VERTICAL RECEIVING ANTENNA

MODELS VRA-9 and VRA-10

Vertical Receiver Antenna Models VRA-9 and VRA-10 are the same as Models VRA-5/6/7 with the exception of antenna height and transformer frequency range; the VRA-9 and VRA-10 will function as described in the technical manual for VRA-5/6/7 with the following differences:

	<u>VRA-9</u>	<u>VRA-10</u>
Transformer Frequency Range:	2-32 mc	3-15 mc
Antenna:	16 foot vertical fiberglass whip	32 foot vertical fiberglass whip

Figure 1. Model VRA, Vertical Receiving Antenna, Front Angle View

1. PURPOSE.

Vertical Receiving Antenna VRA, (figure 1) is a vertical receiving whip antenna unit designed to provide an antenna and proper impedance match for a monitor receiver.

The VRA is used in installations where a convenient broadband device is needed to provide an antenna and impedance match to a monitor receiver operating in various receiving ranges.

2. PHYSICAL DESCRIPTION.

The VRA whip antenna system consists of a broadband 70 ohm impedance matching transformer coupling an aluminum or fiberglass whip antenna to a weatherproof connector receptacle.

The VRA is housed in a weather resistant cast aluminum alloy case. It incorporates an internal spark gap to provide protection of the receiver and personnel from lightning hazards.

Connection of the VRA to a receiver is made through a standard weatherproof connector receptacle (UG-58A/U) mounted on the side of the case. A mating cable connector is also provided for connection of a coaxial cable from the VRA to the monitor receiver.

3. FUNCTIONAL DESCRIPTION.

a. Model VRA-5 - Model VRA-5 is a vertical receiving antenna and impedance matching device to be used with receivers operating in the 200-800 kc frequency range.

The antenna consists of 18 feet of seamless aluminum tubing in 3 sections or 16 feet of fiberglass rod in 4 sections.

The impedance matching transformer provides an input impedance of 50 ohms and an output impedance of 70 ohms to the receiver.

b. Model VRA-6 - Model VRA-6 is a vertical receiving antenna and impedance matching device to be used with receivers operating in the 2-32 mc frequency range.

The antenna consists of 18 feet of seamless aluminum tubing in 3 sections or 16 feet of fiberglass rod in 4 sections.

The impedance matching transformer provides an input impedance of 50 ohms and an output impedance of 70 ohms to the receiver.

c. Model VRA-7 - Model VRA-7 is a vertical receiving antenna and impedance matching device to be used with receivers operating in the 3-15 mc frequency range.

The antenna consists of 35 feet of seamless aluminum tubing in 6 sections.

The impedance matching transformer provides an input impedance of 150 ohms and an output impedance of 70 ohms to the receiver.

The coupling transformer in the model VRA-5 has a frequency response which is flat within plus or minus 1.5 db over the range of 200-800 kc. However, it should be noted that impedance matching over such a wide frequency range as this, using an 18 foot antenna, must of necessity, be a compromise. In this case, optimum match is provided at 400 kc and efficiency either side of this point is somewhat less.

Similar matching at an optimum point is provided in models VRA-6 and VRA-7.

4. TECHNICAL SPECIFICATIONS.

Transformer Frequency Range:	VRA-5 200-800 kc VRA-6 2-32 mc VRA-7 3-15 mc
Transformer Frequency Response:	VRA-5 Flat within ±1.5 db, optimum matching at 400 kc. VRA-6 Flat within ±1.5 db from 2-32 mcs.
Equipment Case:	Waterproof all weather cast aluminum alloy.
Antenna:	Vertical aluminum or fiberglass sections that extend to 18 feet (models VRA-5 and VRA-6) and 35 feet for model VRA-7.
Output Impedance:	70 ohms, nominal.
Standard Weatherproof Connection Provided:	UG-58A/U Receptacle mounted on case with mating cable connector, TMC Part No. AX-259-2.

Safety:

Receiver and personnel protected from lightning by means of an adjustable internal spark gap.

Mounting Kit:

Installation hardware provided:

- 4 LW537MSS Split Washers
- 1 MS543 Plate mounting unit
- 4 MS619 Brackets for mounting unit
- 16 SC-111-2 Bolts (lag)
- 4 SCHH37165516 Bolts (machine)

Construction:

Antenna base is screw fitted into a metal bell mounted on a porcelain insulator which is further supported on rubber bushings to withstand shock.

Installed Size: (Less Antenna)

18-1/2 inches x 16-1/8 inches x 7 inches.

Installed Weight:

27 lbs.

Shipping Weight & Cube:

50 lbs., 2.3 cu. ft.

Components and Construction:

Equipment is manufactured in accordance with JAN/MIL specifications wherever practicable.

5. UNPACKING.

When the unit is uncrated, it should be inspected for any damage which may have incurred in transit. Inspect all packing material for parts which may have been shipped as "loose items".

With respect to damage to the equipment for which the carrier is liable, the Technical Materiel Corporation will assist in describing methods of repair and the furnishing of replacement parts.

6. INSTALLATION.

The VRA is shipped in one crate. Each unit has been factory tested and arrives ready for immediate installation and operation. No preliminary adjustments are necessary other than the insertion of the whip antenna onto the antenna post located on the top of the case and connection of the outer case to a good physical ground. See figure 2 and 3.

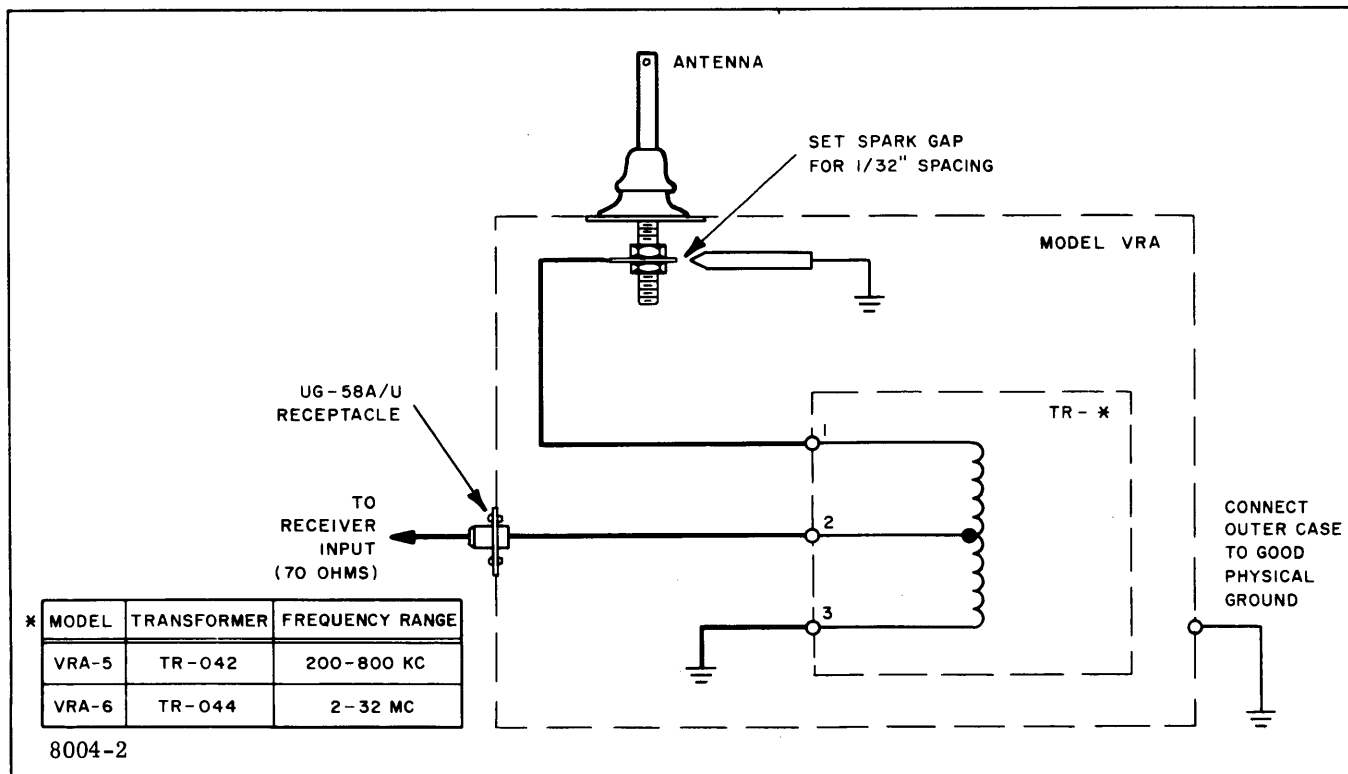

Figure 2. Simplified Schematic and Connection Diagram, Models VRA-5, VRA-6

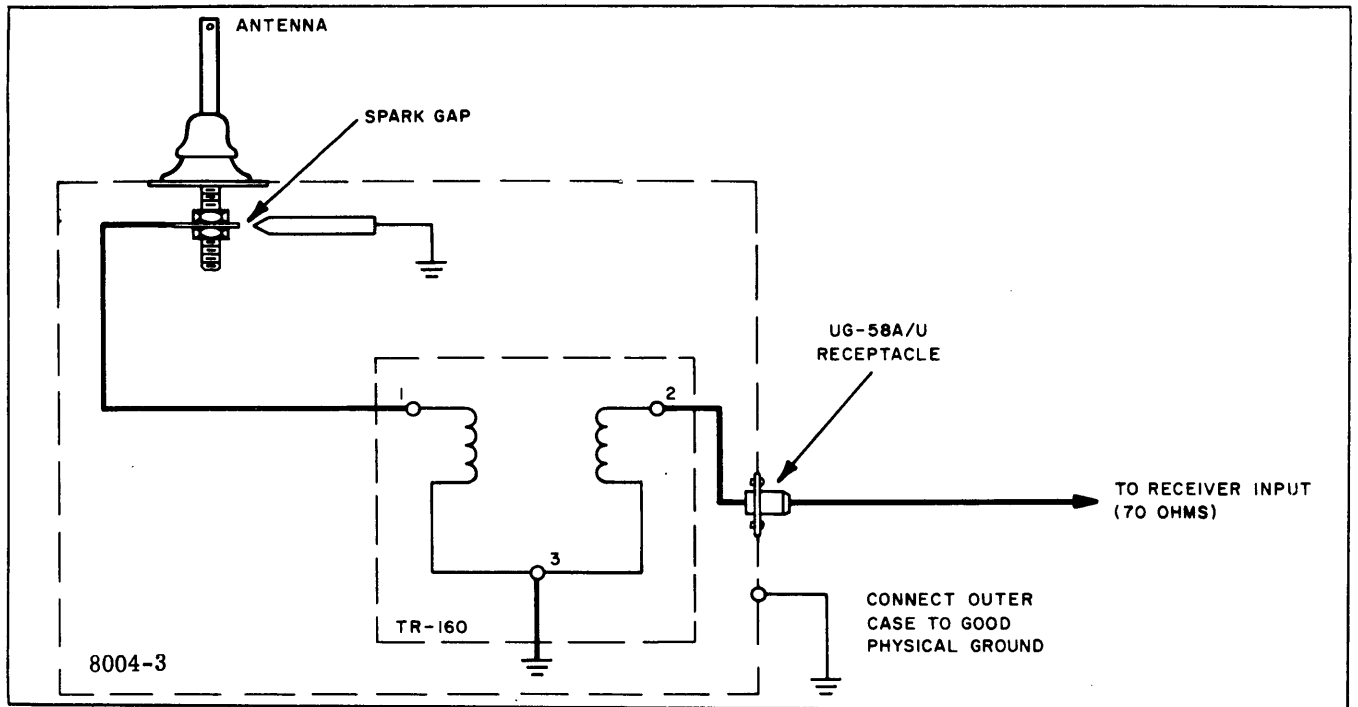

Figure 3. Simplified Schematic and Connection Diagram, Model VRA-7

The VRA has been designed for mounting on a wall, roof, pole or vehicle. For pole mounting, two straps and the necessary lag bolts are provided. For vertical plane mounting or horizontal plane mount-

ing, a universal mounting plate is provided. See figure 4 for installation details of the VRA. See figure 5 for the outline dimensions of the VRA.

Figure 4. Model VRA, Installation Diagram

Figure 5. Outline Dimensional Drawing

7. MAINTENANCE.

Due to the simplicity of construction and design of the VRA, maintenance may consist of simply observing for secure connections and unit cleanliness.

The dessicant package should be changed at least every six months or sooner if required. Spark

gap spacing should also be checked for 1/32" spacing.

Figures 6, 7 and 8 illustrate the test setup which may be used for unit troubleshooting.

Figure 9 provides an inside view of the VRA locating the various parts, to be used in conjunction with the Parts List.
