Errata

Title & Document Type: **1725A Oscilloscope Operating and Service Manual**

Manual Part Number: **01725-90902**

Revision Date: **June 1980**

About this Manual

We've added this manual to the Agilent website in an effort to help you support your product. This manual provides the best information we could find. It may be incomplete or contain dated information, and the scan quality may not be ideal. If we find a better copy in the future, we will add it to the Agilent website.

HP References in this Manual

This manual may contain references to HP or Hewlett-Packard. Please note that Hewlett-Packard's former test and measurement, life sciences, and chemical analysis businesses are now part of Agilent Technologies. The HP XXXX referred to in this document is now the Agilent XXXX. For example, model number HP8648A is now model number Agilent 8648A. We have made no changes to this manual copy.

Support for Your Product

Agilent no longer sells or supports this product. You will find any other available product information on the Agilent Test & Measurement website:

www.agilent.com

Search for the model number of this product, and the resulting product page will guide you to any available information. Our service centers may be able to perform calibration if no repair parts are needed, but no other support from Agilent is available.

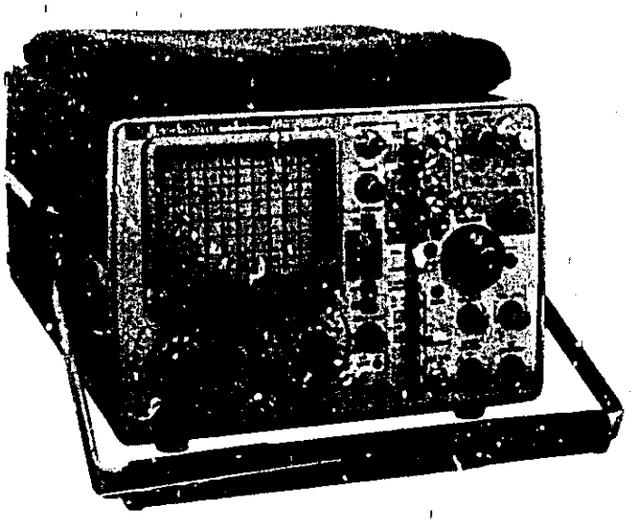
OPERATING AND SERVICE MANUAL

1725A
OSCILLOSCOPE



HEWLETT PACKARD

SAFETY

This product has been designed and tested according to International Safety Requirements. To ensure safe operation and to keep the product safe, the information, cautions, and warnings in this manual must be heeded. Refer to Section I and the Safety Summary for general safety considerations applicable to this product.

CERTIFICATION

Hewlett-Packard Company certifies that this product met its published specifications at the time of shipment from the factory. Hewlett-Packard further certifies that its calibration measurements are traceable to the United States National Bureau of Standards, to the extent allowed by the Bureau's calibration facility, and to the calibration facilities of other International Standards Organization members.

WARRANTY

This Hewlett-Packard product is warranted against defects in material and workmanship for a period of one year from date of shipment. During the warranty period, Hewlett-Packard Company will, at its option, either repair or replace products which prove to be defective.

The cathode-ray tube (CRT) in the instrument and any replacement CRT purchased from HP are also warranted against electrical failure for a period of one year from the date of shipment from Colorado Springs. BROKEN TUBES AND TUBES WITH PHOSPHOR OR MESH BURNS, HOWEVER, ARE NOT INCLUDED UNDER THIS WARRANTY.

For warranty service or repair, this product must be returned to a service facility designated by HP. However, warranty service for products installed by HP and certain other products designated by HP will be performed at Buyer's facility at no charge within the HP service travel area. Outside HP service travel areas, warranty service will be performed at Buyer's facility only upon HP's prior agreement and Buyer shall pay HP's round trip travel expenses.

For products returned to HP for warranty service, Buyer shall prepay shipping charges to HP and HP shall pay shipping charges to return the product to Buyer. However, Buyer shall pay all shipping charges, duties, and taxes for products returned to HP from another country.

LIMITATION OF WARRANTY

The foregoing warranty shall not apply to defects resulting from improper or inadequate maintenance by Buyer, Buyer-supplied software or interfacing, unauthorized modification or misuse, operation outside of the environmental specifications for the product, or improper site preparation or maintenance.

NO OTHER WARRANTY IS EXPRESSED OR IMPLIED. HP SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

EXCLUSIVE REMEDIES

THE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE AND EXCLUSIVE REMEDIES. HP SHALL NOT BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, WHETHER BASED ON CONTRACT, TORT, OR ANY OTHER LEGAL THEORY.

ASSISTANCE

Product maintenance agreements and other customer assistance agreements are available for Hewlett-Packard products.

For any assistance, contact your nearest Hewlett-Packard Sales and Service Office. Addresses are provided at the back of this manual.

MODEL 1725A
OSCILLOSCOPE

(Including Options 001, 003, 011, 090, 096, 101, and 580.)

SERIAL NUMBERS

This manual applies directly to instruments with serial numbers prefixed **2025A**

For additional important information about serial numbers, see INSTRUMENTS COVERED BY MANUAL in SECTION I.

Manual Part Number 01725-90902
Microfiche Part Number 01725-90802

PRINTED: JUNE 1980

SAFETY SUMMARY

The following general safety precautions must be observed during all phases of operation, service, and repair of this instrument. Failure to comply with these precautions or with specific warnings elsewhere in this manual violates safety standards of design, manufacture, and intended use of the instrument. Hewlett-Packard Company assumes no liability for the customer's failure to comply with these requirements.

GROUND THE INSTRUMENT.

To minimize shock hazard, the instrument chassis and cabinet must be connected to an electrical ground. The instrument is equipped with a three-conductor ac power cable. The power cable must either be plugged into an approved three-contact electrical outlet or used with a three-contact to two-contact adapter with the grounding wire (green) firmly connected to an electrical ground (safety ground) at the power outlet. The power jack and mating plug of the power cable meet International Electrotechnical Commission (IEC) safety standards.

DO NOT OPERATE IN AN EXPLOSIVE ATMOSPHERE.

Do not operate the instrument in the presence of flammable gases or fumes. Operation of any electrical instrument in such an environment constitutes a definite safety hazard.

KEEP AWAY FROM LIVE CIRCUITS.

Operating personnel must not remove instrument covers. Component replacement and internal adjustments must be made by qualified maintenance personnel. Do not replace components with power cable connected. Under certain conditions, dangerous voltages may exist even with the power cable removed. To avoid injuries, always disconnect power and discharge circuits before touching them.

DO NOT SERVICE OR ADJUST ALONE.

Do not attempt internal service or adjustment unless another person, capable of rendering first aid and resuscitation, is present.

USE CAUTION WHEN EXPOSING OR HANDLING THE CRT.

Breakage of the Cathode-ray Tube (CRT) causes a high-velocity scattering of glass fragments (implosion). To prevent CRT implosion, avoid rough handling or jarring of the instrument. Handling of the CRT shall be done only by qualified maintenance personnel using approved safety mask and gloves.

DO NOT SUBSTITUTE PARTS OR MODIFY INSTRUMENT.

Because of the danger of introducing additional hazards, do not install substitute parts or perform any unauthorized modification to the instrument. Return the instrument to a Hewlett-Packard Sales and Service Office for service and repair to ensure that safety features are maintained.

DANGEROUS PROCEDURE WARNINGS.

Warnings, such as the example below, precede potentially dangerous procedures throughout this manual. Instructions contained in the warnings must be followed.

WARNING

Dangerous voltages, capable of causing death, are present in this instrument. Use extreme caution when handling, testing, and adjusting.

LIST OF TABLES

SECTION I

GENERAL INFORMATION

1-1. INTRODUCTION.

1-2. The Hewlett-Packard Model 1725A is a general purpose, wide-band oscilloscope designed for bench or field service. It provides accurate measurements of high-frequency signals and fast rise-time pulses with 10-mV/div vertical deflection capability over the full 275 MHz bandwidth. Selectable input impedance of either 50 ohms or 1 megohm provides an impedance that best meets measurement applications. Its low shunt capacitance of less than 11 pF reduces phase shift and signal loss in pulse or cw measurements.

1-3. This manual contains installation, operating, and service instructions for the 1725A. Instrument specifications and procedures for verifying proper operation are included. Procedures are also included for adjusting the instrument to its performance specifications. Schematic diagrams, theory of operation, and troubleshooting information are provided for use in maintaining the instrument.

1-4. This section of the manual contains performance specifications and a list of options available. It also lists the accessories supplied and other accessories that are available. Instrument and manual identification information are also included.

1-5. SPECIFICATIONS.

1-6. Table 1-1 is a complete list of 1725A specifications. Any change in the specifications due to manufacturing, design, or traceability to the U.S. National Bureau of Standards will be listed on a manual change sheet included with this manual. The manual and manual change sheet supersede all previous information concerning specifications of the 1725A.

1-7. ACCESSORIES SUPPLIED.

1-8. The following accessories are supplied with the 1725A:

One Blue Light Filter, HP Part No. 01740-02701
One Front-panel Cover, HP Part No. 5040-0516
One Vinyl Storage Pouch, HP Part No. 1540-0292
One 7.5-ft Power Cord, see Section II
Two 10:1 Divider Probes, HP Model 10017A
One Attenuator Resistor Kit, HP Part No. 5080-9696
One Operators Guide
One Operating and Service Manual

1-9. ACCESSORIES AVAILABLE.

1-10. The following accessories are available for the 1725A:

Model 10020A Resistive Divider Probe Kit
Model 1120A 500 MHZ Active Probe
Model 10023 Temperature Probe
Model 1112A Inverter Power Supply
Model 10491B Rack Mount Adapter*
Models 1006A and 1007A Test Mobiles
Model 197B Oscilloscope Camera

*Not compatable with option 034/035

1-11. OPTIONS.

1-12. The following options extend the usefulness of the 1725A. Replaceable parts are listed at the end of table 6-2.

OPTION 001. Supplies a fixed ac power cord in place of the detachable power cord.

OPTION 003. Supplies two rear-panel connectors for probe power. (See schematic 20.)

OPTION 011. Replaces standard P31 phosphor CRT (V1) with internal graticule P11 phosphor CRT. A new gate assembly A14 is also supplied.

OPTION 034. Provides a built-in digital multimeter that can be used for time interval measurements or as a separate digital multimeter. See schematics 11 and 19 for interface connections. This option is covered in a separate operating and service manual.

OPTION 035. Same as option 034 but for 50HZ line operation

OPTION C90. Deletes the two 10017A divider probes normally supplied. Other probes may be specified that are more suited to your needs.

OPTION 096. Replaces the standard 10017A probes with 10016B 10:1 voltage divider probes.

OPTION 101. Adapts the 1725A for use with an HP Model 1607A Logic State Analyzer to provide both digital and analog analyses. (See schematic 21.)

OPTION 580. Provides a special bottom cover to meet Canadian Fire Safety Codes.

1-13. INSTRUMENTS COVERED BY MANUAL.

1-14. Attached to the instrument is a serial number plate. The serial number is in the form: 0000A00000.

LF Reject: attenuates signals below approx 7 kHz.
HF Reject: attenuates signals above approx 7 kHz.
TRIGGER HOLDOFF: time between sweeps continuously variable, exceeding one full sweep from 10 ns/div to 50 ms/div.

MAIN INTENSIFIED

DELAYED SWEEP: intensified that part of main time base to be expanded to full screen in delayed time base mode. Stop control adjusts position of intensified portion of sweep. Rear panel intensity ratio control sets relative intensity of brightened segment.

ΔTIME MODE: intensifies two parts of main time base to be expanded to full screen in delayed time base mode. "START" control positions the first intensified portion of the sweep. "STOP" control positions the second intensified portion of the sweep. Rear panel intensity control sets relative intensity of brightened segments.

DELAYED TIME BASE

SWEEP

Ranges: 10 ns/div to 20 ms/div (20 ranges) in 1, 2, 5 sequence.
Accuracy (0 to +55°C): same as main time base.
Magnifier (0 to +55°C): same as main time base.

TRIGGERING

Internal: same as main time base except there is no Line Frequency triggering.
Starts After Delay: delayed sweep automatically starts at end of delay period.
Trigger: with delayed trigger level control out of detent (starts after delay) delayed sweep is triggerable at end of delay period.
External: dc to 100 MHz on signals of 50 mV p-p or more, increasing to 100 mV p-p at 300 MHz. Maximum input, ±250 V (dc + peak ac) at 1 kHz or less.
External Input RC: approx 1 megohm shunted by approx 15 pF.

TRIGGER LEVEL AND SLOPE

Internal: at any point on the vertical waveform displayed when in triggered mode.
External: continuously variable from +1.0 V to −1.0 V on either slope of the trigger signal, +10 V to −10 V in divide by 10 mode (÷10).
COUPLING: AC, DC, LF REJ, or HF REJ.
AC: attenuates signals below approx 10 Hz.
LF Reject: attenuates signals below approx 7 kHz.
HF Reject: attenuates signals above approx 7 kHz.
DELAY TIME RANGE: 0.5 to 10X Main Time/Div settings of 20 ns to 0.5 s (minimum delay 50 ns).

Table 1-1. Specifications (Cont'd)

DIFFERENTIAL TIME MEASUREMENT ACCURACY

Main Time Base Setting	Accuracy (+15°C to +35°C)
50 ns/div to 2 ms/div	±(0.5% ±0.1% of full scale)
20 ns/div	±(1% ±0.2% of full scale)
50 ms/div to 0.5 s/div	±3%

DELAY JITTER: <0.005% (1 part in 20 000) of maximum delay in each step.

ΔTIME INTERVAL ΔTIME MODE

FUNCTION: measures time interval between two events on channel A (channel A display); between two events on channel B (channel B display); or between two events starting from an event on either channel A or B and ending with an event on either channel A or B (alternate display).

ACCURACY: measurement accuracy is the Time Interval Accuracy plus the external DVM accuracy.

Main Time Base Setting	Accuracy (+20°C to +30°C)
100 ns/div to 20 ms/div	±0.5% of reading ±0.05% of fs
50 ns/div*	±0.5% of reading ±0.1% of fs
20 ns/div*	±0.5% of reading ±0.2% of fs
50 ms/div to 0.5 s/div	±3%

*Starting after 60 ns of sweep.

ACCURACY (1715A Option 034)

Main Time Base Setting	Accuracy (+20°C to +30°C)
100 ns/div to 20 ms/div	±0.5% of reading ±0.05% of fs
50 ns/div	±0.5% of reading ±0.06% of fs
20 ns/div*	±0.5% of reading ±0.15% of fs
50 ms/div to 0.5 s/div	±3%

*Starting after 60 ns of sweep

STABILITY (0 to +55°C): short-term 0.005%. Temperature, ±0.03%/°C deviation from calibration temperature range.

TIME INTERVAL OUTPUT VOLTAGE: varies from 50 V to 100 mV full scale. Full scale output voltage can be determined by multiplying the number on the TIME/DIV dial by 10 V (e.g., 0.05 s, 0.05 ms, or 0.05 μs per div gives 0.5 V output full-scale).

MIXED TIME BASE

Dual time base in which the main time base drives the first portion of sweep and the delayed time base completes the sweep at the faster delayed sweep. Also operates in single sweep mode.

X-Y OPERATION

BANDWIDTH

Y-axis (channel A): same as channel A.

X-axis (channel B): dc to >1 MHz.

DEFLECTION FACTOR: 5 V/div (10 calibrated positions) in 1, 2, 5 sequence.

PHASE DIFFERENCE BETWEEN CHANNELS: <3°, dc to 1 MHz.

CATHODE-RAY TUBE and CONTROLS

TYPE: post accelerator, approx 20.5 kV accelerating potential, aluminized P31 phosphor.

GRATICULE: 8 x 10 div internal graticule. 0.2 subdivision markings on major horizontal and vertical axes. 1 div = 1 cm. Rear panel adjustment aligns trace with graticule. Internal flood gun graticule illumination.

BEAM FINDER: returns trace to CRT screen regardless of setting of horizontal, vertical, or intensity controls.

INTENSITY MODULATION (Z-AXIS): +8 V, >50 ns width pulse blanks trace of any intensity, usable to 20 MHz for normal intensities. Input R, 1 kΩ ±10%. Maximum input, ±10 V (dc + peak ac).

AUTO-FOCUS: automatically maintains beam focus with variations of intensity.

INTENSITY LIMIT: automatically limits beam current to decrease possibility of CRT damage. Circuit response time ensures full writing speed for viewing low duty cycle, fast rise-time pulses.

REAR PANEL CONTROLS: astigmatism, pattern, main/delayed intensity ratio, and trace align.

GENERAL

REAR PANEL OUTPUTS: Vertical output; main and delayed gates, —0.7 to +1.3V capable of supplying approx 3 mA.

CALIBRATOR: type, 1 kHz ±15% square wave; 3 V p-p ±1%, <0.1 μs rise time.

POWER: 100, 120, 220, 240, —10% +5% 48 to 440 Hz; 110 VA max.

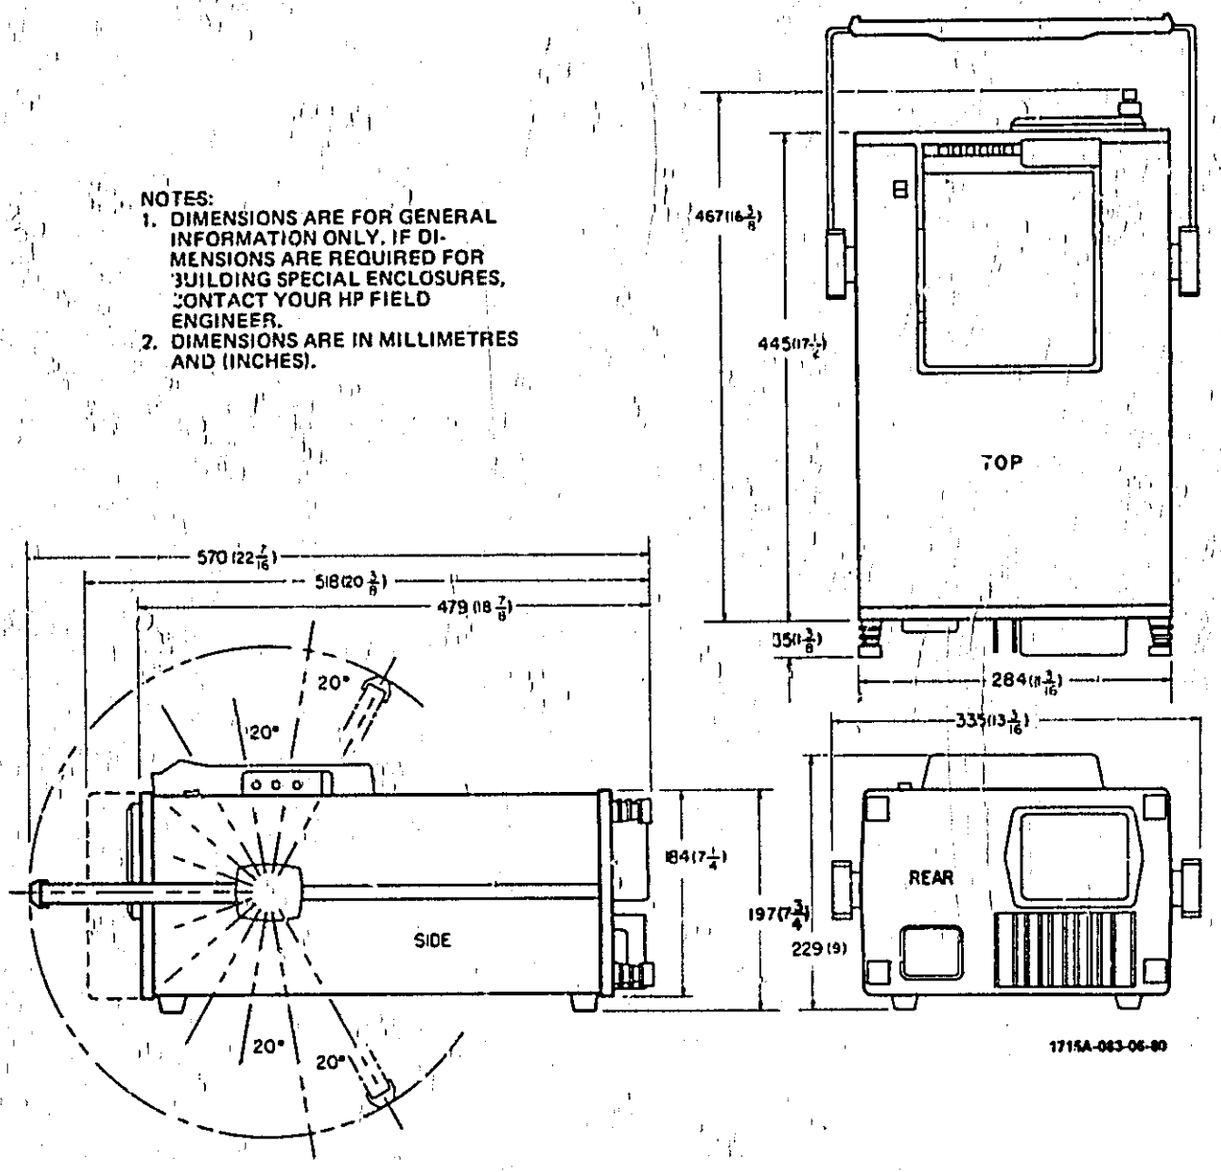
WEIGHT: net, 12.9 kg (28.5 lb); shipping, 17.9 kg (39.5 lb).

OPERATING ENVIRONMENT: temperature, 0 to +55°C (+32°F to +130°F); humidity, to 95% relative humidity at +40°C (+104°F); altitude, to 4600 m (15 000 ft); vibration, vibrated in three planes for 15 min. each with 0.254 mm (0.010 in.) excursion, 10 to 55 Hz.

Table 1-1. Specifications (Cont'd)

DIMENSIONS:

NOTES:
1. DIMENSIONS ARE FOR GENERAL INFORMATION ONLY. IF DIMENSIONS ARE REQUIRED FOR BUILDING SPECIAL ENCLOSURES, CONTACT YOUR HP FIELD ENGINEER.
2. DIMENSIONS ARE IN MILLIMETRES AND (INCHES).



SECTION II

INSTALLATION

2-1. INTRODUCTION.

2-2. This section contains information and instructions for installing and interfacing the Model 1725A. Included are initial inspection procedures, power and grounding requirements, installation instructions, and procedures for repacking the instrument for shipment.

2-3. INITIAL INSPECTION.

2-4. This instrument was carefully inspected both mechanically and electrically before shipment. It should be free of mars or scratches and in perfect electrical order upon receipt. To confirm this, inspect the instrument for damage that may have occurred in transit. If the instrument was damaged in transit, file a claim with the carrier. Check for supplied accessories (listed in Section I) and test electrical performance of the instrument using performance test procedures outlined in Section V. If there is damage or deficiency, see the warranty in the front of this manual.

WARNING

Read the Safety Summary at the front of this manual before installing or operating the instrument.

2-5. POWER CORDS AND RECEPTACLES.

2-6. Figure 2-1 illustrates the configurations used for HP power cords. The number directly above each drawing is the HP part number for the power cord equipped with a connector of that configuration. If the appropriate power cord is not included with the instrument, notify the nearest HP Sales and Service Office and a replacement cord will be provided.

2-7. POWER REQUIREMENTS.

2-8. The 1725A can be operated from any power source supplying 100 V, 120 V, 220 V, or [illegible] V —10% +5%, single phase, 48 to 440 Hz. Power dissipation is 110 VA maximum.

CAUTION

Instrument damage may result if the line-voltage selection switch is not set correctly for the input power source.

2-9. The instrument is normally set at the factory for 120-volt operation. To operate the instrument from any other ac power source, proceed as follows:

a. Verify that Model 1725A power cable is not connected to any input power source.

b. Move LINE VOLTAGE SELECT switch on rear panel to 220 or 240 position.

c. Replace 1.5 Amperes LINE FUSE with 0.8 ampere fuse provided with instrument.

d. Connect input power cable to 220- or 240-Vac source.

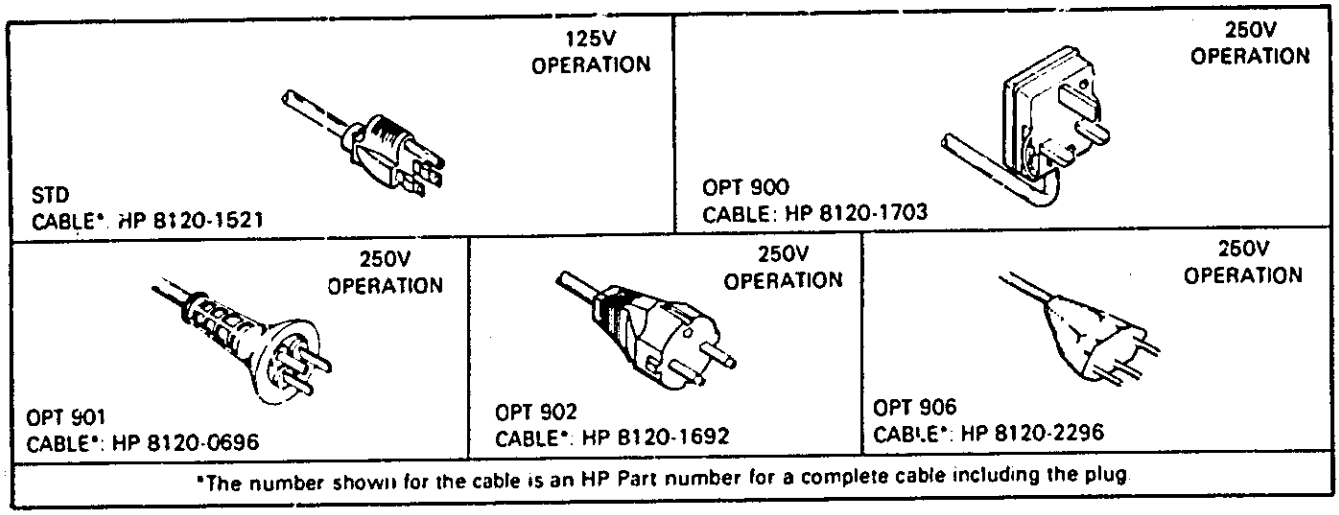


Figure 2-1. Input Power Cable Part Numbers

2-10. REPACKING FOR SHIPMENT.

2-11. If the instrument is to be shipped to a Hewlett-Packard Sales/Service Office for service or repair, attach a tag showing owner (with address), complete instrument serial number, and a description of the service required.

2-12. Use the original shipping carton and packing material. If the original packing material is not available, the Hewlett-Packard Sales/Service Office will provide information and recommendations on materials to be used.

SECTION III

OPERATION

3-1. INTRODUCTION.

3-2. This section provides general operating instructions, functional identification of all controls and connectors, and operating information for the Model 1725A.

3-3. INSTRUMENT CAPABILITIES.

3-4. The 1725A has two vertical preamplifiers for dual-channel operation. Each channel offers a choice of ac, high-Z dc, or 50-ohm input coupling. With the dual trace feature, displays can be obtained on channel A, channel B, or on both channels. Simultaneous display of two signals is possible in either chop or alternate mode of display. A+B and A—B modes are also available. In addition, an X-Y mode of operation is provided; in this mode, the instrument becomes an X-Y display with inputs through channel A (Y-axis) and channel B (X-axis). Sensitivity of each axis is controlled by the channel A or channel B attenuator.

3-5. Ten calibrated switch settings on each vertical amplifier provide a deflection factor range from 10 mV/div to 5 V/div in 1, 2, 5 sequence. The vertical verniers permit fine adjustment between calibrated steps and extend the least sensitive deflection factor (5 V/div) to at least 12.5 V/div.

3-6. Main horizontal amplifier sweep-speed settings from 10 ns/div to 0.5 s/div are available in a 1, 2, 5 sequence. The main sweep speed is calibrated when the SWEEP VERNIER control is in the CAL detent position.

3-7. FRONT- AND REAR-PANEL DESCRIPTIONS.

3-8. Front- and rear-panel features are described in figure 3-1. Description numbers match the numbers on the illustration.

3-9. GENERAL OPERATING INSTRUCTIONS.

3-10. Before connecting ac power to the 1725A, make sure the rear-panel line voltage select switches are set to correspond to the voltage of the available power line. The instrument is normally set at the factory to operate from a 120-Vac source. If a different power source is to be used, refer to Section II for proper switch settings and fuse type.

3-11. INITIAL TURN-ON. To place the 1725A into operation, perform the following steps:

a. Set INTENSITY fully counterclockwise.

b. Set VERT DISPLAY to ALT.

c. Set INT TRIG to A.

d. Set verniers for channels A and B to CAL detent.

e. Set B INVERT switch to out position.

f. Set vertical couplings for channels A and B to GND.

g. Set horizontal POSITION control to midrange.

h. Set main TIME/DIV to 1 mSEC.

i. Set delayed TIME/DIV to OFF.

j. Set main SWEEP VERNIER to CAL detent.

k. Set AUTO/NORM switch to AUTO.

l. Set main INT/EXT trigger switch to INT.

m. Set LINE/SCALE ILLUM switch to on and allow 5-minute warm-up period.

n. Adjust INTENSITY control for just visible trace.

3-12. TRACE ALIGN ADJUSTMENT. The trace align adjustment compensates for external magnetic fields that may affect alignment of the horizontal trace with respect to the graticule. When the instrument is moved to a new location, trace alignment should be checked and adjusted if necessary. To align the trace, proceed as follows:

a. Perform paragraph 3-11.

b. Adjust channel A POSITION control until trace is on center horizontal graticule line.

c. Using a non-metallic alignment tool, adjust TRACE ALIGN control (rear panel) until trace aligns with horizontal graticule.

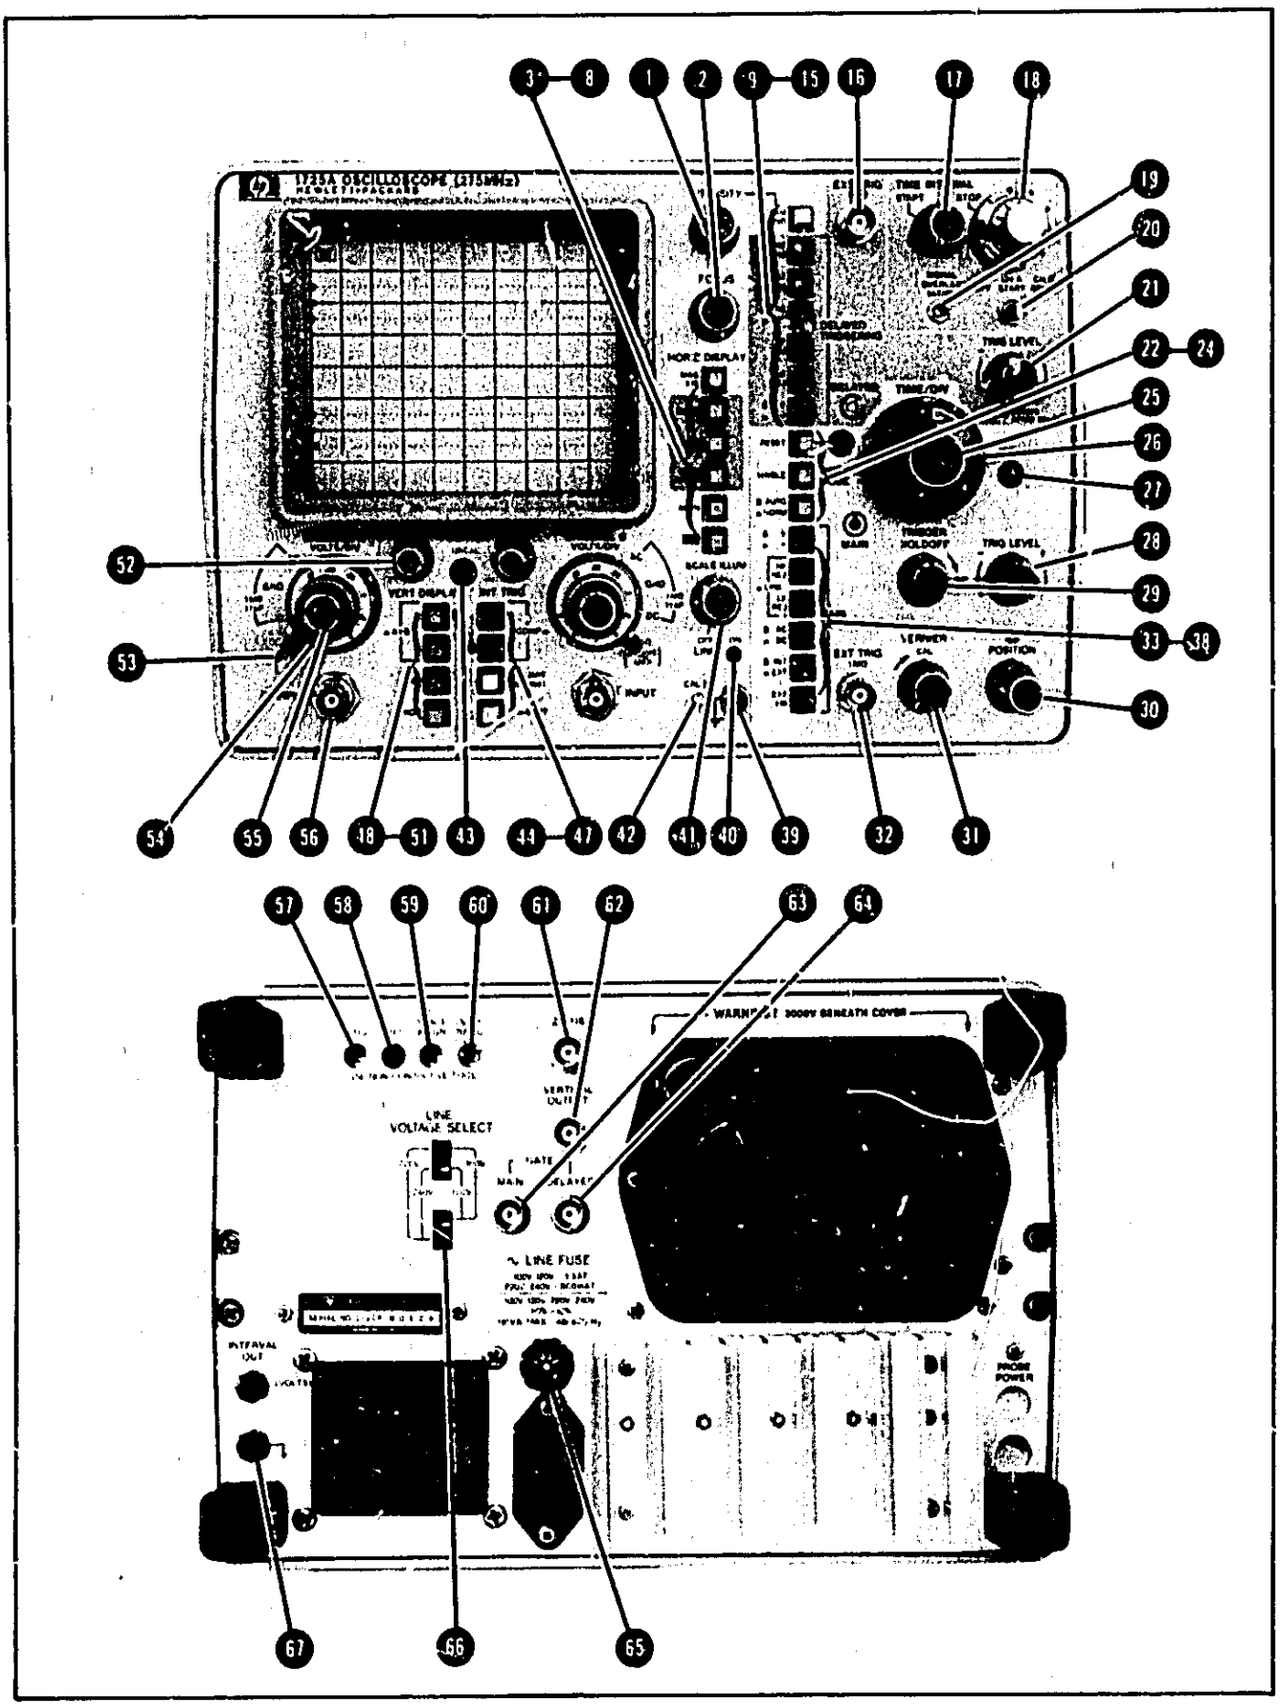

Figure 3-1. Controls and Connectors (Sheet 1 of 2)

1. **INTENSITY.** Controls brightness of display.
2. **FOCUS.** Controls focus of display.
3. **MAG X10.** In X10 position, sweep or X in X-Y mode, is magnified 10 times.
4. **DLY'D.** Selects delayed sweep mode for display.
5. **MIXED.** Selects mixed sweep mode for display.
6. **MAIN INTEN.** Intensifies delayed sweep portion of main sweep.
7. **MAIN.** Selects main sweep mode for display.
8. **X-Y.** Display mode for providing X-axis deflection with signal applied to channel B input.
9. **BEAM FIND.** Returns display to viewing area.
10. **Delayed EXT ÷ 10.** Attenuates external trigger signal by factor of 10; increases external trigger range to ±10 V.
11. **Delayed INT/EXT.** Selects internal or external delayed sweep triggering.
12. **Delayed AC/DC.** Selects delayed sweep triggering coupling.
13. **Delayed LF REJ.** Attenuates delayed trigger signals below 15 kHz.
14. **Delayed HF REJ.** Attenuates delayed trigger signals above 15 kHz.
15. **Delayed slope.** Selects slope of delayed trigger signal that starts sweep.
16. **Delayed EXT TRIG.** BNC connector for delayed external trigger signal.
17. **TIME INTERVAL START.** Selects delay time between start of main sweep and start of delayed sweep.
18. **TIME INTERVAL STOP.** Control for decreasing delay time interval between two events.
19. **SIGNAL OVERLAY (ΔT = 0).** Screwdriver adjustment for nulling measurement errors (refer to paragraph 3-25 for details).
20. **Time Interval Mode Switch.**
    ΔT OFF. Turns off second delayed-sweep marker, providing conventional single marker delayed-sweep operation.

    A START. Sets first delayed-sweep marker on channel A and second delayed-sweep marker on channel B. This allows time measurement from channel A to channel B.

    B START. Reverses the markers, putting first marker on channel B and second marker on channel A. This allows time measurement from channel B to channel A.
21. **Delayed TRIG LEVEL.** Selects amplitude point on trigger signal that starts delayed sweep. There is a detent position for STARTS AFTER DELAY.
22. **RESET.** Resets sweep in SINGLE sweep mode; reset light indicates when sweep is armed.
23. **SINGLE.** Selects single or normal sweep operation.
24. **AUTO/NORM.**
    a. **AUTO.** Automatic sweep in absence of trigger signal. Triggering occurs on trigger signals above 40 Hz.
    b. **NORM.** Sweep is triggered only by applying trigger signal.
25. **Main TIME/DIV.** Controls sweep time in MAIN sweep mode.
26. **Delayed TIME/DIV.** Controls sweep time in MIXED and DLY'D sweep modes; controls intensified portion of sweep in MAIN INTEN sweep mode.
27. **UNCAL light.** Indicates when SWEEP VERNIER is out of CAL detent.
28. **Main TRIG LEVEL.** Selects amplitude point on trigger signal that starts main sweep.
29. **TRIGGER HOLDOFF.** Provides control of time between sweeps. With control fully counterclockwise, holdoff time is minimum.
30. **Horizontal POSITION.** Controls coarse and fine horizontal position of display.
31. **SWEEP VERNIER.** Provides fine adjustment of sweep time between calibrated positions of TIME/DIV switch. UNCAL light indicates when control is out of CAL detent position.
32. **Main EXT TRIG.** BNC connector for main external trigger signal.
33. **Main slope.** Selects slope of main trigger signal that starts sweep.
34. **Main HF REJ.** Attenuates main trigger signals above 15 kHz.
35. **Main LF REJ.** Attenuates main trigger signals below 15 kHz.

    NOTE

    LINE trigger is selected by engaging both HF REJ and LF REJ pushbutton switches simultaneously.

36. **Main AC/DC.** Selects main sweep triggering coupling.
37. **Main INT/EXT.** Selects internal or external main sweep triggering.
38. **Main EXT ÷ 10.** Attenuates external trigger signal by factor of 10; increases external trigger range to ±10 V.
39. ⏚. Chassis ground connection for external equipment.
40. **Power lamp.** Lights when input LINE power switch on.
41. **LINE/SCALE ILLUM.** Controls brightness of scale illumination; also contains input power switch. With control completely counterclockwise in LINE OFF position, ac power is disconnected internally.
42. **CAL 3 V.** Provides 1-kHz, negative square wave of 3 volts ±1%.
43. **Vertical UNCAL light.** Lights when either channel A or channel B vernier is out of CAL detent.
44. **INT TRIG A.** Selects channel A input signal for triggering.
45. **INT TRIG B.** Selects channel B input signal for triggering.

    NOTE

    Engaging both channel A and channel B INT TRIG pushbutton switches results in composite triggering (COMP) on the displayed signal(s).

46. **BW LIMIT (20 MHz).** Display bandwidth limited to 20 MHz. Useful for noise reduction in normal and cascade operation.
47. **B INVERT.** Control used to invert polarity of channel B signal display.
48. **VERT DISPLAY A.** Selects channel A input signal for display.
49. **VERT DISPLAY B.** Selects channel B input signal for display.

    NOTE

    Engaging both channel A and channel B vertical display pushbuttons results in A+B (algebraic addition) display.

50. **ALT.** Displays each channel on alternate sweeps.
51. **CHOP.** Displays each channel by switching between channels at 1-MHz rate.
52. **POSITION A.** Varies vertical position of channel A display.
53. **Coupling.** Selects capacitive (AC), direct (DC), or 50-ohm coupling of input signal. GND position disconnects input signal and grounds input to vertical preamplifier.
54. **VOLTS/DIV.** Selects vertical deflection factor necessary for calibrated measurements.
55. **Vernier.** Provides fine adjustment of volts/div between calibrated positions of VOLTS/DIV switch.
56. **INPUT.** BNC connector for channel A input signal.
57. **ASTIG.** Adjusts roundness of writing spot.
58. **PATT.** Adjusts for uniform pattern over CRT viewing area.
59. **TRACE ALIGN.** Adjust to align trace with horizontal graticule.
60. **INTEN RATIO.** Adjusts intensity of intensified portion of sweep in MAIN INTEN mode of operation.
61. **Z AXIS.** BNC connector for Z-axis input.
62. **VERTICAL OUTPUT.** BNC connector for vertical amplifier output signal; provides approximately X10 gain, dc coupled, and source impedance of 100 ohms.
63. **GATE MAIN.** BNC connector for main gate output to external equipment.
64. **GATED DELAYED.** BNC connector for delayed gate output to external equipment.
65. **LINE FUSE:** AC power input fuse.
66. **LINE VOLTAGE SELECT.** Selects 100/120/220/240 Vac operation.
67. **INTERVAL OUT.** Banana jack connector for time interval measurement. Voltage output and position of TIME/DIV control indicates time interval in s, ms, or μs.

Figure 3-1.
Controls and Connectors (Sheet 2 of 2)

3-13. FOCUS AND ASTIGMATISM ADJUSTMENTS. Adjust focus and astigmatism as follows:

a. Turn INTENSITY control fully counterclockwise.

b. Set LINE/SCALE ILLUM switch to on position.

c. Set channel A controls as follows:

VOLTS/DIV	.01
Coupling	GND
VERT DISPLAY	A
Vernier	fully cw
INT TRIG	B
POSITION	as required
HORIZ DISPLAY	X-Y

d. Set INTENSITY to observe spot.

e. Adjust FOCUS and ASTIG controls for best DEFINED SPOT.

3-14. OPERATORS CHECK.

3-15. Model 1725A operation may be checked without additional test equipment by using the CAL 3 V output as a signal source. The following procedures functionally check each display mode and operation of front-panel controls.

3-16. Operators checks must be performed in the sequence given. Do not start a procedure in mid-sequence, as succeeding steps depend on control settings and results of previous steps. If any results are unobtainable, refer to Section V.

a. Set Model 1725A controls as follows:

CHANNEL A

VOLTS/DIV	.5
Coupling	DC
Vernier	CAL
POSITION	as required
VERT DISPLAY	A
B INVERT	out

TIME BASE

Horizontal POSITION	as required
SWEEP VERNIER	CAL
HORIZ DISPLAY	MAIN
Main TIME/DIV	.5 mSEC
Delayed TIME/DIV	.01 μSEC
AUTO/NORM	AUTO
Main INT/EXT	INT
Main slope +/—	+
Delayed slope +/—	+
Main TRIG LEVEL	as required
Delayed TRIG LEVEL	ccw detent
TRIGGER HOLDOFF	ccw
MAG X10	out
Time Interval Mode Switch	CH A START

b. Set INTENSITY, FOCUS, and POSITION controls for desired baseline display.

c. Apply CAL 3 V output directly to channel A INPUT.

d. Adjust main TRIG LEVEL for stable display. Verify six pulses with leading edge of first and sixth pulse on first and eleventh vertical graticule lines respectively (±15%).

e. Set HORIZ DISPLAY for MAIN INTEN operation.

f. Set delayed TIME/DIV to 0.2 mSEC. Verify intensified portion of sweep.

NOTE

Intensified portion should cover 4 to 5 divisions.

g. Adjust TIME INTERVAL START control until intensified portion is centered on CRT.

h. Set HORIZ DISPLAY for DLY'D operation. Verify that intensified portion is expanded to 10 divisions.

i. Set HORIZ DISPLAY for MAIN INTEN operation.

j. Vary TIME INTERVAL START control. Verify that intensified portion moves smoothly along display.

k. Vary TIME INTERVAL STOP control. Verify that second intensified portion moves smoothly along display.

l. Set delayed TIME/DIV control to 0.01 μSEC.

m. Rotate SWEEP VERNIER counterclockwise to stop. Verify 15 or more pulses between first and eleventh graticule lines.

n. Disconnect CAL 3 V from vertical channel A INPUT connector.

o. Set main TIME/DIV to 0.01 SEC.

p. Set main TRIG LEVEL control to fully clockwise position.

q. Set AUTO/NORM switch to NORM.

r. Select SINGLE operation.

s. Press RESET pushbutton switch. Verify no sweep.

t. Rotate main TRIG LEVEL fully counterclockwise. Verify one sweep; RESET indicator goes off after sweep.

u. Set AUTO/NORM switch to AUTO.

v. Press RESET pushbutton. Verify one sweep.

w. Disengage SINGLE pushbutton.

x. Press ALT sweep pushbutton.

y. Set MAIN TIME/DIV to 5 μSEC and set delayed TIME/DIV to 0.5 μsec.

z. Adjust TIME INTERVAL STOP control. Only marker on channel B should move.

aa. Adjust TIME INTERVAL START control. Both markers should move in unison.

ab. Set time interval mode switch to CH B START.

ac. Repeat steps z and aa. TIME INTERVAL STOP control will only move the marker on channel A.

3-17. OPERATING INFORMATION.

3-18. The following paragraphs provide additional information concerning use of one special function over another.

3-19. AC VERSUS DC. Ac coupling removes the dc level from trigger signals and attenuates signals below 10 Hz. Dc coupling connects input signals directly to the input amplifier. With dc coupling selected, a large dc voltage component in an input signal can offset the input signal outside the trigger level range of the 1725A and cause the oscilloscope to lose trigger.

3-20. AUTO VERSUS NORM. In AUTO operation, a bright base line will be displayed in the absence of a trigger signal. A trigger of 40 Hz or higher overrides AUTO operation and produces a presentation. Adjustment of main TRIG LEVEL control may be necessary for a stable display. If the trigger is <40 Hz, NORM operation must be used. A trigger signal is always needed in NORM operation to generate a sweep.

3-21. MIXED SWEEP. In MIXED sweep modes of operation, a dual sweep-speed display is presented. The main sweep drives the first portion of the display and the delayed sweep completes the display. This mode can also be used when SINGLE sweep is selected.

3-22. DELAYED TRIGGERING. When the delayed TRIG LEVEL control is in the detent position, (starts after delay mode), the delayed sweep starts immediately after the delay period selected by TIME INTERVAL STOP control. When the delayed TRIG LEVEL control is out of detent, the delayed sweep is started by the first trigger signal occurring after the delay period. In this mode, the delay period consists of the time selected by the TIME INTERVAL STOP control and the elapse time until a new trigger signal occurs.

NOTE

When delayed TRIG LEVEL is out of detent, the two marker Δt system is disabled and the oscilloscope defaults to a single marker display. Output from INTERVAL OUT (or DVM on Option 034/035) will indicate the position of the STOP control, not the time interval displayed.

3-23. DELAYED SWEEP. After obtaining a sweep, any portion can be expanded up to 1 ns per division with 5% accuracy over center eight major divisions (X10 magnification) or 10 ns per division with 3% accuracy. This permits viewing of critical rise times or signal shapes with increased resolution.

3-24. REDUCING JITTER. Sweep jitter can be reduced by using the delayed TRIG LEVEL control. By rotating the delayed TRIG LEVEL control out of detent, the delayed sweep starts on a trigger point on the wave form selected by the trigger source selection switches. This trigger is qualified by delay time so the delay sweep will start on the first trigger point after the delay time. This reduces the trigger accumulated since start of the main sweep.

3-25. Δ TIME MEASUREMENTS. Detailed operating instructions for the two marker Δt system and some of its many applications are contained in the Operator Guide. Please refer to this publication for measurement applications such as pulse width, duty cycle, and transition time.

3-26. The Δt = 0 (R24) adjustment removes range to range tracking offsets in the two marker Δt system. The Δt Offset Adjustment (A18R23, side panel adjustment) can remove small systematic errors such as unequal length probes that become apparent at faster sweep speeds. The Δt Offset adjustment (A18R23) should be checked only where interchannel measurements are being performed. The front panel Δt = 0 adjustment procedure is required as part of the setup for any Δt measurement. This adjustment must be repeated for each change in Main Sweep Time setting.

3-27. The ΔT = 0 adjustment (R24) is set as follows:

a. Set MAIN TIME/DIV as required.

b. Set DELAYED TIME/DIV to the fastest sweep speed that can produce a usable display.

c. Connect both probes to a common current node.

d. Set TIME INTERVAL START fully ccw.

e. Set ΔT OFF/A START/B START to A START.

f. Select MAIN INTEN display mode.

g. Set ΔT STOP control to zero and with the ΔT START control position the markers over a leading edge transition of the signal being displayed.

h. Select DLY'D DISPLAY mode.

i. Switch between A START and B START modes and adjust the Δt Offset Adjustment (A18R23, side panel adjustment) for minimum change in the position of the markers.

j. Adjust front panel ΔT = 0 (R24) for precise overlap of the two markers.

NOTE

Changes in MAIN SWEEP TIME/DIV setting require readjustment of the ΔT = 0 control. Changes in equipment setup, i.e. probes, require readjustment of the Δt Offset (A18R23).

SECTION IV

PRINCIPLES OF OPERATION

4-1. INTRODUCTION.

4-2. This section contains functional descriptions keyed to overall, simplified block diagrams of circuit groups that appear in Section VIII, (figure 8-3). For simplicity, the block diagrams are drawn for function and do not show circuit details. Schematics are located in Section VIII.

4-3. VERTICAL SECTION BLOCK DIAGRAM.

4-4. INPUT ATTENUATORS. Channel A and channel B attenuators accept the input signals applied to the front-panel INPUT connectors. The attenuators select the type of input coupling (50Ω, DC, GND, AC) and set the vertical deflection factor (5 mV/div to 5 V/div) as selected by the front-panel VOLTS/DIV switches.

4-5. VERTICAL PREAMPLIFIER AND CONTROL IC. The vertical preamplifier and control integrated circuit (IC) accept a single-ended signal from the attenuator and convert it to a differential signal. The differential signal is then amplified and a portion of it is used for the sync amplifier while the main path is then acted upon by the polarity switch, vernier, position, and channel switch controls (in that sequence).

4-6. DELAY LINE. The delay line assembly delays the vertical signal approximately 50 nanoseconds. This delay allows the sweep to trigger before the vertical signal reaches the CRT plates.

4-7. VERTICAL OUTPUT AMPLIFIER. The vertical output amplifier provides drive to the CRT vertical deflection plates.

4-8. HORIZONTAL SECTION BLOCK DIAGRAM.

4-9. TRIGGER CIRCUIT. The internal sync amplifier provides the synchronization signal for the main and delayed trigger generators. The generators develop the trigger signals that start the main and delayed sweep. The trigger is also applied to an auto circuit that is used in AUTO mode only. The outputs of the generators are controlled by the level of the sync signal applied and the reset signal from the holdoff control circuit. When the reset signal is logic high, the generator is inoperative. When the reset signal is low, the generator is operational and a trigger signal can be developed if there is an internal or external sync input.

4-10. SWEEP AND INTEGRATOR CIRCUITS. The sweep circuits initiate a horizontal sweep by the trigger signal that is applied to their inputs. A Miller integrator produces the horizontal sweep ramp; slope is controlled by the TIME/DIV switch on the front panel of the instrument. Output from the Miller integrator is applied through horizontal display control switches to the horizontal preamplifier circuit.

4-11. The horizontal sweep is also compared to a reference voltage by a comparator sweep length that drives the reset circuit. The reset circuit, along with other holdoff circuits, controls the timing sequence of the sweep ramp.

4-12. HOLDOFF CIRCUITRY. The holdoff circuit establishes the time interval between trigger points. This time interval is adjustable by the TRIGGER HOLDOFF control. The sweep ramp and the TIME/DIV switch control the holdoff ramp generator. When the generator is activated, a ramp, determined by a selected holdoff capacitor and the TRIGGER HOLDOFF control, is produced. When the ramp reaches a predetermined voltage level, the reset circuit activates. This arms the trigger generator. Upon receipt of a new trigger signal, a new sweep is generated.

4-13. HORIZONTAL PREAMPLIFIER. The horizontal preamplifier provides amplification for the sweep-time ramp. A horizontal POSITION control establishes a reference level for the horizontal sweep. The BEAM FIND switch, when engaged, reduces emitter current in the output stage of the preamplifier so that the horizontal sweep will be returned to the viewing area of the CRT.

4-14. HORIZONTAL OUTPUT. The horizontal output stage provides drive to the CRT horizontal deflection plates.

4-15. GATE CIRCUITRY.

4-16. The gate assembly contains the circuitry necessary to control brightness of the CRT display. An intensity control circuit is used for brightening or blanking the CRT when necessary. Astigmatism, focus, pattern, and floodgun filament controls are part of the gate assembly. A 3-V calibrator is also part of the gate assembly.

4-17. HIGH-VOLTAGE POWER SUPPLY.

4-18. The high-voltage power supply consists of the high-voltage oscillator and a rectifying network. The high-voltage oscillator produces cathode and grid voltages for the CRT. A secondary winding on the high-voltage transformer provides voltage for the CRT cathode heater.

4-19. The CRT cathode voltage is sampled and fed back to a HV oscillator control circuit on the gate assembly. If the cathode voltage becomes more negative, less current supplied, the output amplitude of the oscillator is reduced and the cathode voltage will return to its normal operating value. If the cathode becomes less negative, more current is supplied to the oscillator.

4-20. A tap on the secondary of the high-voltage transformer is connected to a multiplier assembly. Output of the multiplier (X6) is connected the CRT post-accelerator terminal.

4-21. LOW-VOLTAGE POWER SUPPLY.

4-22. The low-voltage power supply operates from an ac power source. The ac line is applied to the input power circuit where 100/120/220/240-Vac operation is selectable. The input power circuit contains the ac line protection fuse. The ac input is applied to a stepdown power transformer.

4-23. Secondary outputs from the power transformer are applied to rectifiers and voltage regulator circuits, which convert input ac power to usable dc outputs of different voltage levels.

4-24. CIRCUIT DETAILS.

4-25. The following paragraphs provide a detailed explanation of the individual circuits in the Model 1725A. Circuits that are identical for both channels are only explained for channel A.

4-26. ATTENUATOR ASSEMBLIES.

4-27. GENERAL INFORMATION. (See schematic 1.) The channel A attenuator assembly is a two section, cam-actuated attenuator. The first section is controlled by coupling switch A1S1. The second section is controlled by VOLTS/DIV switch A1S2. The attenuator components are closely mounted and their interrelationship is critical. If a malfunction occurs in an attenuator assembly, it is recommended that the attenuator board be replaced.

4-28. In describing the attenuator assembly, only basic reference designators will be used. When referring to table 6-2 (Section VI), prefix all basic reference designators (except A3 assembly components) with A1. See figure 4-1 for simplified block diagram of the attenuator.

4-29. INPUT. The input signal applied to channel A INPUT connector J1 is routed to coupling switch A1S1 through a 50-ohm stripline that is part of the etched circuit board. With A1S1 in its AC position, the input signal is applied through capacitor A1C1 to the first section of the attenuator. The value of A1C1 is such that signals below 10 Hz will be attenuated. In GND position, A1S1 disconnects the input signal and applies a ground to the attenuator input. In DC position, A1S1 forms a straight-through connection and applies the input signal directly to the high impedance section of the attenuator. In 50Ω position, A1S1 terminates the input signal in 50 ohms. The termination consists of two 100-ohm resistors. A1R1 and A1R2.

NOTE

These resistors are constructed of flameproof material as a precaution against overvoltage application in the 50Ω position of A1S1. The resistors are mounted in sockets to facilitate replacement.

4-30. ATTENUATOR STAGES. The VOLTS/DIV switch A1S2 controls a two-section cascaded attenuator. Each section consists of a group of attenuation networks. The high-impedance section contains X1, X10, and X100 networks. The low-impedance section contains X1, X2, and X5 networks. Each position of A1S2 cascades a network in the high-impedance section with a network in the low-impedance section. By cascading different network combinations, the attenuator provides 10 mV/div to 5 V/div vertical deflection.

4-31. A high-to-low impedance converter stage is inserted between the two sections of attenuator switch A1S2. The high frequency amplifier section of the impedance converter consists of field-effect transistor (FET) A1Q1 connected in a source follower configuration. Input to the gate of the FET is capacitively coupled through A1C5. Transistor A1Q2 functions as the current source for A1Q1. Emitter follower A1Q3 drives the resistive divider network of the low impedance section of attenuator switch A1S2. Under input overvoltage conditions, A1CR1 prevents the reverse breakdown of the base-emitter junction of A1Q3.

4-32. The low frequency path of the input signal consists of error amplifier A3U1 and level shifter A3Q5. The error amplifier samples the input and output signals within a frequency range of DC to 1 kHz. It generates a correction signal to the high frequency amplifier to replace the missing low frequency signal components. The input signal sample is accomplished through a resistor divider network consisting of A1R8 and A3R57—A3R59. This provides isolation of capacitive loading to high frequency signals and over-voltage protection for the error amplifier. The gain of the low frequency path is set by adjusting the resistor divider ratio used to sample the output signal. Adjustment is accomplished with A3R55. Transistor A3Q5 functions

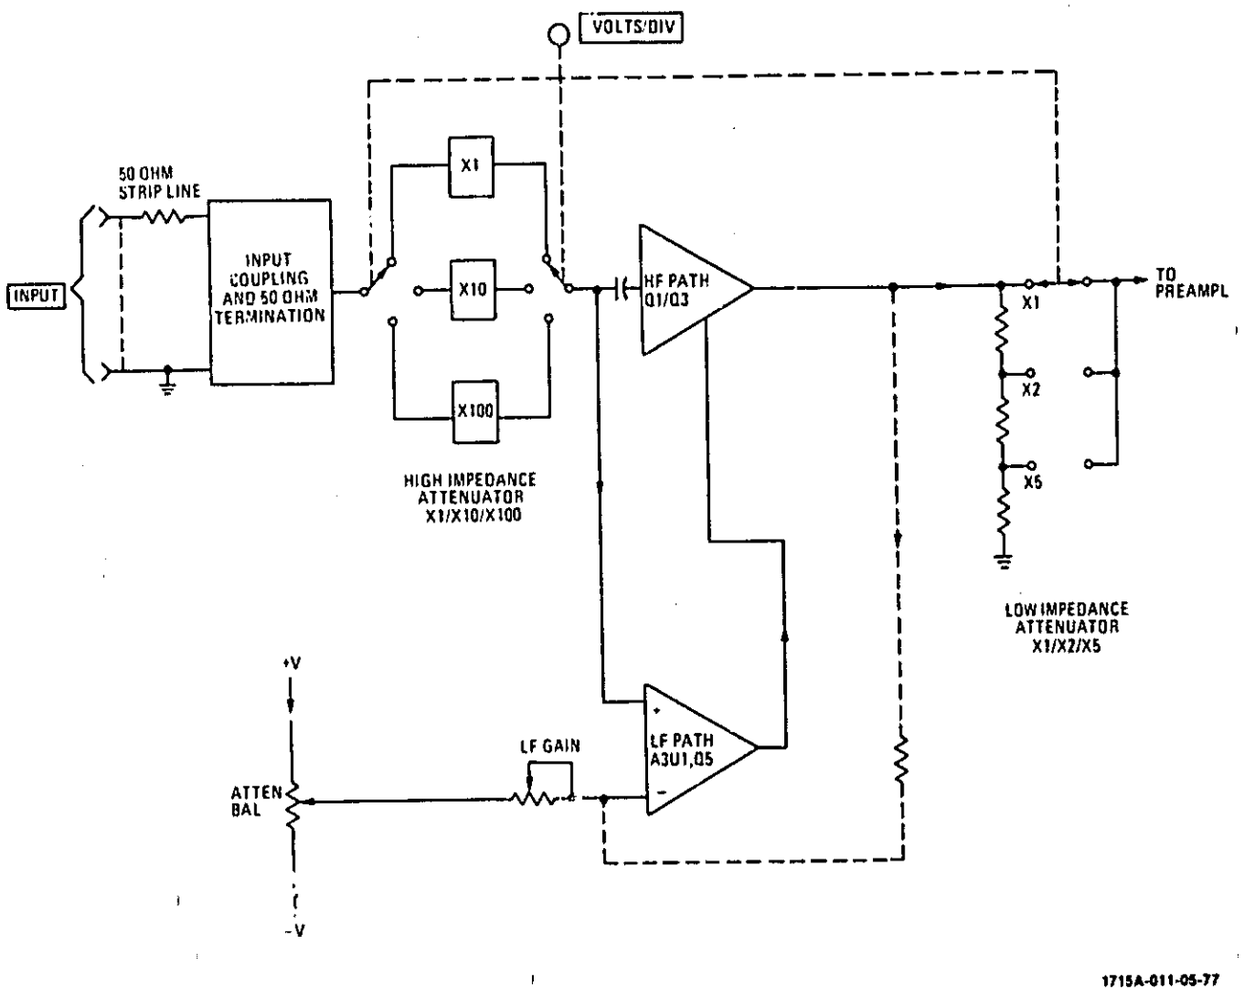

Figure 4-1. Attenuator Simplified Block Diagram

as a level shifter for the low frequency correction signal. The low frequency correction signal is applied through current source A1Q2 to the high frequency amplifier circuit.

4-33. The channel B attenuator (A2) functions identically as the channel A attenuator described in paragraphs 4-27 through 4-32. See schematic 2 for channel B component identification.

4-34. VERTICAL SECTION.

4-35. GENERAL INFORMATION. (See schematic 3.) Each channel preamplifier circuit consists of an integrated circuit (IC) and associated biasing networks. Both ICs are mounted on substrate assembly A3A1. The IC provides two outputs; one output is the main vertical signal, and the other is the internal sync signal.

4-36. PREAMPLIFIER STAGE. Since channel A and channel B are similar, only channel A will be described in detail. Where channel B differs from channel A, the difference will be discussed.

4-37. The input signal from attenuator A1 is applied to the channel A section of substrate assembly A3A1. The input amplifier stage is balanced by main balance potentiometer A3R4 (A3R12 for channel B). A signal split is then accomplished with the two signals taken out separately (main signal and sync signal for time base triggering).

4-38. Outputs from channel A and channel B are combined in a common load resistor and applied to the input of delay line driver stage A3Q1/A3Q2.

4-39. The sync outputs of channel A and channel B

are combined in a common base stage and its output drives a balanced 300Ω line to the input of the main sync amplifier (A10).

4-40. The output of A3Q1/A3Q2 is connected to delay line assembly A4 through a bandwidth limit circuit that limits the amplifier, 3 dB down to 20 MHz. A3Q1/A3Q2 operates as a differential common emitter amplifier.

4-41. BEAM FIND switch A8S1A (see schematic 14) supplies emitter bias (—15 V) to amplifier A3Q1/A3Q2. When A8S1A is pressed, the emitter bias is removed from the circuit. The signal sensitivity is reduced enough to return the trace to the viewing area of the CRT.

4-42. Each channel has a vertical POSITION control (R3 and R4) located on the front panel of the instrument. Vertical positioning of the viewed display is accomplished by adding or subtracting current in the main signal path. This results in shifting the vertical dc level of the output signal and causes the trace on the CRT to move up or down.

4-43. With front-panel vernier controls A1R1 and A2R1 in CAL detent position, the gain of each channel is adjusted by A3R1 (channel A) and A3R14 (channel B). By adjusting the ratio of bias current through two parallel connected junctions, the current division between the two junctions can be controlled.

4-44. An input signal applied to channel B can be inverted for A—B operation by front-panel B INVERT switch A6S1D. A saturated switch and bias circuit is also provided so that only a dc level change is needed to switch polarity. The dc level change (+15 V) is supplied by the B INVERT switch when engaged.

4-45. PREAMPLIFIER CONTROLS. (See schematic 5.) The internal Trigger Switch Assembly, A6, and Vertical Display Switch Assembly, A7, control the operation of substrate assembly A3A1. Control of the substrate assembly is described in the following paragraphs.

4-46. Channel A Display. Engaging VERT DISPLAY switch A7S1A selects the channel A input signal for display on the CRT. When engaged A7S1A applies a constant high (+4.3 V) to the set input on flip-flop A7U1, causing its Q output (pin 2) to be held high and its $\overline{Q}$ output (pin 3) to be held low.

4-47. Since A7U1 is held in its set condition, the base bias applied to A7Q2 is more positive than that applied to A7Q1. Transistor A7Q2 conducts, and applies a disabling voltage to the channel B channel switch on assembly A3. With +V1 bias removed, output from the channel B preamplifier is inhibited.

4-48. Channel B Display Engaging VERT DISPLAY switch A7S1B selects the channel B input signal for display on the CRT. When engaged, A7S1B applies a constant high to the reset input (pin 4) on flip-flop A7U1.

4-49. With A7S1B engaged and A7U1 held in its reset condition, the $\overline{Q}$ output of A7U1 is held high and the Q output is held low. With its base bias more positive, A7Q1 conducts and applies a disabling voltage to the channel A channel switch on assembly A3. With +V1 bias removed, output from the channel A preamplifier is inhibited.

4-50. Channel A and Channel B Displays. To display signals applied to both channels, VERT DISPLAY switches A7S1A and A7S1B are not engaged. The set and reset voltages applied to A7U1 are low. The flip-flop is controlled by inputs from either the ALT signal through OR/NOR gate A7U2A or by the CHOP signal generated by chop oscillator A7U2B. The high and low inputs from either the ALT signal or the chop oscillator cause the Q and $\overline{Q}$ output of A7U1 to alternate between high and low logic levels. This action causes A7Q1 and A7Q2 to conduct alternately.

4-51. Channel A + B Display. To algebraically display input signals applied to both channels, VERT DISPLAY switches A7S1A and A7S1B are pressed simultaneously. With both switches engaged, —15 V bias is removed from the emitter circuits of A7Q1 and A7Q2, cutting them off. This causes both channel A and channel B preamplifier stages on assembly A3 to be operational. In addition, with both A7S1A and A7S1B engaged, +15 V is applied to the junction of A3R21 and A3VR3. This increases the current available at the output circuit of the preamplifiers by effectively bypassing A3R21.

4-52. For composite triggering in A+B or CHOP mode of operation, +15 V is applied to the emitter circuits of A3Q3/Q4 through trigger switches A6S1A and A6S1B. This increases the current available at the emitters of sync amplifier A3Q3/A3Q4.

4-53. CHOP Mode Display. When CHOP mode of display is selected by VERT DISPLAY switch A7S1D, a low (+3.5 V) is applied to pin 13 of OR/NOR gate A7U2B. With a low applied to pin 13, A7U2B operates as an astable multivibrator. The repetition rate of A7U2B, controlled by feedback capacitor A7C3, is approximately 1 MHz. The NOR gate output of A7U2B is applied through OR/NOR A7U2C gate as a clock signal to flip-flop A7U1. The Q and $\overline{Q}$ output of the flip-flop control the operation of A7Q1/A7Q2 explained previously.

4-54. The NOR gate output of A7U2B is also applied to the gate assembly, A14, as a chop blanking signal. The chop blanking signal blanks the CRT trace during channel switching.

4-55. ALT Mode Display. When ALT mode of display is selected by VERT DISPLAY switch A7S1C, it releases all other display switches (A7S1A, A7S1B, and A7S1D). In addition, it supplies the LALT signal to the analog assembly, A18. The LALT signal will be discussed later.

4-56. The ALT signal that is developed on the main sweep assembly, A8, is applied to an input on OR/NOR gate A7U2A. At the start of the main of sweep, the ALT signal goes high. With one input high, the NOR output of U2A (pin 5) is low. The low is applied through A7U2B to the clock input of flip-flop A7U1. At the end of the main sweep, the ALT signal goes low and the NOR output of A7U2A goes high. The positive transition at the input to flip-flop A7U1 causes it to change states. Thus, at the end of each sweep, channel control flip-flop A7U1 alternately disables channel A or channel B.

4-57. CHANNEL A SYNC CIRCUIT. Internal sync switch assembly, A6, contains the sync control circuitry necessary for selective internal triggering.

4-58. When the A sync mode is selected, switch A6S1A is pushed in and A6S1B is out. In this switch configuration, A7U3Q2 is turned on and A7U3Q1 is off. Constant current source A7U3Q5 supplies current to A7U3Q2. When A7U3Q2 is conducting a low is applied to A7U3 pin 5, disabling the channel B sync circuit.

4-59. CHANNEL B SYNC CIRCUIT. When the B sync mode is selected, switch A6S1B is pushed in and A6S1A is out. In this switch configuration, A7U3Q2 is turned off, and A7U3Q1 is conducting. Constant current source A7U3Q5 supplies current to A7U3Q1. As long as A7U3Q1 is conducting a low is applied to A7U3 pin 1, disabling the channel A sync circuit.

4-60. Composite Sync Circuit. When composite sync is selected, channel A and channel B sync switches (A6S1A and A6S1B) are engaged simultaneously. With both sync switches engaged, a ground is applied to the emitter circuit of A7U3Q5, cutting it off. With A7U3Q5 cut off, the emitter circuit of A7U3Q1/A7U3Q2 is disabled, cutting off A7U3Q1 and A7U3Q2. In addition, with both sync switches engaged, -15V is applied to the emitter circuit of A7U3Q3 and A7U3Q4 through CHOP display switch A7S1D.

4-61. For composite sync, the outputs of A7U3Q3 and A7U3Q4 are controlled by the Q and $\overline{Q}$ outputs of A7U1. When the Q output of A7U1 is high ($\overline{Q}$ output low), A7U3Q4 conducts and A7U3Q3 is cut off. With A7U3Q4 conducting, its output (A7U3 pin 11) is approximately the bias voltage applied to its emitter (A7U3 pin 10). The low at A7U3 pin 11 is applied to the B sync enabling network on assembly A3, preventing a channel B sync signal from being generated.

4-62. When the $\overline{Q}$ output of A7U1 is high, A7U3Q3 conducts and its collector (pin 8) is approximately the bias voltage applied to its emitter (A7U3 pin 7). The low at A7U3 pin 8 is applied to the A sync enabling network on assembly A3, preventing a channel A sync signal from being generated. Thus as A7U1 toggles for the Alt Mode Display (paragraph 4-55), the sweep is alternately triggered by channel A and by channel B.

4-63. Composite Sync Chop Mode Display. When composite sync is selected for CHOP mode of display A7U3 is disabled by removing the -15V bias from both sections of the IC. This prevents A7U3 from applying a disabling voltage to either channel A or channel B enabling networks on assembly A3. The sync signal generated is a composite of signals applied to channel A and channel B.

4-64. Also, when composite sync is selected for CHOP mode of display, +15 V is applied by the CHOP switch, A7S1D, through sync switches A6S1A and A6S1B to emitter circuits of sync amplifier A3Q3/A3Q4. The additional voltage source increases current available at the input to the sync amplifier (similar to A+B operation of the main signal amplifier, A3Q1/A3Q2). When the B INVERT switch, A6S1D, is engaged during this mode of operation, the channel B sync signal is inverted prior to developing the composite sync signal by applying +15 V through A6R1 and A6S1D to a crossover network in the channel B sync circuit on A3A1. This results in the channel B sync signal being inverted prior to combining with the channel A sync signal.

4-65. DELAY LINE ASSEMBLY. The output of main signal amplifier A3Q1/A3Q2 is applied to delay line assembly A4. The delay line has a differential impedance of approximately 125 ohms and provides a time delay of approximately 50 nanoseconds. This delay is sufficient to allow the internal sync signal to trigger the time base to start the horizontal sweep. Without the insertion of this time delay in the signal path, the sweep would start after the signal reached the vertical deflection plates of the CRT and the leading edge of fast rise time signals would not be displayed.

4-66. VERTICAL OUTPUT AMPLIFIER. (See schematic 4.) The vertical output amplifier assembly, A5, consists of two integrated circuits with their associated control components. Integrated circuit A5U1 is the main vertical amplifier. It receives the differential signal from the delay line assembly, A4, amplifies it and applies it to output amplifier A5U2. Frequency adjustments A5C4, A5C6, A5C7, A5C13, A5R11, and A5R22 are adjusted for optimum pulse response.

4-67. Output amplifier A5U2 is a shunt-feedback differential amplifier whose transimpedance converts the current gain of A5U1 to a voltage gain at the input of the CRT. The CRT's vertical section is the distributed line type with a 330-ohm terminating impedance.

4-68. HORIZONTAL SECTION.

4-69. MAIN TRIGGER CIRCUITRY. (See schematics 6 and 7.) The internal sync signal developed on the preamplifier assembly, A3, is connected to the horizontal display switch assembly, A10, through a 300-ohm impedance cable. Signal amplification is accomplished by sync amplifier stages A10Q1-A10Q6. Output from A10Q5 is applied through X-Y switch A10S1F to the VERTICAL OUTPUT connector, J4, on the rear panel of the instrument. Output from A10Q6 drives dual emitter followers A10Q7/A10Q8. Transistor A10Q7 supplies the main sync signal. Transistor A10Q8 supplies the delayed sync signal.

4-70. There are two sources of sync input to the main trigger circuit (see figure 4-4 at the back of this section for time base simplified block diagram). One input is from the EXT TRIG connector, J1, on the front panel of the instrument. The other input is from the internal sync source, A10Q7. The position of the INT/EXT switch, A8S10, determines which trigger source is selected. The external sync is applied to A8S10 through the EXT +10 switch, A8S1P. When A8S1P is engaged, a voltage divider network connected to the external input circuit reduces the input signal by a factor of 10.

4-71. The sync signal (external or internal) is applied to a high-frequency circuit and to a low-frequency circuit (see schematic 7). The high-frequency circuit consists of A8Q1/A8Q2. This circuit readily passes all frequencies above 15 kHz. The low-frequency circuit consists of A8U1/A8Q3 and readily passes all frequencies below 15 kHz.

4-72. The low-frequency path for the trigger signal is through the INT/EXT switch, AC/DC switch, and LF REJ switch to the input of an inverting operational amplifier, A8U1. The output of A8U1 is applied to A8Q3 that functions as an emitter follower. The output of the low-frequency path is applied to U2 pin 14. Front-panel TRIG LEVEL control R15 is part of the low-frequency path.

4-73. With the AC/DC switch, A8S1N, in its AC position, A8C1 blocks the dc component of the trigger signal. When the LF REJ switch, A8S1M, is engaged, the low-frequency circuit is disconnected and the input to A8U1 is grounded. Pressing both the LF REJ switch and the HF REJ switch applies the line-frequency signal from primary ac power transformer T1 (see schematic 18) to the input of A8U1.

4-74. For high-frequency rejection, the HF REJ switch, A8S1L, is engaged. This applies −15 V through A8R7 to the gate of A8Q1. The source of A8Q1 and the emitter of A8Q2 are clamped by diodes A8CR2 through A8CR4 turning them off.

4-75. After conditioning by the high- and low-frequency bandpass circuits, the sync signal is applied to A8U2. The IC contains the pulse shaping network, arming circuitry, and trigger controls required to develop the trigger signal.

4-76. The sync signal is amplified by A8U2 and converted to differential signals. The differentially constructed signals are applied to the inputs of a pair of dual-input Schmitt trigger circuits located in the IC. Another Schmitt trigger on the IC controls the dual-input Schmitts.

4-77. At the end of the holdoff period, the holdoff-comparator develops a reset signal that is applied to the first Schmitt trigger on A8U2. The Schmitt trigger changes state, arming the second Schmitt trigger. When the applied trigger signal reaches the selected trigger level established, the second Schmitt trigger fires. One-half cycle later (when the trigger signal falls below the selected trigger level), the third Schmitt trigger fires producing trigger outputs from A8U2 (pin 1 and pin 2).

4-78. The input sensitivity on which A8U2 generates a trigger pulse is controlled by the main trigger sensitivity potentiometer, A8R47. The input sync signal slope on which A8U2 generates a trigger pulse is controlled by the main slope switch, A8S1K. This switch applies +5 volts to pin 16 for positive slope triggering and a ground for negative slope triggering.

4-79. The output of A8U2 (pin 2) is applied as one input of a dual-input current switch consisting of A8Q8 through A8Q10. The other input to the current switch is from the bright-line auto generator, A8U3. When the output of A8U2 (pin 2) or collector of Q36 (no. U3) goes low, either transistor A8Q8 or A8Q9 will conduct. With either transistor conducting the current path for the current switch is through A8R36, A8R37, the conducting transistor, and A8R41. The signal developed at the high end of A8R41 is the main gate signal applied to the gate Schmitt circuit (see schematic 13). In addition, when A8Q8 or A8Q9 conducts, A8Q10 cuts off. With A8Q10 cut off, a sweep ramp is generated by the integrator circuit (see schematic 8).

4-80. Transistor array A8U3 forms the bright-line auto circuit. In the absence of a sync signal, the output at A8U2 pin 2 is high, cutting off A8Q8. The complementary low output at A8U2 pin 1 is applied to the base of transistor A8U3Q3 which drives the base of A8Q11 low causing A8C15 to change to the lower voltage level. The emitter of A8Q11 follows the negative charging of A8C11 which will reach its final charge in approximately 25 milliseconds unless a new sync signal occurs. With the lower voltage at the emitter of A8Q11, A8U3Q1 will now follow the auto signal applied to the base of A8U3Q5. A8U3Q1/A8U3Q2 form a Schmitt trigger circuit. With a sync signal applied, A8U3Q1 conducts constantly,

holding off A8U3Q2. In the absence of a sync signal, the Schmitt trigger will follow the auto signal. When A8U3Q2 conducts its collector goes low, turning on A8Q9, and in turn, cutting off A8Q10. With A8Q10 cut off, the main sweep is activated. At the end of the main sweep, the reset signal goes high and is applied to A8U2 pin 4. With a high applied to A8U2 pin 4, the output at A8U2 pin 6 is low, turniyng on A8Q5. When A8Q5 conducts it turns on A8U3Q5 which turns on A8U3Q1. With A8U3Q1 conducting, bias is removed from A8U3Q2 cutting it off. The output at A8U3 pin 5 goes high, turning off A8Q9 and turning on A8Q10. With A8Q10 conducting, a new sweep ramp will not be generated. At the end of the holdoff period, the reset signal goes low, the output at A8U2 pin 6 goes high, and A8Q5 turns off. When A8Q5 turns off, the cycle is repeated and a new sweep is initiated.

4-81. In NORM position of the AUTO/NORM switch A8S1K, +5 V is applied to the base of A8U3Q4 turning it on. With A8U3Q4 conducting, forward bias is applied to the base of A8U3Q5 turning it on. This applies a constant forward bias to A8U3Q1 turning it on. With A8U3Q1 conducting, A8U3Q2 and A8Q9 are cut off. In the absence of a trigger signal A8Q8 is also cut off and A8Q10 is conducting, preventing the generation of a sweep ramp. When a sync signal is applied to A8U2, the output at A8U2 pin 2 goes low. This turns on A8Q8 and turns off A8Q10, starting a new sweep.

4-82. For single-sweep operation the SINGLE switch, A8S1I, is pressed. With A8S1I engaged, +5 V is applied through resistor network A8R30, A8R32, and A8R34 to A8U2 pin 5. This prevents A8U2 from developing a trigger signal. When the RESET switch, A8S1H, is pressed, it causes a negative-going spike to be applied to A8U2 pin 5. A8U2 is armed causing the output at A8U2, pin 6 to go high turning off A8Q5. A8Q4 and A8Q6 turn on and the reset lamp, DS4, on the front panel lights. A sync signal will produce one sweep.

4-83. The outputs of A8Q8 and A8Q9 develop the ALT and ALT GATE signals through A8Q17. The ALT signal is applied to the vertical display switch assembly, A7 where it is used to select the proper vertical preamplifier channel. The ALT GATE signal is applied to the analog assembly, A18, says a clock signal for flip-flop A18U7. The flip-flop develops the H1M and H2M signals.

4-84. MAIN SWEEP AND INTEGRATOR. (See schematic 8.) The main integrator, in conjunction with the sweep time controls, generates the main sweep ramp. The sweep is applied to the horizontal circuits.

4-85. The main integrator circuit is controlled by A8Q10 on assembly A8. When conducting, A8Q10 serves as a current source and prevents generation of a main sweep ramp. When A8Q10 is cut off by the bright-line auto circuit or the receipt of a trigger signal, A11Q1B and A11Q2 turn off, removing reset current from the ramp capacitors. With A11Q2 cut off, the Miller integrator circuit, A11Q3/A11Q4, is activated. Depending upon the position of the main TIME/DIV switch, A11S1, a specific integrating capacitor is connected between the gate of A11Q3 and the collector of A11Q4. The TIME/DIV switch also connects a specific integrating resistor to the emitter circuit of A11Q6 that functions as a constant current source for the ramp capacitors. When A11Q2 turns off the charging current drained by A11Q6 flows through the selected ramp capacitor (A11C11 through A11C17). This results in a linear, positive-going ramp at the output of A11Q4. The ramp generated is applied to emitter follower A11Q5. The output of A11Q5 is applied to the horizontal amplifier through the horizontal display switch assembly, A10.

4-86. The output of constant current source A11Q6 is controlled by the operational amplifier, A11U1. A different reference voltage is developed for different ranges covered by the TIME/DIV switch. This reference voltage is applied to A11U1 pin 3. When different ranges are selected by the TIME/DIV switch, the values of the ramp capacitor, integrating resistor, and A11U1 reference voltage are changed. This action changes the ramp slope for various sweep speeds. The ramp slope can be varied for any selected range with the main SWEEP VERNIER potentiometer, R12. The potentiometer is part of a voltage divider in parallel with the reference voltage applied to A11U1. When the fastest range (10 ns) of the TIME/DIV switch is selected, capacitors A11C3 and A11C4 function as the ramp generator.

4-87. The sweep ramp, developed at the collector of A11Q4 is applied to the base of A12Q12. Conduction through A12Q12 and A12Q13 follows the positive-going sweep ramp and charges (positively) a particular holdoff capacitor (A12C2 through A12C8) in the collector circuits of A12Q1 through A12Q7. The holdoff capacitor that charges positively is determined by which transistor is conducting. Depending upon the position of the TIME/DIV switch, A11S1 (see schematic 8), base bias is applied to only one transistor which conducts. With the TIME/DIV switch in either the 10-nanosecond or 20-nanosecond position, no transistor is biased on. The holdoff capacitor, which is always in the circuit, is A12C1.

4-88. When the selected holdoff capacitor charges to approximately +11 V, transistor A12Q8 turns off and transistor A12Q9 turns on. The output of A12Q9 is the positive reset pulse applied to A8U2 (refer to paragraph 4-80).

4-89. While the reset pulse is positive, A8Q8 and A8Q9 are turned off and A8Q10 turns on (see schematic 7). Since the base bias on A11Q1A (see schematic 8) is more positive than A11Q1B, A11Q1B conducts heavily and discharges the selected ramp capacitor (A11C11 through A11C17) through A11Q2. When the voltage on the base of A11Q1A reaches the voltage level applied to the base of A11Q1B, both A11Q1B and A11Q2 turn on and the sum of currents at the gate of A11Q3 is zero and the ramp is reset.

4-90. As the sweep ramp resets, transistors A12Q12 and A12Q13 turn off (see schematic 12). The selected holdoff capacitor (A12C1-A12C8) discharges through A12R1 and the TRIGGER HOLDOFF potentiometer, R8. The position of R8 determines the rate of discharge and therefore the holdoff period. When the holdoff capacitor discharges to approximately +1.4 V, A12Q10 turns off and A12Q11 turns on causing the reset signal to go negative. The negative transition of the reset signal arms trigger generator A8U2. Upon receipt of the next sync signal a new sweep is generated.

4-91. The positive-going ramp of the main sweep is also applied to integrated circuit A12U1 (pin 4). The IC is a transistor array that generates the delay comparator control signal used to energize the delay trigger generator (see schematic 9). Four signals are applied to A12U1 from the analog assembly, A18. Two signals are control signals and two signals are level references. The two control signals, H1M and H2M, are complementary and alternately become high and low during successive sweeps of the main sweep ramp. For example, on one sweep of the trace, H1M is high and H2M is low. When H1M is high, it enables a section of A12U1 that compares the input reference signal V1M with the sweep ramp. When the sweep ramp reaches the reference established by V1M, A12U1 energizes the delay trigger generator, A8U5, causing a bright segment to appear on the trace. On the next sweep of the trace, H2M becomes high, enabling a different section of A12U1. This section of A12U1 compares V2M with the sweep ramp. When the sweep ramp reaches the reference level established by V2M, A12U1 again energized the delay trigger generator causing another bright segment to appear on the trace. Thus, for every two sweeps, two bright spots appear on the trace. The first bright spot is used as a reference point where time measurements begin. The second bright spot indicates the end of the time period being measured.

4-92. The Schmitt control circuit (see schematic 13) provides the gate assembly, A14, with the proper input for each display mode. The main and delayed sweep require their own respective gates, (see figure 4-2 for simplified block diagram of gate Schmitt circuit). In mixed mode of display, a gate is generated at the start of the main sweep and stops at the end of the delayed sweep. Depending upon which input is supplied, gate Schmitt (A8U7) changes state on the first positive control pulse and resets on the first negative control pulse. The pulses are provided by differentiating the control pulses.

4-93. DELAYED SWEEP CIRCUITRY. (See schematics 9 and 10.) The delayed trigger, integrator, and sweep circuits function similarly to the main sweep circuit described previously. The one exception is that the slowest speed for delayed sweep is 20 milliseconds. Refer to paragraphs 4-69 through 4-92 for theory of operation of trigger, integrator, and sweep circuits.

4-94. ANALOG ASSEMBLY, A18. (See schematic 11.) The analog assembly produces the control signals and reference voltages applied to the delay comparator circuit. The outputs of assembly A18 are controlled by a number of input signals. The signals are discussed in the following paragraphs.

4-95. To accomplish valid time interval measurements, certain front-panel controls must be properly positioned, or control signals H1M and H2M will not be generated. To develop control signals H1M and H2M, the following front-panel controls must be positioned as indicated: horizontal display MAIN INTEN (HMI) or DLY'D (HDLY) pushbutton must be engaged, main SWEEP VERNIER (HCAL) control must be in CAL detent position delayed TRIG LEVEL (HAT) must be in START AFTER DELAY detent and time interval mode switch in ΔT OFF. The signals from these controls are applied to NAND gate A18U6.

4-96. If front-panel controls are not set properly for time interval measurement, the output of A18U6 will go high, turning on transistors A18Q6 and A18Q8. With A18Q6 and A18Q8 on, A18U7 is held in the preset state, holding H2M high. With H2M high, only one ramp comparator is enabled. A18Q8 clamps V1M low (approximately +1.4 V).

4-97. The transistor circuitry of A18Q3-Q5 control the D-input to flip-flop A18U7. When the instrument is not operated in the ALT mode of vertical display, the LALT signal is high, turning off A18Q4 and applying reverse bias to A18CR2. With A18Q4 turned off, A18Q3 is turned on, applying reverse bias to A18CR1. When the Q output of A18U7 is low, the signal is applied through A18CR4 to the base of A18Q5, turning it off. This action applies a high through A18R29 to the D-input of the flip-flop. Upon receipt of the next ALT GATE signal, the flip-flop is clocked and the Q output goes high. With the Q output high, A18CR4 is reverse biased and A18Q5 turns on, applying a low to the D-input of the flip-flop. Upon receipt of the next ALT GATE signal, the flip-flop is clocked and its Q output becomes low, completing the cycle. In this manner the H1M and H2M signals alternate between high and low with

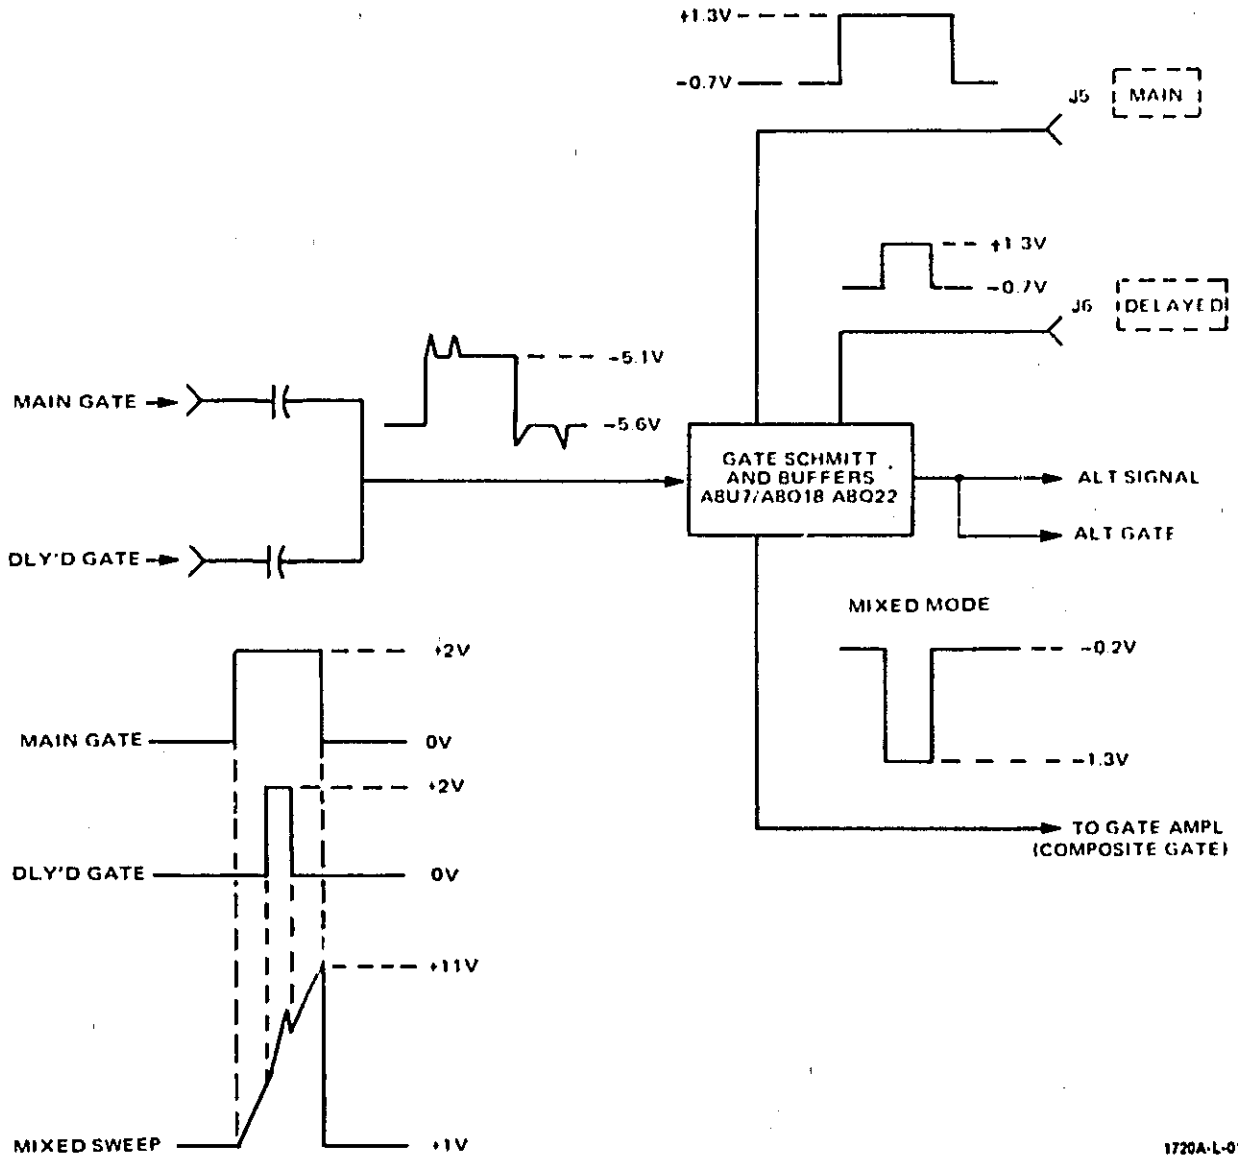

Figure 4-2. Schmitt Simplified Block Diagram (Mixed Mode)

each ALT GATE signal. Therefore, to display two bright segments on the CRT trace, two sweeps of the trace are required.

4-98. When the instrument is operated in the ALT mode of vertical display, a low (LALT) is applied to the junction of A18R26 and A18CR2. LALT enables ECL to TTL level transaltor A18Q3/A18Q4 and disables A18Q5. With A18Q3/A18Q4 enabled, channel switching information controls A18U7, H1M, and H2M are coordinated with the channel selected by time interval mode switch S3.

4-99. The time interval START potentiometer, R7, establishes the position of the first bright segment displayed on the CRT trace. The V1M signal is developed through the isolation amplifier, A18U1. The time interval STOP potentiometer, R23, establishes the position of the second bright setment displayed on the CRT. Output from R23 is applied through amplifiers A18U2 and A18U3 to an input on the summing amplifier, A18U4. The other input to A18U4 is the V1M signal. The output of A18U4 (V2M) is the V1M signal. The output of A18U4 (V2M) is the sum between the V1M signal and the position of R23. The summation on A18U4 establishes the baseline for the time interval STOP voltage so any cw adjustment of STOP potentiometer will delay the second marker beyond the position of the first.

4-100. The output from A18U2 is also applied to inverting amplifier A18U5. The output of A18U5 is applied to a voltage divider network consisting of A18R32 through A18R40. The voltage divider network is connected to different positions of the TIME/DIV switch, S1. The output from the TIME/DIV switch is applied to the INTERVAL OUT connectors, J7 and J8. The SIGNAL OVERLAY (ΔT=0) potentiometer, R24, is used to balance the outputs from the time interval START potentiometer, R7, and time interval STOP potentiometer, R23.

4-101. HORIZONTAL DISPLAY SWITCH ASSEMBLY. (See schematic 6.) The horizontal display switch assembly selects the mode of horizontal display. The different modes are X10 magnification, delayed sweep, mixed sweep, main/delayed intensified sweep, main sweep, and X-Y display.

4-102. X10 Magnification. The MAG switch, A10S1A, supplies bias to one of two circuits in the horizontal preamplifier. When not engaged, A10S1A supplies forward bias to a X1 stage (A8Q28/A8Q29) on the horizontal preamplifier. When engaged, A10S1A removes the forward bias from the X1 stage and applies it to a X10 stage (A8Q26/A8Q27).

4-103. Delayed Sweep. The DLY'D sweep switch A10S1B performs three functions. When engaged, A10S1B reverse biases the main gate control circuit preventing development of a main gate signal. Also, when engaged, A10S1B routes the delayed sweep ramp to the horizontal preamplifier. It furnishes the HDLY signal for the analog assembly.

4-104. Mixed Sweep. The MIXED sweep switch, A10S1C, performs two functions. When engaged, A10S1C applies the main sweep ramp as the reset reference to the delayed sweep integrator circuit. Also, when engaged, A10S1C routes the delayed sweep ramp to the horizontal preamplifier.

4-105. Main Intensified. The MAIN INTEN sweep switch A10S1D performs four functions. When engaged, A10S1D removes the +5 V bias applied to intensity gate A14Q10. It also applies +5 V to the delayed gate control circuit, disabling it. In addition, A10S1D routes the main sweep ramp to the horizontal preamplifier. It furnishes the HMI signal for the analog assembly.

4-106. Main Sweep. The MAIN sweep switch, A10S1E, performs three functions, When engaged, A10S1E applies +5 V to the delay comparator control and to the delayed gate control circuits disabling them. In addition, A10S1E routes the main sweep ramp to the horizontal preamplifier.

4-107. X-Y Control. The X-Y switch, A10S1F, performs a number of functions. When engaged, A10S1F removes the sync signal from rear-panel connector J4 and applies it to the horizontal preamplifier. It applies the x-y offset voltage to the horizontal preamplifier. The x-y control signal is grounded to prevent generation of the composite gate signal. It also inhibits the main signal applied to a connector on the rear of the instrument, inhibits the sweep circuit, and unblanks the CRT.

4-108. HORIZONTAL PREAMPLIFIER. (See schematic 14.) The horizontal preamplifier converts the single ended sweep from the sweep generator into a differential sweep for driving the horizontal output amplifier. During x-y operation, horizontal position and the x signal are summed and applied to the preamplifier. The preamplifier provides sweep gain adjustment, trace magnification (X10), and trace centering.

4-109. Transistors A8Q23 and A8Q24 are emitter followers used to provide input isolation. Current in the collector circuit of A8Q25 is determined by the setting of the horizontal POSITION control, R13A/B. The output current from A8Q25 is applied to A8Q24 base resistor A8R137. In x-y operation, channel B vernier controls the x-axis gain. A8R133 serves as the x-axis gain calibration adjustment. An offset current is supplied to the junction of A8R132, A8R133, and A8R135 to center the x-y display. Variable capacitor A8C45 compensates the x-y phase.

4-110. The emitter outputs from transistors A8Q23 and A8Q24 are applied to a dual differential stage that furnishes the X1 or X10 magnification for the horizontal sweep. When the MAG switch, A10S1A, is not engaged, +53 V is applied to the emitter circuits of transistors A8Q28 and A8Q29, biasing them on. Gain for the X1 range is adjusted by A8R148. Engaging the MAG switch removes the +53 V bias from A8Q28/A8Q29 and applies it to the emitter circuits of A8Q26 and A8Q27. Gain for the X10 range is adjusted by A8R146. Resistors A8R152, A8R153, and A8R154 provide a dc balance network for the differential amplifier.

4-111. Differential amplifier A8Q30/A8Q31 provides differential drive to the horizontal output amplifier. This stage, as well as the preceding differential stage, will current limit when overdriven. This prevents saturation of the output amplifier. Transistor A8Q32 functions as a constant current source for the amplifier stage. When the BEAM FIND switch, A8S1A, is pressed, less current is supplied to the amplifier stage. This ensures that the horizontal portion of the trace is returned to the viewing area of the CRT.

4-112. HORIZONTAL OUTPUT. (See schematic 15.) The horizontal output is a differential shunt-feedback amplifier. The currents through A13R3 and A13R4 determine the output voltage since little

current flows in the bases of transistors A13Q1, A13Q2, A13Q3, and A13Q4. Variable capacitors A13C5 and A13C7 control the fast corner response, and A13C6 and A13C8 control the slightly slower corner response of the circuit. Resistors A13R1 and A13R2 establish the minimum output voltage level. With the input circuit disconnected, the minimum output voltage level is approximately +9 V.

4-113. Transistors A13Q1 through A13Q4 are emitter followers with A13Q1 and A13Q4 providing the dc signal path and A13Q2 and A13Q3 providing the ac signal path. In a similar manner, A13Q5 and A13Q8 are the dc signal path, and A13Q6 and A13Q7 are the ac signal path. Transistors A13Q6 and A13Q7 are current sources, and resistors A13R23 and A13R24 serve to lower the power in these transistors. Each side of the output amplifier can swing from approximately +9 V to +95 V.

4-114. GATE ASSEMBLY AND CALIBRATOR.

4-115. GATE CIRCUITRY. (See schematics 16 and 17.) The gate assembly controls intensity of the trace on the CRT. The gate preamplifier, consisting of A14Q1 through A14Q10 sums all desired functions necessary for control of trace intensity. This is accomplished with current switches (see figure 4-3 for simplified block diagram of gate circuit).

4-116. Gate Preamplifier. The setting of the front-panel INTENSITY control, R2, controls the base voltage applied to A14Q8. The emitter voltage of A14Q8 follows the base voltage and is 0.6 V above the base voltage. This voltage applied to A14R18 establishes the current for current switch A14Q1, A14CR3, and A14Q9.

4-117. The composite gate signal from the gate Schmitt is applied to the base of A14Q1. This signal switches the current path between A14Q1 or A14Q9, thus causing the gate output voltage to the high-voltage power supply to change.

4-118. The intensified gate functions in a similar manner. It is a current switch consisting of A15Q10, A14CR4, and A14CR5. Its current source is the voltage at the emitter of A14Q8 across A14R22 and A14R23. Zener diode A14VR1 and resistor A14R24 limit the maximum level of the intensified gate. The main intensity control signal is applied through A14R25 to this current switch. The main intensity signal enables the current switch during main intensified mode only.

4-119. Chop blanking is accomplished by current switch A14Q2 and A14Q3. When CHOP mode of operation s selected, the chop blanking signal applied to the base of A14Q2 turns it on and off. The alternating action switches the current path between A14Q2 and A14Q3. Transistor A14Q3 sinks current from A14Q9 turning off the trace when switching channels.

4-120. When the BEAM FIND switch, A8S1A, is pressed, the front-panel INTENSITY control, R2, is disabled and a fixed voltage is supplied through the gate amplifier to the high-voltage power supply. A z-axis voltage applied to A14R6 similarly causes a current change through the gate amplifier. A z-axis signal of > +1 V, pulse width > 50 ns, dc to 20 MHz will blank the CRT trace of normal intensity. A z-axis signal of +8 V will blank the CRT trace regardless of intensity setting.

4-121. Transistors A14Q4 and A14Q5 make up an intensity limit circuit. As intensity becomes excessive in the CRT, its first accelerator begins to draw cur-

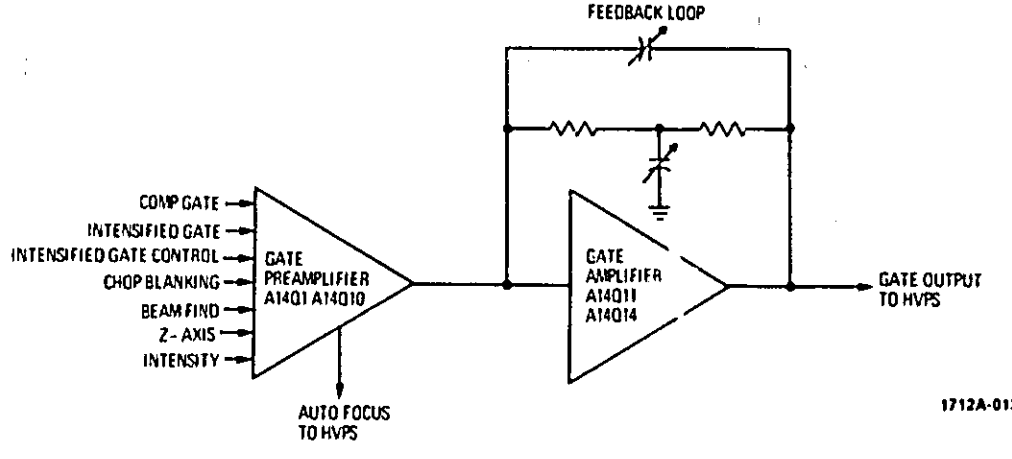

Figure 4-3. Gate Control Simplified Block Diagram

rent. This increases current through A14R16, causing the voltage on the base of A14Q4 to change. The voltage at the emitter of A14Q4 follows the base voltage and is 0.6 V below the base. This raises the voltage applied to the base of A14Q8 through front-panel INTENSITY control R2. Variable resistor A14R15 establishes the level at which limiting takes place. Variable resistor A14R10 sets the maximum level the gate output can reach, providing optimum gate drive to the CRT.

4-122. An autofocus circuit is incorporated in the instrument. Varying the INTENSITY control, R2, varies the bias applied to the emitter circuit of A14Q7. As conduction through A14Q7 increases or decreases, the voltage drop across the FOCUS control, R1, changes accordingly (see schematic 17). This automatically corrects the focus adjustment for changes in intensity level.

4-123. Gate Amplifier. The gate amplifier output is a shunt feedback stage consisting of A14Q11 through A14Q14. Transistors A14Q11 and A14Q13 are emitter followers with A14Q11 providing the ac signal path. Resistors A14R30 and A14R31 provide the dc feedback path. Variable capacitor A14C7 controls fast corner response while A14C8 controls slightly slower corner response.

4-124. Due to the high open loop gain of the amplifier most of the current appearing at the summing junction (bases of A14Q11 and A14Q13 flows through the feedback resistors A14R30 and A14R31. This results in a change in output voltage equal to the input current times the feedback resistance (A14R30 plus A14R31). Under certain conditions, the gate output may swing from +5 V to +100 V.

4-125. CALIBRATOR. (See schematic 16.) The calibrator consists of integrated circuit A14U1 and associated bias controls. It is connected in a multivibrator configuration and free-runs at approximately 1 kHz. The calibrator amplifier adjustment, A14R51, is adjusted to produce a square wave with 3 volts amplitude at the CAL 3 V terminal on the front panel.

4-126. CRT CONTROLS. (See schematic 17.) There are few CRT adjustments physically located on the gate assembly, A14, yet are accessible at the rear panel of the instrument for CRT control. These adjustments are TRACE ALIGN (A14R67), ASTIG (A14R74), and PATT (A14R76). A functional description of these controls is given in Section III.

4-127. Two additional CRT controls physically located on A14 are screwdriver adjustments. The floodgun pattern control, A14R64, adjusts the voltage applied to flood-gun filaments of the CRT to control scale illumination range. The ORTHO ADJ control, A14R70, adjusts current through the y-axis alignment coil on the CRT.

4-128. HIGH-VOLTAGE POWER SUPPLY.

4-129. The high-voltage power supply contains a high-voltage oscillator and a rectifying circuit. The high-voltage regulator is part of A14.

4-130. When the instrument is turned on, +20 V (unregulated) is applied to transistor Q1, turning it on. As Q1 conducts through the primary winding of the high-voltage transformer, A15T1, (pin 3 and 4), positive feedback to the base of Q1 occurs through another winding on the transformer (pins 1 and 2). The circuit oscillates at a rate determined by the inherent distributed inductance and capacitance of the circuit. The magnitude of the oscillations, and consequently the output of the power supply, is controlled by voltage on the collector of voltage regulator A14Q17.

4-131. A reference voltage from the +15 V supply is established at the junction of A15R10 and A15R12 and is applied to the base of A14Q15 on A14. A sample of the rectified cathode voltage is fed back to the base of A14Q15 through A15R10. Any difference in cathode voltage is amplified and inverted by the Darlington amplifier, A14Q15/Q16. Output of the Darlington pair drives the base of A14Q17. causing its collector voltage to change. This change is coupled through a winding on A15T1 to the base of Q1 and causes the amplitude of its oscillations to change. This change is in such a direction as to correct the original change in the rectified cathode voltage. Diode A15CR1 and A15CR2 protect the oscillator transistor base from excess reverse voltage.

4-132. The CRT cathode and grid voltages are developed in the secondary of A15T1. The cathode voltage is rectified and filtered before application to the cathode of the CRT. It is also used as a feedback control to the high-voltage oscillator, as a reference for the CRT filament winding, for grid bias supply, and for the focus voltage-divider network. The cathode voltage will vary between —2827 V and —2973 V, depending on component tolerance and is not adjustable.

4-133. The CRT grid voltage is supplied by a voltage tap (pin 5) on the secondary winding of A15T1. Approximately 300 V peak is developed and applied through a series RC network (A15C2/A15R2) to diodes which clamp the voltage swing between that established by the INT SET control, A15R3, and the gate dc levels. The peak-to-peak voltage swing is rectified, and applied to the grid with reference to cathode voltage and controls the beam brightness.

4-134. The unrectified cathode voltage in the secondary of A15R1 is applied to the multiplier assembly, A16, where the voltage is multiplied approximately six times. The output of the multiplier (approximately +17.5 kV) is applied to the post-accelerator connector on the CRT.

4-135. Another secondary winding of A15T1 provides filament voltage for the CRT. This winding is referenced to the rectified cathode voltage through A15R5.

4-136. LOW-VOLTAGE POWER SUPPLY.

4-137. The low-voltage power supply provides regulated +5 V, +15 V, +53.3 V, +115 V, and —15 V for operation of the various circuits in the instrument. All low-voltage supplies are referenced to the +15 V supply for regulation purposes.

4-138. ±15-VOLT SUPPLIES. (See schematic 19.) One of the secondary windings on input power transformer T1 is connected to bridge rectifier A17CR7. The rectified voltage (nominally +20 Vdc is filtered by A17C8. The output of the supply is maintained at +15 volts by integrated circuit A17U2 and series regulator transistor Q5. Regulator A17U2 contains a differential amplifier with a Darlington output. The reference circuit A17VR3, is connected to the noninverting input of the differential amplifier (pin 3) through A17R20. The +15-volt output is divided through A17R22, A17R23, and A17R24. The wiper of potentiometer A17R23 is connected to the inverting input of the differential amplifier. The Darlington output (pin 6) drives the base of series transistor Q5. Resistor A17R23 is adjusted to compensate for variations of the reference voltage so that with an output of +15 volts from the supply, the inverting and non-inverting input voltages are equal.

4-139. The IC regulation includes an output current limiting circuits consisting of an NPN transistor whose collector is connected to the differential amplifier and first base of the Darlington pair (within the IC). The emitter and base connections for the NPN transistor are pins 1 and 10 on A17U2. When load current through A17R21 produces a sufficient voltage drop, the NPN transistor conducts, pulling the input to the Darlington pair toward the emitter potential of Q5. This limits the output current. The output current limit is 0.55 to 0.75 ampere.

4-140. —15-volt Supply. (See schematic 19.) Operation of the —15 V regulator, A17U3, is identical to that of the +15 V regulator except that the inverting input to the IC is the sum of the +5 V and —15 V outputs (nominally 0 V).

4-141. +5-VOLT SUPPLY. (See schematic 18.) The +5-volt regulator A17U1 functions identically to that of the +15 V regulator A17U2 except that the reference is provided by the output of the +15 V supply and divided by A17R15 and A17R16.

4-142. +115-VOLT AND +53.3-VOLT POWER SUPPLIES. (See schematic 18.) The +115-volt and +53.3-volt power supplies function identically, therefore only the +115-volt supply will be discussed.

4-143. The ac input voltage from power transformer T1 is applied to bridge rectifier A17CR1. The dc output from A17CR1 is filtered by A17C1. A +15 V reference is applied through A17CR5 to the emitter of transistor A17Q3. The base of A17Q3 is connected to a voltage-divider network across the output circuit. If the output falls below +115 V, the base of A17Q3 becomes less positive than the emitter and it conducts. With A17Q3 turned on, conduction through Darlington pair Q2 and A17Q2 increases. This results in an increase in output voltage. When the output voltage again reaches +115 volts, A17Q3 turns off. Transistor A17Q1 and resistor A17R2 form a current limiting circuit. As current requirements increase toward the limit of the supply capability, the voltage drop across A17R2 is applied to the base of A17Q1 which conducts and limits current drain from the Darlington pair.

4-144. The +53.3-volt power supply functions identically as the +115-volt supply. The Darlington pair consists of transistor Q3 and A17Q5. The current limiting circuit consists of transistor A17Q4 and resistor A17R8.

4-145. FLOODGUN FILAMENT VOLTAGE. (See schematic 19.) Floodgun filament voltage is developed in a secondary winding of ac power transformer T1. The ac input voltage is rectified by A17CR9/CR10 and filtered by A17C14. One branch of the output circuit is applied directly to the floodgun filament connection on the CRT. The other branch is applied to a control circuit on gate assembly A14. Output of the control circuit on assembly A14 is applied to the other filament connection on the CRT (see schematic 17).

4-146. LINE FREQUENCY. (See schematic 18.) The line frequency trigger signal is developed in the same secondary winding of power transformer T1 that is used for the +5-volt power supply. The line frequency signal is applied through A17R18 to the HF REJ switch, A8S1M, on assembly A8 (see schematic 7).

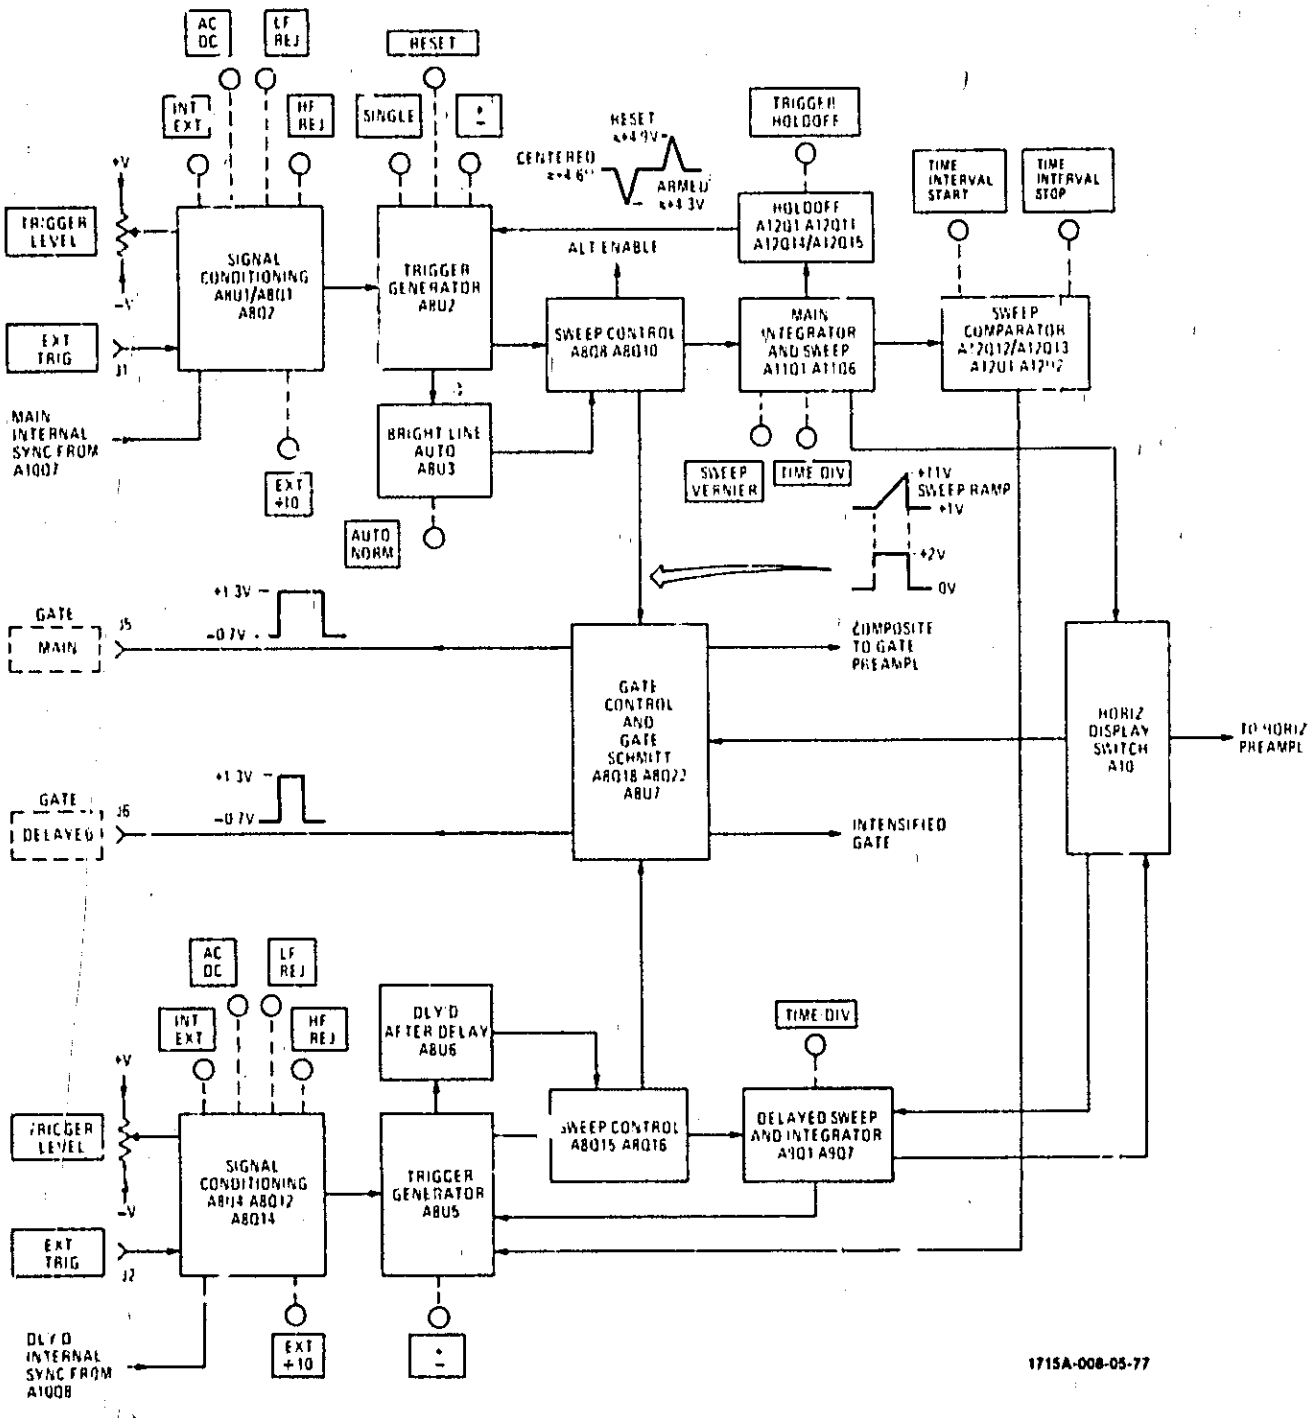

Figure 4-4. Time Base Simplified Block Diagram

SECTION V

PERFORMANCE CHECK AND ADJUSTMENTS

5-1. INTRODUCTION.

5-2. This section contains step-by-step procedures for checking the instrument specifications as given in table 1-1 of this manual. The performance checks are arranged in numerical order. For best results, this order should be followed. Included in this section are test setups, procedures, and test equipment required. Most test points and adjustment locations are shown within the procedures in which they are referenced. The procedures for making all internal adjustments are covered in paragraphs 5-39 through 5-90.

5-3. TEST EQUIPMENT.

5-4. Recommended test equipment and accessories are listed in table 5-1. Test equipment equivalent to that recommended may be substituted, provided it meets the required characteristics listed in the table. For best results, use recently calibrated test equipment.

5-5. PERFORMANCE CHECKS.

5-6. The performance checks given in this section are suitable for incoming inspections, preventative maintenance, and troubleshooting. The checks are designed to verify the published instrument specifications. Perform the checks in the order given, and record the measured information on the performance check record at the end of this section.

5-7. ADJUSTMENTS.

5-8. The adjustment procedures are arranged in a recommended sequence of adjustments. While most adjustments may be made independent of other adjustments, it is recommended that adjustments be made sequentially as a number of adjustments are directly related to preceding or following adjustments.

5-9. PERFORMANCE CHECK RECORD.

5-10. Each measurement point in the performance check is repeated in the performance check record. The pages may be removed for filing. The first time the performance check is made, enter the results on the performance check record and file it for future reference.

5-11. FRONT-PANEL CONTROL SETTINGS.

5-12. Set up the instrument and perform initial adjustments outlined in Section III before proceeding with the performance check and adjustment procedures.

5-13. The control settings listed below are to be used for each performance check and adjustment procedure. If a control is to be set to another position, it will be listed in the procedure. After the completion of each performance check or adjustment procedure, set the controls back to the original front-panel settings.

Control	Position
Vertical (channels A and B):	
POSITION	centered
VOLTS/DIV	.1
Coupling	DC
Verniers	CAL
VERT DISPLAY	A
INT TRIG	A
BW LIMIT	out position
B INVERT	out position
Horizontal:	
POSITION (coarse and fine)	centered
HORIZ DISPLAY	MAIN
MAG X10	X1 position
STOP	1.00
TIME/DIV (main)	.1 mSEC
TIME/DIV (delayed)	OFF
TRIG LEVEL (delayed)	STARTS AFTER DELAY
TRIG LEVEL (main)	midrange
SWEEP VERNIER	CAL
TRIGGER HOLDOFF	detent position
All time base pushbuttons	out position
INTENSITY	visible trace

5-14. PERFORMANCE CHECK PROCEDURES.

5-15. DEFLECTION FACTOR. Ranges are from 10 mV/div to 5 V/div (9 ranges) in 1, 2, 5 sequence. Accuracy is ±2% with the vernier in calibrated position. The vernier is continuously variable between all ranges and extends maximum deflection factor to at least 12.5 volts/div. The UNCAL light indicates when vernier is not in CAL position.

Table 5-1. Recommended Test Equipment

Instrument		Required Characteristics	Required For
Type	Model		
DC Standard Voltmeter	HP Model 740B	Voltage: 0.5 to 30V Accuracy: to 0.1%	P,A
VHF Oscillator	HP Model 3200B	Frequency: to 300 MHz Accuracy: +2%	P,A
Test Oscillator	HP Model 651B	Frequency: 10MHz	P,A
RF Voltmeter	HP Model 3406A	Voltage: to 3V	P,A
50 OHM TEE	HP Model 11063A		P,A
Time-mark Generator	Tektronix* TG 501	Time marks: 2 ns to 0.5 s	P,A
Fast-rise Pulse Generator	Tektronix* PG 506	Pulse rise time: <400 ps	P
Multifunction Digital Voltmeter	HP Model 34740A with 34702A	Voltage Range: >±15V Accuracy: ±0.1%	A
Probe	HP Model 10018A	Divide Ratio: 10:1	A
20-dB Attenuator	HP Model 355D	Attenuator: 20 dB	A
50-ohm Power Divider	HP Model 11549A		P
Test Oscilloscope	HP Model 1740A	100 MHZ, Delayed Sweep Scope	A
Pulse Generator	HP Model 8013B	Trigger Output Frequency: 10 kHz	A

*Requires Tektronix Model TM 503 Main Frame

P = Performance Check, A = Adjustment Procedure.

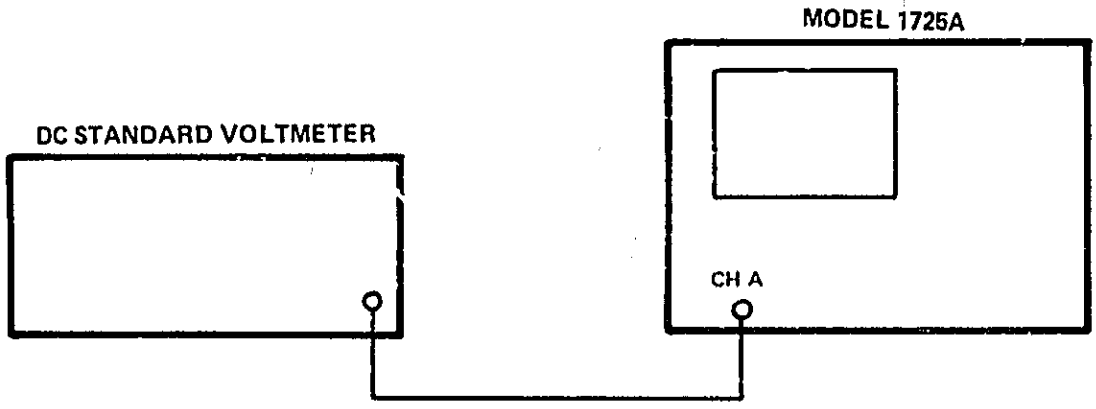

Figure 5-1. Deflection Factor Test Setup

5-16. The deflection factor is checked by applying a dc voltage-calibrated signal to the input. The displayed displacement is compared against the voltage standard.

Equipment Required:

DC Standard voltmeter

5-17. Perform deflection factor check as follows:

a. Connect instruments as shown in figure 5-1.

b. Set main TIME/DIV control to .5 mSEC.

c. Set channels A and B VOLTS/DIV controls to .01 position.

d. Set base line to bottom graticule line.

e. Set dc standard voltmeter controls for 50-mV dc output signal.

f. Note display. Vertical deflection should be 5 divisions ±2% (±.1 div).

g. Observe vertical deflection factors specified in table 5-2.

h. Set dc standard voltmeter output for 30V.

i. Set channel A VOLTS/DIV control to 5.

j. Rotate channel A vernier fully counterclockwise. Vernier UNCAL light should be lighted and display amplitude should decrease to less than 2.4 divisions.

k. Set channel A vernier to CAL position.

l. Connect dc standard voltmeter to channel B INPUT connector.

m. Set VERT DISPLAY control to B.

n. Set INT TRIG control to B.

o. Repeat steps d through k for channel B.

p. Disconnect test equipment.

q. Set Model 1725A front-panel controls to initial settings.

Table 5-2. Deflection Factor Accuracy

DC Standard Settings (Volts)	VOLTS/DIV Settings	Vertical Display (div)
.05	.01	5 ±2% (±.1)
.1	.02	5 ±2% (±.1)
.3	.05	6 ±2% (±.12)
.5	.1	5 ±2% (±.1)
1	.2	5 ±2% (±.1)
3	.5	6 ±2% (±.12)
5	1	5 ±2% (±.1)
10	2	5 ±2% (±.1)
30	5	6 ±2% (±.12)

5-18. CALIBRATOR ACCURACY. The calibrator output is a square wave with 3V ±1% amplitude, at approximately 1 kHz.

5-19. The amplitude is checked by comparing the p-p signal against a known 0.1% signal.

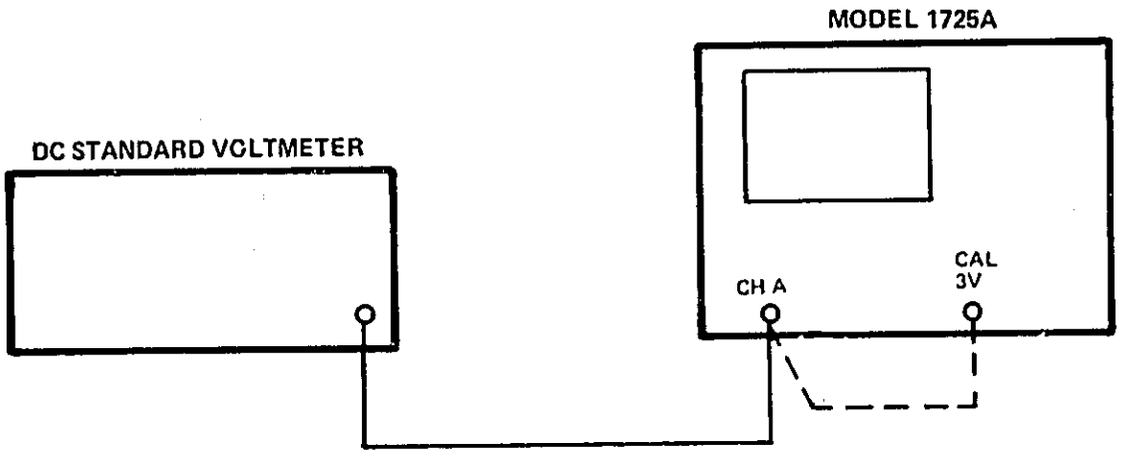

Figure 5-2. Calibrator Accuracy Test Setup

Equipment Required:

DC Standard voltmeter

5-20. Perform calibrator accuracy check as follows:

a. Connect equipment as shown in figure 5-2.

b. Set Model 1725A controls as follows:

TIME/DIV (main) ..... .5 mSEC
VOLTS/DIV (channel A) 5

c. Set dc standard voltmeter for 3V dc output signal.

d. Note vertical deflection on CRT.

e. Disconnect dc standard voltmeter from Model 1725A.

f. Connect Model 1725A CAL 3 V output to channel A INPUT connector using test lead and adapter.

g. Note vertical deflection on CRT. Vertical deflection should be same as noted in step d, ±1%. Frequency should be approximately 1 kHz.

h. Disconnect test lead.

i. Set Model 1725A front-panel controls to initial settings.

5-21. Z-AXIS BLANKING. A signal of +8 volts, >50-ns wide pulse will blank a trace of any intensity. Usable to 20 MHz for normal intensity.

5-22. A free-running trace of normal intensity is obtained on CRT. A signal of +8 volts is applied to the Z-AXIS input connector on the rear panel of Model 1725A. The display should be blanked regardless of INTENSITY setting.

Equipment Required:

DC Standard voltmeter

5-23. Perform Z-axis blanking check as follows:

a. Obtain free-running base line on CRT.

b. Adjust INTENSITY control for normal viewing level of baseline.

c. Connect equipment as shown in figure 5-3.

d. Set dc standard voltmeter for +8 volts, dc output signal.

e. Observe base line is blanked.

f. Disconnect test equipment.

g. Set Model 1725A front-panel controls to initial settings.

5-24. BANDWIDTH. Direct or with HP Model 10020A probe, or with 10 X, 10-megohm divider probe (HP Model 10014A). (3 dB down from a 10-MHz 6-division reference signal from a terminated 50-ohm source.) DC coupled: dc to 275 MHz; AC coupled: 10 Hz to 275 MHz.

5-25. To check the bandwidth, a vhf oscillator is used to apply a 6-division 10-MHz reference signal to the input of Model 1725A. An rf voltmeter is used to measure the signal level. The vhf oscillator frequency is increased to 275 MHz and the amplitude is adjusted to give the same indication on the rf voltmeter. Displayed amplitude must be equal to or greater than 4.2 divisions.

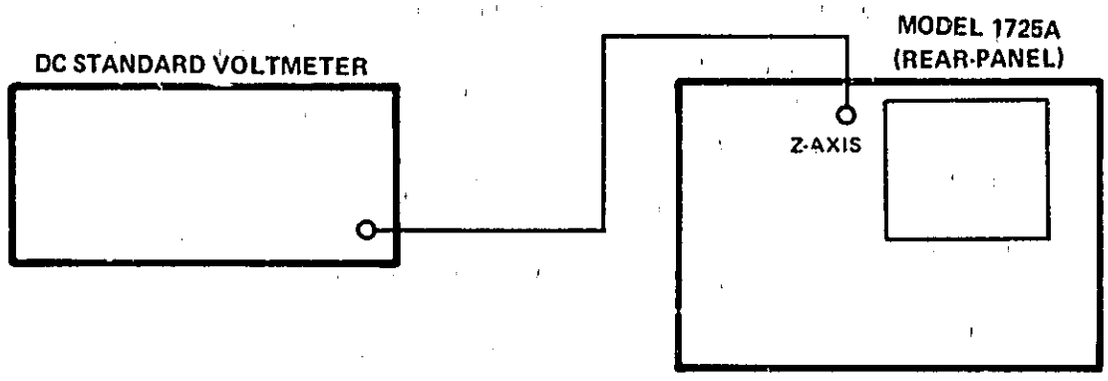

Figure 5-3. Z-axis Blanking Test Setup

Equipment Required:

VHF oscillator
RF voltmeter
50-ohm tee
50-ohm termination
50-ohm power divider
20-dB attenuator

5-26. Perform bandwidth check as follows:

a. Connect equipment as shown in figure 5-4.

b. Set channel A and B input couplings to 50Ω position.

c. Adjust vhf oscillator for 10-MHz 6-division display.

d. Note indication on rf voltmeter.

e. Increase signal output of vhf oscillator to 275 MHz.

f. Adjust output amplitude of signal from vhf oscillator until rf voltmeter indication is same as noted in step d.

g. Observe display. Signal amplitude should be equal to or greater than 4.2 divisions.

h. Disconnect input signal from channel A INPUT connector.

i. Connect input signal to channel B INPUT connector.

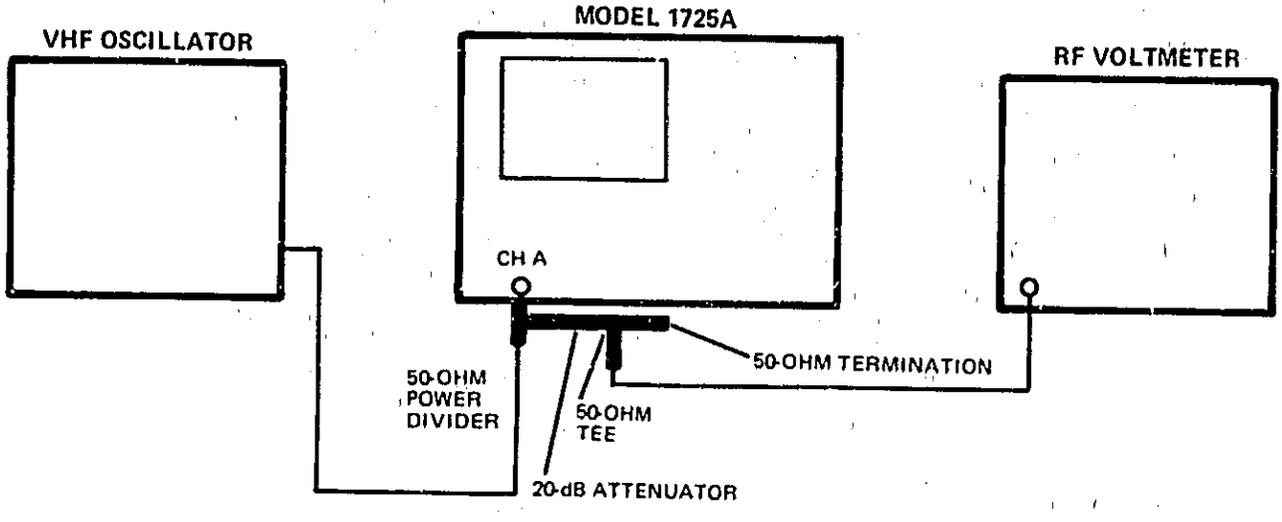

Figure 5-4. Bandwidth Test Setup

j. Set VERT DISPLAY control to B.

k. Set INT TRIG control to B.

l. Repeat steps c through h for channel B.

m. Disconnect test equipment.

n. Set 1725A front-panel controls to initial settings.

5-27. TRIGGERING. Internal triggering occurs from dc to 100 MHz on signals causing 0.5 division or more of vertical deflection, increasing to 1-division vertical deflection at 300 MHz in all display modes. Triggering on line frequency is also selectable. External triggering occurs from dc to 100 MHz on signals with an amplitude of 50 mV p-p or more, increasing to 100 mV p-p at 300 MHz.

5-28. In the internal trigger mode triggering is checked against certain vertical deflections on the CRT. In the external trigger mode, the input signal amplitude is monitored with an rf voltmeter.

Equipment Required:

VHF oscillator
RF voltmeter
50-ohm tee
50-ohm power divider
50-ohm termination

5-29. Perform triggering check as follows:

a. Connect equipment as shown in figure 5-5.

b. Set Model 1725A channel A coupling to 50Ω position.

c. Set vhf oscillator for 100 MHz, 0.5 division of vertical deflection output signal.

d. Adjust main TIME/DIV and main TRIG LEVEL controls for stable display. (If stable display is obtained, instrument is triggering properly.)

e. Set vhf oscillator for 300 MHz, 1 division of vertical deflection output signal.

f. Adjust main TRIG LEVEL control for stable display. (If stable display is obtained, instrument is triggering properly.)

g. Set main INT/EXT switch to EXT position.

h. Set vhf oscillator for 100-MHz, 17.7-mV output signal as observed on rf voltmeter (50 mV p-p).

i. Adjust main TRIG LEVEL control for stable display. (If stable display is obtained, instrument is triggering properly.)

j. Set vhf oscillator for 300-MHz 35.4-mV output signal as indicated on rf voltmeter (100 mV p-p).

k. Adjust main TRIG LEVEL control for stable display. (If stable display is obtained, instrument is triggering properly.)

l. Set main INT/EXT switch to INT position.

m. Set main TIME/DIV control to 20-nSEC position.

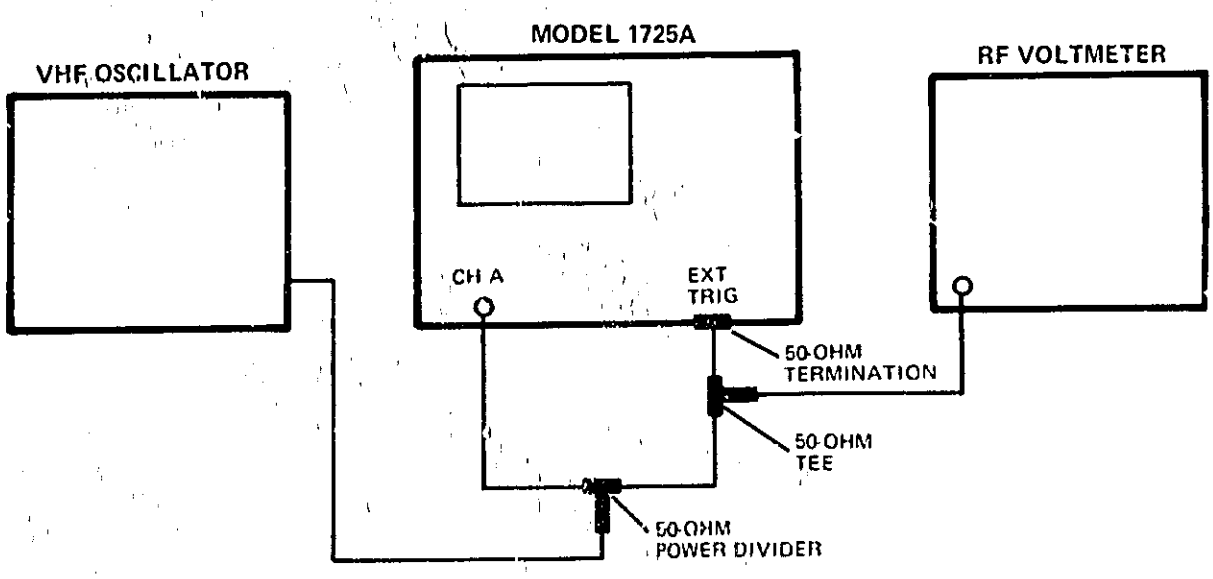

Figure 5-5. Main Triggering Test Setup

n. Set delayed TIME/DIV control to 10-nSEC position.

o. Adjust vhf oscillator for 1 division of signal amplitude.

p. Adjust main TRIG LEVEL control for stable display.

q. Set HORIZ DISPLAY control to DLY'D.

r. Adjust delayed TRIG LEVEL control for stable display.

s. Connect equipment as shown in figure 5-6.

t. Set delayed INT/EXT switch to EXT position.

u. Set HORIZ DISPLAY control to MAIN.

v. Set vhf oscillator for 300-MHz 35.4-mV output signal as indicated on rf voltmeter (100 mV p-p).

w. Adjust channel A VOLTS/DIV switch to .05.

x. Adjust main TRIG LEVEL for stable display.

y. Set HORIZ DISPLAY to DLY'D.

z. Adjust delayed TRIG LEVEL for stable display. (Readjust main TRIG LEVEL if necessary.)

aa. If stable display is obtained, instrument is triggering properly.

ab. Disconnect test equipment.

ac. Set Model 1725A front-panel controls to initial settings.

5-30. COMMON-MODE REJECTION. At least 40 dB, dc to 5 MHz, decreasing to 26 dB at 50 MHz. The common-mode signal amplitude is equivalent to 12 divisions with one vernier adjusted for optimum rejection.

5-31. Identical signals are applied to both channels A and B with channel B set to the inverted mode. The displayed signal is the common-mode signal.

Equipment Required:

Test oscillator
50-ohm power divider

5-32. Perform common-mode rejection check as follows:

a. Connect equipment as shown in figure 5-7.

NOTE

Cables used to connect channels A and B INPUT connectors to 50-ohm power divider must be of the same electrical length.

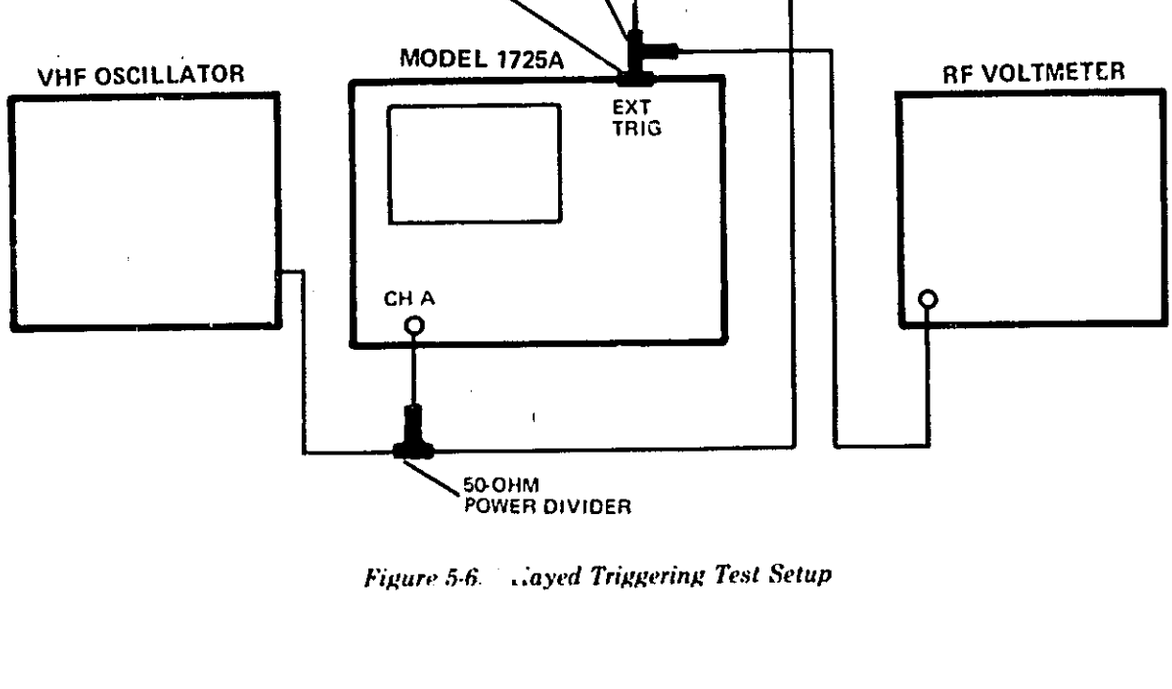

Figure 5-6. Delayed Triggering Test Setup

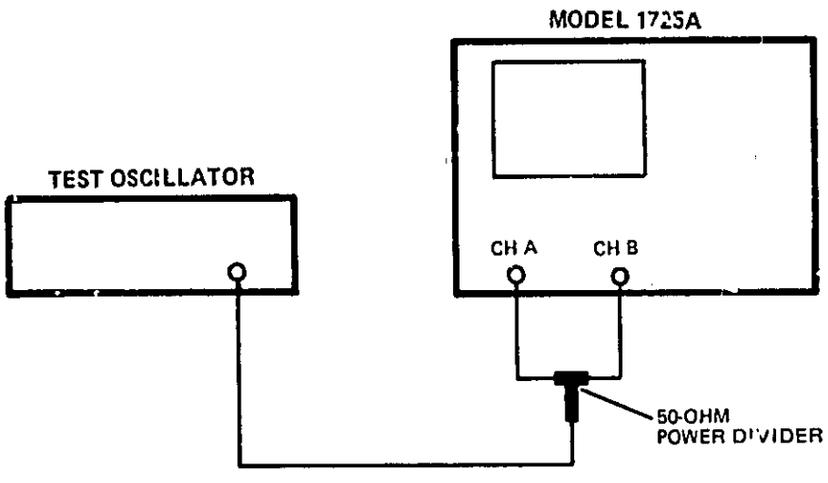

Figure 5-7. CMRR Test Setup

b. Set Model 1725A front-panel controls as follows:

VOLTS/DIV (channels A and B)..... .1
Coupling (channels A and B)..... 50Ω
B INVERT ..... engaged

c. Set test oscillator for 5-MHz 2-division amplitude display on CRT.

d. Set channels A and B VOLTS/DIV controls to .01 position.

e. Set VERT DISPLAY control for A+B operation (both A and B pushbutton switches depressed).

f. Adjust either channel A or channel B vernier (whichever is most effective) to achieve minimum deflection.

g. Deflection should be less than one minor division (40 dB).

h. Set test oscillator for 50-MHz output.

i. Repeat steps b through f, using 50 MHz.

j. Deflection should be less than 1.1 major division (26 dB).

k. Disconnect test equipment.

l. Set Model 1725A front-panel controls to initial settings.

5-33. SWEEP-TIME ACCURACY. The ranges are from .01 μs/div to 0.5 s/div (24 ranges) in 1, 2, 5 sequence. The accuracy of the .01 μs/div through .05 μs/div and .05 s/div through 0.5 s/div ranges is ±3%. The accuracy of the .1 μs/div through .02 s/div ranges is ±2%. The stipulated accuracies of all ranges are with the vernier in calibrated position. The vernier is continuously variable between all ranges and extends slowest sweep to at least 1.25 s/div. The vernier UNCAL light indicates when the vernier is not in CAL position.

5-34. The Model 1725A time base is compared to a time-mark generator to verify accuracy.

Equipment Required:

Time-mark generator

5-35. Perform sweep time accuracy check as follows:

a. Connect equipment as shown in figure 5-8.

b. Set channel A input coupling to 50Ω position.

c. Check main sweep accuracy in accordance with table 5-3.

d. Set HORIZ DISPLAY control to DLY'D.

e. Check delayed sweep accuracy in accordance with table 5-4.

f. Disconnect test equipment.

g. Set Model 1725A front-panel controls to initial settings.

5-36. DIFFERENTIAL TIME INTERVAL ACCURACY. ±0.5% of measurement; ±0.05% to 0.2% of full scale depending upon main time base setting, measured at normal room temperature (≈22.2°C).

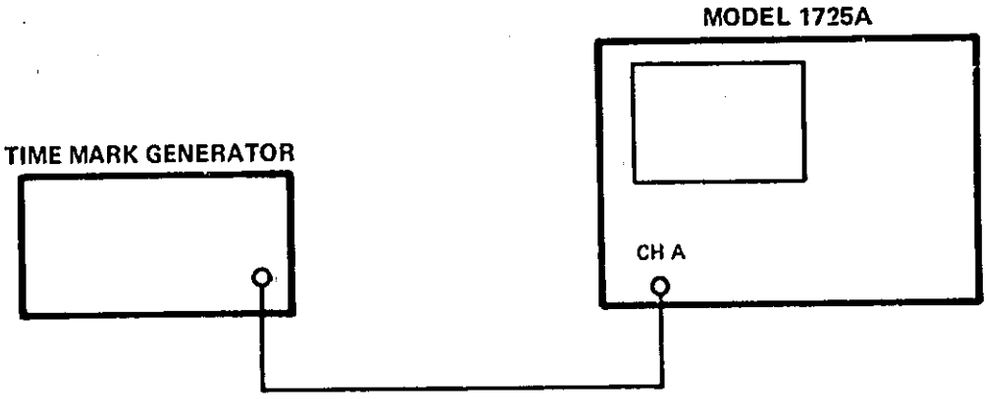

Figure 5-8. Main Sweep Time Test Setup

Table 5-3. Main Sweep Performance Check

Main TIME/DIV and Time Mark Generator Settings	*Accuracy (0°C to 55°C)	
	X1	X10
.01 µSEC to .05 µSEC**	±3% (within .3 div)	±5% (within .4 div)***
.1 µSEC to .02 SEC	±2% (within .2 div)	±3% (within .3 div)
.05 SEC to .5 SEC	±3% (within .3 div)	±3% (within .3 div)

*Set one time mark at 1st left graticule line and read error at 11th graticule line. Adjust main TRIGGER LEVEL control as necessary for stable display.

**Exclude time marks occuring in first 10 nanoseconds of sweep.

***Measure accuracy over inside eight divisions on X10, .01 µSEC to .05 µSEC sweep speeds.

Table 5-4. Delayed Sweep Performance Check

*Delayed TIME/DIV and Time Mark Generator Settings	**Accuracy (0°C to 55°C)	
	X1	X10
.01 µSEC to .05 µSEC***	±3% (within .3 div)	±5% (within .4 div)****
.1 µSEC to .02 SEC	±2% (within .2 div)	±3% (within .3 div)

*Main TIME/DIV switch is always one sweep position slower than delayed TIME/DIV switch setting.

**Set one time mark at 1st left graticule line and read error at 11th graticule line. Adjust main and delayed TRIGGER LEVEL controls as necessary for stable display.

***Exclude time marks occuring in first 10 nanoseconds of sweep.

****Measure accuracy over inside eight divisions on X10, .01 µSEC to .05 µSEC sweep speeds.

5-37. To measure time interval accuracy, a time-mark generator signal is applied and the time interval voltage is measured across 8 divisions of main sweep.

Equipment

Time-mark generator
Multifunction digital voltmeter
(Delete on Option 034)

5-38. Perform differential time interval accuracy check as follows:

a. Connect time mark generator to Model 1725A as shown in figure 5-9.

b. Set Model 1725A front panel controls as follows:

TIME/DIV (main) ..... .02 uSEC
TIME/DIV (delayed)..... .01 uSEC
HORIZ DISPLAY..... MAIN INTEN
VOLTS/DIV (channel A) 0.5
INT/EXT (main)..... EXT
Time Interval Mode Switch ..... CH A START

c. Set time-mark generator for 20 ns time marks.

d. Connect multifunction digital voltmeter to Model 1725A INTERVAL OUT banana-jack connector (rear panel); Option 034 switch DVM to time interval measurement mode.

e. Adjust time interval STOP control for .140 volts displayed on DVM.

f. Adjust time interval START control to position first intensified marker on a time mark at least 60 ns after the beginning of main sweep.

g. Select DLY'D and MAG X10.

h. Center leading edge of time mark with time interval START control.

i. Superimpose two time marks using time interval STOP control.

j. DVM reading must be .140 V ± .0011 V.

k. Repeat steps a-j using time-marks, main and delayed TIME/DIV settings, and DVM readings as follows:

MAIN TIME/DIV	DELAYED TIME/DIV	TIME MARKS	DVM READINGS
.05 µSEC	.01 µSEC	50 ns	.400 V ±.002 V
.5 µSEC	.05 µSEC	.5 µs	4.00 V ±.02 V
5 µSEC	.5 µSEC	5 µs	40.0 V ±.2 V
.05 mSEC	5 µSEC	50 µs	.400 V ±.002 V
.5 mSEC	.05 mSEC	.5 ms	4.00 V ±.02 V

l. Disconnect test equipment and set Model 1725A front-panel controls to initial settings.

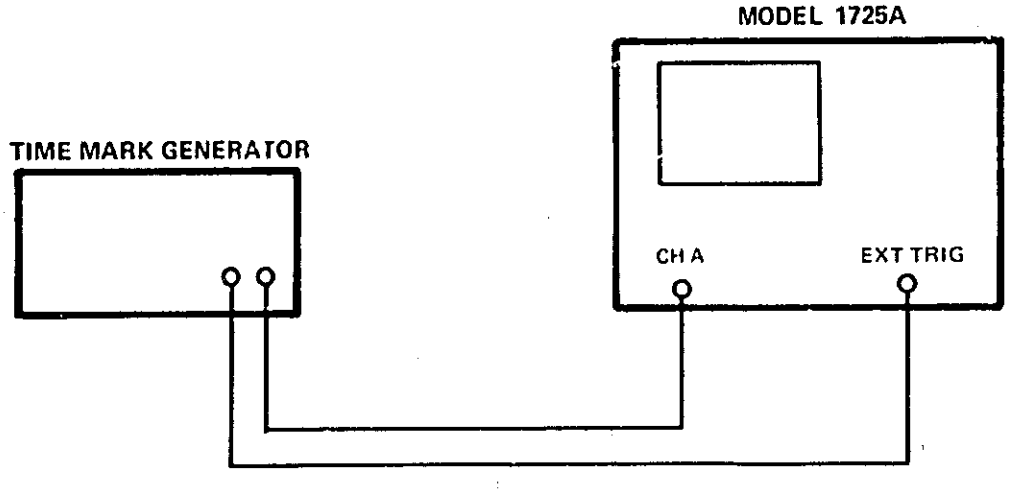

Figure 5-9. Sweep-time Test Setup

5-39. ADJUSTMENT PROCEDURES.

WARNING

Read the Safety Summary at the front of this manual before performing adjustment procedures.

5-40. Remove top and bottom covers from the instrument; set front-panel controls to initial settings listed in paragraph: Front-panel control settings; apply power and allow thirty minutes for instrument to warmup.

5-41. LOW-VOLTAGE POWER SUPPLY ADJUSTMENT. (See schematic 19 and figures 5-10 and 8-2.) The +15-volt power supply is the only adjustable low-voltage power supply in the instrument. All other low-voltage power supplies are referenced to the output of the +15-volt supply.

Equipment Required:

Multifunction digital voltmeter

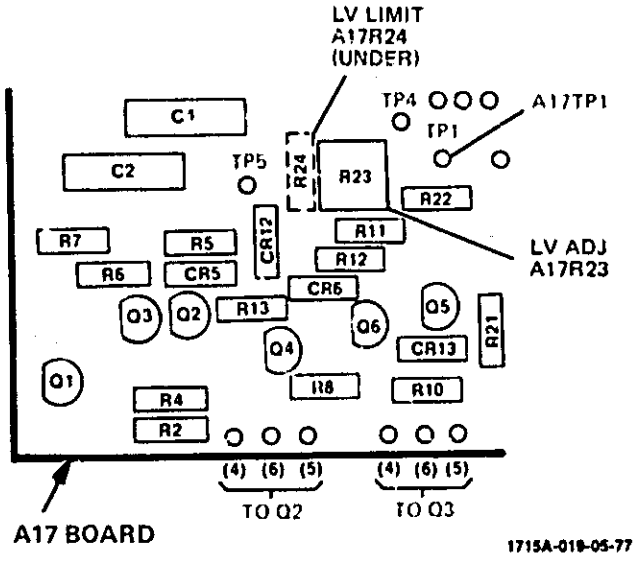

Figure 5-10. Low-voltage Power Supply Adjustment

5-42. Adjust low-voltage power supply as follows:

NOTE

Perform steps a through g only if LVPS assembly A17 has been replaced. Otherwise adjust LVPS by performing steps f and k through m.

a. Set A17R23, LV ADJ, fully clockwise.

b. Turn off ac input power to Model 1725A.

c. Remove LVPS assembly A17 retaining screws.

d. Raise front of assembly A17 until adjustment A17R24 is accessible.

CAUTION

Be careful not to short A17 assembly to chassis or other assemblies.

e. Turn on ac input power to Model 1725A.

f. Connect multifunction digital-voltmeter (DVM) test lead to test point A17TP1.

g. Adjust A17R24, LV LIMIT, for an indication on DVM of +15.3 V.

h. Turn off ac input power to Model 1725A.

i. Remount LVPS assembly A17 with retaining screws removed in step c.

j. Turn on ac input power to Model 1725A.

k. Adjust A17R23 for an indication on DVM of +15 V ±50 mV.

l. Disconnect test equipment.

5-43. INTENSITY SET ADJUSTMENT. (See schematic 17 and figures 5-11 and 8-2.) The intensity set is adjusted so that the front-panel INTENSITY control will adjust the trace from fully off to maximum brightness for the fastest sweep speeds.

Equipment Required:

Test oscilloscope
10:1 divider probe

5-44. Adjust intensity set as follows:

a. Set front-panel main TIME/DIV control to 5 μs position.

b. Connect test oscilloscope to test point A14TP4 using 10:1 divider probe.

c. Connect 10:1 divider probe ground lead to A14TP5.

d. Set front-panel INTENSITY control for a 10 V pk-pk gate pulse.

e. Adjust A15R3, INT SET, to just extinguish trace on CRT.

f. Disconnect test equipment.

g. Set Model 1725A front-panel controls to initial settings.

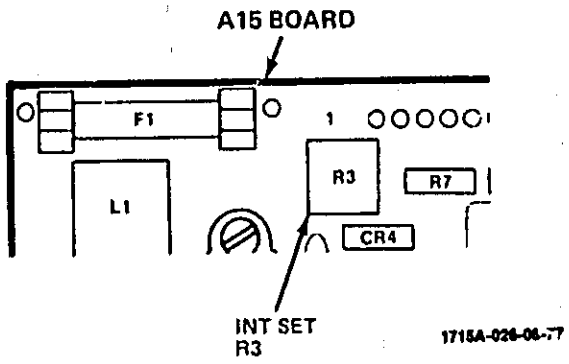

Figure 5-11. Intensity Adjustment

5-45. GATE-RESPONSE, AMPLITUDE, and AUTO-FOCUS ADJUSTMENTS. (See figures 5-12 and 8-2.) The gate amplifier is adjusted for optimum rise time, over-shoot, and correct amplitude. The auto-focus circuit is adjusted for optimum focus at all intensity levels.

Equipment Required:

Test oscilloscope
10:1 divider probe

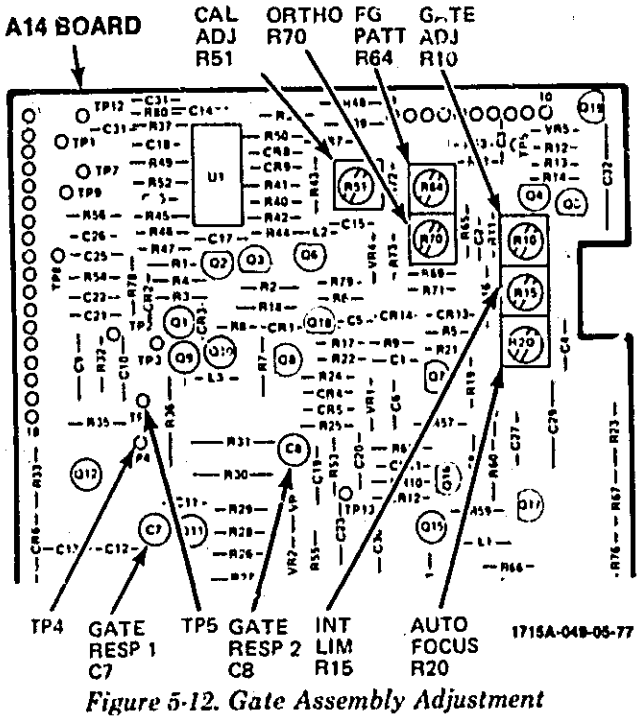

Figure 5-12. Gate Assembly Adjustment

5-46. Adjust gate response, amplitude, and autofocus as follows:

a. Set Model 1725A front panel controls as follows::

POSITION (channel A) .. fully clockwise
TIME/DIV (main) 5μSEC
INTENSITY ..... fully clockwise

b. Connect test oscilloscope to test point A14TP4 using 10:1 divider probe.

c. Connect 10:1 divider probe ground lead to test point A14TP5.

d. Set intensity limit adjust A14R15 fully counter-clockwise.

e. Set gate adjust, A14R10, for gate amplitude of +70 volts.

f. Expand sweep time of test oscilloscope to observe leading edge and overshoot of gate pulse.

g. Alternately turn HF Adj A14C7 and LF Adj A14C8 for fastest rise time and flattest pulse top (A14C7 adjusts fast corner).

h. Set Auto Focus Adj A14R20 fully ccw.

i. Set controls as follows:

TIME/DIV (main)..... .01 mSEC
TIME/DIV (delayed) ..... .01 μSEC
HORIZ DISPLAY ..... DLY'D
INTENSITY ..... maximum
POSITION (channel A) fully centered

j. Observe center screen trace width while at optimum focus. Trace width should be 1 mm. If not, adjust Gate Adj A14R10 slightly to make width 1 mm.

k. Set INTENSITY to 10 o'clock position.

l. Set HORIZ DISPLAY to MAIN.

m. Adjust Auto Focus A14R20 for best focus.

n. Set HORIZ DISPLAY to DLY'D.

o. Set INTENSITY to maximum.

p. Refocus, using front panel FOCUS, if necessary.

q. Set INTENSITY to 10 o'clock position.

r. Set HORIZ DISPLAY to MAIN.

s. Readjust Auto Focus A14R20 is necessary for best focus.

t. Set Model 1725A front-panel controls to initial settings except as follows:

POSITION (channel A) .. fully clockwise
TIME/DIV (main) ..... .01 SEC
INTENSITY ..... fully clockwise

u. Set test oscilloscope TIME/DIV control to 0.02 SEC/div.

v. Use test oscilloscope (connected to test point A14TP4 through 10:1 divider probe) to observe waveform as shown in figure 5-13. If necessary, readjust intensity limit A14R15 to make pulse 30 V to 50 V as shown.

w. Disconnect test equipment.

x. Set Model 1725A front-panel controls to initial settings.

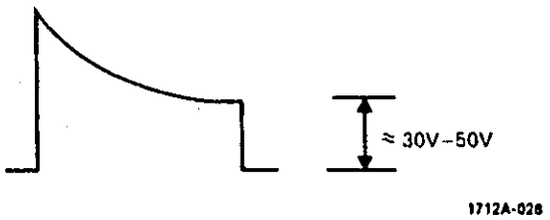

Figure 5-13. Intensity Limit Adjustment

5-47. TRACE ALIGN. (See schematic 17.) The rear-panel TRACE ALIGN control is adjusted to align the horizontal trace parallel to the horizontal-graticule lines.

Equipment Required: None

5-48. Perform trace align adjustment as follows:

a. Adjust front-panel INTENSITY and FOCUS controls to obtain sharp trace on CRT.

b. Adjust rear-panel TRACE ALIGN control A14R67 so that horizontal trace exactly parallels center horizontal-graticule line.

5-49. ORTHOGONALITY AND PATTERN ADJUSTMENTS. (See schematic 17 and figures 5-12 and 8-2.) The orthogonal adjustment aligns the vertical trace with the vertical axis. The pattern adjustment minimizes pincushioning and barreling (trace bow).

Equipment Required: Test oscillator

5-50. Perform orthogonality and pattern adjustment as follows:

a. Connect test oscilator to channel A INPUT connector.

b. Set test oscillator controls for 1 kHz, greater than 6-division output display signal.

c. Set front-panel INT TRIG control for B trigger.

d. Set front-panel HORIZ DISPLAY control for X-Y mode of display.

e. Align vertical trace with center vertical-graticule line using front-panel horizontal POSITION control.

f. Adjust orthogonal control A14R70 so that vertical trace exactly parallels center vertical-graticule line.

g. Set front-panel HORIZ DISPLAY control for MAIN mode of display.

h. Set front-panel INT TRIG control for A trigger.

i. Set test oscillator controls for 500 kHz, 6-division output display signal.

j. Adjust rear-panel PATT control, A14R76, to obtain best raster display (minimum pincushioning or barreling at top, bottom, and both sides of display).

k. Disconnect test equipment.

l. Set Model 1725A front-panel controls to initial settings.

5-51. FLOODGUN PATTERN AND INTENSITY RATIO ADJUSTMENTS. (See schematics 16 and 17; figures 5-12 and 8-2.) The floodgun pattern control is adjusted for the most uniform CRT illumination. The intensity ratio between the normal portion and intensified portion of the sweep is set to the desired contrast.

Equipment Required: None

5-52. Adjust floodgun pattern and intensity ratio as follows:

a. Set front-panel AUTO/NORM pushbutton switch to NORM.

b. Set front-panel SCALE ILLUM control fully clockwise.

c. Set floodgun pattern control, A14R64, fully counterclockwise.

d. Slowly turn floodgun pattern control A14R64 clockwise until an even intensity pattern is noted.

e. Set Model 1725A front-panel controls as follows:

AUTO/NORM ..... AUTO
HORIZ DISPLAY ..... MAIN INTEN
TIME/DIV (delayed) ..... .02 mSEC

f. Turn rear-panel INTEN RATIO control A14R23 fully clockwise.

g. Turn rear-panel INTEN RATIO control A14R23 counterclockwise until desired contrast between normal and intensified protion of trace is obtained.

h. Set Model 1725A front-panel controls to initial settings.

5-53. ATTENUATOR BALANCE ADJUSTMENTS. (See schematics 1 and 2; figures 5-14 and 8-2.) The attenuators are balanced so the trace does not shift when attenuators are changed from one range to another.

Equipment Required: None

5-54. Adjust attenuator balance as follows:

a. Set front-panel channel A VOLTS/DIV switch to .05 position.

b. Center trace using front-panel channel POSITION control.

c. Set channel A VOLTS/DIV switch to .1 position.

d. Center trace using channel A attenuator-balance adjustment A3R52.

e. Set VERT DISPLAY to B.

f. Repeat steps a through d for channel B using channel B attenuator-balance adjustment A3R66.

g. Set 1725A front-panel controls to initial settings.

5-55. VERTICAL PREAMPLIFIER BALANCE ADJUSTMENT. (See schematic 3 and figures 5-14 and 8-2.)

Equipment Required: None

5-56. Adjust vertical preamplifier balance as follows:

a. Center channel A trace on CRT.

b. Adjust main balance adjustment A3R4 for minimum trace shift as channel A vernier is rotated through its range.

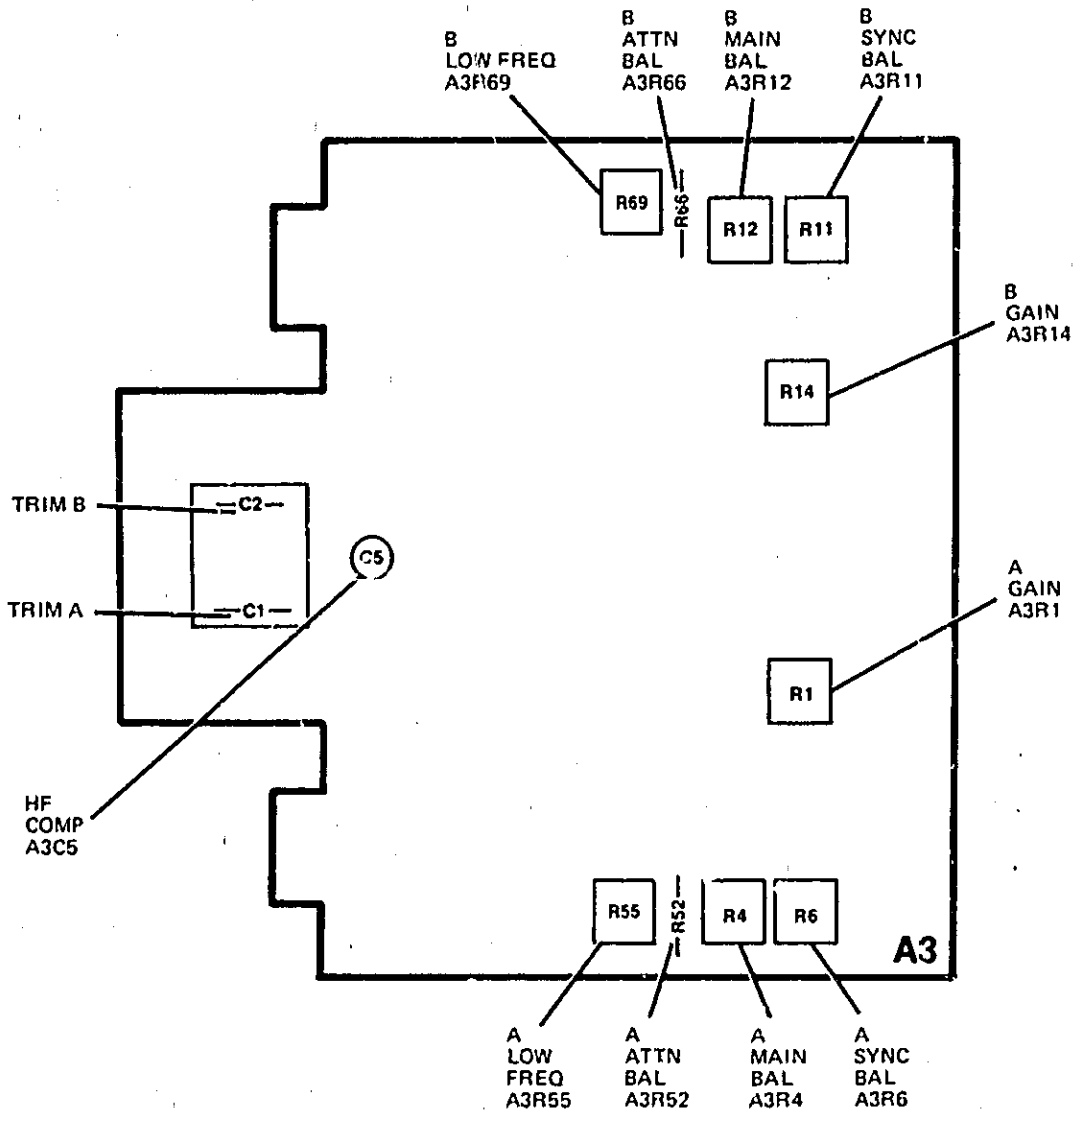

Figure 5-14. Vertical-preamplifier Adjustments

c. Set VERT DISPLAY control to channel B.

d. Repeat steps a and b for channel B using channel B main balance adjustment A3R12.

e. Set 1725A front-panel controls to initial settings.

5-57. SYNC AMPLIFIER BALANCE ADJUSTMENTS. (See schematics 3 and 6; figures 5-14, 5-15, and 8-2.) With no input, the sync amplifier circuit is balanced for a 0-volt outp

Equipment Required:

Multifunction digital voltmeter (DVM)

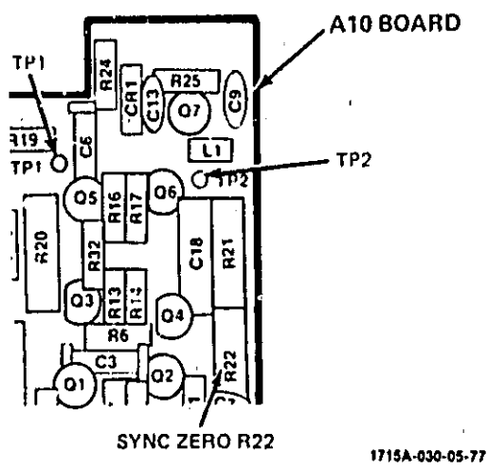

Figure 5-15. Sync Balance Adjustment

5-58. Adjust sync-amplifier balance as follows:

a. Connect DVM across test points A10TP1 and and A10TP2 (DVM ground lead connected to A10TP2).

b. Set channel A sync-balance adjustment A3R6 for indication of 0 volt ±10 mV.

c. Set front-panel INT TRIG control to B trigger.

d. Set channel B sync-balance adjustment, A3R11 for indication of 0 volt ±10 mv.

e. Remove DVM ground lead from test point A10TP2.

f. Connect DVM ground lead to chassis ground.

g. Set sync zero adjustment A10R22 for DVM indication of 0 volt ±20 mV.

h. Disconnect test equipment.

i. Set 1725A front-panel controls to initial settings.

5-59. OUTPUT AMPLIFIER BALANCE ADJUSTMENTS. (See schematic 4 and figures 5-16 and 8-2.) The vertical output amplifier is balanced to center the vertical portion of the display.

5-60. Adjust output-amplifier balance as follows:

a. Press front-panel BEAM FIND pushbutton switch.

b. Center trace by adjusting balance control, A5R23.

c. Release BEAM FIND switch.

5-61. LOW FREQUENCY RESPONSE ADJUSTMENTS. (See schematics 1 and 2; figures 5-14 and 8-2.) Using a 100-Hz square wave input, the low frequency circuit is adjusted for optimum pulse response.

Equipment Required:

Pulse generator

5-62. Adjust low-frequency response as follows:

a. Connect output of pulse generator to channel A INPUT connector.

b. Set Model 1725A front-panel controls as follows:

Coupling (both channels) 50Ω
TIME/DIV (main) ..... 1 mSEC

c. Set pulse generator controls for 100-Hz 6-division output display signal.

d. Adjust front-panel main TRIG LEVEL control for stable display.

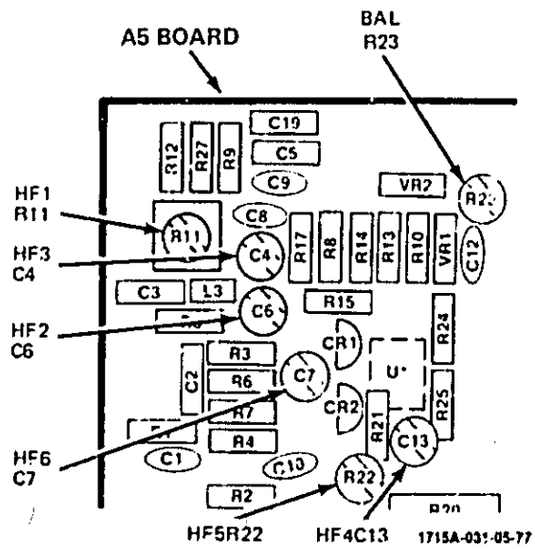

Figure 5-16. Vertical Output Amplifier Adjustments

e. Set channel A low-frequency adjustment A3R55 for best signal response.

f. Connect output from pulse generator to channel B INPUT connector.

g. Set front-panel VERT DISPLAY control to channel B.

h. Set INT TRIG control to B trigger.

i. Set channel B low-frequency adjustment A3R69 for best signal response.

j. Disconnect test equipment.

k. Set 1725A front-panel controls to initial settings.

5-63. ATTENUATOR COMPENSATION ADJUSTMENTS. (See schematics 1 and 2; figures 5-17 and 8-2.) The attenuators are adjusted for optimum signal response using a 10-kHz square-wave signal.

Equipment Required:
Pulse generator

5-64. Adjust attenuator-compensation as follows:

a. Connect pulse generator 50-ohm output to channel A INPUT connector.

b. Set Model 1725A front-panel controls as follows:

VOLTS/DIV (channel A)	.1
Coupling (both)	50Ω
TIME/DIV (main)	.01 mSEC

c. Set pulse generator for 10-kHz ≈0.5 V output-display signal.

d. Set channel A .1 V attenuator-compensation adjustment A1A1C3 for optimum square-wave response.

e. Set channel A VOLTS/DIV switch to 1 VOLTS/DIV position.

f. Increase pulse generator output to ≈5 volts.

g. Set channel A 1 V attenuator compensation adjustment A1A1C4 for optimum square-wave response.

h. Disconnect pulse generator from channel A INPUT connector.

i. Connect pulse generator 50-ohm output to channel B INPUT connector.

j. Set front-panel VERT DISPLAY control to channel B display.

k. Set front-panel INT TRIG control to B trigger.

l. Repeat steps b through g for channel B attenuator using adjustments A2A1C3 for .1 V compensation and A2A1C4 for 1 V compensation.

m. Disconnect test equipment.

n. Set Model 1725A front-panel controls to initial settings.

5-65. CALIBRATOR AMPLITUDE ADJUSTMENT. (See schematic 16 and figures 5-12 and 8-2.) The calibrator output is compared visually to a known standard and adjusted for exactly —3 volts.

Equipment Required:
DC Standard voltmeter

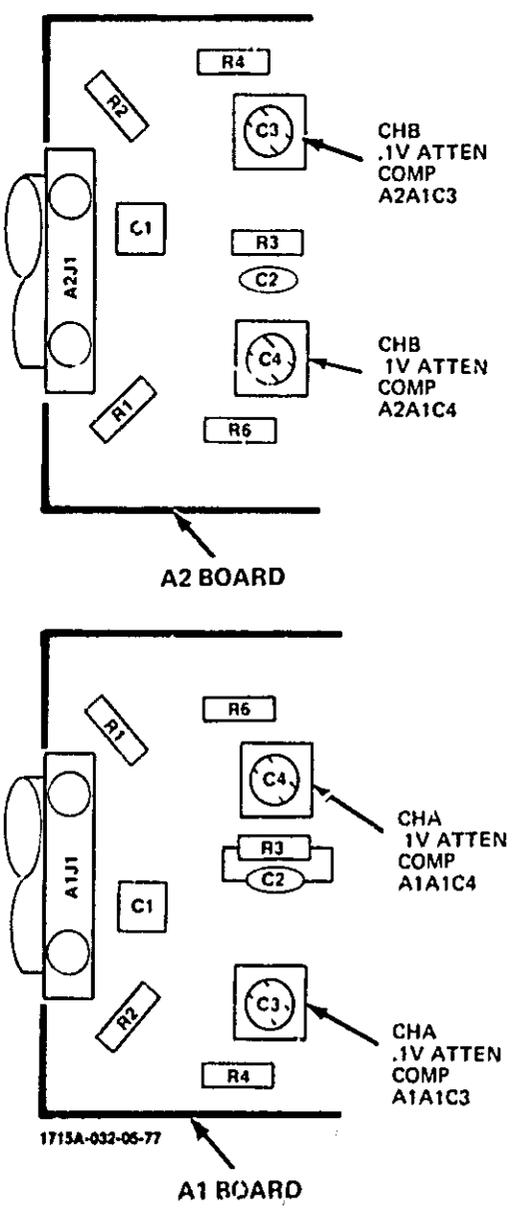

Figure 5-17. Attenuator Adjustments

5-66. Adjust calibrator amplitude as follows:

a. Set channel A VOLTS/DIV switch to 0.5 V position.

b. Set channel A coupling to DC position.

c. Connect dc standard to channel A INPUT connector.

d. Set dc standard to 3 V p-p output.

e. Adjust channel A vernier for display of six divisions.

f. Disconnect dc standard from 1725A.

g. Connect CAL 3 V output to channel A INPUT connector.

h. Adjust cal ampl adj A4R51 for 6-division display.

i. Disconnect CAL 3 V output from channel A INPUT connector.

j. Set 1725A front-panel controls to initial settings.

5-67. VERTICAL GAIN ADJUSTMENTS. (See schematic 3 and figures 5-14 and 8-2.) Vertical preamplifier gain is calibrated using the CAL 3 V output.

5-68. Adjust vertical-gain as follows:

a. Using test lead and adapter, connect CAL 3 V output to channel A INPUT connector.

b. Set channels A and B VOLTS/DIV switches to .5 position.

c. Set channel A gain adjustment A3R1 for exactly six divisions of vertical deflection.

d. Using test lead and adapter, connect CAL 3 V output to channel B INPUT connector.

e. Set front-panel VERT DISPLAY control for channel B display.

f. Set front-panel INT TRIG control for B trigger.

g. Set channel B gain adjustment A3R14 for exactly six divisions of vertical deflection.

h. Disconnect test lead.

i. Set Model 1725A front-panel controls to initial settings.

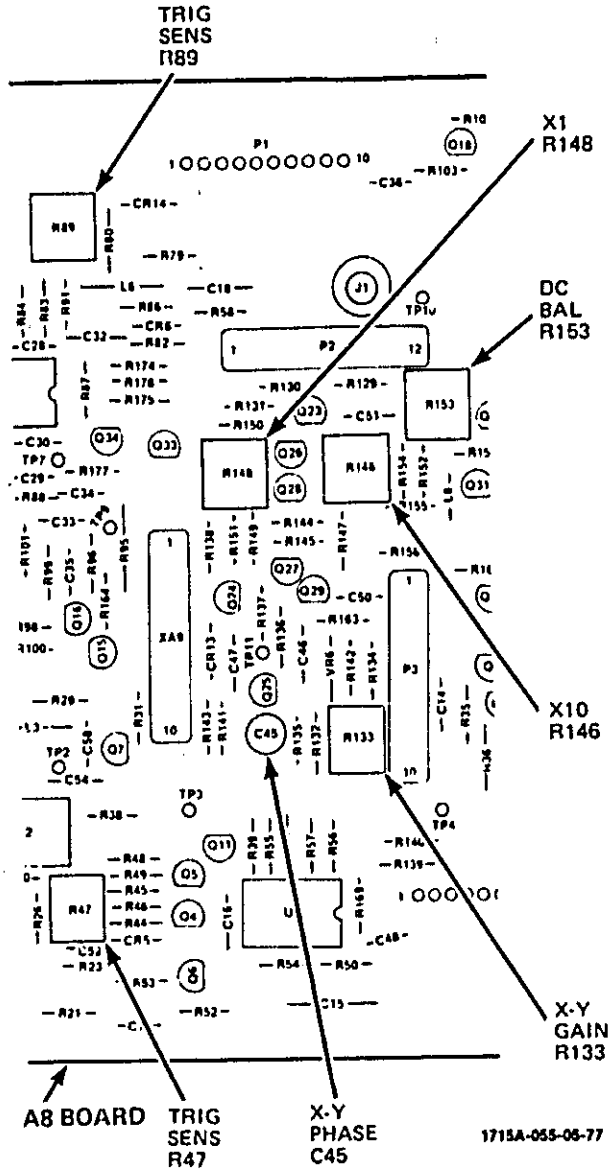

Figure 5-18. Horiz Sweep Assembly Adjustments

5-69. TRIGGER RECOGNITION THRESHOLD ADJUSTMENTS. (See schematics 7 and 9; figures 5-18 and 8-2.) The main- and delayed-trigger recognition circuitry are adjusted for optimum triggering over the triggering spectrum.

Equipment Required:
Test Oscillator

5-70. Adjust trigger-recognition threshold as follows:

a. Set Model 1725A front-panel controls as follows:

Coupling (channel A)	GND
AUTO/NORM	NORM
TIME/DIV (main)	1 mSEC
INT/EXT (main)	EXT

b. Set main trigger sensitivity adjustment A8R47 fully clockwise.

c. Set test oscillator controls for 30 mV pk-pk, 10 MHz sine wave output.

d. Connect test oscillator to main EXT TRIG input connector.

e. Slowly turn main TRIG LEVEL control from one extreme to other. Note that one sweep occurs for each direction of rotation.

f. While turning main TRIG LEVEL control, slowly adjust A8R47 counterclockwise until sweep occurs for only one direction of rotation of main TRIG LEVEL control.

g. Set Model 1725A front-panel controls as follows:

AUTO/NORM	AUTO
HORIZ DISPLAY	DLY'D
INT/EXT (delayed)	EXT
TIME/DIV (delayed)	.5 mSEC
TRIG LEVEL (main)	fully cw
TRIG LEVEL (delayed)	midrange

h. Set test oscillator controls for 30 mV pk-pk, 10 MHz sine wave output.

i. Connect test oscillator to delayed EXT TRIG input connector.

j. Set delayed trigger sensitivity adjustment A8R89 fully counter clockwise.

k. While turning delayed TRIG LEVEL control from one extreme to other, adjust A8R89 counter-clockwise until sweep occurs for only one direction of rotation.

l. Disconnect test equipment.

m. Set Model 1725A front-panel controls to initial settings.

5-71. ANALOG ASSEMBLY A18 ADJUSTMENTS. (See schematic 11 and figures 5-19 and 8-2.) The amplifiers on analog assembly A18 are balanced so that the time interval START and time interval STOP potentiometers track each other.

Equipment Required:

Time-mark generator
Multifunction digital voltmeter

5-72. Adjust the analog assembly as follows:

a. Connect multifunction digital voltmeter to Model 1725A INTERVAL OUT connector (rear panel); Option 034, switch DVM to time interval measurement mode.

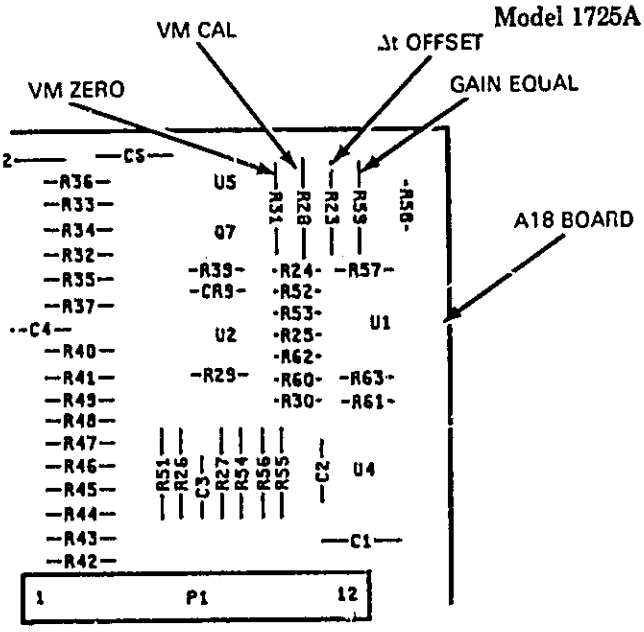

Figure 5-19. Analog Assembly Adjustments

b. Set Model 1725A front-panel controls as follows:

Time Interval STOP	0.00 (fully ccw)
TIME/DIV (main)	1.0 μSEC
TIME/DIV (delayed)	.01 μSEC
HORIZ DISPLAY	MAIN INTEN
Coupling (channel A)	50Ω
VOLTS/DIV (channel A)	0.5
SIGNAL OVERLAY (ΔT = 0)	midrange
Time Interval Mode Switch	CH A START

c. Connect time-mark generator to Model 1725A channel A INPUT connector.

d. Set time-mark generator for 1μs time marks.

e. Using the TIME INTERVAL START control, position intensified dot on the last time mark. Set TIME INTERVAL STOP control fully CCW.

f. Set HORIZ. DISPLAY to DELAY. Adjust TIME INTERVAL START control as required to display the last time mark.

g. Adjust gain Equal (A18R59) until two time marks are superimposed.

h. Vary TIME INTERVAL START control until second time mark is displayed on screen. Adjust front panel Δt = 0 control until the two time marks are superimposed.

i. Vary the TIME INTERVAL START control until the last time mark is displayed on screen. Repeat steps f through h until both the second and tenth time marks are superimposed.

j. Set VERTICAL DISPLAY to ALT.

k. Apply 1 μs time marks through identical length cables to channels A and B. Vary the TIME INTERVAL START control until second marker is displayed.

l. Switch to B START and adjust Δt offset (A18R23) to correct for 1/2 of the shift.

m. Switch to A START and realign time marks using the front panel Δt = 0 control.

n. Repeat steps l through m to remove all shift when switching from A START to B START.

With time interval STOP control set to 0.00 (±1 dial line width), adjust A18R31 for multifunction digitial voltmeter indication of zero ±2 mV (Option 034 to zero ±2 mV).

Set time interval STOP control to 10.00 (±1 dial line width).

Adjust A18R28 for digital voltmeter indication of 10.00 V ±10 mV.

Disconnect test equipment.

Set Model 1725A front-panel controls to initial settings.

5-73. HORIZONTAL AMPLIFIER X1 ADJUSTMENT. (See schematics 8 and 14; figures 5-18, 5-20, and 8-2.) The horizontal amplifier gain is adjusted to a known reference standard.

Equipment Required:

Time-mark generator

5-74. Adjust horizontal amplifier X1 as follows:

a. Connect time-mark generator to channel A INPUT connector.

b. Set Model 1725A controls as follows:

Coupling (channel A)	GND
Main TIME/DIV	.01 mSEC
Delayed TIME/DIV	.01 μSEC
HORIZ DISPLAY	MAIN INTEN

c. Set time interval STOP control to 8.00.

d. Adjust time interval START control until two intensified spots are observed.

e. Adjust X1 Gain Adj A8R148 for exactly 8 divisions of separation between two spots.

f. Set channel A coupling to 50Ω position.

g. Set time-mark generator for 10 μs output markers.

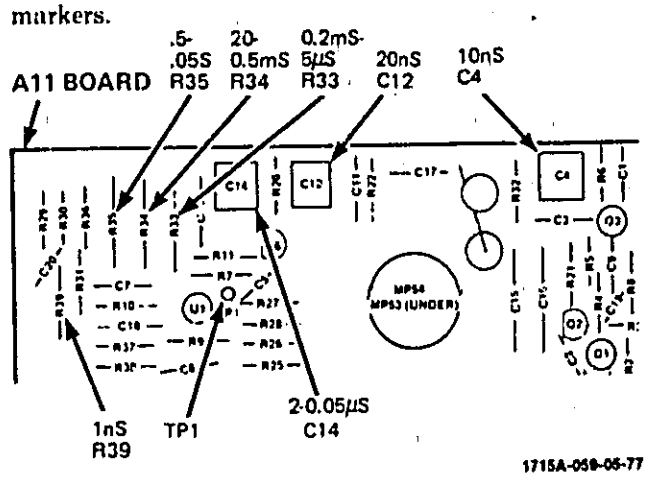

Figure 5-20. Main Sweep Adjustment

h. Adjust A11R33 (.2MS-5US) for exactly 1 marker/div.

i. Press MAG X10 pushbutton switch.

j. Adjust A8R146 (X10 Gain Adj) until one time marker coincides with far left graticule line and one time marker coincides with far right graticule line.

k. Disconnect test equipment.

l. Set Model 1725A front-panel controls to initial settings.

5-75. X10 AMPLIFIER BALANCE ADJUSTMENT. (See schematic 14 and figures 5-18 and 8-2.)

Equipment Required:

5-76. Adjust X10 amplifier balance as follows:

a. Set 1725A front-panel controls as follows:

Coupling (channel A)	50Ω
VOLTS/DIV (channel A)	.5
TIME/DIV (main)	.2 μSEC

b. Connect time-mark generator to channel A INPUT connector.

c. Set time-mark generator for 1 μs time markers.

d. Set HORIZ DISPLAY control to MAG X10.

e. Using horizontal POSITION control, center middle time marker on CRT screen.

f. Set HORIZ DISPLAY control to MAG X1.

g. Using dc balance adjustment A8R153, position center time marker to center of CRT screen.

h. Repeat steps e through g switching between X1 and X10 displays until middle time marker remains at center of CRT screen when magnified.

i. Disconnect test equipment.

j. Set 1725A front-panel controls to initial settings.

5-77. 1, 10, AND 20 NS SWEEP TIME AND LINEARITY ADJUSTMENTS. (See figures 5-20, 5-21, and 8-2.)

5-78. Adjust fast sweep speeds as follows:

a. Set Model 1725A controls as follows:

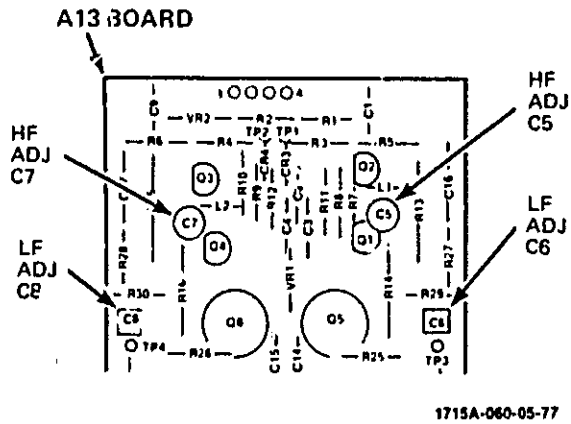

Figure 5-21. Horizontal-linearity Adjustments

Coupling (channel A) 50Ω
VOLTS/DIV (channel A) 5
Main INT/EXT ..... EXT
Main TIME/DIV ..... .01 μSEC

b. Connect time-mark generator to channel A INPUT connector.

c. Set time-mark generator for 10 ns output markers.

d. Externally trigger main sweep.

e. Adjust 10 NS Adj A11C4 until one marker is on each graticule. Disregard first major division of sweep.)

f. Set Model 1725A controls as follows:

Main TIME/DIV ..... .02 μSEC
Delayed TIME/DIV. ..... .01 μSEC
HORIZ DISPLAY..... DLY'D
MAG X10..... engaged

g. Set time interval STOP control to 5.00 (Option 034 to .100).

h. Set time-mark generator for 50 ns output markers.

i. Increase INTENSITY control and rotate horizontal POSITION control until leading edge of first marker is displayed at center screen. Then rotate horizontal POSITION control to display second leading edge.

j. Adjust 20 NS Adj A11C12 until first time marker coincides with second time marker. (This marker can be positioned either before or after displayed one when rotating A11C12 from one extreme to other).

k. Set time-mark generator for 2 ns output markers.

l. Set Model 1725A controls as follows:

VOLTS/DIV (channel A) 2
Delayed TIME/DIV..... OFF
HORIZ DISPLAY..... MAIN
MAG X10..... X1

m. Center display on CRT with horizontal POSITION control.

n. Press MAG X10 pushbutton switch.

o. Note whether 2 ns sweep is slow across right half of CRT (more than 2 complete cycles every 2 major divisions) or whether sweep is fast (less than 2 complete cycles for every 2 major divisions).

p. If sweep is slow (as noted in step q) slowly adjust LF Adj A13C6 and LF Adj A13C8 clockwise in 180° increments until linearity is within ±.5 minor division.

q. Observe sweep across left half on CRT. If sweep is slow, adjust HF Adj A13C5 and HF Adj A13C7 counterclockwise in 180° increments for best linearity. If sweep is fast, adjust A13C5 and A13C7 clockwise in 180° increments for best linearity.

NOTE

Disregard first 15 ns of sweep.

r. Repeat steps o through q to compensate for interaction.

s. Set Model 1725A controls as follows:

Main TIME/DIV ..... .01 μSEC
MAG X10..... X1

t. Center display using horizontal POSITION controls.

u. Press MAG X10 pushbutton switch.

v. Adjust 10 NS X10 Adj A11R39 until one cycle is displayed every two divisions over inside eight divisions (±2 minor divisions).

NOTE

From this point on, do not adjust 10 NS (A11C4) or 20 NS (A11C12) adjustments.

w. Disconnect test equipment.

x. Set Model 1725A front-panel controls to initial settings.

5-79. PRELIMINARY (COARSE) MAIN SWEEP TIME. ADJUSTMENT. (See schematic 8 and figures 5-20 and 8-2.) The main time base is calibrated using a known time standard.

Equipment Required:

Time-mark generator

5-80. Calibrate main time base as follows:

a. Connect time-mark generator to channel A INPUT connector.

b. Set Model 1725A controls as follows:

Coupling (channel A) 50Ω
VOLTS/DIV (channel A) 5
Main TIME/DIV ..... .05 μSEC
Main EXT/INT ..... EXT

c. Externally trigger Model 1725A

d. Set main TIME/DIV and time-mark generator output as shown in table 5-5 and make adjustments as indicated for one marker per div.

Table 5-5. Initial Main Sweep Adjustment

Time-mark Generator Settings	Main TIME/DIV Settings	Adjustment
50 ns	.05 μSEC	A11C14
5 μs	.005 mSEC	A11R33
.5 ms	.5 mSEC	A11R34
50 ms	.05 SEC	A11R35

5-81. DELAYED SWEEP TIME ADJUSTMENTS. (See schematic 10 and figures 5-22 and 8-2.) The delayed time base is calibrated to a known standard.

Equipment Required:

Time-mark generator

5-82. Adjust delayed sweep speeds as follows:

a. Connect time-mark generator to channel A INPUT connector.

b. Set Model 1725A controls as follows:

Coupling (channel A) 50Ω
HORIZ DISPLAY ..... DLY'D
Main TIME/DIV ..... .02 μSEC
Delayed TIME/DIV ..... .01 μSEC
Delayed EXT/INT ..... EXT
Time interval START ..... fully ccw
Delayed TRIG LEVEL ..... as required

c. Externally trigger Model 1725A.

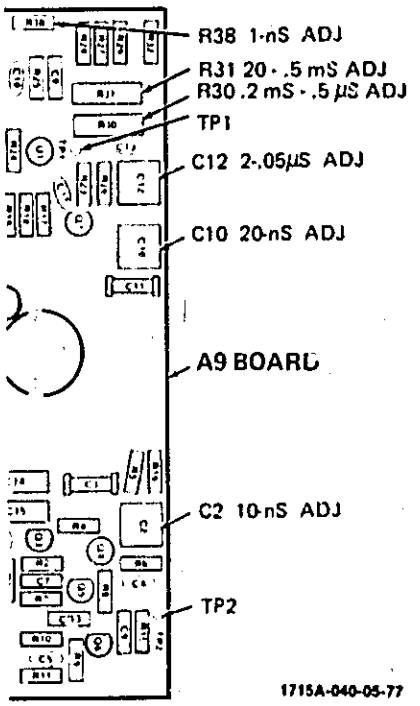

Figure 5-22. Delayed Sweep Adjustments

d. Set time-mark generator and other controls as indicated in table 5-6 and make adjustments as required.

e. Disconnect test equipment.

f. Set Model 1725A front-panel controls to initial settings.

5-83. MAIN SWEEP FINE ADJUSTMENT. (See schematic 8 and figures 5-20 and 8-2.)

NOTE

These adjustments use the accuracy of the TIME INTERVAL STOP dial to calibrate the main sweep more accurately than is possible using the visual method. These adjustments must be performed if the differential time accuracy specification is to be met.

Equipment Required:

Time-mark generator

5-84. Perform main-sweep fine adjustments as follows:

a. Connect time-mark generator to channel A INPUT connector.

b. Set 1725A front-panel controls as follows:

Main TIME/DIV	.5 μSEC
Delayed TIME/DIV	.01 μSEC
HORIZ DISPLAY	MAIN INTEN
TIME INTERVAL START	fully ccw
TIME INTERVAL STOP	8.00

c. Set time-mark generator to 0.5 μs.

d. Set HORIZ DISPLAY to DLY'D.

e. Rotate TIME INTERVAL START cw until second time mark is displayed at center screen.

f. Adjust 0.05 μs adj A11C14 until first time mark coincides with ninth, ±0.23 div.

g. Set MAG X10 to X10 position.

h. Set time-mark generator, and other controls as indicated in table 5-7 and check test limits. If any are not met, readjust A11C14 to distribute any error evenly among all effected ranges.

i. Set MAG X10 to X1.

j. Check ranges indicated in table 5-8 and adjust A11R33, 0.2 ms through 5 μs adj, as required. Rotate TIME INTERVAL STOP fully ccw, then rotate cw to locate pulses in each case.

k. Set time-mark generator and other controls as indicated in table 5-9 and check test limits. Adjust A11R34 20 ms through .5 ms adj, as necessary to make all tests within limits. Rotate TIME INTERVAL STOP fully ccw then cw to locate pulses in each case.

l. Disconnect test equipment.

5-85. VERTICAL AMPLIFIER PULSE RESPONSE ADJUSTMENT. (See schematics 3 and 4 and figures 5-14, 5-16 and 8-2.)

Equipment Required:

Fast-rise pulse generator

5-86. Adjust vertical amplifier pulse responses as follows:

a. Connect fast-rise pulse generator to channel A INPUT connector.

b. Set Model 1725A front-panel controls as follows:

Coupling (both channels)	50Ω
TIME/DIV (main)	.01 μSEC

c. Adjust fast-rise pulse generator output and channel A VOLTS/DIV control to obtain exactly 5 divisions of vertical deflection.

NOTE

Verify that channel A VOLTS/DIV vernier is in CAL detent position.

d. Adjust HF compensation capacitor A3C5 and TRIM A capacitor A3A1C1 for minimum overshoot (minimum capacitance).

e. Make adjustments shown in table 5-10 for vertical preamplifier A3 and output amplifier A5.

NOTE

If pulse generator being used is specified for 3% overshoot, do not set adjustments for less than 3% since this is effectively detuning the vertical amplifier bandwidth. Also, when performing step e, change sweep times as necessary to display best pulse. Repeat the procedure if necessary until optimum pulse response is obtained.

f. Connect pulse generator to channel B INPUT connector.

g. Set VERT DISPLAY control to B.

h. Set INT TRIG control to B.

i. Adjust TRIM B capacitor A3A1C2 to make channel B response most similar to channel A response.

j. Disconnect test equipment.

k. Set 1725A front-panel controls to initial settings.

5-87. X-Y GAIN ADJUSTMENT. (See schematic 14 and figures 5-18 and 8-2.) A low-frequency signal is applied to channel A and then to channel B. While in the X-Y mode of operation, channel B is adjusted to equal the gain of channel A.

Equipment Required:

Test oscillator

5-88. Adjust the X-Y gain as follows:

a. Connect test oscillator to Model 1725A channel A INPUT connector.

Table 5-6. Delayed Sweep Adjustments

Time-mark Generator	Main TIME/DIV	Delayed TIME/DIV	ADJUST	Test Limit
10 ns	.02 µSEC	.01 µSEC	A9C2	±0.5 minor div
2 ns	.02 µSEC	.01 µSEC	(MAG X10 ENGAGED) A9R38	±2 minor div*
20 ns	.05 µSEC	.02 µSEC	A9C10	±0.5 minor div*
50 ns	.1 µSEC	.05 µSEC	A9C12	±0.5 minor div
.1 µs	.2 µSEC	.1 µSEC	A9C12	±0.5 minor div
.2 µs	.5 µSEC	.2 µSEC	A9C12	±0.5 minor div
.5 µs	1 µSEC	.5 µSEC	A9C12	±0.5 minor div
1 µs	.002 mSEC	1 µSEC	A9C12	±0.5 minor div
2 µs	.005 mSEC	.002 mSEC	A9C12	±0.5 minor div
5 µs	.01 mSEC	.005 mSEC	A9R30	±0.5 minor div
10 µs	.02 mSEC	.01 mSEC	A9R30	±0.5 minor div
20 µs	.05 mSEC	.02 mSEC	A9R30	±0.5 minor div
50 µs	.1 mSEC	.05 mSEC	A9R30	±0.5 minor div
.1 ms	.2 mSEC	.1 mSEC	A9R30	±0.5 minor div
.2 ms	.5 mSEC	.2 mSEC	A9R30	±0.5 minor div
.5 ms	1 mSEC	.5 mSEC	A9R31	±0.5 minor div
1 ms	.002 SEC	1 mSEC	A9R31	±0.5 minor div

b. Set Model 1725A front-panel controls as follows:

VOLTS/DIV (channels A and B)..... .1
VERT DISPLAY and
INT TRIG ..... X-Y operation
Coupling (channels A and B)..... 50Ω
HORIZ DISPLAY..... X-Y

c. Set test-oscillator output for approximately 100 Hz.

d. Adjust test-oscillator output for exactly 6 divisions of Y-axis deflection.

e. Disconnect test oscillator from Model 1725A channel A INPUT connector.

f. Connect test oscillator to Model 1725A channel B INPUT connector.

Table 5-10. Vertical-amplifier Adjustments

Adjustment	Ref Designation	Effect on Pulse
HF 1 HF 2	A5R11 A5C6	HF 3	A5C4	HF 4 HF 5	A5C13 A5R22	HF 6	A5C7	HF Comp TRIM A TRIM B	A3C5 A3A1C1 A3A1C2	
g. Adjust X-Y gain adjustment A8R133 for exactly 6 divisions of X-axis deflection.

h. Disconnect test equipment.

i. Set Model 1725A front-panel controls to initial settings.

5-89. X-Y PHASE ADJUSTMENT. (See schematic 14) and figures 5-18 and 8-2.) A 3-MHz signal is applied and the amplifiers are matched for less than 3° of phase shift.

Equipment Required:

Test oscillator
50-ohm power divider

5-90. Adjust X-Y phase as follows:

a. Connect test-oscillator to both channel A INPUT connector and channel B INPUT connector using 50-ohm power divider.

NOTE

Cable lengths from TEE connections to channel INPUT connectors should be as short as possible and of the same electrical length.

b. Set Model 1725A front-panel controls as follows:

Coupling (both channels)..... 50Ω
VERT DISPLAY and
INT TRIG ..... X-Y operation
VOLTS/DIV (both channels)..... .05
HORIZ DISPLAY..... X-Y

c. Adjust test-oscillator output for 3-MHz, ≈500-mV p-p.

d. Adjust X-Y phase adjustment, A8C45, until ellipse most resembles straight diagonal line.

e. Disconnect test equipment.

f. Set Model 1725A front-panel controls to initial settings.

SECTION VI

REPLACEABLE PARTS

6-1. INTRODUCTION.

6-2. This section contains information for ordering parts. Table 6-1 lists abbreviations used in the parts list. Table 6-2 lists all replaceable parts in reference designator order. Table 6-3 contains the names and addresses that corresponds to the manufacturer's code numbers.

6-3. REPLACEABLE PARTS LIST.

6-4. Table 6-2 is the list of replaceable parts and is organized as follows:

a. List of electrical assemblies.

b. Chassis-mounted parts in alphanumerical order by reference designation.

c. Electrical assemblies and their components in alphanumerical order by reference designation.

The information given for each part consists of the following:

a. The Hewlett-Packard part number.

b. The total quantity (Qty) in the instrument.

c. The description of the part.

d. A typical manufacturer of the part in a five-digit code.

e. The manufacturers' number for the part.

The total quantity for each part is given only once—at the first appearance of the part number in the list.

6-5. ORDERING INFORMATION.

6-6. To order a part listed in the replaceable parts table, quote the Hewlett-Packard part number, indicate the quantity required, and address the order to the nearest Hewlett-Packard office.

6-7. To order a part that is not listed in the replaceable parts table, include the instrument model number, instrument serial number, the description and function of the part, and the number of parts required. Address the order to the nearest Hewlett-Packard office.

6-8. SPARE PARTS KIT.

6-9. Stocking spare parts for an instrument is often done to ensure quick return to service after a malfunction occurs. Hewlett-Packard has a Spare Parts Kit available for this purpose. The kit consists of selected replaceable assemblies and components for this instrument. The contents of the kit and the Recommended Spares List are based on failure reports and repair data, and parts support for one year. A Recommended Spares List for this instrument may be obtained on request and the Spare Parts Kit may be ordered through your nearest Hewlett-Packard office.

6-10. DIRECT MAIL ORDER SYSTEM.

6-11. Within the USA, Hewlett-Packard can supply parts through a direct mail order system. Advantages of using the system are as follows:

a. Direct ordering and shipment from the HP Parts Center in Mountain View, California.

b. No maximum or minimum on any mail order (there is a minimum order amount for parts ordered through a local HP office when the orders require billing and invoicing).

c. Prepaid transportation (there is a small handling charge for each order).

d. No invoices—to provide these advantages, a check or money order must accompany each order.

6-12. Mail order forms and specific ordering information is available through your local HP office. Address and phone numbers are located at the back of this manual.

SECTION VII

MANUAL CHANGES

7-1. INTRODUCTION.

7-2. This section contains information for adapting this manual to instruments for which the content does not apply directly.

7-3. MANUAL CHANGES.

7-4. To adapt this manual to your instrument, refer to table 7-1 and make all manual changes listed for your instrument serial prefix number. Perform these changes in the sequence listed. If your instrument serial prefix number is not listed on the title page or in table 7-1, it may be documented in a yellow MANUAL CHANGES supplement. For additional information about serial number coverage, refer to INSTRUMENTS COVERED BY MANUAL in Section I.

Table 7-1. Manual Changes by Serial Prefix Number

Serial Prefix Number	Make Manual Changes
1720A	4, 3, 2, 1
1823A	4, 3, 2
1849A	4, 3
1915A	4

7-5. MANUAL CHANGE INSTRUCTIONS.

CHANGE 1

Figure 7-1. Replacement for A8 Component Locator

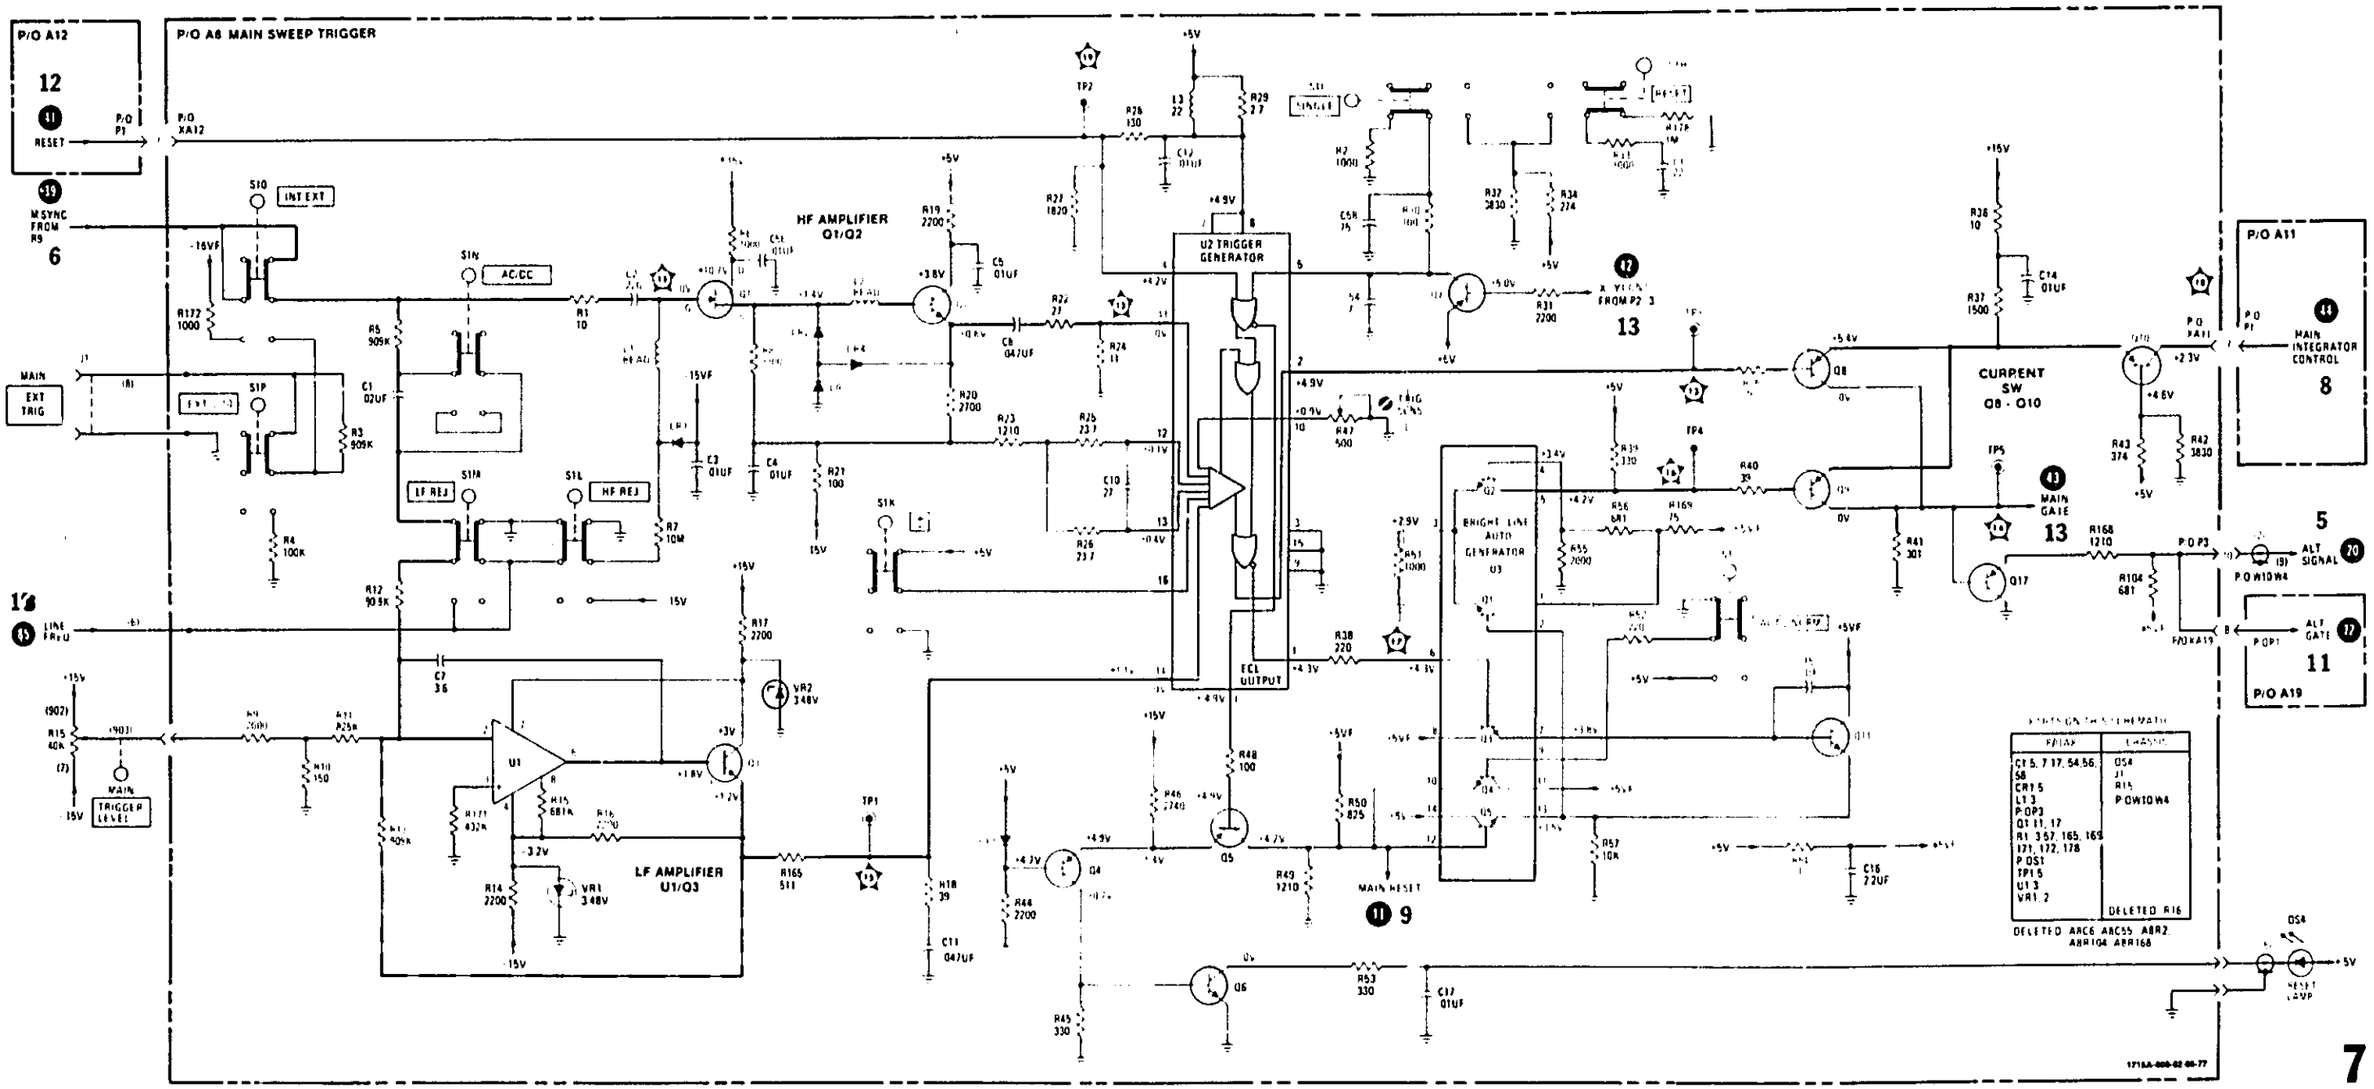

Figure 7-2.
Replacement for Schematic 7

CHANGE 2

SECTION VI,
Table 6-2. Replaceable Parts,
Change: A14, HP and Mfr Part Nos. to 01720-66551 (two places).
Change: W6, HP and Mfr Part Nos. to 01720-61605.
Delete: A14R82.
Delete: A14R83.
Delete: A14R84.
Delete: A14VR6.
Change Parts List for Option 011.
Change: A14, HP and Mfr Part Nos. to 01720-66555.

SECTION VIII,
Schematic 17, Gate Assembly and H.V. Power Supply,
Change Schematic 17 as shown in figure 7-3.

CHANGE 3

SECTION VI,
Table 6-2. Replaceable Parts,
Delete: H43.
Delete: H44.
Delete: H45.
Change: L2, HP and Mfr Part Nos. to 00191-66004, COIL ALIGNMENT Y-AXIS.
Change: MP39, HP and Mfr Part Nos. to 01720-60601, SHIELD ASSY, CRT.

CHANGE 4

SECTION V, ADJUSTMENTS,
Replace paragraph 5-71, Analog Assembly A18 Adjustments, with the following procedure:

5-71. ANALOG ASSEMBLY A18 ADJUSTMENTS.

(See schematic 11 and figures 5-19 and 8-2.) The amplifiers on analog assembly A18 are balanced so that the time interval START and time interval STOP potentiometers trace each other.

Equipment Required:
Time-mark generator
Multifunction digital voltmeter

5-72. Adjust the analog assembly as follows:

a. Connect multifunction digital voltmeter to Model 1725A INTERVAL OUT connector (rear panel); Option 034, switch DVM to time interval measurement mode.

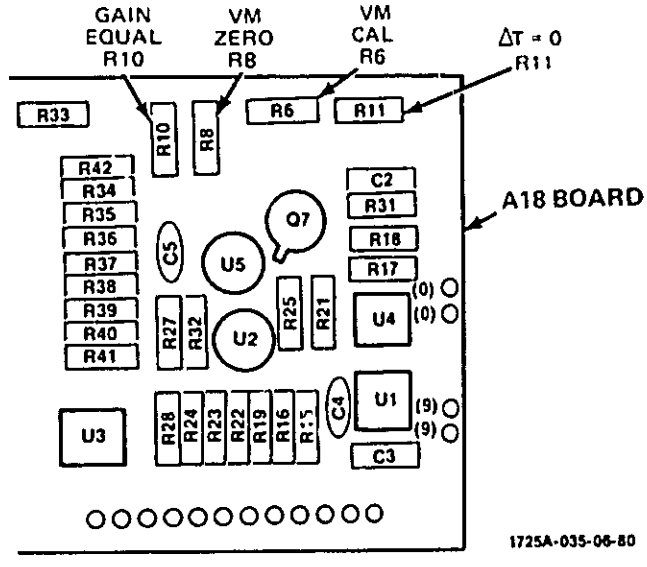

Figure 7-4. Analog Assembly Adjustments

b. Set Model 1725A front-panel controls as follows:

Time Interval STOP ..... 0.00 (fully ccw)
TIME/DIV (main) ..... 1.0 μSEC
TIME/DIV (delayed) ..... .01 μSEC
HORIZ DISPLAY ..... MAIN INTEN
Coupling (channel A) 50Ω
VOLTS/DIV (channel A) 0.5
SIGNAL OVERLAY (ΔT = 0) ..... midrange
Time Interval Mode Switch .... CH A START

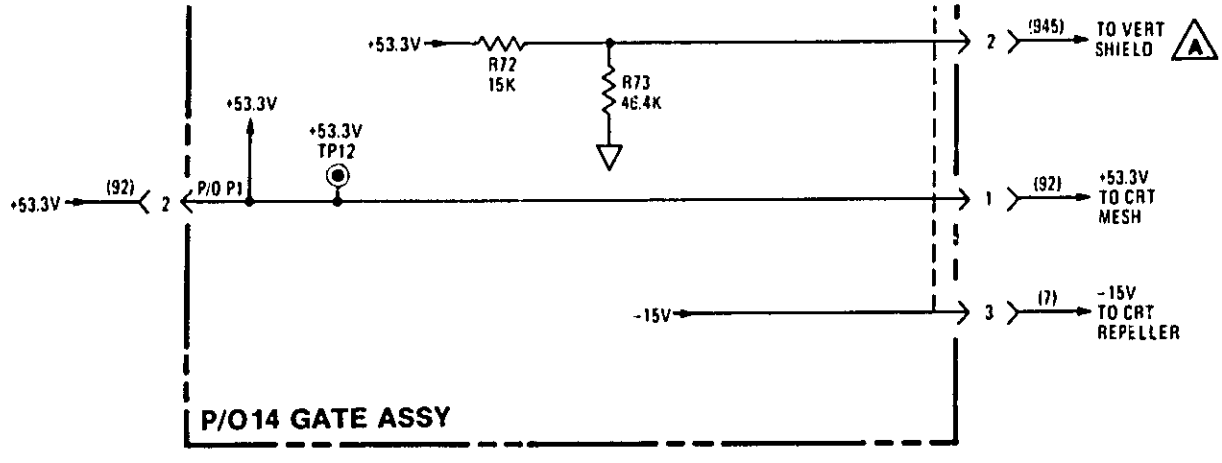

Figure 7-3. Changes to Schematic 17

c. Connect time-mark generator to Model 1725A channel A INPUT connector.

d. Set time-mark generator for 1 μs time marks.

e. Adjust time interval START control to position intensified spot on second time mark from left.

f. Set HORIZ DISPLAY to DLY'd.

g. Set time interval START control as required to observe second time mark (superimposed).

h. Adjust A18R11 to exactly superimpose time mark observed in step g.

i. Set time interval START control to observe tenth time mark.

NOTE

Do not adjust time interval STOP control.

j. Adjust A18R10 to superimpose exactly two time marks observed.

k. Repeat steps c through j until no interaction occurs.

l. With time interval STOP control set to 0.00 (±1 dial line width), adjust A18R8 for multifunction digital voltmeter indication of zero ±2 mV (Option 034 to zero ±2 mV).

m. Set time interval STOP control to 10.00 (±1 dial line width).

n. Adjust A18R6 for digital voltmeter indication of 10.00 V ±10 mV.

o. Disconnect test equipment.

p. Set Model 1725A front-panel controls to initial settings.

SECTION VI,
Table 6-2. Replaceable Parts,
Change: A3, HP and Mfr Part Nos. to 01720-66524, VERTICAL PRE-AMP ASSY (two places).
Change: A5, HP and Mfr Part Nos. to 01720-66538, VERTICAL OUTPUT ASSY (two places).
Change: A7, HP and Mfr Part Nos. to 01720-66535, VERTICAL DISPLAY SWITCH ASSY (two places).
Change: A8, HP and Mfr Part Nos. to 01722-66528, HORIZ. SWEEP ASSY (two places).
Change: A10, HP and Mfr Part Nos. to 01720-66536, HORIZ. DISPLAY SWITCH ASSY (two places).
Change: A11, HP and Mfr Part Nos. to 01720-66564, MAIN SWEEP SWITCH ASSY (two places).
Change: A12, HP and Mfr Part Nos. to 01722-66520, HOLDOFF-DELAY COMPARATOR (two places).
Change: A13, HP and Mfr Part Nos. to 01720-66537, HORIZ. OUTPUT ASSY (two places).
Change: A14, HP and Mfr Part Nos. to 01720-66554, GATE ASSY (two places).
Change: A15, HP and Mfr Part Nos. to 01720-66548, H.V. POWER SUPPLY ASSY (two places).
Change: A17, HP and Mfr Part Nos. to 01720-66528, L.V. POWER SUPPLY ASSY (two places).
Change: A18, HP and Mfr Part Nos. to 01710-66557, ANALOG ASSY (two places).
Delete: H46.
Change: MP 25, HP and Mfr Part Nos. to 01720-04102, COVER, TOP.
Change: MP26, HP and Mfr Part Nos. to 01720-04105, COVER, BOTTOM.
Delete: MP85.
Delete: MP86.
Change: R24, HP and Mfr Part Nos. to 2100-2488, RESISTOR-VAR, CONT 10K 20% CC.
Change: W6, HP and Mfr Part Nos. to 01720-61623, CABLE ASSY CRT NECK PINS.
Change: W7, HP and Mfr Part Nos. to 01720-61631, CABLE ASSY H.V.
Change: W8, HP and Mfr Part Nos. to 01720-61619, CABLE ASSY VERTICAL OUTPUT.
Change: W9, HP and Mfr Part Nos. to 01710-61640, CABLE ASSY, DIGITAL.
Change: W10, HP and Mfr Part Nos. to 01710-61641, CABLE ASSY, MAIN.
Change: W17, HP and Mfr Part Nos. to 01720-61602, CABLE ASSY, MAIN.
Change: A8R168, HP Part No. to 0757-0274, RESISTOR 1.21K 1% .125W F TUBULAR, Mfr Code 24546, Mfr Part No. C4-1/8-T0-1213-F.
Change: A14R3, HP Part No. to 0757-0418, RESISTOR 619 OHM 1% .125W F TUBULAR, Mfr Code 24546, Mfr Part No. C4-1/8-T0-619R-F.
Change: A14R4, HP and Mfr Part No. to 0757-0429, RESISTOR 1.82K 1% .125W F TUBULAR, Mfr. Code 24546, Mfr Part No. C4-1/8-T0-1821-F.
Delete: A17C17.
Delete: A17C18.
Delete: A17C19.
Delete: A17C20.
Delete: A17C21.
Delete: A17C22.
Replace A18 Parts List with table 7-3.
Change Parts List for Option 003 as follows:
Change: A19, HP and Mfr Part Nos. to 01720-60001, PROBE POWER ASSY.
Change Parts List for Option 011 as follows:
Change: A14, HP and Mfr Part Nos. to 01720-66531, GATE ASSY.
Change Parts List for Option 034/035 as follows:
Change: MP25, HP and Mfr Part Nos. to 01710-04106.
Change Parts List for Option 101 as follows:
Change: W14, HP and Mfr Part Nos. to 01710-61635, CABLE ASSY MAIN.

SECTION VIII

SCHEMATICS AND TROUBLESHOOTING

8-1. INTRODUCTION.

8-2. This section contains schematics, repair information, component-identification illustrations, waveforms, and test conditions. A disassembly procedure for removing the CRT and instrument modules for repair and replacement is also contained in this section.

8-3. PREVENTIVE MAINTENANCE.

8-4. CLEANING. Painted surfaces can be cleaned with a commercial, spray-type window cleaner or with a mild soap and water solution. Excess grease can be removed with a degreaser such as M-180 FREON TF DEGREASER produced by Miller-Stevenson Company

8-5. Corroded spots are best removed with soap and water. Stubborn residues can be removed with a fine abrasive. When using abrasives, be careful that fine particles do not fall into instrument. Such areas should be protected from further corrosion by an application of a silicone resin such as GE DRI-FILM 88.

8-6. SWITCH MAINTENANCE. The pushbutton switches in this instrument are designed for long, trouble-free service. If one of these switches becomes defective, replacement rather than repair is recommended.

8-7 Rotary switches in this instrument can easily be serviced after removal of the assembly on which the switch is mounted. In the case of the TIME/DIV switch, the TIME/DIV switch shaft must be removed. Refer to the paragraphs on repair and replacement in this section for instructions on disassembly of modules in the instrument.

8-8. Conventional rotary switches are serviced by cleaning the contacts with a degreaser such as M-180 FREON TF DEGREASER. The contact surfaces are then lubricated with a lubricant comparable to LUBRIPLATE FML produced by the Fiske Brothers Refining Company. LUBRIPLATE FML is available from the Hewlett-Packard Company (HP Part No. 6040-0305).

CAUTION

Do not clean attenuator switches with any cleaning agent. Attenuator switches have self-cleaning contacts.

8-9. The rotary switches on A9, A11, and A18 can be serviced as follows:

a. Remove TIME/DIV knob and shaft (refer to paragraph 8-17).

b. Remove plug-in assembly (A9, A11, or A18) from A8.

c. Note orientation of slot in rotor section of switch.

d. Remove metal retainer ring uniting male and female sections of rotor switch.

e. Separate two rotor sections.

f. Check contacts on both rotor sections. If contacts show excessive wear, replace rotor section.

g. Check contact area on circuit board. If contact area shows excessive wear, replace circuit board.

h. Clean and lubricate contacts on circuit board and rotors as described in paragraph 8-8.

i. Place rotor sections on circuit board and reinstall retainer ring.

j. Position slotted portion of open rotor section as noted in step c.

k. Reinstall assembly in instrument.

l. Reinstall TIME/DIV shaft and knob assembly.

8-10. REMOVAL AND REPLACEMENT.

8-11. The following paragraphs provide procedures for removal and replacement of assemblies, subassemblies, and components. Special servicing instructions for etched circuit boards are provided in paragraph 8-28. Section VI provides a detailed parts list for use in ordering replacement parts.

8-12. CRT REMOVAL. To remove and replace the CRT, see figure 6-1 and proceed as follows:

WARNING

To prevent personal injury, wear a face mask or goggles when handling the CRT. Wear protective gloves and handle the CRT carefully.

a. Remove top and bottom covers from instrument.

b. Remove rear-panel CRT socket cover MP21.

c. Remove front-panel CRT bezel MP16 by squeezing at midpoint on bottom and rotating outward and upward.

d. Remove CRT filter.

e. Remove four VERT IN wires (gray) from side of CRT neck.

f. Disconnect horizontal input cable W4 (wires (9) and (5)) from CRT neck pins.

g. Disconnect CRT cable connector from gate assembly at A14P2.

h. Disconnect floodgun filament wire (924) from CRT neck pin.

i. Carefully disconnect CRT socket XV1.

j. Remove two CRT shield mounting screws from rear panel of instrument (at MP44).

k. Slide CRT shield toward rear of instrument until shield is clear of front panel.

WARNING

Failure to discharge high voltage can result in severe electrical shock to personnel and damage to the instrument. Do not attempt to remove lead from CRT glass.

l. Disconnect white plastic post-accelerator connector and immediately discharge lead to ground.

m. Carefully remove CRT and shield from instrument.

n. Disconnect remaining wires from CRT neck pins.

o. Loosen CRT clamp MP51.

CAUTION

Be careful when removing CRT from shield, to avoid damage to CRT neck pins and align/ortho coils.

p. Remove CRT from shield.

q. To reinstall CRT, reverse removal procedure.

8-13. ATTENUATOR REMOVAL. To remove attenuator assemblies A1 and A2 from the instrument, proceed as follows:

a. Remove screw that holds channel A attenuator shield to vertical preamplifier assembly A3.

b. Remove screw that holds channel B attenuator shield to A3 and ground lug attached to top of attenuator cover.

c. Unsolder three lead-in wires to A3 from channel A attenuator A1.

d. Unsolder three lead-in wires to A3 from channel B attenuator A2.

e. Remove two screws that hold vertical preamplifier to main deck of instrument.

f. Disconnect sync cable W2 from square-pin connections on horizontal display switch assembly A10.

g. Pull vertical preamplifier toward rear of instrument until A3P1 and A3P2 clear attenuator connectors.

NOTE

A6 and A7 are connected to the underside of vertical preamplifier. They also will move to the rear. When reinstalling, be sure that pushbutton switches are aligned with front-panel holes.

h. Remove vernier, volt/div, and coupling lever from attenuator being removed.

i. Remove retaining hardware from INPUT BNC connector of attenuator being removed.

j. Pull attenuator toward rear of instrument until it clears front panel of instrument.

NOTE

Step j clears the attenuator for required maintenance. If complete removal of the attenuator is desired continue with step k.

k. Remove two screws that hold vernier bracket to attenuator.

l. Slide attenuator from vernier shaft.

m. Remove vernier shaft from vernier.

n. To reinstall attenuators, reverse removal procedure

8-14. VERTICAL PREAMPLIFIER REMOVAL. To remove vertical preamplifier assembly A3, proceed as follows:

a. Remove channel A and B attenuators from preamplifier assembly in accordance with paragraph 8-13, steps a through g.

b. Disconnect plastic connector at A3P5.

c. Remove gate and blanking coaxial cables from A7 (square-pin connectors).

d. Remove two screws that hold delay line cable to vertical preamplifier assembly.

e. Unsolder delay line cable wires at vertical preamplifier assembly.

f. Note orientation of delay line. Red marked side of delay line goes to dot on board assembly.

g. Remove A3, A6, and A7 from instrument.

h. Disconnect ASW (9) and BSW (0) wires from square-pin connectors on A7.

i. Simultaneously pull A6 and A7 from male connectors mounted on A3.

j. To reinstall vertical preamplifier assembly, reverse installation procedure.

8-15. DELAY LINE REMOVAL. To remove delay line assembly A4, proceed as follows:

a. Remove two screws that hold delay line cable to vertical preamplifier assembly A3.

b. Unsolder two wires from end of delay line cable to A3.

c. Note orientation of delay line. Red marked side of delay line goes to dot on board assembly.

d. Remove two screws that hold delay line cable to vertical output amplifier A5.

e. Unsolder two wires from end of delay line cable to A5.

f. Note orientation of delay line. Red marked side of delay line goes to dot on board assembly.

g. Remove two screws that hold delay line bracket MP8 to main deck.

h. Remove delay line assembly from instrument.

i. To install delay line assembly, reverse removal procedure.

8-16. REMOVAL OF ASSEMBLIES IN HORIZONTAL SECTION. The following paragraphs provide information required to remove and replace various assemblies in the horizontal section of the instrument.

8-17. TIME/DIV Switch Removal. To remove the TIME/DIV switches, proceed as follows:

a. Set TIME/DIV controls as follows:

TIME/DIV (main) ..... .1 mSEC
TIME/DIV (delayed) ..... OFF

b. Remove retaining ring MP68 from TIME/DIV shaft (inside front panel of instrument).

c. Pull TIME/DIV shaft out.

d. To reinstall TIME/DIV shaft, reverse removal procedure.

8-18. Main Horizontal Sweep Switch Assembly and Holdoff-Comparator Assembly Removal. To remove horizontal sweep switch assembly A11, proceed as follows:

a. Remove TIME/DIV shaft (paragraph 8-17).

b. Gently rock main horizontal sweep switch assembly A11 and holdoff-comparator assembly A12 while pulling upward to remove from sockets on horizontal sweep assembly A8.

c. Separate A11 from A12 by removing two retaining screws and soldered wire.

d. To reinstall assemblies, reverse removal procedure.

8-19. Delayed Horizontal Sweep Switch Assembly Removal. To remove delayed horizontal sweep switch assembly A9, proceed as follows:

a. Remove TIME/DIV shaft (paragraph 8-17).

b. Gently rock A9, while pulling upward to remove from socket on A8.

c. To reinstall A9, reverse removal procedure.

8-20. Analog Assembly Removal and Replacement. To remove analog assembly A18, proceed as follows:

NOTE

A18 is mounted on horizontal sweep assembly A8 using a spare connector on assembly A8. The connector is used only to physically secure A18. There are no electrical circuits between A18 and A8 through this connector.

a. Remove TIME/DIV shaft (paragraph 8-17).

b. Disconnect cable connectors from A18P1 and A18P2.

c. Gently rock A18, while pulling upward to remove from socket on A8.

d. To reinstall A18, reverse removal procedure.

8-21. Horizontal Sweep Assembly Removal and Replacement. To remove horizontal sweep assembly A8, proceed as follows:

a. Perform paragraphs 8-17 through 8-20.

b. Unsolder flex wire from main EXT ÷ 10 switch, A8S1P.

c. Unsolder flex wire from delayed EXT ÷ 10 switch, A8S1B.

d. Unsolder two ground straps from A8 to chassis ground.

e. Disconnect reset lamp coaxial cable (5) from A8 (square-pin connections).

f. Disconnect line sync wire (6) from A8.

g. Disconnect main trig level wire (903) from A8.

h. Disconnect delay trig level wire (97) from A8.

i. Disconnect start after delay wire (916) from A8.

j. Disconnect plastic connectors at A8P1 and A8P5.

k. Remove two retaining screws at rear edge of A8.

NOTE

Horizontal display switch assembly A10 is mounted on the rear of A8. It must also clear the front panel during the next step.

l. Move A8 toward right rear of instrument until pushbutton controls clear front panel.

m. Disconnect sync cable W2 from assembly A10 (square pin connections).

n. Disconnect plastic connector at A8P4.

o. Disconnect at A10 (square-pin connections), the coaxial cable leading from VERTICAL OUTPUT connector J4.

p. Disconnect horizontal input cable W3 at horizontal output assembly A13 (square-pin connections).

q. Remove assemblies A8 and A10 from instrument.

r. To reinstall A8 and A10, reverse removal procedure.

8-22. Horizontal Display Switch Assembly Removal. To remove horizontal display switch assembly A10, proceed as follows:

a. Perform paragraph 8-21 steps a through q.

b. Unsolder R9 and R10 (connected between A8 and A10) at A10 terminals.

c. Remove three screws that hold A8 and A10 together.

d. To reinstall horizontal display switch assembly, reverse removal procedure.

8-23. REPAIR OF ASSEMBLIES.

8-24. GENERAL. The board assemblies used in this instrument are etched circuit type and have plated through component holes to facilitate replacement of components. Before repairing any board assembly refer to paragraph 8-28 for information covering circuit board repair and recommended soldering equipment.

8-25. The only assemblies not recommended for repair are the attenuator assemblies. The attenuator components are closely mounted, and their interrelationship is critical. The only components recommended for replacement are R1, R2, Q1, Q2, and Q3. These items are socket mounted and easily replaced. If other components fail, replacement of the board assembly is recommended.

8-26. REPLACEMENT OF ATTENUATOR TERMINATION RESISTORS.

CAUTION

Do not attempt to clean attenuator assemblies with any cleaning agent. Always wear protective cotton gloves (such as HP Part Number 8650-0030) while handling the attenuator board assemblies. The board assemblies are extremely susceptible to conduction paths caused by finger prints.

8-27. To replace attenuator termination resistors A1A1R1/R2 and A2A1R1/R2, proceed as follows:

a. Remove two screws holding top cover of attenuator.

b. Slide attenuator cover from attenuator.

c. Remove resistors R1/R2 from attenuator board assembly using long-nosed pliers.

d. Replace resistors R1/R2 reversing above procedure.

CAUTION

If new resistors are to be installed, replace with flameproof type only (HP Part No. 0698-6433). Recompensate attenuator assembly when new resistors are installed.

8-28. CIRCUIT BOARDS.

8-29. The following paragraphs provide information regarding servicing procedures for etched circuit boards, use of heat sinks, and special soldering considerations.

8-30. BOARD CONNECTIONS. Square-pin connectors are identified on circuit boards by the color code of the connecting wire or by the signal name. Connector pins on plugs and jacks are identified by either a numeral or a letter. The letters G, I, O, and Q have been omitted. Table 8-1 shows the types of board connections used in the instrument.

8-31. SERVICING ETCHED CIRCUIT BOARDS. The etched circuit boards have plated-through component holes. This allows components to be removed or replaced by unsoldering or soldering from either side of the board. When removing large components, such as potentiometers, rotate the soldering iron tip from lead to lead while applying pressure to the part to lift it from the board. HP Service Note M-20E contains additional information for repair of etched circuit boards.

8-32. SEMICONDUCTOR REMOVAL AND REPLACEMENT. Figure 8-1 is included to help identify the leads on the common shapes and sizes of semiconductor devices. When removing a semiconductor, use long-nose pliers as a heat sink between the device and the soldering iron. When replacing a semiconductor, ensure sufficient lead length to dissipate the soldering heat by using the same length of exposed lead as used for the original part.

8-33. MOS HANDLING PRECAUTIONS. All MOS devices, to varying degrees, are subject to damage from static charge buildup. Generation of static charges is not the problem, but the accumulation of static charges is. In general, any device not connected directly to ground can accumulate static charges. Electrical discharge can occur to ground or to any item having a lower potential; therefore, handling precautions are recommended for all personnel coming into contact with MOS devices.

8-34. When handling or testing the MOS devices, observe the following precautions:

a. Ground test equipment and tools used in testing or handling MOS devices.

b. Apply no power to board assembly while MOS device is being installed. This permits accumulated static charges on MOS device to be safely removed before power is applied.

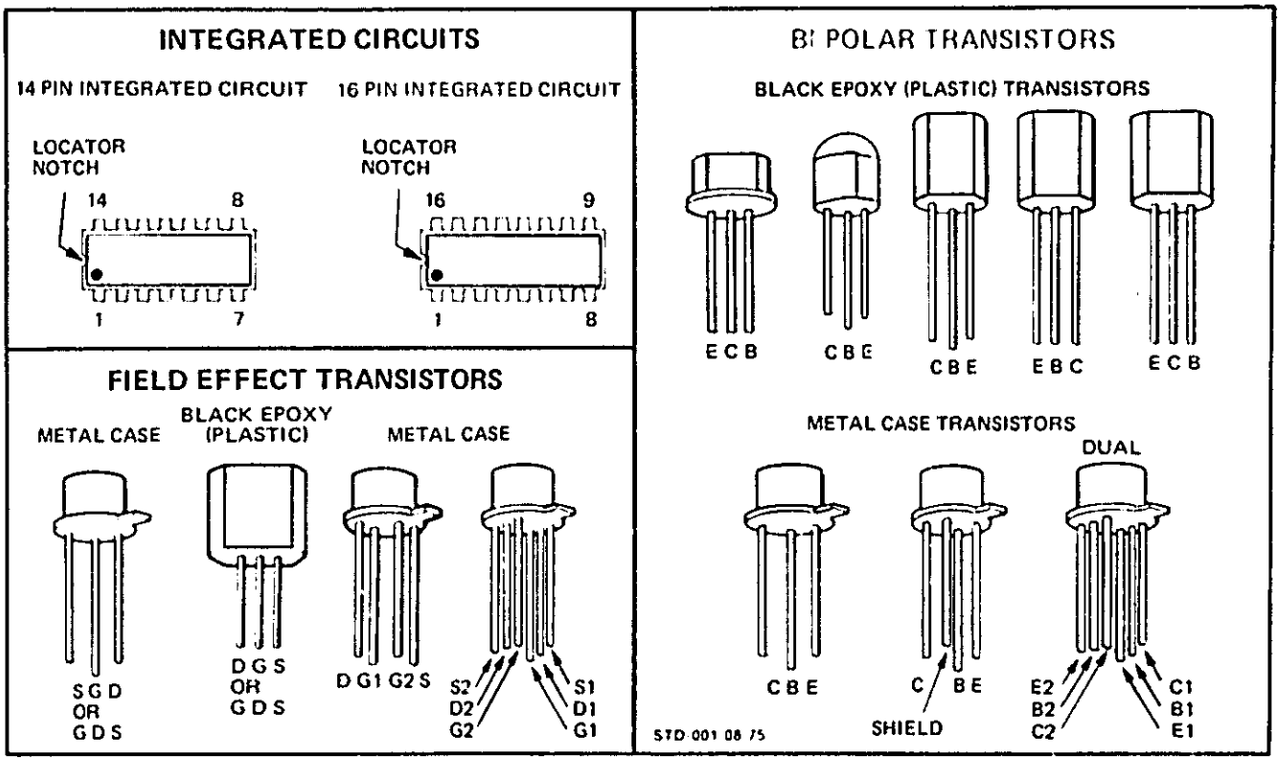

Figure 8-1. Semiconductor Terminal Identification

e. When not in use, short all MOS leads. This prevents voltage differences from occurring on leads.

WARNING

When performing step d, never expose personnel directly to hard electrical ground. For safety, place a resistance of at least 100 kilohms between using personnel and hard electrical ground.

d. Do not handle MOS devices by their leads. Before handling any MOS device, personnel should touch electrical ground to discharge accumulated static charges.

e. Avoid use of plastics, rubber, and silk in MOS areas. Do not use any material susceptible to static charge accumulation.

f. Handle circuit boards and modules containing MOS devices in same manner as individual MOS devices. Regardless of configuration, whenever leads of MOS devices are exposed, damage due to static charge buildup can occur.

g. Use conductive, grounded table tops in MOS work area.

h. Humidity in work area should be maintained above 50%. Static charge generation increases exponentially as relative humidity decreases.

8-35. INTEGRATED CIRCUIT REMOVAL AND REPLACEMENT. The integrated circuits (IC's) in this instrument are plug-in types. Remove a plug-in IC with a straight pull away from the board. When replacing an IC, note the mark or notch used for orientation. Component-identification photographs and the IC pin-location diagrams in this manual show the correct orientation.

CAUTION

Unless an integrated circuit has definitely failed, be careful to prevent damage when removing or replacing it.

8-36. ASSEMBLY A5 INTEGRATED CIRCUIT REPLACEMENT. Use the following procedure when replacing (IC's) in vertical output assembly A5:

a. Remove A5 mounting bracket by removing two screws in rear panel and two screws in main deck.

b. Disconnect four gray wires from CRT neck pins (two wires from A5 and two wires from assembly A5A1).

c. Remove A5 and mounting bracket from instrument.

NOTE

The delay line cable remains attached to assembly A5.

d. Disconnect power supply connector J8 from A5P1.

e. Unsolder wire (92) from termination assembly A5A1 at A5.

NOTE

Read next two steps before performing them.

f. Remove four screws that hold A5 to mounting bracket.

g. Separate A5 from mounting bracket. Do not lose yellow plastic insulator (HP Part No. 5080-9670) held captive between gain cell A5U1 (gold colored IC) and mounting bracket.

h. Remove A5U1 from its mounting socket.

i. To remove output amplifier A5U2, remove four screws that hold it to circuit board. (Go to step l.)

j. Replace gain cell A5U1 by matching mark on gain cell leg (solid line) with polarity dot on circuit board.

CAUTION

Do not use lettering on gain cell A5U1 and number "1" marking on socket as a reference.

k. Insert gain cell in socket, but do not push it all the way in to final position. (When circuit board is remounted on bracket, the screws will seat IC to required depth.)

l. Replace A5U2 by matching contacts on circuit board with gold pads on IC.

m. Secure A5U2 by replacing four mounting screws and lock washers.

n. Using Thermalloy Compound (HP Part No. 6040-0239), coat surfaces of both ICs (A5U1 and A5U2) that will come in contact with mounting bracket.

o. Attach yellow plastic insulator to rear of gain cell A5U1.

p. Coat exposed side of yellow plastic insulator with Thermalloy Compound.

q. Carefully feed two gray wires through hole in mounting bracket.

r. Position A5 and mounting bracket so that yellow plastic insulator is properly positioned between A5U1 and mounting bracket.

s. Using four screws, attach A5 to mounting bracket.

NOTE

Be sure that yellow plastic insulator is properly positioned and IC is flat against bracket.

t. Resolder wire (92) from termination assembly A5A1 to A5.

u. Connect power supply connector J8 to A5P1.

v. Insert mounting bracket with A5 assembly into instrument.

w. Start two screws through rear panel into mounting bracket.

x. Start two screws through mounting bracket into main deck of instrument.

y. Tighten lower screw through rear panel and rear screw through mounting bracket to main deck.

z. Tighten two remaining screws.

NOTE

Steps y and z must be followed carefully to ensure that mounting bracket is positioned correctly for lowest possible IC operating temperature.

aa. Reconnect four gray wires to CRT neck pins.

ab. Verify mounting bracket ground clip is making contact with ground shield.

8-37. TROUBLESHOOTING.

WARNING

Read the Safety Summary at the front of this manual before troubleshooting the instrument.

8-38. Two important prerequisites for successful troubleshooting are: (1) understanding how the in-instrument is designed to operate and (2) knowing the correct use of front-panel controls. Improper control settings or circuit connections can cause apparent malfunctions. Read Section III for an explanation of controls, connectors, and general operating considerations. Read Section IV for explanations of circuit theory.

8-39. If trouble is suspected, visually inspect the instrument. Look for loose or burned components that might suggest a source of trouble. Check to see that

Table 8-2. Assembly Information Index

Assembly No.	Assembly Name	Service Information
A1	Channel A Attenuator	Schematic 1
A2	Channel B Attenuator	Schematic 2
A3	Vertical Preamplifier	Schematic 1, 2, 3
A4	Delay Line	Schematic 3
A5	Vertical Output	Schematic 4
A6	Internal Trigger Switch	Schematic 5
A7	Vertical Display Switch	Schematic 5
A8	Horizontal Sweep	Schematic 7, 9, 13, 14
A9	Delay Sweep Switch	Schematic 10
A10	Horizontal Display Switch	Schematic 6
A11	Main Sweep Switch	Schematic 8
A12	Holdoff-Delay Comparator	Schematic 12
A13	Horizontal Output	Schematic 15
A14	Gate	Schematic 16, 17
A15	HV Power Supply	Schematic 17
A16	HV Multiplier	Schematic 17
A17	LV Power Supply	Schematic 18, 19
A18	Analog Assy	Schematic 11

all circuit board connections are making good contact and are not shorting to an adjacent circuit. If no obvious trouble is found, check the power supply voltages in the instrument. Also check the external power before any extensive troubleshooting.

8-40. DC VOLTAGES. On some of the schematics, dc voltages are indicated for active components (transistors, etc.). Conditions for making these voltage measurements are listed adjacent to the schematics. Since conditions for making measurements may differ from one circuit to another, always check the specific conditions listed.

8-41. INITIAL TROUBLESHOOTING PROCEDURE. Before troubleshooting the Model 1725A in detail, try to perform the adjustment procedures listed in Section V of this manual. Some apparent malfunctions can be corrected by these adjustments; also, the inability to obtain a correct adjustment will often reveal the source of trouble.

8-42. If possible, perform adjustment procedures in listed sequence since the power supplies should be checked first for any malfunction.

8-43. TROUBLE DIAGNOSIS. By use of front-panel controls, note as many symptoms of the malfunction as possible. From the symptoms, it can usually be determined which section (vertical, horizontal, or power supply) is malfunctioning. Normally, the vertical and horizontal sections will not malfunction simultaneously, although symptoms may indicate this to be the case.

8-44. VERTICAL SECTION TROUBLESHOOTING. Although a sweep may not be generated on the CRT, vertical deflection of an input signal on the CRT normally indicates that the vertical section is functioning properly.

8-45. The sync pulse required for internal triggering is developed in the vertical preamplifier and sync amplifier located on horizontal display switch assembly A10. If the instrument does not trigger internally, but triggers properly when an external trigger is applied, the vertical preamplifier section should be checked.

8-46. Due to the low levels of the signal in the preamplifier, signal tracing becomes difficult. When troubleshooting the preamplifier, check dc bias voltages for best results.

8-47. HORIZONTAL SECTION TROUBLESHOOTING. The horizontal section of the instrument consists of the trigger assembly, gate assembly, holdoff-comparator assembly, main and delayed sweep assembly, horizontal preamplifier, and horizontal output assembly. From symptoms derived in paragraph 8-43, check input and output signals of the suspected assembly until the problem is isolated to a particular circuit. Refer to table 8-3 for troubleshooting hints on the horizontal section.

NOTE

Use table 8-3 as a guide only. Slight variations in voltage readings may occur.

8-48. LOW-VOLTAGE POWER SUPPLY TROUBLESHOOTING. The Model 1725A contains seven low-voltage power supplies, two of which are unregulated. The nominal +20 unregulated voltage is used in the HV power supply oscillator circuit. The nominal +15-volt regulated supply provides a reference voltage for the other regulated supplies. Check the output of each regulated supply for a malfunction; a convenient test point is located on each supply. All supplies are regulated to better than ±2%. If a malfunction occurs in the low-voltage supplies, always check the +15-volt supply.

Table 8-3. Troubleshooting Guide - Horizontal Section

The following table is a troubleshooting guide to help analyze the problem under no sweep condition in AUTO mode of operation. Once the sweep is running, individual circuits can be analyzed using schematics and associated waveforms.

Step	Circuit	Test Point	Test Point Measurement	Action
1	Output of Integrators (main-delayed)	Main - A11TP2	1 volt	Go to Step 2.
		Delayed - A9TP2	14 volts	Go to Step 3.
			other	Go to Step 4.
2	Measure Gate	Main - A8TP5	2 volts	Problem in Integrator - troubleshoot.
		Delayed - A8TP9	0 volt	Go to Step 5.

Table 8-3. Troubleshooting Guide - Horizontal Section (Cont'd)

Step	Circuit	Test Point	Test Point Measurement	Action
3	Measure Gate	Main - A8TP5	2 volts	Go to Step 5.
		Delayed - A8TP9	0 volt	Problem in Integrator - troubleshoot.
4	Measure Gate	Main - A8TP5	0 volt or 2 volts	Problem in Integrator - troubleshoot.
		Delayed - A8TP9	other	Problem in sweep control circuit - troubleshoot.
5	Measure Reset input to trigger circuit.	Main - A8TP2	4.3 volts	Go to Step 6.
		Delayed - A8TP7	4.9 volts	Go to Step 5.
			other	Problem in holdoff (main only) or sweep length circuits, rarely in trigger circuits - troubleshoot.
6		Main - A8TP4	+5 volts	Go to Step 7.
			+4 volts	Problem in sweep control circuit - troubleshoot.
		Delayed - A8TP8	+4 volts	Problem in sweep control circuit - troubleshoot.
			+15 volts	Go to Step 8.
7		A8U2 - pin 6	+4.3 volts	Auto problem - check A8U3 and associated circuits.
			+4.9 volts	Problem in A7U2.
8		A8U5 - pin 6	+4.3 volts	Auto problem - check A8U6 and associated circuits.
			+4.9 volts	Problem in A8U5.
9		Main - A8TP4	+4 volts	Go to Step 10.
			+5 volts	Problem in sweep control circuit - troubleshoot
		Delayed - A8TP8	+15 volts	Problem in sweep control circuit - troubleshoot
			+14 volts	Go to Step 11
10		A8U2 - pin 6	+4.3 volts	Problem in A8U2.
			+4.9 volts	Auto problem - check A8U3 and associated circuits.

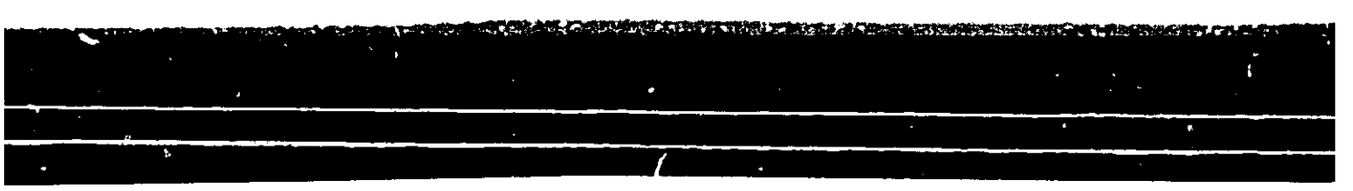

Table 8-3. Troubleshooting Guide - Horizontal Section (Cont'd)

Step	Circuit	Test Point	Test Point Measurement	Action
11		A8U5 - pin 6	+4.3 volts +4.9 volts	Problem in A8U5. Auto problem - check A8U6 and associated circuits.

DC VOLTAGE MEASUREMENT CONDITIONS
SCHEMATIC 1

1. Set front-panel controls in accordance with paragraph 5-13, Section V.
2. All voltages are referenced to chassis ground. All indications are nominal and 15% variation from those indicated should be considered normal.

WAVEFORM MEASUREMENT CONDITIONS
SCHEMATIC 1

1. Set front-panel controls in accordance with paragraph 5-13, Section V, except as follows:

Coupling (channel A)	50Ω
TIME/DIV (delayed)	10 uSEC
DELAY	5.00
HORIZ DISPLAY	MIXED
TRIGGER LEVEL (main)	stable display

2. Set monitor oscilloscope TIME/DIV and VOLTS/DIV controls as indicated under waveform(s).
3. Connect pulse generator 50-ohm output to Model 1725A channel A INPUT connector.
4. Adjust pulse generator output for four divisions of signal amplitude (.4 V).

DC VOLTAGE MEASUREMENT CONDITIONS
SCHEMATIC 7

1. Set front-panel controls in accordance with paragraph 5-13, Section V, except as follows:

Sweep Mode	SINGLE
AUTO/NORM	NORM
RESET	armed
TRIGGER LEVEL (main)	cw

2. All voltages are referenced to chassis ground. All indications are nominal and 15% variation from those indicated should be considered normal.

WAVEFORM MEASUREMENT CONDITIONS
SCHEMATIC 7

1. Set front-panel controls in accordance with paragraph 5-13, Section V, except as follows:

Coupling (channel A)	50Ω
TRIGGER LEVEL (main)	stable display
TIME/DIV (main)	20 µs/div

2. Set monitor oscilloscope TIME/DIV and VOLTS/DIV controls as indicated under waveform(s).

3. Connect pulse generator output to Model 1725A channel A INPUT connector.

4. Adjust pulse generator output for four divisions of signal amplitude (.4 V) at 10 kHz.

5. Waveform timing conditions:

T_0 - Sweep start; position trigger occurs at A8U2 pin 11.
T_1 - Sweep ends; holdoff starts.
T_2 - Holdoff ends; armed starts.
T_3 - Armed ends.

DC VOLTAGE MEASUREMENT CONDITIONS
SCHEMATIC 9

1. Set front-panel controls in accordance with paragraph 5-13, Section V.

2. All voltages are referenced to chassis ground. All indications are nominal and 15% variation from those indicated should be considered normal.

WAVEFROM MEASUREMENT CONDITIONS
SCHEMATIC 9

1. Set front-panel controls in accordance with paragraph 5-13, Section V, except as follows:

Coupling (channel A)	50Ω
TRIG LEVEL (delayed)	stable display
TIME/DIV (main)	.1 mSEC
TIME/DIV (delayed)	50 μSEC
HORIZ DISPLAY	DLY'D

2. Set monitor oscilloscope TIME/DIV and VOLTS/DIV controls as indicated under waveforms(s)

3. Connect pulse generator 50-ohm output to Model 1725A channel A INPUT connector.

4. Adjust pulse generator output for 5 kHz, four divisions of signal amplitude (0.4 V).

DC VOLTAGE MEASUREMENT CONDITIONS
SCHEMATIC 12

1. Set front-panel controls in accordance with paragraph 5-13, Section V, except as follows:

Sweep mode	SINGLE
AUTO/NORM	NORM
RESET	armed
TRIG LEVEL (main)	fully cw
TIME/DIV (delayed)	1 μSEC
INC-DEC	set LED display for 0.500
TIME INTERVAL (DELAY dial)	fully ccw
HORIZ DISPLAY	MAIN INTEN

2. All voltages are referenced to chassis ground. All indications are nominal and 15% variation from those indicated should be considered normal.

WAVEFORM MEASUREMENT CONDITIONS
SCHEMATIC 12

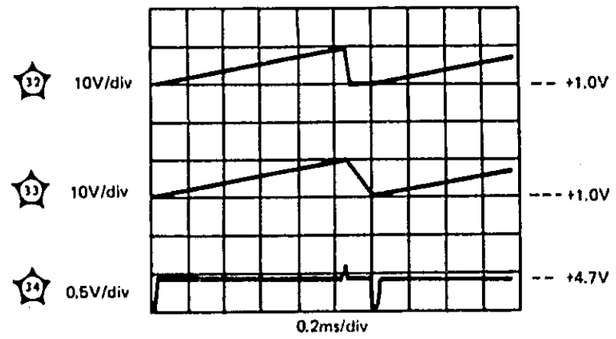
1. Set front-panel controls in accordance with paragraph 5-13, Section V, except as follows:

HORIZ DISPLAY	MAIN INTEN
TIME/DIV (delayed)	1 μSEC
INC-DEC	set LED display for 0.500
Coupling (channel A)	50Ω

2. Set monitor oscilloscope TIME/DIV and VOLTS/DIV controls as indicated under waveform(s).

3. Connect pulse generator 50-ohm output to Model 1725A channel A INPUT connector.

4. Adjust pulse generator output for 5 kHz, four division of signal amplitude (0.4 V).



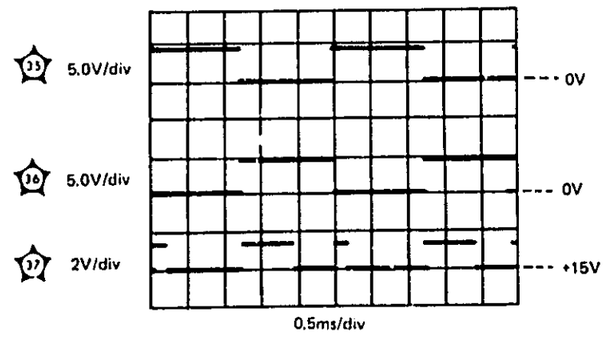


Figure 8-15. Service Information, Holdoff-delayed Comparator, Assembly A12 (Sheet 1 of 2)

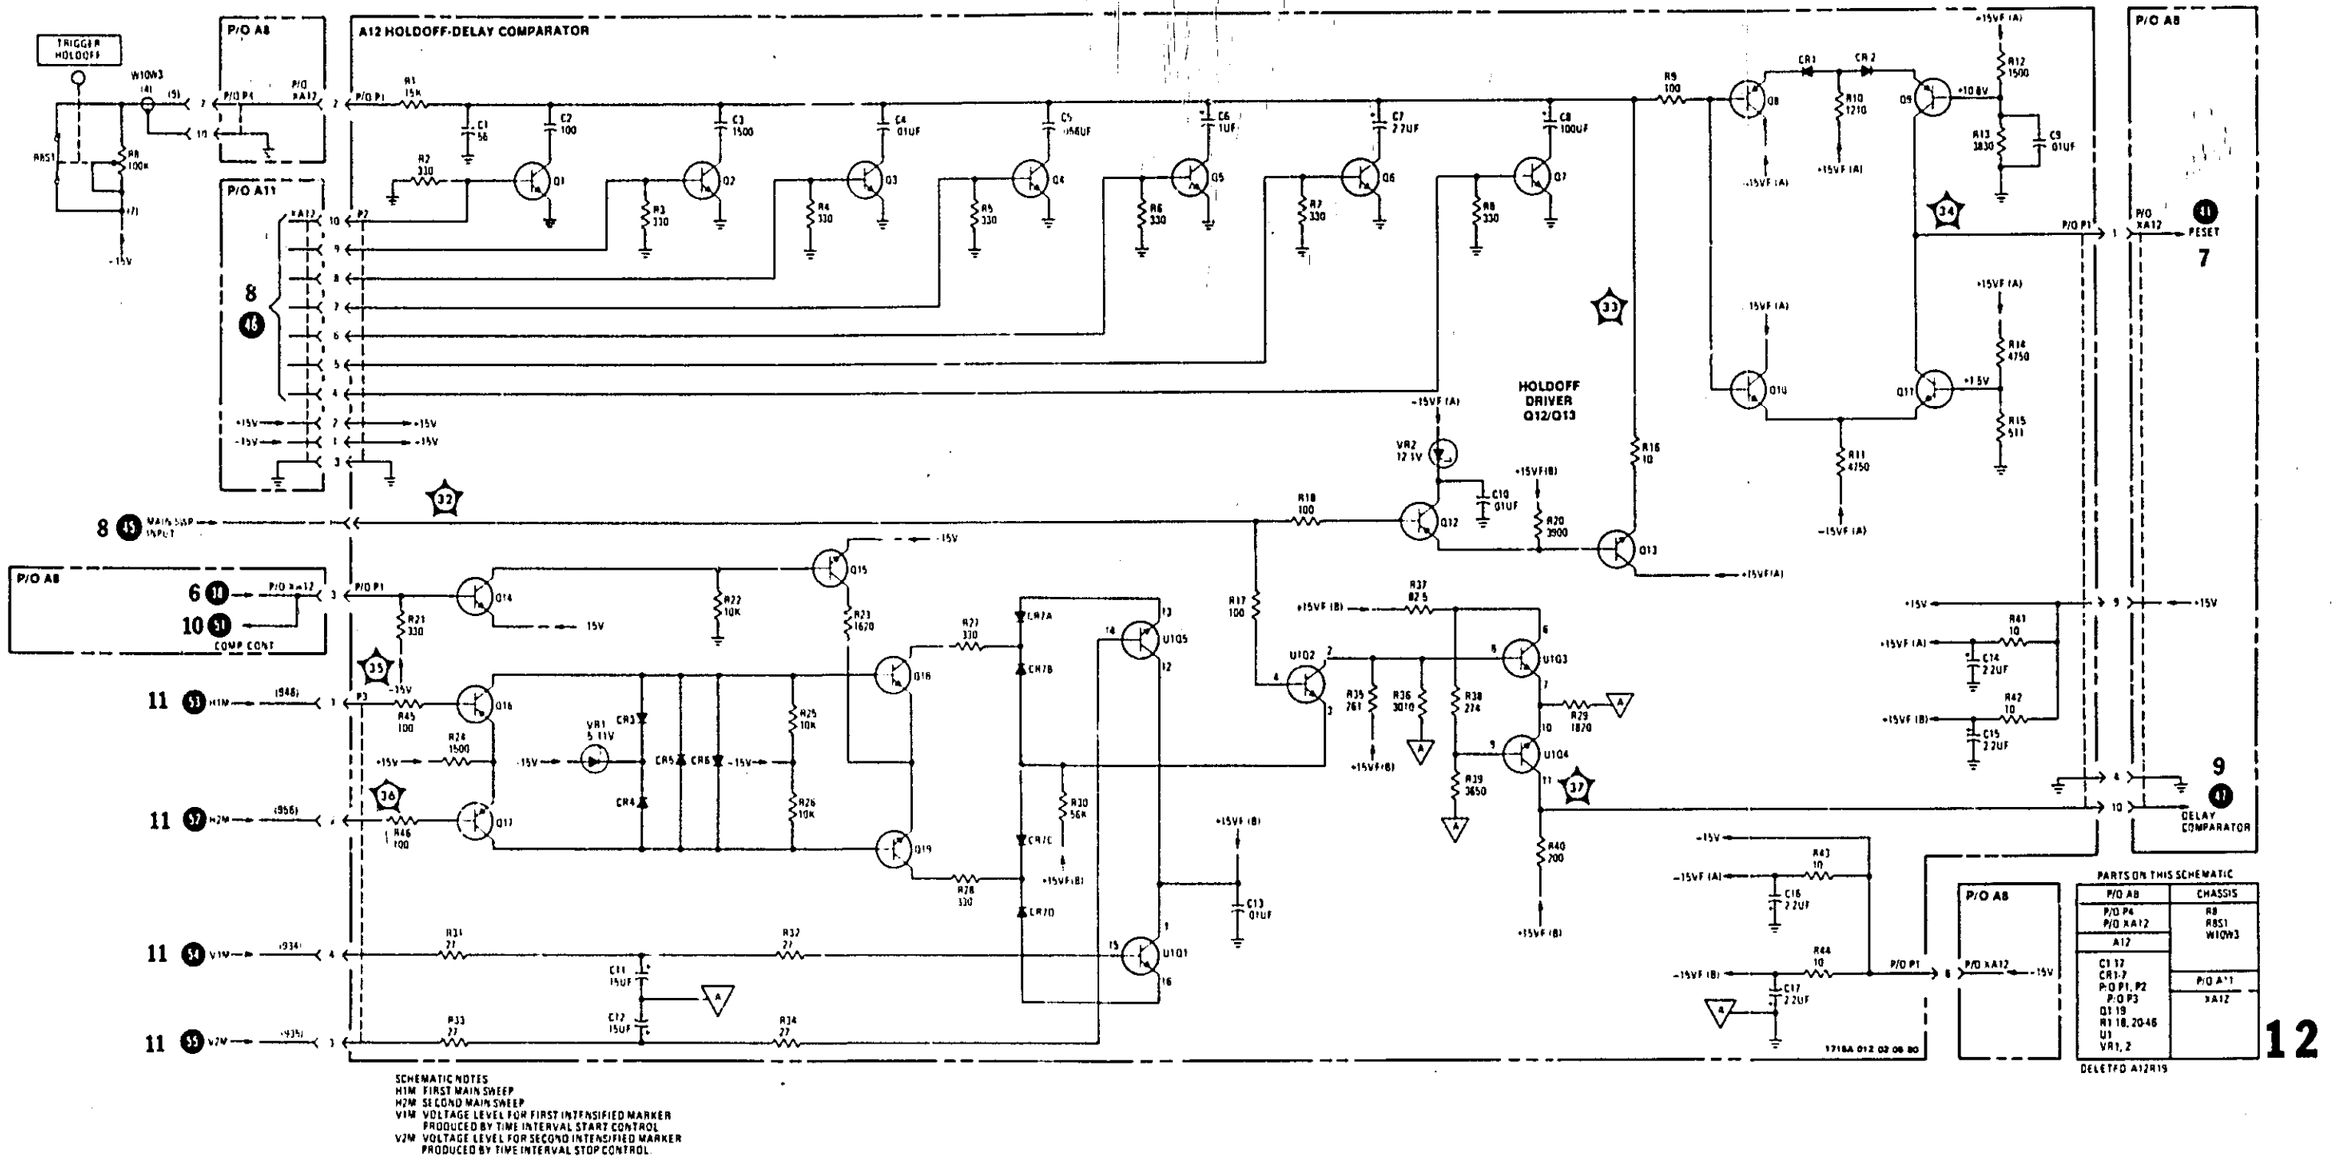

Figure 8-15.

TURN-ON PROCEDURE

A. SET REAR PANEL POWER MODE SWITCH FOR CORRECT POWER SOURCE

B. SET INTENSITY TO MIDRANGE

C. SET POSITION A AND B TO MIDRANGE

D. SET HORIZONTAL POSITION TO MIDRANGE

E. SET LINE SWITCH ON AND ALLOW 5 MINUTE WARMUP

F. SET VERT DISPLAY TO ALT

G. SET INT T. G TO A

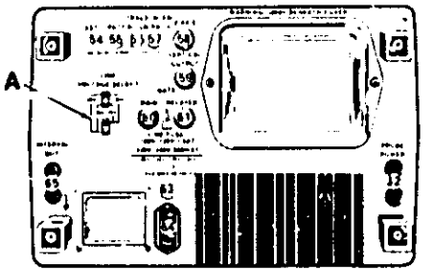
H. SET HORIZ DISPLAY TO MAIN

I. ALL OTHER PUSHBUTTONS DISENGAGED

J. ADJUST INTENSITY FOR NORMAL BRIGHTNESS

K. ADJUST VERTICAL AND HORIZONTAL POSITION CONTROLS TO CENTER TRACE

L. ADJUST FOCUS FOR SHARP TRACE



CONTROLS AND CONNECTORS

CRT AND GENERAL

1. **INTENSITY** CONTROLS BRIGHTNESS OF TRACE
2. **FOCUS** FOCUSES TRACE FOR BEST CRT DISPLAY
3. **LINE SWITCH AND SCALE ILLUM** APPLIES AC POWER TO INSTRUMENT AND CONTROLS BRIGHTNESS OF SCALE ILLUMINATION
4. **LINE LAMP** LIGHTS WHEN LINE SWITCH IS TURNED TO ON POSITION
5. **CAL 3V** ~1 KHZ SQUARE WAVE AT 3 V ±1%
6. ⏚ CHASSIS GROUND CONNECTION FOR EXTERNAL EQUIPMENT
7. **BEAM FIND** RETURNS DISPLAY TO VIEWING AREA

HORIZONTAL

8. **EXT-10** ATTENUATES DELAYED EXTERNAL TRIGGER SIGNAL BY FACTOR OF 10
9. **INT/EXT** SELECTS INTERNAL OR EXTERNAL TRIGGER FOR DELAYED SWEEP
10. **AC/DC** SELECTS COUPLING FOR DELAYED SWEEP TRIGGER
11. **LF REJ** ATTENUATES DELAYED TRIGGER SIGNALS BELOW ~15 KHZ
12. **HF REJ** ATTENUATES DELAYED TRIGGER SIGNALS ABOVE ~15 KHZ
13. + – SELECTS SLOPE OF DELAYED TRIGGER SIGNAL THAT STARTS SWEEP
14. **TIME INTERVAL START** VARIES DELAY TIME INTERVAL BETWEEN START OF MAIN SWEEP AND START OF DELAYED SWEEP
15. **TIME INTERVAL STOP** CONTROLS FOR DECREASING OR INCREASING DELAY TIME INTERVAL BETWEEN TWO EVENTS
16. **SIGNAL OVERLAY** (ΔT=0) ADJUSTMENT FOR NULLING ANALOG AMPLIFIER
17. **TIME INTERVAL MODE SWITCH**

    ΔT OFF TURNS OFF SECOND DELAYED SWEEP MARKER, PROVIDING SINGLE DELAYED SWEEP OPERATION

    A START SETS FIRST DELAYED SWEEP MARKER ON CHANNEL A AND SECOND DELAYED SWEEP MARKER ON CHANNEL B. THIS ALLOWS TIME MEASUREMENT FROM CHANNEL A TO CHANNEL B

    B START REVERSES THE MARKERS, PUTTING FIRST MARKER ON CHANNEL B AND THE SECOND MARKER ON CHANNEL A. THIS ALLOWS TIME MEASUREMENT FROM CHANNEL B TO CHANNEL A
18. **DELAYED TRIGGER LEVEL** SELECTS AMPLITUDE POINT ON DELAYED TRIGGER SIGNAL THAT STARTS DELAYED SWEEP. STARTS AFTER DELAY POSITION AUTOMATICALLY STARTS DELAYED SWEEP AFTER DELAY TIME
19. **RESET** RESETS SWEEP IN SINGLE SWEEP MODE. LIGHT INDICATES WHEN SWEEP IS ARMED
20. **SINGLE** SELECTS SINGLE SWEEP OPERATION
21. **AUTO/NORM**
    AUTO AUTOMATIC SWEEP IN ABSENCE OF TRIGGER SIGNAL
    NORM SWEEP TRIGGERED ONLY BY APPLYING TRIGGER SIGNAL
22. +/– SELECTS SLOPE OF MAIN TRIGGER SIGNAL THAT STARTS SWEEP
23. **HF REJ** ATTENUATES MAIN TRIGGER SIGNALS ABOVE ~15 KHZ
24. **LF REJ** ATTENUATES MAIN TRIGGER SIGNALS BELOW ~15 KHZ
24a. **LINE** LINE TRIGGERING IS SELECTED BY ENGAGING BOTH MAIN HF REJ AND LF REJ SWITCHES SIMULTANEOUSLY
25. **AC/DC** SELECTS COUPLING FOR MAIN SWEEP TRIGGER
26. **INT/EXT** SELECTS INTERNAL OR EXTERNAL TRIGGER FOR MAIN SWEEP
27. **EXT 10** ATTENUATES MAIN EXTERNAL TRIGGER SIGNAL BY FACTOR OF 10
28. **EXT TRIG** BNC CONNECTORS FOR DELAYED AND MAIN EXTERNAL TRIGGER SIGNALS
29. **UNCAL** LIGHT INDICATES WHEN SWEEP VERNIER IS NOT IN CAL DETENT POSITION
30. **TRIGGER HOLDOFF** PROVIDES CONTROL OF TIME BETWEEN SWEEPS FOR TRIGGERING ON COMPLEX DIGITAL WAVEFORMS
31. **TRIGGER LEVEL** SELECTS AMPLITUDE POINT ON MAIN TRIGGER SIGNAL THAT STARTS SWEEP
32. **SWEEP VERNIER** PROVIDES CONTROL OF MAIN SWEEP TIME BETWEEN CALIBRATED POSITIONS OF TIME/DIV SWITCH
33. **MAG X10** IN X10 POSITION, SWEEP IS MAGNIFIED 10 TIMES
34. **DLY'D** SELECTS DELAYED SWEEP MODE FOR DISPLAY
35. **MIXED** SELECTS MIXED SWEEP MODE FOR DISPLAY
36. **MAIN INTEN** INTENSIFIES DELAYED SWEEP PORTION OF DISPLAY
37. **MAIN** SELECTS MAIN SWEEP MODE FOR DISPLAY
38. **X-Y** DISPLAY MODE FOR PROVIDING X AXIS DEFLECTION WITH SIGNAL APPLIED TO CHANNEL B INPUT
39. **DELAYED TIME/DIV** CONTROLS SWEEP TIME IN DLY'D SWEEP MODE
40. **MAIN TIME/DIV** CONTROLS SWEEP TIME IN MAIN SWEEP MODE

VERTICAL

41. **COUPLING** SELECTS CAPACITIVE (AC), DIRECT (DC), OR 50 OHM COUPLING OF INPUT SIGNAL. GND POSITION DISCONNECTS INPUT SIGNAL AND GROUNDS INPUT TO VERTICAL PREAMPLIFIER
42. **VOLTS/DIV** SELECTS VERTICAL DEFLECTION FACTOR FOR CALIBRATED MEASUREMENTS
43. **VERNIER** PROVIDES ADJUSTMENT OF VOLTS/DIV BETWEEN CALIBRATED POSITIONS OF VOLTS/DIV SWITCH
44. **UNCAL** LIGHT INDICATES CHANNEL A OR CHANNEL B VERNIER NOT IN CAL DETENT POSITION
45. **INPUT** BNC CONNECTORS FOR INPUT SIGNALS
46. **VERT DISPLAY A** SELECTS CHANNEL A INPUT SIGNAL FOR DISPLAY
47. **VERT DISPLAY B** SELECTS CHANNEL B INPUT SIGNAL FOR DISPLAY
47a. **A + B** ENGAGING BOTH CHANNEL A AND CHANNEL B VERT DISPLAY SWITCHES SIMULTANEOUSLY RESULTS IN A+B (ALGEBRAIC ADDITION) DISPLAY
48. **ALT** DISPLAYS EACH CHANNEL ON ALTERNATE SWEEPS
49. **CHOP** DISPLAYS EACH CHANNEL BY SWITCHING BETWEEN CHANNELS AT ~1 MHZ RATE
50. **INT TRIG A** SWEEP TRIGGERED ON CHANNEL A INPUT SIGNAL
51. **INT TRIG B** SWEEP TRIGGERED ON CHANNEL B INPUT SIGNAL
51a. **COMP** DISPLAYED MODES TRIGGERED BY DISPLAYED SIGNALS WHEN BOTH INT TRIG A AND INT TRIG B SWITCHES ARE ENGAGED SIMULTANEOUSLY
52. **BW LIMIT** LIMITS BANDWIDTH OF VERTICAL AMPLIFIER TO ~20 MHZ
53. **B INVERT** INVERTS POLARITY OF CHANNEL B INPUT SIGNAL

REAR PANEL

54. **ASTIG** ADJUSTS SHAPE OF CRT SPOT
55. **PATT** ADJUSTS FOR UNIFORM PATTERN OVER CRT VIEWING AREA
56. **TRACE ALIGN** ALIGNS TRACE WITH HORIZONTAL GRATICULE LINE
57. **INTEN RATIO** ADJUSTS INTENSITY OF INTENSIFIED PORTION OF SWEEP IN MAIN INTEN MODE OF OPERATION
58. **Z AXIS** BNC CONNECTOR FOR Z AXIS INPUT
59. **VERTICAL OUTPUT** BNC CONNECTOR FOR VERTICAL OUTPUT
60. **MAIN GATE** BNC CONNECTOR FOR MAIN GATE OUTPUT TO EXTERNAL EQUIPMENT
61. **DELAYED GATE** BNC CONNECTOR FOR DELAYED GATE OUTPUT TO EXTERNAL EQUIPMENT
62. **PROBE POWER** PROVIDES POWER FOR ACTIVE PROBES IF OPTION 02 INSTALLED
63. **LINE FUSE** PROVIDES AC INPUT PROTECTION
64. AC INPUT POWER CONNECTOR
65. **INTERVAL OUT** BANANA JACK CONNECTOR FOR TIME INTERVAL MEASUREMENT VOLTAGE OUTPUT AND POSITION OF TIME DIV CONTROLLED GATE. TIME INTERVAL IS ~10 VOLTS

for

MODEL 1725A OSCILLOSCOPE

August 1977

MANUAL CHANGES

MANUAL IDENTIFICATION

Model Number:	1725A
Date Printed:	June 1980
Part Number:	01725-90902

This supplement contains important information for correcting manual errors and for adapting the manual to instruments containing improvements made after the printing of the manual.

To use this supplement:

Make all ERRATA corrections.

Make all appropriate serial number related changes indicated in the tables below.

Serial Prefix or Number	Make Manual Changes
2034A	1
2047A	2
2135A	2 and 3
2147A	2, 3 and 4
2302A	2, 3, 4 and 5
2315A	2, 3, 4, 5 and 6

Serial Prefix or Number	Make Manual Changes
2440A	2,3,4,5,6,7
2510A	2,3,4,5,6,7

▲ NEW ITEM

ERRATA

Page 1-1, paragraph 1-11. OPTIONS.
Add: OPTION 112. This option adds Model 1112A Inverter Power Supply, a portable power source for the Model 1725A.

Page 5-22, paragraph 5-84, steps j and k.
Change: TIME INTERVAL STOP to TIME INTERVAL START.

Page 6-5, Table 6-2, Replaceable Parts.
Change: A6 HP and Mfr Part Number to 01720-66556.
Change: A7 HP and Mfr Part Number to 01720-66557.
Change: E2 HP and Mfr Part Number to 0340-0949.
Change: E3 Description to INSULATOR, IC.
Change: H28 Description to GROMMET-VINYL 0.375-IN-ID.
Change: L2 HP and Mfr Part Number to 01741-66001.

NOTE

Manual change supplements are revised as often as necessary to keep manuals as current and accurate as possible. Hewlett-Packard recommends that you periodically request the latest edition of this supplement. Free copies are available from all HP offices. When requesting copies quote the manual identification information from your supplement, or the model number and print date from the title page of the manual.

HEWLETT PACKARD

Printed in U.S.A.

Page 6-6, Table 6-2. Replaceable Parts.
Change: MP10 HP and Mfr Part Number to 0370-3042.
Change: MP24 HP and Mfr Part Number to 01712-00205.
Change: MP25 HP and Mfr Part Number to 01725-04101.
Change: MP26 HP and Mfr Part Number to 01725-04103.
Change: MP34 Description to SHAFT, DELAYED SWEEP.
Change: MP38 HP and Mfr Part Number to 5041-2625.
Change: MP39 HP and Mfr Part Number to 01720-60603.
Change: MP49 HP and Mfr Part Number to 0370-3043.
Change: MP50 HP and Mfr Part Number to 5020-8788.
Change: MP54 Mfr Part Number to 01720-61902.
Change: MP58 to HP and Mfr Part Number 00180-09104, Qty 1, CLIP, GROUND, Mfr Code 28480.
Change: MP63 HP and Mfr Part Number to 01720-23707.
Change: MP73 HP and Mfr Part Number to 0510-0515.
Change: Q2 HP and Mfr Part Number to 5081-7675.
Change: Q3 to HP and Mfr Part Number 5081-7676, TRANSISTOR NPN SI TO-220AB PD=1.8W.
Change: Q4, Q5, and Q6 to HP and Mfr Part Number 5081-7555, TRANSISTOR NPN SI PD=1.8W, Mfr Code 28480.

Page 6-7, Table 6-2, Replaceable Parts.
Change: R7 and R23 to HP Part Number 2100-1443 and Mfr Part Number 3540S-483-503.
Change: R20 HP and Mfr Part Number to 2100-3975.
Change: W7 Description to CABLE ASSY: HV OSC.
Change: W9W1 HP and Mfr Part Number to 01710-61650.
Change: W9W2 HP and Mfr Part Number to 01710-61651.
Change: W9W3 HP and Mfr Part Number to 01710-61652.
Change: W10W1 Description to CABLE ASSY: 4 COND, POWER.
Change: W10W2 to HP and Mfr Part Number 01722-61611, CABLE ASSY: TWIN COAX, CHOP BLANK AND CAL SIG.
Change: W10W3 to HP and Mfr Part Number 01722-61612, CABLE ASSY:COAX, HOLDOFF.
Change: W10W4 Description to CABLE ASSY: COAX, ALT SIG.
Change: W11 to HP and Mfr Part Number 01722-61613, CABLE ASSY: TWIN LEAD.
Change: W17 Description to CABLE ASSY: MAIN AND DELAYED GATES.
Change: XF1 to Consists of three parts:
FUSEHOLDER CAP, HP and Mfr Part Number 2110-0565,
FUSEHOLDER BODY, HP and Mfr Part Number 2110-0564, and
FUSEHOLDER NUT, HP and Mfr Part Number 2110-0569, Mfr Code 28480.

Page 6-8, Table 6-2, Replaceable Parts.
Add: A3P3 and A3P4, HP and Mfr Part Number 1251-6596, CONNECTOR 7-CONT MALE POST TYPE, Mfr Code 28480.
Add: A3P5, HP and Mfr Part Number 1251-6099, CONNECTOR 8-CONT MALE POST TYPE, Mfr Code 28480.

Page 6-9, Table 6-2, Replaceable Parts.
Change: A3VR1 and A3VR2 to MATCHED PAIR, DOIDE-ZNR 6.19V,5% DO-7 PD=0.4W, HP and Mfr Part Number 5081-7673, Mfr Code 28480.
Change: A5C2 to 10PF (FACTORY SELECTED).

Page 6-10, Table 6-2, Replaceable Parts.
Add: A5P1, HP and Mfr Part Number 1251-6095, CONNECTOR 3-CONT MALE POST TYPE.
Change: A6 HP and Mfr Part Number to 01720-66556.
Change: A6XA3 HP and Mfr Part Number to 1251-4134.
Change: A6XA7 HP and Mfr Part Number to 1251-8110.
Change: A7P1 HP and Mfr Part Number to 1251-8654.
Change: A7XA3 HP and Mfr Part Number to 1251-4134.
Change: A8 Description to HORIZONTAL SWEEP ASSY (A8U2 AND A8U5 INCLUDED).

Page 6-11, Table 6-2, Replaceable Parts.
Change: A8P1 HP and Mfr Part Number to 1251-6139.

Page 6-12, Table 6-2, Replaceable Parts.
Change: A8P2 HP and Mfr Part Number to 1251-6105.
Change: A8P3 HP and Mfr Part Number to 1251-3898.
Change: A8P4 HP and Mfr Part Number to 1251-5635.
Change: A8P5 HP and Mfr Part Number to 1251-3412
Change: A8P6 HP and Mfr Part Number to 1251-5635.
Change: A8Q11 and A8Q34 to HP and Mfr Part Number 1854-0583, TRANSISTOR NPN SI TO-92 PD=310MW, Mfr Code 28480.
Change A8R38 to HP Part Number 0683-4715, RESISTOR 470 OHM 10% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB4711.
Change: A8U2 and A8U5 Description to ASSY, SUBSTRATE (SUPPLIED WITH A8).

Page 6-13, Table 6-2, Replaceable Parts.
Change: A8R45 to HP Part Number 0757-0393, RESISTOR 47.5 OHM 1% .125W F TC=0±100, Mfr Part Number C4-1/8-TO-47R5-F.
Change: A8R46 to HP Part Number 0698-3447, RESISTOR 422 OHM 1% .125W F TC=0±100, Mfr Part Number C4-1/8-TO-422R-F (FACTORY SELECTED).
Change: A8R49 to HP Part Number 0757-0406, RESISTOR 182 OHM 1% .125W F TC=0±100, Mfr Part Number C4-1/8-TO-182R-F.

Page 6-15 Table 6-2, Replaceable Parts.
Change: A9C13 to HP and Mfr Part Number 0140-0193, CAPACITOR-FXD 82PF ±2% 300WVDC MICA.
Change: A9Q7 and A9Q9 to HP and Mfr Part Number 1854-0583, TRANSISTOR NPN SI TO-92 PD=310MW, Mfr Code 28480.

Page 6-16, Table 6-2, Replaceable Parts.
Change: A10R7 and A10R8 to HP and Mfr Part Number 0757-0276, RESISOR 61.9 OHM 1% .125W F, Mfr Part Number C4-1/8-TO-61R9-F.
Add: A10XA8P2, HP and Mfr Part Number 1251-6108, CONNECTOR 6-CONT FEM POST TYPE, Mfr Code 28480.
Add: A10XA8P3 consists of two parts:
HP and Mfr Part Number 1251-6106, CONNECTOR 4-CONT FEM POST TYPE and
HP and Mfr Part Number 1251-6108, CONNECTOR 6-CONT FEM POST TYPE, Mfr Code 28480.

Page 6-17, Table 6-2, Replaceable Parts.
Change A11Q6 and A11Q8 to HP and Mfr Part Number 1854-0583, TRANSISTOR NPN SI TO-92 PD=310MW, Mfr Code 28480.
Add: A11XA12 consists of two parts:
HP and Mfr Part Number 1251-6106, CONNECTOR 4-CONT FEM POST TYPE and
HP and Mfr Part Number 1251-6108, CONNECTOR 6-CONT FEM POST TYPE, Mfr Code 28480.

Page 6-18, Table 6-2, Replaceable Parts.
Change: A12P2 HP and Mfr Part Number to 1251-3898.
Change: A12P3 HP and Mfr Part Number to 1251-4969.
Change: A12R31 and A12R32 to HP Part Number 0684-2211, RESISTOR 220 OHM 10% .25W CC TUBULAR, Mfr Part Number CB2211,

Page 6-19, Table 6-2, Replaceable Parts.
Change: A13P1 HP and Mfr Part Number to 1251-4969.
Change: A13Q1 Description to TRANSISTOR PNP SI TO-52 PD=360MW, and Mfr Part Number to 1853-0354.
Change: A14C9 and A14C10 HP and Mfr Part Number to 0150-0052.

Page 6-20, Table 6-2, Replaceable Parts.
Delete: A14C31.
Change: A14J1 HP and Mfr Part Number to 1251-6136.
Change: A14P1 to consists of two parts:
HP and Mfr Part Number 1251-5665, CONNECTOR 10-CONT MALE POST TYPE and
HP and Mfr Part Number 1251-6099, CONNECTOR 8-CONT MALE POST TYPE.
Change: A14P2, HP and Mfr Part Number to 1251-5665.
Change A14R8 to HP Part Number 0684-5621, RESISTOR 5.6K 10% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB5621 (FACTORY SELECTED).

Page 6-21, Table 6-2, Replaceable Parts.
Change: A15C6 to 0.1μF.

Page 6-22, Table 6-2, Replaceable Parts.
Change: A15P1 HP and Mfr Part Number to 1251-3898.
Change: A15T1 HP and Mfr Part Number to 01720-61102.
Change: A17C17 and A17C18 to CAPACITOR-FXD 0.1μF ±20% 600V POLYE, Mfr Part Number 0170-0022.
Change: A17C19 through A17C22 to CAPACITOR-FXD 0.1μF ±20% 50V POLYE, Mfr Part Number 0160-4213.
Change: A17P1 HP and Mfr Part Number to 1251-6139.
Change: A17P2 HP and Mfr Part Number to 1251-6139.
Change: A17P3 HP and Mfr Part Number to 1251-6010.

Page 6-24, Table 6-2, Replaceable Parts.
Change: A18R51 Description to RESISTOR-FXD 825k 1% .125W F TUBULAR (FACTORY SELECTED)
Change: A18U1, A18U2, A18U4, and A18U5 to HP Part Number 1826-0433, IC OP AMP DIP, Mfr Part Number LF356BN.
Add: to PARTS LIST FOR OPTION 003:
KIT, OPT 003 (FIELD INSTALLABLE) HP and Mfr Part Number 01720-69503, Mfr Code 28480
Change: PARTS LIST FOR OPTION 034/035:
MP25 HP and Mfr Part Number to 01725-04108.
W12 HP and Mfr Part Number to 01710-61640.
Change: KIT FOR OPTION 034/035 HP and Mfr Part Number to 01715-69503.

Page 6-25, Table 6-2, Replaceable Parts.
Change: Option 101 A26P1 and A26P2 HP and Mfr Part Number to 1251-6143.
Change: Option 580 MP26 HP and Mfr Part Number to 01725-04105.

Page 8-19, Figure 8-6 (sheet 2 of 2).
Change: signal (11) 3 to (11) 5.
Change: signal (12) 3 to (12) 5.
Change: A3 to A6 in box that contains (11) and (12)

Page 8-21, Figure 8-7 (Sheet 2 of 2).
Add: Test Point (4) to signal lines (5) and (6) from delay line.
Change: A5C2 to 10pF (FACTORY SELECTED).

Page 8-22, Figure 8-8 (Sheet 1 of 2).
Change: XA3 pin 10 to XA3 pin 8 on A7 component locator.

Page 8-25, Figure 8-9 (Sheet 2 of 2).
Change: A10R7 and A10R8 to 61.9 ohms.

Page 8-27, Figure 8-10 (Sheet 2 of 2).
Change: A8C15 to 0.1μF (FACTORY SELECTED).
Change: A8R38 to 470 ohms.
Change: A8R45 to 47.5 ohms.
Change: A8R46 to 422 ohms (FACTORY SELECTED).
Change: A8R49 to 182 ohms.
Change: A8R168 to 1100 ohms.
Change: P/O A19 to P/O A18 in box that contains signal number (11) 11.

Page 8-28, Figure 8-11 (Sheet 1 of 2).
Add: MP53 (UNDER) underneath MP68 RETAINER on A11 component locator.

Page 8-31, Figure 8-12 (Sheet 2 of 2).
Change: A8Q34 to A8Q37.

Page 8-32, Figure 8-13 (Sheet 1 of 2).
Add: MP55 (UNDER) underneath MP69 RETAINER on A9 component locator.

Page 8-35, Figure 8-14 (Sheet 2 of 2).
Change: Signal number (11) 9 to (12) 9 on left side of sheet.
Add: W12 designator to cable going to J7 on upper right corner of sheet.

Page 8-37, Figure 8-15 (Sheet 2 of 2).
Change: A12R31 and A12R33 to 220 ohms.

Page 8-44, Figure 8-19 (Sheet 1 of 2).
Delete: A14C31 from component locator.

Page 8-45, Figure 8-19 (Sheet 2 of 2).
Change: A14R3 to 475 ohms.
Change: A14R4 to 1330 ohms.
Change: A14R8 to 5600 ohms (FACTORY SELECTED)

Page 8-47, Figure 8-20 (Sheet 2 of 2).
Change: A15C6 to 0.1μF.

Page 8-48, Figure 8-21 (Sheet 2 of 4).
Replace: A17 component locator with figure 1 of this manual change sheet.

Page 8-49, Figure 8-21 (Sheet 2 of 4).
Change: A17C17, A17C18, and A17C19 to 0.1μF.

Page 8-51, Figure 8-21 (Sheet 4 of 4).
Change: A17C20 and A17C22 to 0.1μF.
Add: Designator T2 (1) to transformer in upper left corner of sheet.

CHANGE 1

Page 6-5. Table 6-2, Replaceable Parts.
Change: A7 HP and Mfr Part Nos. to 01720-66568 (2 places).

Page 6-10. Replace the A7 Parts List with table 1 of this manual change sheet.

Page 7-6. Table 7-2, Replacement for A7 Parts List.
Delete Table 7-2.

Page 7-8. Figure 7-5, Replacement for A6 and A7 component locators.
Delete figure 7-6.

Page 8-22. Figure 8-8, Sheet 1 of 2.
Replace A6 and A7 component locators with figure 2 of this manual change sheet.

Page 8-23. Figure 8-8, Sheet 2 of 2.
Replace Schematic 5 with figure 3 of this manual change sheet.

CHANGE 2

Page 6-5, Table 6-2, Replaceable Parts.
Change: A7 HP and Mfr Part Number to 01720-66569.

Page 6-8, Table 6-2, Replaceable Parts.
Change: A3C21 to HP Part Number 0180-0229, Qty 4, CAPACITOR-FXD 33UF ±10% 10VDC TA-SOLID, Mfr Code 56289, Mfr Part Number 150D336X901082.
Change: A3C22 to HP part number 0180-0229, CAPACITOR-FXD 33UF ±10% 10VDC TA-SOLID, Mfr Code 56289, Mfr Part Number 150D336X901082.
Change: A3C25 Qty to 0.
Add: A3C33, HP and Mfr Part Number 0160-3443, Qty 2, CAPACITOR-FXD .1UF +80-20% 50WVDC CER, Mfr Code 28480.
Change: A3R26 Qty to 4.

Page 6-9, Table 6-2, Replaceable Parts.
Change: A3R54 Qty to 9.

Add: A3R84, HP Part Number 0683-2215, Qty 2, RESISTOR 220 OHM 5% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB2215.
Change: A5C12 Qty to 0.

Page 6-10, Table 6-2, Replaceable Parts.
Change: A5L3 Qty to 10.
Change: A7 HP and Mfr Part Number to 01720-66569.
Delete: A7C5.
Add: A7L1, HP Part Number 9170-0029, CORE,MAG,SHIELDING BEAD, .138 OD .047, Mfr Code 02114, Mfr Part Number 56-590-65A2/4A.
Change: A7R5 to HP Part Number 0757-0394, RESISTOR 51.1 OHM 1% .125W F TUBULAR, Mfr Code 24546, Mfr Part Number C4-1/8-TO-51R1-F.
Change: A7R11 to HP Part Number 0683-2225, Qty 2, RESISTOR 2.2K 5% .25W F TUBULAR, Mfr Code 01121, Mfr Part Number CB2225.
Change: A7R12 to HP Part Number 0683-2225, RESISTOR 2.2K 5% .25W F TUBULAR, Mfr Code 01121, Mfr Part Number CB2225.
Change: A7R13 to HP Part Number 0757-0399, Qty 2, RESISTOR 82.5 OHM 1% .125W F TUBULAR, Mfr Code 24546, Mfr Part Number C4-1/8-TO-82R5-F.
Change: A7R15 to HP Part Number 0683-8225, Qty 6, RESISTOR 8.2K 5% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB8225.
Change: A7R16, A7R17, and A7R18 to HP Part Number 0683-8225, RESISTOR 8.2K 5% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB8225.
Change: A7R19 and A7R20 to HP Part Number 0684-5621, RESISTOR 5.6K 10% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB5621.
Add: A7R21, HP Part Number 0683-3315, Qty 1, RESISTOR 330 OHM 5% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB3315.
Add: A7R22 and A7R23, HP Part Number 0683-8225, RESISTOR 8.2K 5% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB8225.
Add: A7R24, HP Part Number 0683-5605, Qty 2, RESISTOR 56 OHM 5% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB5605.
Add: A7R25, HP Part Number 0683-5605, RESISTOR 56 OHM 5% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB5605.
Add: A7R26, HP Part Number 0683-2215, RESISTOR 220 OHM 5% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB2215.
Add: A7R27, HP Part Number 0683-1025, Qty 4, RESISTOR 1K 5% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB1025.
Add: A7R28, HP Part Number 0683-1025, RESISTOR 1K 5% .25W CC TUBULAR, Mfr Code 01121, Mfr Part Number CB1025.

Page 6-18, Table 6-2, Replaceable Parts.
Change: A12R37 Qty to 0.

Page 6-22, Table 6-2, Replaceable Parts.
Change: A17R4 Qty to 0.

Page 8-18, Figure 8-6 (sheet 1 of 2).
Replace: A3 component locator with Figure 4 of this manual change sheet.

Page 8-19, Figure 8-6 (sheet 2 of 2).
Change: A3C21 and A3C22 to 33UF.
Add: A3C33, 0.1UF from A3A1 pin 12 to ground.
Add: A3R84, 220 ohms between A3A1 pin 14 and A3R8 connection to ASYNC line.

Page 8-22, Figure 8-8 (sheet 1 of 2).
Replace: A6 and A7 component locators with figure 5 of this manual change sheet.
Change: CHOP MODE waveform test point from  to TP1 

Page 8-23, Figure 8-8 (sheet 2 of 2).
Replace: Schematic 5 with figure 6 of this manual change sheet.

CHANGE 3

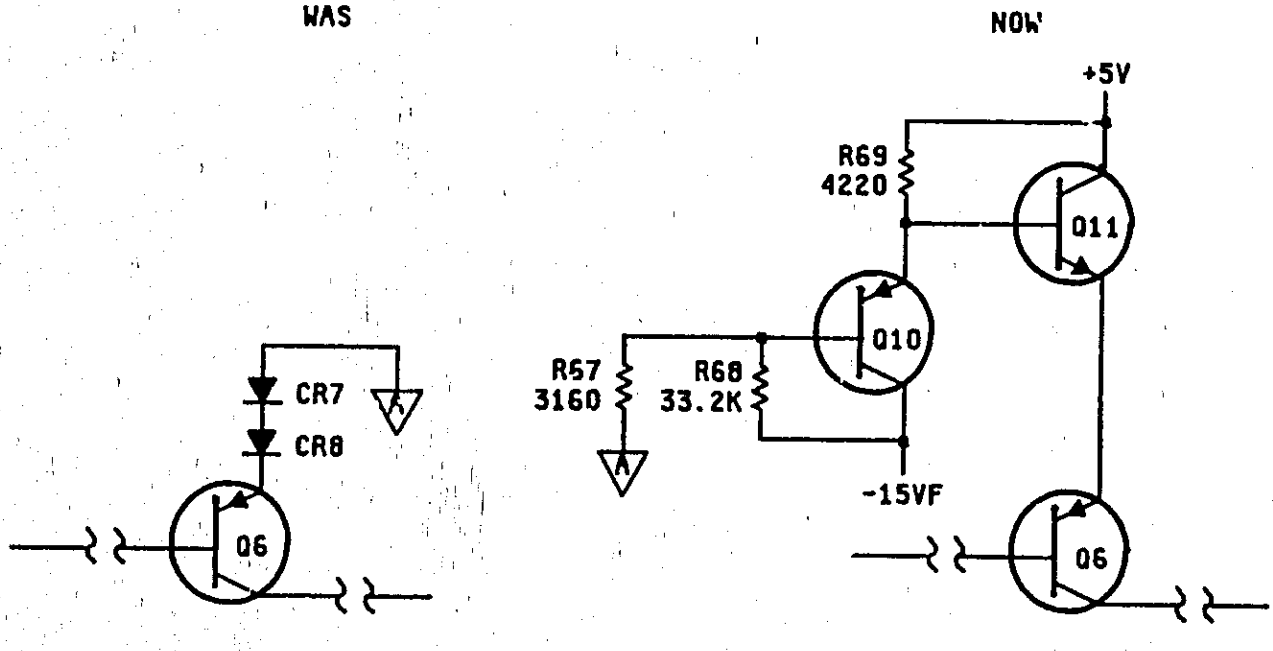
Page 6-5, Table 6-2, Replaceable Parts.
Change: A18 HP and Mfr Part Number to 01710-66568.

Page 6-23, Table 6-2, Replaceable Parts.
Change: A18 HP and Mfr Part Number to 01710-66568.
Delete: A18CR7 and A18CR8.
Add: A18Q10, HP and Mfr Part Number 1853-0036, TRANSISTOR NPN SI PD=310MW FT=250MHZ, Mfr Code 28480.
Add: A18Q11, HP Part Number 1854-0215, TRANSISTOR NPN SI PD=350MW FT=300MHZ, Mfr Code 04713, Mfr Part Number 2N3904.

Page 6-24, Table 6-2, Replaceable Parts.
Add: A18R67, HP Part Number 0757-0279, RESISTOR 3.16K 1% .125W F TC=0±100, Mfr Code 24546, Mfr Part Number C4-1/8-TO-3161-F.
Add: A18R68, HP Part Number 0757-0454, RESISTOR 33.2K 1% .125W F TC=0±100, Mfr Code 24546, Mfr Part Number C4-1/8-TO-3322-F.
Add: A18R69, HP and Mfr Part Number 0698-3154, RESISTOR 4.22K 1% .125W F TC=0±100, Mfr Code 28480.

Page 8-34, Figure 8-14 (Sheet 1 of 2).
Replace A18 component locator with figure 7 of this manual change sheet.

Page 8-35, Figure 8-14 (Sheet 2 of 2).
Make changes to A18Q6 emitter circuitry as shown below



CHANGE 4

Page 6-5, Table 6-2, Replaceable Parts.
Change: J7 to HP and Mfr Part Number 1251-0463, Qty 2, CONNECTOR-BNA SINGLE BLK SLDR-EYE TERM (Attached by H47 and H48).
Add: H47, HP and Mfr Part Number 2950-0007, Qty 2, NUT-HEX-DBL CHAM 5/16-32-THD .09-IN-THK.
Add: H48, HP and Mfr Part Number 2190-0033, Qty 2, WASHER-LK INTL .314-IN-ID.

Page 6-6, Table 6-2, Replaceable Parts.
Change: MP24 HP and Mfr Part Number to 01725-00206.
Change: MP31 HP and Mfr Part Number to 01725-20501.

CHANGE 5

Page 6-5, Table 6-2. Replaceable Parts.
Change: A8 HP and Mfr Part No. to 01722-66541.
Change: A9 HP and Mfr Part No. to 01720-66570.
Change: A11 HP and Mfr Part No. to 01720-66571.

Page 6-7, Table 6-2. Replaceable Parts.
Change: W8 HP and Mfr Part No. to 01720-61644.

Page 6-10, Table 6-2. Replaceable Parts.
Change: A8 HP and Mfr Part No. to 01722-66541.

Page 6-14, Table 6-2. Replaceable Parts.
Change: A8U1 and A8U4 to HP Part No. 1826-0212, IC OP AMP PRGMBL 8-DIP-P PKG, Mfr Code 07263, Mfr Part No. UA776TC.
Change: A8XU1 and A8XU4 to HP and Mfr Part No. 1200-0571, SOCKET-IC 8 CONT DIP-SLDR, Mfr Code 28480.
Change: A9 HP and Mfr Part No. to 01720-66570.

Page 6-15, Table 6-2. Replaceable Parts.
Change: A9U1 to HP Part No. 1826-0212, IC OP AMP PRGMBL 8-DIP-P PKG, Mfr Code 07263, Mfr Part No. UA776TC.
Change: A9XU1 to HP and Mfr Part No. 1200-0571, SOCKET-IC 8 CONT DIP-SLDR, Mfr Code 28480.

Page 6-16, Table 6-2. Replaceable Parts.
Change: A11 HP and Mfr Part No. to 01720-66571.

Page 6-17, Table 6-2. Replaceable Parts.
Add: A11C21, HP and Mfr Part No. 0180-0229, CAPACITOR-FXD 33UF ±10% 10VDC TA.
Change: A11R32 to HP and Mfr Part No. 0757-0735, RESISTOR 1.3K 1% .25W F TC=0±100.
Change: A11U1 to HP Part No. 1826-0212, IC OP AMP PRGMBL 8-DIP-P PKG, Mfr Code 07263, Mfr Part No. UA776TC.
Change: A11XU1 to HP and Mfr Part No. 1200-0571, SOCKET-IC 8 CONT DIP-SLDR, Mfr Code 28480.

Page 8-29, Figure 8-11. Service Sheet 8.
Add: Capacitor A11C21, 33UF, from +1 V line to ground.
Change: A11R32 to 1300 ohms.

CHANGE 6

Page 6-5, Table 6-2. Replaceable Parts.
Change: A8 HP and Mfr Part No. to 01722-66544.

Page 6-10, Table 6-2. Replaceable Parts.
Change: A8 HP and Mfr Part No. to 01722-66544.

Page 6-13, Table 6-2. Replaceable Parts.
Change: A8R45 to HP Part No. 0757-0401, RESISTOR 100 OHM 1% .125W F TC=0±100, Mfr Part No. C4-1/8-TO-101-F.
Change: A8R46 to HP Part No. 0757-0421, RESISTOR 825 OHM 1% .125W F TC=0±100, Mfr Part No. C4-1/8-TO-825R-F.
Change: A8R49 to HP Part No. 0757-0412, RESISTOR 365 OHM 1% .125W F TC=0±100, Mfr Part No. C4-1/8-TO-365R-F.

Page 6-14, Table 6-2. Replaceable Parts.
Add: A8R180, HP Part No. 0757-0406, RESISTOR 182 OHM 1% .125W F TC=0±100, Mfr Part No. C4-1/8-TO-182R-F, Mfr Code 24546.

Page 8-27, Figure 8-10. Service Sheet 7.
Change: A8R45 to 100 ohms.
Change: A8R46 to 825 ohms.
Change: A8R49 to 365 ohms.
Add: A8R180, 182 ohms, from A8Q4-Base to A8Q5-Collector.

▲ CHANGE 7

Page 6-5, Table 6-2. Replaceable Parts.
Change: A5 HP and Mfr Part No. to 01720-66573.

Page 6-9, Table 6-2. Replaceable Parts.
Change: A5 HP and Mfr Part No. to 01720-66573.

Page 6-10, Table 6-2. Replaceable Parts.
Change: R26 HP and Mfr Part No. to 0698-3390, CD 6, Qty 1, RESISTOR 19.6 OHM 1% .5W, Mfr Code 28480.
Add: R32 HP and Mfr Part No. 0757-0986, CD 6, Qty 1, RESISTOR 12.1 OHM 1% .5W, Mfr Code 28480.

Page 8-20, A5 COMPONENT LOCATOR.
Move: C18 (D1) to right below R16 (B2).
Add: R32 to right below R26 (C1).

Page 8-21, Figure 8-7.
Change: R26 (to the left of U2) to 19.6.
Add: R32 12.1, in series with R26 and show connected to +15 VF.
