 km/h).
- The brake pedal is pressed
- The cancel button is pressed
- Neutral, park or reverse gear is selected
- Certain Terrain Modes are selected (i.e. Rock crawl)
- Low range gear selected
- The difference between actual speed and the set speed is too great
- When the vehicle speed reaches a maximum speed of 150 mph (240 kph)
- If the accelerator pedal is used to accelerate beyond the set speed for too long
- Stability control system intervention
- System error causes shut-off.

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

NOTE: Removal steps in this procedure may contain installation details.

1. Make the air bag supplemental restraint system (SRS) safe.

Refer to: Standard Workshop Practices (100-00, Description and Operation).

2. Disconnect the battery ground cable.

Refer to: Specifications (414-00, Specifications).

3. Refer to: Driver Air Bag Module (501-20, Removal and Installation).

4. Torque: 1.5 Nm

- 5.

For additional information, refer to: [External Controls](#) (307-05 Automatic Transmission/Transaxle External Controls - TDV6 3.0L Diesel /V6 S/C 3.0L Petrol , Vehicles With: 8HP70 8-Speed Automatic Transmission AWD, Description and Operation).
 - [TCM \(transmission control module\)](#).
For additional information, refer to: [Transmission Description](#) (307-01 Automatic Transmission/Transaxle - TDV6 3.0L Diesel /V6 S/C 3.0L Petrol , Vehicles With: 8HP70 8-Speed Automatic Transmission AWD, Description and Operation).
 - IC (instrument cluster).
For additional information, refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).

During speed control operation, the ECM controls vehicle speed by adjusting the engine throttle and fuel injection.

DESCRIPTION

Standard Speed Control

Speed Control Switch

E160606

Item	Part Number	Description
1	-	Set + (engage/accelerate) switch
2	-	RES (resume) switch
3	-	- (decelerate) switch

The speed control switches are located on the left steering wheel switchpack. The switches are resistive ladder type switches which vary the resistance of a 5 volt signal sent to them. The resistive ladder is wired to a LIN (local interconnect network) node which transmits the data to the IC (instrument cluster) via the clockspring. The IC then transmits the data to the ECM on the HS (high speed) CAN (controller area network) bus.

Instrument Cluster Warning Indicators

Speed Control Warning Indicator

E147363

The speed control warning indicator illuminates when standard speed control is engaged.

OPERATION

For speed control to engage, the vehicle must be in the following configuration:

- Transmission in D (drive).
- Transfer case in high range.
- Terrain Response® in the general (special programs off) or grass/gravel/snow program.
- HDC (hill descent control) off.
- Traveling at 20 mph (32 km/h) or more.

Speed Control

Engage Speed Control

Speed control is engaged by pressing the SET + switch. On receipt of the switch input, the ECM adopts the current vehicle speed as the speed control set speed. When speed control is engaged the IC (instrument cluster) illuminates the speed control warning indicator and the set speed is displayed in the message center.

The set speed is cleared when the ignition is switched off or if the speed control system develops a fault.

Set Speed Adjustment

Once engaged the set speed can be increased by one of 3 methods:

- Press and hold the SET + switch which will cause the vehicle to accelerate. When the switch is released the attained speed will be the new set speed.
- Repeatedly pressing the SET + switch. Each press increases the vehicle speed by 1 mph (2 km/h).
- Use the accelerator pedal to increase the vehicle speed. Once the required speed is reached, a single press of the SET + switch will set the cruise speed.

The set speed can be reduced by pressing and holding the decelerate - switch until the required speed is reached. When the switch is released the speed is reset at that value. The set speed can be reduced incrementally by pressing and releasing the decelerate - switch. Each press will reduce the speed by 1 mph (2 km/h).

Speed control adjustment is limited around the current vehicle speed. This means speed adjustment won't occur when resuming or if the vehicle speed is noticeably different to set speed. This is noticeable when resuming speed control and a large difference exists between the set speed and the current speed. The driver can set a new speed, but can't adjust the old speed.

Suspending Speed Control

Suspending speed control means speed control has been deactivated without loss of the set speed. Speed control is suspended when one of the following occurs:

- Vehicle speed falls below 20 mph (32 km/h).
- The brake pedal is pressed.
- The CANCEL switch is pressed.
- N (neutral), R (reverse) or P (park) is selected on the TCS.

- The EPB (electronic parking brake) is applied.
- If the accelerator pedal is used to accelerate beyond the set speed for too long (more than 5 minutes).
- Engine speed too high (cancel limit set just below red line).
- The ABS control module activates ETC (electronic traction control) or DSC (dynamic stability control).
- HDC (hill decent control) is selected.
- Terrain Response® adopts a special program other than grass/gravel/snow.
- The transfer case is selected to low range.

Resuming Speed Control

A single press of the RES switch will resume speed control at the memorized set speed.

Climate Control System - General Information -

General Specification

Type	Description
Heating, ventilation and air conditioning unit: <ul style="list-style-type: none">• Front unit - Manual version• Front unit Automatic Temperature Control (ATC) version• Rear unit•	<ul style="list-style-type: none">• Centrally mounted with offset (handed) blower unit• Dual zone with side to side temperature control• Located behind right hand rear quarter panel. Includes heater, evaporator, in-line TVX, blower motor and drain tube. Air intake is 100% recirculation.
Compressor	Clutchless, belt driven from engine with electronically controlled outputs.

Climate Control System - General Information - Climate Control System

Diagnosis and Testing

Principle of Operation

For a detailed description of the Climate Control System, refer to the relevant Description and Operation section in the workshop manual. REFER to:

[Air Distribution and Filtering](#) (412-01 Air Distribution and Filtering, Description and Operation),
[Heating and Ventilation](#) (412-02A Heating and Ventilation, Description and Operation),
[Auxiliary Heater](#) (412-02B Auxiliary Heating, Description and Operation),
[Auxiliary Climate Control](#) (412-03C Auxiliary Climate Control, Description and Operation),
[Control Components](#) (412-04 Control Components, Description and Operation).

Inspection and Verification

WARNING: Servicing must be carried out by personnel familiar with both vehicle system and the charging and testing equipment. All operations must be carried out in a well ventilated area away from open flame and heat sources.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern
2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Coolant level • Hose(s) • Coolant pump • Control flap(s) • Duct(s) • Vent(s) • Cabin air filter • Drive belt • Air conditioning compressor • Thermostatic expansion valve • Evaporator • Receiver drier • Air conditioning condenser • Refrigerant pipes • Auxiliary drive belt • Fuel fired booster heater • Fuel fired booster heater fuel pump • Fuel fired booster heater fuel pipes 	<ul style="list-style-type: none"> • Fuse(s) • Wiring harness • Electrical connectors • Blower • Air conditioning compressor • Electric cooling fan • Automatic Temperature Control Module (ATCM) • Refrigerant pressure sensor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index
5. Check DDW for open campaigns. Refer to the corresponding bulletins and SSMS which may be valid for the specific customer complaint and carry out the recommendations as required

Distribution motor self-test

The motor and flap operation can be checked using the on-board distribution motor self-test function.

The self-test can be initiated by pressing and holding the **ECON** and **RECIRC** buttons while turning the ignition switch to the **ON** position.

The control module will then compare the current motor position with the values stored in the module and will indicate an error by flashing the **ECON** LED (light emitting diode).

If there are no errors, the LED will go out and the system will function normally.

To confirm that there are no errors, turn the ignition switch to the **OFF** position, then back to the **ON** position.

Observe the operation of the **programmed defrost** LED.

If there are errors present, the **programmed defrost** LED will flash and the system will attempt to calibrate itself.

Symptom Chart

Pinpoint Tests

PINPOINT TEST A : PRELIMINARY TESTS	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: PRELIMINARY TEST 1	
NOTES:	
	This test is performed with the engine not running.
	Normal pressure for a correctly charged and switched off system is approximately 4.5 bar on both gauges (system equalised).
	1 Close the valves on the air conditioning station
	2 Connect the air conditioning station to the vehicle charging ports
	3 Check the pressure values
	Is a pressure registered on both gauges?
	Yes GO to Pinpoint Test B .
	No GO to Pinpoint Test D .

PINPOINT TEST B : FUNCTIONALITY TESTS	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: FUNCTIONALITY TEST 1	
NOTES:	
	Normal pressures for a correctly charged and working system are 1.0 bar to 2.0 bar (low) and 11.0 bar to 15.0 bar (high).
	Normal temperature (measured at the center air vent) for a correctly charged and working system is -7°C to -2°C when ambient temperature is 20°C.
	1 Close the valves on the air conditioning station
	2 Connect the air conditioning station to the vehicle charging ports
	3 Open all doors and the tailgate
	4 Start the engine
	5 Set the temperature to the lowest setting (all zones)
	6 Set the fan speed to maximum

	7 Set the recirculate switch to off
	8 Insert a temperature probe into the centre air vent
	9 Raise engine speed to 1500rpm and maintain this speed for 5 minutes
	10 Check the temperature value
	11 Check the pressure values
	Are the pressure readings stable and in the green 'normal' region of the gauge? Yes Air conditioning system operating normally No Air conditioning system fault present. GO to Pinpoint Test C.

PINPOINT TEST C : GAUGE TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: GAUGE TEST 1	
	NOTE: This test is performed with the engine running and the air conditioning set to on.
	1 Check the pressure values
	Did the gauges register a change in pressure when the air conditioning was switched on? Yes GO to C2. No Using the manufacturer approved diagnostic system, check the Automatic Temperature Control Module (ATCM) for related DTCs and refer to the relevant DTC index
C2: GAUGE TEST 2	
	NOTE: This test is performed with the engine running and the air conditioning set to on.
	1 Check the pressure values
	Are the pressure gauge readings fluctuating? Yes Moisture present in the air conditioning system. Recover the refrigerant. Install a new receiver drier. Refer to the relevant section of the workshop manual and evacuate and recharge the air conditioning system. GO to Pinpoint Test B. No GO to C3.
C3: GAUGE TEST 3	
NOTES:	
	This test is performed with the engine running and the air conditioning set to on.
	Normal pressures for a correctly charged and working system are 1.0 bar to 2.0 bar (low) and 11.0 bar to 15.0 bar (high).
	1 Check the pressure values
	Are the pressure gauge readings too low? Yes GO to C4. No GO to C6.
C4: GAUGE TEST 4	
	NOTE: This test is performed with the engine not running.
	1 Stop the engine
	2 Using the manufacturer approved refrigerant leak detector, check for a refrigerant leak
	Was a refrigerant leak detected? Yes Refer to the relevant section of the workshop manual and recover the refrigerant. Repair as necessary. Evacuate and recharge the air conditioning system. GO to Pinpoint Test B. No GO to C5.
C5: GAUGE TEST 5	
	NOTE: This test is performed with the engine not running.
	1 Refer to the relevant section of the workshop manual and recover the refrigerant
	Was the weight of the recovered refrigerant less than specified for the air conditioning system? Yes Refer to the relevant section of the workshop manual and evacuate and recharge the air conditioning system. GO to Pinpoint Test B. No Install a new receiver drier. Refer to the relevant section of the workshop manual and evacuate and recharge the air conditioning system. GO to Pinpoint Test B.
C6: GAUGE TEST 6	

NOTES:

This test is performed with the engine running and the air conditioning set to on.

Normal pressures for a correctly charged and working system are 1.0 bar to 2.0 bar (low) and 11.0 bar to 15.0 bar (high).

	1 Check the pressure values Are the pressure gauge readings too high? Yes GO to C7. No Test inconclusive. GO to Pinpoint Test B.
--	--

C7: GAUGE TEST 7

NOTE: This test is performed with the engine **not** running.

	1 Stop the engine 2 Refer to the relevant section of the workshop manual and recover the refrigerant
	Was the weight of the recovered refrigerant more than specified for the air conditioning system? Yes Refer to the relevant section of the workshop manual and evacuate and recharge the air conditioning system. GO to Pinpoint Test B. No Install a new thermal expansion valve. Refer to the relevant section of the workshop manual and evacuate and recharge the air conditioning system. GO to Pinpoint Test B.

PINPOINT TEST D : NITROGEN LEAK TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

D1: NITROGEN LEAK TEST

CAUTION: When charging the system with nitrogen, the pressure should be regulated to 7.0 bar.

NOTE: This test is performed with the engine **not** running.

	1 Charge the air conditioning system with nitrogen 2 Isolate the nitrogen supply 3 Monitor the pressure gauge and check for leaks
	Has the source of the leak been identified? Yes Rectify the leak as necessary. Install a new receiver drier. Refer to the relevant section of the workshop manual and evacuate and recharge the air conditioning system. GO to Pinpoint Test B. No Refer to the relevant section of the workshop manual and evacuate and recharge the air conditioning system. GO to Pinpoint Test B.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Automatic Temperature Control Module \(ATC\)](#) (100-00 General Information, Description and Operation).

Climate Control System - General Information - Air Conditioning (A/C) System Recovery, Evacuation and Charging

General Procedures

WARNING: Servicing must be carried out by personnel familiar with both vehicle system and the charging and testing equipment. All operations must be carried out in a well ventilated area away from open flame and heat sources.

NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure); the system is leaking and refrigerant has been lost to atmosphere; refrigerant circuit has been open more than 24 hours due to repair.

1. **Refrigerant recovery:** Remove the dust covers from the high and low pressure connections.

2. Connect the high and low pressure lines to the appropriate connections.
3. Open the valves on the connections.
4. Turn the valves on the station to the correct positions.
5. Turn the process switch to the correct position.
6. Turn the main switch to 'ON'.

7. **WARNING:** Refrigerant must always be recycled before re-use to ensure that the purity of the refrigerants high enough for safe use in the air conditioning system. Recycling should always be carried out with equipment which is design certified by Underwriter Laboratory Inc. for compliance with SEA J1991. Other equipment may not recycle refrigerant to the required level of purity. R143a Refrigerant Recover Recycling Recharging station must not be used with any other type of refrigerant. Refrigerant R134a from domestic and commercial sources must not be used in motor vehicles air conditioning systems.

Allow the system to recover the refrigerant from the system.

8. Close the valves on the refrigerant station.
9. Turn the main switch 'OFF'.
10. Close the valves on the connections.
11. Disconnect the high and low pressure connections.
12. Install the dust covers to the connectors.
13. Open the tap at the rear of the station to drain the refrigerant oil.
14. Measure and record the quantity of refrigerant oil recovered from the system.

15. Close the tap at the rear of the station.
16. **Evacuation:** Remove the dust covers from the high and low pressure connections.
17. Connect the high and low pressure lines to the appropriate connections.
18. Open the valves on the connections.
19. Turn the valves on the station to the correct positions.
20. Turn the process switch to the correct position.
21. Turn the main switch to 'ON'.
22. Allow the station to evacuate the A/C system.

23. **CAUTION:** The system must be evacuated immediately before recharging commences. Delay between evacuation and recharging is not permitted

Recharging: Close the valves on the refrigerant station.

24. Close the valve on the oil charger.
25. Disconnect the yellow line from the refrigerant station.
26. Remove the cover from the oil charger.
27. Pour the correct quantity of refrigerant oil into the oil charger.
28. Install the cover to the oil charger.
29. Connect the yellow line to the refrigerant station.
30. Open the valve on the oil charger.
31. Move the pointer on the refrigerant gauge to mark the position of the refrigerant drop.
32. Slowly open the correct valve on the refrigerant to allow the vacuum to pull the refrigerant into the system.
33. Close the valve on the refrigerant station when the correct amount of refrigerant has been drawn into the air conditioning system.
34. Turn the main switch 'OFF'.
35. Close the valves on the connections.
36. Disconnect the high and low pressure connections.

Climate Control System - General Information - Air Conditioning (A/C) Compressor Commissioning

General Procedures

Activation

CAUTION: Failure to follow this instruction may result in damage to the component.

1. Set the ignition to the on position, make sure the air conditioning (A/C) is in the off position.
2. Start the engine and allow to run for a minimum of 5 minutes.
3. Set the heater controls to 22°C, with the fan speed set to 75%.
4. Switch on the A/C system.
5. Open all air vents in the dashboard.
6. Run the A/C system for a minimum of 5 minutes, while the engine is still at idle speed.
7. Once this is achieved the compressor is stabilized, with the oil being distributed evenly throughout the system.

This section contains no data

Air Distribution and Filtering - Driver Side Register Trim Panel

Removal and Installation

Removal

E53866

1. Remove the driver side register trim panel.
 - Release the 2 clips.
 - Disconnect the electrical connector.

E53867

2.  **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the register.

- Release the 4 clips.

E49998

3. Remove the headlamp switch.
 - Remove the 4 Torx screws.

Installation

1. Install the headlamp switch.
 - Tighten the Torx screws.
2. Install the register.
 - Secure with the clips.
3. Install the driver side register trim panel.
 - Connect the electrical connector.
 - Secure with the clips.

Air Distribution and Filtering - Passenger Side Register Trim Panel

Removal and Installation

Removal

1. Remove the passenger side register trim panel.
 - Release the 2 clips.

E49996

2.  **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the register.

- Release the 4 clips.

E53870

3. Remove the cup holder.
 - Remove the 4 Torx screws.

E49997

Installation

1. Install the cup holder.
 - Tighten the Torx screws.
2. Install the register.
 - Secure with the clips.
3. Install the passenger side register trim panel.
 - Secure with the clips.

Air Distribution and Filtering - Pollen Filter

Removal and Installation

Removal

1. Open the glove compartment to the service condition.
 - Release the glove compartment latch stops.

E44782

2. Remove the pollen filter housing cover.

E44783

3. Remove the pollen filter.

Installation

1. To install, reverse the removal procedure.
 - Clean the component mating faces.

Air Distribution and Filtering - Plenum Chamber

Removal and Installation

Removal

1. Remove the A-pillar mouldings.
For additional information, refer to: A-Pillar Moulding LH (501-08, Removal and Installation).
2. Remove the windshield wiper arms.
For additional information, refer to: Front Wiper Pivot Arm (501-16, Removal and Installation).
3. Release the hood seal from the plenum chamber.

E47528

4. Remove the plenum chamber panel.
 - Release the 8 clips.

E47529

5.  **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the clips from the plenum chamber panel.

Installation

1. To install, reverse the removal procedure.

- 4 - Air inlet duct
- 5 - Heater
- 6 - Ventilation outlets

GENERAL

The heating and ventilation system controls the temperature and flow of air supplied to the vehicle interior. The system consists of:

- An air inlet duct.
- A blower.
- A blower control module.
- A blower relay.
- A heater.
- Two ventilation outlets.

Fresh or recirculated air flows into the heater assembly from the inlet duct. The blower, and ram effect when the vehicle is moving, forces the air through the heater assembly. Air from the cabin exhausts through the ventilation outlets.

AIR INLET DUCT

NOTE: RHD version shown, LHD mirror image

E47349

Item	Part Number	Description
1	-	Recirculation door motor
2	-	Recirculation door arm
3	-	Recirculation motor arm
4	-	Evaporator drain tube
5	-	Blower
6	-	Air inlet duct
7	-	Recirculation air inlet

The air inlet duct is installed behind the instrument panel, on the front passenger side, and connected between the plenum chamber below the windshield and the heater.

The plenum chamber is formed by the upper and lower cowl and a plenum molding. Grilles in the plenum molding allow fresh air into the plenum chamber. From the plenum chamber, the air passes through a water separator and into the fresh air inlet of the air inlet duct.

The air inlet duct incorporates a grille to provide the inlet for recirculated air from the vehicle interior. The air inlet duct also accommodates:

- The cabin air filter.
For additional information, refer to: Air Distribution and Filtering (412-01 Air Distribution and Filtering,

- Description and Operation).
- The blower.
 - The blower control module.

The outlet from the air inlet duct forms the rear wall of the heater, enclosing the evaporator and incorporating the two evaporator drain outlets. Drain tubes connect the evaporator drain outlets to the transmission tunnel, to direct the water that condenses on the evaporator overboard.

A recirculation door is installed between the fresh and recirculated air inlets, to control the source of incoming air. A lever on the recirculation door is driven by the recirculation door motor. Operation of the recirculation door motor is automatically controlled by the **ATC (automatic temperature control)** module and manually controlled by a switch on the **ATC** module control panel.

For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

Fresh or recirculated air enters the air inlet duct and passes through the cabin air filter to the hub of the blower. From the blower, the air flows to the outlet of the air inlet and into the heater. The blower, and ram effect from the forward motion of the vehicle, forces the air through the air inlet duct.

Air Flow Through Air Inlet Duct

E47350

Item	Part Number	Description
1	-	Upper cowl
2	-	Water separator
3	-	Recirculation door
4	-	Cabin air filter
5	-	Blower
6	-	Air inlet duct casing
7	-	Lower cowl
8	-	Plenum molding

BLOWER

The blower is installed in the air inlet duct, below the cabin air filter, and consists of an open hub, centrifugal fan powered by an electric motor. Operation of the blower is controlled by the **ATC** module, using the blower relay in the **BJB (battery junction box)** and the blower control module. The blower control module is installed in the air inlet duct downstream of the blower, where any heat generated during operation is dissipated by the air flow. A wiring harness on the air inlet duct connects the recirculation door motor, blower and blower control module to the vehicle wiring.

When the blower is required, the **ATC** module energizes the coil of the blower relay. The energized blower relay supplies battery power to the blower motor, which is connected to ground through the blower control module. The speed of the blower is controlled by the blower control module, the blower motor control module regulates the voltage in response to the voltage signal from the linear **ATC** module. To change the blower motor voltage, **ATC** module will change the working cycle linear voltage signal.

When the blower is in the automatic mode the **ATC** module determines the blower speed required from the comfort algorithms. When the blower is in the manual mode, the **ATC** module operates the blower at one of seven fixed

speeds as selected on the control panel.

For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

HEATER

NOTE: RHD unit shown, LHD units similar

E47351

Item	Part Number	Description
1	-	Coolant outlet pipe
2	-	Coolant inlet pipe
3	-	Windshield distribution door motor
4	-	RH (right-hand) temperature blend motor
5	-	Heater core
6	-	Heater casing
7	-	LH (left-hand) temperature blend motor (automatic system only)
8	-	Evaporator
9	-	Face and feet distribution door motor

The heater controls the temperature of the air supplied to the distribution ducts, as directed by the ATC module. The heater is installed on the vehicle center-line, between the instrument panel and the engine bulkhead. The heater consists of a casing, formed from a series of plastic molding, which contains an evaporator, heater core and control doors. Internal passages integrated into the casing guide the air through the casing and separate it into two flows, one for the LH outlets and one for the RH outlets.

When the A/C (air conditioning) system is operating, the evaporator cools the air entering the heater.

The heater core provides the heat source to warm the air being supplied to the distribution ducts. The heater core is an aluminum two pass, fin and tube heat exchanger, installed across the width of the heater housing. Two aluminum tubes attached to the heater core extend through the engine bulkhead to connect with the engine cooling system. When the engine is running, coolant is constantly circulated through the heater matrix by the coolant pump. On vehicles with a FFBH (fuel fired booster heater), when the FFBH is active the coolant flow is assisted by an electric circulation pump.

For additional information, refer to: Auxiliary Heater (412-02B Auxiliary Heating, Description and Operation).

Two temperature blend doors, one LH and one RH, regulate the flow of air through the heater core to control the temperature of the air leaving the heater. On the automatic system, the two temperature blend doors operate independently to allow different temperatures to be set for the LH and RH outlets. On the manual system, the temperature blend doors are coupled together and produce a common temperature for the LH and RH outlets.

Air Flow Through Heater

E47352

Item	Part Number	Description
1	-	Windshield distribution door
2	-	Face and feet distribution door
3	-	Heater casing
4	-	Front footwell outlet
5	-	Rear footwell outlet
6	-	Heater core
7	-	Temperature blend door
8	-	Air inlet duct casing
9	-	Evaporator

Stepper Motors

On the automatic system, separate stepper motors operate the **RH** and the **LH** side temperature blend doors. On the manual system, a single stepper motor operates both the **RH** and the **LH** temperature blend doors.

The distribution doors in the heater are also operated by stepper motors. One for the windshield distribution door and one for the face and feet distribution door.

If a stepper motor is to be replaced, ensure it is replaced with the correct replacement part. Although similar in appearance, each of the stepper motors is different and faults will occur if an incorrect motor is fitted.

Operation of the distribution and temperature blend door stepper motors is controlled by the **ATC** module, which is connected to the stepper motors by a LIN (local interconnect network) bus.

All of the stepper motors contain microprocessors, which store positional information. To enable the **ATC** module to move the stepper motors correctly it requires the following information:

- The travel range, end to end, of each motor.
- Where each motor is on its range.

Approximately 2 minutes after the vehicle ignition is switched off, the climate control system powers down. At this point, the **ATC** module stores the position of each stepper motor in its memory. Each of the stepper motors also stores its own position in its memory. When the ignition is next switched on, all of the stepper motors send positional information to the **ATC** module via the LIN bus. This information is compared with the positional information stored within the **ATC** module memory.

In normal circumstances, the information sent by the stepper motors matches that held in the **ATC** module memory. In this instance, the **ATC** module recognizes there are no problems with the system and starts normally. If however, there are differences, the **ATC** module carries out a calibration routine.

The stepper motor calibration routine will normally take about 15 seconds to complete, but can take up to approximately 2 minutes in certain circumstances. During this period:

- The programmed de-frost **LED (light emitting diode)** on the **ATC** module panel will flash.
- All other climate control operations will be suspended.

The programmed de-frost LED will stop flashing after 2 minutes, regardless of whether the exercise was successful or not so it is important to check that calibration has been carried out successfully. To do this:

1. Switch the ignition off.
2. Switch the ignition back on.
3. Check for a flashing programmed de-frost LED.

If calibration has been successful, the programmed de-frost LED will not flash and the system will return to normal operation. If flashing does occur, more investigation will be required .

Automatic Calibration: The ATC module will automatically initiate a calibration routine every 175 hours of vehicle life. This occurs approximately 1 minute after the ignition has been switched off once 175 hours is reached. In this instance, the programmed de-frost LED will not blink.

Forced Calibration: The ATC module can be manually forced to carry out a calibration routine on the stepper motors. This can be carried out by holding down the ECON and recirculation buttons on the ATC module panel while simultaneously switching the ignition on. The ATC module will now carry out a calibration routine on the stepper motors, but will flash the ECON LED rather than the programmed de-frost LED.

Stepper Motor Diagnostics

Fault diagnosis on the heater stepper motors falls into two main groups:

- Electrical fault: A DTC (diagnostic trouble code) will be raised and logged in the ATC module memory.
- Mechanical fault: The programmed de-frost LED will blink to indicate the ATC module is attempting to carry out a calibration routine.

A calibration routine will be initiated by the ATC module if any of the following occur:

- One or more of the stepper motors is replaced.
- The ATC module is replaced.
- A foreign object enters the system and causes a stepper motor to stall.

Stepper motor related DTCs are stored in the ATC module memory and can be retrieved using T4. For additional information, refer to: Climate Control System (412-00, Diagnosis and Testing).

VENTILATION OUTLETS

The ventilation outlets promote the free flow of air through the passenger compartment. The outlets are installed in the LH and RH rear quarter body panels, behind the tail lamps.

Each ventilation outlet consists of a grille covered by soft rubber flaps and is effectively a non-return valve. The flaps open and close automatically depending on the differential between cabin and outside air pressures.

Heating and Ventilation - Heating and Ventilation

Diagnosis and Testing

Principles of Operation

For a detailed description of the heating and ventilation system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Heating and Ventilation (412-02 Heating and Ventilation, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Front End Accessory Drive (FEAD) belt • Refrigerant • Heater control flaps • Ducting • Cabin air filter • Coolant level • Compressor • Cooling fan 	<ul style="list-style-type: none"> • Fuses • Electrical harnesses • Harness connectors • Blower motor • Cooling fan • Actuators

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Climate Control Module (HVAC) (100-00, Description and Operation).

Heating and Ventilation - Blower Motor

Removal and Installation

Removal

1. Remove the glove compartment.
For additional information, refer to: Glove Compartment (501-12, Removal and Installation).

2. Remove the passenger side closing trim panel.
 - Release the clip.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

E47530

3. Position the footwell duct aside for access.
 - Release the clip.

E47531

4. Remove the blower motor.
 - Disconnect the electrical connector.
 - Remove the 3 screws.

Installation

1.  **CAUTION:** Fixings must be started by hand to avoid damaging threads.

Install the blower motor.

- Tighten the screws.
- Connect the electrical connector.

2. Secure the footwell duct.
 - Install the clip.

3. Install the closing trim panel.
 - Connect the electrical connector.
 - Secure the clip.
 - Tighten the screws.

4. Install the glove compartment.
For additional information, refer to: Glove Compartment (501-12, Removal and Installation).

Heating and Ventilation - Heater Core LHD AWD

Removal and Installation

Removal

1. Drain the cooling system.
For additional information, refer to: Cooling System Partial Draining, Filling and Bleeding (303-03B, General Procedures).
2. Remove the instrument panel passenger side reinforcement.

For additional information, refer to: [Instrument Panel Passenger Side Reinforcement](#) (501-12 Instrument Panel and Console, Removal and Installation).

3. Remove the heater core upper and lower pipes.
 - Position a container to collect the fluid.
 - Loosen the 4 screws and remove the clips.
 - Remove and discard the 4 O-ring seals.

E51939

4. Remove the heater core.

E51940

Installation

1. Install the heater core.
2. Install the heater core upper and lower pipes.
 - Clean the components.
 - Install the new O-ring seals.
 - Install the clips and tighten the screws.
 - Remove the container.
3. Install the instrument panel passenger side reinforcement.
For additional information, refer to: [Instrument Panel Passenger Side Reinforcement](#) (501-12 Instrument Panel and Console, Removal and Installation).
4. Refill the cooling system.
For additional information, refer to: Cooling System Partial Draining, Filling and Bleeding (303-03B, General Procedures).

Heating and Ventilation - Heater Core RHD AWD

Removal and Installation

Removal

1. Drain the cooling system.
For additional information, refer to: Cooling System Partial Draining, Filling and Bleeding (303-03B, General Procedures).
2. Remove the instrument panel driver side reinforcement.
For additional information, refer to: [Instrument Panel Driver Side Reinforcement](#) (501-12 Instrument Panel and Console, Removal and Installation).

3.  **NOTE:** LHD illustration shown, RHD is similar.

Remove the driver side footwell duct.

- Remove the 2 Torx screws.

4. Remove the heater core upper and lower pipes.
 - Position a container to collect the fluid.
 - Loosen the 4 screws and remove the clips.
 - Remove and discard the 4 O-ring seals.

5. Remove the heater core.

Installation

1. Install the heater core.
2. Install the heater core upper and lower pipes.
 - Clean the components.
 - Install the new O-ring seals.
 - Install the clips and tighten the screws.
 - Remove the container.

3. Install the driver side footwell duct.
 - Tighten the screws.
4. Install the instrument panel driver side reinforcement.
For additional information, refer to: [Instrument Panel Driver Side Reinforcement](#) (501-12 Instrument Panel and Console, Removal and Installation).
5. Refill the cooling system.
For additional information, refer to: Cooling System Partial Draining, Filling and Bleeding (303-03B, General Procedures).

Auxiliary Heating - Auxiliary Heater

Description and Operation

COMPONENT LOCATIONS

E137283

Item	Part Number	Description
1	-	FFBH (fuel fired booster heater) fuel line connection to fuel tank
2	-	FFBH auxiliary fuel pump
3	-	FFBH changeover valve
4	-	FFBH
5	-	FFBH receiver

INTRODUCTION

Auxiliary heating is provided by a FFBH (fuel fired booster heater), which boosts the temperature of the engine coolant. Fuel for the FFBH is taken from the vehicle fuel tank, through a fuel line attached to the fuel pump module. An auxiliary fuel pump supplies the fuel at low pressure to the FFBH. In the FFBH, the fuel is burned and the resultant heat output is used to heat the engine coolant.

For remote operation, the system includes a FFBH receiver and a remote handset.

AUXILIARY FUEL PUMP

The auxiliary fuel pump regulates the fuel supply to the FFBH. The pump is a self priming, solenoid operated plunger pump, controlled by a pulse width modulation (PWM) signal from the control module in the FFBH. When the pump is de-energized, it provides a positive shut-off of the fuel supply.

Sectioned View of Auxiliary Fuel Pump

E43569

Item	Part Number	Description
1	-	Fuel line connector
2	-	Non return valve
3	-	Solenoid coil
4	-	Plunger
5	-	Filter insert
6	-	Fuel line connector
7	-	O-ring seal
8	-	Spring
9	-	Piston
10	-	Bush

The solenoid coil of the auxiliary fuel pump is installed around a housing which contains a plunger and piston. The piston locates in a bush, and a spring is installed on the piston between the bush and the plunger. A filter insert and a fuel line connector are installed in the inlet end of the housing. A non return valve and a fuel line connector are installed in the inlet end of the housing.

While the solenoid coil is de-energized, the spring holds the piston and plunger in the closed position at the inlet end of the housing. An O-ring seal on the plunger provides a fuel tight seal between the plunger and the filter insert, preventing any flow through the pump. When the solenoid coil is energized, the piston and plunger move towards the outlet end of the housing, until the plunger contacts the bush; fuel is then drawn in through the inlet connection and filter. The initial movement of the piston also closes transverse drillings in the bush and isolates the pumping chamber at the outlet end of the housing. Subsequent movement of the piston then forces fuel from the pumping chamber through the non return valve and into the line to the FFBH. When the solenoid de-energizes, the spring moves the piston and plunger back towards the closed position. As the piston and plunger move towards the closed position, fuel flows past the plunger and through the annular gaps and transverse holes in the bush to replenish the pumping chamber.

FFBH (Fuel Fired Booster Heater)

10	-	Air inlet
11	-	Fuel evaporator
12	-	Glow plug / flame sensor

Coolant Circulation Pump

The coolant circulation pump is installed at the coolant inlet to the FFBH to assist the coolant flow through the FFBH and the vehicle heater core. The pump runs continuously while the FFBH is in standby or active operating modes. While the FFBH is inactive, coolant flow is reliant on the engine coolant pump. Operation of the FFBH coolant circulation pump is controlled by a power feed direct from the FFBH control module.

Combustion Air Fan

The combustion air fan regulates the flow of air into the FFBH to support combustion of the fuel supplied by the auxiliary fuel pump and to purge and cool the FFBH after operation.

Burner Housing

The burner housing contains the burner insert and also incorporates connections for the exhaust pipe, the coolant inlet from the coolant circulation pump and the coolant outlet to the vehicle heater core.

The burner insert incorporates the fuel combustion chamber, an evaporator and a glow pin and flame sensor. Fuel from the auxiliary fuel pump is supplied to an evaporator mat, where it evaporates and enters the combustion chamber to mix with air from the combustion air fan. The glow pin/flame sensor provides the ignition source of the fuel: air mixture and, once combustion is established, monitors the flame.

Heat Exchanger

The heat exchanger transfers heat generated by combustion to the coolant. Two sensors are installed in the heat exchanger casing to provide the control module with inputs of coolant temperature. The control module uses the temperature inputs to control system operation.

Air Inlet Pipe

The air inlet pipe delivers air to the combustion chamber for fuel ignition.

Exhaust Pipe and Muffler

The exhaust pipe and muffler directs exhaust combustion gases to atmosphere. Exhaust vapor may be visible when the FFBH is running, depending on atmospheric conditions.

Control Module

The control module controls and monitors operation of the FFBH system. An internal flow of air from the combustion air fan ventilates the control module to prevent it overheating.

The control module communicates with other systems on the vehicle over the medium speed [CAN \(controller area network\)](#) bus.

FFBH Control Module Harness Connector C0925

E50046

FFBH Control Module Harness Connector C0926 Pin Details

Pin No.	Description	Input/Output
1	Permanent battery power supply	Input

2	Ground	Output
---	--------	--------

Changeover Valve

The changeover valve is a normally open solenoid valve installed between the supply and return sides of the heater coolant circuit. When de-energized, the changeover valve connects the heater coolant circuit to the engine coolant circuit. When energized, the changeover valve isolates the heater coolant circuit from the engine coolant circuit.

The changeover valve is controlled by a power feed from the [ATC \(automatic temperature control\)](#) module.

FFBH Receiver

The FFBH receiver translates the FFBH request radio signals, relayed from the [TV \(television\)](#) antenna amplifier, into a voltage output to the FFBH unit. When a request for parked heating is received, the FFBH receiver outputs a battery power feed to the FFBH unit. When a request to switch off parked heating is received, the FFBH receiver disconnects the power feed.

The FFBH receiver has a permanent power feed from the [BJB \(battery junction box\)](#) and is connected to the [TV](#) antenna amplifier by a coaxial cable.

FFBH Remote Handset

E103416

Item	Description
1	On button
2	Off button
3	LED (light emitting diode)
4	Antenna

The FFBH remote handset allows parked heating to be remotely controlled up to a minimum of 100 m (328 ft) from the vehicle. 'On' and 'off' buttons activate and de-activate parked heating.

An [LED](#):

- Flashes green when parked heating is active.
- Flashes red after a start selection, if communication has not been established with the vehicle.
- Flashes orange when the remote handset battery needs replacing.

The FFBH remote handset is powered by a 3.3 V CR1/3N battery located under a cover on the rear of the handset.

Remote Handset Pairing:

Each remote handset must be 'paired' to the receiver to enable communications. Each handset has a unique identification number which is stored by the receiver. The receiver can store up to 3 handset identification numbers. If a fourth handset is paired to the receiver, the receiver will replace the first paired handset number with that for the fourth handset in the receiver memory. Subsequently, the first paired handset will no longer be paired and will not be recognized by the receiver.

The following procedure details the pairing process:

NOTE: The pairing process relies on the FFBH receiver having the power supply removed and then the power supply re-instated. The fuse method is the easiest method but it can also be achieved by battery disconnection or removal of the harness connector from the receiver unit.

- Remove mini-fuse F2 5A (telestart fuse) from the [BJB](#)
- Wait for a minimum of 5 seconds
- Replace fuse to position F2 5A in the [BJB](#)
- Within 5 seconds of replacing the fuse (and restoring the receiver power supply), press and hold the remote handset OFF button
- Confirmation of successful pairing is displayed by the remote handset [LED](#) illuminating in a red color for 2 seconds.

CONTROL DIAGRAM

18	-	BJB
19	-	Battery

OPERATION

The FFBH system operates in two modes:

- Provides additional heating by boosting heater performance while the engine is running.
- If fitted; parked heating heats the passenger compartment or engine while the vehicle is parked with the engine off.

The [ATC](#) module disables FFBH operation if battery voltage is too low, as determined from an ambient air temperature, dependent voltage-map. Where fitted, the battery monitoring system can also disable FFBH operation based on the battery charge state with the engine off.

Parked Heating/Ventilation

Parked heating works in conjunction with parked ventilation. When parked heating/ventilation is selected, the vehicle interior is either heated by parked heating or cooled by parked ventilation, depending on the ambient temperature. Parked heating occurs if the ambient temperature is less than 16 °C (61 °F); parked ventilation occurs if the ambient temperature is 16 °C (61 °F) or more.

Parked heating/ventilation is controlled by direct selection on the (TSD) Touch Screen Display. This is achieved by using the TSD to program one or two 'on/off' cycle start-times per day, and one 'on/off' cycle start-time further in the future.

The direct selection and programmed time modes of operation are selected when the engine is stopped and the smart key is in the vehicle. The key can then be removed and the vehicle locked. Any timed event will automatically run without the key inside the vehicle.

In all operating modes, to prevent excessive drain on the battery, parked heating/ventilation is automatically de-activated after:

- 20 minutes in moderate climate conditions, and
- after 30 minutes in climates where the ambient temperature regularly falls below minus 25 °C (minus 13 °F).

Parked ventilation is automatically de-activated when the ignition is switched on.

When programmed start times for parked heating/ventilation are entered on the TSD, the times are stored in the [CJB](#).

If the engine is started while parked heating is on and:

- the engine coolant temperature is equal to or more than the heater coolant temperature, parked heating is switched off.
- the engine coolant temperature is less than the heater coolant temperature, parked heating remains on until the engine coolant temperature reaches the heater coolant temperature. The changeover valve also remains closed until the engine coolant temperature reaches the heater coolant temperature.

Parked heating/ventilation can also be operated by using the FFBH remote handset.

Programmed Parked Heating/Ventilation

At a programmed parked heating/ventilation start time, the [EJB \(engine junction box\)](#) sends a start signal to the [ATC](#) module on the medium speed [CAN](#).

On receipt of the message:

- If the ambient temperature is less than 16 °C (61 °F) and more than -20 °C (-4 °F), the [ATC](#) module initiates parked heating and:
 - Energizes the changeover valve.
 - Sends a [CAN](#) bus message to activate the FFBH.
 - Operates the blower at 47% of the maximum speed.
 - Operates the distribution doors in the heater assembly to direct the air to the footwells for approximately 30 seconds, then to either only the windscreen, or to both the footwells and the windscreen, depending on the ambient air temperature.
 - Flashes the auto blower [LED](#) at 2 Hz.
 - If the ambient temperature is -20 °C (-4 °F) or below, the [ATC](#) module sends a [CAN](#) bus message to activate the FFBH, but leaves the changeover valve de-energized and does not operate the blower or distribution doors. Heated coolant is circulated around the engine and heater core(s) to heat the engine and improve engine starting.
 - Once the FFBH coolant temperature is above a suitable threshold the cabin blower is switched on and cabin heating commenced.
- If the ambient temperature is 16 °C (61 °F) or more, the [ATC](#) module initiates parked ventilation and:
 - Operates the blower at 47% of maximum speed.
 - Operates the distribution doors in the heater assembly to direct the air to the face level outlets.
 - Flashes the [A/C \(air conditioning\)](#) distribution LED at 2 Hz.

After 20 minutes in moderate climate conditions and after 30 minutes in climates where the ambient temperature regularly falls below minus 25 °C (minus 13 °F), the [ATC](#) module stops the parked heating/ventilation:

- If parked heating is active, the [ATC](#) module:
 - Sends a [CAN](#) bus message to de-activate the FFBH.
 - Switches off the blower.
 - Returns the distribution doors to the previous settings.
 - After 3 minutes, de-energizes the changeover valve.
- If parked ventilation is active, the [ATC](#) module:
 - Switches off the blower.
 - Returns the distribution doors to the previous settings.

Remotely Selected Parked Heating/Ventilation

When parked heating/ventilation is selected 'on' with the remote handset, the request is received by the FFBH receiver via the TV antenna and TV antenna amplifier. The FFBH receiver relays the request as a hardwired signal to the FFBH control module. On receipt of the request, the FFBH control module sends the request to the ATC module on the CAN bus. The ATC module then determines if parked heating or ventilation is required.

Operation of the FFBH is controlled by a status message from the automatic temperature control (ATC) module to the control module. A similar status message, from the control module to the ATC module, advises the ATC module of the current operating status of the FFBH.

While the engine is running, if the ambient air temperature is less than 9 °C (48 °F) and the engine coolant temperature (ECT) is less than 75 °C (167 °F) the ATC module changes the status message from 'heater off' to 'supplemental heat'. The control module then changes the status message it sends the ATC module to 'supplemental heat' and starts the FFBH. The control module will not start the FFBH, or will discontinue operation, if any of the following occur:

- The control module is in the error lockout mode (see Diagnostics, below).
- A crash message is received from the restraints control module (RCM).
For additional information, refer to: Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (501-20B, Description and Operation).
- A low fuel level message is received from the instrument cluster.
For additional information, refer to: Information and Message Center (413-08, Description and Operation).
- The engine is not running, or stops running for approximately 4 seconds. The time delay is included for stall protection.

If the control module does not start the FFBH, or discontinues operation, the status message to the ATC module remains at, or changes to, 'heater off'. If the ambient air temperature increases to 9 °C (48 °F), or the ECT increases to 75 °C (167 °F), the ATC module cancels supplementary heating, by changing the status message to the control module back to 'heater off'. The control module then cancels FFBH operation and changes the status message to the ATC module to 'heater off'.

The FFBH is controlled at one of two heat output levels, 2.8 kW at part load combustion and 5 kW at full load combustion. The control module transmits the FFBH coolant temperature to the ATC module.

Start Sequence: At the beginning of a start sequence, the control module energizes the glow pin function of the glow pin and flame sensor, to pre heat the combustion chamber, starts the combustion air fan at slow speed and energizes the coolant circulation pump. After approximately 30 seconds, the control module energizes the auxiliary fuel pump at the starting sequence speed. The fuel delivered by the auxiliary fuel pump evaporates in the combustion chamber, mixes with air from the combustion air fan and is ignited by the glow pin and flame sensor. The control module then progressively increases the speed of the auxiliary fuel pump and the combustion air fan. Once combustion is established the control module switches the glow pin and flame sensor from the glow pin function to the flame sensing function to monitor combustion. From the beginning of the start sequence to stable combustion at full load takes approximately 240 seconds.

Coolant Temperature Control: While the FFBH is running, the control module cycles the FFBH between full load combustion, part load combustion and a control idle phase of operation, depending on the temperature of the coolant in the heat exchanger.

Switching Point Diagram

Switching Point		Temperature, °C (°F)
Figure Item No.	Description	
1	Full load to part load	84 (183)
2	Part load to control idle	88 (190)
3	Control idle to part load	78 (172)
4	Part load to full load	74 (165)

After the start sequence, the control module maintains full load combustion until the coolant temperature reaches switching point temperature 1. At this temperature, the control module decreases the speed of the auxiliary fuel pump and the combustion air fan to half speed, to produce part load combustion. The control module maintains part load combustion while the coolant temperature remains between switching point temperatures 2 and 4. At part load combustion the temperature of the coolant will increase or decrease depending on the amount of heat required to heat the vehicle interior. If the coolant temperature decreases to switching point temperature 4, the control module increases the speed of the auxiliary fuel pump and the combustion air fan to full speed, to return to full load combustion. If the coolant temperature increases to switching point temperature 2, the control module enters a control idle phase of operation.

On entering the control idle phase, the control module immediately switches the auxiliary fuel pump off, to stop combustion, and starts a timer for the combustion air fan. After a 2 minute cool down period, the control module switches the combustion air fan off and then remains in the control idle phase while the coolant temperature remains above switching point temperature 3. If the coolant temperature decreases to switching point temperature 3, the control module initiates a start to part load combustion. A start to part load combustion takes approximately 90 seconds.

In order to limit the build up of carbon deposits on the glow pin and flame sensor, the control module also enters the control idle phase if continuous combustion time exceeds 72 minutes (at part load, full load or a combination of both). After the cool down period, if the coolant is still in the temperature range that requires additional heat, the control module restarts the FFBH.

Shutdown: To stop the FFBH, the control module de-energizes the auxiliary fuel pump to stop combustion, but continues operation of the combustion air fan and the coolant circulation pump for a time, to cool down the FFBH. The cool down time is 100 seconds if the FFBH was operating at part load combustion and 175 seconds if the FFBH was operating at full load combustion.

DIAGNOSTICS

The control module monitors the FFBH system for faults. Any faults detected are stored in a volatile memory in the control module, which can be interrogated by approved diagnostic equipment via the medium speed CAN bus. A maximum of three faults and associated freeze frame data can be stored at any one time. If a further fault is detected, the oldest fault is overwritten by the new fault.

The control module also incorporates an error lockout mode of operation that inhibits operation to prevent serious faults from causing further damage to the system. In the error lockout mode, the control module immediately stops the auxiliary fuel pump, and stops the combustion air fan and coolant circulation pump after a cool down time of approximately 2 minutes. Error lockout occurs for start sequence failures, combustion flameouts, heat exchanger casing overheat and if battery voltage is out of limits. The error lockout mode can be cleared using approved diagnostic equipment.

Start Failure and Flameout: If a start sequence fails to establish combustion, or a flameout occurs after combustion is established, the control module immediately initiates another start sequence. The start failure or flameout is also recorded by an event timer in the control module. The event timer is increased by one after each start failure or flameout, and decreased by one if a subsequent start is successful. If the event timer increases to three (over any number of drive cycles), the control module enters the error lockout mode.

Heat Exchanger Casing Overheat: To protect the system from excessive temperatures, the control module enters the error lockout mode if the heat exchanger coolant temperature exceeds 125 °C (257 °F).

Battery Voltage Limits: 10.25 - 15.5 volts.

Auxiliary Heating - Fuel Fired Booster Heater

Diagnosis and Testing

Principles of Operation

For a detailed description of the fuel fired booster heater system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Auxiliary Heater (412-02 Auxiliary Heating, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Fuel fired booster heater assembly <ul style="list-style-type: none"> - Coolant inlet/outlet - Exhaust - Fuel inlet - Air inlet • Auxiliary fuel pump and lines • Auxiliary coolant pump 	<ul style="list-style-type: none"> • Fuses • Harnesses • Electrical connector(s) • Control module(s)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Fuel Fired Booster Heater Control Module (FFBH) (100-00, Description and Operation).

Auxiliary Heating - Fuel Fired Booster Heater TDV6 2.7L Diesel

Removal and Installation

Removal

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3.  **NOTE:** Wheel shown removed for clarity.

Carefully release the wheel arch liner, to allow access to the fuel fired burner heater (FFBH) exhaust clamp retaining bolt.

E131518

4.  **NOTE:** Components removed for clarity.

Release the exhaust clamp.

E125162

5.  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the fuel fired booster heater fuel line.

- Release the clip.

E125164

6. Lower the vehicle.

7. Release the power steering fluid reservoir.

8. Disconnect the fuel fired booster heater inlet and outlet coolant hoses.

- Clamp the hoses to minimise coolant loss.
- Release the 2 clips.

9. Remove the fuel fired booster heater.

- Disconnect the 2 electrical connectors.
- Remove the 3 bolts.
- Release the fuel pipe from the clip.

Installation

1. Install the fuel fired booster heater.
 - Tighten the bolts to 10 Nm (7 lb.ft).
 - Connect the electrical connectors.
 - Secure the fuel pipe in the clip.
2. Connect the fuel fired booster heater coolant hoses.
 - Secure with the clips.
 - Remove the clamps.
3. Connect the fuel fired booster heater fuel hose.
 - Secure with the clip.
4. Raise the vehicle.
5. Tighten the exhaust clamp.
 - Tighten to 10 Nm (7 lb.ft).
6. Secure the wheel arch liner.
 - Install the two retaining screws.
 - Install the clip.

7. Lower the vehicle.
8. Install the power steering fluid reservoir.
9. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Charging System - General Information, Specifications).
10. Connect exhaust extraction hoses to the tail pipes.
11. Remove the engine cover.
For additional information, refer to: Engine Cover - 2.7L V6 - TdV6 (501-05 Interior Trim and Ornamentation, Removal and Installation).
12. Loosen the coolant expansion tank bleed screw.

13. Loosen the cylinder head bleed hose bleed screw.

14. Refill the cooling system.
15. Tighten the bleed screws to 14 Nm (10 lb.ft).
16. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank, until a steady stream of coolant is seen returning to the tank.
17.  **NOTE:** When the coolant bleed is complete and prior to installing the expansion tank cap, top up the expansion tank to 30mm above the maximum level.

Install the coolant expansion tank cap.

18.  **WARNING:** Release the cooling system pressure by slowly turning the expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

Start and run the engine.

- Hold the engine speed at 3,000 RPM for one minute.
- Return the engine to idle for five minutes.
- Hold the engine speed at 3,000 RPM for one minute.
- Run the engine until the thermostat opens.

- Remove coolant expansion tank cap, allow float to settle and top-up coolant if required. Install cap.

19. Switch the engine off and allow to cool.

20. Install the engine cover.

For additional information, refer to: Engine Cover - 2.7L V6 - TdV6 (501-05 Interior Trim and Ornamentation, Removal and Installation).

21. Check and top-up the coolant if required.

Removal and Installation

Removal

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Refer to: Specifications (414-00, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3.  **NOTE:** Wheel shown removed for clarity.

- Carefully release the wheel arch liner, to allow access to the fuel fired burner heater (FFBH) exhaust clamp retaining bolt.

E131518

4.

-  **NOTE:** Components removed for clarity.

Torque: 10 Nm

E125162

5.

6.  CAUTION: Be prepared to collect escaping coolant.

- Clamp the hoses to minimize coolant loss.

7.

8.

9.  **CAUTION:** Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

10. *Torque:* 10 Nm

Installation

1. To install, reverse the removal procedure.

2. Refer to: Engine Cover - 3.0L V6 - TdV6 (501-05, Removal and Installation).

3.

4.

5.

6. CAUTIONS:

 Anti-freeze concentration must be maintained at 50%.

 Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

7.  CAUTION: Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

E121324

8.

- Set the heater controls to maximum.

9.

- Start the engine and continue to fill the coolant until the maximum level is reached.

E121694

10.  **CAUTION:** Be prepared to collect escaping coolant.

Fill the coolant expansion tank until coolant appears through the bleed ports.

11. Increase engine speed to 2500rpm and cycle between this and idle.

12.

- Continue to top-up with coolant with the engine at idle.

E121325

13.  **CAUTION:** Correct installation of the Coolant expansion tank cap can be obtained by tightening the cap until an audible click is heard.

14. Allow the engine to idle, until hot air is emitted at the face registers.

15. Once the front heater is warm, check if the rear heater is warm (if equipped). If no heat is felt, increase the engine

speed to 3000 rpm for 30 seconds and return to idle.

16.  CAUTION: Switch off the engine and allow the coolant temperature to go cold.
17. Visually check the engine and cooling system for signs of coolant leakage.

18.  WARNING: When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

CAUTIONS:

 Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure

 Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

 NOTE: When the cooling system is warm, the coolant will be approximately 10mm above the upper level mark on the expansion tank with the cap removed.

Check and top-up the coolant if required.

19. Refer to: Engine Cover - 3.0L V6 - TdV6 (501-05, Removal and Installation).

GENERAL

The A/C system transfers heat from the vehicle interior to the outside atmosphere to provide the heater assembly with dehumidified cool air. The system consists of:

- A compressor.
- A condenser.
- A receiver drier.
- A thermostatic expansion valve.
- An evaporator.
- Low and high pressure refrigerant lines.

The system is a sealed, closed loop, filled with a charge weight of R134a refrigerant as the heat transfer medium. Oil is added to the refrigerant to lubricate the internal components of the compressor.

Operation of the air conditioning system is controlled by the automatic temperature control (ATC) module. The A/C compressor circulates the refrigerant around the system by compressing low pressure, low temperature vapor from the evaporator and discharging the resultant high pressure, high temperature vapor to the condenser.

The A/C compressor is a variable displacement unit which is driven by the engine accessory drive belt. On 2.7L/4.0L and 5.0L vehicles, the A/C (air conditioning) compressor is permanently driven directly from the pulley. On 3.0L diesel vehicles the A/C compressor is driven via an electro-magnetic clutch.

To protect the refrigerant system from excessive pressure, a pressure relief valve is installed in the outlet side of the A/C compressor. The pressure relief valve vents excess pressure into the engine compartment.

For additional information, refer to: Control Components (412-04, Description and Operation).

A/C COMPRESSOR

2.7L TdV6

E131577

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The A/C compressor fitted to 2.7L TdV6 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the A/C compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the ATC (automatic temperature control) module.

The A/C compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 171 cm³/rev (10.43 in³/rev). The ATC module automatically adjusts the displacement of the A/C compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the ATC module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the A/C compressor. The pressure relief valve is set to open at 3.5 to 4.3 MPa (508 to 623 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.01 MPa (436 lbf/in²).

The pulley of the A/C compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

3.0L TdV6

E131579

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector
6	-	electromagnetic clutch connector

The **A/C** compressor fitted to 3.0L TdV6 diesel vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the **A/C** compressor via a pulley and an electromagnetic clutch. Operation of the clutch is controlled by a power feed from the **ATC** module.

The **A/C** compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 163 cm³/rev (9.95 in³/rev). The **ATC** module automatically adjusts the displacement of the **A/C** compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the **ATC** module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the **A/C** compressor. The pressure relief valve is set to open at 3.5 to 4.1 MPa (508 to 595 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.1 MPa (449 lbf/in²).

The clutch of the **A/C** compressor incorporates a thermal cut-off fuse, which disconnects the power feed from the **ATC** module if the temperature increases to 182 ± 5 °C (360 ± 9 °F).

4.0L NA V6

E131581

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The **A/C** compressor fitted to 4.0L NA V6 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the **A/C** compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the **ATC** module.

The **A/C** compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 171 cm³/rev (10.43 in³/rev). The **ATC** module automatically adjusts the displacement of the **A/C** compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the **ATC** module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the **A/C** compressor. The pressure relief valve is set to open at 3.5 to 4.3 MPa (508 to 623 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.01 MPa (437 lbf/in²).

The pulley of the **A/C** compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

5.0L NA V8

E131337

Item	Part Number	Description
1	-	Pulley
2	-	Outlet port
3	-	Inlet port
4	-	Pressure relief valve
5	-	Electronic control valve connector

The **A/C** compressor fitted to 5.0L V8 petrol vehicles is a variable displacement unit. The secondary accessory drive belt, driven by the engine crankshaft, drives the **A/C** compressor via a pulley. Operation of the compressor is controlled by an electronic control valve working in conjunction with the **ATC** module.

The **A/C** compressor is a 7 cylinder swash plate unit with a minimum displacement of 1.6 cm³/rev (0.10 in³/rev) and maximum displacement of 163 cm³/rev (9.95 in³/rev). The **ATC** module automatically adjusts the displacement of the **A/C** compressor between the minimum and maximum values, to match the thermal load of the evaporator. By matching refrigerant flow and the thermal load of the evaporator, the **ATC** module maintains cabin comfort whilst also considering fuel economy.

To protect the refrigerant system from unacceptably high pressure, a pressure relief valve is installed in the outlet side of the **A/C** compressor. The pressure relief valve is set to open at 3.5 to 4.1 MPa (508 to 595 lbf/in²) and vents excess pressure into the engine compartment. The pressure relief valve closes again when the pressure decreases to 3.1 MPa (449 lbf/in²).

The pulley of the **A/C** compressor incorporates a mechanical torque limiter, which disconnects the drive plate from the compressor shaft if torque increases to a level that indicates imminent compressor seizure.

CONDENSER

NOTE: 5.0L NA V8 version shown other installations similar

E46920

Item	Part Number	Description
1	-	right-hand (RH) end tank
2	-	Condenser core
3	-	left-hand (LH) end tank
4	-	High pressure line connector block
5	-	Condenser attachment brackets
6	-	Receiver drier pipes
7	-	Receiver drier attachment bracket

The condenser transfers heat from the refrigerant to the surrounding air to convert the high pressure vapor from the compressor into a liquid. The condenser is installed immediately in front of the radiator. Two brackets on each end tank of the condenser attach the condenser to clips on the end tanks of the radiator.

The condenser is classified as a sub-cooling condenser and consists of a fin and tube heat exchanger core installed between two end tanks. Divisions in the end tanks separate the heat exchanger into a four pass upper (condenser) section and a two pass lower (sub-cooler) section. A connector block on the left end tank of the condenser provides connections for the high pressure lines from the A/C compressor and the evaporator. Two pipes at the bottom of the right end tank of the condenser provide connections for the receiver drier.

RECEIVER DRIER

E46921

Item	Part Number	Description
1	-	Receiver drier
2	-	Clamp
3	-	Condenser RH end tank
4	-	O-ring seals
5	-	Inlet pipe
6	-	Outlet pipe
7	-	Collar
8	-	Bolt

The receiver drier removes solid impurities and moisture from the refrigerant, and provides a reservoir for liquid refrigerant to accommodate changes of heat load at the evaporator.

The receiver drier is attached to the two stub pipes on the right end tank of the condenser. A collar, located on lands on the stub pipes and secured with a bolt, attaches the stub pipes to the receiver drier. A clamp secures the body of the receiver drier to a bracket welded to the right end tank of the condenser. The inlet and outlet ports of the receiver drier are the same size, so care must be taken to install the receiver drier the correct way round on the stub pipes; to assist with installation, the inlet port is identified with the word IN etched into the receiver drier.

Refrigerant entering the receiver drier passes through a filter and a desiccant pack, then collects in the base of the unit before flowing through the outlet stub pipe back to the condenser. The desiccant and the filter are non-serviceable; the complete unit must be replaced when a change of desiccant is required.

THERMOSTATIC EXPANSION VALVE

E46922

Item	Part Number	Description
1	-	Metering valve
2	-	Housing

- 3 - Diaphragm
- 4 - Temperature sensitive tube
- 5 - Outlet passage from evaporator
- 6 - Inlet passage to evaporator

The thermostatic expansion valve meters the flow of refrigerant into the evaporator, to match the refrigerant flow with the heat load of the air passing through the evaporator.

The thermostatic expansion valve is a block type valve located behind the heater assembly, and attached to the inlet and outlet ports of the evaporator. The thermostatic expansion valve consists of an aluminum housing containing inlet and outlet passages. A ball and spring metering valve is installed in the inlet passage and a temperature sensor is installed in the outlet passage. The temperature sensor consists of a temperature sensitive tube connected to a diaphragm. The bottom end of the temperature sensitive tube acts on the ball of the metering valve. Pressure on top of the diaphragm is controlled by evaporator outlet temperature conducted through the temperature sensitive tube. The bottom of the diaphragm senses evaporator outlet pressure.

Liquid refrigerant flows through the metering valve into the evaporator. The restriction across the metering valve reduces the pressure and temperature of the refrigerant. The restriction also changes the liquid stream of refrigerant into a fine spray, to improve the evaporation process. As the refrigerant passes through the evaporator, it absorbs heat from the air flowing through the evaporator. The increase in temperature causes the refrigerant to vaporize and increase in pressure.

The temperature and pressure of the refrigerant leaving the evaporator act on the diaphragm and temperature sensitive tube, which regulate the metering valve opening and so control the volume of refrigerant flowing through the evaporator. The warmer the air flowing through the evaporator, the more heat available to evaporate refrigerant and thus the greater the volume of refrigerant allowed through the metering valve.

EVAPORATOR

E46923

The evaporator is installed in the heater assembly between the blower and the heater matrix, to absorb heat from the exterior or recirculated air. Low pressure, low temperature refrigerant changes from liquid to vapor in the evaporator, absorbing large quantities of heat as it changes state.

Most of the moisture in the air passing through the evaporator condenses into water, which drains out of the heater and through the floorpan, to the underside of the vehicle, through two drain tubes.

REFRIGERANT LINES

To maintain similar flow velocities around the system, the diameter of the refrigerant lines varies to suit the two pressure/temperature regimes. The larger diameters are installed in the low pressure/temperature regime and the smaller diameters are installed in the high pressure/temperature regime.

Low and high pressure charging connections are incorporated into the refrigerant lines for system servicing. Where auxiliary A/C is installed, connections for the auxiliary refrigerant lines are incorporated near the engine bulkhead.

Under normal operating conditions, the smaller diameter pipes (A/C compressor discharge, liquid refrigerant) are hot to the touch and the larger diameter pipes (A/C compressor suction, gaseous refrigerant) are cold to the touch.

SYSTEM OPERATION

To accomplish the transfer of heat, the refrigerant is circulated around the system, where it passes through two pressure/temperature regimes. In each of the pressure/temperature regimes, the refrigerant changes state, during which process maximum heat absorption or release occurs. The low pressure/temperature regime is from the thermostatic expansion valve, through the evaporator to the compressor; the refrigerant decreases in pressure and temperature at the thermostatic expansion valve, then changes state from liquid to vapor in the evaporator, to absorb heat. The high pressure/temperature regime is from the compressor, through the condenser and receiver drier to the thermostatic expansion valve; the refrigerant increases in pressure and temperature as it passes through the compressor, then releases heat and changes state from vapor to liquid in the condenser.

For additional information, refer to: Instrument Panel Upper Section (501-12, Removal and Installation).
7. Release the 3 ground cables from the driver side lower A-pillar.
 - Remove the 2 nuts.

8. Disconnect the 5 electrical connectors from the driver side lower A-pillar.

9. Disconnect the 3 electrical connectors.

E124177

E51210

10. Release the 3 ground cables from the passenger side lower A-pillar.
 - Remove the 2 nuts.

11. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.

12. Disconnect the central junction box (CJB) three electrical connectors.

E124259

13. Disconnect 2 electrical connectors from the instrument panel center reinforcement.

14.  **CAUTION:** Cover fiber optic cable connectors to minimize dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

15. Remove the heater housing center ducts.

16. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

17. Release the heater housing from the instrument panel carrier.

- Remove the 7 Torx screws.

18. Remove the plenum chamber panel.
For additional information, refer to: Plenum Chamber (412-01, Removal and Installation).

19. Remove the instrument panel carrier to bulkhead Torx bolt.

E51204

20. With assistance, remove the instrument panel.
 - Remove the 6 Torx bolts.

E52190

21. Disconnect both exhaust gas recirculation (EGR) coolant cross-over pipe hoses.
 - Release the 2 clips.

E53901

22. Remove the EGR coolant cross-over pipe.
 - Remove the 2 bolts.
 - Release the 2 clips.

E55561

23.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

- Disconnect 2 heater hoses from the bulkhead.
- Release the 2 clips.

24.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Release the 2 A/C refrigerant lines.

- Remove the nut and bolt.
- Remove and discard the O-ring seals.

25. Remove the 2 adapter panels.
- Remove the 4 nuts.

26. Disconnect 2 drain tubes from the heater housing.

E51199

27. Remove the driver side footwell duct.
 - Remove the 2 Torx screws.

E52191

28. Remove the passenger side footwell duct.
 - Remove the 2 Torx screws.

E52192

29. Driver side: Remove the heater housing to bulkhead Torx bolt.

30. Passenger side: Remove the heater housing to bulkhead Torx bolt.
 - With assistance, remove the heater and evaporator core housing.

31. Remove the A/C control module.

32. Disconnect the evaporator core temperature sensor electrical connector.

33. Disconnect the electrical connector.

34. Detach the wiring harness.

35. Remove the bolt from the support bracket.

36. Remove the heater and evaporator core housing.

- Remove the 8 clips.

E124173

- Carefully release the 2 clips.

E124172

37. Remove the thermostatic expansion valve.

E124171

38. Remove the evaporator core.
- Release the temperature sensor.

Installation

- Install the evaporator core.
 - Secure the temperature sensor.
- Secure the heater core housing.
 - Install the clips.
- Install the thermostatic expansion valve.

- Tighten the bolts to 3.5 Nm (2.5 lb.ft).
4. Install the wiring harness.
 5. Install and tighten the bolt.
 6. Connect the temperature sensor electrical connector.
 7. Install the CC module.
 - Tighten the bolts.
 8. Passenger side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
 - With assistance, install the heater and evaporator core housing.
 9. Driver side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
 10. Install the footwell ducts.
 - Tighten the Torx screws.
 11. Connect the drain tubes to the heater housing.
 12. Install the adapter panels.
 - Tighten the nuts to 6 Nm (4 lb.ft).
 13. Secure the A/C refrigerant lines.
 - Clean the components.
 - Install new O-ring seals.
 - Tighten the bolt to 5 Nm (4 lb.ft).
 - Tighten the nut to 6 Nm.
 14. Connect the bulkhead heater hoses.
 15. Install the EGR coolant cross-over pipe.
 - Tighten the bolts to 10 Nm (7 lb.ft).
 - Secure the clips.
 - Connect the hoses and secure with the clips.
 16. With assistance, install the instrument panel.
 - Tighten the Torx bolts to 25 Nm (18 lb.ft).
 17. Install the instrument panel carrier to bulkhead Torx bolt and tighten to 25 Nm (18 lb.ft).
 18. Install the plenum chamber panel.
For additional information, refer to: Plenum Chamber (412-01, Removal and Installation).
 19. Secure the heater housing.
 - Tighten the screws.
 20. Connect the steering column intermediate shaft.
 - Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).
 21. Install the heater housing center ducts.
 22. Connect the instrument panel center reinforcement fibre optic cables.
 23. Connect the instrument panel center reinforcement electrical connectors.
 24. Connect the CJB electrical connectors.
 25. Connect the electrical connectors to the passenger side lower A-pillar.
 26. Connect the ground cables to the passenger side lower A-pillar.
 - Tighten the nuts to 10 Nm (7 lb.ft).

27. Connect the electrical connectors to the driver side lower A-pillar.
28. Connect the ground cables to the driver side lower A-pillar.
 - Tighten the nuts to 10 Nm (7 lb.ft).
29. Connect the 3 electrical connectors.
30. Install the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12, Removal and Installation).
31. Install the floor console.
For additional information, refer to: Floor Console (501-12, Removal and Installation).
32. Install the front seat.
For additional information, refer to: Front Seat (501-10, Removal and Installation).
33. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00, General Procedures).
34. Refill the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03, General Procedures).

Air Conditioning - TDV6 3.0L Diesel - Thermostatic Expansion Valve

Removal and Installation

Removal

1. Evacuate the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).
2. Remove the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

3.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Remove the thermostatic expansion valve.

- Remove the cover.
- Remove the 2 Allen bolts.
- Remove and discard the 4 O-ring seals.

Installation

1. Install the thermostatic expansion valve.
 - Clean the components.
 - Install the new O-ring seals.
 - Tighten the Allen bolts to 5 Nm (4 lb.ft).
 - Install the cover.
2. Install the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).
3. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

Air Conditioning - V6 S/C 3.0L Petrol - Air Conditioning

Description and Operation

COMPONENT LOCATION

E131583

Item	Part Number	Description
1	-	Evaporator
2	-	Thermostatic expansion valve
3	-	Low pressure line
4	-	A/C (air conditioning) compressor
5	-	Condenser
6	-	Receiver drier
7	-	High pressure line
8	-	Low pressure servicing connection
9	-	Refrigerant pressure sensor (reference)
10	-	High pressure servicing connection

OVERVIEW

The A/C system is a sealed, closed loop system filled with a charge weight of refrigerant as the heat transfer medium. Depending on market, the refrigerant is either R1234yf or R134a. Oil is added to the refrigerant to lubricate the internal components of the A/C compressor. The system consists of:

- A A/C compressor.

- A condenser.
- A receiver drier.
- A thermostatic expansion valve.
- An evaporator.
- Low and high pressure refrigerant lines.

A pressure sensor in the high pressure refrigerant line allows the ATCM (automatic temperature control module) to monitor the status of the A/C system.

For additional information, refer to: [Control Components](#) (412-04 Control Components, Description and Operation).

DESCRIPTION

Air Conditioning Compressor

Item	Part Number	Description
1	-	Pulley
2	-	Refrigerant outlet port
3	-	Pressure relief valve
4	-	Electronic control valve
5	-	Refrigerant inlet port
6	-	Electrical connector

On all engine variants, the A/C compressor is a variable displacement unit attached to the front left side of the engine with three bolts.

The compressor is driven by the engine accessory drive belt via an electro-magnetic clutch in the compressor pulley. The ATCM (automatic temperature control module) controls the operation of the electro-magnetic clutch. The clutch incorporates a thermal cut-off fuse, which disconnects the power feed from the ATCM if the temperature increases to $182 \pm 5 \text{ }^\circ\text{C}$ ($360 \pm 9 \text{ }^\circ\text{F}$).

The displacement of the compressor is controlled by an integral electronic control valve, which is operated by the ATCM. The ATCM automatically adjusts the displacement of the A/C compressor, between the minimum and maximum values, to match the thermal load of the evaporator.

To protect the refrigerant system from excessive pressure, a pressure relief valve is installed in the outlet side of the A/C compressor. The pressure relief valve vents excess pressure into the engine compartment.

Condenser

E161114

Item	Part Number	Description
1	-	Refrigerant inlet port
2	-	Receiver drier attachment bracket
3	-	Receiver drier
4	-	Receiver drier pipes
5	-	Refrigerant outlet port

The condenser transfers heat from the refrigerant to the surrounding air to convert the high pressure vapor from the compressor into a liquid. The condenser is installed immediately in front of the radiator. Two brackets on each end tank of the condenser attach the condenser to clips on the end tanks of the radiator.

The condenser is classified as a sub-cooling condenser and consists of a fin and tube heat exchanger core installed between two end tanks. Divisions in the end tanks separate the heat exchanger into a four pass upper (condenser) section and a two pass lower (sub-cooler) section. A connector block on the left end tank of the condenser provides connections for the high pressure lines from the *A/C* compressor and the evaporator. Two pipes at the bottom of the right end tank of the condenser provide connections for the receiver drier.

Receiver Drier

E141370

The receiver drier is attached to the two stub pipes on the right end tank of the condenser. A collar, located on lands on the stub pipes and secured with a bolt, attaches the stub pipes to the receiver drier. The body of the receiver drier is installed in a bracket welded to the right end tank of the condenser.

The inlet and outlet ports of the receiver drier are the same size, so care must be taken to install the receiver drier the correct way round on the stub pipes. To assist with installation, the inlet port is identified with the word 'IN' etched into the receiver drier.

Refrigerant entering the receiver drier passes through a filter and a desiccant pack, then collects in the base of the unit before flowing through the outlet stub pipe back to the condenser. The desiccant and the filter are both

serviceable.

Thermostatic Expansion Valve

E127740

The thermostatic expansion valve is a block type valve attached to the inlet and outlet ports of the evaporator, under a thermal insulation cover.

Two bolts secure the refrigerant pipes and the thermostatic expansion valve to the inlet and outlet ports of the evaporator.

Evaporator

E161115

The evaporator is a fin and tube heat exchanger installed in the heater assembly, between the blower and the heater core.

Refrigerant Lines

E161116

Item	Part Number	Description
1	-	Low pressure pipe
2	-	Internal heat exchanger
3	-	High pressure pipe

The refrigerant lines consist of a combination of rigid pipes and flexible hoses that connect the thermostatic expansion valve on the evaporator to the A/C compressor and the condenser. An internal heat exchanger increases the efficiency of the evaporator and ensures any residual liquid in the low pressure line is evaporated before it reaches the compressor.

Low and high pressure servicing connections are incorporated into the refrigerant lines for system servicing. The high pressure line also incorporates a refrigerant pressure sensor for the climate control system.

For additional information, refer to: [Control Components](#) (412-04 Control Components, Description and Operation).

On vehicles with auxiliary climate control, connections for the auxiliary A/C system are incorporated into the refrigerant lines in the left rear corner of the engine compartment.

For additional information, refer to: [Auxiliary Climate Control](#) (412-03C Auxiliary Climate Control, Description and Operation).

OPERATION

The A/C compressor circulates the refrigerant around the system by compressing low pressure, low temperature vapor from the evaporator and discharging the resultant high pressure, high temperature vapor to the condenser. In the condenser the vapor converts to a liquid, which then passes through the receiver drier and out of the condenser to the thermostatic expansion valve. As it passes through the thermostatic expansion valve, the liquid refrigerant changes to a fine, low pressure, spray, which is directed into the evaporator. In the evaporator the refrigerant changes back to a low pressure, low temperature vapor, as it absorbs heat from the air in the passenger compartment, then returns to the A/C compressor to begin the cycle again.

Operation of the air conditioning system is controlled by the ATCM (automatic temperature control module), which adjust the electronic control valve in the A/C compressor to match the refrigerant flow around the system to the thermal load of the evaporator. By matching refrigerant flow to the thermal load of the evaporator, the ATCM maintains the required temperature in the passenger compartment while maximizing fuel economy.

Air Conditioning System Schematic

E141373

A = Refrigerant vapor; B = Refrigerant liquid; C = Air flow.

Item	Part Number	Description
1	-	Evaporator
2	-	Thermostatic expansion valve

10. Disconnect the 3 electrical connectors.

E124177

11. Release the 3 ground cables from the passenger side lower A-pillar.
 - Remove the 2 nuts.

E51210

12. Disconnect the 5 electrical connectors from the passenger side lower A-pillar.

13. Disconnect the central junction box (CJB) three electrical connectors.

E124259

14. Disconnect 2 electrical connectors from the instrument panel center reinforcement.

15.  **CAUTION:** Cover fiber optic cable connectors to minimize dust ingress and avoid bending the cables in a radius of less than 30 mm.

If installed, disconnect the instrument panel center reinforcement fibre optic cables.

- Disconnect the electrical connector.

16. Remove the heater housing center ducts.

17. Disconnect the steering column intermediate shaft from the steering column.

- Note the fitted position.
- Remove the special bolt and discard the nut.

18. Release the heater housing from the instrument panel carrier.

- Remove the 7 Torx screws.

19. Remove the plenum chamber panel.
For additional information, refer to: [Plenum Chamber](#) (412-01 Air Distribution and Filtering, Removal and Installation).

20. Remove the instrument panel carrier to bulkhead Torx bolt.

21. With assistance, remove the instrument panel.
- Remove the 6 Torx bolts.

22.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect 2 heater hoses from the bulkhead.

- Release the 2 clips.

23.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Release the 2 A/C refrigerant lines.

- Remove the nut and bolt.
- Remove and discard the O-ring seals.

24. Remove the 2 adapter panels.
- Remove the 4 nuts.

25. Disconnect 2 drain tubes from the heater housing.

26. Remove the driver side footwell duct.
- Remove the 2 Torx screws.

27. Remove the passenger side footwell duct.
- Remove the 2 Torx screws.

28. Driver side: Remove the heater housing to bulkhead Torx bolt.

29. Passenger side: Remove the heater housing to bulkhead Torx bolt.

- With assistance, remove the heater and evaporator core housing.

30. Remove the A/C control module.

31. Disconnect the evaporator core temperature sensor electrical connector.

32. Disconnect the electrical connector.

33. Detach the wiring harness.

34. Remove the bolt from the support bracket.

35. Remove the heater and evaporator core housing.

- Remove the 8 clips.

- Carefully release the 2 clips.

E124173

36. Remove the thermostatic expansion valve.

E124172

37. Remove the evaporator core.
- Release the temperature sensor.

E124171

Installation

1. Install the evaporator core.
 - Secure the temperature sensor.
2. Secure the heater core housing.
 - Install the clips.
3. Install the thermostatic expansion valve.

- Tighten the bolts to 3.5 Nm (2.5 lb.ft).
4. Install the wiring harness.
 5. Install and tighten the bolt.
 6. Connect the temperature sensor electrical connector.
 7. Install the CC module.
 - Tighten the bolts.
 8. Passenger side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
 - With assistance, install the heater and evaporator core housing.
 9. Driver side: Install the heater housing to bulkhead Torx bolt and tighten to 6 Nm (4 lb.ft).
 10. Install the footwell ducts.
 - Tighten the Torx screws.
 11. Connect the drain tubes to the heater housing.
 12. Install the adapter panels.
 - Tighten the nuts to 6 Nm (4 lb.ft).
 13. Secure the A/C refrigerant lines.
 - Clean the components.
 - Install new O-ring seals.
 - Tighten the bolt to 5 Nm (4 lb.ft).
 - Tighten the nut to 6 Nm.
 14. Connect the bulkhead heater hoses.
 15. With assistance, install the instrument panel.
 - Tighten the Torx bolts to 25 Nm (18 lb.ft).
 16. Install the instrument panel carrier to bulkhead Torx bolt and tighten to 25 Nm (18 lb.ft).
 17. Install the plenum chamber panel.
For additional information, refer to: [Plenum Chamber](#) (412-01 Air Distribution and Filtering, Removal and Installation).
 18. Secure the heater housing.
 - Tighten the screws.
 19. Connect the steering column intermediate shaft.
 - Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).
 20. Install the heater housing center ducts.
 21. Connect the instrument panel center reinforcement fibre optic cables.
 22. Connect the instrument panel center reinforcement electrical connectors.
 23. Connect the CJB electrical connectors.
 24. Connect the electrical connectors to the passenger side lower A-pillar.
 25. Connect the ground cables to the passenger side lower A-pillar.
 - Tighten the nuts to 10 Nm (7 lb.ft).
 26. Connect the electrical connectors to the driver side lower A-pillar.
 27. Connect the ground cables to the driver side lower A-pillar.

Tighten the nuts to 10 Nm (7 lb.ft).

28. Connect the 3 electrical connectors.
29. Install the instrument panel upper section.
For additional information, refer to: [Instrument Panel Upper Section](#) (501-12 Instrument Panel and Console, Removal and Installation).
30. Install the floor console.
For additional information, refer to: [Floor Console](#) (501-12 Instrument Panel and Console, Removal and Installation).

Air Conditioning - V6 S/C 3.0L Petrol - Thermostatic Expansion Valve

Removal and Installation

Removal

1. Evacuate the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).
2. Remove the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

3.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Remove the thermostatic expansion valve.

- Remove the cover.
- Remove the 2 Allen bolts.
- Remove and discard the 4 O-ring seals.

Installation

1. Install the thermostatic expansion valve.
 - Clean the components.
 - Install the new O-ring seals.
 - Tighten the Allen bolts to 5 Nm (4 lb.ft).
 - Install the cover.
2. Install the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).
3. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

Air Conditioning - V6 S/C 3.0L Petrol - Air Conditioning (A/C) Pressure Transducer

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Charging System - General Information, Specifications).
2. Recover the A/C refrigerant.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

E53157

3. CAUTIONS:

 Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

 To prevent damage to components, use an additional wrench when loosening or tightening unions.

Remove the A/C pressure transducer.

- Disconnect the electrical connector.
- Remove and discard the seal.

Installation

1. Install the A/C pressure transducer.
 - Clean the component mating faces.
 - Install a new seal.
 - Tighten the transducer to 10 Nm (7 lb.ft).
 - Connect the electrical connector.
2. Recharge the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).
3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Charging System - General Information, Specifications).

Auxiliary Climate Control - Auxiliary Climate Control

Description and Operation

COMPONENT LOCATIONS

E47874

Item	Part Number	Description
1	-	Heater lines
2	-	ACCM (auxiliary climate control module)
3	-	Air distribution ducts
4	-	Auxiliary climate control assembly
5	-	Refrigerant lines
6	-	Rear blower relay

GENERAL

The auxiliary climate control system provides additional air conditioning for the second and third row seat occupants. The auxiliary climate control system consists of:

- An auxiliary climate control assembly.
- A refrigerant circuit.
- A heating circuit.
- A distribution system.
- An ACCM.

The automatic temperature control (ATC) module, of the main air conditioning system, is also used in the control of the auxiliary climate control system.

For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

Cabin air is recirculated through the auxiliary climate control assembly, where the air is temperature regulated and then directed through the distribution system to registers in the roof, on the C pillars and on the left side of the loadspace. The volume, temperature and distribution of the air from the auxiliary climate control assembly can be manually controlled by the ACCM or automatically controlled by the ATC module.

AUXILIARY CLIMATE CONTROL ASSEMBLY

E47875

Item	Part Number	Description
1	-	Casing
2	-	Distribution door motor
3	-	Blower inlet
4	-	Solenoid valve
5	-	Thermostatic expansion valve

6	-	Evaporator connector block
7	-	Distribution door
8	-	Footwell outlet
9	-	Evaporator temperature sensor
10	-	Blower control module
11	-	Blower
12	-	Evaporator drain tube
13	-	Heater core inlet pipe
14	-	Heater core outlet pipe
15	-	Evaporator outlet pipe
16	-	Evaporator inlet pipe
17	-	Heater core
18	-	Temperature blend door motor
19	-	Face level outlet

The auxiliary climate control assembly is a reheat unit, which cools the air to a constant value then reheats it as necessary to produce the required temperature. The assembly is installed on the left side of the loadspace, behind the rear quarter panel. A grille in the rear quarter panel allows air to flow from the loadspace into the auxiliary climate control assembly.

The auxiliary climate control assembly consists of a casing, formed from a series of plastic molding, which contains:

- A blower
- A blower control module
- An evaporator
- A heater core
- A temperature blend door
- A distribution door
- An evaporator temperature sensor.

Refrigerant and coolant lines from the engine compartment are connected to pipes from the evaporator and the heater core immediately below the loadspace floor. Where the pipes, and the evaporator drain tube, pass through the loadspace floor, the aperture is sealed by a seal plate.

Internal passages, integrated into the casing of the auxiliary climate control assembly, guide the air from the blower through the evaporator and heater core to the distribution outlets.

The temperature blend door regulates the flow of air through the heater core to control the temperature of the air leaving the auxiliary climate control assembly. A stepper motor installed on the rear of the casing operates the temperature blend door.

The distribution door regulates the flow of air through the face level outlet and the foot level outlet. A stepper motor installed on the top of the casing operates the distribution door.

The temperature blend stepper motor and the distribution stepper motor are both connected to a Local Interconnect (LIN) bus, which also connects the ACCM with the ATC module. Each stepper motor incorporates a microprocessor which operates the motor in response to LIN bus messages from the ACCM. The stepper motors are powered by a feed from the ATC module, and share a ground connection with the rear blower control module.

The ACCM determines the positions of the distribution and temperature blend doors by using either their closed or open position as a datum and memorizing the steps that it drives the individual stepper motors. Each time the ACCM is activated by the ATC module, it checks the memorized position of the stepper motors against fixed values for the current distribution and temperature settings on the control panel. If there is an error, the ACCM calibrates the applicable stepper motor, to re-establish the datums, by driving them fully closed or open before re-setting them to their nominal selected position. A calibration run can also be invoked using T4.

Air Flow Through Auxiliary Climate Control Assembly

E47876

Item	Part Number	Description
1	-	Temperature blend door
2	-	Auxiliary climate control assembly casing
3	-	Face level outlet
4	-	Distribution door
5	-	Heater core
6	-	Evaporator
7	-	Evaporator drain tube
8	-	Blower

The blower is in the air inlet of the auxiliary climate control assembly, and consists of an open hub, centrifugal fan powered by an electric motor. Operation of the blower is controlled by the ACCM, using the rear blower relay in the battery junction box (BJB) and the blower control module. The blower control module is installed in the auxiliary climate control assembly downstream of the blower, where any heat generated during operation is dissipated by the air flow. A wiring harness on the auxiliary climate control assembly connects the blend door motor, distribution door motor, blower and blower control module to the vehicle wiring.

Blower Control Module

E47886

When the blower is required, the ACCM energizes the coil of the rear blower relay. The energized rear blower relay supplies battery power to the blower motor, which is connected to ground through the blower control module. The speed of the blower is controlled by the blower control module, which regulates the blower motor voltage in response to a pulse width modulation (PWM) signal from the ACCM. To vary the blower motor voltage the ACCM varies the duty cycle of the signal.

Evaporator Temperature Sensor

E47884

The evaporator temperature sensor is a negative temperature coefficient (NTC) thermistor installed in the auxiliary climate control assembly on the downstream side of the evaporator. The evaporator temperature sensor supplies a temperature signal to the ACCM.

REFRIGERANT CIRCUIT

Two refrigerant lines, low pressure and high pressure, connect the evaporator in the auxiliary climate control assembly to the front air conditioning (A/C) refrigerant system. On the auxiliary climate control assembly, a solenoid valve and a thermostatic expansion valve control the flow of refrigerant through the evaporator.

Refrigerant Lines

E47877

Item	Part Number	Description
1	-	In-line connections
2	-	Auxiliary climate control assembly
3	-	Connections to auxiliary climate control assembly

The refrigerant lines are routed around the left rear wheel arch and along the left-hand (LH) underside of the vehicle, and connected to the front A/C refrigerant system at the rear of the engine compartment. The refrigerant lines consist of sections of aluminum alloy pipes. All except the front section of the pipes are insulated with foam rubber sleeving.

Solenoid Valve

E47885

The solenoid valve allows the auxiliary climate control assembly to be isolated from the front A/C refrigerant system. Operation of the solenoid valve is controlled by the ACCM switching a ground.

Thermostatic Expansion Valve

E47878

Item	Part Number	Description
1	-	Thermostatic expansion valve
2	-	Capillary tube
3	-	Temperature bulb

The thermostatic expansion valve meters the flow of refrigerant into the evaporator, to match the heat load of the air passing through the auxiliary climate control assembly.

The thermostatic expansion valve is installed in the inlet line to the evaporator. Liquid refrigerant flows through the valve to the evaporator. The restriction across the valve reduces the pressure and temperature of the refrigerant and changes it to a fine spray, which improves the evaporation process. Valve opening is controlled by the pressure in a capillary tube containing a temperature sensitive fluid. One end of the capillary tube is connected to a diaphragm housing on the thermostatic expansion valve, the other end of the capillary tube is sealed and attached to the refrigerant outlet line of the evaporator. As the temperature of the refrigerant leaving the evaporator changes, a corresponding change of capillary tube pressure and valve opening are produced. The warmer the refrigerant leaving the evaporator becomes, the greater the volume of refrigerant allowed through the valve.

Evaporator

The evaporator is installed in the auxiliary climate control assembly between the blower and the heater matrix, to absorb heat from the recirculated air. Low pressure, low temperature refrigerant changes from liquid to vapor in the evaporator, absorbing large quantities of heat as it changes state. Most of the moisture in the air passing through the evaporator condenses into water, which drains out of the auxiliary climate control assembly through the evaporator drain tube.

HEATING CIRCUIT

Two heater lines, supply and return, connect the heater core in the auxiliary climate control assembly to the engine cooling system. The heater lines are routed along the rear crossmember, around the right rear wheel arch and along the RH underside of the vehicle. The heater lines are connected to the engine cooling system at the rear of the engine compartment. The heater lines consist of sections of aluminum alloy pipes, insulated with foam rubber, which are connected together with rubber hose joints. Quick release fittings connect the heater lines to the engine cooling system.

Heater Lines

E47879

Item	Part Number	Description
1	-	Quick release connections to engine cooling system
2	-	Quick release connections to main heater
3	-	Auxiliary climate control assembly
4	-	In-line connections

DISTRIBUTION SYSTEM

E47880

Item	Part Number	Description
1	-	Second row left face level air duct
2	-	Cross-car air duct
3	-	Second row right face level air duct
4	-	Right C pillar air duct
5	-	Third row right face level register
6	-	Second row face level registers
7	-	Third row foot level air duct
8	-	Third row foot level registers
9	-	Third row left face level register
10	-	Left C pillar air duct

The distribution system consists of a network of air ducts that supply air from the outlets of the auxiliary climate control assembly to registers installed in:

- The headliner, to the left and right of the second row interior lamp, to provide face level ventilation for second row seat occupants
- The left and right C pillar finishers, to provide face level ventilation for third row seat occupants
- The loadspace left side molding, to provide foot level ventilation for third row passengers.

The registers can all be adjusted to control the direction and volume of the air flow.

ACCM

E47883

Item	Part Number	Description
1	-	Electrical connector
2	-	Blower switch
3	-	Distribution switch
4	-	Temperature switch

The ACCM allows manual adjustment of the output from the auxiliary climate control assembly. The ACCM is installed in the headliner immediately behind the row 2 interior lamp. An integral control panel contains separate rotary switches for temperature, distribution and blower speed. When the ACCM is in manual mode, amber light emitting diode (LED)s in the switch surrounds illuminate to indicate the current settings of the system and function symbols in the switch surrounds are illuminated when the side lamps or headlamps are on.

The ACCM is disabled when the auxiliary climate control switch on the ATC module is selected off. When the auxiliary climate control switch is selected to automatic or manual, the ACCM is enabled by the connection of a power feed from the ATC module. The same power feed also supplies the stepper motors in the auxiliary climate control assembly.

When it is enabled, the ACCM operates as a slave unit to the ATC module. The ACCM sends status signals on the LIN (local interconnect network) bus to the ATC module, which replies with command signals of the required temperature, distribution and blower settings. The ACCM then outputs the necessary drive signals to the auxiliary climate control assembly:

- In the automatic mode, the command signals are derived from the comfort strategy in the ATC module. The temperature setting is calculated from the mean of the two temperature settings on the ATC module.
- In the manual mode, the command signals reflect the temperature, distribution and blower speed set by the switches on the ACCM control panel. Temperature control by the auxiliary climate control system may be compromised if the temperature settings on the ATC module are set to maximum hot or cold.

ACCM Harness Connector C0695

E47930

ACCM Harness Connector C0695 Pin Details

Pin No.	Description	Input/Output
1	Power supply from ATC module	Input

Auxiliary Climate Control - Auxiliary Climate Control

Diagnosis and Testing

Principle of Operation

For a detailed description of the auxiliary climate control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Auxiliary Climate Control (412-03 Auxiliary Climate Control, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Auxiliary drive belt condition and tension • Air conditioning compressor condition and installation • Air conditioning condenser condition and installation/blockage • Air conditioning hoses and pipes • Air conditioning receiver/drier condition and installation • Cooling fan 	<ul style="list-style-type: none"> • Fuses • Harnesses • Electrical connector(s) • Relays • Sensors • Control panel(s) • Air conditioning compressor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Poor or no cooling	<ul style="list-style-type: none"> • Auxiliary drive belt fault • Air conditioning compressor fault • Distribution motor/flap fault • Refrigerant leak • In-vehicle temperature sensor fault • Refrigerant pressure sensor fault 	<ul style="list-style-type: none"> • Check the auxiliary drive belt condition and tension (see visual inspection) • Check the compressor operation (observe the compressor as the engine is idling with the air conditioning switched on) • Carry out the distribution motor self test • Using the manufacturer approved diagnostic system, check the Automatic Temperature Control Module (ATC) for related DTCs and refer to the relevant DTC index • Check the refrigerant system using the charging station
Noise	<ul style="list-style-type: none"> • Auxiliary drive belt fault • Air conditioning compressor fault • Air conditioning compressor pulley fouling • Refrigerant overcharged 	<ul style="list-style-type: none"> • Confirm the air conditioning as the source of the noise by listening for the noise with the air conditioning switched off • Check the refrigerant system using the charging station
Water entry into cabin	<ul style="list-style-type: none"> • Heater matrix leak • Blocked evaporator drain tubes 	<ul style="list-style-type: none"> • Check for coolant loss. Pressure test the cooling system as necessary • Check and clear the evaporator drain tubes as necessary

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Automatic Temperature Control Module (ATC) (100-00 General Information, Description and Operation).

Auxiliary Climate Control - Thermostatic Expansion Valve

Removal and Installation

Removal

WARNING: Eye protection must be worn.

1. Remove the climate control assembly.
For additional information, refer to: Auxiliary Climate Control Assembly (412-03, Removal and Installation).

2.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

Remove the TXV assembly.

- Disconnect the electrical connector.
- Remove the 2 bolts.
- Remove the 2 screws.
- Discard the O-ring seals.

Installation

1. Install the TXV assembly.
 - Install new O-ring seals.
 - Install the bolts and tighten to 10 Nm (7 lb.ft).
 - Tighten the screws.
2. Install the climate control assembly.
For additional information, refer to: Auxiliary Climate Control Assembly (412-03, Removal and Installation).

Auxiliary Climate Control - Heater Core

Removal and Installation

Removal

WARNING: Eye protection must be worn.

1. Remove the climate control assembly.
For additional information, refer to: Auxiliary Climate Control Assembly (412-03, Removal and Installation).

E54885

2.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

NOTE: The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

Remove the TXV assembly.

- Disconnect the electrical connector.
- Remove the 2 bolts.
- Remove the 2 screws.
- Discard the O-ring seals.

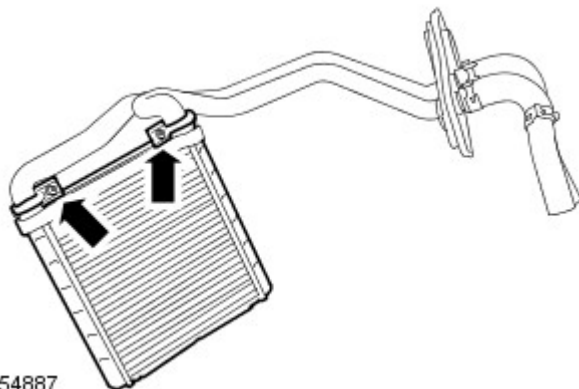

E54886

3.  **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Remove the heater core.

- Carefully release the clips.

E54887

4.  **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the heater core, inlet and outlet pipes.

- Release the 2 clips.
- Discard the O-ring seals.

Installation

1. Connect the heater core inlet and outlet pipes.
 - Install the new O-ring seals.
 - Position and secure in the clips.
2. Install the heater core.

- Install the heater core.
 - Secure in the 2 clips.
- 3. Install the TXV assembly.
 - Install new O-ring seals.
 - Install the bolts and tighten to 10 Nm (7 lb.ft).
 - Tighten the screws.
- 4. Install the climate control assembly.
For additional information, refer to: Auxiliary Climate Control Assembly (412-03, Removal and Installation).

Auxiliary Climate Control - Evaporator Core

Removal and Installation

Removal

 **WARNING:** Eye protection must be worn.

1. Remove the climate control assembly.
For additional information, refer to: Auxiliary Climate Control Assembly (412-03, Removal and Installation).

2.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

 **NOTE:** The receiver drier need only be changed under the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

Remove the TXV assembly.

- Remove the 2 bolts.
- Remove the 2 screws.
- Discard the O-ring seals.
- Disconnect the electrical connector.

3.  **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Remove the heater core.

- Carefully release the clips.

4. Remove 1 screw from the air distribution servo.

5. Separate the climate control unit.
 - Remove the 11 screws.
 - Remove the 6 clips.
 - Release the 7 clips.

E54888

6. Remove the evaporator core.
 - Remove the evaporator end trim.

E54890

Installation

1. Install the evaporator core.
 - Install the evaporator end trim
2. Assemble the climate control unit.
 - Secure the clips.
 - Install the screws.
 - Install the clips.
3. Install the distribution motor.
 - Tighten the screw.
4. Install the heater core.
 - Install the heater core.
 - Secure in the 2 clips.
5. Install the TXV assembly.
 - Install new O-ring seals.
 - Install the bolts and tighten to 10 Nm (7 lb.ft).
 - Tighten the screws.
6. Install the climate control assembly.
For additional information, refer to: Auxiliary Climate Control Assembly (412-03, Removal and Installation).

Auxiliary Climate Control - Auxiliary Climate Control Assembly

Removal and Installation

Removal

WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the LH C-pillar lower trim panel
For additional information, refer to: C-Pillar Lower Trim Panel (501-05, Removal and Installation).
3. Evacuate the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00, General Procedures).
4.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Support the exhaust system. Release the center, left and right rear mountings.

6. Remove the exhaust heat shield.
 - Remove the 4 nuts.

7. Remove the spare wheel and tire.
8. Clamp the relevant hose, to minimise coolant loss.

9.  **CAUTION:** Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

NOTE: The receiver drier need only be changed under

the following circumstances: There is dirt in the refrigerant circuit (eg. compressor seizure). The system is leaking and refrigerant has been lost to atmosphere. Refrigerant circuit has been open more than 24 hours due to repair.

Disconnect the A/C pipes.

- Remove the 2 bolts.
- Discard the O-ring seals.

10.  **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

 **NOTE:** Some fluid spillage is inevitable during this operation.

Disconnect the 2 coolant hoses.

- Position a container to collect the fluid.
- Release the 2 clips.

11. Release the sealing plate.
- Remove the 3 bolts.

12. Remove the climate control assembly.
- Disconnect the 2 electrical connectors.
 - Remove the 3 bolts.

Installation

1. Install the climate control assembly.
 - Tighten the bolts to 10 Nm (7 lb.ft).
 - Connect and secure the electrical connectors.
2. Install the sealing plate.
 - Tighten the bolts to 10 Nm (7 lb.ft).
3. Connect and secure the coolant hoses.
 - Secure the clips.
 - Remove the hose clamps.
4. Connect the A/C pipes.
 - Clean the component mating faces.
 - Install the O-ring seals.
 - Tighten the 2 bolts to 10 Nm (7 lb.ft).

5. Install the heat shield.
 - Tighten the 4 nuts.
6. Secure the exhaust mountings.
7. Fill the A/C system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00, General Procedures).
8. Install the C-pillar lower trim panel.
For additional information, refer to: C-Pillar Lower Trim Panel (501-05, Removal and Installation).
9. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
10. Install the spare wheel and tire.
 - Stow the tool kit.
11. Connect the exhaust extraction hoses to the tail pipes.
12. Remove the coolant expansion tank cap.
 - Top-up the coolant.
13. Start and run the engine.
 - Hold the engine speed at 2,500 RPM for 30 seconds.
 - Return the engine to idle for 30 seconds.
 - Repeat the above procedure a further four times.

14.  **NOTE:** When the coolant bleed is complete and prior to installing the expansion tank cap, top up the expansion tank 30mm above the maximum level.

Install the coolant expansion tank cap.

15. Run the engine until the thermostat opens.
16. Switch the engine off and allow to cool.
17. Check and top-up the coolant if required.

Auxiliary Climate Control - Auxiliary Blower Motor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the LH C-pillar lower trim panel
For additional information, refer to: C-Pillar Lower Trim Panel (501-05, Removal and Installation).

3.  **NOTE:** Note the fitted position.

Remove the blower motor.

- Disconnect the electrical connector.
- Remove the 3 screws.

Installation

1. Install the blower motor.
 - Tighten the screws.
 - Connect and secure the electrical connector.
2. Install the C-pillar lower trim panel.
For additional information, refer to: C-Pillar Lower Trim Panel (501-05, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

Auxiliary Climate Control - Auxiliary Temperature Blend Door Actuator

Removal and Installation

Removal

WARNING: Eye protection must be worn.

1. Remove the climate control assembly.
For additional information, refer to: Auxiliary Climate Control Assembly (412-03, Removal and Installation).

2.  **NOTE:** Note the fitted position.

Remove the blend door motor.

- Disconnect the electrical connector.
- Remove the 3 screws.

Installation

1.  **NOTE:** Align to the position noted on removal.

Install the blend motor.

- Tighten the screws.
- Connect and secure the electrical connector.

2. Install the climate control assembly.
For additional information, refer to: Auxiliary Climate Control Assembly (412-03, Removal and Installation).

Auxiliary Climate Control - Auxiliary Blend Door Actuator

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the LH C-pillar lower trim panel
For additional information, refer to: C-Pillar Lower Trim Panel (501-05, Removal and Installation).

3.  **NOTE:** Note the fitted position.

Remove the air distribution motor.

- Disconnect the electrical connector.
- Remove the 3 screws.

Installation

1.  **NOTE:** Align to the position noted on removal.

Install the distribution motor.

- Tighten the screws.
- Connect and secure the electrical connector.

2. Install the C-pillar lower trim panel.
For additional information, refer to: C-Pillar Lower Trim Panel (501-05, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

Auxiliary Climate Control - Auxiliary Blower Motor Control Module

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the LH C-pillar lower trim panel
For additional information, refer to: C-Pillar Lower Trim Panel (501-05, Removal and Installation).

3.  **NOTE:** Note the fitted position.

Remove the blower motor resistor.

- Disconnect the electrical connector.
- Remove the 2 screws.

Installation

1.  **NOTE:** Align to the position noted on removal.

Install the resistor.

- Tighten the screws.
- Connect and secure the electrical connector.

2. Install the C-pillar lower trim panel.
For additional information, refer to: C-Pillar Lower Trim Panel (501-05, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

Control Components - Control Components

Description and Operation

COMPONENT LOCATIONS

NOTE: right-hand drive (RHD) installation shown; left-hand drive (LHD) installation similar

E 132921

Item	Part Number	Description
1	-	Pollution sensor (Japan only)

2	-	Sunlight sensor
3	-	automatic temperature control (ATC) module
4	-	Center instrument panel switch pack
5	-	Evaporator temperature sensor
6	-	In-vehicle temperature sensor (all except Japan), or in-vehicle temperature and humidity sensor (Japan only)
7	-	Refrigerant pressure sensor
8	-	Ambient air temperature sensor

GENERAL

The control system operates the air conditioning (A/C) system and the heating and ventilation system to control the temperature, volume and distribution of air from the heater.

The system is a dual zone system that automatically adjusts the temperature, volume and distribution of the air from the heater to maintain the individual temperature levels selected for the left-hand (LH) and right-hand (RH) sides of the passenger compartment. The system also has manual overrides for the intake air source, blower speed and air distribution. The system includes:

- An ATC module.
- Center instrument panel switch pack
- An ambient temperature sensor.
- A refrigerant pressure sensor.
- An evaporator temperature sensor.
- An in-vehicle temperature sensor.
- A sunlight sensor.

Vehicles in the Japan market also incorporate:

- A pollution sensor.
- A humidity sensor.

ATC MODULE

E128058

The [ATC \(automatic temperature control\)](#) module is mounted on the outboard end of the air inlet duct, behind the front passenger side of the instrument panel.

The ATC module processes inputs from the center instrument panel switch pack, system sensors and the medium speed controller area network (CAN) bus, then outputs the appropriate control signals to the A/C system and the heating and ventilation system. In addition to controlling the A/C system and the heating and ventilation system, the ATC module also controls the following:

- The front seat heaters.
For additional information, refer to: Seats (501-10, Description and Operation).
- The rear window heater.
For additional information, refer to: Glass, Frames and Mechanisms (501-11, Description and Operation).
- The windshield heater.
For additional information, refer to: Glass, Frames and Mechanisms (501-11, Description and Operation).
- The windshield washer jets and exterior mirror heaters.
For additional information, refer to: Rear View Mirrors (501-09, Description and Operation).

CENTER INSTRUMENT PANEL SWITCH PACK

E132922

Item	Part Number	Description

7	-	Heated rear window switch
8	-	Defrost program switch
9	-	Air recirculation switch
10	-	A/C (air conditioning) control switch
11	-	Blower control switch
12	-	Windshield and side window distribution switch
13	-	Rear environment
14	-	Footwell distribution switch
15	-	Face distribution switch

The switches on the **Center instrument panel switch pack** have the following functions:

- **LH and RH Temperature Switches:** Adjusts the nominal temperature settings of the LH and RH sides of the passenger compartment. The switch can rotate through 270°, between full cold and full hot. The switch surrounds are graduated in 2° increments between 16 and 28 °C. Minor detents define 1 °C steps over the range of the switch. Amber light emitting diode (LED)s in the switch surround illuminate to indicate the temperature setting. When maximum cold is selected, the ATC module also automatically sets the air source to recirculated air, blower speed to maximum and distribution to face. When maximum hot is selected, the ATC module also automatically sets the air source to fresh air, blower speed to maximum and distribution to footwell.
- **LH and RH Seat Heater Switches:** Activates the heater elements in the seat cushion and seat back at one of two heat levels. The first press of the switch energizes the heater elements at the higher heat setting and illuminates two LEDs in the switch. A second press of the switch sets the heater elements to the lower heat setting and extinguishes one of the LEDs. A further press of the switch de-energizes the heater elements and extinguishes the second LED. The seat heaters remain on until selected off or the engine is turned off.
- **Blower Switch:** For manual adjustment of blower speed. The switch can rotate through 240°, from off to maximum speed. Eight primary detents define the off position and seven blower speeds. Minor detents define small steps between the primary detents. When blower speed is manually adjusted, amber LEDs in the switch surround illuminate to indicate the selected blower speed. The LEDs remain off when blower speed is under automatic control.
- **Automatic Mode Switch:** Activates the automatic modes for the A/C system, blower speed and distribution. Separate amber LEDs in the automatic mode switch illuminate to show when the blower and the distribution are in automatic mode. Manually selecting the blower speed or a distribution switch extinguishes the related LED.
- **A/C control switch:** Controls activation of the A/C compressor. Allows the A/C compressor to be selected off for economy operation. A LED (light emitting diode) switch is illuminated when the A/C compressor is selected

- on.
- **Defrost program switch:** Activates a program that automatically selects: inlet air to fresh air; distribution to screen only; blower to speed 5; rear screen heater on; windshield heater on (where fitted), A/C system to automatic mode. An amber LED in the switch is illuminated while the defrost program is active.
 - **Heated windshield switch:** Energizes the windshield heater for a set time period, until the switch is pressed again or until the engine stops, whichever occurs first. An amber LED in the switch is illuminated while the heater is on.
 - **Heated rear window switch:** Enabled only with the engine running. Pressing the switch energizes the rear window heater for a set time period, until the switch is pressed again or until the engine stops, whichever occurs first. An amber LED in the switch is illuminated while the heater is on.
 - **Air recirculation switch:** For selection of fresh or recirculated air. On models without pollution sensing, an amber LED in the switch is illuminated when recirculated air is selected. On models with pollution sensing, the recirculation switch incorporates two amber LED. The first press of the switch sets the recirculation flaps to automatic mode and illuminates one LED. A second press of the switch manually selects recirculated air and illuminates the second LED. A further press of the switch manually selects fresh air and extinguishes the two LEDs.
 - **Distribution Switches (Windshield, Face and Footwell):** For manual selection of air distribution in any combination of windshield, face and footwell outlets. Each switch has a LED which illuminates when the related distribution mode is selected.

AMBIENT AIR TEMPERATURE SENSOR

E43580

The ambient air temperature sensor is a negative temperature coefficient (NTC) thermistor that provides the ATC module with an input of external air temperature. The sensor is attached to a bracket on the rear of the bumper beam, on the vehicle center-line.

REFRIGERANT PRESSURE SENSOR

E43581

The refrigerant pressure sensor provides the ATC module with a pressure input from the high pressure side of the refrigerant system. The refrigerant pressure sensor is located in the refrigerant line between the condenser and the thermostatic expansion valve.

The ATC module supplies a 5 V reference voltage to the refrigerant pressure sensor and receives a return signal voltage, between 0 and 5 V, related to system pressure.

The ATC module uses the signal from the refrigerant pressure sensor to protect the refrigerant system from extremes of pressure and to calculate A/C compressor load on the engine. The ATC module also transmits the A/C compressor load value to the engine control module (ECM), via the medium speed CAN bus, instrument cluster and high speed CAN bus, for use in controlling the speed of the engine cooling fan.

To protect the system from extremes of pressure, the ATC module sets the A/C compressor to the minimum flow position if the pressure:

- Decreases to 1.9 ± 0.2 bar (27.5 ± 3 lbf/in²); the ATC module loads the A/C compressor again when the pressure increases to 2.8 ± 0.2 bar (40.5 ± 3 lbf/in²).
- Increases to 33 ± 1 bar (479 ± 14.5 lbf/in²); the ATC module loads the A/C compressor again when the pressure decreases to 23.5 ± 1 bar (341 ± 14.5 lbf/in²).

EVAPORATOR TEMPERATURE SENSOR

E43582

The evaporator temperature sensor is a NTC thermistor that provides the ATC module with a temperature signal from the downstream side of the evaporator. The evaporator temperature sensor is installed in the right side of the heater assembly casing.

The ATC module uses the input from the evaporator temperature sensor to control the load of the A/C compressor and thus, the operating temperature of the evaporator.

IN-VEHICLE TEMPERATURE SENSOR

E43583

The in-vehicle temperature sensor is a NTC thermistor installed behind a grill in the instrument panel, on the inboard side of the steering column. The sensor is connected to a tube, the other end of which is connected to a venturi on the side casing of the heater. An air bleed from the heater, through the venturi, induces a flow of air down the tube, which draws cabin air through the grill and over the sensor.

HUMIDITY SENSOR (WHERE FITTED)

The humidity sensor is a capacitive device integrated into the in-vehicle temperature sensor (see above).

The humidity sensor element is constructed from film capacitors on different substrates. The dielectric is a polymer which absorbs or releases water proportional to the relative humidity of the air being drawn through the sensor, and thus changes the capacitance of the capacitor. For protection, the sensor element is contained in a nylon mesh cover.

The humidity sensor and the in-vehicle temperature sensor are connected to a PCB (printed circuit board) inside the sensor housing. The PCB is powered by a 5V feed from the ATC module. Separate signals of temperature and relative humidity are transmitted from the PCB to the ATC module.

SUNLIGHT SENSOR

E132923

The sunlight sensor consists of two photoelectric cells that provide the ATC module with inputs of light intensity, one as sensed coming from the left of the vehicle and one as sensed coming from the right. The inputs are a measure of the solar heating effect on vehicle occupants, and are used by the ATC module to adjust blower speed, temperature and distribution to improve comfort. The sensor is installed in the center of the instrument panel upper surface and is powered by a 5V feed from the ATC module.

POLLUTION SENSOR (WHERE FITTED)

E43588

The pollution sensor allows the ATC module to monitor the ambient air for the level of hydrocarbons and oxidized gases such as nitrous oxides, sulphur oxides and carbon monoxide. The sensor is attached to a bracket on the front-end carrier, at the top left corner of the condenser.

The pollution sensor is powered by a battery voltage feed from the ATC module, and returns separate signals of hydrocarbon and oxidized gases.

If there is a fault with the pollution sensor, the ATC module disables the automatic operation of the recirculation door.

SYSTEM OPERATION

A/C Compressor Control

The variable displacement A/C compressor is permanently driven by the engine. The flow of refrigerant through the A/C compressor, and the resultant system pressure and evaporator operating temperature, is regulated by the refrigerant solenoid valve. Operation of the refrigerant solenoid valve is controlled by the ATC module using a 400 Hz pulse width modulation (PWM) signal. The duty cycle of the PWM signal is calculated using the following parameters:

- A/C compressor torque.
- A/C compressor torque maximum.
- A/C cooling status.
- A/C demand.
- A/C refrigerant pressure.
- Ambient air temperature.
- Blower speed.
- Engine cranking status.
- Evaporator temperature.
- Transmission gear status.

When A/C is selected, the ATC module maintains the evaporator at an operating temperature that varies with the in-vehicle cooling requirement. The ATC module increases the evaporator operating temperature, by reducing the refrigerant flow, as the requirement for air cooling decreases, and vice versa. During an increase of evaporator operating temperature, to avoid compromising the dehumidification function, the ATC module controls the rate of temperature increase, which keeps the cabin humidity at a comfortable level.

When the economy mode is selected, the PWM signal holds the refrigerant solenoid valve in the minimum flow position, effectively switching off the A/C function.

The ATC module incorporates limits for the operating pressure of the refrigerant system. When the system approaches the high pressure limit, the duty cycle of the PWM signal is progressively reduced until the system pressure decreases. When the system pressure falls below the low pressure limit, the duty cycle of the PWM signal is held at its lowest setting, so that the A/C compressor is maintained at the minimum stroke, to avoid depletion of lubricant from the A/C compressor. The protection algorithm is calculated at a high rate, to enable early detection of the rapid pressure changes possible if a system fault develops.

A/C Compressor Torque

The ATC module uses refrigerant pressure, evaporator temperature and engine speed to calculate the torque being used to drive the A/C compressor. The calculated value is broadcast on the medium speed CAN bus for the ECM, which uses the calculated value for idle speed control and fueling control. The ATC module also compares the calculated value with a maximum A/C compressor torque value received from the ECM over the medium speed CAN bus. If the calculated value exceeds the maximum value, the ATC module signals the refrigerant solenoid valve to reduce the refrigerant flow and so reduce the torque being used to drive the A/C compressor. By reducing the maximum A/C compressor cooling torque value, the ECM is able to reduce the load on the engine when it needs to maintain vehicle performance or cooling system integrity.

Idle Speed Control

In order to maintain A/C cooling performance, the ATC module requests an increase in engine idle speed if the evaporator temperature starts to rise while the refrigerant solenoid valve is already set to the maximum flow rate. The increase in engine idle speed is requested in three stages, using a medium speed CAN bus message to the ECM. For additional information, refer to:

- Electronic Engine Controls (303-14A, Description and Operation),
- Electronic Engine Controls (303-14B, Description and Operation),
- Electronic Engine Controls (303-14C, Description and Operation).

The need for a change in idle speed is determined as follows:

- If the evaporator temperature increases by 3 °C (5.4 °F), or to 6 °C (10.8 °F) above the target operating temperature, over a 10 seconds period, the first stage of idle speed increase is requested.
- When the first stage of idle speed increase is set, if the evaporator temperature increases by 3 °C (5.4 °F), or increases to 12 °C (21.6 °F) above the target operating temperature, over a 9 seconds period, the second stage of idle speed increase is requested.
- When the second stage of idle speed increase is set, if the evaporator temperature increases by 3 °C (5.4 °F), or increases to 15 °C (27 °F) above the target operating temperature, over a 10 seconds period, the third stage of idle speed increase is requested.
- When an idle speed increase is set, if the evaporator temperature decreases by 3 °C (5.4 °F) over a 10 seconds period, the next stage down of idle speed increase is requested.

Electrical Load Management

The ATC module manages the vehicle electrical loads to:

- Maintain the vehicle battery in a healthy state of charge.
- Ensure adequate power is available for defrost demisting during engine warm-up.
- Ensure adequate power is available for A/C during extended periods with the engine at idle speed.
- To maintain system voltage within acceptable limits.
- To provide adequate power to meet customer expectations.

Electrical load management is achieved by increasing the engine idle speed and controlling the electrical load of systems that do not affect the driveability or safety of the vehicle.

During the engine warm-up period, the ATC module manages the electrical load to make sure that the battery voltage is maintained above a pre-determined level. The battery voltage level that is maintained and the duration of the start period varies with ambient air temperature and engine coolant temperature (ECT). After the engine warm-up period, the ATC module manages the electrical load to make sure that the requested electrical load does not exceed the generator output.

The duration of the engine warm-up period depends on the ambient air temperature and the ECT, as detailed in the following table:

Engine Warm-up Times

Ambient Air Temperature, °C (°F)	ECT, °C (°F)			
	<10 (<50)	>10 to <30 (>50 to <86)	>30 to <60 (>86 to <140)	>60 (>140)
	Warm-up Period, Minutes			
>10 (>50)	15	15	15	15
>5 to <10 (>41 to <50)	15	15	15	15
>0 to <5 (>32 to <41)	10	15	15	15
>-10 to <0 (>14 to <32)	10	10	15	15
<-10 (<14)	5	5	10	15

The ATC module calculates the electrical load from the battery voltage and generator output voltage, and compares the result against the maximum load available from the generator. The calculation is averaged across the first 20 seconds after the engine starts, and subsequently averaged every 60 seconds. When the engine is turned off, the ATC module stores the status of the electrical load management for 20 seconds. If the engine is re-started within the 20 seconds, the ATC module resumes electrical load management using the stored status. If the engine is re-started after the 20 seconds, the timers are reset and the ATC module re-calculates the status.

If the electrical load is more than the maximum load available, the ATC module requests an increase of engine idle speed using the medium speed CAN bus message to the ECM. If an electrical load imbalance remains after an increase in engine idle speed, or if the electrical load is more than the capacity of the charging system, the ATC module reduces the electrical load by reducing the power of some vehicle systems or inhibiting their operation. The number of systems controlled depends on the electrical load reduction required. The systems controlled and the order in which their power is reduced or they are inhibited are contained in three priority tables. The table used depends on the ambient air temperature, battery temperature and ECT:

- The cold start table is used when the ambient air temperature is less than 5 °C (41 °F) and the ECT is less than 30 °C (86 °F).
- The hot start table is used when the ambient air temperature is 5 °C (41 °F) or more and the ECT is less than 30 °C (86 °F).
- The continuous table is used when battery temperature is more than 5 °C (41 °F) and the ECT is more than 50 °C (122 °F).
- If none of the above conditions are met, the ATC module adopts the last used table.

Cold Start Electrical Load Management

Priority		System
Power Reduction	Inhibited	
1	-	Air suspension
2	-	Front seat heaters
3	-	Entertainment system
-	4	Front seat heaters
5	-	Rear window heater
6	-	Windshield washer jet and exterior mirror heaters
-	7	Windshield washer jet and exterior mirror heaters
8	-	Windshield heater
9	-	Climate control blower
-	10	Rear window heater
-	11	Windshield heater

Hot Start Electrical Load Management

Priority		System
Power Reduction	Inhibited	
-	1	Front seat heaters; windshield washer jet and exterior mirror heaters
2	-	Windshield heater
3	-	Rear window heater
4	-	Air suspension
5	-	Entertainment system
-	6	Windshield heater
-	7	Rear window heater

Continuous Electrical Load Management

Priority		System
Power Reduction	Inhibited	
-	1	Front seat heaters
2	-	Windshield heater
3	-	Rear window heater
4	-	Air suspension
5	-	Entertainment system

Engine idle speed changes, and electrical load changes of systems not under direct control of the ATC module (air suspension and entertainment), are initiated using the appropriate medium speed CAN bus message. When partial operation is requested:

- The air suspension system still performs height changes but reduces air compressor operation by not replenishing the reservoir.
- The entertainment system restricts the maximum volume level and reduces the output frequency bandwidth.

Cooling Fan Control

The ATC module determines the amount of condenser cooling required from the refrigerant pressure, since there is a direct relationship between the temperature and pressure of the refrigerant. The cooling requirement is transmitted to the ECM in a medium speed CAN bus message. The ECM controls the condenser cooling using the cooling fan. For additional information, refer to:

- Electronic Engine Controls (303-14A, Description and Operation),
- Electronic Engine Controls (303-14B, Description and Operation),
- Electronic Engine Controls (303-14C, Description and Operation).

Air Temperature Control

Air from the evaporator enters the heater assembly, where temperature blend doors direct a proportion of the air through the heater core to produce the required discharge air temperature. The two temperature blend doors operate independently to enable independent temperature selection for the left and right sides of the vehicle interior. The temperature blend doors are operated by stepper motors. The stepper motors are controlled by the ATC module.

The ATC module calculates the stepper motor position required to achieve the selected temperature and compares it against the current position, which is stored in memory. If there is any difference, the ATC module signals the stepper motor to adopt the new position.

Air temperature is controlled automatically unless maximum heating or maximum cooling is selected. The required air temperature may be adjusted between 16 °C (61 °F) and 28 °C (82 °F) using the air temperature control switches. The control algorithms then attempt to maintain the desired set temperature.

Turning the temperature switches fully counterclockwise gives maximum available cooling. Turning the temperature switches fully clockwise gives maximum available heating. When maximum cooling or maximum heating is selected, the comfort algorithm adopts an appropriate strategy for the air distribution, blower speed,

A/C and air source functions, except where a function is under manual control.

The temperature control of one zone can be compromised by the other zone being set to maximum heating or maximum cooling. True maximum heating or maximum cooling can only be obtained with both controls set to the same maximum state.

When the economy mode is selected, the automatic temperature control function still operates, but with no cooling capability the minimum discharge temperature achievable will be ambient air temperature plus any heat pick up in the air intake path.

Air Distribution Control

When the A/C is in the automatic mode, the ATC module automatically controls air distribution according to a comfort strategy. Automatic control is overridden when one of the manual modes is selected. Air distribution remains manually controlled until the automatic mode is selected again. The distribution doors are operated by two stepper motors, which are controlled by the ATC module.

Blower Control

When A/C is selected or the blower speed is manually selected, the ATC module energizes the coil of the blower relay in the battery junction box (BJB). The energized blower relay supplies battery power to the blower motor, which is grounded through the blower control module. The speed of the blower is controlled by a PWM signal from the ATC module to the blower control module. The blower control module regulates the blower motor voltage in relation to the PWM signal.

When the blower is in the automatic mode the ATC module determines the blower speed required from the comfort algorithms. When the blower is in the manual mode, the ATC module operates the blower at one of seven fixed speeds as selected on the center instrument panel switch pack.

Maximum Defrost

The maximum defrost function automatically provides the maximum defrosting of the vehicle. When the maximum defrost function is selected, the ATC module configures the control system as follows:

- Automatic mode off.
- Air inlet to fresh air, manual control.
- Selected temperature unchanged, automatic control.
- Air distribution set to screen mode, manual control.
- Blower speed set to speed 5, manual control.
- Rear screen heater and windshield heater (if applicable) selected on.
- A/C mode in automatic.

The maximum defrost function is cancelled by one of the following:

- Selecting any distribution switch. The system response will be identical to the normal manual distribution control operation.
- Selecting the automatic switch. This will restore the system to fully automatic operation.
- Selecting the maximum defrost switch again. This returns the system to the state in use immediately before the maximum defrost function was first selected.
- Turning the engine off.

The blower speed can be adjusted manually without terminating the maximum defrost function.

Intake Air Control

The source of intake air is automatically controlled unless overridden by manual selection of recirculation. Under automatic control the ATC module determines the required position of the recirculation door from the comfort strategy and the input from the pollution sensor (if fitted). The recirculation door is operated by an electric motor, which is controlled by hardwired analogue signals from the ATC module. A potentiometer in the motor supplies the ATC module with a position feedback signal for closed loop control.

Provided the intake air has not been manually selected to recirculation, the ATC module adjusts the recirculation door to reduce the ram effect produced by the forward motion of the vehicle.

When the ignition switch is turned off, the ATC module evaluates the ambient air temperature. If the ambient air temperature is less than a pre-determined value, the intake air source is set to recirculation, to prevent the ingress of damp air while the vehicle is parked.

When the vehicle is in the transportation mode, the ATC module sets the intake door to recirculation every time the engine is turned off, regardless of the ambient air temperature.

Pollution Sensing

With a pollution sensor fitted to the vehicle, the ATC module controls the intake air source to reduce contamination of the intake air by external pollutants. This function is fully automatic, but can be overridden by manual selection of the intake air source.

Humidity Sensing

With a humidity sensor fitted, the ATC module controls the moisture content of the air in the vehicle. This is achieved by raising the evaporator temperature to increase the humidity of the air entering the vehicle, and reducing the evaporator temperature to reduce the humidity of the air entering the vehicle.

Front Seat Heaters

The front seat heaters are enabled when Power mode 6 engaged, and operate at one of two temperature settings. With the first press of a front seat heater switch the ATC module adopts the higher temperature setting, supplies a power feed to the related front seat heater elements and illuminates two amber LEDs in the switch. At the second press of the switch the ATC module adopts the lower temperature setting and extinguishes one of the LEDs. At the third press of the switch the ATC module de-energizes the heater elements and extinguishes the second LED. The seat heaters remain on until selected off or the engine is turned off.

The ATC module receives an input from a temperature sensor in each front seat, and regulates the power feed of the heater elements to control the seat temperature at the appropriate temperature setting between 35 and 45 °C (95 and 113 °F). The actual temperature settings vary with the type of seat covering, to allow for the different heat conduction properties of the different materials.

When the front seat heaters are activated at the higher temperature setting, the ATC module automatically resets them to the lower temperature after a time delay. The length of the time delay depends on the in-vehicle temperature.

Temperature Reset Time Delay

In-vehicle Temperature, °C (°F)	< -15 (5)	-15 to -10 (5 to 14)	-10 to 0 (14 to 32)	0 to 15 (32 to 59)	15 to 25 (59 to 77)	>25 (77)
Time Delay, minutes	Remains at higher temperature until manually de-selected	20	15	10	5	3

To protect the heater elements, the ATC module disables front seat heating if battery voltage exceeds 16.5 ± 0.3 V for more than 5 seconds. Front seat heating is re-enabled when battery voltage decreases to 16.2 ± 0.3 V.

The ATC module monitors the power feeds to the heater elements and disables the applicable front seat heating if a short or open circuit is detected. The ATC module also disables seat heating if the seat temperature rises significantly above the target temperature setting.

The plausibility of the temperature sensor inputs is also monitored by the ATC module. When seat heating is selected, if one of the temperature sensor inputs is within 5 °C (9 °F) below the target temperature, the ATC module monitors the sensor input for a temperature increase and checks that it is between the minimum and maximum working temperatures. If a temperature sensor input is at the high end of the working range, while the ambient air temperature and the engine temperature are within 10 °C (18 °F) of each other, the ATC module disables front seat heating until the input decreases below the target temperature setting. The ATC module interprets a temperature sensor input value of -45 °C (-49 °F) or below as an open circuit, and temperature sensor input value of 100 °C (212 °F) or more as a short circuit.

Rear Window Heater

The ATC module controls operation of the rear window heater using medium speed CAN messages to operate the rear window heater relay in the central junction box (CJB). The control module in the CJB interprets the CAN messages and switches the ground connection of the relay coil to operate the rear window heater. While the rear window heater relay is energized, a battery power feed is connected to the rear window heater elements. Rear window heater operation is only enabled when the engine is running.

The ATC module operates the rear window heater in heating cycles of varying power and time. The heating cycle used depends on the ambient air temperature and whether it is the initial or subsequent operation during the current Power mode cycle.

When the rear window heater switch is pressed, the ATC module illuminates an LED in the switch and initiates the appropriate heating cycle. The LED remains illuminated until the rear window heater is selected off, the heating cycle is completed or the engine stops. If the engine stalls or turned off, rear window heating resumes if the engine is re-started within 20 seconds.

On the initial selection of rear window heating, the ATC module uses a short or long defrost phase at full power, followed by a low power phase. The defrost phase used depends on the ambient temperature. During the low power phase, the rear window heater relay is cycled off for 80 seconds and on for 40 seconds.

On subsequent operations, during the same Power mode cycle, the ATC module operates the rear window heater at full power for a fixed time period.

Rear Window Heating Phases

Phase	Time, minutes
Short defrost (-5°C (23°F) and above)	10
Long defrost (less than -5°C (23°F))	15
Low power	20
Subsequent operation	10

Windshield Heater

The ATC module controls operation of the windshield heater using the windshield heater relay in the BJB. The ATC module switches the ground connection of the relay coil to operate the windshield heater. While the windshield heater relay is energized, a battery power feed is connected to each of the two windshield heater elements. Windshield heater operation is only enabled when the engine is running.

The ATC module operates the windshield heater in heating cycles of varying power and time. The heating cycle used depends on the ambient air temperature and whether it is the initial or subsequent operation during the current

Power mode cycle.

When the windshield heater switch is pressed, the ATC module illuminates a LED in the switch and initiates the appropriate heating cycle. The LED remains illuminated until the windshield heater is selected off, the heating cycle is completed or the engine stops. If the engine stalls or turned off, windshield heating resumes if the engine is re-started within 20 seconds.

On the initial selection of the windshield heater, the ATC module uses a short or long defrost phase at full power, followed by a low power phase. The defrost phase used depends on the ambient temperature. During the low power phase, the windshield heater relay is cycled off for 80 seconds and on for 40 seconds.

On subsequent operations, during the same Power mode cycle, the ATC module operates the windshield heater at full power for a fixed time period.

Windshield Heating Phases

Phase	Time, minutes
Short defrost (-5 °C (23 °F) and above)	3
Long defrost (less than -5 °C (23 °F))	5
Low power	10
Subsequent operation	3

Control Components - Control Components

Diagnosis and Testing

Principle of Operation

For a detailed description of the climate control system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Control Components (412-04 Control Components, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Front End Accessory Drive (FEAD) belt • Refrigerant • Heater control flaps • Ducting • Cabin air filter • Coolant level • Compressor • Cooling fan 	<ul style="list-style-type: none"> • Fuses • Electrical harnesses • Harness connectors • Blower motor • Cooling fan • Actuators

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Climate Control Module (HVAC) (100-00, Description and Operation).

Control Components - Ambient Air Temperature Sensor

Removal and Installation

Removal

1. Remove the front spoiler.
For additional information, refer to: Front Bumper Lower Cover (501-19, Removal and Installation).
2. Remove the ambient air temperature sensor.
 - Disconnect the electrical connector.
 - Release the clip.

Installation

1. To install, reverse the removal procedure.

Control Components - Climate Control Assembly

Removal and Installation

Removal

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

Make sure that the gear selector lever is in position N before removing any components.

1. Refer to: Floor Console Upper Section (501-12, Removal and Installation).

2. Torque: 2.5 Nm

3.  CAUTION: When installing the lower locating tang of the trim panel, make sure the floor console is not damaged. If necessary protect the surrounding areas using masking tape.

NOTES:

LHD illustration shown, RHD is similar.

Remove in the sequence shown.

To install, reverse the removal sequence.

Removal and Installation

Removal

1. Remove the glove compartment.
For additional information, refer to: Glove Compartment (501-12, Removal and Installation).

2. Remove the passenger side closing trim panel.
 - Release the clip.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

3. Remove the passenger side footwell duct.
 - Remove the clip.

4. Remove the passenger side footwell duct elbow.
 - Remove the 2 Torx screws.

5. Remove the defrost vent/register blend door actuator.
 - Disconnect the electrical connector.
 - Remove the 2 screws.

Installation

1. Install the defrost vent/register blend door actuator.
 - Tighten the screws to 1 Nm.
 - Connect the electrical connector.
2. Install the passenger side footwell duct elbow.
 - Tighten the screws.
3. Install the passenger side footwell duct.
 - Install the clip.
4. Install the passenger side closing trim panel.
 - Install the interior lamp.
 - Connect the electrical connector.
 - Secure the clip.
5. Install the glove compartment.
For additional information, refer to: Glove Compartment (501-12, Removal and Installation).

Control Components - Defrost Vent/Register Blend Door Actuator RHD AWD

Removal and Installation

Removal

1. Remove the instrument panel driver side reinforcement.
For additional information, refer to: Instrument Panel Driver Side Reinforcement (501-12, Removal and Installation).

2. Remove the driver side footwell duct.
 - Remove the 2 Torx screws.

3. Remove the defrost door actuator.
 - Disconnect the electrical connector.
 - Remove the 2 screws.

Installation

1. Install the defrost door actuator.
 - Tighten the screws.
 - Connect the electrical connector.
2. Install the driver side footwell duct.
 - Tighten the screws.
3. Install the instrument panel driver side reinforcement.
For additional information, refer to: Instrument Panel Driver Side Reinforcement (501-12, Removal and Installation).

Control Components - Driver Side Temperature Blend Door Actuator LHD AWD

Removal and Installation

Removal

1. Remove the instrument panel driver side reinforcement.
For additional information, refer to: Instrument Panel Driver Side Reinforcement (501-12, Removal and Installation).

2.  **NOTE:** RHD illustration shown, LHD is similar.

Remove the driver side footwell duct.

- Remove the 2 Torx screws.

3.  **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Remove the temperature blend door actuator.

- Disconnect the electrical connector.
- Remove the 3 screws.

Installation

1. Install the temperature blend door actuator.
 - Tighten the screws to 1 Nm.
 - Connect the electrical connector.
2. Install the driver side footwell duct.
 - Tighten the screws.
3. Install the instrument panel driver side reinforcement.
For additional information, refer to: Instrument Panel Driver Side Reinforcement (501-12, Removal and Installation).

Control Components - Driver Side Temperature Blend Door Actuator RHD AWD

Removal and Installation

Removal

1. Remove the instrument panel driver side reinforcement.
For additional information, refer to: Instrument Panel Driver Side Reinforcement (501-12, Removal and Installation).

2. Remove the driver side footwell duct.
 - Remove the 2 Torx screws.

3. Remove the temperature blend door actuator.
 - Disconnect the electrical connector.
 - Remove the 2 screws.

Installation

1. Install the temperature blend door actuator.
 - Tighten the screws.
 - Connect the electrical connector.
2. Install the driver side footwell duct.
 - Tighten the screws.
3. Install the instrument panel driver side reinforcement.
For additional information, refer to: Instrument Panel Driver Side Reinforcement (501-12, Removal and Installation).

Control Components - Instrument Panel Blend Door Actuator LHD AWD

Removal and Installation

Removal

1. Remove the instrument panel driver side reinforcement.
For additional information, refer to: Instrument Panel Driver Side Reinforcement (501-12, Removal and Installation).

E54954

2.  **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Remove the driver side footwell duct.

- Remove the 2 Torx screws.

E54647

3.  **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Remove the instrument panel blend door actuator.

- Disconnect the electrical connector.
- Remove the 2 screws.

Installation

1. Install the instrument panel blend door actuator.
 - Tighten the screws to 1 Nm.
 - Connect the electrical connector.
2. Install the driver side footwell duct.
 - Tighten the screws.
3. Install the instrument panel driver side reinforcement.
For additional information, refer to: Instrument Panel Driver Side Reinforcement (501-12, Removal and Installation).

Control Components - Instrument Panel Blend Door Actuator RHD AWD

Removal and Installation

Removal

1. Remove the glove compartment.
For additional information, refer to: Glove Compartment (501-12, Removal and Installation).

2. Remove the passenger side closing trim panel.
 - Release the clip.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

E47530

3. Remove the passenger side footwell duct.
 - Remove the clip.

E54648

4. Remove the passenger side footwell duct elbow.
 - Remove the 2 Torx screws.

E54649

5. Remove the instrument panel blend door actuator.
 - Disconnect the electrical connector.
 - Remove the 2 screws.

Installation

1. Install the instrument panel blend door actuator.
 - Tighten the screws.
 - Connect the electrical connector.
2. Install the passenger side footwell duct elbow.
 - Tighten the screws.
3. Install the passenger side footwell duct.
 - Install the clip.
4. Install the passenger side closing trim panel.
 - Install the interior lamp.
 - Connect the electrical connector.
 - Secure the clip.
5. Install the glove compartment.
For additional information, refer to: Glove Compartment (501-12, Removal and Installation).

Control Components - In-Vehicle Temperature Sensor

Removal and Installation

Removal

1. Fully extend the steering column for access.
2. Remove the instrument panel access panel.
 - Release the 2 clips.

E51369

3. Remove the steering column upper shroud.
 - Release the 6 clips.

E46946

4. Remove the steering column lower shroud.
 - Remove the 3 Torx screws.
 - Release the steering column adjustment lever.

E46947

5. Remove the center console upper finisher trim.

E123215

6. Remove the audio unit bezel.

E123217

7. Remove the instrument panel centre finisher.

E122691

E55223

8. Release the steering column gaiter panel.
 - Remove the 2 Torx screws.
 - Release the 2 clips.

9. Remove the in-vehicle temperature sensor.
 - Release the 2 clips.
 - Disconnect the electrical connector.
 - Disconnect the hose.

E55224

Installation

1. Install the in-vehicle temperature sensor.
 - Connect the hose.
 - Connect the electrical connector.
 - Secure the clips.
2. Install the steering column gaiter panel.
 - Secure with the clips.
 - Tighten the Torx screws.
3. Install the instrument panel centre finisher.
4. Install the audio unit bezel.
5. Install the center console upper finisher trim.
6. Install the steering column shrouds.
7. Install the instrument panel access panel.

Control Components - Passenger Side Temperature Blend Door Actuator LHD AWD

Removal and Installation

Removal

1. Remove the glove compartment.
For additional information, refer to: Glove Compartment (501-12, Removal and Installation).

2.  **NOTE:** RHD illustration shown, LHD is similar.

Remove the passenger side closing trim panel.

- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.

3.  **NOTE:** RHD illustration shown, LHD is similar.

Remove the passenger side footwell duct.

- Remove the clip.

4.  **NOTE:** RHD illustration shown, LHD is similar.

Remove the passenger side footwell duct elbow.

- Remove the 2 Torx screws.

5. Remove the temperature blend door actuator.
 - Disconnect the electrical connector.
 - Remove the 3 screws.

Installation

1. Install the temperature blend door actuator.
 - Tighten the screws to 1 Nm.
 - Connect the electrical connector.
2. Install the passenger side footwell duct elbow.
 - Tighten the screws.
3. Install the passenger side footwell duct.
 - Install the clip.
4. Install the passenger side closing trim panel.
 - Connect the electrical connector.
 - Tighten the screws.
 - Secure the clip.
5. Install the glove compartment.
For additional information, refer to: Glove Compartment (501-12, Removal and Installation).

Control Components - Passenger Side Temperature Blend Door Actuator RHD AWD

Removal and Installation

Removal

1. Remove the glove compartment.
For additional information, refer to: Glove Compartment (501-12, Removal and Installation).

2. Remove the passenger side closing trim panel.
 - Release the clip.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

3. Remove the passenger side footwell duct.
 - Remove the clip.

4. Remove the passenger side footwell duct elbow.
 - Remove the 2 Torx screws.

5. Remove the temperature blend door actuator.
 - Disconnect the electrical connector.
 - Remove the 3 screws.

Installation

1. Install the temperature blend door actuator.
 - Tighten the screws.
 - Connect the electrical connector.
2. Install the passenger side footwell duct elbow.
 - Tighten the screws.
3. Install the passenger side footwell duct.
 - Install the clip.
4. Install the passenger side closing trim panel.
 - Install the interior lamp.
 - Connect the electrical connector.
 - Secure the clip.
5. Install the glove compartment.
For additional information, refer to: Glove Compartment (501-12, Removal and Installation).

Control Components - Recirculation Blend Door Actuator LHD AWD

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Make the SRS system safe.
For additional information, refer to: Standard Workshop Practices (100-00, Description and Operation).
3. Remove the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12, Removal and Installation).

E91604

4.  **NOTE:** RHD illustration shown, LHD is similar.

Remove the recirculation blend door actuator.

- Disconnect the electrical connector.
- Remove the 3 screws.

Installation

1. Install the recirculation blend door actuator.
 - Align the control arm to the recirculation blend door.
 - Install the 3 screws.
 - Connect the electrical connector.
2. Install the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12, Removal and Installation).
3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

Instrument Cluster -

Description	Nm	lb-ft
Steering column switch assembly	3	2

Instrument Cluster - Instrument Cluster

Description and Operation

OVERVIEW

The instrument cluster incorporates large speedometer and tachometer gauges, the instrument cluster also incorporates a TFT (thin film transistor) 5" high-definition display unit.

Instrument cluster overview

E123742

Item	Part Number	Description
1	-	Tachometer
2	-	Clock
3	-	Message center
4	-	External temperature
5	-	Speedometer
6	-	Fuel gauge
7	-	Total distance odometer and trip recorder
8	-	Gear selector position display
9	-	Temperature gauge

The TFT display incorporates a 'Message Center' that communicates vehicle information and status data to the driver. Menus displayed in the message center allow access to a number of vehicle functions through the guidance of the message center menus. The driver operates the message center using the 'menu control' located on the right-hand-side of the steering wheel.

The instrument cluster features a number of warning indicators, where in addition to those located within the speedometer and tachometer gauges, another six indicators are positioned within the TFT unit above the message center.

DESCRIPTION

Warning Indicators – ROW Diesel Shown

E123743

Item	Part Number	Description
1	-	Automatic high beam active warning - green
2	-	Anti-lock Brake System (ABS) warning - amber
3	-	Brake system warning – amber
4	-	Brake system warning - red
5	-	Park brake system warning - red
6	-	Left-hand turn signal indicator - green
7	-	Warning/information - amber
8	-	Glow plug warning / Low fuel warning (dual function indicator) – amber
9	-	Check engine MIL warning - amber
10	-	Charge indicator - red
11	-	Oil pressure warning - red
12	-	Critical warning - red
13	-	Right-hand turn signal indicator - green
14	-	Side lamps - green
15	-	Seat belt warning - red
16	-	Adaptive Speed Control active - amber
17	-	Adaptive Front lighting System (AFS) warning - amber
18	-	Rear fog lamps active - amber
19	-	Tire pressure monitoring warning - amber
20	-	Speed control active - green
21	-	Ambient light sensor (reference only)
22	-	Forward alert active - green
23	-	Hill Descent Control (HDC) active - green
24	-	Airbag warning secondary - amber
25	-	Front fog lamps active - green
26	-	High beam warning - blue
27	-	Dynamic Stability Control (DSC) off warning - amber
28	-	Low range selected - green
29	-	Security Light Emitting Diode (LED) - red
30	-	Trailer warning - green
31	-	Dynamic Stability Control (DSC) active warning - amber

Warning Indicators – NAS Gasoline Shown

E123745

Item	Part Number	Description
1	-	Automatic high beam active warning - green
2	-	Anti-lock Brake System (ABS) warning - amber
3	-	Brake system warning USA only – amber/red
4	-	Brake system warning Canada only - amber/red
5	-	Park brake system warning Canada only - red
6	-	Park brake system warning USA only – red
7	-	Left-hand turn signal indicator - green
8	-	Warning/information - amber
9	-	Glow plug warning / Low fuel warning (dual function indicator) – amber
10	-	Check engine MIL warning - amber
11	-	Charge indicator - red
12	-	Oil pressure warning - red
13	-	Critical warning - red
14	-	Right-hand turn signal indicator - green
15	-	Side lamps - green
16	-	Seat belt warning - red
17	-	Adaptive Speed Control active - amber
18	-	Adaptive Front lighting System (AFS) warning - amber
19	-	Rear fog lamps active - amber
20	-	Tire pressure monitoring warning - amber
21	-	Speed control active - green
22	-	Ambient light sensor (reference only)
23	-	Forward alert active - green
24	-	Hill Descent Control (HDC) active - green
25	-	Airbag warning secondary - amber
26	-	Front fog lamps active - green
27	-	High beam warning - blue
28	-	Dynamic Stability Control (DSC) off warning - amber
29	-	Low range selected - green
30	-	Security Light Emitting Diode (LED) - red
31	-	Trailer warning - green
32	-	Dynamic Stability Control (DSC) active warning - amber

Stepper motors are used to actuate the mechanical speedometer and tachometer gauges to provide a smooth and progressive response.

The warning indicators above the message center are functioned using Thin Film Transistor (TFT) technology. LEDs

are used to illuminate the warning indicators in the speedometer and tachometer gauges and provide backlight illumination of the instrument cluster.

A single ambient light sensor is used to measure cabin lighting and adjust the backlight brightness of the instrument cluster accordingly. The instrument cluster also incorporates an anti-glare coating.

When the vehicle is locked the TFT unit goes off. When the vehicle is unlocked, a welcome screen is displayed featuring a Land Rover logo and an image of the vehicle, together with the current date and odometer information.

The coolant temperature and fuel quantity gauges are the default display when the stop/start button is pressed. These can be overwritten by different permutations of screens which are available to cover numerous vehicle functions through a menu selection. Refer to the 'Information and Message Center' section for further information.

Message Center

E123746

Item	Part Number	Description
1	-	Warning Indicators – this area cannot be overwritten by other information
2	-	Message Center – this area can be overwritten by other information
3	-	Gear Selection and Digital Speedometer Display - this area cannot be overwritten by other information

OPERATION

Control Diagram

NOTE: **A** = Hardwired; **D** = High Speed CAN; **N** = Medium Speed CAN; **O** = LIN Bus;

- LIN (local interconnect network) bus connections

However, some vehicle sensors are hardwired directly to the instrument cluster.

The steering lock control module is connected to a hardwired connection to the instrument cluster. Security information from other control modules is passed via the network buses and when the conditions are correct the instrument cluster instructs the steering lock control module to unlock the steering column.

The clockspring is connected to the instrument cluster on a LIN bus connection. The LIN bus passes driver selections made on the steering wheel mounted switches to the instrument cluster for processing and transmission to other control modules.

Instrument Cluster - Instrument Cluster

Description and Operation

The instrument cluster fitted to the armoured vehicle is the same as that fitted to the standard vehicle except that the [SRS \(supplemental restraint system\)](#) warning indicator remains illuminated. For additional information, refer to: Air Bag Supplemental Restraint System (SRS) (501-20B, Description and Operation).

Instrument Cluster - Instrument Cluster

Diagnosis and Testing

Principles of Operation

For a detailed description of the instrument cluster system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of damage.

Visual Inspection

Electrical
<ul style="list-style-type: none"> • Battery • Fuses • Wiring harness • Damaged, loose or corroded connectors • Controller Area Network (CAN) circuits • Instrument Cluster (IPC) • Central Junction Box (CJB) • Engine Control Module (ECM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Instrument Cluster (IPC) (100-00, Description and Operation).

Instrument Cluster - Instrument Cluster

Removal and Installation

Removal

1. Fully extend the steering column for access.
2. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
3. Remove the steering wheel.
4. Remove the headlamp switch trim panel.
For additional information, refer to: Driver Side Register Trim Panel (412-01, Removal and Installation).
5. Remove the instrument panel access panel.
 - Release the 2 clips.

E51369

6. Remove the steering column upper shroud.
 - Release the 6 clips.

E46958

7. Remove the steering column lower shroud.
 - Remove the 3 Torx screws.
 - Disconnect the electrical connectors.

E122693

8. Remove the audio unit control trim panel.
 - Remove the 2 retaining screws.

E122690

9. Remove the steering column side trim panel.
 - Release the clips.
 - Disconnect the electrical connector.

E122691

10. Disconnect the 2 electrical connectors from the steering column multifunction switches.

E47072

11. Disconnect the 2 electrical connectors from the clockspring.

E47073

12. Remove the steering column switch assembly.
 - Remove the 4 Torx bolts.

E47080

E47118

13. Remove the steering column gaiter panel.
- Remove the 2 Torx screws.
 - Release the 2 clips.

14. Remove the instrument cluster trim panel.
- Release the 2 clips.
 - Release the 2 retaining tangs.

E122724

15. Remove the instrument cluster.
- Remove the 2 Torx screws.
 - Remove the 2 retaining screws.
 - Disconnect the electrical connector.

E 122694

Installation

1. Install the instrument cluster.
 - Connect the electrical connector.
 - Tighten the screws.
2. Install the instrument cluster trim panel.
 - Secure the 2 clips.
 - Secure the 2 tangs.
3. Install the steering column gaiter panel.
 - Secure with the clips.
 - Tighten the Torx screws.
4. Install the steering column switch assembly.
 - Tighten the Torx bolts to 3 Nm (2 lb.ft).
5. Connect the clockspring and multifunction switch electrical connectors.
6.  **CAUTION:** When installing the lower locating tang of the trim panel, make sure the floor console is not damaged. If necessary protect the surrounding areas using masking tape.

NOTES:

To install, reverse the removal sequence.

Make sure that all the clips are correctly installed.

Install the steering column side trim panel.

- Secure with the clip.
 - Connect the electrical connector.
7. Install the audio unit control trim panel.
 - Install the 2 retaining screws.
 8. Install the steering column shrouds.
 - Tighten the Torx screws.
 9. Install the instrument panel access panel.
 - Secure with the clips.
 10. Install the headlamp switch trim panel.
For additional information, refer to: Driver Side Register Trim Panel (412-01, Removal and Installation).
 11. Install the steering wheel.
 12. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

13. Using the diagnostic tool, configure the instrument cluster.

Instrument Cluster - Instrument Cluster Lens

Removal and Installation

Removal

CAUTION: Make sure that the dial indicators are not moved during the removal and installation of the lens. If this occurs, you must not attempt to reset them using your hands as this will affect the calibration of the instrument cluster and will require a full instrument cluster calibration to be carried out.

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Refer to: Instrument Cluster (413-01, Removal and Installation).

E142894

2.  **CAUTION:** To prevent static damage to the circuits, place the instrument cluster inside the electro static discharge bag and use the gloves provided during this procedure.

E141966

3.  **NOTE:** Gently release by pressing down on the white part of the clips.

4.  **CAUTION:** Take care not to damage the circuit board.

NOTE: Gently release by pressing down on the black part of the clips.

E141967

E141969

Installation

E141967

5. Remove the instrument cluster lens from the electro discharge bag and discard.

1.  **CAUTION:** Take care not to damage the circuit board.

Gently install the clips.

2. Gently install the clips and remove the instrument cluster from the electro discharge bag.

E141966

E142895

3. Copy the serial number, build date and assembly number from the old label onto the new label.

4. Refer to: Instrument Cluster (413-01, Removal and Installation).

Horn - Horn

Description and Operation

E140010

Item	Part Number	Description
1	-	Steering wheel horn switches
2	-	Central Junction Box (CJB)
3	-	Horns
4	-	Clockspring

GENERAL

Two horns are fitted to the vehicle; a high tone and a low tone. The horns are mounted on bracket, which is attached centrally to the front end carrier assembly.

The horns are operated by pressing one of the two horn switches, located on each side of the driver airbag, on the steering wheel.

The horns are also used by the vehicle alarm system. When the alarm system requires the horns to operate, the Central Junction Box (CJB) provides a ground, closing the relay contact which in turn supplies battery voltage to operate the horns.

For additional information, refer to: Anti-Theft - Active (419-01A, Description and Operation).

The horn circuit is permanently connected to battery voltage and therefore the horns can be operated at any time, irrespective of ignition switch position.

The horns are controlled by the CJB.

Horn - Horn

Description and Operation

Siren

Overview

When activated the siren emits either a 'wail' or 'yelp' tone to alert other road users of the vehicle's presence; in a similar manner to emergency service vehicles.

The siren system comprises:

- a siren speaker located behind the front bumper on right-hand side of the vehicle;
- an amplifier located under the driver's seat;
- a siren switch located in the auxiliary switch pack.

Siren speaker

System Operation

The siren is activated when both the:

- ignition switch is 'On', and
- the siren switch, in the auxiliary switch pack, is 'On'.

A status lamp in the siren switch will illuminate when in the 'On' position.

Siren switch with integrated status lamp

E101581

When activated the siren operates via the amplifier in one of two modes, emitting either a 'wail' or a 'yelp' tone.

Siren amplifier (underneath driver's seat)

E102924

Siren tone selection is controlled by the vehicle horn button on the steering wheel:

- A single press and each subsequent single press on the horn button will alternate the siren's 'wail' and 'yelp' tones.
- Two presses in quick succession will silence the siren.
- Pressing the horn button when the siren is in silent mode will restart the siren.

Vehicle horn button

E101583

When the siren switch, in the auxiliary switch pack, is in the 'Off' position the vehicle horn will function as normal.

The electrical system for the siren is supplied by the auxiliary battery, via the armoured vehicle options harness and 20 amp fuse (F2) in the satellite junction box.

For additional information, refer to: Battery and Cables (414-01, Description and Operation).

Satellite junction box with siren fuse (F2) highlighted

E101582

NOTE: The supplementary circuit diagrams for the armoured vehicle are located in Land Rover GTR at: Service Information, Discovery 3, 2008 Electrical Circuit Diagrams.

Horn - Horn

Diagnosis and Testing

Principles of Operation

For a detailed description of the horn system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Horn (413-06 Horn, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Warning Devices - Blindspot Monitoring System

Description and Operation

COMPONENT LOCATION

E161549

Item	Part Number	Description
1	-	Right side door mirror
2	-	Right side Blindspot Monitoring Control Module (BMCM)
3	-	Left Side BMCM
4	-	Left side door mirror

OVERVIEW

Blindspot Monitoring System

Eliminating blindspots is a major element in vehicle body design, but because of the structural requirements, blindspots cannot be entirely eliminated, so the blindspot monitoring system is there to help assist the driver safely crossover in moving traffic.

The blindspot monitoring system comprises off:

- Left BMCM (blindspot monitoring control module).
- Right BMCM.
- Left side door mirror assembly.
- Right side door mirror assembly.

The system uses two radar sensors; they are incorporated in each of a BMCM's, that are located at the rear of the

vehicle (one module each side) and are connected via a private **CAN (controller area network)** bus to exchange information.

Closing Vehicle Sensing

In addition to the functionality provided by the blindspot monitoring system, the closing vehicle sensing system monitors a larger area behind the vehicle.

If a vehicle is identified by the system as being a fast approaching vehicle, it will inform the driver.

Reverse Traffic Detection (RTD)

The RTD (reverse traffic detection) system is a further enhancement to the blindspot monitoring system. It will inform the driver if a vehicle is approaching when in the reversing manoeuvre.

DESCRIPTION

Blindspot Monitoring Control Module (BMCM)

There are two BMCM (blindspot monitoring control module)'s and they are located in the corner of the rear bumper, one on each side.

Each BMCM has an 8 way connector that has power, ground, MS (medium speed) **CAN** bus wires, two private CAN wires and two hard wire connections; one for the status light and one for the alert icon in the mirror.

Each BMCM carries out an auto-alignment self-check every time when in use. This procedure can take up to an hour in some environments; however the operation of the blindspot monitoring system will continue to operate as normal.

Each module will detect a vehicle in the driver's blindspot. Once the vehicle is detected the module illuminates an amber warning 'alert icon' **LED (light emitting diode)** in the relevant exterior door mirror.

If the system displays 'blindspot not available' and there is a misalignment trouble code in the system, the physical sensors must be checked for mounting and body work should be checked for damage or repair.

The blind spot monitoring modules receive vehicle speed on the MS CAN. The system activates at 8mph (13km/h) and remains active until the speed lowers below 3mph (5km/h).

CAUTION: The blindspot monitoring system is designed as a driver aid not a safety device. The driver should always exercise due care and attention whilst driving.

Closing Vehicle Sensing

The closing vehicle sensing system also uses the radar sensors in both BMCM (blindspot monitoring control module)'s.

It uses the same radar signal that allows the BMCM (blindspot monitoring control module)'s to monitor the larger area behind the vehicle.

Reverse Traffic Detection (RTD)

The RTD (reverse traffic detection) system again uses the radar sensors in both BMCM (blindspot monitoring control module)'s.

The radar signal monitors the sides of the vehicle and detects a vehicle if approaching.

OPERATION

Blindspot Monitoring Control Module (BMCM)

The blindspot monitoring system uses a cross over radar pattern to the rear of the vehicle and is used to determine actual moving vehicles eliminating any stationary roadside objects.

The system monitors an area extending from the exterior mirrors rearwards, to approximately 6 metres behind the rear wheels, and up to 2.5 metres from the side of the vehicle.

The driver will be alerted, with a solid warning lamp in the relevant door mirror.

The system will warn the driver of the presence of vehicles in a defined closing vehicle warning zone, which poses a threat to the driver if a lane change manoeuvre is made.

The driver will be notified of the threat by flashing the existing blindspot icon in the relevant door mirror.

NOTE: If an overtaking vehicle is detected on both sides of the vehicle simultaneously, the warning alert icons in both mirrors will illuminate.

The LED's are located towards the outside extremity of the mirror face, within the peripheral view of the driver but not in any area of the mirror where they could obscure or distract from the image.

1

2

E97753

Item	Part Number	Description
1	-	Warning alert icon
2	-	System status warning indicator

The LED lighting alerts are as follows:

- Amber alert LED icon permanently lit - System operational, vehicle detected in blind spot area.
- No LED's lit – System active no vehicle detected in blind spot area.
- Amber status LED permanently lit - System not active or faulty.
- Amber alert LED icon flashing – System operational, potential hazard.

The system has operating limitations and is automatically turned off under certain operating conditions. During these operating conditions the amber status LED is permanently lit.

The system operating limitations are as follows:

- The system is inactive until vehicle speed is greater than 8mph – 13kph (amber status LED permanently lit).
- The system is inactive if an approved trailer is connected to the vehicle (amber status LED permanently lit).
- The system is inactive when reverse gear or park is selected (amber status LED permanently lit).

NOTE: If RTD (reverse traffic detection) is fitted the standby dot will be off when reverse is selected indicating that the system is active. If RTD is not fitted then the standby dot will be on indicating that the system is not active.

If either of the radar signals are blocked or distorted, for example by water, the radar face of the module is covered in mud, sleet or snow the system may detect this and be disabled with the amber status LED permanently lit together with a 'blindspot monitoring blocked' message displayed in the IC (instrument cluster) message center. The system is disabled until the blockage is cleared.

If there is a fault in the system the amber status LED is permanently lit and a 'blindspot monitoring not available' message displayed in the IC message center. The system is disabled until the fault is rectified.

System fault and blockage warnings are as follows:

- The system is disabled when the radar module signal is blocked (amber status LED permanently lit and IC message).
- The system is disabled by a fault (amber status LED permanently lit and IC message).

If there is a failure in the communication network and the warning LED cannot be displayed in the mirror, a failure message will be displayed in the IC message center.

When any faults are present in the system, DTC (diagnostic trouble code)'s are stored in both BCM's appropriate to each module. Replacement of modules requires the right module to be configured using the Land Rover approved diagnostic equipment.

Calibration of the modules using the Land Rover approved diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

Closing Vehicle Sensing

The closing vehicle sensing system operates in the same principle as blindspot monitoring however; close vehicle sensing will monitor a larger area extending from the back of the of the blindspot monitoring zone, to approximately 70 metres behind the rear wheels, and up to 2.5 metres from the side of the vehicle.

E161551

This is to alert the driver to the presence of rapidly approaching vehicle beyond the blindspot.

When a vehicle is detected by the system, the following LED lighting sequence will occur:

- Amber alert LED icon flashing – System operational, potential hazard.

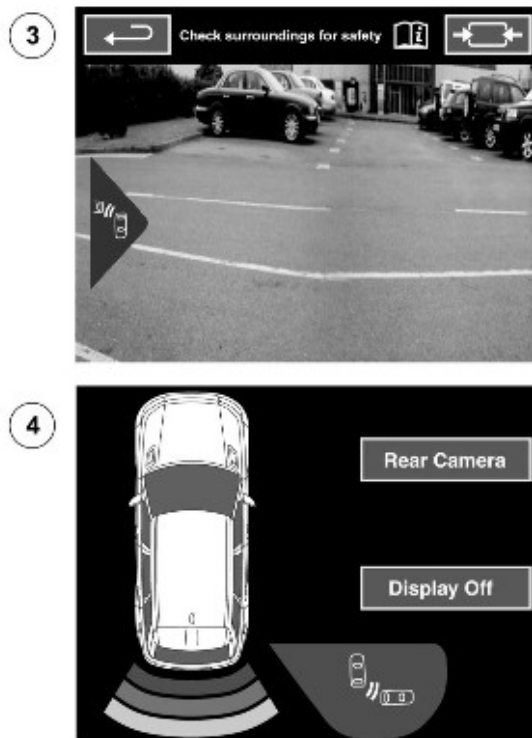

E161552

Item	Part Number	Description
1	-	Warning alert icon

Reverse Traffic Detection (RTD)

The RTD (reverse traffic detection) operates when in reverse gear only and will inform the driver when a less than 3 second time to collision is detected.

An amber warning icon will flash in the relevant exterior mirror and an audible warning will be emitted to indicate the presence of a moving vehicle. The driver is also informed of this with a visual view in the touch screen.

E155963

Item	Part Number	Description
1	-	Warning alert icon
2	-	System status warning indicator
3	-	Rear View Camera (RVC) screen
4	-	Parking aid screen

The RVC (rear view camera) and parking aid screen will also show a warning on the relevant side or sides of which a vehicle is approaching on.

The RTD system will automatically disable if any of the radars become partially or completely obscured. The amber warning indicator dot will illuminate in the exterior mirrors and the message 'Reverse Traffic Sensor Blocked' appears

in the Message centre.

Warning Devices - Low Tire Pressure Module

Removal and Installation

Removal

NOTE: If the tire pressure module is to be replaced then T4 must be connected and the correct procedures adhered to, prior to battery disconnection.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the LH A-pillar upper trim panel.
For additional information, refer to: A-Pillar Trim Panel (501-05, Removal and Installation).
3. Remove the LH B-pillar upper trim panel.
For additional information, refer to: B-Pillar Upper Trim Panel (501-05, Removal and Installation).
4. Remove the LH C-pillar upper trim panel.
For additional information, refer to: C-Pillar Upper Trim Panel (501-05, Removal and Installation).
5. Remove the LH sun visor.
 - Remove the cover.
 - Remove the 2 screws.
 - Disconnect the electrical connector.

E49766

6. Remove the sun visor retaining clip.
 - Release the screw cover.
 - Remove the screw.

E49688

7. Remove the LH passenger assist handles.
 - Carefully release the 6 screw covers.
 - Remove the 6 screws.

E49689

E55550

E49769

8. Release the LH side of the headliner.
 - Release the 6 clips.

9. Remove the low tire pressure module.
 - Disconnect the 2 electrical connectors.
 - Remove the 2 bolts.

Installation

1. Install the low tire pressure module.
 - Tighten the bolts to 10 Nm (7 lb.ft).
 - Connect the electrical connectors.
2. Secure the LH side of the headliner.
 - Carefully secure the clips.
3. Install the LH passenger assist handles.
 - Install the screws.
 - Install the screw covers.
4. Install the sun visor retaining clip.
 - Install the screw.
 - Install the screw cover.
5. Install the LH sun visor.
 - Install the screws.
 - Install the screw covers.
 - Connect the electrical connector.
6. Install the LH C-pillar upper trim panel.
 For additional information, refer to: C-Pillar Upper Trim Panel (501-05, Removal and Installation).

7. Install the LH B-pillar upper trim panel.
For additional information, refer to: B-Pillar Upper Trim Panel (501-05, Removal and Installation).
8. Install the LH A-pillar upper trim panel.
For additional information, refer to: A-Pillar Trim Panel (501-05, Removal and Installation).
9. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

Engine Protection System -

Torque Specifications

Description	Nm	lb-ft
Passive anti-theft system (PATS) module bolts	10	7

Engine Protection System - Engine Protection System

Description and Operation

Fire Suppression System

Overview

The purpose of the fire suppression system is to extinguish engine compartment fires. It is an independent system with no interface with the other vehicle systems.

The fire suppression system comprises:

- An operating panel with integral control module and 9 volt battery power supply.
- A manually operated 'Fire' switch mounted in the floor console.
- A four-litre capacity, non-pressurized cylinder; the cylinder contains a fire suppressing foam.
- A gas-generator cartridge fitted to the cylinder.
- A fire detection cable mounted on the underside of the engine compartment lid; the cable incorporates a temperature sensor.
- Six fire suppression nozzles located in the engine compartment.

The non-pressurized cylinder contains an Aqueous Film Forming Foam; a water-based synthetic foam, able to coat the surface of hydrocarbon based liquids, therefore suffocating the flames.

WARNING: Aqueous Film Forming Foam can cause irritation if it comes into contact with the eye or skin.

Fire suppressant system

Item	Part Number	Description
A	-	Left-hand-drive (LHD) vehicle (identical to RHD module, except as shown).
B	-	Right-hand-drive (RHD) vehicle.
1	-	Control panel, control module and battery
2	-	Cylinder and gas-generator cartridge
3	-	Foam carrying tube
4	-	Fire detection cable
5	-	Fire suppressant nozzle (6 off)

The system is controlled by the fire suppression control module, which monitors the temperature sensor in the fire detection cable. Should the temperature in the engine compartment reach a trigger threshold due to a fire, the control module sends an initiation signal to the gas-generator cartridge. This cartridge in turn sends a pressure charge into the cylinder containing the Aqueous Film Forming Foam; forcing the foam from the cylinder. The cylinder outlet is connected to tubes which carry the foam to the fire suppressant nozzles strategically positioned in the engine compartment.

The fire suppression system can also be activated manually by pressing the red 'Fire' button mounted in the floor console.

Manual 'Fire' button

E101886

WARNINGS:

Always refer to the manufactures instructions when conducting maintenance on the fire suppression system.

Failure to follow the manufacturer's instructions can damage or degrade the fire suppression system.

Unauthorized modifications to the fire suppression system are not permitted.

System Operation

Fire Suppression Control Panel and Module

The control module monitors the temperature sensor in the fire detection cable and automatically initiates the fire suppression system should a fire occur in the engine compartment.

The control module will also initiate the fire suppression system if the red 'Fire' button, mounted in the floor console, is pressed.

Fire suppressant control panel

Item	Part Number	Description
1	-	Access panel to control panel
2	-	Cylinder
3	-	Control panel, module and battery
4	-	Gas generator cartridge

WARNINGS:

The fire suppression system will only operate if the key located in the control panel is turned to the 'System Armed' position.

The key in the control panel must be turned to the 'Off/Check' position prior to any maintenance or repair procedures being performed on the fire suppression system. Failure to do this could cause the system to activate.

System Check

WARNING: A system check must be performed weekly.

System check:

- Insert the security key and turn to the 'Off/Check' position.
- Press and hold down the red 'Check' button on the control panel; release once the panel light response (see below) has been noted.

Panel light response:

- Yellow light flashing - battery in good condition.
- Yellow light showing dim glow – replace the battery.

WARNING: If in doubt replace the battery.

- Green light – gas generator cartridge in good condition.
- Green light does not illuminate – the fire suppressant cylinder must be refilled and the gas generator cartridge must be replaced.

WARNING: At this point DO NOT turn the key in the control panel to the 'System Armed' position as this will allow the system to detonate.

- Inside the vehicle, lift up the transparent cover on the manual 'Fire' button and press the button: a sounder will emit a pulsing tone.
- Red light on the control panel – electrical continuity is good.

This concludes the check procedure. Turn the key to the 'System Armed' position and remove the key.

Components

Fire Detection Cable

The fire detection cable comprises two metallic strips, separated by a small air gap. The condition of the metallic strips is constantly monitored by the fire suppression control module. If a fire develops in the engine compartment and the temperature exceeds 180°C, the metallic strips start to melt and come into contact with each other. Sensing this, the control module introduces the Aqueous Film Forming Foam into the engine compartment via the fire suppression nozzles.

Fire detection cable

E101888

Cylinder and Gas Generator Cartridge

The non-pressurised cylinder has a four-litre capacity; refer to the 'fire suppressant control panel' graphic. The gas generator cartridge provides the propulsion to deliver the Aqueous Film Forming Foam from the cylinder, through the fire suppression nozzles and into the engine compartment. Operation of the gas generator cartridge is controlled by the control module via a hardwired electrical connection.

Fire Suppression Nozzles

Six fire suppression nozzles are strategically positioned to spray Aqueous Film Forming Foam delivered from the cylinder into the engine compartment. The nozzles are positioned as shown in the graphic.

Fire suppression nozzles

E101885

NOTE: Refer to the 'fire suppressant system' graphic, for the position of the nozzles in a left-hand-drive vehicle.

OVERVIEW

Parking Aid

The parking aid system provides an audible warning to the driver when any obstacles are in the path of the vehicle during forward or reverse parking manoeuver.

The system consists off:

- PACM (parking aid control module).
- Parking aid switch.
- Four ultrasonic sensors in the front bumper.
- Four ultrasonic sensors in the rear bumper.

During low speeds, the PACM uses the ultrasonic sensors to monitor the area around the front and rear bumpers. If an object is detected within a monitored area, the module then outputs a warning using the audio system speakers. The sensors can detect solid objects such as posts, walls and other vehicles. Objects very close to the ground may not be detected, but because of their low height may not cause damage to the vehicle.

CAUTION: When washing the vehicle do not aim high pressure water jets directly at the sensors. Do not use

abrasive materials or hard/sharp objects to clean the sensors. Only use approved vehicle shampoo.

Camera Systems

CAUTION: It remains the driver's responsibility to detect obstacles and estimate the vehicle's distance from them when reversing.

The RVC (rear view camera) and Proximity cameras provides additional information to the driver when reversing the vehicle. When reverse gear is selected the camera or cameras, automatically displays a wide-angle colour image of the view from the rear of the vehicle or rear, front and sides of the vehicle onto the touch screen.

Wade Sensing System

The wade sensing system feature provides intuitive information of the vehicles capability during wading through water. The purpose is to assist the average driver whilst driving through water, particularly when the visibility is poor.

The GPSM (general proximity sensor module) hosts software to deliver the wade sensing functionality using two downward facing, door mirror mounted ultrasonic sensors that are connected to the GPSM, which provide the input signals to the GPSM which measure the reflection from the water surface to calculate the depth of the water through which the vehicle is travelling.

DESCRIPTION

Parking Aid Control Module (PACM)

E156975

The PACM (parking aid control module) is located in the left rear quarter panel, behind the side trim panel of the luggage compartment.

The PACM has two connectors which provide power, ground and HS (high speed) CAN (controller area network) bus connections, front parking aid sensors and rear parking aid sensors.

The HS CAN chassis bus connections provide for the receipt of the following information from other systems:

- ABS (anti-lock brake system) module - Road speed signal.
- TCM (transmission control module) - Reverse gear engaged signal.

The PACM also outputs messages on the HS CAN bus. The GWM (gateway module) processes these messages and converts them into MS (medium speed) CAN bus messages, which are sent to the TS (touch screen). The TS converts then converts the MS CAN comfort messages into MOST (media orientated system transport) signals. These signals are then used by the AAM (audio amplifier module) to emit the applicable warning tones from the front or rear audio speakers when an object is detected by the front or rear parking aid sensors. A warning tone can also be emitted to alert the driver to a fault in the parking aid system.

Parking Aid Switch

E122823

The parking aid switch is located in the center console. It is a non-latching with an integral LED (light emitting diode). The switch receives a 12v output to drive the LED when required. The switch is also connected to ground.

When the switch is operated, the momentary completion of the ground is interpreted by the PACM (parking aid control module) as a signal to enable or disable the parking aid system.

NOTE: The parking aid switch allows the driver to activate or deactivate the parking aid system if operation is required or not required.

General Proximity Sensor Module (GPSM)

The GPSM (general proximity sensor module) incorporates a software, which is able to provide the wade sensing functionality.

The GPSM (general proximity sensor module) is located in the passenger compartment, behind the rear left seat bolster trim panel, above the CCM (camera control module).

The GPSM has two connectors which provide for power, ground and HS (high speed) CAN bus connections, and the sensors in the door mirrors.

The control module is able to transmit and receive the following important information on the HS CAN chassis bus:

- +/- offset from the ISCM (integrated suspension control module).
- Water depth to the TS (touch screen) and IC (instrument cluster), via the GWM (gateway module).

When the vehicle is started, the GPSM receives the CCF (car configuration file) from the CJB (central junction box), then the CJB energizes the extended ignition relay in the EJB (engine junction box). The ignition relay supply the GPSM with power, and it is ready to operate.

The GPSM has a diagnostic connection via the HS CAN bus to enable faults to be retrieved using the Land Rover approved diagnostic equipment. Additionally an OBD (on-board diagnostic) routine within the GPSM constantly monitors the system and alerts the driver to a system fault by emitting a 3 second continuous tone through the front audio speakers when the ignition is switched on.

Camera Control Module (CCM)

E117975

The CCM (camera control module) is located under the passenger front seat.

Connections to the module include:

- MS (medium speed) CAN bus network.
- Five camera inputs.
- Video signal output to the TS (touch screen).
- Power supply and ground.

The CCM gathers the camera images and analyses and alters them by adjusting perspectives and applying corrections. The resulting processed images are then relayed to the TS via the NTSC (national television system committee) analogue video line.

The CCM also adds guidance and warning overlays to the camera images to create the various driving-aid features

supported by the camera proximity system; for example, visual direction is made available when reversing the vehicle.

The CCM communicates with each individual camera via the LIN (local interconnect network) bus connection. This data link transmits diagnostic information, for example camera serial numbers and fault notifications to the control module. Camera adjustments, for instance a correction to colour-balance are also communicated via the LIN bus link to the camera.

In addition to the data lines, the camera receives a power supply and a ground from the CCM.

NOTE: Care must be taken when routing, disconnecting and reconnecting the camera harnesses.

Cameras

CAUTION:

Rear View Camera

E161312

Rear View Camera Coverage Zone

E161313

Item	Part Number	Description
1	-	Rear camera coverage zone

The RVC (rear view camera) is located in the tailgate external handle.

The RVC is a VGA (video graphics array) resolution analogue camera that provides an image covering a zone approximately 130° wide by 112° deep and is capable of capturing approximately thirty frames per second. An electrical connector on the camera provides power, ground, MS (medium speed) CAN bus and shielded co-axial cable connections. The co-axial cable connection is used for video image transmission between the camera and the TS (touch screen).

The camera provides additional information to the driver when reversing the vehicle. When reverse gear is selected the camera automatically displays a wide-angle colour image of the view from the rear of the vehicle on the TS. Overlay graphics are displayed by a combination of signals received on the MS CAN by the TS.

The positioning accuracy of the camera is crucial for successful operation, therefore care must be taken when installing a cameras to ensure it sits correctly in the bracket. In the event of camera replacement, a calibration routine must be performed.

Proximity Cameras

E161314

E161315

Item	Part Number	Description
1	-	Front proximity camera coverage zone
2	-	Right door mirror proximity camera coverage zone
3	-	Rear proximity camera coverage zone
4	-	Left door mirror proximity camera coverage zone

The proximity camera system has 5 cameras that are located in the following:

- One camera is located in the tailgate external handle.
- Two cameras are located in the front bumper.
- One camera is mounted in each door mirror.

The proximity camera system uses VGA (video graphics array) resolution cameras, that are permanently powered whenever the ignition is 'on'. Each camera provides an image covering a zone approximately 130° wide by 112° deep and is capable of capturing approximately thirty frames per second.

The cameras employ high-quality digital, HDR (high dynamic range) imaging, which is a set of techniques that allows a greater range of luminance between light and dark areas of an image scene. This allows HDR to more accurately represent the varying intensity levels found in the image scenes that can range from direct sunlight to deep shadows.

Camera Mounting

To reduce the cost of accident repair the mounting of the front bumper cameras feature a 'snap free' bracket. On impact, the bracket will release the camera preventing damage to the camera itself. Depending on the severity of the accident it may also be possible to reuse the brackets as they are manufactured from a memory type plastic.

The positioning accuracy of all the cameras is crucial for the successful operation of the proximity camera system. The camera housings are manufactured using metal to maintain a structural stability in high-ambient temperatures. Without this stability a loss of image focus would be a possibility, therefore care must be taken when mounting the cameras in ensuring they sit correctly into their locations. Secure mounting of the cameras provides an initial 'build up' tolerance accurate to 2 mm. In the event of camera replacement, a calibration routine must be performed.

OPERATION

Parking Aid System

If reverse (R) is the first gear selected after the ignition is switched on, both the front and rear parking aid sensors will become operational. When a forward drive gear is subsequently selected, all of the rear parking aid sensors are de-activated; all of the front parking aid sensors remain operational until vehicle speed increases above 16 km/h (10 mph), park (P) is selected or the parking aid switch is pressed.

If drive (D) is the first gear selected after the ignition is switched on, the front parking aid sensors can be activated by pressing the parking aid switch.

NOTE: The parking aid systems can not be activated while the vehicle is in park (P).

Audible Warnings

The PACM (parking aid control module) processes the distance readings from the parking aid sensors to determine if there are any objects within the detection areas. If there are no objects no audible warning will be emitted. If an object is detected, repeated audible warnings are emitted via the audio system speakers. The time delay between the audible warnings decreases as the distance between the detected object and the vehicle decreases until eventually a continuous tone is emitted from the audio system speakers.

The volume output of the parking aid audible tones can be adjusted using the audio volume control when the parking aid system is activate. The volume can also be adjusted from the TS (touch screen) home menu by selecting Setup, System, Volume presets, Parking aid, then using the + or - soft keys.

Object Detection

E161316

A = Maximum Detection Range; B = Continuous Audio Range

Item Number	Sensor Location	Maximum Detection Range	Audio Tone	Continuous Audio Tone
1	Front/Rear Outer	Approximately 600mm (24 inches)		Approximately 300mm (12 inches)
2	Rear Inner	Approximately 1800mm (71 inches)		Approximately 300mm (12 inches)
3	Front Inner	Approximately 800mm (31 inches)		Approximately 300mm (12 inches)

In the combined mode, the sensors emit a series of ultrasonic impulses and then switch to receiver mode to receive the echo reflected by an obstacle within the detection range. The received echo signals are amplified and converted from an analogue signal to a digital signal by the sensor. The digital signal is passed to the PACM (parking aid control

module) and compared with pre-programmed data stored in an EEPROM (electrically erasable programmable read only memory) within the PACM. The PACM receives this data via the signal line from the sensor and calculates the distance from the object using the elapsed time between the transmitted and received impulse. The duration of the impulse is determined by the module, with the sensor controlling the frequency of the impulse output.

In receiver mode, the sensor receives impulses that were emitted by adjacent sensors. The module uses this information to precisely determine the position and distance of the object.

If no objects are detected there are no further warning tones. If an object is detected, repeated audible tones are emitted from either the front or rear audio speakers as appropriate. The time delay between the tones decreases as the distance between the object and the vehicle decreases, until, at approximately 300 mm (front outer and all rear sensors) or 500 mm (front inner sensors), the audible tone becomes continuous.

When approaching several objects within detection range, the control module recognizes the distance from the vehicle to the nearest object.

The PACM will prioritize the objects detected, the nearest object detected will take priority and the corresponding audio outputs will be emitted. For example if 2 objects are detected (one front one rear) the nearest detected object will take priority and the relevant audible tone will be produced.

If two objects are detected at equal distance (one front one rear) the audible tones will alternate between the front and rear audio speakers.

Diagnostics

The PACM (parking aid control module) has a diagnostic connection via the HS (high speed) CAN bus to enable faults to be retrieved using the Land Rover approved diagnostic equipment. Additionally an OBD routine within the PACM constantly monitors the system and alerts the driver to a system fault by emitting a 3 second continuous tone through the front audio speakers when the ignition is switched on. The parking aid switch LED will also flash 6 times when reverse gear is selected or the parking aid switch is pressed.

Rear View Camera

The RVC (rear view camera) receives power at all times when the ignition is on or the engine is running. When R is selected, the rear view camera receives a reverse gear selected signal from the TCM via the HS (high speed) CAN bus. The camera then sends a MS (medium speed) CAN message to the TS (touch screen) to display the image.

When R is deselected, the camera image remains on the touch screen for 5 seconds after the transmission has been put into D, P, N or S. This is to prevent the touch screen switching between screens if the vehicle is being maneuvered into a parking space. If the vehicle forward speed exceeds 16 km/h (10 mph) within the 5 second period, the camera image is removed from the TS.

If the touch screen is switched off, the camera image will be automatically displayed when reverse gear is selected. When reverse gear is deselected and the 5 second period has expired, the TS will revert back to its switched off state.

The rear view images are overlaid with:

- Dashed lines representing the perimeter of the vehicle.
- Solid lines representing the predicted trajectory of the vehicle; calculated from the steering wheel angle sensor.
- Coloured bars representing the distance between the vehicle and the object being approached. Working in conjunction with the rear parking aid sensors, this adds a visual representation to the existing audible warning. The distance data is received from the PACM (parking aid control module) via the MS CAN.

E161317

Item Part Number Description

A	-	Solid line: The projected path based on current steering wheel position.
B	-	Dotted line: The safe working width of the vehicle (including exterior mirrors).
C	-	Luggage compartment access guideline: Do not reverse beyond this point if luggage compartment access is required.
D	-	Parking aid sensor activation: A coloured area appears, to indicate which rear parking aid sensors have been activated.

System Fault

In the event of camera fault, a [DTC \(diagnostic trouble code\)](#) is logged in the camera and an icon is presented to the driver on the TS (touch screen) where the camera image would normally be viewed.

Proximity Camera

The proximity camera system provides the driver with a visual-aid when maneuvering the vehicle at low speeds. The system uses the CCM (camera control module) to capture the camera data and display the resulting images on the TS (touch screen), providing the driver with a 360° view around the vehicle. The camera system is also supported by various driving-aid features where graphical information and warnings are superimposed onto the images displayed on the TS.

Automatic Operation

NOTE: The following is applicable for all vehicles markets except Japan.

- When reverse gear is selected the rear camera view is shown.
- The images will automatically switch off when the vehicle speed exceeds 18Km/h (11 mph) or a forward gear has been selected for more than five seconds.

NOTE: The following is applicable for Japanese vehicle specifications.

- When either 'Drive' or 'Reverse' are selected, the relevant camera view for direction of movement is shown.
- When 'Reverse' is selected, the rear camera and right door mirror camera views will be shown.
- When 'Drive' is selected, the front camera and right door mirror camera views will be shown.
- The images will automatically switch off when the vehicle speed exceeds 18 km/h (11 mph), the automatic camera function will only operate once per ignition cycle.

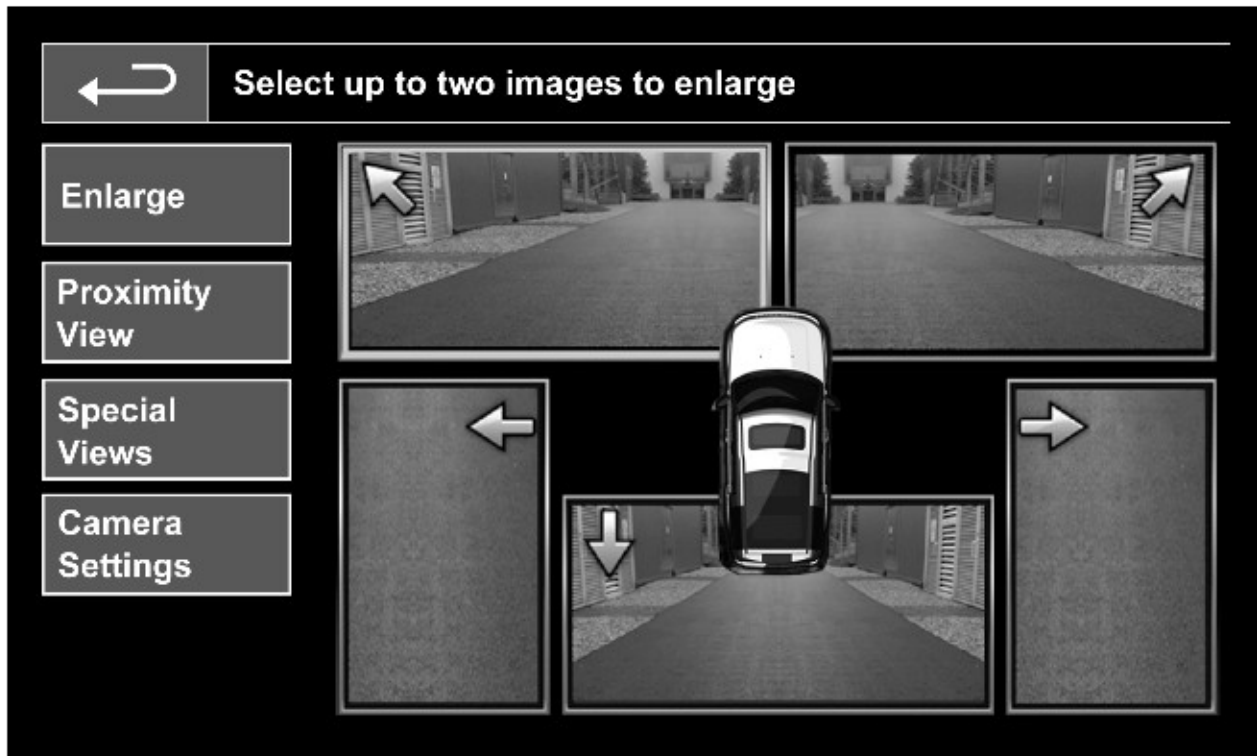

Manual Operation

- The camera views can be accessed by selecting the 'Cameras' icon on the 'Navigation' home screen on the TS (touch screen).

Selecting Views

Camera settings soft key is only visible on Japanese specification vehicles.

Camera home screen frame rate is reduced to 15 frames per second, all other camera views are shown at 30 frames per second.

E161318

- Displayed on the home page are real-time images transmitted from each of the five cameras.
- Any two of the images can be selected and enlarged to view side-by-side on the screen.
- When viewing any two images, any single image can then be selected to view as a full screen image which can be zoomed and panned around using the magnifier and arrow icons.

Manual Proximity View

Selecting proximity view from the camera home screen will display a combination of three images from the front passenger side cameras. These images provide the driver with an enhanced view of the area forward and opposite the driver.

Proximity Camera System

The proximity camera view images are overlaid with:

- Dashed lines representing the perimeter of the vehicle.
- Solid lines representing the predicted trajectory of the vehicle; calculated from the steering angle sensor.
- Coloured bars represent the amount of distance between the vehicle and the object being approached. Working in conjunction with the standard 'rear parking aid' this adds a visual representation to the existing audible warning. The distance data is received from the CCM (camera control module) through the MS (medium speed) CAN bus.

The reversing-aid graphics can be disabled in the settings menu or by touching the TS (touch screen) whilst reverse gear is selected and the camera view is displayed.

Reversing Visual Warnings

E148937

Item	Part Number	Description
1	-	Object being approached - 'Yellow Strip' with steady intermittent warning tone
2	-	Object being approached - 'Orange Strip' with faster intermittent warning tone
3	-	Object being approached - 'Red Strip' with continuous warning tone

The rear view image will not be displayed when any of the following apply:

- Drive is selected for longer than 5 seconds.
- Drive is selected and the vehicle speed is greater than 18 km/h (11 mile/h).

Special Views

E148971

The special views are a selection of pre-set views that provide the driver with some useful driving aids. These can be considered as a shortcut to some pre-determined images that have been developed to assist the driver in various situations:

- Kerb view: downward view from the two door mirror cameras.
- Junction view: outward view from the two front cameras.
- Trailer view: rear camera view of trailer being towed.

System Calibration

This level of accuracy must be maintained after any service procedures are performed on the vehicle that affects the proximity camera system. Should the control module or any one of the cameras require replacement, static re-calibration must be carried out using the approved Land Rover diagnostic equipment.

Camera replacement is detected by the CCM (camera control module), through the recognition of a new serial number during the 'camera count' procedure that takes place during the 'ignition on' phase via the LIN bus.

If a new camera is installed calibration must be performed using the diagnostic equipment and the vehicle's TS (touch screen). During the calibration procedure, setup software in the control module overlays fine coloured lines on the TS highlighting reference points on the bodywork. For example, the mirror camera image must capture the side repeater indicator, the shut-line of the doors and the lower sill trim.

Direction arrows are pressed to shift the image in the desired direction to meet the reference points viewed on the TS.

Adjustments include:

- Up
- Down
- Left
- Right
- Rotation

When the reference points correspond exactly, the setting is saved and the calibration procedure is complete for that camera.

If body repairs are performed that affect the camera system, a calibration procedure must be executed after the repairs are completed.

System Fault

In the event of camera fault, a **DTC** is logged in the CCM (camera control module), and an icon is presented to the driver on the TS (touch screen) where the camera image would normally be viewed.

Wade Sensing System

CAUTION: Wade sensing should not be used during off-road driving, as rapid increases in water depth cannot be detected in time to deliver a warning message to the driver.

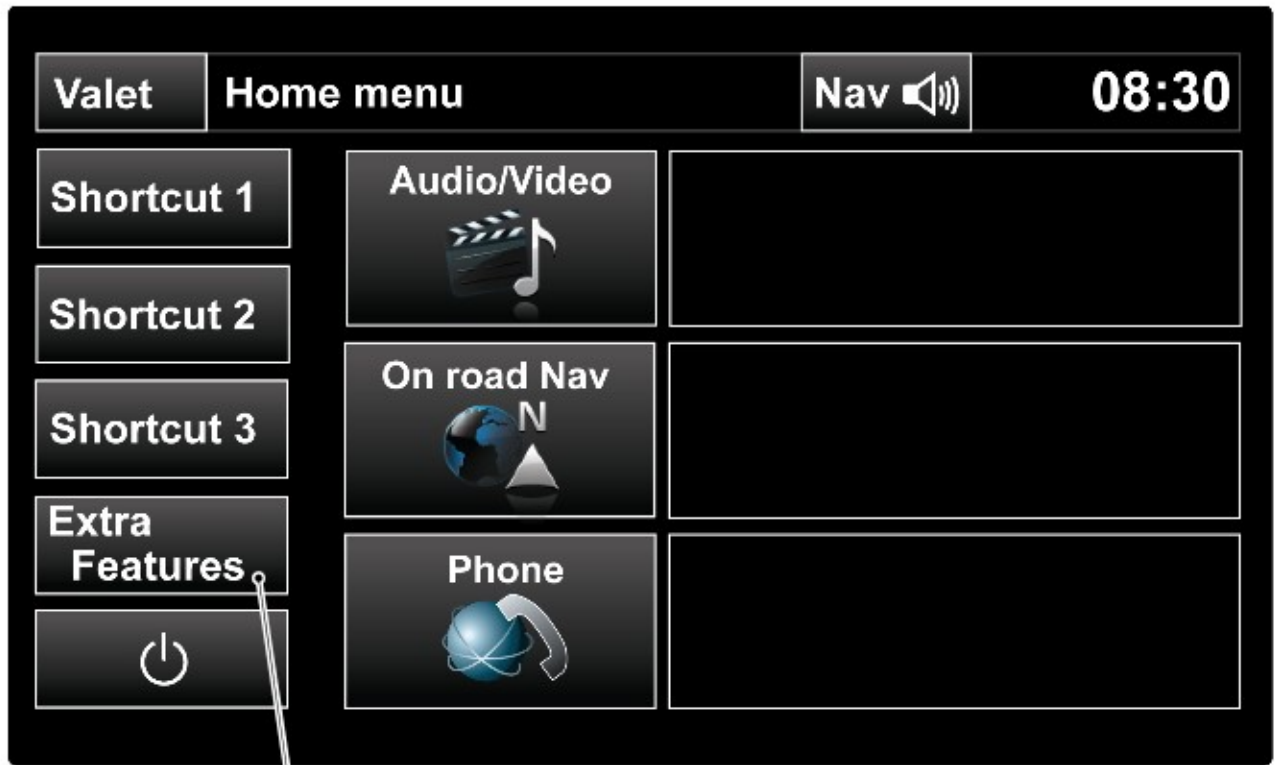

When entering water from a steep gradient, the water level may rise rapidly.

The Wade sensing system cannot detect the true level of water if a layer of ice or snow exists on the surface or if the suspension is in Extended mode.

NOTE: The Parking aid and Intelligent stop/start systems are disabled when Wade sensing is operating.

Wade sensing can be turned on and off from the TS (touch screen) 4x4i section of the Extra features menu.

E161319

1

Item	Part Number	Description
1	-	Extra features menu to reach the wade sensing display

When selected, the TS will display current water depth and the maximum wading depth.

E161320

Item	Part Number	Description
1	-	'Back' soft key
2	-	Parking aid system disabled
3	-	Clock
4	-	Wade sensing screen
5	-	Wade sensing selected

- 6 - Compass display
- 7 - 4X4i display
- 8 - Terrain response display
- 9 - Information display
- 10 - Audio on/off soft key

The system will warn the driver as the maximum depth for wading approaches.

If the system's limitations are exceeded, the TS view will grey out and the water depth will not be displayed.

The water depth calculation is based on the reflection from the water surface, which is measured by:

- The sensors located in each door mirror.
- +/- offset from suspension height adjustment from the ISCM (integrated suspension control module) via the HS (high speed) CAN bus.
- +/- depth effect of road gradient.

From these inputs, the information is transmitted from the GPSM (general proximity sensor module) via the HS CAN bus to the GWM (gateway module). The GWM then converts the HS CAN bus messages to MS (medium speed) CAN bus messages, which is received by the TS and IC. The system will then warn the driver via the TS and IC or audible tones transmitted by the audio system.

NOTE: The Wade sensing sensors are located on the underside of the exterior mirrors. The sensors and the area below the sensors must be kept clean and free from snow, ice, mud, and other debris. Failure to keep the sensors clean may result in sensor miscalculation.

The exterior mirrors must be in the normal (unfolded) position when using the Wade sensing system.

Tow Assist

The RVC (rear view camera) provides additional information to the driver when hitching a trailer to the vehicle. When reverse gear is selected the camera integrated into the tailgate handle assembly, automatically displays a wide-angle color image of the view from the rear of the vehicle onto the TS.

Within the settings menu the driver can activate the hitch guidance and auto-towball zoom feature. Hitch guidance provides a trajectory line indicating the path of the towball in relation to the steering angle applied to the vehicle. 'Auto-towball Zoom' initiates an automatic image zoom when the trailer is within 60cm of the towball to allow more accurate alignment of vehicle to trailer.

E150703

Item	Part Number	Description
1	-	Touch Screen (TS) image - Auto towball zoom feature
2	-	Towball trajectory line
3	-	Automatic zoom

Tow Assist - New Trailer

When the CJB detects the trailer electrical plug has been connected, the trailer setup screen is displayed automatically

on the TS (touch screen) with the question: 'Has a trailer been connected?'

Selecting 'Yes' will bring up the first of a number of trailer setup screens. On first use the setup screens take the user through a series of configuration options for the connected trailer. To configure a new trailer select 'Add New' and then 'OK'.

Trailer Setup – Step 1 of 6

- Choose from the list of generic trailer descriptive names for the trailer attached, then select 'Next'.

Trailer Setup – Step 2 of 6

- Position the trailer straight behind the vehicle, to allow more accurate positioning of the target. Stick the self adhesive tracking target to the front of the trailer within the orange highlighted zone displayed, then select 'Next'.

Trailer Setup – Step 3 of 6

- Select the correct number of axles for the chosen trailer, then select 'Next'.

Trailer Setup – Step 4 of 6

- Select the preferred camera view for use with this trailer, then select 'Next'.

The side cameras view is more suited to tall and/or long trailers for example caravans. The Reverse Camera view is more suited to small and/or short trailers.

Trailer Setup – Step 5 of 6

Using the numeric pad, enter the Hitch Length of the trailer, then select 'Next'.

Hitch Length is the distance from the hitch point to the pivot point of the trailer. The pivot point will vary depending on the number of axles, and will be:

- The center-line of the axle on a single axle trailer.
- The mid-point between the axles on a twin axle trailer.
- The center line of the center axle on a triple axle trailer.

Trailer Setup – Step 6 of 6

- Using the distance adjustment buttons, set the orange overlay graphics at the width of the trailer wheels and then select 'Finish'.

The orange overlay graphics determine the position of the trailer reverse guidance lines.

A confirmation message will appear to show that the trailer information has been retained.

Finally, highlight the trailer that has been memorized, and select 'OK'.

In order to learn the central position of the trailer, the vehicle must be driven forwards at less than 15mph with the steering wheel in the straight-ahead position. There is currently no confirmation for when this process has completed, however the status can be derived by selecting reverse gear and noting the presence of message 'Trailer tracking in progress'. Whilst tracking feature is learning the central position, the trailer trajectory lines will appear in a light blue color, when process is complete they will change to a dark purple color.

The Tow Assist feature is now ready to use.

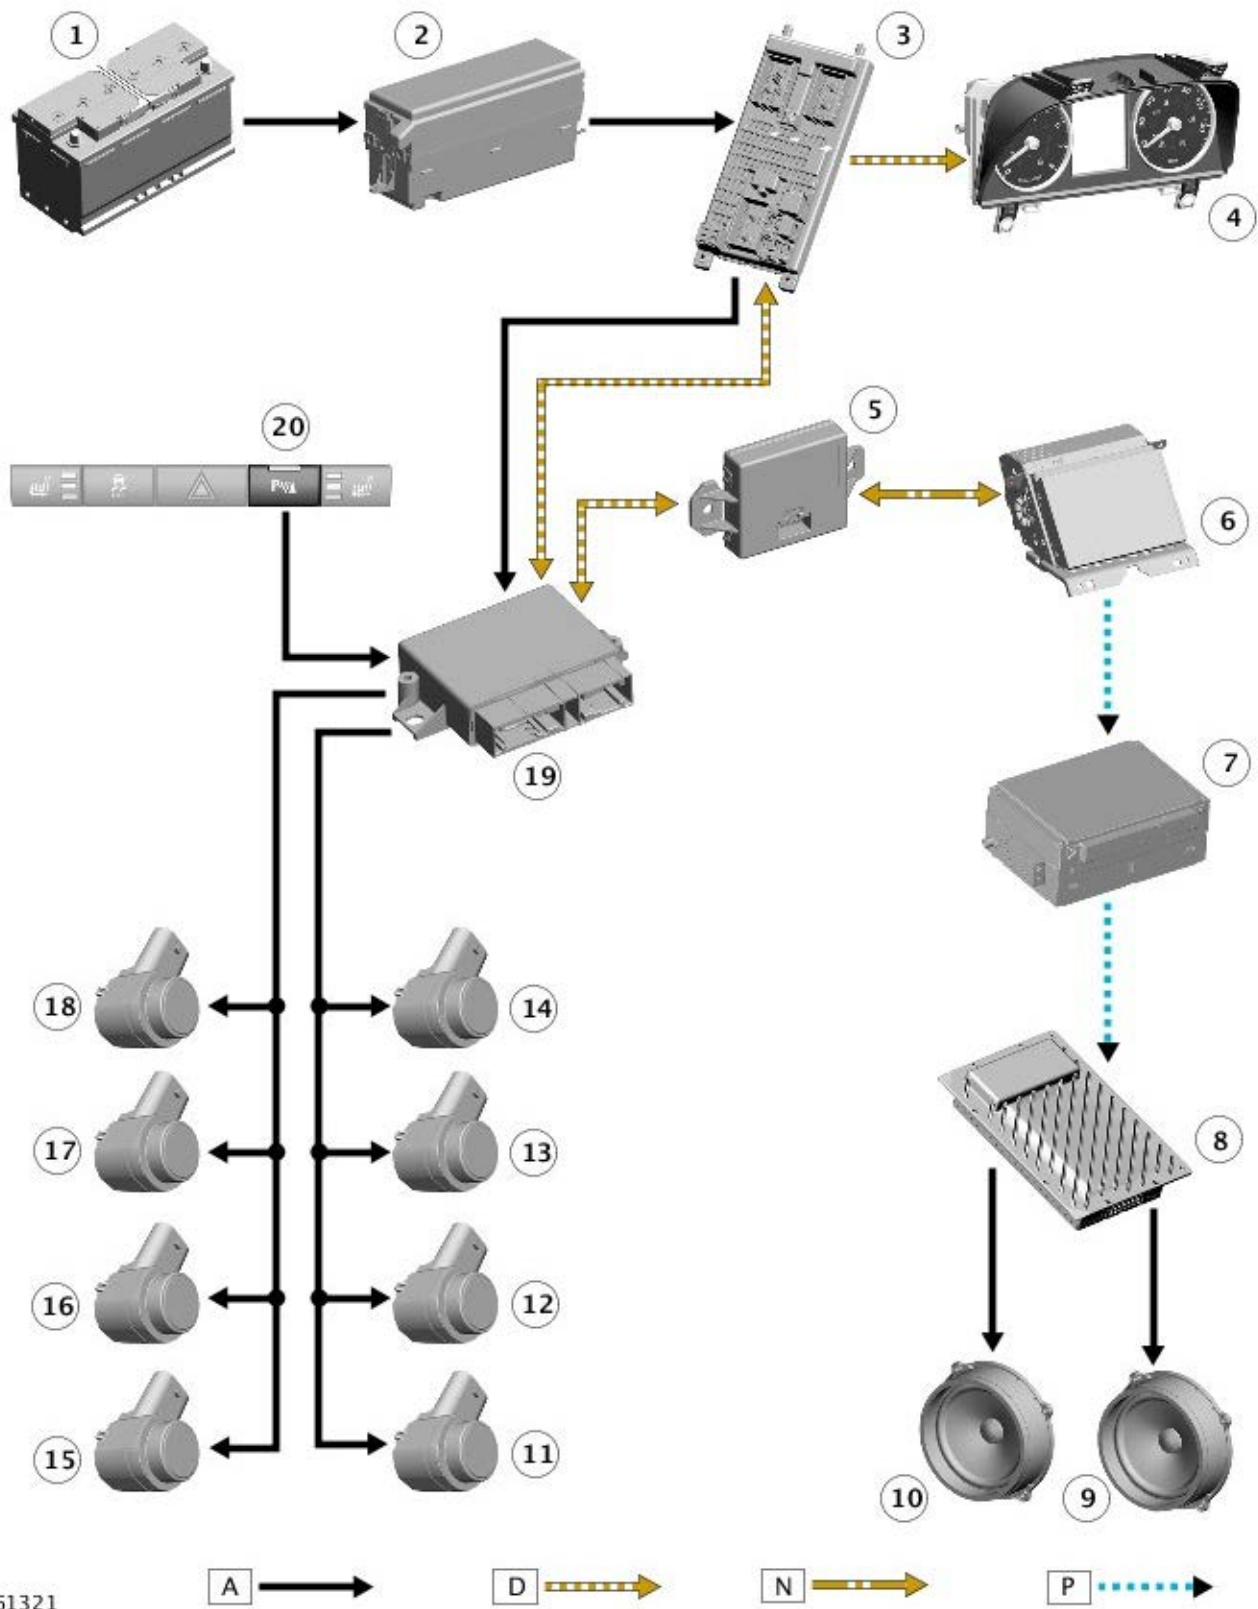

Tow Assist – Previously Saved Trailer

When the **CJB** detects the trailer electrical plug has been connected, the trailer setup screen is displayed automatically on the TS (touch screen) with the question: 'Has a trailer been connected?'

Selecting 'Yes' from the previous screen brings a list of pre-set, or previously saved, trailers. Highlight the required trailer, and select 'OK'.

CONTROL DIAGRAM

Parking Aid - Control Diagram

A = Hardwired; D = High Speed CAN Bus; N = Medium Speed CAN Bus; P = MOST (media oriented system transfer).

Parking Aid - Parking Aid

Diagnosis and Testing

Principles of Operation

For a detailed description of the parking aid system, characteristics and limitations refer to the relevant description and operation section in the workshop manual. REFER to: [Parking Aid](#) (413-13 Parking Aid, Description and Operation).

Parking Aid System On-Board Self-Test

As part of the strategy of the system if any DTCs are detected, a long high-pitched tone approx 3 seconds will sound and the parking aid switch (where fitted) indicator LED will flash 6 times at ignition on

- If a fault is present when the parking aid system is activated then the parking aid switch (where fitted) status LED will flash 6 times indicating an issue with front or rear parking aid sensors, wiring switch, parking aid control module or hard wired sounders
- The rear parking aid sounder/rear audio system will emit an error tone for approx 3 seconds at ignition on if a fault is detected with the front or rear sensors, the switch, or if there is a controller area network (CAN) bus error
- (Only applicable to vehicles fitted with front parking aid and a hard wired rear parking aid sounder). If there is a fault with the rear parking aid sounder the error tone will come from the front parking aid sounder unit (integral with the instrument cluster)

Audible and Visual Warnings when Parking Aid System is in Error State

Rear Parking Aid System Fitted and No Parking Aid System Switch Fitted	Rear Parking Aid System Fitted and Parking Aid System Switch Fitted	Front and Rear Parking Aid System Fitted with Parking Aid System Switch Fitted
A long high-pitched error tone will sound at Ignition On for approx 3 seconds	<ul style="list-style-type: none"> • A long high-pitched error tone will sound at ignition on for approx 3 seconds and the parking aid switch indicator LED will flash 6 times at ignition on. Every time the parking aid system is activated within the same ignition cycle, parking aid switch indicator LED will flash 6 times 	<ul style="list-style-type: none"> • A long high-pitched error tone will sound at ignition on for approximately 3 seconds and the parking aid switch indicator LED will flash 6 times at ignition on. Every time the parking aid system is activated within the same ignition cycle the parking aid switch indicator LED will flash 6 times

Inspection and Verification

CAUTIONS:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the warranty policy and procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle

Do not apply any grease based products to any parking aid system connector or pins

NOTE: Check DDW for open campaigns. Refer to the corresponding bulletins and SSMS which may be valid for the specific customer complaint and carry out the recommendations as required.

1. Verify the customer concern
2. Visually inspect for obvious signs of mechanical or electrical damage
3. Ensure that the parking aid sensor face is clear of contamination that could affect the performance of the sensor

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Parking aid sensor condition/damaged • Parking aid sensor installation and holder • Parking aid sensor alignment • Parking aid sensor contamination • Bumper cover(s) 	<ul style="list-style-type: none"> • Battery • Fuse(s) • Relays • Wiring harness • Electrical connector(s)

- Vehicle ride height
- Non standard/non manufacturer approved accessories fitted

- Front parking aid sensor(s)
- Rear parking aid sensor(s)
- Parking aid switch and LED
- Parking aid control module
- Parking aid sounder
- Audio system

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step

5. If the cause is not visually evident, check for diagnostic trouble codes (DTCs) and refer to the DTC index

Symptom Chart

CAUTION: Do not apply any grease based products to any parking aid system connector or pins

NOTES:

Please note if this diagnosis is being carried out on a vehicle without a hard wired parking aid speaker, ensure the in car infotainment system is fully functional and configured correctly

Parking aid sensors that are painted incorrectly and not to the manufacturer standards, will not be considered in any warranty claim

Symptom	Possible Causes	Action
NOTE: Permanent/Intermittent fault Parking aid system not functioning correctly. (No DTCs displayed)	<ul style="list-style-type: none"> • Front or rear parking aid sensors dirty • Front or rear parking aid sensor position incorrect • Front or rear parking aid sensor incorrectly installed • Front or rear parking aid sensor coupling rings not installed/incorrectly installed • Parking aid control module or parking aid sensor connector not fully latched • Parking aid sensors painted without being removed from the bumper assembly or not painted to the manufacturer specification 	<ul style="list-style-type: none"> • Clean front or rear parking aid sensors • Check the front or parking aid rear sensor position • Check the front or rear parking aid sensor are correctly installed • Check front or rear parking aid sensor coupling rings are installed/installed correctly • Ensure all parking aid system connectors are correctly latched • Remove parking aid sensor and ensure correctly painted parking aid sensor is installed <ul style="list-style-type: none"> - Parking aid sensors that are painted incorrectly and not to the manufacturer standards, will not be considered in any warranty claim
NOTE: Permanent/Intermittent fault Parking aid system not functioning correctly. (No DTCs displayed). System characteristics or environmental effects	<ul style="list-style-type: none"> • Parking aid sensors incorrectly mounted • Incorrect vehicle ride height • Dirty parking aid sensor face. Ice/snow covered sensor. Debris trapped between parking aid sensor and parking aid sensor body. Heavy rain or water splash from the ground • Non standard, bumper, exhausts/tailpipes, tow bar or external spare wheel mounting • Area around vehicle is not clear 	<ul style="list-style-type: none"> • Ensure the sensors are a tight fit in the holder and locked. Ensure the sensors are central in the holder and bumper and at the correct angle • Ensure vehicle ride height is within the specified limits. Rectify as required • Clean the sensor face as required. Defrost the sensor and dry as required. Clear any debris from the sensor and holder as required. Water flowing over the sensor is a system limitation. (no action required) • Check for non standard, bumper, exhausts/tailpipe, tow bar or external spare wheel mounting that may be being detected by the parking aid system. Rectify as required • Ensure the area around the vehicle is clear of any obstacles, move the vehicle to a suitable area before continuing diagnosis • Ensure no exhaust gas or warm area clouds are in the area around the parking aid sensor detection range • Ensure the vehicle is on level ground and clear of any ramps, potholes or speed bumps, move the vehicle to a suitable area before continuing diagnosis • Remove parking aid sensor and ensure correctly painted parking aid sensor is installed <ul style="list-style-type: none"> - Parking aid sensors that are painted incorrectly

	<p>of obstacles such as channels, gutters or other items on the ground</p> <ul style="list-style-type: none"> • Exhaust gas and warm air clouds creating ghost echoes • Vehicle not on level ground or next to a gradient • Parking aid sensors painted without being removed from the bumper assembly or not painted to the manufacturer specification 	<p>and not to the manufacturer standards, will not be considered in any warranty claim</p>
<p>Parking aid sensors are being returned with no faults found or signs of water ingress/corrosion</p>	<p>Possible issue with sensor connectors not latched correctly</p>	<ul style="list-style-type: none"> • When either no/intermittent operation has been reported the following action should be taken • 1. Using Datalogger, identify the position of the suspect parking aid sensor within the bumper • 2. Visually locate the position of the suspect parking aid sensor. Inspect and provide details in claim if the sensor has any sign of physical damage • 3. Remove the bumper. Disconnect the wiring at the main harness connector. Inspect the main harness connectors and terminals for signs of damage, backed out pins, corrosion and water ingress, or damage to the seals. Provide details in claim if any of the above symptoms are present • 4. Attempt to remove the harness connector from the suspect parking aid sensor without using the connector latch i.e. lightly pull back on ALL wires together, ensuring the harness is held close to the back of the connector, not elsewhere on the wiring harness. DO NOT apply excessive force. If the connector can be removed without using the latch, provide details in claim if connector is loose. If the connector is fully latched, disconnect it from the sensor • 5. Inspect and provide details in claim if the suspect sensor harness connector has any sign of water ingress/corrosion • 6. Inspect and provide details in claim if the suspect parking aid sensor harness connector shows any sign that the terminals have backed-out of the connector or for any damage to the terminal seals. Replace/repair the harness as required and proceed • 7. Remove the suspect parking aid sensor from the bumper. Inspect the parking aid sensor connector for signs of water ingress/corrosion. Provide details in claim if corrosion/water ingress is present • 8. Exchange the suspect parking aid sensor with another parking aid sensor within the bumper that is performing correctly. Reconnect all sensors and reconnect the bumper main harness connector. Repeat step 1. Confirm if the original fault now appears at the new position of the suspect parking aid sensor, if so, proceed to step 10 • 9. If not, carry out the appropriate open circuit and short circuit checks between the original suspect parking aid sensor harness connector and the parking aid control module • 10. Refit the parking aid sensors to their original position in the bumper • 11. Reconnect the parking aid sensor to the bumper harness connector. Reconnect main harness connector and refit the bumper • 12. Repeat Step 1. If fault is still present, replace only the faulty sensor

<p>PINPOINT TEST A : PARKING AID SYSTEM NOT FUNCTIONING CORRECTLY WITH NO DTCS LOGGED</p>	
<p>TEST</p>	<p>DETAILS/RESULTS/ACTIONS</p>

CONDITIONS	
A1: PERMANENT FAULT	
	1 When the parking aid system is activated, there is a vibration on the parking aid sensor membrane. This can be verified by touching the parking aid sensor face with a hard item such as a pencil, ball-pen, small screwdriver, or fingernail. Ensure no damage is caused to sensor painted surface
	Are the parking aid sensor(s) vibrating? Yes GO to A2. No GO to A5.
A2: SENSORS VIBRATING WITH PARKING AID FAULT	
	1 Clean the parking aid sensor face
	Parking aid system functioning correctly? Yes No further action required No GO to A3.
A3: SENSORS VIBRATING WITH PARKING AID FAULT	
	1 Check parking aid sensors correctly mounted. Parking aid sensor holder correctly mounted. Parking aid sensor decoupler ring fitted or fitted correctly. Parking aid sensor positioning correct. Parking aid sensor painted without being removed from the bumper assembly or not painted to manufacturer specification. Rectify as required
	Parking aid system functioning correctly? Yes No further action required No GO to A4.
A4: SENSORS VIBRATING WITH PARKING AID FAULT	
	1 Carry out speaker test. Only applicable to vehicles with rear hard wired parking aid speakers. Check the parking aid speaker wiring circuit and connector. Rectify as required. Check and install a new parking aid speaker as required. Vehicles with audio parking aid system. Confirm audio system is functioning correctly. Refer to the relevant section of the workshop manual
	Parking aid system functioning correctly Yes No further action required
A5: SENSORS NOT VIBRATING WITH PARKING AID FAULT	
	1 Isolate the fault to front or rear parking aid sensors
	Are all rear parking aid sensors vibrating? Yes GO to A6. No GO to A10.
A6: FRONT SENSORS NOT VIBRATING WITH PARKING AID FAULT	
	1 Check the parking aid control module is correctly configured. Check and update the car configuration file as required
	Parking aid system functioning correctly? Yes No further action required No GO to A7.
A7: FRONT SENSORS NOT VIBRATING WITH PARKING AID FAULT	
	1 Check the correct parking aid control module is installed to the vehicle
	Parking aid system functioning correctly? Yes No further action required No GO to A8.
A8: FRONT SENSORS NOT VIBRATING WITH PARKING AID FAULT	
	1 If all 4 front parking aid sensors are not vibrating, carry out harness test on common ground, power supply. Check main parking aid harness connector to bumper harness connector. Rectify as required
	Parking aid system functioning correctly? Yes No further action required No GO to A9.
A9: FRONT SENSORS NOT VIBRATING WITH PARKING AID FAULT	
	1 Check and install a new parking aid control module as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
	Parking aid system functioning correctly Yes No further action required

A10: REAR SENSORS NOT VIBRATING WITH PARKING AID FAULT	
	1 Check the parking aid control module is correctly configured. Check and update the car configuration file as required
	Parking aid system functioning correctly? Yes No further action required No GO to A11.
A11: REAR SENSORS NOT VIBRATING WITH PARKING AID FAULT	
	1 If all 4 rear parking aid sensors are not vibrating, carry out harness test on common ground, power supply. Check main parking aid harness connector to bumper harness connector. Rectify as required
	Parking aid system functioning correctly? Yes No further action required No GO to A12.
A12: REAR SENSORS NOT VIBRATING WITH PARKING AID FAULT	
	1 Check and install a new parking aid control module as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
	Parking aid system functioning correctly? Yes No further action required

PINPOINT TEST B : PARKING AID SYSTEM NOT FUNCTIONING CORRECTLY WITH NO DTCS LOGGED	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: PARKING AID SYSTEM GIVES WARNING SIGNAL WITHOUT OBSTACLE	
	1 Clean the parking aid sensor face. Check for any damage to the parking aid sensor face. Rectify as required. Snow, water or ice on sensor face. Parking aid sensor face has been repainted to the incorrect thickness. Rectify as required
	Parking aid system functioning correctly? Yes No further action required No GO to B2.
B2: PARKING AID SYSTEM GIVES WARNING SIGNAL WITHOUT OBSTACLE	
	1 Ensure the vehicle ride height is within manufacturer specified limits. Rectify as required
	Parking aid system functioning correctly? Yes No further action required No GO to B3.
B3: PARKING AID SYSTEM GIVES WARNING SIGNAL WITHOUT OBSTACLE	
	1 Check for any non standard accessories are not fitted, such as tow bar, bike rack, body kit, modified exhaust, lighting or licence plate holder
	Parking aid system functioning correctly? Yes No further action required No GO to B4.
B4: PARKING AID SYSTEM GIVES WARNING SIGNAL WITHOUT OBSTACLE	
	1 Limitations or characteristics of the parking aid system such as vehicle on a gradient, exhaust gas vapour, signal reflection
	Parking aid system functioning correctly? Yes No further action required No For a detailed description of the parking aid system, refer to the relevant description and operation section in the workshop manual. REFER to: Parking Aid (413-13 Parking Aid, Description and Operation).

DTC Index

For a list of diagnostic trouble codes that could be logged on this vehicle, please refer to Section 100-00. REFER to: [Diagnostic Trouble Code \(DTC\) Index - DTC: Parking Aid Control Module \(PACM\)](#) (100-00 General Information, Description and Operation).

Parking Aid - Parking Aid Camera

Removal and Installation

Removal

NOTES:

Removal steps in this procedure may contain installation details.

The ignition must be switched off.

1. Refer to: [Liftgate Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Torque: 10 Nm

E160546

E160545

NOTE: Vehicles with high line camera system:

3. CAUTIONS:

Make sure to protect the paintwork.

Take extra care not to damage the wiring harnesses.

4. CAUTION: Take extra care not to damage the wiring harnesses.

E160543

5.  CAUTION: Take extra care not to damage the clip.

 NOTE: Make sure that this component is installed to the noted removal position.

E160544

 NOTE: Vehicles with low line camera system:

6.  CAUTION: Take extra care not to damage the wiring harnesses.

Parking Aid - Rear Inner Parking Aid Sensor

Removal and Installation

Removal

NOTES:

Removal steps in this procedure may contain installation details.

Check the sensor before removing to note if the sensor(s) are painted or unpainted.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: [Rear Bumper Cover](#) (501-19 Bumpers, Removal and Installation).

3.

E160548

Installation

1.  **CAUTION:** If a new sensor is installed, make sure that the area illustrated is the only area painted. Failure to follow this instruction may result in the component malfunctioning.

NOTE: On vehicles that are equipped with black or unpainted bumpers, the sensor(s) do not require painting.

E156793

E161103

2.  CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

 NOTE: Make sure that the grommets are correctly seated.

3. To install, reverse the removal procedure.

Parking Aid - Rear Outer Parking Aid Sensor

Removal and Installation

Removal

WARNING: Observe due care when working near a hot exhaust system.

NOTES:

Removal steps in this procedure may contain installation details.

Check the sensor before removing to note if the sensor(s) are painted or unpainted.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2.  **CAUTION:** Make sure that the exhaust system is supported with suitable retaining straps.

E160550

3.

E160551

Installation

1.  **CAUTION:** If a new sensor is installed, make sure that the area illustrated is the only area painted. Failure to follow this instruction may result in the component malfunctioning.

 **NOTE:** On vehicles that are equipped with black or unpainted bumpers, the sensor(s) do not require painting.

E156793

2.  **CAUTION:** Make sure that the mating faces are clean and free of corrosion and foreign material.

 **NOTE:** Make sure that the grommets are correctly seated.

E161103

3. To install, reverse the removal procedure.

Parking Aid - Side Parking Aid Camera

Removal and Installation

Removal

NOTES:

Removal steps in this procedure may contain installation details.

The ignition must be switched off.

LH illustration shown, RH is similar.

1. Refer to: [Exterior Mirror Motor](#) (501-09 Rear View Mirrors, Removal and Installation).

2. **CAUTION:** Take extra care not to damage the wiring harnesses.

E160834

3. Torque: 0.5 Nm

E160833

Installation

1. To install, reverse the removal procedure.
2. If a new component has been installed, configure using Land Rover approved diagnostic equipment.

Battery and Charging System - General Information -

Battery

Item	Specifications
All Gasoline (Petrol) Models before 14MY:	
Type	Maintenance free lead-calcium
Capacity	690 amps - 75 amp/hour
Reserve capacity	150 minutes @ 25 amps
All Gasoline (Petrol) Models 14MY onwards:	
Type	Maintenance free lead-calcium
Capacity	825 amps - 90 amp/hour
Reserve capacity	190 minutes @ 25 amps
Diesel Models:	
Type	Maintenance free lead-calcium
Capacity	825 amps - 90 amp/hour
Reserve capacity	190 minutes @ 25 amps

Battery Disconnect/Connect

CAUTION: The vehicle status and battery condition must be established before attempting battery disconnect/connect. Reference must be then made to the following table to establish the relevant procedure to be followed.

Vehicle status	Battery charged Procedure	Battery discharged Procedure
Engine running	1	
Vehicle powered down, locked and alarmed	2	3
Vehicle unlocked	4	5

Procedure 1

Disconnect battery	Connect battery
1. If possible, apply parking brake or alternatively, chock wheels	1. Ensure that all electrical loads are switched OFF
2. Switch off ignition	2. Connect battery leads - GROUND lead last
3. Wait 2 minutes for engine management system to 'power down'	3. Switch on ignition
4. Open the hood	4. Operate parking brake switch several times until parking brake warning lamp is extinguished
5. Disconnect battery - GROUND lead first	

Procedure 2

Disconnect battery	Connect battery
1. Unlock the vehicle and disarm the alarm using the 'plip' button	1. Ensure that all electrical loads are switched OFF
2. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	2. Connect battery leads - GROUND lead last
3. Wait 2 minutes for engine management system to 'power down'	3. Switch on ignition
4. Open the hood	4. Operate parking brake switch several times until parking brake warning lamp is extinguished
5. Disconnect battery - GROUND lead first	

NOTE: 1. **Disconnect battery** - The door unlock process initialises the ICE system.

Procedure 3

Disconnect battery	Connect battery
1. Unlock the vehicle from the left hand front door using the key	1. Ensure that all electrical loads are switched OFF
2. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	2. Connect battery leads - GROUND lead last
3. Wait 2 minutes for engine management system to 'power down'	3. Switch on ignition
4. Open the hood	4. Operate parking brake switch several times until parking brake warning lamp is extinguished
5. Disconnect battery - GROUND lead first	

NOTES:

1. - Disconnect battery - The door unlock process initialises the ICE system

1. Connect battery - If there is insufficient capacity in the battery to disarm the alarm, the alarm may sound on reconnection of the battery - Step 3 will disarm the alarm

Procedure 4

Disconnect battery	Connect battery
1. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	1. Ensure that all electrical loads are switched OFF
2. Wait 2 minutes for engine management system to 'power down'	2. Connect battery leads - GROUND lead last
3. Open the hood	3. Switch on ignition
4. Disconnect battery - GROUND lead first	4. Operate parking brake switch several times until parking brake warning lamp is extinguished

Procedure 5

Disconnect battery	Connect battery
1. Enter the vehicle, turn the ignition key to position II, apply the parking brake or chock the wheels and then turn the ignition key to position 0. Remove the key to 'power down' the ICE system	1. Ensure that all electrical loads are switched OFF
2. Wait 2 minutes for engine management system to 'power down'	2. Connect battery leads - GROUND lead last
3. Open the hood	3. Switch on ignition
4. Disconnect battery - GROUND lead first	4. Operate parking brake switch several times until parking brake warning lamp is extinguished

NOTE: 1. Disconnect battery - If the remote control module (RCM) is not functioning, it will be necessary to manually unlock the vehicle using the key.

Vehicle Jump (Emergency) Starting - Using Another Vehicle

Carry out the following operations in the sequence given
1. Connect one end of the BLACK (-) booster cable to the GROUND (-) battery terminal of the DONOR vehicle
2. Connect the other end of the BLACK (-) booster cable to a good earth point e.g. unpainted metal surface or engine mounting at least 0.5 m (20.0 in) from the battery or fuel lines on the DISABLED vehicle
3. Connect one end of the RED (+) booster cable to the positive (+) battery terminal of the DONOR vehicle
4. Connect the other end of the RED (+) booster cable to the positive (+) battery terminal of the DISABLED vehicle
5. Start the engine of the DONOR vehicle and allow it to idle for a few minutes
6. Start the engine of the DISABLED vehicle
7. Allow engines of both vehicles to idle for a few minutes then switch off the engine of the DONOR vehicle
8. Disconnect the RED (+) booster cable from the battery of the PREVIOUSLY DISABLED vehicle
9. Disconnect the RED (+) booster cable from the battery of the DONOR vehicle
10. Disconnect the BLACK (-) booster cable from the earth point of the PREVIOUSLY DISABLED vehicle
11. Disconnect the BLACK (-) booster cable from the battery of the DONOR vehicle

WARNINGS:

During normal use, batteries emit explosive hydrogen gas sufficient to cause severe explosions and capable of causing serious injury - keep sparks and naked lights away from the engine compartment.

DO NOT attempt to start the disabled vehicle if it is suspected that the electrolyte in the battery is frozen (before 14MY only).

Suitable eye protection must be worn when working in the vicinity of the battery.

Take care when working near rotating parts of the engine.

Prior to attempting to start the disabled vehicle, ensure that the parking brake is applied or suitably chock the wheels. Ensure that 'P' - PARK - Automatic Gearbox or NEUTRAL - Manual Gearbox is selected.

CAUTIONS:

Ensure that all electrical loads are switched OFF prior to connecting booster cables and disconnect booster cables prior to using any electrical equipment.

Ensure that the battery of the DONOR vehicle is of 12 volt capacity and that all electrical loads on the disabled vehicle are switched OFF prior to connecting booster cables.

Ensure that there is no physical contact between the donor and disabled vehicles other than the booster cables.

Vehicle Jump (Emergency) Starting - Using a Slave Battery/Starting Aid

Carry out the following operations in the sequence given
1. Connect the end of the BLACK (-) booster cable to the ground (-) battery terminal of the vehicle
2. Connect the end of the RED (+) booster cable to the positive (+) battery terminal of the vehicle
3. Start the engine of the vehicle and allow it to idle
4. Disconnect the RED (+) booster cable from the battery terminal of the vehicle
5. Disconnect the BLACK (-) booster cable from the battery terminal of the vehicle

WARNINGS:

During normal use, batteries emit explosive hydrogen gas sufficient to cause severe explosions and capable of causing serious injury - keep sparks and naked lights away from the engine compartment.

DO NOT attempt to start the disabled vehicle if it is suspected that the electrolyte in the battery is frozen (before 14MY only).

Suitable eye protection must be worn when working in the vicinity of the battery.

Take care when working near rotating parts of the engine.

Prior to attempting to start the disabled vehicle, ensure that the parking brake is applied or suitably chock the wheels. Ensure that 'P' - PARK - Automatic Gearbox or NEUTRAL - Manual Gearbox is selected.

CAUTIONS:

Ensure that all electrical loads are switched OFF prior to connecting booster cables and disconnect booster cables prior to using any electrical equipment.

Ensure that the slave battery/starting aid are of 12 volt capacity and that all electrical loads on the disabled vehicle are switched OFF prior to connecting booster cables.

Battery and Charging System - General Information - Battery Care Requirements

Description and Operation

1. INTRODUCTION

This document sets out the requirements for care and maintenance of batteries and thereby the standard of battery care at dealers and retailers for new vehicles

This applies to all types of 12 Volt Lead Acid Batteries used in Jaguar and Land Rover vehicles whether they are conventional flooded technology or Absorbed Glass Mat (AGM – also known as Valve Regulated Lead Acid (VRLA)) technology and also applies to both Primary and Auxiliary Batteries. AGM batteries offer improved resistance to cycling as seen in stop start applications.

In order to prevent damage to the battery and ensure a satisfactory service life, all processes detailed within this document must be rigorously adhered to.

It is equally important therefore to note the following key points:

- All new vehicles leave the factory with either a transit relay installed and/or have a transit mode programmed into the vehicle control modules. The transit relay must be removed and the transit mode disabled (where applicable) using an approved diagnostic system, **NOT MORE THAN 72 HOURS** before the customer takes delivery.
- The battery can be discharged by the following mechanisms:
 - **Self Discharge:** -A lead acid battery will very slowly discharge itself due to its own internal chemical processes whether it is connected to a vehicle or not.
 - **Quiescent Discharge:** - The vehicle electrical systems when connected to the battery will draw charge from the battery.

12 Volt Lead Acid Batteries rely on internal chemical processes to create a voltage and deliver current. These processes and the internal chemical structure of the battery can be damaged if the battery is allowed to discharge over a number of weeks / months, or is left in a discharged state for a lengthy time period.

- **On vehicles with conventional ignition keys**, these must not be left in the ignition lock barrel when the transit relay has been removed, otherwise quiescent current will increase and the battery will discharge more rapidly.
- **For keyless vehicles**, the Smart Key must be stored at least 5m away from the vehicle when the vehicle is parked or stored.
- **AGM Batteries are fully sealed and cannot have the electrolyte level topped up.**

NOTE: Dealers and retailers involved in the storage / handling of vehicles and replacement batteries have a responsibility to ensure that only a fully charged battery may be processed through the distribution selling chain.

2. GENERAL RULES FOR BATTERY CARE

2.1 Dealer Demonstration Vehicles

Vehicles used as dealer demonstrator(s), in a showroom, must be connected to a showroom conditioner capable of delivering 50 Amps. This will prevent the battery from being damaged.

2.2 Software Reflash, SDD work or Ignition On related workshop activities

Due to the high electrical current demand and high depth of Discharge that can occur during vehicle software re-flash activities, SDD work or ignition on related work in the workshop, vehicles that are undergoing such activities **MUST** have a power supply capable of delivering 50 Amps or more.

2.3 Extended Vehicle Rework

For any extended vehicle rework that results in consuming vehicle power, either the battery should be disconnected or a suitable power supply connected.

2.4 Jump Starting New vehicles before they have been delivered to the customer

- It is the dealer / retailers responsibility to make sure the battery is not allowed to go flat by following the instructions and processes defined in this manual.
- However, if circumstances dictate that a new vehicle must be jump started due to a flat battery whilst the vehicle is in the dealer / retailers care, **the battery on this vehicle must be replaced with a new one** prior to delivery to the customer at the dealer / retailers liability.
- The vehicle should also undergo investigation as to why the battery went flat.
- Do not connect the jump starting cable to the negative (-) terminal of the battery. Always connect to the recommended earth point. As defined in the owners handbook or service documentation for that vehicle.

2.5 AGM Batteries

- **AGM batteries must not be charged above 14.8 Volts. Doing so will damage them.**
- AGM Batteries must be tested with a capable battery tester as **detailed in the equipment section (Section 5) of this procedure.**

NOTE: Under no circumstances should the battery be disconnected with the engine running because under these conditions the alternator can give a very high output voltage. This high transient voltage will damage the electronic components in the vehicle. Loose or incomplete battery connections may also cause high transient voltage.

3. HEALTH AND SAFETY PRECAUTIONS

WARNINGS:

BATTERY CELLS CONTAIN SULPHURIC ACID AND EXPLOSIVE MIXTURES OF HYDROGEN AND OXYGEN GASES. IT IS THEREFORE ESSENTIAL THAT THE FOLLOWING SAFETY PRECAUTIONS ARE OBSERVED.

Batteries emit highly explosive hydrogen at all times, particularly during charging. To prevent any potential form of ignition occurring when working in the vicinity of a battery:

- Do not smoke when working near batteries.
- Avoid sparks, short circuits or other sources of ignition in the battery vicinity.
- Switch off current before making or breaking electrical connections.
- Ensure battery charging area is well ventilated.
- Ensure the charger is switched off when: a) connecting to a battery; b) disconnecting from the battery.
- Always disconnect the ground cable from the battery terminal first and reconnect it last.

Batteries contain poisonous and highly corrosive acid. To prevent personal injury, or damage to clothing or the vehicle, the following working practices should be followed when topping up, checking electrolyte specific gravity, removal, refitting or carrying batteries:

- Always wear suitable protective clothing (an apron or similar), safety glasses, a face mask and suitable gloves.
- If acid is spilled or splashed onto clothing or the body, it must be neutralized immediately and then rinsed with clean water. A solution of baking soda or household ammonia and water may be used as a neutralizer.
- In the event of contact with the skin, drench the affected area with water. In the case of contact with the eyes, bathe the affected area with cool clean water for approximately 15 minutes and seek urgent medical attention.
- If battery acid is spilled or splashed on any surface of a vehicle, it should be neutralized and rinsed with clean water.
- Heat is generated when acid is mixed with water. If it becomes necessary to prepare electrolyte of a desired specific gravity, SLOWLY pour the concentrated acid into water (not water into acid), adding small amounts of acid while stirring. Allow the electrolyte to cool if noticeable heat develops. With the exception of lead or lead-lined containers, always use non-metallic receptacles or funnels. Do not store acid in excessively warm locations or in direct sunlight.

Due to their hazardous contents, the disposal of batteries is strictly controlled. When a battery is scrapped, ensure it is disposed of safely, complying with local environmental regulations. If in doubt, contact your local authority for advice on disposal facilities.

4. BATTERY CARE REQUIREMENTS

4.1 RECEIPT OF A NEW VEHICLE

Within 24 hours of receipt of a new vehicle, a battery condition check must be carried out in accordance with the battery test process utilizing an appropriate tester as outlined in **the equipment section (Section 5) of this procedure**.

NOTE: The midtronics code must be recorded on the form.

Any actions must be carried out in accordance with the table shown in the **determining battery condition section (Section 6) of this procedure**. The details must be recorded on the New Vehicle Storage Form which is part of the new vehicle storage document.

For additional information, refer to: New Vehicle Storage Form (100-11, Description and Operation).

4.2 NEW VEHICLE STORAGE

If the vehicle is to be stored the transit relays MUST be refitted and / or the vehicle put into transport mode.

Transit relay removal / vehicle placed in normal mode should only be completed a maximum of 72 hours prior to handover to customer

For vehicles without either a transit mode or transit relay the battery negative cable must be DISCONNECTED from the battery.

The battery must be tested and/or re-charged every 30 days and MUST be re-charged after every 90 day period.

NOTE: The midtronics code must be recorded on the form.

Any actions must be carried out in accordance with the table shown in the **determining battery condition section (Section 6) of this procedure**. The details must be recorded on the New Vehicle Storage Form which is part of the new vehicle storage document.

For additional information, refer to: New Vehicle Storage Form (100-11, Description and Operation).

4.3 PDI / DELIVERY TO CUSTOMER

Before the vehicle is handed over to the customer and as part of the PDI, the condition of the battery needs to be confirmed. The battery condition must be checked in accordance with the battery test process utilizing an appropriate tester as outlined in **the equipment section (Section 5) of this procedure**.

NOTE: The midtronics code must be recorded on the form.

Any actions must be carried out in accordance with the table shown in the **determining battery condition section (Section 6) of this procedure**. The details must be recorded on the New Vehicle Storage Form which is part of the new vehicle storage document.

For additional information, refer to: New Vehicle Storage Form (100-11, Description and Operation).

4.4 REPLACEMENT BATTERIES FOR SERVICE

All service replacement batteries must have the battery condition checked within 24 hours of receipt and controlled on a 'First In First Out' basis to ensure batteries are not allowed to age unnecessarily.

For batteries in storage and not yet fitted to a vehicle, they must be stored in a dry environment, not in direct sunlight or under any direct heat source. Any batteries exhibiting any forms of damage or corrosion must not be fitted to any vehicle. Any batteries which are dropped must be scrapped, this applies even if no external damage is apparent.

The battery condition must be checked every 30 days in accordance with the battery test process utilizing an appropriate tester as outlined in **the equipment section (Section 5) of this procedure**.

Any actions must be carried out in accordance with the table shown in the **determining battery condition section (Section 6) of this procedure**. The details must be recorded on the New Vehicle Storage Form which is part of the new vehicle storage document.

For additional information, refer to: New Vehicle Storage Form (100-11, Description and Operation).

4.5 BATTERY MAINTENANCE

Any battery whether it is in a vehicle or a replacement part must be tested and/or re-charged every 30 days and MUST be re-charged after every 90 day period.

4.6 BATTERY TEST PROCESS

It is recommended that this test is conducted at least 24 hours after the vehicle engine has been run or the battery charged to avoid the need of surface charge removal. If time constraints make this unacceptable then the surface charge must be removed.

Surface Charge Removal

A vehicle which has had its battery charged or been driven in a 24 hour period before the test, must have its surface charge removed.

- Turn on the ignition but do not start the vehicle
- Switch on the headlamps on high beam for a minimum 3 minutes
- Switch off the headlamps
- Wait a minimum of 5 minutes before recording test results for any battery measurements

Battery Test

The battery may be tested either on a bench or on the vehicle.

The battery condition must be checked in accordance with the battery test process utilizing an appropriate tester as outlined in **the equipment section (Section 5) of this procedure**.

NOTE: The midtronics code must be recorded on the form.

Any actions must be carried out in accordance with the table shown in the **determining battery condition section (Section 6) of this procedure**. The details must be recorded on the New Vehicle Storage Form which is part of the new vehicle storage document.

For additional information, refer to: New Vehicle Storage Form (100-11, Description and Operation).

CAUTION: DO NOT connect the tester to any other circuit or chassis point other than the battery negative terminal.

5. EQUIPMENT

All equipment used must be functionally capable of meeting the compliance requirements. Please refer to the approved equipment document.

In the case of batteries fitted to a new vehicle at the dealership, battery condition should be measured using the appropriate hand-held Midtronics tester as follows:

Battery Type	Battery Tester	Battery Tester
	Jaguar	Land Rover
Flooded	Midtronics MCR 394 & 494 Midtronics EXP1080 & GR1/GRX	Midtronics MCR 393 & 493 Midtronics EXP1080 & GR1/GRX
AGM	Midtronics EXP1080, GR1/GRX	Midtronics EXP1080, GR1/GRX

The test results must be recorded on the New Vehicle Storage Form which is part of the new vehicle storage document.

For additional information, refer to: New Vehicle Storage Form (100-11, Description and Operation).

NOTE: All equipment must be calibrated

6 DETERMINING BATTERY CONDITION

TESTER RESULTS	ACTION
GOOD BATTERY	Return to service.
GOOD RE-CHARGE	Fully charge battery and return to service.
CHARGE AND RE-TEST	Fully charge battery. Remove surface charge. Re-test battery. If same result replace battery.
REPLACE BATTERY OR BAD CELL BATTERY	Verify surface charge removed. Disconnect battery from vehicle and re-test. If result repeats after surface charge removal, replace battery. DO NOT RECHARGE.
UNABLE TO DO TEST	Disconnect battery from vehicle and re-test.

7 BATTERY CHARGING

It is essential that a suitably ventilated defined area exists in each dealership / retailer for battery charging.

CAUTION: It is very important that when charging batteries using the traction charger or other stand-alone chargers that the charger is set for the correct type of battery before charging commences. If the wrong switch is selected the result would be a battery that is not charged fully and / or overheating can occur. Follow the manufacturers operating instructions.

Batteries **MUST BE** tested and if necessary charged every 30 days and charged after 90 days irrespective of any test. It is recommended that dealers / retailers always have fully charged batteries ready for use.

CAUTION: Do not charge AGM batteries with voltages over 14.8 Volts as this will damage the battery.

A designated controlled area must be allocated for scrap batteries and clearly controlled as such.

To bring a discharged but serviceable battery back to a fully charged condition proceed as follows:

- Check and if necessary top-up the battery electrolyte level. (Flooded maintainable batteries only)
- Charge the battery using a charger as detailed in the approved equipment document following the manufacturers operating instructions.

NOTE: When using the Midtronics Diagnostic Charger, automatic mode must always be used. After charging and analysis, the charger may display 'Top-Off Charging', Hit STOP To End. Do not stop charging until the current falls to 5A or less, otherwise the battery will not be fully charged.

Following charging a post charge battery condition test must be carried out in accordance with the table shown in the **determining battery condition section (Section 6) of this procedure.**

NOTE: The midtronics code must be recorded on the form.

Any actions must be carried out in accordance with the table shown in the **determining battery condition section (Section 6) of this procedure.** The details must be recorded on the New Vehicle Storage Form which is part of the new vehicle storage document.

For additional information, refer to: New Vehicle Storage Form (100-11, Description and Operation).

8 BATTERY REPLACEMENT

If it is determined that a battery requires replacement, always refer to the appropriate section of the workshop manual for instructions on removing and installing the battery from the vehicle.

On in service vehicles fitted with a Battery Monitoring System (BMS), the BMS module must be reset following the installation of a new battery. The BMS module reset procedure must be performed using an approved diagnostic system.

9 CONFIRMING ELECTROLYTE LEVEL

WARNINGS:

BEFORE CHECKING AND TOPPING-UP THE BATTERY ELECTROLYTE, REFER TO THE HEALTH AND SAFETY PRECAUTIONS SECTION.

AGM TECHNOLOGY BATTERIES ARE FULLY SEALED FOR LIFE AND NO ATTEMPT SHOULD BE MADE TO CHECK OR TOP UP THE ELECTROLYTE LEVEL.

On certain types of battery the electrolyte level may need to be checked.

- Make sure the battery is of a type suitable for topping up. These types of batteries will have cell plugs visible on the top face of the battery or a removable access panel to allow access to the cells.
- On batteries with a clear or opaque case and level marks, check the electrolyte level by visual inspection of the maximum level indicator mark on the battery casing indicating adequate level above the battery separators.
- On batteries with black cases, remove the cell plugs or access panel and ensure the electrolyte level is level with the indicator in the cell hole. A flashlight may be required to see the electrolyte level on this type of battery.
- If the electrolyte level is low, top-up using distilled water.

NOTE: Maintenance free and Valve Regulated (AGM) batteries are sealed and therefore cannot be topped up.

CAUTION: **DO NOT** overfill.

Battery and Charging System - General Information - Quiescent Drain

Description and Operation

VEHICLE QUIESCENT CURRENT TESTING

On vehicles fitted with a Battery Monitoring System (BMS), the diagnostic routine for quiescent drain testing in the approved Jaguar or Land Rover diagnostic system should be utilized.

If a customer complains of a vehicle battery that discharges continuously or when left for a prolonged period of time, it is recommended that a quiescent drain test is performed as described below.

The battery drain should be measured using the approved Jaguar or Land Rover diagnostic system or a Digital Multi-Meter (DVOM). A procedure for quiescent drain measurement using the diagnostic system is available in the Diagnosis and Testing section of the Workshop Manual. The vehicle should be in the locked/armed state (for example vehicle alarm fully armed), all doors, engine and luggage compartment lids are open and latched (so as to appear closed from an electrical point of view). The test should take place after the vehicle has entered shutdown mode. The time taken for this to occur after the ignition is switched off varies according to model (Refer to the Topix On line resource for details).

When the vehicle is armed, the effect of the security system Light Emitting Diode (LED) flashing is to cause a pulsation in the measured current drain. In this case, either the average current should be taken (using a Digital Multi-Meter (DVOM) with an averaging system) or the current reading taken, ignoring the brief high current peaks.

EQUIPMENT

Approved Jaguar or Land Rover diagnostic system with current probe **OR** Digital Multi-Meter (DVOM) with current probe.

METHOD OF MEASUREMENT

Using an Approved Jaguar or Land Rover Diagnostic System.

1. Switch off all electrical loads and ensure that the ignition is off
2. Connect the current probe to the approved Jaguar or Land Rover diagnostic system
3. Calibrate the probe
4. Install a clamp around the battery lead/junction box lead
5. Go to the Quiescent Current Testing section in this procedure

Using a digital multimeter

Do not use an in-line DVOM to measure the quiescent drain on vehicles fitted with an electronic throttle (for example Range Rover 2002MY onwards). The current exceeds the maximum amount the fuse in the DVOM is capable of handling.

1. Switch off all electrical loads and ensure that the ignition is off
2. Connect the current probe to the digital multimeter
3. Calibrate the probe
4. Install a clamp around the battery lead/junction box lead
5. Go to the Quiescent Current Testing section in this procedure

QUIESCENT CURRENT TESTING

1. Switch ignition to 'on' or select ignition mode in keyless vehicles and switch to 'off' (do not crank)
2. Remove key from ignition switch (if equipped)
3. Open and latch all doors, hood and luggage compartment lid
4. Lock the vehicle using the remote function on the remote handset. (Single lock only to avoid volumetric alarm arming)
5. Remove any other potential electrical drains such as accessories plugged into accessory sockets
6. Record the amperage readings after the shutdown period referenced in the Topix on line resource for details. Note all cars from 10MY onwards should be less than 30mA after 30 minutes
7. Record the final reading on the battery report form

The preferred method of testing following an excessive current consumption figure is to use a current probe around individual junction box leads to the various suspected circuits to identify a potential cause. This is in preference to the old method of removing fuses for the following reasons:

The drain may be caused by a module remaining active and preventing the quiescent drain from reducing to normal levels

The drain may be caused by a relay winding that is activated. Pulling the fuse can allow this to 'reset' and the drain will be lost and go un-diagnosed

Land Rover Quiescent Drain Values

MODEL	SHUT DOWN PERIOD (minutes)	TYPICAL VALUES BATTERY DRAIN (mA)
Range Rover (LM) - Up to 2009MY	30	<30
Range Rover (LM) - From 2010MY	20 (after lock/arm condition) 2	<30

	33 (unlocked)	<30
Range Rover (LG) From 2013MY	<10 (after lock/arm condition) ²	<20
	<20 (unlocked)	<20
Range Rover Sport (LS) - Up to 2007MY	30	<30
Range Rover Sport (LS) - From 2007MY to 2010MY	30	<30
	33 (unlocked)	<30

	33 (unlocked)	<30
Discovery 4/LR4 (LA) - From 2010MY	<20 (after lock/arm condition) ²	<20
	<20 (unlocked)	<20
Freelander (LN) - Up to 2007MY	30	<30
Freelander 2/LR2 (LF) - From 2007MY	35 (single locked or unlocked)	<25
	15 (double locked)	<25
Defender (LD) - 1998MY to 2007MY	30	<25
Defender (LD) - from 2007MY	<30	<30
Discovery Series 2 (LT)	30	<30

NOTE:

1. The total current drain will be higher if certain approved accessories are fitted (for example: tracker, trailer module, etc.)
2. Applies to vehicles without Tire Pressure Monitoring System (TPMS). Vehicle shut-down period with TPMS is approximately 15 minutes.

Battery and Charging System - General Information - Charging System

Diagnosis and Testing

Principle of Operation

For a detailed description of the charging system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to:

Generator (414-02B, Description and Operation),
 Generator (414-02B, Description and Operation),
 Generator (414-02B, Description and Operation),
 Generator (414-02C, Description and Operation),
 Generator (414-02C, Description and Operation),
 Generator (414-02C, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Generator • Auxiliary drive belt • Auxiliary drive belt tensioner • Generator pulley • Check the security of the generator fittings 	<ul style="list-style-type: none"> • Generator • Battery • Starter motor • Harnesses and connectors • Fuses • Charge warning indicator function • Engine Control Module (ECM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Charge warning indicator does not come on	<ul style="list-style-type: none"> • Bulb/circuit fault • Generator fault • Controller Area Network (CAN) circuit fault • Engine Control Module (ECM) fault 	<ul style="list-style-type: none"> • Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index
Charge warning indicator stays on / battery discharges	<ul style="list-style-type: none"> • Auxiliary drive belt broken • Generator pulley slipping on shaft • Generator fault • Battery cable fault • Controller Area 	<ul style="list-style-type: none"> • Refer to the electrical circuit diagrams and test the generator circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index • Check the auxiliary drive belt condition and tension • Check that the pulley does not rotate independently of the generator

	<ul style="list-style-type: none"> Network (CAN) circuit fault Engine Control Module (ECM) fault 	
Charge warning indicator intermittent	<ul style="list-style-type: none"> Auxiliary drive belt slipping Battery cable fault Generator wiring fault Generator fault Controller Area Network (CAN) circuit fault 	<ul style="list-style-type: none"> Refer to the electrical circuit diagrams and test the generator circuit for short circuit to ground, short circuit to power, open circuit, high resistance Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index Check the auxiliary drive belt condition and tension Check that the pulley does not rotate independently of the generator
Battery discharges without the charge warning indicator staying on	<ul style="list-style-type: none"> Battery fault Battery quiescent drain Intermittent generator fault 	<ul style="list-style-type: none"> Refer to the relevant section of the workshop manual and test the battery Refer to the relevant section of the workshop manual and test the battery quiescent drain Using the manufacturer approved diagnostic system, check the Engine Control Module (ECM) for related DTCs and refer to the relevant DTC index
Noise (mechanical)	<ul style="list-style-type: none"> Auxiliary drive belt slipping Generator fault 	<ul style="list-style-type: none"> Check the auxiliary drive belt condition and tension Remove the auxiliary drive belt and check that the generator rotates freely

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: (100-00)

Diagnostic Trouble Code (DTC) Index - TDV6 3.0L Diesel, DTC: Engine Control Module (PCM) (Description and Operation),
Diagnostic Trouble Code (DTC) Index - V8 5.0L Petrol, DTC: Engine Control Module (PCM) (Description and Operation).

Battery, Mounting and Cables -

General Specification

Item	Specification
Vin Range: Up to 6A381322	
Battery - 4.0 and 4.4 litre petrol engines:	
Voltage	12
Capacity	75 amp/hour, 690 amps
Reserve capacity	150 minutes
Battery - 2.7 litre diesel engine:	
Voltage	12
Capacity	90 amp/hour, 825 amps
Reserve capacity	190 minutes
Vin Range: From 6A381323	
Battery - 4.0 and 4.4 litre petrol engines:	
Type	Flooded Lead Acid
Voltage	12
Capacity	80 amp/hour, 700 amps
Reserve capacity	140 minutes
Battery - 2.7 litre diesel engine:	
Type	Flooded Lead Acid
Voltage	12
Capacity	90 amp/hour, 825 amps
Reserve capacity	190 minutes
Vin Range: From AA000001	
Battery - 4.0 and 5.0 litre petrol engines:	
Type	Flooded Lead Acid
Voltage	12
Capacity	80 amp/hour, 700 amps
Reserve capacity	140 minutes
Battery - 2.7 and 3.0 litre diesel engines:	
Type	Flooded Lead Acid
Voltage	12
Capacity	90 amp/hour, 825 amps
Reserve capacity	190 minutes
Vin Range: From BA587522 to CA617875	
Battery - 4.0 and 5.0 litre petrol engines:	
Type	Flooded Lead Acid
Voltage	12
Capacity	80 amp/hour, 700 amps
Reserve capacity	140 minutes
Vin Range: From BA572502 to BA596276	
Battery - 2.7 and 3.0 litre diesel engines:	
Type	Flooded Lead Acid
Voltage	12
Capacity	90 amp/hour, 950 amps
Reserve capacity	190 minutes
Vin Range: From BA596277 to DA652955	
Battery - 2.7 and 3.0 litre diesel engines:	
Type	AGM
Voltage	12
Capacity	80 amp/hour, 700 amps
Reserve capacity	140 minutes
Vin Range: CA617876 onward	
Battery - 5.0 litre petrol engine:	
Type	Flooded Lead Acid
Voltage	12
Capacity	80 amp/hour, 700 amps
Reserve capacity H7	140 minutes
Reserve capacity H8	160 minutes
Vin Range: DA652956 onward	
Battery - 3.0 litre diesel engine:	
Type	AGM
Voltage	12
Capacity	90 amp/hour, 850 amps
Reserve capacity	150 minutes
Vin Range: EA000001 onward	

Battery - 3.0 litre petrol engine:	
Type	AGM
Voltage	12
Capacity	90 amp/hour, 850 amps
Reserve capacity	150 minutes

Battery, Mounting and Cables - Battery and Cables

Description and Operation

E133243

Item	Part Number	Description
1	-	-VE battery cable
2	-	Battery monitoring module
3	-	Battery
4	-	Transit relay
5	-	+VE battery cable

GENERAL

The battery is located between the bulkhead and the secondary bulkhead, in a protective box, on the passenger side. It sits in a tray and is secured with clamp plates and bolts.

The battery terminal posts allow for the battery cables to be connected with clamp type connections. The battery positive terminal uses a pyrotechnic attachment, which detaches the battery cable in the event of a crash of a severity to trigger the airbags. For additional information, refer to: Air Bag and Safety Pretensioner Supplemental Restraint System (SRS) (descop 501-20B).

All models are fitted with Delphi lead-calcium, maintenance free battery. Each battery is similar in construction with the battery rating varying according to application. There are two different battery sizes:

- H7 - All petrol variants
- H8 - TdV6

The battery uses 'calcium expanded' technology, which has both positive and negative plates with grids expanded from a strip lead-calcium alloy.

The battery is semi-sealed. Each casing has a vent to allow for thermal expansion and to vent oxygen and hydrogen gases, which are produced under certain charging conditions.

The battery incorporates an integral, temperature compensated hydrometer to provide a visual indication of the relative density and level of the electrolyte. The indicator shows different colours to show battery condition as follows:

- GREEN – shows that the battery is charged and in a serviceable condition
- DARK (turning to black) – shows that the battery is in a low state of charge and requires recharging
- CLEAR or YELLOW – the battery is no longer serviceable and must be replaced.

If the battery shows CLEAR or YELLOW the battery has an internal fault. Do not attempt to charge or jump-start the vehicle with the battery in this condition.

When removing the battery, ensure that the alarm is disarmed and that the ignition is switched off. Always disconnect the negative terminal first and then the positive terminal. When refitting the battery, always fit the positive terminal first followed by the negative terminal.

If the battery requires recharging, always use an approved constant current charger, designed for lead-calcium batteries. DO NOT use a fast charger, permanent damage to the battery may occur.

Delivery Mode

The vehicle is fitted with a transit relay. This is a disposable device and **NOT** for use by the customer. This relay fits in series with the battery and ground; it disconnects the battery from the vehicle's ground and thus eliminates quiescent current during delivery. The relay must be removed before delivery to the customer.

Battery Monitoring System

E115177

Optimal battery health is a fundamental factor in the correct operation of the Stop/Start system, therefore to calculate and communicate the battery status a Battery Monitoring System (BMS) module is introduced.

BMS Low Battery Warning and Energy Management Messages

The BMS continuously monitors the condition of the primary vehicle battery. If excessive battery discharge occurs, the system will begin to shut down non-essential electrical systems in order to protect the battery.

If the BMS calculates that battery condition is not within set parameters, there are 3 messages that can be displayed, 2 on the touch screen and 1 on the message center. These inform the user that the battery is either at a low level of charge or the engine-off power consumption limit has been exceeded.

- **Low Battery - Please switch engine on or system will shutdown in 3 minutes:** is displayed as a **Warning** on the touch screen if the engine is not running. This indicates that the battery has fallen below a predefined threshold. As soon as the battery is charged back above this threshold then the message will be removed.
- **Low Battery - Please start your engine** is displayed on the message center if the engine is not running. This indicates that the battery has fallen below a predefined threshold. As soon as the battery is charged back above this threshold then the message will be removed or it can be manually removed by pressing 'OK'.
- **System will shut down in 3 minutes:** is displayed as an **Energy management** on the touch screen if the engine is not running, and system features are causing excessive battery discharge. After 3 minutes the BMS will begin shutting down vehicle systems. Normal system operation will resume when the engine is started.

This is based on a percentage of battery capacity available for the customer to use with the engine off. The percentage can change based upon several factors.

Once triggered, the resetting of this message will not occur until the vehicle is driven for 10 minutes with the engine running (to allow the battery to recoup any lost charge). However, if the engine is run for less than 10 minutes, the message will only be displayed after an additional 5 minutes with the ignition on but engine off.

Battery, Mounting and Cables - Battery and Cables

Description and Operation

Battery

To protect the vehicle's electrical system the main battery and battery junction box are enclosed in an armoured casing. The casing-lid can be removed to gain access to the battery and junction box.

Main battery armoured casing

Split Charging

Overview

To protect the vehicle's electrical system a split-charging system is employed. This allows the electrically powered accessories associated with the armoured vehicle to be operated independently, therefore preserving the condition of the vehicle's main battery.

System Operation

The split-charging system comprises:

- An auxiliary battery, mounted in the engine compartment on the opposite side to the main battery.
- A voltage sensitive relay, mounted next to the auxiliary battery.
- A satellite junction box, mounted in the base of the floor-console stowage compartment.
- A battery status monitoring switch, located in the auxiliary switch pack.
- A battery status monitoring lamp, located in the auxiliary switch pack.

Auxiliary battery and relay

E101542

Item	Part Number	Description
1	-	Auxiliary battery
2	-	Voltage sensitive relay

NOTES:

All the accessories associated with the armoured vehicle are powered via the satellite junction box. Refer to 'Satellite Junction Box' below.

The generator is the same as fitted to standard vehicles.

When the engine is running, the voltage sensitive relay monitors the charging voltage from the generator. If the voltage rises above 13.7 volts, the contacts in the relay close, which connects the auxiliary and main battery in parallel. This allows the generator to charge both batteries simultaneously.

If any accessories connected to the satellite junction box are being used when the engine is not running and the main-battery voltage drops below 12.8V, the voltage sensitive relay contacts will open. This removes the main battery from the circuit, leaving the auxiliary battery to power its associated armoured accessories.

The voltage status of the auxiliary battery can be monitored when the ignition is 'Off' by using the switch and status monitoring lamp in the auxiliary switch pack. A lamp in the battery switch will illuminate when the switch is in the 'On' position.

The status monitoring lamp provides an indication of the auxiliary battery's condition; refer to the 'Auxiliary battery status monitoring lamp' table below. The monitoring lamp has integral ambient light detection, which reduces the LED (light emitting diode) brightness under low-light conditions. The lamp is supplied by a 3 Amp fuse (F5) in the satellite junction box.

Auxiliary switch pack

E101544

Item Part Number Description

- 1 - Auxiliary battery, status monitoring lamp
- 2 - Auxiliary battery, status monitoring switch with integral lamp

Auxiliary battery status monitoring lamp

Colour	Battery Voltage	Meaning
Slow Flashing RED	Less than 10.5 volts	Extreme under voltage (recharge battery immediately)
Continuous RED	10.5 volts	Battery capacity nearly exhausted
Fluctuating between RED and GREEN	10.5 to 12.5 volts	Battery discharging
Continuous GREEN	More than 12.5 volts	Fully charged, battery at rest
Flashing GREEN	More than 13.8 volts	Battery on charge
Fast Flashing RED	More than 15.25 volts	Battery overcharging (investigate)

Satellite Junction Box

The satellite junction box is mounted in the base of the floor-console stowage compartment. All electrically powered accessories associated with the armoured vehicle are routed through the satellite junction box, via the armoured vehicle options harness.

Satellite junction box

E101543

Item	Part Number	Description
1	-	Intercom system – 5 amp fuse (F1)
2	-	Siren – 20 amp fuse (F2)
3	-	Covert lamps – 5 amp fuse (F3)
4	-	Beacon – 10 amp fuse (F4)
5	-	Battery status monitoring lamp - 3 amp fuse (F5)
6	-	Spare terminal – 30 amp fuse maximum (F6)

NOTES:

It is recommended that any additional electrical equipment (apart from authorised Land Rover accessories) fitted by the end user is connected to the spare terminal (F6) of the satellite junction box, with an appropriately rated fuse not exceeding 30 amps.

The supplementary circuit diagrams for the armoured vehicle are located in Land Rover GTR at: Service Information, Discovery 3, 2008 Electrical Circuit Diagrams.

Battery, Mounting and Cables - Battery

Diagnosis and Testing

Principles of Operation

For a detailed description of the battery system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (414-01 Battery, Mounting and Cables)

Battery and Cables (Description and Operation),
 Battery and Cables (Description and Operation),
 Battery and Cables (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Generator • Drive belt • Drive belt tensioner • Generator pulley • Check the security of the generator fixings 	<ul style="list-style-type: none"> • Generator • Battery • Battery connections • Starter motor • Harnesses and connectors • Fuses • Charge warning lamp function • Engine Control Module (ECM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

NOTES:

Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer-approved diagnostic system).

When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

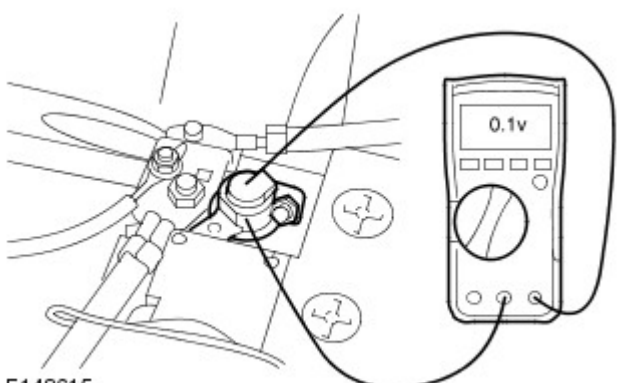

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

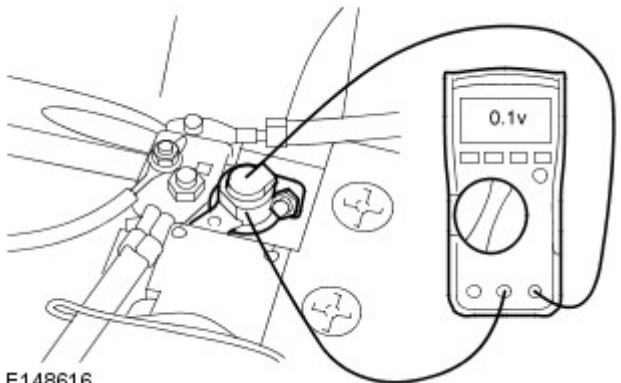

Midtronics EXP-1080 User Guide

Carry out the following: -

PINPOINT TEST A : VOLTAGE DROP	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: GROUND CIRCUIT	
NOTE: This test checks for high resistance between the battery terminal and the battery clamp	
	1 Start the engine, turn on the following: <ul style="list-style-type: none"> • (1) Air conditioning

 <p>E148615</p>	<ul style="list-style-type: none"> • (2) Blower fan on full speed • (3) Headlights on main beam • (4) Heated screen - rear • (5) Heated screen - front (if installed) • (6) Heated seats (if installed)
	<p>2 Connect the multimeter between the battery negative terminal and the battery clamp as shown in picture below (do not disconnect the battery at this stage)</p>
	<p>3 Set the multimeter to read DC voltage and record the reading</p>
	<p>Is reading equal to or below 0.1 volts? Yes GO to A2. No Switch all electrical loads and engine off, return the vehicle to an ignition off condition. Disconnect the battery negative clamp, clean clamp and terminal then reconnect and repeat test GO to A1.</p>

A2: POWER CIRCUIT

<p> NOTE: This test checks for high resistance between the battery terminal and the battery clamp</p>	
 <p>E148616</p>	<p>1 Start the engine, turn on the following:</p> <ul style="list-style-type: none"> • (1) Air conditioning • (2) Blower fan on full speed • (3) Headlights on main beam • (4) Heated screen - rear • (5) Heated screen - front (if installed) • (6) Heated seats (if installed)
	<p>2 Connect the multimeter between the battery positive terminal and the battery clamp as shown in picture below (do not disconnect the battery at this stage)</p>
	<p>3 Set the multimeter to read DC voltage and record the reading</p>
	<p>Is reading equal to or below 0.1 volts? Yes Carry out midtronics battery test procedure No Switch all electrical loads and engine off, return the vehicle to an ignition off condition. Disconnect the battery power clamp, clean clamp and terminal then reconnect and repeat test GO to A2.</p>

E148611

E148612

E148613

E148614

The following steps must be carried out to ensure correct operation of the EXP-1080 during the battery test procedure

Checks	Action
Battery fluid leakage, check for battery fluid leaks or damage to the battery casing	 <p>NOTE: If visible damage to the case is evident do not return battery under warranty</p> <p>Replace the battery if there is any battery fluid leaks evident</p>
Battery vent pipe routing	Check for routing, ensure there are no kinks
EXP-1080 fly lead, condition of clamps	Clean or replace as required
EXP-1080 fly lead connection	Confirm secure connection

NOTE: The Midtronics EXP-1080 is suitable for testing flooded and absorbed glass mat (AGM) type batteries

Typical Values

Amp Hour	CCA (Cold Cranking Amps)	Rating Units
12	200	EN
70	760	SAE
80	700	SAE
80	800	SAE
90	800	SAE
95	850	SAE
90	950	SAE
105	950	SAE

Midtronics Battery Test Procedure

This midtronics battery test procedure will confirm the serviceability of the battery

- 1. Connect the fly-lead to the midtronics EXP-1080
- 2. Connect the fly-leads to the battery terminals
 - **Black lead to negative terminal**
 - **Red lead to positive terminal**
 - Confirm the connections are secure
- 3. The EXP-1080 will power on automatically when connected to a battery, screen below is displayed

E148617

11

NOTE: MAIN MENU SCREEN

- 4. **Main Menu.** Select **Battery test** and press **SELECT**

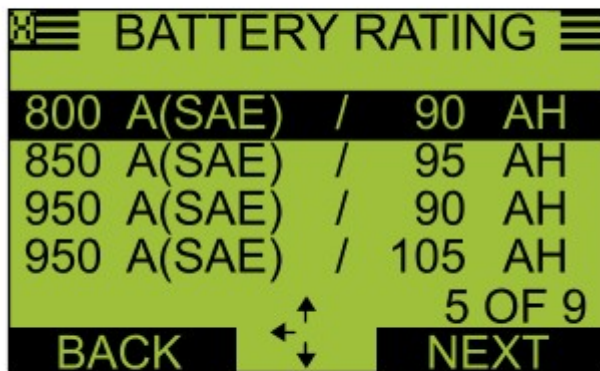

E148618

NOTE: BATTERY LOCATION

- 5. **Battery Location.** Select either, **Out of vehicle** or **In Vehicle** as appropriate
- Select **Next**

E148619

E148620

NOTE: BATTERY RATING

- 6. **BATTERY RATING**. Select the correct battery rating from the pre-installed list, (**Goto step 10**). Or,
- To manually enter the correct battery type, specification and CCA rate. Scroll using the arrow keys on the midtronics panel and select **Other** from the menu
- Select **Next**

E148621

NOTE: BATTERY TYPE

- 7. **Battery Type**. Select the correct battery type (**Regular** or **AGM**)
- NOTE: All **AGM** batteries are marked (Refer to battery label)
- Select **Next**

E148622

NOTE: RATING UNITS

- 8. **Rating Units**. Select the correct rating units. Refer to the battery label for correct specification.
Options **EN, DIN, SAE**
- Select **Next**

E148623

NOTE: BATTERY RATING

- 9. **BATTERY RATING**. Scroll using the arrow keys on the midtronics panel, select the correct **CCA** rating (For CCA refer to battery label)
- Select **Next**

E148624

NOTES:

TEMPERATURE

Ensure that the temperature sensor does not touch any part of the battery or vehicle, this will cause damage not be covered under the midtronics warranty and will require the unit to be returned to a service center

- 10. **Temperature**. Aim the temperature sensor towards the battery casing (Maintain distance of 5cm)
- Select **Next**

E148625

NOTE: TESTING

- 11. **Testing**. The screen displays clock hand's rotating, the EXP-1080 will automatically advance when test has completed

E148626

NOTES:

SURFACE CHARGE

If there is no surface charge this step will not show. **Go to next step**

- 11a. **Surface Charge**. Ensure the **ignition state is on**. Switch on the headlights (high beam) until EXP-1080 shows **Turn off headlights** then return ignition state to off

E148627

NOTES:

 BATTERY CHARGE

 If the state of charge is sufficient this step will not show. **Go to next step**

- 11b. **Battery Charge.** Select **Before Charging** if battery has not been on a recommended mains charger for a minimum of 6 hours
- Select **After Charging** if battery has been on a recommended mains charger for a minimum of 6 hours

E148628

NOTES:

 DEEP SCAN TECHNOLOGY

 This test is automated and will show if required. **Go to next step**

- 12. **Testing.** The EXP-1080 will carry out the deep scan test, then automatically advance when test has completed

Number	Description
1	Battery test result
2	CCA (Measured capacity rating)
3	Voltage
4	CCA (Manually entered)
5	Temperature

E148629

NOTE: RESULTS

Test Result	Action
GOOD BATTERY	Test complete no action required
GOOD - RE-CHARGE	Charge battery using a recommended mains charger (minimum 50 amp) until charging complete
CHARGE AND RE-TEST	Charge battery using a recommended mains charger (minimum 50 amp) until charging complete. Retest. If the result is the same replace battery
REPLACE BATTERY / BAD CELL BATTERY	Replace battery. Do Not Recharge
UNABLE TO COMPLETE TEST	Disconnect battery from vehicle and re-test

NOTES:

TEST CODE

Battery test code, must be given if a battery, starter motor or generator is exchanged under warranty

E148631

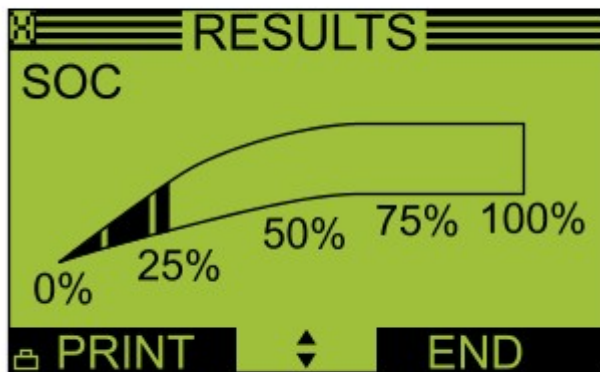

NOTES:

STATE OF HEALTH

General health of the battery and its ability to deliver its specified performance compared with a new battery

E148632

NOTES:

SOC (State Of Charge)

BATTERY STATE OF CHARGE

- **Results.** From the result display use the arrow keys on the control panel to view the test code
- The test code **must** be quoted with every battery claim under warranty

Flooded Battery Care Point

If the vehicle is equipped with a flooded battery, ensure the replacement battery is a flooded battery of the same specification (cold cranking amperage (CCA) / amp hour rating (Ah)) as the original battery

Under no circumstances should you fit a flooded battery to a vehicle that originally had an AGM battery, unless formally instructed by Jaguar/Land Rover

AGM Battery Care Point

If the vehicle is equipped with an absorbed glass mat (AGM) battery, ensure the replacement battery is a AGM battery of the same specification (cold cranking amperage (CCA) / amp hour rating (Ah)) as the original battery,

unless formally instructed by Jaguar/Land Rover

Battery, Mounting and Cables - Auxiliary Battery

Removal and Installation

Removal

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

Removal steps in this procedure may contain installation details.

1. Refer to: [Battery](#) (414-01 Battery, Mounting and Cables, Removal and Installation).

3.  CAUTION: Care must be taken not to damage the component.

NOTE: Note the orientation of the component.

4. Torque: 6 Nm

5. Torque: 6 Nm

6. Torque: 6 Nm

7.  CAUTION: Extra care must be taken to avoid damage to the battery insulator cover on removal. A new insulator cover must be installed if damaged.

E161111

Installation

E161275

1. CAUTIONS:

 Only carry out this step if a new auxiliary battery is being installed or the insulator cover has been damaged.

 Make sure the insulator cover is installed in the correct orientation.

NOTES:

 Make sure that the adhesive backing paper is removed before installation.

 Make sure the insulator cover is correctly installed, by aligning each side, then compressing each corner fold to obtain a consistent thermal protection.

2. To install reverse the removal procedure.

Battery, Mounting and Cables - Auxiliary Battery Tray

Removal and Installation

Removal

1. Remove the battery cover.
 - Release the 2 clips.

E48702

2. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

3. If installed, remove the auxiliary battery.

4. Remove the engine compartment upper heat shield.
 - Remove the screw.
 - Release the 2 clips.

E48703

5. Remove the auxiliary battery compartment side wall.
 - Release the battery positive cable and grommet.
 - Release the four clips.

E48704

6. Release the A/C pipes.
 - Remove the retaining screw.

E63131

7. Remove the auxiliary battery tray.
 - Remove the three retaining nuts.

E48705

Installation

1. To install, reverse the removal procedure.
 - Tighten the nuts to 12 Nm (9 lb.ft).

Battery, Mounting and Cables - Battery

Removal and Installation

Removal

1. Secure the hood in the service position.
 - Release the support struts.

2. Remove the battery cover.

3. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

4. Disconnect the battery positive cable.

5. Remove 2 bolts securing the battery clamp and remove the clamp.

6. Remove the battery.

Installation

1.  **NOTE:** Apply petroleum jelly to the battery terminals.

To install, reverse the removal procedure.

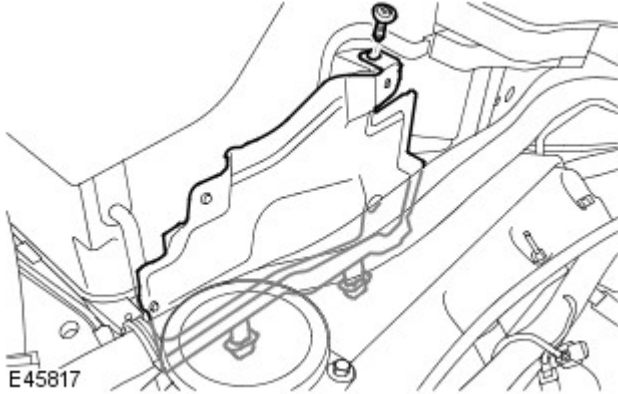

- Tighten the battery clamp bolts to 5 Nm (4 lb.ft).
- Tighten the battery terminals to 5 Nm (4 lb.ft).

Battery, Mounting and Cables - Battery Tray

Removal and Installation

Removal

1. Remove the battery.
For additional information, refer to: Battery (414-01, Removal and Installation).

2. Remove the engine compartment upper heat shield.
 - Remove the screw.
 - Release the 2 clips.

3. Remove the battery compartment side wall.
 - Release the battery positive cable and grommet.
 - Release the four clips.

4. Release the heater pipes.
 - Remove the retaining screw.

5. Remove the battery tray.
 - Remove the three retaining nuts.

E46327

Installation

1. To install, reverse the removal procedure.
 - Tighten the nuts to 12 Nm (9 lb.ft).

Generator and Regulator - V6 S/C 3.0L Petrol -

General Specification

Item	Specification
Generator:	
Make/Type	Denso SC2
Output	90/150 amps @ 25° C
Voltage control	By Power Control Module (PCM)
Voltage setpoint regulation	Controlled by Engine Management System (EMS)

Torque Specifications

Description	Nm	lb-ft
* Battery harness connection nut	10	7

CAUTION: * Damage to the internal connections will result if this torque is exceeded

Generator and Regulator - V6 S/C 3.0L Petrol - Generator

Description and Operation

E50141

GENERAL

The generator is located at the front RH side of the engine, in front of the RH cylinder head. The generator has an output of 85/150 Amps and is manufactured by Denso. An eight-ribbed polyvee belt drives the generator pulley, which in turn is driven from the engine crankshaft pulley.

The generator pulley incorporates a one-way clutch mechanism, which allows the pulley to free wheel, reducing the amount of inertia applied to the engine during deceleration (coast).

The generator comprises a stator, a rotor, a rectifier pack and a regulator. There is a three-pin connector (C0053) on the generator:

- Pin 1 – Voltage reference line to the battery via the Battery Junction Box (BJB)
- Pin 2 – Pulse Width Modulated (PWM) signal from the Engine Control Module (ECM) to the generator (generator control)
- Pin 3 – PWM signal from the generator to the ECM (generator monitoring)

The generator is connected to earth via its mountings.

The rotor comprises a field winding, wound around an iron core and mounted on a shaft. The iron core has extensions at each end, which form North and South poles as current flows through the field winding. The rotor is located inside the stator and is mounted on bearings for smooth running and to support the rotor due to the high side loading applied by the drive belt tension.

The stator has three sets of coils made from copper wire. The three coil windings are connected in a 'star' connection, where one end of the winding is connected to the other two windings. The output current is supplied from the opposite end of each winding. Rotation of the rotor causes ac current to be produced in the coils.

The rectifier converts the ac current produced in the stator coils into dc (rectified) current required by the vehicle electrical system. The rectifier comprises semi-conductor diodes mounted on a heatsink to dissipate heat. An equal number of the diodes are on the negative and positive side, with an additional diode in the regulator to control feedback through the battery voltage signal line. The rectifier also prevents current flow from the battery to the generator when the output voltage is less than the battery voltage.

The 'smart' regulator controls the output voltage from the generator to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximise any re-chargeability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing with consequent water loss. The EMS, which controls the regulator, will calculate the voltage set point required for the ensuing conditions. The 'traditional' regulator controls voltage against generator temperature, which means the battery temperature will lag a long way behind so there will be significant periods of operation when battery charging is compromised. With this system, the EMS can set the voltage by inferring the battery temperature from

information received from its various sensors, hence voltage will follow the battery's needs a lot more accurately.

The regulator has transistors, which rapidly switch on and off to regulate the voltage output according to the voltage sensed internally. The regulator also provides a PWM signal output to the ECM, which uses the signal to adjust the idle speed under varying electrical loads.

Initially, the ignition switch supply provides an excitation current to the rotor at low generator speeds via brushes, which contact slip rings at the end of the rotor shaft. As the generator speed increases the generator becomes self-exciting.

The charge warning lamp function is transmitted to the EMS and then on to the Controller Area Network (CAN) bus to the instrument pack.

LOAD MANAGEMENT SYSTEM

The load management system comprises software resident in the Automatic Temperature Control Module (ATCM).

For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).

Its purpose is to protect battery state-of-charge during abnormal usage of the vehicle. The system will request the Media Orientated System Transport (MOST) ring and the air suspension to go into 'power save' mode, and will modulate features such as seat heating and screen heating to prevent the battery being dragged down to a point where the car becomes unoperational. A 'WARNING - LOW BATTERY' message will be displayed in the message centre.

Generator and Regulator - TDV6 3.0L Diesel - Generator - Component Location

Description and Operation

E117288

Generator and Regulator - TDV6 3.0L Diesel - Generator - Overview

Description and Operation

OVERVIEW

The charging system consists of a 180 Amp output generator and regulator assembly. The generator and regulator assembly generates electrical power for the vehicle electrical system and maintains the battery in a charged state. When the engine is running the generator produces an alternating current, which is converted to a direct current internally. The output from the generator is controlled by the voltage regulator (located inside the generator) and then supplied to the battery through the main battery positive cable.

The generator is mounted on the front right side of the engine and driven at approximately 3 times engine speed by the accessory drive belt.

Generator and Regulator - TDV6 3.0L Diesel - Generator - System Operation and Component Description

Description and Operation

Control Diagram

NOTE: **A** = Hardwired; **D** = High speed CAN (controller area network) bus; **N** = Medium speed CAN bus; **O** = LIN (local interconnect network) bus.

E96985

Item Description

- 1 Battery monitoring system module
- 2 Battery
- 3 BJB (battery junction box)
- 4 Generator and regulator
- 5 ECM (engine control module)
- 6 Instrument cluster
- 7 RJB (rear junction box)

System Operation

OPERATION

The output voltage required from the generator and regulator is calculated by the battery monitoring system. Refer to: Battery and Cables (414-01, Description and Operation).

The battery monitoring system signals the calculated voltage to the [ECM](#) via the [RJB](#) and the instrument cluster. The [ECM](#) then transmits the calculated voltage to the generator and regulator on the [LIN \(local interconnect network\)](#) bus connection.

The [ECM](#) will over-ride the voltage value requested by the battery monitoring system if it detects a fault in the generator and regulator. The [ECM](#) also signals the instrument cluster to display a warning message if it detects a fault with the generator and regulator.

Refer to: Instrument Cluster (413-01, Description and Operation).

Component Description

DESCRIPTION

The regulator provides a controlled variable voltage output from the generator. Two electrical terminals are provided on the outer casing of the generator. One terminal supplies the [DC \(direct current\)](#) voltage output from the generator to the battery positive terminal. The second terminal provides the [LIN](#) bus connection between the regulator and the [ECM](#).

Generator and Regulator - TDV6 3.0L Diesel - Generator

Diagnosis and Testing

DVD Map Updates

E 142913

Vehicles equipped with the 'remote' navigation module are supplied with a DVD map update which is loaded into and left in the navigation module. Map data is read directly from the DVD. This update can be carried out by the customer.

External HD Service Tool Map Updates

E142915

Discovery 4, Range Rover Sport and Range Rover vehicles, equipped with a HDD (hard disc drive) integrated into the touch screen, are updated at point of service. Dealers are supplied with a set of master pack map update DVD's which are loaded onto the dealer Jaguar/Land Rover approved diagnostic equipment. The map data is then loaded from the diagnostic equipment onto the navigation tool hard drive. The map data is loaded to the touch screen from the navigation tool hard drive.

The following process should be used to update the map data:

NOTE: The navigation update tool does not need the map data loading every time. This is only necessary when a new map update DVD is released.

- Using the approved Jaguar/Land Rover diagnostic equipment select the navigation update tool.

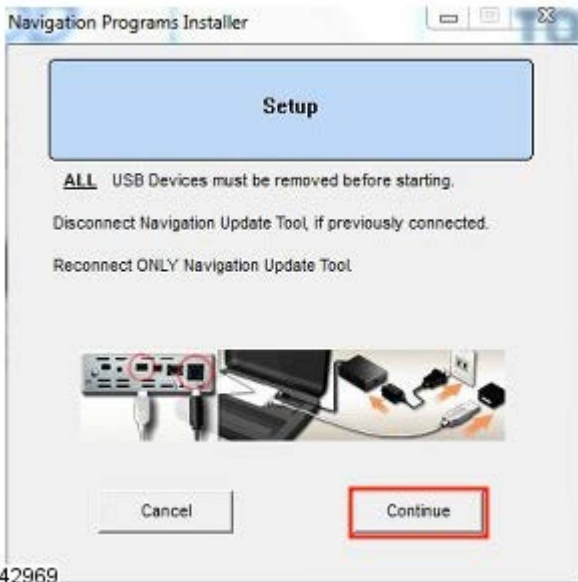

E142966

- Select **Setup** on the navigation update tool.

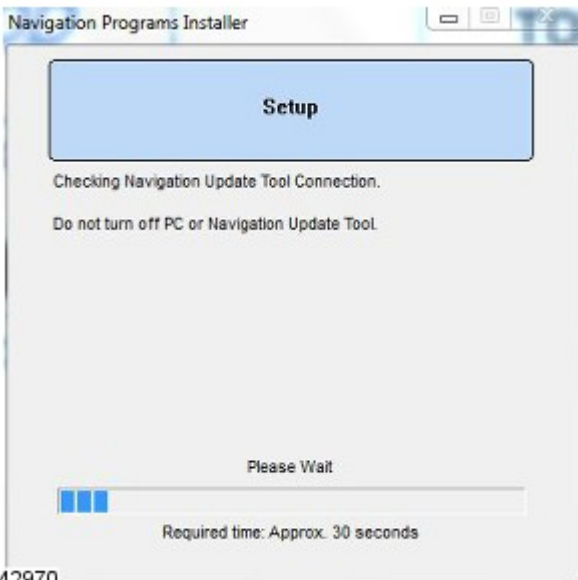

E142967

- Connect the navigation update tool to the Jaguar/Land Rover approved diagnostic equipment using the USB cable and press **Continue** proceed.

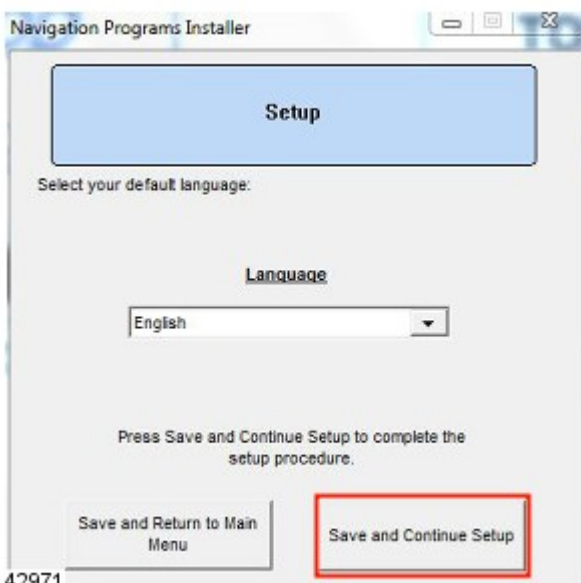

E142969

- The navigation update tool will then check the connection.

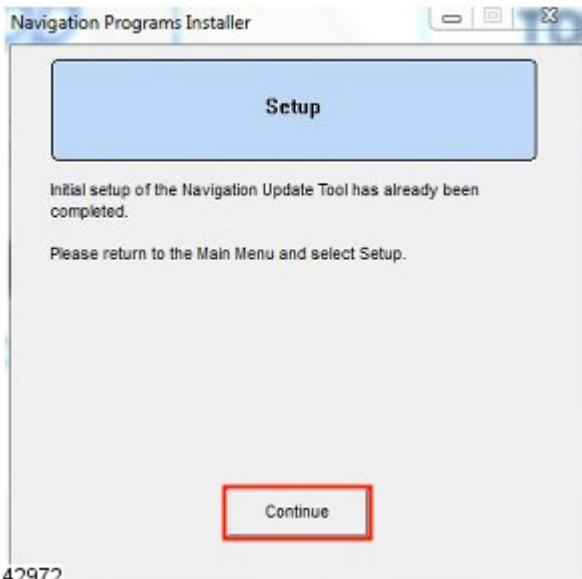

E142970

- Select your preferred language from the drop down menu then press **Save and Continue Setup** to proceed.

E142971

- When the navigation update tool confirms the initial setup is complete, press **Continue** to proceed.

E142972

- The navigation update tool will the return to the main menu screen, select **Load Map Data** to proceed.

E142968

- Disconnect then reconnect, the USB cable connecting to the navigation update tool to the Jaguar/Land Rover approved diagnostic equipment, press **Continue** proceed.

E142973

- The navigation update tool will then check the connection.

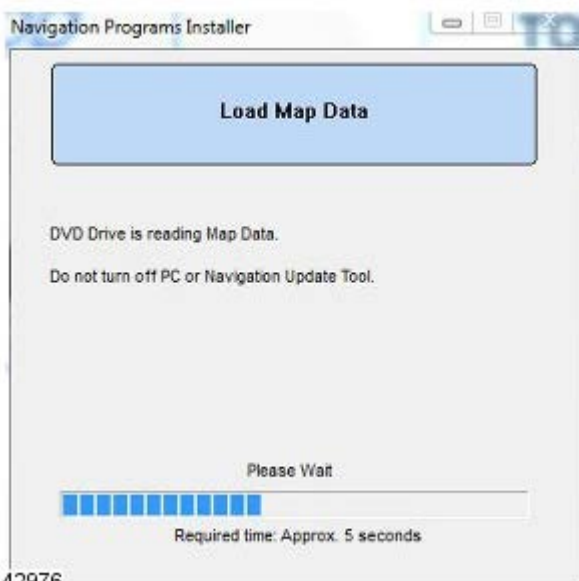

E142974

- Insert map update disk 1 into the DVD drive of the Jaguar/Land Rover approved diagnostic equipment and press **Continue** proceed

E142975

- The navigation update tool will then read the map data

E142976

- Map data will then be copied from disk 1 to the Jaguar/Land Rover approved diagnostic equipment.

E142977

- Insert map update disk 2 into the DVD drive and press **Continue** proceed

E142978

- Map data will then be copied from disk 2 to the Jaguar/Land Rover approved diagnostic equipment.

E142979

- Map data is now ready to be uploaded onto the navigation update tool, press **Continue** proceed.

E142980

- The map data is now being uploaded onto the navigation update tool.

E142981

- Map data upload is now complete.

E142982

- Disconnect the navigation update tool from Jaguar/Land Rover approved diagnostic equipment.
- Connect the navigation update tool to the vehicle using the firewire cable.

- Select **Navigation** using the touch screen display soft key.

E 142956

- Select **Navigation Setup** using the touch screen soft key.

E 142957

- Select **Map Change** using the touch screen.

E 142958

- Select map region using the touch screen display and press **Map Data Update** to continue.

E 142959

- The current map data version and the proposed update map data versions will now be shown, Select the relevant region, using the related touch screen key to proceed.

E142960

- Select **OK** to input the licence key using the touch screen.

E142961

- Input the licence key using the touch screen display and press **OK** to continue.

E142962

- Select **OK** using the touch screen.

E142963

- The map update will begin.

E142964

- When the map update is complete a message will be shown in the touch screen, select **OK** to continue using the touch screen display soft key. The navigation system will restart with the new map data.

E142965

- Disconnect the navigation update tool from the vehicle.

USB Map Updates

E142914

All Gen 2.1 equipped vehicles are supplied with a USB map updates, these updates can be carried out by the customer.

The following process should be used to update the map data:

- Start the engine.
- Navigate to the touch screen **Home Menu** screen.

E 142916

- Insert the USB memory stick containing the map data into the vehicle USB port.

E 142914

- Press **Continue** on the touch screen to proceed with the installation of the map update.

E 142917

- using the touch screen enter the licence code and press **OK** to proceed.

E 142918

-  **NOTE:** Selecting 'Cancel' returns to the 'Home Menu' screen, the map update will continue to run in the background

The map update will begin and a message will be displayed in the touch screen display advising that navigation is unavailable.

E142919

- Map update progress can be viewed as a percentage of the completed download in the **Home Menu** screen.

E142920

- When the update is complete a message is displayed informing the user.

E142921

- The navigation will restart upon completion of the map update.

NOTE: Remove USB stick immediately

E142922

- Turn off the engine.

Exit, lock the vehicle and leave for at 15 minutes before using the navigation system.

Japanese Navigation

The Japanese satellite navigation system uses a separate navigation computer module.

The HDD in the ACM/IAM is not used for navigation downloads in this market.

Map updates are supplied in DVD format. The DVD is loaded into the navigation module. Map data is read directly from the DVD.

Asia Navigation

The Asia market navigation system is an aftermarket unit.

Map updates are supplied in an SD card format. The SD card is loaded into the navigation module. Map data is read directly from the SD card.

Information and Entertainment System - General Information - Cellular Phone

Diagnosis and Testing

Principle of Operation

For a detailed description of the Cellular phone system and operation, refer to the relevant Diagnosis and Testing section of the workshop manual. REFER to:

Audio System (415-01 Audio Unit, Description and Operation),
Antenna (415-02 Antenna, Description and Operation),
Speakers (415-03 Speakers, Description and Operation),
Video System (415-07 Video System, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Check all information and entertainment system modules • Speakers • Switch(s) stuck or damaged • Touch screen display 	<ul style="list-style-type: none"> • Fuses • Electrical harnesses • Harness connectors • Battery condition, state of charge

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, refer to the Symptom Chart below, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Action
Unable to pair	• GO to Pinpoint Test A.
Not Auto Connecting	• GO to Pinpoint Test B.
Poor Quality Audio	• GO to Pinpoint Test C.
No Audio to 3rd Party	• GO to Pinpoint Test D.
No Audio from 3rd Party	• GO to Pinpoint Test E.
No Audio	• GO to Pinpoint Test E.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Bluetooth Module (TEL) (100-00 General Information, Description and Operation).

Pinpoint Tests

PINPOINT TEST A : UNABLE TO PAIR	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: 'NO PHONE FITTED' DISPLAY	
<p>NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the bluetooth function is activated and the telephone handset is placed within the vehicle cabin area.</p>	
	1 Carry out checks to determine if 'No Phone Fitted' is shown on vehicle display.

	<p>Is 'No Phone Fitted' displayed?</p> <p>Yes GO to A2.</p> <p>No Locate the connected telephone and if not Customer telephone, disconnect from the system.</p>
A2: TELEPHONE BLUETOOTH DEVICE SEARCH	
	1 Carry out Bluetooth device search using Customer handset.
	<p>Is 'Land Rover' identified in Bluetooth device list?</p> <p>Yes Select device from list, then continue with diagnosis.GO to A3.</p> <p>No Carry out further Bluetooth device search, to a maximum of 4 times, waiting approximately 20 seconds between searches. If 'Land Rover' still not identified in Bluetooth device list, set ignition status to OFF, wait approximately 30 seconds and set ignition status to ON. Carry out further Bluetooth device search, to a maximum of 4 times, waiting approximately 20 seconds between searches. If 'Land Rover' still not identified in Bluetooth device list, contact your local in market support for further assistance.</p>
A3: TELEPHONE HANDSET ERROR	
	1 Check for any error shown on the telephone handset when 'Land Rover' is selected from the Bluetooth device list.
	<p>Was an error immediately shown on the telephone handset?</p> <p>Yes Wait approximately 10 seconds then re-attempt selection, to a maximum of 4 times, waiting approximately 10 seconds between each attempt. If error still being displayed, contact your local in market support for assistance.</p> <p>No Enter PIN '2121' then continue with diagnosis.GO to A4.</p>
A4: PIN ENTRY STATUS	
	1 Check for successful PIN entry.
	<p>Was PIN entry successful?</p> <p>Yes GO to A5.</p> <p>No Wait approximately 10 seconds then re-attempt PIN entry, to a maximum of 4 times, waiting approximately 10 seconds between each attempt. If PIN entry is still un-successful, contact your local in market support for assistance.</p>
A5: 'NO PHONE FITTED' DISPLAY	
	1 Carry out checks to determine if 'No Phone Fitted' is still shown on vehicle display.
	<p>Is 'No Phone Fitted' still displayed?</p> <p>Yes From the telephone handset, select the connect option for the 'Land Rover' device identified in the Bluetooth device list. If 'No Phone Fitted' is still displayed, suspect a telephone handset fault. Carry out Pinpoint test again using known good telephone handset.</p> <p>No The telephone is paired and connected to the system. No further action is required for this symptom.</p>

PINPOINT TEST B : NOT AUTOMATICALLY CONNECTING	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CUSTOMER TELEPHONE IN POSITION 1	
 NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the bluetooth and auto connect functions are activated and the telephone handset is placed within the vehicle cabin area.	
	1 Carry out checks to determine if the Customer telephone is in position 1 in the Bluetooth Module device list.
	<p>Is the Customer telephone in position 1?</p> <p>Yes GO to B2.</p> <p>No Advise Customer that delays in connection will occur if telephone is not listed in position 1.</p>
B2: BLUETOOTH CONNECTION	
	1 Carry out checks to determine if Bluetooth connection to the vehicle has been achieved.
	<p>Has Bluetooth connection to the vehicle been achieved?</p> <p>Yes No further action is required for this symptom.</p> <p>No GO to B3.</p>
B3: 'NO PHONE FITTED' DISPLAY	
	1 Carry out checks to determine if 'Land Rover' is shown in the Customer Bluetooth telephone device display.
	Is 'Land Rover' identified in the Customer Bluetooth device list?

Yes	Select the device to connect then follow pairing instructions.
No	Carry out the 'Unable to Pair' Pinpoint Test. GO to A.

PINPOINT TEST C : POOR QUALITY AUDIO

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

C1: SIGNAL STRENGTH

 **NOTE:** Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.

	1 Check the signal strength displayed on the telephone handset.
	Are at least two signal strength bars shown on the telephone handset display?
Yes	GO to C2.
No	Suspect GSM Network issue. This can explain intermittent audio and dropped calls, and the inability to initiate calls.

C2: POOR AUDIO FROM THIRD PARTY ONLY

	1 Establish from Customer feedback/symptom if there is poor audio from the Third Party only.
	Is the poor audio from the Third Party only?
Yes	Suspect GSM Network issue. This can explain intermittent audio and dropped calls, and the inability to initiate calls.
No	GO to C3.

C3: POOR AUDIO TO THIRD PARTY ONLY

	1 Establish from Customer feedback/symptom if there is poor audio to the Third Party only.
	Is the poor audio to the Third Party only?
Yes	Check and install a new microphone as necessary.
No	GO to C4.

C4: POOR AUDIO WITH VEHICLE STATIONARY

	1 Establish from Customer feedback/symptom if there is poor audio when the vehicle is stationary only.
	Is the poor audio when the vehicle is stationary only?
Yes	Check and install a new microphone as necessary.
No	GO to C5.

C5: THIRD PARTY MOVING VEHICLE

	1 Establish from Customer feedback/symptom if the Third Party is in a moving vehicle.
	Is the Third Party in a moving vehicle?
Yes	There are limitations to the way the system can improve audio, and in this situation it is not possible to determine the source of the audio degradation.
No	GO to C6.

C6: CUSTOMER HEARING ECHO

	1 Establish from Customer feedback/symptom if the Customer is hearing an echo.
	Is the Customer hearing an echo?
Yes	Echo from the Third Party is not vehicle failure, it is the Third Party set-up. No further action is required for this symptom.
No	Contact your local in market support for assistance.

PINPOINT TEST D : NO AUDIO TO THIRD PARTY

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

D1: MICROPHONE DIAGNOSTIC TROUBLE CODES (DTCs)

 **NOTE:** Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.

	1 Using the Manufacturer approved diagnostic system, check for any logged microphone DTCs in Audio Front Control module.
	Is DTC B1D79-01 logged?
Yes	Carry out diagnosis of electrical failure as advised in Action column of DTC Index.
No	

Contact your local in market support for assistance.

PINPOINT TEST E : NO AUDIO FROM THIRD PARTY

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: 'IN CALL' DISPLAY	
 NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.	
	1 Carry out checks to determine if 'In Call' is shown on the vehicle display.
	Is vehicle display showing 'In Call'? Yes Contact your local in market support for assistance.
	No Call has ended. No further action is required for this symptom.

PINPOINT TEST F : NO AUDIO

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: AUDIO FROM THIRD PARTY	
 NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.	
	1 Establish from Customer feedback/symptom if there is Audio from the Third Party.
	Is there Audio from the Third Party? Yes GO to F2.
	No Refer to the 'No Audio From Third Party' Pinpoint test. GO to E.

F2: AUDIO TO THIRD PARTY

	1 Establish from Customer feedback/symptom if there is Audio to the Third Party.
	Is there Audio to the Third Party? Yes GO to F3.
	No Refer to the 'No Audio To Third Party' Pinpoint test. GO to D.

F3: CD OR RADIO AUDIO

	1 Establish from Customer feedback/symptom if there is Audio from the CD or Radio.
	Is there Audio from the CD or Radio? Yes GO to F4.
	No Suspect MOST ring fault, refer to electrical circuit diagrams and check/rectify MOST ring as necessary.

F4: TELEPHONE HANDSET AUDIO

	1 Establish from Customer feedback/symptom if there is Audio from the telephone handset.
	Is there Audio from the telephone handset? Yes Ensure vehicle is parked. Disconnect and reconnect handset. If issue not resolved, contact your local in market support for assistance.
	No Contact you local in market support for assistance.

Information and Entertainment System - General Information - Information and Entertainment System

Diagnosis and Testing

Principles of Operation

For a detailed description of the information and entertainment system and operation, refer to the relevant Diagnosis and Testing section of the workshop manual. REFER to:

[Audio System](#) (415-01A Audio Unit, Diagnosis and Testing),
[Antenna](#) (415-02 Antenna, Description and Operation),
[Speakers](#) (415-03 Speakers, Diagnosis and Testing),
[Video System](#) (415-07 Video System, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern
2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Audio Head Unit (AHU) • Integrated Audio Module (IAM) • Audio Amplifier Module (AAM) • Multi-Function Display (MFD) • Touch Screen (TS) • Satellite Radio Control Module (SRCM) • Digital Radio Control Module (DRCM) • TV Control Module (TVCM) • Rear Seat Entertainment Control Module (RSECM) • Speakers • Scratched/dirty compact discs • Water ingress 	<ul style="list-style-type: none"> • Fuses • Wiring harnesses and connectors • Audio Head Unit (AHU) • Integrated Audio Module (IAM) • Audio Amplifier Module (AAM) • Multi-Function Display (MFD) • Touch Screen (TS) • Satellite Radio Control Module (SRCM) • Digital Radio Control Module (DRCM) • TV Control Module (TVCM) • Rear Seat Entertainment Control Module (RSECM) • Antennae • Speakers

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index
5. Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required

Symptom Chart

USB/CD Data Disk Audio File Compatibility

NOTE: Before attempting a repair to the in-vehicle infotainment system following concerns regarding no playback of audio files stored either on a USB data storage device or on a CD data disc, check below to ensure that the audio files in question are encoded in a compatible format

There are a number of variables that can be set (either automatically or by the user) at the point of creating the audio file that may contribute to an audio file being encoded in an incompatible format. These include:

- The **type of audio file** created (MP3/WMA/AAC)
- The specification of **Variable Bit Rate** (VBR) or **Constant Bit Rate** (CBR) encoding
- If CBR encoding is being used, then a particular **bit rate** value (measured in kilobits per second - kbps) may be selected
- The rate of **sampling frequency**, measured in kilohertz (kHz), may also be selected

Diagnostic Procedures For Audio Files

Identify File Type: if a customer reports issues with audio file playback, first confirm that the data source is operating normally and is not locked or corrupted. This may be achieved by reading the USB storage device or data disk via a PC and confirming that the audio files can be seen/accessed as expected. If the storage device/data disk appears to be operating normally, the next step is to ascertain the file type of those files that will not play through the infotainment system. There are three types of compatible audio file, either **MP3** (which must have a file extension of .mp3); or **WMA** (which must have a file extension of .wma); or **AAC** (which must have a file extension of either .aac or .m4a). If the affected audio files are not of these types, then successful playback via the infotainment system may not be possible.

Further information about the audio file may be accessed via the file properties tab either when viewing the file in Windows Explorer or when playing the file via a digital media player programme. In such a way, it should be possible to ascertain some or all of the required information concerning the file's specified encoding type/bit rate/sampling frequency. Once this information has been obtained, use the tables detailed below to check if the suspect audio file is compatible with the vehicle infotainment system.

Playback Of Audio Files Stored On A USB Storage Device

USB MP3 Files (only if file extension is '.mp3'): Playback of MP3 audio files encoded in Variable Bit Rate (VBR) format is supported at bit rates between 8-320 kbps. For Constant Bit Rate (CBR) files, see table below for compatible sampling rates and bit rates.

File Format/Encoding Format	Sampling Rate	Bit Rates	Notes
MP3 (MPEG 2.5*)	All available are supported	8-160 kbps playback supported	*For MPEG 2.5 format audio files, playback cannot be guaranteed but an attempt will be made to play

MP3 (MPEG 2)	All available are supported	8-160 kbps playback supported	-
MP3 (MPEG 1)	All available are supported	32-128 kbps; 160-320 kbps playback supported	Playback of MPEG 1 audio files with a bit rate of 144 kbps is not supported

USB WMA Files (only if file extension is '.wma'): Playback of WMA audio files encoded in Variable Bit Rate (VBR) format and created using Windows Media Player Version 8.0 and/or Version 9.0 is supported at bit rates between 5-384 kbps. For Constant Bit Rate (CBR) files, see table below for compatible sampling rates and bit rates. Note that WMA CBR files created using Windows Media Player Versions 7.0, 8.0 and 9.0 can be supported, while playback will be attempted but cannot be guaranteed for files created using Windows Media Player Versions 4.0, 4.1, 9 Beta and 9.1.

File Format/Encoding Format	Sampling Rate	Bit Rates	Notes
WMA - Constant Bit Rate (CBR)	At sampling rates of 8 KHz playback supported only at specified bit rates	5-8 kbps (mono); 12 kbps (stereo) playback supported. 31 kbps (mono) playback cannot be guaranteed but an attempt will be made to play	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported
	At sampling rates of 11.03 KHz playback supported only at specified bit rates	8-10 kbps (mono) playback supported	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported
	At sampling rates of 16 KHz playback supported only at specified bit rates	10-12 kbps and 16 kbps (mono); 16-20 kbps (stereo) playback supported	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported
	At sampling rates of 22.05 KHz playback supported only at specified bit rates	16-20 kbps (mono); 20, 22 and 36 kbps (stereo) playback supported	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported
	At sampling rates of 32 KHz playback supported only at specified bit rates	20 kbps (mono); 32, 40, 48 kbps (stereo) playback supported. 32 kbps (mono); 22, 36, 44, 64, 384 kbps (stereo) playback cannot be guaranteed but an attempt will be made to play	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported
	At sampling rates of 44.1 KHz playback supported only at specified bit rates	20, 32 and 48 kbps (mono); 32, 48, 64, 80, 96, 128, 160, 192, 256 and 320 kbps (stereo) playback supported. 15 kbps (mono) playback cannot be guaranteed but an attempt will be made to play	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported
	At sampling rates of 48 KHz playback supported only at specified bit rates	64, 96, 128, 160, 192 and 256* kbps (stereo) playback supported. 32 kbps (mono) & 48, 63, 95, 127, 191 and 320 kbps (stereo) playback cannot be guaranteed but an attempt will be made to play	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported. *All available versions can be supported at a bit rate of 256 kbps for this sampling rate only

USB AAC Files (only if file extension is '.aac' or '.m4a'): Playback of AAC audio files encoded in Variable Bit Rate (VBR) format is supported at bit rates between 8-320 kbps. For Constant Bit Rate (CBR) files, see table below for compatible sampling rates and bit rates.

--	--	--	--

File Format/Encoding Format	Sampling Rate	Bit Rates	Notes
AAC - Constant Bit Rate (CBR)	At sampling rates of between 8-32 KHz, playback cannot be not guaranteed but may be possible at some bit rates	8-320 kbps playback cannot be not guaranteed, but may be possible in some cases	-
	At sampling rates of between 44.1 - 48 KHz, playback supported at specified bit rates	48-80 kbps; 96-128 kbps; 160-256 kbps; 320 kbps playback supported	Playback at other bit rates between 44.1-576 kbps may be possible, but cannot be verified
	At sampling rates of between 64-96 KHz, playback cannot be not guaranteed but an attempt will be made to play at some bit rates	96-768 kbps playback cannot be not guaranteed but an attempt will be made to play	Playback at other bit rates between 64-1152 kbps cannot be not guaranteed but an attempt will be made to play

Playback Of Audio Files Stored On A CD Data Disk

CD Data Disk MP3 Files (only if file extension is '.mp3'): Playback of MP3 audio files encoded in Variable Bit Rate (VBR) format is supported at bit rates between 8-320 kbps. For Constant Bit Rate (CBR) files, see table below for compatible sampling rates and bit rates.

File Format/Encoding Format	Sampling Rate	Bit Rates	Notes
MP3 (MPEG 2.5*)	All available are supported	8-160 kbps playback supported	*For MPEG 2.5 format audio files, playback cannot be guaranteed but an attempt will be made to play
MP3 (MPEG 2)	All available are supported	8-160 kbps playback supported	-
MP3 (MPEG 1)	All available are supported	32-128 kbps; 160-320 kbps playback supported	Playback of MPEG 1 audio files with a bit rate of 144 kbps is not supported

CD Data Disk WMA Files (only if file extension is '.wma'): Playback of WMA audio files encoded in Variable Bit Rate (VBR) format and created using Windows Media Player Version 9.0 is supported at bit rates between 32-192 kbps. For Constant Bit Rate (CBR) files, see table below for compatible sampling rates and bit rates. Note that WMA CBR files created using Windows Media Player Version 9.0 can be supported, while playback will be attempted but cannot be guaranteed for files created using Windows Media Player Versions 4.0, 4.1, 7.0, 8.0, 9 Beta and 9.1.

File Format/Encoding Format	Sampling Rate	Bit Rates	Notes
WMA - Constant Bit Rate (CBR)	At sampling rates of 22.05 KHz playback supported only at specified bit rates	32 kbps (stereo) playback supported	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported
	At sampling rates of 32 KHz playback supported only at specified bit rates	32, 36, 40, 44 and 48 kbps (stereo) playback supported	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported
	At sampling rates of 44.1 KHz playback supported only at specified bit rates	32 and 48 kbps (mono); 32, 48, 64, 80, 96, 128, 160 & 192 kbps (stereo) playback supported	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported
	At sampling rates of 48 KHz playback supported only at specified bit rates	64, 96, 128, 160 & 192 kbps (stereo) playback supported	'Lossless', 'Professional' or 'Voice' format files created in Windows Media Player Version 9.0 cannot be supported. DRM (Digital Rights Management) protected files cannot be supported

CD Data Disk AAC Files (only if file extension is '.aac' or '.m4a'): Playback of AAC audio files encoded in Variable Bit Rate (VBR) format is supported at bit rates between 8-320 kbps. For Constant Bit Rate (CBR) files, see table below for compatible sampling rates and bit rates.

File Format/Encoding Format	Sampling Rate	Bit Rates	Notes
AAC - Constant Bit Rate (CBR)	At sampling rates of between 8-24 KHz playback supported at specified bit rates	32-40 kbps; 48-80 kbps; 96-128* kbps playback supported	*112 & 128 kbps bit rate playback not supported for audio files with a sampling rate of 8 KHz

At sampling rates of between 16-32 KHz playback supported at specified bit rates	160-256* kbps playback supported	*224 & 256 kbps bit rate playback not supported for audio files with a sampling rate of 16 KHz
At sampling rates of between 32-48 KHz playback supported at specified bit rates	48-80 kbps; 96-128 kbps; 160-256 kbps; 320 kbps playback supported	-

Portable Audio Interface Panel/USB Power Supply

If DTC B1252-19 (USB Port General Electrical Failures - Circuit current above threshold) has been logged, the IAM has detected a current draw from the Portable Audio Interface Panel in excess of 1.7 Amps. In these circumstances, the power supply to the Portable Audio Interface Panel will be cut for an ignition cycle. To reset the system and restore power, the vehicle needs to be locked (with ignition off) and armed for at least 5 minutes.

The USB port on the Portable Audio Interface Panel is able to supply current to a maximum of 500mA. It should be noted that any portable devices connected via the USB port that required more power may not charge or power up correctly and that this may affect the operation of this device with the infotainment system.

Apple Device Compatibility

The following table lists some Apple devices and their compatibility with the information and entertainment system using a USB cable.

Fully Supported	Partially Supported	Not Supported
<ul style="list-style-type: none"> iPod® Classic - 6th/7th generation iPod® Nano - 3rd/4th/5th/6th generation iPod® Touch - 2nd/3rd/4th generation iPhone™ 3/3S iPhone™ 4/4S iPad™ - 1st generation (with iOS 4.0 or later) 	<ul style="list-style-type: none"> iPod® Classic - 4th/5th generation iPod® Nano - 1st/2nd generation iPod® Touch - 1st generation iPhone™ 	<ul style="list-style-type: none"> iPod® Classic - 1st/2nd/3rd generation iPod® Shuffle - 1st/2nd/3rd/4th generation

Pinpoint Tests

PINPOINT TEST A : SOURCE TESTS	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: SOURCE TEST 1	
 NOTE: Soft key confirmation tones will not be audible if this preference is set to off (Set-up / System / Button feedback)	
1 Operate the available soft keys	
Was there an audible confirmation tone to indicate that the soft key input was detected?	
Yes Audio amplifier module and MOST network functioning. GO to A2.	
No Audio amplifier module fault or MOST ring break. GO to A2.	
A2: SOURCE TEST 2	
NOTES:	
 Operating the steering wheel mode switch briefly will cycle through the audio/video sources as follows: Radio - DAB/SDARS - My Music - My Video	
 Operating the steering wheel mode switch for >2 seconds will cycle through the minor sources as follows: (Radio) FM1 - FM2 - FM3 - AM1 - AM2, and (My Music) DVD/CD - iPod® - BT - Stored CDs - USB - AUX	
 Depending on vehicle specification, various audio/video sources may be installed and are contained in the control modules as follows: <ul style="list-style-type: none"> Integrated Audio Module (IAM) - including radio, CD, iPod®, USB, my music, my video, phone and navigation Digital Radio Control Module (DRCM) Satellite Radio Control Module (SRCM) Television Control Module (TVCM) Rear Seat Entertainment Control Module (RSECM) 	
1 Cycle through the audio/video sources by operating the steering wheel mode switch	
Did the audio/video soft key return to normal and/or the selected source function normally?	

	Yes MOST network functioning. GO to A3. No Possible MOST ring break. GO to A3.
A3: SOURCE TEST 3	
	1 Operate the Navigation soft key (or switch)
	Did the navigation system start up and display a map? Yes GO to A4. No GO to A4.
A4: SOURCE TEST 4	
	1 Operate the Phone soft key (or switch)
	Is the phone menu displayed? Yes GO to Pinpoint Test B. No GO to Pinpoint Test B.

PINPOINT TEST B : FUSE PULL TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: FUSE PULL TEST 1	
	1 Remove the fuse from the missing audio/video source control module circuit
	2 Inspect the fuse
	Has the fuse blown? Yes Refer to the electrical circuit diagrams and test the circuit for short circuit to ground. Repair as necessary. Install a new fuse. GO to B2. No Wait at least 30 seconds and re-install the fuse. GO to B2.
B2: FUSE PULL TEST 2	
 NOTE: Depending on vehicle specification, various audio/video sources may be installed and are contained in the control modules as follows: <ul style="list-style-type: none"> • Integrated Audio Module (IAM) - including radio, CD, iPod®, USB, my music, my video, phone and navigation • Digital Radio Control Module (DRCM) • Satellite Radio Control Module (SRCM) • Television Control Module (TVCM) • Rear Seat Entertainment Control Module (RSECM) 	
	1 Set the ignition to off
	2 Set the ignition to on
	3 Check the operation of the touch screen and all audio/video sources
	Has full audio/video functionality been restored? Yes If the missing source was part of the integrated audio module, using the manufacturer approved diagnostic system, re-configure the integrated audio module with the latest level software. Tests complete No GO to B3.
B3: FUSE PULL TEST 3	
	1 Refer to the electrical circuit diagrams and identify the next control module connected to the MOST network
	Is there another control module that has not been reset? Yes GO to B4. No MOST ring break present. REFER to: Communications Network (418-00 Module Communications Network, Diagnosis and Testing).
B4: FUSE PULL TEST 4	
	1 Remove the fuse from the next control module circuit
	2 Inspect the fuse
	Has the fuse blown? Yes Refer to the electrical circuit diagrams and test the circuit for short circuit to ground. Repair as necessary. Install a new fuse. GO to B2. No Wait at least 30 seconds and re-install the fuse. GO to B2.

PINPOINT TEST C : TOUCH SCREEN CALIBRATION

TEST	DETAILS/RESULTS/ACTIONS
------	-------------------------

CONDITIONS	
C1: TOUCH SCREEN CALIBRATION	
 NOTE: A suitable stylus (for example the stylus supplied with a Panasonic CF-19) will be required for this procedure.	
	1 Operate the Valet soft key continuously until the engineering mode screen is displayed (approximately 20 seconds)
	2 Scroll down and select Touch Calibration
	3 Select OK
	4 Tap the touch screen to proceed
	5 Using a suitable stylus, tap the touch screen at the points indicated until a pass/fail result is displayed
	Was the touch screen calibration successful? Yes Calibration complete No Calibration failed. GO to C1.

Pinpoint Tests For Suspected Loudspeaker Faults In Harman/Kardon Audio Systems

 **NOTE:** See separate Pinpoint Tests (below) for sub-woofer faults

PINPOINT TEST D : NO SOUND OUTPUT FROM LOUDSPEAKER(S)	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: NO SOUND OUTPUT FROM LOUDSPEAKER(S)	
	1 Check loudspeaker operation
	Is the harness connector securely connected to the audio amplifier module and the loudspeaker unit(s)? Yes Proceed to the next step GO to D2. No Reconnect wiring harness to audio amplifier module/loudspeaker unit(s)
D2: NO SOUND OUTPUT FROM LOUDSPEAKER(S)	
	1 Check integrated audio module (IAM) operation
	Is the integrated audio module (IAM) operational? Yes Proceed to the next step GO to D3. No Check the integrity of the power supply circuits/fuses to the integrated audio module and rectify as required. Check the IAM for related DTCs and refer to the relevant DTC index
D3: NO SOUND OUTPUT FROM LOUDSPEAKER(S)	
	1 Check which loudspeakers are operational
	Are all loudspeakers working? Yes Proceed to the next step GO to D4. No Use the fader control to direct audio output to different loudspeaker locations to establish which units are non-operational. Refer to the electrical circuit diagrams and check the circuits between the audio amplifier module and the affected loudspeaker units for short circuit to ground, open circuit, high resistance. Repair circuit(s) as required. If fault persists, replace non-operational loudspeaker unit(s) as required
D4: NO SOUND OUTPUT FROM LOUDSPEAKER(S)	
	1 Check for signs of water ingress
	Does the loudspeaker drive unit show any signs of water damage? Yes Replace the loudspeaker unit(s) as required No Proceed to the next step GO to Pinpoint Test E.

PINPOINT TEST E : POOR OR WEAK SOUND OUTPUT FROM LOUDSPEAKER(S)	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: POOR OR WEAK SOUND OUTPUT FROM LOUDSPEAKER(S)	
	1 Check connections to loudspeaker units
	Are the connectors inserted securely into the loudspeaker units? Yes Proceed to the next step GO to E2. No Ensure all connectors are securely attached to the loudspeaker units
E2: POOR OR WEAK SOUND OUTPUT FROM LOUDSPEAKER(S)	
	1 Check integrity of vehicle power supply fuses
	Are the vehicle/audio amplifier module power supply fuses functional? Yes

	Proceed to the next step GO to E3.
No	Replace fuse(s) as required
E3: POOR OR WEAK SOUND OUTPUT FROM LOUDSPEAKER(S)	
	1 Check power and ground circuits to the infotainment system components
	Are all the necessary power and ground feeds present?
Yes	Proceed to the next step GO to E4.
No	Refer to the electrical circuit diagrams and check the infotainment power and ground circuits for short circuit to ground, open circuit, high resistance. Repair circuit(s) as required
E4: POOR OR WEAK SOUND OUTPUT FROM LOUDSPEAKER(S)	
	1 Check power supply voltage at power supply connectors
	Is the power supply voltage measured at the power supply connectors between 12 and 14 volts?
Yes	No further action
No	Refer to the electrical circuit diagrams and check the infotainment power supply circuits for short circuit to ground, open circuit, high resistance. Repair circuit(s) as required. Refer to the relevant section of workshop manual and battery care manual. Check battery state of charge and starting/charging system performance and rectify as required

PINPOINT TEST F : LOUDSPEAKER VIBRATING (BUZZING) EXCESSIVELY	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: LOUDSPEAKER VIBRATING (BUZZING) EXCESSIVELY	
	1 Check for extreme bass/treble settings
	Is the audio system output settings for bass and/or treble set too high?
Yes	Adjust settings to appropriate levels
No	Proceed to the next step GO to F2.
F2: LOUDSPEAKER VIBRATING (BUZZING) EXCESSIVELY	
	1 Check loudspeaker unit(s) fixing screws are securely fastened
	Are all loudspeaker fixing screws fully secured to the surrounding trim?
Yes	Proceed to the next step GO to F3.
No	Tighten the fixing screws to the correct torque as directed in the workshop manual
F3: LOUDSPEAKER VIBRATING (BUZZING) EXCESSIVELY	
	1 Check if the wiring harness is resting against the internal surface of the loudspeaker
	Is there any cabling or other parts of the wiring harness resting against the internal surface of the loudspeaker?
Yes	Re-route and secure the wiring harness so that it is not resting against any internal surfaces of the loudspeaker
No	Proceed to the next step GO to F4.
F4: LOUDSPEAKER VIBRATING (BUZZING) EXCESSIVELY	
	1 Check security of trim in the vicinity of the loudspeaker units
	Is the trim secure in the vicinity of the loudspeaker units?
Yes	No further action
No	Secure loose trim components to ensure no vibration
F5: AUDIO OUTPUT DISTORTED	
	1 Check for extreme bass/treble settings
	Is the audio system output settings for bass and/or treble set too high?
Yes	Adjust settings to appropriate levels
No	No further action

Pinpoint Tests For Suspected Sub-Woofer Faults In Harman/Kardon Audio Systems

NOTE: See separate Pinpoint Tests (above) for other loudspeaker faults

PINPOINT TEST G : NO SOUND OUTPUT FROM SUB-WOOFER	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
G1: NO SOUND OUTPUT FROM SUB-WOOFER	
	1 Check sub-woofer operation
	Is the harness connector securely connected to the audio amplifier module and the sub-woofer unit?
Yes	

	Proceed to the next step GO to G2.
No	Reconnect wiring harness to audio amplifier module/sub-woofer unit
G2: NO SOUND OUTPUT FROM SUB-WOOFER	
1	Check integrated audio module (IAM) operation
	Is the integrated audio module (IAM) operational?
Yes	Proceed to the next step GO to G3.
No	Check the integrity of the power supply circuits/fuses to the integrated audio module and rectify as required. Check the IAM for related DTCs and refer to the relevant DTC index
G3: NO SOUND OUTPUT FROM SUB-WOOFER	
1	Check which sub-woofers are operational
	Are all sub-woofers working?
Yes	Proceed to the next step GO to G4.
No	Use the fader control to direct audio output to different sub-woofer locations to establish which units are non-operational. Refer to the electrical circuit diagrams and check the circuits between the audio amplifier module and the affected sub-woofer units for short circuit to ground, open circuit, high resistance. Repair circuit(s) as required. If fault persists, replace non-operational sub-woofer unit(s) as required
G4: NO SOUND OUTPUT FROM SUB-WOOFER	
1	Check for signs of water damage around sub-woofer unit(s)
	Are there any signs of water damage around sub-woofer unit(s)?
Yes	Dis-assemble sub-woofer moulding and check loudspeaker condition. If the sub-woofer drive unit shows signs of water damage, replace the sub-woofer unit(s) as required
No	Proceed to the next step GO to G5.
G5: NO SOUND OUTPUT FROM SUB-WOOFER	
1	Check for any visible loose components on sub-woofer drive unit
	Are there any visible loose components (ie: loose wires) on the sub-woofer drive unit
Yes	Replace the sub-woofer unit(s) as required
No	No further action

PINPOINT TEST H : POOR OR WEAK SOUND OUTPUT FROM SUB-WOOFER(S)	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
H1: POOR OR WEAK SOUND OUTPUT FROM SUB-WOOFER(S)	
1	Check connections to sub-woofer units
	Are the connectors inserted securely into the sub-woofer units?
Yes	Proceed to the next step GO to H2.
No	Ensure all connectors are securely attached to the sub-woofer units
H2: POOR OR WEAK SOUND OUTPUT FROM SUB-WOOFER(S)	
1	Check integrity of vehicle power supply fuses
	Are the vehicle/audio amplifier module power supply fuses functional?
Yes	Proceed to the next step GO to H3.
No	Replace fuse(s) as required
H3: POOR OR WEAK SOUND OUTPUT FROM SUB-WOOFER(S)	
1	Check power and ground circuits to the infotainment system components
	Are all the necessary power and ground feeds present?
Yes	Proceed to the next step GO to H4.
No	Refer to the electrical circuit diagrams and check the infotainment power and ground circuits for short circuit to ground, open circuit, high resistance. Repair circuit(s) as required
H4: POOR OR WEAK SOUND OUTPUT FROM SUB-WOOFER(S)	
1	Check power supply voltage at power supply connectors
	Is the power supply voltage measured at the power supply connectors between 12 and 14 volts?
Yes	No further action
No	Refer to the electrical circuit diagrams and check the infotainment power supply circuits for short circuit to ground, open circuit, high resistance. Repair circuit(s) as required. Refer to the relevant section of workshop manual and battery care manual. Check battery state of charge and starting/charging system performance and rectify as required

PINPOINT TEST I : SUB-WOOFER VIBRATING (BUZZING) EXCESSIVELY

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
I1: SUB-WOOFER VIBRATING (BUZZING) EXCESSIVELY	
	1 Check for extreme bass/treble settings
	Is the audio system output settings for bass and/or treble set too high?
	Yes Adjust settings to appropriate levels
	No Proceed to the next step GO to I2 .
I2: SUB-WOOFER VIBRATING (BUZZING) EXCESSIVELY	
	1 Check sub-woofer unit(s) fixing screws are securely fastened
	Are all sub-woofer fixing screws fully secured to the surrounding trim?
	Yes Proceed to the next step GO to I3 .
	No Tighten the fixing screws to the correct torque as directed in the workshop manual
I3: SUB-WOOFER VIBRATING (BUZZING) EXCESSIVELY	
	1 Check security of trim in the vicinity of the sub-woofer units
	Is the trim secure in the vicinity of the sub-woofer units?
	Yes No further action
	No Secure loose trim components to ensure no vibration

PINPOINT TEST J : SUB-WOOFER AUDIO OUTPUT DISTORTED	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
J1: SUB-WOOFER AUDIO OUTPUT DISTORTED	
	1 Check for extreme bass/treble settings
	Is the audio system output settings for bass and/or treble set too high?
	Yes Adjust settings to appropriate levels
	No Proceed to the next step GO to J2 .
J2: SUB-WOOFER AUDIO OUTPUT DISTORTED	
	1 Check if the distortion continues when sub-woofer casing is removed
	Does the distortion continue when sub-woofer casing is removed?
	Yes Replace the sub-woofer unit(s) as required
	No No further action

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00. REFER to: (100-00 General Information)

[Diagnostic Trouble Code \(DTC\) Index - DTC: Audio Amplifier Module \(AAM\)](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Audio Head Unit \(AHU\) - Low Line](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Digital Radio Control Module \(DRCM\)](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Integrated Audio Module \(IAM\) - High Line](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Integrated Control Panel \(ICP\)](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Rear Integrated Control Panel \(RICP\)](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Multi-Function Display \(MFD\)](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Navigation Control Module \(NCM\) - India & Israel](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Navigation Control Module \(NCM\) - Extended Markets](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Rear Seat Entertainment Control Module \(RSECM\)](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Satellite Radio Control Module \(SRCM\)](#) (Description and Operation),
[Diagnostic Trouble Code Index: Touch Screen - DTC: Touch Screen \(TS\)](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: TV Control Module \(TVCM\) - Digital](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: Telephone Interface Module \(TIM\)](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: TV Control Module \(TVCM\) - Hybrid](#) (Description and Operation),
[Diagnostic Trouble Code \(DTC\) Index - DTC: TV Control Module \(TVCM\) - Conditional Access System](#) (Description and Operation).

Information and Entertainment System - General Information - Navigation System

Diagnosis and Testing

Principles of Operation

For a detailed description of the information and entertainment system and operation, refer to the relevant Diagnosis and Testing section of the workshop manual. REFER to: (415-01 Information and Entertainment System)

Audio System (Description and Operation),
 Audio System (Description and Operation),
 Audio System (Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart.

Principles of Operation

The information in this section is intended to help with basic diagnosis of the navigation system.

For a detailed description of the Navigation System, refer to the relevant Description and Operation section in the Workshop Manual.

Touch Screen (TS) and Navigation Diagnostics

Fault codes and diagnostics can be retrieved/achieved using the manufacturer approved diagnostic system

Hard Key Test

The hard key test is used to check the operation of the hard switches.

If switch operation is normal, the switch colour on the screen will change when a hard switch is pressed. (Power switch operation cannot be checked on this screen.)

Touch Switch Test

The touch switch test calibrates the touch switch coordinates and checks touch switch operation.

Start Calibration - Calibrates the switch coordinates. Calibrate the coordinates by touching each of the "+" marks in the four corners of the screen.

NOTE: Do not touch any locations other than the "+" marks. (Touching other locations may invalidate the calibration.)

Touch Switch Check - Checks for deviation in the coordinates. Check the coordinates of the touched location by verifying the displayed values. Touch and hold "press here" to return to the previous screen. If there is a large deviation in the coordinates, calibrate the touch switch using the "Start Calibration" function.

DTC Information

Search for the meaning of the displayed DTC.

Vehicle Configurations

Display the status of each vehicle system.

Speed Lock Configuration - Display the status of compulsory navigation settings (setting status of switches that cannot be operated) when driving.

Configurations

Display primary system information.

Vehicle Signals

Display the status of vehicle signals inputted to the Touch Screen (TS). These signals include:

- Lights (on or off)
- Ambient light sensor voltage
- Backlight dimming duty
- Graphic illumination dimming duty

- Vehicle speed, GPS speed, MOST km/h
- Battery voltage
- Reverse gear / electric park brake position (on or off)
- Speed inhibit
- MOST Fibre Optic Transceiver (FOT) temperature
- Output audio allocation

Video Inputs Test

This screen will allow the testing of video inputs that are connected to the Touch Screen (TS). These include:

- Companion camera
- Rear view / proximity camera
- TV/DVD

Self Test

Performs system self-diagnosis and displays the diagnostic results.

If an abnormality is present, a DTC is displayed.

MOST Test

Display the MOST connection status, and reception/transmission messages related to MOST.

"Mpr" displays the number of MOST devices existing on MOST. When "0" or "1" is displayed, communication is not possible.

Colour bar

This function allows the technician to test the colours generated by the Touch Screen (TS). A second screen displays six solid colours, selecting the colour will fill the screen with the chosen colour and pressing the Touch Screen (TS) again will revert back to the colour test screen.

Loading

Update the navigation program.

For details on the update method, refer to the "Navigation Update Tool" operation manual.

HDD information

Display information on the Hard Disc Drive (HDD).

SMART test (Self-Monitoring Analysis and Reporting Technology) is initiated from this screen

Vehicle information

Display information on the vehicle.

- Car configuration - Displays information on vehicle environment settings.
 - Unit (distance) - Units of distance
 - Unit (time) - Units of time
 - Language - Displayed language
 - Fuel information - Remaining fuel quantity
 - Mileage information - Vehicle mileage display
 - Time information - Current time display
 - Override information - Status of switch operation inhibitions (Setting status of switches that cannot be operated.)
- GPS information - Display GPS related information.
 - Received position - Displays the latitude and longitude (displayed in degrees, minutes, and seconds) for the position information calculated by GPS.
 - Map matched position - Displays the latitude and longitude (displayed in degrees, minutes, and seconds) for the position information being used for map matching.
 - Satellites - Number of acquired satellites.
 - Current address - Address of the current location.
 - Satellite Information - Displays satellite information for up to 12 GPS satellite search targets.
 - Measurement HDOP - Positioning accuracy.
 - Status - Positioning status.
 - Date - Displays the current date and time in the following order: day, month, year, hour, minute, second. The year is displayed using the four-digit western calendar; time is displayed in Greenwich Mean Time (GMT).
- Vehicle sensor - Display vehicle signals inputted to the Touch Screen (TS).
 - REV - Reverse signal status.
 - Speed - Current vehicle speed.
 - Speed pulse count - Speed pulse count value.
 - Distance calibration - Learning information for distance calibration.
 - Voltage/Offset - Gyro sensor output voltage value/voltage correction value.
 - Relative bearing - Relative bearing (0° when navigation is started.)
 - Gyro sense - Learning value for gyro sensitivity.
 - Reset - Resets the gyro sensor relative bearing value.
- RDS-TMC information - Display RDS-TMC related information.
 - Date/time (GMT) - Date and time for the TMC signal.
 - Frequency - TMC signal frequency.

- PI code - Personal identification code for the broadcast station.
- PS name - Broadcast station name.
- Country code - Database country code.
- LTN - Database location number (location table number.)
- Service ID - Service provider identification number.
- Air data - TMC data.

Microphone

Check the volume for the voice recognition microphone inputted to the Touch Screen (TS). These include:

- PTT switch status - Checks the PTT switch connection. When the PTT switch is pressed, a signal will be outputted, and the indicator displays in green.
- Microphone input level judging - If a sampling of the user's voice command is at or above the threshold value, the indicator displays in blue.
- Microphone level - Displays the microphone input level.

Voice output check

Check the audio output.

- ON (Normal) - Outputs ADPCM voice (1 kHz sine wave) for five seconds.
- ON (Max) - Outputs ADPCM voice (maximum 1 kHz sine wave) for five seconds.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of damage, water ingress and system integrity.
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Visual Inspection

Electrical
<ul style="list-style-type: none"> • Battery • Fuses <ul style="list-style-type: none"> - Central and Battery Junction Boxes - Megafuses • Wiring harness • Damaged, loose or corroded connectors • Touch Screen (TS) • GPS antenna • TV antenna • Satellite antenna • FM antenna • Companion camera • Rear view camera • Microphone • Accessory USB Unit (AUU) • Steering wheel controls • Clock spring • Integrated Head Unit (IHU) • Audio amplifier • Anti-lock Brake System control module (ABS) • Wheel speed sensors • Vehicle Information and Communication System (VICS Japan only) receiver • VICS beacon antenna (Japan only) • Controller Area Network (CAN) circuits • Media Oriented System Transport (MOST) system • Gigabit Video Interface (GVIF) • Central Junction Box (CJB) • Terrain response • Mobile telephone

Symptom Chart

Symptom	Possible Cause	Action
Black screen (navigation and audio screens do not display)	<ul style="list-style-type: none"> • Temperature in passenger compartment too low • Condensation in passenger compartment • Electrical harness open/short circuit, disconnected 	<ul style="list-style-type: none"> • GO to Pinpoint Test A.

	<ul style="list-style-type: none"> • Component failure 	
The navigation screen does not display, even when the "NAVIGATION" button is pressed (screen does not change)	<ul style="list-style-type: none"> • Electrical harness open/short circuit, disconnected • Component failure 	<ul style="list-style-type: none"> • GO to Pinpoint Test B.
The hard switches do not respond	<ul style="list-style-type: none"> • Component failure • Switch failure 	<ul style="list-style-type: none"> • GO to Pinpoint Test C.
The audio screen cannot be operated (does not display)	<ul style="list-style-type: none"> • Media Oriented System Transport (MOST) system • Electrical harness open/short circuit, disconnected 	<ul style="list-style-type: none"> • GO to Pinpoint Test D.
The screen does not dim	<ul style="list-style-type: none"> • Electrical harness open/short circuit, disconnected • Component failure 	<ul style="list-style-type: none"> • GO to Pinpoint Test E.
Noise on the screen, screen colour is abnormal	<ul style="list-style-type: none"> • Electrical harness open/short circuit, disconnected • Component failure 	<ul style="list-style-type: none"> • GO to Pinpoint Test F.
The touch switches do not respond	<ul style="list-style-type: none"> • Electrical harness open/short circuit, disconnected • Component failure 	<ul style="list-style-type: none"> • GO to Pinpoint Test G.
There is considerable deviation between the displayed vehicle position and the actual position	<ul style="list-style-type: none"> • Electrical harness open/short circuit, disconnected • Component failure 	<ul style="list-style-type: none"> • GO to Pinpoint Test H.
The GPS no reception mark does not disappear	<ul style="list-style-type: none"> • Electrical harness open/short circuit, disconnected • Component failure • No reception from satellite 	<ul style="list-style-type: none"> • GO to Pinpoint Test I.
No sound is emitted	<ul style="list-style-type: none"> • Electrical harness open/short circuit, disconnected • Component failure • Incorrect system settings 	<ul style="list-style-type: none"> • GO to Pinpoint Test J.
There is no navigation voice guidance	<ul style="list-style-type: none"> • Volume level set too low • The amplifier and speakers are incorrectly connected 	<ul style="list-style-type: none"> • GO to Pinpoint Test K.
Voice recognition does not function	<ul style="list-style-type: none"> • Electrical harness open/short circuit, disconnected • Component failure 	<ul style="list-style-type: none"> • GO to Pinpoint Test L.
The vehicle position rotates randomly	<ul style="list-style-type: none"> • Electrical harness open/short circuit, disconnected • Component failure • Vehicle on a turntable in a parking building 	<ul style="list-style-type: none"> • GO to Pinpoint Test M.
The vehicle mark display is unstable	<ul style="list-style-type: none"> • Electrical harness open/short circuit, disconnected • Component failure • No reception from satellite 	<ul style="list-style-type: none"> • GO to Pinpoint Test N.
The vehicle position does not update	<ul style="list-style-type: none"> • HDD contaminated/damaged • Electrical harness open/short circuit, dis- 	<ul style="list-style-type: none"> • GO to Pinpoint Test O.

	<ul style="list-style-type: none"> connected Component failure 	
The map display is incomplete	<ul style="list-style-type: none"> HDD contaminated/damaged Electrical harness open/short circuit, disconnected Component failure 	<ul style="list-style-type: none"> GO to Pinpoint Test P.
Calls cannot be received or placed with Bluetooth®; Bluetooth® cannot connect with the vehicle	<ul style="list-style-type: none"> Incompatible Bluetooth® telephone Incorrect initial connection settings Electrical harness open/short circuit, disconnected Component failure 	<ul style="list-style-type: none"> GO to Pinpoint Test Q.
The map cannot be updated	<ul style="list-style-type: none"> Refer to the "Navigation Update Tool" operation manual 	<ul style="list-style-type: none"> Refer to the "Navigation Update Tool" operation manual
An error screen displays on the navigation screen	<ul style="list-style-type: none"> Access to the map data has not been granted 	<ul style="list-style-type: none"> GO to Pinpoint Test R.
The dual view cannot be switched	<ul style="list-style-type: none"> Incorrect car configuration data received Media Oriented System Transport (MOST) system Component failure 	<ul style="list-style-type: none"> GO to Pinpoint Test S.

Pinpoint Tests

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval Program is in operation, prior to the installation of a new module/component.

The built in diagnostics are accessed as follows:

- 1. With the vehicle at rest, place the ignition switch "ON", or start the engine.
- 2. Press and hold the Touch Screen (TS) in the centre at the top of the screen for approximately 5 seconds and then press and hold the Touch Screen (TS) at the top left corner of the screen for approximately 5 seconds.
- 3. A 'Diag PIN Entry' box will appear' Type in the access code 753.
- 4. Once this code has been accepted the Diagnostic Menu screen will be displayed.

PINPOINT TEST A : BLACK SCREEN (NAVIGATION AND AUDIO SCREENS DO NOT DISPLAY.)	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: THE SCREEN SAVER FUNCTION WORKS	
	1 Check the screen saver function works.
	Does the screen saver function work? Yes Operation is normal. No Proceed to the next step. GO to A2.
A2: THE DISPLAY BACKLIGHT EMITS LIGHT	
	1 Check the display backlight emits light.
	Does the display backlight emits light? Yes Proceed to the next step. No GO to A12.
A3: THE SCREEN IS TURNED OFF	
	1 Check the screen is not turned off.
	Do the navigation and audio screens display when the screen is turned on? Yes Operation is normal.

	<p>No GO to A4.</p>
A4: THE VEHICLE INTERIOR TEMPERATURE IS -20°C OR LESS	
	<p>1 Check the cabin internal temperature.</p>
	<p>Is the cabin internal temperature -20°C or lower? Yes Raise the cabin internal temperature, re-test the vehicle. No GO to A5.</p>
A5: CONDENSATION IS FORMING INSIDE THE VEHICLE	
	<p>1 Check for condensation occurring inside the passenger compartment.</p>
	<p>Is condensation occurring inside the passenger compartment? Yes Dry out the passenger compartment, re-test the vehicle. No GO to A6.</p>
A6: THE LED FOR THE POWER SUPPLY BUTTON IS FLASHING. (RANGE ROVER ONLY)	
	<p>1 Check the status of the audio power button LED.</p>
	<p>Is the audio power button flashing? Yes Carry out MOST Ring diagnostics to locate fault. No GO to A7.</p>
A7: ONLY THE NAVIGATION SCREEN OR AUDIO SCREEN IS BLACK	
	<p>1 Check to see if only the navigation screen is blank.</p>
	<p>Is only the navigation screen blank? Yes Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index. No GO to A8.</p>
A8: ONLY THE BACK MONITOR SCREEN IS BLACK	
	<p>1 Check to see if only the audio screen is blank.</p>
	<p>Is only the audio screen blank? Yes Proceed to the next step. No GO to A10.</p>
A9: AFTER INITIATING THE "VIDEO INPUT TEST" DIAGNOSIS, VIDEO CAN BE DISPLAYED	
	<p>1 Carry out the "Video Input Test" diagnosis' (PIN code 753).</p>
	<p>Are the results of the "Video Input Test" diagnosis' normal? Yes Re-check the system. No Refer to the electrical circuit diagrams and check the cameras control module.</p>
A10: ONLY THE TV SCREEN IS BLACK	
	<p>1 Check to see if only the TV screen is black.</p>
	<p>Is only the TV screen blank? Yes Proceed to the next step. No GO to A12.</p>
A11: AFTER INITIATING THE "VIDEO INPUT TEST" DIAGNOSIS, VIDEO CAN BE DISPLAYED	
	<p>1 Carry out the "Video Input Test" diagnosis' (PIN code 753).</p>
	<p>Are the results of the "Video Input Test" diagnosis' normal? Yes Re-check the system. No Refer to the electrical circuit diagrams and check the TV control module.</p>
A12: THE CONNECTIONS BETWEEN THE VISUAL NAVIGATION AND POWER SUPPLY WIRING HARNESS AND CONNECTORS ARE CORRECT	
	<p>1 Check the display and power supply harness, power, auxiliary and ground circuits, for short, open circuits and are correctly connected.</p>
	<p>Was a fault identified with the display and power supply harness, power auxiliary and ground connections? Yes Rectify the fault and re-test the vehicle. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.</p>
PINPOINT TEST B : THE NAVIGATION MAP SCREEN DOES NOT DISPLAY, EVEN WHEN THE "NAVIGATION" BUTTON IS PRESSED (SCREEN DOES NOT CHANGE.)	

 **NOTE:** When re-confirming the symptoms after inspecting the wiring harness/connector, turn the ignition status to OFF, wait for the Audio power button LED on the display to turn OFF, then turn the ignition status to ON and run the diagnosis again from the beginning.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

B1: NO RESPONSE TO PRESSING NAVIGATION MENU

 **NOTE:** 15 minutes are required for the program to update. If the ignition is accidentally turned OFF, turn the ignition ON again, and wait for 15 minutes.

	1 Check that the ignition was not turned 'OFF' during a navigation software update.
	Was the ignition turned 'OFF' during a navigation software update? Yes Wait for 15 minutes with the ignition ON. Then turn the ignition to OFF then ignition ON. No Refer to electrical circuit diagrams and check integrity of navigation system wiring harness and connectors. GO to B2.

B2: NO RESPONSE TO PRESSING NAVIGATION MENU

	1 Wait for 15 minutes with the ignition ON. Then turn the ignition to OFF then ignition ON.
	Does the navigation screen displays when the "NAVIGATION" button is pressed? Yes Operation is normal. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST C : THE HARD SWITCHES DO NOT RESPOND.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

C1: CHECK FOR FOREIGN OBJECTS

	1 Check for foreign objects near to the button.
	Are there any foreign objects close to the button causing it to be pressed? Yes Remove foreign objects and re-test vehicle. No GO to C2.

C2: DISPLAY DIAGNOSTICS CHECK

	1 Check to see if the display diagnostics can be displayed.
	Can the display diagnostics be displayed? Yes Proceed to the next step. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.

C3: HARD KEY TEST

	1 Carry out the display diagnostics hard key test.
	Is the operation normal when carrying out the display diagnostics hard key test? Yes Operation is normal. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST D : THE AUDIO SCREEN CANNOT BE OPERATED (DOES NOT DISPLAY.)

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

D1: CD CHANGER CHECK

	1 Check to see if a CD changer is installed.
	Is a CD changer installed? Yes Proceed to the next step. No Normal operation, CD screen will not be displayed when there is no CD changer installed.

D2: THE AUDIO SCREEN DISPLAYS WHEN THE "AUDIO VIDEO" HARD SWITCH IS PRESSED.

	1 The audio screen displays when the "AUDIO VIDEO" hard switch is pressed.
	Does the audio screen displays when the "AUDIO VIDEO" hard switch is pressed? Yes Proceed to the next step. No Refer to the hard switches do not respond diagnosis.

D3: THE AUDIO SCREEN DISPLAYS WHEN "AUDIO VIDEO" ON THE "HOME MENU" IS PRESSED.

	1 The audio screen displays when "Audio Video" on the "Home Menu" is pressed.
	Does the audio screen displays when "Audio Video" on the "Home Menu" is pressed?

	<p>Yes Proceed to the next step.</p> <p>No Refer to the touch switches do not respond diagnosis.</p>
D4: EACH SWITCH (AM FM, CD, IPOD/USB, TV/DVD.) ON THE AUDIO SCREEN RESPONDS.	
	1 Each switch (AM FM, CD, iPod/USB, TV/DVD.) on the audio screen responds.
	Does each switch (AM FM, CD, iPod/USB, TV/DVD.) on the audio screen respond? Yes Carry out MOST Ring diagnostics to locate fault. No GO to D5.
D5: THE IGNITION IS TURNED FROM IGNITION ON TO OFF, AND AFTER WAITING FOR APPROXIMATELY 30 SECONDS, THE TOUCH SCREEN (TS) POWER SUPPLY LED WENT OUT. WHEN THE IGNITION IS TURNED TO ON, THE AUDIO SCREEN CAN BE OPERATED.	
	1 The ignition is turned from Ignition ON to OFF, and after waiting for approximately 30 seconds, the Touch Screen (TS) power supply LED went out.
	When the ignition is turned to ON, can the audio screen be operated? Yes Operation is normal. No Carry out MOST Ring diagnostics to locate fault.

PINPOINT TEST E : THE SCREEN DOES NOT DIM.	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: CHECK FOR FOREIGN OBJECTS	
	1 Check for foreign objects adhered to the display light sensor. <ul style="list-style-type: none"> • Range Rover - Top right of display • Discovery/Range Rover Sport - Instrument panel
	Are there any foreign objects adhered to the display light sensor? Yes Remove foreign objects and re-test vehicle. No GO to E2.
E2: DISPLAY LIGHT SENSOR CHECK	
	1 Check to see if display screen switches to low light when sensor is covered.
	Does the display screen switch to low light when the sensor is covered? Yes Operation is normal. No GO to E3.
E3: VEHICLE LIGHT SWITCH TESTS	
	1 Check to see if display screen switches to low light when the vehicle light switch is pressed.
	2 When the vehicle exterior lights are switched on, check diagnostic menu "Vehicle Signals" lights on the diagnostics screen is "ON."
	Does the display screen switch to low light when the vehicle light switch is pressed? Yes Operation is normal. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST F : NOISE ON THE SCREEN; SCREEN COLOUR IS ABNORMAL.	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: DISPLAY POWER AND GROUND CHECKS	
	1 Refer to electrical circuit diagrams and check battery power and power ON relay voltage, and ground resistance.
	Is the battery power and power ON relay voltage between 10.5 and 16 volts, and continuity to ground? Yes Proceed to the next step. No Check and rectify the vehicle wiring harness and connectors.
F2: CONTRAST CHECK	
	1 Check to see if the screen colour is normal when the screen setting (contrast) is re-ret to the default values.
	Is the screen colour normal with the default values? Yes Operation is normal. No GO to F3.

F3: CABIN INTERNAL TEMPERATURE CHECK	
	1 Check the cabin internal temperature.
	Is the cabin internal temperature -20°C or lower? Yes Raise the cabin internal temperature and re-test. No GO to F4.
F4: ADDITIONAL SCREEN CHECKS	
	1 Check all other screens.
	Are all other screens beside the navigation display screen normal? Yes Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index. No GO to F5.
F5: COLOUR BAR CHECK	
	1 Carry out the display diagnostics colour bar check test.
	Are the results of the display diagnostics colour bar check normal? Yes Operation is normal. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST G : THE TOUCH SWITCHES DO NOT RESPOND.	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
G1: TOUCH SWITCH TEST	
	1 The touch switches not responding on the navigation screen only
	Are the touch switches not responding on the navigation screen only? Yes Proceed to the next step. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.
G2: TOUCH SWITCH CHECK	
	1 Carry out the touch switch check in the display diagnostics.
	Are the results of the display diagnostics touch switch check normal? Yes Check the symptoms again. Operation is normal. No GO to G3.
G3: START CALIBRATION ROUTINE	
	1 Carry out the start calibration routine from the display diagnostics touch switch test.
	Is normal operation resumed after correction? Yes Operation is normal. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST H : THERE IS CONSIDERABLE DEVIATION BETWEEN THE DISPLAYED VEHICLE POSITION AND THE ACTUAL POSITION.	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
H1: GPS MARK DISPLAY CHECK	
	1 The GPS no reception mark is displayed.
	Is the GPS no reception mark displayed on the display screen? Yes Refer to GPS no reception mark does not disappear diagnosis. No GO to H2.
H2: LOCATION CHECK	
	1 Check for symptom occurring in particular locations - parallel roads, elevated roads, loop roads, parking centres (buildings) etc.
	Does the symptom occur in a particular location? Yes In places where the vehicle position is hard to specify, the vehicle position may be matched incorrectly and result in position discrepancies. Additionally, a new road layout will mean the Gyro does not match the map position. No Proceed to the next step.
H3: DISTANCE CALIBRATION CHECK	

NOTE: Refer to diagnostic menu "Vehicle Sensor" – Distance Calibration, this value should be approximately 200mm, a large deviation from this value indicates a speed signal fault or incorrect wheel size.

	1 Check to see if distance calibration is being performed.
	Is distance calibration being performed?
	Yes Monitor the condition until distance calibration is complete (drive for over 10km/6.2 miles)
	No GO to H4.

H4: VEHICLE SIGNAL INSPECTION

	1 Check vehicle sensor display screen, from vehicle information diagnostics menu for the following: vehicle speed signal, REV: ON is indicated when the gear shift lever is in the REV position and gyro sensor input status are normal.
	Are the vehicle speed signal, REV signal, and gyro sensor input status normal?
	Yes GO to H5.
	No Refer to the electrical circuit diagrams and check the integrity of the wiring harness and connectors, and CAN circuit, to the Touch Screen (TS).

H5: TIRE CHECK

	1 Check to see if new tires have recently been installed.
	Have new tires been recently installed?
	Yes From the navigation map screen, enter the navigation menu, select navigation setup then select calibration, press 'Distance' then drive the vehicle for 10 to 20 km. Operation will return to normal after performing distance calibration and driving the vehicle for 10 to 20 km.
	No Adjust the current location, and after the GPS no signal mark has disappeared, drive the vehicle for a while to monitor conditions.

PINPOINT TEST I : THE GPS NO RECEPTION MARK DOES NOT DISAPPEAR.

NOTES:

[Move the vehicle to an open area, radio waves from satellites may not be received inside buildings.](#)

[Correct the vehicle cursor to the current location.](#)

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
I1: RETRO-INSTALL INSTALLATIONS CHECK	
	1 Check to see if there are any retro-install installations (anti-theft, radar, etc.)
	Are there any retro-install installations?
	Yes GO to I2.
	No GO to I3.
I2: RETRO-INSTALL INSTALLATIONS RF CHECK	
	1 Turn power supply (including back-up power) to OFF status.
	Does the GPS no reception mark disappear?
	Yes GPS reception may deteriorate when devices receiving radio waves are retro-installed. Alter the position of the retro-install device, and re-test vehicle.
	No GO to I4.
I3: SATELLITE RECEPTION CHECKS	
	1 Check to see if a 'P' or 'T' is displayed in the 'STS' column of the navigation diagnostics GPS information screen after 10 minutes have passed.
	Is a 'P' or a 'T' displayed?
	Yes Wait for reception of another satellite so that position calculation can be performed.
	No Refer to the electrical circuit wiring diagrams and check the integrity of the wiring harness and connectors to the GPS antenna. Proceed to the next step.
I4: GPS ANTENNA REPLACEMENT	
	1 Install a new GPS antenna.
	Does the GPS no signal mark disappears when the GPS antenna is replaced.
	Yes Fault has been rectified.
	No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST J : NO SOUND IS EMITTED.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
J1: SOUND OUTPUT CHECK	
	1 Check sound output across all systems.
	Is there no sound output across all systems? Yes GO to J2. No GO to J3.
J2: VOLUME LEVEL CHECK	
	1 Check the volume level is not set too low.
	Is the volume level set too low? Yes Increase the volume level and re-test vehicle. No GO to J3.
J3: INTEGRITY OF AMPLIFIER AND SPEAKER WIRING.	
	1 The amplifier and speaker wiring harnesses are correctly connected.
	Are the amplifier and speaker wiring harnesses correctly connected? Yes Check the MOST devices. GO to J4. No Refer to the electrical circuit diagrams and check integrity of amplifier and speaker wiring harness and connections.
J4: ONLY VOICE RECOGNITION DOES NOT OUTPUT	
	1 Check to see if only voice recognition does not output.
	Is there no output only from the voice recognition? Yes GO to J5. No Proceed to step 8.
J5: VOICE GUIDANCE	
	1 Check the volume level for voice guidance is not set too low.
	Is the volume level for voice guidance set too low? Yes Increase the volume level and re-test vehicle. No GO to J6.
J6: VOICE GUIDANCE SETTINGS	
	1 Check to see if the voice guidance is set to 'OFF' in the navigation settings.
	Is the voice guidance set to 'OFF' in the navigation settings? Yes Set to 'ON' and re-test the vehicle. No GO to J7.
J7: ADDITIONAL ITEMS	
	1 Check to see if the following items apply. <ul style="list-style-type: none">• There is no destination set• There is no movement along the route
	Do the two items apply? Yes Normal operation, confirm customer symptom and re-test vehicle. No Check MOST connection at the Touch Screen (TS), check the MOST devices.Proceed to the next step.
J8: ONLY VOICE RECOGNITION DOES NOT OUTPUT	
	1 Check to see if only voice recognition does not output.
	Is there no output only from the voice recognition? Yes Refer to the there is no navigation voice guidance diagnosis. No GO to J9.
J9: SOUND IS ONLY ABSENT WHEN USING THE AUDIO SYSTEM OR TELEPHONE.	
	1 Check to see if sound is only absent when using the audio system or telephone.
	Does only the audio system or telephone sound not output? Yes Check MOST connection at the Touch Screen (TS), check the MOST devices. No Refer to the electrical circuit diagrams and check integrity of wiring harness and connections.

PINPOINT TEST K : THERE IS NO NAVIGATION VOICE GUIDANCE.

TEST	DETAILS/RESULTS/ACTIONS
------	-------------------------

CONDITIONS	
K1: SOUND MISSING AUDIO SYSTEM ONLY	
	1 Sound is only absent from the audio system (CD, radio.)
	Is sound only absent from the audio system (CD, radio.)? Yes GO to K4. No Proceed to the next step.
K2: VOICE MISSING NAVIGATION SYSTEM ONLY	
	1 Voice is only absent from the navigation system.
	Is voice only absent from the navigation system? Yes GO to K3. No GO to K3.
K3: NAVIGATION VOICE GUIDANCE CANNOT BE HEARD	
	1 Operate the navigation replay switch and raise the volume.
	Can navigation voice guidance be heard after pressing the navigation replay switch, and raising the volume? Yes Operation is normal. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.
K4: INTEGRITY OF AMPLIFIER AND SPEAKER WIRING.	
	1 The amplifier and speaker wiring harnesses are correctly connected.
	Are the amplifier and speaker wiring harnesses correctly connected? Yes GO to K5. No Refer to the electrical circuit diagrams and check integrity of amplifier and speaker wiring harness and connections.
K5: VOLUME LEVEL CHECK	
	1 Check the volume level is not set too low.
	Is the volume level set too low? No Increase the volume level and re-test vehicle. No Refer to the electrical circuit diagrams and check integrity of complete audio system.

PINPOINT TEST L : VOICE RECOGNITION DOES NOT FUNCTION.	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
L1: AUDIO SOUND IS MUTED WHEN PTT SWITCH IS DEPRESSED	
	1 Check to see if the audio sound is muted when the PTT switch is depressed.
	Is the audio sound muted? Yes GO to L3. No GO to L2.
L2: PTT SWITCH STATUS	
	1 Check to see if the PTT switch status is ok in the navigation diagnostics, manual check, microphone test.
	Is the PTT switch status, in navigation diagnostics, ok? Yes Check MOST connection at the Touch Screen (TS), check the MOST devices. No Replace the MOST master, or the gateway module.
L3: TALK BACK	
	1 Check to see if there is talk back when other voice recognition demands are executed.
	Is there talk back? Yes System operation is normal, (advise change in manner of speech, as incorrect recognition is occurring). No GO to L4.
L4: HARNESS/CONNECTOR CHECKS	
	1 Refer to the electrical circuit diagrams and check integrity of Touch Screen (TS) harness and connections.
	Has a fault been identified with the Touch Screen (TS) harness or connections? Yes Rectify the fault and re-test the vehicle. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component

installation note at top of DTC Index.

PINPOINT TEST M : THE VEHICLE POSITION ROTATES RANDOMLY.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
M1: VEHICLES CURRENT POSITION MARK TURNS ON ITS OWN	
	1 Determine if the ignition status was turned to Auxiliary or On, while the vehicle was on a turntable in a parking building etc.
	Was ignition status set to Auxiliary or On? Yes The angular speed of the vehicle at the time of the ignition status change will be logged as the standard value. To re-set the standard value, turn ignition status to 'OFF' then to 'Auxiliary' or 'On' with the vehicle stationary. Re-test the vehicle. No Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.

PINPOINT TEST N : THE VEHICLE MARK DISPLAY IS UNSTABLE.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
N1: VEHICLE SPEED SIGNAL	
	1 The vehicle speed signal is being properly inputted under "Vehicle Sensor" on the "Vehicle information" diagnostics screen.
	Is the vehicle speed input correctly? Note: MOST and navigation system module speeds are approximately the same. Yes GO to N2. No Carry out MOST ring circuit checks. Check the Anti-Lock Brake System Module for related DTCs and refer to the relevant DTC Index. Carry out network integrity tests using the manufacturer approved diagnostic system. Refer to electrical circuit diagrams and check CAN circuits if required. Repair wiring harness as required. Rectify the fault and re-test the vehicle.

N2: CHECK NUMBER OF SATELLITES

	1 "0" is displayed in the "Satellites" column under "GPS Information" (on the "Vehicle information" diagnostics screen.)
	Is the number of satellites displayed on the screen 0? Yes Refer to GPS no reception mark does not disappear diagnosis. No GO to N3.

N3: CHECK IF SYMPTOMS ARE OCCURRING IN PARTICULAR LOCATIONS

	1 Confirm if the 'car current position not stable' symptom is occurring in particular locations.
	Is the 'car current position not stable' symptom occurring in particular locations? Yes System operation is normal. Signal reflections from buildings or a particular location may be responsible. No Refer to GPS no reception mark does not disappear diagnosis.

PINPOINT TEST O : THE VEHICLE POSITION DOES NOT UPDATE.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
O1: VEHICLE POSITION DOES NOT UPDATE	
	1 Check the GPS no reception mark.
	Has the GPS no reception mark disappeared? Yes GO to O2. No Refer to GPS no reception mark does not disappear diagnosis.
O2: VEHICLE POSITION DOES NOT UPDATE	
	1 Check the map screen scroll function.
	Can the map screen be touched scrolled? Yes GO to O3. No Initiate the "SMART test" on the "HDD information" diagnostics screen.
O3: VEHICLE POSITION DOES NOT UPDATE	
	1 The vehicle speed signal is being properly inputted under "Vehicle Sensor" on the "Vehicle information" diagnostics screen.
	Is the vehicle speed input correctly? Note: MOST and navigation system module speeds are approximately the same. Yes Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index. No

Carry out MOST ring circuit checks. Check the Anti-Lock Brake System Module for related DTCs and refer to the relevant DTC Index. Carry out network integrity tests using the manufacturer approved diagnostic system. Refer to electrical circuit diagrams and check CAN circuits if required. Repair wiring harness as required. Rectify the fault and re-test the vehicle.

PINPOINT TEST P : THE MAP DISPLAY IS INCOMPLETE.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
P1: MAP DISPLAY IS INCOMPLETE	
	1 Check to see if the map screen displays correctly when it is touch scrolled.
	Does the map screen display correctly when it is touch scrolled? Yes GO to P2. No Initiate the "SMART test" on the "HDD information" diagnostics screen.
P2: MAP DISPLAY IS INCOMPLETE	
	1 Check to see if the map screen scale can be reduced.
	Can the map screen scale be reduced? Yes GO to P3. No Initiate the "SMART test" on the "HDD information" diagnostics screen.
P3: MAP DISPLAY IS INCOMPLETE	
	1 Check to see if a point of interest search can be performed.
	Can a point of interest search be performed? Yes Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index. No Initiate the "SMART test" on the "HDD information" diagnostics screen.

PINPOINT TEST Q : CALLS CANNOT BE RECEIVED OR PLACED WITH BLUETOOTH®; BLUETOOTH® CANNOT CONNECT WITH THE VEHICLE.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
Q1: DISPLAY CHECK	
	1 Press the telephone button.
	Is 'Telephone not connected' displayed on the screen? Yes GO to Q2. No Proceed to step 7.
Q2: BLUETOOTH® COMPATIBILITY CHECK	
	1 Check to see if the telephone handset is Bluetooth® compatible.
	Is the telephone handset Bluetooth® compatible? Yes GO to Q3. No Use a Bluetooth® compatible telephone handset.
Q3: HANDSET POWER CHECK	
	1 Check to see if the handset is switched 'ON'.
	Is the telephone handset switched 'ON'? Yes GO to Q4. No Switch handset 'ON' and re-test.
Q4: INITIAL CONNECTION SETTINGS	
	1 Check to see if the initial connection settings to the in-vehicle system have been performed.
	Have the initial connection settings to the in-vehicle system been performed? Yes GO to Q5. No Perform the initial connection settings.
Q5: HANDSET COMMUNICATION CHECK	
	1 Check to see if the telephone handset recognizes the in-vehicle system.
	Does the telephone handset recognize the in-vehicle system? Yes GO to Q6. No Re-test using a different Bluetooth® compatible telephone handset. If the fault is still evident, suspect the telephone module. Refer to the new module/component installation note at the top of this procedure.
Q6: HANDSET COMMUNICATION CHECK	
	1 Switch the Bluetooth® telephone handset 'OFF' then back 'ON' again.

	Does the telephone handset recognize the in-vehicle system? Yes Operation is normal. No Suspect the telephone module. Refer to the new module/component installation note at the top of this procedure.
--	---

Q7: HANDSET COMMUNICATION CHECK

	1 Check to see if the telephone is within communications range.
	Is the telephone within a 10 metre range of the Bluetooth® telephone module? Yes GO to Q8. No Move the telephone handset to within a 10 metre range of the Bluetooth® telephone module.

Q8: HANDSET COMMUNICATION CHECK

	1 Check to see if when transmitting, the telephone handset is also receiving.
	When transmitting, is the telephone handset also receiving? Yes Check MOST connection at the Touch Screen (TS), check the MOST devices. No Replace the telephone handset.

PINPOINT TEST R : AN ERROR SCREEN DISPLAYS ON THE NAVIGATION SCREEN.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
R1: MAP DATA CANNOT BE READ	
	1 Access to the map data has not been granted.
	Has new Touch Screen (TS) been installed? Yes Initiate the "Map Lock routine." No Check that a valid activation code for the particular map version installed is available and is being used, it may be necessary to purchase a new activation code from Navteq. If the activation code is valid but map cannot be activated, check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index. Initiate the "Map Lock routine."

PINPOINT TEST S : THE DUAL VIEW CANNOT BE SWITCHED.

 **NOTE:** Prior to troubleshooting, verify that the vehicle and the Touch Screen (TS) are compatible with Dual Directional View.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
S1: AUDIO VIDEO HARD SWITCH CHECK	
	1 The audio screen displays when the "AUDIO VIDEO" hard switch is pressed.
	Does the audio screen displays when the "AUDIO VIDEO" hard switch is pressed? Yes GO to S2. No Refer to the hard switches do not respond diagnosis.
S2: AUDIO SOURCE	
	1 TV or DVD is the audio source.
	Does TV or DVD display? Yes GO to S3. No Switch the audio source to TV or DVD and carry out diagnosis again.
S3: VIDEO AND SOUND CORRECTLY DISPLAYED	
	1 Video with sound is displayed on the passenger side from the audio screen after the "AUDIO VIDEO" hard switch is pressed.
	Is video with sound displayed on the passenger side from the audio screen after the "AUDIO VIDEO" hard switch is pressed? Yes Operation is normal. No GO to S4.
S4: VIDEO AND SOUND INCORRECTLY DISPLAYED	
	1 Video with sound is incorrectly displayed on the passenger side from the audio screen after the "AUDIO VIDEO" hard switch is pressed
	Is video with sound incorrectly displayed on the passenger side from the audio screen after the "AUDIO VIDEO" hard switch is pressed? Yes Refer to the black screen (navigation and audio screens do not display) diagnosis. No GO to S5.

S5: VEHICLE CONFIGURATION	
	<p>1 The following set values are present on the "Vehicle Configuration" diagnostics screen.</p> <ul style="list-style-type: none"> • HLDF = Dual view • HLDF is fitted • Hand of Drive is correct for vehicle being tested
	<p>Are values present on the "Vehicle Configuration" diagnostics screen.</p> <p>Yes Check and install a new Touch Screen (TS) as required. Refer to the new module/component installation note at top of DTC Index.</p> <p>No Contact dealer technical support to assist in re-configuring the Car Configuration File (CCF) using the manufacturers approved diagnostic system. Clear the DTC, switch off the ignition and allow sufficient time for the infotainment relay to power down. Check MOST connection at the Touch Screen (TS), check the MOST devices.</p>

DTC Index

For a complete list of all Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Integrated Audio Module (IAM) - High Line (100-00 General Information, Description and Operation).

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1.  NOTE: RH side only.

Refer to: Rear Quarter Trim Panel (501-05, Removal and Installation).

2. Torque: 9 Nm

E139083

Installation

1. To install, reverse the removal procedure.
2. Using the diagnostic tool, calibrate the component.

Information and Entertainment System - Speakers

Description and Operation

The speaker configuration depends on the level of audio and head unit fitted to the vehicle. The following details the speaker configuration and control for each system.

LOW LINE AUDIO SYSTEM

Low Line Audio System Speaker Component Location

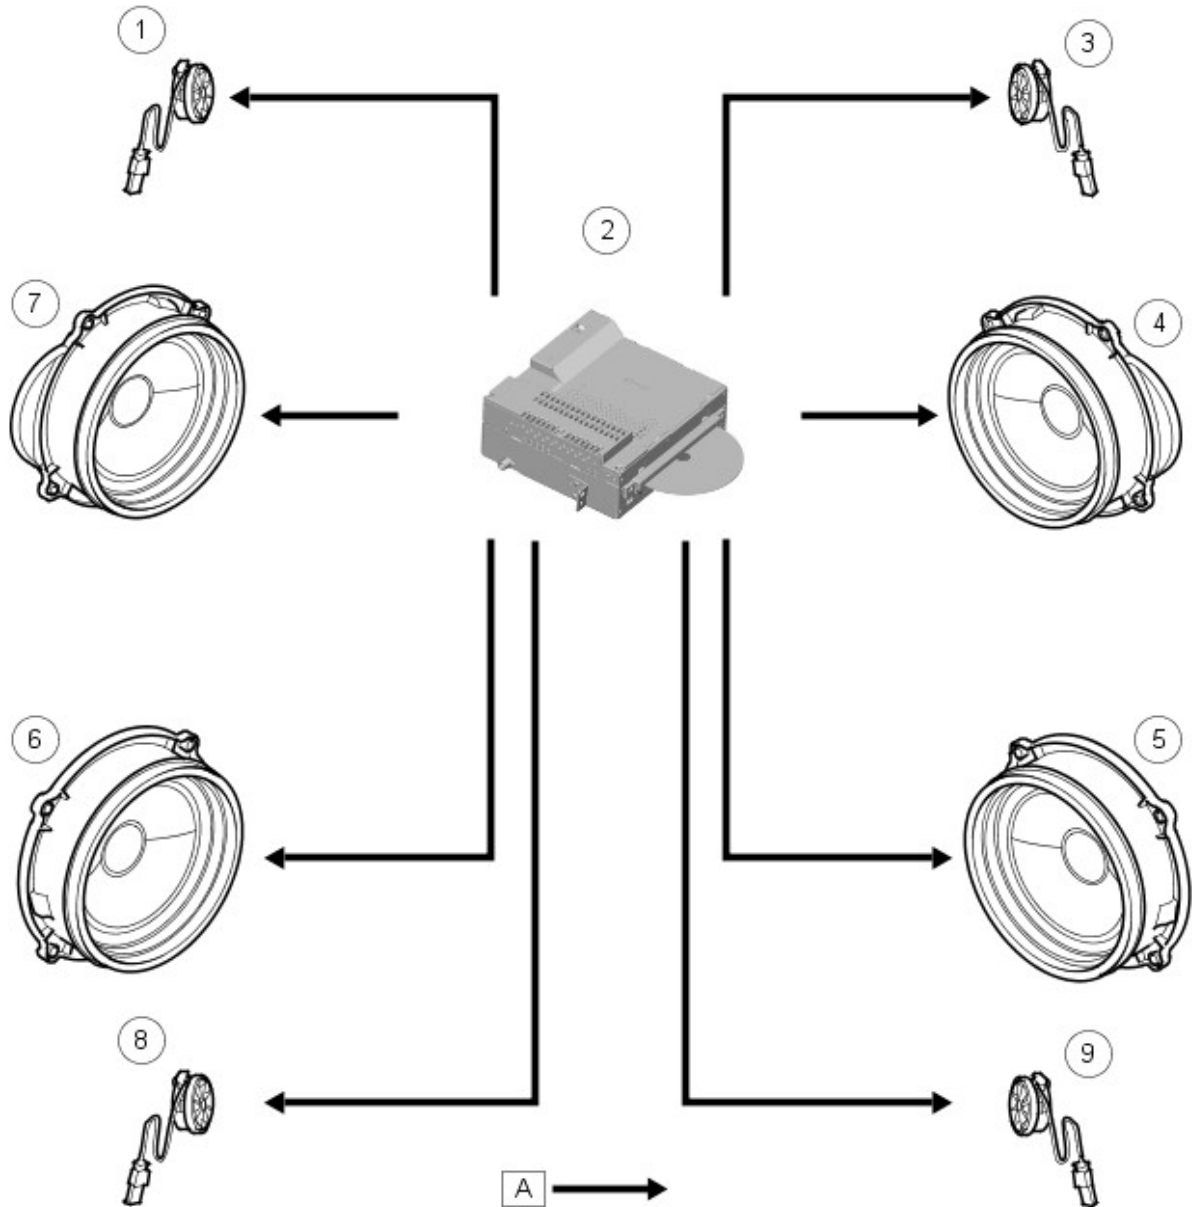

E132119

Item	Part Number	Description
1	70451	Front RH door mid/bass speaker
2	-	Front RH door tweeter
3	-	Rear RH door full range speaker
4	-	Rear LH door full range speaker
5	-	Front LH door tweeter
6	-	Front LH door mid/bass speaker
7	-	Head unit
8	-	Rear RH door tweeter
9	-	Rear LH door tweeter

Low Line Audio System Speaker Control Diagram

NOTE: A= Hardwired

E132120

Item	Part Number	Description
1	-	Front LH tweeter
2	-	Head unit
3	-	Front RH tweeter
4	-	Front RH mid/bass speaker
5	-	Rear RH full range speaker
6	-	Rear LH full range speaker
7	-	Front LH mid/bass speaker
8	-	Rear LH tweeter
9	-	Rear RH tweeter

The low line audio speaker system is driven directly from the audio head unit
 For additional information, refer to: Audio System (415-01B, Description and Operation).
 .The system comprises:

- Head unit
- Two front door mounted mid/bass speakers (one per side)
- Two front door mounted tweeters (one per side)
- Two rear door mounted full range speakers (one per side)
- Two rear door mounted tweeters (one per side)

HIGH LINE-HARMAN/KARDON AUDIO SYSTEM

High line-Harman/Kardon Audio System Speaker Component Location

E49743

Item	Part Number	Description
1	-	Front RH mid/bass speaker
2	-	Front RH tweeter
3	-	Rear RH mid/bass range
4	-	Rear RH tweeter
5	-	Sub-woofer
6	-	Rear LH tweeter
7	-	Rear LH mid/bass range
8	-	Front LH tweeter
9	-	Front LH mid/bass speaker
10	-	High line amplifier

High line-Harman/Kardon Audio System Speaker Control Diagram

NOTE: A= Hardwired

E48353

Item	Part Number	Description
1	-	Front LH tweeter
2	-	High line amplifier
3	-	Front RH tweeter
4	-	Front RH mid/bass speaker
5	-	Rear RH tweeter
6	-	Rear RH mid/bass speaker
7	-	Sub-woofer
8	-	Rear LH mid/bass speaker
9	-	Rear LH tweeter
10	-	Front LH mid/bass speaker

The High line-Harman/Kardon audio speaker system is driven by an amplifier located under the RH front seat. The amplifier is controlled by the Integrated Head Unit (IHU) on the MOST bus and supplies 6x50 watts output, giving a total system power rating of 300 watts

For additional information, refer to: Audio System (415-01B, Description and Operation).

. The system comprises:

- Integrated Head Unit (IHU) Head unit.
- Two front door mounted mid/bass range speakers (one per side).
- Two front door mounted tweeters (one per side).
- Two rear door mounted mid/bass range speakers (one per side).
- Two rear door mounted tweeters (one per side).
- A sub-woofer located in the lower tailgate.
- An audio amplifier located under the front RH seat.

PREMIUM AUDIO SYSTEM - HARMAN/KARDON LOGIC7

Premium Audio - Harman/Kardon LOGIC7 Audio System Speaker Component Location

E49744

Item	Part Number	Description
1	-	Front RH bass speaker
2	-	Front RH tweeter
3	-	Front RH mid range speaker
4	-	Rear RH mid/bass speaker

The Premium Audio - Harman/Kardon LOGIC7 audio speaker system is driven by an amplifier located under the RH front seat. The amplifier is controlled by the Integrated Head Unit (IHU) on the MOST bus and supplies 12x50 watts output, giving a total system power rating of 600 watts. The system comprises:

- Integrated Head Unit (IHU) Head unit
- Two front door mounted mid range speakers (one per side)
- Two front door mounted bass speakers (one per side)
- Two front door mounted tweeters (one per side)
- Two rear door mounted mid/bass range speakers (one per side)
- Two rear door mounted tweeters (one per side)
- A sub-woofer located in the lower tailgate
- Two rear surround speakers in the E post (one per side)
- One centre fill speaker located in the centre of the instrument panel
- Premium amplifier

Information and Entertainment System - Intercom System

Description and Operation

Overview

The intercom system allows the vehicle occupants to have a two-way conversation with persons outside the vehicle. This provides a communication system that does not compromise the occupant's security by opening the vehicle's doors or driver's window.

Interior and exterior microphones and speakers are controlled by switches in auxiliary switch pack.

The system comprises:

Speaker amplifier located underneath the driver's seat

E102954

Internal microphone located above the driver in the roof console.

E102955

External microphone located in the driver-side 'B/C' pillar

E101548

Internal speaker located on the passenger-side fascia

E101549

External speaker located behind the front grille

E102956

System Operation

With the vehicle ignition on:

- Pressing the "push to talk" switch allows the driver to talk to persons outside the vehicle.
- Pressing the "push to listen" switch enables the vehicle occupants to listen to conversation outside the vehicle.

Auxiliary switch pack

E101547

Item	Part Number	Description
1	-	Push to talk
2	-	Push to listen

The electrical system for the intercom is supplied by the auxiliary battery, via the armoured vehicle options harness and 5 amp fuse (F1) in the satellite junction box.
For additional information, refer to: Battery and Cables (414-01, Description and Operation).

Satellite junction box with intercom fuse (F1) highlighted

E101550

NOTE: The supplementary circuit diagrams for the armoured vehicle are located in Land Rover GTR at: Service Information, Discovery 3, 2008 Electrical Circuit Diagrams.

Information and Entertainment System - Audio System - Overview

Description and Operation

OVERVIEW

The audio system is available in four versions:

Lo-Line System

- 80W - Amplifier integral with Audio Head Unit (AHU)
- 8 speakers
- single slot CD (compact disc) player
- Multi-Function Display (MFD) unit
- CAN (controller area network) based system.
- 3.5mm jack plug.

Mid-Line System

- 600W Harman Kardon sound system - separate Audio Amplifier Module (AAM)
- 11 speakers including passive sub-woofer
- single slot CD player.
- Touch Screen (TS)
- HD Radio™ receiver
- Media Oriented System Transport (MOST) based system.
- 3.5mm jack plug.

High-Line System

- 600W Harman Kardon sound system - separate Audio Amplifier Module (AAM)
- 11 speakers including passive sub-woofer
- single slot CD player and virtual multi-changer
- Touch Screen (TS)
- HD Radio™ receiver
- 40GB HDD storage
- Media Oriented System Transport (MOST) based system.
- Auxiliary input - USB and MP3/iPod
- 3.5mm jack plug.

Premium System

- 1200W Harman Kardon Logic 7 sound system - separate Audio Amplifier Module (AAM)
- 17 speakers including passive sub-woofer
- single slot CD player and virtual multi-changer
- Touch Screen (TS)
- HD Radio™ receiver
- 40GB HDD storage
- Media Oriented System Transport (MOST) based system.
- Auxiliary input - USB and MP3/iPod
- 3.5mm jack plug.

All sound systems include:

- MP3-compatible, single slot CD player
- AM / FM radio
- EON, RDS, PTY, TA
- 3.5mm jack plug

All systems can be specified with Bluetooth™

Hi-Line and Premium systems can be specified with:

- Hard Drive Navigation system (except Asian markets) with virtual CD multi-changer and single slot DVD (digital versatile disc) for front Touch Screen Display (TSD)
- Interactive Voice (Navigation required)
- Digital audio tuner (DAB)/Digital Multimedia Broadcasting (DMB) (Europe and Asia only) or Satellite Digital Audio Radio Service (SDARS) receiver (NAS only).

The Lo-Line system comprise an AHU and a MFD. The AHU has the following functions:

- AM/FM tuner
- single CD player
- integral audio power amplifier
- Bluetooth™ and audio streaming capability
- DAB/DMB tuner.

The Mid-Line systems comprise an Integrated Audio Module (IAM) and TS. The IAM has the following function:

- AM/FM tuner
- single CD player
- separate audio power amplifier
- Bluetooth™ and audio streaming capability

- DAB/DMB tuner.

The Hi-Line system comprise an Integrated Audio Module (IAM) and TSD. The IAM has the following function:

- AM/FM tuner
- single CD player 40GB HDD virtual multi-changer (The 40GB hard drive is used by the audio for storing music and also stores the operating system and files for the navigation system (not applicable to Asian market vehicles).
- Bluetooth™ and audio streaming capability
- DAB/DMB tuner.

The Premium system comprise an Integrated Audio Module (IAM) and TSD. The IAM has the following function:

- AM/FM tuner
- single CD player 40GB HDD virtual multi-changer (The 40GB hard drive is used by the audio for storing music and also stores the operating system and files for the navigation system (not applicable to Asian market vehicles).
- Bluetooth™ and audio streaming capability
- DAB/DMB tuner + DMB radio capability.

Digital Audio Broadcasting (DAB)/Digital Multimedia Broadcasting (DMB) is available for most European and Asian markets and gives access to digital radio channels for better sound quality and enhanced functionality depending on local service availability. The DAB/DMB module is located behind the right side luggage compartment trim panel on Mid-Line, High-Line and Premium systems or in the AHU on the Lo-Line system. The DAB/DMB system receives reception signals from the following sources to ensure optimum signal strength.

- DAB band L/DMB antenna located in the roof pod.
- DAB band III/DMB antenna located in the left rear side window.

For NAS vehicles with Mid-Line, High-Line and Premium systems, the digital format adopted is Satellite Digital Audio Radio Service (SDARS) which specifically links to the Sirius network. The system operates in the S-band frequency range, and as a result of the use of satellite transmission, has the ability to provide CD quality audio broadcasts over very large areas (typically continents). The SDARS receiver is located behind the right luggage compartment trim panel. The system receives reception signals from the satellite radio antenna located in the roof pod. SDARS is not available on Lo-Line systems.

HD Radio™ Technology is a free digital radio format broadcast available in NAS market. HD Radio™ digital broadcasts are transmitted alongside the analogue AM and FM signals by stations broadcasting HD Radio™ signals. The HD Radio™ receiver is integrated into the AM FM tuner on NAS variants of the IAM.

Primary user control of the Mid-Line, High-Line and Premium audio systems is via the ICP and the Touch Screen (TS) which are located in the center of the instrument panel. Control signals from the ICP are relayed on the medium speed CAN bus to the IAM. The IAM relays the control signals to the rest of the audio system on the Media Oriented System Transport (MOST) ring. The TS is the timing master for the MOST ring and also hosts a gateway function between the medium speed CAN bus and the MOST ring.

The primary user control of the Lo-Line audio system is via the ICP and the MFD, which are located in the center of the instrument panel. Control signals from the ICP are relayed on the medium speed CAN bus to the MFD. The control signals are passed to the AHU on a dedicated CAN bus.

System Operation

PRINCIPLES OF OPERATION

LO-LINE AUDIO SYSTEM

The components of the Lo-Line audio system are connected on a dedicated CAN bus and also the medium speed CAN bus.

Information is passed between the AHU and the MFD on a dedicated CAN bus. The MFD and the Integrated Control Panel (ICP) communicate on the medium speed CAN bus.

Lo-Line Audio System Gateway Function

The MFD is the gateway between medium speed CAN bus and other CAN based vehicle systems. A typical example of information transfer is vehicle speed information from the ABS (anti-lock brake system) module used to control the automatic volume control function. The vehicle speed information from the ABS module is sent on the high speed CAN bus and collected by the IC gateway. The signal is passed to the medium speed CAN bus, processed by the multi-function display and passed onto the AHU on the dedicated CAN bus. The AHU calculates the volume adjustment required and adjusts the output to the speaker system.

HI-LINE AND PREMIUM AUDIO SYSTEMS

The components of the Hi-Line and Premium audio/infotainment system are all connected on the Media Oriented Systems Transport (MOST) ring. The MOST ring is a fibre optic communications bus for multimedia applications. Audio and control information is passed around the MOST ring and can be picked up by any of the systems units. For example, radio station tuning/selection input by the vehicle user into the Touch Screen (TS) is sent along the MOST ring and collected by the Integrated Audio Module (IAM) which then selects the requested radio station.

MOST technology uses a plastic optical fibre which forms a network connecting the audio and multimedia system components. Each component in the ring is connected to the plastic optical fiber through a device known as a Fiber Optical Transceiver (FOT). Each FOT has two optical connections; one connection is sensitive to light and is the input, the second connection forms the light source and is the output. The system operates by connecting the output from one FOT to the input of another FOT.

The light signals are sent in one direction only and are formed in the following way:

- Electrical signals are converted into an electrical current
- The current then drives an LED (light emitting diode) in the FOT to produce a high intensity red light
- The LED transmits the light through a fiber optic cable
- A photo diode in the FOT at the opposite end of the fiber optic cable detects the light.

The following components may be connected to the MOST ring dependant on the vehicle equipment level:

- IAM
- TS
- DAB/DMB receiver
- SDARS receiver (NAS only)
- Audio Amplifier Module (AAM)
- Navigation computer (Japan only)
- TV tuner (if fitted).
- Rear Seat Entertainment Control Module (RSECM)

MOST is a synchronous network. A timing master supplies the clock information and all other devices on the network synchronize their operation to this clock. The timing master for the MOST network on this vehicle is the TS. This unit controls and manages the MOST ring and the system components. An Optical Bus tester is used in conjunction with approved Land Rover diagnostic equipment to diagnose the MOST system.

The Optical Bus tester emits a visible, high intensity red light which can be connected into the ring at any point to test the ring integrity. Disconnecting a MOST connector will reveal if the high intensity red light is visible. If a break occurs in the MOST ring, fault codes are stored in the TS which can be retrieved using approved Land Rover diagnostic equipment.

Hi-Line and Premium Audio System Gateway Functions

The TS is the gateway between medium speed CAN bus and the MOST systems.

Dynamic Volume Control

The cabin noise is measured via the fitted microphone. The AAM uses this signal to calculate the volume level.

Component Description

LO-LINE AUDIO SYSTEM

Multi-Function Display and Integrated Control Panel

E140296

Item Description

- 1 Audio on/off
- 2 Volume control
- 3 Phone menu switch
- 4 FM (frequency modulation)/AM (amplitude modulation) waveband switch
- 5 Auxiliary mode switch
- 6 Radio preset/CD (compact disc) select switches/telephone keypad
- 7 CD slot
- 8 Seek up/CD next track/manual tuning up/USB or iPod next track
- 9 Audio menu navigational controller
- 10 OK switch
- 11 Seek down/CD previous track/manual tuning up/USB or iPod previous track
- 12 Audio menu switch
- 13 CD mode switch
- 14 Tone switch
- 15 Traffic information switch
- 16 Multi-Function Display (MFD)

The Lo-Line audio systems are based around an Audio head Unit (AHU) which communicates on the medium speed CAN with other audio and entertainment system modules. The Integrated Control Panel(ICP) communicates on the medium speed CAN with the Multi Function Display (MFD).

The ICP has a rotary control for audio volume control. The control can also be pressed to turn the audio system on and off.

Audio Head Unit

E140297

The AHU is located in the instrument panel, behind the ICP and the [ATC \(automatic temperature control\)](#) module.

The AHU contains the following functionality:

- [AM/FM](#) radio dual tuner with diversity
- Single disc [CD/MP3](#) player
- AAM
- DAB/DMB tuner
- Bluetooth phone
- Auxiliary input (for any device featuring a 3.5mm jack plug output)
- Provide audible beeps for the parking aid system (if fitted).

The audio head unit communicates with the multi-function display on a dedicated [CAN](#) bus. The MFD communicates with the other vehicle systems on the medium speed [CAN](#) bus and is therefore the 'gateway' for the lo-line audio system.

The AHU contains an internal 80W which directly drives the vehicle speakers.

The AHU incorporates an AM/FM tuner which allows for the storage of 2 banks of FM presets FM1/FM-AST containing 10 presets each and 2 banks of AM presets AM1/AM-AST containing 10 presets each. The FM-AST & AM-AST bank gives the 10 strongest AM stations stored by an FM or AM autostore. Pre-set stations are stored in the AHU memory. The radio tuner also incorporates the following radio functions:

- AM Auto Store (AM-AST)
- FM Auto Store (FM-AST)
- FM station list
- Presets
- Traffic announcements (TA) – Europe only
- RDS (radio data system) EON (Enhanced Other Networks) function (Radio Broadcast Data System (RBDS) in NAS markets)
- Seek station
- Tune up/down
- Scan
- PTY

A Digital Audio Broadcasting (DAB) tuner is incorporated into the AHU. This allows the reception of digital broadcast stations which can be received via the DAB/DMB III antenna located in the left rear side window or via the DAB/DMB L antenna in the roof pod.

The system allows for the storage of 2 banks of DAB/DMB presets DAB1/2/DMB containing 10 presets each and allows DMB radio capability.

All radio antennas are routed into the AHU. The head unit supplies a power output to the antenna except for AM which has a separate power feed to the AAM.

The AHU also supports optional Bluetooth™ telephone functionality and audio streaming.

The audio head unit also supports optional portable audio, devices are connected to the head unit via the portable audio interface panel.

The head unit incorporates a power management function. Should the vehicle battery level drop below a predetermined level, the unit will switch off if the engine is not started within 3 minutes. The AHU receives medium speed [CAN](#) signals from other vehicle systems which it uses to determine the wake up/shut down process.

Auxiliary audio input is available via the aux input panel. The panel allows the connection of 3.5mm jack plug or optional USB/iPod connectivity.

CD Player

The [CD](#) player has the capability to play MP3 files. The MP3 discs follow a format of folders and files within the folder, folder depth of up to six levels is allowed. It is also possible to place all the files in the root directory on the [CD](#).

The random and repeat features follow the normal [CD](#) random and repeat feature functions.

When an [CD](#) error occurs, the audio head unit will alert the user by showing a message related to the error in the multi-function display. This will be displayed while the [CD](#) audio mode is selected until the error is corrected. The [CD](#) related error does not affect other areas of the audio head unit and a different audio source can be selected.

Error Message in IAM display	Cause
Mechanism error	Mechanical Error, CD stuck, Servo related error, etc..
Disc error	Invalid Disc, CDROM (read only memory) inserted, disc inserted upside-down, etc.

Adaptive Volume Control (AVC)

AVC controls the audio volume in relation to vehicle speed. As vehicle speed increases the audio level is adjusted to compensate for extra road and vehicle noise.

There are 8 steps (0-7) of AVC. The AVC settings can be changed by selection in the multi-function display menu.

The vehicle speed signal is used to enable the audio head unit to calculate the volume adjustment required. The vehicle speed signal is received over the medium speed [CAN](#). The signal is an average of the four wheel speed sensor signals. Should an invalid speed signal be received the AVC will not alter the output volume.

Multi-Function Display

The MFD is located in the instrument panel, above the ICP.

The MFD is connected to other vehicle systems on the medium speed CAN bus and to the audio head unit on a dedicated CAN bus. The MFD receives information from other vehicle systems on the medium speed CAN bus and passes it to the audio head unit on the dedicated CAN bus.

The MFD features a 5" colour TFT LCD (Thin Film Transistor Liquid Crystal Display) screen. Switches surrounding the screen operate the audio functions, with the exception of the parking aid switch. Additional controls for audio are also available on the ICP.

The MFD has controls for radio, CD, auxiliary input and telephone. A 'Menu' switch allows for the selection and adjustment of audio settings, clock settings and language. Each menu can be scrolled through using a 'four-way' menu navigation control switch and the selected menu can be displayed by pressing the 'OK' switch in the center of the control switch.

The following functions can be selected from the menu:

- Regionalisation
- Alternative frequency (AF)
- News
- Adaptive Volume Control (AVC)
- Tone adjustment
- DAB/DMB Service link
- CD repeat and shuffle

Clock functions:

- Time
- Date

Language:

- Select language from list

Portable Audio Interface Panel (Optional Fit)

E151886

The portable audio interface is located in the floor console cubby box. The interface is a media hub between the portable input device and the audio head unit.

Devices that can be connected include:

- **USB (universal serial bus)** mass storage devices (for example a memory stick). Devices must use FAT or FAT32 file format.
- iPod® (iPod Classic, iPod touch, iPhone and iPod Nano are supported - full functionality for older devices cannot be guaranteed). iPod Shuffle functionality cannot be guaranteed.
- Auxiliary device (personal audio, MP3 players).
- Devices with Bluetooth® connectivity. Devices must support A2DP and AVRCP Bluetooth® protocols).

When connecting a portable storage device, press the AUX switch on the multi-function display to select that device input. Depending on the device connected, many of the controls on the multi-function display and ICP can be used.

NOTE: It is recommended to disconnect an iPod when leaving the vehicle. Failure to do so may result in the iPod battery discharging.

To maximize playback quality, it is recommended to use loss-less compression for any media files on iPod. Failing this, it is recommended that compressed files utilise a minimum bitrate of 192 kb/s (a higher bitrate is strongly recommended for increased quality playback).

For media files delivered via **USB** or MP3 players, the highest compression rate supported is 320 kbits per second (kbps). If anything less than 128 kbps is used, Digital Signal Processing (DSP) functionality may be lost.

Some MP3 players may have a file system that is not supported by the audio head unit. To use an MP3 player, it must be set to **USB** Removable Device or Mass Storage Device mode. Only music that has been added to the device in this mode can be played.

STEERING WHEEL CONTROLS

E140298

Item Description

- 1 2. Mode switch
- 2 Volume increase
- 3 Volume decrease
- 4 Seek down
- 5 Seek up

The steering wheel mounted audio control switches are located on the left side of the steering wheel. The operation of each steering wheel audio switch is via a resistive ladder. The MFD processes the received voltage to determine the function selected. This information is then passed to the AHU on the medium speed **CAN** bus to carry out the request.

The steering wheel audio switch controls the following functions:

- **MODE** - Press repeatedly to scroll through all audio/video sources.
- **Short press up** -
 - To select the next radio preset
 - To select the next track on chosen audio source
- **Short press down** -
 - To select the previous radio preset
 - To select the previous track or start of current track on chosen audio source
- With radio manual seek mode activated, further short presses will change the frequency in single increments. A further long press will scan forwards through the current waveband until the switch is released.
- **Long press up** -
 - To auto seek up the frequency to the next radio station.
- **Long press down** -
 - To auto seek down the frequency to the next radio station.
- Volume increase for current audio source
- Volume decrease for current audio source

MID-LINE, HI-LINE AND PREMIUM AUDIO SYSTEMS

Touch Screen Display and Integrated Control Panel

E151901

Item Description

- 1 Touch screen (TS) off switch
- 2 Touch screen
- 3 Audio/video menu switch
- 4 Phone menu switch
- 5 Mode switch
- 6 Menu navigational controller
- 7 Info switch
- 8 Seek up/CD next track/manual tuning up
- 9 CD eject switch
- 10 CD slot
- 11 Seek down/CD previous track/manual tuning down
- 12 Tone switch
- 13 Volume control
- 14 Audio on/off

The Mid-Line, Hi-Line and Premium audio systems are based around an Integrated Audio Module (IAM) which communicates on the MOST with other audio and entertainment system modules. The Integrated Control Panel (ICP) communicates on the medium speed CAN with the Touch Screen (TS).

The ICP has a rotary control for audio volume control. The control can also be pressed to turn the audio system on and off.

The ICP duplicates many of the TS audio user control features. Any volume setting made whilst in audio, TV, phone, navigation or voice activation mode will be memorized for that system. The ICP communicates with the TS on the medium speed CAN bus. The TS converts control/command signals from the ICP and then distributes the information

onto the MOST system to the audio system and other information and entertainment systems.

Integrated Audio Module (IAM)

E140303

The IAM is located in the instrument panel, behind the Integrated Control Panel (ICP) and the [ATC](#) module.

Two levels of IAM are available; IAM 1 and IAM3. IAM3 is the high level unit and supports the following features in addition to the features supported by IAM1:

- Navigation
- TMC/VICS
- Off Road Navigation
- DVD
- 40GB Hard Disc Drive (HDD) - virtual CD/DVD - allows the storage of up to 10 CDs to create a 'virtual' multi-changer.
- Voice recognition
- Rear Seat Entertainment (RSE)

Both versions of the IAM contain the following functionality:

- AM/FM radio tuner with diversity
- HD Radio™ receiver (NAS only)
- [CD](#)/MP3 player (Single [CD](#))
- Auxiliary audio/video is available via a portable audio interface panel. The panel allows for the connection of portable audio/video via 2 USB's (optional fit), iPod connectivity (optional fit) and a 3.5mm jack plug.
- Bluetooth® and audio streaming.

When the vehicle systems become active the TS is woken up by [CAN](#) bus activity and subsequently wakes up the IAM via the MOST.

The IAM incorporates an AM/FM tuner which allows for the storage of 3 banks of FM presets FM1/2/3 containing 6 presets each and 3 banks of AM Presets AM1/AM2/AMA containing 6 presets each. The AMA bank gives the 6 strongest AM stations stored by an AM autostore. Pre-set stations are stored in the IAM and TS memory. The radio tuner also incorporates the following radio functions:

- HD Radio™ (NAS only)
- AM Auto Store (AST)
- FM station list
- Presets
- Traffic announcements (TA) – Europe only
- RDS (radio data system) EON (Enhanced Other Networks) function (Radio Broadcast Data System (RBDS) in NAS markets)
- Seek station
- Tune up/down
- Scan
- PTY

When the optional Digital Audio Broadcasting (DAB) tuner is specified, the audio system is fitted with a separate DAB/DMB receiver. This allows the reception of digital broadcast stations which can be received via the FM2/DAB/DMB III antenna located in the left rear quarter glass or via the DAB/DMB III antenna in the roof pod.

In NAS markets, Satellite Digital Audio Radio Service (SDARS) can be specified, the audio system is fitted with a separate SDARS tuner. This allows for the reception of the satellite digital broadcast stations which are received via an SDARS antenna located in the roof pod.

All radio antennas are routed into the IAM. The IAM supplies a power output to the antenna except for AM which has a separate power feed to the AAM.

The IAM incorporates a power management function. Should the vehicle battery level drop below a predetermined level, the unit will limit its functionality. The AHU receives medium speed [CAN](#) signals from other vehicle systems which it uses to determine the wake up/shut down process.

Calibration of the IAM using approved Land Rover diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates. If the IAM is replaced it must be configured as a new module using approved Land Rover diagnostic equipment.

CD Player/DVD Player (where fitted)

The CD player has the capability to play MP3 files. The MP3 discs follow a format of folders and files within the folder. It is also possible to place all the files in the root directory on the CD.

The random and repeat features follow the normal CD random and repeat feature functions.

When an CD error occurs, the AHU will alert the user by showing a message related to the error in the multi-function display. This will be displayed while the CD audio mode is selected until the error is corrected. The CD related error does not affect other areas of the AHU and a different audio source can be selected.

Error Message in IAM display	Cause
Mechanism error	Mechanical Error, CD stuck, Servo related error, etc..
Disc error	Invalid Disc, CDROM (read only memory) inserted, disc inserted upside-down, etc.

The IAM has the ability to load audio files and 'rip' the music onto the internal hard drive, a 10GB partition is reserved to store music. It is possible to store up to 10 uncompressed albums onto the hard drive. Only CDDA files can be loaded into the virtual changer.

File compatibility for the single slot CD mechanism includes:

- CD audio
- MP3 – (MPEG Layer III)
- WMA – (Microsoft Windows Media Audio)
- WAV – (waveform)
- AAC – (Advanced Audio Coding. Apple iTunes - only through iPod interface).

NOTES:

The CD player may take a longer time to load an MP3 disc, if there are more tracks than on a normal CD. To minimise loading time, a rigid folder structure is recommended.

In the event of customer complaints relating to audio quality, file compression should be taken into consideration during diagnosis.

Dynamic Volume Control (DVC)

DVC controls the audio output parameters in relation to the noise inside the cabin (road noise, wind noise, etc.) and vehicle speed. No customer settings are available for adjustment.

Touch Screen (TS)

The TS is an 8" color touch sensitive display, located in the instrument panel, above the ICP.

The TS is the Bus Master for the MOST system and contains the timing master for the MOST system.

When the vehicle systems become active the TS is woken up by CAN bus activity and subsequently wakes up the other audio module via the MOST.

The TS forms the basis of the audio system. It communicates with the rest of the audio/infotainment system on the MOST ring and allows control of the audio system and other infotainment systems from a single point. The TS communicates with the IAM on the MOST ring and provides the primary user interface and display of the audio system controls. No configuration procedure is required if the TS is replaced.

Calibration of the TS using approved Land Rover diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

The TS provides user control of the following systems:

System	Functions
Audio	Radio display AM/FM or DAB, DMB radio, auxiliary and portable audio, digital TV or CD (compact disc)
Climate control	Air conditioning, distribution, seats, heated steering wheel, automatic air recirculation
Telephone	Digit dialer, phone book, last ten calls (made, received, missed)
Navigation	Destination, stored locations, navigation setup, route options, 4x4 info
Vehicle	Security parking, valet mode, trip computer, clock, brightness, contrast, system settings, vehicle settings, display settings

Clock

The TS contains the master clock functionality. Other vehicle infotainment modules that require clock functionality use the time supplied from the TS.

The clock is available to any control module that is connected to an interconnecting bus, for example, either of the CAN buses or the MOST ring.

The clock display configurable to show in AM/PM or 24 hour format. Midnight is shown as 12:00AM or 00:00 respectively. The default condition, if not specified, after power on or delivery, should default to 12:00PM or 00:00. Depending upon the market set the clock will default to either 12 or 24 hour format.

The time is adjusted from the TS. Under conditions when any bus system could be asleep or shut down, the TS does not allow clock adjustments.

Integrated Control Panel (ICP)

The ICP is located in the instrument panel, above the [ATC](#) module.

The ICP has a rotary control for audio volume control. The control can also be pressed to turn the audio system on and off.

The ICP duplicates many of the TS audio user control features. Any volume setting made whilst in audio, TV, phone, navigation or voice activation mode will be memorized for that system. The ICP communicates with the TSD on the medium speed [CAN](#) bus. The TS converts control/command signals from the ICP and then distributes the information onto the MOST system to the audio system and other information and entertainment systems.

A slot below of the ICP allows a CD to be inserted into the IAM.

Portable Audio Interface Panel and AVIO Panel

Item Description

- 1 [USB](#)/iPod socket
- 2 3.5 mm AUX socket
- 3 [USB](#)/iPod socket
- 4 AV sockets

Both the front and the rear auxiliary input connectors are located in the floor console. AUX (Auxiliary Input) mode allows extra equipment to be connected to the vehicle's audio system. Items such as a personal stereo, MP3 player, hand-held navigation unit etc, can be plugged in to the vehicle's audio system.

To listen to an auxiliary input source portable devices must be connected via 3.5 mm stereo jack sockets or [USB](#) ports. If the device has a line out socket it is preferable that this is used for connection.

Portable Audio Interface

The portable audio interface is located in the floor console cubby box and is fitted to all Hi-Line and Premium audio specified vehicles. The interface is a media hub between the portable input device and the IAM. The interface contains two [USB](#) ports.

Devices that can be connected to the portable audio interface include:

- [USB](#) mass storage devices (for example a memory stick). Devices must use FAT or FAT32 file format.
- iPod® (iPod Classic, iPod touch, iPhone and iPod Nano are supported - full functionality for older devices cannot be guaranteed). iPod Shuffle functionality cannot be guaranteed.
- Auxiliary device (personal audio, MP3 players).
- Devices with Bluetooth® connectivity. Devices must support A2DP and AVRCP Bluetooth® protocols).

When connecting a portable storage device, select AUX on the TS to select that device input. Depending on the device connected, many of the audio controls on the TSD and ICP can be used.

NOTE: It is recommended to disconnect an iPod when leaving the vehicle. Failure to do so may result in the iPod battery discharging.

To maximise playback quality, it is recommended to use lossless compression for any media files on iPod. Failing this, it is recommended that compressed files utilise a minimum bitrate of 192 kb/s (a higher bitrate is strongly recommended for increased quality playback).

For media files delivered via [USB](#) or MP3 players, the highest compression rate supported is 320 kbits per second (kbps). If anything less than 128 kbps is used, Digital Signal Processing (DSP) functionality may be lost.

Some MP3 players may have a file system that is not supported by the IAM. To use an MP3 player, it must be set to [USB](#) Removable Device or Mass Storage Device mode. Only music that has been added to the device in this mode can be played.

AVIO Panel

The Audio Video Inout/Output (AVIO) panel is located at the rear of the floor console. The AVIO panel is only fitted to vehicles with RSE installed.

The panel contains one USB port, one 3.5mm jack plug and three Audio/Video (AV) plug sockets. The AVIO panel is connected directly to the Rear Seat Entertainment (RSE) module.

The AV sockets allow for the connection of video (yellow socket), right audio (red socket) and left audio (white socket) from a remote device such as a PlayStation™. The USB socket allows for the connection of a portable media device.

Aux Panel

The aux panel is located at the rear of the floor console. The aux panel contains one 3.5mm jack plug. If the vehicle is fitted with RSE the aux panel is replaced by the AVIO panel.

Steering Wheel Controls

E140298

Item Description

- 1 Volume increase
- 2 Mode switch
- 3 Seek up
- 4 Volume decrease
- 5 Seek down

The steering wheel mounted audio control switches are located on the left side of the steering wheel. The switches are a resistive ladder type which return a different voltage to the ICP in response to different switches being pressed.

The steering wheel audio switch controls the following functions:

- MODE - Press repeatedly to scroll through all audio/video sources.
- Short press up -
 - To select the next radio preset
 - To select the next track on chosen audio source
 - When telephone is in use, press to scroll up lists of calls or phonebook entries.
- Short press down -
 - To select the previous radio preset
 - To select the previous track or start of current track on chosen audio source
 - When telephone is in use, press to scroll down lists of calls or phonebook entries.
- With radio manual seek mode activated, further short presses will change the frequency in single increments. A further long press will scan forwards through the current waveband until the switch is released.
- Long press up -
 - To auto seek up the frequency to the next radio station.
- Long press down -
 - To auto seek down the frequency to the next radio station.
- Volume increase for any audio source
- Volume decrease for any audio source

Digital Audio Broadcasting (DAB)

DAB/DMB Receiver

E117338

Item Description

- 1 Power supply and ground connection
- 2 MOST bus connector
- 3 L-band and Band III antenna connection

DAB/DMB is a digital radio network designed to provide reliable, multi-service broadcasting for reception by mobile, portable and fixed receivers.

DAB/DMB provides a clear signal with minimal interference, hiss or fading. After a channel (or station) has been tuned and stored, it does not need retuning.

NOTE: Radio signals travel in a straight line so large obstacles, such as tall buildings, can shield the vehicle from the signal causing temporary loss of reception (known as dead spots).

Digital radio is transmitted from regional terrestrial transmitters. Local digital radio channels are not available outside the range of a transmitter. To receive new local channels during vehicle movement around a country, the auto-tune function is used to build new channel lists.

NOTE: When the vehicle DAB radio is first used the system will not receive any digital stations until the auto-tune function has been completed.

Digital radio channels are organized into groups called ensembles (also known as multiplexes). Some individual channels may also provide a number of subchannels. For example, if several sports events are being held simultaneously, the channel may temporarily choose to broadcast each different event on a separate subchannel.

DAB/DMB is broadcast across Europe, Canada and parts of Asia. System transmission is via a terrestrial network, on two separate broadcasting bands:

- DAB/DMB band-L
- DAB/DMB band III

The DAB/DMB system requires additional components to be added to the audio system. DAB/DMB antennas and a receiver are fitted to allow reception of the service.

Operation of the DAB/DMB system is the same as the radio operation with selections made through the TS and ICP to access and navigate the system functions.

The DAB/DMB receiver is a dedicated tuner which is controlled by the IAM on the MOST ring. The receiver processes the signals from the DAB/DMB antennas. Information is transmitted on the MOST ring and processed by the IAM. The processed information is sent out to the power and broadcast through the speaker system.

No configuration procedure is required if the DAB/DMB receiver is replaced. Calibration of the DAB/DMB receiver using Land Rover approved diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

Satellite Digital Audio Radio Service (SDARS)

SDARS Receiver

E139370

The SDARS systems operate in the S-Band frequency range (2.3 GHz) and, as a result of the use of satellite transmission have the ability to provide digital audio broadcasts over very large areas (typically continents). SDARS service providers transmit a signal from their up-link facility (which is the original point of transmission of data, voice or other information through an antenna system) to a satellite where the signal is then down linked to both the terrestrial repeater network and the individual SDARS car radios. The radio switches between the satellite signal and the repeater signal depending on the strength of the signal at any given time.

LandRover will be using the Sirius Satellite Radio service provider in the USA.

The SDARS systems comprise:

- Satellites
- Ground repeaters
- Up-link ground stations
- Radio receiver systems

The SDARS system uses three satellites on an inclined elliptical orbit. This ensures that each satellite spends approximately 16 hours a day over the continent of the USA, with at least one satellite over the country at any one time.

The satellites beam their signals down to the ground where the signal is picked up by receivers or is transmitted to repeater stations to cover built up areas where the signal is obscured.

SDARS is a subscription based service which requires the user to contact Sirius to obtain a subscription. In order to obtain a subscription the SDARS unit ID number will need to be retrieved from the unit. This is achieved as follows:

- When the vehicle first receives live signal within the US or Canada, the HLDf shall display ch184 as the tuned channel (labeled as Preview). The radio text shall display Call 1888-539-Sirius. Alternatively, when the radio is subscribed, unsubscribed channels shall also display this information in the radio text
- The ESN/SID can always be found the following way, no matter what the subscription status of the radio. Press **Settings** on the HLDf, then select **Sat Info** switch in the settings view. This shall display the ESN/SID and the phone number. If a cell phone is paired to the Bluetooth system, the user can select the green phone switch in the Sat info view to call the call center.

If no subscription has been taken, the HLDf will display the Sirius telephone number. To subscribe to Sirius use the displayed phone this number. The user will need payment details, the Sirius ID number and details of the required package.

The SDARS function is accessed by pressing the **SAT** switch. To toggle through the Sat bands, select the + switch next to the **SAT** switch. This shall list SAT 1, SAT 2, SAT 3. Select any of these to change Sat band.

The SDARS module is located in the rear right side of the luggage compartment. The SDARS module is connected to the rest of the audio system on the MOST ring. This allows control signals and received audio to be routed around the system to the relevant module. The SDARS antenna is located in the roof mounted pod. The antenna is hardwired to the SDARS module.

HD Radio™

HD Radio™ technology is a free digital radio format broadcast available in the NAS market and may become available for other markets in the future. HD Radio™ digital broadcasts are transmitted alongside the analogue AM and FM signals by stations broadcasting HD Radio™ signals. HD Radio™ technology has the ability to deliver improved sound quality and content to the listener, blending between analogue and a digital audio streams of the primary station and delivering extra multicast stations on the same frequency. The HD Radio receiver is integrated into the AM FM tuner on NAS variants of the IAM.

Audio Amplifier Module (AAM)

E139623

The audio system has two amplification options dependent on the audio system specified:

- Internal (Lo-Line system)
- Audio Amplifier Module (AAM) (Mid-line' High-line and Premium systems)

The AAM is located in the rear right quarter of luggage compartment. It is connected to the audio system via the MOST bus. Speaker connections are hardwired.

WhiteFire® Digital Wireless Headphones and Transmitter

E121826

Item Description

- 1 WhiteFire® digital wireless headphones
- 2 WhiteFire® digital infrared transmitter

Digital Wireless Headphones headphone system includes Dolby® headphone surround when listening to the DVD source. It is possible to install the vehicle with up to 2 sets of headphones. Each headset contains 2 AAA batteries.

NOTE: The headphones are connected to the AAM only (Mid-line, High-line and Premium systems).

The controls located on the earpiece include the power switch, volume control and channel browse switch. To select a different channel press the browse switch, conformation via an audible beep can then be heard followed by the audio transmission on that channel.

Antennas

Digital Audio Broadcasting and DAB/DMB L-Band/Satellite Digital Audio Radio Service (SDARS) Antenna

E96387

The DAB/DMB L-band/SDARS antenna is located in the roof pod and is shared with the navigation system Global Positioning Satellite (GPS) antenna where fitted.

The DAB/DMB III antenna is located in the leftrear side window

E140301

Item Description

- 1 TV4 antenna
- 2 AM/FM antenna
- 3 TV3 antenna
- 4 Right rear quarter glass
- 5 TV1 antenna
- 6 FM2/DAB/DMB III antenna
- 7 TV2
- 8 Left rear quarter glass

TV Tuner

E121834

The TV tuner is located below the front right seat. The TV tuner forms part of the entertainment system and is available on vehicles fitted with satellite navigation. The TV images can also be viewed on the RSE rear screens when fitted.

TV audio output is sent from the TV tuner on the MOST to the AAM.

Refer to: Video System (415-07 Video System, Description and Operation).

REAR SEAT ENTERTAINMENT (RSE)

RSE Module

E122295

The RSE system consists of the following components:

- Two 8" [LCD \(liquid crystal display\)](#) screens (mounted in the back of the front headrests)
- DVD video player (IAM)
- Rear AVIO panel connectivity
- RSE module
- Two headphone sets.

The fibre optic, Media Orientated System Transport (MOST) based system provides video and audio entertainment for the rear seat occupants. The RSE system provides control of a number of audio and video sources, channelling the output independently to the rear seat passengers via personal infrared digital wireless headphones and video screens or allows output over the main vehicle audio speaker system. The video images can also be displayed on the front Touch Screen Display if the vehicle is below a predetermined speed threshold (or dual view is selected by the passenger).

The video display screens mounted in rear of the front seat headrests can display video pictures from a number of sources and are controlled via the RSE remote control for the rear seat entertainment controls.

The RSE module is located in the right side of the luggage compartment and manages the request signals from the RSE remote control. The module is connected directly to both rear video displays via a medium speed [CAN](#) link. Video signals are communicated via the LVDS (Low Voltage Differential Signal) to one or both screens as requested.

The RSE module is connected directly to the following modules for the purpose of processing audio, video, input and output signals:

- TS - DVD video and TV to rear screens
- AAM - Process audio signals for output on vehicle speaker system or headphones
- TV Module - TV signals processed and passed to TS and rear screens
- AVIO panel - process audio and video signals from remote source.

Refer to: Video System (415-07 Video System, Description and Operation).

Information and Entertainment System - Digital Audio Module

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1.  **NOTE:** RH side only.

Refer to: Rear Quarter Trim Panel (501-05, Removal and Installation).

2. Torque: 9 Nm

Installation

1. To install, reverse the removal procedure.
2. Using the diagnostic tool, calibrate the component.

Antenna - Antenna

16	-	AM/FM antenna amplifier
17	-	GPS antenna
18	-	Beacon antenna - Japan only

SYSTEM OPERATION

The antenna systems fitted to the vehicle comprise:

- AM (glass mounted)
- FM (glass mounted)
- FM2 (glass mounted)
- DAB (glass mounted (Band 3) and within roof pod (L-Band))
- TV (glass mounted, where fitted)
- GPS antenna (rear spoiler mounted, where fitted)
- SDARS (roof pod mounted NAS only)
- VICS antenna and beacon antenna (Japan only where fitted)

COMPONENT DESCRIPTION

FM antenna amplifier

E152098

The AM/FM and FM2 antennas are located above the left and right rear quarter window glasses on all vehicles. The antenna amplifiers connect to the elements on the glass that make up the antenna structure. The FM system uses the combined signal output of both antenna amplifiers to give the best reception. The Traffic Message Channel (TMC) signals are received through the normal FM radio signals as part of the RDS sideband network.

GPS ANTENNA

The GPS antenna is located in the right side of the upper tailgate mounted spoiler. The GPS antenna is connected to the navigation module by a coaxial cable.

TV ANTENNA AMPLIFIER

Where a television system is specified there are four TV antenna elements two in each of the rear quarter window glasses. Each element has an antenna amplifier which is connected to the TV tuner module using a coaxial cable.

SATELLITE DIGITAL AUDIO RADIO SYSTEM (SDARS) ANTENNA (NAS ONLY)

The SDARS antenna and Dab L-Band antennas are mounted in the roof pod (where fitted). The antennas are connected to the SDARS module (NAS only, if fitted) or DAB module (if fitted) using coaxial cables.

VICS BEACON antenna - Japan only

The antenna comprises two separate antenna elements:

- A printed monopole antenna for receiving terrestrial microwave signals
- An Infra Red detector for receiving signals from fixed IR beacons

Antenna - Antenna

Removal and Installation

Removal

1. Remove the front door trim panel.
For additional information, refer to: Front Door Trim Panel (501-05, Removal and Installation).
2. Remove the front door speaker wiring harness.
3. Remove the front door speaker.
 - Remove the 4 screws.
 - Disconnect the electrical connector.

M865638

Installation

1. Install the front door speaker.
 - Connect the electrical connector.
 - Install the screws.
2. Install the front door speaker wiring harness.
3. Install the front door trim panel.
For additional information, refer to: Front Door Trim Panel (501-05, Removal and Installation).

Speakers - Rear Door Speaker

Removal and Installation

Removal

1. Remove the rear door trim panel.
For additional information, refer to: Rear Door Trim Panel (501-05, Removal and Installation).
2. Remove the speaker.
 - Disconnect the electrical connector.
 - Remove the 4 screws.

Installation

1. Install the speaker
 - Tighten the screws.
 - Connect the electrical connector.
2. Install the rear door trim panel.
For additional information, refer to: Rear Door Trim Panel (501-05, Removal and Installation).

Speakers - Instrument Panel Speaker

Removal and Installation

Removal

1. Remove the instrument panel speaker.
 - Remove the speaker grille.
 - Remove the 3 screws.
 - Disconnect the electrical connector.

E47228

Installation

1. To install, reverse the removal procedure.

Speakers - Quarter Panel Speaker

Removal and Installation

Removal

NOTE: The procedure to remove the quarter panel speaker is shown in the D-pillar trim panel procedure.

1. Remove the D-pillar trim panel.
For additional information, refer to: D-Pillar Trim Panel (501-05, Removal and Installation).

Installation

1. Install the D-pillar trim panel.
For additional information, refer to: D-Pillar Trim Panel (501-05, Removal and Installation).

Speakers - Tailgate Speaker

Removal and Installation

Removal

1. Remove the tailgate trim panel.
For additional information, refer to: Tailgate Trim Panel (501-05, Removal and Installation).

E46293

2. Remove the tailgate speaker assembly.
 - Remove the 10 Torx bolts.
 - Disconnect the 2 electrical connectors.

E46294

3.  **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the tailgate speaker.

- Remove the 6 bolts.

Installation

1. Install the tailgate speaker.
 - Tighten the bolts to 10 Nm (7 lb.ft).
2. Install the tailgate speaker assembly.
 - Connect the electrical connectors.
 - Tighten the Torx bolts to 10 Nm (7 lb.ft).
3. Install the tailgate trim panel.
For additional information, refer to: Tailgate Trim Panel (501-05, Removal and Installation).

OVERVIEW

The fiber optic, MOST (media orientated system transport) based system provides video and audio entertainment for the front and rear seat occupants. The system allows rear seat occupants to view [DVD \(digital versatile disc\)](#) video and [TV \(television\)](#) on two RSE (rear seat entertainment) screens, listen to audio output via the vehicle speakers or wireless headphones or display video images on the RSE screens from an external source, such as a video player or games console.

TV and DVD video images can also be displayed on the TS (touch screen) if the vehicle is below a predetermined speed threshold or has dual-view TS fitted (where market regulations allow).

The system comprises the following components:

- RSE control module.
- TV control module.
- Four TV Antennas.
- Four TV Antenna amplifiers.
- Two RSE screens.
- RSE remote control.
- Wireless headphones.
- AVIO panel.

The RSE system also uses other components which form part of the audio system as follows:

- TS (touch screen).
- IAM (integrated audio module).

For additional information, refer to: (415-01B Information and Entertainment System)

[Audio System](#) (Description and Operation),

DESCRIPTION

Touch Screen (TS)

E161428

The TS (touch screen) is located in the center of the instrument panel and is the driver control interface for the infotainment system. The TS comprises an 8 inch color, touch sensitive display. The TS is connected to the MOST (media oriented system transfer) ring and communicates with the other components in the audio/infotainment system.

The TS communicates with the RSE (rear seat entertainment) control module and TVCM (television control module) via MOST ring. CVBS (composite video baseband signal) is used to transmit video images from/to the RSE control module and TVCM.

The TS also provides driver display and control of the audio system, telephone, the rear view camera, proximity cameras, and the navigation system.

Two versions of the TS are available; single view and dual view.

Rear Seat Entertainment (RSE) Control Module

E141950

Item	Part Number	Description
1	-	Low Voltage Differential Signalling connector (LVDS) - video output to left Rear Seat Entertainment (RSE) screen
2	-	LVDS connector - video output to right RSE screen
3	-	Audio Visual Input/Output (AVIO) panel connector - Universal Serial Bus (USB) input
4	-	Connector - AVIO panel audio/video input, Medium Speed (MS) Controller Area Network

		(CAN) to RSE screens, RSE remote control data
5	-	Connector - 12V power supply to RSE screens, 12V power supply to RSE remote control docking station, power supply from Auxiliary Junction Box (AJB) and ground
6	-	Connector - Media Oriented System Transport (MOST)
7	-	CVBS connector - TV video output to Touch Screen (TS)/Video input from TS
8	-	Not used
9	-	Not used
10	-	LVDS connector - video input from TV control module

The RSE (rear seat entertainment) module is located in the rear right side of the luggage compartment.

The RSE control module manages the request signals from the RSE remote control, receives video and audio inputs from the IAM (integrated audio module), TVCM (television control module) and AVIO (audio visual input/output) panel and outputs TV video to the TS (touch screen) and RSE screens and audio to the AAM (audio amplifier module).

The RSE control module is connected directly to the following modules for the purpose of processing audio, video, input and output signals:

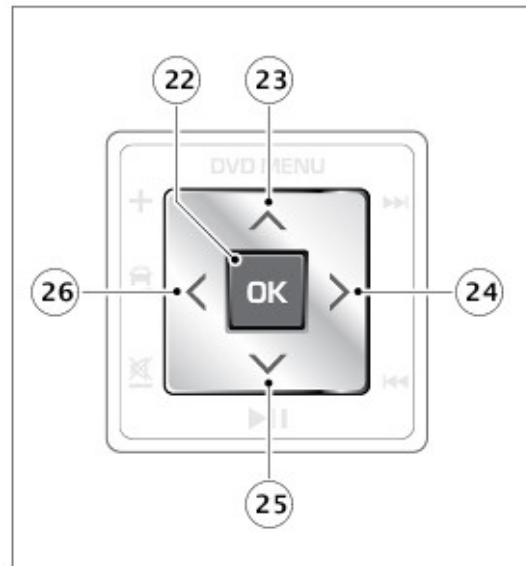

- TS - Connected via CVBS video - Processes DVD video from IAM to RSE screens.
- Audio amplifier module - Connected via MOST - Processes audio signals for output on vehicle speaker system or headphones.
- TVCM - Connected via LVDS (low voltage differential signalling) - TV signals are processed and passed to TS and RSE screens.
- Rear screens/RSE remote control - Connected to RSE screens via LVDS and MS (medium speed) [CAN \(controller area network\)](#) - Processes wireless infra-red signals.
- AVIO panel - Connected via audio/video/[USB \(universal serial bus\)](#) - Processes audio and video signals from remote source.

The RSE control module receives a permanent power supply via a fused connected from the [EJB \(engine junction box\)](#).

Rear Seat Entertainment (RSE) Remote Control

NOTE: To prevent accidental damage, always store the remote control in the stowage area provided when not in use.

22	-	Select
23	-	Cursor control: Up
24	-	Cursor control: Right
25	-	Cursor control: Down
26	-	Cursor control: Left

The RSE (rear seat entertainment) remote control is located in the rear seat center armrest.

The RSE remote control allows independent multimedia control for left and right rear seat passengers.

The RSE remote control is a has a number of switches to control the audio/video functions.

The RSE remote control allows selection of various entertainment system functions. When selected, activate menus displayed in the RSE screens mounted in the head restraints. The menus can be navigated using a five-way switch on the RSE remote control. For example, the user can select and press a soft key on the touch screen to activate a list of available radio stations in the RSE touch screen and then use the five-way switch to browse the list and select a radio station.

Rear Media Remote Control Battery

The RSE (rear seat entertainment) remote control is powered by 2 AAA batteries located inside the chrome cover. Low battery power is indicated by the remote control button flashing 3 times when pressed.

The RSE remote control transmits an infra-red digital signal in response to operation of a switch or soft key. The infra-red signal is received by a receiver sensor located on each RSE screen. The RSE remote control also allows selection of an auxiliary input from the AVIO panel (video or games console) or selection of audio (radio or [CD \(compact disc\)](#)).

The RSE remote control can be used to control functions including radio, CD/ DVD, plug-in audio devices, and TV (television), by displaying options in the TS (touch screen), which activate menus displayed on the RSE screens in the head restraint, which are navigated using the five-way switch on the RSE remote control. The RSE remote can also be used to activate the RSE screens without the need to use the TS (touch screen).

Infra-red transmission takes place between the RSE remote control and the RSE screens. User requests are passed onto the RSE control module to be processed via the MS (medium speed) [CAN bus](#).

Television Control Module (TVCM)

Item	Part Number	Description
1	-	Connectors - Antennas
2	-	Composite Video Baseband Signal (CVBS) connector - to Touch Screen (TS)
3	-	Low-Voltage Differential Signalling (LVDS) connector - to Rear Seat Entertainment (RSE) control module
4	-	Connector - Media Oriented System Transport (MOST)
5	-	Connector - power from AJB (auxiliary junction box) and ground

The TVCM (television control module) is located under the right side front seat. The TVCM is connected to the infotainment system using one harness connector, one LVDS (low-voltage differential signalling) connector (for RSE (rear seat entertainment) vehicles), one single FACRA connector for CVBS (composite video baseband signal) connection to the TS (touch screen) (non RSE vehicles), one MOST (media oriented system transfer) connector and two dual FACRA connectors for the antenna connections.

The RSE video output is passed from the TVCM on LVDS to the RSE control module and from the RSE control module on CVBS to the TS. On a vehicle with RSE fitted the CVBS output from the TVCM is not used.

The front seat occupants can view the TV transmissions on the TS if the vehicle is stationary (market dependent). If the vehicle is fitted with a dual view TS then the front passenger can view the TV transmissions even when the vehicle is moving, but the driver will only be able to watch TV transmissions (or video) when stationary. This can vary depending on local market laws. When the RSE system is fitted, the TVCM allows the rear seat occupants to view television transmissions on the RSE screens.

Due to analogue transmissions Worldwide being switched off, Land Rover are introducing more TVCM to support the numerous digital TV standards that are being implemented. To ensure that analogue and digital transmissions are received in all markets, three types of TV control module are available. The type of TVCM fitted is dependant on which digital standard is supported in different markets (if at all).

- Digital Hybrid TVCM - this TV control module supports digital DVB-T standard (MPEG2 only) and analogue TV transmissions. This TVCM is only fitted to markets that still have significant analogue broadcasts and minor digital coverage or to vehicles in markets that still have significant analogue broadcasts and where Land Rover do not currently have a TVCM that supports the digital TV standard in that market. This TV control module requires the use of a link lead that combines the power/ground and CVBS output into one connector that mates with the connectors on this type of module.
- DVB-T TVCM - this TVCM is digital only (no analogue tuner) and supports both MPEG2 and MPEG4 digital compression standards. This TVCM is fitted in any market that has significant DVB-T coverage (most of Europe and some of the rest of the World).
- ISDB-T TVCM - this TVCM is for the Japanese and Brazilian markets and receives ISDB-T digital broadcasts only (no analogue). This TVCM uses the same connections as the DVB-T TVCM as above, the only difference is the software. The Japanese variety also has a slot for a conditional access card between the antenna and CVBS connectors (annotation 1 & 2 on the TVCM picture above).
- DTMB & CMMB TVCM – this TVCM is for the Chinese market only and receives both DTMB & CMMB (CMMB mode is especially for mobile reception. It has a lower bit rate hence lower resolution. This modulation standard is more robust and is therefore able to offer greater coverage). It also uses the same connections as the DVB-T TVCM above.

The TVCM is connected on the MOST ring which it uses to output its audio signals to the AAM (audio amplifier module). Video output from the TVCM is on an LVDS cable to the RSE control module or a CVBS screened co-axial cable to the TS in vehicles without the RSE system. Four further connections provide for the signal input from four TV antenna amplifiers which are in turn attached to four antennas in the rear quarter windows. For additional information, refer to: [Antenna](#) (415-02 Antenna, Description and Operation).

The TVCM contains four internal tuners; all of the tuners are connected to the antennas. The tuners receive the RF (radio frequency) modulated audio and video signals. The tuner, or combination of tuners with the strongest signal, are automatically used to display the required TV channel (Japan and Brazil Only).

One of the internal tuners is always used to scan the locality for receivable channels (background scanning). The tuner can detect different frequencies transmitting the same channel and can select the strongest signal for use.

In certain areas signal strengths will vary. When in an area of weak reception, a break-up in picture and sound quality, or a blank screen or frozen picture and audio muting may occur. Dependant on the type of TVCM fitted, it may be of benefit to switch between analogue and digital TV stations.

The main advantage of digital TV reception is the improved picture quality. Four TV antennas are located in the rear quarter windows. In the event of a loss of digital reception, a 'loss of reception' message is displayed. The TV system also has a programme diversity function as well as antenna diversity that allows the current tuned programme to be maintained as the vehicle passes through regions with different transmitters broadcasting on different frequencies. This function only occurs where the reception data for the presently tuned channel matches the data of the new signal.

The system offers a choice of aspect ratios, between 4:3, 16:9 and zoom. The zoom ratio will always try to fill the screen and avoid the black bars/squashed image. For digital signals the broadcaster will usually send the correct format for the transmitted programme and this will remove one of the incorrect formats from the screen (4:3 or 16:9). The "Zoom" option is always available and will always be selected as the default format. If the format is unknown (typical for analogue) then all three format options will be displayed. The TS offers picture quality using a resolution of 800x480 pixels for single view and 400x480 pixels for dual view.

TV Control Module - Japan

Japanese market vehicles are fitted with a TVCM unique to that market. The control module has a slot to allow a B-CAS (BS Conditional Access Systems Co., Ltd.) card to be inserted. All digital TV's in Japan (home systems included) require a conditional B-CAS access card. This card decrypts the TV broadcast signal to allow it to be displayed as all broadcasts in Japan are encrypted. Without this card there will be no picture or audio.

B-CAS (BS conditional access systems co.,Ltd.) is a vendor and operator of the ISDB (integrated services digital broadcasting) CAS system in Japan. All ISDB receiving apparatus requires a B-CAS card under regulation, the B-CAS card is supplied as the standard accessory in Japan.

ISDB is a Japanese standard for digital television and digital radio used by the country's radio and television stations.

TV Antennas

TV antennas are located in the rear side windows. Refer to the Antennas section.

For additional information, refer to: [Antenna](#) (415-02 Antenna, Description and Operation).

Wireless Headphones

E141953

Item	Part Number	Description
1	-	Headphones transmitter
2	-	Wireless headphones

The headphones transmitter is located in the roof headliner near the front overhead console assembly.

The headphones transmitter transmits audio output for reception by the wireless headphones for the front and rear seat passengers. The headphone transmitter is connected to the AAM (audio amplifier module) via a LVDS (low voltage differential signal) plug connector. Audio data is relayed to the headphone transmitter from the AAM via the LVDS line. The AAM also supplies the power and ground for the headphones transmitter. The audio signal, is then passed on to the wireless headphones via a Whitefire® digital infra-red signal to any seating position within the interior of the vehicle. The digital signal means that each headphone user is able to listen to a different audio source.

NOTE: Providing an audio source is directed to the headphones transmitter, faint red lights can be seen behind the smoked glass cover of the transmitter. This can be useful for diagnosis to prove audio infra-red transmission is active.

The headphone system includes Dolby® headphone surround sound when listening to the DVD source.

NOTE: There is no docking station to store the wireless headphones, therefore charging of the batteries is not supported via the vehicle electrical system.

The system can support up to three pairs of wireless headphones. When a dual-view screen is fitted, the front passenger can listen to TV/DVD (digital versatile disc) and when RSE (rear seat entertainment) screens are fitted, rear passengers can listen to selected source on RSE screen. The headphones have an adjustable headband which operates on a ratchet mechanism.

The left side and the right side of the wireless headphone houses the infra-red receiver sensors which receive the transmitted signals from the headphones transmitter. Two AAA batteries are located below a sliding cover. When inserting the batteries it is important that the battery polarity is observed as marked in the battery compartment.

The right side of the wireless headphone houses the volume control, a channel switch and a power 'ON' LED (light emitting diode). The channel switch allows the user to select alternative audio channels (rear left/right, dual-view

audio source) when active. The power 'ON' LED is illuminated when the on/off switch on the right side of the wireless headphone is operated. The LED will remain on and the wireless headphones powered until the switch is operated for a second time. If the wireless headphones have not received an infra-red signal from the headphones transmitter for several minutes, they will automatically switch off to prevent battery drain.

Rear Seat Entertainment (RSE) Screens

E135724

The RSE (rear seat entertainment) screens are located in the rear of the front seat head restraints. The screen is secured in the head restraint with one screw and 2 metal clips which are covered by a removable surround. The screen is an 8 inch, auto dimming (selectable via RSE remote control settings), 800X480 resolution TFT (thin film transistor) monitor.

An infrared receiver sensor is located centrally in the bottom portion of the screen surround. The sensor receives infrared transmissions from the RSE remote control and passes them to the RSE control module on a CAN bus system which is only connected between the RSE control module and the RSE screens. The RSE control module can then transmit any relevant messages onto the MOST (media oriented system transport) ring. All screen settings can only be changed using the RSE Screen.

The screen should be cleaned with a lightly, water moistened cloth. Do not use chemical agents or domestic products to clean the screen or any part of the surround.

Each RSE screen is connected to the RSE control module using a 12 pin harness connector and 2 pin LVDS video connector.

Portable Audio Interface Panel

E161429

Item	Part Number	Description
1	-	3.5mm jack plug - MP3 connection
2	-	Universal Serial Bus (USB) connector

The portable audio interface panel is located in the glovebox and is fitted to all audio systems. The interface contains one USB port and a 3.5mm jack plug connector.

The portable audio interface panel is connected to the vehicle with two harness connectors. The harness connector from the USB ports has gold plated pins.

Devices that can be connected to the portable audio interface panel include:

- USB mass storage devices (for example a memory stick). Devices must use FAT or FAT32 file format.
- iPod® (iPod Classic, iPod touch, iPhone and iPod Nano are supported - full functionality for older devices cannot be guaranteed). iPod Shuffle functionality cannot be guaranteed.
- Auxiliary device (personal audio, MP3 players).

- Devices with Bluetooth® connectivity. Devices must support A2DP and AVRCP Bluetooth® protocols).

Audio Visual Input/Output (AVIO) Panel

Item	Part Number	Description
1	-	Universal Serial Bus (USB)
2	-	Yellow socket - Composite video input
3	-	White socket - Left audio input
4	-	Red socket - Right audio input

The AVIO (audio visual input/output) panel is located at the rear of the floor console.

The panel provides for the connection of auxiliary audio and video inputs from an external source, such as a games console, via three AV sockets on the panel.

The sockets are connected to the RSE (rear seat entertainment) control module and allow the auxiliary input video to be played on the RSE screens and the audio to be played on the vehicle speakers or on the wireless headphones. The auxiliary input video cannot be displayed on the TS (touch screen).

The single **USB** plug allows for the attachment of an USB input, such as iPod®/iPhone®, an MP3 player or a USB memory stick. This plug is connected directly to the RSE control module and allows audio to be selectable on the RSE screens and played on the wireless headphones or through the vehicle speakers. It will also allow standard definition Div X video files to be played from a USB memory stick.

The AVIO panel is connected to the RSE control module using a single 20 pin harness connector.

OPERATION

Television

The television system has various levels of user control through the TS (touch screen), the ICP (integrated control panel) and the left steering wheel switchpack. The system includes 6 analogue and 12 digital channel pre-sets. As with the audio system, the user can tune up or down through the channels and store a channel by a long press of the selected preset button. The system offers a choice of screen aspect ratios.

For the digital bands, the options available on the TS are the correct aspect ratio for the broadcast and "zoom" which will fit the picture to the screen (no black bands). For analogue TV all aspect ratio options will be available including 16:9, 4:3 and zoom. Two antennas are used because the system is dynamic and each one is connected to an individual tuner. The TV control module evaluates which antenna has the strongest signal and will use a combination of antennas to generate the TV image and sound. At any point in time the TV control module is using either one or two of the antennas and it's tuners to scan the TV frequencies and generate an up to date channel list.

The television system is primarily controlled from the TS and the ICP which are located in the center of the instrument panel and also the left steering wheel switchpack. Control signals from the TS are sent on the MOST (media oriented system transport) ring to the TVCM (television control module). The TVCM uses a dedicated CVBS (composite video baseband signal) bus to transmit video signals to the TS. Where RSE is fitted, the TV can also be controlled using the RSE remote control and the video output will be delivered to the RSE control module via an LVDS (low voltage differential signalling) video link. The TV video feed is then forwarded on to the TS from the RSE control module via a CVBS output.

Control signals from the ICP and the left steering wheel switchpack are relayed on the MS (medium speed) **CAN** bus to the TS. The TS relays the control signals to the TVCM on the MOST ring. The TS is the bus master for the MOST ring and also hosts a gateway function between the MS CAN bus and the MOST ring.

The TVCM audio output signals are sent on the MOST ring to the AAM (audio amplifier module) for speaker output.

Rear Seat Entertainment (RSE)

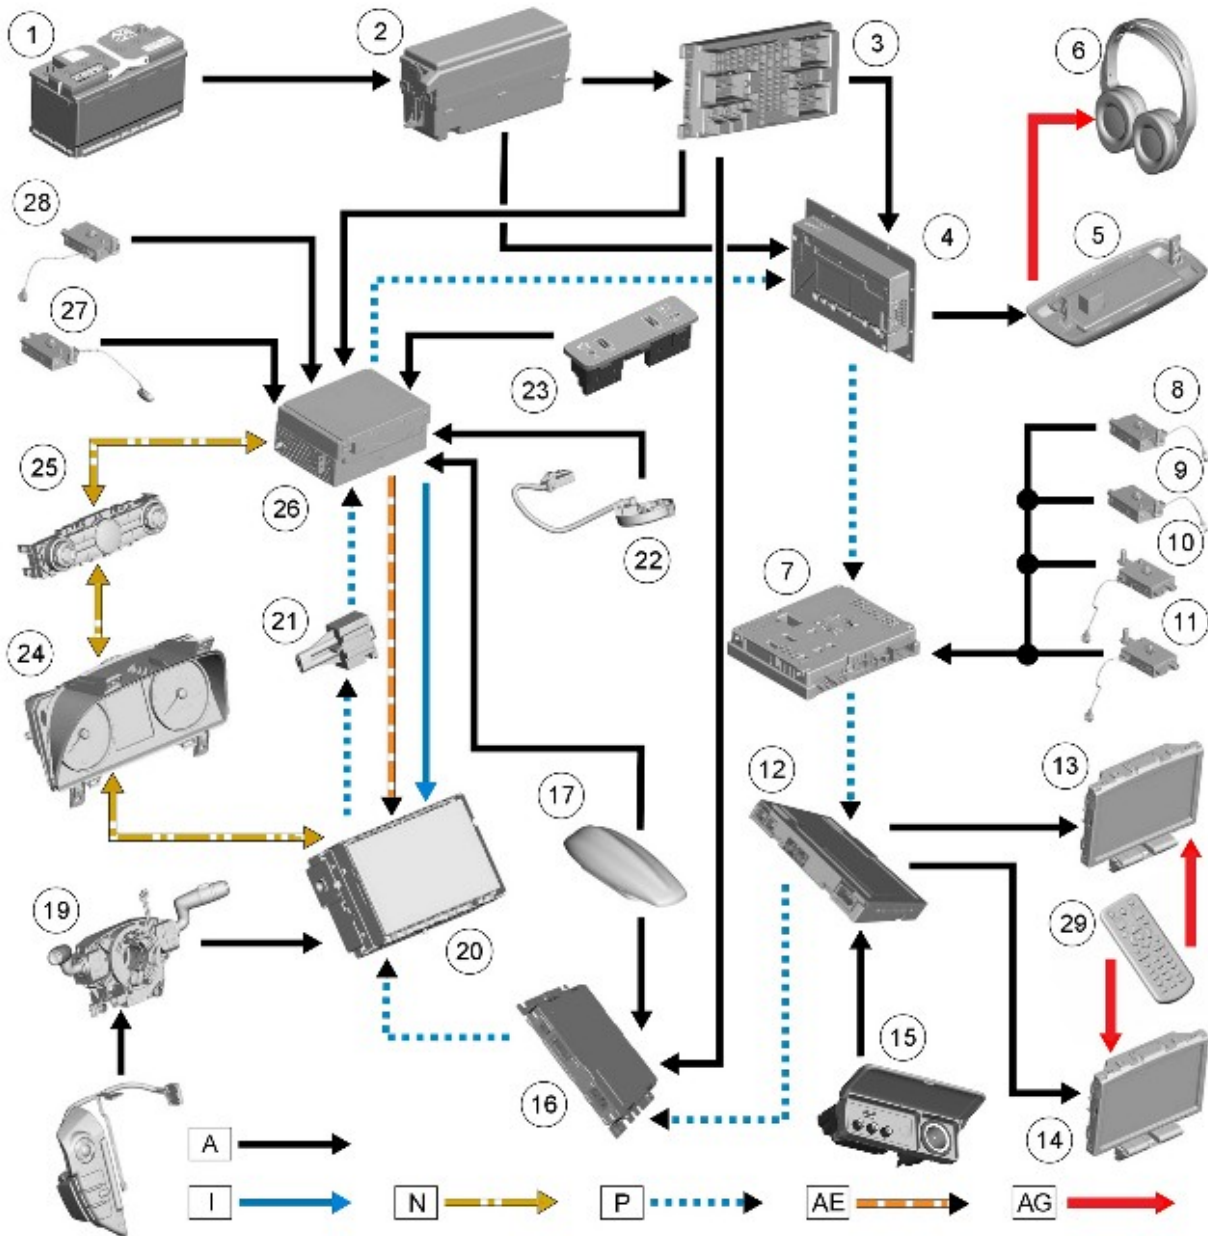

The RSE (rear seat entertainment) control module is connected directly to both rear RSE screens via a MS (medium speed) **CAN** bus and a LVDS (low-voltage differential signaling) connection. Infra-red signals from the RSE remote control are received by the RSE screens and user requests are communicated via a MS CAN link to the RSE control module. Video signals are communicated via the LVDS to one or both screens as requested.

The RSE control module communicates with the audio system via the MOST connection. Audio input from the AVIO (audio video input/output) panel is processed by the RSE control module and passed on the MOST ring to the AAM (audio amplifier module) to allow audio output to be played on the vehicle speakers or on the wireless headphones.

Video input from the TVCM (television control module) and the AVIO panel is also processed by the RSE control module and passed to the two RSE screens. The TV Video is also passed to the TS (touch screens) on separate video connection. The RSE control module also controls the power supplies to the RSE screens and relays the infra-red RSE remote control signals received by the RSE screen infra-red sensors. The infra-red signals are passed from the RSE screens to the RSE control module on a local CAN bus system. The navigation system route can also be displayed on the RSE screens

A time limit operation is active when the ignition is off and the vehicle is unlocked (Power mode 4) and the system is manually switched on using the TS. The system will operate for a maximum of ten minutes. The battery voltage is continually monitored by the IAM (integrated audio module). If the IAM detects that the battery voltage has fallen to a predetermined level, the IAM will shut the infotainment system down to prevent further battery drain. Once the system has shut down due to low battery voltage, it can only be restarted when the engine is running and the battery voltage has risen above the threshold level for more than one minute.

Video System - Video System

Diagnosis and Testing

Principle of Operation

For a detailed description of the video system and operation, refer to the relevant Diagnosis and Testing section of the workshop manual. REFER to: Video System (415-07 Video System, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> • Touch Screen (TS) installation and condition • Rear Seat Entertainment (RSE) screen installation and condition • Digital Versatile Disc (DVD) multi-changer installation and condition • Television antennae (two in each rear side window) 	<ul style="list-style-type: none"> • Fuses • Electrical harnesses • Fibre optic cable harnesses • Infotainment relay • Display screens • DVD multi-changer • TV Control Module (TVCM) • Rear Seat Entertainment Control Module (RSECM) • Television antenna amplifiers (4) • Remote control and batteries

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
The DVD does not operate	<ul style="list-style-type: none"> • DVD multi-changer fuse blown • No power to display screens • Condensation 	<ul style="list-style-type: none"> • Refer to the electrical circuit diagrams and test the DVD power circuit for short circuit to ground • Refer to the electrical circuit diagrams and test the DVD player power and ground circuits for open circuit, high resistance • Wait at least one hour for the condensation to dry out
Remote control operation is unstable	<ul style="list-style-type: none"> • Handset batteries low on power • Remote control receiver sensor or transmitter is dirty 	<ul style="list-style-type: none"> • Check and renew the batteries as necessary • Check and clean the receiver and transmitter as necessary
There is no picture	<ul style="list-style-type: none"> • The display screen is set to an incorrect mode 	<ul style="list-style-type: none"> • Use the switch on the back of the handset to select the correct mode

Removal and Installation

Removal

1. Remove the RH rear quarter trim panel.
For additional information, refer to: Loadspace Trim Panel RH (501-05, Removal and Installation).

2. Release the rear quarter trim panel mounting bracket.
 - Remove the 2 screws.

3. Remove the rear quarter trim panel mounting bracket.
 - Release the 2 clips.

4.  **CAUTION:** Make sure that the fiber optic cables are not bent to a radius of less than 25 mm.

Release the rear seat entertainment module.

- Remove the 3 nuts. TORQUE: 10 Nm
- Position aside.

E114548

5. Release the DVD player from the body.
 - Remove the 4 Torx bolts.

E114549

6. CAUTIONS:

 Make sure that the fiber optic cables are not bent to a radius of less than 25 mm.

 Make sure that the optical connectors are clean and free of foreign material.

Remove the DVD player.

- Disconnect the 3 electrical connectors.

E114550

7. Remove the DVD player mounting bracket.
 - Remove the 8 screws.

E114551

Installation

1. To install, reverse the removal procedure.

15	-	Stop lamp switch
16	-	Adaptive Front lighting System (AFS) control module

Overview

Three types of headlamp are available; Halogen, Xenon or Xenon with Adaptive Front lighting System (AFS). The headlamps share a common, clear lens.

The headlamps are located behind the front carrier assembly. Each headlamp is secured to the front carrier assembly with two locking plates. The locking plate slides in grooves in the rear of the headlamp and two holes in each plate locate on pins on the carrier. Each locking plate is pressed down to lock the pins in the locking plate holes. The locking plates allow removal of the headlamp from the carrier for bulb changing without the requirement for special tools.

The rear of the headlamp unit has removable access panels which allow access to the bulbs for replacement. A large rubber cover allows access to the low/high beam bulb on both halogen and xenon headlamps. Another removable rubber cover provides access to the high beam only halogen bulb which is retained by a push fit. A smaller cover can also be rotated anti-clockwise to provide access to the turn signal indicator lamp bulb. The indicator bulb is a PH24WY orange bulb and is clipped into the cover and is pulled to remove. Below this cover is a removable cover which provides access to the side lamp bulb on halogen headlamps or the cornering lamp/static bending lamp bulb on xenon headlamps and the side marker lamp bulb on NAS models. On xenon headlamps the side lamps are LED's and therefore are not serviceable components.

The headlamps have two adjustment screws on the rear which allow for the manual setting of the vertical and horizontal alignment. On NAS vehicles the headlamp is regarded as Visual Optically Left (VOL) aiming. The adjustment screws have to be turned equal amounts to maintain the correlation in the vertical axis only. There is no horizontal adjustment. Refer to the Service Repair Procedures manual for headlamp alignment data.

Each headlamp has an integral sixteen pin connector which provides inputs and outputs for the various functions of the headlamp assembly. The usage of the pins differs between model variants, refer to the Electrical Reference Library (ERL) for pin details.

The low beam headlamps are switched on when the ignition is in ignition mode 6 and:

- the lighting control switch is in the headlamp position
- the lighting control switch is in the AUTO position and a 'lights on' signal is received by the CJB from the rain/light sensor.

The low beam headlamps can also be operated by the headlamp delay feature.

The high beam headlamps are switched on when the ignition is in ignition mode 6 and:

- the low beam headlamps are selected on in the headlamp position or activated via the AUTO feature
- The left steering column multifunction switch is pushed forward away from the driver
- The auto high beam system (if fitted) has switched on the high beam headlamps.

The high beam headlamps will be switched off when:

- The left steering column multifunction switch is moved rearward towards the driver
- The low beam headlamps are switched off
- The ignition mode is changed to the accessory mode 4 or ignition off
- The AHB system (if fitted) has switched off the high beam headlamps.

GENERAL

The exterior lighting system comprises the following exterior lamps:

- Front and rear side lamps
- License plate lamps
- Side marker lamps (if fitted)
- Front and rear turn signal indicator lamps
- Side turn signal indicator lamps
- Stoplamps and high mounted stop lamp
- Reversing lamps
- Rear fog lamps
- Front fog lamps (if fitted)
- Cornering/Static bending lamps (if fitted) - All except NAS
- Low and high beam headlamps.

Exterior Bulb Type/Rating and LED Table

The following table shows the bulbs/LED's used for the exterior lighting system and their type and specification (where applicable).

Bulb	Type	Rating
Halogen Headlamps - Low beam	Halogen H7	55W
Xenon headlamps - Low/High Beam	Xenon D3S	35W
Headlamps - High Beam	Halogen H7	55W
Front fog lamps	Halogen H11	55W
Rear fog lamps	Bayonet P21	21W
Turn signal indicator lamps - Front	PY24W	24W
Side repeater turn signal indicator lamps	Capless W5W	5W
Turn signal indicator lamps - Rear	12 LED's	-
Side lamps - Front - High specification Halogen and Xenon headlamps	10 LED's	-
Side lamps - Front - Base Specification Halogen headlamps only	Capless W5W	5W
Stop lamps	12 LED's	-
Side lamps - Rear	12 LED's (each side lamp)	-
High mounted stop lamp	LED's	-
License plate lamps	Capless W5W	5W
Reverse lamps	Bayonet P21	21W
Cornering lamp/Static bending lamp	Halogen H8	35W
NAS - Side marker lamp - Front	Capless W3W	3W
NAS - Side marker lamp - Rear	Capless W5W Rear	5W

The bulbs and the Light Emitting Diode (LED)'s are driven by Metal Oxide Semiconductor Field Effect Transistors (MOSFET's) within the Central Electronics Module (CEM) which is an integral component of the Central Junction Box (CJB). An exception to this is the front and rear position lamps, front fog lamps and the reversing lamps which are supplied with power via relays within the CJB and are protected by conventional fuses.

CENTRAL JUNCTION BOX

The CJB is located behind the glovebox compartment and is connected to the vehicle wiring harness with 8 multiplugs.

The CJB receives four permanent battery power supplies via the Battery Junction Box (BJB).

The lighting circuits are not all protected by conventional fuses as some are protected by MOSFET's. The control circuitry within the CJB for each individual circuit can detect and isolate a problem circuit.

Failure of a lamp is not notified to the driver. If a turn signal indicator fails the turn signal warning indicator in the IC will flash at double speed.

Input Signals for Lamp Control

The CJB receives inputs from the following switches:

- Lighting control switch for side lamps, headlamps and auto headlamps (if fitted)
- Momentary push switches for front and rear fog lamps
- Left steering column multifunction switch for turn signal indicators and high beam/headlamp flash and Auto High Beam system
- Brake pedal switch
- Momentary push switch for hazard warning.

The switches are supplied with a 10mA supply from the CJB and switch to ground when operated. The CJB detects that a switch has been operated (ON) when its closing resistance is less than 100 Ohm and is detected as OFF when its resistance is more than 10K Ohm.

The lighting control switch uses a binary system which is detected by the CJB which determines the selected position. The output from the lighting control switch is shown in the following table:

Switch State	Switch 1	Switch 2
Off	1	1
Side lamps	1	0
Headlamps	0	0
Auto headlamps	0	1

The CJB also receives ignition status via hard wired connections from the stop/start switch.

A reverse gear engaged signal is also received on the high speed Controller Area Network (CAN) bus from the Transmission Control Module (TCM) to enable the CJB to activate the reverse lamps.

The CJB can receive a hazard warning indicator activation message from the Restraints Control Module (RCM), via the high speed CAN bus, in the event of a crash. The CJB can also activate the hazard warning indicators to signify vehicle locking to the driver.

On vehicles with Auto High Beam (AHB), the auto high beam control module outputs signals on the medium speed CAN bus to the CJB to control the high beam headlamps. Power for the auto high beam control module is supplied via a relay located in the EJB.

Circuit Protection

Operation of the lamps is performed using overload proof Metal Oxide Semiconductor Field Effect Transistors (MOSFETs). The MOSFETs can detect overload, load interruption with the lamps switched on and short circuit to positive with the lamps switched off.

The MOSFETs are protected against short circuits, removing the requirement for the lamps circuits to be protected by fuses. The MOSFETs respond to heat generated by increased current flow caused by a short circuit. Normally this would cause the fuse to blow. The MOSFETs react to the heat increase and cut the supply to the affected circuit. Once the fault has been rectified or the MOSFET has cooled, the MOSFET will automatically reset and operate the circuit normally.

If an overload occurs, the current flow is dependant on the temperature of the related MOSFET and can be up to 20 times the rated current of the lamp. The MOSFET heats up and deactivates the load applied to the circuit. When the MOSFET cools the circuit is once again reactivated. This thermal cycling occurs continuously in the event of an overload occurring.

A number of lamps are controlled by relays and these circuits are protected by conventional fuses.

Bulb Monitoring

Bulb failure monitoring is performed by the CJB processor. The lamps are cold and warm monitored by the MOSFETs in order to detect bulb failure.

NOTE: Relay controlled lamps have no diagnostic monitoring.

The CJB processor provides outputs to each MOSFET. The output switches the MOSFET to supply the required output to power the applicable lighting circuit. The microprocessor evaluates the circuits by detecting the returned signals from the controlling MOSFET.

When the bulb or LED is functioning normally, the output signal voltage from the controlling MOSFET is 0V. If a bulb or LED in the circuit fails, an open circuit occurs and the MOSFET outputs a signal of 5V to the processor. The signal is interpreted as a bulb or LED failure and generates a Diagnostic Trouble Code (DTC) which can be retrieved using an approved Land Rover diagnostic system.

Warm monitoring is performed continuously when the lights are switched on by evaluating the diagnostic output of the MOSFET switches. Cold monitoring is performed at 32 second intervals when the lights are switched off. The MOSFETs briefly switch on the lights for approximately 1 millisecond (this is insufficient to illuminate the bulb or LED) and checks the bulb or LED as per warm monitoring.

Cold monitoring is not possible for the low/high beam headlamps of vehicles using xenon bulbs. On these vehicles the cold monitoring of the low/high beam headlamps is switched off in the CJB. The CJB detects a failed xenon bulb via a reduction in current flow to the affected headlamp's xenon control module.

When a xenon bulb fails, the control module's current consumption falls to 60mA, which the CJB detects as unsuccessful bulb illumination.

Alarm Indications

The CJB can also display alarm visual indications for alarm arm, disarm and triggered conditions.

If the hazard warning lamps are active when a lock or unlock request is made, the hazard warning cycle is interrupted to allow the visual indication of the requested lock cycle. When visual indication is completed, the hazard warning operation will continue.

If the vehicle is involved in crash of a severity for the RCM to initiate deployment of the airbags, the control module outputs a hazard warning lamps on request on the medium speed CAN bus to the CJB. The hazard warning lamps will be activated and will continue until the RCM outputs a message to deactivate the hazard warning lamps.

Redundant Data Storage

The CJB stores data relating to the Vehicle Identification Number (VIN), total mileage and service interval indicator. This data is received by the CJB from the IC and used as a back-up in the event of IC replacement.

If the CJB is to be replaced, an approved Land Rover diagnostic system must be connected to the vehicle and the CJB replacement procedure followed to ensure that the stored data is transferred to the new unit.

Low Voltage Operation

If the battery voltage falls below 11.2V, the CJB operates the minimum lighting to preserve the remaining battery charge.

Crash Signal Activation

In the event of an accident of a severity to activate and deploy the airbags, the RCM requests various electrical operations to assist with the crash situation. The RCM requests via the bus systems to the CJB to activate the hazard warning lamps.

Security System Activation

In the event of the security system being triggered, the CJB requests activation of the hazard warning lamps.

Instrument Panel and Switch Illumination Dimming

The CJB controls the IC backlighting illumination and also illumination of all instrument panel switches.

The CJB supplies a power output to all switch illumination bulbs at a voltage determined by the position of the manual dimmer rheostat. The switch illumination is activated when the lighting control switch is in the side lamp or headlamp position.

LIGHTING CONTROL SWITCH

The lighting control switch is located in the driver's side of the instrument panel, below the outer fresh air vent. The switch contains a rotary switch for selecting the vehicle exterior lighting functions, a rheostat for instrument illumination dimmer, a front fog lamp switch and a rear fog lamp switch.

E121549

Item	Part Number	Description
1	-	Lighting rotary control switch
2	-	OFF position
3	-	Side lamps position
4	-	Headlamps position
5	-	Instrument illumination dimmer control
6	-	Manual headlamp leveling control
7	-	Rear fog lamp switch
8	-	Front fog lamp switch
9	-	Auto headlamps position

The rotary side and headlamp control switch has 2 connections to the CJB. These 2 connections supply a hardwired binary code to the CJB which correspond to the switch position selection made.

The front and rear fog lamp switches operate by completing earth paths for a reference voltage from the CJB when the switch is pressed. The fog lamp switches are momentary, non-latching switches which briefly complete an earth path which is sensed by the CJB.

Lighting Control Switch Illumination

The switch legends on the lighting control switch are illuminated at the same brightness as the instrument panel switches when the lighting control switch is moved from the 'O' (off) position to the side, headlamp or AUTO position.

Manual Headlamp Leveling Control (if fitted)

The manual headlamp leveling control is only available on vehicles with coil spring suspension and is used to lower the headlamps when an excessive load is placed on the rear of the vehicle, altering the vehicle attitude and raising the headlamp beam.

The control uses a rotary thumbwheel which is connected to a rheostat which gives a variable output to the leveling Direct Current (DC) motors. The motors respond to the output and move to adjust the headlamp position as required.

The control has three marked positions; 0 to 3. The rotary wheel moves in 6, half positions to give fine adjustment control over the headlamp position. The positions relate to vehicle loading or driving conditions as follows: Position 0

is the normal position for unladen driving. Positions 1 to 3 lower the headlamp beam to compensate for a drop in height of the rear of the vehicle.

- 0 = Driver only or driver and front seat passenger
- 0.5 = Driver, front seat passenger
- 1 = All seats occupied
- 1.5 = All seats occupied and maximum rear axle loading
- 2 = Driver only and maximum rear axle loading
- 3 = Can be used under certain driving conditions, i.e. off-road

Dimmer Control

The CJB provides a Pulse Width Modulation (PWM) output to control the illumination brightness of the instrument panel and other fascia illumination. The dimmer switch operates using a rotary thumbwheel which is connected to a rheostat.

The rheostat is a variable resistor which provides a high or low resistance according to its set position. The CJB provides an output to the rheostat measure the voltage passing through to ground. The CJB measures this voltage and uses it to calculate a PWM output of between 8 and 12V to determine the brightness of the illumination.

Automatic Headlamps

Refer to Automatic Headlamps in this section.

HEADLAMP ASSEMBLY

E121550

Item	Part Number	Description
1	-	Low beam headlamp
2	-	Turn signal indicator lamp

3	-	Side marker lamp (NAS only)
4	-	Side lamp (base specification halogen headlamps only), cornering lamp (Xenon headlamps) or cornering/static bending lamp (AFS headlamps)
5	-	Side lamp LED's (high specification halogen and xenon headlamps only)
6	-	High beam halogen 'fill-in' headlamp
7	-	Locking plate
8	-	Low beam halogen bulb (halogen headlamps) or xenon bulb (xenon headlamps)
9	-	Vertical adjuster
10	-	Waterproof breather
11	-	High beam 'fill-in' lamp bulb
12	-	Headlamp Leveling Control Module (HLCM)
13	-	Electrical connector
14	-	Horizontal adjuster
15	-	Side lamp or cornering/static bending lamp cover (hidden)
16	-	Turn signal indicator lamp access cover (hidden)

Common Headlamp Features

Turn Signal Indicator Lamp

The turn signal indicator lamp is incorporated into the outer part of the headlamp assembly. The lamp is located above the side lamp on halogen headlamps and the static bending/cornering lamp on Xenon headlamps. The turn signal indicator lamp uses an PH24W orange colored bulb module. The module is fitted into a holder which is connected via contacts on the headlamp housing to the main connector in the headlamp housing. The module is a snap fit in the holder and needs to be pulled sharply to remove. The holder is fitted with a seal and is located into an aperture in the headlamp housing and rotated to lock into position. Access to the holder requires removal of the headlamp from the front carrier assembly and removal of the outer locking plate from the headlamp.

The turn signal indicator lamps are operated by the left steering column multifunction switch or by the hazard flasher switch. The steering column multifunction switch is only active with the ignition in ignition mode 6, the hazard flasher switch is active at all times. When active, the turn signal indicator lamps will flash at a frequency cycle of 400ms on and 400ms off.

If a bulb fails, the remaining turn signal indicator lamps bulbs continue to flash at normal speed. The turn signal indicators in the IC will flash at double speed to indicate the failure to the driver.

Side Lamp - Base Specification Halogen Headlamps

The side lamp is incorporated into the outer part of the headlamp assembly and is located below the turn signal indicator lamp.

The side lamp uses a capless W5W wedge fitting bulb which locates into a holder which is connected via wires to the main connector on the headlamp housing. The holder is a push fit into a receptacle in the headlamp housing. The bulb is accessible via a removable cover at the rear of the headlamp housing. Access to the cover requires removal of the headlamp from the front carrier assembly and removal of the outer locking plate from the headlamp.

The side lamps are operated by selecting side lamps or headlamps on the lighting control switch. The side lamps are operational at all times and are not dependant on the ignition switch position. The side lamps will also be illuminated when the lighting control switch is in the AUTO position and a 'lights on' signal is received by the CJB from the rain/light sensor.

Side Lamp - High Specification Halogen and Xenon Headlamps

The side lamps on halogen headlamps (except for base specification models) and on all Xenon headlamps are LED's. The 10 LED's are arranged around the outer part of the halogen fill-in lamp and the xenon projector module.

The side lamps are operated by selecting side lamps or headlamps on the lighting control switch. The side lamps are operational at all times and are not dependant on the ignition switch position. The side lamps will also be illuminated when the lighting control switch is in the AUTO position and a 'lights on' signal is received by the CJB from the rain/light sensor.

Cornering Lamp - Xenon (non-AFS headlamps only)

NOTE: The cornering lamps are not fitted to NAS market vehicles

The cornering lamps are an optional feature designed to illuminate the direction of travel when cornering at low speeds. The design of the lens projects a spread of light from the vehicle at approximately 45 degrees to the vehicle axis.

The cornering lamp is incorporated into the outer part of the headlamp assembly and shares the same housing and reflector as the side lamp.

The cornering lamp uses a 35W Halogen H8 bulb which locates in a holder which is connected on the headlamp housing. The holder is located in an aperture in the headlamp housing and rotated to lock. The bulb is accessible via a removable cover at the rear of the headlamp housing.

The cornering lamps are controlled by the left steering column multifunction switch with the lighting control switch in the headlamp position and the ignition in ignition power mode 6. The cornering lamps are supplied power via the ignition circuit to ensure that they do not function with the headlamp delay feature. The cornering lamps are deactivated if the vehicle speed exceeds 25 mph (40 km/h).

Only one cornering lamp will illuminate at any one time. If the left turn signal indicators are selected on, the left cornering lamp will be illuminated and visa versa, providing the vehicle speed and lighting control switch positions are correct. Cornering lamps are disabled when reverse gear is selected.

Cornering/Static Bending Lamps (Xenon AFS headlamps only)

NOTE: The cornering/static bending lamps are not fitted to NAS market vehicles

The cornering/static bending lamps are a standard feature on AFS headlamps designed to illuminate the direction of travel when cornering at low speeds. The design of the lens projects a spread of light from the vehicle at approximately 45 degrees to the vehicle axis. The static bending lamps are powered by the CJB and controlled by the AFS control module. The cornering lamp functionality is controlled by the CJB as described for non-AFS headlamps.

The cornering lamp and static bending lamp is incorporated into the outer part of the headlamp assembly.

The cornering/static bending lamp uses a 35W Halogen H8 bulb which locates in a holder which is connected via wires to the main connector on the headlamp housing. The holder is located in an aperture in the headlamp housing and rotated to lock. The bulb is accessible via a removable cover at the rear of the headlamp housing.

AFS Control

On headlamps with AFS, the cornering lamp function is as described previously for the Xenon non-AFS headlamps.

The static bending lamps operate with a steering angle sensor signal which is received by the AFS control module. The AFS control module sends a static bending lamp on request to the CJB which activates the static bending lamp bulb.

The static bending lamp operation is variable with the speed of the vehicle and the steering wheel angle. The static bending lamps illuminate at 0 mph (0 km/h) when the steering wheel rotation reaches 20 degrees. At 43 mph (70 km/h) the static bending lamps will illuminate when the steering wheel angle reaches 10 degrees. The static bending lamps will be switched off when the vehicle speed exceeds 43 mph (70 km/h).

The operation of the static bending lamps is controlled by the AFS control module. When the operation parameters of the lamp are reached, the CJB fades the static bending lamp bulb on using a PWM voltage over a period of approximately 2 seconds. When the lamp is switched off, the CJB fades the bulb off by decreasing the PWM voltage.

Halogen Headlamps

The halogen headlamps use a projector module for the low beam headlamp and a complex surface reflector for the halogen high beam lamp. The low and high beam bulbs are quartz halogen H7, with a rating of 55W. The bulbs are retained in the headlamp unit with conventional wire retaining clips.

The projector module comprises a reflector, the lens and the halogen bulb. The projector module only operates as a low beam halogen headlamp.

The high beam lamp reflector is divided into separate parabolic segments, with each segment having a different focal length.

The halogen headlamp uses a side lamp bulb which is located in the position used by the cornering/static bending lamp on xenon headlamps. The lens pattern for the side lamp in this position differs from the lens pattern used for the cornering/static bending lamp.

The halogen headlamps do not require adhesive decals to be applied to the clear outer lens to mask the beam cut-off when driving in opposite drive hand markets. A tourist lever mechanism is located on the right side of the projector module. This mechanism moves to blank off a portion of the beam spread to enable the vehicle to be driven in opposite drive hand markets without applying blanking decals to the headlamp lens. The beam is changed by removing the access cover at the rear of the lamp assembly and moving a small lever located near the bulb holder, at the side of the projector module. Make sure that the headlamps are off before removing the access cover.

CAUTION: This lever can be very hot if the lamps have been operating. Allow sufficient time to cool before operating the lever.

Xenon Headlamps

Safety Precautions

WARNING: The Xenon system generates up to 28000 volts and contact with this voltage could lead to fatality. Make sure that the headlamps are switched off before working on the system.

The following safety precautions must be followed when working on the xenon headlamp system:

- **DO NOT** attempt any procedures on the xenon headlamps when the lights are switched on.
- Handling of the D3S Xenon bulb must be performed using suitable protective equipment, e.g. gloves and goggles. The glass part of the bulb must not be touched.
- Only operate the lamp in a mounted condition in the reflector.

The xenon headlamps use a complex surface reflector for the Halogen fill in high beam lamp only lighting unit, which is of the same design as the high beam unit used on the Halogen headlamps. This type of reflector has the reflector divided into separate parabolic segments, with each segment having a different focal length.

The high beam bulbs are quartz halogen H7, with a rating of 55W. The bulbs are retained in the headlamp unit with conventional wire retaining clips.

The Bi-Xenon™ (the Bi-Xenon™ trademark is the property of Hella KGaA Hueck & Co., Germany) projector module headlamp operates as both low beam and high beam headlamp unit. The Xenon lamp (or High Intensity Discharge (HID) lamp), comprises an ellipsoidal lens with a solenoid controlled shutter to change the beam output from low to high beam. The bulb is retained with a locking ring which must be rotated to facilitate removal of the D3S bulb.

NOTE: If the lighting control switch is in the OFF position, the xenon lamps do not operate when the high beam 'flash' function is operated. If the lighting switch is in the headlamps position or AUTO position with the low beam lamps active, the xenon low beam will remain on when the high beam 'flash' function is operated.

The xenon headlamp system is controlled by the CJB using a control module for each headlamp and an igniter. The control modules and the igniters provide the regulated power supply required to illuminate the xenon bulbs through their start-up phases of operation.

Xenon/Halogen Headlamp Beam Comparison

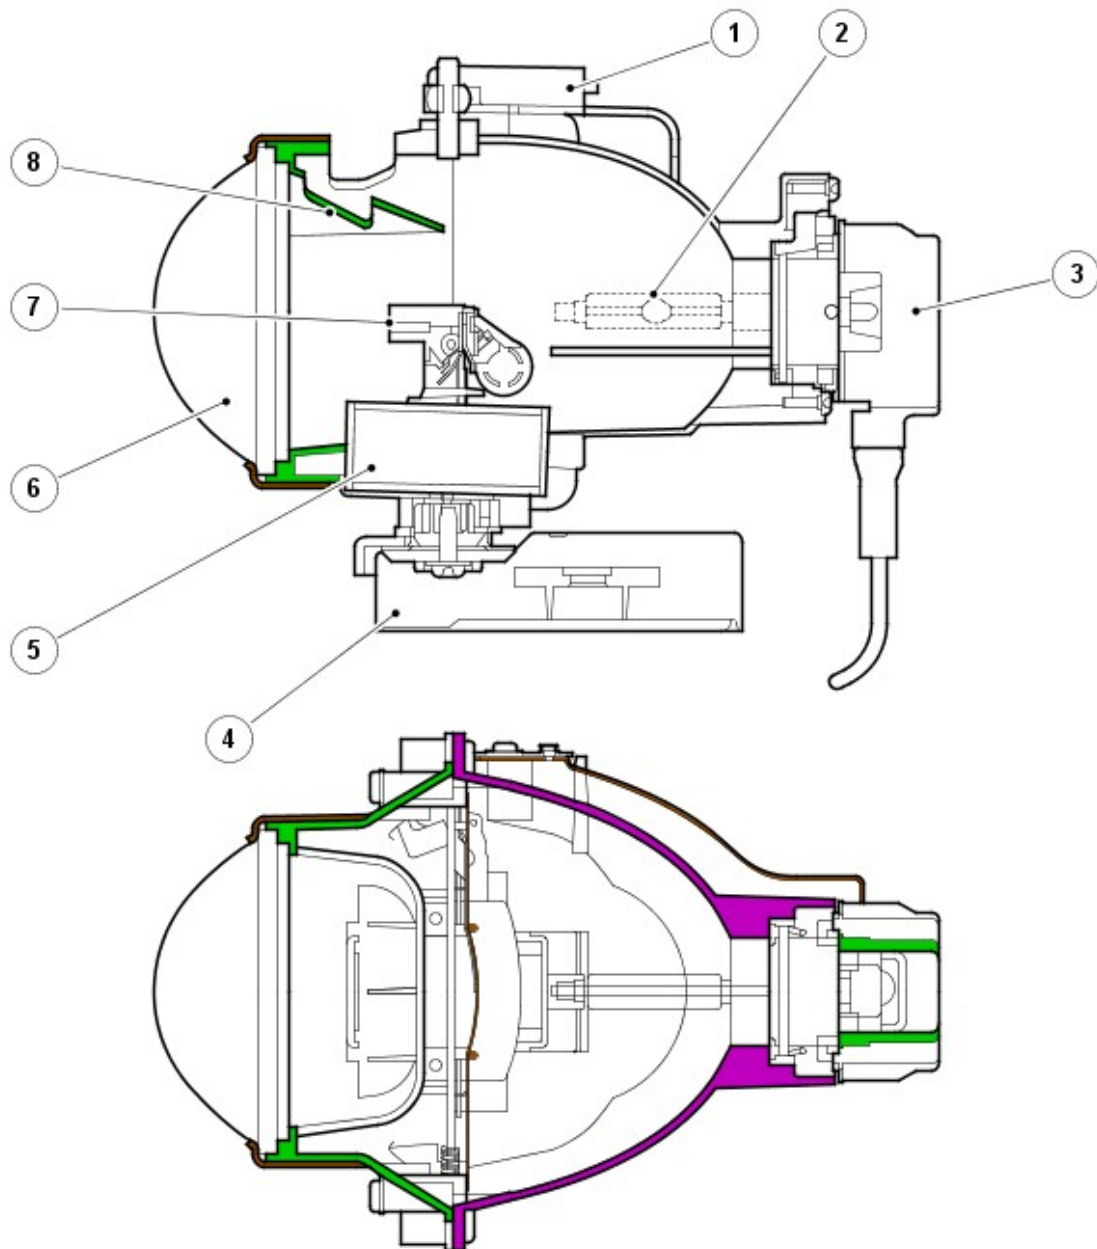

Item	Part Number	Description
A	-	Xenon
B	-	Halogen

The Xenon low/high beam headlamps use ellipsoidal technology for the lens and reflector providing improved night time visibility compared to conventional halogen headlamps. The Xenon headlamps provide the following benefits when compared to halogen headlamps:

- Longer bulb life - Approximately 3 to 5 times longer than a halogen bulb
- Increased light output - Xenon headlamps output 3 to 4 times more light on the road surface than halogen headlamps
- Blue/White light which is closer to natural daylight - Xenon lamps produce a blue/white light compared to a yellow light produced by a halogen bulb
- Improved night time driving visibility - Xenon lamps produce a wider and brighter beam in front of the vehicle than conventional halogen bulbs
- Lower running temperatures
- Lower power consumption
- Mercury free.

Xenon Headlamp Construction

E43261

Item	Part Number	Description
1	-	Bracket
2	-	D3S xenon bulb
3	-	D3S connector
4	-	Swivel actuator (AFS lamp only)
5	-	Solenoid
6	-	Aspheric lens
7	-	Shade
8	-	Shade
9	-	Lens support

The Xenon headlamp is a self contained unit located within the headlamp assembly. The unit comprises a reflector, an adaptor ring, the lens, a shutter controller and the Xenon 35W D3S bulb, which as an assembly is known as the projector module.

The reflector is curved and provides the mounting for the xenon bulb. The bulb locates in a keyway to ensure correct alignment in the reflector and is secured by rotating a locking ring on the projector module to lock. The bulb has a pin connector which is a push to lock fitting.

The shutter controller is a solenoid which operates the shutter via a lever mechanism. The shutter is used to change the beam projection from low beam to high beam and visa versa.

A tourist lever mechanism is located on the right side of the projector module. This mechanism moves to blank off a portion of the beam spread to enable the vehicle to be driven in opposite drive hand markets without applying blanking decals to the headlamp lens. The beam is changed by removing the access cover at the rear of the lamp assembly and moving a small lever located near the bulb holder, at the side of the projector module. Make sure that the headlamps are off before removing the access cover.

The Xenon bulbs illuminate when an arc of electrical current is established between two electrodes within the bulb. The xenon gas sealed in the bulb reacts to the electrical excitation and the heat generated by the current flow. The xenon gas reaction to the controlled current flow between the electrodes produces the blue/white light.

To operate at full efficiency, the xenon bulb goes through three stages of operation before full output for continuous operation is achieved. The three phases are; start-up phase, warm-up phase and continuous phase.

In the start-up phase, the bulb requires an initial high voltage starting pulse of 18000 to 28000 volts to establish the arc. This is produced by the igniters. The warm-up phase begins once the arc is established. The Xenon control modules regulate the supply to the bulbs to 2.6A which gives a lamp output of 75W. During this phase, the Xenon gas begins to illuminate brightly and the environment within the bulb stabilizes ensuring a continual current flow between the electrodes. When the warm-up phase is complete, the xenon control modules change to continuous phase. The supply voltage to the bulb is reduced and the operating power required for continual operation is reduced to 35W.

The Xenon system is controlled by the CJB, the two xenon control modules and the two igniters. The xenon control modules (one per headlamp) receive an operating voltage from the CJB when the headlamps are switched on. The modules regulate the power supply required through the phases of start-up.

The igniters (one per headlamp) generate the initial high voltage required to establish the arc. The igniters have integral coils which generate high voltage pulses required for start-up. Once the xenon bulbs are operating, the igniters provide a closed circuit for regulated power supply from the control modules.

ADAPTIVE FRONT LIGHTING SYSTEM (AFS)

The AFS is a system to improve driver visibility under differing driving conditions. AFS provides a larger visible area which is illuminated when cornering by adjusting the position of the beam distribution on the road. Horizontal adjustment is made automatically to the most suitable orientation for the driving conditions using steering angle and information from other vehicle sensors.

AFS is only available with adaptive Bi-Xenon™ headlamps. The 'Xenon' module within the headlamp is controlled by actuator motors which rotate the projector module on its horizontal axis to adjust the beam output to suit the cornering conditions and vehicle inclination. Only the adaptive bi-xenon™ lamp projector module swivels, the non adaptive xenon and halogen high beam lamp units remains static.

The AFS system is controlled by an AFS control module which is located at the bottom of the passenger side 'A' pillar. The control module controls the horizontal alignment of the adaptive Bi-Xenon™ projector module. The operation of the static bending lamp is controlled by the AFS control module, but powered by the CJB.

AFS Concept

E43466

Item	Part Number	Description
A	-	Conventional headlamp beam distribution
B	-	AFS swivel headlamp beam distribution

AFS Control Module

The AFS control module is connected to the high speed CAN bus and receives inputs from other vehicle systems on the status of the following parameters:

- Steering angle - from steering angle sensor
- Vehicle speed - from ABS module
- Low beam status - from IC
- Suspension height - from air suspension control module
- Odometer value - for diagnostics only
- Engine running - from ECM
- Gear position - From transmission control module or transfer box control module
- Engine crank - from ECM
- Exterior/interior temperature - for diagnostics only.

The AFS will only operate when the AFS control module receives an engine running signal on the CAN bus. When the engine running signal is received, the AFS control module performs an initialization routine which is only performed at engine crank (power mode 9).

The AFS will also function when the lighting control switch is in the AUTO position and the AFS control module receives a lights on signal from the rain/light sensor and an engine running signal.

The AFS control module then monitors the inputs from the other vehicle systems to control the AFS functionality according to cornering angles and vehicle speed.

The AFS control module is connected to each headlamp on a private Local Interconnect Network (LIN) bus. The AFS control module then drives the DC motor actuators inside the headlamp assembly.

The AFS control module controls the swiveling angle of each projector module using speed and steering angle signals. The angles of each projector module differ to give the correct spread of light, For example, when turning left, the left projector module will have a greater swiveling angle than the right projector module

Reverse mode disables the swivel function when reverse gear is selected. The AFS projector modules move to their central straight ahead position and the static bending lamp, if active, will go off. When reverse gear is deselected, the AFS projector modules will move to a position to match the steering angle and the static bending lamp will illuminate if the operating conditions are correct (for example vehicle speed above 1.86 mph (3 km/h)).

Xenon Headlamp Assembly with AFS Construction

The AFS xenon headlamp construction is similar to the non-AFS xenon headlamp assembly. The AFS assembly contains an additional carrier frame which provides the location for the AFS components. The remaining lamps are as described previously for the Xenon headlamp assembly. The functionality of the static bending lamp on the AFS headlamp is different from the functionality of the cornering lamp on the xenon headlamp.

The carrier frame has a radial bearing at the top and a thrust washer at the bottom which provide the horizontal pivot points for the xenon projector module. The lamp module lower pivot has a splined end which locates in the mating splines of the AFS horizontal actuator motor. The carrier frame is suspended on two flexible mountings at the top which provide for the vertical pivot points for the xenon projector module which allow for the vertical adjustment of the projector module. The bottom of the carrier frame is attached to the AFS vertical actuator motor.

The AFS actuator motors are dc motors which are driven by a power output from the CJB in response to signals from the AFS control module.

The actuators contain a potentiometer which is connected via wires with gold plated connector pins to the AFS control module. The two wires to each actuator provide a feedback signal to the AFS control module to give the precise position of the xenon projector module.

The AFS control module receives vehicle speed signals from the ABS module to adjust the projector module vertically to increase the beam range as the vehicle speed increases.

Initialization

When the AFS control module receives an engine running signal, the control module performs the initialisation procedure which ensures that the headlamps are correctly aligned on their horizontal axis.

The AFS swivel initialization is completed in less than 1 second. The left and right AFS motors flick the headlamps to calibrate the centre position of the headlamps.

Failure Mode

In the event of a failure of the AFS system, a warning indicator in the IC is illuminated to warn the driver. The AFS warning indicator illuminates when the ignition is in accessory power mode 4 or ignition power mode 6 and will flash continuously until the fault is rectified. The AFS warning indicator will also be illuminated if a failure of the steering angle sensor or the vehicle speed signal is detected.

Illumination of the AFS warning indicator does not necessarily mean that there is a fault with the AFS system. The fault may be caused by a failure of another system preventing the AFS system operating correctly.

The AFS control module performs a diagnostic routine every time AFS is requested. If any fault is found, the AFS control module will suspend the operation of the AFS function.

If the AFS system has failed with the xenon projector module in a position other than the correct straight ahead position, the AFS control module will attempt to drive the xenon projector module to the zero (straight ahead) position. If this is not possible, the AFS control module will lower the projector module using the leveling actuator motors to prevent excess glare to oncoming vehicles.

The AFS control module software can detect an internal failure of the control module control circuits. The control module will power the projector modules to the zero position and prevent further operation.

Faults can be investigated by interrogating the AFS control module using an approved Land Rover diagnostic system to check for fault codes.

AUTOMATIC HEADLAMP OPERATION

The automatic headlamp function is a driver assistance system. The driver can override the system operation by selection of side lamp or headlamp on if the ambient light conditions require front and rear lighting to be active. The automatic headlamp system uses a light sensor and the CJB, which are connected via the LIN bus to control the headlamp functionality.

A light sensor is incorporated in the rain/light sensor located on the inside of the windshield, below the rear view mirror. The wiper system also uses the rain/light sensor for automatic wiper operation.

For additional information, refer to: Wipers and Washers (501-16, Description and Operation).

The light sensor measures the ambient light around the vehicle in a vertical direction and also the angular light level from the front of the vehicle. The rain/light sensor uses vehicle speed signals, wiper switch position and the park position of the front wipers to control the system.

The automatic headlamp operation uses ambient light levels which are monitored by photodiode incorporated in the rain/light sensor. The rain/light sensor sends a lights on/off request to the CJB on the LIN bus, which responds by switching on the low beam headlamps, front side lamps and rear tail lamps.

The automatic headlamps are activated under the following conditions:

- Twilight
- Darkness
- Rain
- Snow
- Tunnels
- Underground or multistoried car parks.

Operation of the automatic headlamps requires the ignition to be in ignition mode 6, the lighting control switch to be in the 'AUTO' position and a lights on request signal from the light sensor.

HEADLAMP LEVELING

Headlamp leveling provides for the adjustment of the vertical aim of the headlamps. The leveling system is primarily required to minimise glare to other road users when a heavy load is in the rear of the vehicle.

Two systems of headlamp leveling are available; manual and static.

Manual Headlamp Leveling

Manual headlamp leveling is only available on vehicles with halogen headlamps and coil spring suspension.

The manual system comprises the following components:

- Two headlamp leveling motors
- Headlamp leveling rheostat rotary control.

When the ignition is in ignition mode 6, power is supplied to the lighting control switch via the ignition relay in the battery junction box and to the headlamp leveling motor in each headlamp assembly via the CJB. When the lighting control rotary switch is moved to the side lamp or headlamp position, the supply from the ignition relay is passed to the leveling rotary control.

Movement of the leveling rotary control produces a variable voltage output, which is sensed by the motors. The motors react to the supplied voltage and move the headlamp to the requested position which relates to the supplied voltage from the leveling rotary control.

The headlamps can only be lowered from their unladen position to compensate for changes in vehicle attitude due to loading.

Vehicle Headlamp Leveling

Vehicle headlamp leveling is only available on vehicles with air suspension.

Vehicle headlamp leveling is performed by the air suspension system and the air suspension control module. The suspension system constantly monitors the vehicle attitude and adjusts the height of the front and/or rear of the vehicle accordingly. This maintains the correct vehicle attitude and consequently maintains the correct headlamp beam alignment.

The vehicle leveling system is fully automatic, therefore the lighting control switch does not have the manual leveling rotary control.

HIGH BEAM ASSIST

E117701

Item	Part Number	Description
1	-	Rear view mirror calibration bracket
2	-	Ambient light sensor (High beam assist)
3	-	Rain/light sensor (Auto headlamps)
4	-	Image sensor
5	-	Auto High Beam Control Module (AHBCM)

High beam assist is a driving aid which automatically controls the high beam function. If required, the system can be overridden by the driver.

CAUTION: The high beam assist system is designed as a driving aid only. Should the road conditions require, it is the driver's responsibility to consider other road users and operate the high beam headlamps in a safe manner. In certain circumstances the driver will be required to intervene.

High Beam Assist Warning Indicator

E117699

Item	Part Number	Description
1	-	Warning indicator (green)

The high beam assist system is controlled by a high beam assist control module which is located in the interior rear view mirror body and by the CJB. The module and the CJB are connected via the medium speed CAN bus.

The high beam assist control module receives a power supply from the CJB when the ignition is in power mode 6 (ignition on). The rear view mirror also includes a low resolution camera (image) sensor which detects headlamps and tail lamps of preceding vehicles. The sensor is connected to the control module which evaluates the image data, checking for light intensity and location.

If conditions are correct, the control module will activate the high beam assist by sending a high or low beam request message to the CJB via the medium speed CAN bus. The CJB then controls the shutter in the Xenon projector module

together with the high beam fill-in lamp.

High Beam Assist Operation

The high beam assist operates as part of the automatic headlight system. When driving at night with the lighting control switch in the automatic position and the left steering column multifunction switch in the central position, with sufficient darkness (approximately 1 lux or less) and a suitable road speed, the high beam assist will automatically operate the high beam lighting when necessary. A warning symbol in the IC confirms to the driver when the high beam assist system is selected and enabled.

NOTES:

The function of the normal 'blue' high beam indicator remains unchanged and it always reflects the actual status of the high beam lamps

The exterior lighting 'on' threshold for the auto headlamps system is approximately 100 lux which is measured by the rain/light sensor. At light levels below this value the low beam headlamps and exterior lights will be switched on. The high beam assist will not function until the light level has reached approximately 1 lux. At light levels above 1 lux high beam is not required and therefore is not activated.

Activation (system ready)

High beam assist will only activate and illuminate the warning indicator to show system is ready or 'primed' for high beam control, when the following conditions are met:

- High beam assist has been first 'enabled' via the IC menu
- Lighting control switch is in the 'Auto' position
- Left steering column multifunction switch in the central position
- The ambient light level is below 100 lux – refer to 'Light Levels' section that follows
- The system has not been overridden or cancelled – refer to 'Override' section that follows
- The camera (image) sensor view is not blocked.

High Beam Control

When activated, high beam assist will switch the headlamps to high beam when all the following conditions occur:

- No relevant oncoming traffic
- No relevant preceding traffic
- In non-urban environment, i.e. with no street lighting
- Ambient light level is below 1 lux – refer to 'Light Levels' section that follows
- Road speed is suitable – refer to 'Road Speed' section that follows.

Low Beam Control

When activated, high beam assist will switch the headlamps to low beam when any of the following conditions occur:

- Relevant Oncoming traffic is present
- Relevant Preceding traffic is present
- In urban environment, i.e. with street lighting
- Ambient light level is above 1 lux – refer to 'Light Levels' section that follows
- Road speed is not suitable – refer to 'Road Speed' section that follows
- Unrecognisable reflective inputs from road signs or markings – refer to 'System Limitations' section that follows.

Light Levels

The exterior lighting 'on' threshold for the normal 'auto headlamps' feature is approximately 100 lux and is measured by the windscreen mounted 'rain/light' sensor. When the light level falls to this value the low beam headlamps and exterior lights will be switched on together with the high beam assist warning indicator.

This warns the driver that the system is activated and ready to automatically switch on the high beam headlamps when the light level falls a little further to approximately 1 lux, as measured by the 'ambient light sensor' located in the mirror body. High beam is generally not required with light levels above 1 lux.

Road Speed

A road speed signal is received by the CJB from the Anti-lock Braking System (ABS) module via the high speed CAN bus. When the other activation conditions are correct, the CJB will switch the headlamps to high beam when the road speed has increased above 40 km/h (25 mph).

When the road speed falls to below 24 km/h (15mph), the CJB will switch the headlamps to low beam. The 10 mph (15 km/h) difference between the on and off road speed thresholds prevents the system continually switching between high and low beam at low speeds.

Override

The driver can manually override the high beam assist system at any time. When the high beam assist system is activated, pulling the left steering column multifunction switch to the high beam 'flash' position or pushing it forward to the high beam position will de-activate the system and the high beam assist warning indicator in the IC will extinguish.

When the multifunction switch is returned to the central position, from a forward high beam position, the system is re-activated and the high beam assist warning indicator will illuminate again.

Correct Performance

In addition, high beam assist will only exhibit best performance if all of the following conditions are met:

- No false inputs are received by the camera (image) sensor, such as reflected light from certain static signs – refer to 'System Limitations' section that follows
- Headlamps are correctly aligned
- High beam assist system has been set for correct 'hand of traffic' via the driver menu settings – refer to 'Setting Hand of Traffic' section that follows
- Headlamps have been set for correct 'hand of traffic' via the mechanical tourist lever in headlamp casing – refer to 'Setting Hand of Traffic' section that follows
- Camera (image) sensor has been through a self learning 'auto aim' calibration procedure if any components have been replaced – refer to 'Calibration' section that follows
- There are no large reflective items, white papers, etc., sitting on top of the dash board in near view of the camera (image) sensor, or stickers placed directly in front of the camera (image) sensor

Driver Menu Features

The high beam assist feature must first be enabled using the configuration menu available in the IC. However if required, the high beam assist system can be permanently disabled leaving the basic 'Auto Lamps' system still operative.

Within this menu the system can also be configured for driving on the alternate side of the road (Hand of Traffic). This enables the system to be used in different regions and it's setting is important for correct operation.

Setting 'Hand of Traffic' and High Beam Assist 'Enable'

To set the high beam assist options the following steps must be sequenced:

- With the ignition in power mode 6 (ignition on), and the engine not running, use the controls on the steering wheel to select on the IC menu:
 - Menu > Vehicle Set-up > High Beam Assist
- Configure the 'Hand of Traffic' setting by selecting the appropriate 'Drive on Left' (of road) or 'Drive on Right' (of road) to the applicable Market condition
- Enable the feature by setting 'Activate Assist' if not already selected.

NOTES:

Enabling or disabling high beam assist will not affect the 'Hand of Traffic' settings once set.

The headlamps still require manual adjustment using the tourist lever for driving abroad in countries where the alternate side of the road is used.

The IC menu also includes a 'High Beam Assist Sensitivity' selection. This is a requirement option for NAS market vehicles only but it is not recommended for normal use and has been superseded.

NOTE: In other markets the 'Sensitivity' selection is greyed out and cannot be selected.

For additional information, refer to: Instrument Cluster (413-01, Description and Operation).

System Limitations

The high beam assist system can occasionally have difficulty distinguishing between light from other vehicles or reflected light from static highly reflective road signs.

These situations may cause the high beam assist system to undesirably operate the high beam headlamps or take no action at all. Examples of these situations are as follows:

- Dips, hollows or crests in the road
- Highly reflective static Road signs
- Tight bends
- Poorly illuminated vehicles e.g. cyclists or small mopeds
- Motorway central barriers
- Extreme weather conditions e.g. Fog, heavy snow
- Exterior domestic or industrial lighting

Reflective Static Signs

E117702

Item	Part Number	Description
1	-	Red reflective signs could be detected as rear tail lamps
2	-	Large reflective signs could affect the system

Manual Deactivation

E117703

Item	Part Number	Description
1	-	Vehicle equipped with high beam assist
2	-	Oncoming vehicle headlamps can be seen by the driver before the high beam assist image sensor detects the oncoming light input

There are situations when a driver is able to judge if a high beam deactivation is desirable before the high beam assist system actually operates, for example over a crest of a hill. Headlamps from an oncoming vehicle can sometimes be seen on the horizon prior to the detection sensor receiving an input. It is the driver's preference to determine if early intervention is desired in this and similar situations.

System Diagnosis

NOTE: Windshield stickers, stone chips, dirt and general road film will affect the successful operation of the image sensor if sufficient blocking is present. Avoid placing reflective objects on the instrument panel, for example white paper which can affect the image sensor.

High beam assist has a self diagnosis capability by comparing data from the ambient light sensor input (located in the rear view mirror) to light levels detected by the image sensor. If a deviation is detected it is assumed that the ambient light available to the image sensor is being restricted by dirt or other blockage and the system will be deactivated. Diagnostic Trouble Code (DTC)'s are stored in the control module's memory and can be accessed using an approved Land Rover diagnostic system. Within the diagnostic system is a procedure to test the basic operation of the camera function.

In the event of a fault, the warning strategy to the driver is as follows:

- Image sensor internal fault - green icon will extinguish with no additional message to driver
- CJB has lost all communication with image sensor - green icon will extinguish with no additional message to driver
