Manufacturer's Declaration

This statement is provided to comply with the requirements of the German Sound Emission Directive, from 18 January 1991.

This product has a sound pressure emission (at the operator position) < 70 dB(A).

- Sound Pressure Lp < 70 dB(A).
- At Operator Position.
- Normal Operation.
- According to ISO 7779:1988/EN 27779:1991 (Type Test).

Herstellerbescheinigung

Diese Information steht im Zusammenhang mit den Anforderungen der Maschinenlärminformationsverordnung vom 18 Januar 1991.

- Schalldruckpegel Lp < 70 dB(A).
- Am Arbeitsplatz.
- Normaler Betrieb.
- Nach ISO 7779:1988/EN 27779:1991 (Typprüfung).

Safety	
Considerations	

GENERAL

This product and related documentation must be reviewed for familiarization with safety markings and instructions before operation.

This product has been designed and tested in accordance with *IEC Publication 1010*, "Safety Requirements for Electronic Measuring Apparatus," and has been supplied in a safe condition. This instruction documentation contains information and warnings which must be followed by the user to ensure safe operation and to maintain the product in a safe condition.

SAFETY EARTH GROUND

A uninterruptible safety earth ground must be provided from the main power source to the product input wiring terminals, power cord, or supplied power cord set.

CHASSIS GROUND TERMINAL

To prevent a potential shock hazard, always connect the rear-panel chassis ground terminal to earth ground when operating this instrument from a dc power source.

SAFETY SYMBOLS

Indicates instrument damage can occur if indicated operating limits are exceeded.

Indicates hazardous voltages.

Indicates earth (ground) terminal

WARNING

A WARNING note denotes a hazard. It calls attention to a procedure, practice, or the like, which, if not correctly performed or adhered to, could result in personal injury. Do not proceed beyond a WARNING sign until the indicated conditions are fully understood and met.

CAUTION

A CAUTION note denotes a hazard. It calls attention to an operation procedure, practice, or the like, which, if not correctly performed or adhered to, could result in damage to or destruction of part or all of the product. Do not proceed beyond an CAUTION note until the indicated conditions are fully understood and met.

Safety Considerations for this Instrument

WARNING	This product is a Safety Class I instrument (provided with a protective earthing ground incorporated in the power cord). The mains plug shall only be inserted in a socket outlet provided with a protective earth contact. Any interruption of the protective conductor inside or outside of the product is likely to make the product dangerous. Intentional interruption is prohibited
	Whenever it is likely that the protection has been impaired, the instrument must be made inoperative and be secured against any unintended operation.
	If this instrument is to be energized via an autotransformer (for voltage reduction), make sure the common terminal is connected to the earth terminal of the power source.
	If this product is not used as specified, the protection provided by the equipment could be impaired. This product must be used in a normal condition (in which all means for protection are intact) only.
	No operator serviceable parts in this product. Refer servicing to qualified personnel. To prevent electrical shock, do not remove covers.
	Servicing instructions are for use by qualified personnel only. To avoid electrical shock, do not perform any servicing unless you are qualified to do so.
	The opening of covers or removal of parts is likely to expose dangerous voltages. Disconnect the product from all voltage sources while it is being opened.
	Adjustments described in the manual are performed with power supplied to the instrument while protective covers are removed. Energy available at many points may, if contacted, result in personal injury.
	The power cord is connected to internal capacitors that my remain live for 5 seconds after disconnecting the plug from its power supply.
	For Continued protection against fire hazard, replace the line fuse(s) only with 250 V fuse(s) or the same current rating and type (for example, normal blow or time delay). Do not use repaired fuses or short circuited fuseholders.

CAUTION:	Always use the three-prong ac power cord supplied with this product. Failure to ensure adequate earth grounding by not using this cord may cause product damage.
	This product is designed for use in Installation Category II and Pollution Degree 2 per <i>IEC 1010</i> and <i>IEC 664</i> respectively.
	This product has autoranging line voltage input, be sure the supply voltage is within the specified range.
	Ventilation Requirements: When installing the product in a cabinet, the convection into and out of the product must not be restricted. The ambient temperature (outside the cabinet) must be less than the maximum operating temperature of the product by 4° C for every 100 watts dissipated in the cabinet. If the total power dissipated in the cabinet is greater than 800 watts, then forced convection must be used.
Product Markings	CE - the CE mark is a registered trademark of the European Community. A CE mark accompanied by a year indicated the year the design was proven.

CSA - the CSA mark is a registered trademark of the Canadian Standards Association.

CERTIFICATION Hewlett-Packard Company certifies that this product met its published specifications at the time of shipment from the factory. Hewlett-Packard further certifies that its calibration measurements are traceable to the United States National Institute of Standards and Technology, to the extent allowed by the Institute's calibration facility, and to the calibration facilities of other International Standards Organization members

WARRANTY This Hewlett-Packard instrument product is warranted against defects in material and workmanship for a period of one year from date of shipment. During the warranty period, Hewlett-Packard Company will at its option, either repair or replace products which prove to be defective.

For warranty service or repair, this product must be returned to a service facility designated by HP. Buyer shall prepay shipping charges to HP and HP shall pay shipping charges, duties, and taxes for products returned to HP from another country.

HP warrants that its software and firmware designated by HP for use with an instrument will execute its programming instructions when properly installed on that instrument. HP does not warrant that the operation of the instrument, or software, or firmware will be uninterrupted or error free.

LIMITATION OF WARRANTY The foregoing warranty shall not apply to defects resulting from improper or inadequate maintenance by Buyer, Buyer-supplied software or interfacing, unauthorized modification or misuse, operation outside of the environmental specifications for the product, or improper site preparation or maintenance.

NO OTHER WARRANTY IS EXPRESSED OR IMPLIED. HP SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

EXCLUSIVETHE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE ANDREMEDIESEXCLUSIVE REMEDIES. HP SHALL NOT BE LIABLE FOR ANY DIRECT,
INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES,
WHETHER BASE ON CONTRACT, TORT, OR ANY OTHER LEGAL
THEORY.

ASSISTANCE Product maintenance agreements and other customer assistance agreements are available for Hewlett-Packard products. For any assistance, contact your nearest Hewlett-Packard Sales and Service Office.

DECLARATION OF CONFORMITY according to ISO/IEC Guide 22 and EN 45014

HP 8924C Support Contacts

The documentation supplied with your test set is an excellent source of reference, applications, and service information. Please use these manuals if you are experiencing technical problems:

- Applications information is included in the HP 8924C CDMA Mobile Station Test Set Application Guide (HP P/N 08924-90021)
- Calibration and repair information are in the HP 8924C CDMA Mobile Station Test Set Assembly Level Repair Manual this manual (HP P/N 08924-90001).

If you have used the manuals and still have *application* questions, contact your local HP Sales Representative.

Repair assistance is available for the HP 8924C CDMA Mobile Test Set from the factory by phone and e-mail. Internal Hewlett-Packard users can contact the factory through HPDesk or cc:Mail© (Lotus Corporation). Parts information is also available from Hewlett-Packard.

When calling or writing for repair assistance, please have the following information ready:

- Instrument model number (HP 8924C)
- Instrument Serial Number (tag located on the rear panel).
- Installed options if any (tag located on the rear panel).
- Instrument firmware revision (displayed at the top of the screen when the Test Set is powered up, and is also displayed on the CONFIGURE screen). Support Telephone Numbers:

1 800 827 3848 (Spokane Division Service Assistance, U.S. only)

- 1 509 921 3848 (Spokane Division Service Assistance, International)
- 1 800 227 8164 (HP Direct Parts Ordering, U.S. only)
- 1 916 783 0804 (HP Service Parts Identification, U.S. & Intl.)

In this Book Throughout this manual the term "Test Set" is used to denote the HP 8924C.

Test Set screens shown in this manual may not match those displayed on the Test Set in every detail.

Chapter 1, Getting Started

This chapter provides basic remote and front-panel operating procedures, a quick check for verifying operation, HP-IB programming procedures, and simple programming examples.

Chapter 2, Configuring Your Test Set

This chapter provides information about setting screen intensity, setting RF voltage interpretation, setting time and date, and setting the beeper's volume.

Chapter 3, Operating Overview

This chapter explains how to specify units of measure, how to use the analog meter, how to use measurement averaging, how to set a measurement reference, how to set measurement limits, how to enter and change values, how to save and recall instrument setups, how to use the USER keys, and how to set a frequency offset. It also describes some important interactions that occur between screen settings.

Chapter 4, Status Reporting

This chapter provides information about the Test Set's status reporting structure and status register groups.

Chapter 5, Remote Capabilities

This chapter describes the remote interface's functions.

Chapter 6, Remote/Local Modes

This chapter describes the control annunciators, the effect of remote mode on frontpanel operation, the transitions from remote-to-local or local-to remote modes, and how local lockout and clear lockout affect the Test Set's operation.

Chapter 7, Memory Cards, Mass Storage

This chapter describes memory cards and mass storage devices used with the Test Set.

Error Messages

This section discusses error and operating messages.

Index 341

1 Getting Started

This chapter will help familiarize you with fundamental Test Set operation, including:

- Accessing screens and fields
- Making a simple measurement
- Preparation for remote operation via HP-IB

Before Connecting a Radio

Before Connecting a Radio

NOTE:	The RF IN/OUT port should be used for all transmitter tests when the radio is connected directly to the Test Set. (All MSUT (Mobile Station Under Test) transmitter power measurements are made through this port). Off-the-air measurements can be made using the highly-sensitive ANT IN port.
CAUTION:	<i>Overpower Damage</i> — Refer to the Test Set's front panel for maximum input power level. Exceeding this level can cause permanent instrument damage.
	<i>Overpower Damage</i> — Blocking the fans's rotation or operating the Test Set in an environment that causes excessive heat may cause damage.
	Important: If excessive temperatures are sensed on the power supply regulator assembly, the Test Set's power supply will shut off. After temperature has lowered to within normal operating range, use the POWER switch to cycle power on. Remove RF power from the RF IN/OUT connector whenever the Test Set is off.

Accessing the Test Set's Screens

Accessing the Test Set's Screens

CDMA and Analog Modes

The Test Set has two operating modes, analog and CDMA. In CDMA mode, the Test Set configures itself as a calibrated CDMA base station. In Analog mode, the Test Set has AMPS, NAMPS and TACS analog cellular phone test capability.

CDMA is the default power-up mode. To enter analog mode from CDMA mode:

- press one of the ANLG SCRNS keys, or
- select a screen from the Analog **To** Screen menu, or
- programmatically select an analog screen using the display (DISP) HP-IB subsystem, or
- execute a CDMA to Analog handoff.

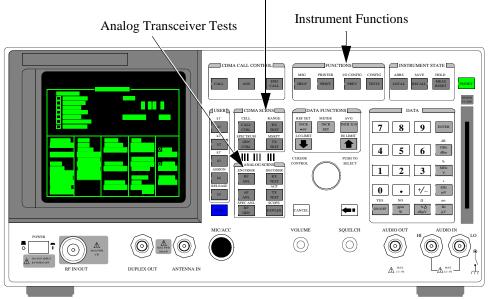

To enter CDMA mode from analog mode:

- press one of the CDMA SCRNS keys, or
- select a screen from the CDMA **To** Screen menu, or
- programmatically select a CDMA screen using the display (DISP) HP-IB subsystem.

Accessing the Test Set's Screens

Functions Screens

Screens that control various instrument functions such as configuration, access to the Tests subsystem, and the PREV (previous screen) key are found under the front-panel "Functions" bracket.

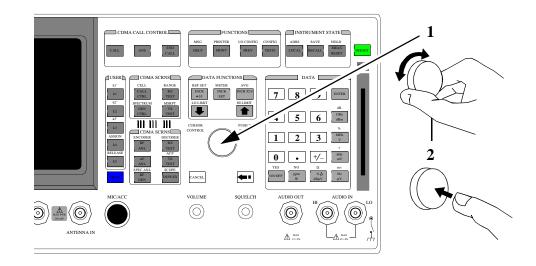

CDMA Digital Transceiver Measurements

Accessing Test Set Screens

Cursor Control

1. Position

To position the cursor, rotate the Cursor Control knob, which moves the cursor from field to field or from menu item to menu item. Normally the cursor appears as a small highlighted rectangular box.

2. Select

To select an item, push the Cursor Control knob. After selection, the background of the item selected becomes highlighted or the item selected appears in an associated field.

There are several types of CRT display fields in the Test Set. This section describes some of the different types of fields, and how they are used.

Units-of-Measure Field

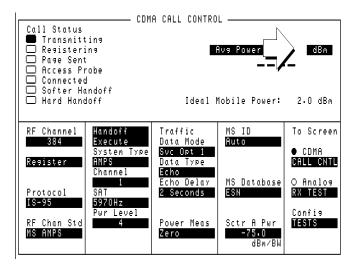

Figure 2 Units-of-Measure Field

Units-of-measure fields allow selection of valid units for given measurement. See $rac{1}{2}$ in figure 2 to see an example of a units-of-measure field.

To change a unit-of-measure

- 1. Position the cursor at the unit field on the display.
- 2. Press a key labeled with a different unit-of-measure (such as W).
- **3.** If the new units are valid, the measurement value will be displayed in the new unit-of-measure.

To change the units-of-measure for data transfer via HP-IB, see "To Specify Unitsof-Measure for HP-IB Data Transfer" in chapter 3.

Underlined Immediate-Action Field

Figure 3 Underlined Immediate-Action Field

Underlined immediate action fields provide a choice of two settings. See rightarrow in figure 3 to see an example of an underlined immediate-action field.

To change an underlined entry

- **1.** Position the cursor at the field.
- **2.** Push the CURSOR CONTROL knob or the ENTER key to underline the desired choice.

One-of-Many Field

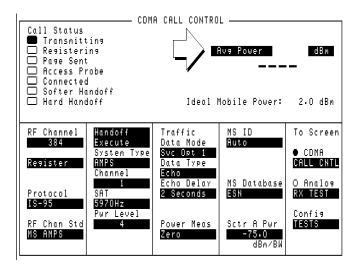

Figure 4 One-of-Many Field

One-of-many fields display a list of choices when selected. See \Box in figure 4 to see an example of a one-of many field.

To make a one-of-many choice

- **1.** Position the cursor at the field.
- 2. Push the CURSOR CONTROL knob or the ENTER key to display the choices.
- 3. Move the cursor through the choices by turning the knob.
- 4. Push the CURSOR CONTROL knob or the ENTER key to make the choice.

Numeric-Entry Field

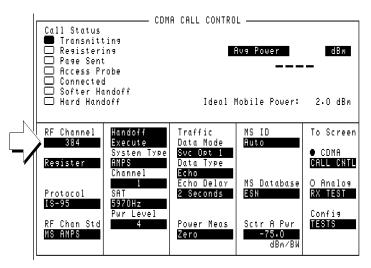

Figure 5 Numeric-Entry Field

Numeric-entry fields contain numeric values. See \Box in figure 5 to see an example of a numeric-entry field.

To change a value

- **1.** Position the cursor at the field.
- 2. Key in the desired number using the DATA keys.
- **3.** Press ENTER to select the choice.

OR

- **1.** Position the cursor at the field.
- 2. Push the CURSOR CONTROL knob to highlight the desired choice.
- 3. Turn the knob to increment or decrement the value.
- 4. Push the CURSOR CONTROL knob or the ENTER key to select the choice.

Obtaining Measurement Results

Obtaining Measurement Results

Setting Up a Call

To obtain CDMA measurements, the Test Set must have the MSUT (Mobile Station Under Test) on a call (the **Connected** annunciator on the CDMA CALL CONTROL screen is lit when the MSUT is on a call).

The procedure for setting up a call is provided in "Setting Up a Call", found in the *HP* 8924*C* Application Guide. In the *HP* 8924*C* Application Guide, there are also procedures for performing CDMA tests.

Triggering and Displaying Measurements

When operated over the front panel (local control), Test Set measurement results are obtained by selecting a screen that displays the desired measurement, arming the measurement if necessary, and observing the displayed value.

When operated remotely, measurement results are obtained via HP-IB by triggering a measurement if necessary and querying the desired measurement field.

NOTE: In CDMA mode, transmitter (TX) measurements and receiver (RX) measurements can run concurrently. For example, an Average Power or Channel Power measurement can be queried while the RX TEST screen is selected and an FER measurement is running.

For a detailed description of triggering measurements, see "Triggering and Displaying Measurements" on page 30.

Preparing the Test Set for HP-IB Control

- 1. If other HP-IB devices are in the system, attach an HP-IB cable from the Test Set's rearpanel HP-IB connector to any one of the other devices in the test system.
- 2. Access the I/O CONFIGURE screen and perform the following steps:
 - a. Set the Test Set's HP-IB address using the HP-IB Adrs field (see "Addressing" on page 36).
 - b. Set the Test Set's HP-IB Controller capability using the Mode field.
 - **Talk&Listen** configures the Test Set to be controlled through HP-IB with an external controller. The Test Set has Active Controller capability (take control/ pass control) in this mode.
 - **Control** configures the Test Set to be the system controller. Use this setting if the Test Set will be the only controller on the HP-IB. Selecting **Control** automatically makes the Test Set the active controller.

NOTE: Only one active controller is allowed on the HP-IB at one time!

- **3.** If an HP-IB printer is or will be connected to the Test Set's rear-panel HP-IB connector, perform the following steps:
 - a. Access the PRINT CONFIGURE screen.
 - b. Select one of the supported HP-IB printer models using the Model field.
 - c. Set the **Printer Port** field to HP-IB.
 - d. Set the printer address using the **Printer Address** field.

Obtaining Measurement Results

General Programming Procedure

- 1. For each measurement you want to perform programmatically, make the measurement manually using the front-panel controls of the Test Set. You will find procedures for making measurements in the *HP 8924C Application Guide*. Record, in sequential order, the screens selected and the settings made within each screen.
- **2.** Record the measurement result(s).
- **3.** Develop the program using the measurement procedure generated in step 2. For CDMA measurements, the *HP 8924C Application Guide* provides step-by-step HP-IB command examples.
- 4. Make sure the desired measurement is selected and in the ON state. This is the PRESET state for most measurements. However, if a previous program has set the state to OFF, no measurement result will be available. Attempting to read from a measurement field that is not in the ON state will cause HP-IB Error:-420 Query UNTERMINATED.
- **5.** Trigger the desired measurement if the RETRigger MODE is SINGle. You will find that the Test Set automatically enters REPetitive trigger MODE for CDMA measurements when an HP-IB command is sent to it.
- 6. Send the appropriate MEASure query command to initiate a reading. This will place the measured value into the Test Set's Output Queue.
- **7.** Use the ENTER statement to transfer the measured value to a variable within the context of the program.

Basic Programming Examples

The following examples illustrate the basic approach to controlling the Test Set through the HP-IB. The punctuation and command syntax used for these examples is given in "Command Punctuation" on page 38.

The bus address 714 used in the following BASIC language examples uses an HP-IB interface at select code **7**, and a Test Set HP-IB address of **14**. All examples use an external controller.

To Change a Field's Setting

- 1. Access the screen containing the field whose setting is to be changed by using the DISP command.
- 2. Make the desired setting using the proper command syntax (refer to "HP-IB Command Syntax" chapter in the *HP 8924C Condensed Programming Reference Guide* for proper syntax).

The following example makes several instrument setting changes:

```
OUTPUT 714;"DISP CCNT"!Displays the CDMA CALL CONTROL screen.
OUTPUT 714;"CDMA:CELL:ASEC -100"!Sets Sector A Power to -100 dBm/BW.
OUTPUT 714;"RFG:OUTP 'DUPL'"!Sets the Output Port to Duplex.
```

To Read a Field's Setting

- **1.** Access the screen containing the field whose setting is to be read using the DISPlay command.
- **2.** Use the query form of the syntax for that field to place the setting's value into the Test Set's output buffer.
- 3. Enter the value into the correct variable type within the program's context.

The following example reads the current power measurement selection (Average Power or Channel Power).

```
10 OUTPUT 714;"DISP CTXT" !Displays the CDMA CELLULAR MOBILE TRANSMITTER TEST screen.
20 OUTPUT 714;"CDMA:TX:POW:MEAS?" !Queries the Average Power/Channel Power field.
30 ENTER 714;Pow$ !Enters the returned value into a string variable
```

```
40 PRINT "The power measurement currently selected is ",Pow$ 50 END
```

Obtaining Measurement Results

To Make a Simple Measurement

- 1. Access the screen containing the desired measurement by using the DISP command.
- **2.** Use the MEAS form of the syntax for that measurement to place the measured value into the Test Set's output buffer.
- **3.** Enter the value into the correct variable type within the program's context (refer to the "Number Measurement Syntax" in HP-IB Command Syntax chapter of the *HP 8924C Condensed Programming Reference Guide* for the proper variable type).

NOTE: Whenever a numeric value is queried, the returned value is always in *HP-IB Units*. Refer to "To Specify Units-of-Measure for HP-IB Data Transfer" on page 56.

The following example program illustrates how to make settings and then take a reading from the Test Set. This setup takes a reading from the analog spectrum analyzer's marker after tuning it to the RF generator output frequency.

```
10
      Addr=714
20
      OUTPUT Addr; "*RST"! Preset to known state
25
      OUPTUT Addr;"CONF:OFR 0" !Set the RF frequency offset to 0 MHz.
      OUTPUT Addr; "TRIG: MODE: RETR SING"! Sets single trigger
30
40
      OUTPUT Addr; "DISP RFG"! Selects the RF GENERATOR screen
      OUTPUT Addr; "AFG1:FM:STAT OFF"! Turns FM OFF
50

      ENTER Addr;Lvl! Places measured value in variable Lvl
140
150
      DISP Lvl! Displays value of Lvl
160
      END
```

The above example is very simple and is designed to demonstrate the fundamental procedure for obtaining a measurement result. Many other factors must be considered when designing a measurement procedure, such as instrument settings, signal routing, settling time, filtering, triggering and measurement speed.

Control Annunciators

The letters and symbols at the top right corner of the display indicate these conditions:

R indicates the Test Set is in remote mode. The Test Set can be put into the remote mode by an external controller or by an IBASIC program running on the built-in IBASIC controller.

- L indicates the Test Set has been addressed to listen.
- **T** indicates the Test Set has been addressed to talk.
- **s** indicates the Test Set has sent the require service message by setting the service request (SRQ) bus line true. (See "Status Reporting" on page 108).
- C indicates the Test Set is currently the active controller on the bus.
- * indicates an IBASIC program is running.
- ? indicates an IBASIC program is waiting for a user response.
- - indicates an IBASIC program is paused.

Addressing

Addressing

Setting the Test Set Bus Address

The Test Set's HP-IB bus address is set using the HP-IB Adrs field which is located on the I/O CONFIGURE screen. The Test Set's HP-IB address is set to decimal 14 at the factory. To set a different HP-IB bus address; select the I/O CONFIGURE screen and position the cursor next to the HP-IB Adrs field. The address can be set from decimal 0 to 30 using the numeric DATA keys, or by pushing and then rotating the CURSOR CONTROL knob. There are no switches for setting the HP-IB bus address in the Test Set. The new setting is retained when the Test Set is turned off.

Displaying the Bus Address

The Test Set's HP-IB bus address can be displayed by pressing and releasing the SHIFT key, then the LOCAL key. The address is displayed in the upper-left corner of the display.

Command Names

HP-IB commands are not case sensitive. Upper and lower case characters can be used for all commands.

For example, to set the destination of AF Generator 1 to Audio Out, any of the following command strings are valid:

```
"AFGENERATOR1:DESTINATION 'AUDIO OUT'"
or
"afgenerator1:destination 'audio out'"
or
"afg1:dest 'audio out'"
or
"AFG1:DEST 'AUDIO OUT'"
"Afg1:Dest 'Audio oUT'"
```

All command names of more than four characters have an alternate abbreviated form. The abbreviated form is presented in uppercase letters in the syntax diagrams.

Command Punctuation

NOTE:Programming Language Considerations: The punctuation rules for the Test Set's HP-IB
commands conform to the IEEE 488.2 standard. It is possible that some programming
languages used on external controllers may not accept some of the punctuation requirements.
It is therefore necessary that the equivalent form of the correct punctuation, as defined by the
language, be used for HP-IB operation. Improper punctuation will result in HP-IB Error:
-102 Syntax Error.

Using Quotes for String Entries

Quotation marks are used to select non-numeric field settings. The value is entered into the command line as a quoted alphanumeric string.

Quotes are used with all <u>underlined</u> (toggling) and one-of-many (menu choice) fields. (See "To Change a Field's Setting" on page 33.)

For example: to set the RF Generator's **Output Port** field to duplex, the menu choice **Dup1** would be entered into the command string.

"RFG:OUTP 'Dupl'"

Using Spaces

When changing a field's setting, a space must always precede the setting value in the command string, regardless of the field type.

RFG:FREQ space 850MHZ

RFG:ATT space 'OFF'

Using Colons to Separate Commands

The HP-IB command syntax is structured using a control hierarchy that is analogous to manual operation.

The control hierarchy for making a manual instrument setting using the frontpanel controls is as follows: first the screen is accessed, then the desired field +is selected, then the appropriate setting is made. HP-IB commands use the same hierarchy. The colon (:) is used to separate the different levels of the command hierarchy.

For example: To set the AF Analyzer's input gain to 40 dB, the following command syntax would be used:

"DISP AFAN" "AFAN:INP:GAIN '40 dB'"

Using the Semicolon to Output Multiple Commands

Multiple commands can be output from one program line by separating the commands with a semicolon (;). The semicolon tells the Test Set's HP-IB command parser to back up one level of hierarchy and accept the next command at the same level as the previous command.

For example, on one command line, it is possible to:

- 1. access the AF ANALYZER screen,
- 2. set the AF analyzer's input to AM Demod
- 3. set Filter 1 to 300 Hz HPF
- 4. set Filter 2 to 3kHz LPF

"DISP AFAN; AFAN: INP 'AM DEMOD'; FILT1 '300Hz HPF'; FILT2 '3kHz LPF'"

The semicolon after the "DISP AFAN" command tells the Test Set's HP-IB command parser that the next command is at the same level in the command hierarchy as the display command. Similarly, the semicolon after the INP 'AM DEMOD' command tells the command parser that the next command (FILT1 '300Hz HPF') is at the same command level as the INP 'AM DEMOD' command.

Using the Semicolon Colon (;:) to Separate Commands

A semicolon followed by a colon (;:) tells the HP-IB command parser that the next command is at the top level of the command hierarchy. This allows commands for different instruments to be output on one command line. The following example sets the RF Analyzer's tune frequency to 850 MHz, and then sets the AF Analyzer's input to FM Demod.

"RFAN: FREQ 850 MHZ; : AFAN: INP 'FM DEMOD'"

Using Question Marks to Query Setting or Measurement Fields

The question mark (?) is used to query (read-back) an instrument setting or measurement value. To generate the query form of a command, place the question mark immediately after the command. Queried information must be read into the proper variable type within the program context before it can be displayed, printed, or used as a numeric value in the program.

Queried information is returned in the same format used to set the value (a queried numeric field returns numeric data; quoted string fields return quoted string information).

For example, the following BASIC language program statements query the current setting of the **AFGen 1 To** field:

OUTPUT 714;"AFG1:DEST?"!Query the AFGen1 To field. ENTER 714;Afg1_to\$!Enter queried value into a string variable

Sample HP-IB Program

The following program was written on an HP 9000 Series 300 controller using Hewlett-Packard Rocky Mountain BASIC (RMB). To run this program directly in the Test Set's IBASIC Controller:

- **1.** use exclamation marks (!) to comment-out lines 440, 450, and 460 (these commands not supported in IBASIC).
- **2.** change line 70 to Bus = 8 (internal HP-IB select code = 8).

10 ! This program generates an FM carrier, measures and displays the 20 ! deviation, and draws the modulation waveform from the oscilloscope 30 ! to the CRT display. For demonstration purposes the 40 ! carrier is generated and analyzed through the uncalibrated input 50 ! path so that no external cables are required. 60 GCLEAR! Clear graphics display. 70 Bus=7! Interface select code of HP-IB interface 80 Dut=100*Bus+14! Default Test Set HP-IB address Dut=100*Bus+14! Default Test Set HP-IB address is 14 90 CLEAR Bus ! Good practice to clear the bus 100 CLEAR SCREEN ! Clear the CRT 110 OUTPUT Dut;"*RST" ! Preset the Test Set 120 OUTPUT Dut;"DISP DUPL" ! Verifying that the Test Set is Operating Properly

Verifying that the Test Set is Operating Properly

If your Test Set powers-up and displays the CDMA CALL CONTROL screen, but you suspect an instrument problem, the CDMA Mode Quick Check will verify operation of the instrument's basic functions.

CDMA Mode Quick Check

NOTE: This procedure assumes that the Test Set is configured for cellular mobile station testing. If necessary, access the CONFIGURE screen and turn PCS Intrfc Control Off. It will then be necessary to cycle power. 1. Remove any cabling from the front-panel connectors. **2.** Turn instrument power on (if it is not already on). 3. Press the PRESET key. 4. Press and release the SHIFT key then the TESTS key to access the CONFIGURE screen. 5. Position the cursor in the **RF Display** field, and press the knob to select **Freq**. The RF Offset and (Gen)-(Anl) fields will appear below RF Display. 6. Change the (Gen) - (Anl) value to 0 MHz. 7. Position the cursor in the Output Port field and Select Dupl. 8. Press GEN CTRL, +/-, 5, 0 ENTER to adjust Sector A Power to -50 dBm/BW. 9. Press and release the SHIFT key then the GEN CTRL key to access the CDMA REVERSE CHANNEL SPECTRUM analyzer screen. 10. Position the cursor in the Ref Level field, and press +/-, 1, 0, ENTER to enter a

reference level of -10 dBm.

11. The display should show a CDMA signal, approximately 1.23 MHz wide.

If no failure is indicated by this test, but you still suspect a problem, refer to the performance tests information in the *HP* 8924C Assembly Level Repair Manual.

2 Configuring Your Test Set

This chapter will help you prepare the Test Set for operation in your environment. This includes:

- Setting screen intensity
- Setting time and date
- Setting beeper volume

General Operating Information

General Operating Information

The following configuration information discusses general operating information for some of the fields in the CONFIGURE screen.

To Set Screen Intensity

- **1.** Access the CONFIGURE screen.
- 2. Select the Intensity field.
- **3.** Rotate the knob to change the setting (1=dim, 8=bright).

To Set RF Voltage Interpretation (50 ohm/emf)

- 1. Access the CONFIGURE screen.
- 2. Position the cursor in front of the **RFGen Volts** field.
- Press the CURSOR CONTROL knob or press the ENTER key to select <u>50 ohm</u> or <u>emf</u>.

Voltage settings can control either:

- the voltage across a 50-ohm load, or
- the open circuit voltage (emf).

This setting affects the RF Generator and Tracking Generator amplitudes.

To Set the Date and Time

- 1. Access the CONFIGURE screen.
- 2. Select the **Date** field and use the DATA keys to enter the date in the format shown below the field.
- 3. Select the **Time** field and use the DATA keys to enter the time in the format shown below the field.

The Test Set has a built-in clock that keeps track of the date and time. It is powered by an internal battery to keep it operating when the instrument is off.

To Change the Beeper's Volume

- 1. Access the CONFIGURE screen.
- 2. Select the **Beeper** field to display the volume choices.
- **3.** Select the desired choice.

The beeper alerts you to important operating and measurement conditions. It beeps any time a message is displayed at the top of the screen. These messages warn you of conditions such as exceeding the RF input level or trying to set a field to an unacceptable value. Therefore, it is recommended that you do not disable the beeper.

Chapter 2, Configuring Your Test Set

General Operating Information

Operating Overview

The information in this chapter describes how to use many of the operating features of the Test Set, including:

- "To Change the Measurement Display" on page 49
- "To Enter and Change Values" on page 58
- "Saving and Recalling Instrument Setups" on page 61
- "Using USER Keys" on page 65
- "Setting an RF Generator/Analyzer Frequency Offset" on page 67
- "Setting an RF Generator/Analyzer Level Offset" on page 68
- "Interaction Between Screens" on page 69
- "Printing A Screen" on page 71
- "Measurement Triggering Process" on page 72
- "Triggering Analog Measurements In Local Mode (Front Panel Operation)" on page 76
- "Triggering CDMA Measurements In Local Mode (Front Panel Operation)" on page 79
- "Triggering Analog Measurements In Remote Mode (HP-IB Operation)" on page 82
- "Triggering CDMA Measurements In Remote Mode (HP-IB Operation)" on page 84
- "Increasing Measurement Throughput" on page 86
- "Passing Instrument Control" on page 94

To Change the Measurement Display

Using the On/Off Function

The on/off function is used for the following operations.

- Measurements that are displayed as numbers, or as meters using the METER function, can be turned on and off.
- The data functions REFerence, METer, HLIMit and LLIMit can be turned on and off.
- Any instrument function that generates a signal can be turned on and off. This includes the CDMA Sector A Power, Sector B Power, and AWGN.
- Trace displays, such as the CDMA Reverse Channel Spectrum Analyzer, cannot be turned off.

The front-panel ON/OFF key is used to turn measurements, instrument functions and data functions on or off.

Front-Panel Example

The following front-panel operation turns Avg Power off.

- 1. Move the cursor in front of the unit-of-measure for the Avg Power measurement.
- 2. Press the ON/OFF key. The Avg Power measurement field displays the word OFF in place of units

The HP-IB STATe command corresponds to the front-panel ON/OFF key. You can use 1 in place of on, or 0 in place of off.

HP-IB Example

The following HP-IB command turns off the Avg Power measurement.

"DISP CCNT; MEAS: CDM: AVGP: STAT OFF"

To Use the METER Format

The METER function displays measurements graphically. The METER format is available for most measurements. To determine if the METER format is provided for a measurement, position the cursor in front of the measurement's units field and press the knob. If the message "Press ON/OFF, LIMITs, REF, AVG, METER, or units" is displayed, the METER format is provided.

As a measurement is displayed on the meter, the value is also displayed in small digits below the meter. You can specify the high and low end points and number of intervals, or you can use the default meter settings.

- 1. Position the cursor in front of the measurement's unit-of-measure.
- 2. Press and release the SHIFT key, then the INCR SET key to select the METER function. The default number of average samples is displayed below the measurement.
- 3. Select On/Off from the Meters: field on the CRT display
- 4. Repeat steps 1 and 2 then select LoEnd, Hi End, or Intervals to enter each meter end point and the meter intervals.
- 5. Repeat steps 1, 2, and 3 to cancel the meter function.

Front-Panel Example

The following front panel operation turns on the Avg Power measurement meter.

- 1. Move the cursor in front of the unit-of-measure for the Avg Power measurement).
- 2. Press and release the SHIFT key, then the INCR SET key to select the METER function, then press the ENTER key. The meter will appear below the measurement units field with default low/high ends and number of intervals. To turn off the measurement meter, repeat this process.

HP-IB Example

The following HP-IB command turns on the Avg Power measurement's meter.

"DISP CCNT; MEAS: CDM: AVGP: MET ON"

To Set a Measurement Reference

The REF SET function establishes a measurement reference point. This allows you to make a direct comparison between two measurement results, or between a measurement standard and the actual measurement results.

Referenced measurements are displayed as either a ratio (dB) or difference between the measured value and the reference.

- 1. Position the cursor in front of the unit-of-measure for the measurement you want to set the reference for.
- 2. Press and release the SHIFT key, then the INCR ÷10 key to select the REF SET function.
- **3.** Enter the reference value.
- 4. **Ref** appears below the measurement value to indicate that a reference has been set. The measurement field may display a different unit-of-measure, and limit choices for units.

Front-Panel Example

The following front-panel operation sets a 10 dBm reference for **Avg Power** measurements.

- 1. Move the cursor in front of the unit-of-measure for the Avg Power measurement).
- **2.** Press and release the SHIFT key, then the INCR $\div 10$ key.
- 3. Enter 10 dBm using the DATA keys.

The abbreviation **Ref** will appear below the **Avg Power** measurement field and **Avg Power** measurements will be expressed in dB. Absolute power (mW, W) will not be selectable.

HP-IB Example

The following HP-IB command also sets a 10 dBm reference for **Avg Power** measurements.

"DISP CCNT; MEAS: CDM: AVGP: REF 10 DBM"

To Use Measurement Averaging

The AVG (average) function allows you to reduce the effects of a rapidly changing measurement by displaying the average value of a number of measurements.

- 1. Position the cursor in front of the measurement's unit-of-measure.
- 2. Press and release the SHIFT key, then the INCR \times 10 key to select the AVG function. The default number of average samples is displayed below the measurement.
 - Enter the desired number of measurement samples to be used for calculating the average, or
 - Press the ON/OFF key to use the currently-displayed number of samples.
- 3. To turn averaging off, position the cursor in front of the unit-of-measure and press release the SHIFT key, then the INCR \times 10 key, then the ON/OFF key to turn averaging off.

Front-Panel Example

The following front-panel operation averages **Avg Power** measurements over 10 samples.

- 1. Move the cursor in front of the unit-of-measure for the Avg Power measurement.
- 2. Press and release the SHIFT key, then the INCR \times 10 key to select the AVG function.
- **3.** Enter 10 using the DATA keys and press the ENTER key. The abbreviation **Avg** will appear below the **Avg Power** measurement field.

HP-IB Example

The following HP-IB command also averages **Avg Power** measurements over 10 samples.

"DISP CCNT; MEAS: CDM: AVGP: AVER 10; AVER: STAT ON"

When Averaging is used, the displayed value will ramp (as opposed to step) in response to changes in the measured values.

Pressing the MEAS RESET key clears the measurement history for all measurements and restarts the averaging process.

Setting Measurement Limits

The LO LIMIT and HI LIMIT functions are used to define a measurement "window" to alert you to measurements that are outside these limits. When limits are assigned, **Lo** and/or **Hi** appear by the measurement.

A measurement that goes above or below the defined limits causes three things to happen:

- 1. A message appears at the top of the screen indicating a limit was exceeded.
- 2. The Lo or Hi indicator by the measurement flashes.
- 3. The Beeper beeps if it is has not been turned off in the CONFIGURATION screen.

Limits are helpful when you can't watch the Test Set display while you are making an adjustment on the equipment you are testing or repairing. They are also a convenient way of alerting you to long-term measurement drift without having to observe the screen.

- **1.** Position the cursor in front of the unit-of-measure for the measurement you are setting limits for.
- **2.** Press and release the SHIFT key, then the down-arrow key to select the LO LIMIT function.
- 3. Enter the measurement's low limit value and unit-of-measure.¹
- **4.** Press and release the SHIFT key, then the up-arrow key to select the LO LIMIT function.
- 5. Enter the measurement's high limit value and unit-of-measure.¹

To reset a limit that has been exceeded:

- **1.** Position the cursor in front of the unit-of-measure for the measurement you assigned the limit to.
- **2.** Press and release the SHIFT key, then the down-arrow (LO LIMIT) or up-arrow (HI LIMIT key, or press the MEAS RESET key.

To remove a limit you have set:

- **1.** Position the cursor in front of the unit-of-measure for the measurement you assigned the limit to.
- **2.** Press and release the SHIFT key, then the down-arrow (LO LIMIT) or up-arrow (HI LIMIT key, then press the ON/OFF key.

1. The fundamental unit for the LIMITs does not have to be the same as the measurement's units. For instance, when measuring AC Level in Volts, you can set HI and LO LIMITs in units of dBm if desired.

Front-Panel Example

This example sets limits for the Avg Power measurement. These limits will indicate if the power level is between -5 dBm and +5 dBm.

- 1. Position the cursor in front of the unit-of-measure for the Avg Power measurement (the default is dBm).
- **2.** Press and release the SHIFT key, then the down-arrow key to select the LO LIMIT function.
- 3. Enter –5 using the DATA keys and press the ENTER key.
- **4.** Press and release the SHIFT key, then the up-arrow key to select the HI LIMIT function.
- 5. Enter 5 using the DATA keys and press the ENTER key.

The Hi limit and Lo limit annunciators will appear below the Avg Power measurement field.

HP-IB Example

The following HP-IB command also sets limits for the average power measurement. These limits will indicate if the power level is between -5 dBm and 5 dBm.

```
"DISP CTXT;MEAS:CDM:AVGP:LLIM -5;LLIM:STAT ON;:MEAS:CDM:AVGP:HLIM 5;HLIM:STAT ON"
```

The Hi limit and Lo limit annunciators will appear below the Avg Power measurement field.

To Specify Units-of-Measure for CRT Display

Most measurements, data functions, and instrument functions allow you to specify which unit-of-measurement should appear on the CRT display.

- 1. Position the cursor in front of the present unit-of-measurement.
- 2. Press the key labeled with the desired unit.

Front-Panel Example

The following front-panel operation causes the Test Set to display **Avg Power** in units of Watts instead of dBm.

- **1.** Press the PRESET key.
- 2. Press the CALL CTRL key to access the CDMA CALL CONTROL screen.
- 3. Move the cursor in front of the unit-of-measure for the Avg Power measurement (dBm).
- 4. Press the RATIO W key. The measurement value is changed immediately to display in Watts.

HP-IB Example (DUNits Command)

The following HP-IB command causes the Test Set to display **Avg Power** in units of Watts instead of dBm. The DUNits command will only change the Test Set's displayed units, *not the units used for data transfer through HP-IB*.

"DISP CCNT; MEAS: CDM: AVGP: DUN W"

Displayed Units DUNits Command Mnemonic

L V	
GHz	GHZ
MHz	MHZ
kHz	KHZ
Hz	HZ
% Δ	PCTDIFF
V	v
mV	MV
$\mu \mathbf{V}$	υv
dBμV	DBUV
\mathbf{W}	W
mW	MW
dBm	DBM
dBm/BW	DBM
db	DB
%	PCT
S	S
ms	MS

To Specify Units-of-Measure for HP-IB Data Transfer

HP-IB Units (UNITs command) are used by the Test Set when sending or receiving numeric values for most field settings and measurement results through HP-IB. Some measurements allow a choice of HP-IB Units, but changing HP-IB Units has no affect on the Display Units or Attribute Units settings.

Attribute Units (AUNits command) are used by the Test Set when sending or receiving numeric values for data functions (Hi and Lo Limits, Reference, Meter, and Averaging) through HP-IB. Some measurements allow a choice of Attribute Units, but changing Attribute Units has no affect on the Display Units or HP-IB Units settings.

HP-IB Example (UNITs command)

The following command changes the HP-IB Units for the Avg Power measurement to **w** (dBm is the power-up default setting).

"DISP CTXT; MEAS: CDM: AVGP: UNIT W"

HP-IB Example (AUNits command)

The following command changes the Attribute Units for the Avg Power measurement to W (dBm is the power-up default setting).

"DISP CTXT; MEAS: CDM: AVGP: AUN W"

After receiving this command, the Test Set will use units of Watts for data functions (such as High and Low Limits).

Function	Available HP-IB Units	Applies to UNITs Command	Applies to AUNits Command
TX Power measurement	W or DBM	x	x
Average Power measurement	W or DBM	x	X
Channel Power measurement	W or DBM	x	х
Adjacent Channel Power:		х	x
Lower Ratio, Upper Ratio	DB or PCT	х	x
Lower Level, Upper Level	W or DBM	х	х
SINAD measurement	DB or PCT	х	х
Distortion measurement	DB or PCT	х	x
SNR measurement	DB or PCT	х	х
RF Generator Amplitude	W or DBM	х	
Frequency Error	Hz	х	x

Table 2 Functions with HP-IB and Attribute Units That Can Be Changed

To Enter and Change Values

To Enter and Change Values

To Enter Decimal Values

Values can be entered and changed using various methods, depending on your testing needs. The unit-of-measure for some of these fields can also be changed (see "To Specify Units-of-Measure for HP-IB Data Transfer" on page 56).

- **1.** Position the cursor in front of the numeric entry field to be changed.
- **2.** Either:
 - Enter the number and unit-of-measure directly using the keypad, or
 - Press the CURSOR CONTROL knob or the ENTER key to highlight the field, and use the knob, or
 - Use the down-arrow and up-arrow keys to increment or decrement the present value.

Front-Panel Example

The following front panel operation changes Sector A Power to -73 dBm/BW.

- 1. Move the cursor in front of the Sector A Power field.
- 2. Enter –73 dBm using the DATA keys.

HP-IB Example

The following HP-IB command also changes Sector A Power to -73 dBm/BW.

"DISP CCNT;CDMA:CELL:ASEC -73 DBM;ASEC:STAT ON"

To Enter Hexadecimal Values

Hexadecimal (Hex) values are used for entering some signaling parameters, such as MIN (Mobile Identification Number). No unit-of-measure is associated with these values.

Hexadecimal values are either entered from the keypad (using the A-F shifted functions), or by using the **Choices** menu.

Front-Panel Example

The following front-panel operation enters the Hexadecimal number #H0D2565F15 into the MIN field.

- 1. Move the cursor to the field below MS ID.
- 2. If the field currently says **Phone Num** press the ENTER key, use the CURSOR CON-TROL knob to select MIN, and press the ENTER key again. (If MIN is already selected, proceed to step 3.)
- 3. Use the CURSOR CONTROL knob to select the numeric entry field below MIN.
- **4.** Enter 0, then press and release the SHIFT key, then the 3 key (to select D), enter 2565, press and release the SHIFT key, then the 5 key (to select F), enter 15, and then press the ENTER key. This is the hexadecimal code derived from the phone number 321-456-7890.

HP-IB Example

The following HP-IB command also enters the Hexadecimal number 0D2565F15 into the MIN field.

"DISP CCNT;CDMA:MOB:MIN '0D2565F15'"

To Enter and Change Values

To Enter Values With Exponents

Front-Panel Example

The following front-panel operation changes Confidence (limit) to 95.

- **1.** Press the CALL CTRL key.
- 2. Move the cursor in front of the **Confidence** field.
- 3. Enter 9 EEX 1.

The EEX key can be used to enter values in exponential notation. Exponential notation is only allowed on floating-point entry fields.

To Increment/Decrement Values

Incrementing and decrementing values on the Test Set can be performed from the front panel with the CURSOR CONTROL knob or the up/down arrow keys., or the INCR \div 10 and INCR \times 10 keys.

The INCR \div 10, INCR \times 10, and INCR SET keys are used to assign a specific increment value. To change an increment/decrement setting:

- **1.** Move the cursor to the numeric entry field to be changed.
- 2. To change the current increment/decrement setting by a factor of 10, use the INCR \div 10 or INCR \times 10 keys.
- **3.** To set a specific increment/decrement value, press INCR SET, and enter the desired value.

Front-Panel Example

The following front panel operation sets the increment value on the **Sector A Power** field to 3 dB.

- 1. Press the CDMA SCRNS, CALL CTRL key.
- 2. Move the cursor in front of the Sector A Power field.
- **3.** Press INCR SET, 3, ENTER.
- 4. Turn the knob or press the up/down arrow keys.

HP-IB Example

The following HP-IB command also sets the increment value on the **Sector A Power** field to 3 dBm/BW, and increments the present value up by 3 dBm/BW.

"DISP CCNT;CDMA:CELL:ASEC:INCR 3;INCR UP"

The save and recall functions allow you to store different instrument setups and retrieve them later, eliminating the task of re-configuring the Test Set.

The number of available save registers depends on how many changes were made to the *BASE* instrument setup for each save. (See "Specifying BASE Settings" on page 64.) The smaller the number of changes, the greater the number of SAVE registers that can be used (typically over 200).

SAVE/RECALL register settings can be saved to several types of mass storage. This allows you to "back up" the settings in case you need to clear them from memory (see "**Memory Considerations**" on page 64) for running large programs, or when a firmware upgrade is performed.

To Save an Instrument Setup

- Press and release the SHIFT key, then the PREV key to access the I/O CONFIGURE screen. Select the storage media using the Save/Recall field. (The default storage media is internal memory.)
- 2. Make any changes to the instrument that you want to save in a register.
- 3. Press and release the SHIFT key, then the RECALL key to select the SAVE function.
- 4. Use the DATA keys or the **Save**: menu at the bottom right of the screen to enter the save register name.

Front-Panel Example

This example saves the current instrument settings.

- 1. Press and release the SHIFT key, then the RECALL key to select the SAVE function. A prompt appears at the top of the screen asking you to enter a name.
- 2. Using the DATA keys, enter 123, then press the ENTER key to assign a name.

HP-IB Example

The following HP-IB command also SAVES the current instrument settings.

"REG:SAVE 123"

To Recall an Instrument Setup

- 1. Press and release the SHIFT key, then the PREV key to access the I/O CONFIGURE screen and select the media to recall settings from using the **Save/Recall** field. (The default is internal memory.)
- 2. Press the RECALL key.
- 3. Use the knob to select the desired setup to be recalled from the **Recall** menu at the bottom right of the screen.

Front-Panel Example

This example recalls the current instrument settings.

Press RECALL, 1, 2, 3, ENTER. The saved instrument settings are recalled.

HP-IB Example

The following HP-IB command also recalls register 123.

"REG:REC 123"

To Clear All SAVE Registers

- **1.** Press the RECALL key.
- 2. Use the knob to position the cursor in front of the entry in the **Recall** menu at the bottom right of the screen.
- **3.** Press the knob or the ENTER key. A prompt appears at the top of the screen to verify that you want to clear all registers.
- 4. Press the ON/OFF key to select YES.

HP-IB Example

The following HP-IB command clears all registers

"REG:CLE:ALL"

To Remove (Clear) an Individual SAVE Register

- 1. Specify where the register is stored using the **Save/Recall** field on the I/O CON-FIGURE screen.
- **2.** Press the RECALL key.
- Use the knob to position the cursor in front of the register to be removed from the Recall menu at the bottom right of the screen. The register name and percentage of SAVE memory occupied by that register are indicated at the very top of the screen.
- 4. Press the ON/OFF key. A prompt appears, asking if you want to delete the save register.
- 5. Press the ON/OFF key to select YES. (Press the RATIO W key to select NO.)

HP-IB Example

The following HP-IB command clears a register

"REG:CLE '<quoted string>'"

Choosing Register Names

You can use any number, letter, or combination of numbers and letters as a name for storing instrument settings. For instance; if you want to save a setup for testing a "Vulcan7" radio, you can save the setting as "VULCAN7".

Two register names are reserved for special purposes: POWERON and BASE.

Specifying POWERON Settings

You can specify the instrument setting at power-on by following the procedure described in "To Save an Instrument Setup" on page 61, and choosing the register name POWERON. If a SAVE Register named POWERON is detected by the Test Set during its power-on routine, the Test Set will configure itself using the settings stored in the POWERON register.

NOTE: If the Test Set does not successfully complete its power-on routine because of the POWERON settings (e.g., the Test Set displays a message that requires you to cycle power to recover) you must:

- 1. Turn off the Test Set.
- 2. Hold down the PRESET and the Hz/uV keys simultaneously.
- **3.** Turn on power while holding the PRESET and the Hz/uV keys down *until the CALL CONTROL screen appears*.

This procedure will clear all SAVE registers, including POWERON.

Specifying BASE Settings

	The <i>BASE</i> register contains any field settings the user has SAVEd that are different from the instrument PRESET state. It establishes a reference point for all future SAVEs. (The PRESET state is stored in the BASE register until you SAVE another instrument setup.)
	When you SAVE an instrument setup, the new setup is compared to the BASE settings, and any <i>differences</i> are stored under the register name you supply. Because only differences are stored, a much larger number of instrument setups can be saved than if the contents of every field was saved.
	When you RECALL an instrument setting, every field is reset to the BASE settings. The SAVED settings are then used to re-establish the desired instrument setup.
	You can define your own BASE setting. If your desired settings are very different from the PRESET values, you may want to change the BASE register. This will decrease the amount of memory used to SAVE each setup, and allow you to SAVE many more setups.
CAUTION:	Since each SAVE/RECALL register only contains the differences between the setup being saved and the present BASE register settings, changing the BASE results in all other saved setups being ERASED from memory (including the POWERON setting if one has been saved).
	Unless you consistently change the same fields to the same value each time you use the instrument, you should probably not create your own BASE settings.

Memory Considerations

When the **Save/Recall** field of the I/O CONFIGURE screen is set to **Internal**, instrument setups are saved to the same non-volatile RAM used to create RAM Disk(s) and run IBASIC programs. By saving a large number of instrument setups, you reduce the amount of RAM available to run programs. If you get a "memory overflow" message while trying to load a program, you must clear one or more SAVE/RECALL registers to free RAM space).

Using USER Keys

User keys instantly access instrument settings without using the knob. You can use USER keys to move quickly between fields on the same screen, and to access field settings that are not normally available on the screen you are using.

Local USER keys are used to move between settings on the screen that is displayed. When the USER key is pressed, the cursor instantly moves to, and selects, the assigned field; eliminating the need to turn and push the knob. Five local USER keys are available for each screen: K1, K2, K3, K4, and K5.

Global USER keys are used to access settings that are not available on the current screen. Three global USER keys are available: K1', K2', and K3'. (These are shifted functions of the local USER keys.)

When defining USER keys, the *ASSIGN* function is used to create key definitions; the *RELEASE* function removes the definitions. Re-assigning a USER key to a different field setting automatically Releases it from the setting it was previously associated with.

To Assign Local USER Keys

- 1. Move the cursor to the field you want to assign a local USER key to.
- 2. Press and release the SHIFT key, then the K4 key to select the ASSIGN function. Press a local USER key (K1-K5). The USER key number appears in front of the field you assigned it to.

Example of Assigning a Local USER Key

Use this example to assign local USER key K1 to the **Filter 1** field in the RX TEST screen.

- 1. Access the RX TEST screen and position the cursor in front of the Filter 1 field.
- 2. Press and release the SHIFT key, then the K4 key to select the ASSIGN function.
- **3.** Press K1. A small **1** appears next to the field indicating that USER key K1 has been assigned to it.
- 4. Move the cursor to any other field on the screen and press K1. The cursor immediately returns to the **Filter 1** field. The field is also highlighted to change the entry using the CURSOR CONTROL knob or arrow keys.

Using USER Keys

To Release Local USER Keys

- 1. Display the screen containing the USER key assignment to be removed.
- 2. Press and release the SHIFT key, then the K5 key to select the RELEASE function.
- 3. Press the USER key (K1-K5) that you want to release.

To Assign Global USER Keys

- 1. Move the cursor to the field you want to assign a global USER key to.
- 2. Press and release the SHIFT key, then the k4 key to select the ASSIGN function.
- **3.** Press a global USER key (K1' -K3'). Unlike a local USER key, the USER key number *does not* appear in front of the field you assigned a global USER key to. A prompt appears at the top of the screen confirming the key assignment.

Example of Assigning a Global USER Key

Use this example to assign global USER key K1' to the **AF Anl In** field, and then access this field in the OSCILLOSCOPE screen.

- 1. Access the AF ANALYZER screen and position the cursor in front of the **AF Anl In** field.
- 2. Press and release the SHIFT key, then the K4 key to select the ASSIGN function.
- 3. Press and release the SHIFT key, then the K1' key. Notice the prompt Global User key 1 assigned. at the top of the screen.
- 4. Access the OSCILLOSCOPE screen.
- 5. Press SHIFT, K1'.

AF Anl Input, FM Demod is displayed at the top of the screen (assuming the present input is set to FM Demod). To change the input, use the arrow keys, or press the ENTER key to access the **Choices** menu.

A field that is accessed using a global USER key is only displayed at the top of the screen while it is being accessed. Moving the cursor to any other field in the screen causes the USER key field to disappear until it is accessed again.

To Release Global USER Keys

- 1. Move the cursor to the field with the global USER key assigned to it.
- 2. Press SHIFT, K5, SHIFT, and the USER key to be released (K1'-K3').

Setting an RF Generator/Analyzer Frequency Offset

You can set a fixed frequency offset between the RF Generator and the RF Analyzer. At power-up and instrument preset this feature is ON with a transmit/receive frequency offset of 45 MHz.

NOTE: A 45 MHz offset is required for making a call or making measurements in CDMA mode.

To Turn Off RF Frequency Offset

- 1. Access the CONFIGURE screen.
- 2. Position the cursor below the RF Display field and select Freq.
- 3. Set the RF Offset to <u>Off</u>.

HP-IB Example

"CONF: OMOD 'OFF'" turns the RF frequency offset off

To Change the RF Frequency Offset

- 1. Access the CONFIGURE screen.
- 2. Position the cursor below the RF Display field and select Freq.
- 3. Set the RF Offset to On.
- 4. Enter an offset frequency ((Gen)-(Anl)).

Setting an RF Generator/Analyzer Level Offset

Setting an RF Generator/Analyzer Level Offset

You can correct for path loss by setting up an RF Level Offset on the front-panel RF connector(s) used in your application. At power-up and instrument preset this feature is OFF with 0.0 dB loss in all connector fields.

An RF Level Offset is required to ensure proper power levels to the analyzer when testing CDMA mobile stations.

Refer to "Determining and Correcting for RF Path Loss" in Calibrating the Test Set chapter of the *HP 8924C Application Guide*.

Interaction Between Screens

Most fields operate *globally*; changing the setting in any screen automatically changes that setting in *all* screens where it is available. **AFGen1 Freq** is an example of this field type.

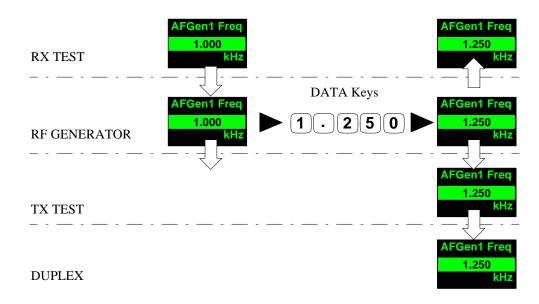

Figure 6

Example of How Global Fields Work

Priority fields give the RX TEST and TX TEST screens priority control of their settings. No matter what these fields were set to in other screens, if the RX TEST or TX TEST screen is accessed, the field changes to whatever it was last set to in these screens. The RF Generator Amplitude is an example of this field type. These fields and their preset values are listed in table 3 on page 70.

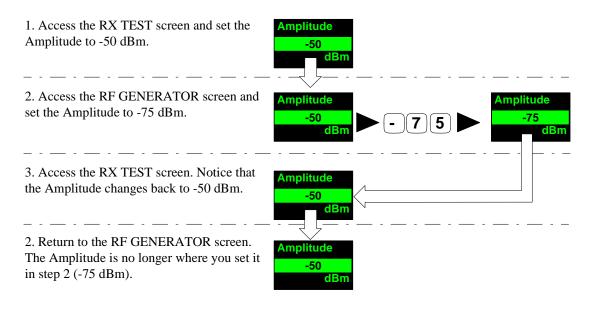

Chapter 3, Operating Overview

Interaction Between Screens

Priority Field	RX TEST	TX TEST
RF Gen Amplitude	Presets to -80 dBm (changeable)	Always Off
AFGen1 To	Presets to FM (changeable)	Always Audio Out
AF Anl In	Always Audio In	Presets to FM Demod (changeable)
Detector	Always RMS	Presets to Pk +- Max(changeable)
De-emphasis	Always Off	Presets to 750µs (changeable)
AF Anl Measurement	Presets to SINAD (changeable)	Presets to Audio Freq (changeable)

Table 3Priority RX TEST and TX TEST Fields

Using your Test Set, duplicate the steps in **figure 7** to demonstrate how the priority fields operate.

Since the RX TEST screen has priority control over this field, the RF GENERATOR screen's Amplitude setting changed when RX TEST was accessed.

Figure 7 Example of How Priority Fields Work

Printing A Screen

To Print A Screen's Contents

- 1. Connect a printer to the appropriate rear-panel connector.
- 2. Press and release the SHIFT key, then the PRINT key to access the PRINT CONFIG-URE screen and set the **Printer Port** field to the appropriate type of printer connection.
 - If HP-IB is selected, enter the HP-IB **Printer Address** of the printer.
- 3. Select the type of printer you are using in the **Model** field. If your printer is not listed, configure your printer to emulate one that is listed.
- 4. Enter a **Print Title** using the knob (optional). The title will appear at the top of your printout.
- 5. Display the screen you want to print and press the PRINT key.

To interrupt printing, select the **Abort Print** field on the PRINT CONFIGURE screen.

Measurement Triggering Process

Measurement Triggering Process

Active Measurements

Only active measurements can be triggered and then queried for a measurement result. Within the Test Set, measurements are differentiated between those that are "active" and those that are "not active". The definition of an active measurement is different for analog measurements than for CDMA measurements.

Definition of Active CDMA Measurement

All CDMA measurements are "active" if:

• either of the following screens is displayed on the CRT of the Test Set

CDMA CELLULAR MOBILE RECEIVER TEST CDMA CELLULAR MOBILE TRANSMITTER TEST

AND

• the measurement is in the ON state

NOTE: Only the Avg/Chan Power measurement is active on the CDMA CALL CONTROL screen.

Definition of Active Analog Measurement

An analog measurement is "active" if:

• the field used to display the measurement result is located on the screen which is currently displayed on the CRT of the Test Set

AND

• the measurement is in the ON state

Measurement Triggering Process

Triggering A Measurement Cycle

The Test Set starts a measurement cycle when a valid trigger is received. The measurement cycle is the process used by the Test Set to obtain measurement results.

The measurement cycle is a firmware process which, for all active measurements, obtains raw data from the hardware and then processes/formats the raw data into a measurement result. The result is then displayed on the screen, and - if operating in remote mode - sent to the HP-IB bus.

The measurement cycle completes when a valid measurement result is obtained for *all* active measurements.

Trigger Modes

NOTE:

The trigger mode used to start the measurement cycle can be selected by the user. The trigger mode is defined by two parameters: retriggering and settling.

Retriggering

Retriggering refers to what the measurement cycle does once it has completed (obtained a valid measurement result for all active measurements). There are two options:

- 1. Single retriggering causes the measurement cycle to stop once a valid measurement result has been obtained for all active measurements. A valid trigger must be received to start the measurement cycle again. When a measurement cycle is completed, the values for all active measurements are held until another trigger is received.
- 2. **Repetitive** retriggering causes the measurement cycle to automatically start over once a valid measurement result has been obtained for all active measurements. No trigger must be received to start the measurement cycle again. Repetitive retriggering will cause measurements that rely on external signals or hardware generated events (such as Traffic Rho) to be automatically re-armed upon completion of a measurement cycle.

The Cont selection in the Meas Cntl field is equal to repetitive retriggering.

Measurement Triggering Process

Settling

Settling refers to the amount of time delay introduced into the measurement cycle to allow signal transients to propagate through the analysis chain and settle out. There are two options:

- 1. Full settling introduces the appropriate delay for all signal transients which might have occurred at the front panel coincident with the trigger command, to pass through the analysis chain and settle out. Delays are also inserted to allow for internal hardware transients to settle.
- 2. Fast settling introduces no delay for internal or external signal transients to settle.

There will still be delays introduced by the couplings between autotuning and autoranging. If the operator wishes to remove these delays as well, all autoranging and autotuning functions must be turned OFF and the operator must explicitly set the ranging amplifiers and the frequency tuning. Delays introduced by the measurement processes themselves cannot be eliminated.

NOTE: CDMA measurements are not affected by the trigger mode settling parameter. CDMA measurements are made with a digital signal processor (DSP) which does not require the settling times associated with analog hardware circuitry.

Rho Suite of Measurements

The following group of CDMA measurements is referred to as the "Rho Suite of Measurements" because a result for each of the following measurements is available each time the Rho Suite of measurements is triggered:

Traffic Rho or TM Rho (only one can be selected) Frequency Error Amplitude Error Time Offset Phase Error Carrier Feedthrough

Default Trigger Modes

Default Trigger Mode for Remote Operation: CDMA and Analog Measurements

Upon powerup, or upon receiving a *RST command, or upon pressing the front panel PRESET key, the Test Set's default trigger mode for remote operation of both CDMA and analog measurements is **Repetitive** retriggering with **Full** settling.

If a local-to-remote transition occurs, the trigger mode will be set to the last trigger mode command received while in remote mode. If no trigger mode command has been received since powerup, the default state is set.

Default Trigger Mode for Local Operation: CDMA Measurements

Upon powerup, or upon receiving a *RST command, or upon pressing the front panel PRESET key, the Test Set's default trigger mode for front panel operation of the FER and Rho Suite of Measurements is **Single** retriggering.

If a remote-to-local transition occurs, the trigger mode will be determined by:

- FER the state of the **Meas Cntl** field on the CDMA CELLULAR MOBILE RECEIVER TEST screen
- Rho Suite of Measurements the state of the **Meas** Cntl field on the CDMA CELLULAR MOBILE TRANSMITTER TEST screen

NOTE: Setting the **Meas Cntl** field to **Cont** (Continuous) sets the trigger mode to repetitive retriggering.

Upon powerup, or upon receiving a *RST command, or upon pressing the front panel PRESET key, or upon a remote-to-local transition the Test Set's default trigger mode for front panel operation of the Avg/Chan Power measurement is **Repetitive** retriggering.

Default Trigger Mode for Local Operation: Analog Measurements

Upon powerup, or upon receiving a *RST command, or upon pressing the front panel PRESET key, the Test Set's default trigger mode for front panel operation of analog measurements is **Repetitive** retriggering with **Full** settling.

Triggering Analog Measurements In Local Mode (Front Panel Operation)

Triggering Analog Measurements In Local Mode (Front Panel Operation)

1. Select the desired trigger mode.

For Signaling • Continuous - Once a measurement has completed, the Test Set is internally re-triggered and another measurement cycle begins.

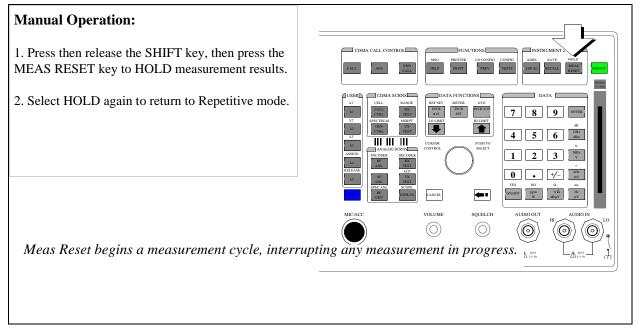

• **Single** - Requires selection of the Arm Meas field to be begin a measurement cycle.

Manual Operation: Position the cursor at the Single/Cont field. Press the knob to underline the desired mode.

Triggering Analog Measurements In Local Mode (Front Panel Operation)

For Analog • Measurements (other than Signaling Decoder)

Repetitive retriggering is the only trigger mode available from the front panel for analog measurements (other than the Signaling Decoder). Single trigger mode can be simulated using the Test Set's measurement hold feature. Selecting the HOLD key causes *all* currently displayed measurement results to be held on the screen and stops the measurement cycle. To resume making measurements press the HOLD key again.

Triggering Analog Measurements In Local Mode (Front Panel Operation)

2. Trigger the Signaling Decoder (applies if trigger mode is "Single")

Manual Operation:	SIGNALING DECODER
1. Position the cursor at the Arm Meas field.	Arm Meas Single/Cont
2. Press the knob.	
Arming the Signaling Decoder as shown in th	is example will cause the measurement to be automati-
cally triggered by an internal trigger comman	•

Selecting the Stop Meas field will stop the currently executing measurement cycle for the Signaling Decoder.

Triggering CDMA Measurements In Local Mode (Front Panel Operation)

Triggering CDMA Measurements In Local Mode (Front Panel Operation)

1. Select the desired trigger mode.

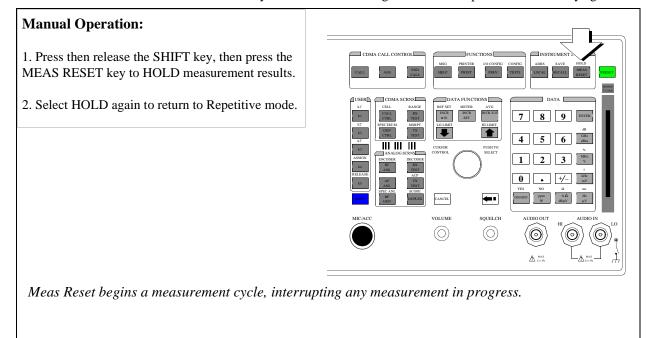

For FER and Rho • Continuous - Once a measurement has completed, the Test Set is internally retriggered and another measurement cycle begins.

Measurements • Single - Requires selection of the Arm field to be begin a measurement cycle.

Manual Operation: 1. Position the cursor at the Single/Cont field. 2. Press the knob to underline the desired mode. Mease Cnil Bingle/Cont When Single is selected, the Arm and Disarm fields are displayed. When Continuous is selected the Arm and Disarm fields are displayed. When Continuous is selected the Arm and Disarm fields are displayed. When Continuous is selected the Arm and Disarm fields will not appear.

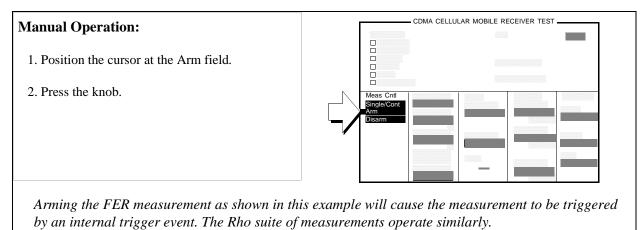

Triggering CDMA Measurements In Local Mode (Front Panel Operation)

Repetitive retriggering is the only trigger mode available from the front panel for the Avg Power and Chan Power measurements. Single trigger mode can be simulated using the Test Set's measurement hold feature. Selecting the HOLD key causes *all* currently displayed measurement results to be held on the screen and stops the measurement cycle. To resume making measurements press the HOLD key again.

Triggering CDMA Measurements In Local Mode (Front Panel Operation)

2. Trigger the FER and Rho Suite Measurements (applies if trigger mode is "Single")

Selecting the Disarm field will stop the currently executing measurement cycle for the FER or Rho Suite of Measurements.

Triggering Analog Measurements In Remote Mode (HP-IB Operation)

Triggering Analog Measurements In Remote Mode (HP-IB Operation)

1. Select the desired trigger mode.

Retriggering

• **Repetitive** - Once a measurement cycle has completed the Test Set is automatically re-triggered and another measurement cycle begins.

When the trigger mode is set to repetitive retriggering, consecutive queries of the same measurement return new measured values.

• **Single** - Once a measurement cycle has completed the Test Set requires an HP-IB trigger command be received to begin a new measurement cycle.

When the trigger mode is set to single retriggering, consecutive queries of the same measurement (with no intervening trigger) will return the same value. Measurements that rely on external signals or hardware-generated events (such as Traffic Rho) must be re-armed with a new trigger before another measurement can be made.

- Settling
 - **Full** Appropriate time delays introduced into measurement cycle to allow internal or external signal transients to settle.
 - **Fast** No time delay introduced into measurement cycle to allow internal or external signal transients to settle.

The programmer must account for transient settling before issuing a trigger command.

There will still be delays introduced by the couplings between autotuning and autoranging. If the programmer wishes to remove these delays as well, all autoranging and autotuning functions must be turned OFF and the program must explicitly set the ranging amplifiers and the frequency tuning. Delays introduced by the measurement processes themselves cannot be eliminated.

HP-IB Syntax|

"TRIG:MODE:RETR REP" !selects Repetitive retriggering mode. "TRIG:MODE:RETR SING" !selects Single retriggering mode. TRIG:MODE:SETT FULL" !selects Full settling mode. "TRIG:MODE:SETT FAST" !selects Fast settling mode. Triggering Analog Measurements In Remote Mode (HP-IB Operation)

2. Trigger all active analog measurements (applies if trigger mode is "Single")

HP-IB Syntax

"TRIG" !triggers all active analog measurements.

HP-IB Example Program

```
10 OUTPUT 714;"DISP RFAN"
20 OUTPUT 714;"TRIG:MODE:RETR SING;SETT FULL"
30 OUTPUT 714;"TRIG"
40 END
```

HP-IB Example Program Comments By Line

```

20 !Sets the Test Set's remote trigger mode to Single retriggering and Full settling

30 !Triggers all active analog measurements

Preventing HP-IB Bus Lockup

HP-IB bus lockup is a condition where the HP-IB bus and the Active Controller handshake are in a temporary holdoff state while the Active Controller waits to read the measurement result from the Test Set. If a measurement cycle does not successfully obtain a valid measurement result, it will continue to try until it does or until the measurement trigger is aborted. This is true for both retriggering modes. This has the consequence of putting the HP-IB in the lockup state.

The control program should include measurement time-out routines that CLEAR the bus and ABORt the trigger if a measurement does not complete within a specified amount of time. This provides a method of preventing the bus from remaining in the temporary holdoff state indefinitely. Triggering CDMA Measurements In Remote Mode (HP-IB Operation)

Triggering CDMA Measurements In Remote Mode (HP-IB Operation)

1. Select the desired trigger mode.

	• Retriggering
	• Repetitive - Once a measurement cycle has completed the Test Set is automatically re-triggered and another measurement cycle begins.
	When the trigger mode is set to repetitive retriggering, consecutive queries of the same measurement return new measured values.
NOTE:	Since the default trigger mode for remote operation is Repetitive, as soon as the Test Set is put into remote mode (a local-to-remote transition) the Test Set will begin to make measurements whether a signal is present or not. If no signal is present, then signal processing error messages will be displayed on the CRT of the Test Set.
	• Single - Once a measurement cycle has completed the Test Set requires an HP-IB trigger command be received to begin a new measurement cycle.
	When the trigger mode is set to single retriggering, consecutive queries of the same measurement (with no intervening trigger) will return the same value. Measurements that rely on external signals or hardware-generated events (such as Traffic Rho) must be re-armed with a new trigger before another measurement can be made.
NOTE:	CDMA measurements are not affected by the trigger mode settling parameter. CDMA measurements are made with a digital signal processor (DSP) which does not require the settling times associated with analog hardware circuitry.

HP-IB Syntax

"TRIG:MODE:RETR	REP"	!selects	Repetitive	retriggering mo	de.
"TRIG:MODE:RETR	SING"	!selects	Single ret	riggering mode.	

Triggering CDMA Measurements In Remote Mode (HP-IB Operation)

2. Trigger all active CDMA measurements

HP-IB Syntax

"TRIG" !triggers all active CDMA measurements.

HP-IB Example Program

10 OUTPUT 714;"DISP CRXT" 20 OUTPUT 714;"TRIG:MODE:RETR SING" 30 OUTPUT 714;"TRIG" 40 END

HP-IB Example Program Comments By Line

10 !Selects CMDA CELLULAR MOBILE RECEIVER TEST screen

20 !Sets the Test Set's remote trigger mode to Single retriggering

30 !Triggers all active CDMA measurements

Preventing HP-IB Bus Lockup

HP-IB bus lockup is a condition where the HP-IB bus and the Active Controller handshake are in a temporary holdoff state while the Active Controller waits to read the measurement result from the Test Set. If a measurement cycle does not successfully obtain a valid measurement result, it will continue to try until it does or until the measurement trigger is aborted. This is true for both retriggering modes. This has the consequence of putting the HP-IB in the lockup state.

The control program should include measurement time-out routines that CLEAR the bus and ABORt the trigger if a measurement does not complete within a specified amount of time. This provides a method of preventing the bus from remaining in the temporary holdoff state indefinitely. Increasing Measurement Throughput

Increasing Measurement Throughput

This section contains a number of techniques for increasing measurement throughput. These techniques include:

"Performing Transmitter and Receiver testing concurrently" on page 86
"Minimizing bus configuration time" on page 90
"Reducing delays caused by screen changes" on page 93
"Reducing delays caused by unused measurements" on page 92
"Reducing measurement setup time" on page 93

Performing Transmitter and Receiver testing concurrently

During an FER test, the Test Set is capable of executing HP-IB commands and returning measurement results from other measurement functions, such as Rho.

Programming Example

The following example assumes a Service Option 2 call is Connected. The program begins an FER measurement and allows an operator to query rho while the FER frame count continues.

Increasing Measurement Throughput

Minimizing bus configuration time

Every time a BASIC or IBASIC OUTPUT or ENTER statement is executed, the bus (HP-IB) has to be configured for data transfer. Using compound HP-IB statements minimizes bus configuration time by combining several operations into one HP-IB OUTPUT or ENTER statement.

To combine multiple HP-IB commands into one OUTPUT statement, use the ; (semicolon) separator and/or the ;: (semicolon colon) separator.

NOTE: It may be helpful to add the common command *OPC following a compound HP-IB command. The *OPC command is used to synchronize the control program with the Test Sets' operating state. For a description of the *OPC command, refer to the HP-IB Common Commands chapter of the *HP 8924C Condensed Programming Reference Guide*.

"Using the semicolon in compound OUTPUT statements" on page 90 "Using the semicolon-colon in compound OUTPUT statements" on page 90 "Reading multiple values using one ENTER statement" on page 91

Using the semicolon in compound OUTPUT statements

The following example sets the Traffic Data Mode to Service Option 2 and the Data Rate to Full. The semicolon separator causes the HP-IB command parsor to back up one level in the command hierarchy.

The following example...

- 10 OUTPUT 714; "CDMA:CALL:TRAFFIC:DATA:MODE 'Svc Opt 2'", and
- 20 OUTPUT 714;"CDMA:CALL:TRAFFIC:DATA:RATE 'Full'"

could be replaced with:

OUTPUT 714; "CDMA:CALL:TRAFFIC:DATA:MODE 'Svc Opt 2';RATE 'Full'"

Using the semicolon-colon in compound OUTPUT statements

The following example sets the Sector A Power level to -70 dBm, then attempts to make a call. The semicolon-colon separator causes the HP-IB command parsor to back up to the top level in the command hierarchy.

OUTPUT 714; "CDMA:CELL:ASECTOR:BWPOWER -70 DBM;:CDMA:CALL:MAKE"

The following example...

- 10 OUTPUT 714; "CDMA:CELL:ASECTOR:BWPOWER -70 DBM", and
- 20 OUTPUT 714; "CDMA:CALL:MAKE"

could be replaced with:

OUTPUT 714; "CDMA:CELL:ASECTOR:BWPOWER -70 DBM;:CDMA:CALL:MAKE"

Reading multiple values using one ENTER statement

The following two lines of code query the Test Set for an Average Power measurement and the Average Power HP-IB units, then read both of these values into the two variables Average_power and Units\$.

The following example...

- 10 OUTPUT 714; "MEAS:CDMANALYZER:AVGPOWER?",
- 20 ENTER 714;Average_power
- 30 OUTPUT 714; "MEAS:CDMANALYZER:AVGPOWER:UNITS?",
- 40 ENTER 714;Units\$

could be replaced by:

- 10 OUTPUT 714; "MEAS:CDMANALYZER:AVGPOWER?; AVGPOWER:UNITS?"
- 20 ENTER 714; Average_power, Units\$

Increasing Measurement Throughput

Reducing delays caused by unused measurements

When a measurement cycle is triggered, the Test Set will attempt to obtain a value for all active measurements. For instance, in CDMA mode (invoked when any CDMA screen is selected) the power measurement that is currently selected (Average Power or Channel Power) is active by default. However, let's assume you are currently measuring rho and do not need the power measurement. You can greatly speed up the rho measurement by turning off the power measurement.

Turning off Average Power and Channel Power measurements

The following example turns off both Average and Channel power using a compound HP-IB statement:

OUTPUT 714: "MEAS: CDM: AVGP: STATE OFF; : MEAS: CDM: CHAN: STAT OFF"

Conversely, lets assume you are making a power measurement and do not need rho or any of the rho suite of measurements.

Turning off the Rho suite of measurements

The following example turns off all rho measurements:

OUTPUT 714: "MEAS: CDM: RHO: STATE OFF"

Reducing delays caused by screen changes

Each time the screen being displayed on the Test Set (active screen) is changed, it takes approximately 250 ms to access and draw the new screen. Additionally, each time a field on the active screen is changed it takes a finite amount of time to update the field. This update time depends on the length and type of field.

When the Test Set is operated remotely, it is possible to display a special "remote screen." When the remote screen is displayed, the active screen is never changed.

When the remote screen is being displayed, the Test Set's display is in the "locked" state. When the control program on the external controller unlocks the display, the screen is returned to the last remote screen requested. The *RST Common Command will place the Test Set's display screen in the "unlocked" state. Pressing the [LOCAL] key causes a locked Test Set display session to end and causes the Test Set's display screen to return to the unlocked state.

To Lock the Test Set's Display Screen.

Use the :SPECial:DISPlay 'LOCKED' 'UNLOCKED' commands to lock and unlock the Test Set's display screen.

Syntax

:SPECiaL:DISPlay 'LOCKED' :SPECiaL:DISPlay 'UNLOCKED'

Example

OUTPUT 714; "SPEC: DISP 'LOCKED'" locks the Test Set's display screen.

NOTE: SPECial:DISPlay 'LOCKED'|'UNLOCKED' must not be invoked from the Test Set's built-in IBASIC Controller. Executing these commands from an IBASIC program can produce unexpected results and is not supported.

Reducing measurement setup time

Measurement setup time can be minimized by specifying an instrument operating state in the BASE register. This approach works in conjunction with SAVE/ RECALL registers to minimize the number of instrument settings that have to change when recalling an instrument state. Refer to "Specifying BASE Settings" on page 64 for a description.

Passing Instrument Control

Communications on the HP-IB bus are accomplished according to a precisely defined set of rules (IEEE 488.1 and 488.2 Standards). Communication (data transfer) is accomplished by designating one device to be a talker (source of data or commands) and designating one or more devices to be listeners (receivers of data or commands). The device on the bus responsible for designating talkers and listeners is the Controller.

The structure of the HP-IB bus allows for more than one Controller to be connected to the bus at the same time. As a means of ensuring that orderly communications can be established on power-up or when communications have failed, the rules state that only one Controller can unconditionally demand control of the bus (through the IFC line). This controller is referred to as the System Controller. There can be only one System Controller connected to the bus at any time.

As a means of ensuring orderly communications in environments where more than one controller is connected to the bus, the rules state that only one Controller can be actively addressing talkers and listeners at any given time. This device is referred to as the Active Controller. The System Controller is the default Active Controller on power-up or after a bus reset. Controllers which are not the Active Controller are referred to as Non-Active Controllers. The Active Controller can pass control of device addressing to one of the Non-Active Controllers. Additionally, Non-Active Controllers can request control from the Active Controller.

The process by which the Active Controller passes device addressing responsibility to a Non-Active Controller is referred to as Passing Control. The Active Controller must first address the prospective new Active Controller to Talk, after which it sends the Take Control Talker (TCT) message across the bus. If the other Controller accepts the message it assumes the role of Active Controller and the previous Active Controller becomes a Non-Active Controller. The Test Set has bus control capability (Active/Non-Active Controller). Additionally the Test Set can be also be configured as the System Controller. By definition then, the Test Set has the capability to demand control, pass control, accept control, and request control of the bus depending upon its configuration, its current operating mode, and the system configuration. Many possibilities for passing control among several controllers on the same bus exist. Attempting to identify all the possible techniques of passing control in such a system is beyond the scope of this document (refer to the IEEE 488.1 and 488.2 Standards for additional information).

Configuring the Test Set as the System Controller

To configure the Test Set as a System Controller, select the I/O CONFIGURE screen, position the cursor to the **Mode** field using the Cursor Control knob, highlight the **Mode** field by pushing the Rotary Knob, select **Control** from the **Choices** menu. As a consequence of setting the Test Set to be the System Controller it will also become the Active Controller. The letter C appears in the upper-right corner of the display to indicate that the Test Set is now the Active Controller.

If the Test Set is the only controller on the bus it must be configured as the System Controller. If the Test Set is not the only controller on the bus, then whether or not it is configured as the System Controller would depend upon three issues:

- 1. whether or not other controllers have System Controller capability
- 2. which controller will be the Active Controller upon power-up
- **3.** which Controller will be monitoring the bus to determine if communications have failed (only the System Controller can unconditionally demand control of the bus and reset it to a known state using the IFC line)

Ensure that only one Controller connected to the bus is configured as the System Controller or bus conflicts will occur.

When Active Controller Capability is Required

The Test Set must be the Active Controller on the bus under the following conditions:

- 1. whenever the Test Set needs to control any device connected to the HP-IB bus, such as an external disk drive, an external printer, or an external instrument
- 2. whenever a screen image is printed to an external HP-IB printer
- **3.** whenever an instrument configuration is saved or recalled from an external HP-IB disk drive
- 4. whenever running any HP 11807 Radio Test Software package which uses an external HP-IB device such as a disk drive, a printer, or an instrument
- 5. whenever running any IBASIC program which uses an external HP-IB device such as a disk drive, a printer, or an instrument

Passing Control Back to Another Controller

The Test Set has two methods of passing control back to another controller: 1) automatically and 2) using the IBASIC PASS CONTROL command from an IBASIC program. The two methods are described in the following sections.

Passing Control Back Automatically

The Test Set will automatically pass control back to the controller whose address was specified in the *PCB Common Command or to a default address of 0 (decimal) if no *PCB command was received. Control will automatically be passed under the following conditions:

Test Set is the Active Controller and an IBASIC Program is Running

- The IBASIC program running in the Test Set is PAUSED.
- •The IBASIC program running in the Test Set finishes executing.
- •An IBASIC RESET occurs while the IBASIC program is running.
- •Control is passed back immediately if the System Controller executes a bus reset (IFC).

Test Set is the Active Controller and no IBASIC Program is Running

- •Control will be passed back within 10 seconds of receiving bus control if no controller commands are executed (such as printing a screen image to an HP-IB printer or saving/recalling an instrument configuration from an HP-IB disk drive).
- •Control is passed back immediately if the System Controller executes a bus reset (IFC).
- •Control is passed back at the completion of a controller command (such as printing a screen image to an HP-IB printer or saving/recalling an instrument configuration from an HP-IB disk drive).

Passing Control Back Using IBASIC PASS CONTROL Command

The Test Set will pass control back to another Controller when the IBASIC PASS CONTROL command is issued while an IBASIC program is running on the builtin IBASIC Controller. Refer to the *HP Instrument BASIC User's Handbook* for a complete description of the IBASIC PASS CONTROL command.

Passing Control to the Test Set

Control is passed to the Test Set when it is addressed to TALK and then receives the Take Control Talker (TCT) command. The programming or controller command which implements the pass control protocol as outlined in the IEEE 488.1 and 488.2 Standards is language/controller specific. Refer to the appropriate language/controller documentation for specific implementations.

Before passing control to the Test Set the Active Controller should send the Test Set the address to use when passing control back. This is accomplished using the *PCB Common Command. The *PCB command tells the Test Set which address should be used when passing control back to another bus controller. Before passing bus control to the Test Set, the currently active controller can use the *PCB command to tell the Test Set where to send the Take Control (TCT) command when the Test Set is ready to give up active control of the bus. The command is followed by a number which contains the bus address of the device that should become the next active controller. The number must round to an integer in the range 0 to 30 decimal. The command may be followed by two numbers. The first will be used as the primary address, the second as the secondary address of the next active controller.

Requesting Control using IBASIC

The Test Set has the capability to request control of the bus from the Active Controller from a running IBASIC program using the IBASIC command EXECUTE ("REQUEST_CONTROL"). When the EXECUTE ("REQUEST_CONTROL") command is executed from a running IBASIC program, the Request Control bit, bit 1, of the Test Set's Standard Event Status Register is set to the TRUE, logic 1, condition. The Active Controller detects the request in the Test Set's Standard Event Status Register either as a result of an SRQ indication by the Test Set or by some polling routine which periodically checks bit 1 of the Standard Event Status Register of all potential controllers on the bus. The Active Controller would then send the Test Set the address to which the Test Set is to later pass control using the *PCB Common Command. The Active Controller would then pass control to the Test Set.

Pass Control Examples

The following examples illustrate how pass control could be implemented in two of the common Test Set operating configurations:

- 1. Test Set controlled by an external controller, and
- **2.** Test Set running an IBASIC program with an external Controller connected to HP-IB bus.

Passing Control While the Test Set is Controlled by an External Controller

This example illustrates passing control between the Test Set and an external controller while the Test Set is being controlled by the external controller. In this mode the Test Set is NOT configured as the System Controller. Generally speaking, in this mode of operation the Test Set is considered just another device on the HP-IB bus and its Controller capabilities are not used. However, it may be desirable, under certain conditions, to print a Test Set screen to the HP-IB printer for documentation or program debugging purposes. With manual intervention it is possible to have the Active Controller pass control to the Test Set, have the operator select and print the desired screen, and then pass control back to the formerly Active Controller. The following steps outline a procedure for accomplishing this task.

This example is based upon having an HP 9000 Series 300 Workstation as the external controller connected to the Test Set through the HP-IB bus. Further, it assumes that the HP-IB interface in the HP 9000 Controller is set to the default select code of 7 and address of 21.

- 1. If a program is running on the HP 9000 Workstation, PAUSE the program.
- 2. Put the Test Set in local mode (press the LOCAL key on the front panel).
- **3.** Configure the Test Set to print to the HP-IB printer using the PRINT CONFIGURE screen.
- 4. Configure the Test Set to display the screen to be printed.
- **5.** From the keyboard of the HP 9000 Workstation type in and execute the following command:

OUTPUT 714; "*PCB 21"

This command tells the Test Set the address of the Controller to pass control back to.

6. From the keyboard of the HP 9000 Workstation type in and execute the following command:

PASS CONTROL 714

This command passes control to the Test Set.

- 7. Put the Test Set in local mode (press the LOCAL key on the front panel).
- 8. Press SHIFT, then TESTS on the front panel of the Test Set to print the screen.
- **9.** After the Test Set finishes printing the screen it will automatically pass control back to the HP 9000 Workstation.

Passing Control Between an External Controller and the Test Set with an IBASIC Program Running

The following example program illustrates the passing of control between an external Controller and the Test Set while an IBASIC program is running in the Test Set. The example is based upon having an HP 9000 Series 300 Workstation as the external controller connected to the Test Set through the HP-IB bus. Further, it is based on the assumption that the HP-IB interface in the HP 9000 Controller is set to the default select code of 7 and address of 21. In this example, the Test Set is NOT configured as the System Controller. This example illustrates the situation where the External Controller would perform the functions listed below.

- 1. Sends commands to the Test Set to cause a program to be loaded off of a Memory Card which is in the Test Set's front panel Memory Card slot.
- 2. Sends commands to the Test Set to run the program just loaded.
- **3.** Passes control to the Test Set and then does other work while the Test Set is making measurements.

When the Test Set is finished making measurements and has data available for the External Controller, it passes control back to the External Controller.

4. The External Controller then requests the data from the Test Set.

The following program would run in the External Controller:

```
10

Passing Instrument Control

4 Status Reporting

This chapter provides an overview of the status reporting structure used in the Test Set. Methods for using status register bits and bit definitions are also found here.

Status Reporting

Status Reporting

This section describes the status reporting structure used in the Test Set. The structure is based on the IEEE 488.1-1987 and 488.2-1987 Standards and the Standard Commands for Programmable Instruments (SCPI) Version 1994.0.

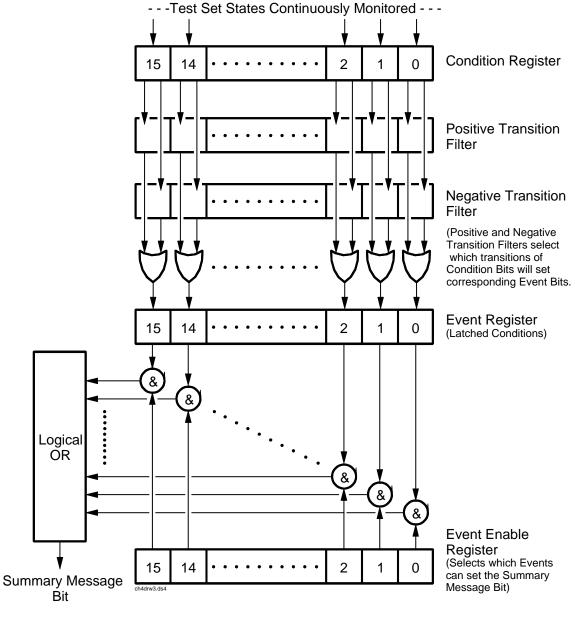

For a full listing of command mnemonics, refer to the "Status" syntax, in HP-IB Command Syntax chapter of the *HP* 8924C Condensed Programming Reference Guide.

Status Register Structure Overview

The structure of the register groups used in the Test Set is based upon the status data structures outlined in the IEEE 488 and SCPI 1994.0 Standards. There are two types of status data structures used in the Test Set: status registers and status queues. The general models, components, and operation of each type of status data structure are explained in the following sections.

Status Register Model

This section explains how the status registers are structured in the Test Set. The generalized status register group model shown on the previous page consists of a Condition Register, Transition Filters, an Event Register, an Enable Register, and a Summary Message Bit.

Status Data Structure - Register Group Model

Condition Register /Transition Filters

A condition is a Test Set state that is either true or false.

Monitored Test Set states that are capable of remaining in each state for a time period long enough to provide a realistic chance of being queried are assigned one of the bits in the appropriate condition register. An example of this type of bit would be FER Test Running, located in the Measuring status register group. When an FER (Frame Error Rate) test is not running, this condition bit is false. When an FER test is running, this bit will transition to a true state and remain there for the duration of the FER test, which at a minimum will take several seconds. During this time an external controller may periodically query the Measuring status register and find that the bit is still true, indicating the test is still running.

Monitored Test Set states that are transient, such as FER Test Passed in the CDMA status register group, do not have a condition register bit assigned to them. The reason for this is evident in the following description of the FER Test Passed states. When an FER test passes, the condition bit toggles from false to true, then is returned false so that it is in a state to signal the next occurrence of this condition. The chances are very slight that an HP-IB query of the FER Test Passed condition bit would ever return a true state indication.

In the following pages, each status register group description includes a table of bit definitions. As part of each bit definition there is a column entitled "Is Condition Register Implemented", with a YES or NO identifier.

There is no latching or buffering of any bits in a Condition Register; it is updated in real time. Condition Registers are read-only. Condition Registers in the Test Set are 16 bits long and may contain unused bits. All unused bits return a zero value when read.

For each bit that has a condition register implemented, the Transition Filters determine which of two bit-state transitions will set the corresponding bit in the Event Register. See "Event Register" on page 111. Transition Filters may be set to pass positive transitions (PTR), negative transitions (NTR) or either (PTR or NTR). A positive transition means a condition bit changed from 0 to 1. A negative transition means a condition bit changed from 1 to 0.

In the Test Set, the Transition Filters are implemented as two registers: a 16-bit positive transition (PTR) register and a 16-bit negative transition (NTR) register. A positive transition of a bit in the Condition register will be latched in the Event Register if the corresponding bit in the positive transition filter is set to 1. A positive transition of a bit in the Condition register will *not* be latched in the Event Register if the corresponding bit in the positive transition filter is set to 0. A negative transition of a bit in the Condition register will be latched in the Event Register if the corresponding bit in the negative transition filter is set to 1. A negative transition of a bit in the Condition register will be latched in the Event Register if the corresponding bit in the negative transition filter is set to 1. A negative transition of a bit in the Condition register will be latched in the Event Register if the corresponding bit in the negative transition filter is set to 0. Either transition (PTR or NTR) of a bit in the Condition Register will be latched in the Event Register if the corresponding bit in the Condition Register will be latched in the Event Register if the corresponding bit in both transition filters is set to 1. No transitions (PTR or NTR) of a bit in the Condition Register will be latched in the Event Register if the corresponding bit in both transition filters is set to 0.

Transition Filters are read-write. Transition Filters are unaffected by a *CLS (clear status) command or queries. The Transitions Filters are set to pass positive transitions (PTR) at power on and after receiving the *RST (reset) command (all 16 bits of the PTR register set to 1 and all 16 bits of the NTR register set to 0).

Event Register

The Event Register captures bit-state transitions in the Condition Register as defined by the Transition Filters. Each bit in the Event Register corresponds to a bit in the Condition Register, or if there is no Condition Register/Transition Filter combination, each bit corresponds to a specific condition in the Test Set. Bits in the Event Register are latched, and, once set, they remain set until cleared by a query of the Event Register or a *CLS (clear status) command. This guarantees that the application can't miss a bit-state transition in the Condition Register. There is no buffering; so while an event bit is set, subsequent transitions in the Condition Registers are read-only. Event Registers in the Test Set are either 8 or 16 bits long and may contain unused bits. All unused bits return a zero value when read.

Event Enable Register

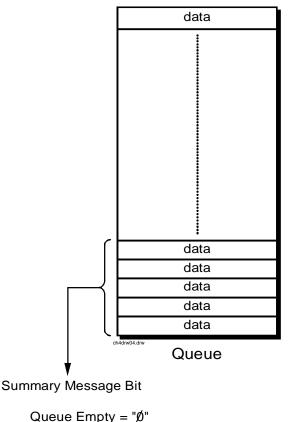

The Event Enable Register defines which bits in the Event Register will be used to generate the Summary Message. Each bit in the Enable Register has a corresponding bit in the Event Register. The Test Set logically ANDs corresponding bits in the Event and Enable registers and then performs an inclusive OR on all the resulting bits to generate the Summary Message. By using the enable bits the application program can direct the Test Set to set the Summary Message to the 1 or TRUE state for a single event or an inclusive OR of any group of events. Enable Registers are read-write. Enable Registers in the Test Set are either 8 or 16 bits long and may contain unused bits which correspond to unused bits in the associated Event Register. All unused bits return a zero value when read and are ignored when written to. Enable Registers are unaffected by a *CLS (clear status) command or queries.

Summary Message Bit

The Summary Message is a single-bit message which indicates whether or not one or more of the enabled events have occurred since the last reading or clearing of the Event Register. The Test Set logically ANDs corresponding bits in the Event and Enable registers and then performs an inclusive OR on all the resulting bits to generate the Summary Message. By use of the enable bits, the application program can direct the Test Set to set the Summary Message to the 1, or TRUE, state for a single event or an inclusive OR of any group of events. The Summary Message is TRUE when an enabled event in the Event Register is set TRUE. Conversely, the Summary Message is FALSE when no enabled events are TRUE. Summary Messages are always seen as bits in another register.

Status Queue Model

This section explains how status queues are structured in the Test Set. The generalized status queue model shown in figure 9 is the basis upon which all the status queues in the Test Set are built. A queue is a data structure containing a sequential list of information. The queue is empty when all information has been read from the list. The associated Summary Message is TRUE, logic 1, if the queue contains some information and FALSE, logic 0, if the queue is empty. Queues can be cleared by reading all the information from the queue. Queues, except the Output Queue, can also be cleared using the *CLS (clear status) command. A status queue can also be referred to as a Status Register Group.

Queue Not - Empty = "1"

Figure 9

Status Data Structure - Queue Mode

Status Register Programming Considerations

When performing certain tasks, such as making a call, program flow can be controlled by the status register group bits. Generally, there are two approaches to using status register group bits, Polling, and Service Requests. The choice of which technique to use, polling or service request, will depend upon the needs of the particular application.

Advantages/Disadvantages of Polling

Polling has the advantage that the control program can react quicker to the change in state since it (the control program) does not have to execute the code necessary to determine what condition caused the service request line to be asserted.

Polling has the disadvantage that, if improperly implemented, it can prevent the Call Processing Subsystem from properly interfacing with the mobile station.

The Test Set has a multi-tasking architecture wherein multiple processes execute on a priority driven and an event driven basis. One of the highest priority processes is the process that services the HP-IB.

If a control program constantly polls the status registers to determine when a particular state is true, that state may never go to the true state because the Test Set is constantly being interrupted by the HP-IB service process.

Therefore, care must be exercised when using the polling technique to allow enough time between polls for processes to execute within the Test Set.

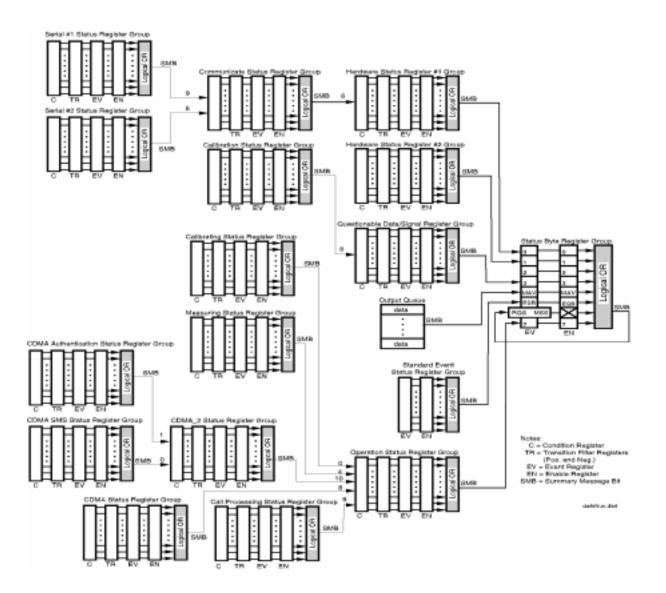

Some computer systems and/or programming languages may not support the service request feature of the HP-IB and consequently polling would be the only technique available to the programmer. When using a polling technique be sure to include a delay in the polling loop. Refer to line 60 in the example below.

HP BASIC Example of Polling

Advantages/Disadvantages of Using Service Request

The service request feature of the HP-IB has the advantage that it allows the Call Processing Subsystem to execute at its maximum speed since processes within the subsystem are not being constantly interrupted by the need to service the HP-IB.

The service request feature of the HP-IB has the disadvantage that it takes more code to implement within the control program. The consequence of which is a slight reduction in the overall throughput of the control program since more code must be executed to accomplish the same task. For an example of using the service request feature, refer to "Controlling Program Flow" chapter in the *HP 8924C Application Guide*.

Calibrating Status Register Group

The Calibrating Status Register Group contains information about events associated with calibrating CDMA measurements. This register group uses 16-bit registers and includes a Condition Register, Transition Filters, an Event Register, an Enable Register, and a Summary Message. p.

The Calibrating Register Group SMB must be enabled in the Operation Status Register Group before any of the following events or conditions can be reported through the Status Byte Register.

Figure 11 on page 118 shows the structure and STATus commands for the Calibrating Status Register Group.

 Table 5 on page 124 details the Calibrating Status Register Group Condition

 Register bit assignments.

2	YES ^a	CDMA Baseband calibration	Calibrating CDMA Baseband Physical Channels
1	YES ^a	Channel power calibration	Calibrating Channel Power measure- ment.
0	YES ^a	Digital power zeroing	Average power measurements zeroed

Table 4 Calibrating Status Register Group Condition Register Bit Assignments

a. Although a Condition register is implemented, the Test Set will not parse out or execute HP-IB commands while this operation is taking place. Consequently, a query of the Condition register will not be executed until after the calibration attempt has completed, and will never indicate a "true" condition. Always query the Event register, and when the calibration attempt has completed an Event register query result will be returned and will show which bit was latched by the initiation of a calibration attempt.

Accessing the Calibrating Status Register Group's Registers

The following sections show the syntax and give programming examples, using the HP BASIC programming language, for the STATus commands used to access the Calibrating Status Register Group's registers.

Reading the Condition Register

Syntax

STATus:OPERation:CALibrating:CONDition?

Example

OUTPUT 714;"STAT:OPERation:CALibrating:COND?" ENTER 714;Register_value

Reading the Transition Filters

Syntax

STATus:OPERation:CALibrating:PTRansition? STATus:OPERation:CALibrating:NTRansition?

Example

OUTPUT 714;"STAT:OPERation:CALibrating:PTR?" ENTER 714;Register_value

Writing the Transition Filters

Syntax

STATus:OPERation:CALibrating:PTRansition <integer> STATus:OPERation:CALibrating:NTRansition <integer>

Example

OUTPUT 714; "STAT: OPERation: CALibrating: PTR 256"

Reading the Event Register

Syntax

STATus:OPERation:CALibrating:EVENt?

Example

OUTPUT 714;"STAT:OPERation:CALibrating:EVEN?" ENTER 714;Register_value

Clearing the Event Register

The EVENT register is cleared whenever it is queried or whenever the Common Command *CLS is sent to the Test Set.

Reading the Enable Register

Syntax

STATus:OPERation:CALibrating:ENABle?

Example

OUTPUT 714;"STAT:OPERation:CALibrating:ENAB?" ENTER 714;Register_value

Writing the Enable Register

Syntax

STATus:OPERation:CALibrating:ENABle <integer>

Example

OUTPUT 714; "STAT: OPERation: CALibrating: ENAB 256"

Clearing the Enable Register

The ENABLE register is cleared by writing to it with an integer value of zero.

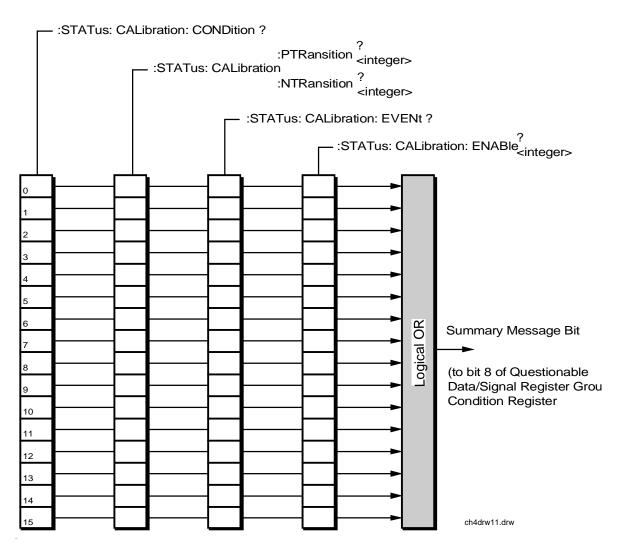

Calibration Status Register Group

The Calibration Status Register Group contains information about the Test Set's hardware.

The Status Byte Register summary message associated with the Calibration Status Register Group is bit three. The Calibration Register Group SMB must be enabled in the Questionable Data/Signal Status Register Group before any of the following events or conditions can be reported through the Status Byte Register.

Figure 12 on page 123 shows the structure and STATus commands for the Calibration Status Register Group.

Table 5 on page 124 details the Calibration Status Register Group ConditionRegister bit assignments.

Calibration Status Register Group

Table 5 Calibration Status Register Group Bit Assignments

Bit Number	Is Condition Register Implemented?	Condition/Event	Comment
15		Not Used (Always 0)	Defined by SCPI Version 1994.0
14		Unused in Test Set

10		Unused in Test Set	
9		Unused in Test Set	
8	NO	CDMA Baseband Physical Channel Calibration Error	
7		Unused in Test Set	
6	NO	Channel Power Calibration Failed	Make sure cables are connected between DUPLEX OUT or RF Out Only (PCS Interface) and RF IN/OUT connectors.
5	NO	Digital Power Zeroing Failed	CDMA Average Power measure- ment zero attempt failed.
4	NO	TX Power Auto-Zero Failed	
3	YES	Voltmeter Self-Calibration Failed	
2	YES	Counter Self-Calibration Failed	
1	YES	Sampler Self-Calibration Failed	
0	YES	Spectrum Analyzer Self-Calibration Failed	

Accessing the Calibration Status Register Group Registers

The following sections show the syntax and give programming examples, using the HP BASIC programming language, for the STATus commands used to access the Calibration Status Register Group registers.

Reading the Condition Register

Syntax

STATus: CALibration: CONDition?

Example

OUTPUT 714;"STAT:CAL:COND?" ENTER 714;Register_value

Reading the Transition Filters

Syntax

STATus:CALibration:PTRansition? STATus:CALibration:NTRansition?

Example

OUTPUT 714;"STAT:CAL:PTR?" ENTER 714;Register_value

Writing the Transition Filters

Syntax

STATUS:CALibration:PTRansition <integer> STATUS:CALibration:NTRansition <integer>

Example

OUTPUT 714;"STAT:CAL:PTR 256"

Chapter 4, Status Reporting

Status Reporting

Reading the Event Register

Syntax

STATus: CALibration: EVENt?

Example

OUTPUT 714;"STAT:CAL:EVEN?" ENTER 714;Register_value

Clearing the Event Register

The EVENT register is cleared whenever it is queried or whenever the Common Command *CLS is sent to the Test Set.

Reading the Enable Register

Syntax

STATus: CALibration: ENABle?

Example

OUTPUT 714;"STAT:CAL:ENAB?" ENTER 714;Register_value

Writing the Enable Register

Syntax

STATus:CALibration:ENABle <integer>

Example

OUTPUT 714;"STAT:CAL:ENAB 256"

Clearing the Enable Register

The ENABLE register is cleared by writing to it with an integer value of zero.

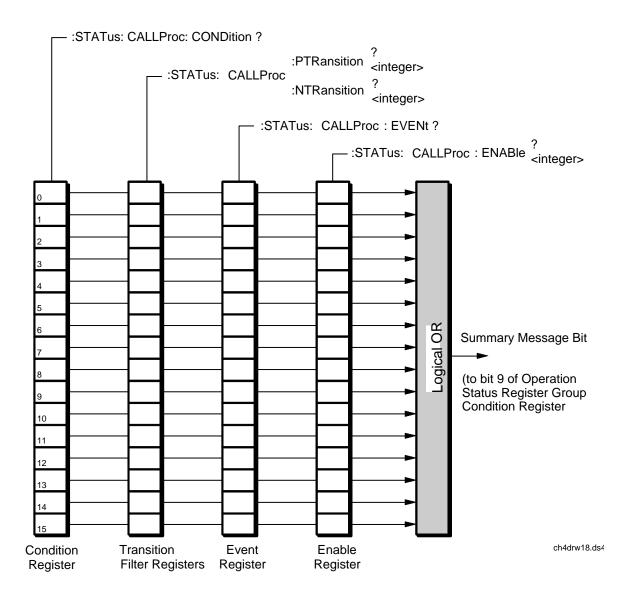

Call Processing Status Register Group

The Call Processing Status Register Group contains information about the Test Set's analog Call Processing Subsystem. This status group is accessed using the STATus commands. The Call Processing Status Register Group uses 16-bit registers and includes a Condition Register, Transition Filters, an Event Register, an Enable Register, and a Summary Message Bit.

Figure 12 shows the structure and STATus commands for the Call Processing Status Register Group.

Refer to the **"Status Register Structure Overview" on page 108** for a discussion of status register operation.

 Table 5 details the Call Processing Status Register Group's Condition Register bit assignments.

Bit Number	Is Condition Register Implemented?	Condition	Comment
15		Not Used (Always 0)	Defined by SCPI Version 1994.0
14		Unused in Test Set

8		Unused in Test Set	
7		Unused in Test Set	
6	Yes	Mobile station ringing.	Bit state goes true (1) after a base station originated call is attempted and the call processing state has pro- gressed past Access. Answering the call from the mobile station causes the bit state to go false (0).
5	Yes	Call Processing subsystem in the Connect state	Bit state mirrors the condition of the Connect pseudo-LED on the CRT display (1=ON, 0=OFF)
4	Yes	Call Processing subsystem is in the Access state	Bit state mirrors the condition of the Access pseudo-LED on the CRT display (1=ON, 0=OFF)
3	Yes	Call Processing subsystem is in the Page state	Bit state mirrors the condition of the Page pseudo-LED on the CRT display (1=ON, 0=OFF)
2	Yes	Authenticating	Call processing is authenticating
1	Yes	Call Processing subsystem is in the Register state	bit state mirrors the condition of the Register pseudo-LED on the CRT display (1=ON, 0=OFF)
0	Yes	Call Processing subsystem is in the Active state	bit state mirrors the condition of the Active pseudo-LED on the CRT display (1=ON, 0=OFF)

Table 6 Call Processing Status Register Group, Condition Register Bit Assignments

Accessing the Call Processing Status Register Group's Registers

The following sections show the syntax and give programming examples (using the HP BASIC programming language) for the STATus commands used to access the Call Processing Status Register Group's registers.

Reading the Condition Register

Syntax

STATus:CALLProc:CONDition?

Example

OUTPUT 714;"STAT:CALLP:COND?" ENTER 714;Register_value

Reading the Transition Filters

Syntax

STATUS:CALLProc:PTRansition? STATUS:CALLProc:NTRansition?

Example

OUTPUT 714;"STAT:CALLP:PTR?" ENTER 714;Register_value

Writing the Transition Filters

Syntax

STATUS:CALLProc:PTRansition <integer> STATUS:CALLProc:NTRansition <integer>

Example

OUTPUT 714; "STAT: CALLP: PTR 256"

Reading the Event Register

Syntax

STATus:CALLProc:EVENt?

Example

OUTPUT 714;"STAT:CALLP:EVEN?" ENTER 714;Register_value

Clearing the Event Register

The EVENT register is cleared whenever it is queried or whenever the Common Command *CLS is sent to the Test Set.

Reading the Enable Register

Syntax

STATus:CALLProc:ENABle?

Example

OUTPUT 714;"STAT:CALLP:ENAB?" ENTER 714;Register_value

Writing the Enable Register

Syntax

STATus:CALLProc:ENABle <integer>

Example

OUTPUT 714; "STAT: CALLP: ENAB 256"

Clearing the Enable Register

The ENABLE register is cleared by writing to it with an integer value of zero.

CDMA Authentication Status Register Group

The CDMA Authentication Status Register Group contains information about the status of authentication tests.

Figure 14 shows the structure and STATus commands for the CDMA Authentication Status Register Group.

 Table 7 shows the CDMA Authentication Status Register Group bit assignments.

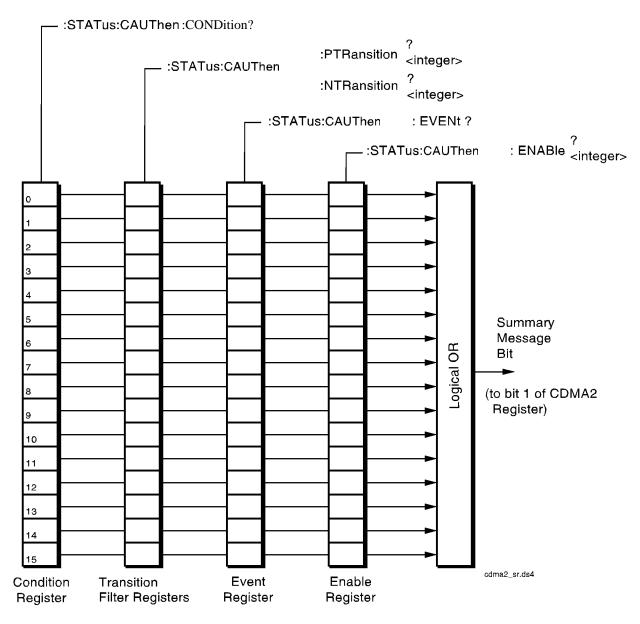

Figure 14 CDMA Authentication Status Register Group

5			-
4			
3			
2	YES	Closed Loop Power Control Step Size Change Pending	A change was made to the Power Cntl Step Size field, and a response to the Power Control Message is pending.
1	YES	CDMA Authentication Status Register SMB	
0	YES	CDMA SMS Status Register SMB	

Accessing the CDMA_2 Status Register Group Registers

The following sections show the syntax and give programming examples, using the HP BASIC programming language, for the STATus commands used to access the CDMA_2 Status Register Group registers.

Reading the Condition Register

Syntax

STATus:CDMA2:CONDition?

Example

OUTPUT 714;"STAT:CDMA2:COND?" ENTER 714;Register_value

Reading the Transition Filters

Syntax

STATus:CDMA2:PTRansition? STATus:CDMA2:NTRansition?

Example

OUTPUT 714;"STAT:CDMA2:PTR?" ENTER 714;Register_value

Writing the Transition Filters

Syntax

STATus:CDMA2:PTRansition <integer> STATus:CDMA2:NTRansition <integer>

Example

OUTPUT 714;"STAT:CDMA2:PTR 1"

Chapter 4, Status Reporting

Status Reporting

Reading the Event Register

Syntax

STATUS:CDMA2:EVENt?

Example

OUTPUT 714;"STAT:CDMA2:EVEN?" ENTER 714;Register_value

Clearing the Event Register

The EVENT register is cleared whenever it is queried or whenever the Common Command *CLS is sent to the Test Set.

Reading the Enable Register

Syntax

STATus:CDMA2:ENABle?

Example

OUTPUT 714;"STAT:CDMA2:ENAB?" ENTER 714;Register_value

Writing the Enable Register

Syntax

STATus:CDMA2:ENABle <integer>

Example

OUTPUT 714; "STAT: CDMA2: ENAB 256"

Clearing the Enable Register

Communication Status Register Group

The Communication Status Register Group contains information about the Test Set's hardware, and the summary message bits for the Serial 1 and Serial 2 Status Register Groups.

The Status Byte Register summary message associated with the Communication Status Register Group is bit zero. The Communication Status Register Group SMB must be enabled in the Hardware1 Status Register Group before any of the following events or conditions can be reported through the Status Byte Register.

Figure 18 shows the structure and STATus commands for the Communication Status Register Group.

 Table 11 shows the Communication Status Register Group Condition Register bit assignments.

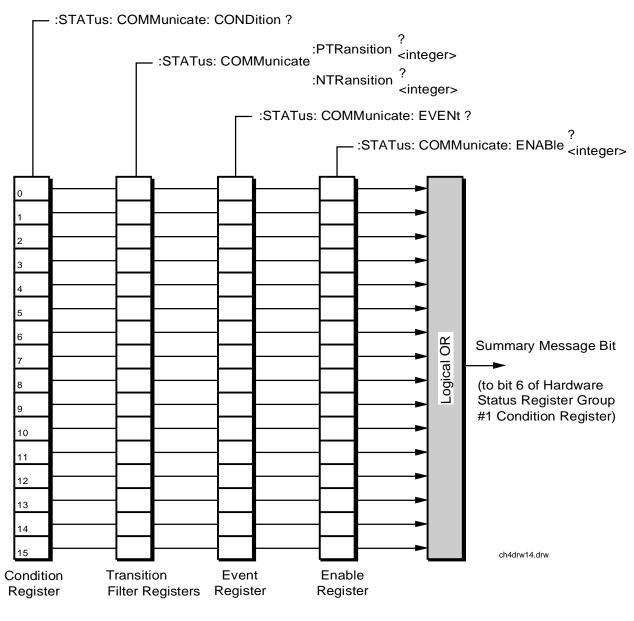

Figure 18 Communication Status Register Group

Bit Number	Is Condition Register Implemented?	Condition/Event	Comment

0	YES	Transmitter DSP Analyzer Communication Channel Failure	

Table 11 Communication Status Register Group Bit Assignments

Accessing the Communication Status Register Group Registers

The following sections show the syntax and give programming examples, using the HP BASIC programming language, for the STATus commands used to access the Communication Status Register Group registers.

Reading the Condition Register

Syntax

STATus:COMMunication:CONDition?

Example

OUTPUT 714;"STAT:COMM:COND?" ENTER 714;Register_value

Reading the Transition Filters

Syntax

STATus:COMMunication:PTRansition? STATus:COMMunication:NTRansition?

Example

OUTPUT 714;"STAT:COMM:PTR?" ENTER 714;Register_value

Writing the Transition Filters

Syntax

STATus:COMMunication:PTRansition <integer> STATus:COMMunication:NTRansition <integer>

Example

OUTPUT 714; "STAT: COMM: PTR 256"

Reading the Event Register

Syntax

STATus:COMMunication:EVENt?

Example

OUTPUT 714;"STAT:COMM:EVEN?" ENTER 714;Register_value

Clearing the Event Register

The EVENT register is cleared whenever it is queried or whenever the Common Command *CLS is sent to the Test Set.

Reading the Enable Register

Syntax

STATus:COMMunication:ENABle?

Example

OUTPUT 714;"STAT:COMM:ENAB?" ENTER 714;Register_value

Writing the Enable Register

Syntax

STATus:COMMunication:ENABle <integer>

Example

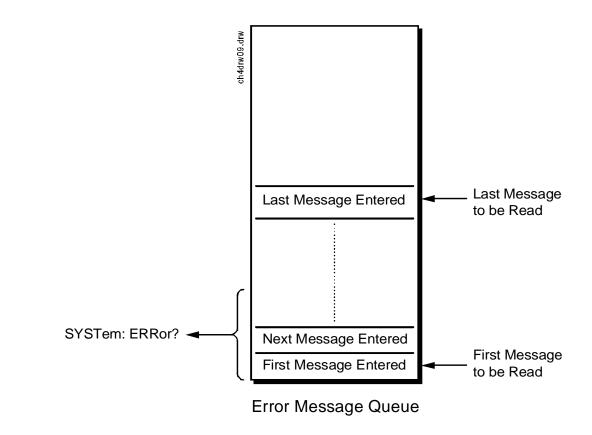

OUTPUT 714;"STAT:COMM:ENAB 256"

Clearing the Enable Register

Error Message Queue Group

The Error Message Queue Group is an implementation of the status queue model described in "**Status Queue Model**" on page 113. The Error Message Queue Group is a first-in, first-out (FIFO) queue that holds up to 20 messages. The Error Message Queue Group includes a FIFO queue but no Message Available (MAV) Summary Message.

Figure 19 shows the structure of the Error Message Queue Group.

Accessing the Error Message Queue

A message appears in the Error Message Queue any time bit 2, 3, 4, or 5 of the Standard Event Status register is asserted. Each message consists of a signed error number, followed by a comma separator, followed by an error description string in double quotes. The maximum length of the error description string is 255 characters. If more than 20 messages are in the queue and another error occurs, the last message is replaced with the message, -350, "Queue overflow". If no messages are in the queue the message, +0, "No error" is returned. Reading a message removes it from the queue. The Error Message Queue is accessed using the SYSTem command. Returned information is read into a numeric variable followed by a string variable.

Reading the Error Message Queue

Syntax

SYSTem: ERRor?

Example

OUTPUT 714;"SYST:ERR?" ENTER 714;Error_num,Error_msg\$

Example IBASIC program

10 INTEGER Error_num 20 DIM Error_msg\$ [255] 30 OUTPUT 714;"SYST:ERR?" 40 ENTER 714;Error_num,Error_msg\$ 50 PRINT Error_num;Error_msg\$ 60 END Example response

-113 "Undefined header"

Hardware 1 Status Register Group

The Hardware 1 Status Register Group contains information about the Test Set's hardware, and the SMB for the Communicate Status Register Group.

The Status Byte Register summary message associated with the Hardware 1 Status Register Group is bit zero.

Figure 20 shows the structure and STATus commands for the Hardware 1 Status Register Group.

 Table 12 shows the Hardware 1 Status Register Group Condition Register bit assignments.

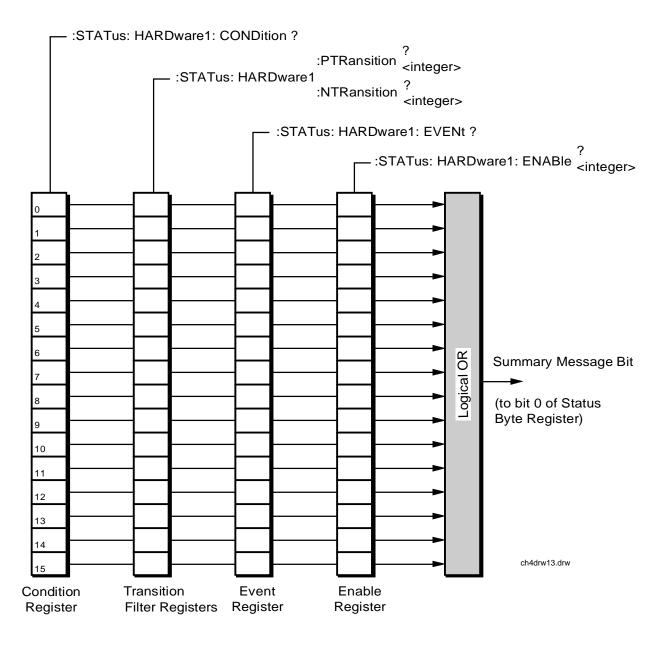

Figure 20 Hardware 1 Status Register Group

Accessing the Hardware Status Register #1 Group Registers

The following sections show the syntax and give programming examples, using the HP BASIC programming language, for the STATus commands used to access the Hardware Status Register #1 Group registers.

Reading the Condition Register

Syntax

STATus: HARDwarel: CONDition?

Example

OUTPUT 714;"STAT:HARD1:COND?" ENTER 714;Register_value

Reading the Transition Filters

Syntax

STATus:HARDwarel:PTRansition? STATus:HARDwarel:NTRansition?

Example

OUTPUT 714;"STAT:HARD1:PTR?" ENTER 714;Register_value

Writing the Transition Filters

Syntax

STATus:HARDwarel:PTRansition <integer> STATus:HARDwarel:NTRansition <integer>

Example

OUTPUT 714;"STAT:HARD1:PTR 256"

Reading the Event Register

Syntax

STATus:HARDwarel:EVENt?

Example

OUTPUT 714;"STAT:HARD1:EVEN?" ENTER 714;Register_value

Clearing the Event Register

The EVENT register is cleared whenever it is queried or whenever the Common Command *CLS is sent to the Test Set.

Reading the Enable Register

Syntax

STATus:HARDwarel:ENABle?

Example

OUTPUT 714;"STAT:HARD1:ENAB?" ENTER 714;Register_value

Writing the Enable Register

Syntax

STATus:HARDwarel:ENABle <integer>

Example

OUTPUT 714; "STAT: HARD1: ENAB 256"

Clearing the Enable Register

Hardware 2 Status Register Group

The Hardware Status Register #2 Group contains information about the Test Set's hardware.

The Status Byte Register summary message associated with the Hardware 2 Status Register Group is bit one.

Figure 21 shows the structure and STATus commands for the Hardware 2 Status Register Group.

 Table 13 shows the Hardware 2 Status Register Group Condition Register bit assignments.

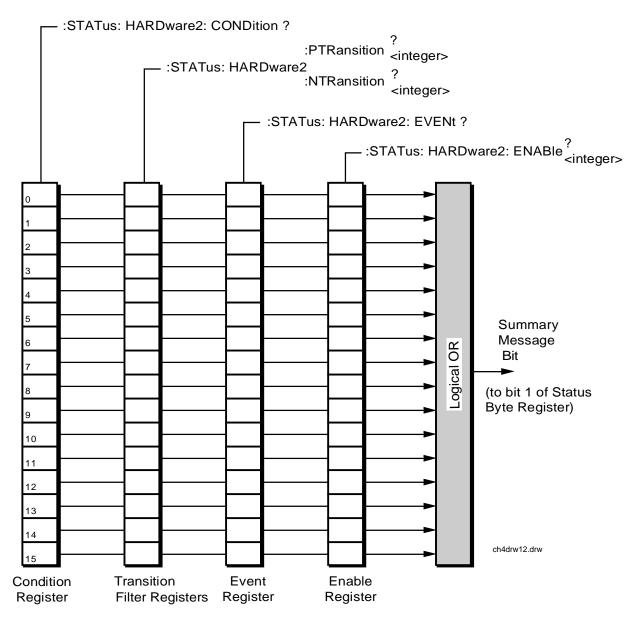

Figure 21 Hardware 2 Status Register Group

Accessing the Operation Status Register Group Registers

The following sections show the syntax and give programming examples, using the HP BASIC programming language, for the STATus commands used to access the Operation Status Register Group registers.

Reading the Condition Register

Syntax

STATus: OPERation: CONDition?

Example

OUTPUT 714;"STAT:OPER:COND?" ENTER 714;Register_value

Reading the Transition Filters

Syntax

STATus:OPERation:PTRansition? STATus:OPERation:NTRansition?

Example

OUTPUT 714;"STAT:OPER:PTR?" ENTER 714;Register_value

Writing the Transition Filters

Syntax

STATUS:OPERation:PTRansition <integer> STATUS:OPERation:NTRansition <integer>

Example

OUTPUT 714; "STAT: OPER: PTR 256"

Chapter 4, Status Reporting

Status Reporting

Reading the Event Register

Syntax

STATus: OPERation: EVENt?

Example

OUTPUT 714;"STAT:OPER:EVEN?" ENTER 714;Register_value

Clearing the Event Register

The EVENT register is cleared whenever it is queried or whenever the Common Command *CLS is sent to the Test Set.

Reading the Enable Register

Syntax

STATus:OPERation:ENABle?

Example

OUTPUT 714;"STAT:OPER:ENAB?" ENTER 714;Register_value

Writing the Enable Register

Syntax

STATus:OPERation:ENABle <integer>

Example

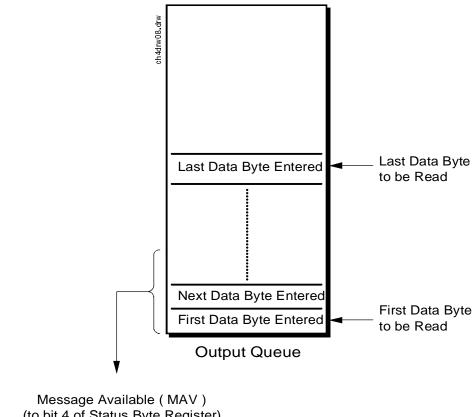

OUTPUT 714; "STAT: OPER: ENAB 256"

Clearing the Enable Register

Output Queue Group

The Output Queue Group is a specific implementation of the status queue model described in "Status Queue Model" on page 113. When a command is sent to the Test Set that causes the Test Set to generate data, this data is buffered in the Output Queue until it is read by the controller or the Output Queue Group is cleared. The Output Queue Group includes a FIFO queue and a Message Available (MAV) Summary Message.

Figure 24 shows the structure of the Output Queue Group.

(to bit 4 of Status Byte Register)

Queue Empty = "Ø" Queue Not - Empty = "1"

Figure 24 Output Queue Group

Accessing the Output Queue

The availability of data from the Test Set is summarized in the MAV bit of the Status Byte Register. The MAV message is TRUE, logic 1, when there is data in the Output Queue and FALSE, logic 0, when it is empty. The Output Queue is read by sending a command, such as the HP Basic command ENTER, and waiting (if necessary) for data to become available. After data is read, subsequent bus messages will be processed.

Reading the Output Queue

Example

Enter 714;Output_data

Questionable Data/Signal Register Group

The Questionable Data/Signal Register Group contains information about the quality of the Test Set's output and measurement data, and the SMB from the Calibration Status Register Group.

The Status Byte Register summary message associated with the Questionable Data/Signal Register Group is bit three.

Figure 25 shows the structure and STATus commands for the Questionable Data/ Signal Register Group.

 Table 16 shows the Questionable Data/Signal Register Group Condition Register bit assignments.

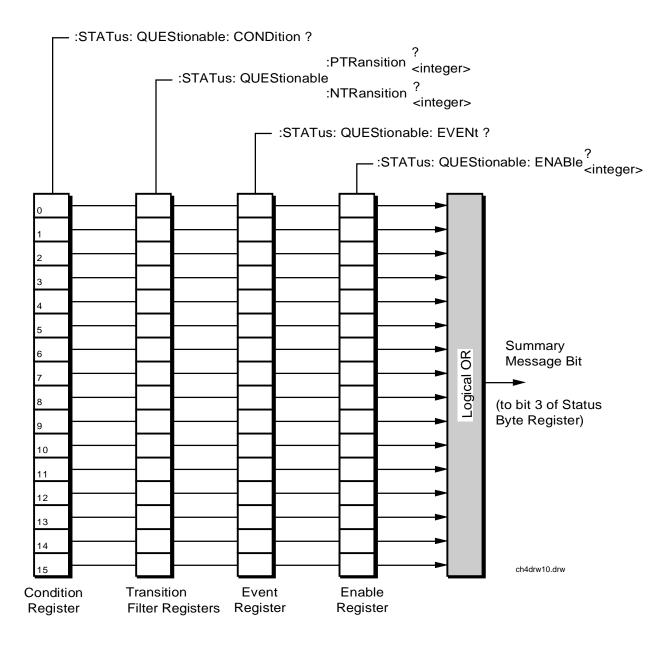

Figure 25 Questionable Data/Signal Register Group

Status Reporting

Bit Number	Is Condition Register Implemented?	Condition/Event	Comment

Status Reporting

Reading the Event Register

Syntax

STATUS:SER2:EVENt?

Example

OUTPUT 714;"STAT:OPER:EVEN?" ENTER 714;Register_value

Clearing the Event Register

The EVENT register is cleared whenever it is queried or whenever the Common Command *CLS is sent to the Test Set.

Reading the Enable Register

Syntax

STATus:SER2:ENABle?

Example

OUTPUT 714;"STAT:OPER:ENAB?" ENTER 714;Register_value

Writing the Enable Register

Syntax

STATus:SER2:ENABle <integer>

Example

OUTPUT 714;"STAT:OPER:ENAB 256"

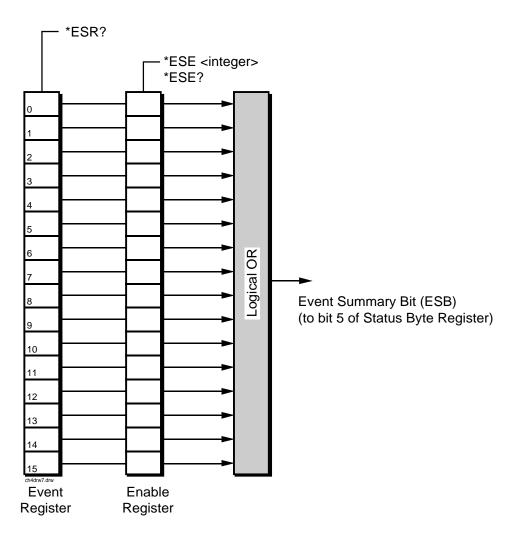

Clearing the Enable Register

The ENABLE register is cleared by writing to it with an integer value of zero.

Standard Event Status Register Group

The Standard Event Status Register Group is a specific implementation of the status register model described in the Status Register Structure Overview section. The conditions monitored by the Standard Event Status Register Group are defined by the IEEE 488.2-1987 Standard.

Figure 28 shows the structure and IEEE 488.2 Common Commands used to access the Standard Event Status Register Group.

Standard Event Status Register Group

Status Reporting

Bit Number	Event	Comment
15	Reserved by IEEE 488.2 (Always 0)	
14	Reserved by IEEE 488.2 (Always 0)	
13	Reserved by IEEE 488.2 (Always 0)	
12	Reserved by IEEE 488.2 (Always 0)	
11	Reserved by IEEE 488.2 (Always 0)	
10	Reserved by IEEE 488.2 (Always 0)	
9	Reserved by IEEE 488.2 (Always 0)	
8	Reserved by IEEE 488.2 (Always 0)	
7	Power On	1 = Test Set's power supply has been turned off and then on since the last time this register was read.
6	User Request	Not implemented in Test Set.
5	Command Error	1 = The Test Set detected an error while trying to process a com- mand. The following events cause a command error:
		 a An IEEE 488.2 syntax error. This means that the Test Set received a message that did not follow the syntax defined by the Standard. b A semantic error. For example, the Test Set received an incorrectly spelled command. c The Test Set received a Group Execute Trigger (GET) inside a program message.
4	Execution Error	1 = The Test Set detected an error while trying to execute a com- mand. The following events cause an execution error:
		 a A <program data=""> element received in a command is outside the legal range for the Test Set or is inconsistent with the operation of the Test Set.</program> b The Test Set could not execute a valid command due to some Test Set hardware/firmware condition.
3	Device Dependent Error	1 = A Test Set dependent error has occurred. This means that some Test Set operation did not execute properly due to some internal condition, such as over range. This bit indicates that the error was not a command, query or execution error.

 Table 19
 Standard Event Status Register Group Bit Assignments

Bit Number	Event	Comment
2	Query Error	1 = An error has occurred while trying to read the Test Set's Output Queue. The following events cause a query error:
		 a An attempt is being made to read data from the Output Queue when no data is present or pending. b Data in the Output Queue has been lost. An example of this would be Output Queue overflow.
1	Request Control	1 = The Test Set is requesting permission to become the active controller on the HP-IB bus.
0	Operation Complete	1 = The Test Set has completed all selected pending operations and is ready to accept new commands. This bit is only generated in response to the *OPC IEEE 488.2 Common Command.

Table 19 Standard Event Status Register Group Bit Assignments (Continued)

Accessing the Standard Event Status Register Group Registers

The following sections show the syntax and give programming examples, using the HP BASIC programming language, for the Common Commands used to access the Standard Event Status Register Group registers.

Reading the Event Register

Syntax

*ESR?

Example

OUTPUT 714;"*ESR?" ENTER 714;Register_value

Clearing the Event Register

The EVENT register is cleared whenever it is queried or whenever the *CLS Common Command is sent to the Test Set.

Reading the Enable Register

Syntax

*ESE?

Example

OUTPUT 714;"*ESE?" ENTER 714;Register_value

10 INTEGER Std_evn_enab_rg
20 OUTPUT 714;"ESE?"
30 ENTER 714;Std_evn_enab_rg
40 PRINT Std_evn_enab_rg
50 END

Writing the Enable Register

Syntax

*ESE <integer>

Example

OUTPUT 714;"*ESE 255"

Clearing the Enable Register

The ENABLE register is cleared by writing to it with an integer value of zero.

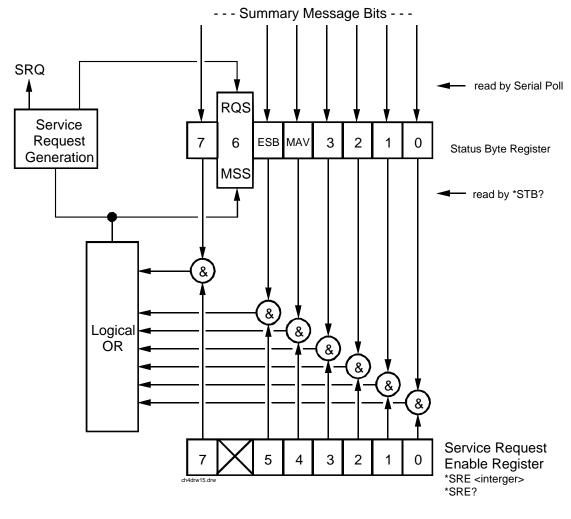

Status Byte/Service Request Enable Register

The Status Byte Register is an 8-bit register that summarizes the Summary Message Bits from the status register groups and the Output Queue. The Status Byte Register can be used to send a Service Request (SRQ) to the controller.

Service request enabling allows the application programmer to select which Summary Messages in the Status Byte Register may cause a service request.

The Service Request Enable Register, illustrated in **figure 29**, is an 8-bit register that enables corresponding Summary Messages in the Status Byte Register.

 Table 20 details the Status Byte Register bit assignments.

Status Byte/Service Request Enable Register

Status Reporting

Table 20	Status Byte Register Bit Assignments					
Bit Number	Defined by	Defined by Data Structures Summarized through this Status Byte Bit Comments				
7	SCPI	*Operation Status Register Group *CDMA Status Register Group *Measuring Status Register Group	TRUE = One or more enabled event bits in the associated status registers is TRUE.			
6	IEEE 488.2	None	Request Service (RQS) when read by serial poll OR Master Summary Status message when read by *STB? command. This bit cannot be masked			
5	IEEE 488.2	*Standard Event Status Register Group	TRUE = One or more enabled event bits in the associated status registers is TRUE.			
4	IEEE 488.2	*Output Queue Group Message Available (MAV) Summary Mes- sage	TRUE = One or more enabled event bits in the associated status registers is TRUE.			
3	SCPI	*Questionable Data/Signal Regis- ter Group *Calibration Status Register group	TRUE = One or more enabled event bits in the associated status registers is TRUE.			
2		Unused in Test Set				
1	Test Set	*Hardware #2 Status Register Group Summary Message	TRUE = One or more enabled event bits in the associated status registers is TRUE.			
0	Test Set	*Hardware #1 Status Register *Communication Status Register Group *Serial 1 Status Register Group *Serial 2 Status Register Group	TRUE = One or more enabled event bits in the associated status registers is TRUE.			

Table 20 Status Byte Register Bit Assignments

Reading the Status Byte Register

Reading with a Serial Poll. The contents of the Status Byte Register can be read by a serial poll from the Active Controller in response to some device on the bus sending the Service Request (SRQ) message. When read with a serial poll, bit 6 in the Status Byte Register represents the Request Service (RQS) condition. Bit 6 is TRUE, logic 1, if the Test Set is sending the Service Request (SRQ) message and FALSE, logic 0, if it is not. Bits 0-5 and bit 7 are defined as shown in **table 20 on page 202**. When read by a serial poll the RQS bit is cleared (set to 0) so that the RQS message will be FALSE if the Test Set is polled again before a new reason for requesting service has occurred. Bits 0-5 and bit 7 are unaffected by a serial poll.

When read with the Serial Poll (SPOLL) command, bit 6 represents the RQS condition.

Reading with the *STB? Common Command. The contents of the Status Byte Register can be read by the application program using the *STB? Common Command. When read with the *STB? Common Command, bit 6 represents the Master Summary Status (MSS) message. The MSS message is the inclusive OR of the bitwise combination (excluding bit 6) of the Status Byte Register and the Service Request Enable Register. For a discussion of Summary Messages, see "**Status Register Structure Overview**" on page 108. Bit 6 is TRUE, logic 1, if the Test Set has at least one reason for requesting service and FALSE, logic 0, if it does not. Bits 0-5 and bit 7 are defined as shown in table 20 on page 202. When read by the *STB? Common Command, bits 0-5, bit 6, and bit 7 are unaffected

The *STB? Status Byte Query allows the programmer to determine the current contents (bit pattern) of the Status Byte Register and the Master Summary Status (MSS) message as a single element. The Test Set responds to the *STB? query by placing the binary-weighted decimal value of the Status Byte Register and the MSS message into the Output Queue. The response represents the sum of the binary-weighted values of the Status Byte Register's bits 0-5 and 7 (weights 1,2,4,8,16,32 and 128 respectively) and the MSS summary message (weight 64). Thus, the response to *STB?, when considered as a binary value, is identical to the response to a serial poll except that the MSS message of 1 indicates that the Test Set has at least one reason for requesting service (Refer to the IEEE 488.2-1987 Standard for a complete description of the MSS message). The decimal value of the bit pattern will be a positive integer in the range of 0 to 255. The response data is obtained by reading the Output Queue into a numeric variable, integer or real.

When read with the *STB? Common Command, bit 6 represents the Master Summary Status (MSS) message.

An example of reading the Status Byte register using *STB? is shown below.

Example BASIC program

```
10 INTEGER Stat_byte_reg,Stat_byte,Mstr_sum_msg
20 OUTPUT 714;"*STB?"
30 ENTER 714;Stat_byte_reg
40 Stat_byte=BINAND(Stat_byte_reg,191)
50 PRINT Stat_byte
60 Mstr_sum_msg=BINAND(Stat_byte_reg,64)
70 PRINT Mstr_sum_msg
80 END
```

Example response

32 0

Writing the Status Byte Register

The Status Byte Register is a read only register and is altered only when the state of the Summary Messages from the overlaying data structures are altered.

Clearing the Status Byte Register

The *CLS Common Command clears all Event Registers and Queues so that their corresponding Summary Messages are cleared. The Output Queue and its MAV Summary Message are an exception and are unaffected by the *CLS Common Command.

Reading the Service Request Enable Register

The Service Request Enable Register is read with the *SRE? Common Command. The *SRE? query allows the programmer to determine the current contents (bit pattern) of the Service Request Enable Register. The Test Set responds to the *SRE? query by placing the binary-weighted decimal value of the Service Request Enable Register bit pattern into the Output Queue. The decimal value of the bit pattern will be a positive integer in the range 0 to 255. The response data is obtained by reading the Output Queue into a numeric variable, integer or real.

Example BASIC program

```
10 INTEGER Srv_rqs_enab_rg
20 OUTPUT 714;"*SRE?"
30 ENTER 714;Srv_rqs_enab_rg
40 PRINT Srv_rqs_enab_rg
50 END
```

Example response

18

Writing the Service Request Enable Register

The Service Request Enable Register is written with the *SRE Common Command. The *SRE command sets the bit pattern (bits 0-5 and 7) of the Service Request Enable Register. The Service Request Enable Register allows the programmer to select which condition(s), as defined by bits 0-5 and 7 of the Status Byte Register, will generate a Service Request on the HP-IB bus. The Test Set always ignores bit 6 (binary weight 64) of the bit pattern set by the *SRE command.

The bit pattern set by the *SRE command is determined by selecting the desired condition(s) from the Status Byte Register, setting the value of the bit position(s) to a logical one, setting the value of all non-selected bit positions to a logical zero, and sending the binary-weighted decimal equivalent of bits 0-5 and 7 after the *SRE command. For example, if the programmer wished to have the occurrence of a message available in the Output Queue (bit position 4 in the Status Byte Register) and the occurrence of a condition in the Hardware# 2 Status Register (bit position 1 in the Status Byte Register) to generate a Service Request on the HP-IB bus, the binary-weighted decimal value of the bit pattern for the Service Request Enable Register would be determined as shown in table 21.

Status Reporting

Table 21	Determining the Service Request Enable Register Bit Pattern								
Bit Position	7	6	5	4	3	2	1	0	
Logical Value	0	Х	0	1	0	0	1	0	X = ignored by the Test Set
Binary Weighting	128	Х	32	16	8	4	2	1	X = ignored by the Test Set
Decimal Value	0+	0+	0+	16+	0+	0+	2+	0	= 18
		mple	14;"*S	RE 18"					

NOTE:The decimal value of the bit pattern must be a positive integer in the range of 0 to
255. Sending a negative number or a number greater than 255 causes an
HP-IB Error: -222 Data out of range.

Clearing the Service Request Enable Register

The Service Request Enable Register is cleared by sending the *SRE Common Command with a decimal value of zero. Clearing the Service Request Enable Register turns off service requests.

5 Memory Cards/Mass Storage

This chapter contains information about using the mass storage devices available in the Test Set for storing and retrieving program and data files.

Default File System

Default File System

The Test Set's default file system is the Microsoft®¹ Disk Operating System (MS-DOS®). The DOS file system is used on IBM-compatible personal computers. (See "**DOS File Naming Conventions**" on page 220 for further information on the DOS file system.) This implies that the Test Set expects a DOS formatted media for operations as shown in table 22 on page 209. If a LIF formatted media is used for the activities outlined in table 22 (with the exception of IBASIC mass storage operations), erroneous operation will result.

The IBASIC file system supports both LIF (Hewlett-Packard's Logical Interchange Format) and DOS. The media format (DOS or LIF) is determined automatically by the IBASIC file system when the mass storage device is first accessed, and the appropriate format is used from then on for IBASIC mass storage operations. File system operation defaults to DOS upon exiting from IBASIC.

NOTE: The IBASIC INITIALIZE command defaults to LIF format. Any media (RAM Disk, SRAM Cards, External Hard Disk Drive, or 3.5-inch floppy) formatted using the default conditions of the INITIALIZE command will be the LIF format and will be unusable except for IBASIC mass storage operations. Refer to "Initializing Media for DOS or LIF File System" on page 223 for information on formatting media for the DOS file system.

The IBASIC WILDCARDS command defaults to WILDCARDS OFF. To use DOS wildcards while in IBASIC execute the WILDCARDS DOS command upon entering the IBASIC environment.

1. Microsoft® and MS-DOS ® are U.S. registered trademarks of Microsoft Corp.

Activity	Default File System

Table 22Test Set Default File System

Mass Storage Device Overview

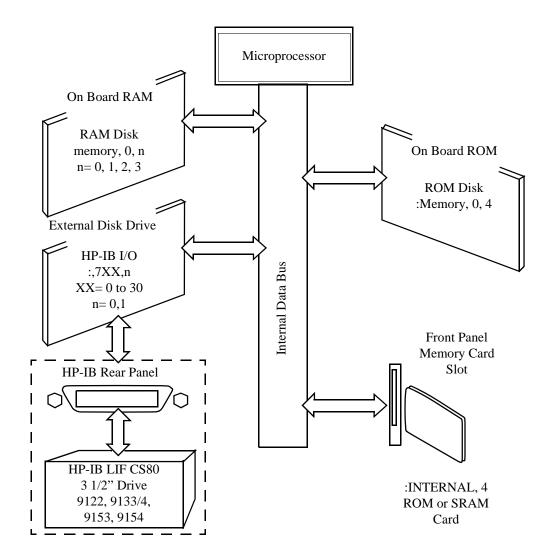

Mass Storage Device Overview

As shown in **figure 30 on page 211**, the Test Set has both internal and external mass storage devices. There are five types of mass storage devices in the Test Set:

- On-board random-access memory disk (RAM disk) located on the Test Set's internal memory board
- On-board read-only memory disk (ROM disk) located on the Test Set's internal memory board
- External disk drives connected to the Test Set's external HP-IB
- Internal static random access memory (SRAM) cards which are inserted into the Test Set's front-panel Memory Card slot

NOTE: The hardware for reading-from and writing-to memory cards is located internal to the Test Set. Therefore, the static random access memory (SRAM) cards and the read only memory (ROM) cards are considered internal to the Test Set even thought the physical media must be inserted into the Test Set's front-panel Memory Card slot.

Programs and data can be retrieved from any of these mass storage devices. Programs and data can only be stored to RAM disk, external disk, or SRAM card mass storage devices. The IBASIC file system supports both the LIF file system and the MS-DOS file system.

Internal and External Mass Storage Devices

Mass Storage Device Overview

Mass Storage Device Types

The following paragraphs provide an overview of the five types of mass storage devices.

Table 23RAM Disk Mass Storage	Overview
-------------------------------	----------

Mass Storage Name	Mass Storage Type	Physical Location	Mass Storage Volume Specifier	Media Type	Supported File System(s)
RAM Disk	Non-volatile random access memory	Test Set's internal memory board	":MEMORY,0,unit number" unit number = 0, 1, 2, or 3 default = 0	N/A	LIF, DOS

Typical Uses

- Temporary program and data storage
- Temporary Save/Recall register storage

- Easily overwritten or erased
- Not recommended for permanent program or data storage
- Unit 0 can be overwritten by the RAM_MANAGER utility program (ROM Disk)
- Unit 1 can be overwritten by the COPY_PL utility program (ROM Disk)
- Units 2 and 3 are not overwritten by any ROM Disk utility program

Mass Storage Device Overview

Mass Storage Name	Mass Storage Type	Physical Location	Mass Storage Volume Specifier	Media Type	Supported File System(s)
ROM Disk	Read-only memory	Test Set internal mem- ory board	":MEMORY,0,4"	N/A	DOS

Table 24ROM Disk Mass Storage Overview

Typical Uses

- Permanent storage of factory supplied utility programs
- Permanent storage of factory supplied diagnostic programs

- Non-erasable
- Not available for user program or data storage
- Not available for Save/Recall register storage

Chapter 5, Memory Cards/Mass Storage

Mass Storage Device Overview

Table 25External Disk Mass Storage Overview

Mass Storage Name	Mass Storage Type	Physical Location	Mass Storage Volume Specifier	Media Type	Supported File System(s)
External Disk	HP-IB Hard disk drive HP-IB Floppy disk drive	Connected to Test Set's external HP-IB	":,7xx,n" xx = device address (0- 30) n = unit number (range device dependent)	Hard disk = NA Floppy disk 3.5-in DS Disk	LIF, DOS

Typical Uses

- Permanent program and data storage
- Permanent Save/Recall register storage

- High capacity (device dependent)
- Slowest access time of Test Set's mass storage devices

Mass Storage Name	Mass Storage Type	Physical Location	Mass Storage Volume Specifier	Media Type	Supported File System(s)
SRAM Memory Card	Static Random- Access Memory Card	Plugs into Memory Card slot on front panel of Test Set	":INTER- NAL,4"	PCMCIA Type 1 or Type 2 SRAM Memory Card	LIF, DOS

Table 26SRAM Card Mass Storage Overview

Typical Uses

- Semi-permanent program and data storage
- Semi-permanent Save/Recall register storage

- Low capacity
- Contents retained by on-card lithium battery
- Contents lost if on-card battery removed while card not in Test Set Memory Card slot
- · Recommended as primary mass storage device for program and data storage

Chapter 5, Memory Cards/Mass Storage

Mass Storage Device Overview

Table 27ROM Card Mass Storage Overview

Mass Storage Name	Mass Storage Type	Physical Location	Mass Storage Volume Specifier	Media Type	Supported File System(s)
ROM or OTP Memory Card	Read-only Memory Card	Plugs into Memory Card slot on front panel of Test Set	":INTERNAL,4"	PCMCIA Type 1 or Type 2 EPROM Memory Card	DOS

Typical Uses

- Permanent storage of factory supplied application programs
- Permanent storage of factory supplied utility programs
- Permanent storage of factory supplied diagnostic programs

- Non-erasable
- Not available for user program or data storage
- Not available for Save/Recall register storage

Default Mass Storage Locations

Built-in IBASIC Controller

The default mass storage location for the built-in IBASIC Controller is the frontpanel memory card slot (mass storage volume specifier ":INTERNAL,4") after any of the following conditions:

- power-up
- initializing RAM with the SERVICE screen's RAM Initialize function

The mass storage location for the built-in IBASIC Controller can be changed using the MASS STORAGE IS command. Refer to the *HP Instrument BASIC Users Handbook* for further information on the MASS STORAGE IS command.

Save/Recall Registers

The default mass storage location for the Save/Recall registers is the Test Set's internal RAM (no mass storage volume specifier) after any of the following conditions:

- Power-up
- Initializing RAM with the SERVICE screen's RAM Initialize function
- Resetting the Test Set using the front-panel PRESET key
- Resetting the Test Set using the *RST HP-IB Common Command

The mass storage location for Save/Recall registers can be changed using the **Save/Recall** field in the I/O CONFIGURE screen. The default mass storage volume specifiers for the Save/Recall register mass storage locations are as follows:

- Internal selection (no mass storage volume specifier, registers are saved to allocated RAM space)
- Card selection (not changeable) ":INTERNAL,4"
- RAM selection (not changeable) ":MEMORY,0,0"
- Disk selection the **External Disk Specification** field in the TESTS (External Devices) screen.

Default Mass Storage Locations

External Disk Drive

The default mass storage volume specifier for the external disk drive is set using the **External Disk Specification** field in the TESTS (External Devices) screen.

TESTS Subsystem

The default mass storage location for the TESTS Subsystem is set using the **Select Procedure Location:** field on the TESTS (Main Menu) screen. The default mass storage volume specifiers for the TESTS Subsystem mass storage locations are as follows:

- Card selection (not changeable) ":INTERNAL,4"
- ROM selection (not changeable) ":MEMORY,0,4"
- RAM selection (not changeable) ":MEMORY,0,0"
- Disk selection the **External Disk Specification** field in the TESTS (External Devices) screen.

Selecting the Mass Storage Location

The IBASIC mass storage location is selected using the IBASIC Mass Storage Is command. The mass storage volume specifier for the desired mass storage location is appended to the Mass Storage Is command. Refer to the *HP Instrument BASIC User's Handbook* for further information regarding the Mass Storage Is command.

For example, to change the default mass storage location to RAM Disk unit 2, execute the following command:

Mass Storage Is ":MEMORY,0,2"

The Mass Storage Is command is keyboard and program executable; however, any changes made are lost when the Test Set is turned off or when the SERVICE screen's **RAM Initialize** function is executed.

Mass Storage Access

Program and data files stored on the Test Set's various mass storage locations can be selectively accessed from the following screens:

• The TESTS (IBASIC Controller) screen.

Any type of file can be accessed from this screen, either through an IBASIC program or the IBASIC command line.

• The TESTS (Main Menu) screen using the Select Procedure Location: and Select Procedure Filename: fields.

Only *procedure* files shipped with HP 83217 software or procedure files created using the TESTS (Save/Delete Procedure) screen of the TESTS Subsystem can be accessed using these fields. When created, procedure file names are prefixed with a lower case *.PRC* file extension (FM_TEST.PRC).

A corresponding *code* file - prefixed with *.PGM* (FM_TEST.PGM must reside on the same media for the procedure to work. Refer to the TESTS Screen chapter in the *HP 8924C Reference Guide* for further information.

• The TESTS (Save/Delete Procedure) screen using the Select Procedure Location: and Enter Procedure Filename: fields.

This screen is used to create "procedure" files. When created, procedure file names are prefixed with a *.PRC* file extension (FM_TEST.PRC).

• The Signaling Decoder screen in NMT mode.

Only user-written NMT tests can be accessed from this screen. NMT test files must be saved with a *.NMT* file extension (NMT_1.NMT).

Save/Recall register files, stored on the Test Set's various mass storage locations, can be accessed using the front-panel SAVE and RECALL keys.

DOS and LIF File System Considerations

DOS and LIF File System Considerations

Program and data files can be stored and retrieved from IBASIC using either the DOS or LIF file system. The media format (DOS or LIF) is determined automatically by the IBASIC file system when the mass storage device is first accessed, and the appropriate format is used from then on. DOS and LIF use different file naming conventions. In addition, the Test Set uses certain file naming conventions which are unique to the Test Set. Unexpected file operation can occur if proper consideration is not given to the file naming conventions.

File Naming Conventions

LIF File Naming Conventions

The LIF file system is used by Hewlett-Packard BASIC on the HP 9000 Series 200/300 Workstations. It is a flat file system, which means that it has no subdirectories. The LIF file system allows up to 10-character file names which are case sensitive. The LIF file system preserves the use of uppercase and lowercase characters for file storage and retrieval. For example, the file names File1, FILE1, file1 and FiLe1 could represent different files. LIF files cannot start with a space, and any file name longer than 10 characters is considered an error.

NOTE: The Test Set's file system does not support the HFS (hierarchical file system) used with HP BASIC. Therefore, no directory path information can be used during mass storage operations with LIF files.

DOS File Naming Conventions

The DOS file system is used on IBM compatible personal computers. The DOS file system is hierarchical, which means it supports subdirectories. The DOS file system allows up to 8-character file names with an optional extension of up to 3 characters. The file name is separated from the extension (if it exists) with a period (.). DOS file names are case independent. The characters are stored as upper case ASCII in the DOS directory but the files may be referenced without regard to case. The DOS file system always converts any lowercase characters to uppercase when files are stored. For example, the file names File1, FILE 1, file1 and FiLe1 all represent the single DOS file FILE1.

The period (.) may appear in the name but only to separate the file name from the extension. The period is not considered part of the file name itself. If the name portion of a DOS file name is longer than 8 characters, it is truncated to 8 characters and no error is generated. Similarly, if the extension is longer than 3 characters, it is truncated to 3 characters and no error is given.

Test Set File Naming Conventions

The TESTS Subsystem uses the following file naming conventions:

- The *.PGM* extension is used to indicate a code file and is automatically appended onto the file name when the program code file is stored for use by the TESTS Subsystem.
- The *.PRC* extension is used to indicate a procedure file and is appended onto the file name when the file is stored by the TESTS Subsystem
- The *.LIB* extension is used to indicate a library file and is appended onto the file name when the file is created for use with the TESTS Subsystem

The Save/Recall register subsystem uses the following file naming convention:

• The .*SAV* extension is used to indicate a stored Save/Recall register file and is appended onto the file name when the file is created

The Signaling Decoder in NMT mode uses the following file naming convention:

• The *.NMT* extension is used to indicate a stored NMT file and is appended onto the file name when the file is created

Test Set File Entry Field Width

The TESTS Subsystem and the Save/Recall register subsystem have fields into which the operator enters a file name. These fields are used by the operator to enter the name of a file to be stored or loaded. The width of these fields is 8 characters and was chosen to support the DOS file naming convention of 8 characters. Consequently these fields will *not* hold a 10-character file name which is allowed in the LIF file system.

DOS and LIF File System Considerations

Potential File Name Conflicts

Unexpected file operation can occur if proper consideration is not given to the different file system naming conventions and the file entry field width.

- A full DOS file name is 12 characters (8-character file name + . + 3 character extension).
 A full DOS file name will not fit in the Test Set's file entry field.
- On a DOS formatted disk, any file with the .*PGM* extension is considered a TESTS Subsystem code file. If the TESTS Subsystem attempts to retrieve a file which is not a code file, the following error will be generated: **Error reading code file**. **Check file and media**.
- On a DOS formatted disk, any file with the *.PRC* extension is considered a TESTS Subsystem procedure file. If the TESTS Subsystem attempts to retrieve a file which is not a procedure file, the following error will be generated: **Error reading procedure file. Check file and media.**
- On a DOS formatted disk, any file with the *.LIB* extension is considered a TESTS Subsystem library file. If the TESTS Subsystem attempts to retrieve a file which is not a library file, the following error will be generated: **Error reading library file. Check file and media.**
- When copying LIF named files to a DOS formatted media, the file name is silently truncated to 8 characters since DOS only allows 8-character file names. This could result in ERROR 54 Duplicate File Name.
- When storing or deleting files to a DOS formatted media, the file name is silently truncated to 8 characters since DOS only allows 8-character file names. This could result in ERROR 54 Duplicate File Name.

File Naming Recommendations

If switching between media types (DOS and LIF) or operating exclusively in DOS the following naming conventions are recommended.

- Ensure that only TESTS Subsystem procedure files use the .PRC file extension.
- Ensure that only TESTS Subsystem library files use the .LIB file extension.
- Ensure that only TESTS Subsystem code files use the .PGM file extension.
- Ensure that only user-written NMT test files use the .NMT file extension.
- Ensure that only Save/Recall register files use the .SAV file extension.

Initializing Media for DOS or LIF File System

The INITIALIZE command is used to initialize a media (external hard disk, external 3.5-inch floppy disk, Epson SRAM Card, PCMCIA SRAM Card and RAM Disk) for use with the DOS or LIF file system. The DOS or LIF file system is specified with the parameter. LIF is the default.

For example, to initialize a PCMCIA SRAM card for the DOS file system, perform the following steps:

- 1. Put the PCMCIA SRAM card into the Test Set's front-panel Memory Card slot.
- 2. Display the TESTS (IBASIC Controller) screen.
- **3.** Using the rotary knob or an external terminal, execute the following command from the IBASIC Controller command line:

INITIALIZE "DOS: INTERNAL, 4"

Refer to the *HP Instrument BASIC User's Handbook* for further information regarding the INITIALIZE command.

Test Set File Types

The Test Set file system supports the following file types:

- ASCII files containing ASCII characters
- BDAT files containing binary data
- DIR DOS subdirectory
- DOS SAVEd code file
- IBPRG STOREd code file

DOS and LIF File System Considerations

Storing Code Files

Two IBASIC commands are available for storing program code to a mass storage location: SAVE and STORE. The type of file created by the Test Set's file system when the program code is stored, is dependent upon the format of the media being used. The type of file created verses the media format is outlined in **table 28**. The IBASIC 2.0 file system can distinguish between DOS files that have been "saved" and those that were "stored."

Table 28	Sable 28Sorted Program Code Figure 1	
	DOS Formatted Media	LIF Formatted Media
SAVE	DOS	ASCII
STORE	IBPRG	IBPRG

Files that have been stored using the SAVE command must be retrieved using the GET command:

```
SAVE "FM_TEST:,704,1"
GET "FM_TEST:,704,1"
```

Files that have been stored using the STORE command must be retrieved using the LOAD command:

STORE "FM_TEST:,704,1"
LOAD "FM_TESTS:,704,1"

Using the ROM Disk

The Test Set comes with several Test Procedures stored on the internal ROM disk. These Test procedures provide instrument diagnostic utilities, periodic calibration utilities, memory management utilities, a variety of general purpose utilities, and several IBASIC demonstration programs.

To see a brief description of what each procedure does perform the following steps:

- 1. Display the TESTS (Main Menu) screen by selecting the front-panel TESTS key.
- 2. Using the rotary knob, select the **Select Procedure Location:** field and choose ROM from the choices.
- 3. Using the rotary knob, select the **Select Procedure Filename** field. A list of Test Procedures stored on the ROM disk is displayed in the **Choices:** field. Using the rotary knob, select the Test Procedure of interest.
- 4. A brief description of the Test Procedure will be displayed in the Description field.

ROM DISK cannot be written to for user storage.

The ROM Disk's mass storage volume specifier is ":MEMORY,0,4"

For example, to catalogue the contents of the ROM Disk from the TESTS (IBASIC Controller) screen enter:

CAT ":MEMORY,0,4"

Using Memory Cards

OTP (One Time Programmable) cards provide removable read-only storage. File editing and erasure are not possible. These cards cannot be programmed by the Test Set; they require a special memory card programmer to save files.

SRAM cards provide removable read/write memory for your files, similar to a flexible disk. Data can be stored, re-stored, read, or erased as needed.

SRAM memory cards require a battery to maintain stored information.

Table 29

Memory Card Part Numbers

Memory	Туре	Part Number
64 kilobytes	SRAM	HP 83230A
1 Mbyte	SRAM	HP 83231A

Inserting and Removing Memory Cards

Figure 31 illustrates how to insert a memory card into the Test Set's front panel. To remove a memory card, simply pull it out.

Memory cards may be inserted and removed with the Test Set powered on or off.

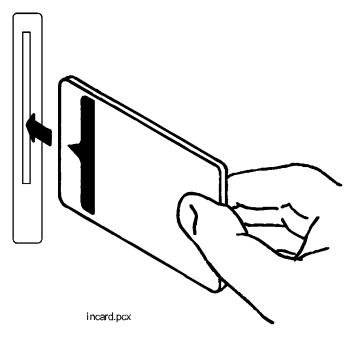

Figure 31 Inserting a Memory Card

The Memory Card Battery

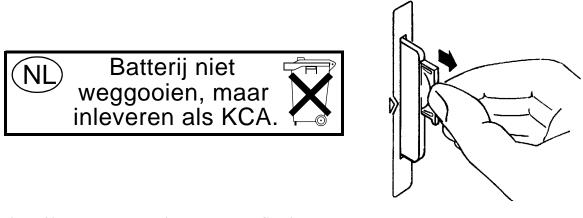

SRAM n	nemory cards use a lithium battery to power the card. SRAM cards
typically	retain data for over 1 year at 25° C. To retain data, the battery should be
replaced	annually. The part number for the SRAM Card Battery is CR2025 or
HP part i	number 1420-0509.

Replacing the Battery

- 1. Turn the Test Set on and insert the memory card. An inserted memory card takes power from the Test Set, preventing the card's contents from being lost.
 - 2. Hold the memory card in the slot with one hand and pull the battery holder out with your other hand. (See figure 32.)

NOTE: The HP SRAM cards have a Battery Holder Lock switch immediately above the Write-Protect switch. If the switch is in the locked position the battery cannot be removed. Ensure that the Battery Holder Lock switch is in the unlocked position before trying to remove the battery.

- **3.** Install the battery with the side marked "+" on the same side marked "+" on the battery holder. Avoid touching the flat sides of the battery, finger oils may contaminate battery contacts in the memory-card.
- 4. Re-insert the battery holder into the memory card.
- **NOTE:** The HP SRAM cards have a Battery Holder Lock switch immediately above the Write-Protect switch. Ensure that the Battery Holder Lock switch is in the locked position after installing the new battery.
 - **5.** Remove the memory card from the Test Set.

- Figure 32Replacing the Memory Card's Battery
- *WARNING:* Do not mutilate, puncture, or dispose of batteries in fire. The batteries can burst or explode, releasing hazardous chemicals. Discard unused batteries according to the manufacturer's instructions.

Setting the Write-Protect Switch

The SRAM memory card's write-protect switch lets the user secure its contents from being overwritten or erased. The switch has two positions (see **figure 33**):

- *Read-write* The memory-card contents can be changed or erased, and new files may written on the card.
- *Read-only* The memory-card contents can be read by the Test Set, but cannot be changed or erased.

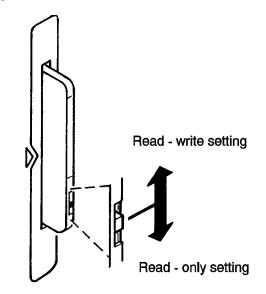

Figure 33

Setting the SRAM Write-Protect Switch

Memory Card Mass Storage Volume Specifier

The front-panel memory card slot's mass storage volume specifier is ":INTERNAL,4" and is the default mass storage device for the Test Set. For example, to catalogue the contents of a memory card from the TESTS (IBASIC Controller) screen, execute the following IBASIC command:

CAT ": INTERNAL, 4"

or, if the mass storage location has not been changed,

CAT

If the MSI (Mass Storage Is) command has been used to change the mass storage location to a different device, the ":INTERNAL,4" designation must be used to access the memory card slot. Any changes to the mass storage location made with the MSI (Mass Storage Is) command are lost when the Test Set is turned off.

Memory Card Initialization

All new SRAM cards must be initialized before they can be used to store information. The RAM_MNG procedure stored on the internal ROM Disk can be used to quickly initialize any SRAM memory card.

SRAM Memory Cards can also be initialized from the TESTS (IBASIC Controller) screen by inserting the memory card into the front-panel slot and executing the following IBASIC command:

INITIALIZE "<volume type>:INTERNAL,4"

where the <volume type> can be LIF or DOS. To verify that the memory card has been properly initialized, execute the IBASIC command:

CAT ": INTERNAL, 4"

If the error message **ERROR 85 Medium uninitialized** appears on the screen the memory card has not been properly initialized. Check the SRAM battery to ensure that it's charged and inserted correctly in the battery holder.

Backing Up Procedure and Library Files

Backing Up Procedure and Library Files

Making a backup copy of procedure and library files helps guard against file loss due to memory card (or battery) failure.

Using the COPY_PL ROM Program

The COPY_PL procedure on the internal ROM Disk will make backup copies of TESTS Subsystem's Procedure and Library files onto a second SRAM memory card, and can also initialize an uninitialized SRAM memory card. This program does not make backup copies of TESTS Subsystem's code files, or copy any type of file to OTP memory cards.

The COPY_PL procedure is designed for use with HP 83217 software to make backup copies of Hewlett-Packard supplied or user-generated Procedure and Library files.

To Run COPY_PL

- 1. Access the TESTS (Main Menu) screen.
- 2. Select the Select Procedure Location: field and choose ROM.
- 3. Select the Select Procedure Filename: field and select IB_UTIL.
- 4. Select the **Run Test** softkey to start the procedure.
- 5. Follow the displayed instructions.

Copying Files Using IBASIC Commands

Files can be copied from one mass storage device to another using the IBASIC COPY command. For example, to copy a file from a memory card to the left drive of an external dual-disk drive with a mass storage volume specifier of ":,702,0", execute the following IBASIC command from the TESTS (IBASIC Controller) command line:

COPY "FM_TEST: INTERNAL, 4" TO "FM_TEST:, 704,0"

"Stored" or "saved" files on one memory card can be copied to another memory card as follows:

- Insert the memory card containing the file to be copied.
- LOAD or GET¹ the desired file from the memory card into the Test Set.
- Remove the original memory card.
- Insert the destination memory card in the Test Set.
- STORE or SAVE¹ the file to the destination memory card.

1. See "**Storing Code Files**" on page 224 for information about the LOAD, GET, STORE, and SAVE commands.

command.

Copying Files Using IBASIC Commands

Copying an Entire Volume

	An entire volume can be copied from one mass storage device to the same type of mass storage device using the volume copy form of the COPY command. The destination volume must be as large as, or larger than, the source volume. The directory and any files on the destination volume are destroyed. The directory size on the destination volume becomes the same size as the source media. Disc-to- disc copy time is dependent on the mass storage device type. The volume copy form of the COPY command was designed to copy like-media to like-media and like-file-systems to like-file-systems. For example, to copy the entire contents of one internal RAM disk to another internal RAM disk, execute the following IBASIC command from the TESTS (IBASIC Controller) command line:
	COPY ":MEMORY,0,0" TO ":MEMORY,0,1"
NOTE:	Using the volume copy form of the COPY command can produce unexpected results. For example, using the volume copy form to copy the contents of a 64-KB SRAM card to an external HP-IB 630-KB floppy disk will result in the external floppy disk having a capacity of only 64 KB when the volume copy is finished. Furthermore all files on the floppy disk before the volume copy was executed will be lost and <i>are not recoverable</i> . Additionally, the file system type on the source media (LIF or DOS) is forced onto the destination media. Caution should be exercised when using the volume copy form of the COPY command.
	The Test Set only supports the following types of volume copy using the volume copy form of the COPY command:
	 Like- media to like-media (RAM disk to RAM disk, external floppy to external floppy, and so forth)
	2. Like-file-system to like-file-system (DOS to DOS, LIF to LIF)
	All other types of volume copy are unsupported and will produce unexpected results or system errors.
	Using wildcards in the COPY command can eliminate the need to use the volume form of the COPY command. Refer to the <i>HP Instrument BASIC User's Handbook</i> for further information on wildcards and their use in the COPY

Using RAM Disk

	RAM Disk is a section of the Test Set's internal RAM memory that has been set aside for use as a mass storage device. RAM Disk acts much the same as an external disk drive; that is, program and data files can be stored, re-stored, erased, and retrieved from the RAM Disk.
	The RAM Disk is partitioned into four separate units: 0-3. Each unit is treated as a separate "disk." The size of each disk can be specified in 256-byte increments.
	The four RAM Disk units are designated ":MEMORY,0,0" to ":MEMORY,0,3". For example, to catalog the contents of RAM Disk unit "0" from the TESTS (IBASIC Controller) screen, execute the following command:
	CAT ":MEMORY,0,0"
	Volume 0's contents can be viewed and loaded from the TESTS (IBASIC Controller) screen, the TESTS (Main Menu) screen, the TESTS (Save/Delete Procedure) screen and the Signaling Decoder screen in NMT mode. Volumes 1, 2, and 3 can <i>only</i> be accessed from the TESTS (IBASIC Controller) screen.
NOTE:	RAM Disk Erasure. The contents of RAM Disk are easily lost. Unit 0 can be overwritten by the RAM_MNG utility program (ROM Disk). Unit 1 can be overwritten by the COPY_PL utility program (ROM Disk). The contents of all units are lost when the SERVICE screen's RAM Initialize function is executed. Therefore, RAM Disk should only be used for non-permanent, short-term storage of program or data files.

Using RAM Disk

Initializing RAM Disks

Each RAM Disk unit must be initialized before it can be used. Unit 0 can be initialized using the RAM_MNG procedure stored on internal ROM Disk. Volumes 1, 2, and 3 must be initialized from the TESTS (IBASIC Controller) screen.

The optional "unit size" parameter in the following procedure specifies the memory area, in 256 byte blocks, set aside for each disk unit.

Follow these steps to initialize volumes 1, 2, or 3:

- 1. Access the TESTS (IBASIC Controller) screen.
- 2. Using the rotary knob or an external terminal, enter and execute the IBASIC command:

INITIALIZE ":MEMORY,0,<unit number 1-3>",<unit size>

For example:

INITIALIZE ":MEMORY,0,1",50

NOTE:The IBASIC INITIALIZE command defaults to LIF format. Any media (RAM Disk, SRAM
Cards, External Hard Disk Drive, or 3.5-inch floppy) formatted using the default conditions
of the INITIALIZE command will be the LIF format and will be unusable in the Test Set,
except for IBASIC mass storage operations. Refer to "Initializing Media for DOS or LIF
File System" on page 223 for information on formatting media for the DOS file system.

Using External Disk Drives

The Test Set supports only HP-IB external disk drives. Certain configuration information is required by the Test Set to access external disk drives.

The I/O CONFIGURE screen's HP-IB **mode** field must be set to Control any time an external disk drive is used by the Test Set.

To load files from the TESTS screens or NMT Signaling Decoder screen, the disk's mass storage volume specifier must be entered in the **External Disk Specification** field on the TESTS (External Devices) screen (for example, :,702,1).

Initializing External Disks

All new external disk media must be initialized before it can be used to store information. External disk media can be initialized for either LIF (Logical Interchange Format) or DOS (Disk Operating System) format using the Test Set. (See "DOS and LIF File System Considerations" on page 220.)

External disk media can be initialized from the TESTS (IBASIC Controller) screen by inserting the new media into the external disk drive and executing the following IBASIC command:

INITIALIZE "<volume type>:<external disk mass storage volume
specifier>"

where the <volume type> can be LIF or DOS

For example:

INITIALIZE "DOS:,702,1").

To verify that disk media has been properly initialized, execute the IBASIC command:

CAT "<external disk mass storage volume specifier>"

For example:

CAT ":,702,1"

NOTE:The IBASIC INITIALIZE command defaults to LIF format. Any media (RAM Disk, SRAM
Cards, External Hard Disk Drive or 3.5-inch floppy) formatted using the default conditions of
the INITIALIZE command will be the LIF format and will be unusable in the Test Set, except
for IBASIC mass storage operations. Refer to "Initializing Media for DOS or LIF File
System" on page 223 for information on formatting media for the DOS file system.

Chapter 5, Memory Cards/Mass Storage

Using External Disk Drives

6 IBASIC Controller

Introduction

Introduction

The Test Set contains an instrument controller that can run programs to control the various instruments in the Test Set and instruments/devices connected to the Test Set's external I/O ports (HP-IB, serial and parallel).

The instrument controller runs a subset of the Hewlett-Packard Rocky Mountain BASIC programming language called Instrument BASIC or IBASIC. Using this programming language it is possible to develop programs which use the Test Set's instruments to automatically test a variety of radios. Software is available from Hewlett-Packard, the HP 83217 series, for testing the major radio systems currently in use today. Users can also develop their own IBASIC programs for automated radio testing.

This chapter is designed to provide the programmer with the information needed to develop IBASIC programs for use on the built-in IBASIC controller. Refer to the individual HP 83217 software manuals for information on using the IBASIC controller with Hewlett-Packard supplied software.

The IBASIC Controller Screen

The Test Set has a dedicated screen for interfacing with the built-in IBASIC controller. This is the TESTS (IBASIC Controller) screen as shown in figure 34. This screen is accessed as follows:

- Select the front panel TESTS key. The TESTS (Main Menu) screen will be displayed.
- Using the rotary knob, position the cursor on the **IBASIC** field in the lower center of the screen.
- Push the rotary knob and the TESTS (IBASIC Controller) screen will be displayed.

The IBASIC Controller Screen

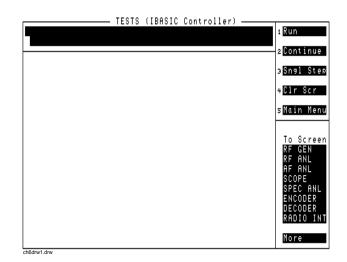

Figure 34 The IBASIC Screen

The TESTS (IBASIC Controller) screen can be accessed programmatically by sending the following command:

OUTPUT 714; "DISP TIBasic"

The TESTS (IBASIC Controller) screen is divided into several areas which are used by the IBASIC controller for different purposes.

The small horizontal rectangle at the top left is the IBASIC command line. As the name implies IBASIC commands can be executed from this line. Commands can be entered locally using the rotary knob or remotely using serial port 9. A maximum of 100 characters may be entered into the command line.

The vertical rectangle at the top right side is the softkey label area. The five highlighted areas within the softkey label area correspond to the five special function keys on the front panel of the Test Set. IBASIC programs can assign tables to these keys and control program execution by using ON KEY interrupts.

The vertical rectangle at the bottom right side is the **To Screen** area and is the same as the **To Screen** area displayed on any other Test Set screen. The user may switch to some other Test Set screen by using the rotary knob to position the cursor onto the desired screen and then pushing the knob.

The large rectangle in the center of the screen is the CRT (display screen) for the IBASIC controller. The IBASIC controller uses this area for, displaying alpha, numeric, and graphic information, program editing, program listing and so forth. This area operates as would the CRT on an external Hewlett-Packard 9000 Series 200/300 Workstation.

Important Notes for Program Development

Important Notes for Program Development

The Test Set is designed to operate the same way under automatic control as it does under manual control. This has several implications when designing and writing programs for the Test Set:

- To automate a particular task, determine how to do the task manually and then duplicate the steps in the program.
- In Manual Control mode, a Test Set function must be displayed and "active" to make a measurement or receive DUT data. Therefore, to make a measurement using an IBA-SIC program, follow these basic steps:
 - 1. Use the DISPlay command to select the screen for the instrument whose front panel contains the desired measurement result or data field (such as AF ANALYZER).
 - 2. Set the measurement field (such as SINAD) to the ON state.
 - **3.** Trigger a reading.
 - **4.** Read the result.

NOTE: The following sections discuss developing IBASIC programs which do not use the TESTS Subsystem. Programs written for the TESTS Subsystem require the creation of supporting Library, Procedure, and Code files, and must be written using a specific program structure. The HP 83217A Software packages are examples of this type of program.

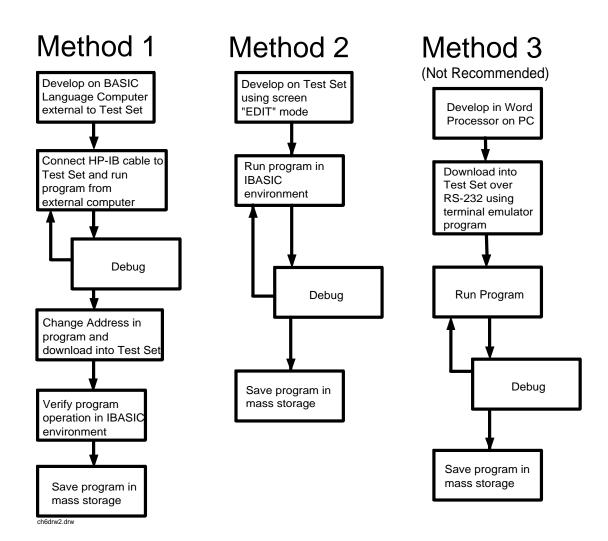

Program Development

Program Development

There are three recommended approaches for developing IBASIC programs. They are outlined in **figure 35** and discussed in more detail later in this chapter. Since the Test Set only has the rotary knob and numeric keypad for data/character entry, developing programs on the Test Set alone is not recommended. All three development methods employ an external computer or terminal. The choice of development method will typically be driven by available equipment and extent of development task. If the development task is large, it is strongly recommended that a BASIC language computer be used as outlined in development Method #1.

Method #2 is recommended for large program modification or smaller program development. Method #2 uses an external PC or terminal as the CRT and keyboard for the built-in IBASIC controller.

Method #3 is least preferred for program development or modification because no syntax checking occurs until the program is first run making it difficult to debug long programs. Details of each development method are given later in this chapter.

Program Development Methods

Interfacing to the IBASIC Controller using Serial Ports

This section describes how to interconnect the Test Set to an external PC or terminal using the Test Set's serial I/O ports. Program development methods #2 and #3 use PC's or terminals connected to the Test Set through the Test Set's serial I/O ports. To determine which programming environment best fits your application, refer to "Choosing Your Development Method" on page 261.

Test Set Serial Port Configuration

To prepare for IBASIC program development, the Test Set must first be configured to operate with a PC or terminal.

This includes,

- Hardware
- Cables
- Screens I/O CONFIGURE and TESTS (IBASIC Controller)

There are two independently controllable serial interfaces in the Test Set, each using a 3-wire transmit / receive / ground implementation of the RS232 standard. The IBASIC Controller can send and receive data from either port by using its assigned select code.

Serial Port Information

The Test Set's rear-panel RJ-11 connector has 6 conductors. (Note that this jack appears the same as a common 4-conductor RJ-11 telephone jack, but the Test Set jack uses 6 conductors). Three of the wires are designated as Serial I/O Port address 9, and the other three wires are designated Serial I/O Port address 10 (also referred to as Serial Port B). These select codes cannot be changed.

Serial Port 9. Serial Port 9 is used for developing and editing IBASIC programs since it can be connected directly to the **IBASIC** Command Line field. It can also be used for data I/O from an IBASIC program. Settings can be changed from the I/O CONFIGURE screen, using IBASIC commands executed from the **IBASIC** Command Line field, or using IBASIC commands executed from an IBASIC program.

Serial Port 10. Serial Port 10 is primarily used for data I/O from an IBASIC program to a device-under-test- (DUT). Settings can be changed using IBASIC commands executed from the **IBASIC** Command Line field, or using IBASIC commands executed from an IBASIC program but not from the I/O CONFIGURE screen.

Reason for Two Serial Ports

A typical application uses serial port 10 to send and receive data to and from a DUT and uses serial port 9 to print or log test results to a serial printer or PC.

In the program development environment, serial port 9 can be used to communicate with the external PC or terminal, and serial port 10 can be connected to a serial printer for generating program listings or as the destination printer for the program itself. This is schematically shown in **figure 37 on page 250**. If simultaneous multiple serial I/O is not a requirement then only use serial port 9 as it can directly access the **IBASIC Command Line** field.

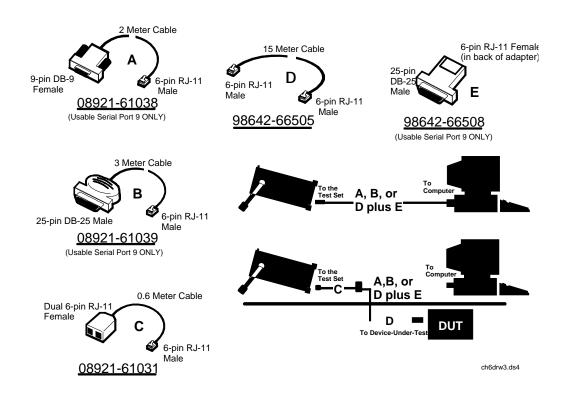

For your convenience, **figure 36 on page 249** and **table 30** on this page, show the cables and adapters that are available from Hewlett-Packard for connecting external devices to the Test Set's serial I/O ports. See **figure 37 on page 250** for a wiring diagram to construct your own cables. RJ-11 cables and adapters can be wired several ways. If you buy a cable or adapter other than the HP parts listed in **table 30**, verify the connections for the pins indicated, before connecting the cables to the Test Set.

Interfacing to the IBASIC Controller using Serial Ports

-			
Device (for RS232 Serial connections)	Typical Uses	Description	HP Part Number
Single to Dual RJ-11 Adapter Cable	To connect to Serial Ports 9 and 10 simultaneously	Single 6-pin RJ-11 (male) to Dual 6-pin RJ-11 (female); 0.6-meter cable	08921-61031
Cable with Connectors	Test Set to PC	6-pin RJ-11 (male) to 9-pin DB-9 (female); 2-meter cable	08921-61038
Cable with Connectors	Test Set to printer or terminal	6-pin RJ-11 (male) to 25-pin DB-25 (male); 3-meter cable	08921-61039
RJ-11 to DB-25 Adapter	Use with long cable 98642-66508.	6-pin RJ-11 (female) to 25-pin DB-25 (male) Adapter	98642-66508
Cable with Connectors	Long Cable from Test Set to PC or printer (use with 98642-66508)	6-pin RJ-11 (male) to 6-pin RJ-11 (male); 15-meter cable	98642-66505

Table 30Available HP RS232 Serial Cables and Adapters

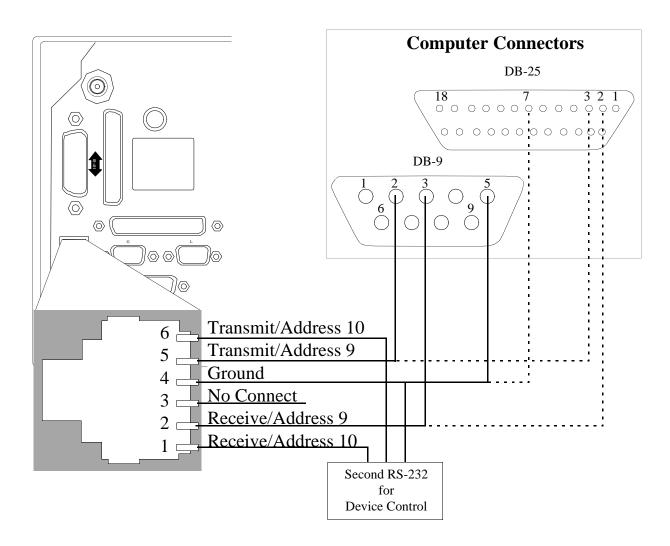

Interfacing to the IBASIC Controller using Serial Ports

Available HP RS-232 Serial Cables and Adapters

Serial Port 9 Configuration

Table 31 on page 252 and the following paragraphs describe how to configure Serial Port 9 for communications with an external PC or terminal. Implications of the various choices are discussed.

- 1. Under the To Screen menu, select More, then select IO CONFIG.
- 2. The I/O CONFIGURE screen will be displayed.
- 3. Set the Serial Baud Rate, Parity, Data Length, Stop Length, Rcv Pace and Xmt Pace fields to match your PC or terminal settings. The recommended settings are shown in table 31 on page 252. These settings will be retained by the Test Set. They will not change if the PRESET key is pressed, if the Test Set receives a *RST Common Command, or the power is turned on and off.
- 4. Set the Serial In field to Inst. This routes Serial Port 9 to the IBASIC Command Line field. Characters typed on the external PC or terminal will now appear in the IBASIC Command Line.
- 5. Set the **IBASIC Echo** field to **ON**. This will cause IBASIC character output from commands (such as LIST, PRINT or DISPLAY) or error messages to echo characters to Serial Port 9 (the characters will in turn show up on the external PC or terminal screen). This will allow program listings and syntax error messages to be seen on the external PC or terminal.
- 6. Another method which can be used to output characters to the external PC or terminal is to execute the IBASIC command, PRINTER IS 9. This causes IBASIC to direct all print output to Select Code 9. Select Code 9 is the Test Set's Serial Port 9. Select Code 1 is the Test Set's CRT. Select Code 1 is also the default address for the PRINTER IS command, so all program printer output defaults to the Test Set's CRT (unless changed with the PRINTER IS command).
- 7. Set the **Inst Echo** field to **ON**. This will cause characters to be echoed back to the external PC or terminal as they are received at Serial Port 9. If the echo feature of the external PC or terminal is also enabled all the characters sent to the Test Set will be displayed twice on the external PC or terminal. Enable echo on only one device, either the Test Set or the external PC or terminal.

Interfacing to the IBASIC Controller using Serial Ports

Receive and Transmit Pacing

When receiving characters into the **IBASIC** Command Line field, the Test Set's microprocessor responds to each entry and no buffering is required. Therefore, when using your PC or terminal to send characters to the **IBASIC** Command Line field, it is permissible to set Rcv Pace and Xmt Pace to None.

When sending data through the Test Set's Serial Port to external devices like printers which may have small input buffers, it is important to set **Rcv Pace** and **Xmt Pace** to **Xon/Xoff**. This allows the printer to stop data transmission from the Test Set when the printer's buffer is full and then start it again when the printer is ready.

The Test Set has a Serial Port input buffer length of 2000 characters. Buffer size becomes important when IBASIC programs expect to receive large amounts of data through the Serial Port with a single ENTER statement.

Field	Available Settings	Recommended Setting
Serial In	Inst/IBASIC	Inst
IBASIC Echo	On/Off	On
Inst Echo	On/Off	On
Serial Baud Rate	150, 300, 600, 1200, 2400, 4800, 9600, 19200	9,600
Parity	None, Odd, Even, Always 1, Always 0	None
Data Length	7 bits, 8 bits	8 bits
Stop Length	1 bit, 2 bits	1 bit
Rcv Pace (receive pacing)	None, Xon/Xoff	Xon/Xoff
Xmt Pace (transmit pacing)	None, Xon/Xoff	Xon/Xoff

 Table 31
 Test Set Serial Port 9 Configuration

PC Configuration

To prepare for IBASIC program development, the external PC or terminal must be configured to operate with the Test Set. This configuration includes

- hardware
- terminal Emulator Software

PC Serial Port Configuration

Refer to **figure 37 on page 250** for connection details. Connect the Test Set's Serial Port 9 to a serial I/O (input/output) port on the PC. On many PCs, a serial port is available as either a 25-pin DB-25 (female) connector or a 9-pin DB-9 (male) connector. This port can be configured as COM1, COM2, COM3, or COM4 (communications port 1, 2, 3, or 4) depending on the installed PC hardware and user-defined setup. Refer to the instructions shipped with the PC for hardware and software configuration information.

Terminal Emulator Configuration Information

A "terminal emulator" is an application program running on the PC that communicates with one of the serial communication ports installed in the PC. It provides a bi-directional means of sending and receiving ASCII characters to the Test Set's serial port.

In general, a "terminal emulator" enables the PC to act like a dedicated computer terminal. This type of terminal was used before PCs to allow remote users to communicate through RS232 with central mainframe computers. An ANSI-compatible terminal like the Digital Equipment Corporation VT-100 can be used to directly communicate with the Test Set. PC terminal emulation application programs have been designed to have setup fields much like these older technology terminals.

Setting Up Microsoft Windows Terminal on your PC (Windows Version 3.1)

- 1. From the Program Manager, select the Accessories Group.
- 2. Select the Terminal icon.
- 3. From the Settings menu, make the following choices:
 - a. Select Terminal Emulator.
 - 1. DEC VT-100 (ANSI).
 - **b.** Select Terminal Preferences.
 - 1. Terminal Modes

Line Wrap: Off Local Echo: Off Sound: Off

- 2. Columns: 132
- 3. CR->CR/LF

Inbound: Off Outbound: Off

4. Cursor

Block Blink: On

- 5. Terminal Font: Fixedsys
- 6. Translations: None
- 7. Show Scroll Bars: On
- 8. Buffer Lines: 100
- 9. Use Function, Arrow, and Ctrl Keys for Windows: OFF
- c. Select Test Transfer.
 - 1. Flow Control: Standard Flow Control
 - 2. Word wrap Outgoing Text at Column: Off

- **d.** Select **Communications** (the first five of the following Communications choices for your PC Serial Port should match your Test Set settings).
 - 1. Baud Rate: 9600
 - 2. Data Bits: 8
 - **3.** Stop Bits: **1**
 - 4. Parity: None
 - 5. Flow Control: Xon/Xoff
 - 6. Connector: COM1, COM2, COM3, or COM4 depending on your PC setup
 - 7. Parity Check: Off
 - 8. Carrier Detect: Off

Setting Up ProComm Revision 2.4.3 on your PC

ProComm is a general purpose telecommunications software package for PC's with MS-DOS. One of its functions is to provide an RS-232 terminal function on a typical PC.

Running ProComm in MSDOS (You can use ProComm's built-in help function to learn more about setting it up).

- 1. To access the help and command functions, press the Alt and F10 keys simultaneously (abbreviated as Alt+F10).
- 2. Press the space bar to move among the choices for a particular field.
- 3. Press ENTER to accept the displayed choice.

Setting up the ProComm Software

- 1. Press Alt+ P to access the LINE SETTINGS window.
- 2. Enter the number 11. This will automatically set the following:

Baud rate: 9600
Parity: None
Data Bits: 8
Stop Bits: 1
Selected communications port: COM1 (This may be different on your PC

- 3. To select a different communications port, enter the following numbers:
 - 20: COM1 21: COM2 22: COM3 23: COM4
- **4.** Enter the number 24 to save changes, to make the new configuration your default, and to exit LINE SETTINGS.
- 5. Press Alt+S for the SETUP MENU.
- 6. Enter the number 1 for MODEM SETUP.
- 7. Enter the number 1 for the Modem init string.
- **8.** Press Enter to set a null string.
- 9. Press Esc to exit MODEM SETUP back to the SETUP MENU.
- 10. Enter the number 2 for TERMINAL SETUP.

11. Terminal emulation: **VT-100**

Duplex: FULL Flow Control: XON/XOFF CR translation (in): CR CR translation (out): CR BS translation: NON-DEST BS key definition: BS Line wrap: ON Scroll: ON Break length (ms): 350 Enquiry (CNTL-E): OFF

12. Press Esc to exit Terminal Setup back to the Setup Menu.

13. Enter the number 4 for General Setup.

Translate Table: **OFF** Alarm sound: **OFF** Alarm time (secs): **1** Aborted downloads: **KEEP**

14. Press Esc to exit General Setup back to the Setup Menu.

15. On the Setup Menu, press S to save your entries.

16. Press Esc to exit the Setup Menu.

17. Press Alt+X to exit ProComm back to MS-DOS.

Setting Up HP AdvanceLink (HP 68333F Version B.02.00) on your PC HP AdvanceLink is a software program which allows PCs to be used as an alphanumeric or graphics terminal. It can also automate terminal and file-transfer functions. The version described will work with PCs with the MS-DOS or PC-DOS operating systems. (AdvanceLink for Windows is also available, and configuration is very similar).

Running AdvanceLink in MSDOS

- 1. Press the Tab key to move from one field to the next, which also accepts the displayed choice.
- **2.** Press the NEXT CHOICE and PREVIOUS CHOICE keys to move among the choices for a particular field.

Setting up the AdvanceLink Software

- **1.** Press the TERMINAL function key.
- 2. Press CONFIG KEYS.
- 3. Press GLOBAL CONFIG.

Keyboard: USASCII Personality: ANSI Language: ENGLISH Terminal Mode: Alphanumeric Remote To: enter your PC's selected serial port number, often, Serial 1 Printer I/F: None Memory Size: 32K Plotter I/F: None Video Type: select your display type Forms Path: no entry Screen Size: select your size - 23 or 24

- 4. Press DONE to return to the Config screen.
- 5. Press REMOTE CONFIG (to set up the Serial port you selected above in Remote To).

Baud Rate: 9600 Parity/DataBits: None/8 Enq Ack: NO Asterisk: OFF Chk Parity: NO SR(CH): LO Recv Pace: Xon/Xoff CS(CB)Xmit: NO XmitPace: Xon/Xoff

6. Press DONE to return to the Config screen.

7. Press TERMINAL CONFIG.

Terminal Id: 2392A $LocalEcho: {\tt OFF}$ CapsLock: OFF Start Col: **01** Bell: ON XmitFnctn(A): NO SPOW(B): NO InhEolWrp(C): NO Line/Page(D): LINE InhHndShk(G): NO Inh DC2(H): NO Esc Xfer(N): YES ASCII 8 Bits: YES Fld Separator: down arrow or US BlkTerminator: up arrow or RS ReturnDef: musical note or CR Copy: Fields Type Ahead: NO Row Size: 160 Host Prompt Character: left arrow or D1 Horiz. Scrolling Increment: 08

- 8. Press DONE to return to the Config screen.
- 9. Press DONE to return to the Terminal screen.
- 10. Press MAIN to return to the Main screen.
- 11. Press EXIT ADVLINK to exit.

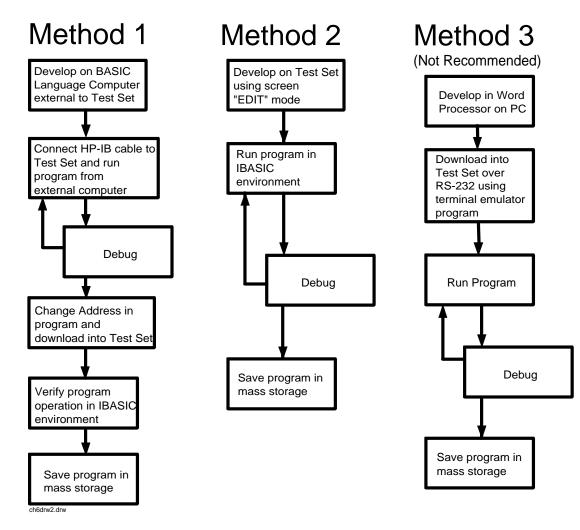

Terminal Configuration

Use the cable information in **table 30 on page 248** and **figure 36 on page 249** for connecting to an external terminal. Terminals typically have a DB-25 (male) connector. Set the terminal for DEC VT-100 ANSI emulation. Many ASCII terminals will also function properly.

To set up the terminal, use the field settings found in the HP AdvanceLink terminal emulator section found earlier in this chapter. As a minimum, make sure the terminal's basic setup information matches the fields on the Test Set's I/O CONFIGURE screen (refer to table 31 on page 252 for recommended settings).

Choosing Your Development Method

There are three fundamental methods for developing IBASIC programs for the Test Set. See **figure 38** below.

Three Possible Development Methods

Chapter 6, IBASIC Controller

Choosing Your Development Method

Method 1

Using a BASIC language computer (either an HP technical computer or a PC running BASIC with HP-IB) is the best method for developing any size program. This is because the program can be debugged directly on the external computer before downloading the program into the Test Set. Using this approach the programmer can observe the Test Set's display to see changes in state and easily verify the correct measurements.

Method 2

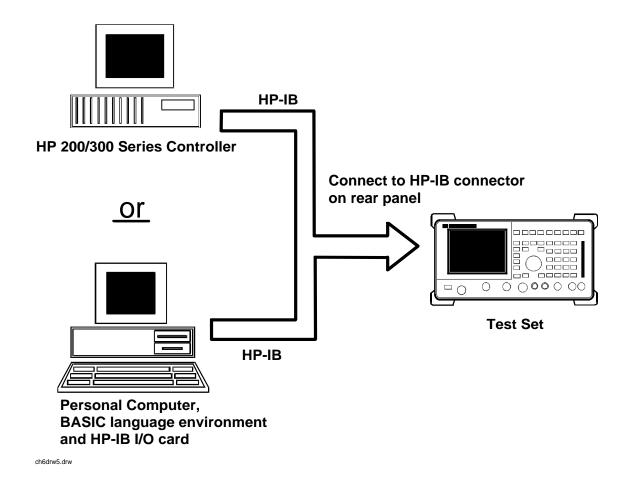

If a BASIC language computer is not available, program development can be done directly on the Test Set using the IBASIC EDIT mode. A PC connected to the Test Set through RS-232, as described earlier in this chapter, is used as the CRT and keyboard for the internal controller. In this method, the program always resides in the Test Set and can be run at any time. Mass storage is usually an SRAM card. When running IBASIC programs on the Test Set's internal controller, the Test Set displays only the IBASIC screen, not the individual instrument screens as the program executes. This makes troubleshooting larger programs more difficult.

Method 3

The third method of program development is to use a word processor on a PC with RS-232, and then download the program into the Test Set for execution. This is the least favorable choice for development because downloading code into the Test Set over RS-232 requires a loader utility program running in the Test Set and a RAM memory card present as an intermediate storage location before running the program. (For shorter programs, the intermediate storage location is not necessary.) No IBASIC command syntax is checked until the program is run after downloading. Also, when running IBASIC programs on the Test Set's internal controller, the Test Set displays only the IBASIC screen, not the individual instrument screens as the program executes. This makes troubleshooting larger programs more difficult.

Method #1. Program Development on an External BASIC Language Computer

Method #1. Program Development on an External BASIC Language Computer

Connecting IBASIC Language Computers to the Test Set

Configuring the Test Set's HP-IB Interface

To use HP-IB (the IEEE 488 interface bus) as a means of communicating with the Test Set, connect a standard HP-IB cable (such as the HP 10833B) between the Test Set's rear-panel HP-IB connector and the HP-IB connector on the external BASIC language computer.

On the Test Set	1. Select the I/O CONFIGURE screen.
	2. Set the Mode field to Talk&Lstn.
NOTE:	If the Mode field is set to Control , there could possibly be a System Controller conflict between the external BASIC language computer and the Test Set, resulting in either an Interface Status Error or "lock up" of the HP-IB. Refer to "Passing Instrument Control" in the Operating Overview chapter of the <i>HP 8924C User's Guide</i> .

3. Set the HP-IB Adrs field to the desired address for the Test Set. The default value is 14.

Compatible BASIC Language Computers

As shown in **figure 39 on page 263**, there are two types of computers that can be used in this development method. The preferred computer is an HP 9000 Series 200/300 Workstation running HP Rocky Mountain BASIC 6.2 or later. IBASIC is a subset of HP Rocky Mountain BASIC (RMB). All IBASIC commands are compatible with RMB and thus will execute from a HP 9000 Series 200/300 Workstation.

If this is not available, a PC running a BASIC language environment, such as TransEra HT BASIC 4.0 and an HP-IB card can be used. If this approach is used ensure that no BASIC language commands are used in the program which are not compatible with IBASIC.

Program Development Procedure

As discussed in "Overview of the Test Set" in chapter 1, the Test Set has two HP-IB buses, an internal HP-IB at select code 8 and an external HP-IB at select code 7. The Test Set's built-in IBASIC controller uses the internal HP-IB to communicate with the Test Set's various instruments and devices. The process of developing a program on an external BASIC language computer utilizes this hardware feature to an advantage. First, develop the program directly on the external BASIC language computer treating the Test Set as a device on the external BASIC language computer's HP-IB. For example, to setup the Test Set's RF Generator use the OUTPUT command with the Test Set's HP-IB address. If the select code of the HP-IB card in the external BASIC language computer is 7 and the address of the Test Set is 14 the address following the OUTPUT command would be 714. When the command executes on the external BASIC language computer the information on how the Test Set's RF Generator is to be configured is sent to the Test Set through its external HP-IB bus. After the program is fully developed, making it run on the Test Set is simply a matter of changing the address of all the HP-IB commands to 8XX (Test Set internal HP-IB bus) and downloading the program into the Test Set's IBASIC controller and executing it.

Method #1. Program Development on an External BASIC Language Computer

There are two ways of allowing easy conversion of all HP-IB commands to a different address. The first way is to establish a variable to which the 3-digit address number is assigned.

For example

10 Addr = 714 ! Sets the value of variable Addr to be 714.
20 OUTPUT Addr;"*RST" ! Commands the Test Set to reset at address 714.

To change the address, simply change the value of variable Addr to 814.

For example

10 Addr = 814 ! Sets the value of variable Addr to be 814. 20 OUTPUT Addr;"*RST" ! Commands the Test Set to reset at address 814.

A second method is to assign an I/O path to the desired I/O port.

For example

To control device #14 on the port with select code 7.

10 ASSIGN @Device TO 714! Establishes I/O path to select code 7 address 14. 20 OUTPUT @Device;"*RST"! Commands Test Set to reset at address 714.

To change the address, simply change line 10 to

10 ASSIGN @Device TO 800.

NOTE: The dedicated HP-IB interface at select code 8 conforms to the IEEE 488.2 Standard in all respects but one. The difference being that each instrument on the bus does not have a unique address. The Instrument Control Hardware determines which instrument is being addressed with the command syntax. As such an explicit device address does not have to be specified. The address 800 and 814 are equally correct.

Method #1. Program Development on an External BASIC Language Computer

Downloading Programs to the Test Set through HP-IB

An IBASIC PROGram subsystem has been developed to allow the external BASIC language controller to download programs to the Test Set through HP-IB (refer to the "**PROGram Subsystem Commands**" on page 287 for more information on the PROGram Subsystem). Four commands from the external BASIC language controller to the Test Set are necessary to transfer the program. The commands are executed serially allowing enough time for each command to finish executing. (The Test Set's HP-IB **Mode** field must be set to **Talk&Lstn**, and the TESTS (IBASIC CONTROLLER) screen must be displayed).

1. OUTPUT 714; "PROG:DEL:ALL"

Deletes any programs that reside in Test Set RAM.

2. OUTPUT 714; "PROG:DEF #0"

Defines the address in Test Set RAM where the downloaded program will be stored.

3. LIST #714

Causes all program lines to transfer over HP-IB to the Test Set which is at address 714.

4. OUTPUT 714;" "END

Defines end of download process by generating an EOI command.

After the above commands complete the program code will be in the Test Set ready to run. If any bugs are detected when the program is run, the program can be uploaded back into the external BASIC language controller to correct the error. Alternately the full screen IBASIC EDIT function through RS-232 can be used to correct the error (refer to "Method #2. Developing Programs on the Test Set Using the IBASIC EDIT Mode" on page 270 for details).

After the program is working properly in the Test Set IBASIC environment, it should be stored for backup purposes.

Uploading Programs from the Test Set to an External BASIC Controller through HP-IB

To upload a program from the Test Set to an external BASIC language controller through HP-IB the following program, which uses a command from the PROGram subsystem to initiate the upload, must be running on the external BASIC language controller. The uploaded program is stored to a file specified by the user.

In the following program the external BASIC language controller is a PC running TransEra HT BASIC. The file is stored to the C:\HTB386 directory. If the external BASIC language controller is an HP 9000 Series 200/300 Workstation, modify the mass storage volume specifier appropriately. After running the program, the uploaded program code will be in the designated file. Use the GET command to retrieve the file for editing.

Method #1. Program Development on an External BASIC Language Computer

10 ! PROGRAM TO UPLOAD IBASIC CODE FROM TEST SET TO BASIC CONTROLLER THROUGH HP-IB. 20 30 40 ! The file for uploaded code will be "C:\htb386\code". ! If you want to use a different file or directory, modify the two lines 50 ! with the labels "File_name_1" and "File_name_2". 60 70 80 90 Addr=714 !Test Set HP-IB address 100 ALLOCATE Line\$[200] PRINTER IS 1 110 120 CLEAR SCREEN 130 DISP "It may be several minutes before code begins transferring if the program is long" 140 OUTPUT Addr;"*RST" !Reset the Test Set OUTPUT Addr; "DISP TIB" 150 !Displays the IBASIC screen OUTPUT Addr; "PROG: EXEC 'CLS'" 160 !Clears the Test Set display 170 OUTPUT 714; "PROG:DEF?" !Initiates the upload of whole program ENTER Addr USING "X,D,#";Count_len 180 !Number of lines in program ENTER Addr USING VAL\$(Count_len)&"D,#";Char_count !Number of characters 190 200 210 File_name_1: CREATE ASCII "C:\htb386\code",(1.05*Char_count/256)+5 220 ! Number of records reserved for upload. 230 File_name_2: ASSIGN @File TO "C:\htb386\code" 240 1 250 DISP "Transferring code from Test Set" 260 LOOP !Program transfer loop. ENTER Addr;Line\$!CR/LF terminates each line. 270 280 PRINT Line\$!Displays new lines on Test Set display. OUTPUT @File;Line\$!Transfer new line to file. 290 300 Char_count=Char_count-LEN(Line\$)-2 !Reduces Char_count by the number of 310 ! characters in current line. EXIT IF Char_count<=0 320 330 END LOOP 340 1 350 ASSIGN @File TO * !Cleans out file buffer. !Close off reading 360 ENTER Addr;Line\$ 370 CLEAR SCREEN DISP "Transfer complete." 380 390 LOCAL Addr 400 END

Method #2. Developing Programs on the Test Set Using the IBASIC EDIT Mode

If a BASIC language computer is not available, program development can be done directly on the Test Set using the IBASIC EDIT mode. A terminal or PC connected to the Test Set through RS-232 is used as the CRT and keyboard for the Test Set's built-in IBASIC controller. In this method, the program always resides in the Test Set and can be run at any time. Mass storage is usually an SRAM memory card. When running IBASIC programs on the Test Set's internal controller, the Test Set displays only the IBASIC screen.

The Test Set's IBASIC controller has an editor that is interactive with a terminal or PC over the RS-232 serial port. (The editor does not work unless a terminal or PC with terminal emulator is connected to Serial Port 9.) The editor, hereafter referred to as the "IBASIC EDIT Mode", allows the programmer to develop code directly in the Test Set with no uploading or downloading. The IBASIC EDIT Mode can be used to develop programs from scratch or to modify existing programs. Refer to "Interfacing to the IBASIC Controller using Serial Ports" on page 246 for information on connecting a terminal or PC to the Test Set.

Selecting the IBASIC Command Line Field

To use the IBASIC EDIT Mode for program development, the **IBASIC Command Line** field must be displayed on the Test Set and Serial Port 9 must be connected to the **IBASIC Command Line** field. An IBASIC command, sent as a series of ASCII characters through Serial Port 9, will appear on the **IBASIC Command Line** field. When a carriage return/line feed is encountered, the Test Set will attempt to execute the command. To display the **IBASIC Command Line** field on the Test Set execute the following steps:

- 1. Press the TESTS key.
- 2. The TESTS (Main Menu) screen will be displayed.
- 3. Using the rotary knob, position the cursor on the IBASIC Cntrl field and select it.
- 4. The TESTS (IBASIC CONTROLLER) screen will be displayed.
- 5. The small horizontal rectangle at the top-left is the IBASIC Command Line

To Access the IBASIC Command Line Field

- 1. Position the cursor on the screen's upper left. This is the **IBASIC** Command Line field.
- 2. The **IBASIC Command Line** field does not have a title like other fields in the Test Set; it is the highlighted, horizontal 2-line "bar" just below the screen title, TESTS (IBASIC Controller).

To Use the IBASIC Command Line Field with the Test Set's Rotary Knob

- 1. Position the cursor at the **IBASIC** Command Line field and push the knob.
- 2. A Choices: field will be displayed in the lower, right corner of the display.
- **3.** By rotating the knob, a list of ASCII characters and cursor positioning commands can be displayed on the right side of the screen.
- **4.** When the cursor is next to the desired character or command, push the knob to select that character.
- **5.** No external hardware is required for this entry method, but it is tedious and is recommended only for short commands. Use this method when doing simple tasks such as initializing memory cards or CATaloging a memory card.
- 6. Program development using the rotary knob alone is not recommended.

Method #2. Developing Programs on the Test Set Using the IBASIC EDIT Mode

Entering and Exiting the IBASIC EDIT Mode

To enter the IBASIC EDIT Mode first position the cursor on the **IBASIC Command Line** field, type the word EDIT on the terminal or PC connected to the Test Set and then press the ENTER key on the terminal or PC. At this point the Test Set will fill the PC screen with 22 lines of IBASIC code from the program currently in the Test Set's RAM memory. No program lines will be displayed on the Test Set screen. If no program is currently in the Test Set's memory, the number 10 will be displayed on the terminal or PC screen. This represents program line number 10 and is displayed to allow you to begin writing an IBASIC program beginning at line number 10. The "*" annunciator will be displayed in the upper, right corner of the Test Set indicating that the IBASIC controller is running to support the full screen edit mode.

After editing is complete, exit the IBASIC EDIT Mode by pressing the terminal or PC's ESCAPE key twice or pressing the SHIFT CANCEL keys on the Test Set.

A variety of editing commands are supported by the IBASIC EDIT Mode. These commands are activated in the Test Set as escape code sequences. Most terminals and PC terminal emulator programs allow function keys to be configured with user defined escape code sequences and user defined labels for the keys. An escape command (when received by a peripheral device like a printer or the Test Set) causes the peripheral to recognize subsequent ASCII characters differently. In the case of the Test Set, escape sequences are used for executing IBASIC EDIT Mode editing commands.

For example, ESCAPE [L causes the Test Set to insert a new line number where the cursor is positioned. Table 32 on page 273 lists the editing escape codes for the Test Set. There is no escape code for DELETE CHARACTER. Use the Backspace key for deleting. Use the arrow keys to position the cursor.

Setting Up Function Keys In Microsoft Windows Terminal

When in the TERMINAL mode, click on Settings, then Function Keys. ^[is ESCAPE in Windows Terminal. See **table 32 on page 273** for the escape codes.

NOTE: Windows Terminal seems to work best when a mouse is used to access the function keys, not the keyboard. Also, scrolling a program works best when the Terminal window display is maximized).

Method #2. Developing Programs on the Test Set Using the IBASIC EDIT Mode

Setting Up Function Keys in HP AdvanceLink

- From the Main (highest level) screen, set up the 8 softkeys as follows:
 - 1. Display User Definition screens by pressing Ctrl F9.
 - 2. Enter all the LABEL titles for K1 through K8.
 - 3. Activate the "Display Function" feature by pressing softkey **F7**.
 - **4.** Now you can enter the escape codes for each edit command aligned with the soft key definitions you just entered. With the Display Functions key pressed, when you press the escape key, a left arrow will be displayed.
- Once you have set up all 8 keys, you activate them by pressing Shift F12. To deactivate your user defined softkeys, press F12.
- (- is ESCAPE in HP AdvanceLink. See table 32 on page 273 for the escape codes.

Setting Up Function Keys in ProComm

ProComm does not have function keys. However, escape sequences can be assigned to number keys 0 through 9 by using the Keyboard Macro function. This function is accessed by keying Alt+M. There is no method of displaying key labels so they will have to be recorded elsewhere. See the ProComm manual for further information.

Function Key Names	Windows Terminal Escape Codes	HP AdvanceLink Escape Codes
INSERT LINE	^[[L	(-[L
DELETE LINE	^[[M	(-[M
GO TO LINE	^[g	(-g
CLEAR LINE	^[[K	(-[K
PAGE UP	^[OQ	(-OQ
PAGE DOWN	^[OR	(-OR
RECALL LINE	^[r	(-r
BEGIN LINE	^[OP	(-OP
END LINE	^[OS	(-OS

Table 32Edit Mode Escape Code Commands

The third method of IBASIC program development is to write the program using a word processor on a PC, save it as an ASCII file, and then download it into the Test Set through the serial port. The benefit of this method is that it can be done on the PC without connecting to a Test Set until download and no BASIC language compiler/interpreter is needed. The primary drawback is that no syntax checking occurs until the downloaded program is run on the Test Set. A second drawback is that, especially for longer programs (>100 lines), it is very time-consuming to transfer the code into the Test Set.

Configuring a Word Processor

The word processor on which the IBASIC code is developed must be able to save the file in ASCII format and have an ASCII file transfer utility. This is necessary because word processors use a variety of escape codes to mark all the special display formats such as bold face, font size, indented text, and the like. When a word processor file is stored in ASCII format, all escape codes are stripped off. The ASCII file transfer utility is used to transfer the file to the Test Set.

 NOTE:
 The GET command can be used on external BASIC language controllers to load ASCII files containing IBASIC programs developed on word processors. Once loaded, the steps for downloading described in "Method #1. Program Development on an External BASIC Language Computer" on page 263 can be used to transfer the program to the Test Set.

Writing Lines of IBASIC Code on a Word Processor

When writing IBASIC programs, follow these steps to ensure that the Test Set will accept the code when it is downloaded.

- 1. Always begin new lines at the far left margin. Never use a leading space or tab.
- 2. Number each consecutive line just like an IBASIC language program.
- 3. Typically begin with 10 and increment by ten for each consecutive line.
- 4. Do not leave any space or double space between lines.
- 5. Make sure to use hard carriage return / line feeds at the end of each line.
- 6. When saving the completed program, save it as an ASCII file. Some word processors have ASCII options which require that the user specify CR/LF at the end of each line. It is important that each line end with a carriage return / line feed.
- 7. Experiment with a short program first to make sure everything is working correctly.

Transferring Programs from the Word Processor to the Test Set

For short (less than 100 lines) programs, use an ASCII file transfer utility on the PC to send the program, one line at a time, down to the Test Set over RS-232 directly into the IBASIC Command Line field. The Test Set must be configured to receive serial ASCII characters by positioning the Test Set cursor at the IBASIC Command Line field as explained under "Method #2. Developing Programs on the Test Set Using the IBASIC EDIT Mode" on page 270. With this setup, when ASCII characters are received they are sent to the IBASIC Command Line field. When a carriage return / line feed is received, the Test Set will parse the line into the IBASIC program memory. Each line takes about two seconds to scroll in and be parsed. This becomes very time consuming for long programs. An alternative for longer programs is discussed later in this section.

To start the transfer process make sure there is no program in the Test Set's IBASIC RAM memory by executing a SCRATCH command from the IBASIC Command Line.

The following example shows how to transfer a short program (<100 lines) using Microsoft Windows Terminal.

- 1. Make sure the Test Set cursor is in the upper left of the IBASIC Command Line field.
- 2. Select the **Terminal application** in the Accessories Group. Set it up as described in earlier in this chapter.
- 3. Select the following: Settings Text Transfers Flow Control: Line at a Time Delay Between Lines: 25/10 Sec Word Wrap Outgoing Text at Column: Off.
 4. Select the following: Transfers Send Text File Following CR: Strip LF selected Append LF not selected.
 5. Select the text file to be transferred and begin the transfer by selecting (OK).

As the transfer starts the **IBASIC** Command Line field will intensify and characters will scroll in left to right. As each line is finished the "*" annunciator will be displayed, for about 0.5 seconds, in the upper, right corner of the Test Set indicating that the IBASIC controller is running as the line is parsed. If another line is sent before this parsing is complete, the Test Set will beep indicating an error, and the next line of the transfer will be rejected.

If the transfer is rejected, the transfer must be halted and the delay between lines increased to a slightly higher number. Start the transfer again from the beginning. When all lines have transferred, list the program to verify it was completely received. At this time, the program is ready to run. The RUN command can be keyed in from the PC or the K1 Run key in the TESTS (IBASIC Controller) screen can be pressed.

NOTE: Do not press the Run Test key in the TESTS (Main Menu) screen as this will scratch the program you just loaded and look to the memory card for a procedure file.

For longer programs (greater than 100 lines), transferring the ASCII text file directly into the IBASIC program memory through the RS-232 serial port is too time consuming. To speed the process up, it is necessary to transfer the program using a two step process.

- 1. Transfer the ASCII text file directly to a Test Set mass storage location (typically an SRAM card).
- **2.** Perform a GET command to bring the program from mass storage into the IBASIC program memory.

To perform the ASCII text file transfer for long programs, an IBASIC program, running in the Test Set, is required to manage the transfer. A suitable program titled "ASCII_DN" (for ASCII downloader) is shown on the following page.

The ASCII_DN program runs on the Test Set and directs ASCII characters coming in Serial Port 9 directly to a file named TEMP_CODE on an SRAM card. The program creates the TEMP_CODE file on the SRAM card with a size of 650 records (166 Kbytes or enough for about 6600 lines of ASCII text). When the program is run, it displays **Ready to receive ASCII file data**. When this prompt is displayed, initiate the transfer of the ASCII text file representing the program from the PC to the Test Set. Shown below are two methods of sending an ASCII file from the PC to the Test Set. Both methods require that the ASCII_DN program can be transferred into the Test Set either by typing it in using the IBASIC EDIT Mode described earlier, or downloading it from an ASCII text file one line at a time as explained earlier.

10 ! ASCII_DN 20 ! Program to download ASCII program file from PC to the Test Set through RS-232 40 1 ! This program must be loaded into the Test Set and run on the Test Set. 50 60 ! It directs ASCII characters that come in the Serial Port 9 to a file ! named "TEMP_CODE" on an SRAM card. After the transfer is complete, 70 80 ! you must SCRATCH this program and GET the transferred program from 90 ! the "TEMP CODE" file. 100 ! 110 ! ***** 120 COM /File_name/ File_name\$[10] 130 DIM In\$[200] 140 File_name\$="TEMP_CODE" !File name on RAM card 150 CLEAR SCREEN 160 CLEAR 9 !Clears serial bus 170 OUTPUT 800; "*RST" 180 ! Sending ASCII Text Files Over RS-232 With Windows Terminal

Set up the Windows Terminal emulator software on the PC as covered in "Setting Up Microsoft Windows Terminal on your PC (Windows Version 3.1)" on page 254. Load and run the ASCII_DN download program in the Test Set's IBASIC controller. When the prompt Ready to receive ASCII file data is displayed on the Test Set, make the following settings in Windows Terminal on the PC:

- 1. Select Settings.
- 2. Select Text Transfers.
- 3. Select Flow Control: Standard Flow Control.
- 4. Select Word Wrap Outgoing Text at Column: unselected.

This will use **Xon/Xoff flow** control by default.

- 5. Select OK.
- 6. Select Transfers.
- 7. Select Send Text File.
- 8. Set Strip LF off and Append LF off. (It is important that the line feeds that are in the ASCII file not be stripped or the file transfer will not work).
- 9. Select or enter the file name to transfer.

10. Begin the transfer by selecting OK.

At this point, each line of the program will rapidly scroll across the screen of the Test Set. When the transfer is finished, the prompt **Down load of ASCII file** complete. will be displayed on the Test Set.

Before running the downloaded program, execute a SCRATCH command on the **IBASIC Command Line** to remove the ASCII_DN download program from Test Set memory.

Next, execute a GET TEMP_CODE command on the IBASIC Command Line. This will load the ASCII text into the IBASIC program memory.

Finally, execute a RUN command on the IBASIC Command Line. This will run the program. If any syntax errors are present in the program IBASIC will generate the appropriate error messages.

Sending ASCII Text Files over RS-232 with ProComm Communications Software

Set up the ProComm terminal emulator software on the PC as covered in "Setting Up ProComm Revision 2.4.3 on your PC" on page 256. On the Test Set, enter and run the ASCII_DN download program in the IBASIC controller. When the prompt Ready to receive ASCII file data is displayed on the Test Set, make the following settings in the ProComm terminal emulator on the PC:

NOTE: The ProComm terminal emulator views the file transfer as sending the file from the PC "up" to the Test Set. This is opposite to the direction used by the previous Windows Terminal example. Therefore, with ProComm an ASCII "upload" transfer is used.

1. Press Alt+F10 to display the ProComm help screen

- 2. Press Alt+P to display the SETUP MENU.
- 3. Select item 6: ASCII TRANSFER SETUP.
- 4. Set Echo locally: NO.
- 5. Expand blank lines: YES.
- 6. Pace character: 0.
- 7. Character pacing: 15.
- 8. Line pacing: 10.
- 9. CR translation: NONE, LF .
- **10.** Translation: **NONE** (This is important since the default setting will strip line feeds and this will cause the transfer to never begin).
- 11. Select the Escape key to exit setup mode and return to the main screen.
- **12.** Press Alt F10 to access the help menu.
- 13. To begin sending the file, select PgUp.
- 14. In the UPLOAD screen, select 7 ASCII protocol.
- 15. Run the ASCII_DN download program on the Test Set.
- 16. When the Test Set displays **Ready to receive ASCII file data**, press Enter on the PC to begin the transfer. At this point, each line of the program will rapidly scroll across the screen of the Test Set. When the transfer is finished, the download program will display **Down load of ASCII file complete.**, and the program file will be stored on the SRAM card in the **TEMP-CODE** file.
- **17.** Before running the transferred program, execute a SCRATCH command on the IBA-SIC Command Line line to remove the ASCII_DN download program from Test Set memory.
- **18.** Next, execute a GET TEMP_CODE command on the IBASIC Command Line. This will load the ASCII text into the IBASIC program memory.
- **19.** Finally, execute a RUN command on the IBASIC Command Line. This will run the program. If any syntax errors are present in the program IBASIC will generate the appropriate error messages.

Uploading Programs from the Test Set to a PC

As an overview, the following steps must be performed:

- 1. The Test Set must output the program over Serial Port 9.
- 2. The PC must receive the data through its serial port and direct the data to a file on disk. This can be done by a terminal emulator program such as Windows Terminal, Pro-Comm, or HP AdvanceLink. This requires having the serial port connection established as outlined in "Interfacing to the IBASIC Controller using Serial Ports" on page 246.

To configure the Test Set to output the program to Serial Port 9 position the cursor on the IBASIC Command Line field. Execute the command PRINTER IS 9. This command sets Serial Port 9 as the default printer port. When PRINT commands are executed, ASCII characters will be sent to Serial Port 9.

On the PC, select **Receive Text File** in Windows Terminal or **Receive Files** (PgDn which is called Download) in ProComm. Enter a file name, then initiate the file transfer. The PC is now looking for ASCII text to come in the serial port.

Load the program to be transferred into the Test Set. Execute the IBASIC LIST command on the IBASIC Command Line. The program listing will be sent to Serial Port 9 and be received by the terminal emulator software on the PC. When the listing is finished, terminate the file transfer by selecting Stop on Windows or Escape on ProComm.

Serial I/O from IBASIC Programs

Serial I/O from IBASIC Programs

There are two serial ports available for I/O (input / output) to peripherals external to the Test Set. To bring data in to the Test Set through the serial port(s) use the IBASIC ENTER command. To send data out, use the OUTPUT command.

Serial Ports 9 and 10

The Test Set uses a small RJ-11 female connector on the rear panel for connecting to the two serial ports. This connector has six wires, 3 for Serial Port Address 9 and 3 for Serial Port Address 10. For information about serial port configuration, refer to the "Test Set Serial Port Configuration" on page 246. For connection information, refer to figure 37 on page 250.

Before using either port, the RS-232 protocol must be established by setting baud rate, pacing, and the other settings as explained in "Test Set Serial Port Configuration" on page 246. Functionally, from an I/O perspective, the two serial ports are identical. However, operationally there is one major difference. The Serial Port Address 9 settings are adjustable on the I/O CONFIGURE screen or with IBASIC commands, while the Serial Port 10 settings are adjustable only with IBASIC commands. There is no screen for Serial Port 10 settings. For more information, see the "CONFigure:SPORt" and "CONFigure:SPB" subsystems in the HP-IB Command Syntax chapter of the *HP 8924C Condensed Programming Reference Guide* which gives the command syntax for Serial Port 9 and 10.

Example IBASIC Program Using Serial Port 10

The following program illustrates I/O to both serial ports. The program sends a prompt message to a terminal connected to Serial Port 9 and waits for a response from the user at the terminal. When the response is received from the terminal connected to Serial Port 9, a series of ASCII characters are sent out Serial Port 10.

10 !....ASCII CHARACTER CYCLER... 20 !.....Prompts user over Serial Port 9. To see this prompt, you need to 30 !....be connected to a terminal at 9600 baud. 40 !.....Outputs ASCII characters on Serial Port 10 beginning with ASCII 50 !.....character 32 (space) and ending with ASCII character 126 (~). 60 !.....Characters are output with no CR/LF. 70 OUTPUT 9; "When you are ready for data to be sent on port 10, press ENTER" 80 OUTPUT 800; "CONF:SPOR:SIN 'IBASIC'; BAUD '9600'" !Allows IBASIC to read port 9. 90 DIM A\$[10] 100 ENTER 9;A\$!Program waits here until CR/LF is received. 110 !.... 120 I=32 130 WHILE I<=126 140 OUTPUT 10 USING "K,#";CHR\$(I) !Outputs characters all on one line. 150 I=I+1 160 END WHILE 170 OUTPUT 800; "CONF:SPOR:SIN 'Inst'" !Sets port 9 to IBASIC entry field. 180 EXECUTE ("CURSOR HOME") !Places cursor at left of IBASIC entry field. 190 END

Serial I/O from IBASIC Programs

Serial Port 10 Information

Serial Port 10 is sometimes called Serial Port B in Test Set documentation and programs.

The default Serial Port 10 settings are the same as Serial Port 9. They are

- 1. Serial Baud rate: 9600
- 2. Parity: None
- 3. Data Length: 8 Bits
- 4. Stop Length: 1 Bit
- 5. Receive and Transmit Pacing: Xon/Xoff
- 6. Serial in: Not available for Port 10
- 7. IBASIC and Instrument Echo: Not available for Port 10

There is no Test Set screen that shows Serial Port 10's settings. Therefore, to know Serial Port 10 settings, they must either be set or queried using IBASIC commands.

For example, the following IBASIC program queries the baud rate setting of Serial Port 10:

```
10 DIM Setting$[20]
20 OUTPUT 800;"CONF:SPB:BAUD?" !Initiates a query.
30 ENTER 800;Setting$
40 DISP Setting$
50 END
```

This program returns a quoted string. If the baud rate is set to 9600, the returned ASCII character string is **9600**. Serial Port 10 settings are held in non-volatile memory. They remain unchanged until modified using an IBASIC command.

PROGram Subsystem

Introduction

The PROGram Subsystem provides a set of commands which allow an external controller to generate and control an IBASIC program within the Test Set. The PROGram Subsystem in the Test Set is a limited implementation of the PROGram Subsystem defined in the Standard Commands for Programmable Instruments (SCPI) Standard. The PROGram Subsystem commands, as implemented in the Test Set, can be used to

- download an IBASIC program from an external controller into the Test Set
- upload an IBASIC program from the Test Set into an external controller
- control an IBASIC program resident in the Test Set from an external controller
- set or query program variables within an IBASIC program which is resident in the Test Set
- execute IBASIC commands in the Test Set's IBASIC Controller from an external controller

SCPI PROGram Subsystem

The SCPI PROGram Subsystem was designed to support instruments which can store multiple programs in RAM memory at the same time. The SCPI PROGram Subsystem provides commands which allow multiple programs to be named, defined and resident in the instrument at the same time. The Test Set does not support this capability.

For complete information on the SCPI PROGram Subsystem refer to the Standard Commands for Programmable Instruments (SCPI) Standard. If you are not familiar with SCPI, it is recommended that you obtain a copy of the book: *A Beginner's Guide to SCPI* (ISBN 0-201-56350, Addison-Wesley Publishing Company).

PROGram Subsystem

Test Set PROGram Subsystem

The Test Set was designed to store only one IBASIC program in RAM memory at any given time. The PROGram Subsystem commands, as implemented in the Test Set, operate differently than described in the SCPI Standard. In addition, the SCPI PROGram Subsystem commands which were designed to support multiple programs are not supported in the Test Set.

Supported SCPI Commands

The Test Set supports the following subset of the :SELected SCPI commands.

- :SELected:DEFine
- :SELected:DEFine?
- :SELected:DELete:ALL
- :SELected:EXECute
- :SELected:NUMBer
- :SELected:NUMBer?
- :SELected:STATe
- :SELected:STATe?
- :SELected:STRing
- :SELected:STRing?
- :SELected:WAIT

Unsupported SCPI Commands

The Test Set does not support the following SCPI commands.

- :CATalog?
- :SELected:DELete:SELected
- :SELected:MALLocate
- :SELected:MALLocate?
- :SELected:NAME
- :SELected:NAME?
- :EXPLicit:DEFine
- :EXPLicit:DEFine?
- EXPLicit:DELete
- :EXPLicit:EXECute
- :EXPLicit:MALLocate
- :EXPLicit:MALLocate?
- :EXPLicit:NUMBer
- :EXPLicit:NUMBer?
- :EXPLicit:STATe
- :EXPLicit:STATe?
- :EXPLicit:STRing
- :EXPLicit:STRing?
- :EXPLicit:WAIT

NOTE: Sending the Test Set any of the unsupported SCPI PROGram Subsystem commands can result in unexpected and/or erroneous operation of IBASIC. This may require the Test Set's RAM to be initialized from the SERVICE screen to regain proper IBASIC operation.

PROGram Subsystem Commands

Command Notation

The following notation is used in the command descriptions:

Letter case (uppercase or lowercase) is used to differentiate between the short form (the uppercase characters) and long form (the whole keyword) of the command.

The lower case letters in the keyword are optional; they can be deleted and the command will still be understood by the Test Set.

[] = Optional keyword; this is the default state, the Test Set will process the command to have the same effect whether the optional keyword is included by the programmer or not.

<> = Specific SCPI-defined parameter types. Refer to the SCPI Standard for definitions of the SCPI-defined parameter types.

{} = One or more parameters that must be included one or more times.

| = Separator for choices for a parameter. Can be read the same as "or."

Command Descriptions

NOTE: When a PROGram Subsystem command is sent to the Test Set through HP-IB from an external controller the Test Set is put into REMOTE mode. The Test Set must be put in LOCAL mode to use the front-panel keys or to use the serial ports to input data into the IBASIC Command line.

[:SELected] All the commands under this keyword access the IBASIC program currently resident in the Test Set. Note that this keyword is optional in the command syntax.

Syntax

PROGram[:SELected]

:DEFine <program> The DEFine command is used to create and download an IBASIC program into the Test Set from an external controller.

To download an IBASIC program, any currently resident IBASIC program must first be deleted using the :DELete:ALL command. Attempting to download a new IBASIC program while an IBASIC program is currently resident causes **IBASIC Error: -282 Illegal program name**.

PROGram Subsystem

NOTE: It is possible for the PROGram Subsystem to think that there is an IBASIC program resident in the Test Set when, in actuality, there is not. This situation would exist for example, if an IBASIC program had been created and downloaded using the :DEFine command and then deleted, from the front panel, using the SCRATCH ALL command from the IBASIC Command line. Under this circumstance IBASIC Error -282 would be generated when another attempt is made to download a program with the PROGram Subsystem. It is recommended that the :DELete:ALL command always be sent immediately before the :DEFine command.

The IBASIC program downloaded into the Test Set must be transferred as IEEE 488.2 Arbitrary Block Program Data. Refer to the IEEE Standard 488.2-1987 for detailed information on this data type. Two syntax forms are provided with the Arbitrary Block Program Data data type: one form if the length of the program is known and another one if it is not.

Syntax (length of program not known)

PROGram[:SELected]:DEFine <#0><program><NL><END>

The following notation is used in the command description:

<#0> = IEEE 488.2 Arbitrary Block Program Data header.

<program> = the IBASIC program sent as 8 bit data bytes.

<NL> = new line = ASCII line-feed character.

<END> = IEEE 488.1 END message. This terminates the block transfer and is only sent once with the last byte of the indefinite block data.

Example BASIC program to download an IBASIC program to Test Set

10 OUTPUT 714;"PROG:DEL:ALL"!Delete current program 20 OUTPUT 714;"PROG:DEF #0"!Create program, send header 30 OUTPUT 714;"10 FOR J = 1 TO 10"!lst prog line 40 OUTPUT 714;"20 DISP J"!2nd prog line 50 OUTPUT 714;"30 BEEP"!3rd prog line 60 OUTPUT 714;"40 NEXT J"!4th prog line 70 OUTPUT 714;"50 END"END!Send END message at end of last line 80 END

Syntax (length of program known)

PROGram[:SELected]:DEFine <#><number of digits in count field>
<count field: number of data bytes in program><program data bytes>

The following notation is used in the command description:

The data starts with a header which begins with a "#", followed by a single non-zero digit in the range 1-9 which specifies the number of digits in the following count field, followed by a series of digits in the range of 0-9 which gives the number of data bytes being sent, followed by the number of data bytes specified by the count field.

Example

#16<data byte><data byte><data byte><data byte><data byte><data byte>

Example BASIC program to download an IBASIC program to Test Set

```
10 OUTPUT 714;"PROG:DEL:ALL"!Delete current program
20 OUTPUT 714;"PROG:DEF #257" !Create program, send header
30 OUTPUT 714;"10 FOR J = 1 TO 10"!18 characters + CR + LF
40 OUTPUT 714;"20 DISP J"!9 characters + CR + LF
50 OUTPUT 714;"30 BEEP"!7 characters + CR + LF
60 OUTPUT 714;"40 NEXT J"!9 characters + CR + LF
70 OUTPUT 714;"50 END"!6 characters
80 END
```

:DEFine? The :DEFine? query command is used to upload an IBASIC program from the Test Set to an external controller.

The IBASIC program uploaded to the external controller is transferred as IEEE 488.2 Definite Length Arbitrary Block Response Data. The following information describes some of the characteristics of the IEEE 488.2 Definite Length Arbitrary Block Response Data type. Refer to the IEEE Standard 488.2-1987 for detailed information on this data type.

The data starts with a header which begins with a "#", followed by a single non-zero digit in the range 1-9 which specifies the number of digits in the following count field, followed by a series of digits in the range of 0-9 which gives the number of data bytes being sent, followed by the number of data bytes specified by the count field.

Example

#16<data byte><data byte><data byte><data byte><data byte><data byte><data</pre>

The transfer is terminated by the transmission, from the Test Set to the external controller, of the response message terminator (NL & END messge).

<NL> = new line = ASCII linefeed character.

<END> = IEEE 488.1 END message.

Syntax

PROGram[:SELected]:DEFine?

Example BASIC program to upload an IBASIC program from Test Set

```
10 DIM Prog_line$[200]!Holds longest program line in Test Set
20 DIM File_name$[10]!Holds the name of file to store IBASIC program
30 LINPUT "Enter name of file to store IBASIC program in:",File_name$
40 OUTPUT 714; "PROG:DEF?"
50 ENTER 714 USING "X,D,#";Count_length !Get length of count field
60 !Get number of characters in program, includes CR/LF on each line
70 ENTER 714 USING VAL$(Count_length)&"D,#";Chars_total
80 !Create ASCII file to hold program, add 5 records for buffer
90 CREATE ASCII File_name$,(Chars_total/256)+5
100 ASSIGN @File TO File_name$
110 LOOP
      ENTER 714; Prog_line$ !Read in one program line
120
130
      OUTPUT @File; Prog_line$ !Store in file
      Chars_xferd=Chars_xferd+LEN(Prog_line$)+2 !CR/LF not read
140
150 EXIT IF Chars_xferd>=Chars_total
160 END LOOP
170 ENTER 714;Msg_terminator$ !Terminate the block data transfer
180 ASSIGN @File TO *
190 END
```

:DELete:ALL The :DELete:ALL command is used to delete an IBASIC program in the Test Set. If the IBASIC program in the Test Set is in the RUN state, an **IBASIC Error: -284 Program currently running** error is generated and the program is not deleted.

Syntax

PROGram[:SELected]:DELete:ALL

Example

OUTPUT 714;"PROGram:SELected:DELete:ALL" or OUTPUT 714;"PROG:DEL:ALL"

:EXECute <program_command> The :EXECute command is used to execute, from an external controller, an IBASIC program command in the Test Set's built-in IBASIC Controller .

<program_command> is string data representing any legal IBASIC command. If the string data does not represent a legal IBASIC command, an **IBASIC Error:** -285 Program syntax error is generated.

Any IBASIC program in the Test Set must be in either the PAUSed or STOPped state before the external controller issues the :EXECute <program_command> command. If the IBASIC program is in the RUN state, an IBASIC Error: -284 Program currently running is generated.

Syntax

PROGram[:SELected]:EXECute <delimiter><program_command><delimiter>

The following notation is used in the command description:

<delimiter> = IEEE 488.2 <string data> delimiter, single quote or double quote, must be the same.

Example

OUTPUT 714;"PROGram:SELected:EXECute 'CLEAR SCREEN'" or OUTPUT 714;"PROG:EXEC 'CLEAR SCREEN'"

:NUMber <varname>{,<nvalues>} The :NUMBer command is used to set, from an external controller, the value of numeric variables or arrays in an IBASIC program in the Test Set. <varname> is the name of an existing numeric variable or array, and can be sent as either character data (<varname> not enclosed in quotes) or string data (<varname> enclosed in quotes). <nvalues> is a list of commaseparated <numeric_values> which are used to set the value of <varname>.

NOTE:

If the variable name <var_name> is longer than 12 characters it must be sent as string data (<var_name> enclosed in quotes). For example, OUTPUT 714;"PROG:NUMB 'Var_name',10".

Attempting to send a <var_name> longer than 12 characters as character data (<var_name> *not* enclosed in quotes) will generate the following error:

HP-IB Error: -112 Program mnemonic too long.

If an attempt is made to set the value of a numeric variable or array and no IBASIC program is in the Test Set an IBASIC Error: -282 Illegal program name is generated. If an attempt is made to set the value of a numeric variable or array and the numeric variable specified in <varname> does not exist in the program an IBASIC Error: -283 Illegal variable name is generated. If the specified numeric variable cannot hold all of the specified <numeric_values> an IBASIC Error: -108 Parameter not allowed is generated.

Syntax

PROGram[:SELected]:NUMBer <varname>{,<nvalues>}

	Example setting the value of a simple variable
	OUTPUT 714;"PROGram:SELected:NUMBer Variable,15"
	or OUTPUT 714;"PROG:NUMB Variable,15"
	Example setting the value of a one dimensional array [Array(5)] with 6 elements
	OUTPUT 714;"PROGram:SELected:NUMBer Array,0,1,2,3,4,5"
	or OUTPUT 714;"PROG:NUMB Array,0,1,2,3,4,5"
NOTE:	Individual array elements cannot be set with the :NUMBer command.
	Example setting the value of a two dimensional array [Array(1,2)] with 6 elements
	OUTPUT 714;"PROGram:SELected:NUMBer Array,0,1,2,3,4,5"
	or OUTPUT 714;"PROG:NUMB Array,0,1,2,3,4,5"
	Arrays are filled by varying the right-most dimension the fastest. After executing the above statement the array values would be, $Array(0,0)=0$, $Array(0,1)=1$, $Array(0,2)=2$, $Array(1,0)=3$, $Array(1,1)=4$, $Array(1,2)=5$.
NOTE:	Individual array elements cannot be set with the :NUMBer command.
	:NUMber? <varname></varname> The :NUMBer? query command is used to return, to an external controller, the current value of numeric variables or arrays in an IBASIC program in the Test Set . <varname> is the name of an existing numeric variable or array in the IBASIC program, and can be sent as either character data (name not enclosed in quotes) or string data (name enclosed in quotes).</varname>
NOTE:	If the variable name <var_name> is longer than 12 characters it must be sent as string data (<var_name> enclosed in quotes). For example, OUTPUT 714;"PROG:NUMB 'Var_name".</var_name></var_name>
	Attempting to send a <var_name> longer than 12 characters as character data (<var_name> <i>not</i> enclosed in quotes) will generate the following error:</var_name></var_name>
	HP-IB Error: -112 Program mnemonic too long
	For simple variables the value is returned as a series of ASCII characters representing a numeric value in scientific notation (+3.0000000000E+000). For arrays the values are returned as a comma separated list of ASCII characters representing a numeric value in scientific notation. For example, +3.000000000E+000,+3.000000000E+000,+3.000000000E+000, etc. Array values are sent by varying the rightmost dimension of the array the fastest.

If an attempt is made to query the value of a numeric variable or array and no IBASIC program is in the Test Set an **IBASIC Error:** -283 **Illegal variable name** is generated. If an attempt is made to query the value of a numeric variable or array and the variable specified in <varname> does not exist in the program an **IBASIC Error:** -283 **Illegal variable name** is generated.

Syntax

PROGram[:SELected]:NUMBer? <varname>

NOTE: The program commands and syntax used to enter data from the Test Set into the external controller will depend upon the programming language used in the external controller. Considerations such as type conversion (integer to real, real to complex, etc.), the sequence in which values are entered into arrays, the capability to fill an entire array with a single enter statement, etc. will depend upon the capabilities of the programming language used in the external controller. The examples which follow represent the capabilities of HP Rocky Mountain BASIC programming language running on an HP 9000/300 Series Controller.

Example querying the value of a simple variable

OUTPUT 714;"PROGram:SELected:NUMBer? Variable" ENTER 714;Value or OUTPUT 714;"PROG:NUMB? Variable" ENTER 714;Value

This example assumes that the variable named Value in the ENTER statement is the same type as the variable named Variable in the IBASIC program.

Example querying the value of a one dimensional array [Array(5)] with 6 elements

```
OUTPUT 714;"PROGram:SELected:NUMBer? Array"
ENTER 714;Result_array(*)
or
OUTPUT 714;"PROG:NUMB? Array"
ENTER 714;Result array(*)
```

This example assumes that the array named Result_array(*) in the ENTER statement is dimensioned exactly the same as the array named Array in the IBASIC program.

NOTE: Individual array elements cannot be queried with the :NUMBer? command.

Example querying the value of a one dimensional array whose name is known but whose current size is unknown

10 DIM Temp\$[5000] !This will hold 250 numbers @ 20 characters each 20 DIM Result_array(500) !This array will hold up to 501 values 30 OUTPUT 714;"PROG:NUMB? Array" !Query the desired array 40 ENTER 714;Temp\$!Enter the values into a temporary string variable 50 N=-1 !Initialize array pointer, assume option base 0 60 REPEAT !Start loop to take values from string and put in array 70 N=N+1 !Increment array pointer 80 Pos_comma=POS(Temp\$,",") !Find comma separator 90 Result_array(N)=VAL(Temp\$[1,Pos_comma-1]) !Put value into array 100 Temp\$=Temp\$[Pos_comma+1] !Remove value from temporary string 110 UNTIL POS(Temp\$,",")=0 !Check for last value in temporary string 120 Result_array(N+1)=VAL(Temp\$) !Put last value into array 130 END

The above example assumes that the dimensioned size of the IBASIC array is smaller than the dimensioned size of the array named Result array.

NOTE: Individual array elements cannot be queried with the :NUMBer? command.

:STATe RUN|PAUSe|STOP|CONTinue The STATe command is used to set, from an external controller, the execution state of the IBASIC program in the Test Set. **Table 33** defines the effect of setting the execution state of the IBASIC program to a desired state from each of the possible current states.

Table 33

Effect of STATe Commands

Desired State of IBASIC Program	Current State of IBASIC Program			
(STATe command sent to Test Set)	RUNNING	PAUSED	STOPPED	
RUN	HP-IB Error: -221 Settings conflict	RUNNING	RUNNING	
CONT	HP-IB Error: -221 Settings conflict	RUNNING	HP-IB Error: -221 Settings conflict	
PAUSE	PAUSED	PAUSED	STOPPED	
STOP	STOPPED	STOPPED	STOPPED	

The program execution states are defined as follows:

- RUNNING, the program is currently executing.
- PAUSED, the program has reached a break in execution but can be continued.
- STOPPED, program execution has been terminated.

Syntax

PROGram[:SELected]:STATe RUN|PAUSe|STOP|CONTinue

Example

```
OUTPUT 714;"PROGram:SELected:STATe RUN"
or
OUTPUT 714;"PROG:STAT RUN"
```

:STATe? The STATe? query command is used to query, from an external controller, the current execution state of the IBASIC program in the Test Set. The return data (RUN, STOP, or PAUS) is sent as a series of ASCII characters.

The program execution states are defined as follows:

- RUN, the program is currently executing.
- PAUS, the program has reached a break in execution but can be continued.
- STOP, program execution has been terminated.

Syntax

PROGram[:SELected]:STATe?

Example

```
OUTPUT 714;"PROGram:SELected:STATe?"
ENTER 714;State$
or
OUTPUT 714;"PROG:STAT?"
ENTER 714;State$
```

:STRing <varname>{,<svalues>} The :STRing command is used to set, from an external controller, the value of string variables or string arrays in an IBASIC program in the Test Set. <varname> is the name of an existing string variable or string array in the IBASIC program. <svalues> is a list of comma-separated quoted strings which are used to set the value of <varname>.

 NOTE:
 If the variable name <var_name> is longer than 12 characters it must be sent as string data (<var_name> enclosed in quotes). For example, OUTPUT 714;"PROG:STR 'Var_name','data'''.

 Attempting to cond or form newsy langer than 12 characters or showster data

Attempting to send a <var_name> longer than 12 characters as character data (<var_name> *not* enclosed in quotes) will generate the following error:HP-IB Error: -112 Program mnemonic too long.

If the programmer wishes to append the IBASIC "\$" string identifier onto the string variable name, the string variable name must be sent as string data, that is enclosed in quotes. For example,

OUTPUT 714;"PROG:STR 'Var_name\$','data'"

Appending the IBASIC "\$" string identifier onto the string variable name without enclosing the string variable name in quotes will generate HP-IB Error: -101 Invalid character.

If an attempt is made to set the value of a string variable or array and no IBASIC program is in the Test Set an **IBASIC Error:** -282 **Illegal program name** is generated. If an attempt is made to set the value of a string variable or array and the string variable specified in <variable of exist in the program an **IBASIC Error:** -283 **Illegal variable name** is generated. If a quoted string value is too long to fit into the string variable then it is silently truncated when stored into the IBASIC string variable. If the specified string variable cannot hold all of the quoted strings an **IBASIC Error:** -108 **Parameter not allowed** is generated.

Syntax

PROGram[:SELected]:STRing <varname>{,<svalues>}

Example setting the value of a simple string variable

OUTPUT 714;"PROGram:SELected:STRing Variable,'data'" or OUTPUT 714;"PROG:STR Variable,'data'"

Example of setting the value of a string array with 3 elements of 5 characters each, such as Array\$(2)[5]

OUTPUT 714; "PROGram: SELected: STRing Array, '12345', '12345', '12345'" or OUTPUT 714; "PROG: STR Array, '12345', '12345', '12345'" Note: With Option Base 0 set in IBASIC, array indexing starts at 0. **:STRing? <varname>** The :STRing? query command is used to return, to an external controller, the current value of string variables or arrays in an IBASIC program in the Test Set . <varname> is the name of an existing string variable or string array in the IBASIC program.

NOTE: If the variable name <var_name> is longer than 12 characters it must be sent as string data (<var_name> enclosed in quotes). For example, OUTPUT 714;"PROG:STR? 'Var_name'".

Attempting to send a <var_name> longer than 12 characters as character data (<var_name> *not* enclosed in quotes) will generate the following error:

HP-IB Error: -112 Program mnemonic too long

If the programmer wishes to append the IBASIC '\$' string identifier onto the string variable name, the string variable name must be sent as string data, that is enclosed in quotes. For example,

OUTPUT 714;"PROG:STR? 'Var_name\$'"

Appending the IBASIC '\$' string identifier onto the string variable name without enclosing the string variable name in quotes will generate the following error

HP-IB Error: -101 Invalid character

For simple string variables the value is returned as a quoted string ("This is an example."). For string arrays the values are returned as a comma separated list of quoted strings ("This is an example.", "This is an example."). The string array elements are returned in ascending order (Array\$(0), Array\$(1), Array\$(2), etc.).

If an attempt is made to query the value of a string variable or array and no IBASIC program is in the Test Set an **IBASIC Error:** -283 **Illegal variable name** is generated. If an attempt is made to query the value of a string variable or array and the string variable specified in <varname> does not exist in the program an **IBASIC Error:** -283 **Illegal variable name** is generated.

Syntax

PROGram[:SELected]:STRing? <varname>

NOTE: The program commands and syntax used to enter string data from the Test Set into the external controller will depend upon the programming language used in the external controller. The examples which follow represent the capabilities of HP Rocky Mountain BASIC programming language running on an HP 9000/300 Series Controller.

Example of querying the value of a simple string variable

```
OUTPUT 714;"PROGram:SELected:STRing? Variable"
ENTER 714;Value$
or
OUTPUT 714;"PROG:STR? Variable"
ENTER 714;Value$
```

Example of querying the value of a string array with 3 elements of 5 characters each, such as Array\$(2)[5]

This example assumes that the string array named Result_array\$(*) is dimensioned exactly the same as the array named Array in the IBASIC program and that each element in the string array Array has five characters in it.

Example of querying the value of a string array whose name is known but whose current size is unknown

```
05 OPTION BASE 1
10 DIM Temp$[5000] !This will hold 5000 characters
20 DIM Temp_array$(50)[200]!Temp array: 50 elements of 200 character
30 OUTPUT 714;"PROG:STR? Array" !Query the desired array
40 ENTER 714;Temp$ !Enter the values into a temporary string variable
50 N=0 !Initialize array pointer
60 REPEAT !Start loop to take values from string and put in array
70 N=N+1 !Increment array pointer
80 Pos_comma=POS(Temp$,",") !Find comma separator
90 Temp_array$(N)=Temp$[2,Pos_comma-2] !Put value into array
100 Temp$=Temp$[Pos_comma+1] !Remove value from temporary string
110 UNTIL POS(Temp$,",")=0 !Check for last value in temporary string
120 Temp_array$(N+1)=Temp$[2,LEN(Temp$)-1]!Put last value in array
130 END
```

The above example assumes that the total number of characters in the dimensioned size of the IBASIC string array named Array is smaller than the dimensioned size of the string variable named Temp\$. Also, the maximum length of any element in the IBASIC string array Array must be less than or equal to 200 characters.

:WAIT The :WAIT command stops the Test Set from executing any commands or queries received through HP-IB until after the IBASIC program exits the RUN state; that is, the program is either PAUSED or STOPPED.

CAUTION: The Test Set will continue to process HP-IB commands into the HP-IB input buffer up to the point that the buffer is full. If the external controller attempts to send more commands than can fit into the HP-IB input buffer before the IBASIC program is PAUSED or STOPPED, the HP-IB bus will appear to be locked up. This is due to the fact that the HP-IB bus and the external controller will be in a temporary holdoff state while waiting for the HP-IB input buffer to empty.

If a query command is sent to the Test Set while the IBASIC program is under the influence of a :WAIT command, no data will be put into the Test Set's Output Queue until the IBASIC program is either PAUSED or STOPPED. If the external controller attempts to enter the queried data before the IBASIC program is PAUSED or STOPPED, the HP-IB bus will appear to be locked up. This is due to the fact that the HP-IB bus and the external controller will be in a temporary holdoff state while waiting for the data to be put into the Output queue to satisfy the enter command.

Syntax

PROGram[:SELected]:WAIT

Example

OUTPUT 714;"PROGram:SELected:WAIT" or OUTPUT 714;"PROG:WAIT"

:WAIT? The :WAIT? query command stops the Test Set from executing any commands or queries received through HP-IB until after the IBASIC program exits the RUN state, that is - the program is either PAUSED or STOPPED. A 1 is returned in response to the :WAIT? query command when the IBASIC program is either stopped or paused.

CAUTION: When the :WAIT? query command is sent to the Test Set the program running on the external controller will hang on the enter or input statement until the IBASIC program is either STOPPED or PAUSED. This is due to the fact that the HP-IB bus and the external controller will be in a temporary holdoff state while waiting for the Test Set to put a 1 into the Output queue to satisfy the :WAIT? query command.

Syntax

PROGram[:SELected]:WAIT?

Example

```
OUTPUT 714;"PROGram:SELected:WAIT?"
ENTER 714;Dummy
or
OUTPUT 714;"PROG:WAIT?"
ENTER 714;Dummy
```

Consider the following example where the user wishes to determine, from an external controller, if the IBASIC program running on the Test Set has finished executing. The example programs show how this might be accomplished with and without using the :WAIT? query command.

Example BASIC program without using the :WAIT? query command

```
10 OUTPUT 714;"PROG:STAT RUN"
20 LOOP
30 OUTPUT 714;"PROG:STAT?"
40 ENTER 714;State$
50 EXIT IF State$="STOP" OR State$="PAUS"
60 END LOOP
70 DISP "IBASIC program not running."
80 END
```

Example BASIC program using the :WAIT? query command

```
10 OUTPUT 714;"PROG:STAT RUN"
20 OUTPUT 714;"PROG:WAIT?"
30 ENTER 714;Dummy !Program will hang here until IBASIC program stops
40 DISP "IBASIC program not running."
50 END
```

Using the EXECute Command

The PROGram:EXECute command can be used to list, edit and control IBASIC programs in the Test Set from an external controller. This eliminates having to use the cursor control knob and provides a more efficient way of making small changes to programs. The full range of IBASIC program commands can be executed from an external controller using the PROGram:EXECute command.

The following operations are given as typical examples of using the PROGram:EXECute command.

NOTE: The program commands and syntax used to send data from the external controller to the Test Set will depend upon the programming language used in the external controller. The examples which follow represent the capabilities of HP Rocky Mountain BASIC programming language running on an HP 9000/300 Series Controller.

When a PROGram Subsystem command is sent to the Test Set through HP-IB from an external controller the Test Set is put into REMOTE mode. The Test Set must be put in LOCAL mode to use the front panel keys or to use the serial ports to input data into the IBASIC Command line.

Entering a new IBASIC program line

IBASIC program lines can be entered directly into the Test Set's RAM memory, one line at a time, from an external controller using the PROGram:EXECute command as follows:

PROG:EXEC '<new program line number/program line>'

where <new program line number/program line> represents a valid IBASIC program line.

For example, to enter the following new program line into the Test Set,

20 A=3.14

execute the following command from the external controller:

OUTPUT 714; "PROG: EXEC '20 A=3.14'"

Quoted strings, such as those used in PRINT commands, must use double quotes. For example,

OUTPUT 714; "PROG: EXEC '30 PRINT ""TEST""'"

Editing an existing IBASIC program line

Existing IBASIC program lines which are resident in the Test Set's RAM memory can be edited, one line at a time, from an external controller using the PROGram:EXECute command as follows:

PROG:EXEC '<existing program line number/modified program line>'

where <existing program line number/modified program line> represents an existing IBASIC program line.

For example, to edit the following existing program line in the Test Set.

30 OUTPUT 814; "AFAN: DEMP: GAIN 20 dB"

to

30 OUTPUT 814; "AFAN: DEMP: GAIN 10 dB"

execute the following command from the external controller:

OUTPUT 714;"PROG:EXEC '30 OUTPUT 814;""AFAN:DEMP:GAIN 10 dB""'"

Quoted strings, such as those used in OUTPUT commands, must use double quotes.

Listing A Program

Execute the following command on the external controller to list an IBASIC program which is resident in the Test Set to the currently specified IBASIC Controller LIST device.

OUTPUT 714; "PROG: EXEC 'LIST'"

Downloading An IBASIC Program Into the Test Set

The following procedure uses the PROGram Subsystem commands to transfer an IBASIC program, which is resident in the memory of the external controller, from the external controller to the Test Set. This procedure assumes the Test Set's HP-IB address is set to 14. The example also assumes the external controller is an HP 9000 Series 300 Controller.

- 1. Access the Test Set's TESTS (IBASIC Controller) screen.
- 2. Enter a program into the external controller. Use the sample program below if no program is available. When run, the sample program clears the Test Set's IBASIC Controller display area, and prints a message indicating that the download procedure worked.

!THIS IS A SAMPLE PROGRAM
 CLEAR SCREEN
 PRINT "DOWNLOADING COMPLETED"
 END

3. Execute the following commands on the external controller:

```
OUTPUT 714;"PROG:DEL:ALL"
OUTPUT 714;"PROG:DEF #0"
LIST #714
OUTPUT 714;" "END
```

4. To verify that the program was downloaded, execute the following commands from the external controller:

OUTPUT 714; "PROG: EXEC 'LIST'"

The program should be listed on the Test Set's TESTS (IBASIC Controller) screen.

5. Run the program on the Test Set by first selecting the LOCAL key on the front panel of the Test Set and then selecting the **Run** key on the Test Set's TESTS (IBASIC Controller) screen.

Uploading a Program From the Test Set

The following BASIC program copies an IBASIC program from the Test Set's IBASIC Controller RAM to the external controller and then stores it to a file on the external controller's currently assigned mass storage device.

When the upload program is entered and run on the external controller, the operator is prompted for the name of the file to store the IBASIC program in. As the upload program is running, the total number of characters in the program, and the number of characters transferred, are displayed.

```
10 !Upload an IBASIC program in Test Set to an external controller.
20 DIM Prog_line$[200] !Holds longest program line in Test Set
30 DIM File_name$[10] !Holds the name of file to store IBASIC program
40 Addr=714 !Test Set HP-IB address
50 LINPUT "Enter name of file to store IBASIC program in:", File_name$
60 OUTPUT Addr; "PROG:DEF?"
70 ENTER Addr USING "X,D,#";Count_length !Get length of count field
80 !Get number of characters in program, includes CR/LF on each line
90 ENTER Addr USING VAL$(Count_length)&"D,#";Chars_total
100 !Create ASCII file to hold program, add 5 records for buffer
110 CREATE ASCII File_name$,(Chars_total/256)+5
120 ASSIGN @File TO File_name$
130 LOOP
140
      ENTER Addr; Prog_line$ !Read in one program line
150
      OUTPUT @File; Prog_line$ !Store in file
160
      Chars_xferd=Chars_xferd+LEN(Prog_line$)+2 !CR/LF not read
      DISP Chars_xferd; "of"; Chars_total; "characters transferred."
170
180 EXIT IF Chars_xferd>=Chars_total
190 END LOOP
200 ENTER Addr; Msg_terminator$ !Terminate the block data transfer
210 ASSIGN @File TO * !Close the file
220 END
```

Saving an IBASIC Program To A Memory Card

The following procedure can be used to save an IBASIC program from the IBASIC Controller's RAM memory to a memory card inserted into the front panel of the Test Set.

- 1. Press LOCAL, SHIFT, CANCEL on the Test Set to perform an IBASIC reset.
- **2.** If the memory card has not been initialized, insert it into the Test Set and execute the following command on the external controller:

OUTPUT 714; "PROG: EXEC 'INITIALIZE " "DOS: INTERNAL, 4" " ' "

- 3. Insert the initialized memory card into the Test Set.
- **4.** Define the memory card as the Mass Storage device by executing the following command on the external controller:

OUTPUT 714; "PROG: EXEC 'MSI "": INTERNAL, 4""'"

5. Save the program to the memory card by executing the following command on the external controller:

OUTPUT 714;"PROG:EXEC 'SAVE ""<filename>""'"

The TESTS Subsystem

The TESTS Subsystem

The Test Set makes available to the user an automated user-interface which has been specifically designed for radio test. One of the primary problems associated with automated radio testing is the need to rapidly configure the software with the information needed to test a specific type of radio. Information such as, test frequencies/channels, test specifications, test parameters, test conditions and pass/ fail limits. Most often the test(s) and test procedure(s) used to test a class of radio (AM, FM, AMPS, TACS, TDMA, CDMA, etc.) are defined by an industry standard and are used to test all radio types within that class. However, for a specific radio type, the test(s) may remain the same but the information needed to test the radio changes. For example, a portable hand-held may have different transmit power levels than a mobile - the RF power test is the same but the power levels, supply voltages, pass/fail limits etc. can be different.

There are two approaches which can be used to provide the software with the information needed to test a radio: a) hardcode the information directly into the software, or b) store the information outside the program code itself and make it available to the software as needed. Hardcoding the information into the software has several serious drawbacks: changing the information is difficult and the software becomes specific to that radio type. Storing the information outside the program code and making it available to the software as needed overcomes both of these problems, that is - the information is easy to change and the software is not specific to a particular type of radio.

The Test Set's automated user-interface was designed using this approach. Hewlett-Packard has developed software specifically designed to run on the Test Set. The HP 83217 Software provides the user with a library of industry standard tests. All radio specific information has been removed from the software. The information needed to test a specific type of radio is available to the user through the TESTS Subsystem. To generate, change and maintain this radio specific information the TESTS Subsystem provides menu driven input screens to define specifications, parameters, test sequencing and system configuration for a particular radio type.

TESTS Subsystem File Descriptions

Three types of files are used in the TESTS Subsystem to store different types of information.

Code Files

The first aspect of an automated definition is the code itself. This is just a standard IBASIC Code file that can reside either on the Memory card, on an external disk drive connected to the HP-IB port of the Test Set, or in an internal RAM disk. The name of this file is appended with .PGM file extension. This tells the TESTS Subsystem that this particular file contains program code.

Library Files

A Library indicates all of the available test subroutines in the code, the set of all parameters that might be entered using the user-interface screens, and all specifications that might be used by the subroutines in the code to decide if a test point passes or fails.

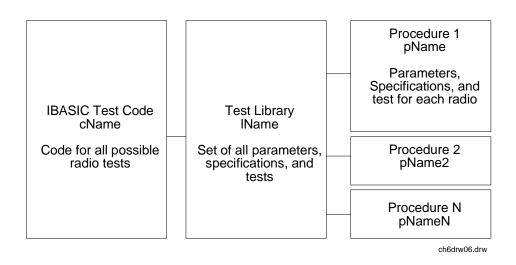

Only one Library is defined for each Code file. The name of this file is appended with a .LIB file extension, telling the TESTS system that this is a Library file. Also, both the Library and Code file should have the same base name to indicate the relationship between them.

A Library is required to use the user-interface screen functions of the TESTS Subsystem. If the program is simple enough that there is no need for user-input, or if all the user-input is simple enough to be accomplished with INPUT statements, a [NO LIB] option is available.

Procedure Files

A Procedure allows the user to define which of the test subroutines, parameters, and specifications defined in the Library will be used to test a specific Radio. There may be many Procedures defined that use the same IBASIC Code and Library, each using a different subset of the choices available in the Library. These files are appended with a .PRC file extension, but are *not* required to have the same base name as either the Library or the Code. The name of the corresponding Library (if any) is stored in each Procedure file.

The TESTS Subsystem

TESTS Subsystem File Relationship

TESTS Subsystem Screens

The TESTS Subsystem uses several screens to create, select, and copy files, and to run tests.

The TESTS (Main Menu) Subsystem Screen

The TESTS (Main Menu) screen is accessed by pressing the front panel TESTS key. Test procedures are selected and run from this screen. Additionally, access to all other TESTS Subsystem screens is accomplished from this screen.

TESTS (Main Menu)	
Please select a procedure to load.	1 Run Test
	2 <mark>Continue</mark>
LOAD TEST PROCEDURE: Select Procedure Location: Card Select Procedure Filename: Library: Program:	4Help
Description:	To Screen RF GEN RF ANL AF ANL

Figure 41

The TESTS (Main Menu) Subsystem Screen

The **Select Procedure Location:** field is used to select the mass storage location for the procedure to be loaded. The **Select Procedure Filename:** field is used to select the name of the procedure to be loaded. The **Description:** field gives the user a brief description of the procedure currently selected in the **Select Procedure Filename:** field.

To view all the Procedures available on the mass storage location currently selected in the **Select Procedure Location:** field, position the cursor on the **Select Procedure Filename:** field and push the rotary knob. A menu will appear in the lower right corner of the screen, displaying all the procedure files which are available. This is not a listing of the full contents of the selected mass storage location, it is only a list of the procedures files that are stored on that media.

The TESTS Subsystem

TESTS Subsystem User-Interface Screens

The TESTS Subsystem allows the user to easily modify the test subroutines, parameters, specifications and configuration to correspond to the requirements of a specific radio. There are several user-interface screens provided to allow the user to make modifications.

To access any of these screens, position the cursor on the desired field and push the rotary knob.

- The *Order of Tests* screen lets the user select the desired test(s) from the full set of available tests in the loaded procedure file.
- The *Channel Information* screen defines the transmit and receive frequencies used for the selected tests.
- The *Pass/Fail Limits* screen defines the specifications used to generate pass/fail messages during testing.
- The *Test Parameters* screen is used to define instrument settings and characteristics to match those of the radio being tested (audio load impedance, audio power, power supply voltage, etc.).
- The *External Devices* screen identifies all connected HP-IB equipped instruments and their HP-IB addresses.
- The Save/Delete Procedure screen is used to save or delete Procedures.
- The *Printer Setup* screen is used to select the printer used for IBASIC PRINT commands and to configure the format of the printer page.
- The *Execution Cond* screen is used to configure the IBASIC program execution conditions.
- The IBASIC Cntrl screen is the IBASIC Controllers display screen.

Refer to the TESTS Screen chapter for descriptions in the *HP 8924C Reference Guide* for information concerning how the different TESTS Subsystem screens are used.

The use of the *IBASIC Controller* screen is described in the beginning of this chapter.

A

Error Messages

This chapter will familiarize you with the different types of error messages the Test Set provided, and will explain the meaning of error messages that require explanation.

General Information About Error Messages

Information concerning error messages displayed by the Test Set may be found in one of the following manuals:

- This section
- The HP Instrument BASIC Users Handbook Version 2.0 (HP P/N E2083-90005)

The format of the displayed message determines which manual contains information about the error message. There are four basic error message formats:

- Positive numbered error messages
- IBASIC error messages
- HP-IB error messages
- Text only error messages

Positive Numbered Error Messages

Positive numbered error messages are generally associated with IBASIC. Refer to the *HP Instrument BASIC User's Handbook* for information on IBASIC error messages.

Positive numbered error messages take the form: ERROR XX Message Text

For example:

• Error 54 Duplicate file name

• or

• Error 80 in 632 Medium changed or not in drive

IBASIC Error Messages

IBASIC Error Messages are associated with IBASIC operation. IBASIC error messages can have both positive and negative numbers. Refer to the *HP Instrument BASIC User's Handbook* for information on positive numbered error messages. Refer to "**HP-IB Error Messages**" on page 315 for information on negative numbered error messages (the error message associated with a negative number is the same for HP-IB errors and IBASIC errors).

 $IBASIC\ error\ messages\ take\ the\ form:\ \textbf{IBASIC\ Error:}\ -\textbf{XX}\ \textbf{Message\ Text}$

For example:

• IBASIC Error: -286 Program runtime error

HP-IB Error Messages

Most HP-IB errors occur when the control program attempts to query a measurement that is not currently available, or tries to access an instrument connected to the external HP-IB without configuring the Test Set as the System Controller. When diagnosing the cause of an error condition check for these conditions first.

Refer to "Text Only HP-IB Error Descriptions" on page 320 or "Numbered HP-IB Error Descriptions" on page 322 for a list of some of the common error messages.

HP-IB error messages take the form:HP-IB Error: -XX Message Text or HP-IB Error: Message Text

For example:

HP-IB Error: -410 Query INTERRUPTED. or HP-IB Error: Input value out of range.

Text Only Error Messages

Text only error messages are generally associated with manual operation of the Test Set. See "The Message Display" on page 317 for more information about messages displayed on the Test Set's display.

Un-numbered (text only) HP-IB error messages are generally self-explanatory. For example, trying to retrieve a saved register that does not exist generates the following error message:

HP-IB Error: Register does not exist.

Text only error messages can also be displayed while running the Test Set's built-in diagnostic or calibration utility programs.

Text only error messages take the form: This is an error message.

For example:

• Input value out of range.

The Message Display

During instrument operation, various messages may appear on the Test Set's display. Prompt-type messages generally appear on the first line of the Test Set's display. General operating and error messages usually appear on the second line of the display. Some messages are persistent; they remain displayed, pending correction of the error condition, or until another persistent message with greater priority occurs. Other messages are only displayed when the error first occurs; they are removed when a key is pressed or the knob is turned, or when an HP-IB command is received. Many of the messages are displayed on the MESSAGE screen until the instrument is turned off.

Messages that are about error conditions may tell you what to do to correct the error (turn something off, reduce a field's value, press a certain key, and so forth). Messages and prompts are sometimes accompanied by a beep or warble.

NOTE: Warbles and Beeps

A warble sound indicates that an instrument-damaging event is occurring. Beeps often occur only with the first occurrence of the message. Prompts are generally silent.

Non-Recoverable Firmware Error

This error, also referred to as an "assert" occurs when the Test Set encounters a condition that the firmware cannot proceed from - causing the Test Set to halt operation until power is cycled. The message appears in the center of the Test Set's display and (except for the two lines in the second paragraph) has the form:

Unfortunately, you will not be able to recover from this condition without turning the Test Set off. If the failure reoccurs when you attempt to repeat the operation that caused the failure in the first place, you should record exactly what the configuration of the instrument was when the error appeared, and contact HP. This information will help us determine the proper course of action for your repair.

If The Non-
RecoverableIf the Test Set displays this error when first powered up, disabling Test Set opera-
tion, it could be related to the Autostart field on the main TESTS screen, or a
POWERON Save/Recall register. This field causes the Test Set to automatically
run the last program loaded in memory when the Test Set is powered up. If the pro-
gram is corrupted, the Test Set will automatically "lock up".

The only way to recover from this condition is to clear the Test Set's operating RAM. This will clear any IBASIC program, Save/Recall registers, and RAM disks that have been saved, as well as three calibration factors. The calibration factors are easily re-entered; the IBASIC programs, Save/Recall registers, and RAM disks must be re-loaded or re-initial-ized after clearing memory.

To Clear the Test Set's RAM:

- 1. Turn the Test Set off.
- 2. Hold the PRESET and HZ/uV buttons down.
- **3.** Turn the power on (with the buttons still held down) and wait until the CDMA CALL CONTROL screen is displayed.

Re-enter the Calibration Factors Erased when RAM is Cleared

Use this procedure to re-enter the three calibration factors that were erased when RAM is cleared. Use the ANLG SCRNS keys (to the left of the cursor control knob) to access the required screens.

- 1. Access the RF GENERATOR screen and select the DC FM Zero field (under FM Coupling).
- 2. Disconnect any cables to the ANT IN or RF IN/OUT connectors.
- 3. Access the TX TEST screen and select Zero under the TX Pwr Zero field.
- 4. Access the AF ANALYZER screen and select Zero under the DC Current field.

Text Only HP-IB Error Descriptions

The following list contains a subset of the Test Set's text only HP-IB error messages. These messages represent error conditions which may require explanation in addition to the error message text.

HP-IB Error during Procedure catalog. Check Config.

This error occurs when the Test Set fails to access an external HP-IB disk drive when trying to obtain a catalog of procedure files. This would occur when the **Select Procedure Location:** field on the TESTS (Main Menu) screen is set to **Disk** and the operator then tries to select a procedure filename using the **Select Procedure Filename:** field. Ensure that the **Mode** field on the I/O CONFIGURE screen is set to **Control** and that the **External Disk Specification** field on the TESTS (External Devices) screen has the correct mass storage volume specifier for the external disk drive.

HP-IB Query Error. Check instrument state.

This message usually appears when the control program queries a measurement that is not currently available (on the currently displayed screen and in the ON state), such as querying the TX Frequency measurement when **TX Freq Error** is displayed. This message may also be immediately followed by the message, **HP-IB Error:** -420: Query UNTERMINATED.

HP-IB Error: Not Enough Memory Available for Save.

This message will be generated when the control program tries to save the current Test Set state into a Save/Recall register using the REG:SAVE commands, but there is insufficient memory available in the Test Set. The Test Set's non-volatile RAM is shared by the following resources:

- IBASIC programs
- Save/Recall registers
- RAM Disk

In order to save the current Test Set state into a Save/Recall register more non-volatile RAM will have to be made available. This can be done by,

- reducing the size of the IBASIC program
- deleting one or more existing Save/Recall registers
- recovering RAM Disk space

The ROM Disk utility RAM_USAGE will display the total amount of non-volatile RAM installed in the Test Set, the RAM Disk allocation, the Save/Recall register allocation and the amount of non-volatile RAM available to IBASIC.

HP-IB Error: Unknown Save/Recall error.

This error can occur when you are trying to SAVE the instrument state to a mass storage device with a LIF formatted media. The default file system is DOS. Refer to **chapter 5**, **''Memory Cards/Mass Storage''** for more information.

HP-IB Error: HP-IB Units cause invalid conversion of attr.

This error is generated when trying to change Attribute Units and one of the Data Function values is set to zero. If this error is encountered the programmer must change the Data Function settings to values that can be converted to the new units_of_measure. Refer to "To Specify Units-of-Measure for HP-IB Data Transfer" on page 56 for more details.

Numbered HP-IB Error Descriptions

The following HP-IB errors can be generated under any of the following conditions:

- controlling the Test Set with an IBASIC program running on the built-in IBASIC controller
- controlling HP-IB devices/instruments, connected to the Test Set's external HP-IB bus, with an IBASIC program running on the built-in IBASIC controller
- controlling the Test Set with a program running on an external controller
- using the Test Set manually to print to an external HP-IB printer
- using the Test Set manually to access procedure/library/code files stored on an external HP-IB disk

The negative numbers which precede the error message text correspond to the error conditions outlined in the Standard Commands for Programmable Instruments (SCPI). For more information on SCPI, order the following book,

A Beginner's Guide to SCPI Addison-Wesley Publishing Company ISBN 0-201-56350-9 HP P/N 5010-7166

NOTE: HP-IB Parser. The term "Parser" is used in the following error message descriptions. It refers to the Test Set's HP-IB command parser.

Error –100 Command error

This code indicates only that a Command Error as defined in *IEEE 488.2, 11.5.1.1.4* has occurred.

Error –101 Invalid character

A syntactic element contains a character which is invalid for that type.

Error –102 Syntax error

An unrecognized command or data type was encountered; for example, a string value was received when the *device* does not accept strings.

Error –103	Invalid separator
	The parser was expecting a separator and encountered an illegal character. For example, the colon used to separate the FREQ and AMPL commands should be omitted in the following command:
	RFG:FREQ 850 MHZ:;AMPL -35
Error –104	Data type error
	The parser recognized a data element different than one allowed. For example, numeric or string data was expected but block data was encountered.
Error –105	GET not allowed
	A Group Execute Trigger was received within a program message (see <i>IEEE 488.2, 7.7</i>).
Error –108	Parameter not allowed
	More parameters were received than expected for the header. For example, the *ESE common command only accepts one parameter; receiving *ESE 36,1 is not allowed.
Error –109	Missing parameter
	Fewer parameters were received than required for the header. For example, the *ESE common command requires one parameter; receiving *ESE is not allowed.
Error –110	Command header error
	An error was detected in the header.
Error –111	Header separator error
	A character which is not a legal header separator was encountered while parsing the header.
Error –112	Program mnemonic too long
	The header contains more than twelve characters (see IEEE 488.2,7.6.1.4).
Error –113	Undefined header
	The header is syntactically correct, but it is undefined for this specific <i>device</i> . For example, *XYZ is not defined for any <i>device</i> .

Error –114	Header suffix out of range
	Indicates that a nonheader character has been encountered in what the parser expects is a header element.
Error –120	Numeric data error
	This error, as well as errors -121 through -128 , are generated when parsing a data element which appears to be numeric, including the nondecimal numeric types.
Error –121	Invalid character in number
	An invalid character for the data type being parsed was encountered. For example, an alpha in a decimal numeric or a "9" in octal data.
Error –123	Exponent too large
	The magnitude of the exponent was larger than 32000 (see <i>IEEE 488.2, 7.7.2.4.1</i>).
Error –124	Too many digits
	The mantissa of a decimal numeric data element contained more than 255 digits excluding leading zeros (see <i>IEEE 488.2, 7.7.2.4.1</i>).
Error –128	Numeric data not allowed
	A legal numeric data element was received, but the <i>device</i> does not accept one in this position for the header.
Error –130	Suffix error
	This error, as well as errors -131 through -138 , are generated when parsing a suffix.
Error –131	Invalid suffix
	The suffix does not follow the syntax described in <i>IEEE 488.2 7.7.3.2</i> , or the suffix is inappropriate for this <i>device</i> .
Error –134	Suffix too long
	The suffix contained more than 12 characters (see IEEE 488.2, 7.7.3.4).

Error –138	Suffix not allowed
	A suffix was encountered after a numeric element which does not allow suffixes.
Error –140	Character data error
	This error, as well as errors -141 through -148 , are generated when parsing a character data element.
Error –141	Invalid character data
	Either the character data element contains an invalid character or the particular element received is not valid for the header.
Error –144	Character data too long
	The character data element contains more than twelve characters (see <i>IEEE 488.2</i> , 7.7.1.4).
Error –148	Character data not allowed
	A legal character data element was encountered where prohibited by the <i>device</i> .
Error –150	String data error
	This error, as well as errors -151 through -158, are generated when parsing a string element.
Error –151	Invalid string data
	A string data element was expected, but was invalid for some reason (see <i>IEEE 488.2</i> , 7.7.5.2). For example, an END message was received before the terminal quote character.
Error –158	String data not allowed
	A string data element was encountered but was not allowed by the <i>device</i> at this point in parsing.
Error –160	Block data error
	This error, as well as errors -161 through -168, are generated when parsing a block data element.

Error –161	Invalid block data
	A block data element was expected, but was invalid for some reason (see <i>IEEE 488.2 7.7.6.2</i>). For example, an END message was received before the length was satisfied.
Error –168	Block data not allowed
	A legal block data element was encountered but was not allowed by the <i>device</i> at this point in parsing.
Error –170	Expression error
	This error, as well as errors -171 through -178, are generated when parsing an expression data element.
Error –171	Invalid expression
	The expression data element was invalid (see <i>IEEE 488.2, 7.7.7.2</i>); for example, unmatched parentheses or an illegal character.
Error –178	Expression data not allowed
	A legal expression data was encountered but was not allowed by the <i>device</i> at this point in parsing.
Error –180	Macro error
	This error, as well as errors -181 through -184, are generated when defining a macro or executing a macro.
Error –181	Invalid outside macro definition
	Indicates that a macro parameter placeholder was encountered outside of a macro definition.
Error –183	Invalid inside macro definition
	Indicates that the program message unit sequence, sent with a *DDT or *DMC command, is syntactically invalid (see 10.7.6.3).
Error –184	Macro parameter error
	Indicates that a command inside the macro definition had the wrong number or type of parameters.

Error –200	Execution error
	This code indicates only that an Execution Error as defined in <i>IEEE 488.2, 11.5.1.1.5</i> has occurred.
Error –201	Invalid while in local
	Indicates that a command is not executable while the <i>device</i> is in local due to a hard local control (see <i>IEEE 488.2, 5.6.1.5</i>). For example, a <i>device</i> with a rotary switch receives a message which would change the switches state, but the <i>device</i> is in local so the message can not be executed.
Error –202	Settings lost due to rtl
	Indicates that a setting associated with a hard local control (see <i>IEEE 488.2, 5.6.1.5</i>) was lost when the <i>device</i> changed to LOCS from REMS or to LWLS from RWLS.
Error –210	Trigger error
Error –211	Trigger ignored
	Indicates that a GET, *TRG, or triggering signal was received and recognized by the device but was ignored because of device timing considerations. For example, the device was not ready to respond.
Error –212	Arm ignored
	Indicates that an arming signal was received and recognized by the <i>device</i> but was ignored.
Error –213	Init ignored
	Indicates that a request for a measurement initiation was ignored as another measurement was already in progress.
Error –214	Trigger deadlock
	Indicates that the trigger source for the initiation of a measurement is set to GET and subsequent measurement query is received. The measurement cannot be started until a GET is received, but the GET would cause an INTERRUPTED error.

Error –215	Arm deadlock
	Indicates that the arm source for the initiation of a measurement is set to GET and subsequent measurement query is received. The measurement cannot be started until a GET is received, but the GET would cause an INTERRUPTED error.
Error –220	Parameter error
	Indicates that a program data element related error occurred.
Error –221	Settings conflict
	Indicates that a legal program data element was parsed but could not be executed due to the current device state (see <i>IEEE 488.2, 6.4.5.3 and 11.5.1.1.5</i>).
Error –222	Data out of range
	Indicates that a legal program data element was parsed but could not be executed because the interpreted value was outside the legal range as defined by the <i>device</i> (see <i>IEEE 488.2, 11.5.1.1.5</i>).
Error –223	Too much data
	Indicates that a legal program data element of block, expression, or string type was received that contained more data than the device could handle due to memory or related device- specific requirements.
Error –224	Illegal parameter value
	Used where exact value, from a list of possibles, was expected.
Error –230	Data corrupt or stale
	Possibly invalid data; new reading started but not completed since last access.
Error –231	Data questionable
	Indicates that measurement accuracy is suspect.
Error –240	Hardware error
	Indicates that a legal program command or query could not be executed because of a hardware problem in the <i>device</i> .

Error –241	Hardware missing
	Indicates that a legal program command or query could not be executed because of missing <i>device</i> hardware. For example, an option was not installed.
Error –250	Mass storage error
	Indicates that a mass storage error occurred.
Error –251	Missing mass storage
	Indicates that a legal program command or query could not be executed because of missing mass storage. For example, an option that was not installed.
Error –252	Missing media
	Indicates that a legal program command or query could not be executed because of a missing media. For example, no disk.
Error –253	Corrupt media
	Indicates that a legal program command or query could not be executed because of corrupt media. For example, bad disk or wrong format.
Error –254	Media full
	Indicates that a legal program command or query could not be executed because the media was full. For example, there is no room on the disk.
Error –255	Directory full
	Indicates that a legal program command or query could not be executed because the media directory was full.
Error –256	File name not found
	Indicates that a legal program command or query could not be executed because the file name on the device media was not found. For example, an attempt was made to read or copy a nonexistent file.

Error –257	File name error
	Indicates that a legal program command or query could not be executed because the file name on the device media was in error. For example, an attempt was made to copy to a duplicate file name.
Error –258	Media protected
	Indicates that a legal program command or query could not be executed because the media was protected. For example, the write-protect switch on a memory card was set.
Error –260	Expression error
	Indicates that an expression program data element related error occurred.
Error –261	Math error in expression
	Indicates that a syntactically legal expression program data element could not be executed due to a math error. For example, a divide-by-zero was attempted.
Error –270	Macro error
	Indicates that a macro-related execution error occurred.
Error –271	Macro syntax error
	Indicates that a syntactically legal macro program data sequence, according to <i>IEEE</i> 488.2, 10.7.2, could not be executed due to a syntax error within the macro definition (see <i>IEEE</i> 488.2, 10.7.6.3).
Error –272	Macro execution error
	Indicates that a syntactically legal macro program data sequence could not be executed due to some error in the macro definition (see <i>IEEE 488.2, 10.7.6.3</i>).
Error –273	Illegal macro label
	Indicates that the macro label defined in the * <i>DMC</i> command was a legal string syntax, but could not be accepted by the <i>device</i> (see <i>IEEE 488.2, 10.7.3 and 10.7.6.2</i>). For example, the label was too long, the same as a common command header, or contained invalid header syntax.

Error –274	Macro parameter error
	Indicates that the macro definition improperly used a macro parameter placeholder (see <i>IEEE 488.2, 10.7.3</i>).
Error –275	Macro definition too long
	Indicates that a syntactically legal macro program data sequence could not be executed because the string of block contents were too long for the device to handle (see <i>IEEE 488.2, 10.7.6.1</i>).
Error –276	Macro recursion error
	Indicates that a syntactically legal macro program data sequence could not be executed because the device found it to be recursive (see <i>IEEE 488.2 10.7.6.6</i>).
Error –277	Macro redefinition not allowed
	Indicates that syntactically legal macro label in the *DMC command could not be executed because the macro label was already defined (see <i>IEEE 488.2, 10.7.6.4</i>).
Error –278	Macro header not found
	Indicates that a syntactically legal macro label in the *GMC? query could not be executed because the header was not previously defined.
Error –280	Program error
	Indicates that a downloaded program-related execution error occurred.
Error –281	Cannot create program
	Indicates that an attempt to create a program was unsuccessful. A reason for the failure might include not enough memory.
Error –282	Illegal program name
	The name used to reference a program was invalid. For example, redefining an existing program, deleting a nonexistent program, or in general, referencing a nonexistent program.
Error –283	Illegal variable name
	An attempt was made to reference a nonexistent variable in a program.

Error –284	Program currently running
	Certain operations dealing with programs are illegal while the program is running. For example, deleting a running program is not possible.
Error –285	Program syntax error
	Indicates that syntax error appears in a downloaded program.
Error –286	Program runtime error
Error –300	Device-specific error
	This code indicates only that a Device-Dependent Error as defined in <i>IEEE 488.2</i> , <i>11.5.1.1.6</i> has occurred.
Error –310	System error
	Indicates that some error, termed "system error" by the device, has occurred.
Error –311	Memory error
	Indicates that an error was detected in the <i>device's</i> memory.
Error –312	PUD memory lost
	Indicates that the protected user data saved by the *PUD command has been lost.
Error –313	Calibration memory lost
	Indicates that nonvolatile calibration data used by the *CAL? command has been lost.
Error –314	Save/recall memory lost
	Indicates that the nonvolatile data saved by the *SAV command has been lost.
Error –315	Configuration memory lost
	Indicates that nonvolatile configuration data saved by the <i>device</i> has been lost.

Error –330	Self-test failed
Error –350	Queue overflow
	This code indicates that there is no room in the queue and an error occurred but was not recorded. This code is entered into the queue in lieu of the code that caused the error.
Error –400	Query error
	This code indicates only that a Query Error as defined in <i>IEEE 488.2 11.5.1.1.7 and 6.3</i> has occurred.
Error –410	Query INTERRUPTED
	Indicates that a condition causing an INTERRUPTED Query error occurred (see <i>IEEE</i> 488.2, 6.3.2.3). For example, a query followed by DAB or GET before a response was completely sent.
	This message appears when you query a measurement without immediately entering the returned value into a variable. For example, the following program lines query the TX Frequency measurement and enter its value into a variable (Rf_freq):
	OUTPUT 714;"MEAS:RFR:FREQ:ABS?" ENTER 714;Rf_freq
Error –420	Query UNTERMINATED
	Indicates that a condition causing an UNTERMINATED Query error occurred (see <i>IEEE</i> 488.2, 6.3.2.2.). For example, the <i>device</i> was addressed to talk and an incomplete program message was received.
	This message usually appears when trying to access a measurement that is not active. For example, you cannot query the DTMF Decoder measurements from the DUPLEX TEST screen, or query the TX Frequency measurement when the TX Freq Error measurement is displayed.
Error –430	Query DEADLOCKED
	Indicates that a condition causing a DEADLOCKED Query error occurred (see <i>IEEE 488.2, 6.3.1.7</i>). For example, both input buffer and output buffer are full and the device cannot continue.

Error –440	Query UNTERMINATED after indefinite response
	Indicates that a query was received in the same program message after a query requesting an indefinite response was executed (see <i>IEEE 488.2, 6.5.7.5.7</i>).
Error –606	Update of Input Module Relay Switch Count file failed.
	Indicates that the Test Set was not able to update the Input Module Relay Switch Count EEPROM file with the current switch count data from the non-volatile RAM switch count array. This error is most probably generated as a result of a hardware error or failure. Refer to the <i>HP 8924C Assembly Level Repair Manual</i> for diagnostic information.
Error –607	Checksum of Non-Volatile RAM Relay Count data bad.
	Indicates that the Test Set was not able to generate the proper checksum for the Input Module Relay Switch Count data from the non-volatile RAM switch count array. This error is most probably generated as a result of a hardware error or failure. Refer to the <i>HP 8924C Assembly Level Repair Manual</i> for diagnostic information.
Error –608	Initialization of Input Module Relay Count file failed.
	Indicates that the Test Set was not able to initialize the Input Module Relay Switch Count EEPROM file during installation of a new input module. This error is most probably generated as a result of a hardware error or failure. Refer to the <i>HP 8924C Assembly Level Repair Manual</i> for diagnostic information.
Error -1300	Order attempted while not in Connect state.
	Indicates that an attempt was made to send an order type Mobile Station Control Message (that is - order a change in power level, put the mobile station in maintenance mode, or send an alert message to the mobile station) when the Call Processing Subsystem was not in the Connect state.
Error –1301	Handoff attempted while not in Connect state.
	Indicates that an attempt was made to handoff a mobile station to a new voice channel when the Call Processing Subsystem was not in the Connect state.
Error -1302	Release attempted while not in Connect state.
	Indicates that an attempt was made to send a Release message to a mobile station when the Call Processing Subsystem was not in the Connect state.

Error –1303	Page attempted while not in Active state.
	Indicates that an attempt was made to Page a mobile station when the Call Processing Subsystem was not in the Active state.
Error –1304	Origination attempted while not in Active state.
	Indicates that a mobile station attempted to originate a call to the simulated Base Station when the Call Processing Subsystem was not in the Active state.
Error –1305	Registration attempted while not in Active state.
	Indicates that an attempt was made to send a Registration message to a mobile station when the Call Processing Subsystem was not in the Active state.
Error –1306	Origination in progress.
	Indicates that an attempt was made to; register, page, handoff, release, order a change in power level, put the mobile station in maintenance mode, or send an alert message to the mobile station while an origination was in progress.
Error –1307	Timeout occurred while attempting to register Mobile.
	Indicates that the simulated Base Station's internal timer expired before receiving a response from the mobile station during a registration attempt. The internal timer is set to 20 seconds when the Register state is entered.
Error –1308	Timeout occurred while attempting to page Mobile.
	Indicates that the simulated Base Station's internal timer expired before receiving a response from the mobile station during a page attempt. The internal timer is set to 20 seconds when the Page state is entered.
Error –1309	Timeout occurred while attempting to access Mobile.
	Indicates that the simulated Base Station's internal timer expired before receiving a response from the mobile station during an access attempt. The internal timer is set to 20 seconds when the Access state is entered.

Error –1310	Timeout occurred while attempting to alert Mobile.
	Indicates that the simulated Base Station's internal timer expired before receiving a response from the mobile station during an alert attempt. The internal timer is set to 20 seconds when the alert order is sent to the mobile station.
Error –1311	RF power loss indicates loss of Voice Channel.
	When the CALL CONTROL screen is displayed and the Call Processing Subsystem is in the Connect state, the host firmware constantly monitors the mobile station's transmitted carrier power. If the power falls below 0.0005Watts the simulated Base Station will terminate the call and return to the Active state. This error message is displayed if the host firmware has detected that the mobile station's carrier power has fallen below the 0.0005Watts threshold. The call is dropped and the Call Processing Subsystem returns to the Active state.
NOTE:	In order to ensure that the host firmware makes the correct decisions regarding the presence of the mobile stations's RF carrier, the Test Set's RF power meter should be zeroed when first entering the Call Processing Subsystem (that is - the first time the CALL CONTROL screen is selected during a measurement session). Failure to zero the power meter can result in erroneous RF power measurements. See "Using the Analog Call Processing Subsystem" chapter in the <i>HP 8924C Application Guide</i> for information on zeroing the RF Power meter.
Error –1312	Data from RVC contains invalid bits in word [1,2,3].
	Indicates that the decoded data received on the reverse voice channel contains invalid bits in word 1 and/or word 2 and/or word 3. The raw decoded data is displayed in hexadecimal format in the top right-hand portion of the CALL CONTROL screen. Raw decoded data is only displayed when the CALL CONTROL screen Display field is set to Data.
Error –1313	Timeout occurred while in Maintenance state.
	Indicates that the simulated Base Station's internal timer expired before the mobile station was taken out of the maintenance state. The internal timer is set to 20 seconds when the maintenance order is sent to the mobile station.
Error –1314	Alert attempted while not in Maintenance or Connect state.
	Indicates that an attempt was made to send an Alert order to the mobile station when the Call Processing Subsystem was not in the Maintenance state or Active state.

Error –1315	Data from RECC contains invalid bits in word [1,2,3].
	Indicates that the decoded data received on the reverse control channel contains invalid bits in word 1 and/or word 2 and/or word 3. The raw decoded data is displayed in hexadecimal format in the top right-hand portion of the CALL CONTROL screen. Raw decoded data is only displayed when the CALL CONTROL screen Display field is set to Data .
Error –1316	Incomplete data received on RECC for word [1,2,3].
	Indicates that the decoded data received on the reverse control channel did not contain the proper number of bits in word 1 and/or word 2 and/or word 3. The raw decoded data is displayed in hexadecimal format in the top right-hand portion of the CALL CONTROL screen. Raw decoded data is only displayed when the CALL CONTROL screen Display field is set to Data .
Error –1317	Incomplete data received on RVC for word [1,2,3].
	Indicates that the decoded data received on the reverse voice channel did not contain the proper number of bits in word 1 and/or word 2 and/or word 3. The raw decoded data is displayed in hexadecimal format in the top right-hand portion of the CALL CONTROL screen. Raw decoded data is only displayed when the CALL CONTROL screen Display field is set to Data .

List of Text Only Error Messages

Operation errors generally occur when you try to do something the Test Set was not designed to do. Most messages tell you what to do to correct the problem, (turn something off, reduce a field's value, press a certain key, and so forth).

Some common messages are listed here:

All self tests passed.

The Test Set did not detect any hardware or firmware failures during its initial selfdiagnostics. This message should always be displayed immediately after instrument turn on.

Cal file checksum incorrect - initializing file.

This error usually occurs after changing the Test Set's firmware ROM's. It is not a problem in that instance, but should not re-appear during subsequent operation of the Test Set.

Cannot make call at this time.

This error message appears when a call is attempted while the Test Set is performing another call processing function, such as registration. Press the END CALL key and attempt the call again.

Change Ref Level, Input Port or Attenuator (if using "Hold").

The RF signal level is either too great or too small for the current input port, attenuator setting, or both. This error often occurs when trying to make a low-level measurement using the RF IN/OUT port with the Spectrum Analyzer. Make the indicated changes until this message is no longer displayed.

Change RF Gen Amplitude, Output Port or Atten Hold (if on).

This message appears when the RF Generator's **Amplitude** field is set too high when using the RF IN/OUT port or when adjusting the amplitude with the **Atten Hold** field set to <u>On</u>.

The RF IN/OUT port has a lower maximum output level than the DUPLEX OUT port. Use the DUPLEX OUT port, or reduce the RF Generator's level.

If **Atten Hold** is <u>On</u>, you may be adjusting the amplitude outside of the allowed range. Change the amplitude

Decoder buffer full. Decrease gate time.

Too many decoder samples were sent to the decoder's buffer during a measurement gate time causing a data overflow. Reducing the gate time decreases the amount of data sent during each measurement.

Delta between RF Power and a channel level greater than 30 dB

A code channel level (pilot, sync, paging, or traffic) is set to a value outside of the 30 dB range relative to the RF Power level.

To find out which code channel is causing this error message, calculate the delta between RF Power and Sector A power. Add to this value the delta between Sector A power and the code channel that is set to the lowest value. If this total exceeds 30 dB, decrease the delta by adjusting the code channel level or the Sector A Power level closer to the displayed RF Power. Repeat for Sector B if necessary.

Direct latch write occurred. Cycle power when done servicing.

The SERVICE screen was accessed and one or more internal latch settings were changed. Turn the instrument off and back on to reset the latches. (This condition can occur during periodic calibration.)

Input value out of range.

A number was entered that was too large or small for the selected field, for example, trying to set **AFG1** Freq to 125 kHz.

Invalid channel setting with paging rate set to 'half'.

It is invalid to set the Sector A **Paging** field or the Sector B **Pilot** field to a level between -3.01 and 0 dB with the **Page Rate** field (on the CELL SITE CONFIGURATION screen) set to **Half**.

Readjust the Sector A **Paging** field and/or the Sector B **Pilot** field (on the CDMA GENERATOR CONTROL screen) so that neither is at a value between -3.01 and 0 dB. Or, set the **Page Rate** field to **Full** to allow levels up to 0 dB.

Invalid keystroke.

You used a key that has no function relating to the selected field, for example, pressing the [ON/OFF] key while the **Filter 1** field is selected.

One or more self tests failed. Error code: XXXX

An instrument failure was detected when the Test Set was turned on. (For example, having a stuck front-panel key during turn on.) The numbered error message corresponds to a binary-weighted group of errors listed in the *TST Common Command description in HP-IB Common Commands chapter of the *HP 8924C Condensed Programming Reference Guide*.

Option not installed.

You selected a function that requires optional hardware that is not present.

Squelch interrupt overflow. Press MEAS RESET.

The Test Set temporarily interrupts audio measurements when squelch is first broken to prevent internal switching transients from influencing measurements (except when using the OSCILLOSCOPE, SPECTRUM ANALYZER, DECODER, or SERVICE screens). If squelch is repetitively broken in a period of a few seconds, the duration of measurement interruption becomes too great, and the Test Set stops interrupting the signal. Following measurements may be influenced by transient signals.

Pressing [MEAS RESET] clears the data buffer used to generate interrupts, resetting the normal squelch operation to eliminate transients.

This condition may occur when monitoring low-level off-the-air signals.

Turn off either AM or FM settings.

You tried to create simultaneous AM and FM (using any combination of AFGen1, AFGen2, and the **Mod In To** field). The Test Set does not provide simultaneous AM and FM.

IBASIC Controller - default mass storage location, 217 COPY command, 233, 234 copying files, 233 default file system, 208 GET command, 224 INITIALIZE command, 223, 231, 236, 237 initializing media, 223 LOAD command, 224 making a simple measurement, 34 Mass Storage Volume Specifier (MSI), 231 MSI, 231 passing control back using PASS CON-TROL, 97 requesting HP-IB active control, 98 running programs, 32 SAVE command, 224 selecting mass storage devices, 218 STORE command, 224 storing files, 224 IBASIC command line, 242 **IBASIC** controller interfacing to serial ports, 246 screen, 241 **IBASIC EDIT mode** entering/exiting, 272 IBASIC program development See See program development. IEEE 488.1 Passing Control (see Passing Control), 94 **IEEE 488.2** Common Commands ESE, 200 Common Commands ESE?, 200 Common Commands ESR?, 200 Common Commands PCB, 98 Common Commands SRE, 205 Common Commands SRE?, 204 Common Commands STB?, 203 Output Queue, 181 Standard Event Status Register, 197 Status Byte Register, 201 Increasing measurement speed screen display time, 93

increasing measurement throughput, 86 instrument function turning ON and OFF, 49 Intensity Configure screen, 44 intensity setting, 44 interactions between fields, 69 between screens, 69 **K** k1 through k5, 65 k1' through k3', 65

L

.LIB files, 307 Library files backing up, 232 library files, 307 LIF file names, 220 LIF file system, 220 initializing media for, 223 limits setting measurement limits, 53 lo limits setting measurement limits, 53

Μ

Manual Control Mode, 30 Mass Storage Devices accessing, 219 default locations, 217 EPSON cards, 215, 216, 226 external disk drives, 214, 237 initializing media for, 223, 231, 236 OTP card, 216, 226 overview, 210 PCMCIA cards, 215, 216, 226 RAM Disk, 212, 235 ROM card, 216, 226 ROM Disk, 213, 225 selecting, 218 SRAM card, 215, 226 write protecting, 230 Mass storage locations default values, 217 selecting, 218 Mass Storage Volume Specifier, 231 measurement averaging, 52 querying value, 40 reference, 51 saving and recalling setups, 61 turning ON and OFF, 49 units, 55, 56 measurement limits setting measurement limits, 53 measurement triggering measurement triggering process, 72 Measuring Status Register Group, 171 memory considerations, 64 Memory Card Part Numbers, 226 Memory Cards address, 231 battery (see Battery), 228 initializing, 223, 231 inserting, 227 Mass Storage Volume Specifier, 231 OTP cards, 216 part numbers, 226 removing, 227 ROM cards, 216 SRAM cards, 215 using, 226

write-protect switch, 230 memory overflow error, 64 message error, 311 operation, 338 types of, 311 meter analog, displaying, 50 example how to use, 50 measurements used for, 50 Microsoft® Windows Terminal terminal emulator, 254, 272 Model Print Configure screen, 71

N

names registers, 63 newlink memcard2, 227 Non-Recoverable Firmware Error, 318 numbers changing, 58 decimal format, 58 entering, 58 system, 58 numeric entries, 58

0

offset example, 67 setting, frequency, 67 On/Off example how to use, 49 Operating Modes external automatic control, 23 internal automatic control, 23 manual control, 23, 30 operation messages, 338 Operation Status Register Group, 176 accessing registers contained in, 120, 174, 179, 191, 195 Condition Register bit assignments, 120, 174, 178, 191, 195 Operation Status Register Group (see Operation StatusRegister Group), 176 OTP Memory card, 210, 216 Output Queue Group, 181 accessing the output queue, 182 Output Queue Group (see Output Queue Group), 181 overpower damage, 22

P

Passing Control, 94 example programs, 99 passing control back automatically, 97 passing control back to another controller, 96 passing control back using PASS CON-TROL, 97 passing control to Test Set, 98 requesting control from IBASIC, 98 PC AdvanceLink (HP 68333F Version B.02.00) terminal emulator, 257, 273 Microsoft® Windows Terminal terminal emulator, 272 ProCommr® Revision 2.4.3 terminal emulator, 273 serial port configuration, 253 terminal emulator, 253 PCMCIA card (see Memory card), 215, 216, 226 pending error messages, 317 .PGM files, 307 Phone numbers customer support, 9 power-on settings changing, 63 .PRC files, 307 preset state changing, 64 default, 64 Print Configure screen Model, 71 Print Title, 71 Printer Address, 71 Printer Port, 71 settings, 71 Print Title Print Configure screen, 71 printer connecting to HP-IB, 31 Printer Address Print Configure screen, 71 Printer Port Print Configure screen, 71 printing

screens, 71 priority fields, 70 Procedure files, 219 backing up, 232 procedure files, 307 ProCommr® Revision 2.4.3 terminal emulator, 273 program development choosing development method, 261 IBASIC, 244 methods of, 244 using external computer, 263 using IBASIC EDIT mode, 270 using word processor on PC, 274 PROGram Subsystem, 285 commands, 287 executing commands, 301

Q

Questionable Data/Signal Register Group, 182 accessing registers contained in, 185 condition register bit assignments, 183

R

radio connecting, 22 RAM Disk, 210, 212 initializing, 236 using, 235 RAM_MNG, 235 recall instrument setups, 62 settings, 62 **RECALL** key using, 62 Ref indicator, 51 reference setting a measurement, 51 registers clearing, 63 naming, 63 RELEASE, 66 release global user key assignment, 66 local user key assignment, 66 remove register contents, 63 RF frequency offset setting, 67 RF IN/OUT connector connecting to, 22 RF offset example, 67 RF voltage setting, 44 **RFGen Volts** Configure Screen, 44 RJ-11 jack, 247 ROM Disk, 210, 213 using, 225 ROM Memory card, 210, 216 RX Test screen priority settings, 69

S

save instrument setups, 61 settings, 61 SAVE key using, 61 Save/Recall Registers default mass storage locations, 217 saving instrument setups, 61 saving settings, 61 screen dump, 71 screens interactions, 69 printing, 71 setting intensity, 44 Serial 1 Status Register Group, 187 Serial 2 Status Register Group, 192 serial port cables/adapters for, 247 configuration, 246, 251, 282 input buffer length, 252 interface to IBASIC controller, 246 receive/transmit pacing, 252 select code 10, 247, 282, 284 select code 9, 247, 251, 282 serial I/O from IBASIC program, 282 Service Request Enable Register, 201 clearing, 206 reading, 204 writing. 205 Service Requests Service Request Enable Register (see Service Request EnableRegister), 201settings base. 64 beeper volume, 45 changing, field, 26 date, 45 default, 63, 64 power-on, 63 recalling, 61 RF voltage, 44 saving, 61 time, 45 setups recalling, 61 saving, 61

SRAM Memory card, 210, 215 Standard Event Status Register Group, 197 accessing registers contained in, 200 bit assignments, 199 Status Byte Register, 201 clearing, 204 reading with serial poll, 203 reading with STB Common Command, 203 writing, 204 Status reporting, 108 clearing the Status Byte Register, 204 Condition register definition, 110 Enable register definition, 112 Event register definition, 111 Questionable Data/Signal Register Group (see QuestionableData/Signal Register Group), 182 reading Status Byte Register with serial poll, 203 reading Status Byte Register with STB CommonCommand, 203 Standard Event Status Register Group (see Standard EventStatus Register Group), 197 Status Byte Register, 201 status queue model, 113 status register model, 109 status register structure overview, 108 status registers in Test Set, 116 Summary Message definition, 112 Transition filter definition, 110 writing the Status Byte Register, 204 Storing code files, 224 Support Contacts electronic mail, 9 HP Desk, 9 telephone, 9 System Controller, 95

Т

terminal configuration, 260 Test Set default file system, 208 display units - changing, 55 file name conflicts, 222 file system, 220 file types, 223 HP-IB units - changing, 56 operating modes, 23 overview. 30 STATe command - definition, 49 status registers, 116 test set configuring, 43 TESTS Subsystem, 306 default mass storage locations, 218 file descriptions, 307 file relationships, 308 screens, 309 TestSet file name entry field width, 221 file names (see also DOS & LIF file names), 221 Time Configure screen, 45 time and date, 45 triggering measurement triggering process, 72 triggering analog measurements in local mode, 76 triggering analog measurements in remote mode, 82 triggering cdma measurements in local mode. 79 triggering cdma measurements in remote mode, 84 TX Test screen

priority settings, 69

U

unit-of-measure changing, 55, 56 converting, 55, 56 uploading programs from Test Set to external controller, 304 from Test Set to PC, 281 to Test Set, 268 user keys assigning global, 66 assigning, local, 65 clearing, global assignment, 66 clearing, local assignment, 66 deleting, global assignment, 66 deleting, local assignment, 66 example, 65 explanation, 65 global, assignment, 66 global, defined, 65 local, assignment, 65 local, defined, 65 releasing, global assignment, 66 releasing, local assignment, 66 setting, global, 66 setting, local, 65

V

V (volts) displaying results in, 55 voltage setting, 44 volume beeper, 45 Volume copy, 234

W

W (watts) displaying results in, 55 Wildcards, 208, 234 word processor configuring for program development, 274 transferring programs to Test Set, 275 writing lines of IBASIC code, 275 Write-protect switch, 230

X Xon/Xoff, 252
